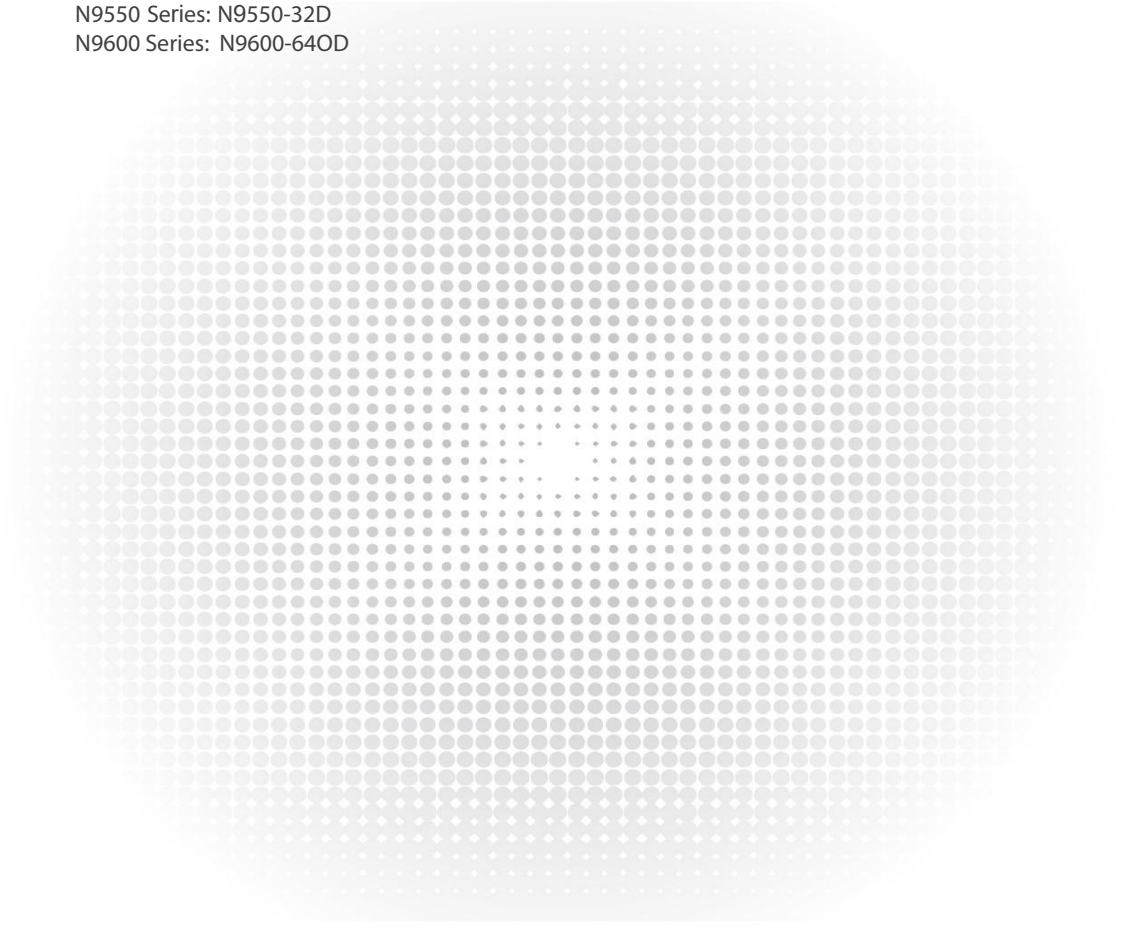
PicOS® Switches

Configuration Guide V4.5

Models:

S5810 Series: S5810-48TS-P; S5810-28TS; S5810-28FS; S5810-48TS; S5810-48FS
S5860 Series: S5860-20SQ; S5860-24XB-U; S5860-24MG-U; S5860-24XMG; S5860-48XMG-U; S5860-48XMG; S5860-48MG-U
S5870 Series: S5870-48T6S-U; S5870-48T6S; S5870-48T6BC-U; S5870-48T6BC; S5870-48MX6BC-U
N5850 Series: N5850-48S6Q; N5850-48X6C
N8550 Series: N8550-48B8C; N8550-32C; N8550-64C; N8550-24CD8D
N8560 Series: N8560-32C
N9550 Series: N9550-32D
N9600 Series: N9600-64OD



CONFIGURATION GUIDE

Release Notes for PICOS 4.5 . . . 15
Hardware Guides . . . 18
Hardware Compatibility . . . 19
FS Switch . . . 20
EdgeCore/Accton Switch . . . 24
Hardware Use Precautions . . . 26

Release Notes for PICOS 4.5

These notes summarize PICOS 4.5 new features, new hardware, known bugs, and bug fixes. Best practices recommend that you read all the content before upgrading to this release. For more detailed feature information, refer to the configuration guides.

PICOS 4.5.0E has been released as an **ESS (Early Sales Support)** stable version, aimed at supporting specific customer deployments and early adoption scenarios. This release provides early access to new features and enhancements tailored for targeted use cases. It serves as an intermediary step between internal testing and the General Availability (GA) release, enabling customers to explore and deploy features in controlled environments.

PICOS 4.5.1E version is an evaluation release specifically designed for the **N8550-24CD8D** platform. This release focuses on providing a foundational feature set but comes with certain limitations in functionality and usage. Please note that the current version supports only core features of the N8550-24CD8D platform, with some advanced capabilities not yet fully implemented or optimized.

PICOS 4.5.2E released as an ESS version for new platform N9600-64OD.

PICOS 4.5.0M2 is a GA release that brings enhanced stability and performance improvements. This version supports all platforms except S3410 series, S3270 series, N5860-48S6Q, N8550-24CD8D, and N9600-64OD switches, ensuring broader compatibility and reliability for network deployments.

Hardware

Ticket ID	Release	Description
-	4.5.2E	**Support FS Model N9600-64OD**
-	4.5.1E	**Support FS Model N8550-24CD8D**

New Features

Layer 2 and Layer 3

Ticket ID	Release	Description
-	4.5.0E	**IPv6 ND Inspection** IPv6 Neighbor Discovery (ND) Inspection is a security feature designed to enhance the protection of IPv6 networks by managing and validating Neighbor Discovery Protocol (NDP) messages, which are essential for the proper operation of IPv6 communication. Please have the details by reference document IPv6 Neighbor Discovery Inspection.
-	4.5.0E	**IPv6 ND Snooping** IPv6 Neighbor Discovery (ND) Snooping is a security feature that safeguards IPv6 networks to prevent various types of attacks. It functions similarly to ARP (Address Resolution Protocol) Snooping in IPv4 networks. Please have the details by reference document IPv6 Neighbor Discovery Snooping.
-	4.5.0E	**MPLS** MPLS (Multiprotocol Label Switching) operates between the link layer and the network layer in the TCP/IP protocol stack. It offers connectivity services to the IP layer while leveraging services from the link layer. Unlike traditional IP forwarding, MPLS uses label switching to direct traffic through the network. Please have the details by reference document MPLS Configuration.
-	4.5.0E	**PIM BSR (Bootstrap Router)** Dynamic RP allows multiple PIM devices within a PIM domain to be configured as C-RPs (Candidate RPs). Among these C-RPs, an RP is determined through an election process. The BSR aggregates information from all C-RPs in the network into an RP Set using Bootstrap messages and distributes it to all PIM devices. Each PIM device uses the RP Set to calculate and compare based on consistent rules, ultimately selecting an RP from the available C-RPs. Please have the details by reference document PIM Configuration Guide.
-	4.5.0E	**Ingress Buffer** Supports ingress buffer management, including guaranteed/shared/headroom management. Please have the details by reference document Configuring PFC Buffer.
-	4.5.0E	**PFC Watchdog Manual Control** The PFC Watchdog feature detects and resolves PFC (Priority Flow Control) deadlocks. Recovery methods include both automatic and manual recovery, allowing users to choose the appropriate approach for resolving deadlock scenarios. Please have the details by reference document Configuring PFC Watchdog.
-	4.5.0E	**PFC Deadlock Prevention** To avoid PFC deadlock issues, the DSCP value and corresponding Dot1p priority of the message can be modified so that the modified message can be forwarded using the new DSCP value in the new Dot1p priority queue, avoiding messages with the same DSCP value from remaining in PFC deadlock state. Please have the details by reference document Configuring PFC Deadlock Prevention.
-	4.5.0E	**Easy ECN** Explicit Congestion Notification (ECN) is a congestion notification mechanism operating at the IP and transport layers, serving as an extension to the TCP/IP protocol. With Easy ECN, users can enable WRED (Weighted Random Early Detection) policies, configure WRED thresholds, and set the maximum packet loss probability to manage network congestion more effectively. Please have the details by reference document Configuring Easy ECN.
-	4.5.0E	**DLB (Dynamic Load Balance)**

Ticket ID	Release	Description
		DLB breaks through the limitations of traditional static hash mechanisms by introducing timestamp and real-time load measurement factors (port bandwidth load, queue size) to optimize load balancing in both time and bandwidth space dimensions, providing a dynamic and intelligent hash mechanism. Please have the details by reference document Configuring Dynamic Load Balancing.
-	4.5.0E	**Standby IP Address** In cases where the management port cannot connect to the DHCP server and no static IP has been set through CLI during the switch's startup, it will default to using the secondary management IP address 192.168.1.1. This IP address serves as a backup, allowing management of the device even if DHCP services are unavailable. It is primarily used when the management port is directly connected to a PC, ensuring uninterrupted device management via this IP address. Please have the details by reference document Default Settings for Out-of-band Management Interface.
-	4.5.0E	**Perpetual PoE** Perpetual PoE (also known as hot-start uninterruptible power supply or permanent PoE) refers to the ability of Power Sourcing Equipment (PSE) to continue providing power during a system restart. This includes restarts initiated through CLI commands such as "request system reboot" or by rebooting under the Linux shell. Additionally, it supports uninterrupted power during system upgrades, including upgrades triggered via CLI or Linux-based upgrade methods. This feature ensures that PoE-powered devices remain operational even when the system is restarting or undergoing an upgrade. Please have the details by reference document Configuring Perpetual PoE.
-	4.5.0E	**PFC/ECN** GRPC monitoring PFC and ECN, in conjunction with gRPC, can provide PFC pause frame counts, PFC deadlock monitoring and ECN-marked packet counts for statistical queries. Please have the details by reference document PFC and ECN Statistical Reporting through gRPC.

Feature Enhancement

Ticket ID	Release	Description
-	4.5.0E	**DHCP Server Enhancement** In versions prior to 4.5.0E, clients were unable to obtain an address in a DHCP relay scenario. However, starting from version 4.5.0E, this issue has been resolved, and the system now fully supports DHCP address assignment in relay scenarios.
-	4.5.0E	**DHCP ZTP** After enabling the DHCP server with PicOS, address pools can be configured to allocate IP addresses to clients, along with additional network information such as gateway, DNS server addresses, log server addresses, TFTP server addresses, boot file names, and other options. These configurations are applied and synchronized with the clients as addresses are allocated. Please have the details by reference document Zero Touch Provisioning (ZTP).
	4.5.0E	**400G Port Splitting** The N9550-32D/AS9716-32D switches support the capability to split a 400G port into 2 * 200G and split to 4 * 100G ports, providing flexible bandwidth allocation for diverse network needs. Please have the details by reference document Configuring Port Breakout and Merge.
	4.5.0E	**PBR ECMP** PBR (Policy-Based Routing) action supports not only specifying a next-hop router or modifying DSCP values, but also enables the use of nexthop-group for ECMP (Equal-Cost Multi-Path) routing, allowing for more advanced and efficient traffic distribution across multiple paths. Please have the details by reference document Policy-Based Routing (PBR).

L2L3 WEB

Ticket ID	Release	Description
-	4.5.0E	**L2L3 WEB Access Control** Support is provided for using the command `set system services web disable` to modify the status of Layer 2 and Layer 3 WEB access, allowing administrators to enable or disable web access. The following switches support L2L3 WEB access, which is enabled by default: • S5810-48TS-P • S5810-28TS • S5810-28FS • S5810-48TS • S5810-48FS • S5860-20SQ • S5860-24XB-U • S5860-24MG-U • S5860-24XMG • S5860-48XMG-U • S5860-48XMG • S5860-48MG-U The following switches support L2L3 WEB access, but WEB access is disabled by default: • S5870-48T6S-U • S5870-48T6S • S5870-48MX6BC-U • S5870-48T6BC-U • S5870-48T6BC

Fixed Issues

Layer 2 and Layer 3

Ticket ID	Release	Description
18564	4.5.0M2	**[MLAG]** After configuring MLAG, the run show mlag link command always shows the link state as IDLE. This issue has been fixed
18446	4.5.0M2	**[MLAG/MLAG+EVPN]** After the MLAG peer restarts or reboots, the MLAG domain status stays at CONNECTING, while the peer shows ESTABLISHED. The issue is caus MLAG socket using the loopback address instead of the configured MLAG IP. This issue has been fixed.
15919	4.5.0M2	**[MLAG]** MLAG occasionally fails to reach FULL state, with error log: local0.err : [SIF]Socket 99 connect is in progress. This issue has been fixed.
17340	4.5.0M2	**[N8560-64C]** Port LED stays off even when the port is operational with an optical module installed.
17378	4.5.0E	**[DOT1X]** Setting the session timeout to 0 on the NAS and a non-zero session timeout on the NAC server causes a crash during 802.1X re-authentication. The bug is fixed in 4.5.0E.
17760	4.5.0M2	**[SNMP] LLDP Neighbor Information Retrieval Issue** When the number of LLDP neighbors exceeded five, SNMP failed to retrieve LLDP neighbor details. This issue has been fixed.
17386	4.5.0M2	**[LLDP] SNMP Notification Issue after Interface Reconfiguration** After enabling an interface by using command **set interface gigabit-ethernet** xx **disable true** and then disabling it by using command **delete interface gigabit-ethernet** xx **disable**, LLDP might not notify SNMP. This issue has been resolved.
17531	4.5.0M2	**[DHCP Server] Address Assignment Failure with Excessive Address Pools** In a direct connection scenario, configuring too many address pools caused the configuration file size to exceed 1024 characters, preventing the DHCP server from assigning IP addresses. This has been fixed.
17481	4.5.0M2	**[N9550-32D] Port LED Issue in Breakout Mode** When enabling breakout mode for 2×200G, the port LEDs did not illuminate. This issue has been addressed.
17544	4.5.0M2	**[CLI] No Output for Interface Command on AS9716-32D** On the AS9716-32D platform, executing the command **`run show interface gigabit-ethernet`** *`xe-1/1/xx`* and pressing Enter produced no output. This issue has been fixed.
17556	4.5.0M2	**[AS4610/N3024/N3048] System Crash when Handling Large Files** Copying or creating large files locally caused a *`core.bcmINTR`* error, leading to the *`pica_lcmgr`* process crashing. The kernel didn't report any errors, but PicOS restarted after some time. This issue has been fixed.
17330	4.5.0M2	**[S5850-48S6Q] High CPU Usage and Memory Leak Due to FPM Packet Handling** When receiving unknown packets, FPM discarded them but did not close the socket, leading to memory leaks and 100% CPU usage. This issue has been resolved.
17647	4.5.0M2	**[ACL - BCM] VRRP Virtual MAC Incorrectly Installed in ACL** In L2/L3 configurations, the VRRP virtual MAC (`00:00:5e`) was added to ACL even when VRRP was not configured, causing ping traffic destined for the VRRP MAC to be blocked. This issue has been fixed.
17366	4.5.0M2	**[SIF] VLAN Removal Issue Affecting Kernel Configuration** If a trunk port was configured with a native VLAN that was also a VLAN member, removing the native VLAN via CLI caused the kernel to incorrectly delete the VLAN, leading to VLAN anomalies. This issue has been fixed.
18806	4.5.0M2	**[N8550-32C] Cannot Correctly Read the SN (Serial Number) of the Power Module** When you execute the show system serial-number command on N8550-32C, the RPSU 1 Serial Number information cannot be displayed correctly. This issue has been fixed.
19136	4.5.0M2	**[MLAG N9550-32D] The MAC Learning Issue after the Counting Number Exceeds 8K** In the MLAG scenario of N9550-32D, due to the flaw in the SDK's MAC address counting mechanism, some MAC addresses are counted repeatedly. Even when the actual number of MAC entries has not reached the maximum capacity limit, the switch stops learning new MAC addresses. This issue has been fixed.

Known Limitations

Ticket ID	Release	Description
18171	4.5.2E	[N9600-64OD] Some sub-interfaces cannot come up in 8×50G mode when using the OSFP-SR8-800G module.
18400	4.5.2E	[N9600-64OD] The port light remains illuminated after the module is removed in port splitting mode.
18091	4.5.2E	[N9600-64OD] Undersized packets are not counted in the interface's 'Undersize Packets' statistics.
18504	4.5.2E	[N9600-64OD] The BMC light remains red after a successful system startup. PICOS does not control the BMC light. The light changes from flashing green to solid red.
18501	4.5.2E	**[N9600-64OD] Front Panel Ports 65 and 66 Not Supported** The two SFP front panel ports (65 and 66) are not adapted and are not supported in **4.5.2E**.
-	4.5.2E	[N9600-64OD] Packets smaller than 295 bytes will not reach full line rate due to hardware limitations.
-	4.5.2E	[N9600-64OD] This platform uses software-based MAC address learning, resulting in a slower learning rate compared to hardware-based platforms.
-	4.5.0M2	PICOS 4.5.0M does not support OSPF Multi-Instance.
-	4.5.0M2	PICOS 4.5.0M does not support telnet server.

Hardware Use Precautions

This document describes the precautions related to hardware you must take when using.

- AG5648/AS7312_54X/AS7312_54XS
- Dell N22xx Series Switches
- Limitation of Port Breakout
- Speed Setting on SFP28 Ports in a Quad-SerDes Core
- AS9716-32D Unsupported Features and Limitations
- N8560-32C Unsupported Features
- FS S5810 Series and S5860 Series Switch Unsupported Features
- S5860-48XMG-U/S5860-48XMG/S5860-48MG-U Limitation
- N9550-32D Unsupported Features and Limitations
- FS S3410 Series Switch Unsupported Features and Limitations
- N8560-64C Unsupported Features
- N8550-24CD8D Feature Support
- N9600-64OD Unsupported Features and Limitations

AG5648/AS7312_54X/AS7312_54XS

Follow the below precautions before using AG5648/AS7312_54X/AS7312_54XS switch:

1. The first 48 ports are grouped, each four ports are grouped as shown in the following table.

Groups of ports	port1- port4	port5- port8	port9- port12	port13- port16	port17- port20	port21- port24
	port25- port28	port29- port32	port33- port36	port37- port40	port41- port44	port45- port48

2. When configuring the port rate, the supported rates are 25 Gbit/s, 10 Gbit/s, and 1 Gbit/s. The four ports in the same group can be configured with the same port rate or different rate. When configured at different port rates, 10G and 1G can coexist, but 25G cannot coexist with other rates. The following table gives several cases of speed setting for the group of ports.

	te-1/1/21	**te-1/1/22**	**te-1/1/23**	**te-1/1/24**	**Allowed or not allowed**
case #1	10 G	10G	10G	10G	✓
case #2	1G	1G	1G	1G	✓
case #3	25G	25G	25G	25G	✓
case #4	1G	10G	1G	10G	✓
case #5	25G	1G	25G	25G	**X**
case #6	25G	10G	25G	10G	**X**
case #7	25G	1G	10G	25G	**X**

Dell N22xx Series Switches

- IPv6 is not supported on Dell N22xx series switches.
- GRE is not supported on Dell N22xx series switches.

Limitation of Port Breakout

Due to ASIC limitation, there are some 100GE interfaces on certain platforms do not support port splitting. The following table gives a summary.

> **NOTE:**
> For AS7726-32X, AS7326-56X, N8550-48B8C and N8550-32C, by default, there are no such limitation described in the below table. The limitation of port breakout only happens when the 10G-Base-KR ports are enabled as either front panel ports or management ports. For details about 10G-Base-KR ports, see 10G-Base-KR Interface Configuration.

Platform	Limitation Description
AS6812_32X	Ports xe-1/1/13, xe-1/1/14, xe-1/1/15, xe-1/1/16, xe-1/1/29, xe-1/1/30, xe-1/1/31 and xe-1/1/32 are not allowed to be split into four Gigabit Ethernet ports.
AS5835_54X/AS5835_54T/ N5850-48X6C	Only ports xe-1/1/1 and xe-1/1/4 can be split into four Gigabit Ethernet ports, other ports are not allowed to be split.
AS7726-32X	Port xe-1/1/32 is not allowed to be split into four Gigabit Ethernet ports.
N8550-32C	Port xe-1/1/32 is not allowed to be split into four Gigabit Ethernet ports.
AS7326-56X	Port xe-1/1/8 is not allowed to be split into four Gigabit Ethernet ports.
N8550-48B8C	Port xe-1/1/8 is not allowed to be split into four Gigabit Ethernet ports.
S5232F-ON	Port xe-1/1/32 is not allowed to be split into four Gigabit Ethernet ports.
AS7816-64X	Only the ports on the first row of front panel are allowed to do breakout, that is, only ports 1, 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27, 29 and 31 can be split into four Gigabit Ethernet ports.
N8550-64C	Only the ports on the first row of front panel are allowed to do breakout, that is, only ports 1, 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27, 29 and 31 can be split into four Gigabit Ethernet ports.
Z9264F-ON	Only the ports on the first row of front panel are allowed to do breakout, that is, only ports 1, 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27, 29 and 31 can be split into four Gigabit Ethernet ports.

Speed Setting on SFP28 Ports in a Quad-SerDes Core

For the 4 ports in a single Quad-SerDes Core, the default speed are set to 25G. And auto detection of the speed is disabled. The four port can link up only if set the speed of all the four ports to either 25G or 10G/1G. This new additions would cover AS7312, N3248PXE, S5248, AS7326 and N3248EPX.

AS9716-32D Unsupported Features and Limitations

Unsupported Features

The following features are not supported on AS9716-32D:

- MAC-based VLAN
- QinQ
- PVLAN
- Mirror output port cannot be a LAG port.
- Regular Hashing for LAGs
- Resilient Hashing for LAGs
- Storm Control
- Egress meter
- Routed interface with VRF
- VxLAN/L2-GRE/L2-MPLS/PBB (Provider Backbone Bridge)
- Interface STM share mode
- OVS ICAP doesn’t support modifying src/dst MAC
- OVS NAT flow
- OVS UDF v2
- OVS L2/L3 buffer mode

Limitations

PICOS has the following limitations on AS9716-32D:

- LAG hash only supports advance mode and symmetric mode
- Only support QoS egress queue 0-3
- Firewall filter copp cannot configure policer on AS9716-32D.

For example,

```
admin@PICOS# set firewall filter copp sequence 100 then policer p1
admin@PICOS# commit
Filter copp can't configure policer in current platform
Commit failed.
```

N8560-32C Unsupported Features

The following OVS and L2/L3 features are not supported on FS N8560-32C switch:

- UDFv1
- Egress meter
- match-vlan-type
- VN-Tag
- Rate limit
- Push VLAN for QinQ packets

FS S5810 Series and S5860 Series Switch Unsupported Features

- The following OVS features are not supported on FS S5810 Series and S5860 Series switch:
  - Vxlan
  - MPLS/L2MPLS
  - PBB
  - Flexible mode
  - NAT
  - GTP Hash
  - Resilient hash
  - Match-vlan-type(vlan format)
  - udfv2
  - Match vxlan vni
  - Xlate table of TTP
- The following L2/L3 features are not supported on FS S5810 Series and S5860 Series switch:
  - GRE
  - VxLAN
  - IPFIX
- DHCP snooping has the following limiation:

DHCP snooping binding file which is set by command **set protocols dhcp snooping binding file** <*file-path*> does not work now.

NOTE:

GRE function is not supported on S5860 Series switches but supported on S5810 Series switches.

S5860-48XMG-U/S5860-48XMG/S5860-48MG-U Limitation

The S5860-48XMG-U/S5860-48XMG/S5860-48MG-U switches are dual-chip switches which flood received broadcast, multicast, or unknown unicast traffic between chips. When there is a large amount of broadcast, multicast, or unknown unicast traffic, it may trigger an intra-device broadcast storm, resulting in inter-chip network congestion and packet loss.

N9550-32D Unsupported Features and Limitations

Unsupported Features

The following features are not supported on N9550-32D:

- MAC-based VLAN
- QinQ
- PVLAN
- Mirror output port cannot be a LAG port.
- Regular Hashing for LAGs
- Resilient Hashing for LAGs
- Storm Control
- Egress meter
- Routed interface with VRF
- VxLAN/L2-GRE/L2-MPLS/PBB (Provider Backbone Bridge)
- Interface STM share mode
- OVS ICAP doesn’t support modifying src/dst MAC
- OVS NAT flow
- OVS UDF v2
- OVS L2/L3 buffer mode

Limitations

PICOS has the following limitations on N9550-32D:

- LAG hash only supports advance mode and symmetric mode.
- Only support QoS egress queue 0-3.
- Firewall filter copp cannot configure policer on N9550-32D.

For example,

```
admin@PICOS# set firewall filter copp sequence 100 then policer p1
admin@PICOS# commit
Filter copp can't configure policer in current platform
Commit failed.
```

FS S3410 Series Switch Unsupported Features and Limitations

- The following L2/L3 features are not supported on S3410 Series switch:
  - not support IS-IS
  - not support OSPFv2/OSPFv3 GR
  - not support IPv6 Source Guard
  - not support IPv6 DHCP Guard
  - not support IPv6 DHCP Snooping
  - not support PFC Watchdog
  - not support ECMP Hash Mode (Randomized Load Balance, Round-Robin Load Balance and Dynamic Load Balance Normal Mode)
  - not support L3 GRE
  - not support VXLAN
  - not support IGMP
  - not support PIM
  - not support buffer dynamic shared for egress multicast queue
  - not support symmetric hash
  - not support resilient hash
  - not support advance hash
  - not support PFC (Priority Flow Control)
  - not support ECMP
  - not support NETCONF
  - not support VRF
  - not support CoPP max bandwidth and min bandwidth configuration
- S3410 Series switches do not support OVS (Open vSwitch).
- S3410 Series switches do not support CrossFlow.
- S3410 Series switches do not support installing through USB.
- When upgrading, the S3410 Series switches only support the **upgrade2** method and do not support the **upgrade** method. For detailed instructions of **upgrade2**, please refer to:

PICOS Installation and Upgrade Guide for FS S5810 Series, S3410 Series, S5860 Series and N8560-32C Switches

- The commands **sudo systemctl stop picos** and **sudo systemctl restart picos** are not supported on S3410 Series switches.
- S3410 Series switches do not have an Eth0 management port; instead, an in-band management port is used. By default, the in-band management function of all the service port is enabled on VLAN 1 with a system built-in interface name *inband-mgmt*. For more details, see document Default Settings for In-Band Management Interface on S3410 Series Switches .
- The loopback port cannot establish BGP neighbors, resulting in routing function cannot work on S3410 Series switches.
- Only up to two concurrent SSH connections can be active at the same time. The idle timeout for SSH sessions is fixed to 3600s.

S3410 Series Switch File Storage Guidelines

- **Small Files**
  - It is recommended to store small files in the `/home/admin/` directory or the default `/cftmp/` directory.
- **Large Files (e.g., Image Files)**
  - Due to limited space in `/home/admin/` and `/cftmp/`, large files should be stored in the `/mnt/open/` directory.
- **Directory Cleanup**
  - To maintain system cleanliness and ensure efficient operation, please delete unnecessary files promptly.

N8560-64C Unsupported Features

The following OVS and L2/L3 features are not supported on FS N8560-64C switch:

- VXLAN routing
- OVS MPLSv1
- OVS VLANv1
- Resilient hashing for LAGs

N8550-24CD8D Feature Support

- 4.5.1E
- 4.5.1.1

4.5.1E

The 4.5.1E version provides a foundational feature set tailored to N8550-24CD8D platform but includes certain limitations in functionality and usage.

It is important to note that the 4.5.1E release focuses on delivering core features for the N8550-24CD8D platform, with some advanced capabilities not yet fully implemented or optimized. Further improvements and feature expansions for the platform will be based on user feedback and testing results, and are planned for upcoming software releases.

The detailed feature support for the N8550-24CD8D in version 4.5.1E is listed below.

Supported Features List

The following features are supported on N8550-24CD8D:

- FDB (Forwarding Database)
- FlexLink
- VRRPv2 (Virtual Router Redundancy Protocol)/VRRPv3/Active VRRP
- ARP (Address Resolution Protocol)/IPv6 Neighbor Discovery
- Undersize/Oversize
- LACP (Link Aggregation Control Protocol)
- IEEE 802.1Q
- SNMPv2 (Simple Network Management Protocol) /SNMPv3
- MSTP (Multiple Spanning Tree Protocol)/ PVST (Per-VLAN Spanning Tree) / RSTP (Rapid Spanning Tree Protocol)
- Mirror
- ERSPAN (Encapsulated Remote SPAN）
- VLAN Range
- NETCONF
- LAG hash
- Resilient LAG hash
- Static Route IPv4/IPv6
- IPv6 Function
- AAA（TACACS / RADIUS）
- SFlow
- VRF (Virtual Routing Forwarding)
- OSPF (Open Shortest Path First) /OSPF VRF
- RIP (Routing Information Protocol)
- DHCP (Dynamic Host Configuration Protocol) Snooping
- CoPP (Control Plane Policing)
- Routed Interface

Unsupported Features List

The following features are not supported on N8550-24CD8D:

- LAG symmetric hash
- DHCP Relay
- ARP Inspection

- IGMPv2 (Internet Group Management Protocol)/IGMPv3
- IGMP Snooping
- Voice VLAN
- LLDP (Link Layer Discovery Protocol)
- Buffer Management
- ECMP (Equal-Cost Multipath Routing) hash
- ECMP symmetric hash
- BPDU (Bridge Protocol Data Unit) Tunnel
- GRE (Generic Routing Encapsulation)
- Sub-interface
- Port-Security
- QinQ (802.1Q-in-802.1Q)
- RA Guard
- STM (Synchronous Transfer Mode)
- PIM (Protocol Independent Multicast)
- Storm/Stormratio/Stormcktbps
- Flow Control
- Counter
- PTP (Precision Time Protocol）
- VXLAN
- MAC-based VLAN
- MLAG

4.5.1.1

Version 4.5.1.1 builds upon the foundational 4.5.1E release, introducing expanded functionality and optimizations for the N8550-24CD8D platform. This release focuses on enhancing performance and usability while providing initial support for some advanced features. This release provides critical functionality validation support for the official GA of the N8550-24CD8D platform.

Expanded support for advanced networking features as listed below:

- MLAG (support MLAG + VRRP)
- PFC
- ECMP (Equal-Cost Multipath Routing) hash
- ECMP symmetric hash
- LAG symmetric hash
- LLDP (Link Layer Discovery Protocol)
- Buffer Management

N9600-64OD Unsupported Features and Limitations

Unsupported Features

The following features are not supported on N9600-64OD:

- MAC-based VLAN
- QinQ
- Voice VLAN
- IPv6 ND Inspection
- EFM OAM
- PTP-TC
- sFlow
- IGMP snooping
- Private VLAN
- VXLAN
- RA Guard
- EVPN
- MPLS
- IPv6SG (IPv6 Source Guard)

***UPoE**

The last 12 RJ45 ports on the front panel of N2224PX-ON support UPoE, the maximum output power can be set to up to 60 watts. The first 12 RJ45 ports support PoE but not UPOE, the maximum output power can be set to up to 30 watts.

25GbE SFP28 Port

Ports Te-1/1/25, Te-1/1/26, Te-1/1/27 and Te-1/1/28 are a group of ports, you should manually configure the port speed for these four ports by using the set interface gigabit-ethernet speed command before inserting an optical module. When configuring the rate, the supported port rates are 25 Gbit/s, 10 Gbit/s, and 1 Gbit/s. The four ports can be configured with the same port rate or different rate. When configured at different port rates, 10G and 1G can coexist, but 25G cannot coexist with other rates. The following table gives several cases of speed setting for this group of ports.

	te-1/1/25	**te-1/1/26**	**te-1/1/27**	**te-1/1/28**	**Allowed or not allowed**
case #1	10 G	10G	10G	10G	✓
case #2	1G	1G	1G	1G	✓
case #3	25G	25G	25G	25G	✓
case #4	1G	10G	1G	10G	✓
case #5	25G	1G	25G	25G	X
case #6	25G	10G	25G	10G	X
case #7	25G	1G	10G	25G	X

Note

If the port rate is set to 25 Gbit/s, but a 10 Gbit/s optical module is inserted, the port cannot go up.

***UPoE**

The last 24 RJ45 ports on the front panel of N2248PX-ON support UPoE, the maximum output power can be set to up to 60 watts. The first 24 RJ45 ports support PoE but not UPOE, the maximum output power can be set to up to 30 watts.

25GbE SFP28 Port

Ports te-1/1/1, te-1/1/2, te-1/1/3 and te-1/1/4 are a group of ports, you should manually configure the port speed for these four ports by using the set interface gigabit-ethernet speed command before inserting an optical module. When configuring the rate, the supported port rates are 25 Gbit/s, 10 Gbit/s, and 1 Gbit/s. The four ports can be configured with the same port rate or different rate. When configured at different port rates, 10G and 1G can coexist, but 25G cannot coexist with other rates. The following table gives several cases of speed setting for this group of ports.

	te-1/1/1	te-1/1/2	te-1/1/3	te-1/1/4	Allowed or not allowed
case #1	10 G	10G	10G	10G	✓
case #2	1G	1G	1G	1G	✓
case #3	25G	25G	25G	25G	✓
case #4	1G	10G	1G	10G	✓
case #5	25G	1G	25G	25G	X
case #6	25G	10G	25G	10G	X
case #7	25G	1G	10G	25G	X

Note:

If the port rate is set to 25 Gbit/s, but a 10 Gbit/s optical module is inserted, the port cannot go up.

***UPoE**

- The first eight RJ45 ports, from ge-1/1/1 to ge-1/1/8, on the front panel support UPoE. For these UPoE ports, the maximum output power supported is up to 90 watts. For details about UPoE, please refer to UPoE.
- See the link PoE Configuration Commands for PoE command reference, the following two PoE commands are not supported on N3208PX-ON:

set poe interface {<*interface-name*> | **all**} **max-power** <*integer*>

set poe power management-mode <*value*>

1G/2.5G/5G RJ45 Port

The four 1G/2.5G/5G RJ45 ports, ge-1/1/5, ge-1/1/6, ge-1/1/7 and ge-1/1/8, don't support setting of the force speed by using **set interface gigabit-ethernet**<*interface-name*> **speed** <*speed*> command, but only supports auto-negotiation mode. Together with the optional **set interface gigabit-ethernet** <*interface-name*> **auto-speeds** <*auto-speed*> command, user can manually specify the auto-negotiation rate range.

***PoE**

- The 24 RJ45 ports on the front panel of N3224P-ON support PoE but N3224T-ON doesn't support. For these PoE ports, the maximum output power can be set to up to 30 watts.
- See the link PoE Configuration for PoE command reference,.

Notes:

The following PoE commands are not supported on N3224P-ON:

- **set poe interface max-power**
- **set poe interface detection-type**
- **set poe interface mode**
- **set poe interface threshold-mode**
- **set poe power management-mode**

25GbE SFP28 Port

Ports Te-1/1/25, Te-1/1/26, Te-1/1/27 and Te-1/1/28 are a group of ports, you should manually configure the port speed for these four ports by using the set interface gigabit-ethernet speed command before inserting an optical module. When configuring the rate, the supported port rates are 25 Gbit/s, 10 Gbit/s, and 1 Gbit/s. The four ports can be configured with the same port rate or different rate. When configured at different port rates, 10G and 1G can coexist, but 25G cannot coexist with other rates. The following table gives several cases of speed setting for this group of ports.

	te-1/1/25	**te-1/1/26**	**te-1/1/27**	**te-1/1/28**	**Allowed or not allowed**
case #1	10 G	10G	10G	10G	✓

***PoE**

The 48x1G RJ45 ports on the front panel of N3248P-ON support PoE, but N3248TE-ON doesn't support PoE, the maximum output power supported is up to 30 watts. See the link PoE Configuration Commands for PoE command reference.

Notes:

The following PoE commands are not supported on N3248P-ON:

- **set poe interface max-power**
- **set poe interface mode**
- **set poe interface threshold-mode**
- **set poe power management-mode**

1G RJ45 Port

The 10/100/1000M RJ45 ports don't support setting of the force speed by using **set interface gigabit-ethernet**<*interface-name*> **speed** <*speed*> command, but only supports auto-negotiation mode. Together with the optional **set interface gigabit-ethernet** <*interface-name*> **auto-speeds** <*auto-speed*> command, user can manually specify the auto-negotiation rate range.

25GbE SFP28 Port

Ports Te-1/1/1, Te-1/1/2, Te-1/1/3 and Te-1/1/4 are a group of ports, you should manually configure the port speed for these four ports by using the **set interface gigabit-ethernet speed** command before inserting an optical module. When configuring the rate, the supported port rates are 25 Gbit/s, 10 Gbit/s, and 1 Gbit/s. The four ports can be configured with the same port rate or different rate. When configured at different port rates, 10G and 1G can coexist, but 25G cannot coexist with other rates. The following table gives several cases of speed setting for this group of ports.

	te-1/1/1	te-1/1/2	te-1/1/3	te-1/1/4	Allowed or not allowed
case #1	10 G	10G	10G	10G	✓
case #2	1G	1G	1G	1G	✓
case #3	25G	25G	25G	25G	✓
case #4	1G	10G	1G	10G	✓
case #5	25G	1G	25G	25G	**X**
case #6	25G	10G	25G	10G	**X**
case #7	25G	1G	10G	25G	**X**

Note:

If the port rate is set to 25 Gbit/s, but a 10 Gbit/s optical module is inserted, the port cannot go up.

HiGig2 stacking ports

N3248P-ON has one slot for QSFP module at the rear side which can be plugged in 2 x 100G QSFP modules. The port numbers of the QSFP module are Xe-1/1/1 and Xe-1/1/2. They can be used as normal 100G QSFP28 ports.

***UPoE**

- The 48x10G RJ45 ports on the front panel of N3248PXE-ON support UPoE. For these UPoE ports, the maximum output power supported is up to 99 watts. For details about UPoE, please refer to UPoE.
- N3248X-ON does not support PoE.
- See the link PoE Configuration Commands for PoE command reference.

Notes:

The following PoE commands are not supported on N3248PXE-ON:

- **set poe interface max-power**
- **set poe interface mode**
- **set poe interface threshold-mode**
- **set poe power management-mode**

2.5G/5G RJ45 Port

The 2.5G/5G RJ45 ports don't support setting of the force speed by using **set interface gigabit-ethernet**<*interface-name*> **speed** <*speed*> command, but only supports auto-negotiation mode. Together with the optional **set interface gigabit-ethernet** <*interface-name*> **auto-speeds** <*auto-speed*> command, user can manually specify the auto-negotiation rate range. The supported speeds include **10M, 100M**, **1G**, **2.5G**, **5G** and **10G**.

25GbE SFP28 Port

Ports Te-1 / 1/49, Te-1 / 1/50, Te-1 / 1/51 and Te-1 / 1/52 are a group of ports, you should manually configure the port speed for these four ports by using the **set interface gigabit-ethernet speed** command before inserting an optical module. When configuring the rate, the supported port rates are 25 Gbit/s, 10 Gbit/s, and 1 Gbit/s. The four ports can be configured with the same port rate or different rate. When configured at different port rates, 10G and 1G can coexist, but 25G cannot coexist with other rates. The following table gives several cases of speed setting for this group of ports.

	te-1/1/49	te-1/1/50	te-1/1/51	te-1/1/52	Allowed or not allowed
case #1	10 G	10G	10G	10G	✓
case #2	1G	1G	1G	1G	✓
case #3	25G	25G	25G	25G	✓
case #4	1G	10G	1G	10G	✓
case #5	25G	1G	25G	25G	**X**
case #6	25G	10G	25G	10G	**X**
case #7	25G	1G	10G	25G	**X**

Note:

If the port rate is set to 25 Gbit/s, but a 10 Gbit/s optical module is inserted, the port cannot go up.

2 x HG[106] stacking ports

N3248PXE-ON/N3248X-ON has one slot for QSFP module at the rear side which can be plugged in 2 x 100G QSFP modules. The port numbers of the QSFP module are Xe-1/1/1 and Xe-1/1/2. They can be used as normal 100G QSFP28 ports.

S5224F-ON

NOTE:

When the system is running normally, if one of the four fans or one of the two power supply units is removed, the remaining fans will run at a full speed. The fan fault alarm is reported and the fan LED changes to solid amber. Until the fan is reinserted, the fan fault recovers, and the system restarts adjusting the fan speed intelligently to control the device temperature within a reasonable range.

NOTE

PoE button:

The 48x1G RJ45 ports on the front panel support PoE, the maximum output power supported is up to 30 watts.

PoE button on the front panel controls whether the port LED indicates data switching status or PoE power supply status of the first 48 ports.

- By default, port LED indicates data switching status of the port. PoE LED on the front panel of system LED block is solid green.
- If pressed the PoE button, the port LED indicates PoE power supply status of the port. PoE LED on the front panel of system LED block changes to solid amber.

NOTE

Combo Port

1. Ports Ge-1/1/1, Ge-1/1/2, Ge-1/1/3, Ge-1/1/4, Ge-1/1/5, Ge-1/1/6, Ge-1/1/7 and Ge-1/1/8 are combo ports that support maximum of 1G port speed. A combo port consists of a GE electrical interface and a GE optical interface separately on the front panel. The multiplexed electrical and optical interfaces share one internal forwarding interface and cannot work at the same time. When one interface works, the other interface is disabled.

   The electrical port has a higher priority, that is, as long as the electrical port is plugged in, the electrical port takes effect but the optical port is invalid.

2. When configuring port speed, the combo ports (when worked as electrical ports) only support auto-negotiation mode, that is, configuring the force rate will not take effect for combo port when it works as an electrical port.

***PoE and LED Mode Button**

The first 24 RJ45 ports on the front panel support UPoE. For these UPoE ports, the maximum output power supported is up to 90 watts.

LED Mode button on the front panel controls whether the port LED indicates data switching status or PoE power supply status of the first 24 ports.

- By default, port LED indicates data switching status of the port. LED Mode LED on the front panel of system LED block is solid green.
- If pressed the LED Mode button, the port LED indicates PoE power supply status of the port. LED Mode LED on the front panel of system LED block changes to solid amber.

***PoE button**

The 24x1G RJ45 ports on the front panel support PoE, the maximum output power supported is up to 30 watts.

PoE button on the front panel controls whether the port LED indicates data switching status or PoE power supply status of the first 24 ports.

- By default, port LED indicates data switching status of the port. PoE LED on the front panel of system LED block is solid green.
- If pressed the PoE button, the port LED indicates PoE power supply status of the port. PoE LED on the front panel of system LED block changes to solid amber.

*__Combo Port__

- Ports ge-1/1/23 and ge-1/1/24 are combo ports that support 1G port speed. A combo port consists of a GE electrical interface and a GE optical interface separately on the front panel. The multiplexed electrical and optical interfaces share one internal forwarding interface and cannot work at the same time. When one interface works, the other interface is disabled.

The electrical port has a higher priority, that is, as long as the electrical port is plugged in, the electrical port takes effect, but the optical port is invalid.

- When configuring port speed, the combo ports (when worked as electrical ports) only support auto-negotiation mode, that is, configuring the force rate will not take effect for combo port when it works as an electrical port.

***Mode button**

The 8x1G RJ45 ports on the front panel support PoE+, the maximum output power supported is up to 30 watts.

Mode button on the front panel controls whether the port LED indicates data switching status or PoE power supply status of the first 8 ports.

- By default, port LED indicates data switching status of the port. PoE LED on the front panel of system LED block is solid green.
- If pressed the Mode button, the port LED indicates PoE power supply status of the port. PoE LED on the front panel of system LED block changes to solid amber.

Working environment temperature	32°F to 122°F (0ºC to 50ºC)

*__PoE button__

The 48x1G RJ45 ports on the front panel support PoE, the maximum output power supported is up to 30 watts.

PoE button on the front panel controls whether the port LED indicates data switching status or PoE power supply status of the first 48 ports.

- By default, port LED indicates data switching status of the port. PoE LED on the front panel of system LED block is solid green.
- If pressed the PoE button, the port LED indicates PoE power supply status of the port. PoE LED on the front panel of system LED block changes to solid amber.

*__Combo Port__

Ports ge-1/1/47 and ge-1/1/48 are combo ports that support 1G port speed. A combo port consists of a GE electrical interface and a GE optical interface separately on the front panel. The multiplexed electrical and optical interfaces share one internal forwarding interface and cannot work at the same time. When one interface works, the other interface is disabled.

- The electrical port has a higher priority, that is, as long as the electrical port is plugged in, the electrical port takes effect, but the optical port is invalid.
- When configuring port speed, the combo ports (when worked as electrical ports) only support auto-negotiation mode, that is, configuring the force rate will not take effect for combo port when it works as an electrical port.

·System LED Definition：

LED	Status	Description
System Status LED	Solid Green	all functions are normal
	Flashing Green with 2 sec on and 1 sec off	Booting
	Solid Amber	Major Fault
	Flashing Amber with 2 sec on and 1 sec off	Minor Fault
Power Status LED	Solid Green	Normal
	Solid Amber	POST in progress
	Flashing Amber with 2 sec on and 1 sec off	Power supply fault
	Off	Off
Fan Status LED	Solid Green	all functions are normal
	Flashing Amber with 2sec on and 1 sec off	One of Fan or Fan tray fault
	Other	Off
System Beacon LED	Off	Idle
	Flashing Blue with 1sec on and 1 sec off	beacon
Platform Stacking LED	Not supported.	

·QSFP28 port status LED Definition：

LED	Status	Description
1st LED	Solid Green	Port linked operating at max port speed, i.e. running 100G on QSFP28 port
	Flash Green (~30ms)	Port Activity operating at max port speed, i.e. running 100G on QSFP28 port
	Solid Amber	Port linked operating at lower speed, i.e. running 40G or 10G on QSFP28 port.
	Flashing Amber (~30ms)	Port Activity operating at lower speed, i.e. running 40G or 10G on QSFP28 port.
	Off	No link
	Flashing Amber with 1 sec on and 1 sec off	Port Beacon
All four LEDs are used when 4x25G mode or 4x10G mode is running on QSFP28 port.	Solid Green	4x25G Link on QSFP28 port
	Solid Amber	4x10G Link on QSFP28 port
	Flashing (~30ms) Green	4x25G Activity on QSFP28 port
	Flashing (~30ms) Amber	4x10G Activity on QSFP28 port
	Off	No link
	Flashing Amber with 1 sec on and 1 sec off	Port Beacon
1st and 3rd LEDs are used when 2x40G mode is running on QSFP28 port.	Solid Amber	2x40G Link on QSFP28 port
	Flashing (~30ms) Amber	2x40G Activity on QSFP28 port
	Off	No link
	Flashing Amber with 1 sec on and 1 sec off	Port Beacon

·SFP+ port status LED Definition：

LED	Status	Description
One Port Link/ Activity Status Green/Amber bi-color LEDs is	Solid Green	Port linked operating at max port speed, i.e. running 10G on SFP+ port
	Flash Green (~30ms)	Port Activity operating at max port speed, i.e. running 10G on SFP+ port
	Solid Amber	Port linked operating at lower speed, i.e. running 1G on SFP+ port.

LED	Status	Description
provided for each front panel port	Flashing Amber (~30ms)	Port Activity operating at lower speed, i.e. running 1G on SFP+ port.
	Off	No link
	Flashing Amber with 1 sec on and 1 sec off	Port Beacon

S4128F-ON/S4128T-ON Switch

System LED Definition

Feature	Detailed Description	Comment
System LED	• Solid Green – all functions are normal. • Flashing Green – Booting. Flashing Green with 2 sec on and 1 sec off • Solid Amber – Major Fault. Displays summary of all major faults within the system; the faults are traffic affecting. • Flashing Amber – Major Fault. Flashing Amber with 2 sec on and 1 sec off Displays summary of all major faults within the system; the faults are not traffic affecting.	At front
Power LED	• Solid Green – Normal. • Solid Amber – POST in progress. • Flashing Amber – Flashing Amber with 2sec on and 1 sec off. Power supply fault. • Off – No power.	At front
FAN LED	• Solid Green – all functions are normal. • Flashing Amber – One of the Fans or Fan tray fault. Flashing Amber with 2 sec on and 1 sec off.	At front
Beacon LED	Not in use.	At front
Stacking LED	Not in use.	At front
7-DIGIT Stack LED	Not in use.	At front

Port LED Definition

10GBT port LEDs

Feature	Detailed Description
10GBT LED	• Off – No Link • Solid Green – Link on 10G speed • Flashing Green(~30ms) – Port Activity operating at 10G speed. • Solid Amber – Port Link operating at lower speed. • Flashing Amber (~30ms)–Port Activity operating at lower speed. • Solid Blue –Port Beacon/Locater

SFP+ port LEDs

Feature	Detailed Description

SFP+ port LED	• Link LED: Green/Amber
	  ◦ Solid Green = Port linked operating at max port speed, i.e. running 10G on SFP+ port
	  ◦ Solid Amber = Port linked operating at lower speed, i.e. running 1G on SFP+ port.
	  ◦ Flashing Amber with 1 sec on and 1 sec off -Port Beacon
	  ◦ Off = No link
	• Activity LED: Green
	  ◦ Off – There is no current transmit/ receive activity.
	  ◦ Flashing Green(~30ms) Port Activity.

QSFP28 port LEDs

1) 1st LED

Feature	Detailed Description
Link/ACT LED	• Solid Green = Port link operating at max port speed, i.e. running 100G on QSFP28 port • Flash Green (~30ms) = Port Activity operating at max port speed, i.e. running 100G on QSFP28 port • Solid Amber = Port link operating at lower speed, i.e. running 40G on QSFP28 port. • Flashing Amber (~30ms) =Port Activity operating at lower speed, i.e. running 40G on QSFP28 port. • Off = No link • Flashing Amber with 1 sec on and 1 sec off – Port Beacon

2) All four LEDs shall be used when 4x25G or 10G mode is running on QSFP28 port

Feature	Detailed Description
Link/ACT LED	• Solid Green = 4x25G Link on QSFP28 port • Solid Amber = 4x10G Link on QSFP28 port • Flashing (~30ms) Green = 4x25G Activity on QSFP28 port • Flashing (~30ms) Amber = 4x10G Activity on QSFP28 port • Off = No link • Flashing Amber with 1 sec on and 1 sec off – Port Beacon

3) 1st and 3rd LEDs shall be used when 2x50G mode is running on QSFP28 port

Feature	Detailed Description
Link/ACT LED	• Solid Amber = 2x50G Link on QSFP28 port • Flashing (~30ms) Amber = 2x50G Activity on QSFP28 port • Off = No link • Flashing Amber with 1 sec on and 1 sec off – Port Beacon

Management Ethernet port LEDs

Feature	Detailed Description
Link LED	• Off – No Link • Solid Green – Port link operating at 1G speed. • Solid Amber – Port link operating at 10/100M speed.
Activity	• Off – No Activity • Flashing Green – Port Activity.

N3208PX-ON Switch

System LED Definition

Feature	Detailed Description	Comment
System Status LED (Bi-color LED)	• Solid Green – all functions are normal • Flashing Green with 2 sec on and 1 sec off – Booting • Solid Amber – Major Fault • Flashing Amber with 2 sec on and 1 sec off – Minor Fault	At front
Power Status LED (Bi-color LED)	• Solid Green – Normal • Solid Amber – POST in progress • Flashing Amber with 2 sec on and 1 sec off – PSU fault • Off – No power	At front
FAN Status LED (Bi-color LED)	• Solid Green – all functions are normal • Flashing Amber with 2 sec on and 1 sec off – Fan tray fault	At front
System Beacon LED	• Off – Idle • Flashing Blue with 1 sec on and 1 sec off – (SID in Dell parlance)	At front

Port LED Definition

1000Base-T Copper Ethernet Port LEDs

Feature	Detailed Description
LINK/SPD LED (Left bi-color LED)	• Solid Green – Link at 1000Base-T (Max) • Solid Amber – Link at 10/100MBase-T • OFF – No Link
ACT/POE LED (Right bi-color LED)	• Blinking Green (~30ms) – Activity, PoE Power Off (Activity for Non-P) • Blinking Amber (~30ms) – Activity, PoE Power On • Solid Amber – No Activity, PoE Power On • Off – No Activity, PoE Power Off

2.5G/5GBase-T Copper Ethernet Port LEDs

Feature	Detailed Description

LINK/SPD LED (Left bi-color LED)	• Solid Green – Link at 5GBase-T (Max) • Solid Amber – Link at 10/100/1000MBase-T or 2.5GBase-T • Off – No Link
ACT/POE LED (Right bi-color LED)	• Blinking Green (~30ms) – Activity, PoE Power Off (Activity for Non-P) • Blinking Amber (~30ms) – Activity, PoE Power On • Solid Amber – No Activity, PoE Power On • Off –No Activity, PoE Power Off

10GbE SFP+ Port LEDs

Feature	Detailed Description
LINK/SPD LED (Left bi-color LED)	• Off – No Link • Solid Green –Link at 10GE Speed • Solid Amber –Link at lower than 10GE Speed
ACT LED (Right bi-color LED)	• Off – No Activity • Blinking Green (~30ms) – Activity

OOB Ethernet Port LEDs:

Feature	Detailed Description
Link/SPD LED (Left bi-color LED)	• Off – No Link • Solid green – Link on 1000Base-T • Solid Amber – Link on 10/100MBase-T
ACT LED **(**Right single color LED**)**	• Off – No Link • Blinking Green (~30ms) – Activity

Console port LEDs:

Feature	Detailed Description
Link/SPD LED (Left bi-color LED)	• Off – No Link • Solid green – Link

System LED Definition

Feature	Detailed Description	Comment
System LED	• Solid green-all functions are normal. • Flashing Green – Booting • Solid Amber –Major Fault. Indicates summary of all major faults within the system; the faults are traffic affecting. • Flashing Amber –Minor Fault: Indicates summary of all minor faults within the system; the faults are not traffic affecting.	At front side
Power LED	• Solid Green – Normal. • Solid Amber – POST in progress. • Flashing Amber – Power supply fault. • Off – No power.	At front side
FAN LED	• Solid Green – all functions are normal. • Solid Amber –Any Fan tray fault.	At front side

(Bi-color LED)
	• 1st LED: Green/Amber
	  ◦ Solid Green = Port linked operating at max port speed, i.e. running 100GbE on QSFP28 port. Green (Luminance at 1.5ft = 45+5 cd/m2)
	  ◦ Flash Green (~30ms) = Port Activity operating at max port speed, i.e. running 100GbE on QSFP28 port. Green (Luminance at 1.5ft = 45+5 cd/m2)
	  ◦ Solid Amber = Port linked operating at lower speed, i.e. running 40GbE or 25GbE or 10GbE on QSFP28 port. Amber (Luminance at 1.5ft = 45+5 cd/m2)
	  ◦ Flashing Amber (~30ms) =Port Activity operating at lower speed, i.e. running 40GbE or 25GbE or 10GbE on QSFP28 port. Amber (Luminance at 1.5ft = 45+5 cd/m2)
	  ◦ Off = No link
	  ◦ Flashing Amber with 1 sec on and 1 sec off – Port Beacon. Amber (Luminance at 1.5ft = 180+10 cd/m2)
	• All four LEDs shall be used when 4x25GbE mode or 4x10GbE mode is running on QSFP28 port.
	  ◦ Solid Green = 4x25GbE Link on QSFP28 port. Green (Luminance at 1.5ft = 45+5 cd/m2)
	  ◦ Solid Amber = 4x10GbE Link on QSFP28 port. Amber (Luminance at 1.5ft = 45+5 cd/m2)
	  ◦ Flashing (~30ms) Green = 4x25GbE Activity on QSFP28 port. Green (Luminance at 1.5ft = 45+5 cd/m2)
	  ◦ Flashing (~30ms) Amber = 4x10GbE Activity on QSFP28 port. Amber (Luminance at 1.5ft = 45+5cd/m2)
	  ◦ Off = No link
	  ◦ Flashing Amber with 1 sec on and 1 sec off – Port Beacon. Amber (Luminance at 1.5ft = 180+10 cd/m2)

OOB Ethernet Port LEDs

Feature	Detailed Description
Link/SPD LED (Left bi-color LED)	• Off – No Link • Solid Green – Link at 1000Base-T • Solid Amber – Link at 10/100MBase-T
ACT LED (Right single color LED)	• Off – No Link • Blinking Green (~30ms) – Activity

Console Port LEDs

Feature	Detailed Description
Link/SPD LED (Left bi-color LED)	• Off – No Link • Solid Green – Link

N3248P-ON/N3248TE-ON Switch

System LED Definition

Feature	Detailed Description	Comment
Platform Stacking LED	Not supported.	At front
System Status LED (Bi-color LED)	• Solid Green – all functions are normal • Flashing Green with 2 sec on and 1 sec off – Booting • Solid Amber – Major Fault • Flashing Amber with 2 sec on and 1 sec off – Minor Fault	At front
Power Status LED (Bi-color LED)	• Solid Green – Normal • Solid Amber – POST in progress • Flashing Amber with 2 sec on and 1 sec off – PSU fault • Off – No power	At front
FAN Status LED (Bi-color LED)	• Solid Green – all functions are normal • Flashing Amber with 2 sec on and 1 sec off – Fan tray fault	At front
System Beacon LED	• Off – Idle • Flashing Blue with 1 sec on and 1 sec off – (SID in Dell parlance)	At front
7-DIGIT Stack LED	Not in use.	At front

Port LED Definition

1000Base-T copper port LEDs

Feature	Detailed Description
Link/SPD LED (Left bi-color LED)	• Solid Green – Link at 1000Base-T (Max) • Solid Amber – Link at 10/100MBase-T • Off – No Link
POE/ACT LED (Right bi-color LED)	• Blinking Green (~30ms) – Activity, PoE Power Off (Activity for Non-P) • Blinking Amber (~30ms) – Activity, PoE Power On • Solid Amber – No Activity, PoE Power On • Off –No Activity, PoE Power Off

10GbE SFP+ Port LEDs:

Feature	Detailed Description
Link/SPD LED	• Off – No Link

(Left bi-color LED)	• Solid Green –Link at 10GE Speed • Solid Amber –Link at lower than 10GE Speed
ACT LED (Right bi-color LED)	• Off – No Activity • Blinking green (~30ms) – Activity

Stacking (QSFP28) Port LEDs:

Feature	Detailed Description
LINK/ACT LED (Bi-color LED)	• 1st LED: Green/Amber ◦ Solid Green = Port linked operating at max port speed, i.e. running 100GbE on QSFP28 port. Green (Luminance at 1.5ft = 45+5 cd/m2) ◦ Flash Green (~30ms) = Port Activity operating at max port speed, i.e. running 100GbE on QSFP28 port. Green (Luminance at 1.5ft = 45+5 cd/m2) ◦ Solid Amber = Port linked operating at lower speed, i.e. running 40GbE or 25GbE or 10GbE on QSFP28 port. Amber (Luminance at 1.5ft = 45+5 cd/m2) ◦ Flashing Amber (~30ms) =Port Activity operating at lower speed, i.e. running 40GbE or 25GbE or 10GbE on QSFP28 port. Amber (Luminance at 1.5ft = 45+5 cd/m2) ◦ Off = No link ◦ Flashing Amber with 1 sec on and 1 sec off – Port Beacon. Amber (Luminance at 1.5ft = 180+10 cd/m2) • All four LEDs shall be used when 4x25GbE mode or 4x10GbE mode is running on QSFP28 port. ◦ Solid Green = 4x25GbE Link on QSFP28 port. Green (Luminance at 1.5ft = 45+5 cd/m2) ◦ Solid Amber = 4x10GbE Link on QSFP28 port. Amber (Luminance at 1.5ft = 45+5 cd/m2) ◦ Flashing (~30ms) Green = 4x25GbE Activity on QSFP28 port. ◦ Green (Luminance at 1.5ft = 45+5 cd/m2) ◦ Flashing (~30ms) Amber = 4x10GbE Activity on QSFP28 port. ◦ Amber (Luminance at 1.5ft = 45+5cd/m2) ◦ Off = No link ◦ Flashing Amber with 1 sec on and 1 sec off – Port Beacon. Amber (Luminance at 1.5ft = 180+10 cd/m2)

Port LED Definition

10GBT port LEDs

Feature	Detailed Description
10GBT LED	• Off – No Link • Solid Green – Link on 10G speed • Flashing Green(~30ms) – Port Activity operating at 10G speed. • Solid Amber – Port Linked operating at lower speed. • Flashing Amber (~30ms)–Port Activity operating at lower speed. • Solid Blue –Port Beacon/Locater

SFP+ port LEDs

Feature	Detailed Description
SFP+ port LED	• Link LED: Green/Amber

	◦ Solid Green = Port linked operating at max port speed, i.e. running 10G on SFP+ port ◦ Solid Amber = Port linked operating at lower speed, i.e. running 1G on SFP+ port. ◦ Flashing Amber with 1 sec on and 1 sec off -Port Beacon ◦ Off = No link • Activity LED: Green ◦ Off – There is no current transmit/ receive activity. ◦ Flashing Green(~30ms) Port Activity.

QSFP28 port LEDs

1) 1st LED:

Feature	Detailed Description
Link/ACT LED	• Solid Green = Port linked operating at max port speed, i.e. running 100G on QSFP28 port • Flash Green (~30ms) = Port Activity operating at max port speed, i.e. running 100G on QSFP28 port • Solid Amber = Port linked operating at lower speed, i.e. running 40G on QSFP28 port. • Flashing Amber (~30ms) =Port Activity operating at lower speed, i.e. running 40G on QSFP28 port. • Off = No link • Flashing Amber with 1 sec on and 1 sec off – Port Beacon

2) All four LEDs shall be used when 4x25G or 10G mode is running on QSFP28 port.

Feature	Detailed Description
Link/ACT LED	• Solid Green = 4x25G Link on QSFP28 port • Solid Amber = 4x10G Link on QSFP28 port • Flashing (~30ms) Green = 4x25G Activity on QSFP28 port • Flashing (~30ms) Amber = 4x10G Activity on QSFP28 port • Off = No link • Flashing Amber with 1 sec on and 1 sec off – Port Beacon

3) 1st and 3rd LEDs shall be used when 2x50G mode is running on QSFP28 port.

Feature	Detailed Description
Link/ACT LED	• Solid Amber = 2x50G Link on QSFP28 port • Flashing (~30ms) Amber = 2x50G Activity on QSFP28 port • Off = No link • Flashing Amber with 1 sec on and 1 sec off – Port Beacon

QSFP+ port LEDs

1) 1st LED:

Feature	Detailed Description
Link/ACT LED	• Solid Green = Port linked operating at 40G. • Flashing Green (~30ms) =Port Activity operating at 40G • Off = No link • Flashing Amber with 1 sec on and 1 sec off – Port Beacon

2) All four LEDs shall be used when 4x10G or 1G mode is running on QSFP+ port.

Feature	Detailed Description
Link/ACT LED	• Solid Green = 4x10G Link on QSFP+ port • Solid Amber = 4x1G Link on QSFP+ port • Flashing (~30ms) Green = 4x10G Activity on QSFP+ port • Flashing (~30ms) Amber = 4x1G Activity on QSFP+ port • Off = No link • Flashing Amber with 1 sec on and 1 sec off – Port Beacon

Management Ethernet port LEDs

Feature	Detailed Description
Link LED	• Off – No Link • Solid Green – Port linked operating at 1G speed. • Solid Amber – Port linked operating at 10/100M speed.
Activity	• Off – No Activity • Flashing Green – Port Activity.

Port LED Definition

SFP28 port status LED Indications:

One Port Link/ Activity Status Green/Amber bi-color LEDs is provided for each front panel port
Solid Green = Port linked operating at max port speed, i.e. running 25G on SFP28 port
Flash Green (~30ms) = Port Activity operating at max port speed, i.e. running 25G on SFP28 port
Solid Amber = Port linked operating at lower speed, i.e. running 10/1G on SFP28 port.
Flashing Amber (~30ms) =Port Activity operating at lower speed, i.e. running 10/1G on SFP28 port.
Off = No link
Flashing Amber with 1 sec on and 1 sec off – Port Beacon

QSFP28 port status LED Indications:

1st LED: Green/Amber
Solid Green = Port linked operating at max port speed, i.e. running 100G on QSFP28 port

Flashing Green (~30ms) = Port Activity operating at max port speed, i.e. running 100G on QSFP28 port
Solid Amber = Port linked operating at lower speed, i.e. running 40G or 10G on QSFP28 port.
Flashing Amber (~30ms) =Port Activity operating at lower speed, i.e. running 40G or 10G on QSFP28 port.
Off = No link
Flashing Amber with 1 sec on and 1 sec off – Port Beacon
All four LEDs are used when 4x25G mode or 4x10G mode is running on QSFP28 port.
Solid Green = 4x25G Link on QSFP28 port
Solid Amber = 4x10G Link on QSFP28 port
Flashing (~30ms) Green = 4x25G Activity on QSFP28 port
Flashing (~30ms) Amber = 4x10G Activity on QSFP28 port
Off = No link
Flashing Amber with 1 sec on and 1 sec off – Port Beacon

Port LED Definition

QSFP28 port status LED Indications

1st LED: Green/Amber
Solid Green = Port linked operating at max port speed, i.e. running 100GbE on QSFP28 port. Green (Luminance at 1.5ft = 45+5 cd/m2)
Flash Green (~30ms) = Port Activity operating at max port speed, i.e. running 100GbE on QSFP28 port. Green (Luminance at 1.5ft = 45+5 cd/m2)
Solid Amber = Port linked operating at lower speed, i.e. running 40GbE on QSFP28 port. Amber (Luminance at 1.5ft = 45+5 cd/m2)
Flashing Amber (~30ms) =Port Activity operating at lower speed, i.e. running 40GbE or 10GbE on QSFP28 port. Amber (Luminance at 1.5ft = 45+5 cd/m2)
Off = No link
Flashing Amber with 1 sec on and 1 sec off – Port Beacon. Amber (Luminance at 1.5ft = 180+10 cd/m2)
All four LEDs shall be used when 4x25GbE mode or 4x10GbE mode is running on QSFP28 port.
Solid Green = 4x25GbE Link on QSFP28 port. Green (Luminance at 1.5ft = 45+5 cd/m2)
Solid Amber = 4x10GbE Link on QSFP28 port. Amber (Luminance at 1.5ft = 45+5 cd/m2)
Flashing (~30ms) Green = 4x25GbE Activity on QSFP28 port. Green (Luminance at 1.5ft = 45+5 cd/m2)
Flashing (~30ms) Amber = 4x10GbE Activity on QSFP28 port. Amber (Luminance at 1.5ft = 45+5 cd/m2)
Off = No link

Flashing Amber with 1 sec on and 1 sec off – Port Beacon. Amber (Luminance at 1.5ft = 180+10 cd/m2)

SFP28 port status LED Indications

One Port Link/ Activity Status Green/Amber bi-color LED shall be provided for each front panel port.
Solid Green = Port linked operating at max port speed, i.e. running 25G Ethernet on SFP28 port Green (Luminance at 1.5ft = 45+5 cd/m2)
Flash Green (~30ms) = Port Activity operating at max port speed, i.e. running 25G Ethernet on SFP28 port Green (Luminance at 1.5ft = 45+5 cd/m2)
Solid Amber = Port linked operating at lower speed, i.e. running 10/1G Ethernet on SFP28 port. Amber (Luminance at 1.5ft = 45+5 cd/m2)
Flashing Amber (~30ms) =Port Activity operating at lower speed, i.e. running 10/1G Ethernet on SFP28 port. Amber (Luminance at 1.5ft = 180+10 cd/m2)
Off = No link
Flashing Amber with 1 sec on and 1 sec off – Port Beacon

Port LED Definition

QSFP-DD port

1st LED: Green/Amber
Solid Green = Port linked operating at max port speed, i.e. running 200GbE on QSFP-DD port. Green (Luminance at 1.5ft = 45±5 cd/m2)
Flash Green (~30ms) = Port Activity operating at max port speed, i.e. running 200GbE on QSFP-DD port. Green (Luminance at 1.5ft = 45±5 cd/m2)
Solid Amber = Port linked operating at lower speed, i.e. running 100GbE or 40GbE or 10GbE on QSFP-DD port. Amber (Luminance at 1.5ft = 45±5 cd/m2)
Flashing Amber (~30ms) =Port Activity operating at lower speed, i.e. running 100GbE or 40GbE or 10GbE on QSFP28 port. Amber (Luminance at 1.5ft = 45±5 cd/m2)
Off = No link
Flashing Amber with 1 sec on and 1 sec off – Port Beacon Amber (Luminance at 1.5ft = 180±10 cd/m2)

All eight LEDs shall be used when 8x25GbE mode or 8x10GbE mode is running on QSFP-DD port.
Solid Green = 4x25GbE Link on QSFP28 port. Green (Luminance at 1.5ft = 45±5 cd/m2)
Solid Amber = 4x10GbE Link on QSFP28 port. Amber (Luminance at 1.5ft = 45±5 cd/m2)
Flashing (~30ms) Green = 4x25GbE Activity on QSFP28 port. Green (Luminance at 1.5ft = 45±5 cd/m2)
Flashing (~30ms) Amber = 4x10GbE Activity on QSFP28 port. Amber (Luminance at 1.5ft = 45±5 cd/m2)
Off = No link
Flashing Amber with 1 sec on and 1 sec off – Port Beacon. Amber (Luminance at 1.5ft = 180±10 cd/m2)
1st and 5th LEDs shall be used when 2x100GbE mode is running on QSFP-DD port.
Solid Green = 2x100GbE Link on QSFP28 port. . Green (Luminance at 1.5ft = 45±5 cd/m2)
Flashing (~30ms) Green = 2x100GbE Activity on QSFP28 port. Green (Luminance at 1.5ft = 45±5 cd/m2) Off = No link
Flashing Amber with 1 sec on and 1 sec off – Port Beacon. Amber (Luminance at 1.5ft = 180±10 cd/m2)
1st & 2nd and 5th & 6th LEDs shall be used when 4x50GbE mode is running on QSFP-DD port. (1st & 2nd LEDs for 1st 2x50GbE port and 5th & 6th LEDs for 2nd 2x50GbE port)
Solid Green = 2x50GbE Link on QSFP-DD port. Green (Luminance at 1.5ft = 45+5 cd/m2)
Flashing (~30ms) Green = 2x50GbE Activity on QSFP-DD port. Green (Luminance at 1.5ft = 45+5 cd/m2)
Off = No link
Flashing Amber with 1 sec on and 1 sec off – Port Beacon. Amber (Luminance at 1.5ft = 180+10 cd/m2)

QSFP28 port status LED

1st LED: Green/Amber
Solid Green = Port linked operating at max port speed, i.e. running 100GbE on QSFP28 port. Green (Luminance at 1.5ft = 45+5 cd/m2)
Flash Green (~30ms) = Port Activity operating at max port speed, i.e. running 100GbE on QSFP28 port. Green (Luminance at 1.5ft = 45+5 cd/m2)
Solid Amber = Port linked operating at lower speed, i.e. running 40GbE or 10GbE on QSFP28 port. Amber (Luminance at 1.5ft = 45+5 cd/m2)
Flashing Amber (~30ms) =Port Activity operating at lower speed, i.e. running 40GbE or 10GbE on QSFP28 port. Amber (Luminance at 1.5ft = 45+5 cd/m2)
Off = No link
Flashing Amber with 1 sec on and 1 sec off – Port Beacon Amber (Luminance at 1.5ft = 180+10 cd/m2)
All four LEDs shall be used when 4x25GbE mode or 4x10GbE mode is running on QSFP28 port.
Solid Green = 4x25GbE Link on QSFP28 port. Green (Luminance at 1.5ft = 45+5 cd/m2)

Solid Amber = 4x10GbE Link on QSFP28 port. Amber (Luminance at 1.5ft = 45+5 cd/m2)
Flashing (~30ms) Green = 4x25GbE Activity on QSFP28 port. Green (Luminance at 1.5ft = 45+5 cd/m2)
Flashing (~30ms) Amber = 4x10GbE Activity on QSFP28 port. Amber (Luminance at 1.5ft = 45+5 cd/m2)
Off = No link
Flashing Amber with 1 sec on and 1 sec off – Port Beacon. Amber (Luminance at 1.5ft = 180+10 cd/m2)
1st and 3rd LEDs shall be used when 2x50GbE mode is running on QSFP28 port.
Solid Green = 2x50GbE Link on QSFP28 port. Green(Luminance at 1.5ft = 45+5 cd/m2)
Flashing (~30ms) Green = 2x50GbE Activity on QSFP28 port. Green (Luminance at 1.5ft = 45+5 cd/m2)
Off = No link
Flashing Amber with 1 sec on and 1 sec off – Port Beacon.Amber (Luminance at 1.5ft = 180+10 cd/m2)

SFP28 port status LED

One Port Link/ Activity Status Green/Amber bi-color LED shall be provided for each front panel port.
Solid Green = Port linked operating at max port speed, i.e. running 25G Ethernet on SFP28 port Green (Luminance at 1.5ft = 45+5 cd/m2)
Flash Green (~30ms) = Port Activity operating at max port speed, i.e. running 25G Ethernet on SFP28 port Green (Luminance at 1.5ft = 45+5 cd/m2)
Solid Amber = Port linked operating at lower speed, i.e. running 10/1G Ethernet on SFP28 port. Amber (Luminance at 1.5ft = 45+5 cd/m2)
Flashing Amber (~30ms) =Port Activity operating at lower speed, i.e. running 10/1G Ethernet on SFP28 port. Amber (Luminance at 1.5ft = 180+10 cd/m2)
Off = No link
Flashing Amber with 1 sec on and 1 sec off – Port Beacon

S5296F-ON Switch

System LED Definition

Feature	Detailed Description	Comment
System LED	Solid green – all functions are normal or PICOS is booting. Solid Amber –Major Fault. Indicates summary of all major faults within the system; the faults are traffic affecting. Flashing Amber –Minor Fault: Indicates summary of all minor faults within the system; the faults are not traffic affecting.	At front side
Power LED	Solid Green – Normal or POST in progress.. Flashing Amber – Power supply fault. Off – No power.	At front side
FAN LED	Solid Green – all functions are normal. Solid Amber –Any Fan tray fault.	At front side
Beacon LED	Not in use.	At front side
Stacking LED	Not in use.	At front side
7-DIGIT Stack LED	Not in use.	At front side

Port LED Definition

QSFP28 port status LED Indications

1st LED: Green/Amber
Solid Green = Port linked operating at max port speed, i.e. running 100G on QSFP28 port
Flash Green (~30ms) = Port Activity operating at max port speed, i.e. running 100G on QSFP28 port
Solid Amber = Port linked operating at lower speed, i.e. running 40G on QSFP28 port.
Flashing Amber (~30ms) =Port Activity operating at lower speed, i.e. running 40G or 10G on QSFP28 port.
Off = No link
Flashing Amber with 1 sec on and 1 sec off – Port Beacon
All four LEDs are used when 4x25G mode or 4x10G mode is running on QSFP28 port.
Solid Green = 4x25G Link on QSFP28 port
Solid Amber = 4x10G Link on QSFP28 port
Flashing (~30ms) Green = 4x25G Activity on QSFP28 port
Flashing (~30ms) Amber = 4x10G Activity on QSFP28 port

Off = No link
Flashing Amber with 1 sec on and 1 sec off – Port Beacon

SFP28 port status LED Indications

One Port Link/ Activity Status Green/Amber bi-color LEDs is provided for each front panel port
Solid Green = Port linked operating at max port speed, i.e. running 25G on SFP28 port
Flash Green (~30ms) = Port Activity operating at max port speed, i.e. running 25G on SFP28 port
Solid Amber = Port linked operating at lower speed, i.e. running 10/1G on SFP28 port.
Flashing Amber (~30ms) =Port Activity operating at lower speed, i.e. running 10/1G on SFP28 port.
Off = No link
Flashing Amber with 1 sec on and 1 sec off – Port Beacon

Z9264F-ON Switch

System LED Definition

Feature	Detailed Description	Comment
System LED	• Solid green – all function are normal. • Flashing Green – Booting. Flashing Green with 2 sec on and 1 sec off. • Solid Amber – Major Fault. Displays summary of all major faults within the system; the faults are traffic affecting. • Flashing Amber – Major Fault. Flashing Amber with 2 sec on and 1 sec off Displays summary of all major faults within the system; the faults are not traffic affecting.	At front side
Power LED	• Solid Green – Normal. • Solid Amber – Post in progress. • Flashing Amber – Flashing Amber with 2sec on and 1 sec off. Power supply fault. • Off – No power.	At front side
FAN LED	• Solid Green – all function are normal. • Flashing Amber – One of Fan or Fan tray fault. • Flashing Amber with 2 sec on and 1 sec off. **Note:** The fan led on the front panel will display Amber if one of FAN LEDs on the rear side failed.	At front side
Beacon LED	Not in use.	At front side
Stacking LED	Not in use.	At front side
7-DIGIT Stack LED	Not in use.	At front side

Port LED Definition

QSFP28 port LEDs

1) 1st LED:

Feature	Detailed Description
Link/ACT LED	Four Port Link/ Activity Status Green/Amber bi-color LEDs shall be provided for each front QSFP28 port. 1 st LED: Green/Amber • Solid Green = Port linked operating at max port speed, i.e. running 100G on QSFP28 port. • Flash Green (~30ms) = Port Activity operating at max port speed, i.e. running 100G on QSFP28 port. • Solid Amber = Port linked operating at lower speed, i.e. running 40G or 10G on QSFP28 port.

	• Flashing Amber (~30ms) =Port Activity operating at lower speed, i.e. running 40G or 10G on QSFP28 port. • Off = No link. • Flashing Amber with 1 sec on and 1 sec off – Port Beacon.

2) All four LEDs shall be used when 4x25G or 10G mode is running on QSFP28 port.

Feature	Detailed Description
Link/ACT LED	All four LEDs shall be used when 4x25G mode or 4x10G mode is running on QSFP28 port. • Solid Green = 4x25G Link on QSFP28 port. • Solid Amber = 4x10G Link on QSFP28 port. • Flashing (~30ms) Green = 4x25G Activity on QSFP28 port. • Flashing (~30ms) Amber = 4x10G Activity on QSFP28 port. • Off = No link. • Flashing Amber with 1 sec on and 1 sec off – Port Beacon.

3) 1st and 3rd LEDs shall be used when 2x50G mode is running on QSFP28 port.

Feature	Detailed Description
Link/ACT LED	1 st and 3 rd LEDs shall be used when 2x50G mode is running on QSFP28 port. • Solid Amber = 2x50G Link on QSFP28 port. • Flashing (~30ms) Amber = 2x50G Activity on QSFP28 port. • Off = No link. • Flashing Amber with 1 sec on and 1 sec off – Port Beaco.

SFP+ port LEDs

Feature	Detailed Description
SFP+ port LED	Link LED: Green/Amber • Solid Green = Port linked operating at max port speed, i.e.running 10G on SFP+ port • Solid Amber = Port linked operating at lower speed, i.e. running 1G on SFP+ port. • Flashing Amber with 1 sec on and 1 sec off – Port Beacon • Off = No link Activity LED: Green • Off – There is no current transmit/ receive activity. • Flash Green (~30ms) – Port Activity

S5232F-ON Switch

System LED Definition

Feature	Detailed Description	Comment
System LED	• Solid green – all functions are normal or PICOS is booting. • Solid Amber –Major Fault. Indicates summary of all major faults within the system; the faults are traffic affecting. • Flashing Amber –Minor Fault: Indicates summary of all minor faults within the system; the faults are not traffic affecting.	At front side
Power LED	• Solid Green – Normal. • Flashing Amber – Power supply fault. • Off – No power.	At front side
FAN LED	• Solid Green – all functions are normal. • Solid Amber –Any Fan tray fault.	At front side
Beacon LED	Not in use.	At front side
Stacking LED	Not in use.	At front side
7-DIGIT Stack LED	Not in use.	At front side

Port LED Definition

SFP+ port status LED Indications

One Port Link/ Activity Status Green/Amber bi-color LED shall be provided for each front panel port.
Solid Green = Port linked operating at max port speed, i.e. running 10GbE on SFP+ port. Green (Luminance at 1.5ft = 45+5 cd/m2)
Flash Green (~30ms) = Port Activity operating at max port speed, i.e. running 10GbE on SFP+ port. Green (Luminance at 1.5ft = 45+5 cd/m2)
Solid Amber = Port linked operating at lower speed, i.e. running 1GbE on SFP+ port. Amber (Luminance at 1.5ft = 45+5 cd/m2)
Flashing Amber (~30ms) =Port Activity operating at lower speed, i.e. running 1GbE on SFP+ port. Amber (Luminance at 1.5ft = 180+10 cd/m2)
Off = No link
Flashing Amber with 1 sec on and 1 sec off – Port Beacon

QSFP28 port status LED Indications

1st LED: Green/Amber

Solid Green = Port linked operating at max port speed, i.e. running 100G Ethernet on QSFP28 port. Green (Luminance at 1.5ft = 45+5 cd/m2)
Flash Green (~30ms) = Port Activity operating at max port speed, i.e. running 100G Ethernet on QSFP28 port Green (Luminance at 1.5ft = 45+5 cd/m2)
Solid Amber = Port linked operating at lower speed, i.e. running 40GbE or 10GbE on QSFP28 port. Amber (Luminance at 1.5ft = 45+5 cd/m2)
Flashing Amber (~30ms) =Port Activity operating at lower speed, i.e. running 40GbE or 10GbE on QSFP28 port. Amber (Luminance at 1.5ft = 45+5 cd/m2)
Off = No link
Flashing Amber with 1 sec on and 1 sec off – Port Beacon. Amber (Luminance at 1.5ft = 180+10 cd/m2)
All four LEDs are used when 4x25G mode or 4x10G mode is running on QSFP28 port.
Solid Green = 4x25GbE Link on QSFP28 port. Green (Luminance at 1.5ft = 45+5 cd/m2)
Solid Amber = 4x10GbE Link on QSFP28 port.Amber (Luminance at 1.5ft = 45+5 cd/m2)
Flashing (~30ms) Green = 4x25GbE Activity on QSFP28 port. Green (Luminance at 1.5ft = 45+5 cd/m2)
Flashing (~30ms) Amber = 4x10GbE Activity on QSFP28 port. Amber (Luminance at 1.5ft = 45+5 cd/m2)
Off = No link
Flashing Amber with 1 sec on and 1 sec off – Port Beacon. Amber (Luminance at 1.5ft = 180+10 cd/m2)

Port LED Definition

N2224PX RJ45 port status LED Indications

Left Link/Speed LED: Green/Amber
Solid Green = Port linked operating at max port speed, i.e. if auto-negotiated/forced to 2.5GBase-T mode on the port. Green (Luminance at 1.5ft = 45+5 cd/m2)
Solid Amber = Port linked operating at lower speed, i.e. if auto-negotiated/forced to 100/1000MBase-T on the port. Amber (Luminance at 1.5ft = 45+5 cd/m2)
Off - No link
Right Activity/POE LED: Green/Amber
Flashing Green (~30ms) = Port Activity and POE Power Off. Green (Luminance at 1.5ft = 45+5 cd/m2)
Flashing Amber (~30ms) =Port Activity and POE Power ON Amber (Luminance at 1.5ft =180+10 cd/m2)
Solid Amber =No Port Activity and POE Power ON. Amber (Luminance at 1.5ft = 45+5 cd/m2)

Off = No activity and POE Power Off

N2224X RJ45 port status LED Indications

Left Link/Speed LED: Green/Amber
Solid Green = Port linked operating at max port speed, i.e. if auto-negotiated/forced to 2.5GBase-T mode on the port. Green (Luminance at 1.5ft = 45+5 cd/m2)
Solid Amber = Port linked operating at lower speed, i.e. if auto-negotiated/forced to 100/1000MBase-T on the port. Amber (Luminance at 1.5ft = 45+5 cd/m2)
Off - No link
Right Activity LED: Green
Flashing Green (~30ms) = Port Activity. Green (Luminance at 1.5ft = 45+5 cd/m2)
Off = No activity

QSFP port status LED Indications

1st LED: Green
Solid Green = Port linked. Green (Luminance at 1.5ft =45+5 cd/m2)
Off = No Link
2nd LED: Green
Flashing Green (~30ms) = Port Activity. Green (Luminance at 1.5ft = 45+5 cd/m2)
Off = No activity

SFP28 port status LED Indications

1st LED: Green/Amber
Solid Green = Port linked operating at max port speed, i.e. running 25GE on the port. Green (Luminance at 1.5ft = 45+5 cd/m2)
Solid Amber = Port linked operating at lower speed, i.e. lower than 25GE on the port. Amber (Luminance at 1.5ft = 45+5 cd/m2)
Off = No Link
2nd LED: Green
Flashing Green (~30ms) = Port Activity. Green (Luminance at 1.5ft = 45+5 cd/m2)
Off = No activity

FAN LED	• Solid Green – FAN operating normally. • Solid Amber – A FAN or more failed	At front side

Note:

For FAN LED, when one of FAN LEDs on the rear side failed, fan led on the front panel will display Amber

QSFP28 port LEDs

LED	Detailed Description
Link/ACT LED	• OFF –No link is established on the port. • Solid Green – A valid link is established as 100GE on the port. • Solid Amber – A valid link is established as 40GE on the port. • Solid Blue – A valid link is established as 25GE on the port. (Through break out cable) • Solid Purple –A valid link is established as 10GE on the port. (Through break out cable) • Blinking LED – Packets transmission or reception is occurring

SFP28 port LEDs：

LED	Detailed Description
Link/ACT LED	• OFF –No link is established • Two LEDs / Port Solid Green – A valid 25G link is established • Solid Yellow – A valid 10G link is established • Blinking LED – Packets transmission or reception is occurring

OOB Management Ethernet port LEDs

LED	Detailed Description
Link LED	• Solid Green = Port linked operating at max port speed, i.e. if auto-negotiated/forced to 1G mode • Solid Amber = Port linked operating at lower speed, i.e. if auto-negotiated/forced to 10/100M on this port • Off = No Link
Activity	• Flashing Green (~30ms) = Port Activity • Off = No activity

AG7648 Switch

System LED Definition

Feature	Detailed Description	Comment
System LED	• Solid green – All OK, CLI prompt available • Blinking green – Boot-up in progress • Solid yellow – Major Fault. Displays summary of all major faults within the system; the faults are traffic affecting. • Blinking yellow – Minor Fault: Displays summary of all minor faults within the system; the faults are not traffic affecting.	At front
FAN LED	• Solid green –fan powered and @expected rpm • Solid yellow –fan failed including incompatible airflow direction from what is indicated in the Board ID for the particular SKU.	At front
PSU LED	• Solid green – The DC output is on and OK. • Solid yellow– Power supply critical event causing a shutdown; failure, OCP, OVP, Fan Fail, OTP, UVP. • Blinking yellow–Power supply warning events where the power supply continues to operate; high temp (PMBus reading inlet > 60deg; PMBus reading hotspot > 100deg), high power, high current (105 %*), slow fan.	At rear
Power LED	• Off - No power • Solid Yellow - POST in progress • Solid Green - Normal Operation (dual or single supply) • Blinking Yellow - One of Power Supplier is failed	At front
LOCATOR LED	Not supported.	At front

Port LED Definition

SFP+ port LEDs

Feature	Detailed Description
Link LED	• Off – No Link • Solid green – Link on 10G speed • Solid amber – Link on 1G speed
Activity LED	• Off – No Link • Blinking green – Transmit/Receive is activity

QSFP+ port LEDs

Feature	Detailed Description
Link/ACT LED	• Off – No Link • Solid green – Link on 40G speed • Solid Amber- Link on 10G speed • Blinking green – 40G speed, transmit/Receive is activity • Blinking amber – 10G speed, transmit/Receive is activity

Front Management Ethernet port LEDs

Feature	Detailed Description
Link LED	• Off – No Link • Solid green – Link on 1G speed • Solid yellow – Link on 10M/100M speed
Activity LED	• Off – No Link • Blinking green – Transmit/Receive is activity

System LED Definition

Label	Condition	Description
PS1 (Power Supply Status)	Green	This power is operating normally.
	Amber	PWR present but not power on or this power is fault.
	Off	Power supply not present.
PS2 (Power Supply Status)	Green	This power is operating normally.
	Amber	PWR present but not power on or this power is fault.
	Off	Power supply not present.
Diag	Green	System self-diagnostic test successfully completed.
	Amber	System self-diagnostic test has detected a fault. (Fan, thermal or any interface fault.)
FAN	Green	System FAN operating normally.
	Amber	Fan tray present buy system FAN is fault.
	OFF	System OFF
LOC	Not supported.	

port LED Definition

LED	Condition	Status
SFP+ Port LED	On/Flashing Green	SFP+ port has a valid link at 10G. Flashing indicates activity.
	On/Flashing Amber	SFP+ port has a valid link at 1G. Flashing indicates activity.
	Off	There is no link on the port.
QSFP28 Port LED in 100G Mode (Port 49~ 54)	On/Flashing Green	QSFP port has a valid link at 100G. Flashing indicates activity.
	Off	There is no link on the port.
QSFP28 Port LED in 25G Mode (With Breakout cable)	On/Flashing Amber	QSFP28 port has a valid link at 25G via break out cable. The LED on 100G QSFP end is also present OFF. Flashing indicates activity.
	Off	There is no link on the port.
QSFP28 Port LED in 40G Mode	On/Flashing blue	QSFP port has a valid link at 100G. Flashing indicates activity.

(Port 49~ 54)	Off	There is no link on the port.
QSFP28 Port LED in 10G Mode (With Breakout cable)	On/Flashing purple	QSFP28 port has a valid link at 10G via break out cable. The LED on 40G QSFP end is also present OFF. Flashing indicates activity.
	Off	There is no link on the port.
OOB LED (Link)	On	Port has a valid link
	Off	There is no link on the port
OOB LED (Activity)	Flashing	Flashing indicates activity
	Off	There is no link on the port

- Single-color LED will be used for 10G SFP+ and 40/100G QSFP28 uplink port to indicate link/activity.
- There should be four LEDs per QSFP28 port. These LEDs can represent state of 40/100GE port or 4 10/25GE ports when used in breakout mode.
- The 40/100G QSFP28 LED should present OFF while there’s breakout cable plugged in.

S5810-48TS-P Switch

System LED Definition

LED Name	Status	Detailed Description
Status LED	OFF	No power supply.
	Blinking green	Boot-up in progress.
	Solid green	The system completes initialization and works normally.
	Solid amber	Temperature exceeds alarm threshold 50ºC but less than 60ºC.
	Solid red	1. System (including any module) Failure 2. The temperature of any part of the machine exceeds 60ºC.
PS1 LED	OFF	Power supply not present.
	Solid green	This power is operating normally.
	Solid red	Power module failure or need to connect to the AC power line.
PS2 LED	OFF	Power supply not present.
	Solid green	This power is operating normally.
	Solid red	Power module failure or need to connect to the AC power line.
MGMT LED	OFF	No Link.
	Solid green	Port linked operating at 1000M.
	Solid amber	Port linked operating at 10M or 100M.
	Flashing	Transmit/Receive is activity.
PoE LED (controlled by PoE button on the front panel)	Solid green	Port LEDs indicate switching status.
	Solid amber	Port LEDs indicate PoE power supply status.

NOTE:

PoE button

The 48x1G RJ45 ports on the front panel support PoE.

PoE button on the front panel controls whether the port LED indicates data switching status or PoE power supply status of the first 48 ports.

- By default, port LED indicates data switching status of the port. PoE LED on the front panel of system LED block is solid green.
- If pressed the PoE button, the port LED indicates PoE power supply status of the port. PoE LED on the front panel of system LED block changes to solid amber.

Port LED Definition

10/100/1000BASE-T RJ45 port LED

Feature	Detailed Description
Non-PoE (controlled by PoE button on the front panel)	• Off – No Link • Solid Green –Port links up at 1000M. • Solid Amber –Port links up at 10M or 100M. • Flashing –Transmit/Receive is activity.
PoE (controlled by PoE button on the front panel)	• Solid Green –PoE Power On • Off –PoE Power Off

SFP+ 10G port LED

Feature	Detailed Description
SFP+ 10G port LED	• Off – No Link • Solid Green –Port links up at 10G or 1G. • Flashing –Transmit/Receive is activity.

Feature	Detailed Description
SFP+ 10G port LED	• Off – No Link • Solid Green –Port links up at 10G or 1G.

	• Flashing –Transmit/Receive is activity.

S5860-20SQ Switch

System LED Definition

LED Name	Status	Detailed Description
Status LED	OFF	No power supply.
	Blinking green	A: Boot-up in progress; B: Short pressing the reset button starts flashing, and after collecting system information, it will return to normal light.
	Solid green	The system completes initialization and works normally.
	Solid amber	Temperature exceeds alarm threshold
	Solid red	1. System Failure A. Board voltage abnormalities. B. Other hardware and software abnormalities, such as a chip cannot be initialized. 2. The temperature of any part of the machine exceeds the maximum temperature allowed by the device.
	Blinking red	A. Long pressing the reset button, it will flash green for the first 5S, and then flash red until the information is collected and the whole machine is reset. B. An optical module short-circuit fault occurs; (see CPLD register)
FAN LED	Solid green	System FAN operating normally.
	Solid red	1. Any fan has failed: A. Model does not match system B. The actual speed read is less than 3000 rpm (judged as stalled). C. Fan power_ok abnormality (see CPLD register) 2. Any fan is not in position (see CPLD register);
PS1 LED	OFF	Power supply not present.
	Solid green	This power is operating normally.
	Solid red	1. Power module failure. A. Cannot read the model number of the power supply module. B. Can read the model number, but does not match the system 2. Power supply appears PWR_ALARM (see CPLD register)
PS2 LED	OFF	Power supply not present.
	Solid green	This power is operating normally.
	Solid red	1. Power module failure. A. Cannot read the model number of the power supply module. B. Can read the model number, but does not match the system 2. Power supply appears PWR_ALARM (see CPLD register)

MGMT LED	OFF	No Link.
	Solid green	Port linked operating at 1000M.
	Solid amber	Port linked operating at 10M or 100M.
	Flashing	Transmit/Receive is activity.
ID LED	OFF	Location function is disabled.
	Solid blue	Location function is enabled. Used to locate switches, O&M personnel can remotely control ID lights on and off.

Port LED Definition

Feature	Detailed Description
SFP+ 10G port LED	• Off – No Link • On/Flashing Green –SFP+ port has a valid link at 10G or 1G. Flashing indicates activity.
SFP28 25G port LED	• Off – No Link • On/Flashing Green –SFP28 port has a valid link at 25G, 10G or 1G. Flashing indicates activity.
QSFP+ 40G port LED	1st LED: Green/OFF • On/Flashing Green = Port linked operating at 40G. Flashing indicates activity. • Off – No Link • All four LEDs shall be used when 4 x10G or 4 x1G mode is running on QSFP+ port. • On/Flashing Green = Port linked operating at 4x10G or 4 x1G. Flashing indicates activity. • Off – No Link

S5860-24XB-U Switch

	Solid amber	Port linked operating at 10M or 100M.
	Flashing	Transmit/Receive is activity.
LED Mode LED (controlled by LED Mode button on the front panel)	Solid green	Port LEDs indicate data switching status.
	Solid amber	Port LEDs indicate PoE power supply status.

Port LED Definition

RJ45 100M/1G/2.5G/5G port LED

Feature	Detailed Description
Non-PoE (controlled by LED Mode button on the front panel)	• Off – No Link. • Solid Green –Port links up at 1G/2.5G/5G. • Solid Amber –Port links up at 100M. • Flashing –Transmit/Receive is activity.
PoE (controlled by LED Mode button on the front panel)	• Solid Green –PoE Power On. • Off –PoE Power Off. • Solid Amber –Port PoE overload or failure.

SFP28 25G port LED

Feature	Detailed Description
SFP28 25G port LED	• Off – No Link. • Solid Green –Port links up at 1G/10G/25G. • Flashing –Transmit/Receive is activity.

S5860-48XMG-U Switch

System LED Definition

LED Name	Status	Detailed Description
Status LED	OFF	No power supply.
	Blinking green	Boot-up in progress.
	Solid green	The system completes initialization and works normally.
	Solid amber	1. Temperature exceeds alarm threshold. 2. Power mixing.
	Solid red	1. System Failure. A. Board voltage abnormalities. B. Other hardware and software abnormalities, such as a chip cannot be initialized. 2. The temperature of any part of the machine exceeds the maximum temperature allowed by the device.
FAN LED	Solid green	System FAN operating normally.
	Solid red	1. Any fan has failed: A. Model does not match system. B. The actual speed read is less than 3000 rpm (judged as stalled). C. Fan power_ok abnormality. 2. Any fan is not in position (see CPLD register);
PWR LED	OFF	Power supply not present.
	Solid green	This power is operating normally.
	Solid red	A. Power module failure, no output of 12V, 54V. B. Power module not connected to AC power cord. C. Cannot read the model number of the power supply module. D. Can read the model number, but does not match the system.
MGMT LED	OFF	No Link.
	Solid green	Port linked operating at 1000M.
	Solid amber	Port linked operating at 10M or 100M.
	Flashing	Transmit/Receive is activity.
LED Mode LED	Solid green	Port LEDs indicate data switching status.

(controlled by LED Mode button on the front panel)	Solid amber	Port LEDs indicate PoE power supply status.

Port LED Definition

RJ45 100M/1G/2.5G/5G/10G port LED

Feature	Detailed Description
Non-PoE (controlled by LED Mode button on the front panel)	• Off – No Link. • Solid Green –Port links up at 1G/2.5G/5G/10G. • Solid Amber –Port links up at 100M. • Flashing –Transmit/Receive is activity.
PoE (controlled by LED Mode button on the front panel)	• Solid Green –PoE Power On. • Off –PoE Power Off. • Solid Amber –Port PoE overload or failure.

SFP28 25G port LED

Feature	Detailed Description
SFP28 25G port LED	• Off – No Link. • Solid Green –Port links up at 25G. • Flashing –Transmit/Receive is activity.

QSFP+ 40G port LED

Feature	Detailed Description
QSFP+ 40G port LED	• Off – No Link. • Solid Green –Port links up at 40G. • Flashing –Transmit/Receive is activity.

S5860-24XMG Switch

System LED Definition

LED Name	Status	Detailed Description

System LED Definition

LED	Condition	Status
System LED	Green solid	System Diagnostic & OS OK
	Green Blinking	System Diagnostic & OS in progress
	Amber solid	System Diagnostic & OS Failed
PSU1 LED	Green solid	Power supply 1 operates normally
	Amber solid	Power supply 1 present but fault
	Off	Power supply 1 isn't presented. No PSU1
PSU2 LED	Green solid	Power supply 2 operates normally
	Amber solid	Power supply 2 present but fault
	Off	Power supply 2 isn't presented. No PSU2
FAN LED	Green solid	Fan works normally
	Amber solid	Fan fail
	Off	The SKU doesn't have system fan.
PoE LED	Green solid	PoE loading << power budget
	Amber solid	PoE loading ~ power budget
	Off	None PoE sku.
STK1/STK2 LED	Not in use.	
PRI LED	Not in use.	

Port LED Definition

RJ45 port status LED Indications

LED	Condition	Status
0~47 Port (1~48)	Green solid	Port Link without POE
	Green Blinking	Port Link/Activity without POE
	Amber solid	Port Link with POE
	Amber Blinking	Port Link/Activity with POE

SFP28 port status LED Indications

LED	Condition	Status
(Link/Activity) 49~52 Ports	Green solid	Port Link on 25G mode
	Green Blinking	Port Link/Activity on 25G mode
	White solid	Port Link on 10G mode
	White Blinking	Port Link/Activity on 10G mode
	Off	Link down

QSFP28 port status LED Indications

LED	Condition	Status
(Link/Activity) 53~54 Ports	White solid	Port Link on 100G mode
	White Blinking	Port Link/Activity on 100G mode
	Green solid	Port Link on 40G mode
	Green Blinking	Port Link/Activity on 40G mode
	Off	Link down

N5850-48X6C Switch

System LED Definition

Label	Condition	Description
PS1 (Power Supply Status)	Green	This power is operating normally.
	Amber	PWR present but not power on or this power is fault.
	Off	Power supply not present.
PS2 (Power Supply Status)	Green	This power is operating normally.
	Amber	PWR present but not power on or this power is fault.
	Off	Power supply not present.
Diag	Green	System self-diagnostic test successfully completed.
	Amber	System self-diagnostic test has detected a fault. (Fan, thermal or any interface fault.)
FAN	Green	System FAN operating normally.
	Amber	Fan tray present buy system FAN is fault.
	OFF	System OFF
LOC	Not supported.	

Port LED Definition

LED	Condition	Status
1~48 Port LED	On/Flashing Green	RJ port has a valid link at 10G. Flashing indicates activity.
	On/Flashing Amber	RJ port has a valid link at 1G. Flashing indicates activity.
	Off	There is no link on the port.
QSFP28 Port LED in 100G Mode (Port 49~ 54)	On/Flashing Green	QSFP port has a valid link at 100G. Flashing indicates activity.
	Off	There is no link on the port.
QSFP28 Port LED in 25G Mode (With Breakout cable)	On/Flashing Amber	QSFP28 port has a valid link at 25G via break out cable. The LED on 100G QSFP end is also present OFF. Flashing indicates activity.
	Off	There is no link on the port.

QSFP28 Port LED in 40G Mode (Port 49~ 54)	On/Flashing blue	QSFP port has a valid link at 100G. Flashing indicates activity.
	Off	There is no link on the port.
QSFP28 Port LED in 10G Mode (With Breakout cable)	On/Flashing purple	QSFP28 port has a valid link at 10G via break out cable. The LED on 40G QSFP end is also present OFF. Flashing indicates activity.
	Off	There is no link on the port.
OOB LED (Link)	On	Port has a valid link
	Flashing	Flashing indicates activity
	Off	There is no link on the port

- Single-color LED will be used for 40/100G QSFP28 uplink port to indicate link/activity.
- There should be four LEDs per QSFP28 port. These LEDs can represent state of 40/100GE port or 4 10/25GE ports when used in breakout mode.
- The 40/100G QSFP28 LED should present OFF while there’s breakout cable plugged in.

Diagnosis LED	• Solid green – All OK, CLI prompt available • Blinking green – Boot-up in progress • Solid amber –System self-diagnostic test has detected a fault (Fan, thermal or any interface fault.).	At front
FAN LED	• Solid green –System FAN operating normally. • Solid amber –Fan tray present buy system FAN is fault. • OFF – System OFF.	At front
PS1 LED	• Solid green –This power is operating normally. • Solid amber –PWR present but not power on or this power is fault. • OFF – Power supply not present.	At rear
PS2 LED	• Solid green –This power is operating normally. • Solid amber –PWR present but not power on or this power is fault. • OFF – Power supply not present.	At front
Locator LED	Not supported.	At front

Port LED Definition

QSFP56-DD ports LED Indications

Only the 1st LED is used when running at 400G without breakout.
Solid Blue - Port linked operating at max port speed 400G.
Off - No link
Flashing Blue - Transmit/Receive is activity.
Only the 1st LED is used when running at 100G without breakout.
Solid Green - Port linked operating at max port speed 100G.
Off - No link
Flashing Green - Transmit/Receive is activity.
All four LEDs are used when running at 4 x 100G in breakout mode.
Solid Green - Port linked operating at max port speed 100G
Off - No link
Flashing Green -Transmit/Receive is activity
Three LEDs are used when running at 2 x 200G in breakout mode.

Solid blue (one LED), solid green (two LEDs) - Port linked operating at max port speed 200G
Off - No link
Flashing Green -Transmit/Receive is activity

Management Port LED SFP+

Feature	Detailed Description
SFP+ 10G management port LED	• Off – No Link • On/Flashing Green –SFP+ port has a valid link at 10G. Flashing indicates activity. • On/Flashing Amber –SFP+ port has a valid link at 1G. Flashing indicates activity.
RJ45 10/100/1G Management port LED	• Off – No Link • On/Flashing Green –Has a valid link. Flashing indicates activity.

	Solid green	The system completes initialization and works normally.
	Solid amber	Temperature exceeds alarm threshold.
	Solid red	• System Failure. • The temperature of any part of the machine exceeds the maximum temperature allowed by the device.
POE LED	Solid green	Port LEDs indicate data switching status.
	Solid amber	Port LEDs indicate PoE power supply status.

Port LED Definition

10/100/1000BASE-T RJ45 port LED

Feature	Detailed Description
Non-PoE (controlled by PoE button on the front panel)	• Off – No Link. • Solid Green –Port links up at 10M, 100M or 100M. • Flashing –Transmit/Receive is activity.
PoE (controlled by PoE button on the front panel)	• Solid Green –PoE Power On. • Solid Amber – PoE Overload. • Solid Red –PoE Failure. • Off –PoE Power Off.

1000M/2.5G/5GBASE-T RJ45 port LED

Feature	Detailed Description
Non-PoE (controlled by PoE button on the front panel)	• Off – No Link. • Solid Green –Port links up at 1000M,2.5G or 5G. • Flashing –Transmit/Receive is activity.
PoE (controlled by PoE button on the front panel)	• Solid Green –PoE Power On. • Solid Amber – PoE Overload. • Solid Red –PoE Failure. • Off –PoE Power Off.

SFP+ 1/10G port LED

Feature	Detailed Description
SFP+ 1/10G port LED	• Off – No Link. • Solid Green –Port links up at 1G or 10G. • Flashing –Transmit/Receive is activity.

S3410C-16TF-P Switch

System LED Definition

LED Name	Status	Detailed Description
Status LED	OFF	No power supply.
	Blinking green	Boot-up in progress.
	Solid green	The system completes initialization and works normally.
	Solid amber	Temperature exceeds alarm threshold.
	Solid red	• System Failure. • The temperature of any part of the machine exceeds the maximum temperature allowed by the device.
POE LED	Solid green	Port LEDs indicate data switching status.
	Solid amber	Port LEDs indicate PoE power supply status.

Port LED Definition

10/100/1000BASE-T RJ45 port LED

Feature	Detailed Description
Non-PoE (controlled by PoE button on the front panel)	• Off – No Link. • Solid Green –Port links up at 10M,100M or 1000M. • Flashing –Transmit/Receive is activity.
PoE (controlled by PoE button on the front panel)	• Solid Green –PoE Power On. • Solid Amber – PoE Overload. • Solid Red –PoE Failure. • Off –PoE Power Off.

SFP 1G port LED

Feature	Detailed Description
SFP 1G port LED	• Off – No Link. • Solid Green –Port links up at 1G. • Flashing –Transmit/Receive is activity.

S3410-48TS-P Switch

System LED Definition

LED Name	Status	Detailed Description
Status LED	OFF	No power supply.
	Blinking Green	Boot-up in progress.
	Solid Green	The system completes initialization and works normally.
	Solid Amber	Temperature exceeds alarm threshold.
	Solid Red	• System Failure. • The temperature of any part of the switch exceeds the maximum temperature allowed by the device.
PWR1 LED	OFF	Power supply not present.
	Solid Green	This power is operating normally.
	Solid Red	Power module failure or need to connect to AC power line.
PWR2 LED	OFF	Power supply not present.
	Solid Green	This power is operating normally.
	Solid Red	Power module failure or need to connect to AC power line.
M1/M2 LED	Not supported.	
PoE LED (controlled by PoE button on the front panel)	Solid Green	Port LEDs indicate data switching status.
	Solid Amber	Port LEDs indicate PoE power supply status.

Port LED Definition

10/100/1000BASE-T RJ45 port LED

Feature	Detailed Description
Non-PoE (controlled by PoE button on the front panel)	• Off – No Link. • Solid Green –Port links up at 1000M. • Solid Amber –Port links up at 10M or 100M. • Flashing –Transmit/Receive is activity.
PoE (controlled by PoE button on the front panel)	• Solid Green –PoE Power On. • Solid Amber – PoE Overload. • Solid Red –PoE Failure. • Off –PoE Power Off.

SFP 1G port LED (47, 48)

Feature	Detailed Description
SFP 1G port LED	• Off – No Link. • Solid Green –Port links up at 1G. • Flashing –Transmit/Receive is activity.

SFP+ 10G port LED

Feature	Detailed Description
SFP+ 10G port LED	• Off – No Link. • Solid Green –Port links up at 10G or 1G. • Flashing –Transmit/Receive is activity.

N8550-48B8C Switch

System LED Definition

LED	Color	Mode
Power Supply 1	Red	Error/Failure/Bad
	Green	Good
	Off	Not present
Power Supply 2	Red	Error/Failure/Bad
	Green	Good
	Off	Not present
FANs	Red	Error/Failure/Bad
	Green	Good
Diag	Red	Error/Fault/Failure
	Green	Good
	Blinking Green	System boot in progress
LOC	Not supported.	

Port LED Definition

SFP28 Port LED Definition

LED	Color	Mode
SFP28 Port LED	On/Flashing Green	SFP28 port has a valid link at 25G. Flashing indicates activity.
	On/Flashing Yellow	SFP28 port has a valid link at 10G. Flashing indicates activity.
	OFF	There is no link on the port.

QSFP28 Port LED Definition

LED	Color	Mode
LED 1~4 (Port 49~56)	On/Flashing Green	QSFP28 port has a valid link at 100G. Flashing indicates activity.
	OFF	There is no link on the port.

	On/Flashing Blue	QSFP28 port has a valid link at 40G. Flashing indicates activity.
	OFF	There is no link on the port.
	On/Flashing Yellow	QSFP28 port has a valid link at 25G via break out cable. The LED on 100G QSFP end is also present OFF. Flashing indicates activity. (With Breakout cable)
	OFF	There is no link on the port.
	On/Flashing Purple	QSFP28 port has a valid link at 10G via break out cable. The LED on 40G QSFP end is also present OFF. Flashing indicates activity. (With Breakout cable)
	OFF	There is no link on the port

SFP+ Port LED Definition

LED	Color	Mode
SFP+ Port LED	On/Flashing Green	SFP+ port has a valid link at 10G. Flashing indicates activity.
	On/Flashing Yellow	SFP+ port has a valid link at 1G. Flashing indicates activity.
	OFF	There is no link on the port.

Management Port LED

LED	Color	Mode
MGMT Port LED	On Green	Port has a valid link
	Flashing Yellow	Flashing indicates activity
	OFF	There is no link on the port.

S3410-48TS Switch

System LED Definition

LED Name	Status	Detailed Description
Status LED	OFF	No power supply.
	Blinking green	Boot-up in progress.
	Solid Green	The switch is operational.
	Solid Amber	Moderate temperature warning: Check the working environment of the switch immediately.
	Solid Red	• Severe temperature warning: The temperature severely exceeds the temperature limit, so the system is going to restart. • The switch is faulty.
PWR1/PWR2 LED	Off	No power supply module is connected.
	Solid Green	A power supply is connected and enable to work.
	Solid Red	Redundant power fails or no AC cable is connected.
ID LED	Off	Locating is disabled.
	Solid Bule	Locating is enabled. Operation and maintenance staff turn on and off the LED remotely.

Port LED Definition

10/100/1000BASE-T RJ45 port LED

Feature	Detailed Description
10/100/1000BASE-T RJ45 port LED	• Off – The port is not connected.. • Solid Green – The port is connected at 1000M. • Solid Amber – The port is connected at 10M/ 100M. • Flashing – Data is being received or transmitted.

SFP+ 10G port LED

Feature	Detailed Description
SFP+ 10G port LED	• Off – The port is not connected. • Solid Green – The port is connected. • Flashing – The port is receiving or transmitted traffic.

S3410L-48TF Switch

System LED Definition

LED Name	Status	Detailed Description
Status LED	OFF	No power supply.
	Blinking green	Boot-up in progress.
	Solid Green	The switch is operational.
	Solid Amber	Moderate temperature warning: Check the working environment of the switch immediately.
	Solid Red	• Severe temperature warning: The temperature severely exceeds the temperature limit, so the system is going to restart. • The switch is faulty.
PSU LED	Off	No power supply module is connected.
	Solid Green	A power supply is connected and enable to work.
	Solid Red	Redundant power fails or no AC cable is connected.
ID LED	Off	Locating is disabled.
	Solid Bule	Locating is enabled. Operation and maintenance staff turn on and off the LED remotely.

Port LED Definition

10/100/1000BASE-T RJ45 port LED

Feature	Detailed Description
10/100/1000BASE-T RJ45 port LED	• Off – The port is not connected.. • Solid Green – The port is connected at 1000M. • Solid Amber – The port is connected at 10M/ 100M. • Flashing – Data is being received or transmitted.

SFP 1G port LED

Feature	Detailed Description
SFP 1G port LED	• Off – The port is not connected. • Solid Green – The port is connected. • Flashing – The port is receiving or transmitted traffic.

N8550-24CD8D Switch

System LED Definition

LED Name	Status	Detailed Description
SYS LED	Off	No power supply.
	Blinking Green	The system is initializing.
	Solid Red	The system is working abnormally.
	Solid Green	The system completes initialization and works normally.
PSU LED (Front Panel)	OFF	No power supply inserted.
	Solid Red	There is a PSU working abnormally.
	Solid Green	All power supplies are operating normally.
PSU LED (Rear Panel)	IN	Power input normal.
	OUT	Power supply is normal.
	!	Power is operating abnormally.
FAN LED (Front Panel)	OFF	No fan inserted.
	Solid Green	All fans operate normally.
	Solid Red	There is fan is working abnormally.
FAN LED (Rear Panel)	OFF	No fan inserted.
	Solid Green	The fan operates normally.
	Solid Red	The fan is working abnormally.
MGMT LED	OFF	No Link.
	Solid Green	Port linked operating at 10M, 100M or 1000M.
	Flashing Amber/Green	Transmit/Receive is activity, Port linked operating at 10000M.
ID LED	Not supported.	

Port LED Definition

200GB QSFP56 port LED

LED Name	Status	Detailed Description
24 x 200GB QSFP56 port LED	Off	The port is not connected.
	Solid Green	Port linked operating at max port speed.
	Solid Amber	The system is launching **lcmgr** process.
	Blinking Green	Data is being received or transmitted.

400GB QSFP-DD port LED

LED Name	Status	Detailed Description
8 x 400GB QSFP56 port LED	Off	The port is not connected.
	Solid Green	Port linked operating at max port speed.
	Solid Amber	The system is launching **lcmgr** process.
	Blinking Green	Data is being received or transmitted.

N9600-64OD Switch

System LED Definition

LED Name	Status	Detailed Description
SYS LED	OFF	No power supply.
	Solid green	The system completes initialization and works normally.
	Blinking amber	The system is initializing.
LINK/ACT LED	OFF	The port is not connected.
	Solid green	Port links up at 1G/100M/10M.
	Blinking green	Data is being received or transmitted.
PSU LED (front panel)	OFF	No power supply inserted.
	Blinking amber	Not all power supplies are operating normally.
	Solid green	Two power supplies are operating normally.
FAN LED (front panel)	OFF	No fan inserted.
	Solid amber	Not all fans are operating normally.
	Solid green	Four fans are operating normally.
BMC LED	Not supported.	
25G SFP28 port LED	Not supported.	
PSU LED (rear panel)	Solid green (IN)	Power input normal.
	Solid green (OUT)	Power supply is normal.
	Solid amber (!)	The PSU module is not powered on or is not operating abnormally.
FAN LED (rear panel)	OFF	No fan inserted.
	Solid green	The fan is operating normally.
800GB OSFP port LED	Off	The port links down.
	Solid Green	Port links up at 800G, split speed of 400G/200G/100G, and reduced speed of 400G/200G/100G/50G.
	Blinking Green	Data is being received or transmitted.

N2224X-ON/N2224PX-ON Switch Port Name Description

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Supported Speed
1	ge-1/1/1	2.5Gb/s, 1Gb/s, 100Mb/s
2	ge-1/1/2	2.5Gb/s, 1Gb/s, 100Mb/s
3	ge-1/1/3	2.5Gb/s, 1Gb/s, 100Mb/s
4	ge-1/1/4	2.5Gb/s, 1Gb/s, 100Mb/s
5	ge-1/1/5	2.5Gb/s, 1Gb/s, 100Mb/s
6	ge-1/1/6	2.5Gb/s, 1Gb/s, 100Mb/s
7	ge-1/1/7	2.5Gb/s, 1Gb/s, 100Mb/s
8	ge-1/1/8	2.5Gb/s, 1Gb/s, 100Mb/s
9	ge-1/1/9	2.5Gb/s, 1Gb/s, 100Mb/s
10	ge-1/1/10	2.5Gb/s, 1Gb/s, 100Mb/s
11	ge-1/1/11	2.5Gb/s, 1Gb/s, 100Mb/s
12	ge-1/1/12	2.5Gb/s, 1Gb/s, 100Mb/s
13	ge-1/1/13	2.5Gb/s, 1Gb/s, 100Mb/s
14	ge-1/1/14	2.5Gb/s, 1Gb/s, 100Mb/s
15	ge-1/1/15	2.5Gb/s, 1Gb/s, 100Mb/s
16	ge-1/1/16	2.5Gb/s, 1Gb/s, 100Mb/s
17	ge-1/1/17	2.5Gb/s, 1Gb/s, 100Mb/s
18	ge-1/1/18	2.5Gb/s, 1Gb/s, 100Mb/s
19	ge-1/1/19	2.5Gb/s, 1Gb/s, 100Mb/s
20	ge-1/1/20	2.5Gb/s, 1Gb/s, 100Mb/s
21	ge-1/1/21	2.5Gb/s, 1Gb/s, 100Mb/s
22	ge-1/1/22	2.5Gb/s, 1Gb/s, 100Mb/s
23	ge-1/1/23	2.5Gb/s, 1Gb/s, 100Mb/s
24	ge-1/1/24	2.5Gb/s, 1Gb/s, 100Mb/s
25	te-1/1/1	25Gb/s,10Gb/s,1Gb/s
26	te-1/1/2	25Gb/s,10Gb/s,1Gb/s
27	te-1/1/3	25Gb/s,10Gb/s,1Gb/s
28	te-1/1/4	25Gb/s,10Gb/s,1Gb/s
29	xe-1/1/1	40Gb/s, 4x10Gb/s, 4x1Gb/s
30	xe-1/1/2	40Gb/s, 4x10Gb/s, 4x1Gb/s

N2248X-ON/N2248PX-ON Switch Port Name Description

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Supported Speed
1	ge-1/1/1	2.5Gb/s, 1Gb/s, 100Mb/s
2	ge-1/1/2	2.5Gb/s, 1Gb/s, 100Mb/s
3	ge-1/1/3	2.5Gb/s, 1Gb/s, 100Mb/s
4	ge-1/1/4	2.5Gb/s, 1Gb/s, 100Mb/s
5	ge-1/1/5	2.5Gb/s, 1Gb/s, 100Mb/s
6	ge-1/1/6	2.5Gb/s, 1Gb/s, 100Mb/s
7	ge-1/1/7	2.5Gb/s, 1Gb/s, 100Mb/s
8	ge-1/1/8	2.5Gb/s, 1Gb/s, 100Mb/s
9	ge-1/1/9	2.5Gb/s, 1Gb/s, 100Mb/s
10	ge-1/1/10	2.5Gb/s, 1Gb/s, 100Mb/s
11	ge-1/1/11	2.5Gb/s, 1Gb/s, 100Mb/s
12	ge-1/1/12	2.5Gb/s, 1Gb/s, 100Mb/s
13	ge-1/1/13	2.5Gb/s, 1Gb/s, 100Mb/s
14	ge-1/1/14	2.5Gb/s, 1Gb/s, 100Mb/s
15	ge-1/1/15	2.5Gb/s, 1Gb/s, 100Mb/s
16	ge-1/1/16	2.5Gb/s, 1Gb/s, 100Mb/s
17	ge-1/1/17	2.5Gb/s, 1Gb/s, 100Mb/s
18	ge-1/1/18	2.5Gb/s, 1Gb/s, 100Mb/s
19	ge-1/1/19	2.5Gb/s, 1Gb/s, 100Mb/s
20	ge-1/1/20	2.5Gb/s, 1Gb/s, 100Mb/s

N3208PX-ON Switch Port Name Description

Mapping between physical ports, interface names and interface supported speeds are in the following table.

Physical Port Number	Interface Names	Interface Supported Speed
1	ge-1/1/1	1Gb/s, 100Mb/s, 10Mb/s
2	ge-1/1/2	1Gb/s, 100Mb/s, 10Mb/s
3	ge-1/1/3	1Gb/s, 100Mb/s, 10Mb/s
4	ge-1/1/4	1Gb/s, 100Mb/s, 10Mb/s
5	ge-1/1/5	5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s, 10Mb/s
6	ge-1/1/6	5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s, 10Mb/s
7	ge-1/1/7	5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s, 10Mb/s
8	ge-1/1/8	5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s, 10Mb/s
9	te-1/1/1	10Gb/s, 1Gb/s
10	te-1/1/2	10Gb/s, 1Gb/s

N3224F-ON/N3224T-ON Switch Port Name Description

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Supported Speed
1	te-1/1/1	1Gb/s
2	te-1/1/2	1Gb/s
3	te-1/1/3	1Gb/s
4	te-1/1/4	1Gb/s
5	te-1/1/5	1Gb/s
6	te-1/1/6	1Gb/s
7	te-1/1/7	1Gb/s
8	te-1/1/8	1Gb/s
9	te-1/1/9	1Gb/s

29	xe-1/1/1	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
30	xe-1/1/2	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s

N3224PX-ON Switch Port Name Description

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Supported Speed
1	te-1/1/1	10/100/1000Mb/s or 2.5/5G/10Gb/s
2	te-1/1/2	10/100/1000Mb/s or 2.5/5G/10Gb/s
3	te-1/1/3	10/100/1000Mb/s or 2.5/5G/10Gb/s
4	te-1/1/4	10/100/1000Mb/s or 2.5/5G/10Gb/s
5	te-1/1/5	10/100/1000Mb/s or 2.5/5G/10Gb/s
6	te-1/1/6	10/100/1000Mb/s or 2.5/5G/10Gb/s
7	te-1/1/7	10/100/1000Mb/s or 2.5/5G/10Gb/s
8	te-1/1/8	10/100/1000Mb/s or 2.5/5G/10Gb/s
9	te-1/1/9	10/100/1000Mb/s or 2.5/5G/10Gb/s
10	te-1/1/10	10/100/1000Mb/s or 2.5/5G/10Gb/s
11	te-1/1/11	10/100/1000Mb/s or 2.5/5G/10Gb/s
12	te-1/1/12	10/100/1000Mb/s or 2.5/5G/10Gb/s
13	te-1/1/13	10/100/1000Mb/s or 2.5/5G/10Gb/s
14	te-1/1/14	10/100/1000Mb/s or 2.5/5G/10Gb/s
15	te-1/1/15	10/100/1000Mb/s or 2.5/5G/10Gb/s
16	te-1/1/16	10/100/1000Mb/s or 2.5/5G/10Gb/s
17	te-1/1/17	10/100/1000Mb/s or 2.5/5G/10Gb/s
18	te-1/1/18	10/100/1000Mb/s or 2.5/5G/10Gb/s
19	te-1/1/19	10/100/1000Mb/s or 2.5/5G/10Gb/s
20	te-1/1/20	10/100/1000Mb/s or 2.5/5G/10Gb/s
21	te-1/1/21	10/100/1000Mb/s or 2.5/5G/10Gb/s
22	te-1/1/22	10/100/1000Mb/s or 2.5/5G/10Gb/s
23	te-1/1/23	10/100/1000Mb/s or 2.5/5G/10Gb/s
24	te-1/1/24	10/100/1000Mb/s or 2.5/5G/10Gb/s
25	te-1/1/25	25Gb/s,10Gb/s,1Gb/s
26	te-1/1/26	25Gb/s,10Gb/s,1Gb/s
27	te-1/1/27	25Gb/s,10Gb/s,1Gb/s
28	te-1/1/28	25Gb/s,10Gb/s,1Gb/s
29	xe-1/1/1	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
30	xe-1/1/2	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s

N3248P-ON/N3248TE-ON Switch Port Name Description

Mapping between physical ports, interface names and interface supported speeds are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	ge-1/1/1	1Gb/s, 100Mb/s, 10Mb/s
2	ge-1/1/2	1Gb/s, 100Mb/s, 10Mb/s
3	ge-1/1/3	1Gb/s, 100Mb/s, 10Mb/s
4	ge-1/1/4	1Gb/s, 100Mb/s, 10Mb/s
5	ge-1/1/5	1Gb/s, 100Mb/s, 10Mb/s
6	ge-1/1/6	1Gb/s, 100Mb/s, 10Mb/s
7	ge-1/1/7	1Gb/s, 100Mb/s, 10Mb/s
8	ge-1/1/8	1Gb/s, 100Mb/s, 10Mb/s
9	ge-1/1/9	1Gb/s, 100Mb/s, 10Mb/s
10	ge-1/1/10	1Gb/s, 100Mb/s, 10Mb/s
11	ge-1/1/11	1Gb/s, 100Mb/s, 10Mb/s
12	ge-1/1/12	1Gb/s, 100Mb/s, 10Mb/s
13	ge-1/1/13	1Gb/s, 100Mb/s, 10Mb/s
14	ge-1/1/14	1Gb/s, 100Mb/s, 10Mb/s
15	ge-1/1/15	1Gb/s, 100Mb/s, 10Mb/s
16	ge-1/1/16	1Gb/s, 100Mb/s, 10Mb/s
17	ge-1/1/17	1Gb/s, 100Mb/s, 10Mb/s
18	ge-1/1/18	1Gb/s, 100Mb/s, 10Mb/s
19	ge-1/1/19	1Gb/s, 100Mb/s, 10Mb/s
20	ge-1/1/20	1Gb/s, 100Mb/s, 10Mb/s
21	ge-1/1/21	1Gb/s, 100Mb/s, 10Mb/s
22	ge-1/1/22	1Gb/s, 100Mb/s, 10Mb/s
23	ge-1/1/23	1Gb/s, 100Mb/s, 10Mb/s
24	ge-1/1/24	1Gb/s, 100Mb/s, 10Mb/s
25	ge-1/1/25	1Gb/s, 100Mb/s, 10Mb/s
26	ge-1/1/26	1Gb/s, 100Mb/s, 10Mb/s
27	ge-1/1/27	1Gb/s, 100Mb/s, 10Mb/s
28	ge-1/1/28	1Gb/s, 100Mb/s, 10Mb/s
29	ge-1/1/29	1Gb/s, 100Mb/s, 10Mb/s
30	ge-1/1/30	1Gb/s, 100Mb/s, 10Mb/s
31	ge-1/1/31	1Gb/s, 100Mb/s, 10Mb/s
32	ge-1/1/32	1Gb/s, 100Mb/s, 10Mb/s
33	ge-1/1/33	1Gb/s, 100Mb/s, 10Mb/s
34	ge-1/1/34	1Gb/s, 100Mb/s, 10Mb/s
35	ge-1/1/35	1Gb/s, 100Mb/s, 10Mb/s
36	ge-1/1/36	1Gb/s, 100Mb/s, 10Mb/s
37	ge-1/1/37	1Gb/s, 100Mb/s, 10Mb/s
38	ge-1/1/38	1Gb/s, 100Mb/s, 10Mb/s
39	ge-1/1/39	1Gb/s, 100Mb/s, 10Mb/s

40	ge-1/1/40	1Gb/s, 100Mb/s, 10Mb/s
41	ge-1/1/41	1Gb/s, 100Mb/s, 10Mb/s
42	ge-1/1/42	1Gb/s, 100Mb/s, 10Mb/s
43	ge-1/1/43	1Gb/s, 100Mb/s, 10Mb/s
44	ge-1/1/44	1Gb/s, 100Mb/s, 10Mb/s
45	ge-1/1/45	1Gb/s, 100Mb/s, 10Mb/s
46	ge-1/1/46	1Gb/s, 100Mb/s, 10Mb/s
47	ge-1/1/47	1Gb/s, 100Mb/s, 10Mb/s
48	ge-1/1/48	1Gb/s, 100Mb/s, 10Mb/s
49	te-1/1/1	10Gb/s, 1Gb/s
50	te-1/1/2	10Gb/s, 1Gb/s
51	te-1/1/3	10Gb/s, 1Gb/s
52	te-1/1/4	10Gb/s, 1Gb/s
53	xe-1/1/1	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
54	xe-1/1/2	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s

N3248PXE-ON/N3248X-ON Switch Port Name Description

NOTE:
Ports Te-1 / 1/49, Te-1 / 1/50, Te-1 / 1/51 and Te-1 / 1/52 are a group of ports, you should manually configure the port speed for these four ports by using the **set interface gigabit-ethernet speed** command before inserting an optical module. When configuring the rate, the supported port rates are 25 Gbit/s, 10 Gbit/s, and 1 Gbit/s. The four ports can be configured with the same port rate or different rate. When configured at different port rates, 10G and 1G can coexist, but 25G cannot coexist with other rates. The following table gives several cases of speed setting for this group of ports.

	te-1/1/49	te-1/1/50	te-1/1/51	te-1/1/52	Allowed or not Allowed
case #1	10 G	10G	10G	10G	✓
case #2	1G	1G	1G	1G	✓
case #3	25G	25G	25G	25G	✓
case #4	1G	10G	1G	10G	✓
case #5	25G	1G	25G	25G	**X**
case #6	25G	10G	25G	10G	**X**
case #7	25G	1G	10G	25G	**X**

Note: If the port rate is set to 25 Gbit/s, but a 10 Gbit/s optical module is inserted, the port cannot go up.

Mapping between physical ports, interface names and interface supported speeds are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	te-1/1/1	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
2	te-1/1/2	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
3	te-1/1/3	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
4	te-1/1/4	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
5	te-1/1/5	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
6	te-1/1/6	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
7	te-1/1/7	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
8	te-1/1/8	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
9	te-1/1/9	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
10	te-1/1/10	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
11	te-1/1/11	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
12	te-1/1/12	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
13	te-1/1/13	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
14	te-1/1/14	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
15	te-1/1/15	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
16	te-1/1/16	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
17	te-1/1/17	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
18	te-1/1/18	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
19	te-1/1/19	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
20	te-1/1/20	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
21	te-1/1/21	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
22	te-1/1/22	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
23	te-1/1/23	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
24	te-1/1/24	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
25	te-1/1/25	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
26	te-1/1/26	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s

27	te-1/1/27	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
28	te-1/1/28	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
29	te-1/1/29	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
30	te-1/1/30	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
31	te-1/1/31	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
32	te-1/1/32	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
33	te-1/1/33	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
34	te-1/1/34	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
35	te-1/1/35	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
36	te-1/1/36	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
37	te-1/1/37	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
38	te-1/1/38	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
39	te-1/1/39	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
40	te-1/1/40	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
41	te-1/1/41	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
42	te-1/1/42	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
43	te-1/1/43	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
44	te-1/1/44	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
45	te-1/1/45	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s

S4048-ON Switch Port Name Description

Mapping between physical port, interface names and interface support speed on S4048-ON are in the following table.

Physical Port Number	Interface Names	interface Support Speed
1	te-1/1/1	10Gb/s, 1Gb/s
2	te-1/1/2	10Gb/s, 1Gb/s
3	te-1/1/3	10Gb/s, 1Gb/s
4	te-1/1/4	10Gb/s, 1Gb/s
5	te-1/1/5	10Gb/s, 1Gb/s
6	te-1/1/6	10Gb/s, 1Gb/s
7	te-1/1/7	10Gb/s, 1Gb/s
8	te-1/1/8	10Gb/s, 1Gb/s
9	te-1/1/9	10Gb/s, 1Gb/s
10	te-1/1/10	10Gb/s, 1Gb/s
11	te-1/1/11	10Gb/s, 1Gb/s
12	te-1/1/12	10Gb/s, 1Gb/s
13	te-1/1/13	10Gb/s, 1Gb/s
14	te-1/1/14	10Gb/s, 1Gb/s
15	te-1/1/15	10Gb/s, 1Gb/s
16	te-1/1/16	10Gb/s, 1Gb/s
17	te-1/1/17	10Gb/s, 1Gb/s
18	te-1/1/18	10Gb/s, 1Gb/s
19	te-1/1/19	10Gb/s, 1Gb/s
20	te-1/1/20	10Gb/s, 1Gb/s
21	te-1/1/21	10Gb/s, 1Gb/s
22	te-1/1/22	10Gb/s, 1Gb/s
23	te-1/1/23	10Gb/s, 1Gb/s
24	te-1/1/24	10Gb/s, 1Gb/s
25	te-1/1/25	10Gb/s, 1Gb/s
26	te-1/1/26	10Gb/s, 1Gb/s
27	te-1/1/27	10Gb/s, 1Gb/s
28	te-1/1/28	10Gb/s, 1Gb/s
29	te-1/1/29	10Gb/s, 1Gb/s
30	te-1/1/30	10Gb/s, 1Gb/s
31	te-1/1/31	10Gb/s, 1Gb/s
32	te-1/1/32	10Gb/s, 1Gb/s
33	te-1/1/33	10Gb/s, 1Gb/s
34	te-1/1/34	10Gb/s, 1Gb/s
35	te-1/1/35	10Gb/s, 1Gb/s
36	te-1/1/36	10Gb/s, 1Gb/s
37	te-1/1/37	10Gb/s, 1Gb/s
38	te-1/1/38	10Gb/s, 1Gb/s
39	te-1/1/39	10Gb/s, 1Gb/s

40	te-1/1/40	10Gb/s, 1Gb/s
41	te-1/1/41	10Gb/s, 1Gb/s
42	te-1/1/42	10Gb/s, 1Gb/s
43	te-1/1/43	10Gb/s, 1Gb/s
44	te-1/1/44	10Gb/s, 1Gb/s
45	te-1/1/45	10Gb/s, 1Gb/s
46	te-1/1/46	10Gb/s, 1Gb/s
47	te-1/1/47	10Gb/s, 1Gb/s
48	te-1/1/48	10Gb/s, 1Gb/s
49	xe-1/1/1	40Gb/s, 4x10Gb/s, 4x1Gb/s
50	xe-1/1/2	40Gb/s, 4x10Gb/s, 4x1Gb/s
51	xe-1/1/3	40Gb/s, 4x10Gb/s, 4x1Gb/s
52	xe-1/1/4	40Gb/s, 4x10Gb/s, 4x1Gb/s
53	xe-1/1/5	40Gb/s, 4x10Gb/s, 4x1Gb/s
54	xe-1/1/6	40Gb/s, 4x10Gb/s, 4x1Gb/s

S4148T-ON Switch Port Name Description

NOTEs:
The uplink ports, with port numbers from 25 to 30, have two different uplink port modes 6x40G (default) and 4x100G.

- You need to change the port mode to 4x100G if you want to use 100G uplinks, please refer to following page with instructions to set up the port mode:

Configuring Port Mapping On S4148 Series Switch

- Ports with physical port number 27 & 28 are only available in the 6x40G mode and are not available in the 4x100G mode.

Mapping between physical ports, interface names and interface support speed of S4148T-ON are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	te-1/1/1	10Gb/s,1Gb/s, 100Mb/s
2	te-1/1/2	10Gb/s,1Gb/s, 100Mb/s
3	te-1/1/3	10Gb/s,1Gb/s, 100Mb/s
4	te-1/1/4	10Gb/s,1Gb/s, 100Mb/s
5	te-1/1/5	10Gb/s,1Gb/s, 100Mb/s
6	te-1/1/6	10Gb/s,1Gb/s, 100Mb/s
7	te-1/1/7	10Gb/s,1Gb/s, 100Mb/s
8	te-1/1/8	10Gb/s,1Gb/s, 100Mb/s
9	te-1/1/9	10Gb/s,1Gb/s, 100Mb/s
10	te-1/1/10	10Gb/s,1Gb/s, 100Mb/s
11	te-1/1/11	10Gb/s,1Gb/s, 100Mb/s
12	te-1/1/12	10Gb/s,1Gb/s, 100Mb/s
13	te-1/1/13	10Gb/s,1Gb/s, 100Mb/s
14	te-1/1/14	10Gb/s,1Gb/s, 100Mb/s
15	te-1/1/15	10Gb/s,1Gb/s, 100Mb/s
16	te-1/1/16	10Gb/s,1Gb/s, 100Mb/s
17	te-1/1/17	10Gb/s,1Gb/s, 100Mb/s
18	te-1/1/18	10Gb/s,1Gb/s, 100Mb/s
19	te-1/1/19	10Gb/s,1Gb/s, 100Mb/s
20	te-1/1/20	10Gb/s,1Gb/s, 100Mb/s
21	te-1/1/21	10Gb/s,1Gb/s, 100Mb/s
22	te-1/1/22	10Gb/s,1Gb/s, 100Mb/s
23	te-1/1/23	10Gb/s,1Gb/s, 100Mb/s

S5212F-ON Switch Port Name Description

Mapping between physical ports, interface names and interface supported speeds are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	te-1/1/1	25Gb/s,10Gb/s,1Gb/s
2	te-1/1/2	25Gb/s,10Gb/s,1Gb/s
3	te-1/1/3	25Gb/s,10Gb/s,1Gb/s
4	te-1/1/4	25Gb/s,10Gb/s,1Gb/s
5	te-1/1/5	25Gb/s,10Gb/s,1Gb/s
6	te-1/1/6	25Gb/s,10Gb/s,1Gb/s
7	te-1/1/7	25Gb/s,10Gb/s,1Gb/s
8	te-1/1/8	25Gb/s,10Gb/s,1Gb/s
9	te-1/1/9	25Gb/s,10Gb/s,1Gb/s
10	te-1/1/10	25Gb/s,10Gb/s,1Gb/s
11	te-1/1/11	25Gb/s,10Gb/s,1Gb/s
12	te-1/1/12	25Gb/s,10Gb/s,1Gb/s
13	xe-1/1/1	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
14	xe-1/1/2	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
15	xe-1/1/3	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s

S5224F-ON Switch Port Name Description

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	te-1/1/1	25Gb/s,10Gb/s,1Gb/s
2	te-1/1/2	25Gb/s,10Gb/s,1Gb/s
3	te-1/1/3	25Gb/s,10Gb/s,1Gb/s
4	te-1/1/4	25Gb/s,10Gb/s,1Gb/s
5	te-1/1/5	25Gb/s,10Gb/s,1Gb/s
6	te-1/1/6	25Gb/s,10Gb/s,1Gb/s
7	te-1/1/7	25Gb/s,10Gb/s,1Gb/s
8	te-1/1/8	25Gb/s,10Gb/s,1Gb/s
9	te-1/1/9	25Gb/s,10Gb/s,1Gb/s
10	te-1/1/10	25Gb/s,10Gb/s,1Gb/s
11	te-1/1/11	25Gb/s,10Gb/s,1Gb/s
12	te-1/1/12	25Gb/s,10Gb/s,1Gb/s
13	te-1/1/13	25Gb/s,10Gb/s,1Gb/s
14	te-1/1/14	25Gb/s,10Gb/s,1Gb/s
15	te-1/1/15	25Gb/s,10Gb/s,1Gb/s
16	te-1/1/16	25Gb/s,10Gb/s,1Gb/s
17	te-1/1/17	25Gb/s,10Gb/s,1Gb/s
18	te-1/1/18	25Gb/s,10Gb/s,1Gb/s
19	te-1/1/19	25Gb/s,10Gb/s,1Gb/s
20	te-1/1/20	25Gb/s,10Gb/s,1Gb/s
21	te-1/1/21	25Gb/s,10Gb/s,1Gb/s
22	te-1/1/22	25Gb/s,10Gb/s,1Gb/s
23	te-1/1/23	25Gb/s,10Gb/s,1Gb/s
24	te-1/1/24	25Gb/s,10Gb/s,1Gb/s
25	xe-1/1/1	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
26	xe-1/1/2	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
27	xe-1/1/3	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
28	xe-1/1/4	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s

S5232F-ON Switch Port Name Description

NOTE:
On S5232F-ON switch, due to ASIC limitations, xe-1/1/32 port is not allowed to be split into four Gigabit Ethernet interfaces.

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	xe-1/1/1	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
2	xe-1/1/2	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
3	xe-1/1/3	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
4	xe-1/1/4	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
5	xe-1/1/5	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
6	xe-1/1/6	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
7	xe-1/1/7	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
8	xe-1/1/8	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
9	xe-1/1/9	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
10	xe-1/1/10	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
11	xe-1/1/11	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
12	xe-1/1/12	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
13	xe-1/1/13	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
14	xe-1/1/14	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
15	xe-1/1/15	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
16	xe-1/1/16	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
17	xe-1/1/17	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
18	xe-1/1/18	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
19	xe-1/1/19	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
20	xe-1/1/20	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
21	xe-1/1/21	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
22	xe-1/1/22	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
23	xe-1/1/23	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
24	xe-1/1/24	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
25	xe-1/1/25	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
26	xe-1/1/26	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
27	xe-1/1/27	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
28	xe-1/1/28	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
29	xe-1/1/29	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
30	xe-1/1/30	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
31	xe-1/1/31	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
32	xe-1/1/32	100Gb/s, 40Gb/s
33	te-1/1/1	10Gb/s,1Gb/s
34	te-1/1/2	10Gb/s,1Gb/s

S5248F Switch Port Name Description

NOTE:

1. The first 48 ports are grouped, each four ports are grouped as shown in the following table.

Groups of ports	port1- port4	port5- port8	port9- port12	port13- port16	port17- port20	port21- port24
	port25- port28	port29- port32	port33- port36	port37- port40	port41- port44	port45- port48

2. For the first 48 ports, the transmission rates of optical modules inserted in the ports of a group needs to be the same, and the configured port speed must be the same too, that is to say,

- when inserting an optical module to the switch port, the transmission rates of the optical modules should be the same in a group.
- you should manually configure the port speed by using the **set interface gigabit-ethernet speed** command before inserting an optical module, and the port speed of the four ports in the same group should be configured together and with the same value.

3. There are two 200G QSFP-DD ports, they should be inserted a 200G optical module. Each of the QSFP-DD port can be used as two separate 100G QSFP28 ports. The port name of the two 200G QSFP-DD ports are xe-1/1/1, xe-1/1/2, xe-1/1/3 and xe-1/1/4.

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Supported Speed
1	te-1/1/1	25Gb/s,10Gb/s,1Gb/s
2	te-1/1/2	25Gb/s,10Gb/s,1Gb/s
3	te-1/1/3	25Gb/s,10Gb/s,1Gb/s
4	te-1/1/4	25Gb/s,10Gb/s,1Gb/s
5	te-1/1/5	25Gb/s,10Gb/s,1Gb/s
6	te-1/1/6	25Gb/s,10Gb/s,1Gb/s
7	te-1/1/7	25Gb/s,10Gb/s,1Gb/s
8	te-1/1/8	25Gb/s,10Gb/s,1Gb/s

S5296F-ON Switch Port Name Description

NOTE:

1. The first 96 ports are grouped, each four ports are grouped as shown in the following table.

Groups of ports	port1- port4	port5- port8	port9- port12	port13- port16	port17- port20	port21- port24
	port25- port28	port29- port32	port33- port36	port37- port40	port41- port44	port45- port48
	port49-port52	port53-port56	port57-port60	port61-port64	port65-port68	port69-port72
	port73-port76	port77-port80	port81-port84	port85-port88	port89-port92	port93-port96

2. For the first 96 ports, you should manually configure the port speed by using the **set interface gigabit-ethernet speed** command before inserting the cable and the port speed of the four ports in the same group should be configured together and with the same value.

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Supported Speed
1	te-1/1/1	25Gb/s,10Gb/s,1Gb/s
2	te-1/1/2	25Gb/s,10Gb/s,1Gb/s
3	te-1/1/3	25Gb/s,10Gb/s,1Gb/s
4	te-1/1/4	25Gb/s,10Gb/s,1Gb/s
5	te-1/1/5	25Gb/s,10Gb/s,1Gb/s
6	te-1/1/6	25Gb/s,10Gb/s,1Gb/s
7	te-1/1/7	25Gb/s,10Gb/s,1Gb/s
8	te-1/1/8	25Gb/s,10Gb/s,1Gb/s
9	te-1/1/9	25Gb/s,10Gb/s,1Gb/s
10	te-1/1/10	25Gb/s,10Gb/s,1Gb/s
11	te-1/1/11	25Gb/s,10Gb/s,1Gb/s
12	te-1/1/12	25Gb/s,10Gb/s,1Gb/s
13	te-1/1/13	25Gb/s,10Gb/s,1Gb/s
14	te-1/1/14	25Gb/s,10Gb/s,1Gb/s
15	te-1/1/15	25Gb/s,10Gb/s,1Gb/s
16	te-1/1/16	25Gb/s,10Gb/s,1Gb/s
17	te-1/1/17	25Gb/s,10Gb/s,1Gb/s
18	te-1/1/18	25Gb/s,10Gb/s,1Gb/s
19	te-1/1/19	25Gb/s,10Gb/s,1Gb/s
20	te-1/1/20	25Gb/s,10Gb/s,1Gb/s
21	te-1/1/21	25Gb/s,10Gb/s,1Gb/s
22	te-1/1/22	25Gb/s,10Gb/s,1Gb/s
23	te-1/1/23	25Gb/s,10Gb/s,1Gb/s
24	te-1/1/24	25Gb/s,10Gb/s,1Gb/s
25	te-1/1/25	25Gb/s,10Gb/s,1Gb/s
26	te-1/1/26	25Gb/s,10Gb/s,1Gb/s
27	te-1/1/27	25Gb/s,10Gb/s,1Gb/s
28	te-1/1/28	25Gb/s,10Gb/s,1Gb/s
29	te-1/1/29	25Gb/s,10Gb/s,1Gb/s
30	te-1/1/30	25Gb/s,10Gb/s,1Gb/s
31	te-1/1/31	25Gb/s,10Gb/s,1Gb/s

32	te-1/1/32	25Gb/s,10Gb/s,1Gb/s

Z9100-ON Switch Port Name Description

Mapping between physical ports, interface names and interface support speed of Z9100-ON are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	xe-1/1/1	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
2	xe-1/1/2	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
3	xe-1/1/3	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
4	xe-1/1/4	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
5	xe-1/1/5	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
6	xe-1/1/6	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
7	xe-1/1/7	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
8	xe-1/1/8	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
9	xe-1/1/9	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
10	xe-1/1/10	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
11	xe-1/1/11	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
12	xe-1/1/12	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
13	xe-1/1/13	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
14	xe-1/1/14	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
15	xe-1/1/15	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
16	xe-1/1/16	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
17	xe-1/1/17	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
18	xe-1/1/18	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
19	xe-1/1/19	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
20	xe-1/1/20	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
21	xe-1/1/21	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
22	xe-1/1/22	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
23	xe-1/1/23	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
24	xe-1/1/24	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
25	xe-1/1/26	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
26	xe-1/1/27	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
27	xe-1/1/28	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
28	xe-1/1/29	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
29	xe-1/1/30	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
30	xe-1/1/31	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
31	xe-1/1/32	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
53	te-1/1/1	10Gb/s, 1Gb/s, 100Mb/s
54	te-1/1/2	10Gb/s, 1Gb/s, 100Mb/s

Z9264F-ON Switch Port Name Description

NOTE:
Only the ports on the first row of front panel are allowed to do breakout, that is, only ports 1, 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27, 29 and 31 can be split into four Gigabit Ethernet interfaces.

Mapping between physical ports, interface names and interface supported speed on Z9264F-ON are in the following table.

Physical Port Number	Interface Names	Interface Supported Speed
1	xe-1/1/1	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
2	xe-1/1/2	100Gb/s, 40Gb/s
3	xe-1/1/3	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
4	xe-1/1/4	100Gb/s, 40Gb/s
5	xe-1/1/5	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
6	xe-1/1/6	100Gb/s, 40Gb/s
7	xe-1/1/7	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
8	xe-1/1/8	100Gb/s, 40Gb/s
9	xe-1/1/9	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
10	xe-1/1/10	100Gb/s, 40Gb/s
11	xe-1/1/11	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
12	xe-1/1/12	100Gb/s, 40Gb/s
13	xe-1/1/13	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
14	xe-1/1/14	100Gb/s, 40Gb/s
15	xe-1/1/15	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
16	xe-1/1/16	100Gb/s, 40Gb/s
17	xe-1/1/17	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
18	xe-1/1/18	100Gb/s, 40Gb/s
19	xe-1/1/19	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
20	xe-1/1/20	100Gb/s, 40Gb/s
21	xe-1/1/21	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
22	xe-1/1/22	100Gb/s, 40Gb/s
23	xe-1/1/23	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
24	xe-1/1/24	100Gb/s, 40Gb/s
25	xe-1/1/25	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
26	xe-1/1/26	100Gb/s, 40Gb/s
27	xe-1/1/27	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
28	xe-1/1/28	100Gb/s, 40Gb/s
29	xe-1/1/29	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
30	xe-1/1/30	100Gb/s, 40Gb/s
31	xe-1/1/31	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
32	xe-1/1/32	100Gb/s, 40Gb/s
33	xe-1/1/33	100Gb/s, 40Gb/s

S4128F-ON Switch Port Name Description

Mapping between physical ports, interface names and interface support speed of S4128F-ON are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	te-1/1/1	10Gb/s, 1Gb/s
2	te-1/1/2	10Gb/s, 1Gb/s
3	te-1/1/3	10Gb/s, 1Gb/s
4	te-1/1/4	10Gb/s, 1Gb/s
5	te-1/1/5	10Gb/s, 1Gb/s
6	te-1/1/6	10Gb/s, 1Gb/s
7	te-1/1/7	10Gb/s, 1Gb/s
8	te-1/1/8	10Gb/s, 1Gb/s

30	te-1/1/30	10Gb/s, 1Gb/s

S4128T-ON Switch Port Name Description

Mapping between physical ports, interface names and interface support speed of S4128F-ON are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	te-1/1/1	10Gb/s, 1Gb/s, 100Mb/s
2	te-1/1/2	10Gb/s, 1Gb/s, 100Mb/s
3	te-1/1/3	10Gb/s, 1Gb/s, 100Mb/s
4	te-1/1/4	10Gb/s, 1Gb/s, 100Mb/s
5	te-1/1/5	10Gb/s, 1Gb/s, 100Mb/s
6	te-1/1/6	10Gb/s, 1Gb/s, 100Mb/s
7	te-1/1/7	10Gb/s, 1Gb/s, 100Mb/s
8	te-1/1/8	10Gb/s, 1Gb/s, 100Mb/s
9	te-1/1/9	10Gb/s, 1Gb/s, 100Mb/s
10	te-1/1/10	10Gb/s, 1Gb/s, 100Mb/s
11	te-1/1/11	10Gb/s, 1Gb/s, 100Mb/s
12	te-1/1/12	10Gb/s, 1Gb/s, 100Mb/s
13	te-1/1/13	10Gb/s, 1Gb/s, 100Mb/s
14	te-1/1/14	10Gb/s, 1Gb/s, 100Mb/s
15	te-1/1/15	10Gb/s, 1Gb/s, 100Mb/s
16	te-1/1/16	10Gb/s, 1Gb/s, 100Mb/s
17	te-1/1/17	10Gb/s, 1Gb/s, 100Mb/s
18	te-1/1/18	10Gb/s, 1Gb/s, 100Mb/s
19	te-1/1/19	10Gb/s, 1Gb/s, 100Mb/s
20	te-1/1/20	10Gb/s, 1Gb/s, 100Mb/s
21	te-1/1/21	10Gb/s, 1Gb/s, 100Mb/s
22	te-1/1/22	10Gb/s, 1Gb/s, 100Mb/s
23	te-1/1/23	10Gb/s, 1Gb/s, 100Mb/s
24	te-1/1/24	10Gb/s, 1Gb/s, 100Mb/s
25	xe-1/1/1	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
26	xe-1/1/2	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s

27	te-1/1/27	10Gb/s, 1Gb/s, 100Mb/s
28	te-1/1/28	10Gb/s, 1Gb/s, 100Mb/s
29	te-1/1/29	10Gb/s, 1Gb/s, 100Mb/s
30	te-1/1/30	10Gb/s, 1Gb/s, 100Mb/s

S4148F-ON Switch Port Name Description

NOTEs:

The uplink ports, with port numbers from 25 to 30, have two different uplink port modes 6x40G (default) and 4x100G.

- You need to change the port mode to 4x100G if you want to use 100G uplinks, please refer to following page with instructions to set up the port mode:

Configuring Port Mapping On S4148 Series Switch

- Ports with physical port number 27 & 28 are only available in the 6x40G mode and are not available in the 4x100G mode.

Mapping between physical ports, interface names and interface support speed of S4148F-ON are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	te-1/1/1	10Gb/s,1Gb/s
2	te-1/1/2	10Gb/s,1Gb/s
3	te-1/1/3	10Gb/s,1Gb/s
4	te-1/1/4	10Gb/s,1Gb/s
5	te-1/1/5	10Gb/s,1Gb/s
6	te-1/1/6	10Gb/s,1Gb/s
7	te-1/1/7	10Gb/s,1Gb/s
8	te-1/1/8	10Gb/s,1Gb/s
9	te-1/1/9	10Gb/s,1Gb/s
10	te-1/1/10	10Gb/s,1Gb/s

AS4630-54NPE Switch Port Name Description

NOTE:
Ports Te-1/1/1, Te-1/1/2, Te-1/1/3 and Te-1/1/4 are a group of ports, you should manually configure the port speed for these four ports by using the **set interface gigabit-ethernet speed** command before inserting an optical module. When configuring the rate, the supported port rates are 25 Gbit/s, 10 Gbit/s, and 1 Gbit/s. The four ports can be configured with the same port rate or different rate. When configured at different port rates, 10G and 1G can coexist, but 25G cannot coexist with other rates. The following table gives several cases of speed setting for this group of ports.

	te-1/1/1	te-1/1/2	te-1/1/3	te-1/1/4	Allowed or not Allowed
case #1	10 G	10G	10G	10G	✓
case #2	1G	1G	1G	1G	✓
case #3	25G	25G	25G	25G	✓
case #4	1G	10G	1G	10G	✓
case #5	25G	1G	25G	25G	**X**
case #6	25G	10G	25G	10G	**X**
case #7	25G	1G	10G	25G	**X**

Note: If the port rate is set to 25 Gbit/s, but a 10 Gbit/s optical module is inserted, the port cannot go up.

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Supported Speed
1	ge-1/1/1	2.5 Gb/s, 1 Gb/s, 100Mb/s
2	ge-1/1/2	2.5 Gb/s, 1 Gb/s, 100Mb/s
3	ge-1/1/3	2.5 Gb/s, 1 Gb/s, 100Mb/s
4	ge-1/1/4	2.5 Gb/s, 1 Gb/s, 100Mb/s
5	ge-1/1/5	2.5 Gb/s, 1 Gb/s, 100Mb/s
6	ge-1/1/6	2.5 Gb/s, 1 Gb/s, 100Mb/s
7	ge-1/1/7	2.5 Gb/s, 1 Gb/s, 100Mb/s
8	ge-1/1/8	2.5 Gb/s, 1 Gb/s, 100Mb/s
9	ge-1/1/9	2.5 Gb/s, 1 Gb/s, 100Mb/s
10	ge-1/1/10	2.5 Gb/s, 1 Gb/s, 100Mb/s
11	ge-1/1/11	2.5 Gb/s, 1 Gb/s, 100Mb/s
12	ge-1/1/12	2.5 Gb/s, 1 Gb/s, 100Mb/s
13	ge-1/1/13	2.5 Gb/s, 1 Gb/s, 100Mb/s
14	ge-1/1/14	2.5 Gb/s, 1 Gb/s, 100Mb/s
15	ge-1/1/15	2.5 Gb/s, 1 Gb/s, 100Mb/s
16	ge-1/1/16	2.5 Gb/s, 1 Gb/s, 100Mb/s
17	ge-1/1/17	2.5 Gb/s, 1 Gb/s, 100Mb/s
18	ge-1/1/18	2.5 Gb/s, 1 Gb/s, 100Mb/s
19	ge-1/1/19	2.5 Gb/s, 1 Gb/s, 100Mb/s
20	ge-1/1/20	2.5 Gb/s, 1 Gb/s, 100Mb/s
21	ge-1/1/21	2.5 Gb/s, 1 Gb/s, 100Mb/s
22	ge-1/1/22	2.5 Gb/s, 1 Gb/s, 100Mb/s
23	ge-1/1/23	2.5 Gb/s, 1 Gb/s, 100Mb/s
24	ge-1/1/24	2.5 Gb/s, 1 Gb/s, 100Mb/s
25	ge-1/1/25	2.5 Gb/s, 1 Gb/s, 100Mb/s
26	ge-1/1/26	2.5 Gb/s, 1 Gb/s, 100Mb/s

27	ge-1/1/27	2.5 Gb/s, 1 Gb/s, 100Mb/s
28	ge-1/1/28	2.5 Gb/s, 1 Gb/s, 100Mb/s
29	ge-1/1/29	2.5 Gb/s, 1 Gb/s, 100Mb/s
30	ge-1/1/30	2.5 Gb/s, 1 Gb/s, 100Mb/s
31	ge-1/1/31	2.5 Gb/s, 1 Gb/s, 100Mb/s
32	ge-1/1/32	2.5 Gb/s, 1 Gb/s, 100Mb/s
33	ge-1/1/33	2.5 Gb/s, 1 Gb/s, 100Mb/s
34	ge-1/1/34	2.5 Gb/s, 1 Gb/s, 100Mb/s
35	ge-1/1/35	2.5 Gb/s, 1 Gb/s, 100Mb/s
36	ge-1/1/36	2.5 Gb/s, 1 Gb/s, 100Mb/s
37	ge-1/1/37	10Gb/s, 5 Gb/s, 2.5 Gb/s, 1Gb/s, 100Mb/s

39	ge-1/1/39	10Gb/s, 5 Gb/s, 2.5 Gb/s, 1Gb/s, 100Mb/s
40	ge-1/1/40	10Gb/s, 5 Gb/s, 2.5 Gb/s, 1Gb/s, 100Mb/s
41	ge-1/1/41	10Gb/s, 5 Gb/s, 2.5 Gb/s, 1Gb/s, 100Mb/s
42	ge-1/1/42	10Gb/s, 5 Gb/s, 2.5 Gb/s, 1Gb/s, 100Mb/s
43	ge-1/1/43	10Gb/s, 5 Gb/s, 2.5 Gb/s, 1Gb/s, 100Mb/s
44	ge-1/1/44	10Gb/s, 5 Gb/s, 2.5 Gb/s, 1Gb/s, 100Mb/s
45	ge-1/1/45	10Gb/s, 5 Gb/s, 2.5 Gb/s, 1Gb/s, 100Mb/s
46	ge-1/1/46	10Gb/s, 5 Gb/s, 2.5 Gb/s, 1Gb/s, 100Mb/s
47	ge-1/1/47	10Gb/s, 5 Gb/s, 2.5 Gb/s, 1Gb/s, 100Mb/s
48	ge-1/1/48	10Gb/s, 5 Gb/s, 2.5 Gb/s, 1Gb/s, 100Mb/s
49	te-1/1/1	25Gb/s,10Gb/s,1Gb/s
50	te-1/1/2	25Gb/s,10Gb/s,1Gb/s
51	te-1/1/3	25Gb/s,10Gb/s,1Gb/s
52	te-1/1/4	25Gb/s,10Gb/s,1Gb/s
53	xe-1/1/1	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
54	xe-1/1/2	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s

AS4630-54PE Switch Port Name Description

NOTE:
Ports Te-1/1/1, Te-1/1/2, Te-1/1/3 and Te-1/1/4 are a group of ports, you should manually configure the port speed for these four ports by using the **set interface gigabit-ethernet speed** command before inserting an optical module. When configuring the rate, the supported port rates are 25 Gbit/s, 10 Gbit/s, and 1 Gbit/s. The four ports can be configured with the same port rate or different rate. When configured at different port rates, 10G and 1G can coexist, but 25G cannot coexist with other rates. The following table gives several cases of speed setting for this group of ports.

	te-1/1/1	te-1/1/2	te-1/1/3	te-1/1/4	Allowed or not Allowed
case #1	10 G	10G	10G	10G	✓
case #2	1G	1G	1G	1G	✓
case #3	25G	25G	25G	25G	✓
case #4	1G	10G	1G	10G	✓
case #5	25G	1G	25G	25G	**X**
case #6	25G	10G	25G	10G	**X**
case #7	25G	1G	10G	25G	**X**

Note: If the port rate is set to 25 Gbit/s, but a 10 Gbit/s optical module is inserted, the port cannot go up.

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Supported Speed
1	ge-1/1/1	1Gb/s, 100Mb/s, 10Mb/s
2	ge-1/1/2	1Gb/s, 100Mb/s, 10Mb/s
3	ge-1/1/3	1Gb/s, 100Mb/s, 10Mb/s
4	ge-1/1/4	1Gb/s, 100Mb/s, 10Mb/s
5	ge-1/1/5	1Gb/s, 100Mb/s, 10Mb/s
6	ge-1/1/6	1Gb/s, 100Mb/s, 10Mb/s
7	ge-1/1/7	1Gb/s, 100Mb/s, 10Mb/s
8	ge-1/1/8	1Gb/s, 100Mb/s, 10Mb/s
9	ge-1/1/9	1Gb/s, 100Mb/s, 10Mb/s
10	ge-1/1/10	1Gb/s, 100Mb/s, 10Mb/s

AS6812_32X Switch Port Name Description

NOTE:

Due to hardware limitations, ports xe-1/1/13, xe-1/1/14, xe-1/1/15, xe-1/1/16, xe-1/1/29, xe-1/1/30, xe-1/1/31 and xe-1/1/32 are not allowed to be split into four Gigabit Ethernet interfaces.

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	xe-1/1/1	40Gb/s, 4x10Gb/s, 4x1Gb/s
2	xe-1/1/2	40Gb/s, 4x10Gb/s, 4x1Gb/s
3	xe-1/1/3	40Gb/s, 4x10Gb/s, 4x1Gb/s
4	xe-1/1/4	40Gb/s, 4x10Gb/s, 4x1Gb/s
5	xe-1/1/5	40Gb/s, 4x10Gb/s, 4x1Gb/s
6	xe-1/1/6	40Gb/s, 4x10Gb/s, 4x1Gb/s
7	xe-1/1/7	40Gb/s, 4x10Gb/s, 4x1Gb/s
8	xe-1/1/8	40Gb/s, 4x10Gb/s, 4x1Gb/s
9	xe-1/1/9	40Gb/s, 4x10Gb/s, 4x1Gb/s
10	xe-1/1/10	40Gb/s, 4x10Gb/s, 4x1Gb/s
11	xe-1/1/11	40Gb/s, 4x10Gb/s, 4x1Gb/s
12	xe-1/1/12	40Gb/s, 4x10Gb/s, 4x1Gb/s
13	xe-1/1/13	40Gb/s
14	xe-1/1/14	40Gb/s
15	xe-1/1/15	40Gb/s
16	xe-1/1/16	40Gb/s
17	xe-1/1/17	40Gb/s, 4x10Gb/s, 4x1Gb/s
18	xe-1/1/18	40Gb/s, 4x10Gb/s, 4x1Gb/s
19	xe-1/1/19	40Gb/s, 4x10Gb/s, 4x1Gb/s
20	xe-1/1/20	40Gb/s, 4x10Gb/s, 4x1Gb/s
21	xe-1/1/21	40Gb/s, 4x10Gb/s, 4x1Gb/s
22	xe-1/1/22	40Gb/s, 4x10Gb/s, 4x1Gb/s
23	xe-1/1/23	40Gb/s, 4x10Gb/s, 4x1Gb/s
24	xe-1/1/24	40Gb/s, 4x10Gb/s, 4x1Gb/s
25	xe-1/1/25	40Gb/s, 4x10Gb/s, 4x1Gb/s
26	xe-1/1/26	40Gb/s, 4x10Gb/s, 4x1Gb/s
27	xe-1/1/27	40Gb/s, 4x10Gb/s, 4x1Gb/s
28	xe-1/1/28	40Gb/s, 4x10Gb/s, 4x1Gb/s
29	xe-1/1/29	40Gb/s
30	xe-1/1/30	40Gb/s
31	xe-1/1/31	40Gb/s
32	xe-1/1/32	40Gb/s

AS7312-54X/AS7312_54XS Switch Port Name Description

NOTE:
Follow the below precautions before using AS7312_54X/AS7312_54XS switch:

1. The first 48 ports are grouped, each four ports are grouped as shown in the following table.

Groups of ports	port1- port4	port5- port8	port9- port12	port13- port16	port17- port20	port21- port24
	port25- port28	port29- port32	port33- port36	port37- port40	port41- port44	port45- port48

2. When configuring the port rate, the supported rates are 25 Gbit/s, 10 Gbit/s, and 1 Gbit/s. The four ports in the same group can be configured with the same port rate or different rate. When configured at different port rates, 10G and 1G can coexist, but 25G cannot coexist with other rates. The following table gives several cases of speed setting for the group of ports.

	te-1/1/21	**te-1/1/22**	**te-1/1/23**	**te-1/1/24**	**Allowed or not allowed**
case #1	10 G	10G	10G	10G	✓
case #2	1G	1G	1G	1G	✓
case #3	25G	25G	25G	25G	✓
case #4	1G	10G	1G	10G	✓
case #5	25G	1G	25G	25G	**X**
case #6	25G	10G	25G	10G	**X**
case #7	25G	1G	10G	25G	**X**

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	te-1/1/1	25Gb/s,10Gb/s,1Gb/s
2	te-1/1/2	25Gb/s,10Gb/s,1Gb/s
3	te-1/1/3	25Gb/s,10Gb/s,1Gb/s
4	te-1/1/4	25Gb/s,10Gb/s,1Gb/s
5	te-1/1/5	25Gb/s,10Gb/s,1Gb/s
6	te-1/1/6	25Gb/s,10Gb/s,1Gb/s
7	te-1/1/7	25Gb/s,10Gb/s,1Gb/s
8	te-1/1/8	25Gb/s,10Gb/s,1Gb/s
9	te-1/1/9	25Gb/s,10Gb/s,1Gb/s
10	te-1/1/10	25Gb/s,10Gb/s,1Gb/s
11	te-1/1/11	25Gb/s,10Gb/s,1Gb/s
12	te-1/1/12	25Gb/s,10Gb/s,1Gb/s
13	te-1/1/13	25Gb/s,10Gb/s,1Gb/s
14	te-1/1/14	25Gb/s,10Gb/s,1Gb/s
15	te-1/1/15	25Gb/s,10Gb/s,1Gb/s
16	te-1/1/16	25Gb/s,10Gb/s,1Gb/s
17	te-1/1/17	25Gb/s,10Gb/s,1Gb/s
18	te-1/1/18	25Gb/s,10Gb/s,1Gb/s
19	te-1/1/19	25Gb/s,10Gb/s,1Gb/s
20	te-1/1/20	25Gb/s,10Gb/s,1Gb/s
21	te-1/1/21	25Gb/s,10Gb/s,1Gb/s
22	te-1/1/22	25Gb/s,10Gb/s,1Gb/s
23	te-1/1/23	25Gb/s,10Gb/s,1Gb/s

24	te-1/1/24	25Gb/s,10Gb/s,1Gb/s
25	te-1/1/25	25Gb/s,10Gb/s,1Gb/s
26	te-1/1/26	25Gb/s,10Gb/s,1Gb/s
27	te-1/1/27	25Gb/s,10Gb/s,1Gb/s
28	te-1/1/28	25Gb/s,10Gb/s,1Gb/s
29	te-1/1/29	25Gb/s,10Gb/s,1Gb/s
30	te-1/1/30	25Gb/s,10Gb/s,1Gb/s
31	te-1/1/31	25Gb/s,10Gb/s,1Gb/s
32	te-1/1/32	25Gb/s,10Gb/s,1Gb/s
33	te-1/1/33	25Gb/s,10Gb/s,1Gb/s
34	te-1/1/34	25Gb/s,10Gb/s,1Gb/s
35	te-1/1/35	25Gb/s,10Gb/s,1Gb/s
36	te-1/1/36	25Gb/s,10Gb/s,1Gb/s
37	te-1/1/37	25Gb/s,10Gb/s,1Gb/s
38	te-1/1/38	25Gb/s,10Gb/s,1Gb/s
39	te-1/1/39	25Gb/s,10Gb/s,1Gb/s
40	te-1/1/40	25Gb/s,10Gb/s,1Gb/s
41	te-1/1/41	25Gb/s,10Gb/s,1Gb/s
42	te-1/1/42	25Gb/s,10Gb/s,1Gb/s
43	te-1/1/43	25Gb/s,10Gb/s,1Gb/s
44	te-1/1/44	25Gb/s,10Gb/s,1Gb/s
45	te-1/1/45	25Gb/s,10Gb/s,1Gb/s
46	te-1/1/46	25Gb/s,10Gb/s,1Gb/s
47	te-1/1/47	25Gb/s,10Gb/s,1Gb/s
48	te-1/1/48	25Gb/s,10Gb/s,1Gb/s
49	xe-1/1/1	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
50	xe-1/1/2	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
51	xe-1/1/3	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s

53	xe-1/1/5	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
54	xe-1/1/6	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s

AS7326-56X Switch Port Name Description

NOTE:

1. The first 48 ports are grouped as shown in the following table, four ports form a group.

Group	Ports
1	Port1, Port2, Port3, Port6
2	Port4, Port5, Port7, Port9
3	Port8, Port10, Port11, Port12
4	Port13, Port14, Port15, Port18
5	Port16, Port17, Port19, Port21
6	Port20, Port22, Port23, Port24
7	Port25, Port26, Port27, Port30
8	Port28, Port29, Port31, Port33
9	Port32, Port34, Port35, Port36
10	Port37, Port38, Port39, Port42
11	Port40, Port41, Port43, Port45
12	Port44, Port46, Port47, Port48

2. For the first 48 ports, the transmission rates of optical modules inserted in the ports of a group needs to be the same, and the configured port speed must be the same too, that is to say,

- when inserting an optical module to the switch port, the transmission rates of the optical modules should be the same in a group.
- you should manually configure the port speed by using the **set interface gigabit-ethernet speed** command before inserting an optical module, and the port speed of the four ports in the same group should be configured together and with the same value.

3. The last two ports are 10G-Base-KR ports which can be configured as two 10G SFP+ ports on the front panel or two 10G-KR ports linked to CPU. By default, 10G-Base-KR ports are disabled. For details please refer to document 10G-Base-KR Interface Configuration.

4. On AS7326-56X switch, when the 10G-Base-KR ports are enabled as either front panel ports or management ports, xe-1/1/8 port is not allowed to be split into four Gigabit Ethernet interfaces.

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	te-1/1/1	25Gb/s,10Gb/s,1Gb/s
2	te-1/1/2	25Gb/s,10Gb/s,1Gb/s
3	te-1/1/3	25Gb/s,10Gb/s,1Gb/s
4	te-1/1/4	25Gb/s,10Gb/s,1Gb/s
5	te-1/1/5	25Gb/s,10Gb/s,1Gb/s
6	te-1/1/6	25Gb/s,10Gb/s,1Gb/s
7	te-1/1/7	25Gb/s,10Gb/s,1Gb/s
8	te-1/1/8	25Gb/s,10Gb/s,1Gb/s
9	te-1/1/9	25Gb/s,10Gb/s,1Gb/s

	te-1/1/50(Front Panel Port)	10Gb/s,1Gb/s

AS7726-32X Switch Port Name Description

NOTE:

- The last two ports are 10G-Base-KR ports which can be configured as two 10G SFP+ ports on the front panel or two 10G-KR ports linked to CPU. By default, 10G-Base-KR ports are disabled. For details please refer to document 10G-Base-KR Interface Configuration.
- On AS7726-32X switch, when the 10G-Base-KR ports are enabled as either front panel ports or management ports, xe-1/1/32 port is not allowed to be split into four Gigabit Ethernet interfaces.

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	xe-1/1/1	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
2	xe-1/1/2	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
3	xe-1/1/3	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
4	xe-1/1/4	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
5	xe-1/1/5	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
6	xe-1/1/6	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
7	xe-1/1/7	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
8	xe-1/1/8	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
9	xe-1/1/9	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
10	xe-1/1/10	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
11	xe-1/1/11	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
12	xe-1/1/12	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
13	xe-1/1/13	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
14	xe-1/1/14	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
15	xe-1/1/15	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
16	xe-1/1/16	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
17	xe-1/1/17	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
18	xe-1/1/18	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
19	xe-1/1/19	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
20	xe-1/1/20	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
21	xe-1/1/21	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
22	xe-1/1/22	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
23	xe-1/1/23	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
24	xe-1/1/24	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
25	xe-1/1/25	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
26	xe-1/1/26	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
27	xe-1/1/27	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
28	xe-1/1/28	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
29	xe-1/1/29	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
30	xe-1/1/30	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
31	xe-1/1/31	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
32	xe-1/1/32	100Gb/s, 40Gb/s
33	me-1/1/1(Management Port)	auto
	te-1/1/1(Front Panel Port)	10Gb/s,1Gb/s
34	me-1/1/2(Management Port)	auto

	te-1/1/2(Front Panel Port)	10Gb/s,1Gb/s

AS7816-64X Switch Port Name Description

NOTE:
Only the ports on the first row of front panel are allowed to do breakout, that is, only ports 1, 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27, 29 and 31 can be split into four Gigabit Ethernet interfaces.

Mapping between physical ports, interface names and interface supported speed on AS7816-64X are in the following table.

Physical Port Number	Interface Names	Interface Supported Speed
1	xe-1/1/1	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
2	xe-1/1/2	100Gb/s, 40Gb/s
3	xe-1/1/3	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
4	xe-1/1/4	100Gb/s, 40Gb/s
5	xe-1/1/5	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
6	xe-1/1/6	100Gb/s, 40Gb/s
7	xe-1/1/7	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
8	xe-1/1/8	100Gb/s, 40Gb/s
9	xe-1/1/9	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
10	xe-1/1/10	100Gb/s, 40Gb/s
11	xe-1/1/11	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
12	xe-1/1/12	100Gb/s, 40Gb/s
13	xe-1/1/13	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
14	xe-1/1/14	100Gb/s, 40Gb/s
15	xe-1/1/15	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
16	xe-1/1/16	100Gb/s, 40Gb/s
17	xe-1/1/17	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
18	xe-1/1/18	100Gb/s, 40Gb/s
19	xe-1/1/19	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
20	xe-1/1/20	100Gb/s, 40Gb/s
21	xe-1/1/21	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
22	xe-1/1/22	100Gb/s, 40Gb/s
23	xe-1/1/23	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
24	xe-1/1/24	100Gb/s, 40Gb/s
25	xe-1/1/25	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
26	xe-1/1/26	100Gb/s, 40Gb/s
27	xe-1/1/27	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
28	xe-1/1/28	100Gb/s, 40Gb/s
29	xe-1/1/29	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
30	xe-1/1/30	100Gb/s, 40Gb/s
31	xe-1/1/31	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
32	xe-1/1/32	100Gb/s, 40Gb/s
33	xe-1/1/33	100Gb/s, 40Gb/s
34	xe-1/1/34	100Gb/s, 40Gb/s
35	xe-1/1/35	100Gb/s, 40Gb/s
36	xe-1/1/36	100Gb/s, 40Gb/s

37	xe-1/1/37	100Gb/s, 40Gb/s
38	xe-1/1/38	100Gb/s, 40Gb/s
39	xe-1/1/39	100Gb/s, 40Gb/s
40	xe-1/1/40	100Gb/s, 40Gb/s
41	xe-1/1/41	100Gb/s, 40Gb/s
42	xe-1/1/42	100Gb/s, 40Gb/s
43	xe-1/1/43	100Gb/s, 40Gb/s
44	xe-1/1/44	100Gb/s, 40Gb/s
45	xe-1/1/45	100Gb/s, 40Gb/s

64	xe-1/1/64	100Gb/s, 40Gb/s

AS9716-32D Switch Port Name Description

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	xe-1/1/1	400Gb/s, 100Gb/s, 4 x 100Gb/s, 2 x 200Gb/s
2	xe-1/1/2	400Gb/s, 100Gb/s, 4 x 100Gb/s, 2 x 200Gb/s
3	xe-1/1/3	400Gb/s, 100Gb/s, 4 x 100Gb/s, 2 x 200Gb/s
4	xe-1/1/4	400Gb/s, 100Gb/s, 4 x 100Gb/s, 2 x 200Gb/s
5	xe-1/1/5	400Gb/s, 100Gb/s, 4 x 100Gb/s, 2 x 200Gb/s
6	xe-1/1/6	400Gb/s, 100Gb/s, 4 x 100Gb/s, 2 x 200Gb/s
7	xe-1/1/7	400Gb/s, 100Gb/s, 4 x 100Gb/s, 2 x 200Gb/s
8	xe-1/1/8	400Gb/s, 100Gb/s, 4 x 100Gb/s, 2 x 200Gb/s
9	xe-1/1/9	400Gb/s, 100Gb/s, 4 x 100Gb/s, 2 x 200Gb/s
10	xe-1/1/10	400Gb/s, 100Gb/s, 4 x 100Gb/s, 2 x 200Gb/s
11	xe-1/1/11	400Gb/s, 100Gb/s, 4 x 100Gb/s, 2 x 200Gb/s
12	xe-1/1/12	400Gb/s, 100Gb/s, 4 x 100Gb/s, 2 x 200Gb/s
13	xe-1/1/13	400Gb/s, 100Gb/s, 4 x 100Gb/s, 2 x 200Gb/s
14	xe-1/1/14	400Gb/s, 100Gb/s, 4 x 100Gb/s, 2 x 200Gb/s
15	xe-1/1/15	400Gb/s, 100Gb/s, 4 x 100Gb/s, 2 x 200Gb/s
16	xe-1/1/16	400Gb/s, 100Gb/s, 4 x 100Gb/s, 2 x 200Gb/s
17	xe-1/1/17	400Gb/s, 100Gb/s, 4 x 100Gb/s, 2 x 200Gb/s

18	xe-1/1/18	400Gb/s, 100Gb/s, 4 x 100Gb/s, 2 x 200Gb/s
19	xe-1/1/19	400Gb/s, 100Gb/s, 4 x 100Gb/s, 2 x 200Gb/s
20	xe-1/1/20	400Gb/s, 100Gb/s, 4 x 100Gb/s, 2 x 200Gb/s
21	xe-1/1/21	400Gb/s, 100Gb/s, 4 x 100Gb/s, 2 x 200Gb/s
22	xe-1/1/22	400Gb/s, 100Gb/s, 4 x 100Gb/s, 2 x 200Gb/s
23	xe-1/1/23	400Gb/s, 100Gb/s, 4 x 100Gb/s, 2 x 200Gb/s
24	xe-1/1/24	400Gb/s, 100Gb/s, 4 x 100Gb/s, 2 x 200Gb/s
25	xe-1/1/25	400Gb/s, 100Gb/s, 4 x 100Gb/s, 2 x 200Gb/s
26	xe-1/1/26	400Gb/s, 100Gb/s, 4 x 100Gb/s, 2 x 200Gb/s
27	xe-1/1/27	400Gb/s, 100Gb/s, 4 x 100Gb/s, 2 x 200Gb/s

AS4610_30T/AS4610_30P Switch Port Name Description

Mapping between physical ports, interface names and interface support speeds on ACCTON_AS4610_30T/ACCTON_AS4610_30P are displayed in the following table.

Physical Port Number	Interface Name In Normal Mode	Port Support Speed
1	ge-1/1/1	1Gb/s,100Mb/s and 10Mb/s
2	ge-1/1/2	1Gb/s,100Mb/s and 10Mb/s
3	ge-1/1/3	1Gb/s,100Mb/s and 10Mb/s
4	ge-1/1/4	1Gb/s,100Mb/s and 10Mb/s
5	ge-1/1/5	1Gb/s,100Mb/s and 10Mb/s
6	ge-1/1/6	1Gb/s,100Mb/s and 10Mb/s
7	ge-1/1/7	1Gb/s,100Mb/s and 10Mb/s
8	ge-1/1/8	1Gb/s,100Mb/s and 10Mb/s
9	ge-1/1/9	1Gb/s,100Mb/s and 10Mb/s
10	ge-1/1/10	1Gb/s,100Mb/s and 10Mb/s
11	ge-1/1/11	1Gb/s,100Mb/s and 10Mb/s
12	ge-1/1/12	1Gb/s,100Mb/s and 10Mb/s
13	ge-1/1/13	1Gb/s,100Mb/s and 10Mb/s
14	ge-1/1/14	1Gb/s,100Mb/s and 10Mb/s
15	ge-1/1/15	1Gb/s,100Mb/s and 10Mb/s
16	ge-1/1/16	1Gb/s,100Mb/s and 10Mb/s
17	ge-1/1/17	1Gb/s,100Mb/s and 10Mb/s
18	ge-1/1/18	1Gb/s,100Mb/s and 10Mb/s
19	ge-1/1/19	1Gb/s,100Mb/s and 10Mb/s
20	ge-1/1/20	1Gb/s,100Mb/s and 10Mb/s
21	ge-1/1/21	1Gb/s,100Mb/s and 10Mb/s
22	ge-1/1/22	1Gb/s,100Mb/s and 10Mb/s
23	ge-1/1/23	1Gb/s,100Mb/s and 10Mb/s
24	ge-1/1/24	1Gb/s,100Mb/s and 10Mb/s

25	te-1/1/1	10Gb/s and 1Gb/s
26	te-1/1/2	10Gb/s and 1Gb/s
27	te-1/1/3	10Gb/s and 1Gb/s
28	te-1/1/4	10Gb/s and 1Gb/s
29	te-1/1/5	20Gb/s
30	te-1/1/6	20Gb/s

NOTE:

Ports te-1/1/5 and te-1/1/6 cannot support 20G/s at this time.

.

AS4610_54T/AS4610_54P Switch Port Name Description

Mapping between physical ports, interface names and interface support speeds on AS4610_54T/AS4610_54P are displayed in the following table.

Physical Port Number	Interface Name	Port Support Speed
1	ge-1/1/1	1Gb/s,100Mb/s and 10Mb/s
2	ge-1/1/2	1Gb/s,100Mb/s and 10Mb/s
3	ge-1/1/3	1Gb/s,100Mb/s and 10Mb/s
4	ge-1/1/4	1Gb/s,100Mb/s and 10Mb/s
5	ge-1/1/5	1Gb/s,100Mb/s and 10Mb/s
6	ge-1/1/6	1Gb/s,100Mb/s and 10Mb/s
7	ge-1/1/7	1Gb/s,100Mb/s and 10Mb/s
8	ge-1/1/8	1Gb/s,100Mb/s and 10Mb/s
9	ge-1/1/9	1Gb/s,100Mb/s and 10Mb/s
10	ge-1/1/10	1Gb/s,100Mb/s and 10Mb/s
11	ge-1/1/11	1Gb/s,100Mb/s and 10Mb/s
12	ge-1/1/12	1Gb/s,100Mb/s and 10Mb/s
13	ge-1/1/13	1Gb/s,100Mb/s and 10Mb/s
14	ge-1/1/14	1Gb/s,100Mb/s and 10Mb/s
15	ge-1/1/15	1Gb/s,100Mb/s and 10Mb/s
16	ge-1/1/16	1Gb/s,100Mb/s and 10Mb/s
17	ge-1/1/17	1Gb/s,100Mb/s and 10Mb/s
18	ge-1/1/18	1Gb/s,100Mb/s and 10Mb/s
19	ge-1/1/19	1Gb/s,100Mb/s and 10Mb/s
20	ge-1/1/20	1Gb/s,100Mb/s and 10Mb/s
21	ge-1/1/21	1Gb/s,100Mb/s and 10Mb/s
22	ge-1/1/22	1Gb/s,100Mb/s and 10Mb/s
23	ge-1/1/23	1Gb/s,100Mb/s and 10Mb/s
24	ge-1/1/24	1Gb/s,100Mb/s and 10Mb/s

25	ge-1/1/25	1Gb/s,100Mb/s and 10Mb/s
26	ge-1/1/26	1Gb/s,100Mb/s and 10Mb/s
27	ge-1/1/27	1Gb/s,100Mb/s and 10Mb/s
28	ge-1/1/28	1Gb/s,100Mb/s and 10Mb/s
29	ge-1/1/29	1Gb/s,100Mb/s and 10Mb/s
30	ge-1/1/30	1Gb/s,100Mb/s and 10Mb/s
31	ge-1/1/31	1Gb/s,100Mb/s and 10Mb/s
32	ge-1/1/32	1Gb/s,100Mb/s and 10Mb/s
33	ge-1/1/33	1Gb/s,100Mb/s and 10Mb/s
34	ge-1/1/34	1Gb/s,100Mb/s and 10Mb/s
35	ge-1/1/35	1Gb/s,100Mb/s and 10Mb/s
36	ge-1/1/36	1Gb/s,100Mb/s and 10Mb/s
37	ge-1/1/37	1Gb/s,100Mb/s and 10Mb/s
38	ge-1/1/38	1Gb/s,100Mb/s and 10Mb/s
39	ge-1/1/39	1Gb/s,100Mb/s and 10Mb/s
40	ge-1/1/40	1Gb/s,100Mb/s and 10Mb/s
41	ge-1/1/41	1Gb/s,100Mb/s and 10Mb/s
42	ge-1/1/42	1Gb/s,100Mb/s and 10Mb/s
43	ge-1/1/43	1Gb/s,100Mb/s and 10Mb/s
44	ge-1/1/44	1Gb/s,100Mb/s and 10Mb/s
45	ge-1/1/45	1Gb/s,100Mb/s and 10Mb/s
46	ge-1/1/46	1Gb/s,100Mb/s and 10Mb/s
47	ge-1/1/47	1Gb/s,100Mb/s and 10Mb/s
48	ge-1/1/48	1Gb/s,100Mb/s and 10Mb/s
49	te-1/1/1	10Gb/s and 1Gb/s
50	te-1/1/2	10Gb/s and 1Gb/s
51	te-1/1/3	10Gb/s and 1Gb/s
52	te-1/1/4	10Gb/s and 1Gb/s
53	te-1/1/5	20Gb/s
54	te-1/1/6	20Gb/s

Note

Ports te-1/1/5 and te-1/1/6 cannot support 20G/s at this time.

AS5712_54X Switch Port Name Description

Mapping between physical ports, interface names and interface support speed of AS5712_54X are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	te-1/1/1	10Gb/s, 1Gb/s
2	te-1/1/2	10Gb/s, 1Gb/s
3	te-1/1/3	10Gb/s, 1Gb/s
4	te-1/1/4	10Gb/s, 1Gb/s
5	te-1/1/5	10Gb/s, 1Gb/s
6	te-1/1/6	10Gb/s, 1Gb/s
7	te-1/1/7	10Gb/s, 1Gb/s
8	te-1/1/8	10Gb/s, 1Gb/s
9	te-1/1/9	10Gb/s, 1Gb/s
10	te-1/1/10	10Gb/s, 1Gb/s
11	te-1/1/11	10Gb/s, 1Gb/s
12	te-1/1/12	10Gb/s, 1Gb/s
13	te-1/1/13	10Gb/s, 1Gb/s
14	te-1/1/14	10Gb/s, 1Gb/s
15	te-1/1/15	10Gb/s, 1Gb/s
16	te-1/1/16	10Gb/s, 1Gb/s
17	te-1/1/17	10Gb/s, 1Gb/s
18	te-1/1/18	10Gb/s, 1Gb/s
19	te-1/1/19	10Gb/s, 1Gb/s
20	te-1/1/20	10Gb/s, 1Gb/s
21	te-1/1/21	10Gb/s, 1Gb/s
22	te-1/1/22	10Gb/s, 1Gb/s
23	te-1/1/23	10Gb/s, 1Gb/s
24	te-1/1/24	10Gb/s, 1Gb/s
25	te-1/1/25	10Gb/s, 1Gb/s
26	te-1/1/26	10Gb/s, 1Gb/s

27	te-1/1/27	10Gb/s, 1Gb/s
28	te-1/1/28	10Gb/s, 1Gb/s
29	te-1/1/29	10Gb/s, 1Gb/s
30	te-1/1/30	10Gb/s, 1Gb/s
31	te-1/1/31	10Gb/s, 1Gb/s
32	te-1/1/32	10Gb/s, 1Gb/s
33	te-1/1/33	10Gb/s, 1Gb/s
34	te-1/1/34	10Gb/s, 1Gb/s
35	te-1/1/35	10Gb/s, 1Gb/s
36	te-1/1/36	10Gb/s, 1Gb/s
37	te-1/1/37	10Gb/s, 1Gb/s
38	te-1/1/38	10Gb/s, 1Gb/s
39	te-1/1/39	10Gb/s, 1Gb/s
40	te-1/1/40	10Gb/s, 1Gb/s
41	te-1/1/41	10Gb/s, 1Gb/s
42	te-1/1/42	10Gb/s, 1Gb/s
43	te-1/1/43	10Gb/s, 1Gb/s
44	te-1/1/44	10Gb/s, 1Gb/s
45	te-1/1/45	10Gb/s, 1Gb/s
46	te-1/1/46	10Gb/s, 1Gb/s
47	te-1/1/47	10Gb/s, 1Gb/s
48	te-1/1/48	10Gb/s, 1Gb/s
49	xe-1/1/1	40Gb/s, 4x10Gb/s, 4x1Gb/s
50	xe-1/1/2	40Gb/s, 4x10Gb/s, 4x1Gb/s
51	xe-1/1/3	40Gb/s, 4x10Gb/s, 4x1Gb/s
52	xe-1/1/4	40Gb/s, 4x10Gb/s, 4x1Gb/s
53	xe-1/1/5	40Gb/s, 4x10Gb/s, 4x1Gb/s
54	xe-1/1/6	40Gb/s, 4x10Gb/s, 4x1Gb/s

AS5835_54X/AS5835_54T Switch Port Name Description

NOTE:

Due to hardware limitations, only ports xe-1/1/1 and xe-1/1/4 support to be split into four Gigabit Ethernet interfaces, other ports are not supported to be split.

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	te-1/1/1	10Gb/s, 1Gb/s
2	te-1/1/2	10Gb/s, 1Gb/s
3	te-1/1/3	10Gb/s, 1Gb/s
4	te-1/1/4	10Gb/s, 1Gb/s
5	te-1/1/5	10Gb/s, 1Gb/s
6	te-1/1/6	10Gb/s, 1Gb/s
7	te-1/1/7	10Gb/s, 1Gb/s
8	te-1/1/8	10Gb/s, 1Gb/s
9	te-1/1/9	10Gb/s, 1Gb/s
10	te-1/1/10	10Gb/s, 1Gb/s
11	te-1/1/11	10Gb/s, 1Gb/s
12	te-1/1/12	10Gb/s, 1Gb/s
13	te-1/1/13	10Gb/s, 1Gb/s
14	te-1/1/14	10Gb/s, 1Gb/s
15	te-1/1/15	10Gb/s, 1Gb/s
16	te-1/1/16	10Gb/s, 1Gb/s
17	te-1/1/17	10Gb/s, 1Gb/s
18	te-1/1/18	10Gb/s, 1Gb/s
19	te-1/1/19	10Gb/s, 1Gb/s
20	te-1/1/20	10Gb/s, 1Gb/s
21	te-1/1/21	10Gb/s, 1Gb/s
22	te-1/1/22	10Gb/s, 1Gb/s
23	te-1/1/23	10Gb/s, 1Gb/s
24	te-1/1/24	10Gb/s, 1Gb/s

25	te-1/1/25	10Gb/s, 1Gb/s
26	te-1/1/26	10Gb/s, 1Gb/s
27	te-1/1/27	10Gb/s, 1Gb/s
28	te-1/1/28	10Gb/s, 1Gb/s
29	te-1/1/29	10Gb/s, 1Gb/s
30	te-1/1/30	10Gb/s, 1Gb/s
31	te-1/1/31	10Gb/s, 1Gb/s
32	te-1/1/32	10Gb/s, 1Gb/s
33	te-1/1/33	10Gb/s, 1Gb/s
34	te-1/1/34	10Gb/s, 1Gb/s
35	te-1/1/35	10Gb/s, 1Gb/s
36	te-1/1/36	10Gb/s, 1Gb/s
37	te-1/1/37	10Gb/s, 1Gb/s
38	te-1/1/38	10Gb/s, 1Gb/s
39	te-1/1/39	10Gb/s, 1Gb/s
40	te-1/1/40	10Gb/s, 1Gb/s
41	te-1/1/41	10Gb/s, 1Gb/s
42	te-1/1/42	10Gb/s, 1Gb/s
43	te-1/1/43	10Gb/s, 1Gb/s
44	te-1/1/44	10Gb/s, 1Gb/s
45	te-1/1/45	10Gb/s, 1Gb/s
46	te-1/1/46	10Gb/s, 1Gb/s
47	te-1/1/47	10Gb/s, 1Gb/s
48	te-1/1/48	10Gb/s, 1Gb/s
49	xe-1/1/1	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
50	xe-1/1/2	100Gb/s, 40Gb/s
51	xe-1/1/3	100Gb/s, 40Gb/s
52	xe-1/1/4	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
53	xe-1/1/5	100Gb/s, 40Gb/s
54	xe-1/1/6	100Gb/s, 40Gb/s

AS7712_32X Switch Port Name Description

Mapping between physical ports, interface names and interface support speed on AS7712_32X are shown in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	xe-1/1/1	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
2	xe-1/1/2	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
3	xe-1/1/3	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
4	xe-1/1/4	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
5	xe-1/1/5	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
6	xe-1/1/6	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
7	xe-1/1/7	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
8	xe-1/1/8	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
9	xe-1/1/9	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
10	xe-1/1/10	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
11	xe-1/1/11	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
12	xe-1/1/12	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
13	xe-1/1/13	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
14	xe-1/1/14	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
15	xe-1/1/15	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
16	xe-1/1/16	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
17	xe-1/1/17	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
18	xe-1/1/18	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
19	xe-1/1/19	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
20	xe-1/1/20	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
21	xe-1/1/21	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
22	xe-1/1/22	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
23	xe-1/1/23	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
24	xe-1/1/24	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
25	xe-1/1/25	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
26	xe-1/1/26	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s

27	xe-1/1/27	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
28	xe-1/1/28	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
29	xe-1/1/29	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
30	xe-1/1/30	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
31	xe-1/1/31	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
32	xe-1/1/32	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s

Delta/Agema Switch Port Name Description

- AG5648V1 Switch Port Name Description
- AG7648 Switch Port Name Description
- AG9032v1 Switch Port Name Description

AG5648V1 Switch Port Name Description

NOTE:
Follow the below precautions before using AG5648 switch:

1. The first 48 ports are grouped, each four ports are grouped as shown in the following table.

Groups of ports	port1- port4	port5- port8	port9- port12	port13- port16	port17- port20	port21- port24
	port25- port28	port29- port32	port33- port36	port37- port40	port41- port44	port45- port48

2. When configuring the port rate, the supported rates are 25 Gbit/s, 10 Gbit/s, and 1 Gbit/s. The four ports in the same group can be configured with the same port rate or different rate. When configured at different port rates, 10G and 1G can coexist, but 25G cannot coexist with other rates. The following table gives several cases of speed setting for the group of ports.

	te-1/1/21	**te-1/1/22**	**te-1/1/23**	**te-1/1/24**	**Allowed or not allowed**
case #1	10 G	10G	10G	10G	✓
case #2	1G	1G	1G	1G	✓
case #3	25G	25G	25G	25G	✓

46	te-1/1/46	10Gb/s, 1Gb/s
47	te-1/1/47	10Gb/s, 1Gb/s
48	te-1/1/48	10Gb/s, 1Gb/s
49	xe-1/1/1	40Gb/s, 4x10Gb/s, 4x1Gb/s
50	xe-1/1/2	40Gb/s, 4x10Gb/s, 4x1Gb/s
51	xe-1/1/3	40Gb/s, 4x10Gb/s, 4x1Gb/s
52	xe-1/1/4	40Gb/s, 4x10Gb/s, 4x1Gb/s
53	xe-1/1/5	40Gb/s, 4x10Gb/s, 4x1Gb/s
54	xe-1/1/6	40Gb/s, 4x10Gb/s, 4x1Gb/s

AG9032v1 Switch Port Name Description

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	xe-1/1/1	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
2	xe-1/1/2	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
3	xe-1/1/3	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
4	xe-1/1/4	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
5	xe-1/1/5	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
6	xe-1/1/6	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
7	xe-1/1/7	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
8	xe-1/1/8	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
9	xe-1/1/9	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
10	xe-1/1/10	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
11	xe-1/1/11	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
12	xe-1/1/12	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
13	xe-1/1/13	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
14	xe-1/1/14	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
15	xe-1/1/15	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
16	xe-1/1/16	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
17	xe-1/1/17	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
18	xe-1/1/18	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
19	xe-1/1/19	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
20	xe-1/1/20	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
21	xe-1/1/21	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
22	xe-1/1/22	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
23	xe-1/1/23	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
24	xe-1/1/24	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
25	xe-1/1/25	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
26	xe-1/1/26	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
27	xe-1/1/27	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
28	xe-1/1/28	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
29	xe-1/1/29	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
30	xe-1/1/30	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
31	xe-1/1/31	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
32	xe-1/1/32	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s

N5850-48S6Q Switch Port Name Description

Mapping between physical ports, interface names and interface support speed of N5850-48S6Q are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	te-1/1/1	10Gb/s, 1Gb/s
2	te-1/1/2	10Gb/s, 1Gb/s
3	te-1/1/3	10Gb/s, 1Gb/s
4	te-1/1/4	10Gb/s, 1Gb/s
5	te-1/1/5	10Gb/s, 1Gb/s
6	te-1/1/6	10Gb/s, 1Gb/s
7	te-1/1/7	10Gb/s, 1Gb/s
8	te-1/1/8	10Gb/s, 1Gb/s
9	te-1/1/9	10Gb/s, 1Gb/s
10	te-1/1/10	10Gb/s, 1Gb/s
11	te-1/1/11	10Gb/s, 1Gb/s
12	te-1/1/12	10Gb/s, 1Gb/s
13	te-1/1/13	10Gb/s, 1Gb/s
14	te-1/1/14	10Gb/s, 1Gb/s
15	te-1/1/15	10Gb/s, 1Gb/s
16	te-1/1/16	10Gb/s, 1Gb/s
17	te-1/1/17	10Gb/s, 1Gb/s
18	te-1/1/18	10Gb/s, 1Gb/s
19	te-1/1/19	10Gb/s, 1Gb/s
20	te-1/1/20	10Gb/s, 1Gb/s
21	te-1/1/21	10Gb/s, 1Gb/s
22	te-1/1/22	10Gb/s, 1Gb/s
23	te-1/1/23	10Gb/s, 1Gb/s
24	te-1/1/24	10Gb/s, 1Gb/s
25	te-1/1/25	10Gb/s, 1Gb/s
26	te-1/1/26	10Gb/s, 1Gb/s

27	te-1/1/27	10Gb/s, 1Gb/s
28	te-1/1/28	10Gb/s, 1Gb/s
29	te-1/1/29	10Gb/s, 1Gb/s
30	te-1/1/30	10Gb/s, 1Gb/s
31	te-1/1/31	10Gb/s, 1Gb/s
32	te-1/1/32	10Gb/s, 1Gb/s
33	te-1/1/33	10Gb/s, 1Gb/s
34	te-1/1/34	10Gb/s, 1Gb/s
35	te-1/1/35	10Gb/s, 1Gb/s
36	te-1/1/36	10Gb/s, 1Gb/s
37	te-1/1/37	10Gb/s, 1Gb/s
38	te-1/1/38	10Gb/s, 1Gb/s
39	te-1/1/39	10Gb/s, 1Gb/s
40	te-1/1/40	10Gb/s, 1Gb/s

44	te-1/1/44	10Gb/s, 1Gb/s
45	te-1/1/45	10Gb/s, 1Gb/s
46	te-1/1/46	10Gb/s, 1Gb/s
47	te-1/1/47	10Gb/s, 1Gb/s
48	te-1/1/48	10Gb/s, 1Gb/s
49	xe-1/1/1	40Gb/s, 4x10Gb/s, 4x1Gb/s
50	xe-1/1/2	40Gb/s, 4x10Gb/s, 4x1Gb/s
51	xe-1/1/3	40Gb/s, 4x10Gb/s, 4x1Gb/s
52	xe-1/1/4	40Gb/s, 4x10Gb/s, 4x1Gb/s
53	xe-1/1/5	40Gb/s, 4x10Gb/s, 4x1Gb/s
54	xe-1/1/6	40Gb/s, 4x10Gb/s, 4x1Gb/s

N8550-32C Switch Port Name Description

NOTE:

- The last two ports are 10G-Base-KR ports which can be configured as two 10G SFP+ ports on the front panel or two 10G-KR ports linked to CPU. By default, 10G-Base-KR ports are disabled. For details please refer to document 10G-Base-KR Interface Configuration.
- On N8550-32C switch, when the 10G-Base-KR ports are enabled as either front panel ports or management ports, xe-1/1/32 port is not allowed to be split into four Gigabit Ethernet interfaces.

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	xe-1/1/1	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
2	xe-1/1/2	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
3	xe-1/1/3	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
4	xe-1/1/4	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
5	xe-1/1/5	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
6	xe-1/1/6	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
7	xe-1/1/7	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
8	xe-1/1/8	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
9	xe-1/1/9	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
10	xe-1/1/10	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
11	xe-1/1/11	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
12	xe-1/1/12	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
13	xe-1/1/13	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
14	xe-1/1/14	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
15	xe-1/1/15	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
16	xe-1/1/16	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
17	xe-1/1/17	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
18	xe-1/1/18	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
19	xe-1/1/19	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
20	xe-1/1/20	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s

33	me-1/1/1(Management Port)	auto
	te-1/1/1(Front Panel Port)	10Gb/s,1Gb/s
34	me-1/1/2(Management Port)	auto

	te-1/1/2(Front Panel Port)	10Gb/s,1Gb/s

N8550-48B8C Switch Port Name Description

NOTEs:

1. The last two ports are 10G-Base-KR ports which can be configured as two 10G SFP+ ports on the front panel or two 10G-KR ports linked to CPU. By default, 10G-Base-KR ports are disabled. For details please refer to document 10G-Base-KR Interface Configuration.

2. On N8550-48B8C switch, when the 10G-Base-KR ports are enabled as either front panel ports or management ports, xe-1/1/8 port is not allowed to be split into four Gigabit Ethernet interfaces.

3. The first 48 ports are grouped as shown in the following table, four ports form a group.

Group	Ports
1	Port1, Port2, Port3, Port6
2	Port4, Port5, Port7, Port9
3	Port8, Port10, Port11, Port12
4	Port13, Port14, Port15, Port18
5	Port16, Port17, Port19, Port21
6	Port20, Port22, Port23, Port24
7	Port25, Port26, Port27, Port30
8	Port28, Port29, Port31, Port33
9	Port32, Port34, Port35, Port36
10	Port37, Port38, Port39, Port42
11	Port40, Port41, Port43, Port45
12	Port44, Port46, Port47, Port48

When configuring the rate, the supported port rates are 25 Gbit/s, 10 Gbit/s, and 1 Gbit/s. The four ports of a group can be configured with the same port rate or different rate. When configuring at different port rates, 10G and 1G can coexist, but 25G cannot coexist with 10G or 1G. The following table gives several cases of speed setting for the group of ports.

	Port1	Port2	Port3	Port6	Allowed or not allowed
case #1	10 G	10G	10G	10G	✓
case #2	1G	1G	1G	1G	✓
case #3	25G	25G	25G	25G	✓
case #4	1G	10G	1G	10G	✓
case #5	25G	1G	25G	25G	×
case #6	25G	10G	25G	10G	×
case #7	25G	1G	10G	25G	×

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	te-1/1/1	25Gb/s,10Gb/s,1Gb/s
2	te-1/1/2	25Gb/s,10Gb/s,1Gb/s

S5860-20SQ Switch Port Name Description

NOTE:

Ports Te-1/1/21, Te-1/1/22, Te-1/1/23 and Te-1/1/24 are a group of ports, you should manually configure the port speed for these four ports by using the **set interface gigabit-ethernet speed** command before inserting an optical module. When configuring the rate, the supported port rates are 25 Gbit/s, 10 Gbit/s, and 1 Gbit/s. The four ports can be configured with the same port rate or different rate. When configured at different port rates, 10G and 1G can coexist, but 25G cannot coexist with other rates. The following table gives several cases of speed setting for this group of ports.

	te-1/1/21	te-1/1/22	te-1/1/23	te-1/1/24	Allowed or not allowed
case #1	10 G	10G	10G	10G	✓
case #2	1G	1G	1G	1G	✓
case #3	25G	25G	25G	25G	✓
case #4	1G	10G	1G	10G	✓
case #5	25G	1G	25G	25G	**X**
case #6	25G	10G	25G	10G	**X**
case #7	25G	1G	10G	25G	**X**

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	te-1/1/1	10Gb/s, 1Gb/s
2	te-1/1/2	10Gb/s, 1Gb/s
3	te-1/1/3	10Gb/s, 1Gb/s
4	te-1/1/4	10Gb/s, 1Gb/s
5	te-1/1/5	10Gb/s, 1Gb/s
6	te-1/1/6	10Gb/s, 1Gb/s
7	te-1/1/7	10Gb/s, 1Gb/s
8	te-1/1/8	10Gb/s, 1Gb/s
9	te-1/1/9	10Gb/s, 1Gb/s
10	te-1/1/10	10Gb/s, 1Gb/s
11	te-1/1/11	10Gb/s, 1Gb/s

N8560-32C Switch Port Name Description

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	xe-1/1/1	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
2	xe-1/1/2	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
3	xe-1/1/3	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
4	xe-1/1/4	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
5	xe-1/1/5	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
6	xe-1/1/6	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
7	xe-1/1/7	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
8	xe-1/1/8	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
9	xe-1/1/9	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
10	xe-1/1/10	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
11	xe-1/1/11	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
12	xe-1/1/12	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
13	xe-1/1/13	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
14	xe-1/1/14	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
15	xe-1/1/15	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
16	xe-1/1/16	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
17	xe-1/1/17	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
18	xe-1/1/18	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
19	xe-1/1/19	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
20	xe-1/1/20	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
21	xe-1/1/21	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
22	xe-1/1/22	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
23	xe-1/1/23	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
24	xe-1/1/24	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
25	xe-1/1/25	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
26	xe-1/1/26	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
27	xe-1/1/27	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s

28	xe-1/1/28	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
29	xe-1/1/29	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
30	xe-1/1/30	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
31	xe-1/1/31	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
32	xe-1/1/32	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s

N8560-64C Switch Port Name Description

Only the ports on the first row of front panel are allowed to do breakout, that is, only ports 1, 2, 3, 9, 10, 17, 18, 19, 25, 26, 27, 33, 34, 41, 42, 49, 50, 57 and 58 can be split into four Gigabit Ethernet interfaces.

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	xe-1/1/1	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
2	xe-1/1/2	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
3	xe-1/1/3	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
4	xe-1/1/4	100Gb/s, 40Gb/s
5	xe-1/1/5	100Gb/s, 40Gb/s
6	xe-1/1/6	100Gb/s, 40Gb/s
7	xe-1/1/7	100Gb/s, 40Gb/s
8	xe-1/1/8	100Gb/s, 40Gb/s
9	xe-1/1/9	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
10	xe-1/1/10	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
11	xe-1/1/11	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
12	xe-1/1/12	100Gb/s, 40Gb/s
13	xe-1/1/13	100Gb/s, 40Gb/s
14	xe-1/1/14	100Gb/s, 40Gb/s
15	xe-1/1/15	100Gb/s, 40Gb/s
16	xe-1/1/16	100Gb/s, 40Gb/s
17	xe-1/1/17	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
18	xe-1/1/18	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
19	xe-1/1/19	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
20	xe-1/1/20	100Gb/s, 40Gb/s
21	xe-1/1/21	100Gb/s, 40Gb/s
22	xe-1/1/22	100Gb/s, 40Gb/s
23	xe-1/1/23	100Gb/s, 40Gb/s
24	xe-1/1/24	100Gb/s, 40Gb/s
25	xe-1/1/25	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s

26	xe-1/1/26	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
27	xe-1/1/27	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
28	xe-1/1/28	100Gb/s, 40Gb/s
29	xe-1/1/29	100Gb/s, 40Gb/s
30	xe-1/1/30	100Gb/s, 40Gb/s
31	xe-1/1/31	100Gb/s, 40Gb/s
32	xe-1/1/32	100Gb/s, 40Gb/s
33	xe-1/1/33	100Gb/s, 40Gb/s, 4 x 25Gb/s
34	xe-1/1/34	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
35	xe-1/1/35	100Gb/s, 40Gb/s
36	xe-1/1/36	100Gb/s, 40Gb/s
37	xe-1/1/37	100Gb/s, 40Gb/s
38	xe-1/1/38	100Gb/s, 40Gb/s
39	xe-1/1/39	100Gb/s, 40Gb/s
40	xe-1/1/40	100Gb/s, 40Gb/s
41	xe-1/1/41	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
42	xe-1/1/42	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
43	xe-1/1/43	100Gb/s, 40Gb/s
44	xe-1/1/44	100Gb/s, 40Gb/s
45	xe-1/1/45	100Gb/s, 40Gb/s
46	xe-1/1/46	100Gb/s, 40Gb/s
47	xe-1/1/47	100Gb/s, 40Gb/s
48	xe-1/1/48	100Gb/s, 40Gb/s
49	xe-1/1/49	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
50	xe-1/1/50	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
51	xe-1/1/51	100Gb/s, 40Gb/s

56	xe-1/1/56	100Gb/s, 40Gb/s
57	xe-1/1/57	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s

58	xe-1/1/58	100Gb/s, 40Gb/s, 4 x 25Gb/s, 4 x 10Gb/s
59	xe-1/1/59	100Gb/s, 40Gb/s
60	xe-1/1/60	100Gb/s, 40Gb/s
61	xe-1/1/61	100Gb/s, 40Gb/s
62	xe-1/1/62	100Gb/s, 40Gb/s
63	xe-1/1/63	100Gb/s, 40Gb/s
64	xe-1/1/64	100Gb/s, 40Gb/s

S5860-24MG-U Switch Port Name Description

NOTE:

Ports te-1/1/1, te-1/1/2, te-1/1/3 and te-1/1/4 are a group of ports, you should manually configure the port speed for these four ports by using the **set interface gigabit-ethernet speed** command before inserting an optical module. When configuring the rate, the supported port rates are 25 Gbit/s, 10 Gbit/s, and 1 Gbit/s. The four ports can be configured with the same port rate or different rate. When configured at different port rates, 10G and 1G can coexist, but 25G cannot coexist with 10G or 1G. The following table gives several cases of speed setting for this group of ports.

	te-1/1/1	te-1/1/2	te-1/1/3	te-1/1/4	Allowed or not allowed
case #1	10 G	10G	10G	10G	✓
case #2	1G	1G	1G	1G	✓
case #3	25G	25G	25G	25G	✓
case #4	1G	10G	1G	10G	✓
case #5	25G	1G	25G	25G	×
case #6	25G	10G	25G	10G	×
case #7	25G	1G	10G	25G	×

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	ge-1/1/1	100M/1G/2.5G/5G
2	ge-1/1/2	100M/1G/2.5G/5G
3	ge-1/1/3	100M/1G/2.5G/5G
4	ge-1/1/4	100M/1G/2.5G/5G
5	ge-1/1/5	100M/1G/2.5G/5G
6	ge-1/1/6	100M/1G/2.5G/5G
7	ge-1/1/7	100M/1G/2.5G/5G
8	ge-1/1/8	100M/1G/2.5G/5G
9	ge-1/1/9	100M/1G/2.5G/5G
10	ge-1/1/10	100M/1G/2.5G/5G
11	ge-1/1/11	100M/1G/2.5G/5G

S5860-48XMG-U/S5860-48XMG Switch Port Name Description

NOTE:
Ports te-1/1/49, te-1/1/50, te-1/1/51 and te-1/1/52 are a group of SFP28 25G ports which don't support to configure the port rate to 10 Gbit/s or 1 Gbit/s.

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	te-1/1/1	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
2	te-1/1/2	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
3	te-1/1/3	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
4	te-1/1/4	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
5	te-1/1/5	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
6	te-1/1/6	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
7	te-1/1/7	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
8	te-1/1/8	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
9	te-1/1/9	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
10	te-1/1/10	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
11	te-1/1/11	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
12	te-1/1/12	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
13	te-1/1/13	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
14	te-1/1/14	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
15	te-1/1/15	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
16	te-1/1/16	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
17	te-1/1/17	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
18	te-1/1/18	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
19	te-1/1/19	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
20	te-1/1/20	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
21	te-1/1/21	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
22	te-1/1/22	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
23	te-1/1/23	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
24	te-1/1/24	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s

25	te-1/1/25	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
26	te-1/1/26	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
27	te-1/1/27	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
28	te-1/1/28	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
29	te-1/1/29	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
30	te-1/1/30	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
31	te-1/1/31	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
32	te-1/1/32	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
33	te-1/1/33	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
34	te-1/1/34	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
35	te-1/1/35	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
36	te-1/1/36	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
37	te-1/1/37	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
38	te-1/1/38	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
39	te-1/1/39	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
40	te-1/1/40	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
41	te-1/1/41	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
42	te-1/1/42	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
43	te-1/1/43	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
44	te-1/1/44	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
45	te-1/1/45	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
46	te-1/1/46	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
47	te-1/1/47	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
48	te-1/1/48	10Gb/s, 5Gb/s, 2.5Gb/s, 1Gb/s, 100Mb/s
49	te-1/1/49	25Gb/s
50	te-1/1/50	25Gb/s
51	te-1/1/51	25Gb/s
52	te-1/1/52	25Gb/s
53	xe-1/1/1	40Gb/s, 4x10Gb/s, 4x1Gb/s
54	xe-1/1/2	40Gb/s, 4x10Gb/s, 4x1Gb/s

S5860-24XMG Switch Port Name Description

NOTE:

Ports te-1/1/29, te-1/1/30, te-1/1/31 and te-1/1/32 are a group of ports, you should manually configure the port speed for these four ports by using the **set interface gigabit-ethernet speed** command before inserting an optical module. When configuring the rate, the supported port rates are 25 Gbit/s, 10 Gbit/s, and 1 Gbit/s. The four ports can be configured with the same port rate or different rate. When configured at different port rates, 10G and 1G can coexist, but 25G cannot coexist with 10G or 1G. The following table gives several cases of speed setting for this group of ports.

	te-1/1/29	te-1/1/30	te-1/1/31	te-1/1/32	Allowed or not allowed
case #1	10 G	10G	10G	10G	✓
case #2	1G	1G	1G	1G	✓
case #3	25G	25G	25G	25G	✓
case #4	1G	10G	1G	10G	✓
case #5	25G	1G	25G	25G	×
case #6	25G	10G	25G	10G	×
case #7	25G	1G	10G	25G	×

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	te-1/1/1	100M/1G/2.5G/5G/10G
2	te-1/1/2	100M/1G/2.5G/5G/10G
3	te-1/1/3	100M/1G/2.5G/5G/10G
4	te-1/1/4	100M/1G/2.5G/5G/10G
5	te-1/1/5	100M/1G/2.5G/5G/10G
6	te-1/1/6	100M/1G/2.5G/5G/10G

54	te-1/1/6	10G, 1G

S5870-48T6BC/S5870-48T6BC-U Switch Port Name Description

NOTE:
Ports Te-1/1/1, Te-1/1/2, Te-1/1/3 and Te-1/1/4 are a group of ports, you should manually configure the port speed for these four ports by using the **set interface gigabit-ethernet speed** command before inserting an optical module. When configuring the rate, the supported port rates are 25 Gbit/s, 10 Gbit/s, and 1 Gbit/s. The four ports can be configured with the same port rate or different rate. When configured at different port rates, 10G and 1G can coexist, but 25G cannot coexist with other rates. The following table gives several cases of speed setting for this group of ports.

	te-1/1/1	te-1/1/2	te-1/1/3	te-1/1/4	Allowed or not Allowed
case #1	10 G	10G	10G	10G	✓
case #2	1G	1G	1G	1G	✓
case #3	25G	25G	25G	25G	✓
case #4	1G	10G	1G	10G	✓
case #5	25G	1G	25G	25G	**X**
case #6	25G	10G	25G	10G	**X**
case #7	25G	1G	10G	25G	**X**

Note: If the port rate is set to 25 Gbit/s, but a 10 Gbit/s optical module is inserted, the port cannot go up.

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Supported Speed
1	ge-1/1/1	1Gb/s, 100Mb/s, 10Mb/s
2	ge-1/1/2	1Gb/s, 100Mb/s, 10Mb/s
3	ge-1/1/3	1Gb/s, 100Mb/s, 10Mb/s
4	ge-1/1/4	1Gb/s, 100Mb/s, 10Mb/s
5	ge-1/1/5	1Gb/s, 100Mb/s, 10Mb/s
6	ge-1/1/6	1Gb/s, 100Mb/s, 10Mb/s
7	ge-1/1/7	1Gb/s, 100Mb/s, 10Mb/s
8	ge-1/1/8	1Gb/s, 100Mb/s, 10Mb/s
9	ge-1/1/9	1Gb/s, 100Mb/s, 10Mb/s
10	ge-1/1/10	1Gb/s, 100Mb/s, 10Mb/s
11	ge-1/1/11	1Gb/s, 100Mb/s, 10Mb/s
12	ge-1/1/12	1Gb/s, 100Mb/s, 10Mb/s
13	ge-1/1/13	1Gb/s, 100Mb/s, 10Mb/s
14	ge-1/1/14	1Gb/s, 100Mb/s, 10Mb/s
15	ge-1/1/15	1Gb/s, 100Mb/s, 10Mb/s
16	ge-1/1/16	1Gb/s, 100Mb/s, 10Mb/s
17	ge-1/1/17	1Gb/s, 100Mb/s, 10Mb/s
18	ge-1/1/18	1Gb/s, 100Mb/s, 10Mb/s
19	ge-1/1/19	1Gb/s, 100Mb/s, 10Mb/s
20	ge-1/1/20	1Gb/s, 100Mb/s, 10Mb/s
21	ge-1/1/21	1Gb/s, 100Mb/s, 10Mb/s
22	ge-1/1/22	1Gb/s, 100Mb/s, 10Mb/s
23	ge-1/1/23	1Gb/s, 100Mb/s, 10Mb/s
24	ge-1/1/24	1Gb/s, 100Mb/s, 10Mb/s
25	ge-1/1/25	1Gb/s, 100Mb/s, 10Mb/s
26	ge-1/1/26	1Gb/s, 100Mb/s, 10Mb/s

Physical Port Number	Interface Names	Interface Supported Speed
27	ge-1/1/27	1Gb/s, 100Mb/s, 10Mb/s
28	ge-1/1/28	1Gb/s, 100Mb/s, 10Mb/s
29	ge-1/1/29	1Gb/s, 100Mb/s, 10Mb/s
30	ge-1/1/30	1Gb/s, 100Mb/s, 10Mb/s
31	ge-1/1/31	1Gb/s, 100Mb/s, 10Mb/s
32	ge-1/1/32	1Gb/s, 100Mb/s, 10Mb/s
33	ge-1/1/33	1Gb/s, 100Mb/s, 10Mb/s
34	ge-1/1/34	1Gb/s, 100Mb/s, 10Mb/s
35	ge-1/1/35	1Gb/s, 100Mb/s, 10Mb/s
36	ge-1/1/36	1Gb/s, 100Mb/s, 10Mb/s
37	ge-1/1/37	1Gb/s, 100Mb/s, 10Mb/s
38	ge-1/1/38	1Gb/s, 100Mb/s, 10Mb/s
39	ge-1/1/39	1Gb/s, 100Mb/s, 10Mb/s
40	ge-1/1/40	1Gb/s, 100Mb/s, 10Mb/s
41	ge-1/1/41	1Gb/s, 100Mb/s, 10Mb/s
42	ge-1/1/42	1Gb/s, 100Mb/s, 10Mb/s
43	ge-1/1/43	1Gb/s, 100Mb/s, 10Mb/s
44	ge-1/1/44	1Gb/s, 100Mb/s, 10Mb/s
45	ge-1/1/45	1Gb/s, 100Mb/s, 10Mb/s
46	ge-1/1/46	1Gb/s, 100Mb/s, 10Mb/s
47	ge-1/1/47	1Gb/s, 100Mb/s, 10Mb/s
48	ge-1/1/48	1Gb/s, 100Mb/s, 10Mb/s
49	te-1/1/1	25Gb/s,10Gb/s,1Gb/s
50	te-1/1/2	25Gb/s,10Gb/s,1Gb/s
51	te-1/1/3	25Gb/s,10Gb/s,1Gb/s
52	te-1/1/4	25Gb/s,10Gb/s,1Gb/s
53	xe-1/1/1	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
54	xe-1/1/2	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s

N5850-48X6C Switch Port Name Description

NOTE:

Due to hardware limitations, only ports xe-1/1/1 and xe-1/1/4 support to be split into four Gigabit Ethernet interfaces, other ports are not supported to be split.

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	te-1/1/1	10Gb/s, 1Gb/s
2	te-1/1/2	10Gb/s, 1Gb/s
3	te-1/1/3	10Gb/s, 1Gb/s
4	te-1/1/4	10Gb/s, 1Gb/s
5	te-1/1/5	10Gb/s, 1Gb/s
6	te-1/1/6	10Gb/s, 1Gb/s
7	te-1/1/7	10Gb/s, 1Gb/s
8	te-1/1/8	10Gb/s, 1Gb/s
9	te-1/1/9	10Gb/s, 1Gb/s
10	te-1/1/10	10Gb/s, 1Gb/s
11	te-1/1/11	10Gb/s, 1Gb/s
12	te-1/1/12	10Gb/s, 1Gb/s
13	te-1/1/13	10Gb/s, 1Gb/s
14	te-1/1/14	10Gb/s, 1Gb/s
15	te-1/1/15	10Gb/s, 1Gb/s
16	te-1/1/16	10Gb/s, 1Gb/s
17	te-1/1/17	10Gb/s, 1Gb/s
18	te-1/1/18	10Gb/s, 1Gb/s
19	te-1/1/19	10Gb/s, 1Gb/s
20	te-1/1/20	10Gb/s, 1Gb/s
21	te-1/1/21	10Gb/s, 1Gb/s
22	te-1/1/22	10Gb/s, 1Gb/s
23	te-1/1/23	10Gb/s, 1Gb/s
24	te-1/1/24	10Gb/s, 1Gb/s

25	te-1/1/25	10Gb/s, 1Gb/s
26	te-1/1/26	10Gb/s, 1Gb/s
27	te-1/1/27	10Gb/s, 1Gb/s
28	te-1/1/28	10Gb/s, 1Gb/s
29	te-1/1/29	10Gb/s, 1Gb/s
30	te-1/1/30	10Gb/s, 1Gb/s
31	te-1/1/31	10Gb/s, 1Gb/s
32	te-1/1/32	10Gb/s, 1Gb/s
33	te-1/1/33	10Gb/s, 1Gb/s
34	te-1/1/34	10Gb/s, 1Gb/s
35	te-1/1/35	10Gb/s, 1Gb/s
36	te-1/1/36	10Gb/s, 1Gb/s
37	te-1/1/37	10Gb/s, 1Gb/s
38	te-1/1/38	10Gb/s, 1Gb/s
39	te-1/1/39	10Gb/s, 1Gb/s
40	te-1/1/40	10Gb/s, 1Gb/s
41	te-1/1/41	10Gb/s, 1Gb/s
42	te-1/1/42	10Gb/s, 1Gb/s
43	te-1/1/43	10Gb/s, 1Gb/s
44	te-1/1/44	10Gb/s, 1Gb/s
45	te-1/1/45	10Gb/s, 1Gb/s
46	te-1/1/46	10Gb/s, 1Gb/s
47	te-1/1/47	10Gb/s, 1Gb/s
48	te-1/1/48	10Gb/s, 1Gb/s
49	xe-1/1/1	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
50	xe-1/1/2	100Gb/s, 40Gb/s
51	xe-1/1/3	100Gb/s, 40Gb/s
52	xe-1/1/4	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
53	xe-1/1/5	100Gb/s, 40Gb/s
54	xe-1/1/6	100Gb/s, 40Gb/s

N8550-64C Switch Port Name Description

NOTE:
Only the ports on the first row of front panel are allowed to do breakout, that is, only ports 1, 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27, 29 and 31 can be split into four Gigabit Ethernet interfaces.

Mapping between physical ports, interface names and interface supported speed on N8550-64C are in the following table.

Physical Port Number	Interface Names	Interface Supported Speed
1	xe-1/1/1	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
2	xe-1/1/2	100Gb/s, 40Gb/s
3	xe-1/1/3	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
4	xe-1/1/4	100Gb/s, 40Gb/s
5	xe-1/1/5	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
6	xe-1/1/6	100Gb/s, 40Gb/s
7	xe-1/1/7	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
8	xe-1/1/8	100Gb/s, 40Gb/s
9	xe-1/1/9	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
10	xe-1/1/10	100Gb/s, 40Gb/s
11	xe-1/1/11	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
12	xe-1/1/12	100Gb/s, 40Gb/s
13	xe-1/1/13	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
14	xe-1/1/14	100Gb/s, 40Gb/s
15	xe-1/1/15	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
16	xe-1/1/16	100Gb/s, 40Gb/s
17	xe-1/1/17	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
18	xe-1/1/18	100Gb/s, 40Gb/s
19	xe-1/1/19	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
20	xe-1/1/20	100Gb/s, 40Gb/s
21	xe-1/1/21	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
22	xe-1/1/22	100Gb/s, 40Gb/s
23	xe-1/1/23	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
24	xe-1/1/24	100Gb/s, 40Gb/s
25	xe-1/1/25	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
26	xe-1/1/26	100Gb/s, 40Gb/s
27	xe-1/1/27	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
28	xe-1/1/28	100Gb/s, 40Gb/s
29	xe-1/1/29	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
30	xe-1/1/30	100Gb/s, 40Gb/s
31	xe-1/1/31	100Gb/s, 40Gb/s, 4x25Gb/s, 4x10Gb/s
32	xe-1/1/32	100Gb/s, 40Gb/s
33	xe-1/1/33	100Gb/s, 40Gb/s
34	xe-1/1/34	100Gb/s, 40Gb/s
35	xe-1/1/35	100Gb/s, 40Gb/s
36	xe-1/1/36	100Gb/s, 40Gb/s

37	xe-1/1/37	100Gb/s, 40Gb/s
38	xe-1/1/38	100Gb/s, 40Gb/s
39	xe-1/1/39	100Gb/s, 40Gb/s
40	xe-1/1/40	100Gb/s, 40Gb/s
41	xe-1/1/41	100Gb/s, 40Gb/s
42	xe-1/1/42	100Gb/s, 40Gb/s
43	xe-1/1/43	100Gb/s, 40Gb/s
44	xe-1/1/44	100Gb/s, 40Gb/s
45	xe-1/1/45	100Gb/s, 40Gb/s
46	xe-1/1/46	100Gb/s, 40Gb/s
47	xe-1/1/47	100Gb/s, 40Gb/s
48	xe-1/1/48	100Gb/s, 40Gb/s
49	xe-1/1/49	100Gb/s, 40Gb/s
50	xe-1/1/50	100Gb/s, 40Gb/s
51	xe-1/1/51	100Gb/s, 40Gb/s
52	xe-1/1/52	100Gb/s, 40Gb/s
53	xe-1/1/53	100Gb/s, 40Gb/s
54	xe-1/1/54	100Gb/s, 40Gb/s
55	xe-1/1/55	100Gb/s, 40Gb/s
56	xe-1/1/56	100Gb/s, 40Gb/s
57	xe-1/1/57	100Gb/s, 40Gb/s
58	xe-1/1/58	100Gb/s, 40Gb/s
59	xe-1/1/59	100Gb/s, 40Gb/s
60	xe-1/1/60	100Gb/s, 40Gb/s
61	xe-1/1/61	100Gb/s, 40Gb/s
62	xe-1/1/62	100Gb/s, 40Gb/s
63	xe-1/1/63	100Gb/s, 40Gb/s
64	xe-1/1/64	100Gb/s, 40Gb/s

N9550-32D Switch Port Name Description

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	xe-1/1/1	400Gb/s, 100Gb/s, 4 x 100Gb/s，2 x 200Gb/s
2	xe-1/1/2	400Gb/s, 100Gb/s, 4 x 100Gb/s，2 x 200Gb/s
3	xe-1/1/3	400Gb/s, 100Gb/s, 4 x 100Gb/s，2 x 200Gb/s
4	xe-1/1/4	400Gb/s, 100Gb/s, 4 x 100Gb/s，2 x 200Gb/s
5	xe-1/1/5	400Gb/s, 100Gb/s, 4 x 100Gb/s，2 x 200Gb/s
6	xe-1/1/6	400Gb/s, 100Gb/s, 4 x 100Gb/s，2 x 200Gb/s
7	xe-1/1/7	400Gb/s, 100Gb/s, 4 x 100Gb/s，2 x 200Gb/s
8	xe-1/1/8	400Gb/s, 100Gb/s, 4 x 100Gb/s，2 x 200Gb/s
9	xe-1/1/9	400Gb/s, 100Gb/s, 4 x 100Gb/s，2 x 200Gb/s
10	xe-1/1/10	400Gb/s, 100Gb/s, 4 x 100Gb/s，2 x 200Gb/s
11	xe-1/1/11	400Gb/s, 100Gb/s, 4 x 100Gb/s，2 x 200Gb/s
12	xe-1/1/12	400Gb/s, 100Gb/s, 4 x 100Gb/s，2 x 200Gb/s
13	xe-1/1/13	400Gb/s, 100Gb/s, 4 x 100Gb/s，2 x 200Gb/s
14	xe-1/1/14	400Gb/s, 100Gb/s, 4 x 100Gb/s，2 x 200Gb/s
15	xe-1/1/15	400Gb/s, 100Gb/s, 4 x 100Gb/s，2 x 200Gb/s
16	xe-1/1/16	400Gb/s, 100Gb/s, 4 x 100Gb/s，2 x 200Gb/s
17	xe-1/1/17	400Gb/s, 100Gb/s, 4 x 100Gb/s，2 x 200Gb/s

18	xe-1/1/18	400Gb/s, 100Gb/s, 4 x 100Gb/s，2 x 200Gb/s
19	xe-1/1/19	400Gb/s, 100Gb/s, 4 x 100Gb/s，2 x 200Gb/s
20	xe-1/1/20	400Gb/s, 100Gb/s, 4 x 100Gb/s，2 x 200Gb/s
21	xe-1/1/21	400Gb/s, 100Gb/s, 4 x 100Gb/s，2 x 200Gb/s
22	xe-1/1/22	400Gb/s, 100Gb/s, 4 x 100Gb/s，2 x 200Gb/s
23	xe-1/1/23	400Gb/s, 100Gb/s, 4 x 100Gb/s，2 x 200Gb/s
24	xe-1/1/24	400Gb/s, 100Gb/s, 4 x 100Gb/s，2 x 200Gb/s
25	xe-1/1/25	400Gb/s, 100Gb/s, 4 x 100Gb/s，2 x 200Gb/s
26	xe-1/1/26	400Gb/s, 100Gb/s, 4 x 100Gb/s，2 x 200Gb/s
27	xe-1/1/27	400Gb/s, 100Gb/s, 4 x 100Gb/s，2 x 200Gb/s
28	xe-1/1/28	400Gb/s, 100Gb/s, 4 x 100Gb/s，2 x 200Gb/s
29	xe-1/1/29	400Gb/s, 100Gb/s, 4 x 100Gb/s，2 x 200Gb/s
30	xe-1/1/30	400Gb/s, 100Gb/s, 4 x 100Gb/s，2 x 200Gb/s
31	xe-1/1/31	400Gb/s, 100Gb/s, 4 x 100Gb/s，2 x 200Gb/s
32	xe-1/1/32	400Gb/s, 100Gb/s, 4 x 100Gb/s，2 x 200Gb/s

N5850-48S6C Switch Port Name Description

NOTE:

Due to hardware limitations, only ports xe-1/1/1 and xe-1/1/4 support to be split into four Gigabit Ethernet interfaces, other ports are not supported to be split.

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	te-1/1/1	10Gb/s, 1Gb/s
2	te-1/1/2	10Gb/s, 1Gb/s
3	te-1/1/3	10Gb/s, 1Gb/s
4	te-1/1/4	10Gb/s, 1Gb/s
5	te-1/1/5	10Gb/s, 1Gb/s
6	te-1/1/6	10Gb/s, 1Gb/s
7	te-1/1/7	10Gb/s, 1Gb/s
8	te-1/1/8	10Gb/s, 1Gb/s
9	te-1/1/9	10Gb/s, 1Gb/s
10	te-1/1/10	10Gb/s, 1Gb/s
11	te-1/1/11	10Gb/s, 1Gb/s
12	te-1/1/12	10Gb/s, 1Gb/s
13	te-1/1/13	10Gb/s, 1Gb/s
14	te-1/1/14	10Gb/s, 1Gb/s
15	te-1/1/15	10Gb/s, 1Gb/s
16	te-1/1/16	10Gb/s, 1Gb/s

S5870-48MX6BC-U Switch Port Name Description

NOTE:
Ports Te-1/1/1, Te-1/1/2, Te-1/1/3 and Te-1/1/4 are a group of ports, you should manually configure the port speed for these four ports by using the **set interface gigabit-ethernet speed** command before inserting an optical module. When configuring the rate, the supported port rates are 25 Gbit/s, 10 Gbit/s, and 1 Gbit/s. The four ports can be configured with the same port rate or different rate. When configured at different port rates, 10G and 1G can coexist, but 25G cannot coexist with other rates. The following table gives several cases of speed setting for this group of ports.

	te-1/1/1	te-1/1/2	te-1/1/3	te-1/1/4	Allowed or not Allowed
case #1	10 G	10G	10G	10G	✓
case #2	1G	1G	1G	1G	✓
case #3	25G	25G	25G	25G	✓
case #4	1G	10G	1G	10G	✓
case #5	25G	1G	25G	25G	**X**
case #6	25G	10G	25G	10G	**X**
case #7	25G	1G	10G	25G	**X**

Note: If the port rate is set to 25 Gbit/s, but a 10 Gbit/s optical module is inserted, the port cannot go up.

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Supported Speed
1	ge-1/1/1	2.5 Gb/s, 1 Gb/s, 100Mb/s
2	ge-1/1/2	2.5 Gb/s, 1 Gb/s, 100Mb/s
3	ge-1/1/3	2.5 Gb/s, 1 Gb/s, 100Mb/s
4	ge-1/1/4	2.5 Gb/s, 1 Gb/s, 100Mb/s
5	ge-1/1/5	2.5 Gb/s, 1 Gb/s, 100Mb/s
6	ge-1/1/6	2.5 Gb/s, 1 Gb/s, 100Mb/s
7	ge-1/1/7	2.5 Gb/s, 1 Gb/s, 100Mb/s
8	ge-1/1/8	2.5 Gb/s, 1 Gb/s, 100Mb/s
9	ge-1/1/9	2.5 Gb/s, 1 Gb/s, 100Mb/s
10	ge-1/1/10	2.5 Gb/s, 1 Gb/s, 100Mb/s
11	ge-1/1/11	2.5 Gb/s, 1 Gb/s, 100Mb/s
12	ge-1/1/12	2.5 Gb/s, 1 Gb/s, 100Mb/s
13	ge-1/1/13	2.5 Gb/s, 1 Gb/s, 100Mb/s
14	ge-1/1/14	2.5 Gb/s, 1 Gb/s, 100Mb/s
15	ge-1/1/15	2.5 Gb/s, 1 Gb/s, 100Mb/s
16	ge-1/1/16	2.5 Gb/s, 1 Gb/s, 100Mb/s
17	ge-1/1/17	2.5 Gb/s, 1 Gb/s, 100Mb/s
18	ge-1/1/18	2.5 Gb/s, 1 Gb/s, 100Mb/s
19	ge-1/1/19	2.5 Gb/s, 1 Gb/s, 100Mb/s
20	ge-1/1/20	2.5 Gb/s, 1 Gb/s, 100Mb/s
21	ge-1/1/21	2.5 Gb/s, 1 Gb/s, 100Mb/s
22	ge-1/1/22	2.5 Gb/s, 1 Gb/s, 100Mb/s
23	ge-1/1/23	2.5 Gb/s, 1 Gb/s, 100Mb/s
24	ge-1/1/24	2.5 Gb/s, 1 Gb/s, 100Mb/s
25	ge-1/1/25	2.5 Gb/s, 1 Gb/s, 100Mb/s
26	ge-1/1/26	2.5 Gb/s, 1 Gb/s, 100Mb/s

27	ge-1/1/27	2.5 Gb/s, 1 Gb/s, 100Mb/s
28	ge-1/1/28	2.5 Gb/s, 1 Gb/s, 100Mb/s
29	ge-1/1/29	2.5 Gb/s, 1 Gb/s, 100Mb/s
30	ge-1/1/30	2.5 Gb/s, 1 Gb/s, 100Mb/s
31	ge-1/1/31	2.5 Gb/s, 1 Gb/s, 100Mb/s
32	ge-1/1/32	2.5 Gb/s, 1 Gb/s, 100Mb/s
33	ge-1/1/33	2.5 Gb/s, 1 Gb/s, 100Mb/s
34	ge-1/1/34	2.5 Gb/s, 1 Gb/s, 100Mb/s
35	ge-1/1/35	2.5 Gb/s, 1 Gb/s, 100Mb/s
36	ge-1/1/36	2.5 Gb/s, 1 Gb/s, 100Mb/s

S3410-24TS Switch Port Name Description

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	ge-1/1/1	10/100/1000Mb/s
2	ge-1/1/2	10/100/1000Mb/s
3	ge-1/1/3	10/100/1000Mb/s
4	ge-1/1/4	10/100/1000Mb/s
5	ge-1/1/5	10/100/1000Mb/s
6	ge-1/1/6	10/100/1000Mb/s
7	ge-1/1/7	10/100/1000Mb/s
8	ge-1/1/8	10/100/1000Mb/s
9	ge-1/1/9	10/100/1000Mb/s
10	ge-1/1/10	10/100/1000Mb/s
11	ge-1/1/11	10/100/1000Mb/s
12	ge-1/1/12	10/100/1000Mb/s
13	ge-1/1/13	10/100/1000Mb/s
14	ge-1/1/14	10/100/1000Mb/s
15	ge-1/1/15	10/100/1000Mb/s
16	ge-1/1/16	10/100/1000Mb/s
17	ge-1/1/17	10/100/1000Mb/s
18	ge-1/1/18	10/100/1000Mb/s
19	ge-1/1/19	10/100/1000Mb/s
20	ge-1/1/20	10/100/1000Mb/s
21	ge-1/1/21	10/100/1000Mb/s
22	ge-1/1/22	10/100/1000Mb/s
23	ge-1/1/23	10/100/1000Mb/s
24	ge-1/1/24	10/100/1000Mb/s
25	te-1/1/1	10Gb/s, 1Gb/s
26	te-1/1/2	10Gb/s, 1Gb/s
27	te-1/1/3	10Gb/s, 1Gb/s

28	te-1/1/4	10Gb/s, 1Gb/s

S3410L-24TF Switch Port Name Description

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	ge-1/1/1	10/100/1000Mb/s
2	ge-1/1/2	10/100/1000Mb/s
3	ge-1/1/3	10/100/1000Mb/s
4	ge-1/1/4	10/100/1000Mb/s
5	ge-1/1/5	10/100/1000Mb/s
6	ge-1/1/6	10/100/1000Mb/s
7	ge-1/1/7	10/100/1000Mb/s
8	ge-1/1/8	10/100/1000Mb/s
9	ge-1/1/9	10/100/1000Mb/s
10	ge-1/1/10	10/100/1000Mb/s
11	ge-1/1/11	10/100/1000Mb/s
12	ge-1/1/12	10/100/1000Mb/s
13	ge-1/1/13	10/100/1000Mb/s
14	ge-1/1/14	10/100/1000Mb/s
15	ge-1/1/15	10/100/1000Mb/s
16	ge-1/1/16	10/100/1000Mb/s
17	ge-1/1/17	10/100/1000Mb/s
18	ge-1/1/18	10/100/1000Mb/s

N8550-24CD8D Switch Port Name Description

NOTE:

For N8550-24CD8D, it supports thirty-two panel interfaces, which belong to four pipes, that is every eight panel ports (six 200G and two 400G ports) belong to one pipe. For only 18 ports are allowed to be split in one pipe, you need to split interfaces within this limitation. The corresponding relationship **of panel ports and pipes** is shown as below.

Table 1. Corresponding relationships of panel ports and pipes

pipe0	pipe1	pipe2	pipe3
1, 2, 3, 4, 5, 7, 26, 28	6, 8, 13, 15, 17, 19, 30, 32	9, 11, 18, 20, 21, 23, 27, 29	10, 12, 14, 16, 22, 24, 25, 31

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	xe-1/1/1	200Gb/s, 100Gb/s, 4 x 50Gb/s, 2 x 100Gb/s, 4 x 25Gb/s, 2 x 50Gb/s
2	xe-1/1/2	200Gb/s, 100Gb/s, 4 x 50Gb/s, 2 x 100Gb/s, 4 x 25Gb/s, 2 x 50Gb/s
3	xe-1/1/3	200Gb/s, 100Gb/s, 4 x 50Gb/s, 2 x 100Gb/s, 4 x 25Gb/s, 2 x 50Gb/s
4	xe-1/1/4	200Gb/s, 100Gb/s, 4 x 50Gb/s, 2 x 100Gb/s, 4 x 25Gb/s, 2 x 50Gb/s
5	xe-1/1/5	200Gb/s, 100Gb/s, 4 x 50Gb/s, 2 x 100Gb/s, 4 x 25Gb/s, 2 x 50Gb/s
6	xe-1/1/6	200Gb/s, 100Gb/s, 4 x 50Gb/s, 2 x 100Gb/s, 4 x 25Gb/s, 2 x 50Gb/s
7	xe-1/1/7	200Gb/s, 100Gb/s, 4 x 50Gb/s, 2 x 100Gb/s, 4 x 25Gb/s, 2 x 50Gb/s
8	xe-1/1/8	200Gb/s, 100Gb/s, 4 x 50Gb/s, 2 x 100Gb/s, 4 x 25Gb/s, 2 x 50Gb/s
9	xe-1/1/9	200Gb/s, 100Gb/s, 4 x 50Gb/s, 2 x 100Gb/s, 4 x 25Gb/s, 2 x 50Gb/s

10	xe-1/1/10	200Gb/s, 100Gb/s, 4 x 50Gb/s, 2 x 100Gb/s, 4 x 25Gb/s, 2 x 50Gb/s
11	xe-1/1/11	200Gb/s, 100Gb/s, 4 x 50Gb/s, 2 x 100Gb/s, 4 x 25Gb/s, 2 x 50Gb/s
12	xe-1/1/12	200Gb/s, 100Gb/s, 4 x 50Gb/s, 2 x 100Gb/s, 4 x 25Gb/s, 2 x 50Gb/s
13	xe-1/1/13	200Gb/s, 100Gb/s, 4 x 50Gb/s, 2 x 100Gb/s, 4 x 25Gb/s, 2 x 50Gb/s
14	xe-1/1/14	200Gb/s, 100Gb/s, 4 x 50Gb/s, 2 x 100Gb/s, 4 x 25Gb/s, 2 x 50Gb/s
15	xe-1/1/15	200Gb/s, 100Gb/s, 4 x 50Gb/s, 2 x 100Gb/s, 4 x 25Gb/s, 2 x 50Gb/s
16	xe-1/1/16	200Gb/s, 100Gb/s, 4 x 50Gb/s, 2 x 100Gb/s, 4 x 25Gb/s, 2 x 50Gb/s
17	xe-1/1/17	200Gb/s, 100Gb/s, 4 x 50Gb/s, 2 x 100Gb/s, 4 x 25Gb/s, 2 x 50Gb/s
18	xe-1/1/18	200Gb/s, 100Gb/s, 4 x 50Gb/s, 2 x 100Gb/s, 4 x 25Gb/s, 2 x 50Gb/s
19	xe-1/1/19	200Gb/s, 100Gb/s, 4 x 50Gb/s, 2 x 100Gb/s, 4 x 25Gb/s, 2 x 50Gb/s
20	xe-1/1/20	200Gb/s, 100Gb/s, 4 x 50Gb/s, 2 x 100Gb/s, 4 x 25Gb/s, 2 x 50Gb/s
21	xe-1/1/21	200Gb/s, 100Gb/s, 4 x 50Gb/s, 2 x 100Gb/s, 4 x 25Gb/s, 2 x 50Gb/s
22	xe-1/1/22	200Gb/s, 100Gb/s, 4 x 50Gb/s, 2 x 100Gb/s, 4 x 25Gb/s, 2 x 50Gb/s
23	xe-1/1/23	200Gb/s, 100Gb/s, 4 x 50Gb/s, 2 x 100Gb/s, 4 x 25Gb/s, 2 x 50Gb/s

28	xe-1/1/28	400Gb/s, 200Gb/s, 100Gb/s, 4 x 100Gb/s, 2 x 200Gb/s, 4 x 50Gb/s, 2 x 100Gb/s, 4 x 25Gb/s, 2 x 50Gb/s
29	xe-1/1/29	400Gb/s, 200Gb/s, 100Gb/s, 4 x 100Gb/s, 2 x 200Gb/s, 4 x 50Gb/s, 2 x 100Gb/s, 4 x 25Gb/s, 2 x 50Gb/s
30	xe-1/1/30	400Gb/s, 200Gb/s, 100Gb/s, 4 x 100Gb/s, 2 x 200Gb/s, 4 x 50Gb/s, 2 x 100Gb/s, 4 x 25Gb/s, 2 x 50Gb/s
31	xe-1/1/31	400Gb/s, 200Gb/s, 100Gb/s, 4 x 100Gb/s, 2 x 200Gb/s, 4 x 50Gb/s, 2 x 100Gb/s, 4 x 25Gb/s, 2 x 50Gb/s
32	xe-1/1/32	400Gb/s, 200Gb/s, 100Gb/s, 4 x 100Gb/s, 2 x 200Gb/s, 4 x 50Gb/s, 2 x 100Gb/s, 4 x 25Gb/s, 2 x 50Gb/s

N9600-64OD Switch Port Name Description

NOTE:

After you split a port into 8 x 100Gb/s, another port in the same group can only be split into 2 x 400Gb/s or remains unsplit due to chip limitations.

A group is defined as two adjacent ports. For example:

- xe-1/1/1 and xe-1/1/2 form a group. If xe-1/1/1 is split into 8 x 100Gb/s, xe-1/1/2 can only be split into 2 x 400Gb/s or remains unsplit.
- Similarly, xe-1/1/3 and xe-1/1/4 form another group, xe-1/1/5 and xe-1/1/6 form another, and so on up to xe-1/1/59 and xe-1/1/60.

Mapping between physical ports, interface names and interface support speed are in the following table.

Physical Port Number	Interface Names	Interface Support Speed
1	xe-1/1/1	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
2	xe-1/1/2	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
3	xe-1/1/3	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
4	xe-1/1/4	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s.

		Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
5	xe-1/1/5	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
6	xe-1/1/6	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
7	xe-1/1/7	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
8	xe-1/1/8	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
9	xe-1/1/9	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.

10	xe-1/1/10	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
11	xe-1/1/11	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
12	xe-1/1/12	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
13	xe-1/1/13	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
14	xe-1/1/14	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
15	xe-1/1/15	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s.

		Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
16	xe-1/1/16	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
17	xe-1/1/17	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
18	xe-1/1/18	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
19	xe-1/1/19	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
20	xe-1/1/20	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.

21	xe-1/1/21	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
22	xe-1/1/22	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
23	xe-1/1/23	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
24	xe-1/1/24	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
25	xe-1/1/25	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
26	xe-1/1/26	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s.

		Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
27	xe-1/1/27	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
28	xe-1/1/28	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
29	xe-1/1/29	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
30	xe-1/1/30	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
31	xe-1/1/31	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.

32	xe-1/1/32	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
33	xe-1/1/33	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
34	xe-1/1/34	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
35	xe-1/1/35	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
36	xe-1/1/36	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
37	xe-1/1/37	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s.

		Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
38	xe-1/1/38	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
39	xe-1/1/39	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
40	xe-1/1/40	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
41	xe-1/1/41	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
42	xe-1/1/42	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.

43	xe-1/1/43	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
44	xe-1/1/44	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
45	xe-1/1/45	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
46	xe-1/1/46	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
47	xe-1/1/47	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
48	xe-1/1/48	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s.

		Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
49	xe-1/1/49	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
50	xe-1/1/50	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
51	xe-1/1/51	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
52	xe-1/1/52	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
53	xe-1/1/53	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.

54	xe-1/1/54	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
55	xe-1/1/55	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
56	xe-1/1/56	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
57	xe-1/1/57	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
58	xe-1/1/58	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
59	xe-1/1/59	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s.

		Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
60	xe-1/1/60	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
61	xe-1/1/61	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
62	xe-1/1/62	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
63	xe-1/1/63	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.
64	xe-1/1/64	800Gb/s, 400Gb/s, 200Gb/s, 100Gb/s. Split speed: 2 x 400Gb/s, 4 x 200Gb/s, 8 x 100Gb/s. Reduced speed: 2 x 400Gb/s supports 200Gb/s and 100Gb/s; 4 x 200Gb/s supports 100Gb/s; 8 x 100Gb/s supports 50Gb/s.

Switch Installation

- Check the Installation Environment
- Install and Remove RPSU
- Install and Remove FRU
- Before Installation
- Installation
  - Install hangers, slide rail, grounding cable to the switch
  - Install the switch to the equipment cabinet
  - The Switch installation flow chart

Before Installation

Unpacking the Switch
Step 1 Carefully cut the tape that seals the shipping container, and open the top.
Step 2 Locate and remove the AC power cord kit.
Step 3 Lift the Switch from the container, and remove the two foam braces.
Step 4 Remove the antistatic bag from the Switch, and place the Switch on an antistatic mat.

Security Precaution
To ensure safe use and to prevent equipment damage, please follow the list below:

- Before cleaning switch, unplug the power cord.
- Prevent water or moisture from getting into the switch.
- Keep the vents unblocked.
- Ensure correct voltage is available.
- To reduce the risk of electric shock and to prevent electrostatic damage to components of the switch, do not open the cover when the switch is in use.

Check the Installation Environment

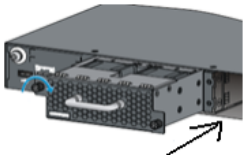
For proper and safe operation, the following conditions must be met prior to installation:

- Confirm that the cabinet itself has a good ventilation and cooling system.
- Confirm that the cabinet is strong enough to support the switches.
- Confirm that the cabinet is well grounded.
- To guarantee normal operation and service life of the switch, a stable temperature and humidity in the equipment room must be maintained.
- Keep the switch clean and maintain normal anti-interference standards.

Install and Remove FRU

The following instructions are used to replace an FRU (field-replaceable unit) on the switch:

1. Remove the faulty FRU from the switch.
2. Unpack the spare FRU, and double check to ensure that the FRU model is compatible with the switch.
3. Plug the FRU into the switch, moving slowly and using standard techniques to reduce electrostatic build-up.
4. Tighten the screws, and double check to make sure that the FRU is properly seated.

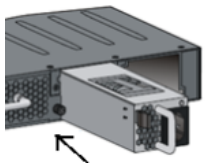


2-5-1 Installation FRU on switch schematic diagram
Remove FRU on the switch in the same way as installation.

Install and Remove RPSU

Installation of RPSU on the switch:
Step 1: Remove RPSU from the packaging box after ensuring the model is consistent with the switch.
Step 2: Plug the RPSU into the switch. Make sure the power supply module is in the right direction (from top to bottom).

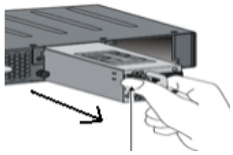
> In the process of plugging in the RPSU, move slowly and prevent electrostatic buildup using standard techniques.



2-4-1 Installation of RPSU on the switch schematic diagram.

Remove the RPSU from the switch in the same way. Remove the power line on the RPSU.

> In order to protect the RPSU, remove the RPSU on the anti-static bag.



2-4-2 Installation of RPSU on switch schematic diagram

> The P-3290 has only one RPSU. Its RPSU is fixed in the switch, so its RPSU cannot be plugged in and out.

Installation

- Install hangers, slide rail, grounding cable to the switch
- Install the switch to the equipment cabinet
- The Switch installation flow chart

Install hangers, slide rail, grounding cable to the switch

During the installation process, create adjustments according to requirements of installation, and select an appropriate location for hanging ears and grounding cable installations.

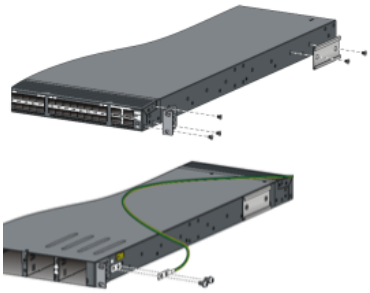
The instructions for how to install hanging ears and slide rails is as follows:

Step 1 Install the hangers to the case:
Line up the mounting holes of the hanging ears and the chassis side screw holes. Tighten the screws so that the hanging ears are fixed to the chassis.

Step 2 Install the slide guide rail to the chassis:

Line up the mounting holes of the slide guide rail and the side screw holes. Tighten the screws so that the slide guide rail is fixed to the chassis.

Step 3 Install the grounding screw, which connects the grounding cable to the screw holes.



2-1 Installation of hangers, slide rail and grounding cable diagram

Install the switch to the equipment cabinet

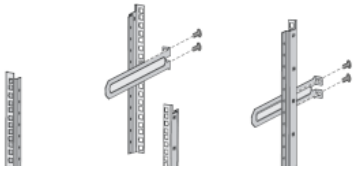
The instructions of how to install the switch on the cabinet is as follows:

Step 1 Allocate an area on the cabinet wherein the switch will be installed.

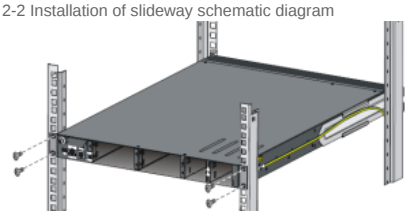
Step 2 Install the slideway on the equipment cabinet.

Step 3 Install the switch to the equipment cabinet. (Try to prevent electrostatic.)

> **NOTE:**
>
> For AG6248C, insert the external USB disk before installing the system, and install PicOS on the USB disk.

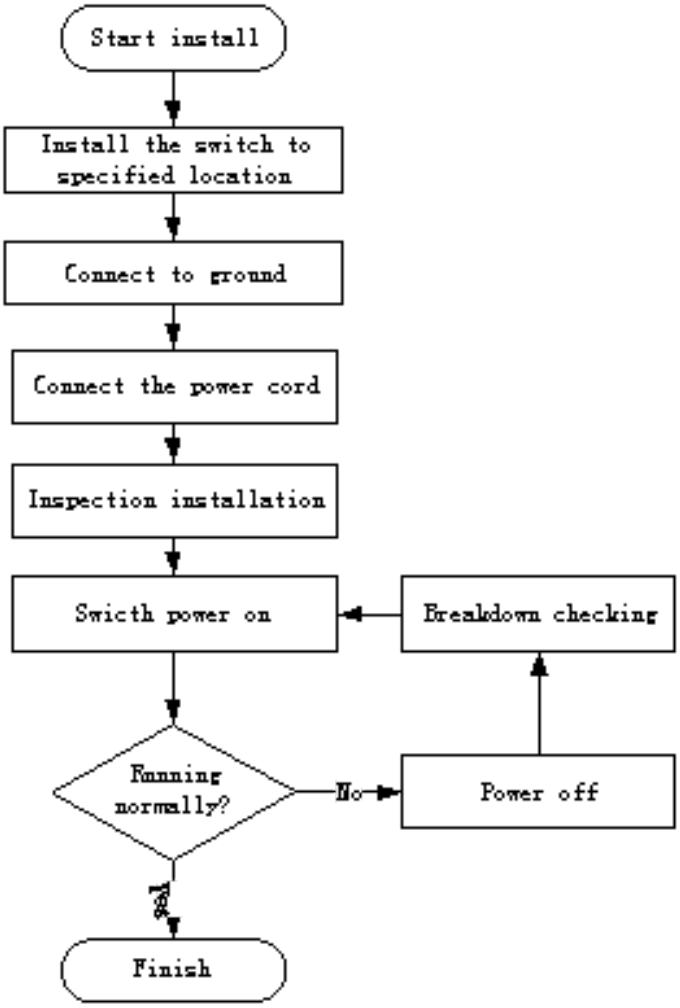


2-2 Installation of slideway schematic diagram



2-3 Installation the switch to the cabinet

The Switch installation flow chart



Flow Scalability per Broadcom Chipset

The maximum entries of OpenFlow Flows is often a critical piece of any SDN solution. This is a summary of Openflow Flow scalability per family of Chipset.

Chipset	ICAP (maximum entries in default or match modes)					ECAP (entries)	VCAP (entries)	L2 (maximum entries when buffer-mode is 5)	L3 (maximum entries when buffer-mode 5)			
	default	IPv4	IPv6	MAC	ARP				IPv4 host route	IPv4 forwarding route	IPv6 host route	IPv6 forwarding route
Helix4	2048	4096	2048	4096	2048	512	1024	32768	16384	6000	8192	3000
Trident 2	2048	4096	2048	4096	4096	512	512	32768	12000	12000	6000	6000

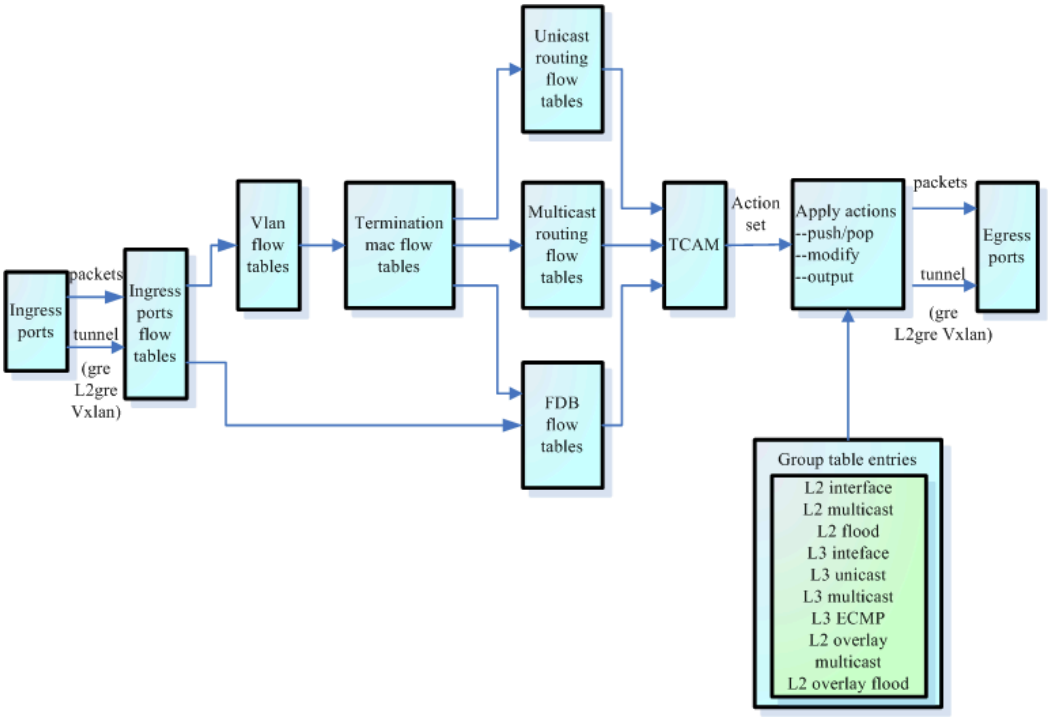
Switch Hardware Architecture

Most Top of Rack switches have the same general architecture. Once packets enter into a switch, they go through an ASIC "Pipeline" designed to make decisions on packets.

As an example, here is the simplified pipeline of a Broadcom chipset.



Here are definitions of the most common terminology to describe those architectures:

FIB - Forwarding Information Base or RoutingTable

FIB is a table memory used mainly to make IP destination prefix-based switching decisions.

The FIB is conceptually similar to a routing table or information base. It maintains a mirror image of the forwarding information contained in the IP routing table. When routing or topology changes occur in the network, the IP routing table is updated, and those changes are reflected in the FIB. The FIB maintains next-hop address information based on the information in the IP routing table.

TCAM - Ternary Content-addressable Memory

Ternary content-addressable memory (TCAM) is a memory type used mainly for QOS or ACL.
A TCAM is a specialized type of high-speed memory that searches all of its contents in a single clock cycle. The term “ternary” refers to its ability to store and query data using three different inputs: 0, 1 and X.

In addition, most modern ASIC switch architecture supports the ability to perform multiple lookups into multiple distinct TCAM regions (or slices) in parallel. As a result of this ability to perform multiple lookups simultaneously, modern switches do not suffer any performance degradation by enabling additional hardware-switching features, such as QoS and IP ACL processing.

PICOS System Configuration Guide

Getting Started

- Boot Process and U-Boot Environment
- Configuring Password for Entering Linux Shell
- Initial Switch Access
- The Default Login

Boot Process and U-Boot Environment

Before following the instructions in this section, user must have access to the switch console. User's terminal emulation software has to be configured with the following settings to ensure a successful console connection to the switch:

- **Baud rate:** 115200
- **Data bits:** 8
- **Stop bits:** 1

Modifying U-Boot Parameters

U-Boot (Universal Boot Loader) is an open source, primary boot loader for embedded devices. U-boot is used to package the instructions to boot the operating system kernel of a device. The following example shows the auto boot-up sequence:

```
U-Boot 1.3.0 (Sep 8 2014 - 16:39:03)
CPU:   8541, Version: 1.1, (0x80720011)
Core:  E500, Version: 2.4, (0x80200020)
Clock Configuration:
       CPU: 825 MHz, CCB: 330 MHz,
       DDR: 165 MHz, LBC:  41 MHz
L1:    D-cache 32 kB enabled
       I-cache 32 kB enabled
I2C:   ready
DRAM:  Initializing
initdram robin1
initdram robin2
robin before CFG_READ_SPD
robin after CFG_READ_SPD
initdram robin3
    DDR: 512 MB
FLASH: 32 MB
L2 cache 256KB: enabled
In:    serial
Out:   serial
Err:   serial
Net:   TSEC0, TSEC1
IDE:   Bus 0: OK
  Device 0: Model: CF 512MB Firm: 20060911 Ser#: TSS250160703090517 50
            Type: Hard Disk
            Capacity: 495.1 MB = 0.4 GB (1014048 x 512)
Hit any key to stop autoboot:  5
```

To modify the baud rate or other boot parameters, interrupt the boot sequence by hitting any key during auto boot. Once the boot sequence is interrupted, user is at the U-boot shell.

> Do not interrupt the default auto boot sequence unless the file system is being fixed or the console port settings are being changed.

The most common commands in U-Boot are:

- **help -** Get command line help.
- **printenv -** Show all environment variables. The U-Boot environment is a block of memory kept on persistent storage and copied to RAM when U-Boot starts. It stores environment variables used to configure the system.
- **version -** Show the U-Boot version.
- **setenv -** Set an environment variable.
- **saveenv -** Save the modification in the environment memory.

Use the **set** and **save** commands to reset the U-Boot environment variables. In the example below, the baud rate is set to 11520 with the **setenv baudrate 115200** command.

```
=> set baudrate 115200
=> save
Saving Environment to Flash...
Un-Protected 1 sectors
Erasing Flash...
. done
Erased 1 sectors
Writing to Flash... done
Protected 1 sectors
=> reset
```

PicOS switches do support Linux shutdown command. To shut down a switch, after running the “sudo shutdown -h now” command, disconnect the power supply.

Configuring Password for Entering Linux Shell

In CLI configure mode, you can use the following command to enter the Linux shell:

```
admin@PICOS# run start shell sh
admin@PICOS:~$
```

To enhance system security, PICOS supports setting a password for entering the Linux shell. The command **set system start-shell-sh password** can be used to configure the password when using command ***run start shell sh*** to entering Linux shell.

The configuration takes effect immediately after successfully commit.

When showing the configuration, the password is displayed as ciphertext.

Example

- Configure the password for entering Linux shell and enter Linux shell with this password.

```
admin@PICOS# set system start-shell-sh password 123456abc
admin@PICOS# commit
Commit OK.
Save done.
admin@PICOS# run start shell sh 123456abc
admin@PICOS:~$
```

Initial Switch Access

- Console Port
- Ethernet Management Port
- Assigning an IP Address to Management Interface
  - Configuring Management Interface
  - Configuration Example

Initial configuration of the switch requires user to connect either a terminal or a computer to the switch console port. Once user gets access to the switch and establishes CLI (command-line interface) over the serial console connection, then assign an IP address to the management port and create an IP route to the gateway. Keep the following points in mind:

- The console port provides local serial access to the switch.
- The Ethernet management port is used for out-of-band network management tasks. Before using the management port for the first time, an IP address must be assigned to that port.

Console Port

The console port is located at the front of the switch, as shown in Figure 1. User can connect a terminal or a computer to the console port using a serial or RS-232 cable. The accessory kit includes an RJ45 to DB9 adapter cable.

Port Settings

Use the following port settings to connect a terminal or a computer to the switch console port:

Baud rate: 115200

Data bits: 8

Stop bits: 1

The default width for a terminal session through the console port is 80 characters. That means that the width of the terminal client should be a minimum of 80 characters to properly use the console port. Most terminal client default width is 80 characters.

Ethernet Management Port

Pica8 switches provide one or two Ethernet management ports for switch configuration and out-of-band network management. Please see Figure 1, which shows the console and management ports of the Pica8 P-3930 switch. The port labelled *ETHERNET* is the management port, while the port labelled *CONSOLE* is the console port.

Figure 1 Console and Management Ports

Assigning an IP Address to Management Interface

Once granted initial access to the switch, user needs to configure the management IP address and default gateway in either L2/L3 mode or OVS mode. This section describes the configurarion in L2/L3 mode.

For detail of configuration in OVS mode, please refer to Configuring IP addressing in OVS mode.

The management IP address is used to maintain and manage the device. You can configure the management interface eth0 with static IP addresses or through dynamic address allocation using DHCP. If the static IP address is not assigned, the system will try to obtain the management port IP address dynamically from the DHCP server by default.

> **NOTE:**
>
> When switching from OVS mode to L2/L3 mode, the static IP address of the management port configured before will still be used if there is no user configuration for it in the new mode.

Configuring Management Interface

Step1 Set static IP addresses for management interface eth0.

set system management-ethernet eth0 ip-address {**IPv4** | **IPv6}** <*ip_address*>

> **NOTE:**
>
> If the static IP address is not assigned, the system will try to dynamically obtain the management port IP address from the DHCP server which is also the factory setting.

Step2 Set the gateway address for management interface eth0.

set system management-ethernet eth0 ip-gateway {**IPv4** | **IPv6}** <*ip_address*>

Configuration Example

Step1 Set static IP addresses for management interface eth0.

```
admin@Xorplus# set system management-ethernet eth0 ip-address IPv4 192.168.10.5/24
```

Step2 Set the gateway address for management interface eth0.

```
admin@Xorplus# set system management-ethernet eth0 ip-gateway IPv4 192.168.10.1
```

Step3 Commit the configuration.

```
admin@XorPlus# commit
```

Step4 Verify the configuration.

- Run **run show system management-ethernet** command to view the configuration information, status and traffic statistics information of the management interface.

```
admin@XorPlus# run show system management-ethernet
eth0     Hwaddr: 00:18:23:30:e5:72       State: UP
               Gateway  : 192.168.10.1
               Inet addr:
                   192.168.10.5/24
       Traffic statistics
               Input Packets.....................3620
               Input Bytes.......................462971
               Output Packets....................597
               Output Bytes......................75459
```

The Default Login

The Pica8 PicOS software operates in two modes.

L2/L3 (Layer 2/Layer 3) Mode: This is the default PicOS mode. In this mode, the switch is used for traditional Layer 2 switching and Layer 3 routing. The OVS daemon is ***not*** running in the L2/L3 mode.

OVS (Open vSwitch) Mode: In this mode, the switch is completely dedicated to Open vSwitch and the L2/L3 daemon is ***not*** running.

By default PicOS has two users, **root** and **admin**.

Password for the **admin** account must be manually set during the first login. User should use **pica8** as the password at first login. Then, the system will prompt user to change the default password. The new password is a string of 8 to 512 case-sensitive characters.

The PICOS Password Recovery process is available in the event of a forgotten password.

```
PICOS login: admin
Password: (input default password "pica8")
You are required to change your password immediately (administrator enforced)
Changing password for admin.
Current password: (input "pica8" again)
New password: (input new password: the new password should be no less than eight characters)
Retype new password: (input new password again)
Linux PICOS 5.10.23 #2 SMP Mon Aug 12 09:14:57 CST 2024 x86_64
Synchronizing configuration...OK.
Welcome to PICOS
admin@PICOS>
```

PICOS go2cli Version

For PICOS **go2cli** version, users login to the operation mode of PICOS CLI:

```
admin@PICOS>
```

At PICOS CLI prompt, run **start shell sh** to enter Linux shell.

```
admin@PICOS> start shell sh
admin@PICOS:~$
```

After entering Linux shell, user should use **sudo su** switch to **root** without a password.

```
admin@PICOS>
admin@PICOS> start shell sh
admin@PICOS:~$ sudo su
root@PICOS:/home/admin#
```

If you want to return from the Linux shell back to the CLI prompt, run "**exit**".

```
admin@PICOS:~$ exit
exit

admin@PICOS>
```

SSH Access to the Switch

After the switch starts up, the management interface (*eth0* or *inband-mgmt*) will be assigned an IP address by DHCP server or use factory default IP *192.168.1.1/24*. You can log in to the switch with this IP through SSH, the operation details are shown below.

Step 1 Users can check the management IP address through `ifconfig`.

```
admin@PICOS:~$ ifconfig
bridge0   Link encap:Ethernet  HWaddr 64:9D:99:D8:FD:09
          inet6 addr: fe80::669d:99ff:fed8:fd09/64 Scope:Link
          UP BROADCAST RUNNING MULTICAST  MTU:65535  Metric:1
          RX packets:279516 errors:0 dropped:0 overruns:0 frame:0
          TX packets:162318 errors:0 dropped:0 overruns:0 carrier:0

          inet6 addr: fe80::669d:99ff:fed8:fd07/64 Scope:Link
          UP BROADCAST RUNNING MULTICAST  MTU:1500  Metric:1
          RX packets:279433 errors:0 dropped:0 overruns:0 frame:0
          TX packets:162311 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0 txqueuelen:1000
          RX bytes:98578866 (94.0 MiB)  TX bytes:7598551 (7.2 MiB)
```

Step 2 You can log in to the switch with this IP through SSH.

```
C:\Users\Administrator>ssh admin@10.10.51.159
```

Connection Management

Pica8 switches support three connection methods:

- Console
- SSH

> By default, console and SSH are *enabled*.

Log in via console port:

The following example shows how user can connect to a switch via SSH with *admin* as username:

```
admin@PICOS> ssh 192.168.50.10 -l admin
admin@192.168.50.10's password:
Last login: Mon Oct 14 08:23:27 2024
Synchronizing configuration...OK.
Welcome to PICOS
admin@PICOS>
```

> By default, root login is disabled via SSH.

The following example enables *root* login via SSH:

```
admin@PICOS# set system services ssh root-login  allow
admin@PICOS# commit
Commit OK.
Save done.
```

⚠ The root user account password is locked (non-existent). If logging in via root, user needs to reset the password.

By default, a SSH session is never terminated. However, user can set a time limit for idle sessions. In other words, if a session is idle for certain time, it will automatically be terminated. Use the **set cli idle-timeout** command, in L2/L3 mode, to configure the maximum time in minutes a session can stay idle before it is terminated.

```
PICOS login: admin
Password:
Linux PICOS 5.10.23 #2 SMP Mon Aug 12 09:14:57 CST 2024 x86_64
Last login: Mon Oct 14 07:25:53 UTC 2024 on ttyS0
Synchronizing configuration...OK.
Welcome to PICOS
admin@PICOS> set cli idle-timeout 10
admin@PICOS>
```

Quick Configuration Guide

- Initial Setup
- Basic Configuration
- Network Configuration
- Security Configuration
- Typical Configuration Example

Initial Setup

Before performing the following operations, you should make sure that the device has been installed successfully. For detailed information of installing PicOS, see Installing or Upgrading PICOS.

Powering on the Switch

Logging in Switch through the Console Port

Powering on the Switch

Connect the switch to a power supply through the power cord, and then press the power button to power on the switch.

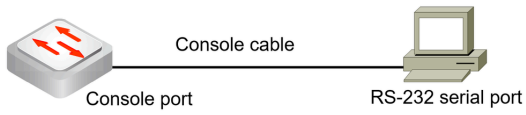
Logging in Switch through the Console Port

For initial system configuration, you should connect the switch to a terminal through the Console port.

Procedure

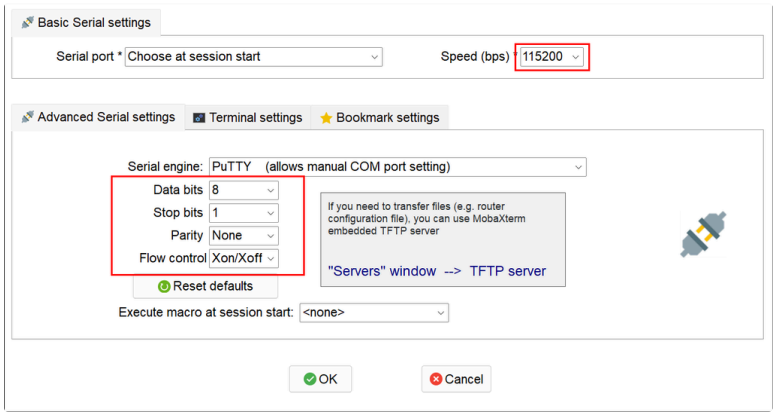
Step1 Connect the console port of the switch to the serial port of a PC through a console cable, as shown in the figure below.

Figure 1. Connetion of Console cable



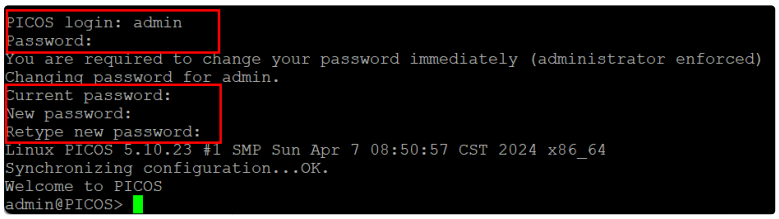
Step2 Open a terminal emulator (e.g., PuTTY) and configure it with the appropriate COM port settings, which should be the same with the switch related parameters. As shown in the figure below.

Figure 2. Serial Settings of Terminal Emulator



Step3 Enter the default administrator name **admin** and password **pica8** at the **PICOS login** and **password** prompts, and press **Enter**. Change the default password according to prompts, press **Enter**, and you can successfully log in CLI. As shown in the figure below.

Figure 3. Password Modification for First login



PICOS login: admin
Password:
You are required to change your password immediately (administrator enforced)
Changing password for admin.
Current password:
New password:
Retype new password:
Linux PICOS 5.10.23 #1 SMP Sun Apr 7 08:50:57 CST 2024 x86_64
Synchronizing configuration...OK.
Welcome to PICOS
admin@PICOS>

Basic Configuration

- Entering CLI Configuration Mode
- Configuring a Host Name
- Configuring the Management IP Address

Entering CLI Configuration Mode

PicOS supports different CLI modes, which are indicated by different prompts. Some commands can only be run in certain modes.

- Operation mode

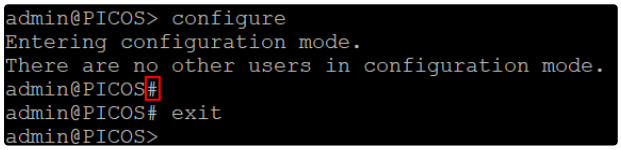
When log in PicOS CLI, you are in the operation mode by default. You can execute some basic configurations in this mode, such as clear and show, etc. **>** indicates the operation mode, as shown in the figure below.

Figure 1. Prompt of Operation Mode

- Configuration mode

You can configure the switch function in this mode, such as interface, routing, etc. Run **configure** in the operation mode to enter the configuration mode, and run **exit** to return to the operation mode. **#** indicates the configuration mode, as shown in the figure below.

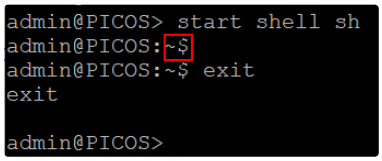
Figure 2. Prompt of Configuration Mode



- Linux shell mode

Run **start shell sh** in the operation mode to enter the Linux shell mode, and run **exit** to return to the operation mode. **~$** indicates the Linux shell mode, as shown in the figure below.

Figure 3. Prompt of Linux Shell Mode



After restarting PICOS using the command `sudo systemctl restart picos` in the Linux shell, entering `exit` will disconnect the current SSH session, requiring the user to log in again to access the device.

Configuring a Host Name

Overview

A host name distinguishes one device from another. The default host name is the system name PICOS. You can modify the host name as required.

Procedure

Step1 In the configuration mode, specify or modify a host name for the switch.

```
set system hostname <hostname>
```

Step2 Commit the configuration.

```
commit
```

Verifying the Configuration

After the configuration is completed, in the configuration mode, use **run show system name** command to view the new host name.

Other Configurations

To reset the hostname to default, use **delete system hostname** command.

Configuring the Management IP Address

Overview

To facilitate the device management and meet the requirement of separating the management traffic from the data traffic, the switch supports the in-band or out-of-band management interface with the factory default IP address 192.168.1.1/24. If the switch cannot obtain the IP address through DHCP, the factory default IP address is valid, and you can access it through PCs in the same network segment. Besides, you can manually configure the IP address as needed.

Procedure

Step1 In the configuration mode, specify the IP address for management interface.

```
set system management-ethernet eth0 ip-address {IPv4 | IPv6} <ip-address>

set l3-interface vlan-interface inband-mgmt address <ipv4-address | ipv6-address> prefix-length
<length>
```

Step2 Commit the configuration.

```
commit
```

Verifying the Configuration

After the configuration is completed, in the configuration mode, use **run show system management-ethernet** command to view the MAC address, IP address, state and traffic statistics.

Other Configurations

To clear the configuration of management interface, use **delete system management-ethernet eth0 ip-address** command.

Network Configuration

- Configuring an Interface
- Configuring the Routing

Configuring an Interface

Interfaces are used to exchange data and communicate with other network devices, which include physical interfaces and logical interfaces.

- Physical interface: exists on interface cards, which can be used for management and service.
  - Management interface: the switch supports a management interface eth0 by default, which is used to log in devices for configuration and management. For detailed information for the management interface, see Configuring the Management IP Address.
  - Service interface: can be used for service transmission, which includes Layer 2 Ethernet interfaces and Layer 3 Ethernet interfaces. By default, service interfaces of switch are all Layer 2 interfaces. To configure a Layer 2 interface as a Layer 3 interface, see the following chapter.
- Logical interface: not exists physically and is configured manually, which is used for service transmission. It includes Layer 3 interfaces, routed interfaces, loopback interfaces, etc.

It includes the following chapters:

- Configuring a loopback interface
- Configuring a Routed interface
- Configuring a VLAN Interface

Configuring a loopback interface

Overview

The loopback interface is always up to ensure network reliability, which has the following features:

- It is always up and has the loopback feature.
- It can be configured with the mask of all 1s.

Based on the features, the loopback interface has the following applications:

- The IP address of a loopback interface is specified as the source address of packets to improve network reliability.
- When no Router ID is configured for dynamic routing protocols, the maximum IP address of the loopback interface is configured as the router ID automatically.

Procedure

Step1 In the configuration mode, specify the name and IP address for the loopback interface.

```
set l3-interface loopback <loopback-name> address <ipv4-address> prefix-length 32
set l3-interface loopback <loopback-name> address <ipv6-address> prefix-length 128
```

Step2 Commit the configuration.

```
commit
```

Verifying the Configuration

After the configuration is completed, in the configuration mode, use **run show l3-interface loopback** <*loopback-name*> command to view the state, IP address, description and traffic statistics.

Other Configurations

By default, the loopback interface is enabled when created. To disable the loopback interface, use **set l3-interface loopback** <*interface-name*> **disable** command.

To clear the configuration of loopback interface, use **delete l3-interface loopback interface** <*interface-name*> command.

Configuring a Routed interface

Overview

All Ethernet ports of switch are Layer 2 interfaces by default. When you need to use an Ethernet port for Layer 3 communication, you can enable the Ethernet port as a routed interface. The routed interface is a Layer 3 interface which can be assigned an IP address and can be configured with a routing protocol to connect to other Layer 3 routing devices.

Procedure

Step1 In the configuration mode, set reserved VLANs for the use of routed interface.

set vlans reserved-vlan <*reserved-vlan*>

- **reserved-vlan** <*reserved-vlan*>: specifies the reserved VLANs. The valid VLAN numbers range is 2-4094. User can specify a range of VLAN numbers, e.g. 2,3,50-100. System supports up to 128 reserved VLANs.

Step2 Select a physical interface as the routed interface and specify a name.

set interface gigabit-ethernet <*interface-name*> **routed-interface name** <*string*>

- **routed-interface name** <*string*>**:** specifies a routed interface name.

The name must start with "rif-", for example, rif-ge1.

Step3 Enable the routed interface.

set interface gigabit-ethernet <*interface-name*> **routed-interface enable true**

Step4 Configure an IP address for the routed interface.

set l3-interface routed-interface <*string*> **address** <*ipv4-address* | *ipv6-address*> **prefix-length** <*prefix-number*>

- **prefix-length** <*prefix-number*>: specifies the network prefix length. The range is 4-32 for IPv4 address, and 1-128 for IPv6 address.

Step5 Commit the configuration.

commit

Verifying the Configuration

After the configuration is completed, in the configuration mode, use **run show l3-interface routed-interface** <*interface-name*> command to view the state, IP address, MAC address, VLAN, MTU, description and traffic statistics.

Other Configurations

To disable the routed interface, use **set interface gigabit-ethernet** <*interface-name*> command.

Configuring a VLAN Interface

Overview

By default, the native VLAN of all physical interfaces is VLAN 1, which can implement Layer 2 communication. To implement Layer 3 communication between users in different VLANs and network segments, you can configure the VLAN interface, which is a Layer 3 logical interface.

Procedure

Step1 In the configuration mode, create a VLAN.

The VLAN ID has been pre-configured in system from version 4.3.2 and you don't need to configure it.

set vlans vlan-id <*vlan-id*>

- **vlan-id** <*vlan-id*>: specifies the VLAN tag identifier. The valid VLAN numbers range 1-4094. User can specify a range of VLAN numbers, e.g. 2,3,5-100.

Step2 Specify the created VLAN as the native VLAN for a physical interface.

set interface gigabit-ethernet <*interface-name*> **family ethernet-switching native-vlan-id** <*vlan-id*>

Step3 Associate a Layer 3 interface with the VLAN.

set vlans vlan-id <*vlan-id*> **l3-interface** <*interface-name*>

- **l3-interface** <*interface-name*>*:* specifies a name for the Layer 3 interface.

Step4 Configure an IP address for the VLAN interface.

set l3-interface vlan-interface <*interface-name*> **address** <*ipv4-address* | *ipv6-address*> **prefix-length** <*prefix-number*>

Step5 Commit the configuration.

commit

Verifying the Configuration

After the configuration is completed, in the configuration mode, use **run show l3-interface vlan-interface** <*interface-name*> command to view the state, IP address, MAC address, VLAN, MTU, description and traffic statistics.

Other Configurations

To clear the configuration of VLAN interface, use **delete l3-interface vlan-interface** <*interface-name*> command.

Configuring the Routing

Routing is a process of forwarding packets from one network to a destination address in another network. The implement of route selection and packet forwarding is based on various routes stored in the routing table. To maintain the routing table, you can manually add or configure different routing protocols.

The switch supports direct routing, static routing and dynamic routing.

- Direct routing: discovered by a data link layer protocol.
- Static routing: manually configured.
- Dynamic routing: discovered by a dynamic routing protocol.

It includes the following chapters:

- Configuring the Static Routing
- Configuring the Dynamic Routing

Configuring the Static Routing

Overview

The static routing is manually configured, which requires low system performance and is applicable to small-size network with simple and stable topologies.

Procedure

Before configuring the routing, make sure that the Layer 3 interface has been configured.

Step1 By default, the IP routing function is disabled. In the configuration mode, enable the IP routing function.

```
set ip routing enable true
```

Step2 Specify the destination address, and configure one of next-hop IP address and outgoing interface as needed.

set protocols static route <*ip/prefixlen*> **next-hop** <*nexthop-address*>

- **route** <*ip/prefixlen*>: specifies a destination IPv4 or IPv6 address and the prefix length of 1 to 32 for IPv4 and 1 to 128 for IPv6.
- **next-hop** <*nexthop-address*>: specifies the next-hop IP address.

set protocols static interface-route <*ip/prefixlen*> **interface** <*interface-name*>

- **interface** <*interface-name*>: specifies the Layer 3 interface as an outgoing interface. The value could be a VLAN interface, loopback interface, routed interface or sub-interface.

Step3 Commit the configuration.

```
commit
```

Verifying the Configuration

After the configuration is completed, in the configuration mode, use **run show route static** command to view all static routing entries.

Other Configurations

To clear the configuration of static interface, use **delete protocols static route**<*ip/prefixlen*> command.

Configuring the Dynamic Routing

The dynamic routing is based on algorithm, which requires higher system performance. It is applicable to network with a large number of Layer 3 devices, and can automatically adapt to the changeable network topology.

The switch supports multiple dynamic routing, such as OSPF, BGP, IS-IS, etc. OSPF is the IGP (Interior Gateway Protocol) recommended by PicOS. Take the OSPF routing as an example to introduce how to configure a dynamic routing.

Overview

OSPF (Open Shortest Path First) is developed by IETF (Internet Engineering Task Force), which uses the shortest path first (SPF) algorithm to calculate a shortest path tree (SPT) to all destination addresses based on the network topology, and is advertised through link state advertisements (LSAs). It is applicable to the network with several hundred devices, such as small and medium-sized enterprises networks.

PicOS supports OSPFv2 and OSPFv3, which is respectively intended for IPv4 and IPv6.

Procedure

Before configuring the routing, make sure that the Layer 3 interface has been configured.

Step1 By default, the IP routing function is disabled. In the configuration mode, enable the IP routing function.

set ip routing enable true

Step2 Set the OSPF router ID.

set protocols ospf router-id <*router-id*>

- **router-id** <*router-id*>: specifies the OSPF router ID, which can uniquely identify the switch within the domain. The value is in IPv4 dotted decimal format.

Step3 Add the specified network segment to an area. Area 0 is required.

set protocols ospf network <*ipv4/prefixlen*> **area** {<*area-id* | *ipv4*>}

- **network** <*ipv4/prefixlen*>: specifies the network prefix and prefix length in IPv4 format.
- **area** {<*area-id* | *ipv4*>}: specifies the OSPF area, the value could be in IPv4 dotted decimal format or an integer ranging from 0 to 4294967295.

Step4 Commit the configuration.

commit

Verifying the Configuration

After the configuration is completed, in the configuration mode, use **run show route ospf** command to view all OSPF routing entries.

Other Configurations

To delete the OSPF routing configuration, use **delete protocols ospf** command.

Security Configuration

- Configuring an ACL
- Configuring the SSH Access

Configuring an ACL

Overview

ACL (Access Control List) is packet filtering rules through defining conditions of source addresses, destination addresses, interfaces, etc. The switch permits or denies packets according to the configured action of ACL rules.

ACL can manage network access behaviors, prevent network attacks, and improve bandwidth utilization through accurately identifying and controlling packets, which ensures network security and service quality.

Procedure

Step1 Set the sequence number of priority.

set firewall filter <*filter-name*> **sequence** <*sequence-number*>

- **sequence** <*sequence-number*>: specifies the sequence number. Smaller values represent higher priorities. The range is 0-9999.

Step2 Specify the source address and source port to filter matched packets.

set firewall filter <*filter-name*> **sequence** <*sequence-number*> **from** {**source-address-ipv4** <*address/prefix-length*> | **source-address-ipv6** < *address/prefix-length* > | **source-mac-address** <*mac-address*> | **source-port** <*port-number*>}

- **source-port** <*port-number*>: specifies the source port number or port number range, for example, 5000 or 7000..7050.

Step3 Specify the execution action for packets matching the filter.

set firewall filter <*filter-name*> **sequence** <*sequence-number*> **then action** {**discard** | **forward**}

- **action** {**discard** | **forward**}: discards or forwards matched packets.

Step4 Specify the physical interface, VLAN interface or routed interface to filter matched incoming and egress packets.

set firewall filter <*filter-name*> **input** {**interface** <*interface-name* > | **vlan-interface** <*vlan-interface-name*> | **routed-interface** <*routed-interface-name*>}

set firewall filter <*filter-name*> **output** {**interface** <*interface-name*> | **vlan-interface** <*vlan-interface-name*> | **routed-interface** <*routed-interface-name*>}

Step5 Commit the configuration.

commit

Verifying the Configuration

After the configuration is completed, in the configuration mode, use **run show filter** <*filter-name*> **[sequence** <*sequence-number*>] command to view the matching condition of specified filter.

Other Configurations

To delete the configured filter, use **delete firewall filter**<*filter-name*> command.

Configuring the SSH Access

Overview

SSH (Secure Shell) is an encryption network protocol, which can perform secure access and file transmission in the unsecured network. It performs data exchange through a secure channel, which is established based on TCP. The default port is 22, which can be changed as required for security purposes.

Procedure

By default, the SSH service is enabled. You can log in switch through SSH protocol by directly access eth0. Besides, if you want to remotely log in and manage the switch through the Layer 3 interface, you should configure as follows:

Step1 In the configuration mode, specify the loopback interface, VLAN interface or routed interface as the inband management port, both management traffic and data plane traffic can be transmitted through the specified interface. The specified interface should be in the default VRF.

set system inband {**loopback** <*ip-address*> | **vlan-interface** <*vlan-interface-name*> | **routed-interface** <*routed-interface-name*>}

Step2 (Optional) Set the limit number of SSH connections.

set system services ssh connection-limit <*int*>

- **connection-limit** <*int*>: specifies the maximum number of allowed connections, the valid number ranges 0-250. Default value is 0, which removes the connection limit.

Step3 (Optional) Specify the listening port number of SSH server.

set system services ssh port <*port-number*>

- **port** <*port-number*>: specifies the listening port number of the SSH server. The value is an integer ranging from 1 to 65535. Th default value is 22.

Step4 Commit the configuration.

commit

Verifying the Configuration

After the configuration is completed, use **ssh admin**@<*ip-address*> **-p** <*port*> to check whether the switch can be accessed through SSH.

Other Configurations

To disable the SSH service, use **set system services ssh disable true** command.

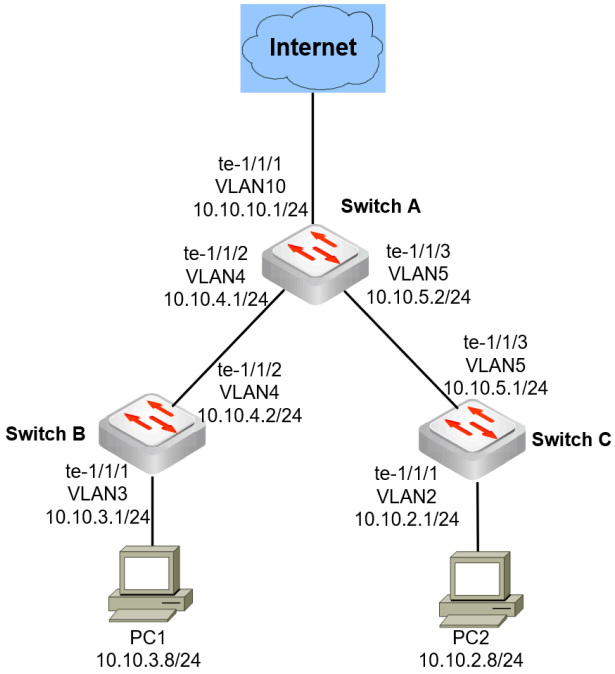
To delete the SSH configuration, use **delete system services ssh** command.

Typical Configuration Example

Overview

Take the following topology as an example to introduce how to implement communication between PC1 and PC2.

Figure 1. Topology of Access Network



The data plan is shown as below.

Device	Interface	VLAN and IP Address	
Switch A	te-1/1/1	VLAN: 10	IP address: 10.10.10.1/24
	te-1/1/2	VLAN: 4	IP address: 10.10.4.1/24
	te-1/1/3	VLAN: 5	IP address: 10.10.5.2/24
Switch B	te-1/1/1	VLAN: 3	IP address: 10.10.3.1/24
	te-1/1/2	VLAN: 4	IP address: 10.10.4.2/24
Switch C	te-1/1/1	VLAN: 2	IP address: 10.10.2.1/24
	te-1/1/3	VLAN: 5	IP address: 10.10.5.1/24
PC1	10.10.3.8/24		
PC2	10.10.2.8/24		

Procedure

Before configuring the following steps, make sure you have logged in the specified switch through Console port or SSH. For detailed information, see Initial Setup and Configuring the SSH Access.

Step1 In the configuration mode, configure the host name of switch respectively as SwitchA, SwitchB and SwitchC.

```
admin@PICOS> configure
admin@PICOS# set system hostname SwitchA
admin@PICOS# commit
admin@SwitchA#
```

Run the same command on other switches to change the hostname as SwitchB and SwitchC.

Step2 Configure the interface and VLAN.

- **Switch A**

Interface te-1-1-1:

```
admin@SwitchA# set vlans vlan-id 10
admin@SwitchA# set interface gigabit-ethernet te-1/1/1 family ethernet-switching native-vlan-id 10
admin@SwitchA# set vlans vlan-id 10 l3-interface vlan10
admin@SwitchA# set l3-interface vlan-interface vlan10 address 10.10.10.1 prefix-length 24
admin@SwitchA# commit
```

Interface te-1-1-2:

```
admin@SwitchA# set vlans vlan-id 4
admin@SwitchA# set interface gigabit-ethernet te-1/1/2 family ethernet-switching native-vlan-id 4
admin@SwitchA# set vlans vlan-id 4 l3-interface vlan4
admin@SwitchA# set l3-interface vlan-interface vlan4 address 10.10.4.1 prefix-length 24
admin@SwitchA# commit
```

Interface te-1-1-3:

```
admin@SwitchA# set vlans vlan-id 5
admin@SwitchA# set interface gigabit-ethernet te-1/1/3 family ethernet-switching native-vlan-id 5
admin@SwitchA# set vlans vlan-id 5 l3-interface vlan5
admin@SwitchA# set l3-interface vlan-interface vlan5 address 10.10.5.2 prefix-length 24
admin@SwitchA# commit
```

- **Switch B**

Interface te-1-1-1:

```
admin@SwitchB# set vlans vlan-id 3
admin@SwitchB# set interface gigabit-ethernet te-1/1/1 family ethernet-switching native-vlan-id 3
admin@SwitchB# set vlans vlan-id 3 l3-interface vlan3
admin@SwitchB# set l3-interface vlan-interface vlan3 address 10.10.3.1 prefix-length 24
admin@SwitchB# commit
```

Interface te-1-1-2:

```
admin@SwitchB# set vlans vlan-id 4
admin@SwitchB# set interface gigabit-ethernet te-1/1/2 family ethernet-switching native-vlan-id 4
admin@SwitchB# set vlans vlan-id 4 l3-interface vlan4
admin@SwitchB# set l3-interface vlan-interface vlan4 address 10.10.4.2 prefix-length 24
admin@SwitchB# commit
```

- **Switch C**

Interface te-1-1-1:

```
admin@SwitchC# set vlans vlan-id 2
admin@SwitchC# set interface gigabit-ethernet te-1/1/1 family ethernet-switching native-vlan-id 2
admin@SwitchC# set vlans vlan-id 2 l3-interface vlan2
admin@SwitchC# set l3-interface vlan-interface vlan2 address 10.10.2.1 prefix-length 24
admin@SwitchC# commit
```

Interface te-1-1-3:

```
admin@SwitchC# set vlans vlan-id 5
admin@SwitchC# set interface gigabit-ethernet te-1/1/3 family ethernet-switching native-vlan-id 5
admin@SwitchC# set vlans vlan-id 5 l3-interface vlan5
admin@SwitchC# set l3-interface vlan-interface vlan5 address 10.10.5.1 prefix-length 24
admin@SwitchC# commit
```

Step3 Configure the IP address and default gateway of PC1 and PC2.

PC1:

```
PC1> ip 10.10.3.8 255.255.255.0 10.10.3.1
Checking for duplicate address...
PC1 : 10.10.3.8 255.255.255.0 gateway 10.10.3.1
```

PC2:

```
PC2> ip 10.10.2.8 255.255.255.0 10.10.2.1
Checking for duplicate address...
PC2 : 10.10.2.8 255.255.255.0 gateway 10.10.2.1
```

Step4 Configure the routing. You can configure the static routing or OSPF routing to connect network.

- **Connecting network through the static routing**

Switch A:

```
admin@SwitchA# set ip routing enable true
admin@SwitchA# set protocols static route 10.10.2.0/24 next-hop 10.10.5.1
admin@SwitchA# set protocols static route 10.10.3.0/24 next-hop 10.10.4.2
admin@SwitchA# commit
```

Switch B:

```
admin@SwitchB# set ip routing enable true
admin@SwitchB# set protocols static route 0.0.0.0/0 next-hop 10.10.4.1
admin@SwitchB# commit
```

Switch C:

```
admin@SwitchC# set ip routing enable true
admin@SwitchC# set protocols static route 0.0.0.0/0 next-hop 10.10.5.2
admin@SwitchC# commit
```

- **Connecting network through the OSPF routing**

Switch A:

```
admin@SwitchA# set l3-interface loopback lo address 1.1.1.1 prefix-length 32
admin@SwitchA# set protocols ospf router-id 1.1.1.1
admin@SwitchA# set protocols ospf network 10.10.4.0/24 area 0
admin@SwitchA# set protocols ospf network 10.10.10.0/24 area 0
```

```
admin@SwitchA# set protocols ospf network 10.10.5.0/24 area 1
admin@SwitchA# commit
```

Switch B:

```
admin@SwitchB# set l3-interface loopback lo address 2.2.2.2 prefix-length 32
admin@SwitchB# set protocols ospf router-id 2.2.2.2
admin@SwitchB# set protocols ospf network 10.10.4.0/24 area 0
admin@SwitchB# set protocols ospf network 10.10.3.0/24 area 0
admin@SwitchB# commit
```

Switch C:

```
admin@SwitchC# set l3-interface loopback lo address 3.3.3.3 prefix-length 32
admin@SwitchC# set protocols ospf router-id 3.3.3.3

admin@SwitchC# set protocols ospf network 10.10.5.0/24 area 1
admin@SwitchC# commit
```

Verifying the Configuration

- **View the routing table of each switch.**

1. Static Routing:

Figure2. Static Routing Entries of SwitchA

```
admin@SwitchA# run show route static
RIB entry for static
====================
Codes: K - kernel route, C - connected, S - static, R - RIP,
       O - OSPF, B - BGP, T - Table, D - SHARP, F - PBR,
       > - selected route, * - FIB route, q - queued, r - rejected, b - backup
       t - trapped, o - offload failure

S>* 10.10.2.0/24 [1/0] via 10.10.5.1, vlan5, weight 1, 00:07:36
S>* 10.10.3.0/24 [1/0] via 10.10.4.2, vlan4, weight 1, 00:07:36
```

Figure3. Static Routing Entries of SwitchB

```
admin@SwicthB# run show route static
RIB entry for static
====================
Codes: K - kernel route, C - connected, S - static, R - RIP,
       O - OSPF, B - BGP, T - Table, D - SHARP, F - PBR,
       > - selected route, * - FIB route, q - queued, r - rejected, b - backup
       t - trapped, o - offload failure

S>* 0.0.0.0/0 [1/0] via 10.10.4.1, vlan4, weight 1, 00:10:38
```

Figure4. Static Routing Entries of SwitchC

```
admin@SwitchC# run show route static
RIB entry for static
====================
Codes: K - kernel route, C - connected, S - static, R - RIP,
       O - OSPF, B - BGP, T - Table, D - SHARP, F - PBR,
       > - selected route, * - FIB route, q - queued, r - rejected, b - backup
       t - trapped, o - offload failure

S>* 0.0.0.0/0 [1/0] via 10.10.5.2, vlan5, weight 1, 00:13:07
```

2. OSPF Routing:

Figure5. OSPF Routing Entries of SwitchA

```
admin@SwitchA# run show route ospf
RIB entry for ospf
==================
Codes: K - kernel route, C - connected, S - static, R - RIP,
       O - OSPF, B - BGP, T - Table, D - SHARP, F - PBR,
       > - selected route, * - FIB route, q - queued, r - rejected, b - backup
       t - trapped, o - offload failure

O>* 10.10.2.0/24 [110/200] via 10.10.5.1, vlan5, weight 1, 00:05:42
O>* 10.10.3.0/24 [110/200] via 10.10.4.2, vlan4, weight 1, 00:05:42
O   10.10.4.0/24 [110/100] is directly connected, vlan4, weight 1, 00:05:52
O   10.10.5.0/24 [110/100] is directly connected, vlan5, weight 1, 00:06:30
O   10.10.10.0/24 [110/100] is directly connected, vlan10, weight 1, 00:06:30
```

Figure6. OSPF Routing Entries of SwitchB

```
admin@SwitchB# run show route ospf
RIB entry for ospf
==================
Codes: K - kernel route, C - connected, S - static, R - RIP,
       O - OSPF, B - BGP, T - Table, D - SHARP, F - PBR,
       > - selected route, * - FIB route, q - queued, r - rejected, b - backup
       t - trapped, o - offload failure

O>* 10.10.2.0/24 [110/300] via 10.10.4.1, vlan4, weight 1, 00:10:41
O   10.10.3.0/24 [110/100] is directly connected, vlan3, weight 1, 00:11:27
O   10.10.4.0/24 [110/100] is directly connected, vlan4, weight 1, 00:11:27
O>* 10.10.5.0/24 [110/200] via 10.10.4.1, vlan4, weight 1, 00:10:41
O>* 10.10.10.0/24 [110/200] via 10.10.4.1, vlan4, weight 1, 00:10:41
```

Figure7. OSPF Routing Entries of SwitchC

```
admin@SwitchC# run show route ospf
RIB entry for ospf
==================
Codes: K - kernel route, C - connected, S - static, R - RIP,
       O - OSPF, B - BGP, T - Table, D - SHARP, F - PBR,
       > - selected route, * - FIB route, q - queued, r - rejected, b - backup
       t - trapped, o - offload failure

O   10.10.2.0/24 [110/100] is directly connected, vlan2, weight 1, 00:14:17
O>* 10.10.3.0/24 [110/300] via 10.10.5.2, vlan5, weight 1, 00:13:32
O>* 10.10.4.0/24 [110/200] via 10.10.5.2, vlan5, weight 1, 00:13:32
O   10.10.5.0/24 [110/100] is directly connected, vlan5, weight 1, 00:14:16
O>* 10.10.10.0/24 [110/200] via 10.10.5.2, vlan5, weight 1, 00:13:32
```

- **Run Ping command to check the connectivity between PC1 and PC2.**

1. PC1 ping PC2:

Figure8. Result of PC1 Ping PC2

```
root@UbuntuDockerGuest-1:~# ping 10.10.2.8
PING 10.10.2.8 (10.10.2.8) 56(84) bytes of data.
64 bytes from 10.10.2.8: icmp_seq=1 ttl=61 time=29.1 ms
64 bytes from 10.10.2.8: icmp_seq=2 ttl=61 time=1.99 ms
64 bytes from 10.10.2.8: icmp_seq=3 ttl=61 time=2.29 ms
64 bytes from 10.10.2.8: icmp_seq=4 ttl=61 time=3.27 ms
64 bytes from 10.10.2.8: icmp_seq=5 ttl=61 time=3.92 ms
64 bytes from 10.10.2.8: icmp_seq=6 ttl=61 time=2.44 ms
```

2. PC2 ping PC1:

Figure9. Result of PC2 Ping PC1

```
root@UbuntuDockerGuest-2:~# ping 10.10.3.8
PING 10.10.3.8 (10.10.3.8) 56(84) bytes of data.

```

Installing or Upgrading PICOS

This section details the procedure used to install Pica8 PICOS software.

- ONIE Version and BIOS/U-Boot Information of Verified Platforms
- Installing PICOS on Bare Metal Switches
- Upgrading PICOS from Version 4.0.0 or Later Using Upgrade Command
- Upgrading PICOS from Version 3.0 or Later Using Upgrade2
- Installing Debian Packages on PICOS
  - Installing GCC on PicOS
  - Installing Puppet on PicOS
  - Installing Salt on PicOS
- PICOS Installation and Upgrade Guide for FS S5810 Series, S3410 Series, S5860 Series and N8560-32C Switches
  - Upgrading PICOS for FS S5810/S5860 Series Switches Using Upgrade Command (Login via Console Port)
  - Upgrading PICOS by Using Upgrade2 for S5860 Series and S3410 Series Switches (Login via Console Port)
  - Installing PICOS for FS S5810/S5860 Series and N8560-32C Switches
  - Installing PICOS for FS S3410 Series Switches
  - Upgrading PICOS for FS S5810/S5860 Series Switches Using Upgrade Command (Login via Eth0 or Inband Management Interface)
  - Upgrading PICOS by Using Upgrade2 for S5860 Series and S3410 Series Switches (Login via Eth0 or Inband Management Interface)
- PICOS Debian Package Upgrade User Guide

ONIE Version and BIOS/U-Boot Information of Verified Platforms

The ONIE and BIOS/U-Boot Version information of platforms verified in the lab are listed below. The users can find the ONIE version information in the **onie-syseeprom** command output.

Platform	BIOS/U-Boot Version	ONIE Version

  - Solution

Introduction

When using ONIE installer to install PICOS, the installer reinstalls the software, rebuilds all the PICOS file system. This can erase the configuration files and system logs from the previous installation.

After a successful ONIE installation of PICOS 4.x, the system generates multiple system partitions including PicOS (partition size: 2G), PicOS2 (partition size: 2G) and User-Data partitions. Among them, PicOS and PicOS2 are two independent system boot partitions. One of them is the active partition on which the running system resides, and the other is the inactive partition. The two-system-boot-partition feature allows the system to revert to a previous version of the installed software package when the it fails to upgrade PICOS by using upgrade2 command.

The ONIE installer removes all partitions to rebuild a brand new OS only when there is no User-Data partition. However, if there exists a User-Data partition (for example, install a new version 4.0.1 from the old one 4.0.0), the ONIE installer only rewrites the "PicOS" partition, installs the new installation package to this partition and sets the system on "PicOS" partition as the default and sole boot system.

User-Data partition is a reserved partition which is not affected by ONIE installer and upgrade unless user manually removes it. User-Data partition uses all the available space left on the disk. Users can use this partition to store files and data.

This document describes how to install PICOS 4.x software using ONIE installer.

Installation Notes and Tools

The installation methods used to install a new PICOS are traditional installation and nos-boot-mode installation. You can choose a suitable installation method that is convenient and appropriate for your installation environment.

- If you want to install PICOS through a console port, refer to sections Traditional Installation or Nos-boot-mode Installation.
- If you want to install the PICOS through a non-console port (through the management port), refer to section Nos-boot-mode Installation.

- You need to log in through the console port of the switch and perform the ONIE installation.
- Other NOSes including user data will be removed when install PICOS under ONIE environment.
- When the ONIE installer is used to downgrade the PICOS version from version 4.x to PICOS 3.x or lower versions, we first need to use ONIE to uninstall the higher version PICOS before proceeding with installing PICOS 3.x or a lower version. On the ARM platform, execute the **onie_uninstaller** command at the ONIE prompt to uninstall the current version PICOS. On the x86 platform, select the "**ONIE: Uninstall OS**" option in the GRUB menu to uninstall the current version PICOS.
- If you enter GRUB rescue mode and the switch has GPT format partition, you can use the following commands to reset the GRUB boot variable to enter ONIE GRUB and then install PICOS.

  ```
  grub rescue> set prefix=(hd0,gpt2)/grub
  grub rescue> set root=(hd0,gpt2)
  grub rescue> insmod normal
  grub rescue> normal
  ```

- Do not plug in the USB disk during onie-nos-installer process until ONIE starts up. If you have plugged in the USB disk before the installation operation, ONIE will find the installer on the USB disk when beginning the installation. On AS4610 series switches, when installation is complete, the installer will display: **Please take out the usb disc**, then remove the USB disk within 10 seconds after installation successful, and before machine restarts.
- All X86 platforms share one installation and upgrade package with the name fixed as: **onie-installer-picos-VERSION-x86.bin**, where **VERSION** is the release version. X86 platform are listed below:
  - FS N9550-32D
  - FS N8550-64C
  - FS N5850-48S6Q
  - FS N8550-48B8C

What is ONIE

ONIE (Open Network Install Environment) is an open source project of OCP (Open Compute Project). ONIE provides the environment to install any network operating system on a bare metal network switch. ONIE liberates users from captive pre-installed network operating systems, like the Cisco IOS, and provides them with a choice.

ONIE is a small Linux operating system that comes pre-installed as firmware on bare metal network switches. ONIE acts as an enhanced boot loader, extending the features provided by U-Boot. ONIE is used to install Pica8 PICOS on compatible switches. The bare metal switches listed in the PICOS Hardware Compatibility List must be pre-loaded with ONIE prior to installing PICOS.

Traditional Installation

NOTE :

- You need to log in through the console port of the switch and perform the ONIE installation described in this section.
- The installation method described in this section only applies to platforms that have pre-installed ONIE.

Mind Map of Installation Process

Figure1 shows the mind map of PICOS installation process.

Figure1 Mind Map of PICOS installation process

Manual Installation Process

The following example describes the installation of PICOS via manual installation method.

Step1 Make sure that the installation package of **.bin** file has been load to the server (server could be HTTP, TFTP, or an FTP server or the switch local directory depending on the actual installation environment).

Step2 Enter ONIE installation environment. The process is different on the following two types of platforms:

- **ARM Platforms (AS4610 Series Switches)**
- **x86 Platform**

- **ARM Platforms (AS4610 Series Switches)**

a) Verify that the switch is pre-loaded with ONIE, which will be used to load PICOS on the switch. Power on the switch and interrupt the boot sequence by pressing any key when the following line is shown:

```
Hit any key to stop autoboot:
```

b) User will then reach the U-Boot command prompt indicated by ->. Run the **printenv** command at the U-Boot prompt. If the information displayed contains keywords like **onie_initargs** and **onie_machine**, the switch is pre-loaded with ONIE.

```
LOADER->printenv
active=image1

```

c) From U-Boot prompt, boot ONIE in rescue mode.

```
LOADER-> run onie_rescue
```

- **x86 Platform**

On x86 platform, it uses GRUB menu to install OS via ONIE.

a) Reboot the system, and enter **ONIE** installation environment from the GRUB menu:

```
+----------------------------------------------------------------------------+
| PicOS                                                                      |
|*ONIE                                                                       |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
+----------------------------------------------------------------------------+
     Use the ^ and v keys to select which entry is highlighted.
     Press enter to boot the selected OS, `e' to edit the commands
     before booting or `c' for a command-line.
```

b) From GRUB prompt, choose **ONIE: Rescue** to Install OS, boot ONIE in rescue mode.

```
                         GNU GRUB  version 2.02~beta2+e4a1fe391

|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
+----------------------------------------------------------------------------+
```

Step3 Run **onie-nos-install** command as follows to manually install PICOS.

- **Install via TFTP**

```
ONIE# onie-nos-install tftp://<path to image>/PICOS.bin
```

- **Install via FTP**

When installing via FTP, you need to type **username** and **password** of the FTP server on which the image file is loaded.

```
ONIE# onie-nos-install ftp://username:password@<path to image>/PICOS.bin
```

- **Install via HTTP**

```
ONIE# onie-nos-install http://<path to image>/PICOS.bin
```

- **Install from Local Directory**

a) In **ONIE rescue** mode, copy the image file to the current directory.

```
ONIE# scp username@<path to image>/PICOS.bin .
```

b) Run **onie-nos-install** command to start installation.

```
ONIE# onie-nos-install PICOS.bin
```

For example,

```
ONIE:/ # onie-nos-install onie-installer-picos-4.0.0-8b1219e112-x86.bin
discover: Rescue mode detected. No discover stopped.
ONIE: Executing installer: onie-installer-picos-4.0.0-8b1219e112-x86.bin
Verifying image checksum ... OK.
Preparing image archive ... OK.
  [1]  PICOS L2/L3 (default)
  [2]  PICOS Open vSwitch/OpenFlow
Enter your choice (1,2):1
PICOS L2/L3 is selected.
ONIE installation will overwrite the configuration file of existing system.
It is recommended to follow the upgrade procedure to upgrade the system.
Press any key to stop the installation...
10 9 8 7 6 5 4 3 2 1 ...
```

The installer runs automatically, before start installation, it will prompt to choose the option to make PICOS to boot into L2/L3 or OVS mode. If not selected, then PICOS boots into L2/L3.

After finishing installation, the device reboots automatically, the system then comes up running the new network operating system.

NOTE :

- After the system restarts, you need to enter the username and password, the initial login username is **admin** and password is **pica8**.
- After the username and password are entered, user will be asked to choose a new password for admin. This is the only post installation step after which the PICOS operating system can be used.

Automatic Installation Process

The automatic installation process uses the DHCP message exchange process to download and install software packages.

Step1 Make sure the switch is connected to DHCP and HTTP servers and the PICOS installation software package is downloaded to the HTTP server.

a) DHCP server configuration: define the path of the installation package and then start DHCP server service:

```
host pica8-3922 {
hardware ethernet 70:72:cf:12:34:56;
fixed-address 192.168.2.50;
option default-url = "http://192.168.2.42/onie-installer-picos-4.0.0-8b1219e112-x86.bin";
}
```

b) Check if the **.bin** installation file is loaded onto the HTTP server:

```
root@dev:/var/www# ls
index.html onie-installer-powerpc.bin
```

Step2 Install PICOS via ONIE. The process is different on the following two types of platforms:

- **ARM Platforms (AS4610 Series Switches)**
- **x86 Platform**

- **ARM Platforms (AS4610 Series Switches)**

a) Verify that the switch is pre-loaded with ONIE, which will be used to load PICOS on the switch. Power on the switch and interrupt the boot sequence by pressing any key when the following line is shown:

```
Hit any key to stop autoboot:
```

b) User will then reach the U-Boot command prompt indicated by ->. Run the **printenv** command at the U-Boot prompt. If the information displayed contains keywords like **onie_initargs** and **onie_machine**, the switch is pre-loaded with ONIE.

```
LOADER-> printenv
active=image1
autoload=no
baudrate=115200
bootcmd=run check_boot_reason;run PicOS_bootcmd;run onie_bootcmd
bootdelay=10

- **x86 Platform**

On x86 platform, it uses GRUB menu to choose install OS via ONIE.

a) Reboot the system, and enter **ONIE** installation environment from the GRUB menu:

```
+----------------------------------------------------------------------------+
| PicOS                                                                      |
|*ONIE                                                                       |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
+----------------------------------------------------------------------------+
     Use the ^ and v keys to select which entry is highlighted.
     Press enter to boot the selected OS, `e' to edit the commands
     before booting or `c' for a command-line.
```

b) From GRUB prompt, choose **ONIE: Rescue** to Install OS, boot ONIE in rescue mode.

```

|                                                                              |
+------------------------------------------------------------------------------+
```

The installer runs and will reboot the system after installation is complete.

NOTE：

- After the system restarts, you need to enter the username and password, the initial login username is **admin** and password is **pica8**.
- After the username and password are entered, user will be asked to choose a new password for admin. This is the only post installation step after which the PICOS operating system can be used.

Nos-boot-mode Installation

NOTE：

- The installation method described in this section applies to installation through both the console port and the management port.
- The installation method described in this section only applies to platforms that have pre-installed ONIE.

The installation methods described in Traditional Installation must be performed through the console port. If you want to install the system through a non-console port, you can use the **nos-boot-mode** command to perform the installation which is described in this section.

Usage of **nos-boot-mode** command:

admin@Xorplus$sudo nos-boot-mode

USAGE

install or uninstall NOS(es)

SYNOPSIS

nos-boot-mode [install|uninstall]

DESCRIPTION

install- Install NOS

uninstall- Remove all NOS(es) including PICOS

When **nos-boot-mode install** command is executed, PICOS will switch to ONIE install mode, and the user should go on to complete the subsequent installation. The steps for the manual installation process and the automatic installation process using the **nos-boot-mode install** command are described below.

When **nos-boot-mode unsinstall** command is executed, the system will remove all NOS(es) including PICOS from the device. Therefore, it is suggested to use the **nos-boot-mode unsinstall** command with caution.

Manual Installation Process

Step1 Make sure that the installation package of **.bin** file has been loaded to the server (server could be HTTP, TFTP, or an FTP server or the switch local directory depending on the actual installation environment).

Step2 Execute the **nos-boot-mode install** command to enter ONIE installation environment.

```
admin@Xorplus:~$ sudo nos-boot-mode install
```

Step3 Type "**yes**" when the below prompt is shown, which will take the system will to ONIE install mode.

```
Type 'yes' to install NOS!
Type 'no' to exit
[no]/yes:
```

Step4 Run **onie-nos-install** command as follows to manually install PICOS.

- **Install via TFTP**

```
ONIE# onie-nos-install tftp://<path to image>/PICOS.bin
```

- **Install via FTP**

When installing via FTP, you need to type in the **username** and **password** for the FTP server on which the image file is loaded.

```
ONIE# onie-nos-install ftp://username:password@<path to image>/PICOS.bin
```

- **Install via HTTP**

```
ONIE# onie-nos-install http://<path to image>/PICOS.bin
```

- **Install from Local Directory**

a) In ONIE rescue mode, copy the image file to the current directory.

```
ONIE# scp username@<path to image>/PICOS.bin .
```

b) Run **onie-nos-install** command to start installation.

```
ONIE# onie-nos-install PICOS.bin
```

For example,

```
ONIE:/ # onie-nos-install onie-installer-picos-4.0.0-8b1219e112-x86.bin
discover: Rescue mode detected. No discover stopped.
ONIE: Executing installer: onie-installer-picos-4.0.0-8b1219e112-x86.bin
Verifying image checksum ... OK.
Preparing image archive ... OK.
  [1]  PICOS L2/L3 (default)
  [2]  PICOS Open vSwitch/OpenFlow
Enter your choice (1,2):1
PICOS L2/L3 is selected.
ONIE installation will overwrite the configuration file of existing system.
It is recommended to follow the upgrade procedure to upgrade the system.
Press any key to stop the installation...
10 9 8 7 6 5 4 3 2 1 ...
```

The installer runs automatically, before start installation, it will prompt to choose the option to make PICOS to boot into L2/L3 or OVS mode. If not selected, then PICOS boots into L2/L3.

After finishing installation, the device reboots automatically, the system then comes up running the new network operating system.

NOTE :

- After the system restarts, you need to enter the username and password, the initial login username is **admin** and password is **pica8**.
- After the username and password are entered, user will be asked to choose a new password for admin. This is the only post installation step after which the PICOS operating system can be used.

Automated Installation Process

The automatic installation process uses the DHCP message exchange process to download and install software packages.

Step1 Make sure the switch is connected to DHCP and HTTP servers, and the PICOS installation software package is downloaded to the HTTP server.

a) DHCP server configuration: define the path of the installation package and then start DHCP server service:

```
host pica8-3922 {
hardware ethernet 70:72:cf:12:34:56;
fixed-address 192.168.2.50;
option default-url = "http://192.168.2.42/onie-installer-picos-4.0.0-8b1219e112-x86.bin";
}
```

b) Check if the **.bin** installation file is loaded onto the HTTP server:

```
root@dev:/var/www# ls
index.html onie-installer-powerpc.bin
```

Step2 Execute the **nos-boot-mode install** command to enter ONIE installation environment.

```
admin@Xorplus$ sudo nos-boot-mode install
```

Step3 Type "**yes**" when the below prompt is shown, and the system will automatically complete the installation.

```
Type 'yes' to install NOS!
Type 'no' to exit
[no]/yes:
```

The installer runs automatically and will reboot the system after installation is completed.

NOTE :

- After the system restarts, you need to enter the username and password, the initial login username is **admin** and password is **pica8**.
- After the username and password are entered, user will be asked to choose a new password for admin. This is the only post installation step after which the PICOS operating system can be used.

Verifying Version after Installation

After system reboots automatically, the system will come up running the new network operating system.

```

Appendix: Troubleshooting Installation/Upgrade Failure on AS7326-56X

Installation or upgrade failure (for example, the switches cannot boot up after install) may occur on the old AS7326-56X hardware models (revision is R01F and before). When booting PICOS on AS7326-56X and detect hardware rev R01F, the system will log a warning message to prompt the hardware revision R01F is a pre-production hardware reversion: "This hardware revision R01F is a pre-production hardware rev, PICOS has applied a work around to work with PICOS. Support will be provided on a best effort basis".

To work around the issue, first we need to check the “Label Revision”. If it is an old hardware model (revision is R01F or before), then, we can perform the following provided solution after installation/upgrade to solve the problem.

Check Label Revision

Under ONIE prompt, run “**onie_syseeprom**” to get the “*Label Revision*”.

```
ONIE:/ # onie-syseeprom
TlvInfo Header:
   Id String:    TlvInfo
   Version:      1
   Total Length: 166
TLV Name             Code Len Value
-------------------- ---- --- -----
Manufacture Date     0x25  19 04/27/2019 02:10:06
Label Revision       0x27   4 R01B
Platform Name        0x28  27 x86_64-accton_as7326_56x-r0
ONIE Version         0x29  13 2018.05.00.05
Manufacturer         0x2B   6 Accton
Diag Version         0x2E   7 0.0.1.0
Base MAC Address     0x24   6 80:A2:35:81:D5:F0
Serial Number        0x23  14 732656X1916012
Country Code         0x2C   2 TW
Part Number          0x22  13 FP4ZZ7656005A
Product Name         0x21  15 7326-56X-O-AC-F
MAC Addresses        0x2A   2 256
Vendor Name          0x2D   6 Accton
CRC-32               0xFE   4 0xC3D3F2DE
Checksum is valid.
ONIE:/ #
```

Solution

You can follow the steps below after installation/upgrade, to fix the problem of installation and upgrade failure on the old AS7326-56X hardware model (revision R01F or before).

Step1 Power cycle the switch.

Step2 From the GRUB menu, choose “**ONIE”** to enter ONIE GRUB menu:

```
+----------------------------------------------------------------------------+
| PicOS                                                                      |
|*ONIE                                                                       |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
```

```
|                                                                              |
|                                                                              |
|                                                                              |
+------------------------------------------------------------------------------+
     Use the ^ and v keys to select which entry is highlighted.
     Press enter to boot the selected OS, `e' to edit the commands
     before booting or `c' for a command-line.
```

Step3 From ONIE GRUB menu, choose "**ONIE: Rescue"** to launch ONIE in Rescue mode.

```
                         GNU GRUB  version 2.02~beta2+e4a1fe391
+------------------------------------------------------------------------------+
| ONIE: Install OS                                                             |
|*ONIE: Rescue                                                                 |
| ONIE: Uninstall OS                                                           |
| ONIE: Update ONIE                                                            |
| ONIE: Embed ONIE                                                             |
| DIAG: Accton Diagnostic                                                      |
|                                                                              |
|                                                                              |
|                                                                              |
|                                                                              |
|                                                                              |
|                                                                              |
+------------------------------------------------------------------------------+
```

Step4 Press Enter to display the ONIE prompt.

Step5 Mount PicOS partition with label is "PicOS".

```
ONIE:/ # blkid
/dev/sda7: LABEL="User-Data" UUID="be63cef8-4560-4c48-ab5a-8f7ced5a950b"
/dev/sda6: LABEL="PicOS2" UUID="f589e53f-4cd1-44ba-8384-f339f4e2b2ac"
/dev/sda5: LABEL="PicOS" UUID="8ca5f7ed-5a15-4a2a-944c-4d8872647bf5"
/dev/sda4: LABEL="PICOS-GRUB" UUID="782a1372-4b66-4783-b920-dab1df8ec6e4"
/dev/sda3: LABEL="ACCTON-DIAG" UUID="3e4117d0-1926-472a-9d9e-08883df83d40"
/dev/sda2: LABEL="ONIE-BOOT" UUID="1a90abd8-f065-4f7a-90a0-af122b8805fa"
ONIE:/ #
ONIE:/ # mount /dev/sda5 /mnt
```

Step6 Execute the following command to modify the I2C access address.

```
ONIE:/ # sed -I "s/0x57/0x56/" /mnt/etc/rc_hw.sh
ONIE:/ # sync
```

Step7 Unmount the PicOS partition.

```
ONIE:/ # unmount /dev/sda5
```

Step8 Reboot the switch.

```
ONIE:/ # reboot
```

Upgrading PICOS from Version 4.0.0 or Later Using Upgrade Command

- Partitioning

- Verifying Version after Upgrading
- Appendix: Troubleshooting Installation/Upgrade Failure on AS7326-56X
  - Check Label Revision
  - Solution

NOTE:

- This document ONLY applies to upgrade from version 4.0.0 or the later version using the **upgrade** command. If you want to upgrade PICOS from the version before 4.0.0, use ONIE installation process described in Installing PICOS on Bare Metal Switches.
- This upgrading guide is not available for FS S5810 Series and S5860 Series switches.
- N8560-32C uses the ONIE method for upgrade described in this guide, while the installation uses Rboot method, please refer to Installing PICOS for FS S5810/S5860 Series and N8560-32C Switches for details on the installation process.
- The installation package name for N8560-32C includes the suffix '**-rboot**', for example, **N8560_picos-4.4.5-9bca0916a3-rboot.bin**. The upgrade package, on the other hand, includes the suffix '**-x86**', such as **picos-4.4.5-9bca0916a3-x86.bin**.

Partitioning

PICOS 4.0.0 have multiple system partitions including PicOS (partition size: 2G), PicOS2 (partition size: 2G) and User-Data partitions. Among them, PicOS and PicOS2 are two independent system boot partitions. One of them is the active partition on which the running system resides, and the other is the inactive partition. The two-system-boot-partition feature allows the system to be reverted to a previous version of the installed software package when it fails to upgrade PICOS.

User-Data partition is a reserved partition which is not affected by ONIE installer and upgrade unless user manually removes it. User-Data partition uses all the available space left on the disk after installation. Users can use this partition to store files and data.

Supported Platforms

PICOS 4.x software requires to run on a high performance device, only the platforms listed in Switch Machine Outline and System Characteristics are supported upgrading to PICOS 4.x.

Preparation before Upgrading

NOTE

If routed interface is configured, before upgrade, make sure that routed interface name and sub-interface name in the configuration file start with the string "**rif-**". Otherwise, upgrade will fail due to configuration error.

Table 1 Checklist before Upgrading

No.	Checking Items	Checking Standard	Results
1	Checking the Running PICOS Version	The currently running system software version is lower than the software version to be installed	
2	Checking License Validation	Run the `license -s` command to verify that the license expiration date extends beyond the planned upgrade date. If the license is close to expiration, consider renewing it to avoid interruptions.	
3	Building Upgrade Environment	Build a different upgrade environment according to the need	
4	Getting the Required Upgrade Software	Obtain the required supported upgrade software	
5	Backing up Important Data in Flash	All the important data in Flash is backed up	
6	Checking Available Flash Space	Flash space is enough to save upgrading package and other files	

Checking the Running PicOS Version

Use the **version** command to check the version of the running system software.

```
admin@PICOS:~$ version
Copyright (C) 2009-2024 Pica8, Inc.
==================================
Base ethernet MAC Address : d4:31:27:c9:e4:51
Hardware Model : S5860-48MG-U
Linux System Version/Revision : 9.8.7-main/fd87d25a10
Linux System Released Date : 10/12/2024
L2/L3 Version/Revision : 9.8.7-main/fd87d25a10
L2/L3 Released Date : 10/12/2024
OVS/OF Version/Revision : 9.8.7-main/fd87d25a10
OVS/OF Released Date : 10/12/2024
```

Checking License Validation

Before performing an upgrade, users can run the `license -s` command to check if the current license has expired, ensuring it is valid and preventing upgrade failure due to license expiration.

```
admin@PICOS:~$ license -s
{
  "Type":"1GE",
  "Feature":["Base Product", "Layer3", "OpenFlow"],
  "Support End Date":"2025-10-28",
  "Hardware ID":"ACD2-F77A-BBA3-2849",
  "Site Name":"PICA8"
```

```
}
```

Building Upgrade Environment

Please make sure that you have set up an HTTP, TFTP or FTP protocol upgrading environment, the basic requirements are as follows:

- PC can log in to the device through serial or SSH.
- The communication between the server and the device works well.
- The upgrading file used by the device has already been stored on the server.

Getting the Required Upgrade Software

Please contact Pica8 technical support engineers at the following website for the latest version of upgrade software.

https://www.pica8.com/support/

Backing up Important Data in Flash

Before upgrading, save the important data in Flash to the local PC through FTP or TFTP, and then upload it to the switch after the upgrade is completed.

Checking the Available Flash Space

Use the **df -h** command to check the available flash space for saving the upgrade package.

```
admin@PICOS:~$ df -h
Filesystem Size Used Avail Use% Mounted on
udev 989M 0 989M 0% /dev
overlay 706M 57M 650M 8% /
tmpfs 1009M 0 1009M 0% /dev/shm
tmpfs 404M 5.9M 398M 2% /run
tmpfs 5.0M 0 5.0M 0% /run/lock
tmpfs 50M 192K 50M 1% /tmp
/dev/ubi1_0 863M 376M 483M 44% /mnt/open
```

Upgrading Notes

- Downgrade from PICOS version 4.x to 3.x or to a lower version is NOT supported by using **upgrade** command. You can use ONIE installation when you want to downgrade. For details about ONIE installation, please refer to Installing PICOS on Bare Metal Switches.
- License check is performed for upgrade:
  - If PICOS has a license installed before the upgrade, the license will be copied and activated after the upgrade. Please check this section for the PICOS Licenses.
  - If there is no license installed prior to upgrade, upgrade2 process can proceed but only the first four ports and the first two uplink ports (if exist) on the newly upgraded system can be used.
  - If the license has expired, it is not allowed to upgrade a major release (e.g. 4.1 to 4.2). However, it will not affect upgrading to a minor release (e.g. 4.1.1 to 4.1.2).
- You can log in to the switch through its console port or using SSH. After successful login, you can run commands on the command line interface (CLI) to upgrade the device.
- When using FTP/TFTP to download the image, user should verify that the "binary" mode is being used. If the "binary" transfer mode is not being used, the image might be modified during download, and the upgrade will fail during the MD5 check.
- When upgrading, the installer checks whether there is a user-data partition. If there exists a User-Data partition, the installer only rewrites the running system boot partition (PicOS/ PicOS2) and installs the new installation package to this partition. However, if there is no User-Data partition, the installer removes all the partitions to rebuild a brand new NOS.

- All X86 platforms share one installation and upgrade package with the name fixed as: **onie-installer-picos-VERSION-x86.bin**, where **VERSION** is the release version. X86 platforms are listed below:
    - FS N9550-32D
    - FS N8550-64C
    - FS N5850-48S6Q
    - FS N8550-48B8C
    - FS N8550-32C
    - Edgecore AS4630-54PE
    - Edgecore AS5712-54X
    - Edgecore AS5812-54T

    - Edgecore AS7712-32X
    - Edgecore AS7726-32X
    - Edgecore AS7816-64X
    - Edgecore AS5835-54X
    - Edgecore AS9716-32D
    - DELL N3248P-ON
    - DELL N3248PXE-ON
    - DELL N3224PX-ON
    - DELL N3248X-ON
    - DELL S4048-ON
    - DELL S4148F-ON
    - DELL S4148T-ON
    - DELL S4128F-ON
    - DELL S5224F-ON
    - DELL S5296F-ON
    - DELL S5212F-ON
    - DELL S5248F-ON
    - DELL Z9100-ON
    - DELL Z9264F-ON
    - DELL N3224T-ON
    - DELL S4128T-ON
- During the upgrade process, please ensure that the power supply is functioning normally; otherwise, power interruption during the upgrade process could cause unpredictable problems.
- In previous 4.x.x versions, PICOS allows the configuration of route leaking by importing BGP IPv4 routes from one user-defined VRF into another user-defined VRF, for example:
  set protocols bgp vrf vrf1 local-as 1
  set protocols bgp vrf vrf1 ipv4-unicast import vrf vrf2
  set protocols bgp vrf vrf2 local-as 2
  That will cause configuration from PICOS CLI is not consistent with FRR configuration. Specifically, FRR will add "set protocols bgp local-as 1" (local as number is same as the value in vrf1) to its configuration automatically, which is not in PICOS CLI. From version 4.4.0, if "set protocols bgp local-as 1" is not configured, the above configurations are not allowed.

Based on the above reasons, users are required to manually add the command "set protocols bgp local-as 1" (local as number is same as the value in vrf1) before the upgrade, if there's above configuration exists in the pre- upgrade version, thus to ensure that the configuration can be loaded successfully after the upgrade.

Usage of Upgrade Command

```
admin@PICOS:~$ sudo upgrade
USAGE
   Upgrade system with local new image
SYNOPSIS
   upgrade [image_name] [factory-default]
DESCRIPTION
   image_name - Image with bin format file(*.bin)
   factory-default - Recovery configuration to factory default
```

PICOS upgrade is done via the command "**upgrade**" in bash (launching a shell script named "upgrade.sh"). This script will upgrade the image and back up configuration files automatically.

The format of the upgrade package is ***.bin**.

The option **no-md5-check** is removed from PICOS 3.7.0 and later versions. If there is an MD5 file in the /cftmp directory, the upgrade script will check package integrity with MD5. Else if there is no MD5 file in the /cftmp directory, then skip the MD5 check step.

The option **factory-default** is used to reset the configuration to factory default when performing upgrade. This option retains the license files from the previous version.

If you want to backup a file during upgrade, use option **backup-file=(*.lst)** to define your own backup file list. The usage of option **backup-file=(*.lst)** is described in the below section.

Usage of Backup-file=(*.lst) Option

During the upgrade process, the switch can automatically back up the following files in the following directories from the previous PICOS system:

```
/etc/passwd
/etc/shadow
/etc/group
/etc/gshadow
/etc/resolv.conf
./etc/network/interfaces
/etc/picos/picos_start.conf
/etc/picos/switch-public.key
/etc/picos/pica.lic
/pica/config/pica_startup.boot
/pica/config/pica.conf.01
/pica/config/pica.conf.02
/pica/config/pica.conf.03
/pica/config/pica.conf.04
```

```
/pica/config/pica.conf.05
/ovs/ovs-vswitchd.conf.db
/ovs/function.conf.db
/ovs/config/meters
/ovs/config/groups
/ovs/config/flows
/ovs/var/lib/openvswitch/pki/
/var/log/report_diag.log
/var/log/report_diag.log.1
/var/log/report_diag.log.2
/var/log/report_diag.log.3
/var/log/report_diag.log.4
/var/log/report_diag.log.5
/cftmp/upgrade.log
/cftmp/upgrade2.log
/cftmp/auto/
```

If you want to save user files that are not in the above default backup file list, you need to first create or specify a **.lst** file and then add all those files that need to be backed up to this **.lst** file. You can use the **backup-file=(*.lst)** option to achieve this, where (*.lst) is the user created file with **.lst** format or specify the path to this file, for example:

```
admin@PICOS:~$ sudo upgrade backup-file=/admin/back_files.lst onie-installer-picos-4.0.1-x86.bin
```

For example, if you want to backup **/home/admin/a.txt** file during the process, then add **/home/admin/a.txt** to back_files.lst.In this example, **back_files.lst** is a user created file. The user has already added the file to back_files.lst that needs to be saved in the event of power off.

```
admin@PICOS:~$ cat /admin/back_files.lst
 /home/admin/a.txt
```

The above operations ensure that user can backup their important files with **backup-file=(*.lst)** option during the upgrade process.

Upgrading Procedure

The upgrading procedure in this document gives an example of upgrading AS7312-54X from PICOS 4.0.0 to 4.0.1.

Step1 Copy the upgrade package (in the form of **.bin**) and the MD5 file to **/cftmp** directory by either FTP, TFTP, HTTP or SCP according to the actual upgrade environment. The following example uses the SCP method.

```
admin@PICOS:~$ sudo scp pica8@10.10.50.16:/tftp/build/4.0.1/as7312_54x/onie-installer-picos-4.0.1-x86.bin
/cftmp
admin@PICOS:~$ sudo scp pica8@10.10.50.16:/tftp/build/4.0.1/as7312_54x/onie-installer-picos-4.0.1-x86.bin.md5
/cftmp
```

NOTE:

If management VRF is enabled, and the FTP/TFTP/HTTP/SCP server is connected via the Eth0/1 port, you need to add the string **sudo ip vrf exec mgmt-vrf** before the SCP command when executing the scp operation. The format is as follows:

admin@Xorplus:~$ sudo ip vrf exec mgmt-vrf scp pica8@10.10.50.22:/tftp/build/4.0.1/as7312_54x/onie-installer-picos-as7312_54x-4.0.1-91bb175.bin /cftmp

admin@Xorplus:~$sudo ip vrf exec mgmt-vrf scp pica8@10.10.50.22:/tftp/build/4.0.1/as7312_54x/onie-installer-picos-as7312_54x-4.0.1-91bb175.bin.md5 /cftmp

If **sudo ip vrf exec mgmt-vrf** is not added, find the next hop routing information from the default VRF. For the usage of VRF, refer to the EVPN Multihoming Configuration Guide.

Step2 Execute the **sync** operation.

```
admin@PICOS:~$ sync
```

Step3 Change directory to /cftmp.

```
admin@PICOS:~$ cd /cftmp
admin@PICOS:/cftmp$
```

Step4 Run the **upgrade** command.

```
admin@PICOS:/cftmp$ sudo upgrade onie-installer-picos-4.0.1-x86.bin
```

After finishing upgrade will reboot automatically, the system will come up running the new network operating system.

Verifying Version after Upgrading

```
admin@PICOS:~$ version
Copyright (C) 2009-2024 Pica8, Inc.
==================================
Base ethernet MAC Address     : d4:31:27:c9:e4:51

Appendix: Troubleshooting Installation/Upgrade Failure on AS7326-56X

Installation or upgrade failure (for example, the switches cannot boot up after install) may occur on the old AS7326-56X hardware models (revision is R01F and before). When booting PICOS on AS7326-56X and detect hardware rev R01F, the system will log a warning message to prompt the hardware revision R01F is a pre-production hardware reversion: "This hardware revision R01F is a pre-production hardware rev, PICOS has applied a work around to work with PICOS. Support will be provided on a best effort basis".

To work around the issue, first we need to check the “Label Revision”. If it is an old hardware model (revision is R01F or before), then, we can perform the following provided solution after installation/upgrade to solve the problem.

Check Label Revision

Under ONIE prompt, run “**onie_syseeprom**” to get the “*Label Revision*”.

```
ONIE:/ # onie-syseeprom
TlvInfo Header:
```

```
   Id String:    TlvInfo
   Version:      1
   Total Length: 166
TLV Name             Code Len Value
-------------------- ---- --- -----
Manufacture Date     0x25  19 04/27/2019 02:10:06
Label Revision       0x27   4 R01B
Platform Name        0x28  27 x86_64-accton_as7326_56x-r0
ONIE Version         0x29  13 2018.05.00.05
Manufacturer         0x2B   6 Accton
Diag Version         0x2E   7 0.0.1.0
Base MAC Address     0x24   6 80:A2:35:81:D5:F0
Serial Number        0x23  14 732656X1916012
Country Code         0x2C   2 TW
Part Number          0x22  13 FP4ZZ7656005A
Product Name         0x21  15 7326-56X-O-AC-F
MAC Addresses        0x2A   2 256
Vendor Name          0x2D   6 Accton
CRC-32               0xFE   4 0xC3D3F2DE
Checksum is valid.
ONIE:/ #
```

Solution

You can follow the steps below after installation/upgrade, to fix the problem of installation and upgrade failure on the old AS7326-56X hardware model (revision R01F or before).

Step1 Power cycle the switch.

Step2 From the GRUB menu, choose “**ONIE”** to enter ONIE GRUB menu:

```
 +----------------------------------------------------------------------------+
 | PicOS                                                                      |
 |*ONIE                                                                       |
 |                                                                            |
 |                                                                            |
 |                                                                            |
 |                                                                            |
 |                                                                            |
 |                                                                            |
 |                                                                            |
 |                                                                            |
 |                                                                            |
 +----------------------------------------------------------------------------+
      Use the ^ and v keys to select which entry is highlighted.
      Press enter to boot the selected OS, `e' to edit the commands
      before booting or `c' for a command-line.
```

Step3 From ONIE GRUB menu, choose “**ONIE: Rescue”** to launch ONIE in Rescue mode.

```
                         GNU GRUB  version 2.02~beta2+e4a1fe391
 +----------------------------------------------------------------------------+
 | ONIE: Install OS                                                           |
 |*ONIE: Rescue                                                               |
 | ONIE: Uninstall OS                                                         |
 | ONIE: Update ONIE                                                          |
 | ONIE: Embed ONIE                                                           |
 | DIAG: Accton Diagnostic                                                    |
```

```
 |                                                                            |
 |                                                                            |
 |                                                                            |
 |                                                                            |
 |                                                                            |
 |                                                                            |
 +----------------------------------------------------------------------------+
```

Step4 Press Enter to display the ONIE prompt.

Step5 Mount PicOS partition with label is “PicOS”.

```
ONIE:/ # blkid
/dev/sda7: LABEL="User-Data" UUID="be63cef8-4560-4c48-ab5a-8f7ced5a950b"
/dev/sda6: LABEL="PicOS2" UUID="f589e53f-4cd1-44ba-8384-f339f4e2b2ac"
/dev/sda5: LABEL="PicOS" UUID="8ca5f7ed-5a15-4a2a-944c-4d8872647bf5"
/dev/sda4: LABEL="PICOS-GRUB" UUID="782a1372-4b66-4783-b920-dab1df8ec6e4"
/dev/sda3: LABEL="ACCTON-DIAG" UUID="3e4117d0-1926-472a-9d9e-08883df83d40"
/dev/sda2: LABEL="ONIE-BOOT" UUID="1a90abd8-f065-4f7a-90a0-af122b8805fa"
ONIE:/ #
ONIE:/ # mount /dev/sda5 /mnt
```

Step6 Execute the following command to modify the I2C access address.

```
ONIE:/ # sed -I "s/0x57/0x56/" /mnt/etc/rc_hw.sh
ONIE:/ # sync
```

Step7 Unmount the PicOS partition.

```
ONIE:/ # unmount /dev/sda5
```

Step8 Reboot the switch.

```
ONIE:/ # reboot
```

Upgrading PICOS from Version 3.0 or Later Using Upgrade2

Introduction

NOTE：

- This document **only** applies to PICOS upgrade from version 3.0 or later version using command **upgrade2**. If you want to upgrade PICOS from the version before 3.0, use ONIE installation process described in Installing PICOS on Bare Metal Switches.
- You cannot do a standard upgrade from 3.x to 4.x. This is because 3.x config and 4.x config are not compatible, and PICOS 4.x will not be able to boot with 3.x config after the upgrade. In order to upgrade from 3.x to 4.x, you MUST convert the configuration to 4.x before upgrade, see section Converting Configuration to 4.x before Upgrade (when Upgrade from Version 3.x to 4.x) in this guide for details.
- This upgrading guide is not available for FS S5810 Series and S5860 Series switches.
- N8560-32C uses the ONIE method for upgrade described in this guide, while the installation uses Rboot method, please refer to Installing PICOS for FS S5810/S5860 Series and N8560-32C Switches for details on the installation process.
- The installation package name for N8560-32C includes the suffix '**-rboot**', for example, **N8560_picos-4.4.5-9bca0916a3-rboot.bin**. The upgrade package, on the other hand, includes the suffix '**-x86**', such as **picos-4.4.5-9bca0916a3-x86.bin**.

PICOS 4.0.0 and later versions have multiple system partitions including PicOS (partition size: 2G), PicOS2(partition size: 2G) and User-Data partitions. Among them, PicOS and PicOS2 are two independent system boot partitions. One of them is the active partition on which the running system resides, and the other is the inactive partition. The two-system-boot-partition feature allows the system to revert to a previous version of the installed software package when it fails to upgrade PICOS by using upgrade2 command.

User-Data partition is a reserved partition which is not affected by ONIE installer and upgrade unless user manually removes it. User-Data partition uses all the available space left on the disk. Users can use this partition to store files and data.

When running upgrade2, the new version PICOS image will be installed and boot onto the inactive partition automatically. Afterwards, the inactive partition will switch to active partition automatically when the switch boots up normally after the upgrading is finished, while the other partition where the old version resides will become the inactive partition.

Upgrade2 method supports system rollback function. The "**nos-rollback**" command can be used to revert to a previous version of the installed software package. Moreover, if it fails to upgrade, the system can automatically rollback to the old system. This can reduce the network interruption risk due to the failure of system upgrade process and ensure the systems' continuous availability. You can refer to section Rollback Procedure in this page for details.

The system also supports the **upgrade** method for PICOS version upgrade, you can refer to the document Upgrading PICOS from Version 4.0.0 or Later Using Upgrade Command for details. We recommend using upgrade2 method to upgrade the NOS as it includes system backup and rollback features.

Preparation before Upgrading

Table 1. Checklist before Upgrading

No.	Checking Items	Checking Standard	Results
1	Checking the Running PICOS Version	The currently running system software version is lower than the software version to be installed.	
2	Checking License Validation	Run the `license -s` command to verify that the license expiration date extends beyond the planned upgrade date. If the license is close to expiration, consider renewing it to avoid interruptions.	
3	Building Upgrade Environment	Build an upgrade environment according to the need.	
4	Getting the Required Upgrade Software	Obtain the required supported upgrade software.	
5	Backing up Important Data	All the important data was backed up.	
6	Converting Configuration to 4.x before Upgrade (when Upgrade from Version 3.x to 4.x)	4.x configuration is generated from 3.x configuration file.	

Checking the Running PICOS Version

Use the **version** command to check the version of the running system software.

```
admin@PICOS:~$ version
Copyright (C) 2009-2024 Pica8, Inc.
==================================
Base ethernet MAC Address : 64:9d:99:d8:fd:07
Hardware Model            : S3410-48TS-P
PICOS Release/Commit      : 4.4.4-s3000/eaf8c6573d
PICOS Released Date       : 09/14/2024
admin@PICOS:~$
```

Checking License Validation

Before performing an upgrade, users can run the `license -s` command to check if the current license has expired, ensuring it is valid and preventing upgrade failure due to license expiration.

```
admin@PICOS:~$ license -s
```

```
{
  "Type":"1GE",
  "Feature":["Base Product", "Layer3", "OpenFlow"],
  "Support End Date":"2025-10-28",
  "Hardware ID":"ACD2-F77A-BBA3-2849",
  "Site Name":"PICA8"
}
```

Building Upgrade Environment

Please make sure that you have set up an HTTP, TFTP or FTP protocol upgrading environment, the basic requirements are as follows:

- PC can log in to the device through serial or SSH.
- The communication between the server and the device works well.
- The upgrading file used by the device has already been stored on the server.

Getting the Required Upgrade Software

Please contact Pica8 technical support engineers at the following webpage for the latest version of upgrade software.

https://www.pica8.com/support/

Backing up Important Data

Before upgrading, save the important data, e.g. the configuration file, to the local PC through FTP or TFTP, and then upload it to the switch after the upgrade is completed if needed.

Converting Configuration to 4.x before Upgrade (when Upgrade from Version 3.x to 4.x)

NOTE:

When upgrade PICOS from version 3.x to 4.x:

- When executing the **upgrade2** command, no other option is supported except the option **image_name**.
- Backup the configuration file before upgrading.
- The OVS configuration for crossflow before the upgrade will be saved and restored automatically after the upgrade.

You cannot do a standard upgrade from 3.x to 4.x. This is because 3.x configuration and 4.x configuration are not compatible, and PICOS 4.x will not be able to boot with 3.x configuration after the upgrade.

In order to upgrade from 3.x to 4.x, follow the procedure below to prepare the 4.x configuration file before upgrade:

1. Create directory */pica/config-4.x/*.
2. Contact Pica8 support to convert the 3.x configuration to 4.x configuration in configuration file *pica_startup.boot.*
3. Copy the 4.x configuration file (converted from 3.x configuration file in step 2) into the directory */pica/config-4.x* just created. After upgrading from 3.x to 4.x and after rebooting, PICOS 4.x will look for the 4.x configuration in */pica/config-4.x.*

After completing these steps, the 4.x configuration file is ready and you can continue with the upgrade process.

If these steps are not performed before upgrade, the system will load the default configuration file of 4.x and the 3.x configuration will not be loaded after upgrade. However, if this happens unexpectly, you can also remedy by loading the 4. x configuration file after upgrade, follow the steps below:

1. Copy the 4.x configuration file *pica_startup.boot* (already converted from 3.x configuration file) into the directory */pica/config/.*
2. Run the **load override** command to load 4. x configuration.

```
admin@PICOS# load override /pica/config/pica_startup.boot
admin@PICOS# Loading config file...
```

```
3 Config file was loaded successfully.
```

Upgrading Notes

- This upgrade2 guide only applies to PICOS upgrade from version 4.0.0 or the later versions.
- When using upgrade2 to upgrade PICOS, you should make sure the “PicOS2” partition exists.
- When using upgrade2 to upgrade PICOS, you should make sure the partition type is **GPT**.
- When using upgrade2 to upgrade PICOS, you should make sure that ONIE is pre-loaded.
- License check is performed for upgrade:
  - If PICOS has a license installed before the upgrade, the license will be copied and activated after the upgrade. Please check this section for the PICOS Licenses.
  - If there is no license installed prior to upgrade, upgrade2 process can proceed but only the first four ports and the first two uplink ports (if exist) on the newly upgraded system can be used.
  - If the license has expired, it is not allowed to upgrade a major release (e.g. 4.1 to 4.2). However, it will not affect upgrading to a minor release (e.g. 4.1.1 to 4.1.2).
- You can log in to a device through its console port or using SSH. After successful login, you can run commands on the command line interface (CLI) to upgrade the device.
- When using FTP/TFTP to download the image, user should verify that the "binary" mode is being used. If the "binary" transfer mode is not being used, the image might be modified during download, and the upgrade will fail during the MD5 check.
- The image is platform dependent, that is, the image should be consistent with the platform, otherwise the upgrade script will abort.
- An upgrage2.log file in **/cftmp** directory will be created which will contain all the logs related to the upgrade2 process.
- All X86 platforms share one installation and upgrade package with the name fixed as: **onie-installer-picos-VERSION-x86.bin**, where **VERSION** is the release version. X86 platform are listed below:
  - FS N9550-32D
  - FS N8550-64C
  - FS N5850-48S6Q
  - FS N8550-48B8C
  - FS N8550-32C

  - Edgecore AS7726-32X
  - Edgecore AS7816-64X
  - Edgecore AS5835-54X
  - Edgecore AS9716-32D
  - DELL N3248P-ON
  - DELL N3248PXE-ON
  - DELL N3224PX-ON
  - DELL N3248X-ON
  - DELL S4048-ON
  - DELL S4148F-ON

    - DELL S4148T-ON
    - DELL S4128F-ON
    - DELL S5224F-ON
    - DELL S5296F-ON
    - DELL S5212F-ON
    - DELL S5248F-ON
    - DELL Z9100-ON
    - DELL Z9264F-ON
    - DELL N3224T-ON
    - DELL S4128T-ON
- In previous 4.x.x versions, PICOS allows the configuration of route leaking by importing BGP IPv4 routes from one user-defined VRF into another user-defined VRF, for example:
  set protocols bgp vrf vrf1 local-as 1
  set protocols bgp vrf vrf1 ipv4-unicast import vrf vrf2
  set protocols bgp vrf vrf2 local-as 2
  That will cause configuration from PICOS CLI is not consistent with FRR configuration. Specifically, FRR will add "set protocols bgp local-as 1" (local as number is same as the value in vrf1) to its configuration automatically, which is not in PICOS CLI. From version 4.4.0, if "set protocols bgp local-as 1" is not configured, the above configurations are not allowed.

Based on the above reasons, users are required to manually add the command "set protocols bgp local-as 1" (local as number is same as the value in vrf1) before the upgrade, if there's above configuration exists in the pre- upgrade version, thus to ensure that the configuration can be loaded successfully after the upgrade.

Usage of Upgrade2 Command

```
admin@PICOS:~$ sudo upgrade2
USAGE
   Upgrade system with local new image
SYNOPSIS
   upgrade2 [image_name] [factory-default]
DESCRIPTION
   image_name - Image with bin format file(*.bin)
   factory-default - Recovery configuration to factory default
admin@PICOS:~$
```

For PICOS **go2cli** version, users can run the upgrade2 command under CLI operational mode or configuration mode:

```
admin@PICOS> upgrade2 image-file xx.bin
Possible completions:
  <[Enter]>                      Execute this command
  backup-file                    Specify a user defined backup list(*.lst)
  factory-default                Recovery configuration to factory default
  use-prev-config                Use previous configuration, and syslog trace

admin@PICOS# run upgrade2 image-file xx.bin
Possible completions:
  <[Enter]>                      Execute this command
  backup-file                    Specify a user defined backup list(*.lst)
  factory-default                Recovery configuration to factory default
```

```
13  use-prev-config                Use previous configuration, and syslog trace
```

PICOS upgrade is done via the command "**upgrade2**" in bash (launching a shell script named "upgrade2.sh"). This script will upgrade the image and backup configuration files automatically.

Image name is in the form of **.bin**, which should be copied to the **/cftmp** directory before running upgrade2 command.

The option **factory-default** is used to reset the configuration to factory default when performing upgrade, but it retains the license files from the previous version.

If you want to use the old configuration file in the new version, you can add the **use-prev-config** option when issuing upgrade2 command. The usage of option **use-prev-config** is described in the section Usage of Use-prev-config Option.

If you want to backup a file during upgrade, use **backup-file=(*.lst)** option to define your own backup file list. The usage of **backup-file=(*.lst)** option is described in the section Usage of Backup-file=(*.lst) Option.

Usage of use-prev-config Option

The main function of **use-prev-config** option is to decide whether to load the previous configuration file after a system reboot when performing upgrade2 or rollback to another version. If there is a command line in the old version configuration file that is not supported in the new system, with **use-prev-config** option that command will be skipped and continue loading the remaining configuration.

By default, upgrade2 or rollback is performed without **use-prev-config** option.

The following table describes the usage of **use-prev-config** option when performing upgrade2 or rollback.

	upgrade2 (From old version to new version)	**rollback** (From current version to old version)
with use-prev-config	1. Load the configuration file of old version after system reboot. 2. If there is a command line in the old version configuration file that is not supported in the new system, skip it and continue loading the remaining configuration.	1. Load the configuration file of current version after system reboot. 2. If there is a command line in the current configuration file that is not supported in the old system, skip it and continue loading the remaining configuration.
without use-prev-config	1. Load the configuration file of old version after reboot. 2. If there is a command in the old version configuration file that is not supported in the new system, load default configuration file.	Load the old version configuration file after rebooting.

Usage of Backup-file=(*.lst) Option

During the upgrade process, the switch can automatically back up the following files in the following directories from the previous PICOS system:

```
/etc/passwd

/etc/shadow

/etc/group
```

```
/etc/gshadow
/etc/resolv.conf
./etc/network/interfaces
/etc/picos/picos_start.conf
/etc/picos/switch-public.key
/etc/picos/pica.lic
/pica/config/pica_startup.boot
/pica/config/pica.conf.01
/pica/config/pica.conf.02
/pica/config/pica.conf.03
/pica/config/pica.conf.04
/pica/config/pica.conf.05
/ovs/ovs-vswitchd.conf.db
/ovs/function.conf.db
/ovs/config/meters
/ovs/config/groups
/ovs/config/flows
/ovs/var/lib/openvswitch/pki/
/var/log/report_diag.log
/var/log/report_diag.log.1
/var/log/report_diag.log.2
/var/log/report_diag.log.3
/var/log/report_diag.log.4
/var/log/report_diag.log.5
/cftmp/upgrade.log
/cftmp/upgrade2.log
/cftmp/auto/
```

If you want to save user files that are not in the above default backup file list, you need to first create or specify a **.lst** file and then add all those files that need to be backed up to this **.lst** file. You can use the **backup-file=(*.lst)** option to achieve this, where (*.lst) is the user created file with **.lst** format or specify the file path to this file, for example:

```
admin@PICOS:~$ sudo upgrade2 backup-file=/admin/back_files.lst onie-installer-picos-as7312_54x-4.0.1-cc8d268.bin
```

For example, if you want to backup **/home/admin/a.txt** file during the process, then add **/home/admin/a.txt** to back_files.lst. In this example, **back_files.lst** is a user created file. The user has already added the file to back_files.lst that needs to be saved in the event of power off.

```
admin@PICOS:~$ sudo upgrade2 backup-file=/admin/back_files.lst onie-installer-picos-as7312_54x-4.0.1-cc8d268.bin
```

The above operations ensure that user can backup their important files with backup-file=(*.lst) option during the upgrade process.

Upgrade Procedure

The upgrading procedure in this document gives an example of upgrading from PICOS 4.0.0 to 4.0.1 using **upgrade2** command on AS7312_54X switch.

Step1 Copy the upgrade package (in the form of **.bin**) and the MD5 file to **/cftmp** directory by either FTP, TFTP, HTTP or SCP according to the actual upgrade environment. The following example uses the SCP method.

```
admin@PICOS:~$ sudo scp pica8@10.10.50.22:/tftp/build/4.0.1/as7312_54x/onie-installer-picos-as7312_54x-4.0.1-cc8d268.bin /cftmp
admin@PICOS:~$ sudo scp pica8@10.10.50.22:/tftp/build/4.0.1/as7312_54x/onie-installer-picos-as7312_54x-4.0.1-cc8d268.bin.md5 /cftmp
```

NOTE:

- If management VRF is enabled, and the FTP/TFTP/HTTP/SCP server is connected via the Eth0/1 port, you need to add the string **sudo ip vrf exec mgmt-vrf** before the SCP command when executing the scp operation. The format is as follows:

admin@Xorplus:~$ sudo ip vrf exec mgmt-vrf scp pica8@10.10.50.22:/tftp/build/4.0.1/as7312_54x/onie-installer-picos-as7312_54x-4.0.1-cc8d268.bin /cftmp

admin@Xorplus:~$sudo ip vrf exec mgmt-vrf scp pica8@10.10.50.22:/tftp/build/4.0.1/as7312_54x/onie-installer-picos-as7312_54x-4.0.1-cc8d268.bin.md5 /cftmp

If **sudo ip vrf exec mgmt-vrf** is not added, find the next hop routing information from the default VRF. For the usage of VRF, refer to the VRF Configuration Guide.

- For PICOS **go2cli** version, users can run the scp command under CLI operational mode or configuration mode:

Φ Download a file:

file scp get remote-file <*remote-file-path*> [**local-file** *local-file-path*] **ip-address** <*ip-address*>:<*port*> [**vrf** <mgmt-vrf | *vrf-name*>]

Φ Upload a file:

file scp put local-file <*local-file-path*> [**remote-file** <*remote-file-path*>] **ip-address** <*ip-address*>:<*port*> [**vrf** <mgmt-vrf | *vrf-name*>]

Step2 Execute the **sync** operation.

```
admin@PICOS:~$ sync
```

Step3 Change directory to **/cftmp**.

```
admin@PICOS:~$ cd /cftmp
```

Step4 Run **upgrade2** command to begin upgrading.

```
admin@PICOS:~$ sudo upgrade2 onie-installer-picos-as7312_54x-4.0.1-cc8d268.bin
```

After finishing upgrade, the switch will reboot automatically, the system will come up running the new network operating system.

NOTE：

- For PICOS **go2cli** version, users can run the upgrade2 command under CLI operational mode or configuration mode.

- It will take 20 - 30 minutes to finish upgrading PICOS. During the upgrade process, please be patient and do not perform any operation until the upgrade is complete, otherwise, the upgrade may be interrupted.

Rollback Procedure

The upgrade2 method supports system rollback function. The "**nos-rollback**" command can be used to revert to a previous version of the installed software package. Moreover, if it fails to upgrade, the system can automatically rollback to the old system.

NOTE：
Usage of **nos-rollback** command:

admin@Xorplus:~$ sudo nos-rollback

USAGE

Rollback to the previous system after next reboot

SYNOPSIS

nos-rollback [use-prev-config]

DESCRIPTION

use-prev-config - Use previous config, and syslog trace

For details about the usage of use-prev-config, please refer to Usage of Use-prev-config Option.

The rollback procedure is as follows:

Step1 Run **nos-rollback** command for manually rollback.

```
admin@PICOS:~$ sudo nos-rollback
USAGE
    Rollback to the previous system after next reboot
SYNOPSIS
    nos-rollback
Checking prerequisites
       Attribute of current system                          [OK]

Will switch from PICOS-4.4.5GA to the other system!
Do you want to continue?[y/N]?y

Updating default boot option
       Modify default boot option                           [OK]
Rollback to the other system successful!
Please reboot to enter the other system!
admin@PICOS:~$
```

Step2 Reboot system manually to finish rollback.

```
admin@Xorplus:~$ sudo reboot
```

You need to manually run reboot command to reboot the system after you have issued "**nos-rollback**" command. After rebooting successfully, the system will come up running the previous version of network operating system.

Verifying Version after Upgrade

```
admin@PICOS:~$ version
```

```

Appendix: Troubleshooting Installation/Upgrade Failure on AS7326-56X

Installation or upgrade failure (for example, the switches cannot boot up after install) may occur on the old AS7326-56X hardware models (revision is R01F and before). When booting PICOS on AS7326-56X and detect hardware rev R01F, the system will log a warning message to prompt the hardware revision R01F is a pre-production hardware reversion: "This hardware revision R01F is a pre-production hardware rev, PICOS has applied a work around to work with PICOS. Support will be provided on a best effort basis".

To work around the issue, first we need to check the “Label Revision”. If it is an old hardware model (revision is R01F or before), then, we can perform the following provided solution after installation/upgrade to solve the problem.

Check Label Revision

Under ONIE prompt, run “**onie_syseeprom**” to get the “*Label Revision*”.

```
ONIE:/ # onie-syseeprom
TlvInfo Header:
   Id String:    TlvInfo
   Version:      1
   Total Length: 166
TLV Name             Code Len Value
-------------------- ---- --- -----
Manufacture Date     0x25  19 04/27/2019 02:10:06
Label Revision       0x27   4 R01B
Platform Name        0x28  27 x86_64-accton_as7326_56x-r0
ONIE Version         0x29  13 2018.05.00.05
Manufacturer         0x2B   6 Accton
Diag Version         0x2E   7 0.0.1.0
Base MAC Address     0x24   6 80:A2:35:81:D5:F0
Serial Number        0x23  14 732656X1916012
Country Code         0x2C   2 TW
Part Number          0x22  13 FP4ZZ7656005A
Product Name         0x21  15 7326-56X-O-AC-F
MAC Addresses        0x2A   2 256
Vendor Name          0x2D   6 Accton
CRC-32               0xFE   4 0xC3D3F2DE
Checksum is valid.
ONIE:/ #
```

Solution

You can follow the steps below after installation/upgrade, to fix the problem of installation and upgrade failure on the old AS7326-56X hardware model (revision R01F or before).

Step1 Power cycle the switch.

Step2 From the GRUB menu, choose “**ONIE”** to enter ONIE GRUB menu:

```
+----------------------------------------------------------------------------+
| PicOS                                                                      |
|*ONIE                                                                       |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
+----------------------------------------------------------------------------+
     Use the ^ and v keys to select which entry is highlighted.
     Press enter to boot the selected OS, `e' to edit the commands
     before booting or `c' for a command-line.
```

Step3 From ONIE GRUB menu, choose “**ONIE: Rescue”** to launch ONIE in Rescue mode.

```
                         GNU GRUB  version 2.02~beta2+e4a1fe391
+----------------------------------------------------------------------------+
| ONIE: Install OS                                                           |
|*ONIE: Rescue                                                               |
| ONIE: Uninstall OS                                                         |
| ONIE: Update ONIE                                                          |
| ONIE: Embed ONIE                                                           |
| DIAG: Accton Diagnostic                                                    |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
+----------------------------------------------------------------------------+
```

Step4 Press Enter to display the ONIE prompt.

Step5 Mount PicOS partition with label is “PicOS”.

```
ONIE:/ # blkid
/dev/sda7: LABEL="User-Data" UUID="be63cef8-4560-4c48-ab5a-8f7ced5a950b"
/dev/sda6: LABEL="PicOS2" UUID="f589e53f-4cd1-44ba-8384-f339f4e2b2ac"
/dev/sda5: LABEL="PicOS" UUID="8ca5f7ed-5a15-4a2a-944c-4d8872647bf5"
/dev/sda4: LABEL="PICOS-GRUB" UUID="782a1372-4b66-4783-b920-dab1df8ec6e4"
/dev/sda3: LABEL="ACCTON-DIAG" UUID="3e4117d0-1926-472a-9d9e-08883df83d40"
/dev/sda2: LABEL="ONIE-BOOT" UUID="1a90abd8-f065-4f7a-90a0-af122b8805fa"
ONIE:/ #
ONIE:/ # mount /dev/sda5 /mnt
```

Step6 Execute the following command to modify the I2C access address.

```
ONIE:/ # sed -I "s/0x57/0x56/" /mnt/etc/rc_hw.sh
ONIE:/ # sync
```

Step7 Unmount the PicOS partition.

```
ONIE:/ # unmount /dev/sda5
```

Step8 Reboot the switch.

```
ONIE:/ # reboot
```

Installing Debian Packages on PICOS

PICOS uses a standard and non-modified Debian Linux distribution. It is very easy to install new packages or software on top of the existing PICOS packages, using the standard Debian package management system.

Here are some installation examples.

Installing GCC on PicOS

Installing Puppet on PicOS

Installing Salt on PicOS

Installing GCC on PicOS

NOTE:
If the FTP server is connected via the Eth0/1 port, you need to add the string **sudo ip vrf exec mgmt-vrf** before the apt-get command when executing the apt-get operation.

For example:

admin@Xorplus:~$ sudo ip vrf exec mgmt-vrf apt-get update

If **sudo ip vrf exec mgmt-vrf** is not added, find the next hop routing information from the default VRF. For the usage of VRF, refer to the VRF configuration guide.

Updating the software list on the source server

```
admin@XorPlus$sudo apt-get update
Hit http://ftp.tw.debian.org stable Release.gpg
Hit http://ftp.tw.debian.org stable Release
Hit http://ftp.tw.debian.org stable/main powerpc Packages
Hit http://ftp.tw.debian.org stable/main Translation-en

Installing Puppet on PicOS

NOTE:

- You can see an example of Puppet module to manipulate PicOS configuration on our Github repository:

  https://github.com/Pica8/Configuration-Managers

- If the FTP server is connected via the Eth0/1 port, you need to add the string **sudo ip vrf exec mgmt-vrf** before the apt-get command when executing the apt-get operation.

  For example:

  admin@Xorplus:~$ sudo ip vrf exec mgmt-vrf apt-get update

  If **sudo ip vrf exec mgmt-vrf** is not added, find the next hop routing information from the default VRF. For the usage of VRF, refer to the VRF configuration guide.

Step 1 Use the correct repository for the specific application and CPU on the switch. Pica8 support can help in the choice of repository.

```
admin@PICOS:~$sudo more /etc/apt/sources.list | grep -v "#"
deb http://ftp.debian-ports.org/debian/ unstable main
```

For a typical puppet installation, the latest standard debian repo is advised.

Step 2 Update the debian packages on PicOS.

```
admin@PICOS:~$ sudo apt-get update
Hit http://ftp.tw.debian.org stable Release.gpg
Hit http://ftp.tw.debian.org stable Release
Hit http://ftp.tw.debian.org stable/main powerpc Packages
Hit http://ftp.tw.debian.org stable/main Translation-en
Reading package lists... Done
admin@PICOS:~$
```

Step 3 Install puppet client and configure it.

```
admin@PICOS:~$ sudo apt-get install puppet
```

Look at the puppet documentation to understand how to connect the puppet client to a puppet server. A simple installation would require at least minor modification on the puppet.conf file.

```
more /etc/puppet/puppet.conf
[agent]
server = master.local.pica8.com
```

Step 4 Verify Puppet installation.

```
admin@PICOS:~$ sudo puppet agent -t
Notice: Using less secure serialization of reports and query parameters for compatibility
Notice: with older puppet master. To remove this notice, please upgrade your master(s)
```

```
Notice: to Puppet 3.3 or newer.
Notice: See http://links.puppetlabs.com/deprecate_yaml_on_network for more information.
Info: Retrieving pluginfacts
Info: Retrieving plugin

Info: Loading facts in /var/lib/puppet/lib/facter/instance_id.rb
Info: Caching catalog for Roma
Info: Applying configuration version '1405148228'
Notice: Finished catalog run in 0.35 seconds
```

Installing Salt on PicOS

NOTE:

- You can see an example of Salt module to manipulate PicOS configuration on our Github repository:

  https://github.com/pica8/Configuration-Managers

- If the FTP server is connected via the Eth0/1 port, you need to add the string **sudo ip vrf exec mgmt-vrf** before the apt-get command when executing the apt-get operation.

  For example:

  admin@Xorplus:~$ sudo ip vrf exec mgmt-vrf apt-get update

- If **sudo ip vrf exec mgmt-vrf** is not added, find the next hop routing information from the default VRF. For the usage of VRF, refer to the VRF configuration guide.

Step 1 Use the correct repository for the specific application and CPU on the switch. Pica8 support can help in the choice of repository.

```
admin@PICOS:~$ sudo more /etc/apt/sources.list | grep -v "#"
deb http://ftp.debian-ports.org/debian/ unstable main
```

For a typical salt installation, the latest standard debian repo is advised.

Step 2 - Update the debian packages on PicOS

```
admin@PICOS:~$ sudo apt-get update
Hit http://ftp.tw.debian.org stable Release.gpg
Hit http://ftp.tw.debian.org stable Release
Hit http://ftp.tw.debian.org stable/main powerpc Packages
Hit http://ftp.tw.debian.org stable/main Translation-en
Reading package lists... Done
admin@PICOS:~$
```

Step 3 - Install salt-common and salt-minion and configure it

```
admin@PICOS:~$ sudo apt-get install salt-common
admin@PICOS:~$ sudo apt-get install salt-minion
```

Look at the salt documentation to understand how to connect the salt-minion to a salt-master. A simple installation would need at least minor modification on the minion configuration file.

```
more /etc/salt/minion
# Set the location of the salt master server, if the master server cannot be
# resolved, then the minion will fail to start.
master: salt.example.com
```

PICOS Installation and Upgrade Guide for FS S5810 Series, S3410 Series, S5860 Series and N8560-32C Switches

- Upgrading PICOS for FS S5810/S5860 Series Switches Using Upgrade Command (Login via Console Port)
- Upgrading PICOS by Using Upgrade2 for S5860 Series and S3410 Series Switches (Login via Console Port)
- Installing PICOS for FS S5810/S5860 Series and N8560-32C Switches
- Installing PICOS for FS S3410 Series Switches
- Upgrading PICOS for FS S5810/S5860 Series Switches Using Upgrade Command (Login via Eth0 or Inband Management Interface)
- Upgrading PICOS by Using Upgrade2 for S5860 Series and S3410 Series Switches (Login via Eth0 or Inband Management Interface)

Upgrading PICOS for FS S5810/S5860 Series Switches Using Upgrade Command (Login via Console Port)

- Preparation before Upgrading
  - Checking the Running PICOS Version
  - Checking License Validation
  - Building Upgrade Environment
  - Getting the Required Upgrade Software
  - Backing up Important Data in Flash
  - Checking Available Flash Space
  - Upgrading Notes
- Upgrading Procedure
- Verifying Version after Upgrading

> **NOTE:**
> This guide is only available for upgrading PICOS for FS S5810/S5860 Series switches when login via the **console port**.

Preparation before Upgrading

Table 1 Checklist before Upgrading

No.	Checking Items	Checking Standard	Results
1	Checking the Running PICOS Version	The currently running system software version is lower than the software version to be installed	
2	Checking License Validation	Run the `license -s` command to verify that the license expiration date extends beyond the planned upgrade date. If the license is close to expiration, consider renewing it to avoid interruptions.	
3	Building Upgrade Environment	Build a different upgrade environment to get the upgrade software according to the need	
4	Getting the Required Upgrade Software	Obtain the required supporting upgrade software	
5	Backing up Important Data in Flash	All the important data in Flash is backed up	
6	Checking Available Flash Space	Flash space is enough to save upgrading package and other files	

Checking the Running PICOS Version

Use the **version** command to check the version of the running system software.

```
admin@PICOS:~$ version

L2/L3 Released Date           : 12/10/2023
OVS/OF Version/Revision       : 4.3.3.1/4f6f523
OVS/OF Released Date          : 12/10/2023
```

Checking License Validation

Before performing an upgrade, users can run the `license -s` command to check if the current license has expired, ensuring it is valid and preventing upgrade failure due to license expiration.

```
admin@PICOS:~$ license -s
{
"Type":"1GE",
"Feature":["Base Product", "Layer3", "OpenFlow"],
"Support End Date":"2020-10-28",
```

```
"Hardware ID":"ACD2-F77A-BBA3-2849",
"Site Name":"PICA8"
}
```

Building Upgrade Environment

Please make sure that you have set up an HTTP, TFTP or FTP protocol upgrading environment to get the upgrade software, the basic requirements are as follows:

- PC can log in to the device through serial.
- The communication between the server and the device works well.
- The upgrading file used by the device has already been stored on the server.

Getting the Required Upgrade Software

Please contact Pica8 technical support engineers at the following website for the latest version of upgrade software.

http://www.pica8.com/support/customer

Backing up Important Data in Flash

Before upgrading, save the important data (such as the configuration file) in Flash to the local PC through FTP or TFTP, and then upload it to the switch after the upgrade is completed.

> Where is the PicOS configuration?
>
> OVSDB file
>
> L2/L3 Configuration Files

Checking Available Flash Space

Use the **df** command to check the available flash space.

```
admin@PICOS:~$ df
Filesystem     1K-blocks   Used Available Use% Mounted on
udev              493028      0    493028   0% /dev
overlay           358904  57528    301376  17% /
tmpfs             512720      0    512720   0% /dev/shm
tmpfs             205088   3256    201832   2% /run
tmpfs               5120      0      5120   0% /run/lock
tmpfs              51200    292     50908   1% /tmp
/dev/ubi1_0       402660 208320    189500  53% /mnt/open
```

Upgrading Notes

- The device is not supported to upgrade to a previous version.
- When using FTP/TFTP to download the image, user should verify that the "binary" mode is being used. If the "binary" transfer mode is not being used, the image can be modified during download, and the upgrade will fail during the md5 check.
- The image is platform dependent, that is, the image_name should be consistent with the platform, otherwise the upgrade script will abort.
- The image file is a **.bin** file, for example S5810-48TS-P-picos-e-4.4.3.2-2f6f578-fs.bin.
- When upgrading, the installer checks whether there is a user-data partition. If there exists a User-Data partition, the installer only rewrites the running system boot partition (PicOS/PicOS2) and installs the new installation package to this partition. However, if there is no User-Data partition, the installer removes all the partitions to rebuild a brand new NOS.
- Upgrade operation via upgrade commands is not allowed on non-default system, you can upgrade PICOS only on default system. When there are more than one PICOS, the default system is the one automatically booted into after system reboot.
- During the upgrade process, no power interruption is allowed.

Upgrading Procedure

NOTE :

Usage of **upgrade** command:

admin@PICOS:~$ sudo upgrade

USAGE

Upgrade system with local new image

SYNOPSIS

upgrade [image_name] [factory-default]

DESCRIPTION

image_name - Image with bin format file(*.bin)

factory-default - Recovery configuration to factory default

- PICOS upgrade is done via the command "**upgrade**" in bash (launching a shell script named "upgrade.sh"). This script will upgrade the image automatically.
- The file format of the upgrade package is ***.bin**.
- If there is an MD5 file in the /cftmp directory, the upgrade script will check package integrity with MD5. Else if there is no MD5 file in the /cftmp directory, then skip the MD5 check step.
- The option **factory-default** is used to reset the configuration to factory default when performing upgrade. This option retains the license files from the previous version.

The upgrading procedure in this document gives an example of upgrading on S5810-48TS-P from PICOS 4.4.3.1 to 4.4.3.2.

Step1 Stop PICOS service before upgrade. On FS S5810 Series and S5860 Series switches, use the following command:

```
admin@PICOS:~$ sudo systemctl stop picos
```

Step2 Copy the upgrade package (in the form of **.bin**) and the MD5 file to **/cftmp** directory by either FTP, TFTP, HTTP or SCP according to the actual upgrade environment. The following example uses the SCP method.

```
admin@PICOS:~$ sudo scp pica8@10.10.50.22:/tftp/build/daily/s5810/S5810-48TS-P-picos-e-4.4.3.2-2f6f578-fs.bin  /cf
admin@PICOS:~$ sudo scp pica8@10.10.50.22:/tftp/build/daily/s5810/S5810-48TS-P-picos-e-4.4.3.2-2f6f578-fs.bin.md5
```

NOTE:
If management VRF is enabled, and the FTP/TFTP/HTTP/SCP server is connected via the Eth0/1 port, you need to add the string **sudo ip vrf exec mgmt-vrf** before the SCP command when executing the scp operation. The format is as follows:

admin@PICOS:~$ sudo ip vrf exec mgmt-vrf scp pica8@10.10.50.22:/tftp/build/s5810/S5810-48TS-P-picos-e-4.4.3.2-2f6f578-fs.bin /cftmp

admin@PICOS:~$ sudo ip vrf exec mgmt-vrf scp pica8@10.10.50.22:/tftp/build/s5810/S5810-48TS-P-picos-e-4.4.3.2-2f6f578-fs.bin.md5 /cftmp

If **sudo ip vrf exec mgmt-vrf** is not added, find the next hop routing information from the default VRF. For the usage of VRF, refer to the VRF Configuration Guide.

Step3 Execute the **sync** operation.

```
admin@PICOS:~$ sync
```

Step4 Change directory to /cftmp.

```
admin@PICOS:~$ cd /cftmp
```

Step5 Run the **upgrade** command.

```
admin@PICOS:~$ sudo upgrade S5810-48TS-P-picos-e-4.4.3.2-2f6f578-fs.bin
```

After the upgrade is complete, the system will automatically reboot and run the new network operating system.

Verifying Version after Upgrading

```
admin@PICOS:~$ version

Upgrading PICOS by Using Upgrade2 for S5860 Series and S3410 Series Switches (Login via Console Port)

- Introduction
- Preparation before Upgrading
  - Checking the Running PICOS Version
  - Checking License Validation
  - Building Upgrade Environment
  - Getting the Required Upgrade Software
  - Backing up Important Data in Flash
- Upgrading Notes
- Upgrading Procedure
  - NOTE:
- Rollback Procedure
- Verifying Version after Upgrading

NOTE:

- This guide is only available for upgrading PICOS for FS S5860 Series and S3410 Series switches when login via the **console port**.
- The S3410 Series switches only support upgrade via the upgrade2 method.
- S5810 Series switches only support the **upgrade** method and do not support the **upgrade2** method.

Introduction

PICOS supports **upgrade2** method for system upgrade. There will be two separate systems on the device after the upgrade2 operation: PICOS and PICOS2. One of them will be the running system and the other will stay inactive. PICOS and PICOS2 system files and their respective configuration files are located in ***/mnt/open/picos/*** of the flash. A list and brief description of these files is as follows.

```
* uImage1.itb
* picos1.sqsh
* config1/backup_files              //User-defined backup files list
* config1/backup.tar.gz                  //Backup of latest.tar.gz
* config1/latest.tar.gz              //The newest configuration files
* uImage2.itb
* picos2.sqsh
* config2/backup_files
* config2/backup.tar.gz
* config2/latest.tar.gz
```

The upgrade2 installer installs the new system into the inactive system's file. The inactive system will be overwritten. After this operation, the new system is the inactive system and then the installer modifies the boot menu to make the newly installed system to be the default boot system. Finally, the system will come up running the new network operating system when boots up normally after the upgrading is finished,.

Upgrade2 method supports system rollback function. The "**nos-rollback**" command can be used to revert to a previous version of the installed software package. Moreover, if it fails to upgrade, the system can automatically rollback to the old system. This can reduce the network interruption risk due to the failure of system upgrade process and ensure the systems' continuous availability. You can refer to section Rollback Procedure for details.

We recommend using upgrade2 method to upgrade the NOS as there are functions of system backup and rollback.

Preparation before Upgrading

Table 1. Checklist before Upgrading

No.	Checking Items	Checking Standard	Results
1	Checking the Running PICOS Version	The currently running system software version is lower than the software version to be installed.	
2	Checking License Validation	Run the `license -s` command to verify that the license expiration date extends beyond	

		the planned upgrade date. If the license is close to expiration, consider renewing it to avoid interruptions.	
3	Building Upgrade Environment	Build an upgrade environment to get the upgrade software according to the need.	
4	Getting the Required Upgrade Software	Obtain the required supporting upgrade software.	
5	Backing up Important Data in Flash	All the important data in Flash is backed up.	

Checking the Running PICOS Version

Use the **version** command to check the version of the running system software.

```
admin@PICOS# run show version
Copyright (C) 2009-2023 Pica8, Inc.
==================================
Base ethernet MAC Address     : 64:9d:99:d2:04:53
Hardware Model                : S5860-24XB-U
Linux System Version/Revision : 4.3.3.2/4b5f523
Linux System Released Date    : 12/14/2023
L2/L3 Version/Revision        : 4.3.3.2/4b5f523
L2/L3 Released Date           : 12/14/2023
OVS/OF Version/Revision       : 4.3.3.2/4b5f523
OVS/OF Released Date          : 12/14/2023
```

Checking License Validation

Before performing an upgrade, users can run the `license -s` command to check if the current license has expired, ensuring it is valid and preventing upgrade failure due to license expiration.

```
admin@PICOS:~$ license -s
{
"Type":"1GE",
"Feature":["Base Product", "Layer3", "OpenFlow"],
"Support End Date":"2020-10-28",
"Hardware ID":"ACD2-F77A-BBA3-2849",
"Site Name":"PICA8"
}
```

Building Upgrade Environment

Please make sure that you have set up an HTTP, TFTP or FTP protocol upgrading environment to get the upgrade software, the basic requirements are as follows:

- PC can log in to the device through serial.
- The communication between the server and the device works well.
- The upgrading file used by the device has already been stored on the server.

Getting the Required Upgrade Software

Please contact Pica8 technical support engineers at the following website for the latest version of upgrade software.

http://www.pica8.com/support/customer

Backing up Important Data in Flash

Before upgrading, save the important data in Flash to the local PC through FTP or TFTP, and then upload it to the switch after the upgrade is completed.

Upgrading Notes

- Downgrade to an earlier version is NOT supported by using upgrade2 command.
- When using FTP/TFTP to download the image, user should verify that the "binary" mode is being used. If the "binary" transfer mode is not being used, the image can be modified during download, and the upgrade will fail during the md5 check.
- The image file is a **.bin** file, for example S5860-24XB-U-picos-e-4.4.3.2-2f6f578-fs.bin.
- The image is platform dependent, that is, the image_name should be consistent with the platform, otherwise the upgrade script will abort.

Upgrading Procedure

The upgrading procedure in this document gives an example of upgrading on S5860-24XB-U from PICOS 3.1.0 to 3.1.1 using **upgrade2** command.

> **NOTE：**
>
> Usage of **upgrade2** command:
>
> USAGE
>
> Upgrade system with local new image
>
> SYNOPSIS
>
> upgrade2 [image_name] [factory-default]
>
> DESCRIPTION
>
> image_name - Image with bin format file(*.bin)
> factory-default - Recovery configuration to factory default
>
> PICOS upgrade is done via the command "**upgrade2**" in bash (launching a shell script named "upgrade2.sh"). This script will upgrade the image and back up configuration files automatically.

> Image name is in the form of **.bin** from version 3.1.0, which should be copied to the /cftmp directo before running upgrade2 command.
>
> The **no-md5-check** option is removed from PICOS 3.1.0. If there is an MD5 file in the /cftmp directory, the upgrade script will check package integrity with MD5. Else if there is no MD5 file in the /cftmp directory, then skip the MD5 check step.
>
> The option **factory-default** is used to reset the configuration to factory default when performing upgrade, but it retains the license files from the previous version.

Upgrade2 Procedure

Step1 Stop PICOS service before upgrade.

- On FS S5810 Series and S5860 Series switches, use the following command:

```
admin@PICOS:~$ sudo systemctl stop picos
```

- On S3410 Series switches, use the following command:

```
admin@PICOS:~$ sudo /etc/init.d/picos stop
```

Step2 Copy the upgrade package (in the form of **.bin**) and the MD5 file to **/cftmp** directory by either FTP, TFTP, HTTP or SCP according to the actual upgrade environment. The following example uses the SCP method.

```
admin@PICOS:~$ sudo scp pica8@10.10.50.22:/tftp/build/daily/S5860-24XB-U/S5860-24XB-U-picos-e-4.4.3.2-2f6f578-fs.bin  /cft
admin@PICOS:~$ sudo scp pica8@10.10.50.22:/tftp/build/daily/S5860-24XB-U/S5860-24XB-U-picos-e-4.4.3.2-2f6f578-fs.bin.md5
```

> **NOTE:**
>
> If management VRF is enabled, and the FTP/TFTP/HTTP/SCP server is connected via the Eth0/1 port, you need to add the string **sudo ip vrf exec mgmt-vrf** before the SCP command when executing the scp operation. The format is as follows:
>
> admin@PICOS:~$ sudo ip vrf exec mgmt-vrf scp pica8@10.10.50.22:/tftp/build/4.4.3.2/S5860-24XB-U/S5860-24XB-U-picos-e-4.4.3.2-2f6f578-fs.bin /cftmp
>
> admin@PICOS:~$ sudo ip vrf exec mgmt-vrf scp pica8@10.10.50.22:/tftp/build/4.4.3.2/S5860-24XB-U/S5860-24XB-U-picos-e-4.4.3.2-2f6f578-fs.bin.md5 /cftmp
>
> If **sudo ip vrf exec mgmt-vrf** is not added, find the next hop routing information from the default VRF. For the usage of VRF, refer to the VRF Configuration Guide.

Step3 Execute the **sync** operation.

```
admin@PICOS:~$ sync
```

Step4 Change directory to **/cftmp**.

```
admin@PICOS:~$ cd /cftmp
```

Step5 Run **upgrade2** command to begin upgrading.

```
admin@PICOS:~$ sudo upgrade2 S5860-24XB-U-picos-e-4.4.3.2-2f6f578-fs.bin
```

After finishing upgrade, the switch will reboot automatically, the system will come up running the new network operating system.

> **NOTE：**
>
> It will take 20 - 30 minutes to finish upgrading PICOS. During the upgrade process, please be patient and do not perform any operation until the upgrade is complete, otherwise, the upgrade may be interrupted.

Rollback Procedure

The upgrade2 method supports system rollback function. The "**nos-rollback**" command can be used to revert to a previous version of the installed software package. Moreover, if it fails to upgrade, the system can automatically rollback to the old system.

> **NOTE：**
>
> Usage of **nos-rollback** command:
>
> admin@PICOS:~$ sudo nos-rollback
>
> USAGE
>
> Rollback to the previous system after next reboot
>
> SYNOPSIS
>
> nos-rollback

The rollback procedure is as follows:

Step1 Run **nos-rollback** command for manually rollback.

```
admin@PICOS:~$ sudo nos-rollback
```

Step2 Reboot system manually to finish rollback.

```
admin@PICOS:~$ sudo reboot
```

You need to manually reboot the system after issued "**nos-rollback**" command and the system switching takes effect. After rebooting successfully, the system will come up running the previous version of network operating system.

Verifying Version after Upgrading

```
admin@PICOS# run show version
Copyright (C) 2009-2023 Pica8, Inc.

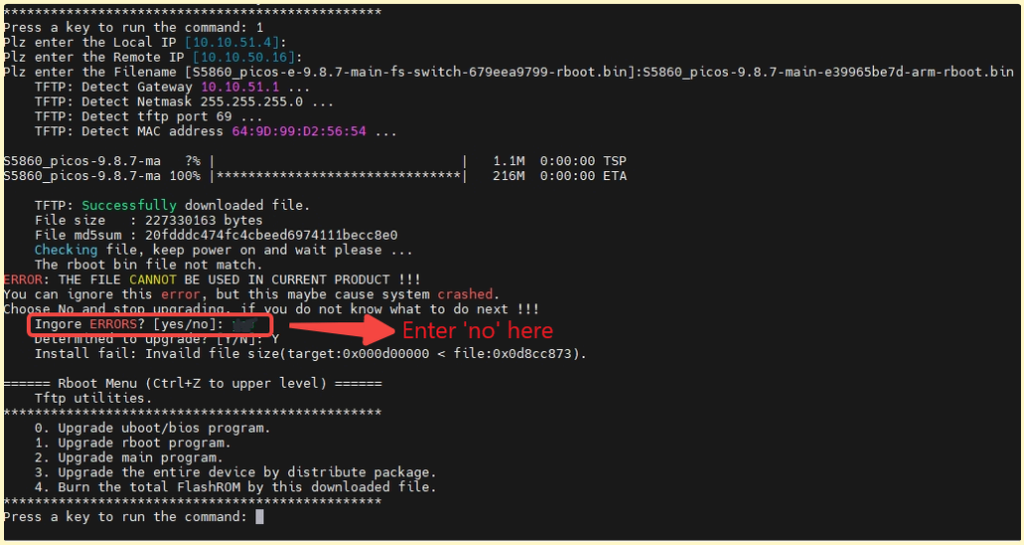
Installing PICOS for FS S5810/S5860 Series and N8560-32C Switches

NOTE:

- N8560-32C uses the Rboot method for installation described in this guide, while upgrade still uses the ONIE method, please refer to Upgrading PICOS from Version 3.0 or Later Using Upgrade2 and Upgrading PICOS from Version 4.0.0 or Later Using Upgrade Command for details on the upgrade process.
- The installation package name for N8560-32C includes the suffix '**-rboot**', for example, **N8560_picos-4.4.5-9bca0916a3-rboot.bin**. The upgrade package, on the other hand, includes the suffix '**-x86**', such as **picos-4.4.5-9bca0916a3-x86.bin**.

Caution:

When an incorrect installation file is detected, the system will display the error message "**Ignore ERRORS? [YES/NO]:**". Users need to enter "**no**" to prevent the system from using the incorrect installation file for system installation. Do NOT enter "yes", or the system will proceed with the incorrect installation file, which may cause a system crash.



PICOS system can be installed under the Rboot menu through TFTP protocol for FS S5810 and S5860 Series switches. The following steps describe the installation procedure.

Step 1 Power off and on to force restarting the switch, then press **Ctrl+C** to enter Rboot menu.

Step 2 (Optional) If the TFTP server and the switch are in the different network segment, configure the gateway address first (if they are in the same network segment, no need to do this step).

a) Enter **4** in the Rboot menu to access the *Scattered utilities* menu.

```
I2C:   ready
DRAM:  1 GiB
NAND:  1024 MiB
Loading Environment from SPI Flash... SF: Detected s25fl128s_64k

    TOP menu items.
***********************************************
    0. Tftp utilities.
    1. X/Y/ZModem utilities.
    2. Run main.
    3. SetMac utilities.
    4. Scattered utilities.
***********************************************
Press a key to run the command: 4
====== Rboot Menu (Ctrl+Z to upper level) ======
    Scattered utilities.
***********************************************
    0. Show Version.
    1. Reload System.
    2. Set Baudrate.
    3. Format Flash.
    4. Exit menu.
    5. Set debug mode.
    6. Run main without enable password.
    7. Set Download Gateway.
***********************************************
Press a key to run the command: 7
Plz enter the Local GatewayIP [<NULL>]:10.10.51.1
Plz enter the IP Netmask [<NULL>]:255.255.255.0
    Set Local GatewayIP to 10.10.51.1
    Set IP Netmask to 255.255.255.0
```

b) Enter **7** to set the gateway IP and IP netmask.

c) Then, press **Ctrl+Z** to go back to the Rboot menu.

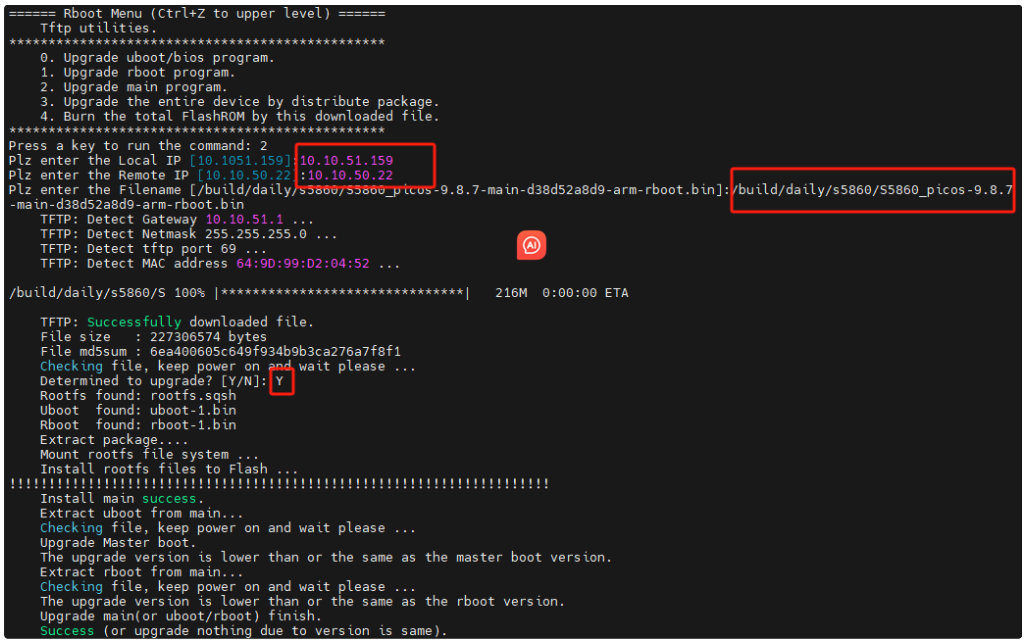
Step 3 In Rboot menu, enter **0** to access *Tftp utilities* menu, and then enter **2** to perform TFTP upgrade.

```
====== Rboot Menu (Ctrl+Z to upper level) ======
    TOP menu items.
***********************************************
    0. Tftp utilities.
    1. X/Y/ZModem utilities.
    2. Run main.
    3. SetMac utilities.
    4. Scattered utilities.
***********************************************
Press a key to run the command: 0
====== Rboot Menu (Ctrl+Z to upper level) ======
    Tftp utilities.
***********************************************
    0. Upgrade uboot/bios program.
    1. Upgrade rboot program.
    2. Upgrade main program.
    3. Upgrade the entire device by distribute package.
    4. Burn the total FlashROM by this downloaded file.
***********************************************
Press a key to run the command: 2
```

Step 4 Use TFTP protocol to download the installation files, and then install PICOS.

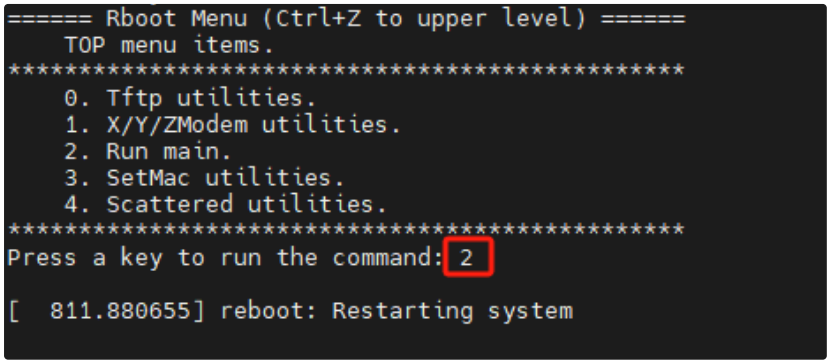
a) Configure the TFTP parameters. **Local IP** is the management interface IP of the switch, **Remote IP** is the IP of the TFTP server, **Filename** is the installation image directory and name located on the TFTP server.

b) After downloaded the installation image successfully, you need to input **Y** manually, then the system will automatically start system installation process.



Wait a few minutes before the installation process is completed. When **Success** is displayed, it indicates that the installation process is successfully completed.

Step 5 Press **Ctrl+Z** to go back to the Rboot menu, then type **2** to reboot the switch.



Then the device reboots and comes up running the new network operating system.

Users need to enter the username and password after the system restarts, the initial login username is admin and password is pica8. Then users will be asked to set a new password for admin. This is the only post installation step after which the PICOS operating system can be used.

Installing PICOS for FS S3410 Series Switches

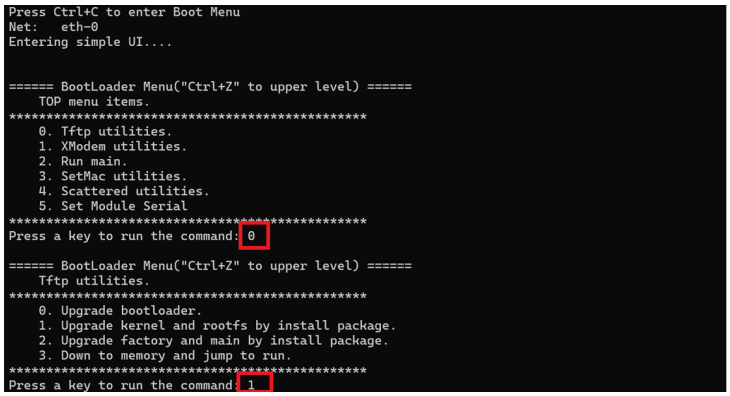
NOTE:

The installation package name for S3410 includes the suffix '**-rboot**', for example, **S3410-PicOS-4.4.5.14-2963b1e57b-rboot.bin**.

PICOS system can be installed under the Uboot menu through TFTP protocol for FS S3410 Series switches. The following steps describe the installation procedure.

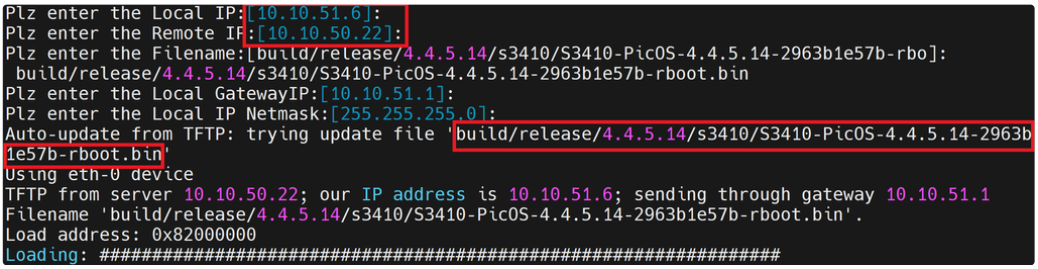
Step 1 Power off and on to force restarting the switch, then press **Ctrl+C** to enter Uboot menu.

Step 2 Enter **0** and then **1** in the Uboot menu to perform the installation process.



Step 3 Use TFTP protocol to download the installation files, and then install PICOS.

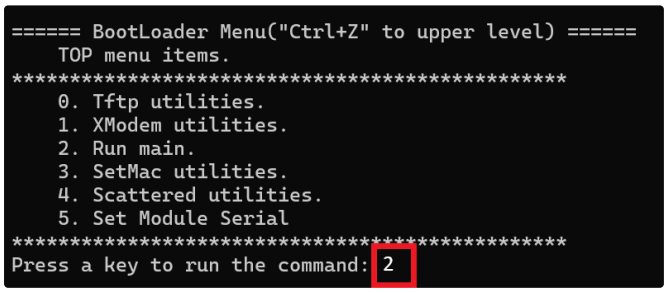
a) Configure the TFTP parameters. **Local IP** is the inband management interface IP of the switch, **Remote IP** is the IP of the TFTP server, **Filename** is the installation image directory and name located on the TFTP server.



b) After downloaded the installation image successfully, you need to input **Y** manually, then the system will automatically start system installation process.

c) Wait a few minutes before the installation process is completed. When **Success** is displayed, it indicates that the installation process is successfully completed.

Step 4 Press **Ctrl+Z** to go back to the Uboot menu, then type **2** to reboot the switch.



Then the device reboots and comes up running the new network operating system.

Users need to enter the username and password after the system restarts, the initial login username is **admin** and password is **pica8**. Then users will be asked to set a new password for admin. This is the only post installation step after which the PICOS operating system can be used.

Upgrading PICOS for FS S5810/S5860 Series Switches Using Upgrade Command (Login via Eth0 or Inband Management Interface)

- Preparation before Upgrading
  - Checking the Running PICOS Version
  - Checking License Validation
  - Building Upgrade Environment
  - Getting the Required Upgrade Software
  - Backing up Important Data in Flash
  - Checking Available Flash Space
  - Upgrading Notes
- Upgrading Procedure
- Verifying Version after Upgrading

NOTE:

- This guide is only available for upgrading PICOS for FS S5810/S5860 Series switches when login via the **eth0** or **inband management interface**, and the supported version should be 4.4.5.7 or later versions before upgrade.
- During the upgrade process, the user connections and services will be interrupted. This means that users may lose access to the system, and any processes or transactions being handled by the services will be paused until the upgrade is complete. After the upgrade, users will need to reconnect to resume normal operations, and services will be restored.

Preparation before Upgrading

Table 1 Checklist before Upgrading

No.	Checking Items	Checking Standard	Results
1	Checking the Running PICOS Version	The currently running system software version is lower than the software version to be installed	
2	Checking License Validation	Run the `license -s` command to verify that the license expiration date extends beyond the planned upgrade date. If the license is close to expiration, consider renewing it to avoid interruptions.	
3	Building Upgrade Environment	Build a different upgrade environment to get the upgrade software according to the need	
4	Getting the Required Upgrade Software	Obtain the required supporting upgrade software	
5	Backing up Important Data in Flash	All the important data in Flash is backed up	
6	Checking Available Flash Space	Flash space is enough to save upgrading package and other files	

Checking the Running PICOS Version

Use the **version** command to check the version of the running system software.

```
admin@PICOS:~$ version
Copyright (C) 2009-2024 Pica8, Inc.
====================================
Base ethernet MAC Address     : 64:9d:99:d7:7d:23
Hardware Model                : S5860-48MG-U
Linux System Version/Revision : 4.4.5.7/4f6f523
Linux System Released Date    : 10/10/2024
L2/L3 Version/Revision        : 4.4.5.7/4f6f523
L2/L3 Released Date           : 10/10/2024
OVS/OF Version/Revision       : 4.4.5.7/4f6f523
OVS/OF Released Date          : 10/10/2024
```

Checking License Validation

Before performing an upgrade, users can run the `license -s` command to check if the current license has expired, ensuring it is valid and preventing upgrade failure due to license expiration.

```
admin@PICOS:~$ license -s
{
"Type":"1GE",
"Feature":["Base Product", "Layer3", "OpenFlow"],
"Support End Date":"2020-10-28",
"Hardware ID":"ACD2-F77A-BBA3-2849",
"Site Name":"PICA8"
}
```

Building Upgrade Environment

Please make sure that you have set up an HTTP, TFTP or FTP protocol upgrading environment to get the upgrade software, the basic requirements are as follows:

- PC can log in to the device through eth0 or inband management interface.
- The communication between the server and the device works well.
- The upgrading file used by the device has already been stored on the server.

Getting the Required Upgrade Software

Please contact Pica8 technical support engineers at the following website for the latest version of upgrade software.

http://www.pica8.com/support/customer

Backing up Important Data in Flash

Before upgrading, save the important data (such as the configuration file) in Flash to the local PC through FTP or TFTP, and then upload it to the switch after the upgrade is completed.

> Where is the PicOS configuration?
>
> OVSDB file
>
> L2/L3 Configuration Files

Checking Available Flash Space

Use the **df** command to check the available flash space.

```
admin@PICOS:~$ df
Filesystem     1K-blocks   Used Available Use% Mounted on
udev              493028      0    493028   0% /dev
overlay           358904  57528    301376  17% /
tmpfs             512720      0    512720   0% /dev/shm
tmpfs             205088   3256    201832   2% /run
tmpfs               5120      0      5120   0% /run/lock
tmpfs              51200    292     50908   1% /tmp
/dev/ubi1_0       402660 208320    189500  53% /mnt/open
```

Upgrading Notes

- The device is not supported to upgrade to a previous version.
- When using FTP/TFTP to download the image, user should verify that the "binary" mode is being used. If the "binary" transfer mode is not being used, the image can be modified during download, and the upgrade will fail during the md5 check.
- The image is platform dependent, that is, the image_name should be consistent with the platform, otherwise the upgrade script will abort.
- The image file is a **.bin** file, for example S5810-48TS-P-picos-e-4.4.5.7-2f6f578-fs.bin.
- Please find the log file related to PICOS upgrade process at */mnt/open/picos/config2/upgrade.log* and */mnt/open/picos/config1/upgrade.log*. This log file contains detailed information about the steps performed during the upgrade, including any errors or warnings that occurred. It can be used to troubleshoot issues or verify that the upgrade was completed successfully.
- When upgrading, the installer checks whether there is a user-data partition. If there exists a User-Data partition, the installer only rewrites the running system boot partition (PicOS/PicOS2) and installs the new installation package to this partition. However, if there is no User-Data partition, the installer removes all the partitions to rebuild a brand new NOS.
- Upgrade operation via upgrade commands is not allowed on non-default system, you can upgrade PICOS only on default system. When there are more than one PICOS, the default system is the one automatically booted into after system reboot.
- During the upgrade process, power interruption is not allowed.

Upgrading Procedure

NOTE :

Usage of **upgrade** command:

admin@PICOS:~$ sudo upgrade

USAGE

Upgrade system with local new image

SYNOPSIS

upgrade [image_name] [factory-default]

DESCRIPTION

image_name - Image with bin format file(*.bin)

factory-default - Recovery configuration to factory default

- PICOS upgrade is done via the command "**upgrade**" in bash (launching a shell script named "upgrade.sh"). This script will upgrade the image automatically.
- The file format of the upgrade package is ***.bin**.
- If there is an MD5 file in the /cftmp directory, the upgrade script will check package integrity with MD5. Else if there is no MD5 file in the /cftmp directory, then skip the MD5 check step.
- The option **factory-default** is used to reset the configuration to factory default when performing upgrade. This option retains the license files from the previous version.

The upgrading procedure in this document gives an example of upgrading on S5860-48MG-U from PICOS 4.4.5.7 to 4.4.5.8.

Step1 Copy the upgrade package (in the form of **.bin**) and the MD5 file to **/cftmp** directory by either FTP, TFTP, HTTP or SCP according to the actual upgrade environment. The following example uses the SCP method.

```
admin@PICOS:~$ sudo scp pica8@10.10.50.22:/tftp/build/daily/s5860/S5860_picos-4.4.5GA-7f06432992.bin  /cftmp
admin@PICOS:~$ sudo scp pica8@10.10.50.22:/tftp/build/daily/s5860/S5860_picos-4.4.5GA-7f06432992.bin.md5  /cftmp
```

NOTE:
If management VRF is enabled, and the FTP/TFTP/HTTP/SCP server is connected via the Eth0/1 port, you need to add the string **sudo ip vrf exec mgmt-vrf** before the SCP command when executing the scp operation. The format is as follows:

admin@PICOS:~$ sudo ip vrf exec mgmt-vrf scp pica8@10.10.50.22:/tftp/build/s5860/S5860_picos-4.4.5GA-7f06432992.bin /cftmp

admin@PICOS:~$ sudo ip vrf exec mgmt-vrf scp pica8@10.10.50.22:/tftp/build/s5860/S5860_picos-4.4.5GA-7f06432992.bin.md5 /cftmp

If **sudo ip vrf exec mgmt-vrf** is not added, find the next-hop routing information from the default VRF. For the usage of VRF, refer to the VRF Configuration Guide.

Step2 Execute the **sync** operation.

```
admin@PICOS:~$ sync
```

Step3 Change directory to /cftmp.

```
admin@PICOS:~$ cd /cftmp
```

Step4 Run the **upgrade** command.

```
admin@PICOS:/cftmp$ sudo upgrade S5860_picos-4.4.5GA-7f06432992.bin
Upgrading system...
The connection may be interrupted. Please wait a moment to complete the upgrading procedure.
admin@PICOS:/cftmp$
```

NOTE :

- It will take about 5 minutes to finish upgrading PICOS. During the upgrade process, please be patient and do not perform any operation until the upgrade is complete, otherwise, the upgrade may be interrupted.
- During the upgrade process, the user connections and services will be interrupted. This means that users may lose access to the system, and any processes or transactions being handled by the services will be paused until the upgrade is complete.

Step5 After the upgrade, users will need to reconnect to resume normal operations, and services will be restored.

```
admin@PICOS:~$ ssh admin@10.10.51.54
```

Verifying Version after Upgrading

Upgrading PICOS by Using Upgrade2 for S5860 Series and S3410 Series Switches (Login via Eth0 or Inband Management Interface)

- Introduction
- Preparation before Upgrading
  - Checking the Running PICOS Version
  - Checking License Validation
  - Building Upgrade Environment
  - Getting the Required Upgrade Software
  - Backing up Important Data in Flash
- Upgrading Procedure
  - Upgrade2 Procedure
    - NOTE:
- Rollback Procedure
- Verifying Version after Upgrading

NOTE:

- This guide is only available for upgrading PICOS for FS S5860 Series and S3410 Series switches when login via the **eth0** or **inband management interface**, and the supported version should be 4.4.5.7 or later versions before upgrade.
- During the upgrade process, the user connections and services will be interrupted. This means that users may lose access to the system, and any processes or transactions being handled by the services will be paused until the upgrade is complete. After the upgrade, users will need to reconnect to resume normal operations, and services will be restored.
- The S3410 Series switches only support upgrade via the upgrade2 method.
- S5810 Series switches only support the **upgrade** method and do not support the **upgrade2** method.

Introduction

PICOS supports **upgrade2** method for system upgrade. There will be two separate systems on the device after the upgrade2 operation: PICOS and PICOS2. One of them will be the running system and the other will stay inactive. PICOS and PICOS2 system files and their respective configuration files are located in ***/mnt/open/picos/*** of the flash. A list and brief description of these files is as follows.

```
* uImage1.itb
* picos1.sqsh
* config1/backup_files              //User-defined backup files list
* config1/backup.tar.gz                  //Backup of latest.tar.gz
* config1/latest.tar.gz              //The newest configuration files
* uImage2.itb
* picos2.sqsh
* config2/backup_files
* config2/backup.tar.gz
* config2/latest.tar.gz
```

The upgrade2 installer installs the new system into the inactive system's file. The inactive system will be overwritten. After this operation, the new system is the inactive system and then the installer modifies the boot menu to make the newly installed system to be the default boot system. Finally, the system will come up running the new network operating system when boots up normally after the upgrading is finished,.

Upgrade2 method supports system rollback function. The "**nos-rollback**" command can be used to revert to a previous version of the installed software package. Moreover, if it fails to upgrade, the system can automatically rollback to the old system. This can reduce the network interruption risk due to the failure of system upgrade process and ensure the systems' continuous availability. You can refer to section Rollback Procedure for details.

We recommend using upgrade2 method to upgrade the NOS as there are functions of system backup and rollback.

Preparation before Upgrading

Table 1. Checklist before Upgrading

No.	Checking Items	Checking Standard	Results
1	Checking the Running PICOS Version	The currently running system software version is lower than the software version to be installed.	
2	Checking License Validation	Run the `license -s` command to verify that the license expiration date extends beyond the planned upgrade date. If the license is close to expiration, consider renewing it to avoid interruptions.	
3	Building Upgrade Environment	Build an upgrade environment to get the upgrade software according to the need.	
4	Getting the Required Upgrade Software	Obtain the required supporting upgrade software.	
5	Backing up Important Data in Flash	All the important data in Flash is backed up.	

Checking the Running PICOS Version

Use the **version** command to check the version of the running system software.

```
admin@PICOS:~$ version
Copyright (C) 2009-2024 Pica8, Inc.
================================
Base ethernet MAC Address     : 64:9d:99:d7:7d:23
Hardware Model                : S5860-48MG-U
Linux System Version/Revision : 4.4.5.7/4f6f523
Linux System Released Date    : 10/10/2024
L2/L3 Version/Revision        : 4.4.5.7/4f6f523
L2/L3 Released Date           : 10/10/2024
```

```
OVS/OF Version/Revision       : 4.4.5.7/4f6f523
OVS/OF Released Date          : 10/10/2024
```

Checking License Validation

Before performing an upgrade, users can run the `license -s` command to check if the current license has expired, ensuring it is valid and preventing upgrade failure due to license expiration.

```
admin@PICOS:~$ license -s
{
"Type":"1GE",
"Feature":["Base Product", "Layer3", "OpenFlow"],
"Support End Date":"2020-10-28",
"Hardware ID":"ACD2-F77A-BBA3-2849",
"Site Name":"PICA8"
}
```

Building Upgrade Environment

Please make sure that you have set up an HTTP, TFTP or FTP protocol upgrading environment to get the upgrade software, the basic requirements are as follows:

- PC can log in to the device through SSH.
- The communication between the server and the device works well.
- The upgrading file used by the device has already been stored on the server.

Getting the Required Upgrade Software

Please contact Pica8 technical support engineers at the following website for the latest version of upgrade software.

http://www.pica8.com/support/customer

Backing up Important Data in Flash

Before upgrading, save the important data in Flash to the local PC through FTP or TFTP, and then upload it to the switch after the upgrade is completed.

Upgrading Notes

- Downgrade to an earlier version is NOT supported by using upgrade2 command.
- When using FTP/TFTP to download the image, user should verify that the "binary" mode is being used. If the "binary" transfer mode is not being used, the image can be modified during download, and the upgrade will fail during the md5 check.
- The image file is a **.bin** file, for example S5860-24XB-U-picos-e-4.4.5.7-2f6f578-fs.bin.
- Please find the log file related to PICOS upgrade process at */mnt/open/picos/config2/upgrade2.log* and */mnt/open/picos/config1/upgrade2.log.* This log file contains detailed information about the steps performed during the upgrade, including any errors or warnings that occurred. It can be used to troubleshoot issues or verify that the upgrade was completed successfully.
- The image is platform dependent, that is, the image_name should be consistent with the platform, otherwise the upgrade script will abort.
- During the upgrade process, power interruption is not allowed.

Upgrading Procedure

The upgrading procedure in this document gives an example of upgrading on S5860-48MG-U from 4.4.5.7 to 4.4.5.8 using **upgrade2** command.

> **NOTE：**
>
> Usage of **upgrade2** command:
>
> USAGE
>
> Upgrade system with local new image
>
> SYNOPSIS
>
> upgrade2 [image_name] [factory-default]
>
> DESCRIPTION
>
> image_name - Image with bin format file(*.bin)
> factory-default - Recovery configuration to factory default
>
> PICOS upgrade is done via the command "**upgrade2**" in bash (launching a shell script named "upgrade2.sh"). This script will upgrade the image and back up configuration files automatically.
>
> Image name is in the form of **.bin** from version 3.1.0, which should be copied to the /cftmp directory before running upgrade2 command.
>
> The **no-md5-check** option is removed from PICOS 3.1.0. If there is an MD5 file in the /cftmp directory, the upgrade script will check package integrity with MD5. Else if there is no MD5 file in the /cftmp directory, then skip the MD5 check step.
>
> The option **factory-default** is used to reset the configuration to factory default when performing upgrade, but it retains the license files from the previous version.

Upgrade2 Procedure

Step1 Copy the upgrade package (in the form of **.bin**) and the MD5 file to **/cftmp** directory by either FTP, TFTP, HTTP or SCP according to the actual upgrade environment. The following example uses the SCP method.

```
admin@PICOS:~$ sudo scp pica8@10.10.50.22:/tftp/build/daily/s5860/S5860_picos-4.4.5GA-7f06432992.bin  /cftmp
admin@PICOS:~$ sudo scp pica8@10.10.50.22:/tftp/build/daily/s5860/S5860_picos-4.4.5GA-7f06432992.bin.md5
/cftmp
```

> **NOTE:**
>
> If management VRF is enabled, and the FTP/TFTP/HTTP/SCP server is connected via the Eth0/1 port, you need to add the string **sudo ip vrf exec mgmt-vrf** before the SCP command when executing the scp operation. The format is as follows:
>
> admin@PICOS:~$ sudo ip vrf exec mgmt-vrf scp pica8@10.10.50.22:/tftp/build/s5860/S5860_picos-4.4.5GA-7f06432992.bin /cftmp
>
> admin@PICOS:~$ sudo ip vrf exec mgmt-vrf scp pica8@10.10.50.22:/tftp/build/s5860/S5860_picos-4.4.5GA-7f06432992.bin.md5 /cftmp
>
> If **sudo ip vrf exec mgmt-vrf** is not added, find the next hop routing information from the default VRF. For the usage of VRF, refer to the VRF Configuration Guide.

Step2 Execute the **sync** operation.

```
admin@PICOS:~$ sync
```

Step3 Change directory to **/cftmp**.

```
admin@PICOS:~$ cd /cftmp
```

Step4 Run **upgrade2** command to begin upgrading.

```
admin@PICOS:/cftmp$ sudo upgrade2 S5860_picos-4.4.5GA-7f06432992.bin
Upgrading system...
The connection may be interrupted. Please wait a moment to complete the upgrading procedure.
admin@PICOS:/cftmp$
```

NOTE：

- It will take about 5 minutes to finish upgrading PICOS. During the upgrade process, please be patient and do not perform any operation until the upgrade is complete, otherwise, the upgrade may be interrupted.
- During the upgrade process, the user connections and services will be interrupted. This means that users may lose access to the system, and any processes or transactions being handled by the services will be paused until the upgrade is complete.

Step5 After the upgrade, users will need to reconnect to resume normal operations, and services will be restored.

```
admin@PICOS:~$ ssh admin@10.10.51.54
```

Rollback Procedure

The upgrade2 method supports system rollback function. The "**nos-rollback**" command can be used to revert to a previous version of the installed software package. Moreover, if it fails to upgrade, the system can automatically rollback to the old system.

NOTE：

Usage of **nos-rollback** command:

admin@PICOS:~$ sudo nos-rollback

USAGE

Rollback to the previous system after next reboot

SYNOPSIS

nos-rollback

The rollback procedure is as follows:

Step1 Run **nos-rollback** command for manually rollback.

```
admin@PICOS:~$ sudo nos-rollback
```

Step2 Reboot system manually to finish rollback.

```
admin@PICOS:~$ sudo reboot
```

You need to manually reboot the system after issued "**nos-rollback**" command and the system switching takes effect. After rebooting successfully, the system will come up running the previous version of network operating system.

Verifying Version after Upgrading

```
admin@PICOS:~$ version

PICOS Debian Package Upgrade User Guide

- Overview
- How to use
- Verifying after Upgrade
- Appendix

Overview

PICOS provides five Debian packages from release 3.2 to let users upgrade some of the available components manually, or reinstall PICOS components in case some of them were broken.

Available PICOS Debian packages and the dependencies between them are described below:

- picos-linux

  PICOS Linux Kernel, drivers and switching ASIC kernel modules

- picos-vasic
  - PICOS VASIC and line card management libraries and utilities
  - Depends on picos-linux
- picos-xorplus
  - PICOS Layer 2 and Layer 3 software package
  - Depends on picos-vasic, picos-utils
- picos-ovs
  - PICOS OVS package
  - “picos-ovs” will have its own lib to access peripherals (such as FAN and PSU and LED) via sysfs
  - Depends on picos-vasic, picos-utils
- picos-utils
  - PICOS common utilities and configuration files
  - System config files, systemd units
  - Common utility such as ZTP/diag

In this way, we do not need to upgrade the entire PICOS system if version changes only appear in one or several of the components. This provides an efficient and effective method of upgrading PICOS system.

> **NOTE：**
>
> Some PICOS component packages would depend on other parts, so the dependent ones should be installed first if they do not exist on the system.

How to use

When new releases of PICOS components have been made available to fix urgent issues, users can get the Debian packages from PICOS support team.

For example, the package users get might be "picos-xorplus-s4100-3.2.3-9dc8d94.deb" saved in the working directory.

To install the package, the following command is OK:

```
admin@Xorplus:~$ sudo dpkg -i picos-xorplus-s4100-3.2.3-9dc8d94.deb
```

After finishing upgrade, the switch will reboot automatically, the system will come up running the PICOS operating system with the new PICOS component.

> **NOTE：**
>
> If certain PICOS components have been removed from the running Linux system, this operation would be an installation instead of upgrade. In this case, users need to confirm the model compatibility manually by inputting `Yes` or `Y` at the prompt `Are you sure the model is *MODEL* (yes/no)?`

Verifying after Upgrade

We can use the following command to check the status of PICOS Debian packages after upgrade.

```
admin@Xorplus:~$ dpkg -l | grep picos-
ii  picos-linux
ii  picos-ovs
ii  picos-utils
ii  picos-vasic
ii  picos-xorplus
```

Here two "**i**" represent **normal**, the first one indicates that the package has been installed successfully. The second "**i**" indicates the installation dependencies between the components and configuration operations are successfully completed met.

Appendix

PICOS component package uninstall operation is provided as follows.

> **NOTE：**
>
> - Uninstall the PICOS component packages may cause severe system errors, we strongly recommend not to uninstall any of the PICOS component package.
> - The uninstall operation will uninstall all packages that depend on this package, either directly or indirectly.

```
admin@Xorplus:~$ sudo apt remove picos-utils
Reading package lists... Done
Building dependency tree
Reading state information... Done
The following packages will be REMOVED:
  picos-utils
0 upgraded, 0 newly installed, 1 to remove and 0 not upgraded.
After this operation, 0 B of additional disk space will be used.
Do you want to continue? [Y/n]
```

Zero Touch Provisioning (ZTP)

- Overview of ZTP
  - ZTP Fundamentals
  - DHCP Configuration of ZTP
  - Provision Script
- Enabling or Disabling ZTP
- Preparation before ZTP Deployment
- Example for Implementing ZTP Deployment through DHCP
- Appendix: ZTP API

Overview of ZTP

- ZTP Fundamentals
- DHCP Configuration of ZTP
- Provision Script

ZTP Fundamentals

NOTEs:

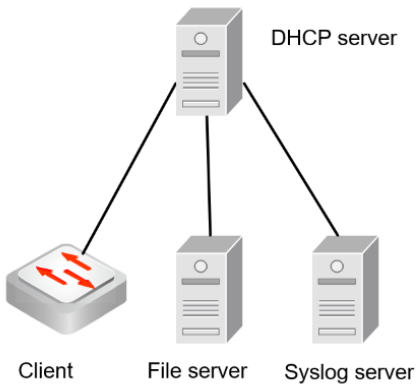
- Currently, the IPv6 ZTP is not supported.
- You are suggested to implement ZTP for unconfigured devices, or the error prompts may appear.
- Before using ZTP, you should configure the switch with two partitions of active partition and backup partition. The active partition can be used for upgrade and the backup partition can be used to save the current version, which can make sure the original version can be recovered once the upgrade is failed.

ZTP (Zero Touch Provisioning) is a technology for automated upgrade and configuration of unconfigured network devices. You can automatically upgrade and configure devices with the provision script of ZTP before the PicOS is up, obtaining the required configuration information without manual intervention, including IP addresses, routing, security policies, etc.

When large numbers of switches need to be upgraded to new versions or issued with configuration files, you can use ZTP to reduce labor costs and improve deployment efficiency. It can implement fast, accurate and reliable device deployment.

Typical Network

Figure 1. Typical network of ZTP

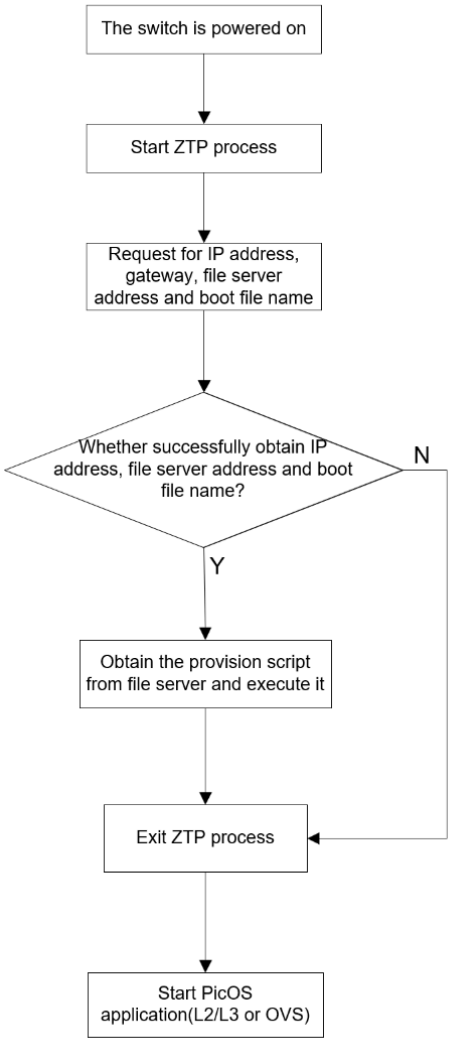


The typical network of ZTP is shown as Figure1. The switch is served as the DHCP client, which uses information configured on the provision script or the DHCP server to locate necessary files on the file server, and sends logs to the Syslog server. The details of device role are shown as below:

- **DHCP client**: the switch can be configured as DHCP client. By default, the client function of management interface eth0 (or VLAN 1 without eth0) is enabled, and the IP address assigned by DHCP server is configured for the management interface, which can be used to communicate with the file server.
- **DHCP server**: allocates the management IP address, default gateway address, file server address and Syslog server address to clients.
- **File server (TFTP server or HTTP server)**: stores the files as needed, such as provision script, configuration file and software image. You can obtain these files from FS support stuffs. For detailed information of configuring TFTP server or HTTP server, see the third-party information.
- **Syslog server**: Optional. It is required only when the switch need to send logs to the Syslog server.

ZTP Process

Figure 2. ZTP process



The ZTP process is shown as above:

1. The switch (DHCP client) is powered on and starts ZTP process.
2. The client sends DHCP request packets to the DHCP server periodically to obtain the management IP address, gateway, file server IP address, boot file name and syslog server IP address. The DHCP server responds with the DHCP ACK packets containing the above information. The interaction is based on DHCP options, see Option Parameters.

> If the client cannot successfully obtain the management IP address, file server address or boot file name, the switch will exit ZTP process.

3. According to the above information, the switch obtains provision script from the file server and execute it. You can customize the script contents by running the *generate_script*, see Provision Script.
4. The switch starts PicOS application (L2/L3 or OVS).

DHCP Configuration of ZTP

Option Parameters

The DHCP server obtains network configuration information required by ZTP through option parameters. The request packets sent by DHCP client carry option 55, and the reply packets responded by DHCP server carry option 7, 66 and 67. The function of option parameters is shown as below.

Table 1. Option description

Option	Description	Carrier
55	Specifies the network configuration parameters need to be obtained from the server. It includes the boot file name, TFTP server address, Syslog server address and gateway.	Client
7	Specifies the IP address of Syslog server.	Server
66	Specifies the IP address of TFTP(HTTP) server allocated for the client.	Server
67	Specifies the boot file name allocated for the client.	Server

DHCP Server Configuration

When the switch is served as the DHCP server, you can configure the DHCP server through PicOS commands (**suggested**) or Linux commands.

PicOS command

Here is an example of configuring the DHCP server through PicOS commands, which specifies the IP address of Syslog server as 192.168.10.1, the IP address of TFTP server as 192.168.10.1, and the working path of provision script on the TFTP server as *./provision.sh*. For detailed information of related commands, see Configuring DHCP server.

```
admin@PICOS# set protocols dhcp server pool pool1 log-server 192.168.10.1
admin@PICOS# set protocols dhcp server pool pool1 tftp-server 192.168.10.2
admin@PICOS# set protocols dhcp server pool pool1 bootfile-name file-path ./provision.sh
admin@PICOS# commit
```

Linux command

Here is an example of configuring the DHCP server through Linux commands.

```
host pica8-pxxxx
{************************//////////////////////////////////////////////////////////////////////////////////
///
hardware ethernet 08:9e:01:62:d5:62;
option bootfile-name "pica8/provision.script";
option tftp-server-name "xx.xx.xx.xx";
option log-servers xx.xx.xx.xx;
fixed-address xx.xx.xx.xx;
}
```

The elements of the segment above are described below:

- **host:** the host name of the PicOS switch.
- **hardware ethernet:** the MAC address of the PicOS switch.
- **bootfile-name:** the file name of the shell scripts and its path relative to the TFTP root directory.
- **tftp-server-name:** the IP address of the TFTP server.
- **log-servers:** the IP address of the log server that will receive logs from ZTP.
- **fixed-address:** optional. Configure a fixed IP address as management IP of the switch.

PicOS switches send a *vendor-class-identifier* to the DHCP server in the format of *pica8-pxxxx* where *xxxx* is the switch model. It is possible for the customer to use the *vendor-class-identifier* to identify PicOS switches.

Provision Script

The provision script describes what is required and how to execute when you upgrade and configure PicOS through ZTP. You can customize the provision script through running the *generate_script* file. The *generate_script* is provided in the format of Shell and Python, and you can click generate_script.py or generate_script.sh to download. The detailed contents are shown as below.

Generate Script in the Shell Format

Shell Script Content

```
#!/bin/bash

function prompt_choice() {
    echo "Please choose an option to configure (enter the number to select, enter 'done' to generate the script):
    1. Add remote Syslog server
    2. Remove remote Syslog server
    3. Get file from TFTP server
    4. Get file from HTTP server
    5. Enable ZTP auto-run when switch boot up
    6. Disable ZTP auto-run when switch boot up
    7. Get PicOS image from file server and upgrade
    8. Get PicOS startup file \"picos_start.conf\" from file server
    9. Get PicOS configuration file \"pica_startup.boot\" from file server
   10. Get file with PicOS L2/L3 CLI commands list and execute these commands
   11. Get PicOS OVS configuration file \"ovs-vswitchd.conf.db\" from file server"
    read -rp "Enter your choice: " choice
}

function generate_script() {
    local config_commands=()
    local revision=""
    while true; do
        prompt_choice

        case $choice in

            1)
                read -rp "Enter syslog server IP address: " ip
                config_commands+=("add_remote_syslog_server $ip")
                ;;
            2)
                read -rp "Enter the syslog server IP address to remove: " ip
                config_commands+=("remove_remote_syslog_server $ip")
                ;;
            3)
                read -rp "Enter file name in TFTP server: " remote_file_name
                read -rp "Enter file name with path in local: " local_file_name
                read -rp "Enter TFTP server IP address (optional): " ip
                config_commands+=("tftp_get_file $remote_file_name $local_file_name $ip")
                ;;

                ;;
            done)
                break
                ;;
            *)
                echo "Invalid choice, please try again."
                ;;
        esac
        printf "\n"
    done

    # Generate Shell script
    local script_name="provision.sh"
    {
        echo "#!/bin/bash"
        echo "source /usr/bin/ztp-functions.sh"
        echo ""
        for command in "${config_commands[@]}"; do
            echo "$command"
        done
    } > "$script_name"
    printf "\n"
    echo "Generated Shell script has been saved as $script_name"
}

# Run script generation program
generate_script
```

Option Description of Shell Script

NOTEs:

- Make sure that names of all files configured in the script is the same with files placed in the file server, or the switch cannot obtain them successfully.
- The IP address of TFTP server from DHCP server will be valid if it is not configured in the script.

Option	Description	Example
1. Add remote Syslog server	Specify the IPv4 address of the Syslog server.	 The IPv4 address of Syslog server is configured as *10.10.30.1*.
2. Remove remote Syslog server	Delete the IPv4 address of the Syslog server.10.10.30.1	 The IPv4 address *10.10.30.1* of Syslog server is deleted.
3. Get file from TFTP server	Download a file with specified name from the TFTP server with a specified IP address and path, and save it in local with another specified name. The path */cftmp* is valid if you don't specify the local path here.	 The file *remote-file.txt* in the TFTP server *10.10.30.2* is downloaded and is saved in local as *local-file.txt*.
4. Get file from HTTP server	Download a file with specified name from the HTTP server with a specified URL and save it in local with another specified name. The root path is valid if you don't specify the local path here.	 The file *remote-file.txt* in the HTTP server *10.10.30.2* is downloaded and is saved in local as *local-file.txt*.
5. Enable ZTP auto-run when switch boot up	Enable ZTP function after completing this ZTP process. You are suggested to configure this option at last, or it may be invalid.	6. Disable ZTP auto-run when switch boot up	Disable ZTP function after completing this ZTP process. You are suggested to configure this option at last, or it may be invalid.	7. Get PicOS image from file server and upgrade	Download the PicOS image from the TFTP server with the specified IP address, path and name, or from the HTTP server with URL. Then, upgrade the switch to the new version.	 The image *onie-installer-picos-9.8.7-main-43d73dd983-x86v.bin* in the working path of the TFTP server *10.10.30.2* is downloaded, and the switch is upgraded to this new version with the version number *43d73dd983*.

	• You should specify the version number to make sure the switch only upgrades one time. • You don't need to configure the TFTP server IP address when downloading files from the HTTP server.	
8. Get PicOS startup file "picos_start.conf" from file server	Download the PicOS startup file *picos_start.conf* from the TFTP server with the specified IP address, path and name, or from the HTTP server with URL. You don't need to configure the TFTP server IP address when downloading files from the HTTP server.	 The file *picos_start.conf* from the HTTP server *10.10.30.3* is downloaded.
9. Get PicOS configuration file "pica_startup.boot" from file server	Download the L2/l3 configuration file *pica_startup.boot* from the TFTP server with the specified IP address, path and name, or from the HTTP server with URL. You don't need to configure the TFTP server IP address when downloading files from the HTTP server.	 The file *pica_startup.boot* from the HTTP server *10.10.30.3* is downloaded.
10. Get file with PicOS L2/L3 CLI commands list and execute these commands	Download the L2/l3 command file from the TFTP server with the specified IP address, path and name, or from the HTTP server with URL. • You don't need to configure the TFTP server IP address when downloading files from the HTTP server. • You can modify the file *ztpl2l3_cfg.cli* as needed. For example, if you need to specify	 The file *ztpl2l3_cfg.cli* in the working directory of the TFTP server *10.10.30.2* is downloaded.

	VLAN 10 and VLAN 20, you can configure as follows:
	`set vlans vlan-id 20`
	`set vlans vlan-id 30`	

11. Get PicOS OVS configuration file "ovs-vswitchd.conf.db" from file server	Download the OVS configuration file *ovs-vswitchd.conf.db* from the TFTP server with the specified IP address, path and name, or from the HTTP server with URL. You don't need to configure the TFTP server IP address when downloading files from the HTTP server.	 The file *ovs-vswitchd.conf.db* from the HTTP server *10.10.30.3* is downloaded.

Generate Script in the Python Format

# Run script generation program
generate_script()
```

Option Description of Python Script

The description of the Python script is the same with the Shell script. For detailed information, see Option Description of Shell Script.

Configuration Example for Generating Provision.sh

Take the Shell script as an example to introduce how to use it:

1. Upload the Shell script *generate_script.sh* to the Linux environment.
2. Use the command **chmod +x *generate_script.sh*** to enable the executable permission.
3. Enter command ***./generate_script.sh*** to run the script, and options are shown as below.

```
admin@PICOS:~$ chmod +x generate_script.sh
admin@PICOS:~$ ./generate_script.sh
Please choose an option to configure (enter the number to select, enter 'done' to generate the script):
    1. Add remote Syslog server
    2. Remove remote Syslog server
    3. Get file from TFTP server
    4. Get file from HTTP server
    5. Enable ZTP auto-run when switch boot up
    6. Disable ZTP auto-run when switch boot up
    7. Get PicOS image from file server and upgrade
    8. Get PicOS startup file "picos_start.conf" from file server
    9. Get PicOS configuration file "pica_startup.boot" from file server
   10. Get file with PicOS L2/L3 CLI commands list and execute these commands
   11. Get PicOS OVS configuration file "ovs-vswitchd.conf.db" from file server
```

4. Select options of 1, 3 and 6 in sequence as needed, and enter **done** to generate the script.

```
Please choose an option to configure (enter the number to select, enter 'done'
o generate the script):
    1. Add remote Syslog server
    2. Remove remote Syslog server
    3. Get file from TFTP server
    4. Get file from HTTP server
    5. Enable ZTP auto-run when switch boot up
    6. Disable ZTP auto-run when switch boot up
    7. Get PicOS image from file server and upgrade
    8. Get PicOS startup file "picos_start.conf" from file server
    9. Get PicOS configuration file "pica_startup.boot" from file server
   10. Get file with PicOS L2/L3 CLI commands list and execute these commands
   11. Get PicOS OVS configuration file "ovs-vswitchd.conf.db" from file serve
Enter your choice: 1
Enter syslog server IP address: 192.168.1.100

Please choose an option to configure (enter the number to select, enter 'done'
o generate the script):
    1. Add remote Syslog server
    2. Remove remote Syslog server
    3. Get file from TFTP server
    4. Get file from HTTP server
    5. Enable ZTP auto-run when switch boot up
    6. Disable ZTP auto-run when switch boot up
    7. Get PicOS image from file server and upgrade
    8. Get PicOS startup file "picos_start.conf" from file server
    9. Get PicOS configuration file "pica_startup.boot" from file server
   10. Get file with PicOS L2/L3 CLI commands list and execute these commands
   11. Get PicOS OVS configuration file "ovs-vswitchd.conf.db" from file serve
Enter your choice: 3
Enter file name in TFTP server: remote-file.txt
Enter file name with path in local: local-file.txt
Enter TFTP server IP address (optional): 192.168.1.101

Please choose an option to configure (enter the number to select, enter 'done'
o generate the script):
    1. Add remote Syslog server
    2. Remove remote Syslog server
    3. Get file from TFTP server
    4. Get file from HTTP server
    5. Enable ZTP auto-run when switch boot up
    6. Disable ZTP auto-run when switch boot up
    7. Get PicOS image from file server and upgrade
    8. Get PicOS startup file "picos_start.conf" from file server
    9. Get PicOS configuration file "pica_startup.boot" from file server
   10. Get file with PicOS L2/L3 CLI commands list and execute these commands
   11. Get PicOS OVS configuration file "ovs-vswitchd.conf.db" from file serve
Enter your choice: 6

Please choose an option to configure (enter the number to select, enter 'done'
o generate the script):
    1. Add remote Syslog server
    2. Remove remote Syslog server
    3. Get file from TFTP server
    4. Get file from HTTP server
    5. Enable ZTP auto-run when switch boot up
    6. Disable ZTP auto-run when switch boot up
    7. Get PicOS image from file server and upgrade
    8. Get PicOS startup file "picos_start.conf" from file server
    9. Get PicOS configuration file "pica_startup.boot" from file server
   10. Get file with PicOS L2/L3 CLI commands list and execute these commands
   11. Get PicOS OVS configuration file "ovs-vswitchd.conf.db" from file serve
Enter your choice: done

Generated Shell script has been saved as provision.sh
```

5. The file named *provision.sh* is generated in the current directory, which includes all selected options. The content of provision script is shown as below.

```
admin@PICOS:~$ cat provision.sh
#!/bin/bash
source /usr/bin/ztp-functions.sh

add_remote_syslog_server 192.168.1.100
tftp_get_file remote-file.txt local-file.txt 192.168.1.101
ztp_disable
```

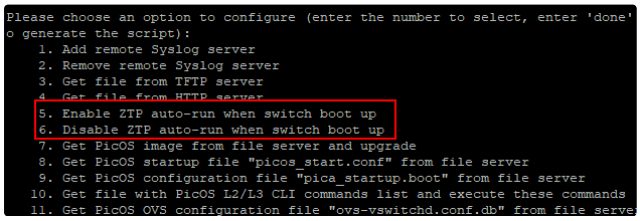
Enabling or Disabling ZTP

NOTE:

By default, ZTP is enabled on PicOS switches. If ZTP is left enabled, the PicOS switch will try to download a new script every time the switch is booted. This is not a desirable situation, so ZTP should be disabled when it is no longer needed.

Four methods are supported to disable or enable ZTP, as detailed below:

- Enable or disable ZTP through running the provision script. To generate the corresponding provision script, select options of 5 and 6 when running the *generate_script*, as shown below.



you are suggested to select this option at last, or the option may be invalid.

- Enable or disable ZTP through the command **set system ztp enable** <**true** | **false**> in PICOS configuration mode. The following example disables ZTP using the command **set system ztp enable** <**true** | **false**>:

```
dmin@XorPlus# set system ztp enable false
admin@XorPlus# commit
```

- Enable or disable ZTP via the **ztp-config** script included with PicOS. The following example disables ZTP using the **ztp-config** script run from the Linux shell:

```
admin@LEAF-A$sudo ztp-config
Please configure the default PicOS ZTP options:
    (Press other key if no change)
         [1]  PicOS ZTP enabled   * default
         [2]  PicOS ZTP disabled
Enter your choice (1,2):2
PicOS ZTP is disabled.
admin@LEAF-A$
```

- Manually edit the PicOS configuration file **picos_start.conf** and change the value of the **ztp_disable** variable. The following snippet from the PicOS configuration file shows that ZTP has been disabled (**ztp_disable**=**true**).

```
admin@LEAF-A$more /etc/picos/picos_start.conf | grep ztp
ztp_disable=true
```

To enable ZTP, you need to set **ztp_disable** to **false**.

Preparation before ZTP Deployment

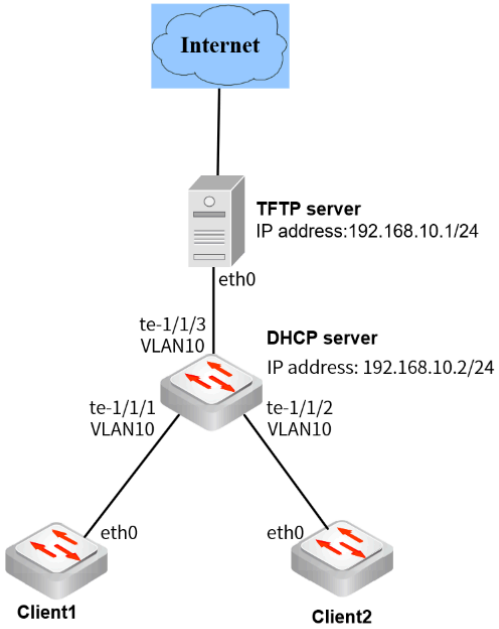
Before powering on the switch to start ZTP deployment, you should make the following preparations:

Items	Preparations
DHCP client	It is network reachable, which can communicate with the DHCP server and file server.
File server	It is configured successfully and is network reachable.
DHCP server	It is network reachable. If the switch is served as the server, you should configure the IP address of file server, the path and name of provision script and the IP address of Syslog server (optional).
Required files	Obtain files (image file, L2/L3 configuration file, OVS configuration file, L2/L3 command file or startup file) from FS stuffs, and save them in the working directory of file servers. **Note**: the *provision.sh* is generated through running the *generate_script* file. For details, see Configuration Example for Generating Provision.sh.

Example for Implementing ZTP Deployment through DHCP

Overview

Figure 1. Typical topology of ZTP implementation



In **Figure 1**, switches are configured respectively as the DHCP client and DHCP server. The client uses information configured on a DHCP server to locate the software image and configuration files on the TFTP server, and then download specified files to upgrade system and load configurations.

The data plan is shown as below:

Device	Interface	VLAN and IP Address
DHCP server	te-1/1/1 te-1/1/2 te-1/1/3	VLAN: 10 IP address: 192.168.10.2/24
TFTP server	eth0	IP address: 192.168.10.1/24

The image information of Client1 and Client2, and the files to be loaded are shown as below:

Device	Current version	Files to be loaded
Client1	PicOS-9.8.7	Image: PICOS-9.8.7-main-43d73dd983-x86v.bin
Client2	PicOS-4.4.0	Command file: ztpl2l3_cfg.cli

Procedure

DHCP Server

Step 1 Configure VLAN and interface.

```
admin@PICOS# set vlans vlan-id 10
admin@ PICOS # set interface gigabit-ethernet te-1/1/1 family ethernet-switching native-vlan-id 10
admin@ PICOS # set interface gigabit-ethernet te-1/1/2 family ethernet-switching native-vlan-id 10
admin@ PICOS # set interface gigabit-ethernet te-1/1/3 family ethernet-switching native-vlan-id 10
admin@ PICOS # set vlans vlan-id 10 l3-interface vlan10
admin@ PICOS # set l3-interface vlan-interface vlan10 address 192.168.10.2 prefix-length 24
admin@ PICOS # commit
```

Step 2 Configure DHCP pool.

```
admin@PICOS# set protocols dhcp server pool pool1 network address 192.168.10.2 prefix-length 24
admin@PICOS# set protocols dhcp server pool pool1 lease-time 1440
admin@ PICOS # set protocols dhcp server pool pool1 range range1 low 192.168.10.3
admin@ PICOS # set protocols dhcp server pool pool1 range range1 high 192.168.10.20
admin@ PICOS # set protocols dhcp server pool pool1 tftp-server 192.168.10.1
admin@ PICOS # set protocols dhcp server pool pool1 bootfile-name file-path provision.sh
admin@ PICOS # set ip routing enable true
admin@ PICOS # commit
```

TFTP Server

Step 1 Set the basic configuration of TFTP server.

Make sure that the TFTP server is network reachable, which can communicate with the DHCP server and DHCP client.

Step 2 Configure files needed to be saved in the TFTP server.

- For the provision file *provision.sh*, you need to run *generate_script* with options 7 and 10 selected to generate it. For details, see Option Description of Shell Script.
- For the L2/L3 command file *ztpl2l3_cfg.cli,* you can modify it as needed, such as configuring VLAN20 and VLAN30.

Step 3 Save the image file, provision script and L2/L3 command file to the working path of TFTP server.

The working path of TFTP server here is */home/admin/tftp*, and you should modify it based on the actual circumstances.

Step 4 Generate the MD5 file.

Enter the directory which saves image file, and run the following Linux command to generate MD5 file. The generated MD5 file will be saved in this directory.

The MD5 file name must be the format of *image-file-name.md5*, otherwise the DHCP server cannot recognize it.

```
admin@TFTP:~$ cd /home/admin/tftp
admin@TFTP:~/tftp$ md5sum onie-installer-picos-9.8.7-main-43d73dd983x86v.bin > onie-installer-picos-9.8.7-main-43d73dd983-x86v.bin.md5
```

Step 5 View the files saved in the directory of */home/admin/tftp*.

```
admin@PICOS:~$ ls /home/admin/tftp
```

```
admin@PICOS:~$ ls /home/admin/tftp/
onie-installer-picos-9.8.7-main-43d73dd983x86v.bin      provision.sh
onie-installer-picos-9.8.7-main-43d73dd983x86v.bin.md5  ztpl2l3_cfg.cli
```

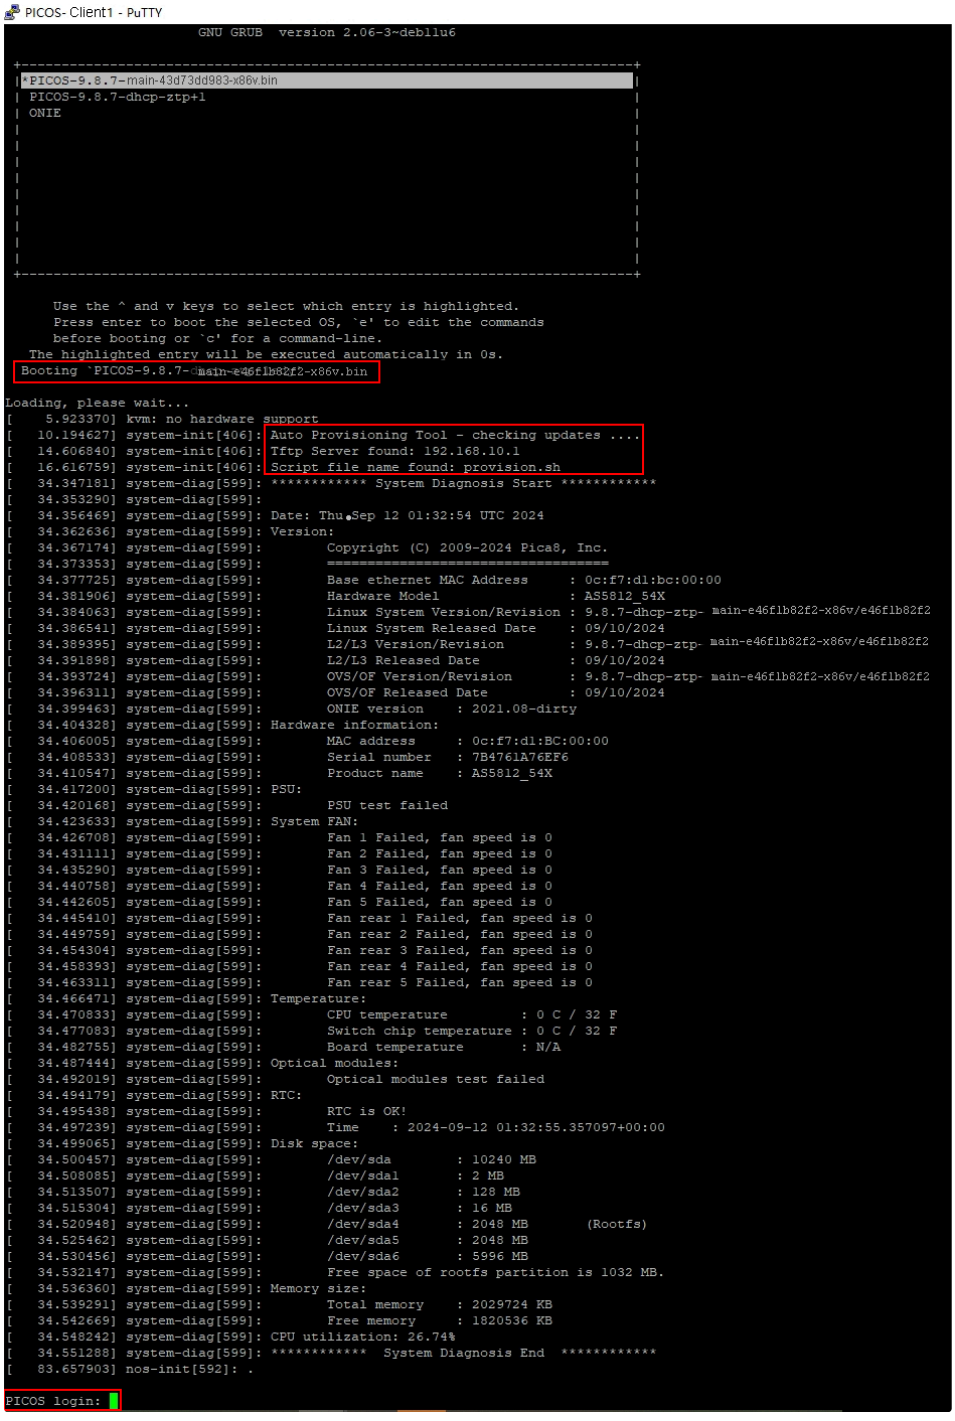
DHCP Client

After completing the above configuration, start client1 and client2.

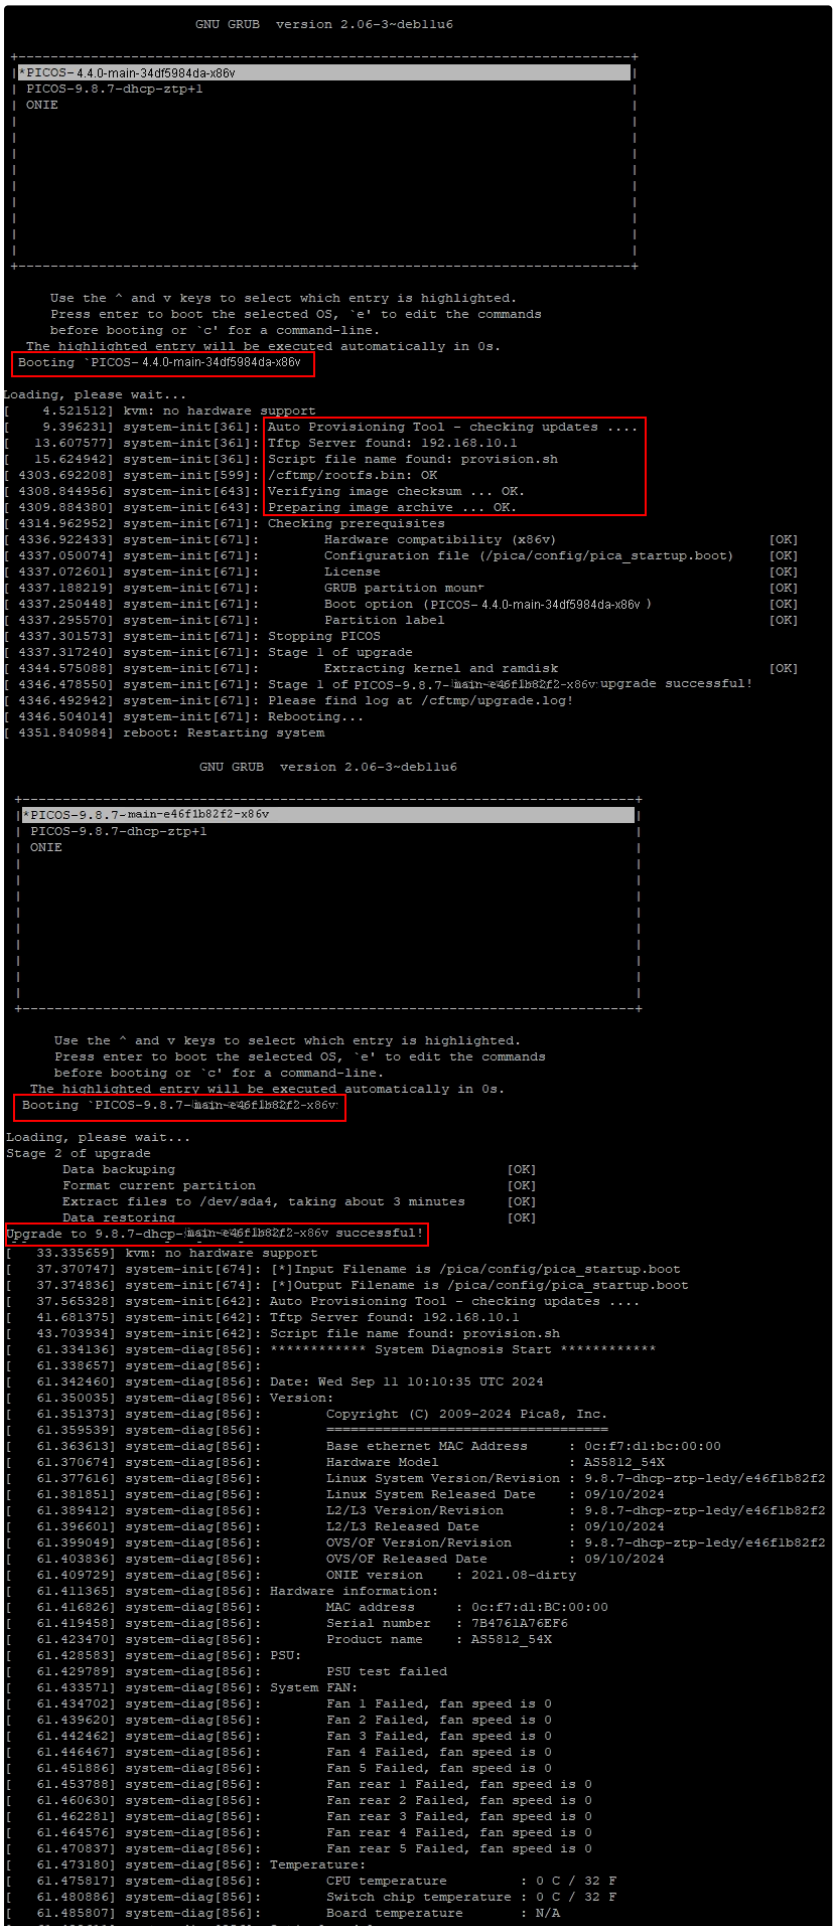
Verifying the Configuration

- View the upgrade process of client1 and client2.

Client1: for the version is already V9.8.7, it directly loads L2/L3 command configurations.



Client2: for the version is V4.4.0, it upgrades to V9.8.7 and then loads L2/L3 command configurations.



GNU GRUB version 2.06-3~deb11u6

Appendix: ZTP API

The ZTP makes use of the API (application programming interface) defined in the *ztp-functions.sh* file located in the */usr/bin* directory.

The API description is shown as below, and you can refer to it when configuring the ZTP function, such as running the *generate_script* to generate the provision script.

NOTE:

For APIs with name changed, please use the correct name in the corresponding version, or the error prompt will appear.

API	Description	Parameter	Return Value	Supported Version
ztp_disable	Disable ZTP auto-run when switch boots up	None	0 = success, 1 = failed	All
ztp_enable	Enable ZTP auto-run when switch boots up	None	0 = success, 1 = failed	All
add_remote_syslog_server <**ip-addrees**>	Add the remote Syslog server	**Parameter #1**: the IP address of remote Syslog server (eg: 192.168.1.200)	0 = success, 1 = failed	All
remove_remote_syslog_server <**ip-address**>	Remove the remote Syslog server	**Parameter #1**: the IP address of remote Syslog server (eg: 192.168.1.200)	0 = success, 1 = failed	All
tftp_get_file <**file-name1**> <**file-name2**> <**ip-address**>	Get file from TFTP server	**Parameter #1**: file name in TFTP server **Parameter #2**: file name with path in local **Parameter #3**: IP address of TFTP server	0 = success, 1 = failed	All
http_get_file **<file-name> <file-url>**	Get file from HTTP server	**Parameter #1**: file name with path in local **Parameter #2**: file name with HTTP server URL	0 = success, 1 = failed	V4.5.0E or later versions

get_l2l3_config_file <**file-name**> <**ip-address**>	Get PicOS configuration file "pica_startup.boot" from file server	**Parameter #1**: For TFTP download: it is the configuration file name with path on TFTP sever For HTTP download: it is the configuration file name with HTTP server URL. Parameter #2 does not need to be set **Parameter #2**: TFTP server IP address, if not set, the TFTP server IP address from DHCP server will be used	0 = success, 1 = failed	V4.5.0E or later versions **Note**: in the previous versions, the name is tftp_get_l2l3_config_file.
get_ovs_config_file <**file-name**> <**ip-address**>	Get PicOS OVS configuration file "ovs-vswitchd.conf.db" from file server	**Parameter #1**: For TFTP download: it is the configuration file name with path on TFTP sever For HTTP download: it is the configuration file name with HTTP server URL. Parameter #2 does not need to be set **Parameter #2**: TFTP server IP address, if not set, the TFTP server IP address from DHCP server will be used	0 = success, 1 = failed	V4.5.0E or later versions **Note**: in the previous versions, the name is tftp_get_ovs_config_file.
get_picos_startup_file <**file-name**> <**ip-address**>	Get PicOS startup file "picos_start.conf" from file server	**Parameter #1**: For TFTP download: it is the startup file name with path on TFTP sever	0 = success, 1 = failed	V4.5.0E or later versions **Note**: in the previous versions, the name is tftp_get_picos_startup_file.

		For HTTP download: it is the startup file name with HTTP server URL. Parameter #2 does not need to be set **Parameter #2**: TFTP server IP address, if not set, the TFTP server IP address from DHCP server will be used		
get_picos_image <**file-name**> <**ip-address**>	Get PicOS image from file server and upgrade	**Parameter #1**: For TFTP download: it is the image file name with path on TFTP sever For HTTP download: it is the image file name with HTTP server URL. Parameter #2 does not need to be set **Parameter #2**: TFTP server IP address, if not set, the TFTP server IP address from DHCP server will be used	0 = success, 1 = failed	V4.5.0E or later versions **Note**: in the previous versions, the name is tftp_ get_picos_image.
l2l3_load_config <**file-name**> <**ip-address**>	Get a file with PicOS L2/L3 commands list, and execute these commands.	**Parameter #1**: For TFTP download: it is the commands file name with path on TFTP sever For HTTP download: it is the commands file name with HTTP server URL. Parameter #2 does not need to be set	0 = success, 1 = failed	All

		Parameter #2: TFTP server IP address, if not set, the TFTP server IP address from DHCP server will be used		

PICOS Licenses

- License Portal Guide
- Installing License under Linux prompt
- Installing and Removing License for PICOS go2cli Version

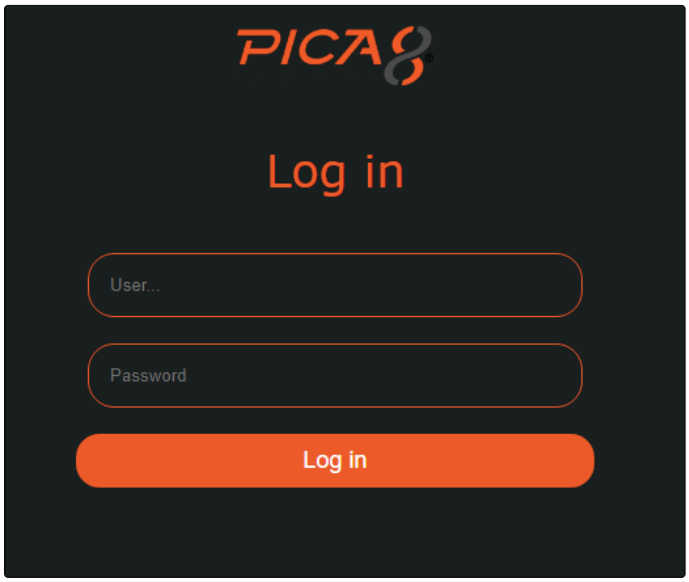
License Portal Guide

Follow the steps below to generate and install the PICOS license.

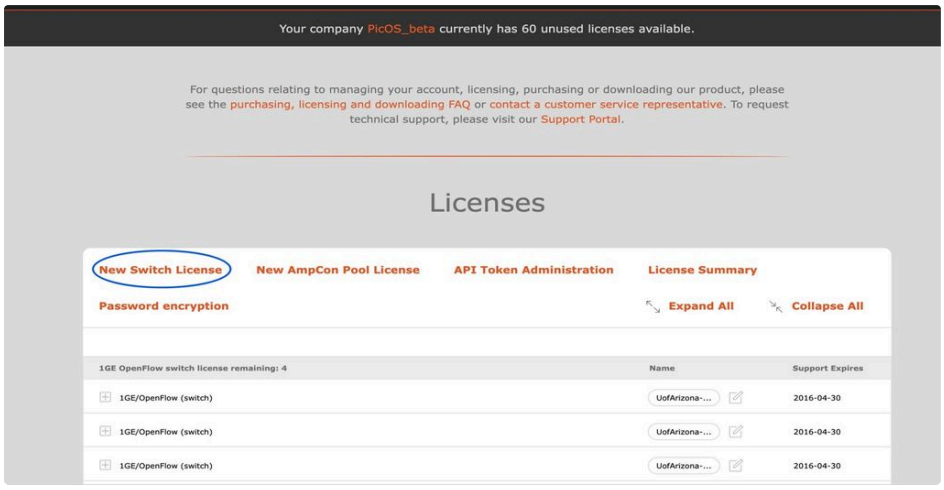
1. Get the switch's speed type and hardware ID by issuing the following command at switch's Linux prompt:

```
admin@XorPlus$ license –s
```

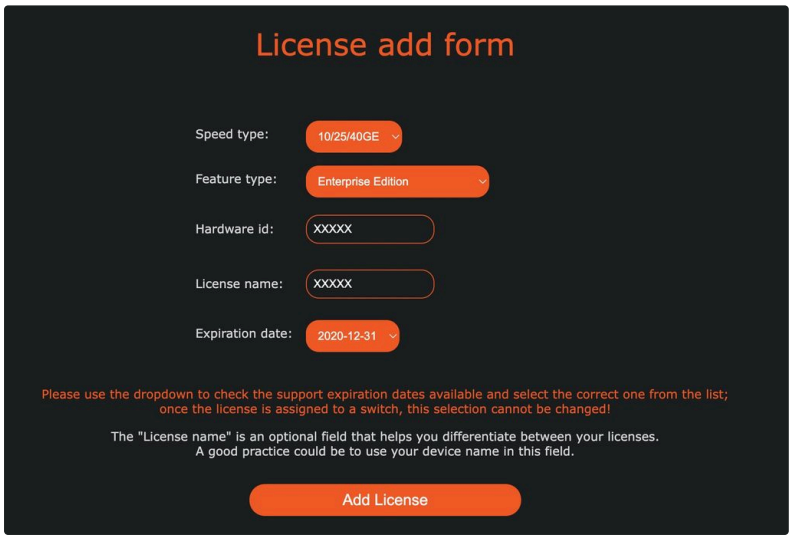
2. Use the assigned credential (SSO) by PICOS License team (*license@pica8.com)* to login at "*License Portal*" website.



3. In the "License Portal" page, click "New Switch License" as shown below:

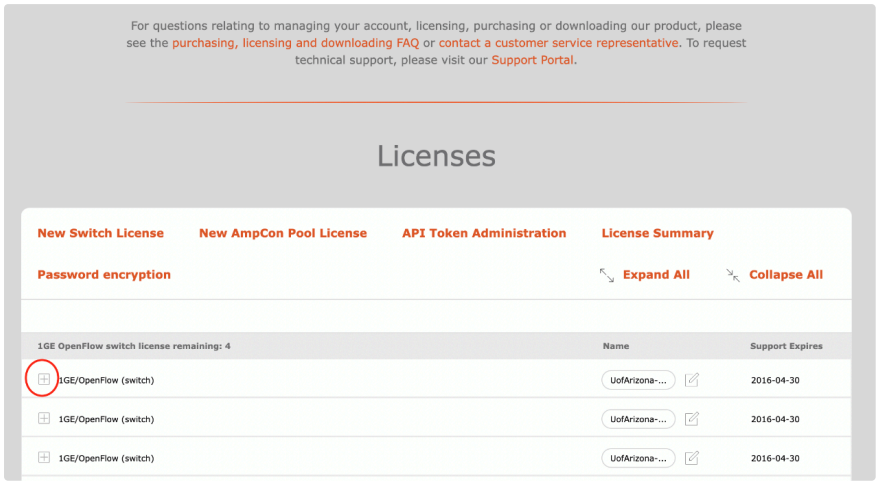


4. In "New Switch License" page, select **Speed type** and **Feature type** based on your purchased order. Then, enter the switch's hardware ID. License name is optional.

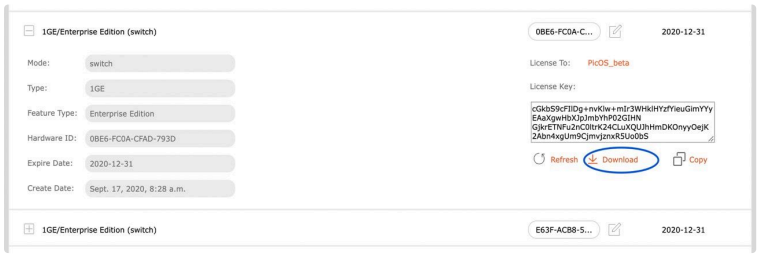


5. After clicking the “Add License” button, the license will be added to the database.

6. Click the “+” sign of the newly added license to display the “Download” button.



7. Click the “Download” button to download the license to the host. The license file name is “hardware_ID.lic”. For example: xxxx-xxxx-xxxx-xxxx.lic



8. Copy the downloaded license file (xxxx.lic) to the switch’s folder /home/admin/ by using scp or tftp etc.

```
admin@XorPlus$ sudo scp xxxx.lic /home/admin/
```

9. Install the license by issuing the following command:

```
admin@XorPlus$ sudo license -i /home/admin/xxxx.lic
```

10. Restart the PICOS service to activate the license:

```
admin@XorPlus$ sudo systemctl restart picos
```

11. After the switch rebooted, use the following command to verify the installed license.

```
admin@XorPlus$ license –s
```

or

```
admin@XorPlus> license show
```

Installing License under Linux prompt

PICOS can be installed on bare metal switches listed in Switch Machine Outline and System Characteristics. A software license is needed to activate PICOS on the specific switch it is installed on.

Please refer to page License Portal Guide, to see how to download licenses for switches.

- Terminology
- PICOS License Types
  - Enterprise License
  - SDN License
- Available Ports without Installing a License
- Speed
- Mode
- Accessing Hardware ID
- Installing the License
- Troubleshooting License Installation
- Displaying License Information
- Removing a License
- License Update on Older Releases
- Add License Directly From License Command

Terminology

The following terms are used throughout this section:

- **Bundle:** This license includes all PICOS features. That is, it *bundles* all three licenses.
- **Evaluation License:** There is *no* evaluation license because users can evaluate PICOS without a license. Please note that only the first four switch ports (and the management port) are active without a license.
- **Hardware ID:** Hardware ID is needed when users download a license. Users can view their own switch ID by executing the license show command **license -s**.
- **Mode:** There are two license modes: switch license and site license.
- **Type:** There are two speed types: 1G and 10G.

PICOS License Types

PICOS includes two types of licenses: Enterprise License and SDN License. Different types of licenses contain different available features. You can purchase the appropriate license according to the network requirements.

Enterprise License

The Enterprise License contains all the features of PICOS, and if you purchase the Enterprise license, all the PICOS features can be applied, which are divided into three types of features: Base Feature, Layer 3 Feature and OpenFlow Feature.

Base Feature

The following features are available as part of the Base feature:

- Network Linux
- Layer 2 (STP/RSTP/MSTP, LLDP, LACP, IGMP-Snooping, dot1x, sFlow, UDLD)

- Multi-chassis Link Aggregation (MLAG)
- Simple Network Management Protocol (SNMP)
- Security
- Zero Touch Provisioning (ZTP)
- Static Routes

Layer 3 Feature

The following features are available as part of the Layer3 feature:

- Open Shortest Path First (OSPF)
- Border Gateway Protocol (BGP)
- Protocol-Independent Multicast (PIM)
- Network Address Translation (NAT)
- Virtual Extensible LAN (VXLAN)
- VRRP (Virtual Router Redundancy Protocol)

OpenFlow Feature

The following features are available as part of the OpenFlow feature:

- Open vSwitch Database Management Protocol (OVSDB)
- OpenFlow Releases 1.3 and 1.4
- Multi Protocol Label Switching (MPLS)
- CrossFlow
- Virtual Extensible LAN (VXLAN)

SDN License

The SDN license only includes the OpenFlow feature, and only the OpenFlow feature can be applied with the purchase of an SDN license.

OpenFlow Feature

The following features are available as part of the OpenFlow feature:

- Open vSwitch Database Management Protocol (OVSDB)
- OpenFlow Releases 1.3 and 1.4
- Multi Protocol Label Switching (MPLS)
- CrossFlow
- Virtual Extensible LAN (VXLAN)

Available Ports without Installing a License

If there is no license installed, only the first four ports and the first two uplink ports (if exist) of the switch are available. The first four ports and the first two uplink ports (if exist) should support to enable any protocol whether there is a license or not. This is also the perfect way to test PICOS without buying a full license.

Note that without a license installed, only the first four physical ports and the first two uplink ports (if exist) can be used, not logical ports. If the first two uplink port is split into four interfaces, available ports for Pica8 switches are listed in **Table 1** if no license is installed or the license is expired.

Table 1. Available Ports for Pica8 Switches when no License is Installed

Devices	Available Ports
AS4610 Series Switches	ge-1/1/1, ge-1/1/2, ge-1/1/3, ge-1/1/4

	te-1/1/1,te-1/1/2
AS5712_54X, AS5812_54T, AS5812_54X, S4048-ON, S4128F-ON, S4148F-ON, S4148T-ON	te-1/1/1, te-1/1/2, te-1/1/3, te-1/1/4 xe-1/1/1 (xe-1/1/1.1, xe-1/1/1.2, xe-1/1/1.3, xe-1/1/1.4 after breakout) xe-1/1/2 (xe-1/1/2.1, xe-1/1/2.2, xe-1/1/2.3, xe-1/1/2.4 after breakout)
AS7712_32X, Z9100-ON	xe-1/1/1 (xe-1/1/1.1, xe-1/1/1.2, xe-1/1/1.3, xe-1/1/1.4 after breakout) xe-1/1/2 (xe-1/1/2.1, xe-1/1/2.2, xe-1/1/2.3, xe-1/1/2.4 after breakout) xe-1/1/3 (xe-1/1/3.1, xe-1/1/3.2, xe-1/1/3.3, xe-1/1/3.4 after breakout) xe-1/1/4 (xe-1/1/4.1, xe-1/1/4.2, xe-1/1/4.3, xe-1/1/4.4 after breakout)
AS7816_64X, Z9264F-ON	xe-1/1/1 (xe-1/1/1.1, xe-1/1/1.2, xe-1/1/1.3, xe-1/1/1.4 after breakout) xe-1/1/2 xe-1/1/3 (xe-1/1/3.1, xe-1/1/3.2, xe-1/1/3.3, xe-1/1/3.4 after breakout) xe-1/1/4

Speed

There are two speeds available for each license.

- **1GE:** Platform with 48 x 1GE **OR** 48 x 1GE + 4 x 10GE ports
- **10GE:** Platform with 48 x 10GE + 4 x 40GE **OR** 48 x 10GE + 6 x 40GE **OR** 32 x 40GE ports

Mode

- **Switch:** Use this to install a license on a single switch only.
- **Site:** Use this to install the same license on all switches at a *site*.

Accessing Hardware ID

User must have the hardware ID available to download a license. A utility generates hardware ID using the **license -s** command in PICOS OVS mode.

```
admin@PICOS:/ovs$ license -s
No license installed. Use below information to create a license.
Type: 1GE
```

```
Hardware ID: E385-FB53-4D57-05EB
```

Installing the License

If no license is installed, only the first four ports and the first two uplink ports (if exist) of the switch are available after the upgrade. To upgrade the switch without production impact, user should install a license *before* the upgrade.

It is possible to install a license in PICOS 2.3 (starting with PICOS 2.3.3).

To upgrade a switch from a PICOS version earlier than 2.3, it may be necessary to upgrade to PICOS 2.3 first to install a license on the system. **To avoid this step, user can run a script that can install the license on PICOS releases earlier than 2.3. Please contact Pica8 support or look at the section below for older PICOS releases.**

The license file cannot name pica.lic, or license will install failed.

Customers can download the generated license file and copy it to the */etc/picos/* directory.

The following example shows the contents of a switch-based license file:

```
{
    "Type": "1GE",
    "Feature":["Open Flow", "Base Product", "Layer3"],
    "Hardware ID":"8A68-A7AC-D702-70D2",
    "Expire Date":"2020-10-28"
}
```

In the license file shown above, the type is 1GE while the feature is *Base Product, Layer3,* and *Open Flow*. Hardware ID is unique to every switch.

The switch cannot upgrade to a PICOS version whose build date is later than the license expiration date.

The following example shows the contents of a site-based license file:

```
{
    "Type": "1GE",
    "Feature":["Open Flow", "Base Product", "Layer3"],
    "Mode":"site",
    "Site Name":"CompanyA",
    "Expire Date":"2020-10-28"
}
```

The license file can be installed with the command-line utility called **license** with the **-i** option. The following example installs a license file named *js.lic*:

```
admin@PICOS:~$ cd /etc/picos
admin@PICOS:/etc/picos$ ls -l
total 32
drwxrwxr-x  2 root xorp 4096 Feb  4 22:00 ./
drwxrwxr-x 60 root xorp 4096 Feb  4 21:56 ../
-rw-rw-r--  1 root xorp   26 Feb  4 18:27 fs_status
-rw-r--r--  1 root root  399 Feb  4 21:59 js.lic
-rw-rw-r--  1 root xorp  247 Sep  4  2014 license.conf
-rw-rw-r--  1 root xorp  183 Aug 10  2014 p2files.lst
-rw-rw-r--  1 root xorp  488 Feb  4 18:28 picos_start.conf
-rw-r--r--  1 root root  251 Feb  4 22:00 public.key
admin@PICOS:~$ sudo -i js.lic
License successfully added, the switch need to be rebooted to activate the license.
admin@PICOS:~$ ls -l
```

```
total 32
drwxrwxr-x  2 root xorp 4096 Feb  4 22:00 ./
drwxrwxr-x 60 root xorp 4096 Feb  4 21:56 ../
-rw-rw-r--  1 root xorp   26 Feb  4 18:27 fs_status
-rw-rw-r--  1 root xorp  247 Sep  4  2014 license.conf
-rw-rw-r--  1 root xorp  183 Aug 10  2014 p2files.lst
-rw-r--r--  1 root root  382 Feb  4 22:00 pica.lic
-rw-rw-r--  1 root xorp  488 Feb  4 18:28 picos_start.conf
-rw-r--r--  1 root root  251 Feb  4 22:00 public.key
-rw-r--r--  1 root root  251 Feb  4 22:00 switch-public.key
admin@PICOS:~$
```

If the license is installed successfully, after **license -i** command, the following message will be displayed:

License successfully added, the switch need to be rebooted to activate the license.

To activate the new license, the switch must be restarted.

Troubleshooting License Installation

User may encounter various problems during license installation as detailed below.

- The *public.key* file cannot be found.

```
admin@PICOS:~$ sudo license -i js.lic
Install failed: Cannot find public key.
```

- The license file does not exist.

```
admin@PICOS:~$ sudo license -i js.lic
Install failed: No such file or directory.
```

- The header or the key is disrupted.

```
admin@PICOS:~$ sudo license -i js.lic
Install failed: License or KEY is disrupted.
```

- The license format is not valid.

```
admin@PICOS:~$ sudo license -i js.lic
Install failed: License format error.
```

- The license file is not compatible with the switch (verify failed).

```
admin@PICOS:~$ sudo license -i js.lic
Install failed: Invalid license.
```

Displaying License Information

User can display the license information using the **license -s** command at the Linux shell.

The following example displays information about the switch-based license:

```
admin@PICOS:~$ license -s
{
        "Type": "1GE",
        "Feature":      ["Open Flow", "Base Product", "Layer3"],
        "Expire Date":  "2020-10-28",
        "Hardware ID":  "8A68-A7AC-D702-70D2"
```

```
}
```

The following example displays information about the site-based license:

```
admin@PICOS:~$ license -s
{
          "Type": "1GE",
          "Feature":      ["Base Product", "Layer3", "Open Flow"],
          "Expire Date":  "2020-10-28",
          "Hardware ID":  "8A68-A7AC-D702-70D2",
          "Site Name":    " CompanyA "
}
```

If the license is not valid, the **license -s** command generates the following output:

```
admin@PICOS:~$ license -s
Invalid license. Use below information to create a license.
Type: 1GE
Hardware ID: 8A68-A7AC-D702-70D2
admin@PicOS-OVS$
```

If no license is installed, the **license -s** command generates the following output:

```
admin@PICOS:~$ license -s
No license installed. Use below information to create a license.
Type: 1GE
Hardware ID: 8A68-A7AC-D702-70D2
admin@PicOS-OVS$
```

Removing a License

User can use the **license -r** command at the Linux shell to remove a license as detailed below:

```
admin@PICOS:~$ cd /etc/picos
admin@PICOS:/etc/picos$ ls -l
total 32
drwxrwxr-x  2 root xorp 4096 Feb  4 22:00 ./
drwxrwxr-x 60 root xorp 4096 Feb  4 21:56 ../
-rw-rw-r--  1 root xorp   26 Feb  4 18:27 fs_status
-rw-rw-r--  1 root xorp  247 Sep  4  2014 license.conf
-rw-rw-r--  1 root xorp  183 Aug 10  2014 p2files.lst
-rw-r--r--  1 root root  382 Feb  4 22:00 pica.lic
-rw-rw-r--  1 root xorp  488 Feb  4 18:28 picos_start.conf
-rw-r--r--  1 root root  251 Feb  4 22:00 public.key
-rw-r--r--  1 root root  251 Feb  4 22:00 switch-public.key
admin@PICOS:$ pwd
/etc/picos
admin@PICOS:~$
admin@PICOS:~$ license -r
admin@PICOS:~$ ls -l
total 28
drwxrwxr-x  2 root xorp 4096 Feb  4 22:05 ./
drwxrwxr-x 60 root xorp 4096 Feb  4 21:56 ../
-rw-rw-r--  1 root xorp   26 Feb  4 18:27 fs_status
-rw-rw-r--  1 root xorp  247 Sep  4  2014 license.conf
-rw-rw-r--  1 root xorp  183 Aug 10  2014 p2files.lst
-rw-rw-r--  1 root xorp  488 Feb  4 18:28 picos_start.conf
-rw-r--r--  1 root root  251 Feb  4 22:00 public.key
```

```
-rw-r--r--  1 root root  251 Feb  4 22:00 switch-public.key
admin@XorPlus$
```

If the license is modified or removed, the switch must be rebooted for the change to be effective.

License Update on Older Releases

To upgrade a switch to PICOS 2.4 from a version earlier than 2.3, it may be necessary to upgrade to PICOS 2.3 first and install a license on the system. To avoid this extra step, user can install a new script on PICOS releases prior to 2.3 and use the script to install a license.

This new script supports the PICOS releases 2.1, 2.2, and 2.3. User has to follow the following steps to install a license using the script:

1. Download the file named *license-powerpc.bin* or *license-powerpcspe.bin* according to the switch model. For example, download the file *license-powerpc.bin* for the Pica8 P-3290 switch.
2. Run the command **./license-powerpc -s** to display the hardware ID.
3. Copy the *upgrade.sh* script from https://github.com/Pica8/Upgrade to the switch.
4. Copy the license tool from http://www.pica8.com/portal/standard/ to the switch. The tool can be used to install a license on PICOS 2.3 or earlier but the license will only become effective after upgrading to PICOS 2.4 or later.

The Pica8 P-3290 and P-3295 use the *license-powerpc* file. All other PICOS switches use the *license-powerpcspe* file.

The following example describes how to upgrade a Pica8 P-3297 switch from PICOS 2.3.

Step 1: Check the version of PICOS using the **version** command at the Linux shell.

```
admin@PICOS:~$ version
Copyright (C) 2009-2024 Pica8, Inc.
==================================
Base ethernet MAC Address     : 28:e4:24:4c:42:ef
Hardware Model                : N9550-64D
Linux System Version/Revision : 4.4.6-rc1/19ef739fab
Linux System Released Date    : 10/15/2024
L2/L3 Version/Revision        : 4.4.6-rc1/19ef739fab
L2/L3 Released Date           : 10/15/2024
OVS/OF Version/Revision       : 4.4.6-rc1/19ef739fab
OVS/OF Released Date          : 10/15/2024
```

Step 2: Copy license tool:

```
admin@PICOS:~$ cd /etc/picos
admin@PICOS:~$ ls -l
total 20
drwxrwxr-x  2 root xorp 4096 Jun 29 08:01 ./
drwxrwxr-x 60 root xorp 4096 Jun 29 08:03 ../
-rw-rw-r--  1 root xorp   26 Jun 29 08:01 fs_status
-rw-rw-r--  1 root xorp  183 Jun 30  2014 p2files.lst
-rw-rw-r--  1 root xorp  488 Jun 29 08:01 picos_start.conf
admin@PICOS:~$
```

Step 3: Copy public.key, license.conf and license to /etc/picos:

```
admin@PICOS:~$ ls -l
total 132
drwxrwxr-x  2 root xorp  4096 Jun 29 08:09 ./
drwxrwxr-x 60 root xorp  4096 Jun 29 08:03 ../
-rw-r--r--  1 root root   354 Jun 29 08:09 1GE-SITE-PICA8.lic
```

```
-rw-rw-r--  1 root xorp    26 Jun 29 08:01 fs_status
-rwxr-xr-x  1 root root 98575 Jun 29 08:08 license-powerpc*
-rw-rw-r--  1 root xorp   183 Jun 30  2014 p2files.lst
-rw-rw-r--  1 root xorp   548 Jun 29 08:07 picos_start.conf
-rw-r--r--  1 root root   251 Jun 29 08:07 public.key
admin@PICOS:~$ ./license-powerpc -s
No license installed. Use below information to create a license.
Type: 1GE
Hardware ID: A326-8F2D-3661-AE76
```

Step 4: Install license:

```
admin@PICOS:/ovs$ sudo ./license-powerpcspe -i 1GE-SITE-PICA8.lic
License successfully added, the switch need to be rebooted to activate the license.
admin@PICOS:/ovs$
```

Add License Directly From License Command

User can also add the license directly from the license command. The PICOS 2.6 image supports this command.

Step 1: Paste the license content.

Step 2: Press enter and then press crtl+d.

Example for P5401, add a site license:

```
admin@PICOS:/ovs$ sudo license -i -
sJXhrpDdd2ZsMemcJ26fqvjjw7vH30gf/4OVtLsROgPNl2VjFQhIJvS3zliF+DK+
tW2QpssH0JB4n8ae9/SumsRWdwdPpbQNB1WaeNq0onWdoTRz2HGiH+XudDAm6B37
kQvCGev7pAe0tCjnB+63F3Z5ZGPbQE89/fNSBGkE6mfZ6dG1F/86C9Bn/MyqkQSI
4uDtRwfo46elZOmwn5aD/mGyh/i2qg8IfhssIn0CbHVaJY8hyt7tYuvgkEb6Xlhx
7i9+qnk9c15ksBdak0f8gxorZDOCacwWACDt/K8NJokOMWTDLnLmDczrXO0Z5l75
eGc7ZygxCjd/jzc5oW9cgIyd
License successfully added, the switch need to be rebooted to activate the license.
admin@PICOS:/ovs$
```

Reboot system and license can be activated.

Installing and Removing License for PICOS go2cli Version

- Installing License under CLI Operation Mode
- Removing License under CLI Operation Mode

Installing License under CLI Operation Mode

The following steps describe how to install a license under CLI operation mode for PICOS go2cli version.

Step 1 Before loading a license, upload the license file to the device. The following example uploads the license file **10GE-SITE-PICA8.lic** to the default path.

By default, the TFTP downloaded file is saved in directory **/cftmp/**.

```
admin@PICOS> file tftp get remote-file /tftp/license/10GE-SITE-PICA8.lic local-file 10GE-SITE-PICA8.lic ip-address 10.10.50.22
```

Step 2 Run the **license install** <*file-name*> command to install the license.

```
admin@PICOS> license install /cftmp/10GE-SITE-PICA8.lic
```

When the license has been successfully installed, it will display the following information:

```
License successfully added, the switch need to be rebooted to activate the license.
```

Step 3 Reboot the switch or restart PICOS to activate the license. Choose either one:

- Reboot the switch

```
admin@PICOS> request system reboot
```

- Restart PICOS service

```
licadmin@PICOS> start shell sh
admin@PICOS:~$ sudo service picos restart
admin@PICOS:~$ exit
exit

admin@PICOS>
```

Step 4 After PICOS starts up, run the **license show** command to view the license information.

```
admin@PICOS> license show
{
               "Type":    "10GE",
               "Feature": ["Base Product", "Layer3", "OpenFlow"],
               "Support End Date":  "2020-10-28",
               "Hardware ID":        "196B-A2AE-147A-73F2",
               "Site Name":            "PICA8"
}
```

Removing License under CLI Operation Mode

The following steps describe how to remove a license under CLI operation mode for PICOS go2cli version.

```
admin@PICOS> license remove
admin@PICOS> license show
No license installed. Use below information to create a license.
Type: 10GE
Hardware ID: 196B-A2AE-147A-73F2
```

PICOS Mode Selection

PicOS can run in two different modes:

- L2/L3 Mode
- OVS Mode

L2/L3 Mode

In the L2/L3 (Layer 2 / Layer 3) mode, PicOS can run switching and routing protocols, as well as OpenFlow applications. In this mode, L2/L3 daemons are running, but OVS can also be activated if OpenFlow in Crossflow Mode is enabled.

OVS Mode

In the OVS (Open vSwitch) mode, PicOS is optimized for OpenFlow applications. In this mode, L2/L3 daemons are not running, and the system is fully dedicated to OpenFlow and OVS.

Helpful related pages:

- Changing PicOS Mode by Modifying the Boot File
- PicOS Boot File
- Changing PicOS Mode from CLI

Changing PicOS Mode by Modifying the Boot File

The PicOS boot configuration is kept in the **picos_start.conf** file located at */etc/picos.*

```
admin@LEAF-A$ls /etc/picos/picos_start.conf
/etc/picos/picos_start.conf
```

User can use the **cat** command at the Linux shell to display the contents of the **picos_start.conf** file.

```
admin@LEAF-A$cat /etc/picos/picos_start.conf
[PICOS]
picos_start=xorplus

[XORPLUS]
xorplus_rtrmgr_verbose=
xorplus_log_facility=local0
xorplus_finder_client_address=127.0.0.1
xorplus_finder_server_address=127.0.0.1

[OVS]
ovs_database_file=/ovs/ovs-vswitchd.conf.db
ovs_inband_database_file=/ovs/inband.conf.db
ovs_inventory_database_file=/tmp/inventory.conf.db
inventory_schema=/ovs/share/openvswitch/inventory.ovsschema
ovs_function_database_file=/ovs/function.conf.db
function_schema=/ovs/share/openvswitch/function.ovsschema
ovs_portGroup_database_file=/ovs/portGroup.conf.db
portGroup_schema=/ovs/share/openvswitch/portGroup.ovsschema
ovs_db_sock_file=/ovs/var/run/openvswitch/db.sock
ovs_invd_file=/ovs/share/openvswitch/scripts/ovs-invd
ovs_invd_python_path=/ovs/share/openvswitch/python
ovs_db_manager=Open_vSwitch,Manager,target
ovs_switch_ip_address=10.10.51.199
ovs_switch_ip_netmask=255.255.255.0
ovs_switch_gateway_ip=10.10.51.1
ovs_switch_tcp_port=6640
ovs_host_name=PICOS-OVS
ovs_use_dhcp=false
ovs_enable_lighttpd=false
ovs_enable_snmpd=false
ovs_enable_npb=false
ovs_enable_mgp_ipv6=false
ovs_output_syslog_local=true

[ZTP]
ztp_disable=false
otp_disable=true
```

The **picos_start** option in the **[PICOS]** section of the **picos_start.conf** file dictates the PicOS mode (L2/L3 or OVS). The **picos_start** option has two possible values: **xorpplus** and **ovs**.

To change the PicOS mode, user has to open the **picos_start.conf** file in a text editor like **vi** and change the value of **picos_start**. After changing the value and saving the file, user must restart the **picos** service to bring the PicOS mode change into effect.

The following example shows an excerpt from the **picos_start.conf** file. If the value of **picos_start** is **ovs**, PicOS will run in OVS mode after the next **PicOS** restart.

```
picos_start=ovs
```

Once the **picos_start.conf** file has been updated, user needs to restart the **picos** service by using the **sudo systemctl restart picos** command, or rebooting the switch.

```
admin@LEAF-A$sudo systemctl restart picos
(No print here, it will cost few minutes for PICOS to restart.)
admin@LEAF-A$
```

User is in PicOS OVS mode now.

The following example shows an excerpt from the **picos_start.conf** file. If value of **picos_start** is **xorpplus,** PicOS will run in L2/L3 mode after the next **PicOS** restart.

```
picos_start=xorplus
```

Once the **picos_start.conf** file has been updated, user needs to restart the **picos** service by using the **sudo systemctl restart picos** command or by rebooting the switch.

```
admin@LEAF-A$sudo systemctl restart picos
(No print here, it will cost few minutes for PICOS to restart.)
admin@LEAF-A$
```

Once the switch is in L2/L3 mode, user can use the **cli** command at the Linux shell to reach the L2/L3 operation mode.

```
admin@LEAF-A$cli
Synchronizing configuration...OK.
Welcome to PicOS L2/L3 on LEAF-A
admin@LEAF-A>
```

PicOS Boot File

The Pica8 PICOS software keeps its boot configuration in the **picos_start.conf** file located in the **/etc/picos** directory.

```
admin@LEAF-A$ ls /etc/picos/picos*
/etc/picos/picos_start.conf
```

User can use the **more** command at the Linux shell to display contents of the **picos_start.conf** file.

```
admin@LEAF-A$ more /etc/picos/picos_start.conf
[PICOS]
picos_start=xorplus

[XORPLUS]
xorplus_rtrmgr_verbose=
xorplus_log_facility=local0
xorplus_finder_client_address=127.0.0.1
xorplus_finder_server_address=127.0.0.1

[OVS]
ovs_database_file=/ovs/ovs-vswitchd.conf.db
ovs_inband_database_file=/ovs/inband.conf.db
ovs_inventory_database_file=/tmp/inventory.conf.db
inventory_schema=/ovs/share/openvswitch/inventory.ovsschema
ovs_function_database_file=/ovs/function.conf.db
function_schema=/ovs/share/openvswitch/function.ovsschema
ovs_portGroup_database_file=/ovs/portGroup.conf.db
portGroup_schema=/ovs/share/openvswitch/portGroup.ovsschema
ovs_db_sock_file=/ovs/var/run/openvswitch/db.sock
ovs_invd_file=/ovs/share/openvswitch/scripts/ovs-invd
ovs_invd_python_path=/ovs/share/openvswitch/python
ovs_db_manager=Open_vSwitch,Manager,target
ovs_switch_ip_address=10.10.51.199
ovs_switch_ip_netmask=255.255.255.0
ovs_switch_gateway_ip=10.10.51.1
ovs_switch_tcp_port=6640
ovs_host_name=PICOS-OVS
ovs_use_dhcp=false
ovs_enable_lighttpd=false
ovs_enable_snmpd=false
ovs_enable_npb=false
ovs_enable_mgp_ipv6=false
ovs_output_syslog_local=true

[ZTP]
ztp_disable=false
otp_disable=true
```

The **picos_start.conf** boot file has the following four sections, each section having one or more variables:

1. PICOS
2. XORPLUS
3. OVS
4. ZTP

The following table describes the variables in **picos_start.conf** - the PicOS boot file.

Section	Variable	Value	Description
PICOS	**picos_start**	**xorplus**	PICOS operates in the L2/L3 mode after the **picos** service is restarted, or the system is rebooted.
		ovs	PICOS operates in the OVS mode after the **picos** service is restarted, or the system is rebooted.
			The device boots into Linux as usual, but both the PICOS modes are *inactive*.
XORPLUS	**xorplus_rtrmgr_verbose**		Indicates that the xorplus_rtrmgr log is in use.
	xorplus_log_facility		Configures the logging facility.
	xorplus_finder_client_address		Configures IP address.
	xorplus_finder_server_address		Configures IP address.
OVS	**ovs_database_file**		Defines the Open vSwitch configuration database.
	ovs_inband_database_file		Defines the Open vSwitch inband configuration database.
	ovs_db_sock_file		Defines the Unix domain socket file for communication between **ovsdb-server** and **ovs-vswitchd**.
	ovs_switch_ip_address		Defines the Open vSwitch management IP address.
	ovs_switch_ip_netmask		Defines the subnet mask for the Open vSwitch management IP address.
	ovs_switch_gateway_ip		Defines the gateway for the Open vSwitch management IP address.
	ovs_switch_tcp_port		Defines the TCP port for communication between **ovsdb_server** and **ovs-vswitchd**.
	ovs_host_name		Defines the Open vSwitch host name.
	ovs_use_dhcp	**true**	Indicates that the Open vSwitch is getting its management IP address through DHCP.
		false	Indicates that the Open vSwitch is configured with a static management IP address.
ZTP	**ztp_disable**	**true**	Indicates that ZTP (Zero Touch Provisioning) is disabled.
		false	Indicates that ZTP (Zero Touch Provisioning) is enabled.
	otp_disable	**true**	Indicates that the OTP function is disabled.
		false	Indicates that the OTP function is enabled.

Changing PicOS Mode from CLI

User can switch between L2/L3 and OVS modes using the **picos_boot** script already included in PicOS. User can run the script from the Linux shell on user's PicOS switch. The script will modify the PicOS boot file */etc/picos/picos_start.conf* automatically, without user having to edit the file manually.

Warning:

On FS S5810 Series and S5860 Series switches, run "save_config" command when perform picos_boot. Otherwise, the picos_boot configuration will be lost after PicOS reboot. For detail, please refer to Configuration Saving Guide.

Switching from L2/L3 Mode to OVS Mode

This section describes the procedure to switch from the L2/L3 mode to OVS mode on a PicOS switch named **LEAF-A**. The switch name is arbitrary.

1. Login with username **admin** to arrive at the Linux shell prompt.

```
Username: admin
Password:
admin@LEAF-A$
```

NOTE:

For PICOS **go2cli** version, users go to PICOS CLI prompt after log in:

```
admin@Xorplus>
```

At PICOS CLI prompt, run "**start shell sh**" to enter Linux shell.

```
admin@Xorplus> start shell sh
admin@Xorplus:~$
```

2. Run the **picos_boot** script located in */usr/bin* directory. The full path does not need to be used because the /usr/bin directory is on the system **PATH** by default.

3. Enter option **2** to select OVS mode.

4. Choose how the IP address of the management interface should be configured: DHCP or static IP. If *Static IP* is chosen, values for static IP address, subnet mask, and default gateway must be provided. If *DHCP* is chosen, no more questions are asked.

```
admin@PICOS:~$ sudo picos_boot
Configure default startup options:
(Select key 3 if no change)
[1] PICOS L2/L3
[2] PICOS Open vSwitch/OpenFlow * default
```

```
[3] Quit
Enter your choice (1,2,3):2

PICOS Open vSwitch/OpenFlow is selected.

Configure management interface(IPv4):
[1] DHCP * default
[2] Static
Enter your choice(1,2):
```

5. Restart the **picos** service to activate PicOS OVS mode.

```
admin@LEAF-A$ exit
admin@LEAF-A> request system reboot
(No print here, it will cost few minutes for PICOS to restart.)
admin@LEAF-A$
```

As an alternative to restarting the **picos** service, user can just reboot the switch to bring the PicOS mode change into effect.

```
admin@LEAF-A$sudo reboot
Broadcast message from root@PicOS-OVS (pts/0) (Sun Aug 16 21:18:48 2015):
The system is going down for reboot NOW!

Username: admin
Password:
admin@PicOS-OVS$
```

The **picos_boot** script has the following options:

Option 1 selects the PICOS L2/L3 (Layer 2 / Layer 3) mode. When user chooses option 1, PICOS will load in L2/L3 mode after a reboot.

Option 2 selects the PICOS OVS (Open vSwitch) mode. When user chooses option 2, PICOS will load in OVS mode after a reboot.

Option 3 does not modify the present PICOS mode.

Switching from OVS Mode to L2/L3 Mode

This section describes the procedure used to switch from OVS mode to L2/L3 mode on a PicOS switch named **LEAF-A**. The switch name is arbitrary.

1. Log in with username **admin** to arrive at the Linux shell prompt.

```
Username: admin
Password:
admin@PicOS-OVS$
```

NOTE:

For PICOS **go2cli** version, users go to PICOS CLI prompt after log in:

```
admin@Xorplus>
```

At PICOS CLI prompt, run "**start shell sh**" to enter Linux shell.

```
admin@Xorplus> start shell sh
admin@Xorplus:~$
```

2. Run the **picos_boot** script located in */usr/bin* directory. The full path does not need to be used because the /usr/bin directory is on the system **PATH** by default.

3. Enter option **1** to select L2/L3 mode.

```
admin@PicOS-OVS$sudo picos_boot
Configure the default system start-up options:
 (Select key 3 if no change)
    [1]  PICOS L2/L3
    [2]  PICOS Open vSwitch/OpenFlow   * default
    [3]  No start-up change
Enter your choice (1,2,3):1
PICOS L2/L3 switch system is selected.
Please restart the PICOS service
```

4. Restart the **picos** service to activate PicOS L2/L3 mode.

```
admin@PicOS-OVS$ exit
admin@PicOS-OVS> request system reboot
(No print here, it will cost few minutes for PICOS to restart.)
admin@PicOS-OVS$
```

5. Optionally, user can run the **cli** command at the Linux shell to enter the PicOS L2/L3 operation mode.

```
admin@PicOS-OVS$cli
Synchronizing configuration...OK.
Welcome to PicOS L2/L3 on LEAF-A
admin@LEAF-A>
```

As an alternative to restarting the **picos** service, user can just reboot the switch to bring the PicOS mode change into effect.

Enabling CrossFlow in L2/L3 Mode

This section describes the procedure to enable CrossFlow in L2/L3 mode.

1. Enter L2/L3 operation mode, using the **cli** command at the Linux shell.

```
admin@LEAF-A$ cli
Synchronizing configuration...OK.
Welcome to PicOS L2/L3 on LEAF-A
admin@LEAF-A>
```

NOTE:

This step is not necessary for PICOS **go2cli** version, as users go to PICOS CLI prompt after log in:

```
admin@Xorplus>
```

At PICOS CLI prompt, run “**start shell sh**” to enter Linux shell.

```
admin@Xorplus> start shell sh
admin@Xorplus:~$
```

If you want to return from the Linux shell back to the CLI prompt, run "**exit**".

```
admin@Xorplus:~$ exit
exit

admin@Xorplus>
```

2. Enter configuration mode, using the **configure** command in the operation mode.

```
admin@LEAF-A> configure
Entering configuration mode.
There are no other users in configuration mode.
admin@LEAF-A#
```

3. Enable CrossFlow mode, using the **set xovs enable true** command in configuration mode. Commit the changes, and exit the configuration mode. Then, exit the operation mode.

```
admin@LEAF-A# set xovs enable true
admin@LEAF-A# commit
Commit OK.
Save done.
admin@LEAF-A# exit
admin@LEAF-A> exit
admin@LEAF-A$
```

4. User can now run the OVS mode commands from the Linux shell.

```
admin@LEAF-A$ovs-vsctl show
e8e63632-d96b-409a-89c3-95bb4ef61f46
    Bridge "ECODE3"
        Controller "tcp:65.19.141.118:6633"
            is_connected: true
        Port "ge-1/1/1"
            Interface "ge-1/1/1"
                type: "pica8"
        Port "ECODE3"
            Interface "ECODE3"
```

```
                type: internal
        Port "ge-1/1/47"
            Interface "ge-1/1/47"
                type: "pica8"
        Port "ge-1/1/48"
            Interface "ge-1/1/48"
                type: "pica8"
        Port "ge-1/1/2"
            Interface "ge-1/1/2"
                type: "pica8"
```

PICOS Password Recovery

This document is used to recover a forgotten password. It operates only on the console port, and it depends on the platforms.

- Password Recovery for X86 Platform
- Password Recovery for AS4610 Series Switches
- Password Recovery Guide for FS S5810/S5860 Series Switches
- Password Recovery Guide for FS N8560-32C

Password Recovery for X86 Platform

This guide provides the procedure for recovering the **admin** account password login from the ETH interface for X86 platform switches. If you forget the admin password, use the password recovery procedure to reset the admin password.

Step1 Login to the switch through the console port.

Step2 Power cycle the switch.

Step3 Enter ONIE.

```
+----------------------------------------------------------------------------+
| PicOS                                                                      |
|*ONIE                                                                       |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
+----------------------------------------------------------------------------+
     Use the ^ and v keys to select which entry is highlighted.
     Press enter to boot the selected OS, `e' to edit the commands
     before booting or `c' for a command-line.
```

Step4 From GRUB prompt, Choose **ONIE: Rescue** to boot ONIE in rescue mode.

```
                  GNU GRUB  version 2.02~beta2+e4a1fe391
+----------------------------------------------------------------------------+
| ONIE: Install OS                                                           |
|*ONIE: Rescue                                                               |
| ONIE: Uninstall OS                                                         |
| ONIE: Update ONIE                                                          |
| ONIE: Embed ONIE                                                           |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
|                                                                            |
+----------------------------------------------------------------------------+
```

Step5 Check out the partition on which "PICOS-GRUB" resides.

```
ONIE:/ # blkid
/dev/sda6: LABEL="User-Data" UUID="da55e09c-0e7b-4d96-a8c9-bee2ed5bb42c"
/dev/sda5: LABEL="PicOS2" UUID="3f228548-64c1-492c-ad3d-8ca7d248c11a"
/dev/sda4: LABEL="PicOS" UUID="039453f9-0879-4c86-9e0b-8ef4d34d9a66"
/dev/sda3: LABEL="PICOS-GRUB" UUID="b3a8ab95-43f9-4f21-9c76-7f48101be381"
/dev/sda2: LABEL="ONIE-BOOT" UUID="7fcaa6c8-d174-42c1-abd1-8c6eea46eb6b"
/dev/sda1: LABEL="EFI System" UUID="36E9-D2F5"
ONIE:/ #
```

We find that the partition of **LABEL="PICOS-GRUB"** is **/dev/sda3**.

Step6 Issue the following commands to check whether the currently running system is PicOS or PicOS2 in the partition running "PICOS-GRUB".

In this example, "PICOS-GRUB" is on partition **/dev/sda3** according to *Step 5*, so we mount **/dev/sda3**.

```
# mount /dev/sda3 /mnt
ONIE:/ # cat /mnt/grub/grubenv
# GRUB Environment Block
```

```
##############################################################################################################################
default=PICOS-3.8.0.1+1
##############################################################################################################################
ONIE:/ #

ONIE:/ # cat /mnt/grub/grub.cfg
serial --port=0x3f8 --speed=115200 --word=8 --parity=no --stop=1
terminal_input serial
terminal_output serial

set timeout=5
if [ -s $prefix/grubenv ]; then
  load_env
fi
if [ "${next_entry}" ] ; then
   set default="${next_entry}"
   set next_entry=
   save_env next_entry
fi

if [ "${saved_entry}" ] ; then
   set default="${saved_entry}"
   set saved_entry=
   save_env saved_entry
fi

 menuentry PICOS-3.8.0.1+2 {
        search --no-floppy --label --set=root PicOS
        linux /boot/vmlinuz root=LABEL=PicOS rw fsck.mode=force fsckfix  rootfstype=ext4 console=ttyS0,115200n8 int
        initrd /boot/initrd.img
}

menuentry PICOS-3.8.0.1+1 {
        search --no-floppy --label --set=root PicOS2
        linux /boot/vmlinuz root=LABEL=PicOS2 rw fsck.mode=force fsckfix  rootfstype=ext4 console=ttyS0,115200n8 in
        initrd /boot/initrd.img
}

menuentry ONIE {
        search --no-floppy --label --set=root "EFI System"
        echo    'Loading ONIE ...'
        chainloader /EFI/onie/grubx64.efi
}
ONIE:/ #
```

1) First, find out the default version of the system.

From the line with "default=PICOS-3.8.0.1+1", we find that the default version of the system is **PICOS-3.8.0.1**, and the label is 1.

2) Then, check out whether the currently running system is PicOS or PicOS2.

According to "PICOS-3.8.0.1+1", find the following block. In this block, there is "label --set=root PicOS2", it means the running system is **PicOS2**.

```
menuentry PICOS-3.8.0.1+1 {
        search --no-floppy --label --set=root PicOS2
        linux /boot/vmlinuz root=LABEL=PicOS2 rw fsck.mode=force fsckfix  rootfstype=ext4 console=ttyS0,115200n8 in
        initrd /boot/initrd.img
}
```

Step7 From the ONIE prompt, perform the following commands to mount the current boot partition.

```
ONIE:/ # blkid
/dev/sda6: LABEL="User-Data" UUID="da55e09c-0e7b-4d96-a8c9-bee2ed5bb42c"
/dev/sda5: LABEL="PicOS2" UUID="3f228548-64c1-492c-ad3d-8ca7d248c11a"
/dev/sda4: LABEL="PicOS" UUID="039453f9-0879-4c86-9e0b-8ef4d34d9a66"
/dev/sda3: LABEL="PICOS-GRUB" UUID="b3a8ab95-43f9-4f21-9c76-7f48101be381"
/dev/sda2: LABEL="ONIE-BOOT" UUID="7fcaa6c8-d174-42c1-abd1-8c6eea46eb6b"
/dev/sda1: LABEL="EFI System" UUID="36E9-D2F5"
/dev/mmcblk0p2: LABEL="EDA-DIAG" UUID="48f14bec-740e-4aa2-9605-f32de15f9f2c"
/dev/mmcblk0p1: LABEL="EFI System" UUID="3D0E-3759"
```

```
ONIE:/ # mount /dev/sda5 /mnt/              // The partition is based on the step 6.
```

Step8 Modify the shadow file.

```
# vi etc/shadow
```

Change the following line from:
admin:**1eE9WFgVk$EwGcNl83uK98.r8TcKn2q/**:15385:0:99999:7:::
into:
admin::15385:0:99999:7::: //Remove the string between the first and the second colon

Step9 Execute the sync operation.

```
# sync
```

The subsequent steps are distinguished between devices currently running in OVS and L2/L3 mode. Please choose the appropriate steps according to the PicOS mode.

Note: You can refer to the document Checking PicOS Mode to check the current PicOS mode of the device.

- If the running PicOS mode is L2/L3 mode, go to L2/L3 Mode.
- If the running PicOS mode is OVS mode, go to OVS Mode.

L2/L3 Mode:

Step10 Modify the configuration file.

```
ONIE:/# vi pica/config/pica_startup.boot
```

In the pica_startup.boot file, you will find lines starting with "***user admin {***", remove lines of user admin configurations.

For example, remove the following six lines in configuration file.

```
user admin {
            authentication {
                plain-text-password: "$1$zL8TUrpq$/Y1tcx1IhwPkm6HEd4aEM/"
            }
            class: "super-user"
        }
```

Save and exit with ":wq".

Copy the configuration file to the backup file.

```
ONIE:/# cp /mnt/pica/config/pica_startup.boot /mnt/backup/pica/config/pica_startup.boot
ONIE:/# sync
```

Step11 Umount and reboot the switch.

```
# umount /mnt
# reboot
```

Step12 When you see PicOS login again, you can log in by the admin user without a password.

Step13 Set a new admin password using the following CLI commands and save the configuration.

```
root@XorPlus# set system login user admin authentication plain-text-password pica8           //Please enter the ne
root@XorPlus# set system login user admin class "super-user"
root@XorPlus# commit
```

After the above steps, you can log into the system with the new password.

OVS Mode：

Step10 Umount and reboot the switch.

```
# umount /mnt
# reboot
```

Step11 Set a new admin password with **passwd admin** command and save the configuration. The commands are illustrated here:

```
root@XorPlus:~$ passwd admin
Enter new UNIX password:
Retype new UNIX password:
passwd: password updated successfully
```

After the above steps, you can log into the system with the new password.

Password Recovery for AS4610 Series Switches

This guide provides the procedure for recovering the **admin** account password login from the ETH interface for AS4610 series switches. If you forget the admin password, use the password recovery procedure to reset the admin password.

Step1 Login to the switch through the console port.

Step2 Power cycle the switch.

Step3 Enter uboot prompt. Please hit any key when see the message "Hit any key to stop autoboot:" on console display.

```
....
Hit any key to stop autoboot:  0
accton_as4610-54->
```

Step4 Issue "**run onie_rescue**" to enter ONIE recue mode.

```
accton_as4610-54-> run onie_rescue
```

Step5 Enter ONIE prompt. Please hit any key when see the following message on console display.

```
...

Please press Enter to activate this console. etc_watchdog can't access PHY, forcing link up
...
ONIE:/ #
```

Step6 Issue command "**blkid**" to see which partitions (where LABEL="**PicOS2**" and LABEL="**PicOS**") are used by PicOS. If your outputs are different from what show below, please forward us the outputs.

```
ONIE:/ # blkid
/dev/sda4: LABEL="User-Data" UUID="14574a7e-34fb-450c-be05-690a71e023d9"
/dev/sda1: LABEL="ACCTON-DIAG" UUID="aa56682f-b0f1-4087-8722-42b16a5703ab"
/dev/sda3: LABEL="PicOS2" UUID="3d744634-4c03-4d53-9d04-33205f0606a8"
/dev/sda2: LABEL="PicOS" UUID="afffc6ab-2983-4452-9e90-7a653fef9a90"
```

Step7 According to the above outputs, there are two partitions (**/dev/sda2** and **/dev/sda3**) installed PicOS. Here, we modify shadow file on both partitions.

a) Mount */dev/sda2*.

```
ONIE:/ # mount /dev/sda2 /mnt/
```

b) Edit shadow file.

```
ONIE:/ # vi /mnt/etc/shadow
```

c) Remove 'admin' password.

Change the following line from:
admin:**1eE9WFgVk$EwGcNl83uK98.r8TcKn2q/**:15385:0:99999:7:::
into:
admin::15385:0:99999:7::: //Remove the string between the first and the second colon

d) Execute "**sync**" command.

```
ONIE:/ # sync
```

Step8 Repeat the steps from **a)** to **d)** in Step7 on */dev/sda3*.

The subsequent steps are distinguished between devices currently running in OVS and L2/L3 mode. Please choose the appropriate steps according to the PicOS mode.

Note: You can refer to the document Checking PicOS Mode to check the current PicOS mode of the device.

- If the running PicOS mode is L2/L3 mode, go to L2/L3 Mode.
- If the running PicOS mode is OVS mode, go to OVS Mode.

L2/L3 Mode:

Step9 Modify the configuration file.

```
ONIE:/# vi pica/config/pica_startup.boot
```

In the pica_startup.boot file, you will find lines starting with "***user admin {***", remove lines of user admin configurations.

For example, remove the following six lines in configuration file.

```
user admin {
            authentication {
                plain-text-password: "$1$zL8TUrpq$/Y1tcx1IhwPkm6HEd4aEM/"
            }
            class: "super-user"
        }
```

Save and exit with ":wq".

Copy the configuration file to the backup file.

```
ONIE:/# cp /mnt/pica/config/pica_startup.boot /mnt/backup/pica/config/pica_startup.boot
ONIE:/# sync
```

Step10 Umount and reboot the switch.

```
# umount /mnt
# reboot
```

Step11 When you see PicOS login again, you can log in by the admin user without a password.

Step12 Set a new admin password using the following CLI commands and save the configuration.

```
root@XorPlus# set system login user admin authentication plain-text-password pica8            //Please enter the ne
root@XorPlus# set system login user admin class "super-user"
root@XorPlus# commit
```

After the above steps, you can log into the system with the new password.

OVS Mode：

Step9 Umount and reboot the switch.

```
# umount /mnt
# reboot
```

Step10 Set a new admin password with **passwd admin** command and save the configuration. The commands are illustrated here:

```
root@XorPlus:~$ passwd admin
Enter new UNIX password:
Retype new UNIX password:
passwd: password updated successfully
```

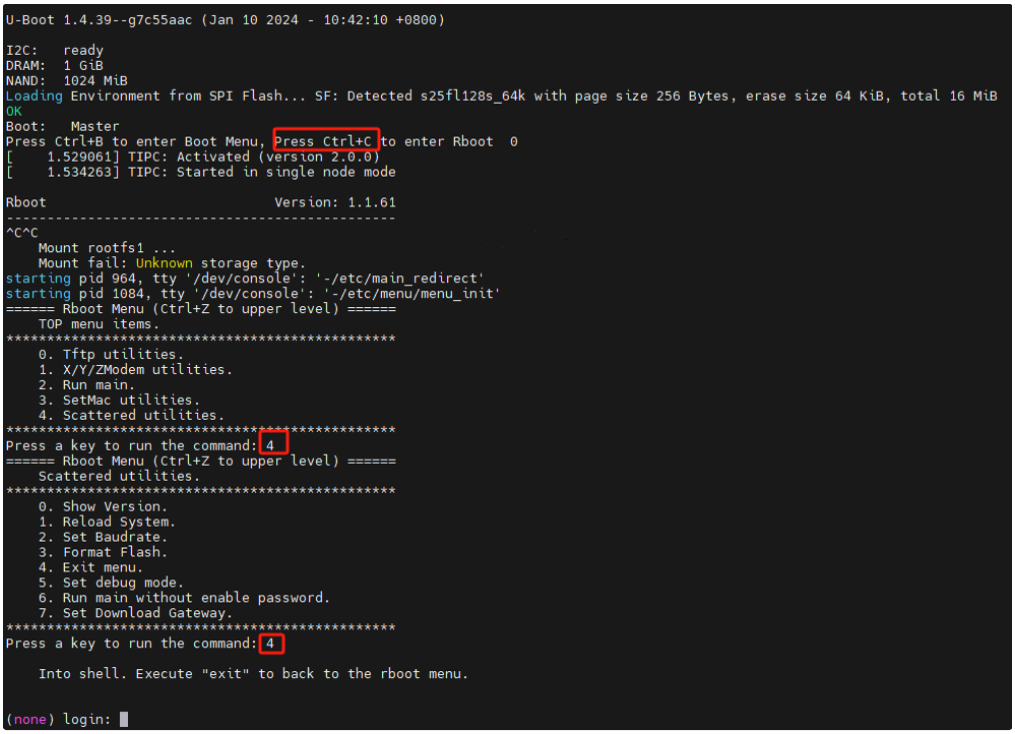
After the above steps, you can log into the system with the new password.

Password Recovery Guide for FS S5810/S5860 Series Switches

NOTEs:

- To enter the Rboot menu you need to reboot the device, which will lead to business interruption, so back up the device as needed, and perform password recovery at a time with less business.
- Before performing this operation, you need to contact the FS support at https://www.fs.com/tech_support.html to get the right *user name/password* used for entering Rboot shell.
- Do not power off the switch during this operation.

Step 1 Power off and on to force restarting the switch, then press **Ctrl+C** to enter Rboot menu.



Step 2 Type **4** in the Rboot menu to enter the *Scattered utilities* menu, then Type **4**, and enter the right user name and password to enter Rboot shell (Contact the FS support at

https://www.fs.com/tech_support.html to get the user name and password).

Step 3 At the Rboot shell, issue the following command to check whether the running system is PICOS or PICOS2 (used for determining the *config* file path described in the following steps).

```
root@(none):~# std_fw_printenv main
main=run picos_bootcmd
root@(none):~# std_fw_printenv main
main=run picos2_bootcmd
```

Step 4 Move the current configuration file.

```
root@(none):~# cd mnt/flash/picos/config1   // The path may be config1 or config2, this is up to the running system checked in step 3.
```

```
root@(none):/mnt/flash/picos/config1# mv latest.tar.gz latest_bak.tar.gz
root@(none):/mnt/flash/picos/config1# mv backup.tar.gz backup_bak.tar.gz
root@(none):/mnt/flash/picos/config1# sync
```

Step 5 Reboot the switch.

```
root@(none):~# reboot
```

Step 6 Since there are no configuration files in the */config1* directory, the switch boots to a factory default configuration. At this point you can log in as the **admin** user with the password **pica8**. Then use the following command to fetch your previous configuration.

```
admin@PICOS:~$ sudo su
root@PICOS:~$ cd  /mnt/open/picos/config1  // The path may be config1 or config2, this is up to the running system checked in step 3.
root@PICOS:~$ cp latest_bak.tar.gz latest.tar.gz
root@PICOS:~$ cp backup_bak.tar.gz backup.tar.gz
```

The subsequent steps distinguish between devices currently running in OVS mode or L2/L3 mode. For different modes, the steps are different.

- **OVS Mode**

Step 7 Modify the shadow file.

```
root@PICOS:~$ tar zxvf latest.tar.gz  etc/shadow
root@PICOS:~$ vi etc/shadow
```

In the shadow file, you will find one line starting with “admin:……..”. Here is an example:

```
admin:$1$eE9WFgVk$EwGcNl83uK98.r8TcKn2q/:15385:0:99999:7:::
```

You need to delete the letters between the first and the second colon and it will become:

```
admin::15385:0:99999:7:::
```

Step 8 Compress the shadow file to the configuration files and reboot**.**

```
root@PICOS:~$ gzip -d latest.tar.gz
root@PICOS:~$ tar -uf latest.tar etc/shadow
root@PICOS:~$ gzip latest.tar
root@PICOS:~$ sync
root@PICOS:~$ reboot -f
```

When you see the PICOS login again, you can log in as the admin user without a password.

Step 9 Login with username **admin**, and then set a new admin password and save the configuration. We can see that the OVS configuration has been restored.

```
PICOS-OVS login: admin
Linux PICOS-OVS 4.19.79 #1 SMP Sat Feb 17 03:04:25 CST 2024 armv7l
admin@PICOS-OVS:~$ passwd admin
New password:
Retype new password:
passwd: password updated successfully
admin@PICOS-OVS:~$ ovs-vsctl display-settings
ovs-vsctl add-br br0
ovs-vsctl set bridge br0  datapath_type=pica8
ovs-vsctl add-port br0 ge-1/1/2
ovs-vsctl set port ge-1/1/2  vlan_mode=trunk  tag=1
```

- **L2/L3 Mode**

Step 7 Under L2/L3 Mode, unzip and load the modified configuration file.

```
root@PICOS:/mnt/open/picos/config1#  tar zxvf latest.tar.gz  pica/config/pica_startup.boot
//The path may be config1 or config2, this is up to the running system checked in step 3.
```

```
root@PICOS# load override /mnt/open/picos/config1/pica/config/pica_startup.boot
root@PICOS# Loading config file...
Config file was loaded successfully.
root@PICOS# commit
```

Step 8 set a new admin password with CLI command and save the configuration.

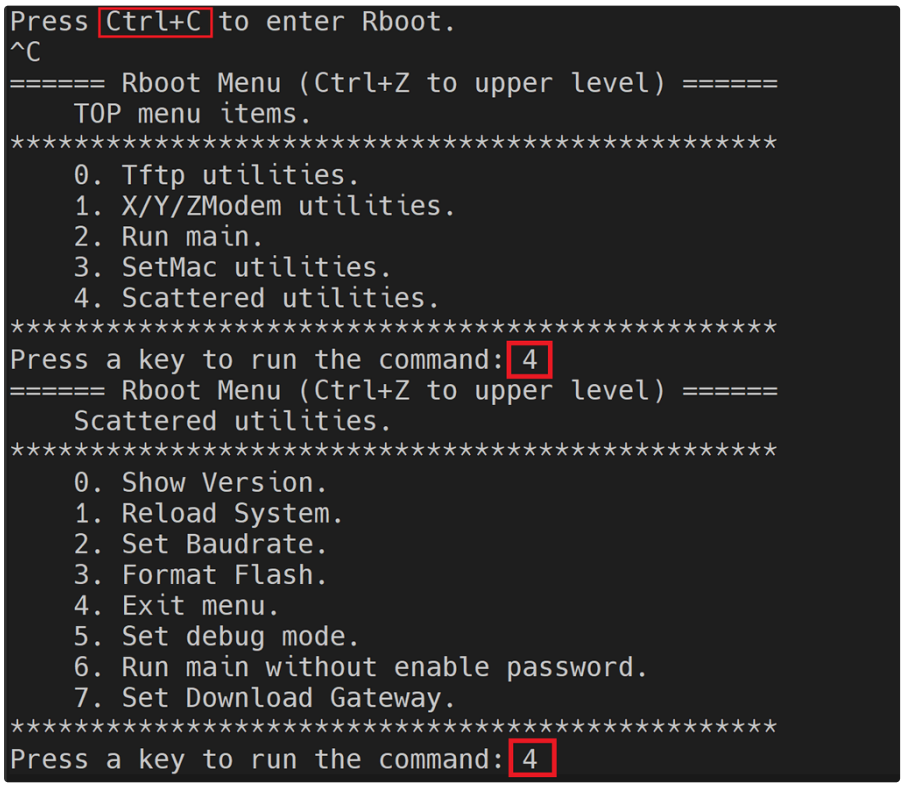
```
root@PICOS# set system login user admin authentication plain-text-password 12345678
root@PICOS# commit
root@PICOS# run copy running-config startup-config
```

Password Recovery Guide for FS N8560-32C

NOTEs:

- To enter the Rboot menu you need to reboot the device, which will lead to business interruption, so back up the device as needed, and perform password recovery at a time with less business.
- Before performing this operation, you need to contact the FS support at https://www.fs.com/tech_support.html to get the right *user name/password* used for entering Rboot shell.
- Do not power off the switch during this operation.

Step 1 Power off and on to force restarting the switch, then press **Ctrl+C** to enter Rboot menu.



Step 2 Type **4** in the Rboot menu to enter the *Scattered utilities* menu, then Type **4**, and enter the right user name and password to enter Rboot shell (Contact the FS support at

https://www.fs.com/tech_support.html to get the user name and password).

Step3 Check out the PICOS system boot partition.

```
ONIE:/ # blkid
/dev/sda6: LABEL="User-Data" UUID="da55e09c-0e7b-4d96-a8c9-bee2ed5bb42c"
/dev/sda5: LABEL="PicOS2" UUID="3f228548-64c1-492c-ad3d-8ca7d248c11a"
/dev/sda4: LABEL="PicOS" UUID="039453f9-0879-4c86-9e0b-8ef4d34d9a66"
/dev/sda3: LABEL="PICOS-GRUB" UUID="b3a8ab95-43f9-4f21-9c76-7f48101be381"
/dev/sda2: LABEL="ONIE-BOOT" UUID="7fcaa6c8-d174-42c1-abd1-8c6eea46eb6b"
/dev/sda1: LABEL="EFI System" UUID="36E9-D2F5"
ONIE:/ #
```

We find that the partition of **LABEL="PicOS2"** is **/dev/sda5** and **LABEL="PicOS"** is **/dev/sda4**.

Step4 From the ONIE prompt, perform the following commands to mount the boot partition.

```
ONIE:/ # mount /dev/sda5 /mnt/
ONIE:/ # mount /dev/sda4 /mnt/
```

Step5 Modify the shadow file.

```
# vi etc/shadow
```

Change the following line from:
admin:**1eE9WFgVk$EwGcNl83uK98.r8TcKn2q/**:15385:0:99999:7:::
into:
admin::15385:0:99999:7::: //Remove the string between the first and the second colon

Step6 Execute the sync operation.

```
# sync
```

The subsequent steps are distinguished between devices currently running in OVS and L2/L3 mode. Please choose the appropriate steps according to the PicOS mode.

L2/L3 Mode:

Step7 Modify the configuration file.

```
ONIE:/# vi pica/config/pica_startup.boot
```

In the pica_startup.boot file, you will find lines starting with "***user admin {***", remove lines of user admin configurations.

For example, remove the following six lines in configuration file.

```
user admin {
            authentication {
                plain-text-password: "$1$zL8TUrpq$/Y1tcx1IhwPkm6HEd4aEM/"
            }
            class: "super-user"
        }
```

Save and exit with ":wq".

Copy the configuration file to the backup file.

```
ONIE:/# cp /mnt/pica/config/pica_startup.boot /mnt/backup/pica/config/pica_startup.boot
ONIE:/# sync
```

Step8 Umount and reboot the switch.

```
# umount /mnt
# reboot
```

Step9 When you see PicOS login again, you can log in by the admin user without a password.

Step10 Set a new admin password using the following CLI commands and save the configuration.

```
root@XorPlus# set system login user admin authentication plain-text-password pica8           //Please enter
the new password
root@XorPlus# set system login user admin class "super-user"
root@XorPlus# commit
```

After the above steps, you can log into the system with the new password.

OVS Mode：

Step7 Umount and reboot the switch.

```
# umount /mnt
# reboot
```

Step8 Set a new admin password with **passwd admin** command and save the configuration. The commands are illustrated here:

```
root@XorPlus:~$ passwd admin
Enter new UNIX password:
Retype new UNIX password:
passwd: password updated successfully
```

After the above steps, you can log into the system with the new password.

Setting Date and Time

This section describes how to set the time zone, date, and time.

Setting Time Zone

To see the current time zone, list the contents of the **/etc/timezone** directory.

```
admin@Switch$cat /etc/timezone
Etc/UTC
```

To set the time zone, run the **dpkg-reconfigure tzdata** command as root.

```
admin@Switch$sudo dpkg-reconfigure tzdata
Package configuration
  +----------------------------------+ Configuring tzdata +-----------------------------------+
  | Please select the geographic area in which you live. Subsequent configuration questions     |
  | will narrow this down by presenting a list of cities, representing the time zones in which  |
  | they are located.                                                                           |
  |                                                                                             |
  | Geographic area:                                                                            |
  |                                                                                             |
  |                                      Africa                                                 |
  |                                      America                                                |
  |                                      Antarctica                                             |
  |                                      Australia                                              |
  |                                      Arctic                                                 |
  |                                      Asia                                                   |
  |                                      Atlantic                                               |
  |                                      Europe                                                 |
  |                                      Indian                                                 |
  |                                      Pacific                                                |
  |                                      SystemV                                                |
  |                                      US                                                     |
  |                                      Etc                                                    |
  |                                                                                             |
  |                                                                                             |
  |                          <Ok>                              <Cancel>                         |
  |                                                                                             |
  +---------------------------------------------------------------------------------------------+
```

Navigate through the menus to set the appropriate time zone.

```
+-----------------------+ Configuring tzdata +-----------------------+
| Please select the city or region corresponding to your time zone.  |
|                                                                    |
| Time zone:                                                         |
|                                                                    |
|                           Alaska                                   |
|                           Aleutian                                 |
|                           Arizona                                  |
|                           Central                                  |
|                           Eastern                                  |
|                           Hawaii                                   |
|                           Indiana-Starke                           |
|                           Michigan                                 |
|                           Mountain                                 |
|                           Pacific                                  |
|                           Pacific-New                              |
|                           Samoa                                    |
|                                                                    |
|                                                                    |
|                 <Ok>                    <Cancel>                   |
|                                                                    |
+--------------------------------------------------------------------+
```

Then, the selected time zone should be displayed.

```
Current default time zone: 'US/Eastern'
Local time is now:      Mon Dec  7 21:15:30 EST 2015.
Universal Time is now:  Tue Dec  8 02:15:30 UTC 2015.
```

Verify if the time zone is correctly set.

```
admin@Switch$cat /etc/timezone
US/Eastern
```

Setting Date and Time

The switch has a hardware clock that maintains system time, even when the switch is rebooted or powered off. The hardware clock is powered by a battery on the system board. When the switch is running, PicOS maintains its own software clock. During switch boot up, the hardware clock is copied to the software clock maintained by PicOS. The software clock is then referenced for anything that requires time keeping. During switch shut down, the software clock is copied back to the hardware clock.

To set the date and time on the software clock, use the **date** command as root.

```
admin@Switch$sudo date --set 2015-12-07
Mon Dec  7 00:00:00 EST 2015
admin@Switch$sudo date --set 13:21:00
Mon Dec  7 13:21:00 EST 2015
```

To display the current date and time, use the **date** command without arguments.

```
admin@Switch$date
Mon Dec  7 13:23:00 EST 2015
```

To set the date and time on the hardware clock, use the **hwclock** command as root.

Boot Diagnosis Report

There is a report to diagnose whether all hardwares are good during switch power on.

Diagnosis content are as below:

1. Version

(1) Show system version

(2) Show ONIE version

(3) Show CPLD version

2. Hardware information

(1) Manage port mac address

(2) System mac address

(3) Board serial number

(4) Board product name

3. PSU

(1) PSU present

(2) PSU power good

(3) PSU serial number (verizon no sn)

4. FAN

(1) FAN fault bit

(2) Fan speed less than 15% error (1200rpm)

5. Temperature

(1) CPU temperature

(2) Switch chip temperature

(3) Board temperature

Warning when environmental temperature more than 60 C!

6. Detect optical module

(1) Detect plugged in

(2) Show vendor name

(3) Show vendor sn

(4) Show optical type (verizon no)

7. RTC

(1) Read time form RTC

(2) Show read time

8. Disk space

(1) Show all disk size

(2) Show PicOS free disk space

(3) Warning when free space Less than 10%

9. Memory size

(1) Total memory size

(2) Free memory size

10. CPU utilization

11. POE module

(1) PoE status

Location of report file

```
admin@XorPlus> start shell sh
admin@XorPlus$vi /var/log/report_diag.log

    Linux System Released Date    : 12/28/2016
    L2/L3 Version/Revision        : 2.7.2S1D/dc2173f
    L2/L3 Released Date           : 12/28/2016
    OVS/OF Version/Revision       : 2.7.2S1D/dc2173f
    OVS/OF Released Date          : 12/28/2016
    ONIE version    : master-201508292125.2.5.4-dirty
    CPLD version    : CPLD version V0.2
Hardware information:
    MAC address : 70:72:CF:FD:8F:20
    Serial number   : AF10029779
```

```
    Product name    : 4610-30P-O-AC-F
PSU:
    PSU 1 status    : present but power off
    PSU 2 status    : present and power on
System FAN:
    Fan 1 fault
Temperature:
    CPU temperature     : 35 C / 95 F
    Switch chip temperature : 35 C / 95 F
    Board temperature   : 35 C / 95 F
Optical modules:
    Port 1 no module
    Port 2 no module
    Port 3 no module
    Port 4 no module
    Port 5 no module
    Port 6 no module
RTC:
    RTC is OK
    Time    : Thu Dec 29 16:43:16 2016  -0.470233 seconds
Disk space:
    /dev/sda    : 7676 MB
    /dev/sda1   : 256 MB
    /dev/sda2   : 1500 MB   (Rootfs)
    /dev/sda3   : 600 MB
    Free size of rootfs partition is 930 MB.
Memory size:
    Total memory    : 2057300 KB
    Free memory : 1826960 KB
CPU utilization: 13.83%
POE module:  OK

```

Auto-Run Script Upon System Boot Up

From PicOS2.9.1, user can add customized scripts which will run automatically upon system boot up.

The script at **/cftmp/auto/pre-nos** will be started when Linux booting is over. The script at **/cftmp/auto/post-xorplus** will be launched when XorPlus is ready. And the script at **/cftmp/auto/post-ovs** will be launched when OVS is ready.

The files **pre-nos/ post-xorplus/ post-ovs** are not existing in directory **/cftmp/auto** defaultly. If user want to run the scripts, they need to create them and make sure they are read and write files.

Example 1:

Run script when Linux booting over.

```
admin@PicOS-OVS$sudo touch /cftmp/auto/pre-nos
admin@PicOS-OVS$sudo chmod 777 /cftmp/auto/pre-nos
admin@PicOS-OVS$sudo vi /cftmp/auto/pre-nos
echo "####################Start add linux scripts####################"
echo "####################Add linux scripts finished####################"

admin@PicOS-OVS$sudo reboot
...
...
[ ok ] Starting enhanced syslogd: rsyslogd.
[ ok ] Starting periodic command scheduler: cron.
[ ok ] Starting OpenBSD Secure Shell server: sshd.
####################Start add linux scripts####################
####################Add linux scripts finished####################
Auto Provisioning Tool - checking updates ....
No tftp server address found, exit now
[ ok ] Stopping enhanced syslogd: rsyslogd.
[ ok ] Starting enhanced syslogd: rsyslogd.
[ ok ] Stopping internet superserver: xinetd.
[ ok ] Restarting OpenBSD Secure Shell server: sshd.
[ ok ] Create Inventory database file.
[ ok ] Starting web server: lighttpd.
[ ok ] Starting network snmp: snmpd.
[....] Starting: Open vSwitch/OpenFlowdevice ovs-pica8 entered promiscuous mode
device br0 entered promiscuous mode
. ok

OVS login:
```

Example 2:

Run script when OVS is ready.

```
admin@PicOS-OVS$sudo touch /cftmp/auto/post-ovs
admin@PicOS-OVS$sudo chmod 777 /cftmp/auto/post-ovs
admin@PicOS-OVS$sudo vi /cftmp/auto/post-ovs
echo "Start add ovs scripts"
ovs-vsctl del-br br0
ovs-vsctl add-br br0
ovs-vsctl add-port br0 te-1/1/1
ovs-vsctl add-port br0 te-1/1/2
ovs-vsctl add-port br0 te-1/1/3
ovs-ofctl add-group br0 group_id=1,type=select,bucket=output:2,bucket=output:3
ovs-ofctl add-meter br0 meter=1,kbps,stats,band=type=drop,rate=10000
ovs-ofctl add-flow br0 in_port=1,actions=meter:1,group:1
echo "Add ovs scripts finished"

admin@PicOS-OVS$sudo systemctl restart picos
```

```
.........................
```

Example 3:

Run script when Xorplus is ready.

```
admin@XorPlus$sudo touch /cftmp/auto/post-xorplus
admin@XorPlus$sudo chmod 777 /cftmp/auto/post-xorplus
admin@XorPlus$sudo vi /cftmp/auto/post-xorplus
echo "Start add xorplus scripts"
/usr/bin/cli -c 'configure;
set interface gigabit-ethernet te-1/1/1 crossflow enable true;
set interface gigabit-ethernet te-1/1/1 crossflow local-control false;
set interface gigabit-ethernet te-1/1/2 crossflow enable true;
set interface gigabit-ethernet te-1/1/2 crossflow local-control false;
set interface gigabit-ethernet te-1/1/3 crossflow enable true;
set xovs enable true;
commit'
ovs-vsctl del-br br0
ovs-vsctl add-br br0
ovs-vsctl add-port br0 te-1/1/1
ovs-vsctl add-port br0 te-1/1/2
ovs-vsctl add-port br0 te-1/1/3 -- set interface te-1/1/3 type=crossflow

```

Sample for Crossflow OVS Remarking Rules with Auto-run Script

NOTE:

Do not use Microsoft txt editors to create your post-ovs file as these include extra formatting which cannot be understood by PICOS. Use only Linux editors.

In the examples below, you can copy and paste these commands to your switch and these commands will create the bridge and add the ports to the bridge. Be sure to change the interface names depending on your specific switch model; as an example ge-1/1/1 or te-1/1/1 etc.

Step1 From the CLI, enable Crossflow and create the ovs-vswitchd.conf.

```
admin@AS5812-54X-SwitchA# set xovs enable true
admin@AS5812-54X-SwitchA# commit
```

Step2 Configure the ports to be Crossflow ports.

```
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/1 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/2 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/3 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/4 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/5 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/6 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/7 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/8 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/9 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/10 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/11 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/12 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/13 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/14 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/15 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/15 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/16 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/17 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/18 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/19 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/20 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/21 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/22 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/23 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/24 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/25 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/26 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/27 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/28 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/29 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/30 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/31 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/32 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/33 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/34 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/35 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/36 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/37 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/38 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/39 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/40 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/41 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/42 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/43 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/44 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/45 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/46 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/47 crossflow enable true
admin@AS5812-54X-SwitchA# set interface gigabit-ethernet te-1/1/48 crossflow enable true
```

Step3 Verify that the ovs-vSwitch DB is present.

```
admin@AS5812-54X-SwitchA# run bash "start shell sh"
admin@AS5812-54X-SwitchA:/$ cd /ovs
admin@AS5812-54X-SwitchA:/ovs$ ls
ovs-vswitchd.conf.db
admin@AS5812-54X-SwitchA:/ovs$ ovs-vsctl show
9c0bd1cb-a65f-4fa1-8c16-4cc045319984
```

Step4 Create a bridge and add interfaces to it:

```
admin@AS5812-54X-SwitchA:/ovs$ ovs-vsctl add-br br0
```

Step5 Add ports to the bridge.

```
ovs-vsctl add-port br0 te-1/1/1 -- set interface te-1/1/1 type=crossflow
ovs-vsctl add-port br0 te-1/1/2 -- set interface te-1/1/2 type=crossflow
ovs-vsctl add-port br0 te-1/1/3 -- set interface te-1/1/3 type=crossflow
ovs-vsctl add-port br0 te-1/1/4 -- set interface te-1/1/4 type=crossflow
ovs-vsctl add-port br0 te-1/1/5 -- set interface te-1/1/5 type=crossflow
ovs-vsctl add-port br0 te-1/1/6 -- set interface te-1/1/6 type=crossflow
ovs-vsctl add-port br0 te-1/1/7 -- set interface te-1/1/7 type=crossflow
ovs-vsctl add-port br0 te-1/1/8 -- set interface te-1/1/8 type=crossflow
ovs-vsctl add-port br0 te-1/1/9 -- set interface te-1/1/9 type=crossflow
ovs-vsctl add-port br0 te-1/1/10 -- set interface te-1/1/10 type=crossflow
ovs-vsctl add-port br0 te-1/1/11 -- set interface te-1/1/11 type=crossflow
ovs-vsctl add-port br0 te-1/1/12 -- set interface te-1/1/12 type=crossflow
ovs-vsctl add-port br0 te-1/1/13 -- set interface te-1/1/13 type=crossflow
ovs-vsctl add-port br0 te-1/1/14 -- set interface te-1/1/14 type=crossflow
ovs-vsctl add-port br0 te-1/1/15 -- set interface te-1/1/15 type=crossflow
ovs-vsctl add-port br0 te-1/1/16 -- set interface te-1/1/16 type=crossflow
ovs-vsctl add-port br0 te-1/1/17 -- set interface te-1/1/17 type=crossflow
ovs-vsctl add-port br0 te-1/1/18 -- set interface te-1/1/18 type=crossflow
ovs-vsctl add-port br0 te-1/1/19 -- set interface te-1/1/19 type=crossflow
ovs-vsctl add-port br0 te-1/1/20 -- set interface te-1/1/20 type=crossflow
ovs-vsctl add-port br0 te-1/1/21 -- set interface te-1/1/21 type=crossflow
ovs-vsctl add-port br0 te-1/1/22 -- set interface te-1/1/22 type=crossflow
ovs-vsctl add-port br0 te-1/1/23 -- set interface te-1/1/23 type=crossflow
ovs-vsctl add-port br0 te-1/1/24 -- set interface te-1/1/24 type=crossflow
ovs-vsctl add-port br0 te-1/1/25 -- set interface te-1/1/25 type=crossflow
ovs-vsctl add-port br0 te-1/1/26 -- set interface te-1/1/26 type=crossflow
ovs-vsctl add-port br0 te-1/1/27 -- set interface te-1/1/27 type=crossflow
ovs-vsctl add-port br0 te-1/1/28 -- set interface te-1/1/28 type=crossflow
ovs-vsctl add-port br0 te-1/1/29 -- set interface te-1/1/29 type=crossflow
ovs-vsctl add-port br0 te-1/1/30 -- set interface te-1/1/30 type=crossflow
ovs-vsctl add-port br0 te-1/1/31 -- set interface te-1/1/31 type=crossflow
ovs-vsctl add-port br0 te-1/1/32 -- set interface te-1/1/32 type=crossflow
ovs-vsctl add-port br0 te-1/1/33 -- set interface te-1/1/33 type=crossflow
ovs-vsctl add-port br0 te-1/1/34 -- set interface te-1/1/34 type=crossflow
ovs-vsctl add-port br0 te-1/1/35 -- set interface te-1/1/35 type=crossflow
ovs-vsctl add-port br0 te-1/1/36 -- set interface te-1/1/36 type=crossflow
ovs-vsctl add-port br0 te-1/1/37 -- set interface te-1/1/37 type=crossflow
ovs-vsctl add-port br0 te-1/1/38 -- set interface te-1/1/38 type=crossflow
ovs-vsctl add-port br0 te-1/1/39 -- set interface te-1/1/39 type=crossflow
ovs-vsctl add-port br0 te-1/1/40 -- set interface te-1/1/40 type=crossflow
ovs-vsctl add-port br0 te-1/1/41 -- set interface te-1/1/41 type=crossflow
ovs-vsctl add-port br0 te-1/1/42 -- set interface te-1/1/42 type=crossflow
ovs-vsctl add-port br0 te-1/1/43 -- set interface te-1/1/43 type=crossflow
ovs-vsctl add-port br0 te-1/1/44 -- set interface te-1/1/44 type=crossflow
ovs-vsctl add-port br0 te-1/1/45 -- set interface te-1/1/45 type=crossflow
ovs-vsctl add-port br0 te-1/1/46 -- set interface te-1/1/46 type=crossflow
ovs-vsctl add-port br0 te-1/1/47 -- set interface te-1/1/47 type=crossflow
ovs-vsctl add-port br0 te-1/1/48 -- set interface te-1/1/48 type=crossflow
```

Step6 Create a bond to treat all access interfaces as same:

```
ovs-vsctl add-port br0 bond1 -- set interface bond1 type=pica8_bond
ovs-vsctl set interface bond1 options:members=te-1/1/1,te-1/1/2,te-1/1/3,te-1/1/4,te-1/1/5,te-1/1/6,te-1/1/7,te-1/
```

Step7 Set OVS to be able to match the VLAN number.

```
ovs-vsctl set-option-match-vlan-type true > /dev/null
```

Step8 Reboot the switch.

```
admin@AS5812-54X-SwitchA$sudo systemctl restart picos
```

NOTE:

- We must reboot the switch to leverage the above feature.
- When using OF rules to direct traffic and remark the DSCP values, bridge and interfaces must already be configured and found within the OVS vSwitchd database as shown be. This configuration of bridges and interfaces only has to be done once. These configurations are automatically saved to the vSwitch database.

Step9 The attached file test-flows.txt which will be the new post-ovs after you edit it and copy it to the /cftmp/auto directory and rename it to post-ovs. You need to change the mode to executable via the following command.

```
admin@AS5812-54X-SwitchA$sudo chmod 777 /cftmp/auto/post-ovs
```

test-flows.txt :

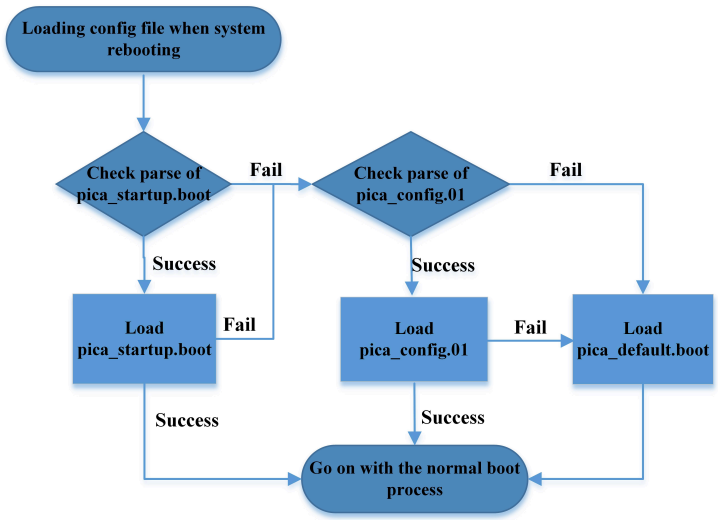
Graceful Bootup with Backup Configuration

When the system's configuration file ***pica_startup.boot*** is damaged due to incorrect configuration, the system will fail to startup. PICA8 provides a feature of Graceful Bootup with Backup Configuration to solve this problem. It ensures the device boots up properly and with the backup configuration file *pica.conf* when startup configuration file ***pica_startup.boot*** is damaged due to incorrect configuration.

pica.conf is a backup of the ***pica_startup.boot*** file which is saved in directory */pica/config*. When the user commits a configuration successfully, the system automatically saves the configuration to the ***pica_startup.boot*** file and synchronizes the configuration to the ***pica.conf*** file. In the event of an upgrade, the upgraded system will retain the previous ***pica_startup.boot***, and the ***pica.conf*** file is a copy of ***pica_startup.boot*** file. But in the case of newly installed image, the system will not have the **pica_startup.boot**, and the ***pica.conf*** file is a copy of ***pica_default.boot*** file. The boot process is further explained below.

Process of Loading Configuration File

Figure 1 Process of loading configuration file when system rebooting



As shown in **Figure 1**, the process of loading configuration file when system rebooting is as follows:

1. The system starts loading the configuration file by parsing the ***pica_startup.boot*** file to the syntax.
   - If the result of the check is success, system will load ***pica_startup.boot*** file, go to step 2.
   - If the result of the check is fail, that is, the ***pica_startup.boot*** file is damaged, the system will check the syntax of ***pica.conf***, and a syslog message is provided, go to step 3.
2. Load ***pica_startup.boot*** file.
   - If load ***pica_startup.boot*** file successfully, it will go on with the normal boot process.
   - If failed to load ***pica_startup.boot*** file, the system will check the syntax of ***pica.conf***, and a syslog message is provided, go to step 3.
3. Check the syntax of ***pica.conf*** file.
   - If the result of the check is success, the system will load ***pica.conf*** file, go to step 4.
   - If the result of the check is fail, that is, the ***pica.conf*** file is damaged, the system will load ***pica_default.boot*** file, and a syslog message is provided, go to step 5.
4. Load ***pica.conf*** file.
   - If load ***pica.conf***file successfully, it will go on with the normal boot process.
   - If failed to load ***pica.conf*** file, the system will load ***pica_default.boot*** file, and a syslog message is provided, go to step 5.
5. Load ***pica_default.boot*** file in directory */pica/etc/platform_name (*For example, on AS5712_54X, **pica_default.boot** file is in the */pica/etc/as5712_54x* directory*)*, and go on with the normal boot process.

IP Rule of Management Network and Service Network

- Introduction
  - Usage of IP Rule
  - Policy Routing Rules
- Example

Introduction

IP rule is a policy routing function of Linux systems. Compared with the classic routing algorithms used on the internet that make routing decisions based only on the destination address of packets, IP rule is more flexible which can support more filter attributes for route forwarding. IP rule can select routes by executing some set of policy routing rules and could set priorities of the rules.

Usage of IP Rule

```
Usage: ip rule [ list | add | del ] SELECTOR ACTION
SELECTOR := [ from PREFIX ] [ to PREFIX ] [ tos TOS ][ dev STRING ] [ pref NUMBER ]
ACTION := [ table TABLE_ID ] [ nat ADDRESS ][ prohibit | reject | unreachable ]
                [ flowid CLASSID ]
TABLE_ID := [ local | main | default | new | NUMBER ]
```

IP rule supports configuring **SELECTOR** of the following attributes for choosing a forwarding path:

From - source address

To - destination address (here we can choose the rules, also used to search the routing entry)

Tos - TOS (type of sevice) field in IP header

Dev - physical interface

Fwmark - firewall parameters

IP rule supports configuring the **ACTION** on how to process the packets if the rule selector matches:

Table - the routing table identifier to lookup if the rule selector matches

Nat - translate the source address of the IP packet into some other value

Prohibit - drop the packets and generate a 'Communication is administratively prohibited' error
Reject - drop the packets

Unreachable - drop the packets and generate a 'Network is unreachable' error

Policy Routing Rules

Linux supports up to 255 routing tables, each routing table has its own table name and table ID. IP rule action defines tables to lookup if the rule selector matches. IP rule also defines the priority parameter which indicates the priority of this rule. Higher number means lower priority, and rules get processed in order of increasing number. Each rule should have an explicitly set unique priority value.

When executing **ip rule** command on Linux shell, we can find all the IP rules of the current system.

```
admin@Xorplus$ip rule
1000:  from all lookup [l3mdev-table]
1500:  from all lookup local
2000:  from 10.10.51.142 lookup main
2001:  from all to 10.10.51.142/24 lookup main
2010:  from all lookup 252
32766: from all lookup main
32767:  from all lookup default
```

By default, the kernel has three rules setting:

- Priority: 1500, Selector: match anything, Action: lookup routing table **local** (ID 255). The local table is a special routing table containing high priority control routes for local and broadcast addresses.
- Priority: 32766, Selector: match anything, Action: lookup routing table **main** (ID 254). The main table is the normal routing table containing all non-policy routes and all the management network routes.
- Priority: 32767, Selector: match anything, Action: lookup routing table **default** (ID 253). The default table is empty. It is reserved for some post-processing if no previous default rules selected the packet.

On the basis of the default rules, PICOS adds three new rules before the rule with priority 32766.

- Priority: 1000, Selector: match anything, Action: lookup routing table **l3mdev-table**. The **l3mdev-table** is a VRF associated routing table.

- Priority: 2000, Selector: match packets from all source to destination address of **eth0_subnet**, Action: lookup routing table main (ID 254). The **eth0_subnet** represents the subnet address of eth0 interface, for example, if the IP address of eth0 interface is 10.10.51.195, then eth0_subnet will be 10.10.51.195/24.
- Priority: 2001, Selector: match from source address of packets **eth0_address**, Action: lookup routing table **main** (ID 254). The **eth0_address** represents the IP address of eth0 interface, for example, 10.10.51.195.
- Priority: 2010, Selector: match anything, Action: lookup routing table **252** (ID 252, both table name and table ID are 252). The **252** table contains all the IPv4 service network routes.

NOTE:

- If data packets match the routes in both 252 table and main table, the routing table entries in 252 table are used preferentially for route forwarding as the priority of 252 table is higher than the main table.
- 252 table only supports IPv4 routing entries, IPv6 routing entries are still in the main table.

Example

Here is an example explaining how IP rule works on management network routes and service network routes.

1. Configure IP addresses for service port and eth0 management port.

   #Configure the IP address for service port.

```
admin@Xorplus# set vlans vlan-id 3
admin@Xorplus# set interface gigabit-ethernet te-1/1/2 family ethernet-switching native-vlan-id 3
admin@Xorplus# set l3-interface vlan-interface vlan-3 address 192.168.2.1 prefix-length 24
admin@Xorplus# set vlans vlan-id 3 l3-interface vlan-3
admin@Xorplus# commit
Commit OK.
Save done.
```

   #Assign an IP address to the eth0 management port by default method of DHCP. Use **ifconfig eth0** command to find the IP address of eth0.

```
admin@Xorplus$ifconfig eth0
eth0      Link encap:Ethernet  HWaddr 00:18:23:30:dd:52
          inet addr:10.10.51.142  Bcast:10.10.51.255  Mask:255.255.255.0
          UP BROADCAST RUNNING MULTICAST  MTU:1500  Metric:1
          RX packets:6866 errors:0 dropped:0 overruns:0 frame:0
          TX packets:1622 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0 txqueuelen:1000
          RX bytes:889873 (869.0 KiB)  TX bytes:200121 (195.4 KiB)
```

2. Configure the next hop of 10.10.20.0/24 as the IP address of the service network segment.

```
admin@Xorplus# set protocols static route 10.10.20.0/24 next-hop 192.168.2.5
admin@Xorplus# commit
Commit OK.
Save done.
```

Check the routing table. The above routing entry is only in 252 table and not in the main table because the next hop is the IP address of the service network segment.

```
admin@Xorplus# run show route ipv4
IPv4 Routing table: 3 routes
10.10.20.0/24      [static(1)/1]
                   > to 192.168.2.5 via vlan-3/vlan-3
192.168.2.1/32     [local(0)/0]
                   > via vlan-3/vlan-3
192.168.2.0/24     [connected(0)/0]
                   > via vlan-3/vlan-3
Codes: K - kernel route, C - connected, S - static, R - RIP,
       O - OSPF, I - IS-IS, B - BGP, E - EIGRP, N - NHRP,
       T - Table, v - VNC, V - VNC-Direct, A - Babel, D - SHARP,
       F - PBR, f - OpenFabric,
       > - selected route, * - FIB route, q - queued route, r - rejected route

C>* 10.10.51.0/24 is directly connected, eth0, 01:33:30
S>* 10.10.20.0/24 [1/0] via 192.168.2.5, vlan3, weight 1, 01:05:18
C>* 192.168.2.0/24 is directly connected, vlan3, 01:05:18
admin@Xorplus# quit
admin@Xorplus> quit
```

```
admin@Xorplus$ip route list table 252
10.10.20.0/24 via 192.168.2.5 dev vlan.3  proto xorp  metric 1
192.168.2.0/24 via 192.168.2.1 dev vlan.3  proto xorp

root@Xorplus$ip route list table main
default via 10.10.51.1 dev eth0
10.10.51.0/24 dev eth0  proto kernel  scope link  src 10.10.51.142
192.168.2.0/24 dev vlan.3  proto kernel  scope link  src 192.168.2.1
```

3. Configure next hop of default route as IP address of the management network gateway.

> **NOTE:**
>
> The management port does not support the configuration of network segment routing, you can only configure the default route.

```
admin@Xorplus# set protocols static route 0.0.0.0/0 next-hop 10.10.51.1
admin@Xorplus# commit
Commit OK.
Save done.
```

Check the routing table. The above routing entry is only in main table and not in 252 table because the next hop is the IP address of the management network segment.

```
admin@Xorplus$ip route list table main
default via 10.10.51.1 dev eth0
10.10.51.0/24 dev eth0  proto kernel  scope link  src 10.10.51.142
192.168.2.0/24 dev vlan.3  proto kernel  scope link  src 192.168.2.1

admin@Xorplus$ip route list table 252
10.10.20.0/24 via 192.168.2.5 dev vlan.3  proto xorp  metric 1
192.168.2.0/24 via 192.168.2.1 dev vlan.3  proto xorp
```

4. Configure the next hop of default route as the IP address of the service network segment.

```
admin@Xorplus# set protocols static route 0.0.0.0/0 next-hop 192.168.2.88
admin@Xorplus# commit
Commit OK.
Save done.
admin@Xorplus# quit
admin@Xorplus> quit
```

Check the routing table. The above routing entry is only in 252 table and not in main table because the next hop is the IP address of the service network segment.

```
admin@Xorplus$ip route list table 252
default via 192.168.2.88 dev vlan.3  proto xorp  metric 1
10.10.20.0/24 via 192.168.2.5 dev vlan.3  proto xorp  metric 1
192.168.2.0/24 via 192.168.2.1 dev vlan.3  proto xorp

admin@Xorplus$ip route list table main
default via 10.10.51.1 dev eth0
10.10.51.0/24 dev eth0  proto kernel  scope link  src 10.10.51.142
192.168.2.0/24 dev vlan.3  proto kernel  scope link  src 192.168.2.1
```

There are default routing entries in both 252 table and main table, the default routing entry in the main table is automatically generated by the system when assigning the IP address by DHCP. When the packet matches no routing entry in the routing table, it will then match the default routing entry. In this case, the default routing entry in 252 table is used preferentially for route forwarding as the priority of 252 table is higher than the main table.

5. If the source IP address carried in a packet is empty and the packet matches no routing entry in the routing table, the default route in the 252 table and the service port is used for packet forwarding.

#For example, ping 10.10.50.22 without source IP.

```
admin@Xorplus$ping 10.10.50.22
PING 10.10.50.22 (10.10.50.22) 56(84) bytes of data.
From 192.168.2.1 icmp_seq=1 Destination Host Unreachable
From 192.168.2.1 icmp_seq=2 Destination Host Unreachable
^C
--- 10.10.50.22 ping statistics ---
```

```
9 packets transmitted, 0 received, +8 errors, 100% packet loss, time 8003ms
pipe 4
```

When the source address carried in a packet is the IP address of the eth0 management interface, the packet will match the IP rule: "*2000: from 10.10.51.142 lookup main*". For example, ping 10.10.50.22 with source IP 10.10.51.142.

```
admin@Xorplus$ping -I 10.10.51.142 10.10.50.22
PING 10.10.50.22 (10.10.50.22) from 10.10.51.142 : 56(84) bytes of data.
64 bytes from 10.10.50.22: icmp_req=1 ttl=63 time=0.183 ms
64 bytes from 10.10.50.22: icmp_req=2 ttl=63 time=0.153 ms
^C
--- 10.10.50.22 ping statistics ---
11 packets transmitted, 11 received, 0% packet loss, time 9999ms
rtt min/avg/max/mdev = 0.139/0.151/0.183/0.014 ms
```

Display System EEPROM Data Block

The system EEPROM data block information is saved in the directory: /sys/class/swmon/hwinfo/onie_syseeprom. The following example shows how to view the system EEPROM data block.

```
root@XorPlus$cat /sys/class/swmon/hwinfo/onie_syseeprom
Product Name: S4048ON
 Part Number: 099TJK
Serial Number: CN099TJK282985640054
Base MAC Address: 34:17:EB:FA:90:C4
Manufacture Date: 06/08/2015 20:36:30
Device Version: 06/08/2015 20:36:30
Label Revision: A00
Platform Name: x86_64-dell_s4000_c2338-r0
Loader Version: 3.21.1.1
MAC Addresses: 256
Manufacturer: 28298
Country Code: CN
Vendor Name: CN
Diag Version: CN
Service Tag: FX4PX42
Vendor Extension:  0x36 0x37 0x34 0x2D 0x46 0x46
```

Manual File Backup

NOTE:

Only FS S5810 Series, S3410 Series and S5860 Series switches need to do manual file backup.

FS S5810 Series, S3410 Series and S5860 Series switches use the OverlayFS file system which doesn't allow the user files on the switch to be saved from the RAM to the flash automatically. This results in the loss of user files when the switch is powered off. The user can add the file path (the file that you want to be saved even after power off) to the backup list, in */mnt/open/picos/backup_files* file, and then run the **save_config** command. With this technique, the user files on the backup list are backed up to the flash ensuring that the user files are not lost when the power is turned off.

PICOS has built-in default backup files, as listed below.

```
root@Xorplus$ cat /etc/picos/backup_files.lst
 /etc/passwd
 /etc/shadow
 /etc/group
 /etc/gshadow
 /etc/resolv.conf
 /etc/picos/picos_start.conf
 /etc/picos/switch-public.key
 /etc/picos/pica.lic
 /pica/config/pica_startup.boot
 /pica/config/pica.conf.01
 /pica/config/pica.conf.02
 /pica/config/pica.conf.03
 /pica/config/pica.conf.04
 /pica/config/pica.conf.05
 /ovs/ovs-vswitchd.conf.db
 /ovs/function.conf.db
 /ovs/config/meters
 /ovs/config/groups
 /ovs/config/flows
 /ovs/var/lib/openvswitch/pki/
 /var/log/report_diag.log
 /var/log/report_diag.log.1
 /var/log/report_diag.log.2
 /var/log/report_diag.log.3
 /var/log/report_diag.log.4
 /var/log/report_diag.log.5
/cftmp/upgrade.log
/cftmp/upgrade2.log
```

Warning:
If the user operation makes change to the above files, you need to manually run the configuration saving command to save these files from the RAM to the flash. For details, please refer to Configuration Saving Guide and copy running-config startup-config.

If you want to save a user files that are not in the above default backup file list, you can follow the backup operation steps described below.

Step1 Add the file path (the file that you want to be saved even after power off) to the backup list, in */mnt/open/picos/backup_files* file.

For example, if you want to backup **/home/admin/a.txt**, then add **/home/admin/a.txt** to the backup file list:

```
root@Xorplus$ cat /etc/picos/user_backup_files.lst
/home/admin/a.txt
```

Step2 Under Linux bash, issue the following command manually to begin file backup.

```
root@Xorplus$ save_config
```

After the above two steps, the user file **/home/admin/a.txt** will be backed up to the flash. This file will not be lost when the power is turned off.

PICOS Monitor

The PICOS Monitor process is a daemon service managed by systemd, it starts before PICOS, and is responsible for the following functions.

- **Monitor PICOS Process**

Restart PICOS if any key process crashs. If restart cannot recover the system, the system will be rebooted.

When a system failure happens, the system LED will enter the warning state.

- **Backup and Restore the Monitored Files**

Backup and restore the monitored files when the system starts up again from a power down. Monitored files are mainly the configurations that could have under updation when a power cycle happened. User application files can be protected as well.

- **Monitor CPU Usage Rate**

Generate a log message if the CPU rate is higher than maximum threshold and stays there for some time period. A log message will be recorded when the CPU usage recovers to the normal rate.

- **Monitor the Memory Usage of PICOS and User Applications**

The memory usage monitored is the physical memory used, not including any system cache of file system.

- **Monitor Disk Usage**

Monitor disk usage, including free space of rootfs, tmpfs, ramdisk and user data partition.

- **Take Care of Watchdog**

PICOS Monitor initializes and feeds the watchdog register to make sure monitor itself is alive. If monitor process fails, the watchdog will trigger to reset the whole system and load the system again.

View Monitor Log

Log messages generated during Monitor process can be found at any of the following two paths. The log entries will have the keyword **[PICOS_MONITOR]**.

```
admin@Xorplus:~$ sudo journalctl /pica/bin/system/tools/picos_monitor/monitor
-- Journal begins at Thu 2022-06-09 14:56:49 UTC, ends at Thu 2022-06-09 16:00:06 UTC. --

admin@Xorplus:~$ tail -f /tmp/log/messages
Jan 17 2022 14:17:44 57switch  local0.info : [PICA_LIB_COMMON]Card batch set port state(2) successfully.
Jan 17 2022 14:17:48 57switch ntpd daemon.info : kernel reports TIME_ERROR: 0x41: Clock Unsynchronized
Jan 17 2022 14:25:01 57switch su auth.notice : (to www-data) root on none
```

Monitor Process Management

We can use **systemctl status picos-monitor** command to check the status of monitor process, where ”Active: ” could be active or inactive, indicating the status of monitor process.

```
admin@Xorplus:~$ sudo systemctl status picos-monitor
 * picos-monitor.service - Picos Monitor
    Loaded: loaded (/lib/systemd/system/picos-monitor.service; enabled)
    Active: active (exited) since Mon 2001-01-08 18:43:02 UTC; 4h 40min ago
   Process: 648 ExecStart=/etc/init.d/picos_monitor start (code=exited, status=0/SUCCESS)
  Main PID: 648 (code=exited, status=0/SUCCESS)
    CGroup: /system.slice/picos-monitor.service
```

The following commands can be used to start/stop picos-monitor process.

```
admin@Xorplus:~$ sudo systemctl stop picos-monitor
admin@Xorplus:~$ sudo systemctl start picos-monitor
```

Enable Web-based Management Interface

> **NOTE:**
>
> When the RESTCONF is enabled, it occupies ports 80 and 443 by default. Since picos-web service also uses these default ports, it may fail to function properly. To use picos-web service on switches with RESTCONF enabled, you must configure picos-web service to use a custom port.

Overview

This feature provides control over the device's web-based management interface via HTTP/HTTPS, allowing administrators to enable or disable web access for enhanced security or preferred management style.

The command **set system services web disable <true | false>** can be used to enable or disable the web service on the system:

- Setting **true** disables the web service, blocking access to the device's web-based management interface. This is often done to enhance security by reducing access points to the system, particularly when the web interface is not needed.
- Setting **false** enables the web service, allowing access to the device's management interface via a web browser (HTTP/HTTPS). This option may be useful in environments where web-based management is the preferred method.

Disabling the web service reduces the number of access points, which is often recommended in high-security environments to minimize potential attack surfaces. In environments where CLI management (e.g., SSH) is preferred over web-based interfaces, this command helps ensure that only authorized access methods are available. This command provides administrators with flexibility in managing access to the device's web interface, helping to align with specific network security policies or management preferences.

Supported Platforms

Not all devices support this command; only platforms that support the PICOS web configuration interface can apply this configuration. For specific compatibility details, please refer to PICOS-WEB_User_Configuration_Manual .

Among the platforms supporting the PICOS web configuration interface, the default settings for web access may vary:

- **ARM models**: Web access is enabled by default.
- **X86 models**: Web access is disabled by default.

The device model (ARM or X86) can be identified using the Linux command:

```
admin@PICOS:~$ uname -m
armv7l
admin@leaf04:~$ uname -m
x86_64
```

Linux command: ssh/scp/ping/traceroute/apt-get/telnet

If management VRF is enabled, and you want to find the next-hop route in management VRF when running the commands **traceroute/SCP/ping/apt get/SSH** at Linux prompt, that is, using Eth0/1 management interface as the route interface, you have to add **ip vrf exec mgmt-vrf** before the commands.

The example format of these commands is shown below:

sudo ip vrf exec <**mgmt-vrf|***vrf-name*> **traceroute** 10.10.51.11

sudo ip vrf exec <**mgmt-vrf|***vrf-name*> **scp** admin@10.10.51.18:/home/Pica8.pm

sudo ip vrf exec <mgmt-vrf|*vrf-name***> ping** 10.10.51.1

sudo ip vrf exec <mgmt-vrf|*vrf-name*> **apt-get update**

sudo ip vrf exec <mgmt-vrf|*vrf-name*> **ssh** <*ip-address*>

sudo ip vrf exec <mgmt-vrf|*vrf-name*> **telnet** {<*ip-address*>|<*host-name*>} [<*port-number*>]

ip vrf exec <**mgmt-vrf|***vrf-name*> is added to specify which VRF to run the command in. If not specified, find the next hop routing information from the default VRF.

For example,

- The following command traceroutes the gateways for the host with the IP address 10.10.50.33 in default VRF.

```
admin@PICOS:~$ sudo traceroute 10.10.51.33
traceroute to 10.10.51.33 (10.10.51.33), 30 hops max, 60 byte packets
 1  10.10.51.57 (10.10.51.57)  3060.699 ms !H  3060.613 ms !H  3060.588 ms !H
```

- The following command checks whether the host at 10.10.51.1 is reachable in default VRF.

```
admin@PICOS:~$ sudo ping 10.10.51.1
PING 10.10.51.1 (10.10.51.1) 56(84) bytes of data.
64 bytes from 10.10.51.1: icmp_seq=1 ttl=64 time=1.94 ms
64 bytes from 10.10.51.1: icmp_seq=2 ttl=64 time=2.03 ms
64 bytes from 10.10.51.1: icmp_seq=3 ttl=64 time=2.00 ms
64 bytes from 10.10.51.1: icmp_seq=4 ttl=64 time=146 ms
64 bytes from 10.10.51.1: icmp_seq=5 ttl=64 time=2.01 ms

--- 10.10.51.1 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 4003ms
rtt min/avg/max/mdev = 1.943/30.832/146.173/57.670 ms
```

- The following command checks whether the host at 10.10.51.205 is reachable in management VRF.

```
admin@PICOS:~$ sudo ip vrf exec mgmt-vrf ping 10.10.51.205
PING 10.10.51.205 (10.10.51.205) 56(84) bytes of data.
64 bytes from 10.10.51.205: icmp_seq=1 ttl=255 time=0.746 ms
64 bytes from 10.10.51.205: icmp_seq=2 ttl=255 time=1.17 ms
64 bytes from 10.10.51.205: icmp_seq=3 ttl=255 time=1.72 ms
64 bytes from 10.10.51.205: icmp_seq=4 ttl=255 time=1.36 ms
^C
--- 10.10.51.205 ping statistics ---
4 packets transmitted, 4 received, 0% packet loss, time 3044ms
rtt min/avg/max/mdev = 0.746/1.249/1.722/0.352 ms
```

- The following command connects to 10.10.51.205 in management VRF using the default Telnet port (23).

```
admin@PICOS:~$ sudo ip vrf exec mgmt-vrf telnet 10.10.51.205
Trying 10.10.51.205...
Connected to 10.10.51.205.
Escape character is '^]'.

PICOS Open vSwitch Configuration Guide

The OpenFlow protocol is driven by ONF (Open Networking Foundation), a leader in software-defined networking (SDN). The OpenFlow protocol encompasses three essential components of an SDN framework:

1. A physical OpenFlow switch.
2. A virtual OpenFlow switch to manage virtual machines.
3. An OpenFlow controller, to organize all network pieces.

> **Warning:**
> On FS S5810 Series and S5860 Series switches, run "save_config" command when set OVS commands. Otherwise, the OVS configuration will be lost after PicOS reboot. For detail, please refer to Configuration Saving Guide.

> The Pica8 PicOS software supports features in OpenFlow 1.0 / OpenFlow 1.1 / OpenFlow1.2 / OpenFlow 1.3.x and OpenFlow 1.4. The details of feature supports in OpenFlow1.3.0 and OpenFlow 1.4.0 please see PicOS Support for OpenFlow 1.3.0 and PicOS Support for OpenFlow 1.4.0.

The following websites provide detailed information on Open vSwitch and the OpenFlow protocol.

- **Open vSwitch:** http://openvswitch.org
- **OpenFlow:** http://www.opennetworking.org/sdn-resources/openflow

PicOS can run in two different modes:

- **OVS (Open vSwitch) mode:** In this mode, PicOS is dedicated and optimized for Openflow applications.
- **L2/L3 (Layer 2/Layer 3) mode:** In this mode, PicOS can run switching and routing protocols, as well as OpenFlow applications

In OVS mode, L2/L3 daemons are not running; the system is fully dedicated to Openflow and OVS.

In L2/L3 mode, L2/L3 daemons are running, but OVS can also be activated if Crossflow Mode Introduction is activated.

This chapter assumes that the PicOS OVS mode is active. Please see PICOS Mode Selection to modify the PicOS mode.

OpenFlow Support Matrix

- PicOS Support for OpenFlow 1.4
- PicOS Support for OpenFlow 1.4.0
- PicOS Support for OpenFlow 1.3.0
- PicOS Support for OpenFlow 1.3

Introduction to Open vSwitch

Introduction to OpenFlow

OVS Web User Interface

- Login Interface
- Monitoring the Switch
- Adding a Bridge
- Add a Port
- Add GRE Port
- Add Group Table
- Add or Edit a Controller
- Edit Flow Tables
- Edit Lag Interface

Configuring Open vSwitch

- Basic Configuration in OVS Mode
- Configuring sFlow v5
- Configuring Port Mirroring
- OVSDB file
- OVS LLDP
- Enabling Radius in PicOS OVS Mode
- Inventory Database
- Broadcom Chip Limitation in OVS
- OVS CLI Enhancements
- Configuring Meter
- Configuration saving
- Configuring Buffer management
- Configuring snmp
- Configuring/Enabling SNMPv3

- Configuring QoS
- Configuring Flow Table
- Configuring Group
- Configuring Controller or Manager
- Configuring Counter
- Switching Open vSwitch version
- Configuring rate limit
- Configuring IPv4/IPv6 address for management port
- Configuring the Duplex Mode of Optical Port
- Configuring Port Speed on AS9716-32D and N9550-32D

Examples and Topologies

- GRE Tunnel
- Multiple Virtual Bridges
- SSL Connection to Controller
- ECMP
- 802.1Q VLAN
- MPLS Network

PICOS OpenFlow Tutorials

- Basic Bridge Configuration
- Basic Flow Configurations
- Connection to a RYU Controller
- Connection to OpenDaylight Controller
- Connection to a Floodlight Controller
- Configuration Guide for Atrium Stack on ONOS Controller

Feature Supported in PicOS OVS

- Feature supported in different platform
- Match fields supported

OpenFlow Support Matrix

- PicOS Support for OpenFlow 1.3
- PicOS Support for OpenFlow 1.3.0
- PicOS Support for OpenFlow 1.4
- PicOS Support for OpenFlow 1.4.0

PicOS Support for OpenFlow 1.3

The following table contains OpenFlow 1.3 features supported by PicOS. For clarity, the feature names in this table are identical to the feature names found in OpenFlow Switch Specification Version 1.3.0.

Table 1 OpenFlow 1.3 Features Supported by PicOS

OpenFlow V1.3 Section #	Title	Features	Additional Feature Specification	R2.0OVS	R2.0XF TCAM	R2.1OVS	R2.1XF TCAM	R2.0 Limitation
1	Introduction	NA						
2	Switch Components	Flow tables		Y	Y	Y	Y	
		Group table		Y	N	Y	Y	Select & fast Fail over are not supported
3	Glossary							
4	OpenFlow Ports	See Section 4.3 - 4.5		Y	Y	Y	Y	
4.1	OpenFlow Ports	See Section 4.3 - 4.5		Y	Y	Y	Y	
4.2	Standard Ports	See Section 4.3 - 4.5		Y	Y	Y	Y	
4.3	Physical Ports	Ingress	OpenFlow packets are received on an ingress port, processed by the OpenFlow pipeline. The packet ingress port is a property of the packet throughout the OpenFlow pipeline and represents the OpenFlow port on which the packet was received into the OpenFlow switch	Y	Y	Y	Y	
		Output	The OpenFlow pipeline can decide to send the packet on an output port using the output action (see 5.9), which defines how the packets goes back to the network	Y	Y	Y	Y	
		Groups		Y	Y	Y	Y	
		Hardware interface		N	N	N	N	
		Virtual slicing of hardware interface		Y	Y	Y	Y	
4.4	Logical Ports	Logical ports are switch defined ports that don't correspond directly to a hardware interface of the switch	Logical ports are higher level abstractions that may be defined in the switch using non-OpenFlow methods					
			LAG	Y	N	Y	Y	
			Tunnels	Y	N	Y	N	
			Loopback interface	N	N	N	N	
		Ingress		Y	Y	Y	Y	
		Output		Y	Y	Y	Y	
		Groups		Y		Y	Y	
		Map to various physical port		N	N	N	N	
		PACKET_IN reports logical port and its underlying physical port (GRE & LAG)		N	N	N	N	only logical port
4.5	Local Reserved Port	Ingress		N	N	N	N	
		Output		Y	Y	Y	Y	
		Groups		Y	N	Y	Y	
		ALL	Only as an output port	Y	Y	Y	Y	
		CONTROLLER	Represent the control channel with the OpenFlow controller	Y	Y	Y	Y	
		TABLE	Represent the start of the OpenFlow pipeline	Y	Y	Y	Y	
		IN_PORT	Used only as an output port, send the packet out its ingress port	N	N	N	N	
		ANY	Cannot be used as an ingress port nor as an output port	Y	Y	Y	Y	

		LOCAL	Represent the switch's local networking stack. Can be used as an ingress port or as an output port	Y	Y	Y	Y	Linux networking stack
			The local port enables remote entities to interact with the switch via the OpenFlow network, rather than via a separate control network. it can be used to implement an in-band controller connection					
		NORMAL	Non-OpenFlow pipelineused only as an output port	N	N	N	Y	
		FLOOD	Flooding using the normal pipeline of the switch, used only as an output port	Y	Y	Y	Y	
			Packet out all standard ports	Y	Y	Y	Y	
			But not to the ingress port or ports that are in OFPPS_BLOCKED state	Y	Y	Y	Y	
5	OpenFlow Tables							
5.1	Pipeline Processing	OpenFlow-only	All packets are processed by the OpenFlow pipeline	Y	N	Y	Y	Software Implementation for ARP match/action, multiple tables
		OpenFlow-hybrid	OpenFlow operation and normal Ethernet switching operation	N	N	N	Y	
			VLAN tag to decide whether to process the packet using which pipeline	N	N	N	N	Port based since R2.0
			Input port to decide whether to process the packet using which pipeline	N	N	N	N	
			Allow a packet to go from the OpenFlow pipeline to the normal pipeline through the NORMAL and FLOOD reserved ports	N	Y	N	Y	
		Multiple flow tables		Y	N	Y	Y	Multiple flow tables are logical tables maintained by software, then mergered & installed in one physical flow table. Certain restrictions of flow rule across tables are prohibited (e.g., modify field in table 1 then matched in table 2, error should returned)
		Sequentially numbered, starting at 0.		Y	Y	Y	Y	
		Only go forward and not backward		Y	Y	Y	Y	
		Last table of the pipeline can not include the Goto instruction		Y	N	Y	Y	
		Table miss behavior configuration	Send packets to the controller	Y	Y	Y	Y	
			Drop the packet	Y	Y	Y	Y	
			The packet is processed by the next sequentially numbered table	N	N	N	N	
			The packet is processed by L2/L3 pipelines	N	N	N	N	
5.2	Flow Table	Flow table entry	Match fields	Y	Y	Y	Y	set vlans dot1q-tunneling egress t2 from customer-vlan 10
			Counters	Y	Y	Y	Y	set vlans dot1q-tunneling egress t2 from service-vlan 200
			Instructions	Y	Y	Y	Y	set vlans dot1q-tunneling egress t2 then action change
								set vlans dot1q-tunneling egress

								t2 then service-vlan 100
5.3	Matching	Packet headers		Y	Y	Y	Y	
		Ingress port		Y	Y	Y	Y	
		Metadata fields	Used to pass information between tables	N	N	N	N	
		State transition	Actions applied in a previous table using the Apply-Actions are reflected in the packet match field	N	N	N	N	
		Support ANY	Matches all possible values in the header	Y	Y	Y	Y	
		Support arbitrary bitmasks on specific match fields		Y	Y	Y	Y	
		Select highest priority flow entry		Y	Y	Y	Y	
		Counters associated with the selected flow entry must be updated		Y	Y	Y	Y	
		CHECK_OVERLAP bit on flow mod messages to avoid overlapping entries		Y	N	Y	Y	software check
		Multiple matching flow entries with the same highest priority		N	N	N	N	Chip limitation
		Support OFPC_FRAG_REASM flag	IP fragments must be reassembled before pipeline processing	N	N	N	N	
		Behavior when a switch receives a corrupted packet		N	N	N	N	
5.4	Group Table	Group identifier	A 32 bit unsigned integer	Y	N	Y	Y	
		Group type	To determine group semantics	Y	N	Y	Y	Select, indirect, fast failover group table types are not supported
		Counters	Updated when packets are processed by a group	Y	N	Y	Y	
		Action buckets	An ordered list of action buckets	Y	N	Y	Y	
5.4.1	Group Types	All	Execute all buckets in the group for multicast or broadcast	Y	N	Y	Y	
			Packet clone is dropped if a bucket directs a packet explicitly out the ingress port	Y	N	Y	Y	
			Support output action to the OFPP_IN_PORT reserved port	Y	N	Y	Y	
		Select	Execute one bucket in the group based on a switch-computed selection algorithm	N	N	Y	Y	
		Indirect	Execute the one defined bucket in this group	Y	Y	Y	Y	
		Fast failover	Execute the first live bucket which is associated with a live port/group is selected	Y	Y	Y	Y	
	ECMP		Hashing	N	N	Y	Y	Restrcicted match & actions
			Round robin	N	N	N	N	
5.5	Per Table Counters	Reference count (active entries)	32 bits	N	N	N	N	
		Packet Lookups	64 bits	N	N	N	N	
		Packet Matches	64 bits	N	N	N	N	
	Per Flow Counters	Received Packets	64 bits	N	N	N	N	
		Received Bytes	64 bits	Y	Y	Y	Y	
		Duration (seconds)	32 bits	Y	Y	Y	Y	
		Duration (nanoseconds)	32 bits	N	N	N	N	
	Per Port Counters	Received Packets	64 bits	Y	Y	Y	Y	
		Transmitted Packets	64 bits	Y	Y	Y	Y	
		Received Bytes	64 bits	Y	Y	Y	Y	

		Transmitted Bytes	64 bits	Y	Y	Y	Y	
		Receive Drops	64 bits	Y	Y	Y	Y	
		Transmit Drops	64 bits	Y	Y	Y	Y	
		Receive Errors	64 bits	Y	Y	Y	Y	
		Transmit Errors	64 bits	Y	Y	Y	Y	
		Receive Frame Alignment Errors	64 bits	Y	Y	Y	Y	
		Receive Overrun Errors	64 bits	Y	Y	Y	Y	
		Receive CRC Errors	64 bits	Y	Y	Y	Y	
		Collisions	64 bits	Y	Y	Y	Y	
	Per Queue Counters	Transmit Packets	64 bits	N	N	N	N	
		Transmit Bytes	64 bits	N	N	N	N	
		Transmit Overrun Errors	64 bits	N	N	N	N	
	Per Group Counters	Reference Count (flow entries)	32 bits	Y	Y	Y	Y	
		Packet Count	64 bits	N	N	N	N	
		Byte Count	64 bits	Y	Y	Y	Y	
	Per Bucket Counters	Packet Count	64 bits	N	N	N	N	
		Byte Count	64 bits	N	N	N	N	
5.6	Instructions	The controller can query the switch about which of the "Optional Instruction" it supports		Y	Y	Y	Y	
		Apply-Actions action(s)	Applies the specific action(s) immediately, without any change to the Action Set	Y	Y	Y	Y	All of these feature are implemented by software
		Clear-Actions	Clears all the actions in the action set immediately	N	N	N	N	
		Write-Actions action(s)	Merges the specified action(s) into the current action set	N	N	N	N	
		Write-Metadata metadata / mask	Writes the masked metadata value into the metadata field	N	N	N	N	
		Goto-Table next-table-id	Indicates the next table in the processing pipeline	Y	Y	Y	Y	
		Clear-Actions instruction is executed before the Write-Actions instruction		N	N	N	N	
		Goto-Table is executed last		Y	Y	Y	Y	
		Reject a flow entry if it is unable to execute the instructions and return an unsupported flow error		Y	Y	Y	Y	
5.7	Action Set	Action set is associated with each packet		Y	Y	Y	Y	All of these feature are implemented by software
		Set is empty by default		Y	Y	Y	Y	
		Action set is carried between flow tables		Y	Y	Y	Y	
		When the instruction set of a flow entry does not contain a Goto-Table instruction, pipeline processing stops and the actions in the action set of the packet are executed		Y	Y	Y	Y	
		Action set contains a maximum of one action of each type		Y	Y	Y	Y	
		The actions in an action set are applied in the order specified below		Y	Y	Y	Y	
		1. copy TTL inwards		N	N	N	N	
		2. pop		Y	Y	Y	Y	

		3. push		Y	Y	Y	Y	
		4. copy TTL outwards		N	N	N	N	
		5. decrement TTL		N	N	N	N	
		6. set		Y	Y	Y	Y	
		7. qos		Y	N	Y	N	
		8. group	If a group action is specified, apply the actions of the relevant group bucket(s) in the order specified by this list.	Y	N	Y	Y	
		9. output	If no group action is specified, forward the packet on the port specified by the output action. The output action in the action set is executed last.	Y	Y	Y	Y	
			If both an output action and a group action are specified in an action set, the output action is ignored and the group action takes precedence.	Y	Y	Y	Y	
			If no output action and no group action were specified in an action set, the packet is dropped.	Y	Y	Y	Y	
			The execution of groups is recursive if the switch supports it; a group bucket may specify another group, in which case the execution of actions traverses all the groups specified by the group configuration.	Y	Y	Y	Y	
5.8	Action List	Apply-Actions instruction and the Packet-out message include an action list	The actions of an action list are executed in the order specified by the list, and are applied immediately to the packet.	Y	Y	Y	Y	
			The effect of those actions is cumulative.	Y	Y	Y	Y	
			If the action list contains an output action, a copy of the packet is forwarded in its current state to the desired port.	Y	Y	Y	Y	
			If the list contains a group actions, a copy of the packet in its current state is processed by the relevant group buckets.	N	N	Y	Y	
5.9	Actions	The controller can also query the switch about which of the "Optional Action" it supports		Y	Y	Y	Y	
		Output	Support forwarding to physical ports, switch-defined logical ports and the required reserved ports.	Y	Y	Y	Y	
		Set-Queue	The set-queue action sets the queue ID for a packet and is used to provide basic Quality-of-Service (QoS) support.	Y	Y	Y	Y	
		Drop		Y	Y	Y	Y	
		Group		Y	Y	Y	Y	
		Push-Tag/Pop-Tag	Order of header fields - Ethernet, VLAN, MPLS, ARP/IP, TCP/UDP/SCTP (IP-only).	Y	Y	Y	Y	
		Push VLAN header	Push a new VLAN header onto the packet. The Ethertype is used as the Ethertype for the tag. Only Ethertype 0x8100 and 0x88a8 should be used.	N	N	Y	N	VCAP implementation, VLAN only actions allowed
		Pop VLAN header	Pop the outer-most VLAN header from the packet.	N	N	Y	N	
		Push MPLS header	Push a new MPLS shim header onto the packet. Only Ethertype 0x8847 and 0x8848 should be used.	Y	Y	Y	Y	
		Pop MPLS header	Pop the outer-most MPLS tag or shim header from the packet.	Y	Y	Y	Y	
		Set-Field						
		Set VLAN ID		Y	Y	Y	Y	
		Strip VLAN ID		N	N	Y	N	Use reserved VLAN ID 4095 as special VLAN for stripping, 2 VLAN tags are supported

		Change-TTL	Modify the values of the IPv4 TTL, IPv6 Hop Limit or MPLS TTL in the packet.	N	N	N	N	
			If it is supported, applied to the outermost-possible header.	N	N	N	N	
		Set MPLS TTL	8 bits: New MPLS TTL, Replace the existing MPLS TTL. Only applies to packets with an existing MPLS shim header.	Y	Y	Y	Y	
		Decrement MPLS TTL	Decrement the MPLS TTL. Only applies to packets withan existing MPLS shim header.	Y	Y	Y	Y	
		Set IP TTL	Replace the existing IPv4 TTL or IPv6 Hop Limit and update the IP checksum. Only applies to IPv4 and IPv6 packets.	N	N	N	N	
		Decrement IP TTL	Decrement the IPv4 TTL or IPv6 Hop Limit field and update the IP checksum. Only applies to IPv4 and IPv6 packets.	N	N	N	N	
		Copy TTL outwards	Copy the TTL from next-to-outermost to outermost header with TTL. Copy can be IP-to-IP, MPLS-to-MPLS, or IP-to-MPLS.	N	N	N	N	
		Copy TTL inwards	Copy the TTL from outermost to next-to-outermost header with TTL. Copy can be IP-to-IP, MPLS-to-MPLS, or MPLS-to-IP.	N	N	N	N	
5.9.1	Default Values (for Fields on Push	Field values for all fields specified in Table 6 should be copied from existing outer headers to new outer headers	VLAN ID ← VLAN ID	Y	Y	Y	N	
		New fields listed in Table 6 without corresponding existing fields should be set to zero	VLAN priority ← VLAN priority	Y	Y	Y	N	
		Fields in new headers may be overridden by specifying a "set" action for the appropriate field(s) after the push operation	MPLS label ← MPLS label	Y	N	Y	N	
			MPLS traffic class ← MPLS traffic class	N	N	N	N	
			MPLS TTL ← MPLS TTL & IP TTL	N	N	N	N	
6	OpenFlow Channel	Encrypted using TLS		Y	Y	Y	Y	
		Directly over TCP		Y	Y	Y	Y	
6.1	OpenFlow Protocol Overview	Controller-to-switch message type	Initiated by the controller and used to directly manage or inspect the state of the switch.	Y	Y	Y	Y	
		Asynchronous message type	Initiated by the switch and used to update the controller of network events and changes to the switch state.	Y	Y	Y	Y	
		Symmetric message type	Initiated by either the switch or the controller and sent without solicitation.	Y	Y	Y	Y	
6.1.1	Controller-to-Switch	Features	Request the capabilities of a switch; the switch must respond with a features reply.	Y	Y	Y	Y	
		Configuration	Set and query configuration parameters in the switch; switch only responds to a query from the controller.	Y	Y	Y	Y	
		Modify-State	Add, delete and modify flow/group entries in the OpenFlow tables and to set switch port properties.	Y	Y	Y	Y	
		Read-State	Used by the controller to collect statistics from the switch.	Y	Y	Y	Y	
		Packet-out	Used by the controller to send packets out of a specified port on the switch, and to forward packets received via Packet-in messages.	Y	Y	Y	Y	
		Barrier	Barrier request/reply messages are used by the controller to ensure message dependencies have been met or to receive notifications for completed operations.	Y	Y	Y	Y	

6.1.2	Asynchronous	Switches send asynchronous messages to controllers to denote a packet arrival, switch state change, or error						
		Packet-in	For all packets that do not have a matching flow entry, the if table configuration is configured for packets forwarded to the CONTROLLER reserved port, a packet-in event is always sent to controllers.	Y	Y	Y	Y	
			If the packet-in event is configured to buffer packets then the packet-in events contain some fraction of the packet header and a buffer ID to be used by a controller when it is ready for the switch to forward the packet.	Y	Y	Y	Y	
			If the packet is buffered, the number of bytes of the original packet to include in the packet-in can be configured. By default, it is 128 bytes.	Y	Y	Y	Y	
			Or table miss it can be configured in the switch configuration.	Y	Y	Y	Y	
			For packet forwarded to the controller it can be configured in the output action.	Y	Y	Y	Y	
		Flow-Removed	Only sent for flow with the OFPFF_SEND_FLOW_REM flag set.	Y	Y	Y	Y	
			Generated as the result of a controller flow delete requests or the switch flow expiry process when one of the flow timeout is exceeded.	Y	Y	Y	Y	
		Port-status	Send port-status messages to controllers as port configuration or port state changes.	Y	Y	Y	Y	
		Error	Notify controllers of problems using error messages.	Y	Y	Y	Y	
6.1.3	Symmetric	Sent without solicitation, in either direction						
		Hello	Exchanged between the switch and controller upon connection startup.	Y	Y	Y	Y	
		Echo	Sent from either the switch or the controller, and must return an echo reply.	Y	Y	Y	Y	
		Experimenter	A standard way for OpenFlow switches to offer additional functionality within the OpenFlow message type space.	Y	Y	Y	Y	
6.2	Connection Setup	Establish communication with a controller at a user-configurable (but otherwise fixed) IP address, using a user-specified port	Traffic to and from the OpenFlow channel is not run through the OpenFlow pipeline. Therefore, the switch must identify incoming traffic as local before checking it against the flow tables.	Y	Y	Y	Y	
			Each side of the connection must immediately send an OFPT_HELLO message with the version field set to the highest OpenFlow protocol version supported by the sender.	Y	Y	Y	Y	
			The recipient may calculate the OpenFlow protocol version to be used as the smaller of the version number that it sent and the one that it received.	Y	Y	Y	Y	
			If the negotiated version is not supported by the recipient, the recipient must reply with an OFPT_ERROR message with a type field of OFPET_HELLO_FAILED, a code field of OFPHFC_COMPATIBLE, and then terminate the connection.	Y	Y	Y	Y	
			Optionally an ASCII string explaining the situation in data.	Y	Y	Y	Y	
6.3	Multiple Controllers	Establish communication withmultiple controllers	Controller fail-over.	Y	Y	Y	Y	Active & Standby controllers
			Controller load balancing.	N	N	N	N	
			Switch virtualisation.	Y	Y	Y	Y	
			Switch must connect to all controllers it is configured with, and try to maintain connection with all of them concurrently.	Y	Y	Y	Y	
			The reply or error messages related to those command must only be sent on the controller	Y	Y	Y	Y	

			connection associated with that command.					
			Asynchronous messages may need to be send to multiple controllers, the message is duplicated for each eligible controller connection and each message sent when the respective controller connection allows it.	Y	Y	Y	Y	
		The default role of a controller is OFPCR_ROLE_EQUAL	Controller has full access to the switch and is equal to other controllers in the same role.	Y	Y	Y	Y	
			Controller receives all the switch asynchronous messages (such as packet-in, flow-removed).	Y	Y	Y	Y	
			The controller can send controller-to-switch commands to modify the state of the switch.	Y	Y	Y	Y	
			The switch does not do any arbitration or resource sharing between controllers.	Y	Y	Y	Y	
		Controller can request its role to be changed to OFPCR_ROLE_SLAVE	Controller has read-only access to the switch.	Y	Y	Y	Y	
			Controller does not receive switch asynchronous messages, apart from Port-status messages.	Y	Y	Y	Y	
			The controller is denied ability to send controller-to-switch commands that modify the state of the switch, OFPT_PACKET_OUT, OFPT_FLOW_MOD, OFPT_GROUP_MOD, OFPT_PORT_MODand OFPT_TABLE_MOD.	Y	Y	Y	Y	
			If the controller sends one of those commands, the switch must reply with an OFPT_ERROR message with a type field of OFPET_BAD_REQUEST, a code field of OFPBRC_IS_SLAVE.	Y	Y	Y	Y	
			Othercontroller-to-switch messages, such as OFPT_STATS_REQUEST and OFPT_ROLE_REQUEST, should be processed normally.	Y	Y	Y	Y	
		A controller can request its role to be changed to OFPCR_ROLE_MASTER	The switch makes sure there is only a single controller in this role.	Y	Y	Y	Y	
			When a controller change its role to OFPCR_ROLE_MASTER, the switch change all other controllers which role is OFPCR_ROLE_MASTER to have the role OFPCR_ROLE_SLAVE.	Y	Y	Y	Y	
			When the switch perform such role change, no message is generated to the controller which role is changed (in most case that controller is no longer reachable).	Y	Y	Y	Y	
		A switch may be simultaneously connected to multiple controllers in Equal state, multiple controllers in Slave state, and at most one controller in Master state	Each controller may communicate its role to the switch via a OFPT_ROLE_REQUEST message, and the switch must remember the role of each controller connection. A controller may change role at any time.	Y	Y	Y	Y	
			To detect out-of-order messages during a master/slave transition, the OFPT_ROLE_REQUEST message contains a 64-bit sequence number field, generation_id, that identifies a given mastership view.	Y	Y	Y	Y	
		On receiving a OFPT_ROLE_REQUEST with role equal to OFPCR_ROLE_MASTER or OFPCR_ROLE_SLAVEthe switch must compare the generation_id in the message against the largest generation id seen sofar	A message with a generation_id smaller than a previously seen generation id must be considered stale and discarded. The switch must respond to stale messages with an error message with typeOFPET_ROLE_REQUEST_FAILED and code OFPRRFC_STALE.	Y	Y	Y	Y	
6.4	Connection Interruption	A switch loses contact with all controllers, the switch should immediately enter either "fail secure mode" or "fail standalone mode"	In "fail secure mode", the only change to switch behavior is that packets and messages destined to the controllers are dropped.	Y	Y	Y	Y	
			Flows should continue to expire according to their timeouts in "fail secure mode."	Y	Y	Y	Y	
			In "fail standalone mode," the switch processes all packets using the OFPP_NORMAL port; in other words, the switch acts as a legacy Ethernet switch or router.	Y	Y	Y	Y	
			Upon connecting to a controller again, the existing flow entries remain.	Y	Y	Y	Y	

			The controller then has the option of deleting all flow entries, if desired.	Y	Y	Y	Y	
		The first time a switch starts up, it will operate in either "fail secure mode" or "fail standalone mode" mode, until is successfully connects to a controller		Y	Y	Y	Y	
6.5	Encryption	The switch and controller may communicate through a TLS connection	The TLS connection is initiated by the switch on startup to the controller, which is located by default on TCP port 6633	Y	Y	Y	Y	
			Each switch must be user-configurable with one certificate for authenticating the controller (controller certificate) and the other for authenticating to the controller (switch certificate)	Y	Y	Y	Y	
6.6	Message Handling	Message Delivery	Messages are guaranteed delivery, unless the connection fails entirely.	Y	Y	Y	Y	
		Message Processing	Switches must process every message received from a controller in full, possibly generating a reply.	Y	Y	Y	Y	
			If a switch cannot completely process a message received from a controller, it must send back an error message.	Y	Y	Y	Y	
			Switches must send to the controller all asynchronous messages generated by internal state changes, such as flow-removed or packet-in messages.	Y	Y	Y	Y	
	Message Ordering	Ordering can be ensured through the use of barrier messages	In the absence of barrier messages, switches may arbitrarily reorder messages to maximize performance.	N	N	N	N	
			Messages must not be reordered across a barrier message and the barrier message must be processed only when all prior messages have been processed.	Y	Y	Y	Y	
			Messages before a barrier must be fully processed before the barrier, including sending any resulting replies or errors.	Y	Y	Y	Y	
			The barrier must then be processed and a barrier reply sent.	Y	Y	Y	Y	
			Messages after the barrier may then begin processing.	Y	Y	Y	Y	
6.7	Flow Table Modification Messages	OFPFC_ADD	For add requests (OFPFC_ADD) with the OFPFF_CHECK_OVERLAP flag set, the switch must first check for any overlapping flow entries in the requested table	Y	Y	Y	Y	
			If an overlap conflict exists between an existing flow entry and the add request, the switch must refuse the addition and respond with an ofp_error_msg with OFPET_FLOW_MOD_FAILED type and OFPFMFC_OVERLAP code	Y	Y	Y	Y	
			If a flow entry with identical match fields and priority already resides in the requested table, then that entry, including its duration, must be cleared from the table, and the newflow entry added	Y	Y	Y	Y	
			If the OFPFF_RESET_COUNTS flag is set, the flow entry counters must be cleared, otherwise they should be copied from the replaced flow	N	N	N	N	
			No flow-removed message is generated for the flow entry eliminated as part of an add request; if the controller wants a flow-removed message it should explicitly send a DELETE STRICT for the old flow prior to adding the new one	Y	Y	Y	Y	
			If a switch cannot find any space in the requested table in which to add the incoming flow entry, the switch should send an ofp_error_msg with OFPET_FLOW_MOD_FAILED type and OFPFMFC_TABLE_FULL code.	N	N	N	N	
		OFPFC_MODIFY or OFPFC_MODIFY_STRICT	If a matching entry exists in the table, the instructions field of this entry is updated with the value from the request, whereas its cookie, idle_timeout, hard_timeout, flags, counters and duration fields are left unchanged.	Y	Y	Y	Y	

			If the OFPFF_RESET_COUNTS flag is set, the flow entry counters must be cleared.	N	N	N	N	
			If no flow currently residing in the requested table matches the request, no error is recorded, and no flow table modification occurs.	Y	Y	Y	Y	
			In the strict versions, the set of match fields, all match fields, including their masks, and the priority, are strictly matched against the entry, and only an identical flow is modified or removed.	Y	Y	Y	Y	
			If the match in a flow mod specifies an arbitrary bitmask for another field which the switch cannot support, the switch must return an ofp_error_msg with OFPET_BAD_MATCH type and OFPBMC_BAD_MASK code.	Y	Y	Y	Y	
			If the match in a flow mod specifies values that cannot be matched, for example, a VLAN ID greater than 4095 and not one of the reserved values, or a DSCP value with one of the two higher bits set, the switch must return an ofp_error_msg with OFPET_BAD_MATCH type and OFPBMC_BAD_VALUE code.	Y	Y	Y	Y	
			If the match in a flow mod message specifies a field that is unsupported in the table, the switch must return an ofp_error_msg with OFPET_BAD_MATCH type and OFPBMC_BAD_FIELD code.	Y	Y	Y	Y	
			If the match in a flow mod message specifies a field more than once, the switch must return an ofp_error_msg with OFPET_BAD_MATCH type and OFPBMC_DUP_FIELD code.	Y	Y	Y	Y	
			If the match in a flow mod message specifies a field but fail to specify its associated prerequisites, for example specifies an IPv4 address without matching the EtherType to 0x800, the switch must return an ofp_error_msg with OFPET_BAD_MATCH type and OFPBMC_BAD_PREREQ code.	Y	Y	Y	Y	
			If the match in a flow mod specifies an arbitrary bitmask for either the datalink or network addresses which the switch cannot support, the switch must return an ofp_error_msg with OFPET_BAD_MATCH type and either OFPBMC_BAD_DL_ADDR_MASK or OFPBMC_BAD_NW_ADDR_MASK.	Y	Y	Y	Y	
			If an action in a flow mod message references a group that is not currently defined on the switch, or is a reserved group, such as OFPG_ALL, the switch must return an ofp_error_msg with OFPET_BAD_ACTION type and OFPBAC_BAD_OUT_GROUP code.	Y	Y	Y	Y	
			If an action in a flow mod message has a value that is invalid, for example a Set VLAN ID action with value greater than 4095, or a Push action with an invalid Ethertype, the switch should return an ofp_error_msg with OFPET_BAD_ACTION type and OFPBAC_BAD_ARGUMENT code.	Y	Y	Y	Y	
			If an action in a flow mod message performs an operation which is inconsistent with the match, for example, a pop VLAN action with a match specifying no VLAN, or a set IPv4 address action with a match wildcarding the Ethertype, the switch may optionally reject the flow and immediately return an ofp_error_msg with OFPET_BAD_ACTION type and OFPBAC_MATCH_INCONSISTENT code.	Y	Y	Y	Y	
			If any other errors occur during the processing of the flow mod message, the switch may return an ofp_error_msg with OFPET_FLOW_MOD_FAILED type and OFPFMC_UNKNOWN code.	Y	Y	Y	Y	
		OFPFC_DELETE or OFPFC_DELETE_STRICT	If a matching entry exists in the table, it must be deleted.	Y	Y	Y	Y	
			If the entry has the OFPFF_SEND_FLOW_REM flag set, it should generate a flow removed message.	Y	Y	Y	Y	
			If no flow currently residing in the requested table matches the request, no error is recorded, and no flow table modification occurs.	Y	Y	Y	Y	

			In the strict versions, the set of match fields, all match fields, including their masks, and the priority, are strictly matched against the entry, and only an identical flow is modified or removed.	Y	Y	Y	Y	
			For non-strict modify and delete commands, all flows that match the flow mod description are modified or removed.	Y	Y	Y	Y	
			In the non-strict versions, a match will occur when a flow entry exactly matches or is more specific than the description in the flow mod command; in the flow mod the missing match fields are wildcarded, field masks are active, and other flow mod fields such as priority are ignored.	Y	Y	Y	Y	
			Delete commands can be optionally filtered by destination group or output port.	N	N	N	N	
			If the out_port field contains a value other than OFPP_ANY, it introduces a constraint when matching.	Y	Y	Y	Y	
			Modify and delete commands can also be filtered by cookie value.	Y	Y	Y	Y	
			Delete commands can use the OFPTT_ALL value for table-id to indicate that matching flows are to be deleted from all flow tables.	Y	Y	Y	Y	
			If the flow modification message specifies an invalid table-id, the switch should send an ofp_error_msg with OFPET_FLOW_MOD_FAILED type and OFPFMFC_BAD_TABLE_ID code.	Y	Y	Y	Y	
			If the instructions requested in a flow mod message are unknown the switch must return an ofp_error_msg with OFPET_BAD_INSTRUCTION type and OFPBIC_UNKNOWN_INST code.	Y	Y	Y	Y	
			If the instructions requested in a flow mod message are unsupported the switch must return an ofp_error_msg with OFPET_BAD_INSTRUCTION type and OFPBIC_UNSUP_INST code.	Y	Y	Y	Y	
			If the instructions requested contain a Goto-Table and the next-table-id refers to an invalid table the switch must return an ofp_error_msg with OFPET_BAD_INSTRUCTION type and OFPBIC_BAD_TABLE_ID code.	Y	Y	Y	Y	
			If the instructions requested contain a Write-Metadata and the metadata value or metadata mask value is unsupported then the switch must return an ofp_error_msg with OFPET_BAD_INSTRUCTION type and OFPBIC_UNSUP_METADATA or OFPBIC_UNSUP_METADATA_MASK code.	Y	Y	Y	Y	
			If the bitmasks specified in both the datalink and network addresses are not supported then OFPBMC_BAD_DL_ADDR_MASK should be used.	Y	Y	Y	Y	
			If any action references a port that will never be valid on a switch, the switch must return an ofp_error_msg with OFPET_BAD_ACTION type and OFPBAC_BAD_OUT_PORT code.	Y	Y	Y	Y	
			If the referenced port may be valid in the future, e.g. when a linecard is added to a chassis switch, or a port is dynamically added to a software switch, the switch may either silently drop packets sent to the referenced port, or immediately return an OFPBAC_BAD_OUT_PORT error and refuse the flow mod.	Y	Y	Y	Y	
			If an action list contain a sequence of actions that the switch can not support in the specified order, the switch should return an ofp_error_msg with OFPET_BAD_ACTION type and OFPBAC_UNSUPPORTED_ORDER code.	Y	Y	Y	Y	
6.8	Flow Removal	Switch flow expiry mechanism	Is run by the switch independently of the controller and is based on the state and configuration of flow entries.	Y	Y	Y	Y	
			A non-zero hard_timeout field causes the flow entry to be removed after the given number of	Y	Y	Y	Y	

			seconds, regardless of how many packets it has matched.					
			A non-zero idle_timeout field causes the flow entry to be removed when it has matched no packets in the givennumber of seconds.	Y	Y	Y	Y	
			The switch must implement flow expiry and remove flow entries from the flow table when one of their timeout is exceeded.	Y	Y	Y	Y	
			When a flow entry is removed, the switch must check the flow entry's OFPFF_SEND_FLOW_REM flag. If this flag is set, the switch must send a flow removed message to the controller.	Y	Y	Y	Y	
			Each flow removed message contains a complete description of the flow entry, the reason for removal (expiry or delete), the flow entry duration at the time of removal, and the flow statistics at time of removal.	Y	Y	Y	Y	
6.9	Group Table Modification Messages	OFPGC_ADD	Groups may consist of zero or more buckets.	Y	Y	Y	Y	
			A group may also include buckets which themselves forward to other groups if the switch supports it.	Y	Y	Y	Y	
			The action set for each bucket must be validated using the same rules as those for flow mods (Section 6.7), with additional group-specific checks.	Y	Y	Y	Y	
			If an action in one of the buckets is invalid or unsupported, the switch should return an ofp_error_msg with OFPET_BAD_ACTION type and code corresponding to the error.	Y	Y	Y	Y	
			If a group entry with the specified group identifier already resides in the group table, then the switch must refuse to add the group entry and must send an ofp_error_msg with OFPET_GROUP_MOD_FAILED type and OFPGMFC_GROUP_EXISTS code.	Y	Y	Y	Y	
			If a specified group type is invalid then the switch must refuse to add the group entry and must send an ofp_error_msg with OFPET_GROUP_MOD_FAILED type and OFPGMFC_INVALID_GROUP code.	Y	Y	Y	Y	
			If a switch does not support unequal load sharing with select groups (buckets with weight different than 1), it must refuse to add the group entry and must send an ofp_error_msg with OFPET_GROUP_MOD_FAILED type and OFPGMFC_WEIGHT_UNSUPPORTED code.	Y	Y	Y	Y	
			If a switch cannot add the incoming group entry due to lack of space, the switch must send an ofp_error_msg with OFPET_GROUP_MOD_FAILED type and OFPGMFC_OUT_OF_GROUPS code.	Y	Y	Y	Y	
			If a switch cannot add the incoming group entry due to restrictions (hardware or otherwise) limiting the number of group buckets, it must refuse to add the group entry and must send an ofp_error_msg with OFPET_GROUP_MOD_FAILED type and OFPGMFC_OUT_OF_BUCKETS code.	Y	Y	Y	Y	
			If a switch cannot add the incoming group because it does not support the proposed liveliness configuration, the switch must send an ofp_error_msg with OFPET_GROUP_MOD_FAILED type and OFPGMFC_WATCH_UNSUPPORTED code.	N	N	N	N	
		OFPGC_MODIFY	if a group entry with the specified group identifier already resides in the group table, then that entry, including its type and action buckets, must be removed, and the new group entry added.	Y	Y	Y	Y	
			If a group entry with the specified group identifier does not already exist then the switch must refuse the group mod and send an ofp_error_msg with OFPET_GROUP_MOD_FAILED type and OFPGMFC_UNKNOWN_GROUP code	Y	Y	Y	Y	
		OFPGC_DELETE	If no group entry with the specified group identifier currentlyexists in the group table, no error is	Y	Y	Y	Y	

			recorded, and no group table modification occurs					
			To delete all groups with a single message, specify OFPG_ALL as the group value	Y	Y	Y	Y	
		Groups	Groups may be chained if the switch supports it, when at least one group forward to another group, or in more complex configuration	Y	Y	Y	Y	
			If a switch does not support groups of groups, it must send an ofp_error_msg with OFPET_GROUP_MOD_FAILED type and OFPGMFC_CHAINING_UNSUPPORTED code.	Y	Y	Y	Y	
			A switch may support checking that no loop is created while chaining groups.	Y	Y	Y	Y	
			If a group mod is sent such that a forwarding loop would be created, the switch must reject the group mod and must send an ofp_error_msg with OFPET_GROUP_MOD_FAILED type and OFPGMFC_LOOP code.	Y	Y	Y	Y	
			A switch may support checking that groups forwarded to by other groups are not removed.	N	N	N	N	
			If a switch cannot delete a group because it is referenced by another group, it must refuse to delete the group entry and must send an ofp_error_msg with OFPET_GROUP_MOD_FAILED type and OFPGMFC_CHAINED_GROUP code.	Y	Y	Y	Y	
A	Appendix A The OpenFlow Protocol							
A.2.1	Port Structures	Port_no field uniquely identifies a port within a switch	Ports are numbered starting from 1.	Y	Y	Y	Y	
		Name field is a null-terminated string containing a human-readable name for the interface		Y	Y	Y	Y	
		Port administrative settings support the following states	The OFPPC_PORT_DOWN bit indicates that the port has been administratively brought down and should not be used by OpenFlow.	Y	Y	Y	Y	
			The OFPPC_NO_RECV bit indicates that packets received on that port shouldbe ignored.	Y	Y	Y	Y	
			The OFPPC_NO_FWD bit indicates that OpenFlow should not send packets to that port.	Y	Y	Y	Y	
			The OFPPC_NO_FWD bit indicates that OpenFlow should not send packets to that port.	Y	Y	Y	Y	
			The OFPPFL_NO_PACKET_IN bit indicates that packets on that port that generate a table miss should never trigger a packet-in message to the controller	Y	Y	Y	Y	
			The port config bits are set by the controller and not changed by the switch.					
			If the port config bits are changed by the switch through another administrative interface, the switch sends an OFPT_PORT_STATUS message to notify the controller of the change.	Y	Y	Y	Y	
		State field describes the port internal state that supports the following states	OFPPS_LINK_DOWN bit indicates the physical link is not present.	Y	Y	Y	Y	
			The OFPPS_BLOCKED bit indicates that a switch protocol outside of OpenFlow, such as 802.1D Spanning Tree, is preventing the use of that port with OFPP_FLOOD.	Y	Y	Y	Y	
			OFPPS_LIVE indicates Live for Fast Failover Group.	N	N	N	N	
			All port state bits are read-only and cannot be changed by the controller.	Y	Y	Y	Y	
			When the port flags are changed, the switch sends an OFPT_PORT_STATUS message to notify the controller of the change.	Y	Y	Y	Y	
		Curr, advertised, supported, and peer fields indicate link modes (speed and duplexity), link type (copper/fiber) and link features (auto negotiation and pause)		Y	Y	Y	Y	

		Curr_speed and max_speed fields indicate the current and maximum bit rate (raw transmission speed) of the link in kbps		Y	Y	Y	Y	
A.2.2	Queue Structures	QoS (DSCP & Q mapping?)	An OpenFlow switch provides limited Quality-of-Service support (QoS) through a simple queuing mechanism. One (or more) queues can attach to a port and be used to map flows on it. Flows mapped to a specific queue will be treated according to that queue's configuration.	Y	Y	Y	Y	
A.2.3	Flow Match Structures	OpenFlow match is composed of a flow match header and a sequence of zero or more flow match fields	The only valid match type in this specification is OFPMT_OXM, the OpenFlow 1.1 match type OFPMT_STANDARD is deprecated.	Y	Y	Y	Y	
			The flow match fields are described using the OpenFlow Extensible Match (OXM) format.	Y	Y	Y	Y	
		OpenFlow specification distinguishes two types of OXM match classes	ONF member classes.					
			ONF reserved classes.					
		Flow Match Fields						
		OXM_OF_IN_PORT	/* Switch input port. */	Y	Y	Y	Y	
		OXM_OF_IN_PHY_PORT	/* Switch physical input port. */	Y	Y	Y	Y	
		OXM_OF_METADATA	/* Metadata passed between tables. */	N	N	N	N	
		OXM_OF_ETH_DST	/* Ethernet destination address. */	Y	Y	Y	Y	
		OXM_OF_ETH_SRC	/* Ethernet source address. */	Y	Y	Y	Y	
		OXM_OF_ETH_TYPE	/* Ethernet frame type. */	Y	Y	Y	Y	
		OXM_OF_VLAN_VID	/* VLAN id. */	Y	Y	Y	Y	
		OXM_OF_VLAN_PCP	/* VLAN priority. */	Y	Y	Y	Y	
		OXM_OF_IP_DSCP	/* IP DSCP (6 bits in ToS field). */	Y	Y	Y	Y	
		OXM_OF_IP_ECN	/* IP ECN (2 bits in ToS field). */	N	N	N	N	
		OXM_OF_IP_PROTO	/* IP protocol. */	Y	Y	Y	Y	
		OXM_OF_IPV4_SRC	/* IPv4 source address. */	Y	Y	Y	Y	
		OXM_OF_IPV4_DST	/* IPv4 destination address. */	Y	Y	Y	Y	
		OXM_OF_TCP_SRC	/* TCP source port. */	Y	Y	Y	Y	
		OXM_OF_TCP_DST	/* TCP destination port. */	Y	Y	Y	Y	
		OXM_OF_UDP_SRC	/* UDP source port. */	Y	Y	Y	Y	
		OXM_OF_UDP_DST	/* UDP destination port. */	Y	Y	Y	Y	
		OXM_OF_SCTP_SRC	/* SCTP source port. */	N	N	N	N	
		OXM_OF_SCTP_DST	/* SCTP destination port. */	N	N	N	N	
		OXM_OF_ICMPV4_TYPE	/* ICMP type. */	N	N	N	N	
		OXM_OF_ICMPV4_CODE	/* ICMP code. */	N	N	N	N	
		OXM_OF_ARP_OP	/* ARP opcode. */	Y	Y	Y	N	All ARP matches are supported via software
		OXM_OF_ARP_SPA	/* ARP source IPv4 address. */	Y	Y	Y	N	
		OXM_OF_ARP_TPA	/* ARP target IPv4 address. */	Y	Y	Y	N	
		OXM_OF_ARP_SHA	/* ARP source hardware address. */	Y	Y	Y	N	
		OXM_OF_ARP_THA	/* ARP target hardware address. */	Y	Y	Y	N	
		OXM_OF_IPV6_SRC	/* IPv6 source address. */	Y	Y	Y	Y	
		OXM_OF_IPV6_DST	/* IPv6 destination address. */	Y	Y	Y	Y	
		OXM_OF_IPV6_FLABEL	/* IPv6 Flow Label */	N	N	N	N	
		OXM_OF_ICMPV6_TYPE	/* ICMPv6 type. */	N	N	N	N	
		OXM_OF_ICMPV6_CODE	/* ICMPv6 code. */	N	N	N	N	
		OXM_OF_IPV6_ND_TARGET	/* Target address for ND. */	N	N	N	N	

		OXM_OF_IPV6_ND_SLL	/* Source link-layer for ND. */	N	N	N	N	
		OXM_OF_IPV6_ND_TLL	/* Target link-layer for ND. */	N	N	N	N	
		OXM_OF_MPLS_LABEL	/* MPLS label. */	Y	Y	Y	Y	
		OXM_OF_MPLS_TC	/* MPLS TC. */	N	N	N	N	
		Required match fields						
		OXM_OF_IN_PORT	Ingress port. This may be a physical or switch-defined logical port.	Y	Y	Y	Y	
		OXM_OF_ETH_DST	Ethernet source address. Can use arbitrary bitmask.	Y	Y	Y	Y	
		OXM_OF_ETH_SRC	Ethernet destination address. Can use arbitrary bitmask.	Y	Y	Y	Y	
		OXM_OF_ETH_TYPE	Ethernet type of the OpenFlow packet payload, after VLAN tags.	Y	Y	Y	Y	
		OXM_OF_IP_PROTO	IPv4 or IPv6 protocol number.	Y	Y	Y	Y	
		OXM_OF_IPV4_SRC	IPv4 source address. Can use subnet mask or arbitrary bitmask.	Y	Y	Y	Y	
		OXM_OF_IPV4_DST	IPv4 destination address. Can use subnet mask or arbitrary bitmask.	Y	Y	Y	Y	
		OXM_OF_IPV6_SRC	IPv6 source address. Can use subnet mask or arbitrary bitmask.	Y	Y	Y	Y	
		OXM_OF_IPV6_DST	IPv6 destination address. Can use subnet mask or arbitrary bitmask.	Y	Y	Y	Y	
		OXM_OF_TCP_SRC	TCP source port.	Y	Y	Y	Y	
		OXM_OF_TCP_DST	TCP destination port.	Y	Y	Y	Y	
		OXM_OF_UDP_SRC	UDP source port.	Y	Y	Y	Y	
		OXM_OF_UDP_DST	UDP destination port.	Y	Y	Y	Y	
A.2.4	Flow Instruction Structures	See Section 5.6						
A.2.5	Action Structures	A number of actions may be associated with flows, groups or packets. The currently defined action types are						
		OFPAT_OUTPUT = 0,	/* Output to switch port. */	Y	Y	Y	Y	
		OFPAT_COPY_TTL_OUT = 11,	/* Copy TTL "outwards" – from next-to-outermost to outermost */	N	N	N	N	
		OFPAT_COPY_TTL_IN = 12,	/* Copy TTL "inwards" – from outermost to next-to-outermost */	N	N	N	N	
		OFPAT_SET_MPLS_TTL = 15,	/* MPLS TTL */	Y	Y	Y	Y	
		OFPAT_DEC_MPLS_TTL = 16,	/* Decrement MPLS TTL */	Y	Y	Y	Y	
		OFPAT_PUSH_VLAN = 17,	/* Push a new VLAN tag */	N	N	Y	N	
		OFPAT_POP_VLAN = 18,	/* Pop the outer VLAN tag */	N	N	Y	N	
		OFPAT_PUSH_MPLS = 19,	/* Push a new MPLS tag */	Y	Y	Y	Y	
		OFPAT_POP_MPLS = 20,	/* Pop the outer MPLS tag */	Y	Y	Y	Y	
		OFPAT_SET_QUEUE = 21,	/* Set queue id when outputting to a port */	Y	Y	Y	Y	
		OFPAT_GROUP = 22,	/* Apply group. */	Y	Y	Y	Y	
		OFPAT_SET_NW_TTL = 23,	/* IP TTL. */	N	N	N	N	
		OFPAT_DEC_NW_TTL = 24,	/* Decrement IP TTL. */	N	N	N	N	
		OFPAT_SET_FIELD = 25,	/* Set a header field using OXM TLV format. */	Y	Y	Y	Y	
		OFPAT_EXPERIMENTER = 0xffff		Y	Y	Y	Y	
		The type of a set-field action can be any valid OXM header type	OXM types OFPXMT_OFB_IN_PORT and OFPXMT_OFB_METADATA are not supported, because those are not header fields.					

		OXM_OF_IN_PHY_PORT	/* Switch physical input port. */	N	N	N	N	
		OXM_OF_ETH_DST	/* Ethernet destination address. */	Y	Y	Y	Y	
		OXM_OF_ETH_SRC	/* Ethernet source address. */	Y	Y	Y	Y	
		OXM_OF_ETH_TYPE	/* Ethernet frame type. */	Y	Y	Y	Y	
		OXM_OF_VLAN_VID	/* VLAN id. */	Y	Y	Y	Y	
		OXM_OF_VLAN_PCP	/* VLAN priority. */	Y	Y	Y	Y	
		OXM_OF_IP_DSCP	/* IP DSCP (6 bits in ToS field). */	Y	Y	Y	Y	
		OXM_OF_IP_ECN	/* IP ECN (2 bits in ToS field). */	N	N	N	N	
		OXM_OF_IP_PROTO	/* IP protocol. */	N	N	N	N	
		OXM_OF_IPV4_SRC	/* IPv4 source address. */	N	N	N	N	
		OXM_OF_IPV4_DST	/* IPv4 destination address. */	N	N	N	N	
		OXM_OF_TCP_SRC	/* TCP source port. */	N	N	N	N	
		OXM_OF_TCP_DST	/* TCP destination port. */	N	N	N	N	
		OXM_OF_UDP_SRC	/* UDP source port. */	N	N	N	N	
		OXM_OF_UDP_DST	/* UDP destination port. */	N	N	N	N	
		OXM_OF_SCTP_SRC	/* SCTP source port. */	N	N	N	N	
		OXM_OF_SCTP_DST	/* SCTP destination port. */	N	N	N	N	
		OXM_OF_ICMPV4_TYPE	/* ICMP type. */	N	N	N	N	
		OXM_OF_ICMPV4_CODE	/* ICMP code. */	N	N	N	N	
		OXM_OF_ARP_OP	/* ARP opcode. */	Y	Y	Y	Y	
		OXM_OF_ARP_SPA	/* ARP source IPv4 address. */	Y	Y	Y	Y	
		OXM_OF_ARP_TPA	/* ARP target IPv4 address. */	Y	Y	Y	Y	
		OXM_OF_ARP_SHA	/* ARP source hardware address. */	Y	Y	Y	Y	
		OXM_OF_ARP_THA	/* ARP target hardware address. */	Y	Y	Y	Y	
		OXM_OF_IPV6_SRC	/* IPv6 source address. */	N	N	N	N	
		OXM_OF_IPV6_DST	/* IPv6 destination address. */	N	N	N	N	
		OXM_OF_IPV6_FLABEL	/* IPv6 Flow Label */	N	N	N	N	
		OXM_OF_ICMPV6_TYPE	/* ICMPv6 type. */	N	N	N	N	
		OXM_OF_ICMPV6_CODE	/* ICMPv6 code. */	N	N	N	N	
		OXM_OF_IPV6_ND_TARGET	/* Target address for ND. */	N	N	N	N	
		OXM_OF_IPV6_ND_SLL	/* Source link-layer for ND. */	N	N	N	N	
		OXM_OF_IPV6_ND_TLL	/* Target link-layer for ND. */	N	N	N	N	
		OXM_OF_MPLS_LABEL	/* MPLS label. */	Y	Y	Y	Y	
		OXM_OF_MPLS_TC	/* MPLS TC. */	Y	Y	Y	Y	
A.3	Controller-to-Switch Messages							
A.3.1	Handshake	Datapath_id	The datapath_id field uniquely identifies a datapath. The lower 48 bits are intended for the switch MAC address, while the top 16 bits are up to the implementer.	Y	Y	Y	Y	
			Use datapath_id to distinguish multiple virtual switch instances on a single physical switch.	Y	Y	Y	Y	
		Capabilities supported by the datapath	OFPC_FLOW_STATS = 1 << 0, /* Flow statistics. */	Y	Y	Y	Y	
			OFPC_TABLE_STATS = 1 << 1, /* Table statistics. */	Y	Y	Y	Y	
			OFPC_PORT_STATS = 1 << 2, /* Port statistics. */	Y	Y	Y	Y	
			OFPC_GROUP_STATS = 1 << 3, /* Group statistics. */	Y	Y	Y	Y	
			OFPC_IP_REASM = 1 << 5, /* Can reassemble IP fragments. */	N	N	N	N	

			OFPC_QUEUE_STATS = 1 << 6, /* Queue statistics. */	N	N	N	N	
			OFPC_PORT_BLOCKED = 1 << 8 /* Switch will block looping ports. */	Y	Y	Y	Y	
A.3.2	Switch Configuration	Controller is able to set and query configuration parameters in the switch with the OFPT_SET_CONFIG and OFPT_GET_CONFIG_REQUEST messages, respectively		Y	Y	Y	Y	
		OFPC_* flags	/* Handling of IP fragments. **/OFPC_FRAG_NORMAL = 0, /** No special handling for fragments. */	Y	Y	Y	Y	
			OFPC_FRAG_DROP = 1 << 0, /* Drop fragments. */	N	N	N	N	
			OFPC_FRAG_REASM = 1 << 1, /* Reassemble (only if OFPC_IP_REASM set). */	N	N	N	N	
			OFPC_FRAG_MASK = 3,	N	N	N	N	
			/* TTL processing - applicable for IP and MPLS packets **/OFPC_INVALID_TTL_TO_CONTROLLER = 1 << 2, /** Send packets with invalid TTL to the controller */	N	N	N	N	
		Miss_send_len	Defines the number of bytes of each packet sent to the controller as a result of flow table miss when configured to generate packet-in messages.	Y	Y	Y	Y	
			If this field equals 0, the switch must send zero bytes of the packet in the ofp_packet_in message.	Y	Y	Y	Y	
			If the value is set to OFPCML_NO_BUFFER the complete packet must be included in the message, and should not be buffered.	Y	Y	Y	Y	
A.3.3	Flow Table Configuration	Flow tables are numbered from 0 and can take any number until OFPTT_MAX	OFPTT_MAX = 0xfe	Y	Y	Y	Y	
		Controller can configure and query table state in the switch with the OFP_TABLE_MOD and OFPST_TABLE_STATS requests, respectively	The switch responds to a table stats request with aOFPT_STATS_REPLY message.	Y	Y	Y	Y	
		OFP_TABLE_MOD	If the table_id is OFPTT_ALL, the configuration is applied to all tables in the switch.	Y	Y	Y	Y	
		Config field is a bitmap that is used to configure the default behavior of unmatched packets	OFPTC_TABLE_MISS_CONTROLLER = 0, /* Send to controller. */	Y	Y	Y	Y	
			OFPTC_TABLE_MISS_CONTINUE = 1 << 0, /* Continue to the next table in the pipeline (OpenFlow 1.0 behavior). */	Y	Y	Y	Y	
			OFPTC_TABLE_MISS_DROP = 1 << 1, /* Drop the packet. */	Y	Y	Y	Y	
			OFPTC_TABLE_MISS_MASK = 3	Y	Y	Y	Y	
A.3.4	Modify State Messages	Modifications to a flow table from the controller are done with the OFPT_FLOW_MOD message		Y	Y	Y	Y	
		Modifications to the group table from the controller are done with the OFPT_GROUP_MOD message		Y	Y	Y	Y	
		The controller uses the OFPT_PORT_MOD message to modify the behavior of the port		Y	Y	Y	Y	
A.3.5	Read State Messages	While the system is running, the datapath may be queried about its current state using the OFPT_STATS_REQUEST message	/* Description of this OpenFlow switch.* The request body is empty.* The reply body is struct ofp_desc_stats. **/OFPST_DESC = 0, /** Body of reply to OFPST_DESC request. Each entry is a NULL- terminated ASCII string. **/struct ofp_desc_stats {char mfr_desc[DESC_STR_LEN]; /** Manufacturer description. **/char hw_desc[DESC_STR_LEN]; /**	Y	Y	Y	Y	

			Hardware description. **/char sw_desc[DESC_STR_LEN]; /** Software description. **/char serial_num[SERIAL_NUM_LEN]; /** Serial number. **/char dp_desc[DESC_STR_LEN]; /** Human readable description of datapath. */};					
			/* Individual flow statistics. The request body is struct ofp_flow_stats_request. 			/* Experimenter extension. The request and reply bodies begin with* struct ofp_experimenter_stats_header. The request and reply bodies are otherwise experimenter-defined. **/OFPST_EXPERIMENTER = 0xffff /** Body for ofp_stats_request/reply of type OFPST_EXPERIMENTER. **/struct ofp_experimenter_stats_header {uint32_t experimenter; /** Experimenter ID which takes the same form as in struct ofp_experimenter_header. **/uint32_t exp_type; /** Experimenter defined. **//** Experimenter-defined arbitrary additional data. */};	Y	Y	Y	Y	
A.3.6	Queue Configuration Messages	Queue configuration takes place outside the OpenFlow protocol, either through a command line tool	CLI support	Y	Y	Y	Y	
		The switch replies back with an ofp_queue_get_config_reply command, containing a list of configured queues	/* Queue configuration for a given port. **/struct ofp_queue_get_config_reply {struct ofp_header header;uint32_t port;uint8_t pad[4];struct ofp_packet_queue queues[0]; /** List of configured queues. */};	N	N	Y	N	
A.3.7	Packet-Out Message	When the controller wishes to send a packet out through the datapath, it uses the OFPT_PACKET_OUT message		Y	Y	Y	Y	
A.3.8	Barrier Message	When the controller wants to ensure message dependencies have been met or wants to receive notifications for completed operations, it may use an OFPT_BARRIER_REQUEST message	Upon receipt, the switch must finish processing all previously-received messages, including sending corresponding reply or error messages, before executing any messages beyond the Barrier RequestRequest. When such processing is complete, the switch must send an OFPT_BARRIER_REPLY message with the xid of the original request.	Y	Y	Y	Y	
A.3.9	Role Request Message	When the controller wants to change its role, it uses the OFPT_ROLE_REQUEST message and can have the following values	OFPCR_ROLE_NOCHANGE = 0, /* Don't change current role. */	Y	Y	Y	Y	
			OFPCR_ROLE_EQUAL = 1, /* Default role, full access. */	Y	Y	Y	Y	
			OFPCR_ROLE_MASTER = 2, /* Full access, at most one master. */	Y	Y	Y	Y	
			OFPCR_ROLE_SLAVE = 3, /* Read-only access. *	Y	Y	Y	Y	

A.4	Asynchronous Messages							
A.4.1	Packet-In Message	Switches that implement buffering are expected to expose, through documentation, both the amount of available buffering, and the length of time before buffers may be reused	A switch should prevent a buffer from being reused until it has been handled by the controller, or some amount of time (indicated in documentation) has passed.	Y	Y	Y	Y	
A.4.2	Flow Removed Message	If the controller has requested to be notified when flows time out or are deleted from tables, the datapath does this with the OFPT_FLOW_REMOVED message	The reason field is one of the following:OFPRR_IDLE_TIMEOUT = 0, /* Flow idle time exceeded idle_timeout. **/OFPRR_HARD_TIMEOUT = 1, /** Time exceeded hard_timeout. **/OFPRR_DELETE = 2, /** Evicted by a DELETE flow mod. **/OFPRR_GROUP_DELETE = 3, /** Group was removed. */	Y	Y	Y	Y	
A.4.3	Port Status Message	As ports are added, modified, and removed from the datapath, the controller needs to be informed with the OFPT_PORT_STATUS message	The status can be one of the following values:OFPPR_ADD = 0, /* The port was added. **/OFPPR_DELETE = 1, /** The port was removed. **/OFPPR_MODIFY = 2, /** Some attribute of the port has changed. */	Y	Y	Y	Y	
A.4.4	Error Message	There are times that the switch needs to notify the controller of a problem. This is done with the OFPT_ERROR_MSG message	Currently defined error types are:OFPET_HELLO_FAILED = 0, /* Hello protocol failed. **/OFPET_BAD_REQUEST = 1, /** Request was not understood. **/OFPET_BAD_ACTION = 2, /** Error in action description. **/OFPET_BAD_INSTRUCTION = 3, /** Error in instruction list. **/OFPET_BAD_MATCH = 4, /** Error in match. **/OFPET_FLOW_MOD_FAILED = 5, /** Problem modifying flow entry. **/OFPET_GROUP_MOD_FAILED = 6, /** Problem modifying group entry. **/OFPET_PORT_MOD_FAILED = 7, /** Port mod request failed. **/OFPET_TABLE_MOD_FAILED = 8, /** Table mod request failed. **/OFPET_QUEUE_OP_FAILED = 9, /** Queue operation failed. **/OFPET_SWITCH_CONFIG_FAILED = 10, /** Switch config request failed. **/OFPET_ROLE_REQUEST_FAILED = 11, /** Controller Role request failed. **/OFPET_EXPERIMENTER = 0xffff /** Experimenter error messages. */	Y	Y	Y	Y	
A.5	Symmetric Messages	See Section 6.1.3		Y	Y	Y	Y	
B	Appendix B Release Notes							
B.6.6	Vendor Extensions	Vendors are now able to add their own extensions, while still being OpenFlow compliant. The primary way to do this is with the new OFPT_VENDOR message type		N	N	N	N	
B.6.8	802.1D Spanning Tree	A switch that implements STP must set the new OFPC_STP bit in the 'capabilities' field of its OFPT_FEATURES_REPLY message.	A switch that implements STP at all must make it available on all of its physical ports, but it need not implement it on virtual ports (e.g. OFPP_LOCAL)	Y	Y	Y	Y	
			The complete set of port configuration flags are:OFPPC_PORT_DOWN = 1 << 0, /* Port is administratively down. **/OFPPC_NO_STP = 1 << 1, /** Disable 802.1D spanning tree on port. **/OFPPC_NO_RECV = 1 << 2, /** Drop most packets received on port. **/OFPPC_NO_RECV_STP = 1 << 3, /** Drop received 802.1D STP packets. **/OFPPC_NO_FLOOD = 1 << 4, /** Do not include this port when flooding. **/OFPPC_NO_FWD = 1 << 5, /** Drop packets forwarded to port. **/OFPPC_NO_PACKET_IN = 1 << 6 /** Do not send packet-in msgs for port. */	Y	Y	Y	Y	
		Packets received on ports that are disabled by spanning tree must follow the normal flow table processing path		Y	Y	Y	Y	

B.6.21	Behavior Defined When Controller Connection Lost	In the case that the switch loses contact with the controller, the default behavior must be to do nothing - to let flows timeout naturally. Other behaviors can be implemented via vendor-specific command line interface or vendor extension OpenFlow messages	Default behavior supported.	Y	Y	Y	Y	
B.7.1	Failover	Switch can be configured with a list of controllers. If the first controller fails, it will automatically switch over to the second controller on the list		Y	Y	Y	Y	
B.7.2	Emergency Flow Cache	The protocol and reference implementation have been extended to allow insertion and management of emergency flow entries. Emergency-specific flow entries are inactive until a switch loses connectivity from the controller	The switch invalidates all normal flow table entries and copies all emergency flows into the normal flow table. Upon connecting to a controller again, all entries in the flow cache stay active. The controller then has the option of resetting the flow cache if needed.	N	N	N	N	
B.7.9	Rewrite DSCP in IP ToS header	Added Flow action to rewrite the DiffServ CodePoint bits part of the IP ToS field in the IP header.	This enables basic support for basic QoS with OpenFlow in in some switches.	Y	Y	Y	Y	
B.8.1	Slicing	OpenFlow now supports multiple queues per output port. Queues support the ability to provide minimum bandwidth guarantees	The bandwidth allocated to each queue is configurable.	Y	Y	Y	Y	
B.9	OpenFlow version 1.1							
B.9.1	Multiple Tables	The switch now expose a pipeline with multiple tables.		Y	Y	Y	Y	
		Flow entry have instruction to control pipeline processing		Y	Y	Y	Y	
		Controller can choose packet traversal of tables via goto instruction		Y	Y	Y	Y	
		Metadata field (64 bits) can be set and match in tables		N	N	N	N	
		Packet actions can be merged in packet action set		N	N	N	N	
		Packet action set is executed at the end of pipeline		Y	Y	Y	Y	
		Packet actions can be applied between table stages		N	N	N	N	
		Table miss can send to controller, continue to next table or drop	To controller only.	N	N	N	N	
		Rudimentary table capability and configuration		N	N	N	N	
B.9.2	Groups	Group indirection to represent a set of ports		Y	Y	Y	Y	
		Group table with 4 types of groups :	All - used for multicast and flooding.	Y	Y	Y	Y	
			Select - used for multipath.	N	N	Y	Y	
			Indirect - simple indirection.	Y	Y	Y	Y	
			Fast Failover - use first live port.	N	N	Y	Y	
		Group action to direct a flow to a group		Y	Y	Y	Y	
B.9.3	Tags: MPLS & VLAN	Support for VLAN and QinQ, adding, modifying and removing VLAN headers		N	N	Y	N	
		Support for MPLS, adding, modifying and removing MPLS shim headers		Y	Y	Y	Y	

B.9.4	Virtual ports	Make port number 32 bits, enable larger number of ports	GRE & LAG	Y	Y	Y	Y	LOCAL, GRE,ALL,FLOOD only
		Enable switch to provide virtual port as OpenFlow ports		Y	Y	Y	Y	
		Augment packet-in to report both virtual and physical ports		N	N	Y	N	
B.9.5	Other changes	Remove 802.1d-specific text from spec		N	N	N	N	
		Remove Emergency Flow Cache from spec		N	N	N	N	
		Cookie Enhancements Proposal		N	N	N	N	
		Set queue action (unbundled from output port)		N	N	N	N	
		Maskable DL and NW address match fields		Y	Y	Y	Y	
		Add TTL decrement, set and copy actions for IPv4 and MPLS		N	N	N	N	
		SCTP header matching and rewriting support		N	N	N	N	
		Set ECN action		N	N	N	N	
		Connection interruption trigger fail secure or fail standalone mode		Y	Y	Y	Y	
		Define message handling : no loss, may reorder if no barrier		N	N	N	N	
		Rename VENDOR APIs to EXPERIMENTER APIs						
B.10	OpenFlow version 1.2							
B.10.1	Extensible match support	The Extensible set_field action reuses the OXM encoding defined for matches, and enables to rewrite any header field in a single action (EXT-13)	Deprecate most header rewrite actions.	N	N	N	N	
			Introduce generic set-field action (EXT-13).	N	N	N	N	
			Reuse match TLV structure (OXM) in set-field action.	N	N	N	N	
B.10.2	Extensible 'set field' packet rewriting support	Rather than introduce a hard coded field in the packet-in message, the flexible OXM encoding is used to carry packet context	Reuse match TLV structure (OXM) to describe metadata in packet-in (EXT-6).	N	N	N	N	Layer-2 field supported
			Include the 'metadata' field in packet-in.	N	N	N	N	
			Move ingress port and physical port from static field to OXM encoding.	N	N	N	N	
			Allow to optionally include packet header fields in TLV structure.	N	N	N	N	
B.10.3	Extensible context expression in 'packet-in'	Rather than introduce a hard coded field in the packet-in message, the flexible OXM encoding is used to carry packet context	Reuse match TLV structure (OXM) to describe metadata in packet-in (EXT-6).	Y	Y	Y	Y	
			Include the 'metadata' field in packet-in.	Y	Y	Y	Y	
			Move ingress port and physical port from static field to OXM encoding.	Y	Y	Y	Y	
			Allow to optionally include packet header fields in TLV structure.	Y	Y	Y	Y	
B.10.4	Extensible Error messages via	An experimenter error code has been added, enabling experimenter functionality to generate custom error messages (EXT-		N	N	N	N	

	experimenter error type	2). The format is identical to other experimenter APIs						
B.10.5	IPv6 support added	Basic support for IPv6 match and header rewrite has been added	Added support for matching on IPv6 source address, destination address, protocol number, traffic class, ICMPv6 type, ICMPv6 code and IPv6 neighbor discovery header fields (EXT-1).	Y	Y	Y	Y	IPv6_SIP + IPv6_DIP; IPv6_SIP + MAC DA + MAC SA; IPv6_DIP + MAC DA + MAC SA; 512 flow for P-3780 & P-3920
			Added support for matching on IPv6 flow label (EXT-36).	N	N	N	N	
B.10.6	Simplified behaviour of flow-mod request	The behaviour of flow-mod request has been simplified (EXT-30)	MODIFY and MODIFY STRICT commands never insert new flows in the table.	N	N	N	N	
			New flag OFPFF RESET COUNTS to control counter reset.	N	N	N	N	
			Remove quirky behaviour for cookie field.	Y	Y	Y	Y	
B.10.7	Removed packet parsing specification	The match fields are only defined logically	OpenFlow does not mandate how to parse packets.	N	N	N	N	
			Parsing consistency achieved via OXM pre-requisite.	N	N	N	N	
B.10.8	Controller role change mechanism	The controller role change mechanism is a simple mechanism to support multiple controllers for failover (EXT-39)	The switch only need to remember the role of each controller to help the controller election mechanism.	N	N	N	N	
			Simple mechanism to support multiple controllers for failover.	Y	Y	Y	Y	
			Switches may now connect to multiple controllers in parallel.	Y	Y	Y	Y	
			Enable each controller to change its roles to equal, master or slave.	Y	Y	Y	Y	
B.10.9	Other changes	Per-table metadata bitmask capabilities (EXT-34)		Y	Y	Y	Y	
		Rudimentary group capabilities (EXT-61)		N	N	N	N	
		Add hard timeout info in flow-removed messages (OFP-283)		Y	Y	Y	Y	
		Add ability for controller to detect STP support(OFP-285)		Y	Y	Y	Y	
		Turn off packet buffering with OFPCML NO BUFFER (EXT-45)		Y	Y	Y	Y	
		Added ability to query all queues (EXT-15)		N	N	N	N	
		Added experimenter queue property (EXT-16)		Y	Y	Y	Y	
		Added max-rate queue property (EXT-21)		Y	Y	Y	Y	
		Enable deleting flow in all tables (EXT-10)		Y	Y	Y	Y	
		Enable switch to check chaining when deleting groups (EXT-12)		N	N	N	N	
		Enable controller to disable buffering (EXT-45)		Y	Y	Y	Y	
		Virtual ports renamed logical ports (EXT-78)		N	N	N	N	
		New error messages (EXT-1, EXT-2, EXT-12, EXT-13, EXT-39, EXT-74 and EXT-82)		Y	Y	Y	Y	
		Include release notes into the specification document		Y	Y	Y	Y	
		Many other bug fixes, rewording and clarifications		Y	Y	Y	Y	

	OpenFlow 1.3							
	Per flow meters	Flexible meter framework based on per-flow meters and meter bands.						
		Meter statistics, including per band statistics.	1 band per meter	Y	Y	Y	Y	
		Enable to attach meters flexibly to flow entries.		Y	Y	Y	Y	
		◖Simple rate-limiter support (drop packets		Y	Y	Y	Y	
	Per connection event filtering	Add asynchronous message filter for each controller connection		Y	Y	Y	Y	
	Per connection event filtering	Add asynchronous message filter for each controller connection						
		Set default lter value to match OpenFlow 1.2 behaviour		Y	Y	Y	Y	
		Remove OFPC_INVALID_TTL_TO_CONTROLLER config flag						
	Auxiliary connections	Auxiliary connections are mostly useful to carry packet-in and packet-out messages		N	N	N	N	
	MPLS BoS matching	match the Bottom of Stack bit (BoS) from the MPLS header (EXT-85). The BoS bit indicates if other MPLS shim header are in the payload of the present MPLS packet, and matching this bit can help to disambiguate case where the MPLS label is present MPLS packet, and matching this bit can help to disambiguate case where the MPLS label is reused across levels of MPLS encapsulation		N	N	N	N	
	Provider Backbone Bridging tagging	Push and Pop operation to add PBB header as a tag.◖		Y	Y	Y	Y	
		New OXM field to match I-SID for the PBB header	PBB-MPLS-VLAN order	N	N	N	N	
	Rework tag order	the nal order of tags in a packet is dictated by the order of the taggingoperations, each tagging operation adds its tag in the outermost position	Remove defined order of tags in packet from the specification.	N	N	N	N	
			Tags are now always added in the outermost possible position.	Y	Y	Y	Y	
			Action-list can add tags in arbitrary order.	N	N	N	N	
			◖Tag order is predened for tagging in the action-set.	Y	Y	Y	Y	
	Tunnel-ID metadata	A new OXM field that expose to the OpenFlow pipeline metadata associated with the logical port, most commonly the demultiplexing eld from the encapsulation header	If the logical port perform GRE encapsulation, the tunnel-id eld would map to the GRE key field from the GRE header. be able to match the GRE key in the tunnel-id match eld.	N	N	N	N	
	Cookies in packet-in							
	Duration for stats	Duration field was added to most statistics, including port statistics, group statistics, queue statistics and meter statistics		Y	Y	Y	Y	
	On demand flow counters	New flow-mod flags have been added to disable packet and byte counters on a per-flow basis		N	N	N	N	

PicOS Support for OpenFlow 1.3.0

This document contains OpenFlow 1.3.0 features supported by the Pica8 PicOS software. For clarity, the feature names in this table are identical to the feature names found in OpenFlow Switch Specification Version 1.3.0.

OpenFlow Messages

Each OpenFlow message begins with the OpenFlow header. The OpenFlow header has several fields, including the **type** field. The **type** field identifies the type of OpenFlow message.

The OpenFlow protocol has three message types: *symmetric*, *controller-to-switch*, *asynchronous*. Each message type has multiple sub-types.

Symmetric Messages

Symmetric messages are unsolicited messages that may be initiated by either the switch or the controller. Symmetric messages are sent without explicit solicitation, in either direction. The following table describes PicOS support for symmetric messages:

Table 1 PicOS Support for OpenFlow Symmetric Messages

Message	Support	Comments
OFPT_HELLO	Supported	
OFPT_ERROR	Supported	
OFPT_ECHO_REQUEST	Supported	
OFPT_ECHO_REPLY	Supported	
OFPT_EXPERIMENTER	Not Supported	

Controller-to-Switch Messages

Controller-to-switch messages are sent from the controller to the switch. These messages are used to directly manage the state of a switch. Controller-to-switch messages may or may not require a response from the switch.

The following table describes PicOS support for controller-to-switch messages:

Table 2 PicOS Support for OpenFlow Controller-to-Switch Messages

Message	Support	Comments
OFPT_FEATURES_REQUEST	Supported	
OFPT_FEATURES_REPLY See Capabilities Supported by Datapath		
OFPT_GET_CONFIG_REQUEST	Supported	
OFPT_GET_CONFIG_REPLY		
OFPT_SET_CONFIG	Supported	
OFPT_PACKET_OUT	Supported	
OFPT_FLOW_MOD	Supported	
OFPT_GROUP_MOD	Supported	
OFPT_PORT_MOD	Supported	
OFPT_TABLE_MOD	Supported	
OFPT_MULTIPART_REQUEST See Multipart Messages	Supported	
OFPT_MULTIPART_REPLY See Multipart Messages	Supported	
OFPT_BARRIER_REQUEST	Supported	
OFPT_BARRIER_REPLY		
OFPT_QUEUE_GET_CONFIG_REQUEST	Supported	
OFPT_QUEUE_GET_CONFIG_REPLY	Supported	
OFPT_ROLE_REQUEST	Supported	
OFPT_ROLE_REPLY		

Message	Support	Comments
OFPT_GET_ASYNC_REQUEST	Supported	
OFPT_GET_ASYNC_REPLY	Supported	
OFPT_SET_ASYNC	Supported	
OFPT_METER_MOD	Supported	

Asynchronous Messages

Asynchronous messages are sent from the switch to the controller. These messages are used to communicate network events and switch state changes to the controller. Asynchronous messages are sent without a controller explicitly requesting them from a switch.

The following table describes PicOS support for asynchronous messages:

Table 3 PicOS Support for OpenFlow Asynchronous Messages

Message	Support	Comments
OFPT_PACKET_IN	Supported	
OFPT_FLOW_REMOVED	Supported	
OFPT_PORT_STATUS	Supported	

Multipart Messages

The following table describes PicOS support for multipart messages: a single OpenFlow message cannot be larger than 64 kilobytes. Multipart messages are used to encode requests or replies that would carry a large amount of data, and would not always fit in a single OpenFlow message. The sender encodes the request or reply as a sequence of multipart messages, with a specific multipart type. The receiver re-assembles the request or reply.

Table 4 PicOS Support for OpenFlow Multipart Messages

Message	Support	Comments
OFPMP_DESC	Supported	
OFPMP_FLOW	Supported	
OFPMP_AGGREGATE		
OFPMP_TABLE	Supported	
OFPMP_PORT_STATS	Supported	
OFPMP_QUEUE	Supported	
OFPMP_GROUP	Supported	
OFPMP_GROUP_DESC	Supported	
OFPMP_GROUP_FEATURES	Not Supported	
OFPMP_METER	Supported	
OFPMP_METER_CONFIG	Supported	
OFPMP_METER_FEATURES	Supported	
OFPMP_TABLE_FEATURES	Supported	
OFPMT_PORT_DESC	Supported	
OFPMP_EXPERIMENTER	Not Supported	

Capabilities Supported by Datapath

The controller sends an **OFPT_FEATURES_REQUEST** message to the switch, once a session is established. The switch responds to the **OFPT_FEATURES_REQUEST** message with an **OFPT_FEATURES_REPLY** message. The **OFPT_FEATURES_REPLY** message has several fields, including the **capabilities** field. The **capabilities** field identifies the capabilities supported by the switch datapath.

The **capabilties** field is a combination of the following bits/flags:

Table 5 PicOS Support for OpenFlow Capabilities Supported by Datapath

Specification	Support	Comments
OFPC_FLOW_STATS	Supported	
OFPC_TABLE_STATS	Supported	
OFPC_PORT_STATS	Supported	
OFPC_GROUP_STATS	Supported	

Specification	Support	Comments
OFPC_IP_REASM		
OFPC_QUEUE_STATS		
OFPC_PORT_BLOCKED		

OpenFlow Ports

OpenFlow ports are abstract network interfaces used for passing traffic between the OpenFlow switch and the rest of the network. An OpenFlow switch makes a number of OpenFlow ports available. The set of OpenFlow ports does not have to be identical to the set of physical network interfaces on the switch hardware.

Port Descriptions

The OpenFlow switch receives and sends packets on OpenFlow ports. The switch may define physical and logical ports, and the OpenFlow specification also defines some reserved ports.

OFPPS_LIVE		

Port Features

The following table describes PicOS support for OpenFlow port features available in the datapath:

Table 9 PicOS Support for OpenFlow Port Features

Specification	Support	Comments
OFPPF_10MB_HD	Supported	
OFPPF_10MB_FD	Supported	
OFPPF_100MB_HD	Supported	
OFPPF_100MB_FD	Supported	
OFPPF_1GB_HD	Supported	
OFPPF_1GB_FD	Supported	
OFPPF_10GB_FD	Supported	
OFPPF_40GB_FD	Supported	
OFPPF_100GB_FD	Supported	
OFPPF_1TB_FD		
OFPPF_OTHER		
OFPPF_COPPER	Supported	
OFPPF_FIBER	Supported	
OFPPF_AUTONEG	Supported	
OFPPF_PAUSE	Supported	
OFPPF_PAUSE_ASYM		

OpenFlow Instructions

Each flow entry contains a set of instructions that are executed when a packets matches the entry. The following table details OpenFlow instructions supported by PicOS:

Table 10 PicOS Support for OpenFlow Instructions

Specification	Support	Comments
OFPIT_GOTO_TABLE	Supported	
OFPIT_WRITE_METADATA	Supported	
OFPIT_WRITE_ACTIONS	Supported	
OFPIT_APPLY_ACTIONS	Supported	
OFPIT_CLEAR_ACTIONS	Supported	
OFPIT_METER	Supported	
OFPIT_EXPERIMENTER		

OpenFlow Action Types

The following table details OpenFlow action types supported by PicOS:

Table 11 PicOS Support for OpenFlow Action Types

Specification	Support	Comments
OFPAT_OUTPUT	Supported	
OFPAT_COPY_TTL_OUT	Supported	
OFPAT_COPY_TTL_IN	Supported	
OFPAT_SET_MPLS_TTL	Supported	
OFPAT_DEC_MPLS_TTL	Not Supported	
OFPAT_PUSH_VLAN	Supported	
OFPAT_POP_VLAN	Supported	
OFPAT_PUSH_MPLS	Supported	
OFPAT_POP_MPLS	Supported	
OFPAT_SET_QUEUE	Supported	
OFPAT_GROUP	Supported	

Specification	Support	Comments
OFPAT_SET_NW_TTL	Not Supported	
OFPAT_DEC_NW_TTL	Not Supported	
OFPAT_SET_FIELD	Supported	
OFPAT_PUSH_PBB	Supported	
OFPAT_POP_PBB	Supported	
OFPAT_EXPERIMENTER	Not Supported	

OpenFlow Match Fields

A match field may include the packet header, the ingress port, and the metadata value. A match field may use wildcards to match any value, and in some cases bitmasks. A packet is matched against a match field.

The following table details the OXM flow match field types supported by PicOS:

Table 12 PicOS Support for OpenFlow Flow Match Fields

Specification	Support	Comments
OFPXMT_OFB_IN_PORT	Supported	
OFPXMT_OFB_IN_PHY_PORT	Supported	
OFPXMT_OFB_METADATA		
OFPXMT_OFB_ETH_DST	Supported	
OFPXMT_OFB_ETH_SRC	Supported	
OFPXMT_OFB_ETH_TYPE	Supported	
OFPXMT_OFB_VLAN_VID	Supported	
OFPXMT_OFB_VLAN_PCP	Supported	
OFPXMT_OFB_IP_DSCP	Supported	
OFPXMT_OFB_IP_ECN		
OFPXMT_OFB_IP_PROTO	Supported	
OFPXMT_OFB_IPV4_SRC	Supported	
OFPXMT_OFB_IPV4_DST	Supported	
OFPXMT_OFB_TCP_SRC	Supported	
OFPXMT_OFB_TCP_DST	Supported	
OFPXMT_OFB_UDP_SRC	Supported	
OFPXMT_OFB_UDP_DST	Supported	
OFPXMT_OFB_SCTP_SRC		
OFPXMT_OFB_SCTP_DST		
OFPXMT_OFB_ICMPV4_TYPE	Supported	
OFPXMT_OFB_ICMPV4_CODE	Supported	
OFPXMT_OFB_ARP_OP	Supported	
OFPXMT_OFB_ARP_SPA	Supported	
OFPXMT_OFB_ARP_TPA	Supported	
OFPXMT_OFB_ARP_SHA		
OFPXMT_OFB_ARP_THA		
OFPXMT_OFB_IPV6_SRC	Supported	
OFPXMT_OFB_IPV6_DST	Supported	
OFPXMT_OFB_IPV6_FLABEL		
OFPXMT_OFB_ICMPV6_TYPE		
OFPXMT_OFB_ICMPV6_CODE		
OFPXMT_OFB_IPV6_ND_TARGET		

Specification	Support	Comments
OFPXMT_OFB_IPV6_ND_SLL		
OFPXMT_OFB_IPV6_ND_TLL		
OFPXMT_OFB_MPLS_LABEL	Supported	
OFPXMT_OFB_MPLS_TC	Supported	
OFPXMT_OFP_MPLS_BOS		
OFPXMT_OFB_PBB_ISID	Supported	
OFPXMT_OFB_TUNNEL_ID	Supported	
OFPXMT_OFB_IPV6_EXTHDR		

OpenFlow Group Types

The following table describes PicOS support for OpenFlow group types:

Table 13 PicOS Support for OpenFlow Group Types

Specification	Support	Comments
OFPGT_ALL	Supported	
OFPGT_SELECT	Supported	
OFPGT_INDIRECT	Supported	
OFPGT_FF	Supported	

PicOS Support for OpenFlow 1.4

The following table contains OpenFlow 1.4 features supported by PicOS. For clarity, the feature names in this table are identical to the feature names found in OpenFlow Switch Specification Version 1.4.0.

Table 1 OpenFlow 1.4 Features Supported by PicOS

Pica8 OpenFlow V1.4 Compliance Matrix						
Chapter	**Title**	**Features**	**Detail Feature Specification**	**Optional**	**R2.3 Support**	**Remarks**
2	Switch Components	NA				
		Flow table			Y	
		Group table	All, indirect, select, fast_failover group table are all supported.		Y	
		Add/update/delete flow entries			Y	
		Match fields			Y	
		Counters			Y	
		Set of instructions			Y	
4	OpenFlow Ports	NA				
4.1	OpenFlow Ports	see 4.2-4.5			Y	
4.2	Standard Ports	See 4.2-4.5			Y	
4.3	Physical Ports	NA				
		Ingress	PicOS only supports it as matching port.		Y	
		Output			Y	
		Hardware interface			Y	
		Groups			Y	
		Port counters			Y	
4.4	Logical Ports	NA	The OpenFlow logical ports are switch defined ports that don't correspond directly to a hardware interface of the switch.			
		Map to various physical ports			Y	
		LAG			Y	
		Tunnel (GRE)			Y	
		Lookback interface			Y	
		Ingress			Y	
		Output			Y	
		Groups			Y	
4.5	Reserved Ports	NA				
		All	Represents all ports the switch can use for forwarding a specific packet. Can be used only as an output port.		Y	
		Controller	Represents the control channel with the OpenFlow controller. Can be used as an ingress port or as an output port.		Y	
		Table	Represents the start of the OpenFlow pipeline.		Y	
		In_port	Represents the packet ingress port. Can be used only as an output port, send the packet out through its ingress port.		Y	Matching must specify the ingress port.
		Any	Special value used in some OpenFlow commands when no port is specified. Can neither be used as an ingress port nor as an output port.		N	

		Local	Represents the switch's local networking stack and its management stack.	O	Y	
		Normal	Represents the traditional non-OpenFlow pipeline of the switch. Can be used only as an output port and processes the packet using the normal pipeline.	O	Y	
		Flood	Represents flooding using the normal pipeline of the switch. Can be used only as an output port.	O	Y	
5	OpenFlow Tables	NA				
5.1	Pipeline Processing					
		Openflow-only	All packets are processed by the OpenFlow pipeline.		Y	
		Openflow-hybrid	OpenFlow operation and normal Ethernet switching operation.		N	
			L2 Ethernet switching, L3 routing (IPv4 routing, IPv6 routing...), ACL and QoS processing.		N	
			VLAN isolation		N	
			A classification mechanism outside of OpenFlow that routes traffic to either the OpenFlow pipeline or the normal pipeline.		N	
			VLAN tag or input port whether to process the packet using which pipeline.		N	
			Normal and flood		N	
		Multiple flow tables, each flow table containing multiple flow entries			Y	
		Sequentially numbered, start at 0			Y	
		Goto instruction			Y	
		Go forward and not backward			Y	
		Last table can not include goto instruction			N	
		Table miss			Y	
5.2	Flow Table	NA				
		Match fields	To match against packets..		Y	
		Priority	Matching precedence of the flow entry.		Y	
		Counters	Updated when packets are matched.		Y	Only count by Byte
		Instructions	To modify the action set or pipeline processing.		Y	
		Timeouts	Maximum amount of time or idle time before flow is expired by the switch.		Y	
		Cookie	Opaque data value chosen by the controller.		Y	
		Wildcards all fields and priority equal 0 is table-miss			Y	
5.3	Matching	NA				
		Ingress port			Y	
		Metadata fields			N	
		Apply-actions			Y	
		Any			N	
		Highest priority matches packets be selected			Y	
		Counters update and instructions applied			Y	
		OFPFF_CHECK_OVERLAP			Y	
		OFPC_FRAG_REASM			N	
		Behavior when a switch receives a corrupted packet			N	

5.4	Table-miss	NA				
		Every flow table support table-miss			Y	
		Send packets to controller			Y	
		Drop packets			Y	
		Direct packets to a subsequent table			Y	
		Wildcard all match fields			N	MAC/IP/Port can support wildcard.
		Priority= 0			Y	
		Not exist by default			Y	
		Add or remove by controller at any time			Y	
		May expire			N	
		Match packets unmatched by others			Y	
		Instructions applied			Y	
		Packet-in reason is table-miss			Y	
		Packets unmatched are dropped is not exist table-miss			Y	
5.5	Flow Removal	NA				
			Is run by the switch independently of the controller and is based on the state and configuration of flow entries.		Y	
			A non-zero hard_timeout field causes the flow entry to be removed after the given number of seconds, regardless of how many packets it has matched.		Y	
			A non-zero idle_timeout field causes the flow entry to be removed when it has matched no packets in the given number of seconds.		Y	
			The switch must implement flow expiry and remove flow entries from the flow table when one of their timeouts is exceeded.		Y	
		OFPFF_SEND_FLOW_REM flag	When a flow entry is removed, the switch must check the flow entry's OFPFF_SEND_FLOW_REM flag. If this flag is set, the switch must send a flow removed message to the controller.		Y	
			Each flow removed message contains a complete description of the flow entry, the reason for removal (expiry or delete), the flow entry duration at the time of removal, and the flow statistics at time of removal.		Y	
		Eviction	Flow entries may be evicted from flow tables when the switch needs to reclaim resources.		Y	
5.6	Group Table	NA				
		Group identifier			Y	
		Group type			Y	
		Counters			Y	
		Action buckets			Y	
5.6.1	Group Types	All	Used for multicast or broadcast.		Y	
			Effectively cloned for each bucket..		Y	
			Process for each bucket.		Y	Some limitation, please see configuration guide.
			Direct out the ingress, packet is dropped.		Y	
			Output action to OFPP_IN_PORT		Y	Need to specify the in_port in matching.
		Select	Processed by a single bucket.		Y	

			Switch-computed selection algorithm.		Y	
			Bucket weight		N	
			Forward to live ports		Y	
		Indirect	Supports only a single bucket.		Y	
			Multiple flow entries or groups to point to a common group identifier.		Y	
			Supporting faster, more efficient convergence.		N	
			Effectively identical to an all group with one bucket.		Y	
		Fast failover	Execute the first live bucket.		Y	
			Associated with a port and/or group.		Y	
			Change forwarding without request to controller.		Y	
			No bucket live, packet dropped.		Y	
5.7	Meter Table					
		Meter entries			Y	
		Per-flow meters			Y	
		Rate-limit			Y	
		Combine with per-port queue			Y	
		Measure and control packet rate			Y	
		Attached to flow entries			Y	
		In flow instruction set			Y	
		Multiple meters in the same table			Y	
		Multiple meters on the same set of packets			Y	
		Meter identifier			Y	
5.7.1		Meter Bands				
		One band			Y	
		More meter bands			N	
		The rate band applies and the way packets be process			Y	
		Processed by a single meter band based on the current measured meter rate			Y	
		Configure rate lower than current rate			Y	
		No meter band applied if current rate lower than specified rate			Y	
		Band type			Y	
		Rate			Y	
		Counters			Y	
5.8	Counters	NA				
	Per Table Counters	Reference count (active entries)	32 bits		Y	
		Packet Lookups	64 bits		Y	
		Packet Matches	64 bits		Y	
	Per Flow Counters	Received Packets	64 bits		Y	
		Received Bytes	64 bits		Y	
		Duration (seconds)	32 bits		Y	
		Duration (nanoseconds)	32 bits			
	Per Port Counters	Received Packets	64 bits		Y	

		Transmitted Packets	64 bits		Y	
		Received Bytes	64 bits		Y	
		Transmitted Bytes	64 bits		Y	
		Receive Drops	64 bits		Y	
		Transmit Drops	64 bits		Y	
		Receive Errors	64 bits		Y	
		Transmit Errors	64 bits		Y	
		Receive Frame Alignment Errors	64 bits		Y	
		Receive Overrun Errors	64 bits		Y	
		Receive CRC Errors	64 bits		Y	
		Collisions	64 bits		Y	
	Per Queue Counters	Transmit Packets	64 bits		N	
		Transmit Bytes	64 bits		N	
		Transmit Overrun Errors	64 bits		N	
	Per Group Counters	Reference Count (flow entries)	32 bits		Y	
		Packet Count	64 bits		Y	
		Byte Count	64 bits		N	
	Per Bucket Counters	Packet Count	64 bits		N	
		Byte Count	64 bits		N	
5.9	Instructions					
		The controller can query the switch about which of the “Optional Instructions” it supports.			Y	
		Apply-Actions action(s)			Y	
		Clear-Actions			Y	
		Write-Actions action(s)			Y	
		Write-Metadata metadata/mask			Y	
		Goto-Table next-table-id			Y	
		Clear-Actions instruction is executed before the Write-Actions instruction.			Y	
		Goto-Table is executed last.			Y	
		Reject a flow entry if it is unable to execute the instructions & return an unsupported flow error.			N	
5.10	Action Set					
		Action set is associated with each packet.			Y	
		This set is empty by default.			Y	
		Action set is carried between flow tables.			Y	
		When the instruction set of a flow entry does not contain a Goto-Table instruction, pipeline processing stops and the actions in the action set of the packet are executed.			Y	
		Action set contains a maximum of one action of each type.			Y	
		The actions in an action set are applied in the order specified below.			Y	
		1. copy TTL inwards			N	

		2. pop			Y	
		3. push			Y	
		4. copy TTL outwards			N	
		5. decrement TTL			N	
		6. set			Y	
		7. qos			Y	
		8. group	If a group action is specified, apply the actions of the relevant group bucket(s) in the order specified by this list.		Y	
		9. output	If no group action is specified, forward the packet on the port specified by the output action. The output action in the action set is executed last.		N	
			If both an output action and a group action are specified in an action set, the output action is ignored and the group action takes precedence.		N	
			If no output action and no group action were specified in an action set, the packet is dropped.		N	
			The execution of groups is recursive if the switch supports it; a group bucket may specify another group, in which case the execution of actions traverses all the groups specified by the group configuration.		N	
5.11	Action list					
		Apply-Actions instruction and the Packet-out message include an action list	The actions of an action list are executed in the order specified by the list, and are applied immediately to the packet.		Y	
			The effect of those actions is cumulative.		Y	
			If the action list contains an output action, a copy of the packet is forwarded in its current state to the desired port.		Y	
			If the list contains a group actions, a copy of the packet in its current state is processed by the relevant group buckets.		Y	
5.12	Actions					
		Output	Support forwarding to physical ports, switch-defined logical ports and the required reserved ports.		Y	
		Set-Queue	The set-queue action sets the queue id for a packet and is used to provide basic Quality-of-Service (QoS) support.		Y	
		Drop			Y	
		Group			Y	
		Push-Tag/Pop-Tag	Order of header fields - Ethernet, VLAN, MPLS, ARP/IP, TCP/UDP/SCTP (IP-only).		Y	
		Push VLAN header	Push a new VLAN header onto the packet. The Ethertype is used as the Ethertype for the tag. Only Ethertype 0x8100 and 0x88a8 should be used.		Y	
		Pop VLAN header	Pop the outer-most VLAN header from the packet.		Y	
		Push MPLS header	Push a new MPLS shim header onto the packet. Only Ethertype 0x8847 and 0x8848 should be used.		Y	
		Pop MPLS header	Pop the outer-most MPLS tag or shim header from the packet.		Y	
		Push PBB header			Y	
		Pop PBB header			Y	
		Set-Field			Y	
		Set VLAN ID			Y	
		Strip VLAN ID			Y	
		Change-TTL	Modify the values of the IPv4 TTL, IPv6 Hop Limit or MPLS TTL in the packet.		N	

			If it is supported, applied to the outermost-possible header.		N	
		Set MPLS TTL	8 bits: New MPLS TTL, Replace the existing MPLS TTL. Only applies to packets with an existing MPLS shim header.		Y	
		Decrement MPLS TTL	Decrement the MPLS TTL. Only applies to packets with an existing MPLS shim header.		N	
		Set IP TTL	Replace the existing IPv4 TTL or IPv6 Hop Limit and update the IP checksum. Only applies to IPv4 and IPv6 packets.		N	
		Decrement IP TTL	Decrement the IPv4 TTL or IPv6 Hop Limit field and update the IP checksum. Only applies to IPv4 and IPv6 packets		N	
		Copy TTL outwards	Copy the TTL from next-to-outermost to outermost header with TTL. Copy can be IP-to-IP, MPLS-to-MPLS, or IP-to-MPLS.		N	
		Copy TTL inwards	Copy the TTL from outermost to next-to-outermost header with TTL. Copy can be IP-to-IP, MPLS-to-MPLS, or MPLS-to-IP.		N	
5.12.1	Default values for field on push					
		Field values for all fields specified in Table 6 should be copied from existing outer headers to new outer headers.	VLAN ID ← VLAN ID		Y	
		New fields listed in Table 6 without corresponding existing fields should be set to zero.	VLAN priority ← VLAN priority		Y	
		Fields in new headers may be overridden by specifying a “set” action for the appropriate field(s) after the push operation.	MPLS label ← MPLS label		Y	
		Fields in new headers may be overridden by specifying a “set” action for the appropriate field(s) after the push operation.	PBB label ← PBB label		Y	
6	OpenFlow Channel					
6.1	OpenFlow Protocol Overview	The OpenFlow protocol supports three message types, controller-to-switch, asynchronous, and sym-metric, each with multiple sub-types.				
6.1.1		Controller-to-Switch	Controller/switch messages are initiated by the controller and may or may not require a response from the switch.		Y	
6.1.2		Asynchronous	Asynchronous messages are sent without a controller soliciting them from a switch.		Y	
			Switches send asynchronous messages to controllers to denote a packet arrival or switch state change.		Y	
6.1.3		Symmetric	Symmetric messages are sent without solicitation, in either direction., including Hello, Echo, Error, Experimenter message.		Y	
6.2	Message Handling	The OpenFlow protocol provides reliable message delivery and processing, but does not automatically provide acknowledgements or ensure ordered message processing.			Y	
6.3	OpenFlow Channel Connections	The OpenFlow channel is used to exchange OpenFlow message between an OpenFlow switch and an OpenFlow controller.				
6.3.1		Connection Setup	The switch must be able to establish communication with a controller at a user-configurable IP address, using either a user-specified transport port or the default transport port.		Y	

6.3.2		Connection Interruption	In the case that a switch loses contact with all controllers the switch must immediately enter either \fail secure mode" or \fail standalone mode", depending upon the switch implementation and configuration.		Y	
6.3.3		Encryption	The switch and controller may communicate through a TLS connection.		Y	
6.3.4		Multiple Controllers	The switch may establish communication with a single controller, or may establish communication with multiple controllers.		Y	
6.3.5		Auxiliary Connections	The OpenFlow channel may also be composed of a main connection and multiple auxiliary connections.		Y	
6.4	Flow Table Modification Messages	Flow table modification messages are used to add, modify, delete flow.			Y	
6.5	Flow Table Synchronization	A flow table may be synchronized with another flow table. with Flow Table Synchronization			N	
6.6	Group Table Modification Messages	Action of group (including add, modify, delete) can be done by Group table modification messages.			Y	
6.7	Meter Modification Messages	Action of meter (including add, modify, delete) can be done by Meter modification messages.			Y	
6.8	Bundle Messages					
6.8.1		Bundle overview	A bundle is a sequence of OpenFlow modification requests from the controller that is applied as a single OpenFlow operation.		Y	
6.8.2		Bundle example usage			Y	
6.8.3		Bundle error processing	The OpenFlow messages part of a bundle must be pre-validated before they are stored in the bundle.		Y	
6.8.4		Bundle atomic modifications	Committing the bundle must be controller atomic.		N	
6.8.5		Bundle parallelism	The switch must support exchanging echo request and echo reply messages during the creation and population of the bundle, the switch must reply to an echo request without waiting for the end of the bundle.		Y	
7	The OpenFlow Protocol					
7.1	OpenFlow Header	Each Openflow message begins with the OpenFlow header			Y	
7.1.1		Padding	Most OpenFlow messages contain padding fields.		Y	
7.2	Common Structures					
7.2.1		Port Structures	The switch may define physical and logical ports.		Y	
7.2.1.1		Port Description Structures, the physical ports, switch-defined logical ports, and the OFPP_LOCAL reserved port	Ports includes: OFPP_IN_PORT,OFPP_TABLE, OFPP_NORMAL, OFPP_FLOOD, OFPP_ALL, OFPP_CONTROLLER, OFPP_LOCAL,OFPP_ANY		Y	
7.2.1.2		Port Description Properties. A property definition contains the property type, length, and any associated data.	Associated date includes curr, advertised, supported, peer, each one consists of speed, duplexity.		Y	
7.2.2		Flow Match Structures	An OpenFlow match is composed of a flow match header and a sequence of zero or more flow match fields.		Y	
7.2.2.1		Flow Match Header, Fields to match against flows	The flow match header is described by the ofp_match structure, The type field is set to OFPMT_OXM and length field is set to the actual length of ofp_match structure including all match fields. The payload of the OpenFlow match is a set of OXM Flow match fields.		Y	
7.2.2.2		Flow Match Field Structures	The flow match fields are described using the OpenFlow Extensible Match (OXM) format, which is a compact type-length-value (TLV) format.		Y	
7.2.2.3		OXM classes	The match types are structured using OXM match classes, The OpenFlow specification distinguishes two types of OXM match classes, ONF member classes		Y	

			and ONF reserved classes, diferentiated by their high order bit.			
7.2.2.4		Flow Matching	A zero-length OpenFlow match (one with no OXM TLVs) matches every packet. Match fields that should be wildcarded are omitted from the OpenFlow match.		Y	
7.2.2.5		Flow Match Field Masking	The masks are defined such that a 0 in a given bit position indicates a \don't care" match for the same bit in the corresponding field, whereas a 1 means match the bit exactly.		Y	Some limitation, please see the configuration guide.
7.2.2.6		Flow Match Field Prerequisite	In general, matching header fields of a protocol can only be done if the OpenFlow match explitly matches the corresponding protocol.		Y	
7.2.2.7		Flow Match Fields	Match fields contains: OFPXMT_OFB_IN_PORT, OFPXMT_OFB_IN_PHY_PORT,		Y	
		OXM_OF_IN_PORT	/* Switch input port. */		Y	
		OXM_OF_IN_PHY_PORT	/* Switch physical input port. */	O		
		OXM_OF_METADATA	/* Metadata passed between tables. */	O		
		OXM_OF_ETH_DST	/* Ethernet destination address. */		Y	
		OXM_OF_ETH_SRC	/* Ethernet source address. */		Y	
		OXM_OF_ETH_TYPE	/* Ethernet frame type. */		Y	
		OXM_OF_VLAN_VID	/* VLAN id. */	O	Y	
		OXM_OF_VLAN_PCP	/* VLAN priority. */	O	Y	
		OXM_OF_IP_DSCP	/* IP DSCP (6 bits in ToS field). */	O	Y	
		OXM_OF_IP_ECN	/* IP ECN (2 bits in ToS field). */	O	N	
		OXM_OF_IP_PROTO	/* IP protocol. */		Y	
		OXM_OF_IPV4_SRC	/* IPv4 source address. */		Y	
		OXM_OF_IPV4_DST	/* IPv4 destination address. */		Y	
		OXM_OF_TCP_SRC	/* TCP source port. */		Y	
		OXM_OF_TCP_DST	/* TCP destination port. */		Y	
		OXM_OF_UDP_SRC	/* UDP source port. */		Y	
		OXM_OF_UDP_DST	/* UDP destination port. */		Y	
		OXM_OF_SCTP_SRC	/* SCTP source port. */	O	N	
		OXM_OF_SCTP_DST	/* SCTP destination port. */	O	N	
		OXM_OF_ICMPV4_TYPE	/* ICMP type. */	O	Y	
		OXM_OF_ICMPV4_CODE	/* ICMP code. */	O	Y	
		OXM_OF_ARP_OP	/* ARP opcode. */	O	Y	
		OXM_OF_ARP_SPA	/* ARP source IPv4 address. */	O	Y	
		OXM_OF_ARP_TPA	/* ARP target IPv4 address. */	O	Y	
		OXM_OF_ARP_SHA	/* ARP source hardware address. */	O	N	
		OXM_OF_ARP_THA	/* ARP target hardware address. */	O	N	
		OXM_OF_IPV6_SRC	/* IPv6 source address. */		Y	
		OXM_OF_IPV6_DST	/* IPv6 destination address. */		Y	
		OXM_OF_IPV6_FLABEL	/* IPv6 Flow Label */	O	N	
		OXM_OF_ICMPV6_TYPE	/* ICMPv6 type. */	O	N	
		OXM_OF_ICMPV6_CODE	/* ICMPv6 code. */	O	N	
		OXM_OF_IPV6_ND_TARGET	/* Target address for ND. */	O	N	
		OXM_OF_IPV6_ND_SLL	/* Source link-layer for ND. */	O	N	
		OXM_OF_IPV6_ND_TLL	/* Target link-layer for ND. */	O	N	
		OXM_OF_MPLS_LABEL	/* MPLS label. */	O	N	

		OXM_OF_MPLS_TC	/* MPLS TC. */	O	N	
7.2.2.8		Experimenter Flow Match Fields	Experimenter-specific ow match fields,may be defined using the oxm_class=OFPXMC_EXPERIMENTER	O	N	
7.2.3		Flow Instruction Structures	Flow instructions associated with a flow table entry are executed when a flow matches the entry.			
7.2.4		Action Structures				
		OFPAT_OUTPUT = 0,	/* Output to switch port. */		Y	
		OFPAT_COPY_TTL_OUT = 11,	/* Copy TTL "outwards" -- from next-to-outermost to outermost */		Y	
		OFPAT_COPY_TTL_IN = 12,	/* Copy TTL "inwards" -- from outermost to next-to-outermost */		Y	
		OFPAT_SET_MPLS_TTL = 15,	/* MPLS TTL */		Y	
		OFPAT_DEC_MPLS_TTL = 16,	/* Decrement MPLS TTL */		N	
		OFPAT_PUSH_VLAN = 17,	/* Push a new VLAN tag */		Y	
		OFPAT_POP_VLAN = 18,	/* Pop the outer VLAN tag */		Y	
		OFPAT_PUSH_MPLS = 19,	/* Push a new MPLS tag */		Y	
		OFPAT_POP_MPLS = 20,	/* Pop the outer MPLS tag */		Y	
		OFPAT_SET_QUEUE = 21,	/* Set queue id when outputting to a port */		Y	
		OFPAT_GROUP = 22,	/* Apply group. */		Y	
		OFPAT_SET_NW_TTL = 23,	/* IP TTL. */		N	
		OFPAT_DEC_NW_TTL = 24,	/* Decrement IP TTL. */		N	
		OFPAT_SET_FIELD = 25,	/* Set a header field using OXM TLV format. */		Y	
		OFPAT_PUSH_PBB = 26	/* Push a new PBB service tag (I-TAG) */		Y	
		OFPAT_POP_PBB = 27	/* Pop the outer PBB service tag (I-TAG) */		Y	
		OFPAT_EXPERIMENTER = 0xffff			N	
7.2.5		Experimenter Structure	Experimenter extensions provide a standard way for OpenFlow switches to offer additional functionality within the OpenFlow message type space.		N	
7.3	Controller-to-Switch Messages					
7.3.1		Handshake	The OFPT_FEATURES_REQUEST message is used by the controller to identify the switch and read its basic capabilities.		Y	
7.3.2		Switch Configuration	The controller is able to set and query configuration parameters in the switch with the OFPT_SET_CONFIG and and OFPT_GET_CONFIG_REQUEST messages, respectively.		Y	
7.3.3		Flow Table Configuration	Flow entries are modified in the flow table using the OFP_FLOW_MOD request.		Y	
7.3.4		Modify State Messages			Y	
7.3.4.1		Modify Flow Table Message	The controller can configure the dynamic state in a flow table with the OFP_TABLE_MOD request.		Y	
7.3.4.2		Modify Flow Entry Message	Modifications to a flow table from the controller are done with the OFPT_FLOW_MOD message.		Y	
7.3.4.3		Modify Group Entry Message	Modifications to the group table from the controller are done with the OFPT_GROUP_MOD message.		Y	
7.3.4.4		Port Modification Message	The controller uses the OFPT_PORT_MOD message to modify the behavior of the port.		Y	
7.3.4.5		Meter Modification Messages	Modifications to a meter from the controller are done with the OFPT_METER_MOD message.		Y	
7.3.5		Multipart Messages	Multipart messages are used to encode requests or replies that potentially carry a large amount of dataand would not always fit in a single OpenFlow message, which is limited to 64KB.			
7.3.5.1		Description	Information about the switch manufacturer, hardware revision, software revision, serial number, and		Y	

			adescription field is available from the OFPMP_DESC multipart request type.			
7.3.5.2		Individual Flow Statistics	Information about individual flow entries is requested with the OFPMP_FLOW multipart request type.		Y	
7.3.5.3		Aggregate Flow Statistics	Aggregate information about multiple flow entries is requested with the OFPMP_AGGREGATE multipart request type.		Y	
7.3.5.4		able Statistics	Information about tables is requested with the OFPMP_TABLE multipart request type.		Y	
7.3.5.5		Table Description	The OFPMP_TABLE_DESC multipart request message provides a way to list the current configuration of the tables on a switch, which is set using the OFPT_TABLE_MOD message.		Y	
7.3.5.6		Table Features	The OFPMP_TABLE_FEATURES multipart type allows a controller to both query for the capabilities of existing tables, and to optionally ask the switch to reconfigure its tables to match a supplied configuration.		N	
		Table Features request and reply	If the OFPMP_TABLE_FEATURES request body is empty the switch will return an array of struct ofp_table_features containing the capabilities of the currently configured flow tables.		N	
		Table Features properties	A property definition contains the property type, length, and any associated data.		N	
7.3.5.7		Port Statistics	Information about ports statistics is requested with the OFPMP_PORT_STATS multipart request type.		Y	
7.3.5.8		Port Description	The port description request OFPMP_PORT_DESCRIPTION enables the controller to get a description of all the ports in the system that support OpenFlow.		Y	
7.3.5.9		Queue Statistics	The OFPMP_QUEUE_STATS multipart request message provides queue statistics for one or more ports and one or more queues.		N	
7.3.5.10		Queue Descriptions	The controller can query the switch for configured queues on a port using OFPMP_QUEUE_DESC multipart request.		Y	
7.3.5.11		Group Statistics	The OFPMP_GROUP multipart request message provides statistics for one or more groups.		Y	
7.3.5.12		Group Description	The OFPMP_GROUP_DESC multipart request message provides a way to list the set of groups on a switch along with their corresponding bucket actions.		Y	
7.3.5.13		Group Features	The OFPMP_GROUP_FEATURES multipart request message provides a way to list the capabilities of groups on a switch.		Y	
7.3.5.14		Meter Statistics	The OFPMT_METER stats request message provides statistics for one or more meters.		Y	
7.3.5.15		Meter Configuration Statistics	The OFPMT_METER_CONFIG stats request message provides configuration for one or more meter.		Y	
7.3.5.16		Meter Features Statistics	The OFPMT_METER_FEATURES stats request message provides the set of features of the metering subsystem.		Y	
7.3.5.17		Flow monitoring	The OFPMP_FLOW_MONITOR multipart type allows a controller to manage flow monitors, that keep track of changes to the flow tables.		N	
		Flow monitoring request	Flow monitor configuration is done with a OFPMP_FLOW_MONITOR multipart request		N	
		Flow monitoring reply	When the switch received a OFPMP_FLOW_MONITOR multipart request, it replies to it using a OFPMP_FLOW_MONITOR multipart reply, the transaction id (xid) of this reply must be the same as the request.		N	
		Flow monitoring pause	OpenFlow messages for flow monitor notifications can over flow the buffer space available to the switch either temporarily or more permanently.		N	
7.3.5.18		Experimenter Multipart	Experimenter-specific multipart messages are requested with the OFPMP_EXPERIMENTER multipart type.		N	

7.3.6		Packet-Out Message	When the controller wishes to send a packet out through the datapath, it uses the OFPT_PACKET_OUT message.		Y	
7.3.7		Barrier Message	When the controller wants to ensure message dependencies have been met or wants to receive notifications for completed operations, it may use an OFPT_BARRIER_REQUEST message.		Y	
7.3.8		Role Request Message	When the controller wants to change its role, it uses the OFPT_ROLE_REQUEST message.		Y	
7.3.9		Bundle messages				
7.3.9.1		Bundle control messages	The controller can create, destroy and commit bundles with the OFPT_BUNDLE_CONTROL request.		Y	
7.3.9.2		Bundle Add message	The controller can add requests to a bundle using the OFPT_BUNDLE_ADD_MESSAGE message.		Y	
7.3.9.3		Bundle flags	Bundle flags enable to modify the behavior of a bundle.		Y	
7.3.9.4		Bundle properties	A property definition contains the property type, length, and any associated data.		Y	
7.3.9.5		Creating and opening a bundle	To create a bundle, the controller sends a OFPT_BUNDLE_CONTROL message with type OFPBCT_OPEN_REQUEST.		Y	
7.3.9.6		Adding messages to a bundle	The switch adds message to a bundle using the OFPT_BUNDLE_ADD_MESSAGE.		Y	
7.3.9.7		Closing a bundle	To finish recording a bundle, the controller may sends a OFPT_BUNDLE_CONTROL message with type OFPBCT_CLOSE_REQUEST.		Y	
7.3.9.8		Committing Bundles	To finish and apply the bundle, the controller sends a OFPT_BUNDLE_CONTROL message with type OFPBCT_COMMIT_REQUEST.		Y	
7.3.9.9		Discarding Bundles	To finish and discard the bundle, the controller sends a OFPT_BUNDLE_CONTROL message with type OFPBCT_DISCARD_REQUEST.		Y	
7.3.9.10		Other bundle error conditions	If a OFPT_BUNDLE_CONTROL message contains an invalid type, the switch must reject the request and send an ofp_error_msg with OFPET_BUNDLE_FAILED type and OFPBFC_BAD_TYPE code.		N	
7.3.10		Set Asynchronous Configuration Message	The switch manages a per-controller asynchronous configuration, which defines the asynchronous messages that it wants to receive (other than error messages) on a given OpenFlow channel.		Y	
7.4	Asynchronous Messages					
7.4.1		Packet-In Message	When packets are received by the datapath and sent to the controller, they use the OFPT_PACKET_IN.		Y	
7.4.2		Flow Removed Message	If the controller has requested to be notified when flow entries time out or are deleted from table, the data path does this with the OFPT_FLOW_REMOVED message.		Y	
7.4.3		Port Status Message	As ports are added, modified, and removed from the datapath, the controller needs to be informed with the OFPT_PORT_STATUS message		Y	
7.4.4		Controller Role Status Message	When a controller has its role changed by the switch, and not directly changed by that controller using a OFPT_ROLE_REQUEST message, the corresponding controller must be informed with a OFPT_ROLE_STATUS message.		Y	
7.4.5		Table Status Message	When the table state changes, the controller needs to be informed with the OFPT_TABLE_STATUS message.		Y	
7.4.6		Request Forward Message	When a controller modifies the state a groups and meters, the request that successfully modifies this state may be forwarded to other controller.		Y	
7.5	Symmetric Messages					
7.5.1		Hello	The OFPT_HELLO message consists of an OpenFlow header plus a set of variable size hello elements.		Y	
7.5.2		Echo Request	An Echo Request message consists of an OpenFlow header plus an arbitrary-length data field.		Y	

7.5.3		Echo Reply	An Echo Reply message consists of an OpenFlow header plus the unmodified data field of an echo request message.		Y	
7.5.4		Error Message	Error messages are used by the switch or the controller to notify the other side of the connection of problems.		Y	
7.5.5		Experimenter Message			N	
A	Header file openflow.h					
B	Release Notes					
B.14	OpenFlow version 1.4.0					
B.14.1		More extensible wire protocol			N	
B.14.2		More descriptive reasons for packet-in			Y	
B.14.3		Optical port properties			N	
B.14.4		Flow-removed reason for meter delete.			Y	
B.14.5		Flow monitoring			N	
B.14.6		Role status events			Y	
B.14.7		Eviction			Y	
B.14.8		Vacancy events			Y	
B.14.9		Bundles			Y	
B.14.10		Synchronized tables			N	
B.14.11		Group and Meter change notifications			Y	
B.14.12		Error code for bad priority			N	
B.14.13		Error code for Set-async-config			Y	
B.14.14		PBB UCA header field			N	
B.14.15		Error code for duplicate instruction			Y	
B.14.16		Error code for multipart timeout			Y	
B.14.17		Change default TCP port to 6653			N	

PicOS Support for OpenFlow 1.4.0

OpenFlow is a communication protocol used in software-defined networking (SDN). It enables an SDN controller to communicate instructions to the forwarding plane of network switches and routers, including virtual switches and routers. Using OpenFlow, the SDN controller can make changes to the switch and router flow tables, enabling administrators to quickly make network changes such as to optimize network performance or test new configurations. OpenFlow is intended to be an extensible protocol, enabling SDN programmers to define additional elements, such as actions or port properties that address new network technologies as they emerge. OpenFlow is maintained by the Open Network Foundation's Open Datapath project, which is seeking to build a foundation for a rich SDN ecosystem and software development lifecycle. The Pica8 PICOS network operating system supports OpenFlow.

This document contains OpenFlow 1.4.0 features supported by the Pica8 PICOS software. For clarity, the feature names in this table are identical to the feature names found in OpenFlow Switch Specification, Version 1.4.0.

OpenFlow Messages

Each OpenFlow message begins with the OpenFlow header. The OpenFlow header has several fields, including the **type** field. The **type** field identifies the type of OpenFlow message.

The OpenFlow protocol has three message types: *symmetric*, *controller-to-switch*, and *asynchronous*. Each message type has multiple sub-types.

Symmetric Messages

Symmetric messages are unsolicited messages that may be initiated by either the switch or the controller. Symmetric messages are sent without explicit solicitation in either direction. The following table describes PicOS support for symmetric messages:

Table 1 PicOS Support for OpenFlow Symmetric Messages

Message	Support	Comments
OFPT_HELLO	Supported	
OFPT_ERROR	Supported	
OFPT_ECHO_REQUEST	Supported	
OFPT_ECHO_REPLY	Supported	
OFPT_EXPERIMENTER	Not Supported	

Controller-to-Switch Messages

As the title suggests, Controller-to-switch messages are sent from the controller to the switch. These messages are used to directly manage the state of a switch. Controller-to-switch messages may or may not require a response from the switch.

The following table describes PicOS support for controller-to-switch messages:

Table 2 PicOS Support for OpenFlow Controller-to-Switch Messages

Message	Support	Comments
OFPT_FEATURES_REQUEST	Supported	
OFPT_FEATURES_REPLY See Capabilities Supported by Datapath		
OFPT_GET_CONFIG_REQUEST	Supported	
OFPT_GET_CONFIG_REPLY		
OFPT_SET_CONFIG	Supported	
OFPT_PACKET_OUT	Supported	
OFPT_FLOW_MOD	Supported	
OFPT_GROUP_MOD	Supported	
OFPT_PORT_MOD	Supported	
OFPT_TABLE_MOD	Supported	
OFPT_MULTIPART_REQUEST See Multipart Messages	Supported	
OFPT_MULTIPART_REPLY See Multipart Messages	Supported	
OFPT_BARRIER_REQUEST	Supported	

Message	Support	Comments
OFPT_BARRIER_REPLY		
OFPT_ROLE_REQUEST	Supported	
OFPT_ROLE_REPLY		
OFPT_GET_ASYNC_REQUEST	Supported	
OFPT_GET_ASYNC_REPLY	Supported	
OFPT_SET_ASYNC	Supported	
OFPT_METER_MOD	Supported	

Asynchronous Messages

Asynchronous messages are sent from the switch to the controller. These messages are used to communicate network events and switch state changes to the controller. Asychronous messages are sent without a controller explicitly requesting them from a switch.

The following table describes PicOS support for asynchronous messages:

Table 3 PicOS Support for OpenFlow Asynchronous Messages

Message	Support	Comments
OFPT_PACKET_IN	Supported	
OFPT_FLOW_REMOVED	Supported	
OFPT_PORT_STATUS	Supported	
OFPT_ROLE_STATUS	Supported	
OFPT_TABLE_STATUS	Supported	
OFPT_REQUESTFORWARD		

Bundle Operations

The following table describes PicOS support for bundle operations:

Table 4 PicOS Support for OpenFlow Bundle Operations

Message	Support	Comments
OFPT_BUNDLE_CONTROL	Supported	
OFPT_BUNDLE_ADD_MESSAGE	Supported	

Multipart Messages

The following table describes PicOS support for multipart messages: a single OpenFlow message cannot be larger than 64 kilobytes. Multipart messages are used to encode requests or replies that would carry a large amount of data, and would not always fit in a single OpenFlow message. The sender encodes the request or reply as a sequence of multipart messages with a specific multipart type. The receiver re-assembles the request or reply.

Table 5 PicOS Support for OpenFlow Multipart Messages

Message	Support	Comments
OFPMP_DESC	Supported	
OFPMP_FLOW	Supported	
OFPMP_TABLE	Supported	
OFPMP_TABLE_DESC	Supported	
OFPMP_TABLE_FEATURES	Supported	
OFPMP_PORT_STATS	Supported	
OFPMP_PORT_DESCRIPTION	Supported	
OFPMP_QUEUE_STATS	Not Supported	
OFPMP_QUEUE_DESC	Supported	
OFPMP_GROUP	Supported	
OFPMP_GROUP_DESC	Supported	

Message	Support	Comments
OFPMP_GROUP_FEATURES	Supported	
OFPMT_METER	Supported	
OFPMT_METER_CONFIG	Supported	
OFPMT_METER_FEATURES	Supported	
OFPMP_FLOW_MONITOR	Supported	
OFPMP_EXPERIMENTER	Not Supported	

Capabilities Supported by Datapath

The controller sends an **OFPT_FEATURES_REQUEST** message to the switch once a session is established. The switch responds to the **OFPT_FEATURES_REQUEST** message with an **OFPT_FEATURES_REPLY** message. The **OFPT_FEATURES_REPLY** message has several fields, including the **capabilities** field. The **capabilities** field identifies the capabilities supported by the switch datapath.

The **capabilties** field is a combination of the following bits/flags:

Table 6 PicOS Support for OpenFlow Capabilities Supported by Datapath

Specification	Support	Comments
OFPC_FLOW_STATS	Supported	
OFPC_TABLE_STATS	Supported	
OFPC_PORT_STATS	Supported	
OFPC_GROUP_STATS	Supported	
OFPC_IP_REASM		
OFPC_QUEUE_STATS		
OFPC_PORT_BLOCKED		

OpenFlow Ports

OpenFlow ports are abstract network interfaces used for passing traffic between the OpenFlow switch and the rest of the network. An OpenFlow switch makes a number of OpenFlow ports available. The set of OpenFlow ports does not have to be identical to the set of physical network interfaces on the switch hardware.

Port Descriptions

The OpenFlow switch receives and sends packets on OpenFlow ports. The switch may define physical and logical ports. OpenFlow specification also defines some reserved ports.

Table 7 PicOS Support for OpenFlow Ports

Specification	Support	Comments
OFPP_MAX		
OFPP_IN_PORT	Supported	
OFPP_TABLE	Supported	
OFPP_NORMAL	Supported	
OFPP_FLOOD	Supported	
OFPP_ALL	Supported	
OFPP_CONTROLLER	Supported	
OFPP_LOCAL	Supported	
OFPP_ANY	Supported	

Port Administrative Settings

The following table describes PicOS support for administrative settings of OpenFlow ports:

Table 8 PicOS Support for OpenFlow Port Administrative Settings

Specification	Support	Comments
OFPPC_PORT_DOWN	Supported	
OFPPC_NO_RECV		

Specification	Support	Comments
OFPPC_NO_FWD		
OFPPC_NO_PACKET_IN		

Port States

The following table describes PicOS support for OpenFlow port states:

Table 9 PicOS Support for OpenFlow Port States

Specification	Support	Comments
OFPPS_LINK_DOWN	Supported	
OFPPS_BLOCKED		
OFPPS_LIVE		

Port Features

The following table describes PicOS support for OpenFlow port features available in the datapath:

Table 10 PicOS Support for OpenFlow Port Features

Specification	Support	Comments
OFPPF_10MB_HD		
OFPPF_10MB_FD	Supported	
OFPPF_100MB_HD		
OFPPF_100MB_FD	Supported	
OFPPF_1GB_HD		
OFPPF_1GB_FD	Supported	
OFPPF_10GB_FD	Supported	
OFPPF_40GB_FD	Supported	
OFPPF_100GB_FD	Supported	
OFPPF_1TB_FD		
OFPPF_OTHER		
OFPPF_COPPER	Supported	
OFPPF_FIBER	Supported	
OFPPF_AUTONEG	Supported	
OFPPF_PAUSE	Supported	
OFPPF_PAUSE_ASYM		

OpenFlow Instructions

Each flow entry contains a set of instructions that are executed to match a packet to an entry. The following table details OpenFlow instructions supported by PicOS:

Table 11 PicOS Support for OpenFlow Instructions

Specification	Support	Comments
OFPIT_GOTO_TABLE	Supported	only next-table-id; is executed last.
OFPIT_WRITE_METADATA	Supported	
OFPIT_WRITE_ACTIONS	Supported	
OFPIT_APPLY_ACTIONS	Supported	
OFPIT_CLEAR_ACTIONS	Supported	
OFPIT_METER	Supported	
OFPIT_EXPERIMENTER		

OpenFlow Action Types

The following table details OpenFlow action types supported by PicOS:

Table 12 PicOS Support for OpenFlow Action Types

Specification	Support	Comments
OFPAT_OUTPUT	Supported	
OFPAT_COPY_TTL_OUT	Supported	
OFPAT_COPY_TTL_IN	Supported	
OFPAT_SET_MPLS_TTL	Supported	
OFPAT_DEC_MPLS_TTL	Not Supported	
OFPAT_PUSH_VLAN	Supported	
OFPAT_POP_VLAN	Supported	
OFPAT_PUSH_MPLS	Supported	
OFPAT_POP_MPLS	Supported	
OFPAT_SET_QUEUE	Supported	
OFPAT_GROUP	Supported	
OFPAT_SET_NW_TTL	Not Supported	
OFPAT_DEC_NW_TTL	Not Supported	
OFPAT_SET_FIELD	Supported	
OFPAT_PUSH_PBB	Supported	
OFPAT_POP_PBB	Supported	
OFPAT_EXPERIMENTER	Not Supported	

OpenFlow Match Fields

A match field may include the packet header, the ingress port, and the metadata value. A match field may use wildcards to match any value and, in some cases, bitmasks. A packet is matched against a match field.

The following table details the OXM flow match field types supported by PicOS:

Table 13 PicOS Support for OpenFlow Flow Match Fields

Specification	Support	Comments
OFPXMT_OFB_IN_PORT	Supported	
OFPXMT_OFB_IN_PHY_PORT	Supported	
OFPXMT_OFB_METADATA		
OFPXMT_OFB_ETH_DST	Supported	
OFPXMT_OFB_ETH_SRC	Supported	
OFPXMT_OFB_ETH_TYPE	Supported	
OFPXMT_OFB_VLAN_VID	Supported	
OFPXMT_OFB_VLAN_PCP	Supported	
OFPXMT_OFB_IP_DSCP	Supported	
OFPXMT_OFB_IP_ECN		
OFPXMT_OFB_IP_PROTO	Supported	
OFPXMT_OFB_IPV4_SRC	Supported	
OFPXMT_OFB_IPV4_DST	Supported	
OFPXMT_OFB_TCP_SRC	Supported	
OFPXMT_OFB_TCP_DST	Supported	
OFPXMT_OFB_UDP_SRC	Supported	
OFPXMT_OFB_UDP_DST	Supported	
OFPXMT_OFB_SCTP_SRC		

Specification	Support	Comments
OFPXMT_OFB_SCTP_DST		
OFPXMT_OFB_ICMPV4_TYPE	Supported	
OFPXMT_OFB_ICMPV4_CODE	Supported	
OFPXMT_OFB_ARP_OP	Supported	
OFPXMT_OFB_ARP_SPA	Supported	
OFPXMT_OFB_ARP_TPA	Supported	
OFPXMT_OFB_ARP_SHA		
OFPXMT_OFB_ARP_THA		
OFPXMT_OFB_IPV6_SRC	Supported	
OFPXMT_OFB_IPV6_DST	Supported	
OFPXMT_OFB_IPV6_FLABEL	Supported	
OFPXMT_OFB_ICMPV6_TYPE		
OFPXMT_OFB_ICMPV6_CODE		
OFPXMT_OFB_IPV6_ND_TARGET		
OFPXMT_OFB_IPV6_ND_SLL		
OFPXMT_OFB_IPV6_ND_TLL		
OFPXMT_OFB_MPLS_LABEL		
OFPXMT_OFB_MPLS_TC		
OFPXMT_OFP_MPLS_BOS		
OFPXMT_OFB_PBB_ISID	Supported	
OFPXMT_OFB_TUNNEL_ID	Supported	
OFPXMT_OFB_IPV6_EXTHDR		
OFPXMT_OFB_PBB_UCA		

OpenFlow Group Types

The following table describes PicOS support for OpenFlow group types:

Table 14 PicOS Support for OpenFlow Group Types

Specification	Support	Comments
OFPGT_ALL	Supported	
OFPGT_SELECT	Supported	
OFPGT_INDIRECT	Supported	
OFPGT_FF	Supported	

Introduction to Open vSwitch

Open vSwitch, sometimes abbreviated as OVS, is an open-source multilayer virtual switch. Open vSwitch can operate both as a soft switch running within the hypervisor and as the control stack for switching silicon. Learn more about Open vSwitch here.

Open vSwitch is already included in the Pica8 PicOS software and runs as a process in PicOS.

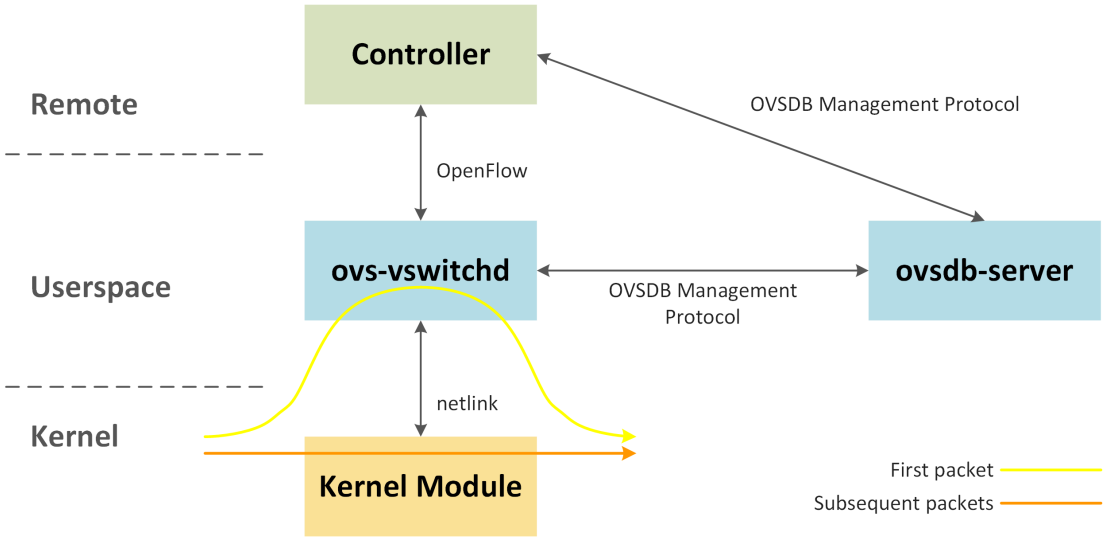
The Open vSwitch version available on a PicOS switch can be determined using the **ovs-appctl version** command from the Linux shell.

```
admin@Switch$ovs-appctl version
ovs-vswitchd (Open vSwitch) 2.3.0
Compiled May 24 2015 21:37:14
```

Open vSwitch Components

The main components of Open vSwitch are:

1. Kernel Module
2. Open vSwitch Database
3. Open vSwitch Daemon



Kernel Module

Kernel modules are pieces of code that can be loaded and unloaded into the kernel on demand. They extend the functionality of the kernel without having to reboot the system. Without modules, new functionality would have to be added directly into the kernel image, resulting in monolithic, larger kernels.

The kernel module handles switching and tunneling. It is designed to be fast and simple. When a packet is received and a match is found, associated actions are executed and counters are updated. Otherwise, packets are sent to userspace.

To manage the kernel module, use the **ovs-dpctl** command-line tool.

Open vSwitch Database

The Open vSwitch Database (OVSDB) holds switch configuration including bridge, interface, and tunnel definitions. The OVSDB and OpenFlow controller addresses are also held by the OVSDB. The OVSDB, and hence switch configuration, is stored on persistent storage and survives a reboot.

The **ovsdb-server** communicates with **ovs-vswitchd** and the controller using the OVSDB management protocol, defined in RFC 7047.

To manage **ovsdb-server**, use the **ovsdb-tool** and **ovs-vsctl** command-line tools.

Open vSwitch Daemon

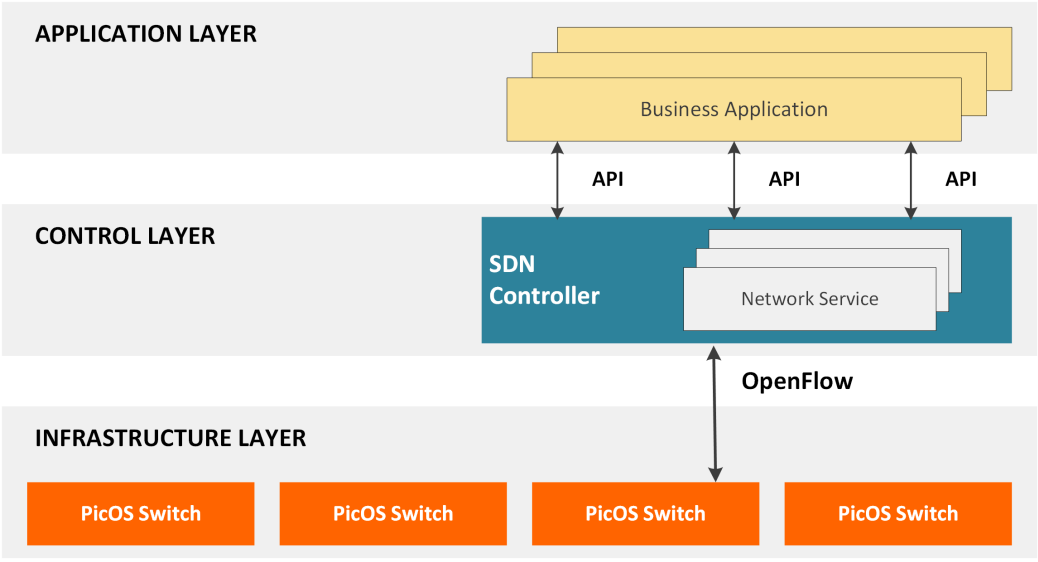
The Open vSwitch daemon (**ovs-vswitchd**) is the core component of an Open vSwitch incarnation. It communicates with the controller using OpenFlow. It communicates with the Open vSwitch Database Server (**ovsdb-server**) using the Open vSwitch Database (OVSDB) management protocol, defined in RFC 7047. The **ovs-vswitchd** communicates with the kernel module over netlink - a Linux kernel interface used for communication between userspace processes and the kernel.

The **ovs-vswitchd** supports multiple independent data paths, known as bridges.

To manage **ovs-vswtichd**, use the **ovs-ofctl** and **ovs-appctl** command-line tools.

Introduction to OpenFlow

The separation of control and data planes is one of the fundamental principles of SDN (Software-Defined Networking). OpenFlow is the first standard interface for communication between the control and data planes of an SDN architecture. The following graphic presents the role OpenFlow plays in the SDN framework:



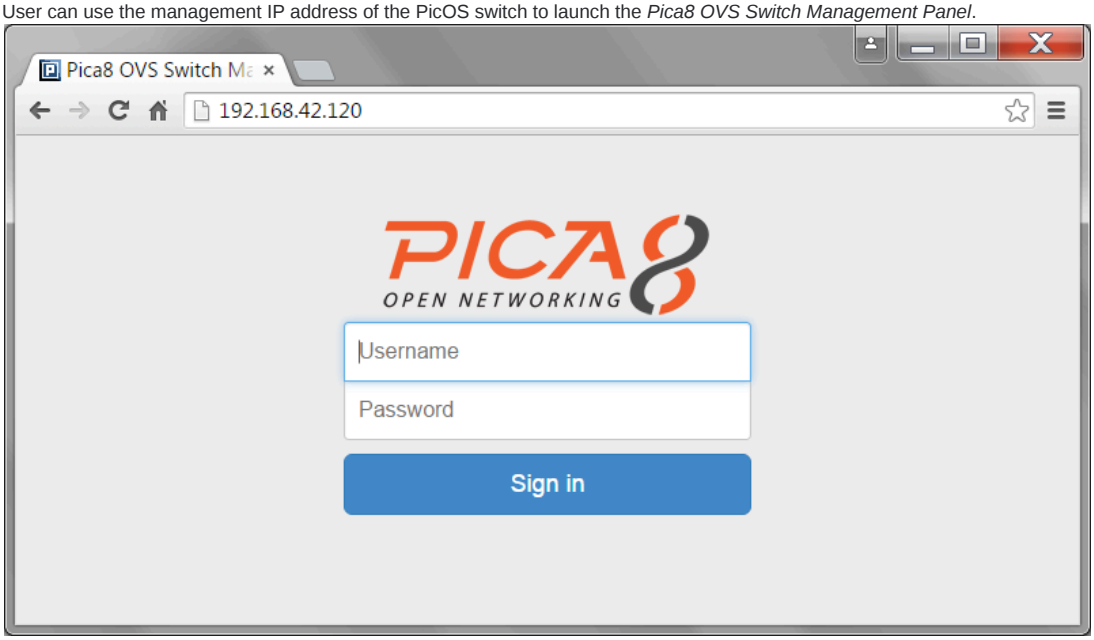
Learn more about OpenFlow here.

OVS Web User Interface

- Login Interface
- Monitoring the Switch
- Adding a Bridge
- Add a Port
- Add GRE Port
- Add Group Table
- Add or Edit a Controller
- Edit Flow Tables
- Edit Lag Interface

Login Interface

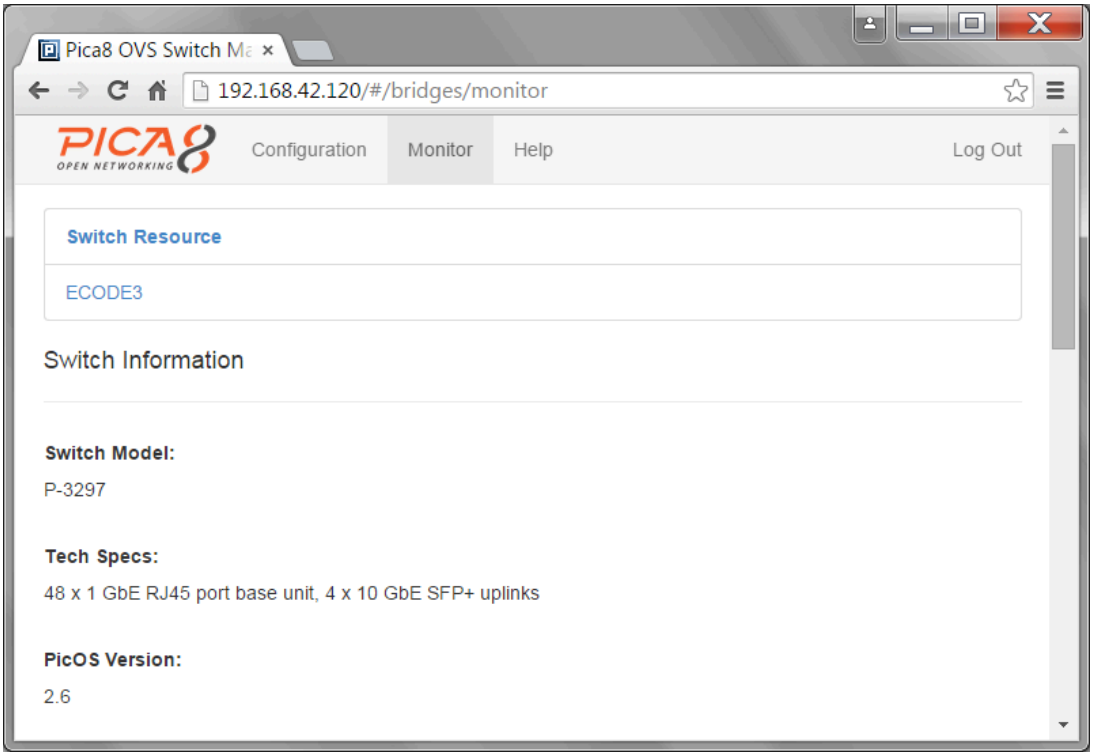
User can use the management IP address of the PicOS switch to launch the *Pica8 OVS Switch Management Panel*.



Monitoring the Switch

The **Monitor** tab provides provides basic switch information and allows users to monitor the switch operation.

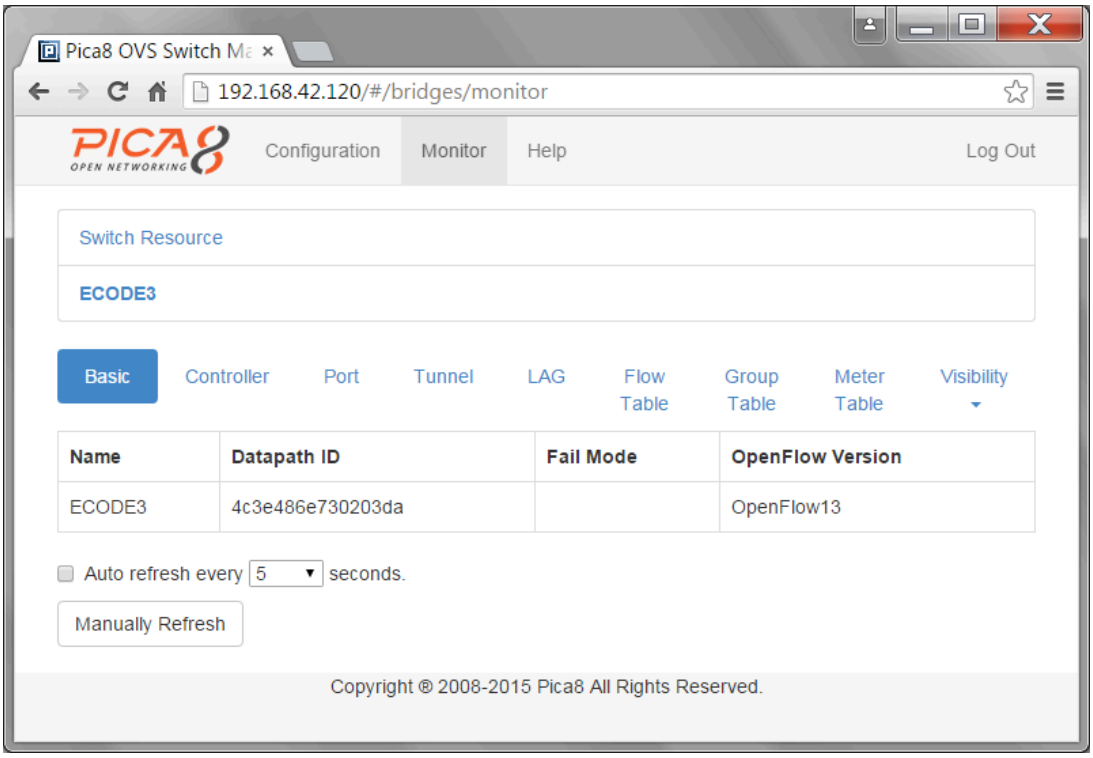
The **Monitor** tab may have several sections including the default *Switch Resource*, as shown below:



The default *Switch Resource* section, provides the following pieces of information:

- Switch Model
- Tech Specs
- PicOS Version
- Software Revision
- Web Interface Version
- Open vSwitch Version
- Maximum Flow Numbers
- Storage Capacity
- MAC Address
- IP Address
- Gateway
- OVSDB Config File Location
- CPU Load

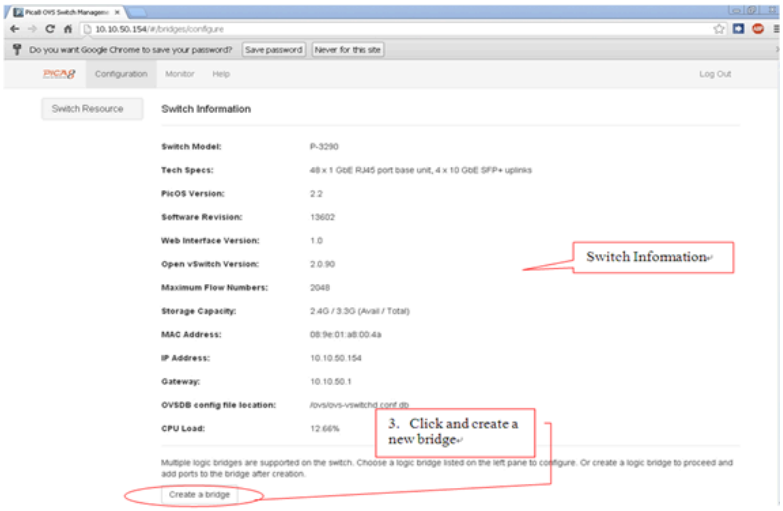
The **Monitor** tab also allows users to monitor any bridges created on the switch. The following screenshot displays information about a bridge that has been named *ECODE3*:



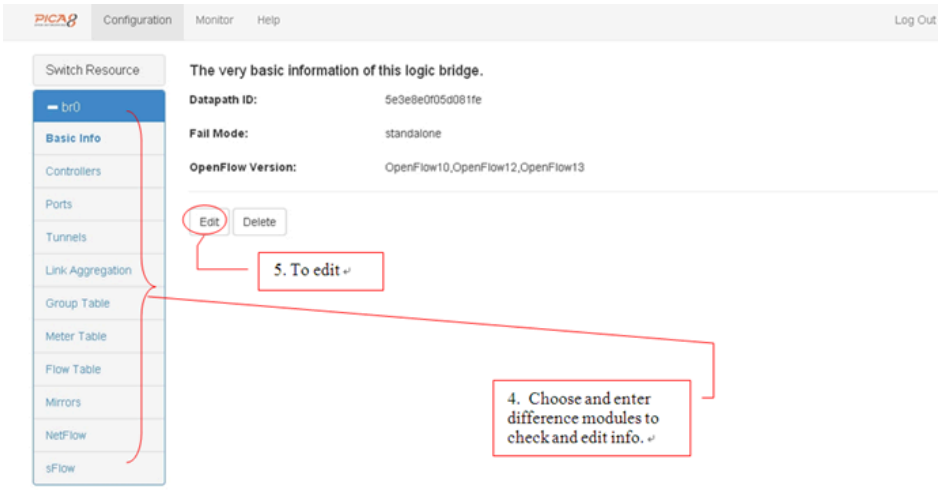
User can refresh bridge information manually or set it to auto-refresh at the specified interval.

Adding a Bridge

Once user has successfully launched the user interface, the ***Configuration*** tab reveals the switch resource section that provides basic switch information. To create a bridge, click on the ***Create a bridge*** icon.

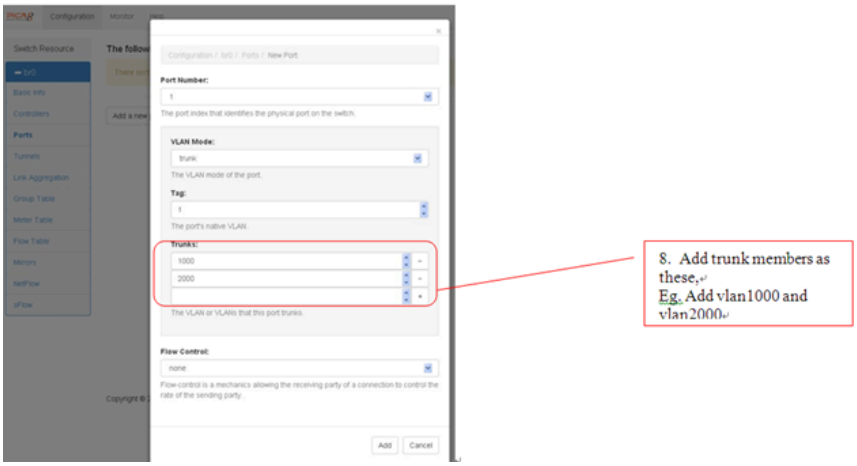


Once user has created a new bridge (br0 in example below), user can edit properties or delete it. The menu on the left (in the graphic below) allows users to view, edit, and change any of the modules listed in the menu.



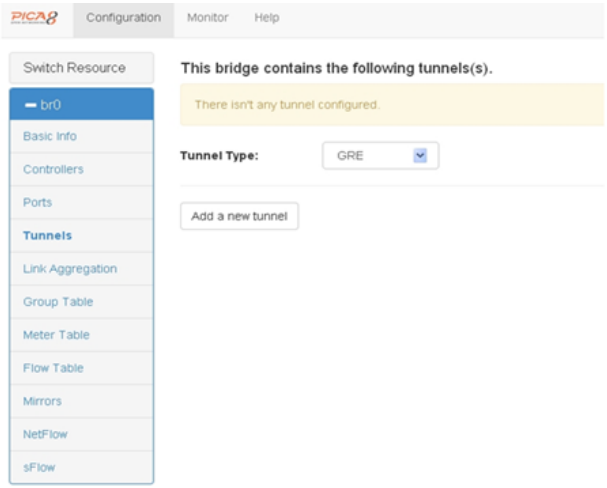
Add a Port

To add a new port, click on ***Port*** from the menu on the left of the screen. Complete the port number, VLAN mode, tag, and trunks. Then, click ***Add*** to save it.

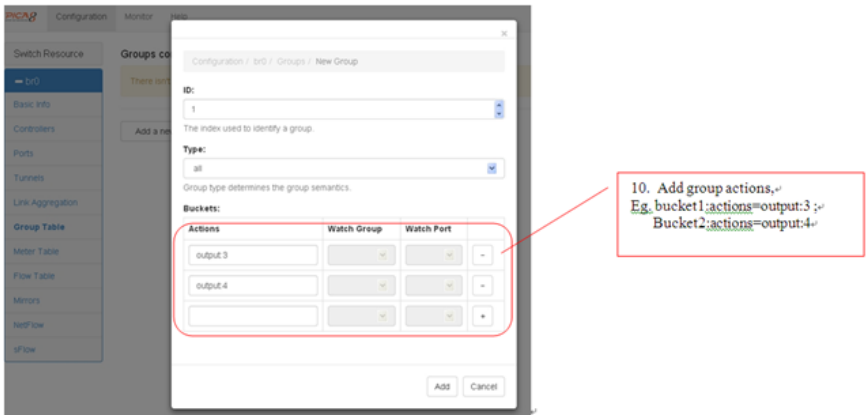


Add GRE Port

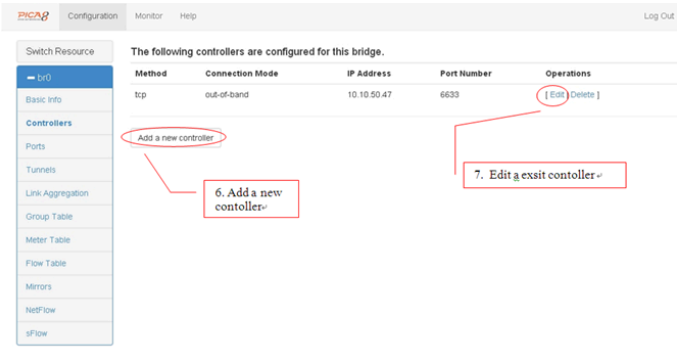
Select ***Tunnels*** from the menu to view the bridge's tunnel type or to add or edit a tunnel.



Add Group Table

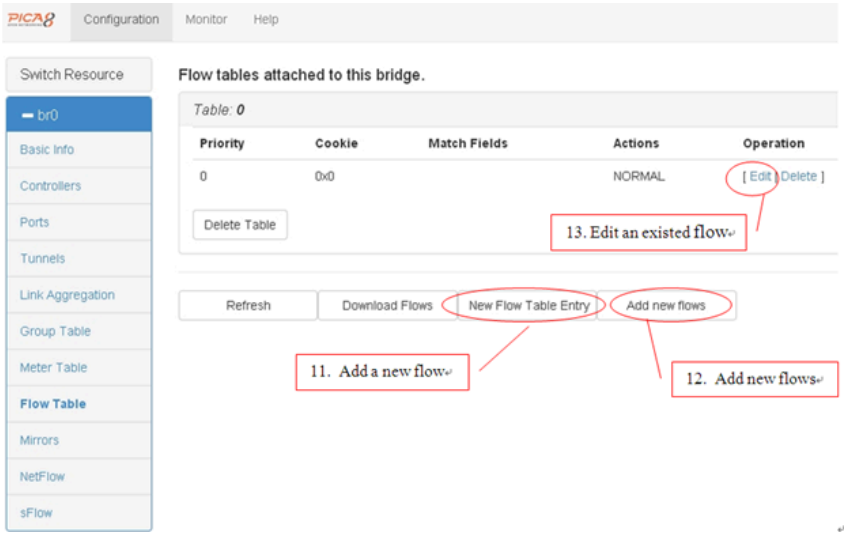


Add or Edit a Controller

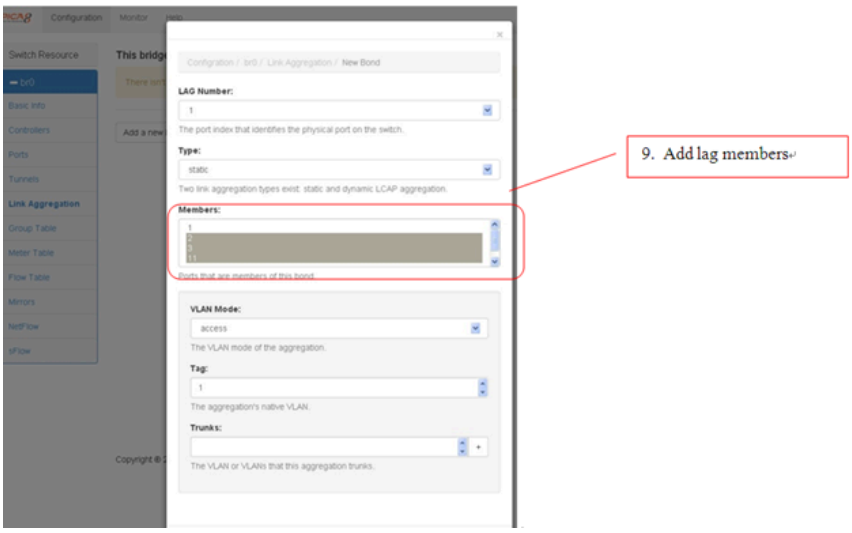


Edit Flow Tables

View the flow table attached to the bridge. Then, select required tabs to delete, edit, download, or add to the flow table.



Edit Lag Interface



Configuring Open vSwitch

Open vSwitch (also known as OVS), is an open source, multilayer virtual switch. It's designed to bring new levels of automation to networks through programmatic extensions and is used in many large production networks. Open vSwitch can be deployed as both a soft switch running on a hypervisor and as a control stack in switching silicon. It has been ported to various virtualization platforms and switching chipsets. It is the default switch in XenServer 6.0 and the Xen Cloud Platform, according to the Linux Foundation, which oversees the Open vSwitch project. It also supports Xen, KVM, Proxmox VE and VirtualBox. It supports standard management interfaces and protocols such as NetFlow, sFlow, IPFIX, RSPAN, CLI, LACP and 802.1ag.

Open vSwitch is included in the Pica8 PICOS network operating system, running as a process in PICOs. This document describes how to configure Open vSwitch in PICOS on an open white box switch.

- Basic Configuration in OVS Mode
- Configuring sFlow v5
- Configuring Port Mirroring
- OVSDB file
- OVS LLDP
- Enabling Radius in PicOS OVS Mode
- Inventory Database
- Broadcom Chip Limitation in OVS

Basic Configuration in OVS Mode

This section describes the basic configuration of PicOS switches in OVS (Open vSwitch) mode.

Once users have access to the switch and have PicOS running in OVS mode, users need to configure the IP address and default gateway.

To configure the management IP address, users should use the **picos_boot** configuration script as described in PICOS Mode Selection. An alternative to using the configuration script is to manually edit the PicOS configuration file.

For accessing the switch through a user interface, instead of the management interface, some OpenFlow flows need to be configured to redirect management traffic to the control plane. This is needed only if the switch cannot be managed through the management interface.

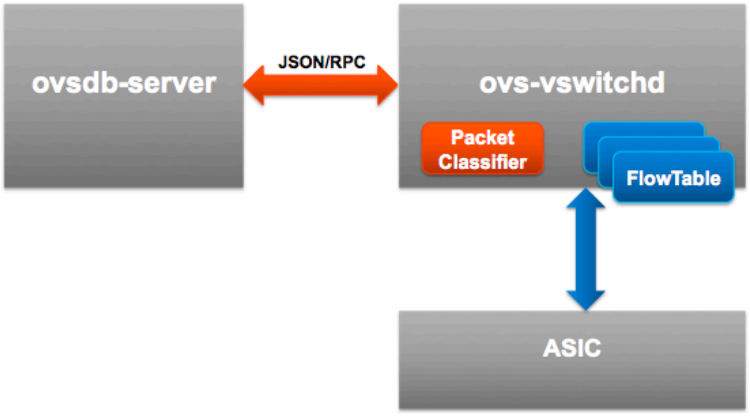
For example, users need to add the following flows to access the switch inband. The bridge **br0** has the MAC address *c8:0a:a9:04:49:19*.

```
root@PicOS-OVS#ovs-ofctl add-flow br0 priority=65300,in_port=local,dl_src=c8:0a:a9:04:49:19,actions=all
root@PicOS-OVS#ovs-ofctl add-flow br0 priority=65300,dl_dst=c8:0a:a9:04:49:19,actions=local
root@PicOS-OVS#ovs-ofctl add-flow br0 priority=65300,dl_dst=FF:FF:FF:FF:FF:FF,actions=all,local
```

Understanding OVS Components

The OVS as several components:

- **ovsdb-server:** A lightweight database server that provides switch level information (for example, information about switch ports).
- **ovs-vswitchd:** It is the core system component, which stores OpenFlow rules and performs flow based switching along with a companion Linux kernel module.
- **openvswitch_mod.ko:** It is a Linux kernel module doing most of the flow-based switching in PicOS OVS mode. This module is not loaded in the PicOS accelerated OVS, and is replaced by the ASIC (application-specific integrated circuit) for packet forwarding.
- **CLI:** The CLI (command-line interface) is used to control and manipulate other OVS components.



Understanding OVS CLI

The following three commands are used to control and monitor OVS:

- **ovs-vsctl Commands:** ovs-vsctl commands are used to control the **ovsdb-server** to create bridges, add interfaces, and configure interfaces.
- **ovs-appctl Commands:** ovs−appctl Commands are used to control the **ovs-vswitchd**.
- **ovs-ofctl Commands:** ovs−ofctl Commands are used to send OpenFlow queries. This can be used to manipulate the flows in **ovs-vswitchd**.

Each of those commands have a main page that can be viewed from the Linux shell on users' PicOS switch.

```
admin@Leaf1$man ovs-ofctl
ovs-ofctl(8)                Open vSwitch Manual                ovs-ofctl(8)
NAME
       ovs-ofctl - administer OpenFlow switches
SYNOPSIS
       ovs-ofctl [options] command [switch] [args...]
DESCRIPTION
       The  ovs-ofctl program is a command line tool for monitoring and admin-
       istering OpenFlow switches.  It can also show the current state  of  an
       OpenFlow  switch, including features, configuration, and table entries.
       It should work with any OpenFlow switch, not just Open vSwitch.
   OpenFlow Switch Management Commands
       These commands allow ovs-ofctl to monitor and  administer  an  OpenFlow
       switch.   It  is  able to show the current state of a switch, including
       features, configuration, and table entries.
```

```
       Most of these commands take an argument that specifies the  method  for
       connecting to an OpenFlow switch.  The following connection methods are
       supported:
<Some output omitted>
```

Configuring sFlow v5

PicOS OVS supports sFlow v5. User can configure the sFlow as follows:

```
root@PicOS-OVS$ ovs-vsctl  --id=@s create sFlow agent=eth0 target=\"10.10.50.207:9901\" header=128 sampling=5000 p
root@PicOS-OVS$
```

In the above example, the parameters are as follows:

```
COLLECTOR_IP=10.10.50.207
COLLECTOR_PORT=9901
AGENT_IP=eth0
HEADER_BYTES=128
SAMPLING_N=5000
POLLING_SECS=30
```

List the configuration of sflow:

```
root@PicOS-OVS$ovs-vsctl list sflow
_uuid               : 88d94294-4bb3-44f3-8a12-6055bf458de6
agent               : "eth0"
external_ids        : {}
header              : 128
polling             : 30
sampling            : 5000
targets             : ["10.10.50.207:9901"]
root@PicOS-OVS$
```

To delete an sFlow, use the clear command, as shown in the following example.:

```
root@PicOS-OVS$ ovs-vsctl -- clear Bridge br0 sflow
root@PicOS-OVS$
```

Tips

1.collector ip is ipv4 address,0.0.0.0 and 255.255.255.255 are invalid collector ip;

2.sample-rate equals to 0,no counter sample and flow sample packets,different with l2/l3 system;

polling-interval equals to 0,no counter sample packets,only flow sample packets.

sample-rate and polling-interval both equal to 0,no couter sample and flow sample packets.

3.header-len and sample rate do not have any limitations in ovs,while in l2/l3 system,header-len is [14,...1350] and sample rate is 0 or bigger than 100.

4.only support random sample mode.

5.Sample rate is 1,has some problem Bug 7939..This bug are related with port's line speed.I have some suggestion for this.

For 10G speed,500 is a better sample rate,at the same time，pps value is best to use 5；

For 1G speed,50 is a better sample rate,at the same time，pps value is best to use 5；

For 100M speed, 5 is the better sample rate,at the same time，pps value is best to use 5；

Configuring Port Mirroring

Chips mirror actions:

PRONTO3290 PRONTO3296 PRONTO3295(TR2)(egress mirror=true)
PRONTO3780 PRONTO3920 PRONTO3922 PRONTO3930 PRONTO3960 PRONTO3965 PRONTO3980 PRONTO3920 PRONTO3924(TD)

ES4654 AS4610_54P AS4610_54T AS4610_30P AS4610_30T(Helix4)(egress mirror=true)
PRONTO5101 PRONTO5401 AS6701_32X N2632XL N2948_6XL AS6712_32X AS5712_54X S4048 ARCTICA4806XP(TD2)

AS5812_54T AS5812_54X(TD2P)
DCS7032Q28 AS7712_32X Z9100 (TH)

Note：Egress mirror only works well on the platforms which egress mirror is true（eg:3290（Firebolt3），3296(Triumph2),4610 (helix4)).Otherwise the behaviour of egress mirror is uncertain.

The behaviour of egress mirror port should be the consistent to the output port.eg:port2 is the egress port,and port 3 is the mirror port(mirror the dst traffic of port 2).If the switch support egress mirror(egress mirror is true),then the packets of port 2 are tagged packets,then traffic of port 3 are also tagged packets.

Configuration Examples

The following examples show how to configure the port mirroring feature.

```
admin@PicOS-OVS$ovs-vsctl -- set bridge br0 mirrors=@m -- --id=@te-1/1/1 get Port te-1/1/1 -- --id=@te-1/1/2 get Port te-1/1/2 -- -
admin@PicOS-OVS$
```

The configuration above includes ports te-1/1/1, te-1/1/2 and te-1/1/3. The source ports are te-1/1/1 and te-1/1/2 (including ingress and egress), and the output port (monitor port) is te-1/1/3.

The "select-dst-port" means some packets (in switch chip) will go-out from the specified port (egress).

The "select-src-port" means some packets will enter the specified port (ingress).

> PicOS can support multiple mirrors, but some limitations exist.
>
> 1. Only has one output port, at this time the specified port can be configure multiple ways..
>
> 2. If configure different output ports, the max monitor port at most is 4.
>
> 3, Before PicOS2.10 ovs only support configure physical port as output_port, from PicOS2.10 ovs also support lag interface as output_port.

The command set 2 mirrors, m1 and m2:

```
admin@PicOS-OVS$ovs-vsctl -- set bridge br0 mirrors=@m1,@m2 -- --id=@te-1/1/11 get Port te-1/1/11 -- --id=@te-1/1/13 get Port te-1/
```

The command add 2 new mirrors, m3 and m4:

```
admin@PicOS-OVS$ovs-vsctl add bridge br0 mirrors @m3,@m4 -- --id=@te-1/1/11 get Port te-1/1/11 -- --id=@te-1/1/12 get Port te-1/1/1
```

Deleting the Mirroring

```
root@PicOS-OVS# ovs-vsctl clear Bridge br0 mirrors
```

> **limitations for tomahawk**
> For tomahawk chip,do not support mirror ingress dirction and egress direction for the same port.

OVSDB file

The PicOS switch stores the OVS (Open vSwitch) configuration in **/ovs/ovs-vswitchd.conf.db**.

```
admin@PicOS-OVS$cd /ovs
admin@PicOS-OVS$ls
bin  function.conf.db  ovs-vswitchd.conf.db  sbin   snmp
etc  lib               portGroup.conf.db     share  var
```

OVS LLDP

The **Link Layer Discovery Protocol** (**LLDP**) is a vendor-neutral link layer protocol used by network devices for advertising their identity, capabilities, and neighbors on ethernet networks. The protocol is formally referred to by the IEEE as *Station and Media Access Control Connectivity Discovery* specified in standards document **IEEE 802.1AB**

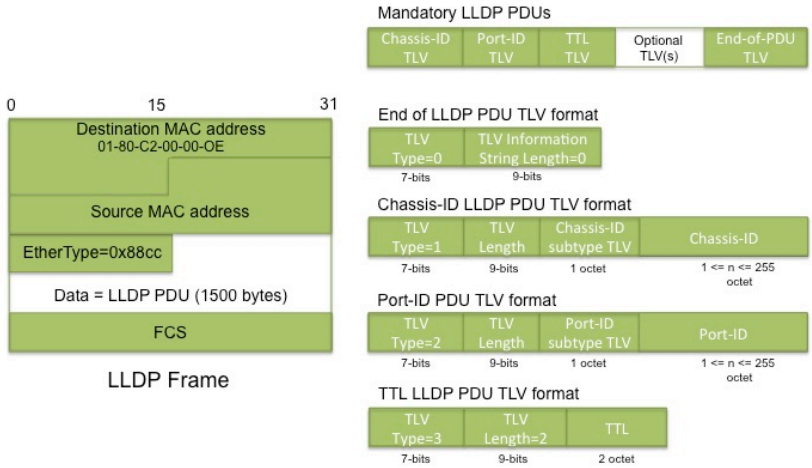


Figure1: LLDP packet format and the mandatory LLDP PDUs

The LLDP frame consists of the following:

1. a well know destination multicast address (01:80:C2:00:00:0E)
2. ether type of 0x88cc
3. LLDP PDU consisting of the following mandatory LLDP TLVs:
    a. Chassis TLV: Identifies the 802 LAN device's chassis.
    b. Port-ID TLV: Identifies the port from which the LLDPDU is transmitted.
    c. TTL TLV: Indicates how long (in seconds) the LAN device's information received in the LLDPDU is to be treated as valid information. Non-zero information indicates the device's information is to be updated in the LLDP remote system MIB. A value of 0 indicates the information associated with the LAN device is no longer valid and should be removed.
    d. End-of-LLDP TLV: Indicates the end of TLVs in the LLDPDU.

Typically, an open flow controller uses LLDP messages to discover neighbor devices, active links and hosts connected to the open flow switches. Following represents a typical flow used to relay LLDP messages from an open flow switch to the controller

dl_dst=01:80:c2:00:00:0e,dl_type=0x88cc, actions:CONTROLLER

Alternatively LLDP can be enabled in PicOS. PicOS supports the following LLDP TLVs:

1. *Port Description TLV*
2. *System Name TLV*
3. *System Description TLV*
4. *System Capabilities TLV*
5. *Management Address TLV.*802.1
6. Organizationally Specific TLV includes:
    a. *PVID TLV* (The default value is false)
    b. *MAC PHY TLV* (The default value is false)
    c. *MDI TLV* (The default value is false)
    d. Max Frame Size TLV (The default value is false)

> PicOS supports LLDP from version 2.6.

LLDP commands

Enable or disable lldp on bridge

```
admin@PicOS-OVS$ovs-vsctl set bridge br0 lldp_enable=true
admin@PicOS-OVS$ovs-vsctl clear bridge br0 lldp_enable
```

LLDP admin status

```
admin@PicOS-OVS$ovs-vsctl set interface ge-1/1/1 lldp_admin_status=RxTx
```

```
admin@PicOS-OVS$ovs-vsctl set interface ge-1/1/1 lldp_admin_status=RxOnly
admin@PicOS-OVS$ovs-vsctl set interface ge-1/1/1 lldp_admin_status=TxOnly
admin@PicOS-OVS$ovs-vsctl set interface ge-1/1/1 lldp_admin_status=disabled
```

LLDP transmit parameters

```
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-msg-tx-hold=4
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-msg-tx-interval=30
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-reinit-delay=2
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-tx-delay=2
```

LLDP transmit parameters on a per interface

```
ovs-vsctl set interface te-1/1/25 lldp_tx_interval=4
ovs-vsctl set interface te-1/1/25 lldp_tx_delay=2

clear commands:
ovs-vsctl clear interface te-1/1/14 lldp_tx_interval
ovs-vsctl clear interface te-1/1/14 lldp_tx_delay
```

Optional TLVs in lldpdu

Port Description TLV (The default value is true)

```
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-tlv-port-desc=true
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-tlv-port-desc=false
```

System Name TLV (The default value is true)

```
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-tlv-sys-name=true
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-tlv-sys-name=false
```

System Description TLV (The default value is true)

```
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-tlv-sys-desc=true
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-tlv-sys-desc=false
```

System Capabilities TLV (The default value is true)

```
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-tlv-sys-cap=true
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-tlv-sys-cap=false
```

Management Address TLV (The default value is true)

```
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-tlv-mgmt-addr=true
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-tlv-mgmt-addr=false
```

PVID TLV (802.1 Organizationally Specific TLV) (The default value is false)

```
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-tlv-pvid=true
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-tlv-pvid=false
```

MAC PHY TLV (802.3 Organizationally Specific TLV) (The default value is false)

```
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-tlv-mac-phy=true
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-tlv-mac-phy=false
```

Power Via MDI TLV (802.3 Organizationally Specific TLV) (The default value is false)

```
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-tlv-power-via-mdi=true
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-tlv-power-via-mdi=false
```

Link Aggregation TLV (802.3 Organizationally Specific TLV) (The default value is false)

```
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-tlv-link-aggregation=true
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-tlv-link-aggregation=false
```

Max Frame Size TLV (802.3 Organizationally Specific TLV) (The default value is false)

```
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-tlv-max-frame-size=true
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-tlv-max-frame-size=false
```

show configuration

```
admin@PicOS-OVS$ovs-vsctl list bridge br0
admin@PicOS-OVS$ovs-vsctl list interface ge-1/1/1
```

show LLDP remote neighbors

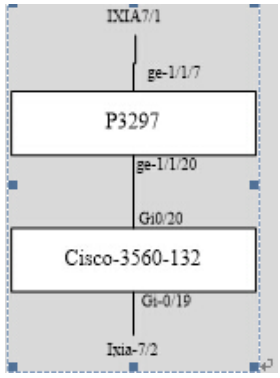
```
admin@PicOS-OVS$ovs-vsctl list lldp_neighbor
```

show LLDP using "ovs-appctl"

```
admin@PicOS-OVS$ovs-appctl lldp/show br0
admin@PicOS-OVS$ovs-appctl lldp/show br0 ge-1/1/1
```

Examples

topology



default port status test

Cisco3560 (mac 00:22:BE:96:F5:94):

```
Switch#configure terminal
Switch(config)#lldp run(default status is TXRx)
Switch(config)#monitor session 1 source interface gigabitEthernet 0/20 rx
Switch(config)#monitor session 1 destination interface gigabitEthernet 0/19
```

P3297 (mac 00:e0:ec:25:2d:5e):

```
admin@PicOS-OVS$ovs-vsctl set bridge br0 lldp_enable=true
not  set lldp_admin_status(default value is RxTx)
admin@PicOS-OVS$ovs-vsctl list lldp_neighbor
_uuid               : dc8a0cba-aefd-4b54-b02f-e53b315fd783
local_id            : "<00:e0:ec:25:2d:5e>:<ge-1/1/20>"
mgmt_address        : {"10.10.51.132"=0}
```

```
port_description    : "GigabitEthernet0/20"
remote_id           : "<00:22:be:96:f5:80>:<Gi0/20>"
system_description  : "Cisco IOS Software, C3560E Software (C3560E-UNIVERSALK9-M), Version 15.0(2)SE2, RELEASE SOF
system_name         : Switch
admin@PicOS-OVS$
```

Result:

7/1: receive the lldp from both Cisco3560 and P3297

7/2: only receiving the lldp with src mac **00:e0:ec:25:2d:5e**

note

1. LLDP only works on physical ports；
2. PicOS does not support power-via-mdi TLV;
3. 1=<lldp-tx-delay<=0.25*msg-tx-interval;

Enabling Radius in PicOS OVS Mode

Perform the following steps to enable Radius in PicOS OVS mode:

1. Enable user map

```
admin@PicOS-OVS$sudo /pica/bin/usermap_disable.sh false
```

2. Enable Radius on the PicOS switch.

```
admin@PicOS-OVS$sudo /pica/bin/radius_disable.sh false
```

3. Configure the IP address of the external Radius server on the PicOS switch. In the following example, IP address of the Radius server is 1.1.5.41 and the shared key is *abc*.

```
admin@XorPlus$cat /etc/pam_radius_auth.conf
1.1.5.41:1812 abc 1
```

4. Users on the Radius server must be super users. The following example shows the Radius record for user *test8*.

```
test8 Cleartext-Password := "pica8"
Service-Type = Framed-User,
Framed-Protocol = PPP,
Framed-IP-Address = 172.16.3.33,
Framed-IP-Netmask = 255.255.255.0,
Framed-Routing = Broadcast-Listen,
Framed-Filter-Id = "std.ppp",
Framed-MTU = 1500,
Framed-Compression = Van-Jacobsen-TCP-IP,
Class = "super-user"
```

5. Login to the switch via SSH and execute Linux shell commands.

```
build@dev-18:$ ssh 10.10.51.145 -l test8
test8@10.10.51.145's password:
test8@PicOS-OVS:~$ version
Copyright (C) 2009-2014 Pica8, Inc.
==================================
Hardware Model                : P-3290
Linux System Version/Revision : 1.1/20809
Linux System Released Date    : 03/21/2015
L2/L3 Version/Revision        : 1.1/20809

test8@PicOS-OVS:~$ pwd
/home/test8
test8@PicOS-OVS:~$
```

6. The Radius user must use the full path to execute OVS commands, as shown below:

```
test8@PicOS-OVS$sudo /ovs/bin/ovs-ofctl show br0
OFPT_FEATURES_REPLY (OF1.4) (xid=0x2): dpid:5e3ee89a8f503d30
n_tables:254, n_buffers:256
capabilities: FLOW_STATS TABLE_STATS PORT_STATS GROUP_STATS
OFPST_PORT_DESC reply (OF1.4) (xid=0x3):
 1(ge-1/1/1): addr:e8:9a:8f:50:3d:30
     config:     0
     state:      LINK_DOWN
     current:    COPPER AUTO_NEG
     advertised: 10MB-HD 10MB-FD 100MB-HD 100MB-FD 1GB-FD COPPER AUTO_NEG
     supported:  10MB-HD 10MB-FD 100MB-HD 100MB-FD 1GB-FD COPPER AUTO_NEG
     speed: 0 Mbps now, 1000 Mbps max
 LOCAL(br0): addr:e8:9a:8f:50:3d:30
     config:     0
     state:      LINK_UP
```

```
     current:    10MB-FD COPPER
     supported:  10MB-FD COPPER
     speed: 10 Mbps now, 10 Mbps max
OFPT_GET_CONFIG_REPLY (OF1.4) (xid=0x5): frags=normal miss_send_len=0

test8@PicOS-OVS:~$ sudo ovs-vsctl show
395575df-5939-45af-8e4c-d99da4c442dc
    Bridge "br0"
        Port "ge-1/1/1"
            tag: 1
            Interface "ge-1/1/1"
                type: "pica8"
        Port "br0"
            Interface "br0"
                type: internal
```

7. User can also modify the path by editing the */etc/sudoers* file, so that Radius users can execute OVS commands directly. Change the value of **Defaults secure_path** from "/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/sbin:/bin:/ovs/bin:/ovs/sbin" to another desired value.

```
test8@PicOS-OVS:~$ sudo cat /etc/sudoers
#
# This file MUST be edited with the 'visudo' command as root.
#
# Please consider adding local content in /etc/sudoers.d/ instead of
# directly modifying this file.
#
# See the man page for details on how to write a sudoers file.
#
Defaults        env_reset
Defaults        mail_badpass
Defaults        secure_path="/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/sbin:/bin:/ovs/bin:/ovs/sbin"
# Host alias specification
# User alias specification
# Cmnd alias specification
# User privilege specification
root    ALL=(ALL:ALL) ALL
# Allow members of group sudo to execute any command
%sudo   ALL=(ALL:ALL) ALL
%xorp ALL=(ALL) NOPASSWD: NOPASSWD: ALL
%root ALL=(ALL) NOPASSWD: NOPASSWD: ALL
# See sudoers(5) for more information on "#include" directives:
#includedir /etc/sudoers.d
```

Inventory Database

Introduction

Pica-OVS mode switch needs to store some basic switch information and some run-time information in the inventory database, this feature is running when Pica-OVS starts.

There are five kinds of information in this module as shown below, including basic Switch Information, SFP/QSFP Information, Counter Information, Alarm Information, and Hardware Flow Information.

Switch Information

Show function control information.

```
root@PicOS-OVS$ovs-invctl show
23aa0580-9578-471a-abae-a9c84b73affd
  sfp_enable: true
  sfp_query_interval: 10
  counter_enable: false
  hwflow_enable: false
  counter_query_interval: 30
  hwflow_query_interval: 30
  alarm_enable: false
  alarm_high_temp: 176
  alarm_low_temp: 32
  last_alarm_id: 0
```

Show basic switch information in the Switch Inventory table, including switch information, temperature information, port information and SFP/QSFP information.

> Before checking the switch information, the DUT must create a bridge and add ports into the bridge. Then make sfp enable-true.

```
root@PicOS-OVS$ovs-invctl enable-sfp true

root@PicOS-OVS$ovs-invctl show-switch-inventory

SFP/QSFP Information

SFP/QSFP information is stored into the database if user enables this feature. The Administrator could enable/disable this function by using command "ovs-invctl enable-sfp {true | false}".

```
root@PicOS-OVS$ovs-invctl enable-sfp true

Administrator could show these information by command "ovs-invctl show-switch-inventory" or "ovs-invctl show-sfp-qs

root@PicOS-OVS$ovs-invctl show-sfp-qsfp
84cb20bd-4ddc-4094-aaaa-b36dc59332a9
  port_name: "te-1/1/49"
  vendor_name: JESS-LINK
  vendor_sn: "12344D0001"
  wavelength: "256 nm"
  temperature: "32 F"
  supply_voltage: "0.00 V"
  connector: "Copper pigtail"
  length_copper: "5 m"

  length_625m: "0 m"
  length_9m: "0 m"
  length_9m_km: "0 m"
  plugged_in: true
  rx_receive_power: "-inf dbM"
  tx_bias_current: "0.00 mA"
  tx_optical_power: "-inf dbM"
```

Administrator could control the refresh interval by command "ovs-invctl set-sfp-interval."

```
root@PicOS-OVS$ovs-invctl set-sfp-interval 50
root@PicOS-OVS$ovs-invctl show
23aa0580-9578-471a-abae-a9c84b73affd
 sfp_enable: true
 sfp_query_interval: 50
 counter_enable: false
 hwflow_enable: false
 counter_query_interval: 30
 hwflow_query_interval: 30
 alarm_enable: false
 alarm_high_temp: 176
 alarm_low_temp: 32
 last_alarm_id: 0
```

Counter Information

There are 4 types of counters: flow, group, meter, and port counter. As expected, the flow counter is the counter of each flow and the port counter is the counter of each port. The meter counter is the counter of each meter, associated with the band counter, and the group counter is the counter of each group, associated with the bucket counter.

> Note: this kind of information generates a lot of data. Turning this on will spend some CPU and memory. So if this information is not needed, please turn it off.

Administrator could enable/disable this function by command **"ovs-invctl enable-counter {true | false}"**

```
root@PicOS-OVS$ovs-invctl enable-counter true
```

Administrator could control the refresh interval by command **"ovs-invctl set-counter-interval"**.

```
root@PicOS-OVS$ovs-invctl enable-counter true
root@PicOS-OVS$ovs-invctl show
23aa0580-9578-471a-abae-a9c84b73affd
 sfp_enable: true
 sfp_query_interval: 50
 counter_enable: true
 hwflow_enable: false
```

```
 counter_query_interval: 20
 hwflow_query_interval: 30
 alarm_enable: false
 alarm_high_temp: 176
 alarm_low_temp: 32
 last_alarm_id: 0
```

The Administrator could show this information by command **"ovs-invctl show-port/meter/flow/group-counter"** or **"ovs-invctl show-all-counter"**.

```
root@PicOS-OVS$ovs-invctl show-all-counter
Switch PicOS-OVS

```

Alarm Information

Alarm stores the alarm information about: PSU, FAN, OPTICS, PORT, TEMP, MANAGEMENT_PORT_STATUE. This information is stored in the Alarm table.

Administrator could enable/disable this function by command "ovs-invctl enable-alarm {true | false}".

```
root@PicOS-OVS$ovs-invctl enable-alarm true

root@PicOS-OVS$ovs-invctl show
23aa0580-9578-471a-abae-a9c84b73affd
  sfp_enable: true
  sfp_query_interval: 50
  counter_enable: true
  hwflow_enable: false
  counter_query_interval: 20
  hwflow_query_interval: 30
  alarm_enable: true
  alarm_high_temp: 176
  alarm_low_temp: 32
  last_alarm_id: 9
```

The Administrator could control the temperature threshold by the command **"ovs-invctl set-high/low-temp"**. When the switch temp id is higher or lower then the temperature threshold, it will produce an alarm message.

```
root@PicOS-OVS$ovs-invctl set-low-temp 10
root@PicOS-OVS$ovs-invctl set-high-temp 133

root@PicOS-OVS$ovs-invctl show
23aa0580-9578-471a-abae-a9c84b73affd

  switch_name: PicOS-OVS
  entity_text: "power 1"
  text: "power removed"
  time: "Tue Nov  3 13:49:39 2015"
Alarm 4
  severity_code: critical
  switch_name: PicOS-OVS
  entity_text: "PSU 1"
  text: "PSU removed"
  time: "Tue Nov  3 13:49:39 2015"
```

Hardware Flow Information

Note: This kind of information is very large, turning this feature on will spend some CPU and memory. So if this information is not needed, please turn it off. For saving memory, we support max 20,000 hardware flows written into the database. If the count of hardware flows is exceeded, they are discarded.

Administrator could enable/disable this function by the command **"ovs-invctl enable-hwflow {true | false}"**.

```
root@PicOS-OVS$ovs-invctl enable-hwflow true

root@PicOS-OVS$ovs-invctl show
23aa0580-9578-471a-abae-a9c84b73affd
  sfp_enable: true
  sfp_query_interval: 50
  counter_enable: true
  hwflow_enable: true
  counter_query_interval: 20
  hwflow_query_interval: 30
  alarm_enable: true
  alarm_high_temp: 133
  alarm_low_temp: 10
  last_alarm_id: 9
```

The Administrator could control the refresh interval by command **"ovs-invctl set-hwflow-interval INTEGER"**.

```
root@PicOS-OVS$ovs-invctl enable-hwflow true

root@PicOS-OVS$ovs-invctl set-hwflow-interval 50
root@PicOS-OVS$ovs-invctl show
23aa0580-9578-471a-abae-a9c84b73affd
  sfp_enable: true
  sfp_query_interval: 50
  counter_enable: true
```

```
  hwflow_enable: true
  counter_query_interval: 20
  hwflow_query_interval: 50
  alarm_enable: true
  alarm_high_temp: 133
  alarm_low_temp: 10
  last_alarm_id: 9
```

The Administrator could get hardware flow information by the command **"ovs-invctl list Hardware_Flow"**

Others Hardware_Flow commands are available by using the command **"root@PicOS-OVS$ovs-invctl --help"**

```
root@PicOS-OVS$ovs-invctl list Hardware_Flow
_uuid               : e6e61c9d-df38-43c6-abc0-2b0654af9713

input : " 11400 rpm"
number : 3
pwm : " 50 %"
```

Broadcom Chip Limitation in OVS

ARP Flow in Combinated Mode Table

Due to VCAP limitation, ARP flow entry will generate an error once combinated-mode is enabled.

When combinated mode is enabled, VCAP needs to match the same fields as ICAP. ARP flows use UDF in ICAP, but not all HW platforms support UDF in VCAP.

Example:

```
ovs-vsctl set-combinated-mode true
admin@PicOS-OVS$ovs-ofctl dump-flows br2
OFPST_FLOW reply (OF1.4) (xid=0x2):
 cookie=0x0, duration=70.192s, table=0, n_packets=n/a, n_bytes=0, priority=500,arp actions=output:2
 cookie=0x0, duration=6.928s, table=0, n_packets=n/a, n_bytes=0, priority=200,in_port=7 actions=push_vlan:0x8100,set_field:2001->vl
```

Actual result:

sent packets match both flows to ge-1/1/7,ge-1/1/2 will receive packets that with "push_vlan:0x8100,set_field:2001->vlan_vid",ge-1/1/8 will not receive any packets.

Overlap flow

Because some limitation of ASIC, some flow installed hardware can not work as expected. User should refer to this chapter before user starts to trouble-shoot the issues.

udp/ip, tcp/ip

When user adds flows with the same priority, and one flow's match fields includes another flow's match fields, the action of flow is at random. For example:

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 priority=10000,ip,in_port=14,dl_vlan=2,actions=push_vlan:0x8100,set_field:2503-\>vlan_vid,ou
admin@PicOS-OVS$ovs-appctl pica/dump-flows
#40 permanent priority=10000,ip,in_port=14,dl_vlan=2, actions:push_vlan(vid=2503),mod_vlan_pcp(pcp=0),15
Total 1 flows in TCAM.
admin@PicOS-OVS$ovs-ofctl add-flow br0 priority=10000,udp,in_port=14,dl_vlan=2,tp_dst=2123,actions=push_vlan:0x8100,set_field:2500-
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-appctl pica/dump-flows
#41 permanent priority=10000,udp,in_port=14,dl_vlan=2,tp_dst=2123, actions:push_vlan(vid=2503),mod_vlan_pcp(pcp=0),15
#40 permanent priority=10000,ip,in_port=14,dl_vlan=2, actions:push_vlan(vid=2503),mod_vlan_pcp(pcp=0),15
Total 2 flows in TCAM.
```

If user doesn't want this result, user should modify the two flows' priorities.

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 priority=12000,udp,in_port=14,dl_vlan=2,tp_dst=2123,actions=push_vlan:0x8100,set_field:2500-
ovs-ofctl add-flow br0 priority=10000,ip,in_port=14,dl_vlan=2,actions=push_vlan:0x8100,set_field:2503-\>vlan_vid,output:15
admin@PicOS-OVS$ovs-appctl pica/dump-flows
#42 permanent priority=12000,udp,in_port=14,dl_vlan=2,tp_dst=2123, actions:push_vlan(vid=2500),mod_vlan_pcp(pcp=0),15
#40 permanent priority=10000,ip,in_port=14,dl_vlan=2, actions:push_vlan(vid=2503),mod_vlan_pcp(pcp=0),15
Total 2 flows in TCAM.
```

Priority of Arp flow

Generally, the priority of an arp group is higher than a mac group. If one flow matches arp group and mac group at the same time, even if the priority of the arp is lower than the mac, packets will be forwarded according to arp group.

Example 1

Basic configuration:

```
admin@PicOS-OVS$ovs-vsctl add-br br0 -- set bridge br0 datapath_type=pica8
admin@PicOS-OVS$ovs-vsctl add-port br0 ge-1/1/1 vlan_mode=trunk tag=1-- set interface ge-1/1/1 type=pica8
admin@PicOS-OVS$ovs-vsctl add-port br0 ge-1/1/4 vlan_mode=trunk tag=1-- set interface ge-1/1/4 type=pica8
admin@PicOS-OVS$ovs-vsctl add-port br0 ge-1/1/5 vlan_mode=trunk tag=1-- set interface ge-1/1/5 type=pica8
```

Add flow:

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,dl_dst=ff:ff:ff:ff:ff:ff,actions=5
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,dl_type=0x0806,arp_op=1,actions=4
```

Check table:

```
admin@PicOS-OVS$ovs-appctl pica/dump-flows
#3720 normal permanent recirc_id=0,arp,in_port=1,arp_op=1, actions:4
#3719 normal permanent recirc_id=0,in_port=1,dl_dst=ff:ff:ff:ff:ff:ff, actions:5
#3718 normal permanent priority=0,recirc_id=0, actions:drop
Total 3 flows in HW.
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-ofctl dump-flows br0
OFPST_FLOW reply (OF1.4) (xid=0x2):
cookie=0x0, duration=28.919s, table=0, n_packets=n/a, n_bytes=0, in_port=1,dl_dst=ff:ff:ff:ff:ff:ff actions=output
cookie=0x0, duration=15.884s, table=0, n_packets=n/a, n_bytes=0, arp,in_port=1,arp_op=1 actions=output:4
admin@PicOS-OVS$
```

Send arp request packets and then check table:

```
admin@PicOS-OVS$ovs-ofctl dump-flows br0
OFPST_FLOW reply (OF1.4) (xid=0x2):
cookie=0x0, duration=62.999s, table=0, n_packets=n/a, n_bytes=0, in_port=1,dl_dst=ff:ff:ff:ff:ff:ff actions=output
cookie=0x0, duration=49.964s, table=0, n_packets=n/a, n_bytes=2560000, arp,in_port=1,arp_op=1 actions=output:4
```

From example above, if packets match files of above flows, packets will be forwarded according to arp.

Example 2

Add flow:

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,priority=333,dl_dst=ff:ff:ff:ff:ff:ff,actions=5
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,priority=222,dl_type=0x0806,arp_op=1,actions=4
```

Send arp request packets and check table:

```
admin@PicOS-OVS$ovs-ofctl dump-flows br0
OFPST_FLOW reply (OF1.4) (xid=0x2):
cookie=0x0, duration=19.544s, table=0, n_packets=n/a, n_bytes=0, priority=333,in_port=1,dl_dst=ff:ff:ff:ff:ff:ff a
cookie=0x0, duration=8.422s, table=0, n_packets=n/a, n_bytes=19846144, priority=222,arp,in_port=1,arp_op=1 actions=
admin@PicOS-OVS$ovs-ofctl dump-flows br0
OFPST_FLOW reply (OF1.4) (xid=0x2):
cookie=0x0, duration=20.931s, table=0, n_packets=n/a, n_bytes=0, priority=333,in_port=1,dl_dst=ff:ff:ff:ff:ff:ff a
cookie=0x0, duration=9.809s, table=0, n_packets=n/a, n_bytes=26813440, priority=222,arp,in_port=1,arp_op=1 actions=
admin@PicOS-OVS$
```

Even if arp group priority is lower than mac group, packets still are forwarded according to arp group.

Vlan Isolation

Vlan Isolation

At the moment, the vlan isolation only works on the egress of a port, not on the ingress direction.

Limitations on trident3

Limitation1:double 'pop_vlan' actions in flow entry on trident3 chip.

delete inner and outer tags in vcap, icap does not match any vlan tag.So may mismatch other packets in icap at this time.

Example:

Add a flow with double ‘pop_vlan’:

```
ovs-ofctl add-flow br0 in_port=1,dl_vlan=200,actions=pop_vlan,pop_vlan,output:2
```

send packets

send packets with outer vlan is 200,inner vlan is 100,then this kinds of packets can be transmitted correctly after pop these two vlans.Send others packets which outer vlan is not 200 or untag packets to port 1,then all the packets may be transmitted by port 2.But theoretically,the packets should not match the above flow.

Limitation2:TD3(s5248,as7326_56x,7726) and Tomahawk don't support egress-meter.

Limitation3:tcam usage

TD3 platforms icap entries max limitation is 3k, even if enable match-mode, the value is still 3k.

Limitation4:Trident3 does not support ingress-rate-limit.

Limitations5:Pop mpls

1) pop one mpls label,match fields exist only one mpls_label.

send packets with only one mpls label,then in SDK match mpls label finally.

2) pop one mpls label,match fields exist two mpls_labels.

send packets with two mpls labels(label1,label2),then in SDK match mpls label1 finally.

3) pop two mpls labels,match fields exist two mpls_labels.then in SDK match mpls label2 finally.

OVS CLI Enhancements

PicOS OVS cli has some enhancements from version 2.7.1.

List ovs running configuration

From PicOS2.7.1 OVS add a new command to display the current configuration by traversing the ovsdb tables. The command is:

ovs-vsctl show-running-config

```
admin@PicOS-OVS$ovs-vsctl show-running-config
Open_vSwitch c645ee8a-34d5-4c64-a3dc-0c1a20f3c26e
  Bridge "br0"
    datapath_id: "1c48cc37ab254bc1"
    datapath_type: "pica8"
    Port "ge-1/1/19"
      Interface "ge-1/1/19"
        type: "pica8"
      tag: 1
      vlan_mode: trunk
    Port "br0"
      Interface "br0"
        mtu: 1500
        type: internal
  Pica8 ecafe6f4-97ac-407b-b4df-c871b5cd9561
    hardware_type: "as4610_54t"
admin@PicOS-OVS$
```

Show ovs-vsctl commands

From PicOS3.2.0, OVS add one command to show the configurations in ovsdb through ovs-vsctl command.

ovs-vsctl display-settings

```
admin@PICOS-OVS:~$ ovs-vsctl display-settings
ovs-vsctl add-br br0
ovs-vsctl add-port br0 ge-1/1/1
ovs-vsctl set port ge-1/1/1  vlan_mode=trunk  tag=1
ovs-vsctl set interface ge-1/1/1  options=link_speed=100M
ovs-vsctl add-port br0 ge-1/1/2
ovs-vsctl set port ge-1/1/2  vlan_mode=trunk  tag=1
ovs-vsctl set interface ge-1/1/2  options=mtu=1500
ovs-vsctl set-group-ranges ecmp-select-groups=1-100
ovs-vsctl set-match-mode ip=1-1000,ipv6_full=1001-2000
```

List System Resources Usage

From PicOS2.7.1 OVS add two commands to display current system resources usage and interfaces.

When we show system resources usage, the current mode is cared, such as match-mode, udf-mode, L2-mode, L3-mode, combinate-mode and egress-mode.

The commands are:

ovs-appctl pica/show tables

ovs-appctl pica/show interfaces

```
admin@PicOS-OVS$ovs-appctl pica/show tables
Pica Tables Statistics:
    Pica Tables              Max Limitation          Current Used
    ------------------------------------------------------------------------

```

Associate sw-flow with hw-flow

From PicOS2.7.1, when a new flow entry is added, a unique 64bit flow-id is assigned to it. The flow-id can be used by ovs-ofctl and ovs-appctl to filter the flow entries and associate sw-flow with hw-flow.

The commands are:

ovs-ofctl dump-flows br0 [flow_id=n]

ovs-appctl pica/dump-flows [flow_id=n]

Example 1:

```
root@PicOS-OVS$ovs-ofctl add-flow br0 priority=200,in_port=1,actions=2
root@PicOS-OVS$ovs-ofctl add-flow br0 priority=124,in_port=1,ip,nw_src=10.10.10.10,actions=4
root@PicOS-OVS$ovs-ofctl dump-flows br0
OFPST_FLOW reply (OF1.4) (xid=0x2):
 cookie=0x0, duration=36.591s, flow_id=1, table=0, n_packets=n/a, n_bytes=0, priority=200,in_port=1 actions=output
 cookie=0x0, duration=6.393s, flow_id=2, table=0, n_packets=n/a, n_bytes=0, priority=124,ip,in_port=1,nw_src=10.10
root@PicOS-OVS$ovs-appctl pica/dump-flows
#4 normal permanent flow_id=1, priority=124,recirc_id=0,ip,in_port=1,nw_src=10.10.10.10, actions:2
#3 normal permanent flow_id=1, priority=200,recirc_id=0,in_port=1, actions:2
#0 normal_d permanent priority=0,recirc_id=0, actions:drop
Total 3 flows in HW.
```

From the above example, if two flow entries in table 0 don't have the exact same match and priority, but the match of sw-flow which has higher priority can cover another sw-flow's match, then two hw-flows with the same flow-id of sw-flow which has the higher priority will be installed.

Example 2:

```
root@PicOS-OVS$ovs-ofctl add-flow br0 priority=200,in_port=1,actions=goto_table:1
root@PicOS-OVS$ovs-ofctl add-flow br0 table=1,priority=101,in_port=1,ip,nw_src=10.10.10.11,actions=2
root@PicOS-OVS$ovs-ofctl add-flow br0 table=1,priority=102,ip,nw_src=10.10.10.12,actions=goto_table:2
root@PicOS-OVS$ovs-ofctl add-flow br0 table=2,priority=123,dl_dst=00:11:22:33:44:55,actions=3
root@PicOS-OVS$
root@PicOS-OVS$ovs-ofctl dump-flows br0
OFPST_FLOW reply (OF1.4) (xid=0x2):
 cookie=0x0, duration=184.078s, flow_id=1, table=0, n_packets=n/a, n_bytes=0, priority=200,in_port=1 actions=goto_t
 cookie=0x0, duration=49.800s, flow_id=2, table=1, n_packets=n/a, n_bytes=0, priority=102,ip,nw_src=10.10.10.12 act
 cookie=0x0, duration=107.575s, flow_id=3, table=1, n_packets=n/a, n_bytes=0, priority=101,ip,in_port=1,nw_src=10.1
 cookie=0x0, duration=7.991s, flow_id=4, table=2, n_packets=n/a, n_bytes=0, priority=123,dl_dst=00:11:22:33:44:55 a
root@PicOS-OVS$ovs-appctl pica/dump-flows
#6 normal permanent flow_id=1, priority=201,recirc_id=0,ip,in_port=1,dl_dst=00:11:22:33:44:55,nw_src=10.10.10.12, a
#5 normal permanent flow_id=1, priority=200,recirc_id=0,ip,in_port=1,nw_src=10.10.10.11, actions:2
```

```
#0 normal_d permanent priority=0,recirc_id=0, actions:drop
Total 3 flows in HW.
```

If a flow entry in table 0 has goto action, then the flow-id will be applied to all hw-flows generated by it. Only the flow-id's of sw-flows in first table are cared now.

Display dpid in both hex and decimal

From PicOS2.7.1, when the status of bridge is shown, we add decimal numbers for dpid to display.

```
admin@PicOS-OVS$ovs-ofctl show br0
OFPT_FEATURES_REPLY (OF1.4) (xid=0x2):

```

List Interface Details

From PicOS2.7.1, a command is added to display the details of a specific interface or all interfaces in the bridge. A corresponding openflow multipart message should be added by using multipart experimenter type, the controller can then get these statistics as well.

The command is:

ovs-ofctl dump-interfaces <bridge> [interface]

Example:

Add the following flow:

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=13,actions=15
```

No packets:

```
admin@PicOS-OVS$ovs-ofctl  dump-interfaces br0 ge-1/1/15
PXST_INTERFACE_STATS reply (OF1.4) (xid=0x4): 1 interfaces
  ge-1/1/15(port 15):
     Traffic statistics:
        Input Packets.............................0
        Output Packets............................0
        Input Octets..............................0
        Output Octets.............................0
```

Port 13 send unicast packets to match the flow and check:

```
admin@PicOS-OVS$ovs-ofctl  dump-interfaces br0 ge-1/1/13
PXST_INTERFACE_STATS reply (OF1.4) (xid=0x4): 1 interfaces
  ge-1/1/13(port 13):

```

Configuring Meter

Summary

If we don't limit the user ability to send data, then a large amount of traffic from different users could continuously make the network congested. In order to allocate the network resources to each user fairly and efficiently, the traffic should be limited. For instance, for the flow of a stream at each time interval, we only assign it a portion of the network resources to prevent network congestion caused by excessive burst.

In the ovs mode, user can configure meter to achieve interface and set the speed-limit including ingress and egress.The meter uses the token bucket to evaluate the specifications of the traffic, then makes a policy for the traffic, such as through, remark or drop.

Now we support 1R2C and 2R3C for the token bucket in the ingress meter and egress meter.

Configuration

In different hardware models, the maximum count of meters that PicOS OVS supports is different. User can use the command to check the maximum count.

And from version 2.9.2,meter capability also support pps.

```
admin@PicOS-OVS$ovs-ofctl meter-features br0
OFPST_METER_FEATURES reply (OF1.4) (xid=0x2):
max_meter:2048 max_bands:1 max_color:3
band_types: drop dscp_remark
capabilities: kbps pps burst stats
```

Ingress Meter

1R2C: Add a meter, the type=drop.

Without burst size. Limit the rate as 300000 kbps.

```
root@PicOS-OVS$ovs-ofctl add-meter br0 meter=1,kbps,band=type=drop,rate=300000
```

With burst size. Limit the rate as 300000 kbps and burst 30000 kbit

```
root@PicOS-OVS$ovs-ofctl add-meter br0 meter=2,kbps,burst,band=type=drop,rate=300000,burst_size=30000
```

1R2C: Add a meter, the type=dscp_remark.

Without burst_size. The prec_level=14.

```
root@PicOS-OVS$ovs-ofctl add-meter br0 meter=2,kbps,band=type=dscp_remark,rate=300000,prec_level=14
root@PicOS-OVS$ovs-ofctl add-meter br0 meter=3,pps,band=type=dscp_remark,rate=300000,prec_level=14
```

With burst_size. The prec_level=14.

```
root@PicOS-OVS$ovs-ofctl add-meter br0 meter=2,kbps,burst,band=type=dscp_remark,rate=300000,prec_level=14,burst_si
root@PicOS-OVS$ovs-ofctl add-meter br0 meter=3,pps,burst,band=type=dscp_remark,rate=300000,prec_level=14,burst_size
```

Check the meter configuration

```
admin@PicOS-OVS$ovs-ofctl dump-meters br0
OFPST_METER_CONFIG reply (OF1.4) (xid=0x2):
meter=2 kbps burst bands=
type=dscp_remark rate=300000 burst_size=30000 prec_level=14
meter=3 pps burst bands=
type=dscp_remark rate=300000 burst_size=30000 prec_level=14
admin@PicOS-OVS$
```

Modify one meter

```
root@LNOS-OVS$ovs-ofctl mod-meter br0 meter=2,kbps,burst,band=type=dscp_remark,
```

```
rate=400000,prec_level=1,burst_size=10000
root@LNOS-OVS$
root@LNOS-OVS$ovs-ofctl dump-meters br0
OFPST_METER_CONFIG reply (OF1.4) (xid=0x2):
meter=2 kbps burst bands=
type=dscp_remark rate=400000 burst_size=10000 prec_level=1
root@LNOS-OVS$
```

Dump meter stats

```
admin@PicOS-OVS$ovs-ofctl meter-stats br0
```

Delete one meter or all meters

```
root@LNOS-OVS$ovs-ofctl del-meter br0 meter=2
root@LNOS-OVS$
root@LNOS-OVS$ovs-ofctl del-meters br0
root@LNOS-OVS$
```

Notice: If one meter applies to multiple flow entries, all the flow entries will share the meter rate.

Example:

```
root@PicOS-OVS$ovs-ofctl add-meter br0 meter=1,kbps,band=type=drop,rate=300000
root@PicOS-OVS$ovs-ofctl add-flow br0 in_port=11,dl_dst=22:00:00:00:00:00,dl_src=22:11:11:11:11:11,dl_type=0x0800,a
root@PicOS-OVS$ovs-ofctl add-flow br0 in_port=12,dl_dst=22:00:00:00:00:00,dl_src=22:11:11:11:11:22,dl_type=0x0800,a
```

1.Each in_port are sent 200M flow to one output port.

The result: the port te-1/1/13,receive 300M flow,all of flow are green,the 100M red flow are dropped.

2R3C:

Without burst size.

The first bucket limit the rate as 300000 kbps,if the rate more than it and less then 600000 kbps,the packets dscp value wiil be remarked 14.

The second bucket limit the rate as 600000 kbps, if the rate more than it,then beyond the part will be dropped.

```
root@PicOS-OVS$ovs-ofctl add-meter br0 meter=2,kbps,bands=type=dscp_remark,rate=300000,prec_level=14,type=drop,rate
```

With burst size. Limit the rate as 300000 kbps , 600000 kbps and burst as 10000 kbit, 20000 kbit.

```
root@PicOS-OVS$ovs-ofctl add-meter br0 meter=2,kbps,burst,bands=type=dscp_remark,rate=300000,burst_size=10000,prec_
```

Example:

```
root@PicOS-OVS$ovs-ofctl add-meter br0 meter=2,kbps,bands=type=dscp_remark,rate=300000,prec_level=14,type=drop,rate
root@PicOS-OVS$ovs-ofctl add-flow br0 in_port=11,dl_dst=22:00:00:00:00:00,dl_src=22:11:11:11:11:11,dl_type=0x0800,a
root@PicOS-OVS$ovs-ofctl add-flow br0 in_port=12,dl_dst=22:00:00:00:00:00,dl_src=22:11:11:11:11:22,dl_type=0x0800,a
```

1. Each in_port are sent 200M flow to one output port.

The result: the port te-1/1/13 is receive 400M flow,including 300M green flow,and 100M yellow,no red flow.

2. Each in_port are sent 300M flow to one output port.

The result: the port te-1/1/13 is receive 500M flow,including 300M green flow, 200M yellow flow, and 100M red flow are dropped.

Egress Meter

Egress meter need redistribute meter id, and it can't be used by ingress meter. After configuring,need restart the ovs service.

```
root@LNOS-OVS$ovs-vsctl set-meter-ranges egress-meter=3-4
  Please reboot for the change to take effect!
root@LNOS-OVS$systemctl restart picos
```

Check egress meter configuration

```
root@LNOS-OVS$ovs-vsctl show-meter-ranges
meter_ranges:
  egress-meter=3-4
root@LNOS-OVS$
```

The egress meter configuration is the same as ingress meter.And egress meter is also support 1R2C and 2R3C.

```
root@PicOS-OVS$ovs-ofctl add-meter br0 meter=3,kbps,bands=type=dscp_remark,rate=300000,prec_level=14,type=drop,rate

root@PicOS-OVS$ovs-ofctl add-meter br0 meter=4,pps,bands=type=dscp_remark,rate=300000,prec_level=14,type=drop,rate=
```

Then put a flow need applying egress meter.

```
root@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,ip,nw_src=1.1.1.2,actions=egress_meter:3,output:38
root@PicOS-OVS$ovs-ofctl add-flow br0 in_port=14,ip,nw_src=1.1.1.2,actions=egress_meter:4,output:38
```

Notice:

1.The meter configure at most two bands now in a meter flow. If only one band is set, 1R2C is effective; otherwise, 2R3C is used, and the rate configured in band1 should be smaller than rate in band2.

2.If the type of band1 is drop, the type of band2 is invalid.

3.ingress meter use color-blind mode which means the bucket don't care the color of incoming packets.

4.egress meter use color-aware mode which means the bucket can aware the color of incoming packets.

5.From version 3.4,the default burst_size value is the same with the rate user set.As following ,the burst_size is 30000kb. If the unit is pps,then the burst' unit is packets as well.The minimum value of burst is 1,when rate unit is pps,and the value is 13kb when the rate unit is kbps.

```
ovs-ofctl add-meter br0 meter=2,kbps,burst,band=type=drop,rate=30000
```

Application :

```
root@LNOS-OVS$ovs-vsctl set-meter-ranges egress-meter=3-4
  Please reboot for the change to take effect!
root@LNOS-OVS$systemctl restart picos

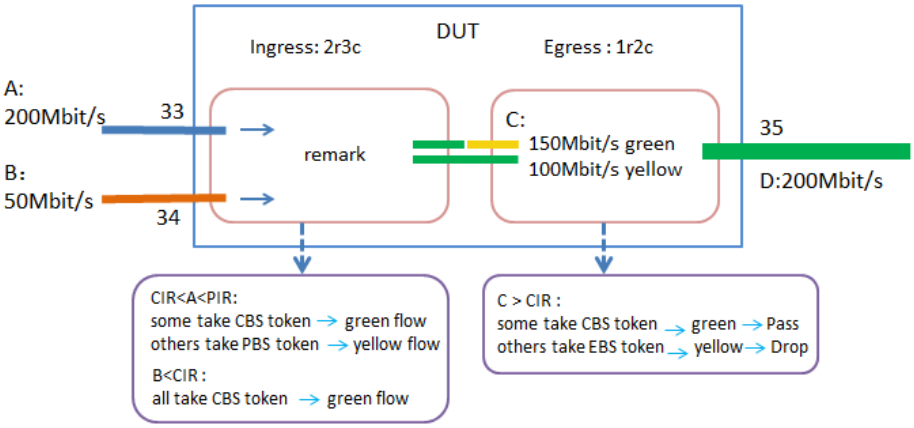
Ingress meter:
root@LNOS-OVS$ovs-ofctl add-meter br0 meter=1,kbps,bands=type=dscp_remark,rate=
100000,prec_level=1,type=drop,rate=300000
root@LNOS-OVS$ovs-ofctl add-meter br0 meter=2,kbps,bands=type=dscp_remark,rate=
100000,prec_level=14,type=drop,rate=300000

Egress meter:
ovs-ofctl
add-meter br0 meter=3,kbps,bands=type=drop,rate=200000

Add flow:
root@LNOS-OVS$ovs-ofctl add-flow br0 in_port=33,ip,dl_src=22:11:11:11:11:11,act
ions=meter:1,egress_meter:3,output:35
root@LNOS-OVS$ovs-ofctl add-flow br0 in_port=34,ip,dl_src=22:11:11:11:11:12,act
ions=meter:2,egress_meter:3,output:35
root@LNOS-OVS$
root@LNOS-OVS$ovs-appctl pica/dump-flows
#0 normal_d permanent flow_id=2 priority=0, actions:drop
#2 normal permanent flow_id=6 ip,in_port=33,dl_src=22:11:11:11:11:11, actions:meter(id=1,band(dscp_remark=1),band(
#3 normal permanent flow_id=7 ip,in_port=34,dl_src=22:11:11:11:11:12, actions:meter(id=2,band(dscp_remark=14),band
Total 3 flows in HW.
root@LNOS-OVS$
```

Process：

sent 200M flow to port 33,50M flow to 34.



Result: the port te-1/1/35 receive 200M flow，including 150M green flow and 50M yellow flow.

Other Result:

1. Each in_port are sent 90M flow to one output port.

The result: the port te-1/1/35 receive 180M flow,all of flow are green.

2. sent 150M flow to port 33,40M flow to 34.

The result: the port te-1/1/35 receive 190M flow，including 50M yellow flow and 140M green flow.

3. Each in_port are sent 150M flow to one output port.

The result: the port te-1/1/35 receive 200M flow，including 200M green flow.

4. sent 250M flow to port 33,70M flow to 34.

The result: the port te-1/1/35 receive 200M flow，including 170M green flow and 30M yellow flow.

5. sent 350M flow to port 33,150M flow to 34.

The result: the port te-1/1/35 receive 200M flow，including 200M green flow.

6. sent 350M flow to port 33,350M flow to 34.

The result: the port te-1/1/35 receive 200M flow，including 200M green flow.

NOTICE:

1.

Simply put, the setting of the Meter parameter depends on the speed-limit of the actual traffic.
In principle, the token bucket capacity needs to be greater than or equal to the length of the largest packet and the normal burst of traffic in the network.

For the PICA8 switches, we have a summary of empirical formulas:
1.rate ≤ 100Mbit/s, token bucket capacity (kbits) = rate (Mbit/s) * 1000 (s)
2.rate > 100Mbit/s, token bucket capacity (kbits) = 100000 (kbit/s) * (s)

2.

Now, Ingress meter are supportted all platform, but egress meter just part of platform are supportted,as shown below:

NIAGARA2632XL // NIAGARA2948_6XL // S4048
PRONTO5101 // PRONTO5401 // AS6712_32X
AS5712_54X // AS6701_32X // ARCTICA4806XP
AS5812_54T

Configuration saving

Pica8 support saving configuration of meters,groups or flows which need to configure again previously after restart the switch system from version 2.8.1.

There are two scripts on /ovs/bin, ovs-pica-save and ovs-pica-load. When you have configured meters,groups or flows, please run ovs-pica-save before restart switch system. And run ovs-pica-load after restart.

Path of ovs-pica-save and ovs-pica-load: /ovs/bin

1.Configure meters.

```
admin@PicOS-OVS$ovs-ofctl add-meter br0 meter=2,kbps,band=type=dscp_remark,rate=300000,prec_level=14
admin@PicOS-OVS$ovs-ofctl add-meter br0 meter=1,kbps,band=type=drop,rate=300000
admin@PicOS-OVS$ovs-ofctl add-meter br0 meter=3,kbps,burst,band=type=dscp_remark,rate=300000,prec_level=14,burst_s
```

2.Configure groups.

```
admin@PicOS-OVS$ovs-ofctl add-group br0 group_id=1,type=indirect,bucket=output:3
admin@PicOS-OVS$ovs-ofctl add-group br0 group_id=2,type=indirect,bucket=set_field:66:66:66:00:00:00-\>dl_src,set_f
```

3.Add flows.

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,ip,dl_dst=22:22:22:22:22:22,actions=meter:1,group:1
admin@PicOS-OVS$ovs-ofctl add-flow br0 arp,arp_tpa=192.168.100.100,actions=2
```

4.Run ovs-pica-save.

```
admin@PicOS-OVS$ovs-pica-save
Meter configurations are saved to  : /ovs/config/meters
Group configurations are saved to  : /ovs/config/groups
Flow configurations are saved to  : /ovs/config/flows

Saved successfully!
admin@PicOS-OVS$
```

5.Restart the switch.

```
admin@XorPlus$sudo systemctl restart picos
```

6.Load configuration.

```
admin@PicOS-OVS$ovs-pica-load

Your configuration has been loaded successfully!
admin@PicOS-OVS$
```

If load failed,user should check files which has been saved in /ovs/config and then modify it.

7.Check after loading configuration.

```
admin@PicOS-OVS$ovs-ofctl dump-meters br0
OFPST_METER_CONFIG reply (OF1.4) (xid=0x2):
meter=1 kbps bands=
type=drop rate=300000

meter=2 kbps bands=
type=dscp_remark rate=300000 prec_level=14

meter=3 kbps burst bands=
type=dscp_remark rate=300000 burst_size=30000 prec_level=14
admin@PicOS-OVS$
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-ofctl dump-groups br0
OFPST_GROUP_DESC reply (OF1.4) (xid=0x2):
 group_id=1,type=indirect,bucket=actions=output:3
 group_id=2,type=indirect,bucket=actions=set_field:66:66:66:00:00:00->eth_src,set_field:66:66:66:11:11:11->eth_dst
```

```
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-ofctl dump-flows br0
OFPST_FLOW reply (OF1.4) (xid=0x2):
 flow_id=6, cookie=0x0, duration=16.841s, table=0, n_packets=n/a, n_bytes=0, arp,arp_tpa=192.168.100.100 actions=ou
 flow_id=7, cookie=0x0, duration=16.840s, table=0, n_packets=n/a, n_bytes=0, ip,in_port=1,dl_dst=22:22:22:22:22:22
admin@PicOS-OVS$
```

Note:

1)Related configuration in br0 will save to :

Meters: /ovs/config/meters/br0

Groups: /ovs/config/groups/br0

Flows: /ovs/config/flows/br0

User can modify above files to add or delete configuration and then load new configuration.

2)If there is error information when load configuration, user can modify above files too.

3)Load meters firstly and then groups and flows lastly.

Configuring Buffer management

Introduction

When network congestion, the port cannot send data immediately to prevent loss of data, the device will send the data is temporarily stored in the data in the buffer.

1. Accounting resources

The chip stores packets in fixed-sized cells, all cells are 208 bytes and all packets user at least one cell.The first cell used by a packet contains 144 bytes of packet data and 64 bytes of buffering related data.

All cells used by a packet after the first cell contain 208 bytes of packet data.

2. Memory Spaces ：

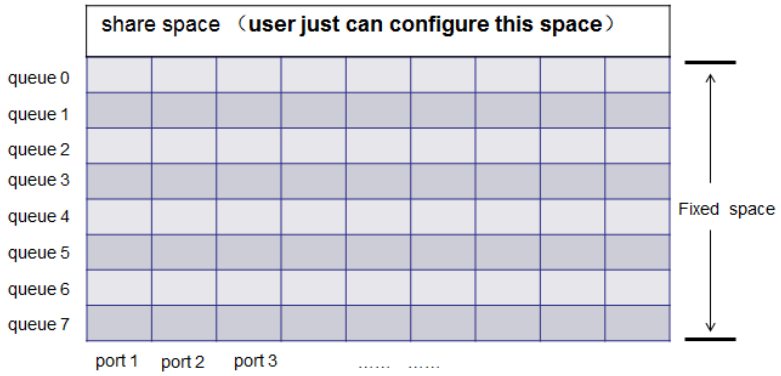
The cell data buffer is divided into fixed and shared spaces.

- Fixed space

Fixed space in accordance with the port queue division, reserved in advance, other ports cannot take up the space, when the port congestion occurs, it will occupy fixed space first, shared space will be used when the fixed space is no longer available. The fixed space is allocated using a static threshold. Fixed space allocation will not be too big, otherwise it will cause waste of resources.

- Shared space

The shared space used by all ports and priority groups when the fixed space is run out. When the shared space is used up, the packet is discarded. If a queue don't have to store packet,the others queue will take up this queue resource.For a queue,all of ports transmit packets will first come first served,if run out of the resource,the came packets will be dropped.The shared space can use dynamic or static threshold configuration at the logical level of the queue.



Command configuration

For the unicast queue and multicast queue，we have different configuration to deal with share space：

1.multicast queue：

static mode: Need configure.

- The static threshold value configured for the multicast queue in shared space.This avoids the case of the port affects the forwarding of other ports in flow control mode, but the disadvantage is that the utilization of shared resources is low.

dynamic mode : This is the default configuration.

disable queue 0 dynamic-shared

```
root@PicOS-OVS$ovs-vsctl set-egress-mc-queue-dynamic 0 false
```

2.unicast queue：

dynamic mode ：

- dynamic threshold is the default mode for the unicast queue，and it can't configure static threshold.

3.dynamic threshold ratio configuration

The dynamic mode both of multicast and unicast queue can configure the dynamic threshold ratio .

Configure queue 0 dynamic threshold ratio 50%

```
root@PicOS-OVS$ovs-vsctl set-egress-shared-queue-ratio 0 50
```

Check the configuration result

```
admin@PicOS-OVS$ovs-vsctl show-egress-shared-queue-ratio
Egress shared queue state:
    queue    uc enable   mc enable   shared ratio (uc)  shared ratio (mc)
    ------------------------------------------------------------------------
      0         true        true          33%                33%
      1         true        true          33%                33%
      2         true        true          33%                33%
      3         true        true          33%                33%
      4         true        true          33%                33%
      5         true        true          33%                33%
      6         true        true          33%                33%
      7         true        true          33%                33%
```

Clear the ratio configuration . Clear dynamic mode configuration

```
root@PicOS-OVS$ovs-vsctl list pica8
_uuid               : fef8cb42-7f42-4a1b-b089-95bf49fd7811
combinate_actions_enable: false
cos_map_enable      : false
disable_extend_group: false
ecmp_symmetric_hash : false
............
............

root@PicOS-OVS$ovs-vsctl clear pica8 fef8cb42-7f42-4a1b-b089-95bf49fd7811 egress-mc-queue-dynamic

root@PicOS-OVS$ovs-vsctl clear pica8 742a4dda-db77-474f-b702-1012141ecd5a egress_shared_queue_ratio
```

For the maximum shared-area ratio for a queue, the percentage values 0 to 100 are divided into 10 rages.The table below shows the effective values that correspond to the configured values of ratio-value.

Value of *ratio-value*	Effective value
0 to 1	1
2 to 3	3
4 to 7	6
8 to 16	11
17 to 29	20
30 to 42	33
43 to 60	50
61 to 76	67
77 to 86	80
87 to 100	89

notice
Now,all of Trident and Trident+ platforms just support eight （1-67）effective ratio value for multicast egress queue.Platform 7312,ratio of 33~100 take the same effect.

Application notice

As show above: send packets from port1 and port2 to port3 in 10G speed in queue 0, and port3 will be in congestion.

For the multicast flow,If flow control is enabled on port1 and port2 and configure static threshold,the packets also perhaps will be dropped in port 3 egress queue,because at the egress shared-ratio is small and ingress can't meet condition of sending pause frame.

So,if users exist this environment,in the this condition,we suggest users configure dynamic mode. port1 and port2 will send out pause frame before port3 queue limit is reached, and absorb burst packets to avoid packet drop.

What's more,if pause frame are not be responsed,uc traffic will be discarded on ingress port,whether mc traffic are discarded on egress port.

Note:

1.support buffer managment platforms:

trident2	trident2 plus	tomahawk(per xpe)	triumph3	trident

2.Unicast queue traffic

push_mpls,push_l2mpls,gre,l2gre,vxlan,multitable flow,TTP unicast flow.

3.platform 4610,6248

multicast queue can absorb 266 cells,other platforms can absorb about 300 cells.

Configuring snmp

Pica8 support snmp from version 2.9.1 on ovs.

SNMP is short for Simple Network Management Protocol, and it is mainly used for monitoring features, data throughout, communication overload, errors and so on of network devices.

SNMP is composed of agent-side and server-side which contains three communication behaviors between them: get, set and trap. The communication process can be detailed roughly as follows: server sends requests (snmpget or snmpwalk) to agent and then agent will deal with the requests and reply to it. While agent will also send notification to server proactively when finding device status changed or errors occuring.What is more,one server-side can monitor multiple agent-sides and vice versa.

SNMP can not work without mibs which determine the available objects of a device. Every mib can be represented by a subtree and each node in the tree corresponds to one OID number which means one available variable in our device. Our SNMP currently mainly support public IF-MIB and private mibs (pica_private_mib.txt and pica_private_trap_mib.txt) which are defined by ourselves. The specified contents of our defined private mibs can be referred in this site: Pica8 Private MIB

1.start snmp on ovs

```
admin@XorPlus$sudo picos_boot
Configure the default system start-up options:
 (Select key 3 if no change)
    [1]  PicOS L2/L3   * default
    [2]  PicOS Open vSwitch/OpenFlow
    [3]  No start-up change
Enter your choice (1,2,3):2
PicOS Open vSwitch/OpenFlow is selected.
Configure the IP of management interface:
    [1] DHCP
    [2] Static IP
Enter your choice(1,2):1
Start OVS web user interface?(y|n)[n]:y
Start OVS network snmp?(y|n)[n]:y
Please restart the PicOS service
admin@XorPlus$sudo systemctl restart picos
```

2.command

We enable ovs snmp to update device data and enable trap using following command.

1)Enable snmp:

```
admin@PicOS-OVS$ovs-vsctl set-snmp-enable true
admin@PicOS-OVS$ovs-vsctl show-snmp
  snmp is enabled
admin@PicOS-OVS$
```

2)Configure snmp community name:

```
admin@PICOS-OVS:~$ ovs-vsctl set-snmp-community-name  pica8
```

Snmp community name default value is public, following command reproduce default value.

```
admin@PicOS-OVS$ ovs-vsctl set-snmp-community-name
```

3)Change trap destinations:

```
admin@PicOS-OVS$ovs-vsctl  show-snmp-trap-targets
snmp trap target is default: l27.0.0.1
admin@PicOS-OVS$
```

Note:default snmp trap target is 127.0.0.1,and we can use following command to change it.

```
admin@PicOS-OVS$ovs-vsctl set-snmp-trap-targets 10.10.50.234
```

Reproduce default snmp trap target:

```
admin@PicOS-OVS$ovs-vsctl set-snmp-trap-targets
```

3.Snmp

Snmpwalk and snmpget:

Both linux console and window SNMP tool can get device data. Following are results from 10.10.51.194:

```
pica8@pica8:~$ snmpwalk -v 2c -c public 10.10.51.157 1.3.6.1.4.1.35098.1.1
iso.3.6.1.4.1.35098.1.1.0 = INTEGER: 8
pica8@pica8:~$
pica8@pica8:~$ snmpget -v 2c -c public 10.10.51.157 1.3.6.1.4.1.35098.1.1.0
iso.3.6.1.4.1.35098.1.1.0 = INTEGER: 8
pica8@pica8:~$
```

Note: Generally using snmpwalk for snmp data is safer and convinient.On one hand, you can get all data of a table or a group for requesting once by snmpwalk. But snmpget need many times. On the other hand,for snmpget,you need use leaf node of a mib plus index as OID number, while snmpwalk do not. The root difference between them lies in that snmpget can only access a leaf node for one request, but snmpwalk can access a root node instead. For example, cpuUsage OID is 1.3.6.1.4.1.35098.1.1. if you use snmpget,you must access it like this:

snmpget -v 2c -c public 10.10.51.145 1.3.6.1.4.1.35098.1.1.0

Trap notification:

You can use window snmp tools to save the notification results.

4.Tap on snmp:

> ⚠ Following configure only used flows which added by web tapping.

As we know, OVS can be configured through its build-in commands, But web looks like more convenient and intuitive.So we develop web to configure OVS in tap units. One tap corresponds a flow in OVS which contains a set of in_ports(flow inports), a set of filters(flow match), a hash type for out-ports(group type + lag hash) and a set of out-ports(make up a group for flow output). One user can create many different taps to control OVS work. Snmp can work as a way of checking the tap configuration other than physical device status and trap.

Oids about tap:

Global lag hash oid:

glLagHashFields OID 1.3.6.1.4.1.35098.3.1

Tap table field oid:

tapEntry OID 1.3.6.1.4.1.35098.3.2.1

tapPrior OID 1.3.6.1.4.1.35098.3.2.1.1

inPortName OID 1.3.6.1.4.1.35098.3.2.1.2

f-srcMac OID 1.3.6.1.4.1.35098.3.2.1.3

f-dstMac OID 1.3.6.1.4.1.35098.3.2.1.4

f-srcIp OID 1.3.6.1.4.1.35098.3.2.1.5

f-dstIp OID 1.3.6.1.4.1.35098.3.2.1.6

f-dlType OID 1.3.6.1.4.1.35098.3.2.1.7

f-nwProto OID 1.3.6.1.4.1.35098.3.2.1.8

f-dlVlan OID 1.3.6.1.4.1.35098.3.2.1.9

f-tcpSrc OID 1.3.6.1.4.1.35098.3.2.1.10

f-tcpDst OID 1.3.6.1.4.1.35098.3.2.1.11

f-udpSrc OID 1.3.6.1.4.1.35098.3.2.1.12

f-udpDst OID 1.3.6.1.4.1.35098.3.2.1.13

f-nwTos OID 1.3.6.1.4.1.35098.3.2.1.14

f-vlanPcp OID 1.3.6.1.4.1.35098.3.2.1.15

a-mod-srcMac OID 1.3.6.1.4.1.35098.3.2.1.16

a-mod-dstMac OID 1.3.6.1.4.1.35098.3.2.1.17

a-mod-vlanVid OID 1.3.6.1.4.1.35098.3.2.1.18

a-mod-vlanPcp OID 1.3.6.1.4.1.35098.3.2.1.19

a-pushVlan OID 1.3.6.1.4.1.35098.3.2.1.20

a-popVlan OID 1.3.6.1.4.1.35098.3.2.1.21

portGroupType OID 1.3.6.1.4.1.35098.3.2.1.22

outPortName OID 1.3.6.1.4.1.35098.3.2.1.23

mirror table oids:

mirrorEntry OID 1.3.6.1.4.1.35098.3.3.1

mirrorIndex OID 1.3.6.1.4.1.35098.3.3.1.1

mirrorName OID 1.3.6.1.4.1.35098.3.3.1.2

srcPort OID 1.3.6.1.4.1.35098.3.3.1.3

dstPort OID 1.3.6.1.4.1.35098.3.3.1.4

outputPort OID 1.3.6.1.4.1.35098.3.3.1.5

Example:

```
admin@PicOS-OVS$ovs-ofctl dump-flows br0
OFPST_FLOW reply (OF1.4) (xid=0x2):
 flow_id=53, cookie=0x3, duration=1823.837s, table=0, n_packets=n/a, n_bytes=0, priority=3,in_port=130 actions=outp
 flow_id=54, cookie=0xfffc, duration=1823.829s, table=0, n_packets=n/a, n_bytes=0, priority=65532,in_port=133,dl_s
admin@PicOS-OVS$
admin@PicOS-OVS$sudo su
root@PicOS-OVS$

root@PicOS-OVS$ovs-vsctl list mirror
_uuid               : 1080b149-740e-414f-8054-3250f041cf7e
external_ids        : {}
name                : "M1"

NPB-PRIVATE-MIB::outputPort.1 = STRING: "he-1/1/19"
pica8@pica8:~$
```

5.Snmp trap

Pica8 added some private and trap MIBs listed below:

1.link up: OID: 1.3.6.1.6.3.1.1.5.4(physical port and lag port)

link down:OID:1.3.6.1.6.3.1.1.5.3(physical port and lag port)

2.sfpTraps: 1.3.6.1.4.1.35098.21.2

1)sfpPlugin: 1.3.6.1.4.1.35098.21.2.1

2)sfpPlugout: 1.3.6.1.4.1.35098.21.2.2

3,Warm start : OID:1.3.6.1.6.3.1.1.5.2

4,Cold start: OID:1.3.6.1.6.3.1.1.5.1

5,Rpsu traps: oid: 1.3.6.1.4.1.35098.21.1

1)rpsuPlugIn：1.3.6.1.4.1.35098.21.1.2

2)rpsuPlugOut：1.3.6.1.4.1.35098.21.1.3

3)rpsuFanFailed: 1.3.6.1.4.1.35098.21.1.4

4)rpsuFanRecovery: 1.3.6.1.4.1.35098.21.1.7

5)rpsuStatusChangePowerOff:1.3.6.1.4.1.35098.21.1.5

6)rpsuStatusChangePowerOn:1.3.6.1.4.1.35098.21.1.6

6,Fan traps: oid: 1.3.6.1.4.1.35098.21.1

1)switchFanFailed: 1.3.6.1.4.1.35098.21.3.1

2)switchFanRecovery: 1.3.6.1.4.1.35098.21.3.4

Note:

From 2.10.0,Pica8 support log info and trap message about fan and psu.
1) Fan log: fan fail, fan recovery.
2) Fan trap: fan fail, fan recovery.
3) Psu log: plugin,plugout,psu fail,psu recovery,psu power on,psu power off,psu status change.
4) Psu trap: plugin,plugout,psu fail,psu recovery,psu power on,psu power off.

Configuring/Enabling SNMPv3

- Description
- Procedure
- Commands
  - SNMPv3 User
  - SNMP MIB View
  - SNMP Group

Description

authentication-key and privacy-key of the user should not below the length requirements of the USM (min=8).

Security-level:If you create a snmpv3 user without adding to any group,then snmpwalk will use user's permission;If the user add to a group with a mib-view,then snmpwalk will use group's permission,and also support to use user's permission to snmpwalk when user's permission is higher then group's permission.

Procedure

Firstly, need to select 'Y' when "Start OVS network snmp?(y|n)[n]:'

Secondly, should execute "ovs-vsctl set-snmp-enable true" to enable snmp

At last, you can configure snmpv3 commands such as snmp-mib-view,snmp-group,snmpv3_user,etc in your test environment.

need to enable snmp(ovs-vsctl set-snmp-enable true) to make snmpv3 works.

Commands

SNMPv3 User

ovs-vsctl set-snmpv3-user username=user1 **readonly**=true **authentication-mode=**MD5 **authentication-key**=pica8123 **privacy-mode**=DES **privacy-key**=11111111

----------Use this command to create or update a user.

ovs-vsctl list snmpv3-user

ovs-vsctl list snmpv3_user

---------- Use these commands to check the user

ovs-vsctl **destroy** snmpv3-user user1

ovs-vsctl **destroy** snmpv3_user user1

---------- Use these commands to delete the user

Note:Of course, privacy-mode and privacy-key, authentication_key are optional, but authentication-mode is mandatory. authentication_key and privacy_key are empty without setting them.

Readonly:true or false, "true" means using rouser,"false" means rwuser。

authentication_mode: MD5, SHA

privacy_mode: DES, AES, AES128

SNMP MIB View

ovs-vsctl set-snmp-mib-view name=view1 subtree=1.3.6.1.2.1.1.2.0 type=included mask=ff

---------- Use this command to create a mib-view

ovs-vsctl list snmp-mib-view

---------- Use this command to check a mib-view

admin@PICOS-OVS:/pica/core$ ovs-vsctl list snmp-mib-view

_uuid : 0f1fc049-c9c6-4386-8824-06c524b208b5

name : all

nodes : [505cd0c9-2dde-442e-b91f-798954f21635]

ovs-vsctl destroy snmp-mib-view view1

ovs-vsctl destroy snmp_mib_view view1

---------- Use these commands to delete a mib-view,but if the view is used in group,then failed to destroy it.

ovs-vsctl add-snmp-mib-view ...

---------- Use this command to append the parameters to the same view,parameters are the same with set-snmp-mib-view

ovs-vsctl set view_node $uuid subtree=… mask=…

---------- Use this command to modify subtree or mask individually

SNMP Group

ovs-vsctl set-snmp-group name=group1 users=user1,user2 security-level=AuthPriv read-view=view1 write-view=view1 notify-view=view1

---------- Use this command to create a group and add user and view to the group

security-level:

AuthPriv

AuthNoPriv

NoAuthNoPriv

ovs-vsctl add snmp-group group1 users $uuid

---------- Use this command to append a user to a group ,uuid is the user's uuid

ovs-vsctl list snmp-group

ovs-vsctl list snmp_group

---------- Use these commands to check the group

ovs-vsctl **destroy** snmp-group group1

ovs-vsctl **destroy** snmp_group group1

---------- Use these commands to destroy the group

4)check all the snmpv3 configurations

ovs-appctl snmp/show-v3-config

check the validation of above configurations

you can check if the configurations works or not through snmpwalk/snmpset

eg:

snmpwalk -v 3 -u user1 -a MD5 -A 11111111 -x DES -X 11111111 -l authPriv 10.10.51.165 1.3.6.1.2.1.1.2.0

iso.3.6.1.2.1.1.2.0 = OID: iso.3.6.1.4.1.35098.1.13

Configuring Precision Time Protocol

PTP introduction

From version 2.9.2,Pica8 switch support PTP(Precision Time Protocol).

On a modern communications network, most telecommunications services require that the frequency offset or time difference between devices be within an acceptable range. To meet this requirement, network clock synchronization must be implemented.

Network clock synchronization includes phase synchronization and frequency synchronization.

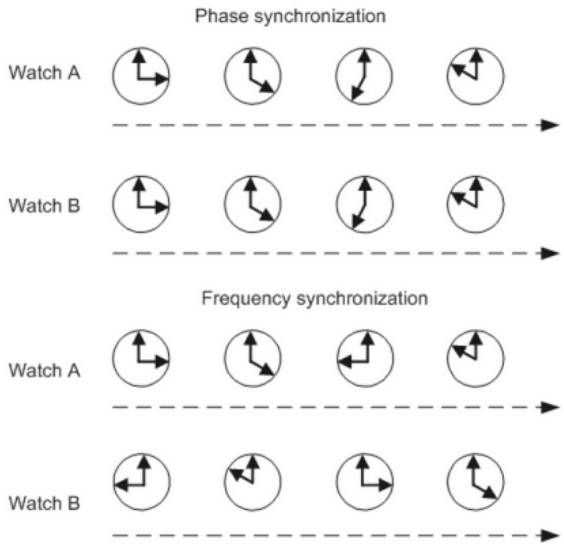
Phase synchronization

Phase synchronization, also called time synchronization, refers to the consistency of both frequencies and phases between signals. That is, the phase difference between signals is always 0.

Frequency synchronization

Frequency synchronization refers to constant phase difference between signals. It ensures that signals are sent or received at the same rate at a moment so that all devices on the communications network operate at the same rate.

Figure 1 Difference between time synchronization and frequency synchronization



PTP (Precision Time Protocol) is a time synchronization protocol, which itself is only used for high-precision time synchronization between devices, but can also be used to synchronize the frequency between devices. Compared to the existing time synchronization mechanism, PTP has the following advantages:

1.Compared to NTP (Network Time Protocol), PTP can meet the more accurate time synchronization requirements, NTP generally can only achieve sub-second time synchronization accuracy, and PTP can reach sub-microsecond.

2.Compared to GPS (Global Positioning System), PTP has lower construction and maintenance costs, and because it can get rid of the dependence on GPS, it has special meaning in national security.

Basic concepts

PTP domain

A PTP domain is a logical grouping of clocks that synchronize to each other using the protocol IEEE 1588v2, but that are not necessarily synchronized to clocks in another domain. Each PTP domain is an independent PTP clock synchronization system and has only one clock source.

Clock node

Clock nodes are nodes in a PTP domain. PTP defines the following types of clock nodes:

1.Ordinary clock (OC) device: provides only one physical port to participate in time synchronization in a PTP domain. An OC device uses this port to synchronize time with an upstream device or to send a downstream device.

2.Boundary clock (BC) device: provides two or more physical ports to participate in time synchronization in a PTP domain. One port synchronizes time with an upstream device, and the others send the time to downstream devices. A clock node is also a BC device if it functions as the clock source and sends time to downstream devices through multiple PTP ports.

3.Transparent clock (TC) device: forwards PTP messages between its PTP ports and measures the link delay of the messages. Different from an OC device and a BC device, a TC device does not synchronize time with other devices through ports.

- E2ETC (End-to-End Transparent Clock): forwards packets of non-P2P (Peer-to-Peer, point-to-point) types directly on the network and participates in the calculation of the entire link Time.

E2ETC calculate the residence time of the device, which is the time it takes the event message from ingress port to egress port, then add the calculated residence time to the correctionfield of the event message.

- P2PTC (Peer-to-Peer Transparent Clock): forwards only Sync messages, Follow_Up messages and Announce messages, and terminates other PTP packets. It is involved in calculating the entire link on the entire link. The delay of a link.

PTP port

A PTP port is a port running PTP. PTP ports are classified into the following types based on roles:

1.Master port: The port is the source of time on the path served by the port, located on a BC or OC device.

2.Slave port: The port synchronizes to the device on the path with the port that is in the MASTER state, is located on a BC or OC device.

3.Passive port: The port is not the master on the path nor does it synchronize to a master.is an idle port on a BC device and does not receive or send synchronization clock signals.

Master-slave hierarchy

Nodes in a PTP domain establish the master-slave hierarchy for clock synchronization. Master nodes send synchronization clock signals, while slave nodes receive synchronization clock signals. A device may receive synchronization clock signals from an upstream node and then send the synchronization clock signals to a downstream device.

If two clock nodes synchronize time with each other:

1.The node that sends synchronization clock signals is the master node, and the node that receives synchronization clock signals is the slave node.

2.The clock on the master node is the master clock, and the clock on the slave node is the slave clock.

3.The port that sends synchronization clock signals is the master port, and the port that receives synchronization clock signals is the slave port.

Grandmaster clock

All clock nodes in a PTP domain are organized into the master-slave hierarchy. The grandmaster clock (GMC) is at the top of the hierarchy and is the reference clock in the PTP domain. Clock nodes exchange PTP messages to synchronize the time of the GMC to the entire PTP domain. Therefore, the GMC is also called the clock source. The GMC can be statically configured or dynamically elected through the best master clock (BMC) algorithm.

PTP message

Nodes exchange PTP messages to establish the master-slave hierarchy and implement time and frequency synchronization. PTP messages are classified into event messages and general messages depending on timestamps:

1.Event message: is tagged with a timestamp when reaching or leaving a port. PTP devices calculate the link delay based on the timestamps carried in event messages. Event messages include Sync, Delay_Req, Pdelay_Req, and Pdelay_Resp messages.

2.General message: is used to establish master-slave hierarchy, and to request and send time information. General messages are not tagged with timestamps. General messages include Announce, Follow_Up, Delay_Resp, Pdelay_Resp_Follow_Up, Management, and Signaling messages. Currently, devices do not support Management and Signaling messages.

> ⚠ The product supports only E2ETC function, and uses Sync, Delay_Req and Delay_Resp PTP messages.

Flow chart of delay Request-Response Mechanism

Figure 2 shows the process of calculating the average link delay and time offset between the master and slave devices using the E2E mechanism.

Figure 2 Delay request-response mechanism

1.The master sends a Sync message to the slave and notes the time t1 at which it was sent..

2.The slave receives the Sync message and notes the time of reception t2.

3.The master conveys to the slave the timestamp t1 by:

a) Embedding the timestamp t1 in the Sync message. This requires some sort of hardware

processing for highest accuracy and precision.

b) Embedding the timestamp t1 in a Follow_Up message.

4.The slave sends a Delay_Req message to the master and notes the time t3 at which it was sent.

5.The master receives the Delay_Req message and notes the time of reception t4.

The master conveys to the slave the timestamp t4 by embedding it in a Delay_Resp message.

By exchanging messages with the master device, the slave device obtains t1, t2, t3, and t4, and calculates the average link delay and time offset between the master and slave devices. Then the slave device can adjust the local time according to the calculated time offset to synchronize with the master device. The formulas for calculating the link delay and time offset are as follows:

Average link delay = [(t4- t1) - (t3- t2)]/2

Offset = [(t2- t1) + (t3- t4)]/2

Product Support

The table below shows the model and the corresponding switch ASIC that support the PTP function, others do not support.

Switch ASIC		Model
Helix4	BCM56342	as4610-30t
		as4610_30p
	BCM56340	as4610_54t
		as4610_54p

Trident2	BCM56850	pronto5101
		pronto5401
		as6701-32x
		as6712-32x
	BCM56854	pronto5101
		as5712-54x
		s4048
		arctica4806xp
Trident2Plus	BCM56864	as5812-54t
		as5812-54x
Tomahawk	BCM56960	dcs7032q28
		z9100
		as7312
		as7712-32x

PTP configuration

Configure the device interface as the E2ETC node type, enable the PTP function on the interface, and implement the device to forward the PTP packets directly.

```
admin@PicOS-OVS$ovs-vsctl set interface te-1/1/1 options:ptp-mode=e2etransparent
```

By default, PTP is disabled on an interface.

Disable ptp mode on the interface:

```
admin@PicOS-OVS$ovs-vsctl set interface te-1/1/1 options:ptp-mode=none
```

- The PTP function can only be configured on the physical interface.
- On the TC device, PTP must be enabled on all the interfaces that receive and send PTP messages. Otherwise, the PTP function will work inproperly.

Configuration example

Configure the port te-1/1/1 that receiving PTP messages and the port te-1/1/2 that sends PTP packets as E2ETC node.

```
admin@PicOS-OVS$ovs-vsctl set interface te-1/1/1 options:ptp-mode=e2etransparent
admin@PicOS-OVS$ovs-vsctl set interface te-1/1/2 options:ptp-mode=e2etransparent
```

Add flow.

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,actions=output:2
```

Result:ptp message are forwarded normally and te-1/1/2 receive ptp packets with correction.

Configuring Tunneling

Configuring GRE

PicOS OVS supports IP GRE tunneling.

The port ranges in PicOS are as follows:

Port Type	Port Number
GRE	3073-4095

GRE ON Physical PORT

Creating a GRE tunnel

```
root@PicOS-OVS# ovs-vsctl add-port br0 gre1 -- set Interface gre1 type=pica8_gre options:remote_ip=10.10.60.10 opt
```

If the user wants to create a GRE tunnel, the user will need to configure a GRE tunnel along with two flows, which are used for sending traffic to the GRE and sending output from the GRE respectively.

```
root@PicOS-OVS# ovs-ofctl add-flow br0 in_port=1,actions=output:3073
root@PicOS-OVS# ovs-ofctl add-flow br0 in_port=3073,actions=mod_dl_src:00:11:11:11:11:11,mod_dl_dst:00:33:33:33:33
```

The GRE port number starts from 3073, which is the port number of GRE1. The first flow in the example above, is configured so that all traffic from port ge-1/1/1 will be sent to the GRE tunnel, whose port number is 3073. The second flow is configured so that all of the traffic coming out from the GRE tunnel will be forwarded to port ge-1/1/1 and the source MAC address modified to the switch's MAC address and the destination MAC address to the MAC address of the internal target. (If user doesn't specify the dl_src in the action of second flow, the src mac will be the switch's mac, but the dst mac must be specified.)

Description

1. br0: bridge name
2. remote_ip=10.10.60.10: the IP address of the peer GRE tunnel interface; this IP address will be the destination IP of the encapsulated GRE packets
3. local_ip=10.10.61.10: the IP address of this GRE tunnel interface; this IP address will be the source IP of the encapsulated GRE packets
4. src_mac=00:11:11:11:11:11: the logical MAC address of the GRE tunnel interface; this MAC address will be the source MAC of the encapsulated GRE packets to next-hop
5. dst_mac=00:22:22:22:22:22: the next-hop MAC address; this MAC address will be the destination MAC the encapsulated GRE packets to next-hop
6. egress_port=ge-1/1/5: the output port of the encapsulated GRE packets

GRE ON LAG/LACP PORT

Static Lag and GRE Tunnel

Command:

```
admin@PicOS-OVS$ovs-vsctl add-port br0 ae1 vlan_mode=trunk tag=1 -- set interface ae1 type=pica8_lag options:membe
admin@PicOS-OVS$ovs-vsctl -- set interface ae1 options:lag_type=static
admin@PicOS-OVS$ovs-vsctl add-port br0 gre1 -- set Interface gre1 type=pica8_gre options:local_ip=10.10.60.10 optic
```

Flows:

```
root@PicOS-OVS# ovs-ofctl add-flow br0 in_port=1,actions=output:3073
root@PicOS-OVS# ovs-ofctl add-flow br0 in_port=3073,actions=mod_dl_src:00:11:11:11:11:11,mod_dl_dst:00:33:33:33:33
```

LACP and GRE Tunnel

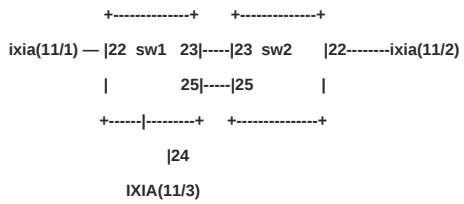
Command:

```
admin@PicOS-OVS$ovs-vsctl add-port br0 ae1 vlan_mode=trunk tag=1 -- set interface ae1 type=pica8_lag options:membe
admin@PicOS-OVS$ovs-vsctl -- set interface ae1 options:lag_type=lacp
admin@PicOS-OVS$ovs-vsctl add-port br0 gre1 -- set Interface gre1 type=pica8_gre options:local_ip=10.10.60.10 optic
```

Flows:

```
root@PicOS-OVS# ovs-ofctl add-flow br0 in_port=1,actions=output:3073
root@PicOS-OVS# ovs-ofctl add-flow br0 in_port=3073,actions=mod_dl_src:00:11:11:11:11:11,mod_dl_dst:00:33:33:33:33
```

Example



SW1 CONFIG:

Step1: Create a bridge and add two ports (PX1,PX2,PX3)

```
ovs-vsctl add-br br0 -- set bridge br0 datapath_type=pica8
ovs-vsctl add-port br0 ge-1/1/22 vlan_mode=trunk tag=1 -- set interface ge-1/1/22 type=pica8
ovs-vsctl add-port br0 ge-1/1/23 vlan_mode=trunk tag=1 -- set interface ge-1/1/23 type=pica8
ovs-vsctl add-port br0 ge-1/1/25 vlan_mode=trunk tag=1 -- set interface ge-1/1/25 type=pica8
```

Step 2: Add static lag port and gre port

```
ovs-vsctl add-port br0 ae1 vlan_mode=trunk tag=1 -- set interface ae1 type=pica8_lag options:members=ge-1/1/23,ge-
ovs-vsctl -- set interface ae1 options:lag_type=static
ovs-vsctl add-port br0 gre1 -- set Interface gre1 type=pica8_gre options:local_ip=10.10.60.10 options:remote_ip=10
```

Step 3: Add flow

```
ovs-ofctl add-flow br0 in_port=22,actions=output:3073
ovs-ofctl add-flow br0 in_port=3073,actions=set_field:66:66:66:44:44:44-\>dl_dst,set_field:66:66:66:33:33:33-\>dl_
```

SW2 CONFIG:

Step1: Create a bridge and add two ports (PX1,PX2,PX3)

```
ovs-vsctl add-br br0 -- set bridge br0 datapath_type=pica8
ovs-vsctl add-port br0 ge-1/1/22 vlan_mode=trunk tag=1 -- set interface ge-1/1/22 type=pica8
ovs-vsctl add-port br0 ge-1/1/23 vlan_mode=trunk tag=1 -- set interface ge-1/1/23 type=pica8
ovs-vsctl add-port br0 ge-1/1/25 vlan_mode=trunk tag=1 -- set interface ge-1/1/25 type=pica8
```

Step 2: Add flow

```
ovs-ofctl add-flow br0 in_port=23,actions=output:22
ovs-ofctl add-flow br0 in_port=25,actions=output:22
```

SEND Packets

Step 4: Send ipv4 packets,check the result(limitation:the src mac and vlan of the packets must be the same with gre tunnel)

(1) send no changing packets to PX1,

Result:

then PX2 or PX3 will transmit all the encapsulated packets

check nw_dst=10.10.61.10,nw_src= 10.10.60.10,vlan=1012,src_mac=C8:0A:A9:04:49:1A ,dst_mac=C8:0A:A9:9E:14:A5

Check:

dst mac: C8 0A A9 9E 14 A5

src mac: C8 0A A9 04 49 1A

offset:12

vlan: 81 00 03F4

dst ip: 0A 0A 3D 0A

src ip: 0A 0A 3C 0A

(2) sending increasing src ip to PX1,(first enable hash mapping mode:ovs-vsctl -- set Interface ae1 options:hash-mapping=advance ovs-vsctl set-lag-advance-hash-mapping-fields nw_src)

Result:

```
then both PX2 and PX3 will transmit the encapsulated packets
check nw_dst=10.10.61.10,nw_src= 10.10.60.10,vlan=1012,src_mac=C8:0A:A9:04:49:1A ,dst_mac=C8:0A:A9:9E:14:A5
```

Then reconfigure sw2

Step1: Add static lag port and gre port

```
ovs-vsctl add-port br0 ae1 vlan_mode=trunk tag=1 -- set interface ae1 type=pica8_lag options:members=ge-1/1/23,ge-
ovs-vsctl -- set interface ae1 options:lag_type=static
ovs-vsctl add-port br0 gre1 -- set Interface gre1 type=pica8_gre options:remote_ip=10.10.60.10 options:local_ip=10
options:dst_mac=C8:0A:A9:04:49:1A options:egress_port=ae1
```

Step 2: Add flow

```
ovs-ofctl add-flow br0 in_port=22,actions=output:3073
ovs-ofctl add-flow br0 in_port=3073,actions=set_field:66:66:66:44:44:44-\>dl_dst,set_field:66:66:66:33:33:33-\>dl_
```

SEND Packets

(1) sending no changing packets to ge-1/1/22(SW1),

Result:

ge-1/1/22(SW2) will transmit the decapsulated packets.

check dl_src=66:66:66:33:33:33,dl_dst=66:66:66:44:44:44,vlan 1012

Configuring L2GRE

The port ranges in PicOS are as follows:

Port Type	Port Number
L2GRE	5121-6143

PicOS OVS support Layer 2 over Generic Routing Encapsulation (L2GRE); the port number of L2GRE ranges from 5121 to 6143. GRE is an encapsulated mechanism that encapsulates packet IPs; L2GRE is an encapsulated mechanism that encapsulates the entire packet.To resolve the problem that pushes the interface PVID to the untagged packets before encapsulation by the L2GRE header, use the command **ovs-vsctl set interface <interface> type=pica8 options:access-vport=true**. Like this, the untagged packets can be encapsulated by L2GRE header with no VLAN; that is, the PVID of ingress port. And the tagged packets are encapsulated by L2GRE header, the inner VLAN is the VLAN tag of the packets that are received by ingress port. See the example below.

```
admin@PicOS-OVS$ovs-vsctl add-port br0 l2gre1 -- set interface l2gre1 type=pica8_l2gre options:remote_ip=10.10.61.1
```

Description

1. br0: bridge name
2. remote_ip=10.10.61.10: the IP address of the peer L2GRE tunnel interface; this IP address will be the destination IP of the encapsulated L2GRE packets
3. local_ip=10.10.60.10: the IP address of this L2GRE tunnel interface; this IP address will be the source IP of the encapsulated L2GRE packets
4. src_mac==C8:0A:A9:9E:49:1A: the logical MAC address of the L2GRE tunnel interface; this MAC address will be the source MAC of the encapsulated L2GRE packets to next-hop
5. dst_mac=C8:0A:A9:9E:14:A5: the next-hop MAC address; this MAC address will be the destination MAC the encapsulated L2GRE packets to next-hop
6. egress_port=te-1/1/12: the output port of the encapsulated L2GRE packets
7. l2gre_key=1234:the key value of L2GRE tunnel,different tunnel has different key.
8. vlan=1:the vlan of L2GRE tunnel.this vlan will be pop or not according to the pvid of the egress port.

Examples

push one L2GRE header

topology

Creating a L2GRE tunnel

(1) create a new bridge named br0.

```
admin@PicOS-OVS$ovs-vsctl add-br br0 -- set bridge br0 datapath_type=pica8
```

(2) add ports to br0.

```
admin@PicOS-OVS$ovs-vsctl add-port br0 te-1/1/11 vlan_mode=trunk tag=1 -- set Interface te-1/1/11 type=pica8
admin@PicOS-OVS$ovs-vsctl add-port br0 te-1/1/12 vlan_mode=trunk tag=1 -- set Interface te-1/1/12 type=pica8
admin@PicOS-OVS$ovs-vsctl add-port br0 l2gre1 -- set interface l2gre1 type=pica8_l2gre options:remote_ip=10.10.61.1
```

User must configure a flow if user wants to send packets to a L2GRE port. And port number is 5121 for l2gre1 tunnel, different L2GRE tunnels must have different l2gre_key.

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,actions=output:5121
```

Send packets (ARP, L2/L3 packets) to te-1/1/11,then packets are encapsulated by L2GRE header. when the VLAN tag of Layer 2 GRE tunnel is the same with native VLAN-ID of output port, L2GRE VLAN of the packets are stripped when forwarded by egress port. When the VLAN tag of L2GRE tunnel is different from native VLAN-ID \output port, L2GRE VLAN of the packets are not stripped when forwarded by egress port.

strip L2GRE tunnel

configuration

configure the L2GRE tunnels named l2gre1 on te-1/1/12 of swa and l2gre2 on te-1/1/12 of swb.

swa:

```
admin@PicOS-OVS$ovs-vsctl add-port br0 l2gre1 -- set Interface l2gre1 type=pica8_l2gre options:remote_ip=10.10.61.
```

swb:

```
admin@PicOS-OVS$ovs-vsctl add-port br0 l2gre1 -- set Interface l2gre1 type=pica8_l2gre options:remote_ip=10.10.60.
```

User must add the two flows below if user wants to push L2GRE header on te-1/1/12 of swa and strip the Layer 2 GRE header on te-1/1/12 of swb.

Swa:

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,actions=output:5121
```

swb:

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=5121,actions=output:1
```

te-1/1/11 of swb will receive the original packets (the contents of packets are the same with packets that te-1/1/11 of swa received).

configure two L2GRE tunnels on one physical port

Configuration

Configure two L2GRE tunnels on both te-1/1/12(l2gre1,l2gre2) and te-1/1/13(l2gre1,l2gre2). These two tunnels have different IP and l2gre_key so user must configure some flows.

Sw1:

```
admin@PicOS-OVS$ovs-vsctl add-port br0 l2gre1 -- set Interface l2gre1 type=pica8_l2gre options:remote_ip=10.10.60.
admin@PicOS-OVS$ovs-vsctl add-port br0 l2gre2 -- set Interface l2gre2 type=pica8_l2gre options:remote_ip="10.10.61
```

flows in sw1,

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,dl_dst=22:66:66:66:66:66,actions=output:5121
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,dl_dst=22:66:66:66:66:67,actions=output:5122
```

sw2:

```
admin@PicOS-OVS$ovs-vsctl add-port br0 l2gre1 -- set Interface l2gre1 type=pica8_l2gre options:remote_ip=10.10.61.
admin@PicOS-OVS$ovs-vsctl add-port br0 l2gre2 -- set Interface l2gre2 type=pica8_l2gre options:remote_ip=10.10.60.
```

flows in sw2

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=5121,dl_dst=22:66:66:66:66:66,actions=output:4
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=5122,dl_dst=22:66:66:66:66:67,actions=output:5
```

send packets to te-1/1/11,different packets will go to different L2GRE tunnels. When they are stripped L2GRE header on te-1/1/13,they are forwarded to a different port.

Length of l2gre_key

In pica8 switch, the length of l2gre_key can be 16bit, 20bit, 24bit or 32bit; 24 bit is the default value.

configuration

configure the L2GRE tunnel on te-1/1/12 .

```
admin@PicOS-OVS$ovs-vsctl add-port br0 l2gre1 -- set Interface l2gre1 type=pica8_l2gre options:remote_ip=10.10.61.
```

Add a flow to switch

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,actions=output:5121
```

This key of L2GRE tunnel is 1234 here in decimal, 4d2 in hex. The default value of Layer 2 GRE key is 24, so the value of GRE key of packets is 0x004d2000. When user sets the l2gre_key value to 16 using the command **ovs-vsctl set-l2gre-key-length 16,** the value of the GRE key of packet is 0x04d20000. When user sets the l2gre_key value to 20 using the command **ovs-vsctl set-l2gre-key-length 24,** the value of GRE key packet is 0x0004d200. When user sets the l2gre_key value to 32 using the command **ovs-vsctl set-l2gre-key-length 32,** the value of GRE key packet is 0x000004d2.

Collaboration between nvgre and VXLAN

Configuration

configure the L2GRE tunnel and VXLAN tunnel on te-1/1/12 and te-1/1/13.

```
admin@PicOS-OVS$ovs-vsctl add-port br0 l2gre1 -- set Interface l2gre1 type=pica8_l2gre options:remote_ip=10.10.61.1
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-vsctl add-port br0 l2gre1 -- set Interface l2gre1 type=pica8_l2gre options:remote_ip=10.10.60.1
admin@PicOS-OVS$ovs-vsctl add-port br0 vxlan1 -- set interface vxlan1 type=pica8_vxlan options:remote_ip=10.10.10.2
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-vsctl add-port br0 vxlan1 -- set interface vxlan1 type=pica8_vxlan options:remote_ip=10.10.10.1
```

Flows in Switches

sw1:

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,dl_dst=22:22:22:22:22:23,actions=output:4097
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,dl_dst=22:22:22:22:22:22,actions=output:5121
```

sw2:

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=5122,dl_dst=22:22:22:22:22:22,actions=output:4
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=4098,dl_dst=22:22:22:22:22:23,actions=output:5
```

te-1/1/14 should receive the de-capsulated packets with src_mac 22:22:22:22:22:22, te-1/1/15 should receive the de-capsulated packets with src_mac 22:22:22:22:22:23.That is to say VXLAN and L2GRE do not affect each other.

Configuring L2MPLS

> **INFO**
> 1.set mac actions should not be added before push_l2mpls

PUSH L2 MPLS

Pushing an L2 MPLS with one label:

```
root@PicOS-OVS$ovs-ofctl add-flow br0 "in_port=17,ip,dl_vlan=11,actions=push_l2mpls:0x8847,set_field:22:11:11:11:1
```

Pushing an L2MPLS with two labels:

```
root@PicOS-OVS$ovs-ofctl add-flow br0 "in_port=17,ip,dl_vlan=11,actions=push_l2mpls:0x8847,set_field:22:11:11:11:1
root@PicOS-OVS$ovs-ofctl add-flow br0 "in_port=17,dl_type=0x8847,dl_vlan=11,actions=push_mpls:0x8847,set_field:22:
```

SWAP L2 MPLS Label

In the following configuration example, specify a flow which has two labels, and in this situation user wants to swap the outer label. The output flow is L2MPLS packet with outer label 30 and inner label 20.

```
root@PicOS-OVS$ovs-ofctl add-flow br0 "in_port=18,dl_type=0x8847,dl_dst=22:00:00:00:00:01,dl_vlan=11,mpls_label=16
```

POP L2MPLS Label

Popping an MPLS Label of the flow:

```
root@PicOS-OVS$ovs-ofctl add-flow br0 "in_port=17,dl_vlan=11,dl_dst=22:00:00:00:00:01,mpls,mpls_label=16,actions=p
```

Popping one MPLS label for flows with two MPLS labels:

Two labels then pop one outer label.

```
root@PicOS-OVS$ovs-ofctl add-flow br0 "in_port=17,dl_vlan=11,dl_dst=22:00:00:00:00:01,mpls,mpls_label=16,mpls_label
```

Popping two MPLS labels for flows with two MPLS lables

In the following configuration, specify a flow which has two labels to pop. The output flow is IP packet. Configure two pop entries to pop the flow.

```
root@PicOS-OVS#ovs-ofctl add-flow br0 "in_port=17,dl_vlan=11,dl_dst=22:00:00:00:00:01,mpls,mpls_label=16,mpls_label
```

PUSH L2MPLS Label and VLAN

Pushing one L2MPLS label and one VLAN:

In the following configuration, specify flows to push one L2MPLS label and one VLAN.

```
root@PicOS-OVS#ovs-ofctl add-flow br0 "in_port=17,ip,actions=push_l2mpls:0x8847,set_field:22:22:22:22:22:22->dl_ds
root@PicOS-OVS#ovs-ofctl add-flow br0 in_port=2,dl_type=0x8847,dl_vlan=2999,dl_dst=22:22:22:22:22:22,mpls_label=66
```

Pushing two L2MPLS Labels and one VLAN:

In the following configuration, specify flows to push two MPLS labels and one VLAN.

```
root@PicOS-OVS#ovs-ofctl add-flow br0 "in_port=17,ip,actions=push_l2mpls:0x8847,set_field:22:11:11:11:11:10->dl_ds
```

Pushing One MPLS Label and Pop One VLAN

```
root@PicOS-OVS#ovs-ofctl add-flow br0 "in_port=18,dl_type=0x8847,mpls_label=30,dl_dst=22:22:22:22:22:22,dl_src=44:4
```

Pushing One L2MPLS Label and Pop One VLAN

```
root@PicOS-OVS#ovs-ofctl add-flow br0 "in_port=18,dl_vlan=100,actions=push_L2mpls:0x8847,set_field:22:22:22:22:22:2
```

Pushing Two L2MPLS Headers

```
root@PicOS-OVS#ovs-ofctl add-flow br0 "in_port=18,dl_type=0x8847,actions=push_l2mpls:0x8847,set_field:22:00:00:00:0
```

Configuring Inner VLAN

Push L2MPLS, push one inner VLAN:

```
ovs-ofctl add-flow br0 "in_port=17,ip,actions=push_vlan:0x8100,set_field:8->vlan_vid,push_l2mpls:0x8847,set_field:2

ovs-ofctl add-flow br0 "in_port=17,dl_vlan=2,ip,actions=push_vlan:0x8100,set_field:8->vlan_vid,push_l2mpls:0x8847,s
```

Push L2MPLS, modify inner VLAN:

```
ovs-ofctl add-flow br0 "in_port=17,ip,actions=set_field:8->vlan_vid,push_l2mpls:0x8847,set_mpls_ttl:64,set_field:22

ovs-ofctl add-flow br0 "in_port=17,dl_vlan=2,ip,actions=set_field:8->vlan_vid,push_l2mpls:0x8847,set_mpls_ttl:64,se
```

Push L2MPLS, pop inner VLAN:

```
ovs-ofctl add-flow br0 "in_port=17,dl_vlan=2,ip,actions=pop_vlan,push_l2mpls:0x8847,set_mpls_ttl:64,set_field:22:22
```

Pop inner VLAN after pop L2MPLS:

```
ovs-ofctl add-flow br0 "in_port=17,dl_vlan=11,dl_dst=22:22:22:22:22:22,mpls,mpls_label=1000,actions=pop_l2mpls,pop_
```

Modify inner VLAN after popping L2MPLS:

```
ovs-ofctl add-flow br0 "in_port=18,dl_vlan=11,dl_dst=22:22:22:22:22:22,mpls,mpls_label=16,mpls_label2=20,actions=po
```

ⓘ The L2MPLS packet must encapsulate outer VLAN and not be PVID, the original packets must encapsulate the VLAN tag.

Push inner VLAN after popping L2MPLS:

```
ovs-ofctl add-flow br0
"in_port=17,dl_vlan=11,dl_dst=22:22:22:22:22:22,mpls,mpls_label=1000,actions=pop_l2mpls,push_vlan:0x8100,set_field
```

ⓘ The L2MPLS packet must encapsulate outer VLAN and not be PVID, the original packets shouldn't encapsulate VLAN tag.

Configuring MPLS

The basic MPLS actions are Push, Swap and Pop. Beginning with PicOS 2.4, user does not need to set the ***eth_src*** in actions during Push MPLS. The packet **src_mac** pushes the MPLS to the MAC address of this switch.

- User can add flows to modify and copy the MPLS TTL and IP TTL.
- User can push/pop 2 MPLS labels per flow.

> Every un-tagged packet is tagged with the default VLAN-ID before Push, Pop and Swap.

Hardware or Software based Forwarding

The flow is pre-installed in hardware if there is enough information on the Flow to be processed by the ASIC.

Here is the minimal set of information required in flow match to process the packet on hardware only,**before version 2.8.1**:

If the Flow action is a POP : dl_dst, dl_vlan, mpls_lse
If the Flow action is a PUSH : dl_dst, dl_vlan, dl_type,mpls_lse (only being needed when dl_type is 0x8847 or 0x8848)
If the Flow action is a SWAP :dl_dst, dl_vlan, mpls_lse

Since version 2.8.1,configuration is changed,the minimal set on hardware only as shown below:

If the Flow action is a PUSH:
push mpls for ip packet: in_port,dl_vlan,dl_dst,dl_type
push mpls for mpls packet: in_port,dl_vlan,dl_dst,dl_type(mpls),mpls_label

If the Flow action is a SWAP: in_port,dl_vlan,dl_dst,dl_type(mpls),mpls_label

If the Flow action is a POP: in_port,dl_vlan,dl_dst,dl_type(mpls),mpls_label

> 1. There is one exception. If the action is "pop_mpls:0x8847" and matches enough fields (dl_dst,vlan_id,mpls_label), the flow becomes a direct flow (hardware only).
>
> 2. If the flow actions a push, flow match must include dl_type=0x0800/dl_type=0x86dd/dl_type=0x8847/dl_type=0x8848. If the flow match not include one of them, the flow entry cannot add.

If there is some information missing to process the packet, the flow becomes a "packet-driven" flow. This means that the first MPLS packet is sent to the CPU, which analyzes it and downloads a new flow on the hardware with the missing information to handle the packet in hardware. Following packets for this specific flow will then be handled by the hardware (ASIC) without reaching the Switch CPU.

PUSH MPLS

Pushing an MPLS Label

In the following configuration, user specifies a flow, which should match:
{ in_port=1,dl_type=0x0800, dl_dst=22:00:00:00:00:00,dl_vlan=1}
The action is to push an MPLS label (i.e. 10) and forward to port te-1/1/2
Note that MPLS TTL will copy from the IP header and decrease

Pushing two MPLS Labels

```
root@PicOS-OVS# ovs-ofctl add-flow br0 in_port=1,dl_type=0x0800,dl_dst=22:00:00:00:00:00,dl_vlan=1,actions=push_mp
```

In the following configuration, specify a flow, which should match { in_port=1,dl_type=0x0800,dl_dst=22:00:00:00:00:00,dl_vlan=1}, the action is to push two labels (i.e. 10 and 20) /EXP/TTL and forward to port te-1/1/2

```
root@PicOS-OVS# ovs-ofctl add-flow br0 in_port=1,dl_type=0x0800,dl_dst=22:00:00:00:00:00,dl_vlan=1,actions=push_mp
root@PicOS-OVS#
```

SWAP MPLS Label

Swapping MPLS Labels

In following configuration, user specifies a flow, which should match { in_port=1,dl_type=0x8847,dl_dst=22:00:00:00:00:00,dl_vlan=1,mpls_label=10}, the action is to swap label 10 with 20 and forward to port te-1/1/2

```
root@PicOS-OVS# ovs-ofctl add-flow br0 in_port=1,dl_type=0x8847,dl_dst=22:00:00:00:00:00,dl_vlan=1,mpls_label=10,a
root@PicOS-OVS#
```

POP MPLS Label

Popping an MPLS Label of the flow

In following configuration, specify a flow, which should match { in_port=1,dl_type=0x8847,dl_dst=22:00:00:00:00:00,dl_vlan=1,mpls_label=10}, the action is to pop MPLS label and forward to port te-1/1/2.
Note that MPLS TTL will be copied to IP header TTL and decremented by 1.

```
root@PicOS-OVS# ovs-ofctl add-flow br0 in_port=1,dl_type=0x8847,dl_dst=22:00:00:00:00:00,dl_vlan=1,mpls_label=10,a
```

Popping one MPLS Label for flows with Two MPLS Labels

In the following configuration, specify a flow that has two MPLS labels (i.e. 10 and 20). The pop action is always popping the outer MPLS header. Note that the two label flow pops only one label, the output packet is also a MPLS packet. Thus, the "pop_mpls:0x8847" must be configured.

```
root@PicOS-OVS# ovs-ofctl add-flow br0 in_port=1,dl_type=0x8847,dl_dst=22:00:00:00:00:00,dl_vlan=1,mpls_label=10,mp
```

Popping two MPLS Labels for flows with two MPLS Lables

In following configuration, specify a flow which has two labels to pop. The output flow is IP packet. Configure two pop entries to pop the flow.

```
root@PicOS-OVS# ovs-ofctl add-flow br0 in_port=1,dl_type=0x8847,mpls_label=10,mpls_label2=20,dl_dst=22:00:00:00:00
```

notice :

if the action is pop_mpls:0x0800 to pop two mpls label, must have to match two mpls label.

PUSH MPLS Label and VLAN

Pushing one MPLS Label and one VLAN

In following configuration, specify flows to push one MPLS Label and one VLAN

```
ovs-ofctl add-flow br0 in_port=2,dl_type=0x0800,dl_vlan=2999,dl_dst=22:22:22:22:22:22,actions=push_mpls:0x8847,set_
ovs-ofctl add-flow br0 in_port=2,dl_type=0x8847,dl_vlan=2999,dl_dst=22:22:22:22:22:22,mpls_label=66,actions=push_mp
```

Pushing two MPLS Labels and one VLAN

In following configuration, specify flows to push two mpls labels and one VLAN

```
ovs-ofctl add-flow br0 in_port=2,dl_type=0x0800,dl_vlan=2999,dl_dst=22:22:22:22:22:22,actions=push_mpls:0x8847,set_
```

POP One or Two MPLS Labels

In following configuration, specify flows which should match dl_type,dl_vlan and the MPLS label. The action is to pop one MPLS label and set a new src mac address. The first flow will pop one MPLS label and the second flow will pop two MPLS labels.

```
ovs-ofctl add-flow br0 in_port=2,dl_type=0x8847,dl_vlan=2999,mpls_label=333,mpls_label=111,dl_dst=22:22:22:22:22:22
ovs-ofctl add-flow br0 in_port=2,dl_type=0x8847,dl_vlan=2999,mpls_label=333,mpls_label=111,actions=pop_mpls:0x0800
```

POP One or Two MPLS Labels and PUSH/SWITCH/POP VLAN

The following flow should match dl_type and dl_vlan, action is to pop one MPLS label and push one VLAN.

```
ovs-ofctl add-flow br0 in_port=2,dl_type=0x8847,dl_vlan=2999,mpls_label=333,mpls_label=111,dl_dst=22:22:22:22:22:22
```

The following flow should match dl_type and dl_vlan, with the action of popping two MPLS labels and pushing one VLAN.

```
ovs-ofctl add-flow br0 in_port=2,dl_type=0x8847,dl_vlan=2999,mpls_label=333,mpls_label=111,dl_dst=22:22:22:22:22:22
```

The following flow should match dl_type and dl_vlan and mpls label, and the action is to pop one MPLS labels and swap VLAN.

```
ovs-ofctl add-flow br0 in_port=2,dl_type=0x8847,dl_vlan=2999,mpls_label=333,dl_dst=22:22:22:22:22:22,actions=pop_mp
```

The following flow should match dl_type, the action is to pop two MPLS labels and pop VLAN.

```
ovs-ofctl add-flow br0 in_port=2,dl_type=0x8847,dl_vlan=2999,mpls_label=333,dl_dst=22:22:22:22:22:22,actions=pop_mp
```

PUSH MPLS and POP VLAN

In the following configuration, push MPLS label and pop VLAN have been supported. Following flow, the action is to push one MPLS label and pop one VLAN.

```
ovs-ofctl add-flow br0 in_port=2,dl_type=0x8847,dl_vlan=2999,mpls_label=333,dl_dst=22:22:22:22:22:22,actions=push_
```

SWITCH MPLS Labels and MOD/POP VLAN

Following flow, action is to push two MPLS labels and pop VLAN.

```
ovs-ofctl add-flow br0 in_port=2,dl_type=0x8847,dl_vlan=2999,mpls_label=333,dl_dst=22:22:22:22:22:22,actions=set_f
```

Following flow, action is to push two MPLS labels and mod VLAN.

```
ovs-ofctl add-flow br0 in_port=2,dl_type=0x8847,dl_vlan=2999,mpls_label=333,dl_dst=22:22:22:22:22:22,actions=set_f
```

NOTICE:

1. If flows match dl_vlan and the actions have push_vlan, then receives packets only carry the pushed vlan.
2. Hardware can't support pop_mpls and pop_vlan at the same time, and the packets can't forward with line-speed.
3. When actions don't appoint to modify dl_src, the src mac of received packets should be modified to bridge mac whatever for direct flows or packet-driven flow.
4. Push two mpls labels is supported, but push two vlans at the same time is not supported.
5. Hardware can't support push two vlan_header.

Match or Pop Reserved Mpls Label 0/2/3

From version 2.9.2, mpls support to match or pop reserved mpls label.

A value of 0 represents the "IPv4 Explicit NULL Label",this label value is only legal at the bottom of the label stack.

A value of 1 represents the "Router Alert Label", this label value is legal anywhere in the label stack except at the bottom.

A value of 2 represents the "IPv6 Explicit NULL Label",this label value is only legal at the bottom of the label stack.

A value of 3 represents the "Implicit NULL Label",this is a label that an LSR may assign and distribute, but which never actually appears in the encapsulation.

Example 1,match mpls label=0 and then pop_mpls:0x8847.

```
admin@PICOS-OVS$ovs-ofctl add-flow br0 in_port=1,mpls,mpls_label=0,dl_dst=22:22:22:22:22:22,dl_vlan=199,actions=pop
```

Send ipv4 packets with mpls_label=0 to match the flow, te-1/1/14 receive packets without mpls label.

Example 2,match mpls label2=0 and then pop_mpls:0x8847.

```
admin@PICOS-OVS$ovs-ofctl add-flow br0 in_port=1,mpls,mpls_label=100,mpls_label2=0,dl_dst=22:22:22:22:22:22,dl_vlan
```

Send ipv4 packets with mpls_label=100 and mpls_label2=0 to match the flow, te-1/1/14 receive packets with mpls_label=0.

Example 3,match mpls label=2 and then pop_mpls:0x8847.

```
admin@PICOS-OVS$ovs-ofctl add-flow br0 in_port=1,mpls,mpls_label=2,dl_dst=22:22:22:22:22:22,dl_vlan=199,actions=pop
```

Send ipv6 packets with mpls_label=2 to match the flow, te-1/1/14 receive packets without mpls label.

Example 4,match mpls label2=2 and then pop_mpls:0x0800.

```
admin@PICOS-OVS$ovs-ofctl add-flow br0 in_port=1,mpls,mpls_label=100,mpls_label2=2,dl_dst=22:22:22:22:22:22,dl_vlan
```

Send ipv6 packets with mpls_label=100 and mpls_label2=2 to match the flow, te-1/1/14 receive packets without mpls label.

1.It's not allowed to match/pop label 3. Additionally a label of 3 should not be included in MPLS encapsulation.
2.Platforms which support mpls:

3296 3780 3920 3922 3924 3930 5101 5401
* arctica4806xp as5712_54x as5812 as6701_32x as6712_32x as7712_32x
* dcs7032q28 es4654bf niagara2632xl niagara2948-6xl s4048 z9100 msh8920

2.Platforms which not support mpls:

3290 3295 as4610

Configuring PBB

PBB means Provider Backbone Bridge.

push

Push pbb_isid,eth_src,eth_dst

Outer src mac is set as 00:00:00:11:11:11, and dsc mac is set as 00:00:00:22:22:22,Vlan is set as 4094, pbb isid is set as 23.

```
root@PicOS-OVS# ovs-ofctl add-flow br0 in_port=11,dl_type=0x0800,dl_src=22:11:11:11:11:11,dl_dst=22:22:22:22:22:22
```

Push pbb without pbb_isid,eth_src,eth_dst

Outer src mac is set as 22:11:11:11:11:11, and dsc mac is set as 22:22:22:22:22:22,Vlan is set as 4094, pbb isid is set as 0.

```
root@PicOS-OVS# ovs-ofctl add-flow br0 in_port=11,dl_type=0x0800,dl_src=22:11:11:11:11:11,dl_dst=22:22:22:22:22:22
```

Push pbb_isid,eth_src,eth_dst for pbb packets

Outer src mac is set as 00:00:00:11:11:11, and dsc mac is set as 00:00:00:22:22:22,
Vlan is set as 4094, pbb isid is set as 21. (isid of primary pbb packet should not be 21)

```
root@PicOS-OVS# ovs-ofctl add-flow br0 in_port=11,dl_type=0x88e7,actions=push_pbb:0x88e7,set_field:21-\>pbb_isid,se
```

pop

Pop pbb packets tagged with vlan 1 (Primary pbb packets should be tagged with vlan 1) Pbb packets are popped.

```
root@PicOS-OVS# ovs-ofctl add-flow br0 in_port=11,dl_type=0x88e7,dl_src=00:00:00:11:11:11,dl_dst=00:00:00:22:22:22
```

Pop pbb packets tagged with vlan 2000 (Primary pbb packets should be tagged with vlan 2000) Pbb packets are popped.

```
root@PicOS-OVS# ovs-ofctl add-flow br0 in_port=11,dl_type=0x88e7,pbb_isid=23,dl_vlan=2000,dl_src=00:00:00:11:11:11
```

Important Things to Know

- Push pbb should be done with push_vlan,
- When do push pbb, primary src mac, and dst mac will be used if no config of eth_src , eth_dst
- Do push pbb for pbb packet, primary pbb isid should be not same as the push pb isid.
- When do pop pbb, primary packets should include vlan, and actions should include pop_vlan.
- All switches support pbb except P3290,P3295 and P4610.

Configuring QinQ

PicOS OVS supports QinQ. (3290,3295,3296 do not support set inner pcp)

Push tag, Push <tag:2000>

root@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,actions=push_vlan:0x8100,set_field:2000-\>vlan_vid,output:2

Push <tag:2000 pcp:3>

root@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,actions=push_vlan:0x8100,set_field:2000-\>vlan_vid,set_field:3-\>vlan_pcp,output:2

Push <tag:3000 tag:4094>

```
root@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,actions=push_vlan:0x8100,set_field:3000-\>vlan_vid,push_vlan:0x810(
```

Push <tag:3000 tag:4094 pcp:3>

```
root@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,actions=push_vlan:0x8100,set_field:3000-\>vlan_vid,push_vlan:0x810(
```

Push <tag:3000 pcp:3 tag:4094 pcp:7>

```
root@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,actions=push_vlan:0x8100,set_field:3000-\>vlan_vid,set_field:3-\>v1
```

Pop tag, Pop one header

```
root@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,actions=pop_vlan,output:2
```

Pop two header

```
root@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,actions=pop_vlan,pop_vlan,output:2
```

User can also use the strip_vlan to achieve pop VLAN tagged, for example:

```
root@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,priority=100,actions=strip_vlan,output:2
```

In hardware ASIC, implementation of "strip_vlan" is: change the packet's tag to "4095" and strip the vlan tag of 4095 in the egress. Thus, the above flow will be split into two flows in ingress and egress respectively, as follows:

Ingress "in_pot=1, priority=100, action=set_field:2000-\>vlan_vid"
Egress "in_pot=1, priority=100,action=strip_vlan,output:2"

In this case, maybe other traffic which matches the egress flow will be stripped vlan and forwarded to port-3. Users can install the other flow with higher priority to avoid this problem.

Hardware limitation of Pushing Two Tags
There is a limitation in pushing two tags; hardware ASIC can only identify two tags.

a. If primary packet is untagged, do two push_vlan (add tagA, tagB), output packets is tagged with two vlans. (tagA, tagB)

b. If primary packet is tagged with one vlan (tag0), do two push_vlan (add tagA, tagB), output packets is tagged with two vlans. (tag0, tagB),

c. If primary packet is tagged with more than one vlan (outer vlan is tag0), do two push_vlan (add tagA, tagB), output packets is tagged with vlans. (tag0 and other tag of primary packets, tagB),

d. For Platform 3290, 3295, 3296, 3297, 4804, these don't support modifying inner vlan pcp.

Configuring VXLAN

VXLAN port number of VXLAN ranges from 4097 to 5119. VXLAN mechanism is based on the limited number of VLANs(0-4094).VXLAN is used to provide more networks for switches or the host. To resolve the problem that pushing the interface' PVID to the untagged packets before encapsulated by the VXLAN header, the user must use this command "ovs-vsctl set interface <interface> type=pica8 options:access-vport=true ". Like this, the untagged packets can be encapsulated by VXLAN header with no VLAN that is pvid of ingress port. And the tagged packets are encapsulated by VXLAN header, the inner VLAN is the VLAN tag of packets that received by ingress port.

1, The port ranges in PicOS are as follows:

Port Type	Port Number
VXLAN	4097-5119

2.When the vxlan packets wants to be decapsulated,the mac address(src/dst) in the flow's match means the inner packets' mac address.Other match fields like dl_vlan is the vxlan packets' vlan.

eg:ovs-ofctl add-flow br0 in_port=4097,dl_vlan=1,dl_src=22:11:11:11:11:11,dl_dst=22:22:22:22:22:22,actions=2

3.The vxlan encapsulation flow do not support multiple ingress port(like lag,bond).Because vxlan encapsulation is in vcap,and vcap can not suport multiple ports.

4.Vxlan decapsulation flow's action also support group(type=all,lag-select-group),do not support modify mac or vlan before vxlan port 4097.

Command

```
admin@PicOS-OVS$ovs-vsctl add-port br0 vxlan1 -- set interface vxlan1 type=pica8_vxlan options:remote_ip=10.10.10.2
```

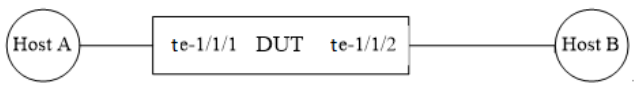
Description

1. br0: bridge name
2. remote_ip=10.10.10.2: the IP address of the peer VXLAN tunnel interface; this IP address will be the destination IP of the encapsulated VXLAN packets
3. local_ip=10.10.10.1: the IP address of this VXLAN tunnel interface; this IP address will be the source IP of the encapsulated VXLAN packets
4. src_mac==C8:0A:A9:9E:49:1A: the logical MAC address of the VXLAN tunnel interface; this MAC address will be the source MAC of the encapsulated VXLAN packets to next-hop
5. dst_mac=C8:0A:A9:9E:14:A5: the next-hop MAC address; this MAC address will be the destination MAC the encapsulated VXLAN packets to next-hop
6. egress_port=te-1/1/2: the output port of the encapsulated VXLAN packets
7. vnid=1234:the key value of VXLAN tunnel,different tunnel has different vnid.
8. vlan=1:the vlan of VXLAN tunnel.this vlan will be pop or not according to the pvid of the egress port.
9. udp_dst_port=4789:the udp destination port of encapsulating packets by VXLAN tunnel.All the encapsulated packets has the this udp dst port.

Examples

configure a VXLAN tunnel

topology



configuration

(1)create a new bridge named br0.

```
admin@PicOS-OVS$ovs-vsctl add-br br0 -- set bridge br0 datapath_type=pica8
```

(2)add ports to br0.

```
admin@PicOS-OVS$ovs-vsctl add-port br0 te-1/1/1 vlan_mode=trunk tag=1  -- set Interface te-1/1/1 type=pica8
admin@PicOS-OVS$ovs-vsctl add-port br0 te-1/1/2 vlan_mode=trunk tag=1  -- set Interface te-1/1/2 type=pica8
```

(3)add a VXLAN port named vxlan1 on te-1/1/2

```
admin@PicOS-OVS$ovs-vsctl add-port br0 vxlan1 -- set interface vxlan1 type=pica8_vxlan options:remote_ip=10.10.10.2
```

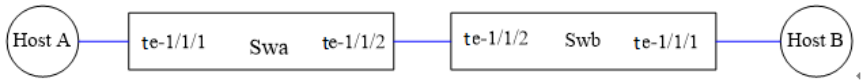
add a flow to switch

```
admin@PicOS-OVS$ovs-ofctl  add-flow br0 in_port=1,actions=output:4097
```

Send packets to te-1/1/1,te-1/1/2 will receive pakcets that encapsulated by VXLAN header. When VLAN of VXLAN tunnel is the same with the pvid of te-1/1/2,the packets from te-1/1/2 will be stripped VLAN of VXLAN. Or, packets will have two VLANs (outer VLAN is vxlan-vlan, inner VLAN is the pvid of ingress port or original VLAN of packets)

strip a VXLAN header

topology



configuration

User must configure VXLAN port on te-1/1/2 and te-1/1/3,and add some flows to the switches so that packets can be encapsulated or decapsulated and forwarded correctly.

(1) create a new bridge named br0.

```
admin@PicOS-OVS$ovs-vsctl add-br br0 -- set bridge br0 datapath_type=pica8
```

(2) add ports to br0.

SwA:

```
admin@PicOS-OVS$ovs-vsctl add-port br0 te-1/1/1 vlan_mode=trunk tag=1  -- set Interface te-1/1/1 type=pica8
admin@PicOS-OVS$ovs-vsctl add-port br0 te-1/1/2 vlan_mode=trunk tag=1  -- set Interface te-1/1/2 type=pica8
```

SWb:

```
admin@PicOS-OVS$ovs-vsctl add-port br0 te-1/1/1 vlan_mode=trunk tag=1  -- set Interface te-1/1/1 type=pica8
admin@PicOS-OVS$ovs-vsctl add-port br0 te-1/1/2 vlan_mode=trunk tag=1  -- set Interface te-1/1/2 type=pica8
```

(3) add VXLAN port vxlan1 on egress port te-1/1/2 of switcha and switchb

Swa:

```
admin@PicOS-OVS$ovs-vsctl add-port br0 vxlan1 -- set interface vxlan1 type=pica8_vxlan options:remote_ip=10.10.10.2
```

flow in swa.

```
admin@PicOS-OVS$ovs-ofctl  add-flow br0 in_port=1,actions=output:4097
```

Swb:

```
admin@PicOS-OVS$ovs-vsctl add-port br0 vxlan1 -- set interface vxlan1 type=pica8_vxlan options:remote_ip=10.10.10.1
```

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=4097,actions= output:1
```

send packets to te-1/1/1 of swa,te-1/1/1 of switchb will receive the orignal packets(the contents of packets are the same with packets that te-1/1/1 of swa received).

configure two VXLAN tunnels on a pair of physical port

topology

configuration

add two pairs of VXLAN ports on te-1/1/2,te-1/1/3

sw1:

```
admin@PicOS-OVS$ovs-vsctl add-port br0 vxlan1 -- set interface vxlan1 type=pica8_vxlan options:remote_ip=10.10.10.2
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-vsctl add-port br0 vxlan2 -- set interface vxlan2 type=pica8_vxlan options:remote_ip=10.10.60.1
```

flows in sw1,

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,dl_src=22:22:22:22:22:22,actions=output:4097
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,dl_src=22:22:22:22:22:23,actions=output:4098
```

sw2:

```
admin@PicOS-OVS$ovs-vsctl add-port br0 vxlan1 -- set interface vxlan1 type=pica8_vxlan options:remote_ip=10.10.10.1
admin@PicOS-OVS$ovs-vsctl add-port br0 vxlan2 -- set interface vxlan2 type=pica8_vxlan options:remote_ip=10.10.60.1
```

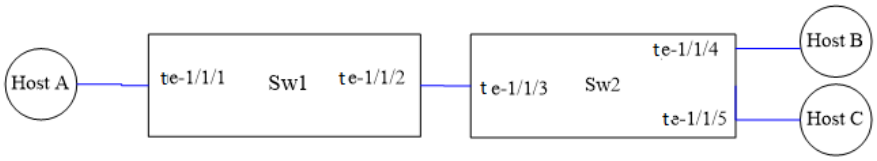
flows in sw2,

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=4097,dl_src=22:22:22:22:22:22,actions=output:4
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=4098,dl_src=22:22:22:22:22:23,actions=output:5
```

send packets to te-1/1/1 of sw1,te-1/1/4 should receive the packets with src_mac :22:22:22:22:22:22,and te-1/1/5 should receive the packets with src_mac 22:22:22:22:22:23.

collaboration between L2GRE and VXLAN

topology



configuration

User must configure VXLAN port and l2gre port on te-1/1/2 and te-1/1/3.Add flows on both switches, so packets can be forwarded correctly.

sw1:

```
admin@PicOS-OVS$ovs-vsctl add-port br0 vxlan1 -- set interface vxlan1 type=pica8_vxlan options:remote_ip=10.10.10.2
admin@PicOS-OVS$
ovs-vsctl add-port br0 l2gre1 -- set Interface l2gre1 type=pica8_l2gre options:remote_ip=10.10.61.10 options:local_
```

flows in sw1,

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,dl_dst=22:22:22:22:22:22,actions=output:4097
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,dl_dst=22:22:22:22:22:23,actions=output:5121
```

sw2:

```
admin@PicOS-OVS$ovs-vsctl add-port br0 vxlan1 -- set interface vxlan1 type=pica8_vxlan options:remote_ip=10.10.10.1
admin@PicOS-OVS$ovs-vsctl add-port br0 l2gre1 -- set Interface l2gre1 type=pica8_l2gre options:remote_ip=10.10.60.1
```

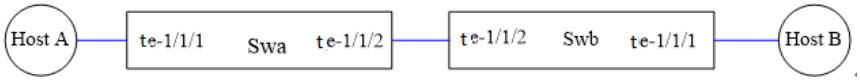
flows in sw2,

```
admin@PicOS-OVS$ovs-ofctl  add-flow br0 in_port=4097,dl_dst=22:22:22:22:22:22,actions=output:4
admin@PicOS-OVS$ovs-ofctl  add-flow br0 in_port=5121,dl_dst=22:22:22:22:22:23,actions=output:5
```

Vnid must be the same when the user wants to build a VXLAN tunnel between two ports. Different VXLAN tunnels must have different vnids. Besides, packets are not decapsulated when the vnid is different between the VXLAN tunnel. VXLAN can work together with GRE, L2GRE, VXLAN.

Option:

topology



Generally, untagged packets from Host A sent through Swa will be tagged by pvid in port te-1/1/1. The new tagged packet adds VXLAN header and strip VXLAN header through VXLAN tunnel, and will keep the tag while forwarding on Swb te-1/1/1 even though the tag equals the pvid of Swb te-1/1/1. The result is that Host B receives a tagged packet which is different from the original packet.

To avoid the above issue, pica8 support packet keep untag through pica8 switch port. The following command is necessary.

```
ovs-vsctl set interface te-1/1/1 options:access-vport=true
```

If the user adds the command on Swa, untagged packets that pass through Swa te-1/1/1 will not be tagged by the pvid, then pass through VXLAN tunnel and stay untagged while forwarding to Swb te-1/1/1. The result is Host B will receive untag packet.

vxlan numbers
User can create 1023 VXLAN ports at most (with the same mac, ip, vlan, only vnid is different) on one physical port. But the max flows number of VXLAN flow (with action=output:4097) is the minimum value of flows number that Vfilter table and Tcam table can support. That is 512 on P5401, P5101, AS6701, P5712,2632,tomahawk chip

Configure VxLAN Ecmp

From version 2.9.1, Pica8 switch support configuring Vxlan ecmp.That is to say,the traffic can hash to one or more ports of the ecmp.So the l3-ecmp-hash-fields is also valid to vxlan ecmp.And the egress port number suported is controlled by "ovs-vsctl set-max-ecmp-ports ",could be 2,4,8,16,32,default value is 4.

Command

```
ovs-vsctl add-port br0 vxlan1 -- set interface vxlan1 type=pica8_vxlan options:remote_ip=10.10.10.2 options:local_
```

the usage is the same with vxlan.

.

Match Vxlan VNI

Introduction

From version 2.9.2, Pica8 switches support match vxlan vni fields.Platforms that supports VXLAN also supports matching VXLAN VNI field. The tun_id/tunnel_id uses the lower 24 bits in the lower 32 bits of the 64 bit vnid field.The higher 32 bits are 0x02000000. The udp, tp_dst and tun_id/tunnel_id are the necessary match fields, besides, you can match more fields like dl_vlan, dl_dst, dl_src, nw_src, nw_dst etc.The tp_dst must be the same with the configuration set by "*ovs-vsctl set-vxlan-udp-dst-port [port]*". This global configuration works well on vxlan decapsulation, but does not work on encapsualtion by vxlan tunnel.

Command

ovs-vsctl set-match-vxlan-vni-enable *[true/false]*: Please restart the Picos service after enabling or disabling the vxlan vni mode

ovs-vsctl set-vxlan-udp-dst-port *[port]*: Users can use this command to modify the layer 4 port number. The default value is 4789. If you want to recover the default value from another port number, use the command like this "*ovs-vsctl set-vxlan-udp-dst-port"*

Flow

ovs-ofctl add-flow br0 udp,tp_dst=5000,tun_id=0x0200000000112233,actions=2

> **flows info**
> 1.udp,tp_dst,tun_id are the necessary match fields, besides, you can match more fields like dl_vlan,dl_dst,dl_src,nw_src,nw_dst etc.
>
> 2.Actions could be set_field vlan vid, push_mpls etc. Vcap actions can not be supported(only push_vlan and only two pop_vlan etc)

Example1

step1: Configure bridge and port

```
ovs-vsctl add-br br0 -- set bridge br0 datapath_type=pica8
ovs-vsctl add-port br0 te-1/1/1 vlan_mode=trunk tag=1 -- set interface te-1/1/1 type=pica8
ovs-vsctl add-port br0 te-1/1/2 vlan_mode=trunk tag=1 -- set interface te-1/1/2 type=pica8
ovs-vsctl add-port br0 te-1/1/3 vlan_mode=trunk tag=1 -- set interface te-1/1/3 type=pica8
```

step2: Enable vxlan vni

```
ovs-vsctl set-match-vxlan-vni-enable true
```

step3:set ecmp select group and lag select group

```
ovs-vsctl set-group-ranges ecmp-select-groups=1-100,lag-select-groups=200-300
sudo systemctl restart picos
```

step4:add two groups

```
ovs-ofctl add-group br0 group_id=10,type=select,bucket=set_field:10-\>vlan_vid,set_field:00:00:00:22:22:22-\>dl_sr
ovs-ofctl add-group br0 group_id=200,type=select,bucket=set_field:1000-\>vlan_vid,set_field:00:00:00:11:11:11-\>et
```

step5:add a flow using ecmp-select-group

```
ovs-ofctl del-flows br0
ovs-ofctl add-flow br0 in_port=1,udp,tp_dst=4789,tun_id=0x0200000000112233,actions=group:10
```

step6:send src ip changing vxlan packets with tunnel id is 112233,udp dst port is 4789(vxlan dst mac is C8 0A A9 04 49 1A,vxlan src mac is C8 0A A9 9E 14 A5)

step7: add a flow using lag-select-group

```
ovs-ofctl del-flows br0
ovs-ofctl add-flow br0 in_port=1,udp,tp_dst=4789,tun_id=0x0200000000112233,dl_vlan=10,dl_dst=C8:0A:A9:04:49:1A,act
```

step8:send src ip changing vxlan packets with tunnel id is 112233,udp dst port is 4789(vxlan dst mac is C8 0A A9 04 49 1A,vxlan src mac is C8 0A A9 9E 14 A5)

Result

Step6:vxlan packets will hash to te-1/1/2,te-1/1/3.te-1/1/2 transmit the packets like this(dst mac is 00 00 00 33 33 33,src mac is 00 00 00 22 22 22 vlan is 10).te-1/1/3 transmit the packets like this (dst mac is 00 00 00 55 55 55,src mac is 00 00 00 44 44 44,vlan is 20)

Step8:vxlan packets will hash to te-1/1/2,te-1/1/3.te-1/1/2 and te-1/1/3 transmit the same vxlan packets like this(dst mac is 00 00 00 11 11 11,src mac is C8 0A A9 9E 14 A5,vlan is 1000)

Multiple vxlan output port

From 4.1.0, ovs support multiple vxlan output port in flow, such as “in_port=1,actions=output:4097,output:4098”. You must use this command “ovs-vsctl set-port-default-flood true” to use this function.

Note:the multiple vxlan tunnels’ vnid must the same, but the egress ports can be different or the same, both are ok.

Example

step1,enable default flood and restart picos service first.

```
admin@PICOS-OVS:~$ ovs-vsctl set-port-default-flood true
 Please reboot for the change to take effect!
admin@PICOS-OVS:~$ sudo /etc/init.d/picos restart
```

step2,create two vxlan tunnels

```
admin@PICOS-OVS:~$ ovs-vsctl add-port br0 vxlan1 -- set interface vxlan1 type=pica8_vxlan options:remote_ip=10.10.1

admin@PICOS-OVS:~$ ovs-vsctl add-port br0 vxlan2 -- set interface vxlan2 type=pica8_vxlan options:remote_ip=20.20.1
```

step3,add flow

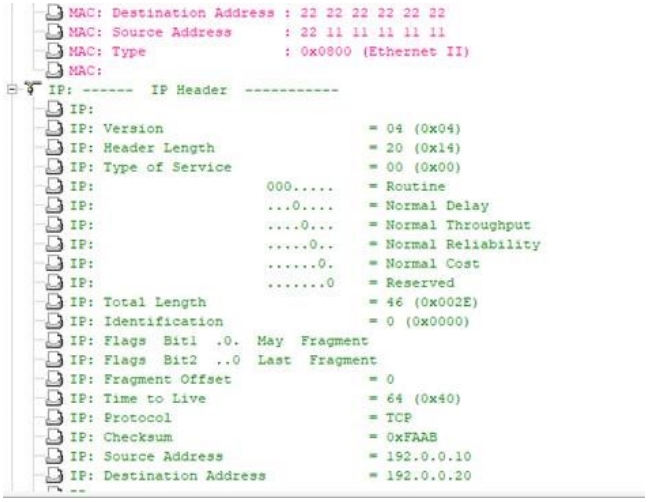
```
admin@PICOS-OVS:~$ ovs-ofctl add-flow br0 in_port=17,actions=output:4097,output:4098

admin@PICOS-OVS:~$ ovs-ofctl add-flow br0 in_port=4097,actions=17

admin@PICOS-OVS:~$ ovs-ofctl add-flow br0 in_port=4098,actions=17
```

step4,send packets to port 17,then check the vxlan packets of port 18,port 18 should transmit two kinds of vxlan ports.

te-1/1/17 receive packets:



Te-1/1/18:One kind is like this:

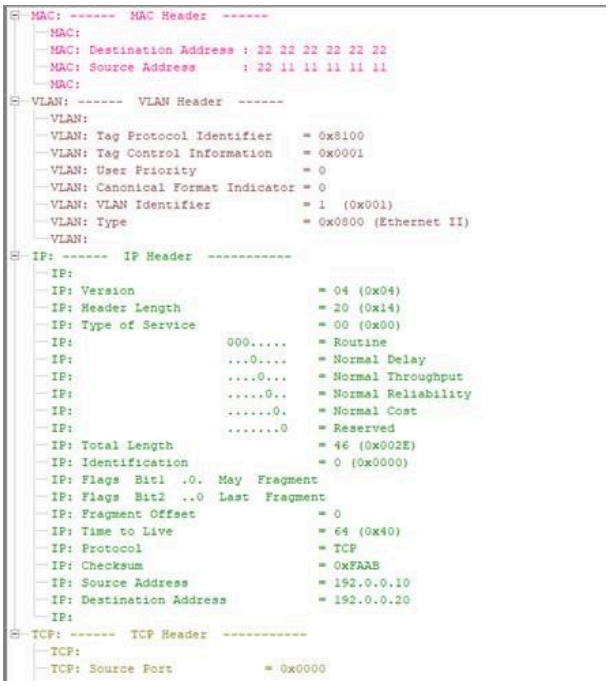
```
MAC: ------  MAC Header  ------
    MAC:
    MAC: Destination Address : C8 0A A9 9E 14 A5
    MAC: Source Address      : C8 0A A9 04 49 1A
    MAC: Type                : 0x0800 (Ethernet II)
    MAC:
IP: ------  IP Header  ----------
    IP:
    IP: Version                         = 04 (0x04)
    IP: Header Length                   = 20 (0x14)
    IP: Type of Service                 = 00 (0x00)
    IP:                   000.....      = Routine
    IP:                   ...0....      = Normal Delay
    IP:                   ....0...      = Normal Throughput
    IP:                   .....0..      = Normal Reliability
    IP:                   ......0.      = Normal Cost
    IP:                   .......0      = Reserved
    IP: Total Length                    = 100 (0x0064)
    IP: Identification                  = 43589 (0xAA45)
    IP: Flags  Bit1  .0.  May  Fragment
    IP: Flags  Bit2  ..0  Last  Fragment
    IP: Fragment Offset                 = 0
    IP: Time to Live                    = 64 (0x40)
    IP: Protocol                        = UDP
    IP: Checksum                        = 0xA82D
    IP: Source Address                  = 10.10.10.1
    IP: Destination Address             = 10.10.10.2
    IP:
UDP: ------  UDP Header  ----------
    UDP:
    UDP: Source Port         = 5555 (0x15B3)
    UDP: Destination Port    = 4789 (0x12B5)
    UDP: Length              = 80 (0x0050)
    UDP: Checksum            = 0 (0x0000)
    UDP:
```

Te-1/1/18:the other kind like this:

```
MAC: ------  MAC Header  ------
    MAC:
    MAC: Destination Address : 88 88 88 88 88 88
    MAC: Source Address      : 66 66 66 66 66 66
    MAC:
VLAN: ------  VLAN Header  ------
    VLAN:
    VLAN: Tag Protocol Identifier    = 0x8100
    VLAN: Tag Control Information    = 0x000A
    VLAN: User Priority              = 0
    VLAN: Canonical Format Indicator = 0
    VLAN: VLAN Identifier            = 10  (0x00A)
    VLAN: Type                       = 0x0800 (Ethernet II)
    VLAN:
IP: ------  IP Header  ----------
    IP:
    IP: Version                         = 04 (0x04)
    IP: Header Length                   = 20 (0x14)
    IP: Type of Service                 = 00 (0x00)
    IP:                   000.....      = Routine
    IP:                   ...0....      = Normal Delay
    IP:                   ....0...      = Normal Throughput
    IP:                   .....0..      = Normal Reliability
    IP:                   ......0.      = Normal Cost
    IP:                   .......0      = Reserved
    IP: Total Length                    = 100 (0x0064)
    IP: Identification                  = 24005 (0x5DC5)
    IP: Flags  Bit1  .0.  May  Fragment
    IP: Flags  Bit2  ..0  Last  Fragment
    IP: Fragment Offset                 = 0
    IP: Time to Live                    = 64 (0x40)
    IP: Protocol                        = UDP
    IP: Checksum                        = 0xCC99
    IP: Source Address                  = 20.20.20.1
    IP: Destination Address             = 20.20.20.2
    IP:
UDP: ------  UDP Header  ----------
    UDP:
    UDP: Source Port         = 5555 (0x15B3)
    UDP: Destination Port    = 4789 (0x12B5)
    UDP: Length              = 80 (0x0050)
```

step5,Send above two kinds of vxlan packets to te-1/1/18,then te-1/1/17 will transmit the decapsulated packets.

te-1/1/17 transmit packets like this:



MAC: ------ MAC Header ------
MAC:
MAC: Destination Address : 22 22 22 22 22 22
MAC: Source Address : 22 11 11 11 11 11
MAC:
VLAN: ------ VLAN Header ------
VLAN:

Decapsulation by pop actions

From version 3.2,pica8 switch support another decapsulation way.Users can use pop_vxlan/pop_l2gre/pop_gre to decapsulate the vxlan/l2gre/gre packets.If you want to use this kind of decapsulation way,you should enable npb mode first by command **"ovs-vsctl enable-npb-mode true".**Then need to retart the picos serviece(sudo /etc/init.d/picos restart).After the restarting,you can use this way to do some decapsulation.

Notes
1.The tunnels created on different ports/same ports must have different source ips to ensure that these tunnels can be decapsulated normally. If the ips in these tunnels are the same,then some problems will occur.
2.Multiple tunnels are created on the same port. The src mac, dst mac, and vlan of these tunnels must be the same to ensure that these tunnel encapsulations work properly. Decapsulation is not subject to this limitation.
3.Pop_gre to work with pop_l2gre and pop_vxlan at the same time, you must ensure that pop_gre flow has a lower priority than pop_l2gre|pop_vxlan.
4.The location of pop_vxlan/pop_l2gre in the flow action has no relationship and can be decapsulated normally.

5.do not match tunnel_id feature only supported on 5812.

POP_Vxlan

There are two ways including matching tunnel_id or do not match tunnel_id.The matching fields must include **"in_port,dl_dst,ip,nw_src,nw_dst,tunnel_id"** or **"in_port,dl_dst,nw_src,nw_dst,udp,tp_dst=4789".**

```
admin@PICOS-OVS:~$ ovs-ofctl add-flow br0 in_port=2,dl_dst=c4:39:3a:fb:be:d9,ip,nw_src=10.10.2.20,nw_dst=10.10.1.2(
```

```
admin@PICOS-OVS:~$ ovs-ofctl add-flow br0 in_port=6,dl_dst=44:44:44:44:44:44,nw_src=255.255.255.100,nw_dst=255.255
```

Pop_l2gre

There are two ways including matching tunnel_id or do not match tunnel_id.The matching fields must include **"in_port,dl_dst,ip,nw_src,nw_dst,tunnel_id"** or **"in_port,dl_dst,nw_src,nw_dst".**

```
admin@PICOS-OVS:~$ovs-ofctl add-flow br0 in_port=2,dl_dst=c4:39:3a:fb:be:d9,ip,nw_src=10.10.60.10,nw_dst=10.10.61.1
```

```
admin@PICOS-OVS:~$ovs-ofctl add-flow br0 in_port=6,dl_dst=66:66:66:66:66:66,ip,nw_src=20.20.20.20,nw_dst=40.40.40.4
```

Pop_gre

```
admin@PICOS-OVS:~$ovs-ofctl add-flow br0 in_port=2,ip,dl_vlan=1000,dl_dst=C8:0A:A9:9E:14:A5,nw_src=10.10.60.10,nw_(
```

Configuring Bridge and Ports

Configuring bridge

Users can create one or more bridges on a PICA8 switch. Note that each physical port can only be added to one bridge.

User can use command 'ovs-appctl pica/show' to show valid ports.

```
admin@PicOS-OVS$ovs-appctl pica/show
Max Hardware Flow Entry Limitation:
    TCAM Table    : 2048
    Egress Table  : 256

```

Create a Bridge

User can command "**ovs-vsctl add-br *<bridge> [-- set bridge br0 datapath_type=pica8]***".

From PicOS2.6.5, due to the default datapath_type is pica8, so "***-- set bridge br0 datapath_type=pica8***" is optional.

```
root@PicOS-OV$ovs-vsctl add-br br0 -- set bridge br0 datapath_type=pica8
root@PicOS-OVS$ovs-vsctl add-br br1
```

Viewing the Bridge Settings

Use the **show <bridge_name>** command to view the bridge details.

```
root@PicOS-OVS$ovs-ofctl show br0

View software table flows

Normally,we view software table flows using below command without options.

```
admin@PicOS-OVS$ovs-ofctl dump-flows br0
```

And picos add a cli view to group flows into certain application categories (LLDP, VRRP, IP, Controller, Miscellaneous) or a user-configurable value from Picos 2.8.0. User can filter flows using the flow group name.

ovs-ofctl dump-flows br0 --filter=<VRRP | LLDP | IPV4 | IPV6 | CONTROLLER | MISC>

You can use one filter or more.

For example:

```
admin@PicOS-OVS$ovs-ofctl dump-flows br0 --filter=VRRP,LLDP,IPV4,IPV6,CONTROLLER,MISC

VRRP flows (count=1):
 flow_id=9, cookie=0x0, duration=64.268s, table=0, n_packets=n/a, n_bytes=0, priority=22016,ip,in_port=1,dl_dst=01

LLDP flows (count=1):
 flow_id=6, cookie=0x0, duration=92.408s, table=0, n_packets=n/a, n_bytes=0, in_port=3,dl_dst=01:80:c2:00:00:0e,dl_

IPV4 flows (count=2):
 flow_id=9, cookie=0x0, duration=64.268s, table=0, n_packets=n/a, n_bytes=0, priority=22016,ip,in_port=1,dl_dst=01
 flow_id=8, cookie=0x0, duration=72.908s, table=0, n_packets=n/a, n_bytes=0, ip,in_port=2,nw_dst=192.168.100.200 a

IPV6 flows (count=1):
 flow_id=10, cookie=0x0, duration=57.592s, table=0, n_packets=n/a, n_bytes=0, tcp6,in_port=3 actions=CONTROLLER:65

Controller flows (count=2):
 flow_id=8, cookie=0x0, duration=72.908s, table=0, n_packets=n/a, n_bytes=0, ip,in_port=2,nw_dst=192.168.100.200 a
 flow_id=10, cookie=0x0, duration=57.592s, table=0, n_packets=n/a, n_bytes=0, tcp6,in_port=3 actions=CONTROLLER:65
```

```
MISC flows (count=1):
 flow_id=7, cookie=0x0, duration=80.295s, table=0, n_packets=n/a, n_bytes=0, priority=40000,in_port=3,dl_dst=01:80
admin@PicOS-OVS$
```

Enable STP in bridge

Defaultly, STP is disabled in ovs mode. User can use following command to enable/disable STP in bridge.

ovs-vsctl set bridge <*bridge*> stp_enable=<*true*|*false*>

Example:

```
admin@PicOS-OVS$ovs-vsctl set bridge br-12 stp_enable=true

admin@PicOS-OVS$ovs-ofctl show br-12

Other_config about bridge

1)Configure datapath-id:

```
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:datapath-id=0000d80aa99e14a3
```

2)Human readable description of datapath:

```
admin@PicOS-OVS$ovs-vsctl set bridg br0 other_config:dp-desc=pica8
```

3)Disable or enable in-band:

```
admin@PicOS-OVS$ovs-vsctl set bridge br0 other-config:disable-in-band=true/false
```

4)The flow table will be cleared or not:

```
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:enable-flush=true/false
```

5)This sets the OpenFlow queue ID that will be used by flows set up by in-band control on this bridge:

```
admin@PicOS-OVS$ovs-vsctl set bridg br0 other_config:in-band-queue=4
```

Note: in-band-queue is in range 0 to 7.

6)Configure stp:

```
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:stp-priority=0x7800
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:stp-system-id=123456
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:stp-hello-time=10
```

Note：stp hello time is in range 1 to 10.

```
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:stp-max-age=6
```

Note：stp max age is in range 6 to 40.

```
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:stp-forward-delay=6
```

Note：stp-forward-delay **is in range 4 to 30.**

7)Specifies the number of threads for software datapaths to use for handling new flows:

```
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:n-handler-threads=1
```

8)Specifies the number of threads for software datapaths to use for revalidating flows in the Datapath:

```
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:n-revalidator-threads=2
```

9)The maximum number of seconds to retain a MAC learning entry for which no packets have been seen.

```
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:mac-aging-time=300
```

10)The maximum number of MAC addresses to learn.

```
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:mac-table-size=2048
```

11)LLDP:

```
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-msg-tx-hold=4
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-msg-tx-interval=30
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-reinit-delay=2
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-tx-delay=2
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-tlv-port-desc=false
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-tlv-sys-name=true
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-tlv-sys-desc=true
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-tlv-sys-cap=true
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-tlv-mgmt-addr=true
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-tlv-pvid=true
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-tlv-mac-phy=true
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-tlv-power-via-mdi=true
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-tlv-max-frame-size=true
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:lldp-tlv-link-aggregation=true
```

12)Configure bridge mac address.

```
admin@PicOS-OVS$ovs-vsctl set bridge br0 other_config:hwaddr=22:22:22:22:22:22
```

Configuring CDR

Clock and Data Recovery (CDR) is a process that is dependent upon a clock signal synchronous with the data flow. When a data flow arrives at the receiver, it is sent without additional clocking information, the receiver generates a clock from an approximate frequency reference, and then phase-aligns the clock to the transitions in the data flow with a phase-locked loop (PLL). Data distortion, noise, and jitter on the incoming data can be reduced if the CDR technology is used for data recovery from the transmission channel.

NOTEs:

- CDR function can only be configured on the 800G, 400G, 200G, 100G or 40G optical module interface and the split interfaces broke out from them.
- The CDR configurations of split interfaces which broke out from the 800G, 400G, 200G, 100G or 40G optical module interface should be the same.

Procedure

- Use the following command to disable or enable the CDR function.

  ovs-vsctl set interface <*interface-name*> options:cdr-admin-state=[true | false]

  The default setting is **true**. The command takes effect immediately after committing.

- Use the following command to remove CDR function.

  ovs-vsctl remove interface <*interface-name*> options cdr-admin-state

Configuration Example

- Enable the CDR function on interface te-1/1/1~te-1/1/4.

```
admin@PICOS-OVS$ovs-vsctl set interface te-1/1/1 options:cdr-admin-state=true
admin@PICOS-OVS$ovs-vsctl set interface te-1/1/2 options:cdr-admin-state=true
admin@PICOS-OVS$ovs-vsctl set interface te-1/1/3 options:cdr-admin-state=true
admin@PICOS-OVS$ovs-vsctl set interface te-1/1/4 options:cdr-admin-state=true
```

- Disable the CDR function on interface te-1/1/1~te-1/1/4.

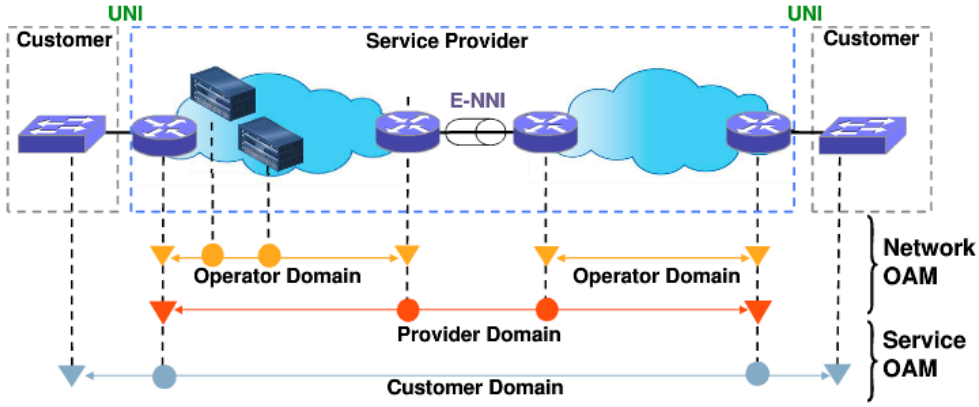
```
admin@PICOS-OVS$ovs-vsctl set interface te-1/1/1 options:cdr-admin-state=false
admin@PICOS-OVS$ovs-vsctl set interface te-1/1/2 options:cdr-admin-state=false
admin@PICOS-OVS$ovs-vsctl set interface te-1/1/3 options:cdr-admin-state=false
admin@PICOS-OVS$ovs-vsctl set interface te-1/1/4 options:cdr-admin-state=false
```

- Remove the CDR function on interface te-1/1/1~te-1/1/4.

```
admin@PICOS-OVS$ovs-vsctl remove interface te-1/1/1 optionscdr-admin-state
admin@PICOS-OVS$ovs-vsctl remove interface te-1/1/2 optionscdr-admin-state
admin@PICOS-OVS$ovs-vsctl remove interface te-1/1/3 optionscdr-admin-state
admin@PICOS-OVS$ovs-vsctl remove interface te-1/1/4 optionscdr-admin-state
```

Configuring CFM

Connectivity Fault Management (CFM) is an IEEE standard, 802.1ag, which specifies protocols, procedures, and managed objects to support transport fault management. CFM is used for detecting link connectivity fault, confirming the fault and locating the fault in the network.



The standard, 802.1ag defines:

- Maintenance domains (MD), their constituent maintenance points (MIP, MEP), and the managed objects (MA) required to create and administer them.
- The relationship between maintenance domains and the services offered by VLAN-aware bridges and provider bridges.
- The description of protocols and procedures used by maintenance points to maintain and diagnose connectivity faults within a maintenance domain.
- Means for future expansion of the capabilities of maintenance points and their protocols.

As illustrated in the above figure, each domain (operator, provider, customer) is allocated. Maintenance association Intermediate endPoint (MIP) and Maintenance domain End Point (MEP) essentially define the domain boundaries and the intermediate elements. Effectively, these end-points define a fault-domain which aids in building a flexible fault-management framework. Network and Service OAM shown above, are typically used to represent faults to a network operator and a service consumer.

IEEE 802.1ag Ethernet CFM (Connectivity Fault Management) protocols comprise three protocols that work together to help administrators debug Ethernet networks. They are:

Continuity Check Protocol (CCP) - Heartbeat messages for CFM. The Continuity Check Message (CCM) provides a means to detect connectivity failures in an MA. CCMs are multicast messages. CCMs are confined to a domain (MD). These messages are unidirectional and do not solicit a response. Each MEP transmits a periodic multicast Continuity Check Message inward towards the other MEPs.

Link Trace (LT) - Link Trace messages otherwise known as Mac Trace Route, are Multicast frames that a MEP transmits to track the path (hop-by-hop) to a destination MEP, which is similar in concept to User Datagram Protocol(UDP) Trace Route. Each receiving MEP sends a Trace Route Reply directly to the Originating MEP, and regenerates the Trace Route Message.

Loop-back (LB) - Loop-back messages otherwise known as MAC ping are Unicast frames that a MEP transmits, they are similar in concept to an Internet Control Message Protocol (ICMP) Echo (Ping) messages, sending Loopback to successive MIP's can determine the location of a fault. Sending a high volume of Loopback Messages can test bandwidth, reliability, or jitter of a service, which is similar to flood ping. An MEP can send a Loopback to any MEP or MIP in the service. Unlike CCMs, Loop back messages are administratively initiated and stopped.

Monitor connectivity to a remote maintenance point on ge-1/1/1

Set the MPID of CFM:

```
admin@PicOS-OVS$ ovs-vsctl set Interface ge-1/1/1 cfm_mpid=2333
```

A Maintenance Point ID (MPID) uniquely identifies each endpoint within a Maintenance Association. According to the 802.1ag specification, MPIDs can only range between [1, 8191].

Set extended mode:

```
admin@PicOS-OVS$ovs-vsctl set Interface ge-1/1/1 other_config:cfm_extended=true
```

Extended mode increases the accuracy of the cfm_interval configuration parameter by breaking wire compatibility with 802.1ag compliant implementations. An extended mode allows **eight byte MPIDs**.

Set demand mode:

```
admin@PicOS-OVS$ovs-vsctl set Interface ge-1/1/1 other_config:cfm_demand=true
```

When true, and cfm_extended is true, the CFM module operates in demand mode. By default it is set to false. When in demand mode, traffic received on the Interface is used to indicate liveness. CCMs are still transmitted and received. At least one CCM must be received every 100 * cfm_interval amount of time. Otherwise, even if traffic is received, the CFM module will trigger the connectivity fault. Demand mode disables itself when there are multiple remote maintenance points.

Set the requested transmission interval:

```
admin@PicOS-OVS$ovs-vsctl set Interface ge-1/1/1 other_config:cfm_interval=10000
```

In standard mode supports intervals of 3, 10, 100, 1000, 10000,60000, or 600000 ms are supported. Extended mode supports any interval up to 65535 ms and default is 1000 ms. However, we do not recommend intervals less than 100 ms.

Set CCM VLAN tag:

```
admin@PicOS-OVS$ovs-vsctl set Interface ge-1/1/1 other_config:cfm_ccm_vlan=2000
admin@PicOS-OVS$ovs-vsctl set Interface ge-1/1/1 other_config:cfm_ccm_vlan=random
```

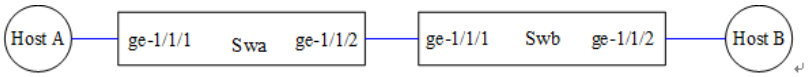
When set, the CFM module will apply a VLAN tag to all CCMs it generates with the given value.

Set CCM Priority:

```
admin@PicOS-OVS$ovs-vsctl set Interface ge-1/1/1 other_config:cfm_ccm_pcp=7
```

When set, the CFM module will apply a VLAN tag to all CCM's, it generates with the given PCP value, the VLAN ID of the tag is governed by the value of "cfm_ccm_vlan". If "cfm_ccm_vlan" is unset, a VLAN ID of zero is used.

CFM Example



Step 1: Basic configuration

DUT1:

```
admin@PicOS-OVS$ovs-vsctl add-br br0 -- set bridge br0 datapath_type=pica8
admin@PicOS-OVS$ovs-vsctl add-port br0 ge-1/1/1 vlan_mode=trunk tag=1  -- set Interface ge-1/1/1 type=pica8
admin@PicOS-OVS$ovs-vsctl add-port br0 ge-1/1/2 vlan_mode=trunk tag=1  -- set Interface ge-1/1/2 type=pica8
```

DUT2:

```
admin@PicOS-OVS$ovs-vsctl add-br br0 -- set bridge br0 datapath_type=pica8
admin@PicOS-OVS$ovs-vsctl add-port br0 ge-1/1/1 vlan_mode=trunk tag=1  -- set Interface ge-1/1/1 type=pica8
admin@PicOS-OVS$ovs-vsctl add-port br0 ge-1/1/2 vlan_mode=trunk tag=1  -- set Interface ge-1/1/2 type=pica8
```

Step 2: Configure cfm:

DUT1:

```
admin@PicOS-OVS$ovs-vsctl set interface ge-1/1/2 cfm-mpid=8999
admin@PicOS-OVS$ovs-vsctl set interface ge-1/1/2 other_config:cfm_extended=true
```

DUT2:

```
admin@PicOS-OVS$ovs-vsctl set interface ge-1/1/1 cfm-mpid=9000
admin@PicOS-OVS$ovs-vsctl set interface ge-1/1/1 other_config:cfm_extended=true
```

Step 3: Check packets

DUT1:

Check list interface:

```
admin@PicOS-OVS$ovs-vsctl list interface ge-1/1/2
_uuid : 94942d57-d9a8-4030-ad3b-483dadbd7926
admin_state : up
bfd : {}
bfd_status : {}
cfm_fault : false
cfm_fault_status : []
```

```
cfm_flap_count : 2
cfm_health : []
cfm_mpid : 8999
cfm_remote_mpids : [9000]
cfm_remote_opstate : up
duplex : full
external_ids : {}
ifindex : 13
ingress_policing_burst: 0
ingress_policing_rate: 0
lacp_current : []
link_resets : 0
link_speed : 1000000000
link_state : up
mac : []
mac_in_use : "00:e0:ec:25:2d:5e"
mtu : 9212
name : "ge-1/1/2"

status : {}
type : "pica8"
wred_queues : {}
admin@PicOS-OVS$
```

Check cfm/show:

```
admin@PicOS-OVS$ovs-appctl  cfm/show
---- ge-1/1/1 ----
MPID 9000: extended
                average health: undefined
                opstate: up
                remote_opstate: up
                interval : 1000ms
                next CCM tx: 802ms
                next fault check: 1254ms
Remote MPID 8999
                recv since check: true
                opstate: up
admin@PicOS-OVS$
```

Check hardware table:

```
admin@PicOS-OVS$ovs-appctl pica/dump-flows
#168 normal permanent priority=18000000,in_port=1,dl_dst=01:23:20:00:00:30,dl_type=0x8902, actions:userspace(pid=0
#167 normal permanent priority=0, actions:drop
Total 2 flows in HW.
```

> Standard mode, dl_mac is 01:80:c2:00:00:30; when extended mode,the dst mac is 01:23:20:00:00:30.

Configue cfm on port ge-1/1/13, if delete cfm

```
admin@PicOS-OVS$ovs-vsctl clear interface ge-1/1/13 cfm_mpid
admin@PicOS-OVS$ovs-vsctl remove interface ge-1/1/13 other_config cfm_interval="10000"
admin@PicOS-OVS$ovs-vsctl remove interface ge-1/1/13 other_config cfm_extended="true"
admin@PicOS-OVS$ovs-vsctl remove interface ge-1/1/13 other_config cfm_ccm_vlan=random
```

Configuring LFS

Abstract

Link fault signaling operates between the remote RS and the local RS. Faults detected between the remote RS and the local RS are received by the local RS as Local Fault. Only an RS originates Remote Fault signals.

Sub-layers within the PHY are capable of detecting faults that render a link unreliable for communication. Upon recognition of a fault condition, a PHY sub-layer indicates Local Fault status on the data path. When this Local Fault status reaches an RS, the RS stops sending MAC data, and continuously generates a Remote Fault status on the transmit data path (possibly truncating a MAC frame being transmitted). When Remote Fault status is received by an RS, the RS stops sending MAC data, and continuously generates Idle control characters. When the RS no longer receives fault status messages, it returns to normal operation, sending MAC data.

The RS reports the fault status of the link. Local Fault indicates a fault detected on the receive data path between the remote RS and the local RS. Remote Fault indicates a fault on the transmit path between the local RS and the remote RS.

The fault status is as follows:

a) link_fault = OK

The RS shall send MAC frames as requested through the PLS service interface. In the absence of MAC frames, the RS shall generate Idle control characters.

b) link_fault = Local Fault

The RS shall continuously generate Remote Fault Sequence ordered_sets.

c) link_fault = Remote Fault

The RS shall continuously generate Idle control characters.

Link Fault Signaling

If ignore local fault is set as false. When link local fault is triggered, the RS shall continuously generate Remote Fault Sequence ordered_sets. Otherwise, the RS will not generate Remote Fault Sequence ordered_sets.

If ignore remote fault is set as false. When link remote fault is received, The RS shall continuously generate Idle control characters. Other, The RS shall send MAC frames as requested through the PLS service interface and generate Idle control characters in the absence of MAC frames.

LFS Commands

The following is the configuration command as sample:

```
ovs-vsctl set Interface te-1/1/1 options:link-fault-signaling=ignore-none
ovs-vsctl set Interface te-1/1/1 options:link-fault-signaling=ignore-local
ovs-vsctl set Interface te-1/1/1 options:link-fault-signaling=ignore-remote
ovs-vsctl set Interface te-1/1/1 options:link-fault-signaling=ignore-both
```

1. "ignore-local" means ignoring local signaling fault.
2. "ignore-remote" means ignoring local remote fault.
3. "ignore-both" means ignoring both local and remote signaling fault.
4. "ignore-none" means not ignoring neither local signaling fault nor remote signaling fault.

Up Mode

The force up command forcibly brings up a fiber Ethernet port and enables the port to forward packets uni-directionally over a single link. In this way, transmission links are well utilized.

Up mode commands.

The following is the configuration command as a sample:

```
ovs-vsctl set Interface te-1/1/1 options:up-mode=true
ovs-vsctl set Interface te-1/1/1 options:up-mode=false
```

1. Disable port command has a higher priority than set port up command. If one port is disabled manually, it is not effective to set it up forcibly.

2. Up-mode true command should be configured together with ignore-local-fault true command. If user only configures up-mode true and not ignore-local-fault command, traffic can't transmit from TX link

3. LFS command must configurate on more than 10G port.

Configuring Loopback

Loop the traffic which into switch back to ingress.

It is possible to configure the egress interface to be the ingress interface.

PicOS supports loopback interface in hardware. By default, a packet coming into an interface cannot be sent back to the same interface via Openflow. That means the user cannot configure a flow whose output port is the "in_port". For example, the following flow will not work in hardware by default:

```
root@PicOS-OVS# ovs-ofctl add-flow br0 in_port=1,actions=in_port
```

This behavior can be changed with the following commands:

```
ovs-appctl loopback/enable true
```

This is supported starting in PicOS 2.2. It should only be used for specific traffic as it can be dangerous to send broadcast traffic back on the same port on a Layer 2 network.

Except this one, also supports another command to enable loopback. This one will replace above command.

```
root@PicOS-OVS#ovs-vsctl set-loopback-enable true
```

With the above configuration, hardware can allow the flow output port to be the same as in_port. The user can disable the loopback interface with the following command:

```
ovs-vsctl set-loopback-enable false
```

Users should know the limitation of the loopback interface in hardware. In the OpenFlow Specification, there are some actions (Flood, Group table, for example) that are for broadcasting. The packet should not be forwarded back to the **in_port** port. Be cautious using the enable loopback interface, so that the packet is not forwarded back to the in_port port.

Example1, loop the traffic back to in_port.

```
admin@PicOS-OVS$ovs-vsctl set-loopback-enable true
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,actions=in_port
```

Example2, loop the traffic back to in_port and same time send out from others.

```
admin@PicOS-OVS$ovs-vsctl set-loopback-enable true
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,actions=in_port,all
```

⚠ 1, The port can be physical port, lag interface.

Loop the traffic which out from switch back to switch again.

From version 2.8.1, PicOS also support enable loop in interface, and the feature is different from above.

User can configure one or more ports as loopbcak port. Thus, traffic can be outputed and loopback to itself. The port can be plugin module or not.

Command:

ovs-vsctl set interface <port> options:loopback=true|false

<port>: ***can be physical port, lag port and GRE/L2GRE/VxLAN tunnel port.***

Configure port te-1/1/1 as a loopback port:

```
ovs-vsctl set interface te-1/1/1 options:loopback=true
```

Example1, Modify traffic dl_dst=22:22:22:11:11:11 and out from port14, then modify dl_dst=22:22:22:22:22:22 and out from port25.

Need configure two port as loopback port, use port2 and port3 here.

```
admin@PicOS-OVS$ovs-vsctl set interface te-1/1/2 options:loopback=true
admin@PicOS-OVS$ovs-vsctl set interface te-1/1/3 options:loopback=true
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,actions=output:2,3
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=2,actions=set_field:22:22:22:11:11:11-\>eth_dst,output:14
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=3,actions=set_field:22:22:22:22:22:22-\>eth_dst,output:25
```

Example2, traffic after encap vxlan then go through L3 flow table.

Configure loopback in physical port.

```
admin@PicOS-OVS$ovs-vsctl set-l2-mode true
admin@PicOS-OVS$ovs-vsctl set-l3-mode true
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-vsctl add-port br0 vxlan1 -- set interface vxlan1 type=pica8_vxlan options:remote_ip=10.10.10.2
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-vsctl set interface te-1/1/2 options:loopback=true
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,actions=output:4097
admin@PicOS-OVS$ovs-ofctl add-flow br0 table=251,dl_vlan=1,dl_dst=C8:0A:A9:9E:14:A5,actions=normal
admin@PicOS-OVS$ovs-ofctl add-flow br0 table=252,ip,nw_dst=10.10.10.2,actions=set_field:100-\>vlan_vid,set_field:2
```

Example2, traffic go through L3 flow table then discap vxlan.

Configure loopback in physical port.

```
admin@PicOS-OVS$ovs-vsctl set-l2-mode true
admin@PicOS-OVS$ovs-vsctl set-l3-mode true
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-vsctl add-port br0 vxlan1 -- set interface vxlan1 type=pica8_vxlan options:remote_ip=10.10.10.2
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-vsctl set interface te-1/1/2 options:loopback=true
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-ofctl add-flow br0 table=251,dl_vlan=1,dl_dst=C8:0A:A9:04:49:1A,actions=normal
admin@PicOS-OVS$ovs-ofctl add-flow br0 table=252,ip,nw_dst=10.10.10.1,actions=set_field:1-\>vlan_vid,set_field:C8:(
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=4097,actions=output:1
```

1. The port will be always be "linkup" because it is a loopback port
2. Add loopback config in interface options for phyical ports and lag ports at ovs mode.
3. Due to different switch's chip are different, so some switch loopback port can send out packets, and others can not.
4. This function in crossflow mode should be added by xorplus.

Configuring ovs Remotely

Configuring ovsdb Locally

User can check the status of the **ovsdb-server** process using the **ps** command from the Linux shell.

```
admin@PicOS-OVS$ps aux|grep ovs
root      3422  0.0  0.1   7020  2788 ?        S    10:42   0:00 ovsdb-server /ovs/ovs-vswitchd.conf.db /tmp/invent
root      3435 15.7  1.5 122860 32320 ?        Sl   10:42   2:12 ovs-vswitchd --pidfile=ovs-vswitchd.pid --overwri
root      3494  0.0  0.2  12960  5752 ?        Ss   10:43   0:00 /usr/bin/python /ovs/share/openvswitch/scripts/ovs
admin     3738  0.0  0.0   2200   684 ttyS0    S+   10:56   0:00 grep --color=auto ovs
admin@PicOS-OVS$
```

The string '--remote=ptcp:6640:127.0.0.1' in the output above shows that the **ovsdb-server** is listening the local IP 127.0.0.1 and port 6640.

User can configure **ovs-vswitchd** locally as shown below:

```
root@PicOS-OVS$ovs-vsctl add-br br0 -- set bridge br0 datapath_type=pica8
root@PicOS-OVS$ovs-vsctl add-port br0 te-1/1/1 vlan_mode=trunk tag=1 -- set interface te-1/1/1 type=pica8
root@PicOS-OVS$ovs-vsctl add-port br0 vxlan1 -- set interface vxlan1 type=pica8_vxlan options:remote_ip=10.10.10.2
root@PicOS-OVS$ovs-vsctl set-controller br0 tcp:10.10.51.51:6633
```

Configuring ovsdb Remotely

Check the state of **ovsdb-server** on the switch.

```
admin@PicOS-OVS$ps aux|grep ovs
root      3422  0.0  0.1   7020  2788 ?        S    10:42   0:00 ovsdb-server /ovs/ovs-vswitchd.conf.db /tmp/invent
root      3435 14.9  1.5 122860 32388 ?        Sl   10:42   3:16 ovs-vswitchd --pidfile=ovs-vswitchd.pid --overwri
root      3494  0.0  0.2  12960  5752 ?        Ss   10:43   0:00 /usr/bin/python /ovs/share/openvswitch/scripts/ovs
admin     3835  0.0  0.0   2200   680 ttyS0    S+   11:04   0:00 grep --color=auto ovs
```

The string '--remote=db:Open_vSwitch,Manager,target' in the output above shows that the **ovsdb-server** is listening remote Manager and target default. User can configure switch ovsdb at remote side.

User can configure **ovs-vswitchd** remotely as shown below, switch's managerment ip is 10.10.51.138.

```
root@dev-42:~# ovs-vsctl --db=tcp:10.10.51.138:6640 add-br br0 -- set bridge br0 datapath_type=pica8
root@dev-42:~# ovs-vsctl --db=tcp:10.10.51.138:6640 add-port br0 te-1/1/1 vlan_mode=trunk tag=1 -- set interface te
root@dev-42:~# ovs-vsctl --db=tcp:10.10.51.138:6640 add-port br0 vxlan1 -- set interface vxlan1 type=pica8_vxlan op
root@dev-42:~# ovs-vsctl --db=tcp:10.10.51.138:6640 set-controller br0 tcp:10.10.51.51:6633
```

Add flow locally

User can add flow entry in switch cli.

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=31,actions=output:32
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-ofctl dump-flows br0
OFPST_FLOW reply (OF1.4) (xid=0x2):
 flow_id=29, cookie=0x0, duration=3.313s, table=0, n_packets=n/a, n_bytes=3481169152, in_port=31 actions=output:32
admin@PicOS-OVS$
```

Add flow remotely

User can add flow entry at remote side, and must configure controller before, switch's managerment ip is 10.10.51.138.

```
Switch,
admin@PicOS-OVS$ovs-vsctl set-controller br0 ptcp:6633:10.10.51.138
```

```
Remote server,
root@dev-42:~# ovs-ofctl add-flow tcp:10.10.51.138:6633 in_port=32,actions=output:31
root@dev-42:~#
```

Configuring ports in bridge

Adding ports in bridge

Adding access port

In the example below, the user creates a bridge named **br0,** using the **set bridge** command. With the **add-port** command, add access ports, **ge-1/1/1** and **ge-1/1/2**, to **br0**. The default PVID for both ports is 1.

```
root@PicOS-OVS$ovs-vsctl add-br br0
root@PicOS-OVS$ovs-vsctl add-port br0 ge-1/1/1 vlan_mode=access tag=1 -- set Interface ge-1/1/1 type=pica8
root@PicOS-OVS$ovs-vsctl add-port br0 ge-1/1/2 vlan_mode=access tag=1 -- set Interface ge-1/1/2 type=pica8
root@PicOS-OVS$
```

If the user wants to allow use of a DAC line, user should enable DAC.

```
root@PicOS-OVS$ovs-vsctl add-port br0 te-1/1/49 vlan_mode=access tag=1 -- set Interface te-1/1/49 type=pica8 optio
```

Adding Trunk Port

PicOS supports 802.1Q trunk ports (since PicOS 2.1). Each port has a default VLAN-ID; and by default, the VLAN-ID is 1. If user wants a port to belong to more than one VLAN, use the **vlan mode=trunk** command. When user specifies one port to a trunk port (tag=1), this port is the trunk port, the PVID is the tag number, and this port belongs to all the other VLANs (2-4094).

In the example below, the user specifies the VLAN mode to equal *trunk,* and then specifies the VLANs in the trunks:

```
root@PicOS-OVS$ ovs-vsctl add-port br0 ge-1/1/4 vlan_mode=trunk tag=1 trunks=1000 -- set Interface ge-1/1/4 type=p
root@PicOS-OVS$
```

Setting the Port Link Speed

The trunk port can carry all VLANs if the user does not specify the *trunks* field, as shown below.

```
root@PicOS-OVS$ ovs-vsctl add-port br0 te-1/1/49 vlan_mode=access tag=1 -- set Interface te-1/1/49 type=pica8 optic
root@PicOS-OVS$
```

Modify port ofport

PicOS support modify port ofport,for example,modify ofport of te-1/1/69 from 69 to 190.

```
admin@PICOS-OVS$ovs-vsctl set interface te-1/1/69 ofport_request=190
admin@PICOS-OVS$ovs-ofctl show br0
OFPT_FEATURES_REPLY (OF1.4) (xid=0x2):

Setting FEC in port

Introduction

Forwarding Error Correction (FEC) is a technique used for controlling errors in data transmission over unreliable or noisy communication channels. The sender sends the data together with a certain redundant error correction code. When the data is received at the receiver's end, it is checked according to the error correction code. If an error is found, the receiver recognizes it and corrects the error without data retransmission.

The FEC function can be applied to 100G, 40G and 25G ports of the switch and works only when all of the three following conditions are matched:

- FEC function is enabled on both ends of the link.
- Optical modules are plugged in.
- Interface rate is auto or at the default value, i.g. 100G optical port works at 100Gb/s.

PICOS offers FEC algorithm RS-FEC (CL91) on 100G port and FEC BASE-R (CL74) on 40G port.

For 25G port, PICOS offers two different FEC algorithms on different switch platforms:

Trident 3, Maverick2, Helix5 and Tomahawk 2 platform switches support RS-FEC (CL108) mode, Tomahawk+/Tomahawk platform switches support BASE-R (CL74) mode.

> **NOTE:**
> The port can link up only when the FEC configurations and the FEC algorithm mode on both ends of the link are the same.

Configuration Example

```
root@PicOS-OVS$ ovs-vsctl add-port br0 xe-1/1/1 -- set Interface xe-1/1/1 type=pica8 options:use_fec=true
root@PicOS-OVS$
root@PicOS-OVS$ ovs-vsctl add-port br0 xe-1/1/1 -- set Interface xe-1/1/1 type=pica8 options:use_fec=false
root@PicOS-OVS$
```

Add Bond Ports

PicOS supports bond multiple ports as in_port or output, and this virtual port does not influence each physical port's forwarding packets. That mean the physical port which adds in bond port also can be configured as lag/gre/l2gre/vxlan and others.

Bonding port ge-1/1/1 ~ ge-1/1/4 as one port.

```
// add portsovs-vsctl add-br br0 -- set bridge br0 datapath_type=pica8
ovs-vsctl add-port br0 ge-1/1/1 vlan_mode=trunk tag=1 -- set Interface ge-1/1/1 type=pica8
ovs-vsctl add-port br0 ge-1/1/2 vlan_mode=trunk tag=1 -- set Interface ge-1/1/2 type=pica8
ovs-vsctl add-port br0 ge-1/1/3 vlan_mode=trunk tag=1 -- set Interface ge-1/1/3 type=pica8
ovs-vsctl add-port br0 ge-1/1/4 vlan_mode=trunk tag=1 -- set Interface ge-1/1/4 type=pica8

// add bond ports
ovs-vsctl add-port br0 bond1 -- set Interface bond1 type=pica8_bond
ovs-vsctl set Interface bond1 options:members=ge-1/1/2,ge-1/1/3,ge-1/1/4

// add flows
ovs-ofctl add-flow br0 in_port=2049,actions=1
ovs-ofctl add-flow br0 in_port=1,actions=2049
```

Port other_config

STP:

```
admin@PicOS-OVS$ovs-vsctl set port te-1/1/1 other_config:stp-path-cost=10
admin@PicOS-OVS$ovs-vsctl set port te-1/1/1 other_config:stp-port-num=20
admin@PicOS-OVS$ovs-vsctl set port te-1/1/1 other_config:stp-port-priority=255
```

Interface options

1)Interface options:

```
admin@PicOS-OVS$ovs-vsctl set interface te-1/1/1 options:link_speed=1G
```

Note:speed value support to configure 40G,100G,25G,10G,1G,100M,10M and auto.

```
admin@PicOS-OVS$ovs-vsctl set interface te-1/1/1 options:mtu=1500
admin@PicOS-OVS$ovs-vsctl set Interface te-1/1/1 options:flow_ctl=tx_rx
```

Note:flow control value support tx,rx,tx_rx and none.

```
admin@PicOS-OVS$ovs-vsctl set interface he-1/1/1 options:use_fec=true
```

2)LACP:

```
admin@PicOS-OVS$ovs-vsctl -- set Interface ae1 options:lag_type=lacp
admin@PicOS-OVS$ovs-vsctl -- set Interface ae1 options:members=ge-1/1/1,ge-1/1/2
admin@PicOS-OVS$ovs-vsctl -- set Interface ae1 options:lacp-system-id=00:11:11:11:11:11
admin@PicOS-OVS$ovs-vsctl -- set Interface ae1 options:lacp-time=fast | slow
admin@PicOS-OVS$ovs-vsctl -- set Interface ae1 options:lacp-system-priority=32768
admin@PicOS-OVS$ovs-vsctl -- set Interface ae1 options:lacp-mode=active | passive
admin@PicOS-OVS$ovs-vsctl -- set Interface te-1/1/1 options:lacp-port-id=2
admin@PicOS-OVS$ovs-vsctl -- set Interface te-1/1/1 options:lacp-port-priority=32768
admin@PicOS-OVS$ovs-vsctl -- set Interface te-1/1/1 options:lacp-aggregation-key=0
```

3)LFS:

```
admin@PicOS-OVS$ovs-vsctl set Interface te-1/1/1 options:link-fault-signaling=ignore-none
```

Note:it support ignore-none, ignore-local, ignore-remote and ignore-both.

```
admin@PicOS-OVS$ovs-vsctl set Interface te-1/1/1 options:up-mode=true
```

4)Tpid

```
admin@PicOS-OVS$ovs-vsctl set interface te-1/1/1 options:tpid=0x8100
```

Note:tpid support 0x8100,0x88a8,0x9100 and 0x9200.

5)Access-vport

```
admin@PicOS-OVS$ovs-vsctl set interface te-1/1/1 options:access-vport=true
```

Note:default value is false.

6)Loop the traffic which out from switch back to switch again.

```
admin@PicOS-OVS$ovs-vsctl set interface te-1/1/1 options:loopback=true
```

7)Tunnel:

Gre:

```
admin@PicOS-OVS$ovs-vsctl add-port br0 gre1 -- set Interface gre1 type=pica8_gre options:remote_ip=10.10.60.10 opt
```

L2gre:

```
admin@PicOS-OVS$ovs-vsctl add-port br0 l2gre1 -- set interface l2gre1 type=pica8_l2gre options:remote_ip=10.10.61.
```

vxlan:

```
admin@PicOS-OVS$ovs-vsctl add-port br0 vxlan1 -- set interface vxlan1 type=pica8_vxlan options:remote_ip=10.10.10.
```

8)Bond:

```
admin@PicOS-OVS$ovs-vsctl set Interface bond1 options:members=te-1/1/1,te-1/1/2
```

9)Lag:

```
admin@PicOS-OVS$ovs-vsctl set Interface ae1 options:lag_selected_min=1
admin@PicOS-OVS$ovs-vsctl -- set Interface ae1 options:lag_type=static
admin@PicOS-OVS$ovs-vsctl -- set Interface ae1 options:hash-mapping=dl_dst
admin@PicOS-OVS$ovs-vsctl -- set Interface ae1 options:hash-mapping=dl_src_dst
admin@PicOS-OVS$ovs-vsctl -- set Interface ae1 options:hash-mapping=dl_src
admin@PicOS-OVS$ovs-vsctl -- set Interface ae1 options:hash-mapping=nw_dst
admin@PicOS-OVS$ovs-vsctl -- set Interface ae1 options:hash-mapping=nw_src_dst
admin@PicOS-OVS$ovs-vsctl -- set Interface ae1 options:hash-mapping=nw_src
admin@PicOS-OVS$ovs-vsctl -- set Interface ae1 options:hash-mapping=resilient
```

```
admin@PicOS-OVS$ovs-vsctl -- set Interface ae1 options:hash-mapping=advance
```

Note:default hash mapping is dl_src_dst.

10) Enable CDR function:

```
admin@PICOS-OVS$ovs-vsctl set interface te-1/1/1 options:cdr-admin-state=true/false
```

11)PTP

```
admin@PicOS-OVS$ovs-vsctl set interface te-1/1/2 options:ptp-mode=e2etransparent
```

Interface other_config

Cfm:

```
admin@PicOS-OVS$ovs-vsctl set Interface te-1/1/1 other_config:cfm_extended=true
admin@PicOS-OVS$ovs-vsctl set Interface te-1/1/1 other_config:cfm_demand=true
admin@PicOS-OVS$ovs-vsctl set Interface te-1/1/1 other_config:cfm_interval=10000
admin@PicOS-OVS$ovs-vsctl set Interface te-1/1/1 other_config:cfm_ccm_vlan=2000
admin@PicOS-OVS$ovs-vsctl set Interface te-1/1/1 other_config:cfm_ccm_vlan=random
admin@PicOS-OVS$ovs-vsctl set Interface te-1/1/1 other_config:cfm_ccm_pcp=7
admin@PicOS-OVS$ovs-vsctl set Interface te-1/1/1 other_config:cfm_opstate=up/down
```

Configuring the Duplex Mode of Optical Port as Auto-negotiation Mode

Notes:

- Currently, duplex mode for optical port is only available for the 10 optical port when its port rate set to 1G.
- Duplex mode for optical port currently only supports to configure as auto, i.e. auto-negotiation mode.

```
admin@PicOS-OVS$ovs-vsctl set Interface te-1/1/1 options:link_speed=1G
admin@PicOS-OVS$ovs-vsctl set Interface te-1/1/1 options:duplex=auto
```

Configuring Port Breakout

Notes:

You need to restart or reboot the system to make the setting take effect when performing port breakout operation.

The following command configures port breakout for port with number 49.

```
admin@PICOS:~$ ovs-vsctl set-port-breakout 49 true
  Port 49 has been set breakout=true!
  Please reboot for the change to take effect!
admin@PICOS:~$ sudo systemctl restart picos
```

The following command disables port breakout for port with number 49.

```
admin@PICOS:~$ ovs-vsctl set-port-breakout 49 false
  Port 49 has been set breakout=false!
  Please reboot for the change to take effect!
admin@PICOS:~$ sudo systemctl restart picos
```

Configuring TPID in Port

PicOS support push/swap/pop S-VLAN in Q-in-Q, and the S-VLAN TPID can configure as 0x8100/0x88a8/0x9100 and 0x9200. But in the same port, PicOS only support configure one TPID value, that means the traffic through one port will can push/swap/pop one type of TPID.

a, If one TPID configured in ingress port, switch can recognize it and deal the matched traffic;

b, If one TPID configured in egress port, switch can design it in the traffic which send out from the port.

1, TPID used in Q-in-Q

> ⚠ If the actions include push-vlan and has no push_l2mpls:
>
> push_vlan action will use out_port's tpid.
>
> For example,
>
> a. untagged packet push one tag, the result will be: out_port's tpid | payload
>
> b. untagged packet push two tags, the result will be: out_port's tpid | 0x8100 | payload

Once configure TPID in port, need reboot switch.Command:

```
ovs-vsctl set interface <port> options:tpid=<value>

<value> can configure mutiple values such as 0x8100/0x88a8/0x9100/0x9200, for example if the S-VLAN TPID is 0x88a8,
By default, the value is 0x8100.
```

In Q-in-Q flow, only support match outer-vlan.

Push-vlan: Design TPID during push S-VLAN, need configure TPID in egress.

Example:

```
admin@PicOS-OVS$ovs-vsctl set interface te-1/1/1 options:tpid=0x8100
admin@PicOS-OVS$ovs-vsctl set interface te-1/1/2 options:tpid=0x88a8

Push one vlan:
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,actions=push_vlan=0x88a8,set_field:1234-\>vlan_vid,output:2

Push two vlans,
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,actions=push_vlan=0x8100,set_field:10-\>vlan_vid,push_vlan=0x88a8,
```

Swap-vlan: Match TPID in ingress port and design TPID in egress port, so need configure TPID in ingress and egress.

Example:

```
admin@PicOS-OVS$ovs-vsctl set interface te-1/1/1 options:tpid=0x88a8
admin@PicOS-OVS$ovs-vsctl set interface te-1/1/2 options:tpid=0x88a8

admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,dl_vlan=10,actions=set_field:100-\>vlan_vid,output:2
```

Pop-vlan: Match TPID in ingress port, need configure TPID in ingress port.

Example:

```
admin@PicOS-OVS$ovs-vsctl set interface te-1/1/1 options:tpid=0x88a8

admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,dl_vlan=10,actions=pop_vlan,output:2
```

2, TPID used in push L2MPLS

This feature means push/swap/pop vlan before push L2MPLS. It is simmilar with Q-in-Q, but operation is different from Q-in-Q.

> ⚠ 1, This feature only support in platform 3922 and 3924;
>
> 2, If user want use TPID before push L2MPLS, must configure TPID on ingress port.

3, push_vlan action before push_l2mpls will use in_port's tpid, and push_vlan action in push_l2mpls will use out_port's tpid. One case need to note is that if only one tag exist before l2mpls, its tpid should be 0x8100.

For example,

a. untagged packet push one tag and then push l2mpls, the result will be: l2mpls | 0x8100 | payload

b. untagged packet push two tags and then push l2mpls, the result will be: l2mpls | in_port's tpid | 0x8100 | payload

a, No mather push/swap/pop vlan before push L2MPLS, TPID must configure in ingress port.

Once configure TPID in port, need reboot switch.Command:

```
ovs-vsctl set interface <port> options:tpid=<value>

<value> can configure one value as 0x8100/0x88a8/0x9100/0x9200, for example if the S-VLAN TPID is 0x88a8, the valu
By default, the value is 0x8100.
```

Push-vlan: Configure TPID in ingress port.

Example: The push_vlan and push_l2mpls are performed in network ingress side. In network egress side, PicOS switch just pop_l2mpls. In this example, we only care the network ingress side.

a, At the Ingress side, matching in_port and untag, actions: push_svlan (TPID 0x8100/0x88a8/0x9100/0x9200) push_cvlan(TPID 0x8100) then push l2mpls.

```
ovs-vsctl set interface te-1/1/11 options:tpid=0x88a8
ovs-ofctl add-flow br-iris "in_port=11,vlan_vid=0x0000/0x1fff,actions=push_vlan:0x88a8,set_field:100->vlan_vid,pus
```

b, At the Ingress side, cvlan (TPID=0x8100) then push_l2mpls.

```
ovs-vsctl set interface te-1/1/11 options:tpid=0x88a8
ovs-ofctl add-flow br-iris "in_port=11,vlan_vid=0x0000/0x1fff,actions=push_vlan:0x8100,set_field:10->vlan_vid,push_
```

If want match untag packets, the flow entry should include match vlan_vid=0x0000/0x1fff, and must set option-match-vlan-type is true.

admin@PicOS-OVS$ovs-vsctl set-option-match-vlan-type true

Swap-vlan: Configure TPID in ingress port.

Example: Swap and push_l2mpls are performed in network ingress side. In egress side, PicOS switch just pop_l2mpls. In this example, we only care the network ingress side.

a, At the **Ingress** side, matching in_port and S-VLAN/C-VLAN (C-VLAN TPID support 0x8100, S-VLAN TPID support 0x8100/0x88a8/0x9100/0x9200), actions: swap S-VLAN and C-VLAN;

```
ovs-vsctl set interface te-1/1/11 options:tpid=0x88a8
ovs-ofctl add-flow br-iris "in_port=11,vlan_tci=0x1032,inner_vlan_tci=0x100a,actions=set_field:100->vlan_vid,set_f
```

b, swap S-VLAN only or swap C-VLAN , then push_l2mpls.

```
ovs-vsctl set interface te-1/1/11 options:tpid=0x88a8
ovs-ofctl add-flow br-iris "in_port=11,vlan_tci=0x1032,inner_vlan_tci=0x1000/0x1000,actions=set_field:100->vlan_vi

ovs-ofctl add-flow br-iris "in_port=11,vlan_tci=0x1000/0x1000,inner_vlan_tci=0x1000/0x1000,actions=set_field:100->
```

Pop_vlan: Configure TPID in ingress port.

Example: The pop_vlan and push_l2mpls are performed in network ingress side. In egress side, PicOS switch just pop_l2mpls. In this example, we only care the network ingress side.

At the Ingress side, matching in_port and S-VLAN/C-VLAN, actions: pop S-VLAN or pop S-VLAN and C-VLAN, then push_l2mpls.

```
ovs-vsctl set interface te-1/1/11 options:tpid=0x88a8
ovs-ofctl add-flow br-iris "in_port=11,vlan_tci=0x1032,inner_vlan_tci=0x100a,actions=pop_vlan,pop_vlan,push_l2mpls
```

Configuring LAG and LACP

- Adding LAG and LACP
- GTP hash
- Lag hash
- Lag Resilient hash
- Symmetric Hashing in lag and ecmp

Adding LAG and LACP

LAG/LACP

Link aggregation (LAG) refers to *aggregating* multiple physical network links in parallel in order to increase throughput beyond what a single link could sustain, and provide redundancy in case any of the links should fail.

Link Aggregation Control Protocol (LACP) refers to bundling of several physical ports together to form a single logical channel. Network devices use LACP to negotiate automatic bundling of links by sending LACP packets to its directly connected peer(s)

LACP features and practical examples:

1. Maximum number of bundled ports allowed in the port channel: valid values are from 1 to 8.
2. LACP packets are sent with a well known multicast group MAC address 01:80:c2:00:00:02
3. LACP detection period:
    - LACP packets are transmitted every second
    - Keep alive mechanism for link members: (default: slow = 30s, fast=1s)
4. LACP can have the port-channel load-balance mode:
    - load-balancing can be configured using a combination of in_port, L2, L3 and L4 headers.
5. LACP mode:
    - active: Enables LACP unconditionally.
    - passive: Enables LACP only when an LACP device is detected. (This is the default state)

1, PicOS OVS supports LAG and LACP.

2, PicOS can support 48 LAG or LACP at most. Each LAG has a maximum of 8 member ports.

3, The port ranges in PicOS are as follows:

Port Type	Port Number
LAG	1025-2047

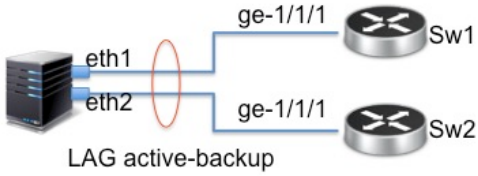
Create a Static LAG

In following configuration, user can create LAG ae1, and add port 2 and port 3 into this LAG

```
root@PicOS-OVS# ovs-vsctl  add-port br0 ae1 vlan_mode=trunk tag=1 -- set Interface ae1 type=pica8_lag
root@PicOS-OVS# ovs-vsctl -- set Interface ae1 options:lag_type=static
root@PicOS-OVS# ovs-vsctl -- set Interface ae1 options:members=ge-1/1/2,ge-1/1/3
```

Dual Homing a Host

While dual-homing a host does not require a LAG configuration on the switch, this configuration illustrates steps required to setup LAG on the host connected to two different switches.



Host LAG Configuration	Switch Port Configuration
pica8@Ubuntu$ more /etc/modprobe.d/bonding.conf bonding mode=1 miimon=100 pica8@Ubuntu$ more /etc/network/interfaces # NIC bonding config for LAG active-backup START auto eth1 iface eth1 inet manual	OVS-Sw1$ovs-vsctl add-port br0 ge-1/1/1 vlan_mode=trunk tag=1 -- set interface ge-1/1/1 type=pica8 OVS-Sw2$ovs-vsctl add-port br0 ge-1/1/1 vlan_mode=trunk tag=1 -- set interface ge-1/1/1 type=pica8

Host LAG Configuration	Switch Port Configuration
bond-master bond0 bond-primary eth1 auto eth2 iface eth2 inet manual bond-master bond0 auto bond0 iface bond0 inet static address 10.0.0.20 netmask 255.255.255.0 bond-mode active-backup bond-miimon 100 bond-slaves none # NIC bonding config for LAG active-backup END pica8@Ubuntu$ cat /proc/net/bonding/bond0 Ethernet Channel Bonding Driver: v3.7.1 (April 27, 2011) Bonding Mode: fault-tolerance (active-backup) Primary Slave: eth1 (primary_reselect always) Currently Active Slave: eth1 MII Status: up MII Polling Interval (ms): 100 Up Delay (ms): 0 Down Delay (ms): 0 Slave Interface: eth2 MII Status: up Speed: 1000 Mbps Duplex: full Link Failure Count: 0 Permanent HW addr: 00:0c:29:70:2e:c2 Slave queue ID: 0 Slave Interface: eth1 MII Status: up Speed: 1000 Mbps Duplex: full Link Failure Count: 0 Permanent HW addr: 00:0c:29:70:2e:b8 Slave queue ID: 0	

Create a LACP Port

Following is the configuration on the host (running Ubuntu):

```
pica8@Ubuntu:~$ more /etc/modprobe.d/bonding.conf
bonding mode=4 miimon=100 lacp_rate=1

pica8@Ubuntu:~$ more /etc/network/interfaces
# This file describes the network interfaces available on your system
# and how to activate them. For more information, see interfaces(5).
# The loopback network interface
auto lo
iface lo inet loopback
```

```
# The primary network interface
auto eth0
iface eth0 inet dhcp

# NIC bonding config with LACP START
auto eth1
iface eth1 inet manual
        bond-master bond0
auto eth2
iface eth2 inet manual
        bond-master bond0
auto bond0
iface bond0 inet static
 address 10.0.0.10
 netmask 255.255.255.0
bond-mode 802.3ad
bond-miimon 100
bond-lacp-rate 1
bond-slaves none
# NIC bonding config with LACP END

pica8@Ubuntu:~$ sudo systemctl restart networking

pica8@Ubuntu:~$ cat /proc/net/bonding/bond0
Ethernet Channel Bonding Driver: v3.7.1 (April 27, 2011)
Bonding Mode: IEEE 802.3ad Dynamic link aggregation
Transmit Hash Policy: layer2 (0)
MII Status: up

```

Following is the LACP configuration on the switch.

The default (slow) LACP timer is 30s whereas fast timer is 1s. LACP mode determines which node initiates the negotiation: active sets the switch to initiate the LACP handshake, while in passive mode the switch accepts all incoming LACP requests.

```
admin@PicOS-OVS$ ovs-vsctl  add-port br0 ae1 vlan_mode=trunk tag=1 -- set Interface ae1 type=pica8_lag
admin@PicOS-OVS$ ovs-vsctl  -- set Interface ae1 options:lag_type=lacp
```

```
admin@PicOS-OVS$ ovs-vsctl  -- set Interface ae1 options:members=ge-1/1/1,ge-1/1/2
admin@PicOS-OVS$ ovs-vsctl  -- set Interface ae1 options:lacp-system-id=00:11:11:11:11:11
admin@PicOS-OVS$ ovs-vsctl  -- set Interface ae1 options:lacp-time=fast | slow

Optional Settings:
admin@PicOS-OVS$ ovs-vsctl  -- set Interface ae1 options:lacp-system-priority=32768
admin@PicOS-OVS$ ovs-vsctl  -- set Interface ae1 options:lacp-mode=active | passive
admin@PicOS-OVS$ ovs-vsctl  -- set Interface ge-1/1/2 options:lacp-port-id=2
admin@PicOS-OVS$ ovs-vsctl  -- set Interface ge-1/1/2 options:lacp-port-priority=32768
admin@PicOS-OVS$ ovs-vsctl  -- set Interface ge-1/1/2 options:lacp-aggregation-key=0
```

From PicOS version 2.7.1, support is added to configure minimum number port in a LACP or LAG. The command is as follows:

`ovs-vsctl set Interface <lag port> options:lag_selected_min=<value>`

```
admin@PicOS-OVS$ovs-vsctl set Interface ae1 options:lag_selected_min=1
```

Create Static Flow for LAG or LACP

In following configuration, user can create static flow whose output port is a LAG or LACP.

```
root@PicOS-OVS# ovs-ofctl add-flow br0 in_port=1025,actions=output:1
root@PicOS-OVS# ovs-ofctl add-flow br0 in_port=1,actions=output:1025
```

LAG number index is shown as following:

LAG Name	LAG Number
ae1	1025
ae2	1026
..	..
ae1023	2047

Display the LACP Information

User can display the LACP information with the following CLI commands.

```
admin@PicOS-OVS$ovs-appctl lacp/show

---- ae1 ----
status: active negotiated
sys_id:00:11:11:11:11:11

```

LAG speed

From PicOS version 2.7.2, support for LAG speed has been added. User can check the LAG speed configuration with the command **"ovs-ofctl show br0 ".**

Examples

Topology

ge-1/1/1----------connect ixia1

ge-1/1/2----------connect ixia2

ge-1/1/3----------connect ixia3

ge-1/1/4----------connect ixia4

Step 1: Create a bridge and add four ports (PX1,PX2,PX3)

```
ovs-vsctl add-br br0 -- set bridge br0 datapath_type=pica8
ovs-vsctl add-port br0 ge-1/1/1 vlan_mode=trunk tag=1 -- set interface ge-1/1/1 type=pica8
ovs-vsctl add-port br0 ge-1/1/2 vlan_mode=trunk tag=1 -- set interface ge-1/1/2 type=pica8
ovs-vsctl add-port br0 ge-1/1/3 vlan_mode=trunk tag=1 -- set interface ge-1/1/3 type=pica8
ovs-vsctl add-port br0 ge-1/1/4 vlan_mode=trunk tag=1 -- set interface ge-1/1/4 type=pica8
```

Step 2: Add a lag port

```
ovs-vsctl add-port br0 ae1 vlan_mode=trunk tag=1 -- set interface ae1 type=pica8_lag options:members=ge-1/1/2,ge-1/
ovs-vsctl -- set interface ae1 options:lag_type=static
```

Check the lag port speed

```
ovs-ofctl show br0
check "1025(ae1).*state.* LINK_UP"
check "speed.*300 Mbps"
```

Step 3: Add flow

```
ovs-ofctl add-flow br0 in_port=1,actions=output:1025
 check the flows:
ovs-ofctl dump-flows br0
check "in_port=1"
ovs-appctl pica/dump-flows
check "in_port=1"
```

Step 4: Send ipv4 packets and check the result

(1) Send no changing packets to PX1,(dl_src=22:11:11:11:11:11,dl_dst=22:22:22:22:22:22,dl_vlan=10,ip,nw_src=192.168.1.10,nw_dst=192.168.2.10)

Result:

```
then PX2,PX3 or PX4 will transmit all the packets.
```

```
Check:
dl_src: 22 11 11 11 11 11
dl_dst:22 22 22 22 22 22
offset:30
ip:C0 A8 01 0A C0 A8 02 0A
```

(2)sending increasing src mac to PX1, (dl_src=22:11:11:11:11:11(increase),dl_dst=22:22:22:22:22:22,dl_vlan=10,ip,nw_src=192.168.1.10,nw_dst=192.168.2.10)

Result:

```
then both PX2, PX3 and PX4 will transmit the packets.
Check:
dl_dst:22 22 22 22 22 22
offset:30
ip:C0 A8 01 0A C0 A8 02 0A
```

Step 5: Down one or more port of lag and check the lag speed

(1)ovs-ofctl mod-port br0 ge-1/1/2 down

```
ovs-ofctl show br0
check "1025(ae1).*state.* LINK_UP"
check "speed.*200Mbps"
```

(2)ovs-ofctl mod-port br0 ge-1/1/3 down

```
ovs-ofctl show br0
check "1025(ae1).*state.* LINK_UP"
check "speed.*100Mbps"
```

(3)ovs-ofctl mod-port br0 ge-1/1/4 down

```
ovs-ofctl show br0
check "1025(ae1).*state.* LINK_DOWN"
check  "speed.*0Mbps"
```

Step 6: Up all the ports of lag and check the lag speed

```
ovs-ofctl mod-port br0 ge-1/1/2 up
ovs-ofctl mod-port br0 ge-1/1/3 up
ovs-ofctl mod-port br0 ge-1/1/4 up
ovs-ofctl show br0
check "1025(ae1).*state.* LINK_UP"
check "speed.*300Mbps"
```

Step 7: Test end and clear the configure

```
ovs-vsctl del-br br0
```

GTP hash

From 2.9.1.3,GTP hash is supported on pica8 switch.GTP hash support ecmp-gtp-hash and lag-gtp-hash.GTP teid hash works well whatever adding a lag port or lag-select-group.But only works well when configure ecmp-select-group.The layer4 port hash fields does not work when setting with gtp_teid(ovs-vsctl set-lag-advance-hash-mapping-fields gtp_teid port_src),but works well when not set gtp_teid(ovs-vsctl set-lag-advance-hash-mapping-fields port_src).You can modify the udf dst port through this commnad "ovs-vsctl set-gtp-udp-dst-ports <portnumber>",default is 2152.After enable advance mode on lag port,all hash fields are enabled except gtp_teid.The same with the ecmp-hash-fields.

support platforms
TridentII, tridentII+,thomahawk support gtp hash

Command
1. hash through a lag port
step1,add a lag port
ovs-vsctl add-port br0 te-1/1/4 vlan_mode=trunk tag=1
ovs-vsctl add-port br0 te-1/1/5 vlan_mode=trunk tag=1
ovs-vsctl add-port br0 ae1 vlan_mode=trunk tag=1 -- set interface ae1 type=pica8_lag options:members=te-1/1/4,te-1/1/5
step2,set hash-fields to teid
ovs-vsctl set interface ae1 options:hash-mapping=advance
ovs-vsctl set-lag-advance-hash-mapping-fields gtp_teid
step3,add a flow
without matching teid
ovs-ofctl add-flow br0 in_port=3,actions=1025
matching teid
ovs-vsctl set-udf-mode "udf0(l4,offset=12,length=4)"
ovs-ofctl add-flow br0 in_port=1,table=250,udf0=0x00000000/0xffffffff0,actions=1025
2. lag-select-group
step1,enable lag-select-group and add a group
ovs-vsctl set-group-ranges lag-select-groups=2-20
sudo systemctl restart picos

ovs-ofctl add-group br0 group_id=2,type=select,bucket=output:4,bucket=output:5
step2,set hash-fields to teid
ovs-vsctl set-lag-advance-hash-mapping-fields gtp_teid
step3,add a flow
without matching teid
ovs-ofctl add-flow br0 in_port=3,actions=group:2
with matching teid:
ovs-vsctl set-udf-mode "udf0(l4,offset=12,length=4)"
ovs-ofctl add-flow br0 in_port=1,table=250,udf0=0x00000000/0xffffffff0,actions=group:2
3. ecmp-select-group
step1,enable ecmp-select-group and add a group
ovs-vsctl set-group-ranges ecmp-select-groups=1-100

sudo systemctl restart picos

ovs-ofctl add-group br0 group_id=1,type=select,bucket=output:14,bucket=output:25,bucket=output:38

Step2, enable ecmp-udf-hash and configure hash-fields is gtp_teid.

ovs-vsctl set-l3-ecmp-hash-fields gtp_teid

Step3, add a flow

ovs-ofctl add-flow br0 in_port=1,actions=group:1

Lag hash

Lag Hash Configuration

Lag hash commands are as follows.

```
# Config command
ovs-vsctl -- set Interface ae1 options:hash-mapping=dl_dst
ovs-vsctl -- set Interface ae1 options:hash-mapping=dl_src_dst
ovs-vsctl -- set Interface ae1 options:hash-mapping=dl_src
ovs-vsctl -- set Interface ae1 options:hash-mapping=nw_dst
ovs-vsctl -- set Interface ae1 options:hash-mapping=nw_src_dst
ovs-vsctl -- set Interface ae1 options:hash-mapping=nw_src
ovs-vsctl -- set Interface ae1 options:hash-mapping=resilient
ovs-vsctl -- set Interface ae1 options:hash-mapping=advance
ovs-vsctl -- set-lag-advance-hash-mapping-fields dl_dst dl_src ether_type in_port nw_dst nw_proto nw_src port_dst p
vlan
# Show command
ovs-vsctl show-lag-advance-hash-mapping-fields
```

If not special the hash-mapping in one lag interface, dl_src_dst will be set by default; And if not special the hash-mapping in set-lag-advance-hash-mapping-fields, all field will be set.

Lag Resilient hash

From 2.9.2,pica8 switch support lag resilient hash. If one port removed from the lag or link_down,the traffic of this port will hash to the other ports of the lag without affect orignal traffic of the other ports.

Command

ovs-vsctl -- set Interface ae1 options:hash-mapping=resilient: Once enable resilient hash,all the hash fields in advance mode are enabled by default.

ovs-vsctl set-max-resilient-hash-lag-count COUNT : the valid value of COUNT is 1, 2, 4, 8, 16, 32, 64; The default value is 1.The COUNT means the max count of lags which can be set to resilient hash.

support platform
At present, trident2, trident2 plus support resilient hash.Eg:4048,4806,P5401,P5101,as5712,AS6701_32x,as6712_32x,as5812

Example

set hash-mapping-fields to mac,ip,vlan

Test Name	Test basic flow
Test Configuration	
Test Procedure	**Step1:configure bridge and port** ovs-vsctl add-br br0 -- set bridge br0 datapath_type=pica8 ovs-vsctl add-port br0 te-1/1/1 vlan_mode=trunk tag=1 -- set interface te-1/1/1 type=pica8 ovs-vsctl add-port br0 te-1/1/2 vlan_mode=trunk tag=1 -- set interface te-1/1/2 type=pica8 ovs-vsctl add-port br0 te-1/1/3 vlan_mode=trunk tag=1 -- set interface te-1/1/3 type=pica8 ovs-vsctl add-port br0 ae1 vlan_mode=trunk tag=1 – set interface ae1 type=pica8_lag options:members=te-1/1/2,te-1/1/3,te-1/1/4 options:lag_type=static ovs-vsctl -- set Interface ae1 options:hash-mapping=resilient **step2:add flow** ovs-ofctl add-flow br0 in_port=1,actions=1025 **step3:set hash-mapping-field to dl_dst:** ovs-vsctl set-lag-advance-hash-mapping-fields dl_dst **Send 12packets/sec ipv4 packets to te-1/1/1,with different dst mac(22:22:22:22:22:10 to 22:22:22:22:22:15):** MAC: Destination Address : 22 22 22 22 22 10 MAC: Source Address : 22 11 11 11 11 40 Vlan----------20 **Te-1/1/2,te-1/1/3,te-1/1/4 will transmit the packets,eg:te-1/1/2 transmit packets with dst mac 22:11:11:11:11:10,13,15,te-1/1/3 transmit packets with dst mac 11,14,te-1/1/4 transmit packets with dst mac 12.** **send 12packets/sec ip packets with src ip increasement to te-1/1/1,then one of the lag port transmit all the packets.** **Down te-1/1/2 then the traffic of te-1/1/2 will be hash to te-1/1/3 and te-1/1/4, the original traffic of te-1/1/3 and te-1/1/4 will not be redistribute.** **Then up the te-1/1/2 port, the traffic of te-1/1/2 is some traffic of the other two ports.** **Step4:set hash-mapping-field to dl_src** ovs-vsctl set-lag-advance-hash-mapping-fields dl_src **Send 12packets/sec ipv4 packets to te-1/1/1,with different src mac(22:11:11:11:11:40 to 22:11:11:11:11:45):** MAC: Destination Address : 22 22 22 22 22 10 MAC: Source Address : 22 11 11 11 11 40 Vlan----------20 **Te-1/1/2,te-1/1/3,te-1/1/4 will transmit the packets,eg:te-1/1/2 transmit packets with dst mac 22:11:11:11:11:40,43,45,te-1/1/3 transmit packets with dst mac 41,44,te-1/1/4 transmit packets with dst mac 42.** **Down te-1/1/2 then the traffic of te-1/1/2 will be hash to te-1/1/3 and te-1/1/4, the original traffic of te-1/1/3 and te-1/1/4 will not be redistribute.** **Then up the te-1/1/2 port, the traffic of te-1/1/2 is some traffic of the other two ports** **Step5:set hash-mapping-field to nw_src** ovs-vsctl set-lag-advance-hash-mapping-fields nw_src **send 12packets/s contents with src ip 1.1.1.1-1.1.6:**

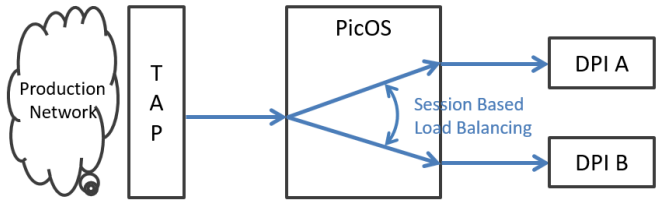
Symmetric Hashing in lag and ecmp

Summary

From PicOS2.9.1, OVS support Symmetric Hashing in LAG interface and ECMP interface.



Traffic from the production network is transferred to DPIs by session based load balancing.
Session based load balancing means same session uplink and downlink packets are transferred to same DPI.
In current image, the packets that are transferred to same DPI have same **IP addresses** and **L4 port numbers** symmetrically with each other.

> 1, Symmetric hashing is supported on Helix4 , Trident2, Trident2+, Trident3 and Tomahawk platform switches.
>
> 2, Symmetric hash key only include: ip address, ip address+l4 port number.
>
> 3, If the hash fields include other keys: mac address, vlan, etc. Symmetric hash will be influenced.

Command

Enable/Disable symmetric hash in lag interface

```
ovs-vsctl set-symmetric-hash lag true
ovs-vsctl set-symmetric-hash lag false
```

Except enable lag symmetric hash in glocal, user also need configure advance field in lag interface.

```
ovs-vsctl -- set Interface ae1 options:hash-mapping=advance
```

Configure IP addresses symmetrically in lag advance hash mapping fields.

```
ovs-vsctl set-lag-advance-hash-mapping-fields nw_dst nw_src
```

Configure IP addresses and L4 port numbers symmetrically in lag advance hash mapping fields.

```
ovs-vsctl set-lag-advance-hash-mapping-fields nw_dst nw_src port_src port_dst
```

Enable/Disable symmetric has in ecmp interface

```
ovs-vsctl set-symmetric-hash ecmp true
ovs-vsctl set-symmetric-hash ecmp false
```

Configure IP addresses symmetrically in l3 ecmp hash fields.

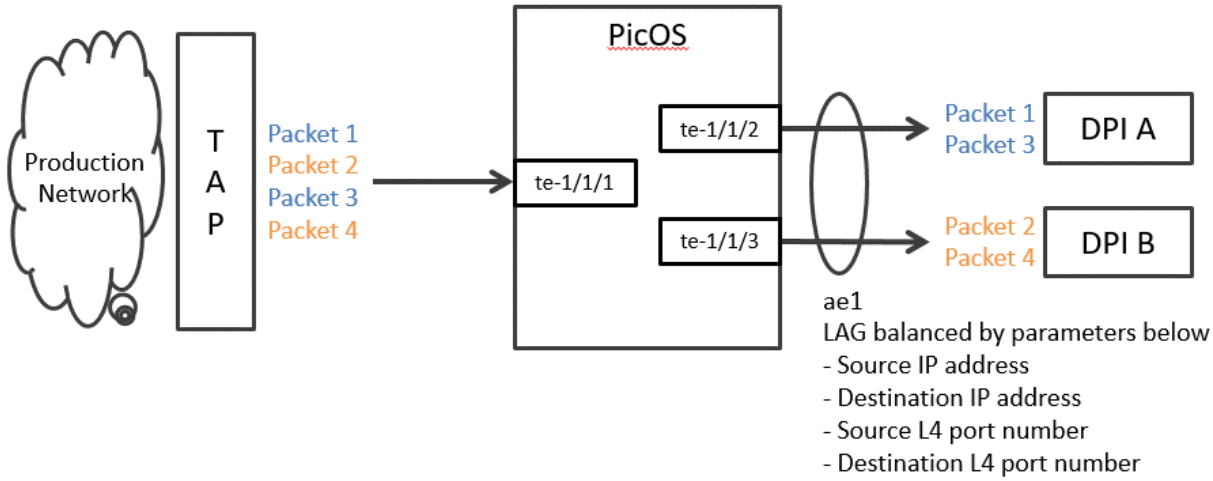
```
ovs-vsctl set-l3-ecmp-hash-fields nw_src nw_dst
```

Configure IP addresses and L4 port numbers symmetrically in l3 ecmp hash fields.

```
ovs-vsctl set-l3-ecmp-hash-fields nw_src nw_dst port_src port_dst
```

Example

1. Configure symmetric in lag interface.



The image of session-based load balancing like below:

Packet X (Src IP, Src Port, Dest IP, Dest Port)

Packet 1 (20.0.0.1, 10001, 10.0.0.1, 80) => output to te-1/1/2 of ae1

Packet 2 (20.0.0.1, 10002, 10.0.0.2, 80) => output to te-1/1/3 of ae1

Packet 3 (10.0.0.1, 80, 20.0.0.1, 10001) => output to te-1/1/2 of ae1

Packet 4 (10.0.0.2, 80, 20.0.0.1, 10002) => output to te-1/1/3 of ae1

-> Packet 1 and Packet 3 are the same session. So the 2 packets are transferred to same LAG member port.

-> Packet 2 and Packet 4 are the same session. So the 2 packets are transferred to same LAG member port.

```
1, Add bridge and ports.
ovs-vsctl add-br br0
ovs-vsctl add-port br0 te-1/1/1 vlan_mode=trunk tag=1
ovs-vsctl add-port br0 te-1/1/2 vlan_mode=trunk tag=1
ovs-vsctl add-port br0 te-1/1/3 vlan_mode=trunk tag=1
ovs-vsctl add-port br0 ae1 vlan_mode=trunk tag=1 -- set interface ae1 type=pica8_lag options:members=te-1/1/2,te-1/

2, Configure advance hash mapping field and apply to ae1.
ovs-vsctl -- set Interface ae1 options:hash-mapping=advance
ovs-vsctl set-lag-advance-hash-mapping-fields nw_dst nw_src port_src port_dst

3, Enable lag symmetric.
ovs-vsctl set-symmetric-hash lag true

4, Add flow entry.
ovs-ofctl add-flow br0 in_port=1,actions=output:1025
```

2. Configure symmetric in ecmp interface.

```
1, Add bridge and ports.
ovs-vsctl add-br br0
ovs-vsctl add-port br0 te-1/1/1 vlan_mode=trunk tag=1
ovs-vsctl add-port br0 te-1/1/2 vlan_mode=trunk tag=1
ovs-vsctl add-port br0 te-1/1/3 vlan_mode=trunk tag=1

2, Configure ecmp group.
ovs-vsctl set-group-ranges ecmp-select-groups=1-10000

3, Configure l3 ecmp hash field.
ovs-vsctl set-l3-ecmp-hash-fields nw_src nw_dst port_src port_dst
```

```
4, Enable ecmp symmetric.
ovs-vsctl set-symmetric-hash ecmp true

5, add group and flow.
ovs-ofctl add-group br0 group_id=1,type=select,bucket=set_field:00:00:00:11:11:11-\>eth_src,set_field:00:00:00:22:
ovs-ofctl add-flow br0 in_port=1,actions=group:1
```

Configuring QoS

Configuring QoS scheduler

PicOS OVS Supports qos/queue

> 1, PicOS OVS support configure qos scheduler type: SP, RR, WRR, WFQ
>
> 2, In the PicOS switch, there are 7 queues in ASIC with priority 0~7 (In the current version, P3922/P3780/3920, only support queues 0~3). Queue 7 being the highest priority and queue 0 being the lowest priority.

Command:

Add qos

```
ovs-vsctl -- set port <interface name> qos=@<qos name1> -- --id=@<qos name1> create qos type=<scheduler type> queue
```

List qos and queue table

```
ovs-vsctl list qos
ovs-vsctl list queue
```

Check qos config in interface

```
ovs-appctl qos/show <interface>
ovs-ofctl queue-get-config br0 [port]
```

Check queue counter

```
ovs-ofctl queue-stats <bridge> [port]
```

Clear queue and qos

```
ovs-vsctl clear port <interface> qos
ovs-vsctl --all destroy qos
ovs-vsctl --all destroy queue
```

SP

In SP (short for Strict Priority) mode.

> 1, The SP queue has priority to be scheduled when work with others queue whether the queue priority is high or not.
>
> 2, If different flows from different input ports and enter the different queue on the one output port, and low priority queue has congestion, this time maybe appear **Head-of-line blocking.**

Example:

Flow (dl_src is 22:11:11:11:11:11) will be forwarded to queue 0 of port 3

Flow (dl_src is 22:11:11:11:11:12) will be forwarded to queue 7 of port 3.
Min and max rate of queue 0 and queue 7 is set as 10M

```
root@PicOS-OVS# ovs-ofctl del-flows br0
root@PicOS-OVS# ovs-ofctl add-flow br0 in_port=1,dl_src=22:11:11:11:11:11,actions=set_queue:0,output=3
root@PicOS-OVS# ovs-ofctl add-flow br0 in_port=2,dl_src=22:11:11:11:11:12,actions=set_queue:7,output=3
root@PicOS-OVS# ovs-vsctl -- set port ge-1/1/3 qos=@newqos -- --id=@newqos create qos type=PRONTO_STRICT queues:0=@
```

RR

RR(short for Round Robin) is a scheduler mode of Qos. It uses a round robin scheduling algorithm between the queues and can avoid the lowest priority queues not being serviced for long time when traffic congestion happens.

Example:

Add qos on interface te-1/1/5, and configure queue2 and queue3

```
ovs-vsctl -- set port te-1/1/5 qos=@newqos -- --id=@newqos create qos type=PRONTO_ROUND_ROBIN queues:2=@newqueue qu
```

WRR

WRR(short for Weighted Round Robin)is a scheduler mode of Qos. It uses a round robin scheduling algorithm between the queues and can avoid the lowest priority queues not being serviced for long time when traffic congestion happens. When you use WRR scheduling mode, you can define your own weighted value for each queue to distribute different service time for queue.Generaly,greater the weight, longer the serviced time.

Example:

1.1 Create a qos and add two queues (0 and 3)to qos for port te-1/1/3

```
root@PicOS-OVS$ovs-vsctl -- set port te-1/1/3 qos=@newqos -- --id=@newqos create qos type=PRONTO_WEIGHTED_ROUND_ROI
b41dbaab-dc60-40ff-8a11-7a241bfd5a5c

Total 3 flows in HW.
root@PicOS-OVS$
```

notice: queue 0 is the default queue,the HW flow don't display it.

1.3 Result

Firstly,both the queue 0 and queue 7 should provides a minimum bandwidth guarantee (200M) during congestion, then each queue distribute the remaining packets according the queue weight .

2 Check qos

```
root@PicOS-OVS$ovs-vsctl list qos
_uuid               : b41dbaab-dc60-40ff-8a11-7a241bfd5a5c
external_ids        : {}
other_config        : {}
queues              : {0=f7c5e8ff-f81f-4e69-9096-9b1251f29618, 3=5d57cffb-b9b7-4324-9402-034ab9fac050}
type                : PRONTO_WEIGHTED_ROUND_ROBIN
root@PicOS-OVS$
```

3 Check one queue according to its queue-uuid.

```
root@PicOS-OVS$ovs-vsctl list queue 5d57cffb-b9b7-4324-9402-034ab9fac050
_uuid               : 5d57cffb-b9b7-4324-9402-034ab9fac050
dscp                : []
external_ids        : {}
other_config        : {min-rate="200000000", weight="3"}
root@PicOS-OVS$
```

4 Check qos of a port from hardware

```
root@PicOS-OVS$ovs-appctl qos/show te-1/1/3
QoS: te-1/1/3 PRONTO_WEIGHTED_ROUND_ROBIN
Default:
        burst: 0
        max-rate: 0
        min-rate: 200000000
        weight: 3
        tx_packets: 0
        tx_bytes: 0
        tx_errors: 0
Queue 3:
        burst: 0
        max-rate: 0
        min-rate: 200000000
        weight: 3
        tx_packets: 0
        tx_bytes: 0
        tx_errors: 0
root@PicOS-OVS$
```

5 Reset one queue according to queue-uuid

```
root@PicOS-OVS$ovs-vsctl set queue f7c5e8ff-f81f-4e69-9096-9b1251f29618 other-config=min-rate=100000000,weight=2
root@PicOS-OVS$
root@PicOS-OVS$ovs-appctl qos/show te-1/1/3
QoS: te-1/1/3 PRONTO_WEIGHTED_ROUND_ROBIN
Default:
        burst: 0
        max-rate: 0
        min-rate: 100000000
        weight: 2
        tx_packets: 0
        tx_bytes: 0
        tx_errors: 0
Queue 3:
        burst: 0
        max-rate: 0
        min-rate: 200000000
        weight: 3
        tx_packets: 0
        tx_bytes: 0
        tx_errors: 0
root@PicOS-OVS$
```

6 Remove one queue from qos according qos-uuid and queue-key.

```
root@PicOS-OVS$ovs-vsctl remove qos b41dbaab-dc60-40ff-8a11-7a241bfd5a5c queue 3
root@PicOS-OVS$
root@PicOS-OVS$ovs-appctl qos/show te-1/1/3
QoS: te-1/1/3 PRONTO_WEIGHTED_ROUND_ROBIN
Default:
        burst: 0
        max-rate: 0
        min-rate: 100000000
        weight: 2
        tx_packets: 0
        tx_bytes: 0
        tx_errors: 0

root@PicOS-OVS$ovs-vsctl destroy queue 5d57cffb-b9b7-4324-9402-034ab9fac050
root@PicOS-OVS$
root@PicOS-OVS$ovs-vsctl list queue
_uuid               : f7c5e8ff-f81f-4e69-9096-9b1251f29618
dscp                : []
external_ids        : {}
```

```
other_config        : {min-rate="100000000", weight="2"}
```

7 Add one new queue to qos according qos-uuid

```
root@PicOS-OVS$ovs-vsctl set qos b41dbaab-dc60-40ff-8a11-7a241bfd5a5c queues:1=
@newqueue1 -- --id=@newqueue1 create queue other-config:weight=3
02273a2b-f556-454f-959f-96290dac7642
root@PicOS-OVS$
root@PicOS-OVS$ovs-vsctl list qos
_uuid               : b41dbaab-dc60-40ff-8a11-7a241bfd5a5c
external_ids        : {}
other_config        : {}
queues              : {0=f7c5e8ff-f81f-4e69-9096-9b1251f29618, 1=02273a2b-f556-454f-959f-96290dac7642}
type                : PRONTO_WEIGHTED_ROUND_ROBIN
```

8 Remove all queues from qos

```
root@PicOS-OVS$ovs-vsctl clear qos b41dbaab-dc60-40ff-8a11-7a241bfd5a5c queues
root@PicOS-OVS$ovs-vsctl --all destroy queue
root@PicOS-OVS$
root@PicOS-OVS$ovs-vsctl list queue
root@PicOS-OVS$
root@PicOS-OVS$ovs-appctl qos/show te-1/1/3
QoS: te-1/1/3 PRONTO_STRICT
root@PicOS-OVS$
```

9 Remove qos

```
root@PicOS-OVS$ovs-vsctl clear port te-1/1/3 qos
root@PicOS-OVS$ovs-vsctl --all destroy qos
root@PicOS-OVS$
```

WFQ

The full name of WFQ is Weighted Fair Queuing. It is similar to WRR. The only difference between WFQ and WRR is that the scheduling mode in WRR is by packets but in WFQ is by bytes.

Example

```
ovs-vsctl -- set port te-1/1/4 qos=@newqos -- --id=@newqos create qos type=PRONTO_WEIGHTED_FAIR_QUEUING queues:1=@
other-config=min-rate=300000000,weight=5  -- --id=@newqueue1 create queue other-config=min-rate=100000000,weight=5
```

CoS Mapping

In PicOS-2.1, if user enables the Class of Service (CoS) mapping, the packet will be mapped to a physical queue (0-7). With DSCP (0-7), it maps to queue-0 and with DSCP (8-16), it maps to queue-1 and so on. Queue-7 has the highest priority. Enable the CoS Mapping as follows:

```
admin@PicOS-OVS$ovs-vsctl set-cos-map true

admin@PicOS-OVS$ovs-vsctl show-cos-map
cos mapping: enabled
```

Display the configuration by entering the following:

```
admin@PicOS-OVS$ovs-vsctl show-cos-map ge-1/1/1
cos mapping: enabled
{
       dscp   queue
    --------  -----
     0 -  7:   q0
     8 - 15:   q1
    16 - 23:   q2
    24 - 31:   q3
    32 - 39:   q4
    40 - 47:   q5
    48 - 55:   q6
    56 - 63:   q7
}
```

To configure a flow, use the following command:

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,dl_src=22:11:11:11:11:11,actions=set_queue:7,output=3
```

The action of "**set-queue:7**" will take the place of the default CoS mapping.

Modify the dscp value of port:

```
admin@XorPlus$ovs-vsctl set-cos-map true
admin@XorPlus$
admin@XorPlus$ovs-vsctl set interface ge-1/1/1 dscp_map=0=q1,1=q1,2=q2
admin@XorPlus$ovs-vsctl show-cos-map ge-1/1/1
cos mapping: enabled
{
dscp queue
-------- -----
0: q1
1: q1
2: q2
others: q0
}
admin@XorPlus$
```

The following command is also permitted:

```
admin@XorPlus$ovs-vsctl set interface ge-1/1/2 dscp_map:0=q1 dscp_map:1=q1 dscp_map:2=q2
admin@XorPlus$
admin@XorPlus$
admin@XorPlus$ovs-vsctl show-cos-map ge-1/1/2
cos mapping: enabled
{
dscp queue
-------- -----
0: q1
1: q1
2: q2
```

```
others: q0
}
admin@XorPlus$
```

WRED

WRED

WRED(short for Weighted Random Early Detection) is a congestion avoidance mechanism which makes use of the congestion control mechanism of TCP (Transmission Control Protocol). When an output queue begins to experience congestion, WRED starts dropping packets *selectively.*By dropping some packets earlier than the point when the queue is full, WRED prevents the situation where a large number of packets get dropped at once. The principle specifys as follows:

(1)The length of the queue(measured with kbps or pktps) is calculated.

(2)If the queue length is less than the minimum threshold, the packet is placed in the queue.

(3)If the queue length is more than the maximum threshold, the packet is dropped.

(4)If the queue length is more than the minimum threshold but less than the maximum threshold, the packet is either dropped or queued, based on the packet drop probability. The greater the chance of the packet is dropped when the drop_probability value of its corresponding queue is greater.Usually,the drop_probability value of the lower priority queues with less importance are the greatest.

1 Create two wred_queues for interface te-1/1/35

```
root@PicOS-OVS$ovs-vsctl set interface te-1/1/35 wred_queues:0=@wred1 wred_queues:3=@wred2 -- --id=@wred1 create wred_queue enable=true
52f26264-3656-4840-8f0e-fb7be8e52ef8
9b36b9dc-903a-4bb6-8e25-f6e2b1fd2b4d
root@PicOS-OVS$ovs-ofctl add-flow br0 in_port=34,dl_src=22:11:11:11:11:11,actio
ns=set_queue:3,output=35
```

Notice: The drop_probability is according to the percentage to drop packets.

2 Check wred queues

```
Check all wred_queue:
root@PicOS-OVS$ovs-vsctl list wred_queue
_uuid               : 52f26264-3656-4840-8f0e-fb7be8e52ef8
drop_probability    : 50
enable              : true
max_thresh          : 200
min_thresh          : 100
_uuid               : 9b36b9dc-903a-4bb6-8e25-f6e2b1fd2b4d
drop_probability    : 40
enable              : true
max_thresh          : 400
min_thresh          : 200
root@PicOS-OVS$

Check one wred_queue:
root@PicOS-OVS$ovs-vsctl list wred_queue 9b36b9dc-903a-4bb6-8e25-f6e2b1fd2b4d
_uuid               : 9b36b9dc-903a-4bb6-8e25-f6e2b1fd2b4d
drop_probability    : 40
enable              : true
max_thresh          : 400
min_thresh          : 200
root@PicOS-OVS$

Check interface wred_queue:
root@PicOS-OVS$ovs-vsctl list interface te-1/1/35
_uuid               : db795f1d-71e9-448c-9ac4-f2304c4bf74d
............
............
status              : {}
type                : "pica8"
wred_queues         : {0=f37f30cf-8470-4edd-925f-5c2abcd061eb, 3=b97fa496-57b2-40f1-a525-b978abc64403}
root@PicOS-OVS$
```

3 Reset one wred queue according to its uuid

```
root@PicOS-OVS$ovs-vsctl set wred_queue 9b36b9dc-903a-4bb6-8e25-f6e2b1fd2b4d max_thresh=300

root@PicOS-OVS$ovs-vsctl list wred_queue 9b36b9dc-903a-4bb6-8e25-f6e2b1fd2b4d
_uuid               : 9b36b9dc-903a-4bb6-8e25-f6e2b1fd2b4d
drop_probability    : 40
enable              : true
max_thresh          : 300
min_thresh          : 200
root@PicOS-OVS$
```

4 Add one wred queue to wred_queues

```
root@PicOS-OVS$ovs-vsctl set interface te-1/1/35 wred_queue:1=@wrednew -- --id=@wrednew create wred_queue enable=true min_thresh=100 ma
d60801bd-827b-45b7-aa5d-1a2db9f1e513
root@PicOS-OVS$
```

5 Remove one or all wred queue

```
Remove one wred queue:
root@PicOS-OVS$ovs-vsctl remove interface te-1/1/35 wred_queues 3
root@PicOS-OVS$
root@PicOS-OVS$ovs-vsctl list wred_queue
_uuid               : 52f26264-3656-4840-8f0e-fb7be8e52ef8
drop_probability    : 50
enable              : true
max_thresh          : 200
min_thresh          : 100
_uuid               : d60801bd-827b-45b7-aa5d-1a2db9f1e513
drop_probability    : 40
enable              : true
max_thresh          : 500
min_thresh          : 100
root@PicOS-OVS$

Delete all wred queues:
root@PicOS-OVS$ovs-vsctl clear interface te-1/1/35 wred_queues
root@PicOS-OVS$
root@PicOS-OVS$ovs-vsctl list wred_queue
root@PicOS-OVS$
```

WRED-ECN

From PicOS2.10.0, pica8 switch support enable ecn.

ECN (short for Explicit Congestion Notification)is a property of queue. When congestion occurs, WRED drops packets based on the queue length exceeding certain threshold value.But if you enable ECN on a queue,the packets are marked instead of dropped. Downstream routers and hosts would see this marking as an indication of network congestion and slow down their packet transmission rates.

ECN is a value in the DS (Differentiated Services) field of the IPv4 protocol header. ECN uses the two least significant (right-most) bits of the 8-bit DF field to encode four different codepoints:

(1)00 - Not ECN-Support Transport

(2)01 - ECN-Support Transport(1)

(3)10 - ECN-Support Transport(0)

(4)11 - Congestion Experienced

When both end hosts support ECN they mark their packets with either 10 or 01. When WRED and ECN is enabled and the queue is congested, the PicOS changes the ECN field of all such packets to 11. When ECN is not enabled, the ECN bits are not changed.

> 1, WRED-ECN only support in unicast flow entry.

Command:

ECN take effect when enabling WRED on a port.The ecn value of each queue can be different,you can use command like this, disable ecn in queue2 and enable ecn in queue5.

```
ovs-vsctl set-port-wred-ecn ge-1/1/1 2=false 5=true
```

If user want to make the ecn values of all queues are equal,you can use command like this for simplification.

```
ovs-vsctl set-port-wred-ecn ge-1/1/1 true/false
```

Show wred-ecn

```
ovs-vsctl show-port-wred-ecn ge-1/1/1
```

Example:

1, Add bridge ports and configure wred in physical port te-1/1/4 queue0.

```
ovs-vsctl add-br br0
ovs-vsctl add-port br0 te-1/1/2 vlan_mode=trunk tag=1 -- set interface te-1/1/2 options:link_speed=1G
ovs-vsctl add-port br0 te-1/1/3 vlan_mode=trunk tag=1 -- set interface te-1/1/3 options:link_speed=1G
ovs-vsctl add-port br0 te-1/1/4 vlan_mode=trunk tag=1 -- set interface te-1/1/4 options:link_speed=1G

ovs-vsctl set interface te-1/1/4 wred_queues:0=@wred1 -- --id=@wred1 create wred_queue enable=true min_thresh=100 max_thresh=200 drop_p
```

2, enable ecn in port te-1/1/4.

```
ovs-vsctl set-port-wred-ecn te-1/1/4 true
ovs-vsctl show-port-wred-ecn te-1/1/4
```

3, add unicast flow entry.

```
ovs-ofctl add-flow br0 in_port=2,dl_dst=22:00:00:00:00:11,dl_vlan=1,ip,actions=push_mpls:0x8847,set_field:10-\>mpls_label,set_queue:0,output:4
ovs-ofctl add-flow br0 in_port=3,dl_dst=22:00:00:00:00:22,dl_vlan=1,ip,actions=push_mpls:0x8847,set_field:20-\>mpls_label,set_queue:0,output:4
ovs-appctl pica/dump-flows
```

Vlan Priority CoS Mapping

From PicOS-2.11, the vlan priority cos mapping is disabled default, user can enable it and configure special mapping in ingress interface. Enable vlan priority cos mapping will make the ingress packes which with different vlan_pcp enter different queues.

> 1, Before PicOS-2.11, the vlan priority cos mapping is enabled defaultly, and cannot configure the mapping.
>
> 2, If enable ***vlan-priority-cos-map*** and traffic can match the flow 'in_port=1,actions=output:2' in switch, the original traffic will send out from switch; if disable ***vlan-priority-cos-map,*** the traffic no mater attach which vlan_pcp will be change the vlan_pcp to 0 and send out from switch.
>
> 3, If enable ***vlan-priority-cos-map*** and ***cos-map*** , and traffic can match both of the mapping at same time, at last the cos-mapping working.

Command:

1, Check vlan priority cos mapping state:

ovs-vsctl show-vlan-priority-cos-map

2, Enable/disable vlan priority cos mapping:

ovs-vsctl set-vlan-priority-cos-map TRUE|FALSE

3, Once enable the mapping, user can see the default mapping is vlan_pcp 0~7 mapping queue 0~7.

ovs-vsctl show-vlan-priority-cos-map <interface>

4, configure the mapping:

ovs-vsctl set interface <interface> vlan_priority_mapping=<vlan_pcp>=q<queue number>[,<vlan_pcp>=q<queue number>,...]

5, user also can configure the untag packet same as one vlan_pcp and send to the mapping queue:

ovs-vsctl set interface <interface> vlan_priority_untagged=<vlan_pcp>

Example:

1, enable vlan-priority-cos-map, and show the mapping in interface te-1/1/9

```
admin@PICOS-OVS$ovs-vsctl set-vlan-priority-cos-map TRUE
admin@PICOS-OVS$ovs-vsctl show-vlan-priority-cos-map
vlan priority cos mapping: enabled

admin@PICOS-OVS$ovs-vsctl show-vlan-priority-cos-map te-1/1/9
vlan priority cos mapping: enabled
{
    vlan-priority   queue
    -------------  -------
               0    q0
               1    q1
               2    q2
               3    q3
               4    q4
               5    q5
               6    q6
               7    q7
}
```

2, configure the mapping, vlan_pcp:7 enter queue3, vlan_pcp:6 enter queue2, and others enter default queue0.

```
admin@PICOS-OVS$ovs-vsctl set interface te-1/1/9 vlan_priority_mapping=7=q3,6=q2
admin@PICOS-OVS$
admin@PICOS-OVS$ovs-vsctl show-vlan-priority-cos-map te-1/1/9
vlan priority cos mapping: enabled
{
    vlan-priority   queue
    -------------  -------
               6:   q2
               7:   q3
         others:   q0
```

```
}
```

3, set untag packets same as vlan_pcp:7 and enter queue3.

```
admin@PICOS-OVS$ovs-vsctl set interface te-1/1/9 vlan_priority_untagged=7
```

4, add flow entry, in_port is port te-1/1/9, the untag packets which enter from port te-1/1/9 will be send to queue3.

```
admin@PICOS-OVS$ovs-ofctl add-flow br0 in_port=9,actions=output:10
```

Configuring Flow Table

Combinated Mode

Our switches support such a command "*ovs-vsctl set-combinated-mode true | false".*This command is for resolving the packets forwarding problem of push_vlan. Sometimes,the packets forwarding is not as expected.

Eg：there are two flows in our switch below:

priority=100, in_port=1, dl_vlan=1, actions=push_vlan:100, output:2

priority=110,in_port=1,dl_vlan=100,actions=output:3

Sending packets match to the first flow: We expect the packets to forward to port 2 after pushing vlan 100, but the actual result is that port 3 receives these packets with outer vlan 100.

In order to solve this kind of problem, we add a new command "ovs-vsctl set-combinated-mode true|false". When enabling this combinated mode, each flow can have a new match field class-id added. Each flow has a different class-id, so the packets can be forwarded correctly. In hardware,each flow is separated with two flows with class-id as following:

When user adds such two flows to the switch:

priority=100, in_port=1, dl_vlan=1, actions=push_vlan:100, output:2

priority=110,in_port=1,dl_vlan=100,actions=output:3

In hardware,this flow can be sepeared to two parts in icap and vcap:

vcap: priority=100, class-id=1, in_port=1, dl_vlan=1, and push_vlan 100

icap: priority=100, class-id=1, in_port=1, dl_vlan=100, and output:2

priority=110, class-id=2, in_port=1, dl_vlan=100, and output:3

Commands

enable combinatedmode

```
admin@PicOS-OVS$ovs-vsctl set-combinated-mode true
```

disable combinated mode(by default)

```
admin@PicOS-OVS$ovs-vsctl set-combinated-mode false
```

Example

```
admin@PicOS-OVS$ovs-vsctl add-br br0 -- set bridge br0 datapath_type=pica8
admin@PicOS-OVS$ovs-vsctl add-port br0 ge-1/1/1 vlan_mode=trunk tag=1 -- set interface ge-1/1/1 type=pica8
admin@PicOS-OVS$ovs-vsctl add-port br0 ge-1/1/2 vlan_mode=trunk tag=1 -- set interface ge-1/1/2 type=pica8
admin@PicOS-OVS$ovs-vsctl add-port br0 ge-1/1/3 vlan_mode=trunk tag=1 -- set interface ge-1/1/3 type=pica8
admin@PicOS-OVS$ovs-vsctl set-combinated-mode true
admin@PicOS-OVS$ovs-ofctl add-flow br0 priority=100,in_port=1,dl_vlan=1,actions=push_vlan:100,output:2
admin@PicOS-OVS$ovs-ofctl add-flow br0 priority=110,in_port=1,dl_vlan=100,actions=output:3
```

When sending packets match the first flow with dl_vlan=1 to ge-1/1/1,then ge-1/1/2 will forward packets with outer vlan 100, not ge-1/1/3. This will provide our expected result.

Note

1. When enabling or disabling combinated mode, all the flows in table 0 are evicted from the switch, except the default **drop** flow;

2.When enabling combinated mode, the max flow numbers including push_vlan and other normal flows is different in different platforms:

P5401&&P5101&&P3922&&P3930&&AS6701&&P3780: the max number is 512.

P3290&&P3297&&P3295:the max number is 1024

Configuring ECMP

Command

ovs-vsctl set-max-ecmp-ports *[numbers]*

ovs-vsctl show-max-ecmp-ports

Parameters

Numbers:[2-32],max is 32 ,and this must be 2^n(n=1,2,3,4,5). ***Default*** *number is 4.*

Example

PicOS OVS supports ecmp (nw_src, nw_dst),the default ecmp ports is 4.
IP packets (nw_src=192.168.1.0/255.255.255.1) will forward to port 2.
IP packets (nw_src=192.168.1.1/255.255.255.1) will forward to port 3.

```
root@PicOS-OVS#ovs-ofctl add-group br0 group_id=1,type=select,bucket=output:2,bucket=output:3
root@PicOS-OVS#ovs-ofctl add-flow br0 dl_type=0x0800,nw_src=192.168.1.0/24,actions=group:1
```

If port 2 is down, all packets will forward to port 3.

Configuring egress flow table

In egress table,can not match mpls label in match field because the mpls label achived by udf and egress table are not achieved by udf.Supporting match fields are dl_type,vlan_tci,dl_dst,dl_src,src ip,dst ip,.tp_dst,tp_src.From version 2.10,pica8 switch support match "output_port" in egress table.The prerequisites using this match field is that must exist a flow with an output port in other flow table.

Egress mode is disabled by default,users can enable this mode by command ***"ovs-vsctl set-egress-mode true [table_id]"***.The default table id is 253.

Command

ovs-vsctl set-egress-mode true [table_id]

table_id range is 0~254.default value is 253.

Egress Flow

The flows' match field must include table_id,the actions of egress flow can be ***drop,mod_nw_tos,set_queue***.When you want to modify the tos value,***dl_type*** is neccessary in match field.

eg:

```
ovs-vsctl set-egress-mode true
ovs-ofctl add-flow br0 table=253,in_port=1,ip,actions=mod_nw_tos:32
```

Example

add a flow in icap table

```
ovs-ofctl add-flow br0 in_port=2,dl_vlan=10,actions=set_field:20-\>vlan-vid,3
```

enable egress mode

```
ovs-vsctl set-egress-mode true
```

add a flow to table 253

```
ovs-ofctl add-flow br0 table=253,in_port=2,output_port=3,dl_vlan=20,actions=drop
```

Configuring Flow Handling Mode

PicOS supports set-flow-handling-mode from version 2.7.1. If the flow is integrated and can be installed directly, there is no need for set-flow-handling-mode, and whatever mode it is, it should be installed. But If the hardware does not support the actions, or the flow is not an exact match, it will not be installed directly. This is where we need set-flow-handling-mode, to decide what to do with the flow, whether to install the flow and how to install it.

The command is:

```
admin@PicOS-OVS$ovs-vsctl set-flow-handling-mode [mode]
```

Mode value: [enable_packet_driven, hardware_flow_only, software_flow_allowed], and default value is software_flow_allowed.

After setting a particular flow handling mode, the switch should be rebooted to make the mode effective.

```
admin@PicOS-OVS$ovs-vsctl show-flow-handling-mode
```

Direct Flows

These flows can be installed directly to the hardware table whatever mode it is.

Example 1

```
admin@XorPlus$ovs-ofctl add-flow br0 in_port=9,ip,actions=push_vlan:0x8100,set_field:19-\>vlan_vid,output:11
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-appctl pica/dump-flows
#96 normal permanent flow_id=18 ip,in_port=9, actions:push_vlan(vid=19),mod_vlan_pcp(pcp=0),11
normal_d permanent internal flow_id=7 priority=0, actions:drop
Total 1 flows in HW.
admin@PicOS-OVS$
```

Example 2

```
admin@XorPlus$ovs-ofctl add-flow br0 in_port=9,dl_vlan=19,dl_dst=22:22:22:22:22:22,tcp,actions=set_field:3.3.3.3-\>
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-appctl pica/dump-flows
normal_d permanent internal flow_id=7 priority=0, actions:drop
#98 normal permanent flow_id=20 tcp,in_port=9,dl_vlan=19,dl_dst=22:22:22:22:22:22, actions:set(ipv4(dst=3.3.3.3)),s
Total 1 flows in HW.
admin@PicOS-OVS$
```

Regardless of whatever flow handling mode is currently in effect, direct flows will always be installed to the hardware table directly.

Packet-driven-flows

The packet-driven status is as follows:

set-flow-handling-mode = hardware_flow_only

This mode forbids the flow installation if the hardware does not support the actions or the flow is not an exact match.

Example

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=9,tcp,dl_vlan=19,actions=set_field:192.168.1.1-\>nw_src,set_field:0x
OFPT_ERROR (OF1.4) (xid=0x2): OFPBAC_MATCH_INCONSISTENT
OFPT_FLOW_MOD (OF1.4) (xid=0x2):
(***truncated to 64 bytes from 136***)
00000000  05 0e 00 88 00 00 00 02-00 00 00 00 00 00 00 00 |................|
00000010  00 00 00 00 00 00 00 00-00 00 00 00 00 00 80 00 |................|
00000020  ff ff ff ff ff ff ff ff-ff ff ff ff 00 00 00 00 |................|
00000030  00 01 00 1d 80 00 00 04-00 00 00 09 80 00 0a 02 |................|
admin@PicOS-OVS$
```

In hardware_flow_only mode, configuring packet-driven flows will return an error.

set-flow-handling-mode = software_flow_allowed

This mode forbids the flow installation if the hardware does not support the actions. This mode permits the flow installation TO_CPU if the hardware supports the action but the flow is not exact an match. The item will be submitted to the CPU for further actions .

Example

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=9,ip,dl_vlan=199,actions=push_mpls:0x8847,set_field:299-\>mpls_label
admin@PicOS-OVS$ovs-appctl pica/dump-flows
#1 normal_d permanent flow_id=12 priority=0, actions:drop
#2 normal_u permanent flow_id=16 ip,in_port=9,dl_vlan=199, actions:To_CPU(for_packet_driven)
Total 2 flows in HW.
admin@PicOS-OVS$
```

Packets which match this flow will be submitted to cpu, and it will not be forwarded at line-speed.

set-packet-driven-mode = enable_packet_driven

This mode forbids the flow installation if the hardware does not support the actions. This mode permits the flow installation TO_CPU if the hardware supports the actions but the flow is not an exact match. The item will be submitted to the CPU. The CPU will modify the match and make it exact by parsing, then install the exact flow.

Example

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=9,dl_dst=22:22:22:22:22:22,udp,actions=set_field:192.168.100.2-\>nw_
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-appctl pica/dump-flows
#1 normal_d permanent flow_id=12 priority=0, actions:drop
#3 normal_u permanent flow_id=17 udp,in_port=9,dl_dst=22:22:22:22:22:22, actions:To_CPU(for_packet_driven)
Total 2 flows in HW.
admin@PicOS-OVS$
```

The packets matching this flow are checked in the hardware table, if there is no exact match, the packets are forwarded to the CPU. The CPU will modify the match and install the exact match flow on to the hardware table.

```
admin@PicOS-OVS$ovs-appctl pica/dump-flows
#2 normal flow_id=11 priority=1048560,udp,in_port=9,vlan_tci=0x0000/0x1fff,dl_dst=22:22:22:22:22:22,nw_dst=2.2.2.2
#0 normal_d permanent flow_id=2 priority=0, actions:drop
#1 normal_u permanent flow_id=11 udp,in_port=9,dl_dst=22:22:22:22:22:22, actions:To_CPU(for_packet_driven)
Total 3 flows in HW.
admin@PicOS-OVS$
```

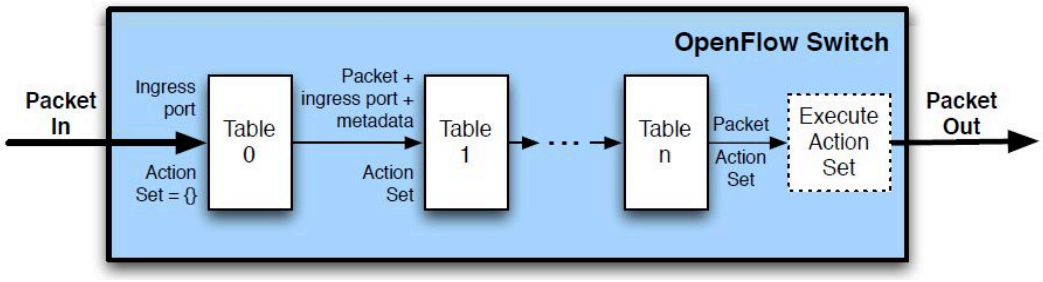
Packets can then be transmitted at line-speed since there is now an exact match flow entry in the hardware table.

> ⚠ In case of direct flows, the set-packet-driven-mode is irrelevant and can be ignored. It is only when the flows cannot be installed directly, that the set-packet-driven-mode becomes necessary. The underlying hardware support is crucial to adding flows, if there is no support for the flow in the hardware, the system will generate an error message.

Configuring Multi-Table

Hardware OpenFlow Multi-table Limitations

OpenFlow 1.1 and later versions have a concept of tables--independent lookup tables that can be chained in any way user wishes. This is a very useful concept to decrease the number of flows by segmenting those flows in multiple tables.



The implementation of those multiple tables is not difficult in a software based switch like OVS, but it is a substantial issue for a hardware based switch. This is because most ASIC's have a limited set of capacities and the ability to do multiple lookup on packets is severely limited.

The multi-table concept is very useful though to emulate an ASIC Pipeline. It allows the Openflow based solution to leverage a lot more of the Switch ASIC capacities like complex lookup or different types of memory available on the ASIC. A hardware based multi-table implementation must be limited to reflect the limitation of the underlying ASIC.

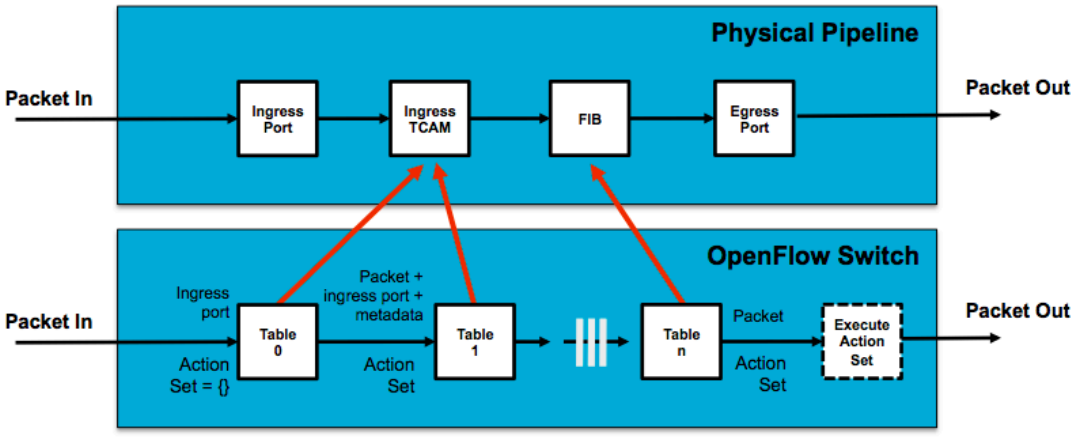
This means that the number of tables, the conflict between tables, the capacity of those tables and the link between them will be limited by the implementation. This is now defined more generically as a Table Typed Patterned by the ONF.

Multi-Tables in TCAM

Traditionally in a hardware based Openflow implementation, the flows are placed in the switch TCAM memory. This is because this memory is perfect for complex matching (can match on many parts of the packet header and the actions possible once the flow is matched are very diverse) and as such is a good match for most Openflow solutions.

In PicOS, by default, all Openflow tables are implemented in TCAM.

It is possible to create multiple tables, but because only one table is available, the OS is normalizing the flows into only one hardware table (table 0).



(a) Packetes are matched against multiple tables in the pipeline

Because the normalizing process cannot simulate all the types of multi table logic, using this TCAM-only Multi-table implementation is typically not recommended. It is mainly used as a proof of concept or demonstration purpose.

One way to be sure that the normalizing process will render the logic of the flows correctly, is to have only one of the tables with actions. All the other tables should only have drop or goto action.

Note:

- If adding L2/L3 flow entry applied to one port which does not exist in the bridge, the flow cannot add correctly.
- Command of adding L3 flow modified. User must enable L2 mode first and add a system mac flow (the action is normal in ovs2.3, the actions is goto_l3 in ovs2.6) to the L2 table. If user wants to use the L3 table to do the routing.
- The route flows are limited to 12000 by default.

Using the Forwarding Database instead of the TCAM

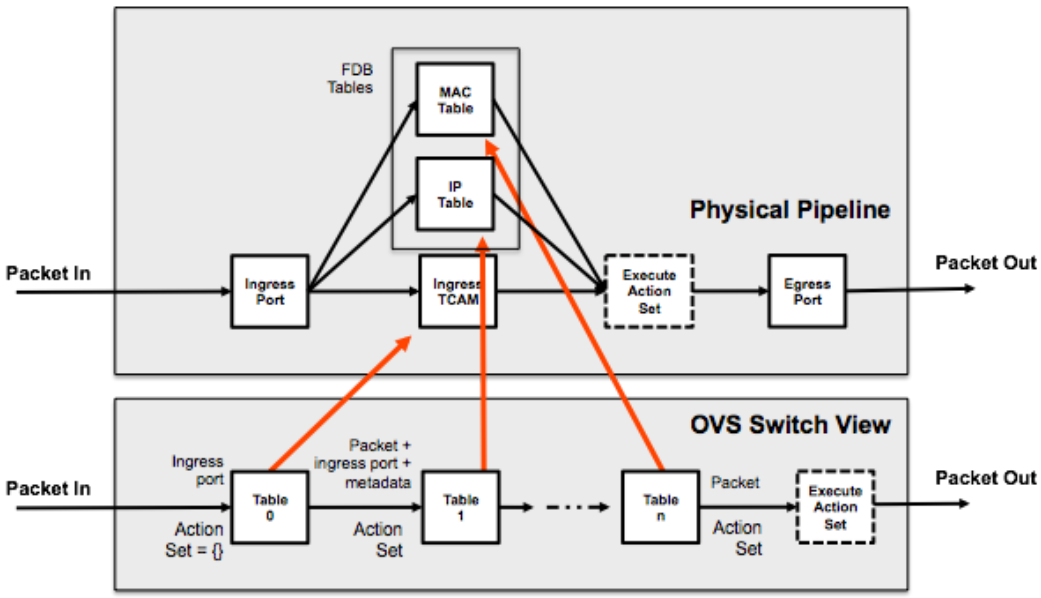
Starting in version 2.4, PicOS supports the FDB (forwarding database) table or ROUTE table like the traditional L2/L3 mode. That is to say the flows can be stored not only in TCAM table but also in FDB or ROUTE table. See the Switch Hardware Architecture for a description of the actual hardware pipeline.

This is very useful when the scaling of the solution is important and this allows the usage of more memories on the switch, as well as access to a more complex lookup.

The FDB tables consist of a MAC table (similar to a typical L2 Switch Mac lookup) and an IP Table (similar to a typical L3 Router IP lookup). User can select to download flows into the TCAM (default), the MAC table, or the IP table.

Every packet will match all those tables. Conflict between tables (different action in different tables) is managed by the table priority which can be configured.

OpenFlow "goto" action is not supported between tables. In this hardware implementation, all tables will be used.



To Map a specific OpenFlow table to the MAC table, use the command:

set-l2-mode TRUE|FALSE [TABLE] command to *enable the MAC table to store flows.* ***[TABLE]*** is the table number which table user set as the FDB table. By default it is the table 251. The flow in the TCAM table should strictly match dl_dst,dl_vlan, (output port in action of flow).

To Map a specific OpenFlow table to the IP table, use the command:

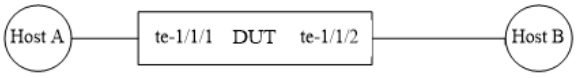
set-l3-mode TRUE|FALSE [TABLE] command to *enable the ROUTE table to store flows.* ***[TABLE]*** is the table number user set as the ROUTE table. By default, the ROUTE table number is 252. The flows to be stored in ROUTE must strictly match dl_type,nw_dst, (mod_dl_dst,mod_dl_vlan,output port in action of flow). But user should add a flow with normal action to FDB table first if user wants the L3 flow to work.

By default, TCAM matching has higher priority than L2/L3, and the priority is 0. User can use the command '**ovs-vsctl set-l2-l3-preference true**' to have the FIB/MAC table with a higher priority than the TCAM table.

By default, the ROUTE table is higher priority than the MAC table.

It is possible to have a maximum of 3 hardware tables with flows in our current implementation simultaneously: 1 TCAM table, 1 ROUTE table and 1 MAC table.

Examples



FDB table configuration example

Step 1: Create a new bridge named br0.

```
admin@PicOS-OVS$ovs-vsctl add-br br0 -- set bridge br0 datapath_type=pica8
```

Step 2: Add ports to br0.

```
admin@PicOS-OVS$ovs-vsctl add-port br0 te-1/1/1 vlan_mode=trunk tag=1  -- set Interface te-1/1/1 type=pica8
admin@PicOS-OVS$ovs-vsctl add-port br0 te-1/1/2 vlan_mode=trunk tag=1  -- set Interface te-1/1/2 type=pica8
```

Step 3: Set L2-mode true without table number

```
admin@PicOS-OVS$ovs-vsctl set-l2-mode true
```

Step 4: Add a flow with table = 251

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 table=251,dl_vlan=10,dl_dst=22:22:22:22:22:22,actions=output:2
```

Check the flows in hardware using command ***ovs-appctl pica/dump-flows.*** User will see that the flow is stored in L2 table. If user wants table 2 to be the FDB table, use the ***ovs-vsctl set-l2-mode true 2*** command.

ROUTE table configuration example

Step 1: Create a new bridge named br0.

```
admin@PicOS-OVS$ovs-vsctl add-br br0 -- set bridge br0 datapath_type=pica8
```

Step 2: Add ports to br0.

```
admin@PicOS-OVS$ovs-vsctl add-port br0 te-1/1/1 vlan_mode=trunk tag=1  -- set Interface te-1/1/1 type=pica8
admin@PicOS-OVS$ovs-vsctl add-port br0 te-1/1/2 vlan_mode=trunk tag=1  -- set Interface te-1/1/2 type=pica8
```

Step 3: Set L3-mode true without table number

```
admin@PicOS-OVS$ovs-vsctl set-l3-mode true
```

Step 4: Add a flow with table = 252

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 table=251,dl_dst=22:22:22:22:22:22,dl_vlan=10,actions=normal
admin@PicOS-OVS$ovs-ofctl add-flow br0 table=252,dl_type=0x0800,nw_dst=192.168.2.30,actions=set_field:44:44:44:22:
```

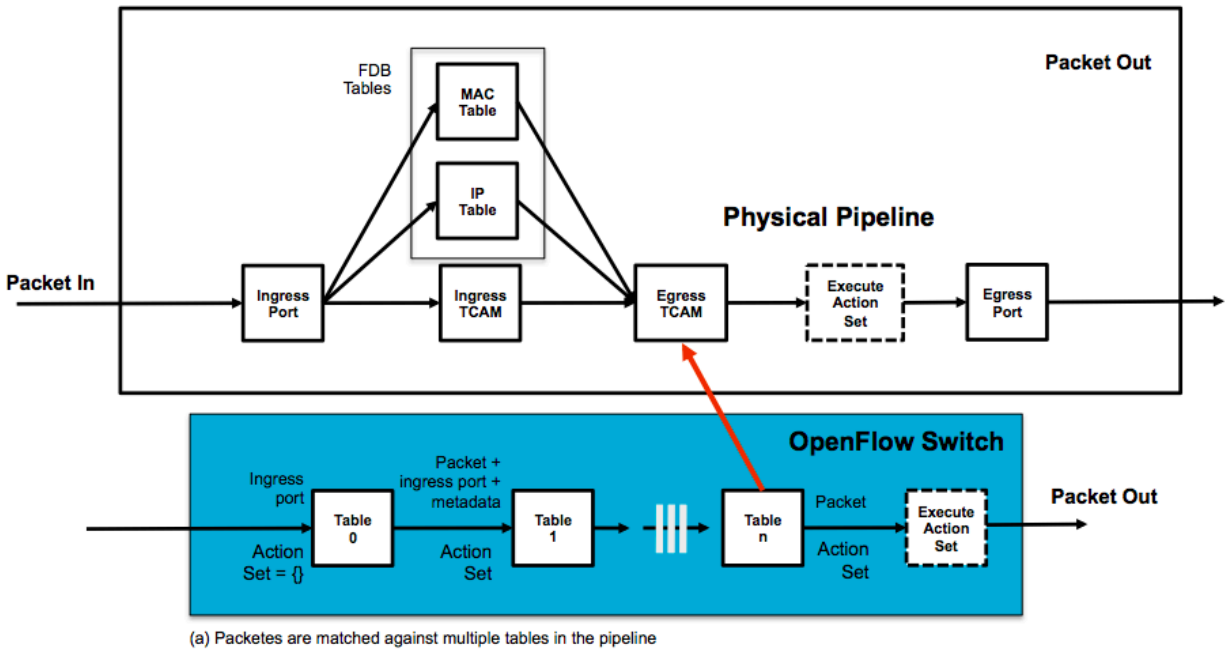
Check the flows in hardware using command ***ovs-appctl pica/dump-flows.*** User will see that the flow is stored in L3 table. If user wants table 4 to be the FDB table, use the ***ovs-vsctl set-l3-mode true 4*** command.

Egress Flow Table

The match in the egress openflow table is very similar to the ingress tcam table. Only some ipv6 fields cannot be matched.
The full match list is in_port, src_mac, dst_mac, ether_type, vlan_id, vlan_priority, ip_protocol, ipv4_src_addr, ipv4_dst_addr, ipv4_tos, tcpudp_src_port, tcpudp_dst_port.

The size of egress table is 512 flows for most platforms (one exception is the P-3290 limited to only 256 flows).

For a full description of the command usage to configure the egress TCAM, see: Egress-mode Command



(a) Packetes are matched against multiple tables in the pipeline

- Multitable Resources

Multitable Resources

Description

From PicOS version 2.7.1, some new modifications have been made to the multitable feature with the addition of the "resource" feature. Different platforms have different resources.

(All platforms which support l2-l3-buffer-mode are as follows: as5712_54x, as6701_32x, as6712_32x, dcs7032q28, es4654bf, niagara2632xl, niagara2948_6xl, pronto5101, pronto5401, as4610_54p, as4610_54t, as4610_30p, as4610_30t)

Platforms	Buffer-mode Resources
as5712_54x	"0" "l2-size 294912, host-route 12000, route 12000"; "1" "l2-size 229376, host-route 44800, route 12000"; "2" "l2-size 163840, host-route 70400, route 12000"; "3" "l2-size 98304, host-route 96000, route 12000 "; "4" "l2-size 32768, host-route 12000, route 115200"; "5" "l2-size 32768, host-route 12000, route 12000";
as6701_32x	"0" "l2-size 294912, host-route 12000, route 12000"; "1" "l2-size 229376, host-route 44800, route 12000"; "2" "l2-size 163840, host-route 70400, route 12000"; "3" "l2-size 98304, host-route 96000, route 12000 "; "4" "l2-size 32768, host-route 12000, route 115200"; "5" "l2-size 32768, host-route 12000, route 12000";
as6712_32x	"0" "l2-size 294912, host-route 12000, route 12000"; "1" "l2-size 229376, host-route 44800, route 12000"; "2" "l2-size 163840, host-route 70400, route 12000"; "3" "l2-size 98304, host-route 96000, route 12000 "; "4" "l2-size 32768, host-route 12000, route 115200"; "5" "l2-size 32768, host-route 12000, route 12000";
dcs7032q28	"0" "l2-size 294912, host-route 12000, route 12000"; "1" "l2-size 229376, host-route 44800, route 12000"; "2" "l2-size 163840, host-route 70400, route 12000"; "3" "l2-size 98304, host-route 96000, route 12000"; "4" "l2-size 32768, host-route 12000, route 115200"; "5" "l2-size 32768, host-route 12000, route 12000";
es4654bf	"0" "l2-size 131072, host-route 13100, route 4800"; "1" "l2-size 98304, host-route 39300, route 4800"; "2" "l2-size 98304, host-route 13100, route 4800"; "3" "l2-size 32768, host-route 91700, route 4800"; "4" "l2-size 32768, host-route 13100, route 4800"; "5" "l2-size 32768, host-route 13100, route 4800";
niagara2632xl	"0" "l2-size 294912, host-route 12000, route 12000"; "1" "l2-size 229376, host-route 44800, route 12000"; "2" "l2-size 163840, host-route 70400, route 12000"; "3" "l2-size 98304, host-route 96000, route 12000"; "4" "l2-size 32768, host-route 12000, route 115200"; "5" "l2-size 32768, host-route 12000, route 12000";

niagara2948_6xl	"0" "l2-size 294912, host-route 12000, route 12000"; "1" "l2-size 229376, host-route 44800, route 12000"; "2" "l2-size 163840, host-route 70400, route 12000"; "3" "l2-size 98304, host-route 96000, route 12000 "; "4" "l2-size 32768, host-route 12000, route 115200"; "5" "l2-size 32768, host-route 12000, route 12000";
pronto5101	"0" "l2-size 294912, host-route 12000, route 12000"; "1" "l2-size 229376, host-route 44800, route 12000"; "2" "l2-size 163840, host-route 70400, route 12000"; "3" "l2-size 98304, host-route 96000, route 12000 "; "4" "l2-size 32768, host-route 12000, route 115200"; "5" "l2-size 32768, host-route 12000, route 12000";
pronto5401	"0" "l2-size 294912, host-route 12000, route 12000"; "1" "l2-size 229376, host-route 44800, route 12000"; "2" "l2-size 163840, host-route 70400, route 12000"; "3" "l2-size 98304, host-route 96000, route 12000"; "4" "l2-size 32768, host-route 12000, route 115200"; "5" "l2-size 32768, host-route 12000, route 12000";
as4610_54p, as4610_54t, as4610_30p, as4610_30t	"0" "l2-size 65536, host-route 8192, route 6000"; "1" : "l2-size 49152, host-route 16384, route 6000"; "2" "l2-size 49152, host-route 24576, route 6000"; "3" "l2-size 49152, host-route 8192, route 6000"; "4" "l2-size 32768, host-route 24576, route 6000"; "5" "l2-size 32768, host-route 16384, route 6000";
Others (not support buffer mode)	"l2-size 32768, host-route 12000, route 12000";

First, user should enable the L2 and L3 mode. Then, use the command "**ovs-appctl pica/show tables "** to check the L2 and L3 max flows in the switch.

Example

Step 1: Add bridge and port

```
ovs-vsctl add-br br0 -- set bridge br0 datapath_type=pica8
ovs-vsctl add-port br0 te-1/1/77 vlan_mode=trunk tag=1 -- set Interface te-1/1/77 type=pica8
ovs-vsctl add-port br0 te-1/1/78 vlan_mode=trunk tag=1 -- set Interface te-1/1/78 type=pica8
```

Step 2: Enable L2 and L3 mode

```
ovs-vsctl set-l2-mode true
ovs-vsctl set-l3-mode true
```

Step 3: Check the default resources

```
admin@PicOS-OVS$ovs-appctl pica/show tables
Pica Tables Statistics:
    Pica Tables              Max Limitation          Current Used
    ------------------------------------------------------------------------
    ICAP Table                 2044                    10
    ECAP Table                 (null)                  (null)
    VCAP Table                 512                     0
    L2 System Table            512                     0
    L2 FDB Table               32256                   0
    L3 Host Table              12000                   IPv4(0),IPv6(0*2)
```

```
    L3 Route Table             12000                  IPv4(0),IPv6(0*2)
UDF Table                  (null)                 (null)
```

Step 4: Add L2 flows

```
ssun@dev-42:~/ryu/ryu/app$ ryu-manager simple_switch_13_ssun_buffer_mode5.py
 for i in range(4797, 5195):
             for k in ('0','1','2','3','4','5','6','7','8','9'):
                 for z in ('0','1','2','3','4','5','6','7','8','9'):
                     dl_dst="22:22:22:22:"+k+z+":22"
                     match=self.set_match(datapath, dl_dst=dl_dst, vlan_vid=i)
                     output_port=78
                     actions=self.set_action(datapath, out_port=output_port)
                     self.add_flow(datapath, 251, 32768, match, actions)
```

Step 5: Check max L2 flow members

```
admin@PicOS-OVS$ovs-ofctl dump-flows br0|grep -c "table=251"
32256
admin@PicOS-OVS$ovs-appctl pica/show tables
Pica Tables Statistics:
    Pica Tables              Max Limitation          Current Used
    ------------------------------------------------------------------------
    ICAP Table                 2044                   8
    ECAP Table                 (null)                 (null)
    VCAP Table                 512                    0
    L2 System Table            512                    0
    L2 FDB Table               32256                  32256
    L3 Host Table              12000                  IPv4(0),IPv6(0*2)
    L3 Route Table             12000                  IPv4(0),IPv6(0*2)
UDF Table                  (null)                 (null)
```

Step 6: Delete L2 flows and add ipv4 net route (ipv4 l3 host ,ipv6 host ,ipv6 route)

```
admin@PicOS-OVS$ovs-ofctl del-flows br0
ssun@dev-42:~/ryu/ryu/app$ ryu-manager simple_switch_13_ssun_buffer_mode5.py
for j in range(0,51):
             for i in range(0,255):
                 output_port=78
                 tmp1='%d' %i
                 tmp2 = '%d' %j
                 ipv4_dst='192.168.' + tmp2 +' .' +tmp1
                 dl_dst="22:22:22:22:22:22"
                 vlan_vid=20
                 match=self.set_match(datapath, dl_type=0x0800, ipv4_dst=ipv4_dst, ipv4_dst_mask="255.255.255.255")
                 actions=self.set_action(datapath, dl_dst="44:44:44:88:88:88", vlan_vid=vlan_vid, out_port=output_p
                 self.add_flow(datapath, 252, 32768, match, actions)
```

Step 7: Check max ipv4 l3 flow members

```
admin@PicOS-OVS$ovs-ofctl dump-flows br0|grep -c "table=252"
12000
admin@PicOS-OVS$ovs-appctl pica/show tables
Pica Tables Statistics:
    Pica Tables              Max Limitation          Current Used
    ------------------------------------------------------------------------
    ICAP Table                 2044                   10
    ECAP Table                 (null)                 (null)
    VCAP Table                 512                    0

    L3 Route Table             12000                  IPv4(12000),IPv6(0*2)
UDF Table                  (null)                 (null)
```

Configuring NAT flow

The Network Address Translation (NAT) process maps IP addresses from one address domain (or realm) to another to provide transparent routing to end hosts. Typically, NAT allows organizations to map public external addresses to private or unregistered addresses. A flow with NAT actions (changing IP address or L4 port) can be hardware switched. Flows can be associated with the following actions: mod_nw_dst, mod_nw_src, mod_tp_dst and mod_tp_src.

Listed below is the minimal information needed to process the packet on hardware only (direct flow):

1) dl_dst(match field or action), dl_vlan(match field or action), mod_nw_src, mod_tp_src

2) dl_dst(match field or action), dl_vlan(match field or action), mod_nw_dst, mod_tp_dst

3) dl_dst(match field or action), dl_vlan(match field or action), tp_src(with or wthout in match field),mod_nw_src

4) dl_dst(match field or action), dl_vlan(match field or action), nw_src(match field),mod_tp_src

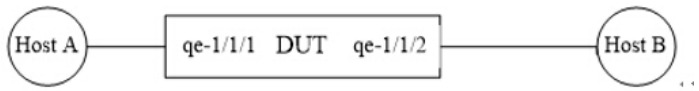
5) dl_dst(match field or action), dl_vlan(match field or action), tp_dst(with or wthout in match field),mod_nw_dst

6) dl_dst(match field or action), dl_vlan(match field or action), nw_dst(match field),mod_tp_dst

Supported Platform

Vendor	Platform
Delta	AG5648 v1-R, AG7648, AG9032v1
Accton	AS5712-54X, AS5812-54T, AS5812-54X, AS5835-54T, AS5835-54X, AS6712-32X, AS6812-32X, AS7312-54X, AS7326-56X, AS7712-32X, AS7726-32X, AS7816-64X
Dell	N3248X-ON, N3248PXE-ON, S4048-ON, S4128T-ON, S4128F-ON, S4148T-ON, S4148F-ON, S5212F-ON, S5224F-ON, S5248F-ON, S5232F-ON, S5296F-ON, Z9100-ON, Z9264F-ON
FS	N8560-32C, N8560-64C

Example



Example 1: SNAT

Step 1: Create a new bridge named br0.

```
admin@PicOS-OVS$ovs-vsctl add-br br0  -- set bridge br0 datapath_type=pica8
```

Step 2: Add ports to br0.

```
admin@PicOS-OVS$ovs-vsctl add-port br0 te-1/1/1 vlan_mode=trunk tag=1-- set interface te-1/1/1 type=pica8
admin@PicOS-OVS$ovs-vsctl add-port br0 te-1/1/2 vlan_mode=trunk tag=1-- set interface te-1/1/2 type=pica8
```

Step 3: If user is inside network and wants to visit outside network, source IP needs to be modified:

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,tcp,dl_vlan=1999,dl_dst=22:22:22:22:22:22,actions=set_field:192.1(
```

Step 4: Check flow tables.

```
admin@PicOS-OVS$ovs-ofctl dump-flows br0
OFPST_FLOW reply (OF1.4) (xid=0x2):
 cookie=0x0, duration=264.202s, table=0, n_packets=n/a, n_bytes=0, tcp,in_port=1,dl_vlan=1999dl_dst=22:22:22:22:22
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-appctl pica/dump-flows
#7417 normal permanent recirc_id=0,tcp,in_port=1,dl_vlan=1999,dl_dst=22:22:22:22:22:22,actions:set(ipv4(src=192.168
#7416 normal permanent priority=0,recirc_id=0, actions:drop
Total 2 flows in HW.
```

```
admin@PicOS-OVS$
```

Example 2: DNAT

Step 1: Create a new bridge named br0

```
admin@PicOS-OVS$ovs-vsctl add-br br0  -- set bridge br0 datapath_type=pica8
```

Step 2: Add ports to br0

```
admin@PicOS-OVS$ovs-vsctl add-port br0 te-1/1/1 vlan_mode=trunk tag=1-- set interface te-1/1/1 type=pica8
admin@PicOS-OVS$ovs-vsctl add-port br0 te-1/1/2 vlan_mode=trunk tag=1-- set interface te-1/1/2 type=pica8
```

Step 3: If user is outside network and wants to visit inside network, destination IP needs to be modified:

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,tcp,dl_vlan=1999,dl_dst=22:22:22:22:22:22,actions=set_field:192.1
```

Step 4: Check flow tables

```
admin@PicOS-OVS$ovs-ofctl dump-flows br0
OFPST_FLOW reply (OF1.4) (xid=0x2):
 cookie=0x0, duration=264.202s, table=0, n_packets=n/a, n_bytes=0, tcp,in_port=1,dl_vlan=1999,dl_dst=22:22:22:22:22
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-appctl pica/dump-flows
#7417 normal permanent recirc_id=0,tcp,in_port=1,dl_vlan=1999,dl_dst=22:22:22:22:22:22,actions:set(ipv4(dst=192.168
#7416 normal permanent priority=0,recirc_id=0, actions:drop
Total 2 flows in HW.
admin@PicOS-OVS$
```

Example 3: Packet-driven-flow

If match field or actions cannot satisfy condition of direct flow, this flow will be packet-driven-flow, and it cannot be added to hardware table directly.

Establish br0 and add ports in br0 like above configration. And add flow as follows:

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,dl_type=0x0800,tcp,actions=set_field:192.168.5.5-\>nw_src,set_fie
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-ofctl dump-flows br0
OFPST_FLOW reply (OF1.4) (xid=0x2):
 cookie=0x0, duration=3.442s, table=0, n_packets=n/a, n_bytes=0, tcp,in_port=1 actions=set_field:192.168.5.5->ip_s
admin@PicOS-OVS$ovs-appctl pica/dump-flows
#7460 normal permanent recirc_id=0,tcp,in_port=1, actions:To_CPU(for_packet_driven)
#7458 normal permanent priority=0,recirc_id=0, actions:drop
Total 2 flows in HW.
admin@PicOS-OVS$
```

Sending increasing dst_mac packets to te-1/1/1, mac address from 22:22:22:22:22:22 to 22:22:22:22:22:2b, then check tables:

```
admin@PicOS-OVS$ovs-ofctl dump-flows br0
OFPST_FLOW reply (OF1.4) (xid=0x2):
 cookie=0x0, duration=135.680s, table=0, n_packets=n/a, n_bytes=1124112312, tcp,in_port=1 actions=set_field:192.168
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-appctl pica/dump-flows
#7479 normal priority=1048560,recirc_id=0,tcp,in_port=1,vlan_tci=0x0000/0x1fff,dl_dst=22:22:22:22:22:22,nw_src=2.0
#7478 normal priority=1048560,recirc_id=0,tcp,in_port=1,vlan_tci=0x0000/0x1fff,dl_dst=22:22:22:22:22:2a,nw_src=2.0

#7475 normal priority=1048560,recirc_id=0,tcp,in_port=1,vlan_tci=0x0000/0x1fff,dl_dst=22:22:22:22:22:27,nw_src=2.0
#7471 normal priority=1048560,recirc_id=0,tcp,in_port=1,nw_src=192.168.5.5,nw_frag=no,tp_src=1110, actions:2
#7476 normal priority=1048560,recirc_id=0,tcp,in_port=1,vlan_tci=0x0000/0x1fff,dl_dst=22:22:22:22:22:28,nw_src=2.0
#7472 normal priority=1048560,recirc_id=0,tcp,in_port=1,vlan_tci=0x0000/0x1fff,dl_dst=00:00:00:00:00:00,nw_src=2.0
#7484 normal permanent recirc_id=0,tcp,in_port=1, actions:To_CPU(for_packet_driven)
#7483 normal permanent priority=0,recirc_id=0, actions:drop
#7480 normal priority=1048560,recirc_id=0,tcp,in_port=1,vlan_tci=0x0000/0x1fff,dl_dst=22:22:22:22:22:23,nw_src=2.0
#7482 normal priority=1048560,recirc_id=0,tcp,in_port=1,vlan_tci=0x0000/0x1fff,dl_dst=22:22:22:22:22:26,nw_src=2.0
#7481 normal priority=1048560,recirc_id=0,tcp,in_port=1,vlan_tci=0x0000/0x1fff,dl_dst=22:22:22:22:22:24,nw_src=2.0
#7474 normal priority=1048560,recirc_id=0,tcp,in_port=1,vlan_tci=0x0000/0x1fff,dl_dst=22:22:22:22:22:2b,nw_src=2.0
#7473 normal priority=1048560,recirc_id=0,tcp,in_port=1,vlan_tci=0x0000/0x1fff,dl_dst=22:22:22:22:22:25,nw_src=2.0
```

```
Total 14 flows in HW.
admin@PicOS-OVS$
```

1. And te-1/1/2 receive packets with the src_ip 192.168.5.5 and src_port 1110.

Due to ASIC limitation, a flow can not modify l4_src_port without modifying SIP or modify l4_dst_port without modifying DIP.

If only modifying SIP(DIP) or SIP+L4_SRC_PORT(DIP+L4_DST_PORT), up to 2k flow can be configured. If modifying both SIP[|L4_SRC_PORT] and DIP[|L4_DST_PORT], the flow supported is 1k.

2. If set_dl_src is included in actions, the packets will be stamped with set_dl_src (as before). If set_dl_src is not included in actions, the packets will be stamped with the original dl_src. That is to say, keep the original source mac address.

```
Eg1:
ovs-ofctl add-flow br0 in_port=1,ip,tcp,dl_vlan=2,dl_src=00:11:22:33:44:55,dl_dst=00:01:02:03:04:05,actions=set_fi
send packets
result:

MAC: ------ MAC Header ------
MAC: Destination Address : 00 01 02 03 04 05
MAC: Source Address : 00 11 22 33 44 55

Eg2:
ovs-ofctl add-flow br0 in_port=1,ip,tcp,dl_vlan=2,dl_dst=00:01:02:03:04:05,actions=set_field:0x456-\>tp_src,set_fi
send packets
result:

MAC: ------ MAC Header ------
MAC: Destination Address : 00 01 02 03 04 05
MAC: Source Address : 00 11 22 33 44 55

Eg3:
ovs-ofctl add-flow br0 in_port=1,ip,tcp,dl_vlan=2,dl_src=00:11:22:33:44:55,dl_dst=00:01:02:03:04:05,actions=set_fi
send packets
result:

MAC: ------ MAC Header ------
MAC: Destination Address : 00 01 02 03 04 05
MAC: Source Address : 22 22 22 22 22 22

Eg4:
ovs-ofctl add-flow br0 in_port=1,ip,tcp,dl_vlan=2,dl_dst=00:01:02:03:04:05,actions=set_field:0x456-\>tp_src,set_fi
send packets
result:

MAC: ------ MAC Header ------
MAC: Destination Address : 00 01 02 03 04 05
MAC: Source Address : 22 22 22 22 22 22
```

Configuring option-match-vlan-type

PicOS supports enable/disable option-match-mode-type from version 2.6.5 in Platform P-3922/3924. This function is used to enable or disable matching untagged packets.

Example:

```
admin@PicOS-OVS$ovs-vsctl set-option-match-vlan-type TRUE
  Please reboot for the change to take effect!
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-vsctl set-option-match-vlan-type FALSE
  Please reboot for the change to take effect!
admin@PicOS-OVS$
```

If the type is false, PicOS cannot configure one flow entry only matching untagged packets, and cannot configure one flow entry match all tagged packets (tag from1 to 4094). Once option-match-vlan-type is enabled, the flow entry vlan_tci=0x0000/0x1000 can match untagged packets, and flow entry vlan_tci=0x1000/0x1000 can match all tagged packets.

Example:

```
admin@PicOS-OVS$ovs-vsctl set-option-match-vlan-type TRUE
  Please reboot for the change to take effect!
admin@PicOS-OVS$

admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=11,vlan_tci=0x0000/0x1000,actions=output:12
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=12,vlan_tci=0x1000/0x1000,actions=output:11
```

Send untagged packets to port te-1/1/11, the packets can match the first flow entry and forward on port te-1/1/12. Send tagged packets to port te-1/1/11, the packets cannot match the first flow entry;

Send untagged packets to port te-1/1/12, the packets cannot match the second flow entry; Send tagged (1~4094) packets to port te-1/1/12, the packets can match the second flow entry and forward on port te-1/1/12.

Configuring TTP

TTP means Table Type Pattern.
Before version 2.8.0, the ttp file named as "vz_etech_ttp_v0.3.json." And from version 2.8.0,the ttp json file changed the name to "routing_ttp_v1.0.json",from 3.7.4,the ttp file is named to "picos_ttp.json".
The ttp json file is as following:

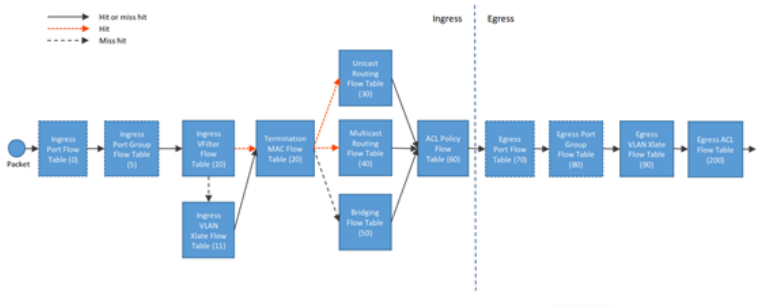

Figure 1:the json file analyse

- Pipeline

```
"table_map": {
    "Ingress_Port_Flow_Table": 0,
    "Ingress_Port_Group_Flow_Table": 5,
    "Ingress_VFilter_Flow_Table": 10,
    "Ingress_VLAN_Xlate_Flow_Table": 11,
    "Termination_MAC_Flow_Table": 20,
    "Unicast_Routing_Flow_Table": 30,
    "Multicast_Routing_Flow_Table": 40,
    "Bridging_Flow_Table": 50,
    "ACL_Policy_Flow_Table": 60,
    "Egress_Port_Flow_Table": 70,
    "Egress_Port_Group_Flow_Table": 80,
    "Egress_VLAN_Xlate_Flow_Table": 90,
    "Egress_ACL_Flow_Table": 200
}
```

Flow Tables

Required flow table:

- Ingress_VFilter_Flow_Table (Required)

  Ingress_VFilter_Flow_Table uses the vcap tcam in hardware, supports QinQ vlan actions.Vcap has the highest priority in VLAN stage.

- Ingress_VLAN_Xlate_Flow_Table (Required)

  Ingress_VLAN_Xlate_Flow_Table uses the VLAN Translation in hardware, supports QinQ vlan actions.

- Termination_MAC_Flow_Table (Required)

  Termination_MAC_Flow_Table add system mac entry in my_station_tcam, to match input packet's service-vlan and dst-mac, and determine whether to route this packet.

- Unicast_Routing_Flow_Table (Required)

  Unicast_Routing_Flow_Table supports match Host and Route IP address.L3 unicast supports ECMP.

- Multicast_Routing_Flow_Table (Required)

  Multicast_Routing_Flow_Table supports l2 ports multicast and l3 multicast.

  L2 ports multicast use “L3 Multicast” group and has no set-field actions.

- Bridging_Flow_Table (Required)

Bridging_Flow_Table supports static mac entries installed by openflow controller and dynamic mac entries if mac-learning enabled.If packet hits a mac entry, the packet will be marked bridging_hit=1.Dynamic mac entry is learned in hardware, and will send an upcall event to software, ovs store the mac entry in bridging table and may notify controller with an experimenter message.

- ACL_Policy_Flow_Table (Required)

  ACL_Policy_Flow_Table uses ICAP TCAM in hardware, can meter, redirect, normal, controller, drop, set-queue, ecmp, etc.

- Egress_VLAN_Xlate_Flow_Table (Required)

  Egress_VLAN_Xlate_Flow_Table uses the egress VLAN Translation in hardware, supports QinQ vlan actions.

- Egress_ACL_Flow_Table (Required)

  Egress_ACL_Flow_Table uses ECAP TCAM in hardware, supports set-dscp, normal, drop actions.Not support matching metadata now.

optional flow table

- Ingress_Port_Flow_Table (Optional)

  Ingress_Port_Flow_Table is the first table in pipeline, represent ingress pipeline start.No flow is allowed to add in this table.

- Ingress_Port_Group_Flow_Table (Optional)

Ingress_Port_Group_Flow_Table matches in_port, and is used to set port ingress port-group id for input port grouping.The port-group is similar to bond port, it is a physical port attribute and can bundle multiple physical ports in a group. Port-group can be used on vlan_xlate table and vfilter flow table, as a match key. Each physical port has a port-group id, default value is 0.

- Egress_Port_Flow_Table (Optional)

  Egress_Port_Flow_Table is the first table in egress pipeline, represent egress pipeline start.No flow is allowed to add in this table.

- Egress_Port_Group_Flow_Table (Optional)

Egress_Port_Group_Flow_Table matches output port (use <in_port> match field), and is used to set port egress port-group id for output port grouping.

Descriptions

Metadata:16-22bits of metadata represents ingress/egress port group.

default-config:You can check the default state using "ovs-vsctl show-port-default-config",admin state is up,config is 0,you can change the state by "ovs-vsctl set-port-default-admin-down true".Need to restart the service after changing the admin state.

default-flood:default state is false,all packets will be dropped if do not matching any flow in flow table.You can change this state by "ovs-vsctl set-port-default-flood true".Need to restart the service after changing the flood state.

Restrictions

- not support ip_ecn in ingress acl match field.
- Do not support following commands “ovs-appctl pica/dump-flows 30””ovs-appctl pica/dump-flows Unicast”
- egress acl table do not support match-mode

TTP Multicast

We will include support for TTP multicast from version 2.8.0. The table number is 40 by default.The pipeline is as follows:

Introduction

The process is different from adding a flow to a unicast routing table. If you add a flow to multicast routing table, you do not need to add the corresponding flows to the VLAN and terminal MAC tables. The switch will check whether the destination MAC of the packet is a multicast address or not. In case its a unicast MAC address, the switch will report an error message. The match fields are Ethernet type, vlan_vid, multicast destination IP address, source IP address. Source ip 0.0.0.0 means (*,g). And (s,g) has the higher priority.

By far, the policy ACL table has ecmp problems in processing the multicast packets coming from multicast routing table.

The multicast routing flow priority is 32768, the IPV4 multicast destination IP address ranges from 224.0.0.0 to 239.255.255.255.The IPV4 destination MAC must begin from 01:00:5e:0…, the IPV6 multicast destination IP address should begin with 0xFF…, the IPV6 multicast destination MAC begins with 33:33…...

Table Description

Multicast Routing table

IPV4 multicast

- **table_id:40**
- **priority:32768**
- **match fields:**

  eth_type:0x0800

  vlan_vid: <vid> 12-bit VLAN id value from header field which Picos support

  IPV4_SRC:<ipv4_src>------IPv4 Unicast Source Address - 32 bits represented as 4 decimal values - nnn.nnn.nnn.nnn

  IPV4_DST:<ipv4_mc>------valid value is from 224.0.0.0 to 239.255.255.255
- **instructions**

  goto_table:60 (optional)

  write_actions(necessary): L3 Multicast group,DEC_NW_TTL

IPV6 multicast

- **table_id:40**
- **priority:32768**
- **match fields:**

  eth_type:0x86dd

  vlan_vid: <vid> 12-bit VLAN id value from header field which Picos support

  IPV6_SRC:<ipv6_src>------IPv6 Unicast Source Address - 128 bits represented as 8 groups of hex quartets - nnnn:nnnn:nnnn:nnnn:nnnn:nnnn:nnnn:nnnn

  IPV6_DST:<ipv6_mc>------valid value is ff00:0:0:0:0:0:0:0,mask is ff00:0:0:0:0:0:0:0
- **instructions**

  goto_table:60 (optional)
  write_actions(necessary): L3 Multicast group,DEC_NW_TTL

default flows in multicast routing table

- **priority:32768**
- **match fields:[ ]**
- **instructions:**

  goto_table:policy table(table_id is 60)

ACL table

match fields:all the match fields the same with tcam in non-TTP mode.

instructions:write_actions,

actions: L2 interface group |L2 Rewrite group | L3 ECMP group | output:controller ,all these actions can not exist at the same time ,only one kind of group exist.

POP_VLAN(optional)

SET_QUEUE(optional)

modify DSCP(optional)

Default flow in ACL table is pass.

> **l2 multicast and l3 multicast**
> l2 multicast:the field "dec_nw_ttl" can not work,but in flow,dec_nw_ttl is the neccessary.
>
> l3 multicast:del_nw_dec field is neccessary and works as well

> **Multicast table and Acl table can not be matched at the same time.If packets match multicast table,can not match the acl table at the same time unless not match the multicast table.**

Groups Description

L2 Interface group

group type is ***indirect***,and action only support output port.

L3 Multicast Interface group

group type is ***indirect,***actions is modify src mac and vlan,**output** is a "L2 Interface group group".

L3 Multicast group

group type is ***all***,bucket is a ***"L3 Multicast Interface group" or "L2 Interface group"***

Examples

Example 1: IPv4 Multicast (l3 multicast)

(1)configure ttp

```
ovs-vsctl set-ttp-enable true
ovs-vsctl set-ttp-file picos_ttp.json
ovs-vsctl show-ttp
sudo systemctl restart picos
```

(2)configure bridge and port

```
ovs-vsctl add-br br0 -- set bridge br0 datapath_type=pica8
ovs-vsctl add-port br0 ge-1/1/1 vlan_mode=trunk tag=1 -- set interface ge-1/1/1 type=pica8
ovs-vsctl add-port br0 ge-1/1/2 vlan_mode=trunk tag=1 -- set interface ge-1/1/2 type=pica8
ovs-vsctl add-port br0 ge-1/1/3 vlan_mode=trunk tag=1 -- set interface ge-1/1/3 type=pica8
```

(3)add groups

l2 interface group:

```
ovs-ofctl add-group br0 group_id=1,type=indirect,bucket=output:2
ovs-ofctl add-group br0 group_id=2,type=indirect,bucket=output:3
```

l3 multicast interface:

```
ovs-ofctl add-group br0 group_id=3,type=indirect,bucket=set_field:88:88:88:00:00:00-\>dl_src,set_field:200-\>vlan_
ovs-ofctl add-group br0 group_id=4,type=indirect,bucket=set_field:44:44:44:00:00:00-\>dl_src,set_field:300-\>vlan_
```

l3 multicast group:

```
ovs-ofctl add-group br0 group_id=5,type=all,bucket=group:3,bucket=group:4
```

(4)add flow

Here,flows' action ***goto_table:60*** is optional.

```
ovs-ofctl add-flow br0 table=40,priority=32768,dl_type=0x0800,dl_vlan=10,nw_src=192.168.1.100,nw_dst=234.234.245.2
```

(5)check the hardware flow table

```
admin@PicOS-OVS$ovs-appctl pica/dump-flows
Multicast Routing Table: (Total 1 flows)
 ID=12 ip,dl_vlan=10,nw_src=192.168.1.100,nw_dst=234.234.245.245, actions:group(id=3,all,n=2,b0(group(id=2,indirec
```

(6) send multicast packets

send packets with dst mac "01:00:5E:07:88:88",vlan is 10,dst multicast ipv4 address is 234.234.245.245.

Then ge-1/1/2 will transmit the packets with vlan 200,src mac is 88:88:88:00:00:00,ge-1/1/3 will transmit the packets is src mac is 44:44:44:00:00:00,vlan is 300

Example 2: IPv4 Multicast (l2 multicast)

(1)enable TTP and add bridge and port first.

(2)**Add group**

l2 interface group:

```
ovs-ofctl add-group br0 group_id=1,type=indirect,bucket=output:2
```

l3 multicast group:

```
ovs-ofctl add-group br0 group_id=3,type=all,bucket=group:1
```

(3)add flow

```
ovs-ofctl add-flow br0 table=40,priority=32768,dl_type=0x0800,dl_vlan=10,nw_src=192.168.1.100,nw_dst=234.234.245.24
```

(4)**Check the hardware flow**

```
admin@PicOS-OVS$ovs-appctl pica/dump-flows
Multicast Routing Table: (Total 1 flows)
 ID=10 ip,dl_vlan=10,nw_src=192.168.1.100,nw_dst=234.234.245.245, actions:group(id=3,all,n=1,b0(live,group(id=1,inc
```

(5)send packets

send packets with dst mac "01:00:5E:07:88:88",vlan is 10,dst multicast ipv4 address is 234.234.245.245.

Then ge-1/1/2 will transmit the packets which are the sane with the packets from ge-1/1/1.

Example 3: IPv6 Multicast(l3 multicast)

(1) enable TTP and add port and bridge.

(2)add group

l2 interface group:

```
ovs-ofctl add-group br0 group_id=1,type=indirect,bucket=output:2
ovs-ofctl add-group br0 group_id=5,type=indirect,bucket=output:3
```

l3 multicast interface group:

```
ovs-ofctl add-group br0 group_id=2,type=indirect,bucket=set_field:88:88:88:00:00:00-\>dl_src,set_field:200-\>vlan_\
ovs-ofctl add-group br0 group_id=6,type=indirect,bucket=set_field:44:44:44:00:00:00-\>dl_src,set_field:300-\>vlan_\
```

l3 multicast group:

```
ovs-ofctl add-group br0 group_id=3,type=all,bucket=group:2,bucket=group:6
```

(3) add flow

```
ovs-ofctl add-flow br0 table=40,priority=32768,dl_type=0x86dd,dl_vlan=10,ipv6_src=2000::1,ipv6_dst=ff00::1,actions=
```

(4)**Check the hardware flow**

```
admin@PicOS-OVS$ovs-appctl pica/dump-flows
Multicast Routing Table: (Total 1 flows)
 ID=5040 ipv6,dl_vlan=10,ipv6_src=2000::1,ipv6_dst=ff00::1, actions:group(id=3,all,n=2,b0(live,group(id=2,indirect
```

(5)send ipv6 mutlicast packets

send ipv6 packets with dst mac 33:33:33:00:00:01,vlan is 10,ipv6 src address is 2000::1,ipv6 dst address is ff00::1

Then ge-1/1/2 will transmit the packets with source mac 88:88:88:00:00:00,vlan is 200,ge-1/1/3 will transmit the packets with dst mac is 33:33:33:00:00:01,src mac is 44:44:44:00:00:00, vlan is 300.

Example 4: IPv6 Multicast (l2 multicast)

(1) enable TTP and add bridge and port

(2)add groups

l2 interface group:

```
ovs-ofctl add-group br0 group_id=1,type=indirect,bucket=output:2
ovs-ofctl add-group br0 group_id=2,type=indirect,bucket=output:3
```

l3 multicast group:

```
ovs-ofctl add-group br0 group_id=3,type=all,bucket=group:1,bucket=group:2
```

(3)add flow

```
ovs-ofctl add-flow br0 table=40,priority=32768,dl_type=0x86dd,dl_vlan=10,ipv6_src=2000::1,ipv6_dst=ff00::1,actions=
```

(4)check the hardware flow

```
admin@PicOS-OVS$ovs-appctl pica/dump-flows
Multicast Routing Table: (Total 1 flows)
 ID=1 ipv6,dl_vlan=10,ipv6_src=2000::1,ipv6_dst=ff00::1, actions:group(id=3,all,n=2,b0(group(id=1,indirect,n=1,b0(
```

(5)send ipv6 packets

send ipv6 packets with dst mac 33:33:33:00:00:01,src mac is 22:11:11:11:11:11,vlan is 10,ipv6 src address is 2000::1,ipv6 dst address is ff00::1

Then ge-1/1/2 and ge-1/1/3 will transmit the packets with source mac 22:11:11:11:11:11,vlan is 10.

TTP Unicast

Introduction

This document describes the Table Type Pattern (TTP) and its usage.

TTP defines a template of tables that can be configured using open flow. It uses JSON notation to define the data structure for the pipeline defined in the TTP. Open flow instructions can use the parameters defined in the TTP file to program the flows. If a flow cannot be configured, the switch will report an error message.

Enabling TTP Mode

From PicOS version 2.7.1, supporting for TTP mode has been added in our switches. To use the TTP mode, user must first enable this mode. To enable the TTP mode, use the command ***"ovs-vsctl set-ttp-enable true"*** . To add the TTP file, use the command ***"ovs-vsctl set-ttp-file <TTP file>.json".*** After adding the file, restart the switch and the TTP mode should be enabled on the switch.From version 3.7.4,add some flow tables(bridging flow table,Egress_Port_Flow_Table,Egress_Port_Group_Flow_Table,Egress_VLAN_Xlate_Flow_Table,Egress_ACL_Flow_Table)

json file
About .JSON FILE:

- Only "table_map" and "flow_tables" can be modified.
- "table_map": User can modify the table number of "VLAN," "Termination MAC," "Unicast Routing" and "Policy ACL". All of the four table id's must be increasing and different. For example, if user wants table 20 to be the VLAN table, write like this "VLAN:" 20 and so on.
- Flow_tables: Only the priority of all the flows tables can be changed. If user modifies vlan filter tables' priority to 1999, when user adds a flow, user must specify that the priority is 1999.
- path: /ovs/share/openvswitch

At present, users cannot modify the json file. If necessary, users may notify our team, and we may be able to change it.

Table map is:

- "Ingress_Port_Flow_Table": 0,
- "Ingress_Port_Group_Flow_Table": 5,
- "Ingress_VFilter_Flow_Table": 10,
- "Ingress_VLAN_Xlate_Flow_Table": 11,
- "Termination_MAC_Flow_Table": 20,
- "Unicast_Routing_Flow_Table": 30,
- "Multicast_Routing_Flow_Table": 40,
- "Bridging_Flow_Table": 50,
- "ACL_Policy_Flow_Table": 60,
- "Egress_Port_Flow_Table": 70,
- "Egress_Port_Group_Flow_Table": 80,
- "Egress_VLAN_Xlate_Flow_Table": 90,
- "Egress_ACL_Flow_Table": 200

Notification

- In the acl table, if any layer 2 header content of packets is modified, previous actions in route table will be invalid.
- At present, the packets can ecmp in src ip by default.

Table match and instructions

Ingress_Port_Group_Flow_Table:

Match:in_port

Actions: write_metadata(bit16-22: Port Group [0-127]),goto_table: Ingress_VFilter_Flow_Table

Built-in:

Match:[]

Actions: write_metadata:0,goto_table: Ingress_VFilter_Flow_Table

```
ovs-ofctl add-flow br0 table=5,priority=32768,in_port=1,actions=write_metadata:0x20000/0x7f0000,goto_table:10
```

Ingress_VFilter_Flow_Table:

Match:none or metadata or in_port,Of course you can match “priority,in_port,vlan_vid,dl_vlan_pcp,dl_type” at the same time.

Note:metadata and in_port should better not match at the same time.

Actions:push_vlan,goto_table:Termination_MAC_Flow_Table

built-in:

Match:[]

Actions:goto_table:Termination_MAC_Flow_Table

```
ovs-ofctl add-flow br0 table=10,actions=push_vlan:0x8100,set_field:200-\>vlan_vid,push_vlan:0x8100,set_field:300-\>
ovs-ofctl add-flow br0 table=10,priority=32768,metadata=0x000002/0x7f0000,vlan_vid=0x064/0x0ff,dl_vlan_pcp=4,dl_typ
ovs-ofctl add-flow br0 table=10,priority=32768,in_port=1,vlan_vid=0x064/0x0ff,dl_vlan_pcp=4,dl_type=0x0800,actions=
```

Ingress_VLAN_Xlate_Flow_Table

QinQ ingress vlan xlate table for packets, table size is 4K

Match: metadata,vlan_vid

Actions: push_vlan(optional), set_field vlan,goto “Termination_MAC_Flow_Table”

Built-in: goto “Termination_MAC_Flow_Table”

```
ovs-ofctl add-flow br0 table=11,priority=32768,metadata=0x000002/0x7f0000,dl_vlan=100,actions=push_vlan:0x8100,set_
```

Termination_MAC_Flow_Table

In this table, the user can configure a flow to decide if the packets go to the route table or not,do not support a output port in this table. By default, packets will go to the bridging flow table directly, instead of going to route table first. The match fields of the flow supported by this table are dl_dst, dl_vlan, action is goto_table:30. Multicast and broadcast MAC are not supported here.

Match:eth_dst,vlan_vid

Actions:goto “Unicast_Routing_Flow_Table”

Built-in: goto “Bridging_Flow_Table”

```
ovs-ofctl add-flow br-s table=20,priority=32768,dl_dst=00:11:22:33:44:56,dl_vlan=2015,actions=goto_table:30
```

Unicast_Routing_Flow_Table

In this table, users can direct the packets' route through several different kind of groups by means of writing actions. The matching fields are dl_type, nw_dst, actions are several kinds of groups and dec_nw_ttl, then go to ACL table. According our .json file we can add this kind of flow. Broadcast and multicast are not supported in this table. By default,all packets pass through this table and goto acl table.

Match:dl_type,nw_dst/ipv6_dst(optional)

Actions:clear_actions or controller or L3 Unicast/L3 ecmp group,goto_table:60(necessary)

Built-in:goto_table: ACL_Policy_Flow_Table

```
ovs-ofctl add-flow br0 table=30,priority=32768,dl_type=0x0800,nw_dst=192.168.1.100,actions=output:controller,goto_
```

example1:

```
step1,add group
#########add l2 interface group:
ovs-ofctl add-group br0 group_id=1,type=indirect,bucket=output:2

#########add l3 unicast group:
ovs-ofctl add-group br0 group_id=2,type=indirect,bucket=set_field:66:66:66:11:11:11-\>dl_src,set_field:88:88:88:11

Step2,delete route flow and add another flow
ovs-ofctl add-flow br0 table=20,priority=32768,dl_vlan=100,dl_dst=22:22:22:22:22:22,actions=goto_table:30
ovs-ofctl add-flow br0 table=30,priority=32768,dl_type=0x0800,nw_dst=192.168.1.100,actions=write_actions\(group:2,

step3,check the flows
ovs-ofctl dump-flows br0
ovs-appctl pica/dump-flows

step4,send packets
send 10000 packets with vlan 100,dst mac is 22:22:22:22:22:22,dst ip is 192.168.1.100 to te-1/1/1.

Result:te-1/1/2 should transmit packets with vlan 3000,dst mac is 88:88:88:11:11:11,src mac is 66:66:66:11:11:11,t
```

Example2

User can also complete the ecmp through a select group.

L2 interface group:

```
ovs-ofctl add-group br-s group_id=1,type=indirect,bucket=output:77
 ovs-ofctl add-group br-s group_id=5,type=indirect,bucket=output:79
```

L3 UNICAST group:

```
ovs-ofctl add-group br-s group_id=2,type=indirect,bucket=set_field:66:66:66:00:00:00-\>dl_src,set_field:66:66:66:1
ovs-ofctl add-group br-s group_id=6,type=indirect,bucket=set_field:22:11:11:11:11:11-\>dl_src,set_field:44:44:44:1
```

L3 ff group:

```
ovs-ofctl add-group br-s group_id=3,type=fast_failover,bucket=group:2,watch_port:77
ovs-ofctl add-group br-s group_id=7,type=fast_failover,bucket=group:6,watch_port:79
```

L3 ecmp:

```
ovs-ofctl add-group br-s group_id=4,type=select,bucket=group:2,bucket=group:7
```

Add flow and check:

```
ovs-ofctl add-flow br-s table=30,priority=32768,dl_type=0x0800,nw_dst=192.168.1.100,actions=write_actions\(group:4
admin@PicOS-OVS$ovs-ofctl dump-flows br-s
OFPST_FLOW reply (OF1.4) (xid=0x2):
 cookie=0x0, duration=76.544s, table=30, n_packets=n/a, n_bytes=n/a, ip,nw_dst=192.168.1.100 actions=write_actions
admin@PicOS-OVS$ovs-appctl pica/dump-flows
Ingress Port Table: (Total 0 flows)

VLAN Table: (Total 0 flows)

Termination MAC Table: (Total 0 flows)

Unicast Routing Table: (Total 1 flows)
 ID=1 ip,nw_dst=192.168.1.100, actions:group(id=9,select,n=2,b0(live,group(id=3,ff,n=1,b0(live,group(id=2,indirect

Policy ACL Table: (Total 0 flows)
```

Bridging_Flow_Table

When Mac-Learning is enabled on the chip, the entries for unicast forwarding are automatically learned, updated(station-move) and deleted(idle-timeout)." To be installed/updated/deleted via FlowMod(ADD/MODIFY/MODIFY_STRICT/DELETE).

Match:eth_dst,vlan_vid

Actions:output_port,goto_table: ACL_Policy_Flow_Table

Built-in: goto_table: ACL_Policy_Flow_Table

```
ovs-ofctl add-flow br0 table=50,priority=32768,dl_dst=44:44:44:44:44:44,dl_vlan=2000,actions=write_actions\(output
```

send packets matching above flow with dst mac 44:44:44:44:44:44,vlan 2000 to te-1/1/1.

Result: te-1/1/2 should transmit the packets.

ACL_Policy_Flow_Table

In this table, users can add a flow with any match field supported by our switch. The actions could be meter, group, controller, drop, set_queue.

Match:in_port,mpls,vlan,mac,ip,inner_vlan_vid,inner_vlan_pcp,sctp,mpls_label2etc.All the match fields are optional.

Actions:meter(optional),pop_l2mpls(optional),pop_mpls(optional),push_l2mpls,set_field:mpls_label(optional),group,output_port,and so on.

Built-in: goto_table:Egress_VLAN_Xlate_Flow_Table

```
ovs-ofctl add-flow br0 table=60,in_port=1,dl_vlan=2000,dl_dst=44:33:22:11:00:00,mpls,mpls_label=16,mpls_tc=3,mpls_l
```

```
ovs-ofctl add-flow br-s table=60,priority=65535,in_port=78,dl_type=0x86dd,dl_src=22:22:22:22:22:22,dl_dst=44:44:44
```

```
ovs-ofctl add-flow br-s table=60,actions=write_actions\(group:4\)
```

Egress_VLAN_Xlate_Flow_Table

This entry is for converting outgoing Tagged packets from QinQ to Single Tagged or untagged.

Match:metadata,vlan_vid,inner_vlan_vid

actions:pop_vlan,set_field:vlan,goto_table:Egress_ACL_Flow_Table

built-in: goto_table:Egress_ACL_Flow_Table

```
ovs-ofctl add-flow br0 table=90,priority=32768,metadata=0x20000/0x7f0000,dl_vlan=2000,inner_vlan_vid=1000,actions=
```

Egress_ACL_Flow_Table

match: IN_PORT,OUTPUT_PORT, ETH_DST/ ETH_SRC, ETH_TYPE, VLAN_VID/ VLAN_PCP,TCP/UDP,SCTP，etc.

actions:set_field:ip_dscp, clear_actions, output:normal

####add flow in ingress acl ####

```
ovs-ofctl add-flow br0 table=60,in_port=1,actions=write_actions\(output:2\)
```

####add flow in egress acl

```
ovs-ofctl add-flow br0 table=200,in_port=1,dl_dst=22:22:22:22:22:22,dl_src=22:11:11:11:11:11,dl_vlan=2000,dl_vlan_
```

send packets

a,send packets with dst mac 22:22:22:22:22:22,src mac 22:11:11:11:11:11,pcp is 3 to te-1/1/1.

b,send packets with dst mac 22:22:22:22:22:22,src mac 22:11:11:11:11:11,pcp is 0 to te-1/1/1.

Result:

a,te-1/1/2 should drop packets.

b,te-1/1/2 should transmit the packets.

List TTP System Resources Usage

From version 2.8.0, when ttp is enabled,we can use command ovs-appctl pica/show tables to check max limitation or current used of different tables.

```
admin@PICOS-OVS:~$ ovs-appctl pica/show tables
TTP Tables Statistics:
    TTP Tables                    Max Limitation          Current Used
    ------------------------------------------------------------------------
    Ingress Port Group Table        1024                    0
    Ingress VFilter Table           510                     0
    Ingress VLAN Xlate Table        4096                    0
    Termination MAC Table           510                     0
    Unicast Routing Table (Host)    12000                   IPv4(0),IPv6(0*2)
    Unicast Routing Table (Route)   12000                   IPv4(0),IPv6(0*2)

Configuring udf flow

Abstract

The goal is to be able to add flows which utilizes the udf (User defined filter) function of the hardware.

As hardware cannot parse the L3 protocol of an mpls packet, we can not match both mpls labels and transport layer ports. But we can do this by utilizing the udf function of hardware. The udf allow us to match 4 bytes of content at the given offset of the L2 header of the L3 header. The L2 header refers to the mac header of frame, and the L3 header refers to the first mpls lable of mpls frame or IP header of the non-mpls frame (in other words the header next to the inner VLAN tag).

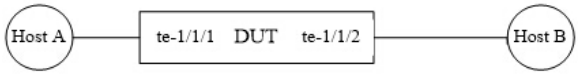
Due to the limitation of the hardware, we only support 4 fields of udf. The max number of udf flows share the same limitation of normal tcam flows.

> Note:
>
> Only untag packets can be matched when configure udf base L2 and L3 at the same time.

Example 1

Send IP packets with dl_dst 22:22:22:22:22:22, dl_src 22:11:11:11:11:11, tag 1000.

And we want to match this tag.



Step1: Create a new bridge named br0

```
admin@PicOS-OVS$ovs-vsctl add-br br0 -- set bridge br0 datapath_type=pica8
```

Step 2: Add ports to br0

```
admin@PicOS-OVS$ovs-vsctl add-port br0 te-1/1/1 vlan_mode=trunk tag=1  -- set Interface te-1/1/1 type=pica8
admin@PicOS-OVS$ovs-vsctl add-port br0 te-1/1/2 vlan_mode=trunk tag=1  -- set Interface te-1/1/2 type=pica8
```

Step 3: Configure udf and add flow

```
ovs-vsctl set-udf-mode "udf0(l2,offset=12,length=4)"
ovs-ofctl add-flow br0 table=250,in_port=1,udf0=0x810003E8/0x0000ffff,actions=2
```

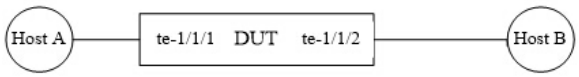
Step 4: Check table

```
admin@PicOS-OVS$ovs-vsctl show-udf-mode
  udf mode is udf0(l2,offset=12,length=4)
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-ofctl dump-flows br-vi
OFPST_FLOW reply (OF1.4) (xid=0x2):
 cookie=0x0, duration=25.315s, table=250, n_packets=n/a, n_bytes=0, in_port=4,udf0=0x3e8/0xffff actions=output:5
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-appctl pica/dump-flows
#1 udf permanent recirc_id=0,in_port=4,udf0=0x3e8/0xffff, actions:5
#0 normal permanent priority=0,recirc_id=0, actions:drop
Total 2 flows in HW.
admin@PicOS-OVS$
```

Example 2

Send IP packets with dl_dst 22:22:22:22:22:22, dl_src 22:11:11:11:11:11,ip_src=192.168.200.100,ip_dst=192.168.100.100,tp_src=2002,tp_dst=3003,mpls_label=666;

And we want to match mpls_label and tp_src:



Step1: Create a new bridge named br0

```
admin@PicOS-OVS$ovs-vsctl add-br br0 -- set bridge br0 datapath_type=pica8
```

Step 2: Add ports to br0

```
admin@PicOS-OVS$ovs-vsctl add-port br0 te-1/1/1 vlan_mode=trunk tag=1  -- set Interface te-1/1/1 type=pica8
admin@PicOS-OVS$ovs-vsctl add-port br0 te-1/1/2 vlan_mode=trunk tag=1  -- set Interface te-1/1/2 type=pica8
```

Step 3: Configure udf and add flow

```
ovs-vsctl set-udf-mode "udf0(l3,offset=0,length=4), udf1(l3,offset=24,length=2)"
ovs-ofctl add-flow br0 table=250, in_port=1,udf0=0x0029a140/0xfffff000,udf1=0x07d2,actions=2
```

Note:

1. Offset needs to be aligned on 4 bytes and less than or equal to 124, length is less than or equal to 4.
2. (base, offset, length) defines one field of udf. Base refers to L2 or L3. Due to hardware limitations, we only support 4 fields of udf. But the max number of udf flows share the same limitation of normal tcam flows. L2 fields must be placed before L3 fields, and fields are in ascending order of offset with no overlapping of each other.
3. In the udf table, we can only use udf match format. We can not use both OXM (OpenFlow Extensible Match) and udf format in the same flow.
4. Flows in other tables can not use goto action with a udf table, and udf tables do not support goto action either, supporting output and drop actions,and from version 2.6.4,udf actions also support set_queue,meter and normal.
5. All udf flows will have higher priority than all the other tcam flows.
6. Adding udf flows will return errors, when there are arp or mpls flows in hardware already; also arp or mpls flows will return an error when there are udf flows in the hardware table already.
7. When adding udf flows, table=250 in match field is needed.
8. User cannot enable udf mode and match mode at the same time.

UDF L4

From PicOS2.8.0, picos support UDF offset from L4. The L4 header refers to L4 protocol ports, such as tcp or udp.

For example:

Send packets with：

dl_dst=22:22:22:22:22:22,dl_src=22:11:11:11:11:11, dl_vlan=199,nw_dst=1.1.1.1,nw_src=2.2.2.2,udp,udp_src=1234,udp_dst=5678

And we will match udp source port and destination port with udf.

Configure udf:

```
admin@PicOS-OVS$ovs-vsctl set-udf-mode "udf0(l4,offset=0,length=4)"
```

Add flow.

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,table=250,udf0=0x04d2162e,actions=2
```

Macro UDF

From PicOS2.8.0, support a new format to add udf flow entry. Different from previous use (base, offset, length) to configure udf, user can use udf fields to configure it now.

1)Show all udf field.

```
admin@PicOS-OVS$ovs-vsctl show-udf-field
     Udf support fields:
    Match field                   layer       Offset      Length
    ------------------------------------------------------------
    dl_type                       l2          12          2
    vlan_inner                    l2          16          4
    mpls_outermost                l3          0           4
    ip_src                        l3          12          4
    ip_dst                        l3          16          4
    l2gre_key                     l3          24          4
    l2gre_ip_src_high             l3          52          4
    l2gre_ip_src_low_dst_high     l3          56          4
    l2gre_ip_dst_low              l3          60          2
    l2gre_ip_src_high_tag         l3          56          4
    l2gre_ip_src_low_dst_high_tag l3          60          4
    l2gre_ip_dst_low_tag          l3          64          2
```

```
    l4_port                      l4          0           4
    vxlan_vni                    l4          12          3
    vxlan_ip_src_high            l4          40          4
    vxlan_ip_src_low_dst_high    l4          44          4
    vxlan_ip_dst_low             l4          48          2
    vxlan_ip_src_high_tag        l4          44          4
    vxlan_ip_src_low_dst_high_tag l4         48          4
    vxlan_ip_dst_low_tag         l4          52          2
admin@PicOS-OVS$
```

2)configure macro udf.

```
admin@PicOS-OVS$ovs-vsctl set-macro-udf dl_type,ip_src,ip_dst
```

The match field can be any field in show-udf-field.

3)show udf mode.

```
admin@PicOS-OVS$ovs-vsctl show-udf-mode
```

or:

```
admin@PicOS-OVS$ovs-vsctl show-macro-udf
```

For example:

We will match vxlan vni for sending vxlan packets with vni=1122867.

1)Configure macro udf.

```
admin@PicOS-OVS$ovs-vsctl set-macro-udf vxlan_vni
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-vsctl show-udf-mode
  udf mode is udf0(l4,offset=12,length=3)
admin@PicOS-OVS$ovs-vsctl show-macro-udf
  macro udf mode is
 vxlan_vni : udf0(l4,offset=12,length=3)
admin@PicOS-OVS$
```

2)Add flow to macth vni.

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 table=250,udf0=0x112233,actions=3
```

1.l4 can not work with l2/l3.

2.If you want to configure l2 and l3 udf at the same time, the matched packets must be untag packets.

3.It cannot match the tag value which packets have one tag using macro udf.

UDF on TD3

Three commands you can use to show and set udf.

```
ovs-vsctl show-udf-base
ovs-vsctl show-udf-mode
ovs-vsctl set-udf-mode MODE
```

On trident3 platforms, using "ovs-vsctl show-udf-base" will show udf_v2 base types.

```
root@PICOS-OVS:~# ovs-vsctl show-udf-base
UDF_v2 base types:

 base-id    base-packet-format                                    description
 ----------------------------------------------------------------------------------------------------
 1          UdfAbstractPktFormatUnknownL3                 Abstract from the start of first byte after unknown ethertype.
 2          UdfAbstractPktFormatKnownNonIp                Abstract from the start of first byte after Known non-ip ethertype (other than Known IPv4/6 and FcoE/Mim/MPLS tunnels).
 3          UdfAbstractPktFormatKnownL3MplsOneLabel       Abstract from the start of MPLS Header with one label.
```

4	UdfAbstractPktFormatKnownL3MplsTwoLabel	Abstract from the start of MPLS Header with two labels.
5	UdfAbstractPktFormatUnknownL4	Abstract from the start of first byte of unknown L4 Header.
6	UdfAbstractPktFormatUdpUnknownL5	Abstract from the start of first byte of unknown L5 after UDP Header.
7	UdfAbstractPktFormatUdpVxlan	Abstract from the start of first byte of known L5 VXLAN header after UDP.
8	UdfAbstractPktFormatTcpUnknownL5	Abstract from the start of first byte of TCP.
9	UdfAbstractPktFormatGreWithoutKey	Abstract from the start of first byte of L4 header for GRE packets without key flag set (C=0/1, R=0/1 and K=0).
10	UdfAbstractPktFormatGreWithKey	Abstract from the start of first byte of L4 header for GRE packet

Users can set udf mode using command **"ovs-vsctl set-udf-mode "udf0(base=2,offset=0,length=2)"",**on td3 support 10 base ids. According to above descriptions of each base id to set the udf mode you need.

Match standard head in UDf mode

Prior to this, UDF match format can not mix with other OXM(OpenFlow Extensible Match) except for in_port in a flow. Now we remove the restriction from version 3.2. In UDF mode, we can use both UDF format and other standard header fields which are defined by OpenFlow as matching fields in the same flow.All the standard match fields in flows can be used with udf fields except for "ipv6_src, ipv6_dst, ipv6_label, mpls_label, mpls_label2, arp_op, arp_tpa, arp_spa, vn_tag, ingress_lag, tcp_flags, inner_vlan_vid and inner_vlan_pcp".

Note

- UDF match can only be used in Table 250 for flows.
- UDF flows have conflict witch arp and mpls flows which can not appear in hardware together
- Flows mixing standard match fields with UDF format have no influence on the capacity of UDF flows.
- UDF flows have the higher priority than normal flows because the group priority of UDF flows' is 1 while normal flow's is 0.
- In match mode, we add a new match mode **"udf_ext_ipv4"** to distinguish it from the old "udf" match mode. The available standard match fields for "udf_ext_ipv4" mode are the same to the normal UDF mode.
- All platforms except for TD(trident) support mixed UDF with more standard match fields in the same flow.

Non-match-mode

enable udf mode

```
ovs-vsctl set-udf-mode "udf0(l2,offset=12,length=4)"
```

add flow

```
ovs-ofctl add-flow br0 table=250,in_port=1,dl_dst=00:11:11:11:11:11,dl_src=00:22:22:22:22:22,dl_vlan=100,udf0=0x81(
```

Match-mode

In match mode,you must use "udf_ext_ipv4" group if you want to use udf and standard fields at the same time.And "udf_ext_ipv4" group also works well with other match mode groups.

set match mode and enable udf mode

```
ovs-vsctl set-match-mode udf_ext_ipv4=2000-3000
ovs-vsctl set-udf-mode "udf0(l2,offset=12,length=4)"
```

add flow

```
ovs-ofctl add-flow br0 table=250,in_port=1,priority=2000,dl_dst=00:11:11:11:11:11,dl_src=00:22:22:22:22:22,udf0=0x8
```

Goto_table

PicOS OVS supports goto_table on all platforms. When user dump-tables, tables 0 to 253 can be seen, but PicOS OVS only supports table 0. Also, flows will be merged as a flow to hardware when configuring flows with different tables.

Example 1. add flow entries with one goto action.

1) Add bridge

```
admin@PicOS-OVS$ovs-vsctl add-br br0 -- set bridge br0 datapath_type=pica8
```

2) Add ports to br0

```
admin@PicOS-OVS$ovs-vsctl add-port br0 ge-1/1/13 vlan_mode=trunk tag=1 -- set interface ge-1/1/13 type=pica8
admin@PicOS-OVS$ovs-vsctl add-port br0 ge-1/1/15 vlan_mode=trunk tag=1 -- set interface ge-1/1/15 type=pica8
admin@PicOS-OVS$ovs-vsctl add-port br0 ge-1/1/17 vlan_mode=trunk tag=1 -- set interface ge-1/1/17 type=pica8
```

3) Add flows with actions=goto_table:

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 priority=200,in_port=13,actions=goto_table:1
admin@PicOS-OVS$ovs-ofctl add-flow br0 table=1,priority=101,in_port=13,ip,nw_src=10.10.10.11,actions=15
```

After adding flows, check software table and hardware table:

```
admin@PicOS-OVS$ovs-ofctl dump-flows br0
OFPST_FLOW reply (OF1.4) (xid=0x2):
 flow_id=10, cookie=0x0, duration=18.552s, table=0, n_packets=n/a, n_bytes=0, priority=200,in_port=13 actions=goto_
 flow_id=11, cookie=0x0, duration=4.648s, table=1, n_packets=n/a, n_bytes=0, priority=101,ip,in_port=13,nw_src=10.1
admin@PicOS-OVS$ovs-appctl pica/dump-flows
#3 normal permanent flow_id=10 priority=200,ip,in_port=13,nw_src=10.10.10.11, actions:15
#0 normal_d permanent flow_id=2 priority=0, actions:drop
Total 2 flows in HW.
```

From the example above, two flow entries were merged as one flow entry in the hardware table, and we only use table=0. The priority of flow entry in hardware is decided by flow in table=0.

Example 2. add flow entries with two goto action.

Add flows:

```
admin@PicOS-OVS$ovs-ofctl add-flow br0 priority=200,in_port=13,actions=goto_table:1
admin@PicOS-OVS$ovs-ofctl add-flow br0 table=1,priority=101,in_port=13,ip,nw_src=10.10.10.11,actions=15
admin@PicOS-OVS$ovs-ofctl add-flow br0 table=1,priority=102,ip,nw_src=10.10.10.12,actions=goto_table:2
admin@PicOS-OVS$ovs-ofctl add-flow br0 table=2,priority=123,dl_dst=00:11:22:33:44:55,actions=17
admin@PicOS-OVS$
```

After adding flows, check software table and hardware table:

```
admin@PicOS-OVS$ovs-ofctl dump-flows br0
OFPST_FLOW reply (OF1.4) (xid=0x2):
 flow_id=6, cookie=0x0, duration=43.530s, table=0, n_packets=n/a, n_bytes=0, priority=200,in_port=13 actions=goto_t
 flow_id=8, cookie=0x0, duration=15.120s, table=1, n_packets=n/a, n_bytes=0, priority=102,ip,nw_src=10.10.10.12 act
 flow_id=7, cookie=0x0, duration=25.110s, table=1, n_packets=n/a, n_bytes=0, priority=101,ip,in_port=13,nw_src=10.1
 flow_id=9, cookie=0x0, duration=4.330s, table=2, n_packets=n/a, n_bytes=0, priority=123,dl_dst=00:11:22:33:44:55 a
admin@PicOS-OVS$ovs-appctl pica/dump-flows
#0 normal_d permanent flow_id=2 priority=0, actions:drop
#1 normal permanent flow_id=6 priority=200,ip,in_port=13,nw_src=10.10.10.11, actions:15
#2 normal permanent flow_id=6 priority=201,ip,in_port=13,dl_dst=00:11:22:33:44:55,nw_src=10.10.10.12, actions:17
Total 3 flows in HW.
admin@PicOS-OVS$
```

This example shows that four flow entries in table0 and table1 have goto action, so these flows are merged as two flows in hardware.

Optimizing TCAM Usage

- Configuring extend-group
- Configuring match-mode

Configuring extend-group

TCAM flow table support add arp/mpls and other normal flows. Due to ASIC limitation these flows cannot use one same slice, so we use group to devide these flows. In other words, arp and mpls flows use different groups from normal flow, we said them extend groups.

Before PicOS2.8.1, user can add these different groups flow at same time. From PicOS2.8.1, user also can add these flows at same time, but also can control disable or enable extend group for arp/mpls flows. The command as below,

ovs-vsctl disable-extend-group <TRUE|FALSE>

Once disable it, user will not allowed to add arp flow which include arp_tpa or arp_spa, and not allowed to add mpls flow include mpls_label. But support add dl_type=0x0806 and dl_type=0x8847/0x8848.

For example,

```
admin@PicOS-OVS$ovs-vsctl disable-extend-group TRUE
  Please reboot for the change to take effect!
admin@PicOS-OVS$sudo systemctl restart picos

.........................
admin@PicOS-OVS$ovs-pica8 entered promiscuous mode
device br0 entered promiscuous mode
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-vsctl show-extend-group
extend group: disabled
admin@PicOS-OVS$
```

Configuring match-mode

By default, 2 TCAM entries are used to support all matching tuples for all flows even if the flow does not use all matching tuples. All the groups below can be used in combination.

PicOS allows users to configure the switch in short flow TCAM match mode to optimize the TCAM usage, in this mode, each flow will only consume 1 TCAM entry (doubling the flows capacity in the TCAM).

When this mode is enabled (with the set-match-mode command), only specific fields can be used in the priority range defined by the command.Use " ovs-appctl pica /show tables" to check the max flows numbers can be installed to switch .

From version 2.11,pica8 switch support thirteen match mode groups.

The flows must use the exact fields described below:

mac(in_port: INGRESS_PORTS+INGRESS_LAG**):** ***"in_port,dl_src,dl_dst,dl_vlan,dl_type"***

mac_x(in_port: INGRESS_PORTS)**:** ***"in_port,dl_src,dl_dst,dl_vlan,dl_type"***

ip(in_port: INGRESS_PORTS+INGRESS_LAG)***: "in_port,nw_proto,nw_src,nw_dst,tp_src,tp_dst,dl_type=0x0800"***

ip_x(in_port: INGRESS_PORTS): ***"in_port,nw_proto,nw_src,nw_dst,tp_src,tp_dst,dl_type=0x0800"***

ipv4_quintuple(in_port: INGRESS_PORTS, dl_type: NONE): ***"in_port,dl_vlan,nw_src,nw_dst,tp_src,tp_dst,nw_proto,dl_type=0x0800"***

arp_tpa: ***"in_port,arp_tpa,dl_type=0x0806"***

arp_full: ***"in_port,dl_src,dl_dst,dl_vlan,arp_spa,arp_tpa,arp_op,dl_type=0x0806"***

arp_min: ***"in_port,arp_spa,arp_tpa,arp_op,dl_type=0x0806"***

l2l4: ***"in_port,dl_src,dl_dst,dl_vlan,dl_vlan_pcp,dl_type,nw_proto,nw_src,nw_dst,nw_tos,tp_src,tp_dst"***

ipv6_full:*"in_port,dl_vlan,ipv6_src,ipv6_dst,ipv6_label,tp_src,tp_dst,nw_proto,dl_type=0x86dd"* (from PicOS3.2.0, support ipv6_label in this group)

ipv6_src:*"in_port,dl_src,dl_dst,dl_vlan,ipv6_src,ipv6_label,nw_proto,dl_type=0x86dd"* (from PicOS3.2.0, support ipv6_label in this group)

ipv6_dst:*"in_port,dl_src,dl_dst,dl_vlan,ipv6_dst,ipv6_label,nw_proto,dl_type=0x86dd"* (from PicOS3.2.0, support ipv6_label in this group)

udf ***"in_port,udf0,udf1,udf2,udf3"***

You can use one or more fields in a match mode group.For example, if mac mode is enabled, all the flows must only use one or more fields defined in the mac mode. If mac and ip modes are enabled, then user can configure either mac flows or ip flows based on the fields described above. However, user cannot mixed the fields from mac and ip (that is, dl_src and nw_src).

Each match mode group is configured with a priority range. All the priorities can not be overlapped among all the match mode groups you configured.The max match mode groups you can configure in command "ovs-vsctl set-match-mode" must be not more than 10.

in the example below, all the flows between priority "10 and 1000" have to be Mac flows. All flows between 2000 and 20000 have to be IP flows and all flows between 30000 and 60000 have to be ARP flows, all flows between 50000 and 50001 have to be ipv6_full, all flows between 50002 and 50003 have to be ipv6_dst, all flows between 50004 and 60000 have to be ipv6_src.

1. all platforms support all the match mode groups from 2.11.
2. **all the vcap flows include l2gre encapsulation,vxlan encapsulation,push_pbb can not be supported.**
3. mac_x,ip_x,ipv4_quintuple match modes can not **match lag in port**.
4. udf mode is conflict with the arp match group.After enable udf mode,arp flow in arp match group can not be installed to flow table.
5. .ipv6 match mode group do not support vcap actions (eg:push_vlan,push_pbb)
6. The max flows of each match mode group has nothing to do with the numbers of match fields in a flow,but the width of the group ifself.
7. in tomahawk switch, nw_src or nw_dst is must added in ipv4_quintuple group.

From version 3.5,on trident3 chip' switches such as as7326_54x,add one command to enlarge max flow entries under match mode.The command and usage are as below:

command

ovs-vsctl disable-match-mode-inports TRUE|FALSE

true:do not enlarge the flow entries.

false:enlarge the flow entries

ovs-vsctl show-match-mode-inports

check the match-mode inports' status.

Test steps

step1:configure match mode

ovs-vsctl set-match-mode mac=1-100,mac_x=101-200 ...

step2:configure match-mode-inports

ovs-vsctl disable-match-mode-inports false

step3:add max flows in each match mode:

ovs-appctl pica/show tables

when "ovs-vsctl disable-match-mode-inports false",the max flow entries are as following:

match-mode	enable-inports(default)	disable-inports
mac	Double(3072)	IntraSliceDouble(9216)
mac_x	Double(3072)	IntraSliceDouble(9216)
ip	Double(3072)	IntraSliceDouble(9216)
ip_x	Double(3072)	IntraSliceDouble(9216)
ipv4_quintuple	Double(3072)	IntraSliceDouble(9216)
l2l4	Triple(3072)	Double(3072)
ipv6_full	Triple(3072)	Triple(3072)
ipv6_src	Triple(3072)	Double(3072)
ipv6_dst	Triple(3072)	Double(3072)
arp_tpa	IntraSliceDouble(9216)	IntraSliceDouble(9216)
arp_min	Double(3072)	IntraSliceDouble(9216)
arp_full	Double(3072)	Double(3072)
udf	IntraSliceDouble(9216)/Double(3072)	IntraSliceDouble(3072)
udf_ext_ipv4	Triple(3072)	Double(3072)/Triple(3072)

Examples

example1:arp_min group

Step1,set match mode to arp_min

```
ovs-vsctl set-match-mode arp_min=1-2000
```

Step2,add a flow

```
ovs-ofctl del-flows br0
ovs-ofctl add-flow br0 priority=1000,in_port=1,arp_spa=192.168.1.100,arp_tpa=192.168.2.100,arp_op=2,dl_type=0x0806,
ovs-appctl pica/dump-flows
```

Step3,send packets to te-1/1/1

a.Send arp packets with arp_spa is 192.168.1.100,arp tpa is 192.168.2.100,arp op is 2 to te-1/1/1

result:te-1/1/2 will transmit the arp packets.

b.Send arp packets with arp_spa is 192.168.1.100,arp tpa is 192.168.2.100,arp op is 1 to te-1/1/1

result:te-1/1/2 will not transmit the arp packets.

example2:l2l4 group

Step1,set match mode to l2l4 group

```
ovs-vsctl set-match-mode l2l4=1000-20000
```

Step2,add a flow with all match fields

```
ovs-ofctl del-flows br0
ovs-ofctl add-flow br0 priority=10000,in_port=1,vn_tag=0x01110222,dl_src=22:11:11:11:11:11,dl_dst=22:22:22:22:22:22
ovs-appctl pica/dump-flows
```

Step3,send packets to te-1/1/1

a.Send ip packets with vntag ethertype is 0x893f,vn_tag is 0x01110222,src mac is 22:11:11:11:11:11,dst mac is 22:22:22:22:22:22,dl_vlan=10,src ip is 192.168.1.100,dst ip is 192.168.2.100,vlan pcp is 3,nw_proto is 6,tos is 24,tp_src is 0x1000,tp_dst is 0x2000 to te-1/1/1.

result:te-1/1/2 will transmit the packets.

example3:udf match group

step1,set udf match mode

```
ovs-vsctl set-match-mode udf=2000-3000
```

step2,set udf mode

```
ovs-vsctl set-udf-mode "udf0(l2,offset=12,length=2)"
```

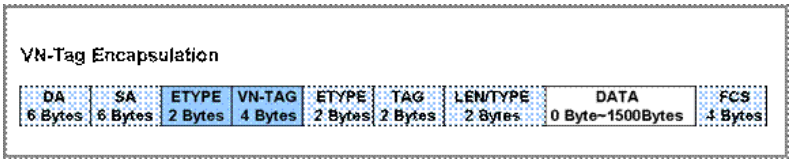
step3,add ipv4 flow with other priority except 2000-3000

```
ovs-ofctl add-flow br0 priority=500,table=250,in_port=1,udf0=0x0800,actions=14
```

VN-tag

From version 2.11,pica8 switch support vn-tag.This is a standard reported by VMware and Cisco,is a private technology of Cisco.Vn-tag is a tag before vlan in packets.Pica8 switch only support matching vn-tag and hashing by vn-tag.

1.packets format



16bits 1 1 14bits 1 1 2 12bits

| Ethertype | D | P | Dst_VIF | L | R | VER | Src_VIF |

---

2. detail description

Ethertype:pica8 switch can recognize two kinds of vn-tag packets with ethertype **0x8926 and 0x893f.**0x893f is the default ethertype of vn-tag packets switch can recognize.You can use command "ovs-vsctl set-vntag-ethertype **0x8926**" to set recognize another type of vn-tag packets.And use "ovs-vsctl show-vntag-ethertype" to show the current ethertype.

D|P ,L|R :can be 0 or 1,do not do any limitations.

Dst_vif:destination virtual interface.Can be any values.

Src_vif:source virtual interface.Can be any values.

3.matching vn-tag

Now support matching vn-tag in icap and udf table.Not support matching vn-tag in egress table.Examples as below.

```
admin@PICOS-OVS:~$ovs-vsctl set-vntag-ethertype 0x8926
admin@PICOS-OVS:~$ovs-ofctl del-flows br0
admin@PICOS-OVS:~$ovs-ofctl add-flow br0 vn_tag=0x33330000/0x3FFF0000,dl_dst=00:11:11:11:11:11,actions=2
Send packets with vntag 0x8926,dst mac is 00:11:11:11:11:11,vntag is 0x33330000 to te-1/1/1.te-1/1/2 will transmit
```

4.hashing according to dst_vif and src_vif

For pica8 switch,support dst_vif and src_vif hash fields in ecmp/lag advance hash mapping fields,For a lag port,only support dst_vif|src_vif hash fields in advance mode.Also support these two fields in **l3-ecmp-select-group** and **lag-advance-hash-mapping-fields**.By default,src_vif and dst_vif is disabled in the hash fields.Examples as below:

example1:

step1. set ethertype for VN-tag

```
admin@PICOS-OVS:~$ovs-vsctl set-vntag-ethertype 0x8926
admin@PICOS-OVS:~$ovs-vsctl show-vntag-ethertype
```

step2.add a ecmp select group

```
admin@PICOS-OVS:~$ovs-vsctl set-group-ranges ecmp-select-groups=1-200
admin@PICOS-OVS:~$sudo systemctl restart picos
admin@PICOS-OVS:~$ovs-ofctl add-group br0 group_id=20,type=select,bucket=set_field:44:44:44:11:11:11-\>dl_src,outpu
```

step3. add a flow only matching dvif

```
admin@PICOS-OVS:~$ovs-ofctl add-flow br0 vn_tag=0x01110000/0x3FFF0000,dl_dst=00:11:11:11:11:11,actions=group:20
admin@PICOS-OVS:~$ovs-ofctl dump-flows br0
admin@PICOS-OVS:~$ovs-appctl pica/dump-flows
```

step4.set ecmp hash field to svif

```
admin@PICOS-OVS:~$ovs-vsctl set-l3-ecmp-hash-fields src_vif
```

step5.send packets with vn-tag

Send 10000 vntag packets dst mac is 00:11:11:11:11:11,dvif is 0x0111,vntag ethertype is 8926,svif is changing,initial value is 001,changing 100
result:the packets will hash to the te-1/1/2 and te-1/1/3.te-1/1/2 will transmit the vntag packets with dst mac is switch mac,src mac is 44:44:44:11:11:11,te-1/1/3 will transmit the vntag packets with dst mac is switch mac,src mac is 66:66:66:11:11:11.

example2:

step1. set ethertype for VN-tag

```
admin@PICOS-OVS:~$ovs-vsctl set-vntag-ethertype 0x8926
admin@PICOS-OVS:~$ovs-vsctl show-vntag-ethertype
```

step2.add a lag select group

```
admin@PICOS-OVS:~$ovs-vsctl set-group-ranges lag-select-groups=201-300
admin@PICOS-OVS:~$sudo systemctl restart picos
admin@PICOS-OVS:~$ovs-ofctl add-group br0 group_id=220,type=select,bucket=set_field:44:44:44:11:11:11-\>dl_src,outp
```

step3. add a flow only matching dvif

```
admin@PICOS-OVS:~$ovs-ofctl del-flows br0
admin@PICOS-OVS:~$ovs-ofctl add-flow br0 vn_tag=0x01110000/0x3FFF0000,dl_dst=22:11:11:11:11:11,actions=group:220
admin@PICOS-OVS:~$ovs-ofctl dump-flows br0
admin@PICOS-OVS:~$ovs-appctl pica/dump-flows
```

step4.set ecmp hash field to svif

```
admin@PICOS-OVS:~$ovs-vsctl set-lag-advance-hash-mapping-fields src_vif
```

step5.send packets with vn-tag

Send 10000 vntag packets dst mac is 22:11:11:11:11:11,dvif is 0x0111,vntag ethertype is 8926,svif is changing,initial value is 001,changing 10

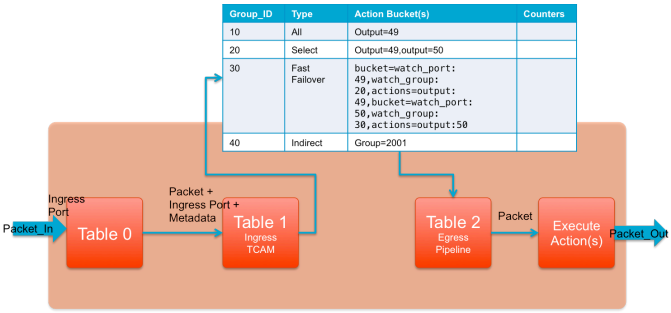
result:the packets will hash to the te-1/1/2 and te-1/1/3.te-1/1/2 and te-1/1/3 will transmit the vntag packets with dst mac is 22:11:11:11:11:11,src mac is 44:44:44:11:11:11.

Configuring Group

Creating a Group Table

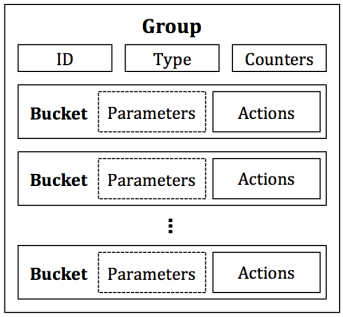
Group Tables

Group tables enable Openflow to process forwarding decisions on multiple links. Examples include: load-balancing, multicast, and active/standby.



The above figure illustrates how group-tables can simplify the configuration required to consolidate forwarding decisions for flows in an Openflow pipeline.

An **OpenFlow group** is an abstraction that facilitates more complex and specialized packet operations that cannot easily be performed through a flow table entry. Each group receives packets as input, and performs any OpenFlow actions on these packets. A group is not capable of performing any OpenFlow instructions, so it cannot send packets to other flow tables or meters. Furthermore, it is expected that packets have been matched appropriately prior to entry to a group, as groups do not support matching on packets. Groups are merely mechanisms to perform advanced actions, or sets of actions.



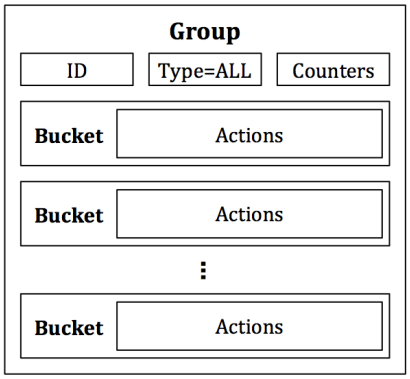
As shown in the above figure, the power of a group is that it contains separate lists of actions, and each individual action list is referred to as an **OpenFlow bucket**. Thus, it is said that a group contains a bucket list (or a list of lists of actions). Each bucket or list of buckets can be applied to entering packets; the exact behavior depends on the group type. There are certain types of groups that make use of additional parameters within a bucket. The details of these parameters will be discussed with each group type, where applicable.

There are four types of groups: **ALL**, **SELECT**, **INDIRECT**, and **FAST-FAILOVER**.

1. PicOS OVS supports group tables in Openflow 1.2 Openflow 1.3 and Openflow 1.4
2. The number of buckets supported is dependent on the TCAM size in the ASIC. So there is a possibility that all defined group tables will not be installed in hardware.
3. Max group number is 512, and max bucket number in one group is 128.

The ALL Group

Starting with one of the simplest, the **ALL group**, illustrated in the following figure, will take any packet received as input, and duplicate it to be operated on independently by each bucket in the bucket list. In this way, an ALL group can be used to replicate and then operate on separate copies of the packet defined by the actions in each bucket. Different and distinct actions can be in each bucket, which allows different operations to be performed on different copies of the packet.



Limitation in PicOS switch:

Due to limitation in the ASIC, PicOS OVS switches do not support replicating the packet and then operating by the actions in each bucket. So if user wants to configure type=all group, the actions of different buckets must be same. In other word, all the buckets need be uniform.

Example:

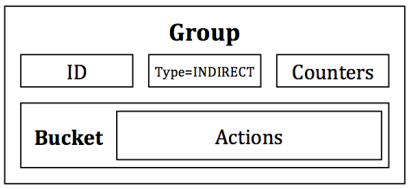
```
admin@PicOS-OVS$ovs-ofctl add-group br0 group_id=20,type=all,bucket=mod_dl_src=00:00:00:11:11:11,mod_dl_dst=22:22:2
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=11,dl_src=22:11:11:11:11:11,dl_dst=22:00:00:00:00:00,dl_type=0x0800

admin@PicOS-OVS$ovs-ofctl dump-groups br0 20
OFPST_GROUP_DESC reply (OF1.4) (xid=0x2):
 group_id=20,type=all,bucket=actions=set_field:00:00:00:11:11:11->eth_src,set_field:22:22:22:00:00:00->eth_dst,outp

admin@PicOS-OVS$ovs-appctl pica/dump-flows
#134 normal permanent recirc_id=0,tcp,in_port=11,dl_src=22:11:11:11:11:11,dl_dst=22:00:00:00:00:00,nw_src=1.1.2.10(
```

The INDIRECT Group

The **INDIRECT group** illustrated in the figure below, can be difficult to comprehend as a “group,” since it contains only a single bucket, where all packets received by the group are sent to this lone bucket. In other words, the INDIRECT group does not contain a list of buckets but a single bucket (or single list of actions) instead. The purpose of the INDIRECT group is to encapsulate a common set of actions used by many flows. For example, if flows A, B, and C match on different packet headers but have a common set or subset of actions, these flows can send packets to the single INDIRECT group as opposed to having to duplicate the list of common actions for each flow. The INDIRECT group is used to simplify an OpenFlow deployment and reduce the memory footprint of a set of similar flows.



```
admin@PicOS-OVS$ovs-ofctl add-group br0 group_id=30,type=indirect,bucket=mod_dl_src=00:00:00:11:11:11,mod_dl_dst=22
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=11,dl_src=22:11:11:11:11:11,dl_dst=22:00:00:00:00:00,dl_type=0x0800
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=11,dl_src=22:11:11:11:11:22,dl_dst=22:00:00:00:00:00,dl_type=0x0800

admin@PicOS-OVS$ovs-ofctl dump-flows br0
OFPST_FLOW reply (OF1.4) (xid=0x2):
 cookie=0x0, duration=7.342s, table=0, n_packets=n/a, n_bytes=0, tcp,in_port=11,dl_src=22:11:11:11:11:22,dl_dst=22
 cookie=0x0, duration=31.446s, table=0, n_packets=n/a, n_bytes=0, tcp,in_port=11,dl_src=22:11:11:11:11:11,dl_dst=22

admin@PicOS-OVS$ovs-appctl pica/dump-flows
#136 normal permanent recirc_id=0,tcp,in_port=11,dl_src=22:11:11:11:11:22,dl_dst=22:00:00:00:00:00,nw_src=1.1.2.20(
#135 normal permanent recirc_id=0,tcp,in_port=11,dl_src=22:11:11:11:11:11,dl_dst=22:00:00:00:00:00,nw_src=1.1.2.10(
```

The FAST-FAILOVER Group

Lastly, the **FAST-FAILOVER group** is the topic of conversation for this tutorial and is designed specifically to detect and overcome port failures. Like the SELECT and ALL groups, the FAST-FAILOVER group, as indicated in **Figure 5**, has a list of buckets. In addition to this list of actions, each bucket has a **watch port** and/or **watch group** as a special parameter. The watch port/group will monitor the “liveness” or up/down status of the indicated port/group. If the status is deemed to be down, then the bucket will not be used. If it is determined to be up, then the bucket can be used. Only one bucket can be used at a time, and the bucket in use will not be changed unless the status of the watch port/group transitions from up to down. When such an event occurs, the FAST-FAILOVER group will quickly select the next bucket in the bucket list with a watch port/group that is up.

Actually, watch group is not supported in PicOS.

There is no guarantee on the transition time to select a new bucket when a failure occurs. The transition time is dependent on search time to find a watch port/group that is up and on the switch implementation. However, the motivation behind using a FAST-FAILOVER group is that it is almost guaranteed to be quicker than consulting the control plane to handle the port down event, and inserting a new flow or set of flows. With FAST-FAILOVER groups, link failure detection and recovery takes place entirely in the data plane.

```
admin@PicOS-OVS$ovs-ofctl add-group br0 group_id=1,type=fast_failover,bucket=watch_port:1,output:1
admin@PicOS-OVS$ovs-ofctl add-group br0 group_id=2,type=fast_failover,bucket=watch_port:2,output:2
admin@PicOS-OVS$ovs-ofctl add-group br0 group_id=3,type=fast_failover,bucket=watch_port:3,watch_group:1,output:5,bu

admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=11,dl_src=22:11:11:11:11:11,dl_dst=22:00:00:00:00:00,dl_type=0x0800
```

The SELECT Group

Next, there is the **SELECT group**, which is primarily designed for load balancing. As indicated in the following figure, each bucket in a SELECT group has an assigned weight, and each packet that enters the group is sent to a single bucket. The bucket selection algorithm is undefined and is dependent on the switch's implementation; however, weighted round robin is perhaps the most obvious and simplest choice of packet distribution to buckets. The weight of a bucket is provided as a special parameter to each bucket. Each bucket in a SELECT group is still a list of actions, so any actions supported by OpenFlow can be used in each bucket, and the buckets need not be uniform.

> ⚠ PicOS does **not** support weight. Because OVS forward is based on priority of entries in TCAM, the traditional ECMP in routing table cannot be used. For a typical IP flow, PicOS implements a "dummy ECMP" by splitting the matching fields of a flow. For a group-table with type=select, PicOS support set-select-group-hash-fields and the packets will hash according to the value of set-select-group-hash-fields.

The command added for setting select-group hash fields is:

```
ovs-vsctl set-select-group-hash-fields [FIELDS]
FIELDS: default or some of [nw_src, nw_dst, dl_src, dl_dst] spliced by ",".

In the default mode the order is "nw_src, nw_dst, dl_src, dl_dst", so will check the first filed "nw_src" and find
```

Description: This command takes at most 1 argument that specifies match fields to do hash for select-group, these match fields should be spliced by "," with descending priority and must use the constrained fields list above. If there is 0 argument token or 1 argument with string "default", the default mode will take effect.

The priority for match fields means that when match fields are set, they will be checked in sequence to select one can do hash. If select fails, the first field in the configured match fields will be picked on and only one bucket can be used.

In default mode, the check order is "nw_src, nw_dst, dl_src, dl_dst" with non-zero field mask. If select failed, check the order "nw_src, nw_dst, dl_src, dl_dst" with field mask equals zero again.

If the selected field is an exact value, means all mask bits are "1", then only one bucket can be used.

> ⚠
>
> "When user want the traffic match nw_src or nw_dst to hash, the flow entry match field must include dl_type=0x0800. If not include dl_type=0x0800, the flow entry only hash by dl_src and dl_dst.ovs-ofctl add-flow br0 in_port=1,dl_type=0x0800,actions=output:2"

Example

```
1. If the match field does not include dl_type=0x0800.

set-select-group-hash-fields: dl_src,dl_dst
admin@PicOS-OVS$ovs-vsctl set-select-group-hash-fields dl_src,dl_dst
admin@PicOS-OVS$ovs-vsctl show-select-group-hash-fields
select_group_hash_fields: dl_src,dl_dst

1> There is no dl_src or dl_dst in flow match field, use dl_src for hashing,
admin@PicOS-OVS$ovs-ofctl add-group br0 group_id=1,type=select,bucket=output:14,bucket=output:25,bucket=output:38
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=1,actions=group:1
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-appctl pica/dump-flows

Ecmp Select Group

From PicOS 2.8.0, Pica8 switch supports the traffic which has processed in TCAM, still can hash as ecmp interface or lag interface.

In prior PicOS version, the traffic in TCAM table only could hash as select group, refer to chapter 'Creating a Group Table,' the hash algorithm is defined by the designer. But from the new version, user can use ecmp or lag to process traffic.

> 1, 'dec_ttl' only can be used in table=252 route table and ecmp-select-group, others will neglect it.
>
> Once configure ecmp-select-group, L2 table (table=251) cannot work.
>
> 2, Platforms P-3290/P-3295/P-3297 do not support configure ecmp-group.
>
> 3, The max ecmp group buckets number is 32.
>
> 4.When ecmp-select-group has been configured,the following functions cannot work.
>
> vxlan,gre,l2gre;
>
> push_pbb,pop_pbb;
>
> push_mpls,pop_mpls
>
> push_l2mpls,pop_l2mpls.

In default, ecmp and lag hash cannot work in TCAM table, user needs to use group table to define them. 'lag-select-groups=0-0' means the group ID range is 0-0, that is disable lag-select-groups. Same as others.

The command to show the ranges of ecmp-select-groups and lag-select-groups.

```
admin@PicOS-OVS$ovs-vsctl show-group-ranges
group_ranges: default
  lag-select-groups=0-0
  ecmp-select-groups=0-0
  ingress-mirror-groups=0-0
  egress-mirror-groups=0-0
```

ECMP Select Group

Select group uses ecmp, create an ecmp interface for each select group, and the ecmp interface contains egress interfaces which correspond to buckets in the group.

The command to configure ecmp-select-group ID range:

ovs-vsctl set-group-ranges ecmp-select-groups=<*min_value*>-<*max_value*>

The group IDs may be divided into different areas: ecmp-select-groups and the original groups. Ecmp-select-groups ranges is <*min_value*>-<*max_value*> and the rest of group IDs for original groups. The max range of group is 1-4294967039.

After configuring the command, user needs to reboot switch.

Use command **ovs-vsctl set-group-ranges** to back default group ranges.

```
admin@PicOS-OVS$ovs-vsctl set-group-ranges ecmp-select-groups=1-10000
admin@PicOS-OVS$ovs-vsctl show-group-ranges
group_ranges:
  lag-select-groups=0-0
  ecmp-select-groups=1-10000
  ingress-mirror-groups=0-0
  egress-mirror-groups=0-0
```

In ecmp select group can modify dl_dst, dl_src, dl_vlan, dec_ttl and set_queue. And the actions must be same in different buckets, the value can be the same or not.

If dec_ttl is set or set_field with vlan_vid,dl_src or dl_dst is set in an ecmp select group flow's actions, the ecmp will modify packet's corresponding field. If the fields are not set in an ecmp select group flow, the value also will be modified via L3 ecmp interface, and dl_src and dl_dst will be switch system mac and ttl will decrease.

User can use command 'set-l3-egress-keep-fields' to keep the field as original value.

ovs-vsctl set-l3-egress-keep-fields *[FIELDS]*

[FIELDS] allows one or more value of *{dl_vlan, dl_src, dl_dst, nw_ttl}.* If not special configure *[FIELDS]* , will back default value and the fields will be modified by L3 ecmp interface.

> During add flow entry whose actions include ecmp-select-group, other actions fields only support above fields: dl_src, dl_src, dl_vlan, dec_ttl and set_queue.

ovs-vsctl set-l3-ecmp-hash-fields *[FIELDS]*

<FIELDS> allowed values in_port, nw_dst, nw_proto, nw_src, port_dst, port_src, vlan, src_vif, dst_vif, gtp_teid. If not special configure <*FIELDS],* the default value is nw_src. If user want configure multiple values, should use blank.

```
admin@PicOS-OVS$ovs-vsctl set-l3-ecmp-hash-fields in_port nw_dst
```

Example 1

Set group 1 as an ecmp select group, modify dl_vlan, dl_src and dl_dst, dec ttl.

```
admin@PicOS-OVS$ovs-ofctl add-group br0 group_id=1,type=select,bucket=set_field:10-\>vlan_vid,set_field:00:00:00:22
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=31,ip,actions=group:1

admin@PicOS-OVS$ovs-appctl pica/dump-flows
#0 normal_d permanent flow_id=2 priority=0, actions:drop
#1 normal permanent flow_id=6 (ecmp select group) in_port=31, actions:egress_dec_ttl,set(eth(src=00:00:00:22:22:22
Total 2 flows in HW.
```

Example 2

Set group 1 as an ecmp select group, do not change dl_vlan,dl_src,dl_dst and ttl.

vlan_vid,dl_src and dl_dst are not set in an ecmp select group flow, and packet's corresponding fields stay unchanged.

```
admin@PicOS-OVS$ovs-vsctl set-l3-egress-keep-fields dl_vlan,dl_src,dl_dst,nw_ttl

admin@PicOS-OVS$ovs-ofctl add-group br0 group_id=1,type=select,bucket=output:33,bucket=output:34
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=31,dl_vlan=30,dl_dst=00:00:00:11:11:11,actions=group:1

admin@PicOS-OVS$ovs-appctl pica/dump-flows
#0 normal_d permanent flow_id=2 priority=0, actions:drop
#2 normal permanent flow_id=8 (ecmp select group) in_port=31,dl_vlan=30,dl_dst=00:00:00:11:11:11, actions:33,34
Total 2 flows in HW.
```

Example 3

Set group 1 as an ecmp select group, modify dl_vlan, dl_src only and other packet's corresponding fields stay unchanged.

```
admin@PicOS-OVS$ovs-vsctl set-l3-egress-keep-fields dl_dst,nw_ttl

admin@PicOS-OVS$ovs-ofctl add-group br0 group_id=1,type=select,bucket=set_field:10-\>vlan_vid,set_field:00:00:00:22
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=31,actions=group:1

admin@PicOS-OVS$ovs-appctl pica/dump-flows
#0 normal_d permanent flow_id=2 priority=0, actions:drop
#3 normal permanent flow_id=9 (ecmp select group) in_port=31, actions:set(eth_src((src=00:00:00:22:22:22))),set_vla
Total 2 flows in HW.
```

LAG Select Group

LAG Select Group

If user wants the traffic load balance like lag interface and doesn't want special configuration lag interface, lag select group is one choice.

Select group uses lag, create an lag interface for each select group, and the lag interface contains egress interfaces which corresponds to buckets in the group.

> PICOS reserve ae1 to ae20 for static lag configuration, ae21 to ae48 use the internal lag for select group.
>
> PICOS will create internal lag when the user creates a lag select group. It only uses the first bucket actions except the output. It means that we can support 24 lag select groups.
>
> The physical port which has added in lag-select-group cannot be used in other groups and cannot work as one physical port.

Before add lag select group, user need configure group range.

The command to configure lag-select-group ID range:

ovs-vsctl set-group-ranges lag-select-groups=<*min_value*>-<*max_value*>

The group IDs may be divided into different areas: lag-select-groups and the original groups. Lag-select-groups ranges is <*min_value*>-<*max_value*> and the rest of group IDs for original groups. After configure the command, user needs to reboot switch.

```
admin@PicOS-OVS$ovs-vsctl set-group-ranges lag-select-groups=1-10000
admin@PicOS-OVS$ovs-vsctl show-group-ranges
group_ranges:
  lag-select-groups=1-10000
  ecmp-select-groups=0-0
  ingress-mirror-groups=0-0
  egress-mirror-groups=0-0
```

In lag select group can modify any fields switch support. And the actions must be configured in first bucket, other buckets only include output.

Example 1

Set group 1 as a lag select group, modify dl_vlan and dl_dst.

```
 admin@PicOS-OVS$ovs-ofctl add-group br0 group_id=1,type=select,bucket=set_field:1000-\>vlan_vid,set_field:00:00:0(
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=31,actions=group:1
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-appctl pica/dump-flows
#0 normal_d permanent flow_id=2 priority=0, actions:drop
#1 normal permanent flow_id=6 (lag select group) in_port=31, actions:set(eth_dst((dst=00:00:00:11:11:11))),set_vlar
Total 2 flows in HW.
```

Close all Group-ranges

If user want close the group-ranges, please use command as below.

ovs-vsctl set-group-ranges

```
admin@PicOS-OVS$ovs-vsctl set-group-ranges
admin@PicOS-OVS$ovs-vsctl show-group-ranges
group_ranges:
  lag-select-groups=0-0
  ecmp-select-groups=0-0
  ingress-mirror-groups=0-0
  egress-mirror-groups=0-0
```

Mirror Group

From PicOS 2.8.0, Pica8 switch support ingress-mirror-group and egress-mirror-group.

- Ingress-mirror-group: Packets can modify corresponding fields and send out from one port, at the same time the packets also can keep original and send out from other ports.
- Egress-mirror-group: Packets can modify corresponding fields send out from one port, also can send out from another port at same time.

Using configure type=all group to create ingress-mirror-group or egress-mirror-group.

- Ingress-mirror-group: Only support 2 buckets, the first bucket process packets as normal, use the second bucket to mirror original packets at ingress and send out from one physical port or lag interface.
- Egress-mirror-group: Only support 2 buckets, the first bucket process packets as normal, use the second bucket to mirror modified packets at egress and send out from one physical port or lag interface.

We said the output in second bucket as monitor port.

> 1. ingress/Egress mirror group only support configure 2 buckets; Monitor port can be physical port/lag port/lag-select-group.
>
> 2. lag-select-group can include multiple ports, but if lag-select-group as monitor port only first eight ports can work.
>
> 3. only support add 4 monitor port (include ingress+egress) at most.
>
> 4. ingress/egress mirror group only can configure in table=0 flow entry.
>
> 5. ingress/egress mirror group cannot configure dec_tll in bucket.
>
> 6.do not support any other actions except ingress/egress mirror group in a flow's action.All actions you want to use must be added to the first bucket of the ingress/egress mirror-group.

In default, ingress/egress-mirror-groups is disabled, user need use command to configure them. 'ingress-mirror-groups=0-0' means the group ID range is 0-0, that is disable ingress-mirror-groups.

The command to show the ranges of ingress-mirror-groups and egress-mirror-groups.

```
admin@PicOS-OVS$ovs-vsctl show-group-ranges
group_ranges: default
  lag-select-groups=0-0
  ecmp-select-groups=0-0
  ingress-mirror-groups=0-0
  egress-mirror-groups=0-0
```

The command to configure ingress-mirror-group and egress-mirror-group ID range:

ovs-vsctl set-group-ranges ingress-mirror-groups=*<min_value>-<max_value>*

or

ovs-vsctl set-group-ranges egress-mirror-groups=*<min_value>-<max_value>*

or

ovs-vsctl set-group-ranges ingress-mirror-groups=*<min_value1>-<max_value1>*,egress-mirror-groups=*<min_value2>-<max_value2>*

The group IDs may be divided into different areas: ingress-mirror-groups, egress-mirror-group and the original groups. The max range of group is 1-4294967039, and if configure different group the group range cannot conflict.

After configure the command, user need reboot switch.

Use command 'ovs-vsctl set-group-ranges' to back default group ranges.

```
admin@PicOS-OVS$ovs-vsctl set-group-ranges ingress-mirror-groups=1-10000,egress-mirror-groups=20000-30000

admin@PicOS-OVS$ovs-vsctl show-group-ranges
group_ranges:
  lag-select-groups=0-0
  ecmp-select-groups=0-0
  ingress-mirror-groups=1-10000
  egress-mirror-groups=20000-30000
```

Example 1

And ingress-mirror-group, first bucket modify packet's fields dl_vlan and dl_dst.

```
admin@PicOS-OVS$ovs-ofctl add-group br0 group_id=100,type=all,bucket=set_field:100-\>vlan_vid,set_field:22:00:00:0(
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=31,dl_dst=22:11:11:11:11:11,actions=group:100
admin@PicOS-OVS$
```

```
admin@PicOS-OVS$ovs-appctl pica/dump-flows
#0 normal_d permanent flow_id=2 priority=0, actions:drop
#1 normal permanent flow_id=6 (ingress mirror group) in_port=31,dl_dst=22:11:11:11:11:11, actions:set(eth_dst((dst=
Total 2 flows in HW.
admin@PicOS-OVS$
```

Example 2

And egress-mirror-group, first bucket modify packet's fields dl_src and dl_dst, second bucket is lag interface.

```
admin@PicOS-OVS$ovs-vsctl add-port br0 ae1 vlan_mode=trunk tag=1 -- set interface ae1 type=pica8_lag options:membe
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-ofctl add-group br0 group_id=20010,type=all,bucket=set_field:00:00:00:11:11:11-\>eth_src,set_f
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-ofctl add-flow br0 in_port=31,actions=group:20010
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-appctl pica/dump-flows
#0 normal_d permanent flow_id=2 priority=0, actions:drop
#2 normal permanent flow_id=7 (egress mirror group) in_port=31, actions:set(eth(src=00:00:00:11:11:11,dst=00:00:00
Total 2 flows in HW.
```

Close all Group-ranges

If user want close the group-ranges, please use command as below.

ovs-vsctl set-group-ranges

```
admin@PicOS-OVS$ovs-vsctl set-group-ranges
admin@PicOS-OVS$ovs-vsctl show-group-ranges
group_ranges:
  lag-select-groups=0-0
  ecmp-select-groups=0-0
  ingress-mirror-groups=0-0
  egress-mirror-groups=0-0
```

Configuring Controller or Manager

Connecting to a Controller

Use the OVSDB protocol to connect to a controller. The **ovs-vsctl** command requires an IP address and a port number on the OVS database server. In the example below, the switch connects to an OF controller with an IP address of 10.10.53.50, and port number of 6633.

```
root@PicOS-OVS# ovs-vsctl set-controller br0 tcp:10.10.53.50:6633
root@PicOS-OVS#
```

Verify connectivity with the controller:

```
admin@PicOS-OVS$ovs-vsctl show

101c4a95-2973-4aeb-9c0a-a04380950b4d
    Bridge "br0"
        Controller "tcp:10.10.53.50:6633"
            is_connected: true
        Port "te-1/1/50"
            tag: 1
            Interface "te-1/1/50"
                type: "pica8"
        Port "ge-1/1/48"
            tag: 1
            Interface "ge-1/1/48"
                type: "pica8"
        Port "br0"
            Interface "br0"
               type: internal
```

Check detailed controller status. A properly working controller configuration would appear as:

```
admin@PicOS-OVS$ovs-vsctl list controller

_uuid               : f35735f3-1d62-45ba-967e-59e324d1e150
auxiliary           : {}
connection_mode     : []
controller_burst_limit: []
controller_rate_limit: []
enable_async_messages: []
external_ids        : {}
inactivity_probe    : []
is_connected        : true
local_gateway       : []
local_ip            : []
local_netmask       : []
max_backoff         : []
other_config        : {}
role                : other
status              : {current_version="OpenFlow13", sec_since_connect="20", state=ACTIVE}
target              : "tcp:10.10.53.50:6633"
```

In the event of an error in the bridge configuration, such as a mismatch in the open flow version, the output would appear as:

```
admin@PicOS-OVS$ovs-vsctl list controller

_uuid               : f35735f3-1d62-45ba-967e-59e324d1e150
auxiliary           : {}
connection_mode     : []
controller_burst_limit: []
controller_rate_limit: []
```

```
enable_async_messages: []
external_ids        : {}
inactivity_probe    : []
is_connected        : true
local_gateway       : []
local_ip            : []
local_netmask       : []
max_backoff         : []
other_config        : {}
role                : other
status              : {last_error="Connection refused", sec_since_connect="7713",sec_since_disconnect="7721", state
target              : "tcp:10.10.53.50:6633"
```

Modify Openflow Protocol

PicOS supports openflow1.0, openflow1.2, openflow1.3, openflow1.4 default, if user wants special configuration openflow protocol number, the command is below.

ovs-vsctl set bridge br0 protocol=<OpenFlow protocol number>

```
admin@PicOS-OVS$ovs-vsctl set bridge br0 protocol=OpenFlow13
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-vsctl set bridge br0 protocol=OpenFlow10,OpenFlow13
```

Connection Mode between Bridge and Controller

From PicOS 2.4, the default connection between one bridge and all the controllers is in-band mode. User can configure to disable it, using the command as shown below.

ovs-vsctl set bridge br0 other_config=disable-in-band=<true|false>

Disable in-band mode. After disable in-band is done, all the controllers must use out-of-band mode connection to bridge, which means only the management port can be used to connect.

```
ovs-vsctl set bridge br0 other_config=disable-in-band=true
```

Enable in-band mode, all the controllers can use in-band connect to bridge.

```
ovs-vsctl set bridge br0 other_config=disable-in-band=false
```

If enabling in-band in bridge, user also can configure in-band or out-of-band in one single controller. That mean that this controller only uses out-of-band, Others still use in-band connect to bridge.

ovs-vsctl set controller [_uuid] connection_mode=out-of-band

```
admin@PicOS-OVS$ovs-vsctl list controller
_uuid               : 7f651b3b-4b0d-4d9b-b6e5-fe67499be1c4
auxiliary           : {}
connection_mode     : in-band
controller_burst_limit: []
controller_rate_limit: []
enable_async_messages: []
external_ids        : {}
inactivity_probe    : []
is_connected        : false
local_gateway       : []
local_ip            : []
local_netmask       : []
max_backoff         : []
other_config        : {}
role                : other
status              : {last_error="Network is unreachable", state=BACKOFF}
target              : "tcp:10.10.50.42:6653"
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-vsctl set controller 7f651b3b-4b0d-4d9b-b6e5-fe67499be1c4 connection_mode=out-of-band
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-vsctl list controller
_uuid               : 7f651b3b-4b0d-4d9b-b6e5-fe67499be1c4
auxiliary           : {}
connection_mode     : out-of-band
controller_burst_limit: []
controller_rate_limit: []
```

```
enable_async_messages: []
external_ids        : {}
inactivity_probe    : []
is_connected        : false
local_gateway       : []
local_ip            : []
local_netmask       : []
max_backoff         : []
other_config        : {}
role                : other
status              : {last_error="Network is unreachable", state=BACKOFF}
target              : "tcp:10.10.50.42:6653"
```

Auxiliary Connections

PicOS OVS supports Auxiliary connections to the controller. Auxiliary connections configuration is based on the OVS controller. When the user wants to use it, they must first configure auxiliary in the controller list.

ovs-vsctl set controller {uuid} auxiliary:{id}={udp | tcp}

Auxiliary configuration has two parameters:

- The first is Auxiliary ID, an integer that identifies auxiliary connections.

And the range is [1, 255].

- The second is a string that specifies the transport of auxiliary connection.

And now we only support “udp” and “tcp”.

Example:

Step 1: Assume there is a controller “tcp:10.10.51.16:6633” on Bridge br0 using this:

Firstly, get uuid of the controller using this:

```
ovs-vsctl set-controller br0 tcp:10.10.51.50:6633
```

Step 2: Get controller uuid:

```
ovs-vsctl list controller
admin@PicOS-OVS$ovs-vsctl list controller
_uuid               : 6eb5d036-87af-44ca-aa58-2b916ae126f4
auxiliary           : {}
connection_mode     : []
controller_burst_limit: []
controller_rate_limit: []
enable_async_messages: []
external_ids        : {}
inactivity_probe    : []
is_connected        : false
local_gateway       : []
local_ip            : []
local_netmask       : []
max_backoff         : []
other_config        : {}
role                : other
status              : {last_error="Connection refused", sec_since_disconnect="1", state=BACKOFF}
target              : "tcp:10.10.51.50:6633"
```

Step 3:

```
admin@PicOS-OVS$ovs-vsctl set controller 6eb5d036-87af-44ca-aa58-2b916ae126f4 auxiliary:1=udp
```

Configure Flow Table Flush once set or delete controller

ovs-vsctl set bridge br0 other_config:enable-flush=<true|false>

In PicOS OVS switch, the flow table will be cleared when user uses the **set-controller** command for the bridge. Starting with PicOS 2.6, user can define if the flow table is flushed or not by the **set-controller** and **del-controller** commands.

The flow table is flushed when **enable-flush=true**. The flow table is not flushed when **enable-flush=false**. The default value is **enable-flush=true**.

```
ovs-vsctl set bridge br0 other_config:enable-flush=true
ovs-vsctl set bridge br0 other_config:enable-flush=false
```

Display the configuration.

```
ovs-vsctl list Bridge
ovs-vsctl list bridge br0
```

Connecting to Manager

PicOS OVS supports connection to Manager.

Command to set manager as below,

```
admin@PicOS-OVS$ovs-vsctl set-manager ptcp:6640:10.10.51.49
or
admin@PicOS-OVS$ovs-vsctl set-manager tcp:10.10.51.49:6640
```

Before PicOS 2.6.5, manager is not supported by default. If user wants to connect manager, ovsdb-server must be restarted.

```
Kill following ovsdb-server:
ovsdb-server /ovs/ovs-vswitchd.conf.db /ovs/inventory.conf.db --pidfile --remote=ptcp:6640:10.10.51.138 --remote=pu

Then run ovsdb-server with --remote=db:Open_vSwitch,Manager,target:
ovsdb-server /ovs/ovs-vswitchd.conf.db /ovs/inventory.conf.db --pidfile --remote=ptcp:6640:10.10.51.138 --remote=pu
```

From PicOS 2.6.5, manager supported in ovsdb-server. Once user configures “ovs-vsctl set-manager tcp:10.10.51.49:6640”, user can connect manager by remote.

```
root@PicOS-OVS$ps aux | grep ovsdb-server
root      9598  0.1  0.1   7256  2816 pts/0    S    18:00   0:00 ovsdb-server /ovs/ovs-vswitchd.conf.db /tmp/invent
```

Before PicOS 2.7.1, when using command “ovs-vsctl set-manager tcp:10.10.51.49:6640” to connect manager, the manager’s “is_connected” is false, such like:

```
root@PicOS-OVS$ovs-vsctl list manager
_uuid               : 3cd2a235-6921-4580-a093-a3dd96431cc4
connection_mode     : []
external_ids        : {}
inactivity_probe    : []
is_connected        : false
max_backoff         : []
other_config        : {}
status              : {}
target              : "tcp:10.10.51.49:6640"
```

The behavior depends on the “remote” configuration.

If the “remote” is “db: Open_vSwitch,Manager, target”, the manager status will not be refreshed.

```
root@PicOS-OVS$ps aux | grep ovsdb-server
root      9598  0.1  0.1   7256  2816 pts/0    S    18:00   0:00 ovsdb-server /ovs/ovs-vswitchd.conf.db /tmp/invent
```

If the “remote” is “db: Open_vSwitch, Open_vSwitch, manager_options”, the manager status will be displayed right.

We can change the boot argument:

```
ovsdb-server /ovs/ovs-vswitchd.conf.db /tmp/inventory.conf.db /ovs/function.conf.db --pidfile --remote=ptcp:6640:12
```

Or we can use command to add this “remote”:

```
root@PicOS-OVS$ovs-appctl -t ovsdb-server ovsdb-server/add-remote db:Open_vSwitch,Open_vSwitch,manager_options
root@PicOS-OVS$ovs-vsctl list manager
_uuid               : 3cd2a235-6921-4580-a093-a3dd96431cc4
connection_mode     : []
external_ids        : {}
inactivity_probe    : []
is_connected        : true
max_backoff         : []
other_config        : {}
status              : {sec_since_connect="6", state=ACTIVE}
```

```
target              : "tcp:10.10.51.49:6640"
```

We can delete manager using command:

```
admin@PicOS-OVS$ovs-vsctl del-manager
```

From PicOS 2.7.1, user can list manager status correctly without re-configure ovsdb-server.

Creating SSL Connection to a Controller

- Creating SSL Connection to a RYU Controller
- Configure OVS Connection Using SSL with Self-signed Certificates

Creating SSL Connection to a RYU Controller

This section describes the procedure to create an SSL connection with the RYU controller.

PicOS Switch

The following steps need to be completed on the PicOS switch:

```
root@PicOS-OVS#apt-get install openssl
Reading package lists... Done
Building dependency tree
Reading state information... Done
Suggested packages:
  ca-certificates
The following NEW packages will be installed:
  openssl
0 upgraded, 1 newly installed, 0 to remove and 17 not upgraded.
Need to get 696 kB of archives.
After this operation, 1070 kB of additional disk space will be used.
WARNING: The following packages cannot be authenticated!
  openssl
Authentication warning overridden.

```

Configure OVS Connection Using SSL with Self-signed Certificates

To make a SSL/TLS Openflow connection between onos and OVS switches using self-signed certificates, there are five main steps to follow:

1. *Generate SSL key/certificate for onos;*
2. *Test the SSL connection.*
3. *Copy the onos certificate to the appropriate OVS location so that OVS can accept the certificate from onos;*
4. *Generate SSL key/certificate for OVS;*
5. *Copy the OVS certificate to the appropriate onos location so that onos can accept the certificate from OVS;*

The following is an example of the detailed configuration steps.

Step 1. Generating SSL key/certificate for onos. On the host running onos, we generate the SSL key/certificate as the following:

a). Create a folder named “ssl”, in this folder we use "keytool" to generate a .jks keystone:

```
root@devel:/opt/onos# cd ssl
root@devel:/opt/onos/ssl# keytool -genkey -keyalg RSA -alias onos -keystore onos.jks -storepass 111111 -validity 3(

  [Unknown]:  Beijing
What is the name of your State or Province?
  [Unknown]:  Beijing
What is the two-letter country code for this unit?
  [Unknown]:  CN
Is CN=Ai Haoyu, OU=FNLab-BUPT, O=BUPT, L=Beijing, ST=Beijing, C=CN correct?
  [no]:  yes

Enter key password for <onos>
        (RETURN if same as keystore password):

Warning:
The JKS keystore uses a proprietary format. It is recommended to migrate to PKCS12 which is an industry standard fo
root@devel:/opt/onos/ssl# ls
onos.jks
```

b). Covert the .jks keystore (which onos uses) to PEM file (which OVS uses) in a 2-step conversions: from .jks to .p12, then to .pem:

```
root@devel:/opt/onos/ssl# keytool -importkeystore -srckeystore onos.jks -destkeystore onos.p12 -srcstoretype jks -d
Importing keystore onos.jks to onos.p12...
Enter destination keystore password:
Re-enter new password:
Enter source keystore password:
Entry for alias onos successfully imported.
Import command completed:  1 entries successfully imported, 0 entries failed or cancelled
root@devel:/opt/onos/ssl# ls
onos.jks  onos.p12
root@devel:/opt/onos/ssl# openssl pkcs12 -in onos.p12 -out onos.pem
Enter Import Password:
Enter PEM pass phrase:
Verifying - Enter PEM pass phrase:
root@devel:/opt/onos/ssl# ls
onos.jks  onos.p12  onos.pem
```

c). Use the certificate portion of the "onos.pem" file to create a new file, called "cacert.pem" - this is the file to be copied over to OVS - it is from "Bag Attributes" to "END CERTIFICATE":

```
root@devel:/opt/onos/ssl# cat onos.pem
<Private key here>
Bag Attributes
```

```
    friendlyName: onos
    localKeyID: 54 69 6D 65 20 31 35 33 39 33 32 37 38 34 32 31 39 39
subject=/C=CN/ST=Beijing/L=Beijing/O=BUPT/OU=FNLab-BUPT/CN=Ai Haoyu
issuer=/C=CN/ST=Beijing/L=Beijing/O=BUPT/OU=FNLab-BUPT/CN=Ai Haoyu
-----BEGIN CERTIFICATE-----
MIIDbzCCAlegAwIBAgIEOtHFEDANBgkqhkiG9w0BAQsFADBoMQswCQYDVQQGEwJD
TjEQMA4GA1UECBMHQmVpamluZzEQMA4GA1UEBxMHQmVpamluZzENMAsGA1UEChME
......
-----END CERTIFICATE-----

root@devel:/opt/onos/ssl# sudo vi ./cacert.pem
Bag Attributes
    friendlyName: onos
    localKeyID: 54 69 6D 65 20 31 35 33 39 33 32 37 38 34 32 31 39 39
subject=/C=CN/ST=Beijing/L=Beijing/O=BUPT/OU=FNLab-BUPT/CN=Ai Haoyu
issuer=/C=CN/ST=Beijing/L=Beijing/O=BUPT/OU=FNLab-BUPT/CN=Ai Haoyu
-----BEGIN CERTIFICATE-----
MIIDbzCCAlegAwIBAgIEOtHFEDANBgkqhkiG9w0BAQsFADBoMQswCQYDVQQGEwJD
TjEQMA4GA1UECBMHQmVpamluZzEQMA4GA1UEBxMHQmVpamluZzENMAsGA1UEChME
.......
-----END CERTIFICATE-----
```

Note:

The intermediate key/cert, "onos.p12", and onos.pem, are no longer used and should be discarded.

Step 2. Copy the onos certificate to the appropriate OVS location so that OVS can accept the certificate from onos:

a). In the case of PicaOS, firstly we need to install openssl module, then create controllerca directory and switchca directory, and generate key and certificate for the OVS switch in switchca directory:

```
admin@PICOS-OVS:~$ sudo apt-get install openssl
Reading package lists... Done
Building dependency tree
Reading state information... Done
openssl is already the newest version.
0 upgraded, 0 newly installed, 0 to remove and 60 not upgraded.
admin@PICOS-OVS:~$ sudo su
root@PICOS-OVS:/home/admin# ovs-pki init --force
Creating controllerca...
Creating switchca...
root@PICOS-OVS:~$ cd /ovs/var/lib/openvswitch/pki/switchca
root@PICOS-OVS:/ovs/var/lib/openvswitch/pki/switchca# ovs-pki req+sign sc switch
sc-req.pem      Mon Oct 15 16:01:11 UTC 2018
        fingerprint 0d336057404dab9bc7dc158b7f4a7007ced6efd4
root@PICOS-OVS:/ovs/var/lib/openvswitch/pki/switchca# ls -lat
total 76
drwxr-xr-x 6 root root 4096 Oct 15 16:01 .
.....
-rw-r--r-- 1 root root 4002 Oct 15 16:01 sc-cert.pem
-rw-r--r-- 1 root root 3565 Oct 15 16:01 sc-req.pem
-rw------- 1 root root 1675 Oct 15 16:01 sc-privkey.pem
-rw-r--r-- 1 root root 4028 Oct 15 15:56 cacert.pem
....
drwxr-xr-x 4 root root 4096 Oct 15 15:56 ..
```

a). Copy cacert.pem from your ONOS working directory(/opt/ssl) to this directory your OVS machine: "/ovs/var/lib/openvswitch/pki/controllerca/cacert.pem", you can replace or backup the original cacert.pem file.

```
root@PICOS-OVS:/etc# mkdir ovsbackup
root@PICOS-OVS:/etc# cd ovsbackup/
root@PICOS-OVS:/etc/ovsbackup# cd /ovs/var/lib/openvswitch/pki/controllerca
root@PICOS-OVS:/ovs/var/lib/openvswitch/pki/controllerca# ls
ca.cnf  cacert.pem  careq.pem  certs  crl  crlnumber  index.txt  index.txt.attr  index.txt.old  newcerts  private
root@PICOS-OVS:/ovs/var/lib/openvswitch/pki/controllerca# mv cacert.pem /etc/ovsbackup/
root@PICOS-OVS:/ovs/var/lib/openvswitch/pki/controllerca# ls
ca.cnf  careq.pem  certs  crl  crlnumber  index.txt  index.txt.attr  index.txt.old  newcerts  private  serial  ser
root@PICOS-OVS:/ovs/var/lib/openvswitch/pki/controllerca# scp pica8@10.10.50.243:/opt/ssl/cacert.pem .
The authenticity of host '10.10.50.243 (10.10.50.243)' can't be established.
```

```
ECDSA key fingerprint is a3:a4:a2:ab:a9:bd:81:02:16:7a:9b:8d:f9:07:e3:90.
Are you sure you want to continue connecting (yes/no)? yes
Warning: Permanently added '10.10.50.243' (ECDSA) to the list of known hosts.
pica8@10.10.50.243's password:
cacert.pem
root@PICOS-OVS:/ovs/var/lib/openvswitch/pki/controllerca# ls
ca.cnf  cacert.pem  careq.pem  certs  crl  crlnumber  index.txt  index.txt.attr  index.txt.old  newcerts  private
```

c). Make OVS to use the new keys:

```
root@PICOS-OVS:/ovs/var/lib/openvswitch/pki/switchca# ovs-vsctl set-ssl /ovs/var/lib/openvswitch/pki/switchca/sc-pr
```

Step 3. Copy the OVS certificate to the appropriate onos location so that onos can accept the certificate from OVS:

a). Copy "sc-cert.pem" (the OVS public key just generated in 2.1) to the ONOS host, and import it to onos.jks store with trust:

```
root@pica8:/opt/ssl# scp admin@10.10.51.140:/ovs/var/lib/openvswitch/pki/switchca/sc-cert.pem .
The authenticity of host '10.10.51.140 (10.10.51.140)' can't be established.
ECDSA key fingerprint is SHA256:3hI1TnyjNj2k7QgjCRS5xR/2wh5yxKijgwMHIuCsm0s.
Are you sure you want to continue connecting (yes/no)? yes
Warning: Permanently added '10.10.51.140' (ECDSA) to the list of known hosts.
admin@10.10.51.140's password:
sc-cert.pem
root@pica8:/opt/ssl# ls
cacert.pem  onos.jks  onos.p12  onos.pem  sc-cert.pem
root@pica8:/opt/ssl# keytool -importcert -file sc-cert.pem -keystore onos.jks
Enter keystore password:
Owner: CN=sc id:2018 Oct 15 16:01:09, OU=Open vSwitch certifier, O=Open vSwitch, ST=CA, C=US
Issuer: CN=OVS switchca CA Certificate (2018 Oct 15 15:56:46), OU=switchca, O=Open vSwitch, ST=CA, C=US
Serial number: 2
Valid from: Tue Oct 16 00:01:11 CST 2018 until: Fri Oct 13 00:01:11 CST 2028
Certificate fingerprints:
         MD5:  AA:53:F9:43:D4:77:07:38:87:25:DC:3D:8A:0A:19:A6
         SHA1: 45:19:64:D8:E1:A7:2A:18:CC:15:25:10:9A:C8:AE:BC:FD:53:AB:CC
         SHA256: 75:BE:13:3D:DB:8E:DC:39:D1:73:01:A8:A3:04:00:9B:D1:7B:98:84:49:85:2A:B9:5C:E9:1D:B6:F6:45:C5:E0
Signature algorithm name: MD5withRSA (weak)
Subject Public Key Algorithm: 2048-bit RSA key
Version: 1

Warning:
The input uses the MD5withRSA signature algorithm which is considered a security risk.

Trust this certificate? [no]:  yes
Certificate was added to keystore

Warning:
The JKS keystore uses a proprietary format. It is recommended to migrate to PKCS12 which is an industry standard fo
root@pica8:/opt/ssl# keytool -list -keystore onos.jks
Enter keystore password:
Keystore type: jks
Keystore provider: SUN

Your keystore contains 2 entries

onos, Oct 15, 2018, PrivateKeyEntry,
Certificate fingerprint (SHA1): F9:D6:36:06:B8:5A:AE:0C:50:CE:B8:E3:DF:16:0F:9B:5C:8B:2E:7C
mykey, Oct 15, 2018, trustedCertEntry,
Certificate fingerprint (SHA1): 45:19:64:D8:E1:A7:2A:18:CC:15:25:10:9A:C8:AE:BC:FD:53:AB:CC
```

b). In the ONOS host, make sure these applications are activated:

```
onos> apps -s
......
*  21 org.onosproject.hostprovider         1.13.3   Host Location Provider
*  22 org.onosproject.lldpprovider         1.13.3   LLDP Link Provider
*  23 org.onosproject.optical-model        1.13.3   Optical Network Model
```

```
*  24 org.onosproject.openflow-base        1.13.3   OpenFlow Base Provider
*  25 org.onosproject.openflow             1.13.3   OpenFlow Provider Suite
......
*  37 org.onosproject.drivers              1.13.3   Default Drivers
......
```

c). Enable ONOS to use OFTLS by configuring "$ONOS_HOME/bin/onos-service":

```
root@pica8:/opt/onos/bin# vi onos-service
#!/bin/bash
# -----------------------------------------------------------------------------
# Starts ONOS Apache Karaf container
# -----------------------------------------------------------------------------

# uncomment the following line for performance testing
# export JAVA_OPTS="${JAVA_OPTS:--Xms16G -Xmx16G -XX:+UseConcMarkSweepGC -XX:+CMSIncrementalMode -XX:+PrintGCDetail

# uncomment the following line for Netty TLS encryption
# Do modify the keystore location/password and truststore location/password accordingly
#export JAVA_OPTS="${JAVA_OPTS:--DenableNettyTLS=true -Djavax.net.ssl.keyStore=/home/ubuntu/onos.jks -Djavax.net.ss

export JAVA_OPTS="${JAVA_OPTS:--DenableOFTLS=true -Djavax.net.ssl.keyStore=/opt/ssl/onos.jks -Djavax.net.ssl.keySto

export JAVA_OPTS="${JAVA_OPTS:--Dds.lock.timeout.milliseconds=10000}"

set -e  # exit on error
set -u  # exit on undefined variable
................
"onos-service" 57L, 2308C written
```

c). Restart the ONOS controller.

Step 4. Testing the SSL connection:

a). On the OVS machine, we create a new bridge named br0, and set it connect to the controller by ssl:

```
admin@PICOS-OVS:/$ ovs-vsctl add-br br0 - set bridge br0 datapath_type=pica8
admin@PICOS-OVS:/$ ovs-vsctl show
5187ffd7-d781-48dc-82a6-37692344a877
    Bridge "br0"
        Port "br0"
            Interface "br0"
                type: internal
admin@PICOS-OVS:/$ ovs-vsctl set-controller br0 ssl:10.10.50.243:6653
```

b). Check the OVS machine log, You should see the following log messages:

```
admin@PICOS-OVS:~$ tail -f /tmp/log/messages
Oct 15 2018 17:39:54 Xorplus daemon.notice : 17:39:54.742|ovs|00879|rconn|INFO|br0<->ssl:10.10.50.243:6653: connect
Oct 15 2018 17:40:06 Xorplus daemon.notice : 17:40:06.390|ovs|00880|connmgr|INFO|br0<->ssl:10.10.50.243:6653: 3 flo
```

c). Check the device on ONOS host, you can see the OVS machine in the list:

```
onos> devices
id=of:1c480030ab283b4f, available=true, local-status=connected 25m15s ago, role=MASTER, type=SWITCH, mfr=Pica8, Inc
```

We can see the SSL connection is successful.

Configuring Counter

Clear counter

Clear port counter

Command: ovs-appctl bridge/clear-counts br0

User can use above command to clear the port counter.

Example:

```
Check port counter:
ovs-ofctl dump-ports br0

Clear the port counter:
ovs-appctl bridge/clear-counts br0
```

Clear flow counter

Command: ovs-ofctl mod-flows br0 reset_counts,<match>,<actions>

User can use the command to clear flow counter.

Example:

```
ovs-ofctl add-flow br0 in_port=3,actions=4
ovs-ofctl mod-flows br0 reset_counts,in_port=3,actions=4
```

Drop counter

Pica8 has added support for drop counter from PicOS version 2.7.2. This feature is useful in cases where we need to count the dropped packets. For this counter, we use rdbgc4 register to count the dropped packets.

The command is:

```
ovs-vsctl set-rdbgc4 [TYPE]
```

TYPE value: **rfldr; ripd4; ripd6; riphe6; vlandr**

Default value: **rfldr**

Use the command below to display rdbgc4 setting.

```
 ovs-vsctl show-rdbgc4
```

The command below is used get drop statistics on a given port.

```
ovs-ofctl dump-drop br0 [PORT]
```

1. rdbgc4 drop counter values:

1)ovs-vsctl set-rdbgc4 rfldr

Setting the rdbgc4 value to rfldr will count the packets which are dropped by a drop action (actions=drop) flow in TCAM. Packets matching this flow are dropped and drop statistics are recorded in the drop counter.

Example:

```
ovs-vsctl add-br br0
ovs-vsctl add-port br0 te-1/1/9 vlan_mode=trunk tag=1  -- set Interface te-1/1/9 type=pica8
ovs-vsctl add-port br0 te-1/1/10 vlan_mode=trunk tag=1  -- set Interface te-1/1/10 type=pica8
```

Packets will match default drop flow without configuring flows.

```
admin@PicOS-OVS$ovs-ofctl dump-drop br0 9
PXST_DROP_STATS reply (OF1.4) (xid=0x2): 1 interfaces
  te-1/1/9(port 9):
      Statistics type in rdbgc4: rfldr
        Discarded  Packets.................10000
      Statistics type : ingress drop caused by congestion (bytes)
        Discarded  Octets..................0
      Statistics type : ingress drop caused by congestion (packets)
        Discarded  Packets.................0
      Statistics type : egress drop caused by congestion (bytes)
        Discarded  Octets..................0
      Statistics type : egress drop caused by congestion (packets)
        Discarded  Packets.................0
      Statistics type : ingress drop caused by flow-match (packets)
        Discarded  Packets.................10000
```

2) ovs-vsctl set-rdbgc4 vlandr

Count the packets whose tag doesn't match the ingress port's VLAN ID.

Example:

```
ovs-vsctl add-port br0 te-1/1/9 vlan_mode=access tag=10  -- set Interface te-1/1/9 type=pica8
ovs-vsctl add-port br0 te-1/1/10 vlan_mode=trunk tag=1  -- set Interface te-1/1/10 type=pica8
```

add flow:

```
ovs-ofctl add-flow br0 in_port=9,actions=10
```

Send packets with vlan=199 to port 10 and check drop counter.

```
admin@PicOS-OVS$ovs-ofctl dump-drop br0 9
PXST_DROP_STATS reply (OF1.4) (xid=0x2): 1 interfaces
  te-1/1/9(port 9):
      Statistics type in rdbgc4: vlandr
        Discarded  Packets.................10000
      Statistics type : ingress drop caused by congestion (bytes)
        Discarded  Octets..................0
      Statistics type : ingress drop caused by congestion (packets)
        Discarded  Packets.................0
      Statistics type : egress drop caused by congestion (bytes)
        Discarded  Octets..................0
      Statistics type : egress drop caused by congestion (packets)
        Discarded  Packets.................0
      Statistics type : ingress drop caused by flow-match (packets)
        Discarded  Packets.................0
```

If modify flow actions=drop,after above steps, ingress drop caused by flow-match will have discarded packets statistics 10000.

3) ovs-vsctl set-rdbgc4 ripd4

Count the ipv4 packets which send to route table with VLAN **CFI=set or TTL=0**.

Example:

```
ovs-vsctl set-l2-mode true
ovs-vsctl set-l3-mode true
ovs-ofctl add-flow br0 table=251, dl_vlan=199,dl_dst=22:22:22:22:22:22,actions=normal
ovs-ofctl add-flow br0 table=252, ip,nw_dst=2.2.2.2,actions=set_field: 00:00:00:00:22:22-\>dl_dst,set_field:1999-\>
```

Send packets with dl_dst=22:22:22:22:22:22, dl_dst=22:11:11:11:11:11,dl_vlan=199,**CFI=SET**, nw_dst=2.2.2.2, nw_src=1.1.1.1 to port 10.

Check drop counter:

```
admin@PicOS-OVS$ovs-ofctl dump-drop br0 9
PXST_DROP_STATS reply (OF1.4) (xid=0x2): 1 interfaces
  te-1/1/9(port 9):
      Statistics type in rdbgc4: ripd4
        Discarded  Packets.................10000
      Statistics type : ingress drop caused by congestion (bytes)
        Discarded  Octets..................0
      Statistics type : ingress drop caused by congestion (packets)
        Discarded  Packets.................0
      Statistics type : egress drop caused by congestion (bytes)
        Discarded  Octets..................0
      Statistics type : egress drop caused by congestion (packets)
        Discarded  Packets.................0
      Statistics type : ingress drop caused by flow-match (packets)
        Discarded  Packets.................0
```

4) ovs-vsctl set-rdbgc4 ripd6

Count the ipv6 packets which send to route table with **VLAN CFI=set or Hop=0**.

Example:

```
ovs-vsctl set-l2-mode true
ovs-vsctl set-l3-mode true
ovs-ofctl add-flow br0 table=251,dl_vlan=199,dl_dst=22:22:22:22:22:22,actions=normal
ovs-ofctl add-flow br0 table=252,ipv6,ipv6_dst=2001::1,actions=set_field: 00:00:00:00:22:22-\>dl_dst,set_field:199
```

Send packets with dl_dst=22:22:22:22:22:22, dl_dst=22:11:11:11:11:11,dl_vlan=199,**CFI=RESET, hop=0,** ipv6_dst=2001::1,ipv6_src=2002::1 to port 10:

Check drop counter:

```
admin@PicOS-OVS$ovs-ofctl dump-drop br0 9
PXST_DROP_STATS reply (OF1.4) (xid=0x2): 1 interfaces
  te-1/1/9(port 9):
       Statistics type in rdbgc4: ripd6
        Discarded  Packets.................10000
      Statistics type : ingress drop caused by congestion (bytes)
```

```
        Discarded  Octets.................0
      Statistics type : ingress drop caused by congestion (packets)
        Discarded  Packets.................0
      Statistics type : egress drop caused by congestion (bytes)
        Discarded  Octets.................0
      Statistics type : egress drop caused by congestion (packets)
        Discarded  Packets.................0
      Statistics type : ingress drop caused by flow-match (packets)
        Discarded  Packets.................0
```

5) ovs-vsctl set-rdbgc4 riphe6

Count the ipv6 packets which send to route table with **ipv6_dst=::**

Example:

```
ovs-vsctl set-l2-mode true
ovs-vsctl set-l3-mode true
ovs-ofctl add-flow br0 table=251,dl_vlan=199,dl_dst=22:22:22:22:22:22,actions=normal
ovs-ofctl add-flow br0 table=252,ipv6,ipv6_dst=2001::1,actions=set_field:00:00:00:00:22:22-\>dl_dst,set_field:1999
```

Send packets with dl_dst=22:22:22:22:22:22,dl_dst=22:11:11:11:11:11,dl_vlan=199, ipv6_dst=0::0,ipv6_src=2002::1

Check drop counter:

```
admin@PicOS-OVS$ovs-ofctl dump-drop br0 9
PXST_DROP_STATS reply (OF1.4) (xid=0x2): 1 interfaces
  te-1/1/9(port 9):
       Statistics type in rdbgc4: riphe6
        Discarded  Packets.................10000
      Statistics type : ingress drop caused by congestion (bytes)
        Discarded  Octets.................0
      Statistics type : ingress drop caused by congestion (packets)
        Discarded  Packets.................0
      Statistics type : egress drop caused by congestion (bytes)
        Discarded  Octets.................0
      Statistics type : egress drop caused by congestion (packets)
        Discarded  Packets.................0
      Statistics type : ingress drop caused by flow-match (packets)
        Discarded  Packets.................0
```

2.Congest drop counter:

Count packets which dropped because of congestion.

```
admin@PicOS-OVS$ovs-ofctl dump-drop br0 9
PXST_DROP_STATS reply (OF1.4) (xid=0x2): 1 interfaces
  te-1/1/9(port 9):
      Statistics type in rdbgc4: rfldr
        Discarded  Packets.................0
      Statistics type : ingress drop caused by congestion (bytes)
        Discarded  Octets.................0
      Statistics type : ingress drop caused by congestion (packets)
        Discarded  Packets.................0
      Statistics type : egress drop caused by congestion (bytes)
        Discarded  Octets.................22567715016
      Statistics type : egress drop caused by congestion (packets)
        Discarded  Packets.................331876187
      Statistics type : ingress drop caused by flow-match (packets)
        Discarded  Packets.................0
```

3.ingress drop counter:

the packets which dropped by the actions=drop flow in tcam.

Example：

```
ovs-ofctl add-flow br0 in_port=9,ip,dl_vlan=199,nw_dst=192.168.100.100,actions=drop
```

Send packets to match this flow and check drop counter:

```
admin@PicOS-OVS$ovs-ofctl dump-drop br0 9
PXST_DROP_STATS reply (OF1.4) (xid=0x2): 1 interfaces
  te-1/1/9(port 9):
    Statistics type in rdbgc4: vlandr
        Discarded  Packets.................0
      Statistics type : ingress drop caused by congestion (bytes)
        Discarded  Octets..................0
      Statistics type : ingress drop caused by congestion (packets)
        Discarded  Packets.................0
      Statistics type : egress drop caused by congestion (bytes)
        Discarded  Octets..................0
      Statistics type : egress drop caused by congestion (packets)
        Discarded  Packets.................0
      Statistics type : ingress drop caused by flow-match (packets)
        Discarded  Packets.................10000
```

1.Drop counter only works in ingress,but when congest statistics is in egress.

2.User can use following command to clear statistics：

ovs-appctl bridge/clear-counts br0

Counter Interval

The default flow counter interval is 500ms and port counter interval is 1000~1200ms. User can shorten the flow interval time and from PicOS-2.11 can shorten the port interval, but this will cause switch cpu busy.

Flow counter interval

By default, the flow counter interval is about 500ms. User can use following cammand to change it.

ovs-vsctl set open_vswitch . other_config:max-idle=<ms>

<ms>: 1~500 ms, the max interval is 500ms.

Example:

```
admin@PICOS-OVS$ovs-vsctl set open_vswitch . other_config:max-idle=100
```

Port Counter Interval

By default, the flow counter interval is about 1000~1200ms. User can use following cammand to change it.

ovs-vsctl set-counter-interval <ms>

<ms>: 10~1000 ms, the max interval is 1000ms.

Example:

```
admin@PICOS-OVS$ovs-vsctl set-counter-interval 100
```

Port Counter Interval

By default, the flow counter interval is about 1000~1200ms. User can use following cammand to change it.

ovs-vsctl set-counter-interval <ms>

<ms>: 10~1000 ms, the max interval is 1000ms.

Example:

```
admin@PICOS-OVS$ovs-vsctl set-counter-interval 100
```

Switching Open vSwitch version

Pica8 also support ovs 2.6 from version 2.11.0, and following command is used for switching between ovs 2.3 and ovs 2.6. System enter ovs 2.3 default.

Switch ovs from 2.3 to 2.6:

```
admin@PICOS-OVS$switch-to-ovs-2.6
```

And switch ovs from 2.6 to 2.3:

```
admin@PICOS-OVS$switch-to-ovs-2.3
```

If you swith ovs from 2.3 to 2.6,you had better to exit firstly and then enter system again. And some commands and functions are diferent from ovs 2.3.

Following table is the difference between ovs 2.3 and ovs 2.6.

Points	Ovs 2.3	Ovs 2.6
Pid in hardware table	userspace(pid=0,slow_path(lldp))	userspace(slow_path(lldp))
Ovs-appctl pica/dump-flows	Normal permanent;not distinguish table show	table_miss; distinguish table show
Arp/icmpv6 proxy	Flow priority in hardware table is 2	Flow priority in hardware table is the same with softeare table
Eviction in ovs-ofctl dump-tables-desc br0	0: config: EVICTION, eviction_flag: OTHER LIFETIME	show with vacancy together
Vacancy in ovs-ofctl dump-tables-desc br0	0: config: VACANCY_EVENTS, vacancy: 0%, vacancy_down: 20%, vacancy_up: 50%	show with eviction together
Enable-packet-driven	support	not support
TTP	support	not support
L3 table using lag/ecmp select group	ttl-1	ttl not change,keep primary value if not modified
Ovs-vsctl **Keep-l3-egress-fields**	support	delete
Ovs-appctl pica/dump-ecmp-flows	/	new command
Down one port when do ecmp select hash	output number stay the same	output number dynamic changed according ports' up/down
Multitable	dl_src changed to system mac if actions have no dl_src modification	keep primary value if actions have no dl_src modification
Ovs-vsctl set-select-group-hash-fields	Not clear flows in table 0	Clear flows in table 0
Ovs-ofctl queue-get-config br0 index	Queue get configure based port index	Queue get configure based port index or bridge
Ovs-appctl loopback/enable true	support	delete
Flows with same match filed except priority	Flow with high priority to hardware table	All flows installed to hardware table directly
Set match mode	ovs-appctl pica/dump-flows have echo	ovs-appctl pica/dump-flows have no echo

Configuring rate limit

From 2.11.16, Pica8 support configuring rate limit for port. Interface-based rate limiting controls the total rate of all packets passing through an interface to ensure that the bandwidth usage is within the allowed range. For the same interface, you can configure interface-based rate limiting in both ingress and egress directions or in only one direction.

1, Configuring ingress interface-based rate limt

If you do not limit the traffic sent by users, the continuous burst of data of a large number of users will make the network more crowded. By configuring the ingress interface-based rate limiting on the interface, you can limit the traffic entering the interface to a reasonable range.

Command:

```
ovs-vsctl set interface <ingress-port> ingress_policing_rate=<value1>
ovs-vsctl set interface <ingress-port> ingress_policing_burst=<value2>
```

Note:

(1) The unit is kbps.

(2) These commands can only apply on physical ports.

(3) When there is none burst configure,ingress_policing_burst is equal to ingress_policing_rate.

Configuration example:

Set the rate limit 300000 on ingress port for the ingress traffic.

1)create bridge and add ports to bridge.

```
ovs-vsctl add-br br0
ovs-vsctl add-port br0 te-1/1/1 vlan_mode=trunk tag=1
ovs-vsctl add-port br0 te-1/1/2 vlan_mode=trunk tag=1
```

2)add flow.

```
ovs-ofctl add-flow br0 in_port=1,actions=2
```

3)configure ingress rate limit on te-1/1/1.

```
ovs-vsctl set interface te-1/1/1 ingress_rate_limit=300000
```

And after above configuration, you can limit the traffic entering to te-1/1/1 as 300M.

2, Configuring egress interface-based rate limt

To control the rate of all outgoing traffic on an interface, configure egress interface-based rate limiting. When the transmit rate of packets exceeds the configured rate limit, the excess packets will be discarded.

Command:

```
ovs-vsctl set interface <egress-port> egress_policing_rate=<value1>
ovs-vsctl set interface <egress-port> egress_policing_burst=<value2>
```

Note:

(1) The unit is kbps.

(2) These commands can only apply on physical ports.

(3) When there is none burst configure,egress_policing_burst is equal to egress_policing_rate.

Configuration example:

Set the rate limit 300000 on egress port for the egress traffic.

1)create bridge and add ports to bridge.

```
ovs-vsctl add-br br0
ovs-vsctl add-port br0 te-1/1/1 vlan_mode=trunk tag=1
ovs-vsctl add-port br0 te-1/1/2 vlan_mode=trunk tag=1
```

2)add flow.

```
ovs-ofctl add-flow br0 in_port=1,actions=2
```

3)configure egress rate limit on te-1/1/1.

```
ovs-vsctl set interface te-1/1/2 egress_rate_limit=300000
```

And after above configuration,when the transmit rate of packets exceeds 300M, the excess packets will be discarded

Configuring IPv4/IPv6 address for management port

Introduction

Now support configure ipv4 and ipv6 address for eth0 from 3.2.1 for NPB.And support this feature from 3.4.0.When change ovs mode from l2/l3,there are some options for users to select.Such as the following example:

sudo picos_boot->chose '2',then you can chose how to configure the IP(IPv4) of management interface,DHCP or static IP.And then you can choose how to configure the ip(ipv6) of management interface,DHCP/Static IP/SLAAC/Disable IPv6.

Description

configure ipv4 or ipv6 address example.

```
admin@Xorplus:~$ sudo picos_boot
Configure the default system start-up options:
(Select key 3 if no change)
[1]  PICOS L2/L3   * default
[2]  PICOS Open vSwitch/OpenFlow
[3]  No start-up changeEnter your choice (1,2,3):2
PICOS Open vSwitch/OpenFlow is selected.
Configure the IP(IPv4) of management interface:
[1] DHCP    * default
[2] Static IP
Enter your choice(1,2):1
Configure the IP(IPv6) of management interface:
[1] DHCP
[2] Static IP
[3] SLAAC
[4] Disable IPv6    * default
Enter your choice(1,2,3,4):4
Start OVS web user interface?(y|n)[n]:y
Start OVS network snmp?(y|n)[n]:y
Please restart the PICOS service
```

Configuring the Duplex Mode of Optical Port

Thenew command configures the duplex mode of optical port as auto negotiation mode.

Command Syntax

ovs-vsctl set interface <*interface-name*> **options:duplex=auto**

Parameter

Parameter	Description
gigabit-ethernet <*interface-name*>**>**	Specifies the optical port name.

Usage Guidelines

Pay attention to the following notes:

- Currently, duplex mode for optical port is only available for the 10 optical port when its port rate set to 1G.
- Duplex mode for optical port currently only supports to configure as auto, i.e. auto negotiation mode.
- It is required that the duplex mode of the peer 1G optical port is also set to auto negotiation mode, otherwise the port cannot link up.

Use command **delete interface gigabit-ethernet** <*interface-name*> **duplex** to go back to the default duplex mode to full.

Example

- Set the duplex mode of optical port te-1/1/1 as auto negotiation mode.

```
admin@PICOS-OVS:~$ovs-vsctl set interface te-1/1/1 options:link_speed=1G
admin@PICOS-OVS:~$ovs-vsctl set interface te-1/1/1 options:duplex=auto
```

Configuring Port Speed on AS9716-32D and N9550-32D

Step 1 Configure port lane mode before set port speed. To make this configuration effective, users have to restart PICOS service after the configuration.

ovs-vsctl set-port-lane-mode {**all** | <*port_number*>} <**0**|**1**>

- **all** | <*port_number*>: specifies the port number. **all** indicates to configure for all ports. <*port_number*> indicates the port number on the front panel, for example, number 10 represents port xe-1/1/10.
- **0**|**1**: specifies the port lane mode. **0** indicates 8 lanes, supporting port speed 400Gb/s. **1** indicates 4 lanes, supporting port speed 100Gb/s.

By default, the port lane mode is **0**.

The following command configures the lane mode of port xe-1/1/10 to 1 to support speed 100Gb/s.

```
admin@PICOS-OVS:~$ ovs-vsctl set-port-lane-mode 10 1

  Port 10 has been set lane_mode=1!
  Please reboot for the change to take effect!
```

Step 2 Restart PICOS service after the configuration to make the configuration effective.

```
admin@PICOS-OVS:~$ sudo systemctl restart picos
```

Step 3 Show port information. From the show result, we can see that lane mode of port xe-1/1/10 has been set to 1.

```
admin@PICOS-OVS:~$ ovs-vsctl show-valid-port
Front Sub BreakOut IfIndex Quad-Group Interface-Name Lane-Mode Configurable-Speed
----- --- -------- ------- ---------- -------------- --------- ------------------
 1     1   False    129     N/A        xe-1/1/1       0         400G,100G
 2     1   False    130     N/A        xe-1/1/2       0         400G,100G
 3     1   False    131     N/A        xe-1/1/3       0         400G,100G
 4     1   False    132     N/A        xe-1/1/4       0         400G,100G
 5     1   False    133     N/A        xe-1/1/5       0         400G,100G
 6     1   False    134     N/A        xe-1/1/6       0         400G,100G
 7     1   False    135     N/A        xe-1/1/7       0         400G,100G
 8     1   False    136     N/A        xe-1/1/8       0         400G,100G
 9     1   False    137     N/A        xe-1/1/9       0         400G,100G
 10    1   False    138     N/A        xe-1/1/10      1         400G,100G
 11    1   False    139     N/A        xe-1/1/11      0         400G,100G
 12    1   False    140     N/A        xe-1/1/12      0         400G,100G
.......
```

Step 4 Configure the port speed.

```
admin@PICOS-OVS:~$ ovs-vsctl add-port br0 xe-1/1/10
admin@PICOS-OVS:~$ ovs-vsctl set interface xe-1/1/10 options:link_speed=100G
```

Step 5 Show bridge information. From the result, we can see that the link speed of port xe-1/1/10 has been set to 100G.

```
admin@PICOS-OVS:~$ ovs-vsctl show
ab0f08dc-9262-43f1-9894-d82c62827a06
    Bridge "br0"
        Port "br0"
            Interface "br0"
                type: internal
```

```
        Port "xe-1/1/25"
            tag: 3
            Interface "xe-1/1/25"
                type: "pica8"
        Port "xe-1/1/10"
            Interface "xe-1/1/10"
                options: {link_speed="100G"}
        Port "xe-1/1/26"
            tag: 4
            Interface "xe-1/1/26"
                type: "pica8"
```

Examples and Topologies

This chapter provides configuration examples for 802.1Q.

- GRE Tunnel
- Multiple Virtual Bridges
- SSL Connection to Controller
- ECMP
- 802.1Q VLAN
- MPLS Network

802.1Q VLAN

In the following topology, user needs to configure 2 VLANs in switches A and B.

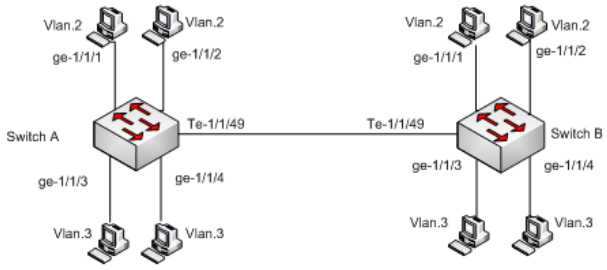

Figure 4-1. 802.1Q network configuration

Configure Switch-A

In Switch-A, user needs to configure ge-1/1/1~ge-1/1/4 as access port while configuring te-1/1/49 as trunk port because the 10Gbit link will trunk the traffic of VLAN-2 and VLAN-3.

```
root@PicOS-OVS# ovs-vsctl add-port br0 te-1/1/1 vlan_mode=access tag=2 -- set Interface te-1/1/1 type=pica8
root@PicOS-OVS# ovs-vsctl  add-port br0 te-1/1/2 vlan_mode=access tag=2 -- set Interface te-1/1/2 type=pica8
root@PicOS-OVS#
root@PicOS-OVS# ovs-vsctl  add-port br0 te-1/1/3 vlan_mode=access tag=3 -- set Interface te-1/1/3 type=pica8
root@PicOS-OVS# ovs-vsctl add-port br0 te-1/1/4 vlan_mode=access tag=3 -- set Interface te-1/1/4 type=pica8
root@PicOS-OVS#
root@PicOS-OVS# ovs-vsctl  add-port br0 te-1/1/49 vlan_mode=trunk trunk=2,3 -- set Interface te-1/1/49 type=pica8
root@PicOS-OVS#
```

Configure Switch-B

In Switch-B, user needs to configure ge-1/1/1~ge-1/1/4 as access port while te-1/1/49 as trunk port because the 10Gbit link will trunk the traffic of VLAN-2 and VLAN-3.

```
root@PicOS-OVS# ovs-vsctl  add-port br0 te-1/1/1 vlan_mode=access tag=2 -- set Interface te-1/1/1 type=pica8
root@PicOS-OVS# ovs-vsctl  add-port br0 te-1/1/2 vlan_mode=access tag=2 -- set Interface te-1/1/2 type=pica8
root@PicOS-OVS#
root@PicOS-OVS# ovs-vsctl  add-port br0 te-1/1/3 vlan_mode=access tag=3 -- set Interface te-1/1/3 type=pica8
root@PicOS-OVS# ovs-vsctl add-port br0 te-1/1/4 vlan_mode=access tag=3 -- set Interface te-1/1/4 type=pica8
root@PicOS-OVS#
root@PicOS-OVS# ovs-vsctl  add-port br0 te-1/1/49 vlan_mode=trunk trunk=2,3 -- set Interface te-1/1/49 type=pica8
root@PicOS-OVS#
```

ECMP

```
root@PicOS-OVS#ovs-vsctl  del-br br0
root@PicOS-OVS#ovs-vsctl  add-br br0 -- set bridge br0 datapath_type=pica8
root@PicOS-OVS#ovs-vsctl  add-port br0 ge-1/1/1 vlan_mode=trunk tag=1 trunks=1000,2000,3000,4094 -- set Interface g
root@PicOS-OVS#ovs-vsctl  add-port br0 ge-1/1/2 vlan_mode=trunk tag=1 trunks=1000,2000,3000,4094 -- set Interface g
root@PicOS-OVS#ovs-vsctl  add-port br0 ge-1/1/3 vlan_mode=trunk tag=1 trunks=1000,2000,3000,4094 -- set Interface g
root@PicOS-OVS#ovs-vsctl  add-port br0 ge-1/1/4 vlan_mode=trunk tag=1 trunks=1000,2000,3000,4094 -- set Interface g
root@PicOS-OVS#ovs-ofctl del-flows br0
root@PicOS-OVS#ovs-ofctl add-group br0 group_id=1,type=select,bucket=output:2,bucket=output:3,bucket=output:4
root@PicOS-OVS#ovs-vsctl set-l3-mode true
root@PicOS-OVS#ovs-ofctl add-flow br0 table=251,dl_dst=22:22:22:22:22:22,dl_vlan=10,actions=normal
root@PicOS-OVS#ovs-ofctl add-flow br0 dl_type=0x0800,nw_dst=192.168.2.0/24,actions=group:1
```

Send packets (nw_dst incr number is 200) to Port 1,

Packets whose nw_dst= 192.168.2.0/255.255.255.3 will be forwarded to Port 2.

Packets whose nw_dst= 192.168.2.1/255.255.255.3 will be forward to Port 3.

Packets whose nw_dst= 192.168.2.2/255.255.255.3 will be forward to Port 4.

Packets whose nw_dst= 192.168.2.3/255.255.255.3 will be forward to Port 2.

GRE Tunnel

In the following topology, the GRE tunnel between Switches A and B needs to be configured. The IP address of the GRE tunnel is 10.10.61.10/24 and 10.10.60.10/24.

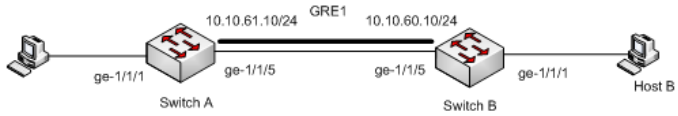

Figure 4-2. GRE tunnel configuration

Configure Switch-A

In Switch-A, user needs to configure a GRE tunnel and two flows as follows:

```
root@PicOS-OVS# ovs-vsctl  add-br br0 -- set bridge br0 datapath_type=pica8
root@PicOS-OVS# ovs-vsctl  add-port br0 ge-1/1/1 vlan_mode=trunk tag=1 -- set Interface ge-1/1/1 type=pica8
root@PicOS-OVS# ovs-vsctl  add-port br0 ge-1/1/5 vlan_mode=trunk tag=1 -- set Interface ge-1/1/5 type=pica8
root@PicOS-OVS#
root@PicOS-OVS# ovs-vsctl add-port br0 gre1 -- set Interface gre1 type=pica8_gre options:remote_ip=10.10.60.10 opt
root@PicOS-OVS#
root@PicOS-OVS# ovs-ofctl add-flow br0 in_port=1,actions=output:3073
root@PicOS-OVS# ovs-ofctl add-flow br0 in_port=5,actions=mod_dl_src:00:11:11:11:11:11,mod_dl_dst:00:33:33:33:33:33
```

Configure Switch-B

In Switch-A, user also needs to configure a GRE tunnel and two flows as follows:

```
root@PicOS-OVS# ovs-vsctl  add-br br0 -- set bridge br0 datapath_type=pica8
root@PicOS-OVS# ovs-vsctl  add-port br0 ge-1/1/1 vlan_mode=trunk tag=1 -- set Interface ge-1/1/1 type=pica8
root@PicOS-OVS# ovs-vsctl  add-port br0 ge-1/1/5 vlan_mode=trunk tag=1 -- set Interface ge-1/1/5 type=pica8
root@PicOS-OVS#
root@PicOS-OVS# ovs-vsctl  add-port br0 gre1 -- set Interface gre1 type=pica8_gre options:remote_ip=10.10.61.10 opt
root@PicOS-OVS#
root@PicOS-OVS# ovs-ofctl add-flow br0 in_port=1,actions=output:3073
root@PicOS-OVS# ovs-ofctl add-flow br0 in_port=5,actions=mod_dl_src:00:22:22:22:22:22,mod_dl_dst:00:66:66:66:66:66
```

MPLS Network

The Pica8 PICOS network operating system can run in two different modes:

- OVS (Open vSwitch) mode, in which PICOS is optimized for OpenFlow applications
- L2/L3 (Layer 2/Layer 3) mode, where PICOS can run traditional switching and routing protocols, as well as OpenFlow applications

In OVS mode, L2/L3 daemons are turned off and the switch is dedicated to OpenFlow and OVS. In this mode, PICOS open white box switches can support various configurations, including 802.1Q VLANs, Multiple Virtual Bridges, SSL Connection to Controller and Multiprotocol Label Switching (MPLS).

MPLS is a technique for routing traffic across a network using short path labels rather than long network addresses. It is intended to more efficiently and quickly route traffic across a network by avoiding routing table lookups and potentially circuitous routes to a destination.

This document describes how to configure PICOS for an MPLS network.

Traffic (Red) from host-A to host-B is forward by the MPLS network with Label 10. The traffic (Blue) from host-C to host-D is forwarded by the MPLS network with Label 20. All the flows will only push one MPLS header.

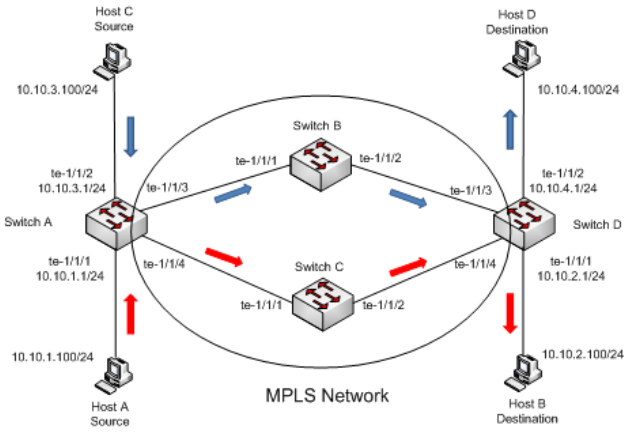

Figure 4-2. MPLS network configuration

Configure Switch-A

In Switch-A, user needs to configure two flows, which will push the MPLS Label 10 and 20 for traffic RED and BLUE, respectively.

```
root@PicOS-OVS# ovs-vsctl add-br br0 -- set bridge br0 datapath_type=pica8
device br0 entered promiscuous mode
root@PicOS-OVS#
root@PicOS-OVS# ovs-vsctl add-port br0 te-1/1/1 vlan_mode=access tag=1 -- set Interface te-1/1/1 type=pica8
root@PicOS-OVS# ovs-vsctl add-port br0 te-1/1/2 vlan_mode=access tag=1 -- set Interface te-1/1/2 type=pica8
root@PicOS-OVS# ovs-vsctl add-port br0 te-1/1/3 vlan_mode=access tag=1 -- set Interface te-1/1/3 type=pica8
root@PicOS-OVS# ovs-vsctl add-port br0 te-1/1/4 vlan_mode=access tag=1 -- set Interface te-1/1/4 type=pica8
root@PicOS-OVS#
root@PicOS-OVS# ovs-ofctl add-flow br0 in_port=1,dl_type=0x0800,nw_src=10.10.1.100,nw_dst=10.10.2.100,dl_vlan=1,act
root@PicOS-OVS#
root@PicOS-OVS# ovs-ofctl add-flow br0 in_port=2,dl_type=0x0800,nw_src=10.10.3.100,nw_dst=10.10.4.100,dl_vlan=1,act
root@PicOS-OVS#
```

The received packet format in port te-1/1/1 and te-1/1/2 is shown as follows (ingress):

Ethernet	IP Header

The transmitted packet format to port te-1/1/3 and te-1/1/4 is shown as follows (egress):

Ethernet	MPLS label 10	IP Header

Ethernet	MPLS label 20	IP Header

Configure Switch-B

In Switch-B, user needs to configure one flow, which will SWAP the MPLS Label 20 to 200 for traffic BLUE.

```
root@PicOS-OVS# ovs-vsctl add-br br0 -- set bridge br0 datapath_type=pica8
device br0 entered promiscuous mode
root@PicOS-OVS#
root@PicOS-OVS# ovs-vsctl add-port br0 te-1/1/1 vlan_mode=access tag=1 -- set Interface te-1/1/1 type=pica8
root@PicOS-OVS# ovs-vsctl add-port br0 te-1/1/2 vlan_mode=access tag=1 -- set Interface te-1/1/2 type=pica8
root@PicOS-OVS#
root@PicOS-OVS# ovs-ofctl add-flow br0 in_port=1,dl_type=0x08847,nw_src=10.10.3.100,nw_dst=10.10.4.100,dl_vlan=1,mp
root@PicOS-OVS#
```

The transmitted packet format to port te-1/1/2 is shown as follows (egress):

Configure Switch-C

In Switch-C, user needs to configure one flow which will SWAP the MPLS Label 10 to 100 for traffic RED.

```
root@PicOS-OVS# ovs-vsctl add-br br0 -- set bridge br0 datapath_type=pica8
device br0 entered promiscuous mode
root@PicOS-OVS#
root@PicOS-OVS# ovs-vsctl add-port br0 te-1/1/1 vlan_mode=access tag=1 -- set Interface te-1/1/1 type=pica8
root@PicOS-OVS# ovs-vsctl add-port br0 te-1/1/2 vlan_mode=access tag=1 -- set Interface te-1/1/2 type=pica8
root@PicOS-OVS#
root@PicOS-OVS# ovs-ofctl add-flow br0 in_port=1,dl_type=0x08847,nw_src=10.10.1.100,nw_dst=10.10.2.100,dl_vlan=1,mp
root@PicOS-OVS#
```

The transmitted packet format to port te-1/1/2 is shown as follows (egress):

Configure Switch-D

In Switch-D, user needs to configure two flows, which will POP the MPLS Label 100 and 200 for traffic RED and BLUE, respectively.

```
root@PicOS-OVS# ovs-vsctl add-br br0 -- set bridge br0 datapath_type=pica8
device br0 entered promiscuous mode
root@PicOS-OVS#
root@PicOS-OVS# ovs-vsctl add-port br0 te-1/1/1 vlan_mode=access tag=1 -- set Interface te-1/1/1 type=pica8
root@PicOS-OVS# ovs-vsctl add-port br0 te-1/1/2 vlan_mode=access tag=1 -- set Interface te-1/1/2 type=pica8
root@PicOS-OVS# ovs-vsctl add-port br0 te-1/1/3 vlan_mode=access tag=1 -- set Interface te-1/1/3 type=pica8
root@PicOS-OVS# ovs-vsctl add-port br0 te-1/1/4 vlan_mode=access tag=1 -- set Interface te-1/1/4 type=pica8
root@PicOS-OVS#
root@PicOS-OVS# ovs-ofctl add-flow br0 in_port=4,dl_type=0x08847,nw_src=10.10.1.100,nw_dst=10.10.2.100,dl_vlan=1,ac
root@PicOS-OVS#
root@PicOS-OVS# ovs-ofctl add-flow br0 in_port=3,dl_type=0x08847,nw_src=10.10.3.100,nw_dst=10.10.4.100,dl_vlan=1,ac
root@PicOS-OVS#
```

The transmitted packet format to port te-1/1/1 and te-1/1/2 is shown as follows (egress):

Multiple Virtual Bridges

In PicOS OVS, user can create multiple virtual bridges that are independent of one another. One physical port is able to add into only one virtual bridge. Each virtual bridge can be configured as a controller, respectively.

```
root@PicOS-OVS# ovs-vsctl  add-br br0 -- set bridge br0 datapath_type=pica8 other-config=datapath-id=0000d80aa99aaa
device br0 entered promiscuous mode
root@PicOS-OVS# ovs-vsctl  add-port br0 te-1/1/1 vlan_mode=access tag=1 -- set Interface te-1/1/1 type=pica8
root@PicOS-OVS# ovs-vsctl  add-port br0 te-1/1/2 vlan_mode=access tag=1 -- set Interface te-1/1/2 type=pica8
root@PicOS-OVS# ovs-vsctl  set-controller br0 tcp:10.10.50.1:6633
root@PicOS-OVS# ovs-vsctl  add-br br1 -- set bridge br1 datapath_type=pica8 other-config=datapath-id=0000d80bb99bbb
device br0 entered promiscuous mode
root@PicOS-OVS# ovs-vsctl  add-port br1 te-1/1/3 vlan_mode=access tag=1 -- set Interface te-1/1/3 type=pica8
root@PicOS-OVS# ovs-vsctl  add-port br1 te-1/1/4 vlan_mode=access tag=1 -- set Interface te-1/1/4 type=pica8
root@PicOS-OVS# ovs-vsctl  set-controller br1 tcp:10.10.50.2:6633
```

SSL Connection to Controller

If user wants to create an SSL connection with the controller in PicOS switch, please follow the following steps:

 # Switch

root@PicOS-OVS#**sudo apt-get install openssl**

Basic Bridge Introduction

This document provides instructions on how to configure open switches running Pica8 PicOS software in various application scenarios. This document assumes minimal to no knowledge of OVS (Open vSwitch) and OpenFlow.

After studying this document, user will be able to configure OpenFlow on PicOS switches, know how to optimize the configuration for an application environment, and understand more about Open vSwitch and OpenFlow.

This document provides instructions for completing the following tasks:

- Configuring a PicOS switch as an OVS/OpenFlow switch.
- Creating bridges, adding ports, displaying bridge and port status/statistics, and displaying the OVS database.
- Configuring flow tables for uni-directional traffic, bi-directional traffic, traffic switching, one-to-many multicasting, mirroring, filtering, many-to-one aggregation etc.
- Configuring PicOS switches to connect with the Ryu controller

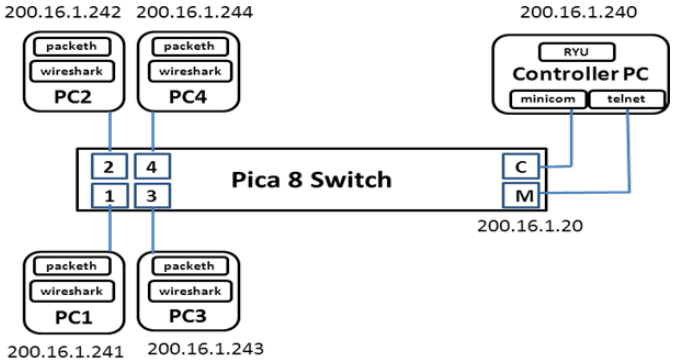

Figure 1 Test bed configuration

In this document, the system configuration depicted in Figure 1 includes:

- A Pica8 P-3295 open switch with 48 x 1GbE and 4 x 10GbE uplinks
- 5 Linux PCs running Ubuntu 12.4.1 LTS, one is connected to the management LAN port (RJ45) and console port (RJ45F); this PC is referred to the controller PC. The OpenFlow controller will be running on this PC. Four PCs are connected to 1GbE port 1 to 4 and serve as a data terminal for generating and monitoring traffic
- Tools installed on all the PCs are listed below. They can be installed through Linux installation utility *apt-get*
  - Terminal emulator minicom
  - Traffic monitoring tool Wireshark
  - Packet generator Packeth
  - ftp and ftpd

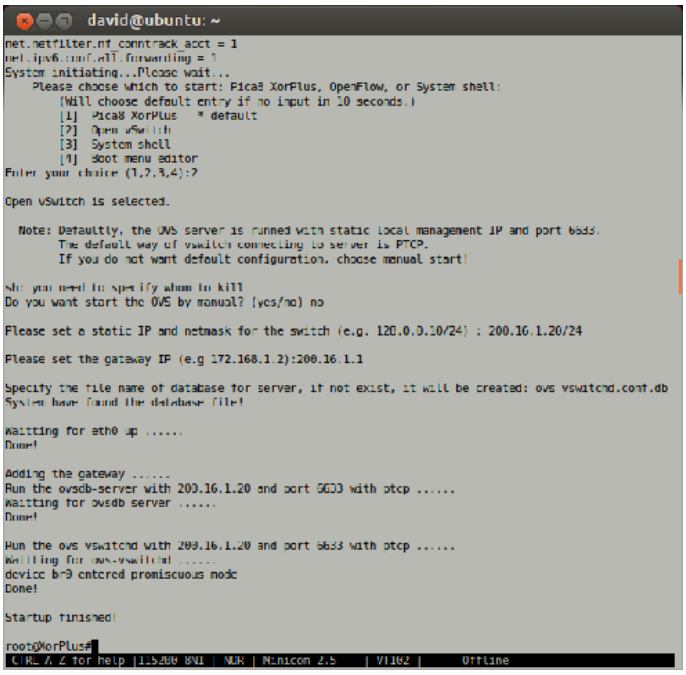
Power On Configuration

Connect with the console port of the PicOS switch as described in Initial Switch Access. Once the console connection is set up, power on the switch.

Figure 2 shows the console output. Do not not hit any keys until the booting choice menu appears. Enter ***2*** to boot into Open vSwitch mode. Next, the switch asks if the switch configuration should be done manually, enter ***no*** to enter the automatic mode. In this mode, the OVS processes will start automatically with default configuration such as log file, etc.

Next, the switch static IP address is entered. In this configuration, subnet 200.16.1.x is used. User can choose their own subnet address at this point. After the static IP address, a gateway IP address is entered. Next, an Open vSwitch configuration database name is required to store all the configuration information. In this example, *ovs-vswitchd.conf.db* database name is used. If the database name does not exist from previous configuration, it will be created in the default /ovs directory based on a database schema defined in /ovs/share/openvswitch/vswitch.ovsschema. Multiple databases can be created to provide different configurations; but only one database can be entered during this start up sequence. The OVS processes can be stopped and restarted manually, once the system is running. They can also be configured as cron processes. The database is persistent. The configuration stored in the database will be restored once the OVS processes start.

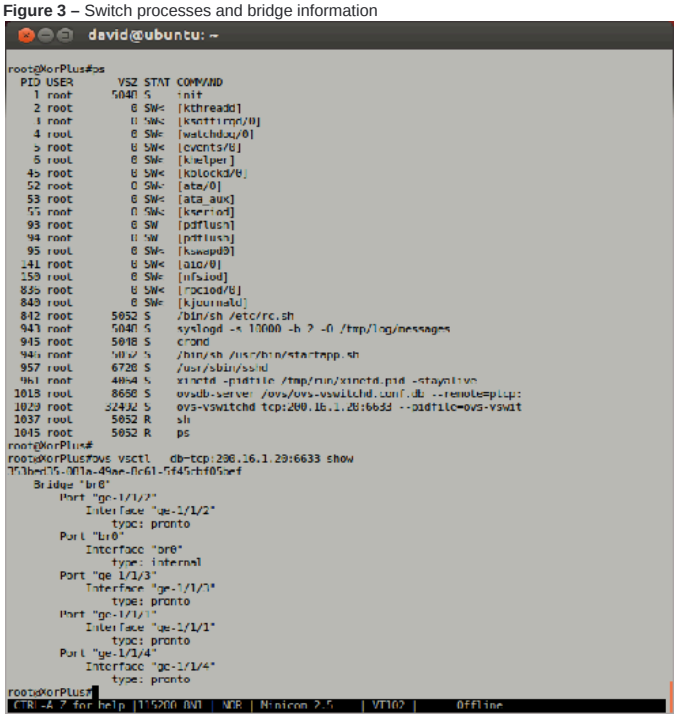
Figure 2 – Power on console output



In this example, the *ovs-vswitchd.conf.db* was used in a previous configuration. Therefore, the system found the database and created the initial configuration which will be shown later. In Figure 1, the management LAN port on the switch is *eth0. eth0* is connected to the *eth0* in the controller PC to allow the controller PC to *telnet* into the switch without the limitation of the console. In this configuration, all PCs are configured with static IP addresses to form an isolated environment for testing.

Next, the switch continues the boot sequence. Pay attention to the console messages regarding the *ovsdb-server* and *ovs-vswitchd*. They are the ovsdb server and ovs switch daemons. The IP address is the switch IP address and the 6633 is the default port number used to communicate with the ovs switch database server process. A different port number can be set through the manual configuration steps. Reference the PicOS Open vSwitch Configuration Guide for manual configuration steps.

Figure 3 – Switch processes and bridge information



The IP address and the port number is often used in the *ovs-vsctl* and *ovs-ofctl* commands discussed in later sections. The *ovs-vswitchd.conf.db* was used in a previous configuration, which contains a bridge *br0* with 4 1GbE ports. After the *ovs-vswitchd* process started, a message on *device br0* is shown to indicate the bridge has been created. At this point, the switch is up and running. The root level *root@PicOS-OVS#* shell prompt is shown and ready for user input. Multiple telnet windows can be started from the controller PC to login to the switch. The user id is *root* and the default password is *pica8.*

Configure Switch

Use Linux command ***ps -A*** to show the running processes. The *ovsdb-server* and *ovs-vswitchd* are there to indicate the ovs switch is ready for operation. Next, print the content of the switch database by using the ***ovs-vsctl show*** command to dump the switch configuration. It shows the database id, a bridge named *br0* with four 1GbE ports, and an internal port.

In most start up cases, a new database name of administrator's choice will be entered. As a result, an empty database is created. The show command will just show the database id. If a new database is created, the next step should be skipped, so move on to the *add-br* command. The following example will demonstrate how to delete the old bridge by utilizing the ***ovs-vsctl del-br br0*** command. Check the database content by using the show command which should just show the database id.The following example shows how to create a bridge and add ports for the bridge.

```
root@PicOS-OVS$
root@PicOS-OVS$ovs-vsctl add-br br0 -- set bridge br0 datapath_type=pica8
device br0 entered promiscuous mode
root@PicOS-OVS$ovs-vsctl add-port br0 te-1/1/1 vlan_mode=trunk tag=1 -- set interface te-1/1/1 type=pica8
root@PicOS-OVS$ovs-vsctl add-port br0 te-1/1/2 vlan_mode=trunk tag=1 -- set interface te-1/1/2 type=pica8
root@PicOS-OVS$ovs-vsctl add-port br0 te-1/1/3 vlan_mode=trunk tag=1 -- set interface te-1/1/3 type=pica8
root@PicOS-OVS$ovs-vsctl add-port br0 te-1/1/4 vlan_mode=trunk tag=1 -- set interface te-1/1/4 type=pica8
root@PicOS-OVS$
root@PicOS-OVS$ovs-vsctl show
d4d12890-c07a-4303-80cc-c6f79cf3afd7
    Bridge "br0"
        Port "te-1/1/3"
            tag: 1
            Interface "te-1/1/3"
                type: "pica8"
        Port "te-1/1/4"
            tag: 1
            Interface "te-1/1/4"
                type: "pica8"
        Port "br0"
            Interface "br0"
                type: internal
        Port "te-1/1/2"
            tag: 1
            Interface "te-1/1/2"
                type: "pica8"
        Port "te-1/1/1"
            tag: 1
            Interface "te-1/1/1"
                type: "pica8"
root@PicOS-OVS$
```

Configure Bridge

To create a new bridge, issue ***ovs-vsctl add-br br0 – set bridge br0 datapath_type=pica8*** command. In the following example, the bridge needs four 1GbE ports. To add each 1GbE port to the bridge, issue ***ovs-vsctl add-port br0 ge-1/1/1 – set interface ge-1/1/1 type=pica8*** command 4 times to add ge-1/1/1 to ge1/1/4 to the bridge. To verify the configuration, use ***ovs-vsctl show*** to show the database content. As shown in the screen shot, the bridge should have four 1GbE ports and an internal port.
Next, monitor the port status and examine the port configuration with ***ovs-ofctl show br0*** command. The following commands are to show the configuration of the bridge.

```
root@PicOS-OVS$ovs-ofctl show br0

```
root@PicOS-OVS$
```

In the example provided, port state is *LINKDOWN* because in the example set up, the cable has not been connected yet. The Pica8 1GbE port supports RJ45 copper connector and auto negotiation from 10 MB to 1 GB speed range. Next, examine the port statistics, using the _***ovs-ofctl dump-ports br0*** command. It shows the RX and TX statistics: since the link is down, no packets are sent or received, and all counters should be zeros.

Configure Port

A port can be added, deleted, turned up, or turned down, dynamically. The *add-port* command has been tested. To delete a port, use ***ovs-vsctl del-port br0 ge-1/1/1***. Port state can also be modified with the *mod−port* command ***ovs-ofctl mod-port br0 ge-1/1/1*** *action.* The keyword *action* can be one of the following parameters:

- Up or down

Enable or disable the interface. This is equivalent to *ifconfig up* or *ifconfig down* on a Linux system.

- Stp or no−stp

Enable or disable 802.1D spanning tree protocol (STP) on the interface. OpenFlow implementations that don't support STP will refuse to enable it.

- Receive or no−receive/receive−stp or no−receive−stp

Enable or disable OpenFlow processing of packets received on this interface. When packet processing is disabled, packets will be dropped instead of being processed through the OpenFlow table. The receive or no−receive setting applies to all packets except 802.1D spanning tree packets, which are separately controlled by receive−stp or no−receive−stp.

- Forward or no−forward

Allow or disallow forwarding of traffic to this interface. By default, forwarding is enabled.

- Flood or no−flood

Controls whether an OpenFlow flood action will send traffic out this interface. By default, flooding is enabled. Disabling flooding is primarily useful to prevent loops when a spanning tree protocol is not in use.

- packet−in or no−packet−in

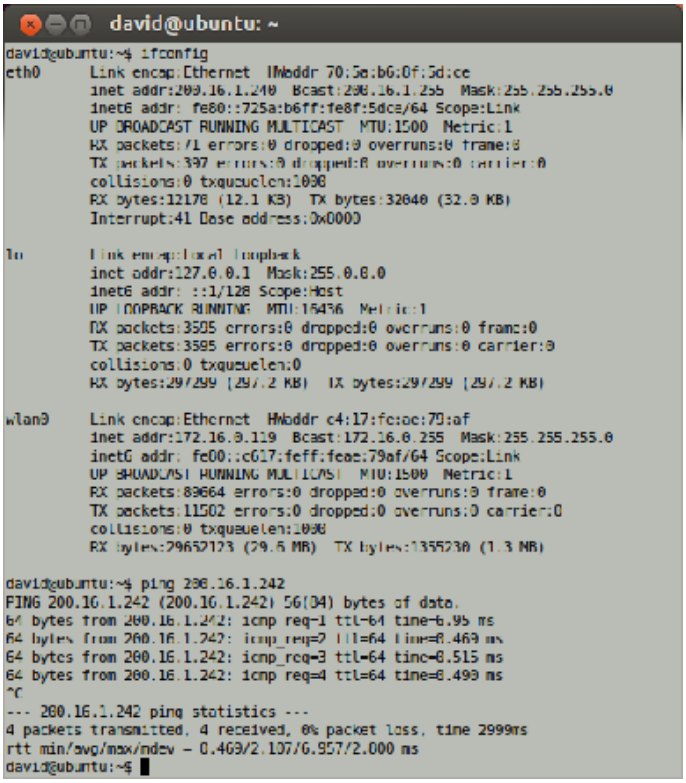
Controls whether packets received on this interface that do not match a flow table entry generate a "packet in" message to the OpenFlow controller. By default, "packet in" messages are enabled.

Again, the show command displays (among other information) the configuration that *mod−port* changes.

Default Bridge Behavior

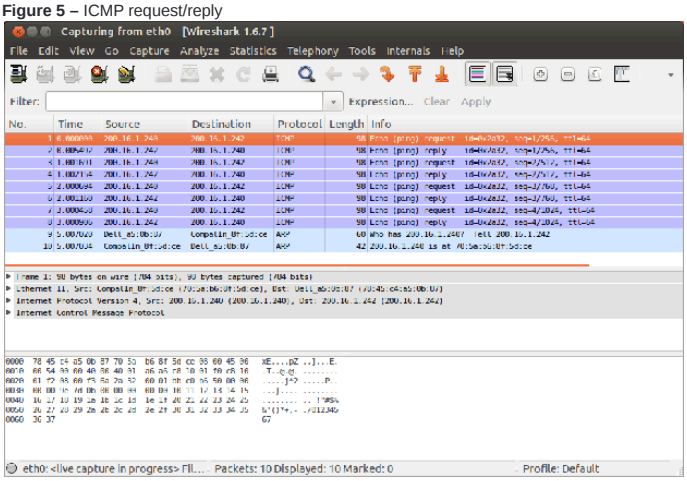
If the newly created bridge does not connect to the OpenFlow controller, it will behave as a simple L2 switch, which floods packets received from a port to all other ports. This behavior is implemented with a default low priority flow added at bridge creation time. The flow can be shown by using the **ovs-ofctl dump-flows br0** command. The flow will be shown as priority 0 and actions=NORMAL. Action NORMAL means the packet is subject to the device's normal L2/L3 processing. This action is not implemented by all OpenFlow switches. Next, connect 2 PCs to switch port 1 and port 2 with an Ethernet cable. Once the PCs are connected, the port state should be changed to LINK_UP soon after the cable is connected. Once both links are up, use ping to test the connectivity.

Figure 4 – Ping test



In this example, another Linux tool, wireshark, is also used to capture the packets sent and received on eth0. On the wireshark screen, a total of 4 pairs ping requests/replies are captured along with some arp packets. We can connect other PCs to the switch now, and ping should work for all PCs. In our set up, telnetd and ftpd are installed in our linux PC. User can try the telnet and ftp sessions to test the connectivity and bridge functionalities.

Figure 5 – ICMP request/reply



At this point, the switch is powered on, and the initial switch configuration without an open flow controller is completed. Proceed to Open SDN: Started Kit – Configure flows for flow manipulation.

- Packet Address File

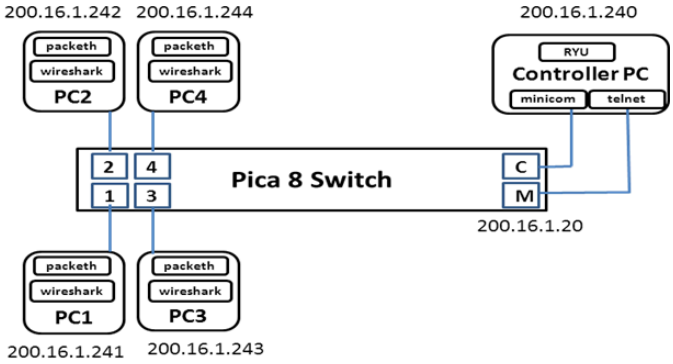
Flow Introduction

This document provides instructions on how to configure Pica8's open switches to work in various application scenarios. This document assumes the reader with minimal to no knowledge of the Open Virtual Switch (OVS) implementation defined by http://openvswitch.org/ or the OpenFlow protocol defined by https://www.opennetworking.org/. After studying this guide, user will have the tools needed to configure Pica8's open switches as an OpenFlow switch. User will also gain insights on how to optimize the configuration to work in an application environment, while also learning about OVS and the OpenFlow protocol.

This starter kit provides screen shots and a list of off-the-shelf applications needed to complete the configuration, as well as tips on problems user may encounter during setup. More documents or cookbooks on other subjects will be published periodically. This document provides a tutorial on how to:

- Configure a Pica8 switch as an OVS OpenFlow switch
- Create bridges; add ports; show bridge, port statistics, and status; introduction to the OVS database
- Configure flow tables for uni-directional, bi-directional, traffic switching, one-to-many multi-casting, mirroring, filtering, many-to-one aggregation, etc.
- Configure Pica8 OpenFlow switches to interface with the RYU OpenFlow Controller

Figure 1 – Test bed configuration



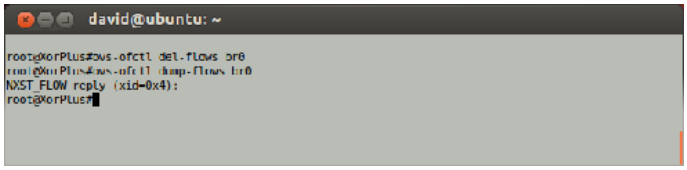
In this document, the system configuration depicted in Figure 1 includes:

- A Pica8 P-3295 open switch with 48 x 1 GbE and 4 x 10 GbE uplinks
- 5 Linux PCs running Ubuntu 12.4.1 LTS, one is connected to the management LAN port (RJ45) and console port (RJ45F). This PC is referred to the controller PC. The OpenFlow controller will be running on this PC. Four PCs are connected to 1GbE port 1 to 4 and serve as a data terminal for generating and monitoring traffic
- Tools installed on all the PCs are listed below. They can be installed through Linux installation utility *apt-get*
  - Terminal emulator minicom
  - Traffic monitoring tool Wireshark
  - Packet generator Packeth
  - ftp and ftpd

Modify Default Flow

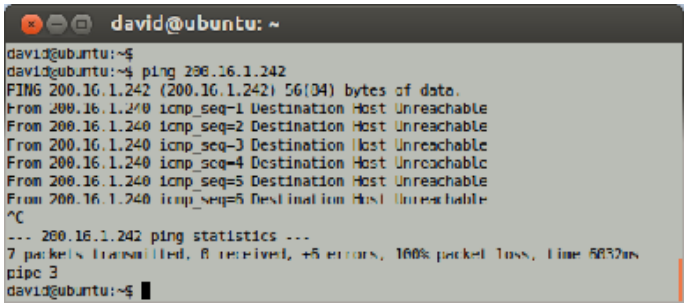
Next, the process of disabling flooding behavior, starting configuration of flow table, and manipulating packet flows will be shown. Use the ***ovs-ofctl del-flows br0*** command to delete the default flow. Dump the flow table, and no flow entry is shown.

Figure 2 – Delete flows and dump flows



At this point, the ping should stop working because the flooding has been disabled. If interested, user can delete the bridge and re-create it with four ports. Then, the ping should work again.

Figure 3 – Pings



Uni-directional Flow

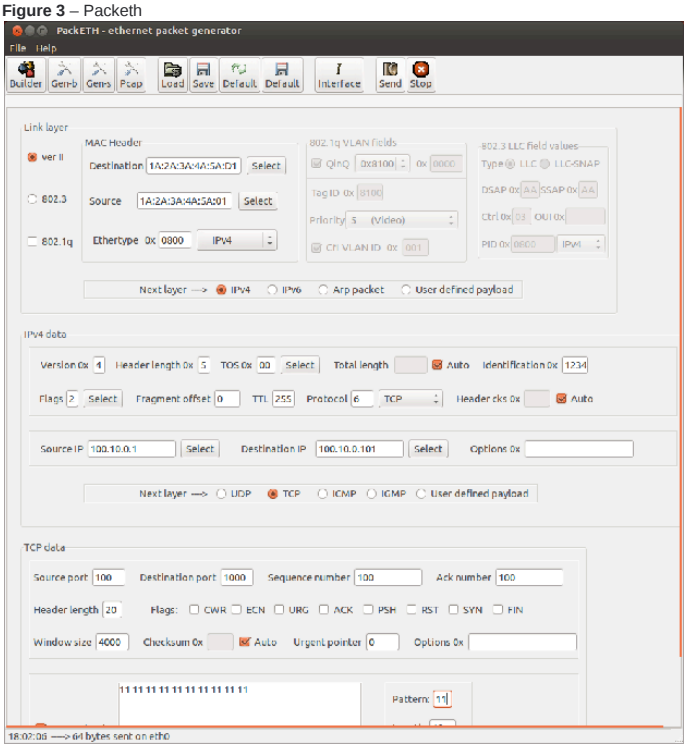
Before running uni-directional flow, user needs a packet generator to work with *wireshark* for packet generation and capturing. In this starter kit, a linux tool *packeth* is used for packet generation. The *packeth* can be installed via the linux command *sudo apt-get install packeth*. To use the *packeth*, an address file needs to be created as the address database for packet creation. The format is <IP address>:<MAC address>:<Names>. A sample address file is provided in the appendix Packet Address File.

Next, user can create some packets to be used in the later test scenarios. Start the *packeth*, click the *builder* button to enter the tab for creating a packet. The next screen shows the test packet we built for this test. Fill in each field using the *select* button or by entering the value. Each packet includes information in link layer, IP layer, and TCP payload. Once the packet is built, click the *interface* button then select *eth0* as the interface.

Next, create a uni-directional flow from port 1 to port 2 using ***ovs-ofctl add-flow br0 in_port=1,actions=output:2*** command. Then, use the dump flow command to show the flow. The command added a flow into *br0* to forward all packets coming in from *in_port=1* to *out_port=2*. Next, start the *wireshark* application to capture all packets on *eth0* for both PC1 and PC2.

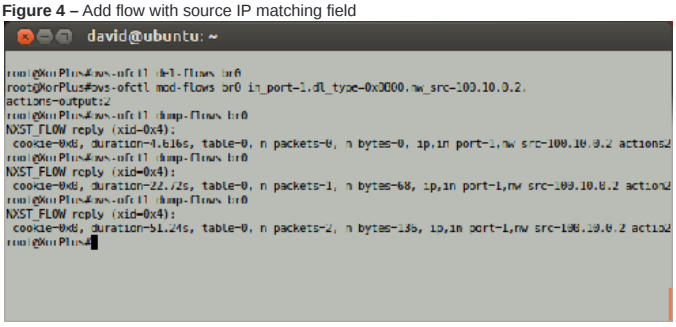
Next, return to the *packeth* screen and click the *send* button. At the bottom of the *packeth* screen, there should be a time stamp and the number of bytes sent to eth0 shown. User can verify the packet content on *wireshark* on both the sending and receiving PCs. This verifies the flow entry entered via the *add-flow* command works as expected. To test this flow further, follow the next *packeth* screen to create another packet with different information and send it through the *eth0*.

Figure 3 – Packeth



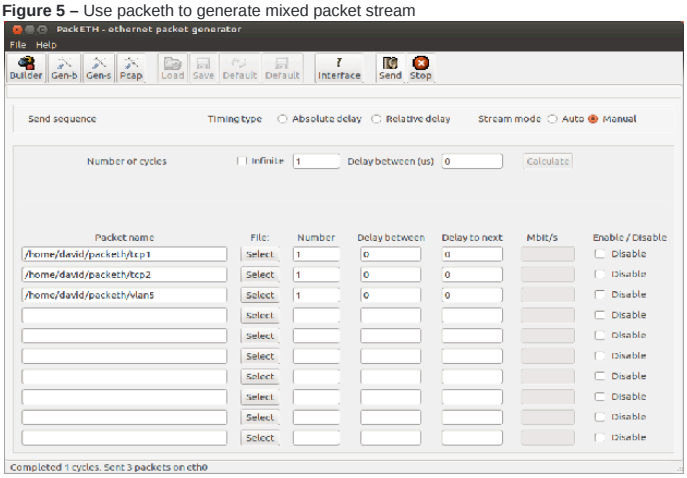
Next, use *ovs-ofctl del-flows br0* command to delete the flow. Then, use *ovs-ofctl add-flow br0 in_port=1,dl_type=0x0800,nw_src=100.10.0.2,actions=output:2* to add a new flow that filters all packets received from port 1 and only forwards the packets with the matching IP address to port 2.

Figure 4 – Add flow with source IP matching field



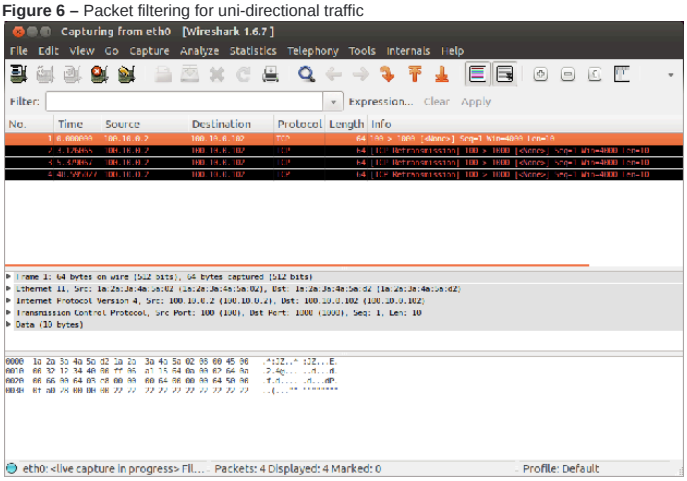
On the *packeth* menu, click the *gen-s* button to mix packets into one output stream. Select different packets built with different IP addresses to form one packet stream. Specify the delay and number of iteration. Then, select the manual operation to send the stream. Use *wireshark* to examine the result.

Figure 5 – Use packeth to generate mixed packet stream



As shown in the screen shot, the packet stream sent using *packeth,* with 3 different types of the packet and 3 different source IP addresses, is filtered by the flow and only the packet with source IP address 100.10.0.2 is forwarded to output port 2. With the *packeth* and *wireshark*, many of the fields can be tested in the uni-directional flow configuration.

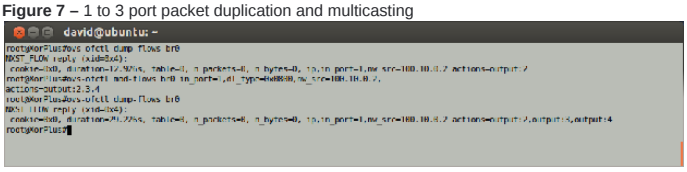
Figure 6 – Packet filtering for uni-directional traffic



1-to-Many Multicasting

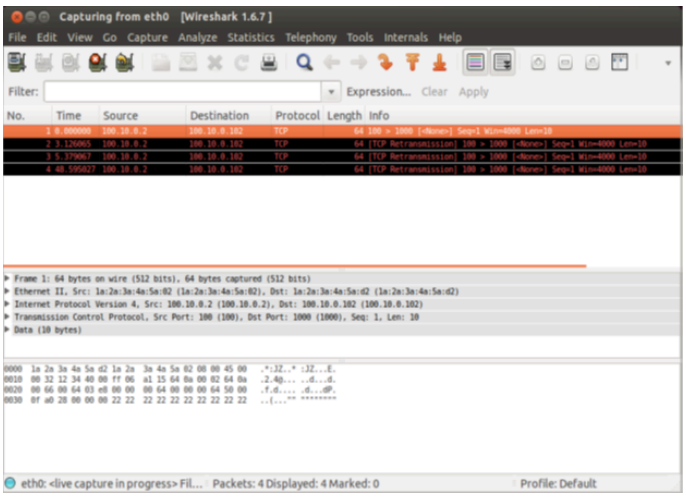
After the unidirectional flow from one port to another, modify the flow entry to configure a 1-to-3 ports multicasting scenario where packets matching the flow entry are duplicated and forwarded to 3 output ports. This time, use the *mod-flows* command ***ovs-ofctl mod-flows br0 in_port=1,dl_type=0x0800,nw_src=100.10.0.2,actions=output:2,3,4***. Then, use the dump flow command to verify the flow is set up correctly.

Figure 7 – 1 to 3 port packet duplication and multicasting



Configure the *packeth* and *wireshark* on all PCs, send the packets into port 1, and examine the packets received on port 2, 3, and 4 to see if the action matches the flow specification.

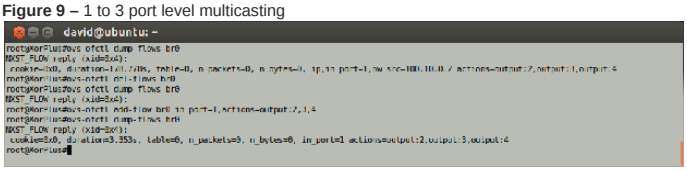
Figure 8 – 1 to 3 port packet filtering, duplication, and multicasting



Next, use the *packeth* to build packet with VLAN, priority, ARP, TCP, UDP, and ICMP packets to exercise various flow packet matching fields and use the *wireshark* to verify the output.

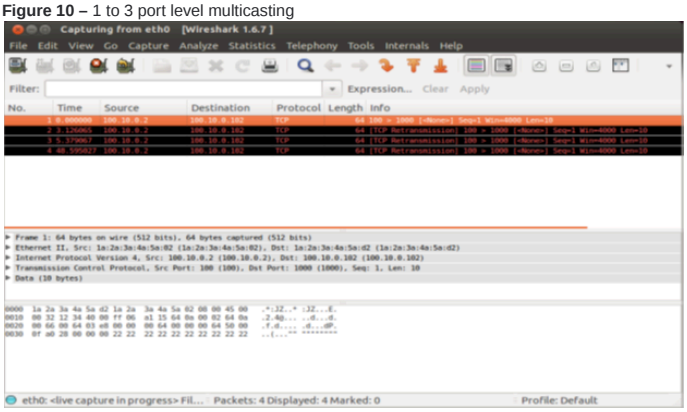
In addition to using filters in multicasting, port level duplication and multicasting is also supported. To configure this scenario, first clean up the flows in *br0* using *ovs-ofctl del-flows br0*. Then, use *ovs-ofctl add-flow br0 in_port=1,actions=output:2,3,4* to add a new multicasting flow.

Figure 9 – 1 to 3 port level multicasting



The same traffic with source IP 100.10.0.2 is sent to port 1. The received traffic on port 4 is captured using *wireshark*. With the tools described in this document, various traffic patterns combined with different filters can be configured to test application scenarios.

Figure 10 – 1 to 3 port level multicasting

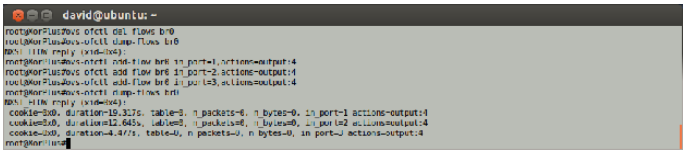


Many-to-One Aggregation

In this section, flow aggregation from multiple ports is examined. Two scenarios will be configured. The first scenario is to aggregate traffic from port 1, 2, and 3 without any filtering to port 4. The second scenario is to apply packet matching filter on each port to select specific traffic based on source IP address from each port for aggregation. For the first scenario, delete the existing flows using the ***ovs-ofctl del-flows br0*** command. Then, use the following commands to add 3 flows to the flow table:

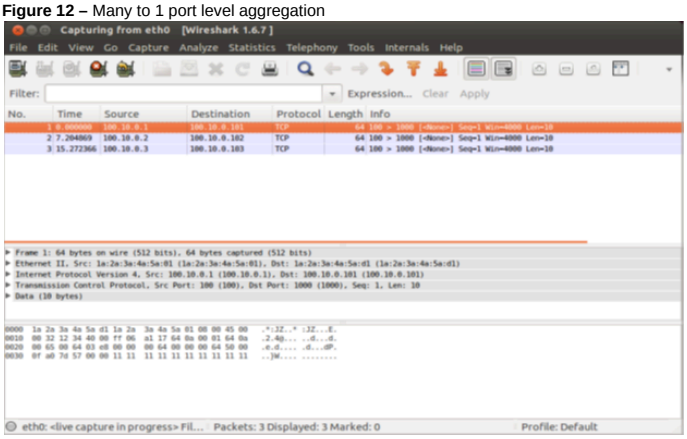
- *ovs-ofctl add-flow br0 in_port=1,actions=output:4*
- *ovs-ofctl add-flow br0 in_port=2,actions=output:4*
- *ovs-ofctl add-flow br0 in_port=3,actions=output:4*

Figure 11 – Many to 1 port level aggregation



Configure *packeth* on each PC to send packets from port 1 to 3, with source IP 100.10.0.1 from port1, source IP 100.10.0.2 from port 2, and 100.10.0.3 from port 3. All the packets should be forwarded to port 4.

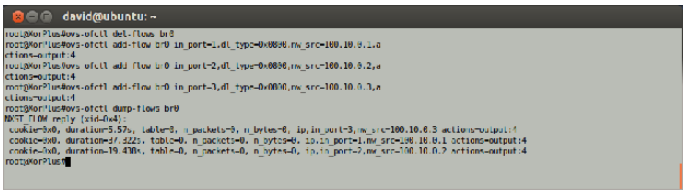
Figure 12 – Many to 1 port level aggregation



In this many-to-one aggregation configuration, if the aggregated traffic is more than 1 Gbps, the over-subscribed packets will be dropped. The over-subscription scenario could not be demonstrated in this set up because the PC only has a 100 Mbps Ethernet port. But if user can create the scenario, the dropped packets can be shown via the ***ovs-ofctl dump-ports br0*** command as part of the port counters.
To engineer the traffic aggregation, the filters described in *Open SDN: Starter kit – Power on and configure switch* can be applied to identify and select traffic for aggregation. In the scenario below, three flows are created with a filter on separate IP address on each port. The previous flows need to be deleted first, then use the following commands to set up the new flows:

- *ovs-ofctl add-flow br0 in_port=1,dl_type=0x0800,nw_src=100.10.0.1,actions=output:4*
- *ovs-ofctl add-flow br0 in_port=2,dl_type=0x0800,nw_src=100.10.0.2,actions=output:4*
- *ovs-ofctl add-flow br0 in_port=3,dl_type=0x0800,nw_src=100.10.0.3,actions=output:4*

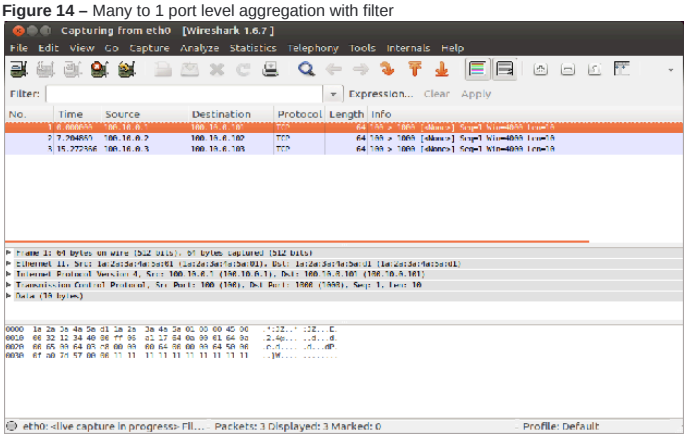
Figure 13 – Many to 1 port level aggregation



The *packeth* is configured to generate traffic with mixed source IP addresses. Try this with a manual option first to send a small amount of traffic through each port. Then, monitor the traffic on *wireshark* to see if the packets are filtered and forwarded correctly.

The *dump-flows* command is handy to verify the number of packets matched by the filtering rule. The ***ovs-ofctl dump-ports br0*** command is also very useful to show all the port statistics. Flows can be modified dynamically based on traffic conditions to throttle traffic during over-subscription, provide load balance, and re-distribute traffic. In deployment scenario, flows are managed via Open Flow controller with Open Flow protocols. In the next Starter kit, the RYU Open Flow controller will be discussed to show the controller-switch interaction.

Figure 14 – Many to 1 port level aggregation with filter



OVS Commands Used in this Tutorial

```
ovs-vsctl show
ovs-ofctl show br0
ovs-ofctl dump-ports br0
ovs-vsctl list-br
ovs-vsctl list-ports br0
ovs-vsctl list-ifaces br0
ovs-ofctl dump-flows br0
ovs-ofctl snoop br0
ovs-vsctl add-br br0 - set bridge br0 datapath_type=pica8
ovs-vsctl del-br br0
ovs-vsctl set-controller br0 tcp:172.16.1.240:6633
ovs-vsctl del-controller br0
ovs-vsctl set Bridge br0 stp_enable=true
ovs-vsctl add-port br0 ge-1/1/1 - set interface ge-1/1/1 type=pica8
ovs-vsctl add-port br0 ge-1/1/2 - set interface ge-1/1/2 type=pica8
ovs-vsctl add-port br0 ge-1/1/3 - set interface ge-1/1/3 type=pica8
ovs-vsctl add-port br0 ge-1/1/4 - set interface ge-1/1/4 type=pica8
ovs-vsctl add-port br0 ge-1/1/1 type=pronto options:link_speed=1G
ovs-vsctl del-port br0 ge-1/1/1
ovs-ofctl add-flow br0 in_port=1,actions=output:2
ovs-ofctl mod-flows br0 in_port=1,dl_type=0x0800,nw_src=100.10.0.1,actions=output:2

Connection to a RYU Controller

In a software-defined network, the Ryu controller is used to manage how traffic is handled. Ryu provides APIs intended to make it easy for developers to write network management and control applications used in an SDN. Using Ryu, organizations can create customized applications for managing and controlling their networks. They can also modify existing components. In either case, the applications communicate to the Ryu controller, delivering instructions on how network traffic should be managed. Ryu supports OpenFlow and other protocols (including Netconf and OF-config) to interact with the forwarding plane and dictate traffic flows. It works with Open vSwitch switches, including switches based on Pica8 PICOS.

This document describes how to configure Ryu controllers in PICOS.

- RYU Introduction
- Introduce RYU Open Flow Controller
- Configure OVS for RYU OpenFlow Controller
- Controller-OVS Interaction
- RYU Simple Switch Application
- Open Flow Message Type
- RYU Guide OVS Commands Reference
- Using TTP (router profile) with RYU Controller

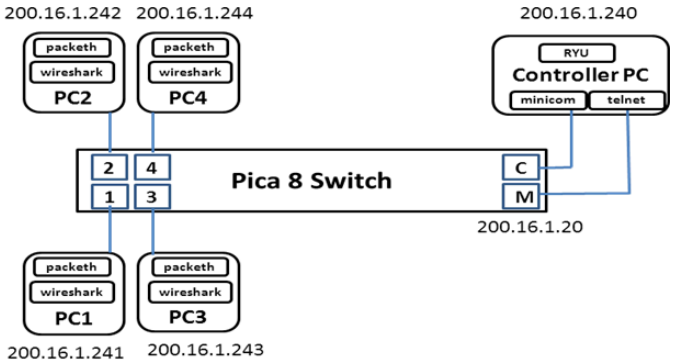
RYU Introduction

This document provides instructions on how to configure Pica8's open switches to work in various application scenarios. This document assumes the reader with minimal to no knowledge of the Open Virtual Switch (OVS) implementation defined by http://openvswitch.org/ or the OpenFlow protocol defined by https://www.opennetworking.org/. After studying this guide, user will have the tools needed to configure Pica8's open switches as an OpenFlow switch. User will also gain insights on how to optimize the configuration to work in an application environment while also learning about OVS and the OpenFlow protocol.

This starter kit provides screen shots and a list of off-the-shelf applications needed to complete the configuration, as well as tips regarding problems user may encounter during the setup. More documents or cookbooks on other subjects will be published periodically. This document provides a tutorial on how to:

- Configure Pica8 as an OVS OpenFlow switch
- Create bridges, add ports, show bridge and port statistics, status, as well as the OVS database
- Configure flow tables for uni-directional, bi-directional, traffic switching, one-to-many multi-casting, mirroring, filtering, many-to-one aggregation, etc.,
- Configure Pica8 OVS OpenFlow switches to interface with the RYU OpenFlow Controller

Figure 1 – Test bed configuration



In this document, the system configuration depicted in Figure 1 includes:

- A Pica8 P-3295 open switch with 48 x 1 GbE and 4 x 10 GbE uplinks
- 5 Linux PCs running Ubuntu 12.4.1 LTS, one is connected to the management LAN port (RJ45) and console port (RJ45F); this PC is referred to the controller PC. The OpenFlow controller will be running on this PC. Four PCs are connected to 1GbE port 1 to 4 and serve as a data terminal for generating and monitoring traffic
- Tools installed on all the PCs are listed below. They can be installed through Linux installation utility *apt-get*
    - Terminal emulator minicom
    - Traffic monitoring tool Wireshark
    - Packet generator Packeth
    - ftp and ftpd

Introduce RYU Open Flow Controller

RYU is an open flow controller that has been integrated with the Pica8 open switch with OVS 1.10 implementation that supports Open Flow v1.3. Additional RYU information can be found at the RYU website http://osrg.github.com/ryu/. The purpose of Pica8 RYU integration is to provide an open source SDN platform so that the SDN community can prototype, test, and develop applications in an open source environment with an open flow switching platform for real traffic testing. With the configuration provided in this starter kit, user should be able to have real traffic running in a week to test out the application scenarios using OVS commands. Both OVS and RYU are open source with Apache licenses that developers can access easily.

To clone the RYU directory, open a shell window from $home directory. Then, use *git clone git://github.com/osrg/ryu.git* to copy the RYU code base. It will create an *ryu* directory in $home.

Figure 2 – Clone RYU. Then *cd ryu* and *sudo python ./setup.py install* to complete the installation.

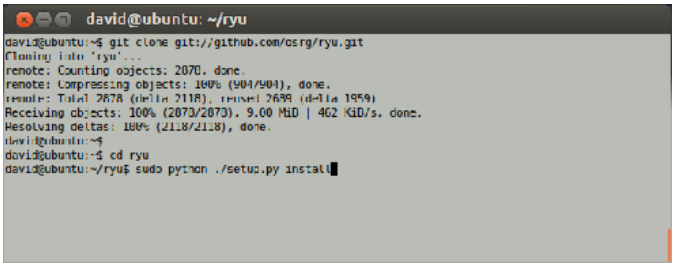


Figure 3 – Install RYU. The installation installs the *ryu-manager* and *ryu-client* to the $home/*ryu/bin* and */usr/local/bin* directories. Now we are ready to run the test applications.

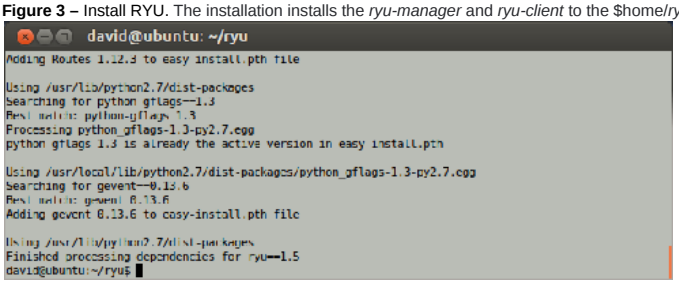

Figure 4 – RYU-manager and RYU-client

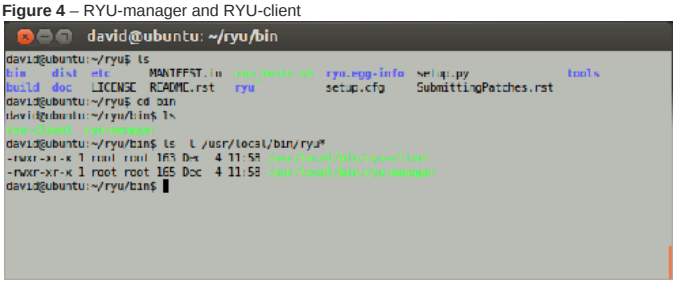
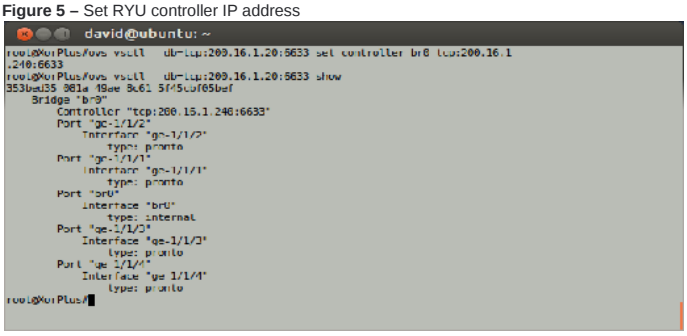


Configure OVS for RYU OpenFlow Controller

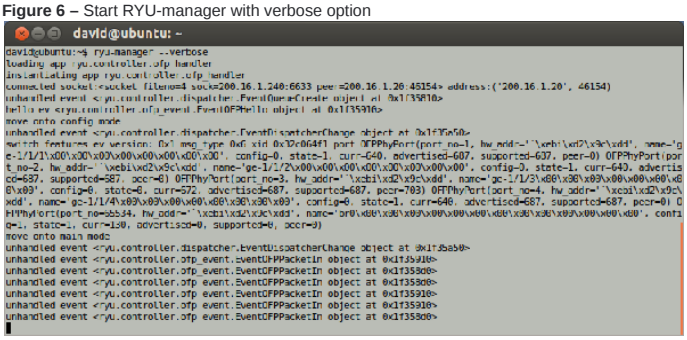
In OVS, the controller property of the bridge created earlier needs to be added to include the controller IP address and port number. The command ***ovs-vsctl set-controller br0 tcp:200.16.1.240:6633*** sets the controller address for bridge *br0* on port 6633. The command ***ovs-vsctl show*** would then show the bridge information. The connection status is not shown because the controller has not been started yet.

Figure 5 – Set RYU controller IP address



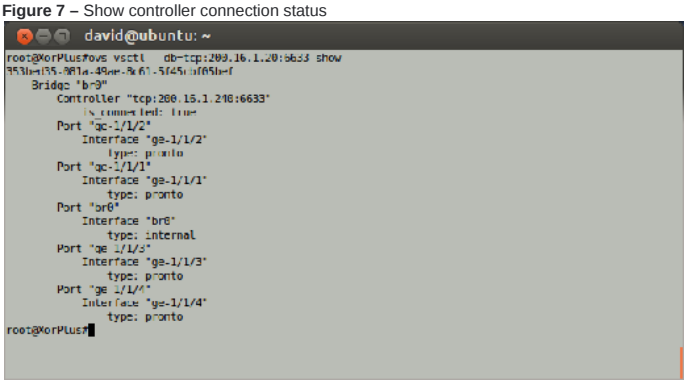
The RYU controller will be running on the controller PC with IP address 200.16.1.240 using the default port 6633. The port number can be changed. For this exercise, the controller will be started with the *–verbose* mode.

Figure 6 – Start RYU-manager with verbose option



The *--verbose mode* helps us understand the *RYU controller-OVS* interaction. Use the command ***ryu-manager* –verbose** to start the controller. The TCP connection is established first and the connection information is printed with peer (OVS) IP address 10.10.50.20. Once the controller is started, the connection status will change to *is_connected: true*. The controller port information can also be shown using the command ***ovs-ofctl show*** *br0*.

Figure 7 – Show controller connection status

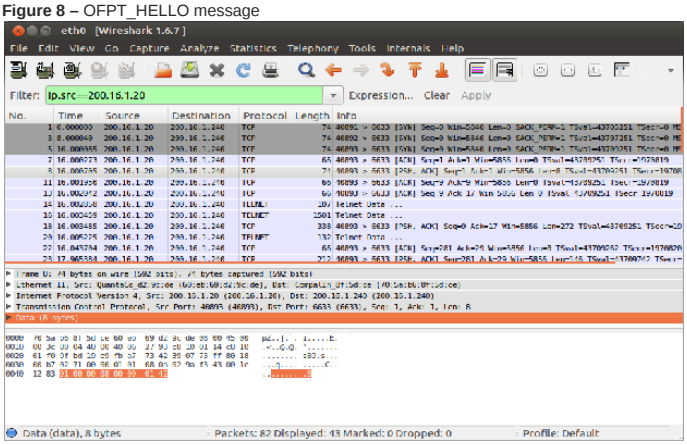


Controller-OVS Interaction

Once the controller and OVS are connected, a set of messages will be exchanged. For example, the OVS sends an OFPT_HELLO message to the controller. The hello message is captured on the *wireshark* screen. The first byte of the message is the version number and the second byte is the OFPT_TYPE. OFTP_HELLO message is type 0.

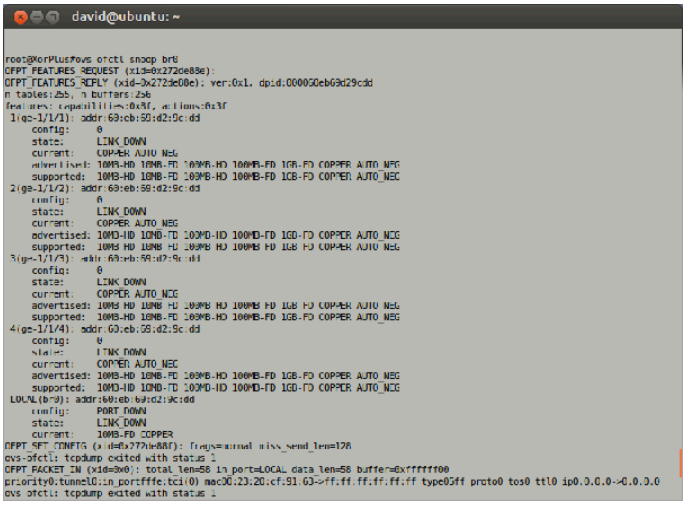
After the hello message from the switch, the controller sends OFPT_FEATURES_REQUEST (type=5) to retrieve the switch capabilities, including the supported open flow version, switch configuration, port hardware address, etc. The switch sends OFPT_FEATURES_REPLY (type=6) to provide the feature information. The message is shown on both the controller console and switch console.

Figure 8 – OFPT_HELLO message



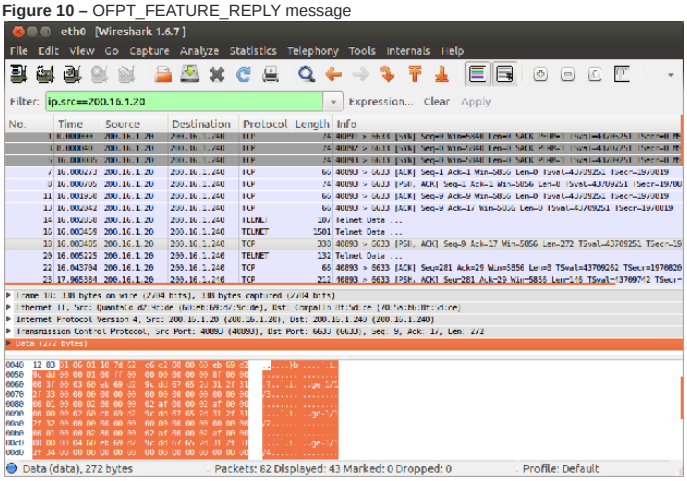
The switch console information is provided by the snoop option of the *ovs-ofctl* command. The command is ***ovs-ofctl snoop br0.*** It shows the feature request from the controller and the feature reply with the bridge information. User can compare the switch console information with the controller console information to get a better understanding of the message exchange.

Figure 9 – ovs-ofctl snoop br0



The *wireshark* also captured the information. Notice the message type in the second byte is 6 representing the OFPT_FEATURES_REPLY. After the feature reply, the controller sends an OFPT_SET_CONFIG message to set the message parameters such as max length, etc. Once the controller is connected, the OVS changes its default behavior from a layer 2 switch to an OVS switch. It means the flooding is disabled and open flow packet processing starts. Each packet is processed based on the flow table entry. Unmatched packets are forwarded to the controller for analysis unless a rule is defined to drop the packet.
During initial start up with the controller, the flow table is empty. Therefore, packets received from any port are forwarded to the controller. The next message from the switch is type OFPT_PACKET_IN (type=10/0x0a).

Figure 10 – OFPT_FEATURE_REPLY message

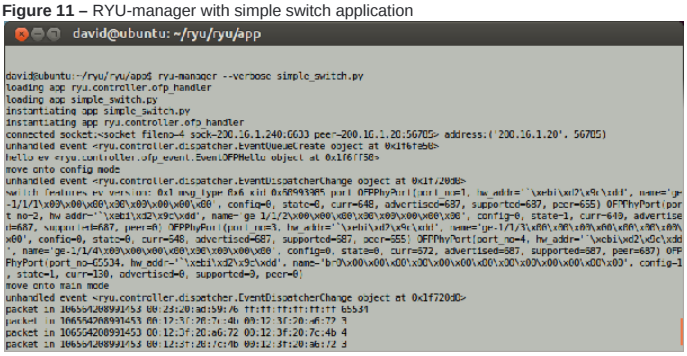


In this exercise, the *RYU-manager* does not have any application to receive and process the OFPT_PACKET_IN message. Therefore, on the controller screen, a bunch of *unhandled_events* are printed on the console. At this point, the RYU-OVS open flow session is established and ready for Open Flow application to take over the event handling and flow configuration.

RYU Simple Switch Application

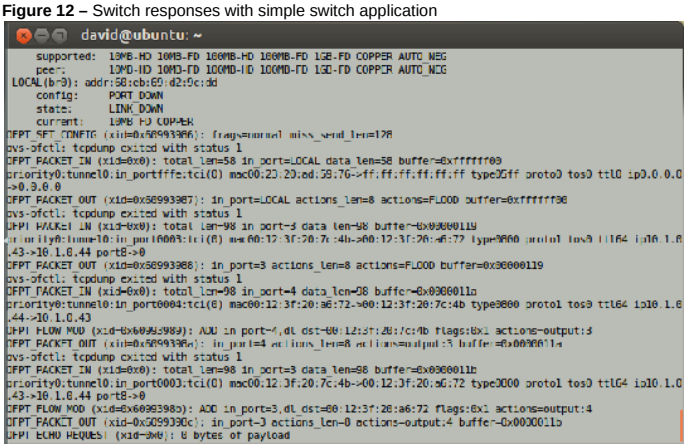
With just the controller connected without any application, the ping between the PCs cannot work because the ARP requests are forwarded to the controller without any packet processing instructions in the flow tables. RYU code distribution comes with a set of applications to show how applications can be integrated. The following instructions will show how to run the simple switch application. The application processes the *packet_in* messages (e.g., ICMP_REQUEST) and instructs the bridge to flood all other ports with the packets once the destination host has received the request and has replied with its MAC address. This simple switch application sets up the flow table to forward traffic from source port to the correct destination port. This is the default switch behavior that we have tested before. The application is in the $home/ryu/ryu/application directory. Run the *ryu-manager –verbose simple_switch.py* command to start the application.

Figure 11 – RYU-manager with simple switch application



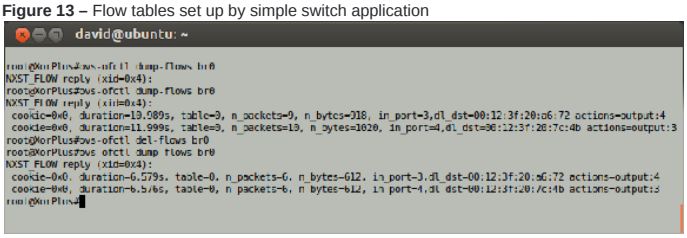
Once the simple switch application starts, the first part of the message output is the same as before, but instead of receiving unhandled events only as the previous RYU-manager only run, it sends an OFPT_PACKET_OUT message to the switch with FLOOD actions on first two packet_in messages. The first one is a probe message sent by the controller on local port.

Figure 12 – Switch responses with simple switch application



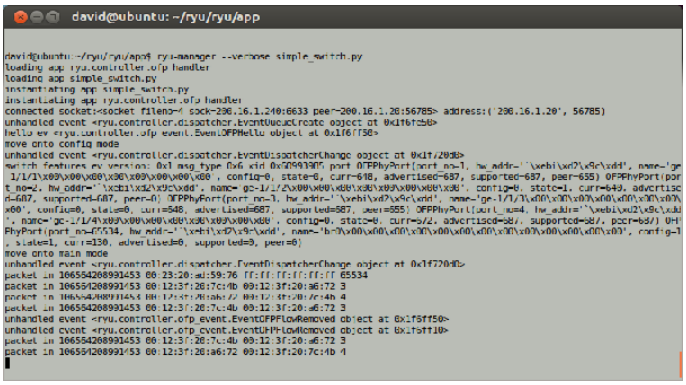
The second message is an ICMP request that comes in from port 3 and has a target destination of port 4. This message is the result of a ping test running on the PC connected to port 3 to PC on port 4. Since the controller does not know which port has the PC 4 MAC address. It sends the OFPT_PACKET_OUT instruction to the switch to flood the message received on port 3. Once the PC on port 4 receives the ICMP request, it responds with its reply. The controller matches the reply destination MAC address with the PC3 on port3 and sends an OFPT_FLOW_MOD action to create a flow from port 4 to port 3 to forward the packets. The same process repeats again for setting up flows from port 3 and port 4.

Figure 13 – Flow tables set up by simple switch application



As a result, the *dump-flows* show 2 flows created by the simple switch application. To test it again, simply use *del-flows* command to delete the flow.

Figure 14 – Delete flow event from switch to controller



Once the flows are deleted, two OPEN_FLOW_REMOVED events are generated by the switch to notify the controller. The MAC learning process repeats itself again. The two flows will be created when the next round of the ICMP requests come into the controller. User can dump the flow table to verify its behavior. At this point, the starter kit has demonstrated the basic RYU controller integration with OVS and a simple application built on top of the RYU controller. Reader should be able to start testing and writing test applications using the SDN platform presented in this document.

Open Flow Message Type

```
# enum ofp_type
OFPT_HELLO = 0 # Symmetric message
OFPT_ERROR = 1 # Symmetric message
OFPT_ECHO_REQUEST = 2 # Symmetric message
OFPT_ECHO_REPLY = 3 # Symmetric message
OFPT_VENDOR = 4 # Symmetric message
OFPT_FEATURES_REQUEST = 5 # Controller/switch message
OFPT_FEATURES_REPLY = 6 # Controller/switch message

```

Using TTP (router profile) with RYU Controller

A Table Type Pattern (TTP) is an Open Network Foundation (ONF) effort to more easily enable an OpenFlow controller and switch to agree on a set of functionalities during configuration. A TTP describes specific forwarding behaviors that an OpenFlow controller can program using the OpenFlow-Switch protocol.

With respect to the Pica8 PICOS network operating system and white box switches, TTPs help overcome the limitations of Ternary Content Addressable Memory (TCAM) devices. TCAMs are power hungry, expensive memory devices that bloat the cost of solutions and cannot scale well. TTPs enable OpenFlow access to other ASIC tables, such as the VLAN, MAC, and IP along with TCAM tables. As the NOS opens up the different tables in the ASIC, an OpenFlow application is able to control the population of these tables directly in a normalized way. What this means is that the TTP is persistent across ASIC architectures. As a result, the SDN application can scale across ASIC architectures without any modification. For example, a fixed pipeline for IP routing, policy routing or an MPLS flow could be made consistent across any ASIC implementation.

This document details how to use TTP with the RYU OpenFlow Controller.

RYU Controller Configuration

RYU controller comes with sample applications that enable user to jumpstart SDN deployment. These sample applications are stored in the following directory:

```
ls -l /home/sudhirmodali/ryu/ryu/app
total 292
-rw-rw-r-- 1 sudhirmodali sudhirmodali  3647 Jul  5 00:12 bmpstation.py

-rw-rw-r-- 1 sudhirmodali sudhirmodali  4396 Jul  5 00:12 ws_topology.py
```

Among all the applications, "ofctl_rest.py" (highlighted above) enables openflow REST interface for an open flow capable switch. This program supports OpenFlow versions 1.0 through 1.5. This provides a good framework to develop the APIs for configuring open flow rules.

```
pica8@ubuntu:~$ pip install ryu
pica8@ubuntu:~$ cd ryu
pica8@ubuntu:~/ryu$ ryu-manager ryu.app.ofctl_rest --verbose

```

Another important tool required to work with APIs is one of the following:

1. POSTman : (https://www.getpostman.com)
2. Swagger : (http://swagger.io/swagger-ui/)

The following example will demonstrate the use of POSTman to configure the open flow rules. Typically, these tools are used with a single switch to determine the REST APIs required to configure the switch. POSTman has a facility to run the set of APIs in an iterative process to perform the task multiple times if required.

The following is the configuration on the switch required to configure TTP:

```
admin@PicOS-OVS$ovs-vsctl show-running-config

Open_vSwitch ab7af11d-fc7a-4e9c-8165-36e67f92d043
  Bridge "br0"
    Controller fb5f8fd6-aca8-49f9-add0-800cd6c4d840
      is_connected: true
      role: other
      status: {current_version="OpenFlow14", sec_since_connect="691372", state=ACTIVE}
      target: "tcp:172.16.0.123:6633"
    datapath_id: "5e3e00e09500169a"
    datapath_type: "pica8"
    Port "te-1/1/1"
      Interface "te-1/1/1"
        type: "pica8"
      tag: 1
      vlan_mode: trunk
    Port "br0"
      Interface "br0"
        mtu: 1500
        type: internal
    Port "te-1/1/2"
      Interface "te-1/1/2"
        type: "pica8"
      tag: 1
      vlan_mode: trunk
    protocols: ["OpenFlow14"]

  Pica8 6d736702-1adb-44f8-93e6-998166ca813f
    hardware_type: "5401"
    pica_ttp_enable: true
    pica_ttp_name: RouterTTP.json
```

Step 1: Setting the following environment variables in Postman helps in managing the variables

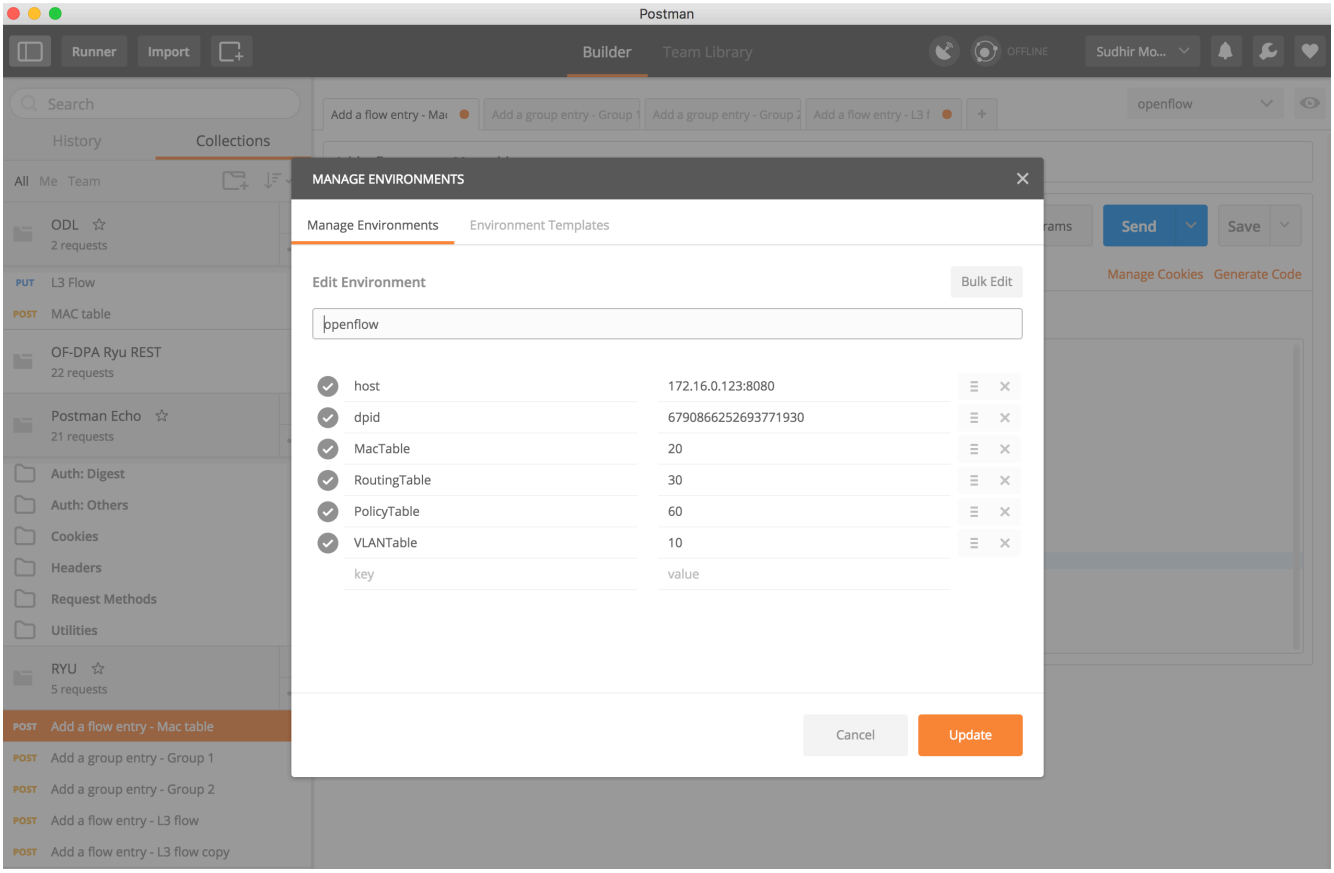

Table Type Patterns (TTP) are described in detail in the following blog (http://www.pica8.com/pica8-deep-dive/scaling-up-sdns-using-ttps-table-type-patterns/). The following is based on steps mentioned in the blog.

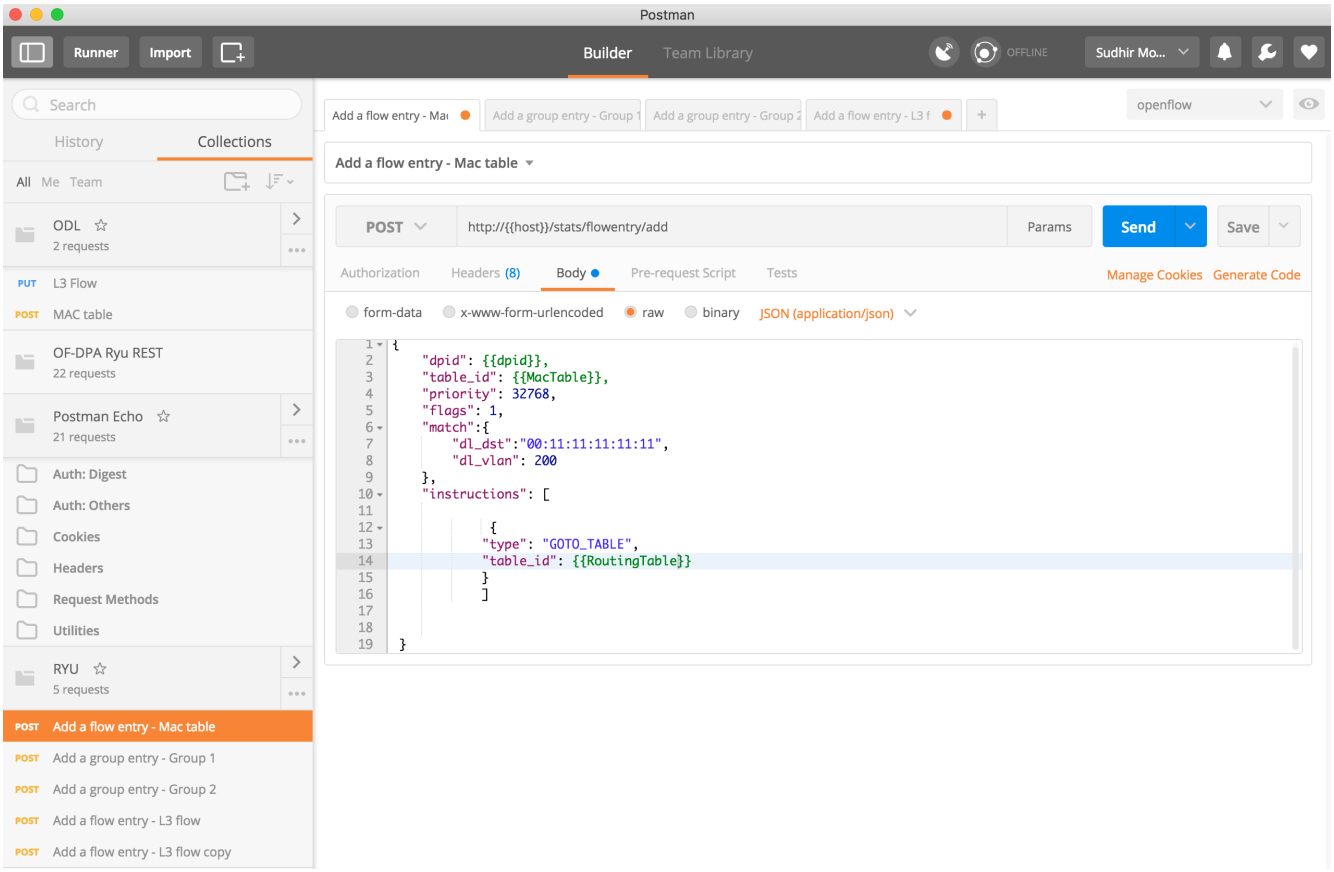
Step 2 : Creating a mac entry in the L2 table

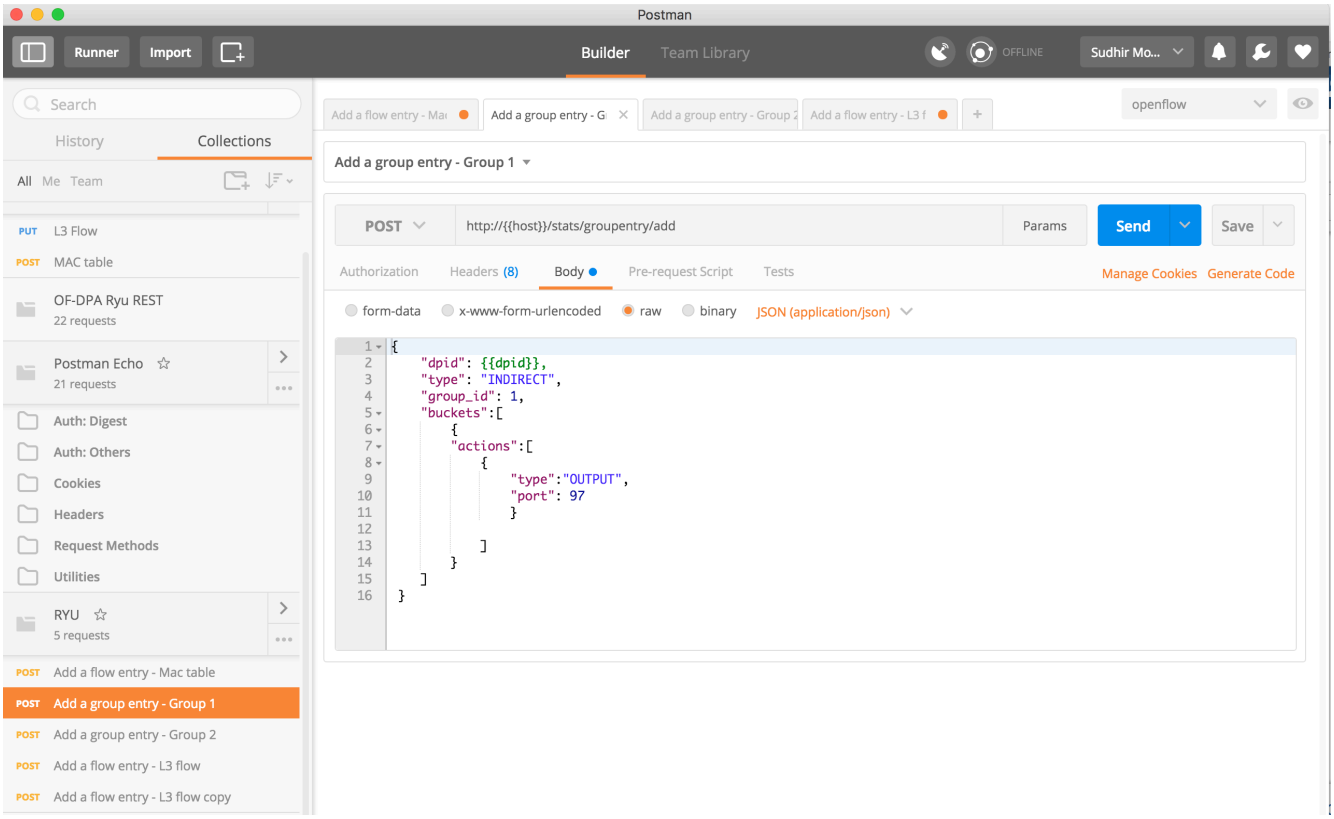


Verify the switch has the flow configured

```
admin@PicOS-OVS$ovs-ofctl dump-flows br0

OFPST_FLOW reply (OF1.4) (xid=0x2):
 flow_id=3735291, cookie=0x0, duration=690201.683s, table=20, n_packets=n/a, n_bytes=n/a, dl_vlan=200,dl_dst=00:11
```

Step 3 : Creating a group entry (group_id = 1) for the egress L2 interface

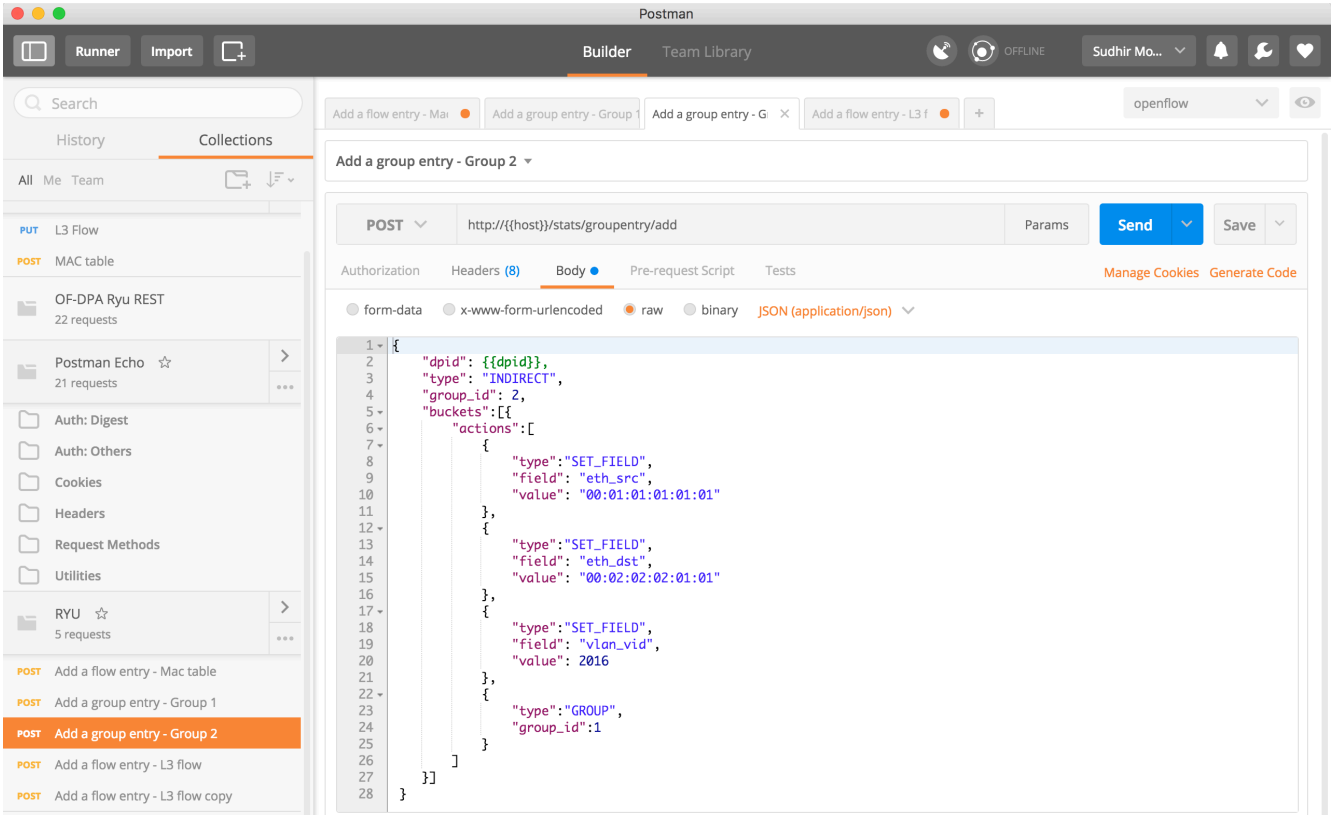


Verify the group exists on the switch

```
admin@PicOS-OVS$ovs-ofctl dump-groups br0

OFPST_GROUP_DESC reply (OF1.4) (xid=0x2):
 group_id=1,type=indirect,bucket=weight:0,actions=output:97
```

Step 4 : Create a group entry (group_id = 2) for the egress L3 interface

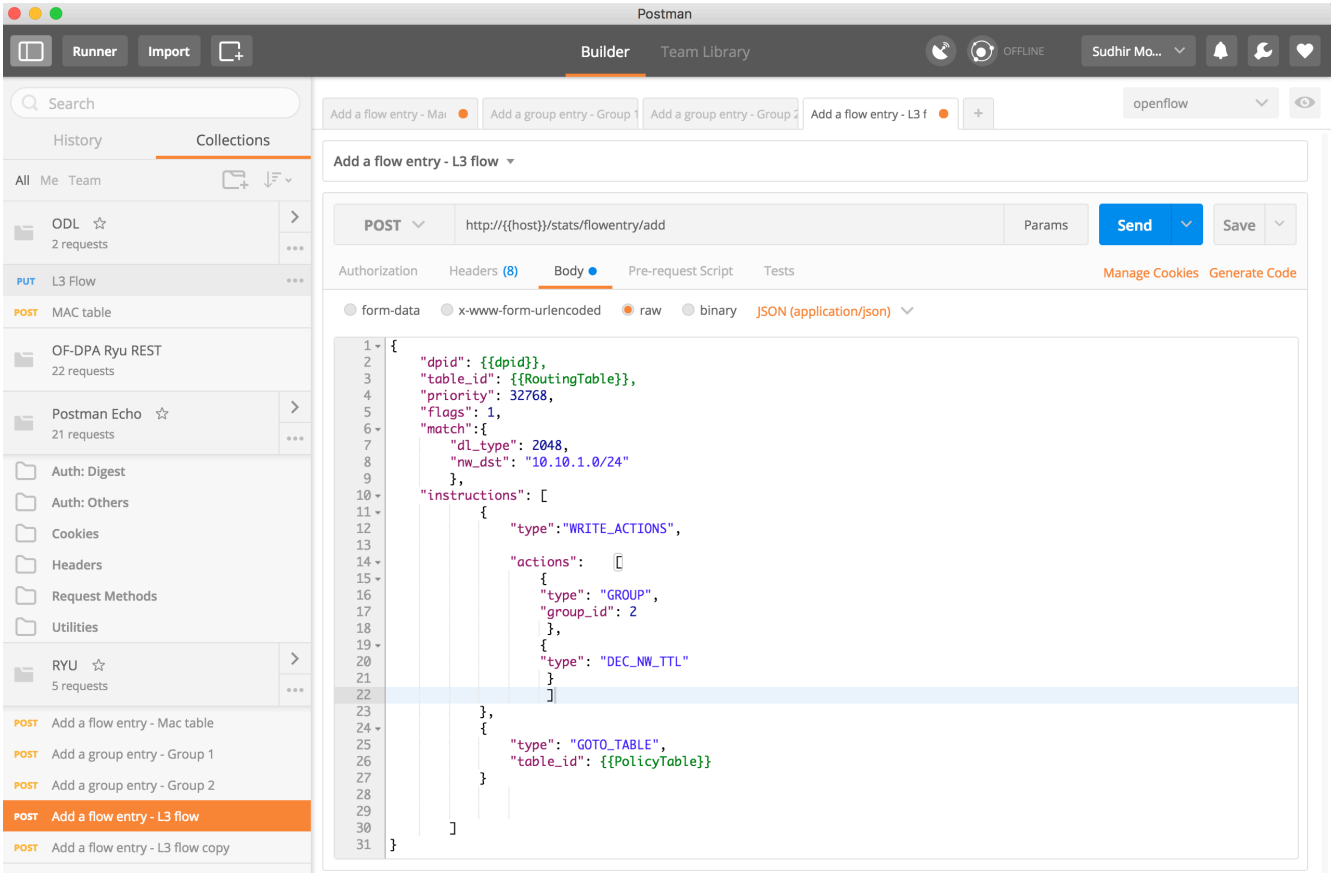


Verify the switch has the configuration

```
admin@PicOS-OVS$ovs-ofctl dump-groups br0

OFPST_GROUP_DESC reply (OF1.4) (xid=0x2):
 group_id=1,type=indirect,bucket=weight:0,actions=output:97
 group_id=2,type=indirect,bucket=weight:0,actions=set_field:00:01:01:01:01:01->eth_src,set_field:00:02:02:02:01:01
```

Step 5 : Create a IP flow in the L3 table



Verify the configuration on the switch

```
admin@PicOS-OVS$ovs-ofctl dump-flows br0

OFPST_FLOW reply (OF1.4) (xid=0x2):
 flow_id=3735291, cookie=0x0, duration=690201.683s, table=20, n_packets=n/a, n_bytes=n/a, dl_vlan=200,dl_dst=00:11
 flow_id=3735292, cookie=0x0, duration=690201.538s, table=30, n_packets=n/a, n_bytes=n/a, ip,nw_dst=10.0.1.0/24 act
```

"ovs-ofctl dump-flows br0" shows the software flow table configured by the controller. "ovs-appctl pica/dump-flows" shows the ASIC tables.

```
admin@PicOS-OVS$ovs-appctl pica/dump-flows

Ingress Port Table: (Total 0 flows)

VLAN Table: (Total 0 flows)

Termination MAC Table: (Total 1 flows)
 ID=5 dl_vlan=200,dl_dst=00:11:11:11:11:11, actions:goto(Unicast Routing Table)

Unicast Routing Table: (Total 1 flows)
 ID=6 ip,nw_dst=10.0.1.0/24, actions:group(id=2,indirect,n=1,b0(set(dl_src=00:01:01:01:01:01,dl_dst=00:02:02:02:01

Policy ACL Table: (Total 1 flows)
 ID=1 priority=18000009,tcp,dl_dst=00:e0:95:00:16:9a,nw_src=172.16.0.123,tp_src=6633, actions:set(queue=7),output:(

Connection to OpenDaylight Controller

OpenDaylight is an open source platform for building programmable SDNs (software-defined networks). Learn more about OpenDaylight here.

- OpenDaylight Introduction
- Introduction to the OpenDaylight OpenFlow Controller
- Configure OVS for OpenDaylight Open Flow Controller
- OpenDaylight Controller-OVS Interaction
- OpenDaylight Simple Switch Application
- Message Type of Open Flow
- OVS Commands Reference 04

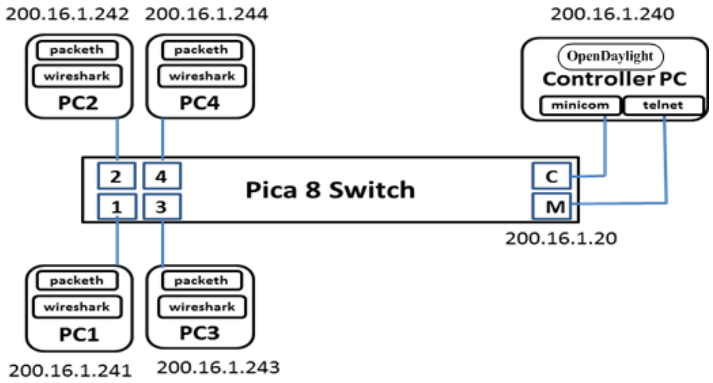
OpenDaylight Introduction

This document provides instructions on how to configure Pica8's open switches to work in various application scenarios. This guide assumes the reader has minimal to no knowledge of the Open Virtual Switch (OVS) implementation defined by http://openvswitch.org/; or the OpenFlow protocol, defined by https://www.opennetworking.org/. This guide will provide the tools required to configure Pica8's open switches as an OpenFlow switch. By reading this guide, user will gain insights on how to optimize the configuration to work in a specific application environment, while also learning about OVS and the OpenFlow protocol.

This starter kit provides screen shots and a list of off-the-shelf applications needed to complete the configuration, as well as tips on problems users may encounter during the setup. More documents or cookbooks on other subjects will be published periodically. This document provides a tutorial on how to:

- Configure Pica8 as an OVS OpenFlow switch
- Create bridges, add ports, show bridge and port statistics, status, and utilize the OVS database
- Configure flow tables for uni-directional, bi-directional, traffic switching, one-to-many multi-casting, mirroring, filtering, many-to-one aggregation, etc.
- Configure Pica8 OVS OpenFlow switches to interface with the OpenDaylight OpenFlow Controller

Figure 1 – Test bed configuration



In this document, the system configuration depicted in Figure 1 includes:

- A Pica8 P-3295 open switch with 48 x 1 GbE and 4 x 10 GbE uplinks
- 5 Linux PCs running Ubuntu 12.4.1 LTS, one is connected to the management LAN port (RJ45) and console port (RJ45F); this PC is referred to the controller PC. The OpenFlow controller will be running on this PC. Four PCs are connected to 1GbE port 1 to 4 and serve as a data terminal for generating and monitoring traffic
- Tools from installed on all the PCs are listed below. They can be installed through Linux installation utility *apt-get*
  - Terminal emulator minicom
  - Traffic monitoring tool Wireshark
  - Packet generator Packeth
  - ftp and ftpd

Introduction to the OpenDaylight OpenFlow Controller

OpenDaylight is an OpenFlow controller that has been integrated with the Pica8 open switch with OVS 1.10 implementation and supports Open Flow v1.3. Additional OpenDaylight information can be found at the OpenDaylight website http://www.opendaylight.org. The purpose of Pica8 OpenDaylight integration is to provide an open source SDN platform that the SDN community can prototype, test, and develop for application in an open source environment, with an open flow switching platform for real traffic testing. With the configuration provided in this starter kit, user should be able to have real traffic running within a week to test out the application scenarios using OVS command. Both OVS and OpenDaylight are open source with Apache licenses that developers can access easily.

User can obtain a copy of OpenDaylight from http://www.opendaylight.org/software/downloads. To install OpenDaylight, follow the procedure in the OpenDaylight Getting Started Guide.

After installing OpenDaylight, user can first edit the configuration file in */opendaylight/configuration/config.ini* and then start the OpenDaylight controller by using the ***./run.sh*** command.

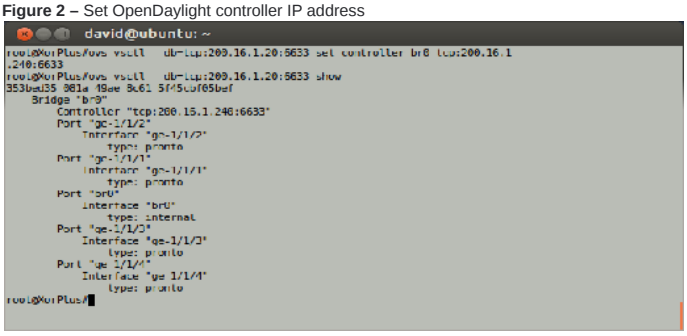
Configure OVS for OpenDaylight Open Flow Controller

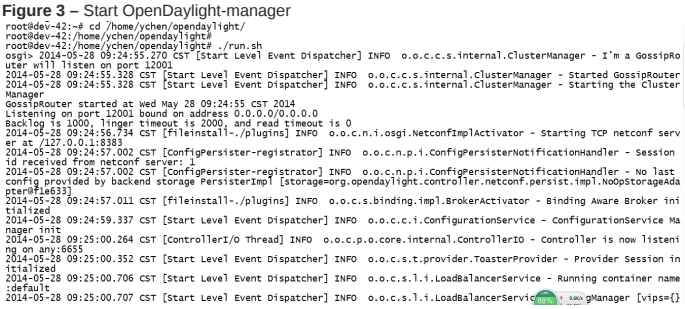
In OVS, the controller property of the bridge created earlier needs to be added to include the controller IP address and port number. The command ***ovs-vsctl set-controller br0 tcp:200.16.1.240:6633,*** is to set a controller address for bridge *br0.* The command ***ovs-vsctl show*** can now show the bridge information. The connection status is not shown because the controller has not been started yet.

Figure 2 – Set OpenDaylight controller IP address



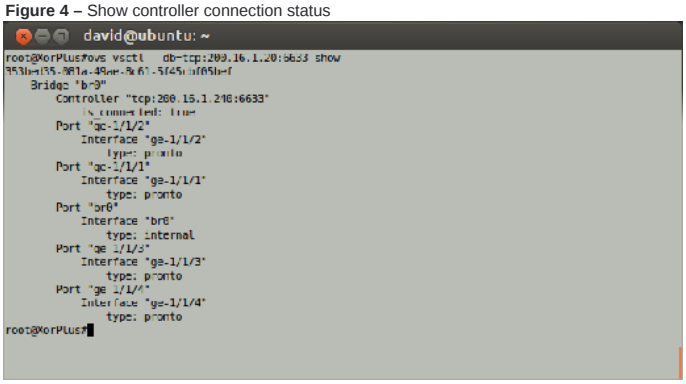
The OpenDaylight controller will be running on the controller PC with IP address 200.16.1.240, using default port 6633. The port number can be changed. For this exercise, the controller will be started with *"./run.sh"*

Figure 3 – Start OpenDaylight-manager



Once the controller is started, the connection status will change to *is_connected: true*. The controller port information can also be shown using the command ***ovs-ofctl show*** *br0*.

Figure 4 – Show controller connection status

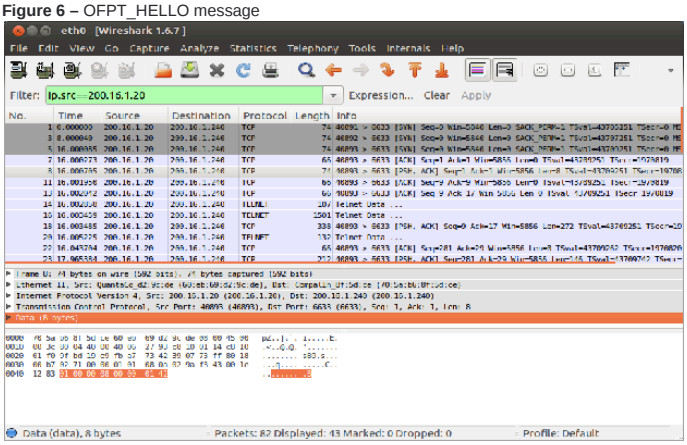


OpenDaylight Controller-OVS Interaction

Once the controller and OVS are connected, a set of messages will be exchanged. For example, the OVS sends an OFPT_HELLO message to the controller. The hello message is captured on the *wireshark* screen. The first byte of the message is the version number, and the second byte is the OFPT_TYPE. OFTP_HELLO message is type 0.

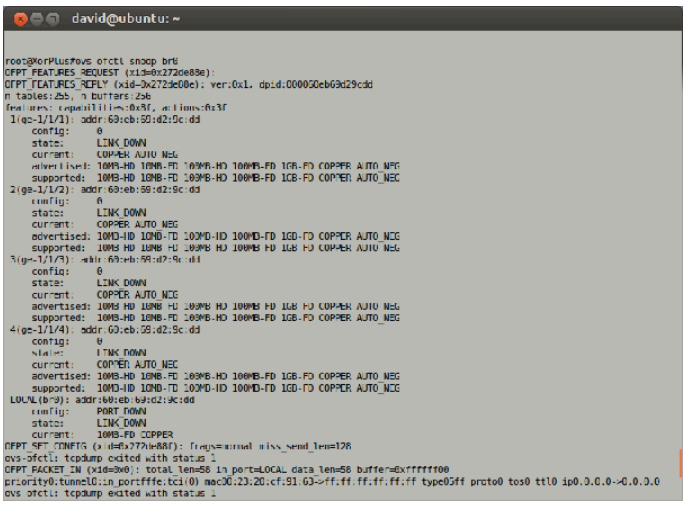
After the hello message from the switch, the controller sends OFPT_FEATURES_REQUEST (type=5) to retrieve the switch capabilities, including supported open flow version, switch configuration, and port hardware address. The switch sends OFPT_FEATURES_REPLY (type=6) to provide the feature information. The message is shown on both the controller console and the switch console.

Figure 6 – OFPT_HELLO message



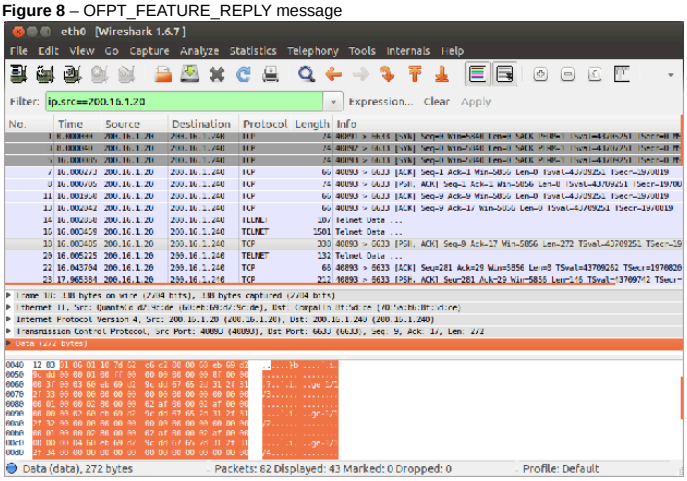
The switch console information is provided by the snoop option of the *ovs-ofctl* command. The command is ***ovs-ofctl snoop br0*.** It shows the feature request from the controller and the feature reply with the bridge information. User can compare the switch console information with the controller console information to get a better understanding of the message exchange.

Figure 7 – ovs-ofctl snoop br0



The *wireshark* also captured the information. Notice the message type in the second byte is 6 representing the OFPT_FEATURES_REPLY. After the feature reply, the controller sends an OFPT_SET_CONFIG message to set the message parameters like the max length, etc. Once the controller is connected, the OVS changes its default behavior from a layer 2 switch to an OVS switch. It means the flooding is disabled and open flow packet processing starts. Each packet is processed based on the flow table entry. Unmatched packet is forwarded to the controller for analysis unless a rule is defined to drop the packet. During initial start up with the controller, the flow table is empty. Therefore, packets received from any port are forwarded to the controller. The next message from the switch is type OFPT_PACKET_IN (type=10/0x0a).

Figure 8 – OFPT_FEATURE_REPLY message



In this exercise, the *OpenDaylight controller* does not have any application to receive and process the OFPT_PACKET_IN message. Therefore, on the controller screen, a bunch of *unhandled_events* are printed on the console. At this point, the OpenDaylight-OVS open flow session is established and ready for Open Flow application to take over the event handling and flow configuration.

OpenDaylight Simple Switch Application

With only the controller connected, without any application, the ping between the PCs cannot work because the ARP requests are forwarded to the controller without any packet processing instructions in the flow tables. OpenDaylight code distribution comes with a set of applications to show how applications can be integrated. Next, an example will be shown of running the simple switch application. The application processes the *packet_in* messages (e.g., ICMP_REQUEST) and instructs the bridge to flood all other ports with the packets. Once the destination host receives the request and replies with its MAC address, this simple switch application sets up the flow table to forward traffic from source port to the correct destination port. This is the default switch behavior that has been tested. When starting the OpenDaylight controller with "/home/ychen/opendaylight# ./run.sh", user can configure the controller on the web, http://10.10.50.42:8080/

Figure 9 – Web configure

Connection to a Floodlight Controller

- Floodlight Controller Introduction
- Floodlight Open Flow Controller
- Test Topology
- Configure OVS
- Launch Floodlight
- Floodlight REST Interface

Floodlight Controller Introduction

This is the fourth document of the *Open SDN Starter Kit series*. This document provides instructions on how to configure Pica8's open switches in order to work with *Floodlight Controller*. This document assumes the reader has read the first two documents of the *Open SDN Starter Kit series*.

Floodlight Open Flow Controller

The *Floodlight* Open SDN Controller is an enterprise-class, Apache-licensed, Java-based OpenFlow Controller and it supports OpenFlow v1.0. In fact, *Floodlight* is not just an OpenFlow controller and it also includes a collection of applications built on top the *Floodlight* Controller. Additional *Floodlight* information can be found at *Floodlight* website http://www.projectfloodlight.org/floodlight/.

Users can either download the *Floodlight* source from http://www.projectfloodlight.org/download/ or follow the *Installation Guide,* http://docs.projectfloodlight.org/display/floodlightcontroller/Installation+Guide to install *Floodlight*.
In this document, we follow the *Installation Guide* to clone the source to an Ubuntu 11.10 system:

Figure 1 – Clone Floodlight

```
frank@ubuntu:~/wd/pica8/bigswitch/test$ git clone git://github.com/floodlight/floodlight.git
Cloning into floodlight...
remote: Counting objects: 24067, done.
remote: Compressing objects: 100% (9042/9042), done.
remote: Total 24067 (delta 12504), reused 23511 (delta 11994)
Receiving objects: 100% (24067/24067), 26.64 MiB | 960 KiB/s, done.
Resolving deltas: 100% (12504/12504), done.
frank@ubuntu:~/wd/pica8/bigswitch/test$ ls
floodlight
frank@ubuntu:~/wd/pica8/bigswitch/test$ cd floodlight/
frank@ubuntu:~/wd/pica8/bigswitch/test/floodlight$ git checkout fl-last-passed-build
Note: checking out 'fl-last-passed-build'.

You are in 'detached HEAD' state. You can look around, make experimental
changes and commit them, and you can discard any commits you make in this
state without impacting any branches by performing another checkout.

If you want to create a new branch to retain commits you create, you may
do so (now or later) by using -b with the checkout command again. Example:

  git checkout -b new_branch_name

HEAD is now at e890662... Merge pull request #405 from vy/patch-5
frank@ubuntu:~/wd/pica8/bigswitch/test/floodlight$
```

Why Make Changes?

By default, *Floodlight* forwards the unknown packets from the Pica8 switch to the destination. In this case, things may go well even if there are no flows set in the Pica8 switch. The purpose of this document is to show users how to use Floodlight REST interface to add flows to the Pica8 switch and verify the transmission of the traffic. In order to eliminate the confusion whether the packets are forwarded by Pica8 switch or *Floodlight* controller, we will disable *Floodlight*'s default forwarding feature.

Changes to Floodlight

The *Floodlight*'s default setting is in $floodlight/src/resources/floodlightdefault.properties. We need to remove the line "net.floodlightcontroller.forwarding.Forwarding,\" as shown below:

Figure 2 – Edit Floodlight Default Properties

```
floodlight.modules = net.floodlightcontroller.storage.memory.MemoryStorageSource,\
net.floodlightcontroller.core.FloodlightProvider,\
net.floodlightcontroller.threadpool.ThreadPool,\
net.floodlightcontroller.devicemanager.internal.DeviceManagerImpl,\
net.floodlightcontroller.devicemanager.internal.DefaultEntityClassifier,\

Build Floodlight

Before building *Floodlight*, we need to install *JDK* and *Ant*. Then, issue *ant* to build *Floodlight*.

Figure 3 – Build Floodlight

```
frank@ubuntu:~/wd/pica8/bigswitch/test/floodlight$ ant
Buildfile: /home/frank/wd/pica8/bigswitch/test/floodlight/build.xml

init:
    [mkdir] Created dir: /home/frank/wd/pica8/bigswitch/test/floodlight/target/bin
    [mkdir] Created dir: /home/frank/wd/pica8/bigswitch/test/floodlight/target/bin-test
    [mkdir] Created dir: /home/frank/wd/pica8/bigswitch/test/floodlight/target/lib
    [mkdir] Created dir: /home/frank/wd/pica8/bigswitch/test/floodlight/target/test

compile:
    [javac] Compiling 397 source files to /home/frank/wd/pica8/bigswitch/test/floodlight/target/bin
    [javac] Note: Some input files use unchecked or unsafe operations.
    [javac] Note: Recompile with -Xlint:unchecked for details.
     [copy] Copying 52 files to /home/frank/wd/pica8/bigswitch/test/floodlight/target/bin

compile-test:
    [javac] Compiling 79 source files to /home/frank/wd/pica8/bigswitch/test/floodlight/target/bin-test

dist:
      [jar] Building jar: /home/frank/wd/pica8/bigswitch/test/floodlight/target/floodlight.jar
      [jar] Building jar: /home/frank/wd/pica8/bigswitch/test/floodlight/target/floodlight-test.jar

BUILD SUCCESSFUL
Total time: 55 seconds
frank@ubuntu:~/wd/pica8/bigswitch/test/floodlight$
```

Then, the *Floodlight* Java Archive file, *floodlight.jar*, is generated under *target* directory and ready to be run.

Figure 4 – floodlight.jar

```
frank@ubuntu:~/wd/pica8/bigswitch/test/floodlight$ ls
apps                   floodlight_style_settings.xml  NOTICE.txt
build.xml              lib                            README.md

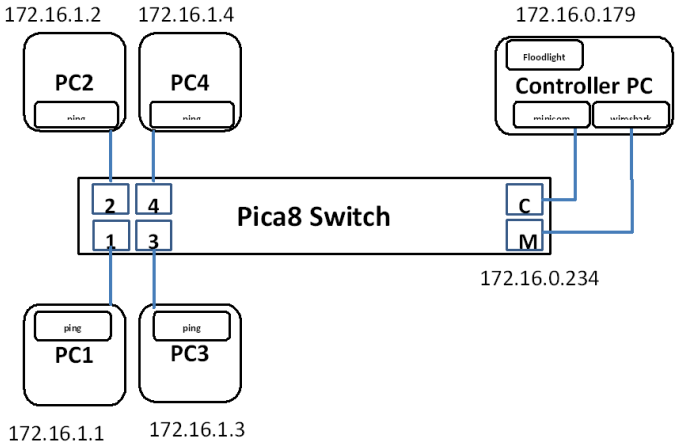
findbugs-exclude.xml   logback.xml                    src
floodlight.sh          Makefile                       target
frank@ubuntu:~/wd/pica8/bigswitch/test/floodlight$ ls target
bin  bin-test  floodlight.jar  floodlight-test.jar  lib  test
frank@ubuntu:~/wd/pica8/bigswitch/test/floodlight$
```

Test Topology

The following picture shows the test topology which is similar to the topology in the first two documents of the *Open SDN Starter Kit series,* even though the IP addresses are different.

Figure 5 – Test Topology



In this document, the systems depicted in the above diagram include:

- A Pica8 switch which is P-3295
- 5 Linux PCs running Ubuntu 11.10
  - The one, connected to the P-3295 management port (RJ45) and console port (RJ45F), is referred as the controller PC. The *Floodlight* controller will be running on this PC.
  - The other four PCs are connected to physical port 1 to 4 and serve as a data terminal to verify the flow.

Configure OVS

In this document, we start OVS manually. After powering on the Pica8 switch, users will see the following messages on the console display. Select choice "2" for OVS and enter "yes" to start OVS by manual.

Figure 6 – Start OVS Manually

```

port 6633.
        The default way of vswitch connecting to server is PTCP.
        If you do not want default configuration, choose manual start!

sh: you need to specify whom to kill
Do you want start the OVS by manual? (yes/no) yes
You need start troot@PicOS-OVS#
root@PicOS-OVS#
```

Please refer to PicOS 1.6 OVS Configuration Guide, http://www.pica8.org/document/picos-1.6-ovs-configuration-guide.pdf, for the details how to configure OVS. First, we need to provide a fixed IP address to the Pica8 switch, create the OVS database, and launch the OVS database server and the switch daemon. Here are the commands:

- ifconfig eth0 172.16.0.234/24
- ovsdb-tool create /ovs/ovs-vswitchd.conf.db /ovs/bin/vswitch.ovsschema
- ovsdb-server /ovs/ovs-vswitchd.conf.db --remote=ptcp:6632:172.16.0.234 &
- ovs-vswitchd tcp:172.16.0.234:6632 --pidfile=pica8 --overwrite-pidfile > /var/log/ovs.log 2> /dev/null &

Figure 7 – Configure OVS - 1

```
root@PicOS-OVS#ifconfig eth0 172.16.0.234/24
root@PicOS-OVS#PHY: 24520:00 - Link is Up - 1000/Full
ovsdb-tool create /ovs/ovs-vswitchd.conf.db /ovs/bin/vswitch.ovss
chema
root@PicOS-OVS#
root@PicOS-OVS#ovsdb-server /ovs/ovs-vswitchd.conf.db --remote=ptcp:6632:172.16.
0.234 &
root@PicOS-OVS#2013-06-11T19:17:50Z|00001|ovsdb_server|INFO|ovsdb-server (Open v
Switch) 1.9.90

root@PicOS-OVS#ovs-vswitchd tcp:172.16.0.234:6632 --pidfile=pica8 --overwrite-pi
dfile > /var/log/ovs.log 2> /dev/null &
```

In the following steps, we create the bridge, br0, and add 4 physical ports to it and set up its connection to a specific OpenFlow Controller (*Floodlight* in this case):

- ovs-vsctl add-br br0 – set bridge br0 datapath_type=pica8
- ovs-vsctl add-port br0 ge-1/1/1 – set interface ge-1/1/1 type=pica8
- ovs-vsctl add-port br0 ge-1/1/2 – set interface ge-1/1/2 type=pica8
- ovs-vsctl add-port br0 ge-1/1/3 – set interface ge-1/1/3 type=pica8
- ovs-vsctl add-port br0 ge-1/1/4 – set interface ge-1/1/4 type=pica8
- ovs-vsctl set-controller br0 tcp:172.16.0.179:6633

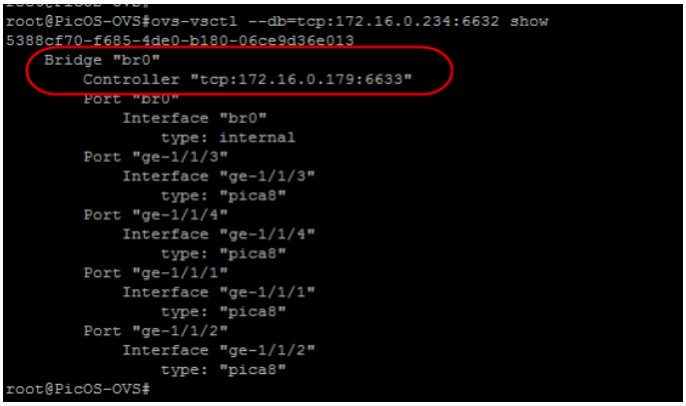
Figure 8 – Configure OVS - 2

```
root@PicOS-OVS#
root@PicOS-OVS#ovs-vsctl --db=tcp:172.16.0.234:6632 add-br br0  -- set bridge br
0 datapath_type=pica8
device ovs-pica8 entered promiscuous mode
device br0 entered promiscuous mode
root@PicOS-OVS#ovs-vsctl --db=tcp:172.16.0.234:6632 add-port br0 ge-1/1/1 -- set
 interface ge-1/1/1 type=pica8
root@PicOS-OVS#ovs-vsctl --db=tcp:172.16.0.234:6632 add-port br0 ge-1/1/2 -- set
 interface ge-1/1/2 type=pica8
root@PicOS-OVS#ovs-vsctl --db=tcp:172.16.0.234:6632 add-port br0 ge-1/1/3 -- set
 interface ge-1/1/3 type=pica8
root@PicOS-OVS#ovs-vsctl --db=tcp:172.16.0.234:6632 add-port br0 ge-1/1/4 -- set
 interface ge-1/1/4 type=pica8
root@PicOS-OVS#ovs-vsctl --db=tcp:172.16.0.234:6632 set-controller br0 tcp:172.1
6.0.179:6633
root@PicOS-OVS#
```

We can verify the configuration by issuing:

- ovs-vsctl show

Figure 9 – Show OVS Configuration

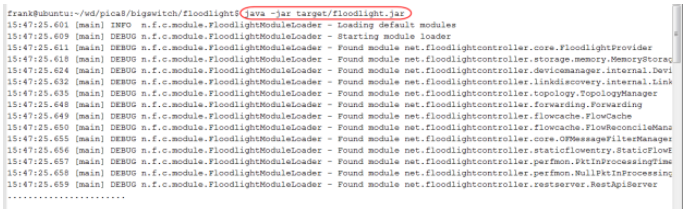


In the above pictures, it shows that the OpenFlow Controller has been defined. After the connection between Pica8 switch and OpenFlow Controller, the same command will show the connection status.

Launch Floodlight

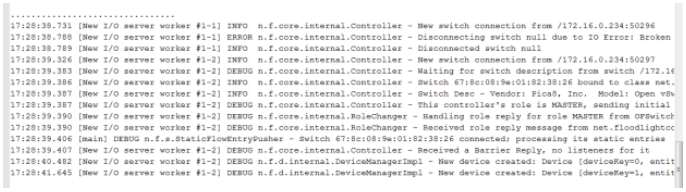
It makes no difference whether to launch *Floodlight* before or after bringing up Pica8 switch. In this document, we start *Floodlight* after bringing up Pica8 switch.

Figure 10 – Start Floodlight



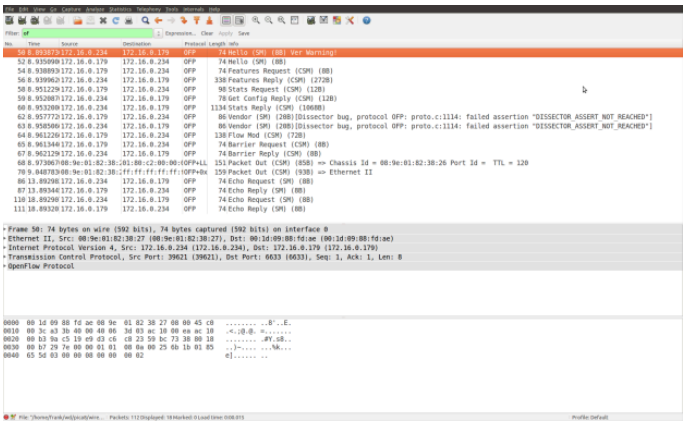
The following figure shows the connection between Pica8 switch and *Floodlight*.

Figure 11 – Start Floodlight



We can also use Wireshark to capture the traffic between Pica8 switch and Floodlight as shown below:

Figure 12 – Wireshark Captures



We can also use the following command to show the connection status:

- ovs-vsctl show

Figure 13 – Show OVS Connection Status

```
root@PicOS-OVS#ovs-vsctl --db=tcp:172.16.0.234:6632 show
5388cf70-f685-4de0-b180-06ce9d36e013
    Bridge "br0"
        Controller "tcp:172.16.0.179:6633"
            is_connected: true
        Port "br0"
            Interface "br0"
                type: internal
        Port "ge-1/1/3"
            Interface "ge-1/1/3"
                type: "pica8"
        Port "ge-1/1/4"
            Interface "ge-1/1/4"
                type: "pica8"
        Port "ge-1/1/1"
            Interface "ge-1/1/1"
                type: "pica8"
        Port "ge-1/1/2"
            Interface "ge-1/1/2"
                type: "pica8"
root@PicOS-OVS#
root@PicOS-OVS#
```

We can now use the following command to verify that all of the physical ports are connected:

- ovs-ofctl show br0

Figure 14 – Show Physical Port Status

```
root@PicOS-OVS#ovs-ofctl show br0

OFPT_GET_CONFIG_REPLY (OF1.2) (xid=0x4): frags=normal miss_send_len=0
root@PicOS-OVS#
```

At this moment, there are no flows defined:

- ovs-ofctl dump-flows br0

Figure 15 – No Flows defined in Pica8 Switch

```
root@PicOS-OVS#
root@PicOS-OVS#ovs-ofctl dump-flows br0
OFPST_FLOW reply (OF1.2) (xid=0x2):
root@PicOS-OVS#
```

If we try to ping from PC1 to PC2, it fails:

Figure 16 – Ping Fails

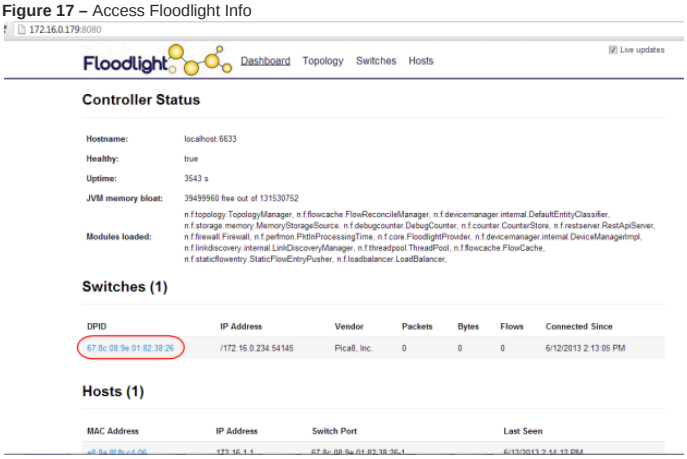
```
PC1> ping 172.16.1.2
PING 172.16.1.2 (172.16.1.2) 56(84) bytes of data.
From 172.16.1.1 icmp_seq=1 Destination Host Unreachable
From 172.16.1.1 icmp_seq=2 Destination Host Unreachable
From 172.16.1.1 icmp_seq=3 Destination Host Unreachable
From 172.16.1.1 icmp_seq=4 Destination Host Unreachable
From 172.16.1.1 icmp_seq=5 Destination Host Unreachable

--- 172.16.1.2 ping statistics ---
5 packets transmitted, 0 received, +5 errors, 100% packet loss, time 4016ms pipe 3
```

Floodlight REST Interface

We can use the browser to view *Floodlight*'s real time information. The URL can be http://172.16.0.179:8080/ui/index.html or http://127.0.0.1:8080/ui/index.html if users access it from Controller PC.

Figure 17 – Access Floodlight Info



User should pay attention to the DPID in the picture above. User needs to replace it with user's own DPID in the following tests.

curl

Use the command line tool curl for transferring data with URL syntax. It is also the tool to send Floodlight REST APIs to configure Pica8 switch flows. We can use apt-get to install it on Controller PC:

- sudo apt-get install curl

Add Flows

Here is the command to add a flow from port 1 to port 2:

- curl -d '{"switch": "67:8c:08:9e:01:82:38:26", "name":"pc1-pc2", "cookie":"0", "priority":"0", "ingress-port":"1", "active":"true", "actions":"output=2"}' http://127.0.0.1:8080/wm/staticflowentrypusher/json

We need another flow from port 2 to port 1 in order to make the ping between PC1 and PC2 work.

- curl -d '{"switch": "67:8c:08:9e:01:82:38:26", "name":"pc2-pc1", "cookie":"0", "priority":"0", "ingress-port":"2", "active":"true", "actions":"output=1"}' http://127.0.0.1:8080/wm/staticflowentrypusher/json

Now, the ping from PC1 to PC2 works.

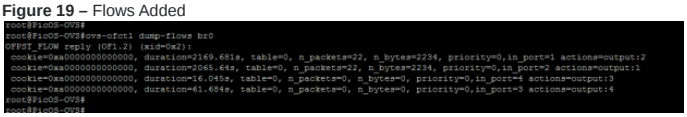
Figure 18 – Ping Successes

```
PC1> ping 172.16.1.2
PING 172.16.1.2 (172.16.1.2) 56(84) bytes of data.
64 bytes from 172.16.1.2: icmp_req=1 ttl=64 time=1.83 ms
64 bytes from 172.16.1.2: icmp_req=2 ttl=64 time=0.176 ms
64 bytes from 172.16.1.2: icmp_req=3 ttl=64 time=0.159 ms
64 bytes from 172.16.1.2: icmp_req=4 ttl=64 time=0.133 ms
64 bytes from 172.16.1.2: icmp_req=5 ttl=64 time=0.154 ms

--- 172.16.1.2 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 4005ms
rtt min/avg/max/mdev = 0.133/0.491/1.833/0.671 ms
PC1>
```

We can add the same flows between port 3 and port 4 to make ping working between them.

Figure 19 – Flows Added



Delete Flows

We can remove all of the flows by issuing:

- curl http://127.0.0.1:8080/wm/staticflowentrypusher/clear/67:8c:08:9e:01:82:38:26/json

Configuration Guide for Atrium Stack on ONOS Controller

ONOS is a production ready controller software, capable of enabling applications at scale with its architecture. To get more information on ONOS, please visit their home page.

ONF developed a BGP router application on the ONOS controller called the Atrium. This is a fully functional production ready peering application that uses OpenFlow enabled switches. To get relevant roadmap information and additional information on Atrium, please refer to the Atrium page.

- ONOS Introduction
- Installation Guide
- ONOS Configuration Guide
- Quagga Configuration Guide
- PicOS Configuration Guide
- How to Install ONOS

ONOS Introduction

ONOS

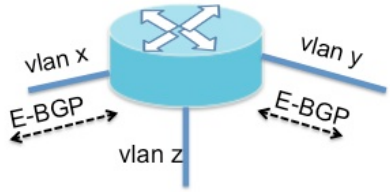
ONOS (Open Network Operating System) is the first open source SDN network operating system targeted specifically at the service provider and mission critical networks. ONOS is purpose built to provide high availability (HA), scale out, and performance for large scale networks. In addition, ONOS has useful Northbound abstractions and APIs to enable easier application development, as well as Southbound abstractions and interfaces to control OpenFlow ready and legacy devices. Thus, ONOS will:

- bring carrier grade features (scale, availability, and performance) to the SDN control plane
- enable web style agility
- help service providers migrate their existing networks to white boxes
- lower service provider CapEx and OpEx

ONOS has been developed in concert with leading service providers (AT&T, NTT Communications), R&E network operators (Internet2, CNIT, CREATE=NET), collaborators (SRI, Infoblox), and with ONF to validate its architecture through real world use cases.

Atrium

In the first release (2015/A), Atrium is an open-source router that speaks BGP with other routers and programs flows on the open flow switch packets between ports or VLANs based on the next-hop learned via BGP peering.



Atrium creates a vertically-integrated stack to produce an SDN based router. This stack can have the forms shown below.

The stack includes a controller (ONOS) with a peering application (called BGP Router) integrated with an instance of Quagga BGP. The controller uses OpenFlow v1.3.4 to communicate with the hardware switch. The peering application uses multi-tables to install flows on the switch.

Installation Guide

Distribution VM

To get started with Atrium Release 2015/A, download the distribution VM (Atrium_2015_A.ova) from here: size ~ 2GB

https://www.dropbox.com/s/vw7k5y2vkhfytgx/Atrium_2015_A.ova?dl=0

login: admin

password: bgprouter

NOTE: This distribution VM is NOT meant for development. The only purpose is to help get a working system up and running for testing and deployment as painlessly as possible. A developer guide using mechanisms other than this VM will be available shortly after the release.

The VM can be run on any desktop, laptop, or server with virtualization software (VirtualBox, Parallels, VMWare Fusion, VMWare Player, etc.). We recommend using VirtualBox for non-server uses. For running on a server, see the subsection below.

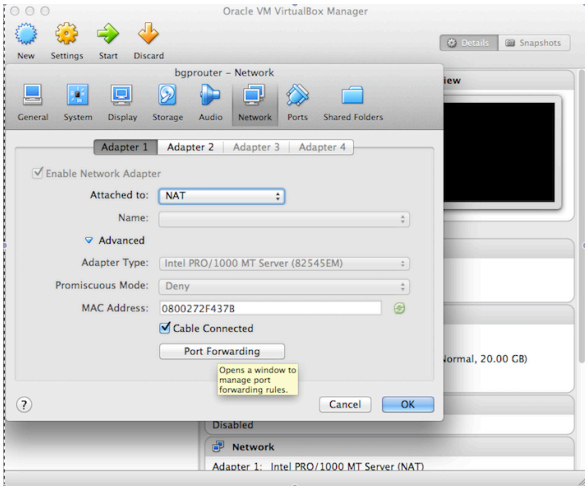
Get a recent version of VirtualBox to import and run the VM. We recommend the following:

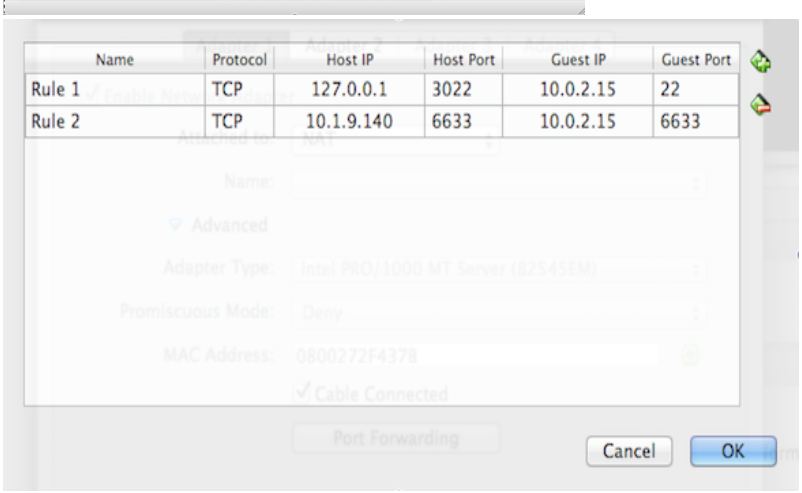
1) using 2 cores and at least 4GB of RAM.

2) For networking, user can "Disable" the **2nd** Network Adapter. We only need the 1st network adapter for this release.

3) User could choose the primary networking interface (Adapter 1) for the VM to be NATed or "bridged". If choosing to NAT, user would need to create the following port-forwarding rules. The first rule allows user to ssh into user's VM with a command from a Linux or MAC terminal like the one below:

```
$ ssh -X -p 3022 admin@localhost
```





The second rule allows user to connect an external switch to the controller running within the VM (the guest-machine) using the IP address of the host-machine (in the example its 10.1.9.140) on the host-port 6633.

If choosing to bridge (with DHCP) instead of NAT, user should login to the VM to see what IP address was assigned by user's DHCP server (on the eth0 interface). Then, user should use ssh to get in to the VM from a terminal:

```
$ ssh -X admin@<assigned-ip-addr>
```

User can login to the VM with the following credentials --> **login:** admin, **password:** bgprouter

Once in, user should try to ping the outside world as a sanity check (ping www.cnn.com).

Running the Distribution VM on a Server

The Atrium_2015_A.ova file is simply a tar file containing the disk image (vmdk file) and some configuration (ovf file). Most server virtualization softwares can directly run the vmdk file. However, most people prefer to run qcow2 format in servers. First, untar the ova file

```
$ tar xvf Atrium_2015_A.ova
```

Use the following command to convert the vmdk file to qcow2. Then, the virtualization software can be used to create a VM using gcow2 image.

```
$ qemu-img convert -f vmdk Atrium_2015_A-disk1.vmdk -O qcow2 Atrium_2015_A-disk1.qcow2
```

Running the Distribution VM on the Switch

While it should be possible to run the controller and other software that is part of the distribution VM directly on the switch CPU in a linux based switch OS, it is not recommended. This VM has not been optimized for such an installation, and it has not been tested in such a configuration.

Installation Steps

Once user has the VM up and running, the following steps will help bring up the system.

User has two choices:

A) Bring up the Atrium Router completely in software and completely self-contained in this VM. In addition, a complete test infrastructure (other routers to peer with, hosts to ping from, etc.) that can be played with (via the router-test.py script) will be provided. Note that when using this setup, software switches emulate hardware pipelines. Head over to the "Running Manual Tests" section on the Test Infrastruture page.

B) Bring up the Atrium Router in hardware, working with one of the seven OpenFlow switches Pica8 has certified to work for Project Atrium. Follow the directions below:

Basically, user needs to configure the controller/app, bring up Quagga, connect it to ONOS (via the router-deploy.py script), and configure the switch that is being worked on to connect it to the controller. The following pages will help with that:

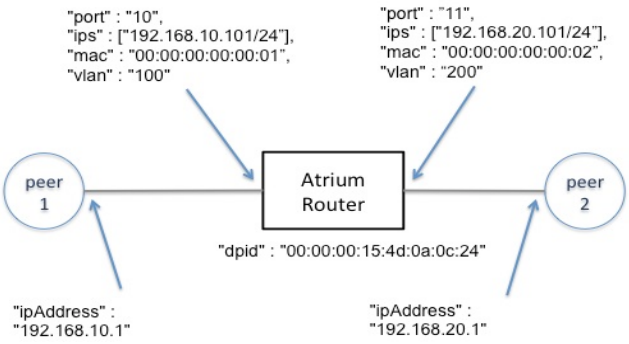
1. Configure and run ONOS
2. Configure and run Quagga
3. Configure Pica8 P-3295

ONOS Configuration Guide

Configuring ONOS

The distribution VM has taken care of most things necessary to configure and run ONOS. What still needs to be done is the routing application within ONOS. At this time, Atrium does not support the ability to change configuration at runtime, an issue which is known. Therefore, it is necessary to pre-configure the controller/app with router-interface addresses and expected BGP peers before launching ONOS. For an example configuration, please see the network shown below.

Figure 1



The configuration shown above needs to be entered in addresses.json and sdnip.json.

addresses.json, which is located in the folder Applications/config, is a file mainly used for ARP handling and router interface IP/VLAN config.

Figure 2

```
admin@atrium:~$ cat Applications/config/addresses.json
{
    "addresses" : [
                  {
                      "dpid" : "00:00:00:15:4d:0a:0c:24",
                      "port" : "10",
                      "ips" : ["192.168.10.101/24"],
                      "mac" : "00:00:00:00:00:01",
                      "vlan" : "100"
                      },
                  {
                      "dpid" : "00:00:00:15:4d:0a:0c:24",
                      "port" : "11",
                      "ips" : ["192.168.20.101/24"],
                      "mac" : "00:00:00:00:00:02",
                      "vlan" : "200"
                      }
    ]
}
```

With reference to the topology diagram, the addresses of our router-interfaces are being specified. The "dpid" refers to the OpenFlow datapath-id of the data-plane switch, "port" refers to the data-plane switch port (the OpenFlow port number), "vlan" is one vlan-id configured on that port, "ips" are the set of ip-addresses assigned to that port/vlan, and "mac" is the mac-address assigned to that port.

A few things to note:

- To assign another vlan to the same port, user needs to create another block within the "addresses" array similar to the two shown above.
- The "mac" does not need to be the actual mac address of the physical switch-port. The "mac" does, however, have to be unique because this is what the router uses to reply to ARP-requests for its interface IPs (on that vlan).
- The "mac" can be the same for all port-vlans. In this case, user is essentially using a single "Router-MAC", which is used to reply to ARP-requests for any interface IP and the source-mac address on all Ethernet frames sent out of this router.
- Most switches do not have any dataplane restrictions on the use of "mac" addresses. However, Pica8 switches **require** the use of a single Router MAC (08:9e:01:82:38:68). See the example config files: Applications/config/pica_addresses.json and Applications/config/pica_sdnip.json

Applications/config/sdnip.json is addressed below.

Figure 3

```
admin@atrium:~$ cat Applications/config/sdnip.json
{

    "bgpPeers" : [
                {
                    "attachmentDpid" : "00:00:00:15:4d:0a:0c:24",
                    "attachmentPort" : "10",
                    "ipAddress" : "192.168.10.1"
                },
                {
                    "attachmentDpid" : "00:00:00:15:4d:0a:0c:24",
                    "attachmentPort" : "11",
                    "ipAddress" : "192.168.20.1"
                }

    ],
    "bgpSpeakers" : [
            {
                 "name" : "bgpSpeaker1",
                 "attachmentDpid" : "00:00:00:00:00:00:00:aa",
                 "attachmentPort" : "1",
                 "macAddress" : "aa:bb:cc:dd:ee:ff",
                 "interfaceAddresses" : [
                                {
                                    "interfaceDpid" : "00:00:00:15:4d:0a:0c:24",
                                    "interfacePort" : "10",
                                    "ipAddress" : "192.168.10.101"
                                },
                                {
                                    "interfaceDpid" : "00:00:00:15:4d:0a:0c:24",
                                    "interfacePort" : "11",
                                    "ipAddress" : "192.168.20.101"
                                }

                    ]

            }

    ]
}
```

"bgpPeers" refers to other routers connected to our Atrium router. These peers can be traditional routers or other Atrium routers. "bgpSpeakers" refers to our Atrium router (i.e there is only one bgpSpeaker).

For the "bgpPeers", the app needs to know two things: the IP address of the peer's interface and where it is attached on the Atrium router. In the example above, for peer1, the IP address of the peer's interface is 192.168.10.1, and it is attached to the Atrium router (attachmentDpid: "00:00:00:15:4d:0a:0c:24") on port 10.

For the "bgpSpeakers", the app needs to know the Atrium router's interface IP addresses in the "interfaceAddresses" section. (Do not change information under "bgpSpeakers" like "attachmentDpid" and "attachmentPort".)

Then, ONOS configuration is complete.

Launching ONOS for a Test

If launching ONOS for testing, user can run the following command from the shell (over ssh). If deploying the router, however, user should follow the instructions below.

To ensure that there are no remaining processes left over from previous runs, please run "./router-cleanup.sh".

Figure 4

```
admin@atrium:~$ ./router-cleanup.sh
*** Removing excess controllers/ofprotocols/ofdatapaths/pings/noxes
killall controller ofprotocol ofdatapath ping nox_core lt-nox_core ovs-openflowd ovs-controller udpbwtest mnexec ivs 2> /dev/null
killall -9 controller ofprotocol ofdatapath ping nox_core lt-nox_core ovs-openflowd ovs-controller udpbwtest mnexec ivs 2> /dev/null
pkill -9 -f "sudo mnexec"
*** Removing junk from /tmp
rm -f /tmp/vconn* /tmp/vlogs* /tmp/*.out /tmp/*.log
*** Removing old X11 tunnels
*** Removing excess kernel datapaths
ps ax | egrep -o 'dp[0-9]+' | sed 's/dp/nl:/'
***  Removing OVS datapaths
ovs-vsctl --timeout=1 list-br
ovs-vsctl --timeout=1 list-br
*** Removing all links of the pattern foo-ethX
ip link show | egrep -o '([-_.[:alnum:]]+-eth[[:digit:]]+)'
( ip link del sw1-eth4;ip link del as6sw-eth2;ip link del rootTestOn-eth0;ip link del swTestOn-eth1 ) 2> /dev/null
ip link show
*** Killing stale mininet node processes
pkill -9 -f mininet:
*** Shutting down stale tunnels
pkill -9 -f Tunnel=Ethernet
pkill -9 -f .ssh/mn
rm -f ~/.ssh/mn/*
*** Cleanup complete.
admin@atrium:~$
```

ONOS may already be running. Use the following command to ensure that ONOS has not started automatically.

```
admin@atrium:~$ onos-service localhost stop
```

Then, to launch, run "ok clean" (onos-service start/stop can also be used to launch ONOS.)

Figure 5

```
admin@atrium:~$ ok clean
Creating local cluster configs for IP 127.0.0.1...
Staging builtin apps...
Customizing apps to be auto-activated: drivers,openflow,proxyarp,bgprouter...
Welcome to Open Network Operating System (ONOS)!
    ____  _  ______  ____
   / __ \/ |/ / __ \/ __/
  / /_/ /    / /_/ /\ \
  \____/_/|_/\____/___/

Hit '<tab>' for a list of available commands
and '[cmd] --help' for help on a specific command.
Hit '<ctrl-d>' or type 'system:shutdown' or 'logout' to shutdown ONOS.

onos>
```

To check, enter the command "log:tail" on the ONOS (karaf) CLI.

```
onos> log:tail
```

Scroll through the log and verify that the lines, like those in the figure below, can be seen.

Figure 6

```
2015-06-25 17:18:52,483 | INFO  | FelixStartLevel  | RoutingConfigurationImpl         | 166 - org.onosproject.onos-app-routing - 1.2.0.SNAPSHOT | Routing configuration service started
2015-06-25 17:18:52,495 | INFO  | FelixStartLevel  | BgpRouter                        | 165 - org.onosproject.onos-app-bgprouter - 1.2.0.SNAPSHOT | Router dpid: of:000000154d0a0c24
2015-06-25 17:18:52,495 | INFO  | FelixStartLevel  | BgpRouter                        | 165 - org.onosproject.onos-app-bgprouter - 1.2.0.SNAPSHOT | Control Plane OVS dpid: of:00000000000000aa
2015-06-25 17:18:52,502 | DEBUG | FelixStartLevel  | BgpSessionManager                | 166 - org.onosproject.onos-app-routing - 1.2.0.SNAPSHOT | BGP Session Manager start.
2015-06-25 17:18:52,537 | INFO  | FelixStartLevel  | BgpRouter                        | 165 - org.onosproject.onos-app-bgprouter - 1.2.0.SNAPSHOT | BgpRouter started
```

The "Router dpid" should be the one the user just configured in the config files. The "Control Plane OVS dpid" will be explained in the next section.

User is now ready to configure Quagga.

Launching ONOS for Deployment

For deployment, it is best to launch ONOS within a terminal multiplexer like tmux because, among other things, tmux gives user the ability to maintain persistent working state on remote servers (in our case, on the distribution VM) while detaching and re-attaching at will.

For more on tmux, please see this tutorial.

While still connected via ssh into the distribution VM and having already configured the controller but before ONOS is launched, user should enter

```
admin@atrium:~$ tmux new
```

This command should bring up a window like the one shown below. Notice the "bar" at the bottom, identifying the tmux session.

Figure 7

```
RTNETLINK answers: File exists
admin@atrium:~$ ok clean
Creating local cluster configs for IP 127.0.0.1...
Staging builtin apps...
Customizing apps to be auto-activated: drivers,openflow,proxyarp,bgprouter...
Welcome to Open Network Operating System (ONOS)!
    ____  _  ______  ____
   / __ \/ |/ / __ \/ __/
  / /_/ /    / /_/ /\ \
  \____/_/|_/\____/___/

Hit '<tab>' for a list of available commands
and '[cmd] --help' for help on a specific command.
Hit '<ctrl-d>' or type 'system:shutdown' or 'logout' to shutdown ONOS.

onos>
```

Now, user can enter "ok clean" to launch ONOS (after running "./router-cleanup.sh" and possibly "onos-service localhost stop").

To detach from the window, enter 'Ctrl-b' followed by 'd'.

User can view the active tmux windows by typing:

```
admin@atrium:~$ tmux ls
0: 1 windows (created Thu Jun 25 17:39:27 2015) [109x36]
```

To reattach to the session:

```
admin@atrium:~$ tmux at -t 0
```

User is now ready to configure Quagga.

Quagga Configuration Guide

Configuring Quagga BGP & Connecting to ONOS

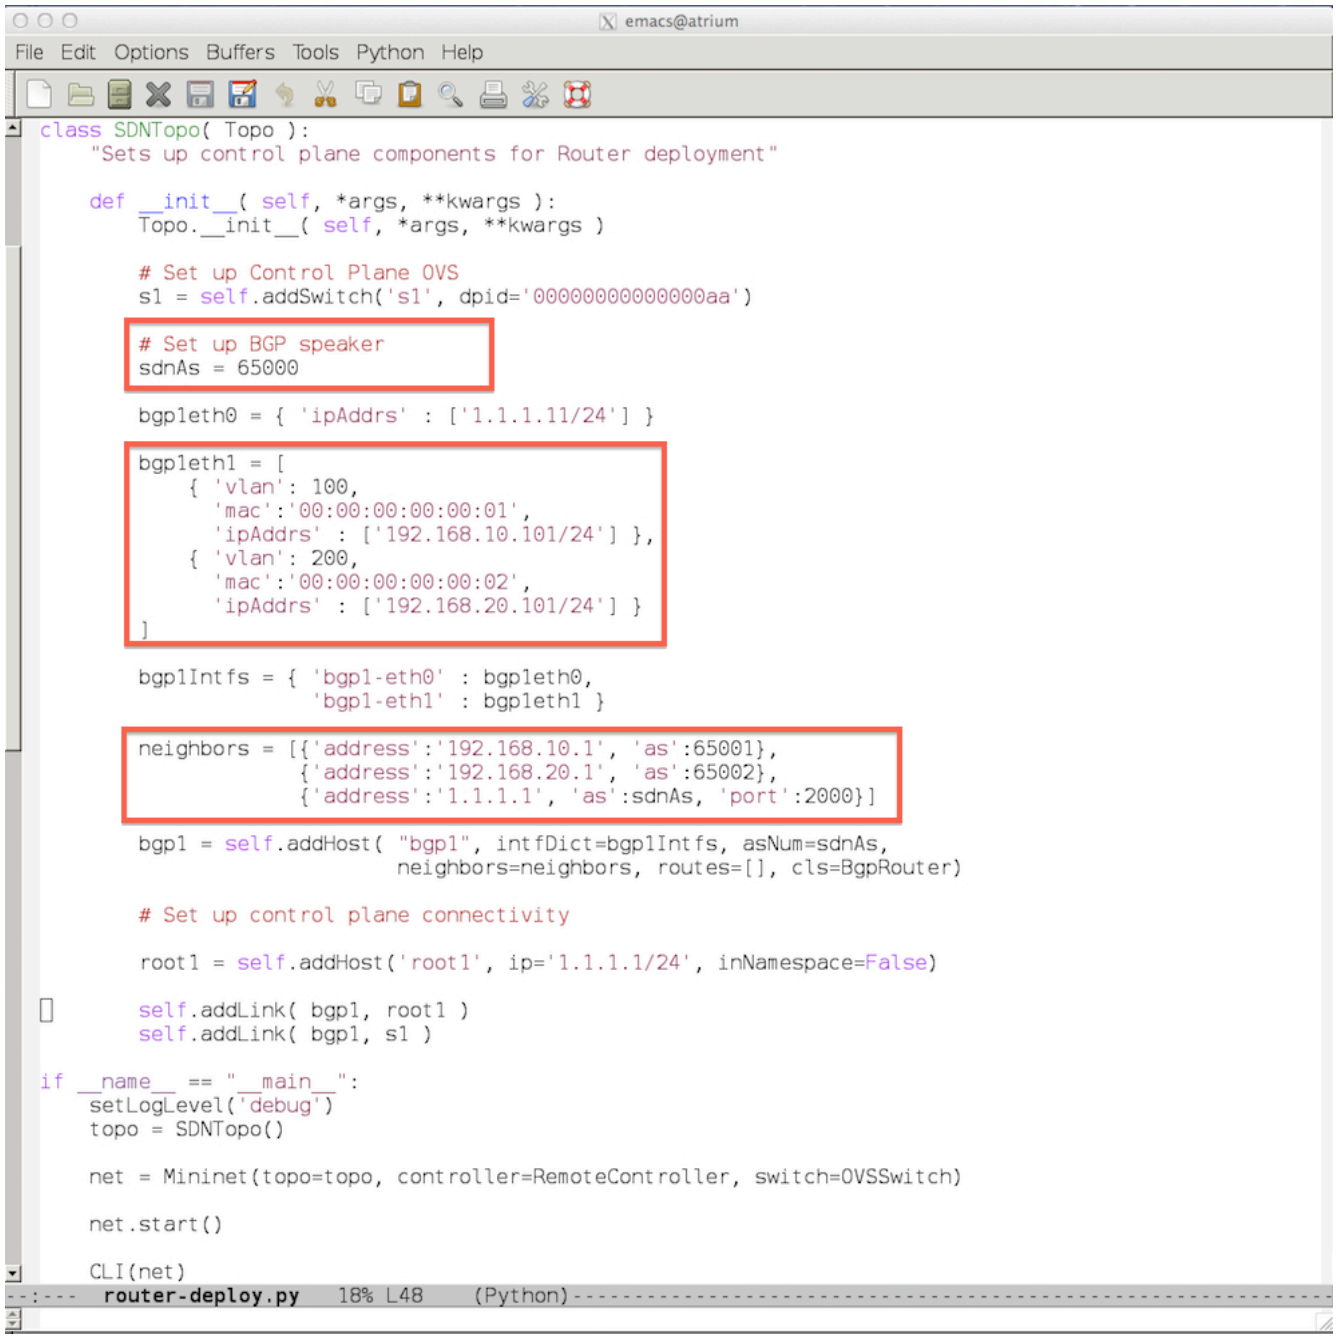
Quagga comes with a rich (Cisco-like) CLI. However, it is not enough to simply configure Quagga BGP. We also need to configure Zebra, as well as the Linux-host on which Quagga runs. In addition, we need to hook up Quagga to ONOS in the control plane. This hookup happens on two different fronts: 1) where BGP communication from the data-plane hardware switch is delivered to ONOS, which in-turn delivers those packets to Quagga (and the reverse communication); and 2) where the ONOS lightweight BGP implementation peers with Quagga BGP using iBGP.

Sounds complicated! But part of Project Atrium's goal is to make life easier for the end user. And so, we have created a script that users can modify in a couple of places and launch with one command that would take care of all the pieces above. If interested in understanding the underlying plumbing, user should refer to the System Architecture.

The script resides at the top level of the directory structure in the distribution VM: **router-deploy.py**

Here is what it looks like:

Figure 1



The highlighted boxes in the script above show what user needs to change for the network:

1. The Atrium Router speaks BGP, so it must have an AS number. Set the AS number in the first box.

2. The second box is where user configures the same interface addresses (mac/vlan/ip) for the Atrium Router as was done when configuring ONOS. Note that there is no need to configure "port" information here. Also note that if user had configured the same mac address for all ports (eg. the RouterMAC case for Pica8 switches), the same would need to be done here.
3. The third box is where user configures the peer's (also called neighbor) IP address and AS number. Do not change the last line in this box: it refers to the ONOS iBGP peer.

User may have noticed that step#2 could be done using Linux commands, and steps 1 and 3 can be done using the Quagga CLI. User may also have noticed that we did not give the ability to advertise routes (also known as 'networks' in BGP terminology). This is a known issue with the Atrium router implementation, an issue which will be addressed in the next release. For this release, the Atrium router can only be used in transit, ie. it can receive and readvertise routes, but it cannot originate route advertisements itself.

Launching Quagga

Similar to what was shown in the "Launching ONOS" section, quagga can be launched simply by running the command in bash (over ssh) if it is just to be run for testing. For deployment, it is better to use tmux and launch quagga in a separate tmux window/pane.

In this example, a new "pane" to launch Quagga was created in the same tmux "window" where ONOS was launched.

In bash, listing the current tmux session should show what was created for launching ONOS.

```
$ tmux ls
0: 1 windows (created Thu Jun 25 17:39:27 2015) [109x36]
```

Attach to the session:

```
$ tmux at -t 0
```

That should bring up the window where ONOS was launched.

Enter the keys Ctrl-b followed by " (double quotation mark). This command will split the window vertically into two panes.

In the lower pane, start the script user just edited in the background.

```
$ sudo ./router-deploy.py &
```

As a checkpoint, user should see the following responses when checking the following commands.

Figure 2

```
admin@atrium:~$ ps aux | grep mininet
root      7474  0.0  0.0  21168  2156 pts/4    Ss+  17:09   0:00 bash --norc -is mininet:c0
root      7480  0.1  0.0  21168  2156 pts/5    Ss+  17:09   0:00 bash --norc -is mininet:bgp1
root      7486  0.0  0.0  21168  2160 pts/6    Ss+  17:09   0:00 bash --norc -is mininet:root1
root      7492  0.0  0.0  21168  2156 pts/7    Ss+  17:09   0:00 bash --norc -is mininet:s1
admin     7627  0.0  0.0  11736   932 pts/3    S+   17:09   0:00 grep --color=auto mininet
```

Here, "bgp1" represents the linux-host (container) that runs Quagga. User can enter this host with:

```
$ ./mininet/util/m bgp1
```

Then, user can telnet into the Quagga BGP process with:

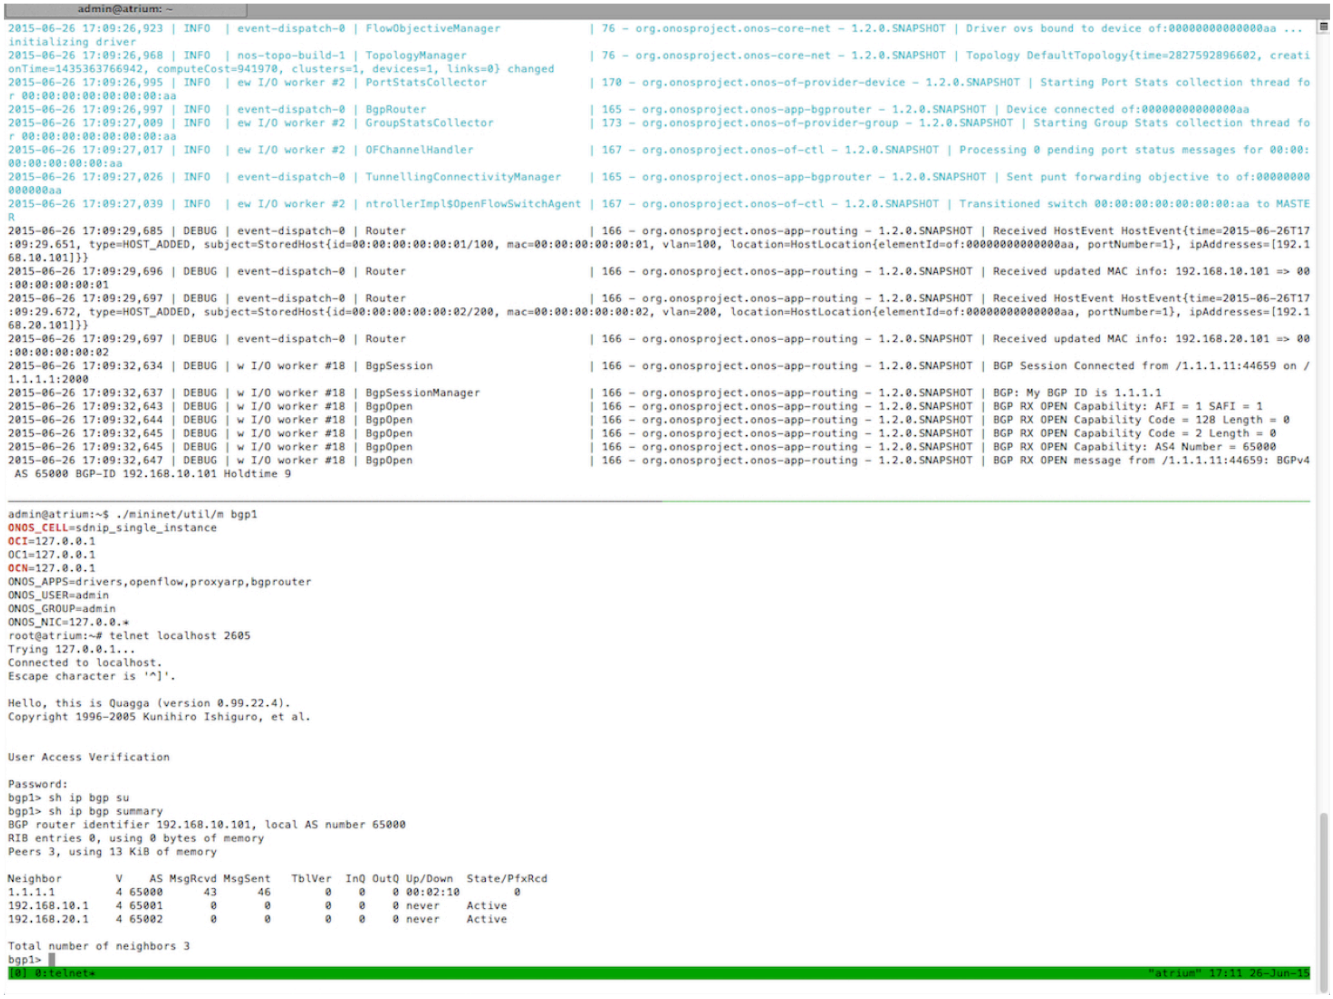
```
$ telnet localhost 2605
```

password: **sdnip**

Now user is in the Quagga CLI. To see the status of BGP peering, enter:

```
> show ip bgp summary
```

Figure 3



The screenshot above shows that the iBGP peering session between ONOS (1.1.1.1) and Quagga is up. The screenshot also shows that the BGP peering session with the neighbors (peers) is not up. This display is due to the fact that the dataplane switch and controller have not been connected.

User is now ready to connect a switch of choice to the controller.

PicOS Configuration Guide

Configuration & Launch

Atrium Specific Configuration

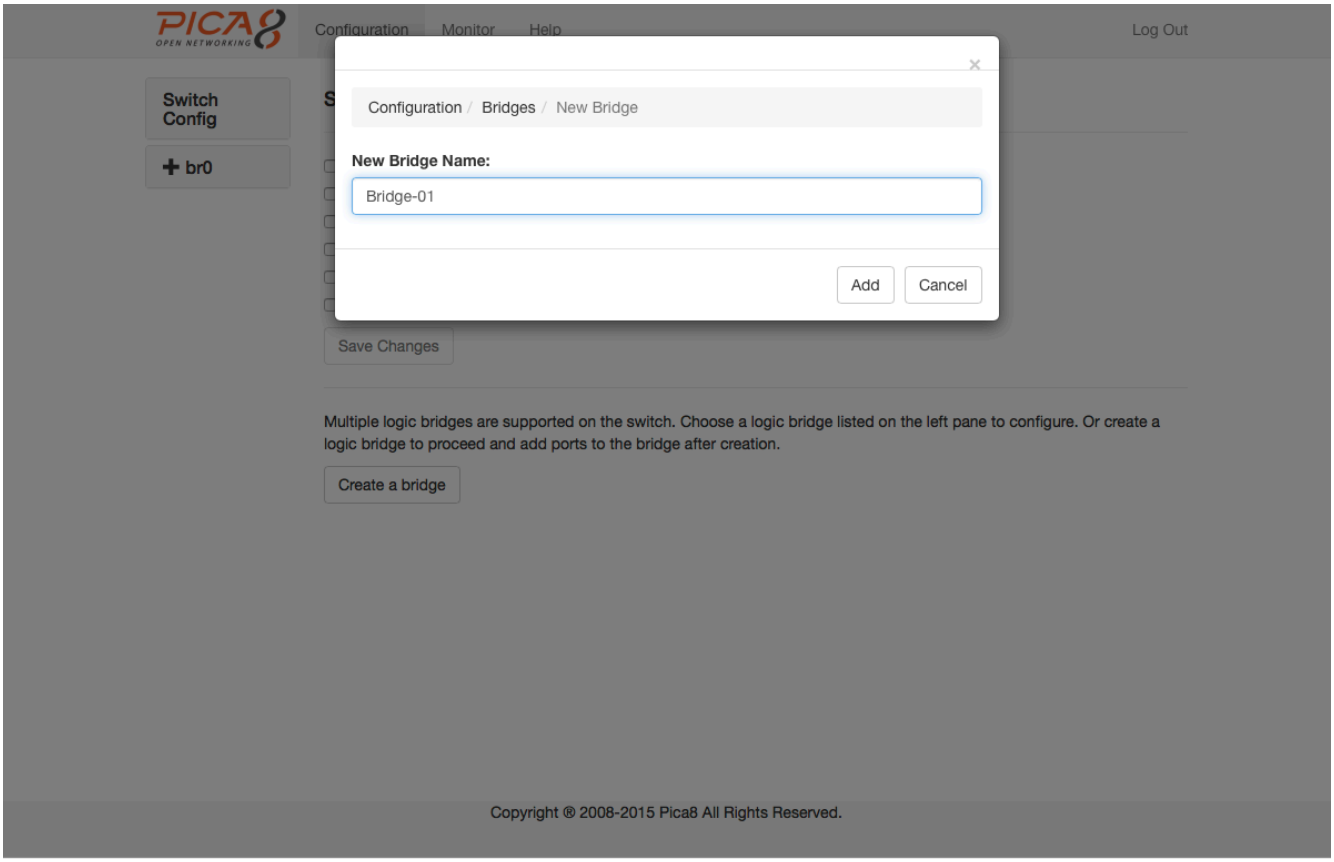
1. Enable multi-table on PicOS. Table 252 is the FDB for IP entries. The preference setting instructs the switch to prioritize match on FDB entries over TCAM.

```
admin@PicOS-OVS$ ovs-vsctl set-l3-mode TRUE 252
admin@PicOS-OVS$ ovs-vsctl set-l2-l3-preference TRUE
```

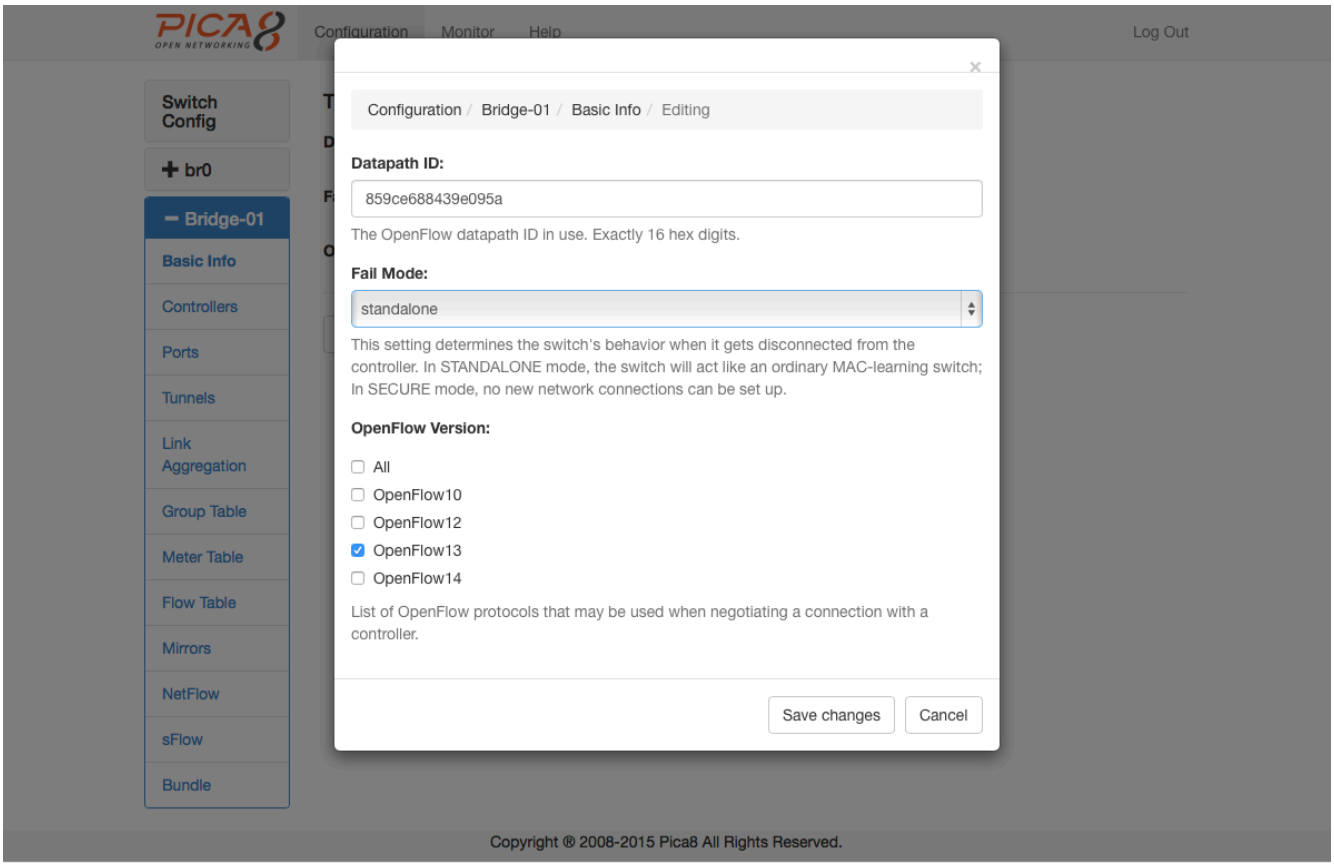
Verify multi-tables are enabled.

```
 admin@PicOS-OVS$ovs-vsctl show-l2-l3-preference
  l2/l3 flow preference is enabled
admin@PicOS-OVS$ovs-vsctl show-l3-mode
  l3 mode is enabled, table id is 252
```

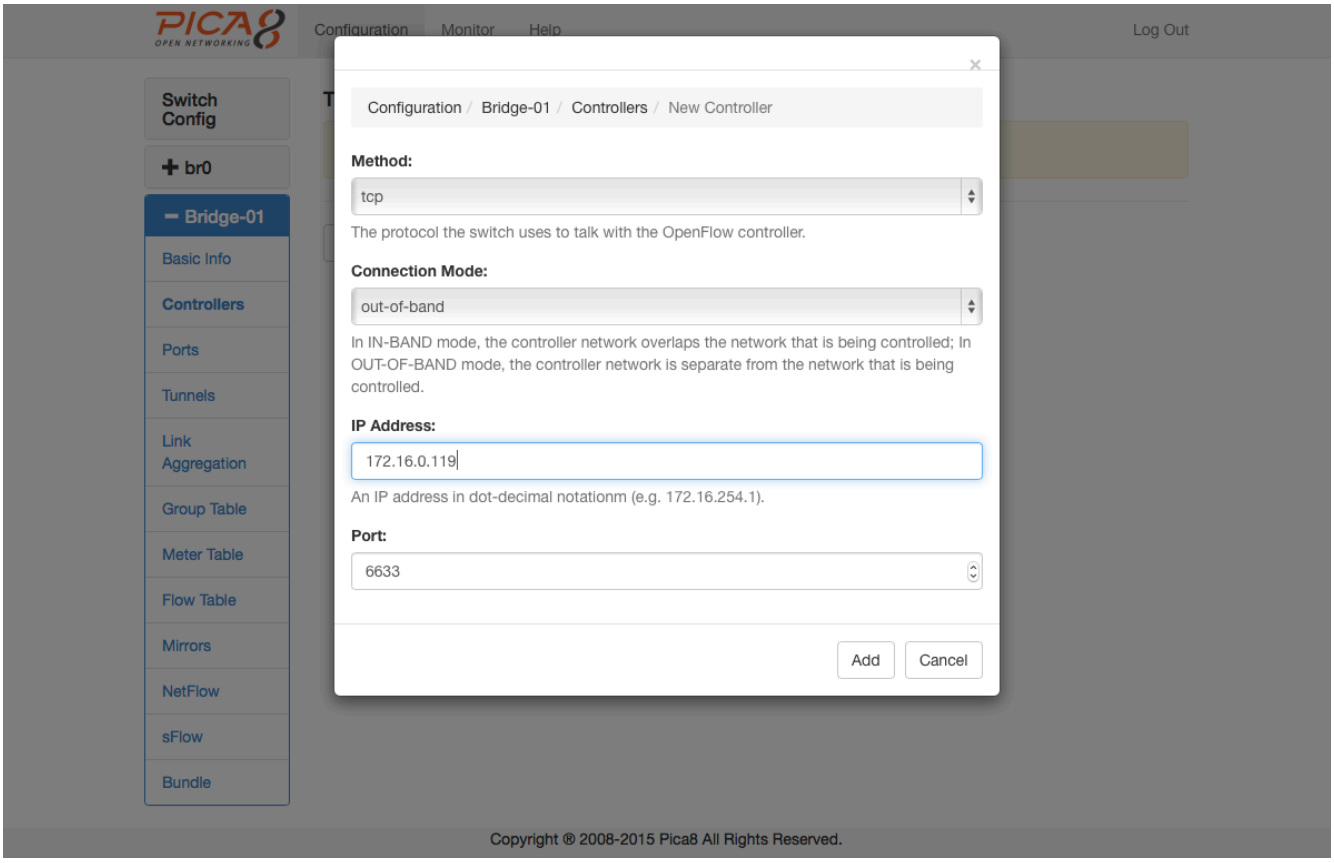
2. Next, create a bridge. Using the GUI is the easiest way: point a browser to the switch management port IP address, use the configuration tab, click on the "Create a bridge" button, and give the bridge a name.



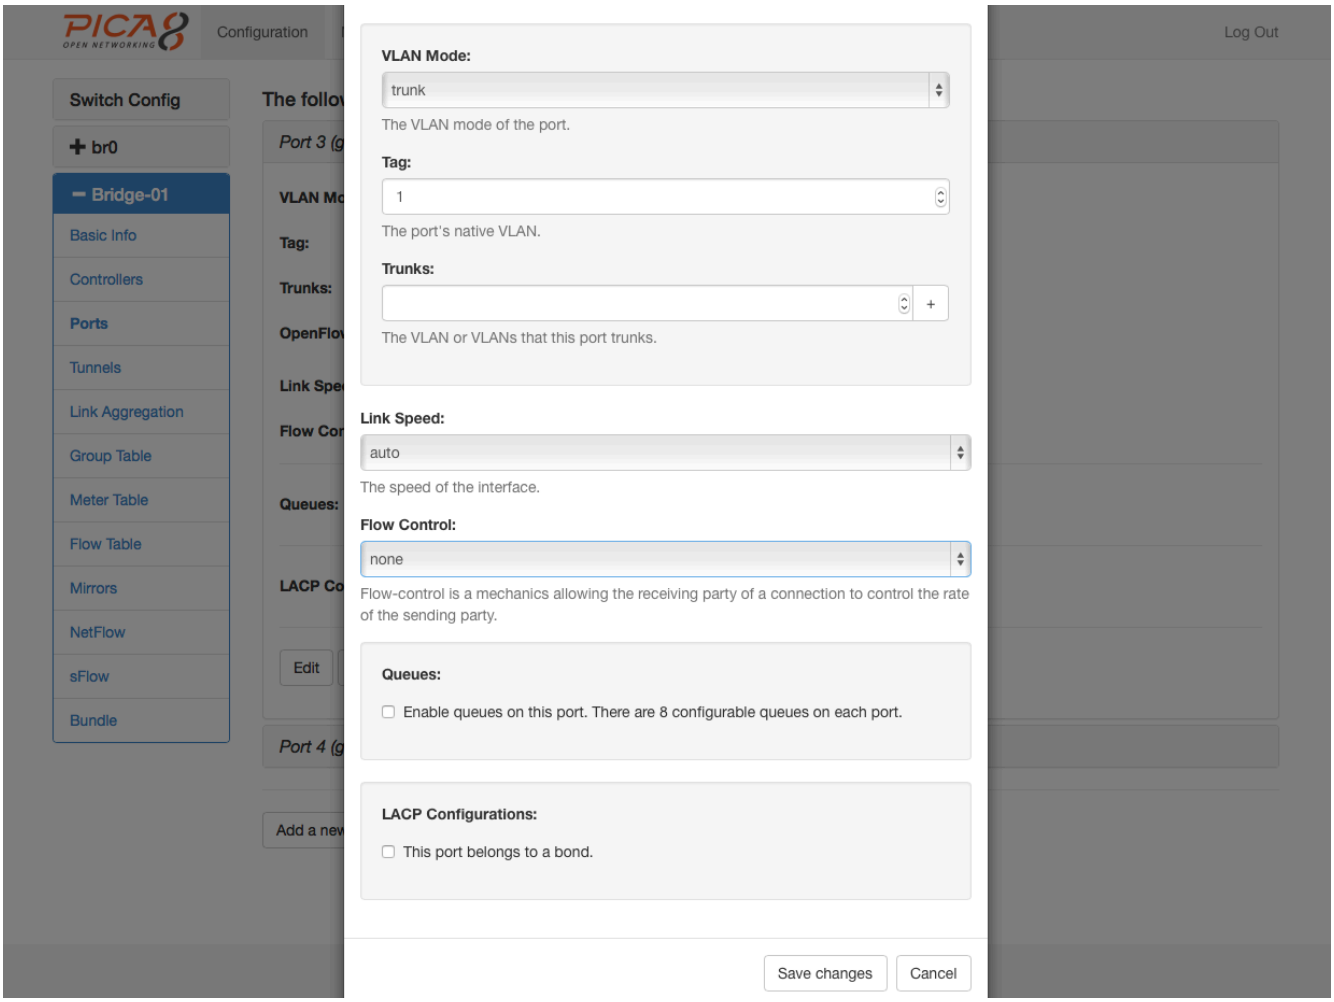
3. Click on the newly created bridge and then "Basic Info". Hit the Edit button. Give a Datapath ID (same one configured in ONOS). Select OpenFlow version 13. The fail mode does not matter.



4. Add a new controller: tcp, out-of-band, <controller-IP> and port 6633



5. Add as many ports as wanted to the bridge. Select the port number. Select TRUNK mode (important). Don't worry about the Tag/Trunk and there is no Flow Control.



Step 6: Finally, remember to use the routerMac: 08:9e:01:82:38:68 for all ports when doing configuration in the controller (in addresses.json and router-deploy.py)

Step 7: Verify the appropriate flows have been installed

```
admin@PicOS-OVS$ovs-ofctl dump-flows atrium-br0
OFPST_FLOW reply (OF1.3) (xid=0x2):

```

How to Install ONOS

Open Network Operating System (ONOS) is an open source network operating system for software-defined networks (SDN). Intended to run on white box switches, ONOS is targeted at mission critical networks, including service providers. It provides benefits including:

- Virtually unlimited control plane scalability
- High performance, suitable for large network operators
- Mission-critical level of resiliency
- Support for legacy devices
- Next-generation device support and control for devices that support OpenFlow and P4

ONOS is intended to help service providers migrate their existing networks to white box switches, thus lowering CapEx and OpEx. It was developed in conjunction with service providers including AT&T and NTT Communications.

This document describes how to install ONOS.

INSTALLING ONOS :-

1) INSTALL GIT CORE

$ sudo apt-get install git-core

2) ONOS REQUIREMENTS

System requirements

- 2GB or more RAM (I personally recommend at least 4GB)
- 2 or more processors
- Ubuntu 14.04 LTS or 16.04 LTS (Checked with both distros)

3) INSTALL MAVEN AND KARAF

Software requirements

i) Maven

Install Maven 3.3.9 on your Applications directory

$ cd ~

$ mkdir Applications

$ wget http://archive.apache.org/dist/maven/maven-3/3.3.9/binaries/apache-maven-3.3.9-bin.tar.gz

$ tar -zxvf apache-maven-3.3.9-bin.tar.gz -C ../Applications/

NOTE: Although ONOS has been migrated to Buck, maven was used in earlier releases.

ii) Karaf

Install Karaf 3.0.5 on your Applications directory

$ cd ~

$ cd Applications

$ wget http://archive.apache.org/dist/karaf/3.0.5/apache-karaf-3.0.5.tar.gz

$ tar -zxvf apache-karaf-3.0.5.tar.gz -C ../Applications/

4) INSTALL JAVA 8 and set JAVA_HOME

i) Java 8

$ sudo apt-get install software-properties-common -y

$ sudo add-apt-repository ppa:webupd8team/java -y

$ sudo apt-get update

$ sudo apt-get install oracle-java8-installer oracle-java8-set-default -y

ii) SET YOUR JAVA_HOME

$ export JAVA_HOME=/usr/lib/jvm/java-8-oracle

iii) VERIFY IT WITH FOLLOWING COMMAND

$ env | grep JAVA_HOME

JAVA_HOME=/usr/lib/jvm/java-8-oracle

5) DOWNLOAD THE LATEST ONOS

$ git clone https://gerrit.onosproject.org/onos

$ cd onos

$ git checkout master

6) ENVIRONMENTAL VARIABLES

The ONOS source comes with a sample bash_profile that can set these variables for you.

i) Edit ~/.bashrc

$ nano ~/.bashrc

ii) Add the following line at the end

. ~/onos/tools/dev/bash_profile

iii) Reload .bashrc or log out and log in again to apply the changes

. ~/.bashrc

iv) Once you run the above command, you will see in the output of the env command that several new variables, such as ONOS_ROOT, MAVEN, and KARAF_ROOT, have been set.

$ env | grep ONOS_ROOT

ONOS_ROOT=/Users/nirmalkaria/onos

$ env | grep MAVEN

MAVEN=/Users/nirmalkaria/Applications/apache-maven-3.3.9

$ env | grep KARAF_ROOT

KARAF_ROOT=/Users/nirmalkaria/Applications/apache-karaf-3.0.8

7) BUILD AND DEPLOY ONOS

i) Edit ~/Applications/apache-karaf-3.0.5/etc/org.apache.karaf.features.cfg file by appending the following line to featuresRepositories:

$ nano ~/Applications/apache-karaf-3.0.5/etc/org.apache.karaf.features.cfg

ii) Locate the featuresRepositories and append this line (will need a comma before appending the text to separate from the previous value)

mvn:org.onosproject/onos-features/1.10.0-SNAPSHOT/xml/features

8) BUILD ONOS WITH MAVEN

$ cd ~/onos

$ mvn clean install or use the alias 'mci'

9) Selecting IP address

Export ONOS4_IP or ONOS_NIC environment variables with the IP address prefix to configure ONOS clustering component. This IP address is the ip address of the controller.

$ export ONOS_IP=10.1.9.255

$ export ONOS_NIC=10.1.9.*

10) Selecting ONOS apps to activate

To configure ONOS with a set of applications that should be automatically activated on startup, use the ONOS_APPS environment variable as follows:

$ export ONOS_APPS=drivers,openflow,proxyarp,mobility,fwd

11) Starting ONOS

```
$ ok clean
Creating local cluster configs for IP 10.1.9.247...
Setting up hazelcast.xml for subnet 10.1.9.*...
Staging builtin apps...
Customizing apps to be auto-activated: drivers,openflow,proxyarp,mobility,fwd...
Welcome to Open Network Operating System (ONOS)!

    ____  _  _______  ____
   / __ \/ |/ / __ \/ __/
  / /_/ /    / /_/ /\ \
  \____/_/|_/\____/___/

Hit '<tab>' for a list of available commands
and '[cmd] --help' for help on a specific command.
Hit '<ctrl-d>' or type 'system:shutdown' or 'logout' to shutdown ONOS.
onos>
```

At this point, typing help onos at the prompt should still bring up a list of available commands. Pressing **Ctrl-D** or logout will exit the CLI.

METHOD 2

BUILDING ONOS USING BUCK

1) INSTALL JAVA 8 and set JAVA_HOME

i) Java 8

$ sudo apt-get install software-properties-common -y

$ sudo add-apt-repository ppa:webupd8team/java -y

$ sudo apt-get update

$ sudo apt-get install oracle-java8-installer oracle-java8-set-default -y

ii) SET YOUR JAVA_HOME

$ export JAVA_HOME=/usr/lib/jvm/java-8-oracle

iii) Verify it with the following command

$ env | grep JAVA_HOME

JAVA_HOME=/usr/lib/jvm/java-8-oracle

2) Download latest ONOS

$ git clone https://gerrit.onosproject.org/onos

$ cd onos

$ git checkout master

3) Development Environment Setup

The ONOS_ROOT environment variable is exported in the shell profile (.bash_aliases, .profile, etc.)

$ export ONOS_ROOT=~/onos

$ source $ONOS_ROOT/tools/dev/bash_profile

4) Build with Buck

$ sudo apt-get install zip unzip

$ cd $ONOS_ROOT

$ tools/build/onos-buck build onos --show-output

```
Vineels-MacBook-Air:onos nirmalkaria$  tools/build/onos-buck build onos --show-output

Not using buckd because NO_BUCKD is set.
[-] PROCESSING BUCK FILES...FINISHED 5.2s [100%] 🐳 New buck daemon
[+] DOWNLOADING... (0.00 B/S, TOTAL: 0.00 B, 0 Artifacts)
[+] BUILDING...14.3s [15%] (208/209 JOBS, 1 UPDATED, 1 [0.5%] CACHE MISS)

 |=> IDLE
The outputs are:
//tools/package:onos-package buck-out/gen/tools/package/onos-package/onos.tar.gz
```

ii) To execute ONOS unit tests,

$ tools/build/onos-buck test

```
Vineels-MacBook-Air:onos nirmalkaria$ tools/build/onos-buck test
Not using buckd because NO_BUCKD is set.
[-] PROCESSING BUCK FILES...FINISHED 1.0s [100%] 🐳 New buck daemon

PICOS Open vSwitch Command Reference

Pica8 PicOS software leverages Open vSwitch, a production quality, multi-layer virtual switch licensed under the open source Apache 2.0 license. OVS runs as a process within PicOS. The OpenFlow protocol is driven by the Open Networking Foundation (ONF), a leader in software-defined networking (SDN). The OpenFlow protocol governs three essential components of SDN, including an OpenFlow physical switch, an OpenFlow virtual switch to manage virtual machines, and an OpenFlow controller to organize all network pieces.

Organization

This document presents OVS commands arranged in three major sections:

- **ovs−appctl:** Utility for querying and controlling **ovs-vswitchd** (Open vSwitch daemon)
- **ovs-ofctl:** OpenFlow switch management utility
- **ovs-vsctl:** Utility for configuring and controlling **ovs-vswitchd** (Open vSwitch daemon)

Additional Resources

For detailed information about Open vSwitch, OpenFlow, and command usage, visit the following web sites:

- **Open vSwitch Advanced Features Tutorial**
- **Open vSwitch**
- **OpenFlow**

ovs−appctl Commands

- ovs-appctl Target Commands
- ovs-appctl Common Commands

ovs−ofctl Commands

- ovs-ofctl Common Commands
- ovs-ofctl dump-meters <bridge>

ovs−vsctl Commands

ovs−appctl Commands

ovs−appctl is a utility for querying and controlling the Open vSwitch daemon.

User can view the **ovs-appctl** help for more information about the utility.

```
admin@Leaf1$ovs-appctl --help
ovs-appctl, for querying and controlling Open vSwitch daemon
usage: ovs-appctl [TARGET] COMMAND [ARG...]
Targets:
  -t, --target=TARGET  pidfile or socket to contact
Common commands:
  help               List commands supported by the target
  version            Print version of the target
  vlog/list          List current logging levels
  vlog/set [SPEC]
      Set log levels as detailed in SPEC, which may include:
      A valid module name (all modules, by default)
      'syslog', 'console', 'file' (all facilities, by default))
      'off', 'emer', 'err', 'warn', 'info', or 'dbg' ('dbg', bydefault)
  vlog/reopen        Make the program reopen its log file
Other options:
  --timeout=SECS     wait at most SECS seconds for a response
  -h, --help         Print this helpful information
  -V, --version      Display ovs-appctl version information
```

User may also view the ovs-appctl manual page for detailed syntax and additional information.

```
admin@Leaf1$man ovs-appctl
ovs-appctl(8)                Open vSwitch Manual               ovs-appctl(8)
NAME
       ovs-appctl - utility for configuring running Open vSwitch daemons
SYNOPSIS
       ovs-appctl [--target=target | -t target] command [arg...]
       ovs-appctl --help
       ovs-appctl --version
DESCRIPTION
       Open  vSwitch  daemons  accept  certain  commands at runtime to control
       their behavior and query their settings.  Every daemon accepts a common
       set  of  commands documented under COMMON COMMANDS below.  Some daemons
       support  additional  commands  documented  in  their  own  manpages.
       ovs-vswitchd in particular accepts a number of additional commands doc-
       umented in ovs-vswitchd(8).
       The ovs-appctl program provides a simple way to invoke these  commands.
       The  command  to  be  sent is specified on ovs-appctl's command line as
       non-option arguments.  ovs-appctl sends the command and prints the dae-
       mon's response on standard output.
<Some output omitted>
```

- ovs-appctl Target Commands

ovs-appctl Common Commands

This section includes the common comands of ovs-appctl.

- ovs-appctl Help
- ovs-appctl hwlog/set-level <module> <level>
- ovs-appctl hwlog/set-type <mode> <type>
- ovs-appctl ofproto/set_L34_enable
- ovs-appctl Version
- ovs-appctl vlog/list
- ovs-appctl vlog/set
- Pica8 Commands

ovs-appctl Help

Lists commands supported by the ovs-vswitchd.

ovs-appctl hwlog/set-level <module> <level>

Set hwlog level of <module> as detailed in <level>.
The <module> contains sdk/api/all; the <level> contains debug/info/warn/error|/off.

ovs-appctl hwlog/set-level all debug

Set hwlog level of 'all' module as 'debug'.

ovs-appctl hwlog/set-level sdk debug

Set hwlog level of 'sdk' module as 'debug'.

ovs-appctl hwlog/set-level api debug

Set hwlog level of 'api' module as 'debug'.

ovs-appctl hwlog/set-type <mode> <type>

Enable/disable hwlog of <mode>.
The <mode> contains config/packet/all; the <type> contains true/false.

ovs-appctl hwlog/set-type config true

Enable hwlog of configurations.

ovs-appctl ofproto/set_L34_enable

To control whether or not flows unsupported by the hardware can be added, use the **ovs-appctl ofproto/set_L34_enable** command in OVS mode.

Command Syntax

ovs-appctl ofproto/set_L34_enable { **true** | **false** }

Parameters

true	Flows not supported by hardware can be added. This is the default option.
false	Flows not supported by hardware cannot be added.

ovs-appctl Version

ovs-appctl version

Print the version of the ovs-vswitchd.

Example

```
admin@PicOS-OVS$ovs-appctl version
ovs-vswitchd (Open vSwitch) 2.3.0
Compiled May 27 2015 23:04:41
```

ovs-appctl vlog/list

To list the known logging modules and their current levels, use the **ovs-appctl vlog/list** command.

Syntax

ovs-appctl vlog/list

Parameters

There are no parameters for this command.

Examples

The following example lists the known logging modules and their current levels:

```
admin@Switch$ovs-appctl vlog/list
                 console    syslog    file
                 -------    ------    ------

```

ovs-appctl vlog/set

To enable Open vSwitch logging and customize the logging levels, use the **ovs-appctl vlog/set** command.

Syntax

ovs-appctl vlog/set *module*[**:***facility*[**:***level*]]

Parameters

Parameters	
module	A valid module name, as displayed by the ovs-appctl vlog/list command. The log level change is only applied to the specified module. If *module* is not specified, the new settings are applied to all modules.
facility	The log level change is limited to the specified facility. Valid options are **syslog**, **console**, and **file**.
level	Messages of the given severity or higher will be logged, and messages of lower severity will be filtered out. Valid options are **off**, **emer**, **err**, **warn**, **info**, or **dbg**. **off** filters out all messages. If *level* is not specified, the logging level is set to **dbg** (debugging).

Examples

The following example configures debugging messages for Open vSwitch daemon to be logged to the console:

```
admin@Switch$ovs-appctl vlog/set vswitchd:console:dbg
```

Pica8 Commands

Command List

ovs-appctl pica/show

This command displays available resources for open flow.

```
Max Hardware Flow Entry Limitation:
    TCAM Table    : 8192
    Egress Table  : 512
    VFilter Table : 512
    L2 Table      : 32768
    L3 Table      : 24000

Valid Interfaces On Switch as5812_54x:
    Physical interfaces:
        te-1/1/1(1)       te-1/1/2(2)       te-1/1/3(3)       te-1/1/4(4)
        te-1/1/5(5)       te-1/1/6(6)       te-1/1/7(7)       te-1/1/8(8)
        te-1/1/9(9)       te-1/1/10(10)     te-1/1/11(11)     te-1/1/12(12)
        te-1/1/13(13)     te-1/1/14(14)     te-1/1/15(15)     te-1/1/16(16)
        te-1/1/17(17)     te-1/1/18(18)     te-1/1/19(19)     te-1/1/20(20)

    L2GRE interfaces: l2gre1(5121) - l2gre1023(6143)
```

ovs-appctl bridge/clear-counts bridge *[interface]*

This command clears ports statistics.

```
admin@PicOS-OVS$ovs-appctl bridge/clear-counts br0
admin@PicOS-OVS$ovs-appctl bridge/clear-counts br0 ge-1/1/1
```

ovs-appctl pica/dump-flows [--sort | --rsort]

Shows the hardware flow.

User can use [--sort|--rsort]to sort the output of the hardware flow dump by priority.

```
admin@PicOS-OVS$ovs-appctl pica/dump-flows
#4 normal permanent flow_id=7 priority=2,in_port=49, actions:50
#0 normal_d permanent flow_id=2 priority=0, actions:drop
#5 normal permanent flow_id=8 priority=3,in_port=51, actions:50
Total 3 flows in HW.

admin@PicOS-OVS$ovs-appctl pica/dump-flows --sort
#0 normal_d permanent flow_id=2 priority=0, actions:drop
#4 normal permanent flow_id=7 priority=2,in_port=49, actions:50
#5 normal permanent flow_id=8 priority=3,in_port=51, actions:50
Total 3 flows in HW.
```

```
admin@PicOS-OVS$ovs-appctl pica/dump-flows --rsort
#5 normal permanent flow_id=8 priority=3,in_port=51, actions:50
#4 normal permanent flow_id=7 priority=2,in_port=49, actions:50
#0 normal_d permanent flow_id=2 priority=0, actions:drop
Total 3 flows in HW.
```

ovs-appctl bridge/dump-flows bridge

Shows all software flows, including those flows not added by user or switch.

```
admin@SpineA-OVS$ovs-appctl bridge/dump-flows br0

ovs-appctl inband/dump-flows bridge

Show inband flows.

ovs-appctl inband/enable true|false

Enable or disable inband mode.

ovs-appctl inband/show

Show inband status.

ovs-appctl lacp/show

This command displays the LACP status on the configured ports.

```
admin@PicOS-OVS$ovs-appctl lacp/show

ovs-appctl Target Commands

This section includes one command of target. ovs-appctl -t <target> <command> The default <target> is ovs-vswitchd.

- ovs-appctl -t ovs-vswitchd <command>

ovs-appctl -t ovs-vswitchd <command>

ovs-appctl -t ovs-vswitchd lacp/show

Display the information of LACP.

ovs-appctl -t ovs-vswitchd dpif/dump-flows <bridge>

This command can be used in OVS 2.0.

ovs-appctl -t ovs-vswitchd bridge/dump-flows <bridge>

ovs-appctl -t ovs-vswitchd pica/dump-flows

This command can be used in OVS 2.0. Using this command user can print hardware flows..

ovs−ofctl Commands

ovs−ofctl is a utility for managing OpenFlow switches. **ovs-ofctl** should work with any OpenFlow switch, not just Open vSwitch.

Users can view the **ovs-ofctl** help for more information about the utility.

```
admin@Leaf1$ovs-ofctl --help
ovs-ofctl: OpenFlow switch management utility
usage: ovs-ofctl [OPTIONS] COMMAND [ARG...]
For OpenFlow switches:
  show SWITCH                 show OpenFlow information
  dump-desc SWITCH            print switch description
  dump-tables SWITCH          print table stats
  dump-table-features SWITCH  print table features
  mod-port SWITCH IFACE ACT   modify port behavior
  mod-table SWITCH MOD        modify flow table behavior
  get-frags SWITCH            print fragment handling behavior
  set-frags SWITCH FRAG_MODE  set fragment handling behavior
  dump-ports SWITCH [PORT]    print port statistics
  dump-ports-desc SWITCH [PORT]  print port descriptions
  dump-flows SWITCH           print all flow entries
  dump-flows SWITCH FLOW      print matching FLOWs
  dump-aggregate SWITCH       print aggregate flow statistics
  dump-aggregate SWITCH FLOW  print aggregate stats for FLOWs
  queue-stats SWITCH [PORT [QUEUE]]  dump queue stats
  add-flow SWITCH FLOW        add flow described by FLOW
  add-flows SWITCH FILE       add flows from FILE
  mod-flows SWITCH FLOW       modify actions of matching FLOWs
  del-flows SWITCH [FLOW]     delete matching FLOWs
  replace-flows SWITCH FILE   replace flows with those in FILE
  diff-flows SOURCE1 SOURCE2  compare flows from two sources
  packet-out SWITCH IN_PORT ACTIONS PACKET...
                              execute ACTIONS on PACKET
  monitor SWITCH [MISSLEN] [invalid_ttl] [watch:[...]]
                              print packets received from SWITCH
  snoop SWITCH                snoop on SWITCH and its controller
  add-group SWITCH GROUP      add group described by GROUP
  add-groups SWITCH FILE       add group from FILE
  mod-group SWITCH GROUP      modify specific group
  del-groups SWITCH [GROUP]   delete matching GROUPs
  dump-group-features SWITCH  print group features
  dump-groups SWITCH [GROUP]  print group description
  dump-group-stats SWITCH [GROUP]  print group statistics
  queue-get-config SWITCH PORT  print queue information for port
  add-meter SWITCH METER      add meter described by METER
  mod-meter SWITCH METER      modify specific METER
  del-meter SWITCH METER      delete METER
  del-meters SWITCH           delete all meters
  dump-meter SWITCH METER     print METER configuration
  dump-meters SWITCH          print all meter configuration
  meter-stats SWITCH [METER]  print meter statistics
  meter-features SWITCH       print meter features
For OpenFlow switches and controllers:
  probe TARGET                probe whether TARGET is up
  ping TARGET [N]             latency of N-byte echos
  benchmark TARGET N COUNT    bandwidth of COUNT N-byte echos
SWITCH or TARGET is an active OpenFlow connection method.
Other commands:
  ofp-parse FILE              print messages read from FILE
  mod-temp-thresh SWITCH THRESHOLD  modify temperature threshold
  dump-temp-thresh SWITCH     print temperature threshold
  ofp-parse-pcap PCAP         print OpenFlow read from PCAP
  dump-tables-desc SWITCH     print tables description
  bundle SWITCH MSG           send bundle messages
Active OpenFlow connection methods:
  tcp:IP[:PORT]           PORT (default: 6633) at remote IP
  ssl:IP[:PORT]           SSL PORT (default: 6633) at remote IP
```

```
  unix:FILE               Unix domain socket named FILE
PKI configuration (required to use SSL):
  -p, --private-key=FILE  file with private key
  -c, --certificate=FILE  file with certificate for private key
  -C, --ca-cert=FILE      file with peer CA certificate
Daemon options:
  --detach                run in background as daemon
  --no-chdir              do not chdir to '/'
  --pidfile[=FILE]        create pidfile (default: /ovs/var/run/openvswitch/ovs-ofctl.pid)
  --overwrite-pidfile     with --pidfile, start even if already running
OpenFlow version options:
  -V, --version           display version information
  -O, --protocols         set allowed OpenFlow versions
                          (default: OpenFlow10, OpenFlow11, OpenFlow12, OpenFlow13, OpenFlow14)
Logging options:
  -vSPEC, --verbose=SPEC   set logging levels
  -v, --verbose            set maximum verbosity level
  --log-file[=FILE]        enable logging to specified FILE
                           (default: /ovs/var/log/openvswitch/ovs-ofctl.log)
  --syslog-target=HOST:PORT  also send syslog msgs to HOST:PORT via UDP
Other options:
  --strict                    use strict match for flow commands
  --readd                     replace flows that haven't changed
  -F, --flow-format=FORMAT    force particular flow format
  -P, --packet-in-format=FRMT force particular packet in format
  -m, --more                  be more verbose printing OpenFlow
  --timestamp                 (monitor, snoop) print timestamps
  -t, --timeout=SECS          give up after SECS seconds
  --sort[=field]              sort in ascending order
  --rsort[=field]             sort in descending order
  --unixctl=SOCKET            set control socket name
  -h, --help                  display this help message
  -V, --version               display version information
```

See ovs-ofctl manual page for detailed syntax and additional information.

```
admin@Leaf1$man ovs-ofctl
ovs-ofctl(8)                                    Open vSwitch Manual                                    ovs-of
NAME
       ovs-ofctl - administer OpenFlow switches
SYNOPSIS
       ovs-ofctl [options] command [switch] [args...]
DESCRIPTION
       The ovs-ofctl program is a command line tool for monitoring and administering OpenFlow switches.  It can als
       the current state of an OpenFlow switch, including features, configuration, and table  entries.   It  should
       with any OpenFlow switch, not just Open vSwitch.
   OpenFlow Switch Management Commands
       These commands allow ovs-ofctl to monitor and administer an OpenFlow switch.  It is able to show the current
       of a switch, including features, configuration, and table entries
<Some output omitted>
```

ovs-ofctl Common Commands

- ovs-ofctl mod-group <bridge> group_id=<id>,type=<type>,bucket=<actions>
- ovs-ofctl dump-desc <bridge>
- ovs-ofctl del-group <bridge> [group_id=<id>]
- ovs-ofctl mod-table <bridge> <table> <mod>
- ovs-ofctl monitor <bridge> [MISSLEN] [invalid_ttl] [watch:[...]]
- ovs-ofctl mod-meter <bridge> meter=<id>,<meter-parameter>
- ovs-ofctl dump-tables <bridge>
- ovs-ofctl dump-tables-desc <bridge>
- ovs-ofctl mod-flows <bridge> <flow>
- ovs-ofctl add-flow <bridge> <flow>
- ovs-ofctl del-meters <bridge>
- ovs-ofctl add-group <bridge> group_id=<id>,type=<type>,bucket=<actions>
- ovs-ofctl add-flows <bridge> <file>
- ovs-ofctl del-meter <bridge> meter=<id>
- ovs-ofctl add-meter <bridge> meter=<id>,<meter-parameter>
- ovs-ofctl show <bridge>
- ovs-ofctl dump-ports-desc <bridge>
- ovs-ofctl bundle <bridge> <bundle>

- ovs-ofctl dump-flows <bridge> <flow>
- ovs-ofctl snoop <bridge>
- ovs-ofctl dump-ports <bridge> <port>
- ovs-ofctl del-flows <bridge> <flow>
- ovs-ofctl mod−port <bridge> <iface> <action>
- ovs-ofctl replace-flows <bridge> <file>
- ovs-ofctl diff-flows <source1> <source2>
- ovs-ofctl add-groups <bridge> <file>
- ovs-ofctl queue-get-config <bridge> <port>
- ovs-ofctl meter-stats <bridge> [meter]
- ovs-ofctl meter-features <bridge>

ovs-ofctl dump-meters <bridge>

---

ovs-ofctl Common Commands

Most of these commands take an argument that specifies the method for connecting to an OpenFlow switch. The following connection methods are supported:

- ovs-ofctl add-flow <bridge> <flow>
- ovs-ofctl add-flows <bridge> <file>
- ovs-ofctl add-group <bridge> group_id=<id>,type=<type>,bucket=<actions>
- ovs-ofctl add-meter <bridge> meter=<id>,<meter-parameter>
- ovs-ofctl bundle <bridge> <bundle>
- ovs-ofctl del-flows <bridge> <flow>
- ovs-ofctl del-group <bridge> [group_id=<id>]
- ovs-ofctl del-meter <bridge> meter=<id>
- ovs-ofctl del-meters <bridge>
- ovs-ofctl dump-desc <bridge>
- ovs-ofctl dump-flows <bridge> <flow>
- ovs-ofctl dump-ports <bridge> <port>
- ovs-ofctl dump-ports-desc <bridge>
- ovs-ofctl dump-tables <bridge>
- ovs-ofctl dump-tables-desc <bridge>
- ovs-ofctl mod-flows <bridge> <flow>
- ovs-ofctl mod-group <bridge> group_id=<id>,type=<type>,bucket=<actions>
- ovs-ofctl mod-meter <bridge> meter=<id>,<meter-parameter>
- ovs-ofctl mod-table <bridge> <table> <mod>
- ovs-ofctl mod−port <bridge> <iface> <action>
- ovs-ofctl monitor <bridge> [MISSLEN] [invalid_ttl] [watch:[...]]
- ovs-ofctl show <bridge>
- ovs-ofctl snoop <bridge>
- ovs-ofctl replace-flows <bridge> <file>
- ovs-ofctl diff-flows <source1> <source2>
- ovs-ofctl add-groups <bridge> <file>
- ovs-ofctl queue-get-config <bridge> <port>
- ovs-ofctl meter-stats <bridge> [meter]
- ovs-ofctl meter-features <bridge>

ovs-ofctl add-flow <bridge> <flow>

Add flow described by flow.

ovs-ofctl add-flow <bridge> in_port=<port>,actions=<action>

Matches the in_port port in open flow, <port> can be a port number or keyword (eg:LOCAL).

ovs-ofctl add-flow <bridge> dl_vlan=<vlanid>,actions=<action>

Add a flow with the match field dl_vlan (IEEE 802.1q Virtual LAN tag). When the VLAN ID of the packets matches the flow match field then it will be forward according to the actions.The VLAN value ranges from 0 to 4095.

ovs-ofctl add-flow <bridge> dl_vlan_pcp=<value>,actions=<action>

dl_vlan_pcp is an identifier that matches IEEE 802.1q Priority Code Point (PCP) priority. It is a value between 0 and 7. When the value is higher, frame priority level is higher.

ovs-ofctl add-flow <bridge> dl_src=<mac>,actions=<action>

Add a flow with the match field dl_src that matches an Ethernet source address. This value uses 6 pairs of hexadecimal digits to specify, eg: 00:0B:C4:A8:22:B0.

ovs-ofctl add-flow <bridge> dl_dst=<mac>,actions=<action>

Add a flow with the match field dl_dst that matches an Ethernet destination address. This value uses 6 pairs of hexadecimal digits to specify, eg: 00:0B:C4:A8:22:B0.

ovs-ofctl add-flow <bridge> dl_src=<mac/mask>,actions=<action>

ovs-ofctl add-flow <bridge> dl_dst=<mac/mask>,actions=<action>

This type of source mac address provides a wider match field. When the 6 pairs of masks are full *ff*, it indicates exact match, as to say, it is the same with *dl_src=xx:xx:xx:xx:xx:xx.* Otherwise,1-bit in mask indicates that the corresponding bit in *mac* must match exactly, 0-bit in mask indicates wildcards.

ovs-ofctl add-flow <bridge> dl_type=<ethernet type>,actions=<action>

Matches Ethernet protocol type *ethertype*, which is specified as an integer between 0 and 65535, inclusive, either in decimal or as a hexadecimal number prefixed by **0x.** (e.g. **0x0806** to match ARP packet).

ovs-ofctl add-flow <bridge> dl_type=<ethernet type>,nw_src=ip[/netmask],actions=<action>

ovs-ofctl add-flow <bridge> dl_type=<ethernet type>,nw_dst=ip[/netmask],actions=<action>

nw_src and nw_dst are the identifiers of IP source/destination addresses. But before the IP source/destination address is set, Ethernet Type(dl_type) must be set.Type values include：0x0800: matches IPv4 source/destination address IP (eg:ip, tcp). 0x0806: the arp protocol type, matches the ar_sqa or ar_tpa field. respectively, in ARP packets for IPv4 and Ethernet. 0x8035:therarp protocol type, matches the ar_spa or ar_tpa field, respectively, in RARP packets for IPv4 and Ethernet. Other than 0x0800, 0x0806, or 0x8035, the values of nw_src and nw_dst are ignored

ovs-ofctl add-flow <bridge> dl_type=<ethernet type>, nw_proto=<proto>, actions=<action>

This parameter <proto> is specified as a decimal number with the value between 0-255.
When dl_type=0x86dd or IPv6 is specified, the packets must match IPv6 header type.Set proto to 58 to match ICMPv6 packets.
When dl_type=0x0806 or arp is specified,packets must match the lower 8 bits of the ARP opcodes. The opcodes greater than 255 are treated as 0.
When dl_type=0x8035 or rarp is specified,packets must match the lower 8 bits of the RARP opcodes The opcodes greater than 255 are treated as 0.

ovs-ofctl add-flow <bridge> dl_type=<ethernet type>, nw_tos=<tos>, actions=<action>

This parameter <tos> is specified as a decimal number with the value between 0-255. When dl_type=0x0800 or 0x86dd is specified,matches the IP TOS/DHCP or IPv6 traffic class field tos. Note that the two lower reserved bits of tos are ignored for matching purposes. When **dl_type** is wildcarded or set to a value other than 0x0800 or 0x86dd, the value of **nw_tos** is ignored (see **Flow Syntax** above).

ovs-ofctl add-flow <bridge> dl_type=<ethernet type>, nw_ecn=<ecn>,actions=<action>

This parameter <tos> is specified as a decimal number with the value between 0-3. When dl_type=0x0800 or 0x86dd is specified,matches the *ecn* bits in IP ToS or IPv6 traffic class fields .When **dl_type** is wildcarded or set to a value other than 0x0800 or 0x86dd, the value of **nw_ecn** is ignored

ovs-ofctl add-flow <bridge> dl_type=<ethernet type>,nw_proto=<proto>,tp_src=<port>,actions=<action>

ovs-ofctl add-flow <bridge> dl_type=<ethernet type>,nw_proto=<proto>,tp_dst=<port>,actions=<action>

When you want to match **tp_src** or **tp_dst**, you must specify**dl_type** and **nw_proto**as TCP or UDP , <port> is specified as decimal number between 0-65535. When **dl_type** and **nw_proto** take other values, the values of these settings are ignored.

ovs-ofctl add-flow <bridge> dl_type=<ethernettype>,nw_proto=<proto>,tp_src=<port/mask>,actions=<action>

ovs-ofctl add-flow<bridge> dl_type=<ethernet type>,nw_proto=<proto>,tp_dst=<port/mask>,actions=<action>

When you set the **tp_src** and **tp_dst** like this, that means bitwise match on TCP (or UDP) source or destination port. Both the port and mask are 16-bit decimal numbers or hexadecimal numbers prefixed by 0X. Each 1bit in mask requires the corresponding bit in port must match, while each 0-bit in mask requires the corresponding bit in port to be ignored.

ovs-ofctl add-flow <bridge> table=<number><flow>

By default, the table number is 0. When **table** number is specified, that will limit flow manipulations and dump flow commands to apply to the specified table number which is between 0-254.

ovs-ofctl add-flow <bridge> metadata=value[/mask]<flow>

metadata is just useful across multiple flow tables. It makes matching flows easy. Sometimes, we will just check the **metadata** of flow because different metadata means different flows. But this field is only applied to software flow tables, not applied to the only hardware flow table in our switch.

ovs-ofctl add-flow<bridge> dl_type=<ethernettype>,nw_proto=1,icmp_type=<type>,actions=<action>

ovs-ofctl add-flow<bridge> dl_type=<ethernettype>,nw_proto=1,icmp_code=<type>,actions=<action>

When you specify **dl_type** and**nw_proto** as ICMP or ICMPv6,then **icmp_type** must matches the ICMP type (eg:**icmp_type=1**), and **icmp_code** must matched ICMP code that the value of code is between 0-255.
When **dl_type** and **nw_proto** take other values, the values of these settings are ignored.

ovs-ofctl add-flow<bridge> dl_type=0x8847,mpls_label=<label>,actions=<action>

The value of mpls label is between 0-1048575.That is to say you can add 1048575 mpls labels at most.

ovs-ofctl add-flow<bridge> dl_type=0x8847,mpls_tc=<tc>,actions=<action>

The value of **mpls_tc** is between 0-7.It is for experimental use.

ovs-ofctl add-flow<bridge> vlan_tci=<tci[/mask]>,actions=<action>

The tci matches VLAN TCI. The tci and mask are 16-bit values are decimal by default;you can use a 0x prefix to set the values in hexadecimal.when mask is specified,1-bit number in mask requires corresponding bit in tci must match exact,and 0-bit in mask makes corresponding bit in tci be ignored.If do not specify mask,thentci is the exact VLAN TCI to match.

ovs-ofctl add-flow<bridge> dl_type=0x86DD,ipv6_src=<ipv6[/netmask]>,actions=<action>

ovs-ofctl add-flow<bridge> dl_type=0x86DD,ipv6_dst=<ipv6[/netmask]>,actions=<action>

If you want to add a flow with the ipv6 source and destination,you must first set the dl_type as 0x86dd(or ipv6 or tcp6).
The actions of flow include the following values,all the values are applied into add-flow, add-flows, and mod-flows .These are just examples of add-flow below.

ovs-ofctl add-flow<bridge><match-field>actions=[target][,target...]

ovs-ofctl add-flow<bridge><match-field>actions=output:<port>

The port should be an OpenFlow port number or keyword as LOCAL and so on.That means outputting packets to port.

ovs-ofctl add-flow<bridge><match-field>actions=enqueue:<port>:<queue>

The *port* should be an OpenFlow port number or keyword(eg:LOCAL).This action means to enqueue the packets on specified *queue* within the port.The queues numbers depend on switch.

ovs-ofctl add-flow<bridge><match-field>actions=NORMAL

This action means making packets be processed as device' normal L2/L3.

ovs-ofctl add-flow<bridge><match-field>actions=flood

This action means outputting packets on all physical ports other than the port on which it was receivedand any ports on which flooding is disabled (typically, these would be ports disabled by the IEEE 802.1D spanning tree protocol).

ovs-ofctl add-flow <bridge> <match-field> actions=all

This action means outputting packets on all physical ports other than the port on which it was received.

ovs-ofctl add-flow <bridge> <match-field>actions=controller(key=value...)

When you set action as controller, the packets will be sent in OpenFlow controller as packet-in message.

ovs-ofctl add-flow <bridge> <match-field>actions=drop

This action means discard the packets without further processing or forwarding. When this action **drop** is used,you should not specify other actions.

ovs-ofctl add-flow <bridge> <match-field> actions=push_vlan:<ethertype>,set_field:<value>-\>vlan_vid,output:<port>

Using **push_vlan**, you can push a new VLAN to packets, *ethertype* is the ethertype for the tag **(**only support **0x8100** at the moment. **set_field** is used to set the value of priority.

ovs-ofctl add-flow <bridge> <match-field> dl_type=<ethertype>,dl_src=<src>,dl_dst=<dst>,actions=push_mpls:<ethertype>,set_field:<value>-\>mpls_label,output:<port>

Using **push_mpls,** you can push a new mpls label for a packet without any mpls label. At this time,the *ethertype* must be either MPLS unicast ethertype**0x8847,** or the MPLS multicast ethertype**0x8848.** if the packets has already contains a mpls label, pushes a new outermost label as a copy of the existing outermost label.

ovs-ofctl add-flow<bridge><match-field>actions=pop_mpls:<ethertype>

You can pop outer mpls label by setting *ethertype*to MPLS Ethertype.and pop all MPLS label by setting *ethertype* to the types except mplsethertype.

ovs-ofctl add-flow<bridge><match-field>actions=push_pbb:<ethertype>,set_field:<value>-\...

You can push outermost mac address for packets.PBB is a mac-in-mac technology.ethertype is **0x88e7.**

ovs-ofctl add-flow<bridge><match-field>actions=pop_pbb

You can pop the outer mac for packets by using pop_pbb.

ovs-ofctl add-flow<bridge><match-field>actions=mod_vlan_vid:<vlan_vid>

This action means modify the thevlan id of the packets.Thevlan tag is added or modified as necessary to match specifiedvalue.when the vlan tag is added ,then priority of the packets are 0 by default.You can set priority by **mod_vlan_pcp**.*vlan_id* is between 0-4095.

ovs-ofctl add-flow<bridge><match-field>actions=mod_vlan_pcp:<vlan_pcp>

You can modify the vlan priority of the packets.vlan_pcp value is between0-7, 0 presents the lowest priority and 7 means highest priority.

ovs-ofctl add-flow<bridge><match-field>actions=strip_vlan

Using this action ,you can pop vlan tag from packets.

ovs-ofctl add-flow<bridge><match-field>actions=mod_dl_src:<mac>

User can modify source mac of packets from the output port by **mod_dl_src.**

ovs-ofctl add-flow<bridge><match-field>actions=mod_dl_dst:<mac>

User can modify *destination* mac of packets from the output port by **mod_dl_dst**

ovs-ofctl add-flow<bridge><match-field>actions=mod_nw_src:<ip>

Modify the *source ipv4* addressof specified flow,by using mod_nw_src.

ovs-ofctl add-flow<bridge><match-field>actions=mod_nw_dst:<ip>

Modify the *destination ipv4* addressof specified flow,by using mod_nw_dst.

ovs-ofctl add-flow<bridge><match-field>actions=mod_tp_src:<port>

Modify the TCP or UDP source port.

ovs-ofctl add-flow<bridge><match-field>actions=mod_tp_dst:<port>

Modify the TCP or UDP destination port.

ovs-ofctl add-flow<bridge><match-field>actions=mod_nw_tos:<tos>

By using this action you can modify the IPv4 TOS or DSCP field to tos, which must be a multiple of 4 between 0-255.This action can not modify the lower 2-bits of tos field which represents ECN bits.

ovs-ofctl add-flow<bridge><match-field>actions=resubmit([port],[table])

By this action,you can re-search OpenFlow flow table with the**in_port** field replaced by *port*. Or research the table whose number is specified by table.

ovs-ofctl add-flow<bridge><match-field>actions=set_queue:<queue>

By taking this action, the packets that is output the port will be output the specified *queue*. Different switch has different numbers of supported queues.

ovs-ofctl add-flow<bridge><match-field>actions=set_mpls_ttl:ttl

This action will set the TTL of outer MPLS label stack entry of a packet. The range of TTL number is between 0-255.

ovs-ofctl add-flow<bridge><match-field>actions=controller(key=value...)

Taking this action will send packets to OpenFlow controller as "packet-in" message. There are some key-value pairs as follow.
max_len=*nbytes:* limit the maximum length of packets sent to the controller. By default, the entire packet is sent.
reason=*reason:*Specify *reason* as the reason for sending the message in the ''packet in'' message. The supported reasons are **action** (the default), **no_match**, and **invalid_ttl**.

ovs-ofctl add-flow <bridge> in_port=<port>,ip, actions=set_field:16-\>tos,output:<port>

modify the value of tos in packets.

support vntag and vnid in match fields now.

ovs-ofctl add-flow <bridge> vn_tag=0x33330000/0x3FFF0000,dl_dst=00:11:11:11:11:11,actions=2. For the details,check the link:VN-tag.

ovs-ofctl add-flow <bridge> **udp,tp_dst=5000,tun_id=0x0200000000112233,actions=2**

support the udf fields

ovs-ofctl add-flow <bridge> table=250,in_port=<port>,udf0=0x810003E8/0x0000ffff,actions=2

please check the details through the following link:Configuring udf flow

Summarize Above Flows as a Table

ovs-ofctl add-flow <bridge> <flow>

Add table:

feature	Match fields	actions	example
L2	in_port=<port>	<action>	ovs-ofctl add-flow br0 in_port=1,actions=output:2
	dl_src=<mac>	<action>	ovs-ofctl add-flow br0 in_port=1,dl_src=22:22:22:22:22:22,actions=output:2

ovs-ofctl add-flows <bridge> <file>

Add multiple flows from file. You can create a file with many flows in the server, and copy this file to your switch. Then use this command **ovs-ofctl add-flows <bridge> <file>** to add these flows in this file.

Command

ovs-ofctl add-flows <bridge> <file>

Example

There are two flows in file 111.txt. Add these flows in this file as below:

admin@PicOS-OVS$sudo scp sophia.sun@10.10.50.20:/home/sophia.sun/111.txt ./
The authenticity of host '10.10.50.20 (10.10.50.20)' can't be established.
ECDSA key fingerprint is 8f:f3:ca:a1:b9:a9:67:26:e1:54:dc:6a:62:74:d5:f6.
Are you sure you want to continue connecting (yes/no)? yes
Warning: Permanently added '10.10.50.20' (ECDSA) to the list of known hosts.

ovs-ofctl add-group <bridge> group_id=<id>,type=<type>,bucket=<actions>

PicOS OVS supports group tables from Openflow 1.2.

ovs-ofctl add-group *<bridge>* group_id=*<id>*,type=all,bucket=*<actions>[,bucket=<actions>]*

Add a group that group_id=<id>, type=all in <bridge>. The max buckets number can be created is 10.

Example:
Create a group type=all, include two buckets to modify the src-mac and dst-mac.

```
admin@PicOS-OVS$ovs-ofctl add-group br0 group_id=1,type=all,bucket=mod_dl_src=00:00:00:11:11:11,mod_dl_dst=00:00:0
```

ovs-ofctl add-group *<bridge>* group_id=*<id>*,type=indirect,bucket=*<actions>*

Add a group that group_id=<id>, type=indirect in <bridge>.

Example:
Create a group type=indirect, just include one bucket to modify the src-mac and dst-mac.

```
admin@PicOS-OVS$ovs-ofctl add-group br0 group_id=2,type=indirect,bucket=mod_dl_src=00:00:00:99:11:11,mod_dl_dst=00
```

ovs-ofctl add-group *<bridge>* group_id=*<id>*,type=select,bucket=*<actions>[,bucket=<actions>]*

Add a group that group_id=<id>, type=select in <bridge>.
PisOS OVS is not support weighting now, user cannot specify the weight, weight=1.
Because OVS forwards packets by TCAM, the traditional ECMP in the routing table can not be used in OVS mode.
We implement a "dummy ECMP" by splitting the matching fields of a flow. By the group that type=select, the system will choose one match field to split in nw_src, nw_dst, dl_src, dl_dst. The nw_src is the highest priority, if it has no special nw_src or if the mask of nw_src is 32, it will choose nw_dst. The last choose dl_src and dl_dst. The premise is the match fields must have mask except 32 nor ff:ff:ff:ff:ff:ff.
Exception to this use, is other flows involved with the select group will be packet-driven flows.
Example:
Create a group type=select, the actions of multi buckets only have output.

```
admin@PicOS-OVS$ovs-ofctl add-group br0 group_id=3,type=select,bucket=bucket=output:1,output:2,bucket=output:3,bucl
```

ovs-ofctl add-group *<bridge>* group_id=*<id>*,type=ff,bucket=*<actions>[,bucket=<actions>]*

Add a group that group_id=<id>, type=ff, in <bridge>. The ff means fast_failover.
Example:

```
admin@PicOS-OVS$ovs-ofctl add-group br0 group_id=4,type=ff,bucket=watch_port:2,watch_group:2,output:3,watch_port:3
```

Actions supported table:

The following actions are not supported.

Different modification for a different bucket

eg.

bucket=mod_dl_src:22:11:11:11:11:11,output:2,bucket=mod_dl_src:22:22:22:22:22:22,output:3

ovs-ofctl add-meter <bridge> meter=<id>,<meter-parameter>

> In PicOS OVS, each meter only support configure one meter band.
>
> The counters of one meter are the same as the flow entry counters which the meter applied.

PicOS OVS supports meters from Openflow 1.3. In different Hardware Models, the maximum count of meters that PicOS OVS supports is different. User can use the command to check the maximum count.

```
admin@PicOS-OVS$ovs-ofctl meter-features br0
OFPST_METER_FEATURES reply (OF1.4) (xid=0x2):
max_meter:2048 max_bands:1 max_color:3
band_types: drop dscp_remark
capabilities: kbps burst stats
```

ovs-ofctl add-meter <*bridge*> meter=<*id*>,kbps*[,burst,stats]*,band=type=drop,rate=<*rate*>*[,burst_size=<size>][,prec_level=<level>]*

Add a meter, the type=drop.

Example:

Without burst size. Limit the rate as 30000kbps.

```
root@PicOS-OVS$ovs-ofctl add-meter br0 meter=1,kbps,band=type=drop,rate=30000
```

With burst size. Limit the rate as 30000kbps.

```
root@PicOS-OVS$ovs-ofctl add-meter br0 meter=2,kbps,burst,band=type=drop,rate=30000,burst_size=30000
```

ovs-ofctl add-meter <*bridge*> meter=<*id*>,kbps*[,burst,stats]*,band=type= dscp_remark,rate=<*rate*>,prec_level=<*level*>*[,burst_size=<size>]*

Add a meter, the type=dscp_remark.

Example:

Without burst_size. The prec_level=14.

```
root@PicOS-OVS$ovs-ofctl add-meter br0 meter=2,kbps,band=type=dscp_remark,rate=30000,prec_level=14
```

With burst_size. The prec_level=14.

```
root@PicOS-OVS$ovs-ofctl add-meter br0 meter=2,kbps,burst,band=type=dscp_remark,rate=30000,prec_level=14,burst_size
```

If one meter applies to multiple flow entries, all the flow entries will share the meter rate.

Example:

```
root@PicOS-OVS$ovs-ofctl add-meter br0 meter=1,kbps,band=type=drop,rate=30000
root@PicOS-OVS$ovs-ofctl add-flow br0 in_port=11,dl_dst=22:00:00:00:00:00,dl_src=22:11:11:11:11:11,dl_type=0x0800,a
root@PicOS-OVS$ovs-ofctl add-flow br0 in_port=12,dl_dst=22:00:00:00:00:00,dl_src=22:11:11:11:11:22,dl_type=0x0800,a
```

The result: the total rate in port te-1/1/13 is limit to 30000 kbps.

ovs-ofctl bundle <bridge> <bundle>

PicOS OVS supports bundles from version 2.3.

User can add a bundle with the format as follows:

ovs-ofctl bundle <bridge> "[open:bundle_id=<id>,]add:bundle_id=<id>,message=<message>[,add:bundle_id=<id>,message=<message>...][,close:bundle_id=<id>],commit:bundle_id=<id>"

Using bundles is to group related state changes on a switch so that all changes are applied together, or that none of them is applied. The second goal is to better synchronize changes across a set of OpenFlow switches. Bundles can be prepared and pre-validated on each switch and applied at the same time.

PicOS OVS supports applying 10 bundles maximum at the same time. And the maximum messages is 100 of each bundle.
Also supports port/flow/group/meter-mods at present.

Flow-mod

message=add-flow <match><,actions>

User can add a flow by bundle.
Example:

```
admin@PicOS-OVS$ovs-ofctl bundle br0 "open:bundle_id=1,add:bundle_id=1,message=add-flow in_port=1,dl_src=22:11:11:1
```

messag=mod-flows <match><,actions>

Modify flows by bundle.

message=del-flows <match>

Delete flows by bundle.
Example:

Delete the flows that match the field.

```
admin@PicOS-OVS$ovs-ofctl bundle br0 "open:bundle_id=1,add:bundle_id=1,message=del-flows in_port=1,commit:bundle_id
```

Delete all flows in br0.

```
admin@PicOS-OVS$ovs-ofctl bundle br0 "open:bundle_id=1,add:bundle_id=1,message=del-flows,commit:bundle_id=1"
```

Group-mod

message=add-group group_id=<id>,type=<type>,bucket=<actions>[,bucket=<actions>]

Add groups by bundle.

Example:

```
admin@PicOS-OVS$ovs-ofctl bundle br0 "open:bundle_id=1,add:bundle_id=1,message=add-group group_id=1,type=all,bucket
```

message=mod-group group_id=<id>,type=<type>,bucket=<actions>[,bucket=<actions>]

Modify a group by bundle.

message=del-groups group_id=<id>

Delete groups by bundle.
Example:

```
admin@PicOS-OVS$ovs-ofctl bundle br0 "open:bundle_id=1,add:bundle_id=1,message=del-groups ,commit:bundle_id=1"
```

Meter-mod

message=add-meter meter=<id> kbps[,burst,stats],band=type=<type>,rate=<rate>[,burst_size=<size>,prec_level=<level>]

Add meter by bundle.

message=mod-meter meter=<id> kbps[,burst,stats],band=type=<type>,rate=<rate>[,burst_size=<size>,prec_level=<level>]

Modify meter by bundle.

message=del-meter meter=<id>

Delete meter that meter=<id>.

Port-mod

message=mod-port <port> <down/up/no-receive/receive/no-forward/forward/no-packet-in/packet-in>

Modify port state, the configure must be one of 'down/up/no-receive/receive/no-forward/forward/no-packet-in/packet-in'.

Example:

```
admin@PicOS-OVS$ovs-ofctl bundle br0 'open:bundle_id=1,add:bundle_id=1,message=mod-port te-1/1/1 no-packet-in,comm
```

Multiple bundles

User can apply multiple bundles at the same time. Each bundle has its own open/add/close/commit/discard.
Example:

```
root@PicOS-OVS$ovs-ofctl bundle br-iris "open:bundle_id=1,open:bundle_id=2,add:bundle_id=1,message=add-flow dl_src=
```

ovs-ofctl del-flows <bridge> <flow>

Delete the flow entries from the flow table of <*bridge*>. If the *[flow]* is omitted, delete all flows in <*bridge*>, otherwise, will delete the matched flows.

ovs-ofctl del-group <bridge> [group_id=<id>]

Delete group in <bridge>. If the group_id is specified, the group that <group_id> in <bridge> will delete, otherwise, all groups in <bridge> will be cleared.
Example:

```
admin@PicOS-OVS$ovs-ofctl del-groups br0 group_id=2
admin@PicOS-OVS$ovs-ofctl del-groups br0
```

ovs-ofctl del-meter <bridge> meter=<id>

Delete the meter that meter=<id> in <bridge>.

ovs-ofctl del-meters <bridge>

Delete all the meters in <bridge>.

ovs-ofctl dump-desc <bridge>

Prints <*bridge*> description, including manufacturer, hardware, software, serial number and dp description.

ovs-ofctl dump-flows <bridge> <flow>

Prints flow.entries of <bridge>. With the *[flow]* specified will only print the matching flow. If the *[flow]* is omitted, all flow entries of the bridge will be printed.

ovs-ofctl dump-ports <bridge> <port>

Prints the port statistics of <*bridge*>. If the port is specified, only the port statistics of the bridge will be printed, otherwise, will print all the ports statistics.

ovs-ofctl dump-ports-desc <bridge>

Prints port statistics. Will show detail information about the interfaces in this bridge, including the state, peer and speed information,etc. The information printed by this command is a subset of command 'ovs-ofctl show ***<bridge>'.***

ovs-ofctl dump-tables <bridge>

Prints <*bridge*> all table stats. Including all 254 tables.

ovs-ofctl dump-tables-desc <bridge>

Prints the descriptions of tables of <bridge>.

ovs-ofctl mod-flows <bridge> <flow>

Modify the actions of matching flows in the *<bridge>*.

ovs-ofctl mod-group <bridge> group_id=<id>,type=<type>,bucket=<actions>

Modify a group if the group entry with the specified group identifier already resides in the group table. If the group identifier does not exist, the group will add in group table successfully.
Example:

```
admin@PicOS-OVS$ovs-ofctl mod-group br0 group id=100,type=indirect,bucket=mod dl src=00:00:00:99:11:11,mod dl dst=00:00:00:99:22:22
```

ovs-ofctl mod-meter <bridge> meter=<id>,<meter-parameter>

Modify a meter if the meter entry with the specified meter identifier already exists.

The format is shown as follows:

ovs-ofctl mod-meter <bridge> meter=<id>,kbps[,burst,stats],band=type=<type>,rate=<rate>,burst_size=<size>,prec_level=<level>

ovs-ofctl mod−port <bridge> <iface> <action>

Modify behaviors of port *<iface>* in *switch*. *<iface>* can be an OpenFlow port number or name, or the **LOCAL** port name. The *<action>* can be as follows:

ovs-ofctl mod-port <bridge> <iface> up

ovs-ofctl mod-port <bridge> <iface> down

Enable or disable the port link status.

ovs-ofctl mod-port <bridge> <iface> receive

ovs-ofctl mod-port <bridge> <iface> no−receive

Allow or disallow this interface to receive traffic. By default, receiving is allowed.

ovs-ofctl mod-port <bridge> <iface> forward

ovs-ofctl mod-port <bridge> <iface> no−forward

Allow or disallow traffic forwarding on this interface. By default, forwarding is allowed.

ovs-ofctl mod-port <bridge> <iface> flood

ovs-ofctl mod-port <bridge> <iface> no−flood

Controls whether the interface is to flood the received traffic or not. By default, flooding is enabled. Disabling flooding is primarily useful to prevent loops when a spanning tree protocol is not in use.

ovs-ofctl mod-table <bridge> <table> <mod>

ovs-ofctl mod-table <bridge> <table> evict

Enable eviction on <table> of <bridge>. Eviction adds a mechanism enabling the switch to automatically eliminate entries of lower importance to make space for newer entries. This enables smoother degradation of behavior when the table is full.
To enable eviction on all tables, user can set the <table> as 'all'.

ovs-ofctl mod-table <bridge> <table> vacancy:<range>

Configure the vacancy <range> on <table> of <bridge>. The vacancy event adds a mechanism enabling the controller to get an early warning based on a capacity threshold chosen by the controller. This allows the controller to react in advance and avoid getting the table full. If user wants to configure vacancy range on all tables, set the <table> as 'all'.
The syntax of <range> as <low..high>.

ovs-ofctl mod-table <bridge> <table> clear

Clear the eviction or vacancy on <table> of <bridge>. If user wants to clear eviction on all tables, set the <table> as 'all'.

ovs-ofctl monitor <bridge> [MISSLEN] [invalid_ttl] [watch:[...]]

Print packets received from <bridge>.

ovs-ofctl show <bridge>

Show OpenFlow information on <*bridge*>, including OpenFlow features and port descriptions.

ovs-ofctl snoop <bridge>

ovs-ofctl snoop br0

This command snoops the bridge for open flow messages exchanged with the controller. It can be used to debug flow installations, modifications and packet_in and packet_out messages on the bridge. This command executes in a continuous loop. ^C should be used to break the display output.

```
admin@SpineA-OVS$ovs-ofctl snoop br0

ovs-ofctl replace-flows <bridge> <file>

ovs-ofctl replace-flows <bridge> <file>

Using this command, you can replace existing flows in the bridge.

Example:

```
admin@PicOS-OVS$ovs-appctl pica/dump-flows
#13 normal permanent recirc_id=0,in_port=10, actions:8,9
#12 normal_d permanent priority=0,recirc_id=0, actions:drop
Total 2 flows in HW.
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-ofctl replace-flows br0 file2.txt
admin@PicOS-OVS$ovs-appctl pica/dump-flows
#14 normal permanent recirc_id=0,in_port=8,dl_dst=22:22:22:22:22:33, actions:10
#15 normal permanent recirc_id=0,in_port=8,dl_dst=22:22:22:22:22:22, actions:9
```

ovs-ofctl diff-flows <source1> <source2>

ovs-ofctl diff-flows <source1> <source2>

Compare flows from two sources, you can also compare flows from a bridge and a source.

Example:

```
admin@PicOS-OVS$ls
file1.txt file2.txt
admin@PicOS-OVS$cat file1.txt
in_port=9,dl_vlan=10,actions=output:8
admin@PicOS-OVS$
admin@PicOS-OVS$cat file2.txt
in_port=8,dl_dst=22:22:22:22:22:22,actions=output:9
in_port=8,dl_dst=22:22:22:22:22:33,actions=output:10
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-ofctl diff-flows file2.txt file1.txt
-in_port=8,dl_dst=22:22:22:22:22:22 actions=output:9
-in_port=8,dl_dst=22:22:22:22:22:33 actions=output:10
+in_port=9,dl_vlan=10 actions=output:8
```

ovs-ofctl add-groups <bridge> <file>

ovs-ofctl add-groups <bridge> <file>

Add groups to the switch from a file.

Example:

```
admin@PicOS-OVS$cat group.txt
group_id=1,type=all,bucket=output:8
group_id=2,type=select,bucket=output:9,bucket=output:10
admin@PicOS-OVS$ovs-ofctl add-groups br0 group.txt
admin@PicOS-OVS$
admin@PicOS-OVS$
admin@PicOS-OVS$
admin@PicOS-OVS$ovs-ofctl dump-groups br0
OFPST_GROUP_DESC reply (OF1.4) (xid=0x2):
group_id=1,type=all,bucket=actions=output:8
group_id=2,type=select,bucket=actions=output:9,bucket=actions=output:10
admin@PicOS-OVS$
admin@PicOS-OVS$
```

ovs-ofctl queue-get-config <bridge> <port>

ovs-ofctl queue-get-config <bridge> <port>

Print queue information for specified port.

Example:

```
admin@PicOS-OVS$ovs-ofctl queue-get-config br0 ge-1/1/8
OFPT_QUEUE_GET_CONFIG_REPLY (OF1.4) (xid=0x4): port=8
queue 0: port=8 min_rate:1.2% max_rate:1.2%
queue 7: port=8 min_rate:1.2% max_rate:1.2%
```

ovs-ofctl meter-stats <bridge> [meter]

ovs-ofctl meter-stats <bridge> [meter]

Print meter statistics.

Example:

```
admin@PicOS-OVS$ovs-ofctl meter-stats br0
OFPST_METER reply (OF1.4) (xid=0x2):
meter:100 flow_count:0 packet_in_count:0 byte_in_count:0 duration:346.419s bands:
0: packet_count:0 byte_count:0
```

ovs-ofctl meter-features <bridge>

ovs-ofctl meter-features <bridge>

Print meter features.

Example:

```
admin@PicOS-OVS$ovs-ofctl meter-features br0
OFPST_METER_FEATURES reply (OF1.4) (xid=0x2):
max_meter:100 max_bands:1 max_color:3
band_types: drop dscp_remark
capabilities: kbps burst stats
```

ovs-ofctl dump-meters <bridge>

ovs-ofctl dump-meters <bridge>

Print all meter configurations.

ovs-ofctl dump-meter <bridge> [meter_id]

Print METER configuration of this meter_id.

ovs−vsctl Commands

The command **ovs-vsctl** is a utility for querying and configuring the Open vSwitch. The Open vSwitch configuration is kept in a database managed by the **ovsdb-server** process.The **ovs-vsctl** command connects to **ovsdb-server**, which maintains the Open vSwitch configuration database. Using this connection, **ovs-vsctl** queries and applies changes to the database, based on the supplied commands.

See **ovs-vsctl** help for more information about the utility.

```
admin@PICOS-OVS:~$ ovs-vsctl --help
ovs-vsctl: ovs-vswitchd management utility
usage: ovs-vsctl [OPTIONS] COMMAND [ARG...]

Open vSwitch commands:
  init                        initialize database, if not yet initialized
  show                        print overview of database contents
  emer-reset                  reset configuration to clean state

Bridge commands:
  add-br BRIDGE               create a new bridge named BRIDGE
  add-br BRIDGE PARENT VLAN   create new fake BRIDGE in PARENT on VLAN
  del-br BRIDGE               delete BRIDGE and all of its ports
  list-br                     print the names of all the bridges
  br-exists BRIDGE            exit 2 if BRIDGE does not exist
  br-to-vlan BRIDGE           print the VLAN which BRIDGE is on
  br-to-parent BRIDGE         print the parent of BRIDGE
  br-set-external-id BRIDGE KEY VALUE  set KEY on BRIDGE to VALUE
  br-set-external-id BRIDGE KEY  unset KEY on BRIDGE
  br-get-external-id BRIDGE KEY  print value of KEY on BRIDGE
  br-get-external-id BRIDGE  list key-value pairs on BRIDGE

Port commands (a bond is considered to be a single port):
  list-ports BRIDGE           print the names of all the ports on BRIDGE
  add-port BRIDGE PORT        add network device PORT to BRIDGE
  add-bond BRIDGE PORT IFACE...  add bonded port PORT in BRIDGE from IFACES
  del-port [BRIDGE] PORT      delete PORT (which may be bonded) from BRIDGE
  port-to-br PORT             print name of bridge that contains PORT

Interface commands (a bond consists of multiple interfaces):
  list-ifaces BRIDGE          print the names of all interfaces on BRIDGE
  iface-to-br IFACE           print name of bridge that contains IFACE

Controller commands:
  get-controller BRIDGE      print the controllers for BRIDGE
  del-controller BRIDGE      delete the controllers for BRIDGE
  set-controller BRIDGE TARGET...  set the controllers for BRIDGE
  get-fail-mode BRIDGE       print the fail-mode for BRIDGE
  del-fail-mode BRIDGE       delete the fail-mode for BRIDGE
  set-fail-mode BRIDGE MODE  set the fail-mode for BRIDGE to MODE

Manager commands:
  get-manager                print the managers
  del-manager                delete the managers
  set-manager TARGET...      set the list of managers to TARGET...

SSL commands:
  get-ssl                     print the SSL configuration
  del-ssl                     delete the SSL configuration
  set-ssl PRIV-KEY CERT CA-CERT  set the SSL configuration

Switch commands:
  emer-reset                  reset switch to known good state

Database commands:
  list TBL [REC]              list RECord (or all records) in TBL
  find TBL CONDITION...       list records satisfying CONDITION in TBL
  get TBL REC COL[:KEY]       print values of COLumns in RECord in TBL
  set TBL REC COL[:KEY]=VALUE set COLumn values in RECord in TBL
```

```
  add TBL REC COL [KEY=]VALUE add (KEY=)VALUE to COLumn in RECord in TBL
  remove TBL REC COL [KEY=]VALUE  remove (KEY=)VALUE from COLumn
  clear TBL REC COL           clear values from COLumn in RECord in TBL
  create TBL COL[:KEY]=VALUE  create and initialize new record
  destroy TBL REC             delete RECord from TBL
  wait-until TBL REC [COL[:KEY]=VALUE]  wait until condition is true
Potentially unsafe database commands require --force option.

Options:
  --db=DATABASE               connect to DATABASE
                              (default: unix:/ovs/var/run/openvswitch/db.sock)
  --no-wait                   do not wait for ovs-vswitchd to reconfigure
  --retry                     keep trying to connect to server forever
  -t, --timeout=SECS          wait at most SECS seconds for ovs-vswitchd
  --dry-run                   do not commit changes to database
  --oneline                   print exactly one line of output per command

Pica commands:
  show-running-config                           print current ovsdb config
  show-valid-port [FRONT]                       print all valid ports or one
  set-port-breakout ALL|FRONT TRUE|FALSE        use breakout cable or not
  set-port-name FRONT [1,4]=default|XXX         modify name of sub-port on FRONT
  set-match-mode MODE:OPTIONS=PRIORITY          set match-modes
  show-match-mode                               print current match-modes
  set-gtp-udp-dst-ports PORT...                 set gtp udp ports, PORT is up to 4
  show-gtp-udp-dst-ports                        show gtp udp ports
  set-match-vxlan-vni-enable TRUE|FALSE         enable or disable vxlan vni matching
  show-match-vxlan-vni                          show vxlan vni matching
  set-vxlan-udp-dst-port [1, 65535]             set vxlan udp destination port
  show-vxlan-udp-dst-port                       show vxlan udp destination port
  set-vntag-ethertype [0x6000, 0xffff]          set VN tag ethertype
  show-vntag-ethertype                          show VN tag ethertype
  set-snmp-enable TRUE|FALSE                    enable or disable snmp
  show-snmp                                     show snmp
  set-snmp-trap-targets    IPv4(s)              set snmp trap targets
  show-snmp-trap-targets                        show snmp trap targets
  set-snmp-community-name                       set snmp agent community name
  show-snmp-community-name                      show snmp agent community name
  set-cos-map TRUE|FALSE                        enable or disable cos-mapping
  show-cos-map [IFACE]                          show cos-mapping
  set-vlan-priority-cos-map TRUE|FALSE          enable or disable vlan-priority-cos-mapping
  show-vlan-priority-cos-map                    show vlan-priority-cos-mapping
  set-egress-mode TRUE|FALSE [TABLE]            set egress mode
  show-egress-mode                              show egress-mode
  set-combinated-mode TRUE|FALSE                enable or disable combinated-mode
  show-combinated-mode                          show combinated-mode
  set-l2gre-key-length                          set l2gre key length
  show-l2gre-key-length                         show l2gre key length
  set-proxy-arp TRUE|FALSE SUBNETS              set proxy arp
  show-proxy-arp                                show proxy arp
  set-proxy-icmpv6 TRUE|FALSE SUBNETS           set proxy icmpv6 for NS/NA
  show-proxy-icmpv6                             show proxy icmpv6
  set-l2-mode TRUE|FALSE [TABLE]                set l2 mode
  show-l2-mode                                  show l2 mode
  set-l3-mode TRUE|FALSE [TABLE]                set l3 mode
  show-l3-mode                                  show l3 mode
  set-l2-l3-buffer-mode [0, 5]                  set l2/l3 buffer mode(0-5)
  show-l2-l3-buffer-mode                        show l2/l3 buffer mode
  set-l2-l3-preference TRUE|FALSE               set l2/l3 flow preference
  show-l2-l3-preference                         show l2/l3 flow preference
  set-max-ecmp-ports NUM                        set l3 max ecmp ports to NUM(2~32 and a power of 2)
  show-max-ecmp-ports                           show l3 max ecmp ports
  set-lag-advance-hash-mapping-fields FIELDS    set hash fields of advance hash-mapping
  show-lag-advance-hash-mapping-fields          show hash fields of advance hash-mapping
  set-udf-mode MODE                             set udf mode, MODE's format is udfN(l2|l3,offset=OFS,length=LEN),.
                                                only up to 4 udfs(udf0,udf1,udf2,udf3) are supported
  show-udf-mode                                 show udf mode
  set-max-resilient-hash-lag-count COUNT        set lag-max-resilient-hash-lag-count.
                                                COUNT is max count of lags which,
                                                can be set to resilient hash,
```

```
                                                the valid value of COUNT is
                                                1, 2, 4, 8, 16, 32, 64.
                                                The default value is 1.
  show-max-resilient-hash-lag-count             show lag-max-resilient-hash-lag-count.
  set-macro-udf MODE                            set macro udf mode instead of offset and length, look up show udf t
  show-macro-udf                                show macro udf mode
  show-udf-field                                options for macro udf
  set-egress-mc-queue-dynamic [0,7] TRUE|FALSE  set certain queue id multicast dynamic buffer enable
  set-egress-shared-queue-ratio [0,7] [0,100]   set certain queue id shared buffer ratio
  show-egress-shared-queue-ratio                show added queue id shared buffer ratio
  set-loopback-enable TRUE|FALSE                set loopback enable or disable
  set-option-match-vlan-type TRUE|FALSE         enable or disable matching untagged pakcets
  show-option-match-vlan-type                   show vlan format enable or disable
  set-select-group-hash-fields [FIELDS]         set select-group-hash-fields
  show-select-group-hash-fields                 show current select-group-hash-fields
  set-flow-handling-mode [MODE]                 set flow-handling-mode
  show-flow-handling-mode                       show current flow-handling-mode
  set-rdbgc4 [TYPE]                             set rdbgc4
  show-rdbgc4                                   show current rdbgc4
  set-lag-members-sorted                        set lag members sorted
  show-lag-members-sorted                       show lag members sorted
  set-group-ranges [GROUPS]                     set special groups(lag-select-groups, ecmp-select-groups,
                                                ingress-mirror-groups, egress-mirror-groups) ranges
  show-group-ranges                             show current group ranges
  set-meter-ranges [METERS]                     set special meters(egress-meter) ranges
  show-meter-ranges                             show current meter ranges
  set-l3-ecmp-hash-fields FIELDS                set l3 ecmp hash fields
  show-l3-ecmp-hash-fields                      show l3 ecmp hash fields
  set-l3-egress-keep-fields [FIELDS]            set default keep fields in l3 egress interface
  show-l3-egress-keep-fields                    show default keep fields in l3 egress interface
  disable-extend-group TRUE|FALSE               disable or enable extend group for arp/mpls flows
  show-extend-group                             show extend group config
  set-symmetric-hash [LAG|ECMP] TRUE|FALSE      disable or enable symmetric hash
  show-symmetric-hash                           show symmetric hash config
  set-flow-counter-mode both|bytes|packets      set flow counter mode
  show-flow-counter-mode                        show flow counter mode
  set-ttp-enable TRUE|FALSE                     set ttp module enable or disable
  set-ttp-file FILE                             set ttp file name
  show-ttp                                      show ttp status and file name
  set-counter-interval [10,1000]                set counter interval
  show-counter-interval                         show counter interval
  display-settings                              show the configurations in OVSDB through ovs-vsctl comands

Logging options:
  -vSPEC, --verbose=SPEC   set logging levels
  -v, --verbose            set maximum verbosity level
  --log-file[=FILE]        enable logging to specified FILE
                           (default: /ovs/var/log/openvswitch/ovs-vsctl.log)
  --syslog-target=HOST:PORT  also send syslog msgs to HOST:PORT via UDP
  --no-syslog              equivalent to --verbose=vsctl:syslog:warn

Active database connection methods:
  tcp:IP:PORT              PORT at remote IP
  ssl:IP:PORT              SSL PORT at remote IP
  unix:FILE                Unix domain socket named FILE
Passive database connection methods:
  ptcp:PORT[:IP]           listen to TCP PORT on IP
  pssl:PORT[:IP]           listen for SSL on PORT on IP
  punix:FILE               listen on Unix domain socket FILE
PKI configuration (required to use SSL):
  -p, --private-key=FILE   file with private key
  -c, --certificate=FILE   file with certificate for private key
  -C, --ca-cert=FILE       file with peer CA certificate

Other options:
  -h, --help                  display this help message
  -V, --version               display version information
admin@PICOS-OVS:~$
```

See ovs-vsctl main page for detailed syntax and additional information.

```
admin@Switch$man ovs-vsctl
ovs-vsctl(8)                                  Open vSwitch Manual                                  ovs-vs
NAME
       ovs-vsctl - utility for querying and configuring ovs-vswitchd
SYNOPSIS
       ovs-vsctl [options] -- [options] command [args] [-- [options] command [args]]...
DESCRIPTION
       The  ovs-vsctl  program  configures ovs-vswitchd(8) by providing a high-level interface to its configuratio
       base.  See ovs-vswitchd.conf.db(5) for comprehensive documentation of the database schema.
       ovs-vsctl connects to an ovsdb-server process that maintains an Open vSwitch configuration database.   Usin
       connection, it queries and possibly applies changes to the database, depending on the supplied commands.  Th
       it applied any changes, by default it waits until ovs-vswitchd has finished reconfiguring itself before it
       (If you use ovs-vsctl when ovs-vswitchd is not running, use --no-wait.)
       ovs-vsctl  can  perform any number of commands in a single run, implemented as a single atomic transaction a
       the database.
       The ovs-vsctl command line begins with global options (see OPTIONS below for details).   The  global  optio
       followed by one or more commands.  Each command should begin with -- by itself as a command-line argument, t
       arate it from the following commands.  (The -- before the first command is optional.)  The command  itself
       with  command-specific  options,  if  any, followed by the command name and any arguments.  See EXAMPLES bel
       syntax examples.
   Linux VLAN Bridging Compatibility
       The ovs-vsctl program supports the model of a bridge implemented by Open vSwitch, in which a  single  bridge
       ports  ports  on  multiple  VLANs.   In  this model, each port on a bridge is either a trunk port that poter
       passes packets tagged with 802.1Q headers that designate VLANs or it is assigned a single implicit  VLAN  th
       never tagged with an 802.1Q header.
       For  compatibility  with  software designed for the Linux bridge, ovs-vsctl also supports a model in which t
       associated with a given 802.1Q VLAN is segregated into a separate bridge.  A special form of  the  add-br  c
       (see below) creates a ``fake bridge'' within an Open vSwitch bridge to simulate this behavior.  When such a
       bridge'' is active, ovs-vsctl will treat it much like a bridge separate from its ``parent bridge,'' but the
       implementation in Open vSwitch uses only a single bridge, with ports on the fake bridge assigned the implici
       of the fake bridge of which they are members.  (A fake bridge for VLAN 0 receives packets that have no 802.1
       or a tag with VLAN 0.)
<Some output omitted>
```

- Bridge Commands
  - ovs-vsctl add-br
  - ovs-vsctl del-br
  - ovs-vsctl list-br
  - ovs-vsctl set bridge
- Port Commands
  - ovs-vsctl add-port
  - ovs-vsctl list-ports
  - ovs-vsctl del-port
- Controller commands
- Database commands
- Interface commands
- Mirror Commands
- NetFlow Commands
- Open vSwitch commands
- Match-mode Command
- QoS_queue Commands
- sFlow commands
- Cos-map Command
- Egress-mode Command
- Set-flow-counter-mode Command
- Combinated-mode Command
- DSCP Commands

Bridge Commands

These commands are used to create and configure Open vSwitch bridges. Commands for displaying the status of OpenvSwitch bridges are also provided.

- ovs-vsctl add-br
- ovs-vsctl del-br
- ovs-vsctl list-br
- ovs-vsctl set bridge

ovs-vsctl add-br

To create a new bridge, use the **ovs-vsctl add-br** command. The new bridge initially has no ports, other than the bridge itself.

Syntax

ovs-vsctl [*options*] [**--may-exist**] **add-br** *bridge*

Parameters

options	See the output of **ovs-vsctl --help** command, also reproduced ovs−vsctl Commands.
--may-exist	Without the **--may-exist** option, attempting to create bridge that already exists creates an error. With the **--may-exist** option, the command does nothing if the bridge already exists as a real bridge.
bridge	Arbitrary bridge name.

Examples

The following example creates a new bridge named **br0**:

```
admin@Switch$ovs-vsctl --may-exist add-br br0
```

ovs-vsctl del-br

To delete a bridge and all of its ports, use the **ovs-vsctl del-br** command. If the bridge is real, this command also deletes any fake bridges that were created with the bridge as parent, and all of their ports.

Syntax

ovs-vsctl [*options*] [**--if-exists**] **del-br** *bridge*

Parameters

options	See the output of **ovs-vsctl --help** command, also reproduced ovs−vsctl Commands.
--if-exist	Without the **--if-exists** option, attempting to delete a bridge that does not exist creates an error. With the **--if-exists** option, attempting to delete a bridge that does not exist has no effect.
bridge	Name of the bridge to be deleted.

Examples

The following example deletes the bridge named **br0**:

```
admin@Switch$ovs-vsctl --if-exists del-br br0
```

ovs-vsctl list-br

To list all existing real and fake bridges, use the **ovs-vsctl list-br** command.

Syntax

ovs-vsctl [*options*] [**--real** | **--fake**] **list-br**

Parameters

options	See the output of **ovs-vsctl --help** command, also reproduced ovs−vsctl Commands.
--real	List only real bridges.
--fake	List only fake bridges.

Examples

The following example lists bridges, where only a single real bridge **br0** exists:

```
admin@Switch$ovs-vsctl list-br
br0
admin@Switch$ovs-vsctl --fake list-br
admin@Switch$ovs-vsctl --real list-br
br0
```

ovs-vsctl set bridge

Examples

The following examples provide typical usage of the **ovs-vsctl set bridge** command.

Disabling In-Band Management

By default, remote in-band management is enabled on Open vSwitch. You can disable in-band management by setting the **other-config** parameter **disable-in-band** to **true**. And the configurations will apply in all the controllers in the bridge.

The following example disables in-band management of bridge *br0*:

```
admin@Switch$ovs-vsctl set bridge br0 other-config:disable-in-band=true
```

The following example enables in-band management of bridge *br0*:

```
admin@Switch$ovs-vsctl set bridge br0 other-config:disable-in-band=false
```

Port Commands

ovs-vsctl *[--OPTION]* add-port *<bridge> <port> [ARG...] [--[OPTION] <COMMAND> [ARGs]]*

Add a new port named *<port>* to *<bridge>*. Including physic port, LAG port and GRE tunnel.

Physical Port

Example:

Add a physical port.

```
ovs-vsctl add-port br0 ge-1/1/1 vlan_mode=trunk tag=1 trunks=2000,4094 -- set interface ge-1/1/1 type=pica8
```

Add a physical port and configure special link_speed.

```
ovs-vsctl add-port br0 te-1/1/49 vlan_mode=trunk tag=1 trunks=2000,4094 -- set interface te-1/1/49  type=pica8 opt
```

Crossflow Port

Example:

When adding a crossflow port the vlan_mode and the trunks should be set via CLI.

```
ovs-vsctl add-port br0 te-1/1/1 -- set interface te-1/1/1 type=crossflow
```

LAG Port

Example:

Add a lag interface:

```
root@PicOS-OVS#ovs-vsctl add-port br0 ae1 vlan_mode=trunk tag=1 trunks=2000,4094 -- set Interface ae1 type=pica8_la
root@PicOS-OVS#ovs-vsctl set Interface ae1 options:lag_type=static
```

Modify the numbers of the lag

```
root@PicOS-OVS#ovs-vsctl set Interface ae1 options:members=ge-1/1/2,ge-1/1/3
```

LACP Port

Example:

Add a lacp port and configure the parameter.

```
root@PicOS-OVS#ovs-vsctl add-port br0 ae1 vlan_mode=trunk tag=1 trunks=2000,4094 -- set Interface ae1 type=pica8_la
root@PicOS-OVS#ovs-vsctl set Interface ae1 options:lag_type=lacp
root@PicOS-OVS#ovs-vsctl set Interface ae1 options:members=ge-1/1/2,ge-1/1/3
root@PicOS-OVS#ovs-vsctl set Interface ae1 options:lacp-system-id=00:11:11:11:11:11
root@PicOS-OVS#ovs-vsctl set Interface ae1 options:lacp-system-priority=32768
root@PicOS-OVS#ovs-vsctl set Interface ae1 options:lacp-time=fast
root@PicOS-OVS#ovs-vsctl set Interface ae1 options:lacp-time=slow
root@PicOS-OVS#ovs-vsctl set Interface ae1 options:lacp-mode=active
root@PicOS-OVS#ovs-vsctl set Interface ae1 options:lacp-mode=passive
root@PicOS-OVS#ovs-vsctl set Interface ge-1/1/2 options:lacp-port-id=2
root@PicOS-OVS#ovs-vsctl set Interface ge-1/1/2 options:lacp-port-priority=32768
root@PicOS-OVS#ovs-vsctl set Interface ge-1/1/2 options:lacp-aggregation-key=0
```

GRE Port

Example:

Add a GRE port.

```
ovs-vsctl add-port br0 gre1 -- set Interface gre1 type=pica8_gre options:remote_ip=10.10.61.10 options:local_ip=10
```

ovs-vsctl *[--OPTION]* list-ports *<bridge>*

Print the names of all the ports on *<bridge>*.

Example:

```
ovs-vsctl list-ports br0
```

ovs-vsctl *[--OPTION]* del-port *<bridge>* *<port>*

Delete the port named *<port>* from *<bridge>*.

Example:

```
ovs-vsctl del-port br1 ge-1/1/1
```

ovs-vsctl *[--OPTION]* port-to-br *<port>*

Print name of the bridge which contrains the special *<port>*.

Example:

```
ovs-vsctl port-to-br ge-1/1/1
```

VXLAN Port

Example:

Add a VXLAN port.

```
admin@PicOS-OVS$ovs-vsctl add-port br0 vxlan1 -- set interface vxlan1 type=pica8_vxlan options:remote_ip=10.10.10.
```

L2GRE Port

Example:

Add a L2GRE port.

```
admin@PicOS-OVS$ovs-vsctl add-port br0 l2gre1 -- set interface l2gre1 type=pica8_l2gre options:remote_ip=10.10.61.
```

- ovs-vsctl add-port
- ovs-vsctl list-ports
- ovs-vsctl del-port

ovs-vsctl add-port

To create a new port on the bridge from the network device of the same name, use the **ovs-vsctl add-port** command.

Syntax

ovs-vsctl [*options*] [**--may-exist**] **add-port** *bridge port* [*args*]

Parameters

options	See the output of **ovs-vsctl --help** command, also reproduced here.
--may-exist	Without the **--may-exist** option, attempting to create a port that exists is an error. With the **--may-exist** option, this command does nothing if the port already exists in the bridge and is not a bonded port.
bridge	Bridge name.
port	Port name.
args	Optional arguments configure additional parameters for the port. For example, tag=9 would make the port an access port for VLAN 9. The syntax is the same as that for the **ovs-vsctl set port** command.

Examples

The following example adds the ge-1/1/1 port to bridge br0:

```
admin@Switch$ovs-vsctl add-port br0 ge-1/1/1
```

Add Bond Ports

PicOS support bond multiple ports as in_port or output, and this virtual port will not influnce each physical port forwarding packets.

Examples

Bonding port ge-1/1/1 ~ ge-1/1/4 as one port.

```
// add ports
ovs-vsctl add-br br0 -- set bridge br0 datapath_type=pica8
ovs-vsctl add-port br0 ge-1/1/1 vlan_mode=trunk tag=1 -- set Interface ge-1/1/1 type=pica8
ovs-vsctl add-port br0 ge-1/1/2 vlan_mode=trunk tag=1 -- set Interface ge-1/1/2 type=pica8
ovs-vsctl add-port br0 ge-1/1/3 vlan_mode=trunk tag=1 -- set Interface ge-1/1/3 type=pica8
ovs-vsctl add-port br0 ge-1/1/4 vlan_mode=trunk tag=1 -- set Interface ge-1/1/4 type=pica8

// add bond ports
ovs-vsctl add-port br0 bond1 -- set Interface bond1 type=pica8_bond
ovs-vsctl set Interface bond1 options:members=ge-1/1/2,ge-1/1/3,ge-1/1/4

// add flows
ovs-ofctl add-flow br0 in_port=2049,actions=1
ovs-ofctl add-flow br0 in_port=1,actions=2049
```

ovs-vsctl list-ports

To list all of the ports within a bridge, use the **ovs-vsctl list-ports** command. The local bridge port is not included in the list.

Syntax

ovs-vsctl [*options*] **list-ports** *bridge*

Parameters

options	See the output of **ovs-vsctl --help** command, also reproduced here.
bridge	Bridge name.

Examples

The following example lists ports within the bridge **br0**:

```
admin@Switch$ovs-vsctl list-ports br0
```

ovs-vsctl del-port

To create a new port on the bridge from the network device of the same name, use the **ovs-vsctl add-port** command.

Syntax

ovs-vsctl [*options*] [**--may-exist**] **del-port** *bridge port*

Parameters

options	See the output of **ovs-vsctl --help** command, also reproduced ovs−vsctl Commands.
--may-exist	Without the **--may-exist** option, attempting to create a port that exists is an error. With the **--may-exist** option, this command does nothing if the port already exists in the bridge and is not a bonded port.
bridge	Bridge name.
port	Port name.

Examples

The following example deletes the ge-1/1/1 port to bridge br0:

```
admin@Switch$ovs-vsctl del-port br0 ge-1/1/1
```

Controller commands

ovs-vsctl *[--OPTION]* set-controller <*bridge*> <*target*> *[target]*

Set the controllers for <*bridge*>. Support set multiple controllers at same time.
The bridge is typically configured to connect to multiple controllers. The controllers may select a primary controller that takes change of the flow tables of the bridge to inplement a network policy.
The <target> can use any of the following forms:

ovs-vsctl *[--OPTION]* set-controller <*bridge*> tcp:<*ip*>:<*port*>

Connect to controller with tcp port, the default value is 6633.
Example:

```
root@PicOS-OVS$ovs-vsctl set-controller br0 tcp:10.10.50.47:6633
```

ovs-vsctl *[--OPTION]* set-controller <*bridge*> ssl:<*ip*>:<*port*>

Connect to controller with specified SSL port, the default value is 6633.
Example:

```
root@PicOS-OVS$ovs-vsctl set-controller br0 ssl:10.10.50.100:6633
```

ovs-vsctl *[--OPTION]* get-controller <*bridge*>

Print the controllers for <*bridge*>.
Example:

```
ovs-vsctl get-controller br0
```

ovs-vsctl *[--OPTION]* del-controller <*bridge*>

Delete the controllers for <*bridge*>.
Example:

```
ovs-vsctl del-controller br0
```

ovs-vsctl *[--OPTION]* set-fail-mode <*bridge*> <*mode*>

Set the fail-mode for <*bridge*> to <*mode*>.
The <*mode*> used in control flow table when controller failure setting. Support **standalone** and **secure** modes, the default mode is **secure** mode.
If set the mode is standalone, ovs-vswitchd will take over responsibility for setting up flows when connect to controller fail, and all flows in bridge will clear and there is a flow named "normal" to let the switch work as a L2 switch ; If fail-mode set to secure, ovs-vswitchd will not set up flows nor clear all flows. In secure mode, the packet is dropped default, in other word, there is no flow named "normal" to let switch work as a L2 switch
Example:

```
ovs-vsctl set-fail-mode br0 standalone
```

ovs-vsctl *[--OPTION]* get-fail-mode <*bridge*>

Print the fail-mode for <*bridge*>. If not set the fail-mode, will print nothing.
Example:

```
ovs-vsctl get-fail-mode br0
```

ovs-vsctl *[--OPTION]* del-fail-mode <*bridge*>

Delete the fail-mode for <*bridge*>. After delete current mode will return the default mode standalone.
Example:

```
ovs-vsctl del-fail-mode br0
```

Database commands

Database commands create, list and modify the contents of ovsdb tables.PicOS OVS support the following tables, as:

Bridge table

Configure a bridge within an Open vSwitch. Record bridge configurations by _uuid in bridge tables.

Controller table

Configure an OpenFlow controller, record controller infos by _uuid in controller table.

Interface table

Configure a network device attached to a port, record interface configurations by _uuid in interface table.

Mirror table

Configure a mirror port to a bridge, record mirror configurations by _uuid in mirror table.

Open_vSwitch table

The global configurations for ovs-vswitchd, record configurations by _uuid.

Pica8 table

Pica_match_mode table

Port table

Configure bridge ports, record port configurations by _uuid in port table.

QoS table

Configure quality-of-service for a port, record QoS configurations by _uuid in QoS table.

Queue table

Configure one queue within a QoS, record by _uuid in queue table.

SSL table

sFlow table

Configure an sFlow exporter attached to a bridge, record by _uuid in sFlow table.

NetFlow table

Configure a NetFlow attached to a bridge, records by _uuid in NetFlow table.

ovs-vsctl *[--OPTION]* list *<table> [record]*

List the *[record]* record if special *[record]*, otherwise, list all records in *<table>*.
The *[record]* mean _uuid or special name
Examples:

```
admin@XorPlus$ovs-vsctl list port te-1/1/1
_uuid               : e16c6743-999e-49af-8c0a-bc27eb897924

```

ovs-vsctl *[--OPTION]* find *<table> <condition> [condition…]*

List records satisfying *<condition>* in *<table>*.
The *<condition>* represent a column equels value or not. If the value is specified, the operations can be support: "=", "!=", "<", ">", "<=", ">=", "\{=\}", "\{!=\}", "{<}", "{>}", "{<=}" and "{>=}".
Example:

```
ovs-vsctl find bridge datapath_id=5e3e089e01616580 name=br0
```

ovs-vsctl *[--OPTION]* get *<table> <record > <column> [:key]*

Print values of column in *<record>* in *<table>*. *<table>* mean table name, and *<record>* mean _uuid.
Example:(print the value of datapath_id in the _uuid=80984dfb-5f63-45c8-bd3f-6bda918ffc75 in bridge table.)

```
ovs-vsctl get bridge 80984dfb-5f63-45c8-bd3f-6bda918ffc75 datapath_id
```

ovs-vsctl *[--OPTION]* set *<table> <record > <column> [:key] <=value>*

Set or change the column values in *<record>* in *<table>*.
Example: (change the value of trunks in ge-1/1/2 in port table.)

```
root@PicOS-OVS$ovs-vsctl list port ge-1/1/2
```

```
_uuid : 6e7b862a-6503-4f1b-982d-b33b65e3dc01

other_config : {}
qos : []
statistics : {}
status : {}
tag : 1
trunks : [100, 200]
vlan_mode : trunk
```

ovs-vsctl *[--OPTION]* destroy *<table> <record>*

Deletes<record> from <table>.

ovs-vsctl *[--OPTION]* add *<table> <record > <column> [key=] <value>*

Add the column values in *<record>* in *<table>.*
Example: (add the value of trunks in ge-1/1/2 in port table.)

```
root@PicOS-OVS$ovs-vsctl get port ge-1/1/2 trunks
[100, 200]
root@PicOS-OVS$
root@PicOS-OVS$ovs-vsctl add port ge-1/1/2 trunks 100,300
root@PicOS-OVS$ovs-vsctl get port ge-1/1/2 trunks
[100, 200, 300]
```

ovs-vsctl *[--OPTION]* remove *<table> <record > <column> [key=] <value>*

Remove the column value in *<record>* in *<table>.*
Example: (remove the value of trunks in ge-1/1/2 in port table.)

```
root@PicOS-OVS$ovs-vsctl get port ge-1/1/2 trunks
[100, 200, 300]
root@PicOS-OVS$ovs-vsctl remove port ge-1/1/2 trunks trunks 100
root@PicOS-OVS$
root@PicOS-OVS$ovs-vsctl get port ge-1/1/2 trunks
[200, 300]
```

ovs-vsctl *[--OPTION]* clear *<table> <record > <column>*

Clear all values from column in <record> in <table>.
Example:
Clear all values of trunks in ge-1/1/2 in port table.

```
root@PicOS-OVS$ovs-vsctl get port ge-1/1/2 trunks
[200, 300]
root@PicOS-OVS$ovs-vsctl clear port ge-1/1/2 trunks
[]
root@PicOS-OVS$
```

Interface commands

ovs-vsctl *[--OPTION]* list-ifaces *<bridge>*

Print the names of all interfaces on *<bridge>*.
Example:

```
ovs-vsctl list-ifaces br0
```

ovs-vsctl *[--OPTION]* iface-to-br *<interface>*

Print the name of bridge that contains *<port>*.
Example:

```
ovs-vsctl iface-to-br ge-1/1/1
```

Mirror Commands

Chips mirror actions:

PRONTO3290 PRONTO3296 PRONTO3295(TR2)(egress mirror=true)
PRONTO3780 PRONTO3920 PRONTO3922 PRONTO3930 PRONTO3960 PRONTO3965 PRONTO3980 PRONTO3920 PRONTO3924(TD)

ES4654 AS4610_54P AS4610_54T AS4610_30P AS4610_30T(Helix4)(egress mirror=true)
PRONTO5101 PRONTO5401 AS6701_32X N2632XL N2948_6XL AS6712_32X AS5712_54X S4048 ARCTICA4806XP(TD2)

AS5812_54T AS5812_54X(TD2P)
DCS7032Q28 AS7712_32X Z9100 (TH)

Note：Egress mirror works correctly only on those switches that the parameter 'egress mirror' is true.According to above chips,3290（Firebolt3),3296(Triumph2),helix4 support egress mirror.On other switches,the mirror port' traffics' action are not certain.

Below is the test result on some kinds of chips:

p3290(Firebolt3):

module name	**mirror dst traffic test result**
multitable	pass
udf/ttp multicast	pass
push mpls/pop mpls	failed(3290 do not support mpls)
egress mode	pass
flow control	pass
l2mpls	failed(3290 do not support mpls)

p3297(trumph2):

module name	**mirror dst traffic test result**
multitable	pass
ttp multicast	pass
udf/push mpls/pop mpls	pass
egress mode	pass
flow control	mirror test pass
l2mpls	pass

as5812_54t(trident2plus):

module name	**mirror dst traffic test result**
multitable	pass
ttp multicast	failed
udf/push mpls/pop mpls	pass
egress mode	pass
flow control	mirror test pass
l2mpls	failed(mirror port packets has one more vlan 4095)
vxlan/l2gre/NAT	pass

p6701(trident2):

module name	**mirror dst traffic test result**
multitable	pass
ttp multicast	failed
udf/push mpls/pop mpls	pass

egress mode	pass
flow control	pass
l2mpls/nat	pass

vxlan/l2gre	failed

p3920(trident+):

module name	mirror dst traffic test result
multitable	pass
ttp multicast	failed
udf/push mpls/pop mpls	pass
egress mode	pass
flow control	pass
l2mpls	pass

4610_54t_b(helix4):

module name	mirror dst traffic test result
multitable	pass
ttp multicast /udf	pass
push mpls/pop mpls	failed(4610 do not support mpls)
egress mode	pass
flow control	pass
l2mpls	failed(4610 do not support l2mpls)

as7712_32x(tomhark):

module name	mirror dst traffic test result
multitable	pass
ttp multicast	failed
pop mpls/udf	failed(do not support mpls)
egress mode	pass
flow control /l2mpls/nat/push mpls(ip packets)	pass
vxlan/l2gre	failed

Create One Mirror

ovs-vsctl [--OPTION] -- set bridge <bridge> mirrors=@m -- --id=@<port1> get Port <port1> -- --id=@<port2> get Port <port2> [-- --id=@<port3> get Port <port3>]-- --id=@m create Mirror name=<mirror-name> select-src-port=@<port1>[,@<port3>] select-dst-port=@<port1>[,@<port3>] output-port=@<port2>

PicOS OVS supports mirroring, **select-src-port** and **select-dst-port** represent the source ports of mirroring, **select-dst-port** means some packets (in switch chip) will go-out from the specified port (egress); **select-src-port** means some packets will enter the specified port (ingress); **output_port** means the monitor port. PicOS OVS supports up to 4 mirrors.

Before PicOS2.10 ovs only support configure physical port as output_port, from PicOS2.10 ovs also support lag interface as output_port.

Example1:
Add port ge-1/1/1, ge-1/1/2 and ge-1/1/3 to mirror, ge-1/1/1 and ge-1/1/2 as ingress and egress, the output port is ge-1/1/3.

```
root@PicOS-OVS$ovs-vsctl set bridge br0 mirrors=@m -- --id=@ge-1/1/1 get Port ge-1/1/1 -- --id=@ge-1/1/2 get Port g
```

Example2:
Add port ge-1/1/1, ge-1/1/2 and ae1 to mirror, ge-1/1/1 and ge-1/1/2 as ingress and egress, the output port is ae1.

```
root@PicOS-OVS$ovs-vsctl set bridge br0 mirrors=@m -- --id=@ge-1/1/1 get Port ge-1/1/1 -- --id=@ge-1/1/2 get Port g
```

ovs-vsctl *[--OPTION]* destroy *<table> <record>* – clear Bridge *<bridge>* mirrors

Example:

Delete a mirror named mymirror from mirror table in bridge br0.

```
admin@PicOS-OVS$ ovs-vsctl destroy Mirror mymirror -- clear Bridge br0 mirrors
or
admin@PicOS-OVS$ ovs-vsctl clear Bridge br0 mirrors
```

Create Two Mirrors

```
admin@PicOS-OVS$ovs-vsctl  -- set bridge br-s mirrors=@m,@m1 -- --id=@ge-1/1/1 get Port ge-1/1/1 -- --id=@ge-1/1/3
```

Add one mirror and monitor port is lag

```
admin@PicOS-OVS$ovs-vsctl -- add bridge br-s mirrors @m -- --id=@te-1/1/1 get Port te-1/1/1 -- --id=@te-1/1/2 get P
```

Delete one mirror

```
admin@PicOS-OVS$ovs-vsctl remove bridge br0 mirrors 76fd4479-67e9-4c65-8edb-b99d8706d8f9
```

NetFlow Commands

---

ovs-vsctl set Bridge <*bridge*> netflow=@nf -- --id=@nf create NetFlow targets=<*target*> active-timeout=<*timeout*>

Example:

```
admin@PicOS-OVS$ovs-vsctl set Bridge br0 netflow=@nf -- --id=@nf create NetFlow targets=\"10.10.50.207:5566\" activ
In the above CLI, the parametersare shown as following:
COLLECTOR_IP=10.10.50.207
COLLECTOR_PORT=5566
ACTIVE_TIMEOUT=30
```

ovs-vsctl – clear Bridge <*bridge*> netflow

Delete NetFlow from NetFlow table.

Example:
Clear NetFlow from NetFlow table in bridge br0.

```
admin@PicOS-OVS$ovs-vsctl -- clear Bridge br0 netflow
```

Open vSwitch commands

ovs-vsctl init (the command is not effect)

To initialize the Open vSwitch database if not yet initialized. If the database has already been initialized, the init command will have no effect.

ovs-vsctl show

Print a brief overview of database contents.

ovs-vsctl emer-reset

Reset the configurarion to clean state. Using this command can delete fail mode, OpenFLow controllers, port mirrors, NetFlow, sFlow, and IPFIX configuration.

Match-mode Command

ovs-vsctl *[--OPTION]* set-match-mode *<mode:options=priority> [mode:options=priority]*

By default, 2 TCAM entries are used to support all matching tuples for all flows, even if the flow does not use all matching tuples. To optimize the TCAM usage, PicOS-2.1 allows user to configure the switch in short flow TCAM match mode, in which, each flow will only consume 1 TCAM entry. To use this feature, the flow must use the exact fields described below and cannot mix fields from various modes:

When this mode is enabled (with the set-match-mode command), only specific fields can be used in the priority range defined by the command.

From PicOS2.9.0,add a new group(ipv4_quintuple group) for tomahawk platform besides the normal match mode groups supported by other platforms.

The flows must use the exact fields described below:

mac mode: "in_port,dl_src,dl_dst,dl_vlan,dl_type"

ip mode: "in_port,nw_proto,nw_src,nw_dst,tp_src,tp_dst,dl_type=0x0800"

arp_tpa mode: "in_port, arp_tpa, dl_type=0x0806"

ipv6_full mode: "in_port,dl_vlan,ipv6_src,ipv6_dst,tp_src,tp_dst,nw_proto,dl_type=0x86dd"

ipv6_src mode: "in_port,dl_src,dl_dst,dl_vlan,ipv6_src,nw_proto,dl_type=0x86dd"

ipv6_dst mode: "in_port,dl_src,dl_dst,dl_vlan,ipv6_dst,nw_proto,dl_type=0x86dd"

ipv4_quintuple: "in_port,dl_vlan,nw_src,nw_dst,tp_src,tp_dst,nw_proto,dl_type=0x0800"

For example, if mac mode is enabled, all the flows must only use one or more fields defined in the mac mode. If mac and ip modes are enabled, then you can configure either mac flows or ip flows based on the fields described above. However, you cannot mix the fields from mac and ip (that is, dl_src and nw_src)

Each mode is configured with a priority range that determines the flow priority. The flow priority must be specified when user configures the flow through ovs commands or controller. If user does not want match-mode, configure match-mode as default. The default value is default.

Example:

Configure match-mode mac priority from 200 to 499; ip priority 500-999; arp_tpa priority 1000-2000.

```
root@PicOS-OVS$ovs-vsctl set-match-mode mac=10-1000,ip=2000-20000,arp_tpa=30000-40000,ipv6_full=50000-50001,ipv6_ds
```

Remove match-mode configuration.

```
root@PicOS-OVS$ ovs-vsctl set-match-mode [default]
```

ovs-vsctl show-match-mode

Print current match-mode.

Example:

```
admin@PicOS-OVS$ovs-vsctl show-match-modecurrent match modes:
 ipv4_quintuple:
   priorities={60001-65535}
   fields={in_port,dl_vlan,nw_src,nw_dst,tp_src,tp_dst,nw_proto,dl_type=0x0800}
 ipv6_src:
   priorities={50004-60000}
   fields={in_port,dl_src,dl_dst,dl_vlan,ipv6_src,nw_proto,dl_type=0x86dd}
 ipv6_dst:
   priorities={50002-50003}
   fields={in_port,dl_src,dl_dst,dl_vlan,ipv6_dst,nw_proto,dl_type=0x86dd}
 ipv6_full:
   priorities={50000-50001}
   fields={in_port,dl_vlan,ipv6_src,ipv6_dst,tp_src,tp_dst,nw_proto,dl_type=0x86dd}
 arp_tpa(both):
   priorities={30000-40000}
   fields={in_port,arp_tpa,dl_type=0x0806}
 mac:
   priorities={10-1000}
   fields={in_port,dl_src,dl_dst,dl_vlan,dl_type}
 ip:
   priorities={2000-20000}
   fields={in_port,nw_proto,nw_src,nw_dst,tp_src,tp_dst,dl_type=0x0800}
```

QoS_queue Commands

ovs-vsctl [--OPTION] -- set port <port> qos=@newqos -- --id=@newqos create qos type=PRONTO_STRICT queues:<queueid>=@newqueue [queues:<queueid>=@newqueue1] -- --id=@newqueue create queue other-config:min-rate=<minrate> other-config:max-rate=<maxrate> [-- --id=@newqueue1 create queue other-config:min-rate=<minrate> other-config:max-rate=<maxrate>]

Queue 0~7 represent priority 0~7, respectively.

Example:
Configure qos contain two queues: queue 0 and queue 7. And min and max rate of queue 0 and queue 7 is set as 10M.

```
admin@PicOS-OVS$ovs-vsctl set port ge-1/1/3 qos=@newqos -- --id=@newqos create qos type=PRONTO_STRICT queues:0=@nev
```

ovs-vsctl *[--OPTION]* clear port <*port*> qos

Delete QoS applied <*port*>.

Example:
Clear QoS and queues applied port ge-1/1/3 from Qos table and queue table.

```
admin@PicOS-OVS$ovs-vsctl clear port ge-1/1/3 qos
admin@PicOS-OVS$ovs-vsctl --all destroy qos
admin@PicOS-OVS$ovs-vsctl --all destroy queue
```

sFlow commands

ovs-vsctl -- --id=@s create sFlow agent=*<agent>* target=*<target>[,<target>,...]* header=*<header>* samping=*<samping>* polling=*<polling>* -- set Bridge *<bridge>* sflow=@s

PicOS OVS supports sFlow v5.
Example:

```
admin@PicOS-OVS$ovs-vsctl -- --id=@s create sFlow agent=eth0 target=\"10.10.50.207:9901\" header=128 sampling=2000
In the above CLI, the parameters are shown as following:
COLLECTOR_IP=10.10.50.207
COLLECTOR_PORT=9901
AGENT_IP=eth0
HEADER_BYTES=128
SAMPLING_N=64
POLLING_SECS=10
```

ovs-vsctl – clear Bridge *<bridge>* sflow

Delete sFlow from sFlow table.
Example:
Clear sFlow from sFlow table in bridge br0.

```
admin@PicOS-OVS$ovs-vsctl -- clear Bridge br0 sflow
```

Troubleshoot the configuration

```
admin@5712$ovs-vsctl list sflow
_uuid               : 3362a543-4a1a-47db-898a-0ec0eddb7aa0
agent               : "eth0"
external_ids        : {}
header              : 128
polling             : 30
sampling            : 2000
targets             : ["172.16.0.173:8008"]
```

Cos-map Command

ovs-vsctl set-cos-map <*TRUE|FALSE*>

From Picos-2.6, user can enable/disable the cos-mapping, the default value is disabled. Once cos-mapping is enabled, the packet with the different cos value is mapped to queue0-7.
Usage:

```
Enable/Disable:
 ovs-vsctl set-cos-map true
 ovs-vsctl set-cos-map false

Set dscp map on port:
 ovs-vsctl set interface ge-1/1/1 dscp_map=0=q1,1=q1,2=q2
 equal to:
 ovs-vsctl set interface ge-1/1/1 dscp_map:0=q1 dscp_map:1=q1 dscp_map:2=q2

 Note:
  dscp range is [0, 63];
  queue range value is {q0, q1, q2, q3, q4, q5, q6, q7};
  if a dscp value is not configured, the default queue is q0.

Clear all dscp map on port:
 ovs-vsctl clear interface ge-1/1/1 dscp_map

 Note:
 if no dscp_map configuration, the default map is:

       dscp   queue
    --------  -----
     0 -  7:   q0
     8 - 15:   q1
    16 - 23:   q2
    24 - 31:   q3
    32 - 39:   q4
    40 - 47:   q5
    48 - 55:   q6
    56 - 63:   q7
```

ovs-vsctl show-cos-map

Display the configuration of cos-mapping.
Example:

```
admin@PicOS-OVS$ovs-vsctl show-cos-map
cos mapping: enabled

admin@PicOS-OVS$ovs-vsctl show-cos-map ge-1/1/1
cos mapping: enabled
{
       dscp   queue
    --------  -----
     0 -  7:   q0
     8 - 15:   q1
    16 - 23:   q2
    24 - 31:   q3
    32 - 39:   q4
    40 - 47:   q5
    48 - 55:   q6
    56 - 63:   q7
}
```

Egress-mode Command

ovs-vsctl enable-egress-mode <*TRUE|FALSE*> *[TABLE]*

Enable or disable egress-mode.

If not specified the [TABLE], use table 253 to support another 256 flow, the action of flow should be drop or mod_nw_tos.

eg. The valid table is from 1 to 253, except the table 250, it is used by udf-mode.

> ⚠ egress-mode cannot be configured on the table which has configured L2/L3 mode.

Enable egress-mode on default table or specify table:

```
ovs-vsctl set-egress-mode TRUE
ovs-vsctl set-egress-mode TRUE 251
```

Add flow in egress-mode table:

```
ovs-ofctl add-flow br0 table=253,in_port=1,actions=drop
ovs-ofctl add-flow br0 table=253,dl_type=0x0800,nw_dst=192.168.1.3,actions=mod_nw_tos:16
```

ovs-vsctl show-egress-mode

Show the current configuration of egress-mode.

Set-flow-counter-mode Command

ovs-vsctl set-flow-counter-mode <bytes|packets|both>

Set the flow counter type.

Example:

```
admin@PicOS-OVS$ovs-vsctl set-flow-counter-mode bytes

  Please reboot for the change to take effect!

admin@PicOS-OVS$sudo systemctl restart picos
...............
admin@PicOS-OVS$ovs-ofctl add-meter br0 meter=1,kbps,band=type=drop,rate=50000

admin@PicOS-OVS$
```

Combinated-mode Command

ovs-vsctl set-combinated-mode <*TRUE|FALSE*>

Enable combinated mode to deal with VCAP/ICAP flow conflict, only half of TCAM flow number can be used.

ovs-vsctl show-combinated-mode

Show whether combinated-mode is enabled or not.

DSCP Commands

DSCP (Differentiated Services Code Point) is a field in the header of an IP packet that is used to provide QoS (Quality of Service). You can mark each packet with a DSCP code and assign to it the corresponding level of service. PicOS 2.6 enables users to map a specific DSCP value to an interface queue. If you do not configure DSCP mappings, PicOS 2.6 uses the following defaults:

DSCP Values	Queue
0-7	q0
8-15	q1
16-23	q2
24-31	q3
32-39	q4
40-47	q5
48-55	q6

The following command is used to enable or disable DSCP mapping:

ovs-vsctl set-cos-map <**true** | **false**>

By default, DSCP mapping is disabled in PicOS 2.6. Once DSCP mapping is enabled, packets with different DSCP values are placed in different queues (q0-q7).

The following example enables DSCP mapping:

ovs-vsctl set-cos-map true

The following example disables DSCP mapping:

ovs-vsctl set-cos-map false

The default DSCP map for interface **ge-1/1/1** can be modified as shown below:

ovs-vsctl set interface ge-1/1/1 dscp_map=0=q1,1=q1,2=q2

An alternative method would be to use the following command:

ovs-vsctl set interface ge-1/1/1 dscp_map:0=q1, dscp_map:1=q1 dscp_map:2=q2

DSCP values range from 0 to 63. The available queues are q0, q1, q2, q3, q4, q5, q6, and q7. If a DSCP value is not configured, the default queue is q0. Incoming packets with any DSCP values will be treated the same.

Use the following command to clear the DSCP map of an interface:

ovs-vsctl clear interface ge-1/1/1 dscp_map

Use the following command to set the DSCP map of an interface:

ovs-vsctl set interface ge-1/1/1 dscp_map=0=q1,1=q1,2=q2

or

ovs-vsctl set interface ge-1/1/1 dscp_map:0=q1 dscp_map:1=q1 dscp_map:2=q2

You may use the following commands to show the DSCP map:

ovs-vsctl show-cos-map
ovs-vsctl show-cos-map ge-1/1/1

L2/L3 Troubleshooting Guide

This guide describes how to identify and resolve common problems related to the Pica8 PicOS software used on supported switches.

- Monitoring and Debugging L2/L3 protocols
- Routing and Forwarding Table
- Using Pipe (|) Filter Functions
- Using the show tech-support Command

Monitoring and Debugging L2/L3 protocols

Find and Configure the Log File

By default, the syslog local-file is ram. The log file name is "message" which is in the directory "/tmp/log"

```
admin@XorPlus$cd /tmp/log
admin@XorPlus$ls
lastlog lighttpd messages wtmp
```

You can use "tail -f /tmp/log/messages" to display the log messages.

You can set the syslog local-file location to disk. The log file name is "messages" which is in the directory of "/var/log"

```
admin@XorPlus# set system syslog local-file disk
admin@XorPlus# commit
Commit OK.
Save done.
admin@XorPlus#
admin@XorPlus$cd /var/log/
admin@XorPlus$ls
apt dmesg fsck last_death lastlog messages news ntpstats wtmp
admin@XorPlus$
```

You can use "tail -f /var/log/messages" to show the log messages.

Enable Important Debugs

Enable debug interface：

```

Find the Core Dump File

When the device crashes, it will create a core file which can be found in a directory called *pica/core*.

```
admin@R2:/pica/core$ pwd
/pica/core
```

Find the last_death file for Troubleshooting

You can view the last_death file after the device crashes. It will record the last log message and is located in /var/log directory.

```
admin@R2:/pica/core$ cd /var/log/
admin@R2:/var/log$ ls
btmp   faillog  fsck        lastlog   messages  report_diag.log
dmesg  frr      last death  lighttpd  private   wtmp
```

Routing and Forwarding Table

Check the Software and Hardware Route Tables

To display the hardware *host* route table, use the **show route forward-host ipv4 all** command in L2/L3 operation mode.

```
admin@Switch> show route forward-host ipv4 all
Address HWaddress Port
--------------- ----------------- ---------
10.10.3.2 48:6E:73:02:03:DA ge-1/1/48
Total host count:1
```

To display the hardware route table, use the **show route forward-route ipv4 all** command in L2/L3 operation mode.

```
admin@Switch> show route forward-route ipv4 all
Destination          NextHopMac          Port
---------------      -----------------   ---------
10.10.3.0/24         48:6E:73:02:04:64   connected
101.101.101.0/24     48:6E:73:02:03:DA   ge-1/1/48
102.102.102.0/24     48:6E:73:02:03:DA   ge-1/1/48
Total route count:4
```

To display the software route table, use the **show route ipv4** command in L2/L3 operation mode.

```
admin@Switch> show route ipv4
```

If PicOS is running in OVS mode, check the software and hardware flow tables.

Using Pipe (|) Filter Functions

Pipe (|) Filter Functions

This topic describes the pipe (|) filter functions supported in the Pica8 PicOS L2/L3 CLI (command-line interface). The PicOS L2/L3 mode has a growing number of CLI commands that users can use to troubleshoot common problems. These commands usually generate a lot of output. The use of pipe (|) filter functions increases readability of command output, making troubleshooting more effective.

The following filter functions are available with the PicOS L2/L3:

Function	Description
compare	Compare configuration changes with a prior version
count	Count occurrences
display	Display additional configuration information
except	Show only the lines of output that do not contain a pattern
find	Show output starting from the first occurrence of a pattern
match	Show only the lines of output that contain a pattern
no-more	Disable pagination of command output

Comparing Configurations

The **compare** filter compares the current committed configuration with a previously committed configuration.

```
admin@XorPlus# show | compare rollback nn
```

nn is the index into the list of previously committed configurations, also known as the rollback number. The range of values for **nn** is 01-48.

For example:

```
admin@XorPlus# show | compare rollback 03
```

Counting the Number of Output Lines

To count the number of lines in the output of a command, enter **count** after the pipe symbol (|).

The following example uses **count** with the **show** command in configuration mode to display the number of non-default configuration lines:

```
admin@XorPlus# show | count
Count: 11 lines
```

Displaying Output that Matches a Pattern

To display only the lines of output that match a pattern, enter **match** after the pipe symbol (|).

The following example displays the status of only TbE (terabit Ethernet) interfaces:

```
admin@XorPlus> show interface brief | match te-
te-1/1/1    Enabled     Down    Disabled      Full    Auto
te-1/1/2    Enabled     Down    Disabled      Full    Auto
te-1/1/3    Enabled     Down    Disabled      Full    Auto
te-1/1/4    Enabled     Down    Disabled      Full    Auto
te-1/1/5    Enabled     Down    Disabled      Full    Auto
te-1/1/6    Enabled     Down    Disabled      Full    Auto
te-1/1/7    Enabled     Down    Disabled      Full    Auto
te-1/1/8    Enabled     Down    Disabled      Full    Auto
te-1/1/9    Enabled     Down    Disabled      Full    Auto
te-1/1/10   Enabled     Down    Disabled      Full    Auto
<Some output omitted>
```

Omitting Output that Matches a Pattern

To omit lines from the output of a command that make up a pattern, enter **except** after the pipe symbol (|).

The following example uses **except** with the **show interface brief** command in the operation mode to list the interfaces that are *not* down:

```
admin@XorPlus> show interface brief | except Down
```

Preventing Output from Being Paginated

By default, if the output of a command is longer than the length of terminal screen, user will see the **--More--** message to display the remaining output. Press the space bar to display the remaining output.

User can disable pagination by entering **no-more** after the pipe symbol (|).

The following example displays the output of **show** command, executed in PicOS L2/L3 configuration mode, all at once:

```
admin@XorPlus# show | no-more
```

This feature is useful, for example, when user wants to copy the entire output of a command and paste it into an e-mail to be sent to technical support.

Using the show tech-support Command

Show Tech-Support Command

When contacting Pica8 for technical support, issue the command **show tech-support** because it captures the complete status of a PicOS switch. It is recommended to send the output of **show tech-support** command along with the system log. The following samples describe how to obtain the output.

Log in to the switch and enter the **cli** command at the Linux shell to reach the PicOS L2/L3 operation mode.

```
admin@Leaf-1$cli
Synchronizing configuration...OK.
Pica8 PicOS Version 2.6
Welcome to PicOS L2/L3 on Leaf-1
admin@Leaf-1>
```

Enter the **show tech-support** command.

```
admin@Leaf-1> show tech_support
Start......

Process BCM commands, total count=47

The information has been stored in /tmp/Leaf-1-201507050614-techSupport.log, please forward to support@pica8.com
```

The last line of the output of **show tech-support** command provides the name and location of the file to which the output was saved. In the above example, the name of the file is *Leaf-1-201507050614-techSupport.log* that has been saved to the */tmp* directory.

You can transfer the file, generated by **show tech-support** command, from the switch to your computer over SCP (Secure Copy Protocol). There is a nice free Windows utility called WinSCP, available for download at https://winscp.net/eng/download.php, which you can use to copy the file from the switch to your computer over SCP.

PICOS OVS Troubleshooting

This section details basic procedures to troubleshoot PicOS switches in OVS (Open vSwitch) mode.

Verifying PicOS Mode

Verify if PicOS is actually running in OVS (Open vSwitch) mode, as described in Checking PicOS Mode.

When PicOS is running in the OVS mode, two processes should be running: **ovsdb-server** and **ovs-vswitchd**.

```
admin@XorPlus$ps -ef | grep ovs
root      1356     1  0 Jan26 ?        00:00:10 /ovs/sbin/ovsdb-server /ovs/ovs-vswitchd.conf.db --pidfile --remote
root      1358     1  0 Jan26 ?        00:19:07 /ovs/sbin/ovs-vswitchd --enable-shared-lcmgr
```

In CrossFlow mode, the router stack must have been initialized in addition to having **ovsdb-server** and **ovs-vswitchd** processes running.

```
admin@XorPlus$ps -ef | grep pica
root     12430     1  0 Jan07 ?        00:05:49 pica_cardmgr
root     12432     1  0 Jan07 ?        01:03:19 pica_sif
root     12439     1  0 Jan07 ?        00:08:45 pica_lacp
root     12441     1 19 Jan07 ?        4-10:50:14 pica_lcmgr
root     12447     1  0 Jan07 ?        00:09:58 pica_login
root     13218     1  0 Jan07 ?        00:20:47 pica_mstp
root     13236     1  0 Jan07 ?        01:25:30 /pica/bin/xorp_rtrmgr -d -L local0.info -P /var/run/xorp_rtrmgr.pi
```

Verifying Bridge Configuration

For the bridge and ports to forward frames in hardware, the **datapath_type** configured for each entity must be set to **pica8**.

```
admin@PicOS-OVS$ovs-vsctl show
ac9e5b1e-4234-4158-9214-5660b9343779
  Bridge east
      Controller "tcp:172.16.0.142:6653"
          is_connected: true
      fail_mode: standalone
      Port "ae1"
          tag: 1
          Interface "ae1"
              type: "pica8_lag"
              options: {lacp-mode=active, lacp-system-priority="32768", lacp-time=slow, lag_type=lacp, link_speed=a
      Port "te-1/1/2"
          tag: 1
          Interface "te-1/1/2"
              type: "pica8"
              options: {flow_ctl=none, link_speed=auto}
      Port "te-1/1/1"
          tag: 1
          Interface "te-1/1/1"
              type: "pica8"
              options: {flow_ctl=none, link_speed=auto}

admin@PicOS-OVS$ovs-ofctl show east
OFPT_FEATURES_REPLY (OF1.4) (xid=0x2): dpid:1deb0ae61be44040
n_tables:254, n_buffers:256

OFPT_GET_CONFIG_REPLY (OF1.4) (xid=0x6): frags=normal miss_send_len=0
admin@PicOS-OVS$
```

Once the ports are configured and verified, flows can be managed in OVS.

Checking Flow Discrepancies

Check **ovs-vswitchd** flow discrepancies between the control plane and hardware:

```
admin@PicOS-OVS$ovs-ofctl dump-tables br0 | grep -v active=0:
  0: active=4, lookup=n/a, matched=n/a

admin@PicOS-OVS$ovs-ofctl dump-flows br0
OFPST_FLOW reply (OF1.4) (xid=0x2):
 cookie=0x0, duration=1449.903s, table=0, n_packets=n/a, n_bytes=0, in_port=1,dl_src=00:00:3d:a6:c8:f2 actions=outp
 cookie=0x0, duration=1444.537s, table=0, n_packets=n/a, n_bytes=0, in_port=1,dl_src=00:00:3d:a6:c9:14 actions=outp
 cookie=0x0, duration=71723.842s, table=0, n_packets=n/a, n_bytes=0, mpls,in_port=1,dl_vlan=1,mpls_label=10 actions
 cookie=0x0, duration=74839.581s, table=0, n_packets=n/a, n_bytes=923443200, in_port=1 actions=output:2
```

Display hardware flows as shown below:

```
admin@PicOS-OVS$ovs-appctl pica/dump-flows
#24 normal permanent priority=32769,in_port=1,dl_src=00:00:3d:a6:c8:f2, actions:2
#23 normal permanent priority=32769,in_port=1,dl_src=00:00:3d:a6:c9:14, actions:1
#22 normal permanent priority=32769,mpls,in_port=1,dl_vlan=1,mpls_label=10, actions:3
#21 normal permanent priority=32769,in_port=1, actions:2
#20 normal permanent priority=0, actions:drop
Total 5 flows in HW.
```

Displaying OVSDB

Display the full OVSDB (Open vSwitch Database) as shown below:

```
admin@Leaf1$ovsdb-client dump
Bridge table
_uuid                                controller                                datapath_id        datapath_type extern
------------------------------------ ----------------------------------------- ------------------ ------------- ------
c880536a-b614-41bf-9870-2d0bdab3664f [bedb4af7-2125-4346-8c89-bf61bd21f63b] "4c3e486e730203da" "pica8"       {}
<Some output omitted>
```

Debug Packet-In Messages

To debug the protocol messages between the switch and the controller, use the **ovs-ofctl snoop** command in the OVS mode. The following commands debug the protocol messages exchanged between the **br0** bridge and the controller:

```
admin@Switch$ovs-ofctl snoop br0
```

Debug while switch port cannot up

Issue 1, During add port error.

```
admin@PicOS-OVS$ovs-vsctl add-port br0 te-1/1/49 vlan_mode=trunk tag=1 -- set i
nterface te-1/1/49 type=pica8
ovs-vsctl: Error detected while setting up 'te-1/1/49'.  See ovs-vswitchd log for details.
admin@PicOS-OVS$
```

Please check license installed or not.

```
admin@PicOS-OVS$license -s
```

If no license installed, please install license first; If license has installed but the port also add error, please check the port whether is valid in the switch.

```
admin@PicOS-OVS$ovs-appctl pica/show
```

Issue 2, Port cannot up.

```
admin@PicOS-OVS$ovs-ofctl show br0
OFPT_FEATURES_REPLY (OF1.4) (xid=0x2):
dpid:0x5e3e047d7b6293ff(6790870225108767743)

     supported:  1GB-FD 10GB-FD FIBER AUTO_NEG
     speed: 0 Mbps now, 10000 Mbps max
```

1, Please verify the connection, make sure the connect is correct.

2, Use CLI check module plugin or not.

```
admin@PicOS-OVS$ovs-invctl enable-sfp true
admin@PicOS-OVS$ovs-invctl show-sfp-qsfp
```

3, If there is no module informations about the port, please repeat plugin module to check log messages.

```
admin@PicOS-OVS$ovs-appctl vlog/set hwlog
admin@PicOS-OVS$ovs-appctl hwlog/set-type config true
admin@PicOS-OVS$ovs-appctl hwlog/set-level all debug

Jan  5 2017 14:32:41 XorPlus daemon.warning : 14:32:41.220|ovs|00009|pica private|WARN|SFP te-1/1/1 is plugged in, optical module t
```

4, If there is no log message as above. This is bug, please contract us.

5, If there have log message, and can read module use cammand 'ovs-invctl show-sfp-qsfp'. But port still cannot up, this also one bug, please contract us.

```
ec869713-92af-406e-abb4-f60efdec59f3
  port_name: "te-1/1/1"
  vendor_name: OEM
  vendor_sn: "A85351050280"

PICOS System Troubleshooting

User can troubleshoot by checking system logs and PIcOS works mode.

- Reset the Switch to Factory Default
- Automating Ping to Multiple Hosts
- Troubleshooting Switch Crashes
- CPU/Memory Rate Limit
- High CPU Utilization
- Backup Partition for PicOS
- SSH Server Preparation
- Linux_configure.py script
- Provision.py script
- How to Disable Weak SSH Cipher/ MAC Algorithms in PICOS

Check log using two methods as follows:

> **NOTE:**
> Users should not put their other files in the /tmp directory, because the space size limit of the /tmp directory is 50M, once exceeded, it will lead to unpredictable system errors.

System logs are stored in two locations:

```
/var/log/messages
```

This directory is stored in Flash.

and

```
/tmp/log/messages
```

This directory is stored in RAM.

Switches use flash memory that has a limited number of lifetime write operations. Hence, it is important that logs are not written continuously to the flash memory. This would dramatically impact the lifetime of the flash memory.

This is why most of the log information is written by default on the /tmp directory.

```
admin@XorPlus$df
Filesystem     1K-blocks   Used Available Use% Mounted on
rootfs           6202636 900184   4987368  16% /
/dev/root        6202636 900184   4987368  16% /
tmpfs             207348     28    207320   1% /run
tmpfs               5120      0      5120   0% /run/lock
tmpfs             414680      0    414680   0% /run/shm
tmpfs              51200     36     51164   1% /tmp
```

The "/tmp" directory is mounted on "tmpfs" which is a filesystem mounted in RAM.

The tmp logs are moved to /var/log when dramatic events occur like system crash or system reboot.

Checking PicOS works mode as follows:

In L2/L3 Mode (Or XORP), only the XORP system is running.

```
admin@PicOS-OVS$ps aux | grep ovs | grep -v grep
admin@PicOS-OVS$
admin@XorPlus$ps aux | grep xorp | grep -v grep
root 16383 0.0 1.2 18100 6596 ? S Jan29 5:26 xorp_policy
root 16385 0.3 2.5 34980 13380 ? Ss Jan29 99:20 /pica/bin/xorp_rtrmgr -d -L local0.info -P /var/run/xorp_rtrmgr.pi
```

In OVS Mode, only the OVS daemon is running.

```
admin@PicOS-OVS$ps aux | grep xorp | grep -v grep
admin@PicOS-OVS$
admin@PicOS-OVS$ps aux | grep ovs | grep -v grep
root 1984 0.0 0.1 6696 2524 ? S Nov13 0:10 ovsdb-server /ovs/ovs-vswitchd.conf.db --pidfile --remote=ptcp:6640:10.
```

```
root 1989 25.6 1.5 113256 32392 ? Sl Nov13 1393:50 ovs-vswitchd --pidfile=ovs-vswitchd.pid --overwrite-pidfile
```

Reset the Switch to Factory Default

Occasionally, it could be useful to reset the equipment to factory default (to erase all configurations or tools on the equipment).

This can be done using the Upgrade command and an image of PicOS, for details about the usage of Upgrade command, please see Upgrading PICOS from Version 4.0.0 or Later Using Upgrade Command.

Here is an example:

```
admin@XorPlus$sudo upgrade picos-2.4-P3295-13912.tar.gz factory-default
```

Automating Ping to Multiple Hosts

PicOS switches support **ping**, which may be used to test connectivity to remote IP addresses. Users often want to test connectivity to all subnets in their network. This can be accomplished manually by pinging IP addresses in all subnets one-by-one, but that method is error-prone and tedious.

This section describes how to write a simple re-usable script to ping a number of IP addresses at once. This script is especially useful when troubleshooting connectivity in a network, and user needs to ping a number of IP addresses again and again for verification.

User can create the script once and use it again and again from the PicOS L2/L3 operation mode.

This requires a text editor to create the script and save it as a file on user's PicOS switch. PicOS includes the **vi** text editor, which can be run from the Linux shell on user's PicOS switch. We choose to call our script **pingAll.sh** though user may choose any other name. The **.sh** file extension is not mandatory, though we recommend using it to make it obvious to anyone that the file is a shell script.

```
admin@Leaf-1$vi pingAll.sh
```

Inside the **vi** editor, press **i** to be able to insert text. Paste the following lines of text (after modifying them for user's network):

```
ip[0]='192.168.42.2'
ip[1]='192.168.42.4'
ip[2]='192.168.42.5'
ip[3]='192.168.42.9'
ip[4]='192.168.42.20'
ip[5]='192.168.42.40'
ip[6]='192.168.42.60'
ip[7]='192.168.42.100'
ip[8]='192.168.42.110'
ip[9]='192.168.42.120'
ip[10]='192.168.42.130'
ip[11]='192.168.42.240'
ip[12]='192.168.42.22'

for ((i=0; i <=12; i++))
do
   ping -c 3 ${ip[$i]}
done
```

Press **Esc** and then enter **:wq** to save the file and exit the **vi** editor.

Some information about the script follows. The **ip[]** array has thirteen elements (**ip[0]** – **ip[12]**) and each element holds an IP address. User can change both the IP addresses and the number of array elements. The script will send three ping requests to each IP address in the **ip[]** array, one by one. If user is familiar with shell scripting or programming in C-like languages, the script should be self-descriptive. Even if user is an absolute beginner to programming and scripting, user should be able to modify and use the script after some research.

List the contents of user's home directory.

```
admin@Leaf-1$ls
pingAll.sh
```

Make the new file **pingAll.sh** executable.

```
admin@Leaf-1$chmod +x pingAll.sh
```

Enter the PicOS L2/L3 operation mode.

```
admin@Leaf-1$cli
Synchronizing configuration...OK.
Pica8 PicOS Version 2.6
Welcome to PicOS L2/L3 on Leaf-1
admin@Leaf-1>
```

Run the script from PicOS L2/L3 operation mode.

```
admin@Leaf-1> bash /home/admin/pingAll.sh
PING 192.168.42.2 (192.168.42.2) 56(84) bytes of data.

rtt min/avg/max/mdev = 1.812/3.876/6.594/2.006 ms

<Some output omitted>
```

Troubleshooting Switch Crashes

The PicOS switch may restart after detecting an unrecoverable error. This situation is usually referred to as a *system crash*.

When the switch crashes, it will create a core file that user can use to figure out what went wrong. The core file is stored in the directory */pica/core*. Use the **file list** command in PicOS L2/L3 operation mode to display the contents of the directory.

```
admin@LEAF-A> file list /pica/core
total 0
```

The output above shows that there is no file in the /pica/core directory. The switch we used never crashed and did not create any core file.

The PicOS writes the last log messages to the */var/log/last_death* file after a system crash.

```
admin@LEAF-A> file show /var/log/last_death | count
Count: 405 lines
admin@LEAF-A> file show /var/log/last_death | match lcmgr
Jun 23 2015 04:08:56 XorPlus local0.info : [PICA_MONITOR]Process pica_lcmgr, running, PID 2823

```

CPU/Memory Rate Limit

From PicOS 2.6, we added the CPU rate limit for processes of PicOS. Including pica_lcmgr, pica_sif, and ovs-vswitchd.

Summary:

- The default CPU usage is 40% if not provided, and default memory size is 150 MB.
- The warning message will be printed if the memory size is bigger than the default value.
- The CPU limitation is based on all CPU's on the system. If the system CPU is P2020 dual cores, 40% CPU limitation is equal to 80% single CPU.

Running CPU/memory rate limit tools manually as follows:

```
sudo /pica/bin/system/tools/pica_monitor -v -c 40 -m 150 pica_lcmgr
```

Checking CPU/memory rate limit tools as follows:

```
admin@XorPlus$ps -aux | grep pica_monitor
warning: bad ps syntax, perhaps a bogus '-'?
See http://gitorious.org/procps/procps/blobs/master/Documentation/FAQ
root      3420  0.6  0.7  38944  3896 ?        S<l  Apr07   3:42 /pica/bin/system/tools/pica_monitor -c 40 -m 150 p
admin    26490  0.0  0.1   2128   688 pts/0    S+   03:26   0:00 grep --color=auto pica_monitor
admin@XorPlus$
```

High CPU Utilization

CPU (Central Processing Unit) utilization is the percentage of time the CPU spends on processing, as compared to the time it sits idle.

The Pica8 PicOS switches will start to experience problems if the CPU utilization begins to reach 75%. User doesn't have to be concerned about brief periods of high CPU utilization. However, if CPU utilization remains consistently high, user needs to investigate further.

The symptoms include:

- Poor system performance
- Switch management slower than usual
- Ping to the management interface times out
- Packet drops

Step 1

To diagnose why a PicOS switch is slow, start with the **top** command. By default, **top** runs in interactive mode and updates its output every few seconds.

```
admin@Switch$top
top - 22:02:10 up 40 days, 13:06,  1 user,  load average: 0.01, 0.02, 0.00
Tasks:  61 total,   2 running,  59 sleeping,   0 stopped,   0 zombie

    8 root      20   0     0    0    0 S   0.0  0.0   0:00.14 events/1
    9 root      20   0     0    0    0 S   0.0  0.0   0:00.07 khelper
   13 root      20   0     0    0    0 S   0.0  0.0   0:00.00 async/mgr
  134 root      20   0     0    0    0 S   0.0  0.0   0:00.02 sync_supers
  136 root      20   0     0    0    0 S   0.0  0.0   0:00.20 bdi-default
  137 root      20   0     0    0    0 S   0.0  0.0   0:00.00 kblockd/0
  138 root      20   0     0    0    0 S   0.0  0.0   0:00.00 kblockd/1
  144 root      20   0     0    0    0 S   0.0  0.0   0:00.00 ata/0
```

CPU-bound load is caused when too many processes contend for CPU resources. To check whether load is CPU-bound, check the third line of output:

```
%Cpu(s):  4.5 us,  0.5 sy,  0.0 ni, 94.5 id,  0.0 wa,  0.0 hi,  0.5 si,  0.0 st
```

Each of the percentages indicates the fraction of CPU time consumed by a category of tasks. Symbol **us** indicates the CPU usage of user processes, and **sy** indicates the CPU usage of the kernel and other system processes. CPU-bound load should result in a high percentage of either **us** (user) or **sy** (system) CPU time.

If the user or system percentage is high, the load is likely to be CPU-bound. To narrow down the root cause, look at the processes that consume the highest percentage of CPU resources. By default, **top** sorts processes based on the percentage of CPU usage, with the top consumers appearing first. Once user is armed with the knowledge of processes with the highest CPU utilization, further troubleshooting can be done.

Step 2

Check the log messages for any errors or warning for the following important PicOS modules:

PicOS L2/L3 Mode: pica_lcmgr, pica_sif, and xorp_rtrmgr

PicOS OVS Mode: ovs-vswitchd, and ovsdb-server

By default, the log file is **/tmp/log/messages**. The file may be huge with possibly several thousand lines. Examine the log file using the **cat** command, with an appropriate pipe (|) filter function:

```
admin@Switch$cat /tmp/log/messages | grep lcmgr
Aug 29 2015 01:30:57 SPINE-B local0.info : [PICA_MONITOR]Process pica_lcmgr, running, PID 12983
Aug 29 2015 01:30:57 SPINE-B local0.info : [PICA_MONITOR]Monitor for process pica_lcmgr started
Sep  1 2015 18:07:00 SPINE-B local0.warning : [PICA_MONITOR]pica_lcmgr cpu rate limit 0.80, cpu 0.81 working-rate (
```

```
Sep  3 2015 13:13:32 XorPlus local0.err : [RTRMGR]XRL Death: class lcmgr01 instance lcmgr01-87510959a54d13e97bb845
Sep  3 2015 13:14:28 XorPlus local0.info : [PICA_MONITOR]Process pica_lcmgr, running, PID 23228
Sep  3 2015 13:14:28 XorPlus local0.info : [PICA_MONITOR]Monitor for process pica_lcmgr started
Sep  7 2015 05:05:10 SPINE-B local0.warning : [PICA_MONITOR]pica_lcmgr cpu rate limit 0.80, cpu 0.80 working-rate
Sep 11 2015 05:37:12 SPINE-B daemon.notice : 05:37:12.480|ovs|00001|lcmgr_shared|INFO|XOVS got system mac (48:6e:7
Sep 11 2015 05:37:12 SPINE-B daemon.notice : 05:37:12.481|ovs|00002|lcmgr_shared|INFO|XOVS got QE port mode (0)
Sep 11 2015 05:37:12 SPINE-B daemon.notice : 05:37:12.481|ovs|00003|lcmgr_shared|INFO|XOVS got flow count limitati
Sep 11 2015 05:37:12 SPINE-B daemon.notice : 05:37:12.492|ovs|00001|lcmgr_shared(sif_handler1)|INFO|sif handler cr

<Some output omitted>
```

Step 3

Check the core dump in the */pica/core* directory.

Step 4

To display the virtual interfaces configured on the switch, use the **ifconfig** command at the Linux shell:

```
 admin@Switch$ifconfig
eth0      Link encap:Ethernet  HWaddr 48:6e:73:02:04:63
          inet addr:192.168.42.110  Bcast:192.168.42.255  Mask:255.255.255.0
          UP BROADCAST RUNNING MULTICAST  MTU:1500  Metric:1
          RX packets:2379952 errors:0 dropped:0 overruns:0 frame:0
          TX packets:1060135 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0 txqueuelen:1000
          RX bytes:354374731 (337.9 MiB)  TX bytes:152816006 (145.7 MiB)
          Base address:0x2000
lo        Link encap:Local Loopback
          inet addr:127.0.0.1  Mask:255.0.0.0
          inet6 addr: ::1/128 Scope:Host
          UP LOOPBACK RUNNING  MTU:16436  Metric:1
          RX packets:98303973 errors:0 dropped:0 overruns:0 frame:0
          TX packets:98303973 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0 txqueuelen:0
          RX bytes:860429061 (820.5 MiB)  TX bytes:860429061 (820.5 MiB)
vlan.3    Link encap:Ethernet  HWaddr 48:6e:73:02:04:64
          inet addr:10.10.3.1  Bcast:10.10.3.255  Mask:255.255.255.0
          inet6 addr: fe80::4a6e:73ff:302:464/64 Scope:Link
          UP BROADCAST RUNNING MULTICAST  MTU:1500  Metric:1
          RX packets:36973 errors:0 dropped:0 overruns:0 frame:0
          TX packets:36446 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0 txqueuelen:500
          RX bytes:2927602 (2.7 MiB)  TX bytes:2743024 (2.6 MiB)
```

Step 5

To display packets on a specific virtual interface, use the **tcpdump** command at the Linux shell:

```
admin@Switch$sudo tcpdump -i vlan.3
tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
listening on vlan.3, link-type EN10MB (Ethernet), capture size 65535 bytes
```

To debug the protocol messages between the switch and the controller, use the **ovs-ofctl snoop** command in the OVS mode. The following commands debug the protocol messages exchanged between the **br0** bridge and the controller:

```
admin@Switch$ovs-ofctl snoop br0
```

Common Causes

In the CrossFlow mode, both L2/L3 and OVS processes are running. The switch has to process both OVS protocol messages and the L2/L3 packets like BPDUs, OSPF packets, and BGP packets. The switch is likely to have a higher CPU utilization in the CrossFlow mode compared with the L2/L3 or OVS modes.

Normally, the CPU-bound packets are less than 1000 pps (packets per second), and the CPU utilization is not high. However, the **eth0** management interface has no rate limiting configured. Therefore, an attacker can send a large number of packets to the management interface, making the switch slow and even unusable for legitimate traffic.

Possible Fixes

User can deploy the following fixes for high CPU utilization:

1. Add a default drop flow for table-miss packets, to prevent these packet from causing high CPU utilization.
2. Remove some flows with actions: *Controller*, *LOCAL*
3. Make sure that the controller is not sending exessive OpenFlow messages to the switch.
4. Configure the management interface **eth0** at a low speed like 10 Mbps, using the **ethtool -s eth0 speed 10** command.
5. Reload the switch

Backup Partition for PicOS

Backup partition for PicOS:

PowerPc Platform:
We use backup partitions for PicOS to upgrade the system and recover PicOS. Usually users need to reserve about 400 MB for partition 2(eg:sda2). The rest of the SD card belongs to partition 1(eg：sda1). If the size of the SD card is 2 GB, partition 1 should be 1.6GB (1600M) and partition 2 is 400M.

```
Command (m for help): p
Disk /dev/sda: 8004 MB, 8004304896 bytes
247 heads, 62 sectors/track, 1020 cylinders, total 15633408 sectors
Units = sectors of 1 * 512 = 512 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
Disk identifier: 0x00000000
Device Boot Start End Blocks Id System
/dev/sda1 62 12603421 6301680 83 Linux             ------the primary partition for PicOS
/dev/sda2 12603422 15620279 1508429 83 Linux         ------the backup partition for PicOS
```

X86 platform:
There are two partitioning ways used with ONIE, GPT and MBR. With GPT partitioning, the sda1/2MB, is allocated to GRUB as BOOT PARTITION. The second partition is used by ONIE itself. The 3rd or others are free, and can be used by NOS. In this mode, the 3rd partition is allocated to PICOS GRUB, for the grub bootup config files. 4th and 5th are for PicOS and PicOS-BACKUP. When the user runs uninstall from ONIE, all partitions except 1st and 2nd are reserved, all NOS are wiped out. With MBR partitioning mode (which is not recommended), the GRUB boot codes are saved before MBR sector and first partition, the first partition is used by ONIE itself. PicOS begins from the 2nd partition for PicOS-GRUB, PicOS and PicOS-BACKUP partitions.

eg:(With MBR)

```
/dev/sda1: LABEL="ONIE-BOOT" UUID="08ae2c6a-6f14-498f-8e13-d0e7c0a567c1"
/dev/sda3: LABEL="PicOS" UUID="b2735e76-8594-41b9-87e7-d25113dc22f7"        ------the primary partition for PicOS
/dev/sda2: LABEL="PICOS-GRUB" UUID="ca79674b-70fc-4540-b9ef-c98c3afadce3"
/dev/sda4: LABEL="PICOS-BAK" UUID="92028225-403a-44d4-a40e-25e26d46373b"     ------the backup partition for PicOS
```

eg:(with GPT)

```
Disk /dev/sda: 15649200 sectors, 7.5 GiB
Logical sector size: 512 bytes
Disk identifier (GUID): 1687245E-B39A-48E5-860B-D7967A67FBE8
Partition table holds up to 128 entries
First usable sector is 34, last usable sector is 15649166
Partitions will be aligned on 1-sector boundaries
Total free space is 8547665 sectors (4.1 GiB)
Number Start (sector) End (sector) Size Code Name
1 2048 6143 2.0 MiB EF02 GRUB-BOOT
2 6144 268287 128.0 MiB 3000 ONIE-BOOT
3 268288 1244140 476.5 MiB 0700 PICOS-GRUB
4 1244141 5150390 1.9 GiB 0700 PicOS            -----the primary partition for PicOS
5 5150391 7103515 953.7 MiB 0700 PICOS-BAK       ------the backup partition for PicOS
```

SSH Server Preparation

Add the PKI files、two scripts and the PicOS image on the ssh server.

1: The directory of ssl-private-key (Our openssl connection is not ready, so you only need to create these key files on the server)

```
root@dev-1:/ssl#ls
cacert.pem  sc-cert.pem  sc-privkey.pem
```

Linux_configure.py script

This script usually starts automatically at the end of the configuration interactive shell. This script can set hostname, create accounts and update the time via ntp. You can modify or add this script to define the hostname and accounts and passwords.

```
root@dev-1:/pica8# vim linux_configure.py
 _hostname = "HostName-Test"
_accounts = {"lily":"1R.O.4HRDfvEY", "tom":"7hCft0situjJQ"}
```

> The password of the user should be created by password generator.

Provision.py script

This script usually starts automatically at the end of configuration interactive shell. It is used to download PKI files、PicOS image and linux_configure.py, and then for updating the image and running the linxu_configure.py. You should modify the scipt to define the directory of the files.

```
root@dev-1:/pica8# vim provision.py
 _server_paths = {
     "pki_sw_pri_key":"/ssl/sc-privkey.pem",
     "pki_sw_ca":"/ssl/sc-cert.pem",
     "pki_ctl_ca":"/ssl/cacert.pem",
     "ovs_upgrade_deb":"/pica8/pica-ovs-2.5-P3290-17741.deb",
      "linux_configure_script":"/pica8/linux_configure.py"
}
```

How to Disable Weak SSH Cipher/ MAC Algorithms in PICOS

Requirement

Some of the security scans may show below Server-to-Client or Client-To-server encryption algorithms as vulnerable:
arcfour
arcfour128
arcfour256

Below are some of the Message Authentication Code (MAC) algorithms:
hmac-md5
hmac-md5-96
hmac-sha1-96

> **NOTE:**
> PICOS 3.1.0 and the later version use OpenSSH(?) version is 6.7p1 and following are default Ciphers:
>
> chacha20-poly1305@openssh.com,
>
> aes128-ctr,aes192-ctr,aes256-ctr,
>
> aes128-gcm@openssh.com,aes256-gcm@openssh.com

Description

Verify weak cipher and MAC algorithms are currently used by the SSH running in PICOS switch.

Perform following three steps:

1. First check the cipher and MAC algorithms currently supported in the PICOS SSH protocol.

Check the version of SSH:

```
root@Xorplus:/etc/ssh# ssh -v

OpenSSH_6.0p1 Debian-4+deb7u2, OpenSSL 1.0.1e 11 Feb 2013
```

2. Check what cipher and MAC algorithms are currently supported.

From another Linux Server run the following to list the cipher and MAC algorithms supported by PICOS, using the following command:
nmap --script ssh2-enum-algos -sV -p 22 <IP of PICOS switch>

Example output:

```
root@AutomationServer1 html]# nmap --script ssh2-enum-algos -sV -p 22 172.16.0.191

Starting Nmap 6.40 ( http://nmap.org ) at 2019-03-14 14:13 PDT

Nmap scan report for 172.16.0.191

Host is up (0.00079s latency).

PORT   STATE SERVICE VERSION

22/tcp open  ssh     OpenSSH 6.0p1 (protocol 2.0)

| ssh2-enum-algos:

|   kex_algorithms (7)

|       ecdh-sha2-nistp256

|       ecdh-sha2-nistp384

|       ecdh-sha2-nistp521

|       diffie-hellman-group-exchange-sha256
```

```
|       diffie-hellman-group-exchange-sha1
|       diffie-hellman-group14-sha1
|       diffie-hellman-group1-sha1
|   server_host_key_algorithms (3)
|       ssh-rsa
|       ssh-dss
|       ecdsa-sha2-nistp256
|   encryption_algorithms (13)
|       aes128-ctr
|       aes192-ctr
|       aes256-ctr
|       arcfour256
|       arcfour128
|       aes128-cbc
|       3des-cbc
|       blowfish-cbc
|       cast128-cbc
|       aes192-cbc
|       aes256-cbc
|       arcfour
|       rijndael-cbc@lysator.liu.se
|   mac_algorithms (11)
|       hmac-md5
|       hmac-sha1
|       umac-64@openssh.com
|       hmac-sha2-256
|       hmac-sha2-256-96
|       hmac-sha2-512
|       hmac-sha2-512-96
|       hmac-ripemd160
|       hmac-ripemd160@openssh.com
|       hmac-sha1-96
|       hmac-md5-96
```

3. From the above output decide which cipher or MAC algorithm you want to disable. For example say you want to disable arcfour cipher algorithm.

Solution

Disable weak Cipher and MAC algorithms used by the SSH running in PICOS switch by performing the following three steps:

1. Disable the weak Cipher and MAC algorithms used by the SSH running in PICOS switch as follows:

You could disable the Ciphers using the command below:

```
# vi /etc/ssh/sshd_config

Press key 'i' to insert and copy the lines below to the end of the file (put only the cipher and MAC algorithms tha

Ciphers aes128-ctr,aes192-ctr,aes256-ctr,aes128-cbc,3des-cbc,blowfish-cbc,aes192-cbc,aes256-cbc

Macs hmac-sha1,umac-64@openssh.com,hmac-sha2-256,hmac-sha2-512
```

Save the file.

2. On the PICOS switch restart SSH with the following Linux command:

```
/etc/init.d/ssh restart
```

3. Verify whether weak Cipher and MAC algorithms are now not used by the SSH running in PICOS switch:

From another Linux Server run the following to list the cipher and MAC algorithms supported by PICOS, using the following command:
nmap --script ssh2-enum-algos -sV -p 22 <IP of PICOS switch>

You will see arcfour cipher algorithm is not used by SSH from the following output.

This would show the only the allowed cipher and MAC algorithms now.

Example output:

```
root@AutomationServer1 html]# nmap --script ssh2-enum-algos -sV -p 22 172.16.0.191

Starting Nmap 6.40 ( http://nmap.org ) at 2019-03-14 14:35 PDT

Nmap scan report for 172.16.0.191

Host is up (0.00055s latency).

PORT   STATE SERVICE VERSION

22/tcp open  ssh     OpenSSH 6.0p1 (protocol 2.0)

MSTP Configuration Example . . . 493
Rapid PVST+ Configuration . . . 503
Rapid PVST+ Configuration Example . . . 508
BPDU Tunneling Configuration . . . 511
UDLD Configuration . . . 515
LFS Configuration . . . 519
Storm Control in Ethernet Port Configuration . . . 520
Ethernet Ring Protection Switching (ERPS) . . . 521
Overview of ERPS . . . 522
Configuration Notes and Constraints of ERPS . . . 527
Configuring ERPS . . . 528
Example for Configuring ERPS (Single Ring) . . . 530
Example for Configuring ERPS (Intersection Rings) . . . 536
Loopback Detection . . . 544
Overview of Loopback Detection . . . 545
Configuring Loopback Detection . . . 547
Layer 3 Routing Configuration . . . 550
ARP Configuration . . . 553
Configuring ARP . . . 554
Dynamic ARP Inspection (DAI) . . . 555
Flushing ARP and the Neighbor Table . . . 559
Configuring IP Routing . . . 560
Static Routing Configuration . . . 562
Configuring Static Routes . . . 563
Example for Configuring IPv4 Static Routes . . . 565
VRF Configuration Guide . . . 568
Introduction to VRF . . . 569
Configuration Notes of VRF . . . 572
Configuring a User-defined VRF . . . 573
Enabling Management VRF . . . 574
Example for Configuring Basic VRF . . . 575
DHCP Configuration . . . 577
Introduction to DHCP . . . 578
Configuration Notes of DHCP . . . 582

Configuring DHCP Server (IPv4) . . . 583
Configuring DHCP Relay . . . 588
Configuring DHCP Relay (IPv4) . . . 589
Example for Configuring DHCPv6 Relay . . . 592
Example for Configuring DHCP Relay over GRE Tunnel . . . 594
Configuring DHCP Snooping . . . 597
Configuring DHCP Snooping (IPv4) . . . 598
Configuring DHCPv6 Snooping (IPv6) . . . 601
Typical Configuration Example for DHCP Relay and DHCP Snooping . . . 604
DHCPv6 Guard Configuration . . . 606
Overview of DHCPv6 Guard . . . 607
Configuring DHCPv6 Guard . . . 610
Example for Configuring DHCPv6 Guard . . . 612
RFC Lists . . . 614
Default Administrative Distance Values . . . 615
OSPF (Open Shortest Path First) . . . 616
OSPF Overview . . . 617
Basic OSPF Configuration Tasks . . . 618
Configuring OSPF Route Summarization . . . 620
Basic OSPF Configuration Example . . . 621
OSPF Area Type Configuration Example: NSSA, Stub and Standard Areas . . . 624
OSPF Stub and NSSA Areas with no-summary . . . 627
OSPF Area Range Configuration Guide . . . 628
OSPF Route Redistribution and Route Maps . . . 630
Example for Configuring OSPF with Different VRFs . . . 632
OSPFv3 Configuration Guide . . . 636
OSPF Multi-Instance Support . . . 638
OSPF GR . . . 640
ECMP (Equal-Cost Multipath Routing) Configuration . . . 648
Symmetric Hash for ECMP Configuration Example . . . 651
VRRP Configuration . . . 653
Principle of VRRP . . . 654
Configuration Notes of VRRP . . . 659
Configuring Standard VRRP . . . 660
Configuring Active-Active VRRP . . . 662
VRRP Configuration Example . . . 664
Example for Configuring Standard VRRPv3 for IPv4 . . . 665
Example for Configuring Active-Active VRRPv3 for IPv4 . . . 667
Example for Configuring Active-Active VRRPv3 for IPv6 . . . 670
IPv4/IPv6 BGP Configuration . . . 673
BGP Introduction . . . 674
BGP Regular Expressions . . . 677
Basic BGP Configuration . . . 678
Configuring BGP Security . . . 680
Configuring a BGP Route Reflector . . . 681

Configuring BGP Timers . . . 682
Configuring BGP Route Aggregation . . . 684
Configuring BGP Dynamic Neighbors . . . 685
Configuring eBGP Multihop . . . 686
Configuring Removing and Replacing Private ASNs from the AS Path . . . 687
Configuring BGP Multipath . . . 688
Configuring ebgp-requires-policy . . . 689
Enable BGP Read-only Mode . . . 690
Configuring Route Maps for Route Updates . . . 691
BGP Unnumbered . . . 692
Overview of BGP Unnumbered . . . 693
Example for Configuring Basic BGP Unnumbered . . . 694
Example for Configuring BGP Unnumbered EVPN Fabric . . . 698
Configuring BGP Attribute . . . 703
Configuring the AS_Path Attribute . . . 704
Configuring the BGP Community Attribute . . . 705
Configuring the MED Attribute . . . 706
Configuring the Next_Hop Attribute . . . 707
Configuration Examples . . . 708
Example for Configuring Basic BGP Functions . . . 709
Example for Configuring a BGP Route Reflector . . . 715
Example for Configuring BGP Load Balancing . . . 718
Routing Map Configuration . . . 723
Routing Map Introduction . . . 724
Configuring Filters . . . 725
Configuring a Community Filter . . . 726
Configuring a Large Community Filter . . . 727
Configuring an AS_Path Filter . . . 728
Configuring an Extended Community Filter . . . 729
Configuring an IP Prefix List . . . 730
Configuring a Routing Map . . . 731
Example for Filtering the Routes to Be Advertised and Receiving . . . 733
IPv6 Support . . . 737
IPv6 Neighbor Discovery Configuration . . . 739
PICOS L2/L3 Support for IPv6 . . . 741
Enable Path MTU Discovery . . . 742
IPv6 Neighbor Discovery Inspection . . . 743
Overview of ND Inspection . . . 744
Configuring ND Inspection . . . 747
Example for ND Inspection . . . 748
IPv6 Neighbor Discovery Snooping . . . 750
Overview of ND Snooping . . . 751
Operation Mechanism of ND Snooping . . . 755
Configuring ND Snooping . . . 757
Example for ND Snooping . . . 758

VRF Route Leaking Configuration . . . 760
BGP Route Leaking Configuration Example . . . 761
Static Route Leaking Example . . . 765
Bidirectional Forwarding Detection (BFD) . . . 768
Introduction of BFD . . . 769
Configuring BFD . . . 770
Configuring Static BFD . . . 771
Configuring Dynamic BFD . . . 772
Configuration Examples of BFD . . . 774
Example for Configuring Single-Hop BFD . . . 775
Example for Configuring Multi-Hop BFD . . . 777
Example for Configuring BFD for BGP . . . 780
Example for Configuring BFD for OSPF . . . 783
Example for Configuring BFD for PIM-SM . . . 786
RFC Lists for BFD . . . 788
RIP/RIPng Configuration . . . 789
RIP/RIPng Overview . . . 790
Enabling RIP/RIPng . . . 791
Configuring RIP Version . . . 792
Configuring RIP Route Redistribute . . . 793
Configuring RIPv2 Authentication . . . 796
Configuring RIP to Advertise Default Routes . . . 797
Example for Configuring Basic RIP . . . 798
Example for Configuring Basic RIPng . . . 801
RFC Lists for RIP/RIPng . . . 804
Policy-Based Routing (PBR) . . . 805
Overview of PBR . . . 806
Configuring Policy-Based Routing . . . 807
Example for Configuring Policy-Based Routing . . . 809
IPv4 Source Guard (IPSG for IPv4) . . . 811
IPv6 Source Guard (IPSG for IPv6) . . . 815
IPv6 RA Guard Configuration . . . 819
IS-IS Configuration . . . 821
IS-IS Overview . . . 822
Configuring IS-IS Basic Function . . . 824
Configuring IS-IS Authentication . . . 826
Configuring LSP Packet Attributes . . . 828
Customizing Routes for IS-IS . . . 830
Configuring IS-IS Timers . . . 832
Configuring the Interval for Sending Hello Messages . . . 833
Configuring the Hello-Multiplier for the Neighbor Holding Time . . . 834
Configuring the Interval for Sending CSNP Messages . . . 835
Configuring the Interval for Sending PSNP Messages . . . 836
Controlling IS-IS Routing Information Exchange . . . 837
Configuring IS-IS Advertising Default Routes . . . 838

Configuring IS-IS Introducing External Routes . . . 839
Adjusting SPF Calculation Time . . . 840
Configuration Examples of IS-IS . . . 841
Basic IS-IS Configuration Example . . . 842
Configuration Example of Interaction Between IS-IS and BGP . . . 846
IP Multicast Routing Configuration . . . 850
IGMP Configuration . . . 851
PIM Configuration Guide . . . 853
Introduction of PIM . . . 854
Configuring PIM-SM . . . 856
Example for Configuring PIM-SM . . . 858
Example for Configuring PIM-SSM . . . 861
Example for Configuring PIM over GRE Tunnel . . . 864
RFC List of PIM . . . 868
Example for Configuring Basic PIM-SM . . . 869
IGMP Snooping Configuration Guide . . . 872
Introduction to IGMP Snooping . . . 873
Enable Unknown Multicast Traffic Flooding with IGMP Snooping Enabled . . . 874
Configuring IGMP Snooping . . . 875
Example for Configuring Basic IGMP Snooping . . . 876
Example for Configuring IGMP Snooping with IGMP . . . 879
RFC List . . . 881
Multicast Source Discovery Protocol (MSDP) . . . 882
Introduction of MSDP . . . 883
Example for Configuring PIM-SM Inter-domain Multicast Using MSDP . . . 884
Example for Configuring Anycast RP . . . 888
RFC Lists of MSDP . . . 893
Multicast VLAN Registration (MVR) . . . 894
Overview of MVR . . . 895
Configuration Notes and Constraints of MVR . . . 897
Configuring MVR . . . 898
ACL Configuration . . . 900
Configuring Basic ACL . . . 901
Configuring Time Range . . . 904
QoS Configuration . . . 907
Weighted Random Early Detection . . . 908
WRED Overview . . . 909
WRED Configuration Tasks . . . 910
WRED Configuration Example . . . 912
QoS Principle . . . 914
SP Configuration Example . . . 915
QoS Configuration Example . . . 917
Configuring Classifier-based QoS . . . 918
Configuring ACL-based QoS . . . 920
PFC Configuration Example . . . 923

ACL-based Traffic Policer . . . 925
CoPP Configuration Guide . . . 928
Principle . . . 929
Default Settings for CoPP (N2224PX-ON/N2248X-ON/N3208PX-ON) . . . 931
CoPP Configuration . . . 939
Configuration Notes . . . 940
Configuring CoPP . . . 941
Configuration Example . . . 943
Default Settings for CoPP . . . 949
Queue-based Rate Limiting . . . 961
Interface-based Rate Limiting . . . 963
Configuring Ingress Interface-based Rate Limiting . . . 964
Configuring Egress Interface-based Rate Limiting . . . 965
WRR Configuration Example . . . 967
Buffer Management . . . 970
WFQ Configuration Example . . . 974
VXLAN Configuration . . . 977
VXLAN Base Configuration Example . . . 978
VXLAN Routing . . . 980
Cross-Subnet Packet Forwarding Process . . . 981
Example for Configuring VXLAN for Different Subnets . . . 983
VXLAN Configuration Guide . . . 987
VXLAN ECMP Configuration . . . 992
BGP EVPN Configuration Guide . . . 997
BGP EVPN Route Types . . . 998
Anycast Gateway for EVPN Distributed Networks . . . 1000
EVPN Symmetric Routing Configuration Example . . . 1004
EVPN Asymmetric Routing Example . . . 1009
EVPN With NAC Configuration Guide . . . 1014
EVPN Multihoming Configuration Guide . . . 1019
EVPN Enhancements . . . 1034
Introduction to BGP EVPN . . . 1035
Generic Routing Encapsulation Protocol (GRE) . . . 1039
Overview . . . 1040
GRE Configuration Example . . . 1042
MPLS Configuration . . . 1045
MPLS Overview . . . 1046
Configuration Restrictions and Guidlines . . . 1048
Basic MPLS LDP Configuration . . . 1049
(Optional) Configuring MPLS LDP Security . . . 1052
(Optional) Configuring MPLS LDP Timers . . . 1054
(Optional) Configuring MPLS LDP to Allocate Labels for Host Routes Only . . . 1057
(Optional) Configuring MPLS LDP PHP (Penultimate Hop Popping) . . . 1058
Example for Configuring MPLS LDP . . . 1059
RFC Lists for MPLS . . . 1063

Lossless Network Configuration . . . 1064
Lossless Network Introduction . . . 1065
Application Scenarios . . . 1067
Key Features of Lossless Network . . . 1069
Configuring Priority-based Flow Control (PFC) . . . 1070
Enabling PFC Function . . . 1071
Configuring PFC Buffer . . . 1074
Configuring PFC Watchdog . . . 1077
Configuring PFC Deadlock Prevention . . . 1082
Configuring Explicit Congestion Notification (ECN) . . . 1085
Configuring Easy ECN . . . 1089
PFC and ECN Statistical Reporting through gRPC . . . 1091
Configuring Dynamic Load Balancing . . . 1092
Typical Configuration Example of Lossless Network . . . 1095
OpenFlow in Crossflow Mode . . . 1099
Crossflow Mode Introduction . . . 1100
CrossFlow Mode Known Limitations . . . 1103
Crossflow Basic Configuration . . . 1104
Configuration Example1 in Crossflow Mode . . . 1105
Configuration Example2 in Crossflow Mode . . . 1110
Example for Configuring STM Resource Allocation . . . 1113
Multi-action in crossflow mode . . . 1115
PICOS Routing and Switching Command Reference . . . 1117
Command-Line Interface Commands . . . 1139
copy running-config startup-config . . . 1140
set cli idle-timeout . . . 1141
set cli screen-length . . . 1142
set cli terminal . . . 1143
syslog monitor . . . 1144
syslog notify . . . 1145
hwclock . . . 1146

PICOS Routing and Switching Configuration Guide

Pica8 PicOS supports Layer 2 switching protocols, including: STP, RSTP, MSTP, MAC learning, and Q-in-Q. PicOS also supports several Layer 3 protocols, including: static routing, RIPv2, OSPF, IGMP, PIM-SM, and IPv6. This guide provides instructions and examples for configuring switches and controllers. Intended for system administrators, this guide assumes a working knowledge of Layer 2 and Layer 3 protocols.

PicOS can run in 2 different modes of operation:

- **Open vSwitch (OVS) Mode:** In this mode, PicOS is dedicated and optimized for OpenFlow applications.
- **Layer 2/Layer 3 (L2/L3) Mode:** In this mode, PicOS can run switching and routing protocols, as well as OpenFlow applications.

In OVS mode, L2/L3 daemons are not running, and the system is fully dedicated to OpenFlow and OVS. In L2/L3 mode, L2/L3 daemons are running, and OVS can also be used if OpenFlow in Crossflow Mode is activated.

This chapter assumes that user is running PicOS L2/L3 mode. Please see PICOS Mode Selection to learn how to switch between L2/L3 and OVS modes.

> **Warning:**
> On FS S5810 Series and S5860 Series switches, run "copy running-config startup-config" command when set L2 / L3 CLI commands. Otherwise, the L2 / L3 configuration will be lost after PicOS reboot. For detail, please refer to Configuration Saving Guide.

PICOS Supported Features

Collection of Feature Specification of Different Platforms

Command-Line Interface

- From Linux Shell to L2/L3 Shell
- Operation Mode and Configuration Mode
- Displaying the Current Configuration
- Display Setting Configuration
- Rolling Back a Configuration
- Managing Configuration Files
- Saving and Loading Configuration Files
- Commit Confirmed
- Commit Check
- Commit Failed and Exit Discard
- Configuring a Command Alias
- Configure L2/L3 from Linux Shell
- Bash Linux Shell
- PicOS Upgrade and Configuration Change
- Set CLI
- CLI Configuration
- Configuring Multi-window Command Configuration Display on The User Terminal
- Configuration Saving Guide

System Administration

Command-Line Interface

- From Linux Shell to L2/L3 Shell
- Operation Mode and Configuration Mode
- Displaying the Current Configuration
- Display Setting Configuration
- Rolling Back a Configuration
- Managing Configuration Files
- Saving and Loading Configuration Files
- Commit Confirmed
- Commit Check
- Commit Failed and Exit Discard
- Configuring a Command Alias
- Configure L2/L3 from Linux Shell
- Bash Linux Shell
- PicOS Upgrade and Configuration Change
- Set CLI
- CLI Configuration
- Configuring Multi-window Command Configuration Display on The User Terminal
- Configuration Saving Guide

From Linux Shell to L2/L3 Shell

Once in the Linux shell, user can use the command **pica_sh** or **cli** (under /pica/bin) to launch the L2/L3 CLI (or XORP CLI).

```
admin@XorPlus$
admin@XorPlus$cli
Synchronizing configuration...OK.
Welcome to PicOS L2/L3 on XorPlus
admin@XorPlus>
```

To come back to the Linux Shell from the L2/L3 CLI (or XORP CLI), use the **exit** command.

```
admin@XorPlus> exit
admin@XorPlus$
```

PICOS go2cli Version

> **NOTE:**
> For PICOS **go2cli** version, the operation is different.

For PICOS **go2cli** version, users go to PICOS CLI prompt after log in:

```
admin@Xorplus>
```

At PICOS CLI prompt, run "**start shell sh**" to enter Linux shell.

```
admin@Xorplus> start shell sh
admin@Xorplus:~$
```

If you want to return from the Linux shell back to the CLI prompt, run "**exit**".

```
admin@Xorplus:~$ exit
exit

admin@Xorplus>
```

Operation Mode and Configuration Mode

By default, the switch's operation mode is activated when it starts up.

Welcome to PicOS L2/L3 on XorPlus

```
admin@XorPlus>
```

Activate the configuration mode by entering the configure command. Be sure to enter the configuration mode if the admin@XorPlus# prompt appears.

```
admin@XorPlus> configure
Entering configuration mode.
There are no other users in configuration mode.
admin@XorPlus#
```

Displaying the Current Configuration

In L2/L3, non-default configuration can be displayed with the **show** commands. The command **show all** displays the default value of the current configuration. Default configurations are shown in the pica_default.boot file. The command **show running-config** displays the configuration active on the system.

```
admin@XorPlus# show
vlans {
vlan-id 200 {
}
}
admin@XorPlus#
admin@XorPlus# show all
vlans {
vlan-id 200 {
description: ""
vlan-name: "default"
l3-interface: ""
}
}
```

```
admin@XorPlus> show running-config
    vlans {
        vlan-id 200 {
        }
    }
```

Display Setting Configuration

This command displays which settings the configuration has set by default and which settings need to set manually.

```
admin@XorPlus# show | display set
set interface ethernet-switching-options analyzer test input ingress ge-1/1/2
set interface ethernet-switching-options analyzer test input egress ge-1/1/2
set interface ethernet-switching-options analyzer test output "ge-1/1/3"
```

```
admin@XorPlus# show | display set
    set vlans vlan-id 11
    set vlans vlan-id 22
admin@XorPlus#
admin@XorPlus# set vlans vlan-id 33
admin@XorPlus# set vlans vlan-id 44
admin@XorPlus# set vlans vlan-id 55
admin@XorPlus# show | display set
    set vlans vlan-id 11
    set vlans vlan-id 22
>   set vlans vlan-id 33
>   set vlans vlan-id 44
>   set vlans vlan-id 55
admin@XorPlus# com
Merging the configuration.
Commit OK.
Save done.
admin@XorPlus# show | display set
    set vlans vlan-id 11
    set vlans vlan-id 22
    set vlans vlan-id 33
    set vlans vlan-id 44
    set vlans vlan-id 55
admin@XorPlus#
```

Rolling Back a Configuration

Each time a configuration in L2/L3 is commited, a rollback configuration file is created. For example, if configuration is committed five times, **pica.conf.01** through **pica.conf.05** are created. User can rollback to any of these configurations when necessary. The maximum quantity of rollback files is limited to five. The current configuration is located in ***pica.conf***.

```
admin@XorPlus# rollback 1
admin@XorPlus# Loading config file...
Config file was loaded successfully.
admin@XorPlus# commit
Merging the configuration.
Commit OK.
Save done.
admin@XorPlus#
```

Displaying the difference between the current config with destination config file

```
admin@XorPlus# show | compare rollback 2
[edit vlans]
-------------------------------------------------------------------------------------
+vlan-id 3 {
+}
admin@XorPlus#
```

The **rollback default** command completely replaces the running configuration with the default configuration file. After this command is executed, a commit is required to make the rollback to default configuration take effect.

Warning: This command should be used with caution. All the user configurations will be overridden by the default configurations.

Example,

```
admin@Xorplus# show | display set
    set system management-vrf enable true
    set system ntp vrf "mgmt-vrf"
    set system ntp server-ip 10.10.50.143
    set system syslog server-ip 10.10.50.143
    set system syslog vrf "mgmt-vrf"
    set system aaa tacacs-plus key "VzVua2V5c3RyaW5nYTJW"
    set l3-interface loopback lo address 20.1.1.1 prefix-length 32
    set l3-interface vlan-interface vlan100 address 30.1.1.1 prefix-length 24
    set vlans vlan-id 100 l3-interface "vlan100"

admin@Xorplus# rollback default
Loading config file...
Config file was loaded successfully.
admin@Xorplus# commit
Commit OK.
Save done.
admin@Xorplus# show | display set

admin@Xorplus#
```

Managing Configuration Files

Configuration files can be copied, deleted, or renamed in the system, but system files should *not* be deleted.

The L2/L3 configuration is stored in /pica/config/pica_startup.boot.

```
admin@XorPlus$
admin@XorPlus$cd /pica/config/
admin@XorPlus$ls
admin  pica.conf  pica.conf.01  pica.conf.02  pica.conf.03  pica.conf.04  pica.conf.05  pica startup.boot root
```

User can display the files of a specified directory:

```

User can change the current directory using functions like cwd or cd.

```
admin@XorPlus> file cwd
Current working directory: /tmp/home/admin
admin@XorPlus>
admin@XorPlus> file cwd /pica/config
admin@XorPlus> file cwd
Current working directory: /pica/config
admin@XorPlus>
```

Saving and Loading Configuration Files

The Pica8 PicOS provides several commands to save, load, and execute PicOS configuration files, as detailed in this document.

> The **save** command saves configuration files in the */home/admin* directory for admin user, and /home/test directory for test user. The **load** and **execute** commands look for configuration files in the same directory.

You can use the **save** command in L2/L3 configuration mode to save the running configuration to a file. The following example demonstrates how to save the running configuration to a file named *myconfig.conf*.

```
admin@Spine1# save ?
Possible completions:
  <file name>                   Save running configuration to specified file
admin@Spine1# save myconfig.conf
Save done.
```

The configuration saved earlier in a file can be loaded or applied using the **load merge** or **load override** command in L2/L3 mode.

```
admin@Spine1# load ?
Possible completions:
  merge                         Merge the loaded configuration to the current running configuration
  override                      Override the current running configuration with the loaded configuration
```

The **load override** command completely replaces the running configuration with the configuration in a file (saved earlier). The following example replaces the running configuration with the configuration in a file named *myconfig.conf*.

```
admin@Spine1# load override ?
Possible completions:
  <text>                        Local file name
  myconfig.conf                 Size: 16643, Last changed: Wed Sep  9 21:33:21 2015
admin@Spine1# load override myconfig.conf
Loading config file...
Config file was loaded successfully.
```

NOTE:

When you fail to load configuration file by using the **load override** command, you can try using **load merge** command to load the configuration file.

The **load merge** command merges the configuration in a file (saved earlier) with the running configuration. The following example merges the configuration in a file named *myconfig.conf* with the running configuration.

```
admin@Spine1# load merge ?
Possible completions:
  <text>                        Local file name
  myconfig.conf                 Size: 16643, Last changed: Wed Sep  9 21:33:21 2015
admin@Spine1# load merge myconfig.conf
Loading config file...
Config file was applied successfully.
```

Commit Confirmed

User can commit a candidate configuration before this configuration becomes permanent. By using **commit confirmed**, the system will apply the configuration with a ten minute default. After ten minutes, the system will roll back to the original configuration automatically. User can configure the roll back time in the CLI. By default, roll back time is 10 minutes.

By default, it will be automatically rolled back to the previous configuration after 600 seconds (10 minutes).

```
admin@XorPlus# set vlans vlan-id 2
admin@XorPlus# commit confirmed
Merging the configuration.
Will be automatically rolled back in 600 seconds unless confirmed by new commit.
Commit OK.
admin@XorPlus#
```

Modify the rollback confirmation time

```
admin@XorPlus# set vlans vlan-id 3
admin@XorPlus# commit confirmed 100
Merging the configuration.
Will be automatically rolled back in 100 seconds unless confirmed by new commit.
Commit OK.
admin@XorPlus#
```

Commit Check

User can check to see if the configuration is correct before this configuration becomes permanent. Use **commit check**. A result of "Commit check ok" means the configuration is correct as is. Then, user can commit the configuration to become permanent. A result of "Commit check failed" means the configuration has an error that needs to be corrected.

Commit Check one correct configuration

```
admin@XorPlus# set vlans vlan-id 4094
admin@XorPlus# commit check
Commit check OK.
admin@XorPlus#
admin@XorPlus# show all
    vlans {
>       vlan-id 4094 {
>           description: ""
>           vlan-name: "default"
>           l3-interface: ""
>       }
    }
admin@XorPlus#
admin@XorPlus# commit
Commit OK.
Save done.
admin@XorPlus#
admin@XorPlus# show all
    vlans {
        vlan-id 4094 {
            description: ""
            vlan-name: "default"
            l3-interface: ""
        }
    }
admin@XorPlus# run show vlans

    }
admin@XorPlus# commit
Invalid vlan 4096
Commit failed.
```

```
admin@XorPlus#
admin@XorPlus# exit discard
admin@XorPlus>
admin@XorPlus> configure
```

Commit Failed and Exit Discard

Switch from the configuration mode to the execution mode *without* any uncommitted configurations.

```
admin@XorPlus# exit
admin@XorPlus>
```

Use the exit discard command to enter the execution mode from the configuration mode with any uncommitted or failed committed configurations.

```
admin@XorPlus# set interface gigabit-ethernet ge-1/1/1 disable true
admin@XorPlus# exit
ERROR: There are uncommitted changes.
Use "commit" to commit the changes, or "exit discard" to discard them.
admin@XorPlus# exit discard
admin@XorPlus>
```

Configuring a Command Alias

User can configure an alias for a PicOS command. This CLI also supports multiple parameters. In other words, user can use the parameter in PicOS CLI e.g. $1,$2…., which will be used in the alias command.

```
admin@XorPlus# set alias set_vlans as "set vlans vlan-id $1"
admin@XorPlus# commit
Commit OK.
Save done.
admin@XorPlus# set_vlans 10
admin@XorPlus# commit
Commit OK.
Save done.
admin@XorPlus# set alias set_vlans_interface as " set vlans vlan-id $1 vlan-name $2"
admin@XorPlus# commit
Commit OK.
Save done.
admin@XorPlus# set_vlans_interface 20 vlan20
admin@XorPlus# commit
Commit OK.
Save done.
```

Configure L2/L3 from Linux Shell

Configure L2/L3 via Linux Shell on PicOS.

```
admin@XorPlus:~$cli -c "configure;set vlans vlan-id 100;commit"
Synchronizing configuration...OK.
Welcome to PicOS L2/L3 on XorPlus
admin@XorPlus>
Execute command: configure.
Entering configuration mode.
There are no other users in configuration mode.
admin@XorPlus#
Execute command: set vlans vlan-id 100.
admin@XorPlus#
Execute command: commit
.
The configuration has been changed by user admin
DELTAS:
    vlans {
        vlan-id 100 {
            vlan-name: "default"
        }
    }
Commit OK.
Save done.
admin@XorPlus#
admin@XorPlus:~$
```

Show the Configuration via Linux Shell

```
admin@XorPlus:~$cli -c "show vlans"
Synchronizing configuration...OK.
Welcome to PicOS L2/L3 on XorPlus
admin@XorPlus>
Execute command: show vlans
.

Bash Linux Shell

User can execute Linux commands in the PicOS CLI to display the system process, create a directory, or execute commands added by third party software.

```
admin@XorPlus# run bash "ps"
  PID TTY          TIME CMD
5289 ttyS0    00:00:00 bash
5301 ttyS0    00:00:03 pica_sh
7725 ttyS0    00:00:00 ps
admin@XorPlus# run bash "pwd"
/home/admin
admin@XorPlus>
```

If the command requires multiple parameters, quotation marks are required. Here is an example from the configuration mode used to check the system configuration file.

```
TelAviv# run bash "cat /pica/config/pica.conf"
/*XORP Configuration File, v1.0*/
/* Copyright (C) 2009-2013 Pica8, Inc.*/
/*Last commit : Fri May 9 12:43:39 2014 by admin*/
/*PicOS Version : 2.3*/
/*Version Checksum: 6b1435290092ce1b89fb98c06e20e66c*/
[...]
```

PicOS Upgrade and Configuration Change

As part of PicOS improvements, the CLI configuration structure may change between releases. Some commands or knobs may be added, removed, or modified. At the same time, a switch should be able to be upgraded without impact to a network, while still keeping the configuration intact.

A process was defined to achieve both of those goals (improved CLI with smooth upgrade).

When a command is modified in a release, the old command is marked with a "deprecated" flag.

A "deprecated" command can still be used on the next PicOS version, and, at a minimum, on all the PicOS versions published during the life time of this version (typically 9 months for a standard release).

Deprecated commands are hidden from the CLI, so a new user cannot access it without specific knowledge of the command (old commands cannot be auto-completed by tab key or shown by “?”). The old command must be fully entered manually to be used.

A warning message will be shown when a **commit** is done using a deprecated command.

Here is an example:

On PicOS 2.4, the command of “set interface management-ethernet” was deprecated and replaced by “set system management-ethernet.”
This means that both of these commands work on PicOS 2.4, and the “interface management-ethernet” will be removed in a future release (9 months after PicOS 2.4 is published).

When using "set interface management-ethernet” in CLI, user will get the following information:

Configure node "interface management-ethernet" has been deprecated in version 2.4, please use "system management-ethernet" instead.

> ⚠ Note: The prompted information will not disappear until you remove the deprecated command.

When upgrading an image from an old version to a new one with configuration save, there will be some configuration nodes that are marked as deprecated in the new version, and user will get some notice information when committing in CLI.

For example, the following example reflects what may have happened during an upgrade from 2.3 to 2.4 with configuration saved, after upgrading and removing VLAN:

```
admin@XorPlus# delete vlans vlan-id 111
Deleting:
111 {
}
OK
admin@XorPlus# commit
Commit OK.
Configure node "interface management-ethernet" has been deprecated in version 2.4, please use "system management-et
Configure node "system syslog host" has been deprecated in version 2.4, please use "system syslog server-ip" instea
Configure node "system syslog port-number" has been deprecated in version 2.4, please use "system syslog server-ip"
Configure node "system syslog port-protocol" has been deprecated in version 2.4, please use "system syslog server-i
Save done.
admin@XorPlus#
```

> ⚠ When upgrading image from an old version to a new one, with a configuration that contains deprecated nodes, the upgrade will fail. Remove the deprecated nodes on the configuration tree. Then, install upgrade again.

Set CLI

We support setting some values for CLI.

```
admin@XorPlus> set cli ?
Possible completions:
idle-timeout Set maximum idle time before login session ends
screen-length Set terminal screen length
terminal Set terminal type
admin@XorPlus> set cli screen-length ?
Possible completions:
<length> Number of lines of text that the terminal screen displays (0..10,000).
admin@XorPlus> set cli ?
Possible completions:
idle-timeout Set maximum idle time before login session ends
screen-length Set terminal screen length
terminal Set terminal type
admin@XorPlus> set cli idle-timeout 0
admin@XorPlus> set cli screen-length ?
Possible completions:
<length> Number of lines of text that the terminal screen displays (0..10,000).
admin@XorPlus> set cli screen-length 0
admin@XorPlus>
admin@XorPlus> set cli terminal ?
Possible completions:
ansi ANSI-compatible terminal
linux Linux-compatible terminal
vt100 VT100-compatible terminal
xterm Xterm window terminal
admin@XorPlus> set cli terminal
```

CLI Configuration

This chapter describes the different ways to configure PicOS and demonstrates the CLI configuration.

There are 2 CLI's used to configure PicOS:

- The Linux CLI
- The PicOS CLI

The Linux CLI is a standard debian based bash shell.

A good Bash tutorial can be found at this address:
http://www.tldp.org/LDP/Bash-Beginners-Guide/html/

PicOS added some commands to the standard Bash shell:

Version - This is to provide the PicOS version running on the switch

```
admin@XorPlus:~$ version
Copyright (C) 2009-2022 Pica8, Inc.
===================================
Hardware Model                : N3248PXE-ON
Linux System Version/Revision : 2.5/17907
Linux System Released Date    : 10/14/2021
L2/L3 Version/Revision        : 2.5/17907
L2/L3 Released Date           : 10/14/2021
OVS/OF Version/Revision       : 2.5/17907
OVS/OF Released Date          : 10/14/2021
```

cli - command to move to the PicOS command or launch PicOS CLI commands from the Linux shell.

```
admin@XorPlus$cli
Synchronizing configuration...OK.
Welcome to PicOS L2/L3 on XorPlus
admin@XorPlus>
```

In the above example, the cli command is used to move to the PicOS CLI.

```
admin@XorPlus$cli -c "show version"
Synchronizing configuration...OK.
Welcome to PicOS L2/L3 on XorPlus
admin@XorPlus>
Execute command: show version
.
Copyright (C) 2009-2022 Pica8, Inc.
===================================
Hardware Model                : N3248PXE-ON
Linux System Version/Revision : 2.5/17907
Linux System Released Date    : 10/14/2021

```

In the command above, the cli command is used to launch commands of the PicOS CLI from the Linux shell.

Configuring Multi-window Command Configuration Display on The User Terminal

Introduction

By setting the function of multi-window command configuration on the user terminal, you can control whether or not to synchronously print the configurations of the same switch from other CLI windows to the current CLI interface.

The CLI window will not synchronously print the configurations of the same switch from other CLI windows to the current CLI interface if disables the function of multi-window command configuration on the user terminal.

Here is an example:

If you open a window, for example Window A, login a switch and set **syslog notify off**, and then the CLI configurations of this switch on any other terminal window will not be displayed to Window A synchronously. But if you set **syslog notify on** on Window A, and then CLI configurations of this switch on any other terminal window will be displayed to Window A synchronously.

NOTE :

- The function is window dependent, that is, it will take effect based on CLI windows regardless of the CLI login method (Console or SSH) or the login IP of terminal or the login users.
- When the window is restarted, the configuration of multi-window command configuration display on the user terminal function will go to the default value.

Configuring Multi-window Command Configuration Display on The User Terminal

Procedure

- From the "**>**" prompt, use the following command to disable or enable the function of multi-window command configuration display on the user terminal.

  syslog notify <**on | off**>

  The default setting is **syslog notify on**.

Configuration Example

- Enable the function of multi-window command configuration display on the user terminal.

```
admin@Xorplus> syslog notify on
```

- Disable the function of multi-window command configuration display on the user terminal.

```
admin@Xorplus> syslog notify off
```

Configuration Saving Guide

Introduction

> **Warning:**
>
> On FS S5810 Series, S3410 Series and S5860 Series switches, you have to do configuration saving described below. This specific save command is requested by hardware vendor due to the Flash limitation on numbers of write/erase cycles.

FS S5810 Series, S3410 Series and S5860 Series switches use the OverlayFS file system with which the running configuration files on the switch will not be saved from the RAM to the flash automatically. Therefore, when the power is turned off, the configuration is lost.

You need to manually issue the configuration saving command to save the configuration file from the RAM to the flash every time when you perform the following operations.

- Modify the password after PICOS installation(not including the first modification)
- Perform picos_boot
- Set L2 / L3 CLI commands (for the L2 / L3 CLI configuration, you need to issue the **commit** command before saving the configuration to flash)
- Set OVS commands
- Set Crossflow commands

You can use either one of the following two methods to save your configuration, using the **save_config** command or the **copy running-config startup-config** command:

- Method 1: Under Linux bash, issue the following command manually (When setting OVS commands, you can only use this command to save the configuration file):

```
admin@Xorplus$ sudo save_config
```

- Method 2: In the L2/L3 CLI operating mode, issue the following command manually:

```
admin@Xorplus> copy running-config startup-config
```

- In-Band Management Interface
- Out-of-band Management Interface

In-Band Management Interface

- Configuring In-Band Management Interface
- Default Settings for In-Band Management Interface on S3410 Series Switches

Configuring In-Band Management Interface

NOTE:

Only the L3 VLAN interfaces/loopback interface/routed interface/sub-interface in the default VRF can be set as the in-band management ports. If an L3 interface has been set as an in-band management port, it can only stay in the default VRF, but not any user-defined VRFs.

By default, the user cannot remotely log in and manage the switch through an L3 VLAN interface, a loopback interface, a routed interface or a sub-interface. You need to enable the in-band management function by using the following commands to perform the SSH, TELNET, SNMP and HTTP services through the L3 interface in the default VRF:

set system inband vlan-interface <*vlan-interface-name*>

set system inband loopback <*ip-address*>

set system inband routed-interface <*routed-interface-name*>

Example

- The following commands set the L3 VLAN interface VLAN400 in the default VRF as the in-band management port.

```
admin@XorPlus# set interface gigabit-ethernet te-1/1/2 family ethernet-switching native-vlan-id 40
0
admin@XorPlus# set vlans vlan-id 400 l3-interface vlan400
admin@XorPlus# set l3-interface vlan-interface vlan400 address 192.168.1.1 prefix-length 24
admin@Xorplus# set system inband vlan-interface vlan400
admin@Xorplus# commit
```

- The following commands set the loopback interface IP in the default VRF as the in-band management IP.

```
admin@Xorplus# set l3-interface loopback lo address 1.1.1.1 prefix-length 32
admin@Xorplus# set system inband loopback 1.1.1.1
admin@Xorplus# commit
```

- The following commands set the routed interface rif-ge3 in the default VRF as the in-band management port.

```
admin@XorPlus# set vlans reserved-vlan 80-90
admin@XorPlus# set interface gigabit-ethernet te-1/1/3 routed-interface enable true
admin@XorPlus# set interface gigabit-ethernet te-1/1/3 routed-interface name rif-te3
admin@XorPlus# set l3-interface routed-interface rif-te3
admin@XorPlus# set l3-interface routed-interface rif-te3 address 172.168.10.10 prefix-length 24
admin@Xorplus# set system inband routed-interface rif-te3
admin@Xorplus# commit
```

In-band management provides a method of access to the switch even if the Ethernet0/1 interface is down.

Default Settings for In-Band Management Interface on S3410 Series Switches

Overview

NOTEs:

- Currently, only S3410 Series switches support this feature.
- The VLAN interface *inband-mgmt* cannot be deleted.
- By default, all ethernet ports are enabled. If you run command **set interface gigabit-ethernet disable true** to disable ports, please make sure that at least one port in VLAN 1 is always enabled.

By default, the in-band management interface, VLAN interface *inband-mgmt*, is configured with the factory default IP address 192.168.1.1/24 based on VLAN 1. In this way, when you cannot obtain valid IP address or with no eth0 management interface to access the switch, a built-in IP address of the in-band management interface is applied, which makes sure that the switch can be always accessed by the direct connection PC.

The switch can obtain an IP address through three ways, prioritized as follows: **static IP address > dynamic IP address assigned by DHCP > factory default IP address**. When the switch can obtain an IP address through higher-priority way, the others will be disregarded. The detailed matching process is as follows:

1. By default, the DHCP client function is enabled. When the switch boots, it attempts to obtain IP address through DHCP assignment before loading configuration files, if successful, it uses this IP address; if fails to obtain in 1 minutes, it uses the factory default IP address.
2. When the switch loads configuration files with a static IP address, or when you specify an IP address for the in-band management interface *inband-mgmt*, it uses the configured IP address. For details on modifying the IP address of the in-band management interface *inband-mgmt*, refer to the next section.

NOTEs:

- When the switch uses the factory default IP address, it will continue to attempt to obtain an IP address from the DHCP server. If successful, it will use the assigned IP address instead of the default IP address.
- When the switch uses the IP address assigned by DHCP server, if the IP address lease is out of date and the switch cannot communicate with DHCP server, the IP address will be covered with 0.0.0.0 and the switch will execute the matching process again to obtain the IP address.

Modifying the IP Address

NOTE:

Please be cautious to perform this operation. If the IP address of in-band management interface is modified, the user login session will be interrupted, and you need to log in again with the new IP address.

To modify the default IP address of interface *inband-mgmt*, take the following steps:

Step 1 Disable the DHCP function.

set l3-interface vlan-interface inband-mgmt dhcp false

Step 2 Specify the IP address for interface *inband-mgmt*.

set l3-interface vlan-interface inband-mgmt address <*ipv4-address* | *ipv6-address*> **prefix-length** <*length*>

Step 3 Commit the configuration. If you configure multiple IP addresses, the latest configuration is valid.

Commit

Step 4 View the *inband-mgmt* configuration information.

run show l3-interface vlan-interface inband-mgmt

Step 5 Restore the IP address to default value 192.168.1.1.

rollback default

Out-of-band Management Interface

- Configuring Port Speed of eth0 Out-of-Band Management Interface
- Default Settings for Out-of-band Management Interface

Configuring Port Speed of eth0 Out-of-Band Management Interface

The management interface **eth0** is a special Ethernet interface that provides configuration management support for the user, that is, the user can log on to the device and perform configuration and management operations through this interface. The **eth0** management interface is not responsible for the transmission of data services.

The following command can be used to configure the port speed (in Mbit/s) of **eth0** out-of-band management interface in operational mode.

set management-ethernet-speed eth0 <**10 | 100 | 1000 | auto**>

Example

- Configure port speed of **eth0** out-of-band management interface to 100Mbit/s and show the configuration result.

```
admin@PICOS> set management-ethernet-speed eth0 100
admin@PICOS> start shell sh
admin@PICOS:~$ sudo ethtool eth0
Settings for eth0:
        Supported ports: [ TP ]
        Supported link modes:   10baseT/Half 10baseT/Full
                                100baseT/Half 100baseT/Full
                                1000baseT/Full
        Supported pause frame use: Symmetric
        Supports auto-negotiation: Yes
        Supported FEC modes: Not reported
        Advertised link modes:  Not reported
        Advertised pause frame use: Symmetric
        Advertised auto-negotiation: No
        Advertised FEC modes: Not reported
        Speed: 100Mb/s
        Duplex: Full
        Port: Twisted Pair
        PHYAD: 2
        Transceiver: internal
        Auto-negotiation: off
        MDI-X: Unknown
```

Default Settings for Out-of-band Management Interface

By default, the out-of-band management interface *eth0* is configured with the factory default IP address 192.168.1.1/24. In this way, when you cannot obtain valid IP address to access the switch, a built-in IP address is applied, which makes sure that the switch can be always accessed by the direct connection PC.

The switch can obtain an IP address through three ways, prioritized as follows: **static IP address > dynamic IP address assigned by DHCP > factory default IP address**. When the switch can obtain an IP address through higher-priority way, the others will be disregarded. The detailed matching process is as follows:

1. Initially, the switch uses the factory default IP address before PicOS boots up. The DHCP client function is enabled by default, and the switch attempts to obtain IP address through DHCP assignment when PicOS boots up, if successful, it uses this IP address; if fails to obtain in 1 minutes, it uses the factory default IP address.
2. When the switch loads configuration files with a static IP address, or when you specify an IP address for the interface *eth0*, it uses the configured IP address. For details on modifying the IP address of the out-of-band management interface *eth0*, refer to the next section.

Modifying the IP Address

To modify the default IP address of interface *eth0*, take the following steps:

Step 1 Specify the IP address for interface *eth0*. Meanwhile, the DHCP client function is disabled.
set system management-ethernet eth0 ip-address IPv4 <*ipv4-address*>

Step 2 Commit the configuration. If you configure multiple IP addresses, the latest configuration is valid.
Commit

Step 3 View the configuration information of interface *eth0*.
run show system management-ethernet

To delete the specified IP address of interface *eth0*, use the command **delete system management-ethernet eth0 ip-address IPv4**. Meanwhile, the DHCP client function is enabled.

Configuring User Account and Login Banner

There are two types of user accounts: **super-user** and **read-only**. The newly created user account, by default, is read-only.

> **NOTE:**
> "**net-admin**" is not allowed to use when configuring a username.

Creating a User Class and Password

```
admin@XorPlus# set system login user ychen authentication plain-text-password pica8
admin@XorPlus#set system login user ychen class super-user
admin@XorPlus# commit
Commit OK.
Save done.
admin@XorPlus#
```

Configuring a Login Announcement after Login

```
admin@XorPlus# set system login announcement "welcome the switch-1101"
admin@XorPlus# commit
Commit OK.
Save done.
admin@XorPlus#
```

Configuring a Multi-line Login Announcement after Login

The following example configures a multi-line announcement which will be printed on the teminal after user login.

```
admin@XorPlus# set system login multiline-announcement 1 message "*********************************************"
admin@XorPlus# set system login multiline-announcement 2 message "Welcome to the system！"
admin@XorPlus# set system login multiline-announcement 3 message "*********************************************"
admin@XorPlus# commit
Commit OK.
Save done.
admin@XorPlus#
```

Configuring a Login Banner before Login

```
admin@XorPlus# set system login banner "Hello! Welcome!"
admin@XorPlus# commit
Commit OK.
Save done.
admin@XorPlus#
```

Configuring a Multi-line Login Banner before Login

The following example configures a multi-line banner which will be printed on the teminal before user login.

```
admin@Xorplus# set system login multiline-banner 1 message "********************NOTICE**********************"
admin@Xorplus# set system login multiline-banner 2 message "This is a property of Pica8."
admin@Xorplus# set system login multiline-banner 3 message "All users log-in are subject to company monitoring!"
admin@Xorplus# set system login multiline-banner 4 message "************************************************"
admin@Xorplus# commit
```

Configuring SSH and Telnet Parameters

Configuring the SSH Connection Limit

```
admin@XorPlus# set system services ssh protocol-version v2
admin@XorPlus# set system services ssh connection-limit 5
admin@XorPlus# commit
Waiting for merging configuration.
Commit OK.
Save done.
admin@XorPlus#
```

Enabling and Disabling Inband Service

By default, SSH with inband interfaces are disabled. You can enable inband services by entering the command below.

- Set the L3 VLAN interface VLAN400 in the default VRF as the in-band management port.

```
admin@Xorplus# set system inband vlan-interface VLAN400
admin@Xorplus# commit
```

- Set the loopback interface IP in the default VRF as the in-band management IP.

```
admin@Xorplus# set system inband loopback 192.168.10.1
admin@Xorplus# commit
```

- Set the routed interface rif-ge3 in the default VRF as the in-band management port.

```
admin@Xorplus# set system inband routed-interface rif-ge3
admin@Xorplus# commit
```

Configuring the Idle Timeout for SSH User

```
admin@Xorplus# set system services ssh idle-timeout 60
admin@XorPlus# commit
Waiting for merging configuration.
Commit OK.
Save done.
admin@XorPlus#
```

Configuring the Port Number of the SSH server

Users can use this command to configure the new port number of SSH server to prevent attackers from accessing the standard port of SSH service and ensure security. The default listening port number of the SSH server is 22.

Note that, if the modified port number is not 22, the client needs to specify port number when logging in using SSH.

```
admin@Xorplus# set system services ssh port 30
admin@Xorplus# commit
```

Enabling Telnet Service

The Pica8 switch supports functioning as a telnet server. To enable the telnet server function, users can enable the telnet service.

The following command enables telnet service on the device.

NOTEs:

- Telnet service is insecure. Do not enable a telnet server if you don't know what exactly it may mean.

- Limit to a maximum of 20 connections within 10 seconds.
- Terminate the session in 60 seconds if the connection is not successful.

```
admin@PICOS# set system services telnet disable false
admin@PICOS# commit
```

Configuring the Log-in ACL

Configure the ACL to control whether remote hosts within specified sub-networks are allowed to log in to the system. In our example, remote hosts from both sub-networks that we configured may log in.

```
admin@XorPlus# set system login-acl network 192.168.1.0/24
admin@XorPlus# set system login-acl network 192.168.100.100/32
admin@XorPlus#
admin@XorPlus# commit
Waiting for merging configuration.
Commit OK.
Save done.
admin@XorPlus#
```

AAA Configuration Guide

- Introduction
- Configuration Notes of AAA
- TACACS+ Configuration
- RADIUS Configuration
- Local Authentication Configuration
- Sample configuration file on the AAA server

Introduction

AAA (Authentication, Authorization and Accounting) is a management mechanism of network security and provides three security functions of authentication, authorization and accounting.

Authentication: Confirm the identity of remote users accessing the network to determine whether the visitor is a validated network user.

Authorization: Give different users with different permissions, restriction to services that users can use. For example, after the user successfully logs in to the server, the administrator can authorize the user to execute CLI commands.

Accounting: Record all operations of users using network services, including the type of service used, starting time, data traffic, etc. It is not only a means of billing, but also monitors network security.

PICOS supports TACACS+, RADIUS and local authentication method. TACACS+ (Terminal Access Controller Access Control System) is a security protocol that is an enhancement to the original TACACS protocol. The protocol is similar to the RADIUS protocol. It uses the client / server model to communicate with the NAS and the TACACS + server to achieve user's AAA management.

TACACS+/RADIUS Authentication and Authorization Process

This section describes the TACACS+/RADIUS authentication and authorization of PICOS 2.11.7 and the later versions.

	TACACS+/RADIUS server is reachable and TACACS+/RADIUS service is configured	TACACS+/RADIUS server is unreachable or TACACS+/RADIUS service is not configured
Console Login	Allow to login only if pass authentication form TACACS+ server.	Generate a syslog and fallback to local authentication. Allow to login if pass local authentication. After successful login, local authorization will be performed. By default, generate a syslog and do nothing else.
Network (INTERFACE/VLAN/MGMT Port/INBAND) Login	After successful login, if the TACACS+ server goes down, the user will be logged out and asked to re-log in.	User can configure to enable local authentication fallback function to fallback to local authentication and authorization in this case. For details about local authentication fallback function, see set system aaa local-auth-fallback disable.

Console Login:

- If the TACACS+/RADIUS server is reachable and the TACACS+/RADIUS service is configured, the system uses TACACS/RADIUS server for authentication. Access will be denied on failure. After successful login, if the TACACS+ server goes down, the user will be logged out and asked to re-log in.
- If the TACACS+/RADIUS server is unreachable or the TACACS+/RADIUS service is not available, the system generates a syslog and uses local user/passwd file for authentication. After successful login, local authorization will be performed.

Network (INTERFACE/VLAN/MGMT Port/INBAND) Login:

- If the TACACS+/RADIUS server is reachable and the TACACS+/RADIUS service is configured, the system uses TACACS+/RADIUS server for authentication. Access will be denied on failure. After successful login, if the TACACS+ server goes down, the user will be logged out and asked to re-log in.
- If the TACACS+/RADIUS server is unreachable or the TACACS+/RADIUS service is not available, by default, the system generates a syslog and does nothing else. However, user can configure local authentication fallback function to perform local authentication and authorization. For details about local authentication fallback function, see set system aaa local-auth-fallback disable.

User Level Mapping

If users login to PICOS via TACACS+/RADIUS, PICOS will not create new users in Linux platform. There is a mapping relationship between user level configured on AAA server and PICOS local user. The following table lists the mapping relationship between TACACS+ user and local user.

Howerver, note that RADIUS user is mapped to admin when login to PICOS.

Table 1. User level mapping between TACACS+ user level and PICOS local user

User Level on TACACS+ Server	User Account	Permission Class	Descriptions
15	admin	Super-user	Users of this level can configure network services, such as routing and commands of all network layers, and can control basic system operations and user management.

1-14	operator	Read-only	Users of this level can access to **configuration** mode to view the current configuration with limited access. A network operator cannot modify any configuration setting on a switch.
0	guest	Guest	Users of this level can do nothing but show the version and exit.

Configuration Notes of AAA

When configuring AAA on a device, pay attention to the following points:

- TACACS+ and RADIUS cannot be used at the same time. If both TACACS+ and RADIUS are enabled, then TACACS+ is valid but RADIUS is invalid.
- Users authenticate with the AAA server to gain access to the NAS server when AAA function is enabled. Make sure that the communication between the NAS server and AAA server works well.
- If the same accounts of admin/root/operator are used in conjunction with TACACS, TACACS authorization will be ignored and the local account policy will take precedence.
- For redundancy management of AAA server, multiple remote AAA servers can be configured at the same time. Only one server can be used at the same time. However, there are a few differences between TACACS + and RADIUS validation.
  - If user validation on one TACACS+ server fails, it will switch to the other reachable TACACS+ servers for validation automatically.
  - Only one RADIUS server with the smallest IP address will be used for user validation, if user validation on one RADIUS server fails, it will not use the other reachable RADIUS servers for validation.
- When the AAA server is unreachable, users who have logged in successfully will quit CLI interface and fallback to Linux shell when they execute the CLI command that needs to be authorized.
- If the value of the shared key is different from that of the TACACS+/RADIUS server,
  - For RADIUS, it is considered that the RADIUS server is unreachable.
  - For TACACS+, it is considered that the TACACS+ server is reachable but the authentication failed.
- When resetting any AAA radius / TACACS + configuration, the new setting takes effect only for the subsequent users who log in to the CLI. For example, change the IP of the current TACACS+ server.

  Note that：For online users who have already passed AAA Authentication and successfully logged in are not affected by the resetting configurations. If the user logs out and then logs in again, the system will use the new configurations for AAA Authentication.

TACACS+ Configuration

TACACS + uses TCP reliable transmission and data encryption transmission, it is a more secure AAA feature.

PicOS supports a maximum of eight TACACS+ servers. When multiple TACACS+ servers are configured, only one will be used, the IP addresses are used in alphabetical order.

For example, the following TACACS+ servers are configured.

```
set system aaa tacacs-plus server-ip 146.13.191.77
set system aaa tacacs-plus server-ip 146.13.191.78
set system aaa tacacs-plus server-ip 1.1.1.1
set system aaa tacacs-plus server-ip 2.2.2.2
set system aaa tacacs-plus server-ip 3.3.3.3
```

The servers will be used in below order.

1. 1.1.1.1
2. 146.13.191.77
3. 146.13.191.78
4. 2.2.2.2
5. 3.3.3.3

Configuring TACACS+

Procedure

Step1 Enable TACACS+ function.

set system aaa tacacs-plus disable <true | false>

Step2 Configure TACACS+ shared key.

set system aaa tacacs-plus key *<string>*

The value of TACACS+ shared key should be the same with that on the TACACS+ servers. The shared key should have a same value on different TACACS+ servers.

Step3 Configure IP address of TACACS+ server.

set system aaa tacacs-plus server-ip *<ipv4_address>*

Step4 (Optional) Configure the port number of TACACS+ server.

set system aaa tacacs-plus port-number *<integer>*

By default, the port number of TACACS+ server is 49. The value of port number should be the same with that on the TACACS+ servers.

Step5 Configure the source interface.

set system aaa tacacs-plus source-interface *<interface-name>*

Step6 (Optional) Configure TACACS+ connection timeout.

set system aaa tacacs-plus timeout *<integer>*

By default, the value of TACACS+ connection timeout is 5 seconds.

Step7 (Optional) Configure TACACS+ authentication type.

set system aaa tacacs-plus auth-type <ascii | chap | pap>

By default, the TACACS+ authentication type is ascii.

Step8 (Optional) Enable TACACS+ authorization. By default, TACACS+ authorization is enabled.

set system aaa tacacs-plus authorization <true | false>

Step9 (Optional) Enable TACACS+ accounting. By default, TACACS+ accounting is enabled.

set system aaa tacacs-plus accounting <true | false>

Step10 Commit the configurations.

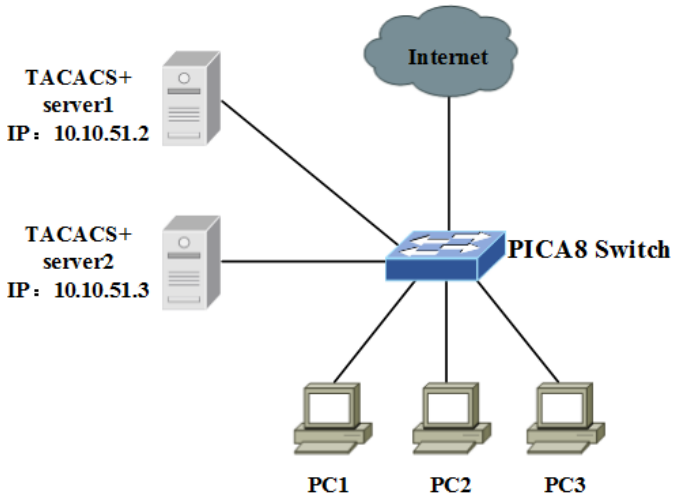
commit

TACACS+ Configuration Example

Networking Requirements

As shown in Figure 1, PC1, PC2, and PC3 connect to the internet through the PICA8 Switch. Configure TACACS+ function on PICA8 Switch to accomplish authentication, authorization, and accounting of PC1, PC2, and PC3 through TACACS + server1 and TACACS + server2. Suppose PICA8 Switch connects to the TACACS + servers through management interface eth0.

Figure 1. TACACS+ Networking Topology



Procedure

Step1 Enable TACACS+ function.

```
admin@XorPlus# set system aaa tacacs-plus disable false
```

Step2 Configure shared key of the TACACS+ servers.

```
admin@XorPlus# set system aaa tacacs-plus key pica8pica8
```

Step3 Configure TACACS+ server IP.

```
admin@XorPlus# set system aaa tacacs-plus server-ip 10.10.51.2
admin@XorPlus# set system aaa tacacs-plus server-ip 10.10.51.3
```

Step4 (Optional) Configure the port number of TACACS+ server.

```
admin@XorPlus# set system aaa tacacs-plus port-number 50
```

Step5 Configure the source interface.

```
admin@XorPlus# set system aaa tacacs-plus source-interface eth0
```

Step6 (Optional) Configure TACACS+ connection timeout.

```
admin@XorPlus# set system aaa tacacs-plus timeout 30
```

Step7 (Optional) Configure TACACS+ authentication type.

```
admin@XorPlus# set system aaa tacacs-plus auth-type chap
```

Step8 Commit the configurations.

```
admin@XorPlus# commit
```

Check the Configuration

- You can use the **show system aaa tacacs-plus** command to view the configuration information of TACACS+.

```
admin@XorPlus# show system aaa tacacs-plus
disable: false
server-ip 10.10.51.2
server-ip 10.10.51.3
key: "QT09cGljYThwaWNhOA==Y0ds"
source-interface: "eth0"
```

RADIUS Configuration

As the RADIUS protocol is simple and scalable, it is the most widely used AAA protocol.

Configuring RADIUS

Procedure

Step1 Enable RADIUS authentication and authorization.

set system aaa radius authorization disable <true | false>

Step2 Configure IP address of RADIUS authentication and authorization server.

set system aaa radius authorization server-ip <*ipv4_address*>

Step3 Configure port number of RADIUS authentication and authorization server.

set system aaa radius authorization server-ip <*ipv4_address*> **port** <*integer*>

By default, the port number of RADIUS authentication and authorization server is 1812. The value of port number should be the same with that on the RADIUS servers.

Step4 Configure RADIUS authentication and authorization shared key.

set system aaa radius authorization server-ip <*ipv4_address*> **shared-key** <*string*>

The value of RADIUS authentication and authorization shared key should be the same with that on the RADIUS server.

Step5 Configure the source interface.

set system aaa radius source-interface <*interface-name*>

Step6 Configure RADIUS authentication and authorization connection timeout.

set system aaa radius authorization server-ip <*ipv4_address*> **timeout** <*integer*>

By default, the value of RADIUS authentication and authorization connection timeout is 5 seconds.

Step7 Enable RADIUS accounting function.

set system aaa radius accounting disable <true | false>

Step8 Configure RADIUS accounting server IP.

set system aaa radius accounting server-ip <*ipv4_address*>

Step9 Configure port number of RADIUS accounting server.

set system aaa radius accounting server-ip <*ipv4_address*> **port** <*integer*>

By default, the port number of RADIUS accounting server is 1813. The value of port number should be the same with that on the RADIUS servers.

Step10 Configure RADIUS accounting shared key.

set system aaa radius accounting server-ip <*ipv4_address*> **shared-key** <*string*>

Step11 Configure RADIUS accounting connection timeout.

set system aaa radius accounting server-ip <*ipv4_address*> **timeout** <*integer*>

Step12 Commit the configurations.

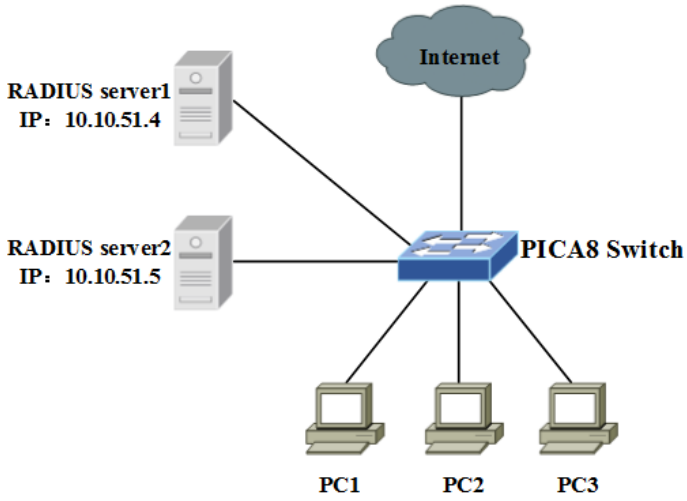
commit

Configuration Example

Networking Requirements

As shown in Figure 1, PC1, PC2, and PC3 connect to the internet through the PICA8 Switch. Configure RADIUS function on PICA8 Switch to accomplish authentication, authorization, and accounting of PC1, PC2, and PC3 through RADIUS server1 and RADIUS server2.

Figure 1. RADIUS Networking Topology



Procedure

Step1 Enable RADIUS authentication and authorization.

```
admin@XorPlus# set system aaa radius authorization disable false
```

Step2 Configure IP address of RADIUS authentication and authorization server.

```
admin@XorPlus# set system aaa radius authorization server-ip 10.10.51.4
admin@XorPlus# set system aaa radius authorization server-ip 10.10.51.5
```

Step3 Configure port number of RADIUS authentication and authorization server.

```
admin@XorPlus# set system aaa radius authorization server-ip 10.10.51.4 port 1800
admin@XorPlus# set system aaa radius authorization server-ip 10.10.51.5 port 1800
```

By default, the port number of RADIUS authentication and authorization server is 1812.

Step4 Configure RADIUS authentication and authorization shared key.

```
admin@XorPlus# set system aaa radius authorization server-ip 10.10.51.4 shared-key pica8
admin@XorPlus# set system aaa radius authorization server-ip 10.10.51.5 shared-key pica8
```

The value of RADIUS authentication and authorization shared key should be the same with that on the RADIUS server.

Step5 Configure the source interface.

```
admin@XorPlus# set system aaa radius source-interface eth0
```

Step6 Configure RADIUS authentication and authorization connection timeout.

```
admin@XorPlus# set system aaa radius authorization server-ip 10.10.51.4 timeout 30
admin@XorPlus# set system aaa radius authorization server-ip 10.10.51.5 timeout 30
```

By default, the value of RADIUS connection timeout is 5 seconds.

Step7 Enable RADIUS accounting.

```
admin@XorPlus# set system aaa radius accounting disable false
```

Step8 Configure IP address of RADIUS accounting server.

```
admin@XorPlus# set system aaa radius accounting server-ip 10.10.51.4
admin@XorPlus# set system aaa radius accounting server-ip 10.10.51.5
```

Step9 Configure port number of RADIUS accounting server.

```
admin@XorPlus# set system aaa radius accounting server-ip 10.10.51.4 port 1801
```

```
admin@XorPlus# set system aaa radius accounting server-ip 10.10.51.5 port 1801
```

By default, the port number of RADIUS accounting server is 1813.

Step10 Configure RADIUS accounting shared key.

```
admin@XorPlus# set system aaa radius accounting server-ip 10.10.51.4 shared-key pica8
admin@XorPlus# set system aaa radius accounting server-ip 10.10.51.5 shared-key pica8
```

Step11 Configure RADIUS accounting connection timeout.

```
admin@XorPlus# set system aaa radius accounting server-ip 10.10.51.4 timeout 30
admin@XorPlus# set system aaa radius accounting server-ip 10.10.51.5 timeout 30
```

Step12 Commit the configurations.

```
admin@XorPlus# commit
```

Check the Configuration

- You can use the **show system aaa radius** command to view the configuration information of RADIUS.

```
admin@XorPlus# show system aaa radius
radius {
        authorization {
            disable: false
            server-ip 10.10.51.4 {
                 timeout: 30
                port: 1800
            }
            server-ip 10.10.51.5 {
                timeout: 30
                port: 1800
            }
        }
        accounting {
            disable: false
            server-ip 10.10.51.4{
                timeout: 30
                port: 1801
            }
            server-ip 10.10.51.5 {
                timeout: 30
                port: 1801
            }
        }
```

Local Authentication Configuration

This chapter describes the configuration of local authentication.

Configuring Local Authentication

> **NOTE:**
> The local authentication and authorization is enabled by default if remote authentication and authorization is not deployed, the access users are authenticated and authorized based on the local user information.

Step1 Enable local authentication.

set system aaa local disable <true | false>

Step2 Commit the configuration.

commit

Configuring a Local User

When local authentication is configured, configure authentication and authorization information on the device, including the user name, password, and user level.

Step1 Configure a local user account.

set system login user <*username*> **authentication plain-text-password** <*password*>

Step2 Configure user authorization.

set system login user <*username*> **class** <**read-only** | **super-user**>

By default, the newly created user is read-only.

Step3 Commit the configuration.

commit

Example for Configuring Local Authentication

Step1 Enable local authentication.

```
admin@XorPlus# set system aaa local disable false
```

Step2 Commit the configuration.

```
admin@XorPlus# commit
```

Example for Configuring a Local User

Step1 Configure a local user account **manager**.

```
admin@XorPlus# set system login user manager authentication plain-text-password 123456
```

Step2 Configure the user as super-user for user account **manager**.

```
admin@XorPlus# set system login user manager class super-user
```

Step3 Commit the configuration.

```
admin@XorPlus# commit
```

Sample configuration file on the AAA server

Here is a sample configuration file on the AAA server.

```
key = pica8

Accounting File
accounting file = /var/tmp/acctfile
default authentication = file /etc/passwd
user = admin {
member = admins
}
group = admins {
global = cleartext "password"
service = exec {
default attribute = permit
}
}
user = operator {
global = cleartext "operator"
service = exec {
default attribute = permit
}
}
user = ychen {
global = cleartext "ychen"
member = admins
service = exec {
default attribute = permit
}
}
Add "/usr/share/freeradius/dictionary.pica8" to radius server before the configuration.

Radius server configuration:
operator Cleartext-Password := "testing"
Service-Type = Framed-User,
Framed-Protocol = PPP,
Framed-IP-Address = 172.16.3.33,
Framed-IP-Netmask = 255.255.255.0,
Framed-Routing = Broadcast-Listen,
Framed-Filter-Id = "std.ppp",
Framed-MTU = 1500,
Framed-Compression = Van-Jacobsen-TCP-IP,
Class = "read-only"
ychen Cleartext-Password := "testing"
Service-Type = Framed-User,
Framed-Protocol = PPP,
Framed-IP-Address = 172.16.3.33,
Framed-IP-Netmask = 255.255.255.0,
Framed-Routing = Broadcast-Listen,
Framed-Filter-Id = "std.ppp",
Framed-MTU = 1500,
Framed-Compression = Van-Jacobsen-TCP-IP,
Class = "super-user"
```

Follow the configuration above, the admin or operator can access the switch via SSH.
Any valid CLI commands executed by the admin or operator will be recorded to the specified accounting file. In our example above, the accounting file is/var/tmp/acctfile.

Configuration Notes of NAC

When configuring NAC on a device, pay attention to the following points:

- 802.1X client authentication software is required on the supplicant when you use the 802.1X authentication to control the network access of the supplicant. If you only use MAB authentication to control network access of the clients, the 802.1X client software is not required.
- The MAB authentication is performed each time when the port link goes down and then up.
- 802.1X authentication is used on the port connected to the host user. It is not supported for the port connected to the AAA server.
- It is strongly recommended not to use both voice VLAN and dynamic VLAN on the port enabled with NAC function.
- The link type for the port of dynamic VLAN should be trunk port.
- 802.1X authentication only supports RADIUS protocol between the authenticator and the authentication server. It does not support TACACS/TACACS+ authentication.
- A maximum of eight NAC authenticated users are supported on each port.
- 802.1X authentication and MAB authentication cannot be configured on a LAG port or a physical port that belongs to a LAG. When we need to configure these functions on the physical port that belongs to a LAG, we must first remove the physical port from the LAG port before configuration.
- The recommended AAA servers are ClearPass, ISE and PacketFence.
- The link type of the port used for NAC function should be trunk port.
- The static firewall filter rule (set by the commands **set firewall filter** *XX*) cannot be applied to the port used for NAC function. Similarly, if a static firewall filter rule is applied to a port, then the port cannot employ NAC.
- The Web authentication process relies on MAB authentication. If you want to deploy Web authentication, you need to enable MAB authentication on the switch first.
- In CLI configuration, you need to enable MAB authentication before enable CWA authentication.
- The CWA authentication process will be implemented after the MAB authentication fails.
- Up to 20 AAA servers can be configured (using command **set protocols dot1x aaa radius authentication server-ip** <ipv4-address> [**shared-key** <*key-string*>]); only one Web authentication server can be configured (using command **set protocols dot1x aaa web server-ip** <*ipv4-address*> **port** <*port-number*>).
- For the NAC authentication, if dynamic VLAN is not provided by the AAA server, the native VLAN will be used instead.
- The static MACs also need to be authenticated if the port is enabled with NAC.
- Rapid PVST+ blocks traffic from the dynamic VLAN delivered from the RADIUS authentication server.

Configuring NAC

Prerequisite

You need to complete the NAC configuration on both AAA server and PICA8 switch when employ NAC function. The following section describes how configure NAC on PICA8 switch. For details about how to configure NAC on AAA server, please refer to the following documents in Typical Configuration of NAC:

- Configuring Dynamic and Downloadable ACL for ClearPass
- Configuring Dynamic and Downloadable ACL on Cisco ISE
- Configuring Pica8 Switches with ClearPass Guest Central Web Authentication
- Integrating Pica8 Switches with Cisco ISE

Procedure

Step1 Configure VLAN.

a) Create a VLAN.

set vlans vlan-id <*vlan-id*>

b) Configure the interface to VLAN.

set interface gigabit-ethernet <*port*> **family ethernet-switching native-vlan-id** <*vlan-id*>

c) Configure the IP address of the VLAN.

set l3-interface vlan-interface <*interface-name*> **address** <*address*> **prefix-length** <*number*>

d) Associate a Layer 3 interface with a VLAN.

set vlans vlan-id <vlan-id> **l3-interface** <interface-name>

Step2 Configure IP address for RADIUS authentication server and the shared key.

set protocols dot1x aaa radius authentication server-ip <*ip-address*> [**shared-key** <*key-string*>]

Step3 (Optional) Configure the UDP port for RADIUS authentication server and accounting server.

set protocols dot1x aaa radius authentication server-ip <*ip-address*> **auth-port** <*port-number*>

set protocols dot1x aaa radius authentication server-ip <*ip-address*> **acct-port** <*port-number*>

Step4 Configure the DNS serve IP address. This step is required for Web authentication.

set system dns-server-ip <*dns-server-ip*>

> **NOTEs:**
> Make sure to configure the mapping of the domain name of the redirect URL to the IP address on the DNS server.

Step5 Configure the NAS IP address to the L3 interface IP which is connected to the AAA server.

set protocols dot1x aaa radius nas-ip <*ip-address*>

This command is used to set the nas-ip field in RADIUS access-request message. It can be the IP address of a VLAN interface, eth0, routed interface or sub-interface.

Step6 Configure the authentication mode.

set protocols dot1x interface <*interface-name*> **auth-mode 802.1x**

set protocols dot1x interface <*interface-name*> **auth-mode mac-radius**

set protocols dot1x interface <*interface-name*> **auth-mode web**

Step7 Configure block VLAN. This step is required for Web authentication.

a) Configure block VLAN ID.

set protocols dot1x block-vlan-id <*block-vlan-id*>

b) Configure the interface to VLAN.

set interface gigabit-ethernet <*port*> **family ethernet-switching native-vlan-id** <*vlan-id*>

c) Configure the IP address of block VLAN interface.

set l3-interface vlan-interface <*interface-name*> **address** <*address*> **prefix-length** <*number*>

d) Associate a Layer 3 interface with block VLAN.

set vlans vlan-id <block-vlan-id> **l3-interface** <interface-name>

Step8 Configure a RADIUS dynamic authorization client from which the switch accepts Change of Authorization (CoA) messages. This step is required for CoA and Web authentication.

set protocols dot1x aaa radius dynamic-author client <*client-ip*> **shared-key** <*key-string*>

Step9 (Optional) Configure the UDP port of the RADIUS dynamic authorization server of CoA function. This is the UDP port on the switch side.

set protocols dot1x aaa radius dynamic-author client <*client-ip*> **port** <*port-number*>

Step10 Configure host mode for NAC authentication interface.

set protocols dot1x interface <*interface-name*> **host-mode** <**single** | **multiple**>

Step11 Configure dynamic ACL on the switch.

a) Configure the filter conditions.

set protocols dot1x filter <*filter-name*> **sequence** <*sequence-number*> **from** <*filter-condition*>

b) Configure the filter action.

set protocols dot1x filter <*filter-name*> **sequence** <*number*> **then action** <**discard** | **forward**>

> **NOTE:**
>
> The filter name configured in the Filter-Id must be the same as the filter name of the dynamic ACL configured on the switch.

Step12 (Optional) Configure a server fail VLAN on the switch.

set protocols dot1x server-fail-vlan-id <*vlan-id*>

Step13 (Optional) Enable fallback to WEB function.

set protocols dot1x interface <*interface-name*> **auth-mode 802.1x fallback-to-web disable** <**true** |**false**>

Step14 (Optional) Enable open authentication function on a specified interface.

set protocols dot1x interface <*interface-name*> **authentication-open disable <true | false>**

Step15 (Optional) You can use either one of the following two commands to configure the maximum number of NAC sessions that are allowed to be established on the port enabled for NAC.

By default, there is no limit on the number of NAC sessions.

set protocols dot1x interface <*interface-name*> **max-sessions** <*max-sessions-number*>

set protocols dot1x max-sessions-per-port <*max-sessions-number*>

Step16 Commit the configuration.

commit

Configuration Example of NAC

- Example for Configuring 802.1X Authentication
- Example for Configuring MAB Authentication
- Example for Configuring CWA Authentication
- Example for Configuring Multiple Authentication Modes

Example for Configuring 802.1X Authentication

Networking Requirements

As shown in **Figure 1**, a large number of user terminals in a company access the Internet through ge-1/1/1 of the PICA8 Switch (as the access device). To ensure network access security, the administrator employs 802.1X authentication on the Switch and AAA server, to control the network access rights of the user terminals. The Switch allows the user terminals to access resources on the Internet only when the authentication is successfully passed.

Prerequisite

Ensure that PICA8 Switch is properly connected to the AAA server. In this example, the switch uses the management port Eth0 to connect to the AAA server.

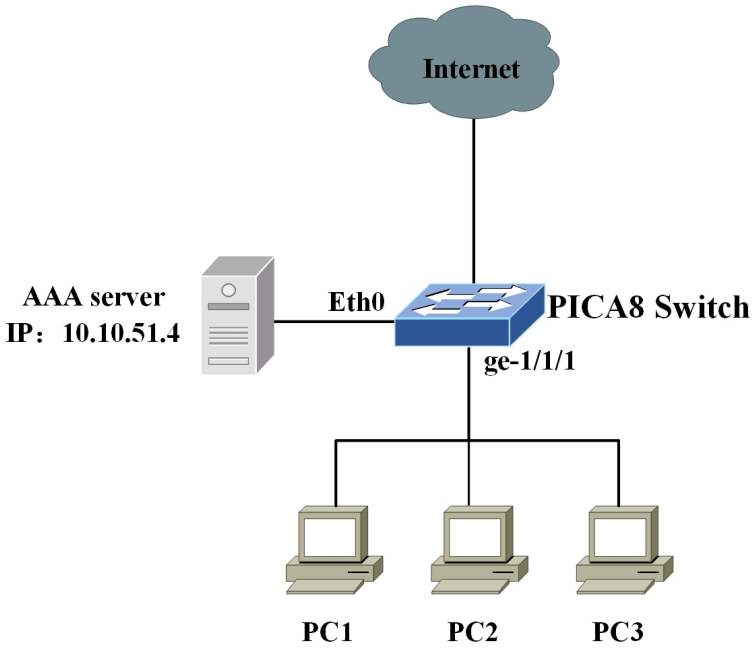
Configuration on the AAA Server

- Configure the Eth0 IP address of the switch to establish a connection to the switch.
- Configure the username and password on the AAA server.
- Configure the shared key.
- Configure other RADIUS attributes for 802.1X authentication.

Configuration on the Switch

- Use Eth0 management port connects to the AAA server.
- Configure the 802.1X authentication server IP and shared key on the Switch.
- Enable 802.1X authentication on the Switch.
- Configure the host mode to multiple on interface ge-1/1/1.

Figure 1. Networking Diagram for Configuring 802.1X Authentication



Procedure

Step1 Configure the access port to trunk mode and enable 802.1X authentication mode.

```
admin@XorPlus# set interface gigabit-ethernet ge-1/1/1 family ethernet-switching port-mode trunk
admin@XorPlus# set protocols dot1x interface ge-1/1/1 auth-mode 802.1x
```

Step2 Configure IP address of AAA server and the shared key.

```
admin@XorPlus# set protocols dot1x aaa radius authentication server-ip 10.10.51.4 shared-key pica8
```

Step3 Configure the NAS IP address to the L3 VLAN interface IP which is connected to the RADIUS server.

```
admin@XorPlus# set protocols dot1x aaa radius nas-ip 10.10.51.100
```

This command is used to set the nas-ip field in RADIUS access-request message. If you use the management interface eth0/eth1 to connect to the RADIUS server, the IP address of the management interface eth0/eth1 should be used for the NAS IP address configured here.

Step4 Configure the host mode for NAC authentication interface.

```
admin@XorPlus# set protocols dot1x interface ge-1/1/1 host-mode multiple
```

Step5 Commit the configuration.

```
admin@XorPlus# commit
```

Step6 Verify the configuration.

a) Run the **run show dot1x interface** to check the 802.1X authentication configurations. The command output (**802.1x = enable**) shows that the 802.1X authentication has been enabled on the interface ge-1/1/1 and MAC address ae:11:01:39:1a:00 is successfully authenticated.

```
admin@Xorplus# run show dot1x interface
Interface 802.1x  MAC-RADIUS  WEB     HOST-MODE    Session-Timeout  CLIENT-MAC       CLIENT-STATUS
-------------------------------------------------------------------------------------------------
ge-1/1/1  enable  disable     disable  multiple(3)   0              00:11:22:33:44:55  authorized
                                                                    33:12:a1:49:1b:0c authorized
                                                                    b3:55:c1:d7:2f:22 authorized
```

b) The user starts the 802.1X client software on the terminal, enters the username and password, and starts authentication.

c) If the user name and password are correct, there will be an authentication success message displayed. Then users can access the network through this port.

Example for Configuring MAB Authentication

Networking Requirements

As shown in **Figure 1**, a large number of dumb terminals (Printers in this example) in a company that access the Internet through ge-1/1/1 of the PICA8 Switch (as the access device). To ensure network access security, the administrator employs MAB authentication on the Switch and AAA server, to control the network access rights of the Printers. The Switch allows the Printers to access resources on the Internet only when the MAB authentication is successfully passed.

Prerequisite

Ensure that PICA8 Switch is properly connected to the AAA server. In this example, the switch uses the management port Eth0 to connect to the AAA server.

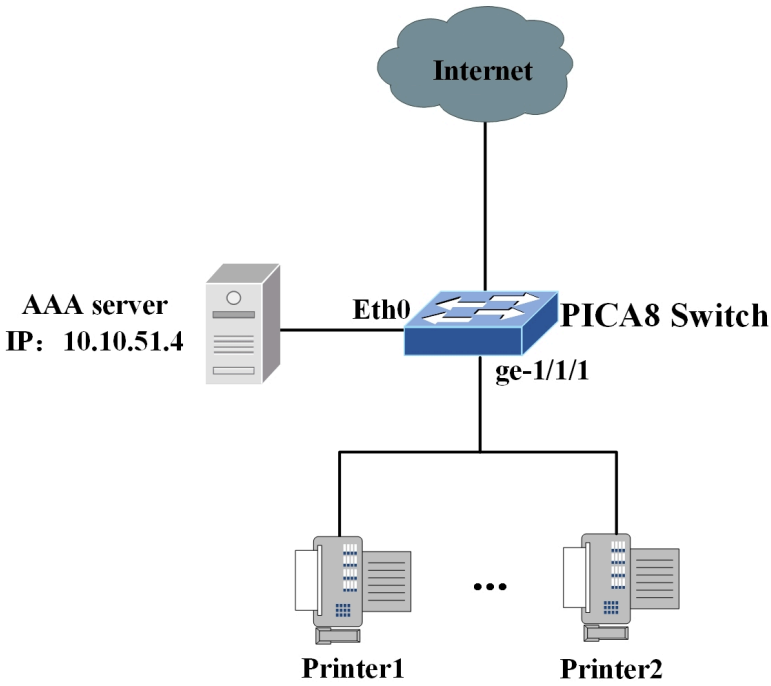
Configuration on the AAA Server

- Configure the Eth0 IP address of the switch to establish a connection to the switch.
- Configure the credentials for each printer on the AAA server.
- Configure the shared key.
- Configure other RADIUS attributes for MAB authentication.

Configuration on the Switch

- Configure the AAA server IP and shared key on the Switch.
- Enable MAB authentication on the Switch, to perform MAB authentication on terminals that cannot install the 802.1X client software.
- Configure the host mode to multiple on interface ge-1/1/1.

Figure 1. Networking Diagram for Configuring MAB Authentication



Procedure

Step1 Configure the access port to trunk mode and enable MAB authentication mode.

```
admin@XorPlus# set interface gigabit-ethernet ge-1/1/1 family ethernet-switching port-mode trunk
admin@XorPlus# set protocols dot1x interface ge-1/1/1 auth-mode mac-radius
```

Step2 Configure IP address of AAA server and the shared key.

```
admin@XorPlus# set protocols dot1x aaa radius authentication server-ip 10.10.51.4 shared-key pica8
```

Step3 Configure the NAS IP address to the IP address of Eth0 interface which is connected to the AAA server.

```
admin@XorPlus# set protocols dot1x aaa radius nas-ip 10.10.51.100
```

This command is used to set the nas-ip field in RADIUS access-request message. If you use the management interface eth0/eth1 to connect to the AAA server, the IP address of the management interface eth0/eth1 should be used for the NAS IP address configured here.

Step4 Configure the host mode for NAC authentication interface.

```
admin@XorPlus# set protocols dot1x interface ge-1/1/1 host-mode multiple
```

Step5 Commit the configuration.

```
admin@XorPlus# commit
```

Step6 Verify the configuration.

Run the **run show dot1x interface** to check the MAB authentication configurations. The command output (**MAC-RADIUS** = **enable**) shows that the MAB authentication has been enabled on the interface ge-1/1/1 and MAC address ae:11:01:39:1a:00 is successfully authenticated.

```
admin@Xorplus# run show dot1x interface
Interface  802.1x   MAC-RADIUS  WEB     HOST-MODE   Session-Timeout  CLIENT-MAC  CLIENT-STATUS
-------------------------------------------------------------------------------------------------
ge-1/1/1  disable   enable   disable    multiple(3)  0               ae:11:01:39:1a:00 authorized
                                                                    33:12:a1:49:1b:0c authorized
                                                                    b3:55:c1:d7:2f:22 authorized
```

Example for Configuring CWA Authentication

Networking Requirements

As shown in **Figure 1**, the terminals in the visitor area are connected to the company's internal network through the Switch. Unauthorized access to the internal network can damage the company's service system and cause leakage of key information assets. Therefore, the administrator employs the CWA on the Switch and on the Web Authentication Server of the AAA to control the users' network access rights to ensure internal network security.

Prerequisite

Ensure that PICA8 Switch is properly connected to the AAA server. In this example, the switch uses the management port Eth0 to connect to the AAA server.

Configuration on the AAA Server

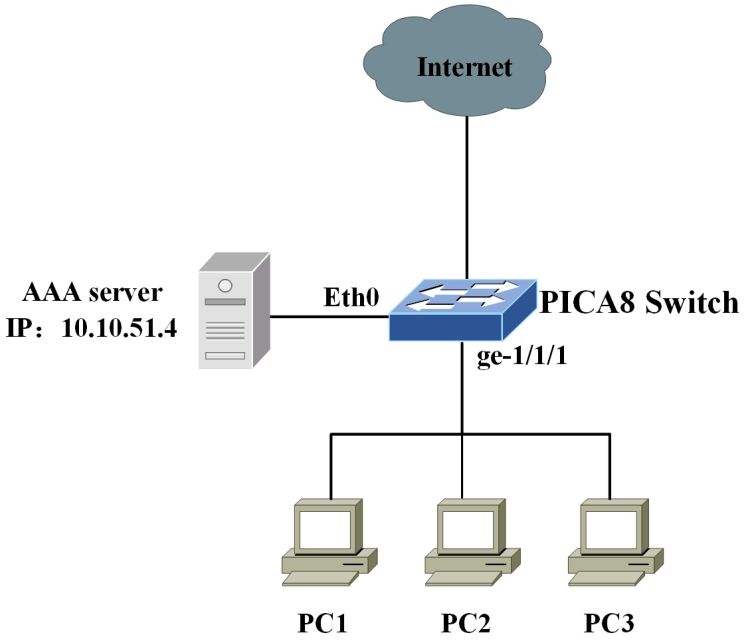
The configuration roadmap on the Web Authentication Server is as follows. For details, refer to the solution document Configuring Pica8 Switches with ClearPass Guest Central Web Authentication in Typical Configuration of NAC.

- Configure the Eth0 IP address of the switch to establish a connection to the switch.
- Configure the username and password on the AAA server for Web authentication.
- Configure a dynamic VLAN which is used to access the network normally after the user successfully authenticates.
- Configure other Web authentication attributes for Web authentication.

Configuration on the Switch

- Configure the 802.1X authentication server and Web authentication server on the Switch.
- The Web authentication process relies on MAB authentication. If you want to deploy Web authentication, enable MAB authentication on the switch first.
- Configure block VLAN and dynamic VLAN.
- Configure CoA authorization client.

Figure 1. Networking Diagram for Configuring CWA Authentication



Procedure

Step1 Configure the access port to trunk mode.

```
admin@XorPlus# set interface gigabit-ethernet ge-1/1/1 family ethernet-switching port-mode trunk
```

Step2 Configure the MAB and Web authentication modes. The Web authentication process relies on MAB authentication. If you want to deploy Web authentication, enable MAB authentication on the switch first.

```
admin@XorPlus# set protocols dot1x interface ge-1/1/1 auth-mode mac-radius
admin@XorPlus# set protocols dot1x interface ge-1/1/1 auth-mode web
```

Step3 Configure IP address of RADIUS server and the DNS server.

```
admin@XorPlus# set protocols dot1x aaa radius authentication server-ip 10.10.51.4 shared-key pica8
```

```
admin@Xorplus# set system dns-server-ip 192.168.10.1
```

NOTE:

- Configuring DNS server IP is required for CWA authentication.
- Make sure to configure the mapping of the domain name of the redirect URL to the IP address on the DNS server.

Step4 Configure the NAS IP address to the IP address of Eth0 interface which is connected to the AAA server.

```
admin@XorPlus# set protocols dot1x aaa radius nas-ip 10.10.51.100
```

This command is used to set the nas-ip field in RADIUS access-request message. If you use the management interface eth0/eth1 to connect to the RADIUS server, the IP address of the management interface eth0/eth1 should be used for the NAS IP address configured here.

Step5 Configure block VLAN. This step is required for Web authentication.

```
admin@XorPlus# set protocols dot1x block-vlan-id 10
admin@XorPlus# set interface gigabit-ethernet ge-1/1/1 family ethernet-switching port-mode trunk
admin@XorPlus# set interface gigabit-ethernet ge-1/1/2 family ethernet-switching native-vlan-id 10
admin@XorPlus# set vlans vlan-id 10 l3-interface vlan10
admin@XorPlus# set l3-interface vlan-interface vlan10 address 10.10.51.10 prefix-length 24
```

Step6 Configure a RADIUS dynamic authorization client from which the switch accepts Change of Authorization (CoA) messages. This step is required for CoA and Web authentication.

```
admin@Xorplus# set protocols dot1x aaa radius dynamic-author client 10.10.10.1 shared-key pica8123
```

Step7 Configure the host mode for NAC authentication interface.

```
admin@XorPlus# set protocols dot1x interface ge-1/1/1 host-mode multiple
```

Step8 Commit the configuration.

```
admin@Xorplus# commit
```

Step9 Verify the configuration.

a) After starting the browser and entering any Web address, the user is redirected to the Web authentication login page. Run command **run show dot1x interface gigabit-ethernet** *<interface-name>* to check the CWA authentication configurations.

```
admin@Xorplus# run show dot1x interface gigabit-ethernet ge-1/1/1
Interface ge-1/1/1:
============================================================
  Client MAC                : 10:11:01:39:1a:00
  Status                    : unauthorized
  Redirect URL              : https://www.clearpass.com/guest/weblogin.php/2?&mac=10:11:01:39:1a:00
============================================================
  Client MAC                : a1:31:a1:b9:6a:0c
  Status                    : unauthorized
  Redirect URL              : https://www.clearpass.com/guest/weblogin.php/2?&mac=a1:31:a1:b9:6a:0c
============================================================
  Client MAC                : a2:e1:55:78:1a:33
  Status                    : unauthorized
  Redirect URL              : https://www.clearpass.com/guest/weblogin.php/2?&mac=a2:e1:55:78:1a:33
============================================================
```

b) The user then enters the user name and password for authentication. If the user name and password are correct, an authentication success message is displayed on the Web authentication page. The user can then access the network.

c) Run the **run show dot1x interface** or **run show dot1x interface gigabit-ethernet** *<interface-name>* to check the CWA authentication configurations. The command output (**WEB = enable**) shows that the CWA authentication has been enabled on the interface ge-1/1/1 and MAC addresses 10:11:01:39:1a:00, a1:31:a1:b9:6a:0c and a2:e1:55:78:1a:33 are successfully authenticated.

```
admin@Xorplus# run show dot1x interface
Interface  802.1x   MAC-RADIUS  WEB   HOST-MODE   Session-Timeout    CLIENT-MAC  CLIENT-STATUS
-------------------------------------------------------------------------------------------------------------
ge-1/1/1  disable  enable   enable   multiple(3)   0               10:11:01:39:1a:00  authorized
                                                                    a1:31:a1:b9:6a:0c  authorized
                                                                    a2:e1:55:78:1a:33  authorized

admin@Xorplus# run show dot1x interface gigabit-ethernet ge-1/1/1
```

```
Interface ge-1/1/1:
============================================================
  Client MAC               : 10:11:01:39:1a:00
  Status                   : authorized
  Success Auth Method      : MAB
  Dynamic VLAN ID          : 100 (active)
============================================================
  Client MAC               : a1:31:a1:b9:6a:0c
  Status                   : authorized

============================================================
```

Example for Configuring Multiple Authentication Modes

- Networking Requirements
  - Prerequisite
  - Configuration Roadmap on PICA8 Switch
- Procedure
- Verify the configuration

Networking Requirements

As shown in **Figure 1**, there are different types of terminal access the network in a company. For the security of the company network, the administrator needs to employ different types of NAC authentication modes on the access switch to control the access rights of different users.

Figure1. Topology for Configuring Multiple Authentication Modes

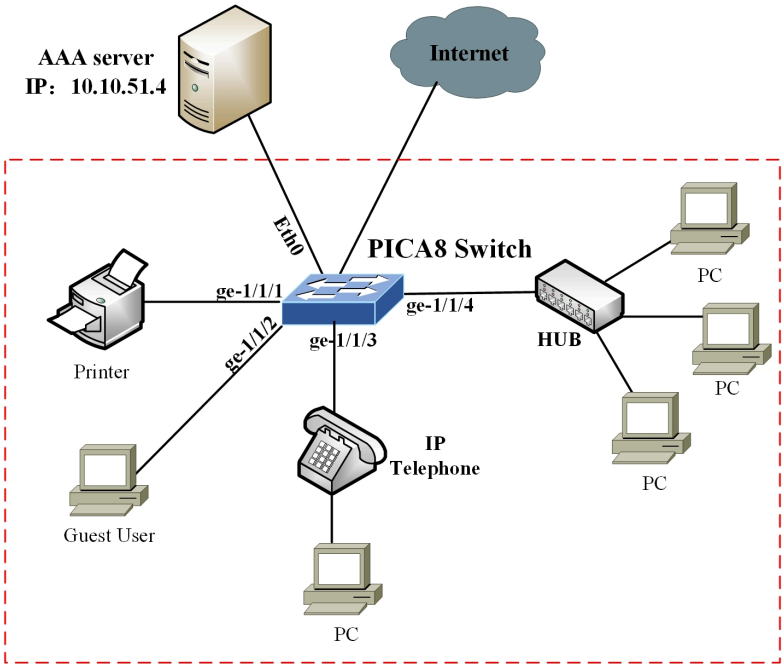

Figure 1 shows the topology for configuring multiple authentication modes. Follow the configuration roadmap below to complete the configuration.

Prerequisite

- Ensure that PICA8 Switch is properly connected to the AAA server. In this example, the switch uses the management port Eth0 to connect to the AAA server.
- Complete the NAC configurations on the AAA server. For details about how to configure NAC on AAA server, please refer to documents Typical Configuration of NAC.

Configuration Roadmap on PICA8 Switch

- A printer accesses the network through interface ge-1/1/1 of the switch. It is a dumb terminal and lacks the supplicant feature which is needed to pass on the 802.1X authentication credentials between the client and the authentication server. In this case, you can configure MAB authentication. You can use the **set protocols dot1x interface** *<interface-name>* **auth-mode mac-radius** command to enable MAB authentication mode on the interface.
- A guest user accesses the network through interface ge-1/1/2 of the switch, it doesn't have proper 802.1X or MAC Radius credentials saved on the authentication servers. In this case, you can configure CWA authentication to control the guest user's network access rights. Remember to enable MAB authentication before using CWA authentication.
- On interface ge-1/1/3, a PC and an IP telephone are connected to the switch so that both data and voice services can be transmitted.
  - Enable LLDP protocol for OUI learning from LLDP packets.
  - Configure 802.1X authentication on the ge-1/1/3 interface to perform access authentication on the connected PC.
  - Since there are two devices, a PC and an IP telephone, on port ge-1/1/3, you need to configure access port ge-1/1/3 for multiple host mode authentication.
  - It is strongly recommended not to use both voice VLAN and dynamic VLAN on the port enabled with NAC function. If both voice VLAN and dynamic VLAN are enabled on the port, dynamic VLAN A has a higher priority.
  - In this example, on the AAA server, you have to configure voice VLAN 300 for IP phone communication and dynamic VLAN 400 for data communication for the PC on the ge-1/1/3 interface.
  - On the switch, you need to use the **set vlans vlan-id** <vlan-id> command to create the dynamic VLANs in advance. And the link type of interface ge-1/1/3 should be configured as trunk port.
- Multiple PCs are connected to the switch on ge-1/1/4 interface. Enable 802.1X authentication on ge-1/1/4, and configure access port ge-1/1/4 for multiple host mode authentication.

Procedure

Step1 Create VLANs on the switch for dynamic VLAN.

```
admin@XorPlus# set vlans vlan-id 300
admin@XorPlus# set vlans vlan-id 400
```

Step2 Configure the access ports to trunk mode.

```
admin@XorPlus# set interface gigabit-ethernet ge-1/1/1 family ethernet-switching port-mode trunk
admin@XorPlus# set interface gigabit-ethernet ge-1/1/2 family ethernet-switching port-mode trunk
admin@XorPlus# set interface gigabit-ethernet ge-1/1/3 family ethernet-switching port-mode trunk
admin@XorPlus# set interface gigabit-ethernet ge-1/1/4 family ethernet-switching port-mode trunk
```

Step3 Enable the authentication mode.

```
admin@XorPlus# set protocols dot1x interface ge-1/1/1 auth-mode mac-radius
admin@XorPlus# set protocols dot1x interface ge-1/1/2 auth-mode web
admin@XorPlus# set protocols dot1x interface ge-1/1/2 auth-mode mac-radius
admin@XorPlus# set protocols dot1x interface ge-1/1/3 auth-mode 802.1x
admin@XorPlus# set protocols dot1x interface ge-1/1/3 auth-mode mac-radius
admin@XorPlus# set protocols dot1x interface ge-1/1/4 auth-mode 802.1x
```

Step4 Configure IP address of AAA server, DNS server and CoA client.

```
admin@XorPlus# set protocols dot1x aaa radius authentication server-ip 10.10.51.4 shared-key pica8
admin@XorPlus# set protocols dot1x aaa radius dynamic-author client 10.10.51.4 shared-key pica8
admin@Xorplus# set system dns-server-ip 192.168.10.1
```

Step5 Configure a block VLAN for CWA authentication.

```
admin@Xorplus# set protocols dot1x block-vlan-id 200
admin@XorPlus# set interface gigabit-ethernet ge-1/1/2 family ethernet-switching native-vlan-id 200
admin@XorPlus# set vlans vlan-id 200 l3-interface vlan200
admin@XorPlus# set l3-interface vlan-interface vlan200 address 10.10.51.11 prefix-length 24
```

Step6 Configure the NAS IP address to the IP of the management interface eth0 which connected to the AAA server.

```
admin@XorPlus# set protocols dot1x aaa radius nas-ip 10.10.51.100
```

This command is to set the nas-ip field in RADIUS access-request message. If you use the management interface eth0/eth1 to connect to the AAA server, the IP address of the management interface eth0/eth1 should be used for the NAS IP address configured here.

Step7 Configure the host mode for NAC authentication interface.

```
admin@XorPlus# set protocols dot1x interface ge-1/1/3 host-mode multiple
admin@XorPlus# set protocols dot1x interface ge-1/1/4 host-mode multiple
```

Step8 Enable LLDP protocol for OUI learning from LLDP packets.

```
admin@XorPlus# set protocols lldp enable true
```

Step9 (Optional) Enable PoE function on the interface ge-1/1/3 if the IP telephone obtains power through the PoE port of the switch.

```
admin@XorPlus# set poe interface ge-1/1/3 enable true
```

Step10 Commit the configuration.

```
admin@XorPlus# commit
```

Verify the configuration

a) Run the **run show dot1x interface** or **run show dot1x interface gigabit-ethernet** <*interface-name*> to check the NAC authentication configurations. The command output shows that the NAC authentication has been enabled and the terminals are successfully authenticated on each port.

```
admin@Xorplus# run show dot1x interface
Interface  802.1x   MAC-RADIUS  WEB     HOST-MODE   Session-Timeout    CLIENT-MAC  CLIENT-STATUS
-------------------------------------------------------------------------------------------------------------
ge-1/1/1   disable  enable      disable      single(1)    0    f8:9e:01:9e:cc:a1    authorized
ge-1/1/2   disable  enable      enable       single(2)    0    23:5e:81:77:ac:a2    authorized
```

```
ge-1/1/3   enable   enable      disable      multiple(2)  0    ad:ee:02:45:d3:a3    authorized
                                                              6d:33:12:4b:ef:a4    authorized
ge-1/1/4   enable   enable      disable      multiple(3)  0    f2:3e:00:8a:90:a5    authorized
                                                              a2:44:00:5a:90:3d    authorized
                                                              56:33:a0:ee:f0:ab    authorized

admin@Xorplus# run show dot1x interface gigabit-ethernet ge-1/1/3
Interface ge-1/1/3:
============================================================
  Client MAC               : ad:ee:02:45:d3:a3
  Status                   : authorized
  Success Auth Method      : MAB
  Traffic Class            : Voice
  Dynamic VLAN ID          : 300 (active)
============================================================
  Client MAC               : 6d:33:12:4b:ef:a4
  Status                   : authorized
  Success Auth Method      : MAB
  Traffic Class            : Other
  Dynamic VLAN ID          : 400 (active)
============================================================
```

b) Use run show lldp neighbor command to check the LLDP neighbor information on interface ge-1/1/3.

```
admin@Xorplus# run show lldp neighbor
LLDP Remote Devices Information
LocalPort   ChassisId                PortId             Management Address  System Name      Platform           Ca
----------  -----------------------  -----------------  ------------------  ---------------  -----------------  --
ge-1/1/3    3C:2C:99:41:47:E1        ge-1/1/13          10.10.51.100        Xorplus          as4610_30t         B
```

c) The terminal can access the network after passed the corresponding authentication method.

Typical Configuration of NAC

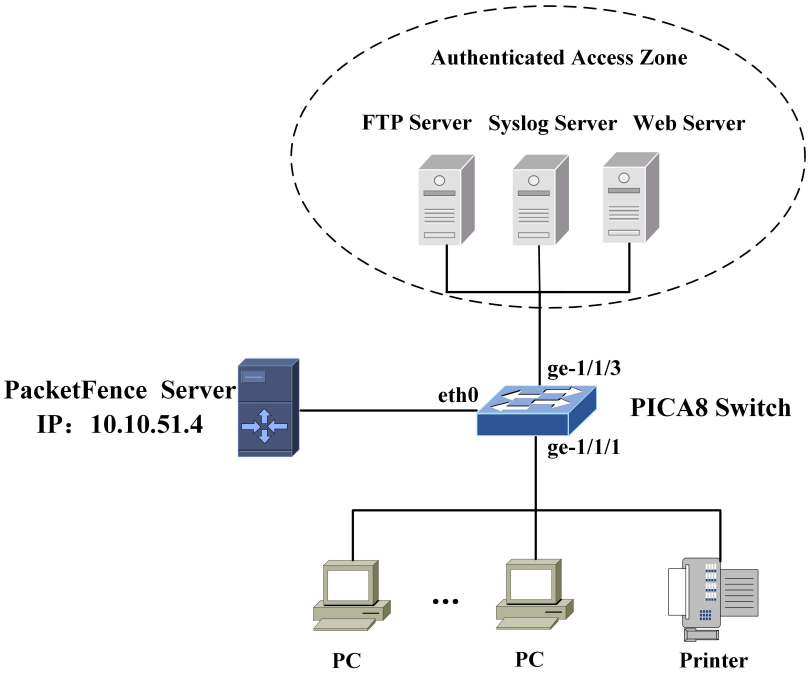
- Example for Configuring NAC (PacketFence as the Authentication Server)
- Solution Documents Download

Example for Configuring NAC (PacketFence as the Authentication Server)

Networking Requirements

As shown in **Figure 1**, a large number of user terminals access the Authenticated Access Zone of a company through ge-1/1/1 of the PICA8 Switch (as the access device). If the user terminals are not authenticated, any visitor may easily steal the company's confidential information or attack the company's intranet, resulting in an insecure intranet.

Figure 1. Networking Diagram for Configuring 802.1X Authentication



To ensure network access security, the administrator employs 802.1X authentication on the Switch and PacketFence server, to control the network access of the user terminals. The Switch allows the user terminals to access resources in the Authenticated Access Zone only when the 802.1X authentication is successfully passed.

There are both PCs and dumb terminals, such as printers and IP phones, connected to the enterprise network. In order to flexibly adapt to different authentication requirements from different access terminals in the user environment, both 802.1X authentication and MAB authentication should be deployed on the PICA8 access switch. Users can access the network through either 802.1X or MAB authentication, or both authentication modes.

Basic Configuration Plan

Table 1. PICA8 Switch Data Plan

Items	Data	Description
PICOS version	PICOS: 2.11.22	-
PacketFence server IP address	192.168.10.7	-
Shared-key	pica8	Make sure you enter the same secret key as shared-key on the PacketFence server when adding a PICA8 switch in PacketFence database.
Authentication mode	802.1x mac-radius	Enable both 802.1X and MAB authentication methods.
RADIUS dynamic authorization client for Change of Authorization (CoA)	192.168.10.7	-

Table 2. PacketFence Server Data Plan

Items	Data	Description
Switch IP address	192.168.10.10	The IP address of ge-1/1/2 on PICA8 switch, using in-band communication.
Access user	Username: pica8 Password: Pica8pica8	**Note:** Ethernet-EAP connection type means the client is connecting using 802.1X credentials.
	Connection Profile : Connection Type = Ethernet-EAP Sources: local	
MAC address of the connected dumb terminal device	MAC address: 00:00:06:00:00:07	No need to specify a username and password for MAC authentication in PacketFence database (the node's MAC address is used by the switch as the username and password when sending an Access Request on behalf of the client).
	Connection Profile : Connection Type=WIRED_MAC_AUTH	
RADIUS secret key	pica8	Make sure you enter this same secret key as shared-key on the switch when configuring 802.1X protocol on PICA8 switch.
RADIUS authentication methods	**MSCHAPv2** and **PEAP**	On the client side also set **PEAP** and **MSCHAPv2** for 802.1X configuration.

Configuration Notes

- The shared key must be consistently configured on PICA8 switch and the PacketFence server.
- On the client side also set **PEAP** and **MSCHAPv2** for 802.1X configuration which is same to the RADIUS authentication methods on PacketFence server.
- Make sure the 802.1X client software is installed and enabled on the client device.

Configuration Roadmap

1. Configure PICA8 Switch, including the VLAN to which the access interface belongs, parameters for connecting to the PacketFence server, and enabling 802.1X and MAB authentication.

> **NOTE:**
> Make sure network connection between PICA8 Switch and the PacketFence Server is reachable.

2. Configure the PacketFence server:
    a. Log in to the PacketFence server.
    b. Add a switch to the PacketFence server.
    c. Add a user and node to the PacketFence server.
    d. Add the secret key and Radius Authentication Methods on the PacketFence server.
    e. Packetfence configuration file changes and miscellaneous configurations.

Procedure

PICA8 Switch Configuration

Step1 Configure the VLAN interface.

```
admin@XorPlus# set vlans vlan-id 100
admin@XorPlus# set vlans vlan-id 200
admin@XorPlus# set interface gigabit-ethernet ge-1/1/1 family ethernet-switching port-mode trunk
admin@XorPlus# set interface gigabit-ethernet ge-1/1/3 family ethernet-switching native-vlan-id 200
admin@XorPlus# set vlans vlan-id 100 l3-interface vlan100
admin@XorPlus# set vlans vlan-id 200 l3-interface vlan200
admin@XorPlus# set l3-interface vlan-interface vlan100 address 192.168.10.10 prefix-length 24
admin@XorPlus# set l3-interface vlan-interface vlan200 address 192.168.20.10 prefix-length 24
```

Step2 Configure IP address of PacketFence server and the shared key.

```
admin@XorPlus# set protocols dot1x aaa radius authentication server-ip 192.168.10.7 shared-key pica8
```

Step3 Configure the NAS IP address to the L3 VLAN interface IP which connected to the RADIUS server.

```
admin@XorPlus# set protocols dot1x aaa radius nas-ip 192.168.10.10
```

This command is to set the nas-ip field in RADIUS access-request message. If you use the management interface eth0/eth1 to connect to the RADIUS server, the IP address of the management interface eth0/eth1 should be used for the NAS IP address configured here.

Step4 Enable 802.1X and MAB authentication mode on interface ge-1/1/1.

```
admin@XorPlus# set protocols dot1x interface ge-1/1/1 auth-mode 802.1x
admin@XorPlus# set protocols dot1x interface ge-1/1/1 auth-mode mac-radius
```

Step5 Configure the host mode to multiple for the interface ge-1/1/1.

```
admin@XorPlus# set protocols dot1x interface ge-1/1/1 host-mode multiple
```

Step6 (Optional) Configure a RADIUS dynamic authorization client from which the switch accepts Change of Authorization (CoA) messages.

```
admin@XorPlus# set protocols dot1x aaa radius dynamic-author client 192.168.10.7 shared-key pica8
```

Step7 Commit the configuration.

```
admin@Xorplus# commit
```

PacketFence Configuration

Step1 Login to the PacketFence server.

a) Go to Web login page at: https://*server-ip*:1443/admin/

b) Enter Username/password and click login. (You setup username/password during initial configuration of PacketFence)

Step2 Add a switch to the PacketFence server.

a) Click **Configuration** > **Switches** > **ADD SWITCH** > **default**.

b) Add switch with the switch IP address: 192.168.10.10.

c) Choose type as **Pica8** and mode as **production**.

d) Click on **Radius** tab and enter secret key. Make sure you enter this same secret key as shared-key on the switch when configuring 802.1X protocol on PICA8 switch.

e) Click on the Roles tab, make sure the Role mapping by VLAN ID is checked, also define your roles and the corresponding VLANs should be defined here.

f) For the **Deauthentication Method**, select RADIUS.

g) Make sure the **use CoA** box is checked.

h) Leave all other configuration as they are (default) and click Save to add the switch to PacketFence database.

Refer to **Figure 2** which illustrates adding a new switch to PacketFence.

Figure 2. Add PICA8 switch to PacketFence

Step3 Add a User to PacketFence Database.

For 802.1X authentication , we must first add all our users to the PacketFence database. The username and password are the two most important attributes in 802.1X authentication. We must make sure that username and password sent in the Access-Request by clients matches an entry in the PacketFence database otherwise 802.1X authentication won't be successful. Follow the steps below to add a User to PacketFence.

a) Click on **USERS** > **Create**.

b) Enter username, password and email address for this user.

c) You can enter other user details as per requirement like Firstname, Company etc.

d) Enter the time in **Registration Window** (mandatory).

e) In Action, Choose **Role** and then select a proper role for this user.

f) Choose appropriate access duration (mandatory).

g) Click **CREATE USERS** to save the user to PacketFence.

Refer to **Figure 3** below for an illustration.

Figure 3. Adding a User in PacketFence

Step4 Add a connection profile in Packetfence.

a) Click on **CONFIGURATION > Connection Profiles > ADD PROFILE**.

b) Give it any name and description, say dot1x.

c) Add a filter in dot1x profile, If Any,... Connection Type = Ethernet-EAP.

d) Choose sources as **local**.

e) For **Device registration** select default.

f) Leave the remaining options as they are (default values).

g) Click **Save** to save your changes.

Note: Ethernet-EAP connection type means the client is connecting using 802.1X credentials.

The above Connection Profile would be activated whenever 802.1X authentication requests are received at the PacketFence server.

Refer to **Figure 4** for illustration.

Figure 4. Adding a Connection Profile

Step5 Configure PacketFence for MAC Authentication.

For MAC authentication we need to perform the following steps:

a) Add a node to the PacketFence database (similar to how we add a node for 802.1X Authentication).

b) Add the MAC address: 00:00:06:00:00:07. Note: No need to specify a username and password for MAC authentication in PacketFence database (the node's MAC address is used by the switch as the username and password when sending an Access Request on behalf of the client).

c) Add a connection profile for MAC authentication. Even though we can have a single Connection Profile for both 802.1X and MAC authentications, it would be however, better if we have separate Connection Profile for the two different types of authentications. To add a MAC authentication profile follow the procedure mentioned in the 802.1X section of adding a Connection Profile with the exception of **Connection Type** in **Filter.** While adding a Connection Profile for MAC authentication, choose Connection Type as **WIRED_MAC_AUTH.** The rest of the procedure is same as that of the 802.1X.

Step6 Configure Radius Authentication Methods in Packetfence.

a) Click on **CONFIGURATION > System Config (bottom item on far left) > Authentication Methods**.

b) For EAP Auth Type, remove all methods except **MSCHAPv2** and **PEAP**, you can add **MD5** here as well if you wish to use MD5 with 802.1X.

c) Click **SAVE**.

d) On the client side also set **PEAP** and **MSCHAPv2** for 802.1X configuration.

Refer to **Figure 5** below for illustration.

Figure 5. Configuring Radius Authentication Methods

Step7 Miscellaneous configurations.

a) We need to change or set the way how PacketFence stores passwords in its database. For PICA8 switches, we need to save user passwords as plaintext. To achieve this follow the steps below:

Click on **Configuration > System Config > >dvanced > Database passwords hashing method >** choose **plaintext**.

b) To enable radius communication on the management interface we need to make the following changes to ensure radius messages are accepted on the management interface.

Click on **Configuration > Network Configuration > Interfaces >** click **eth0 > Type** = **Management**.

For the **Additionnal listening daemon**(s) choose **radius**.

Step8 Packetfence configuration file changes.

a) To allow local authentication with radius integrated with packetfence, uncomment the line *packetfence-local-auth* in **/usr/local/pf/conf/radiusd/packetfence-tunnel**.

b) To allow EAP-MD5 authentication, add **packetfence-eap-mac-policy** line just before **packetfence-eap-mac-policy** in file **/usr/local/pf/conf/radiusd/packetfence**

Note: It is recommended to use PEAP for 802.1X authentication as it is considered more secure compared to MD5.

Verify the Configuration

- Run the **run show dot1x interface** and **run show dot1x mab** command to check the 802.1X and MAB authentication configurations. The command output (**PortEnabled = true**) shows that the 802.1X authentication has been enabled on the interface ge-1/1/1 and MAC address 00:00:06:00:00:07 is successfully authenticated.

```
admin@Xorplus# run show dot1x interface gigabit-ethernet ge-1/1/1
Interface ge-1/1/1:
============================================================
  Client MAC              : 00:00:06:00:00:07
  Status                  : authorized
  Success Auth Method     : 802.1x
  Dynamic VLAN ID         : 200 (active)
============================================================
Client MAC                  : e0:db:55:cd:84:62
  Status                    : authorized
  Success Auth Method       : MAB
  Dynamic VLAN ID           : 200 (active)
============================================================
```

- The user starts the 802.1X client software on the terminal, enters the username and password, and starts authentication.
- If the user name and password are correct, there will be an authentication success message displayed. Then users can access the network through this port.

Appendix

A sample configuration file of the switch when using the out-of-band (OOB) management port (i.e. eth0) to connect to PacketFence is provided here.

```
# ge-1/1/11 and ge-1/1/13 are the access ports which have enabled 802.1x authentication.
  set interface gigabit-ethernet ge-1/1/11 family ethernet-switching port-mode "trunk"
  set interface gigabit-ethernet ge-1/1/13 family ethernet-switching port-mode "trunk"
  set protocols dot1x interface ge-1/1/11 auth-mode "mac-radius"
  set protocols dot1x aaa radius authentication server-ip 10.10.53.234 shared-key "test"
  set vlans vlan-id 10
  set vlans vlan-id 20
  set vlans vlan-id 30
```

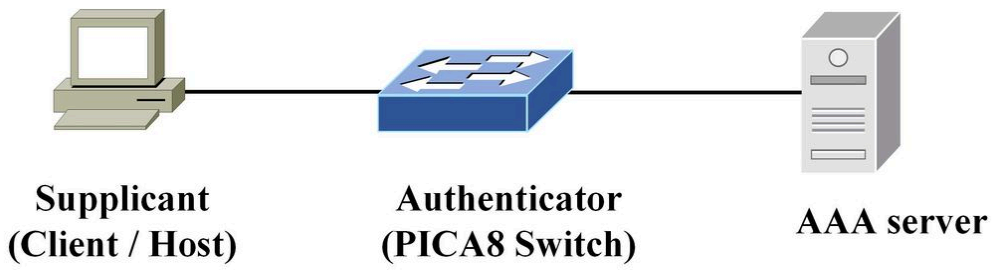
Introduction to NAC Authentication

Network Access Control (NAC) is a network access security function which controls the user authentication and access to the network resources through the access port.

As shown in **Figure 1**, the NAC authentication system is a typical Client/Server architecture which involves three components: Supplicant, Authenticator and AAA server.

Figure 1. Architecture of the NAC Authentication System



- **Supplicant**: The supplicant is the user device that wants access to the network resources through the switch. It is a client or a host that provides the user name and password to the authentication server to obtain network access rights.

- **Authenticator**: The PICA8 Switch functions as the authenticator in the NAC authentication system. As an authentication gateway device, PICA8 Switch transfers authentication information between the client and the authentication server, and controls network access and authorization of the client.
- **AAA server**: The authentication server is the entity that validates authentication credentials provided by the supplicant. RADIUS is a commonly used authentication server. The administrator configures the user's authentication and authorization information on the AAA server that is used to validate the client in the NAC authentication process and determine whether the client can access the network resources.

> **NOTE:**
>
> - The administrator needs to configure both the AAA server and PICA8 switch to deploy the NAC function successfully.
> - From PICOS version 2.11.22, the NAC authentication function is extended to support Web authentication, downloadable ACL and dynamic ACL.

Host Mode

Host Mode refers to whether a single or multiple clients are allowed access on a single switch port. PICOS NAC function is a combination of switch port and the client's MAC address learned on that switch port to implement user access control. Each switch port can be configured to operate in either **single** or **multiple** host mode**.**

- **single:** Only one user is allowed access to the switch port, unless the user goes offline other users will not be allowed access to the network. The authentication process will be reinitiated if the port is bounced or client is changed.
- **multiple:** Multiple clients connect to the network through the same switch port. If a user goes offline, the network access rights of other users are not affected. At most 8 clients are allowed to be authenticated on a single switch port, the ninth will be added into the pending list.

You can set the host mode of the interface by using command **set protocols dot1x interface** <*interface-name*> **host-mode** <**single** | **multiple**>. The default host mode is **single**. Note that changing host mode from CLI will cause re-authentication for all connected users of the port.

Server Fail VLAN

The purpose of a server fail VLAN is to provide limited network connectivity to users in the event of AAA server failure or unreachability. After a RADIUS server is configured, the switch sends Test Radius Request message to the server to detect the reachability of the RADIUS server. If all the RADIUS servers are unreachable, the port connected to the client will be added to the server fail VLAN, and the packets from the client can be forwarded in server fail VLAN. The switch continues to send the detection packets every second for 3 times (can be set by CLI command) to check whether the server is reachable. If one of the RADIUS servers is reachable, the switch removes this client from the server fail VLAN and adds it back into the block VLAN, and the switch stops sending the detective packets.

Users can use the **set protocols dot1x server-fail-vlan-id** <*vlan-id*> command to specify a server fail VLAN, the **run show dot1x server** command can be used to show the reachability of each RADIUS servers configured on the switch, **run show dot1x all** command can be used to view the NAC configuration information, including the server fail VLAN.

For example,

```
admin@Xorplus# run show dot1x server
Server-IP         Status        Priority  Retry-Interval  Retry-Num   Detect-Interval   Consecutive-Detect-Num
---------------   -----------   --------  --------------  ---------   ---------------   ----------------
10.10.51.70       reachable     2          5   Sec(s)      5          5   Sec(s)         8

admin@Xorplus# run show dot1x all
Global-Info:
--------------------------------------------------------------------------------
NAS-IP           :  10.10.1.1
```

```
Block-VLAN         :  2
Block-VLAN-IP        :  172.16.1.1/24
WEB-AUTH-MODE           :  Remote
Server-Fail-VLAN      :  100
--------------------------------------------------------------------------------
```

NOTE:

A maximum of 20 RADIUS servers can be configured on the switch. The reachable server with the smallest IP address will be used for NAC authentication.

Block VLAN and Dynamic VLAN

Block VLAN is a global configuration for NAC authentication. The port enabled with web authentication NAC feature will be added to the block VLAN automatically. Users in the block VLAN have very limited access network resources before being authenticated successfully through the web authentication portal. Block VLAN is a mandatory prerequisite for web authentication. If block VLAN is not specified, the switch won't allow the user to configure web authentication for any physical port.

The switch will move the clients from the block VLAN to an AAA server specified dynamic VLAN after successful authentication. If the RADIUS authentication server does not deliver a dynamic VLAN, then the client is moved to the native VLAN of the interface.

When configuring dynamic VLAN, you need to pay attention to the following points:

- On the switch, you need to use the **set vlans vlan-id** <*vlan-id*> command to create a dynamic VLAN in advance. And the link type of the port should be configured as trunk port.
- On the AAA server, you need to configure and deliver a dynamic VLAN. When configuring the dynamic VLAN, dynamic VLAN name is a string type, and its length must be less than or equal to 10 characters.
- Dynamic VLAN and block VLAN cannot be the same VLAN.

The L3 VLAN interface should be enabled on the block VLAN. The IP address of this VLAN-interface should be configured to establish a temporary connection between the user and the switch to complete the subsequent Web authentication process.

After creating a block VLAN, you can use the **run show vlans** command to view VLAN information.

NOTE:

When deploying voice VLAN feature together with NAC feature, pay attention the following points:

- It is strongly recommended not to use both voice VLAN and dynamic VLAN on the port enabled with NAC function, as this may cause voice traffic to be blocked.
- If the returned RADIUS access accept message includes an extra Pica8 vendor-specific-attribute (VSA)"pica8-traffic-class=voice", the dynamic VLAN will take precedence over the locally configured voice VLAN when making LLDP negotiation. If you want to transmit voice traffic through dynamic VLAN, please configure and deliver this VSA on AAA server.

Fallback to WEB Function

PICOS NAC function includes three authentication modes: 802.1X authentication, MAB authentication and Central Web Authentication (CWA). To use NAC to control users' network access rights, you must enable one or more authentication modes on a switch interface. Note that: CWA authentication process relies on MAB authentication. If you want to deploy CWA, you need to enable MAB authentication first.

PICOS supports fallback to WEB if 802.1X authentication fails. This function controls whether MAB authentication is performed when 802.1X authentication fails. Enabling or disabling fallback to WEB function leads to two different results.

1. Fallback to WEB function is disabled. This is the default configuration.

- When both 802.1X authentication and MAB authentication modes are enabled, the 802.1X authentication will take precedence over MAB.

If the Supplicant supports 802.1X authentication, the system performs 802.1X authentication. If the Supplicant does not support 802.1X authentication, the system performs MAB authentication.

For the former case, irrespective of whether 802.1X authentication is successful or not, MAB authentication will not be performed. It's important to note here that if the client sends in 802.1X credentials and the authentication fails for some reason, the switch will not initiate MAB authentication in case where both 802.1X and MAB are configured for the switch port.

If the 802.1X authentication fails, the switch will try the authentication process maximum of three times. If the authentication fails after trying three times, the switch will ignore any more request from the client in the EAP_TIME_OUT time (60 seconds) which is called a quiet time before the switch initiates re-authentication.

- If all three modes are enabled, the system considers 802.1X authentication and MAB authentication as described above. If the 802.1X authentication is not supported and the MAB authentication fails, the system will perform the CWA authentication mode for the client.

2. Fallback to WEB function is enabled.

- When both 802.1X authentication and MAB authentication modes are enabled, the 802.1X authentication will take precedence over MAB.

If the Supplicant supports 802.1X authentication, the system performs 802.1X authentication. If the Supplicant does not support 802.1X authentication, the system performs MAB authentication.

For the former case, if the 802.1X authentication fails, the system tries to perform MAB authentication. This is different from the scenarios when fallback to WEB function is disabled. Note that: It will not take dot1x authentication if already fallback to CWA until MAC ages out and learns again by cable plugging in/out or MAC address clearing.

- If all three modes are enabled, at first, the system considers 802.1X authentication and MAB authentication as described above. If the 802.1X authentication is not supported and the MAB authentication fails, the system will perform the CWA authentication mode for the client.

Comparison of the Three Authentication Modes

The application scenarios of the three authentication modes are different, the below table compares the three authentication modes.

Items	802.1X Authentication	MAB Authentication	CWA Authentication
Client Software	The 802.1X client software is required to be installed on the supplicant device.	Not required.	The supplicant needs to install a Web browser.
Characteristics	The Extensible Authentication Protocol (EAP) is used to exchange authentication information between the client, the switch and the authentication server. High security.	Complex management as it requires registering each MAC address on the AAA server.	Flexible deployment.
Scenarios	Applicable to scenarios where requirements for security are high.	Can be deployed in scenarios where 802.1X cannot be deployed. Authentication of dumb terminals such as printers and fax machines.	Applicable to temporary access or guest access scenarios.

802.1X Authentication

802.1X authentication is an authentication method that controls the network access rights of users based on the switch port and the MAC addresses of clients learned on that port. The Extensible Authentication Protocol (EAP) packet is used to exchange authentication information between the supplicant, authenticator and authentication server. This technology is mainly used in networks with high security requirements. 802.1X authentication requires 802.1X client software to be installed on the supplicant.

You can use the **set protocols dot1x interface** <*interface-name*> **auth-mode 802.1x** command to enable 802.1X authentication mode on an interface.

EAP Packet Exchange Process

The EAP packet exchange process is described as follows:

1. The EAP packets transmitted between the authenticator and supplicant are encapsulated in EAPOL format and transmitted across the LAN.
2. The authenticator and authentication server (a RADIUS server) exchange EAP packets in EAP relay mode. The authenticator encapsulates EAP packets in EAP over RADIUS (EAPOR) format and sends the packets to the RADIUS server for authentication. This authentication mode supports various EAP authentication methods, such as MD5- Challenge, EAP-TLS, and PEAP. However, the RADIUS server is required to support the corresponding EAP authentication methods. The credentials can be based on username/password or the certificate-based. You need to follow the configuration guide in this document to employ 802.1X authentication based on the username/password. However, certificate-based authentication does not need to do any configuration on the switch.

Authentication Trigger Types

The 802.1X authentication process can be initiated by either the client or the access device in the following two types:

- Triggered by the client

The client sends an EAPOL-Start packet to the access device to trigger authentication. The destination address of the packet is a multicast MAC address assigned by the IEEE 802.1X protocol: 01:80:C2:00:00:03.

- Triggered by the access device

For clients that cannot send EAPOL-Start packets proactively, the access device supports proactive trigger of the 802.1X authentication.

The access device sends a multicast EAP-Request/Identity packet to the client with the multicast MAC address 01:80:C2:00:00:03 to trigger 802.1X authentication every 30 seconds.

MAC Authentication Bypass (MAB) Authentication

Not all the network devices support 802.1X, such as a printer, camera, or a wireless phone. Such devices lack the supplicant feature which is needed to pass on the 802.1X authentication credentials between the client and the authentication server.

In this case, you can use MAC Authentication Bypass (MAB) function to authenticate network devices. You can use the **set protocols dot1x interface** <*interface-name*> **auth-mode mac-radius** command to enable MAB authentication mode on an interface.

When the interface enabled with MAB authentication learns the MAC address of the user, PICOS will perform the MAB authentication process. During the authentication process, the user is not required to manually enter a username or password. The user's MAC address will be encapsulated as the user-name and password in a RADIUS Access Request packet and sent to the AAA server. The port will be opened to the user with this MAC address only if MAB authentication is passed successfully. This technology is suitable for environments where the MAC address is fixed and the security requirements are not very high. At the same time, it can meet the authentication requirements of terminals such as printers that cannot install the 802.1X authentication client software.

When the MAC entry is aged or deleted, the user session with this source MAC will be disconnected. MAB authentication will be performed again if the user wants to access the network resources through this port.

Central Web Authentication (CWA)

Introduction

Central Web Authentication (CWA) provides a means to enterprise network administrators to allow guests on the network some form of access to network resources, which is also referred to as Web authentication. This feature is particularly helpful because guest users usually do not have proper 802.1X or MAC Radius credentials saved on the authentication servers.

With Web authentication feature, PICA8 switches can now provide an additional feature to guest users to use their web browser to access a login page where they can provide either authentication credentials for guests or simply accept a use-policy to access the network. In centralized web authentication environment, the PICA8 switch works as a proxy between the authentication server and user. When the user connects to the network and tries to access a Web page, the user is redirected to the authentication page on the Web authentication server. Only after entering the correct username and password can the user successfully access the network resources.

You can use the **set protocols dot1x interface** <*interface-name*> **auth-mode web** command to enable WEB authentication mode on an interface.

NOTE:

- The Web authentication process relies on MAB authentication. If you want to deploy Web authentication, enable MAB authentication on the switch first.

Ø From CLI configuration, you need to enable MAB authentication before enabling CWA authentication.

Ø The CWA authentication works in conjunction with MAB authentication. The CWA authentication process will be implemented after the MAB authentication fails.

- To implement CWA authentication, there are a series of configurations on both the switch and AAA server, for details of how to configure CWA, please refer to section Example for Configuring CWA Authentication and the solution documentation Configuring Pica8 Switches with ClearPass Guest Central Web Authentication in Typical Configuration of NAC.
- Both L2 and L3 connections between the client and the switch are supported when deploying CWA authentication.

Redirect URL

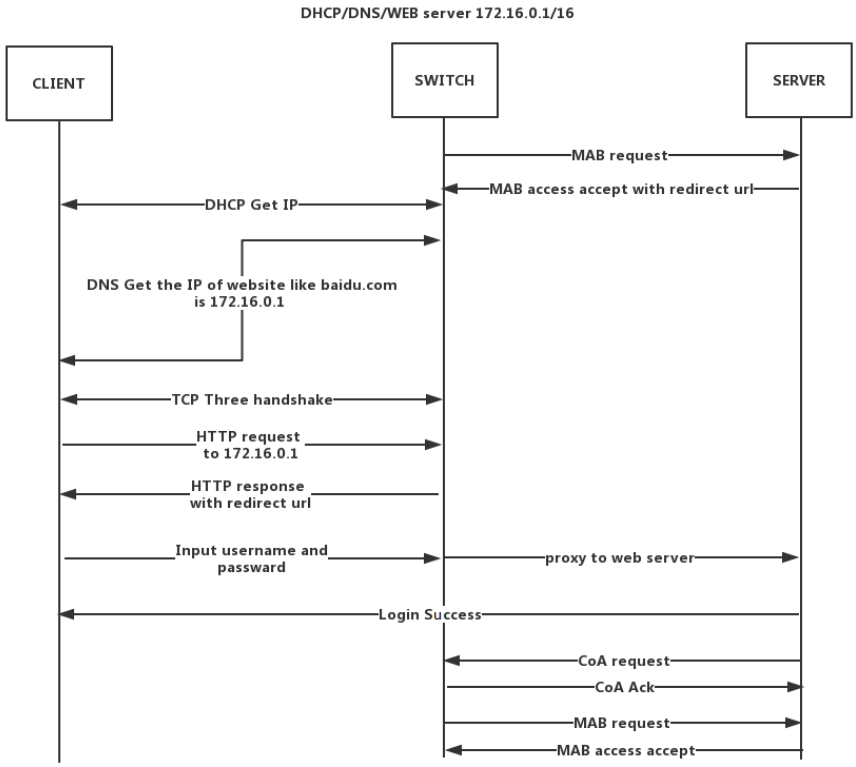
In the CWA authentication process, when the user connects to the network and tries to access a web page, the user is redirected to the authentication page on the web authentication server. Only after entering the correct username and password can the user successfully access the network resources.

The Redirect URL is a vendor-specific attribute (VSA) of type string defined on the AAA server. The attribute name is **Pica8-Redirect-URL** and the attribute ID number is **4** in the PICA8 RADIUS dictionary. To use the Redirect URL VSA the user has to import PICA8 RADIUS dictionary to AAA server. For details about how to import PICA8 RADIUS dictionary, please refer to the document How to Import PICA8 RADIUS Dictionary.

CWA Authentication Process

Figure 2 shows the CWA authentication process.

Figure 2. CWA authentication process



1. The client is connected to the switch port and its MAC address is learned by the switch. The switch sends an MAB Request message to the AAA server to initiate MAB authentication for the guest user. The message carries the MAC address of the client as the authentication username and password.
2. As the client's MAC address is an unregistered address on the AAA server, the MAB authentication fails. However, the AAA server is configured in such a way that an Access-Accept message is sent to the switch with a redirect URL for unregistered users.
3. The client interacts with the switch to obtain a temporary IP address from the DHCP server running in the block VLAN.
4. DNS resolution is done locally on DNS server running on the switch. Domain names such as www.example.com are resolved to the block VLAN interface IP address (e.g. 172.16.0.1) instead of its actual IP address. It’s important to note that both the DNS and DHCP server have the same IP address as the block VLAN interface IP address of 172.16.0.1.
5. The client and the switch perform a TCP three-way handshake to establish a TCP connection.
6. Then the client opens a web browser, initiates an HTTP access request.
7. The switch replies to the client with the redirect URL in the HTTP response. The Switch gets the IP address of CWA server (is included in the re-directio URL) resolved by the configured DNS.
8. The client’s request is redirected to the redirect URL page on the AAA server that requires the client to enter the username and password.
9. After the client enters the correct username and password, login succeeds. AAA server sends a CoA bounce-port command to the switch.
10. The switch and AAA server perform MAB authentication on the client MAC address again. This time the client is a known client to the AAA server, so another Access-Accept message is sent along with a dynamic VLAN ID. The switch port is then put into the dynamic VLAN.
