1. Introduction

This manual provides essential information for the proper installation, operation, and maintenance of your Briggs & Stratton 590406 Piston Assembly. This component is an Original Equipment Manufacturer (O.E.M.) authorized part designed for various Briggs & Stratton engine models. Adhering to these instructions will help ensure the longevity and optimal performance of your engine.

The Briggs & Stratton 590406 Piston Assembly includes the piston, connecting rod, and piston rings, which are critical components for the internal combustion process in your engine.

2. Safety Information

Always prioritize safety when working with engine components. Failure to follow safety precautions can result in serious injury or damage to equipment.

- **Read the Engine Manual:** Before beginning any work, consult your specific engine's service manual for detailed disassembly and reassembly procedures, torque specifications, and safety warnings.
- **Wear Protective Gear:** Always wear appropriate personal protective equipment, including safety glasses, gloves, and hearing protection if necessary.
- **Disconnect Power:** Ensure the engine is completely shut off, cooled down, and spark plug wire is disconnected to prevent accidental starting.
- **Work in a Ventilated Area:** If using cleaning solvents or lubricants, ensure adequate ventilation.
- **Use Correct Tools:** Employ the proper tools for each task to prevent damage to parts and ensure secure fastening.
- **Keep Children and Pets Away:** Maintain a safe working environment free from distractions.
- **California Proposition 65 Warning:** This product may expose you to chemicals known to the State of California to cause cancer and birth defects or other reproductive harm. For more information, visit www.P65Warnings.ca.gov.

3. Package Contents

The Briggs & Stratton 590406 Piston Assembly package typically includes the following components:

4. Installation

Installation of the piston assembly requires careful attention to detail and adherence to manufacturer specifications. This is a general guide; always refer to your specific engine's service manual for precise instructions and torque values.

4.1 Pre-Installation Checks

1. **Inspect Components:** Carefully examine all parts of the new piston assembly for any signs of damage or manufacturing defects.
2. **Cylinder Bore Preparation:** Ensure the cylinder bore is clean, free of debris, and properly honed. A cross-hatch pattern is essential for proper ring seating.
3. **Check Ring Gaps:** Before installing rings on the piston, insert each ring into the cylinder bore (squarely) and measure the end gap with a feeler gauge. Compare this to your engine's service manual specifications. Adjust if necessary by filing the ring ends.

4. **Cleanliness:** Thoroughly clean all engine components that will come into contact with the new assembly.

4.2 Piston Ring Installation

1. **Oil Ring Expander:** Install the oil ring expander into the lowest groove on the piston.
2. **Oil Ring Rails:** Install the two thin oil ring rails, one above and one below the expander. Ensure the gaps are staggered.
3. **Second Compression Ring:** Install the second compression ring (usually the darker or tapered one) into the middle groove. Note any "TOP" markings or taper direction.
4. **Top Compression Ring:** Install the top compression ring (usually chrome or shiny) into the uppermost groove. Note any "TOP" markings.
5. **Stagger Gaps:** Once all rings are installed, rotate them so that all ring end gaps are staggered at 90 or 120-degree intervals around the piston circumference, away from the piston pin bore.

4.3 Connecting Rod and Piston Pin Assembly

1. **Lubricate:** Apply clean engine oil to the piston pin, piston pin bore, and connecting rod small end bore.
2. **Assemble:** Align the connecting rod with the piston, ensuring any directional markings on the piston (e.g., "FRONT" or an arrow) and connecting rod are correctly oriented towards the front of the engine. Insert the piston pin through the piston and connecting rod.
3. **Secure Pin:** Install the piston pin retainers (circlips) into their grooves on both sides of the piston to secure the pin. Ensure they are fully seated.

4.4 Piston and Connecting Rod Installation into Engine

1. **Lubricate:** Liberally lubricate the piston skirt, piston rings, and cylinder bore with clean engine oil.
2. **Compress Rings:** Use a piston ring compressor to compress the piston rings. Ensure the ring compressor is properly sized and positioned.
3. **Insert Piston:** Carefully insert the piston assembly into the cylinder bore, ensuring the directional markings on the piston (e.g., "FRONT" or an arrow) are facing the correct direction (typically towards the flywheel or camshaft, consult engine manual). Gently tap the piston crown with a rubber mallet or wooden block until the rings enter the cylinder.
4. **Connect to Crankshaft:** Guide the connecting rod onto the crankshaft journal. Install the connecting rod cap, ensuring any alignment marks on the rod and cap match.
5. **Torque Bolts:** Install and torque the connecting rod bolts to the specifications provided in your engine's service manual. Use a torque wrench for accuracy.
6. **Final Checks:** Rotate the crankshaft manually to ensure smooth movement of the piston and connecting rod without binding.

5. Maintenance

While the piston assembly itself does not require routine maintenance after proper installation, its longevity is directly tied to the overall health and maintenance of the engine.

- **Regular Oil Changes:** Follow the engine manufacturer's recommendations for oil type and change intervals. Clean oil is crucial for lubricating the piston, rings, and cylinder walls, preventing premature wear.
- **Maintain Air Filter:** A clean air filter prevents abrasive particles from entering the engine and causing wear to the cylinder bore and piston rings.
- **Proper Fuel:** Use the recommended fuel type and ensure it is fresh and clean to prevent carbon buildup on the piston crown and rings.
- **Avoid Overheating:** Ensure the engine cooling system (if applicable) is functioning correctly to prevent excessive

heat, which can damage piston rings and cause piston seizure.

6. Troubleshooting

If you experience issues after installing the piston assembly, consider the following common problems and their potential causes:

Problem	Possible Cause	Solution
Engine knocking/tapping noise	Incorrect connecting rod bolt torque; damaged connecting rod bearing; piston slap due to incorrect piston size or excessive cylinder wear.	Recheck connecting rod bolt torque. Inspect connecting rod bearing for wear. Verify piston and cylinder bore dimensions.
Excessive oil consumption/blue smoke	Piston rings not seated properly; incorrect ring gap; damaged or improperly installed oil control ring; worn cylinder bore.	Ensure proper cylinder honing and ring seating. Verify ring gaps and installation. Inspect cylinder bore for wear.
Loss of compression/hard starting	Piston rings not sealing; broken piston ring; incorrect ring installation; damaged piston.	Perform a compression test. Inspect piston and rings for damage or improper installation.
Engine seizure	Lack of lubrication; overheating; incorrect piston-to-cylinder clearance.	Ensure adequate oil level and proper cooling. Verify piston and cylinder bore dimensions.

If you are unable to resolve an issue, it is recommended to consult a qualified engine technician or contact Briggs & Stratton customer support.
