5. Setup

1. **Unpack:** Remove all packaging materials and ensure all components are present.
2. **Placement:** Place the pizza oven on a flat, stable, and heat-resistant surface. Ensure there is adequate clearance (at least 10-15 cm) around the oven for ventilation.
3. **Initial Cleaning:** Wipe the exterior of the oven with a damp cloth. The ceramic pizza stone should not be washed with water; wipe it with a dry cloth if necessary.

4. **Power Connection:** Plug the power cord into a grounded electrical outlet (220-240V, 50/60Hz).
5. **First Use Burn-Off:** Before cooking, operate the oven empty for 10-15 minutes at maximum temperature to burn off any manufacturing residues. A slight odor or smoke is normal during this process. Ensure good ventilation. Allow the oven to cool completely afterward.

6. Operating Instructions

6.1 Preheating the Oven

1. Close the oven lid.
2. Turn both the upper and lower temperature control knobs to your desired setting, typically maximum (420°C) for traditional pizza.
3. Allow the oven to preheat for approximately 5-10 minutes. The integrated thermometer will indicate when the desired temperature is reached. For best results, allow the stone to heat thoroughly for at least 10 minutes after

the target temperature is reached.

6.2 Cooking Your Pizza

Image: A freshly baked pizza resting on the ceramic stone inside the KLAIF Electric Pizza Oven, ready to be served.

1. Once preheated, carefully open the oven lid using the heat-resistant handle.
2. Place your pizza directly onto the hot ceramic pizza stone. A pizza peel (not included) is recommended for easy transfer.
3. Close the lid immediately to retain heat.
4. Monitor the cooking process through the viewing window. Cooking times vary depending on pizza thickness, toppings, and desired crispness, but typically range from 3 to 5 minutes.
5. You can adjust the upper and lower heating elements independently during cooking to achieve perfect results. For example, if the crust is browning too quickly, you can lower the bottom element's temperature.
6. For even cooking, you may gently lift and rotate the pizza stone using its handles without fully opening the oven.
7. When the pizza is cooked to your preference, carefully remove it using a pizza peel.
8. Close the lid to maintain oven temperature for the next pizza.

6.3 Tips for Best Results

- Use fresh dough for the best texture.
- Avoid overloading your pizza with toppings, as this can lead to uneven cooking.

- Lightly flour your pizza peel to prevent sticking.
- For a crispier crust, ensure the pizza stone is fully preheated.
- Experiment with different temperature settings for various pizza styles.

7. Cleaning and Maintenance

Proper cleaning and maintenance will extend the life of your KLAIF Electric Pizza Oven.

1. **Always Unplug:** Ensure the oven is unplugged from the power outlet and completely cooled before cleaning.
2. **Pizza Stone Cleaning:** The ceramic pizza stone should **NOT** be washed with water or soap. After it has cooled, scrape off any burnt-on food residues with a plastic scraper or a stiff brush. For stubborn stains, you can gently sand the surface with fine-grit sandpaper. The stone will naturally darken over time, which is normal and does not affect performance.
3. **Exterior Cleaning:** Wipe the exterior surfaces of the oven with a damp cloth. Do not use abrasive cleaners or

scouring pads, as they may damage the finish.

4. **Interior Cleaning:** For the interior metal surfaces, wipe with a damp cloth. Ensure no water enters the heating elements or electrical components.
5. **Storage:** Store the oven in a dry place when not in use.

8. Troubleshooting

Problem	Possible Cause	Solution
Oven does not heat up.	Not plugged in; power outlet issue; control knobs not set.	Ensure oven is securely plugged in. Check power outlet. Turn control knobs to desired temperature.
Pizza is not crispy.	Insufficient preheating time; stone not hot enough; too many toppings; dough too thick.	Allow oven and stone to preheat for at least 10-15 minutes. Reduce toppings. Use thinner dough.
Pizza burns too quickly.	Temperature too high; pizza left in too long.	Lower temperature settings, especially the upper element. Monitor closely through the viewing window and remove promptly.
Smoke or odor during first use.	Manufacturing residues burning off.	This is normal. Ensure good ventilation. It should subside after initial use.
