microcontroller's range of application and making the process of program testing easier. In addition to these modules, it is also possible to use numerous additional modules linked to the development system through the I/O port connectors. Some of these additional modules can operate as stand-alone devices without being connected to the microcontroller.

3.3V REG Additional Board

The 3.3V REG additional board is used to reduce the power supply voltage. The additional board should be provided with a 5V DC voltage via a screw terminal CN1. This voltage is reduced and stabilized by using the on-board voltage regulator MC33269DT-3.3. The reduced voltage amounts to 3.3V and is delivered from the additional board via a screw terminal CN2. The maximum current for the 3.3V voltage amounts to 800mA.

SUPPORT

If you want to learn more about our products, please visit our website at www.mikroe.com

If you are experiencing some problems with any of our products or just need additional information, please place your ticket at www.mikroe.com/en/support

If you have any questions, comments or business proposals, do not hesitate to contact us at office@mikroe.com
