STRONGER DEVICE SECURITY

Keeping your tech (and your sensitive data) safer online is simpler than you might think. No device connected to the internet can ever be 100% protected, but smart online habits, common sense and some simple technical know-how can save you and your technology a heap of hassle.

1. Keep your software and operating system up to date.
2. Use anti-virus protection and your operating system's firewall.

3. Use strong passwords and a reliable password manager.
4. Use two-factor authentication.
5. Protect your sensitive personal information, including your name, address, phone numbers, date of birth, social security number, IP address and location details.
6. Learn about phishing scams and how to identify them.
7. Address mobile security, including using a secure passcode, keeping your device updated and other privacy protections as you would an office computer.
8. Back up data regularly.
9. Avoid public WiFi (or if you have to, use a Virtual Private Network).
10. Review your online accounts and credit reports regularly for changes.
