### 4. INSTALLATION INSTRUCTIONS

---

Follow these steps carefully to replace your oven door seal:

1. **Power Disconnection:** Ensure the oven is completely disconnected from the electrical supply at the wall socket or circuit breaker.
2. **Cool Down:** Allow the oven cavity and door to cool down completely to avoid burns.
3. **Remove Old Seal:** Gently pull the old door seal away from the oven frame. Most seals are held in place by clips or hooks that fit into small holes around the oven cavity opening. Note the orientation of the old seal for reference.
4. **Clean Surface:** Clean the area around the oven door frame where the seal sits. Remove any food debris, grease, or residue that could prevent the new seal from seating properly.
5. **Install New Seal:** Starting from one corner, carefully push the clips or hooks of the new Neff B1140W1GB/01 door seal into the corresponding holes in the oven frame. Work your way around the entire perimeter of the oven door opening, ensuring each clip is securely seated.
6. **Check Fit:** Once installed, gently press along the entire length of the seal to ensure it is firmly in place and forms a continuous, even barrier. The seal should not be twisted or kinked.
7. **Reconnect Power:** Reconnect the oven to the main power supply.

### 5. OPERATING CHECK

---

After installation, perform a quick check to ensure proper function:

- Close the oven door gently. It should close smoothly and feel secure.
- Visually inspect the seal around the entire door perimeter to confirm there are no gaps or areas where the seal is compressed unevenly.
- Turn on the oven to a low temperature (e.g., 100°C / 212°F) for a few minutes. Carefully feel around the door seal for any escaping heat. A properly installed seal should prevent significant heat leakage.

### 6. MAINTENANCE

---

- **Regular Cleaning:** Periodically wipe the oven door seal with a damp cloth and mild detergent to remove food splatters and grease. Ensure the oven is cool before cleaning.
- **Avoid Harsh Chemicals:** Do not use abrasive cleaners, scouring pads, or harsh chemical oven cleaners on the door seal, as these can damage the material and compromise its sealing ability.
- **Inspection:** Regularly inspect the seal for any signs of wear, cracks, tears, or hardening. A damaged seal should be replaced promptly to maintain oven efficiency and safety.

### 7. TROUBLESHOOTING

---

Problem	Possible Cause	Solution
Heat escaping from oven door	Seal not properly seated; Seal damaged or worn; Incorrect seal type.	Ensure all clips are securely in place. Inspect the seal for damage and replace if necessary. Verify the seal is the correct model for your oven.
Oven door not closing properly	Seal is twisted or kinked; Obstruction preventing door closure.	Re-seat the seal, ensuring it lies flat and untwisted. Check for any debris or objects obstructing the door's path.
