## 6. TROUBLESHOOTING

### 6.1 No Internet Access

- **Check Connections:** Ensure all cables (power, WAN, LAN) are securely connected.
- **Restart Devices:** Power off your modem and router, wait 30 seconds, then power on the modem first. Once the modem is fully online, power on the router.
- **Verify WAN Settings:** Log into the router's web interface and check the WAN settings to ensure your internet connection type (e.g., DHCP, PPPoE) is correctly configured.

### 6.2 Wi-Fi Not Visible or Cannot Connect

- **Wi-Fi Enabled:** Confirm that the wireless function is enabled in the router's web interface.
- **Correct Password:** Double-check that you are entering the correct Wi-Fi password (case-sensitive).
- **Channel Interference:** In the router settings, try changing the Wi-Fi channel to a less congested one (e.g., 1, 6, or 11).

### 6.3 Slow Connection Speed

- **Router Placement:** Position the router in a central location, away from obstructions and other electronic devices that may cause interference.
- **Firmware:** Ensure your router's firmware is up to date.

- **Connected Devices:** Too many devices connected simultaneously can reduce speed. Consider limiting usage or upgrading your internet plan.
