Safety Information

- Read all instructions thoroughly before attempting installation.
- Do not use with water that is microbiologically unsafe or of unknown quality without adequate disinfection before or after the system.
- Ensure the filter is securely installed to prevent leaks.
- Keep out of reach of children.

Installation Instructions

Follow these steps to install your new Denali Pure water filter:

1. **Locate Filter Compartment:** Identify the water filter compartment in your refrigerator. This is typically located in the upper right corner of the fresh food section, or in the grille at the bottom of the refrigerator.

2. **Remove Old Filter:** Twist the old filter counter-clockwise until it releases from the filter housing. Pull the old filter straight out. A small amount of water may drip out; this is normal.
3. **Prepare New Filter:** Remove the protective cap from the new Denali Pure filter.
4. **Insert New Filter:** Push the new filter into the housing and twist it clockwise until it stops and is securely seated. You may feel a slight resistance as the filter seals.
5. **Flush System:** After installation, dispense approximately 2.5 gallons (about 10 liters) of water through the refrigerator dispenser to flush out air and carbon fines. The water flow may be intermittent initially as air is purged from the system.
6. **Check for Leaks:** Inspect the filter area for any signs of water leakage. If a leak occurs, re-seat the filter or contact support.
7. **Reset Filter Indicator:** If your refrigerator has a filter change indicator light, consult your refrigerator's user manual for instructions on how to reset it.

Operating Instructions

Once the filter is installed and flushed, your refrigerator's water dispenser and ice maker will provide filtered water. No special operating procedures are required beyond regular use.

Maintenance

For optimal performance and to ensure continuous access to clean, filtered water, it is recommended to replace your Denali Pure water filter every **6 months** or after filtering **300 gallons (1136 liters)**, whichever comes first. Regular replacement helps maintain water quality and flow rate.

Troubleshooting

Problem	Possible Cause	Solution

Problem	Possible Cause	Solution
Slow water flow from dispenser	Clogged filter, air in system, low water pressure	Flush the system for 2-3 minutes. If problem persists, replace filter. Check household water pressure.
Water leaking from filter area	Filter not seated correctly, damaged O-ring	Remove and re-install the filter, ensuring it is twisted clockwise until secure. Inspect O-rings for damage.
Bad taste or odor in water	New filter not flushed, filter expired, contamination	Flush the system thoroughly. If taste persists, replace the filter. Ensure filter is replaced every 6 months.
No water from dispenser	Filter not installed, water supply off, frozen water line	Ensure filter is correctly installed. Check if refrigerator water supply valve is open. Thaw any frozen lines.
