Microsoft Wireless Display Adapter (Model P3Q-00001) - Instruction Manual

INTRODUCTION

The Microsoft Wireless Display Adapter allows you to wirelessly project content from your Miracast-enabled tablet, laptop, or smartphone to an HDTV or monitor. This device utilizes Wi-Fi CERTIFIED Miracast technology, enabling you to display various content, including movies, personal photos, games, websites, and presentations, on a larger screen. It is compatible with Windows 10 and Windows 8.1 devices, as well as Intel Wireless Display (WiDi) capable devices. Please note that it is not compatible with Surface RT.

SETUP INSTRUCTIONS

1. Physical Connection

To set up the Microsoft Wireless Display Adapter, plug the HDMI connector into an available HDMI port on your HDTV or monitor. Then, plug the USB connector into a USB port on the same display for power. If the USB port is not conveniently located, you may use a USB extension cable (not included) or a USB power adapter (not included) to provide power.

2. Wireless Connection (Miracast)

Once the adapter is powered and connected to your display, switch your display's input to the corresponding HDMI port. The display will show a waiting screen. On your Miracast-enabled Windows 10/8.1 device or compatible Android device, initiate the screen mirroring or casting function. For Windows, typically access this via the Action Center (Windows key + A) and select "Connect," then choose the Microsoft Wireless Display Adapter from the list. For Android, look for "Cast," "Screen Mirroring," or "Smart View" in your quick settings or display settings.

Video: Connecting to a Display

Your browser does not support the video tag.

Video Description: This video demonstrates how to connect a device to a monitor using a USB-C to HDMI adapter or a USB-C to USB-C cable, and also shows the wireless connection process using a Miracast adapter. It highlights the desktop-like experience on a connected display, including floating windows, desktop versions of Microsoft Office, web browsing, file management, and game controller support. The video also details the Microsoft Miracast adapter, its wired and wireless connection capabilities, and the resolution limitations of wireless connections.

OPERATING INSTRUCTIONS

Once connected, your device's screen will be mirrored or extended to the connected display. You can typically choose between "Duplicate" (mirroring your device's screen) or "Extend" (using the external display as a second monitor) modes through your device's display settings. For optimal performance, ensure your device is within a reasonable range of the adapter.

Display Modes:

- **Duplicate:** Your device's screen content is shown on the external display.
- **Extend:** The external display acts as an additional screen, allowing you to drag windows and content between your device and the external display.

For Windows devices, you can access display settings by right-clicking on the desktop and selecting "Display settings" or by using the Action Center. For Android devices, these options are usually found within the "Display" section of the device's main settings.

TROUBLESHOOTING

- **No Display:** Ensure the adapter is correctly plugged into both the HDMI and USB ports of your display. Verify that your display is set to the correct HDMI input.
- **Connection Issues:** Ensure your device's Wi-Fi is enabled (even if not connected to a network) as Miracast uses Wi-Fi Direct. Restart both your source device and the display adapter. Check for any available firmware updates for the adapter via the Microsoft Wireless Display Adapter app (Windows only).
- **Lag or Stuttering:** Wireless connections may experience some latency, especially with fast-paced content like gaming. Ensure your device is close to the adapter and there are no significant obstructions. Wired connections (if using a USB-C to HDMI cable/adapter) generally offer lower latency.
- **Incompatible Device:** The adapter is compatible with Miracast-enabled Windows 10/8.1 devices and Intel WiDi devices. It is not compatible with Surface RT. Verify your device supports Miracast.
- **Audio Not Playing on TV:** On your source device, ensure the audio output is directed to the Wireless Display Adapter. This setting is usually found in your device's sound or display settings.
