Troubleshooting

Problem	Possible Cause	Solution
Skillet does not heat up.	Not plugged in; temperature controller not fully inserted; power outlet issue.	Ensure the power cord is securely plugged into a working outlet. Verify the temperature controller is fully inserted into the skillet's receptacle. Check the circuit breaker.
Food sticks to the surface.	Insufficient preheating; damaged non-stick coating; using metal utensils.	Allow the skillet to preheat fully. Ensure only wooden, plastic, or silicone utensils are used. Avoid abrasive cleaners.
Uneven heating.	Temperature controller not properly calibrated or inserted.	Ensure the temperature controller is fully and correctly inserted. The Rock.Tec technology is designed for even heat distribution; if issues persist, contact customer support.
Burn marks or discoloration on the surface.	Normal wear and tear; excessive heat settings; food residue.	Some discoloration around the heating element is normal over time. Ensure you are not consistently using excessively high heat settings. Clean thoroughly after each use to prevent residue buildup.
Non-stick coating flaking or peeling.	Use of metal utensils; abrasive cleaning; extreme temperature changes.	Always use non-metal utensils. Clean with soft sponges only. Avoid sudden temperature changes (e.g., plunging hot skillet into cold water). This issue is typically not covered under warranty if caused by misuse.
