SETUP

1. Initial Inspection

Upon unpacking, carefully inspect all components for any signs of damage. Ensure all parts listed in

the 'Included Components' section are present.

2. Attaching the Guitar Strap

Locate the two strap buttons on your guitar (one near the neck joint, one at the bottom of the body). Securely attach the guitar strap to both buttons.

3. Tuning the Guitar

1. Attach the clip-on tuner to the headstock of your guitar.
2. Pluck each string individually. The tuner will display the note being played.
3. Adjust the corresponding tuning peg until the tuner indicates the correct pitch for each string. Standard tuning from thickest to thinnest string is E-A-D-G-B-e.
4. Gently stretch each string after initial tuning to help it settle, then re-tune as necessary. New strings may require frequent re-tuning initially.

4. Connecting the Amplifier

1. Ensure the amplifier's power switch is OFF and the volume is set to minimum.
2. Connect one end of the instrument cable to the output jack on your guitar.
3. Connect the other end of the instrument cable to the 'Input' jack on the amplifier.
4. Plug the amplifier's power cord into a suitable power outlet.

OPERATING YOUR KIT

1. Guitar Controls

- **Volume Knob:** Rotate clockwise to increase volume, counter-clockwise to decrease.
- **Tone Knobs:** Adjust these to shape the brightness or warmth of your sound.
- **Pickup Selector:** Move the switch to select different pickups or combinations for varied tones.
- **Whammy Bar:** Gently push or pull the tremolo arm to create vibrato effects. Use sparingly to maintain tuning stability.

2. Amplifier Operation

1. With the guitar connected and amplifier volume at minimum, turn the amplifier's power switch ON.
2. Slowly increase the amplifier's volume to a desired level.
3. Experiment with the 'Gain' control to add overdrive or distortion to your sound.
4. Adjust 'Treble' and 'Bass' controls to fine-tune your amplifier's tone.
5. For private practice, plug headphones into the 'Headphone Output' jack. This will mute the amplifier's speaker.

MAINTENANCE

- **Cleaning:** Regularly wipe down your guitar and amplifier with the provided cleaning cloth to remove dust and fingerprints.
- **String Replacement:** Replace strings when they become old, dull-sounding, or break. Use the included spare strings or a new set of your preferred gauge. A string winder (not included in JSON, but mentioned in video) can assist with this.
- **Storage:** When not in use, store your guitar in the gig bag to protect it from dust, humidity, and physical damage.
- **Temperature and Humidity:** Avoid exposing your guitar to extreme changes in temperature or humidity, as this can affect the wood and tuning stability.

TROUBLESHOOTING

- **No Sound:** Check all cable connections, ensure the amplifier is powered on and volume is up, and verify the guitar's volume knob is not at zero.
- **Buzzing Sound:** Ensure the instrument cable is fully inserted. Check if strings are properly seated in the bridge saddles and nut. If buzzing persists, consult a guitar technician.
- **Tuning Instability:** New strings require stretching and frequent re-tuning. Ensure tuning pegs are tight. Extreme temperature changes can also affect tuning.
