## 4. CPU SOCKET COMPATIBILITY

The FROSTFLOW X 280 CPU Liquid Cooler is compatible with the following CPU sockets:

- **Intel:** LGA2066, LGA2011, LGA1151, LGA1150, LGA1155, LGA1156, LGA1200, LGA1700
- **AMD:** AM4, AM5

## 5. INSTALLATION GUIDE

This section provides a general overview of the installation process. Refer to the detailed graphical instructions included in your product packaging for specific steps for your CPU socket type.

### General Installation Steps:

1. **Prepare Motherboard:** Install the appropriate backplate and standoffs for your CPU socket.
2. **Apply Thermal Paste:** Apply a thin, even layer of thermal paste to the CPU IHS (Integrated Heat Spreader).

3. **Mount Pump/Cold Plate:** Secure the pump/cold plate unit onto the CPU, ensuring even pressure.
4. **Install Fans on Radiator:** Attach the two 140mm PWM fans to the radiator using the provided screws. Ensure correct airflow direction (typically pushing air through the radiator).
5. **Mount Radiator:** Install the radiator assembly into your PC case in a suitable location (e.g., front, top, or side panel).
6. **Connect Cables:** Connect the pump power cable to the designated header on your motherboard (usually AIO\_PUMP or CPU\_FAN). Connect the fan cables to the CPU\_FAN or other available fan headers, ensuring PWM control is enabled in your BIOS/UEFI.

## 6. OPERATION

Once installed, the FROSTFLOW X 280 operates automatically. The PWM fans adjust their speed based on CPU temperature, as configured in your motherboard's BIOS/UEFI settings. The pump's white LED will illuminate upon system power-on.

## Fan Control:

For optimal performance and noise levels, it is recommended to configure a custom fan curve in your motherboard's BIOS/UEFI. This allows the fan speed to increase with CPU temperature, providing efficient cooling when needed and quieter operation during lighter loads.

# 800~1,600±10% RPM PRECISE PWM CONTROL

Adjust fan speeds to accommodate the demands  
of your system, minimizing noise or maximizing airflow.

Image 5: An illustration demonstrating the airflow generated by a PWM fan, indicating how air is moved for cooling.

## LED Lighting:

The pump features a static white LED illumination. This lighting is not addressable or customizable and will be active whenever the pump receives power.

## 7. MAINTENANCE

Regular maintenance helps ensure the longevity and performance of your liquid cooler.

- **Dust Removal:** Periodically clean the radiator fins and fan blades using compressed air to remove dust buildup. Dust can impede airflow and reduce cooling efficiency.
- **Inspect Tubing:** Check the tubing for any signs of kinks, leaks, or damage.
- **Pump Inspection:** Ensure the pump is operating quietly. Unusual noises may indicate an issue.

**Caution:** Do not attempt to open the pump or radiator, as this will void the warranty and may cause damage or leaks.

## 8. TROUBLESHOOTING

If you encounter issues with your FROSTFLOW X 280, refer to the following common solutions:

- **High CPU Temperatures:**

- Ensure the pump is connected and running (check BIOS/UEFI for pump RPM).
- Verify fans are spinning and correctly oriented for airflow.
- Check thermal paste application; reapply if necessary.
- Confirm the cold plate is making full contact with the CPU IHS.

- **Excessive Noise:**

- Adjust fan speed curves in BIOS/UEFI to reduce RPM at lower temperatures.
- Check for loose fan screws or cables interfering with fan blades.
- If pump noise is excessive, ensure the radiator is mounted higher than the pump to prevent air bubbles from accumulating in the pump.

- **LED Not Lighting Up:**

- Ensure the pump power cable is securely connected to the motherboard.
- Check motherboard BIOS/UEFI settings for any pump-related power options.
