Setup and Installation

1. **Locate the Drain Port:** Identify the water drainage port on your Pro Breeze Portable Air Conditioner. This is typically located at the lower rear section of the unit.
2. **Prepare the Hose:** Uncoil the replacement water hose. Ensure there are no kinks or obstructions within the hose.
3. **Connect the Hose:** Carefully push one end of the water hose onto the drainage port of the air conditioner. Ensure a snug and secure fit to prevent leaks.
4. **Position the Hose:** Direct the other end of the hose to a suitable drainage point, such as a floor drain, a large bucket, or outdoors. Ensure the hose has a continuous downward slope to allow gravity to facilitate water flow. Avoid creating upward loops or sharp bends that could impede drainage.

Operating Instructions

Once the water hose is securely connected and positioned, the Pro Breeze Portable Air Conditioner will automatically drain condensed water through the hose during operation. No specific user action is required for the hose itself during operation, beyond ensuring proper placement for drainage.

- **Continuous Drainage:** For continuous drainage, ensure the hose is always directed to an appropriate drain or container.
- **Monitoring:** Periodically check the drainage point to confirm water is flowing freely and that the collection container (if used) is not overflowing.

Maintenance

Regular maintenance ensures optimal performance and longevity of your water hose.

- **Cleaning:** If the hose appears dirty or shows signs of mold/mildew buildup, disconnect it from the air conditioner and flush it with warm, soapy water. Rinse thoroughly and allow it to air dry completely before reattaching.
- **Inspection:** Regularly inspect the entire length of the hose for any cracks, punctures, or blockages. Ensure the connections remain tight and free of leaks.
- **Storage:** When not in use for extended periods, disconnect the hose, clean it, and store it in a cool, dry place away from direct sunlight and extreme temperatures.

Troubleshooting

If you encounter issues with water drainage, consider the following:

Problem	Possible Cause	Solution
No water draining	Hose is kinked or blocked. Hose is not sloped downwards.	Check the hose for kinks and straighten them. Ensure the hose has a continuous downward slope to the drain. Clear any blockages.
Water leaking from connection	Hose not securely attached. Hose or port is damaged.	Ensure the hose is pushed firmly onto the drainage port. Inspect the hose and port for damage; replace if necessary.
Slow drainage	Partial blockage or insufficient slope.	Clean the hose to remove any buildup. Adjust the hose position to ensure a steeper downward slope.
