SETUP

Connecting the Monitor

The monitor offers flexible connection options depending on your device's capabilities:

Single Cable Connection (USB-C)

If your device has a full-featured USB-C port (USB 3.1 or higher), you can connect the monitor using a single USB-C to USB-C cable. This cable transmits power, video, and touch signals simultaneously.

1. Connect one end of the USB-C to USB-C cable to your device's full-featured USB-C port.
2. Connect the other end to one of the USB-C ports on the monitor.
3. If the monitor does not power on or the power supply is low, connect the power adapter to the second USB-C port on the monitor.

Two Cable Connection (HDMI + USB-C)

If your device does not have a full-featured USB-C port, or for devices like game consoles, use an HDMI cable for video and a USB-A to USB-C cable for power and touch functionality.

1. Connect one end of the HDMI to HDMI cable to your device's HDMI output.
2. Connect the other end to the HDMI port on the monitor.
3. Connect the USB-A end of the USB-A to USB-C cable to your device (or a power adapter for power only).
4. Connect the USB-C end of the USB-A to USB-C cable to one of the USB-C ports on the monitor. This provides power and enables touch functionality.

Different Connections

More connectivity options as different devices can be connected

Single cable connection

With only one full-featured cable (included) and one full-featured USB C port, AV, power and touch signals can be transmitted without the hassle of many cables.

Note: 1. If the voltage of the power supply is too low, it is recommended to add another power supply; 2. Fully equipped USB C ports are usually USB version 3.1 or higher, but some USB C ports are non-fully equipped, please check before purchase.

Two Cable Connections

If your device has an HDMI port, simply connect the HDMI cable, and USB-A to USB-C cable to the monitor's USB C port, plug and play.

Note: For proper use of the monitor's touch function, the USB-A to USB-C cable must be connected to the device, with the USB-A end connected to the computer host and the USB-C end connected to the monitor.

TROUBLESHOOTING

If you encounter issues with your monitor, please refer to the following common solutions:

Problem	Possible Cause	Solution
---------	----------------	----------

Problem	Possible Cause	Solution
No display/No signal	Incorrect cable connection, insufficient power, incorrect input source selected.	Ensure all cables are securely connected. Use the provided power adapter if necessary. Check your device's display settings. Use the OSD menu to select the correct input source (HDMI, USB-C).
Touch function not working	USB-C cable not fully featured, USB-A to USB-C cable not connected, driver issue (rare).	Ensure your device's USB-C port supports video and touch (full-featured). If using HDMI, ensure the USB-A to USB-C cable is connected from your device to the monitor. For Mac/macOS, note that only single-touch is supported. Restart your device and monitor.
Screen flickering	Loose cable connection, incompatible resolution/refresh rate.	Check cable connections. Adjust your device's display resolution or refresh rate to match the monitor's specifications (1920x1200, 60Hz).
Image distorted/incorrect aspect ratio	Device outputting non-standard resolution.	The monitor should automatically adjust. If not, check your device's display settings and ensure the output resolution is compatible with the monitor's native resolution (1920x1200).
Monitor not powering on	No power, faulty cable/adaptor.	Ensure the power adapter is securely connected to a working power outlet and the monitor. Try a different power outlet or cable if available.
