Safety Information

Always prioritize safety when using any hand tool. Follow these guidelines to prevent injury:

- **Wear Safety Glasses:** Always protect your eyes from flying debris.
- **Inspect Before Use:** Check the hammer for any damage, such as a loose head or cracked handle, before each use. Do not use a damaged hammer.
- **Proper Grip:** Hold the hammer firmly near the end of the handle for maximum leverage and control.
- **Clear Work Area:** Ensure your work area is free of obstructions and other people.
- **Strike Squarely:** Always strike the nail head squarely to prevent bending the nail or damaging the hammer face.
- **Avoid Overstriking:** Do not strike hardened steel surfaces or other hammers with this tool, as it can cause chipping or breakage.

Operating Instructions

This section details the proper techniques for using your Hyper Tough Claw Hammer.

Driving Nails:

1. **Position the Nail:** Hold the nail between your thumb and forefinger, placing its point on the desired surface.
2. **Initial Taps:** Lightly tap the nail head with the hammer face until the nail stands by itself. Remove your fingers.
3. **Full Swings:** With a firm grip, swing the hammer in a controlled arc, striking the nail head squarely with the hammer face. Use your elbow and shoulder for power, not just your wrist.
4. **Finish Driving:** Continue striking until the nail head is flush with or slightly below the surface.

Pulling Nails:

1. **Position the Claw:** Slide the V-shaped notch of the hammer's claw under the head of the nail.
2. **Leverage:** If necessary, place a small block of wood under the hammer head to increase leverage and protect the surface.
3. **Pulling Motion:** Roll the hammer back, using the curved claw as a fulcrum. Apply steady, even pressure to pull the nail out.

Maintenance

Proper maintenance will extend the life of your hammer and ensure its continued performance.

- **Cleaning:** After each use, wipe down the hammer head and handle with a clean, dry cloth to remove dirt, dust, and moisture.
- **Rust Prevention:** If the hammer head is exposed to moisture, dry it thoroughly and apply a light coat of rust-preventative oil to the metal surfaces.
- **Storage:** Store the hammer in a dry place, away from extreme temperatures and corrosive materials. Hang it on a tool rack or place it in a toolbox to prevent damage.
- **Handle Integrity:** Periodically check the fiberglass handle for cracks, splinters, or looseness. If any damage is found, discontinue use and replace the hammer.

Troubleshooting

This section addresses common issues you might encounter while using your hammer.

Problem	Possible Cause	Solution
Nails bending easily	Improper striking angle; nail too long for material; material too hard.	Ensure you strike the nail head squarely. Use appropriate nail length and type for the material. Consider pre-drilling in very hard materials.
Hammer slipping off nail head	Loose grip; worn hammer face; improper striking technique.	Maintain a firm grip. Ensure the hammer face is clean and free of debris. Practice striking squarely. If the face is severely worn, replace the hammer.
Difficulty pulling nails	Insufficient leverage; nail too deeply embedded.	Use a block of wood under the hammer head for increased leverage. If the nail is very deep, consider using a pry bar.
