- **Display Detection:** Right-click on your desktop and check if the display is detected in the display settings. If not, try replacing the Type-C data cable or switching the USB port again.
- **Display Mode:** Confirm that the display is not in duplicate mode if you intend to use it as an extended display. Change it to extended mode in your display settings.
- **Restart MS USB Display Process:** Open Task Manager, locate and close the 'MS USB Display' process, then restart the program.
- **Config.ini File:** Ensure the 'config.ini' file has been correctly replaced if instructed during driver installation.

5.2 Incorrect Resolution (800x600 instead of 1024x600)

- **Verify 'config.ini':** Check if the 'config.ini' file is installed in the 'C:\Program Files\Win USB Display' directory.
- **System Restart:** After installation, restart your system to enable the 1024x600 resolution.

5.3 Screen Remains Black After Driver Installation

- **Sufficient Power Supply:** Ensure the USB 2.0 interface has sufficient power. It is recommended to connect the monitor to a USB port directly on the PC or use a USB 3.0 interface.
