MAINTENANCE

Automatic Slag Discharge System:

Reasons for choosing

Automatic slag removal system

Say goodbye to manual slag

Using the principle of the pressure of the water pump, the residue is discharged through pressurization, the professional slag removal system design can discharge the residue of less than 1cm in diameter, and will not repeatedly contaminate the tableware inside the machine, making the tableware cleaner. No need to clean up the residue after washing, making it more comfortable to use.

The separation of slag and water is converted into clean water, re-washing is more energy-saving and water-saving

Kitchen residues cannot be discharged and need to be cleaned manually

The dishwasher features an automatic slag removal system. Residue is discharged through pressurization, with particles less than 1 cm in diameter. This system prevents residue from contaminating the tableware, making cleaning more convenient and eliminating the need for manual residue removal.

General Cleaning:

- Wipe the exterior of the dishwasher with a soft, damp cloth.
- Periodically check and clean the spray arms and filters to ensure optimal performance.
- Use a dishwasher cleaner as recommended by the manufacturer to prevent mineral buildup.
