4. **Rest Period:** To prolong the lifespan of the unit, it is recommended to cut off the power cord after 24 hours of continuous running and let it rest for at least 10 minutes.

8. Troubleshooting

If you encounter issues with your dehumidifier, please refer to the following common problems and solutions:

Problem	Possible Cause	Solution
Dehumidifier not turning on.	Unit not plugged in; power outage; water tank full or incorrectly positioned.	Ensure power cord is securely plugged in. Check power outlet. Empty and correctly reinsert the water tank.
Unit collects very little water.	Low room humidity; low temperature; room too large; air inlets/outlets blocked.	Ensure the unit is running in a confined environment with high humidity (RH > 45%) and temperature above 59°F (15°C). Clear any obstructions from vents.
Unit stops working unexpectedly.	Water tank is full or improperly installed.	Empty the water tank and ensure it is securely reinserted. The unit has an auto shut-off feature for safety.
Dehumidification effect is weak at certain temperatures.	Operating temperature is too low (under 59°F / 15°C) or too high (over 104°F / 40°C).	The dehumidifier's efficiency is reduced outside its optimal operating temperature range. While it won't stop working, the effect will be weaker. Adjust room temperature if possible.

If the problem persists after trying these solutions, please contact KNKA customer support.
