## SECURA 7752771

# SECURA 560mm Scraper Bar Instruction Manual

For Troy-Bilt Polar 5056 31A-3PAD609 (2006) Snow Blower

## INTRODUCTION

This manual provides essential information for the safe and correct installation, operation, and maintenance of your SECURA 560mm Scraper Bar. This scraper bar is designed as a replacement part for specific Troy-Bilt Polar 5056 31A-3PAD609 (2006) snow blower models. Please read these instructions thoroughly before proceeding with installation or use.

## SAFETY INFORMATION

Always prioritize safety when working with machinery. Failure to follow these safety instructions may result in serious injury or damage to equipment.

- **Disconnect Power:** Before beginning any installation or maintenance, ensure the snow blower's engine is off, the spark plug wire is disconnected, and the key is removed to prevent accidental starting.
- **Wear Protective Gear:** Always wear appropriate personal protective equipment, including gloves and eye protection.
- **Stable Work Area:** Work on a flat, stable surface.
- **Refer to Snow Blower Manual:** Consult your snow blower's original owner's manual for specific safety procedures and component locations.

## COMPATIBILITY

This SECURA 560mm Scraper Bar (Model: 7752771) is specifically designed for compatibility with the following snow blower model:

- **Troy-Bilt Polar 5056 (Model 31A-3PAD609, Year 2006)**

Verify your snow blower's model number and year before installation to ensure proper fit and function.

## INSTALLATION (SETUP)

Follow these steps to replace the scraper bar on your snow blower.

### Tools Required:

- Wrench set (typically 1/2 inch or 13mm)

- Socket set (optional, for easier access)
- Safety gloves
- Eye protection

### Procedure:

1. **Prepare the Snow Blower:** Ensure the snow blower is turned off, the spark plug wire is disconnected, and the key is removed. Position the snow blower on a stable, level surface. It may be helpful to tilt the snow blower back so it rests on its handles, providing easier access to the auger housing.
2. **Locate the Scraper Bar:** The scraper bar is located at the bottom edge of the snow blower's auger housing, directly beneath the auger blades. It is a long, flat metal strip.
3. **Remove Old Scraper Bar:** Using the appropriate wrench or socket, carefully remove the bolts, nuts, and washers that secure the old scraper bar to the auger housing. Keep track of all hardware. The old scraper bar may be worn down or bent.
4. **Clean Mounting Area:** Once the old scraper bar is removed, clean any debris, rust, or ice from the mounting area on the auger housing. This ensures a flush fit for the new scraper bar.
5. **Position New Scraper Bar:** Align the new SECURA 560mm Scraper Bar with the mounting holes on the auger housing. Ensure the scraper bar is oriented correctly, with the angled edges facing the ground (if applicable) or as per the original installation.
6. **Secure New Scraper Bar:** Insert the bolts through the scraper bar and the auger housing. Secure them with the washers and nuts. Hand-tighten all hardware first.
7. **Tighten Hardware:** Once all hardware is in place, progressively tighten the bolts and nuts using your wrench or socket. Do not overtighten, but ensure they are snug to prevent the scraper bar from shifting during operation.
8. **Final Check:** Verify that the new scraper bar is securely attached and properly aligned. Reconnect the spark plug wire and return the key.

*Image 1: Top-down view of the SECURA 560mm Scraper Bar. This image shows the overall length and the square mounting holes along the bar, indicating where it attaches to the snow blower's auger housing.*

*Image 2: Front view of the SECURA 560mm Scraper Bar. This perspective illustrates the profile of the bar, including the angled ends that help guide snow and protect the auger housing. The mounting holes are also visible.*

## USAGE CONSIDERATIONS

The scraper bar is a wear item designed to protect the auger housing and clear snow effectively down to the surface. Its primary function is to scrape snow from the ground without damaging the snow blower's main body.

- **Surface Contact:** The scraper bar should make light contact with the ground surface during operation.
- **Wear Indicator:** A worn scraper bar will show significant material loss, reducing its effectiveness and potentially exposing the auger housing to damage.

## MAINTENANCE

Regular inspection and maintenance of the scraper bar will extend the life of your snow blower and ensure optimal performance.

- **Inspect Regularly:** Before each snow season and after every few uses, inspect the scraper bar for signs of wear, bending, or damage.
- **Replace When Worn:** Replace the scraper bar when it shows significant wear (e.g., less than 1/4 inch of material remaining) or if it is bent or cracked. A worn scraper bar reduces snow clearing efficiency and can lead to damage to the auger housing.
- **Check Hardware:** Periodically check that all mounting bolts and nuts are tight. Tighten if necessary.

## TROUBLESHOOTING

If you experience issues related to the scraper bar, consider the following:

- **Poor Snow Clearing:** If the snow blower is leaving a layer of snow on the ground, the scraper bar may be excessively worn and needs replacement.
- **Unusual Noise/Vibration:** Check if the scraper bar is loose or bent. Tighten mounting hardware or replace the bar if damaged.
- **Damage to Auger Housing:** If the auger housing is scraping the ground, the scraper bar is likely completely worn out or missing and requires immediate replacement to prevent further damage.
