- **OBD-II Cable**

Pre-Setup Check List

- Before setup, please ensure you have the following:
- An internet connection with minimum up/down speeds of 10Mbps
- A computer and web browser for wireless network configuration (Google Chrome is recommended)
- Access to an open ethernet port on your network device
- Access to the vehicle's OBDII port
- A battery support device is connected to the vehicle

Connect to Network

Locate an open Ethernet port on your network device
Connect the provided Ethernet cable to the open network port and the port on your asTech device.

Connect to Vehicle

With battery support in place, switch the vehicle to the "ON" position, but do not start it.
Note: If battery support is unavailable you may need to have the key on and the engine running.
Connect the OBD-II cable to both the vehicle and your tech device. An IP address, and "Connected & Waiting" should appear on the device screen. The device is now ready to use.

Connect to Wi-Fi (Optional)

Note: If you wish to disconnect the Ethernet cable, and use the device wirelessly, you can complete the steps below.

In the address field of a web browser, enter the IP address displayed on the asTech device screen, followed by "/wifi.shtml".

Select the network name of your business under "SSID", and enter the network password in the "Pass Phrase" field.

Submit a Support Request

To submit a Support Request, visit our website, or download the asTech app (available for iOS and Android).
