Product Sustainability Fact Sheet

eero Max 7 – 3 Pack

2023 release

Updated September 2023 – for US only

Figures apply to eero Max 7 – 3 Pack only, not including bundle accessories

Designed for Sustainability

We're working to make eero devices more sustainable—from how we build them to how customers use and eventually retire them.

Carbon Footprint

1814 kg CO₂e total carbon emissions

Materials

Made from 61% recycled materials.

Eco Efficiency Mode

Eco Efficiency Mode — When eero's eco efficiency mode is enabled, your gateway device will reduce its power consumption depending on network conditions and the actual speeds provided by your internet service plan.

Trade-in and Recycle

Built to last. But when you're ready, you can trade-in or recycle your devices. Explore Amazon Second Chance.

Figures apply to only eero Max 7 – 3 Pack, not including bundle accessories

This device is a Climate Pledge Friendly product. We partner with trusted third-party certifications and create our own certifications like Compact by Design and Pre-owned Certified to highlight products that meet sustainability standards.

Life Cycle

We consider sustainability in every stage of a device's life cycle—from sourcing raw materials to end-of-life.

eero Max 7 – 3 Pack total life cycle carbon emissions: 1814 kg CO₂e

Carbon emissions of each life cycle stage:

Life Cycle Assessment: A methodology to assess the environmental impact (e.g., carbon emissions) associated with life cycle

stages of a product—from raw material extraction and processing, through production, use, and disposal.

This product's biogenic carbon emissions of 3.258 kg CO₂e are included in the total footprint calculation. The total biogenic

carbon content in this product is 0.205 kg C. Percentage values may not add up to 100% due to rounding.

Materials and Manufacturing

We account for the extraction, production, and transportation of raw materials, as well as the manufacturing, transporting, and assembling of all parts.

Recycled Materials

This device is made from 61% recycled materials. The plastic in this device is made from 49% postconsumer recycled plastic. The aluminum parts are made from 94% of recycled aluminum. We incorporate recycled fabrics, plastics, and metals into many new Amazon devices, giving new life to materials. Bundle accessories not included.

Chemical Safety

Through our partnership with Chem FORWARD, we're collaborating with industry peers to proactively identify harmful chemicals and safer alternatives ahead of regulations.

Suppliers

We engage suppliers who manufacture our devices or their components—particularly final assembly sites, semiconductors, printed circuit boards, displays, batteries, and accessories—and encourage them to increase renewable energy use and reduce manufacturing emissions. In 2022, we received commitments from 28 key suppliers to work with us on decarbonization, and helped six of them develop renewable energy implementation plans for Amazon Devices production. We are continuing to expand this program in 2023 and beyond.

Transportation

We account for an average inbound and outbound trip that is representative of an average device or accessory. This includes transporting the product from final assembly to the end customer.

Amazon Commitment

Delivering for our global customers requires Amazon to rely on a variety of transportation solutions for long and short distances. Decarbonizing our transportation network is a key part of meeting The Climate Pledge by 2040. That's why we're actively transforming our fleet network and operations.

Product Use

We determine the expected energy consumption of a device over its lifetime and calculate the carbon emissions associated with the use of our devices.

Renewable Energy

In 2020, Amazon became the first consumer electronics company to commit to addressing the electricity used by our devices through renewable energy development, starting with Echo devices. We're making investments in additional wind and solar farm capacity that, by 2025, will be equal to the energy use of Echo, FireTV, and Ring devices worldwide.

Eco Efficiency Mode

With Eco Efficiency Mode enabled, the power consumption of eero mesh wifi routers optimize to the actual speeds provided by your internet service plan. eero mesh wifi routers already run regular speed tests, allowing our customers to always know the actual internet speeds they are getting, and now customers can enable Eco Efficiency Mode to lower the energy used by their eero router based on those actual speeds. Even better, Eco Efficiency Mode was built so as to not impact the performance customers see across their eero mesh network. Eco Efficiency Mode is enabled by default, but can be disabled within the eero app settings, so our customers can decide whether to keep the feature on or turn it off.

End-of-Life

To model end-of-life emissions, we estimate the ratio of end products that are sent to each disposal pathway including recycling, combustion, and landfill. We also account for any emissions required to transport and/or treat the materials.

Durability

We design our devices with best-in-class reliability models, so they're more resilient and last longer. We also release over-the-air software updates for our customers' devices so they don't need to replace them as often. With backwards compatibility, you can grow your network by adding more eero devices. So, as your needs change, you can easily connect new extenders or boosters to your current eero router.

Trade-in & Recycling

We make it easy for you to retire your devices. Using Amazon Trade-In, you can trade-in your old devices for a gift card. Your retired devices will then be either refurbished and re-sold, or recycled.

Methodology

Our approach to measuring a product's carbon footprint?

To meet The Climate Pledge goal to be net-zero carbon by 2040, we measure and estimate this

product's carbon footprint, and identify opportunities to reduce its carbon emissions. Our life cycle assessment ("LCA") models align with internationally recognized standards, like the Greenhouse Gas ("GHG")

Protocol Product Life Cycle Accounting and Reporting Standard² and International Standards Organization ("ISO") 14067³. Our methodology and product carbon footprint results are reviewed by the Carbon Trust with reasonable assurance. All carbon footprint numbers are estimates and we continuously improve our methodology as the science and data available to us evolve.

What's in an Amazon device's product carbon footprint?

We calculate this product's carbon footprint throughout its life cycle stages, including materials and manufacturing, transportation, use, and end-of-life.

Two carbon footprint metrics are considered: 1) the total carbon emissions across all life cycle stages of one device or accessory (in kilograms of carbon dioxide equivalent, or kg CO₂e), and 2) the average carbon emissions per year used of the estimated device lifetime, in kg CO₂e/use-year.

Materials and Manufacturing: We calculate the carbon emissions from material and manufacturing based on the list of raw materials and components to manufacture a product, namely the bill of materials.

We account for the emissions from the extraction, production, and transportation of raw materials, as well as the manufacturing, transporting, and assembling of all parts. For certain components and materials, we may collect primary data from our suppliers to supplement our industry average data, collected from a mix of commercially and publicly available LCA databases.

Transportation: We estimate the emissions of transporting the product from final assembly to our end customer using actual or best estimated average transportation distances and transportation modes for each device or accessory.

Use: We calculate the emissions associated with the use (i.e., electricity consumption) of this product by multiplying the total electricity consumption over a device's estimated lifetime with the carbon emissions from the generation of 1 kWh electricity (the grid emission factor). The total energy consumption of a device is based on the average customer's power consumption and estimated time spent in various modes of operation like playing music, playing video,

idle, and low power mode. A specific customer may have a higher or lower use phase footprint associated with their device depending on their specific usage patterns.

We use country-specific grid emission factors to account for the regional variations in electricity grid mix. Learn more about how Amazon plans to decarbonize and neutralize the use phase of our connected devices by 2040.

End-of-Life: For end-of-life emissions, we account for any emissions required to transport and/or treat the materials destined to each disposal pathway (e.g., recycling, combustion, landfill).

How do we use the product carbon footprint?

The footprint helps us identify carbon reduction opportunities across this product's various life cycle stages. In addition, we use it to communicate our carbon reduction progress over time—this is included in the calculation of Amazon's corporate carbon footprint. Learn more about Amazon corporate carbon footprint methodology.

How often do we update a product's carbon footprint?

After we launch a new product, we track and audit the carbon emissions of all life cycle phases of our devices. Product sustainability fact sheets are updated when we discover new information that changes the estimated carbon footprint of a device by more than 5% or if it materially changes our estimated reduction generation over generation.

Learn more about our product carbon footprint methodology and limitations in our full methodology document.

Definitions:

Biogenic carbon emissions: Carbon released as carbon dioxide or methane from combustion or decomposition of biomass or bio-based products.

Life Cycle Assessment: A methodology to assess the environmental impact (e.g., carbon emissions) associated with life cycle stages of a product—from raw material extraction and processing, through production, use, and disposal.
