Cleaning sinks in stainless steel

- A sink in stainless steel does not absorb taste or smell and will keep fresh for many years if cleaned at regular intervals. Therefore, wipe the sink clean with a damp cloth or sponge and washing-up detergent, if necessary, after use. Rinse the bowl with water and then wipe the sink with a dry cloth to avoid lime stains from dried-up water. You should also wipe up washing-up detergent or cleaner to avoid stains. Do not leave chlorous liquids in the bowl or on the sink for several hours, as chlorine can damage the sink and make the stainless steel surface matt.
- Stains which can't be removed by normal wiping can be rubbed off with a soft brush or a nylon sponge and liquid cleaner. Do not use cleaners containing abrasives. Rinse with water and wipe with a dry cloth.

- Always wipe and rub the sink lengthwise when cleaning.

Good to know

- Do not use scouring-powder, steel wool, hard or sharp tools which can scratch the stainless steel surface. The damp surface can be discoloured if substances containing iron, from steel wool, nails or gravel, are allowed to remain on it. Discolouration is caused by the foreign material.
- Matt parts of the sink will be shiny again if you sprinkle them with chalk, rub with a soft cloth, rinse with water and wipe the surface dry.
