## Night Shift Helmet

### Step 1. Clean

Gently clean the area you will be sticking the light strips on with the alcohol prep pad.

### **Step 2. Mount Controller**

Clip your controller onto your LightMode mount, plug-in an LED strip, and locate a good spot to stick your mount to. Use the provided extension wires if needed.

### **Step 3. Stick Mount to Helmet**

Peel off the adhesive backing on your mount and lightly stick it on your helmet. Do not press firmly until after Step 4.

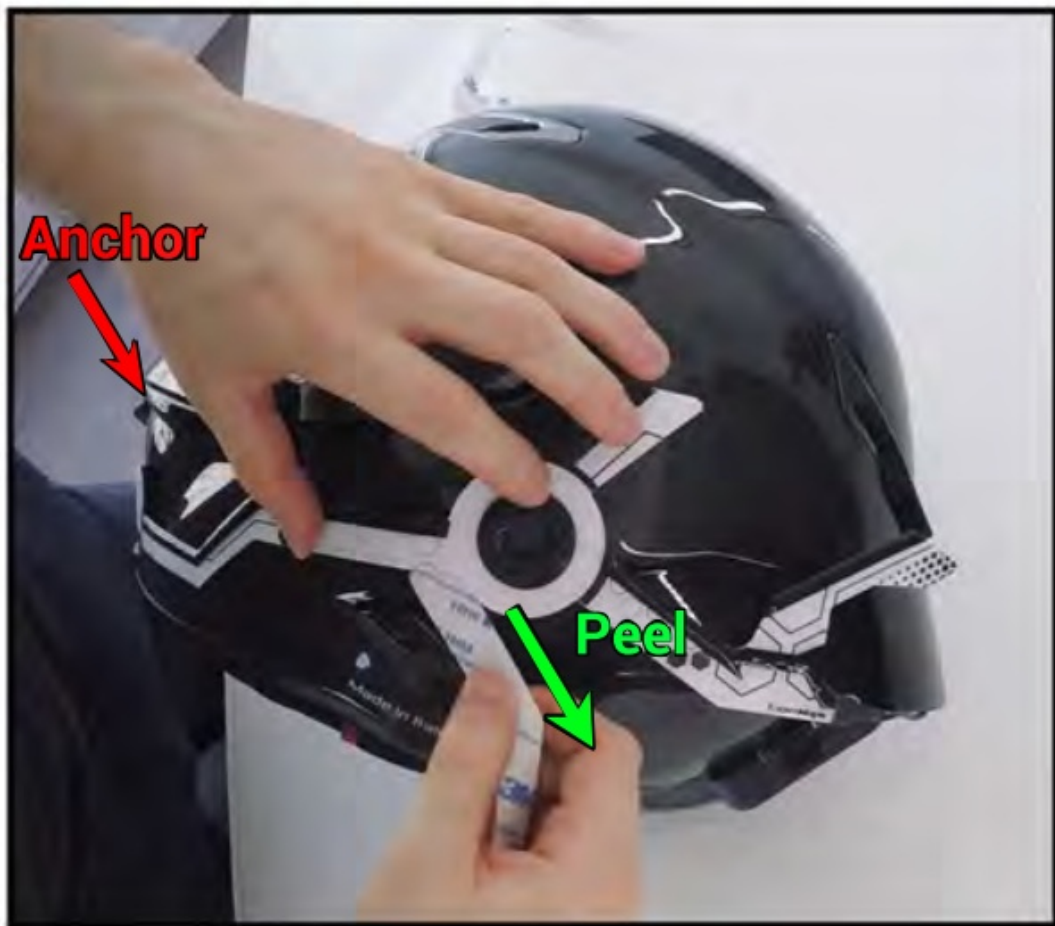

**TIP**

If there are gaps between your helmet and LightMode mount, cut the provided 3M adhesive to size and fill the gaps.

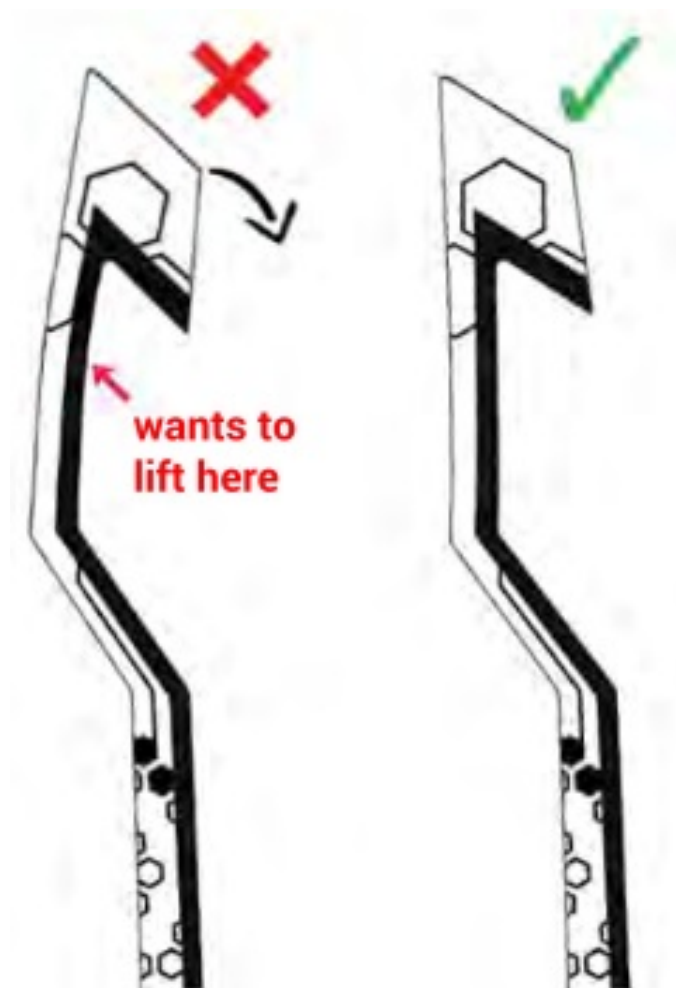

**Step 4. Stick Light Strips to Helmet.**

Peel off a section of the backing and use it to anchor your light strip to your helmet. Gradually peel off the backing as you lightly stick the light strip from one side to the other.

**TIP**

The LED strips naturally want to follow a straight path. If you try to bend a strip laterally, while laying it down, the edge will tend to lift. Try to avoid this IF possible.

Try to avoid repeatedly unpeeling the LED strips to reposition. They may not be as sticky after multiple attempts. You also run a small risk of accidentally breaking the circuit inside the LED strip.

#### Step 5. Press Firmly

Once you are completely satisfied with the position of your mount and light strips, press them firmly to your helmet.

**ENJOY!**
