

## Reinvents Its Companion App

The new Bryton Active app offers better user interface, new features and greater stability.

"Active" will feature a completely overhauled user interface that is more intuitive and easier to use, while also introducing more powerful features and functions. With much simpler interface navigation, reorganising all menus and functions into easy-to-understand categories (instead of the single home-page navigation of the previous app), the app promises a fantastic new experience for its users.

Bryton Active now supports interactive two-way Bluetooth communication between the app and the Bryton device, allowing users to modify almost all settings in their device with changes occurring in real time. Now it will be possible to modify preferences, user/bike profiles, add WLAN connections, and much more without ever having to touch a button on the computer. This "zero touch" approach to GPS bike computer setup will make it even easier and more convenient for users to completely customise their device without having to navigate through the device's menus.

With the goal of a truly mobile experience, users will now be able to update their GPS data and Firmware or upload any activities "cable-free" directly from the Active app automatically, essentially eliminating the need to ever connect the device to a PC.

Internet connection will no longer have to be maintained for many of the new app's functions, instead relying on Bluetooth, allowing users to truly make the best use of their Bryton computers whenever and wherever. The improved and more stable Bluetooth connectivity will allow users to sync and plan their workouts, download planned trips, view/upload ride logs, modify device and grid settings, and calibrate altitude all without WLAN connection.

The new Active app also seeks to vastly improve the overall customer experience. After pairing one of Bryton's GPS cycle computers with the app, the app will check the firmware version and GPS data of the device and notify users that updates are available, ensuring that the most up-to-date firmware is always installed.

The Active app will be compatible with all of the same devices as the previous Bryton app from the time of launch. The newly added features, such as Auto Sync Track, Auto Calibration Altitude, and Auto Pause, will be available initially only for Rider 410, Rider 450 and Aero 60 users and will roll out for older models shortly afterwards.
