

HRXSL Handheld Controller - Battery-powered

The HRXSL handheld controller offers an intelligent optional feature that detects open windows or doors and responds to temperature changes in the room or area where it's installed. Once activated in the setup menu, this feature operates automatically without needing further attention. When an open window or door causes a sudden temperature drop, the heater will power off to conserve energy. Once the window or door is closed, the heater resumes regular operation. You can adjust the detection time and temperature settings within the setup menu.
