## CIRCUIT DESCRIPTION

**Frequency Configuration**

The receiver utilizes double conversion. The first IF is 49.95MHz and the second IF is 450kHz. The first local oscillator signal is supplied from the PLL circuit.

The PLL circuit in the transmitter generates the necessary frequencies. Figure 1 shows the frequencies.

**Fig. 1 Frequency configuration**

**Receiver System**

The receiver is double conversion superheterodyne. The frequency configuration is shown in Figure 1.

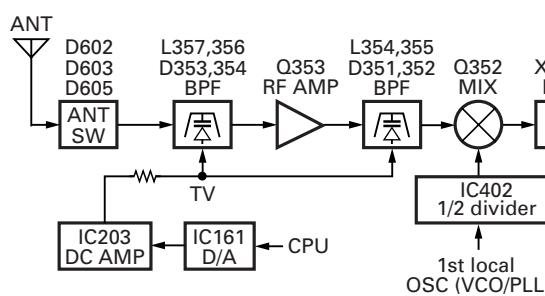

**Front-end RF Amplifier**

An incoming signal from the antenna is applied to an RF amplifier (Q353) after passing through a transmit/receive switch circuit (D603, D605 are off) and a band pass filter (L357, L356 and varactor diodes : D353, D354). After the signal is amplified (Q353), the signal is filtered through a band pass filter (L354, L355 and varactor diodes: D351, D352) to eliminate unwanted signals before it is passed to the first mixer.

The voltage of these diodes are controlled by tracking the CPU (IC101) center frequency of the band pass filter. (See Fig. 2.)

**First Mixer**

The signal from the RF amplifier is heterodyned with the first local oscillator signal from the PLL frequency synthesizer circuit at the first mixer (Q352) to create a 49.95MHz first intermediate frequency (1st IF) signal. The first IF signal is then fed through one pair of monolithic crystal filter (MCF : XF351) to further remove spurious signals.

**Fig. 2 Receiver system**

**IF Amplifier**

The first IF signal is amplified by Q351, and then goes to IC301 (FM processing IC). The signal is heterodyned again with a second local oscillator signal within IC301 to create a 450kHz second IF signal. The second IF signal is then fed through a 450kHz ceramic filter (Wide : CF301, Narrow : CF302) to further eliminate unwanted signals before it is amplified and FM detected in IC301.

Item	Rating
Nominal center frequency	49.95MHz
Pass bandwidth	$\pm 5.0\text{kHz}$ or more at 3dB
35dB stop bandwidth	$\pm 20.0\text{kHz}$ or less
Ripple	1.0dB or less
Insertion loss	5.0dB or less
Guaranteed attenuation	80dB or more at $f_0 \pm 1\text{MHz}$
Spurious	40dB or more
Terminal impedance	$350\Omega / 5.5\text{pF}$

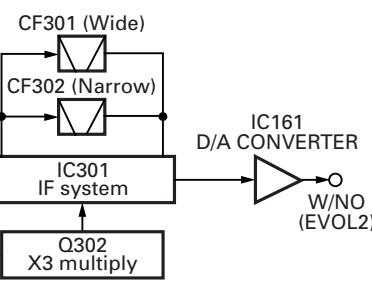

**Table 1 Crystal filter (L71-0620-05) : XF351**

Item	Rating
Nominal center frequency	450kHz
6dB bandwidth	$\pm 6.0\text{kHz}$ or more
50dB bandwidth	$\pm 12.5\text{kHz}$ or less
Ripple	2.0dB or less
Insertion loss	6.0dB or less
Guaranteed attenuation	35.0dB or more within $f_0 \pm 100\text{kHz}$
Terminal impedance	$2.0\text{k}\Omega$

**Table 2 Ceramic filter (L72-0993-05) : CF301**

Item	Rating
Nominal center frequency	450kHz
6dB bandwidth	$\pm 4.5\text{kHz}$ or more
50dB bandwidth	$\pm 10.0\text{kHz}$ or less
Ripple	2.0dB or less
Insertion loss	6.0dB or less
Guaranteed attenuation	60.0dB or more within $f_0 \pm 100\text{kHz}$
Terminal impedance	$2.0\text{k}\Omega$

**Table 3 Ceramic filter (L72-0999-05) : CF302**

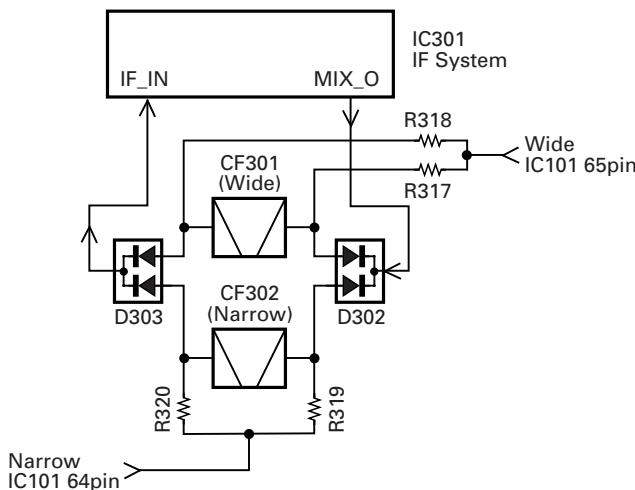

# CIRCUIT DESCRIPTION

## ■ Wide/Narrow Switching Circuit

The Wide port (pin 65) and Narrow port (pin 64) of the CPU is used to switch between ceramic filters. When the Wide port is high, the ceramic filter SW diodes (D303, D302) cause CF301 to turn on to receive a Wide signal.

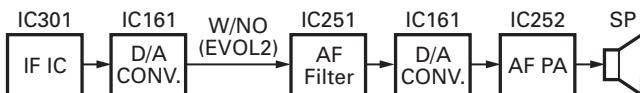

When the Narrow port is high, the ceramic filter SW diodes (D303, D302) cause CF302 to turn on to receive a Narrow signal. (See Fig. 3.)

**Fig. 3** Wide/Narrow switching circuit

## ■ AF Signal System

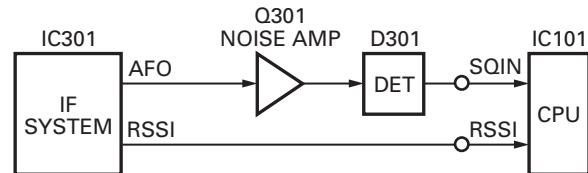

The detection signal from IF IC (IC301) goes to D/A converter (IC161) to adjust the gain and is output to AF filter (IC251) for characterizing the signal. The AF signal output from IC251 and the DTMF signal, BEEP signal are summed and the resulting signal goes to the D/A converter (IC161). The AFO output level is adjusted by the D/A converter. The signal output from the D/A converter is input to the audio power amplifier (IC252). The AF signal from IC252 switches between the internal speaker and speaker jack (J1) output. (See Fig. 4.)

**Fig. 4** AF signal system

## ■ Squelch Circuit

The detection output from the FM IF IC (IC301) passes through a noise amplifier (Q301) to detect noise. A voltage is applied to the CPU (IC101). The CPU controls squelch according to the voltage (SQIN) level. The signal from the RSSI pin of IC301 is used for S-meter. The electric field strength of the receive signal can be known before the SQIN voltage is input to the CPU, and the scan stop speed is improved.

**Fig. 5** Squelch circuit

## PLL Frequency Synthesizer

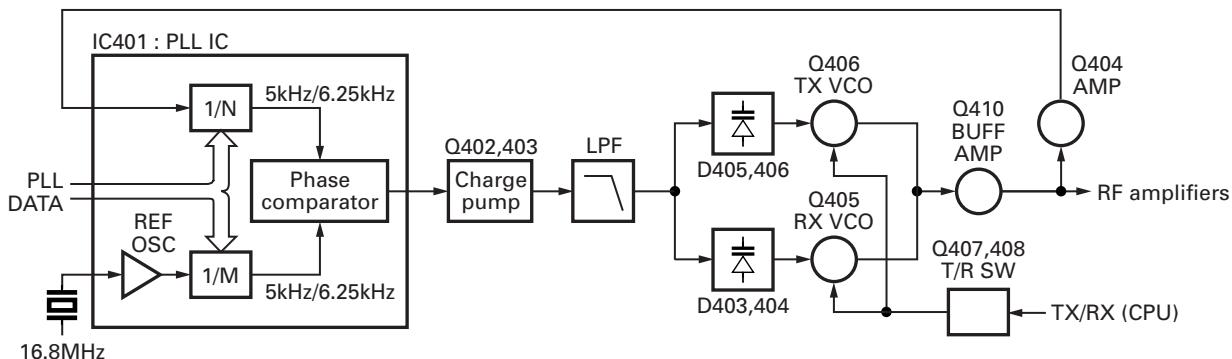

The PLL circuit generates the first local oscillator signal for reception and the RF signal for transmission.

## ■ PLL

The frequency step of the PLL circuit is 5 or 6.25kHz. A 16.8MHz reference oscillator signal is divided at IC401 by a fixed counter to produce the 5 or 6.25kHz reference frequency. The voltage controlled oscillator (VCO) output signal is buffer amplified by Q410, then divided in IC401 by a dual-module programmable counter. The divided signal is compared in phase with the 5 or 6.25kHz reference signal in the phase comparator in IC401. The output signal from the phase comparator is filtered through a low-pass filter and passed to the VCO to control the oscillator frequency. (See Fig. 6.)

## ■ VCO

The operating frequency is generated by Q406 in transmit mode and Q405 in receive mode. The oscillator frequency is controlled by applying the VCO control voltage, obtained from the phase comparator, to the varactor diodes (D405 and D406 in transmit mode and D403 and D404 in receive mode). The TX/RX pin is set high in receive mode causing Q408 and Q407 to turn Q406 off, and turn Q405 on. The TX/RX pin is set low in transmit mode. The outputs from Q405 and Q406 are amplified by Q410 and sent to the RF amplifiers. (See Fig. 6.)

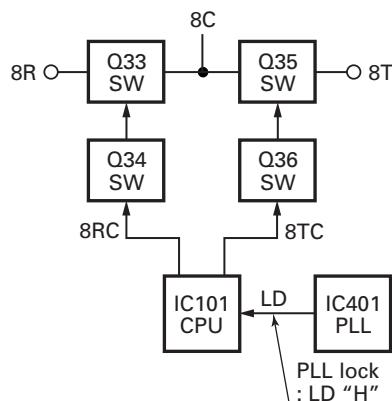

**Fig. 6** PLL circuit

# CIRCUIT DESCRIPTION

## ■ Unlock Circuit

During reception, the 8RC signal goes high, the 8TC signal goes low, and Q34 turns on. Q33 turns on and a voltage is applied to 8R. During transmission, the 8RC signal goes low, the 8TC signal goes high and Q36 turns on. Q35 turns on and a voltage is applied to 8T.

The CPU monitors the PLL (IC401) LD signal directly. When the PLL is unlocked during transmission, the PLL LD signal goes low. The CPU detects this signal and makes the 8TC signal low. When the 8TC signal goes low, no voltage is applied to 8T, and no signal is transmitted. (See Fig. 7.)

**Fig. 7** Unlock circuit

## Transmitter System

### ■ Outline

The transmitter circuit produces and amplifies the desired frequency directly. It FM-modulates the carrier signal by means of a varicap diode.

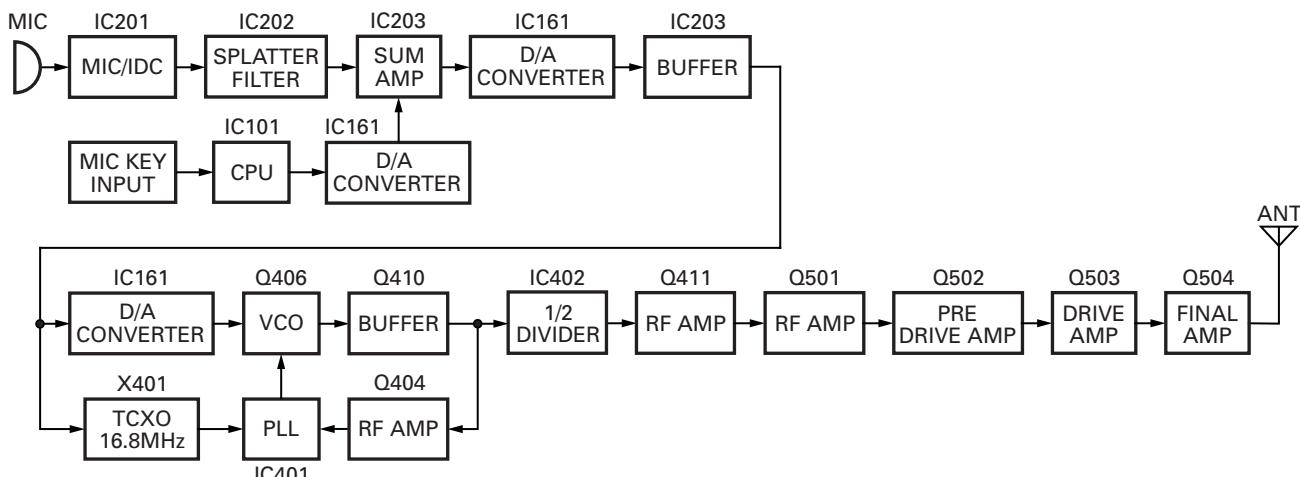

### ■ Power Amplifier Circuit

The transmit output signal from the VCO passes through the transmission/reception selection diode (D409) and amplified by Q501, Q502 and Q503. The amplified signal goes to the final amplifier (Q504) through a low-pass filter. The low-pass filter removes unwanted high-frequency harmonic components, and the resulting signal is transmitted through the antenna terminal. (See Fig. 8.)

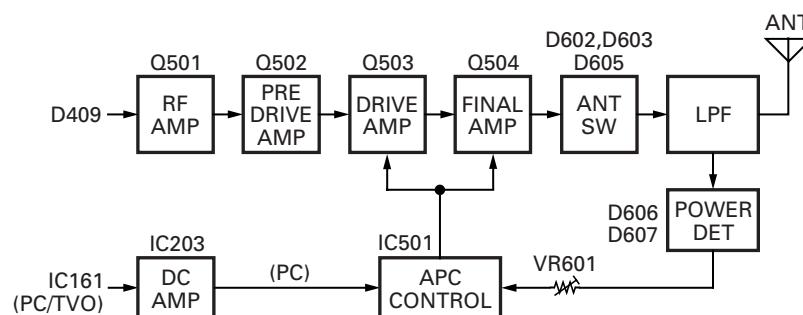

### ■ APC Circuit

The automatic transmission power control (APC) circuit detects part of a final amplifier output with a diode (D606, D607) and applies a voltage to IC501. IC501 compares the APC control voltage (PC) generated by the D/A converter (IC161) and DC amplifier (IC203) with the detection output voltage. IC501 generates the voltage to control Q503 and Q504 and stabilizes transmission output.

The APC circuit is configured to protect over current of Q503 and Q504 due to fluctuations of the load at the antenna end and to stabilize transmission output at voltage and temperature variations. (See Fig. 9.)

**Fig. 8** Transmitter system

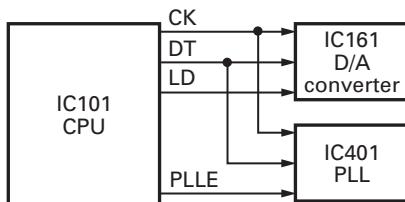

**Fig. 9** APC circuit

# CIRCUIT DESCRIPTION

## Control Circuit

The CPU carries out the following tasks (See Fig. 10.):

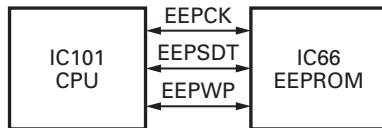

- 1) Controls the WIDE, NARROW, TX/RX outputs.
- 2) Adjusts the AF signal level of the AF filter (IC251) and turns the filter select compounder on or off.
- 3) Controls the display unit.
- 4) Controls the PLL (IC401).
- 5) Controls the D/A converter (IC161) and adjusts the volume, modulation and transmission power.

**Fig. 10 Control circuit**

## Memory Circuit

The transceiver has an 64k-bit EEPROM (IC66). The EEPROM contains adjustment data. The CPU (IC101) controls the EEPROM through three serial data lines. (See Fig. 11.)

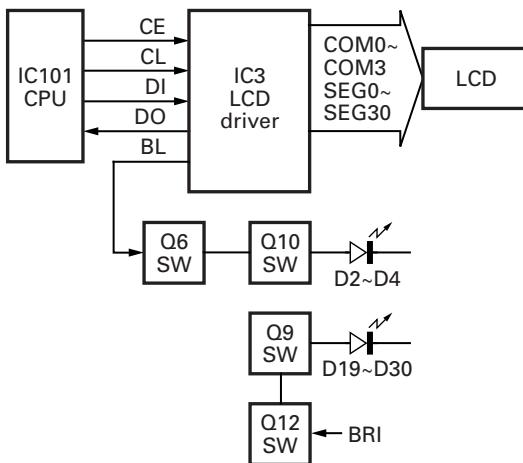

**Fig. 11 Memory circuit**

## Display Circuit

The CPU (IC101) controls the display LCD and LEDs. When power is on, the LCD driver will use the BL line to control the LCD illumination and key backlight LEDs.

The brightness function is controlled by the switch Q12. The LCD driver (IC3) and CPU (IC101) communicate through the CE, CL, DI, DO lines. (See Fig. 12.)

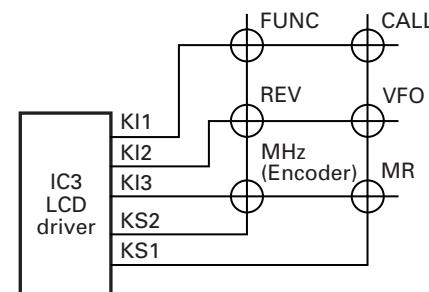

**Fig. 12 Display circuit**

## ■ Key Matrix Circuit

The TM-271 front panel has function keys. Each of them is connected to a cross point of a matrix of the KI1 to KI3 and KS1 to KS2 ports of the LCD driver.

The LCD driver monitors the status of the KI1 to KI3 and KS1 to KS2 ports. If the state of one of the ports changes, the LCD driver assumes that the key at the matrix point corresponding to that port has been pressed.

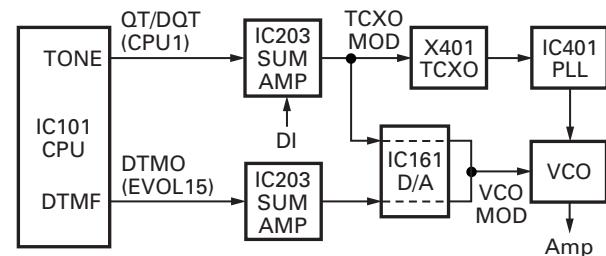

**Fig. 13 Key matrix circuit**

## ■ Encode

The DCS and CTCSS signals are output from QT/DQT of the CPU (IC101) and summed with the external pin DI line by the summing amplifier (IC203) and the resulting signal goes to the D/A converter (IC161). The DTMF signal is output from DTMF pin of the CPU and summed with a MIC signal by the summing amplifier (IC203), and the resulting signal goes to the D/A converter (IC161).

The D/A converter (IC161) adjusts the MOD level and the balance between the MOD and CTCSS/DCS levels. Part of a CTCSS/DCS signal is summed with MOD and the resulting signal goes to the VCOMOD pin of the VCO. This signal is applied to a varicap diode in the VCO for direct FM modulation.

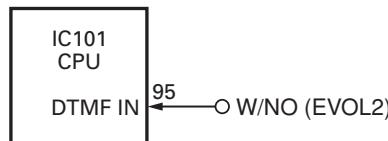

**Fig. 14 Encoder**

## CIRCUIT DESCRIPTION

**■ Decode****• CTCSS/DCS**

The signal (W/NO (EVOL2)) goes to DTMF IN (pin 95) of CPU (IC101). The CTCSS/DCS signal will pass through the low-pass filters in the CPU (IC101) and be decoded within the CPU (IC101). The DTMF signal will be decoded within the CPU (IC101).

**Fig. 15 Decode****■ D/A Converter**

The D/A converter (IC161) is used to adjust MO modulation, AF volume, TV voltage, FC reference voltage, and PC POWER CONTROL voltage level.

Adjustment values are sent from the CPU as serial data. The D/A converter has a resolution of 256 and the following relationship is valid:

$$\text{D/A output} = (\text{Vin} - \text{VDeref}) / 256 \times n + \text{VDeref}$$

Vin: Analog input

VDeref: D/A reference voltage

n: Serial data value from the microprocessor (CPU)

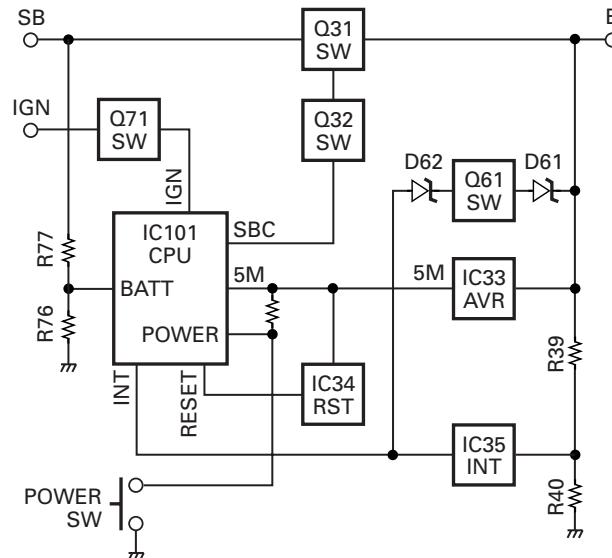

**Power Supply Circuit**

When the power switch on the display unit is pressed, the power port on the display unit which is connected port 17 (POWER), goes low, then port 82 (SBC) goes high, Q32 turns on, SB SW (Q31) turns on and power (SB) is supplied to the radio.

When the DC power supplied to the radio, the voltage regulator IC (IC33) supply into the CPU VDD and reset voltage detect IC (IC34). IC34 will generate signal (RESET) in to the reset terminal on the CPU (IC101) to carry out a power ON reset. If DC power is less than about 9.5V, the radio is unable to power on.

When the DC power voltage deceases from normal voltage, the INT voltage detector IC (IC35) will set to high on CPU port 18 (INT) if B line will became less than about 9.5V. Then CPU send to EEPROM (IC66) the backup data and go into STOP mode.

This circuit has an overvoltage protection circuit. If a DC voltage of 18V or higher is applied to the base of Q61, this voltage turns Q61 on and will set to high on CPU port 18 (INT). Then CPU send to EEPROM (IC66) the backup data and go into stop mode. (See Fig. 16.)

**Fig. 16 Power supply circuit****Data Terminal and Peripheral Circuits**

CN2 (data terminal) is the data communications terminal on the TX/RX PCB. It handles transmission control, data input/output, and squelch signals.

There are two data communications modes : 9600bps mode and 1200bps mode. Unlike with 1200bps AFSK, with this type of high-speed modulation, frequency modulation is carried out after the digital base band signals (rectangular wave) are passed through a band limiting filter. For 9600bps GMSK for example, compared to 4800Hz signals (nearly sine wave signals passed through a filter), these signals have a hissing sound like digital modulation when listened to by ear. Different types of modulation, such as GMSK is distinguished by the type of band limiting filter.

Pin No.	Pin Name	Specification		
1	PKD	bps switching	1200bps	9600bps
		Modulation input	400mVp-p	4Vp-p
		Frequency shift	3±0.5kHz	2.2±0.5kHz
4	PR9	Output level 500mVp-p/10kΩ	Always output during reception	
5	PR1	Output level 500mVp-p/10kΩ	Not output when squelch off	

**Table 4 Data terminal input/output level**

# CIRCUIT DESCRIPTION

## ■ Transmission Signals

Transmission modulation signals enter from PKD of the data terminal (CN2). The path to the modulation depends on whether communications are 1200bps or 9600bps mode.

For 1200bps mode, the transmission modulation signals from single analog switch (IC204) pass through MIC amplifier (IC201,202) and summing amplifier (IC203), and go to VCO (X401) through D/A converter (IC161).

For 9600bps mode, the transmission modulation signals from single analog switch (IC205) pass through summing amplifier (IC303), go to TCXO (X401) and VCO through D/A converter (IC161). (See Fig. 17.)

## ■ Reception Signals

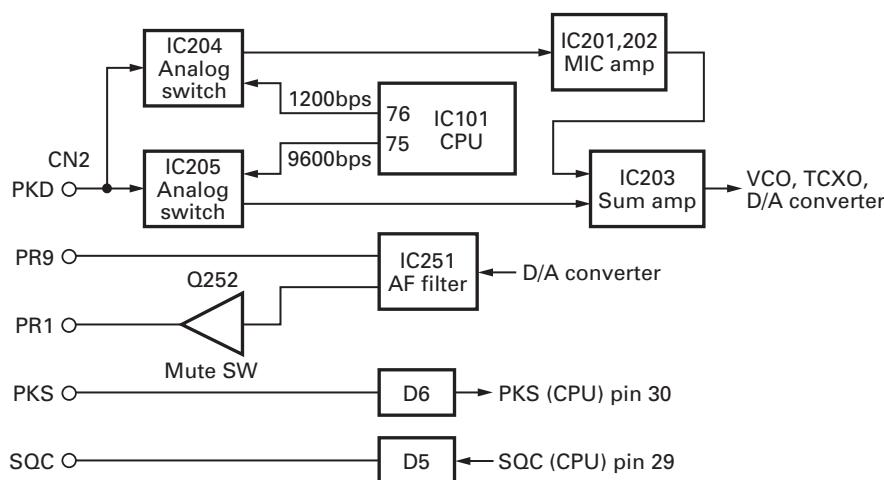

PR9 is the 9600bps data communications reception output. It outputs the FM detection circuit output through an AF filter (IC251). These signals are always output whether the squelch is open or closed.

PR1 is the 1200bps data communications reception output. It outputs the FM detection circuit output through an AF filter (IC251). Output is controlled with the mute switch (Q252) according to whether squelch is open or closed. (See Fig. 17.)

## ■ Squelch Signal Output Circuit

The squelch circuits is input to the TNC to prevents conflicts from occurring between simultaneous receive mode and transmit mode traffic during packet communications (only during 1200bps). The signal is output from pin 29 of IC101 to the data terminal. The logic is as shown in the table below.

SQC terminal output CN2	L : SQ CLOSE H : SQ BUSY

## EXPLODED VIEW

Parts with the exploded numbers larger than 700 are not supplied.

## PACKING

# RESETTING THE TRANSCEIVER

## Resetting the Transceiver

If your transceiver seems to be malfunctioning, resetting the microprocessor may solve the problem. The following 2 reset modes are available. When performing the reset, you may lose memory data and stored information. Back up or write down important data before performing the reset.

### Initial Settings

The factory defaults for the operating frequencies are as follows.

Transceiver : 144.000MHz

The Memory Channels have no data stored. The Weather Radio frequency (AL channel) is restored as 162.550MHz (K market model only). The Call Channel and frequency step size default values.

**Note :** When in Channel Display Mode or while Key Lock is activated, you cannot perform VFO reset or Full reset.

### Full Reset

This resets all transceiver parameters to the factory default values. There are two methods available for resetting the transceiver.

#### • Full Reset Method 1:

1. With the transceiver power OFF, press [F]+[φ] (Power).
  - All indicators light momentarily, followed by the full reset confirmation message.

#FLRS TR

2. Press [F].
  - "SURE ?" appears.
  - Press any key other than [F] to cancel.
3. Press [F] again to reset the transceiver.
  - "WAIT" appears momentarily.

#### • Full Reset Method 2:

1. Press [F], [MENU] and turn the Tuning control to select Menu No. 99 (RESET).
2. Press [MENU] and turn the Tuning control to select "FULL".
3. Press [MENU].
  - "SURE ?" appears.

#SURE ? 99

- Press any key other than [MENU] to cancel.
4. Press [MENU] to reset the transceiver.
  - "WAIT" appears momentarily.

### VFO Reset

This resets the transceiver parameters excluding the DTMF Memory, the Memory channel contents, and the Call channel contents. There are two methods available for resetting the transceiver.

**Note :** Menu No. 7 (P.VFO) and Menu No. 10 (OFFSET) return to the factory default values.

#### • VFO Reset Method 1:

1. With the transceiver power OFF, press [VFO]+[φ] (Power).
  - The VFO reset confirmation message appears.

#VFRST.R

2. Press [VFO].
  - "SURE ?" appears.
  - Press any key other than [VFO] to cancel.
3. Press [VFO] again to reset the transceiver.
  - "WAIT" appears momentarily.

#### • VFO Reset Method 2:

1. Press [F], [MENU] and turn the Tuning control to select Menu No. 99 (RESET).
2. Press [MENU] and turn the Tuning control to select "VFO".
3. Press [MENU].
  - "SURE ?" appears.

#SURE ? 99

- Press any key other than [MENU] to cancel.
4. Press [MENU] to reset the transceiver.

## ADJUSTMENT

**Adjustment Mode**

In Adjustment Mode, the transceiver can be adjusted using its panel keys.

**■ Items that can be adjusted in Adjustment Mode \*1**

- |                            |                          |
|----------------------------|--------------------------|
| 1. Frequency Tune          | 7. DCS Fine Deviation *3 |
| 2. Transmit High Power *2  | 8. DTMF Fine Deviation   |
| 3. Transmit Low Power *2   | 9. Band Pass Tuning *4   |
| 4. DCS Balance *3          | 10. Squelch Tight *5     |
| 5. Max Deviation *3        | 11. Squelch Open *5      |
| 6. CTCSS Fine Deviation *3 | 12. S-Meter S1 Level     |
|                            | 13. S-Meter Full Level   |

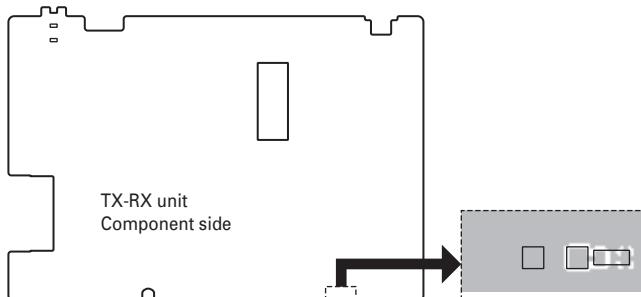

**Note :**

- \*1 : The PLL lock voltage and Max Power Alignment for transmission cannot be adjusted in Adjustment Mode.
- \*2 : Adjusted in 5 points in the transmission operating frequency range.
- \*3 : Adjusted in 3 points for the Wide Band Width in the transmission operating frequency range.  
Adjusted in 1 point for the Narrow Band Width
- \*4 : Adjusted in 3 points in the reception operating frequency range.
- \*5 : Adjusted in 3 points for the Wide Band Width in the reception operating frequency range.  
Adjusted in 1 point for the Narrow Band Width

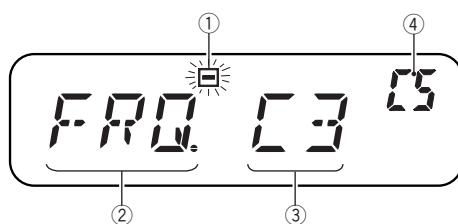

**■ How to Enter Adjustment Mode**

To perform adjustments with transceiver panel keys, the transceiver must be set to "Adjustment Mode".

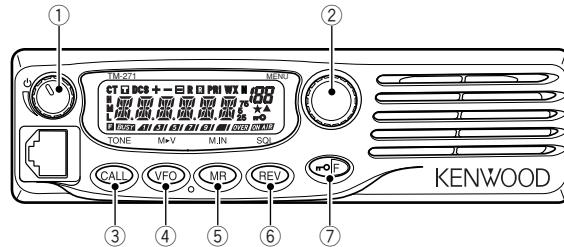

While shorting the following figure terminals on the PCB with tweezers, etc., turn the power switch ON to enter Adjustment Mode. (See Fig. 1.)

**Fig. 1****■ LCD Display When Adjustment Mode is Enabled**

Example of Frequency Tune. See "Table 1" for an LCD display list.

**Fig. 2**

- ① Blinks in Adjustment Mode.
- ② Adjustment item display
- ③ Adjustment value display. Can be adjusted while it is "blinking".  
Displayed as a hexadecimal number from 00 to FF.
- ④ Adjustment value stored in memory.  
When an adjustment value is determined, it is equal to the value in "3".

**■ Panel Key Operation Method in Adjustment Mode****Fig. 3**

- ① Power switch/Volume control
- ② When the knob is pressed once, the adjustment value display blinks. (Select an adjustment item with "4" or "5" key before performing the operation. It cannot be performed while transmitting.)  
When the knob is rotated while the adjustment display is blinking, the adjustment value changes. (Adjust transmission items while transmitting.)  
When the knob is pressed again, the adjustment value stops blinking and lights, and the adjustment value is saved in the memory of the transceiver. (For transmission item adjustment, enter receive mode before performing the operation.)
- ③ Changing between adjustment value display and frequency display  
The display changes as follows : Adjustment value display → Transmit frequency display → Receive frequency display → Adjustment value display.  
The frequency for adjustment can be confirmed.
- ④ Moves the adjustment item backward. (If it is operated when a frequency is displayed, the adjustment item display returns.)
- ⑤ Moves the adjustment item forward. (If it is operated when a frequency is displayed, the adjustment item display returns.)
- ⑥ If it is pressed before determining the adjustment value, the adjustment value of the Adjustment item returns to its original value.
- ⑦ Not used in Adjustment Mode.

**Note :**

If Max Power for transmission is low, check the DC cable.  
If the DC cable connector has poor contact due to rust or stain, voltage may drop occur frequently and correct transmission power may not be supplied.

In this case, polish the DC cable connector. If the problem still persists, replace the DC cable with a new one.

Table 1 Adjustment items, display and test frequency list

## ADJUSTMENT

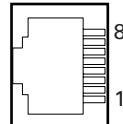

## Test Equipment Required for Alignment

Test Equipment	Major Specifications	
1. Standard Signal Generator (SSG)	Frequency Range Modulation Output	136 to 175MHz Frequency modulation and external modulation -127dBm/0.1μV to greater than -7dBm/100mV
2. Power Meter	Input Impedance Operation Frequency Measurement Capability	50Ω 136 to 175MHz or more Vicinity of 100W
3. Deviation Meter	Frequency Range	136 to 175MHz
4. Digital Volt Meter (DVM)	Measuring Range Accuracy	1 to 20V DC High input impedance for minimum circuit loading
5. Oscilloscope		DC through 30MHz
6. High Sensitivity Frequency Counter	Frequency Range Frequency Stability	10Hz to 1000MHz 0.2ppm or less
7. Ammeter		20A
8. AF Volt Meter (AF VTVM)	Frequency Range Voltage Range	50Hz to 10kHz 1mV to 3V
9. Audio Generator (AG)	Frequency Range Output	20Hz to 20kHz or more 0 to 1V
10. Distortion Meter	Capability Input Level	3% or less at 1kHz 50mV to 10Vrms
11. 8Ω Dummy Load		Approx. 8Ω, 10W or more
12. Regulated Power Supply		13.8V, approx. 20A (adjustable from 9 to 17V) Useful if ammeter equipped
13. Spectrum Analyzer	Center frequency	50KHz to 1000MHz
14. Tracking Generator	Output Voltage	100mV or more

Test cable for microphone input (E30-3360-08)

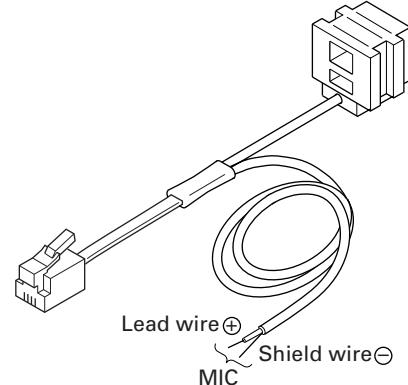

MIC connector (Front view)

- 1 : BLC
- 2 : PSB
- 3 : E
- 4 : PTT
- 5 : ME
- 6 : MIC
- 7 : HOOK
- 8 : CM

Tuning cable (E30-3383-05)

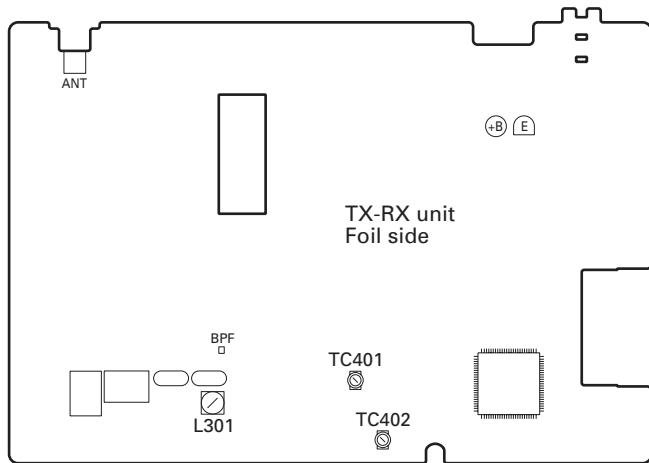

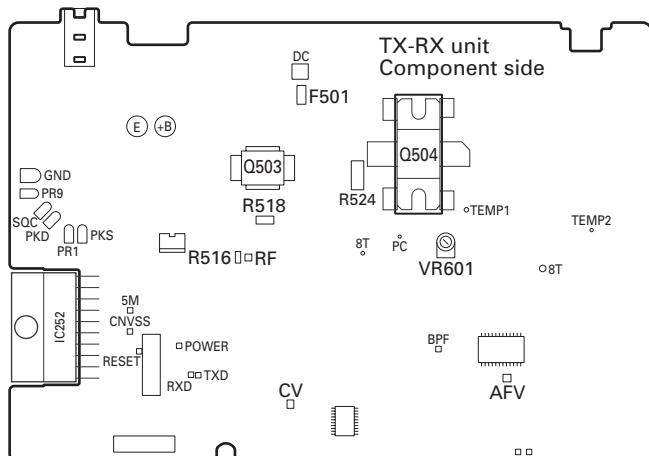

Adapter cable (E30-3383-05) is required for injecting an audio if adjustment mode is used.

# ADJUSTMENT

## Adjustment Location

### ■ Adjustment Points

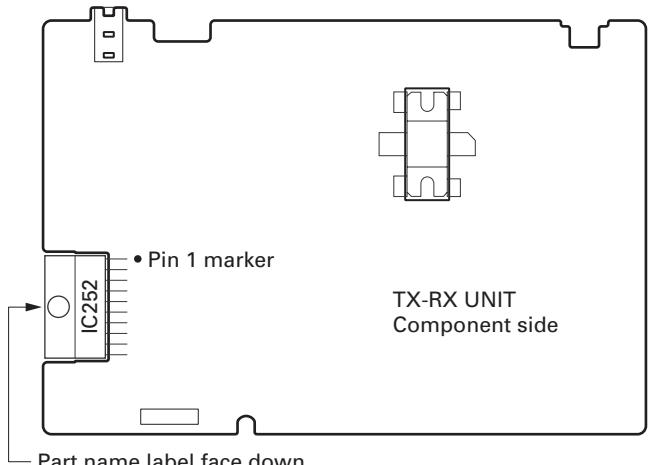

### ■ Notes

#### • EEPROM

The tuning data (Deviation, Squelch, etc.) for the EEPROM, is stored in memory. When parts are changed, re-adjust the transceiver.

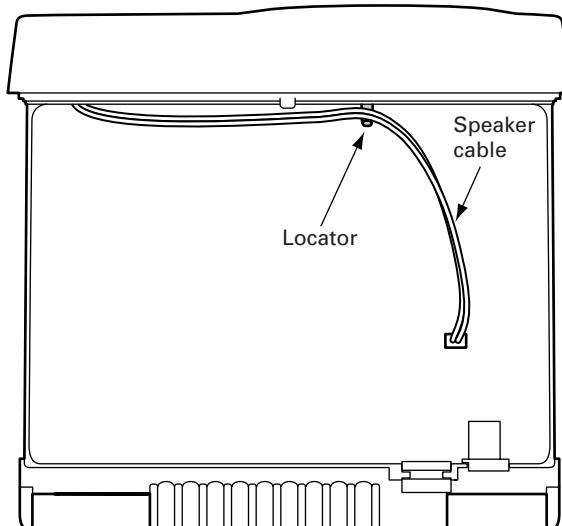

#### • AF PA IC (IC252)

How to mounting the IC252.

### • Speaker Cable

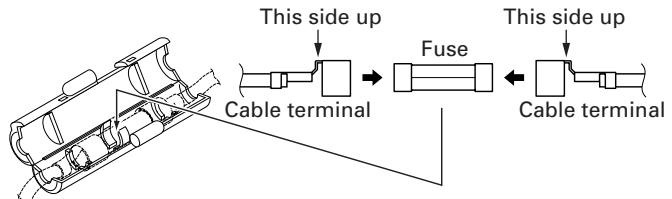

The speaker cable should be formed before mounting the shield cover as below.

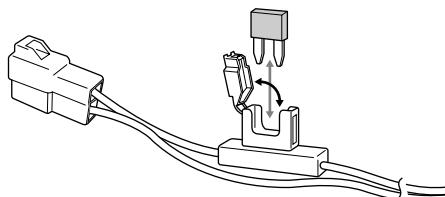

### • Fuse

To mount the fuse, the cable terminal direction must be as follow.

- Except the E type models

- E type models

## ADJUSTMENT

## PCB Section

Item	Condition	Measurement		Adjustment		Specifications/ Remarks
		Test equipment	Terminal	Parts	Method	
1. Setting	1) Power supply voltage DC Power supply terminal : 13.8V					
2. VCO lock voltage*	1) CH : TX high	Digital voltmeter	CV	TC402	5.5V	±0.2V
	2) CH : RX high			TC401	5.5V	±0.2V
	3) CH : TX low				Check	0.5V or more
	4) CH : RX low					
3. IF coil	1) CH : RX center (Wide) 2) SSG output : -53dBm (501μV) Mod : 1kHz Dev : 3kHz	SSG Digital voltmeter	AFV	L301	3.25~3.35V (DC)	

## \* Adjustment of TX VCO lock voltage

1. Remove R516, F501, R518 and R524 (all on component side).
2. Remove PCB from chassis.
3. Transmit and check voltage at [CV] point.
4. Adjust of voltage can be done by tuning TC402.

## Transmitter Section

Item	Condition	Measurement		Adjustment		Specifications/ Remarks

## ADJUSTMENT

Item	Condition	Measurement		Adjustment		Specifications/ Remarks
		Test equipment	Terminal	Parts	Method	
6. MAX deviation	1) CH : TX low (Wide) CH : TX center (Wide/Narrow) CH : TX high (Wide) 2) AG : 1kHz/50mV 3) Transmit	Modulation analyzer or Linear detector (LPF : 15kHz) Oscilloscope AG AF V.M	ANT MIC	Encoder knob	±4.0kHz (Wide) ±2.0kHz (Narrow) According to the large +, -	±100Hz (Wide) ±50Hz (Narrow)
7. MIC sensitivity	1) CH : TX center (Narrow) 2) AG : 1kHz/5.4mV (TM-271A) AG : 1kHz/2.4mV (TM-271E) 3) Transmit				Check	±1.2~1.9kHz (Narrow)
8. CTCSS fine deviation	1) CH : TX low (Wide) CH : TX center (Wide/Narrow) CH : TX high (Wide) 2) Transmit				±0.75kHz (Wide) ±0.35kHz (Narrow)	±50Hz
9. DCS fine deviation	1) CH : TX low (Wide) CH : TX center (Wide/Narrow) CH : TX high (Wide) 2) Transmit	Modulation analyzer or Linear detector (LPF : 3kHz) Oscilloscope		Encoder knob	±0.75kHz (Wide) ±0.35kHz (Narrow)	±50Hz (Wide) ±40Hz (Narrow)
10. DTMF fine deviation	1) CH : TX center (Wide/Narrow) 2) Transmit				±3.0kHz (Wide) ±1.5kHz (Narrow)	±200Hz (Wide) ±100Hz (Narrow)

**If normal power is not obtained, please follow the step below**

Open the shielding cover (upper), and screw 3 locations around ANT pin.

1. Switch off the transceiver.

Impedance of Final FET (Q504) and Drive FET (Q503) can be measured easily using DVM  $\Omega$  mode.

Normal condition – Gate :  $20\text{k}\Omega$ ~ $50\text{k}\Omega$ , Drain :  $1\text{M}\Omega$ ~ $2\text{M}\Omega$   
The above impedance values are rough estimations.

2. Switch on the transceiver. Check the voltage at F501 output point.

The voltage is around 13.8V in receiving condition. The voltage will be 12.6V~ in transmitting condition. If found 0V at this point then F501 is broken.

3. Remove R516.

4. Connect  $50\Omega$  load at the ANT location.  
Transmit and check current drain at High power mode.  
If the current drain is less than 1A, then Final FET is broken.  
If the current drain is less than 5.0A, short the Drive FET gate to ground, and check the current drain.  
If the current drain is not 0.1A less than the original value, then the Drive FET is broken.
5. Check input power level at Drive FET gate location.  
Connect the wire to [RF] location.  
Transmit and check for power to be within the range of 0.3W~0.6W.  
If power found is less than 0.3W, check the circuit before the Drive FET.

2. Squelch tight	1) CH : RX low (Wide) CH : RX center (Wide/Narrow) CH : RX high (Wide) 2) SSG output : -115dBm (0.4μV) (Wide/Narrow) Mod : 1kHz Dev : ±3.0kHz (Wide) Dev : ±1.5kHz (Narrow)	SSG Oscilloscope AF V.M Distortion meter	ANT EXT. SP	Encoder knob	Adjust to open the squelch	
3. Squelch open	1) CH : RX low (Wide) CH : RX center (Wide/Narrow) CH : RX high (Wide) 2) SSG output : -125dBm (0.126μV) (Wide/Narrow) Mod : 1kHz Dev : ±3.0kHz (Wide) Dev : ±1.5kHz (Narrow)					
4. RSSI writing	1) CH : RX center (Wide) 2) SSG output : -53dBm (501μV) Mod : 1kHz Dev : ±3.0kHz			Push encoder knob	RSSI value writing is performed by the "Squelch open" item (center wide). SSG output level is changed and adjusted after SQ adjustment. This adjustment should not turn the encoder.	
5. S-meter S1	1) CH : RX center (Wide) 2) SSG output : -118dBm (0.28μV) Mod : 1kHz Dev : ±3.0kHz					
6. S-meter full scale	1) CH : RX center (Wide) 2) SSG output : -96dBm (3.54μV) Mod : 1kHz Dev : ±3.0kHz

# TM-271A/271E

## BLOCK DIAGRAM

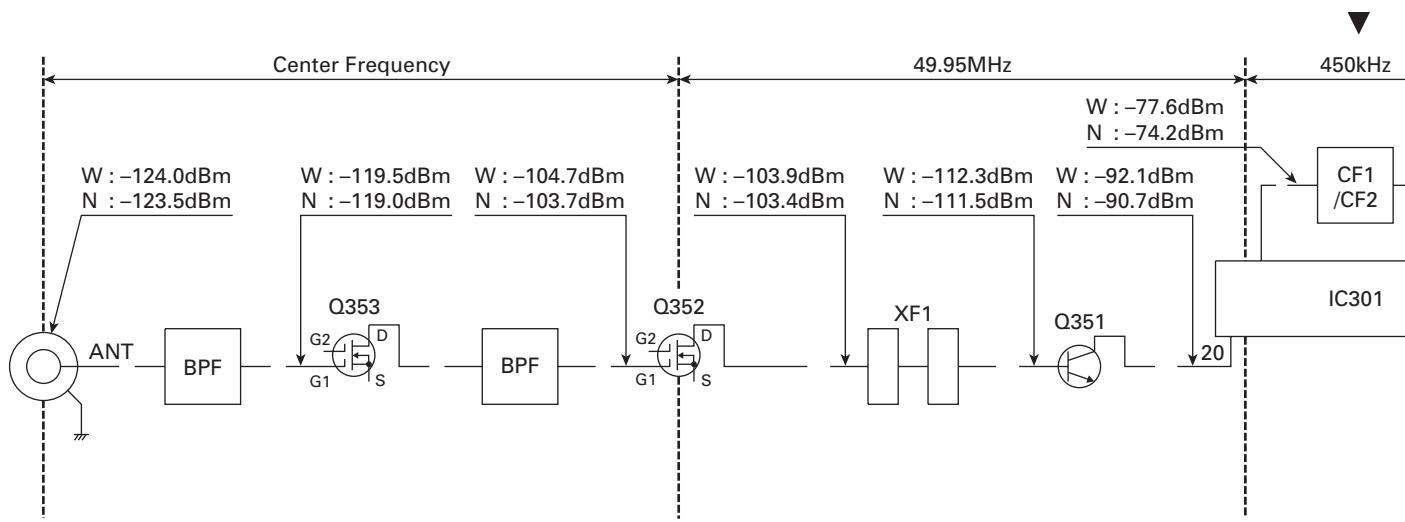

## BLOCK DIAGRAM

# TM-271A/271E

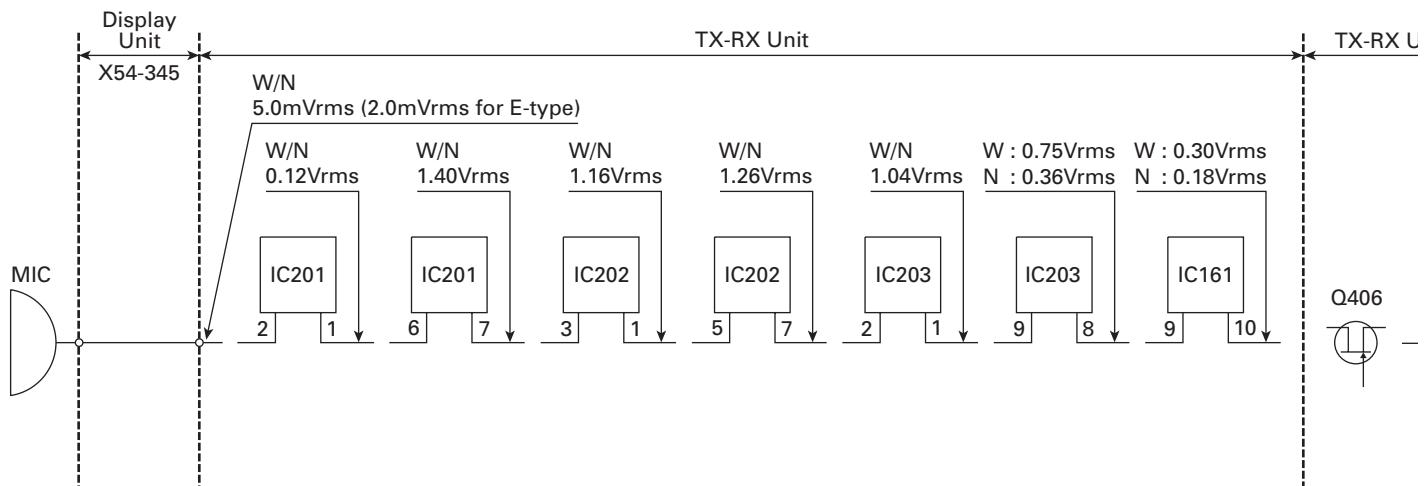

## LEVEL DIAGRAM

### Receiver Section

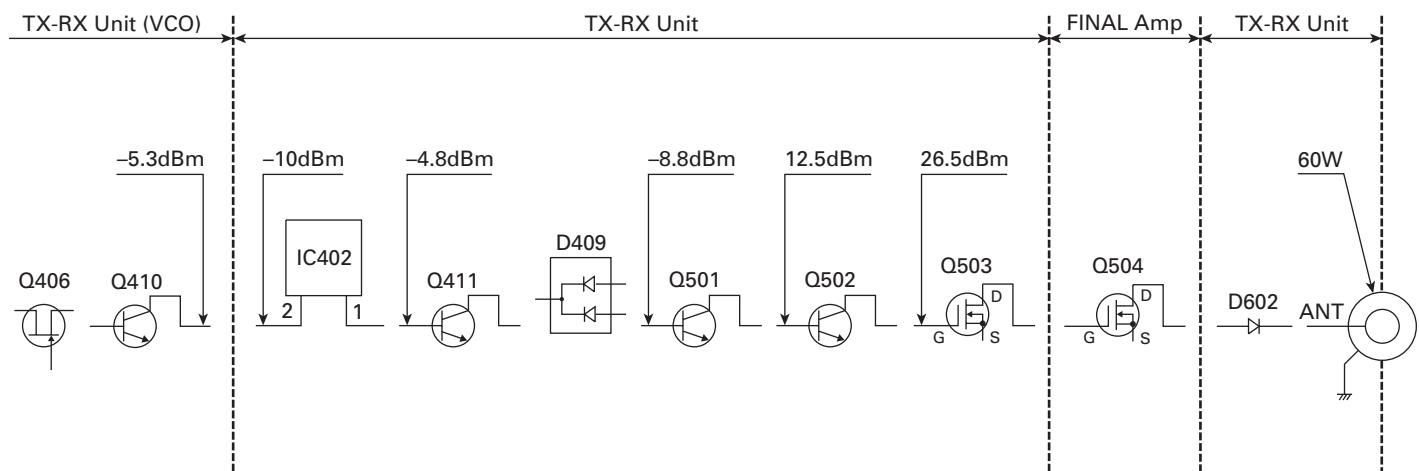

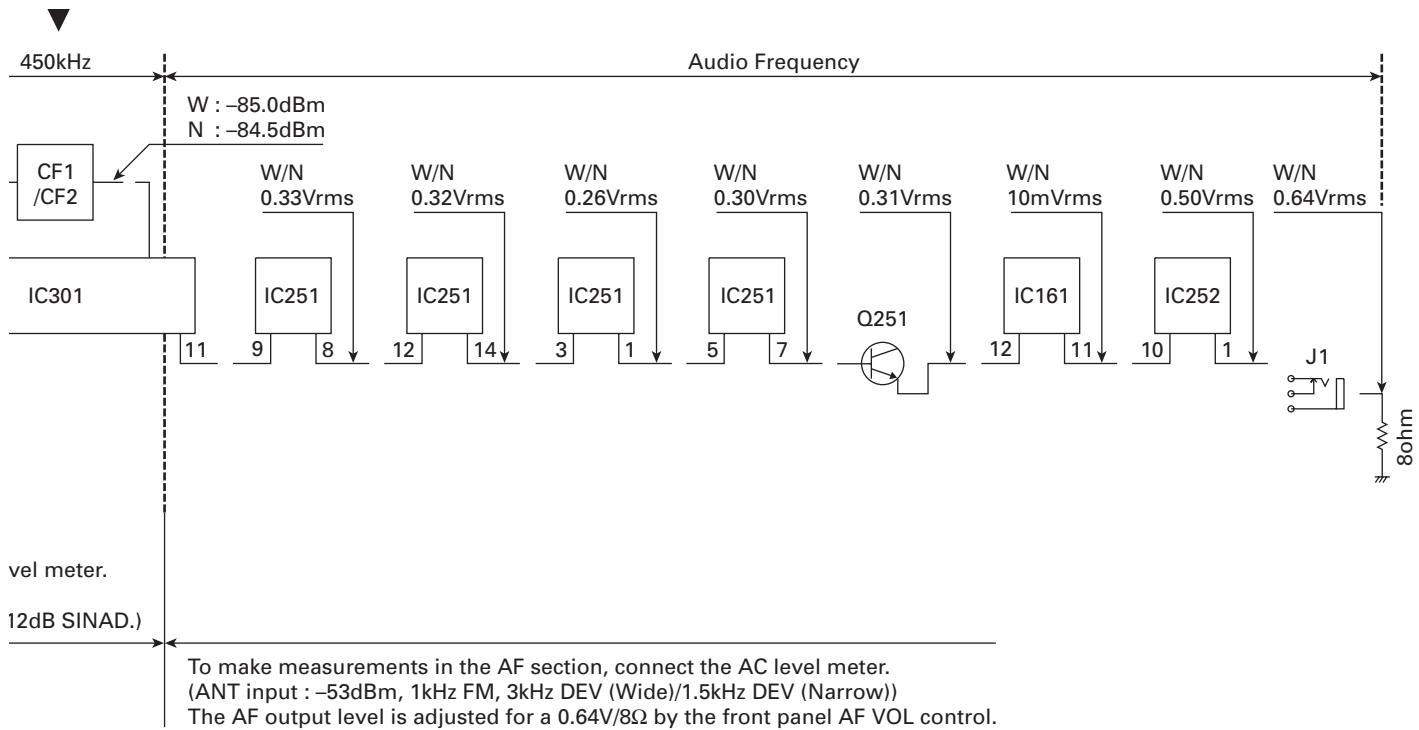

To make measurements in the RF section, connect the RF level meter.  
In the RF section, use a  $0.01\mu\text{F}$  coupling capacitor.  
(The display shows the SSG input value required to obtain 12dB SINAD)

### Transmitter Section

To make measurements in the AF section, connect the AC level meter.  
AG is set so that MIC input becomes 3kHz/1.5kHz (Wide/Narrow) DEV at 1kHz MOD.

## LEVEL DIAGRAM

# TM-271A/E

## SPECIFICATIONS

### GENERAL

Frequency Range

TX ..... K,M4 : 144~148MHz E : 144~146MHz M2,M3 : 136~174MHz

RX ..... K,E,M2,M3 : 136~174MHz M4 : 144~148MHz

Mode ..... F3E (FM)

Antenna Impedance ..... 50Ω

Usable Temperature Range ..... -20°C~+60°C (-4°F~+140°F)

Power Supply ..... 13.8V DC±15% (11.7~15.8V)

Grounding Method ..... Negative ground

Current

Transmit (max.) ..... K,E,M2,M3 : 13A or less M4 : 8A or less

Receive (at 2W output) ..... 1.0A or less

Frequency Stability (-20°C~+60°C) ..... Within ±2.5ppm

Dimensions (W x H x D projections not included) ..... 160 x 43 x 137 mm / 6-5/16 x 1-11/16 x 5-13/32 inch

Weight ..... Approx. 1.2kg / 2.6lb

### RECEIVER

Circuitry ..... Double conversion superheterodyne

Intermediate Frequency (1st / 2nd) ..... 49.95MHz / 450kHz

Sensitivity (12dB SINAD) ..... Wide : 0.18µV or less Narrow : 0.22µV or less

Selectivity

-6dB ..... Wide : 12kHz or more Narrow : 10kHz or more

-60dB ..... Wide : 30kHz or less Narrow : 24kHz or less

Squelch Sensitivity ..... 0.1µV or less

Audio Output (8Ω, 5% distortion) ..... 2W or higher (5% distortion)

Audio Output Impedance ..... 8Ω

### TRANSMITTER

Power Output

High ..... K,E,M2,M3 : 60W M4 : 25W

Low ..... K,E,M2,M3 : Approx. 25W

Modulation ..... Reactance modulation

Spurious Emissions ..... -60dB or less

Maximum Frequency Deviation ..... Wide : ±5kHz Narrow : ±2.5kHz

Audio Distortion (at 60% modulation) ..... 3% or less

Microphone Impedance ..... 600Ω

**Note : All specifications (General, Transmitter and Receiver) are guaranteed within the amateur radio band.**

Guarantee	K,M2,M3,M4	E
frequency range	144~148MHz	144~146MHz

## KENWOOD CORPORATION

2967-3, Ishikawa-machi, Hachioji-shi, Tokyo, 192-8525 Japan
