Do We Really Need a Baby Thermometer?

You cannot merely take a reliable and trusted reading by touching the forehead or neck of the baby with your hand. The solution is the **Baby Thermometer** designed for babies to keep them safe and have an accurate reading.

You can rightly ask, “**Why not the regular thermometer that you already have?**”

Well, the regular thermometers (Oral thermometers) are required to be kept under the tongue; obviously, babies cannot do that. Also, these types of regular thermometers cannot be used underarm as they are unable to provide an accurate reading.

The old mercury thermometer can be dangerous for babies. In case it breaks, the mercury can be inhaled by the baby, which can cause health issues.

Types of Baby Thermometer Mostly Used

There are several different modern baby thermometers available in the market. You can pick the one according to your needs and requirements. The most common types available are the following:

- 1. Forehead Thermometer or Temporal Artery Thermometer**
- 2. Ear Thermometer or Tympanic Thermometer**
- 3. Rectal Thermometer or Bottom Thermometer**
- 4. Underarm Thermometer or Axillary Thermometer**
- 5. Oral Thermometer or Mouth Thermometer**

Now, let's have a look in detail at the individual thermometer mentioned above

1. Forehead Thermometer or Temporal Artery Thermometer:

This fast, non-invasive, and easy to use baby thermometer is swiped across the baby forehead to get the reading. The thermometer measures the temporal artery temperature on the forehead. It is safe to be used with babies aged six months and beyond. The reading via this thermometer is less accurate than the rectal one.

2. Ear Thermometer or Tympanic Thermometer:

It is easy to use and fast thermometer that senses the infrared heat coming from inside of the ear. It is less accurate as compared to the rectal thermometer. The positioning of the baby thermometer inside the ear is vital for having good reading. The ear wax can also disturb the accuracy of the measurement. Well, it's not 100% accurate but sufficient enough to get the information about the baby's fever. The ear thermometer is safe to use with babies aged six months and beyond.

3. Rectal Thermometer or Bottom Thermometer:

According to the research, rectal thermometers are the most accurate. These are best for use with infants of 3 months or younger. Rectal thermometers are slightly uncomfortable for the baby while taking measurement but the most reliable and accurate.

4. Underarm Thermometer or Axillary Thermometer:

The measurement is taken by placing the thermometer under the arm. The axillary thermometer is easier to use as compared to a rectal thermometer but less accurate. This thermometer needs a bit of a baby's cooperation by holding it without moving till the thermometer beeps.

5. Oral Thermometer or Mouth Thermometer:

Oral thermometers are safe and accurate to use. The only downside is that the instruments need to be placed under the tongue for roughly a minute to get the correct result. It usually is possible with the child having the age of 4 years and older.

Age Appropriate Thermometers

Age:	Type of Thermometer
3 Months or less	Rectal thermometer
3 Months – 4 Years	Rectal, Axillary, Tympanic Thermometer
4 Years – 5 Years	Rectal, Axillary, Tympanic, Oral Thermometer
5 Years or beyond	Oral, Axillary, Tympanic Thermometer

Is It Time To Call Your Doctor?

Depending upon the age of your child and temperature reading, you can have a look at the below information for calling your doctor. In case your child is having other symptoms like cold, cough, specific pain e.g., in the stomach, etc. you are advised to call your doctor immediately.

1. A rectally obtained temperature of 100.4 °F is a matter of concern for young babies less than three months old.
2. A rectally obtained temperature of 102 °F is a matter of concern for babies less than six months old but more than three months.
3. A rectally obtained temperature of greater than 102 °F is a matter of concern for babies who are between the age of 6 months to 2 years.

Now I find myself wishing that we had Kinsa in the hospital. One really frustrating thing for me about taking someone's temp is how long it takes. This thermometer is fast and has proven to be very accurate. I was checking it against my old one, same readings, just faster. The app is easy to use and my kids love it. This flu season has been scary to say the least and an accurate quick temp is important. "I worked in pediatrics for ten years where we used a higher end thermometer but also by this brand. The pediatrician recommended this one instead of paying \$400 for the high end. I have been using it for about 8 years with all kids and i love it. I recently lost mine so bought this one as a replacement. Battery lasts a long time and when it dies a plain battery from the dollar store lasts over 6 months. Its very easy to use and very accurate. Very fast to take a temperature and easy even on infants. Only thing, do not take a temp as soon as a person comes in from the outside as the forehead still holds temp of the outdoors and same goes for straight out of a bath or shower. "This Braun ThermoScan 7 IRT6520 Thermometer comes with everything you need to start using it. You get 20 caps, 2 batteries, an excellent storage case and the scanner. It works as it should and seems accurate enough for checking sick persons. One thing mentioned by another reviewer was having to set the age of the person being tested each time you use it and that is true but not really hard to do and it really doesn't matter what you set it on, baby, child, or adult, as the temperature number output is the same for all. That feature is only for the built in alert for the different ages since, yes, 'normal' temperature is different for the three age groups but the temperature number output doesn't change on the screen so if all you want to know is the temperature number then any setting will work. It is also backlit display so reading in the dark is really easy. Thank goodness this takes regular batteries so no need to keep the some 2032 computer batteries around."
