Introduction

The Xerox Smart Card solution brings an advanced level of security to sensitive information. Organizations can restrict access to the walk-up features of a Xerox device. This ensures only authorized users are able to copy, scan, e-mail and fax information.

The key benefit of this solution is its two-factor identification requirement. Users must insert their access card and enter a unique Personal Identification Number (PIN) at the device. This provides added security in the event that a card is lost or stolen.

Once validated, a user is logged into the Xerox device for all walk-up features. The system allows for functions to be tracked for an added layer of security.

The Xerox Smart Card enablement kit integrates with Xerox multifunction printers and existing smart and personal identity verification cards and readers.

This guide explains how to install and configure the Smart Card solution. It identifies the resources and equipment required to complete a successful installation.

Should you require any further information, please contact your Local Xerox Representative.

Compatibility

This solution is compatible with the following configuration:

Configuration	Software Level	CAC	PIV	.NET
ColorQube™ 8700 and ColorQube™ 8900	071.160.222.26600 or lower Note: If your System Software Version is 071.160.222.26601 or higher, please refer to the Xerox Smart Card Installation and Configuration Guide for Xerox ColorQube™ 8700/8900 with System Software Version 071.160.222.26601 or higher.	Yes	Yes	Yes

- To identify the software level on your machine, press the **Machine Status** button on the control panel.
- The System Software Version number is displayed.

Card Readers and Card Types

Supported Card Readers

The customer is responsible for providing a card reader for each Xerox device. The following card readers are compatible with the solution:

- Gemplus GemPC USB SL
- Gemplus GEMPC Twin
- SCM Micro SCR3310
- SCM Micro SCR3311
- OmniKey Cardman 3021 USB
- OmniKey Cardman 3121 USB
- ActivCard USB Reader V2 with SCR-331 firmware¹
- Cherry ST1044U

Other CCID compliant readers may function with the solution, but have not been validated.

Supported Card Types

The customer is also responsible for purchasing and configuring the access cards. The following card types are supported:

- CAC
- PIV & PIV II
- Gemalto.NET

Other card types may function with the solution, but have not been validated.

Additional information from your System Administrator may be required to validate which card reader works best in your environment.

Note: Information about CCID compliant card types can be obtained from various websites, for example www.pcsclite.alioth.debian.org/ccid. This site is not a Xerox website and is not endorsed by Xerox.

Documentation and Support

For information specifically about your Xerox product, the following resources are available:

- **System Administrator Guide** provides detailed instructions and information about connecting your device to the network and installing optional features. This guide is intended for System/Machine Administrators.
- **User Guide** provides detailed information about all the features and functions on the device. This guide is intended for general users.

Most answers to your questions will be provided by the support documentation supplied on disc with your product. Alternatively you can contact the Xerox Support Center or access the Xerox website at www.xerox.com.

Preparation

2

This section explains the preparation and resources required to install the *Smart Card Reader*.

The installation will take approximately one hour for each device. The following items are required in order to complete the installation:

Item	Supplier
Compatible Card Reader (refer to Supported Card Readers on page 6)	Customer
Compatible Access Card (refer to Supported Card Types on page 6)	Customer
Smart Card enablement kit 498K17546 (one for each Xerox device)	Xerox
Feature Enable Key	Xerox
TCP/IP enabled on the device	Customer
DNS Host name or static IP address assigned	Customer
Network Settings to be checked to ensure network is fully functional	Customer
Domain Controller (DC) information: • Domain Controller authentication environment • IP address or Host Name • Domain information • Domain Controller Root and Intermediate certificates • Check that all certificates are in 64 bit X.509 format • Determine if the DC is registered with the OCSP at this site	Customer
Online Certificate Status Protocol (OCSP) Server Information: • OCSP Server URL • OCSP - Root and Intermediate Certificates • Check that all certificates are in 64 bit X.509 format	Customer
Proxy Server configuration details	Customer

To set up the Domain Controller (DC) validation, you will need to determine if your site validates the DC against the Online Certificate Status Protocol (OCSP) server. Many sites use OCSP to validate individuals, but do not register the DC with it. If you set up the Xerox device to validate the DC and it isn't registered, the procedure will fail.

If your site does register the DC with OCSP, you will need to decide whether:

- to validate the DC against OCSP before validation of the user, or
- to validate the DC after validation of the user

Preparation

The first method requires installation of the DC certificate as part of this procedure and is the more accepted method for validation. The second method retrieves the DC certificate automatically for each authentication and doesn't require installation of the DC certificate onto the Xerox device.

An additional option is to combine the first and second options and compare the retrieved DC certificate to the one stored at installation. This provides the most security as it prevents rogue DCs masquerading as the real DC.

Note: Certificates are often obtained from the Information Technology professionals that support your organization. If you are unable to obtain the required certificates, refer to the process outlined in Appendix A. You can determine the domain that you are registered in using the process outlined in Appendix B.

Server Specifications

Prior to installation, ensure your network infrastructure supports *Smart Card* or *Personal Identification Verification (PIV)*.

Names or IP addresses of all servers and domains are required during setup.

Electrical Requirements

The USB port on the back of the Xerox device network controller provides the power required for any of the supported card readers.

Installation

3

This section provides instructions for installing and configuring the *Smart Card* solution.

There are 4 main installation procedures to follow in sequence.

- **Enabling and Configuring the Smart Card**
Use the Feature Enable Key to enable the *Smart Card* to be configured.
- **Configuring the Smart Card**
Enabling the Smart Card function and customizing the settings.
- **Hardware Installation**
Unpacking the Smart Card Enablement kit and installing the card reader device.
- **Using Smart Card**
Instructions on how to use the card reader device to access the device functions.

Software Enablement

Prior to installing the *Xerox Smart Card* solution, the software requires enabling on your Xerox device using the Internet Services. The Feature Enable Key is printed on the inside cover of the Enablement guide provided within the *Xerox Smart Card* kit.

Follow the instructions below to enable the device software.

Note: Some of the steps shown may require the System Administration password for your device to be entered.

1. Access **Internet Services**
 - a. Open the web browser from your Workstation.
 - b. In the URL field, enter http:// followed by the IP Address of the device. For example: If the IP Address is 192.168.100.100, enter the following into the URL field: http://192.168.100.100.
 - c. Press **Enter** to view the Home page.

2. Access **Properties**
 - a. Select the **Properties** tab.
 - b. If prompted, enter the Administrator User ID and Password. The default is **admin** and **1111**.
 - c. Select the **Login** button.

3. Enable the *Smart Card* software
 - a. Select the **Security** link.
 - b. Select the **Authentication** link.
 - c. Select **Setup** in the directory tree.
 - d. In the **Authentication, Authorization, and Personalization** area, select **Edit**.

- e. Set the *Authentication method on the machine's touch interface (Touch UI)* option to **Smart Cards** using the drop-down menu. If you require the device to use the E-mail address registered to the authenticated user, select the **Personalize the machine's touch interface** checkbox
- f. Select **Save**.

- g. In the *CAC/PIV Enablement* area, enter the unique *Feature Enable Key* provided on the inside cover of the [Smart Card Enablement Guide](#).
- h. Select **Next**.

A confirmation message is displayed.

- i. Select **Next**. The *Smart Card* settings are now ready for configuring.

Note: No services will be restricted until Smart Card has been fully configured using Internet Services.

Configuring the Smart Card

Once the *Xerox Smart Card* feature has been enabled on the device it can be configured using *Internet Services*.

Follow the instructions below to enable and configure the *Smart Card*:

1. Access **Internet Services** and select **Properties**. Refer to [Access Internet Services](#) on page 12 for instructions.
2. Configure the **Date & Time** to update automatically
 - a. Select the **General Setup** link, then **Date & Time**.
 - b. Select **Automatic Using NTP**.
 - c. Check the Time Zone is set to the correct option for your region.
 - d. Select **Apply**. The device will reboot to apply the changes.

Notes:

- The sign in front of the number is important. Most of Europe is plus of Greenwich Mean Time, while North America is minus. Please consider the implications of *Daylight Savings Time* when selecting the *Offset of Local Time Zone* option.
- If *Network Time Protocol* is not available, check that the time set on the device matches the network time on the Domain Controller Authentication Server. Refer to the [System Administrator](#) guide for instructions. If using Network Time Protocol (NTP) do not change the time on the device.

3. Access the **Smart Card** settings
 - a. Select the **Authentication** link.
 - b. Select **Setup** in the directory tree.

4. Configure the **Smart Card Inactivity Timer**
 - a. Select **Smart Card Inactivity Timer Edit...** from the *Configuration Settings* list.
 - b. Enter the **Smart Card Inactivity Timer** minutes required between 1 and 120. The default setting is 5 minutes. If the machine is inactive for the period of time specified, it will end the session automatically.
 - c. Select **Save**.

5. Enter the **Domain Controller** details for the authentication server.

- a. Select **Domain Controller(s)** **Edit...** from the *Configuration Settings* list.

Note: Initially the Domain Controller(s) will be empty and the NTP server will not be set.

- b. Select **Add Domain Controller**.

- c. Ensure the **Domain Controller Type** is configured correctly for your authentication environment.

- d. Enter the IP Address or enter the Domain Controller Host Name (this must be the fully qualified Host Name).

- e. Ensure Port 88 is selected unless your Kerberos Port is different.

- f. Enter the *Domain* (this must be the fully qualified Domain Name).

- g. Select **Save**.

- h. Select **Close**.

6. Configure Certificate Validation

- a. Select **Certificate Validation** **Edit...** from the *Configuration Settings* list.

Note: Ensure the Domain Controller is configured prior to the next step.

The default settings for registering the DC with OCSP is **No**.

Note: Depending on your environment, the details entered may be case sensitive.

- b. If you wish to validate the DC against OCSF after validation of the user:

- Select the **Yes** radio button for **Validate the certificate returned from the domain controller server against the OCSF server.**
- Select **Next.**
- Enter the *OCSF Server Service URL* details.

- c. If you wish to validate the DC against OCSF before validation of the user:

- Select the **Yes** radio button for **Validate the domain controller certificate stored on the Xerox machine against the OCSF server.**
- Select **Next.**
- Enter the *OCSF Server Service URL* details.

- d. If you wish to validate the email encryption certificate on the smartcard for validity on an OCSF server:

- Load the required certificate and select the **Yes** radio button for **Validate the e-mail encryption certificate from the smart card against the OCSF server.**
- Select **Next.**
- Enter the *OCSF Server Service URL* details.

- e. If you wish to validate the DC certificate retrieved as part of the user authentication process against the one stored during installation:

- Select the **Yes** radio button for **Validate domain controller certificate returned by the domain controller server matches the domain controller certificate stored on the Xerox machine.**

Note: To change the Domain Controller search order, select the controller and use the up and down arrows on the right side of the screen to promote or demote the controller order.

7. Load the DC root and intermediate certificates and the OCSF root and intermediate certificates.

- a. Setup the SSL protocol before uploading certificates:

- Select **Properties > Connectivity > Protocols** from the menu.
- Select **HTTP.**
- Under *Secure HTTPS*, select **Enabled.**

Note: The HTTP server will restart when HTTPS is enabled.

Note: When Secure HTTP is enabled, all pages in CentreWare Internet Services contain https:// in the URL for the Web page.

- b. Select **Install Missing Certificates** from the *Domain Controller Certificates* list. Alternatively select **Security > Certificates > Security Certificates** from the menu.
 - c. At the Security Certificates screen, select **Download the Generic Xerox Trusted CA Certificate** and **Open** to install the certificate.
 - d. Select the **Domain Controller Certificates** tab and select **Install Domain Controller Certificate**.
 - e. Select the required Domain Controller Certificate and select **Next**.
 - f. Enter the Domain Controller Certificate **Friendly Name** and select **Next**.
 - g. Repeat the process until all certificates are installed.
8. Check the Proxy Server details are configured.
- a. If required by your network environment, ensure the Proxy Server details have been configured.
 - b. Select the **Properties** tab, then **Connectivity**, then **Protocols** and **Proxy Server** and enter the details.
 - c. Select **Apply**.

The Smart Card settings are now configured. You are now ready to install the Smart Card hardware using the instructions starting on the next page.

Hardware Installation

Install the card reader device using the following instructions.

1. Unpack the Smart Card Enablement Kit

The kit contains the following items:

- Xerox Smart Card Enablement Guide (1)
- Four Dual Lock Fastener pads (Velcro) (2)
- Three Cable Ties (3)
- One Ferrite Bead (4)

Ensure you have read the licence agreement and agree to the terms and conditions specified prior to installation.

2. Locate the card reader device being installed

- There are four types of card reader available, one upright model or three slimline models.
- Locate the device being installed and ensure it has been configured.

Note: The System Administrator should configure the cards prior to the card reader being installed on the machine.

Installation

3. Attach the ferrite bead to the reader cable.

Note: The ferrite bead should be clipped onto the cable directly behind the connector.

4. Attach the fasteners to the card reader device
- Fasteners have been provided to secure the card reader to the Xerox device.
 - Peel back the fastener backing strip.
 - Position the fastener on the under-side of the card reader, as shown.
 - Repeat for each of the fasteners supplied.

5. Remove the fastener backing strips

When all the fasteners have been attached to the card reader, remove the backing strips on each of the fasteners.

6. Place the card reader on the Xerox device

- Gently place the card reader on the device (do not fix in place at this point).
- Position the card reader in a suitable location, ensure it does not obstruct any access points or the opening of doors or covers.
- Check the cable has sufficient length to connect to the rear of the network controller.
- Once it is in a suitable location, press firmly on the card reader to fix it in place.

Installation

7. Connect the card reader to the Xerox device

- Insert the USB connection into the slot provided on the rear of the network controller.
- Use the cable ties provided to ensure the cabling is neat and tidy.

The hardware installation is now complete.

8. Confirm the installation

- When the card reader and the software has been installed and configured, the *Card Reader Detected* screen displays on the Xerox device local user interface.
- Select **OK**.

Smart Card is now ready for use.

Note: If the card reader is not detected, refer to [Troubleshooting Tips](#) on page 29 for information.

Using Smart Card

Once the *Smart Card* has been enabled, each user must insert a valid card and enter their Personal Identification Number (PIN) on the touch screen. When a user has finished using the Xerox device, they are then required to remove their card from the card reader to end the session. For instances where a user forgets to remove their card, the machine will end the session automatically after a specified period of inactivity.

Follow the instructions below to use the *Smart Card*:

1. The *Authentication Required* window may be displayed on the touch screen, depending on your device configuration.
2. Insert your card into the card reader.
3. Use the touch screen and numeric keypad to enter your PIN and then select **Enter**.
4. If the card and PIN are authenticated, access is granted.

Note: If the access attempt fails, refer to [Troubleshooting Tips](#) on page 29.

5. Complete the job.
6. To end the session, remove your card from the card reader.
The current session is terminated and the *Authentication Required* window is displayed.

Troubleshooting

4

For optimal performance from your card reader, ensure the following guidelines are followed:

- The Card Reader is only compatible with network connected products.
- Ensure the Card Reader is plugged into the Network Controller. Refer to [Connect the card reader to the Xerox device](#) on page 24 for instructions.
- Do not position the Card Reader in direct sunlight or near a heat source such as a radiator.
- Ensure the Card Reader does not get contaminated with dust and debris.

Fault Clearance

When a fault occurs, a message displays on the User Interface which provides information relating to the fault. If a fault cannot be resolved by following the instructions provided, refer to [Troubleshooting Tips](#) on page 29.

If the problem persists, identify whether it is related to the card reader device or the Xerox device.

- For problems with the card reader device, contact the manufacturer for further assistance.
- For problems relating to the Xerox device, contact the Xerox Welcome and Support Center. The Welcome and Support Center will want to know the nature of the problem, the Machine Serial number, the fault code (if any) plus the name and location of your company.

Contact Xerox using the numbers 1-800-ASK-XEROX or 1-800-275-9376.

Locating the Serial Number

- Press the **Machine Status** button on the control panel.
The *Machine Information* tab is displayed.
- The *Machine Serial Number* is displayed on this screen.

Note: The serial number can also be found on a metal plate inside the front door.

Troubleshooting Tips

The table below provides a list of problems and the possible cause and a recommended solution.

If you experience a problem during the installation process please refer to the [During Installation](#) problem solving table below.

If you have successfully installed the Smart Card solution but are now experiencing problems, refer to [After Installation](#) on page 30.

During Installation

Problem	Possible Cause	Solution
Card reader is installed but no message displays on the User Interface	Card reader is faulty.	- Try a different card reader. - Contact the System Administrator.
	Card reader connection is faulty.	- Check the cable is plugged in correctly. Refer to Connect the card reader to the Xerox device on page 24 for instructions. - Unplug the card reader cable then plug back in. - Plug the card reader into a different USB port.
	Card reader is not compatible.	Check that the card reader is on the list of compatible devices, refer to Supported Card Readers on page 6.
	<i>Smart Card</i> access is not enabled on the machine.	Enable CAC through the <i>Properties</i> set up screens using Internet Services, refer to Software Enablement on page 12.

After Installation

Problem	Possible Cause	Solution
Authentication failures	Incorrect PIN has been entered.	• Retry entering the correct PIN. If problem persists, contact the System Administrator for advice.
	Card is locked due to too many failed PIN attempts.	• Contact Registration Authority to reload or to get a new card.
	Unable to find identity certificate.	
	Identity certificate has been revoked.	
	Authentication with Domain Controller Failed.	• Check network cable is firmly connected. • Contact the System Administrator.
	Unable to validate server certificate.	
	Smart Card Authentication System Failed.	
	Authentication Failed.	
	System Administrator has not selected All Features or Scanning Service Only.	• Contact the System Administrator.

Problem	Possible Cause	Solution
Time for date mismatch error	There is a mismatch between the time and date setting on the Xerox device and the authentication server time or date setting.	• Verify that Network Time Protocol is properly set up. • Verify that the date and time and GMT Offset (Time Zone) is correct, refer to Configure the Date & Time to update automatically on page 14 for instructions. • Verify that GMT offset is correct for Daylight Savings Time. • Contact your System Administrator.
Cannot see the Internet Services web page after software upgrade	IP Address incorrect or has been reset.	• Check the IP Address printed on the configuration report. Ensure the DHCP settings match your site settings. • To print a configuration report at the Xerox device, select Machine Status, then Information Pages. Select the Configuration Report from the list and select Print.

Retrieving the Certificate from a Domain Controller or OCSP Server

1. Access the Domain Controller using a web browser using the following syntax:

https://IP Address of the Domain Controller:636

For example: *https://111.222.33.44:636* where 111.222.33.44 is the IP address of the appropriate server.

A *Security Alert* warning window is displayed, similar to the one shown.

2. Click on **View Certificate** to proceed.

If the window does not display, double click on the padlock icon in the lower right hand corner of your browser window.

The *Certification Information* window is displayed.

Retrieving the Certificate from a Domain Controller or OCSP Server

3. Select the **Details** tab.
Record the name of the *Certificate Authority (CA)* that issued this certificate, the "Issuer".
A certificate from this CA will be required during *Smart Card* setup.
4. Select the **Copy to File** button.

The *Certification Export Wizard* is displayed.

5. Select **Next**.

6. Select **Base-64 encoded X.509 (.CER)**.
7. Select **Next**.

8. Select **Browse**.
Browse to a directory to save the Certificate.
9. Enter a filename for the *Certificate* and select **Save**.
10. Select **Next**.

11. Select **Finish**.
The *Certificate* is retrieved from the server and saved in the selected directory.
A pop-up message will confirm that the *Certificate* has been successfully saved.
Once saved the *Certificate* can be loaded onto the device.

This process can be repeated to retrieve the *Certificates* from each of the required servers.

Retrieving the Certificate from a Domain Controller or OCSP Server

Determining the Domain in which your Card is Registered

1. From your PC, click the **Start** menu and right click on **My Computer**.
2. From the drop down list, select **Properties**.
When the *System Properties* window opens, click on the **Computer Name** tab.
Beneath the *Full Computer* name is the *Domain Name*.
3. Copy and paste the *Domain Name* directly into the CAC setup page on the Internet Services user interface.
Refer to [Configuring the Smart Card](#) on page 14 for instructions.
4. Select **Cancel** to close the *System Properties* window.

Determining the Domain in which your Card is Registered
