Uncompromising Quality

Safety Knows no Compromise

The braking system is crucial to the safety of the vehicle occupants. Uncompromising quality is demanded so that the vehicle driver can depend on uncompromised functionality, 100% of the time, as well as the highest braking comfort characterised by:

- Excellent response behaviour
- Precise operational sensitivity
- Without noise and vibration
- Consistent action

Designed for extreme loads

The loads that a braking system must handle are enormous. These systems are subjected to environmental influences such as moisture, salt, dust, and dirt. Above all, brakes are subjected to extreme forces much greater than the forces from an engine.

Tested under Extreme Conditions

Bosch is always testing its braking system components under severe conditions in the development phase. Prototypes are then installed in the vehicle that they are intended for and tested in every imaginable road condition and climatic condition.

Complete Programme in Original Equipment Quality

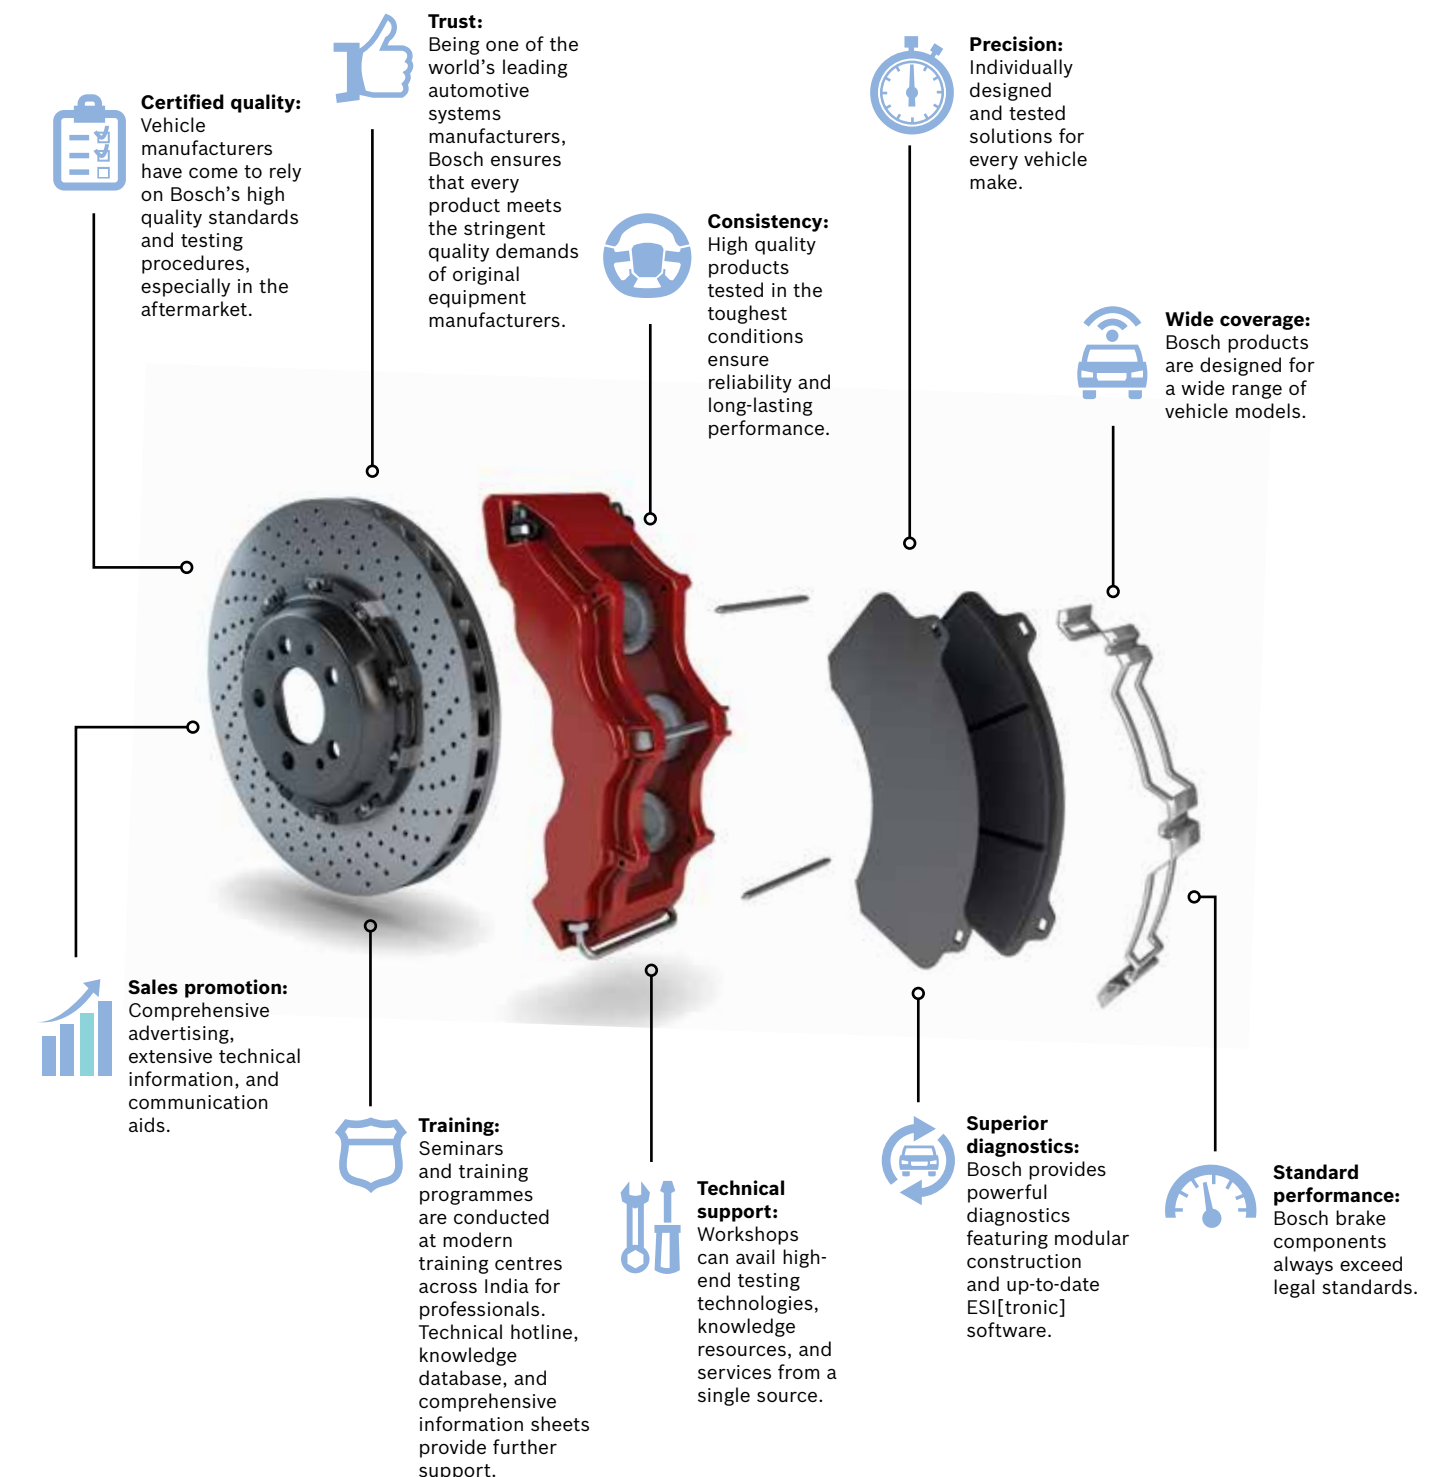

The high-quality measures from original equipment apply in the aftermarket sector too. Bosch offers a broad range of products for distributors and workshops in the:

- Foundation Mechanism
- Transfer Mechanism
- Actuation Mechanism

Bosch supports workshops with brake service tools and testing technology for every possible requirement. In addition, the Bosch training package is just as high-quality as the product itself, for effective and safe brake installation and repairs. Professional and practice-oriented service trainings provide the workshops with information on the latest technological developments in the automotive world. Bosch's technical hotline provides further assistance in case of unexpected problems.

Bosch Braking System Advantage

With high-quality auto parts, state-of-the-art diagnostic equipment, and world-class service, we keep vehicles moving. Here are ten reasons why distributors and workshops prefer Bosch:

Foundation Mechanism - Brake Pads

Regular Brake Pads

Features and Benefits:

- ▶ Advanced friction technology ensures excellent stopping distance
- ▶ Asbestos-free manufacturing (non-carcinogenic)
- ▶ Optimum friction co-efficiency for superior response
- ▶ Improved wear and tear resistance for long operating life
- ▶ Better NVH characteristics (OE specifications)

Coated Pads – Pioneering Technology for Good Bedding-In

Features and Benefits:

Contact Optimiser Technology – Abrasive compound on pad surface provides:

- ▶ Reduced braking distance with enhanced contact surface
- ▶ Optimizer immediately removes contaminants
- ▶ Disc is polished and smoothened for optimal braking
- ▶ Reduced friction hot spots for enhanced life and performance

QuietCast™ Premium Ceramic Brake Pads

Features and Benefits:

- ▶ Multi-layered RMR shims for excellent sound dampening
- ▶ Advanced ceramic formulation for high temperature threshold
- ▶ Optimised for fit and forget bedding-in with required friction characteristics
- ▶ Stable friction co-efficient for effective braking at all speeds

High-performance RMR shims offer:

- ▶ Insulation against heat, dampness, and vibrations, for quieter, longer service life
- ▶ Baffles between back plate and caliper for quiet braking

Bedding-In – Instructions and Benefits:

Bedding-in is a process where the pad and disc alignment happens. It helps to transfer the even layer of brake pad material on the brake disc which assists in smoother braking operation and improved braking performance.

- ▶ Step 1: Fit the brake pads as per the recommended procedure ensuring cleaning of all the sliding surfaces and greasing of caliper pins with silicon-based grease suitable for operation at high temperatures.
- ▶ Step 2: After the fitment and servicing are complete, ensure a trial run of 3–4 km to understand smooth performance of the vehicle after servicing.
- ▶ Step 3: Accelerate gradually to a speed of 50 kmph and apply the brakes. Slow down to 10 kmph without stopping. This will help the bedding-in process.

Caution: Do not apply excessive pedal pressure or continuous braking.

- ▶ Step 4: Repeat Step 3 at least 10–15 times.

***PS:** For the red-coated pads: The bedding-in between the coated pads and the surface of the existing brake disc may initially have a rubbing noise which indicates that the uneven surfaces on the disc are getting polished and matched properly with the surface of the new pads.

The rubbing noise of the abrasive material will disappear along with the red coating, and braking will be smooth and efficient.

Foundation Mechanism - Brake Shoes

Brake shoes carry the brake lining in the drum brakes used in automobiles, and belong to the most stressed parts of a braking system. They consist of a mount and a lining. The lining is fixed directly onto the mount. Extreme temperature difference can cause cracking of

the shoes. Hence, they should be checked and replaced every few years as a safety precaution.

Bosch brake shoes feature a host of high-performance properties, ensuring reliable response even in conditions of high stress.

Features

- ▶ Advanced friction formulation
- ▶ 100% asbestos-free construction
- ▶ Optimal coefficient of friction
- ▶ Rust-inhibitive coating

Benefits

- ▶ Extended wear, consistent performance, and long service life
- ▶ Elimination of exposure to harmful friction materials
- ▶ Assured quality and safety
- ▶ Protection against rust

Foundation Mechanism - Brake Discs

While braking, most pressure is applied on the brake disc. Made from high-quality cast steel, Bosch brake discs are resistant to corrosion and wear, providing assured stopping power over a long operating life. Designed for high performance in the most extreme conditions, Bosch brake discs are featured as original equipment by leading automakers in their vehicles.

Cast in Steel

Improved engine performance and higher vehicle weights are increasing the quality requirement for braking systems. Only brake discs made from high-grade materials and homogenous casting structures without trapped air and friction will meet the specifications of the car manufacturers.

Minimal Tolerances for Disc Thickness Variation (DTV) and Run-out

These characteristics are essential for best braking comfort. Considerable variation of the friction ring's thickness generates immediate vibrations (oscillating brake torque) which cause brake judder and noise.

Always Replace in Pairs

Brake discs are subject to wear and should always be replaced as two per axle as soon as one of them drops below the recommended minimum thickness.

Say Goodbye to Braking Trouble

Brake vibrations and squealing are usually caused by irregularities on the brake disc surface or by a side run-out of the disc. However, excessive slackness of the wheel bearings, the wheel suspension, and even the steering conduction components can be a factor too. Professional repairs and the use of high-quality spares help eliminate these problems.

Foundation Mechanism - Wheel Cylinders

A crucial component of braking systems, wheel cylinders transfer the brake pressure generated in the master cylinder to the drum brake shoes. A brake pressure limiter (CRCL) is integrated into the wheel cylinder with certain designs.

Wheel cylinders are made of cast iron or aluminium. High-quality materials and minimum tolerances guarantee long service life. Pressure and dust protection seals made of high-quality materials guarantee optimal functionality and protection from external elements.

Features and Benefits

- Close tolerances ensure long service life
- Continuous safety / leak testing
- Made from superior quality and durable materials (cast iron or aluminium, weight reduced)
- Pressure- and dust-protection sleeves made from EPDM ensure optimal leak-proof functioning, and prevent the ingress of dirt, air, and pressure

This prevents the unwanted intrusion of dirt, air, and humidity.

Wheel cylinders must be replaced if the dust seal is defective or broken. Otherwise, the brake fluid can contaminate the shoes and influence the effectiveness of braking.

Tested in a variety of brake application cycles under a wide range of test temperatures, Bosch brake wheel cylinders comply with the highest safety standards and easily pass stringent testing procedures.

Transmission Mechanism - Brake Fluid

Brake fluid is one of the most important components in a braking system. When the pedal is actuated, the fluid is pressurised and it transmits the pressure to the pads or shoes. Additionally, it also lubricates the moving parts and protects the entire system from corrosion. Brake fluids are also suitable for use in clutch systems.

Bosch brake fluids exceed the legal standards. With higher wet and dry boiling points, Bosch brake fluids are recommended every time, as they are the safest choice.

Benefits

- Consistent and steady brake pressure response throughout its service life
- Optimal viscosity even under extreme temperature conditions
- Maximum protection against vapour formation and corrosion
- Enhanced lubrication of the hydraulic components

Bosch offers several brake fluid variants conforming to DOT standards, in accordance with IS:8654-2001. DOT 3 is the most commonly used brake fluid in vehicles. It cannot be mixed with or replaced by other variants. DOT 4 indicates brake fluid with higher boiling points. This fluid is used in new-generation vehicles.

Characteristics	DOT 3	DOT 4
Equilibrium reflux boiling point (ERBP),°C	≥ 205	≥ 230
Wet equilibrium reflux boiling point,°C,	≥ 140	≥ 155
Kinematic viscosity, cSt At - 40°C,	≤ 1500	≤ 1800
Kinematic viscosity, cSt At 100°C,	≥ 1.5	≥ 1.5
pH value	7.0 to 11.5	7.0 to 11.5

Actuation Mechanism

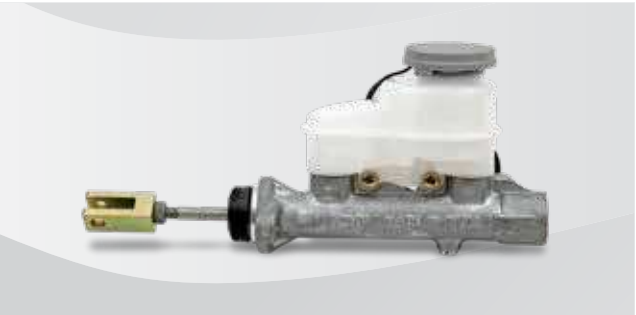

Brake Booster

Brake booster amplifies the force applied by the driver’s foot, significantly reducing the amount of pressure required for braking. It is combined with the master cylinder to form a single unit and is a component of a car braking system.

Bosch offers scalable design solutions with standardised manufacturing processes that guarantee the same quality standards in every region of the world.

Benefits

- **Modularity:** The NOAH vacuum booster uses a globally standardised valve technology, which allows a modular integration of mechanical brake assist system.
- **Comfort:** The reduced dead stroke and input force lead to better pedal feel and more comfort.
- **Scalability:** With the scalable design from 8” to 11” (single boosters) and from 7+8” to 10+10” (tandem boosters) the NOAH supplies an appropriate solution for every customer requirement.
- **Worldwide Standardisation:** Bosch’s standardised design concept and manufacturing process guarantees the same excellent quality in every region of the world.

Tandem Master Cylinder

The master cylinder is a pressure-generating cylinder in the hydraulic brake system. Every vehicle equipped with a hydraulic brake system has a tandem master cylinder. It converts the foot pressure on the brake pedal into hydraulic braking force, admitting the brake fluid into the brake circuits.

Benefits

- Complex production processes and stringent quality control assure quality
- Superior-quality material for seals and pistons prevent premature failure and leakage
- Abrasion is minimised by optimised contact surfaces and pistons

- High efficiency, low volumetric capacity
- High ventilation capacity
- Compact design
- Made from cast iron or aluminium

Clutch Master Cylinder / Clutch Slave Cylinder

Clutch Master Cylinders (CMC) and Clutch Slave Cylinders (CSC) are precision cylinders in hydraulically actuated, pressure-operated clutch systems, provided in premium automobile applications.

The Clutch Master Cylinder contains a reservoir that stores the brake fluid. It is connected to the Clutch Slave Cylinder through hoses. The clutch pedal force applied by the driver is converted into hydraulic pressure in the Clutch Master Cylinder. This hydraulic pressure then flows towards the clutch, where it is converted back into force in the Clutch Slave Cylinder, thereby operating the clutch.

Benefits

- Manufactured by precision processes; quality is assured under stringent quality control
- Specially developed rubber seals
- High efficiency compared to mechanical clutch systems
- Compact design
- Body material is cast iron or aluminium for every customer requirement

Brake Force Regulators

Brake force regulators are particularly useful in vehicles with large load volumes. These are installed close to the rear axle and react depending on the load. Brake force regulators control braking force on the rear wheel depending on the volume of the load. This prevents the rear tyres from locking, thus reducing the danger of skidding.

Features

- Superior-quality materials
- Modern construction
- Weight reduction through the use of latest aluminium alloys

Engineered to perfection
Bosch Braking Systems
for Passenger Vehicles.

Foundation Mechanism - Brake Pad Kits
