### 3.How To Use

#### 3.1 Connect the device to the vehicle's DLC (Data Link Connector) using the diagnostic cable

The location of the vehicle's DLC is usually located under the steering wheel,generally as shown in the figure below.

#### 3.2 Language Setting

Once the DLC is connected, the device will automatically power on. For first-time use, the first step is to set the language. The default language of the device is English. If you want to change the language, please proceed to the next step and connect to Wi-Fi to download the latest diagnostic software for the selected language.

#### 3.3 Select Wi-Fi

Wi-Fi connects the device to the internet, allowing for enhanced diagnostic services and access to the latest information. This device supports the 2.4GHz band. If you choose to skip the Wi-Fi connection, the default English version of the diagnostic software can still be used. However, it is recommended to connect to Wi-Fi during initial setup to easily download the latest version of the diagnostic software.

### 3.4 Enter the Main Interface

After reviewing and agreeing to the privacy policy, you will enter the main interface. Select the corresponding function on the interface to perform diagnostic tasks.

## 4.Function Introduction

### 4.1 AutoSearch Function

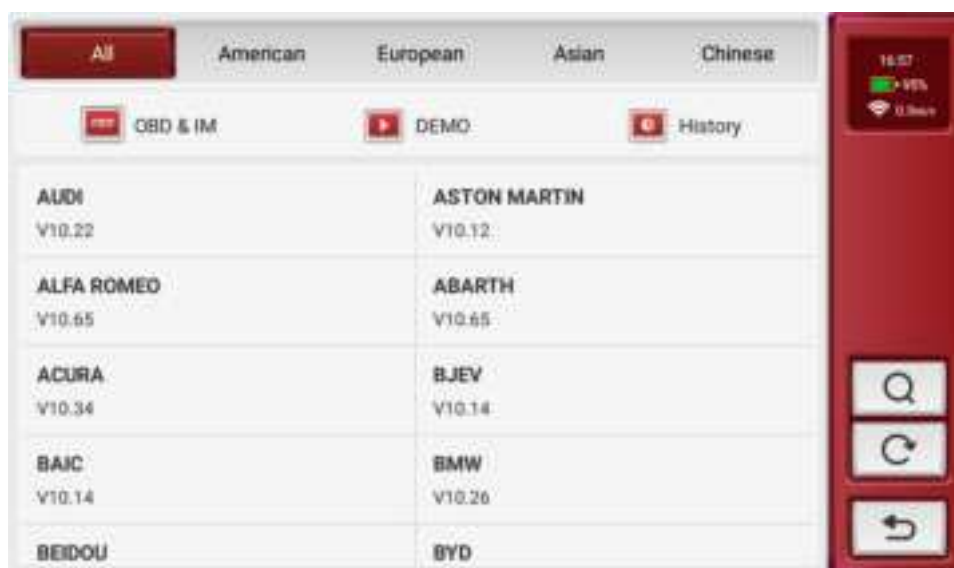

This function obtains the vehicle's VIN through the OBDII interface, analyzes the VIN, and automatically identifies the vehicle model to enhance diagnostic accuracy. It effectively prevents inaccurate diagnostic data caused by selecting the wrong vehicle model. To use this function, a Wi-Fi connection is required.

If the VIN code cannot be recognized, you can manually enter the VIN. You can also navigate to the "Diagnose" menu and select the corresponding option based on the vehicle's year and model.

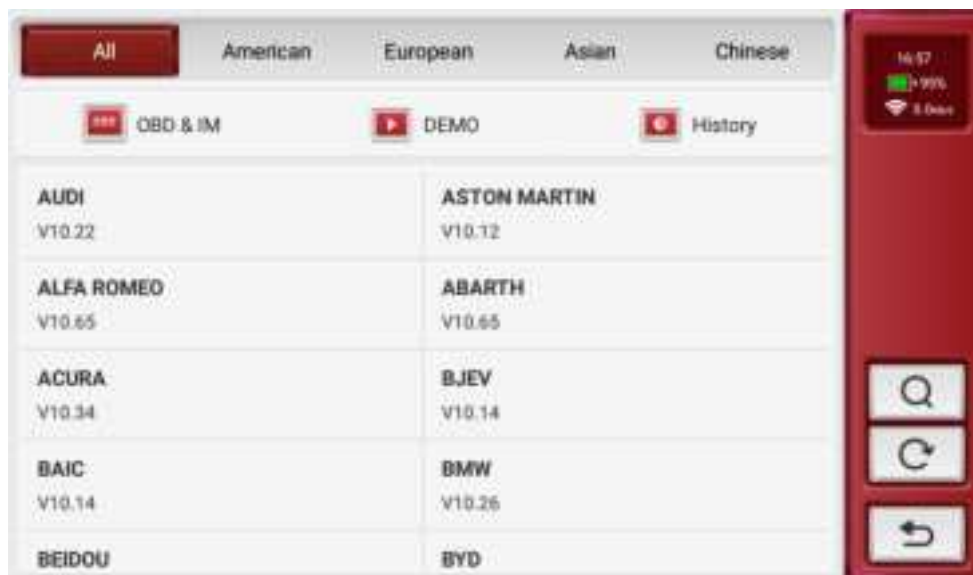

#### 4.2 Diagnose Function

In this menu, directly select the corresponding vehicle brand, year, and model. You can then perform a full vehicle diagnostic scan to retrieve the fault codes from all ECUs. Alternatively, you can select a specific ECU system to read fault codes one by one, view data streams, or perform maintenance functions.

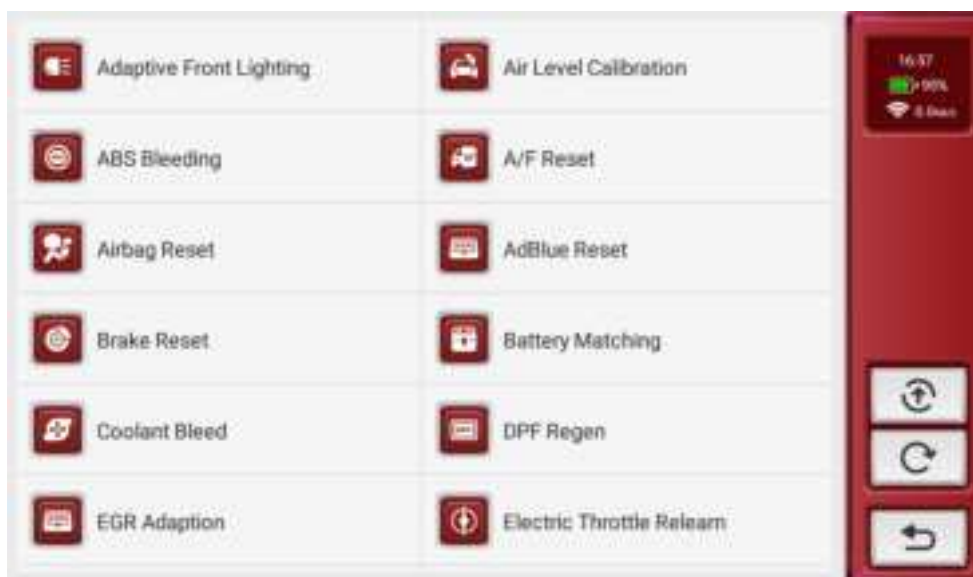

#### 4.3 OBD Function

This function is for diagnosing the engine system, retrieving the status of various sensors and components related to the engine and emissions. This function is applicable to a wide range of vehicles. Since the implementation of the OBDII standard in 1996, any vehicle equipped with an OBDII system can perform this function.

#### 4.4 Maintenance

This function is currently available only on DS200. It consolidates all maintenance functions from various vehicle diagnostic software into a separate menu, making the diagnostic software more user friendly. In the DS160 series, you can find the corresponding maintenance functions within the specific ECU system, for example, the oil reset function can be found in the engine's special functions menu. The DS200 currently includes 15 maintenance functions, as listed in the menu:

#### 4.5 File

This function manages all report files generated during the diagnostic process, making it easy to review, share and delete.

#### 4.6 Consult

**OBD Fault Code Library:** Use the OBD fault codes generated during the diagnostic process to query detailed fault descriptions.

**Coverage Lists:** Quickly check the supported models and functions available on the current device.

**Learning:** Access video tutorials that provide guidelines for equipment usage, maintenance, and diagnostics.

**Video:** Watch instructional videos that demonstrate how to operate the device effectively.

**User Manual:** Helps technicians quickly understand how to use the device and improve diagnostic capabilities efficiently.

#### 4.7 Feedback

This function allows you to provide feedback when encountering diagnostic errors with certain vehicle models. These errors may result from undeveloped software features or incorrect diagnostic commands sent by the device. Please follow the prompts to send the latest diagnostic logs and error descriptions via Wi-Fi, enabling our team to analyze the issue, make improvements, and update the vehicle diagnostic software.

## 4.8 Update

This function is used to upgrade the diagnostic software. When new vehicle models are released or diagnostic features are optimized, we update the software to ensure the device can effectively detect and diagnose vehicles. A Wi-Fi connection is required during the upgrade.

Please note: Since the DS160 is a full-function diagnostic device for a single vehicle brand, its upgrade interface layout may vary slightly.

## 4.9 Settings

This function is primarily used to set various parameters and diagnostic conditions for the device. The main options are as follows:

**Feedback:** Report any bugs in the diagnostic software app to us for analysis and improvement.

**Screenshots:** Turn on this switch to enable screen capture.

**Screen Floating Window:** Turn on this switch to record screen operation videos.

**Wi-Fi:** Set up the connectable Wi-Fi network.

**Firmware Fix:** Used to update the firmware.

**Language:** Select the language for the tool.

**Time Zone:** Choose the time zone of your current location; the system will then automatically configure the time according to your selection.
