# Show commands

## show ip aspath-list

```
show ip aspath-list [<NAME>] [vsx-peer]
```

### Description

Shows the configuration details of the AS path list.

| Parameter | Description |
|---|---|
| *<NAME>* | Specifies name of the AS path list. |
| vsx-peer | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Example

Showing the IP AS path list configuration information:

```
switch# show ip aspath-list
ip aspath-list ASLst
    seq 10 permit 22 33
    seq 20 deny 44
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Manager (#) | Administrators or local user group members with execution rights for this command. |

## show ip community-list

`show ip community-list [<NAME>] [vsx-peer]`

### Description

Shows the configuration details of the community-list.

| Parameter | Description |
|---|---|
| *<NAME>* | Specifies name of the community-list. |
| vsx-peer | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Example

Showing the community list configuration information:

```
switch# show ip community-list
ip community-list standard CommLst
    seq 10 permit 11:101
    seq 20 deny 12:201
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Manager (#) | Administrators or local user group members with execution rights for this command. |

## show ip prefix-list

```
show ip prefix-list [<NAME>] [vsx-peer]
```

### Description

Shows the configuration details of the IP prefix lists.

| Parameter | Description |
|---|---|
| *<NAME>* | Specifies name of the IP prefix lists. |
| vsx-peer | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Example

Showing the IP prefix list configuration information:

```
switch# show ip prefix-list
ip prefix-list PfxLst: 2 entries
   seq 10 permit 3.0.0.0/8 ge 8 le 8
   seq 20 deny 4.0.0.0/8 ge 8 le 8
```

```
switch# show ipv6 prefix-list
ipv6 prefix-list x: 1 entries
                       seq     10 permit 2011::/64ge 64le 64
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Manager (#) | Administrators or local user group members with execution rights for this command. |

# show route-map

```
show route-map [<NAME>] [vsx-peer]
```

## Description

Shows the configuration details of the route map.

| Parameter | Description |
|---|---|
| *<NAME>* | Specifies name of the route map. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

## Example

Showing the route map configuration information:

```
switch# show route-map
Route map: InternetFilter
   Seq 10, permit,
     Match :
       origin : egp
       metric : 123
     Set :
       community : 23:34
       metric : 3
       as_path_exclude : 123
       local_preference : 3456
       origin : igp
       weight : 25
   Seq 20, permit,
     Match :
       origin : egp
       metric : 456
     Set :
       community : 44:44
       metric : 5
       as_path_prepend : 444
       local_preference : 66
       origin : igp
       weight : 250

Route map: LocalFilter
   Seq 10, permit,
       origin : egp
       metric : 10
                                                       ip next-hop address         : 2.2.2.3
       local-preference            : 20
       route-type                  : external_type1
       source-protocol             : static
       prefix-list                 : PfxLst
       aspath-list                 : ASLst
       community-list              : CommLst
       ip next-hop prefix-list     : PfxLst
       ip route-source prefix-list : PfxLst
     Set :
       community : 22:33
       metric : 25
       as_path prepend : 65535 65534
                                                       ip next-hop address : 2.2.2.4
       local_preference : 30
       origin : igp
       weight : 30
       dampening                   : half-life = 5, reuse = 50, suppress = 125,
max-suppress-time = 15
```

All the match clauses are grouped. All the set clauses are grouped.

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

# Chapter 137
# RPVST+ commands

## clear spanning-tree statistics

```
clear spanning-tree statistics [VLAN-ID]
```

### Description

Clears the spanning tree BPDU statistics, either all statistics or those related to a specified VLAN.

| Parameter | Description |
|---|---|
| `VLAN-ID` | Specifies the VLAN ID. |

### Example

Clearing all spanning tree BPDU statistics:

```
switch(config)# clear spanning-tree statistics
```

Clearing spanning tree BPDU statistics for a particular VLAN :

```
switch(config)# clear spanning-tree statistics 10
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

### Command History

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## show capacities rpvst

```
show capacities rpvst
```

### Description

Shows the capacities of RPVST VLANs configurable on a system and RPVST VPORTs supported in a system.

### Examples

Showing capacities on a 6400 switch:

```
switch# show capacities rpvst
System Capacities : Filter RPVST
Capacities Name                                                   Value
--------------------------------------------------------------------------
Maximum number of RPVST VLANs configurable on the system           768
Maximum number of RPVST VPORTs supported in a system              2048
```

Showing capacities on a 6300 switch:

```
switch# show capacities rpvst
System Capacities : Filter RPVST
Capacities Name                                                   Value
--------------------------------------------------------------------------
Maximum number of RPVST VLANs configurable on the system           512
Maximum number of RPVST VPORTs supported in a system              2048
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.09 | Increased RPVST VLAN capacity to 768 on 6400 switch series. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show capacities-status rpvst

```
show capacities-status rpvst
```

### Description

Shows the number of RPVST VLANs and RPVST VPORTs currently configured.

### Examples

Showing capacities-status on a 6400 switch:

```
switch# show capacities rpvst
System Capacities Status : Filter RPVST
Capacities Status Name                Value            Maximum
--------------------------------------------------------------------------
Number of RPVST VLANs configured          5                768
Number of RPVST VPORTs configured         9               2048
```

Showing capacities-status on a 6300 switch:

```
switch# show capacities-status rpvst
System Capacities Status : Filter RPVST
Capacities Status Name                Value             Maximum
--------------------------------------------------------------------------
Number of RPVST VLANs configured          3                 254
Number of RPVST VPORTs configured         9                2048
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.09 | Increased RPVST VLAN capacity to 768 on 6400 switch series. |
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

# show spanning-tree

```
show spanning-tree [vsx-peer]
```

## Description

Shows the spanning tree mode and information on the RPVST instances.

When Port security is enabled on the port and the client is not-yet authenticated, the security feature keeps the port in the **Down** state. STP also keeps the port in the **Blocking** state and the role as **Disabled** in the **show spanning-tree** command output, whereas in the hardware, the state is maintained as **Learning**. After client authentication is successful, the port state changes to **Forwarding**.

| Parameter | Description |
|---|---|
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

## Examples

*On the 6400 Switch Series, interface identification differs.*

Showing spanning tree mode and RPVST instance information:

```
switch# show spanning-tree
Spanning tree status             : Enabled Protocol: RPVST
Extended System-id               : Enabled
Ignore PVID Inconsistency        : Enabled
Path cost method                 : Long
RPVST-MSTP Interconnect VLAN     : 1
Current Virtual Ports Count      : 7
Maximum Allowed Virtual Ports    : 2048

VLAN1
  Root ID    Priority   : 32768

| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show spanning-tree detail

`show spanning-tree detail [vsx-peer]`

### Description

Shows the detailed spanning tree mode and information on the RPVST instances.

When Port security is enabled on the port and the client is not-yet authenticated, the security feature keeps the port in the **Down** state. STP also keeps the port in the **Blocking** state and the role as **Disabled** in the **show spanning-tree** command output, whereas in the hardware, the state is maintained as **Learning**. After client authentication is successful, the port state changes to **Forwarding**.

| Parameter | Description |
|---|---|
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Examples

*On the 6400 Switch Series, interface identification differs.*

Showing spanning tree mode and detailed RPVST instance information:

```
switch# show spanning-tree detail
Spanning tree status           : Enabled Protocol: RPVST AUTO
Extended System-id             : Enabled
Ignore PVID Inconsistency      : Disabled
Path cost method               : Long
RPVST-MSTP Interconnect VLAN   : 1
Current Virtual Ports Count    : 2032
Maximum Allowed Virtual Ports  : 2048
Maximum Allowed RPVST Instances: 254
Configured RPVST Enable Vlans  : 20-30,100
Configured RPVST Disable Vlans : 1-10
Auto RPVST Enable Vlans        : 11-19,31-99,101-264
Vlans with no RPVST Instance due to Max limit reach : 265-300

## show spanning-tree inconsistent-ports

```
show spanning-tree inconsistent-ports [vlan <VLAN-ID>]
```

## Description

Shows ports blocked by STP protection functions such as Root guard, Loop guard, BPDU guard, and RPVST guard.

| Parameter | Description |
|---|---|
| *<VLAN-ID>* | Specifies a VLAN ID number. |

## Examples

*On the 6400 Switch Series, interface identification differs.*

Showing inconsistent port information:

```
switch# show spanning-tree inconsistent-ports
VLAN ID      Blocked Port   Reason
------------ -------------- ------------
1            1/1/1          BPDU Guard
2            1/1/1          BPDU Guard
3            1/1/1          BPDU Guard
4            1/1/1          BPDU Guard
5            1/1/1          BPDU Guard
6            1/1/1          BPDU Guard
7            1/1/1          BPDU Guard
8            1/1/1          BPDU Guard
9            1/1/1          BPDU Guard
10           1/1/1          BPDU Guard
```

Showing inconsistent port information for VLANs 1 to 4:

```
switch# show spanning-tree inconsistent-ports vlan 1-4
VLAN ID      Blocked Port   Reason
------------ -------------- ------------
1            1/1/3          Root Guard
2            1/1/7          BPDU Guard
3            1/1/9          Loop Guard
4            1/1/37         RPVST Guard
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

# show spanning-tree summary port

```
show spanning-tree summary port
```

## Description

Shows a summary of port-related spanning-tree configuration and status.

## Example

*On the 6400 Switch Series, interface identification differs.*

Showing a summary of port-related spanning tree information:

```
switch# show spanning-tree summary port

STP status                     : Enabled
Protocol                       : RPVST
BPDU guard timeout value       : None
BPDU guard enabled interfaces  : 1/1/1
BPDU filter enabled interfaces : None
Root guard enabled interfaces  : 1/1/3
Loop guard enabled interfaces  : 1/1/2
TCN guard enabled interfaces   : 1/1/1-1/1/3

Interface count by state

VLAN                   Blocking Listening Learning Forwarding Down
---------------------- -------- --------- -------- ---------- ----
VLAN1                         0         0        0          1    0
VLAN2                         0         0        0          1    0
---------------------- -------- --------- -------- ---------- ----
Total = 2                     0         0        0          2    0
```

## show spanning-tree summary root

`show spanning-tree summary root`

### Description

Shows the summary of spanning tree root and configurations for all VLANs.

### Example

*On the 6400 Switch Series, interface identification differs.*

Showing summary of spanning tree configurations:

```
switch# show spanning-tree summary root

STP status            : Enabled
Protocol              : RPVST
System ID             : f8:60:f0:c9:70:40

Root bridge for VLANs : 1-10

                                         Root Hello Max Fwd
VLAN     Priority Root ID                cost  Time Age Dly    Root Port
-------- -------- ----------------- --------- ----- --- --- ------------
VLAN1       32768 f8:60:f0:c9:70:40         0     2  20  15            0
VLAN2       32768 f8:60:f0:c9:70:40         0     2  20  15            0
VLAN3       32768 f8:60:f0:c9:70:40         0     2  20  15            0
VLAN4       32768 f8:60:f0:c9:70:40         0     2  20  15            0
VLAN5       32768 f8:60:f0:c9:70:40         0     2  20  15            0
VLAN6       32768 f8:60:f0:c9:70:40         0     2  20  15            0
VLAN7       32768 f8:60:f0:c9:70:40         0     2  20  15            0
VLAN8       32768 f8:60:f0:c9:70:40         0     2  20  15            0
VLAN9       32768 f8:60:f0:c9:70:40         0     2  20  15            0
VLAN10      32768 f8:60:f0:c9:70:40         0     2  20  15            0
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

### Command History

| Release | Modification |

# show spanning-tree vlan

`show spanning-tree vlan <VLAN-ID> [vsx-peer]`

## Description

Displays the spanning tree mode and information on the RPVST instance of the specified VLAN.

| Parameter | Description |
|---|---|
| *<VLAN-ID>* | Specifies the number of a VLAN. |
| vsx-peer | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

## Examples

*On the 6400 Switch Series, interface identification differs.*

Showing spanning tree mode and RPVST instance information for VLAN 2:

```
switch# show spanning-tree vlan 2
VLAN2
Spanning tree status: Enabled Protocol: RPVST
  Root ID     Priority   : 32768

## show spanning-tree vlan detail

```
show spanning-tree vlan <VLAN-ID> detail [vsx-peer]
```

### Description

Displays the spanning tree mode and information on the RPVST instance of the specified VLAN and optionally displays details on the RPVST instance for the VLAN.

| Parameter | Description |
|---|---|
| *<VLAN-ID>* | Specifies the number of a VLAN. |
| vsx-peer | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Examples

*On the 6400 Switch Series, interface identification differs.*

Showing spanning tree mode and detailed RPVST instance information for VLAN 2:

```
switch# show spanning-tree vlan 2 detail
VLAN2
Spanning tree status: Enabled Protocol: RPVST
```

```
  Root ID    Priority   : 32768
             MAC-Address: 70:72:cf:76:43:2a
             This bridge is the root
             Hello time(in seconds):2  Max Age(in seconds):20
             Forward Delay(in seconds):15

# spanning-tree bpdu-guard timeout

```
spanning-tree bpdu-guard timeout <INTERVAL>
no spanning-tree bpdu-guard timeout [<INTERVAL>]
```

## Description

Enables and configures the auto re-enable timeout in seconds for all interfaces with BPDU guard enabled. When an interface is disabled after receiving an unauthorized BPDU it will automatically be re-enabled after the timeout expires. The default is for the interface to stay disabled until manually re-enabled.

The **no** form of the command disables BPDU guard timeout on the interface. This is the default.

| Parameter | Description |
|---|---|
| *<INTERVAL>* | Specifies the re-enable timeout in seconds. Range: 1 to 65535. |

## Example

*On the 6400 Switch Series, interface identification differs.*

Enabling the BPDU guard timeout on interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# spanning-tree bpdu-guard timeout 10
```

Disabling BPDU guard timeout on interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# no spanning-tree bpdu-guard
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## spanning-tree extend-system-id

```
spanning-tree extend-system-id {enable | disable}
no spanning-tree extend-system-id
```

### Description

Configures use of extended system ID. When enabled, the VLAN ID is included in spanning tree packets. When disabled, the VLAN ID is set to NULL in the spanning tree packets.

By default, extended system ID is enabled. If you disable extended system ID, the bridge identifier field in the spanning tree packet is filled with zeros.

The **no** form of this command disables extended system ID.

| Parameter | Description |
|---|---|
| `enable` | Specifies enabling use of extended system ID. |
| `disable` | Specifies disabling use of extended system ID. |

### Examples

Enabling extended system ID:

```
switch# config
switch(config)# spanning-tree extend-system-id enable
```

Disabling extended system ID:

```
switch# config
switch(config)# spanning-tree extend-system-id disable
switch(config)# no spanning-tree extend-system-id
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## spanning-tree ignore-pvid-inconsistency

```
spanning-tree ignore-pvid-inconsistency {enable | disable}
no spanning-tree ignore-pvid-inconsistency
```

### Description

Configures port behavior when per-VLAN ID inconsistencies are present. For example, when the ports on both ends of a point-to-point link are untagged members of different VLANs, enabling this option allows RPVST+ to process untagged RPVST+ packets belonging to the peer's untagged VLAN as if they were received on the current device's untagged VLAN. When this option is disabled, RPVST+ blocks the link, causing traffic on the mismatched VLANs to be dropped.

If this option is enabled on multiple switches connected by hubs, there could be more than two VLANs involved in PVID mismatches that will be ignored by RPVST+.

If port VLAN memberships is misconfigured on a switch in the network, then enabling this option prevents RPVST+ from detecting the problem, which may result in packet duplication in the network since RPVST+ would not converge correctly.

This command affects all ports on the switch belonging to VLANs on which RPVST+ is enabled.

By default ignore per-VLAN ID inconsistency is disabled.

The **no** form of this command sets the ignore per-VLAN ID inconsistencies to disabled.

| Parameter | Description |
|---|---|
| `enable` | Specifies ignore per-VLAN ID inconsistencies and allow RPVST to run on mismatched links. |
| `disable` | Disables the ignore per-VLAN ID inconsistencies functionality. |

### Examples

Enabling ignore per-VLAN ID inconsistencies:

```
switch# config
switch(config)# spanning-tree ignore-pvid-inconsistency enable
```

Disabling ignore per-VLAN ID inconsistencies:

```
switch# config
switch(config)# spanning-tree ignore-pvid-inconsistency disable
switch(config)# no spanning-tree ignore-pvid-inconsistency
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## spanning-tree link-type

```
spanning-tree link-type {point-to-point | shared}
no spanning-tree link-type
```

### Description

Configures the link type of a port.

The **no** form of this command sets the spanning tree link type to the default value of **point-to-point**.

| Parameter | Description |
|---|---|
| `point-to-point` | Sets the spanning tree link type as point-to-point. Use this for full-duplex ports that provide a point-to-point link to devices such as a switch, bridge, or end-node. Default. |
| `shared` | Sets the spanning tree link type as shared. Use this when the port is connected to a hub. |

### Examples

*On the 6400 Switch Series, interface identification differs.*

Setting spanning tree link type to shared:

```
switch(config)# interface 1/1/1
switch(config-if)# spanning-tree link-type shared
```

Setting spanning tree link type to point-to-point for a port:

```
switch(config)# interface 1/1/1
switch(config-if)# no spanning-tree link-type
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config-if` | Administrators or local user group members with execution rights for this command. |

## spanning-tree mode

```
spanning-tree mode {mstp|rpvst [auto-vlan-enable [priority <NUMBER>]]}
no spanning-tree mode {mstp|rpvst [auto-vlan-enable [priority <NUMBER>]]}
```

### Description

Sets the spanning tree protocol (STP) mode to either MSTP mode (Multiple-instance Spanning Tree Protocol) or RPVST mode (Rapid Per VLAN Spanning Tree). Enabling the RPVST Auto VLAN feature will run RPVST on all VLANs currently configured on the switch. Default priority of 8 will be assigned to the VLANs being auto created.

The **no** form of this command sets the spanning tree mode to the default **mstp**.

Enabling auto-VLAN can lead to an undeterministic state if auto scaled beyond the max system limit mentioned in the capacity-status.

| Parameter | Description |
|---|---|
| `mstp` | Sets the STP mode to MSTP which applies spanning tree separately for each set of VLANs called an MSTI (multiple spanning tree instance). |
| `rpvst` | Sets the STP mode to RPVST. |
| `auto-vlan-enable` | Selects RPVST auto VLAN mode. |
| `priority <NUMBER>` | Specifies the priorites for all auto created RPVST instances. Configured as a multiple of 4096. Default: 8. |

### Examples

Enabling MSTP mode:

```
switch(config)# spanning-tree mode mstp
```

Disabling MSTP mode:

```
switch(config)# no spanning-tree mode mstp
```

Enabling RPVST mode:

```
switch(config)# spanning-tree mode rpvst
```

Disabling RPVST mode:

```
switch(config)# no spanning-tree mode rpvst
```

Enabling RPVST auto VLAN with a priority of 1:

```
switch(config)# spanning-tree mode rpvst auto-vlan-enable priority 1
```

Disabling RPVST auto VLAN with a priority of 1:

```
switch(config)# no spanning-tree mode rpvst auto-vlan-enable priority 1
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.12.1000 | Auto VLAN enable added. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## spanning-tree pathcost-type

```
spanning-tree pathcost-type {long | short}
no spanning-tree pathcost-type [long|short]
```

### Description

Configures the spanning tree path cost type. The long mode provides support for the wider range of link speeds required by high-speed interfaces. All switches in the network must use the same path cost type or errors can occur in the spanning tree.

The **no** form of this command sets the spanning tree path cost type to the default **long**.

| Parameter | Description |
|---|---|
| `long` | Specifies the spanning tree path cost type as a 32-bit value, allowing port cost values to be set in the range 1-200,000,000. Default. |
| `short` | Specifies the spanning tree path cost type as a 16-bit value, allowing port cost values to be set in the range 1-65535. |

### Examples

Setting spanning tree path cost type to short:

```
switch# config
switch(config)# spanning-tree pathcost-type short
```

Setting spanning tree path cost type to long:

```
switch# config
switch(config)# spanning-tree pathcost-type long
```

Setting spanning tree path cost to default of long:

```
switch# config
switch(config)# no spanning-tree pathcost-type
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

### Command History

## spanning-tree rpvst-mstp interconnect vlan

```
spanning-tree rpvst-mstp-interconnect-vlan <VLAN-ID>
no spanning-tree rpvst-mstp-interconnect-vlan [<VLAN-ID>]
```

### Description

Configures the VLAN that has to be used to interconnect RPVST and MSTP domains. VLAN 1 is used by default.

The **no** form of this command sets the VLAN configuration to the default of 1.

- It is required to create the interconnect VLAN and then configure RPVST spanning tree on it.
- The same interconnect VLAN must be kept on all the switches in the network.
- Adding or deleting the interconnect VLAN triggers a re-convergence in the network.
- Deleting a VLAN that is configured as the interconnect VLAN does not reset the value to the default.

| Parameter | Description |
|---|---|
| *<VLAN-ID>* | Specifies the number of a VLAN. |

### Examples

This example configures VLAN 10 to used to interconnect RPVST and MSTP domains.

```
switch#(config)# spanning-tree rpvst-mstp-interconnect-vlan 10
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

### Command History

| Release | Modification |

## spanning-tree tcn-guard

```
spanning-tree tcn-guard
no spanning-tree tcn-guard
```

### Description

Disables propagation of topology change notifications (TCNs) to other STP ports. Use this when you do not want topology changes to be noticed by peer devices. By default, the propagation is enabled.

The **no** form of this command, enables propagation of topology changes which is the default.

### Examples

Enabling `tcn-guard`, which disables propagation of topology changes:

```
switch(config-if)# spanning-tree tcn-guard
```

Disabling `tcn-guard`, which enables propagation of topology changes:

```
switch(config-if)# no spanning-tree tcn-guard
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

### Command History

| Release | Modification |

## spanning-tree vlan

```
spanning-tree vlan <VLAN-LIST> [{hello-time | foward-delay | max-age | priority} <VALUE>]
no spanning-tree vlan <VLAN-LIST> [hello-time | foward-delay | max-age | priority]
```

### Description

Creates an RPVST instance for the specified VLAN. This command also allows for configuration of RPVST instance-specific time parameters.

The **no** form of this command removes the RPVST instance associated with the specified VLAN, and configures default values for RPVST instance-specific parameters.

| Parameter | Description |
|---|---|
| `<VLAN-LIST>` | Specifies the number of a single VLAN, or a series of numbers for a range of VLANs, separated by commas (1, 2, 3, 4), dashes (1-4), or both (1-4,6). |
| `hello-time <VALUE>` | Specifies the hello-time in seconds for the RPVST instance. Range: 2-10 seconds. Default: 2 seconds. |
| `forward-delay <VALUE>` | Specifies the forward-delay time in seconds for the RPVST instance. Range: 4-30 seconds. Default: 15 seconds. |
| `max-age <VALUE>` | Specifies the maximum age time in seconds for the RPVST instance. Range: 6-40 seconds. Default: 20 seconds. |
| `priority <VALUE>` | Specifies the priority for the RPVST instance. Priority value is |

| Parameter | Description |
|---|---|
|  | configured as a multiple of 4096. Range: 0-15. Default: 8 which is 32768. |

### Examples

Creating an RPVST instance for a list of VLANs and configuring various time parameters:

```
switch# config
switch(config)# spanning-tree vlan 2-5
switch(config)# spanning-tree vlan 2-5 hello-time 5
switch(config)# spanning-tree vlan 5 max-age 10
switch(config)# spanning-tree vlan 2-5 forward-delay 25
switch(config)# spanning-tree vlan 2-5 priority 5
```

Removing an RPVST instance for a list of VLANs and setting various time parameters to the default:

```
switch# config
switch(config)# no spanning-tree vlan 2-5
switch(config)# no spanning-tree vlan 2-5 hello-time
switch(config)# no spanning-tree vlan 2-5 forward-time
switch(config)# no spanning-tree vlan 2-5 max-age
switch(config)# no spanning-tree vlan 2-5 priority
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

# spanning-tree vlan cost

```
spanning-tree vlan <VLAN-LIST> cost <PORT-COST>
no spanning-tree vlan <VLAN-LIST> cost
```

### Description

Configures the spanning tree cost for the VLAN. This is the cost to reach the root port.

The **no** form of this command sets the port cost to the default value.

| Parameter | Description |
|---|---|
| *<VLAN-LIST>* | Specifies the number of a single VLAN, or a series of numbers for a range of VLANs, separated by commas (1, 2, 3, 4), dashes (1-4), or both (1-4,6). |
| *<PORT-COST>* | Specifies the spanning tree cost for the VLAN. Range: 1-200,000,000. Default is calculated from the port link speed:<br>■ 10 Mbps link speed equals a path cost of 2,000,000.<br>■ 100 Mbps link speed equals a path cost of 200,000.<br>■ 1 Gbps link speed equals a path cost of 20,000.<br>■ 2 Gbps link speed equals a path cost of 10,000.<br>■ 10 Gbps link speed equals a path cost of 2,000.<br>■ 100 Gbps link speed equals a path cost of 200.<br>■ 1 Tbps link speed equals a path cost of 20. |

### Examples

Setting port cost:

```
switch(config-if)# spanning-tree vlan 5 cost 100000
```

Setting port cost to the default:

```
switch(config-if)# no spanning-tree vlan 5 cost
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

## spanning-tree vlan port-priority

```
spanning-tree vlan <VLAN-LIST> port-priority <PRIORITY>
no spanning-tree vlan <VLAN-LIST> port-priority
```

### Description

Configures port priority. A port with the lowest priority number has the highest priority for use in forwarding traffic.

The **no** form of this command, sets the port priority to the default of 8.

| Parameter | Description |
|---|---|
| *<VLAN-LIST>* | Specifies the number of a single VLAN, or a series of numbers for a range of VLANs, separated by commas (1, 2, 3, 4), dashes (1-4), or both (1-4,6). |
| *<PRIORITY>* | Specifies the port priority. The value, configured as a multiple of 16, helps in determining the designated port. The lower a priority value, the higher the priority. Range: 1 to15. Default: 8. |

### Examples

Setting port priority:

```
switch(config-if)# spanning-tree vlan 5 port-priority 10
```

Setting port priority to the default of 8:

```
switch(config-if)# no spanning-tree vlan 5 port-priority
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

## spanning-tree trap

```
spanning-tree trap {new-root | topology-change [vlan <VLAN-ID>] |
   errant-bpdu | root-guard-inconsistency | loop-guard-inconsistency}
no spanning-tree trap {new-root | topology-change [vlan <VLAN-ID>] |
   errant-bpdu | root-guard-inconsistency | loop-guard-inconsistency}
```

### Description

Enables SNMP traps for new root, topology change event, errant-bpdu received event, root-guard inconsistency, and loop-guard inconsistency notifications. It is disabled by default.

The **no** form of this command disables the notifications for SNMP traps.

| Parameter | Description |
|---|---|
| new-root | Enables SNMP notification when a new root is elected on any PVST vlan on the switch. |
| topology-change | Enables SNMP notification when a topology change event occurred in specified PVST vlan on the switch. |
| *<VLAN-ID>* | Specifies the VLAN ID for the topology change trap. Range: 1 to 4094. |
| errant-bpdu | Enables SNMP notification when an errant bpdu is received by any PVST vlan on the switch. |
| root-guard-inconsistency | Enables SNMP notification when the root-guard finds the port inconsistent for any PVST vlan on the switch. |
| loop-guard-inconsistency | Enables SNMP notification when the loop-guard finds the port inconsistent for any PVST vlan on the switch. |

## Examples

Enabling the notifications for the SNMP traps:

```
switch(config)# spanning-tree trap
  new-root                  Enable notifications which are sent when a new root is
elected
  topology-change           Enable notifications which are sent when a topology
change occurs
  errant-bpdu               Enable notifications which are sent when an errant
bpdu is received
  root-guard-inconsistency  Enable notifications which are sent when root guard
inconsistency occurs
  loop-guard-inconsistency  Enable notifications which are sent when loop guard
inconsistency occurs
switch(config)# spanning-tree trap new-root
  <cr>
switch(config)# spanning-tree trap topology-change
  vlan  Enable topology change notification for the specified PVST vlan id.
switch(config)# spanning-tree trap topology-change vlan
  <1-4094>  Enable topology change information on the specified vlan id.
switch(config)# spanning-tree trap topology-change vlan 1
  <cr>
switch(config)# spanning-tree trap errant-bpdu
  <cr>
switch(config)# spanning-tree trap root-guard-inconsistency
  <cr>
switch(config)# spanning-tree trap loop-guard-inconsistency
  <cr>
```

Disabling the notifications for the SNMP traps:

```
switch(config)# no spanning-tree trap
  new-root                  Disable notifications which are sent when a new root
is elected
  topology-change           Disable notifications which are sent when a topology
change occurs
  errant-bpdu               Disable notifications which are sent when an errant
bpdu is received
```

```
  root-guard-inconsistency  Disable notifications which are sent when root guard
inconsistency occurs
  loop-guard-inconsistency  Disable notifications which are sent when loop guard
inconsistency occurs
switch(config)# no spanning-tree trap new-root
  <cr>
switch(config)# no spanning-tree trap topology-change
  instance  Disable topology change notification for the specified PVST vlan id.
switch(config)# no spanning-tree trap topology-change vlan
  <1-4094>  Disable topology change information on the specified PVST vlan id.
switch(config)# no spanning-tree trap topology-change vlan 1
  <cr>
switch(config)# no spanning-tree trap errant-bpdu
  <cr>
switch(config)# no spanning-tree trap root-guard-inconsistency
  <cr>
switch(config)# no spanning-tree trap loop-guard-inconsistency
  <cr>
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

## Command History

| Release | Modification |

# Chapter 138

# Runtime diagnostic commands

## diagnostic monitor

```
diagnostic monitor {fan-tray  | line-module | management-module} [<SLOT-ID>]
no diagnostic monitor {fan-tray  | line-module | management-module} [<SLOT-ID>]
```

For 6400 switches only:

```
diagnostic monitor {fabric <SLOT-ID>}
no diagnostic monitor {fabric <SLOT-ID>}
```

### Description

Enables runtime diagnostics for all modules or for a specified module. This feature is enabled by default for all modules.

The **no** form of this command disables runtime diagnostics for all modules or for a specified module.

| Parameter | Description |
|---|---|
| `fan-tray` | Specifies the enabling of diagnostic monitoring specific to a fan tray. |
| `line-module` | Specifies the enabling of diagnostic monitoring specific to a line module. |
| `management-module` | Specifies the enabling of diagnostic monitoring specific to a management module. |
| *<SLOT-ID>* | Specifies the slot ID of a module. Format: member/slot. |

### Usage

When no parameters are used in the command (**diagnostic monitor** or **no diagnostic monitor**), the command applies to all modules. This command impacts the diagnostics that run periodically. It does not affect on-demand diagnostics.

### Example

Enabling runtime diagnostics for a specified module:

```
switch(config)# diagnostic monitor management-module 1/1
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## diag on-demand

```
diag on-demand {fan-tray  | line-module | management-module} [<SLOT-ID>]
```

For 6400 switches only:

```
diag on-demand {fabric <SLOT-ID>}
```

### Description

Runs the diagnostic tests for all modules or for a specified module.

| Parameter | Description |
|---|---|
| `[fan-tray | line-module | management-module]` | Selects the options for enabling or disabling run-time diagnostics for a specific module. |
| `fan-tray` | Specifies the enabling of diagnostic monitoring specific to a fan tray. |
| `line-module` | Specifies the enabling of diagnostic monitoring specific to a line module. |
| `management-module` | Specifies the enabling of diagnostic monitoring specific to a management module. |
| *<SLOT-ID>* | Specifies the member/slot for management modules (1/1 or 1/2), line modules (1/3-1/7, 1/8-1/12), fan trays (1/1-1/3), and fabric modules (1/1-1/2) on a 6400 switch.<br>Specifies the member/slot for management modules (1/1), line modules (1/1), and fan trays (1/1-1/2) on a 6300 switch. |

### Usage

When no parameters are used in the command (**diag on-demand**), the command applies to all modules.

### Examples

Running diagnostic tests for all modules on a 6300 switch:

```
switch# diag on-demand
Fetching Test results.  Please wait ...
```

```
Module               ID    Diagnostics Success
                           Performed
-------------------- ----- ----------- -------
FanTray              1/2             1     100%
FanTray              1/1             1     100%
LineModule           1/1            13     100%
ManagementModule     1/1            13     100%
```

Running diagnostic tests for a specific module on a 6300 switch:

```
switch# diag on-demand management-module 1/1
Performing diagnostic tests.  Please wait ...
Fetching Test results.  Please wait ...

Module               ID    Diagnostics Success
                           Performed
-------------------- ----- ----------- -------
ManagementModule     1/1            13     100%
```

Running diagnostic tests for all modules on a 6400 switch:

```
switch# diag on-demand
Fetching Test results.  Please wait ...

Module               ID    Diagnostics Success
                           Performed
-------------------- ----- ----------- -------
FanTray              1/2             2     100%
LineModule           1/3            24     100%
ManagementModule     1/1            19     100%
LineModule           1/7            12     100%
Fabric               1/1             6     100%
LineModule           1/5            24     100%
LineModule           1/4            24     100%
FanTray              1/1             2     100%
LineModule           1/6            24     100%
```

Running diagnostic tests for a specific module on a 6400 switch:

```
switch# diag on-demand management-module
Performing diagnostic tests.  Please wait ...
Fetching Test results.  Please wait ...

Module               ID    Diagnostics Success
                           Performed
-------------------- ----- ----------- -------
ManagementModule     1/1            19     100%
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Manager (#) | Administrators or local user group members with execution rights for this command. |

## show diagnostic

`show diagnostic {fan-tray  | line-module | management-module} [<SLOT-ID>] {brief | detail} [vsx-peer]`

### Description

Displays the diagnostic test results for all modules or for a specified module.

| Parameter | Description |
|---|---|
| `[fan-tray | line-module | management-module]` | Selects the options for enabling or disabling runtime diagnostics for a specific module. |
| `fan-tray` | Specifies the enabling of diagnostic monitoring specific to a fan tray. |
| `line-module` | Specifies the enabling of diagnostic monitoring specific to a line module. |
| `management-module` | Specifies the enabling of diagnostic monitoring specific to a management module. |
| *`<SLOT-ID>`* | Specifies the member/slot for management modules (1/1), line modules (1/1), and fan trays (1/1-1/2) on the 6300 switch. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Usage

When no parameters are used in the command (**show diagnostic**), the command applies to all modules.

### Example

Showing diagnostic test results in brief format for all modules on a 6300 switch:

```
switch# show diagnostic brief
Module               ID    Diagnostics Success
                           Performed
-------------------- ----- ----------- -------
```

```
ManagementModule     1/1           13     100%
LineModule           1/1           13     100%
FanTray              1/1            1     100%
FanTray              1/2            1     100%
```

Showing diagnostic test results in brief format for a specified module on a 6300 switch:

```
switch# show diagnostic line-module brief

Module               ID    Diagnostics Success
                           Performed
-------------------- ----- ----------- -------
LineModule           1/1           13     100%
```

Showing diagnostic test results in detail format for all modules on a 6300 switch:

```
switch# show diagnostic detail

## show diagnostic events

`show diagnostic events`

### Description

Displays the diagnostic related event logs.

### Example

Showing diagnostic related event logs:

```
switch# show diagnostic events
2019-08-07:17:19:21.214532|hhmd|106001|ERR|
Diagnostic mm_mcbe failed with error code 0x380 on management module 1/1
2019-08-07:17:19:21.214554|hhmd|106001|ERR|
Diagnostic pmc failed with error code 0x4 on management module 1/1
2019-08-07:17:19:21.215532|hhmd|106001|ERR|
Diagnostic ledpld failed with error code 0x4 on management module 1/1
2019-08-07:17:19:21.353221|hhmd|106001|ERR|
Diagnostic mm_mcbe failed with error code 0x380 on management module 1/1
2019-08-07:17:19:21.354421|hhmd|106001|ERR|
Diagnostic pmc failed with error code 0x4 on management module 1/1
2019-08-07:17:19:21.453221|hhmd|106001|ERR|
Diagnostic ledpld failed with error code 0x4 on management module 1/1
```

Showing diagnostic related event logs (Output from a 6400 switch):

```
switch# show diagnostic events
---------------------------------------------------
Event logs from current boot
---------------------------------------------------
2019-10-17T20:27:04.066486+00:00 6405 hhmd[9237]: Event|3002|LOG_

# Chapter 139

# Security log commands

## clear security-logs

`clear security-logs`

### Description

Clears the security logs.

Only members of the security user group have permission to use this command.

### Examples

Showing the current boot security logs and then clearing the security logs:

```
switch# show security-logs
---------------------------------------------------
Security logs from current boot
---------------------------------------------------
2021-12-01:12:37:31.733551|restd|15007|INFO|AMM|1|User admin successfully changed
password
2021-12-01:12:37:31.734541|restd|4001|WARN|AMM|1|User auditor password change
failed
2021-12-01:12:37:32.583256|hpe-credmgr|24002|WARN|AMM|1|An internal error occurred
while reading the export password and default export password was used instead.

switch# clear security-logs

switch# show security-logs
---------------------------------------------------
Security logs from current boot
---------------------------------------------------
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.09 | Command introduced |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Manager (#) | The security user. |

## copy security-log

`copy security-log <REMOTE-URL> [vrf <VRF-NAME>]`

### Description

Copies the security logs to a remote URL using SFTP, SCP, or TFTP.

Only members of the security user group have permission to use this command.

| Parameter | Description |
|---|---|
| *<REMOTE-URL>* | Specifies the remote destination URL.<br>URL Syntax:<br>▪ **sftp://<*USER*>@{<*IP*>\|<*HOST*>}[:<*PORT*>]/<*FILE*>**<br>▪ **scp://<*USER*>@{<*IP*>\|<*HOST*>}[:<*PORT*>]/<*FILE*>**<br>▪ **tftp://{<*IP*>\|<*HOST*>}[:<*PORT*>][;blocksize=<*VAL*>]/<*FILE*>** |
| vrf *<VRF-NAME>* | Specifies the VRF name. When omitted, the VRF named *default* is used. |

### Examples

Copying the security log with SFTP:

```
switch# copy security-log sftp://user1@99.99.99.99/coredump.xz vrf mgmt
```

Copying the security log with SCP:

```
switch# copy security-log scp://user2@99.99.99.99/coredump.xz vrf mgmt
```

Copying the security log with TFTP:

```
switch# copy security-log tftp://99.99.99.99:9999/coredump.xz vrf mgmt
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.09 | Command introduced. |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Manager (#) | The security user. |

## show security-logs

```
show security-logs {-s <SEVERITY> | -r | -a | -n <COUNT>
                        | -d {lldpd | bgpd | fand | ...}}
```

### Description

Shows the security logs. Multiple parameters can be used in the same command.

Only members of the security user group have permission to use this command.

| Parameter | Description |
|---|---|
| `-s <SEVERITY>` | Shows the event logs for the specified severity.<br>■ **emer**: Emergency (7) only.<br>■ **alert**: Alerts (6) and above.<br>■ **crit**: Critical (5) and above.<br>■ **err**: Error (4) and above.<br>■ **warn**: Warning (3) and above.<br>■ **notice**: Notice (2) and above.<br>■ **info**: Info (1) and above.<br>■ **debug**: All severity levels. |
| `-r` | Shows the security logs in reverse order with the most recent log items first. |
| `-a` | Shows all security logs, including items from previous boots. |
| `-n <COUNT>` | Shows the specified number of security log items. Range: 1 to 4294967295. |
| `-d {lldpd \| bgpd \| fand \|...}` | Shows the security logs for the specified daemon. |

### Examples

Showing security logs from the current boot:

```
switch# show security-logs
---------------------------------------------------
Security logs from current boot
---------------------------------------------------
2021-12-01:12:37:31.733551|restd|15007|INFO|AMM|1|User admin successfully changed
password
2021-12-01:12:37:31.734541|restd|4001|WARN|AMM|1|User auditor password change
failed
2021-12-01:12:37:32.583256|hpe-credmgr|24002|WARN|AMM|1|An internal error occurred
while reading the export password and default export password was used instead.
```

Showing security logs in reverse order with the most recent logs first: :

```
switch# show security-logs -r
---------------------------------------------------
Security logs from current boot
---------------------------------------------------
2021-12-01:12:37:32.583256|hpe-credmgr|24002|WARN|AMM|1|An internal error occurred
while reading the export password and default export password was used instead.
2021-12-01:12:37:31.734541|restd|4001|WARN|AMM|1|User auditor password change
failed
2021-12-01:12:37:31.733551|restd|15007|INFO|AMM|1|User admin successfully changed
password
```

Showing security logs from the current and previous boot:

```
switch# show security-logs -a
---------------------------------------------------
Security logs from previous boot
---------------------------------------------------
2021-12-01:12:31:31.733551|restd|15007|INFO|AMM|1|User admin successfully changed
password
2021-12-01:12:31:31.734541|restd|4001|WARN|AMM|1|User auditor password change
failed
---------------------------------------------------
Security logs from current boot
---------------------------------------------------
2021-12-01:12:37:31.733551|restd|15007|INFO|AMM|1|User admin successfully changed
password
2021-12-01:12:37:31.734541|restd|4001|WARN|AMM|1|User auditor password change
failed
2021-12-01:12:37:32.583256|hpe-credmgr|24002|WARN|AMM|1|An internal error occurred
while reading the export password and default export password was used instead.
```

Showing security logs with a severity of **warn** and higher:

```
switch# show security-logs -s warn
---------------------------------------------------
Security logs from current boot
---------------------------------------------------
2021-12-01:12:37:31.734541|restd|4001|WARN|AMM|1|User auditor password change
failed
2021-12-01:12:37:32.583256|hpe-credmgr|24002|WARN|AMM|1|An internal error occurred
while reading the export password and default export password was used instead.
```

Showing security logs for the specified daemon :

```
switch# show security-logs -d hpe-restd
---------------------------------------------------
Security logs from current boot
---------------------------------------------------
2021-12-01:12:37:31.733551|restd|15007|INFO|AMM|1|User admin successfully changed
password
2021-12-01:12:37:31.734541|restd|4001|WARN|AMM|1|User auditor password change
failed
```

Showing the two most recent security logs:

```
switch# show security-logs -n 2
---------------------------------------------------
Security logs from current boot
---------------------------------------------------
2021-12-01:12:37:31.733551|restd|15007|INFO|AMM|1|User admin successfully changed
password
2021-12-01:12:37:31.734541|restd|4001|WARN|AMM|1|User auditor password change
failed
```

Showing the two most recent security logs in reverse order for the specified daemon:

```
switch# show security-logs -r -n 2 -d hpe-restd
---------------------------------------------------
Security logs from current boot
---------------------------------------------------

# Chapter 140

# Selftest commands

## fastboot

```
fastboot
no fastboot
```

### Description

Enables fastboot for the system.

The **no** form of this command disables fastboot for the system.

### Usage

When fastboot is enabled, most tests under a Power On Self Test (POST) are skipped. By default, fastboot is enabled.

After disabling fastboot, save switch configurations and then reboot for POST to run. POST verifies the hardware functionality of various modules during boot-up. Based on the criticality of the test, the selftest module decides whether to go ahead with the boot-up sequence of a particular subsystem or interface during a POST failure.

POST runs memory built-in selftest (BISTs) and front-end port loopback tests. Memory BISTs verify the internal and external memory blocks present in the module. The memory tables are critical for proper functionality of the system so any failures in these tests results in the corresponding subsystem to be marked as "Failed" and thus that subsystem is not available for use.

Front-end port loopback tests verify the physical port front-end interface. These tests check if a particular interface can function properly. A test failure means that a particular interface has been marked as "Failed" and is now unavailable for use.

On 6300 and 6400 switches, the line-module and fabric-module selftest is run regardless of fastboot setting. The interface selftest is only run when fastboot is disabled.

### Examples

Enabling fastboot:

```
switch# configure terminal
switch(config)# fastboot
switch(config)# end
switch# show running-config
Current configuration:
!
!Version AOS-CX ML.10.06.0001
module 1/1 product-number jl726a!Version AOS-CX FL.10.06.0001
module 1/1 product-number jl661a!Version AOS-CX XL.10.00.0002
module 1/1 product-number jl363a!Version AOS-CX PL.10.06.0001
module 1/1 product-number jl677a
!
!
!
```

```
!
!
!
!
vlan 1
interface 1/1/1
    no shutdown
```

Disabling fastboot:

```
switch# configure terminal
switch(config)# no fastboot
switch(config)# end
switch(config)# write mem
Configuration changes will take time to process, please be patient.
switch# show running-config
Current configuration:
!
!Version AOS-CX ML.10.06.0001
module 1/1 product-number jl726a!Version AOS-CX FL.10.06.0001
module 1/1 product-number jl661a!Version AOS-CX XL.10.00.0002
module 1/1 product-number jl363a!Version AOS-CX PL.10.06.0001
module 1/1 product-number jl677a
!
!
!
no fastboot
!
!
!
!
vlan 1
interface 1/1/1
    no shutdown
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

## show selftest

```
show selftest [brief] [vsx-peer]
show selftest line-module <SLOT-ID>
show selftest line-module <SLOT-ID> interface [brief] [vsx-peer]
show selftest interface [<PORT-NUM>] [vsx-peer]
```

For 8400 and 6400 switches only:

```
show selftest {line-module | fabric-module} [<SLOT-ID>] [brief] [vsx-peer]
```

## Description

Displays selftest results.

| Parameter | Description |
|---|---|
| `[brief]` | Shows the selftest results as a brief description. Default. |
| `line-module` | Shows the selftest results for a line module. |
| `fabric-module` | Shows the selftest results for a fabric module. Applicable only for 8400 and 6400 switches. |
| *<SLOT-ID>* | Shows the selftest results for the slot ID of the line or fabric module. |
| *<PORT-NUM>* | Shows the selftest results for the port number. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

## Examples

Displaying the output when fastboot is disabled on an 8400 or a 6400 switch:

```
switch# show selftest
Name        Id   Status          ErrorCode  LastRunTime
---------- ---- -------------- ---------- -------------------
LineModule 1/1  passed          0x0       2016-10-15 10:10:09
LineModule 1/2  failed          0x09      2016-10-15 10:10:56
Fabric 1/1      passed          0x0       2016-10-15 10:10:09
Fabric 1/2      failed          0x1E      2016-10-15 10:10:56

switch# show selftest line-module
Name        Id   Status          ErrorCode LastRunTime
---------- ---- -------------- --------- -------------------
LineModule 1/1  passed          0x0       2016-10-15 10:10:09
LineModule 1/2  failed          0x09      2016-10-15 10:10:56

switch# show selftest fabric-module
Name   Id        Status          ErrorCode LastRunTime
------ -------- -------------- --------- -------------------
Fabric 1/1      passed          0x0       2016-10-15 10:10:09
Fabric 1/2      failed          0x1E      2016-10-15 10:10:56

switch# show selftest fabric-module 1/2
Name   Id        Status          ErrorCode LastRunTime
------ -------- -------------- --------- -------------------
Fabric 1/2      failed          0x11      2016-10-15 10:10:56

switch# show selftest line-module 1/10
Name        Id   Status          ErrorCode LastRunTime
```

```
---------- ---- -------------- --------- -------------------
LineModule 1/10 failed         0x1A      2016-10-15 10:10:56

switch# show selftest interface 1/2/2
Name    Status         ErrorCode LastRunTime
------- -------------- --------- -------------------
1/2/2   passed         0x0       2016-11-19 05:10:11

switch# show selftest line-module 1/3 interface
Name    Status         ErrorCode LastRunTime
------- -------------- --------- -------------------
1/3/1   passed         0x0       2016-11-19 05:10:11
1/3/2   passed         0x0       2016-11-19 05:10:11
1/3/3   passed         0x0       2016-11-19 05:10:11
1/3/31  failed         0x20      2016-11-19 05:10:11
```

Displaying the output when fastboot is disabled on a 6300 switch:

```
switch# show selftest interface

Name       Status            ErrorCode        LastRunTime

---------- ----------------- ---------------- -------------------

1/1/2      skipped           0x0

1/1/44     skipped           0x0

1/1/46     skipped           0x0

switch# show selftest interface 1/1/1

Name       Status            ErrorCode        LastRunTime
---------- ----------------- ---------------- -------------------
1/1/1      skipped           0x0
```

Displaying the output when fastboot is enabled on a 6400 switch:

```
switch# show selftest
Name       Id   Status         ErrorCode  LastRunTime
---------- ---- -------------- ---------- -------------------
LineModule 1/1  passed         0x0
LineModule 1/2  passed         0x0
Fabric     1/1  passed         0x0
Fabric     1/2  passed         0x0

switch# show selftest line-module
Name       Id   Status         ErrorCode LastRunTime
---------- ---- -------------- --------- -------------------
LineModule 1/1  passed         0x0
LineModule 1/2  passed         0x0
```

```
switch# show selftest fabric-module
Name       Id   Status         ErrorCode  LastRunTime
---------- ---- -------------- ---------- -------------------
Fabric     1/1  passed         0x0
Fabric     1/2  passed         0x0

switch# show selftest fabric-module 1/2
Name   Id       Status         ErrorCode LastRunTime
------ -------- -------------- --------- -------------------
Fabric 1/2      passed         0x0

switch# show selftest line-module 1/1
Name       Id   Status         ErrorCode LastRunTime
---------- ---- -------------- --------- -------------------
LineModule 1/1  passed         0x0
```

Displaying the output when fastboot is enabled:

```
switch# show selftest interface 1/1/2
Name    Status         ErrorCode LastRunTime
------- -------------- --------- -------------------
1/1/2   skipped        0x0

switch# show selftest line-module 1/1 interface
Name    Status         ErrorCode LastRunTime
------- -------------- --------- -------------------
1/1/1   skipped        0x0
1/1/2   skipped        0x0
1/1/3   skipped        0x0
1/1/31  skipped        0x0
```

Displaying the output when fastboot is disabled:

Testing to register read/write:

This test is run irrespective of fastboot being enabled or disabled.

```
switch# show selftest

Name       Id   Status         ErrorCode  LastRunTime
---------- ---- -------------- ---------- -------------------
LineModule 1/1  passed         0x0        2018-02-16 18:15:53
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

# Chapter 141

# sFlow agent commands

## clear sflow statistics

```
clear sflow statistics {global | interface <INTERFACE-NAME>}
```

### Description

This command clears the sFlow sample statistics counter to 0 either globally or for a specific interface.

| Parameter | Description |
|---|---|
| `global` | Specifies all interfaces on the switch. |
| `interface <INTERFACE-NAME>` | Specifies the name of an interface on the switch. |

### Examples

Clearing the global sFlow sample statistics counter to 0 globally:

```
switch(config)# clear sflow statistics global
```

Clearing the global sFlow sample statistics counter to 0 for interface *1/1/1*:

```
switch(config)# clear sflow statistics interface 1/1/1
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

## sflow

```
sflow
```

```
no sflow
```

## Description

Enables the sFlow agent.

- In the **config** context, this command enables the sFlow agent globally on all interfaces.
- In an **config-if** context, this command enables the sFlow agent on a specific interface. sFlow cannot be enabled on a member of a LAG, only on the LAG.

The sFlow agent is disabled by default.

The **no** form of this command disables the sFlow agent and deletes all sFlow configuration settings, either globally, or for a specific interface.

## Examples

*On the 6400 Switch Series, interface identification differs.*

Enabling sFlow globally on all interfaces:

```
switch(config)# sflow
```

Disabling sFlow globally on all interfaces:

```
switch(config)# no sflow
```

Enabling sFlow on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# sflow
```

Disabling sFlow on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# no sflow
```

Enabling sFlow on interface **lag100**:

```
switch(config)# interface lag100
switch(config-if)# sflow
```

Disabling sFlow on interface **lag100**:

```
switch(config)# interface lag100
switch(config-if)# no sflow
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config`<br>`config-if` | Administrators or local user group members with execution rights for this command. |

## sflow agent-ip

```
sflow agent-ip <IP-ADDR>
no sflow agent-ip [<IP-ADDR>]
```

### Description

Defines the IP address of the sFlow agent to use in sFlow datagrams. This address must be defined for sFlow to function. HPE recommends that the address:

- can uniquely identify the switch
- is reachable by the sFlow collector
- does not change with time

The **no** form of this command deletes the IP address of the sFlow agent. This causes sFlow to stop working and no datagrams will be sent to the sFlow collector.

| Parameter | Description |
|---|---|
| *<IP-ADDR>* | Specifies an IP address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255, or IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F. The agent address is used to identify the switch in all sFlow datagrams sent to sFlow collectors. It is usually set to an IP address on the switch that is reachable from an sFlow collector. |

### Examples

Setting the agent address to **10.10.10.100**:

```
switch(config)# sflow agent-ip 10.0.0.100
```

Setting the agent address to **2001:0db8:85a3:0000:0000:8a2e:0370:7334**:

```
switch(config)# sflow agent-ip 2001:0db8:85a3:0000:0000:8a2e:0370:7334
```

Removing the address configuration from the switch, which results in sFlow being disabled:

```
switch(config)# no sflow agent-ip
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## sflow collector

```
sflow collector <IP-ADDR> [port <PORT>] [vrf <VRF>]
no sflow collector <IP-ADDR> [port <PORT>] [vrf <VRF>]
```

### Description

Defines a collector to which the sFlow agent sends data. Up to three collectors can be defined. At least one collector should be defined, and it must be reachable from the switch for sFlow to work.

| Parameter | Description |
|---|---|
| `collector <IP-ADDR>` | Specifies the IP address of a collector in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255, or IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F. |
| `port <PORT>` | Specifies the UDP port on which to send information to the sFlow collector. Range: 0 to 65536. Default: 6343. |
| `vrf <VRF>` | Specifies the VRF on which to send information to the sFlow collector. The VRF must be defined on the switch. If no VRF is specified, the default VRF (**default**) is used. |

### Example

Defining a collector with IP address **10.10.10.100** on UDP port **6400**:

```
switch(config)# sflow collector 10.0.0.1 port 6400
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## sflow disable

```
sflow disable
```

### Description

Disables the sFlow agent, but retains any existing sFlow configuration settings. The settings become active if the sFlow agent is re-enabled.

### Example

Disabling sFlow support:

```
switch(config)# sflow disable
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## sflow header-size

```
sflow header-size <SIZE>
no sflow header-size [<SIZE>]
```

### Description

Sets the sFlow header size in bytes.

The **no** form of this command sets the header size to the default value of 128.

| Parameter | Description |
|---|---|
| `header-size <SIZE>` | Specifies the sFlow header size in bytes. Range: 64 to 256. Default: 128. |

### Examples

Setting the header size to **64** bytes:

```
switch(config)# sflow header-size 64
```

Setting the header size to the default value of **128** bytes:

```
switch(config)# no sflow header-size
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## sflow max-datagram-size

```
sflow max-datagram-size <SIZE>
no sflow max-datagram-size [<SIZE>]
```

### Description

Sets the maximum number of bytes that are sent in one sFlow datagram.

The **no** form of this command sets maximum number of bytes to the default value of 1400.

| Parameter | Description |
|---|---|
| `max-datagram-size <SIZE>` | Specifies the maximum datagram size in bytes. Range: 1 to 9000. Default: 1400. |

### Examples

Setting the datagram size to **1000** bytes:

```
switch(config)# sflow max-datagram-size 1000
```

Setting the header size to the default value of **1400** bytes:

```
switch(config)# no sflow max-datagram-size
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## sflow mode

```
sflow mode {ingress | egress | both}
no sflow mode {ingress | egress | both}
```

### Description

Sets the sFlow sampling mode. The default mode is ingress.

The no form of the command sets the sampling mode to ingress. Executing the no form of the command with the ingress option will have no impact as ingress is the default mode.

| Parameter | Description |
|---|---|
| `ingress` | Samples only ingress traffic. |
| `egress` | Samples only egress traffic. |
| `both` | Samples both ingress and egress traffic. |

### Examples

Setting the sFlow mode to only sample egress traffic:

```
switch# configure terminal
switch(config)# sflow mode egress
```

Setting the sFlow mode to only sample ingress traffic:

```
switch# configure terminal
switch(config)# sflow mode ingress
```

Setting the sFlow mode to sample both sample ingress and egress traffic:

```
switch# configure terminal
switch(config)# sflow mode both
```

Resetting the sFlow sampling mode to the default of ingress from previously configured mode of egress:

```
switch# configure terminal
switch(config)# no sflow mode egress
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | config | Administrators or local user group members with execution rights for this command. |

## sflow polling

```
sflow polling <INTERVAL>
no sflow polling [<INTERVAL>]
```

### Description

Defines the global polling interval for sFlow in seconds.

The **no** form of this command sets the polling interval to the default value of 30 seconds.

| Parameter | Description |
|---|---|
| *<INTERVAL>* | Specifies the polling interval in seconds. Range: 10 to 3600. Default: 30. |

### Examples

Setting the polling interval to 10:

```
switch(config)# sflow polling 10
```

Setting the polling interval to the default value.

```
switch(config)# no sflow polling
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## sflow sampling

```
sflow sampling <RATE>
no sflow sampling [<RATE>]
```

### Description

Defines the global sampling rate for sFlow in number of packets. The default sampling rate is 4096, which means that one in every 4096 packets is sampled. A warning message is displayed when the sampling rate is set to less than 4096 and proceeds only after user confirmation.

The **no** form of this command sets the sampling rate to the default value of 4096.

| Parameter | Description |
|---|---|
| `sampling <RATE>` | Specifies the sampling rate. Range: 1 to 1000000000. Default: 4096. |

### Examples

Setting the sampling rate to **5000**:

```
switch(config)# sflow sampling 5000
```

Setting the sampling rate to the default:

```
switch(config)# no sflow sampling
```

Setting the sampling rate to **1000**:

```
switch(config)# sflow sampling 1000
Setting the sFlow sampling rate lower than 4096 is not recommended and might
affect system performance.
Do you want to continue [y/n]? y
switch(config)#
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## show sflow

```
show sflow [interface <INTERFACE-NAME>] [vsx-peer]
```

### Description

Shows sFlow configuration settings and statistics for all interfaces, or for a specific interface. It also displays the current status of sFlow on the device and reports any errors that require attention.

If sFlow is enabled on the interfaces associated with a lag interface, then the interfaces will not be shown as separate entries under `sFlow enabled on Interface` in the output. Only the associated lag interface will have an entry in the column.

| Parameter | Description |
|---|---|
| `interface <INTERFACE-NAME>` | Specifies the name of an interface on the switch. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Examples

*On the 6400 Switch Series, interface identification differs.*

Showing sFlow information for all interfaces:

```
switch# show sflow
sFlow Global Configuration
-----------------------------------------
sFlow                         enabled
Collector IP/Port/Vrf         10.0.0.2/6343/default
                              10.0.0.3/6400/default
Agent Address                 10.0.0.1

# Chapter 142

# Smartlink commands

## Configuration commands

### smartlink group

```
smartlink group <GROUP-ID>
no smartlink group <GROUP-ID>
```

#### Description

Creates a Smartlink group with specified ID.

The **no** form of this command removes the Smartlink group and all associated configurations for a specified ID.

| Parameter | Description |
|---|---|
| *<GROUP-ID>* | Specifies ID for the Smartlink group. |

#### Usage

The maximum number of Smartlink groups is 24.

#### Examples

Configuring a Smartlink group:

```
switch(config)# smartlink group 2
switch(config-smartlink-2)#
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

#### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

#### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | config | Administrators or local user group members with execution rights for this command. |

## smartlink recv-control-vlan

```
smartlink recv-control-vlan <VID-LIST>
no smartlink recv-control-vlan <VID-LIST>
```

### Description

Configures control VLANs to receive flush messages.

The **no** form of this command disables VLANs from receiving flush messages.

| Parameter | Description |
|---|---|
| *<VID-LIST>* | Specifies VLAN ID. |

### Usage

- Configure this command on uplink devices where MAC flush is required.
- A flush message clears stale MAC and ARP entries enabling fast traffic convergence.

### Examples

Configuring control VLAN to receive flush messages:

```
switch(config)# smartlink recv-control-vlan 2,3
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

# Group context commands

## description

```
description <DESC>
no description
```

### Description

Adds description to a Smartlink group.

The **no** form of this command removes a description from a Smartlink group.

| Parameter | Description |
|---|---|
| *<DESC>* | Specifies description for a Smartlink group. 1 to 64 printable ASCII characters are allowed. |

### Examples

Adding a description to a Smartlink group:

```
switch(config)# smartlink group 3
switch(config-smartlink-3)# Description for group 3
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | config-smartlink-*<GROUP>* | Administrators or local user group members with execution rights for this command. |

## diag-dump smartlink basic

```
diag-dump smartlink basic
```

### Description

Dumps the Smartlink configuration, state and statistics.

### Examples

Dump of Smartlink configuration, state, and statistics:

```
switch# diag-dump smartlink basic

```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## primary-port

```
primary-port <INTERFACE-NAME>
no primary-port
```

### Description

Configures primary port for a Smartlink group.

The **no** form of this command removes primary port from a Smartlink group.

| Parameter | Description |
|---|---|
| *<INTERFACE-NAME>* | Specifies interface for primary port. |

### Examples

Configuring primary port for a Smartlink group:

```
switch(config)# smartlink group 3
switch(config-smartlink-3)# primary-port 1/1/1
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | config-smartlink-*<GROUP>* | Administrators or local user group members with execution rights for this command. |

## smartlink group secondary-port

```
secondary-port <INTERFACE-NAME>
no secondary-port
```

### Description

Configures secondary port for a Smartlink group.

The **no** form of this command removes secondary port from a Smartlink group.

| Parameter | Description |
|---|---|
| *<INTERFACE-NAME>* | Specifies interface for secondary port. |

### Examples

Configuring secondary port for a Smartlink group:

```
switch(config)# smartlink group 3
switch(config-smartlink-3)# secondary-port 1/1/2
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-smartlink-<GROUP>` | Administrators or local user group members with execution rights for this command. |

## control-vlan

```
control-vlan <VLAN-ID>
no control-vlan <VLAN-ID>
```

### Description

Configures control VLAN in a Smartlink group.

The **no** form of this command removes control VLAN from a Smartlink group.

| Parameter | Description |
|---|---|
| *<VLAN-ID>* | Specifies VLAN ID for a Smartlink group. |

### Usage

- In a Smartlink group, the control VLAN is used to send flush messages.
- Control VLAN is configured on the device intended to send flush messages.
- Each Smartlink group must use a unique control VLAN.
- Control VLAN is protected in the Smartlink group to avoid loops.

### Examples

Configuring control VLAN in a Smartlink group:

```
switch(config)# smartlink group 3
switch(config-smartlink-3)# control-vlan 10
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-smartlink-<GROUP>` | Administrators or local user group members with execution rights for this command. |

## protected-vlans

```
protected-vlans <VLAN-ID-LIST>
no protected-vlans <VLAN-ID-LIST>
```

### Description

Specifies VLANs protected by a Smartlink group.

The **no** form of this command removes VLANs protected by a Smartlink group.

| Parameter | Description |
|---|---|
| *<VLAN-ID-LIST>* | Specifies list of VLAN IDs. Range is 1 to 4094. |

### Examples

Configuring protected VLANs for a Smartlink group.:

```
switch(config)# smartlink group 3
switch(config-smartlink-3)# protected-vlans 1, 10-50
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-smartlink-<GROUP>` | Administrators or local user group members with execution rights for this command. |

# preemption

```
preemption
no preemption
```

## Description

Configures preemption in a Smartlink group.

The **no** form of this command disables preemption in a Smartlink group.

## Usage

- If preemption is enabled, a recovered primary port preempts the active interface after the configured preemption delay.
- If preemption is disabled, a recovered primary port serves as a backup interface and does not forward traffic.

## Examples

Configuring preemption in a Smartlink group:

```
switch(config)# smartlink group 3
switch(config-smartlink-3)# preemption
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-smartlink-<GROUP>` | Administrators or local user group members with execution rights for this command. |

# preemption-delay

```
preemption-delay <SECONDS>
no preemption-delay
```

## Description

Specifies preemption delay for a Smartlink group.

The **no** form of this command removes previously configured preemption delay from a Smartlink group and sets it to the default of 1 second.

| Parameter | Description |
|---|---|
| *<SECONDS>* | Specifies preemption delay in seconds. Range is 0 to 300 seconds. |

### Usage

When preemption is enabled, a recovered primary port always preempts the active interface after the configured preemption delay.

### Examples

Configuring preemption delay on a Smartlink group:

```
switch(config)# smartlink group 3
switch(config-smartlink-3)# preemption
switch(config-smartlink-3)# preemption-delay 10
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | config-smartlink-*<GROUP>* | Administrators or local user group members with execution rights for this command. |

# Display commands

## show smartlink group

```
show smartlink group <GROUP-ID>
```

### Description

Shows information for a specific Smartlink group.

| Parameter | Description |
|---|---|
| *<GROUP-ID>* | Specifies Smartlink group ID. |

### Examples

Showing Smartlink group information:

```
switch# show smartlink group 1
Smartlink Group 1 Information:
=============================
Group description         : Uplink1
Protected VLANs           : 20-30
Control VLAN              : 10
Preemption                : ON
Preemption Delay          : 10
Ports  Role      State      Flush Count Last Flush Time
------ --------- ---------- ----------- -------------------------
1/1/1  Primary   Active     2           Sat Oct 17 19:09:10 2020
1/1/2  Secondary Backup     0
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

## Command History

| Release | Modification |

| 6300<br>6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

# show smartlink group all

```
show smartlink group all
```

## Description

Shows information for all configured Smartlink groups.

## Examples

Showing information for all configured Smartlink groups:

```
switch# show smartlink group all
Smartlink Group Information:
=============================
     Primary Secondary  Active  Backup   Ctrl      Preemption Preemption
Grp  Port    Port       Port    Port     Vlan                 Delay
---- ------- ---------  ------  -------  --------- ---------- ----------
1    1/1/1   1/1/2      1/1/1   1/1/2    10          OFF        1
2    1/1/5   1/1/6      1/1/5   1/1/6    11          OFF        1
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

### Command History

| Release | Modification |

| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show smartlink group detail

```
show smartlink group detail
```

### Description

Shows detailed information for all configured Smartlink groups.

### Examples

Showing detailed information for all configured Smartlink groups:

```
switch# show smartlink group detail
Smartlink Group 1 Information:
===============================
Protected VLAN                : 1-3
Control VLAN                  : 1
Preemption                    : OFF
Preemption Delay              : 1
Ports    Role         State        Flush Count  Last Flush Time
--------- ------------ ------------ ------------ ------------------------
1/3/1    Primary      Backup       0
1/3/2    Secondary    Active       0

Smartlink Group 2 Information:
===============================
Protected VLAN                : 4-6
Control VLAN                  : 4
Preemption                    : OFF
Preemption Delay              : 1
Ports    Role         State        Flush Count  Last Flush Time
--------- ------------ ------------ ------------ ------------------------
1/3/2    Primary      Active       0
1/3/1    Secondary    Backup       0
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

| 6300<br>6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

# show smartlink flush-statistics

```
show smartlink flush-statistics
```

## Description

Shows information for received flush messages.

## Usage

This command must be executed on an uplink or peer device configured with **recv-control-vlan**.

## Examples

Showing information for received flush messages:

```
switch# show smartlink flush-statistics
Last Flush Packet Detail:
========================

Flush Packets Received                      : 2
Last Flush Packet Received On Interface     : 1/1/1
Last Flush Packet Received On               : Sat Oct 17 19:09:10 2020
Device Id Of Last Flush Packet Received     : 5065f3-127080
Control VLAN Of Last Flush Packet Received  : 10
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## clear smartlink group statistics

```
clear smartlink group [<GROUP-ID>] statistics
```

### Description

Clears Smartlink statistics for the specified Smartlink group or all Smartlink groups.

| Parameter | Description |
|---|---|
| *<GROUP-ID>* | Specifies Smartlink group. |

### Examples

Clearing Smartlink statistics for a specified Smartlink group:

```
switch# clear smartlink group 1 statistics
```

Clearing all Smartlink statistics for all Smartlink groups:

```
switch(config)# clear smartlink group statistics
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## clear smartlink flush-statistics

```
clear smartlink flush-statistics
```

### Description

Clears Smartlink flush statistics.

## Usage

This command must be executed on the uplink device configured with **recv-control-vlan**.

## Examples

Clearing Smartlink flush statistics:

```
switch# clear smartlink flush-statistics
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

## Command History

| Release | Modification |
|---|---|

|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

# show running-config

```
show running-config
```

## Description

Shows current running configuration.

## Examples

Showing currently running configuration:

```
switch# configure terminal
switch(config)# smartlink group 1
switch(config-smartlink-1)# description Uplink1
switch(config-smartlink-1)# primary-port 1/1/1
switch(config-smartlink-1)# secondary-port 1/1/2
switch(config-smartlink-1)# control-vlan 10
switch(config-smartlink-1)# protected-vlans 20-30
switch(config-smartlink-1)# preemption
switch(config-smartlink-1)# preemption-delay 10
switch(config)# smartlink group 2
switch(config-smartlink-2)# primary-port 1/1/8
switch(config-smartlink-2)# secondary-port 1/1/9
switch(config-smartlink-2)# control-vlan 11
switch(config-smartlink-2)# protected-vlans 20-30
switch# show running-config
Current configuration:
```

```
!
!
!
smart-link group 1
  primary-port 1/1/1
  secondary-port 1/1/2
  control-vlan 10
  protected-vlans 20-30
  preemption
  preemption-delay 10
  exit
smart-link group 2
  primary-port 1/1/8
  secondary-port 1/1/9
  control-vlan 11
  protected-vlans 20-30
  exit
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

# Supportability commands

## show capacities smartlink

```
show capacities smartlink | show capacities-status smartlink
```

### Description

Shows Smartlink capacities or Smartlink capacities and status.

### Examples

Showing Smartlink capacities:

```
switch# show capacities smartlink

System Capacities: Filter SMARTLINK
Capacities Name
```

```
Value
----------------------------------------------------------------------------------
--
Maximum number of SMARTLINK GROUPS configurable in a system
24
```

Showing Smartlink capacities and status:

```
switch# show capacities-status smartlink

System Capacities Status: Filter SMARTLINK
Capacities Status Name                                                Value
Maximum
----------------------------------------------------------------------------------
--
Number of SMARTLINK GROUPS currently configured                           1
24
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

## Command History

| Release | Modification |

# Chapter 143

# SNMP commands

## event-trap-enable

```
event-trap-enable
no event-trap-enable
```

### Description

Enables the notification of events to be sent as traps to the SNMP management stations. It is enabled by default.

The **no** form of this command disables the event traps.

### Examples

Enabling the event traps:

```
switch(config)# event-trap-enable
```

Disabling the event traps:

```
switch(config)# no event-trap-enable
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## lldp trap enable

```
lldp trap enable
no lldp trap enable
```

### Description

Enables sending SNMP traps for LLDP related events from a particular interface. LLDP trap generation is enabled by default on all the interfaces and has to be disabled for interfaces on which traps are not required to be generated.

The **no** form of this command disables the LLDP trap generation.

LLDP trap generation is disabled by default at the global level and must be enabled before any LLDP traps are sent.

## Examples

Enabling LLDP trap generation on global level:

```
switch(config)# lldp trap enable
```

Enabling LLDP trap generation on interface level:

```
switch(config-if)# lldp trap enable
```

Disabling LLDP trap generation on global level:

```
switch(config)# no lldp trap enable
```

Disabling LLDP trap generation on interface level:

```
switch(config-if)# no lldp trap enable
```

Displaying LLDP global configuration:

```
switch# show lldp configuration

LLDP Global Configuration
=========================
LLDP Enabled                 : No

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` and `config-if` | Administrators or local user group members with execution rights for this command. |

## mac-notify traps

```
mac-notify traps {aged | learned | moved | removed}
no mac-notify traps {aged | learned | moved | removed}
```

### Description

Configures a Layer 2 or VXLAN interface to generate SNMP trap notifications for up to four different types of MAC address related events on the trunk or access in physical or lag interfaces.

MAC notification trap addition to or removal from an interface can be in any combination, quantity, or order. The addition of existing configured traps or removal of non-configured traps will be accepted and ignored.

The **mac-notify** feature must be enabled globally for any interface configurations to generate SNMP traps. Enabling **mac-notify traps** may impact the system performance on networks with a large number of mac-notify events.

The **no** form of this command removes the traps from the interface.

| Parameter | Description |
|---|---|
| `aged` | Notifies when a MAC address aged out on the interface. |
| `learned` | Notifies when a MAC address is learned on the interface. |
| `moved` | Notifies when a MAC address moved from the interface. |
| `removed` | Notifies when a MAC address is removed from the interface. |

MAC notification cannot be configured on a Layer 3 (routing) interface. A Layer 2 interface that is changed to a Layer 3 interface through the `routing` command will discard any existing MAC notification configurations.

When MACs are learned on VXLAN tunnels or **port-access port-security** enabled ports, the move scenario is handled by the EVPN/port-access feature respectively. It performs the move by deleting the MAC from the old port and installing it on the new port. In this scenario, MAC trap notifications, if enabled, will reflect that by producing **removed** and **learned** notifications.

### Usage

- MAC notify trap will not generate for static MACs.
- **vsx-sync** is not supported. You must enable the MAC notify traps explicitly on secondary to ensure the traps are generated.
- For EVPN MAC move between the following interfaces, the respective event types are produced (not always removed or learned)
  - Port to port: **moved**
  - Port to tunnel: **removed/learned**
  - Tunnel to port: **removed/learned**
  - Tunnel to Tunnel: **moved**

### Examples

MAC notification types and the associated events only apply to Layer 2 and VXLAN interfaces, hence routing might need to be disabled on the relevant interfaces.

Enable MAC notification traps within the SNMP module at a global level:

```
switch(config)# snmp-server trap

 aaa-server-reachability-status  Enable SNMP trap for AAA server reachability
status
 configuration-changes           Enable configuration changes traps
 cpu-utilization                 Enable high CPU utilization traps
 link-status                     Enable link status traps for all physical
interfaces
 mac-notify                      Enable MAC table change notification traps
 memory-utilization              Enable high memory utilization traps
 module                          Enable module event traps
 port-security                   Enable port-security violation traps.
                                  (Default: enable)
 rmon-events                     Enable RMON event traps
 snmp                            Enable snmp traps
```

For more information, see snmp-server trap mac-notify.

Enabling the traps on an L2 interface:

```
switch(config)# interface 1/1/1
switch(config-if)# mac-notify traps learned
1/1/1 is not an L2 interface or tunnel
switch(config-if)# no routing
switch(config-if)# mac-notify traps learned removed
switch(config-if)# mac-notify traps moved
switch(config-if)# mac-notify traps aged
```

```
switch(config)# interface vxlan 1
switch(config-vxlan-if)# mac-notify traps learned removed
```

```
switch(config)# interface lag101
switch(config-if)# mac-notify traps removed
```

Disabling the `learned` and `removed` traps from the interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# no mac-notify traps learned removed
```

```
switch(config)# interface vxlan 1
switch(config-vxlan-if)# no mac-notify traps learned removed
```

Enable sending SNMP notifications for MAC table changes:

```
switch(config-vxlan-if)# mac-notify traps
  aged             Notify when a MAC address aged out on the interface
  learned          Notify when a MAC address was learned on the interface
  moved            Notify when a MAC address moved from the interface
  removed          Notify when a MAC address was removed from the interface
switch(config-vxlan-if)# mac-notify traps learned aged removed moved
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.13.1000 | Support for SNMP MAC notify traps on VXLAN tunnels. |
| 10.10 | Support for port access features with mac-notify added. |
| 10.08 | Command introduced. |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|

Operators can execute this command from the operator context (>) only.<br>Auditors or Administrators or local user group members with execution rights for this command. Auditors can execute this command from the auditor context (auditor>) only. |

## rmon alarm

```
rmon alarm index <INDEX> snmp-oid <SNMP-OID> rising-threshold <RISING-THRESHOLD>
     falling-threshold <FALLING-THRESHOLD> [sample-interval <SAMPLE-INTERVAL>] [sample-
type <ABSOLUTE|DELTA>]
no rmon alarm [index <INDEX>]
```

### Description

Stores configuration entries in an alarm table that defines the sample interval, sample-type, and threshold parameters for an SNMP MIB object. Only the SNMP MIB objects that resolve to an ASN.1

primitive type of INTEGER (INTEGER, Integer32, Counter32, Counter64, Gauge32, or TimeTicks) will be monitored.

The **no** form of this command removes all RMON alarms and allows you to specify an index to remove a particular RMON alarm.

| Parameter | Description |
|---|---|
| `index <INDEX>` | Specifies the RMON alarm index. Range: 1 to 20. |
| `snmp-oid <SNMP-OID>` | Specifies the SNMP MIB object to be monitored by RMON. |
| `rising-threshold <RISING-THRESHOLD>` | Specifies the upper threshold value for the RMON alarm. |
| `falling-threshold <FALLING-THRESHOLD>` | Specifies the falling threshold value for the RMON alarm. The falling threshold must be less than the rising threshold. |
| `sample-interval  <SAMPLE-INTERVAL>` | Sample interval in seconds. Default: 30. |
| `sample-type <ABSOLUTE\|DELTA>` | Specifies the method of sampling of the SNMP MIB object. Default: Absolute. |

### Examples

Configuring RMON for the MIB object **ifOutErrors.15** with an index **1**, rising threshold of **2147483647** and falling threshold of **-2134** using **absolute** sampling for a sample interval of **100** seconds:

```
switch(config)# rmon alarm index 1 snmp-oid ifOutErrors.15 rising-threshold
2147483647
     falling-threshold -2134 sample-type absolute sample-interval 100
```

Removing RMON alarm with the index 5:

```
switch(config)# no rmon alarm index 5
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

# rmon alarm {enable | disable} {index | all}

```
rmon alarm {enable | disable} {index <INDEX> | all}
no rmon alarm [enable | disable] [index <INDEX> | all]
```

## Description

Enables and disables the RMON alarm and its index. RMON alarm is enabled by default.

| Parameter | Description |
|---|---|
| `enable` | Enables the RMON alarm index |
| `disable` | Disables the RMON alarm index. |
| `index <INDEX>` | Specifies the RMON alarm index. Range: 1 to 20. |
| `all` | Specifies all the RMON alarms. |

## Examples

Enabling or disabling all the RMON alarm:

```
switch(config)# rmon alarm enable all
switch(config)# rmon alarm disable all
```

Enabling or disabling RMON alarm by index:

```
switch(config)# rmon alarm enable index 1
switch(config)# rmon alarm disable index 1
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

## Command History

| Release | Modification |

| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

# show configuration-changes trap

```
show configuration-changes trap
```

## Description

Shows the SNMP configuration changes trap settings.

### Example

Showing the SNMP configuration changes trap:

~~~~
switch# show configuration-changes trap

SNMP Configuration changes trap : Enabled
```
~~~~

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

### Command History

| Release | Modification |

| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show mac-notify

`show mac-notify`

### Description

Displays whether the MAC notification feature in the SNMP module is enabled or not. It also displays the trap notification types configured on the Layer 2 ports in the system.

### Examples

Showing the MAC notification configuration on all configured ports in the system:

```
switch# show mac-notify

MAC notification global setting : Enabled

Port          Enabled Traps
---------------------------------------
1/1/1         aged learned moved
1/1/5         moved
lag101        removed
lag104        aged learned moved removed
...
...
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.08 | Command introduced |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show mac-notify port

```
show mac-notify [port <PORTS>]
```

### Description

Displays the MAC notification configuration on a range of ports.

| Parameter | Description |
|---|---|
| `[port <PORTS>]` | Specifies a port, range of ports, or list of ports. |

### Examples

Showing the MAC notification configuration on a range of ports:

```
switch(config)# show mac-notify port 1/1/1,1/1/3,1/1/5,lag101-lag104

MAC notification global Setting: Enabled

Port         Enabled Traps
---------------------------------------
1/1/1        aged learned moved
1/1/3        --
1/1/5        moved
lag101       removed
lag102       --
lag103       --
lag104       aged learned moved removed
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.08 | Command introduced |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show rmon alarm

`show rmon alarm [index <INDEX>]`

### Description

Displays the RMON alarm configurations.

| Parameter | Description |
|---|---|
| `index <INDEX>` | Specifies the RMON alarm index. Range: 1 to 20. |

### Examples

Showing all RMON alarm configurations:

```
switch# show rmon alarm
Index                : 1
Enabled              : true
Status               : valid
MIB object           : ifOutErrors.15
Sample type          : delta
Sampling interval    : 6535 seconds
Rising threshold     : 100
Falling threshold    : 10
Last sampled value   : 0
Last sample time     : 2020-09-21 05:58:11

Index                : 3
Enabled              : true
Status               : invalid
MIB object           : IF-MIB::ifDescr.19
Sample type          : absolute
Sampling interval    : 10000 seconds
Rising threshold     : 4000
Falling threshold    : 10
Last sampled value   : 0
```

Showing RMON alarm with alarm index 1:

```
switch# show rmon alarm index 1
Index                : 1
Enabled              : true
```

```
Status               : valid
MIB object           : ifOutErrors.15
Sample type          : delta
Sampling interval    : 6535 seconds
Rising threshold     : 100
Falling threshold    : 10
Last sampled value   : 0
Last sample time     : 2020-06-21 05:58:11
```

Showing disabled RMON alarm information:

```
switch# show  rmon   alarm
Index                : 1
Enabled              : false
Status               : valid
MIB object           : ifOutErrors.15
Sample type          : delta
Sampling interval    : 6535 seconds
Rising threshold     : 100
Falling threshold    : 10
Last sampled value   : 0
Last sample time     : 2020-09-21 05:58:11

Index                : 3
Enabled              : false
Status               : invalid
MIB object           : IF-MIB::ifDescr.19
Sample type          : absolute
Sampling interval    : 10000 seconds
Rising threshold     : 4000
Falling threshold    : 10
Last sampled value   : 0
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## show snmp agent-port

`show snmp agent-port`

### Description

Displays SNMP agent UDP port number.

### Example

Displaying SNMP agent UDP port number:

```
switch# show snmp agent-port
SNMP agent port : 161
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show snmp community

```
show snmp community
```

### Description

Displays a list of all configured SNMPv1/v2c communities.

### Usage

When a user creates a custom community before enabling an SNMP agent, AOS-CX automatically removes the default **public** community from the system.

### Example

Displaying a list of all configured SNMPv1/v2c communities:

```
switch#show snmp community

SNMP-COMMUNITIES

-------------------------------------------------------------------
Community          Access-level  ACL Name   ACL Type   View
-------------------------------------------------------------------
private            ro            my_acl     ipv4       view1
private            ro            my_acl     ipv6       none
private2           rw            new_Acl    ipv6       view2
private3           rw            none       none       none
```

When the switch is configured to use SNMPv3 only, the output of the **show snmp community** command displays the message **SNMP v1/v2c is disabled while snmpv3-only mode is configured**:

```
switch# show snmp community
----------------------------------------------------------------------------------
--------
Community                       Access-level ACL Name                  ACL Type
View
----------------------------------------------------------------------------------
--------
SNMP v1/v2c is disabled while snmpv3-only mode is configured
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.14 | The output of this command now displays an error message when the switch is in SNMPv3-only mode. |
| 10.10 | Output has been updated with SNMP view details. A *View* column is added to the command output. |
| 10.08 | Added *ACL Type* column to the command output. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (#) | Administrators or local user group members with execution rights for this command. |

## show snmp system

```
show snmp system
```

### Description

Displays SNMP description, location, and contact information.

### Example

Displaying SNMP description, location, and contact information:

```
switch# show snmp system
SNMP system information
----------------------------
System description : Aggregation router
System location : Main lab
System contact : John Smith, Lab Admin
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show snmp trap

```
show snmp trap
```

### Description

Displays all configured SNMP traps/informs receivers.

### Example

Displaying all configured SNMP trap and informs receivers:

```
switch# show snmp trap
```

```
HOST           PORT  TYPE   VER COMMUNITY/USER NAME VRF        NOTIFICATION TYPES
---------------------------------------------------------------------------------
-
10.10.10.10    162   trap   v1  public              default    bgp
10.10.10.10    162   inform v2c public              default    bgp, ospf, fan,
mstp
10.10.10.10    162   inform v3  name                default
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.14 | Updated the example output. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show snmp views

```
show snmp views
```

### Description

Displays the list of all the configured SNMP views.

### Usage

The following table contains the status and its description of the configured SNMP views:

| Status | Description |
|---|---|
| **pending_validation** | Default value that indicates SNMP view is yet to be validated. |
| **operational** | OID and mask validated. |
| **invalid** | Invalid OID/mask. |
| **failed** | Validation failed for reasons other than OID/mask. |

### Examples

Displaying the list of all the configured SNMP views:

```
switch# show snmp views
-------------------------------------------------------
SNMP MIB Views
-------------------------------------------------------
View     : new
OID Tree: sysUpTime.0
Mask     : ff
Type     : included
Status   : pending_validation

View     : admin
OID Tree: ifIndex.1
Mask     : ff:a0
Type     : included
Status   : operational

View     : user
OID Tree: sysb
Mask     : none
Type     : excluded
Status   : invalid

View     : admin
OID Tree: .1.3.6.1.2.1.1
Mask     : none
```

```
Type     : excluded
Status   : operational
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.10 | Command introduced |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show snmp vrf

```
show snmp vrf
```

### Description

Displays the VRF on which the SNMP agent service is running.

### Example

Displaying SNMP services enabled on VRF:

```
switch#show snmp vrf
SNMP enabled VRF
----------------------------
mgmt
default
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

# show snmpv3 context

```
show snmpv3 context
```

## Description

Displays all configured SNMP contexts.

## Examples

Displaying all configured SNMP contexts:

```
switch# show snmpv3 context
--------------------------------------------------------------------------
name                            vrf                             community
--------------------------------------------------------------------------
contextA                        default                         private
contextB                        vrf_A                           public

switch#
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

# show snmpv3 engine-id

```
show snmpv3 engine-id
```

### Description

Displays the configured SNMPv3 snmp engine-id.

If the SNMPv3 engine-id is not configured, by default a unique engine-id is created by the switch using a combination of the enterprise OID value and the switch's mac address.

### Example

Displaying the configured SNMPv3 engine-id:

```
switch# show snmpv3 engine-id
SNMP engine-id : 80:00:B8:5C:08:00:09:1d:de:a5
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

### Command History

| Release | Modification |

|---|---|---|
| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show snmpv3 security-level

```
show snmpv3 security-level
```

### Description

Displays the configured SNMPv3 security level.

### Examples

Displaying the configured SNMPv3 security level:

```
switch# show snmpv3 security-level
SNMPv3 security-level : auth
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

### Command History

| Release | Modification |

# show snmpv3 users

`show snmpv3 users`

## Description

Displays all configured SNMPv3 users.

For more details on the user enabled status, see **snmpv3 security-level**.

## Example

Displaying all configured SNMPv3 users:

```
switch# show snmpv3 users
------------------------------------------------------------------------
User        AuthMode  PrivMode  Status   Context    Access-level  View
------------------------------------------------------------------------
name        md5       none      Enabled  context2   ro            view1
                                         context1
                                         context3
name2       none      none      Disabled none       ro            view2
name3       none      none      Disabled none       ro            none
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

## Command History

# snmp-server agent-port

```
snmp-server agent-port <PORT>
no snmp-server agent-port [<PORT>]
```

## Description

Sets the UDP port number that the SNMP master agent uses to communicate. UDP port 161 is the default port.

The **no** form of this command sets the SNMP master agent port to the default value.

| Parameter | Description |
|---|---|
| *<PORT>* | Specifies the UDP port number that the SNMP master agent will use. Range: 1 to 65535. Default: 161. |

## Examples

Setting the SNMP master agent port to **2000**:

```
switch(config)# snmp-server agent-port 2000
```

Resetting the SNMP master agent port to the default value:

```
switch(config-schedule)# no snmp-server agent-port 2000
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |

| All platforms | config | Administrators or local user group members with execution rights for this command. |

# snmp-server community

```
snmp-server community <STRING>
```

```
no snmp-server community <STRING>
```

## Description

Adds an SNMPv1/SNMPv2c community string. A community string is like a password that controls read/write access to the SNMP agent. A network management program must supply this name when attempting to get SNMP information from the switch. A maximum of 10 community strings are supported. Once you create your own community string, the default community string (`public`) is deleted.

The **no** form of this command removes the specified SNMPv1/SNMPv2c community string. When no community string exists, a default community string with the value **public** is automatically defined.

| Parameter | Description |
|---|---|
| *<STRING>* | Specifies the SNMPv1/SNMPv2c community string. Range: 1 to 32 printable ASCII characters, excluding space and question mark. |

## Subcommands

```
access-level {ro | rw}
no access-level {ro | rw}
```

This subcommand changes the access level of the SNMP community. The default access level is read-only (**ro**).

The **no** form of this subcommand changes the access level of the community to default.

| Parameter | Description |
|---|---|
| `ro` | Specifies Read-Only access with the SNMP community. |
| `rw` | Specifies Read-Write access with the SNMP community. |

```
access-list {ip | ipv6} <ACL-NAME>
no access-list {ip | ipv6} <ACL-NAME>
```

This subcommand associates an ACL with the SNMP community. If an ACL is not associated with the SNMP community, the default access is allowed for all the hosts.

The **no** form of this subcommand removes association of the ACL with the SNMP community.

| Parameter | Description |
|---|---|
| `ip` | Specifies the IPv4 ACL type. |
| `ipv6` | Specifies the IPv6 ACL type. |
| *<ACL-NAME>* | Specifies the ACL name. It supports a maximum of 64 characters. |

## Examples

Setting the SNMPv1/SNMPv2c community string to **private**:

```
switch(config)# snmp-server community private
```

Removing SNMPv1/SNMPv2c community string **private**:

```
switch(config)# no snmp-server community private
```

Configuring the access level for the SMNP community to read-only:

```
switch(config-community)# access-level ro
```

Changing the access level of the SNMP community to default:

```
switch(config-community)# no access-level rw
```

Associating an IPv4 ACL named **my_acl** with the SMNP community:

```
switch(config-community)# access-list ip my_acl
```

Removing the associated IPv4 ACL named **my_acl** from the SNMP community:

```
switch(config-community)# no access-list ip my_acl
```

The `deny` rule is not supported for SNMP ACL.

Configuration supported for SNMP ACL:

```
access-list ip ipv4_acl
    10 permit any 4.4.4.4 4.4.4.1
    20 permit any 3.3.3.3 3.3.3.1
access-list ipv6 ipv6_acl
    10 permit any 2001::2 2001::1
    20 permit any 3001::2 3001::1
snmp-server vrf default
snmp-server community my_comm_1
    access-list ip ipv4_acl
    access-list ipv6 ipv6_acl
```

Configuration not supported for SNMP ACL:

```
access-list ip ipv4_acl
    10 deny any 6.6.6.6 6.6.6.1
access-list ipv6 ipv6_acl
    10 deny any 6001::6 6000::1
snmp-server vrf default
snmp-server community my_comm_1
    access-list ip ipv4_acl
    access-list ipv6 ipv6_acl
```

**hitcounts** for SNMP ACL will not be incremented.
**Example:show access-list hitcounts ip all** will not show the hit count of SNMP ACL.

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.14 | Replaced the **ipv4** parameter with the **ip** parameter. The **ipv4** parameter is deprecated. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config`<br>`config-community` | Administrators or local user group members with execution rights for this command. |

## snmp-server community view

```
snmp-server community <STRING> [view <VIEW-NAME>]
no snmp-server community <STRING> [view <VIEW-NAME>]
```

### Description

Associates an SNMP MIB view with the SNMP community.

The **no** form of this command removes the associated SNMP MIB view from the SNMP community.

| Parameter | Description |
|---|---|
| *<STRING>* | Specifies the SNMPv1/SNMPv2c community string. Range: 1 to 32 printable ASCII characters, excluding space and question mark. |
| *<VIEW-NAME>* | Specifies the view name for the SNMP MIB view. Accepts a maximum of 32 characters. |

### Examples

Configuring the SNMPv1/SNMPv2c community:

```
switch(config)# snmp-server community my_community
switch(config-community)#
```

Adding SNMP MIB view to the SNMP community:

```
switch(config-community)# view name1
```

Removing SNMP MIB view from the SNMP community:

```
switch(config-community)# no view name1
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.10 | Command introduced |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config`<br>`config-community` | Administrators or local user group members with execution rights for this command. |

## snmp-server historical-counters-monitor

```
snmp-server historical-counters-monitor
no snmp-server historical-counters-monitor
```

### Description

Enables the Remote Network Monitoring agent (**rmond**) to start collecting historical interface statistics. The **no** form of this command stops the historical interface statistics collection.

### Example

Enabling the `rmond` agent to start historical interface statistics collection:

```
switch(config)# snmp-server historical-counters-monitor
```

Disabling the `rmond` agent to stop historical interface statistics collection:

```
switch(config)# no snmp-server historical-counters-monitor
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

# snmp-server response-source

```
snmp-server response-source {interface <IF-NAME> | <IPv4-ADDRESS> | <IPv6-ADDRESS>} [vrf
<VRF-NAME>]
no snmp-server response-source {interface <IF-NAME | <IPv4-ADDRESS> | <IPv6-ADDRESS>}
[vrf <VRF-NAME>]
```

## Description

Configures the source interface or IP address for sending SNMP responses. Each SNMP can independently have its own unique response source IP address.

The **no** form of this command removes the source interface name or IP address for sending SNMP responses.

- It is recommended to use the loopback interface or ip address of the loopback interface as the response source. If a device does not support a loopback interface, then configure SVI interface or SVI IP address as the response source.
- The active gateway IP address cannot be configured as the response source.
- It is recommended to limit the maximum number of response source to five.
- The interface used for the response source should be in the up state. If the interface is down, the default source IP will be used.
- The use of **udp6** is mandatory for IPv6 SNMP operations. For example, you can use the following syntax: **snmpwalk -v2c -c public -m ALL udp6:[2100::2] .1.3.6.1.2.1.1**.

| Parameter | Description |
|---|---|
| `interface <IF-NAME>` | Specifies the source interface name. The interface can be a physical interface, loopback interface, or VLAN interface. |
| `<IPv4-ADDRESS>` | Specifies  the IPv4 address of the source interface for the SNMP response. |
| `<IPv6-ADDRESS>` | Specifies  the IPv6 address of the source interface for the SNMP response. |
| `vrf <VRF-NAME>` | Specifies the VRF name associated to the source interface for the SNMP response. |

## Examples

Configuring a response source for the interface **1/1/12**:

```
switch(config)# snmp-server response-source interface 1/1/12 vrf red
```

Configuring a response source for interface **loopback10**:

```
switch(config)# snmp-server response-source interface loopback10 vrf red
```

Configuring a response source for the IPv4 address **10.0.0.1**:

```
switch(config)# snmp-server response-source 10.0.0.1 vrf sample
```

Configuring a response source for the IPv6 address **2001::1**:

```
switch(config)# snmp-server response-source 2001::1 vrf default
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.13 | Added support for IPv6 address. |
| 10.10 | Command introduced. |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## snmp-server snmpv3-only

```
snmp-server snmpv3-only
no snmp-server snmpv3-only
```

### Description

Accepts SNMPv3 messages only, SNMPv1 and SNMPv2c will be disabled. By default SNMPv1, SNMPv2c and SNMPv3 will all be enabled.

The **no** form of this command restores the default setting and reenables SNMPv1 and SNMPv2c .

### Examples

Configuring SNMPv3 messages only, and disabling SNMPv1 and SNMPv2c:

```
switch(config)# snmp-server snmpv3-only
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

### Command History

| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## snmp-server host

```
snmp-server host <IPv4-ADDR | IPv6-ADDR> trap version <VERSION> [community <STRING>]
[port <UDP-PORT>] [<VRF-NAME>] [notification-type <NOTIFICATION-TYPE>]
no snmp-server host <IPv4-ADDR | IPv6-ADDR> trap version <VERSION> [community <STRING>]
[port <UDP-PORT>] [<VRF-NAME>] [notification-type <NOTIFICATION-TYPE>]

snmp-server host <IPv4-ADDR | IPv6-ADDR> inform version v2c [community <STRING>]
[port <UDP-PORT>] [<VRF-NAME>] [notification-type <NOTIFICATION-TYPE>]
no snmp-server host <IPv4-ADDR | IPv6-ADDR> inform version v2c [community <STRING>]
[port <UDP-PORT>] [<VRF-NAME>] [notification-type <NOTIFICATION-TYPE>]

snmp-server host <IPv4-ADDR | IPv6-ADDR> [trap version v3 | inform version v3] user
<NAME> [port <UDP-PORT>] [<VRF-NAME>] [notification-type <NOTIFICATION-TYPE>]
no snmp-server host <IPv4-ADDR | IPv6-ADDR> [trap version v3 | inform version v3] user
<NAME> [port <UDP-PORT>] [<VRF-NAME>] [notification-type <NOTIFICATION-TYPE>]
```

### Description

Configures a trap/informs receiver to which the SNMP agent can send SNMP v1/v2c/v3 traps or v2c informs. A maximum of 30 SNMP traps/informs receivers can be configured.

The **no** form of this command removes the specified trap/inform receiver.

| Parameter | Description |
|---|---|
| `<IPv4-ADDR>` | Specifies the IP address of a trap receiver in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. You can remove leading zeros. For example, the address **192.169.005.100** becomes **192.168.5.100**. |
| `<IPv6-ADDR>` | Specifies the IP address of a trap receiver in IPv6 format (**x:x::x:x**). |
| `trap version <VERSION>` | Specifies the trap notification type for SNMPv1, v2c or v3. Available options are: **v1**, **v2c** or **v3**. |
| `inform version v2c` | Specifies the inform notification type for SNMPv2c. |
| `trap version v3` | Specifies the trap notification type for SNMPv3. |
| `user <NAME>` | Specifies the SNMPv3 user name to be used in the SNMP trap notifications. |
| `community <STRING>` | Specifies the name of the community string to use when |

| Parameter | Description |
|---|---|
| | sending trap notifications. Range: 1 - 32 printable ASCII characters, excluding space and question mark. Default: **public**. |
| *<UDP-PORT>* | Specifies the UDP port on which notifications are sent. Range: 1 - 65535. Default: 162. |
| *<VRF-NAME>* | Specifies the VRF on which the SNMP agent listens for incoming requests. |
| *<notification-type>* | Specifies the type of notification to be sent to the trap receiver. If no type is specified, all notifications are sent.<br>The supported notification types are:<br>■ aaa-server<br>■ alarm<br>■ bgp<br>■ card<br>■ config<br>■ entity<br>■ fan<br>■ interface<br>■ lldp<br>■ loop-protect<br>■ mac-notify<br>■ mstp<br>■ mvrp<br>■ ospf<br>■ ospfv3<br>■ port-security<br>■ power<br>■ power-ethernet<br>■ rmon<br>■ rpvst<br>■ stp<br>■ temperature<br>■ vrrp<br>■ vsf<br>■ vsx |

## Examples

```
switch(config)# snmp-server host 10.10.10.10 trap version v1
switch(config)# no snmp-server host 10.10.10.10 trap version v1
switch(config)# snmp-server host a:b::c:d trap version v1
switch(config)# no snmp-server host a:b::c:d trap version v1
switch(config)# snmp-server host 10.10.10.10 trap version v2c community public
switch(config)# no snmp-server host 10.10.10.10 trap version v2c community public
switch(config)# snmp-server host a:b::c:d trap version v2c community public
switch(config)# no snmp-server host a:b::c:d trap version v2c community public
switch(config)# snmp-server host 10.10.10.10 trap version v2c community public
port 5000
switch(config)# no snmp-server host 10.10.10.10 trap version v2c community public
port 5000
switch(config)# snmp-server host 10.10.10.10 trap version v2c community public
```

```
port 5000 vrf default
switch(config)# no snmp-server host 10.10.10.10 trap version v2c community public
port 5000 vrf default
switch(config)# snmp-server host a:b::c:d trap version v2c community public port
5000
switch(config)# no snmp-server host a:b::c:d trap version v2c community public
port 5000
switch(config)# snmp-server host 10.10.10.10 inform version v2c community public
switch(config)# no snmp-server host 10.10.10.10 inform version v2c community
public
switch(config)# snmp-server host a:b::c:d inform version v2c community public
switch(config)# no snmp-server host a:b::c:d inform version v2c community public
switch(config)# snmp-server host 10.10.10.10 inform version v2c community public
port 5000
switch(config)# no snmp-server host 10.10.10.10 inform version v2c community
public port 5000
switch(config)# snmp-server host 10.10.10.10 inform version v2c community public
port 5000 vrf default
switch(config)# no snmp-server host 10.10.10.10 inform version v2c community
public port 5000 vrf default
switch(config)# snmp-server host a:b::c:d inform version v2c community public port
5000
switch(config)# no snmp-server host a:b::c:d inform version v2c community public
port 5000
switch(config)# snmp-server host 10.10.10.10 trap version v3 user Admin
switch(config)# no snmp-server host 10.10.10.10 trap version v3 user Admin
switch(config)# snmp-server host a:b::c:d trap version v3 user Admin
switch(config)# no snmp-server host a:b::c:d trap version v3 user Admin
switch(config)# snmp-server host 10.10.10.10 trap version v3 user Admin port 2000
switch(config)# no snmp-server host 10.10.10.10 trap version v3 user Admin port
2000
switch(config)# snmp-server host a:b::c:d trap version v3 user Admin port 2000
switch(config)# no snmp-server host a:b::c:d trap version v3 user Admin port 2000
```

SNMP trap notification type examples:

```
switch(config)# snmp-server host 10.10.10.10 trap version v2c community public
notification-type bgp fan interface power entity
switch(config)# no snmp-server host 10.10.10.10 trap version v2c community public
notification-type bgp
switch(config)# snmp-server host a:b::c:d inform version v3 user Admin
notification-type bgp fan interface power-ethernet
switch(config)# no snmp-server host a:b::c:d inform version v3 user Admin
notification-type bgp interface
switch(config)# snmp-server host a:b::c:d inform version v3 user Admin
notification-type ?
  aaa-server      Sends AAA notifications.
  alarm           Sends Alarm notifications.
  bgp             Sends Border Gateway Protocol (BGP) state change notifications.
  card            Sends Card notifications.
  config          Sends Configuration change notifications.
  entity          Sends Entity notifications.
  fan             Sends Fan notifications.
  interface       Sends Interface notifications.
  lldp            Sends Link Layer Discovery Protocol (LLDP) notifications.
  loop-protect    Sends Loop Protect notifications.
  mac-notify      Sends MAC Notify notifications.
  mstp            Sends Multiple Spanning Tree Protocol (MSTP) notifications.
  mvrp            Sends Multiple VLAN Registration Protocol (MVRP) notifications.
  ospf            Sends Open Shortest Path First (OSPFv2) notifications.
  ospfv3          Sends Open Shortest Path First version 3 (OSPFv3) notifications.
  port-security   Sends Port Security notifications.
  power           Sends Power notifications.
  power-ethernet  Sends Power over Ethernet (PoE) notifications.
  rmon            Sends Remote Network Monitoring (RMON) notifications.
  rpvst           Sends Rapid Per VLAN Spanning Tree (RPVST) notifications.
  snmp            Sends Sends Simple Network Management Protocol (SNMP)
notifications.
  stp             Sends Spanning Tree Protocol (STP) notifications.
  temperature     Sends Temperature notifications.
  vrrp            Sends Virtual Router Redundancy Protocol (VRRP) notifications.
  vsf             Sends Virtual Switching Framework (VSF) notifications.
  vsx             Sends Virtual System Extension (VSX) notifications.
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## snmp-server system-contact

```
snmp-server system-contact <INFO>
no snmp-server system-contact [<INFO>]
```

### Description

Sets SNMP contact information.

The **no** form of this command removes the SNMP contact information.

| Parameter | Description |
|---|---|
| *<INFO>* | Specifies SNMP contact information. Range: 1 to 128 printable ASCII characters, except for question mark (?). |

### Examples

Defines SNMP contact information to be **John Smith, Lab Admin**:

```
switch(config)# snmp-server system-contact John Smith, Lab Admin
```

Removes SNMP contact information:

```
switch(config)# no snmp-server system-contact
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## snmp-server system-description

```
snmp-server system-description <DESCRIPTION>
no snmp-server system-description
```

### Description

Sets the SNMP system description.

The **no** form of this command removes the SNMP system description.

| Parameter | Description |
|---|---|
| *<DESCRIPTION>* | Specifies the SNMP system description. Typical content to include would be the full name and version of the following:<br>▪ Hardware type of the system<br>▪ Software operating system<br>▪ Networking software<br>Range: 1 to 64 printable ASCII characters, except for the question mark (?). |

### Examples

Defines the SNMP system description to be **mainSwitch**:

```
switch(config)# snmp-server system-description mainSwitch
```

Removes the SNMP system description:

```
switch(config)# no snmp-server system-description mainSwitch
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

## snmp-server system-location

```
snmp-server system-location <INFO>
no snmp-server system-location
```

### Description

Sets the SNMP location information.

The **no** form of this command removes the SNMP location information.

| Parameter | Description |
|---|---|
| *<INFO>* | Specifies the SNMP location information. Range: 1 to 128 printable ASCII characters, except for the question mark (?). |

### Examples

Defines the SNMP location information to be **Main Lab**:

```
switch(config)# snmp-server system-location Main Lab
```

Removes the SNMP location information:

```
switch(config)# no snmp-server system-location
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

# snmp-server trap

```
snmp-server trap {cpu-utilization | memory-utilization | rmon-events}
no snmp-server trap {cpu-utilization | memory-utilization | rmon-events}
```

## Description

Enables the SNMP traps. The SNMP traps are enabled by default.

The **no** form of this command disables the SNMP traps.

| Parameter | Description |
|---|---|
| `cpu-utilization` | Enables the CPU utilization traps. |
| `memory-utilization` | Enables the memory utilization traps. |
| `rmon-events` | Enables the RMON event traps. |

## Examples

Enabling the SNMP traps:

```
switch(config)# snmp-server trap cpu-utilization
switch(config)# snmp-server trap memory-utilization
switch(config)# snmp-server trap rmon-events
```

Disabling the SNMP traps:

```
switch(config)# no snmp-server trap cpu-utilization
switch(config)# no snmp-server trap memory-utilization
switch(config)# no snmp-server trap rmon-events
```

Displaying the SNMP trap configuration:

```
switch(config)# show running-config all | inc snmp
snmp-server trap rmon-events
snmp-server trap cpu-utilization
snmp-server trap memory-utilization
```

Displaying CPU and Memory usage:

```
switch(config)# show system
Hostname           : XXXX
System Description : XX.10.07.0001CI
System Contact     :
```

```
System Location    :
Vendor             : Aruba
Product Name       : JLXXXX XXXX Base Chassis/3xFT/18xFans/Cbl Mgr/X462 Bundle
Chassis Serial Nbr : SG6ZOO9068
Base MAC Address   : f40343-806400
AOS-CX Version : XX.10.07.0001CI
Time Zone          : UTC
Up Time            : 8 minutes
CPU Util (%)       : 1
Memory Usage (%)   : 10
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## snmp-server trap aaa-server-reachability-status

```
snmp-server trap aaa-server-reachability-status
no snmp-server trap aaa-server-reachability-status
```

### Description

Enables the SNMP trap for AAA server status. When enabled, traps are sent whenever AAA server (RADIUS, TACACS) status changes from reachable to unreachable and vice versa.

The **no** form of this command disables sending SNMP trap for AAA server status.

### Examples

Enabling the SNMP trap for AAA server status:

```
switch(config)# snmp-server trap aaa-server-reachability-status
```

Disabling the SNMP trap for AAA server status:

```
switch(config)# no snmp-server trap aaa-server-reachability-status
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.09 | Command introduced on 6200, 6300 and 6400 |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## snmp-server trap configuration-changes

```
snmp-server trap configuration-changes
no snmp-server trap configuration-changes
```

### Description

Enables sending SNMP traps whenever the configuration changes. Configuration trap generation is disabled by default.

The **no** form of this command disables sending SNMP traps for configuration changes.

| Parameter | Description |
|---|---|
| `configuration-changes` | Specifies SNMP traps for configuration changes. |

### Examples

Enabling the SNMP traps for configuration changes:

```
switch(config)# snmp-server trap configuration-changes
```

Disabling the SNMP traps for configuration changes:

```
switch(config)# no snmp-server trap configuration-changes
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.10 | Command introduced |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

# snmp-server trap mac-notify

```
snmp-server trap mac-notify
no snmp-server trap mac-notify
```

### Description

Enables the MAC notification traps within the SNMP module at a global level. When enabled, traps are sent for interfaces that are configured for MAC notification events.

The **no** form of this command disables sending MAC notification traps at a global level. When disabled, existing **mac-notify** interface configuration is preserved but MAC notification events on configured interfaces will not cause SNMP traps to be transmitted.

### Examples

Enabling the SNMP MAC notification feature in the system globally:

```
switch(config)# snmp-server trap mac-notify
```

Disabling the SNMP MAC notification feature in the system globally:

```
switch(config)# no snmp-server trap mac-notify
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

### Command History

| Release | Modification |

| 10.08 | Command introduced |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

# snmp-server trap module

```
snmp-server trap module
no snmp-server trap module
```

### Description

Enables SNMP trap generation for modules. Module trap generation is enabled by default. Generates the module event traps whenever a modular line or fabric card changes state, which includes inserted, removed, ready, and down, as well as when a modular card is unrecognized.

The **no** form of this command disables the SNMP trap generation for module events.

| Parameter | Description |
|---|---|
| `module` | Specifies SNMP traps for module events. |

### Examples

Enabling the SNMP traps for modules:

```
switch(config)# snmp-server trap module
```

Disabling the SNMP traps for modules:

```
switch(config)# no snmp-server trap module
```

```
switch(config)# show running-config
no snmp-server trap module
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.10 | Command introduced |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | `config` | Administrators or local user group members with execution rights for this command. |

## snmp-server trap port-security

```
snmp-server trap port-security
no snmp-server trap port-security
```

### Description

Enables SNMP port-security violation traps on the system. Port-security violation traps are enabled by default.

The **no** form of this command disables the SNMP port-security violation traps on the system.

| Parameter | Description |
|---|---|
| `port-security` | Specifies SNMP traps for port-security. |

### Examples

Enabling the SNMP port-security violation traps on the system:

```
switch(config)# snmp-server trap port-security
```

Disabling the SNMP port-security violation traps on the system:

```
switch(config)# no snmp-server trap port-security
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.10 | Command introduced |

### Command Information

|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## snmp-server trap snmp

```
snmp-server trap snmp {authentication | coldstart | warmstart} [vrf <VRF_NAME>]
no snmp-server trap snmp {authentication | coldstart | warmstart} [vrf <VRF_NAME>]
```

### Description

Enables SNMPv2 MIB traps. The SNMPv2 traps are disabled by default.

The **no** form of this command disables the SNMPv2 MIB traps.

SNMPv2 MIB supports the following traps:

- `authentication`: Authentication trap is sent when the SNMP server receives a protocol message that is not properly authenticated.
- `coldstart`: A coldstart trap is sent when the switch reboots.
- `warmstart`: A warmstart trap is sent when there is a user intervention to enable or disable the SNMP service on the switch.

SNMPv2 Authentication traps do not support source IP configuration.

| Parameter | Description |
|---|---|
| `authentication` | Enables the authentication traps. |
| `coldstart` | Enables the coldstart traps. |
| `warmstart` | Enables the warmstart traps. |
| *<VRF_NAME>* | Specifies the VRF name. Enables the SNMPv2 traps for a VRF. |

### Examples

Enabling all SNMPv2 traps:

```
switch(config)# snmp-server trap snmp
```

Enabling only SNMPv2 authentication traps:

```
switch(config)# snmp-server trap snmp authentication
```

Disabling all SNMP traps:

```
switch(config)# no snmp-server trap snmp
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.10 | Command introduced |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## snmp-server trap-source interface vrf

```
snmp-server trap-source {interface <IF-NAME> | <IPv4-Address> | <IPv6-Address>} [vrf
<VRF-NAME>]
no snmp-server trap-source {interface <IF-NAME> | <IPv4-Address> | <IPv6-Address>} [vrf
<VRF-NAME>]
```

### Description

Configures SNMP trap source interface or IP address for a VRF.

The **no** form of this command removes the SNMP **trap-source** configuration for a VRF.

| Parameter | Description |
|---|---|
| *<IF-NAME>* | Specifies the source interface name. Interface name can be physical interface, loopback interface, LAG interface, or VLAN interface. |
| *<IPv4-Address>* | Specifies the IPv4 address of source interface for the SNMP trap. |
| *<IPv6-Address>* | Specifies the IPv6 address of source interface for the SNMP trap. |
| *<VRF-NAME>* | Specifies the name of a VRF associated to the source interface for the SNMP trap. |

### Examples

Configuring SNMP trap source interface for a VRF.

```
switch(config)# snmp-server trap-source interface 1/1/12 vrf sample
switch(config)# snmp-server trap-source interface loopback10 vrf sample
switch(config)# snmp-server trap-source interface vlan23 vrf sample
```

Configuring SNMP trap source IP address for a VRF.

```
switch(config)# snmp-server trap-source 10.0.0.1 vrf red
switch(config)# snmp-server trap-source 1001::1 vrf red
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

### Command History

| Release | Modification |

|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## snmp-server trap vsx

```
snmp-server trap vsx
no snmp-server trap vsx
```

### Description

Enables sending the SNMP traps for VSX related events. VSX trap generation is disabled by default.

The **no** form of this command disables sending the SNMP traps for VSX related events.

The trap support is available for the following VSX events:

- ISL up and down
- KA up and down
- MCLAG up and down

| Parameter | Description |
|---|---|
| `vsx` | Specifies SNMP traps for VSX events. |

### Examples

Enabling the VSX traps:

```
switch(config)# snmp-server trap vsx
```

```
switch(config)# show vsx configuration trap
SNMP traps : Enabled
```

Disabling the VSX traps:

```
switch(config)# no snmp-server trap vsx
```

```
switch(config)# show vsx configuration trap
SNMP traps : Disabled
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## snmp-server view

```
snmp-server view <VIEWNAME> <OID_TREE> [<MASK>] <included/excluded>
no snmp-server view <VIEWNAME> <OID_TREE> [<MASK>] <included/excluded>
```

### Description

Configures an SNMP MIB view.

The **no** form of this command removes the specified SNMP MIB view.

| Parameter | Description |
|---|---|
| *<VIEWNAME>* | Specifies the name of the SNMP MIB view. Supports up to a maximum of 32 characters. |
| *<OID_TREE>* | Specifies the OID tree to be included or excluded in SNMP MIB view. |
| *<MASK>* | Specifies the OID mask value. The values must be in hexadecimal character separated with : (colon). |
| *<included/excluded>* | Specifies the OID tree that is included in or excluded from the SNMP MIB view. |

## Usage

You can configure a maximum of 50 SNMP MIB views. The following VTY message is displayed when the configuration exceeds the maximum SNMP MIB views:

```
switch(config)# snmp-server view name51 1.3.6.1.2.1.1 fe:00 included
Configuration failed: Maximum allowed views are configured.
```

## Examples

Configuring the SNMP MIB views:

```
switch(config)# snmp-server view name1 .1.3.6.1.2.1.2.2.1.1.1 FF:A0 included
switch(config)# snmp-server view name2 IF-MIB::ifindex included
switch(config)# snmp-server view name4 1.3.6.1.2.1.1 fe:00 included
```

Removing an SNMP MIB view:

```
switch(config)# no snmp-server view name4 1.3.6.1.2.1.1 fe:00 included
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

## Command History

| Release | Modification |

| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

# snmp-server vrf

```
snmp-server vrf <VRF-NAME>
no snmp-server vrf <VRF-NAME>
```

## Description

Configures a VRF on which the SNMP agent listens for incoming requests. By default, the SNMP agent does not listen on any VRF. 4100i, 6000, and 6100 only support default VRF. **The SNMP agent can listen on multiple VRFs.**

The **no** form of this command stops the SNMP agent from listening for incoming requests on the specified VRF.

| Parameter | Description |
|---|---|
| *<VRF-NAME>* | Specifies the name of a VRF. |

## Examples

Configuring the SNMP agent to listen on VRF **default**.

```
switch(config)# snmp-server vrf default
```

Configuring the SNMP agent to listen on VRF **mgmt**.

```
switch(config)# snmp-server vrf mgmt
```

Configuring the SNMP agent to listen on used-defined VRF **myvrf**.

```
switch(config)# snmp-server vrf myvrf
```

Stopping the SNMP agent from listening on VRF **default**.

```
switch(config)# no snmp-server vrf default
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

## Command History

| Release | Modification |

# snmpv3 context

```
snmpv3 context <NAME> vrf <VRF-NAME> [community <STRING>]
no snmpv3 context <NAME> [vrf <VRF-NAME>] [community <STRING>]
```

## Description

Creates an SNMPv3 context on the specified VRF.

The **no** form of this command removes the specified SNMP context.

| Parameter | Description |
|---|---|
| *<NAME>* | Specifies the name of the context. Range: 1 to 32 printable ASCII characters, excluding space and question mark (?). |
| `vrf <VRF-NAME>` | Specifies the VRF associated with the context. Default: default. |
| `community <STRING>` | Specifies the SNMP community string associated with the context. Range: 1 to 32 printable ASCII characters, excluding space and question mark. Default: public. |

## Examples

Creating an SNMPv3 context named **newContext**:

```
switch(config)# snmpv3 context newContext
```

Creating an SNMPv3 context named **newContext** on VRF **myVrf** and with community string **private**.

```
switch(config)# snmpv3 context newContext vrf myVrf community private
```

Removing the SNMPv3 context named **newContext** on VRF **myVrf**:

```
switch(config)# no snmpv3 context newContext vrf myVrf
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

## Command History

| Release | Modification |

# snmpv3 engine-id

```
snmpv3 engine-id <ENGINE-ID>
no snmpv3 engine-id <ENGINE-ID>
```

## Description

Configures the SNMPv3 SNMP engine-id allowing an administrator to configure a unique SNMP engine-id for the switch. This engine-id is used by the NMS management tool to identify and distinguish multiple switches on the same network.

The **no** form of this command restores the default engine-id, created by the switch using a combination of the enterprise OID value and the switch's mac address.

| Parameter | Description |
|---|---|
| *<ENGINE-ID>* | SNMPv3 SNMP engine-id in colon separated hexadecimal notation. |

## Examples

Configuring the SNMPv3 engine-id:

```
switch(config)#
switch(config)# snmpv3 engine-id
  WORD  SNMPv3 snmp engine-id in colon seperated hexadecimal notation
switch(config)# snmpv3 engine-id 01:23:45:67:89:ab:cd:ef:01:23:45:67
```

Restoring the default SNMPv3 engine-id:

```
switch(config)# no snmpv3 engine-id
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

# snmpv3 security-level

```
snmpv3 security-level {auth | auth-privacy}
no snmpv3 security-level {auth | auth-privacy}
```

## Description

Configures the SNMPv3 security level. The security level determines which SMNPv3 users defined by the command `snmpv3 user` are able to connect.

The **no** form of this command changes the security level as follows:

- **no snmpv3 security-level auth**: Sets the security level to **auth-privacy**.
- **no snmpv3 security-level auth-privacy**: Sets the security level to no authentication or privacy, allowing any SNMP user to connect.

| Parameter | Description |
|---|---|
| `auth` | SNMPv3 users that support authentication, or authentication and privacy are allowed. |
| `auth-privacy` | Only SNMPv3 users with both authentication and privacy are allowed. This is the highest level of SNMPv3 security. Default. |

## Examples

Setting the SNMPv3 security level to authentication and privacy:

```
switch(config)# snmpv3 security-level auth-privacy
```

Setting the SNMPv3 security level to authentication only:

```
switch(config)# snmpv3 security-level auth
```

Setting the SNMPv3 security level to no authentication and no privacy:

```
switch(config)# no snmpv3 security-level auth-privacy
```

Restoring the default SNMPv3 security level to authentication and privacy:

```
switch(config)# no snmpv3 security-level auth
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

# snmpv3 user

```
snmpv3 user <NAME>
      [auth <AUTH-PROTO> auth-pass [{plaintext | ciphertext} <AUTH-PASS>]]
      [priv <PRIV-PROTO> priv-pass [{plaintext | ciphertext} <PRIV-PASS>]]
      [access-level ro|rw]

no snmpv3 user <NAME>
        [auth <AUTH-PROTO> auth-pass [{plaintext | ciphertext} <AUTH-PASS>]]
        [priv <PRIV-PROTO> priv-pass [{plaintext | ciphertext} <PRIV-PASS>]]
        [access-level ro|rw]
```

## Description

Creates an SNMPv3 user and adds it to an SNMPv3 context. The SNMPv3 security level (set with command **snmpv3 security-level**) determines which users are allowed to authenticate.

The **no** form of this command removes the specified SNMPv3 user.

When updating the authentication protocols and privacy protocols for the existing SNMPv3 users, you must also update the access level. Otherwise, the access level will be set to read-only.

| Parameter | Description |
|---|---|
| *<NAME>* | Specifies the SNMPv3 username. Range 1 to 32 printable ASCII characters, excluding space and question mark (?). |
| access-level | Configures the access level for the SNMPv3 user:<br>■ **ro**: Allow read-only access for the SNMPv3 user<br>■ **rw**: Allow read-write access for the SNMPv3 user |
| `auth <AUTH-PROTO>` | Sets the authentication protocol used to validate user logins. Supported protocols are **md5**, **sha**, **sha224**, **sha256**, **sha384**, and **sha512**. |
| `auth-pass [{plaintext \| ciphertext} <AUTH-PASS>]` | Specifies the SNMPv3 user authentication password. Range for **plaintext** is 8 to 32 printable ASCII characters, excluding space and question mark (?). Range for **ciphertext** is 1 to 256 printable ASCII characters. Ciphertext is used when copying user configuration settings between switches.<br>**NOTE:** Authentication passwords that include special characters must be enclosed |

| Parameter | Description |
|---|---|
|  | in single quotation marks ('). For example, **'auth-pwd20246!@#'**. |
| `priv <PRIV-PROTO>` | Sets the SNMPv3 privacy protocol (encryption method). Supported privacy protocols are **aes**, **aes192**, **aes256**, and **des**. |
| `priv-pass [{plaintext \| ciphertext} <PRIV-PASS>]` | Specifies the SNMPv3 user privacy encryption password. Range for **plaintext** is 8 to 32 printable ASCII characters, excluding space and question mark (?). Range for **ciphertext** is 1 to 256 printable ASCII characters. Ciphertext is used when copying user configuration settings between switches.<br>**NOTE:** Authentication passwords that include special characters must be enclosed in single quotation marks ('). For example, **'priv-pwd20246!@#'**. |

When the authentication password is not provided on the command line, plaintext authentication password prompting occurs upon pressing Enter, followed by privacy encryption protocol prompting, and finally plaintext encryption password prompting. The entered password characters are masked with asterisks.

When the authentication type and password plus the privacy protocol (encryption method) are provided on the command line but the encryption password is not provided, plaintext encryption password prompting occurs upon pressing Enter. The entered password characters are masked with asterisks.

## Examples

Defining SNMPv3 user **Admin1** using **sha** authentication and **des** privacy encryption with provided plaintext passwords:

```
switch(config)# snmpv3 user Admin1 auth sha auth-pass plaintext F82#450h
                priv des priv-pass plaintext F82#4eva
```

Defining SNMPv3 user **Admin2** using **MD5** authentication and **AES** privacy encryption with provided authentication password and privacy encryption type but prompted encryption password:

```
switch(config)# snmpv3 user Admin2 auth md5 auth-pass plaintext F82#450h
                priv aes priv-pass
Enter the privacy encryption key: ********
Re-Enter the privacy encryption key: ********
```

Defining SNMPv3 user **Admin2** using **MD5** authentication and **AES** privacy encryption with plaintext password prompting and privacy encryption selection:

```
switch(config)# snmpv3 user Admin2 auth md5 auth-pass
Enter the authentication password: ********
Re-Enter the authentication password: ********

Configure the privacy protocol (y/n)? y
Enter the privacy protocol (aes/des)? aes

Enter the privacy encryption key: ********
Re-Enter the privacy encryption key: ********
```

Removing SNMPv3 user **Admin1**:

```
switch(config)# no snmpv3 user Admin1
```

Creating an SNMP user on switch 1 and then creating the same user on switch 2 by copying from the switch 1 configuration:

On switch 1, configure a user named **Admin3**, and then use the **show running-config** command to display switch configuration. Save a copy of the full **snmpv3 user** command (shown by **show running-config**). This saved command is used on switch 2.

```
switch1(config)# snmpv3 user Admin3 auth sha auth-pass plaintext F82#450h
                 priv des priv-pass plaintext F82#4eva
switch1(config)# exit
switch1# show running-config
Current configuration:
!
!Version AOS-CX xx.xx.xx.xxxxxx
!
snmpv3 user Admin3 auth sha auth-pass ciphertext AQBaf2d...FJVcZ3o=
priv des priv-pass ciphertext AQBaH2p...2jfTFwQ=
ssh server vrf mgmt
!
interface mgmt
    no shutdown
    ip dhcp
vlan 1
```

On switch 2, execute the **snmpv3 user** command that you saved from switch 1 (as shown by **show running-config**). This creates the user on switch 2 with the same configuration.

```
switch2(config)# snmpv3 user Admin3 auth sha auth-pass ciphertext
AQBaf2d...FJVcZ3o=
                 priv des priv-pass ciphertext AQBaH2p...2jfTFwQ=
```

The following command sets a read-write access level for an SNMPv3 user with the user name **user1**.

```
switch(config)# snmpv3 user user1 auth md5 auth-pass plaintext abc1234 access-
level rw
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.13 | Following authentication protocols are supported: **sha224**, **sha256**, **sha384**, and **sha512**.<br>Following privacy protocols are supported: **aes192** and **aes256**. |
| 10.09 | The **access-level** parameter was introduced. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## snmpv3 user view

```
snmpv3 user <USER-NAME> view <VIEW-NAME>
no snmpv3 user <USER-NAME> view <VIEW-NAME>
```

### Description

Associates a user with an existing SNMP MIB view.

The **no** form of this command removes the associated user from the specified SNMP MIB view.

| Parameter | Description |
|---|---|
| *<USER-NAME>* | Specifies the user name for the SNMP MIB view. Accepts a maximum of 32 characters. |
| *<VIEWNAME>* | Specifies the view name for the SNMP MIB view. Accepts a maximum of 32 characters. |

### Examples

Adding a user in the existing SNMP MIB view:

```
switch(config)# snmpv3 user nw-admin view my-nw-view
```

Removing the user from the SNMP MIB view:

```
switch(config)# no snmpv3 user nw-admin view my-nw-view
```

Attaching unconfigured or unknown SNMP view to an SNMPv3 user:

```
switch(config)# snmpv3 user nw-admin view myView
View myView is not configured.
```

For more information on features that use this command, refer to the SNMP/MIB Guide for your switch model.

## Command History

| Release | Modification |

# Chapter 144

# Source-interface selection commands

## ip source-interface

```
ip source-interface <PROTOCOL> {<IP-ADDR>|interface <IFNAME>} [vrf <VRF-NAME>]
no ip source-interface <PROTOCOL> interface <IFNAME> [vrf <VRF-NAME>]
```

### Description

Configures the IPv4 source-interface interface to use for the specified protocol. If a VRF is not given, the default VRF applies.

The **no** form of this command removes the specified configuration.

| Parameter | Description |
|---|---|
| *<PROTOCOL>* | Specifies the protocol to configure.<br>`all`<br>Selects the source for all protocols covered by this command.<br>`central`<br>Selects Aruba Central.<br>`dhcp_relay`<br>Selects DHCP relay. When you configure a dhcp_relay source interface, you must also enable DHCP relay Option 82 using the **dhcp-relay option 82 source-interface** command.<br>`dns`<br>Selects DNS.<br>`http`<br>Selects HTTP.<br>`ipfix`<br>Selects ipfix. Configures source interface for IPFIX.<br>`ntp`<br>Selects NTP.<br>`ptp`<br>Selects PTP.<br>`radius`<br>Selects RADIUS.<br>`sflow`<br>Selects sFLow.<br>`sftp-scp`<br>Selects SFTP and SCP.<br>`ssh-client`<br>Selects SSH Client.<br>`syslog` |

| Parameter | Description |
|---|---|
| | Selects the source for syslog packets.<br>tacacs<br>Selects the source for TACACS packets.<br>tftp<br>Selects TFTP.<br>ubt<br>Selects UBT. |
| | Specifies the VRF name. |
| *<IFNAME>* | Specifies the interface name. |
| *<IP-ADDR>* | Specifies the IPv4 address. |
| vrf *<VRF-NAME>* | Specifies the VRF name. |

## Examples

Configuring IPv4 source-interface interface 1/1/1 to use for the TFTP protocol:

```
switch(config)# ip source-interface tftp interface 1/1/1
```

Configuring IPv4 source-interface interface 1/1/2 to use for the TFTP protocol on VRF green :

```
switch(config)# ip source-interface tftp interface 1/1/2 vrf green
```

Removing IPv4 source-interface 1/1/1configuration for the TFTP protocol:

```
switch(config)# no ip source-interface tftp interface 1/1/1
```

Removing source-interface interface 1/1/2 configuration for TFTP protocol on VRF green:

```
switch(config)# no ip source-interface tftp interface 1/1/2 vrf green
```

Configuring source-interface IPv4 10.1.1.1 to use for the TFTP protocol:

```
switch(config)# ip source-interface tftp 10.1.1.1
```

Configuring source-interface IPv4 10.1.1.2 to use for the TFTP protocol on VRF green :

```
switch(config)# ip source-interface tftp 10.1.1.2 vrf green
```

Removing source-interface IPv4 10.1.1.1 configuration for the TFTP protocol:

```
switch(config)# no ip source-interface tftp 10.1.1.1
```

Removing source-interface IPv4 10.1.1.2 configuration for TFTP protocol on VRF green:

```
switch(config)# no ip source-interface tftp 10.1.1.2 vrf green
```

Configuring source-interface IPv4 10.1.1.1 to use for the DNS protocol:

```
switch(config)# ip source-interface dns 10.1.1.1
```

Configuring source-interface IPv4 10.1.1.2 to use for the DNS protocl on VRF green :

```
switch(config)# ip source-interface dns 10.1.1.2 vrf green
```

Removing source-interface IPv4 10.1.1.1configuration for the DNS protocol:

```
switch(config)# no ip source-interface tftp 10.1.1.1
```

Removing source-interface IPv4 10.1.1.2 configuration for the DNS protocol on VRF green:

```
switch(config)# no ip source-interface dns 10.1.1.2 vrf green
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.12.1000 | Added `cental`, `sftp-scp`, and `ssh-client` parameters. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## ipv6 source-interface

```
ipv6 source-interface <PROTOCOL> {<IPV6-ADDR>|interface <IFNAME>} [vrf <VRF-NAME>]
no ipv6 source-interface <PROTOCOL> {<IPV6-ADDR>|interface <IFNAME>} [vrf <VRF-NAME>]
```

### Description

Configures the IPv6 source-interface interface to use for the specified protocol. If a VRF is not given, the default VRF applies.

The **no** form of this command removes all configurations.

| Parameter | Description |
|---|---|
| *<PROTOCOL>* | Specifies the protocol to configure.<br>`all`<br>Selects all protocols supported by this command.<br>`central`<br>Selects Aruba Central.<br>`dhcp_relay`<br>Selects DHCP relay.<br>`dns`<br>Selects DNS packets<br>`http`<br>Selects HTTP.<br>`ntp`<br>Selects NTP.<br>`radius`<br>Selects radius.<br>`sftp-scp`<br>Selects SFTP and SCP.<br>`sflow`<br>Selects sFLow.<br>`ssh-client`<br>Selects SSH Client.<br>`syslog`<br>Selects syslog.<br>`tacacs`<br>Selects TACACS.<br>`tftp`<br>SelectsTFTP.<br>`ipfix`<br>Selects ipfix. Configures source interface for IPFIX. |
| *<IPV6-ADDR>* | Specifies the IPv6 address. |
| *<IFNAME>* | Specifies the interface name. |
| `vrf` *<VRF-NAME>* | Specifies the VRF name. |

## Examples

Configuring IPv6 source-interface interface 1/1/1 to use for the TFTP protocol :

```
switch(config)# ipv6 source-interface tftp interface 1/1/1
```

Configuring IPv6 source-interface interface 1/1/2 to use for the TFTP protocol on VRF green :

```
switch(config)# ipv6 source-interface tftp interface 1/1/2 vrf green
```

Removing IPv6 source-interface interface 1/1/1 configuration for the TFTP protocol:

```
switch(config)# no ipv6 source-interface tftp interface 1/1/1
```

Removing IPv6 source-interface interface 1/1/2 configuration for the TFTP protocol on VRF green:

```
switch(config)# no ipv6 source-interface tftp interface 1/1/2 vrf green
```

Configuring source-interface IPv6 1111:2222 to use for the TFTP protocol:

```
switch(config)# ipv6 source-interface tftp 1111:2222
```

Configuring source-interface IPv6 1111:3333 to use for TFTP protocol on VRF green :

```
switch(config)# ipv6 source-interface tftp 1111:3333 vrf green
```

Removing source-interface IPv6 1111:2222 configuration for TFTP protocol:

```
switch(config)# no ipv6 source-interface tftp 1111:2222
```

Removing source-interface IPv6 1111:3333 configuration for TFTP protocol on VRF green:

```
switch(config)# no ipv6 source-interface tftp 1111:3333 vrf green
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.13.0001 | Added the **dns** protocol parameter. |
| 10.12.1000 | Added **central, sftp-scp, dhcp_relay** and **ssh-client** parameters. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

# ipv6 source-interface dns

```
ipv6 source-interface {dns | all} {interface | X:X::X:X} [vrf <VRF-NAME>]
[no] ipv6 source-interface {dns | all} {interface | X:X::X:X} [vrf <VRF-NAME>]
```

## Description

Configures the IPv6 source-interface or source IP for IPv6 DNS clients.

The **no** form of this command removes all configurations.

| Parameter | Description |
|---|---|
| *<PROTOCOL>* | Specifies the protocol to configure.<br>`all`<br>Selects all protocols supported by this command.<br>`central`<br>Selects Aruba Central.<br>`dhcp_relay`<br>Selects DHCP relay.<br>`dns`<br>Selects DNS packet source.<br>`http`<br>Selects HTTP.<br>`ntp`<br>Selects NTP.<br>`radius`<br>Selects radius.<br>`sftp-scp`<br>Selects SFTP and SCP.<br>`sflow`<br>Selects sFLow.<br>`ssh-client`<br>Selects SSH Client.<br>`syslog`<br>Selects syslog.<br>`tacacs`<br>Selects TACACS.<br>`tftp`<br>SelectsTFTP.<br>`ubt`<br>SelectsUBT. |
| *<IPV6-ADDR>* | Specifies the IPv6 address. |
| `vrf` *<VRF-NAME>* | Specifies the VRF name. |

## Examples

Configuring IPv6 source-interface dns :

```
switch(config)# ipv6 source-interface
        all         All protocols
        central     Aruba Central protocol
        dhcp_relay  DHCP_RELAY protocol
        dns         DNS protocol
        http        HTTP protocol
        ntp         NTP protocol
        radius      RADIUS protocol
        sflow       sFlow protocol
        sftp-scp    SFTP and SCP protocols
        ssh-client  SSH Client protocol
        syslog      syslog protocol
        tacacs      TACACS protocol
        tftp        TFTP protocol
```

Configuring IPv6 source -interface dns:

```
switch(config)# ipv6 source-interface dns
X:X::X:X   Specify an IPv6 address
interface  Interface information
```

Configuring IPv6 source-interface dns on 1: :1:

```
switch(config)# ipv6 source-interface dns 1::1
vrf   VRF Configuration
<cr>
```

Configuring IPv6 source-interface dns on 1: :1: vrf:

```
switch(config)#  ipv6 source-interface dns 1::1 vrf
VRF_NAME  VRF name
```

Configuring IPv6 source-interface dns on 1: :1 vrf BLUE

```
switch(config)# ipv6 source-interface dns 1::1 vrf BLUE
switch(config)# ipv6 source-interface dns interface vlan10
vrf   VRF Configuration
<cr>
```

Configuring IPv6 source-interface dns on vlan10 vrf BLUE:

```
switch(config)# ipv6 source-interface dns interface vlan10 vrf BLUE
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.13 | Command introduced. |

## Command Information

# show ip source-interface

```
show ip source-interface <PROTOCOL> [vrf <VRF-NAME> | all-vrfs]
```

## Description

Displays the source interface information for all VRFs or a specific VRF.

If a VRF is not specified, the default is displayed.

| Parameter | Description |
|---|---|
| *<PROTOCOL>* | Specifies the protocol to show.<br>`all`<br>Shows the source interface configuration for all other protocols.<br>`central`<br>Shows the source interface configuration for Aruba Central.<br>`dhcp relay`<br>Shows the source interface configuration for DHCP relay.<br>`dns`<br>Shows the source interface configuration for DNS.<br>`ipfix`<br>Selects ipfix. Configures source interface for IPFIX.<br>`http`<br>Shows the source interface configuration for HTTP.<br>`ntp`<br>Shows the source interface configuration for NTP.<br>`ptp`<br>Shows the source interface configuration for PTP.<br>`radius`<br>Shows the source interface configuration for radius.<br>`sflow`<br>Shows the source interface configuration for sFLow.<br>`sftp-scp`<br>Shows source interface configuration for SFTP and SCP.<br>`ssh-client`<br>Shows source interface configuration for SSH Client.<br>`syslog`<br>Shows the source interface configuration for syslog.<br>`tacacs`<br>Shows the source interface configuration for TACACS.<br>`tftp`<br>Shows the source interface configuration for TFTP. |

| Parameter | Description |
|---|---|
|  | `ubt`<br>Shows the source interface configuration for PTP. |
| `vrf` *`<VRF-NAME>`* | Specifies the VRF name. |
| *`all-vrfs`* | Shows the source interface configuration for all VRFs. |

## Examples

Displaying all source-interface protocol configurations for VRF red:

```
switch# show ip source-interface all vrf red
Source-interface Configuration Information
----------------------------------------------------------------
Protocol        Src-Interface        Src-IP                 VRF
----------------------------------------------------------------
all             1/1/1                                       red
switch#
```

Displaying all source-interface protocol configurations for default VRF:

```
switch# show ip source-interface all
Source-interface Configuration Information
--------------------------------------------------------------------
Protocol        Src-Interface        Src-IP                 VRF
--------------------------------------------------------------------
all                                  1.1.1.1                default
switch#
```

Displaying all source-interface protocol configurations for all VRFs:

```
switch# show ip source-interface all all-vrfs
Source-interface Configuration Information
--------------------------------------------------------------------
Protocol        Src-Interface        Src-IP                 VRF
--------------------------------------------------------------------
all                                  2.2.2.2                all-vrfs
all                                  1.1.1.1                default
all              1/1/1/1                                    red
switch#
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.12.1000 | Added `central`, `sftp-scp`, and `ssh-client` parameters. |
| 10.07 or earlier | -- |

## show ipv6 source-interface

`show ipv6 source-interface <PROTOCOL> [detail] [vrf <VRF-NAME> | all-vrfs]`

### Description

Displays the IPV6 source interface information configured in the router for all VRFs or a specific VRF.

If a VRF is not specified, the default is displayed.

| Parameter | Description |
|---|---|
| *<PROTOCOL>* | Specifies the protocol to show.<br>`all`<br>Shows the source interface configuration for all other protocols.<br>`central`<br>Shows the source interface configuration for Aruba Central.<br>`dhcp_relay`<br>Shows the source interface configuration for DHCP realy.<br>`dns`<br>Shows the source interface configuration for DNS.<br>`http`<br>Shows the source interface configuration for HTTP.<br>`ntp`<br>Shows the source interface configuration for NTP.<br>`radius`<br>Shows the source interface configuration for radius.<br>`sflow`<br>Shows the source interface configuration for sFLow.<br>`sftp-scp`<br>Shows source interface configuration for SFTP and SCP.<br>`ssh-client`<br>Shows source interface configuration for SSH Client.<br>`ipfix`<br>Selects ipfix. Configures source interface for IPFIX.<br>`syslog`<br>Shows the source interface configuration for syslog.<br>`tacacs`<br>Shows the source interface configuration for TACACS.<br>`tftp`<br>Shows the source interface configuration for TFTP. |

| Parameter | Description |
|---|---|
| vrf *<VRF-NAME>* | Specifies the VRF name. |
| *all-vrfs* | Shows the source interface configuration for all VRF. |

### Examples

Displaying all IPv6 source-interface protocol configurations for default VRF:

```
switch# show ipv6 source-interface all
Source-interface Configuration Information
------------------------------------------------------------------
Protocol        Src-Interface       Src-IP                 VRF
------------------------------------------------------------------
all                                 1111::2222              default
switch#
```

Displaying all IPv6 source-interface protocol configuration for VRF red:

```
switch# show ipv6 source-interface all vrf red
Source-interface Configuration Information
---------------------------------------------------------------
Protocol        Src-Interface       Src-IP                 VRF
---------------------------------------------------------------
all             1/1/1              2005::2                        red
switch#
```

Displaying all IPv6 source-interface protocol configurations for all VRFs:

```
switch# show ipv6 source-interface all all-vrfs
Source-interface Configuration Information
-------------------------------------------------------------------
Protocol        Src-Interface       Src-IP                VRF
-------------------------------------------------------------------
all                                2222::3333           all-vrfs
all                                1111::2222           default
all             1/1/1              2::2                 red
```

Displaying all IPv6 source-interface protocol confirgurations for dns all VRFs:

```
switch# show ipv6 source-interface dns all-vrfs
Source-interface Configuration Information
----------------------------------------------------------------------------------
--
Protocol        Src-Interface       Src-IP                  VRF
----------------------------------------------------------------------------------
--
dns                                 1::3                    blue
dns                                 1::4                    default
dns                                 1::2                    red
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.13 | Added `dns` parameters. |
| 10.12.1000 | Added `central`, `sftp-scp`, and `ssh-client` parameters. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (#) | Administrators or local user group members with execution rights for this command. |

## show running-config

`show running-config`

### Description

Displays the current running configuration.

### Examples

Displaying the running configuration (only items of interest to source interface selection are shown in this example output command):

Aruba Central is the priority agent. If no command is specified for ip source-interface, Central will choose the command automatically if it is reachable on any of the known ports.

```
switch# show running-config
vrf green
ip source-interface tftp interface 1/1/2 vrf green
ip source-interface radius interface 1/1/2 vrf green
ip source-interface ntp interface 1/1/2 vrf green
ip source-interface tacacs interface 1/1/2 vrf green
ip source-interface dns interface 1/1/2 vrf green
ip source-interface central interface 1/1/2 vrf green
ip source-interface all interface 1/1/2 vrf green
ipv6 source-interface tftp 2222::3333 vrf green
ipv6 source-interface radius 2222::3333 vrf green
ipv6 source-interface ntp 2222::3333 vrf green
ipv6 source-interface tacacs 2222::3333 vrf green
ipv6 source-interface central 2222::3333 vrf green
ipv6 source-interface all 2222::3333 vrf green
ip source-interface tftp 10.20.3.1
ip source-interface radius 10.20.3.1
ip source-interface ntp 10.20.3.1
ip source-interface tacacs 10.20.3.1
ip source-interface dns 10.20.3.1
ip source-interface central 10.20.3.1
ip source-interface all 10.20.3.1
```

```
interface 1/1/1
     no shutdown
     ip address 10.20.3.1/24
interface 1/1/2
     vrf attach green
     ip address 20.1.1.1/24
     ipv6 address 2222::3333/64
interface 1/1/45
     no shutdown
     ip address 100.1.0.1/24
     ipv6 address 1111::2222/64
ip route 100.2.0.0/24 10.20.3.2
switch#
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

# Chapter 145

# SSH client commands

## ssh (client login)

```
ssh [<USERNAME>@]{<IPV4> | <HOSTNAME>} [vrf <VRF-NAME>] [port <PORT-NUMBER>]
```

### Description

Establishes a client session with an SSH server which is typically another switch.

username, vrf and port number are optional parameters. If a source ip address or source interface is configured for the ssh client protocol, the configuration values are used for establishing the client session with the SSH server.

> The source interface can be configured using the IP source interface configuration commands described in the Fundamentals Guide.

| Parameter | Description |
|---|---|
| *<USERNAME>* | Specifies the username that the client uses to log in to an SSH server. When omitted, the username of the current session is used. |
| *<IPV4>* | Specifies the SSH server to which the SSH client will connect as an IPv4 address. |
| *<HOSTNAME>* | Specifies the SSH server to which the SSH client will connect as a host name. |
| vrf *<VRF-NAME>* | Specifies the VRF to be used for the SSH client session. When omitted, the default VRF named `default` is used. |
| port *<PORT-NUMBER>* | Specifies the SSH server TCP port number. When omitted, the default TCP port 22 is used. |

### Examples

Establishing an SSH client session (using the management VRF) with an SSH server:

```
switch# ssh admin@10.0.11.180 vrf mgmt
```

Establishing an SSH client session (using the default VRF and a specific port) with an SSH server:

```
switch# ssh admin@10.0.11.175 port 223
```

Configuring a test user on switch 1 and then connecting to switch 1 from switch 2 using the SSH client on the mgmt VRF:

```
** Configuring a test user on switch 1 **
switch(config)# user-group test
switch(config-usr-grp-test)# permit cli command ".*"
switch(config)# exit
switch(config)# user test-user group test password plaintext tst#9J

** On switch 2, connecting to switch 1 using the SSH client **
switch# ssh test-user@10.0.11.177 vrf mgmt
```

For more information on features that use this command, refer to the Security Guide for your switch model.

# Chapter 146
# SSH client commands

## ssh (client login)

`ssh [<USERNAME>@]{<IPV4> | <HOSTNAME>} [vrf <VRF-NAME>] [port <PORT-NUMBER>]`

### Description

Establishes a client session with an SSH server which is typically another switch.

username, vrf and port number are optional parameters. If a source ip address or source interface is configured for the ssh client protocol, the configuration values are used for establishing the client session with the SSH server.

> The source interface can be configured using the IP source interface configuration commands described in the Fundamentals Guide.

| Parameter | Description |
|---|---|
| *<USERNAME>* | Specifies the username that the client uses to log in to an SSH server. When omitted, the username of the current session is used. |
| *<IPV4>* | Specifies the SSH server to which the SSH client will connect as an IPv4 address. |
| *<HOSTNAME>* | Specifies the SSH server to which the SSH client will connect as a host name. |
| vrf *<VRF-NAME>* | Specifies the VRF to be used for the SSH client session. When omitted, the default VRF named `default` is used. |
| port *<PORT-NUMBER>* | Specifies the SSH server TCP port number. When omitted, the default TCP port 22 is used. |

### Examples

Establishing an SSH client session (using the management VRF) with an SSH server:

```
switch# ssh admin@10.0.11.180 vrf mgmt
```

Establishing an SSH client session (using the default VRF and a specific port) with an SSH server:

```
switch# ssh admin@10.0.11.175 port 223
```

Configuring a test user on switch 1 and then connecting to switch 1 from switch 2 using the SSH client on the mgmt VRF:

```
** Configuring a test user on switch 1 **
switch(config)# user-group test
switch(config-usr-grp-test)# permit cli command ".*"
switch(config)# exit
switch(config)# user test-user group test password plaintext tst#9J

** On switch 2, connecting to switch 1 using the SSH client **
switch# ssh test-user@10.0.11.177 vrf mgmt
```

For more information on features that use this command, refer to the Security Guide for your switch model.

# SSH server commands

## show ssh host-key

`show ssh host-key [ecdsa | ed25519 | rsa]`

### Description

Shows the public host keys for the SSH server. If the key type is not provided, all available host-keys are shown.

| Parameter | Description |
|---|---|
| `ecdsa` | Selects the ECDSA host-key pair. |
| `ed25519` | Selects the ED25519 host-key pair. |
| `rsa` | Selects the RSA host-key pair. |

### Examples

Showing the ECDSA public host-key:

```
switch# show ssh host-key ecdsa

Key Type : ECDSA     Curve : ecdsa-sha2-nistp256

ecdsa-sha2-nistp256 AAAAE2VjZHNhLXNoYTItbmlzdHAyNTYAAAAIbmlzdHAyNTYAAhtuv5rABBBGs
...
O4mjVFGMVKZ87RWkyrxeQa2fAGZZEp1902K33/k3q17fA4EivRzC75YvjDu8=
```

Showing all public host keys:

```
switch# show ssh host-key
Key Type : ECDSA     Curve : ecdsa-sha2-nistp256
ecdsa-sha2-nistp256 AAAAE2VjZHNhLXNoYTItbmlzdHAyNTYAAAAIbmlzdHAyNTYAAhtuv5rABBBGs
...
O4mjVFGMVKZ87RWkyrxeQa2fAGZZEp1902K33/k3q17fA4EivRzC75YvjDu8=

Key Type : ED25519
ssh-ed25519 AAAAC3NzaC1lZDI1NTE5AAAAIGb6910Jwoe8Hkl9K5YhqijrWI3yovNbiJVq6tw4WjJr4

Key Type : RSA       Key Size : 2048
ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAABAQDdVCXlw43h4n1bwg9jI6DSBMngymCdPD0JUG42Sn9IS
...
nGSXtrNy6OmlFDJTAy+zz5Kd8d21ZLuhf07IHNgF3pff65Xc8qNJBv
```

For more information on features that use this command, refer to the Security Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (#) | Administrators or local user group members with execution rights for this command. |

# show ssh server

```
show ssh server [vrf <VRF-NAME> | all-vrfs] [vsx-peer]
```

## Description

Shows the SSH server configuration for the specified VRF. Administrators can show the server configuration of all VRFs by using the **all-vrfs** parameter. If no VRF name is provided in this command, the command shows the SSH server configuration on the default VRF.

| Parameter | Description |
|---|---|
| `vrf <VRF-NAME>` | Specifies the VRF name. |
| `all-vrfs` | Selects all VRFs. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

## Examples

Showing the SSH server configuration on the default VRF:

```
switch# show ssh server

SSH server configuration on VRF default :

   IP Version        :  IPv4 and IPv6        SSH Version          : 2.0
   TCP Port          :  22                   Grace Timeout (sec)  : 120
   Max Auth Attempts :         6
   Allow-list        : disabled

   Ciphers:
   chacha20-poly1305@openssh.com, aes128-ctr, aes192-cbc,
   aes128-cbc, aes192-ctr, aes256-gcm@openssh.com,
   aes128-gcm@openssh.com, aes256-ctr, aes256-cbc

   Host Key Algorithms:
   ecdsa-sha2-nistp256, ecdsa-sha2-nistp384, ecdsa-sha2-nistp521,
    ssh-ed25519, rsa-sha2-256, rsa-sha2-512, ssh-rsa

    Key Exchange Algorithms:
    curve25519-sha256, curve25519-sha256@libssh.org,
    ecdh-sha2-nistp256,ecdh-sha2-nistp384, ecdh-sha2-nistp521,
    diffie-hellman-group-exchange-sha256,diffie-hellman-group16-sha512,
    diffie-hellman-group18-sha512,diffie-hellman-group14-sha256,
    diffie-hellman-group14-sha1

    MACs:
    hmac-sha1-etm@openssh.com, umac-64@openssh.com,
    umac-128@openssh.com, hmac-sha2-256,hmac-sha2-512,hmac-sha1

    Public Key Algorithms:
    rsa-sha2-256, rsa-sha2-512ssh-rsa, ecdsa-sha2-nistp256,
    ecdsa-sha2-nistp384, ecdsa-sha2-nistp521, ssh-ed25519,
    x509v3-rsa2048-sha256, x509v3-ssh-rsa, x509v3-sign-rsa,
    x509v3-ecdsa-sha2-nistp256, x509v3-ecdsa-sha2-nistp384,
    x509v3-ecdsa-sha2-nistp521
```

Showing the SSH server configuration on the management VRF:

```
switch# show ssh server vrf mgmt

SSH server configuration on VRF mgmt :

    IP Version             : IPv4 and IPv6        SSH Version          : 2.0
    TCP Port               : 22                   Grace Timeout (sec)  : 120
    Max Auth Attempts      : 6

    Ciphers:
    chacha20-poly1305@openssh.com, aes128-ctr, aes192-cbc,
    aes128-cbc, aes192-ctr, aes256-gcm@openssh.com,
    aes128-gcm@openssh.com, aes256-ctr, aes256-cbc

    Host Key Algorithms:
    ecdsa-sha2-nistp256, ecdsa-sha2-nistp384, ecdsa-sha2-nistp521,
    ssh-ed25519, rsa-sha2-256, rsa-sha2-512, ssh-rsa

    Key Exchange Algorithms:
    curve25519-sha256, curve25519-sha256@libssh.org,
    ecdh-sha2-nistp256,ecdh-sha2-nistp384, ecdh-sha2-nistp521,
    diffie-hellman-group-exchange-sha256,diffie-hellman-group16-sha512,
    diffie-hellman-group18-sha512,diffie-hellman-group14-sha256,
    diffie-hellman-group14-sha1

    MACs:
    hmac-sha1-etm@openssh.com, umac-64@openssh.com,
    umac-128@openssh.com, hmac-sha2-256,hmac-sha2-512,hmac-sha1

    Public Key Algorithms:
    rsa-sha2-256, rsa-sha2-512ssh-rsa, ecdsa-sha2-nistp256,
    ecdsa-sha2-nistp384, ecdsa-sha2-nistp521, ssh-ed25519,
    x509v3-rsa2048-sha256, x509v3-ssh-rsa, x509v3-sign-rsa,
    x509v3-ecdsa-sha2-nistp256, x509v3-ecdsa-sha2-nistp384,
```

Showing the SSH server configuration for all VRFs:

```
switch# show ssh server all-vrfs

SSH server configuration on VRF default :

    IP Version              :  IPv4 and IPv6       SSH Version          : 2.0
    TCP Port                :  22                  Grace Timeout (sec)  : 120
    Max Auth Attempts       :  6

    Ciphers:
    chacha20-poly1305@openssh.com, aes128-ctr, aes192-cbc,
    aes128-cbc, aes192-ctr, aes256-gcm@openssh.com,
    aes128-gcm@openssh.com, aes256-ctr, aes256-cbc

    Host Key Algorithms:
    ecdsa-sha2-nistp256, ecdsa-sha2-nistp384, ecdsa-sha2-nistp521,
    ssh-ed25519, rsa-sha2-256, rsa-sha2-512, ssh-rsa

    Key Exchange Algorithms:
    curve25519-sha256, curve25519-sha256@libssh.org,
    ecdh-sha2-nistp256,ecdh-sha2-nistp384, ecdh-sha2-nistp521,
    diffie-hellman-group-exchange-sha256,diffie-hellman-group16-sha512,
    diffie-hellman-group18-sha512,diffie-hellman-group14-sha256,

    MACs:
    hmac-sha1-etm@openssh.com, umac-64@openssh.com,
    umac-128@openssh.com, hmac-sha2-256,hmac-sha2-512,hmac-sha1

    Public Key Algorithms:
    rsa-sha2-256, rsa-sha2-512ssh-rsa, ecdsa-sha2-nistp256,
    ecdsa-sha2-nistp384, ecdsa-sha2-nistp521, ssh-ed25519,
    x509v3-rsa2048-sha256, x509v3-ssh-rsa, x509v3-sign-rsa,
    x509v3-ecdsa-sha2-nistp256, x509v3-ecdsa-sha2-nistp384,
    x509v3-ecdsa-sha2-nistp521

SSH server configuration on VRF mgmt :

    IP Version              : IPv4 and IPv6       SSH Version          : 2.0
    TCP Port                : 22                  Grace Timeout (sec)  : 120
    Max Auth Attempts       : 6

    Ciphers:
    chacha20-poly1305@openssh.com, aes128-ctr, aes192-cbc,
    aes128-cbc, aes192-ctr, aes256-gcm@openssh.com,
    aes128-gcm@openssh.com, aes256-ctr, aes256-cbc

    Host Key Algorithms:
    ecdsa-sha2-nistp256, ecdsa-sha2-nistp384, ecdsa-sha2-nistp521,
    ssh-ed25519, rsa-sha2-256, rsa-sha2-512, ssh-rsa

    Key Exchange Algorithms:
    curve25519-sha256, curve25519-sha256@libssh.org,
    ecdh-sha2-nistp256,ecdh-sha2-nistp384, ecdh-sha2-nistp521,
    diffie-hellman-group-exchange-sha256,diffie-hellman-group16-sha512,
    diffie-hellman-group18-sha512,diffie-hellman-group14-sha256,
    diffie-hellman-group14-sha1

    MACs:
    hmac-sha1-etm@openssh.com, umac-64@openssh.com,
    umac-128@openssh.com, hmac-sha2-256,hmac-sha2-512,hmac-sha1
```

```
Public Key Algorithms:
rsa-sha2-256, rsa-sha2-512ssh-rsa, ecdsa-sha2-nistp256,
ecdsa-sha2-nistp384, ecdsa-sha2-nistp521, ssh-ed25519,
x509v3-rsa2048-sha256, x509v3-ssh-rsa, x509v3-sign-rsa,
x509v3-ecdsa-sha2-nistp256, x509v3-ecdsa-sha2-nistp384,
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show ssh server sessions

`show ssh server sessions [vrf <VRF-NAME> | all-vrfs] [vsx-peer]`

### Description

Shows the active SSH sessions on a specified VRF or on all VRFs. If no VRF is specified, the active sessions on the **default** VRF are shown.

| Parameter | Description |
|---|---|
| `vrf <VRF-NAME>` | Specifies the VRF name. |
| `all-vrfs` | Selects all VRFs. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Usage

If you provide the command with a VRF name, the command shows the active SSH session for the specified VRF. Any user can show sessions of all VRFs by using the **all-vrfs** parameter. The maximum number of sessions per VRF is five. The maximum SSH idle session timeout is 60 seconds.

### Examples

Showing the active SSH sessions on the default VRF:

```
switch# show ssh server sessions

SSH sessions on VRF default
    IPv4 SSH Sessions
        Server IP         : 10.1.1.1
        Client IP         : 10.1.1.2
        Client Port       : 58835

    IPv6 SSH Sessions
        Server IP         : FF01:0:0:0:0:0:0:FB
        Client IP         : FF01:0:0:0:0:0:0:FC
        Client Port       : 58836
```

Showing the SSH server configuration for all VRFs:

```
switch# show ssh server sessions all-vrf

SSH sessions on VRF mgmt
    IPv4 SSH Sessions
        Server IP         : 10.1.1.1
        Client IP         : 10.1.1.2
        Client Port       : 58835

    IPv6 SSH Sessions
        Server IP         : FF01:0:0:0:0:0:0:FB
        Client IP         : FF01:0:0:0:0:0:0:FC
        Client Port       : 58836

SSH sessions on VRF default
    IPv4 SSH Sessions
        Server IP         : 20.1.1.1
        Client IP         : 20.1.1.2
        Client Port       : 58837

    IPv6 SSH Sessions
        Server IP         : FF01:0:0:0:0:0:0:FD
        Client IP         : FF01:0:0:0:0:0:0:FE
        Client Port       : 58838
```

For more information on features that use this command, refer to the Security Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

|---|---|---|
| All platforms | Operator (>) or Manager (#) | Administrators or local user group members with execution rights for this command. |

# ssh ciphers

```
ssh ciphers <CIPHERS-LIST>
no ssh ciphers
```

## Description

Configures SSH to use a set of ciphers in the specified priority order. Ciphers in SSH are used for privacy of data being transported over the connection. The first cipher type entered in the CLI is considered a first priority. Each option is an algorithm that is used to encrypt the link and each name indicates the algorithm and cryptographic parameters that are used. Only ciphers that are entered by the user are configured.

The **no** form of this command removes the configuration of ciphers and reverts SSH to use the default set of ciphers.

| Parameter | Description |
|---|---|
| *<CIPHERS-LIST>* | Valid ciphers:<br>▪ **aes128-cbc**<br>▪ **aes192-cbc**<br>▪ **aes256-cbc**<br>▪ **aes128-ctr**<br>▪ **aes192-ctr**<br>▪ **aes256-ctr**<br>▪ **aes128-gcm@openssh.com**<br>▪ **aes256-gcm@openssh.com**<br>▪ **chacha20-poly1305@openssh.com**<br>Default set of ciphers in priority order (highest at top):<br>▪ **chacha20-1305@openssh.com**<br>▪ **aes128-ctr**<br>▪ **aes192-ctr**<br>▪ **aes256-ctr**<br>▪ **aes128-gcm@openssh.com**<br>▪ **aes256-gcUm@openssh.com** |

## Examples

Configuring SSH to use only specified ciphers in the priority order:

```
switch(config)# ssh ciphers chacha20-poly1305@openssh.com aes256-ctr aes256-cbc
```

Reverting SSH to use the default set of ciphers:

```
switch(config)# no ssh ciphers
```

For more information on features that use this command, refer to the Security Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## ssh host-key

```
ssh host-key {ecdsa [ecdsa-sha2-nistp256 | ecdsa-sha2-nistp384 | ecdsa-sha2-nistp521] |
    ed25519 | rsa [bits {2048 | 4096}] }
```

### Description

Generates an SSH host-key pair.

| Parameter | Description |
|---|---|
| `ecdsa` | Selects the ECDSA host-key pair type as **ecdsa-sha2-nistp256** (the default), **ecdsa-sha2-nistp384**, or **ecdsa-sha2-nistp521**. |
| `ed25519` | Selects the ED25519 host-key pair. |
| `rsa` | Selects the RSA host-key pair. Optionally, the key bit length is selected with either **bits 2048** (the default) or **bits 4096**. |

### Usage

When an SSH server is enabled on a VRF for the first time, host-keys are generated.

If the host-key of the given type exists, a warning message is displayed with a request to overwrite the previous host-key with the new key.

### Examples

Overwriting an old ECDSA host-key with a new ecdsa-sha2-nistp384 host-key:

```
switch(config)# ssh host-key ecdsa ecdsa-sha2-nistp384
ecdsa host-key will be overwritten.
Do you want to continue (y/n)?
```

Overwriting an old RSA host-key with a new RSA host-key with 2048 bits:

```
switch(config)# ssh host-key rsa bits 2048
rsa host-key will be overwritten.
Do you want to continue (y/n)?
```

Overwriting an ECDSA host-key with an ED25519 host-key pair:

```
switch(config)# ssh host-key ed25519
ed25519 host-key will be overwritten.
Do you want to continue (y/n)?
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## ssh host-key-algorithms

```
ssh host-key-algorithms <HOST-KEY-ALGORITHMS-LIST>
no ssh host-key-algorithms
```

### Description

Configures SSH to use a set of host key algorithms in the specified priority order. Host key algorithms specify which host key types are allowed to be used for the SSH connection. The first host key entered in the CLI is considered a first priority. Each option represents a type of key that can be used. Host keys are used to verify the host that you are connecting to. This configuration allows you to control which host key types are presented to incoming clients, or which host key types to receive first from hosts. Only the host key algorithms that are specified by the user are configured.

The **no** form of this command removes the configuration of host key algorithms and reverts SSH to use the default set of algorithms.

| Parameter | Description |
|---|---|
| *<HOST-KEY-ALGORITHMS-LIST>* | Default set of public key algorithms in priority order (highest at top), comprised of all possible valid algorithms:<br>▪ **ecdsa-sha2-nistp256**<br>▪ **ecdsa-sha2-nistp384**<br>▪ **ecdsa-sha2-nistp521**<br>▪ **ssh-ed25519**<br>▪ **rsa-sha2-256**<br>▪ **rsa-sha2-512**<br>▪ **ssh-rsa** |

### Examples

Configuring SSH to use only specified host key algorithms:

```
switch(config)# ssh host-key-algorithms ssh-rsa ssh-ed25519 ecdsa-sha2-nistp521
```

Reverting SSH to use the default set of host key algorithms:

```
switch(config)# no host-key-algorithms
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## ssh key-exchange-algorithms

```
ssh key-exchange-algorithms <KEY-EXCHANGE-ALGORITHMS-LIST>
no ssh key-exchange-algorithms
```

### Description

Configures SSH to use a set of key exchange algorithm types in the specified priority order. The first key exchange type entered in the CLI is considered a first priority. Key exchange algorithms are used to exchange a shared session key with a peer securely. Each option represents an algorithm that is used to distribute a shared key in a way that prevents outside interference, manipulation, or recovery. Only the key exchange algorithms that are specified by the user are configured.

The **no** form of this command removes the configuration of key exchange algorithms and reverts SSH to use the default set of algorithms.

| Parameter | Description |
|---|---|
| *<KEY-EXCHANGE-ALGORITHMS-LIST>* | Valid key exchange algorithms:<br>■ **curve25519-sha256**<br>■ **curve25519-sha256@libssh.org**<br>■ **diffie-hellman-group-exchange-sha1**<br>■ **diffie-hellman-group-exchange-sha256**<br>■ **diffie-hellman-group14-sha1**<br>■ **diffie-hellman-group14-sha256**<br>■ **diffie-hellman-group16-sha512**<br>■ **diffie-hellman-group18-sha512**<br>■ **ecdh-sha2-nistp256** |

| Parameter | Description |
|---|---|
| | ■ **ecdh-sha2-nistp384**<br>■ **ecdh-sha2-nistp521**<br>Default set of key exchange algorithms in priority order (highest at top):<br>■ **curve25519-sha256**<br>■ **curve25519-sha256@libssh.org**<br>■ **ecdh-sha2-nistp256**<br>■ **ecdh-sha2-nistp384**<br>■ **ecdh-sha2-nistp521**<br>■ **diffie-hellman-group-exchange-sha256**<br>■ **diffie-hellman-group16-sha512**<br>■ **diffie-hellman-group18-sha512**<br>■ **diffie-hellman-group14-sha256**<br>■ **diffie-hellman-group-exchange-sha1** |

### Examples

Configuring SSH to use a set of specified key exchange algorithms:

```
switch(config)# ssh key-exchange-algorithms ecdh-sha2-nistp256 curve25519-sha256
 diffie-hellman-group-exchange-sha256
```

Reverting SSH to use the default set of key-exchange-algorithms:

```
switch(config)# no key-exchange-algorithms
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## ssh known-host remove

`ssh known-host remove {all | {<IPv4-ADDRESS> | <HOSTNAME> | <IPv6-ADDRESS>} }`

### Description

Clears the list of trusted SSH servers for your user account. When you download or upload a file to or from a server using SFTP, you establish a trusted SSH relationship with that server. Each user account maintains its own set of SSH server host-keys for every server to which the user previously connected.

| Parameter | Description |
|---|---|
| `all` | Clears the trusted servers list. |
| *<IPv4-ADDRESS>* | Specifies the IPv4 address of the remote device. |
| *<HOSTNAME>* | Specifies the host name of the remote device. Range: up to 255 characters. |
| *<IPv6-ADDRESS>* | Specifies the IPv6 address of the remote device. |

### Examples

Clearing the trusted server list:

```
switch(config)# ssh known-host remove all
```

Removing a specified server from the trusted server list:

```
switch(config)# ssh known-host remove 1.1.1.1
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |

| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## ssh macs

```
ssh macs <MACS-LIST>
no ssh macs
```

### Description

Configures SSH to use a set of message authentication codes (MACs) in the specified priority order. The first MAC entered in the CLI is considered a first priority. MACs maintain the integrity of each message sent across an SSH connection. Each option represents an algorithm that can be used to provide integrity between peers. Only the MAC types that are specified by the user are configured.

The **no** form of this command removes the configuration of MACs and reverts SSH to use the default set of MACs.

| Parameter | Description |
|---|---|
| *<MACS-LIST>* | Valid MACs:<br>- **hmac-sha1**<br>- **hmac-sha1-96**<br>- **hmac-sha1-etm@openssh.com**<br>- **hmac-sha2-256**<br>- **hmac-sha2-512**<br>- **hmac-sha2-256-etm@openssh.com**<br>- **hmac-sha2-512-etm@openssh.com**<br>Default set of MACs in priority order (highest at top):<br>- **hmac-sha2-256-etm@openssh.com**<br>- **hmac-sha2-512-etm@openssh.com**<br>- **hmac-sha1-etm@openssh.com**<br>- **hmac-sha2-256**<br>- **hmac-sha2-512**<br>- **hmac-sha1** |

### Examples

Configuring SSH to use a set of specified MACs:

```
switch(config)# ssh macs hmac-sha2-256 hmac-sha2-512
```

Reverting SSH to use the default set of MACs:

```
switch(config)# no ssh macs
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## ssh maximum-auth-attempts

```
ssh maximum-auth-attempts <ATTEMPTS>
no maximum-auth-attempts
```

### Description

Sets the SSH maximum number of authentication attempts.

The **no** form of the command resets the maximum to its default of 6.

| Parameter | Description |
|---|---|
| *<ATTEMPTS>* | Specifies the maximum number of SSH authentication attempts. Range: 1 to 10. Default: 6. |

### Examples

Setting the maximum number of authentication attempts:

```
switch(config)# ssh maximum-auth-attempts 3
```

Resetting the maximum number of authentication attempts to its default of 6:

```
switch(config)# no maximum-auth-attempts
```

For more information on features that use this command, refer to the Security Guide for your switch model.

## ssh public-key-algorithms

```
ssh public-key-algorithms <PUBLIC-KEY-ALGORITHMS-LIST>
no ssh public-key-algorithms
```

### Description

Configures SSH to use a set of public key algorithms in the specified priority order. The first public key type entered in the CLI is considered a first priority. Public key algorithms specify which public key types can be used for public key authentication in SSH. Each option represents a public key type that the SSH server can accept or that the SSH client can present to a server. Only the public key algorithms that are chosen by the user are configured.

The **no** form of this command removes the configuration of public key algorithms and reverts SSH to use the default set.

| Parameter | Description |
|---|---|
| *<PUBLIC-KEY-ALGORITHMS-LIST>* | Default set of public key algorithms in priority order (highest at top), comprised of all possible valid algorithms:<br>■ **rsa-sha2-256**<br>■ **rsa-sha2-512**<br>■ **ssh-rsa**<br>■ **ecdsa-sha2-nistp256**<br>■ **ecdsa-sha2-nistp384**<br>■ **ecdsa-sha2-nistp521**<br>■ **ssh-ed25519**<br>■ **x509v3-rsa2048-sha256**<br>■ **x509v3-ssh-rsa**<br>■ **x509v3-sign-rsa**<br>■ **x509v3-ecdsa-sha2-nistp256**<br>■ **x509v3-ecdsa-sha2-nistp384**<br>■ **x509v3-ecdsa-sha2-nistp521** |

### Examples

Configuring SSH to use a set of specified public key algorithms:

```
switch(config)# ssh public-key-algorithms x509v3-ssh-rsa ssh-rsa rsa-sha2-256
```

Reverting SSH to use the default set of public key algorithms:

```
switch(config)# no ssh public-key-algorithms
```

For more information on features that use this command, refer to the Security Guide for your switch model.

# ssh server allow-list

```
ssh server allow-list
  ip <ipv4-addr>[mask]
```

```
ipv6 <ipv6-addr>[mask]
enable
no
```

## Description

Configure a list of addresses that will be the only hosts allowed to connect to the SSH servers running on all VRFs of the switch. By default, the allow-list is disabled and any host is allowed to connect given the correct authentication criteria. When the allow-list is enabled, only the hosts that fall under one of the entries may connect with the correct authentication criteria, all other hosts will be denied to attempt authentication.

| Parameter | Description |
|---|---|
| *ip <ipv4-addr>[mask]* | An allowed host IP address and (optional) subnet in any of the following formats:<br>▪ **A.B.C.D**: An allowed IPv4 address<br>▪ **A.B.C.D/M**: An allowed IPv4 subnet with prefix length<br>▪ **A.B.C.D W.X.Y.Z**: An allowed IPv4 address with network mask<br>▪ **A.B.C.D/W.X.Y.Z**: An allowed IPv4 address with network mask |
| *ipv6 <iv6p-addr>[mask]* | An allowed host IPv6 address and (optional) subnet in any of the following formats:<br>▪ **X:X::X:X**: An allowed IPv6 address<br>▪ **X:X::X:X/M**: An allowed IPv6 subnet |
| enable | Enable the allow-list. |
| no ... | Negate a command or set its default. |

## Usage

The allow-list can contain up to 20 entries of IPv4 or IPv6 addresses, including entire subnets. The order in which the entries are added to the list does not matter. The configuration will only take effect once the allow-list is enabled by issuing the **enable** command in the the *config-ssh-al* (**ssh server allow-list**) context.

When the allow-list is enabled, SSH servers on all VRFs will restart and all active SSH sessions will be terminated. The enabled allow-list may be modified to remove existing entries or add new entries, and each of those modifications will trigger an SSH server restart for all VRFs and will terminate all active SSH sessions, which may include the current user if they are connected via SSH. If you disable the allow-list before making changes and enabling the allow-list again once the changes are made, any host will be allowed to connect during the modification period before the allow-list is re-enabled. When the allow-list is disabled, the SSH servers on all VRFs will restart and active SSH sessions will persist.

Every SSH allow-list ends with an implicit **deny all** rule. When you add entries to an allow list, take care to avoid blocking connectivity to the SSH server. If an SSH allow-list is enabled with no entries configured, the **deny all** functionality will block all addresses, and the SSH server will be unusable.

## Examples

Configuring and enabling an SSH server allow list

```
switch(config)# ssh server allow-list
switch(config-ssh-al)# 1.1.1.1
switch(config-ssh-al)# enable
Active SSH sessions will be terminated.
Do you want to continue (y/n)?
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.12 | Command introduced |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` and `config-ssh-al` contexts | Administrators or local user group members with execution rights for this command. |

## ssh server port

```
ssh server port <PORT-NUMBER>
no ssh server port [<PORT-NUMBER>]
```

### Description

Configures SSH server to listen on a particular TCP port number. The default value is 22.

This port will be used for all VRFs that have SSH server enabled.

Configuring the TCP port number restarts the SSH server and terminates all active SSH sessions. It may take a few seconds for the SSH sessions to reach the running state on some VRFs.

The **no** form of the command resets the TCP port number to the default, 22.

| Parameter | Description |
|---|---|
| *<PORT-NUMBER>* | Specifies the TCP port number. Range: 1 to 65535. Default: 22. |

### Examples

Configuring TCP port number `19222`:

```
switch(config)# ssh server port 19222
```

Resetting the TCP port number to the default, `22`:

```
switch(config)# no ssh server port
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## ssh server vrf

```
ssh server vrf <VRF-NAME>
no ssh server vrf <VRF-NAME>
```

### Description

Enables the SSH server on the specified VRF. SSH is disabled by default and will not be operational till the admin password is set on the switch. Note that the admin password is considered set even if it is configured to be empty.

The **no** form of the command disables the SSH server on the specified VRF. If no VRF is specified, by default the SSH server will be enabled on the **default** or **mgmt** VRF, depending on the switch model.

| Parameter | Description |
|---|---|
| `vrf <VRF-NAME>` | Specifies the VRF name. |

### Examples

Enabling the SSH server on the management VRF:

```
switch(config)# ssh server vrf mgmt
```

Disabling the SSH server on the management VRF:

```
switch(config)# no ssh server vrf mgmt
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |

# Chapter 148

# Static routing commands

## ip route

```
ip route <DEST-IPV4-ADDR>/<NETMASK> {<NEXTHOP-ADDR> | <NEXTHOP-PORT-LAG-VLAN> | reject |
   nullroute}
no ip route <DEST-IPV4-ADDR>/<NETMASK> {<NEXTHOP-ADDR> | <NEXTHOP-PORT-LAG-VLAN> | reject
|
   nullroute}
```

### Description

Adds an IPv4 static route on the default VRF.

The **no** form of this command deletes a IPv4 static route.

You can configure a maximum of 32 next hops per route.

| Parameter | Description |
|---|---|
| *<DEST-IPV4-ADDR>/<NETMASK>* | Specifies the IPv4 route destination. |
| *<NEXTHOP-ADDR>* | Specifies the next hop address for reaching the destination in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. |
| *<NEXTHOP-PORT-LAG-VLAN>* | Specifies the next hop as an outgoing interface. |
| nullroute | Specifies that packets matching the destination route are silently discarded and no ICMP error notification is sent to the sender. |
| reject | Specifies that packets matching the destination route are discarded and an ICMP error notification is sent to the sender. |

### Examples

*On the 6400 Switch Series, interface identification differs.*

```
switch(config)# ip route 10.0.0.0/24 nullroute
switch(config)# ip route 10.0.1.0/24 reject
switch(config)# ip route 10.0.2.0/24 20.0.0.2
switch(config)# ip route 10.0.3.0/24 1/1/1
switch(config)# ip route 10.0.3.0/24 1/1/1.110
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.10 | Inclusive language update. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## ip route bfd

```
ip route <DEST-IPV4-ADDR>/<NETMASK> [<NEXT-HOP-IP-ADDR> | <INTERFACE>] [bfd]
no ip route <DEST-IPV4-ADDR>/<NETMASK> [<NEXT-HOP-IP-ADDR> | <INTERFACE>] [bfd]
```

### Description

Enables or disables BFD on the specified static route. To disable BFD, issue the command without the `bfd` option.

| Parameter | Description |
|---|---|
| *<DEST-IPV4-ADDR>* | Specifies a route destination in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. |
| *<NETMASK>* | Specifies the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128. |
| *<NEXT-HOP-IP-ADDR>* | Specifies the next hop address for reaching the destination in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. |
| *<INTERFACE>* | Specifies the next hop as an outgoing interface. |
| `bfd` | Enables BFD on the static route. Omit this parameter to disable BFD. |

### Examples

*On the 6400 Switch Series, interface identification differs.*

Enabling BFD on a static route:

```
switch(config)# interface 1/1/1
switch(config-if)# ip address 20.1.1.2/24
switch(config-if)# no shutdown
switch(config-if)# routing
switch(config-if)# exit
switch(config)# ip route 192.0.0.0/8 20.1.1.1 bfd
```

Disabling BFD on a static route:

```
switch(config)# ip route 192.0.0.0/8 20.1.1.1
```

For more information on features that use this command, refer to the High Availability Guide or IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |

# ip route distance

```
ip route <DEST-IPV4-ADDR>/<NETMASK> [<NEXT-HOP-IP-ADDR>|<INTERFACE>] distance <VALUE>
no ip route <DEST-IPV4-ADDR>/<NETMASK> [<NEXT-HOP-IP-ADDR>|<INTERFACE>] distance <VALUE>
```

### Description

Configures the administrative distance for the IPv4 static route.

The **no** form of this command deletes the static route.

| Parameter | Description |
|---|---|
| *<DEST-IPV4-ADDR>>* | Specifies an IP address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. |
| *<MASK>* | Specifies the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 32. |
| *<NEXT-HOP-IP-ADDR>* | Specifies the next hop IPv4 address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. |
| *<INTERFACE>* | Specifies the next hop as an outgoing interface. |
| distance *<VALUE>* | Specifies the administrative distance to associate with this static route. Default: 1. Range: 1-255. |

### Examples

```
switch(config)# ip route 10.0.2.0/24 20.0.0.2 distance 4
switch(config)# ip route 10.0.3.0/24 1/1/1 distance 6
switch(config)# no ip route 10.0.3.0/24 1/1/1 distance 6
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |

## ip route tag

```
ip route <DEST-IPV4-ADDR>/<NETMASK> {<NEXTHOP-ADDR> | <NEXTHOP-PORT-LAG-VLAN> | reject |
   nullroute} [tag] <1-4294967295>
no ip route <DEST-IPV4-ADDR>/<NETMASK> {<NEXTHOP-ADDR> | <NEXTHOP-PORT-LAG-VLAN> | reject
|
   nullroute} [tag] <1-4294967295>
```

### Description

Configures tag for IPv4 static route.

The **no** form of this command deletes tag for IPv4 static route.

| Parameter | Description |
|---|---|
| *<DEST-IPV4-ADDR>/<NETMASK>* | Specifies the IPv4 route destination. |
| *<NEXTHOP-ADDR>* | Specifies the next hop address for reaching the destination in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. |
| *<NEXTHOP-PORT-LAG-VLAN>* | Specifies the next hop as an outgoing interface. |
| `reject` | Specifies that packets matching the destination route are discarded and an ICMP error notification is sent to the sender. |
| `nullroute` | Specifies that packets matching the destination route are silently discarded and no ICMP error notification is sent to the sender. |
| `tag` | Specifies and assigns tag for the route. |

### Examples

```
switch(config)# ip route 10.1.1.1/32 20.1.1.2 tag 10
switch(config)# ip route 10.1.1.5/32 1/1/1 tag 20
```

```
switch(config)# no ip route 10.1.1.1/32 20.1.1.2 tag 10
switch(config)# no route 10.1.1.5/32 1/1/1 tag 20
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.10 | Inclusive language update. |

## ip route vrf

```
ip route <DEST-IPV4-ADDR>/<MASK> [<NEXT-HOP-IP-ADDR>|<INTERFACE>|reject|nullroute]
   vrf <VRF-NAME>
no ip route <DEST-IPV4-ADDR>/<MASK> [<NEXT-HOP-IP-ADDR>|<INTERFACE>|reject|nullroute]
   vrf <VRF-NAME>
```

### Description

Adds the destination IPv4 static route on the specified VRF. If no *<VRF-NAME>* is specified the route is applied to the default VRF.

The **no** form of this command removes the IPv4 static route from the VRF.

| Parameter | Description |
|---|---|
| *<DEST-IPV6-ADDR>* | Specifies the route destination in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. |
| *<MASK>* | Specifies the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128. |
| *<NEXT-HOP-IP-ADDR>* | Specifies the next hop in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. |
| *<INTERFACE>* | Specifies the next hop as an outgoing interface. |
| `nullroute` | Silently discards packets to the destined route. |

| Parameter | Description |
|---|---|
| `reject` | Discards packets to the destined route and returns an ICMP error to the sender. |
| `vrf <VRF-NAME>` | Specifies a VRF name. |

### Examples

```
switch(config)# ip route 20.0.0.0/8 10.20.30.44 vrf myvrf
switch(config)# ip route 20.1.2.0/24 1/1/30 vrf myvrf
switch(config)# ip route 1.2.3.4/32 nullroute vrf myvrf
switch(config)# ip route 1.2.3.4/32 reject vrf myvrf
```

```
switch(config)# no ip route 20.0.0.0/8 10.20.30.44 vrf myvrf
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.10 | Inclusive language update. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

# ipv6 route

```
ipv6 route <DEST-IPV6-ADDR>/<NETMASK> {<NEXTHOP-ADDR> | <NEXTHOP-PORT-LAG-VLAN> | reject
|   nullroute}
no ipv6 route <DEST-IPV6-ADDR>/<NETMASK> {<NEXTHOP-ADDR> | <NEXTHOP-PORT-LAG-VLAN> |
   reject | nullroute}
```

### Description

Adds an IPv6 static route.

The **no** form of this command deletes an IPv6 static route on the default VRF.

| Parameter | Description |
|---|---|
| *<DEST-IPV6-ADDR>* | Specifies the route destination in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a |

| Parameter | Description |
|---|---|
|  | hexadecimal number from 0 to F. |
| *<NETMASK>* | Specifies the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128. |
| *<NEXTHOP-ADDR>* | Specifies the next hop in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F. |
| *<NEXTHOP-PORT-LAG-VLAN>* | Specifies the next hop as an outgoing interface. |
| `reject` | Specifies that packets matching the destination route are discarded and an ICMP error notification is sent to the sender. |
| `nullroute` | Specifies that packets matching the destination route are silently discarded and no ICMP error notification is sent to the sender. |

## Usage

On the 6200, 6300, 6400, 8100, and 8360 switch series, a limited number of IPv6 routes with prefixes from 65-127 can be programmed in the ASIC; this allows for hardware/line-rate forwarding for traffic that matches these routes. Any additional IPv6 routes are software forwarded. (Routing performance to destination addresses on these networks may be impacted.) Use the **show capacities l3-resources** command to see the **maximum number of IPv6 routes with these prefix lengths** that can be configured in the ASIC. These prefixes are recommended for transit network use only.

Refer to **show capacities** in the ACLs and Classifiers Policy Guide to see the **maximum number of IPv6 routes with prefixes 65-127** that can be configured on the ASIC. Refer to **show capacities-status** in the ACLs and Classifiers Policy Guide to see the maximum number and current consumption.

This limited hardware support for long prefix IPv6 routes applies whether the routes are configured statically or learned dynamically.

## Examples

*On the 6400 Switch Series, interface identification differs.*

```
switch(config)# ipv6 route 120::/124 nullroute
switch(config)# ipv6 route 121::/124 nullroute
switch(config)# ipv6 route 122::/124 1/1/1
switch(config)# ipv6 route 122::/124 1/1/1.110
```

```
switch(config)# no ipv6 route 122::/124 1/1/1.110
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

## Command History

## ipv6 route distance

```
ipv6 route <DEST-IPV6-ADDR>/<MASK> [<NEXT-HOP-IP-ADDR>|<INTERFACE>] distance <VALUE>
no ipv6 route <DEST-IPV6-ADDR>/<MASK> [<NEXT-HOP-IP-ADDR>|<INTERFACE>] distance <VALUE>
```

### Description

Configures the administrative distance for the IPv6 static route

The **no** form of this command deletes the static route.

| Parameter | Description |
|---|---|
| *<DEST-IPV6-ADDR>* | Specifies the route destination address in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F. |
| *<MASK>* | Specifies the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128. |
| *<NEXT-HOP-IP-ADDR>* | Specifies the next hop in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F. |
| *<INTERFACE>* | Specifies the next hop as an outgoing interface. |
| distance *<VALUE>* | Specifies the administrative distance to associate with this static route. Range: 1 to 255. Default: 1. |

### Examples

*On the 6400 Switch Series, interface identification differs.*

```
switch(config)# ipv6 route 122::/124 1/1/1 distance 5
switch(config)# ipv6 route 123::/124 120::1 distance 6
```

```
switch(config)# no ipv6 route 123::/124 120::1 distance 6
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |

## ipv6 route tag

```
ipv6 route <DEST-IPV6-ADDR>/<NETMASK> {<NEXTHOP-ADDR> | <NEXTHOP-PORT-LAG-VLAN> | reject
|
   nullroute} [tag] <1-4294967295>
no ipv6 route <DEST-IPV6-ADDR>/<NETMASK> {<NEXTHOP-ADDR> | <NEXTHOP-PORT-LAG-VLAN> |
   reject | nullroute} [tag] <1-4294967295>
```

### Description

Configures tag for IPv6 static route.

| Parameter | Description |
|---|---|
| *<DEST-IPV6-ADDR>* | Specifies the route destination in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F. |
| *<NETMASK>* | Specifies the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128. |
| *<NEXTHOP-ADDR>* | Specifies the next hop in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F. |
| *<NEXTHOP-PORT-LAG-VLAN>* | Specifies the next hop as an outgoing interface. |
| `reject` | Specifies that packets matching the destination route are discarded and an ICMP error notification is sent to the sender. |
| `nullroute` | Specifies that packets matching the destination route are silently discarded and no ICMP error notification is sent to the sender. |
| `tag` | Specifies and assigns tag for the route. |

### Examples

```
switch(config)# ipv6 route 3001::1/128 1/1/1 tag 10
switch(config)# ipv6 route 3002::1/128 1000::2 tag 20
switch(config)# no ipv6 route 3001::1/128 1/1/1 tag 10
switch(config)# no ipv6 route 3002::1/128 1000::2 tag 20
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## show ip rib

```
show ip rib <FILTER> [vrf <VRF-NAME>]
```

### Description

Shows the IPv4 Routing Information Base (RIB) of VRF with name (**<VRF-NAME>**). If VRF name is not specified, default VRF routes are displayed.

| Parameter | Description |
|---|---|
| *<FILTER>* | Selects filter, see Usage section. |
| vrf *<VRF-NAME>* | Specifies the VRF name. |

### Usage

There are sub-options available within this command:

- **A.B.C.D:** Shows longest prefix match.
- **A.B.C.D/M:** Shows exact route match.
- **all-vrfs:** Shows all VRF information.
- **bgp:** Shows BGP routes only.
- **connected:** Shows connected routes only.
- **connected:** Shows connected routes only.
- **local:** Shows local routes only.
- **ospf:** Shows OSPF routes only.
- **rip:** Shows RIP routes only.
- **static:** Shows static routes only.

- **summary:** Shows aggregate count of routes per routing protocol.
- **vrf:** Specifies the VRF name.
- **selected:** Shows routes selected for forwarding only.
- **non-selected:** Shows routes not selected for forwarding only.

The output of the **show ip rib** commands are not available in information generated by the **show tech files** command. This information is now available in the file ipv4_rib_dump.gz, which can be generated using the command **sudo ovs-appctl -t hpe-routing hpe-metaswitch/show_ip_rib ipv4 all-vrfs**.

## Examples

Showing IPv4 routes in RIB for 8325, 10000, 8360, and 9300 switch series:

```
switch# show ip rib
Origin Codes: R - RIP, O - OSPFv2, B - BGP
              C - connected, S - static, H - host-routes
Type Codes:   E - External BGP, I - Internal BGP, IA - OSPF inter area
              E1 - OSPF external type 1, E2 - OSPF external type 2
* indicates selected for forwarding

VRF: default

Prefix          Nexthop      Interface   VRF       Origin/ Distance/ Age
                                                       Type    Metric
----------------------------------------------------------------------------------
--
*1.1.1.1/32     -            1/1/33      -         H      [1/0]
00h:00m:07s
*10.0.0.0/30    -            1/1/1       -         S      [20/0]
0d:10h:01m:41s
*10.0.1.0/30    -            1/1/1       -         B/I    [200/0]
2d:20h:01m:42s
*10.1.64.0/18   -            loopback2   -         C      [0/0]      -

0d:04h:03m:43s

Total Route Count : 14
```

Showing IPv4 exact route match in RIB:

```
switch# show ip rib 10.0.0.0/30

VRF : default

Prefix          : 10.0.0.0/30            VRF(egress)        :  -
Nexthop         :  -                     Interface          :  1/1/1
Origin          : Connected              Type               :  -
Distance        : 0                      Metric             :  0
Age             : -                      Tag                :  0
Selected        : Yes                    Recursive Nexthop  :  No
```

Showing IPv4 RIB summary:

```
switch# show ip rib summary

IPv4 RIB Table Summary

VRF name :      default
  Protocol      RIB Routes
```

```
-------------- -------------
connected      1010
local          1011
static         4
ospfv2         509
bgp            9014
selected       10008
non-selected   1518
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|

## show ipv6 rib

`show ipv6 rib <FILTER> [vrf <VRF-NAME>]`

### Description

Shows the IPv6 Routing Information Base (RIB) of VRF with name (**<VRF-NAME>**). If VRF name is not specified, default VRF routes are displayed.

| Parameter | Description |
|---|---|
| *<FILTER>* | Selects filter, see usage section. |
| vrf *<VRF-NAME>* | Shows routes in the VRF and specifies VRF name. |

### Usage

There are sub-options available within this command:

- **X:X: :X:X:** Shows longest prefix match.
- **X:X: :X:X/M:** Shows exact route match.
- **all-vrfs:** Shows all VRF information.
- **bgp:** Shows BGP routes only.
- **connected:** Shows connected routes only.
- **local:** Shows local routes only.

- **ospf:** Shows OSPF routes only.
- **rip:** Shows RIP routes only.
- **static:** Shows static routes only.
- **summary:** Shows aggregate count of routes per routing protocol.
- **vrf:** Specifies the VRF name.
- **selected:** Shows routes selected for forwarding only.
- **non-selected:** Shows routes not selected for forwarding only.

## Examples

Showing IPv6 routes in RIB for 8325, 10000, 8360, and 9300 switch series:

```
switch# show ipv6 rib
Origin Codes: R - RIPng, O - OSPFv3, B - BGP
              C - connected, S - static, H - host-routes
Type Codes:   E - External BGP, I - Internal BGP, IA - OSPF inter area
              E1 - OSPF external type 1, E2 - OSPF external type 2
* indicates selected for forwarding

VRF: default

Prefix               Nexthop     Interface  VRF    Origin/ Distance/ Age
                                                       Type    Metric
----------------------------------------------------------------------------------
--
*1::2/128            1::2        1/1/1      -      H      [1/0]        00h:00m:06s
*1000::/64           -           1/1/1      -      C      [0/0]     -
*1000::8/128         -           1/1/1      -      L      [0/0]     -
*1001:db8::/32       1000::10    1/1/1      -      B/I    [200/0]   1d:20h:01m:42s
*2000::/64           fe80::3182  vlan100    -      S      [1/0]     2d:05h:03m:43s
 2000::/64           fe80::1241  1/1/1      -      O/E1   [110/25]  0d:05h:03m:43s
*2000::2000:0:0:0/67 fe80::1111  lag1       Green  B/E    [20/0]    1d:10h:01m:45s
*3001::0/64          -           vlan100    -      C      [0/0]     -
*3001::1/128         -           vlan100    -      L      [0/0]     -
*6101::0/64          -           nullroute  -      S      [1/0]
12d:10h:01m:43s

Total Route Count : 10
```

Showing IPv6 routes in RIB for the other switch series:

```
switch# show ipv6 rib
Origin Codes: R - RIPng, O - OSPFv3, B - BGP
              C - connected, S - static, D- DHCP
Type Codes:   E - External BGP, I - Internal BGP, IA - OSPF inter area
              E1 - OSPF external type 1, E2 - OSPF external type 2
* indicates selected for forwarding

VRF: default

Prefix               Nexthop     Interface  VRF    Origin/ Distance/ Age
                                                       Type    Metric
----------------------------------------------------------------------------------
--
*1000::/64           -           1/1/1      -      C      [0/0]     -
*1000::8/128         -           1/1/1      -      L      [0/0]     -
*1001:db8::/32       1000::10    1/1/1      -      B/I    [200/0]   1d:20h:01m:42s
```

```
*2000::/64           fe80::3182  vlan100    -      S      [1/0]      2d:05h:03m:43s
 2000::/64           fe80::1241  1/1/1      -      O/E1   [110/25]   0d:05h:03m:43s
*2000::2000:0:0:0/67 fe80::1111  lag1       Green  B/E    [20/0]     1d:10h:01m:45s
*3001::0/64          -           vlan100    -      C      [0/0]      -
*3001::1/128         -           vlan100    -      L      [0/0]      -
*6101::0/64          -           nullroute  -      S      [1/0]
12d:10h:01m:43s

Total Route Count : 10
```

Showing IPv6 exact route match in RIB:

```
switch# show ipv6 rib 2000::2000:0:0:0

VRF : default

Prefix           : 2000::2000:0:0:0/67         VRF(egress)        :  Green
Nexthop          : fe80::1111                  Interface          :  lag1
Origin           : BGP                         Type               :  External
Distance         : 20                          Metric             :  0
Age              : 1d:10h:01m:45s              Tag                :  20
Selected         : Yes                         Recursive Nexthop  :  Yes
```

Showing IPv6 RIB summary:

```
switch# show ipv6 rib summary

IPv6 RIB Table Summary

VRF name :  default
  Protocol       RIB Routes
-------------- -------------
connected      1009
local          1010
static         3
ospfv3         508
bgp            1013

selected       10004
non-selected   1527
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.10 | Inclusive language update. |
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|

# ipv6 route vrf

```
ipv6 route <DEST-IPV6-ADDR>/<PREFIX> [<NEXT-HOP-IP-ADDR>|<INTERFACE>|reject|nullroute]
vrf <VRF-NAME>
no ipv6 route <DEST-IPV6-ADDR>/<PREFIX> [<NEXT-HOP-IP-ADDR>|<INTERFACE>|reject|nullroute]
vrf <VRF-NAME>
```

## Description

Adds an IPv6 static route in the specified VRF. If no *<VRF-NAME>* is specified it is added to the default VRF.

The **no** form of this command removes an IPv6 static route from the VRF.

| Parameter | Description |
|---|---|
| *<DEST-IPV6-ADDR>* | Specifies an IP address in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F. |
| *<MASK>* | Specifies the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128. |
| *<NEXT-HOP-IP-ADDR>* | Specifies the next hop in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F. |
| *<INTERFACE>* | Specifies the next hop as an outgoing interface. |
| nullroute | Specifies that packets matching the destination prefix are silently discarded and no ICMP error notification is sent to the sender. |
| reject | Specifies that packets matching the destination prefix are discarded and an ICMP error notification is sent to the sender. |
| vrf *<VRF-NAME>* | Specifies the name of a VRF. Default: default. |

## Examples

```
switch(config)# ipv6 route 120::/124 121::2 vrf test
switch(config)# ipv6 route 121::/124 1/1/9 vrf test
switch(config)# ipv6 route 122::/124 nullroute vrf test
switch(config)# ipv6 route 123::/124 reject vrf test
```

```
switch(config)# no ipv6 route 120::/124 121::2 vrf test
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.10 | Inclusive language update. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## show ip route

```
show ip route [<A.B.C.D> | <A.B.C.D/M> | all-vrfs | bgp | connected | local | ospf |
static | summary | vrf <VRF-NAME>] [vsx-peer]
```

### Description

Displays IPv4 route tables.

| Parameter | Description |
|---|---|
| **`<A.B.C.D>`** | Display longest prefix match. |
| **`<A.B.C.D/M>`** | Display exact route match. |
| `all-vrfs` | Display information for all VRFs. |
| `bgp` | Display bgp routes only. |
| `connected` | Display connected routes only. |
| `local` | Display local routes only. |
| `ospf` | Display ospf routes only. |
| `static` | Display static routes only. |
| `summary` | Display the aggregate count of routes per routing protocol. |
| `vrf` *`<vrf-name>`* | Specify a VRF by VRF name (if no <*VRF-NAME*> is specified, the default VRF is implied. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Examples

Showing IPv4 route tables:

```
switch# show ip route

Displaying ipv4 routes selected for forwarding

'[x/y]' denotes [distance/metric]
10.0.0.0/24, vrf default
     via  vlan2,  [0/0],  connected
10.0.0.1/32, vrf default
     via  vlan2,  [0/0],  local
10.100.11.0/24, vrf default
     via  vlan1,  [0/0],  connected
10.100.11.82/32, vrf default
     via  vlan1,  [0/0],  local
20.0.0.0/24, vrf default
     via  10.0.0.2,  [1/0],  static
20.0.1.0/24, vrf default
     via  10.0.0.2,  [1/0],  static
20.0.2.0/24, vrf default
     via  vlan1,  [1/0],  static
20.0.4.0/24, vrf default
     nullroute,  [1/0],  static
20.0.5.0/24, vrf default
     reject route,  [1/0],  static
```

Showing IPv4 route tables for the test VRF:

```
switch# show ip route vrf test

Displaying ipv4 routes selected for forwarding

'[x/y]' denotes [distance/metric]

30.0.0.0/24,  1 (nullroute) next-hops
       via  30.0.0.2,  [0/0],  connected
90.0.0.0/24,  1 unicast next-hops
       via  30.0.0.1,  [1/0],  static
90.0.1.0/24,  1 unicast next-hops
       via  1/1/2,  [1/0],  static
90.0.3.0/24, nullroute, 1, [1/0], static
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

# show ipv6 route

```
show ipv6 route [<X.X.X.X> | <X.X.X.X/M> | all-vrfs | bgp | connected | local | ospf |
static | summary | vrf <vrf-name>] [vsx-peer]
```

## Description

Displays IPv6 route tables.

| Parameter | Description |
|---|---|
| **`<X.X.X.X>`** | Display exact route match. |
| **`<X.X.X.X/M>`** | Display exact route match. |
| `all-vrfs` | Display information for all VRFs. |
| `bgp` | Display bgp routes only. |
| `connected` | Display connected routes only. |
| `local` | Display local routes only. |
| `ospf` | Display ospf routes only. |
| `static` | Display static routes only. |
| `summary` | Display the aggregate count of routes per routing protocol. |
| `vrf` *`<vrf-name>`* | Specify a VRF by VRF name (if no <*VRF-NAME*> is specified, the default VRF is implied. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

## Example

Showing IPv6 route tables:

```
switch# show ipv6 route

Displaying ipv6 routes selected for forwarding

'[x/y]' denotes [distance/metric]

1000::/64, vrf default
        via  vlan2,  [0/0],  connected
1000::1/128, vrf default
        via  vlan2,  [0/0],  local
2000::/64, vrf default
        via  vlan2,  [1/0],  static
2001::/64, vrf default
        via  1000::2,  [1/0],  static
3000:2301::/64, vrf default
        nullroute,  [1/0],  static
4000:2301::/64, vrf default
        reject route,  [1/0],  static
```

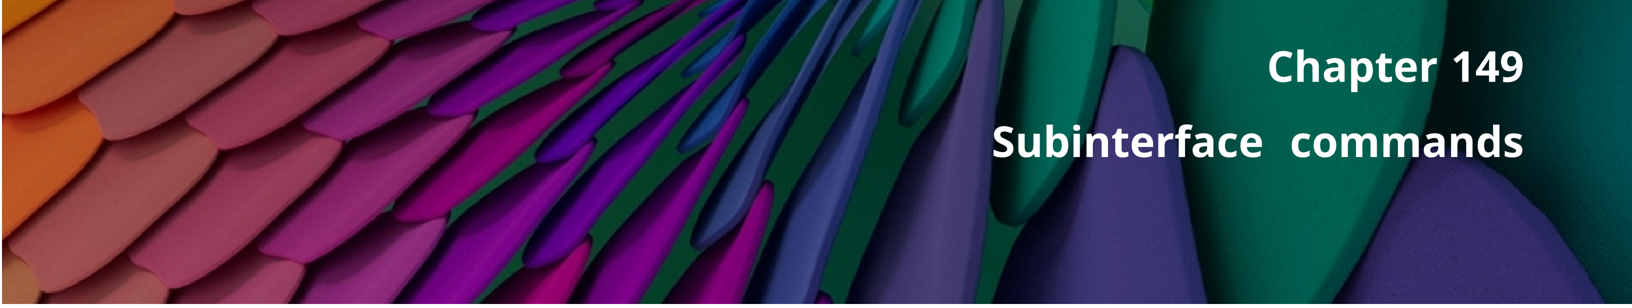
For more information on features that use this command, refer to the IP Routing Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.10 | Inclusive language update. |
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |



# Chapter 149
# Subinterface commands

## encapsulation dot1q

```
encapsulation dot1q <VLAN-ID>
no encapsulation dot1q <VLAN-ID>
```

### Description

Configures 802.1Q encapsulation on a subinterface.

The **no** form of this command removes 802.1Q encapsulation on a subinterface.

| Parameter | Description |
|---|---|
| *<VLAN-ID>* | Specifies encapsulation VLAN ID.<br>Range 1 to 4094.<br>**NOTE:** The encapsulation VLAN ID should be unique within an L3 LAG subinterface. The same encapsulation VLAN ID can be configured among different parent interfaces, but the encapsulation VLAN ID should not be configured in the internal VLAN range. (Encapsulation VLAN IDs and static VLANs are entirely different and do not coincide.) |

### Usage

Associates an 802.1Q VLAN ID with a subinterface.

### Examples

Configuring 802.1Q encapsulation on a subinterface:

```
switch(config)# interface 1/1/1.201
switch(config-subif)# encapsulation dot1q 10
```

Removing 802.1Q encapsulation on a subinterface:

```
switch(config-subif)# no encapsulation dot1q 10
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.08 | Command introduced for the 6300, 6400switch series. |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-subif` | Administrators or local user group members with execution rights for this command. |

## interface

```
interface <IFNAME>.<ID>
no interface <IFNAME>.<ID>

interface lag <LAGNUM>.<ID>
no interface lag <LAGNUM>.<ID>
```

### Description

Creates a subinterface on an L3 interface and enters subinterface configuration mode. The subinterface name consists of the parent interface name (for example, 1/1/1) followed by a period and a unique ID number.

The **no** form of these commands deletes a subinterface from an L3 interface.

| Parameter | Description |
|---|---|
| *<IFNAME>* | Specifies L3 interface name. |
| *<ID>* | Specifies subinterface ID. Range 1 to 4094. |
| *<LAGNUM>* | Specifies L3 LAG interface number. |

### Usage

To create a LAG subinterface, the parent LAG must exist before creating the subinterface.

### Examples

Creating a subinterface on L3 interface 1/1/1.201 and entering subinterface configuration mode:

```
switch(config)# interface 1/1/1.201
switch(config-subif)#
```

Deleting subinterface on L3 interface 1/1/1.201:

```
switch(config)# no interface 1/1/1.201
```

Creating a subinterface on an L3 LAG port and entering subinterface configuration mode:

```
switch(config)# interface lag 1
switch(config-if)# interface lag 1.201
switch(config-subif)#
```

Deleting subinterface on an L3 LAG port :

```
switch(config)# no interface lag 1.201
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.08 | Command introduced for the 6300, 6400 switch series. |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## show capacities subinterface

`show capacities subinterface`

### Description

Displays maximum subinterface capacity.

### Examples

Showing maximum subinterface capacity:

```
switch# show capacities subinterface

System Capacities: Filter Subinterface
Capacities Name
Value
---------------------------------------------------------------------------------
-
Maximum number of LAG subinterfaces for the entire system
256
Maximum number of LAG members when the LAG has subinterfaces
4
Maximum number of normal subinterfaces for the entire system
1024
Maximum number of subinterface resources for the entire system (normal+(4*LAG)
1024
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.08 | Command introduced for the 6300, 6400 switch series. |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Auditors or Administrators or local user group members with execution rights for this command. Auditors can execute this command from the auditor context (auditor>) only. |

## show interface

```
show interface <IFNAME>.<ID>
show interface lag <LAGNUM>.<ID>
```

### Description

Displays a subinterface configuration.

| Parameter | Description |
|---|---|
| *<IFNAME>* | Specifies L3 interface name. |
| *<ID>* | Specifies subinterface ID. |
| *<LAGNUM>* | Specifies L3 LAG interface number. |

### Examples

Showing subinterface configuration:

```
switch# show interface 1/1/1.201
Interface 1/1/1.201 is down
Admin state is up
State information: Waiting for link
Description:
Hardware: Ethernet, MAC Address: 38:21:c7:5a:80:80
Encapsulation dot1Q ID: 10
Statistic                          RX                   TX                Total
---------------- -------------------- -------------------- --------------------
L3 Packets                          0                    0                    0
L3 Bytes                            0                    0                    0
```

Showing subinterface LAG configuration:

```
switch# show interface lag1.1
Interface lag1.1 is down
Admin state is up
Description:
Hardware: Ethernet, MAC Address: 38:21:c7:5a:80:80
Encapsulation dot1Q ID: 2
Statistic                                 RX                   TX                Total
---------------- -------------------- -------------------- --------------------
L3 Packets                                 0                    0                    0
L3 Bytes                                   0                    0                    0
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.08 | Command introduced for the 6300, 6400 switch series. |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Auditors or Administrators or local user group members with execution rights for this command. Auditors can execute this command from the auditor context (auditor>) only. |

# Chapter 150

# Supportability copy commands

## copy checkpoint

```
copy checkpoint <CHECKPOINT-NAME> {<STORAGE-URL> | <REMOTE-URL>}
```

### Description

Copies the checkpoint using TFTP, SFTP, SCP, or USB.

| Parameter | Description |
|---|---|
| *<CHECKPOINT-NAME>* | Specifies the checkpoint name. |
| {*<STORAGE-URL>* \| *<REMOTE-URL>*} | Select either the storage URL or the remote URL for the destination of the copied command output. Required. |
| *<STORAGE-URL>* | Specifies the USB to copy command output.<br>Syntax:<br>**{usb}:/*<FILE>*** |
| *<REMOTE-URL>* | Specifies the URL to copy the command output.<br>Syntax:<br>■ **{tftp://}{*<IP>* \| *<HOST>*}[:*<PORT>*][;blocksize=*<VAL>*]/*<FILE>***<br>■ **{sftp:// \| scp:// *<USER>*@}{*<IP>* \| *<HOST>*}[:*<PORT>*]/*<FILE>*** |

### Examples

Copying checkpoint chpt to a remote URL:

```
switch# copy checkpoint chpt scp://root@10.0.1.1/config vrf mgmt
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.08 | Added SCP support. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (#) | Auditors or Administrators or local user group members with execution rights for this command. Auditors can execute this command from the auditor context (auditor>) only. |

# copy command-output

```
copy command-output "<COMMAND>" {<STORAGE-URL> | <REMOTE-URL> [vrf <VRF-NAME>]}
```

## Description

Copies the specified command output using TFTP, SFTP, SCP, or USB.

| Parameter | Description |
|---|---|
| *<COMMAND>* | Specifies the command from which you want to obtain its output. Required. Users with auditor rights can specify these two commands only:<br>**show accounting log**<br>**show events** |
| {*<STORAGE-URL>* \| *<REMOTE-URL>* [vrf *<VRF-NAME>*]} | Select either the storage URL or the remote URL for the destination of the copied command output. Required. |
| *<STORAGE-URL>* | Specifies the USB to copy command output.<br>Syntax:<br>**{usb}:/*<FILE>*** |
| *<REMOTE-URL>* | Specifies the URL to copy the command output.<br>Syntax:<br>■ **{tftp://}{*<IP>* \| *<HOST>*}[:*<PORT>*][;blocksize=*<VAL>*]/*<FILE>***<br>■ **{sftp:// \| scp:// *<USER>*@}{*<IP>* \| *<HOST>*}[:*<PORT>*]/*<FILE>*** |
| vrf *<VRF-NAME>* | Specifies the VRF name. The default VRF name is default. Optional. |

## Examples

Copying the output from the **show events** command to a remote URL:

```
switch# copy command-output "show events" tftp://10.100.0.12/file
```

Copying the output from the **show tech** command to a remote URL with a VRF named *mgmt*:

```
switch# copy command-output "show tech" scp://user@10.100.0.12/file vrf mgmt
```

Copying the output from the **show tech** command to a remote URL with a VRF named *mgmt*:

```
switch# copy command-output "show tech" tftp://10.100.0.12/file vrf mgmt
```

Copying the output from the **show events** command to a file named **events** on a USB drive:

```
switch# copy command-output "show events" usb:/events
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.08 | Added SCP support. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (#) | Auditors or Administrators or local user group members with execution rights for this command. Auditors can execute this command from the auditor context (auditor>) only. |

## copy core-dump [<MEMBER/SLOT>] daemon

```
copy core-dump [<MEMBER/SLOT>] daemon <DAEMON-NAME>[:<INSTANCE-ID>] <REMOTE-URL> [vrf
<VRF-NAME>]
```

### Description

Copies the core-dump from the specified daemon using TFTP, SFTP, SCP, or USB.

| Parameter | Description |
|---|---|
| *<MEMBER/SLOT>* | Specifies the slot ID on an 8400 or 6400 switch. Required.<br>Syntax: Slot number for line (**1/1-1/4**, **1/7-1/10**) MM(**1/5** or **1/6**) |
| *<DAEMON-NAME>* | Specifies the name of the daemon. Required. |
| [:*<INSTANCE-ID>*] | Specifies the instance of the daemon core dump. Optional. |
| *<REMOTE_URL>* | Specifies the remote destination URL. Required. The syntax of the URL is the following:<br>Syntax:<br>■ **{tftp://}{*<IP>* \| *<HOST>*}[:*<PORT>*][;blocksize=*<VAL>*]/*<FILE>***<br>■ **{sftp:// \| scp:// *<USER>*@}{*<IP>* \| *<HOST>*}[:*<PORT>*]/*<FILE>*** |
| vrf *<VRF-NAME>* | Specifies the VRF name. If no VRF name is provided, the VRF named *default* is used. Optional. |

### Examples

Copying the core dump from daemon **ops-vland** to a remote URL with a VRF named **mgmt**:

```
switch# copy core-dump daemon ops-vland sftp://abc@10.0.14.211/vland_coredump.xz
vrf mgmt
```

Copying the core dump from daemon **ops-vland** to a remote URL with a VRF named **mgmt**:

```
switch# copy core-dump daemon ops-vland scp://abc@10.0.14.211/vland_coredump.xz
vrf mgmt
```

Copying the core dump from daemon **ops-switchd** to a USB drive:

```
switch# copy core-dump daemon ops-switchd usb:/switchd
```

Copying the core dump with slot ID 1/1 from daemon **hpe-sysmond** to a remote URL:

```
switch# copy core-dump 1/1 daemon hpe-sysmond sftp://abc@10.0.14.206/core.hpe-
sysmond.xz vrf mgmt
```

Copying the core dump from the **hpe-config** process to a USB drive:

```
switch# copy core-dump daemon hpe-config usb:/config_core
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.08 | Added SCP support. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | Manager (#) | Administrators or local user group members with execution rights for this command. |

# copy core-dump [<MEMBER/SLOT>] kernel

```
copy core-dump [<MEMBER/SLOT>] kernel <REMOTE-URL> [vrf <VRF-NAME>]
```

### Description

Copies a kernel core dump using TFTP, SFTP, or SCP.

| Parameter | Description |
|---|---|
| *<MEMBER/SLOT>* | Specifies the slot ID on an 8400 or 6400 switch. Required.<br>Syntax: Slot number for line (**1/1-1/4**, **1/7-1/10**) MM(**1/5** or **1/6**) |
| *<REMOTE-URL>* | Specifies the URL to copy the command output. Required.<br>Syntax:<br>▪ **{tftp://}{*<IP>* \| *<HOST>*}[:*<PORT>*][;blocksize=*<VAL>*]/*<FILE>***<br>▪ **{sftp:// \| scp:// *<USER>*@}{*<IP>* \| *<HOST>*}[:*<PORT>*]/*<FILE>*** |
| vrf *<VRF-NAME>* | Specifies the VRF name. The default VRF name is default. Optional. |

### Examples

Copying the kernel core dump to the URL:

```
switch# copy core-dump kernel tftp://10.100.0.12/kernel_dump.tar.gz
```

Copying the kernel core dump to the URL with the VRF named mgmt:

```
switch# copy core-dump kernel tftp://10.100.0.12/kernel_dump.tar.gz vrf mgmt
```

Copying the kernel core dump from slot ID 1/1 to the URL with the VRF named mgmt:

```
switch# copy core-dump 1/1 kernel sftp://abc@10.0.14.206/kernel_dump.tar.gz vrf
mgmt
```

Copying the kernel core dump from slot ID 1/1 to the URL with the VRF named mgmt:

```
switch# copy core-dump 1/1 kernel scp://abc@10.0.14.206/kernel_dump.tar.gz vrf
mgmt
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.08 | Added SCP support. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | Manager (#) | Administrators or local user group members with execution rights for this command. |

# copy core-dump [<MEMBER/SLOT>] kernel *<STORAGE-URL>*

```
copy core-dump [<MEMBER/SLOT>] kernel <STORAGE-URL>
```

### Description

Copies the kernel core dump to a USB drive.

| Parameter | Description |
|---|---|
| *<MEMBER/SLOT>* | Specifies the slot ID. Required.<br>Syntax: Slot number for line (**1/1-1/4**, **1/7-1/10**) MM(**1/5** or **1/6**) |
| *<STORAGE-URL>* | Specifies the USB to copy command output. Required.<br>Syntax: **{usb]:/*<FILE>*** |

### Examples

Copying the kernel core dump to a USB drive:

```
switch# copy core-dump kernel usb:/kernel.tar.gz
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | Manager (#) | Administrators or local user group members with execution rights for this command. |

# copy core-dump vsf member daemon

Applicable for 6300 switches only.

```
copy core-dump vsf member <MEMBER-ID>
     daemon [<DAEMON-NAME> | <DAEMON-NAME>:<INSTANCE-ID>]
<REMOTE-URL> [vrf <VRF-NAME>]
copy core-dump vsf member <MEMBER-ID>
     daemon [<DAEMON-NAME> | <DAEMON-NAME>:<INSTANCE-ID>]
<STORAGE-URL>
```

### Description

Copies the core-dump from the specified daemon using TFTP, SFTP, SCP, or USB.

| Parameter | Description |
|---|---|
| `vsf member` *`<MEMBER-ID>`* | Specifies the member-id of the VSF member. Required. |
| *`<DAEMON-NAME>`* | Specifies the name of the daemon. Required. |
| `[:`*`<INSTANCE-ID>`*`]` | Specifies the instance of the daemon core dump. Optional. |
| *`<REMOTE_URL>`* | Specifies the remote destination URL. Required. The syntax of the URL is the following:<br>Syntax:<br>■ **{tftp://}{<*IP*> \| <*HOST*>}[:<*PORT*>][;blocksize=<*VAL*>]/<*FILE*>**<br>■ **{sftp:// \| scp:// <*USER*>@}{<*IP*> \| <*HOST*>}[:<*PORT*>]/<*FILE*>** |
| `vrf` *`<VRF-NAME>`* | Specifies the VRF name. If no VRF name is provided, the VRF named *default* is used. Optional. |
| *`<STORAGE-URL>`* | Specifies the USB to copy command output. Required.<br>Syntax: **{usb}:/<*FILE*>** |

## Examples

Copying the core dump from daemon hpe-sysmond to a remote URL with a VRF named mgmt:

```
switch# copy core-dump vsf member 1 daemon hpe-sysmond
sftp://abc@10.0.14.206/sysmon.xz vrf mgmt
```

Copying the core dump from daemon hpe-sysmond to a remote URL with a VRF named mgmt:

```
switch# copy core-dump vsf member 2 daemon hpe-sysmond
scp://user@10.0.14.206/sysmon.xz vrf mgmt
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.08 | Added SCP support. |
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300 | Manager (#) | Administrators or local user group members with execution rights for this command. |

# copy core-dump vsf member kernel

Applicable for 6300 switches only.

```
copy core-dump vsf member <MEMBER-ID> kernel <REMOTE-URL> [vrf <VRF-NAME>]
copy core-dump vsf member <MEMBER-ID> kernel <STORAGE-URL>
```

## Description

Copies the kernel core-dump using TFTP, SFTP, SCP, or USB.

| Parameter | Description |
|---|---|
| *<MEMBER-ID>* | Specifies the member-id of the VSF member. Required. |
| *<REMOTE_URL>* | Specifies the remote destination URL. Required. The syntax of the URL is the following:<br>Syntax:<br>■ **{tftp://}{*<IP>* \| *<HOST>*}[:*<PORT>*][;blocksize=*<VAL>*]/*<FILE>***<br>■ **{sftp:// \| scp:// *<USER>*@}{*<IP>* \| *<HOST>*}[:*<PORT>*]/*<FILE>*** |
| `vrf` *<VRF-NAME>* | Specifies the VRF name. If no VRF name is provided, the VRF named *default* is used. Optional. |
| *<STORAGE-URL>* | Specifies the USB to copy command output. Required.<br>Syntax: **{usb}:/*<FILE>*** |

## Examples

Copying the kernel core dump to the URL with a VRF named mgmt:

```
switch# copy core-dump vsf member 3 kernel sftp://abc@10.0.14.206/kernel.tar.gz
vrf mgmt
```

Copying the kernel core dump to the URL with a VRF named mgmt:

```
switch# copy core-dump vsf member 3 kernel scp://abc@10.0.14.206/kernel.tar.gz vrf
mgmt
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.08 | Added SCP support. |

## copy diag-dump feature *<FEATURE>*

`copy diag-dump feature <FEATURE> {<REMOTE-URL> [vrf <VRF-NAME>] | <STORAGE-URL>}`

### Description

Copies the specified diagnostic information using TFTP, SFTP, SCP, or USB.

| Parameter | Description |
|---|---|
| `<FEATURE>` | The name of a feature, for example **aaa or vrrp**. Required. |
| `{<REMOTE-URL> [vrf <VRF-NAME> \|<STORAGE-URL>]}` | Select either the remote URL or the storage URL for the destination of the copied command output. Required. |
| `<REMOTE-URL>` | Specifies the remote destination URL. Required. The syntax of the URL is the following:<br>Syntax:<br>- **{tftp://}{*<IP>* \| *<HOST>*}[:*<PORT>*] [;blocksize=*<VAL>*]/*<FILE>***<br>- **{sftp:// \| scp:// *<USER>*@}{*<IP>* \| *<HOST>*} [:*<PORT>*]/*<FILE>*** |
| `vrf <VRF-NAME>` | Specifies the VRF name. If no VRF name is provided, the VRF named *default* is used. Optional. |
| `<STORAGE-URL>` | Specifies the USB to copy command output. Required.<br>Syntax: `{usb}:/<FILE>` |

### Examples

Copying the output from the aaa feature to a remote URL with a specified VRF:

```
switch# copy diag-dump feature aaa tftp://10.100.0.12/diagdump.txt vrf mgmt
```

Copying the output from the aaa feature to a remote URL with a specified VRF:

```
switch# copy diag-dump feature aaa scp://user@10.100.0.12/diagdump.txt vrf mgmt
```

Copying the output from the vrrp feature to a USB drive:

```
switch# copy diag-dump feature vrrp usb:/diagdump.txt
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.08 | Added SCP support. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (#) | Administrators or local user group members with execution rights for this command. |

## copy diag-dump local-file

```
copy diag-dump local-file {<REMOTE-URL> [vrf <VRF-NAME>] | <STORAGE-URL>}
```

### Description

Copies the diagnostic information stored in a local file using TFTP, SFTP, SCP, or USB.

| Parameter | Description |
|---|---|
| `{<REMOTE-URL> [vrf <VRF-NAME>] \|<STORAGE-URL>}` | Select either the storage URL or the remote URL for the destination of the copied command output. Required. |
| `<REMOTE-URL>` | Specifies the URL to copy the command output.<br>Syntax:<br>■ **{tftp://}{*<IP>* \| *<HOST>*}[:*<PORT>*] [;blocksize=*<VAL>*]/*<FILE>***<br>■ **{sftp:// \| scp:// *<USER>*@}{*<IP>* \| *<HOST>*} [:*<PORT>*]/*<FILE>*** |
| `vrf <VRF-NAME>` | Specifies the VRF name. The default VRF name is default. Optional. |
| `<STORAGE-URL>` | Specifies the USB to copy command output.<br>Syntax: **{usb}:/*<FILE>*** |

### Usage

The **copy diag-dump local-file** command can be used only after the information is captured. Run the **diag-dump *<FEATURE-NAME>* basic local-file** command before you enter the **copy diag-dump local-file** command to capture the diagnostic information for the specified feature into the local file.

### Examples

Copying the output from the local file to a remote URL:

```
switch# diag-dump aaa basic local-file
switch# copy diag-dump local-file tftp://10.100.0.12/diagdump.txt
```

Copying the output from the local file to a remote URL:

```
switch# diag-dump aaa basic local-file
switch# copy diag-dump local-file scp://user@10.100.0.12/diagdump.txt
```

Copying the output from the local file to a USB drive:

```
switch# diag-dump aaa basic local-file
switch# copy diag-dump local-file usb:/diagdump.txt
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.08 | Added SCP support. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (#) | Administrators or local user group members with execution rights for this command. |

# copy diag-dump vsf member local-file

Applicable for 6300 switches only.

```
copy diag-dump vsf member <MEMBER-ID> local-file {<REMOTE-URL> [vrf <VRF-NAME>] |
<STORAGE-URL>}
```

### Description

Copies the diagnostic information stored in a local file using TFTP, SFTP, SCP, or USB.

| Parameter | Description |
|---|---|
| `vsf member <MEMBER-ID>` | Specifies the member-id of the VSF member. Required. |
| `{<REMOTE-URL> [vrf <VRF-NAME>] \|<STORAGE-URL>}` | Select either the storage URL or the remote |

| Parameter | Description |
|---|---|
| | URL for the destination of the copied command output. Required. |
| *<REMOTE-URL>* | Specifies the URL to copy the command output.<br>Syntax:<br>■ {tftp://}{*<IP>* \| *<HOST>*}[:*<PORT>*][;blocksize=*<VAL>*]/*<FILE>*<br>■ **{sftp:// \| scp:// *<USER>*@}{*<IP>* \| *<HOST>*}[:*<PORT>*]/*<FILE>*** |
| vrf *<VRF-NAME>* | Specifies the VRF name. The default VRF name is default. Optional. |
| *<STORAGE-URL>* | Specifies the USB to copy command output.<br>Syntax: **{usb}:/*<FILE>*** |

## Usage

The **copy diag-dump local-file** command can be used only after the information is captured. Run the **diag-dump *<FEATURE-NAME>* basic local-file** command before you enter the **copy diag-dump local-file** command to capture the diagnostic information for the specified feature into the local file.

## Examples

Copying the output from the local file to a remote URL:

```
switch# diag-dump aaa basic local-file
switch# copy diag-dump vsf member 2 local-file scp://user@10.100.0.12/diagdump.txt
```

Copying the output from the local file to a remote URL:

```
switch# diag-dump aaa basic local-file
switch# copy diag-dump vsf member 2 local-file tftp://10.100.0.12/diagdump.txt
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

## Command History

| Release | Modification |

# copy *<IMAGE>*

```
copy <IMAGE> {<STORAGE-URL> | <REMOTE-URL>} <FILE-NAME> [vrf <VRF-NAME>]
```

## Description

Copies the image using TFTP, SFTP, SCP, or USB.

| Parameter | Description |
|---|---|
| *<IMAGE>* | Specifies the image. |
| {*<STORAGE-URL>* \| *<REMOTE-URL>*} | Select either the storage URL or the remote URL for the destination of the copied command output. Required. |
| *<STORAGE-URL>* | Specifies the USB to copy command output.<br>Syntax:<br>**{usb}:/*<FILE>*** |
| *<REMOTE-URL>* | Specifies the URL to copy the command output.<br>Syntax:<br>■ **{tftp://}{*<IP>* \| *<HOST>*}[:*<PORT>*][;blocksize=*<VAL>*]/*<FILE>***<br>■ **{sftp:// \| scp:// *<USER>*@}{*<IP>* \| *<HOST>*}[:*<PORT>*]/*<FILE>*** |
| *<FILE-NAME>* | Specifies the file name. |
| vrf *<VRF-NAME>* | Specifies the VRF name. The default VRF name is default. Optional. |

## Examples

Copying the image to a remote URL:

```
switch# copy scp://root@20.0.1.1/primary.swi primary vrf mgmt
```

Copying the secondary image to a remote URL:

```
switch# copy secondary scp://root@20.0.1.1/primary.swi vrf mgmt
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.08 | Added SCP support. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (#) | Auditors or Administrators or local user group members with execution rights for this command. Auditors can execute this command from the auditor context (auditor>) only. |

## copy running-config

```
copy running-config {<STORAGE-URL> | <REMOTE-URL>}/config <CONFIG-NAME> [vrf <VRF-NAME>]
```

### Description

Copies the running configuration using TFTP, SFTP, SCP, or USB.

| Parameter | Description |
|---|---|
| `{<STORAGE-URL> | <REMOTE-URL>}` | Select either the storage URL or the remote URL for the destination of the copied command output. Required. |
| `<STORAGE-URL>` | Specifies the USB to copy command output.<br>Syntax:<br>**{usb}:/*<FILE>*** |
| `<REMOTE-URL>` | Specifies the URL to copy the command output.<br>Syntax:<br>■ `{tftp://}{<IP> | <HOST>}[:<PORT>][;blocksize=<VAL>]/<FILE>`<br>■ **{sftp:// \| scp:// *<USER>*@}{*<IP>* \| *<HOST>*}[:*<PORT>*]/*<FILE>*** |
| `config <CONFIG-NAME>` | Specifies the running configuration. |
| `vrf <VRF-NAME>` | Specifies the VRF name. The default VRF name is default. Optional. |

### Examples

Copying the running configuration to a remote URL:

```
switch# copy running-config scp://root@10.0.1.1/config cli vrf mgmt
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.08 | Added SCP support. |
| 10.07 or earlier | -- |

### Command Information

## copy show-tech feature

`copy show-tech feature <FEATURE> {<REMOTE-URL> [vrf <VRF-NAME>] | <STORAGE-URL>}`

### Description

Copies show tech output using TFTP, SFTP, SCP, and USB.

| Parameter | Description |
|---|---|
| `{<REMOTE-URL> [vrf <VRF-NAME> | <STORAGE-URL>]}` | Select either the remote URL or the storage URL for the destination of the copied command output. Required. |
| `<REMOTE-URL>` | Specifies the URL to copy the command output. Required.<br>Syntax:<br>■ **{tftp://}{*<IP>* \| *<HOST>*}[:*<PORT>*] [;blocksize=*<VAL>*]/*<FILE>***<br>■ **{sftp:// \| scp:// *<USER>*@}{*<IP>* \| *<HOST>*}[:*<PORT>*]/*<FILE>*** |
| `vrf <VRF-NAME>` | Specifies the VRF name. The default VRF name is default. Optional. |
| `<STORAGE-URL>` | Specifies the USB to copy command output. Required.<br>Syntax: **{usb}:/*<FILE>*** |

### Example

Copying show tech output of the **aaa** feature using SCP:

```
switch# copy show-tech feature aaa scp://user@10.0.0.12/file.txt vrf mgmt
```

Copying show tech output of the `config` feature using SFTP on the `mgmt` VRF:

```
switch# copy show-tech feature config sftp://root@10.0.0.1/tech.txt vrf mgmt
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.08 | Added SCP support. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (#) | Administrators or local user group members with execution rights for this command. |

## copy show-tech local-file

`copy show-tech local-file {<REMOTE-URL> [vrf <VRF-NAME>] | <STORAGE-URL>}`

### Description

Copies show tech output stored in a local file.

| Parameter | Description |
|---|---|
| `{<REMOTE-URL> [vrf <VRF-NAME>] \| <STORAGE-URL> ]}` | Select either the remote URL or the storage URL for the destination of the copied command output. Required. |
| `<REMOTE-URL>` | Specifies the URL to copy the command output.<br>Syntax:<br>▪ **{tftp://}{*<IP>* \| *<HOST>*}[:*<PORT>*][;blocksize=*<VAL>*]/*<FILE>***<br>▪ **{sftp:// \| scp:// *<USER>*@}{*<IP>* \| *<HOST>*}[:*<PORT>*]/*<FILE>*** |
| `vrf <VRF-NAME>` | Specifies the VRF name. The default VRF name is default. Optional. |
| `<STORAGE-URL>` | Specifies the USB to copy command output.<br>Syntax: **{usb}:/*<FILE>*** |

### Usage

Before entering the **copy show-tech local-file** command, run the **show tech** command with the **local-file** parameter for the specified feature.

### Examples

Copying the output to a remote URL:

```
switch# copy show-tech local-file tftp://10.100.0.12/file.txt
```

Copying the output to a remote URL:

```
switch# copy show-tech local-file scp://user@10.100.0.12/file.txt
```

Copying the output to a remote URL with a VRF:

```
switch# copy show-tech local-file tftp://10.100.0.12/file.txt vrf mgmt
```

Copying the output to a USB:

```
switch# copy show-tech local-file usb:/file
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.08 | Added SCP support. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (#) | Administrators or local user group members with execution rights for this command. |

## copy show-tech vsf member local-file

Applicable for 6300 switches only.

```
copy show-tech vsf member <MEMBER-ID> local-file {<REMOTE-URL> [vrf <VRF-NAME>] |
<STORAGE-URL>}
```

### Description

Copies show tech output stored in a local file.

| Parameter | Description |
|---|---|
| `vsf member <MEMBER-ID>` | Specifies the member-id of the VSF |

| Parameter | Description |
|---|---|
| | member. Required. |
| `{<REMOTE-URL> [vrf <VRF-NAME>] \| <STORAGE-URL> ]}` | Select either the remote URL or the storage URL for the destination of the copied command output. Required. |
| *<REMOTE-URL>* | Specifies the URL to copy the command output.<br>Syntax:<br>■ **{tftp://}{*<IP>* \| *<HOST>*}[:*<PORT>*] [;blocksize=*<VAL>*]/*<FILE>***<br>■ **{sftp:// \| scp:// *<USER>*@}{*<IP>* \| *<HOST>*}[:*<PORT>*]/*<FILE>*** |
| `vrf <VRF-NAME>` | Specifies the VRF name. The default VRF name is default. Optional. |
| *<STORAGE-URL>* | Specifies the USB to copy command output.<br>Syntax: **{usb}:/*<FILE>*** |

## Usage

Before entering the `copy show-tech local-file` command, run the `show tech` command with the `local-file` parameter for the specified feature.

## Examples

Copying the output to a remote URL with a VRF:

```
switch# copy show-tech vsf member 2 local-file tftp://10.100.0.12/showtech.txt vrf
mgmt
```

Copying the output to a USB:

```
switch# copy show-tech vsf member 2 local-file usb:/file
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.08 | Added SCP support. |
| 10.07 or earlier | -- |

# copy startup-config

`copy startup-config {<STORAGE-URL> | <REMOTE-URL>}/config <CONFIG-NAME> [vrf <VRF-NAME>]`

## Description

Copies the running configuration using TFTP, SFTP, SCP, or USB.

| Parameter | Description |
|---|---|
| `{<STORAGE-URL> | <REMOTE-URL>}` | Select either the storage URL or the remote URL for the destination of the copied command output. Required. |
| `<STORAGE-URL>` | Specifies the USB to copy command output.<br>Syntax:<br>**{usb}:/*<FILE>*** |
| `<REMOTE-URL>` | Specifies the URL to copy the command output.<br>Syntax:<br>■ **{tftp://}{*<IP>* \| *<HOST>*}[:*<PORT>*][;blocksize=*<VAL>*]/*<FILE>***<br>■ **{sftp:// \| scp:// *<USER>*@}{*<IP>* \| *<HOST>*}[:*<PORT>*]/*<FILE>*** |
| `config <CONFIG-NAME>` | Specifies the startup configuration. |
| `vrf <VRF-NAME>` | Specifies the VRF name. The default VRF name is default. Optional. |

## Examples

Copying the startup configuration to a remote URL:

```
switch# copy startup-config scp://root@10.0.1.1/config json vrf mgmt
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.08 | Added SCP support. |
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (#) | Auditors or Administrators or local user group members with execution rights for this command. Auditors can execute this command from the auditor context (auditor>) only. |

# copy support-files

```
copy support-files
   <REMOTE-URL> [vrf <VRF-NAME>]
   <STORAGE-URL>
   all <REMOTE-URL> [vrf <VRF-NAME>]
   all <STORAGE-URL>
   feature <FEATURE-NAME> <STORAGE-URL>
   previous-boot <REMOTE-URL> [vrf <VRF-NAME>]
   previous-boot <STORAGE-URL>
```

For the 6400 switch only:

```
   module <SLOT-ID> <REMOTE-URL> [vrf <VRF-NAME>]
   module <SLOT-ID> <STORAGE-URL>
   standby <REMOTE-URL> [vrf <VRF-NAME>]
```

For the 6300 switch only:

```
   vsf member <MEMBER-ID> <REMOTE-URL> {vrf <VRF-NAME>}
   vsf member <MEMBER-ID> <STORAGE-URL>
```

## Description

Copies a set of support files to a compressed file in tar.gz format using TFTP, SFTP, SCP, or USB or to a directory over SFTP or USB.

This command does not support TFTP transfer on 6300 switches.

| Parameter | Description |
|---|---|
| *<FEATURE-NAME>* | The feature name, for example, `aaa`. |
| {*<REMOTE-URL>* [vrf *<VRF-NAME>*] \| *<STORAGE-URL>* ]} | Select either the remote URL or the storage URL for the destination of the copied command output. Required. |
| *<REMOTE-URL>* | Specifies the URL to copy the command output.<br>Syntax:<br>■ **{tftp://}{*<IP>* \| *<HOST>*}[:*<PORT>*] [;blocksize=*<VAL>*]/*<FILE>***<br>■ **{sftp:// \| scp:// *<USER>*@}{*<IP>* \| *<HOST>*}[:*<PORT>*]/*<FILE>*** |
| vrf *<VRF-NAME>* | Specifies the VRF name. The default VRF name is default. Optional. |
| *<STORAGE-URL>* | Specifies the USB to copy command output.<br>Syntax: **{usb}:/*<FILE>*** |

| Parameter | Description |
|---|---|
| *<MEMBER-ID>* | The member ID in the VSF stack. Range 1-10. |
| *<SLOT-ID>* | Specifies the slot ID on 6400 switches. Optional.<br>Syntax: Slot number for line (**1/1-1/4**, **1/7-1/10**) MM(**1/5** or **1/6**) |

### Usage

If feature name is not provided, the command collects generic system-specific support information. If a feature name is provided, the command collects feature-specific support information.

In order to collect data from standby and member in a VSF stack, the command will prompt for the local user password once.

In order to collect data from the standby 6400 swtich, the command will prompt for the local user password once.

### Examples

Copying the support files to a remote URL:

```
switch# copy support-files tftp://10.100.0.12/file.tar.gz
```

Copying the support files of the **lldp** feature to a remote URL with a specified VRF:

```
switch# copy support-files feature lldp tftp://10.100.0.12/file.tar.gz vrf mgmt
```

Copying the support files from the previous boot to a remote URL with a specified VRF:

```
switch# copy support-files previous-boot scp://user@10.0.14.206/file.tar.gz vrf
mgmt
```

Copying the support files to a USB:

```
switch# copy support-files usb:/file.tar.gz
```

Copying the files from a module to a remote URL with a specified VRF on an 8400 or 6400 switch:

```
switch# copy support-files module 1/1 tftp://10.100.0.12/file.tar.gz vrf mgmt
```

Copying the files from a standby module to a remote URL with a specified VRF on an 8400 or 6400 switch:

```
switch# copy support-files standby sftp://root@10.0.14.216/file.tar.gz vrf mgmt
```

Copying all the support files to a remote URL:

```
switch# copy support-files all sftp://root@10.0.14.216/file.tar.gz vrf mgmt
```

Copying the support files of the `config` feature to a USB:

```
switch# copy support-files feature config usb:/file.tar.gz
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.08 | Added SCP support. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (#) | Administrators or local user group members with execution rights for this command. |

## copy support-files local-file

```
copy support-files [feature <FEATURE-NAME> | previous-boot | all | module <SLOT-ID> |
standby | vsf member <MEMBER-ID>] local-file {<REMOTE-URL> [vrf <VRF-NAME>] | <STORAGE-
URL>}
```

The **module** and **standby** are supported only on 6400 switch. The **vsf member** is supported only on 6300 switch.

### Description

Stores a set of support files as a compressed file in the switch locally and copies the preserved support files to a directory using TFTP, SFTP, SCP, or USB.

You can store only one copy of the support file locally. When you store a new support file, it overwrites the existing support file.

| Parameter | Description |
|---|---|
| *<FEATURE-NAME>* | Specifies the feature for the support files. |

| Parameter | Description |
|---|---|
| *<SLOT-ID>* | Specifies the module slot number identifier for the support files. Range: 1/1-1/4, 1/7-1/10 |
| *<MEMBER-ID>* | Specifies the VSF member identifier for the support files. Range: 1-10 |
| *<REMOTE-URL>* | Specifies the URL to copy the support files. |
| *<STORAGE-URL>* | Specifies the USB to copy the support files. |
| *<VRF-NAME>* | Specifies the VRF name. The default VRF name is default. |

## Usage

If the copy of the support files to the destination fails, an alternate option is prompted to store the collected data in the local file. This helps us to retry the copy process using **copy support-files local-file *<REMOTE-URL/STORAGE-URL>*** without the need of regenerating the file.

## Examples

Copying support file to the local file:

```
switch# copy support-files local-file
switch# copy support-files feature lldp local-file
switch# copy support-files previous-boot local-file
switch# copy support-files all local-file
The operation to copy all support files could take a while to complete.
Do you want to continue (y/n)?
switch# copy support-files module 1/1 local-file
switch# copy support-files standby local-file
switch# copy support-files vsf member 7 local-file
```

Copying local support file to a remote URL and storage URL:

```
switch# copy support-files local-file usb:/support_files_dir_path/
switch# copy support-files local-file scp://root@10.0.14.206//support_files_dir_
path/abc.tar.gz vrf mgmt
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |

| All platforms | Manager (#) | Administrators or local user group members with execution rights for this command. |

# copy support-files vsf member

Applicable for 6300 switches only.

```
copy support-files vsf member <MEMBER-ID> {<REMOTE-URL> [vrf <VRF-NAME>] | <STORAGE-URL>}
```

## Description

Copies a set of support files using TFTP, SFTP, SCP, or USB.

| Parameter | Description |
|---|---|
| *<MEMBER-ID>* | Specified the member-id of the VSF member. Required. |
| {*<REMOTE-URL>* [vrf *<VRF-NAME>* \| *<STORAGE-URL>*]} | Select either the remote URL or the storage URL for the destination of the copied command output. Required. |
| *<REMOTE-URL>* | Specifies the URL to copy the command output.<br>Syntax:<br>■ **{tftp://}{*<IP>* \| *<HOST>*}[:*<PORT>*] [;blocksize=*<VAL>*]/*<FILE>***<br>■ **{sftp:// \| scp:// *<USER>*@}{*<IP>* \| *<HOST>*}[:*<PORT>*]/*<FILE>*** |
| vrf *<VRF-NAME>* | Specifies the VRF name. The default VRF name is default. Optional. |
| *<STORAGE-URL>* | Specifies the USB to copy command output.<br>Syntax: **{usb}:/*<FILE>*** |

## Usage

If feature name is not provided, the command collects generic system-specific support information. If a feature name is provided, the command collects feature-specific support information.

## Examples

Copying the support files to a USB:

```
switch# copy support-files vsf member 2 usb:/file.tar.gz
```

Copying all the support files to a remote URL with a specified VRF:

```
switch# copy support-files vsf member 2 scp://user@10.100.0.12/file.tar.gz/ vrf
mgmt
```

Copying all the support files to a remote URL with a specified VRF:

```
switch# copy support-files vsf member 2 sftp://user@10.100.0.12/support_files_dir_
path/ vrf mgmt
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.08 | Added SCP support. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300 | Manager (#) | Administrators or local user group members with execution rights for this command. |

## copy support-log

`copy support-log` *`<DAEMON-NAME>`* `[`*`<MEMBER/SLOT>`*`] {`*`<STORAGE-URL>`*` | `*`<REMOTE-URL>`*` [vrf `*`<VRF-NAME>`*`]}`

### Description

Copies the specified support log for a daemon TFTP, SFTP, SCP, or USB.

| Parameter | Description |
|---|---|
| *<MEMBER/SLOT>* | Specifies the slot ID on an 8400 or 6400 switch. Optional.<br>Syntax: Slot number for line (**1/1-1/4**, **1/7-1/10**) MM(**1/5** or **1/6**) |
| *<DAEMON-NAME>* | Specifies the name of the daemon. Required. |
| {*<STORAGE-URL>* \| *<REMOTE-URL>* [vrf *<VRF-NAME>*]} | Selects either the storage URL or the remote URL for the destination of the copied command output. Required. |
| *<STORAGE-URL>* | Specifies the USB to copy command output.<br>Syntax: **{usb}:/*<FILE>*** |
| *<REMOTE-URL>* | Specifies the URL to copy the command output.<br>Syntax:<br>■ **{tftp://}{*<IP>* \| *<HOST>*}[:*<PORT>*] [;blocksize=*<VAL>*]/*<FILE>***<br>■ **{sftp:// \| scp:// *<USER>*@}{*<IP>* \|** |

| Parameter | Description |
|---|---|
| | ***<HOST>}[:<PORT>]/<FILE>*** |
| `vrf <VRF-NAME>` | Specifies the VRF name. If no VRF name is provided, the VRF named *default* is used. Optional. |

### Usage

Fast log is a high performance, per-daemon binary logging infrastructure used to debug daemon level issues by precisely capturing the per daemon/module/functionalities debug traces in real time. Fast log, also referred to as support logs, helps users to understand the feature internals and its specific happenings. The fast logs from one daemon are not overwritten by other daemon logs because fast logs are captured as part of a daemon core dump. Fast logs are enabled by default.

### Examples

Copying the support log from the daemon hpe-fand to a remote URL:

```
switch# copy support-log hpe-fand tftp://10.100.0.12/file
```

Copying the support log from the daemon fand to a remote URL with a VRF named mgmt:

```
switch# copy support-log fand scp://user@10.100.0.12/file vrf mgmt
```

Copying the support log from the daemon hpe-fand to a remote URL with a VRF named mgmt:

```
switch# copy support-log hpe-fand tftp://10.100.0.12/file vrf mgmt
```

Copying the support log from the daemon hpe-fand to a USB:

```
switch# copy support-log hpe-fand usb:/support-log
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.08 | Added SCP support. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (#) | Administrators or local user group members with execution rights for this command. |

## copy support-log vsf member

Applicable for 6300 switches only.

`copy support-log vsf member <MEMBER-ID> <DAEMON-NAME> {<STORAGE-URL> | <REMOTE-URL> [vrf <VRF-NAME>]}`

### Description

Copies the specified support log for a daemon using TFTP, SFTP, SCP, or USB.

| Parameter | Description |
|---|---|
| *<MEMBER-ID>* | Specifies the member-id of the VSF member. Required. |
| *<DAEMON-NAME>* | Specifies the name of the daemon. Required. |
| {*<STORAGE-URL>* \| *<REMOTE-URL>* [vrf *<VRF-NAME>*]} | Selects either the storage URL or the remote URL for the destination of the copied command output. Required. |
| *<STORAGE-URL>* | Specifies the USB to copy command output.<br>Syntax: **{usb}:/<*FILE*>** |
| *<REMOTE-URL>* | Specifies the URL to copy the command output.<br>Syntax:<br>▪ **{tftp://}{<*IP*> \| <*HOST*>}[:<*PORT*>] [;blocksize=<*VAL*>]/<*FILE*>**<br>▪ **{sftp:// \| scp:// <*USER*>@}{<*IP*> \| <*HOST*>}[:<*PORT*>]/<*FILE*>** |
| vrf *<VRF-NAME>* | Specifies the VRF name. If no VRF name is provided, the VRF named *default* is used. Optional. |

### Usage

Fast log is a high performance, per-daemon binary logging infrastructure used to debug daemon level issues by precisely capturing the per daemon/module/functionalities debug traces in real time. Fast log, also referred to as support logs, helps users to understand the feature internals and its specific happenings. The fast logs from one daemon are not overwritten by other daemon logs because fast logs are captured as part of a daemon core dump. Fast logs are enabled by default.

### Examples

Copying the support log from the daemon hpe-fand to a remote URL with a VRF named mgmt:

```
switch# copy support-log vsf member 2 hpe-fand tftp://10.100.0.12/file vrf mgmt
```

Copying the support log from the daemon hpe-fand to a remote URL with a VRF named mgmt:

```
switch# copy support-log vsf member 2 hpe-fand scp://user@10.100.0.12/file vrf
mgmt
```

Copying the support log from the daemon hpe-fand to a USB:

```
switch# copy support-log vsf member 2 hpe-fand usb:/support-log
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.08 | Added SCP support. |
| 10.07 or earlier | -- |

| 6300 | Manager (#) | Administrators or local user group members with execution rights for this command. |

# Chapter 151

# Switch system and hardware commands

## bluetooth disable

```
bluetooth disable
no bluetooth disable
```

### Description

Disables the Bluetooth feature on the switch. The Bluetooth feature includes both Bluetooth Classic and Bluetooth Low Energy (BLE). Bluetooth is enabled by default.

The **no** form of this command enables the Bluetooth feature on the switch.

### Example

Disabling Bluetooth on the switch. *<XXXX>* is the switch platform and *<NNNNNNNNNN>* is the device identifier.

```
switch(config)# bluetooth disable
switch# show bluetooth
Enabled              : No
Device name          : <XXXX>-<NNNNNNNNNN>

switch(config)# show running-config
...
bluetooth disabled
...
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## bluetooth enable

```
bluetooth enable
no bluetooth enable
```

### Description

This command enables the Bluetooth feature on the switch. The Bluetooth feature includes both Bluetooth Classic and Bluetooth Low Energy (BLE).

Default: Bluetooth is enabled by default.

The **no** form of this command disables the Bluetooth feature on the switch.

### Usage

The default configuration of the Bluetooth feature is `enabled`. The output of the `show running-config` command includes Bluetooth information only if the Bluetooth feature is disabled.

The Bluetooth feature includes both Bluetooth Classic and Bluetooth Low Energy (BLE).

The Bluetooth feature requires the USB feature to be enabled. If the USB feature has been disabled, you must enable the USB feature before you can enable the Bluetooth feature.

### Examples

```
switch(config)# bluetooth enable
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## clear events

```
clear events
```

### Description

Clears up event logs. Using the `show events` command will only display the logs generated after the `clear events` command.

### Examples

Clearing all generated event logs:

```
switch# show events
---------------------------------------------------
show event logs
---------------------------------------------------
2018-10-14:06:57:53.534384|hpe-sysmond|6301|LOG_INFO|MSTR|1|System resource
utilization poll interval is changed to 27
2018-10-14:06:58:30.805504|lldpd|103|LOG_INFO|MSTR|1|Configured LLDP tx-timer to
36
2018-10-14:07:01:01.577564|hpe-sysmond|6301|LOG_INFO|MSTR|1|System resource
utilization poll interval is changed to 49

switch# clear events

switch# show events
---------------------------------------------------
show event logs
---------------------------------------------------
2018-10-14:07:03:05.637544|hpe-sysmond|6301|LOG_INFO|MSTR|1|System resource
utilization poll interval is changed to 34
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (#) | Administrators or local user group members with execution rights for this command. |

## clear ip errors

`clear ip errors`

### Description

Clears all IP error statistics.

### Example

Clearing and showing ip errors:

```
switch# clear ip errors
switch# show ip errors
----------------------------------
Drop reason                Packets
----------------------------------
```

```
Malformed packets                0
IP address errors                0
...
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

## Command History

# console baud-rate

```
console baud-rate <SPEED>
no console baud-rate <SPEED>
```

## Description

Sets the console serial port speed.

The no form of this command resets the console port speed to its default of 115200 bps.

| Parameter | Description |
|---|---|
| *<SPEED>* | Selects the console port speed in bps, either `9600` or `115200`. |

## Usage

The speed change occurs immediately for the active console session. The console will be inaccessible until the client terminal settings are updated to match the console port speed that you set. After the command is executed you will be prompted to log in again.

## Examples

Setting the console port speed to 9600 bps:

```
switch(config)# console baud-rate 9600
This command will configure the baud rate immediately for the active serial
console session. After the command is executed the user will be prompted to
re-login. The serial console will be inaccessible until the terminal client
settings are updated to match the baud rate of the switch.
Continue (y/n)? y
```

Resetting the console port to its default speed 115200 bps:

```
switch(config)# no console baud-rate
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

|---|---|---|
| All platforms | config | Administrators or local user group members with execution rights for this command. |

## domain-name

```
domain-name <NAME>
no domain-name [<NAME>]
```

### Description

Specifies the domain name of the switch.

The **no** form of this command sets the domain name to the default, which is no domain name.

| Parameter | Description |
|---|---|
| *<NAME>* | Specifies the domain name to be assigned to the switch. The first character of the name must be a letter or a number. Length: 1 to 32 characters. |

### Examples

Setting and showing the domain name:

```
switch# show domain-name

switch# config
switch(config)# domain-name example.com
switch(config)# show domain-name
example.com
switch(config)#
```

Setting the domain name to the default value:

```
switch(config)# no domain-name
switch(config)# show domain-name

switch(config)#
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## hostname

```
hostname <HOSTNAME>
no hostname [<HOSTNAME>]
```

### Description

Sets the host name of the switch.

The **no** form of this command sets the host name to the default value, which is `switch`.

| Parameter | Description |
|---|---|
| *<HOSTNAME>* | Specifies the host name. The first character of the host name must be a letter or a number. Length: 1 to 32 characters. Default: `switch` |

### Examples

Setting and showing the host name:

```
switch# show hostname
switch
switch# config
switch(config)# hostname myswitch
myswitch(config)# show hostname
myswitch
```

Setting the host name to the default value:

```
myswitch(config)# no hostname
switch(config)#
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

## module admin-state

```
module <SLOT-ID> admin-state {diagnostic | down | up}
no module <SLOT-ID> [admin-state [diagnostic | down | up]]
```

### Description

Sets the administrative state of the specified line module.

The **no** form of the command configures administrative state to the default **up**.

| Parameter | Description |
|---|---|
| *<SLOT-ID>* | Specifies the member and slot of the module. For example, to specify the module in member 1, slot 3, enter the following:<br>`1/3` |
| `diagnostic` | Selects the **diagnostic** administrative state. Network traffic does not pass through the module. |
| `down` | Selects the **down** administrative state. Network traffic does not pass through the module. |
| `up` | Selects the **up** administrative state. The line module is fully operational. The **up** state is the default administrative state. |

### Example

Setting the administrative state of the module in slot **1/3** to **down**:

```
switch(config)# module 1/3 admin-state down
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | `config` | Administrators or local user group members with execution rights for this command. |

## module product-number

```
module <SLOT-ID> product-number [<PRODUCT-NUM>]
no module <SLOT-ID> [product-number [<PRODUCT-NUM>]]
```

### Description

Changes the configuration of the switch to indicate that the specified member and slot number contains, or will contain, a line module.

The **no** form of this command removes the line module and its interfaces from the configuration. If there is a line module installed in the slot, the line module is powered off and then powered on.

| Parameter | Description |
|---|---|
| *<SLOT-ID>* | Specifies the member and slot in the form **m/s**, where **m** is the member number, and **s** is the slot number. |
| *<PRODUCT-NUM>* | Specifies the product number of the line module. For example: `JL363A`<br>If there is a line module installed in the slot when you execute this command, *<PRODUCT-NUM>* is optional. The switch reads the product number information from the module that is installed in the slot.<br>If there is no line module installed in the slot when you execute this command, *<PRODUCT-NUM>* is required. |

### Usage

The default configuration associated with a line module slot is:

- There is no module product number or interface configuration information associated with the slot. The slot is available for the installation with any supported line module.
- The Admin State is Up (which is the default value for Admin State).

To add a line module to the configuration, you must use the **module** command either before or after you install the physical module.

If you execute the **module** command after you install a line module in an empty slot, you can omit the **<PRODUCT-NUM>** variable. The switch reads the product information from the installed module.

If the module is not installed in the slot when you execute the module command, you must specify a value for the **<PRODUCT-NUM>** variable:

- The switch validates the product number of the module against the slot number you specify to ensure that the right type of module is configured for the specified slot.

For example, the switch returns an error if you specify the product number of a line module for a slot reserved for management modules.

- You can configure the line module interfaces before the line module is installed.

When you install the physical line module in a preconfigured slot, the following actions occur:

- If a product number was specified in the command and it matches the product number of the installed module, the switch initializes the module.
- If a product number was specified in the command and the product number of the module does not match what was specified, the module device initialization fails.

The **no** form of the command removes the line module and its interfaces from the configuration and restores the line module slot to the default configuration.

If there is a line module installed in the slot when you execute the **no** form of the command, the command also powers off and then powers on the module. Traffic passing through the line module is stopped. Management sessions connected through the line module are also affected.

If the slot associated with the line module is in the default configuration, you can remove the module from the chassis without disrupting the operation of the switch.

## Examples

Configuring slot 1/1 for future installation of a line module:

```
switch(config)# module 1/1 product-number jl363a
```

Configuring a line module that is already installed in slot 1/1:

```
switch(config)# module 1/1 product-number
```

Attempting to configure slot 1/1 for the future installation of a line module without specifying the product number (returned error shown):

```
switch(config)# module 1/1 product-number
Line module '1/4' is not physically available.  Please provide the product
number to preconfigure the line module.
```

Removing a module from the configuration:

```
switch(config)# no module 1/1
This command will power cycle the specified line module and restore its default
```

```
configuration. Any traffic passing through the line module will be interrupted.
Management sessions connected through the line module will be affected. It
might take a few minutes to complete this operation.

Do you want to continue (y/n)? y
switch(config)#
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |

## mtrace

```
mtrace <IPV4-SRC-ADDR> <IPV4-GROUP-ADDR> [lhr <IPV4-LHR-ADDR>] [ttl <HOPS>]
   [vrf <VRF-NAME>]
```

### Description

Traces the specified IPv4 source and group addresses.

| Parameter | Description |
|---|---|
| *IPV4-SRC-ADDR* | Specifies the source IPv4 address to trace. |
| *IPV4-GROUP-ADDR* | Specifies the group IPv4 address to trace. |
| `lhr` *<IPV4-LHR-ADDR>* | Specifies the last hop router address from which to start the trace. |
| `ttl` *<HOPS>* | Specifies the Time-To-Live duration in hops. Range: 1 to 255 hops. Default: 8 hops. |
| `vrf` *<VRF-NAME>* | Specifies the name of the VRF. If a name is not specified the default VRF will be used. |

### Examples

Tracing with source, group, and LHR addresses and TTL:

```
(switch)# mtrace 20.0.0.1 239.1.1.1 lhr 10.1.1.1 ttl 10

Type escape sequence to abort.
Mtrace from 10.0.0.1 for Source 20.0.0.1 via Group 239.1.1.1
From destination(?) to source (?)...
Querying ful reverse path...
0  10.0.0.1
-1  30.0.0.1 PIM  0 ms
-2  40.0.0.1 PIM  2 ms
-3  50.0.0.1 PIM  100 ms
-4  60.0.0.1 PIM  156 ms
-5  20.0.0.1 PIM  123 ms
```

Tracing with source and group addresses:

```
(switch)# mtrace 200.0.0.1 239.1.1.1

Type escape sequence to abort.
Mtrace from self for Source 200.0.0.1 via Group 239.1.1.1
From destination(?) to source (?)...
Querying ful reverse path...
0  10.0.0.1
-1  30.0.0.1 PIM  0 ms
-2  40.0.0.1 PIM  2 ms
-3  50.0.0.1 PIM  100 ms
-4  60.0.0.1 PIM  156 ms
-5  200.0.0.1 PIM  123 ms
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

## power consumption-average-period

`power consumption-average-period <PERIOD-IN-SECONDS>`

### Description

Configures a time period for average power consumption in seconds.

| Parameter | Description |
|---|---|
| *<PERIOD-IN-SECONDS>* | Specifies the period in seconds for average power consumed.<br>Range: 60-3600. Default: 600 |

### Example

Configuring a time period of 60 seconds for average power consumption:

```
switch(config)# power consumption-average-period 60
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

## show bluetooth

```
show bluetooth
```

### Description

Shows general status information about the Bluetooth wireless management feature on the switch.

### Usage

This command shows status information about the following:

- The USB Bluetooth adapter
- Clients connected using Bluetooth
- The switch Bluetooth feature.

The output of the **show running-config** command includes Bluetooth information only if the Bluetooth feature is disabled.

The device name given to the switch includes the switch serial number to uniquely identify the switch while pairing with a mobile device.

The management IP address is a private network address created for managing the switch through a Bluetooth connection.

### Examples

Example output when Bluetooth is enabled but no Bluetooth adapter is connected. *<XXXX>* is the switch platform and *<NNNNNNNNNN>* is the device identifier.

```
switch# show bluetooth
Enabled             : Yes
Device name         : <XXXX>-<NNNNNNNNNN>
Adapter State       : Absent
```

Example output when Bluetooth is enabled and there is a Bluetooth adapter connected:

```
switch# show bluetooth
Enabled             : Yes
Device name         : <XXXX>-

Adapter State       : Ready
Adapter IP address  : 192.168.99.1
Adapter MAC address : 480fcf-af153a

Connected Clients
-----------------
Name            MAC Address     IP Address    Connected Since
--------------  --------------  ------------  ------------------------
Mark's iPhone   089734-b12000   192.168.99.10  2018-07-09 08:47:22 PDT
```

Example output when Bluetooth is disabled:

```
switch# show bluetooth
Enabled             : No
Device name         : <XXXX>-<NNNNNNNNNN>
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

# show boot-history

```
show boot-history [all|{vsf member <1-10>}]
```

## Description

Shows boot history information. When no parameters are specified, shows the most recent information about the current boot operation, and the three previous boot operations for the switch. When the **all** parameter is specified, the output of this command shows the boot information for the active management module.

For switches that support line modules (such as 6400 switch series) including the **all** parameter displays information for the active management module and all available line modules.

To view boot-history on a standby, the command must be sent on the conductor console.

| Parameter | Description |
|---|---|
| `all` | Optional. Shows boot information for the active management module. For switches that support line modules, including this parameter displays information for and all available line modules. |
| `vsf member <1-10>` | Optional. Display boot history for the specified VSF member |

## Usage

This command displays the boot-index, boot-ID, and up time in seconds for the current boot. If there is a previous boot, it displays boot-index, boot-ID, reboot time (based on the time zone configured in the system) and reboot reasons. Previous boot information is displayed in reverse chronological order.

The output of this command includes the following information:

| Parameter | Description |
|---|---|
| `Index` | The position of the boot in the history file. Range: 0 to 3. |
| `Boot ID` | A unique ID for the boot . A system-generated 128-bit string. |
| `Current Boot, up for <time>` | For the current boot, the **show boot-history** command shows the number of seconds the module has been running on the current software. |
| `<Timestamp>: boot reason` | For previous boot operations, the **show boot-history** command shows the time at which the operation occurred and the reason for the boot. The reason for the boot is one of the following values:<br>■ ***<DAEMON-NAME>* crash**: The daemon identified by *<DAEMON-NAME>* caused the module to boot.<br>■ **Kernel crash**: The operating system software associated with the module caused the module to boot.<br>■ **Uncontrolled reboot**: The reason for the reboot is not known.<br>■ **Reboot requested through database**: The reboot occurred because of a request made through the CLI or other API. For details, see , show boot-history |

**Table 1:** *Description of reboots handled through the database*

| Boot History String | Description |
|---|---|
| Reboot requested by user | A user requested a switch reboot through the CLI or web UI. |
| Reset button pressed | The switch detected a short-press of the reset button |
| Backplane fault | A backplane fault occurred. |
| Configuration change | A configuration change resulted in a reboot. |
| Configuration version migration | A configuration version migration occurred which required a reboot. |
| Console error | The console failed to start. |
| Fabric fault | A fabric fault occurred. |
| All line modules faulted | A zero line card condition occurred. |
| Redundancy switchover requested | A user requested a redundancy switchover. |
| Redundant Management communication timeout | The standby management module has taken over from an unresponsive active management module. |
| Redundant Management election timeout | A failure to elect a standby management module in the allotted time. |
| Critical service fault (error) | A daemon critical to switch operation has stopped functioning. An extra error string may be present to describe the error in detail. |
| VSF autojoin renumber | Reset triggered by VSF autojoin. |
| VSF member renumbered | A user requested a renumber of a VSF member. |
| VSF switchover requested | A user requested a VSF switchover. |
| VSX software update | Reset triggered by a VSX software update. |
| Chassis critical temperature | Chassis operating temperature exceeded. |
| Chassis low critical temperature | Chassis temperature below the minimum operating threshold. |
| Chassis insufficient fans | Insufficient fans to cool the chassis. |
| Chassis unsupported PSUs/fans | Unsupported or misconfigured PSUs or system fans. |
| Management module critical temperature | Management module operating temperature exceeded. |
| ISSU SMM update | Standby management module reboot triggered by an In-Service Software Upgrade (ISSU). |
| ISSU switchover | Redundancy switchover triggered by an In-Service Software Upgrade. |

| Boot History String | Description |
|---|---|
| ISSU aborted | Standby management module reset triggered by failure during an In-Service Software Upgrade. |
| Rollback timer expired | Reset triggered by the ISSU rollback timer expiring. |

```

In the event of a reset triggered by a power supply unit (PSU), or a PSU input fault, the output of this command also displays information about why the PSU initiated a reboot. The following example displays the boot history of a switch with a reboot initiated by a PSU.

```
switch# show boot-history

Management module

For more information on features that use this command, refer to the Fundamentals Guide or the Monitoring Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.13.1000 | The output of this command is enhanced to display additional information about the reason for the reboot, if available. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (#) | Administrators or local user group members with execution rights for this command. |

## show capacities

```
show capacities <FEATURE> [vsx-peer]
```

### Description

Shows system capacities and their values for all features or a specific feature.

| Parameter | Description |
|---|---|
| *<FEATURE>* | Specifies a feature. For example, **aaa** or **vrrp**. |
| vsx-peer | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Usage

Capacities are expressed in user-understandable terms. Thus they may not map to a specific hardware or software resource or component. They are not intended to define a feature exhaustively.

### Examples

Showing all available capacities for BGP:

```
switch# show capacities bgp

System Capacities: Filter BGP
Capacities Name                                                             Value
----------------------------------------------------------------------------------
-
Maximum number of AS numbers in as-path attribute
32
...
```

Showing all available capacities for mirroring:

```
switch# show capacities mirroring

System Capacities: Filter Mirroring
Capacities Name                                                             Value
----------------------------------------------------------------------------------
-
Maximum number of Mirror Sessions configurable in a system
4
Maximum number of enabled Mirror Sessions in a system
4
```

Showing all available capacities for MSTP:

```
switch# show capacities mstp

System Capacities: Filter MSTP
Capacities Name                                                             Value
----------------------------------------------------------------------------------
-
Maximum number of mstp instances configurable in a system
64
```

Showing all available capacities for VLAN count:

```
switch# show capacities vlan-count

System Capacities: Filter VLAN Count
Capacities Name                                                             Value
----------------------------------------------------------------------------------
-
Maximum number of VLANs supported in the system
4094
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (#) | Administrators or local user group members with execution rights for this command. |

## show capacities-status

`show capacities-status <FEATURE> [vsx-peer]`

### Description

Shows system capacities status and their values for all features or a specific feature.

| Parameter | Description |
|---|---|
| *<FEATURE>* | Specifies the feature, for example **aaa** or **vrrp** for which to display capacities, values, and status. Required. |
| vsx-peer | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Examples

Showing the system capacities status for all features:

```
switch# show capacities-status

System Capacities Status
Capacities Status Name                                           Value Maximum
------------------------------------------------------------------------------
Number of active gateway mac addresses in a system               0      16
Number of aspath-lists configured                                0      64
Number of community-lists configured                             0      64
...
```

Showing the system capacities status for BGP:

```
switch# show capacities-status bgp

System Capacities Status: Filter BGP
Capacities Status Name                                            Value Maximum
-------------------------------------------------------------------------------
Number of aspath-lists configured                                 0      64
Number of community-lists configured                              0      64
Number of neighbors configured across all VRFs                    0      50
Number of peer groups configured across all VRFs                  0      25
Number of prefix-lists configured                                 0      64
Number of route-maps configured                                   0      64
Number of routes in BGP RIB                                       0   256000
Number of route reflector clients configured across all VRFs      0      16
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (#) | Administrators or local user group members with execution rights for this command. |

## show console

```
show console
```

### Description

Shows the serial console port current speed.

### Examples

Showing the console port current speed:

```
switch# show console
Baud Rate: 9600
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.08 | Command introduced |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

# show core-dump

```
show core-dump [all | <SLOT-ID>]
```

## Description

Shows core dump information about the specified module. When no parameters are specified, shows only the core dumps generated in the current boot of the management module. When the **all** parameter is specified, shows all available core dumps.

| Parameter | Description |
|---|---|
| `all` | Shows all available core dumps. |
| *`<SLOT-ID>`* | Shows the core dumps for the management module or line module in **`<SLOT-ID>`**. **`<SLOT-ID>`** specifies a physical location on the switch. Use the format **member/slot/port** (for example, `1/3/1`) for line modules. Use the format **member/slot** for management modules.<br>You must specify the slot ID for either the active management module, or the line module. |

## Usage

When no parameters are specified, the `show core-dump` command shows only the core dumps generated in the current boot of the management module. You can use this command to determine when any crashes are occurring in the current boot.

If no core dumps have occurred, the following message is displayed: **No core dumps are present**

To show core dump information for the standby management module, you must use the **standby** command to switch to the standby management module and then execute the **show core-dump** command.

In the output, the meaning of the information is the following:

`Daemon Name`
Identifies name of the daemon for which there is dump information.

`Instance ID`
Identifies the specific instance of the daemon shown in the **Daemon Name** column.

`Present`
Indicates the status of the core dump:

`Yes`
The core dump has completed and available for copying.

`In Progress`
Core dump generation is in progress. Do not attempt to copy this core dump.

`Timestamp`
Indicates the time the daemon crash occurred. The time is the local time using the time zone configured on the switch.

`Build ID`
Identifies additional information about the software image associated with the daemon.

## Examples

Showing core dump information for the current boot of the active management module only:

```
switch# show core-dump
==================================================================================
Daemon Name      | Instance ID | Present     | Timestamp                | Build ID
==================================================================================
hpe-fand          1399          Yes         2017-08-04 19:05:34       1246d2a
hpe-sysmond       957           Yes         2017-08-04 19:05:29       1246d2a
==================================================================================
Total number of core dumps : 2
==================================================================================

# show deprecated commands

```
show deprecated-commands [<feature>]
```

## Description

Shows the list of CLI commands that will be deprecated in a future release along with the new form of the same command which is recommended for use.

Both the command options will be supported until a certain release, after which only the newer replacement command will be supported.

| Parameter | Description |
|---|---|
| `feature` | Optional.<br>Specify feature name.<br>The list of features for which you can view deprecated commands are:<br>■ bgp<br>■ dsnoop<br>■ ipfix<br>■ lldp<br>■ ndmd<br>■ ptp<br>■ qos<br>■ routing<br>■ snmp<br>■ tunnel<br>■ vlan<br>■ vrf<br>■ vrrp |

## Examples

Check the deprecated CLI commands for a specific feature:

```
switch# show deprecated-commands
----------------------------------------------------------------------------------
-----------
The following commands with ipv4 keyword will be replaced with ip
----------------------------------------------------------------------------------
-----------

Deprecated:  vrrp <1-255> address-family (ipv4 | ipv6)
Replacement: vrrp <1-255> address-family (ip | ipv6)

Deprecated:  show bgp ipv4 unicast
Replacement: show bgp ip unicast
...

switch# show deprecated-commands vrrp
----------------------------------------------------------------------------------
-----------
The following commands with ipv4 keyword will be replaced with ip
----------------------------------------------------------------------------------
-----------

Deprecated:  vrrp <1-255> address-family (ipv4 | ipv6)
```

```
Replacement: vrrp <1-255> address-family (ip | ipv6)

Deprecated:  show vrrp (ipv4 | ipv6 | brief | detail)(<1-255>)
Replacement: show vrrp (ip | ipv6 | brief | detail)(<1-255>)
...

switch# show deprecated-commands vsf
Feature vsf has no deprecated commands.
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.14 | Command introduced. |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show domain-name

`show domain-name [vsx-peer]`

### Description

Shows the current domain name.

| Parameter | Description |
|---|---|
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Usage

If there is no domain name configured, the CLI displays a blank line.

### Example

Setting and showing the domain name:

```
switch# show domain-name

switch# config
```

```
switch(config)# domain-name example.com
switch(config)# show domain-name
example.com
switch(config)#
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (#) | Administrators or local user group members with execution rights for this command. |

## show environment fan

```
show environment fan [vsf | vsx-peer]
```

### Description

Shows the status information for all fans and fan trays (if present) in the system.

| Parameter | Description |
|---|---|
| vsf | Shows output from the VSF member-id on switches that support VSF. |
| vsx-peer | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Usage

For fan trays, **Status** is one of the following values:

- ready:The fan tray is operating normally.
- fault:The fan tray is in a fault event. The status of the fan tray does not indicate the status of fans.
- empty:The fan tray is not installed in the system.

For fans:

```
Speed :Indicates the relative speed of the fan based on the nominal speed range of the
fan. Values are:
   Slow:The fan is running at less than 25% of its maximum speed.
   Normal:The fan is running at 25-49% of its maximum speed.
```

Medium:The fan is running at 50-74% of its maximum speed.
Fast:The fan is running at 75-99% of its maximum speed.
Max:The fan is running at 100% of its maximum speed.
N/A:The fan is not installed.

Direction: The direction of airflow through the fan. Values are:
front-to-back:Air flows from the front of the system to the back of the system.
N/A:The fan is not installed.

Status: Fan status. Values are:
**uninitialized:**The fan has not completed initialization.
**ok**: The fan is operating normally.
**fault**: The fan is in a fault state.
**empty**: The fan is not installed.

## Examples

Showing output for systems with fan trays for 6300 switch series:

```
switch# show environment fanFan tray information
-------------------------------------------
-----------------------------------
Name Description Status Serial Number
Fans
-------------------------------------------
-----------------------------------
1/1 JL669A Aruba X751 FB Fan Tray ready
CN97KN9131 2
1/2 JL669A Aru
---------------------------------------------------------------------------
1/1/1         N/A      N/A            slow    front-to-back  ok      5371
1/1/2         N/A      N/A            slow    front-to-back  ok      5320
1/1/3         N/A      N/A            slow    front-to-back  ok      5328
1/1/4         N/A      N/A            slow    front-to-back  ok      5256
1/2/1         N/A      N/A            slow    front-to-back  ok      5371
1/2/2         N/A      N/A            slow    front-to-back  ok      5349
1/2/3         N/A      N/A            slow    front-to-back  ok      5292
1/2/4         N/A      N/A            slow    front-to-back  ok      5349
1/3/1         N/A      N/A            slow    front-to-back  ok      5313
1/3/2         N/A      N/A            slow    front-to-back  ok      5371
1/3/3         N/A      N/A            slow    front-to-back  ok      5379
1/3/4         N/A      N/A            slow    front-to-back  ok      5379
1/4/1         N/A      N/A            slow    front-to-back  ok      5313
1/4/2         N/A      N/A            slow    front-to-back  ok      5299
1/4/3         N/A      N/A            slow    front-to-back  ok      5285
1/4/4         N/A      N/A            slow    front-to-back  ok      5371
```

Showing output for a system without a fan tray:

```
switch# show environment fan

Fan information
---------------------------------------------------------------
Fan   Serial Number  Speed   Direction      Status        RPM
---------------------------------------------------------------
1     SGXXXXXXXXXX   slow    front-to-back  ok            6000
2     SGXXXXXXXXXX   normal  front-to-back  ok            8000
3     SGXXXXXXXXXX   medium  front-to-back  ok            11000
4     SGXXXXXXXXXX   fast    front-to-back  ok            14000
5     SGXXXXXXXXXX   max     front-to-back  fault         16500
6     N/A            N/A     N/A            empty
...
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show environment led

```
show environment led <MEMBER-ID> [vsx-peer]
```

### Description

Shows state and status information for all the configurable LEDs in the system.

| Parameter | Description |
|---|---|
| *<MEMBER-ID>* | Shows output from the specified VSF member ID on switches that support VSF. |
| vsx-peer | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Example

Showing state and status for LED:

```
switch# show environment led
Mbr/Name       State     Status
-------------------------------
1/locator      off       ok
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show environment power-consumption

```
show environment power-consumption <DETAIL>
show environment power-consumption member <MEMBER-ID>
```

### Description

Displays power consumption information.

| Parameter | Description |
|---|---|
| *<DETAIL>* | Displays detailed power consumption information. |
| *<MEMBER-ID>* | For VSF supported platforms only. Displays the power consumption information for the specified VSF member. Range: 1-10. |

### Usage

Power consumed values are updated every minute. The total power consumed is the total power used in a chasis. The power consumed average is calculated from the total power consumed as a running average over a period of time. The average period has a default of 10 minutes. The period can be configured using **power-consumption-average-period.**

For VSF supported platforms, this command displays the power consumed for all modules of the member in a given argument.

The following information is provided for a summary of power consumption:

- line module: power used by line module
- management module: power used by management module
- fabric module: power used by fabric module
- chassis module: power used by chassis module
- fan module: power used by fan module
- power total: total power consumption
- average power: average for total power consumption that is calculated over a given period
- average period: time to calculate power average

### Example

Showing the power consumption for a switch with a single line card:

```
switch# show environment power-consumption

Power Consumption Averaging Period: 60 seconds

Name     Description          Instantaneous Power (W)      Average Power (W)
----------------------------------------------------------------------------
1        8360-32YAC Switch                     300.00                 311.50
```

Showing the power consumption for a VSF stack:

```
switch# show environment power-consumption

Power Consumption Averaging Period: 60 seconds

Name        Description              Instantaneous Power (W)    Average Power (W)
---------------------------------------------------------------------------------
1           6200M 24G 24G 4SPF+ SW                    300.00               311.50
2           6200M 24G 24G 4SPF+ SW                    280.00               275.50
```

Showing the power consumption for a switch with multiple line cards, in brief:

```
switch# show environment power-consumption

Power Consumption Averaging Period: 60 seconds

Name     Description        Instantaneous Power (W)       Average Power (W)
---------------------------------------------------------------------------
1        6410 v2 Chassis                    1300.00                 1311.50
```

Showing the power consumption for a switch with multiple line cards, in detail:

```
switch# show environment power-consumption detail

Power Consumption Averaging Period: 60 seconds

Name  Module Type      Instantaneous Power (W)       Average Power (W)
-----------------------------------------------------------------------
1     chassis total                    1000.00                 1002.50
1/1     fabric                           40.00
1/1     line                            120.00
1/2     line                            350.00
1/1     management                       20.00
        other                           470.00
```

Showing the power consumption for 4 member stack, in detail:

```
switch# show environment power-consumption detail

Power Consumption Averaging Period: 60 seconds

Name  Module Type      Instantaneous Power (W)       Average Power (W)
-----------------------------------------------------------------------
1     chassis total                     300.00                  302.50
2     chassis total                     320.00                  319.50
3     chassis total                     280.00                  282.50
4     chassis total                     310.00                  311.50
```

```
Total power consumption 1210.00
```

Showing the power consumption for VSF member 2:

```
switch# show environment power-consumption member 2

Power Consumption Averaging Period: 60 seconds

Name  Module Type        Instantaneous Power (W)       Average Power (W)
-------------------------------------------------------------------------
2     6200M 24G 4SFP+ SW                 280.00                  275.00
```

Showing the power consumption for VSF invalid member:

```
switch# show environment power-consumption member 5
Member 5 is not present
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.13 | Command introduced. |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Administrators or local user group members with execution rights for this command. |

## show environment power-consumption

*Not supported on the 6300 Switch Series.*

```
show environment power-consumption [vsx-peer]
```

### Description

Shows the power being consumed by each management module, line card, and fabric card subsystem, and shows power consumption for the entire chassis.

| Parameter | Description |
|---|---|
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

## Usage

This command is only applicable to systems that support power consumption readings.

The power consumption values are updated once every minute.

The output of this command includes the following information:

| Parameter | Description |
|---|---|
| Name | Shows the member number and slot number of the management module, line module, or fabric card module. |
| Type | Shows the type of module installed at the location specified by Name. |
| Description | Shows the product name and brief description of the module. |
| Usage | Shows the instantaneous power consumption of the module. Power consumption is shown in Watts. |
| Module Total Power Usage | Shows the total power consumption of all the modules listed. Power consumption is shown in Watts. |
| Chassis Total Power Usage | Shows the total instantaneous power consumed by the entire chassis, including modules and components that do not support individual power reporting. Power consumption is shown in Watts. |
| Chassis Total Power Available | Shows the total amount of power, in Watts, that can be supplied to the chassis. |
| Chassis Total Power Allocated | Shows total power, in Watts, that is allocated to powering the chassis and its installed modules. |
| Chassis Total Power Unallocated | Shows the total amount of power, in Watts, that has not been allocated to powering the chassis or its installed modules. This power can be used for additional hardware you install in the chassis. |

## Example

Showing the power consumption for an Aruba 6400 switch:

```
switch> show environment power-consumption
                                                                       Power
Name    Type                Description                                Usage
------------------------------------------------------------------------------
1/1     management-module   R0X31A 6400 Management Module              18 W
1/2     management-module                                              0 W
1/3     line-card-module                                               0 W
1/4     line-card-module    R0X39A 6400 48p 1GbE CL4 PoE 4SFP56 Mod    54 W
1/5     line-card-module                                               0 W
1/6     line-card-module    R0X39A 6400 48p 1GbE CL4 PoE 4SFP56 Mod    56 W
1/7     line-card-module    R0X39A 6400 48p 1GbE CL4 PoE 4SFP56 Mod    51 W
1/1     fabric-card-module  R0X24A 6405 Chassis                        71 W

Module Total Power Usage                                               250 W
```

```
Chassis Total Power Usage                                  294 W

Chassis Total Power Available                              1800 W
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show environment power-supply

```
show environment power-supply [vsf | vsx-peer]
```

### Description

Shows status information about all power supplies in the switch.

| Parameter | Description |
|---|---|
| `vsf` | Shows output from the VSF member-id on switches that support VSF. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Usage

The following information is provided for each power supply:

| Parameter | Description |
|---|---|
| `Mbr/PSU` | Shows the member and slot number of the power supply. |

| Parameter | Description |
|---|---|
| `Product Number` | Shows the product number of the power supply. |
| `Serial Number` | Shows the serial number of the power supply, which uniquely identifies the power supply. |
| `PSU Status` | The status of the power supply. Values are:<br>- **OK**:Power supply is operating normally.<br>- **OK***: Power supply is operating normally, but it is the only power supply in the chassis. One power supply is not sufficient to supply full power to the switch. When this value is shown, the output of the command also shows a message at the end of the displayed data.<br>- **Absent**: No power supply is installed in the specified slot.<br>- **Input fault**: The power supply has a fault condition on its input.<br>- **Output fault**: The power supply has a fault condition on its output.<br>- **Warning**: The power supply is not operating normally.<br>- **Wattage Maximum**: Shows the maximum amount of wattage that the power supply can provide. |

### Example

Showing the output when only one power supply is installed in an Aruba 6400 switch chassis:

```
switch#  show environment power-supply
         Product  Serial                 PSU            Wattage
Mbr/PSU  Number   Number                 Status         Maximum
---------------------------------------------------------------
1/1      R0X36A   CN91KMM2H3             OK             3000
1/2      N/A      N/A                    Absent         0
1/3      N/A      N/A                    Absent         0
1/4      N/A      N/A                    Absent         0
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

# show environment rear-display-module

`show environment rear-display-module [vsx-peer]`

## Description

Shows information about the display module on the back of the switch.

| Parameter | Description |
|---|---|
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

## Example

Showing the rear display module information on the back of the switch:

```
switch> show environment rear-display-module

Rear display module is ready
Description: 8400 Rear Display Mod
Full Description: 8400 Rear Display Module
Serial number: SG00000000
Part number: 5300_0272
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

# show environment temperature

`show environment temperature [detail] [vsf | vsx-peer]`

## Description

Shows the temperature information from sensors in the switch that affect fan control.

| Parameter | Description |
|---|---|
| detail | Shows detailed information from each temperature sensor. |
| vsf | Shows output from the VSF member-id on switches that support VSF |
| vsx-peer | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

## Usage

Temperatures are shown in Celsius.

Valid values for status are the following: \

| Parameter | Description |
|---|---|
| normal | Sensor is within nominal temperature range. |
| max | Highest temperature from this sensor. |
| low_critical | Lowest threshold temperature for this sensor. |
| critical | Highest threshold temperature for this sensor. |
| fault | Fault event for this sensor. |
| emergency | Over temperature event for Over temperature event for this sensor. |

## Examples

Showing current temperature information for a 6300 switch:

```
switch# show environment temperature
Temperature information
------------------------------------------------------------------------------
                                                     Current
Mbr/Slot-Sensor                 Module Type        temperature  Status
------------------------------------------------------------------------------
1/1-PHY-01-04                   line-card-module     45.00 C    normal

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show events

```
show events [ -e <EVENT-ID> |
    -s {emergency | alert | critical | error | warning | notice | info | debug} |
    -r |
    -a |
    -n <COUNT> |
    -i  <MEMBER-SLOT> |
    -m {active | standby} |
    -c {lldp | ospf | ...} |
    -d {lldpd | bgpd | fand | ...}]
```

### Description

Shows event logs generated by the switch modules since the last reboot.

| Parameter | Description |
|---|---|
| `-e <EVENT-ID>` | Shows the event logs for the specified event ID. Event ID range: 101 through 99999. |
| `-s {emergency \| alert \| critical \| error \| warning \| notice \| info \| debug}` | Shows the event logs for the specified severity. Select the severity from the following list:<br>■ `emergency`: Displays event logs with severity emergency only.<br>■ `alert`: Displays event logs with severity alert and above.<br>■ `critical`: Displays event logs with severity critical and above.<br>■ `error`: Displays event logs with severity error and above.<br>■ `warning`: Displays event logs with severity warning and above.<br>■ `notice`: Displays event logs with severity notice and above.<br>■ `info`: Displays event logs with severity info and above.<br>■ `debug`: Displays event logs with all severities. |
| `-r` | Shows the most recent event logs first. |
| `-a` | Shows all event logs, including those events from previous boots. |
| `-n <COUNT>` | Displays the specified number of event logs. |

| Parameter | Description |
|---|---|
| `-i` *`<MEMBER-SLOT>`* | On a 6400: Shows the event logs for the specified slot ID. |
| `-i` *`<MEMBER-SLOT>`* | On a 6300: Shows the event logs for the specified VSF member ID. |
| `-m {active \| standby}` | On a 6400: Shows the event logs for the specified management card role. Selecting `active` displays the event log for the AMM management card role and `standby` displays event logs for the SMM management card role. |
| `-m {active \| standby}` | On a 6300: Shows the event logs for the specified role. Selecting `active` displays the event log for the VSF conductor role and `standby` displays event logs for the VSF standby role. |
| `-c {lldp \| ospf \| ...}` | Shows the event logs for the specified event category. Enter `show event -c` for a full listing of supported categories with descriptions. |
| `-d {lldpd \| bgpd \| fand \| ...}` | Shows the event logs for the specified process. Enter `show event -d` for a full listing of supported daemons with descriptions. |

## Examples

Showing event logs:

```
switch# show events
---------------------------------------------------
show event logs
---------------------------------------------------
2016-12-01:12:37:31.733551|lacpd|15007|INFO|AMM|1|LACP system ID set to
   70:72:cf:51:50:7c
2016-12-01:12:37:31.734541|intfd|4001|INFO|AMM|1|Interface port_admin set to
   up for bridge_normal interface
2016-12-01:12:37:32.583256|switchd|24002|ERR|AMM|1|Failed to create VLAN 1
   in Hardware
```

Showing the most recent event logs first:

```
switch# show events -r
---------------------------------------------------
show event logs
---------------------------------------------------
2016-12-01:12:37:32.583256|switchd|24002|ERR|AMM|1|Failed to create VLAN 1
   in Hardware
2016-12-01:12:37:31.734541|intfd|4001|INFO|AMM|1|Interface port_admin set to
   up for bridge_normal interface
2016-12-01:12:37:31.733551|lacpd|15007|INFO|AMM|1|LACP system ID set to
   70:72:cf:51:50:7c
```

Showing all event logs:

```
switch# show events -a
---------------------------------------------------
```

```
show event logs
---------------------------------------------------
2016-12-01:12:37:31.733551|lacpd|15007|INFO|AMM|1|LACP system ID set to
   70:72:cf:51:50:7c
2016-12-01:12:37:31.734541|intfd|4001|INFO|AMM|1|Interface port_admin set to
   up for bridge_normal interface
2016-12-01:12:37:32.583256|switchd|24002|ERR|AMM|1|Failed to create VLAN 1
   in Hardware
```

Showing event logs related to LACP:

```
switch# show events -c lacp
---------------------------------------------------
show event logs
---------------------------------------------------
2016-12-01:12:37:31.733551|lacpd|15007|INFO|AMM|1|LACP system ID set to
   70:72:cf:51:50:7c
```

Showing event logs as per the specified management card role for a 6400 switch:

```
switch# show events -m active
---------------------------------------------------
show event logs
---------------------------------------------------
2016-12-01:12:37:31.733551|lacpd|15007|INFO|AMM|1|LACP system ID set to
   70:72:cf:51:50:7c
2016-12-01:12:37:31.734541|intfd|4001|INFO|AMM|1|Interface port_admin set to
   up for bridge_normal interface
2016-12-01:12:37:32.583256|switchd|24002|ERR|AMM|1|Failed to create VLAN 1
   in Hardware
```

Showing event logs as per the specified member/slot ID:

```
switch# show events -i 1/1
---------------------------------------------------
show event logs
---------------------------------------------------
2017-08-17:22:32:25.743991|hpe-sysmond|6301|LOG_INFO|LC|1/1|System resource
   utilization poll interval is changed to 313

## show fabric

*Not supported on the 6300 Switch Series.*

`show fabric [<SLOT-ID>] [vsx-peer]`

### Description

Shows information about the installed fabrics.

| Parameter | Description |
|---|---|
| *<SLOT-ID>* | Specifies the member and slot of the fabric to show. For example, to show the module in member 1, slot 2, enter the following:<br>`1/2` |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Examples

Showing all fabrics on Aruba 6400 switches that have two fabrics:

```
switch# show fabric

Fabric Modules
==============

     Product                                    Serial
Name Number  Description                        Number     Status
---- ------- ---------------------------------  ---------- ----------------
1/1  R0X25A  6410 Chassis                       SG9ZKM9999 Ready
1/2  R0X25A  6410 Chassis                       SG9ZKM9999 Ready
```

Showing all fabrics on Aruba 6400 switches that have one fabric:

```
switch# show fabric

Fabric Modules
==============

     Product                                        Serial
Name Number  Description                            Number     Status
---- ------- -------------------------------------- ---------- ----------------
1/1  R0X24A  6405 Chassis                           SG9ZKM9076 Ready
```

Showing a single fabric module on Aruba 6400 switches:

```
switch# show fabric 1/1

Fabric module 1/1 is ready
Admin state: Up
Description: 6405 Chassis
Full Description: 6405 Chassis
Serial number: SG00000000
Product number: R0X24A
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show hostname

```
show hostname [vsx-peer]
```

### Description

Shows the current host name.

| Parameter | Description |
|---|---|
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Example

Setting and showing the host name:

```
switch# show hostname
switch
switch# config
switch(config)# hostname myswitch
myswitch(config)# show hostname
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| All platforms | Manager (#) | Administrators or local user group members with execution rights for this command. |

## show images

```
show images [vsx-peer]
```

### Description

Shows information about the software in the primary and secondary images.

| Parameter | Description |
|---|---|
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

## Example

Showing the primary and secondary images on a 6300 switch:

```
switch(config)# show images
---------------------------------------------------------------------------
AOS-CX Primary Image
---------------------------------------------------------------------------
Version : FL.xx.xx.xxxx
Size    : 722 MB
Date    : 2019-10-22 17:00:46 PDT

| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show ip errors

```
show ip errors [vsx-peer]
```

### Description

Shows IP error statistics for packets received by the switch since the switch was last booted.

| Parameter | Description |
|---|---|
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Usage

IP error info about received packets is collected from each active line card on the switch and is preserved during failover events. Error counts are cleared when the switch is rebooted.

Drop reasons are the following:

- **Malformed packet**
  The packet does not conform to TCP/IP protocol standards such as packet length or internet header length.
  A large number of malformed packets can indicate that there are hardware malfunctions such as loose cables, network card malfunctions, or that a DOS (denial of service) attack is occurring.
- **IP address error**
  The packet has an error in the destination or source IP address. Examples of IP address errors include the following:

- The source IP address and destination IP address are the same.
- There is no destination IP address.
- The source IP address is a multicast IP address.
- The forwarding header of an IPv6 address is empty.
- There is no source IP address for an IPv6 packet.

- **Invalid TTLs**
  The TTL (time to live) value of the packet reached zero. The packet was discarded because it traversed the maximum number of hops permitted by the TTL value.
  TTLs are used to prevent packets from being circulated on the network endlessly.

### Example

Showing ip error statistics for packets received by the switch:

```
switch# show ip errors
----------------------------------
Drop reason                Packets
----------------------------------
Malformed packets                1
IP address errors               10
...
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show module

`show module [<SLOT-ID>] [vsx-peer]`

### Description

Shows information about installed line modules and management modules.

| Parameter | Description |
|---|---|
| *<SLOT-ID>* | Specifies the member and slot numbers in format |

| Parameter | Description |
|---|---|
| | member/slot. For example, to show the module in member 1, slot 3, enter 1/3. |
| vsx-peer | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

## Usage

Identifies and shows status information about the line modules and management modules that are installed in the switch.

If you use the **<SLOT-ID>** parameter to specify a slot that does not have a line module installed, a message similar to the following example is displayed:

```
Module 1/4 is not physically present.
```

To show the configuration information—if any—associated with that line module slot, use the **show running-configuration** command.

Status is one of the following values:

Active
This module is the active management module.

Standby
This module is the standby management module.

Deinitializing
The module is being deinitialized.

Diagnostic
The module is in a state used for troubleshooting.

Down
The module is physically present but is powered down.

Empty
The module hardware is not installed in the chassis.

Failed
The module has experienced an error and failed.

Failover
This module is a fabric module or a line module, and it is in the process of connecting to the new active management module during a management module failover event.

Initializing
The module is being initialized.

Present
The module hardware is installed in the chassis.

Ready
The module is available for use.

Updating
A firmware update is being applied to the module.

## Examples

Showing all installed modules on a 6300 switch:

```
switch(config)# show module

Management Modules
==================
     Product                                        Serial
Name Number  Description                            Number     Status
---- ------- -------------------------------------- ---------- ----------------
1/1  JL659A  6300M 48SR5 CL6 PoE 4SFP56 Swch        ID9ZKHN090 Active (local)

Line Modules
============

     Product                                        Serial
Name Number  Description                            Number     Status
---- ------- -------------------------------------- ---------- ----------------
1/1  JL659A  6300M 48SR5 CL6 PoE 4SFP56 Swch        ID9ZKHN090 Ready

Management Modules
==================

     Product                                        Serial
Name Number  Description                            Number     Status
---- ------- -------------------------------------- ---------- ----------------
1/1  JL659A  6300M 48SR5 CL6 PoE 4SFP56 Swch        ID9ZKHN090 Active (local)

Line Modules
============

     Product                                        Serial
Name Number  Description                            Number     Status
---- ------- -------------------------------------- ---------- ----------------
1/1  JL659A  6300M 48SR5 CL6 PoE 4SFP56 Swch        ID9ZKHN090 Ready
```

Showing a line module on a 6400 switch:

```
switch# show module 1/3

Line module 1/3 is ready
 Admin state: Up
 Description: 6400 24p 10GT 4SFP56 Mod
 Full Description: 6400 24-port 10GBASE-T and 4-port SFP56 Module
 Serial number: SG9ZKMS045
 Product number: R0X42A
 Power priority: 128
```

Showing a slot that does not contain a line module:

```
switch(config)# show module 1/3
Module 1/3 is not physically present
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show running-config

`show running-config [<FEATURE>] [all] [vsx-peer]`

### Description

Shows the current nondefault configuration running on the switch. No user information is displayed.

| Parameter | Description |
|---|---|
| *<FEATURE>* | Specifies the name of a feature. For a list of feature names, enter the `show running-config` command, followed by a space, followed by a question mark (?). When the `json` parameter is used, the `vsx-peer` parameter is not applicable. |
| *all* | Shows all default values for the current running configuration. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Examples

Showing the current running configuration:

```
switch> show running-config
Current configuration:
!
!Version AOS-CX 10.0X.XXXX
!
lldp enable
linecard-module LC1 part-number JL363A
vrf green
!
!

## show running-config current-context

`show running-config current-context`

### Description

Shows the current non-default configuration running on the switch in the current command context.

### Usage

You can enter this command from the following configuration contexts:

- Any child of the global configuration (`config`) context. If the child context has instances—such as interfaces—you can enter the command in the context of a specific instance. Support for this command is provided for one level below the `config` context. For example, entering this command for a child of a child of the `config` context not supported. If you enter the command on a child of the `config` context, the current configuration of that context and the children of that context are displayed.

- The global configuration (`config`) context. If you enter this command in the global configuration (`config`) context, it shows the running configuration of the entire switch. Use the `show running-configuration` command instead.

## Examples

*On the 6400 Switch Series, interface identification differs.*

Showing the running configuration for the current interface:

```
switch(config-if)# show running-config current-context
interface 1/1/1
vsx-sync qos vlans
    no shutdown
    description Example interface
vlan access 1
    exit
```

Showing the current running configuration for the management interface:

```
switch(config-if-mgmt)# show running-config current-context
interface mgmt
    no shutdown
    ip static 10.0.0.1/24
    default-gateway 10.0.0.8
    nameserver 10.0.0.1
```

Showing the running configuration for the external storage share named `nasfiles`:

```
switch(config-external-storage-nasfiles)# show running-config current-context
external-storage nasfiles
   address 192.168.0.1
   vrf default
   username nasuser
   password ciphertext
AQBapalKj+XMsZumHEwIc9OR6YcOw5Z6Bh9rV+9ZtKDKzvbaBAAAAB1CTrM=
   type scp
   directory /home/nas
   enable
switch(config-external-storage-nasfiles)#
```

Showing the running configuration for a context that does not have instances:

```
switch(config-vsx)# show run current-context
vsx
    inter-switch-link 1/1/1
    role secondary
    vsx-sync sflow time
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` or a child of `config`. See Usage. | Administrators or local user group members with execution rights for this command. |

## show startup-config

```
show startup-config [json]
```

### Description

Shows the contents of the startup configuration.

Switches in the `factory-default` configuration do not have a startup configuration to display.

| Parameter | Description |
|---|---|
| **json** | Display output in JSON format. |

### Examples

Showing the startup-configuration in non-JSON format for a 6300 switch:

```
switch(config)# show startup-config
Startup configuration:
!
!Version AOS-CX FL.xx.xx.xxxx
!export-password: default
hostname BLDG01-F1
user admin group administrators password ciphertext

## show system error-counter-monitor

```
show system error-counter-monitor {basic <PORT-NUM> | extended} [vsx-peer]
```

## Description

Shows error counter statistics.

| Parameter | Description |
|---|---|
| `basic <PORT-NUM>` | Specifies a physical port on the switch. Use the format `member/slot/port` (for example, `1/3/1`). |
| `extended` | Shows statistics for all interfaces. |

## Examples

Showing error counter statistics for interface 1/1/1:

```
switch# show system error-counter-monitor basic 1/1/1

Interface error counter statistics for 1/1/1

Error Counter                      Value
-----------------------------------------
EtherStatsOversizePkts             983
EtherStatsUndersizePkts            1024
EtherStatsJabbers                  10
Dot3StatsAlignmentErrors           462
Dot3StatsFCSErrors                 321
Dot3StatsLateCollisions            2024
EtherStatsFragments                121
Dot3StatsExcessiveCollisions       1025
IfInBroadcastPkts                  2001
```

Showing error counter statistics for all interfaces:

```
switch# show system error-counter-monitor extended

Interface error counter statistics for 1/1/1

Error Counter                      Value
-----------------------------------------
EtherStatsOversizePkts             983
EtherStatsUndersizePkts            1024
EtherStatsJabbers                  10
Dot3StatsAlignmentErrors           462
Dot3StatsFCSErrors                 321
Dot3StatsLateCollisions            2024
EtherStatsFragments                121
Dot3StatsExcessiveCollisions       1025
IfInBroadcastPkts                  2001
...
...
Interface error counter statistics for 1/8/32

Error Counter                     Value
-----------------------------------------
EtherStatsOversizePkts             0
...
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Manager (#) | Administrators or local user group members with execution rights for this command. |

## show system

`show system [serviceos password-prompt] [vsx-peer]`

### Description

Shows general status information about the system.

| Parameter | Description |
|---|---|
| `serviceos password-prompt` | Shows the Service OS password prompt status. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Usage

CPU utilization represents the average utilization across all the CPU cores.

System Description, System Contact, and System Location can be set with the `snmp-server` command.

When `vsx-peer` is specified, the `Up Time` value is not shown because it is not synchronized between VSX peers.

### Examples

Showing system information:

```
switch# show system
Hostname                : switch
System Description      : switch description
System Contact          : contact
System Location         : location

Vendor                  : Aruba
Product Name            : Xxxxxx ...
```

```
Chassis Serial Nbr      : XXXXXXXXXX
Base MAC Address        : xxxxxx-xxxxxx
AOS-CX Version          : XX.99.99.9999

Time Zone               : UTC

Up Time                 : 1 week, 5 hours, 28 minutes
CPU Util (%)            : 5
CPU Util (% avg 1 min)  : 11
CPU Util (% avg 5 min)  : 10
Memory Usage (%)        : 35
```

Showing the Service OS password prompt status:

```
switch# show system serviceos password-prompt
password-prompt: disabled
```

Showing system information for a VSX primary and secondary (peer) switch:

```
switch# show system
Hostname                : vsx-primary
System Description      : switch description
System Contact          : contact
System Location         : location

Vendor                  : Aruba
Product Name            : Xxxxxx ...
Chassis Serial Nbr      : XXXXXXXXXX
Base MAC Address        : xxxxxx-xxxxxx

Hostname                : vsx-primary
System Description      : switch description
System Contact          : contact
System Location         : location

Vendor                  : Aruba
Product Name            : Xxxxxx ...
Chassis Serial Nbr      : XXXXXXXXXX
Base MAC Address        : xxxxxx-xxxxxx
AOS-CX Version          : XX.99.99.9999

Time Zone               : UTC

Up Time                 : 1 week, 2 hours, 15 minutes
CPU Util (%)            : 15
CPU Util (% avg 1 min)  : 12
CPU Util (% avg 5 min)  : 8
Memory Usage (%)        : 37

switch# show system vsx-peer
Hostname                : vsx-secondary
System Description      : switch description
System Contact          : contact
System Location         : location

Vendor                  : Aruba
Product Name            : Xxxxxx ...
Chassis Serial Nbr      : XXXXXXXXXX
```

```
Base MAC Address        : xxxxxx-xxxxxx
AOS-CX Version          : XX.99.99.9999

Time Zone               : UTC

CPU Util (%)            : 7
CPU Util (% avg 1 min)  : 13
CPU Util (% avg 5 min)  : 9
Memory Usage (%)        : 32
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.12 | Added `CPU Util (% avg 1 min)` and `CPU Util (% avg 5 min)`. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show system resource-utilization

Applies to the 6300 Switch Series:

```
show system resource-utilization [all | daemon <DAEMON-NAME>] |
     standby | member <MEMBER-NUM>] [vsx-peer]
```

Applies to the 6400 Switch Series:

```
show system resource-utilization [all | daemon <DAEMON-NAME>] |
     standby | module <SLOT-ID>] [vsx-peer]
```

### Description

Shows the system resource utilization data.

| Parameter | Description |
|---|---|
| `all` | Shows the resource utilization data for the entire switch. |
| `daemon <DAEMON-NAME>` | Shows only the resource utilization data for the process identified by *<DAEMON-NAME>*. |
| `standby` | Shows only the resource utilization data for the standby management module. |

| Parameter | Description |
|---|---|
| `member <MEMBER-NUM>` | (Applies to the 6300 Switch Series.) Shows only the resource utilization data for the VSF member identified by *<MEMBER-NUM>*. |
| `module <SLOT-ID>` | (Applies to the 6400 Switch Series.) Shows only the resource utilization data for the line module identified by *<SLOT-ID>*. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

## Usage

For a list of daemons that log events, enter `show events -d ?` from a switch prompt in the manager (`#`) context.

## Examples

Showing system resource utilization data:

```
switch# show system resource-utilization
System Resources:
Processes                            :  144
CPU usage(%)                         :   10
CPU usage(% average over 1 minute)   :   11
CPU usage(% average over 5 minute)   :   15
Memory usage(%)                      :   22
Open FD's                            : 1358
Storage 1: Endurance utilization = 10-20% (mmc-type-a), 0-10% (mmc-type-b),
   Health = normal

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (#) | Administrators or local user group members with execution rights for this command. |

## show tech

```
show tech [basic | <FEATURE>] [local-file]
```

## Description

Shows detailed information about switch features by automatically running the `show` commands associated with the feature. If no parameters are specified, the `show tech` command shows information about all switch features. Technical support personnel use the output from this command for troubleshooting.

| Parameter | Description |
|---|---|
| `basic` | Specifies showing a basic set of information. |
| *`<FEATURE>`* | Specifies the name of a feature. For a list of feature names, enter the `show tech` command, followed by a space, followed by a question mark (?). |
| `local-file` | Shows the output of the `show tech` command to a local text file. |

## Usage

To terminate the output of the `show tech` command, enter **Ctrl+C**.

If the command was not terminated with **Ctrl+C**, at the end of the output, the `show tech` command shows the following:

- The time consumed to execute the command.
- The list of failed `show` commands, if any.

To get a copy of the local text file content created with the show tech command that is used with the local-file parameter, use the `copy show-tech local-file` command.

## Example

Showing the basic set of system information:

```
switch# show tech basic
=============================================================
Show Tech executed on Wed Sep  6 16:50:37 2017
=============================================================
=============================================================
[Begin] Feature basic
=============================================================

*******************************
Command : show core-dump all
*******************************
no core dumps are present

...
=============================================================
[End] Feature basic
=============================================================

=============================================================
1 show tech command failed
=============================================================
Failed command:
  1. show boot-history
=============================================================
Show tech took 3.000000 seconds for execution
```

Directing the output of the **show tech basic** command to the local text file:

```
switch# show tech basic local-file
Show Tech output stored in local-file. Please use 'copy show-tech local-file'
to copy-out this file.
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (#) | Administrators or local user group members with execution rights for this command. |

## show usb

```
show usb [vsx-peer]
```

### Description

Shows the USB port configuration and mount settings.

| Parameter | Description |
|---|---|
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Examples

If USB has not been enabled:

```
switch> show usb
Enabled: No
Mounted: No
```

If USB has been enabled, but no device has been mounted:

```
switch> show usb
Enabled: Yes
Mounted: No
```

If USB has been enabled and a device mounted:

```
switch> show usb
Enabled: Yes
Mounted: Yes
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show usb file-system

```
show usb file-system [<PATH>]
```

### Description

Shows directory listings for a mounted USB device. When entered without the <PATH> parameter the top level directory tree is shown.

| Parameter | Description |
|---|---|
| *<PATH>* | Specifies the file path to show. A leading "/" in the path is optional. |

### Usage

Adding a leading "/" as the first character of the *<PATH>* parameter is optional.

Attempting to enter '..' as any part of the *<PATH>* will generate an invalid path argument error. Only fully-qualified path names are supported.

### Examples

Showing the top level directory tree:

```
switch# show usb file-system
/mnt/usb:
'System Volume Information'  dir1'
```

```
/mnt/usb/System Volume Information':
IndexerVolumeGuid  WPSettings.dat

/mnt/usb/dir1:
dir2  test1

/mnt/usb/dir1/dir2:
test2
```

Showing available path options from the top level:

```
switch# show usb file-system /
total 64
drwxrwxrwx 2 32768 Jan 22 16:27 'System Volume Information'
drwxrwxrwx 3 32768 Mar  5 15:26 dir1
```

Showing the contents of a specific folder:

```
switch# show usb file-system /dir1
total 32
drwxrwxrwx 2 32768 Mar  5 15:26 dir2
-rwxrwxrwx 1     0 Feb  5 18:08 test1

switch# show usb file-system dir1/dir2
total 0
-rwxrwxrwx 1 0 Feb  6 05:35 test2
```

Attempting to enter an invalid character in the path:

```
switch# show usb file-system dir1/../..
Invalid path argument
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show version

```
show version [vsx-peer]
```

### Description

Shows version information about the network operating system software, service operating system software, and BIOS.

| Parameter | Description |
|---|---|
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Example

Showing version information for a 6300 switch:

```
6300# show version
-----------------------------------------------------------------------------
ArubaOS-CX
(c) Copyright 2017-2022 Hewlett Packard Enterprise Development LP

## system resource-utilization poll-interval

```
system resource-utilization poll-interval <SECONDS>
```

### Description

Configures the polling interval for system resource information collection and recording such as CPU and memory usage.

| Parameter | Description |
|---|---|
| *<SECONDS>* | Specifies the poll interval in seconds. Range: 10-3600. Default: 10. |

### Example

Configuring the system resource utilization poll interval:

```
switch(config)# system resource-utilization poll-interval 20
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## top cpu

`top cpu`

### Description

Shows CPU utilization information.

### Example

Showing top CPU information:

```
switch# top cpu
top - 09:42:55 up 3 min, 3 users, load average: 3.44, 3.78, 1.70
Tasks:  76 total, 2 running, 74 sleeping,  0 stopped,  0 zombie
%Cpu(s): 31.4 us, 32.7 sy, 0.5 ni, 34.4 id, 04. wa, 0.0 hi, 0.6 si, 0.0 st
KiB Mem : 4046496 total,  2487508 free,  897040 used,   661948 buff/cache
KiB Swap:       0 total,        0 free,       0 used,  2859196 avail Mem

  PID USER     PRI  NI   VIRT    RES   SHR S  %CPU %MEM      TIME+ COMMAND
...
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

# top memory

`top memory`

## Description

Shows memory utilization information.

## Example

Showing top memory:

```
switch> top memory
top - 09:42:55 up 3 min, 3 users, load average: 3.44, 3.78, 1.70
Tasks:  76 total, 2 running, 74 sleeping,  0 stopped,  0 zombie
%Cpu(s): 31.4 us, 32.7 sy, 0.5 ni, 34.4 id, 04. wa, 0.0 hi, 0.6 si, 0.0 st
KiB Mem : 4046496 total,  2487508 free,  897040 used,   661948 buff/cache
KiB Swap:       0 total,        0 free,       0 used,  2859196 avail Mem

  PID USER     PRI  NI   VIRT    RES   SHR S  %CPU %MEM      TIME+ COMMAND
...
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

## Command History

| Release | Modification |

|---|---|---|
| All platforms | Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

# usb

```
usb
no usb
```

### Description

Enables the USB ports on the switch. This setting is persistent across switch reboots and management module failovers. Both active and standby management modules are affected by this setting.

The **no** form of this command disables the USB ports.

### Example

Enabling USB ports:

```
switch(config)# usb
```

Disabling USB ports when a USB drive is mounted:

```
switch(config)# no usb
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

# usb mount | unmount

```
usb {mount | unmount}
```

### Description

Enables or disables the inserted USB drive.

| Parameter | Description |
|---|---|
| `mount` | Enables the inserted USB drive. |
| `unmount` | Disables the inserted USB drive in preparation for removal. |

## Usage

If USB has been enabled in the configuration, the USB port on the active management module is available for mounting a USB drive. The USB port on the standby management module is not available.

An inserted USB drive must be mounted each time the switch boots or fails over to a different management module.

A USB drive must be unmounted before removal.

The supported USB file systems are FAT16 and FAT32.

## Examples

Mounting a USB drive in the USB port:

```
switch# usb mount
```

Unmounting a USB drive:

```
switch# usb unmount
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

## Command History

# Chapter 152

# System profile commands

## profile

```
profile <PROFILE-NAME>
no profile [<PROFILE-NAME>]
```

### Description

Selects the system profile. System profiles set the overall capabilities and capacities of the switch based on the selected profile used at boot time. Switch profiles set capacities such as that of the hardware forwarding table. Use command show profiles available to show the details of each available profile.

> When a switch is configured with a non-default profile, the switch requires a reboot for the profile to be applied. You are prompted for the reboot.

The no form of this command resets the specified profile to its defaults.

| Profile names | Description |
|---|---|
| `default` | Selects the original default. v1 and v2 modules supported. |
| `v2-default` | (The default.) Selects the v2 default. Only v2 modules are supported. |
| `v2-Aggregation-High-Bandwidth` | Selects aggregation high bandwidth. Only R0X44C (1G/10G/25G) and R0X45C (40G/100G) v2 modules are supported. |
| `v2-Core-High-Bandwidth` | Selects core high bandwidth. Only R0X44C (1G/10G/25G) and R0X45C (40G/100G) v2 modules are supported. |
| `v2-Leaf-Extended-High-Bandwidth` | Selects leaf extended high bandwidth. Only R0X44C (1G/10G/25G) and R0X45C (40G/100G) v2 modules are supported. |

### Examples

Selecting the v2-Aggregation-High-Bandwidth profile and then rebooting the system:

```
switch(config)# profile v2-Aggregation-High-Bandwidth
switch(config)# exit
switch# boot system
switch(config)# The config will be cleared, and the switch will be
   rebooted with the v2-Aggregation-High-Bandwidth profile
Continue(y/n)...
```

Selecting the default profile and then rebooting the system:

```
switch(config)# profile default
switch(config)# exit
switch# boot system
switch(config)# The config will be cleared, and the switch will be
   rebooted with the Default profile
Continue(y/n)...
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.10 | Command introduced on the 6400. |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | `config` | Administrators or local user group members with execution rights for this command. |

## show profiles available

`show profiles available`

### Description

Shows all system profile names available and profile details.

### Examples

Showing all available profiles:

```
switch# show profiles available

Available Profiles
-------------------
Default                v1 and v2 modules supported
                       32768 L2 entries, 49152 Host entries, 65536 Route entries
v2-Aggregation-        Only R0X44C(1G/10G/25G)& R0X45C(40G/100G)v2 modules
supported
  High-Bandwidth       114688 L2 entries, 163840 Host entries, 65536 Route entries
                       enhanced feature set
v2-Core-High-Bandwidth Only R0X44C(1G/10G/25G)& R0X45C(40G/100G)v2 modules
supported
                       32768 L2 entries, 65536 Host entries, 630784 Route entries
                       enhanced feature set
v2-Default             Only v2 modules supported (Default)
                       32768 L2 entries, 49152 Host entries, 65536 Route entries
                       enhanced feature set
                       (Default)
```

```
v2-Leaf-Extended-      Only R0X44C(1G/10G/25G)& R0X45C(40G/100G)v2 modules
supported
  High-Bandwidth       212992 L2 entries, 16384 Host entries, 65536 Route entries
                       enhanced feature set

Note: Not all profiles are supported by all the modules, in order for the profile
to
      perform as expected, the profile must be supported by the module.
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.10 | Command introduced on the 6400. |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | Manager (#) | Administrators or local user group members with execution rights for this command. |

## show profile current

```
show profile current
```

### Description

Shows the current system profile.

### Examples

Showing the current profile:

```
switch# show profile current

Current profile
-------------------
v2-Aggregation-High-Bandwidth
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |

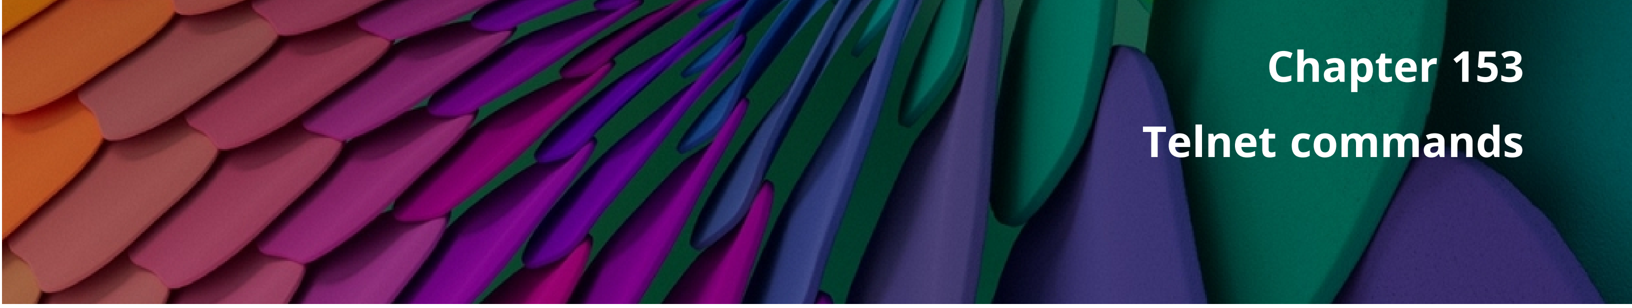
|---|---|---|
| 6400 | Manager (#) | Administrators or local user group members with execution rights for this command. |



# Chapter 153

# Telnet commands

## show telnet server

`show telnet server`

### Description

Shows the Telnet server configuration.

### Examples

Showing the Telnet server configuration:

```
switch(config)# show telnet server
TELNET Server Configuration:

    IP Version          : IPv4
    TCP Port            : 23
    Enabled VRFs        : default, vrf1, vrf2,
                          red, green
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.08.1021 | Command introduced on the 6200, 6300, 6400 Switch Series. |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## show telnet server sessions

`show telnet server sessions [vrf <VRF-NAME> | all-vrfs]`

### Description

Shows all active Telnet sessions for the specified VRF or all VRFs. If no VRF is provided, the Telnet sessions on the **default** VRF are shown.

| Parameter | Description |
|---|---|
| `vrf <VRF-NAME>` | Specifies the Telnet sessions for a specific VRF. |
| `all-vrfs` | Specifies the Telnet sessions for all VRFs |

### Examples

Showing the Telnet session on the **default** VRF:

```
switch(config)# show telnet server sessions
TELNET sessions on VRF default:

    IPv4 TELNET Sessions:
        Server IP         : 10.1.1.1
        Client IP         : 10.1.1.2
        Client Port       : 58835
```

Showing the Telnet sessions on all VRFs:

```
switch(config)# show telnet server sessions all-vrfs
TELNET sessions on VRF mgmt:

    IPv4 TELNET Sessions:
        Server IP         : 10.1.1.1
        Client IP         : 10.1.1.2
        Client Port       : 58835

TELNET sessions on VRF default:

    IPv4 TELNET Sessions:
        Server IP         : 20.1.1.1
        Client IP         : 20.1.1.2
        Client Port       : 58837
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.08.1021 | Command introduced on the 6200, 6300, 6400 Switch Series. |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## telnet server

```
telnet server vrf <VRF-NAME>
no telnet server vrf <VRF-NAME>
```

### Description

Enables the Telnet server on the desired VRF. Telnet server is disabled by default.

The **no** form of this command disables the Telnet server.

| Parameter | Description |
|---|---|
| `vrf <VRF-NAME>` | Specifies the VRF on which the Telnet server will be enabled or disabled. |

### Examples

Configuring the Telnet server on the **mgmt** VRF:

```
switch(config)# telnet server vrf mgmt
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.08.1021 | Command introduced on the 6200, 6300, 6400 Switch Series. |

### Command Information

| Platforms | Command context | Authority |

# Chapter 154

# Terminal monitor commands

## logging console {notify | severity | filter}

`logging console{notify <event|debug|all> | severity <level> | filter keyword}`

`no logging console`

### Description

Enables the logging console feature in the console session. It display all debug log or event log or both debug and event log messages. Monitoring can be filtered with the severity options or with the help of keywords. Enabling terminal monitor without options displays both debug and event log with a severity error. This command is persistent across reboot.

The **no** form of this command disables the terminal monitor configuration.

| Parameter | Description |
|---|---|
| `notify <event|debug|all>` | Specifies the type of log notification.<br>■ **Event:** Displays the event log messages. (Default)<br>■ **Debug:** Displays the debug log messages.<br>■ **All:** Displays both event and debug log messages. |
| `severity <level>` | Specifies the severity level for the logs. The different severity levels are emergency, critical, error, warning, notice, information (default), alert, and debug (shows all severities). |
| `filter <keyword>` | Specifies the filter by applying keyword for the logs. |

### Authority

Administrators or local user group members with execution rights for this command.

### Examples

Configuring console logging in the console session:

```
switch(config)# logging console
Terminal-monitor is enabled successfully

switch(config)# logging console notify all
Terminal-monitor is enabled successfully

switch(config)# logging console notify event severity info
Terminal-monitor is enabled successfully

switch(config)# logging console filter lldp
Terminal-monitor is enabled successfully
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.08 | Feature introduced. |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## show terminal-monitor

`show terminal-monitor`

### Description

Shows whether the terminal monitoring is enabled or disabled.

This command will not show any information about console logging.

### Examples

Displaying terminal monitor when enabled:

```
switch# show terminal-monitor

Terminal-monitor is enabled
-------------------------------------
Notify     | Severity   | Filter
-------------------------------------
event        debug        lldp
-------------------------------------
```

Displaying terminal monitor when disabled:

```
switch# show terminal-monitor

Terminal-monitor is disabled
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (#) | Administrators or local user group members with execution rights for this command. |

## terminal-monitor {notify | severity | filter}

```
terminal-monitor {notify <event|debug|all> | severity <level> | filter <keyword>}
```

```
no terminal-monitor
```

### Description

Enables and saves the terminal monitor feature in the switch configuration. It displays all debug log or event log or both debug and event log messages. Terminal monitoring can be filtered with the severity options or with the help of keywords. Enabling terminal monitor without options displays both debug and event log with a severity error.

The **no** form of this command removes the terminal monitor feature from the switch configuration and the command will not persist.

| Parameter | Description |
|---|---|
| `notify <event\|debug\|all>` | Specifies the type of log notification.<br>■ **Event:** Displays the event log messages. (Default)<br>■ **Debug:** Displays the debug log messages.<br>■ **All:** Displays both event and debug log messages. |
| `severity <level>` | Specifies the severity level for the logs. The different severity levels are emergency, critical, error, warning, notice, information (default), alert, and debug (shows all severities). |
| `filter <keyword>` | Specifies the filter by applying keyword for the logs. |

### Authority

Administrators or local user group members with execution rights for this command.

### Examples

Enabling terminal monitor:

```
switch# terminal-monitor
Terminal-monitor is enabled successfully

switch# terminal-monitor notify all
Terminal-monitor is enabled successfully

switch# terminal-monitor notify event severity info
```

```
Terminal-monitor is enabled successfully

switch# terminal-monitor filter lldp
Terminal-monitor is enabled successfully
```

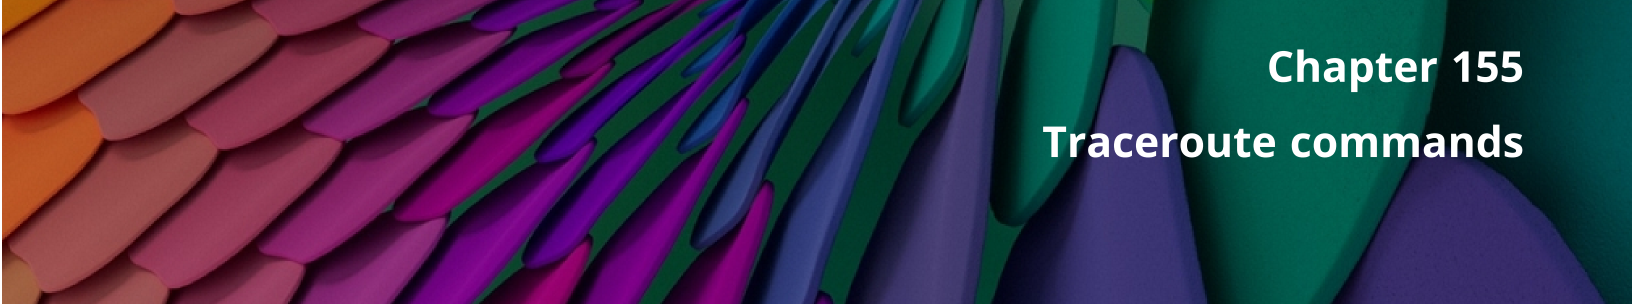
For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (#) | Administrators or local user group members with execution rights for this command. |



# Chapter 155

# Traceroute commands

## traceroute

```
traceroute {<IPV4-ADDR> | <HOSTNAME>} [ip-option loosesourceroute <IPV4-ADDR>] [dstport
<NUMBER> | maxttl <NUMBER> | minttl <NUMBER> | probes <NUMBER> | timeout <TIME>] [vrf
<VRF-NAME>] source {<IPV4-ADDR> | <IFNAME>}
```

Traceroute over VXLAN with `ip-option loosesourceroute` on L3VNI is not supported.

### Description

Uses traceroute for the specified IPv4 address or hostname with or without optional parameters.

| Parameter | Description |
|---|---|
| `IPv4-address <IPV4-ADDR>` | Specifies the IPv4 address. |
| `hostname` | Specifies the hostname of the device to traceroute. |
| `ip-option` | Specifies the IP option. |
| `loosesourceroute <IPV4-ADDR>` | Specifies the route for loose source record route. Enter one or more intermediate router IP addresses separated by ',' for loose source routing. |
| `dstport <NUMBER>` | Specifies the destination port, <*1-34000*>. Default: 33434 |
| `maxttl <NUMBER>` | Specifies the maximum number of hops to reach the destination, <*1-255*>. Default: 30 |
| `minttl <NUMBER>` | Specifies the Minimum number of hops to reach the destination, <*1-255*>. Default: 1 |
| `probes <NUMBER>` | Specifies the number of probes, <*1-5*>. Default: 3 |
| `timeout <TIME>` | Specifies the traceroute timeout in seconds, <*1-60*>. Default: 3 seconds |
| `vrf <VRF-NAME>` | Specifies the virtual routing and forwarding (VRF) to use . |
| `source {<IPV4-ADDR> \| <IFNAME>}` | Specifies the source IPv4 address or interface name. |

### Usage

Traceroute is a computer network diagnostic tool for displaying the route (path), and measuring transit delays of packets across an Internet Protocol (IP) network. It sends a sequence of User Datagram Protocol (UDP) packets addressed to a destination host. The time-to-live (TTL) value, also known as hop limit, is used in determining the intermediate routers being traversed towards the destination.

### Examples

```
switch# traceroute 10.0.10.1
traceroute to 10.0.10.1 (10.0.10.1) , 1 hops min, 30 hops max, 3 sec. timeout, 3
probes
  1   10.0.40.2  0.002ms  0.002ms  0.001ms
  2   10.0.30.1  0.002ms  0.001ms  0.001ms
  3   10.0.10.1  0.001ms  0.002ms  0.002ms

switch# traceroute localhost
traceroute to localhost (127.0.0.1), 1 hops min, 30 hops max, 3 sec. timeout, 3
probes
  1   127.0.0.1  0.018ms  0.006ms  0.003ms

switch# traceroute 10.0.10.1 maxttl 20
traceroute to 10.0.10.1 (10.0.10.1) , 1 hops min, 20 hops max, 3 sec. timeout, 3
probes
  1   10.0.40.2  0.002ms  0.002ms  0.001ms
  2   10.0.30.1  0.002ms  0.001ms  0.001ms
  3   10.0.10.1  0.001ms  0.002ms  0.002ms

switch# traceroute 10.0.10.1 minttl 1
traceroute to 10.0.10.1 (10.0.10.1) , 1 hops min, 30 hops max, 3 sec. timeout, 3
probes
  1   10.0.40.2  0.002ms  0.002ms  0.001ms
  2   10.0.30.1  0.002ms  0.001ms  0.001ms
  3   10.0.10.1  0.001ms  0.002ms  0.002ms

switch# traceroute 10.0.10.1 dstport 33434
traceroute to 10.0.10.1 (10.0.10.1) , 1 hops min, 30 hops max, 3 sec. timeout, 3
probes
  1   10.0.40.2  0.002ms  0.002ms  0.001ms
  2   10.0.30.1  0.002ms  0.001ms  0.001ms
  3   10.0.10.1  0.001ms  0.002ms  0.002ms

switch# traceroute 10.0.10.1 probes 2
traceroute to 10.0.10.1 (10.0.10.1) , 1 hops min, 30 hops max, 3 sec. timeout, 2
probes
  1   10.0.40.2  0.002ms  0.002ms
  2   10.0.30.1  0.002ms  0.001ms
  3   10.0.10.1  0.001ms  0.002ms

switch# traceroute 10.0.10.1 timeout 5
traceroute to 10.0.10.1 (10.0.10.1) , 1 hops min, 30 hops max, 5 sec. timeout, 3
probes
  1   10.0.40.2  0.002ms  0.002ms  0.001ms
  2   10.0.30.1  0.002ms  0.001ms  0.001ms
  3   10.0.10.1  0.001ms  0.002ms  0.002ms

switch# traceroute localhost vrf red
traceroute to localhost (127.0.0.1), 1 hops min, 30 hops max, 3 sec. timeout, 3
probes
  1   127.0.0.1  0.003ms  0.002ms  0.001ms

switch# traceroute localhost mgmt
traceroute to localhost (127.0.0.1), 1 hops min, 30 hops max, 3 sec. timeout, 3
probes
  1   127.0.0.1  0.018ms  0.006ms  0.003ms

switch# traceroute 10.0.10.1 maxttl 20 timeout 5 minttl 1 probes 3 dstport 33434

switch# traceroute 10.0.0.2 source 10.0.0.1
traceroute to 10.0.0.2 (10.0.0.2), 30 hops max
  1   10.0.0.2  0.299ms  0.155ms  0.115ms

switch# traceroute 10.0.0.2 source 1/1/1
traceroute to 10.0.0.2 (10.0.0.2), 30 hops max
  1   10.0.0.2  0.479ms  0.222ms  0.171ms
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.08 | Added `source IP address` and `source interface name` parameters. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## traceroute6

```
traceroute6 {<IPV6-ADDR> | <HOSTNAME>} [dstport <NUMBER> | maxttl <NUMBER> | probes
<NUMBER> | timeout <TIME>] [vrf <VRF-NAME>] source {<IPV6-ADDR> | <IFNAME>}
```

### Description

Uses traceroute for the specified IPv6 address or hostname with or without optional parameters.

| Parameter | Description |
|---|---|
| `IPv6-address <IPV6-ADDR>` | Specifies the IPv6 address. |
| `hostname` | Specifies the hostname of the device to traceroute. |
| `dstport <NUMBER>` | Specifies the destination port, *<1-34000>*. Default: 33434 |
| `maxttl <NUMBER>` | Specifies the maximum number of hops to reach the destination, *<1-255>*. Default: 30 |
| `probes <NUMBER>` | Specifies the number of probes, *<1-5>*. Default: 3 |
| `timeout <TIME>` | Specifies the traceroute timeout in seconds, *<1-60>*. Default: 3 seconds |
| `vrf <VRF-NAME>` | Specifies the virtual routing and forwarding (VRF) to use, *<VRF-NAME>*. |
| `source {<IPV6-ADDR> \| <IFNAME>}` | Specifies the source IPv6 address or interface name. |

## Usage

Traceroute is a computer network diagnostic tool for displaying the route (path), and measuring transit delays of packets across an Internet Protocol (IP) network. It sends a sequence of User Datagram Protocol (UDP) packets addressed to a destination host. The time-to-live (TTL) value, also known as hop limit, is used in determining the intermediate routers being traversed towards the destination.

## Examples

```
switch# traceroute6 0:0::0:1
traceroute to 0:0::0:1 (::1) from ::1, 30 hops max, 3 sec. timeout, 3 probes, 24
byte packets
 1  localhost (::1)  0.117 ms  0.032 ms  0.021 ms

switch# traceroute6 localhost
traceroute to localhost (::1) from ::1, 30 hops max, 3 sec. timeout, 3 probes, 24
byte packets
 1  localhost (::1)  0.089 ms  0.03 ms  0.014 ms

switch# traceroute6 0:0::0:1 maxttl 30
traceroute to 0:0::0:1 (::1) from ::1, 30 hops max, 3 sec. timeout, 3 probes, 24
byte packets
 1  localhost (::1)  0.117 ms  0.032 ms  0.021 ms

switch# traceroute6 0:0::0:1 dsrport 33434
traceroute to 0:0::0:1 (::1) from ::1, 30 hops max, 3 sec. timeout, 3 probes, 24
byte packets
 1  localhost (::1)  0.117 ms  0.032 ms  0.021 ms

switch# traceroute6 0:0::0:1 probes 2
traceroute to 0:0::0:1 (::1) from ::1, 30 hops max, 3 sec. timeout, 2 probes, 24
byte packets
 1  localhost (::1)  0.117 ms  0.032 ms

switch# traceroute6 0:0::0:1 timeout 3
traceroute to 0:0::0:1 (::1) from ::1, 30 hops max, 3 sec. timeout, 3 probes, 24
byte packets
 1  localhost (::1)  0.117 ms  0.032 ms  0.021 ms
```

```
switch# traceroute6 localhost vrf red
traceroute to localhost (::1) from ::1, 30 hops max, 3 sec. timeout, 3 probes, 24
byte packets
 1  localhost (::1)  0.077 ms  0.051 ms  0.054 ms

switch# traceroute6 localhost mgmt
traceroute to localhost (::1) from ::1, 30 hops max, 3 sec. timeout, 3 probes, 24
byte packets
 1  localhost (::1)  0.089 ms  0.03 ms  0.014 ms

switch# traceroute6 0:0::0:1 maxttl 30 timeout 3 probes 3 dstport 33434
traceroute to 0:0::0:1 (::1) from ::1, 30 hops max, 3 sec. timeout, 3 probes, 24
byte packets
 1  localhost (::1)  0.117 ms  0.032 ms  0.021 ms

switch# traceroute6 2001::2 source 2001::1
traceroute to 2001::2 (2001::2) from 2001::1, 30 hops max, 3 sec. timeout, 3
probes, 24 byte packets
1  2001::2 (2001::2)  0.4331 ms  0.3186 ms  0.1874 ms

switch# traceroute6 2001::2 source 1/1/1
traceroute to 2001::2 (2001::2) from 2001::1, 30 hops max, 3 sec. timeout, 3
probes, 24 byte  packets
1  2001::2 (2001::2)  0.6145 ms  0.4165 ms  0.1620 ms
```

# Chapter 156

# Traffic insight commands

## collect egress-vlan

```
collect egress-vlan
[no] collect egress-vlan
```

### Description

Configures collect (non-key) fields for a flow record when in the **config-flow-record** context.

The [no] form of this command removes a collect field from a flow record.

> Only one collect field can be specified per line.

> A flow record can have multiple collect fields.

| Parameter | Description |
|---|---|
| `https` | Specifies HTTP/HTTPS parameters as a non-key field in a flow record. |
| `dns` | Specifies DNS parameters as a non-key field in a flow record. |
| `name` | Specifies the name of the application. |
| `tls-attributes` | Specifies TLS Attributes as a non-key field in a flow record. |
| `egress-vlan` | Specifies egress VLAN ID as a non-key field in a flow record. |

### Examples

The following example adds **egress-vlan** collect field to flow-record-1 on the 6300 and 6400 switch series platforms:

```
switch(config)# flow record flow-record-1
switch(config-flow-record)# collect egress-vlan
```

> For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |

## collect forwarding-status

```
collect forwarding-status
[no] collect forwarding-status
```

### Description

Configures collect (non-key) fields for a flow record when in the **config-flow-record** context.

The [no] form of this command removes a collect field from a flow record.

Only one collect field can be specified per line.

A flow record can have multiple collect fields.

| Parameter | Description |
|---|---|
| https | Specifies HTTP/HTTPS parameters as a non-key field in a flow record. |
| dns | Specifies DNS parameters as a non-key field in a flow record. |
| name | Specifies the name of the application. |
| tls-attributes | Specifies TLS Attributes as a non-key field in a flow record. |
| forwarding-status | Specifies forwarding status as a non-key field in a flow record. |

### Examples

The following example adds **forwarding-status** collect field to flow-record-1 on the 6300 and 6400 switch series platforms:

```
switch(config)# flow record flow-record-1
switch(config-flow-record)# collect forwarding-status
```

For more information on features that use this command, refer to the Security Guide for your switch model.

## show running-config traffic-insight

```
show running-config traffic-insight
```

### Description

Display configuration settings for all traffic insight instances.

### Examples

```
switch# show running-config traffic-insight
traffic-insight t1
    enable
    source ipfix
    monitor mon1 type topN-flows group-by appid filter-by dstport 443
    monitor mon2 type application-flows
    monitor mon3 type raw-flows
    monitor mon4 type dns-average-latency
    monitor mon5 type topN-flows entries 20
...
```

```
 switch# show running-config traffic-insight
traffic-insight config_TI_3
enable
source ipfix
monitor mon2 type dns-average-latency
monitor mon3 type dns-onboarding-latency
...
```

For more information on features that use this command, refer to the Application Traffic Visibility Guide for your switch model.

| 6300<br>6400 | Operator (>) or Manager (#) | Administrators or local user group members with execution rights for this command. |

# show tech traffic-insight

```
show tech traffic-insight
```

## Description

Shows the Traffic Insight configuration settings.

## Examples

The example shows the Traffic Insight configuration settings.

```
Switch# show tech traffic-insight
====================================================
Show Tech executed on Wed Oct 26 11:11:37 2022
====================================================
====================================================
[Begin] Feature traffic-insight
====================================================
*********************************
Command : show running-config traffic-insight
```

```
*********************************
traffic-insight t1
enable
source ipfix
!
monitor top4 type topN-flows entries 20 group-by srcip
monitor dns type dns-average-latency
monitor top3 type topN-flows entries 18 running-statistics-timeout 900 group-by
appid filter-by dstport 443
monitor app type application-flows
====================================================
[End] Feature traffic-insight
====================================================
====================================================
Show Tech commands executed successfully
====================================================
```

For more information on features that use this command, refer to the Security Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.11 | Command introduced. |

## Command Information

| Platforms | Command context | Authority |

| 6300<br>6400 | Manager (#) | Administrators or local user group members with execution rights for this command. |

# show traffic-insight monitor-type

```
show traffic-insight <INSTANCE_NAME> monitor-type
                 application-flows <MONITOR_NAME> {app-details | client-role | url-
     details |
      permitted | denied | {tls-visibility [{client client-mac>}]| {tls-cert-visibility
     [detail|expired]}}

     dns-average-latency <MONITOR_NAME>
     topN-flows {<MONITOR_NAME> | all} [app-details]
     raw-flows <MONITOR_NAME>
```

## Description

Display information for traffic insight monitored flows.

| Parameter | Description |
|---|---|
| *<INSTANCE_NAME>* | Name of the traffic insight instance, string of maximum length up to 32 characters. |

| Parameter | Description |
|---|---|
| `monitor-type` | Specifies traffic insight monitor type. |
| `application flows` | Monitors client application flows and provides application level rx/tx counters and application visibility. The frequency at which the Traffic Insight application flow table is updated with new flow statistics is 30 seconds if the flow count is more than 2k. Otherwise, it is updated every 12 minutes. A maximum of 2k flows can be updated in the table at a time. Any excess flows are updated in subsequent update. |
| `raw-flows` | Shows the last 5k flows that switch has received across all the ports where IPFIX is enabled in non-chronological order. |
| `<MONITOR_NAME> \| all` | Specify a monitor name to display information for that monitor, or enter all to display information for all monitors.<br>**NOTE:** The **all** parameter displays all topN-flows monitor instances information |
| `app-details` | Displays traffic insight monitor flows with application details.<br>This option is supported only on monitors with one of the following configurations:<br>`monitor <MONITOR_NAME> monitor-type topN-flows {filter-by <FILTER-TYPE>}`<br>`monitor <MONITOR_NAME> monitor-type topN-flows group-by appid {filter-by <FILTER-TYPE>}`<br>`monitor <MONITOR_NAME> monitor-type topN-flows group-by srcip_appid {filter-by <FILTER-TYPE>}` |
| `client-role` | Shows traffic insight monitor flows with client role details. |
| `url-details` | Shows traffic insight flows with app URL details. |
| `permitted` | Shows traffic insight flows permitted by ABP |
| `denied` | Shows traffic insight flows denied by ABP |
| `tls-visibility` | Shows TLS attributes for traffic insight flows. |
| `client <CLIENT_MAC>` | (Optional) Specifies the client MAC address in xx:xx:xx:xx:xx:xx format. |
| `tls-cert-visibility` | Shows TLS certificate attributes for traffic insight flows. |
| `detail` | (Optional) Shows traffic insight flows with application TLS Certificate Visibility with additional details |
| `expired` | (Optional) Shows traffic insight flows with application TLS for expired . |

To have application flows indicate denied flows appropriately, IPFIX monitor should contain forwarding status and egress VLAN collect configurations.

In the 6300 and 6400 Switch Series **policy_action** will be set to permitted for all flows when **collect forwarding-status** is not enabled.

## Examples

The following example shows **all** monitoring flow data for **topN-flows**, for instance **instance-1**:

```
switch# show traffic-insight instance-1 monitor-type topN-flows all

       ]
    application-flows
    raw-flows
    dns-average-latency
    dns-onboarding-latency
```

## Description

Traffic insight monitors data collected from flow exporters like the IP Flow Information Export (IPFIX) flow exporter. Traffic insight tracks multiple monitor requests simultaneously and provides monitor reports for each request.

| Parameter | Description |
|---|---|
| `<INSTANCE_NAME>` | Name of the traffic insight instance, string of maximum length up to 32 characters. |
| `[no] enable` | Enable or disable this traffic insight configuration |
| `[no] source ipfix` | The traffic insight configuration uses this source protocol to collect traffic flows. The only available protocol is **ipfix**. |
| `monitor <INSTANCE_NAME>` | Enable flow monitoring on a traffic insight instance and configure rules for filtering and grouping traffic flows. |
| `type` | Specifies type of the monitor |
| `topN-flows` | Monitors IP traffic flowing through the switch and captures topN flows volume. The default number of top flows captured is 5. |
| `entries <Entry-VALUE>` | Select the maximum number of entries in the monitor report. Range: 1 to 20. The default value is 5. |
| `running-statistics-timeout <TIMEOUT-SECONDS>` | Sets running-statistics reset timeout value. Range: 360 to 86400. The default value is 600. |
| `filter-by <FILTER-TYPE>` | Include any of the following values to filter the data set.<br>■ **src_ip_mask *<IP_MASK>***—Filter by source IP netmask<br>■ **dst_ip_mask *<IP_MASK>***—Filter by destination IP netmask<br>■ **src_ip *<IP_ADDRESS>***—Filter by source IP address |

| Parameter | Description |
|---|---|
|  | ■ **dst_ip <*IP_ADDRESS*>**— Filter by destination IP address<br>■ **src_port <*PORT*>**—Filter by source port number<br>■ **dst_port <*PORT*>**:—Filter by destination port number<br>■ **ip_proto <*PROTOCOL*>**—Filter by IP protocol |
| `group-by <GROUP-TYPE>` | Include any of the following values to create a monitor that groups matching traffic flows by that criteria.<br>■ **srcip**—Group by source IP address<br>■ **dstip** —Group by destination IP address<br>■ **srcport**—Group by source port number<br>■ **dstport**—Group by destination port number<br>■ **ipproto**—Group by IP protocol<br>■ **appid**—Group by application ID<br>■ **srcip_dstip**—Group by Source IP and Destination IP<br>■ **srcip_dstport**—Group by Source IP and Destination Port<br>■ **srcip_appid**—Group by Source IP and Application ID. |
| `application-flows` | Monitors client application flows and provides application level rx/tx counters and application visibility. The frequency at which the Traffic Insight application flow table is updated with new flow statistics is 30 seconds if the flow count is more than 2k. Otherwise, it is updated every 12 minutes. A maximum of 2k flows can be updated in the table at a time. Any excess flows are updated in subsequent updates. |
| `raw-flows` | Provides uni-direction flow details for all apps or clients to CNX on-demand basis. It is used by CNX for trouble-shooting work-flow. |
| `src_ip` | Source IP address of the flow. |
| `dst_ip` | Destination IP address of the flow. |
| `protocol` | Type of protocol that is carried by IP. |

| Parameter | Description |
|---|---|
| `dest port` | Destination L4 port of the IP traffic. |
| `app_details` | Application details like app_name, category, URL etc. |
| `Bytes` | Number of bytes received. |
| `Packets` | Number of packets received. |
| `Action` | Specifies if flow is allowed or blocked due to a policy. |
| `dns-average-latency` | Monitors DNS request and response flows and provides average dns-latency details per client. The Traffic Insight application flow table in the database is updated every 5 minutes with dns average latency information. |
| `dns-onboarding-latency` | Monitors DNS request and response flows and provides DNS onboarding latency details per client. |
| `no` | Negate a command or set its defaults |

## Examples

The following example creates a traffic insight instance named **TI_1**:

```
switch(config)# traffic-insight  TI_1
```

The following example deletes a traffic insight instance named **TI_1**:

```
switch(config)# no traffic-insight TI_1
```

The following example enables traffic insight instance for **TI_1** instance:

```
switch(config)# traffic-insight  TI_1
switch(config-ti)#enable
```

The following example disables traffic insight instance for **TI_1** instance:

```
switch(config)# traffic-insight  TI_1
switch(config-ti)#no enable
```

The following example sets the source protocol for **TI_1** instance to collect flows information from IPFIX:

```
switch(config)# traffic-insight TI_1
switch(config-ti)# source ipfix
```

The following example removed the source protocol for **TI_1** instance:

```
switch(config)# traffic-insight TI_1
switch(config-ti)# no source ipfix
```

The following examples create traffic insight monitor with filter and grouping rules for **topN-flows** for the **mnti1** monitoring:

```
switch(config)# traffic-insight TI_1
switch(config-ti)# monitor mnti1 type topN-flows
switch(config-ti)# monitor mnti1 type topN-flows running-statistics-timeout 1800
switch(config-ti)# monitor type topN-flows group-by src_ip
switch(config-ti)# monitor type topN-flows filter-by src_ip_mask 192.0.0.0/8
```

The following example creates a traffic insight monitor with filter and grouping rules for **topN-flows** using the below parameter for the **mnti1** monitoring:

- 10 entries
- Grouped by **srcip** (Source IP)
- Filter by **src_ip_mask** (Source IP Mask)

```
switch(config-ti)# monitor mnti1 type topN-flows entries 10 group-by srcip filter-
by src_ip_mask 192.0.0.0/8
```

The following example removes flow monitoring:

```
switch(config)#traffic-insight TI_1
switch(config-ti)# no monitor mnti1 topN-flows
```

The following examples create a traffic insight monitor for **application-flows** for the **mnti2** instance:

```
switch(config-ti)# monitor mnti2 type application-flows
```

The following examples create a traffic insight monitor for **raw-flows** for the **mnti3** instance:

```
switch(config-ti)# monitor mnti3 type raw-flows
```

The following examples create a traffic insight monitor for **dns-average-latency** for the **mnti3** instance:

```
switch(config-ti)# monitor mnti3 type dns-average-latency
```

The following examples create a traffic insight monitor for **dns-onboarding-latency** for the **mnti3** instance:

```
switch(config-ti)# monitor mnti3 type dns-onboarding-latency
```

For more information on features that use this command, refer to the Security Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.12.1000 | The **dns-onboarding-latency** sub-parameter was introduced. |
| 10.13 | The **raw-flows** sub-parameter introduced. |
| 10.11 | Command introduced. |

# Chapter 157

# Two-factor authentication commands

## aaa authorization radius

```
aaa authorization radius {ssh | https-server} group <GROUP-LIST>
no aaa authorization radius {ssh | https-server} group <GROUP-LIST>
```

### Description

Enables RADIUS authorize-only for use with two-factor authentication. By default RADIUS authenticates and authorizes a client that is configured for AAA based access. This command causes the RADIUS server to instead be used only for authorization and not for authentication.

Authorization requests are sent over TLS and therefore RADIUS authorize-only requires a RadSec RADIUS server.

> If command authorization is also configured it is given priority over RADIUS authorize-only and therefore command authorization is done on the basis of command authorization configuration and not the user role and privilege level assigned by the RADIUS server.

The **no** form of this command disables RADIUS authorize-only, causing RADIUS to be again used for both authentication and authorization.

| Parameter | Description |
|---|---|
| `ssh` | Selects the SSH authorization list. |
| `https-server` | Selects the HTTPS server authorization list. |
| `group <GROUP-LIST>` | Specifies the list of remote RADIUS server group names. Each name can be specified one time. Predefined remote RADIUS group name **radius** is available.<br>The remote RADIUS server groups are accessed in the order that the group names are listed in this command. Within each group, the servers are accessed in the order in which the servers were added to the group. Server groups are defined using command **aaa group server** and servers are added to a server group with the command **server**. |

### Examples

Enabling RADIUS authorize only for SSH with the default RADIUS group:

```
switch(config)# aaa authorization radius ssh group radius
All commands will fail if none of the radsec servers in the group list are
reachable.
Continue (y/n)? y
```

Disabling RADIUS authorize only for SSH with the default RADIUS group, causing RADIUS to be again used for both authentication and authorization:

```
switch(config)# no aaa authorization radius ssh group radius
```

Enabling RADIUS authorize only for HTTPS server with the default RADIUS group:

```
switch(config)# aaa authorization radius https-server group radius
All commands will fail if none of the radsec servers in the group list are
reachable.
Continue (y/n)? y
```

Disabling RADIUS authorize only for HTTPS server with the default RADIUS group, causing RADIUS to be again used for both authentication and authorization:

```
switch(config)# no aaa authorization radius https-server group radius
```

For more information on features that use this command, refer to the Security Guide for your switch model.

| Release | Modification |
|---|---|
| 10.11 | Command introduced |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## https-server authentication certificate

`https-server authentication certificate [authorization radius] [username {<CERT-FIELD>}]`

### Description

Enables certificate-based authentication where the HTTPS server uses an X.509 certificate for authentication and a RADIUS server for authorization.

Enabling password authentication is the only way of disabling certificate authentication.

| Parameter | Description |
|---|---|
| `authorization radius` | Specifies that after certificate authentication succeeds, instead of prompting for a password, the HTTPS server checks the RADIUS server only for authorization. A local user is not required.<br>By default, the username found in the certificate field UserPrincipalName (UPN) is used for authorization on the RADIUS serer.<br>When this parameter is omitted, **authorization radius** is still the assumed active setting. |
| *<CERT-FIELD>* | Selects which certificate username field is to be used for authorization. |

| Parameter | Description |
|---|---|
| | ▪ Specify **user_pincipal_name** to use the certificate UserPrincipalName (UPN) field. This is the default.<br>▪ Specify **common_name** to use the certificate CommonName (CN) field.<br>When this parameter is omitted, **user_pincipal_name** is assumed. |

### Examples

Enabling HTTPS server authentication with authorization on a RADIUS server with the username in certificate field UserPrincipalName (UPN):

```
switch(config)# https-server authentication certificate authorization radius
```

Enabling HTTPS server authentication with authorization on a RADIUS server with the username in certificate field UserPrincipalName (UPN) (**authorization radius** is still implied even though not specified):

```
switch(config)# https-server authentication certificate
```

Enabling HTTPS server authentication with authorization on a RADIUS server with the username in certificate field CommonName (CN):

```
switch(config)# https-server authentication certificate authorization radius
username common_name
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.11 | Command introduced |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## ssh certificate-as-authorized-key

```
ssh certificate-as-authorized-key
no ssh certificate-as-authorized-key
```

### Description

Enables SSH enforcement that the username must be present in the certificate that is being used for authorization. This configuration alters how certificate-based authentication maps to a user account. When this is enabled, SSH will not require local user association with an authorized-key and instead enforces that the username used to log in is present within the certificate.

The SSH server will check for the username in certificate fields **Common Name** or **User Principle Name** for a match. If a certificate is not used for authentication then this configuration has no effect on SSH authentication.

The **no** form of this command disables the SSH enforcement of username in the certificate.

### Examples

Enabling SSH enforcement of username in the certificate:

```
switch(config)# ssh certificate-as-authorized-key
```

Disabling SSH enforcement of username in the certificate:

```
switch(config)# no ssh certificate-as-authorized-key
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.11 | Command introduced |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | config | Administrators or local user group members with execution rights for this command. |

## ssh two-factor-authentication

```
ssh two-factor-authentication [authorization radius]
no ssh two-factor-authentication [authorization radius]
```

### Description

Enables the selected SSH Two Factor authentication method. Two-factor authentication uses an X.509 certificate and possibly a password. First the X.509 certificate presented by the user is authenticated.

Then, if successful, (when the **authorization-radius** parameter is not specified) the (locally-defined) user is prompted for a password. When the **authorization radius** parameter is specified, instead of prompting for a password, SSH checks only for authorization with the remote RADIUS server. A local user is not required.

The **no** form of the command disables SSH two-factor authentication.

| Parameter | Description |
|---|---|
| `authorization radius` | Specifies that after certificate authentication succeeds, SSH checks the RADIUS server only for authorization. |

## Examples

Enabling two-factor authentication for local user with password prompting:

```
switch(config)# ssh two-factor-authentication
```

Disabling two-factor authentication for local user with password prompting:

```
switch(config)# no ssh two-factor-authentication
```

Enabling two-factor authentication for remote-only RADIUS-defined users without password prompting:

```
switch(config)# ssh two-factor-authentication authorization radius
```

Disabling two-factor authentication for remote-only RADIUS-defined users without password prompting: :

```
switch(config)# no ssh two-factor-authentication authorization radius
```

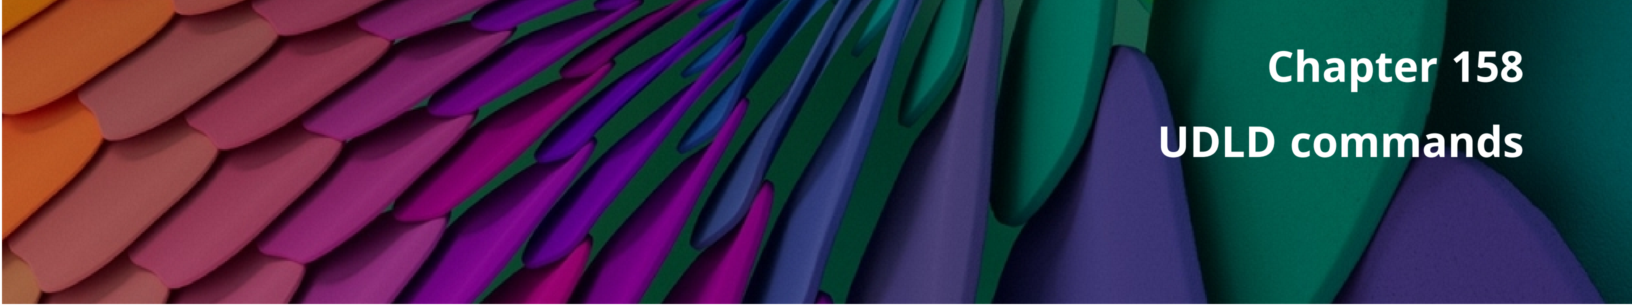
For more information on features that use this command, refer to the Security Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.11 | Added the **authorization radius** parameter |
| 10.10 | Command introduced |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |



# Chapter 158

# UDLD commands

## clear udld statistics

```
clear udld statistics [interface <INTERFACE-NAME>]
```

### Description

Clears UDLD statistics for all interfaces or a specific interface.

### Examples

*On the 6400 Switch Series, interface identification differs.*

Clearing all UDLD statistics on all interfaces:

```
switch# clear udld statistics
```

Clearing all UDLD statistics on interface 1/1/1:

```
switch# clear udld statistics interface 1/1/1
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (#) | Administrators or local user group members with execution rights for this command. |

## show udld

```
show udld [interface <INTERFACE-NAME>] [vsx-peer]
```

### Description

Displays UDLD information for all interfaces or for a specific interface.

| Parameter | Description |
|---|---|
| `interface <INTERFACE-NAME>` | Specifies the name of a logical interface on the switch, which can be:<br>▪ An Ethernet interface associated with a physical port. Use the format **member/slot/port** (for example, **1/3/1**).<br>▪ UDLD runs only on physical interfaces. LAGs, tunnels, and the like are not supported. However, UDLD can be configured individually on each port of a LAG or trunk group. Configuring UDLD on a trunk group primary port enables UDLD on that port only. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

## Examples

*On the 6400 Switch Series, interface identification differs.*

Displaying all UDLD information:

```
switch# show udld

# udld

```
udld [disable]
no udld [disable]
```

### Description

Enables UDLD support on a physical interface. UDLD is disabled by default. UDLD is configured on a per-port basis and must be enabled at both ends of the link.

UDLD runs only on physical interfaces. LAGs, tunnels, and the like are not supported. However, UDLD can be configured individually on each port of a LAG or trunk group. Configuring UDLD on a trunk group's primary port enables UDLD on that port only.

The **no** form of this command disables UDLD support and resets all configuration values to their default settings.

| Parameter | Description |
|---|---|
| *disable* | Disables UDLD on the interface but retains all UDLD configuration settings. |

### Examples

*On the 6400 Switch Series, interface identification differs.*

Enabling UDLD on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# udld
```

Disabling UDLD on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# no udld
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

## udld interval

```
udld interval <TIME>
```

```
no udld interval [<TIME>]
```

## Description

Sets the packet transmission interval.

The **no** form of this command sets the packet transmission interval to the default value of 7000 ms.

The allowed values vary depending on the operation mode.

The default interval is 7000 ms (7 seconds) for both ArubaOS-Switch and RFC5171 operation modes.

Values must be specified as multiples of 10 ms (7000 ms is allowed but 7005 ms is not a valid setting).

Sessions under 100ms total detection time are susceptible to increasing processing load on the system. It is advisable to experiment with values that provide adequate detection times and system/protocol stability. Aruba recommends additional testing prior to configuring these sessions on a production environment.

However, these settings are recommended for specific deployments only, such as using UDLD for Ethernet Ring Protection Switching (ERPS) link-failure detection. The minimum detection time appropriate for your environment depends on the specific device family and configuration on which the protocol and system load is running. Aruba recommends additional testing for these configurations. During testing, monitor for unexpected false positive detections (i.e., UDLD records a failure when there was not any) on the interfaces running UDLD. Such false positive failures are an indication that the interval configuration requires tuning and that the system load might not allow such configuration.

When configuring detection times under 100ms for LAG interfaces, consider adding the interface first to the LAG and then enabling UDLD in the interface, to avoid false positive link failure detections. Adding an interface to a LAG causes momentary control plane traffic interruption for up to 100ms, which UDLD detects as a link failure if the detection time is following the control traffic interruption interval.

| Parameter | Description |
|---|---|
| *<TIME>* | Specifies the packet transmission interval. Range: 200 ms to 90000 ms (in increments of 10). |

## Examples

*On the 6400 Switch Series, interface identification differs.*

Setting the packet transmission interval to **1000** ms on interface **1/1/1**.

```
switch(config)# interface 1/1/1
switch(config-if)# udld interval 1000
```

Setting the packet transmission interval on interface **1/1/1** to the default value.

```
switch(config)# interface 1/1/1
switch(config-if)# no udld interval
```

Trying to set the packet interval to 1055 ms on interface 1 is rejected because the interval must be specified as a multiple of 10:

```
switch(config)# interface 1
switch(config-if)# udld interval 1055
Invalid interval. The interval value must be between 20ms and 90000ms and should
be
specified as a multiple of 10, for example: 20, 100, 3000 or 90000.
```

Trying to set the packet interval to less than 7000 ms on interface 1 is rejected if using the RFC5171 mode.

```
switch(config)# interface 1
switch(config-if)# udld mode rfc5171 normal
switch(config-if)# udld interval 1000
Invalid interval. The interval must be equal or greater than 7000ms.
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

### Command History

## udld mode

```
udld mode aruba-os {verify-then-forward | forward-then-verify}
udld mode rfc5171 <RFC5171-MODE>
no udld mode [[aruba-os [verify-then-forward | forward-then-verify]] | [rfc5171
[<RFC5171-MODE>]]]
```

### Description

Sets the operating mode.

The **no** form of this command sets the operating mode to the default value of **aruba-os** and **forward-then-verify**.

| Parameter | Description |
|---|---|
| `aruba-os {verify-then-forward | forward-then-verify}` | Selects the ArubaOS mode to use. Use this mode when interconnecting with HPE PVOS/Brocade/Foundry switches. |
| `verify-then-forward` | In this mode:<br>■ Interfaces start as unblocked. |

| Parameter | Description |
|---|---|
| | ■ Once an interface is determined to be bidirectional, it is blocked if the retry limit is reached without receiving any UDLD packets.<br>■ Interfaces automatically unblock if a UDLD packet is received.<br>■ On failover, the UDLD state does not change if the (interval * retries) time is around 6 seconds. |
| `forward-then-verify` | In this mode:<br>■ Interfaces start as unblocked.<br>■ Interfaces transition to the unblocked state when receiving UDLD packets.<br>■ Once an interface is determined to be bidirectional, it is blocked if the retry limit is reached without receiving any UDLD packets.<br>■ Interfaces automatically unblock if a UDLD packet is received. |
| `rfc5171` *`<RFC5171-MODE>`* | Selects the RFC5171 mode to use. Use this mode when interconnecting with third-party switches. |
| `normal` | In this mode:<br>■ Interfaces start as unblocked.<br>■ Interfaces do not block when the retry limit is reached without receiving any UDLD packets (plus 8 extra packets sent to the peer). Instead, an event is generated.<br>■ Interfaces automatically unblock if a UDLD packet is received. |
| `aggressive` | In this mode:<br>■ Interfaces start as unblocked.<br>■ Once an interface is determined to be bidirectional, an interface will block when the retry limit is reached without receiving any UDLD packets (plus 8 extra packets sent to the peer).<br>■ Interfaces implement a limited/reduced errDisabled recovery mechanism. When the interface's state goes to errDisabled, a maximum of 3 attempts (5 minutes apart) are triggered to try and bring up the interface in case the remote endpoint is still sending UDLD packets. After these 3 retries, the interface will remain blocked even if UDLD packets are received. The only way to unblock the interface when this occurs is to disable (and optionally re-enable) UDLD on the interface. The retry limit is reset once the interface becomes unblocked. |

## Examples

*On the 6400 Switch Series, interface identification differs.*

Setting the operating mode to **aruba-os** and **forward-then-verify** on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# udld mode aruba-os forward-then-verify
```

Setting the operating mode to **rfc5171** and **aggressive** on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# udld mode rfc5171 aggressive
```

Setting the operating mode on interface **1/1/1** to the default value:

```
switch(config)# interface 1/1/1
switch(config-if)# no udld mode
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

## udld retries

```
udld retries <COUNT>
no udld retries [<COUNT>]
```

### Description

Sets the UDLD retry count.

The **no** form of this command sets the retry count to the default of 4.

| Parameter | Description |
|---|---|
| *<COUNT>* | Specifies the UDLD retry count. Range: 3 to 10. Default: 4. |

### Examples

*On the 6400 Switch Series, interface identification differs.*

Setting the UDLD retry count to **5** on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# udld retries 5
```

Setting the UDLD retry count on interface **1/1/1** to the default value:

```
switch(config)# interface 1/1/1
switch(config-if)# no udld retries
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

# Chapter 159

# UFD (Uplink Failure Detection) commands

## debug ufd all

```
debug ufd all
no debug ufd all
```

### Description

Enables the UFD debug logs.

The no form of this command disables the UFD debug logs.

### Examples

Enabling UFD debug logs:

```
switch(config)# debug ufd all
```

Disabling UFD debug logs:

```
switch(config)# no debug ufd all
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

### Command History

| Release | Modification |

|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## delay

```
delay {down | up} <DELAY>
no delay {down | up} <DELAY>
```

### Description

Within the selected UFD (Uplink Failure Detection) session context, specifies the amount of time (in seconds) to delay before bringing up or down the configured Links to Disable (LtD) after the corresponding Links to Monitor (LtM) come back up or go down.

For example, with **delay down 10**, when **all LtM links go down** and remain down after 10 seconds, UFD disables the interfaces/LAGs configured as Links-to-Disable (LtD). Similarly, with **delay up 10**, If **any of the LtM links come back up** and remain up after 10 seconds, then all the LtD links are brought back up.

In addition to any configured delay there is an additional delay of 3 to 5 seconds before bringing any Links-to-Disable (LtD) down or back up. So with the default delay of 0 seconds, a delay of 3 to 5 seconds does occur.

The no form of this command restores the delay to its default of 0 seconds.

| Parameter | Description |
|---|---|
| *<DELAY>* | Species the delay in seconds. Range 0 to 180 seconds. Default: 0 seconds. |

## Examples

Setting the up and down delays to 10 seconds:

```
switch(config)# ufd enable
switch(config)# ufd session-id 1
switch(config-ufd-1)# links-to-monitor 1/1/1,1/1/2
switch(config-ufd-1)# links-to-disable 1/1/11,1/1/12
switch(config-ufd-1)# delay down 10
switch(config-ufd-1)# delay up 10
switch(config-ufd-1)# exit
switch(config)#
```

Resetting the up and down delays to their default of 0:

```
switch(config-ufd-1)# no delay down 10
switch(config-ufd-1)# no delay up 10
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

## Command History

# links-to-disable

```
links-to-disable <IF/LAG-LIST>
no links-to-disable <IF/LAG-LIST>
```

## Description

Within the selected UFD (Uplink Failure Detection) session context, specifies the interfaces or LAGs to disable when the monitored uplink interfaces go down.

For proper UFD operation, **links-to-disable** and **links-to-monitor** must both be configured. Use command **links-to-monitor** to specify a corresponding list of interfaces/LAGs to monitor.

The no form of this command deletes the specified links to disable list within the selected UFD session context.

A LAG member interface cannot be added as a link to disable. A interface configured as a link to disable cannot be added as a LAG member interface.

| Parameter | Description |
|---|---|
| *<IF/LAG-LIST>* | List of L2 interfaces or LAGs. Separate interfaces/LAGs with commas (for individual interfaces/LAGs) or hyphens (for a consecutive range of interfaces/LAGs). |

## Examples

Configuring two links to be disabled:

```
switch(config)# ufd enable
switch(config)# ufd session-id 1
switch(config-ufd-1)# links-to-monitor 1/1/1,1/1/2
switch(config-ufd-1)# links-to-disable 1/1/11,1/1/12
switch(config-ufd-1)# delay down 10
switch(config-ufd-1)# delay up 10
switch(config-ufd-1)# exit
switch(config)#
```

Configuring a range of interfaces to disable:

```
switch(config)# ufd session-id 2
switch(config-ufd-2)# links-to-monitor lag18-lag20
switch(config-ufd-2)# links-to-disable 1/1/3-1/1/5
switch(config-ufd-2)# exit
switch(config)#
```

Deleting the links to disable for two interfaces:

```
switch(config-ufd-1)# no links-to-disable 1/1/11,1/1/12
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.09 | Command introduced. |

### Command Information

## links-to-monitor

```
links-to-monitor <IF/LAG-LIST>
no links-to-monitor <IF/LAG-LIST>
```

### Description

Within the selected UFD (Uplink Failure Detection) session context, specifies the uplink interfaces or LAGs to monitor for UFD.

For proper UFD operation, **links-to-monitor** and **links-to-disable** must both be configured. Use command **links-to-disable** to specify a corresponding list of interfaces/LAGs to disable if the monitored uplinks go down.

The no form of this command deletes the specified links to monitor list within the selected UFD session context.

A LAG member interface cannot be added as a link to monitor. A interface configured as a link to monitor cannot be added as a LAG member interface.

| Parameter | Description |
|---|---|
| *<IF/LAG-LIST>* | List of L2 interfaces or LAGs. Separate interfaces/LAGs with commas (for individual interfaces/LAGs) or hyphens (for a consecutive range of interfaces/LAGs). |

### Examples

Configuring two uplinks to monitor for UFD session 1:

```
switch(config)# ufd enable
switch(config)# ufd session-id 1
switch(config-ufd-1)# links-to-monitor 1/1/1,1/1/2
switch(config-ufd-1)# links-to-disable 1/1/11,1/1/12
switch(config-ufd-1)# delay down 10
switch(config-ufd-1)# delay up 10
switch(config-ufd-1)# exit
switch(config)#
```

Configuring a range of uplink LAGs to monitor for UFD session 2:

```
switch(config)# ufd session-id 2
switch(config-ufd-2)# links-to-monitor lag18-lag20
switch(config-ufd-2)# links-to-disable 1/1/3-1/1/5
switch(config-ufd-2)# exit
switch(config)#
```

Deleting both links to monitor for UFD session 1:

```
switch(config-ufd-1)# no links-to-monitor 1/1/1,1/1/2
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

## show capacities ufd

```
show capacities ufd
show capacities-status ufd
```

### Description

Command **show capacities ufd** shows UFD session capacity. Command **show capacities-status ufd** shows UFD session capacity and the number of UFD sessions configured.

### Example

Showing UFD session capacity:

```
switch# show capacities ufd

System Capacities: Filter UFD
Capacities Name                                                              Value
----------------------------------------------------------------------------------
---
Maximum number of Uplink Failure Detection sessions configurable in a system  128
```

Showing UFD session capacity and the number of UFD sessions configured:

```
switch(config)# show capacities-status ufd

System Capacities Status: Filter UFD
Capacities Status Name                                                Value
Maximum
----------------------------------------------------------------------------------
---
Number of Uplink Failure Detection sessions currently configured        1    128
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.09 | Command introduced. |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

# show running-config ufd

```
show running-config ufd
```

## Description

Shows the running configuration for UFD.

## Example

Showing the UFD portion of running configuration information:

```
switch(config)# ufd enable
switch(config)# ufd session-id 1
switch(config-ufd-1)# links-to-monitor 1/1/1,1/1/2
switch(config-ufd-1)# links-to-disable 1/1/11,1/1/12
switch(config-ufd-1)# delay down 10
switch(config-ufd-1)# delay up 10
switch(config-ufd-1)# exit
switch(config)#

switch# show running-config ufd
Current configuration:
ufd enable

ufd session-id 1
    delay up 10
    delay down 10
    links-to-monitor 1/1/1,1/1/2
    links-to-disable 1/1/11,1/1/12
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

## show ufd

```
show ufd [session-id <ID>]
```

### Description

Shows information on all UFD sessions or the specified UFD session.

| Parameter | Description |
|---|---|
| *<ID>* | Specifies an existing UFD session ID. Range: 1 to 128. |

## Example

Showing information on all configured UFD sessions:

```
switch# show ufd
Global UFD Status : Enabled

UFD session-id                     : 1
UFD Links-to-Monitor status        : Up
Up Delay                           : 10 sec
Down Delay                         : 10 sec
Links-to-Monitor                   : 1/1/1,1/1/2
Links-to-Disable                   : 1/1/11,1/1/12

# ufd enable

```
ufd enable
```

```
no ufd enable
```

### Description

Enables UFD (Uplink Failure Detection). UFD is disabled by default. This command must be issued before the configuration that is set with related UFD commands takes effect.

The no form of this command disables UFD.

### Examples

Enabling UFD:

```
switch(config)# ufd enable
switch(config)# ufd session-id 1
switch(config-ufd-1)# links-to-monitor 1/1/1,1/1/2
switch(config-ufd-1)# links-to-disable 1/1/11,1/1/12
switch(config-ufd-1)# delay down 10
switch(config-ufd-1)# delay up 10
switch(config-ufd-1)# exit
switch(config)#
```

Disabling UFD:

```
switch(config)# no ufd enable
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.09 | Command introduced. |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## ufd session-id

```
ufd session-id <ID>
no ufd session-id <ID>
```

### Description

Creates the specified UFD (Uplink Failure Detection) session and then enters its context. If the specified session already exists, this command enters its context.

The no form of this command deletes the specified session configuration.

| Parameter | Description |
|---|---|
| *<ID>* | Specifies the UFD session ID. Range: 1 to 128. |

### Examples

Creating UFD session 1 and then entering its context:

```
switch(config)# ufd enable
switch(config)# ufd session-id 1
switch(config-ufd-1)# links-to-monitor 1/1/1,1/1/2
switch(config-ufd-1)# links-to-disable 1/1/11,1/1/12
switch(config-ufd-1)# delay down 10
switch(config-ufd-1)# delay up 10
switch(config-ufd-1)# exit
switch(config)#
```

Creating UFD session 2 and then entering its context:

```
switch(config)# ufd session-id 2
switch(config-ufd-2)# links-to-monitor lag18-lag20
switch(config-ufd-2)# links-to-disable 1/1/3-1/1/5
switch(config-ufd-2)# exit
switch(config)#
```

Deleting UFD session 1:

```
switch(config)# no ufd session-id 1
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

### Command History

| Release | Modification |

# Chapter 160
# UDP commands

## ip forward-protocol udp

```
ip forward-protocol udp <IPV4-ADDR> {<PORT-NUM> | <PROTOCOL>}
no ip forward-protocol udp
```

### Description

Defines the UDP server to which the interface forwards ingress UDP broadcast packets received on a specific UDP port. A maximum of 8 UDP broadcast servers can be configured per interface.

The **no** form of this command removes traffic forwarding for the specified server and port/protocol.

| Parameter | Description |
|---|---|
| *<IPV4-ADDR>* | Specifies the UDP server IP address in IPv4 format (x.x.x.x), where x is a decimal number from 0 to 255. |
| *<PORT-NUM>* | Specifies the UDP port number for which traffic is forwarded. |
| *<PROTOCOL>* | Specifies the protocol name for which traffic is forwarded. Supported protocols and their port numbers are:<br>■ dns (53): Domain Name Service<br>■ ntp (123): Network Time Protocol<br>■ netbios-ns (137): NetBIOS Name Service<br>■ netbios-dgm (138): NetBIOS Datagram Service<br>■ radius (1812): Remote Authentication Dial-In User Service<br>■ radius-old (1645): Remote Authentication Dial-In User Service<br>■ rip (520): Routing Information Protocol<br>■ snmp (161): Simple Network Management Protocol<br>■ snmp-trap (162): Simple Network Management Protocol<br>■ tftp (69): Trivial File Transfer Protocol<br>■ timep (37): Time Protocol |

### Examples

*On the 6400 Switch Series, interface identification differs.*

Forwarding DNS traffic to server 192.168.1.10 on interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# ip udp-bcast-forward protocol udp 192.168.1.10 dns
```

Forwarding DNS traffic (port 53) to server 192.168.1.10 on interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# ip udp-bcast-forward protocol udp 192.168.1.10 53
```

### Command History

## ip udp-bcast-forward

```
ip udp-bcast-forward
no ip udp-bcast-forward
```

### Description

Enables UDP broadcast forwarding.

The **`no`** form of this command disables UDP broadcast forwarding.

### Examples

Enabling UDP broadcast forwarding:

```
switch(config)# ip udp-bcast-forward
```

Disabling UDP broadcast forwarding:

```
switch(config)# no ip udp-bcast-forward
```

### Command History

## show ip forward-protocol udp

```
show ip forward-protocol udp [<INTERFACE-NAME>] [vsx-peer]
```

### Description

Shows the configured UDP forwarding settings for all interfaces or a specific interface.

| Parameter | Description |
|---|---|
| *<INTERFACE-NAME>* | Specifies the name of an interface. Format: member/slot/port. |
| [vsx-peer] | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

## Examples

*On the 6400 Switch Series, interface identification differs.*

Showing the configured UDP forwarding settings for all interfaces:

```
switch# show ip forward-protocol udp
UDP Broadcast Forwarder : enabled

Interface: 1/1/1
IP Forward Address UDP Port
-----------------------------
2.2.2.2 1645
4.4.4.4 138
4.4.4.4 1812
1.1.1.1 53
8.1.1.1 123
8.1.1.1 137
Interface: 1/1/2
IP Forward Address UDP Port
-----------------------------
2.2.2.2 37
2.2.2.2 69
2.2.2.2 520
2.2.2.2 161
2.2.2.2 162
```

Showing the configured UDP forwarding settings for a specific interface:

```
switch# show ip forward-protocol udp interface 1/1/1
UDP Broadcast Forwarder : enabled

Interface: 1/1/1
IP Forward Address UDP Port
-------------------------------
2.2.2.2 1645
4.4.4.4 138
4.4.4.4 1812
1.1.1.1 53
8.1.1.1 123
8.1.1.1 137
```

# Chapter 161

# User and group commands

## password complexity

```
password complexity
no password complexity
```

### Description

Enters the password-complexity context (shown in the switch prompt as **config-pwd-cplx**) for the purpose of enabling and configuring password complexity. Password complexity enhances security by enforcing specific password complexity requirements. Password complexity is disabled by default and must be enabled by execution of the **enable** command.

Enabling or changing password complexity settings effects password creation or password change after the password complexity feature is enabled or changed. All existing passwords will continue to function as currently configured. When existing passwords are changed they will have to comply with whatever password complexity settings are enabled at the time of the change.

The **no** form of this command reverts all settings to their default values and disables password complexity enforcement.

To ensure that enhanced security is maintained, it is recommended that you do not set any values to less than their defaults.

Password complexity apples only to local authentication. For remote authentication, you may choose to set up an equivalent of password complexity according to whatever is supported on your particular TACACS+ or RADIUS server.

### Subcommands

These subcommands are available within the password complexity context (shown in the switch prompt as **config-pwd-cplx**).

`enable`

Enables password complexity enforcement. The enforcement only applies to passwords created after this enabling. Existing passwords are not checked against password complexity.

`disable`

Disables password complexity enforcement.

`[no] history-count **<COUNT>**`

Specifies the number of previous passwords checked to prevent excessive reuse. Not applicable when adding new users. The **no** form of this subcommand resets the value to its default. Default: 5. Range: 1 to 5.

Previous passwords checked includes passwords used prior to enabling the password complexity feature.

`[no] minimum-length **<LENGTH>**`

Specifies the minimum password length. The no form of this subcommand resets the value to its default. Default: 8. Range: 1 to 32.

`[no] position-changes` **`<POSITIONS>`**

Specifies the minimum number of characters that must change in the new password compared to the previous password. Not applicable if no previous password exists, including when adding new users. The no form of this subcommand resets the value to its default. Default: 8. Range: 1 to 32.

The number of password position changes is based on the number of simple character insertions, deletions, or replacements. For example:

Old password: abCD4$ New password: abCD$ Position changes=1 ("4" deleted) Old password: abCD4$ New password: abCDEF4$ Position changes=2 ("EF" inserted) Old password: abCD4$ New password: ebCD4Position changes=2 ("a" replaced with "e," "1" added) Old password: abCD4$ New password: abC$# Position changes=3 ("D4" deleted, "#" added)

`[no] lowercase-count` **`<COUNT>`**

Specifies the minimum lowercase character count for new passwords. The no form of this subcommand resets the value to its default. Default: 1. Range: 0 to 32.

`[no] uppercase-count` **`<COUNT>`**

Specifies the minimum uppercase character count for new passwords. The no form of this subcommand resets the value to its default. Default: 1. Range: 0 to 32.

`[no] numeric-count` **`<COUNT>`**

Specifies the minimum numeric digit count for new passwords. The no form of this subcommand resets the value to its default. Default: 1. Range: 0 to 32.

`[no] special-char-count` **`<COUNT>`**

Specifies the minimum special character count for new passwords. The no form of this subcommand resets the value to its default. Default: 1. Range: 0 to 32.

`[no] adjacent-char-type-count`

Specifies the maximum number of adjacent characters from a character set allowed in a password. The different character sets are:

- Numbers

- Lowercase alphabets

- Uppercase alphabets

- Special characters

The number of adjacent characters from the character set in the password has to be less than or equal to the configured value. When set to 0, adjacent character type length check requirement is disabled. The no form of this subcommand resets the value to its default. Default: 0. Range: 0-31.

`list`

List the subcommands available within the password complexity context.

`exit`

Exits the password complexity context.

`end`

Exits the password complexity context and then the config context.

## Usage

- Password complexity is only for use with plaintext passwords. With password complexity enabled, existing ciphertext passwords will continue working until a password is changed. All new passwords must be entered in plaintext form and be compliant with your password complexity configuration.
- The effective minimum password length may be larger than the configured **minimum-length** value. The effective minimum password length is calculated as follows:

```
LARGEST-of:(minimum-length, position-changes,(SUM-of:lowercase-count+uppercase-
count+numeric-count+special-char-count))
```

For example, with **minimum-length=8**, and **position-changes=10** (and the sum of the other four count settings **<=9**), the **effective minimum-length is 10** (because **position-changes** is largest). Similarity, with a **minimum-length=12**, **position-changes=8**, **lowercase-count=8**, **uppercase-count=4**, **numeric-count=1**, **special-char-count=1**, the **effective minimum-length is `14`** (**8+4+1+1=14**) (because sum off the four counts is largest).

## Examples

Configuring password complexity settings with an effective minimum length of 10 (because **position-changes** is 10):

```
switch(config)# password complexity
switch(config-pwd-cplx)# history-count 3
switch(config-pwd-cplx)# minimum-length 8
switch(config-pwd-cplx)# position-changes 10
switch(config-pwd-cplx)# lowercase-count 2
switch(config-pwd-cplx)# uppercase-count 2
switch(config-pwd-cplx)# numeric-count 2
switch(config-pwd-cplx)# special-char-count 2
switch(config-pwd-cplx)# adjacent-char-type-count 3
switch(config-pwd-cplx)# enable
switch# exit
```

Configuring password complexity settings with an effective minimum length of 14 (because the sum of the four count items is 14):

```
switch(config)# password complexity
switch(config-pwd-cplx)# history-count 4
switch(config-pwd-cplx)# minimum-length 12
switch(config-pwd-cplx)# position-changes 8
switch(config-pwd-cplx)# lowercase-count 8
switch(config-pwd-cplx)# uppercase-count 4
switch(config-pwd-cplx)# numeric-count 1
switch(config-pwd-cplx)# special-char-count 1
switch(config-pwd-cplx)# adjacent-char-type-count 3
switch(config-pwd-cplx)# enable
switch# exit
```

Enabling password complexity (with default settings) and changing a user (admin1) password successfully but failing to change another user (admin2) password due to not meeting complexity requirements:

```
switch(config)# password complexity
switch(config-pwd-cplx)# enable
switch(config-pwd-cplx)# exit
switch(config)#
switch(config)# user admin1 password
Changing password for user admin1
Enter old password:************
Enter new password:************
Confirm new password:************
switch(config)#
switch(config)# user admin2 password
Changing password for user admin2
Enter old password:************
Enter new password:************
Confirm new password:************
```

```
User password not changed.
The new password does not meet one or more of the following complexity
requirements:
Minimum length          : 8
Position changes        : 8
Numeric count           : 1
Lowercase count         : 1
Uppercase count         : 1
Special character count : 1
Adjacent character type count: 3
```

With password complexity already enabled, attempting to change an existing user password but failing because the new password is identical to a recently used one (**history-count**).

```
switch(config)# user admin1 password
Changing password for user admin1
Enter old password:************
Enter new password:************
Confirm new password:************
User password not changed.
The new password is the same as a recently used password.
```

With password complexity already enabled, creating a new admin user (admin3) with a plaintext password that meets complexity requirements.

```
switch(config)# user admin3 group administrators password
Adding user admin3
Enter password:************
Confirm password:************
```

With password complexity already enabled, attempting to create a new admin user (admin4) with a ciphertext password but failing because ciphertext passwords are not supported with password complexity enabled.

```
switch(config)# user admin4 group administrators password ciphertext AQBapPd...==
Ciphertext passwords cannot be used when password complexity is enabled.
switch(config)#
```

## Command History

| Release | Modification |
|---|---|
| 10.11.1010 | **adjacent-char-type-count** subcommand added. |
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

# user

```
user <USERNAME> group {administrators | operators | auditors | <USER-GROUP>}
     password [ciphertext <CIPHERTEXT-PASSWORD> | plaintext <PLAINTEXT-PASSWORD>]
no user <USERNAME>
```

## Description

Creates a user and adds the user to one of the user groups. Users are given the privileges of their group. For the three built-in user groups (**administrators**, **operators**, **auditors**), the privileges are fixed. For user-defined local user groups, the privileges are defined by the CLI command authorization rules of the group.

When entered without either optional **ciphertext** or **plaintext** parameters, the cleartext password is prompted for twice, with the characters entered masked with "*" symbols.

The **no** form of this command removes a user account from the switch. The administrator cannot delete the user account from which they are logged in. The **admin** user cannot be deleted.

| Parameter | Description |
|---|---|
| *<USERNAME>* | Specifies the user name. Requirements:<br>Must start with a lowercase or uppercase letter.<br>Can contain numbers, lowercase, and uppercase letters.<br>Can include only these three special characters: hyphens ( - ), dots ( . ), and underscores ( _ ).<br>Can have a maximum of 32 characters.<br>Cannot be empty.<br>Cannot be: admin, `root`, or `remote_user`.<br>Cannot be Linux reserved names such as: `daemon`, `bin`, `sys`, `sync`, `proxy`, `www-data`, `backup`, `list`, `irc`, `gnats`, `nobody`, `systemd-bus-proxy`, `sshd`, `messagebus`, `rpc`, `systemd-journal-gateway`, `systemd-journal-remote`, `systemd-journal-upload`, `systemd-timesync`, `systemd-coredump`, `systemd-resolve`, `rpcuser`, `vagrant`, `opsd`, `rdanet`, `_lldpd`, `rdaadmin`, `rdaweb`, `docker_container`, `tss`.<br>**NOTE**: Usernames containing the same consecutive letters with varying capitalization, such as Admin, ADMIN, and aDmin, will each be treated as different customer-configured user accounts. |
| `group` | Selects the local user group to which the new user will be assigned. |
| `administrators \| operators \| auditors` | Selects one of three built-in local user groups. |
| *<USER-GROUP>* | Specifies an existing user-defined local user group. |
| `ciphertext` *<CIPHERTEXT-PASSWORD>* | Specifies a ciphertext password. No password prompts are provided and the ciphertext password is validated before the configuration is applied for the user. The variable *<CIPHERTEXT-PASSWORD>* is Base64 and is typically copied from another switch using the `show running-config` command output and then pasted into this command. |

| Parameter | Description |
|---|---|
| | **NOTE:** The administrator cannot construct ciphertext passwords themselves. The ciphertext is only created by an AOS-CX switch. The ciphertext is created by setting a password for a user with the `user` command. The ciphertext is available for copying from the `show running-config` output and pasting into the configuration on any other AOS-CX switch. The target switch must have the same export password (default or otherwise) as the source switch. |
| `plaintext <PLAINTEXT-PASSWORD>` | Specifies the password without prompting. The password is visible as cleartext when entered but is encrypted thereafter. Command history does show the password as cleartext. |

## Usage

- Up to 63 local users can be added, for a total of 64 users including the default user **admin**. A user can belong to only one group.
- The switch ships with the **admin** user account and three built-in local user groups: **administrators**, **operators**, and **auditors**. The **admin** account belongs to the **administrators** group. The Service OS also includes the administrator user **admin**. The two admin users are entirely distinct.
- When a local user account is removed, the user loses all active login/SSH sessions. Any calls on the existing REST session with that local user account fail with a permissions issue as soon as the user is deleted. Soon afterwards, the existing REST sessions with the deleted local user account become invalidated. If a user is viewing the GUI while their account is deleted, the user is redirected to the login page within 60 seconds. The home directory associated with the user is also removed from the switch.
- Cleartext passwords (whether entered with prompting or entered directly) must:
  - Contain only ASCII characters from hexadecimal 21 to hexadecimal 7E [\x21-\x7E] (decimal 33 to 126). Spaces are not allowed. When the password is entered directly without prompting, the "`?`" symbol (hexadecimal 3F [\x3F] (decimal 63)) is not permitted.
  - Contain at most 32 characters.
  - Contain at least the number of characters configured (optionally) for `minimum-password-length`.

Although empty passwords are supported, it is recommended that you use strong passwords for all production switches.

Only an administrator can change the password of a user assigned to the `operators` role.

Although usernames with uppercase letters appear in the show-running configuration, users will not have login access if the username was configured and downgraded to a version without uppercase support.

## Examples

Creating local user **jamie** in the **administrators** group with a prompted password:

```
switch(config)# user jamie group administrators password
Adding user jamie
Enter password:************
Confirm password:************
```

Creating user **chris** in the existing user-defined local user group **admuser2** with a cleartext password, using direct entry without prompting:

```
switch(config)# user chris group admuser2 password plaintext passWORDxJ|989
```

Creating user **alex** in the **operators** group with a ciphertext password (the ciphertext shown is a placeholder that must be replaced with actual ciphertext):

```
switch(config)# user alex group operators password ciphertext NDcDI2...8igJfA=
```

Removing user **jamie**:

```
switch(config)# no user jamie
User jamie's home directory and active sessions will be deleted.
Do you want to continue [y/n]?y
```

Using uppercase letters within username:

```
switch(config)# user TestUser1 group administrators password plaintext testuser1
switch(config)#
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.13 | Added support for use of uppercase letters within username. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## user-group

```
user-group <GROUP-NAME>
no user-group <GROUP-NAME>
```

## Description

If **<GROUP-NAME>** does not exist, this command creates a local user group and then enters its context. If **<GROUP-NAME>** exists, this command enters the context for the specified **<GROUP-NAME>**. Within the **<GROUP-NAME>** context, several subcommands are available for working with rules that specify what CLI commands are permitted or denied for all members of the local group.

In addition to the three built-in user groups **administrators**, **operators**, and **auditors**, up to 29 user-defined local user groups can be defined. All users can be members of only one of the up to 32 groups.

The **no** form of this command deletes the specified user group. All members of the deleted group lose all command authorization privilege.

| Parameter | Description |
|---|---|
| *<GROUP-NAME>* | Specify a user group name up to 32 characters long. A new group is created if the specified group does not exist and then the group context is entered. If the group name exists, its context is entered. |

Do not causally delete user-defined local user groups without understanding the implications. Although user-defined local user groups can be deleted with the respective members losing all privileges, the three built-in groups `administrators`, `operators`, and `auditors` are always available and their privileges are unchangeable.

## Subcommands

These subcommands are available within the user-defined local user group context (shown in the switch prompt as **config-usr-grp-<*GROUP-NAME*>**).

```
[<SEQ-NUM>] {permit | deny} cli command "<REGEX>"
no <SEQ-NUM>
```

Defines a CLI command privilege **permit** or **deny** rule. There is an implicit **"deny .*"** rule at the end of every user-defined group rule list. Members of a user-defined group without any **permit** rules have no CLI command privileges.

The no form of this subcommand deletes the specified (by sequence number) rule from the group.

Rule evaluation proceeds from lowest to highest sequence number until the first successful match, resulting in either CLI command permission or denial. Rule evaluation ceases upon first match. Therefore, rules for related CLI commands must be defined in most restrictive to least restrictive order.

*<SEQ-NUM>*

Specifies the CLI command rule sequence number. When omitted, a sequence number that is 10 greater the highest existing sequence number is auto-assigned. When no rules exist, the first auto-assigned sequence number is 10.

**{permit | deny}**

Sets the rule type as either **permit** or **deny**. Rule order is important. For example, these two related rules together authorize all **show** commands except for the **show aaa** commands.

```
switch(config-usr-grp-admuser2)#10 deny cli command "show aaa .*"
switch(config-usr-grp-admuser2)#20 permit cli command "show .*"
```

To achieve the wanted effect in this example, the **deny** rule must precede the **permit** rule. These two rules together achieve the following:

- All **show aaa** commands match on rule 10, triggering command denial, and the immediate cessation of further rule evaluation. Matching on rule 20 is never attempted.
- All other **show** commands (excluding **show aaa** commands) match on rule 20 and are therefore permitted.

**<REGEX>**

Specifies the CLI command matching criteria of the rule. The criteria can be expressed as "**.***" which matches all commands. Otherwise, the criteria is expressed as a POSIX-compliant regular expression (regex) string starting with an exact match command token (for example **show**) followed by a regex representing command arguments. The first word must be a string that contains only alphanumeric or hyphen characters.

For example, to allow all commands starting with the word **interface**, the regex must be "**interface .***" or just "**interface**". Using "**interface.***" (without the space) is not supported. For example, "**show .***" matches every **show** command. Consult the Extended regular expression information available at: https://pubs.opengroup.org/onlinepubs/9699919799/basedefs/V1_chap09.html#tag_09_04.

| Sample matching criteria | Sample matched CLI command or specifier | Matches |
|---|---|---|
| `show .*` | `show accounting log` | All **show** commands |
| `bgp .*` | `bgp router-id 1.1.1.1` | All **bgp** commands |
| `interface .*` | `interface 1/1/1` | All interface specifiers |
| `vlan (3\|4)` | `vlan 3` | VLAN 3 or 4 |
| `vlan [1-9]` | `vlan 5` | A single VLAN in the range 1 to 9 |
| `vlan ([1-9]\|1[0-9])` | `vlan 19` | A single VLAN in the range 1 to 19 |

`[<SEQ-NUM>] comment <TEXT-STRING>`
`no <SEQ-NUM> comment`

Adds a comment to an existing rule. The no form of this subcommand removes an existing comment.

```
switch(config-usr-grp-admuser2)# 10 comment Deny all show aaa commands.
switch(config-usr-grp-admuser2)# 20 comment Permit all other show commands.
switch(config-usr-grp-admuser2)#
switch(config-usr-grp-admuser2)# show running-config current-context
user-group admuser2
    10 comment Deny all show aaa commands.
    10 deny cli command "show aaa .*"
    20 comment Permit all other show commands.
    20 permit cli command "show .*"
```

`include <GROUP-NAME> [no] include <GROUP-NAME>`

Include all rules from the specified user-defined ***<GROUP-NAME>***. Only one group can be included in the definition of another group. The content of the included group is effectively placed at the top of the rules list in the current group. If the specified ***<GROUP-NAME>*** does not exist, it is created.

The no form of this subcommand removes the specified included group from the current group. The specified included group must exist and must be included in the current group or else an error message is shown.

The name of the included group is shown at the top of the **show user-group** command for the group with the **include**.

In this example, group **admuser1** is included in group **admuser2**. So the **admuser1** rules are evaluated first and then the rules in the **admuser2** group are only evaluated if no CLI command match occurs for the rules in group **admuser1**.

```
switch(config-usr-grp-admuser2)# include admuser1
switch(config-usr-grp-admuser2)# show user-group admuser2
User Group Summary
==================
Name            : admuser2
Type            : configuration
Included Group  : admuser1
Number of Rules : 2
User Group Rules
================
SEQUENCE NUM  ACTION     COMMAND                       COMMENT
------------- ---------- ----------------------------- ---------------------------
-----
10            deny       show aaa .*                   Deny all show aaa commands.
20            permit     show .*                       Permit all other show
commands.
```

`resequence [<STARTING-SEQ-NUM> <INCREMENT>]`

Resequences the CLI command authorization rules. When entered without the optional parameters the rules are resequenced with a ***<STARTING-SEQ-NUM>*** of 10 and an ***<INCREMENT>*** of 10.

*<STARTING-SEQ-NUM>*

Specifies the starting sequence number.

*<INCREMENT>*

Specifies the sequence number increment.

Resequencing the rules to start at 100 with an increment of 20:

```
switch(config-usr-grp-admuser2)# resequence 100 20
switch(config-usr-grp-admuser2)# show running-config current-context
user-group admuser2
    100 comment Deny all show aaa commands.
    100 deny cli command "show aaa .*"
    120 comment Permit all other show commands.
    120 permit cli command "show .*"
```

Resequencing the rules to the default of starting at 10 with an increment of 10:

```
switch(config-usr-grp-admuser2)# resequence
switch(config-usr-grp-admuser2)# show running-config current-context
user-group admuser2
    10 comment Deny all show aaa commands.
    10 deny cli command "show aaa .*"
    20 comment Permit all other show commands.
    20 permit cli command "show .*"
```

`show running-config current-context`

Shows all the commands used to configure the rules in the current group context.

```
switch(config-usr-grp-admuser2)# show running-config current-context
user-group admuser2
    10 comment Deny all show aaa commands.
    10 deny cli command "show aaa .*"
    20 comment Permit all other show commands.
    20 permit cli command "show .*"
```

`list`

List the subcommands available within the user-defined group context.

`exit`

Exits the user-defined group context.

`end`

Exits the user-defined group context and then the config context.

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## user management-interface

```
user <USERNAME> management-interface <MGMT-INTERFACE>
no user <USERNAME> management-interface <MGMT-INTERFACE>
```

### Description

Enables a management interface for the specified local user. By default, all management interfaces are enabled for all local users.

The **no** form of this command disables the selected management interface for the specified local user.

| Parameter | Description |
|---|---|
| *<USERNAME>* | Specifies the name of an existing local user. |
| *<MGMT-INTERFACE>* | Selects one of the management interfaces: **ssh**, **telnet**, **https-server**, **console**. Note that **https-server** corresponds to the Web UI and REST. |

### Examples

Enabling the SSH management interface for local user **admin1**:

```
switch(config)# user admin1 management-interface ssh
```

Disabling the SSH management interface for local user **admin1**:

```
switch(config)# no user admin1 management-interface ssh
```

Enabling the telnet management interface for local user **admin1**:

```
switch(config)# user admin1 management-interface telnet
```

Disabling the telnet management interface for local user **admin1**:

```
switch(config)# no user admin1 management-interface telnet
```

Enabling the https-server (Web UI) management interface for local user **admin1**:

```
switch(config)# user admin1 management-interface https-server
```

Disabling the https-server (Web UI) management interface for local user **admin1**:

```
switch(config)# no user admin1 management-interface https-server
```

Enabling the console management interface for local user **admisn1**:

```
switch(config)# user admin1 management-interface console
```

Disabling the console management interface for local user **admin1**:

```
switch(config)# no user admin1 management-interface console
```

For more information on features that use this command, refer to the Security Guide for your switch model.

| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

# user password

```
user <USERNAME> password [ciphertext <CIPHERTEXT-PASSWORD> | plaintext <PLAINTEXT-PASSWORD>]
```

## Description

Changes a password for an account or enables the password for the admin account. When entered without either optional **ciphertext** or **plaintext** parameters, the cleartext password is prompted for twice, with the characters entered masked with "*" symbols.

| Parameter | Description |
|---|---|
| `<USERNAME>` | Specifies the corresponding user name for the password you want to change. |
| `ciphertext <CIPHERTEXT-PASSWORD>` | Specifies a ciphertext password. No password prompts are provided and the ciphertext password is validated before the configuration is applied for the user. The variable `<CIPHERTEXT-PASSWORD>` is Base64 and is typically copied from another switch using the `show running-config` command output and then pasted into this command.<br>**NOTE:** The administrator cannot construct ciphertext passwords themselves. The ciphertext is only created by an AOS-CX switch. The ciphertext is created by setting a password for a user with the `user` command. The ciphertext is available for copying from the `show running-config` output and pasting into the configuration on any other AOS-CX switch. The target switch must have the same export password (default or otherwise) as the source switch. |
| `plaintext <PLAINTEXT-PASSWORD>` | Specifies the password without prompting. The password is visible as cleartext when entered but is encrypted thereafter. Command history does show the password as cleartext. |

## Usage

The admin account is available on the switch without a password by default.

Cleartext passwords (whether entered with prompting or entered directly) must:

- Contain only ASCII characters from hexadecimal 21 to hexadecimal 7E [\x21-\x7E] (decimal 33 to 126). Spaces are not allowed. When the password is entered directly without prompting, the "`?`" symbol (hexadecimal 3F [\x3F] (decimal 63)) is not permitted.
- Contain at most 32 characters.
- Contain at least the number of characters configured (optionally) for `minimum-password-length`.

Although empty passwords are supported, it is recommended that you use strong passwords for all production switches.

Only an administrator can change the password of a user assigned to the `operators` role.

Although usernames with uppercase letters appear in the show-running configuration, users will not have login access if the username was configured and downgraded to a version without uppercase support.

### Examples

Enabling (or changing) a cleartext password for **admin**:

```
switch(config)# user admin password
Changing password for user admin
Enter password:************
Confirm password:************
```

Changing the cleartext password for user **chris**, using direct entry without prompting:

```
switch(config)# user chris password plaintext PASSwordZQ#@67
```

Changing the ciphertext password for user **alex** (the ciphertext shown is a placeholder that must be replaced with actual ciphertext):

```
switch(config)# user alex password ciphertext XqYJ36...W83D4Y=
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## service export-password

```
service export-password
no service export-password
```

### Description

Configures a nondefault export password. The export password is used to transform critical security parameters (such as password hashes) into ciphertext suitable for exporting and showing by commands such as **show running-config**. This transformation enables safe switch configuration import and export.

The **no** form of this command reverts the export password to its factory default.

All factory-default switches have identical default export passwords. For security, it is recommended that you set the same nondefault export password on every switch in a group that will exchange configuration information. Only switches with identical export passwords can exchange configuration information.

### Usage

Prompts you twice for the new export password.

The export password must:

- Contain only ASCII characters from hexadecimal 21 to hexadecimal 7E [\x21-\x7E] (decimal 33 to 126). Spaces are not allowed.
- Contain at most 32 characters.
- Not be blank.

### Examples

Configuring a new export password:

```
switch(config)# service export-password
Enter password:************
Confirm password:************
```

Reverting the export password to its factory default:

```
switch(config)# no service export-password
```

For more information on features that use this command, refer to the Security Guide for your switch model.

## show password-complexity

```
show password-complexity
```

## Description

Shows user-configured or default password complexity checking criteria.

## Examples

Showing the current password complexity checking criteria:

```
switch(config)# show password-complexity

Global password complexity checking criteria:
    Password complexity                   : Enabled
    Previous passwords to check           : 3
    Minimum password length               : 12
    Minimum position changes              : 10
    Maximum adjacent characters count     : 3
    Password composition
         Minimum lowercase characters     : 3
         Minimum uppercase characters     : 1
         Minimum special characters       : 1
         Minimum numeric characters       : 3
```

For more information on features that use this command, refer to the Security Guide for your switch model.

# show user-group

`show user-group [<GROUP-NAME>] [vsx-peer]`

## Description

Shows user group information for the built-in groups plus any user-defined local user groups. When entered without **`<GROUP-NAME>`**, summary information is shown for all groups.

| Parameter | Description |
|---|---|
| *`<GROUP-NAME>`* | Narrows the **show** command output to that of the specified group, and for local user groups, adds the **User Group Rules** list. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Examples

Show the list of all user groups, including built-in groups and local user groups.

```
switch# show user-group
GROUP NAME     GROUP TYPE     INCLUDED GROUP    NUMBER OF RULES
-------------- -------------- ----------------- -------------------
administrators built-in       n/a               n/a
admuser1       configuration  --                5
admuser2       configuration  admuser1          2
auditors       built-in       n/a               n/a
operators      built-in       n/a               n/a
```

Show detailed information for local user group **admuser2**.

```
switch(config-usr-grp-admuser2)# show user-group admuser2
User Group Summary
==================
Name             : admuser2
Type             : configuration
Included Group   : admuser1
Number of Rules  : 2
User Group Rules
================
SEQUENCE NUM  ACTION     COMMAND                       COMMENT
------------- ---------- ----------------------------- ---------------------------
-----
10            deny       show aaa .*                   Deny all show aaa commands.
20            permit     show .*                       Permit all other show
commands.
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |

| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (#) | Administrators or local user group members with execution rights for this command. |

## show user information

```
show user information
```

### Description

Shows the following information for the logged-in user:

- User name.
- User authentication type: **local**, **RADIUS**, or **TACACS+**.
- User group: **administrators**, **operators**, or **<GROUP-NAME>**. This field is not applicable for remote authenticated users who are mapped to administrators or operators based on their privilege level.
- User privilege level: For the built-in user groups and RADIUS or TACACS+, the role privilege level value is shown. For user-defined user groups, **N/A** is shown.
- User login session: **ssh**, **telnet**, **https-server**, or **console**.

### Examples

Showing information for the **admin** user:

```
switch# show user information
Username              : admin
Authentication type   : Local
User group            : administrators
User privilege level : 15
User login session    : console
```

Showing information for a member of the user-defined local user group **admuser2**:

```
switch# show user information
Username              : admin2-b
Authentication type   : Local
User group            : admuser2
User privilege level : N/A
User login session    : telnet
```

Showing information for a member of **operators**:

```
switch# show user information
Username              : operator
Authentication type   : Local
User group            : operators
User privilege level : 1
User login session    : https-server
```

Showing information for remote RADIUS user **rad_user1** mapped to local user group **administrators**:

```
switch# show user information
Username              : rad_user1
Authentication type   : RADIUS
User group            : administrators
User privilege level : 15
User login session    : telnet
```

Showing information for remote RADIUS user **rad_user2** mapped to local user group **operators**:

```
switch# show user information
Username              : rad_user2
Authentication type   : RADIUS
User group            : operators
User privilege level : 1
User login session   : console
```

Showing information for remote TACACS+ **tac_user1** logged in with **priv-lvl** 15 (mapped to user group **administrators**):

```
switch# show user information
Username             : tac_user1
Authentication type  : TACACS+
User group           : administrators
User privilege level : 15
User login session   : ssh
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.11 | Command now includes **User login session** information in its output |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show user-list

`show user-list [vsx-peer]`

### Description

Shows all configured users and their corresponding group names.

| Parameter | Description |
|---|---|
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Examples

Show the user list from a switch with only the admin user defined.

```
switch# show user-list

USER                         GROUP
---------------------------------------------
admin                        administrators
```

Show the user list after adding a user to the operators built-in group.

```
switch# show user-list

USER                         GROUP
---------------------------------------------
admin                        administrators
oper1                        operators
```

Show the user list after adding a user to the auditors built-in group.

```
switch# show user-list

USER                         GROUP
---------------------------------------------
admin                        administrators
oper1                        operators
audit1                       auditors
```

Show the user list after adding a total of three users to two user-defined user groups.

```
switch# show user-list

USER                         GROUP
---------------------------------------------
admin                        administrators
oper1                        operators
audit1                       auditors
adm1a                        admuser1
admin2-a                     admuser2
admin2-b                     admuser2
```

For more information on features that use this command, refer to the Security Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (#) | Administrators or local user group members with execution rights for this command. |

# show user-list management-interface

```
show user-list management-interface [vsx-peer]
```

## Description

Shows a list of local users and the enabled management interfaces for each user.

| Parameter | Description |
|---|---|
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

## Examples

Disabling SSH and https-server for user **admin1**, disabling Telnet for **admin2**, then showing the configuration:

```
switch(config)# no user admin1 management-interface ssh
switch(config)# no user admin1 management-interface https-server
switch(config)# no user admin2 management-interface telnet
switch(config)# show user-list management-interface
USER                         ENABLED MANAGEMENT INTERFACE(S)
------------------------------------------------------------
admin                        ssh,telnet,https-server,console
admin1                       telnet,console
admin2                       ssh, https-server, console
```

Re-enabling https-server for user **admin1**, re-enabling Telnet for **admin2**, then showing the configuration:

```
switch(config)# user admin1 management-interface https-server
switch(config)# user admin2 management-interface telnet
switch(config)# show user-list management-interface
USER                         ENABLED MANAGEMENT INTERFACE(S)
------------------------------------------------------------
admin                        ssh,telnet,https-server,console
admin1                       telnet,https-server,console
admin2                       telnet,https-server,console
```

For more information on features that use this command, refer to the Security Guide for your switch model.

# Chapter 162

# User-based tunneling commands

## backup-controller ip

```
backup-controller ip <IP-ADDR>
no backup-controller ip <IP-ADDR>
```

### Description

Specifies the IP address of the backup controller for the UBT zone.

The no form of this command deletes the IP address of the backup controller.

| Parameter | Description |
|---|---|
| *<IP-ADDR>* | Specifies the IP address of the backup controller. |

### Examples

Specifying the backup controller ip address for `zone1`:

```
switch(config)# ubt zone zone1
switch(config-ubt-zone1)# backup-controller ip 10.116.51.11
```

Delete the configured backup controller IP address:

```
switch(config)# ubt zone zone1
switch(config-ubt-zone1)# no backup-controller ip 10.116.51.11
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-ubt-<ZONE-NAME>` | Administrators or local user group members with execution rights for this command. |

# enable

```
enable
no enable
```

## Description

Enables the UBT zone.

The **no** form of this command disables the UBT zone.

## Examples

Enabling UBT for zone `zone1`:

```
switch(config)# ubt zone zone1
switch(config-ubt-zone1)# enable
```

Disabling UBT for `zone1`:

```
switch(config)# ubt zone zone1
switch(config-ubt-zone1)# no enable
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-ubt-<ZONE-NAME>` | Administrators or local user group members with execution rights for this command. |

# ip source-interface

```
ip source-interface {all | ubt} {interface <IFNAME> | <IPV4-ADDR>} [vrf <VRF-NAME>]
no ip source-interface {all | ubt} {interface <IFNAME> | <IPV4-ADDR>} [vrf <VRF-NAME>]
```

## Description

Sets a single source IP address for the UBT zone VRF. This ensures that all traffic sent by UBT zone/VRF has the same source IP address, regardless of how it egresses the switch.

This command provides two ways to set the source IP addresses: either by specifying a static IP address, or by using the address assigned to a switch interface. If you define both options, then the static IP address takes precedence.

The **no** form of this command deletes the single source IP address for UBT.

| Parameter | Description |
|---|---|
| `all` | When used no other parameters are required. |
| `interface <IFNAME>` | Specifies the name of the interface from which UBT obtains its source IP address. The interface must have a valid IP address assigned to it. If the interface has both a primary and secondary IP address, the primary IP address is used. |
| `<IPV4-ADDR>` | Specifies the source IP address to use for UBT. The IP address must be defined on the switch, and it must exist on the specified VRF, Default: default. Specify the address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. |
| `vrf <VRF-NAME>` | Specifies the name of the VRF from which the UBT zone sets its source IP address. |

### Examples

*On the 6400 Switch Series, interface identification differs.*

Setting interface 1/1/7 as the source address for UBT for VRF default:

```
switch(config)# ip source-interface ubt interface 1/1/7 vrf default
```

Deleting the configured source interface `1/1/7` as the source address for UBT for VRF `default`:

```
switch(config)# no ip source-interface ubt interface 1/1/7 vrf default
```

Specifying the static IP address `1.1.1.1` as the source address for UBT for VRF `default`:

```
switch(config)# ip source-interface ubt 1.1.1.1 vrf default
```

Deleting the configured ip address as the source address for UBT for VRF `default`:

```
switch(config)# no ip source-interface ubt 1.1.1.1 vrf default
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

# papi-security-key

```
papi-security-key [{ciphertext <SEC-KEY> | plaintext <SEC-KEY>}]
no papi-security-key
```

## Description

Specifies the shared security key used to encrypt UBT PAPI messages exchanged between the switch and the controller cluster for the zone.

The **no** form of this command deletes the shared security key .

| Parameter | Description |
|---|---|
| `ciphertext` *`<SEC-KEY>`* | Specifies an encrypted security key. |
| `plaintext` *`<SEC-KEY>`* | Specifies a plaintext security key. Range: 10 to 64 characters.<br>**NOTE:**<br>When the security key is not provided on the command line, plaintext security key prompting occurs upon pressing Enter. The entered security key characters are masked with asterisks.. |

## Examples

Specifying the PAPI security key for UBT zone `zone1` as plaintext:

```
switch(config)# ubt zone zone1
switch(config-ubt-zone1)# papi-security-key plaintext F82#450b
```

Specifying the PAPI security key for UBT `zone2` with plaintext prompting:

```
switch(config)# ubt zone zone2
switch(config-ubt-zone2)# papi-security-key
Enter the PAPI security key: **********
Re-Enter the PAPI security key: **********
```

Specifying the PAPI security key for UBT `zone1` as ciphertext:

```
switch(config)# ubt zone zone1
switch(config-ubt-zone1)# papi-security-key ciphertext AQBapdAVz5...RmH3+4cpg=
```

Removing the PAPI security key for UBT `zone1`:

```
switch(config)# ubt zone zone1
switch(config-ubt-zone1)# no papi-security-key
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

## primary-controller ip

```
primary-controller ip <IP-ADDR>
no primary-controller ip <IP-ADDR>
```

### Description

Specifies the IP address of the primary controller IP address for the zone.

The **no** form of this command deletes the IP address of the primary controller.

| Parameter | Description |
|---|---|
| *<IP-ADDR>* | Specifies the IP address of the primary controller. |

### Examples

Specify the primary controller IP address for `zone1`:

```
switch(config)# ubt zone zone1
switch(config-ubt-zone1)# primary-controller ip 10.116.51.10
```

Delete the configured primary controller IP address:

```
switch(config)# ubt zone zone1
switch(config-ubt-zone1)# no primary-controller ip 10.116.51.10
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

## sac-heartbeat-interval

```
sac-heartbeat-interval <TIME>
no sac-heartbeat-interval <TIME>
```

### Description

Specifies the SAC heartbeat refresh time interval in seconds.

The **no** form of this command sets the heartbeat interval to the default value.

| Parameter | Description |
|---|---|
| *<TIME>* | Specifies the SAC heartbeat refresh time interval in seconds. Range: 1 to 8. Default: 1. |

### Examples

Specifying a heartbeat refresh interval of 1 for UBT `zone1`:

```
switch(config)# ubt zone zone1
switch(config-ubt-zone1)# sac-heartbeat-interval 1
```

Deleting the configured heartbeat refresh interval:

```
switch(config)# ubt zone zone1
switch(config-ubt-zone1)# no sac-heartbeat-interval
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

# show ip source-interface ubt

`show ip source-interface ubt`

## Description

Displays source IP address configuration information for the UBT zone(s).

## Examples

*On the 6400 Switch Series, interface identification differs.*

Showing source IP address configuration information:

```
switch(config)# show ip source-interface ubt

Source-interface Configuration Information
----------------------------------------------------------------------
Protocol        Src-Interface       Src-IP                   VRF
----------------------------------------------------------------------
ubt             vlan10              10.1.1.2                 default
ubt             vlan20              20.1.1.2                 blue
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Administrators or local user group members with execution rights for this command. |

# show capacities ubt

`show capacities ubt`

## Description

Shows the maximum number of UBT clients and zones that can be configured in the system.

## Example

Showing maximum number of UBT clients and zones that can be configured:

```
switch# show capacities ubt

System Capacities: Filter UBT
Capacities Name                                                            Value
--------------------------------------------------------------------------------
Maximum number of UBT clients in a system                                   1017
Maximum number of UBT zones per VRF                                            8
Maximum number of UBT zones                                                    8
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.11.1000 | Example updated to show UBT multi-zone support on 6200 Switch Series. |
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

# show running-config ubt

`show running-config ubt`

## Description

Shows the current running configuration of UBT.

## Examples

Showing running configuration of ubt in vlan extend mode:

```
switch# show running-config ubt
ubt-mode vlan-extend
ubt zone zone1 vrf default
       primary-controller ip 192.168.1.10
       wol-enable vlan 10, 20-40, 50, 60
       enable
```

Showing running configuration of ubt in local vlan mode:

```
switch# show running-config ubt
ubt-client-vlan 3000
ubt zone zone1 vrf default
       primary-controller ip 192.100.1.10
       backup-controller ip 192.100.1.11
       enable
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | Command introduced. |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Manager (#) | Administrators or local user group members with execution rights for this command. |

## show ubt

```
show ubt [brief]
show ubt zone <ZONE-NAME> [brief]
```

### Description

Shows global configuration information for UBT in addition to detailed or brief information for a specific UBT zone.

| Parameter | Description |
|---|---|
| zone *<ZONE-NAME>* | Specifies the name of a zone. Length: 1 to 64 characters. |
| brief | Displays brief information. |

### Examples

Showing global UBT configuration information where local-VLAN mode has been configured:

```
switch# show ubt

Zone Name                  : zone1
UBT Mode                   : local-vlan
Primary Controller         : 10.116.51.10
Backup Controller          : 10.116.51.11
SAC HeartBeat Interval     : 1
UAC KeepAlive Interval     : 60
```

```
VLAN Identifier            : 4094
VRF Name                   : default
Wake-on-LAN Enabled-VLANS  : -NA-
Admin State                : ENABLED
PAPI Security Key          : AQBapdxySvGPvdTl ... bL4FE=
Operational State          : Up

Zone Name                  : zone2
UBT Mode                   : local-vlan
Primary Controller         : 1.1.5.10
Backup Controller          : 1.1.5.11
SAC HeartBeat Interval     : 1
UAC KeepAlive Interval     : 60
VLAN Identifier            : 4094
VRF Name                   : blue
Wake-on-Lan Enabled-VLANS  : -NA-
Admin State                : ENABLED
PAPI Security Key          : TRQapdxySvGPvdTlkYn1 ... zP4FE=
Operational State          : Up
```

Showing global UBT configuration information where VLAN-extend mode has been configured:

```
switch# show ubt

Zone Name                  : zone1
UBT Mode                   : vlan-extend
Primary Controller         : 192.100.1.10
Backup Controller          : 192.100.1.11
SAC HeartBeat Interval     : 1
UAC KeepAlive Interval     : 60
VLAN Identifier            : ---/---
VRF Name                   : default
Wake-on-LAN Enabled-VLANS  : 2-90, 200, 300, 400, 500
Admin State                : ENABLED
PAPI Security Key          : DISABLED
Operational State          : up

Zone Name                  : zone2
UBT Mode                   : vlan-extend
Primary Controller         : 1.1.5.10
Backup Controller          : 1.1.5.11
SAC HeartBeat Interval     : 1
UAC KeepAlive Interval     : 60
VLAN Identifier            : ---/---
VRF Name                   : blue
Wake-on-Lan Enabled-VLANS  : ---/---
Admin State                : ENABLED
PAPI Security Key          : TRQapdxySvGPvdTlkYn1 ... zP4FE=
Operational State          : Up
```

Showing global UBT configuration information where multi-zone has been configured:

```
switch# show ubt

Zone Name                  : zone1
UBT Mode                   : vlan-extend
Primary Controller         : 10.10.10.251
Backup Controller          : ---/---
SAC HeartBeat Interval     : 1
```

```
UAC KeepAlive Interval    : 60
VLAN Identifier           : ---/---
VRF Name                  : default
Wake-on-LAN Enabled-VLANS : ---/---
Admin State               : ENABLED
PAPI Security Key         : DISABLED
Operational State         : Up

Zone Name                 : zone2
UBT Mode                  : vlan-extend
Primary Controller        : 162.10.0.6
Backup Controller         : ---/---
SAC HeartBeat Interval    : 1
UAC KeepAlive Interval    : 60
VLAN Identifier           : ---/---
VRF Name                  : default
Wake-on-LAN Enabled-VLANS : ---/---
Admin State               : ENABLED
PAPI Security Key         : DISABLED
Operational State         : Up

Zone Name                 : zone3
UBT Mode                  : vlan-extend
Primary Controller        : 20.20.20.11
Backup Controller         : ---/---
SAC HeartBeat Interval    : 1
UAC KeepAlive Interval    : 60
VLAN Identifier           : ---/---
VRF Name                  : default
Wake-on-LAN Enabled-VLANS : ---/---
Admin State               : ENABLED
PAPI Security Key         : DISABLED
Operational State         : Up
```

Showing global UBT configuration information with operational state down failure reason:

```
switch# show ubt

Zone Name                 : my-zone
UBT Mode                  : local-vlan
Primary Controller        : 10.116.51.10
Backup Controller         : 10.116.51.11
SAC HeartBeat Interval    : 1
UAC KeepAlive Interval    : 60
VLAN Identifier           : 4094
VRF Name                  : my-vrf
Wake-on-LAN Enabled-VLANS : -NA-
Admin State               : ENABLED
PAPI Security Key         :
AQBapdxySvGPvdTlkYn1/naKX4O3jKHrm28xLYfO6mLOK499BwAAAHdJp/bL4FE=
Operational State         : up

Zone Name                 : my-zone2
UBT Mode                  : local-vlan
Primary Controller        : 10.116.51.10
Backup Controller         : 10.116.51.11
SAC HeartBeat Interval    : 1
UAC KeepAlive Interval    : 60
VLAN Identifier           : 4094
VRF Name                  : my-vrf2
```

```
Wake-on-LAN Enabled-VLANS : -NA-
Admin State               : ENABLED
PAPI Security Key         :
AQBapdxySvGPvdTlkYn1/naKX4O3jKHrm28xLYfO6mLOK499BwAAAHdJp/bL4FE=
Operational State         : down
Failure Reason            : Controller is unreachable
```

Showing brief global UBT configuration information where local-VLAN mode has been configured:

```
switch(config)# show ubt brief
----------------------------------------------------------------------------------
--------------------
Zone Name    UBT Mode         Primary Controller Address    VRF Name     Status
 Operational State
----------------------------------------------------------------------------------
--------------------
zone1        local-vlan       10.116.51.10                  default      Enabled
  up
zone2        local-vlan       20.116.51.20                  vrf2         Enabled
  down
zone3        local-vlan       30.116.51.30                  vrf3         Enabled
  up
```

Showing brief global UBT configuration information where VLAN-extend mode has been configured:

```
switch# show ubt brief
----------------------------------------------------------------------------------
--------------------
Zone Name    UBT Mode         Primary Controller Address    VRF Name     Status
 Operational State
----------------------------------------------------------------------------------
--------------------
zone1        vlan-extend      10.116.51.10                  default      Enabled
  up
zone2        vlan-extend      20.116.51.20                  vrf2         Enabled
  down
zone3        vlan-extend      30.116.51.30                  vrf3         Enabled
  up
```

Showing brief configuration for UBT `zone1` where local-VLAN mode has been configured:

```
switch# show ubt zone zone1 brief
--------------------------------------------------------------------------------
Zone Name    UBT Mode         Primary Controller Address    VRF Name     Status
--------------------------------------------------------------------------------
zone1        local-vlan       10.116.51.10                  default      Enabled
```

Showing brief configuration for UBT `zone1` where VLAN-extend mode has been configured:

```
switch# show ubt zone zone1 brief
--------------------------------------------------------------------------------
Zone Name    UBT Mode         Primary Controller Address    VRF Name     Status
--------------------------------------------------------------------------------
zone1        vlan-extend      10.116.51.10                  default      Enabled
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.10 | Wake-on-LAN enabled VLANs added. |
| 10.09 | ■ **Failure Reason** field added in the output of `show ubt` command.<br>■ **Operational State** column added in the output of `show ubt brief` command. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show ubt information

```
show ubt information
show ubt information zone <ZONE-NAME>
```

### Description

Shows SAC and UAC information for UBT. Specifying a zone name displays UBT information for that zone.

| Parameter | Description |
|---|---|
| *ZONE-NAME* | Specifies UBT zone name. Maximum characters: 64. |

### Examples

Showing SAC and UAC information for the tunneled node server:

```
switch(config)# show ubt information

======================================================================
Zone zone1:
======================================================================
SAC Information :

  Active          : 192.168.10.8
  Standby         : -NA-
```

```
Controller is in Standalone mode

Wake-on-LAN VLAN boostrap information:
    Active-SAC registered vlans    :
    Active-SAC failed vlans        : 200
    Active-SAC failure reason      : Failed in controller
    Standby-SAC registered vlans   :
    Standby-SAC failed vlans       :
    Standby-SAC failure reason     :

=====================================================================
Zone zone2:
=====================================================================
SAC Information :

  Active         : 20.1.1.2
  Standby        : 20.1.1.3

Node List Information :

  Cluster Name        : cluster2

  Cluster Alias Name  :

  Node List      :
  ----------------
    20.1.1.2
    20.1.1.3
    20.1.1.4

Bucket Map Information :

Bucket Map Active   : [0...255]

Bucket ID  A-UAC           S-UAC                Connectivity
----------------------------------------------------------
0          20.1.1.2        20.1.1.3             L2
1          20.1.1.3        20.1.1.4             L2
2          20.1.1.4        20.1.1.2             L2
Wake-on-LAN VLAN boostrap information:
    Active-SAC registered vlans    : 10-20,30,40
    Active-SAC failed vlans        :
    Active-SAC failure reason      :
    Standby-SAC registered vlans   : 10-20,30,40
    Standby-SAC failed vlans       :
    Standby-SAC failure reason     :
```

Showing SAC and UAC information for **zone1**:

```
switch(config)# show ubt information zone zone1

=====================================================================
Zone zone1:
=====================================================================
SAC Information :

  Active         : 10.116.51.12
  Standby        : 10.116.51.13
```

```
Node List Information :

  Cluster Name        : my-cluster

  Node List      :
  ----------------
    10.1.1.1
    10.1.1.2
    10.1.1.3

Bucket Map Information :

Bucket Name         : my-bucket
Bucket Map Active   : [0...255]

Bucket ID  A-UAC           S-UAC               Connectivity
----------------------------------------------------------
0          10.1.1.1        10.1.1.2            L2
1          10.1.1.2        10.1.1.3            L2
2          10.1.1.3        10.1.1.1            L2

Wake-on-LAN VLAN boostrap information:
    Active-SAC registered vlans    : 100,300,400
    Active-SAC failed vlans        : 200
    Active-SAC failure reason      : Failed in controller
    Standby-SAC registered vlans   : 100,300,400
    Standby-SAC failed vlans       :
    Standby-SAC failure reason     :
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.10 | Wake-on-LAN enabled VLANs added. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show ubt state

```
show ubt state
show ubt state zone <ZONE-NAME>
show ubt state zone <ZONE-NAME> uac-ip <UAC-ADDR>
```

### Description

Shows the global UBT state.

Specifying a zone shows the UBT state of that zone.

Specifying a UAC IP address shows the UBT state of that UAC.

| Parameter | Description |
|---|---|
| `zone <ZONE-NAME>` | Specifies UBT zone name. Maximum characters: 64. |
| `uac-ip <UAC-ADDR>` | Specifies the IP address of the user anchor controller for which to view user information. Specify the address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. |

### Examples

*On the 6400 Switch Series, interface identification differs.*

Showing the UBT state where local-VLAN mode has been configured:

```
switch# show ubt state
=====================================================================
Zone zone1:
=====================================================================
Local Conductor Server (LCS) State:
LCS Type      IP Address    State               Role
---------------------------------------------------------------------
Primary     : 10.1.1.2      ready_for_bootstrap operational_primary
Secondary   : 10.1.1.10     ready_for_bootstrap operational_secondary
Switch Anchor Controller (SAC) State:
              IP Address      MAC Address          State
-----------------------------------------------------------------
Active      : 10.1.1.2        00:0b:86:b7:62:9f    registered
Standby     : 10.1.1.3        00:0b:86:b7:64:0f    registered
User Anchor Controller(UAC): 10.1.1.2
User              Port    State                          Bucket ID  Gre Key  VLAN
----------------------------------------------------------------------------------
00:00:00:00:00:01  1/1/1   registered                     5          13       4094
User Anchor Controller(UAC): 10.1.1.3
User              Port    State                          Bucket ID  Gre Key  VLAN
----------------------------------------------------------------------------------
00:00:00:00:00:02  1/1/2   registered                     4          14       4094
=====================================================================
Zone zone2:
=====================================================================
Local Conductor Server (LCS) State:
LCS Type      IP Address    State               Role
---------------------------------------------------------------------
Primary     : 20.1.1.2      ready_for_bootstrap operational_primary
Secondary   : 20.1.1.10     ready_for_bootstrap operational_secondary
Switch Anchor Controller (SAC) State:
              IP Address      MAC Address          State
-----------------------------------------------------------------
Active      : 20.1.1.2        00:0b:86:b7:62:9f    registered
Standby     : 20.1.1.3        00:0b:86:b7:64:0f    registered
User Anchor Controller(UAC): 20.1.1.2
User               Port    State                          Bucket ID  Gre Key  VLAN
----------------------------------------------------------------------------------
00:00:00:00:00:03  1/1/1   registered                     5          13       4094
User Anchor Controller(UAC): 20.1.1.3
User               Port    State                          Bucket ID  Gre Key  VLAN
----------------------------------------------------------------------------------
00:00:00:00:00:04  1/1/2   registered                     4          14       4094
```

Showing the UBT state where VLAN-extend mode has been configured:

```
switch# show ubt state
=====================================================================
Zone zone1:
=====================================================================
Local Conductor Server (LCS) State:
LCS Type      IP Address    State               Role
---------------------------------------------------------------------
Primary     : 10.1.1.2      ready_for_bootstrap operational_primary

Secondary   : 10.1.1.10     ready_for_bootstrap operational_secondary
Switch Anchor Controller (SAC) State:
              IP Address      MAC Address          State
-----------------------------------------------------------------
Active      : 10.1.1.2        00:0b:86:b7:62:9f    registered
Standby     : 10.1.1.3        00:0b:86:b7:64:0f    registered
User Anchor Controller(UAC): 10.1.1.2
User               Port    State                          Bucket ID  Gre Key  VLAN

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Administrators or local user group members with execution rights for this command. |

# show ubt statistics

```
show ubt statistics
show ubt statistics zone <ZONE-NAME>
show ubt statistics zone <ZONE-NAME> uac-ip <UAC-ADDR>
```

### Description

Displays statistics for UBT.

Specifying a zone shows the UBT statistics for that zone.

Specifying a UAC IP address shows the UBT statistics for that UAC.

| Parameter | Description |
|---|---|
| `zone <ZONE-NAME>` | Specifies UBT zone name. Maximum characters: 64. |
| `uac-ip <UAC-ADDR>` | Specifies the IP address of the user anchor controller for which to view user information. Specify the address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. |

### Examples

Showing UBT statistics where local-VLAN mode has been configured:

```
switch# show ubt statistics
UBT Statistics

```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show ubt users

```
show ubt users [ all | count | down | mac <MAC-ADDR> | {port <IF-NAME> | <IF-RANGE>} |
up] zone <ZONE-NAME>
```

### Description

Displays user information for UBT.

| Parameter | Description |
|---|---|
| `all` | Display information for all users. |
| `count` | Display the total number of users configured to tunnel traffic. |
| `down` | Display the users that are not able to tunnel traffic. |
| `mac <MAC-ADDR>` | Display user information based on MAC address. |
| `port <IF-NAME> \| <IF-RANGE>` | Display user information for a specific interface or range of interfaces. For example, **port 1/1/1** or **port 1/1/1-1/1/10**. |
| `up` | Display user information that are active. |
| `zone <ZONE-NAME>` | Specifies UBT zone name. Maximum characters: 64. |

## Examples

*On the 6400 Switch Series, interface identification differs.*

Showing information for all users:

```
switch# show ubt users all
=====================================================================
Displaying All UBT Users for Zone: zone1
=====================================================================
Downloaded user roles are preceded by *
Port    Mac Address        Tunnel Status  Secondary UserRole   Failure Reason
--------------------------------------------------------------------------
1/25    00:00:00:11:12:03  activated      authenticated         ---/---
=====================================================================
Displaying All UBT Users for Zone: zone2
=====================================================================
Downloaded user roles are preceded by *
Port    Mac Address        Tunnel Status  Secondary UserRole   Failure Reason
--------------------------------------------------------------------------
2/25    00:00:00:13:12:03  activated      authenticated         ---/---
```

Showing information for users of **zone1**:

```
switch# show ubt users all zone zone1

=====================================================================
Displaying All UBT Users for Zone: zone1
=====================================================================
Downloaded user roles are preceded by *
Port    Mac Address        Tunnel Status  Secondary UserRole   Failure Reason
--------------------------------------------------------------------------
1/25    00:00:00:11:12:03  activated      authenticated         ---/---
```

Displaying the number of users that are tunneling traffic:

```
switch# show ubt users count

Total Number of Users using ubt Zone : zone2 is 1
Total Number of Users using ubt Zone : zone1 is 2
===================================================
Total Number of Users in all the zones : 3
===================================================
```

Showing users that are down:

```
switch# show ubt users down

=====================================================================
Displaying UBT Users of Zone: zone1 having Tunnel Status DOWN
=====================================================================
Downloaded user roles are preceded by *
Port Mac Address       Tunnel Status      Secondary UserRole   Failure Reason
----------------------------------------------------------------------------------
1/25 00:00:00:11:12:03 activation_failed  authenticated        User bootstrap has
                                                               failed
```

Showing information for users of **zone1** that are down:

```
switch# show ubt users down zone zone1

=====================================================================
Displaying UBT Users of Zone: zone1 having Tunnel Status DOWN
=====================================================================
Downloaded user roles are preceded by *
Port Mac Address       Tunnel Status     Secondary UserRole   Failure Reason
--------------------------------------------------------------------------
1/25 00:00:00:11:12:03 activation_failed  authenticated       User bootstrap has
                                                              failed
```

Showing information for users on port `2/25`:

```
switch# show ubt users port 2/25

=====================================================================
Displaying UBT Users of Zone: zone1
=====================================================================
Downloaded user roles are preceded by *
Port    Mac Address        Tunnel Status  Secondary UserRole  Failure Reason
--------------------------------------------------------------------------
2/25    00:00:00:11:12:03   activated      authenticated       ---/---
```

Showing information for users that are up:

```
switch# show ubt users up

=====================================================================
Displaying UBT Users of Zone: zone1 having Tunnel Status UP
=====================================================================
Downloaded user roles are preceded by *
Port    Mac Address       Tunnel Status  Secondary UserRole  Failure Reason
--------------------------------------------------------------------------
1/25    00:00:00:11:12:03 activated      authenticated       ---/---
```

Showing information for users of `zone1` that are up:

```
switch# show ubt users up zone zone1

=====================================================================
Displaying UBT Users of Zone: zone1 having Tunnel Status UP
=====================================================================
Downloaded user roles are preceded by *
Port    Mac Address       Tunnel Status  Secondary UserRole  Failure Reason
--------------------------------------------------------------------------
1/25    00:00:00:11:12:03 activated      authenticated       ---/---
```

Showing information for the user with MAC address `00:00:00:11:12:03`:

```
switch# show ubt users mac 00:00:00:11:12:03

Displaying UBT User of Zone: zone1 having MAC-Address: 00:00:00:11:12:03
Downloaded user roles are preceded by *
Port    Mac Address       Tunnel Status  Secondary UserRole  Failure Reason
--------------------------------------------------------------------------
1/25    00:00:00:11:12:03 activated      authenticated       ---/---
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |

## uac-keepalive-interval

```
uac-keepalive-interval <TIME>
no uac-keepalive-interval <TIME>
```

### Description

Specifies the UAC keep alive refresh time interval in seconds for the UBT zone.

The **no** form of this command sets the keep alive interval to the default value.

| Parameter | Description |
|---|---|
| *<TIME>* | Specifies the UAC keep-alive refresh time interval in seconds. Range: 1 to 60. Default: 60. |

### Examples

Specifying a keepalive interval of 60 seconds for UBT **zone1**:

```
switch(config)# ubt zone zone1
switch(config-ubt-zone1)# uac-keepalive-interval 60
```

Deleting the configured UAC keepalive interval:

```
switch(config)# ubt zone zone1
switch(config-ubt-zone1)# no uac-keepalive-interval 60
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-ubt-<ZONE-NAME>` | Administrators or local user group members with execution rights for this command. |

## ubt

```
ubt zone <ZONE-NAME> vrf <VRF-NAME>
no ubt zone <ZONE-NAME> vrf <VRF-NAME>
```

### Description

Creates a User Based Tunnel (UBT) zone with a specified zone name and VRF name. A UBT name is used to configure all UBT properties advertised by the UBT feature.

The **no** form of this command removes the specified UBT zone.

This configuration will disable flow tracking statistics collection.

| Parameter | Description |
|---|---|
| *<ZONE-NAME>* | Specifies a name for the UBT zone. Length: 1 to 64 characters. |
| *<VRF-NAME>* | Specifies the VRF on which to establish the UBT tunnel. |

### Examples

Creating UBT zone called **zone1** associated with a VRF called **default**:

```
switch(config)# ubt zone zone1 vrf default
```

Removing UBT zone **zone1** on VRF **default**:

```
switch(config)# no ubt zone zone1 vrf default
```

Deleting all UBT configurations:

```
switch(config)# no ubt
```

Warning message is displayed when this configuration is enabled:

```
switch(config)# ubt zone my-zone vrf my-vrf
Warning: This configuration will disable flow tracking statistics collection.
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.14 | Added information related to role based IPFIX. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## ubt-client-vlan

```
ubt-client-vlan <VLAN-ID>
no ubt-client-vlan <VLAN-ID>
```

### Description

Specifies the UBT Client VLAN or local VLAN. This VLAN is used in local-VLAN mode only. If the UBT client VLAN is configured in VLAN-extend mode it is ignored, this is the reserved VLAN that all client traffic uses to get to the gateway. At the gateway, VLAN and policy will be assigned to the client traffic. No other feature should be enabled on the UBT client VLAN.

The **no** form of this command removes the VLAN to use for tunneled clients.

| Parameter | Description |
|---|---|
| *<VLAN-ID>* | Specifies the VLAN ID to use for tunneled clients. Range: 1-4094. |

## Examples

Creating VLAN 4000:

```
switch(config)# vlan 4000
switch(config-vlan-4000)# no shutdown
```

Specifying UBT client VLAN 4000:

```
switch(config)# ubt-client-vlan 4000
```

Setting multi-zone:

```
switch(config)# ubt-client-vlan 4000
switch(config)# ubt zone zone8 vrf default
switch(config-ubt-zone8)# primary-controller ip 20.20.20.13
switch(config-ubt-zone8)# enable
switch(config)# ubt zone zone5 vrf default
switch(config-ubt-zone5)# primary-controller ip 20.20.20.10
switch(config-ubt-zone5)# enable
switch(config)# ubt zone zone3 vrf default
switch(config-ubt-zone3)# primary-controller ip 10.10.10.248
switch(config-ubt-zone3)# enable
switch(config)# ubt zone zone2 vrf default
switch(config-ubt-zone2)# primary-controller ip 162.10.0.6
switch(config-ubt-zone2)# enable
switch(config)# ubt zone zone7 vrf default
switch(config-ubt-zone7)# primary-controller ip 20.20.20.12
switch(config-ubt-zone7)# enable
switch(config)# ubt zone zone4 vrf default
switch(config-ubt-zone4)# primary-controller ip 10.10.10.251
switch(config-ubt-zone4)# enable
ip source-interface ubt interface loopback200
```

Removing configured UBT client VLAN 4000:

```
switch(config)# no ubt-client-vlan 4000
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## ubt mode vlan-extend

```
ubt-mode vlan-extend
no ubt-mode [vlan-extend]
```

### Description

Selects VLAN extended mode. When VLAN-extend mode is enabled clients are assigned to their UBT role-based VLAN in the hardware datapath.

The **no** form of the command selects the default local-VLAN mode. In local-VLAN mode clients are assigned to a local switch VLAN and associated with their UBT role-based VLAN when client traffic reaches the controller.

The default UBT mode is local-VLAN.

### Examples

Setting the UBT mode to VLAN-extend:

```
switch(config)# ubt-mode vlan-extend
```

Setting multi-zone:

```
switch(config)# ubt-mode vlan-extend
switch(config)# ubt zone zone8 vrf default
switch(config-ubt-zone8)# primary-controller ip 20.20.20.13
switch(config-ubt-zone8)# enable
switch(config)# ubt zone zone5 vrf default
switch(config-ubt-zone5)# primary-controller ip 20.20.20.10
switch(config-ubt-zone5)# enable
switch(config)# ubt zone zone3 vrf default
switch(config-ubt-zone3)# primary-controller ip 10.10.10.248
switch(config-ubt-zone3)# enable
switch(config)# ubt zone zone2 vrf default
switch(config-ubt-zone2)# primary-controller ip 162.10.0.6
switch(config-ubt-zone2)# enable
switch(config)# ubt zone zone7 vrf default
switch(config-ubt-zone7)# primary-controller ip 20.20.20.12
switch(config-ubt-zone7)# enable
switch(config)# ubt zone zone4 vrf default
switch(config-ubt-zone4)# primary-controller ip 10.10.10.251
switch(config-ubt-zone4)# enable
ip source-interface ubt interface loopback200
```

Setting the UBT mode back to the default of local-VLAN:

```
switch(config)# no ubt-mode
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.09 | Added multi-zone support. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## wol-enable vlan

```
wol-enable vlan <VLANID>
no wol-enable vlan <VLANID>
```

### Description

Configures Wake-on-LAN VLANs in the ubt <zone-name> context. The maximum number of VLANs that can be configured per UBT zone is 100. VLANs must be pre-configured on the switch and controller.

The **no** form of this command removes the specified configuration.

This command is applicable for UBT vlan-extend mode only.

The Wake-on-LAN VLAN / Silent client device support feature is supported only on Aruba Mobility Controller (AOS) v8.10 and above.

Wake-on-LAN enabled VLANs should not be configured on Layer-2 trunked uplink ports to avoid network loops.

Wake-on-LAN configuration should not be modified when active UBT users are present.

| Parameter | Description |
|---|---|
| *<VLANID>* | Specifies the VLANs. |

### Examples

Configure wake-on-LAN VLANs in a UBT zone called **my-zone** associated with a VRF called **red**:

```
switch(config)# ubt zone my-zone vrf red
switch(config-ubt-my-zone)# wol-enable vlan 10-20
```

Delete wake-on-LAN VLANs in a UBT zone called **my-zone** associated with a VRF called **red**:

```
switch(config)# ubt zone my-zone vrf red
switch(config-ubt-my-zone)# no wol-enable vlan 10-20
```

Removing wake-on-LAN VLANs in a UBT zone called **my-zone**:

```
switch(config)# ubt zone my-zone
switch(config-ubt-my-zone)# no wol-enable
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.10 | Command introduced. |

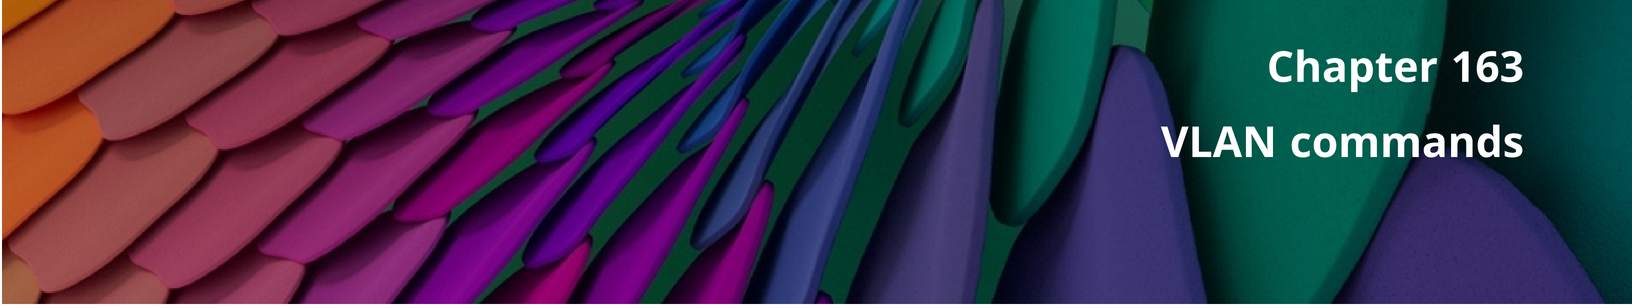
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |



# Chapter 163
# VLAN commands

## description

`description <DESCRIPTION>`

### Description

Specifies a descriptive for a VLAN.

| Parameter | Description |
|---|---|
| *<DESCRIPTION>* | Specifies a description for the VLAN. |

### Examples

Assigning a description to VLAN **20**:

```
switch(config)# vlan 20
switch(config-vlan-20)# description primary
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config-vlan-<VLAN-ID>` | Administrators or local user group members with execution rights for this command. |

## vlan name

`name <VLAN-NAME>`

### Description

Associates a name with a VLAN.

| Parameter | Description |
|---|---|
| *<VLAN-NAME>* | Specifies a name for a VLAN. Length: 1 to 32 alphanumeric characters, including underscore (_) and hyphen (-). |

### Usage

- Each named VLAN must have a unique name; there cannot be duplicate names for VLANs.
- By default, VLANs are created with the default name: VLAN *<VLAN-ID>*

### Examples

Assigning the name **backup** to VLAN **20**:

```
switch(config)# vlan 20
switch(config-vlan-20)# name backup
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config-vlan-<VLAN-ID>` | Administrators or local user group members with execution rights for this command. |

## show capacities-status vlan-count

```
show capacities-status vlan-count
```

### Description

Shows the number of VLANs present on the switch and the maximum number of VLANs allowed on the switch.

### Example

Showing switch VLAN capacity status:

```
show capswitch# show capacities-status vlan-count
System Capacities: Filter VLAN count
Capacities Name                                         Value    Maximum
-------------------------------------------------------------------------
Maximum number of VLANs currently configured             1        xxxx
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (#) | Administrators or local user group members with execution rights for this command. |

## show capacities svi-count

`show capacities svi-count`

### Description

Shows the maximum number of SVIs supported by the switch.

### Examples

Showing switch SVI capacity:

```
switch# show capacities svi-count
System Capacities: Filter SVI count
Capacities Name                                                   Value
---------------------------------------------------------------------
Maximum number of SVIs supported in the system                    128
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (#) | Administrators or local user group members with execution rights for this command. |

# show capacities vlan-count

`show capacities vlan-count`

## Description

Shows the maximum number of VLANs allowed on the switch.

## Example

Showing switch VLAN capacity:

```
show capswitch# show capacities vlan-count
System Capacities: Filter VLAN count
Capacities Name                                                   Value
------------------------------------------------------------------------
Maximum number of VLANs supported in the system                    4094
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (#) | Administrators or local user group members with execution rights for this command. |

# show capacities-status vlan-translation

`show capacities-status vlan-translation`

## Description

Shows the number of VLAN translation rules present on the switch and the maximum number of VLAN translation rules allowed on the switch. The maximum number of VLAN translation rules allowed are 4000.

## Example

Showing switch VLAN translation rules capacity:

```
switch(config-vlan-100)# show capacities vlan-translation
System Capacities: Filter VLAN Translation
Capacities Name                                                 Value
------------------------------------------------------------------------
Maximum number of VLAN Translation rules supported               4000
```

```
switch(config-vlan-100)#
switch(config-vlan-100)#
switch(config-vlan-100)#
switch(config-vlan-100)#
switch(config-vlan-100)# show capacities-st vlan-translation

System Capacities Status: Filter VLAN Translation
Capacities Status Name                                     Value Maximum
--------------------------------------------------------------------------
Number of VLAN Translation rules currently configured         1   4000
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Manager (#) | Administrators or local user group members with execution rights for this command. |

## show vlan

`show vlan [<VLAN-ID>] [vsx-peer]`

### Description

Displays configuration information for all VLANs or a specific VLAN.

| Parameter | Description |
|---|---|
| *<VLAN-ID>* | Specifies a VLAN ID. |
| vsx-peer | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Examples

*On the 6400 Switch Series, interface identification differs.*

Displaying configuration information for VLAN **2**:

```
switch# show vlan 2
----------------------------------------------------------------------------------
```

```
VLAN  Name                     Status  Reason          Type      Interfaces
----------------------------------------------------------------------------------
2     UserVLAN1                up      ok              static    1/1/1,1/1/3,1/1/5
```

Displaying configuration information for all defined VLANs:

```
switch# show vlan
----------------------------------------------------------------------------------
VLAN  Name                 Status  Reason        Type      Interfaces
----------------------------------------------------------------------------------
-
1     DEFAULT_VLAN_1       up      ok            static    1/1/3-1/1/4
2     UserVLAN1            up      ok            static    1/1/1,1/1/3,1/1/5
3     UserVLAN2            up      ok            static    1/1/2-1/1/3,1/1/5-1/1/6
5     UserVLAN3            up      ok            static    1/1/3
10    TestNetwork          up      ok            static    1/1/3,1/1/5
11    VLAN11               up      ok            static    1/1/3
12    VLAN12               up      ok            static    1/1/3,1/1/6,lag1-lag2
13    VLAN13               up      ok            static    1/1/3,1/1/6
14    VLAN14               up      ok            static    1/1/3,1/1/6
20    ManagementVLAN       down    admin_down    static    1/1/3,1/1/10
```

Displaying configuration information for auto-vlan:

```
switch# show vlan
----------------------------------------------------------------------------------
VLAN  Name        Status  Reason        Type        Interfaces
----------------------------------------------------------------------------------
--------------------------------
23    VLAN23       up       ok        port-access    1/1/1
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show vlan port

`show vlan port <INTERFACE-ID> [vsx-peer]`

## Description

Displays the VLANs configured for a specific layer 2 interface.

| Parameter | Description |
|---|---|
| *<INTERFACE-ID>* | Specifies an interface ID. Format: **member/slot/port**. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

## Examples

*On the 6400 Switch Series, interface identification differs.*

Displaying the VLANs configured on interface **1/1/1**:

```
switch# show vlan port 1/1/1
--------------------------------------------------------------------------------
VLAN  Name                            Mode            Mapping
--------------------------------------------------------------------------------
2     UserVLAN1                       access          port
3     UserVLAN2                       access          arp,ipv4
5     UserVLAN5                       access          ipv6
```

Displaying RADIUS server provided VLAN 2,3,5 as extended access VLANs (MBV):

```
switch# show vlan port 1/1/1
--------------------------------------------------------------------------------
VLAN  Name                            Mode            Mapping
--------------------------------------------------------------------------------
2     UserVLAN1                       access          mbv, port
3     UserVLAN2                       access          mbv
5     UserVLAN5                       access          mbv

Overriden VLAN list: 2-3,5
```

Displaying RADIUS server provided VLAN 50 as access VLAN and mode as access:

```
switch# show vlan port 1/1/1
--------------------------------------------------------------------------------
VLAN  Name                            Mode            Mapping
--------------------------------------------------------------------------------
50    VLAN50                          access          port-access

Overridden VLAN list: 2-3,5
```

Displaying RADIUS server provided VLAN 50 as access VLAN and mode as access, and 2,3 as extended access VLANs (MBV):

```
switch# show vlan port 1/1/1
--------------------------------------------------------------------------------
VLAN  Name                            Mode            Mapping
--------------------------------------------------------------------------------
```

```
2     UserVLAN1                       access          mbv
3     UserVLAN2                       access          mbv
50    VLAN50                          access          port-access

Overridden VLAN list: 2-3,5
```

Displaying RADIUS server provided mode as native-untagged, 11-14 as trunk VLANs, VLAN 11 as an access VLAN and VLAN 2, 3 as extended access VLANs (MBV):

```
switch# show vlan port 1/1/1
--------------------------------------------------------------------------------
VLAN  Name                            Mode            Mapping
--------------------------------------------------------------------------------
2     UserVLAN1                       access          mbv
3     UserVLAN2                       access          mbv
11    VLAN11                          native-untagged port-access
12    VLAN12                          trunk           port-access
13    VLAN13                          trunk           port-access
14    VLAN14                          trunk           port-access

Overridden VLAN list: 2-3,5
```

Displaying RADIUS server provided mode as native-tagged, 11-14 as trunk VLANs, VLAN 11 as an access VLAN and VLAN 2, 3 as extended access VLANs (MBV):

```
switch# show vlan port 1/1/1
--------------------------------------------------------------------------------
VLAN  Name                            Mode            Mapping
--------------------------------------------------------------------------------
2     UserVLAN1                       native-untagged mbv, port
3     UserVLAN2                       access          mbv
11    VLAN11                          trunk           port-access
12    VLAN12                          trunk           port-access
13    VLAN13                          trunk           port-access
14    VLAN14                          trunk           port-access

Overridden VLAN list: 3,5
```

Displaying RADIUS server provided mode as native-tagged, 3, 11-14 as trunk VLANs, VLAN 11 as an access VLAN and VLAN 2, 3 as extended access VLANs (MBV):

```
switch# show vlan port 1/1/1
--------------------------------------------------------------------------------
VLAN  Name                            Mode            Mapping
--------------------------------------------------------------------------------
2     UserVLAN1                       native-untagged mbv, port
3     UserVLAN2                       native-untagged port-access, mbv
11    VLAN11                          trunk           port-access
12    VLAN12                          trunk           port-access
13    VLAN13                          trunk           port-access
14    VLAN14                          trunk           port-access

Overridden VLAN list: 3,5
```

Displaying RADIUS server provided mode as native-tagged, 2, 11-14 as trunk VLANs, VLAN 11 as an access VLAN:

```
switch# show vlan port 1/1/1
-------------------------------------------------------------------------------
VLAN  Name                                Mode            Mapping
-------------------------------------------------------------------------------
2     UserVLAN1                           trunk           port-access
11    VLAN11                              native-tagged   port-access
12    VLAN12                              trunk           port-access
13    VLAN13                              trunk           port-access
14    VLAN14                              trunk           port-access

Overridden VLAN list: 2-3,5
```

Displaying the VLANs configured on interface **1/1/3**:

```
switch# show vlan port 1/1/3
-------------------------------------------------------------------------------
VLAN  Name                                Mode            Mapping
-------------------------------------------------------------------------------
1     DEFAULT_VLAN_1                      native-untagged port
2     UserVLAN1                           trunk           port
3     UserVLAN2                           trunk           port
5     UserVLAN3                           trunk           port
10    TestNetwork                         trunk           port
11    VLAN11                              trunk           port
12    VLAN12                              trunk           port
13    VLAN13                              trunk           port
14    VLAN14                              trunk           port
20    ManagementVLAN                      trunk           port
30    VLAN30                              trunk           port
40    VLAN40                              trunk           port
50    VLAN50                              trunk           port
100   VLAN100                             trunk           port
200   VLAN200                             trunk           port
```

Displaying RADIUS server provided VLANs 2,11-14 as trunk VLANs, VLAN 2 as an access VLAN, and mode as native-untagged:

```
switch# show vlan port 1/1/3
-------------------------------------------------------------------------------
VLAN  Name                                Mode            Mapping
-------------------------------------------------------------------------------
2     UserVLAN1                           native-untagged port-access
11    VLAN11                              trunk           port-access
12    VLAN12                              trunk           port-access
13    VLAN13                              trunk           port-access
14    VLAN14                              trunk           port-access

Overridden VLAN list: 1-3,5,10-14,20,30,40,50,100,200
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show vlan summary

```
show vlan summary [vsx-peer]
```

### Description

Displays a summary of the VLAN configuration on the switch.

| Parameter | Description |
|---|---|
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Examples

Displaying a summary of the VLAN configuration on the switch:

```
switch# show vlan summary
Number of existing VLANs: 11
Number of static VLANs:   11
Number of dynamic VLANs:  0
Number of port-access VLANs: 1
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

| All platforms | Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show vlan translation

`show vlan translation [interface <INTERFACE-NAME>] [vsx-peer]`

### Description

Shows a summary of all VLAN translations rules defined on the switch, or the rules defined for a specific interface.

| Parameter | Description |
|---|---|
| `interface <INTERFACE-NAME>` | Specifies the name of a layer 2 interface. Format: **member/slot/port**. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Examples

*On the 6400 Switch Series, interface identification differs.*

Displaying a summary of all VLAN translations rules defined on the switch:

```
switch# show vlan translation
--------------------------------------------
Interface  VLAN-1      VLAN-2
--------------------------------------------
1/1/5      10          20
1/1/5      30          40
1/1/5      50          100
1/1/6      100         200

Total number of translation rules : 4
```

Displaying a summary of all VLAN translations rules defined on interface **1/1/5**:

```
switch# show vlan translation interface 1/1/5
--------------------------------------------
Interface  VLAN-1      VLAN-2
--------------------------------------------
1/1/5      10          20
1/1/5      30          40
1/1/5      50          100
```

Displaying VLAN translation information when VSX peer is configured:

```
switch(config-if)# show vlan translation vsx-peer
--------------------------
Interface VLAN-1  VLAN-2
--------------------------
1/3/1     10      20
Total number of translation rules : 1
```

Displaying VLAN translation information when VSX peer is not configured:

```
switch(config-if)# show vlan translation vsx-peer
VSX is not configured
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show vlan translation pending

`show vlan translation pending`

### Description

Shows a list of pending VLAN translation rules.

### Examples

Displaying a list of VLAN translations rules pending on the switch:

```
switch# show vlan translation pending
-------------------------------------------
Interface  VLAN-1      VLAN-2
-------------------------------------------
1/1/5      10          20
1/1/5      30          40
1/1/5      50          100
1/1/6      100         200

Total number of VLAN translation rules that are pending: 4
```

Displaying the output when there are no VLAN translation rules in the pending list:

```
switch# show vlan translation interface 1/1/5
No pending VLAN translation rules
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.08 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show vlan voice

`show vlan voice`

### Description

Displays the voice VLAN list showing the VLAN ID, name, operational state of the VLAN, and the interfaces associated with the VLAN.

### Example

Displaying the voice VLANs list :

```
switch# show vlan voice
----------------------------------------------------------------------------------
------------
VLAN  Name                              Status                Type      Interfaces
----------------------------------------------------------------------------------
------------
10    TestNetwork                       up                    static
1/1/3,1/1/5
```

Displaying the information when voice VLANs are not configured:

```
switch# show vlan voice
Voice VLAN not configured
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## shutdown

```
shutdown
no shutdown
```

### Description

Disables a VLAN. (By default, a VLAN is automatically enabled when it is created with the **vlan** command.)

The **no** form of this command enables a VLAN.

### Examples

Enabling VLAN 20:

```
switch(config)# vlan 20
switch(config-vlan-20)# no shutdown
```

Disabling VLAN 20:

```
switch(config)# vlan 20
switch(config-vlan-20)# shutdown
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config-vlan-<VLAN-ID>` | Administrators or local user group members with execution rights for this command. |

# system vlan-client-presence-detect

```
system vlan-client-presence-detect
no system vlan-client-presence-detect
```

### Description

Enables VNI mapped VLANs when detecting the presence of a client. When enabled, VNI mapped VLANs are *up* only if there are authenticated clients on the VLAN, or if the VLAN has statically configured ports and those ports are *up*. When not enabled, VNI mapped VLANs are always *up*.

The **no** form of this command disables detection of clients on VNI mapped VLANs.

### Examples

Enabling detection of clients:

```
switch(config)# system vlan-client-presence-detect
```

Disabling detection of clients:

```
switch(config)# no system vlan-client-presence-detect
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

# trunk-dynamic-vlan-include

```
trunk-dynamic-vlan-include
no trunk-dynamic-vlan-include
```

### Description

Indicates if dynamically learned VLANs from MVRP and port-access should be included or excluded on ports configured with **vlan trunk allowed all**. By default, dynamic VLANs are not included in the trunk allowed list. This command is used at the system-level.

The **no** form of this command disables the inclusion of dynamic VLANs in the VLANs table. This is the default.

### Examples

Including the dynamic VLANs in the VLAN table:

```
switch(config)# trunk-dynamic-vlan-include
```

Disabling the inclusion of dynamic VLANs in the VLAN table (default):

```
switch(config)# no trunk-dynamic-vlan-include
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.08 | Command introduced |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## uufb

```
uufb
no uufb
```

### Description

Enables the Unknown Unicast Flood Block (UUFB) feature on a physical interface. When this feature is enabled on a physical interface, unknown unicast packets are blocked from egressing the physical interface. This feature is disabled by default.

UUFB can be enabled only on the physical interface.

UUFB cannot be enabled on:

- Routed interface
- LAGs
- VSX inter-switch link
- Interface used as an ISL

## Examples

Enabling UUFB on an L2 access port:

```
switch(config)# interface 1/1/1
switch(config-if)# vlan access 1
switch(config-if)# uufb
```

Enable UUFB on an L2 trunk port:

```
switch(config)# interface 1/1/1
switch(config-if)# vlan trunk allowed all
switch(config-if)# uufb
```

Disabling UUFB on an L2 access or trunk port:

```
switch(config-if)# no uufb
```

## Command History

| Release | Modification |
|---|---|
| 10.11 | Command introduced. |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-if` | Administrators or local user group members with execution rights for this command. |

# vlan

```
vlan <VLAN-LIST>
no vlan <VLAN-LIST>
```

## Description

Creates a VLAN and changes to the **config-vlan-id** context for the VLAN. By default, the VLAN is enabled. To disable a VLAN, use the **shutdown** command.

If the specified VLAN exists, this command changes to the **config-vlan-id** context for the VLAN. If a range of VLANs is specified, the context does not change.

> VLANs used for internal purposes using the command **system internal vlan range** cannot be used for any other (L2) purposes.

The **no** form of this command removes a VLAN. VLAN 1 is the default VLAN and cannot be deleted.

| Parameter | Description |
|---|---|
| *<VLAN-LIST>* | Specifies a single ID, or a series of IDs separated by commas (2, 3, 4), dashes (2-4), or both (2-4,6). Range: 1 to 4094. |

## Examples

Creating VLAN **20**:

```
switch(config)# vlan 20
switch(config-vlan-20)#
```

Removing VLAN **20**:

```
switch(config)# no vlan 20
```

Creating VLANs **2** to **8** and **10**:

```
switch(config)# vlan 2-8,10
```

Removing VLANs **2** to **8** and **10**:

```
switch(config)# no vlan 2-8,10
```

Creating a VLAN which is already configured as an internal VLAN:

```
switch(config)# vlan 3001
Ignoring the operation on internal VLAN(s) 3001.
```

Deleting an unconfigured VLAN which is already configured as internal VLAN:

```
switch(config)# no vlan 300
Ignoring the operation for non-configured VLAN(s) 300.
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

# vlan access

```
vlan access <VLAN-ID>
no vlan access [<VLAN-ID>]
```

## Description

Creates an access interface and assigns an VLAN ID to it. Only one VLAN ID can be assigned to each access interface.

VLANs can only be assigned to non-routed (Layer 2) interfaces. All interfaces are non-routed (Layer 2) by default when created. Use **routing** and **no routing** commands to move ports between Layer 3 and Layer 2 interfaces.

The **no** form of this command removes an access VLAN from the interface in the current context and sets it to the default VLAN ID of 1.

## Command context

| Parameter | Description |
|---|---|
| *<VLAN-ID>* | Specifies a single ID, or a series of IDs separated by commas (2, 3, 4), dashes (2-4), or both (2-4,6). Range: 1 to 4094. |

## Examples

*On the 6400 Switch Series, interface identification differs.*

Configuring interface **1/1/2** as an access interface with VLAN ID set to **20**:

```
switch(config)# interface 1/1/2
switch(config-if)# vlan access 20
```

Removing VLAN ID **20** from interface **1/1/2**:

```
switch(config)# interface 1/1/2
switch(config-if)# no vlan access 20
```

or:

```
switch(config)# interface 1/1/2
switch(config-if)# no vlan access
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config-if` | Administrators or local user group members with execution rights for this command. |

## vlan protocol

```
vlan protocol <PROTOCOL_NAME> <VLAN-ID>
no vlan protocol <PROTOCOL_NAME> <VLAN-ID>
```

### Description

Adds protocol mapping to a VLAN on an interface.

The **no** form of this command removes protocol mapping from the VLAN on an interface.

| Parameter | Description |
|---|---|
| *<VLAN-ID>* | Specifies a VLAN ID. Range: 2 to 4094. |
| *<PROTOCOL_NAME>* | Specifies the protocol that the VLAN is bound to for a given interface. Options are: **appletalk**, **arp**, **ip**, **ipv6**, **ipx**, **netbui**, and **sna**. |

### Usage

- This command is only applicable to access ports.
- Protocol VLAN should be different from access VLANs.
- VLAN should be configured on the switch.
- Routing must be disabled on the interface.
- Interface must be a physical or LAG interface.
- The same protocol-mapped VLAN is recommended for ARP and IPv4 protocols to avoid IPv4 traffic loss.

### Examples

Assigning a protocol mapping to a VLAN on an interface:

```
switch(config)# interface 1/1/2
switch(config-if)# vlan protocol ip 10
```

Assigning a protocol mapping to a VLAN on a LAG interface:

```
switch(config)# interface lag 2
switch(config-lag-if)# vlan protocol ipv6 10
```

Removing a protocol mapping from a VLAN on an interface:

```
switch(config)# interface 1/1/2
switch(config-if)# no vlan protocol ipv6 10
```

Removing a protocol mapping from a VLAN on a LAG interface:

```
switch(config)# interface lag 2
switch(config-lag-if)# no vlan protocol ipv6 10
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.14 | Replaced the **ipv4** parameter with the **ip** parameter. The **ipv4** parameter is deprecated. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-if`<br>`config-lag-if` | Administrators or local user group members with execution rights for this command. |

## vlan translate

```
vlan translate <VLAN-1> <VLAN-2>
no vlan translate <VLAN-1> <VLAN-2>
```

### Description

Defines a bidirectional VLAN translation rule that maps an original VLAN ID (VLAN-1) to a translated internal VLAN ID (VLAN-2) on a LAG or layer 2 interface. Applies to both incoming and outgoing traffic.

On the Aruba 6300, 6400 Switch Series: Traffic for translated VLANs and native VLAN is allowed, and VLANs which are part of the VLAN trunk allowed list are blocked.

The **no** form of this command removes an existing VLAN translation rule on the current interface.

VLAN translation and MVRP cannot be enabled on the same interface.

A port with a VLAN translation configuration allows traffic only for the translated VLAN and the native VLAN; if it is a member of more VLANS, it does not allow traffic for them.

A translated VLAN must be present on the switch before the rule is created; the original VLAN need not be present.

| Parameter | Description |
|---|---|
| *<VLAN-1>* | Specifies the number of an origin VLAN. Range: 1 - 4000. |
| *<VLAN-2>* | Specifies the number of a translated VLAN. Range: 1 - 4000. |

## Usage

- This configuration can be applied only on layer 2 trunk ports.
- Routing must be disabled on the interface.
- Interface must be a layer 2 physical or LAG interface.
- This configuration is supported only on 24 ports.
- Maximum unique VLAN translation rules supported on the Aruba 6300, 6400 Switch Series—4000
- For a given port, VLAN translation cannot be applied if there are any Private-VLAN (PVLAN) configuration(s) on the switch (applies to Aruba 6300 and 6400 Switch Series). VLAN translation and PVLANs are mutually exclusive features.

## Examples

Translates origin VLAN **200** to translated VLAN **20** on interface **1/1/2**.

```
switch# config
switch(config)# vlan 20
switch(config-vlan-20)# exit
switch(config)# interface 1/1/2
switch(config-if)# no routing
switch(config-if)# vlan trunk allowed 20
switch(config-if)# vlan translate 200 20
```

Translates origin VLANs **100** and **300** to translated VLANs **10** and **20** on interface **1/1/2**.

```
switch# config
switch(config)# vlan 10,30
switch(config-vlan-20)# exit
switch(config)# interface 1/1/2
switch(config-if)# no routing
switch(config-if)# vlan trunk allowed 10,30
switch(config-if)# vlan translate 100 10
switch(config-if)# vlan translate 300 30
```

Though VLAN translation is not supported on Native VLAN configurations, a translation rule will be created to ensure VLAN translation works when the native VLAN is updated. These rules appear in the output of the **show running-config** command, though they are not operational.

```
(config)# interface 1/1/4
switch (config-if)# vlan translate 10 2
Warning: Operation not allowed on native VLAN 1
switch(config-if)# show runing-config current-context
interface 1/1/1
no shutdown
no routing
```

```
vlan trunk native 1
vlan trunk allowed all
vlan translate 1 2 <<< non-functional translation rules
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-if` | Administrators or local user group members with execution rights for this command. |

## vlan trunk allowed

```
vlan trunk allowed [<VLAN-LIST> | all]
no vlan trunk allowed [<VLAN-LIST>]
```

### Description

Assigns a VLAN ID to an trunk interface. Multiple VLAN IDs can be assigned to a trunk interface. These VLAN IDs define which VLAN traffic is allowed across the trunk interface.

VLANs can only be assigned to non-routed (Layer 2) interfaces. All interfaces are non-routed (Layer 2) by default when created. Use **routing** and **no routing** commands to move ports between Layer 3 and Layer 2 interfaces.

The **no** form of this command removes one or more VLAN IDs from a trunk interface. When the last VLAN is removed from a trunk interface, the interface continues to operate in trunk mode, and will trunk all the VLANs currently defined on the switch, and any new VLANs defined in the future. To disable the trunk interface, use the command shutdown.

| Parameter | Description |
|---|---|
| *<VLAN-LIST>* | Specifies a single ID, or a series of IDs separated by commas (2, 3, 4), dashes (2-4), or both (2-4,6). Range: 1 to 4094. |
| `all` | Configures the trunk interface to allow all the VLANs currently configured on the switch and any new VLANs that are configured in the future. |

### Examples

*On the 6400 Switch Series, interface identification differs.*

Assigning VLANs **2**, **3**, and **4** to trunk interface **1/1/2**:

```
switch(config)# interface 1/1/2
switch(config-if)# vlan trunk allowed 2,3,4
```

Assigning VLAN IDs **2** to **8** to trunk interface **1/1/2**:

```
switch(config)# interface 1/1/2
switch(config-if)# vlan trunk allowed 2-8
```

Assigning VLAN IDs **2** to **8** and 10 to trunk interface **1/1/2**:

```
switch(config)# interface 1/1/2
switch(config-if)# vlan trunk allowed 2-8,10
```

Removing VLAN IDs **2**, **3**, and **4** from trunk interface **1/1/2**:

```
switch(config)# interface 1/1/2
switch(config-if)# no vlan trunk allowed 2,3,4
```

Removing all VLANs assigned to trunk interface **1/1/2**:

```
switch(config)# interface 1/1/2
switch(config-if)# no vlan trunk allowed 2
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config-if` | Administrators or local user group members with execution rights for this command. |

## vlan trunk native

```
vlan trunk native <VLAN-ID>
no vlan trunk native [<VLAN-ID>]
```

### Description

Assigns a native VLAN ID to a trunk interface. By default, VLAN ID 1 is assigned as the native VLAN ID for all trunk interfaces. VLANs can only be assigned to a non-routed (layer 2) interface or LAG interface. Only one VLAN ID can be assigned as the native VLAN.

When a native VLAN is defined, the switch automatically executes the **vlan trunk allowed all** command to ensure that the default VLAN is allowed on the trunk. To only allow specific VLANs on the trunk, issue the **vlan trunk allowed** command specifying only specific VLANs.

The **no** form of this command removes a native VLAN from a trunk interface and assigns VLAN ID 1 as its native VLAN.

| Parameter | Description |
|---|---|
| *<VLAN-ID>* | Specifies a VLAN ID. Range: 1 to 4094. |

### Examples

*On the 6400 Switch Series, interface identification differs.*

Assigning native VLAN ID **20** to trunk interface **1/1/2**:

```
switch(config)# interface 1/1/2
switch(config-if)# vlan trunk native 20
```

Removing native VLAN **20** from trunk interface **1/1/2** and returning to the default VLAN 1 as the native VLAN.

```
switch(config)# interface 1/1/2
switch(config-if)# no vlan trunk native 20
```

or:

```
switch(config)# interface 1/1/2
switch(config-if)# no vlan trunk native
```

Assigning native VLAN ID **20** to trunk interface **1/1/2** and then removing it from the list of allowed VLANs. (Only allow VLAN 10 on the trunk.)

```
switch(config)# interface 1/1/2
switch(config-if)# vlan trunk native 20
switch(config-if)# vlan trunk allowed 10
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| All platforms | `config-if` | Administrators or local user group members with execution rights for this command. |

## vlan trunk native tag

```
vlan trunk native <VLAN-ID> tag
no vlan trunk native <VLAN-ID> tag
```

### Description

Enables tagging on a native VLAN. Only incoming packets that are tagged with the matching VLAN ID are accepted. Incoming packets that are untagged are dropped except for BPDUs. Egress packets are tagged.

The **no** form of this command removes tagging on a native VLAN.

| Parameter | Description |
|---|---|
| *<VLAN-ID>* | Specifies the number of a VLAN. Range: 1 to 4094. |

### Examples

*On the 6400 Switch Series, interface identification differs.*

Enabling tagging on native VLAN **20** on trunk interface **1/1/2**:

```
switch(config)# interface 1/1/2
switch(config-if)# vlan trunk native 20
switch(config-if)# vlan trunk native 20 tag
```

Removing tagging on native VLAN **20** assigned to trunk interface **1/1/2**:

```
switch(config)# interface 1/1/2
switch(config-if)# no vlan trunk native 20 tag
```

Enabling tagging on native VLAN **20** assigned to LAG trunk interface **2**:

```
switch(config)# interface lag 2
switch(config-lag-if)# vlan trunk native 20
switch(config-lag-if)# vlan trunk native 20 tag
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

| All platforms | `config-if` | Administrators or local user group members with execution rights for this command. |

## voice

```
voice
no voice
```

### Description

Configures a VLAN as a voice VLAN.

The **no** form of this command removes voice configuration from a VLAN.

### Examples

Configuring VLAN 10 as a voice VLAN:

```
switch(config)# vlan 10
switch(config-vlan-10)# voice
```

Removing voice from VLAN 10:

```
switch(config-vlan-10)# no voice
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

# Chapter 164

# VRF commands

## ip route vrf

```
ip route <DEST-IPV4-ADDR>/<MASK> [<NEXT-HOP-IP-ADDR>|<INTERFACE>|reject|nullroute]
   vrf <VRF-NAME>
no ip route <DEST-IPV4-ADDR>/<MASK> [<NEXT-HOP-IP-ADDR>|<INTERFACE>|reject|nullroute]
   vrf <VRF-NAME>
```

### Description

Adds the destination IPv4 static route on the specified VRF. If no *<VRF-NAME>* is specified the route is applied to the default VRF.

The **no** form of this command removes the IPv4 static route from the VRF.

| Parameter | Description |
|---|---|
| *<DEST-IPV6-ADDR>* | Specifies the route destination in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. |
| *<MASK>* | Specifies the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128. |
| *<NEXT-HOP-IP-ADDR>* | Specifies the next hop in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. |
| *<INTERFACE>* | Specifies the next hop as an outgoing interface. |
| `nullroute` | Silently discards packets to the destined route. |
| `reject` | Discards packets to the destined route and returns an ICMP error to the sender. |
| `vrf` *<VRF-NAME>* | Specifies a VRF name. |

### Examples

```
switch(config)# ip route 20.0.0.0/8 10.20.30.44 vrf myvrf
switch(config)# ip route 20.1.2.0/24 1/1/30 vrf myvrf
switch(config)# ip route 1.2.3.4/32 nullroute vrf myvrf
switch(config)# ip route 1.2.3.4/32 reject vrf myvrf
```

```
switch(config)# no ip route 20.0.0.0/8 10.20.30.44 vrf myvrf
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

## ipv6 route gc interval

```
ipv6 route-gc-interval <INTERVAL>
no ipv6 route-gc-interval
```

### Description

Sets the garbage collection interval timer to remove invalid or old route entries from kernel route cache.

The **no** form of this command resets the garbage collection interval timer to default (30 seconds).

| Parameter | Description |
|---|---|
| *<INTERVAL>* | Specifies time interval in seconds. Range: 30 to 600. Default: 30. |

### Examples

Setting garbage collection interval timer to 300:

```
switch(config)# ipv6 route-gc-interval 300
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.10 | Command introduced |

# ipv6 route vrf

```
ipv6 route <DEST-IPV6-ADDR>/<PREFIX> [<NEXT-HOP-IP-ADDR>|<INTERFACE>|reject|nullroute]
vrf <VRF-NAME>
no ipv6 route <DEST-IPV6-ADDR>/<PREFIX> [<NEXT-HOP-IP-ADDR>|<INTERFACE>|reject|nullroute]
vrf <VRF-NAME>
```

## Description

Adds an IPv6 static route in the specified VRF. If no *<VRF-NAME>* is specified it is added to the default VRF.

The **no** form of this command removes an IPv6 static route from the VRF.

| Parameter | Description |
|---|---|
| *<DEST-IPV6-ADDR>* | Specifies an IP address in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F. |
| *<MASK>* | Specifies the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128. |
| *<NEXT-HOP-IP-ADDR>* | Specifies the next hop in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F. |
| *<INTERFACE>* | Specifies the next hop as an outgoing interface. |
| nullroute | Specifies that packets matching the destination prefix are silently discarded and no ICMP error notification is sent to the sender. |
| reject | Specifies that packets matching the destination prefix are discarded and an ICMP error notification is sent to the sender. |
| vrf *<VRF-NAME>* | Specifies the name of a VRF. Default: default. |

## Examples

```
switch(config)# ipv6 route 120::/124 121::2 vrf test
switch(config)# ipv6 route 121::/124 1/1/9 vrf test
switch(config)# ipv6 route 122::/124 nullroute vrf test
switch(config)# ipv6 route 123::/124 reject vrf test
```

```
switch(config)# no ipv6 route 120::/124 121::2 vrf test
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.10 | Inclusive language update. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## show ip route

```
show ip route [<A.B.C.D> | <A.B.C.D/M> | all-vrfs | bgp | connected | local | ospf |
static | summary | vrf <VRF-NAME>] [vsx-peer]
```

### Description

Displays IPv4 route tables.

| Parameter | Description |
|---|---|
| **`<A.B.C.D>`** | Display longest prefix match. |
| **`<A.B.C.D/M>`** | Display exact route match. |
| `all-vrfs` | Display information for all VRFs. |
| `bgp` | Display bgp routes only. |
| `connected` | Display connected routes only. |
| `local` | Display local routes only. |
| `ospf` | Display ospf routes only. |
| `static` | Display static routes only. |
| `summary` | Display the aggregate count of routes per routing protocol. |
| `vrf` *`<vrf-name>`* | Specify a VRF by VRF name (if no <*VRF-NAME*> is specified, the default VRF is implied. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Examples

Showing IPv4 route tables:

```
switch# show ip route

Displaying ipv4 routes selected for forwarding

'[x/y]' denotes [distance/metric]
10.0.0.0/24, vrf default
```

```
     via  vlan2,  [0/0],  connected
10.0.0.1/32, vrf default
     via  vlan2,  [0/0],  local
10.100.11.0/24, vrf default
     via  vlan1,  [0/0],  connected
10.100.11.82/32, vrf default
     via  vlan1,  [0/0],  local
20.0.0.0/24, vrf default
     via  10.0.0.2,  [1/0],  static
20.0.1.0/24, vrf default
     via  10.0.0.2,  [1/0],  static
20.0.2.0/24, vrf default
     via  vlan1,  [1/0],  static
20.0.4.0/24, vrf default
     nullroute,  [1/0],  static
20.0.5.0/24, vrf default
     reject route,  [1/0],  static
```

Showing IPv4 route tables for the test VRF:

```
switch# show ip route vrf test

Displaying ipv4 routes selected for forwarding

'[x/y]' denotes [distance/metric]

30.0.0.0/24,  1 (nullroute) next-hops
       via  30.0.0.2,  [0/0],  connected
90.0.0.0/24,  1 unicast next-hops
       via  30.0.0.1,  [1/0],  static
90.0.1.0/24,  1 unicast next-hops
       via  1/1/2,  [1/0],  static
90.0.3.0/24, nullroute, 1, [1/0], static
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show ipv6 route

```
show ipv6 route [<X.X.X.X> | <X.X.X.X/M> | all-vrfs | bgp | connected | local | ospf |
static | summary | vrf <vrf-name>] [vsx-peer]
```

## Description

Displays IPv6 route tables.

| Parameter | Description |
|---|---|
| **<X.X.X.X>** | Display exact route match. |
| **<X.X.X.X/M>** | Display exact route match. |
| `all-vrfs` | Display information for all VRFs. |
| `bgp` | Display bgp routes only. |
| `connected` | Display connected routes only. |
| `local` | Display local routes only. |
| `ospf` | Display ospf routes only. |
| `static` | Display static routes only. |
| `summary` | Display the aggregate count of routes per routing protocol. |
| `vrf` *<vrf-name>* | Specify a VRF by VRF name (if no <*VRF-NAME*> is specified, the default VRF is implied. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

## Example

Showing IPv6 route tables:

```
switch# show ipv6 route

Displaying ipv6 routes selected for forwarding

'[x/y]' denotes [distance/metric]

1000::/64, vrf default
        via  vlan2,  [0/0],  connected
1000::1/128, vrf default
        via  vlan2,  [0/0],  local
2000::/64, vrf default
        via  vlan2,  [1/0],  static
2001::/64, vrf default
        via  1000::2,  [1/0],  static
3000:2301::/64, vrf default
        nullroute,  [1/0],  static
4000:2301::/64, vrf default
        reject route,  [1/0],  static
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.10 | Inclusive language update. |
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

# show vrf

```
show vrf <VRF-NAME>
show vrf
```

## Description

Displays the status and attached interfaces for the specified VRF instance.

The **show vrf** command shows this information for all the VRFs.

| Parameter | Description |
|---|---|
| *<VRF-NAME>* | Specifies the VRF name. Length: Up to 32 alphanumeric characters. |

## Examples

Showing VRF information for the test VRF:

```
switch# show vrf test
VRF Configuration:
------------------
VRF Name   : test
        Interfaces             Status
        -----------------------------
        1/1/29                   up
        1/1/30                   up
```

Showing VRF information for all VRFs:

```
switch# show vrf
VRF Configuration:
------------------
VRF Name   : default
        Interfaces             Status
        -----------------------------

VRF Name   : red
        Interfaces             Status
        -----------------------------
        1/1/32                   up

VRF Name   : test
        Interfaces             Status
        -----------------------------
        1/1/29                   up
        1/1/30                   up
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| 6300<br>6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## vrf

```
vrf <VRF-NAME>
no vrf <VRF-NAME>
```

### Description

Creates a VRF instance named *<VRF-NAME>* and then enters its context. Use **default** for *<VRF-NAME>* to enter the default VRF configure context.

Except for the default VRF, the **no** form of the command deletes the named VRF instance and any IP configuration for interfaces or SVI linked to default VRF. The default VRF cannot be deleted and a warning is given if attempted. To erase the Route-Distinguisher and Route-Targets, enter the default VRF context and delete them manually one by one.

| Parameter | Description |
|---|---|
| *<VRF-NAME>* | Specifies the VRF name. Range: Up to 32 alphanumeric characters. The **mgmt** VRF cannot be used. |

### Examples

Creating the VRF named **cust_A** and then entering its context:

```
switch(config)# vrf cust_A
```

Entering the **default** VRF context:

```
switch(config)# vrf default
```

Deleting the VRF named **test**:

```
switch(config)# no vrf test
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.09 | Added default VRF information. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## vrf attach

```
vrf attach <VRF-NAME>
no vrf attach <VRF-NAME>
```

### Description

Attaches the interface to the VRF with the name <*VRF-NAME*>. The command can be entered in several different command contexts.

The **no** form of the command detaches the interface from the named VRF and will remove all configurations from the interface and attach the interface to the default VRF. A warning message is displayed that prompts you whether to proceed: **All Layer 3 configurations associated with the VRF will be deleted. Continue (y/n)?**

| Parameter | Description |
|---|---|
| *<VRF-NAME>* | Specifies the VRF name. Required. Length: Up to 32 alphanumeric characters. |

### Examples

```
switch(config)# interface 1/1/29
switch(config-if)# vrf attach test
```

```
switch(config)# vlan 3
switch(config-vlan)# exit
switch(config)# interface vlan 3
switch(config-if-vlan)# vrf attach test
```

```
switch(config)# vrf test
switch(config)# interface lag 3
switch(config-lag-if)# no shutdown
switch(config-lag-if)# vrf attach test
```

```
switch(config)# interface 1/1/29
switch(config-if)# no vrf attach test
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

# Chapter 165
# VRRP commands

## address

```
address <IP-ADDR> [ primary | secondary ]
no address <IP-ADDR> [ primary | secondary ]
```

### Description

Configures a primary or secondary IPv4 or IPv6 address for the VRRP group. To use secondary IP addresses in a VRRP group, you must first configure a primary IP address on the same group. A maximum of 16 IP addresses per IPv4 VRRP group and 8 IPv6 addresses per IPv6 VRRP group are supported.

> Do not configure an IPv4 VRRP group using addresses from the /30, /31, and /32 subnets of the interface IP address.

16 Virtual IP addresses per IPv4 VR and 8 Virtual IP addresses per IPv6 VR are supported.

> The total number of VIPs supported by a switch is:
>
> - 1024 VIPs for IPv4 VRs
> - 512 VIPs for IPv6 VRs

The **no** form of this command deletes a primary or secondary IPv4 or IPv6 address from the VRRP group.

| Parameter | Description |
|---|---|
| *<IP-ADDR>* | Configures the IPv4 or IPv6 address. |
| `primary` | Configures a primary address. |
| `secondary` | Configures a secondary address. |

### Examples

```
switch(config)# interface 1/1/1
switch(config-if)# vrrp 1 address-family ipv4
switch(config-if-vrrp)# address 10.0.0.1 primary

switch(config)# interface 1/1/1
switch(config-if)# vrrp 1 address-family ipv6
switch(config-if-vrrp)# address fe80::1 primary
switch(config)# interface 1/1/1
switch(config-if)# vrrp 1 address-family ipv4
switch(config-if-vrrp)# no address 10.0.0.1 primary

switch(config)# interface 1/1/1
switch(config-if)# vrrp 1 address-family ipv6
switch(config-if-vrrp)# no address fe80::1 primary
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## authentication

```
authentication {text | md5} [{plaintext | ciphertext} <KEY>]
no authentication
```

### Description

This command enables authentication mode and the authentication key for VRRP groups on an interface. VRRP members or routers of the same VRRP group must use the same authentication mode and authentication key.

The no form of this command disables authentication mode and the authentication key for VRRP groups on an interface.

IPv4 VRRPv3 and IPv6 VRRPv3 do not support VRRP packet authentication. Authentication mode and key configuration take effect only in VRRPv2 (IPv4 only - RFC2338).

In VRRPv3, authentication mode and authentication key settings do not take effect because VRRP Authentication was removed from RFC5798.

VRRP provides the following authentication modes as described in RFC2338:

**Simple authentication**

The sender fills an authentication key into the VRRP packet and the receiver compares the received authentication key with its local authentication key.

If the two authentication keys match, the received VRRP packet is legitimate. Otherwise, the received packet is illegitimate and is discarded.

Authentication key text is sent in the clear and can be seen in a packet trace. This makes MD5 authentication more secure than text.

### MD5 authentication

The sender computes a digest for the packet that will be sent using the authentication key and MD5 algorithm, and saves the result in the VRRP packet.

The receiver performs the same operation with the authentication key and MD5 algorithm, and compares the result with the content in the authentication header. If the results match, the received VRRP packet is legitimate. Otherwise, the received packet is illegitimate and is discarded.

| Parameter | Description |
|---|---|
| `text` | Configures the simple authentication type. |
| `md5` | Configures the MD5 (message-digest) authentication type. |
| `plaintext` | Specifies that the key is provided as plaintext. |
| `ciphertext` | Specifies that the key is provided as ciphertext. |
| *<KEY>* | Specifies the key in the chosen format. |

When the key is not provided on the command line, plaintext key prompting occurs upon pressing Enter. The entered key characters are masked with asterisks.

## Examples

Enabling VRRP authentication using MD5 with a provided plaintext key:

```
switch(config)# interface 1/1/1
switch(config-if)# vrrp 1 address-family ip
switch(config-if-vrrp)# version 2
switch(config-if-vrrp)# authentication md5 plaintext testvrrpkey
```

Enabling VRRP authentication using MD5 with a prompted plaintext key:

```
switch(config)# interface 1/1/1
switch(config-if)# vrrp 1 address-family ip
switch(config-if-vrrp)# version 2
switch(config-if-vrrp)# authentication md5
Enter the authentication key: *************
Re-Enter the authentication key: *************
```

Enabling VRRP authentication using MD5 with a provided ciphertext key:

```
switch(config)# interface 1/1/1
switch(config-if)# vrrp 1 address-family ip
switch(config-if-vrrp)# version 2
switch(config-if-vrrp)# authentication md5 ciphertext
AQBapfciFZ/P...biBAAAAOjc0a8=
```

Disabling VRRP authentication:

```
switch(config)# interface 1/1/1
switch(config-if)# vrrp 1 address-family ip
switch(config-if-vrrp)# version 2
switch(config-if-vrrp)# no authentication
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-if-vrrp` | Administrators or local user group members with execution rights for this command. |

# bfd *<IPV4-ADDR>*

```
bfd <IPV4-ADDR>
no bfd <IPV4-ADDR>
```

## Description

Enables BFD under VRRP for the specified IP address. BFD is asynchronous and echo mode is supported.

The **no** form of this command disables BFD under VRRP for the specified IP address.

| Parameter | Description |
|---|---|
| *<IPV4-ADDR>* | Specifies the address on which to enable BFD in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. |

## Examples

*On the 6400 Switch Series, interface identification differs.*

Enabling BFD on the address **10.0.0.1** on VRRP **1**:

```
switch(config)# interface 1/1/1
switch(config-if)# routing
switch(config-if)# vrrp 1 address-family ipv4
switch(config-if-vrrp)# bfd 10.0.0.1
```

Disabling BFD on the address **10.0.0.1** on VRRP **1**:

```
switch(config)# interface 1/1/1
switch(config-if)# routing
switch(config-if)# vrrp 1 address-family ipv4
switch(config-if-vrrp)# no bfd 10.0.0.1
```

For more information on features that use this command, refer to the High Availability Guide or IP Routing Guide for your switch model.

### Command History

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-if-vrrp` | Administrators or local user group members with execution rights for this command. |

## preempt

```
preempt
no preempt
```

### Description

Enables the preempt option. The default value is enabled. In default mode, a Standby router with a higher priority than another Standby that is operating as Active will take over the Active function.

Applies to VRRP Standby routers only and is used to minimize network disruption caused by unnecessary preemption of the Active operation among Standby routers.

The **no** form of this command disables the preempt option, thus preventing the higher-priority Standby from taking over the Active operation from a lower-priority Standby. This command does not prevent an owner router from resuming the Active function after recovering from being unavailable.

### Examples

```
switch(config)# interface 1/1/1
switch(config-if)# vrrp 1 address-family ip
switch(config-if-vrrp)# preempt
```

```
switch(config)# interface 1/1/1
switch(config-if)# vrrp 1 address-family ip
switch(config-if-vrrp)# no preempt
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

# preempt delay minimum

```
preempt delay minimum <DELAY-IN-SECONDS>
no preempt delay minimum <DELAY-IN-SECONDS>
```

## Description

Sets the time in seconds (1-3600) that the router will wait before taking control of the virtual IP and starting to route packets.

The **no** form of this command sets the preempt delay for the VRRP group to the default preempt delay of 0 seconds.

The VRRP Preempt Delay Timer (PDT) allows admin users to configure a period of time before the VR takes control of the virtual IP address. It does not transition to the Active state until the timer period expires.

The timer value configured should be long enough to allow upper layer protocol to converge. The PDT is applied during initialization and down/up events of the router.

| Parameter | Description |
|---|---|
| *<DELAY-IN-SECONDS>* | Selects the time in seconds (1-3600). Default is 0 seconds. |

## Examples

```
switch(config)# interface 1/1/1
switch(config-if)# vrrp 1 address-family ip
switch(config-if-vrrp)# preempt delay minimum 30

switch(config)# interface 1/1/1
switch(config-if)# vrrp 1 address-family ip
switch(config-if-vrrp)# no preempt delay
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## priority

```
priority <1-254>
no priority
```

### Description

Sets the priority for the VRRP group.

The **no** form of this command sets the priority for the VRRP group as default priority.

- The default value for non-Owner virtual routers is 100.
- The default value for Owner virtual router is 255, which cannot be changed.

### Examples

```
switch(config)# interface 1/1/1
switch(config-if)# vrrp 1 address-family ip
switch(config-if-vrrp)# priority 150
```

```
switch(config)# interface 1/1/1
switch(config-if)# vrrp 1 address-family ip
switch(config-if-vrrp)# no priority
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

# router vrrp {enable | disable}

```
router vrrp {enable | disable}
no router vrrp {enable | disable}
```

## Description

Enables or disables VRRP protocol globally. You must globally enable the VRRP feature for VRRP virtual router.

**no router vrrp enable** disables VRRP protocol globally but does not remove all VRRP configurations.

**no router vrrp disable** enables VRRP protocol globally.

## Example

Enabling VRRP protocol globally:

```
switch(config)# router vrrp enable
```

Disable VRRP protocol globally:

```
switch(config)# router vrrp disable
```

Disable VRRP protocol globally:

```
switch(config)# no router vrrp enable
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

## Command History

| Release | Modification |

|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

# no router vrrp

```
no router vrrp
```

## Description

Removes VRRP configuration and VRRP global protocol. If **auto-confirm** is enabled or VRRP is not configured on any interface, this command will not ask for user confirmation.

## Examples

Removing VRRP configuration:

```
switch(config)# no router vrrp
All VRRP configuration will be deleted.
Do you want to continue (y/n)?
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

## Command History

| Release | Modification |

# show track

`show track [brief | <OBJECT-ID>]`

## Description

Shows all or specific track object information.

| Parameter | Description |
|---|---|
| `brief` | Displays brief information about all or specific track objects |
| *`<OBJECT-ID>`* | Displays information about a specified track object (1-128) |

## Examples

```
switch# show track
Track 1
  interface 1/1/1
  Interface is DOWN
```

```
switch# show track brief
Track  Interface        State

1      1/1/1            Down
2      None             Down
3      1/1/2            Up
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |

## show track brief

```
show track brief
```

### Description

Shows brief information for all track objects.

### Examples

Showing brief information for all track objects:

```
switch# show track brief
Track  Interface       State

1      1/1/1           Down
2      None            Down
3      1/1/2           Up
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |

| 6300<br>6400 | Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show vrrp

```
show vrrp [brief | detail | interface <INTERFACE-NAME> | interface <LAG-NAME> | interface
<VLAN-NAME> | ip | ipv6 | statistics | statistics interface <INTERFACE-NAME> | statistics
interface <LAG-NAME> | statistics interface <VLAN-NAME>]
[vsx-peer]
```

### Description

Shows all VRRP virtual routers information.

| Parameter | Description |
|---|---|
| `brief` | Displays brief output of all VRRP virtual routers<br>Keywords used in displayed information:<br>Grp: VRRP virtual router group ID.<br>A-F: Address Family.<br>Pri: Priority.<br>Time: Uptime of VRRP virtual router since it moved out of INIT state.<br>Pre: Preempt mode (Y is enabled, N if not enabled). |
| `detail` | Displays detailed output of all VRRP virtual routers |
| `interface <INTERFACE-NAME>` | Displays VRRP information for a specific interface |
| `interface <LAG-NAME>` | Displays VRRP information for a specific LAG interface |
| `interface <VLAN-NAME>` | Displays VRRP information for a specific VLAN interface |
| `ip` | Displays the IPv4 address family |
| `ipv6` | Displays IPv6 address family |
| `statistics` | Displays VRRP statistics information for all interfaces |
| `statistics interface <INTERFACE-NAME>` | Displays VRRP statistics information for a specific interface |
| `statistics interface <LAG-NAME>` | Displays VRRP statistics information for a specific LAG interface |
| `statistics interface <VLAN-NAME>` | Displays VRRP statistics information for a specific VLAN interface |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Examples

```
switch# show vrrp

```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.14 | Replaced the **ipv4** parameter with the **ip** parameter. The **ipv4** parameter is deprecated. |
| 10.08 | Updated command output for inclusive language |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## shutdown

```
shutdown
no shutdown
```

### Description

Enables standby VRRP groups on the interface to route the traffic sent to virtual router's MAC address.

It is recommended to enable this mode on VLANs where mc-lags are configured.

Disabled by default.

The **no** form of this command disables standby VRRP groups on the interface to route the traffic sent to virtual router's MAC address.

Only supported on SVI interfaces.

### Examples

Enabling standby VRRP groups on interface VLAN 10 to route traffic sent to the router's MAC address:

```
switch(config)# interface vlan 10
switch(config-if-vlan)# vrrp dual-active-forwarding
```

Disabling the ability of standby VRRP groups on interface VLAN 10 to route traffic sent to the router's MAC address:

```
switch(config)# interface vlan 10
switch(config-if-vlan)# no vrrp dual-active-forwarding
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.12.1000 | Command introduced. |

### Command Information

|---|---|---|
| 6400 | `config` | Administrators or local user group members with execution rights for this command. |

## timers advertise

```
timers advertise <ADVERTISE-IN-MILLISECONDS>
no timers advertise
```

### Description

Sets the advertisement interval in ms (100-40950). The default value is 1000. Advertisement interval can be configured in multiples of 1,000 ms.

The **no** form of this command sets the advertisement interval in ms to the default value of 1000.

This release does not support sub-second timer for VRRPv3.

### Examples

Setting the advertisement interval in ms to 2000:

```
switch(config)# interface 1/1/1
switch(config-if)# vrrp 1 address-family ip
switch(config-if-vrrp)# timers advertise 2000
```

Setting the advertisement interval in ms to the default value of 1000:

```
switch(config)# interface 1/1/1
switch(config-if)# vrrp 1 address-family ip
switch(config-if-vrrp)# no timers advertise
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |

|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## track (VRRP group)

```
track <OBJECT-ID>
no track <OBJECT-ID>
```

### Description

Sets the track object ID (1-128) for the group. The track object is first configured globally for the interface and then attached to the VRRP virtual router.

The track object must not track the same interface for which a VRRP group is configured.

The **no** form of this command removes the track object ID from the group.

### Examples

Setting the track object ID for the group:

```
switch(config)# interface 1/1/1
switch(config-if)# vrrp 1 address-family ip
switch(config-if-vrrp)# track 1
```

Removing the track object ID from the group:

```
switch(config)# interface 1/1/1
switch(config-if)# vrrp 1 address-family ip
switch(config-if-vrrp)# no track 1
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## track (VRRP virtual router)

```
track <OBJECT-ID>
no track <OBJECT-ID>
```

### Description

Configures a track object that can be associated with an interface. A change in interface state will then affect the priority of a VRRP group. By default, no interface is associated to a track object, so state is down.

The **no** form of this command deletes a tracked object for an interface. If it is not associated with a VRRP virtual router, a track object cannot be deleted.

Track cannot be configured by using port with no routing.

When all tracked interfaces go down on a virtual router, priority is automatically set to zero instead of its configured value. Owner virtual routers always use a default priority of 255.

| Parameter | Description |
|---|---|
| *<OBJECT-ID>* | Specify the track object ID value. Range: 1 to 128. |

### Examples

Configuring a tracked object:

```
switch(config)# track 1
```

Deleting a tracked object:

```
switch(config)# no track 1
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## track by

```
track by <OBJECT-ID>
no track by <OBJECT-ID>
```

### Description

Specifies an interface to be tracked when changes in the state of the interface affect the priority of a VRRP group. Once track is associated with an interface, the track state reflects the interface forwarding state.

The **no** form of this command removes an interface from tracking, affecting VRRP states of any interfaces associated with VRRP groups.

The VLAN interface 1 is always tracked.

| Parameter | Description |
|---|---|
| *<OBJECT-ID>* | Specifies the track object ID value. Range: 1 to 128. |

### Example

Specifying an interface to be tracked:

```
switch (config)# interface 1/1/1
switch (config-if)# track by 1
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |

| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## version

`version <VERSION-NUMBER>`

### Description

Sets the protocol version for the VRRP group. Version change is allowed only for the IPv4 address-family. The default value is 2, which supports IPv4 with minimum 1 second advertisement interval. Value 3 supports IPv4 and IPv6 with minimum 1 second advertisement interval.

| Parameter | Description |
|---|---|
| *<VERSION-NUMBER>* | Specifies the VRRP protocol version. Possible values: 2 or 3. The default value is 2, which supports IPv4 with a minimum 1 second advertisement interval. |

### Example

Setting the protocol version for the VRRP group to 3:

```
switch(config)# interface 1/1/1
switch(config-if)# vrrp 1 address-family ip
switch(config-if-vrrp)# version 3
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

# vrrp

```
vrrp <VRID> address-family {ip | ipv6}
no vrrp <VRID> address-family {ip | ipv6}
```

## Description

Creates a VRRP group and establishes VRRP group configuration context.

- A maximum of 16 VRRP groups, including both IPv4 and IPv6, are supported on an interface.
- A maximum of 256 VRRP groups is supported on a router. The groups can be IPv4 or IPv6 on a first come first serve basis.

The **no** form of this command deletes a VRRP group.

| Parameter | Description |
|---|---|
| `<VRID>` | Selects the VRRP router ID value. Range: 1 to 255. |
| `address-family [IP\| IPv6]` | Specifies which address family to use, IP or IPv6. |

## Examples

```
switch(config)# interface 1/1/1
switch(config-if)# vrrp 1 address-family ip
switch(config-if-vrrp)#

switch(config-if-vrrp)# no vrrp 1 address-family ip
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.14 | Replaced the **ipv4** parameter with the **ip** parameter. The **ipv4** parameter is deprecated. |
| 10.07 or earlier | -- |

## Command Information

# vrrp dual-active-forwarding

```
vrrp dual-active-forwarding
no vrrp dual-active-forwarding
```

## Description

Allows standby VRRP groups on an interface to route traffic sent to a virtual router's MAC address.

It is recommended to enable VRRP dual active forwarding on VLANs configured on MCLAG interfaces.

Disabled by default.

The **no** form of this command prevents standby VRRP groups on the interface to route traffic sent to the virtual router's MAC address.

VRRP dual active forwarding is only supported on SVI interfaces.

VRRP dual active forwarding and VRRP owner mode are mutually exclusive.

To verify the configuration of **vrrp dual-active-forwarding** use the `show vrrp` command.

## Examples

Enabling VRRP dual active forwarding on interface VLAN 10:

```
switch(config)# interface vlan 10
switch(config-if-vlan)# vrrp dual-active-forwarding
```

Disabling VRRP dual active forwarding on interface VLAN 10:

```
switch(config)# interface vlan 10
switch(config-if-vlan)# no vrrp dual-active-forwarding
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

## Command History

| Release | Modification |

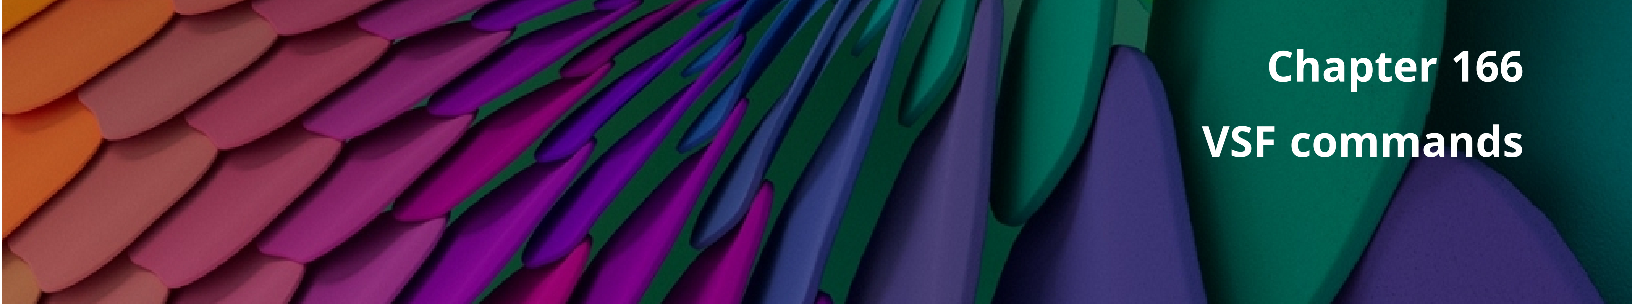
| 6400 | `config-if-vlan` | Administrators or local user group members with execution rights for this command. |



# Chapter 166

# VSF commands

## description

```
description
no description
```

### Description

Adds a description for one or more VSF link interfaces.

The **no** form of this command removes the interface description.

### Examples

Adding a description for VSF link interface **1/1/25**:

```
switch(config)# interface 1/1/25
switch(config-if-vsf)# description mem 1 intf 1/1/25
```

Removing the description from interface 1/1/25

```
switch(config)# int 1/1/25
switch(config-if-vsf)# no description
```

For more information on features that use this command, refer to the Virtual Switching Framework (VSF) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.10 | Command introduced. |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300 | `config-if-vsf` | Administrators or local user group members with execution rights for this command. |

## interface

```
interface <IFRANGE>
```

### Description

Enters configuration context for one or more VSF link interfaces.

VSF link interfaces cannot be included in a range with other interfaces.

| Parameter | Description |
|---|---|
| *<IFRANGE>* | Poet identifier range. Required. |

### Examples

Entering configuration context:

```
switch(config)# interface 1/1/1
```

For more information on features that use this command, refer to the Virtual Switching Framework (VSF) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300 | `config` | Administrators or local user group members with execution rights for this command. |

## issu rollback-timer

`issu rollback-timer [wait-time <TIME>]`

### Description

Enables the ISSU rollback timer on the system. The rollback timer automatically rolls the system back to the configuration and OS image used before starting the ISSU, unless the upgrade is confirmed with `issu update-software confirm`. Changing the rollback-timer will not affect an active timer and will apply on the next ISSU. To cancel the active timer, confirm the previous ISSU with `issu update-software confirm`. Disabled by default.

The **no** form of this command disables the rollback timer on the system.

| Parameter | Description |
|---|---|
| *<TIME>* | Specifies how many minutes the system will wait for confirmation |

| Parameter | Description |
|---|---|
| | that the last ISSU is accepted before triggering a system reboot and roll back to the previous configuration and OS version. This change will not affect an active timer and will apply on the next ISSU. Range: 30-1440. |

## Examples

Enabling the ISSU rollback timer:

```
switch(config)# issu rollback-timer
```

Disabling the ISSU rollback timer:

```
switch(config)# no issu rollback-timer
```

Disabling the ISSU rollback timer on the system while a previous ISSU's timer is active:

```
switch(config)# no issu rollback-timer
The ISSU rollback timer is active. This change will apply on the next ISSU
operation
To cancel the active timer, confirm the previous ISSU with 'issu update-software
confirm'
```

Setting the ISSU rollback timer wait time to 80 minutes:

```
switch# issu rollback-timer wait-time 80
```

Setting the ISSU rollback timer wait time to 81 minutes while a previous ISSU's timer is active:

```
switch# issu rollback-timer wait-time 81
The ISSU rollback timer is active. This change will apply on the next ISSU
operation
```

Resetting the ISSU rollback timer wait time to default:

```
switch(config)# no issu rollback-timer wait-time
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.11 | Command introduced |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300, except for S3L75A, S3L76A and S3L77A | `config` | Administrators or local user group members with execution rights for this command. |

# issu update-software

```
issu update-software [validate|confirm]
```

### Description

Initiates ISSU to the alternate boot location. The newer operating system image must be downloaded to the alternate boot location prior to running this command. Additionally, the current running operating system version must match the version that is stored in the current boot location or ISSU will not be allowed.

This operation is disruptive and will result in the management interface being disconnected during the process.

Starting an ISSU will cause the running configuration to be saved in case an error is encountered that requires a reboot to recover the switch. In addition, a special configuration checkpoint will be stored to disk and is used to roll back to the pre-ISSU firmware. During the ISSU process all management methods (CLI, REST, WebUI) will be blocked from making configuration changes to the switch. The configuration block is active from the time ISSU starts until the time ISSU switchover is complete. fter the ISSU switchover is completed, switch configuration can resume.

| Parameter | Description |
|---|---|
| `validate` | Runs all pre-ISSU validations without executing the actual upgrade. The validation runs in the background, however its results will be displayed in real time for approximately the next three minutes . If the validation is not finished within that time frame or if the display is aborted with Control+C or Control+Z, the results can be queried using the `show issu validation` command. |
| `confirm` | Confirms the software update and cancels the configured rollback timer. If the rollback timer is configured then this command has to be executed after an ISSU before the timer expires. Else, the pre-ISSU checkpoint is copied to the startup configuration and the system is rebooted to the image used before ISSU.<br>**Note: To perform an intentional system rollback before the timer expires, a manual downgrade must be executed through the following steps:**<br>1. Copy the pre-ISSU checkpoint to the startup configuration using the `copy checkpoint pre-issu-startup-config startup-config` command. |

| Parameter | Description |
|---|---|
| | 2. Boot to the previous image using the `boot system` command. |

## Usage

Note the following points before running this command:

- The newer operating system image must be downloaded to the alternate boot location prior to running this command.
- The current running operating system version must match the version that is stored in the current boot location or ISSU will not be allowed.
- This operation is disruptive and will result in the management interface being disconnected during the process.
- The running configuration will be stored in case an error is encountered that requires a reboot to recover the switch.
- During the ISSU process all management methods (CLI, REST, WebUI) are blocked from making configuration changes to the switch. The configuration changes are not allowed from the time ISSU starts until ISSU switchover is complete. fter the ISSU switchover is completed, switch configuration can resume.
- In case of ISSU, conductor gets transitioned to standby role without reboot.
- The stack topology must be a ring before initiating ISSU. ISSU is not supported in chain topologies and the process is aborted if the ISSU is initiated.
- During the ISSU process, the **show core-dump all**, **show tech all**, and **copy support-files** commands all may fail to run or display correct output.

## Examples

Initiating an ISSU:

```
switch# issu update-software
This command will perform an in-service software upgrade
using pre-staged secondary operating system image
FL.10.13.1000M
This will save the current running configuration
WARNING:
The rollback timer is enabled and configured to 30 minutes.
After the upgrade is done, execute "issu update-software confirm"
to confirm the new image works as expected. If the command is not
entered, the system will be rebooted to the previous version.

Continue (y/n)? y
```

```
Starting in-service software upgrade.

Use "show issu" to monitor status and progress.

Use "show events -c issu" to view event notifications.
```

Initiating an ISSU, but stopping it without confirming the upgrade:

```
switch(config)# issu update-software

This command will perform an in-service software upgrade
using pre-staged secondary operating system image
FL.10.13.1000M
This will save the current running configuration

WARNING:

The rollback timer is enabled and configured to 30 minutes.
After the upgrade is done, execute "issu update-software confirm"
to confirm the new image works as expected. If the command is not
entered, the system will be rebooted to the previous version.

Continue (y/n)? n
In-service software upgrade aborted. No changes were made.
```

Confirming the ISSU configuration when the rollback timer has been configured and started:

```
switch# issu update-software confirm

The ISSU has been confirmed and the rollback timer has been cancelled.
```

Confirming the ISSU configuration when the rollback timer has not started:

```
switch# issu update-software confirm

No rollback timer has been started, no action was done.
```

Executing an ISSU "dry run" where all pre-ISSU validations are run without executing the actual upgrade:

```
switch# issu update-software validate

ISSU Validation

=======================
Condition                   Status

-----------------------------------------------------------
Current Image Valid         ---
Target Image Valid          ---
Target Version Compatible   ---
Management Modules Ready    ---
Line Modules Ready          ---
Features Ready              ---

In Progress[/]
```

Executing an ISSU "dry run" where all pre-ISSU validations are run and the user aborts the ISSU validation on screen display without user confirmation:

```
switch# issu update-software validate

ISSU Validation

=======================
Condition                   Status

Features Ready              ---

In Progress[\]
To view the validation progress and results, execute "show issu validation"
```

Executing an ISSU "dry run" where all pre-ISSU validations are run without executing the actual upgrade and the validation progress has finished successfully:

```
switch# issu update-software validate

ISSU Validation

=======================
Condition                   Status

-----------------------------------------------------------
Current Image Valid         Pass
Target Image Valid          Pass
Target Version Compatible   Pass
Management Modules Ready    Pass
Line Modules Ready          Pass
Features Ready              Pass

ISSU Validation has completed
```

Executing an ISSU validation while a previous ISSU is unconfirmed, i.e. the rollback timer is still running:

```
switch# issu update-software validate
The previous ISSU has not been confirmed. Please confirm it with
'issu update-software confirm' before starting a new ISSU or running a validation.
```

Executing an ISSU "dry run" when the validations are taking more than three minutes to complete, then checking the result of the validation afterwards:

```
switch# issu update-software validate
ISSU validation is taking longer than expected. Check the final result with 'show
issu validation'

switch# show issu validation
```

```
ISSU Validation
=======================

Condition                       Status
-----------------------------------------------------------

Current Image Valid               Pass
Target Image Valid                Pass
Target Version Compatible         Pass
Management Modules Ready          Pass
Line Modules Ready                Pass
Features Ready                    Pass
```

Following example shows ISSU performed with chain topology:

```
switch# issu update-software
Stack topology is not a ring. ISSU upgrade aborted.
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.11 | Validate and confirm parameters added. |
| 10.10 | Command introduced. |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300, except for S3L75A, S3L76A and S3L77A | `config` | Administrators or local user group members with execution rights for this command. |

## link

```
link <LINK-ID> [<IFRANGE>][description <DESCRIPTION>]
no link <LINK-ID> [<IFRANGE>][description <DESCRIPTION>]
```

### Description

Creates or modifies a VSF link. The user can specify the physical interfaces that make up the VSF link.

Once an interface is part of a VSF link, all existing configuration on the interface is removed and the interface will operate as a VSF interface. At least one interface must be specified for the creation of a VSF link. VSF interfaces carry VSF traffic and can only be connected to other VSF interfaces. Before removing an individual interface from the VSF link using the `no vsf link <x> <interface>` command, ensure that the interface is administratively shutdown at both local and peer ends.

Interface(s) configured with MACsec cannot be added as VSF links. You have to remove the MACsec configuration before adding an interface to a VSF link.

The **no** form of the command can be used to remove interfaces from a link or remove the link completely.

When configuration is removed from a link, it may cause the stack to split.

| Parameter | Description |
|---|---|
| *<LINK-ID>* | The VSF link number. Range: 1 to 2. |
| *<IFRANGE>* | The interface identifier range. |
| *<DESCRIPTION>* | Adds a description for the link. Range: 1 to 64 printable ASCII characters. |

### Examples

Creating a VSF link called **link 1** with an interface range of **1/1/51** and a description, and a VSF link called **link 2** with an interface range of **1/1/52**:

```
switch(vsf-member-1)# link 1 1/1/51
switch(vsf-member-1)# link 1 description link 1 connected to member 2
switch(vsf-member-1)# link 2 1/1/52
```

Removing VSF **link 1** and **link 2** completely:

```
switch(vsf-member-1)# no link 1
switch(vsf-member-1)# no link 2
```

Removing an assigned interface **1/1/51** from VSF **link 1**:

```
switch(vsf-member-1)# no link 1 1/1/51
```

Attempting to add an interface configured with MACsec to a VSF link:

```
switch(vsf-member-1)# link 1 1/1/51
VSF link cannot be configured on an interface with MACsec policy enabled.
```

For more information on features that use this command, refer to the Virtual Switching Framework (VSF) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.10 | Added the `description` parameter. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300 | `vsf-member-<ID>` | Administrators or local user group members with execution rights for this command. |

## member

`member <MEMBER-ID>`

### Description

Connects to the specified member in a VSF environment.

| Parameter | Description |
|---|---|
| *<MEMBER-ID>* | VSF member ID.<br>■ Range for 6300 devices: 1-10. |

### Examples

VSF stack is formed with two members:

```
switch# member 2
admin@172.17.17.2's password:

Last login: 2019-09-30 11:42:17 from the console
User "admin" has logged in 1 time in the past 30 days
member-2#
```

Member to self:

```
switch# member 1
Already on member id 1
```

VSF stack is not formed and member not available:

```
switch# member 2
No stack role for member id 2
```

For more information on features that use this command, refer to the Virtual Switching Framework (VSF) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300 | Manager (#) | Administrators or local user group members with execution rights for this command. |

## type

```
type <TYPE>
no type <TYPE>
```

### Description

Configures the part number of the VSF member being provisioned. After provisioning, the interfaces of the member are available for configuration.

When the member eventually joins the stack, it will boot up with the configuration made on the pre-provisioned interfaces.

To provision a member, the member number and the part number of the member must be specified.

The **no** form of this command removes the configuration for the part number of the VSF member provisioned.

| Parameter | Description |
|---|---|
| *<TYPE>* | The part number of the member being provisioned. Required. |

### Examples

Configuring the part number of a VSF member:

```
switch(vsf-member-2)#
  type  The part number of the member being provisioned

switch(vsf-member-2)# type ?
  jl658a  6300M 24SFP+ /4SFP56 Switch

  jl664a  6300M 24G /4SFP56 Switch
  jl665a  6300F 48G PoE CLS 4 /4SFP56 Switch
  jl666a  6300F 24G PoE CLS 4 /4SFP56 Switch
  jl667a  6300F 48G /4SFP56 Switch
  jl668a  6300F 24G /4SFP56 Switch
  jl762a  6300M 48G 4SFP56 Pwr2Prt Switch

switch(vsf-member-2)# type jl662a
switch(vsf-member-2)# show running-config
Current configuration:
!
!Version AOS-CX
!
!
!
!
ssh maximum-auth-attempts 6
!
!
!
!
!
vlan 1
vsf member 1
    type jl661a
exit
vsf member 2
    type jl662a
exit
```

For more information on features that use this command, refer to the Virtual Switching Framework (VSF) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300 | `vsf-member-`*`<ID>`* | Administrators or local user group members with execution rights for this command. |

## shutdown

```
shutdown
no shutdown
```

### Description

Shuts down one or more VSF link interfaces.

The **no** form of this command turns on one or more VSF link interfaces.

### Examples

Shutting down a VSF link interface:

```
switch(config)# interface 1/1/1-1/1/2
switch(config-if-vsf-<1/1/1-1/1/2>)# shutdown
```

Shutdown configuration for VSF interfaces is not persistent across reboots.

For more information on features that use this command, refer to the Virtual Switching Framework (VSF) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300 | `config-if-vsf` | Administrators or local user group members with execution rights for this command. |

## show issu

`show issu [brief|history|validation]`

### Description

Shows information about the current state of ISSU. If no ISSU is currently in progress, the command displays the progress details of the last ISSU.

The command with the **brief** parameter displays a short summary of the ISSU state and indicates if the system is ready to accept an ISSU command and whether or not an ISSU is in progress. If the `brief` parameter is not included, then more details about an in progress ISSU or the last ISSU are displayed.

| Parameter | Description |
|---|---|
| brief | Shows a short summary of the ISSU state. |
| history | Shows details of ISSU software update history. |
| validation | Shows information about the current state of an ISSU validation. |

### Examples

Showing detailed ISSU status with an ISSU in progress for the first time:

```
switch# show issu
ISSU Summary

3   38:21:c7:5c:57:c0   JL668A         Member
4   18:7a:3b:1b:66:40   R8S89A         Member Booting
```

Showing the information about the configuration and status of a VSF stack and its stack members (with S0E91A or S0X44A SKU member):

(Applies only to 6300 Switch Series)

```
switch# show vsf
Force Autojoin              : Disabled
Autojoin Eligibility Status: Not Eligible
MAC Address                 : 08:97:34:b0:0e:00
Egress Shape Rate           : 10000000 kbps
Secondary                   : 2
Topology                    : Chain
Status                      : No Split
Split Detection Method      : None

Mbr MAC Address          Type           Status
ID

4                       JL662A         Not Present
```

Showing the information about the configuration and status of a VSF stack and its stack members with egress shape rate is populated with **Not Applied** indicating that port shaping failed to apply on one or more active VSF interfaces:

(Applies only to 6300 Switch Series)

```
switch# show vsf

Force Autojoin              : Disabled
Autojoin Eligibility Status: Not Eligible
MAC Address                 : 08:97:34:b0:0e:00

3   08:97:34:b7:cc:00   SOE91A         Member
```

The **Egress Shape Rate** displays the operational speed of the stack when the VSF egress port shaping is applied. An error message is displayed if port shaping fails to apply to the interface. The purpose of the VSF port shaping feature is to ensure that all VSF interface operate at a lowest common port speed across the stack. This feature is supported only in the 6300 switch series.

For more information on features that use this command, refer to the Virtual Switching Framework (VSF) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.13.1000 | Command updated to display **Egress Shape Rate**. Applicable only for 6300 Switch Series. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300 | Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show vsf detail

```
show vsf detail
```

### Description

Displays detailed information related to the current state of the VSF stack and the stack members.

### Example

```
switch# show vsf detail

VSF Stack
    MAC Address                  : ec:eb:b8:d0:80:40

## show vsf link

```
show vsf link
```

### Description

Displays the VSF link state for each member.

### Example

```
switch# show vsf link

VSF Member 1

     Link       Peer    Peer
Link State      Member  Link   Interfaces
---- ---------- ------- ------ ---------------------------
1    up         2       1      1/1/50
2    up         10      2      1/1/49

VSF Member 2

     Link       Peer    Peer
Link State      Member  Link   Interfaces
---- ---------- ------- ------ ---------------------------
1    up         1       1      2/1/49
2    up         3       1      2/1/50

VSF Member 3

     Link       Peer    Peer
Link State      Member  Link   Interfaces
---- ---------- ------- ------ ---------------------------
1    up         2       2      3/1/25
2    up         4       1      3/1/26

VSF Member 4

     Link       Peer    Peer
Link State      Member  Link   Interfaces
---- ---------- ------- ------ ---------------------------
1    up         3       2      4/1/25
2    up         5       1      4/1/26
```

## show vsf link detail

`show vsf link detail`

### Description

Shows detailed information of the interfaces configured on links of all stack members.

### Example

```
switch# show vsf link detail

VSF Member: 1  Link 1  Description: link 1 connected to member 2

Port     State     Status Code  Peer Interface  Peer System MAC     Peer Product
Type
-------  --------  -----------  --------------  ------------------  --------------
---
1/1/27   up        S            2/1/27          38:21:c7:5c:e4:c0   JL668A

1/1/28   error     M            1/1/27          38:21:c7:5c:d7:40   JL668A

VSF Member: 2  Link 1  Description: link 1 connected to member 1

Port     State       Status Code  Peer Interface  Peer System MAC     Peer Product
Type
-------  --------  -----------  --------------  ------------------  --------------
---
2/1/27   up        S            1/1/27          38:21:c7:5c:99:80   JL668A

2/1/28   error     T

VSF Member: 2  Link 2  Description: link 2 connected to member 3

Port     State       Status Code  Peer Interface  Peer System MAC     Peer Product
Type
-------  --------  -----------  --------------  ------------------  --------------
---
2/1/25   up        S            3/1/26          38:21:c7:5c:f0:00   JL668A

2/1/26   down      D

VSF Member: 3  Link 1  Description: link 1 in loop

Port     State     Status Code  Peer Interface  Peer System MAC     Peer Product
Type
```

```
-------  --------  -----------  --------------  ------------------  --------------
---
3/1/27   error     L            3/1/28          38:21:c7:5c:f0:00   JL668A

3/1/28   error     L            3/1/27          38:21:c7:5c:f0:00   JL668A

VSF Member: 3  Link 2

Port     State     Status Code  Peer Interface  Peer System MAC     Peer Product
Type
-------  --------  -----------  --------------  ------------------  --------------
---
3/1/25   down      D

3/1/26   up        S            2/1/25          38:21:c7:5c:e4:c0   JL668A

Flag abbreviation:
S   - Success      D - Interface physically down     T   - Peer timed out
L   - Loop detected on the interface                 AP  - Peer autojoin in
progress
P   - Peer with incompatible product type       ANE - Peer is not autojoin
eligible
SV  - Peer with incompatible software version   AF  - Peer autojoin validations
failed
M   - Peer with inconsistent system MAC address
ILC - Peer with inconsistent VSF link configuration
AMS - Peer autojoin failed as it has MACsec configuration
AMI - Peer with multiple VSF interfaces attempting to autojoin
ACM - Peer attempting to autojoin on non-provisioned interface
AND - Peer with non-default VSF interface attempting to autojoin
AID - Peer autojoin failed as it is connected in incorrect direction
AFN - Peer autojoin failed as there is no free member number available
```

For more information on features that use this command, refer to the Virtual Switching Framework (VSF) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## show vsf link error-detail

```
show vsf link error-detail
```

### Description

Shows detailed error information of the interfaces configured on links of all stack members. Also, the corrective action is also recommended to recover from the error.

## Example

Showing error information of the interfaces about the loop detection:

```
switch(config)# show vsf link error-detail

VSF Member: 2  Link 1

Port                          : 2/1/27
Status Code                   : L  - `Loop detected on the interface`

Error Description             : There is a loop detected between interfaces 2/1/27
and
                                2/1/28 of member 2 indicating wrong cabling.

Suggested Corrective Action : VSF interfaces 2/1/27 and 2/1/28 are connected back
to
                                back - please fix the cabling.

VSF Member: 2  Link 1

Port                          : 2/1/28
Status code                   : L - `Loop detected on the interface`

Error Description             : There is a loop detected between interfaces 2/1/28
and
                                2/1/27 of member 2 indicating wrong cabling.

Suggested Corrective Action : VSF interfaces 2/1/28 and 2/1/27 are connected back
to
                                back - please fix the cabling.

VSF Member: 10  Link 1

Port                          : 10/1/26
Status Code                   : AFN  - `Peer autojoin failed as there is no free
                                member number available`

Error Description             : Maximum stack size has been reached or there are no
                                free provisioned member entries available matching
the
                                peer switch with product type JL667A.

Suggested Corrective Action : Remove a member using “no vsf member x” CLI and then
                                physically disconnect and reconnect the new switch
                                with product type JL667A for adding it into the
stack.
```

Showing error information when peer member is connected to VSF link via its MACsec-configured interface for autojoin:

```
switch(config)# show vsf link error-detail

VSF Member: 2  Link 2
```

```
Port                           : 2/1/26
Status Code                    : AMS - `Peer autojoin failed as it has MACsec
                                 configuration`

Error Description              : Autojoin failed as interface 2/1/26 is connected to
                                 peer with MAC 38:21:c7:5c:d4:00 on interface 1/1/27
                                 which has MACsec configuration.

Suggested Corrective Action : MACsec configuration should be removed from the
                                 peer with MAC 38:21:c7:5c:d4:00 on interface 1/1/27.
```

For more information on features that use this command, refer to the Virtual Switching Framework (VSF) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300 | Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show vsf link error-detail member

```
show vsf link error-detail member <MEMBER-ID>
```

### Description

Shows error information and the suggestive action to resolve the error of the interfaces configured on links of a particular stack member.

| Parameter | Description |
|---|---|
| *<MEMBER-ID>* | VSF member identifier. Required.<br>■ Range for 6300 devices: 1-10. |

### Example

Showing error information and the suggestive action for member 1:

```
switch# show vsf link error-detail member 1

VSF Member: 1  Link 1

Port                           : 1/1/52
```

```
Status Code                  : M - `Peer with inconsistent system MAC address`

Error Description            : All interfaces within a single VSF link must
terminate
                               into the same peer switch. Interface 1/1/52 of
                               member 1 link 1 is connected to a wrong peer with
                               MAC 38:21:c7:5c:26:40.

Suggested Corrective Action : Multiple VSF neighbors detected on this VSF link 1.
                               Interface 1/1/52 is connected to device MAC
                               38:21:c7:5c:26:40. Please make sure the VSF
interfaces
                               of link 1 terminate on the same peer device.
```

Showing error information and the suggestive action for member 4:

```
switch# show vsf link error-detail member 4

VSF Member: 4  Link 1

Port                         : 4/1/27
Status Code                  : AND  - `Peer with non-default VSF interface
attempting
                               to autojoin`

Error Description            : Switch with MAC 38:21:c7:5c:a0:c0 is connected on
port
                               1/1/27 which is a non default autojoin VSF
interface.

Suggested Corrective Action : Auto-join failed on device with MAC
38:21:c7:5c:a0:c0.
                               Please connect this device via interfaces 25 or 26 -
                               those are the auto-join capable interfaces on this
                               device.
```

Showing error information when the peer member is connected to member 2’s VSF link via its MACsec-configured interface for autojoin:

```
switch(config)# show vsf link error-detail member 2

VSF Member: 2  Link 2

Port                         : 2/1/26
Status Code                  : AMS - `Peer autojoin failed as it has MACsec
                               configuration`

Error Description            : Autojoin failed as interface 2/1/26 is connected to
                               peer with MAC 38:21:c7:5c:d4:00 on interface 1/1/27
                               which has MACsec configuration.

Suggested Corrective Action : MACsec configuration should be removed from the
                               peer with MAC 38:21:c7:5c:d4:00 on interface 1/1/27

VSF Member: 2  Link 2

Port                         : 2/1/26
Status Code                  : AMS - `Peer autojoin failed as it has MACsec
```

```
                               configuration`

Error Description            : Autojoin failed as interface 2/1/26 is connected to
                               peer with MAC 38:21:c7:5c:d4:00 on interface 1/1/27
                               which has MACsec configuration.

Suggested Corrective Action : MACsec configuration should be removed from the
                               peer with MAC 38:21:c7:5c:d4:00 on interface 1/1/27
```

Showing output when there is no error-detail for a particular member:

```
switch# show vsf link error-detail member 2
No Error found in member 2
```

For more information on features that use this command, refer to the Virtual Switching Framework (VSF) Guide for your switch model.

## show vsf member

`show vsf member <MEMBER-ID>`

### Description

Displays information about the specified VSF member.

| Parameter | Description |
|---|---|
| *<MEMBER-ID>* | VSF member identifier. Required.<br>■ Range for 6300 devices: 1-10. |

### Example

```
switch# show vsf member 1

Member ID                 : 1
```

```
    MAC Address         : ec:eb:b8:d0:80:40
    Type                : JL557A
    Model               : Aruba JL557A 2930F-48G-740W-PoE+-4SFP Switch
    Status              : Conductor
    ROM Version         : SL.10.02.0000-7755
    Serial Number       : CN7ZK90012
    Uptime              : 0d 0h 18m
    CPU Utilization     : 0%
    Memory Utilization : 15%
    VSF link 1          : Down
    VSF link 2          : Down
```

For more information on features that use this command, refer to the Virtual Switching Framework (VSF) Guide for your switch model.

## show vsf topology

```
show vsf topology
```

### Description

Displays information about VSF stack member connections.

### Example

```
switch# show vsf topology

          Stby      Conductor
+---+    +---+    +---+
| 3 |1==2| 2 |1==1| 1 |
+---+    +---+    +---+
```

For more information on features that use this command, refer to the Virtual Switching Framework (VSF) Guide for your switch model.

## vsf force-auto-join

`vsf force-auto-join`

### Description

Forces the switch with non-factory default configuration to join a stack. The switch should not have any existing VSF configurations for force auto-join to work. If VSF configurations are made after force auto-join is enabled, the switch will no longer be eligible for auto-join.

### Examples

Forcing a switch with non-factory default configuration to join a stack:

```
switch(config)# vsf force-auto-join
```

For more information on features that use this command, refer to the Virtual Switching Framework (VSF) Guide for your switch model.

### Command History

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300 | `config` | Administrators or local user group members with execution rights for this command. |

## vsf start-auto-stacking

vsf start-auto-stacking

### Description

Configures the secondary member and VSF links automatically. To use this command, the switch must be in the factory default configuration.

This command is applicable only on the primary switch. The primary switch must be in factory default condition and must not have any VSF configuration.

### Examples

Configuring a VSF secondary member and VSF link on conductor:

```
switch(config)# vsf start-auto-stacking
This will configure links and secondary on conductor

Do you want to continue (y/n)? y
```

Running the configuration on non-factory default switch:

```
switch(config)# vsf start-auto-stacking
The switch is having non-factory default running configuration.
Command is not applicable
```

Running the configuration on non-primary switch:

```
switch(config)# vsf start-auto-stacking
The command is applicable only on Primary switch
```

For more information on features that use this command, refer to the Virtual Switching Framework (VSF) Guide for your switch model.

### Command History

| Release | Modification |

| 6300 | `config` | Administrators or local user group members with execution rights for this command. |

## vsf split-detect

```
vsf split-detect <MGMT-INTERFACE>
no vsf split-detect <MGMT-INTERFACE>
```

### Description

Configures the VSF split detection method that specifies the mechanism used for stack fragment discovery when there is a stack split.

Once the stack fragments are discovered, the fragment having the primary member always wins. All non-VSF interfaces on the losing stack fragment will be brought down to minimize network disruption due to duplicate MAC/IP.

The **no** form of this command removes the VSF split detection configuration.

| Parameter | Description |
|---|---|
| *<MGMT-INTERFACE>* | Configures mgmt-interface as the split detection method. Connect the management interfaces of the primary and secondary members to the same L2 network. Optionally, the management interfaces of primary and secondary can be directly connected to each other. |

### Examples

Configuring mgmt-interface as the split detection method:

```
switch(config)# vsf split-detect mgmt
```

Removing split detection from the stack:

```
switch(config)# no vsf split-detect
```

For more information on features that use this command, refer to the Virtual Switching Framework (VSF) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |

| 6300 | config | Administrators or local user group members with execution rights for this command. |

## vsf secondary-member

```
vsf secondary-member <MEMBER-ID>
no vsf secondary-member <MEMBER-ID>
```

### Description

Configures a secondary member from the available members. The secondary member will normally operate as the Standby member of the stack.

The **no** form of this command removes the configuration of the secondary member.

Member 1 cannot be configured as the secondary member.

| Parameter | Description |
|---|---|
| *<MEMBER-ID>* | Secondary member number. Required.<br>▪ Range for 6300 devices: 2-10. |

## Examples

Configuring and un-configuring a secondary member:

```
switch(config)# vsf secondary-member 3
This will save the configuration and reboot the specified switch.
Do you want to continue (y/n)? y

switch(config)# no vsf secondary-member
The secondary member will go for a reboot.
Do you want to continue (y/n)? y
```

Configuring a secondary member when secondary member is already configured:

```
switch(config)# vsf secondary-member 3
This will save the configuration and reboot the specified switch.
Do you want to continue (y/n)? y

switch (config)# vsf secondary-member 4
A secondary member is already configured. Existing secondary member
will be unconfigured and rebooted to join the stack as a member. The
specified switch is then rebooted and will join the stack as the new
standby.
Do you want to continue (y/n)? y
```

Configuring a secondary member when one or more members are booting:

```
switch(config)# vsf secondary-member 3
One or more members are currently booting. Allowing this configuration
may cause stack to split leading to traffic disruption.
Do you want to continue (y/n)? y
This will save the configuration and reboot the specified switch.
Do you want to continue (y/n)? y

switch(config)#no vsf secondary-member
One or more members are currently booting. Allowing this configuration
may cause stack to split leading to traffic disruption.
Do you want to continue (y/n)? y
The secondary member will go for a reboot.
Do you want to continue (y/n)? y
```

For more information on features that use this command, refer to the Virtual Switching Framework (VSF) Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300 | `config` | Administrators or local user group members with execution rights for this command. |

## vsf renumber-to

`vsf renumber-to <MEMBER-ID>`

### Description

Renumbers VSF member 1 to a value from 2 through 10 (for 6300 devices) and 2 through 8 (for the 6200F device). Changing the member number causes the switch to reboot with the new member number. Only member 1 can be renumbered.

> VSF links must be configured before renumbering a switch. Renumbering will be disallowed if no links are configured or there are provisioned/physically present members.

| Parameter | Description |
|---|---|
| *<MEMBER-ID>* | Member number to which the member will be renumbered. Required.<br>■ Range for 6300 devices: 2-10. |

### Examples

Renumbering primary VSF member from 1 to 2:

```
switch(config)# vsf renumber-to 2
Member 1 cannot be renumbered until all other members are removed.

switch(config)# vsf renumber-to 2
Member 1 cannot be renumbered until a VSF link is configured.

switch(config)# vsf renumber-to 2
This will save the VSF configuration and reboot the switch.
Do you want to continue (y/n)? y
```

> For more information on features that use this command, refer to the Virtual Switching Framework (VSF) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300 | `config` | Administrators or local user group members with execution rights for this command. |

## vsf member

```
vsf member <MEMBER-ID>
no vsf member <MEMBER-ID>
```

### Description

Creates VSF member context in the switch for the specified member.

The **no** form of this command removes the specified member from the stack. All configuration associated with the member, as well as the subsystems and interfaces of the member will also be removed.

If the member is physically present in the stack at the time it is removed, it will reboot with the default configuration and lose its identity as a member of the stack from which it was removed.

When a physically present member is removed, it may cause the stack to split.

| Parameter | Description |
|---|---|
| *<MEMBER-ID>* | VSF member identifier.<br>■ Range for 6300 devices: 1 to 10. |

### Examples

Configuring a VSF member:

```
switch(config)# vsf member 2
switch(vsf-member-2)#
```

Removing a non-conductor member from the stack:

```
switch(config)# no vsf member 2
The specified switch will be unconfigured and rebooted
Do you want to continue (y/n)? y
```

Removing the running conductor should be done with caution as it can make the stack unusable if there is no standby.

For more information on features that use this command, refer to the Virtual Switching Framework (VSF) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300 | `config` | Administrators or local user group members with execution rights for this command. |

## vsf member reboot

`vsf member <MEMBER-ID> reboot`

### Description

Reboots the specified VSF member. Upon reboot, if the conductor is reachable, the member will rejoin the stack.

| Parameter | Description |
|---|---|
| *<MEMBER-ID>* | Member number to be rebooted. Required.<br>■ Range for 6300 devices: 1-10. |

### Examples

Rebooting the primary switch of the stack:

```
switch# vsf member 1 reboot
Rebooting the conductor switch of the stack without a standby
will make the stack unusable.
Do you want to continue (y/n)? y

switch# vsf member 1 reboot
The conductor switch will reboot and the standby will become the conductor.
Do you want to continue (y/n)? y

switch# vsf member 2 reboot
This will reboot the specified switch.
Do you want to continue (y/n)? y
```

For more information on features that use this command, refer to the Virtual Switching Framework (VSF) Guide for your switch model.

# Chapter 167
# VSX commands

VSX commands do not apply to the 6300 series switches.

## active-gateway

```
active-gateway
   ip [<IP-ADDRESS>] [mac <MAC-ADDRESS> [extended-mac]]
   ipv6 [<IPv6-ADDRESS>] [[mac <MAC-ADDRESS> [extended-mac]]
   no ...
```

### Description

Configures a virtual IP and virtual MAC for an interface VLAN. The `extended-mac` option stores MAC addresses in a supplemental table which allows configuring more than 16 virtual MAC addresses.

The **no** form of this command removes the active gateway for active-active routing.

This configuration will disable flow tracking statistics collection.

| Parameter | Description |
|---|---|
| `ip` | Specifies the configuration of an IPv4 address. |
| *<IP-ADDRESS>* | Specifies the IPv4 address. Syntax: **A.B.C.**. |
| *<MAC-ADDR>* | Specifies the Virtual MAC address. Syntax: `xx:xx:xx:xx:xx:xx` |
| `extended-mac` | Stores the MAC address in the extended MAC table. |
| `ipv6` | Specifies the configuration of an IPv6 address. |
| *<IP-ADDRESS>* | Specifies the IPv6 address. Syntax: **A:B::C:D** |
| *<MAC-ADDR>* | Specifies the Virtual MAC address. Syntax: `xx:xx:xx:xx:xx:xx` |
| `extended-mac` | Stores the MAC address in the extended MAC table. |
| `l3-src-mac` | Configures the virtual gateway MAC address as the source MAC for routed packets. |
| `no` | Negates any configured parameter. |

### Usage

Before configuring active gateway, confirm that an IP address is on the SVI that is in the same subnet as the active gateway IP you are trying to configure. If an active gateway IP does not have an SVI IP with the same subnet, the CLI allows the configuration, but the active gateway IP will not be programmed in the kernel, resulting the active gateway to be unreachable.

It is highly recommended that you use an IPv6 link-local address as a gateway (VIP) on the active gateway IPv6 configuration.

If VRRP or active forwarding is configured on an SVI, active gateway cannot be configured. Active gateway with overlapping networks is not allowed. Maximum of 16 unique virtual MACs are supported in a system.

The maximum number of supported active gateways per switch is 4,000. Since a maximum of 31 secondary IPv4 addresses can be configured on an SVI, 32 IPv4 active gateways (along with the primary IPv4 address) can be configured per SVI with IP multinetting support. This support is also the same for IPv6 addresses.

The `extended-mac` option allows you to increase the maximum number of MAC addresses supported in the system. The following are some important points to be considered for using this option:

- The extended-mac feature has some limitations over regular active gateway MACs. Therefore, it is recommended to use the regular active-gateway MACs first.
- Maximum of 500 unique instances, containing the specified active gateway IP and MAC address as a pair can be configured.
- Configuration of `extended-mac` can only be done on VLAN interfaces.
- Extended MAC addresses cannot be one of the 16 MAC addresses in the regular active-gateway table.
- The mac-address matches will only match on the outer destination address of an overlay network packet, making this feature useable only in underlay environments or overlay environments where the L3 gateways using the extended-mac feature are distributed across all VTEPs.
- The `extended-mac` feature is mutually exclusive with the `mac-lockout` feature:
  - If the `mac-lockout` entries are configured, the `extended-mac` configuration will fail .
  - If the `extended-mac` entries are configured, the `mac-lockout` configuration will fail.
  - When both `mac-lockout` and `extended-mac` options are configured through REST API, the `mac-lockout` configuration will take precedence and become the active feature. A log message will be displayed, explaining the conflict.
  - If the `mac-lockout` feature is configured through REST API when the `extended-mac` feature is active, then the `extended-mac` feature will be deactivated.

If the active gateway is configured with the same IP as an SVI IP, then IPv6 DAD cannot be configured and the SVI IP cannot be changed.

The recommended order for configuring an active gateway with the same IPv6 address same as an SVI on both VSX Peers is:

1. IPv6 active gateway configuration
2. SVI IPv6 address configuration

If the configuration is applied in a different order, it may result in a DAD status of DUPLICATE. To remove the DUPLICATE status of the SVI IP address, perform a `shutdown` and `no shutdown` on the interface.

Do not use peer system MAC address as an active-gateway VMAC. If same MAC address is used, the VSX synchronization will try to sync the configuration on secondary switch and cause traffic disruptions.

## Examples

Configuring active-gateway, when the IP address is different from the SVI IP address on both VSX peers (valid for IPv4 and IPv6):

Switch 1:

```
switch1(config-if-vlan)# ip address 192.168.1.250/24
switch1(config-if-vlan)# active-gateway ip 192.168.1.253 mac 00:00:00:00:00:01
switch1(config-if-vlan)# active-gateway ipv6 fe80::01 mac 00:00:00:01:00:01
```

Switch 2:

```
switch2(config-if-vlan)# ip address 192.168.1.251/24
switch2(config-if-vlan)# active-gateway ip 192.168.1.253 mac 00:00:00:00:00:01
switch2(config-if-vlan)# active-gateway ipv6 fe80::01 mac 00:00:00:01:00:01
```

Configuring active-gateway when the IP address is the same as the SVI IP address on both VSX peers (valid for IPv4 and IPv6):

Switch 1:

```
switch1(config-if-vlan)# ip address 192.168.1.250/24
switch1(config-if-vlan)# active-gateway ip 192.168.1.250 mac 00:00:00:00:00:01
switch1(config-if-vlan)# active-gateway ipv6 fe80::100 mac 00:00:00:00:00:01
switch1(config-if-vlan)# ipv6 address link-local fe80::100/64
```

Switch 2:

```
switch2(config-if-vlan)# ip address 192.168.1.250/24
switch2(config-if-vlan)# active-gateway ip 192.168.1.250 mac 00:00:00:00:00:01
switch2(config-if-vlan)# active-gateway ipv6 fe80::100 mac 00:00:00:00:00:01
switch2(config-if-vlan)# ipv6 address link-local fe80::100/64
```

Configuring only the active gateway address:

```
switch(config-if-vlan)# ip address 192.168.1.250/24
switch(config-if-vlan)# active-gateway ip 192.168.1.250
```

Configuring only the active gateway IP MAC address:

```
switch2(config-if-vlan)# ip address 192.168.1.250/24
switch2(config-if-vlan)# active-gateway ip mac 00:00:00:01:00:01
```

Configuring the active gateway with the extended MAC usage (IPv4 and IPv6):

```
switch(config-if-vlan)# active-gateway ip mac 00:00:00:00:00:01 extended-mac
Warning: This configuration will disable flow tracking statistics collection.
switch(config-if-vlan)# active-gateway ipv6 mac 00:00:00:00:00:02 extended-mac
Warning: This configuration will disable flow tracking statistics collection.
switch(config-if-vlan)# active-gateway ip 10.0.0.2 mac 00:00:00:00:00:01 extended-
mac
switch(config-if-vlan)# active-gateway ipv6 fe80::100 mac 00:00:00:00:00:01
```

```
extended-macc
```

Removing the active gateway for active-active routing (IPv6 and IPv4):

```
switch(config-if-vlan)# no active-gateway ip
switch(config-if-vlan)# no active-gateway ipv6
```

Removing the active gateway for active-active routing for an IP address:

```
switch(config-if-vlan)# no active-gateway ip 192.168.1.250
```

Removing the active gateway for active-active routing for virtual MAC addresses:

```
switch(config-if-vlan)# no active-gateway ip mac
```

When configuring the virtual active gateway for IPv6 on an SVI, it is recommended to use the same global IPv6 and active gateway IPv6 address. Similarly, if you want to use the IPv6 link-local address for the virtual active gateway then the same address should be configured for both the SVI and the active gateway.

Global IPv6 address:

```
switch(config-if-vlan)# ipv6 address 1001::1/64
switch(config-if-vlan)# active-gateway ipv6 1001::1
switch(config-if-vlan)# active-gateway ipv6 mac 00:00:00:00:aa:01
```

IPv6-Link-Local address:

```
switch(config-if-vlan)# ipv6 address link-local fe80::1/64
switch(config-if-vlan)# active-gateway ipv6 fe80::1
switch(config-if-vlan)# active-gateway ipv6 mac 00:00:00:00:aa:01
```

Configuring l3-src-mac, when only a IPv4 virtual MAC is configured, a IPv4 virtual MAC is used as a source MAC for IPv4 routed packets.

```
switch(config-if-vlan)# ip address 192.168.1.250/24
switch(config-if-vlan)# active-gateway ip 192.168.1.253 mac 00:00:00:00:00:01
switch(config-if-vlan)# active-gateway l3-src-mac
```

Configuring l3-src-mac, when only a IPv6 virtual MAC is configured, a IPv6 virtual MAC is used as a source MAC for IPv6 routed packets.

```
switch(config-if-vlan)# ip address 192.168.1.250/24
switch(config-if-vlan)# active-gateway ipv6 fe80::01 mac 00:00:00:01:00:01
switch(config-if-vlan)# active-gateway l3-src-mac
```

Configuring l3-src-mac, when both IPv4 and IPv6 virtual MACs are configured, IPv4 virtual MAC is used as source MAC for IPv4 and IPv6 routed packets. It is recommended to use the same virtual MAC when both ipv4 and ipv6 vitrual MACs are configured.

```
switch(config-if-vlan)# ip address 192.168.1.250/24
switch(config-if-vlan)# active-gateway ip 192.168.1.253 mac 00:00:00:00:00:01
switch(config-if-vlan)# active-gateway ipv6 fe80::01 mac 00:00:00:00:00:01
switch(config-if-vlan)# active-gateway l3-src-mac
```

When ipv4 and ipv6 virtual MACs are same, 8325 and 10000 switches support 512 SVIs. When ipv4 and ipv6 virtual MACs are different, 8325 and 10000 switches support 341 SVIs.

### Configuration table for supported SVIs

| Configuration | Platforms | Supported SVIs |
|---|---|---|
| When the l3-src-mac IPv4 is configured on SVI along with the active-gateway | 8320 | Up to 190 |
| | 8325 and 10000 | Up to 380 |
| | 8360 and 6400 | Up to 384 |
| | 8100 | Up to 256 |
| When the l3-src-mac IPv4 and IPv6 are configured on SVI along with the active-gateway | 8320 | Up to 165 |
| | 8325 and 10000 | Up to 330 |
| | 8360 and 6400 | Up to 384 |
| | 8100 | Up to 256 |
| When the VSX active-forwarding, VRRP and virtual-mac features are configured | 8320, 8325,8360, 8100, 6400, and 10000 | Goes down |

Configuring l3-src-mac, when no virtual MACs are configured, the System MAC is used as source MAC for routed packets. Such configuration can generate a CLI warning as shown.

```
switch(config-if-vlan)# ip address 192.168.1.250/24
switch(config-if-vlan)# active-gateway l3-src-mac
Warning: Active Gateway VMAC is not configured
```

With VSX-Sync configured, "active-gateway l3-src-mac" configuration synces to the peer device. Following configuration from vsx-primary device can get synced to vsx-secondary device.

VSX-Primary-Switch:

```
vsx-pri-switch(config-if-vlan)# ip address 192.168.1.250/24
vsx-pri-switch(config-if-vlan)# active-gateway ip 192.168.1.253 mac
00:00:00:00:00:01
vsx-pri-switch(config-if-vlan)# active-gateway ipv6 fe80::01 mac 00:00:00:01:00:01
vsx-pri-switch(config-if-vlan)# active-gateway l3-src-mac
```

For VSX-peer devices, without VSX-Sync configured, it is expected that virtual MACs and l3-src-mac configurations are identical on both devices for a given interface VLAN. If configurations don't match, each device may end up using different source MAC for routed traffic for this inteface and connectivity from connected devices to this VSX-peer devices may get affected.

VSX-Primary-Switch:

```
vsx-pri-switch(config-if-vlan)# ip address 192.168.1.250/24
vsx-pri-switch(config-if-vlan)# active-gateway ip 192.168.1.253 mac
00:00:00:00:00:01
vsx-pri-switch(config-if-vlan)# active-gateway ipv6 fe80::01 mac 00:00:00:01:00:01
vsx-pri-switch(config-if-vlan)# active-gateway l3-src-mac
```

VSX-Secondary-Switch:

```
vsx-sec-switch(config-if-vlan)# ip address 192.168.1.250/24
vsx-sec-switch(config-if-vlan)#
vsx-sec-switch(config-if-vlan)# active-gateway ip 192.168.1.253 mac
00:00:00:00:00:01
vsx-sec-switch(config-if-vlan)# active-gateway ipv6 fe80::01 mac 00:00:00:01:00:01
vsx-sec-switch(config-if-vlan)# active-gateway l3-src-mac
```

Configuring l2-vlan-mac-mode flood on a VLAN interface, l3-src-mac cannot be configured. Such configuration can generate an error as shown and command will not take affect.

```
switch(config)# system l2-vlan-mac-mode flood
switch(config-if-vlan)# ip address 192.168.1.250/24
switch(config-if-vlan)# active-gateway l3-src-mac
active-gateway l3-src-mac cannot be configured when l2-vlan-mac-mode flood is
configured.
```

### Configuration table for supported SVIs

| Configuration | Platforms | Supported SVIs |
|---|---|---|
| When flood mode is configured | 8320 | Less than 512 |
| | 8325 and 10000 | Less than 1024 |
| When the active-gateway IPv4 is configured on SVI along with the flood mode | 8320 | Up to 190 |
| | 8325 and 10000 | Up to 380 |
| When the active-gateway IPv4 and IPv6 are configured on SVI along with the flood mode | 8320 | Up to 165 |
| | 8325 and 10000 | Up to 330 |
| When the VSX active-forwarding, VRRP and virtual-mac features are configured | 8320, 8325 and 10000 | Goes down |

When l3-src-mac option is unconfigured, System MAC uses as source MAC for routed traffic.

```
switch(config-if-vlan)# no active-gateway l3-src-mac
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.14 | Added information related to role based IPFIX. |
| 10.12.1000 | Added the `extended-mac` feature support for 6400v2, 8100, and 8360v2 switches. |
| 10.12 | The `l3-src-mac` parameter supported for 6400, 8100, and 8360 switches. |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-if-vlan` | Administrators or local user group members with execution rights for this command. |

## config-sync disable

```
config-sync disable
no config-sync disable
```

### Description

Pauses VSX synchronization.

The **no** form of this command restarts VSX synchronization.

### Examples

Pauses VSX configuration synchronization:

```
switch(config)# vsx
switch(config-vsx)# config-sync disable
```

Enables the VSX configuration synchronization:

```
switch(config)# vsx
switch(config-vsx)# no config-sync disable
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|

## inter-switch-link {<*PORT-NUM*> | lag <*LAG-ID*>}

```
inter-switch-link {<PORT-NUM> | lag <LAG-ID>}
no inter-switch-link [lag <LAG-ID>]
```

### Description

Configures a physical port or a LAG as an interswitch link port. Only one port or LAG can be configured to act as an ISL. Once a port is configured as an ISL, it becomes a part of all VLANs in a system.

The **no** form of this command clears the configuration of the interswitch link port from a physical port or a LAG.

| Parameter | Description |
|---|---|
| *<PORT-NUM>* | Specifies a physical port on the switch. Use the format `member/slot/port` (for example, `1/3/1`). Sets the port to act as ISL |
| *<LAG-ID>* | Specifies the LAG ID. Run the `show capacities` command for the maximum number of VSX LAGs supported for your particular type of switch. |

### Examples

Configuring port 1/1/1 as an interswitch link port:

```
switch(config-vsx)# inter-switch-link 1/1/1
```

Configuring LAG 100 as an interswitch link port:

```
switch(config-vsx)# inter-switch-link lag 100
```

Clears the interswitch link port:

```
switch(config-vsx)# no inter-switch-link
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.08 | Added optional `lag` parameter to the no form of the command. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

## inter-switch-link dead-interval

```
inter-switch-link dead-interval <DEAD-INTERVAL>
no inter-switch-link dead-interval
```

### Description

Sets the dead interval for the interswitch link protocol. The dead interval is the amount of time to wait for hellos from a peer before declaring the peer to be dead. The default dead interval time is 20 seconds.

The **no** form of this command resets the interswitch link dead interval to the default of 20 seconds.

| Parameter | Description |
|---|---|
| *`<DEAD-INTERVAL>`* | Specifies the dead interval in seconds. Required. Range: 2 to 20 seconds. |

### Examples

Setting the dead interval for the interswitch link protocol to 10 seconds:

```
switch(config)# vsx
switch(config-vsx)# inter-switch-link dead-interval 10
```

Setting the dead interval for the interswitch link protocol to the default:

```
switch(config)# vsx
switch(config-vsx)# no vsx inter-switch-link dead-interval
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |

## inter-switch-link hello-interval

```
inter-switch-link hello-interval <HELLO-INTERVAL>
no inter-switch-link hello-interval
```

### Description

Configures the interswitch link hello-interval. The hello interval determines the frequency of a hello packet exchange to confirm the control plane of the peer is alive. The default hello-interval is 1 second.

The **no** form of this command sets the interswitch link hello-interval to the default of 1 second.

| Parameter | Description |
|---|---|
| *<HELLO-INTERVAL>* | Specifies hello interval in seconds. Range: 1 to 5 seconds. |

### Examples

Configuring the interswitch link hello-interval to 3 seconds:

```
switch(config)# vsx
switch(config-vsx)# inter-switch-link hello-interval 3
```

Resetting the interswitch link hello-interval to the default of 1 second:

```
switch(config)# vsx
switch(config-vsx)# no inter-switch-link hello-interval
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

# inter-switch-link hold-time

```
inter-switch-link hold-time <HOLD-INTERVAL>
no inter-switch-link hold-time
```

## Description

Sets the holdtime for the interswitch link protocol. A port is treated as down only when it stays down for the configured holdtime interval. The default holdtime is 0 seconds.

The **no** form of this command sets the interswitch link protocol holdtime to the default of 0 seconds.

| Parameter | Description |
|---|---|
| *<HOLD-INTERVAL>* | Specifies the hold interval in seconds. Required. Range: 0 to 3 seconds. |

## Examples

Setting the holdtime for interswitch link protocol to 2 seconds:

```
switch(config)# vsx
switch(config-vsx)# inter-switch-link hold-time 2
```

Setting the interswitch link protocol holdtime to the default of 0 seconds:

```
switch(config)# vsx
switch(config-vsx)# no inter-switch-link hold-time
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

## Command History

# inter-switch-link peer-detect-interval

```
inter-switch-link peer-detect-interval <PEER-DETECT-INTERVAL>
no inter-switch-link peer-detect-interval
```

## Description

Sets the amount of time in seconds that the VSX switch waits for the ISL interface to link up after a reboot. If the ISL link does not come up within this time window, the VSX switch declares itself as split from its peer. The default peer detect interval is 300 seconds.

The **no** form of this command sets the interswitch link protocol peer detect interval to the default of 300 seconds.

| Parameter | Description |
|---|---|
| *<PEER-DETECT-INTERVAL>* | Specifies the peer detect interval in seconds. Required. Range: 60 to 1800 seconds. |

## Usage

After a VSX switch reboots, the switch waits 5 minutes by default to receive a hello packet before it declares itself to be out-of-sync. The `inter-switch-link peer-detect-interval` *<PEER-DETECT-INTERVAL>* command lets you change how long the switch waits to receive the hello packet before the switch declares itself to be out-of-sync.

## Examples

Setting the peer detect interval to 180 seconds:

```
switch(config)# vsx
switch(config-vsx)# inter-switch-link peer-detect-interval 180
```

Restoring the peer detect interval to the default (300 seconds):

```
switch(config)# vsx
switch(config-vsx)# no inter-switch-link peer-detect-interval
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

# interface lag multi-chassis

```
interface lag <LAG-ID> multi-chassis [static]
no interface lag <LAG-ID>
```

## Description

Configures a given LAG as a dynamic multichassis LAG (VSX LAG), which supports a maximum of four member links per switch segment. A VSX LAG across a downstream switch can have at most a total of 16 member links.

The **no** form of this command removes a VSX LAG.

| Parameter | Description |
|---|---|
| *<LAG-ID>* | Specifies the LAG ID. Run the `show capacities vsx` command for the maximum number of VSX LAGs supported for your particular type of switch; however, the maximum VSX LAG value considers that one port is used for the ISL, which is not a VSX LAG. Required. |
| `static` | Specifies the multichassis LAG as static. Optional. |

## Usage

A VSX LAG across a VSX pair can have at most a total of 16 interfaces.

- When creating a VSX LAG, select an equal number of member links in each segment for load balancing, such as four member links (one segment) and four member links (another segment). Do not create a VSX LAG with four member links in one switch and two member links on another segment. A switch can have a maximum of four member links.
- Make sure that the VSX LAG interface on both the VSX primary and secondary switches has a member port configured and enabled.
- Make sure that you also have a non-VSX port that is available for the ISL.
- It is recommended to use hashing algorithm value as **l3-src-dst** (default) or **l2-src-dst** on the VSX LAG.

You cannot change the mode of a multichassis LAG without removing the multichassis LAG first. To change a pre-existing VSX LAG to a static VSX LAG, first remove the VSX LAG with the **no interface lag <LAG-ID>** command. Then, enter the **interface lag *<LAG-ID>* multi-chassis static** command.

## Examples

Configuring LAG 100 as a VSX LAG:

```
switch(config)# interface lag 100 multi-chassis
```

Removing LAG 100 as a VSX LAG:

```
switch(config)# no interface lag 100
```

Specifying LAG 100 as a static VSX LAG:

```
switch(config)# interface lag 100 multi-chassis static
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

## ip icmp redirect

```
ip icmp redirect
no ip icmp redirect
```

### Description

Enables the sending of ICMPv4 and ICMPv6 redirect messages to the source host. Enabled by default.

The **no** form of this command disables ICMPv4 and ICMPv6 redirect messages to the source host.

### Examples

Enabling ICMP redirect messages:

```
switch(config)# ip icmp redirect
```

Disabling ICMP redirect messages:

```
switch(config)# no ip icmp redirect
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

## keepalive dead-interval

```
keepalive dead-interval <DEAD-INTERVAL>
no keepalive dead-interval
```

### Description

Sets the dead-interval for keepalive protocol. The dead interval is the amount of time to wait for hellos from a peer before declaring the peer to be dead. The default dead-interval is 3 seconds.

The **no** form of this command sets the interswitch link dead-interval to the default of 3 seconds.

| Parameter | Description |
|---|---|
| `dead-interval <DEAD-INTERVAL>` | Specifies the dead-interval in seconds. Range: 2 to 20 seconds |

### Examples

Setting the dead-interval for keepalive protocol to 10 seconds:

```
switch(config)# vsx
switch(config-vsx)# keepalive dead-interval 10
```

Setting the dead-interval for keepalive protocol to the default:

```
switch(config)# vsx
switch(config-vsx)# no keepalive dead-interval
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

# keepalive hello-interval

```
keepalive hello-interval <HELLO-INTERVAL>
no keepalive hello-interval
```

## Description

Sets the hello-interval for keepalive protocol. The hello interval determines the frequency of a hello packet exchange to confirm the peer is alive. The default hello-interval is 1 second.

The **no** form of this command sets the hello-interval for keepalive protocol to the default of 1 second.

| Parameter | Description |
|---|---|
| `hello-interval <HELLO-INTERVAL>` | Specifies the hello-interval in seconds. Range: 1 to 5 seconds |

## Examples

Setting the hello-interval for keepalive protocol to 3 seconds:

```
switch(config)# vsx
switch(config-vsx)# keepalive hello-interval 3
```

Resetting the hello-interval for keepalive protocol to the default:

```
switch(config)# vsx
switch(config-vsx)# no keepalive hello-interval
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |

| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

# keepalive peer

```
keepalive peer <PEER-IP-ADDR> source <SOURCE-IP-ADDR> [vrf <VRF-NAME>]
no keepalive [peer <PEER-IP-ADDR> source <SOURCE-IP-ADDR> [vrf <VRF-NAME>]]
```

## Description

Sets the source and peer IP addresses for keepalive packets in a specified VRF. If a VRF is not specified, it sets to the default VRF. Both IPv4 and IPv6 are supported. Source and peer IP addresses for keepalive packets can also be configured on the management VRF.

The **no** form of this command removes the source and peer IP addresses and VRF for the keepalive protocol. VSX continues to work.

| Parameter | Description |
|---|---|
| `peer <PEER-IP-ADDR>` | Specifies the peer IPv4 or IPv6 address. Syntax: A.B.C.D |
| `source <IP-ADDR>` | Specifies the source IPv4 or IPv6 address. The source IP address is the IP address assigned to the keepalive interface on the switch. For example, if you are entering this command on the primary switch, the source IP address would be the IP address assigned to the keepalive interface on the primary switch. Syntax: A.B.C.D |
| `vrf <VRF-NAME>` | Specifies the VRF name. If you are entering this command on the primary switch, the peer IP address is the IP address assigned to the keepalive interface for the secondary switch. If you are entering this command on the secondary switch, the peer IP address is the IP address assigned to the keepalive interface for the primary switch. Syntax: String |

## Usage

To configure the keepalive feature, enter this command once on the primary switch and once on the secondary switch. The keepalive feature is recommended for redundancy. If the ISL link goes down, the keepalive connection keeps the traffic moving so that the peer and secondary switches can continue to communicate. The keepalive connection is established over a routed network, and it does not have to be a dedicated peer-to-peer link unlike ISL.

## Examples

Setting the source and peer IP addresses for keepalive in the default VRF:

```
switch(config)# vsx
switch(config-vsx)# keepalive peer 192.168.1.1 source 192.168.1.5
```

Setting the source and peer IPv6 addresses for keepalive in the default VRF:

```
switch(config)# vsx
switch(config-vsx)# keepalive peer 2002:2 source 2002::3
```

Setting the source and peer IP addresses for keepalive in the vrf1:

```
switch(config)# vsx
switch(config-vsx)# keepalive peer 10.0.0.1 source 10.0.0.2 vrf vrf1
```

Setting the source and peer IP addresses for keepalive in the managament VRF:

```
switch(config)# vsx
switch(config-vsx)# keepalive peer 10.0.0.1 source 10.0.0.2 vrf mgmt
```

Removing the source and peer IP addresses and VRF for the keepalive protocol:

```
switch(config)# vsx
switch(config-vsx)# no keepalive
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.08 | Added optional parameters to the **no** form of the command. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

## keepalive udp-port

```
keepalive udp-port <PORT-NUM>
no keepalive udp-port
```

### Description

Sets the UDP port for the keepalive protocol.

The **no** form of this command sets the UDP port for keepalive protocol to the default of 7678.

| Parameter | Description |
|---|---|
| `udp-port <PORT-NUM>` | Specifies UDP port number. Range: 1024-65535 |

### Examples

Setting the UDP port for keepalive protocol to 2000:

```
switch(config)# vsx
switch(config-vsx)# keepalive udp-port 2000
```

Setting the UDP port for keepalive protocol to the default of 7678:

```
switch(config)# vsx
switch(config-vsx)# no keepalive udp-port
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

## lacp fallback

```
lacp fallback
no lacp fallback
```

### Description

Sets LACP fallback on a VSX LAG port. When no LACP partner is detected, the VSX LAG port makes members of the VSX LAG function as nonbonded interfaces. To create a VSX LAG, use the `interface lag multi-chassis` command.

The **no** form of this command sets the VSX LAG to a block state when no LACP partner is detected.

### Usage

LACP fallback is supported only when there is a single link from the downstream or peer device to each VSX node.

Even though this command appears to be accepted on a standard/non-VSX LAG, the fallback feature works only on a VSX LAG (multichassis LAG) interface.

### Examples

Enabling LACP fallback:

```
switch(config)# interface lag 1
switch(config-lag-if)# lacp fallback
```

Disables LACP fallback:

```
switch(config)# interface lag 1
switch(config-lag-if)# no lacp fallback
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

## linkup-delay-timer

```
linkup-delay-timer <DELAY-TIMER>
no linkup-delay-timer [<DELAY-TIMER>]
```

### Description

Configures the VSX link-up delay timer. The VSX delay timer feature lets you configure the delay timer, which delays bringing downstream VSX links up, following a VSX device reboot or an ISL flap.

The **no** form of this command restores the VSX link-up delay timer to a default of 180 seconds.

| Parameter | Description |
|---|---|
| *<DELAY-TIMER>* | Specifies the VSX LAG bring-up delay in seconds. Range: 0 to 600 seconds |

### Usage

The recommended delay timer setting is determined by the number of MAC addresses, ARPv4, and routes. The link-up delay timer might need to be set to a higher value for larger networks, depending on the ARP and routing table size.

### Examples

Setting the VSX link-up delay timer to 35 seconds:

```
switch(config)# vsx
switch(config-vsx)# linkup-delay-timer 35
```

Setting the VSX link-up delay timer to the default:

```
switch(config)# vsx
switch(config-vsx)# no linkup-delay-timer
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.08 | Added optional *<DELAY-TIMER>* parameter to the **no** form of the command. |
| 10.07 or earlier | -- |

### Command Information

|---|---|---|
| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

## linkup-delay-timer exclude lag-list

```
linkup-delay-timer exclude lag-list <LAG-LIST>
no linkup-delay-timer exclude lag-list <LAG-LIST>
```

### Description

Configures the VSX link-up delay timer exclude list. It excludes the bringing up of specified downstream VSX LAGs, following a device reboot or an ISL flap.

The **no** form of this command unconfigures the VSX link-up delay timer exclude list.

| Parameter | Description |
|---|---|
| *<LAG-LIST>* | Specifies a range or a set of LAG interfaces to exclude. For example: `1` or `1-10` or `1,2,3` or `1,2-10`. Range: 1-128 characters. |

### Examples

Specifying LAGs to exclude LAG 100:

```
switch(config)# vsx
switch(config-vsx)# linkup-delay-timer exclude lag-list 100
```

Unconfiguring the VSX link-up delay timer exclude list for LAG 100:

```
switch(config)# vsx
switch(config-vsx)# no linkup-delay-timer exclude lag-list 100
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

## neighbor <IP-ADDRESS> vsx-sync-exclude

`neighbor <IP-ADDRESS> vsx-sync-exclude`

### Description

Excludes VSX sync for the BGP neighbor.

### Examples

Excluding VSX sync for the BGP neighbor:

```
switch(config-bgp)#  neighbor 1.1.1.1 vsx-sync-exclude
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |

| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | `config-bgp` | Administrators or local user group members with execution rights for this command. |

## role {primary | secondary}

`role {primary | secondary}`

```
no role
```

### Description

Configures the VSX device role.

The **no** form of this command removes the device role of the switch in VSX and causes the interswitch link to be out-of-sync.

| Parameter | Description |
|---|---|
| `{primary \| secondary}` | Selects the VSX role to either primary or secondary for the device. |

### Usage

VSX has no default role defined for the device. The device role assigns the device as the primary or secondary for VSX synchronization. For ISL to be in-sync, one device in VSX must be configured as the primary and the other device must be configured as the secondary.

### Examples

Setting the VSX role to primary:

```
switch(config)# vsx
switch(config-vsx)# role primary
```

Removing the device role:

```
switch(config)# vsx
switch(config-vsx)# no role
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

|---|---|---|
| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

## show active-gateway

```
show active-gateway [vsx-peer]
```

### Description

Displays the gateway information configured on SVIs, such as:

- Number of active-gateway interface VLANs
- Number of IPv4 active-gateway interface VLANs
- Number of IPv6 active-gateway interface VLANs
- Per virtual MAC address
  - IPv4 reference count and its interface VLANs
  - IPv6 reference count and its interface VLANs

| Parameter | Description |
|---|---|
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

## Examples

```
primary# show active-gateway
Number of active-gateway interface VLANs          : 265
Number of IPv4 active-gateway interface VLANs     : 264
Number of IPv6 active-gateway interface VLANs     : 1
VMAC 00:00:00:01:01:16 :
     IPv4 ref count          : 32
     IPv4 interface VLANs    : vlan192-223
     IPv6 ref count          : 0
     IPv6 interface VLANs    : none
VMAC 00:00:00:01:01:11 :
     IPv4 ref count          : 32
     IPv4 interface VLANs    : vlan32-63
     IPv6 ref count          : 0
     IPv6 interface VLANs    : none
VMAC 00:00:00:01:01:17 :
     IPv4 ref count          : 32
     IPv4 interface VLANs    : vlan224-255
     IPv6 ref count          : 0
     IPv6 interface VLANs    : none
VMAC 00:00:00:01:01:18 :
     IPv4 ref count          : 6
     IPv4 interface VLANs    : vlan256-259,300-301
     IPv6 ref count          : 0
     IPv6 interface VLANs    : none
VMAC 00:00:00:01:01:13 :

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show active-gateway <*IFNAME*>

```
show active-gateway <IFNAME> [vsx-peer]
```

### Description

Displays the gateway information per SVI, such as:

- Active-Gateway IPV4 and its MAC address
- Active-Gateway IPV6 and its MAC address

| Parameter | Description |
|---|---|
| *<IFNAME>* | Specifies the VSX interface name. |
| vsx-peer | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Examples

```
switch# show active-gateway vlan2000
Active-gateway IPv4 MAC address           : 00:00:00:01:01:18
Active-gateway IPv4 address
       173.6.1.10
 173.7.1.10
Active-gateway IPv6 MAC address           : 00:00:00:03:00:12
Active-gateway IPv6 address
       173::2
 173::3
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

|---|---|---|
| 6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show interface <VLAN-NAME>

`show interface <VLAN-NAME> [vsx-peer]`

### Description

Displays a virtual IPv4/IPv6 and MAC configured for active-active routing.

| Parameter | Description |
|---|---|
| *<VLAN-NAME>* | Specifies the VLAN name. Syntax: string |
| vsx-peer | Shows the output from the VSX peer switch. If the switches do not |

| Parameter | Description |
|---|---|
|  | have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Example

```
switch# show interface vlan100

Interface vlan100 is up
 Admin state is up
 Hardware: Ethernet, MAC Address: 48:0f:cf:af:c1:9e
 IPv4 address 192.168.1.1/24
 IPv4 address 192.168.2.1/24 secondary
    active-gateway ip mac 00:00:00:00:00:01
    active-gateway ip 192.168.1.1
    active-gateway ip 192.168.2.2
    active-gateway ipv6 mac 00:00:00:00:00:01
    active-gateway ipv6 fe80::1

 Statistics                         RX                    TX                 Total
 ------------- -------------------- -------------------- --------------------
 L3 Packets                          8                     2                    10
 L3 Bytes                          812                    80                   892
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show lacp aggregates

`show lacp aggregates [<LAG-NAME>] [vsx-peer]`

### Description

Displays a specified LAG or all configured LAGs along with VSX LAGs.

| Parameter | Description |
|---|---|
| *<LAG-NAME>* | Specifies the LAG name. Optional. Syntax: string |
| vsx-peer | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Examples

Displaying all configured LAGs along with VSX LAGs:

```
switch# show lacp aggregates

Aggregate name   : lag100 (multi-chassis)
Interfaces       : 1/1/44
Peer interfaces  : 1/1/44
Heartbeat rate   : Slow
Hash             : l3-src-dst
Aggregate mode   : Active
```

Displaying a specified LAG:

```
switch# show lacp aggregates lag100

Aggregate name   : lag100 (multi-chassis)
Interfaces       : 1/1/44
Peer interfaces  : 1/1/44
Heartbeat rate   : Slow
Hash             : l3-src-dst
Aggregate mode   : Active
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show lacp interfaces

`show lacp interfaces [<IFNAME>] [vsx-peer]`

### Description

Displays an LACP configuration of the physical interfaces, including VSXs. If an interface name is passed as argument, it only displays an LACP configuration of a specified interface.

| Parameter | Description |
|---|---|
| *<IFNAME>* | Optional: Specifies an interface name. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Examples

This example displays an LACP configuration of the physical interfaces. One of the interfaces has the `lacp-block` forwarding state. If a VSX switch has loop protect enabled on an interface and a loop occurs, VSX blocks the interface to stop the loop. The forwarding state of the blocked interface is set to `lacp-block`.

```
switch# show lacp interfaces
State abbreviations :
A - Active        P - Passive      F - Aggregable I - Individual
S - Short-timeout L - Long-timeout N - InSync     O - OutofSync
C - Collecting    D - Distributing
X - State m/c expired              E - Default neighbor state

Actor details of all interfaces:
----------------------------------------------------------------------------------
--
Intf   Aggr    Port    Port   State   System-id          System  Aggr Forwarding
       name    id      Pri                               Pri     Key  State
----------------------------------------------------------------------------------
--
1/1/1  lag10   17      1      ALFOE   70:72:cf:37:a3:5c  20      10   lacp-block
1/1/2  lag128  69      1      ALFNCD  70:72:cf:37:a3:5c  20      128  up
1/1/3  lag128  14      1      ALFNCD  70:72:cf:37:a3:5c  20      128  up
1/1/4  lag128                                                         down
1/1/5  lag20                                                          up

Partner details of all interfaces:
------------------------------------------------------------------------------
Intf   Aggr    Partner Port     State     System-id       System   Aggr
       name    Port-id Pri                                Priority Key
------------------------------------------------------------------------------
1/1/1  lag10   0       65534    PLFOEX  00:00:00:00:00:00 65534    0
1/1/2  lag128  69      1        PLFNCD  70:72:cf:8c:60:a7 65534    128
1/1/3  lag128  14      1        PLFNCD  70:72:cf:8c:60:a7 65534    128
1/1/4  lag128
1/1/5  lag20
```

Displaying static LAG:

```
switch# show lacp interfaces
State abbreviations :
A - Active        P - Passive      F - Aggregable I - Individual
S - Short-timeout L - Long-timeout N - InSync     O - OutofSync
```

```
C - Collecting    D - Distributing
X - State m/c expired              E - Default neighbor state

Actor details of all interfaces:
------------------------------------------------------------------------------
Intf   Aggr   Port    Port   State   System-id         System  Aggr Forwarding
       Name   Id      Pri                              Pri     Key  State
------------------------------------------------------------------------------
1/1/1  lag10                                                        up
1/1/2  lag10                                                        up

Partner details of all interfaces:
------------------------------------------------------------------------------
Intf   Aggr   Port    Port   State   System-id         System  Aggr
       Name   Id      Pri                              Pri     Key
------------------------------------------------------------------------------
1/1/1  lag10
1/1/2  lag10
```

Displaying an LACP configuration of the 1/1/1 interface:

```
switch# show lacp interfaces 1/1/1

State abbreviations :
A - Active        P - Passive      F - Aggregable I - Individual
S - Short-timeout L - Long-timeout N - InSync     O - OutofSync
C - Collecting    D - Distributing
X - State m/c expired              E - Default neighbor state

Aggregate-name : lag1
-------------------------------------------------
                       Actor             Partner
-------------------------------------------------
Port-id            | 28                 | 31
Port-priority      | 1                  | 1
Key                | 1                  | 1
State              | ALFNCD             | ALFNCD
System-id          | 98:f2:b3:68:40:a0  | 98:f2:b3:68:60:a6
System-priority    | 65534              | 65534
```

Displaying an LACP configuration after loop-protect is enabled on the primary VSX switch:

```
switch# show lacp interfaces

State abbreviations :
A - Active        P - Passive      F - Aggregable I - Individual
S - Short-timeout L - Long-timeout N - InSync     O - OutofSync
C - Collecting    D - Distributing
X - State m/c expired              E - Default neighbor state

Actor details of all interfaces:
------------------------------------------------------------------------------
Intf    Aggr       Port  Port  State   System-ID         System Aggr Forwarding
        Name       Id    Pri                             Pri    Key  State
------------------------------------------------------------------------------
1/4/14  lag1(mc)   206   1     ALFNCD  f8:60:f0:06:49:00 65534  1    up
1/5/15  lag2(mc)                                                     down

```

```
Partner details of all interfaces:
------------------------------------------------------------------------------
Intf    Aggr       Port  Port  State   System-ID         System Aggr
        Name       Id    Pri                             Pri    Key
------------------------------------------------------------------------------
1/4/14  lag1(mc)   130   1     ALFNCD  f8:60:f0:06:87:00 65534  1
1/5/15  lag2(mc)
```

Displaying an LACP configuration after loop-protect is enabled on the secondary VSX switch:

```
switch# show lacp interfaces

State abbreviations :
A - Active        P - Passive      F - Aggregable I - Individual
S - Short-timeout L - Long-timeout N - InSync     O - OutofSync
C - Collecting    D - Distributing
X - State m/c expired              E - Default neighbor state

Actor details of all interfaces:
------------------------------------------------------------------------------
Intf    Aggr       Port  Port  State   System-ID         System Aggr Forwarding
        Name       Id    Pri                             Pri    Key  State
------------------------------------------------------------------------------
1/3/2   lag1(mc)   1130  1     ALFNCD  f8:60:f0:06:49:00 65534  1    up
1/9/3   lag2(mc)                                                     down

Partner details of all interfaces:
------------------------------------------------------------------------------
Intf    Aggr       Port  Port  State   System-ID         System Aggr
        Name       Id    Pri                             Pri    Key
------------------------------------------------------------------------------
1/3/2   lag1(mc)   131   1     ALFNCD  f8:60:f0:06:87:00 65534  1
1/9/3   lag2(mc)
```

## show lacp interfaces multi-chassis

```
show lacp interfaces multi-chassis [<IFNAME>] [vsx-peer]
```

## Description

Shows all configured VSX remote interface details. The interface that has the ALFNCD status has been synced with the partner and is ready for flow distribution.

| Parameter | Description |
|---|---|
| *<IFNAME>* | Specifies the VSX interface name. Optional. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

## Examples

```
switch# show lacp interfaces multi-chassis

State abbreviations :
A - Active        P - Passive      F - Aggregable I - Individual
S - Short-timeout L - Long-timeout N - InSync     O - OutofSync
C - Collecting    D - Distributing
X - State m/c expired              E - Default neighbor state

## show running-config interface

`show running-config interface`

### Description

Displays all configured interface commands, including VSX commands.

### Example

```
switch# show running-config interface
interface lag 100 multi-chassis
    no shutdown
    no routing
    lacp mode active
interface 1/1/1
    no shutdown
    no routing
interface 1/1/2
    no shutdown
    lag 100
interface 1/1/3
    no shutdown
    ip address 192.168.1.2/24
interface vlan100
    no shutdown
    ip address 192.168.1.1/24
    active-gateway ip 192.168.1.253 mac 00:00:00:00:00:01
    active-gateway ipv6 fe80::01 mac 00:00:00:01:00:01
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

|---|---|
| 10.09.0010 | Command will now display results for configurations where the active gateway and SVI share the same IPv6 address. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show running-config vsx-sync

```
show running-config vsx-sync
```

### Description

Displays the lines of running-configuration that VSX configuration synchronization is enabled on. The command also provides a rolled-up view of configuration expected to be synced. This command can be run from the primary or secondary peer.

### Example

Displaying the running configuration on which VSX synchronization is enabled:

```
switch# show running-config vsx-sync
Current vsx-sync configuration:
vlan 3
    vsx-sync
access-list ip test1
    vsx-sync
    !
policy test2
    vsx-sync
    !
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

# show running-config vsx-sync peer-diff

```
show running-config vsx-sync peer-diff
```

## Description

Displays the difference between the configuration of features enabled for VSX synchronization on the primary and secondary switches.

## Usage

Use this command for diagnosing errors. This command provides visibility into which configuration lines did not synchronize from the primary peer to the secondary peer. This command can be run from the primary or secondary peer. The output is displayed in the GNU diff unified format.

## Example

Displaying the running configuration on which VSX synchronization is enabled:

```
switch# show running-config vsx-sync peer-diff
--- /tmp/running-config-vsx.83e 2018-05-01 17:03:38.083281976 +0000

# show system l2-vlan-mac-mode

```
show system l2-vlan-mac-mode
```

## Description

This command displays the L2 VLAN MAC Mode configuration and status.

| Parameter | Description |
|---|---|

## Examples

Following example shows L2 VLAN MAC Mode configuration.

```
switch# show system l2-vlan-mac-mode
Configured L2 VLAN MAC mode: flood
Operational L2 VLAN MAC mode: flood
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

# show vsx active-forwarding

```
show vsx active-forwarding [interface <INTERFACE-VLAN>] [vsx-peer]
```

## Description

Shows all the VSX active-forwarding configured interface VLANs or the VSX active-forwarding peer information for a particular interface VLAN.

| Parameter | Description |
|---|---|
| `interface <INTERFACE-VLAN>` | Specifies the interface VLAN name. Syntax: string |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

## Examples

Displaying a list of VSX active-forwarding enabled interfaces:

```
switch# show vsx active-forwarding
List of VSX active-forwarding enabled interfaces:
vlan30
vlan32
vlan33
```

Displaying the VSX active-forwarding peer information for `vlan30`:

```
switch# show vsx active-forwarding interface vlan30
Interface vlan30 has VSX active-forwarding enabled.
Interface vlan30 Peer Data:
Peer MAC: 94:f1:28:21:22:00
Peer IPv6 Addresses:
    fe80::96f1:28ff:fe21:2200
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

# show vsx brief

`show vsx brief [vsx-peer]`

## Description

Displays the brief VSX status.

| Parameter | Description |
|---|---|
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

## Usage

The `show vsx brief` command displays the ISLP device protocol states under the "Device State" heading.

**Table 1:** *ISLP device protocol states*

| Device state | Definition |
|---|---|
| Peer-Established | The VSX switch is in a steady state. VSX LAGs are up. |
| Sync-Primary | ISL connectivity to the peer VSX switch is restored, and the VSX switch is syncing states to the peer VSX switch. VSX LAGs are up. |
| Sync-Secondary | ISL connectivity to the peer VSX switch is restored, and the VSX switch is learning states from the peer VSX switch. VSX LAGs are down. |
| Sync-Secondary-Linkup-Delay | The VSX switch has learned its states from the peer VSX switch, and the VSX switch is monitoring for hardware to be programmed. VSX LAGs are down. |
| Split-System-Primary | The VSX switch has lost ISL connectivity to the peer VSX switch. The VSX switch is operating as the primary VSX switch. VSX LAGs are up. |
| Split-System-Secondary | The VSX switch has lost ISL connectivity to the peer VSX switch. The VSX switch is operating as the secondary VSX switch. VSX LAGs are down. |
| Waiting-For-Peer | The VSX switch is waiting for connectivity to the peer VSX switch. |

## Example

Displaying the brief VSX status for the switch you are logged into:

```
vsx-primary# show vsx brief
ISL State                              : In-Sync
Device State                           : Peer-Established
Keepalive State                        : Keepalive-Established
Device Role                            : primary
Number of Multi-chassis LAG interfaces : 2
```

Displaying the brief VSX status for the peer (secondary) switch while entering the command on the primary switch:

```
vsx-primary# show vsx brief vsx-peer
ISL State                              : In-Sync
Device State                           : Peer-Established
Keepalive State                        : Keepalive-Established
```

```
Device Role                               : secondary
Number of Multi-chassis LAG interfaces : 2
```

Displaying the brief VSX status for the peer (primary) switch while entering the command on the secondary switch:

```
vsx-secondary# show vsx brief vsx-peer
ISL State                                 : In-Sync
Device State                              : Peer-Established
Keepalive State                           : Keepalive-Established
Device Role                               : primary
Number of Multi-chassis LAG interfaces : 2
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

# show vsx config-consistency

```
show vsx config-consistency [vsx-peer]
```

## Description

Displays the VSX global configuration consistency between two VSX switches.

| Parameter | Description |
|---|---|
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

## Example

The following example shows a comparison between the two VSX switches.

~~~
switch# show vsx config-consistency
Configurations                          Local                             Peer

## show vsx configuration

```
show vsx configuration {inter-switch-link | keepalive} [vsx-peer]
```

## Description

Displays the ISL configuration or keepalive protocol configuration in VSX.

| Parameter | Description |
|---|---|
| `{inter-switch-link \| keepalive}` | Selects `inter-switch-link` or `keepalive`. |
| `inter-switch-link` | Displays the ISL configuration in VSX. |
| `keepalive` | Displays the keepalive protocol configuration in VSX. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

## Examples

Displaying the ISL configuration in VSX:

```
switch# show vsx configuration inter-switch-link
Inter Switch Link     : 1/1/43
Hello Interval        : 1 Seconds
Dead Interval         : 20 Seconds
Hold Time             : 0 Seconds
Peer detect interval : 300 Seconds
System MAC            : 10:00:00:00:00:01
Device Role           : primary
Multichassis LAGs     : lag100
```

Displaying the keepalive protocol configuration in VSX:

```
switch# show vsx configuration keepalive
Keepalive Interface      : 1/1/1
Keepalive VRF            : test1
Source IP Address        : 192.168.1.1
Peer IP Address          : 192.168.1.2
UDP Port                 : 7678
Hello Interval           : 1 Seconds
Dead Interval            : 3 Seconds
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

## Command History

| Release | Modification |

| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

# show vsx configuration split-recovery

```
show vsx configuration split-recovery [vsx-peer]
```

### Description

Displays the state of the split recovery mode.

| Parameter | Description |
|---|---|
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Example

```
switch# show vsx configuration split-recovery
Split Recovery Mode    : Enabled
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |

# show vsx ip data-path

```
show vsx ip data-path [<IP-ADDR> | <IP-ADDR>/<MASK>] [vrf <VRF-NAME>] [vsx-peer]
```

### Description

Displays the datapath of the IPv4 route present on local and VSX peer devices.

| Parameter | Description |
|---|---|
| *<IP-ADDR>* \| *<IP-ADDR>/<MASK>*] | Selects one of the following: *<IP-ADDR>* or *<IP-ADDR>/<MASK>* |
| *<IP-ADDR>* | Specifies the datapath for an IPv4 address based on the parameters provided. |
| *<IP-ADDR>/<MASK>* | Specifies the datapath for an IPv4 address and its specified subnet. Optional. Syntax: A.B.C.D/M |
| vrf *<VRF-NAME>* | Shows the IPv4 datapath for a specified VRF. |
| vsx-peer | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

## Example

Displaying the datapath on a VSX switch for 192.0.2.0:

```
switch# show vsx ip data-path 192.0.2.0

IPv4 Data Path Information For 192.0.2.0

Local Device
------------
Route : 192.0.2.0/32
    Egress L3 Interface : 1/1/2
    Next Hop MAC Address    : 08:00:09:ea:d7:d1
    Egress Port    : 1/1/2

    Egress L3 Interface : 1/1/3
    Nexthop Hop MAC Address    : 08:00:09:8e:59:1d
    Egress Port    : 1/1/3

Peer Device
------------
Route : 192.0.2.0/32
    Egress L3 Interface : loopback1
```

Displaying the datapath on a VSX switch for 198.51.100.0/32:

```
switch# show vsx ip data-path 198.51.100.0/32

IPv4 Data Path Information For 198.51.100.0/32

Local Device
------------
Route : 198.51.100.0/32
    Egress L3 Interface : 1/1/4
```

Displaying the datapaths on a VSX switch for 198.51.100.1:

```
switch# show vsx ip data-path 198.51.100.1

IPv4 Data Path Information For 198.51.100.1
```

```
Local Device
------------
Route : 198.51.100.1/32
    Egress L3 Interface : 1/1/4

Peer Device
------------
Route : 198.51.100.0/24
    Egress L3 Interface : 1/1/2
    Next Hop MAC Address   : 08:00:09:db:21:e8
    Egress Port   : 1/1/2
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | Operator (>) or Manager (#) | Administrators or local user group members with execution rights for this command. |

# show vsx ip route

`show vsx ip route [<IP-ADDR> | <IP-ADDR>/<MASK> | unique] [vrf <VRF-NAME> | all-vrfs] [vsx-peer]`

## Description

Displays a specified LAG or all configured LAGs along with VSX LAGs.

| Parameter | Description |
|---|---|
| `<IP-ADDR> \| <IP-ADDR>/<MASK> \| unique]` | Selects one of the following: `<IP-ADDR>`, `<IP-ADDR>/<MASK>`, or `unique` |
| `<IP-ADDR>` | Specifies the route information for an IPv4 address based on the parameters provided. |
| `<IP-ADDR>/<MASK>` | Specifies the route information for an IPv4 address and its specified subnet. Optional. Syntax: A.B.C.D/M |
| `unique` | Specifies routes that are present only on the primary switch or only on the secondary switch. The routes that are present on both the primary and secondary switch |

| Parameter | Description |
|---|---|
| | are excluded. Optional. Syntax string. |
| `vrf <VRF-NAME> \| all-vrfs` | Selects the VRF name or all VRFs. |
| `<VRF-NAME>` | Shows the IPv4 route information for a specified VRF. |
| `all-vrf` | Shows the IPv4 route information for all VRFs. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

## Examples

Displaying IPv4 routes on a VSX switch:

```
switch# show vsx ip route

IPv4 Forwarding Routes

'[x/y]' denotes [distance/metric]

192.0.2.0/32, vrf default
    via  192.0.2.1,  [1/0],  static on vsx1
    via  192.0.2.2,  [1/0],  static on vsx2
```

Displaying IPv4 routes on a VSX switch:

```
switch# show vsx ip route

IPv4 Forwarding Routes

'[x/y]' denotes [distance/metric]

192.0.2.3/24, vrf default
    via  1/1/3,  [0/0],  connected on vsx1
    via  192.0.2.2,  [110/2],  ospf on vsx2
192.0.2.4/32, vrf default
    via  1/1/3,  [0/0],  local on vsx1
192.0.2.5/24, vrf default
    via  1/1/4,  [0/0],  connected on vsx1
    via  192.0.2.2,  [110/3],  ospf on vsx2
192.0.2.6/32, vrf default
    via  1/1/4,  [0/0],  local on vsx1
192.0.2.7/32, vrf default
    via  192.0.2.8,  [110/1],  ospf on vsx1
    via  192.0.2.1,  [110/1],  ospf on vsx1
    via  loopback1,  [0/0],  local on vsx2
```

Displaying IPv4 unique routes on a VSX switch:

```
switch# show vsx ip route unique
```

```
IPv4 Forwarding Routes

'[x/y]' denotes [distance/metric]

192.0.2.0/32, vrf default
    via  192.0.2.2,  [1/0],  static on vsx2
192.0.2.9/32, vrf default
    via  192.0.2.1,  [1/0],  static on vsx1
```

Displaying IPv4 routes on a VSX switch for 192.0.2.10:

```
switch# show vsx ip route 192.0.2.10

IPv4 Forwarding Routes

'[x/y]' denotes [distance/metric]

192.0.2.10/32, vrf default
    via  192.0.2.1,  [1/0],  static on vsx1
    via  192.0.2.2,  [1/0],  static on vsx2
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

## show vsx ipv6 data-path

```
show vsx ipv6 data-path [<IPv6-ADDR> | <IPv6-ADDR>/<MASK>] [vrf <VRF-NAME>] [vsx-peer]
```

### Description

Displays the datapath of the IPv6 route on local and peer VSX devices.

| Parameter | Description |
|---|---|
| *<IPV6-ADDR>* \| *<IPV6-ADDR>/<MASK>*] | Selects one of the following: *<IPV6-ADDR>* or *<IPV6-ADDR>/<MASK>* |

| Parameter | Description |
|---|---|
| *<IPV6-ADDR>* | Specifies the datapath for an IPv6 address based on the parameters provided. |
| *<IPV6-ADDR>/<MASK>* | Specifies the datapath for an IPv6 address and its specified subnet. Optional. Syntax: A.B.C.D/M |
| `vrf` *<VRF-NAME>* | Shows the IPv6 datapath for a specified VRF. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

## Examples

Displaying an IPv6 datapath on a VSX switch:

```
switch# show vsx ipv6 data-path 1000::

IPv6 Data Path Information For 1000::

Local Device
------------
Route : 1000::/64
    Egress L3 Interface : 1/1/2

Peer Device
------------
Route : 1000::/64
    Egress L3 Interface : 1/1/2
```

Displaying an IPv6 datapath on a VSX switch:

```
switch# show vsx ipv6 data-path 2000::
IPv6 Data Path Information For 2000::

Local Device
------------
Route : 2000::/64
    Egress L3 Interface : 1/1/2
    Next Hop MAC Address   : 08:00:09:0e:0c:1b
    Egress Port   : 1/1/2
```

Displaying IPv6 datapath for 3000::/64 on a VSX switch:

```
switch# show vsx ipv6 data-path 3000::/64
IPv6 Data Path Information For 3000::/64

Local Device
------------
Route : 3000::/64
    Egress L3 Interface : 1/1/2
    Next Hop MAC Address   : 08:00:09:0e:0c:1b
    Egress Port   : 1/1/2
IPv6 Data Path Information For 3000::/64
```

```
Local Device
------------
Route : 3000::/64
    Egress L3 Interface : 1/1/2
    Next Hop MAC Address    : 08:00:09:0e:0c:1b
    Egress Port    : 1/1/2
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show vsx ipv6 route

```
show vsx ipv6 route [<IPv6-ADDR> | <IPv6-ADDR>/<MASK> | unique]
     [vrf <VRF-NAME> | all-vrfs] [vsx-peer]
```

### Description

Displays a specified LAG or all configured LAGs along with VSX LAGs.

| Parameter | Description |
|---|---|
| `<IPV6-ADDR> \| <IPV6-ADDR>/<MASK> \| unique]` | Selects one of the following: `<IPV6-ADDR>`, `<IPV6-ADDR>/<MASK>`, or `unique` |
| `<IPV6-ADDR>` | Specifies the route information for an IPv4 address based on the parameters provided. |
| `<IPV6-ADDR>/<MASK>` | Specifies the route information for an IPv4 address and its specified subnet. Optional. Syntax: A.B.C.D/M |
| `unique` | Specifies routes that are present only on the primary switch or only on the secondary switch. The routes that are present on both the primary and secondary switch are excluded. Optional. Syntax string. |
| `vrf <VRF-NAME> \| all-vrfs` | Selects the VRF name or all VRFs. |

| Parameter | Description |
|---|---|
| *<VRF-NAME>* | Shows the IPv4 route information for a specified VRF. |
| all-vrf | Shows the IPv4 route information for all VRFs. |
| vsx-peer | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

## Examples

Displaying IPv6 routes on a VSX switch:

```
switch# show vsx ipv6 route

IPv6 Forwarding Routes

'[x/y]' denotes [distance/metric]

1000::/64, vrf default
    via  1/1/2,   [0/0],  connected on vsx1
    via  1/1/2,   [0/0],  connected on vsx2
1000::1/128, vrf default
    via  1/1/2,   [0/0],  local on vsx1
```

Displaying IPv6 unique routes on a VSX switch:

```
switch# show vsx ipv6 route unique
IPv6 Forwarding Routes

'[x/y]' denotes [distance/metric]

1000::1/128, vrf default
    via  1/1/2,   [0/0],  local on vsx1
1000::2/128, vrf default
    via  1/1/2,   [0/0],  local on vsx2
3000::/64, vrf default
    via  1000::2,   [1/0],  static on vsx1
```

Displaying IPv6 routes on a VSX switch for 2000::/64:

```
switch# show vsx ipv6 route 2000::/64
IPv6 Forwarding Routes

'[x/y]' denotes [distance/metric]

2000::/64, vrf default
    via  1000::2,   [1/0],  static on vsx1
    via  1000::1,   [1/0],  static on vsx2
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show vsx status

```
show vsx status [inter-switch-link | keepalive | linkup-delay] [vsx-peer]
```

### Description

Displays global VSX status or a specified status determined by the selected parameter.

| Parameter | Description |
|---|---|
| `[inter-switch-link \| keepalive \| linkup-delay]` | Selects one of the following: `inter-switch-link`, `keepalive`, or `linkup-delay` |
| `inter-switch-link` | Specifies the display of the ISL status in VSX. |
| `keepalive` | Specifies the display of the VSX keepalive protocol status. |
| `linkup-delay` | Specifies the display of the VSX link-up delay information, such as the:<br>■ Configured link-up delay timer.<br>■ Delay timer status.<br>■ Initial sync status.<br>■ LAGs on which the delay timer is running.<br>■ Status of the LAGs excluded from the link-up delay timer.<br>■ Interfaces that are shut down during VSX split.<br>■ Interfaces that are shut down during VSX split |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Examples

Displaying the global VSX status:

```
switch# show vsx status
VSX Operational State
---------------------
  ISL channel             : In-Sync
  ISL mgmt channel        : operational
  Config Sync Status      : in-sync
  NAE                     : peer_reachable
  HTTPS Server            : peer_reachable

Attribute           Local                       Peer
------------        --------                    --------
ISL link            1/1/43                      1/1/43
ISL version         2                           2
System MAC          48:0f:cf:af:70:84           48:0f:cf:af:c2:84
Platform            8320                        8320
Software Version    10.0x.xxxx                  10.0x.xxxx
Device Role         primary                     secondary
```

Displaying the ISL status in VSX:

```
switch# show vsx status inter-switch-link
State                     : In-Sync
Link Status               : up
Mgmt state                : operational

Inter-switch link Statistics
----------------------------
Hello Packets Tx          : 4572
Hello Packets Rx          : 4573
Data Packets Tx           : 80634
Data Packets Rx           : 80637
Mgmt Packets Tx           : 25946
Mgmt Packets Rx           : 25167
Mgmt Packet Drops         : 0
```

Displaying the VSX keepalive protocol status:

```
switch# show vsx status keepalive
Keepalive State           : Keepalive-Established
Last Established          : Thu Jun  8 09:03:01 2018
Last Failed               : Thu Jun  8 09:04:02 2018
Peer System Id            : 58:1f:cf:af:a0:84
Peer Device Role          : primary

Keepalive Counters
Keepalive Packets Tx      : 322
Keepalive Packets Rx      : 121
Keepalive Timeouts        : 0
Keepalive Packets Dropped : 14
```

Displaying the VSX link-up delay status while ARP/MAC VSX synchronization is in progress:

```
switch# show vsx status linkup-delay

Configured linkup delay-timer                                : 180 seconds
Initial sync status                                          : In-progress
```

```
Delay timer status                                           : Waiting-to-start
Linkup Delay time left                                       :
Interfaces that will be brought up after delay timer expires : lag20,lag30-lag31
Interfaces enabled for shutdown-on-split that will be brought
up after the delay timer expires                             :
Interfaces that are excluded from delay timer                : lag2
```

Displaying the VSX link-up delay status with ARP/MAC VSX synchronization completed with the delay timer running:

```
switch# show vsx status linkup-delay

Configured linkup delay-timer                                : 180 seconds
Initial sync status                                          : Completed
Delay timer status                                           : Running
Linkup Delay time left                                       : 1 minutes 22
seconds
Interfaces that will be brought up after delay timer expires : lag20,lag30-lag31
Interfaces enabled for shutdown-on-split that will be brought
up after the delay timer expires                             :
Interfaces that are excluded from delay timer                : lag2
```

Displaying the VSX link-up delay status with ARP/MAC VSX synchronization completed and the delay timer expired:

```

```

Displaying the global VSX status for the peer switch:

```
vsx-primary# show vsx status vsx-peer
VSX Operational State
---------------------
  ISL channel             : In-Sync
  ISL mgmt channel        : operational
  Config Sync Status      : in-sync
  NAE                     : peer_reachable
  HTTPS Server            : peer_reachable

Attribute           Local               Peer
------------        --------            --------
ISL link            lag1                lag1
ISL version         2                   2
System MAC          e0:07:1b:cb:72:e4   98:f2:b3:68:79:2e
Platform            8320                8320
Software Version    10.0x.xxxx          10.0x.xxxx
Device Role         secondary           primary
```

Displaying the status for an out-of-sync status for VSX.

```
switch# show vsx status linkup-delay

Configured linkup delay-timer                                : 20 seconds
Initial sync status                                          :
Delay timer status                                           :
Linkup Delay time left                                       :
```

```
Interfaces that will be brought up after delay timer expires :
Interfaces enabled for shutdown-on-split that will be brought
up after the delay timer expires                             :
Interfaces that are excluded from delay timer                :
```

Displaying the status VSX link-up delay status when interfaces enabled for shutdown-on-split.

```
switch# show vsx status linkup-delay
Configured linkup delay-timer                                : 180 seconds
Initial sync status                                          : In-progress
Delay timer status                                           : Waiting-to-start
Linkup Delay time left                                       :
Interfaces that will be brought up after delay timer expires : lag8,lag256
Interfaces enabled for shutdown-on-split that will be brought
up after the delay timer expires                             : 1/1/27,1/1/37,
                                                               vlan2-vlan57
Interfaces that are excluded from delay timer                :
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show vsx status config-sync

```
show vsx status config-sync [vsx-peer]
```

### Description

Displays VSX configuration synchronization status for peers. This command can be run from the primary or secondary peer to view the configuration synchronization state.

| Parameter | Description |
|---|---|
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Example

```
switch# show vsx status config-sync
Admin State                : Enabled
Operational State          : Operational
Error State                : None
Recommended remediation : N/A
Current Time               : Wed Jul 18 23:41:07 2018
Last Sync Time             : Wed Jul 18 23:38:26 2018
```

The Admin State parameter can be configured individually on each of the switches on the VSX pair. Hence difference in values does not imply a failure.

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show vsx status peering

```
show vsx status peering
```

### Description

Displays synchronization peering status and hardware peering status for modules such as MAC, neighbor, spanning-tree, and route. This command can be used to view the status of VSX peering, following a VSX device reboot or an ISL flap.

Following are the possible values for VSX peering status:

- **Complete**—VSX peering process is successfully completed.
- **In-progress**—VSX peering is being processed.
- **Not-started**—VSX peering process is yet to be started.

### Examples

Displaying the VSX peering status :

```
switch# show vsx status peering
----------------------------------------------------------------
```

```
Module             Sync-Status       Hardware-Status
-----------------------------------------------------------------
MAC                In-progress       Not-started
Neighbor           Complete          In-progress
Route              Complete          Complete
Spanning-tree      In-progress       Not-started
EVPN               In-progress       Not-started
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |

| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show vsx status shutdown-on-split

```
show vsx status shutdown-on-split
```

### Description

Displays the status of the interfaces that are shut down during a VSX split.

You can also use `show interface` command to view the status of the interface. For example, assume that you have shut down the non-vsx interface 1/1/2 during the VSX split. When you enter `show interface` command on the secondary switch, the output from the command indicates that the interface was blocked by VSX feature.

### Examples

Displaying the status of interfaces that are shut down during the VSX split:

```
switch(config)# show vsx status shutdown-on-split
List of non-vsx interfaces enabled for split shutdown and its status.

Interfaces                    Status
1/1/1                        Disabled
lag100                       Disabled
vlan2                        Disabled
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

## split recovery

```
split-recovery
no split-recovery
```

### Description

Enables split recovery mode. Split recovery mode is enabled by default.

The **no** form of this command disables split-recovery mode.

### Usage

Split recovery mode prevents traffic loss when the ISL goes out-of-sync and keepalive subsequently fails. When the ISL goes out-of-sync and keepalive is established, the secondary VSX LAGs are brought down. If keepalive then also fails, this situation causes a split condition. In this case, if split recovery mode is enabled, the secondary switch restores its VSX LAGs so they are up.

When split recovery mode is disabled during a split condition, the secondary switch keeps it VSX LAGs down.

### Examples

Enabling split recovery mode:

```
switch(config-vsx)# split-recovery
```

Disabling split recovery mode:

```
switch(config-vsx)# no split-recovery
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |

## system l2-vlan-mac-mode

```
system l2-vlan-mac-mode {drop|flood}
no system l2-vlan-mac-mode {drop|flood}
```

### Description

This command configures the forwarding action for packets received on an l2 VLAN port when switch system MAC address as the destination MAC address.

The **no** form of this command configures the switch to the default setting of dropping packets.

| Parameter | Description |
|---|---|
| `drop` | Forwarding action of the packets is to drop. (default) |
| `flood` | Forwarding action of the packets is to flood. |

When flood mode is configured, 8320 and 8325 or 10000 switches support less than 512 and 1024 SVIs respectively. When the active-gateway is configured on SVI along with the flood mode, it supports up to 10 SVIs.

### Examples

The following example for flood the packets:

```
switch(config)# system l2-vlan-mac-mode flood
```

The following example for drop the packets:

```
switch(config)# system l2-vlan-mac-mode drop
```

The Following example for packets default setting:

```
switch(config)# no system l2-vlan-mac-mode
```

The Following example for default setting of system l2-vlan-mac-mode drop command:

```
switch(config)# no system l2-vlan-mac-mode drop
```

The Following example for default setting of system l2-vlan-mac-mode flood command:

```
switch(config)# no system l2-vlan-mac-mode flood
```

Configuring l3-src-mac on a VLAN interface, l2-vlan-mac-mode flood cannot be configured. Such configuration can generate an error as shown and command will not take affect.

```
switch(config-if-vlan)# active-gateway l3-src-mac
switch(config)# system l2-vlan-mac-mode flood
l2-vlan-mac-mode flood cannot be configured when active-gateway l3-src-mac is
configured.
```

### Configuration table for supported SVIs

| Configuration | Platforms | Supported SVIs |
|---|---|---|
| When flood mode is configured | 8320 | Less than 512 |
| | 8325 and 10000 | Less than 1024 |
| When the active-gateway IPv4 is configured on SVI along with the flood mode | 8320 | Up to 190 |
| | 8325 and 10000 | Up to 380 |
| When the active-gateway IPv4 and IPv6 are configured on SVI along with the flood mode | 8320 | Up to 165 |
| | 8325 and 10000 | Up to 330 |
| When the VSX active-forwarding, VRRP and virtual-mac features are configured | 8320, 8325 and 10000 | Goes down |

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

# system-mac

```
system-mac <MAC-ADDR>
no system-mac [<MAC-ADDR>]
```

## Description

Sets the MAC address as the VSX system MAC address to be used by control plane protocols, such as STP and LACP. A pair of VSX switches must have the same VSX system MAC.

The **no** form of this command unconfigures the VSX system MAC address to be used by control plane protocols.

| Parameter | Description |
|---|---|
| *<MAC-ADDR>* | Specifies the MAC address in a colon separated format, such as XX:XX:XX:XX:XX:XX, for control plane protocols. |

## Usage

The **system-mac <*MAC-ADDR*>** command is highly recommended for preventing traffic disruptions when the primary VSX switch restores after the secondary VSX switch, such as during:

- A primary switch hardware replacement.
- A power outage with the primary switch restore after the secondary switch restore.

When the primary switch is restored after the secondary switch, a traffic disruption might occur when the ISL starts to sync. This situation occurs because the MAC system address changes from the secondary switch to the primary switch for the LACP. To avoid the traffic disruption, set the common system MAC address by entering the **system-mac <MAC-ADDR>** command. This command creates a common system MAC address between the two VSX switches. This common system MAC address prevents a traffic disruption when the secondary switch comes up before the primary switch. If the common system MAC access is enabled, the secondary switch uses the common system MAC address instead of its own system MAC address, which prevents a traffic loss.

The system MAC address also maintains the same MSTP bridge ID across VSX switches, which act as a single switch.

## Examples

Setting a MAC address as the VSX system MAC address to be used by control plane protocols:

```
switch(config-vsx)# system-mac 02:01:00:00:01:00
```

Unconfiguring a VSX system MAC address to be used by control plane protocols:

```
switch(config-vsx)# no system-mac 02:01:00:00:01:00
```

Null system MAC address such as 00:00:00:00:00:00 is not allowed.

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.08 | Updated **no** form of the command. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

## VSX

```
vsx
no vsx
```

### Description

Creates the VSX context on the switch.

The **no** form of this command disables the VSX context on the switch and removes all related configuration settings.

### Examples

Creating the VSX context on the switch:

```
switch(config)# vsx
switch(config-vsx)#
```

Removing the VSX context and all VSX configuration settings from the switch:

```
switch(config-vsx)# no vsx
VSX configuration will be deleted.
Do you want to continue (y/n)? y
switch(config)#
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |

# vsx active-forwarding

```
vsx active-forwarding
no vsx active-forwarding
```

## Description

Configures VSX active-forwarding on an interface VLAN.

The **no** form of this command unconfigures VSX active-forwarding on a VLAN interface.

## Usage

Active forwarding cannot be configured when ICMP redirect is enabled. The ICMP redirect setting is global not per SVI. Enter the `no ip icmp redirect` command for disabling ICMP redirect at the `switch (config)#` prompt.

If a system has active forwarding enabled, an active gateway can have a maximum of 14 "unique" MAC addresses per system, including IPv4 and IPv6 addresses.

If a system has active forwarding disabled, an active gateway can have a maximum of 16 "unique" MAC addresses per system, including IPv4 and IPv6 addresses.

## Examples

Successfully enabling VSX active-forwarding:

```
switch# interface vlan 3
switch(config-if-vlan)# vsx active-forwarding
switch(config-vsx)#
```

Unconfiguring VSX active-forwarding:

```
switch# interface vlan 3
switch(config-if-vlan)# no vsx active-forwarding
switch(config-vsx)#
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

## Command History

| Release | Modification |

# vsx shutdown-on-split

```
vsx shutdown-on-split
no vsx shutdown-on-split
```

## Description

Shuts down the configured non-VSX interfaces on the VSX secondary along with VSX interfaces during a VSX split.

The **no** form of this command resumes the non-VSX interfaces that are shut down during the VSX split.

This command has no effect on the VSX primary during a split. However, when applied on the VSX primary, the command will bring down the non-VSX interfaces until linkup delay timer expires during the VSX primary reboot.

## Examples

Shutting down the non-VSX interface 1/1/1during the VSX split:

```
switch(config)# interface 1/1/1
switch(config-if)# vsx shutdown-on-split
switch(config)# interface lag 1
witch(config-lag-if)# vsx shutdown-on-split
```

Shutting down the non-VSX interface LAG 5 during the VSX split:

```
switch(config)# interface lag 5
switch(config-lag-if)# vsx shutdown-on-split
```

Shutting down the non-VSX SVI during the VSX split:

```
switch(config)# interface vlan 2
switch(config-if-vlan)# vsx shutdown-on-split
```

Resuming the non-VSX interface that are shutdown during the VSX split:

```
switch(config-if)# no vsx shutdown-on-split
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

|---|---|---|
| 6400 | `config-if`<br>`config-lag-if`<br>`config-if-vlan` | Administrators or local user group members with execution rights for this command. |

## vsx-sync

```
vsx-sync
no vsx-sync
```

### Description

Enables VSX synchronization for the entire context for the following features from the primary VSX node to the secondary peer switch:

- Access list context
- Classifier context
- Object group context
- Policy-based routing profile context
- Policy context
- QoS queue profile context
- QoS schedule profile context
- VLAN context

The **no** form of this command disables VSX synchronization for the entire context for a feature, but it does not remove the feature configurations from the secondary peer. Any subsequent configuration changes made under the specific configuration context are not synchronized to the secondary peer switch.

### Usage

Make sure that you are in the correct context for the feature that you are trying to enable VSX synchronization:

| Feature context for enabling VSX synchronization | Command for accessing correct context for the `vsx-sync` command* |
|---|---|
| Access list context for an ACL type, such as IPv4, IPv6, or MAC. | access-list *<ACL-TYPE>* *<ACL-NAME>* |
| Class context for a class type, such as IPv4, IPv6, or MAC. | class *<CLASS-TYPE>* *<CLASS-NAME>* |
| Object group context for IPv4 | object-group ip address *<OBJECT-GROUP-NAME>* |

| Feature context for enabling VSX synchronization | Command for accessing correct context for the `vsx-sync` command* |
|---|---|
| Object group context for IPv6 | `object-group ipv6 address` *<OBJECT-GROUP-NAME>* |
| Object group context for ports | `object-group port` *<OBJECT-GROUP-NAME>* |
| Policy-based routing profile context | `pbr` *<ACTION-LIST-NAME>* |
| Policy context | `policy` *<POLICY-NAME>* |
| QoS queue profile context | `qos queue-profile` *<QUEUE-PROFILE-NAME>* |
| QoS schedule profile context | `qos schedule-profile` *<SCHEDULE-PROFILE-NAME>* |
| VLAN context | `vlan` *<ID>* |

*The commands listed in this column are entered at the `switch(config)#` prompt, as shown in the following examples.

## Examples

Enabling VSX synchronization for this IPv4 access list context to the secondary peer:

```
switch(config)# access-list ip ITBoston
switch(config-acl-ip)# vsx-sync
```

Enabling VSX synchronization for this IPv6 access list context to the secondary peer:

```
switch(config)# access-list ipv6 ITRoseville
switch(config-acl-ipv6)# vsx-sync
```

Enabling VSX synchronization for this MAC access list context to the secondary peer:

```
switch(config)# access-list mac ITBangalore
switch(config-acl-ipv6)# vsx-sync
```

Enabling VSX synchronization for this IPv4 class context to the secondary peer:

```
switch(config)# class ip ITengineering
switch(config-class-ip)# vsx-sync
```

Enabling VSX synchronization for this object group context for IPv4:

```
switch(config)# object-group ip address group1
switch(config-addrgroup-ip)# 1.1.1.1
switch(config-addrgroup-ip)# vsx-sync
```

Enabling VSX synchronization for this QoS queue profile context to the secondary peer:

```
switch(config)# qos queue-profile test_queue_profile
switch(config-queue)# vsx-sync
```

Enabling VSX synchronization for this QoS schedule profile context to the secondary peer:

```
switch(config)# qos schedule-profile test_queue_profile1
switch(config-schedule)# vsx-sync
```

Enabling VSX synchronization for this PBR profile context to the secondary peer:

```
switch(config)# pbr engineering
switch(config-pbr-action-list-engineering)# vsx-sync
```

Enabling VSX synchronization for this policy context to the secondary peer:

```
switch(config)# policy ITPaloAlto
switch(config-policy)# vsx-sync
```

Enabling VSX synchronization for this VLAN context to the secondary peer:

```
switch(config)# vlan 1
switch(config-vlan-1)# vsx-sync
```

Disabling VSX synchronization for this IPv4 class context to the secondary peer:

```
switch(config)# class ip ITengineering
switch(config-class-ip)# no vsx-sync
```

Disabling VSX synchronization for this object group context for IPv4:

```
switch(config)# object-group ip address group1
switch(config-addrgroup-ip)# no vsx-sync
```

Disabling VSX synchronization for this QoS queue profile context to the secondary peer:

```
switch(config)# qos queue-profile test_queue_profile
switch(config-queue)# no vsx-sync
```

Disabling VSX synchronization for this QoS schedule profile context to the secondary peer:

```
switch(config)# qos schedule-profile test_queue_profile1
switch(config-schedule)# no vsx-sync
```

Disabling VSX synchronization for this PBR profile context to the secondary peer:

```
switch(config)# pbr engineering
switch(config-pbr-action-list-engineering)# no vsx-sync
```

Disabling VSX synchronization for this policy context to the secondary peer:

```
switch(config)# policy ITPaloAlto
switch(config-policy)# no vsx-sync
```

Disabling VSX synchronization for this MAC access list context to the secondary peer:

```
switch(config)# access-list mac ITBangalore
switch(config-acl-ipv6)# no vsx-sync
```

Disabling VSX synchronization for this VLAN context to the secondary peer:

```
switch(config)# vlan 1
switch(config-vlan-1)# no vsx-sync
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |

| 6400 | `config-acl-`*`<ACL-TYPE>`*<br>`config-addrgroup-ip`<br>`config-addrgroup-ipv6`<br>`config-class-`*`<CLASS-TYPE>`*<br>`config-policy`<br>`config-portgroup`<br>`config-pbr-action-list-`*`<ACTION-LIST-NAME>`*<br>`config-queue`<br>`config-schedule-`*`<NAME>`*<br>`config-vlan-`*`<VLAN-ID>`* | Administrators or local user group members with execution rights for this command. |

# vsx-sync (config-if, config-lag-if contexts)

```
vsx-sync {[access-lists] [qos] [rate-limits] [vlans] [policies] [irdp] [portfilter]
[private-vlan port-type] [dhcp-snooping]}
no vsx-sync {[access-lists] [qos] [rate-limits] [vlans] [policies] [irdp] [portfilter]
[private-vlan port-type] [dhcp-snooping]}
```

### Description

Enables VSX synchronization for the following for a logical interface or a LAG instance:

- Access lists
- IRDP configurations
- QoS
- Rate limits
- Port filter configurations
- VLAN associations
- PVLAN port type configurations
- DHCP snooping

This command enables VSX synchronization for individual associations and to the combination of associations to the interface context. To synchronize the associations, you must configure the same interface on the peer switch.

When enabling VSX synchronization under a physical interface, under a VLAN interface, or a VSX LAG, create on the secondary switch the physical interface, VLAN interface, or VSX LAG with the same name and routing setting as on the primary switch. For example, if the primary switch has a physical interface of 1/1/1, you must create another physical interface of 1/1/1 on the secondary switch. Also, if the primary VSX switch has routing enabled, the secondary switch must have routing enabled. Once the name and routing information is the same, VSX synchronization synchronizes the additional configuration information from the primary VSX switch to the secondary VSX switch.

The **no** form of this command disables VSX synchronization, but it does not remove the feature configurations from the secondary peer.

| Parameter | Description |
|---|---|
| `{[access-lists] [qos] [rate-limits] [vlans] [policies] [irdp] [portfilter] [private-vlan port-type] [dhcp-snooping]}` | Specifies one or more of the features for which to enable VSX synchronization. |
| `access-lists` | Specifies the access lists that are associated under the interface enabled for VSX syncing. |
| `qos` | Specifies the QoS associated under the interface enabled for VSX syncing. |
| `rate-limits` | Specifies the rate limits that are associated under the interface enabled for VSX syncing. |
| `vlans` | Specifies the VLANs that are associated under the interface enabled for VSX syncing. |
| `policies` | Specifies the classifier |

| Parameter | Description |
|---|---|
| | policies that are associated under the interface enabled for VSX syncing. |
| `irdp` | Specifies the Internet Router Discovery Protocol (IRDP) configurations that are associated under the interface enabled for VSX syncing. |
| `portfilter` | Specifies the port filter configurations that are associated under the interface enabled for VSX syncing. |
| `private-vlan port-type` | Specifies the PVLAN port type configurations that are associated under the interface enabled for VSX syncing. |
| `dhcp-snooping` | Specifies the DHCP snooping configuration parameters that are associated under the interface enabled for VSX syncing. |

## Example

Enabling VSX synchronization for VLANs associated with logical interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# vsx-sync vlans
```

Enabling VSX synchronization for access lists associated with logical interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# vsx-sync access-lists
```

Enabling VSX synchronization for access lists and policies that are associated with logical interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# vsx-sync access-lists policies
```

Enabling VSX synchronization for VLANs and QoS that are associated under logical interface 1/1/5:

```
switch(config)# interface 1/1/5
switch(config-if)# vsx-sync vlans qos
```

Enabling VSX synchronization for rate limits that are associated under logical interface 1/1/5:

```
switch(config)# interface 1/1/5
switch(config-if)# vsx-sync rate-limits
```

Enabling VSX synchronization for rate limits, VLANs, QoS, access lists, policies associated with logical interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# vsx-sync rate-limits vlans qos access-lists policies
```

Enabling VSX synchronization for VLAN 1 under interface LAG 1:

```
switch(config)# interface lag 1
switch(config-lag-if)# vsx-sync vlans
switch(config-lag-if)# vlan trunk native 1
```

Enabling VSX synchronization for an access list under interface LAG 2:

```
switch(config)# interface lag 2
switch(config-lag-if)# vsx-sync access-lists
switch(config-lag-if)# apply access-list ip test1 in
```

Enabling VSX synchronization for a QoS under interface LAG 3:

```
switch(config)# interface lag 3
switch(config-lag-if)# vsx-sync qos
switch(config-lag-if)# apply qos schedule-profile test
```

Enabling VSX synchronization for a rate limit under interface LAG 4:

```
switch(config)# interface lag 4
switch(config-lag-if)# vsx-sync rate-limits
switch(config-lag-if)# rate-limit broadcast 23 kbps
```

Enabling VSX synchronization for a policy named test under interface LAG 5:

```
switch(config)# interface lag 5
switch(config-lag-if)# vsx-sync policies
switch(config-lag-if)# apply policy test in
```

Enabling VSX synchronization for a policy named test1, a rate limit of 23 kbps, a QoS named test, VLAN 1, and an access list named test1 under interface LAG 6:

```
switch(config)# interface lag 6
switch(config-lag-if)# vsx-sync policies rate-limits qos vlans access-lists
switch(config-lag-if)# apply policy test1 in
switch(config-lag-if)# rate-limit broadcast 23 kbps
switch(config-lag-if)# apply qos schedule-profile test
switch(config-lag-if)# vlan trunk native 1
switch(config-lag-if)# apply access-list ip test 1 in
```

Enabling VSX synchronization for a port filter:

```
switch(config)# interface 1/1/1
switch(config-if)# vsx-sync portfilter
```

```
switch(config)# interface lag 1
switch(config-lag-if)# vsx-sync portfilter
```

Enabling VSX synchronization for a PVLAN port type configuration under interface LAG 3:

```
switch(config)# interface lag 3
switch(config-lag-if)# vsx-sync private-vlan-port-type
```

Enabling VSX synchronization for DHCP snooping configuration under interface LAG 9:

```
switch(config)# interface lag 9 multi-chassis
switch(config-lag-if)# vsx-sync dhcp-snooping
```

Disabling VSX synchronization for DHCP snooping configuration under interface LAG 9:

```
switch(config)# interface lag 9 multi-chassis
switch(config-lag-if)# no vsx-sync dhcp-snooping
```

Disabling VSX synchronization for access lists and policies under logical interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# no vsx-sync access-lists policies
```

Disabling VSX synchronization for access lists and policies under interface LAG 2:

```
switch(config)# interface lag 2
switch(config-if)# no vsx-sync access-lists policies
```

Enabling VSX synchronization of IRDP configurations under logical interface 1/1/1. The first five lines in the example configure IRDP and the last line enables VSX synchronization for IRDP configurations associated under interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# ip irdp
switch(config-if)# ip irdp minadvertinterval 550
switch(config-if)# ip irdp maxadvertinterval 850
switch(config-if)# ip irdp holdtime 900
switch(config-if)# vsx-sync irdp
```

Disabling VSX synchronization for a PVLAN port type configuration under interface LAG 8:

```
switch(config)# interface lag 8
switch(config-lag-if)# no vsx-sync private-vlan-port-typeno vsx-sync private-vlan-
```

```
port-type
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.09 | Added `private-vlan-port-type` parameter. Updated examples. |
| 10.07 or earlier | -- |

|---|---|---|
| 6400 | `config-if`<br>`config-lag-if` | Administrators or local user group members with execution rights for this command. |

## vsx-sync (config-vlan-if context)

```
vsx-sync {[active-gateways] [policies]}
no vsx-sync {[active-gateways] [policies]}
```

### Description

Enables VSX sync of active gateways or policies associated under an interface. To synchronize the associations, you must configure the same `interface vlan` on the peer switch.

The **no** form of this command removes VSX synchronization for active gateways or policies associated under an interface, but it does not remove the feature configurations from the secondary peer switch.

| Parameter | Description |
|---|---|
| `{[active-gateways] [policies]}` | Specifies one or more of the features for which to enable VSX synchronization. |
| `access-gateways` | Specifies that active gateways associated with an interface are enabled for VSX syncing. |
| `policies` | Specifies that policies associated with an interface are enabled for VSX syncing. |

### Usage

Configure an SVI on the secondary switch; however, you do not need to run the `vsx-sync active-gateways` command on the secondary VSX switch.

Do not use peer system MAC address as an active-gateway VMAC. If same MAC address is used, the VSX synchronization will try to sync the configuration on secondary switch and cause traffic disruptions.

### Examples

Enabling VSX synchronization for an active gateway associated with VLAN 1:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# vsx-sync active-gateways
```

Enabling VSX synchronization for policies associated with VLAN 1:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# vsx-sync policies
```

Enabling VSX synchronization for active gateways and policies associated with VLAN 1:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# active-gateway ip 10.10.10.10 mac 23:24:25:26:27:28
switch(config-if-vlan)# active-gateway ipv6 fd12:3456:789a:1::1 mac
fd12:3456:789a:1::1 23:24:25:26:27:28
switch(config-if-vlan)# vsx-sync active-gateways policies
```

Disabling VSX synchronization for active gateways associated with VLAN 1:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# no vsx-sync active-gateways
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

## vsx-sync aaa

```
vsx-sync aaa
no vsx-sync aaa
```

### Description

Enables VSX synchronization of all AAA configurations, including user, RADIUS server, and TACACS+ server, on the primary VSX node to the secondary peer switch.

The **no** form of this command removes VSX synchronization of global AAA configurations, but it does not remove the existing global AAA feature configurations from the secondary peer switch.

### Examples

Enabling VSX sync for the AAA configurations to the secondary peer:

```
switch(config)# vsx
switch(config-vsx)# vsx-sync aaa
```

Disabling VSX sync for the AAA configurations to the secondary peer:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync aaa
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

## vsx-sync acl-log-timer

```
vsx-sync acl-log-timer
no vsx-sync acl-log-timer
```

### Description

Enables VSX synchronization of access list log timer configurations on the primary VSX node to the secondary peer.

The **no** form of this command removes VSX synchronization of access list log timer configurations to the secondary peer. However, it does not remove the previously synced configurations from the secondary peer switch.

### Examples

Enabling VSX sync for the access list log timer configurations:

```
switch(config)# access-list log timer 30
switch(config)# vsx
switch(config-vsx)# vsx-sync acl-log-timer
```

Disabling VSX sync for the access list log timer configurations:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync acl-log-timer
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

|---|---|---|
| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

## vsx-sync acl-secure-update

```
vsx-sync acl-secure-update
no vsx-sync acl-secure-update
```

### Description

If this setting is enabled and the primary VSX node has configurations with the access list secure-update feature enabled,  this configuration can synchronize to the secondary peer. This setting is disabled by default.

The **no** form of the command disables the syncing of access list secure-update configurations to the secondary peer, but that does not remove any existing access list secure-update feature configurations from the secondary peer.

### Examples

Enabling VSX sync for configurations with the access list secure-update feature:

```
switch(config)# vsx
switch(config-vsx)# vsx-sync acl-secure-update
```

Disabling VSX sync for configurations with the access list secure-update feature:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync acl-secure-update
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Related Commands

| Command | Description |
|---|---|
| `access-list secure-update` | This command determines if access lists are updated using the secure-update feature. Secure-update is enabled by default. Refer to the *ACLs and Classifiers Policy Guide* for details. |

## vsx-sync arp-security

```
vsx-sync arp-security
no vsx-sync arp-security
```

### Description

Enables VSX synchronization of the ARP security configurations on the primary VSX switch to the secondary peer switch. After you enter `vsx-sync arp-security`, you must enter `vsx-sync mclag-interfaces` for enabling VSX synchronization for the ARP security feature.

The **no** form of this command removes VSX synchronization of ARP security configurations on VLAN mode and LAG interface mode to the secondary peer switch. However, it does not remove the existing ARP security configurations from the secondary peer switch.

### Examples

Enabling of VSX synchronization for ARP security feature configurations to a secondary peer:

```
primary_sw(config)# vsx
primary_sw(config-vsx)# vsx-sync arp-security
primary_sw(config-vsx)# vsx-sync mclag-interfaces
```

Disabling the VSX synchronization for ARP security feature configurations to a secondary peer:

```
primary_sw(config)# vsx
primary_sw(config-vsx)# no vsx-sync arp-security
switch(config-vsx)# no vsx-sync mclag-interfaces
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

## vsx-sync bfd-global

```
vsx-sync bfd-global
no vsx-sync bfd-global
```

### Description

Enables syncing of global BFD configurations, such as `echo-src-ip-address`, `detect-multiplier`, `min-transmit-interval`, and `min-receive-interval`, on the primary VSX node to the secondary peer.

This command enables VSX synchronization only at the top level and not at the context level.

The **no** form of this command disables the syncing of global BFD configurations to the secondary peer, but it does not remove the existing global BFD feature configurations from it.

### Examples

Enabling VSX synchronization for various global BFD configurations:

```
switch(config)# bfd detect-multiplier 1
switch(config)# bfd min-transmit-interval 1000
switch(config)# bfd min-receive-interval 1000
switch(config)# bfd echo-src-ip-address 2.2.2.2
switch(config)# bfd min-echo-receive-interval 1000
switch(config)# vsx
switch(config-vsx)# vsx-sync bfd-global
```

Disabling VSX synchronization for global BFD configurations:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync bfd-global
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |

| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

## vsx-sync bgp

```
vsx-sync bgp
no vsx-sync bgp
```

### Description

Enables syncing of BGP configurations on the primary VSX switch to the secondary peer switch.

The **no** form of this command disables syncing BGP, as path lists, community lists, prefix lists, and route map configurations to the secondary peer, but it does not remove the previously synced configurations from the secondary peer switch.

### Usage

The following BGP configurations are synchronized: as path lists, community lists, prefix lists, and route map configurations. To maintain the uniqueness of a switch in the autonomous system, the BGP router ID, BGP cluster ID, and BGP neighbor update-source are not synchronized. This exclusion is required for BGP functionality to work seamlessly even with VSX topology.

Several settings are also not synced. The `neighbor <IP address> shutdown` setting is not synced because syncing that setting would cause both the primary and secondary VSX nodes towards the core to go down. In route map configurations, the following settings are also not synced from the primary VSX switch to the secondary VSX switch, because the next-hop is always set differently for the primary and secondary VSX peers:

- `set ip nexthop <IP-ADDR>`
- `set ipv6 nexthop global <IP-ADDR>`

If the next-hop must be same for both primary and secondary VSX peers, configure the same value on the individual switches.

### Examples

Enabling VSX sync for the BGP configurations:

```
switch(config)#  ip aspath-list list1 seq 10 permit 10
switch(config)# ip community-list expanded com1 seq 10 permit 10
switch(config)# ip extcommunity-list standard ext1 seq 10 permit rt 10:4
switch(config)# ip prefix-list pref1 seq 10 permit any
switch(config)# route-map rm1 permit
switch(config-route-map-rm1-10)#  match ip next-hop 1.1.1.1
switch(config)#  router bgp 100
switch(config-bgp)# bgp router-id 1.1.1.1
switch(config-bgp)# neighbor 12.1.1.1 remote-as 1
switch(config-bgp)# address-family ipv4 unicast
switch(config-bgp-ipv4-uc)# neighbor 12.1.1.1 activate
switch(config)# vsx
switch(config-vsx)# vsx-sync bgp
```

Disabling VSX sync for the BGP configurations:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync bgp
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

## vsx-sync copp-policy

```
vsx-sync copp-policy
no vsx-sync copp-policy
```

### Description

Enables VSX synchronization of CoPP policy configurations on the primary VSX node to the secondary peer switch.

The **no** form of this command removes VSX synchronization of global CoPP configurations, but it does not remove the existing global CoPP configurations from the secondary peer switch.

### Examples

The first three lines in the following example show the setting of several policy configurations. The last two lines of the example show the enabling of VSX synchronization for CoPP policy configurations.

```
switch(config)# copp-policy mypolicy
switch(config-copp)# class arp-broadcast drop
switch(config-copp)# no class arp-unicast
switch(config)# vsx
switch(config-vsx)# vsx-sync copp-policy
```

Disabling VSX synchronization for global CoPP configurations:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync copp-policy
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|

## vsx-sync dhcp-relay

```
vsx-sync dhcp-relay
no vsx-sync dhcp-relay
```

### Description

Enables VSX synchronization of DHCPv4 and DHCPv6 relay configurations on the primary VSX node to the secondary peer.

The **no** form of the command disables the VSX synchronization of DHCPv4 and DHCPv6 relay configurations to the secondary peer; however, it does not remove the existing DHCPv4 and DHCPv6 relay configurations from the secondary VSX peer.

### Examples

This example enables VSX synchronization for DHCPv4 relay configurations. The first six lines in the example show DHCPv4 relay configurations. The last two lines show how to enable VSX synchronization for the DHCP relay configurations:

```
switch(config)# interface 1/1/1
switch(config-if)# ip helper-address 192.168.10.1
switch(config-if)# ip helper-address 192.168.20.1
switch(config)# interface 1/1/2
switch(config-if)# ip helper-address 192.168.30.1
switch(config)# dhcp-relay option 82
switch(config)# vsx
switch(config-vsx)# vsx-sync dhcp-relay
```

This example enables VSX synchronization for DHCPv6 relay configurations. The first seven lines in the example show DHCPv6 relay configurations. The last two lines show how to enable VSX synchronization for the DHCP relay configurations:

```
switch(config)# dhcpv6-relay
switch(config)# interface 1/1/1
switch(config-if)# ipv6 helper-address unicast 2001:db8:0:1::
switch(config-if)# ipv6 helper-address multicast FF01::1:1000 egress 1/1/2
switch(config)# interface 1/1/2
switch(config-if)# ipv6 helper-address unicast 2001:db8:0:2::
switch(config)# dhcpv6-relay option 79
switch(config)# vsx
switch(config-vsx)# vsx-sync dhcp-relay
```

Disabling VSX synchronization for DHCP relay configurations:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync dhcp-relay
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|

| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

## vsx-sync dhcp-server

```
vsx-sync dhcp-server
no vsx-sync dhcp-server
```

### Description

Enables VSX synchronization of all DHCPv4 server configurations, including external storage configurations, on the primary VSX node to the secondary peer. Only the primary VSX node answers DHCP service requests, and leases can only be exported from the primary VSX node.

The **no** form of the command disables VSX synchronization of DHCPv4 server configurations to the secondary peer; however, it does not remove the existing DHCPv4 server feature configurations from the secondary peer.

### Examples

The first six lines in the following example show the setting of a DHCPv4 server configuration. The last line of the example shows the enabling of VSX synchronization for global DHCPv4 server configurations.

```
switch(config)# dhcp-server external-storage dhcp-dbs file dhcpv4_lease_file delay
600
switch(config)# dhcp-server vrf default
switch(config-dhcp-server)# pool test
switch(config-dhcp-server-pool)# range 10.0.0.20 10.0.0.30
switch(config-dhcp-server-pool)# default-router 10.0.0.1 10.0.0.10
switch(config-dhcp-server-pool)# static-bind ip 10.0.0.1 mac 24:be:05:24:75:73
switch(config)# vsx
switch(config-vsx)# vsx-sync dhcp-server
```

Disabling VSX synchronization for global DHCPv4 server configurations:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync dhcp-server
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

|---|---|---|
| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

## vsx-sync dhcp-snooping

```
vsx-sync dhcp-snooping
no vsx-sync dhcp-snooping
```

### Description

Enables VSX synchronization of DHCP snooping configurations on the primary node to the secondary peer switch.

To synchronize DHCP snooping configurations associated with a particular VLAN and interface, configure the same VLAN and interface on the peer device.

The **no** form of this command disables syncing DHCP snooping configurations to the secondary peer, but it does not remove the previously synced configurations from the secondary peer.

### Examples

Enabling VSX sync for the DHCP snooping configurations to the secondary peer:

```
switch(config)# vsx
switch(config-vsx)# vsx-sync dhcp-snooping
```

Disabling VSX sync for the DHCP snooping configurations to the secondary peer:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync dhcp-snooping
```

#### In the DHCP snooping guard policy context

Enabling VSX-sync for the DHCPv6 snooping guard policy pol:

```
switch(config)# dhcpv6-snooping guard-policy po1
switch(config-dhcpv6-guard-policy)# vsx-sync
```

Disabling VSX-sync for the DHCPv6 snooping guard policy pol:

```
switch(config)# dhcpv6-snooping guard-policy po1
switch(config-dhcpv6-guard-policy)# no vsx-sync
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

|---|---|---|
| 6400 | `config-vsx`<br>`config-dhcpv6-guard-policy` | Administrators or local user group members with execution rights for this command. |

## vsx-sync dhcpv6-server

```
vsx-sync dhcpv6-server
no vsx-sync dhcpv6-server
```

### Description

Enables VSX synchronization of all DHCPv6 server configurations, including external storage configurations, on the primary VSX node to the secondary peer.

The **no** form of the command disables VSX synchronization of DHCPv6 server configurations to the secondary peer; however, it does not remove the existing DHCPv6 server feature configurations from the secondary peer.

### Examples

The first six lines in the following example show the setting of a DHCPv6 server configuration. The last two lines of the example show the enabling of VSX synchronization for global DHCPv6 server configurations.

```
switch(config)# dhcpv6-server external-storage dhcpv6-dbs file dhcpv6_lease_file
delay 600
switch(config)# dhcpv6-server vrf default
switch(config-dhcp-server)# pool test
switch(config-dhcpv6-server-pool)# range 2001::1 2001::10 prefix-len 64
switch(config-dhcpv6-server-pool)# option 22 ipv6 2001::12
switch(config-dhcpv6-server-pool)# static-bind ipv6 2001::11 client-id
1:0:a0:24:ab:fb:9c
switch(config)# vsx
switch(config-vsx)# vsx-sync dhcpv6-server
```

Disabling VSX synchronization for global DHCPv6 server configurations:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync dhcpv6-server
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

## vsx-sync dns

```
vsx-sync dns
no vsx-sync dns
```

### Description

Enables VSX synchronization of the global DNS configurations on the primary VSX node to the secondary peer switch.

The **no** form of this command removes VSX synchronization for global DNS configurations, but it does not remove the feature configurations from the secondary peer switch.

### Examples

The first line in the following example shows the setting of a DNS configuration. The last two lines of the example show the enabling of VSX synchronization for global DNS configurations.

```
switch(config)# ip dns domain-name domain.com
switch(config)# vsx
switch(config-vsx)# vsx-sync dns
```

Disabling VSX synchronization for global DNS configurations:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync dns
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |

| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

## vsx-sync evpn

```
vsx-sync evpn
no vsx-sync evpn
```

### Description

Enables syncing of all EVPN context-related configurations on primary VSX node to the secondary peer switch.

The **no** form of this command disables syncing EVPN configurations to the secondary peer, but it does not remove the previously synced configurations from the secondary peer switch.

As a prerequisite, VLAN vsx-sync must be enabled separately for the VLAN configurations inside EVPN context to get synced.

### Examples

Enabling VSX sync for the EVPN configurations:

```
switch(config)# vlan 2
switch(config-vlan-2)# vsx-sync
switch(config)# evpn
switch(config-evpn)# vlan 2
switch(config-evpn-vlan-2)# rd 5:5
switch(config-evpn-vlan-2)# route-target export 1:1
switch(config-evpn-vlan-2)# route-target import 1:1
switch(config)# vsx
switch(config-vsx)# vsx-sync evpn
```

Disabling VSX sync for the EVPN configurations:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync evpn
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

## vsx-sync icmp-tcp

```
vsx-sync icmp-tcp
no vsx-sync icmp-tcp
```

### Description

Enables VSX synchronization of IP ICMP configurations, including `ip icmp unreachable`, `ip icmp redirect`, and `ip icmp throttle` configurations, on primary VSX node to the secondary peer.

The **no** form of the command disables the VSX synchronization of IP ICMP configurations to the secondary peer. However, it does not remove the existing IP ICMP configurations from the secondary VSX peer.

### Examples

Enabling VSX synchronization for IP ICMP configurations:

```
switch(config)# vsx
switch(config-vsx)# vsx-sync icmp-tcp
```

Disabling VSX synchronization for IP ICMP configurations:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync icmp-tcp
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

## vsx-sync keychain

```
vsx-sync keychain
no vsx-sync keychain
```

### Description

Enables synchronizing of key chain configurations on primary VSX node to the secondary peer. There is no configuration synchronization from secondary to primary peer.

If any additional modification or configuration is made on the primary for the key chain set of features, the features will be auto-synchronized.

The **no** form of the command disables synchronizing key chain configurations to the secondary peer. But it does not remove the previously synchronized configurations from the secondary peer.

### Examples

Enabling synchronizing of key chain configurations on primary VSX node to the secondary peer:

```
switch(config)# keychain ospf_keys
switch(config-keychain)# key 1
switch(config-keychain-key)# send-lifetime start-time 10:10:10 10/25/2019 end-time
10:10:10 11/25/2019
switch(config-keychain-key)# accept-lifetime duration infinite
switch(config)# vsx
switch(config-vsx)# vsx-sync keychain
```

Disabling synchronizing key chain configurations to the secondary peer:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync keychain
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

## vsx-sync lldp

```
vsx-sync lldp
no vsx-sync lldp
```

### Description

Enables VSX synchronization of the LLDP configurations on the primary VSX node to the secondary peer.

The **no** form of this command disable VSX synchronization of LLDP configurations to the secondary peer, but it does not remove the existing LLDP feature configurations from the secondary peer switch.

### Examples

The first line in the following example shows the setting of an LLDP configuration. The last two lines of the example show the enabling of VSX synchronization for LLDP configurations.

```
switch(config)#  lldp reinit 6
switch(config)# vsx
switch(config-vsx)# vsx-sync lldp
```

Disabling VSX synchronization of LLDP configurations:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync lldp
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|

## vsx-sync loop-protect-global

```
vsx-sync loop-protect-global
no vsx-sync loop-protect-global
```

### Description

Enables the VSX synchronization of global loop protect configurations, such as transmit-interval and re-enable-timer, on the primary VSX node to the secondary peer switch. To enable VSX synchronization at the context level for this feature, enter the `vsx-sync mclag-interfaces` command at the context level.

The **no** form of this command removes VSX synchronization of global loop protect configurations, but it does not remove the existing global loop protect feature configurations from the secondary peer switch.

### Examples

The first two lines in the following example show the setting of global loop protect configurations. The last two lines of the example show the enabling of VSX synchronization for global loop protect configurations.

```
switch(config)# loop-protect transmit-interval 10
switch(config)# loop-protect re-enable-timer 300
switch(config)# vsx
switch(config-vsx)# vsx-sync loop-protect-global
```

Disabling VSX synchronization of global loop protect configurations:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync loop-protect-global
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

## vsx-sync mac-lockout

Applies only to the Aruba 6400 Switch Series.

```
vsx-sync mac-lockout
no vsx-sync mac-lockout
```

### Description

Enables VSX synchronization of the MAC Lockout configurations on the primary VSX node to the secondary peer.

The **no** form of this command disables syncing MAC Lockout configurations to the secondary peer. However, it does not remove the existing MAC Lockout feature configurations from the secondary peer.

### Examples

Enabling VSX synchronization for MAC Lockout configurations:

```
switch(config)# mac-lockout 10:10:10:10:10:10
switch(config)# vsx
switch(config-vsx)# vsx-sync mac-lockout
```

Disabling VSX synchronization for MAC Lockout configurations:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync mac-lockout
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

## vsx-sync mclag-interfaces

```
vsx-sync mclag-interfaces
no vsx-sync mclag-interfaces
```

### Description

Enables the VSX synchronization of VSX LAG interface associations and attributes on the primary VSX switch to the secondary peer switch. The Usage section in this topic provides a listing of specific associations and attributes that are synchronized to the secondary switch.

The **no** form of this command removes VSX synchronization of global VSX LAG and attributes, but it does not remove the existing VSX LAG feature configurations from the secondary peer switch.

### Usage

The VSX LAG interface associations and attributes that support VSX synchronization are for example:

Interface associations:

- Access lists
- Policies
- QoS
- Port access
- Port filters
- Rate limits
- VLANs

Supported attributes:

- LAG description
- LACP
- Loop protect
- QoS trust
- sFlow
- STP

This configuration overrides the existing VSX synchronization associations created under the VSX LAG interface context. Also with this configuration, the system blocks further configuration of VSX synchronization associations under the VSX LAG context.

### Examples

The first four lines in the following example show the creation and configuration of a VSX LAG. The last two lines of the example show the enabling of VSX synchronization for VSX LAG interface associations and attributes.

```
switch(config)# interface lag 1 multi-chassis
switch(config-lag-if)# access-list ip MY_IP_ACL in
switch(config-lag-if)# rate-limit broadcast 50 kbps
switch(config-lag-if)# qos trust cos
switch(config-lag-if)# exit
switch(config)# vsx
switch(config-vsx)# vsx-sync mclag-interfaces
```

Disabling the VSX synchronization of VSX LAG interface associations and attributes:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync mclag-interfaces
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

## vsx-sync nd-snooping

```
vsx-sync nd-snooping
no vsx-sync nd-snooping
```

### Description

Enables VSX synchronization of ND snooping configurations on the primary VSX node to the secondary peer switch.

To synchronize ND snooping configurations associated with a particular VLAN and interface, configure the same VLAN and interface on the peer device.

When RA guard policy is enabled, this command also synchronizes RA guard policy related configurations.

The **no** form of this command disables syncing ND snooping configurations to the secondary peer, but it does not remove the previously synced configurations from the secondary peer.

### Examples

Enabling VSX sync for the ND snooping configurations to the secondary peer:

```
switch(config)# interface 1/1/3
switch(config-if)# no routing
switch(config-if)# nd-snooping trust
switch(config)# vlan 2
switch(config-vlan-2)# nd-snooping
switch(config-vlan-2)# nd-snooping ra-drop
switch(config-vlan-2)# nd-snooping prefix-list 2001::2/64
switch(config)# vsx
switch(config-vsx)# vsx-sync nd-snooping
```

Disabling VSX sync for the ND snooping configurations to the secondary peer:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync nd-snooping
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

## vsx-sync neighbor

```
vsx-sync neighbor
no vsx-sync neighbor
```

### Description

Enables VSX synchronization of IPv4 and IPv6 static neighbors configuration on primary VSX node to the secondary peer. There is no configuration sync from secondary to primary peer. If any new modification or additional configuration is made on the primary node for IPv4 and IPv6 static neighbors configuration, they will be auto-synced.

The **no** form of this command VSX synchronization of IPv4 and IPv6 static neighbors configurations to the secondary peer, but it does not remove the previously synced configurations from the secondary peer switch.

### Examples

Enabling VSX sync for the IPv4 and IPv6 static neighbors configurations:

```
DUT-1 (config-vsx)# show run in vlan127
interface vlan127
               ip address 137.1.1.1/16
               ipv6 address 7f00::1/64
               arp ipv4 137.1.1.35 mac 00:12:01:00:00:1a
               arp ipv4 137.1.1.70 mac 00:12:01:00:00:3d
               exit
DUT-1(config-vsx)
switch(config)# vsx
switch(config-vsx)# vsx-sync neighbor
```

Disabling VSX sync for the IPv4 and IPv6 static neighbors configurations:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync neighbor
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

## vsx-sync ospf

```
vsx-sync ospf
no vsx-sync ospf
```

### Description

Enables syncing of OSPF (including OSPFv2 and OPSFv3), route map, and key chain configurations on the primary VSX switch. There is no configuration sync from secondary to primary peer.

To synchronize OSPF configurations at the port level context, configure the same port on the peer device.

The **no** form of this command disables syncing of OSPF, route map, and key chain configurations to the secondary peer. But it does not remove the previously synced configurations from the secondary peer switch.

The OSPF router ID is not synchronized. This exclusion is needed because the router ID uniquely identifies the router. The two OSPF routers with the same router ID do not form an adjacency between them.

### Examples

Enabling VSX sync for the OSPF configurations to the secondary peer:

```
switch(config)# router ospf 1
switch(config-ospf-1)# area 0
switch(config-ospf-1)# area 1 nssa
switch(config-ospf-1)# area 2 stub
switch(config-ospf-1)# redistribute connected route-map map1
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# max-metric router-lsa on-startup
switch(config-ospfv3-1)# bfd all-interfaces
switch(config-if)# ip ospf 1 area 0
switch(config-if)# ip ospf hello-interval 33
switch(config-if)# ipv6 ospfv3 1 area 0
switch(config-if)# ipv6 ospfv3 dead-interval 55
switch(config)# vsx
switch(config-vsx)# vsx-sync ospf
```

Disabling VSX sync for the OSPF configurations to the secondary peer:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync ospf
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

# vsx-sync policy-global

```
vsx-sync policy-global
no vsx-sync policy-global
```

### Description

Enables VSX synchronization of global classifier policy configurations on the primary VSX node to the secondary peer switch.

The **no** form of this command disables VSX synchronization of global policy configurations to the secondary peer, but it does not remove the previously synced configurations from the secondary peer switch.

### Examples

Enabling VSX sync for the global policy configurations to the secondary peer:

```
switch(config)# apply policy testPolicy in
switch(config)# vsx
switch(config-vsx)# vsx-sync policy-global
```

Disabling VSX sync for the global policy configurations to the secondary peer:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync policy-global
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

## vsx-sync port-access

```
vsx-sync port-access
no vsx-sync port-access
```

### Description

Enables VSX synchronization of port-access configurations such as MAC groups, LLDP groups, CDP groups, Port-Access roles, and Device-Profile to the secondary peer.

The **no** form of this command disables VSX synchronization of port-access configurations to the secondary peer, but it does not remove the previously synced configurations from the secondary peer switch.

### Usage

The port-access configurations that support VSX synchronization are:

- port-access cdp-group
- port-access device-profile
- port-access lldp-group
- mac-group

- port-access role with the following attributes
  - auth-mode
  - gbp
  - mtu
  - poe-allocate-by
  - poe-priority
  - private-vlan
  - stp-admin-edge-port
  - trust-mode
  - vlan

### Examples

Enabling VSX sync for port-access configuration:

```
switch(config)# port-access lldp-group l1
switch(config-lldp-group)# match sysname 6405
switch(config-lldp-group)# exit
switch(config)# vsx-sync mclag-interfaces
switch(config)# port-access role r1
switch(config-pa-role)# private-vlan port-type secondary
switch(config-pa-role)# exit
switch(config)# port-access device-profile dp1
switch(config-device-profile)# enable
switch(config-device-profile)# associate role r1
switch(config-device-profile)# associate lldp-group l1
```

Disabling VSX sync for port-access configuration:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync port-access
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.14 | Added VSX synchronization options for port-access configurations. |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

# vsx-sync private-vlan-global

```
vsx-sync private-vlan-global
no vsx-sync private-vlan-global
```

### Description

Enable sync for private VLAN global configuration on the primary VSX node to the secondary peer.

Private VLAN global configuration syncing is supported on the switch by configuring the feature name under **vsx** configuration context.

There are no parameters in this command.

The **no** form of this command disables Private VLAN global configuration syncing to the secondary peer.

### Examples

```
switch(config)# vsx
switch(config-vsx)# vsx-sync private-vlan-globalx

switch(config)# vsx
switch(config-vsx)# no vsx-sync private-vlan-global
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.14 | Command introduced. |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

# vsx-sync qos-global

```
vsx-sync qos-global
no vsx-sync qos-global
```

### Description

Enables the VSX synchronization of global QoS configurations, such as CoS map, DSCP map, and trust policy, on the primary VSX node to the secondary peer switch. To enable VSX synchronization at the context level for this feature, enter the `vsx-sync qos` command at the context level.

The **no** form of this command removes VSX synchronization of global QoS configurations, but it does not remove the existing global QoS feature configurations from the secondary peer switch.

### Examples

The first five lines in the following example show the setting of global QoS configurations. The last two lines of the example show the enabling of VSX synchronization for global QoS configurations.

```
switch(config)# qos cos-map 1 local-priority 0
switch(config)# qos cos-map 0 local-priority 1
switch(config)# qos cos-map 2 local-priority 2
switch(config)# qos dscp-map 2 local-priority 3
switch(config)# qos trust dscp
switch(config)# vsx
switch(config-vsx)# vsx-sync qos-global
```

Disabling VSX synchronization of global QoS configurations:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync qos-global
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

## vsx-sync route-map

```
vsx-sync route-map
no vsx-sync route-map
```

### Description

Enables syncing of all As Path lists, community lists, prefix lists, and route map configurations on primary VSX node to the secondary peer switch. There is no configuration sync from the secondary to primary peer.

The **no** form of this command disables syncing of As Path lists, community lists, prefix lists, and route map configurations to the secondary peer, but it does not remove the previously synced configurations from the secondary peer switch.

When vsx-sync for BGP or OSPF is configured, route map configurations are synchronized from primary VSX node to the secondary peer due to the dependency in configurations.

### Examples

Enabling VSX sync for the route map configurations:

```
switch(config)#  ip aspath-list list1 seq 10 permit 10
switch(config)# ip community-list expanded com1 seq 10 permit 10
switch(config)# ip extcommunity-list standard ext1 seq 10 permit rt 10:4
switch(config)# ip prefix-list pref1 seq 10 permit any
switch(config)# route-map rm1 permit
switch(config-route-map-rm1-10)# match ip next-hop 1.1.1.1
switch(config)# vsx
switch(config-vsx)# vsx-sync route-map
```

Disabling VSX sync for the route map configurations:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync route-map
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

|---|---|---|
| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

## vsx-sync sflow

```
vsx-sync sflow
no vsx-sync sflow
```

### Description

Enables VSX synchronization of the sFlow configurations on the primary VSX node to the secondary peer.

The **no** form of this command removes VSX synchronization of global sFlow configurations, but it does not remove the existing global sFlow feature configurations from the secondary peer switch.

### Usage

To maintain compliance with sFlow collector functionality for non-VSX topology, the `vsx-sync sflow` command on primary VSX peer is expected to sync all sFlow configurations, except for the `agent-ip` configuration. This exclusion is required for sFlow collector functionality to work seamlessly even with VSX topology.

### Examples

The first line in the following example shows the setting of an sFlow configuration. The last two lines of the example show the enabling of VSX synchronization for sFlow configurations.

```
switch(config)# sflow agent-ip 10.0.0.100
switch(config)# vsx
switch(config-vsx)# vsx-sync sflow
```

Disabling VSX synchronization of global sFlow configurations:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync sflow
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

## vsx-sync sflow-global

```
vsx-sync sflow-global
no vsx-sync sflow-global
```

### Description

Enables VSX synchronization of the sFlow global configurations on the primary VSX node to the secondary peer.

The **no** form of this command disables VSX synchronization of global sFlow configurations, but it does not remove the existing sFlow feature configurations from the secondary peer switch.

### Usage

To maintain compliance with sFlow collector functionality for non-VSX topology, the `vsx-sync sflow` command on primary VSX peer is expected to sync all sFlow configurations, except for the `agent-ip` configuration. This exclusion is required for sFlow collector functionality to work seamlessly even with VSX topology. VSX syncs only the global sFLow configurations and not the sFlow configurations under physical or LAG interfaces.

### Examples

The first line in the following example shows the setting of an sFlow configuration. The last two lines of the example show the enabling of VSX synchronization for sFlow configurations.

```
switch(config)# sflow collector 1.1.1.1
switch(config)# vsx
switch(config-vsx)# vsx-sync sflow-global
```

Disabling VSX synchronization of global sFlow configurations:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync sflow-global
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |

| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

## vsx-sync snmp

```
vsx-sync snmp
no vsx-sync snmp
```

### Description

Enables VSX synchronization of SNMP configurations on the primary VSX node to the secondary peer.

The **no** form of this command removes VSX synchronization of global SNMP configurations, but it does not remove the existing global SNMP feature configurations from the secondary peer switch.

### Examples

Enabling VSX synchronization for SNMP configuration:

```
switch(config)# vsx
switch(config-vsx)# vsx-sync snmp
```

Disabling VSX synchronization for SNMP configuration:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync snmp
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |

| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

## vsx-sync ssh

```
vsx-sync ssh
no vsx-sync ssh
```

### Description

Enables VSX synchronization of SSH server configurations on the primary VSX node to the secondary peer switch.

The **no** form of this command removes VSX synchronization of global SSH configurations, but it does not remove the existing global SSH feature configurations from the secondary peer switch.

### Examples

The first line in the following example shows the setting of an SSH server configuration. The last two lines of the example show the enabling of VSX synchronization for SSH server configurations.

```
switch(config)# ssh certified-algorithms-only
switch(config)# vsx
switch(config-vsx)# vsx-sync ssh
```

Disabling VSX synchronization for global SSH server configurations:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync ssh
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |

| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

## vsx-sync static-routes

```
vsx-sync static-routes
no vsx-sync static-routes
```

### Description

Enables VSX synchronization of static route configurations on the primary VSX node to the secondary peer switch.

The **no** form of this command removes VSX synchronization of global static route configurations, but it does not remove the existing global static route feature configurations from the secondary peer switch.

### Examples

Enabling VSX synchronization for static routes:

```
switch(config)# vsx
switch(config-vsx)# vsx-sync static-routes
```

Disabling VSX synchronization for static routes:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync static-routes
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

# vsx-sync stp-global

```
vsx-sync stp-global
no vsx-sync stp-global
```

## Description

Enables the VSX synchronization of global STP configurations on the primary VSX node to the secondary peer switch. Use the `vsx-sync mclag-interfaces` command to sync context level spanning trees. To enable VSX synchronization at the context level for this feature, enter the `vsx-sync mclag-interfaces` command at the context level.

The **no** form of this command removes VSX synchronization of global STP configurations, but it does not remove the existing global STP feature configurations from the secondary peer switch.

## Examples

The first two lines in the following example show the setting of global STP configurations. The last two lines of the example show the enabling of VSX synchronization for global STP configurations.

```
switch(config)# spanning-tree config-name abc
switch(config)# spanning-tree config-revision 1
switch(config)# vsx
switch(config-vsx)# vsx-sync stp-global
```

Disabling VSX synchronization of global STP configurations:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync stp-global
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

# vsx-sync telnet

```
vsx-sync telnet
no vsx-sync telnet
```

## Description

Enables VSX synchronization of Telnet server configurations from the primary VSX node to the secondary peer. To synchronize Telnet configurations associated with a particular VRF, you need to configure the same VRF on the peer device.

The **no** form of the command disables VSX synchronization of Telnet server configurations to the secondary peer, however, it does not remove the existing Telnet server configurations from the secondary peer.

## Examples

Enabling VSX synchronization of Telnet servers:

```
switch(config)# telnet server vrf main
switch(config)# vsx
switch(config-vsx)# vsx-sync telnet
```

Disabling VSX synchronization of Telnet servers:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync telnet
```

## Command History

|---|---|---|
| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

# vsx-sync time

```
vsx-sync time
no vsx-sync time
```

## Description

Enables VSX synchronization of time-related configurations, including NTP and time zone configurations, on the primary VSX node on the secondary peer switch.

The **no** form of this command removes VSX synchronization of global time-related configurations, but it does not remove the existing global time-related feature configurations from the secondary peer switch.

### Examples

The first two lines in the following example show the setting of time-related configurations. The last two lines of the example show the enabling of VSX synchronization for time-related configurations.

```
switch(config)# ntp authentication
switch(config)# clock timezone utc
switch(config)# vsx
switch(config-vsx)# vsx-sync time
```

Disabling VSX synchronization for time-related configurations:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync time
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

|---|---|---|
| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

## vsx-sync udp-forwarder

```
vsx-sync udp-forwarder
no vsx-sync udp-forwarder
```

### Description

Enables VSX synchronization of UDP forwarder configurations on the primary VSX node to the secondary peer.

The **no** form of the command disables the VSX synchronization of UDP forwarder configurations to the secondary peer; however, it does not remove the existing udp-forwarder configurations from the secondary VSX peer.

### Examples

Enabling VSX synchronization for UDP forwarder configurations:

```
switch(config)# vsx
switch(config-vsx)# vsx-sync udp-forwarder
```

Disabling VSX synchronization for UDP forwarder configurations:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync udp-forwarder
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

## vsx-sync vrrp

```
vsx-sync vrrp
no vsx-sync vrrp
```

### Description

Enables VSX synchronization of all VRRP configurations on the primary VSX node to the secondary peer switch. There is no configuration sync from secondary to primary peer.

To synchronize VRRP configurations at the port level context, the same port must be configured on the peer device with IP address.

The **no** form of this command disables syncing VRRP configurations to the secondary peer, but it does not remove the previously synced configurations from the secondary peer.

BFD IP is the IP address of VRRP peer device. Hence it cannot be synced.

In the owner scenario, in case the priority is synced, both VSX primary and secondary devices will have 255 as their priority. If the primary device goes down and comes up again, the secondary device will still act as the Active in spite of the primary device being the owner. Hence priority cannot be synced.

### Examples

Enabling VSX sync for the VRRP configurations to the secondary peer:

```
switch(config)# router vrrp enable
switch(config-if)# vrrp 1 address-family ipv4
switch(config-if-vrrp)# address 1.1.1.100 primary
switch(config-if-vrrp)# timers advertise 1000
switch(config-if-vrrp)# no shutdown
switch(config-if)# vrr 1 address-family ipv6
switch(config)# vsx
switch(config-vsx)# vsx-sync vrrp
```

Disabling VSX sync for the VRRP configurations to the secondary peer:

```
switch(config)#
```

```
switch(config-vsx)# no vsx-sync vrrp
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6400 | `config-vsx` | Administrators or local user group members with execution rights for this command. |

## vsx-sync vsx-global

```
vsx-sync vsx-global
no vsx-sync vsx-global
```

### Description

Enables VSX synchronization of global VSX configurations on the primary VSX node to the secondary peer.

The **no** form of the command disables VSX synchronization of global VSX configurations to the secondary peer; however, it does not remove the existing VSX feature configurations from the secondary peer.

### Usage

The following commands are synced from primary VSX node to secondary VSX node:

- inter-switch-link dead-interval *<DEAD-INTERVAL>*
- inter-switch-link hello-interval *<HELLO-INTERVAL>*
- inter-switch-link hold-time *<HOLD-INTERVAL>*
- inter-switch-link peer-detect-interval *<PEER-DETECT-INTERVAL>*
- keepalive dead-interval *<DEAD-INTERVAL>*
- keepalive hello-interval *<HELLO-INTERVAL>*
- keepalive udp-port *<PORT-NUM>*
- linkup-delay-timer *<DELAY-TIMER>*
- split-recovery
- system-mac *<MAC-ADDR>*

### Examples

The first three lines in the following example show the setting of global VSX configurations. The last line in the example shows the enabling of VSX synchronization for global VSX configurations.

```
switch(config)# vsx
switch(config-vsx)# inter-switch-link dead-interval 15
switch(config-vsx)# inter-switch-link hello-interval 2
switch(config-vsx)# inter-switch-link hold-time 1
switch(config-vsx)# vsx-sync vsx-global
```

Disabling VSX synchronization for global VSX configurations:

```
switch(config)# vsx
switch(config-vsx)# no vsx-sync vsx-global
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

| Release | Modification |
|---|---|

## vsx update-software

vsx update-software *<REMOTE-URL>* [vrf *<VRF-NAME>*]

### Description

This command lets you update the software.

| Parameter | Description |
|---|---|
| `<REMOTE-URL>` | Specifies the TFTP URL for downloading the software. Syntax: `tftp://{<IP-ADDRESS>\|<HOSTNAME>}[:<PORT>] [;blocksize=<VAL>]/<FILE-NAME>` |
| `vrf <VRF-NAME>` | Specifies the VRF name for downloading the software. Optional |

## Usage

This command gives you the option to save the running configuration on the primary and secondary VSX switches. After the command saves the running configuration, it downloads new software from the TFTP server and verifies the download. After a successful verification, the command installs the software to the alternative image of both the VSX primary and secondary switches.

The command displays the status of the VSX primary and secondary switches during the upgrade. The command also refreshes the progress bar as the image update progresses. Do not interrupt the VSX primary CLI session until the software updates completes; however, software update process can be stopped. If you stop the upgrade when the secondary switch has already installed the image in its flash memory or the secondary switch has started the reboot the process, it comes up with the new software. The primary switch continues to have with older software. You can stop the software update process by pressing **ctrl+c**.

## Example

Updating the software using TFTP:

```
switch# vsx update-software tftp://192.168.1.1/XL.10.0x.xxxx vrf mgmt
Do you want to save the current configuration (y/n)? y
The running configuration was saved to the startup configuration.

This command will download new software to the %s image of both the VSX primary
and
secondary systems, then reboot them in sequence. The VSX secondary will reboot
first, followed by the primary.
Continue (y/n)? y
VSX Primary Software Update Status     : <VSX primary software update status>
VSX Secondary Software Update Status   : <VSX secondary software update status>
VSX ISL Status                         : <VSX ISL status>
Progress
[..........................................................................]
Secondary VSX system updated completely. Rebooting primary.
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

## vsx update-software boot-bank

`vsx update-software boot-bank {primary | secondary}`

### Description

Upgrades the VSX pairs using the specified bank on both the devices. This command compares whether the image versions are same in both the primary and secondary switches and reboots them in sequence, the VSX secondary switch followed by VSX primary switch.

Before executing this command, download the software image and install in the required boot banks.

| Parameter | Description |
|---|---|
| `boot-bank` | Specifies the boot bank where the image is pre-staged . |
| `{primary \| secondary}` | Selects either primary or secondary VSX switch for the software upgrade. |

### Usage

This command gives you the option to save the running configuration on the primary and secondary VSX switches. After the command saves the running configuration, it downloads new software from the TFTP server and verifies the download. After a successful verification, the command installs the software to the alternative image of both the VSX primary and secondary switches.

The command displays the status of the VSX primary and secondary switches during the upgrade. The command also refreshes the progress bar as the image update progresses. Do not interrupt the VSX primary CLI session until the software updates completes; however, software update process can be stopped. If you stop the upgrade when the secondary switch has already installed the image in its flash memory or the secondary switch has started the reboot the process, it comes up with the new software. The primary switch continues to have with older software. You can stop the software update process by pressing **ctrl+c**.

### Example

Selecting primary bank for upgrade:

```
switch# vsx update-software boot-bank primary
Do you want to save the current configuration (y/n)? y
The running configuration was saved to the startup configuration.

This command will upgrade both VSX primary and secondary systems, using pre-staged
image 'X' installed in secondary bank on both devices, then reboot
them in sequence. The VSX secondary will reboot first, followed by primary.
Continue (y/n)? y
VSX Primary Software Update Status     : Reboot started
VSX Secondary Software Update Status   : Image updated successfully
VSX ISL Status                         : Up
```

```
Progress [.....................................................................]
Secondary VSX system updated completely. Rebooting primary.
```

Selecting secondary bank for upgrade:

```
switch# vsx update-software boot-bank secondary
Do you want to save the current configuration (y/n)? y
The running configuration was saved to the startup configuration.

This command will upgrade both VSX primary and secondary systems, using pre-staged
image 'X' installed in secondary bank on both devices, then reboot
them in sequence. The VSX secondary will reboot first, followed by primary.
Continue (y/n)? y
VSX Primary Software Update Status     : Reboot started
VSX Secondary Software Update Status   : Image updated successfully
VSX ISL Status                         : Up
Progress [......................................................................]
Secondary VSX system updated completely. Rebooting primary.
```

For more information on features that use this command, refer to the Virtual Switching Extension (VSX) Guide for your switch model.

### Command History

# Chapter 168
# VXLAN commands

## interface vxlan

```
interface vxlan 1 [mode ipv4|ipv6]
no interface vxlan 1 [mode ipv4|ipv6]
```

### Description

Creates VXLAN interface 1 and changes to the **config-vxlan-if** context. A maximum of one VXLAN interface is supported. By default, the VXLAN is disabled. To enable the VXLAN, use the command **no shutdown**.

The **no** form of this command removes VXLAN interface 1. This deletes the VXLAN tunnel, and all VNIs and VLAN-to-VNI mappings associated with it.

| Parameter | Description |
|---|---|
| `1` | Only one VXLAN interface is supported. |
| mode ipv4\|ipv6 | (Optional) Specify if the interface tunnel uses IPv4 or IPv6 addressing. If this parameter is not included, the interface default is IPv6. |

### Examples

Creating VXLAN interface 1:

```
switch(config)# interface vxlan 1
switch(config-vxlan-if)#
```

Deleting VXLAN interface 1:

```
switch(config)# no interface vxlan 1
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.11.1000 | Added IPv6 support for 6300, 6400, 8100, and 8360 Switch Series. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

# inter-vxlan-bridging mode

```
inter-vxlan-bridging mode {deny | static-evpn | static-all}
no inter-vxlan-bridging mode {static-evpn | static-all}
```

## Description

Changes the inter-VXLAN bridging mode on tunnels where VXLAN bridging across tunnels is disabled by default. Default mode is deny.

The **no** form of this command sets the inter-VXLAN bridging mode to the default mode of deny.

| Parameter | Description |
|---|---|
| `deny` | Specifies disabling inter-VXLAN bridging across tunnels. |
| `static-evpn` | Specifies enabling inter-VXLAN bridging between static and dynamic tunnels. |
| `static-all` | Specifies enabling inter-VXLAN bridging between static and all tunnels. |

## Usage

- By default, inter VXLAN bridging is disabled. Therefore, packets arriving over an L2VNI over a VXLAN tunnel are not forwarded on the same L2VNI over another VXLAN tunnel. VXLAN bridging across tunnels is disabled by default.
- To enable VXLAN bridging between static and dynamic tunnels, set the mode to `static-evpn`.
- To enable VXLAN bridging between static and all other static and dynamic tunnels, set the mode to `static-all`. Since dynamic tunnels for single fabric are always full mesh, VXLAN bridging between dynamic tunnels remains blocked.

Configuration of static tunnels is not recommended on VTEPs where split horizon is disabled between the EVPN tunnels, either by using the ibgp-ebgp command or by using the route map- based broadcast-group configuration.

## Examples

Enabling VXLAN bridging between static and dynamic tunnels:

```
switch(config-vxlan-if)# inter-vxlan-bridging-mode static-evpn
```

Disabling VXLAN bridging between static and dynamic tunnels:

```
switch(config-vxlan-if)# no inter-vxlan-bridging-mode static-evpn
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.08 | Command introduced |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-vxlan-if` | Administrators or local user group members with execution rights for this command. |

## mcast-group flood

```
mcast-group flood ip <IP-ADDR>
no mcast-group flood ip <IP-ADDR>
```

### Description

Overrides the automatic assignment of the multicast group IP for the VNI flood replication in underlay multicast replication mode. This command is only usable if **underlay-multicast replication mode** is configured.

The **no** form of this command removes the mcast-group flood configuration.

| Parameter | Description |
|---|---|
| `ip <IP-ADDR>` | Specifies the multicast group address in IPv4 format (x.x.x.x) where x is a decimal number from 0 to 255. |

### Examples

Configuring mcast-group flood for IPv4 multicast address **239.1.14.10**:

```
switch(config)# interface vxlan 1
switch(config-vxlan-if)# vni 1000
switch(config-vni-1000)# mcast-group flood ip 239.1.14.10
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.14 | Command introduced. |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-vni-<VNI-NUMBER>` | Administrators or local user group members with execution rights for this command. |

# replication-mode

```
replication-mode {ingress | underlay-multicast [pim-bidir]
[flood-group-range <IPV4-ADDR>/MASK>]}
no replication-mode {ingress | underlay-multicast [pim-bidir]
[flood-group-range <IPV4-ADDR>/MASK>]}
```

## Description

Configures the global replication mode for overlay flood traffic within a VXLAN domain.

In ingress mode the source VXLAN tunnel endpoint replicates flood or BUM (broadcast, unknown unicast, multicast) traffic for every destination remote tunnel endpoint. This is the default mode when a VXLAN interface is created. The source tunnel endpoint forwards the packet over each point to point unicast VXLAN tunnel.

When underlay-multicast replication mode is configured, then overlay flood traffic replication occurs in the multicast underlay network. The source VXLAN tunnel endpoint forwards the packet to a multipoint VXLAN tunnel.

For the multicast tree to be built dynamically, each flood domain must be mapped to a multicast group IP address. That address is used by the PIM control protocol to build and join the multicast tree in the underlay network.

The replication mode command has auto mapping option called **flood-group-range**. When a multicast group IP address range is specified the software maps the L2 VNIs to the group IP addresses. A static group IP configuration is allowed at the VNI level and if configured will override the automatic assignment of multicast group IP addresses to the VNI.

The group IP range in the **interface vxlan** context and the group IP in the **VNI** context should be consistently configured across all the tunnel endpoint devices in the VXLAN domain.

Static VXLAN tunnels are not supported in underlay-multicast mode.

The following features are not supported when operating in the underlay multicast replication mode:

1. Multi-fabric
2. Static VXLAN
3. GPO
4. EVPN multi-homing (overlay ECMP)
5. VLAN-aware bundling
6. IP-directed broadcast over VXLAN tunnels (IPDB)
7. Network load balancing over VXLAN tunnels (NLB)
8. IPv6 VXLAN mode
9. Fast roaming

The **no** form of this command removes the replication mode configuration.

| Parameter | Description |
|---|---|
| `ingress` | Selects ingress as the replication mode. Overlay flood traffic is replicated in the ingress node using point to point VXLAN tunnel. Default. |
| `underlay-multicast` | Selects underlay multicast as the replication mode. Flood or BUM traffic is replicated in the underlay multicast network via multipoint VXLAN tunnel. |
| `pim-bidir` | Selects pim-bidir. Default multicast routing protocol in **replication-mode underlay-multicast** configuration when the VxLAN interface is operating in IPv4. |
| `flood-group-range` | Specifies the multicast group address range. |
| *<IPV4-ADDR>* | Specifies the multicast group IP address range in IPv4 format (x.x.x.x) where x is a decimal number from 0 to 255. |
| *<MASK>* | Specifies the subnet mask for the group range in CIDR notation as a decimal number from 1-32. |

### Examples

Configuring underlay multicast replication mode:

```
switch(config-vxlan-if)# replication-mode underlay-multicast pim-bidir flood-
group-range 239.1.0.0/24
```

Configuring ingress replication mode:

```
switch(config-vxlan-if)# replication-mode ingress
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.14 | Command introduced. |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-vxlan-if` | Administrators or local user group members with execution rights for this command. |

## routing

```
vni <VNI-NUMBER>
no vni <VNI-NUMBER>
```

### Description

Enables a layer 3 VNI for EVPN VXLAN distributed L3 gateways with symmetric IRB. The VNI is automatically assigned the default VRF. To assign another VRF, use the command **vrf**. Used with EVPN-based VXLANs. If a user tries to enable routing on a VNI already associated to a VLAN, an appropriate warning is displayed.

The **no** form of this command disables symmetric routing on a VNI.

If you enable this configuration, collection of flow tracking statistics is disabled.s

### Examples

Enabling L3 VNI **1000** for EVPN VXLAN distributed L3 gateways with symmetric IRB using VRF **vrf-1**:

```
switch(config)# interface vxlan 1
switch(config-vxlan-if)# vni 1000
switch(config-vni-1000)# routing
switch(config-vni-1000)# vrf vrf-1
```

Disabling L3 VNI **1000** for EVPN VXLAN distributed L3 gateways with symmetric IRB:

```
switch(config)# interface vxlan 1
switch(config-vxlan-if)# vni 1000
switch(config-vni-1000)# no routing
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.14 | Added information related to role based IPFIX. |

## show interface vxlan

```
show interface vxlan <IFNAME>
```

### Description

Shows detailed VXLAN interface information.

| Parameter | Description |
|---|---|
| *<IFNAME>* | Specifies the VXLAN interface to show. |

### Example

*On the 6400 Switch Series, interface identification differs.*

Showing settings for VXLAN interface 1.

```
switch# show interface vxlan1
Interface vxlan1 is up
Admin state is up
Description:VXLAN1
Underlay VRF: default
Destination UDP port: 4789
VTEP source IPv4 address: 1.1.1.1

VNI        Routing   VLAN  VRF       VTEP Peers        Origin

# show interface vxlan multipoint-tunnel

```
show interface vxlan multipoint-tunnel [forwarding-status|flood-
status|brief|statistics|<IP-ADDR>|brief|group-mapping]
```

## Description

Shows detailed VXLAN interface information.

| Parameter | Description |
|---|---|
| `forwarding-status` | Shows multipoint tunnel encap and decap forwarding status. |
| `flood-status` | Shows multipoint tunnel flood status. |
| `statistics` | Shows multipoint tunnel encap and decap statistics. |
| `<IP-ADDR>` | Specifies a multipoint tunnel. |
| `brief` | Shows brief information about multipoint tunnels. |
| `group-mapping` | Shows the underlay-mapped multicast group |

## Example

*On the 6400 Switch Series, interface identification differs.*

Showing information for all multipoint tunnels:

```
switch# show interface vxlan multipoint-tunnel
Destination             :  239.1.0.1
Source                  :  1.1.1.1
Origin                  :  pim-bidir
VRF                     :  default
Type                    :  flood
Encap Status            :  Up
Decap Status            :  Up
Underlay Information
========
    L3 Interface  L2 Interface
    ------------  ------------

## show interface vxlan vni

```
show interface vxlan vni <VNI-NUMBER> vteps
```

### Description

Shows detailed VNI information for VXLAN interface 1.

| Parameter | Description |
|---|---|
| *<VNI-NUMBER>* | Specifies the number for a VNI. Range: 1 to 16777214. |

### Usage

Status can be one of the following:

- operational: Virtual network ID is fully programmed on the switch hardware.
- configuration_error: Virtual network ID programming in the switch hardware failed due to misconfiguration.
- no_hw_resources: Virtual network ID programming failed in the switch hardware due to insufficient resources.
- activating: Initial state of virtual network ID when it is configured.

When a tunnel endpoint is a directly connected via nexthop, then nexthop reachability appears empty (--).

### Example

Showing VNI information:

~~~
switch# show interface vxlan vni
VNI        : 1000          VLAN   : 10
Routing    : disabled      VRF    : --
VNI-Status : operational

VNI        : 2000          VLAN   : 20
Routing    : enabled       VRF    : default
VNI-Status : activating
```
~~~

~~~~
```
switch# show interface vxlan vni 1000
VNI         : 1000          VLAN   : 10
Routing     : disabled      VRF    : --
VNI-Status  : operational
~~~~

```
switch# show interface vxlan vni vteps
VNI         : 1000          VLAN   : 10
Routing     : disabled      VRF    : --
VNI-Status  : operational
VTEPS
=====
    ORIGIN     SOURCE     DESTINATION  VRF      VTEP-STATUS
    ---------  ---------  -----------  -------  ------------
    static     11.0.0.1   11.0.0.2     default  operational

VNI         : 2000          VLAN   : 20
Routing     : enabled       VRF    : default

## show interface vxlan vteps

`show interface vxlan vteps [detail | <IPV4-ADDR>]`

### Description

Shows information about the VTEPs on VXLAN interface 1.

| Parameter | Description |
|---|---|
| `detail` | Show detailed information. |
| *`<IPV4-ADDR>`* | Specifies the IP address of a VTEP peer in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. |

## Usage

Status can be one of the following:

- operational: Tunnel endpoint is fully programmed on the switch hardware.
- configuration_error: Tunnel endpoint programming in the switch hardware failed due to misconfiguration.
- no_hw_resources: Tunnel endpoint programming failed in the switch hardware due to insufficient resources.
- activating: Initial state of tunnel endpoint when it is configured.

When a tunnel endpoint is a directly connected via nexthop, then nexthop reachability appears empty (--).

## Example

*On the 6400 Switch Series, interface identification differs.*

Showing information for VTEPs on a VXLAN interface with IPv4 source and destination IP addresses.

```
switch# show interface vxlan vteps
Source      Destination   Origin   Status           VNI    Routing   VLAN  VRF
----------- ------------- -------- ---------------- ------ --------  ----  -------
-
11.0.0.1    11.0.0.2      static   operational      1000   disabled  10    --
11.0.0.1    12.0.0.2      static   activating       2000   disabled  20    --
11.0.0.1    22.1.1.1      evpn     operational      4000   enabled   --    red
11.0.0.1    23.1.1.1      evpn     activating       4001   enabled   --    blue
```

Showing information the VTEPs on a VXLAN interface with IPv6 source and destination IP addresses.

```
switch# show interface vxlan vteps
Source            Destination       Origin Status       VNI       Routing   VLAN

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## shutdown

```
shutdown
no shutdown
```

### Description

Disables the VXLAN interface and deletes all VXLAN tunnels, segments, and members on the interface.

The **no** form of this command starts the VXLAN interface and creates all VXLAN tunnels and segments. If members are configured, they are added to the VXLAN segment.

## Examples

Disabling VXLAN interface 1:

```
switch(config)# interface vxlan 1 mode ipv4
switch(config-vxlan-if)# shutdown
```

Enabling VXLAN interface 1:

```
switch(config)# interface vxlan 1 mode ipv4
switch(config-vxlan-if)# no shutdown
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

|---|---|---|
| 6300<br>6400 | `config-vxlan-if` | Administrators or local user group members with execution rights for this command. |

# source ip

`source ip <IPV4-ADDR>`

## Description

Configures the source IPv4 address for a VXLAN interface. All VXLAN encapsulated packets use this source IP address in the outer IP header.

If you change an existing source IP address, all tunnels with the old source IP address are deleted, and new tunnels are created with the new source IP address.

The **no** form of this command deletes the source IP address for the VXLAN interface and deletes all VXLAN tunnels using this source IP address.

| Parameter | Description |
|---|---|
| *<IPV4-ADDR>* | Specifies the IP address to assign to the VXLAN interface in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. This must be an address assigned to an existing switch interface, either a loopback interface or a layer 3 interface. |

## Examples

*On the 6400 Switch Series, interface identification differs.*

Configuring the loopback IP address as the source IPv4 address:

```
switch(config)# interface loopback 1
switch(config-loopback-if)# ip address 1.1.1.1/24
switch(config)# interface vxlan 1
switch(config-vxlan-if)# source ip 1.1.1.1
```

Configuring a layer 3 interface IP address as the source IPv4 address:

```
switch(config)# interface 1/1/2
switch(config-if)# no shutdown
switch(config-if)# routing  (6300/6400 only)
switch(config-if)# ip address 11.10.10.1/24
switch(config)# interface vxlan 1
switch(config-vxlan-if)# source ip 10.10.10.1
```

Deleting the source IP address for VXLAN interface 1:

```
switch(config)# interface vxlan 1
switch(config-vxlan-if)# no source ip 10.10.10.1
```

Whenever the VxLAN source IP address or virtual MAC address is changed via the command-line interface or REST API, all the EVPN routes need to be re-advertised with new IPaddresses or MAC address. Thefore, the **clear bgp** command is issued internally for all EVPN neighbors to ensure all EVPN routes get re-advertised.

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.11.1000 | The **<IPV6-ADDR>** parameter is introduced. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-vxlan-if` | Administrators or local user group members with execution rights for this command. |

## source ipv6

`source ipv6 {<IPV6-ADDR>}`

### Description

Configures the source IPv6 address for a VXLAN interface. All VXLAN encapsulated packets use this source IP address in the outer IP header.

If you change an existing source IP address, all tunnels with the old source IP address are deleted, and new tunnels are created with the new source IP address.

The **no** form of this command deletes the source IP address for the VXLAN interface and deletes all VXLAN tunnels using this source IP address.

| Parameter | Description |
|---|---|
| *<IPV6-ADDR>* | Specifies the IP address to assign to the VXLAN interface in IPv6 format (X:X::X:X). This must be an address assigned to an existing switch interface, either a loopback interface or a layer 3 interface. |

### Examples

*On the 6400 Switch Series, interface identification differs.*

Configuring the loopback IP address as the source IPv6 address:

```
switch(config)# interface loopback 1
switch(config-loopback-if)# ipv6 address 1::1/128
switch(config)# interface vxlan 1
switch(config-vxlan-if)# source ipv6 1::11
```

Deleting the source IP address for VXLAN interface 1:

```
switch(config)# interface vxlan 1
switch(config-vxlan-if)# no source ipv6 1::11
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.11.1000 | Command introduced |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-vxlan-if` | Administrators or local user group members with execution rights for this command. |

## system vlan-client-presence-detect

```
system vlan-client-presence-detect
no system vlan-client-presence-detect
```

### Description

Enables VNI mapped VLANs when detecting the presence of a client. When enabled, VNI mapped VLANs are *up* only if there are authenticated clients on the VLAN, or if the VLAN has statically configured ports and those ports are *up*. When not enabled, VNI mapped VLANs are always *up*.

The **no** form of this command disables detection of clients on VNI mapped VLANs.

### Examples

Enabling detection of clients:

```
switch(config)# system vlan-client-presence-detect
```

Disabling detection of clients:

```
switch(config)# no system vlan-client-presence-detect
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## vlan

```
vlan <VLAN-ID>
no vlan <VLAN-ID>
```

### Description

Associates an existing VLAN with a VNI. Only one VLAN can be associated with a VNI and the VNI must have symmetric routing disabled. To change the VLAN associated with a VNI, execute the command `vlan` with a different VLAN ID.

The **no** form of this command removes the specified VLAN from a VNI. Traffic on the specified VLAN is no longer bridged on the VXLAN interface.

| Parameter | Description |
|---|---|
| *<VLAN-ID>* | Specifies the number of an existing VLAN. Range: 2 to 4040. |

### Examples

Assigning VLAN **10** to VNI **1000**:

```
switch(config)# interface vxlan 1
switch(config-vxlan-if)# vni 1000
switch(config-vni-1000)# vlan 10
```

Deleting VLAN **10** from VNI **1000**:

```
switch(config)# interface vxlan 1
switch(config-vxlan-if)# vni 1000
witch(config-vni-1000)# no vlan 10
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

### Command History

| Release | Modification |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-vni-<VNI-NUMBER>` | Administrators or local user group members with execution rights for this command. |

## vni

```
vni <VNI-NUMBER>
no vni <VNI-NUMBER>
```

### Description

Creates a VNI (Virtual Network Identifier) for the VXLAN interface and changes to the `config-vni-<VNI-NUMBER>` context. The VNI identifies a VXLAN segment, which acts as a logical network. The VNI can be associated with either a VLAN or VRF.

- When the VNI is associated with a VLAN, the VNI supports asymmetric routing.
- Enable support for asymmetric routing by executing the `routing` command. By default, the VNI is associated with the default VRF. To use another VRF, execute the `vrf` command.

The **no** form of this command deletes the specified VNI from the VXLAN interface. All VXLAN tunnels, VXLAN segments, and members associated with the VNI are deleted.

| Parameter | Description |
|---|---|
| *<VNI-NUMBER>* | Specifies the number for a VNI. Range: 1 to 16777214. |

### Examples

Creating VNI **1000**:

```
switch(config)# interface vxlan 1
switch(config-vxlan-if)# vni 1000
switch(config-vni-1000)#
```

Deleting VNI **1000**:

```
switch(config)# interface vxlan 1
switch(config-vxlan-if)# no vni 1000
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-vxlan-if` | Administrators or local user group members with execution rights for this command. |

## vrf

```
vrf <VRF-NAME>
no vrf <VRF-NAME>
```

### Description

Changes the VRF associated with an L3 VNI after symmetric routing is activated using the `routing` command. The default VRF should not be configured as an EVPN-enabled VRF. If user tries to configure VRF on a VNI that is already associated with a VLAN, an appropriate error is displayed

If a user tries to remove or reconfigure the VRF attached to a VNI while a policy is applied, an appropriate error is displayed.

The **no** form of this command sets the VRF associated with an L3 VNI to the default VRF.

### Examples

Enabling L3 VNI **1000** using VRF **vrf-1**:

```
switch(config)# interface vxlan 1
switch(config-vxlan-if)# vni 1000
switch(config-vni-1000)# routing
switch(config-vni-1000)# vrf vrf-1
```

Setting the VRF on L3 VNI **1000** to the default VRF:

```
switch(config)# interface vxlan 1
switch(config-vxlan-if)# vni 1000
switch(config-vni-1000)# routing
switch(config-vni-1000)# no vrf vrf-1
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

## vtep-peer

```
vtep-peer <IPV4-ADDR>
no vtep-peer <IPV4-ADDR>
```

### Description

Adds a VTEP peer to a VNI. The VMI must not have routing enabled. The VTEP peer IP address must be reachable for a VXLAN tunnel to be established.

The **no** form of this command removes a VTEP peer from a VNI, which deletes the VXLAN tunnel to the peer.

| Parameter | Description |
|---|---|
| *<IPV4-ADDR>* | Specifies the IP address of a VTEP peer in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. |

### Examples

Adding VTEP peer **10.10.10.1** to VNI **1000**:

```
switch(config)# interface vxlan 1
switch(config-vxlan-if)# vni 1000
switch(config-vni-1000)# vlan 10
switch(config-vni-1000)# vtep-peer 10.10.10.1
```

Deleting VTEP peer **10.10.10.1** from VNI **1000**:

```
switch(config)# interface vxlan 1
switch(config-vxlan-if)# vni 1000
switch(config-vni-1000)# no vtep-peer 10.10.10.1
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

### Command History

| 6300<br>6400 | `config-vni-<VNI-NUMBER>` | Administrators or local user group members with execution rights for this command. |

## vtep-peer-ipv6

```
vtep-peer-ipv6 <IPV6-ADDR>
no vtep-peer-ipv6 <IPV6-ADDR>
```

### Description

Adds an IPv6 VTEP peer to a VNI. The VMI must not have routing enabled. The VTEP peer IP address must be reachable for a VXLAN tunnel to be established.

The **no** form of this command removes a VTEP peer from a VNI, which deletes the VXLAN tunnel to the peer.

| Parameter | Description |
|---|---|
| *<IPV6-ADDR>* | Specifies the IP address of a VTEP peer in IPv6 format (X:X::X:X). |

### Examples

Adding VTEP peer**12::1** to VNI **1000**:

```
switch(config)# interface vxlan 1
switch(config-vxlan-if)# vni 1000
switch(config-vni-1000)# vlan 10
switch(config-vni-1000)# vtep-peer-ipv6 12::1
```

Deleting VTEP peer **12::1** from VNI **1000**:

```
switch(config)# interface vxlan 1
switch(config-vxlan-if)# vni 1000
switch(config-vni-1000)# no vtep-peer-ipv6 12::1
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

|---|---|---|
| 6300<br>6400 | `config-vni-<VNI-NUMBER>` | Administrators or local user group members with execution rights for this command. |

## vxlan-counters aggregate

```
vxlan-counters aggregate
no vxlan-counters aggregate
```

### Description

Attaches VXLAN counters to a VXLAN interface. The counters aggregate statistics for packets sent through the interface. Display statistics with the command `show interface vxlan`. Statistics are only displayed once a valid configuration is made on the interface.

### Example

Enabling counters for VXLAN interface 1.

```
switch(config)# interface vxlan 1
switch(config-vxlan-if)# vxlan-counters aggregate
```

Disabling counters for VXLAN interface 1.

```
switch(config)# interface vxlan 1
switch(config-vxlan-if)# no vxlan-counters aggregate
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

# Chapter 169

# Zeroization commands

## erase all zeroize

```
erase [all] zeroize
```

### Description

Restores the switch to its factory default configuration. You will be prompted before the procedure starts. Once complete, the switch will restart from the primary image with factory default settings.

### Usage

The **erase all** command is always available in the CLI. On running the **erase all** command, the switch is restored to a factory default settings, but retains the enhanced secure mode settings.

The **erase all zeroize** command is not available in the CLI when enhanced secure mode is enabled. This command restore the switch to a factory default settings. On running the **erase all zeroize** command in enhanced secure mode, displays a notification stating that the command is unavailable in enhanced secure mode.

Back up all data before running this command as all configuration settings will be lost.

### Example

Restoring the switch to factory default configuration, except for the enhance secure mode settings:

```
switch# erase all
This command will erase all data and reset the switch to factory
defaults, with the exception of the secure mode setting. This process
will take several minutes to an hour to complete and the switch will
be unavailable during that time.

################ Restoring files ###########################
```

Restoring the switch to factory default configuration only when enhance secure mode settings is disabled.

```
switch# erase all zeroize
This will securely erase all customer data and reset the switch
to factory defaults. This will initiate a reboot and render the
switch unavailable until the zeroization is complete.
This should take several minutes to one hour to complete.
Continue (y/n)? y
The system is going down for zeroization.

# Chapter 170

# ZTP commands

## show ztp information

```
show ztp information
```

### Description

Shows information about Zero Touch Provisioning (ZTP) operations performed on the switch.

### Usage

When a switch configured to use ZTP is booted from a factory default configuration, the switch contacts a DHCP server, which offers options for obtaining files used to provision the switch:

- The IP address of the TFTP server
- The name of the image file
- The name of the configuration file
- The Aruba Central FDQN or IPv4 address
- The HTTP proxy FDQN or IPv4 address

The **show ztp information** command shows the options offered by the DHCP server and the status of the ZTP operation.

The status of the ZTP operation is one of the following:

**Success**

The ZTP operation succeeded.

One of the following is true:

- Both the running configuration and the startup configuration were updated.
- The IP address of the TFTP server was received, but the offer did not include a configuration file or a firmware image file.
- Any combination of vendor encapsulated DHCP options are received as configured, along with the firmware image and switch configuration file.
- Only vendor encapsulated DHCP options are configured and are received accordingly.

**Failed - Custom startup configuration detected**

The switch was booted from a configuration that is not the factory default configuration. For example, the administrator password has been set.

**Failed - Timed out while waiting to receive ZTP options**

Either the switch received the DHCP IPv4 address but no ZTP options were received within 1 minute or ZTP force-provision is triggered and no ZTP options are received within 3 minutes.

**Failed - Detected change in running configuration**

The running configuration was modified by a user while the ZTP operation was in progress.

**Failed - TFTP server unreachable**

The TFTP server is not reachable at the specified IP address.

**Failed - TFTP server information unavailable**

The image file name or config file name is provided without the TFTP server location to fetch the files from and ZTP enters failed state.

**Failed - Invalid configuration file received**

Either the file transfer of the configuration file failed, or the configuration file is invalid (an error occurred while attempting to apply the configuration).

**Failed - Invalid image file received**

Either the file transfer of the firmware image file failed, or the firmware image file is invalid (an error occurred while verifying the image).

In the case of reconnection, connect with a main or alternative location to the COP instance as a user. The current connection is shown in the **Central location** field.

Scenario 1: If the location the device is currently connected on is updated, the system reconnects in order to connect with the new location.

Scenario 2: If the location in which the device is not currently connected on is updated, the DUT does not go through the reconnection process.

## Examples

Showing switch image download in progress after receiving ZTP options:

```
switch# show ztp information
TFTP Server                          : 10.0.0.2
Image File                           : TL_10_02_0001.swi
Configuration File                   : config_file
ZTP Status                           : In-progress - Image download and verification
Aruba Central Location               : secure.arubanetworks.com
Alternative Aruba Central Location: NA
Aruba Central Shared Token           : aruba123
Force-Provision                      : Disabled
HTTP Proxy Location                  : http.proxy.arubanetworks.com
```

Showing switch image download failure after receiving ZTP options:

```
switch# show ztp information
TFTP Server                          : 10.0.0.2
Image File                           : TL_10_02_0001.swi
Configuration File                   : config_file
ZTP Status                           : Failed - Unable to download image
Aruba Central Location               : secure.arubanetworks.com
Alternative Aruba Central Location: NA
Aruba Central Shared Token           : aruba123
Force-Provision                      : Disabled
HTTP Proxy Location                  : http.proxy.arubanetworks.com
```

Showing switch configuration download in progress after receiving ZTP options:

```
switch# show ztp information
TFTP Server                           : 10.0.0.2
Image File                            : TL_10_02_0001.swi
Configuration File                    : config_file
```

```
ZTP Status                           : In-progress - Configuration download
Aruba Central Location               : secure.arubanetworks.com
Alternative Aruba Central Location : NA
Aruba Central Shared Token           : aruba123
Force-Provision                      : Disabled
HTTP Proxy Location                  : http.proxy.arubanetworks.com
```

Showing switch configuration download failure after receiving ZTP options:

```
switch# show ztp information
TFTP Server                          : 10.0.0.2
Image File                           : TL_10_02_0001.swi
Configuration File                   : config_file
ZTP Status                           : Failed - Unable to download configuration
Aruba Central Location               : secure.arubanetworks.com
Alternative Aruba Central Location : NA
Aruba Central Shared Token           : aruba123
Force-Provision                      : Disabled
HTTP Proxy Location                  : http.proxy.arubanetworks.com
```

Showing switch failure to update start-up configuration after downloading configuration received from ZTP options:

```
switch# show ztp information
TFTP Server                         : 10.0.0.2
Image File                          : TL_10_02_0001.swi
Configuration File                  : config_file
ZTP Status                          : Failed - Could not copy to start-up configuration
Aruba Central Location              : secure.arubanetworks.com
Alternative Aruba Central Location: NA
Aruba Central Shared Token          : aruba123
Force-Provision                     : Disabled
HTTP Proxy Location                 : http.proxy.arubanetworks.com
```

In the following example, the ZTP operation succeeded, and both an image file and a configuration file were provided.

```
VSF-10-Mbr# show ztp information
TFTP Server                          : 10.1.84.160
Image File                           : FL_10_06_0001CK.swi
Configuration File                   : 102720-new-setup-config-updated.txt
Status                               : Success
Aruba Central Location               : NA
Alternative Aruba Central Location : NA
Aruba Central Shared Token           : aruba123
Force-Provision                      : Disabled
HTTP Proxy Location                  : NA
VSF-10-Mbr#
```

In the following example, the ZTP option succeeded. A configuration file was not provided, but an image file was provided.

```
VSF-10-Mbr# show ztp information
TFTP Server                    : 10.1.84.160
Image File                     : TL_10_02_0001.swi
Configuration File             : NA
Status                         : Success
Aruba Central Location         : NA
Alternative Aruba Central Location: NA
Aruba Central Shared Token     : aruba123
Force-Provision                : Disabled
HTTP Proxy Location            : NA
VSF-10-Mbr#
```

In the following example, the ZTP operation failed because the TFTP server was unreachable.

```
VSF-10-Mbr# show ztp information
TFTP Server                       : 10.1.84.160
Image File                        : TL_10_02_0001.swi
Configuration File                : 102720-new-setup-config-updated.txt
Status                            : Failed - TFTP server unreachable
Aruba Central Location            : NA
Alternative Aruba Central Location: NA
Aruba Central Shared Token        : NA
Force-Provision                   : Disabled
HTTP Proxy Location               : NA
VSF-10-Mbr#
```

In the following example, the ZTP operation was stopped because the switch did not receive any options from the DHCP server for ZTP within 1 minute of receiving the IP address from the server.

```
VSF-10-Mbr## show ztp information
TFTP Server                       : NA
Image File                        : NA
Configuration File                : NA
Status                            : Failed - Timed out while waiting to receive ZTP
options
Aruba Central Location            : NA
Alternative Aruba Central Location: NA
Aruba Central Shared Token        : NA
Force-Provision                   : Disabled
HTTP Proxy Location               : NA
VSF-10-Mbr#
```

In the following example, the ZTP operation was stopped because the switch was booted from a configuration that was not the factory default configuration.

```
switch# show ztp information
TFTP Server                       : 10.0.0.2
Image File                        : TL_10_02_0001.swi
Configuration File                : ztp.cfg
Status                            : Failed - Custom startup configuration detected
Aruba Central Location            : NA
Alternative Aruba Central Location: NA
Aruba Central Shared Token        : NA
Force-Provision                   : Disabled
HTTP Proxy Location               : NA
```

In the following example, the switch received the image file and the TFTP-sever and config file from the DHCP server for ZTP was successful:

```
switch# show ztp information
TFTP Server                          : 10.0.0.2
Image File                           : TL_10_02_0001.swi
Configuration File                   : ztp.cfg
ZTP Status                           : Success
Aruba Central Location               : NA
Alternative Aruba Central Location: NA
Aruba Central Shared Token           : NA
Force-Provision                      : Disabled
HTTP Proxy Location                  : NA
```

In the following example, the switch received the image file and the TFTP-sever and config file from the DHCP server entered the failed state as teh TFTP server was not reachable:

```
switch# show ztp information
TFTP Server                          : 10.0.0.2
Image File                           : TL_10_02_0001.swi
Configuration File                   : ztp.cfg
ZTP Status                           : Failed - TFTP server unreachable
Aruba Central Location               : NA
Alternative Aruba Central Location: NA
Aruba Central Shared Token           : NA
Force-Provision                      : Disabled
HTTP Proxy Location                  : NA
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## ztp force provision

```
ztp force-provision
no ztp force-provision
```

### Description

Starts on-demand ZTP.

## Usage

DHCP options received are processed independent of he current state of configuration on the switch. Previous ZTP TFTP Server, Image File, Configuration File, Aruba Central Location, and HTTP Proxy location options are cleared and the switch sends a DHCP request.

## Examples

In the following example, force-provision is enabled.

```
switch# configure terminal
switch(config)# ztp force-provision
```

In the following example, force-provision status is checked while enabled.

```
switch# show ztp information
TFTP Server                     : 10.0.0.2
Image File                      : TL_10_02_0001.swi
Configuration File              : ztp.cfg
Status                          : Success
Aruba Central Location          : NA
Aruba Central Shared Token      : NA
Force-Provision                 : Enabled
HTTP Proxy Location             : NA
```

In the following example, force-provision is disabled.

```
switch# configure terminal
switch(config)# no ztp force-provision
```

In the following example, force-provision status is checked while disabled.

```
switch# show ztp information
TFTP Server                     : 10.0.0.2
Image File                      : TL_10_02_0001.swi
Configuration File              : ztp.cfg
Status                          : Success
Aruba Central Location          : NA
Aruba Central Shared Token      : NA
Force-Provision                 : Disabled
HTTP Proxy Location             : NA
```

# Accessing Updates

You can access updates from the HPE Aruba Networking Support Portal at https://networkingsupport.hpe.com.

Some software products provide a mechanism for accessing software updates through the product interface. Review your product documentation to identify the recommended software update method.

To subscribe to eNewsletters and alerts:

https://networkingsupport.hpe./notifications/subscriptions (requires an active HPE Aruba Networking Support Portal account to manage subscriptions). Security notices are viewable without an HPE Aruba Networking Support Portal account.

# Warranty Information

To view warranty information for your product, go to https://www.arubanetworks.com/support-services/product-warranties/.

# Regulatory Information

To view the regulatory information for your product, view the *Safety and Compliance Information for Server, Storage, Power, Networking, and Rack Products*, available at https://www.hpe.com/support/Safety-Compliance-EnterpriseProducts

## Additional regulatory information

HPE Aruba Networking is committed to providing our customers with information about the chemical substances in our products as needed to comply with legal requirements, environmental data (company programs, product recycling, energy efficiency), and safety information and compliance data, (RoHS and WEEE). For more information, see https://www.arubanetworks.com/company/about-us/environmental-citizenship/.

# Documentation Feedback

HPE Aruba Networking is committed to providing documentation that meets your needs. To help us improve the documentation, send any errors, suggestions, or comments to Documentation Feedback (docsfeedback-switching@hpe.com). When submitting your feedback, include the document title, part number, edition, and publication date located on the front cover of the document. For online help content, include the product name, product version, help edition, and publication date located on the legal notices page.
