Chapter 1

About this document

This document describes features of the AOS-CX network operating system. It is intended for administrators responsible for installing, configuring, and managing Aruba switches on a network.

Applicable products

This document applies to the following products:

- HPE Aruba Networking 6300 Switch Series (JL658A, JL659A, JL660A, JL661A, JL662A, JL663A, JL664A, JL665A, JL666A, JL667A, JL668A, JL762A, R8S89A, R8S90A, R8S91A, R8S92A, S0E91A, S0X44A)
- HPE Aruba Networking 6400 Switch Series (R0X31A, R0X38B, R0X38C, R0X39B, R0X39C, R0X40B, R0X40C, R0X41A, R0X41C, R0X42A, R0X42C, R0X43A, R0X43C, R0X44A, R0X44C, R0X45A, R0X45C, R0X26A, R0X27A, JL741A, S0E48A,S0E48A #0D1, S1T83A, S1T83A #0D1)

What's new in this release

Commands introduced or modified in 10.14.0001

Command	Description
actions (NAE-lite)	Existing command with new **Schedule** and **Trap** actions introduced.
arp ip	Replaced the **ipv4** parameter with the **ip** parameter. The**i pv4** parameter is deprecated.
arp ip mac	Replaced the **ipv4** parameter with the **ip** parameter. The **ipv4** parameter is deprecated.
class gbp-ip	The **app-category** parameter is introduced to support application-based roles for IPv4 networks.
class gbp-ipv6	The **app-category** parameter is introduced to support application-based roles for IPv6 networks.
clear arp	Replaced the **ipv4** parameter with the **ip** parameter. The **ipv4** parameter is deprecated.
clear dhcp-snooping binding	Replaced the **ipv4** parameter with the **ip** parameter. The **ipv4** parameter is deprecated.
collect egress-vlan	New command that configures collect (non-key) fields for a flow record when in the **config-flow-record** context.
collect forwarding-status	New command that configures collect (non-key) fields for a flow record when in the **config-flow-record** context.
dhcp-snooping ...	The **dhcpv4-snooping**, **show dhcpv4-snooping**, and **clear dhcpv4-**

Command	Description
show dhcp-snooping ... clear dhcp-snooping ...	**snooping** series of commands are deprecated, and are replaced with **dhcp-snooping**, **show dhcp-snooping** and **clear dhcp-snooping** commands with similarsyntax and functionality.
eapol-eth-type	New command that configures the Ether-Type for use in frames for MKA.
erase feature-pack	The **reset** parameter is introduced, Running the **erase feature-pack reset** command will disable all subscription features and stop honor mode warnings.
fib-optimization evpn-vxlan host-route	Replaced the **ipv4** parameter with the **ip** parameter. Th e**ipv4** parameter is deprecated.
flow-tracking	The **track icmp** parameter is introduced, enabling tracking of ICMP flows, in addition to the TCP/UDP flows tracked by default.
flow record	Replaced the **ipv4** parameter with the **ip** parameter. The **ipv4** parameter is deprecated.
image-location	The **allow-unsigned** parameter is introduced to allow the download and deployment of an unsigned container image.
interface tunnel	Replaced the **ipv4** parameter with the **ip** parameter. The **ipv4** parameter is deprecated.
ipv4|ipv6 flow monitor	
rate-limit	Replaced the **ipv4** parameter with the **ip** parameter. The **ipv4** parameter is deprecated.
show history	The **all-sessions** parameter is introduced.
show ip pim tree-state	This new command displays upstream join states for a specified group and source address in a VRF.
show ipv6 pim6 tree-state	This new command displays upstream join states for a specified group and source address in a VRF in an IPv6 network.
show running-config container	Replaced the **ipv4** parameter with the **ip** parameter. The **ipv4** parameter is deprecated.
show snmp community	The output of this command now displays an error message when the switch is in SNMPv3-only mode.
show vrrp	Replaced the **ipv4** parameter with the **ip** parameter. The **ipv4** parameter is deprecated.
snmp-server community	Replaced the **ipv4** parameter with the **ip** parameter. Th e**ipv4** parameter is deprecated.
snmp-server host	**Notification-type**is added to SNMP trap receivers. Now, you can select which traps are sent to each trap receiver.
system private-vlan share-hw-resource	In the PVLAN default mode, there is now no limit on the number of secondary ports configured. In this mode, multiple trunk ports configured as secondary ports can share the hardware resources.

Command	Description
transport-protocol	Replaced the **ipv4** parameter with the **ip** parameter. The **ipv4** parameter is deprecated.
vlan protocol	Replaced the **ipv4** parameter with the **ip** parameter. The **ipv4** parameter is deprecated.
vrrp	Replaced the **ipv4** parameter with the **ip** parameter. The **ipv4** parameter is deprecated.

Command	Description
area (ospf) redistribute clear ip ospf neighbors clear ip ospf statistics show ip ospf border-routers show ip ospf interface show ip ospf lsdb show ip ospf routes show ip ospf statistics show ip ospf statistics interface show ip ospf virtual-links area clear ipv6 ospfv3 neighbors clear ipv6 ospfv3 statistics redistribute reference-bandwidth retransmit-interval router-id show ipv6 ospfv3 show ipv6 ospfv3 border-routers show ipv6 ospfv3 interface show ipv6 ospfv3 neighbors show ipv6 ospfv3 routes show ipv6 ospfv3 statistics show ipv6 ospfv3 statistics interface show ipv6 ospfv3 virtual-links redistribute redistribute redistribute	The supported **<process-ID>** parameter range is expanded from 1-63 to 1-65535.

Latest version available online

Updates to this document can occur after initial publication. For the latest versions of product documentation, see the links provided in Support and Other Resources.

Command syntax notation conventions

Convention	Usage
`example-text`	Identifies commands and their options and operands, code examples, filenames, pathnames, and output displayed in a command window. Items

Convention	Usage
	that appear like the example text in the previous column are to be entered exactly as shown and are required unless enclosed in brackets (**[ ]**).
example-text	In code and screen examples, indicates text entered by a user.
Any of the following: ■ *`<example-text>`* ■ `<example-text>` ■ *`example-text`* ■ *example-text*	Identifies a placeholder—such as a parameter or a variable—that you must substitute with an actual value in a command or in code: ■ For output formats where italic text cannot be displayed, variables are enclosed in angle brackets (**< >**). Substitute the text—including the enclosing angle brackets—with an actual value. ■ For output formats where italic text can be displayed, variables might or might not be enclosed in angle brackets. Substitute the text including the enclosing angle brackets, if any, with an actual value.
|	Vertical bar. A logical **OR** that separates multiple items from which you can choose only one. Any spaces that are on either side of the vertical bar are included for readability and are not a required part of the command syntax.
`{ }`	Braces. Indicates that at least one of the enclosed items is required.
`[ ]`	Brackets. Indicates that the enclosed item or items are optional.
… or `...`	Ellipsis: ■ In code and screen examples, a vertical or horizontal ellipsis indicates an omission of information. ■ In syntax using brackets and braces, an ellipsis indicates items that can be repeated. When an item followed by ellipses is enclosed in brackets, zero or more items can be specified.

About the examples

Examples in this document are representative and might not match your particular switch or environment.

The slot and port numbers in this document are for illustration only and might be unavailable on your switch.

Understanding the CLI prompts

When illustrating the prompts in the command line interface (CLI), this document uses the generic term **switch**, instead of the host name of the switch. For example:

```
switch>
```

The CLI prompt indicates the current command context. For example:

```
switch>
```

Indicates the operator command context.

```
switch#
```

Indicates the manager command context.

switch(*CONTEXT-NAME*)#

Indicates the configuration context for a feature. For example:

```
switch(config-if)#
```

Identifies the **interface** context.

Variable information in CLI prompts

In certain configuration contexts, the prompt may include variable information. For example, when in the VLAN configuration context, a VLAN number appears in the prompt:

```
switch(config-vlan-100)#
```

When referring to this context, this document uses the syntax:

```
switch(config-vlan-<VLAN-ID>)#
```

Where *<VLAN-ID>* is a variable representing the VLAN number.

Identifying switch ports and interfaces

Physical ports on the switch and their corresponding logical software interfaces are identified using the format:

member/slot/port

On the 6300 Switch Series

- *member*: Member number of the switch in a Virtual Switching Framework (VSF) stack. Range: 1 to 10. The primary switch is always member 1. If the switch is not a member of a VSF stack, then member is 1.
- *slot*: Always 1. This is not a modular switch, so there are no slots.
- *port*: Physical number of a port on the switch.

For example, the logical interface **1/1/4** in software is associated with physical port 4 on member 1.

On the 6400 Switch Series

- *member*: Always 1. VSF is not supported on this switch.
- *slot*: Specifies physical location of a module in the switch chassis.
  - Management modules are on the front of the switch in slots 1/1 and 1/2.
  - Line modules are on the front of the switch starting in slot 1/3.
- *port*: Physical number of a port on a line module.

For example, the logical interface **1/3/4** in software is associated with physical port 4 in slot 3 on member 1.

Identifying modular switch components

- Power supplies are on the front of the switch behind the bezel above the management modules. Power supplies are labeled in software in the format: *member/power supply*:
  - *member*: 1.
  - *power supply*: 1 to 4.
- Fans are on the rear of the switch and are labeled in software as: *member/tray/fan*:
  - *member*: 1.
  - *tray*: 1 to 4.
  - *fan*: 1 to 4.

- Fabric modules are not labeled on the switch but are labeled in software in the format: *member/module*:
  - *member*: 1.
  - *member*: 1 or 2.
- The display module on the rear of the switch is not labeled with a member or slot number.

Chapter 2

Introduction to the AOS-CX CLI

CLI access

Access the CLI through the following interfaces:

Console port

Connect the management port on the switch to your computer using a serial cable and then use terminal emulation software to reach the switch from the computer. Typically, the console port is used when first installing the switch and performing initial configuration tasks.

On switches that support active and standby management modules, there is a console port is on each management module. Connect to the console port on the active management module.

Management port (out-of-band connection)

Connect the management port on the switch to your network, and then use SSH client software to reach the switch from a computer connected to the same network. This requires that a DHCP server is installed on the network.

On switches that support active and standby management modules, connect the management port of the active management module to the network.

In the switch factory default state, the management port and SSH on the management VRF (**mgmt**) are enabled.

Data port (in-band connection)

Connect a data port on the switch to your network, and then use SSH client software to reach the switch from a computer connected to the same network. Management traffic ingresses and egresses switch data ports with rest of the traffic on the network, therefore it can be affected by traffic congestion and other issues impacting the network.

Getting CLI help

To show the available commands that you can execute in the current command context, enter the **?** symbol.

For example:

```
switch# ?
  boot            Reboot all or part of the system
  checkpoint      Checkpoint information
switch#
```

The **?** symbol does not display on the screen when you enter it.

The commands that are available to you depend on your authority and the command context. In a given command context, you can only list and execute the commands available in that context.

To show the available parameters for a command, enter the command followed by a space and then enter the **?** symbol.

For example:

```
switch(config)# access-list ?
  all        All access-lists
  ip         Internet Protocol v4 (IPv4)
  ipv6       Internet Protocol v6 (IPv6)
  log-timer  Set ACL log timer length (frequency)
  mac        Ethernet MAC Protocol
switch(config)# access-list
```

After the CLI displays the information, it automatically displays the text you entered before you entered the **?** symbol.

If there is no **<cr>** symbol at the end the command help output, the command is not complete as displayed. You must specify one of the listed parameters.

The **<cr>** symbol alone in the command help output indicates that there are no additional parameters and that you must press the enter key to complete the command. For example:

```
switch# list ?
  <cr>
switch# list
```

The **<cr>** symbol at the end of the command help output indicates that the parameters preceding the **<cr>** are optional and you can enter the command as is displayed. For example:

```
switch# configure ?
  terminal    Configuration terminal (default)
  <cr>
switch# configure
```

To show information about a parameter for a command, enter the command and parameter followed by a space, then enter the **?** symbol.

For example:

```
switch(config)# access-list log-timer ?
  <30-300>  Specify value (in seconds)
  default   Default value (300 seconds)
switch(config)# access-list log-timer
```

Authority levels

In command descriptions, the authority level indicates the user role that is required to execute a command:

Administrators

Users with the role: **administrators**

Users with administrator rights can execute any command.

Operators

Users with the role: **operators**.

Users with operator rights can execute commands in the operator context (**>**) only.

Auditors

Users with the role: **auditors**.

Users with auditor rights can execute commands in the auditor context (**auditor>**) only.

Local user group members with execution rights for a command

You can create up to 29 user-defined local user groups on the switch. Each group can be defined to allow execution of up to 1024 specific CLI commands.

Command contexts

The command context determines the following:

- Which parts of the switch can be managed
- Which commands are available to users with the appropriate authority

Command contexts have a parent-child tree structure in which contexts might themselves contain nested contexts.

Operator context (>)

The operator context enables you to execute commands to view—but not change—the configuration.

The operator context requires the least user privilege to execute commands.

In command descriptions, this context is listed as: Operator (>)

Switch prompt example

switch>

Authority

Operators or Administrators

Showing the available commands in this context

At the command prompt, enter the **?** symbol.

Navigating to the operator context (>)

To navigate to the operator command context (>), do one of the following:

- Log in to the switch CLI with a user ID that has the **operator-group** role.
- From the manager context (#), enter the **disable** command.

Auditor context

When you log in to the switch as user with auditor rights, you have access to the auditor command context only.

Users with auditor rights have access to a limited set of commands. for more information about auditors, see the *Security Guide* for your switch and software version.

Switch prompt example

auditor>

Showing the available commands in this context

At the command prompt, enter the **?** symbol.

Manager context (#)

From the manager context (#), you can execute commands that do not require saving changes to the configuration.

In command descriptions, this context is listed as: Manager (#)

Switch prompt example

switch#

Authority

Administrators or local user group members with execution rights for this command.

Showing the available commands in this context

At the command prompt, enter the **?** symbol.

Access to manager context commands from descendant contexts

The **do** command enables you to access commands from the manager context while you are in a child or descendent context, such as **config** or **config-if**.

For example, to execute the **clear** command from the **config** context, enter the following: **do clear**.

The **show** command can be executed from configuration contexts as well as the manager context, so using the **do** command with the **show** command is deprecated. Support for **do show** might be discontinued in a future software release.

Navigating to the manager context (#)

To navigate to the manager command context (#), do one of the following:

- Log in to the switch CLI with a user ID that has the **administrators** role.
- From the operator context (>), enter the **enable** command.

  You must have administrator authority to enter the **enable** command.

  ```
  switch> enable
  switch#
  ```

- From the configuration context (**config**), enter either the **exit** or the **end** command.

  For example:

  ```
  switch(config)# exit
  switch#
  ```

- From any child or descendent context, enter the **end** command.

  For example:

```
switch(config-vlan-100)# end
switch#
```

Global configuration context (config)

From the global configuration context (**config**), you can execute commands that change the configuration of the switch.

In command descriptions, this context is listed as: **config**

Switch prompt example

switch(config)#

Authority

Administrators or local user group members with execution rights for this command.

Showing the available commands in this context

At the command prompt, enter the **?** symbol.

> You can use the **do** command to execute some manager context commands—such as the **clear** command—from the global configuration context.

Navigating to the config context

To navigate to the **config** command context, do one of the following:

- From the manager context (#), enter the **configure terminal** command:

```
switch# configure terminal
switch(config)#
```

- From a child configuration context, enter the **exit** command.

  For example:

```
switch(config-vlan-100)# exit
switch(config)#
```

Other configuration command contexts

All other configuration command contexts are descendants of the global configuration command context (**config**).

From these command contexts, you can execute commands that apply to that specific context, such as an interface or a VLAN.

Switch prompt examples

- **switch(config-if)#**
- **switch(config-router)#**
- **switch(config-vlan-100)#**

Authority

Administrators or local user group members with execution rights for this command.

Showing the available commands in this context

At the command prompt, enter the **?** symbol.

Support for range contexts

On the 6400 Switch Series, interface identification differs.

Some switch features enable you to use a single command to apply configuration settings to multiple items. You specify the multiple items by creating a type of command context called a **range context**. Then you can execute commands that are applied to every item in the range. For example:

```
switch(config)# interface 1/1/1-1/1/5
switch(config-if-<1/1/1-1/1/5>)# no shutdown
```

You can use a range context to specify multiple items for the following:

Physical interfaces

- Command example: **interface 1/1/1-1/1/8,1/1/10,1/1/12**
- Switch prompt example: **switch(config-if-<1/1/1-1/1/8,1/1/10,1/1/12>)#**

LAG interfaces

- Command example: **interface lag 1-10**
- Switch prompt example: **switch(config-if-lag-<1-10>)#**

Loopback interfaces

- Command example: **interface loopback 1-10**
- Switch prompt example: **switch(config-if-loopback-<1-10>)#**

VLAN interfaces

- Command example: **interface vlan 1,2,3-6**
- Switch prompt example: **switch(config-vlan-if-<1,2,3-6>)#**

VLANs

- Command example: **vlan 1-10,15,20-25**
- Switch prompt example: **switch(config-vlan-<1-10,15,20-25>)#**

Commands entered in a range context are applied to each item in the range individually:

- Each item in the range has its own entry in the output of **show running-config** commands.

  For example, you can configure a range of interfaces as follows:

  ```
  switch(config)# interface 1/1/1-1/1/5
  switch(config-if-<1/1/1-1/1/5>)# no shutdown
  ```

  In the output for the show running-config command, the interfaces are displayed individually:

```
switch(config-if-<1/1/1-1/1/5>)# show running-config
Current configuration:
...
interface 1/1/1
        no shutdown
interface 1/1/2
        no shutdown
interface 1/1/3
        no shutdown
interface 1/1/4
        no shutdown
interface 1/1/5
        no shutdown
...
switch(config-if-<1/1/1-1/1/5>)#
```

- If you specify a range context for interfaces, you cannot execute commands that create a context within the range context. For example, you cannot execute the **vrrp** command from an interface range context, even though you can execute the command from the **config-if** context for a single interface.
- If error is encountered during the execution of a command for an item in the range, the error message returned includes a prefix that identifies the item to which the error applies. However command execution does not stop until the command is attempted on all the items in the range.

  For example, attempting to set an IP address in a range context of loopback interfaces results in the IP address being applied to the first loopback interface in the range, but results in errors for the subsequent interfaces:

```
switch(config)# interface loopback 1-4
switch(config-loopback-if-<1-4>)# ip address 10.1.11.11/24
[loopback2] Overlapping networks observed for "10.1.11.11/24". Please configure
non overlapping networks.
[loopback3] Overlapping networks observed for "10.1.11.11/24". Please configure
non overlapping networks.
[loopback4] Overlapping networks observed for "10.1.11.11/24". Please configure
non overlapping networks.

switch(config-loopback-if-<1-4>)# show running-config | begin 4 "loopback 1"
interface loopback 1
    ip address 10.1.11.11/24
interface loopback 2
interface loopback 3
interface loopback 4
```

- The range context is created only if every item in the range is successfully created or already exists in configuration. If an error occurs during the creation of an item in a range, the items that are created successfully are added to the configuration, but the range context is not created. The switch prompt.

  For example, in the following sequence:

  1. VLANs 1 through 100 are created successfully, so the switch prompt reflects the range of VLANs: **switch(config-vlan-<1-100>)#**
  2. The command **interface vlan 95-105** fails for VLANs 101 through 105, so the range context is not created and the switch prompt remains in the global configuration context: **switch (config)#**
  3. The configuration includes all the VLANs and VLAN interfaces that are created successfully.

```
switch(config)# vlan 1-100
switch(config-vlan-<1-100>)# exit
switch(config)# interface vlan 95-105
VLAN 101 should be created before creating interface VLAN101.
VLAN 102 should be created before creating interface VLAN102.
VLAN 103 should be created before creating interface VLAN103.
VLAN 104 should be created before creating interface VLAN104.
VLAN 105 should be created before creating interface VLAN105.
switch(config)# show running-config
Current configuration:
...
vlan 1-100
interface vlan95
interface vlan96
interface vlan97
interface vlan98
interface vlan99
interface vlan100
...
switch(config)#
```

- If the **no** form of the command can be used to remove an item from the configuration, you can use a range context with the **no** form of the command to remove multiple items from the configuration.

  For example, you can remove VLANs 95 through 100 from the configuration by entering: **no vlan 95-100**

Rules for range contexts

For interfaces that use the ***member/slot/port*** notation, items in the range must be specified in ascending order.

Contiguous items in the range are represented by the smallest and largest values separated by a hyphen.

For example:

Command: **interface 1/1/1-1/1/8**

Switch prompt: **switch(config-if-<1/1/1-1/1/8>)#**

Command: **vlan 1-10**

Switch prompt: **switch(config-vlan-<1-10>)#**

Noncontiguous items in the range must be separated by commas.

For example:

Command: **interface 1/1/1-1/1/8,1/1/10,1/1/12**

Switch prompt: **switch(config-if-<1/1/1-1/1/8,1/1/10,1/1/12>)#**

Command: **vlan 1-10,15,20-25**

Switch prompt: **switch(config-vlan-<1-10,15,20-25>)#**

The switch prompt is truncated to 50 characters.

Command history

You can use the **up arrow** key or **Ctrl+P** to display the previous command in the session history, if any.

You can use the **down arrow** key or **Ctrl+N** to display the next command in the session history, if any.

You can use the **show history** command to show a numbered list of the commands executed during this session. You use the command numbers to specify commands to repeat using the **repeat** command. The **show history** and **repeat** commands are not saved in the history buffer.

The commands saved in the history command buffer are in the same format in which you entered the commands. If you enter an incomplete command, the command saved in the history command buffer is also an incomplete one.

If you execute the same command repeatedly, the switch saves only the earliest record. However, if you execute the same command in different formats, the switch saves them as different commands.

For example, if you execute the **show startup-config** command repeatedly, the system saves only one command in the history command buffer. If you execute the command in the format of **show start** and **show startup** respectively, the system saves them as two commands.

Command completion

The CLI supports both command abbreviation and command completion:

- If you enter enough letters to match a valid command, the CLI accepts the command.

  For example, you can enter **con** instead of **configure** to navigate from the manager context to the global configuration context.

  ```
  switch# con
  switch(config)#
  ```

- If you enter part of a command word and then the press the **Tab** key, one of the following occurs:
  - If you have entered enough letters to match a valid command, the CLI displays the remainder of the word.
  - If you have not entered enough letters to match a valid command, the CLI does not complete the command.

    If you press the **Tab** key a second time, the CLI displays commands that match the letters you entered.

    For example:

    ```
    switch(config)# cl
    class clear clock
    switch(config)# cl
    ```

- If you press the **Tab** key twice after a completed word, the CLI displays the command options.

  For example, if you enter the word **clock** followed by a space and then press the **Tab** key twice, the CLI displays the commands available in that command context that start with that word, and then displays the prompt—including the characters you entered—enabling you to complete the command without retyping.

  ```
  switch(config)# clock
  date       datetime     time   timezone
  switch(config)# clock
  ```

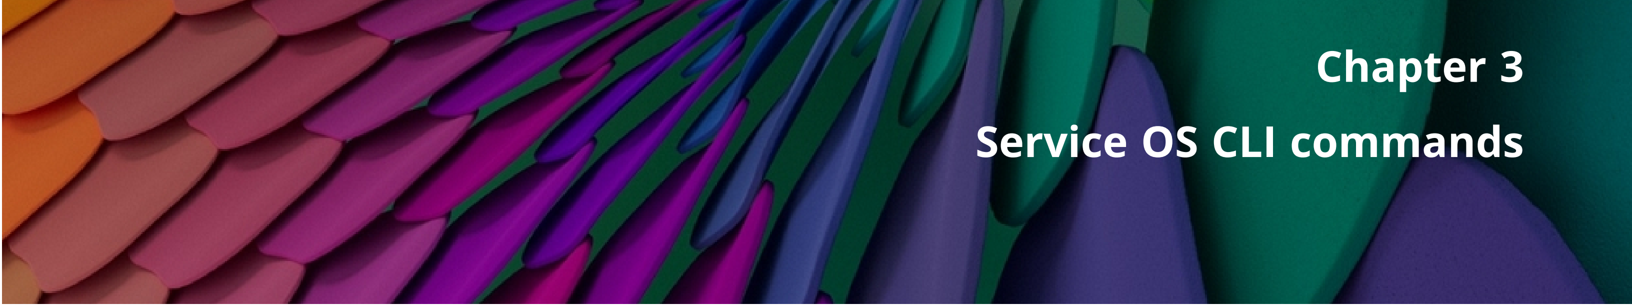
Pipe (|) support in show commands

The pipe (**|**) command is a CLI session command that filters the output of show **show** commands according to the criteria specified by the parameter **include**, **exclude**, **count**, **begin**, or **redirect**.

- The pipe (**|**) command is supported for use with the **show** command only.
- You can use multiple pipe commands with a single show command.
  For example: **show running-config | include "vlan" | exclude "vlan2" | count**
- You can use the pipe command with the **page** command.
- Command completion by pressing the **Tab** key is not supported for pipe commands.

Command syntax notation conventions

Convention	Usage
`example-text`	Identifies commands and their options and operands, code examples, filenames, pathnames, and output displayed in a command window. Items that appear like the example text in the previous column are to be entered exactly as shown and are required unless enclosed in brackets (**[ ]**).
example-text	In code and screen examples, indicates text entered by a user.
Any of the following: ■ *`<example-text>`* ■ `<example-text>` ■ *`example-text`* ■ *example-text*	Identifies a placeholder—such as a parameter or a variable—that you must substitute with an actual value in a command or in code: ■ For output formats where italic text cannot be displayed, variables are enclosed in angle brackets (**< >**). Substitute the text—including the enclosing angle brackets—with an actual value. ■ For output formats where italic text can be displayed, variables might or might not be enclosed in angle brackets. Substitute the text including the enclosing angle brackets, if any, with an actual value.
`|`	Vertical bar. A logical **OR** that separates multiple items from which you can choose only one. Any spaces that are on either side of the vertical bar are included for readability and are not a required part of the command syntax.
`{ }`	Braces. Indicates that at least one of the enclosed items is required.
`[ ]`	Brackets. Indicates that the enclosed item or items are optional.
… or `...`	Ellipsis: ■ In code and screen examples, a vertical or horizontal ellipsis indicates an omission of information. ■ In syntax using brackets and braces, an ellipsis indicates items that can be repeated. When an item followed by ellipses is enclosed in brackets, zero or more items can be specified.



Chapter 3

Service OS CLI commands

boot

`boot`

Description

Presents you with the boot menu prompt. You can then specify which boot profile: primary, secondary, or Service OS console.

Example

Presenting the boot menu prompt:

```
SVOS> boot

ServiceOS Information:
    Version:          FL.01.07.0002-internal
    Build Date:       2020-09-03 10:38:03 PDT
    Build ID:         ServiceOS:FL.01.07.0002-internal:1a017598b673:202009031038
    SHA:              1a017598b6738448ef679175712e022a966eca88

Boot Profiles:

0. Service OS Console
1. Primary Software Image [FL.10.06.0001]
2. Secondary Software Image [FL.10.08.0000-308-gcfbc0e3]

Select profile(primary):
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	ServiceOS (`svos>`)	Administrators or local user group members with execution rights for this command.

cat

`cat <FILENAME/DIRECTORY-NAME>`

Description

Prints the contents of a file to the console. The Service OS does not allow command output redirection, so this command is only useful for reading short text files.

Parameter	Description
<FILENAME/DIRECTORY-NAME>	Shows the contents of the specified file or directory.

Example

Showing the contents of /nos/hosts:

```
SVOS> cat /nos/hosts
127.0.0.1       localhost.localdomain           localhost

SVOS>
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	ServiceOS (`SVOS>`)	Administrators or local user group members with execution rights for this command.

cd path

`cd path`

Description

Changes the current working directory.

Example

Changing the current working directory:

```
cd /
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	ServiceOS (`SVOS>`)	Administrators or local user group members with execution rights for this command.

config-clear

```
config-clear
```

Description

Configures the switch to set all configuration settings to factory default when the switch is restarted. The next time the switch starts, the current **startup-config** is renamed to **startup-config-fixme**, and a new **startup-config** is created with factory default settings.

Using this command is not the same as performing zeroization, which securely erases the entire primary storage and other devices, and not just the configuration.

Example

Configuring the system to clear the switch configuration:

```
SVOS> config-clear

The switch configuration will be cleared.

Continue (y/n)? y
The system has been configured to clear the startup-config on the next
boot. Please execute the 'boot' command to complete this action.
SVOS>
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

cp

```
cp [options] <SOURCE-FILENAME/SOURCE-DIRECTORY> <DESTINATION-FLENAME/DESTINATION-
DIRECTORY>
```

Description

Copies files or directories.

Parameter	Description
`[options]`	Selects the options for the command.
`-d,-P`	Specifies the preservation of symlinks (default if **-R**).
`-a`	Same as **-dpR**.
`R,-r`	Specifies recursiveness, all files, and subdirectories are copied.
`-L`	Specifies the following of all symlinks.
`-H`	Specifies the following of symlinks on command line.
`-p`	Specifies the preservation of file attributes if possible.
`-f`	Specifies the overwriting of a file or directory.
`-i`	Specifies the prompting before an overwrite.
`-l,-s`	Specifies the creation of (sym) links.
`<SOURCE-FILENAME/SOURCE-DIRECTORY>`	Specifies the name of the source file or directory.
`<DESTINATION-FLENAME/DESTINATION-DIRECTORY>`	Specifies the name of the destination file or directory.

Example

Copying /home/customers directory to the /home/clients directory:

```
SVOS> cp /home/customers /home/clients
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

All platforms	ServiceOS (`svos>`)	Administrators or local user group members with execution rights for this command.

du

`du [options] <FILENAME/DIRECTORY-NAME>...`

Description

Shows estimated disk space used for each file or directory or both.

Parameter	Description
`[options]`	Selects the options for the command.
`-a`	Show file sizes.
`-L`	Shows all symlinks.
`-H`	Shows symlinks on a command line.
`-d, N`	Shows limited output to directories (and files with **-a**) of depth less than **N**.
`-c`	Shows the total disk space usage of all files or directories or both.
`-l`	Shows the count sizes if hard linked.
`-s`	Shows only a total for each argument.
`-x`	Does not show directories on different file systems.
`-h`	Show sizes in human readable format (1K, 243M, and 2G).
`-m`	Show sizes in megabytes.
`-k`	Show sizes in kilobytes (default).
`<FILENAME/DIRECTORY-NAME>`	Specifies the file or directory or both for displaying a size estimate.

Example

Estimating disk space for the /nos directory:

```
SVOS> du -ah /nos
196.4M  /nos/primary.swi
196.4M  /nos
SVOS>
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

Platforms	Command context	Authority
All platforms	ServiceOS (`SVOS>`)	Administrators or local user group members with execution rights for this command.

erase zeroize

`erase zeroize`

Description

Securely erases any user data contained on the SSD or other storage devices on the management module.

Back up all data before running this command or all user/config data will be lost.

Usage

Use this command to securely erase all customer data and restore the software environment to factory default. When you issue this command:

- Software images are copied to RAM to be restored on completion.
- All bits undergo a 0>1>0 transition to completely zeroize data. This data is not recoverable.
- This feature can be used to remove all configuration settings or system alterations for debugging or troubleshooting.
- The zeroization process takes approximately two minutes.

All logs and data are lost in the zeroization process. Best practices is to collect all applicable data before performing zeroization.

Example

Erasing user data:

~~~
SVOS> SVOS> erase --help
Usage: erase zeroize

Securely erases storage devices on the management module.
SVOS>
```

```
SVOS> erase zeroize
############################WARNING############################
This will securely erase all customer data and reset the switch
to factory defaults. This will initiate a reboot and render the
switch unavailable until the zeroization is complete.
This should take several minutes to one hour to complete.
############################WARNING############################

Continue (y/n)? y
reboot: Restarting system

format

`format`

Description

Configures the primary storage device with the correct partition and file system formatting. This command removes all pre-existing data on the primary storage device.

Example

Configuring the primary storage device with the correct partition and file system formatting:

```
SVOS> format
#################WARNING####################
The following action will cause all data on
the primary storage device to be lost. After
formatting has completed, a reboot will be
initiated to complete storage initialization.
#################WARNING####################

Continue? (y/n): y

Working...This may take a few minutes...

identify

`identify`

Description

Prints the version and serial number information of hardware devices on the management module (for example, FPGAS, PLDs).

Example

Output from a 6400/6300 switch:

```
SVOS> identify
mc svos_primary           : FL.01.05.0001
mc svos_secondary         : FL.01.05.0001
mc uboot_single           : FL.01.0001
mc uboot_capsule          : FL.01.0001
mc pmc_single             : 0x4
mc pmc_primary            : 0x4
mc pmc_secondary          : 0x4
mc mcb_single             : 0x6
mc mcb_primary            : 0x6

All platforms	ServiceOS (`svos>`)	Administrators or local user group members with execution rights for this command.

ip

`ip {show | dhcp | disable | addr <`*`ADDR-NETMASK-GATEWAY`*`>}`

Description

Shows or configures the port with a static IP address (IPv4 only) or enables the DHCP client on the port. An address is set only if a DHCP server is available to provide one.

Parameter	Description
`{show	dhcp	disable	addr <`*`ADDR-NETMASK-GATEWAY`*`>}`	Selects the options for the OOBM port.
`show`	Shows the OOBM port.
`dhcp`	Configures the port with a DHCP address.
`disable`	Disables the OOBM port.
`addr <`*`ADDR-NETMASK-GATEWAY`*`>`	Configures the port with a static IP address (IPv4 only). Specify address, netmask, and gateway as A.B.C.D.

Example

Configuring the port with a DHCP IP address:

```
SVOS> ip dhcp
SVOS> ip show
Interface   : Link Up
IP Address  : 10.0.26.17
Subnet Mask: 255.255.252.0
Gateway     : 10.0.24.1

SVOS> ip disable
SVOS> ip show
Interface : Disabled
SVOS>
```

ls

```
ls [<OPTIONS>] [<FILE-NME>]
```

Description

This command lists directory contents.

Parameter	Description
<OPTIONS>	Specifies options for the command.
-1	Shows one-column output.
-a	Shows entries which start with a period (.).
-A	Shows output similar to **-a**, but excludes a period (.) and a double period (..).
-C	Shows output list by columns.
-x	Shows output list by lines.
-d	Shows listing of directory entries instead of contents

Parameter	Description
`-L`	Follows symlinks.
`-H`	Follows symlinks on the command line.
`-R`	Recurse.
`-p`	Appends a slash (/) to directory entries.
`-F`	Appends an indicator to entries. An indicator can be as an asterisk (*) or slash (/) or equal sign (=) or at sign (@) or pipe (|).
`-l`	Shows the output in a long listing format.
`-i`	Shows the list inode numbers.
`-n`	Shows a list of numeric UIDs and GIDs instead of names.
`-s`	Shows a list of allocated blocks.
`-e`	Shows in one column a list with the full date and time.
`-h`	Shows list sizes in human readable format (1K, 243M, 2G) with a one-column output.
`-r`	Shows in one column a sort in reverse order.
`-S`	Shows in one column a sort by size.
`-X`	Shows in the output sort by extension.
`-v`	Shows in one column a sort by version.
`-c`	With **-l**, it shows a sort in one column by **ctime**.
`-t`	With **-l**, it shows a sort by **mtime**.
`-u`	With **-l**, sort by **atime**.
`-c`	With **-l**, it shows a sort in one column by **ctime**
`-w` *<N>*	Assumes that the terminal has the number of columns wide as specified by <*N*>.
`--color[={always | never | auto}]`	Controls color in the output.
<FILE-NAME>	Specifies the name of the file to list.

Example

Listing directory contents:

```
SVOS> ls -la /nos
drwxr-xr-x    3 0        0             4096 Nov 21 03:19 .
drwxr-xr-x   11 0        0              220 Nov 21 03:21 ..
drwx------    2 0        0            16384 Nov 21 03:20 lost+found
```

```
-rwxr-xr-x    1 0         0         205957424 Nov 21 03:19 primary.swi
SVOS>
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

md5sum

`md5sum [-c | -s | -w] [<FILE-NAME>]`

Description

This command computes and checks the MD5 message digest.

Parameter	Description
`[-c	-s	-w]`	Selects the options for the command.
`-c`	Specifies to check the sums against the list in files.
`-s`	Specifies not output anything, status code shows success.
`-w`	Specifies to warn about improperly formatted checksum lines.
`<FILE-NAME>`	Specifies the file name to run the checksum against.

Example

Computing and checking the MD5 message digest for /nos/primary.swi:

```
SVOS> md5sum /nos/primary.swi
93ffc89e7ec357854704d8e450c4b7ab  /nos/primary.swi
SVOS>
```

mkdir

`mkdir [-m | -p] [<DIRECTORY-NAME>]`

Description

This command makes directories.

Parameter	Description
`[-m	-p]`	Specifies the options for the command.
`-m`	Specifies the mode.
`-p`	Specifies to make parent directories as needed with no errors for pre-existing directories.
`<DIRECTORY-NAME>`	Specifies the directory to create.

Example

Making the dir directory:

```
SVOS> mkdir dir
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

mount

`mount <DEVICE>`

Description

This command mounts the SSD partitions to the following locations: **/coredump**, **/logs**, **/nos**, **/selftest**, and mounts the USB device to **/mnt/usb**.

Users can mount USB flash drives formatted as either FAT16 or FAT32 with a single partition.

Parameter	Description
<DEVICE>	Specifies the device to be mounted. Supported device options include `all` and `usb`.

Examples

Mounting all of the SSD   partitions:

```
SVOS> mount all
SVOS> mount usb
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

mv

`mv [-f | -i | -n] <TARGET-DIRECTORY>`

Description

This command moves (renames) files.

Parameter	Description
`-f`	Specifies not to prompt before overwriting.
`-i`	Specifies to prompt before overwriting.
`-n`	Specifies to not overwrite an existing file.

Example

Moving the file named myfile:

```
SVOS> mv myfile
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

password (svos)

`password`

Description

Sets the admin user account password for both Service OS and AOS-CX once the user boots into AOS-CX and saves the configuration. This will overwrite the previous password if one exists. User input is masked with asterisks.

This command is not available if enhanced secure mode is set.

Example

Setting the admin account password:

```
SVOS> password
Enter password:********
Confirm password:********
SVOS>
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

ping

`ping <HOST-IP-ADDRESS>`

Description

Pings network hosts for debug purposes.

Parameter	Description
<HOST-IP-ADDRESS>	Specifies the host IP address.

Example

Pinging a network host:

```
SVOS> ping 10.0.8.10
PING 10.0.8.10 (10.0.8.10): 56 data bytes
64 bytes from 10.0.8.10: seq=0 ttl=63 time=3.496 ms
64 bytes from 10.0.8.10: seq=1 ttl=63 time=0.367 ms
64 bytes from 10.0.8.10: seq=2 ttl=63 time=0.380 ms
64 bytes from 10.0.8.10: seq=3 ttl=63 time=0.282 ms

rm

`rm [-f | -i | -R | -r] <FILE-NAME>`

Description

Removes files or directories.

Parameter	Description
`[-f	-i	-R	-r]`	Selects the options for removing files or directories.
`-f`	Never prompt before removing files or directories.
`-i`	Always prompt before removing files or directories.
`-R	-r`	Recursive.

Example

Removing the file named **foo**:

```
SVOS> rm foo
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Command Information

Platforms	Command context	Authority
All platforms	ServiceOS (`svos>`)	Administrators or local user group members with execution rights for this command.

secure-mode

```
secure-mode <enhanced | standard | status>
```

Description

Sets the secure mode to enhanced or standard secure mode. Also can display the current secure mode. A zeroization is required before switching between enhanced and standard secure modes.

The command also displays a message notifying the user that they are already in the targeted secure mode.

Example

Setting the secure mode to enhanced or standard:

~~~
SVOS> secure-mode --help
Usage: secure-mode <enhanced | standard | status>

Set or retrieve the secure mode setting. Requires a zeroization to change modes.
SVOS>
```

```
SVOS> secure-mode enhanced
############################WARNING############################
This will set the switch into enhanced secure mode.  Before
enhanced secure mode is enabled, the switch must securely erase
all customer data and reset the switch to factory defaults.
This will initiate a reboot and render the switch unavailable
until the zeroization is complete.
This should take several minutes to one hour to complete.
############################WARNING############################

Continue (y/n)? y
reboot: Restarting system

```

```
SVOS> secure-mode standard
############################WARNING############################
This will set the switch into standard secure mode.  Before
standard secure mode is enabled, the switch must securely erase
all customer data and reset the switch to factory defaults.
This will initiate a reboot and render the switch unavailable
until the zeroization is complete.
This should take several minutes to one hour to complete.
############################WARNING############################

Continue (y/n)? y
reboot: Restarting system

```

```
SVOS> secure-mode standard
############################WARNING############################
Secure mode is already set to standard.  Setting it again will
repeat the zeroization process.  The switch must securely erase
all customer data and reset the switch to factory defaults.
This will initiate a reboot and render the switch unavailable
until the zeroization is complete.
This should take several minutes to one hour to complete.
############################WARNING############################
~~~

~~~
Continue (y/n)? y
reboot: Restarting system

```

```
SVOS> secure-mode status
enhanced secure mode is set.

Platforms	Command context	Authority
All platforms	ServiceOS (`SVOS>`)	Administrators or local user group members with execution rights for this command.

sh

`sh`

Description

Launches a bash shell for support purposes. To quit bash, enter **exit**.

This command is not available if enhanced secure mode is set.

Example

Launching a bash shell:

```
SVOS> sh
switch:/cli/fs/home#
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

system serviceos password-prompt

```
system serviceos password-prompt
no system serviceos password-prompt
```

Description

Use this command to enable password authentication for ServiceOS. By default, the ServiceOS shell (accessible only from the local switch console port) requires no password to login as an admin use.

When this setting is enabled, the same password used to authenticate the admin user in the AOS-CX CLI or WeUI can be used to log in to the ServiceOS shell. If this setting is enabled, a forgotten admin user password cannot be reset using ServiceOS; if there are no other local or RADIUS/TACACS user accounts with administrator-level access, the switch must be zeroized by entering the **username zeroize** command at the ServiceOS login prompt to restore administrator access.

Example

Enablling password authentication for ServiceOS

```
switch(config)# system serviceos password-prompt
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config`	Administrators or local user group members with execution rights for this command.

umount

`umount <DEVICE>`

Description

Unmounts the SSD partitions mounted to the following locations: **/coredump**, **/logs**, **/nos**, **/selftest**, and unmounts the USB device mounted to **/mnt/usb**.

Parameter	Description
<DEVICE>	Specifies the device to be unmounted. Supported device options include **all** and **usb**.

Examples

Unmounting all devices:

```
SVOS> umount all
SVOS> umount usb
```

Unmounting a USB device:

```
SVOS> umount all
SVOS> umount usb
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

All platforms	ServiceOS (`SVOS>`)	Administrators or local user group members with execution rights for this command.

update

`update {primary | secondary} <IMAGE>`

Description

Verifies and installs a product image. The user can select the primary or secondary boot profile to update and the location of the file.

Parameter	Description
`{primary	secondary}`	Selects either the primary or secondary image.
<IMAGE>	Specifies the image name.

Examples

Updating the software image using TFTP:

The OOBM port is disabled on first boot and must be enabled using the **ip** command.

```
SVOS> ip dhcp
SVOS> ip show
Interface   : Link Up
IP Address : 192.0.2.22
Subnet Mask: 255.255.200.20
Gateway     : 10.0.24.1
SVOS> tftp -g -r XL.10.00.0001.swi -l image.swi 192.4.8.10
XL.10.00.0001.swi 100% |*******************************|   178M  0:00:00 ETA
SVOS> ls
image.swi
SVOS> update primary image.swi
Updating primary software image...
Verifying image...
Done
```

Update the software image using USB:

This example assumes that the user has preloaded a USB flash drive with the image to be updated. The image name on the flash drive is not important.

```
SVOS> mount usb
SVOS> ls /mnt/usb
image.swi
SVOS> update primary /mnt/usb/image.swi
Updating primary software image...
Verifying image...
Done
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

tftp

```
tftp {-b | -g | -l <LOCAL-FILE> | -p | -r <REMOTE-FILE>} host [<PORT>]
```

Description

Transfers files to and from a remote machine (TFTP a file).

Parameter	Description
{-b | -g | -l | -p | -r *<REMOTE-FILE>*}	Selects the options for transferring a file.
-b	Specifies the transfer blocks of size octets. The default blocksize is set to 1468, which can be overridden with the -b option.
-g	Specifies to get a file.
-l	Specifies a local file.
-p	Specifies to put a file in remote location.
-r *<REMOTE-FILE>*	Specifies a remote file.
<PORT>	Specifies the port for transfer. If no port option is specified, TFTP uses the standard UDP port 69 by default.

Example

Transferring files:

```
SVOS> tftp -b 65464 -g -r XL.10.00.0002.swi.swi 192.0.2.1
XL.10.00.0002 100% |*******************************|   178M  0:00:00 ETA
SVOS>
```

version

`version`

Description

Displays the following build strings:

- Version.
- Build date.
- Build time.
- Build ID.
- SHA.

Example

Displaying version build strings:

```
SVOS> version
ServiceOS Information:
    Version:          GT.01.01.0001
    Build Date:       2017-07-19 14:52:31 PDT
    Build ID:         ServiceOS:GT.01.01.0001:461519208911:201707191452
    SHA:              461519208911 95cdb2267ea6889a3c6cbc3d4193
SVOS>
```

Chapter 4
ACL commands

ACL application

ACLs can be applied as follows:

ACL type Direction	IPv4+6 In	IPv4+6 Out	MAC In	MAC Out
L2 interface (port)	Yes	Yes	Yes	Yes
L2 LAG	Yes	Yes	Yes	Yes
L3 interface (port)	Yes	Yes	Yes	Yes
L3 LAG	Yes	Yes	Yes	Yes
L3 interface (port) subinterface	Yes	Yes	Yes	Yes
L3 LAG subinterface	Yes	Yes	Yes	Yes
VLAN	Yes	Yes	Yes	Yes
Interface VLAN	Yes (routed)	Yes (routed)		
Management interface	Yes			
Control Plane (per VRF)	Yes			

The following match criteria is not supported. If this match criteria is attempted to be configured, an error message will be displayed and the action will not be completed.

```
TTL on IP ACLs
```

To apply IPv4 and/or IPv6 ACLs to the management interface, apply them to the Control Plane on the management VRF.

access-list copy

```
access-list {ip|ipv6|mac} <ACL-NAME> copy <DESTINATION-ACL>
```

Description

Copies an IPv4, IPv6, or MAC ACL to a new destination ACL or overwrites an existing ACL.

Parameter	Description
{ip|ipv6|mac}	Specifies the type of ACL.
<ACL-NAME>	Specifies the name of the ACL to be copied.
<DESTINATION-ACL>	Specifies the name of the destination ACL.

Examples

Copying *MY_IP_ACL* to *MY_IP_ACL2*:

```
switch(config)# access-list ip MY_IP_ACL copy MY_IP_ACL2
switch(config-acl-ip)# exit

switch(config)# do show access-list
Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
--------------------------------------------------------------------------------
IPv4       MY_IP_ACL
         1 permit                          udp
           any
           172.16.1.0/255.255.255.0
         2 permit                          tcp
           172.16.2.0/255.255.0.0           >  1023
           any
         3 permit                          tcp
           172.26.1.0/255.255.255.0
           any
           dscp: AF11
           ack
           syn
         4 deny                            any
           any
           any
           Hit-counts: enabled
--------------------------------------------------------------------------------
IPv4       MY_IP_ACL2
         1 permit                          udp
           any
           172.16.1.0/255.255.255.0
         2 permit                          tcp
           172.16.2.0/255.255.0.0           >  1023
           any
         3 permit                          tcp
           172.26.1.0/255.255.255.0
           any
           dscp: AF11
           ack
           syn
         4 deny                            any
           any
           any
           Hit-counts: enabled
```

Copying MY_IPV6_ACL to MY_IPV6_ACL2:

```
switch(config)# access-list ipv6 MY_IPV6_ACL copy MY_IPV6_ACL2
switch(config-acl-ip)# exit

switch(config)# do show access-list
Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
-------------------------------------------------------------------------------
IPv6       MY_IPV6_ACL
         1 permit                          udp
           any
           2001::1/64
         2 Permit all TCP ephemeral ports
           permit                          tcp
           2001:2001::2:1                   >  1023
           any
         3 permit                          tcp
           2001:2011::1/64
           any
         4 deny                            any
           any
           any
           Hit-counts: enabled
-------------------------------------------------------------------------------
IPv6       MY_IPV6_ACL2
         1 permit                          udp
           any
           2001::1/64
         2 Permit all TCP ephemeral ports
           permit                          tcp
           2001:2001::2:1                   >  1023
           any
         3 permit                          tcp
           2001:2011::1/64
           any
         4 deny                            any
           any
           any
           Hit-counts: enabled
```

Copying MY_MAC_ACL to MY_MAC_ACL2:

```
switch(config)# access-list mac MY_MAC_ACL copy MY_MAC_ACL2
switch(config-acl-mac)# exit

switch(config)# do show access-list
Type       Name
  Sequence Comment
           Action                          EtherType
           Source MAC Address
           Destination MAC Address
           Additional Parameters
-------------------------------------------------------------------------------
MAC        MY_MAC_ACL

Command Information

Platforms	Command context	Authority
All platforms	`config`	Administrators or local user group members with execution rights for this command.

access-list ip

Syntax to create an IPv4 ACL and enter its context. Plus syntax to remove an ACL:

```
access-list ip <ACL-NAME>
no access-list ip <ACL-NAME>
```

Syntax (within the ACL context) for creating or removing ACEs for protocols **ah**, **gre**, **esp**, **igmp**, **ospf**, **pim** (**ip** is available as an alias for **any**):

```
  [<SEQUENCE-NUMBER>]
  {permit|deny}
  {any|ip|ah|gre|esp|igmp|ospf|pim|<IP-PROTOCOL-NUM>}
  {any|<SRC-IP-ADDRESS>[/{<PREFIX-LENGTH>|<SUBNET-MASK>}]|<ADDRESS-GROUP>}
  {any|<DST-IP-ADDRESS>[/{<PREFIX-LENGTH>|<SUBNET-MASK>}]|<ADDRESS-GROUP>}
  [dscp <DSCP-SPECIFIER>] [ecn <ECN-VALUE>] [ip-precedence <IP-PRECEDENCE-VALUE>]
  [tos <TOS-VALUE>] [fragment] [vlan <VLAN-ID>] [ttl <TTL-VALUE>] [count] [log]

  no <SEQUENCE-NUMBER>
```

Syntax (within the ACL context) for creating or removing ACEs for protocols `sctp`, `tcp`, `udp`:

```
  [<SEQUENCE-NUMBER>]
  {permit|deny}
  {sctp|tcp|udp}
  {any|<SRC-IP-ADDRESS>[/{<PREFIX-LENGTH>|<SUBNET-MASK>}]|<ADDRESS-GROUP>}
  [{eq|gt|lt} <PORT>|range <MIN-PORT> <MAX-PORT>|group <PORT-GROUP>]
  {any|<DST-IP-ADDRESS>[/{<PREFIX-LENGTH>|<SUBNET-MASK>}]|<ADDRESS-GROUP>}
  [{eq|gt|lt} <PORT>|range <MIN-PORT> <MAX-PORT>|group <PORT-GROUP>]
  [urg] [ack] [psh] [rst] [syn] [fin] [established]
  [dscp <DSCP-SPECIFIER>] [ecn <ECN-VALUE>] [ip-precedence <IP-PRECEDENCE-VALUE>]
  [tos <TOS-VALUE>]  [fragment] [vlan <VLAN-ID>] [ttl <TTL-VALUE>] [count] [log]
```

```
no <SEQUENCE-NUMBER>
```

Syntax (within the ACL context) for creating or removing ACEs for protocol `icmp`:

```
[<SEQUENCE-NUMBER>]
{permit|deny}
{icmp}
{any|<SRC-IP-ADDRESS>[/{<PREFIX-LENGTH>|<SUBNET-MASK>}]|<ADDRESS-GROUP>}
{any|<DST-IP-ADDRESS>[/{<PREFIX-LENGTH>|<SUBNET-MASK>}]|<ADDRESS-GROUP>}
[icmp-type {echo|echo-reply|<ICMP-TYPE-VALUE>}] [icmp-code <ICMP-CODE-VALUE>]
[dscp <DSCP-SPECIFIER>] [ecn <ECN-VALUE>] [ip-precedence <IP-PRECEDENCE-VALUE>]
[tos <TOS-VALUE>] [fragment] [vlan <VLAN-ID>] [ttl <TTL-VALUE>] [count] [log]

no <SEQUENCE-NUMBER>
```

Syntax (within the ACL context) for ACE comments:

```
[<SEQUENCE-NUMBER>] comment <TEXT-STRING>

no <SEQUENCE-NUMBER> comment
```

Description

Creates an IPv4 Access Control List (ACL) comprised of one or more Access Control Entries (ACEs) ordered and prioritized by sequence number. The lowest sequence number is the highest prioritized ACE.

The **no** form of this command deletes the entire ACL, or deletes an ACE identified by sequence number, or deletes only the comment from the ACE identified by sequence number.

Parameter	Description
<ACL-NAME>	Specifies the name of this ACL.
<SEQUENCE-NUMBER>	Specifies a sequence number for the ACE. Range: 1 to 4294967295.
`{permit|deny}`	Specifies whether to permit or deny traffic matching this ACE.
<IP-PROTOCOL-NUM>	Specifies the protocol as its Internet Protocol number. For example, 2 corresponds to the IGMP protocol. Range: 0 to 255.
`{any|<SRC-IP-ADDRESS>[/{<PREFIX-LENGTH>|<SUBNET-MASK>}]|<ADDRESS-GROUP>}`	Specifies the source IPv4 address. ■ **any** - specifies any source IPv4 address. ■ ***<SRC-IP-ADDRESS>*** - specifies the source IPv4 host address. ○ ***<PREFIX-LENGTH>*** - specifies the address bits to mask (CIDR subnet mask notation). Range: 1 to 32. ○ ***<SUBNET-MASK>*** - specifies the address bits to mask (dotted decimal notation). ■ ***<ADDRESS-GROUP>*** - specifies an IPv4 address group defined with **object-group ip address**.
`{any|<DST-IP-ADDRESS>[/{<PREFIX-LENGTH>|<SUBNET-MASK>}]|<ADDRESS-GROUP>}`	Specifies the destination IPv4 address. ■ **any** - specifies any destination IPv4 address. ■ ***<DST-IP-ADDRESS>*** - specifies the destination IPv4

Parameter	Description
	host address. ◦ ***<PREFIX-LENGTH>*** - specifies the address bits to mask (CIDR subnet mask notation). Range: 1 to 32. ◦ ***<SUBNET-MASK>*** - specifies the address bits to mask (dotted decimal notation). ■ ***<ADDRESS-GROUP>*** - specifies an IPv4 address group that you defined earlier with `object-group ip address`.
`[{eq|gt|lt} <PORT>|range <MIN-PORT> <MAX-PORT>|group <PORT-GROUP>]`	Specifies the port, port range, or port group. Port numbers are in the range of 0 to 65535. ■ **eq *<PORT>*** - specifies the Layer 4 port. ■ **gt *<PORT>*** - specifies any Layer 4 port greater than the indicated port. ■ **lt *<PORT>*** - specifies any Layer 4 port less than the indicated port. ■ **range *<MIN-PORT> <MAX-PORT>*** - specifies the Layer 4 port range. ■ **group *<PORT-GROUP>*** - specifies the Layer 4 port group that you defined earlier with `object-group port`. **NOTE:** Upon application of the ACL, ACEs with L4 port ranges may consume more than one hardware entry.
`urg`	Specifies matching on the TCP Flag: **Urgent**.
`ack`	Specifies matching on the TCP Flag: **Acknowledgment**.
`psh`	Specifies matching on the TCP Flag: **Push buffered data to receiving application**.
`rst`	Specifies matching on the TCP Flag: **Reset the connection**.
`syn`	Specifies matching on the TCP Flag: **Synchronize sequence numbers**.
`fin`	Specifies matching on the TCP Flag: **Finish connection**.
`established`	Specifies matching on the TCP Flag: Established connection.
`[icmp-type {echo|echo-reply| <ICMP-TYPE-VALUE>}]`	Specifies the ICMP type. ■ **echo** - specifies an ICMP echo request packet. ■ **echo-reply** - specifies an ICMP echo reply packet. ■ ***<ICMP-TYPE-VALUE>*** - specifies an ICMP type

Parameter	Description
	value. Range: 0 to 255.
`[icmp-code <ICMP-CODE-VALUE>]`	Specifies the ICMP code value. Range: 0 to 255.
`dscp DSCP-SPECIFIER>`	Specifies the Differentiated Services Code Point (DSCP), either a numeric ***<DSCP-VALUE>*** (0 to 63) or one of these keywords: ▪ **AF11** - DSCP 10 (Assured Forwarding Class 1, low drop probability) ▪ **AF12** - DSCP 12 (Assured Forwarding Class 1, medium drop probability) ▪ **AF13** - DSCP 14 (Assured Forwarding Class 1, high drop probability) ▪ **AF21** - DSCP 18 (Assured Forwarding Class 2, low drop probability) ▪ **AF22** - DSCP 20 (Assured Forwarding Class 2, medium drop probability) ▪ **AF23** - DSCP 22 (Assured Forwarding Class 2, high drop probability) ▪ **AF31** - DSCP 26 (Assured Forwarding Class 3, low drop probability) ▪ **AF32** - DSCP 28 (Assured Forwarding Class 3, medium drop probability) ▪ **AF33** - DSCP 30 (Assured Forwarding Class 3, high drop probability) ▪ **AF41** - DSCP 34 (Assured Forwarding Class 4, low drop probability) ▪ **AF42** - DSCP 36 (Assured Forwarding Class 4, medium drop probability) ▪ **AF43** - DSCP 38 (Assured Forwarding Class 4, high drop probability) ▪ **CS0** - DSCP 0 (Class Selector 0: Default) ▪ **CS1** - DSCP 8 (Class Selector 1: Scavenger) ▪ **CS2** - DSCP 16 (Class Selector 2: OAM) ▪ **CS3** - DSCP 24 (Class Selector 3: Signaling) ▪ **CS4** - DSCP 32 (Class Selector 4: Real time) ▪ **CS5** - DSCP 40 (Class Selector 5: Broadcast video) ▪ **CS6** - DSCP 48 (Class Selector 6: Network control) ▪ **CS7** - DSCP 56 (Class Selector 7) ▪ **EF** - DSCP 46 (Expedited Forwarding)
`ecn <ECN-VALUE>`	Specifies an Explicit Congestion Notification value. Range: 0 to 3.
`ip-precedence <IP-PRECEDENCE-VALUE>`	Specifies an IP precedence value. Range: 0 to 7.
`tos <TOS-VALUE>`	Specifies the Type of Service value. Range: 0 to 31.
`fragment`	Specifies a fragment packet.
`vlan <VLAN-ID>`	Specifies VLAN tag to match on. 802.1Q VLAN ID.

Parameter	Description
	NOTE: This parameter cannot be used in any ACL that will be applied to a VLAN.
`ttl <TTL-VALUE>`	Specifies a time-to-live (hop limit) value. Range: 0 to 255. Not supported for ACLs.
`count`	Keeps the hit counts of the number of packets matching this ACE.
`log`	Keeps a log of the number of packets matching this ACE. Works with both `permit` and `deny` actions. Works with ACLs applied on ingress, egress, or Control Plane.
`[<SEQUENCE-NUMBER>] comment <TEXT-STRING>`	Adds a comment to an ACE. The **no** form removes only the comment from the ACE.

Usage

- If the ***<IP-PROTOCOL-NUM>*** parameter is used instead of a protocol name, ensure that any needed ACE-definition parameters specific to the selected protocol are also provided.
- When using multiple ACL types (IPv4, IPv6, or MAC) with logging on the same interface, the first packet that matches an ACE with `log` option is logged. Until the log-timer wait-period is over, any packets matching other ACL types do not create a log. At the end of the wait-period, the switch creates a summary log for all the ACLs that were matched, regardless of type.

Examples

Creating an IPv4 ACL with four entries:

```
switch(config)# access-list ip MY_IP_ACL
switch(config-acl-ip)# 10 permit udp any 172.16.1.0/24
switch(config-acl-ip)# 20 permit tcp 172.16.2.0/16 gt 1023 any
switch(config-acl-ip)# 30 permit tcp 172.26.1.0/24 any syn ack dscp 10
switch(config-acl-ip)# 40 deny any any any count
switch(config-acl-ip)# exit

switch(config)# show access-list
Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
-------------------------------------------------------------------------------
IPv4       MY_IP_ACL
        10 permit                          udp
           any
           172.16.1.0/255.255.255.0
        20 permit                          tcp
           172.16.2.0/255.255.0.0           >  1023
           any
        30 permit                          tcp
           172.26.1.0/255.255.255.0
           any
           dscp: AF11
           ack
           syn
        40 deny                            any
           any
           any
           Hit-counts: enabled
```

Adding a comment to an existing IPv4 ACE:

```
switch(config)# access-list ip MY_IP_ACL
switch(config-acl-ip)# 20 comment Permit all TCP ephemeral ports
switch(config-acl-ip)# exit

switch(config)# show access-list
Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
-------------------------------------------------------------------------------
IPv4       MY_IP_ACL
        10 permit                          udp
           any
           172.16.1.0/255.255.255.0
        20 Permit all TCP ephemeral ports
           permit                          tcp
           172.16.2.0/255.255.0.0           >  1023
           any
        30 permit                          tcp
           172.26.1.0/255.255.255.0
           any
           dscp: AF11
           ack
           syn
        40 deny                            any
           any
           any
           Hit-counts: enabled
```

Removing a comment from an existing IPv4 ACE:

```
switch(config)# access-list ip MY_IP_ACL
switch(config-acl-ip)# no 20 comment
switch(config-acl-ip)# exit

switch(config)# show access-list
Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
-------------------------------------------------------------------------------
IPv4       MY_IP_ACL
        10 permit                          udp
           any
           172.16.1.0/255.255.255.0
        20 permit                          tcp
           172.16.2.0/255.255.0.0           >  1023
           any
        30 permit                          tcp
           172.26.1.0/255.255.255.0
           any
           dscp: AF11
           ack
           syn
        40 deny                            any
           any
           any
           Hit-counts: enabled
```

Adding an ACE (insert line 25) to an existing IPv4 ACL:

```
switch(config)# access-list ip MY_IP_ACL
switch(config-acl-ip)# 25 permit icmp 172.16.2.0/16 any
switch(config-acl-ip)# exit

switch(config)# show access-list
Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
-------------------------------------------------------------------------------
IPv4       MY_IP_ACL
        10 permit                          udp
           any
           172.16.1.0/255.255.255.0
        20 permit                          tcp
           172.16.2.0/255.255.0.0           >  1023
           any
        25 permit                          icmp
           172.16.2.0/255.255.0.0 any
        30 permit                          tcp
           172.26.1.0/255.255.255.0
           any
           dscp: AF11
           ack
           syn
        40 deny                            any
           any
           any
           Hit-counts: enabled
```

Replacing an ACE in an existing IPv4 ACL:

```
switch(config)# access-list ip MY_IP_ACL
switch(config-acl-ip)# 25 permit icmp 172.17.1.0/16 any
switch(config-acl-ip)# exit

switch(config)# show access-list
Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
-------------------------------------------------------------------------------
IPv4       MY_IP_ACL
        10 permit                          udp
           any
           172.16.1.0/255.255.255.0
        20 permit                          tcp
           172.16.2.0/255.255.0.0           >  1023
           any
        25 permit                          icmp
           172.17.1.0/255.255.0.0
        30 permit                          tcp
           172.26.1.0/255.255.255.0
           any
           dscp: AF11
           ack
           syn
        40 deny                            any
           any
           any
           Hit-counts: enabled
Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
-------------------------------------------------------------------------------
IPv4       MY_IP_ACL
        10 permit                          udp
           any
           172.16.1.0/255.255.255.0
        20 permit                          tcp
           172.16.2.0/255.255.0.0           >  1023
           any
        25 permit                          icmp
           172.17.1.0/255.255.0.0
        30 permit                          tcp
           172.26.1.0/255.255.255.0
           any
           dscp: AF11
           ack
           syn
        40 deny                            any
           any
           any
           Hit-counts: enabled
```

Removing an ACE from an IPv4 ACL:

```
switch(config)# access-list ip MY_IP_ACL
switch(config-acl-ip)# no 25
switch(config-acl-ip)# exit

switch(config)# show access-list
Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
-------------------------------------------------------------------------------
IPv4       MY_IP_ACL
        10 permit                          udp
           any
           172.16.1.0/255.255.255.0
        20 permit                          tcp

        40
           deny                            any
           any
           any
           Hit-counts: enabled
```

Removing an IPv4 ACL:

```
switch(config)# no access-list ip MY_IP_ACL

switch(config)# show access-list
Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
-------------------------------------------------------------------------------
IPv4       MY_IP_ACL2
         1 permit                          udp
           any
           172.16.1.0/255.255.255.0
         2 permit                          tcp
           172.16.2.0/255.255.0.0           >  1023
           any
         3 permit                          tcp
           172.26.1.0/255.255.255.0
           any
           dscp: AF11
           ack
           syn
         4 deny                            any
           any
           any
           Hit-counts: enabled
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

Command History

Release	Modification
10.12	Allow ACLs applied to the Control Plane to be logged.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config` The **access-list ip *<ACL-NAME>*** command takes you into the named ACL context where you enter the ACEs.	Administrators or local user group members with execution rights for this command.

access-list ipv6

Syntax to create an IPv6 ACL and enter its context. Plus syntax to remove an ACL:

```
access-list ipv6 <ACL-NAME>
no access-list ipv6 <ACL-NAME>
```

Syntax (within the ACL context) for creating or removing ACEs for protocols **ah**, **gre**, **esp**, **ospf**, **pim** (**ipv6** is available as an alias for **any**):

```
  [<SEQUENCE-NUMBER>]
  {permit|deny}
  {any|ipv6|ah|gre|esp|ospf|pim|<IP-PROTOCOL-NUM>}
  {any|<SRC-IP-ADDRESS>[/<PREFIX-LENGTH>]|<ADDRESS-GROUP>}
  {any|<DST-IP-ADDRESS>[/<PREFIX-LENGTH>]|<ADDRESS-GROUP>}
  [dscp <DSCP-SPECIFIER>] [ecn <ECN-VALUE>] [ip-precedence <IP-PRECEDENCE-VALUE>]
  [tos <TOS-VALUE>] [fragment] [vlan <VLAN-ID>] [ttl <TTL-VALUE>] [count] [log]

  no <SEQUENCE-NUMBER>
```

Syntax (within the ACL context) for creating or removing ACEs for protocols `sctp`, `tcp`, `udp`:

```
  [<SEQUENCE-NUMBER>]
  {permit|deny}
  {sctp|tcp|udp}
  {any|<SRC-IP-ADDRESS>[/<PREFIX-LENGTH>}]|<ADDRESS-GROUP>}
  [{eq|gt|lt} <PORT>|range <MIN-PORT> <MAX-PORT>|group <PORT-GROUP>]
  {any|<DST-IP-ADDRESS>[/<PREFIX-LENGTH>]|<ADDRESS-GROUP>}
  [{eq|gt|lt} <PORT>|range <MIN-PORT> <MAX-PORT>|group <PORT-GROUP>]
  [urg] [ack] [psh] [rst] [syn] [fin] [established]
  [dscp <DSCP-SPECIFIER>] [ecn <ECN-VALUE>] [ip-precedence <IP-PRECEDENCE-VALUE>]
  [tos <TOS-VALUE>] [fragment] [vlan <VLAN-ID>] [ttl <TTL-VALUE>] [count] [log]

  no <SEQUENCE-NUMBER>
```

Syntax (within the ACL context) for creating or removing ACEs for protocol `icmpv6`:

```
  [<SEQUENCE-NUMBER>]
  {permit|deny}
  {icmpv6}
```

```
    {any|<SRC-IP-ADDRESS>[/<PREFIX-LENGTH>]|<ADDRESS-GROUP>}
    {any|<DST-IP-ADDRESS>[/<PREFIX-LENGTH>]|<ADDRESS-GROUP>}
    [icmp-type {echo|echo-reply|<ICMP-TYPE-VALUE>}] [icmp-code <ICMP-CODE-VALUE>]
    [dscp <DSCP-SPECIFIER>][ecn <ECN-VALUE>] [ip-precedence <IP-PRECEDENCE-VALUE>]
    [tos <TOS-VALUE>] [fragment] [vlan <VLAN-ID>] [ttl <TTL-VALUE>] [count] [log]

  no <SEQUENCE-NUMBER>
```

Syntax (within the ACL context) for ACE comments:

```
  [<SEQUENCE-NUMBER>] comment <TEXT-STRING>

  no <SEQUENCE-NUMBER> comment
```

Description

Creates an IPv6 Access Control List (ACL). The ACL is made of one or more Access Control Entries (ACEs) ordered and prioritized by sequence number. The lowest sequence number is the highest prioritized ACE.

The **no** form of this command deletes the entire ACL, or deletes an ACE identified by sequence number, or deletes only the comment from the ACE identified by sequence number.

Parameter	Description
<ACL-NAME>	Specifies the name of this ACL.
<SEQUENCE-NUMBER>	Specifies a sequence number for the ACE. Range: 1 to 4294967295.
{permit|deny}	Specifies whether to permit or deny traffic matching this ACE.
<IP-PROTOCOL-NUM>	Specifies the protocol as its Internet Protocol number. For example, 2 corresponds to the IGMP protocol. Range: 0 to 255.
{any|*<SRC-IP-ADDRESS>*[/*<PREFIX-LENGTH>*]|*<ADDRESS-GROUP>*}	Specifies the source IPv6 address. ■ **any** - specifies any source IPv6 address. ■ ***<SRC-IP-ADDRESS>*** - specifies the source IPv6 host address. ○ ***<PREFIX-LENGTH>*** - specifies the address bits to mask (CIDR subnet mask notation). Range: 1 to 128. ■ ***<ADDRESS-GROUP>*** - specifies an IPv6 address group that you defined earlier with **object-group ipv6 address**.
{any|*<DST-IP-ADDRESS>*[/*<PREFIX-LENGTH>*]|*<ADDRESS-GROUP>*}	Specifies the destination IPv6 address. ■ **any** - specifies any destination IPv6 address. ■ ***<DST-IP-ADDRESS>*** - specifies the destination IPv6 host address. ○ ***<PREFIX-LENGTH>*** - specifies the address bits to mask (CIDR subnet mask notation). Range: 1 to 128. ■ ***<ADDRESS-GROUP>*** - specifies an IPv6 address group that you defined earlier with `object-group ipv6 address`.

Parameter	Description
`[{eq|gt|lt} <PORT>|range <MIN-PORT><MAX-PORT>|group <PORT-GROUP>]`	Specifies the port, port range, or port group. Port numbers are in the range of 0 to 65535. - **eq *<PORT>*** - specifies the Layer 4 port. - **gt *<PORT>*** - specifies any Layer 4 port greater than the indicated port. - **lt *<PORT>*** - specifies any Layer 4 port less than the indicated port. - **range *<MIN-PORT>* *<MAX-PORT>*** - specifies the Layer 4 port range. - **group *<PORT-GROUP>*** - specifies the Layer 4 port group that you defined earlier with `object-group port`. **NOTE:** Upon application of the ACL, ACEs with L4 port ranges may consume more than one hardware entry.
`urg, ack, psh, rst, syn, fin, established`	These TCP flag-matching parameters are supported for both ingress and egress.
`[icmp-type {echo|echo-reply|<ICMP-TYPE-VALUE>}]`	Specifies the ICMP type. - **echo** - specifies an ICMP echo request packet. - **echo-reply** - specifies an ICMP echo reply packet. - ***<ICMP-TYPE-VALUE>*** - specifies an ICMP type value. Range: 0 to 255.
`[icmp-code <ICMP-CODE-VALUE>]`	Specifies the ICMP code value. Range: 0 to 255.
`dscp DSCP-SPECIFIER>`	Specifies the Differentiated Services Code Point (DSCP), either a numeric ***<DSCP-VALUE>*** (0 to 63) or one of these keywords: - **AF11** - DSCP 10 (Assured Forwarding Class 1, low drop probability) - **AF12** - DSCP 12 (Assured Forwarding Class 1, medium drop probability) - **AF13** - DSCP 14 (Assured Forwarding Class 1, high drop probability) - **AF21** - DSCP 18 (Assured Forwarding Class 2, low drop probability) - **AF22** - DSCP 20 (Assured Forwarding Class 2, medium drop probability) - **AF23** - DSCP 22 (Assured Forwarding Class 2, high drop probability) - **AF31** - DSCP 26 (Assured Forwarding Class 3, low drop probability) - **AF32** - DSCP 28 (Assured Forwarding Class 3, medium drop probability) - **AF33** - DSCP 30 (Assured Forwarding Class 3, high drop probability) - **AF41** - DSCP 34 (Assured Forwarding Class 4, low drop probability)

Parameter	Description
	- **AF42** - DSCP 36 (Assured Forwarding Class 4, medium drop probability) - **AF43** - DSCP 38 (Assured Forwarding Class 4, high drop probability) - **CS0** - DSCP 0 (Class Selector 0: Default) - **CS1** - DSCP 8 (Class Selector 1: Scavenger) - **CS2** - DSCP 16 (Class Selector 2: OAM) - **CS3** - DSCP 24 (Class Selector 3: Signaling) - **CS4** - DSCP 32 (Class Selector 4: Real time) - **CS5** - DSCP 40 (Class Selector 5: Broadcast video) - **CS6** - DSCP 48 (Class Selector 6: Network control) - **CS7** - DSCP 56 (Class Selector 7) - **EF** - DSCP 46 (Expedited Forwarding)
`ecn` *`<ECN-VALUE>`*	Specifies an Explicit Congestion Notification value. Range: 0- 3.
`ip-precedence` *`<IP-PRECEDENCE-VALUE>`*	Specifies an IP precedence value. Range: 0-7.
`tos` *`<TOS-VALUE>`*	Specifies the Type of Service value. Range: 0-31.
`fragment`	Specifies a fragment packet.
`vlan` *`<VLAN-ID>`*	Specifies VLAN tag to match on. 802.1Q VLAN ID. **NOTE:** This parameter cannot be used in any ACL that will be applied to a VLAN.
`ttl` *`<TTL-VALUE>`*	Not supported.
`count`	Keeps the hit counts of the number of packets matching this ACE.
`log`	Keeps a log of the number of packets matching this ACE. Works with both `permit` and `deny` actions. Works with ACLs applied on ingress, egress, or Control Plane.
`[`*`<SEQUENCE-NUMBER>`*`] comment` *`<TEXT-STRING>`*	Adds a comment to an ACE. The **no** form removes only the comment from the ACE.

Usage

- If the ***<IP-PROTOCOL-NUM>*** parameter is used instead of a protocol name, ensure that any needed ACE-definition parameters specific to the selected protocol are also provided.
- When using multiple ACL types (IPv4, IPv6, or MAC) with logging on the same interface, the first packet that matches an ACE with `log` option is logged. Until the log-timer wait-period is over, any packets matching other ACL types do not create a log. At the end of the wait-period, the switch creates a summary log all the ACLs that were matched, regardless of type.

Examples

Creating an IPv6 ACL with four entries:

```
switch(config)# access-list ipv6 MY_IPV6_ACL
switch(config-acl-ipv6)# 10 permit udp any 2001::1/64
switch(config-acl-ipv6)# 20 permit tcp 2001:2001::2:1/128 gt 1023 any
switch(config-acl-ipv6)# 30 permit tcp 2001:2011::1/64 any
switch(config-acl-ipv6)# 40 deny any any any count
switch(config-acl-ipv6)# exit

switch(config)# do show access-list
Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
-------------------------------------------------------------------------------
IPv6       MY_IPV6_ACL
        10 permit                          udp
           any
           2001::1/64
        20 permit                          tcp
           2001:2001::2:1                   >  1023
           any
        30 permit                          tcp
           2001:2011::1/64
           any
        40 deny                            any
           any
           any
           Hit-counts: enabled
```

Adding a comment to an existing IPv6 ACE:

```
switch(config)# access-list ipv6 MY_IPV6_ACL
switch(config-acl-ipv6)# 20 comment Permit all TCP ephemeral ports
switch(config-acl-ipv6)# exit

switch(config)# do show access-list
Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
-------------------------------------------------------------------------------
IPv6       MY_IPV6_ACL
        10 permit                          udp
           any
           2001::1/64
        20 Permit all TCP ephemeral ports
           permit                          tcp
           2001:2001::2:1                   >  1023
           any
        30 permit                          tcp
           2001:2011::1/64
           any
        40 deny                            any
           any
           any
           Hit-counts: enabled
```

Removing a comment from an existing IPv6 ACE:

```
switch(config)# access-list ipv6 MY_IPV6_ACL
switch(config-acl-ipv6)# no 20 comment
switch(config-acl-ipv6)# exit

switch(config)# do show access-list
Type       Name
  Sequence Comment
           Action                             L3 Protocol
           Source IP Address                  Source L4 Port(s)
           Destination IP Address             Destination L4 Port(s)
           Additional Parameters
--------------------------------------------------------------------------------
IPv6       MY_IPV6_ACL
        10 permit                             udp
           any
           2001::1/64
        20 permit                             tcp
           2001:2001::2:1                      >  1023
           any
        30 permit                             tcp
           2001:2011::1/64
           any
        40 deny                               any
           any
           any
           Hit-counts: enabled
```

Adding an ACE to an existing IPv6 ACL:

```
switch(config)# access-list ipv6 MY_IPV6_ACL
switch(config-acl-ipv6)# 25 permit icmpv6 2001::1/64 any
switch(config-acl-ipv6)# exit

switch(config)# do show access-list
Type       Name
  Sequence Comment
           Action                             L3 Protocol
           Source IP Address                  Source L4 Port(s)
           Destination IP Address             Destination L4 Port(s)
           Additional Parameters
--------------------------------------------------------------------------------
IPv6       MY_IPV6_ACL
        10 permit                             udp
           any
           2001::1/64
        20 permit                             tcp
           2001:2001::2:1                      >  1023
           any
        25 permit                             icmpv6
           2001::1/64
           any
        30 permit                             tcp
           2001:2011::1/64
           any
        40 deny                               any
           any
           any
           Hit-counts: enabled
```

Replacing an ACE in an existing IPv6 ACL:

```
switch(config)# access-list ipv6 MY_IPV6_ACL
switch(config-acl-ipv6)# 25 permit icmpv6 2001::2:1/64 any
switch(config-acl-ipv6)# exit

switch(config)# do show access-list
Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
--------------------------------------------------------------------------------
IPv6       MY_IPV6_ACL
        10 permit                          udp
           any
           2001::1/64
        20 permit                          tcp
           2001:2001::2:1                   >  1023
           any
        25 permit                          icmpv6
           2001::2:1/64
           any
        30 permit                          tcp
           2001:2011::1/64
           any
        40 deny                            any
           any
           any
           Hit-counts: enabled

Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
--------------------------------------------------------------------------------
IPv6       MY_IPV6_ACL
        10 permit                          udp
           any
           2001::1/64
        20 permit                          tcp
           2001:2001::2:1                   >  1023
           any
        25 permit                          icmpv6
           2001::2:1/64
           any
        30 permit                          tcp
           2001:2011::1/64
           any

           any
           any
           Hit-counts: enabled
```

Removing an IPv6 ACL:

```
switch(config)# no access-list ipv6 MY_IPV6_ACL

switch(config)# do show access-list
Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
-------------------------------------------------------------------------------
IPv6       MY_IPV6_ACL2
         1 permit                          udp
           any
           2001::1/64
```

```
          2 Permit all TCP ephemeral ports
            permit                          tcp
            2001:2001::2:1                   >  1023
            any
          3 permit                          tcp
            2001:2011::1/64
            any
          4 deny                            any
            any
            any
            Hit-counts: enabled
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

Command History

Release	Modification
10.12	Allow ACLs applied to the Control Plane to be logged.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config` The **access-list ipv6 <ACL-NAME>** command takes you into the named ACL context where you enter the ACEs.	Administrators or local user group members with execution rights for this command.

access-list log-timer

`access-list log-timer {default|<INTERVAL>}`

Description

Sets the log timer interval for all ACEs that have the **log** parameter configured.

Parameter	Description
`default`	Resets the log timer to its default 300 seconds.
`<INTERVAL>`	Specifies the log timer interval in seconds. Range: 5 to 300.

Usage

- ACL logging keeps a log of the number of packets matching this ACE. Works with both `permit` and `deny` actions. Works with ACLs applied on ingress, egress, or Control Plane.

- The first packet that matches an ACE with the **log** parameter within an ACL log timer window (configured with the **access-list log-timer** command) has its header contents extracted and sent to the configured logging destination, such as the console and syslog server. Each time the ACL log timer expires, a summary of all ACEs with **log** configured are sent to the logging destination. This capability allows throttling of logging ACL hits.
- If no further log messages are generated in the wait-period, the switch suspends the timer and resets itself to log as soon as a new match occurs.
- When using multiple ACL types (IPv4, IPv6, or MAC) with logging on the same interface, the first packet that matches an ACE with the `log` option is logged. Any packets, matching other ACL types, do not create a log until the log-timer wait-period is over. At the end of the wait-period, a summary log is made of all the ACLs that were matched, regardless of type.

Remarked ACL traffic may lose logging information when a QoS action or a classifier policy with remark is enabled. A classifier policy with remark takes precedence over QoS actions and QoS actions takes precedence over ACL remarked traffic.

- You may see a minor discrepancy between the ACL logging statistics and the hit counts statistics due to the time required to record the log message.

Examples

Although these examples use debug logging, you can alternatively use event logging.

On the 6400 Switch Series, interface identification differs.

Enabling debug logging for the ACL logging module:

```
switch# debug acl log severity info
switch# show debug
----------------------------------------------------------------
module sub_module severity vlan  port   ip     mac  instance vrf
----------------------------------------------------------------
acl    acl_log    info     ----- -----  -----  ---- -----    ---
```

Setting the debug destination to console with the minimum security level of info:

```
switch# debug destination console severity info
switch# show debug destination
---------------------------------------------------------------------
                show debug destination
---------------------------------------------------------------------
CONSOLE:info
```

Setting the access list log-timer to 30 seconds:

```
switch(config)# access-list log-timer 30
switch(config)# do show access-list log-timer
ACL log timer length (frequency): 30 seconds
```

Creating an IPv4 ACL with one entry with the log parameter:

```
switch(config)# access-list ip MY_IP_ACL
switch(config-acl-ip)# deny icmp 1.1.1.1 1.1.1.2 log
switch(config-acl-ip)# do show access-list
Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
-------------------------------------------------------------------------------
IPv4       MY_IP_ACL
        10 deny                            icmp
           1.1.1.1
           1.1.1.2
           Logging: enabled
           Hit-counts: enabled
```

Enabling interface 1/1/1 and applying the ACL:

```
switch(config)# interface 1/1/1
switch(config-if)# no shutdown
switch(config-if)# no routing
switch(config-if)# apply access-list ip MY_IP_ACL in
switch(config-if)# do show running-config interface 1/1/1
interface 1/1/1
   no shutdown
   apply access-list ip MY_IP_ACL in
   no routing
   vlan access 1
   exit
```

Sending packets that will match the ACE and observe the ACL logging message on the console:

```
2017-10-10T20:13:36.044+00:00 ops-switchd[875]: debug|LOG_INFO|AMM|1/5|ACL|ACL_
LOG|
List MY_IP_ACL, seq# 10 denied icmp 1.1.1.1 -> 1.1.1.2 type 8 code 0,
on vlan 1, port 1/1/1, direction in
```

When the access list log-timer expires, the summary message is printed on the console. The number 30 is the number of packets received during the last access list log-timer window.

```
2017-10-10T20:14:06.051+00:00 ops-switchd[875]: debug|LOG_INFO|AMM|1/5|ACL|ACL_
LOG|
MY_IP_ACL on 1/1/1 (in): 30  10 deny icmp 1.1.1.1 1.1.1.2 log count
```

Resetting the ACL log timer to the default value:

```
switch(config)# access-list log-timer default
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

Command History

Release	Modification
10.12	Allow ACLs applied to the Control Plane to be logged.
10.09	<INTERVAL> parameter range changed to **5 to 300**. Was 30 to 300.
10.07 or earlier	--

Command Information

access-list mac

```
access-list mac <ACL-NAME>
no access-list mac <ACL-NAME>

[<SEQUENCE-NUMBER>]
{permit|deny}
{any|<SRC-MAC-ADDRESS>[/<ETHERNET-MASK>]]}
{any|<DST-MAC-ADDRESS>[/<ETHERNET-MASK>]]}
{any|aarp|appletalk|arp|fcoe|fcoe-init|ip|ipv6|
      ipx-arpa|ipx-non-arpa|is-is|lldp|mpls-multicast|mpls-unicast|q-in-q|
      rbridge|trill|wake-on-lan|<NUMERIC-ETHERTYPE>}
[pcp <PCP-VALUE>] [vlan <VLAN-ID>] [count] [log]
no <SEQUENCE-NUMBER>

[<SEQUENCE-NUMBER>] comment <TEXT-STRING>
no <SEQUENCE-NUMBER> comment
```

Description

Creates a MAC Access Control List (ACL). The ACL is made of one or more Access Control Entries (ACEs) ordered and prioritized by sequence numbers. The lowest sequence number is the highest prioritized ACE.

The **no** form of this command deletes the entire ACL, or deletes an ACE identified by sequence number, or deletes only the comment from the ACE identified by sequence number.

Parameter	Description
<ACL-NAME>	Specifies the name of this ACL.
<SEQUENCE-NUMBER>	Specifies a sequence number for the ACE. Range: 1 to 4294967295.
`{permit|deny}`	Specifies whether to permit or deny traffic matching this ACE.
`comment`	Specifies storing the remaining entered text as an ACE comment.
`{any|<SRC-MAC-ADDRESS>`	Specifies the source host MAC address (xxxx.xxxx.xxxx), OUI, or

Parameter	Description
`[/<ETHERNET-MASK>}]}`	the keyword `any`. You can optionally include the following: *<ETHERNET-MASK>* - The address bits to mask (xxxx.xxxx.xxxx).
`{any|<DST-MAC-ADDRESS> [/<ETHERNET-MASK>}]}`	Specifies the destination host MAC address (xxxx.xxxx.xxxx), OUI, or the keyword `any`. You can optionally include the following: *<ETHERNET-MASK>* - The address bits to mask (xxxx.xxxx.xxxx).
`{any|aarp|appletalk| ... |wake-on-lan|<NUMERIC-ETHERTYPE>`	Specifics the protocol encapsulated in the Ethernet frame. The encapsulated protocol is identified by the EtherType Ethernet field. The EtherType is specified in one of the following three ways: ■ `any` - any EtherType. ■ *<NUMERIC-ETHERTYPE>* - the numerical EtherType protocol number. Range: 0x600 to 0xffff. ■ One of these EtherType protocol name keywords: ○ `aarp` ○ `appletalk` ○ `arp` ○ `fcoe` ○ `fcoe-init` ○ `ip` ○ `ipv6` ○ `ipx-arpa` ○ `ipx-non-arpa` ○ `is-is` ○ `lldp` ○ `mpls-multicast` ○ `mpls-unicast` ○ `q-in-q` ○ `rbridge` ○ `trill` ○ `wake-on-lan`
`pcp <PCP-VALUE>`	Specifies 802.1Q QoS Priority Code Point value. Range: 0 to 7.
`vlan <VID>`	Specifies a VLAN ID. The VLAN ID must exist. **NOTE:** This parameter cannot be used in any ACL that will be applied to a VLAN.
`count`	Keeps the hit counts of the number of packets matching this ACE.
`log`	Keeps a log of the number of packets matching this ACE. Works with both `permit` and `deny` actions. Works with ACLs applied on ingress or egress.

Usage

When using multiple ACL types (IPv4, IPv6, or MAC) with logging on the same interface, the first packet that matches an ACE with `log` option is logged. Until the log-timer wait-period is over, any packets matching other ACL types do not create a log. At the end of the wait-period, the switch creates a summary log all the ACLs that were matched, regardless of type.

Examples

Creating a MAC ACL with four entries:

```
switch(config)# access-list mac MY_MAC_ACL
switch(config-acl-ip)# 10 permit 1122.3344.5566/ffff.ffff.0000 any ipv6
switch(config-acl-ip)# 20 permit aaaa.bbbb.cccc 1111.2222.3333 any pcp 4
switch(config-acl-ip)# 30 permit any any appletalk vlan 40
switch(config-acl-ip)# 40 deny any any any count
switch(config-acl-ip)# exit

switch(config)# do show access-list
Type       Name
  Sequence Comment
           Action                          EtherType
           Source MAC Address
           Destination MAC Address
           Additional Parameters
--------------------------------------------------------------------------------
MAC        MY_MAC_ACL
        10 permit                          ipv6
           1122.3344.5566/ffff.ffff.0000
           any
        20 permit                          any
           aaaa.bbbb.cccc
           1111.2222.3333
           QoS Priority Code Point: 4
        30 permit                          appletalk
           any
           any
           VLAN: 40
        40 deny                            any
           any
           any
           Hit-counts: enabled
```

Adding a comment to an existing MAC ACE:

```
switch(config)# access-list mac MY_MAC_ACL
switch(config-acl-ip)# 30 comment Permit all vlan-40 tagged Appletalk traffic
switch(config-acl-ip)# exit

switch(config)# do show access-list
Type       Name
  Sequence Comment
           Action                          EtherType
           Source MAC Address
           Destination MAC Address
           Additional Parameters
--------------------------------------------------------------------------------
MAC        MY_MAC_ACL
        10 permit                          ipv6
           1122.3344.5566/ffff.ffff.0000
           any
        20 permit                          any
```

```
           aaaa.bbbb.cccc
           1111.2222.3333
           QoS Priority Code Point: 4
        30 Permit all vlan-40 tagged Appletalk traffic
           permit                          appletalk
           any
           any
           VLAN: 40
        40 deny                            any
           any
           any
           Hit-counts: enabled
```

Removing a comment from an existing MAC ACE:

```
switch(config)# access-list mac MY_MAC_ACL
switch(config-acl-mac)# no 30 comment
switch(config-acl-mac)# exit

switch(config)# do show access-list
Type       Name
  Sequence Comment
           Action                          EtherType
           Source MAC Address
           Destination MAC Address
           Additional Parameters
-------------------------------------------------------------------------------
MAC        MY_MAC_ACL
        10 permit                          ipv6
           1122.3344.5566/ffff.ffff.0000
           any
        20 permit                          any
           aaaa.bbbb.cccc
           1111.2222.3333
           QoS Priority Code Point: 4
        30 permit                          appletalk
           any
           any
           VLAN: 1
        40 deny                            any
           any
           any
           Hit-counts: enabled
```

Adding an ACE to an existing MAC ACL:

```
switch(config)# access-list mac MY_MAC_ACL
switch(config-acl-ip)# 35 permit any aabb.cc11.1234 0xffee
switch(config-acl-ip)# exit

switch(config)# do show access-list
Type       Name
  Sequence Comment
           Action                          EtherType
           Source MAC Address
           Destination MAC Address
           Additional Parameters
-------------------------------------------------------------------------------
MAC        MY_MAC_ACL
```

```
        10 permit                          ipv6
           1122.3344.5566/ffff.ffff.0000
           any
        20 permit                          any
           aaaa.bbbb.cccc
           1111.2222.3333
           QoS Priority Code Point: 4
        30 permit                          appletalk
           any
           any
           VLAN: 1
        35 permit                          0xffee
           any
           aabb.cc11.1234
        40 deny                            any
           any
           any
           Hit-counts: enabled
```

Replacing an ACE in an existing MAC ACL:

```
switch(config)# access-list mac MY_MAC_ACL
switch(config-acl-ip)# 35 permit any aabb.cc11.1234 0xeeee
switch(config-acl-ip)# exit

switch(config)# do show access-list
Type       Name
  Sequence Comment
           Action                          EtherType
           Source MAC Address
           Destination MAC Address
           Additional Parameters
-------------------------------------------------------------------------------
MAC        MY_MAC_ACL
        10 permit                          ipv6
           1122.3344.5566/ffff.ffff.0000
           any
        20 permit                          any
           aaaa.bbbb.cccc
           1111.2222.3333
           QoS Priority Code Point: 4
        30 permit                          appletalk
           any
           any
           VLAN: 1
        35 permit                          0xeeee
           any
           aabb.cc11.1234
        40 deny                            any
           any
           any
           Hit-counts: enabled
```

Removing an ACE from an MAC ACL:

```
switch(config)# access-list mac MY_MAC_ACL
switch(config-acl-ip)# no 35
switch(config-acl-ip)# exit
switch(config)# do show access-list
Type       Name
  Sequence Comment
           Action                          EtherType
           Source MAC Address
           Destination MAC Address
           Additional Parameters
-------------------------------------------------------------------------------
MAC        MY_MAC_ACL
        10 permit                          ipv6
           1122.3344.5566/ffff.ffff.0000
           any
        20 permit                          any
           aaaa.bbbb.cccc
           1111.2222.3333
           QoS Priority Code Point: 4
        30 permit                          appletalk
           any
           any
           VLAN: 1
        40 deny                            any
           any
           any
           Hit-counts: enabled
```

Removing a MAC ACL:

```
switch(config)# no access-list mac MY_MAC_ACL

switch(config)# do show access-list
Type       Name
  Sequence Comment
           Action                          EtherType
           Source MAC Address
           Destination MAC Address
           Additional Parameters
-------------------------------------------------------------------------------
MAC        MY_MAC_ACL2
         1 permit                          ipv6
           1122.3344.5566/ffff.ffff.0000
           any
         2 permit                          any
           aaaa.bbbb.cccc
           1111.2222.3333
           QoS Priority Code Point: 4
         3 Permit all vlan-40 tagged Appletalk traffic
           permit                          appletalk
           any
           any
           VLAN: 1
         4 deny                            any
           any
           any
           Hit-counts: enabled
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

All platforms	`config` The `access-list mac <ACL-NAME>` command takes you into the named ACL context where you enter the ACEs.	Administrators or local user group members with execution rights for this command.

access-list resequence

`access-list {ip|ipv6|mac} <ACL-NAME> resequence <STARTING-SEQUENCE-NUMBER> <INCREMENT>`

Description

Resequences the ACE sequence numbers in an ACL.

Parameter	Description
`{ip|ipv6|mac}`	Specifies the ACL type.
`<ACL-NAME>`	Specifies the ACL name.
`<STARTING-SEQUENCE-NUMBER>`	Specifies the starting sequence number.
`<INCREMENT>`	Specifies the sequence number increment.

Examples

Resequencing an IPv4 ACL to start at 1 with an increment of 1:

```
switch(config)# access-list ip MY_IP_ACL resequence 1 1
switch(config-acl-ip)# exit

switch(config)# do show access-list
Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
-------------------------------------------------------------------------------
IPv4       MY_IP_ACL
         1 permit                          udp
           any
           172.16.1.0/255.255.255.0
         2 permit                          tcp
           172.16.2.0/255.255.0.0           >  1023
           any
         3 permit                          tcp
```

```
           172.26.1.0/255.255.255.0
           any
           dscp: AF11
           ack
           syn
         4 deny                             any
           any
           any
           Hit-counts: enabled
```

Resequencing an IPv6 ACL to start at 1 with an increment of 1:

```
switch(config)# access-list ipv6 MY_IPV6_ACL resequence 1 1
switch(config-acl-ip)# exit

switch(config)# do show access-list
Type       Name
  Sequence Comment
           Action                           L3 Protocol
           Source IP Address                Source L4 Port(s)
           Destination IP Address           Destination L4 Port(s)
           Additional Parameters
-------------------------------------------------------------------------------
IPv6       MY_IPV6_ACL
         1 permit                           udp
           any
           2001::1/64
         2 Permit all TCP ephemeral ports
           permit                           tcp
           2001:2001::2:1                    >  1023
           any
         3 permit                           tcp
           2001:2011::1/64
           any
         4 deny                             any
           any
           any
           Hit-counts: enabled
Type       Name
  Sequence Comment
           Action                           L3 Protocol
           Source IP Address                Source L4 Port(s)
           Destination IP Address           Destination L4 Port(s)
           Additional Parameters
-------------------------------------------------------------------------------
IPv6       MY_IPV6_ACL
         1 permit                           udp
           any
           2001::1/64
         2 Permit all TCP ephemeral ports
           permit                           tcp
           2001:2001::2:1                    >  1023
           any
         3 permit                           tcp
           2001:2011::1/64
           any
         4 deny                             any
           any
           any
           Hit-counts: enabled
```

Resequencing a MAC ACL to start at 1 with an increment of 1:

```
switch(config)# access-list mac MY_MAC_ACL resequence 1 1
switch(config-acl-mac)# exit

switch(config)# do show access-list
Type        Name
  Sequence Comment
           Action                          EtherType
           Source MAC Address
           Destination MAC Address
           Additional Parameters
-------------------------------------------------------------------------------
MAC        MY_MAC_ACL
         1 permit                          ipv6

access-list reset

access-list {all|ip *<ACL-NAME>*|ipv6 *<ACL-NAME>*|mac *<ACL-NAME>*} reset

Description

Changes the user-specified ACL configuration to match the active ACL configuration. Use this command when a discrepancy exists between what the user configured and what is active and accepted by the system.

Parameter	Description
all|ip *ACL-NAME>*|ipv6 *<ACL-NAME>*|mac *<ACL-NAME>*	Specifies **one** of the following: ■ a reset of `all` ACLs. ■ a reset of a named IPv4 ACL. ■ a reset of a named IPv6 ACL. ■ a reset of a named MAC ACL.

Usage

The output of the **show access-list** command displays the active configuration of the product. The active configuration is the ACLs that have been configured and accepted by the system. The output of the **show access-list** command with the **configuration** parameter, displays the ACLs that have been configured. The output of this command may not be the same as what was programmed in hardware or what is active on the product.

If the active ACLs and user-configured ACLs are not the same, a warning message is displayed in the output of the show command. Modify the user-configured ACL until the warning message is no longer displayed or run the **access-list reset** command to change the user-specified configuration to match the active configuration.

Examples

On the 6400 Switch Series, interface identification differs.

Apply an ACL with TCP acknowledgments (ACKs) on ingress, which is unsupported by hardware:

```
switch(config-acl)# 10 permit tcp 172.16.2.0/16 any ack
```

Displaying the user-specified configuration:

```
switch(config)# do show access-list commands
! access-list ip TEST_ACL user configuration does not match active configuration.
! run 'access-list TYPE NAME reset' to reset access-list to match active
configuration.
access-list ip TEST_ACL
! access-list ip TEST_ACL user configuration does not match active configuration.
! run 'access-list TYPE NAME reset' to reset access-list to match active
configuration.
interface 1/1/1
    apply access-list ip TEST_ACL in

switch(config)# do show access-list commands configuration
! access-list ip TEST_ACL user configuration does not match active configuration.
! run 'access-list TYPE NAME reset' to reset access-list to match active
configuration.
access-list ip TEST_ACL
    10 permit tcp 172.16.2.0/255.255.0.0 any ack
! access-list ip TEST_ACL user configuration does not match active configuration.
! run 'access-list TYPE NAME reset' to reset access-list to match active
configuration.
interface 1/1/1
    apply access-list ip TEST_ACL in

switch(config)# do show access-list
Type       Name
  Sequence Comment
```

```
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)

access-list secure-update

```
access-list secure-update
no access list secure-update
```

Description

This command determines if access lists are updated using the secure-update feature. Secure-update is enabled by default.

When secure-update is enabled and an ACL is updated or replaced, one or more override entries are installed in the TCAM table(s) containing the ACL that is being modified. As a result, all traffic of the same type as the currently configured ACL will be denied on the interfaces to which the ACL is applied. This ensures that traffic is not temporarily allowed while modifying an ACL. Upon completion of the update, the TCAM override entries are uninstalled and traffic resumes ACL matching.

The **no** version of this command disables this feature. If secure-update is disabled, there will be no override entry installed. This results in the faster modification of an ACL and ensures that there is no interruption to previously permitted traffic, but may temporarily allow previously denied traffic to pass through the switch. Once the ACL has been modified, traffic will be processed by the updated ACL.

Examples

Disabling secure-update:

```
switch(config)# no access-list secure-update
```

Reenabling secure-update:

```
switch(config)# access-list secure-update
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

Related Commands

Command	Description
`vsx-sync acl-secure-update`	If this setting is enabled and the primary VSX node has configurations with the access list secure-update feature enabled, this configuration can synchronize to the secondary peer. This setting is disabled by default. Refer to the *Virtual Switching Extension (VSX) Guide* for details.

apply access-list control-plane

```
apply access-list {ip|ipv6} <ACL-NAME> control-plane vrf <VRF-NAME>
no apply access-list {ip|ipv6} <ACL-NAME> control-plane vrf <VRF-NAME>
```

Description

Applies an ACL to the specified VRF.

The **no** form of this command removes application of the ACL from the specified VRF.

Parameter	Description
`ip|ipv6`	Specifies the ACL type: `ip` for IPv4, or`ipv6` for IPv6.
`<ACL-NAME>`	Specifies the ACL name.
`vrf` *`<VRF-NAME>`*	Specifies the VRF name.

Usage

Only one ACL per type (**ip**, or **ipv6**) may be applied to a Control Plane VRF at a time. Therefore, using the **apply access-list control-plane** command on a VRF with an already-applied ACL of the same type, will replace the applied ACL.

Examples

Applying **My_ip_ACL** to Control Plane traffic on the default VRF:

```
switch(config)# apply access-list ip My_ip_ACL control-plane vrf default
```

Replacing My_ip_ACL with **My_Replacement_ACL** on the default VRF:

```
switch(config)# apply access-list ip My_Replacement_ACL control-plane vrf default
```

Remove (unapply) the **My_Replacement_ACL** from the default VRF. Any other interfaces or VLANs with My_Replacement_ACL applied are unaffected.

```
switch(config)# no apply access-list ip My_Replacement_ACL control-plane vrf
default
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

apply access-list (to interface or LAG)

```
no apply access-list {ip | ipv6 | mac} <ACL-NAME> {in | out}
```

Description

Applies an ACL to the interface (Individual front plane port) or Link Aggregation Group (LAG) identified by the current interface or LAG context.

The **no** form of this command removes application of the ACL from the current interface or LAG identified by the current interface or LAG context.

Parameter	Description
`ip|ipv6|mac`	Specifies the ACL type: `ip` for IPv4, `ipv6` for IPv6, or `mac` for MAC ACL.
`<ACL-NAME>`	Specifies the ACL name.
in	Selects the inbound (ingress) traffic direction.
`out`	Selects the outbound (egress) traffic direction.

Usage

- Each ACL of a given type can be applied to the same interface or LAG once in each direction. Therefore, using the **apply access-list** command on an interface or LAG with an already-applied ACL of the same typewill replace the currently applied ACL.
- An ACL can be applied to an individual front plane port or to a Link Aggregation Group (LAG).
- A port that is a member of a LAG with an applied ACL cannot have a different ACL applied to that member port.
- When the port membership of a LAG with an applied ACL is changed, the LAG ACL is automatically applied or removed from that port depending on the modification type.

Examples

On the 6400 Switch Series, interface identification differs.

Applying **My_IP_ACL** to ingress traffic on interface range 1/1/10 to 1/1/12:

```
switch(config)# int 1/1/10-1/1/12
switch((config-if-<1/1/10-1/1/12>)# apply access-list ip My_IP_ACL in
switch((config-if-<1/1/10-1/1/12>)# exit
```

Applying **MY_IP_ACL** to ingress traffic on LAG 100 and egress traffic on interface 1/1/2:

```
switch(config)# interface lag 100
switch(config-lag-if)# apply access-list ip MY_IP_ACL in
switch(config-lag-if)# exit

switch(config)# interface 1/1/2
switch(config-if)# apply access-list ip MY_IP_ACL out
switch(config-if)# exit
switch(config)#
```

Applying **MY_IPV6_ACL** to ingress traffic on interface 1/1/1 and to ingress traffic on LAG 100:

```
switch(config)# interface 1/1/1
switch(config-if)# apply access-list ipv6 MY_IPV6_ACL in
switch(config-if)# exit

switch(config)# interface lag 100
switch(config-lag-if)# apply access-list ipv6 MY_IPV6_ACL in
switch(config-lag-if)# exit
switch(config)#
```

Applying **MY_MAC_ACL** to ingress traffic on interface 1/1/1 and ingress traffic on interface 1/1/2:

```
switch(config)# interface 1/1/1
switch(config-if)# apply access-list mac MY_MAC_ACL in
switch(config-if)# exit

switch(config)# interface 1/1/2
switch(config-if)# apply access-list mac MY_MAC_ACL in
switch(config-if)# exit
switch(config)#
```

Replacing **MY_IP_ACL** with **MY_REPLACEMENT_ACL** on interface 1/1/2:

```
switch(config)# interface 1/1/2
switch(config-if)# apply access-list ip MY_REPLACEMENT_ACL out
switch(config-if)# exit
switch(config)#
```

Unapplying **MY_REPLACEMENT_ACL** from interface 1/1/2 (out):

```
switch(config)# interface 1/1/2
switch(config-if)# no apply access-list ip MY_REPLACEMENT_ACL out
switch(config-if)# exit
switch(config)#
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

Command History

All platforms	`config-if` `config-lag-if`	Administrators or local user group members with execution rights for this command.

apply access-list (to interface VLAN)

```
apply access-list {ip|ipv6} <ACL-NAME> {routed-in|routed-out}
no apply access-list {ip|ipv6} <ACL-NAME> {routed-in|routed-out}
```

Description

Applies an ACL to the interface VLAN (or range of interface VLANs) identified by the current interface VLAN context. Using the apply access-list command on an interface VLAN interface with an already-applied ACL of the same direction and type will replace the currently-applied ACL.

The **no** form of this command removes application of the ACL from the interface VLAN (or range of interface VLANs) identified by the current interface VLAN context.

Parameter	Description
`ip|ipv6`	Specifies the ACL type: **ip** for IPv4, **ipv6** for IPv6.
`<ACL-NAME>`	Specifies the ACL name.
`routed-in`	Selects the routed inbound (routed ingress) traffic direction.

Parameter	Description
`routed-out`	Selects the routed outbound (routed egress) traffic direction.

Usage

- Each ACL of a given type can be applied to the same interface VLAN once in each direction. Therefore, using the **apply access-list** command on an interface VLAN with an already-applied ACL of the same direction and type, will replace the applied ACL.
- Applicable to the 6300 and 6400 Switch Series: When an ACL is applied to an interface VLAN, it will create hardware entries on all stack members (6300 switch) and line cards (6400 switch) regardless of whether an interface VLAN member exists on any specific stack member or line card.

Examples

Creating an IPv4 ACL and applying it to routed ingress traffic on interface VLAN vlan100:

```
switch(config)# access-list ip test
switch(config-acl-ip)# 10 permit any 1.1.1.2 2.2.2.2 count
switch(config-acl-ip)# 20 permit any 1.1.1.2 2.2.2.1 count
switch(config-acl-ip)# 30 permit any 2.2.2.2 1.1.1.2 count
switch(config-acl-ip)# 40 permit any 2.2.2.2 1.1.1.1 count
switch(config-acl-ip)# 50 permit any any any count
switch(config-acl-ip)# exit
switch(config)#
switch(config)# interface vlan100
switch(config-if-vlan)# apply access-list ip test routed-in
```

Applying My_ip_ACL to routed ingress traffic on interface VLAN 10:

```
switch(config)# interface vlan 10
switch(config-if-vlan)# apply access-list ip My_ip_ACL routed-in
```

Applying My_ipv6_ACL to routed ingress traffic on interface VLAN 10:

```
switch(config)# interface vlan 10
switch(config-if-vlan)# apply access-list ipv6 My_ip_ACL routed-in
```

Applying My_ip_ACL to routed ingress traffic on interface VLANs 20 to 25:

```
switch(config)# interface vlan 20-25
switch(config-if-vlan-<20-25>)# apply access-list ip My_ip_ACL routed-in
```

Replacing My_ipv6_ACL with My_Replacement_ACL on interface VLAN 10 (following the above examples):

```
switch(config)# interface vlan 10
switch(config-if-vlan)# apply access-list ipv6 My_Replacement_ACL routed-in
```

Removing (unapplying) My_Replacement_ACL on interface VLAN 10. Any other interfaces or VLANs with My_Replacement_ACL applied are not affected:

```
switch(config)# interface vlan 10
switch(config-if-vlan)# no apply access-list ipv6 My_Replacement_ACL routed-in
```

Removing (unapplying) My_ip_ACL on interface VLANs 20 to 25. Any other interfaces or VLANs with My_ip_ACL applied are not affected:

```
switch(config)# interface vlan 20-25
switch(config-if-vlan-<20-25>)# no apply access-list ip My_ip_ACL routed-in
```

Applying My_ip_ACL to routed egress traffic on interface VLAN 30:

```
switch(config)# interface vlan 30
switch(config-if-vlan)# apply access-list ip My_ip_ACL routed-out
```

Applying My_ip_ACL to routed egress traffic on interface VLANs 40 to 50:

```
switch(config)# interface vlan 40-50
switch(config-if-vlan-<40-50>)# apply access-list ip My_ip_ACL routed-out
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

apply access-list (to subinterface)

```
apply access-list {ip|ipv6|mac} <ACL-NAME> {in|out}
no apply access-list {ip|ipv6|mac} <ACL-NAME> {in|out}
```

Description

Applies an ACL to the current port or LAG subinterface context or subinterface context range.

The **no** form of this command removes application of the ACL from the current port or LAG subinterface context or subinterface context range.

An ACL cannot be applied to the parent interface of one or more subinterfaces. This also means that a subinterface cannot be added to an interface if there is an ACL applied.

ACE VLAN IDs cannot be added to ACLs applied to subinterfaces. This also means that an ACL with an ACE matching on a VLAN ID cannot be applied to a subinterface.

Parameter	Description
`ip|ipv6|mac`	Specifies the ACL type: **ip** for IPv4, **ipv6** for IPv6, or **mac** for MAC ACL.
<ACL-NAME>	Specifies the ACL name.
`in|out`	Selects the traffic direction.

Usage

- Each ACL of a given type can be applied to the same subinterface once in each direction. Therefore, using the `apply access-list` command on a subinterface with an already-applied ACL of the same type and direction will replace the currently applied ACL.
- In the case of a failed ACL application to a subinterface during switch reboot or hotswap, the subinterface will be shut down. Fixing the failure will cause the subinterface to come back up.
- In the case of a failed ACL application to an added subinterface LAG member(s), the entire LAG subinterface will be shut down. Fixing the failure will cause the LAG subinterface to come back up. For this case to occur, the ACL must already be successfully applied to existing subinterface LAG members. This is done to prevent traffic from circumventing the ACL by passing through new LAG members where the ACL was not successfully applied. This only occurs when the LAG spans more than one line card or stack member.

Examples

On the 6400 Switch Series, interface identification differs.

Applying My_ip_ACL to ingress traffic on subinterface 1/1/1.10:

```
switch(config)# interface 1/1/1.10
switch(config-subif)# apply access-list ip My_ip_ACL in
```

Applying My_ip_ACL_egr to egress traffic on subinterface 1/1/2.8:

```
switch(config)# interface 1/1/2.8
switch(config-subif)# apply access-list ip My_ip_ACL_egr out
```

Applying My_ipv6_ACL to ingress traffic on subinterface 1/1/1.10:

```
switch(config)# interface 1/1/1.10
switch(config-subif)# apply access-list ipv6 My_ipv6_ACL in
```

Applying My_ip_ACL to ingress traffic on subinterface range 1/1/1.11 to 1/1/1.15:

```
switch(config)# interface 1/1/1.11-1/1/1.15
switch(config-subif-<1/1/1.11-1/1/1.15>)# apply access-list ip My_ip_ACL in
```

Replacing My_ipv6_ACL with My_Replacement_ACL on subinterface 1/1/1.10 (following the above examples):

```
switch(config)# interface 1/1/1.10
switch(config-subif)# apply access-list ipv6 My_Replacement_ACL in
```

Removing (unapplying) My_Replacement_ACL on subinterface 1/1/1.10. Any other interfaces or VLANs with My_Replacement_ACL applied are not affected.

```
switch(config)# interface 1/1/1.10
switch(config-subif)# no apply access-list ipv6 My_Replacement_ACL in
```

Removing (unapplying) My_ip_ACL on subinterface 1/1/1.11 to 1/1/1.15. Any other interfaces or VLANs with My_ip_ACL applied are not affected.

```
switch(config)# interface 1/1/1.11-1/1/1.15
switch(config-subif-<1/1/1.11-1/1/1.15>)# no apply access-list ip My_ip_ACL in
```

Applying My_ip_ACL to ingress traffic on subinterface lag1.10:

```
switch(config)# interface lag1.10
switch(config-subif)# apply access-list ip My_ip_ACL in
```

Removing (unapplying) My_ip_ACL from subinterface lag1.10:

```
switch(config)# interface lag1.10
switch(config-subif)# no apply access-list ip My_ip_ACL in
```

Applying My_ip_ACL_egr to egress traffic on subinterface lag1.4:

```
switch(config)# interface lag1.4
switch(config-subif)# apply access-list ip My_ip_ACL_egr out apply access-list ip
My_ip_ACL_egr out
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

Command History

Release	Modification
10.10	Added subinterface egress support for interfaces and LAGs.
10.08	Command introduced.

Command Information

Platforms	Command context	Authority
6300 6400	`config-subif`	Administrators or local user group members with execution rights for this command.

apply access-list (to L3 VNI)

```
apply access-list {ip|ipv6} <ACL-NAME> {routed-in}
no apply access-list {ip|ipv6} <ACL-NAME> {routed-in}
```

Description

Applies an ACL to the current L3 VNI. Only one direction (`routed-in`) and one type (IPv4/IPv6) of an ACL may be applied to an L3 VNI at a time, thus the `apply` command on an L3 VNI with an already applied ACL of the same direction and type will replace the currently-applied ACL.

The **no** form of this command removes application of the ACL from the L3 VNI identified by the current L3 VNI context.

Parameter	Description
`ip|ipv6`	Specifies the ACL type: **ip** for IPv4 or **ipv6** for IPv6.
`<ACL-NAME>`	Specifies the ACL name.
`routed-in`	Selects the routed-inbound (routed ingress) traffic direction.

Usage

- Each ACL of a given type can be applied to the same L3 VNI interface once in each direction. Therefore, using the **apply access-list** command on an L3 VNI interface with an already-applied ACL of the same type, will replace the applied ACL.
- Applicable to the 6300 and 6400 Switch Series: When an ACL is applied to an L3 VNI interface, it will create hardware entries on all stack members (6300 switch) and line cards (6400 switch) regardless of whether an L3 VNI interface member exists on any specific stack member or line card.

Examples

Applying My_ip_ACL to routed ingress traffic on VNI 10:

```
switch(config)# interface vxlan 1
switch(config-vxlan-if)# vni 10
switch(config-vni-10)# vrf red
switch(config-vni-10)# routing
switch(config-vni-10)# apply access-list ip My_ip_ACL routed-in
switch(config-vni-10)# exit
switch(config-vxlan-if)# exit
switch(config)#
```

Applying My_ipv6_ACL to routed ingress traffic on VNI 10:

```
switch(config)# interface vxlan 1
switch(config-vxlan-if)# vni 10
switch(config-vni-10)# vrf red
switch(config-vni-10)# routing
switch(config-vni-10)# apply access-list ipv6 My_ipv6_ACL routed-in
switch(config-vni-10)# exit
switch(config-vxlan-if)# exit
switch(config)#
```

Replacing My_ipv6_ACL with My_Replacement_ACL on VNI 10 (following the preceding examples):

```
switch(config)# interface vxlan 1
switch(config-vxlan-if)# vni 10
switch(config-vni-10)# apply access-list ipv6 My_Replacement_ACL routed-in
switch(config-vni-10)# exit
switch(config-vxlan-if)# exit
switch(config)#
```

Removing My_Replacement_ACL on interface VNI 10. Any other interfaces, VLANs, or VNIs with My_ip_ACL applied are not affected:

```
switch(config)# interface vxlan 1
switch(config-vxlan-if)# vni 10
switch(config-vni-10)# no apply access-list ipv6 My_Replacement_ACL routed-in
switch(config-vni-10)# exit
switch(config-vxlan-if)# exit
switch(config)#
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

Command History

Release	Modification
10.14	Added support for L3 VNI ACLs.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

apply access-list (to VLAN)

```
apply access-list {ip|ipv6|mac} <ACL-NAME> {in|out}
no apply access-list {ip|ipv6|mac} <ACL-NAME> {in|out}
```

Description

Applies an ACL to the VLAN identified by the current VLAN context.

The **no** form of this command removes application of the ACL from the VLAN identified by the current VLAN context.

Parameter	Description
`ip|ipv6|mac`	Specifies the ACL type: **ip** for IPv4, **ipv6** for IPv6, or **mac** for MAC ACL.
<ACL-NAME>	Specifies the ACL name.
`in`	Selects the inbound (ingress) traffic direction.
`out`	Selects the outbound (egress) traffic direction. **NOTE:** For 6000 and 6100 switch series, the outbound (egress) traffic direction is supported only for MAC ACLs.

Usage

- Each ACL of a given type can be applied to the same VLAN once in each direction. Therefore, using the **apply access-list** command on a VLAN with an already-applied ACL of the same type, will replace the applied ACL.
- Applicable to the 6300 and 6400 Switch Series: When an ACL is applied to a VLAN, it will create hardware entries on all stack members (6300 switch) and line cards (6400 switch) regardless of whether a VLAN member exists on any specific stack member or line card.

Examples

Applying My_ip_ACL to ingress traffic on VLAN range 20 to 25:

```
switch(config)# vlan 20-25
switch(config-vlan-<20-25>)# apply access-list ip My_ip_ACL in
```

Applying My_ip_ACL to egress traffic on VLAN range 40 to 50:

```
switch(config)# vlan 40-50.
switch(config-vlan-<40-50>)# apply access-list ip My_ip_ACL out
```

Applying My_ip_ACL to ingress traffic on VLAN 10:

```
switch(config)# vlan 10
switch(config-vlan-10)# apply access-list ip My_ip_ACL in
```

Applying My_ipv6_ACL to ingress traffic on VLAN 10:

```
switch(config)# vlan 10
switch(config-vlan-10)# apply access-list ipv6 My_ipv6_ACL in
```

Applying My_mac_ACL to ingress traffic on VLAN 10:

```
switch(config)# vlan 10
switch(config-vlan-10)# apply access-list mac My_mac_ACL in
```

Replacing My_ipv6_ACL with My_Replacement_ACL on VLAN 10 (following the preceding examples):

```
switch(config)# vlan 10
switch(config-vlan-10)# apply access-list ipv6 My_Replacement_ACL in
```

Removing (unapplying, Specifies the ACL type: **ip** for IPv4, **ipv6** for IPv6, or **mac** for MAC ACL.) several ACLs on VLAN 10:

```
switch(config)# vlan 10
switch(config-vlan-10)# no apply access-list ipv6 My_Replacement_ACL in
switch(config-vlan-10)# no apply access-list mac My_mac_ACL in
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

clear access-list hitcounts

```
clear access-list hitcounts { all |  [{ip|ipv6|mac} <ACL-NAME>]
                  [interface <IF-NAME>| vlan <VLAN-ID>] [in|out|routed-in|routed-out] }
```

Description

Clears the hit counts for ACLs with ACEs that include the `count` keyword.

Parameter	Description
`all`	Selects all ACLs.
`ip|ipv6|mac`	Specifies the ACL type: `ip` for IPv4, `ipv6` for IPv6, or `mac` for MAC.
`<ACL-NAME>`	Specifies the ACL name.
`interface` *`<IF-NAME>`*	Specifies the interface name (port or LAG). For ingress ACLs you may optionally include a **subinterface ID <SUB-INT>** in the range 1 to 4094 in the form **<IF-NAME>.<SUB-INT>**, for example **1/1/4.1**.
`vlan` *`<VLAN-ID>`*	Specifies the VLAN.
`in`	Selects the inbound (ingress) traffic direction.
`out`	Selects the outbound (egress) traffic direction.
`routed-in|routed-out`	Selects the routed traffic direction on which the ACL is applied. **NOTE:** This is only available for IPv4 and IPv6 ACLs applied to interface VLANs. ▪ **routed-in** selects the routed inbound (routed ingress) traffic direction. ▪ **routed-out** selects the routed outbound (routed egress) traffic direction.

Examples

On the 6400 Switch Series, interface identification differs.

Clearing the hit counts for My_ip_ACL applied to port 1/1/2 (egress):

```
switch# clear access-list hitcounts ip My_ip_ACL interface 1/1/2 out
```

Clearing the hit counts for My_ip_ACL applied to VLAN 10 (ingress):

```
switch# clear access-list hitcounts ip My_ip_ACL vlan 10 in
```

Clearing the hit counts for My_ip_ACL applied to subinterface 1/1/4.1 (ingress):

```
switch# clear access-list hitcounts ip My_ip_ACL interface 1/1/4.1 in
```

Clearing the hit counts for all ACLs:

```
switch# clear access-list hitcounts all
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

clear access-list hitcounts control-plane

```
clear access-list hitcounts [{ip|ipv6} <ACL-NAME>] control-plane vrf <VRF-NAME>
```

Description

Clears the hit counts for ACLs applied to the Control Plane VRF.

Parameter	Description
ip|ipv6	Specifies the ACL type: **ip** for IPv4, or **ipv6** for IPv6.
<ACL-NAME>	Specifies the ACL name.
vrf *<VRF-NAME>*	Specifies the VRF name.

Examples

Clearing the hit counts for an IPv4 ACL applied to the Control Plane `default` VRF:

```
switch# clear access-list hitcounts ip My_ipv4_ACL control-plane vrf default
```

Clearing the hit counts for an IPv6 ACL applied to the Control Plane `default` VRF:

```
switch# clear access-list hitcounts ipv6 My_ipv6_ACL control-plane vrf default
```

object-group address resequence

`object-group {ip|ipv6} address <OBJECT-GROUP-NAME> resequence <STARTING-SEQUENCE-NUMBER> <INCREMENT>`

Description

Reorders the sequence numbers in an address object group.

Parameter	Description
`ip|ipv6`	Specifies the object group IP address type, either `ip` or `ipv6`.
<OBJECT-GROUP-NAME>	Specifies the address object group name.
<STARTING-SEQUENCE-NUMBER>	Specifies the starting sequence number.
<INCREMENT>	Specifies the sequence number increment.

Examples

Resequencing address object group my_ipv4_addr_group to use sequence numbers 5, 10, 15 and so on:

```
switch(config)# object-group address my_ipv4_addr_group resequence 5 5
switch(config)#
```

object-group address reset

`object-group {ip|ipv6} address <OBJECT-GROUP-NAME> reset`

Description

Resets the user configuration back to the active configuration. This command takes immediate effect, it is not saved in the user configuration. Use this command if misconfiguration of an address object group has occurred.

Parameter	Description
`ip|ipv6`	Specifies the object group IP address type, either `ip` or `ipv6`.
`<OBJECT-GROUP-NAME>`	Specifies the address object group name.

Examples

Resetting IPv4 address object group my_ipv4_group:

```
switch(config)# object-group ip address my_ip_group reset
switch(config)#
```

Resetting IPv6 address object group my_ipv6_group:

```
switch(config)# object-group ipv6 address my_ipv6_group reset
switch(config)#
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

object-group all reset

`object-group all reset`

Description

Resets the user configuration back to the active configuration for all object types (address and port). This command takes immediate effect, it is not saved in the user configuration. Use this command if misconfiguration of address object groups and port object groups has occurred. Individual address and port object groups can be reset respectively with the **object-group address reset** and **object-group port** reset commands.

Examples

Resetting the user configuration for all object types (address and port):

```
switch(config)# object-group all reset
switch(config)#
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

object-group ip address

Syntax to create an IPv4 address object group and enter its context:

```
object-group ip address <OBJECT-GROUP-NAME>
no object-group ip address <OBJECT-GROUP-NAME>
```

Syntax (within the address object-group context) for creating or removing IPv4 address entries :

```
[<SEQUENCE-NUMBER>]  <IP-ADDRESS>[/{<PREFIX-LENGTH>|<SUBNET-MASK>}]

  no <SEQUENCE-NUMBER>
```

Description

Creates an IPv4 address object group comprised of one or more address entries. Address groups are used solely as a shorthand way of specifying groups of addresses in the ACEs that make up ACLs. IPv4 address groups can be used only in the **access-list ip** command. Entering **object-group ip address** with an existing address group name, enables you to modify an existing address group.

The **no** form of this command deletes the entire address group or deletes a particular address group entry identified by sequence number.

Parameter	Description
<OBJECT-GROUP-NAME>	Specifies the address object group name.
<SEQUENCE-NUMBER>	Specifies a sequence number for the address entry. Range: 1 to 4294967295. When omitted, a sequence number 10 larger than the current highest sequence number is auto-assigned. Default auto-assigned sequence numbers are 10, 20, 30, and so on.
<IP-ADDRESS>[/{*<PREFIX-LENGTH>*|*<SUBNET-MASK>*}]	Specifies the IPv4 address. ■ ***<IP-ADDRESS>*** - specifies the IPv4 host address. ■ ***<PREFIX-LENGTH>*** - specifies the address bits to mask (CIDR subnet mask notation). Range: 1 to 32. ■ ***<SUBNET-MASK>*** - specifies the address bits to mask (dotted decimal notation).

Examples

Creating an IPv4 address group with two entries:

```
switch(config)# object-group ip address my_ipv4_addr_group
switch(config-addrgroup-ip)# 10 192.168.0.1
switch(config-addrgroup-ip)# 20 192.168.0.2
switch(config-addrgroup-ip)# exit
switch(config)# show object-group
Type       Name
  Sequence L4 Port(s)/IP Address
-------------------------------------------------------------------------------
IPv4       my_ipv4_addr_group
        10 192.168.0.1
        20 192.168.0.2
```

Adding an entry to an existing IPv4 address group:

```
switch(config)# object-group ip address my_ipv4_addr_group
switch(config-addrgroup-ip)# 30 192.168.0.3
switch(config-addrgroup-ip)# exit
switch(config)# show object-group
Type       Name
  Sequence L4 Port(s)/IP Address
-------------------------------------------------------------------------------
IPv4       my_ipv4_addr_group
        10 192.168.0.1
        20 192.168.0.2
        30 192.168.0.3
```

Removing an entry (20) from an existing IPv4 address group:

```
switch(config)# object-group ip address my_ipv4_addr_group
switch(config-addrgroup-ip)# no 20
switch(config-addrgroup-ip)# exit
switch(config)# show object-group
Type       Name
  Sequence L4 Port(s)/IP Address
-------------------------------------------------------------------------------
IPv4       my_ipv4_addr_group
        10 192.168.0.1
        30 192.168.0.3
```

Removing an IPv4 address group:

```
switch(config)# no object-group ip address my_ipv4_addr_group
switch(config)# show object-group
No object group found.
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config` The **object-group ip address** command takes you into the named address group context (with prompt **switch (config-addrgroup-ip)#**) where you enter the addresses.	Administrators or local user group members with execution rights for this command.

object-group ipv6 address

Syntax to create an IPv6 address object group and enter its context:

```
object-group ipv6 address <OBJECT-GROUP-NAME>
no object-group ipv6 address <OBJECT-GROUP-NAME>
```

Syntax (within the address object-group context) for creating or removing IPv6 address entries :

```
  [<SEQUENCE-NUMBER>]  <IP-ADDRESS>[/{<PREFIX-LENGTH>|<SUBNET-MASK>}]

  no <SEQUENCE-NUMBER>
```

Description

Creates an IPv6 address object group comprised of one or more address entries. Address groups are used solely as a shorthand way of specifying groups of addresses in the ACEs that make up ACLs. IPv6 address groups can be used only in the `access-list ipv6` command. Entering `object-group ipv6 address` with an existing address group name, enables you to modify an existing address group.

The **no** form of this command deletes the entire address group or deletes a particular address group entry identified by sequence number.

Parameter	Description
<OBJECT-GROUP-NAME>	Specifies the address object group name.
<SEQUENCE-NUMBER>	Specifies a sequence number for the address entry. Range: 1 to 4294967295. When omitted, a sequence number 10 larger than the current highest sequence number is auto-assigned. Default auto-assigned sequence numbers are 10, 20, 30, and so on.
*<IP-ADDRESS>***[/{***<PREFIX-LENGTH>***|***<SUBNET-MASK>***}]**	Specifies the IPv6 address. ▪ *<IP-ADDRESS>* - specifies the IPv6 host address. ◦ *<PREFIX-LENGTH>* - specifies the address bits to mask (CIDR subnet mask notation). Range: 1 to 128. ◦ *<SUBNET-MASK>* - specifies the address bits to mask (dotted decimal notation).

Examples

Creating an IPv6 address group with two entries:

```
switch(config)# object-group ipv6 address my_ipv6_addr_group
switch(config-addrgroup-ipv6)# 10 1000::1
switch(config-addrgroup-ipv6)# 20 1000::2
switch(config-addrgroup-ipv6)# exit
switch(config)# show object-group
Type       Name
  Sequence L4 Port(s)/IP Address
-------------------------------------------------------------------------------
IPv6       my_ipv6_addr_group
        10 1000::1
        20 1000::2
```

Adding an entry to an existing IPv6 address group:

```
switch(config)# object-group ipv6 address my_ipv6_addr_group
switch(config-addrgroup-ipv6)#
switch(config-addrgroup-ipv6)# 30 1000::3
switch(config-addrgroup-ipv6)# exit
switch(config)# show object-group
Type       Name
  Sequence L4 Port(s)/IP Address
-------------------------------------------------------------------------------
IPv6       my_ipv6_addr_group
        10 1000::1
        20 1000::2
        30 1000::3
```

Removing an entry (20) from an existing IPv6 address group:

```
switch(config)# object-group ipv6 address my_ipv6_addr_group
switch(config-addrgroup-ipv6)# no 20
switch(config-addrgroup-ipv6)# exit
switch(config)# show object-group
Type        Name
  Sequence L4 Port(s)/IP Address
-------------------------------------------------------------------------------
IPv6        my_ipv6_addr_group
        10 1000::1
        30 1000::3
```

Removing an IPv6 address group:

```
switch(config)# no object-group ipv6 address my_ipv6_addr_group
switch(config)# show object-group
No object group found.
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

All platforms	`config` The **object-group ipv6 address** command takes you into the named address group context (with prompt **switch (config-addrgroup-ipv6)#**) where you enter the addresses.	Administrators or local user group members with execution rights for this command.

object-group port

Syntax to create a Layer 4 port object group and enter its context:

```
object-group port <OBJECT-GROUP-NAME>

no object-group port <OBJECT-GROUP-NAME>
```

Syntax (within the port object-group context) for creating or removing Layer 4 port entries:

```
  [<SEQUENCE-NUMBER>] { {eq|gt|lt} <PORT>|range <MIN-PORT> <MAX-PORT> }

  no <SEQUENCE-NUMBER>
```

Description

Creates a Layer 4 port object group comprised of one or more port entries. Port groups are used solely as a shorthand way of specifying groups of ports in the ACEs that make up ACLs. Layer 4 port groups can be used only in the **access-list ip** and **access-list ipv6** commands. Entering **object-group port** with an existing port group name, enables you to modify an existing port group.

The **no** form of this command deletes the entire port group or deletes a particular port group entry identified by sequence number.

Parameter	Description
<OBJECT-GROUP-NAME>	Specifies the port object group name.
<SEQUENCE-NUMBER>	Specifies a sequence number for the port entry. Range: 1 to 4294967295. When omitted, a sequence number 10 larger than the current highest sequence number is auto-assigned. Default auto-assigned sequence numbers are 10, 20, 30, and so on.
{ {eq|gt|lt} *<PORT>***|range** *<MIN-PORT><MAX-PORT>* **}**	Specifies the port or port range. Port numbers are in the range of 0 to 65535. ■ **eq *<PORT>*** - specifies the Layer 4 port. ■ **gt *<PORT>*** - specifies any Layer 4 port greater than the indicated port. ■ **lt *<PORT>*** - specifies any Layer 4 port less than the indicated port. ■ **range *MIN-PORT> <MAX-PORT>*** - specifies the Layer 4 port range. **NOTE:** When ACLs using ACEs defined with port groups are applied, the same number of hardware resources are consumed as when the ports are specified directly in the ACEs and not in a group. Keep this in mind when creating port groups that include many ports. Although hardware resource consumption is the same, with or without port groups used, it may not be immediately obvious that some port groups that you have defined, include many ports. It is recommended that you name port groups in a manner that reminds you that a group includes many ports.

Examples

Creating a port group with two entries to cover port 80 plus ports 0 through 50:

```
switch(config)# object-group port my_port_group
switch(config-portgroup)# 10 eq 80
switch(config-portgroup)# 20 range 0 50
switch(config-portgroup)# exit
switch(config)# show object-group
Type       Name
  Sequence L4 Port(s)/IP Address
-------------------------------------------------------------------------------
Port       my_port_group
        10 eq 80
        20 range 0 50
```

Adding an entry for ports greater than 65525 (covers ports 65526 through 65535):

```
switch(config)# object-group port my_port_group
switch(config-portgroup)# 30 gt 65525
switch(config-portgroup)# exit
switch(config)# show object-group
Type       Name
  Sequence L4 Port(s)/IP Address
-------------------------------------------------------------------------------
Port       my_port_group
        10 eq 80
        20 range 0 50
        30 gt 65525
```

Removing an entry (#20) from the port group:

```
switch(config)# object-group port my_port_group
switch(config-portgroup)# no 20
switch(config-portgroup)# exit
switch(config)# show object-group
Type       Name
  Sequence L4 Port(s)/IP Address
-------------------------------------------------------------------------------
Port       my_port_group
        10 eq 80
        30 gt 65525
```

Removing the port group:

```
switch(config)# no object-group port my_port_group
switch(config)# show object-group
No object group found.
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config` The **object-group ip port** command takes you into the named port group context (with prompt **switch(config-portgroup)#**) where you specify the ports.	Administrators or local user group members with execution rights for this command.

object-group port resequence

`object-group port <OBJECT-GROUP-NAME> resequence <STARTING-SEQUENCE-NUMBER> <INCREMENT>`

Description

Reorders the sequence numbers in a port object group.

Parameter	Description
<OBJECT-GROUP-NAME>	Specifies the port object group name.
<STARTING-SEQUENCE-NUMBER>	Specifies the starting sequence number.
<INCREMENT>	Specifies the sequence number increment.

Examples

Resequencing port object group my_port_group to use sequence numbers 110, 120, 130 and so on:

```
switch(config)# object-group port my_port_group resequence 110 10
switch(config)#
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

All platforms	`config`	Administrators or local user group members with execution rights for this command.

object-group port reset

```
object-group port <OBJECT-GROUP-NAME> reset
```

Description

Resets the user configuration back to the active configuration. This command takes immediate effect, it is not saved in the user configuration. Use this command if misconfiguration of a port object group has occurred.

Parameter	Description
<OBJECT-GROUP-NAME>	Specifies the port object group name.

Examples

Resetting port object group my_port_group:

```
switch(config)# object-group port my_port_group reset
switch(config)#
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

show access-list

Syntax that filters by ACLs applied to an interface, VLAN, or VNI:

```
show access-list [interface <IF-NAME>|vlan <VLAN-ID>|vni <VNI-ID>]
                 [in|out|routed-in|routed-out][ip|ipv6|mac] [<acl-name>][commands] [configuration]
show access-list [ip|ipv6] [<ACL-NAME>] control-plane [vrf <VRF-NAME>] [commands]
[configuration]
```

Syntax that filters by the named ACL:

```
show access-list [ip|ipv6|mac] [<ACL-NAME>] [commands] [configuration] [vsx-peer]
```

Description

Shows information about your defined ACLs and where they have been applied. When **show access-list** is entered without parameters, information for all ACLs is shown. The parameters filter the list of ACLs for which information is shown.

Available filtering includes:

- The content of a specific ACL.
- All ACLs of a specific type.
- The ACL applied in a particular direction.
- The ACL applied to a specific interface (port or split port or LAG).
- The ACL applied to a specific subinterface (port or LAG).
- The ACL applied to a specific VLAN.
- The ACL applied to a specific VNI.
- The ACL applied to specific interface VLAN (routed-in or routed-out).
- The control-plane ACL applied to a specific VRF.

Parameter	Description
`interface <IF-NAME>`	Specifies the interface name (port or LAG). For ingress ACLs you may optionally include a subinterface ID `<SUB-INT>` in the range 1 to 4094 in the form `<IF-NAME>.<SUB-INT>`, for example `1/1/4.1`.
`vlan <VLAN-ID>`	Specifies the VLAN.
`vni <VNI-ID>`	Specifies the ID of the VNI.
`control-plane vrf <VRF-NAME>`	Specifies the VRF of the control plane ACL.
`ip|ipv6|mac`	Specifies the ACL type: ■ **ip** for IPv4, ■ **ipv6** for IPv6, or ■ **mac** for MAC.
`in`	Selects the inbound (ingress) traffic direction.
`out`	Selects the outbound (egress) traffic direction.
`routed-in`	Selects the routed inbound (routed ingress) traffic direction. **NOTE**: This is only available for IPv4 and IPv6 ACLs applied to interface VLANs.
`routed-out`	Selects the routed outbound (routed egress) traffic direction. **NOTE**: This is only available for IPv4 and IPv6 ACLs applied to interface VLANs.
`<ACL-NAME>`	Specifies the ACL name.
`commands`	Specifies that the ACL definition is to be shown as the commands and parameters used to create it rather than in tabular form.
`configuration`	Specifies that the user-configured ACLs be shown as entered, even if the ACLs are not active due to ACE-definition command issues or hardware issues. This parameter is useful if there is a mismatch between the entered configuration and the previous successfully programmed (active) ACLs configuration.

Parameter	Description
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Creating an IPv4 ACL, applying it to an interface VLAN (routed in), and then showing ACL information filtered for that interface VAN:

```
switch(config)# access-list ip test
switch(config-acl-ip)# 10 permit any 1.1.1.2 2.2.2.2 count
switch(config-acl-ip)# 20 permit any 1.1.1.2 2.2.2.1 count
switch(config-acl-ip)# 30 permit any 2.2.2.2 1.1.1.2 count
switch(config-acl-ip)# 40 permit any 2.2.2.2 1.1.1.1 count
switch(config-acl-ip)# 50 permit any any any count
switch(config-acl-ip)# exit
switch(config)#
switch(config)# interface vlan100
switch(config-if-vlan)# apply access-list ip test routed-in
switch(config-if-vlan)# exit
switch(config)# show access-list interface vlan100 ip routed-in

Direction
Type       Name

           QoS Priority Code Point: 4
        30 deny                            any
           any
           any
           Hit-counts: enabled
-------------------------------------------------------------------------------
```

Showing a MAC ACL as commands:

```
switch# show access-list mac MY_MAC_ACL commands
access-list mac MY_MAC_ACL
    10 permit 1122.3344.5566/ffff.ffff.0000 any ipv6
    20 permit aaaa.bbbb.cccc 1111.2222.3333 any pcp 4
    30 deny any any any count
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

Command History

Release	Modification
10.14	Added support for L3VNI ACLs.

Release	Modification
10.08	Added subinterface information and examples.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show access-list control-plane

```
show access-list [ip|ipv6] [<ACL-NAME>] control-plane [vrf <VRF-NAME>]
                 [commands] [configuration][vsx-peer]
```

Description

Shows information about your defined ACLs that have been applied to the Control Plane. When **show access-list control-plane** is entered without parameters, information for all ACLs applied to the Control Plane is shown. The parameters filter the list of ACLs for which information is shown.

Available filtering includes:

- The content of a specific ACL that has been applied to the Control Plane.
- All ACLs of a specific type that have been applied to the Control Plane.
- All ACLs applied to the Control Plane for a specific VRF.

Parameter	Description
`ip|ipv6`	Specifies the ACL type: `ip` for IPv4, or`ipv6` for IPv6.
<ACL-NAME>	Specifies the ACL name.
`vrf` *<VRF-NAME>*	Specifies the VRF name.
`[commands]`	Specifies that the ACL definition is to be shown as the commands and parameters used to create it rather than in tabular form.
`[configuration]`	Specifies that the user-configured ACLs be shown as entered, even if the ACLs are not active due to ACE-definition command issues or hardware issues. This parameter is useful if there is a mismatch between the entered configuration and the previous successfully programmed (active) ACLs configuration.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing an IPv4 ACL applied to the Control Plane `default` VRF:

```
switch# show access-list ip My_ipv4_ACL control-plane vrf default
Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
------------------------------------------------------------------------------
IPv4       My_ipv4_ACL
        10 permit                          udp
           any
           172.16.1.0/24
        20 permit                          tcp
           172.16.2.0/16                    >  1023
           any
        30 permit                          tcp
           172.26.1.0/24
           any
           syn
           ack
           dscp 10
        40 deny                            any
           any
           any
           Hit-counts: enabled
------------------------------------------------------------------------------
```

Showing an IPv6 ACL applied to the Control Plane `default` VRF:

```
switch# show access-list ipv6 My_ipv6_ACL control-plane vrf default
Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
------------------------------------------------------------------------------
IPv6       My_ipv6_ACL
        10 permit                          udp
           any
           2001::1/64
        20 permit                          tcp
           2001:2001::2:1/128               >  1023
           any
        30 permit                          tcp
           2001:2011::1/64
        40 deny                            any
           any
           any

show access-list hitcounts

```
show access-list hitcounts { [{ip|ipv6|mac} <ACL-NAME>] [interface <IF-NAME> |
                 vlan <VLAN-ID>] [in|out|routed-in|routed-out] [vsx-peer] }
show access-list hitcounts { [{ip|ipv6|mac} <ACL-NAME>] [interface <IF-NAME>|
vlan <VLAN-ID>|vni <VNI-ID>] [in|out|routed-in|routed-out]} [vsx-peer] }
show access-list hitcounts [{ip|ipv6} <acl-name>] control-plane vrf <VRF-NAME>
```

Description

Shows the hit count of the number of times an ACL has matched a packet or frame for ACEs with the **count** keyword. For ACEs without the **count** keyword, a dash is shown in place of a hit count.

Parameter	Description
`ip|ipv6|mac`	Specifies the ACL type: **ip** for IPv4, **ipv6** for IPv6, or **mac** for MAC.
<ACL-NAME>	Specifies the ACL name.
`interface` *<IF-NAME>*	Specifies the interface name (port or split port or LAG). For ingress ACLs you may optionally include a subinterface ID **<SUB-INT>** in the range 1 to 4094 in the form **<IF-NAME>.<SUB-INT>**, for example **1/1/4.1**.
`vlan` *<VLAN-ID>*	Specifies the VLAN.
`vni` *<VNI-ID>*	Specifies the ID of the VNI.
`control-plane vrf` *<VRF-NAME>*	Specifies the VRF of the control plane ACL.
`in`	Selects the inbound (ingress) traffic direction.
`out`	Selects the outbound (egress) traffic direction.
`routed-in`	Selects the routed inbound (routed ingress) traffic direction.
`routed-out`	Selects the routed outbound (routed egress) traffic direction.

Usage

- ACL hit counts are aggregated across all:
  - Physical interfaces to which the ACL is applied to on ingress.
  - Physical interfaces to which the ACL is applied to on egress.
  - VLANs to which the ACL is applied to on ingress.
  - VLANs to which the ACL is applied to on egress.
  - Interface VLANs to which the IPv4 or IPv6 ACL is applied on routed ingress.
  - Interface VLANs to which the IPv4 or IPv6 ACL is applied on routed egress.
  - L3 VNI ACLs with interface VLANs applied on routed ingress.
- If an ACL with an ACE with the **count** keyword is applied to multiple physical interfaces or VLANs, the hit counts are aggregated. There is one aggregation for physical interfaces and another for VLANs.
- If an ACL with an ACE with the **count** keyword is applied to multiple subinterfaces, the hit counts are aggregated.
- Accumulated hit counts for an applied ACL are cleared upon any modification of the ACL.

Examples

On the 6400 Switch Series, interface identification differs.

Showing the hit counts for **My_ip_ACL** applied to port 1/1/2:

```
switch# show access-list hitcounts ip My_ip_ACL interface 1/1/2
Statistics for ACL My_ip_ACL (ipv4):
interface 1/1/1-1/1/2,lag1 (out):
     Matched Packets  Configuration
                   -  10 permit udp any 172.16.1.0/255.255.255.0
                   0  20 permit tcp 172.16.2.0/255.255.0.0 gt 1023 any count
                   -  30 permit tcp 172.26.1.0/255.255.255.0 any dscp AF11 ack syn
                   0  implicit deny any any any count
```

Showing the hit counts for **My_ip_ACL** applied to VLAN 10:

```
switch# show access-list hitcounts ip My_ip_ACL vlan 10
Statistics for ACL My_ip_ACL (ipv4):
vlan 10,20-100,300 (in):
     Matched Packets  Configuration
                   -  10 permit udp any 172.16.1.0/255.255.255.0
                   0  20 permit tcp 172.16.2.0/255.255.0.0 gt 1023 any count
                   -  30 permit tcp 172.26.1.0/255.255.255.0 any dscp AF11 ack syn
                   0  implicit deny any any any count
```

Showing the hit counts for ACLs applied to subinterfaces:

```
switch# show access-list hitcounts ip My_ip_ACL interface 1/1/4.1
Statistics for ACL My_ip_ACL (ipv4):
interface 1/1/4.1,1/1/10.10 (in):
     Matched Packets  Configuration
                   -  10 permit udp any 172.16.1.0/255.255.255.0
                   0  20 permit tcp 172.16.2.0/255.255.0.0 gt 1023 any count
                   -  30 permit tcp 172.26.1.0/255.255.255.0 any dscp AF11 ack syn
                   0  implicit deny any any any count

switch# show access-list hitcounts ip My_ip_ACL2 interface lag1.3
```

```
Statistics for ACL My_ip_ACL2 (ipv4):
interface lag1.3-lag1.4 (in):
     Matched Packets  Configuration
                   0  10 deny icmp any 192.168.42.1 count
                3884  100 permit any any any count
                   0  implicit deny any any any count
```

Showing the hit counts for **My_ip_ACL** applied to interface VLAN 10:

```
switch# show access-list hitcounts ip My_ip_ACL vlan 10
Statistics for ACL My_ip_ACL (ipv4):
interface vlan 10,20,30 (routed-in):
     Matched Packets  Configuration
                   -  10 permit udp any 172.16.1.0/255.255.255.0
                   0  20 permit tcp 172.16.2.0/255.255.0.0 gt 1023 any count
                   -  30 permit tcp 172.26.1.0/255.255.255.0 any dscp AF11 ack syn
                   0  implicit deny any any any count
```

Showing the hit counts for My_ip_ACL applied on any interface and direction:

```
switch# show access-list hitcounts ip My_ip_ACL vlan 10
switch# show access-list hitcounts ip My_ip_ACL
Statistics for ACL My_ip_ACL (ipv4):
interface 1/1/1 (in):
     Matched Packets  Configuration
                   -  10 permit udp any 172.16.1.0/255.255.255.0
                   0  20 permit tcp 172.16.2.0/255.255.0.0 gt 1023 any count
                   -  30 permit tcp 172.26.1.0/255.255.255.0 any dscp AF11 ack syn
                   0  implicit deny any any any count

interface 1/1/4.1,1/1/10.10 (in):
     Matched Packets  Configuration
                   -  10 permit udp any 172.16.1.0/255.255.255.0
                   0  20 permit tcp 172.16.2.0/255.255.0.0 gt 1023 any count
                   -  30 permit tcp 172.26.1.0/255.255.255.0 any dscp AF11 ack syn
                   0  implicit deny any any any count

interface vlan 10,20,30 (routed-in):
     Matched Packets  Configuration
                   -  10 permit udp any 172.16.1.0/255.255.255.0
                   0  20 permit tcp 172.16.2.0/255.255.0.0 gt 1023 any count
                   -  30 permit tcp 172.26.1.0/255.255.255.0 any dscp AF11 ack syn
                   0  implicit deny any any any count

interface vlan 80-85 (routed-out):
     Matched Packets  Configuration
                   -  10 permit udp any 172.16.1.0/255.255.255.0
                   0  20 permit tcp 172.16.2.0/255.255.0.0 gt 1023 any count
                   -  30 permit tcp 172.26.1.0/255.255.255.0 any dscp AF11 ack syn
                   0  implicit deny any any any count

vlan 10,20-100,300 (in):
     Matched Packets  Configuration
                   -  10 permit udp any 172.16.1.0/255.255.255.0
                   0  20 permit tcp 172.16.2.0/255.255.0.0 gt 1023 any count
                   -  30 permit tcp 172.26.1.0/255.255.255.0 any dscp AF11 ack syn
                   0  implicit deny any any any count

vrf blue,default,red (control-plane):
     Matched Packets  Configuration
                   -  10 permit udp any 172.16.1.0/255.255.255.0
                   0  20 permit tcp 172.16.2.0/255.255.0.0 gt 1023 any count
                   -  30 permit tcp 172.26.1.0/255.255.255.0 any dscp AF11 ack syn
                   0  implicit deny any any any count
```

Showing hit counts for **My_ip_ACL** applied to L3 VNIs.

```
switch# show access-list hitcounts ip My_ip_ACL vni 10
Statistics for ACL My_ip_ACL (ipv4):
vni 10 (routed-in):
     Matched Packets  Configuration
                   -  10 permit udp any 172.16.1.0/255.255.255.0
                   0  20 permit tcp 172.16.2.0/255.255.0.0 gt 1023 any count
                   -  30 permit tcp 172.26.1.0/255.255.255.0 any dscp AF11 ack syn
                   0  implicit deny any any any count
```

Removing hit counts for **My_ip_ACL** applied on L3 VNIs.

```
switch# clear access-list hitcounts ip My_ip_ACL vni 10 routed-in
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

Command History

Release	Modification
10.14	Added support for L3 VNI ACLs.
10.08	Added subinterface information and examples.
10.07 or earlier	Updated command output to use interface and VLAN ranges to reflect aggregation.

Command Information

Platforms	Command context	Authority
All platforms	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show access-list hitcounts control-plane

```
show access-list hitcounts [{ip|ipv6} <ACL-NAME>] control-plane vrf <VRF-NAME> [vsx-peer]
```

Description

Shows the hit count of the number of times an ACL (applied to the Control Plane) has matched a packet for ACEs with the `count` keyword. For ACEs without the `count` keyword, a dash is shown in place of a hit count.

Parameter	Description
`ip|ipv6`	Specifies the ACL type: **ip** for IPv4, or **ipv6** for IPv6.
`<ACL-NAME>`	Specifies the ACL name.
`vrf` *`<VRF-NAME>`*	Specifies the VRF name.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Usage

- ACL hit counts are aggregated across all VRFs to which the ACL is applied to on ingress.
- Accumulated hit counts for an applied ACL are cleared upon any modification of the ACL.

Examples

Showing the hit counts for an IPv4 ACL applied to the Control Plane default VRF:

```
switch# show access-list hitcounts ip My_ipv4_ACL control-plane vrf default
Statistics for ACL My_ip_ACL (ipv4):
vrf default (control-plane):
     Matched Packets  Configuration
                   -  10 permit udp any 172.16.1.0/255.255.255.0
                   0  20 permit tcp 172.16.2.0/255.255.0.0 gt 1023 any count
                   -  30 permit tcp 172.26.1.0/255.255.255.0 any dscp AF11 ack syn
                   0  implicit deny any any any count
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

show access-list secure-update

```
show access-list secure-update
```

Description

Use this command to determine if access lists are updated using the secure-update feature. Secure-update is enabled by default.

Examples

Displaying the status of the access list secure-update feature when that feature is enabled:

```
switch(config)# show access-list secure-update
Access-list secure-update is enabled
```

Displaying the status of the access list secure-update feature when that feature is disabled:

```
switch(config)# show access-list secure-update
Access-list secure-update is disabled
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

Related Commands

Chapter 5

Aruba Central commands

aruba-central

```
aruba-central
no aruba-central
```

Description

Creates or enters the Aruba Central configuration context (`config-aruba-central`).

Example

Creating the Aruba Central configuration context:

```
switch(config)# aruba-central
switch(config-aruba-central)#
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

aruba-central support-mode

```
aruba-central support-mode
no aruba-central support-mode
```

Description

Allows the device to be writable for all operations in Aruba Central lockout mode for troubleshooting. The no form of this command disables this activity.

Support-mode is disabled by default when the switch is managed by Aruba Central. This command is only effective in the CLI session where it is executed.

Examples

Configuring the device to be writable for all operations in Aruba Central lockout mode:

```
switch# aruba-central support-mode
switch#
```

Removing the configuration that allows the device to be writable for all operations in Aruba Central lockout mode:

```
switch# no aruba-central support-mode
switch#
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

6300 6400	Manager (#)	Administrators or local user group members with execution rights for this command.

configuration-lockout central managed

```
configuration-lockout central managed
no configuration-lockout central managed
```

Description

Configures the device to only be writable from Aruba Central. Aruba Central will be the only agent that can add, modify, or delete configurations on the device. The no form of this command disables this feature.

The no form of this command is only available when the device is disconnected from Aruba Central.

Usage

The AOS-CX switch connects to Aruba Central in either of two modes: monitor or managed. When the device is connected in monitor mode, Aruba Central monitors the configurations on the switch. When the device is connected in managed mode, the **configuration-lockout central managed** command does not allow configuration changes from other interfaces such as CLI or Web UI.

Examples

Configuring the device to only be writable from Aruba Central :

```
switch(config)# configuration-lockout central managed
switch# show configuration-lockout
configuration lockout
---------------------
central: managed
switch# sh aruba-central
Central admin state                 :enable

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

disable

`disable`

Description

Disables connection to Aruba Central server.

When the connection is disabled, the switch does not attempt to connect to the Aruba Central server or fetch central location from any of the three sources (CLI/Aruba Activate/DHCP). It also disconnects any active connection to the Aruba Central server.

Example

```
switch(config-aruba-central)# disable
switch(config-aruba-central)#
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-aruba-central`	Administrators or local user group members with execution rights for this command.

enable

`enable`

Description

Enables connection to Aruba Central server. When the connection is enabled, the switch attempts to download the location of the Aruba Central server in one of the following ways at startup and after the connection is lost:

- Using command-line interface (CLI).
- Connecting to Aruba Activate server.
- Using DHCP options provided during ZTP.

DHCP servers provide the options requested by the device to connect to Central, Central On-premise managment, or the TFTP server.

When a switch is able to connect to Aruba Central, but is not registered in the Aruba Central inventory or does not have a proper license, the switch will get disconnected. If the Aruba Central feature is enabled using this command, the switch will then reconnect back to Aruba Central and will get disconnected again. This connect/disconnect process will continue until the switch is properly registered in Aruba Central. To avoid this unnecessary reconnection cycle, best practices is to disable Aruba Central until the switch is registered in Aruba Central, or a license is obtained for that device.

Examples

```
switch(config-aruba-central)# enable
switch(config-aruba-central)#
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command Information

Platforms	Command context	Authority
6300 6400	`config-aruba-central`	Administrators or local user group members with execution rights for this command.

location-override

```
location-override <location> [vrf <VRF-NAME>]
no location-override
```

Description

When **location** and **vrf** are configured, the switch overrides existing connections to Aruba Central. The switch attempts to establish connection to Aruba Central with the specified location and VRF with highest priority.

Location can take one of the following values:

- A fully qualified domain name (FQDN) along with an optional port number.
- An IPv4 address with an optional port number.
- An IPv6 address with an optional port number.

If the port number is not specified, then port 443 is used by default. If the command is executed without the VRF parameter, the switch uses

the 'default' VRF.

The **no** form of this command removes location override values from the Aruba Central configuration context.

When you configure an IPv6 address with a port number, specify the address part inside square brackets, optionally followed by the port number, e.g. [2001:0db8:85a3:0000:0000:8a2e:0370:7334]:443.

Parameter	Description
<location>	Specifies one of these values: - *<FQDN>*: a fully qualified domain name. - *<IPV4>*: an IPv4 address. - *<IPV6>*: an IPv6 address.
vrf *<VRF-NAME>*	Specifies the VRF name to be used for communicating with the

Parameter	Description
	server. If no VRF name is provided, the default VRF named `default` is used.

Examples

Configuring location override with location and VRF:

```
switch(config-aruba-central)# location-override aruba-central.com vrf default
switch(config-aruba-central)#
switch(config-aruba-central)# location-override aruba-central.com vrf red
switch(config-aruba-central)# location-override 10.0.0.1 vrf red
switch(config-aruba-central)# location-override 10.0.0.1:443 vrf red
switch(config-aruba-central)# location-override
2001:0db8:85a3:0000:0000:8a2e:0370:7334 vrf red
switch(config-aruba-central)# location-override
[2001:0db8:85a3:0000:0000:8a2e:0370:7334]:443 vrf red
```

Configuring location override with location only:

```
switch(config-aruba-central)# location-override aruba-central.com
switch(config-aruba-central)#
```

Removing location override values from the Aruba Central configuration context:

```
switch(config-aruba-central)# no location-override
switch(config-aruba-central)#
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

location-override-alternative

```
location-override-alternative <LOCATION> [vrf <VRF>]
no location-override-alternative <LOCATION> [vrf <VRF>]
```

Description

Configures information about Aruba Central connection when the alternative location is used.

The **no** form of this command removes the **location-override-alternative** configuration.

Parameter	Description
<LOCATION>	Specifies the Aruba-Central location.
vrf *<VRF>*	Specifies the VRF used to connect to Aruba-Central.

Usage

When the main and alternative Aruba Central server locations are specified, the switch attempts to connect to the main Aruba Central server. If there is connectivity failure with the main Aruba Central server location, it attempts to establish a connection with the alternative server location.

If the alternative location is configured without a main location, the user is prompted for confirmation. In this case, there is no redundancy and the switch attempts to connect to the alternative location.

Location can take one of the following values:

- A fully qualified domain name (FQDN) along with an optional port number.
- An IPv4 address with an optional port number.
- An IPv6 address with an optional port number.

If the port number is not specified, then port 443 is used by default. If the command is executed without the VRF parameter, the switch uses

the 'default' VRF.

An Aruba Central server location can only be a fully qualified domain name (FQDN) or a valid IP address. If the command is entered without the VRF parameter, the switch uses the default VRF.

Examples

Example of configuring with the aruba-central.com location and VRF red:

```
switch(config-aruba-central)# location-override-alternative aruba-central.com vrf
red
switch(config-aruba-central)#
```

Example of a configuration with location only:

```
switch(config-aruba-central)# location-override-alternative aruba-central.com
switch(config-aruba-central)#
```

Example of removing the override configuration:

```
switch(config-aruba-central)# no location-override-alternative
switch(config-aruba-central)# location-override-alternative 10.0.0.1 vrf red
switch(config-aruba-central)# location-override-alternative 10.0.0.1:443 vrf red
switch(config-aruba-central)# location-override-alternative
2001:0db8:85a3:0000:0000:8a2e:0370:7334 vrf red
switch(config-aruba-central)# location-override-alternative
[2001:0db8:85a3:0000:0000:8a2e:0370:7334]:443 vrf red
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.13.1000	Command updated to reflect OTP scenario.
10.12.1000	Command introduced.

Command Information

Platforms	Command context	Authority
All platforms	`config-aruba-central`	Administrators or local user group members with execution rights for this command.

show aruba-central

```
show aruba-central
```

Description

Shows information about Aruba Central connection and the status of the Activate server connection.

Examples

Example of a switch that has the Aruba Central connection:

```
switch# show aruba-central
Central admin state                     : enabled
Central location                        : 10.0.0.1
VRF for connection                      : mgmt
Shared Token                            : N/A
Central connection status               : connected
Central source                          : activate
Central source connection status        : connected
Central source last connected on        : Wed Jun 28 23:07:25 UTC 2023
Main location                           : 10.0.0.1
Main VRF                                : mgmt
Alternative location                    : N/A
Alternative VRF                         : N/A
Activate Server URL                     : devices-v2.arubanetworks.com
System time synchronized from Activate  : N/A
Source IP                               : N/A
Source IP Overridden                    : False
Central support mode                    : disabled
```

Example of a switch when the main CLI location is used:

```
switch# show aruba-central
Central admin state                    : enabled
Central location                       : 10.0.0.1
```

```
VRF for connection                     : mgmt
Shared secret                          : N/A
Central connection status              : connected
Central source                         : cli
Central source connection status       : connected
Central source last connected on       : Wed Jun 28 23:07:25 UTC 2023
Main location                          : 10.0.0.1
Main VRF                               : mgmt
Alternative location                   : 20.0.0.1
Alternative VRF                        : default
Activate server URL                    : devices-v2.arubanetworks.com
System time synchronized from Activate : N/A
Source IP                              : N/A
Source IP Overridden                   : False
Central support mode                   : disabled
```

Example of a switch when the alternative CLI location is used:

```
switch# show aruba-central
Central admin state                    : enabled
Central location                       : 20.0.0.1
VRF for connection                     : default
Shared secret                          : N/A
Central connection status              : connected
Central source                         : cli
Central source connection status       : connected
Central source last connected on       : Wed Jun 28 23:07:25 UTC 2023
Main location                          : 10.0.0.1
Main VRF                               : mgmt
Alternative location                   : 20.0.0.1
Alternative VRF                        : default
Activate server URL                    : devices-v2.arubanetworks.com
System time synchronized from Activate : N/A
Source IP                              : N/A
Source IP Overridden                   : False
Central support mode                   : disabledswitch# show aruba-central
Central admin state                    : enabled
Central location                       : 20.0.0.1
VRF for connection                     : default
Shared secret                          : N/A
Central connection status              : connected
Central source                         : cli
Central source connection status       : connected
Central source last connected on       : Wed Jun 28 23:07:25 UTC 2023
Main location                          : 10.0.0.1
Main VRF                               : mgmt
Alternative location                   : 20.0.0.1
Alternative VRF                        : default
Activate server URL                    : devices-v2.arubanetworks.com
System time synchronized from Activate : N/A
Source IP                              : N/A
Source IP Overridden                   : False
Central support mode                   : disabled
```

Example of a switch when the location is obtained from DHCP options:

```
switch# show aruba-central
Central admin state                    : enabled
Central location                       : central-western-us.arubanetworks.com
```

```
VRF for connection                      : RED
Shared secret                           : N/A
Central connection status               : connected
Central source                          : DHCP
Central source connection status        : connected
Central source last connected on        : Fri Jun 30 20:22:33 UTC 2023
Main location                           : central-western-us.arubanetworks.com
Main VRF                                : mgmt
Alternative location                    : N/A
Alternative VRF                         : N/A
Activate server URL                     : devices-v2.arubanetworks.com
System time synchronized from Activate : N/A
Source IP                               : 100.0.0.1
Source IP Overridden                    : False
Central support mode                    : disabled
```

Example of a switch when Aruba Central is disabled:

```
switch# show aruba-central
Central admin state                     : disabled
Central location                        : N/A
VRF for connection                      : N/A
Shared secret                           : N/A
Central connection status               : N/A
Central source                          : none
Central source connection status        : N/A
Central source last connected on        : N/A
Main location                           : N/A
Main VRF                                : N/A
Alternative location                    : N/A
Alternative VRF                         : N/A
Activate server URL                     : devices-v2.arubanetworks.com
System time synchronized from Activate : N/A
Source IP                               : N/A
Source IP Overridden                    : False
Central support mode                    : disabledswitch# show aruba-central
Central admin state                     : disabled
Central location                        : N/A
VRF for connection                      : N/A
Shared secret                           : N/A
Central connection status               : N/A
Central source                          : none
Central source connection status        : N/A
Central source last connected on        : N/A
Main location                           : N/A
Main VRF                                : N/A
Alternative location                    : N/A
Alternative VRF                         : N/A
Activate server URL                     : devices-v2.arubanetworks.com
System time synchronized from Activate : N/A
Source IP                               : N/A
Source IP Overridden                    : False
Central support mode                    : disabled
```

Example of a switch when Aruba Central is not reachable:

```
switch# show aruba-central
Central admin state                     : enabled
Central location                        : N/A
```

```
VRF for connection                       : N/A
Shared secret                            : N/A
Central connection status                : not-reachable
Central source                           : activate
Central source connection status         : connected
Central source last connected on         : Fri Jun 30 20:22:33 UTC 2023
Main location                            : N/A
Main VRF                                 : N/A
Alternative location                     : N/A
Alternative VRF                          : N/A
Activate server URL                      : devices-v2.arubanetworks.com
System time synchronized from Activate : N/A
Source IP                                : N/A
Source IP Overridden                     : False
Central support mode                     : disabled
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.12.1000	Enhanced to support more scenarios
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Operator (>) or Manager (#)	Administrators or local user group members with execution rights for this command.

show running-config current-context

```
show running-config current-context
```

Description

Shows the running configuration for the current-context. If user is in the context of Aruba-Central (**config-aruba-central**), then Aruba Central running configuration is displayed.

Examples

Shows the running configuration of Aruba Central:

```
switch(config-aruba-central)# show running-config current-context
aruba-central
       disable
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show capacities

```
show capacities <FEATURE> [vsx-peer]
```

Description

Shows system capacities and their values for all features or a specific feature.

Parameter	Description
<FEATURE>	Specifies a feature. For example, **aaa** or **vrrp**.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Usage

Capacities are expressed in user-understandable terms. Thus they may not map to a specific hardware or software resource or component. They are not intended to define a feature exhaustively.

Examples

Showing all available capacities for BGP:

```
switch# show capacities bgp

System Capacities: Filter BGP
Capacities Name                                                            Value
---------------------------------------------------------------------------------
-
Maximum number of AS numbers in as-path attribute
32
...
```

Showing all available capacities for mirroring:

```
switch# show capacities mirroring

System Capacities: Filter Mirroring
Capacities Name                                                             Value
----------------------------------------------------------------------------------
-
Maximum number of Mirror Sessions configurable in a system
4
Maximum number of enabled Mirror Sessions in a system
4
```

Showing all available capacities for MSTP:

```
switch# show capacities mstp

System Capacities: Filter MSTP
Capacities Name                                                             Value
----------------------------------------------------------------------------------
-
Maximum number of mstp instances configurable in a system
64
```

Showing all available capacities for VLAN count:

```
switch# show capacities vlan-count

System Capacities: Filter VLAN Count
Capacities Name                                                             Value
----------------------------------------------------------------------------------
-
Maximum number of VLANs supported in the system
4094      /switch# show capacities vlan-count

System Capacities: Filter VLAN Count
Capacities Name                                                             Value
----------------------------------------------------------------------------------
-
Maximum number of VLANs supported in the system
4094
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Manager (#)	Administrators or local user group members with execution rights for this command.

show capacities-status

`show capacities-status <FEATURE> [vsx-peer]`

Description

Shows system capacities status and their values for all features or a specific feature.

Parameter	Description
<FEATURE>	Specifies the feature, for example **aaa** or **vrrp** for which to display capacities, values, and status. Required.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing the system capacities status for all features:

```
                 switch# show capacities-status

System Capacities Status
Capacities Status Name                                                      Value
Maximum
----------------------------------------------------------------------------------
-------
Number of active gateway mac addresses in a system                              0
    16
Number of aspath-lists configured                                               0
    64
Number of community-lists configured                                            0
    64
...
```

Showing the system capacities status for BGP:

```
switch# show capacities-status bgp

System Capacities Status: Filter BGP
Capacities Status Name                                              Value  Maximum
----------------------------------------------------------------------------------
--
Number of aspath-lists configured                                   0      64
Number of community-lists configured                                0      64
Number of neighbors configured across all VRFs                      0      50
Number of peer groups configured across all VRFs                    0      25
Number of prefix-lists configured                                   0      64
Number of route-maps configured                                     0      64
Number of routes in BGP RIB                                         0      256000
Number of route reflector clients configured across all VRFs        0      16
```

Showing the system capacities status for L3:

```
switch# show capacities-status l3

System Capacities Status: Filter L3 resources
Capacities Status Name                                                 Value
Maximum
----------------------------------------------------------------------------------
--
Number of IP neighbor (IPv4+IPv6) entries                               4
49152
Number of IP Directed Broadcast neighbor entries                        0
4096
Number of IPv6 Long Prefix Routes currently configured                  3
5000
Number of IPv6 neighbor(ND) entries                                     4
49152
Number of L3 Groups for IP Tunnels and ECMP Groups currently configured 1
2047
Number of L3 Destinations for Routes, Nexthops in ECMP groups and
      Tunnels currently configured                                      4
2045
Number of routes (IPv4+IPv6) currently configured                       5
65536
Number of IPv4 routes currently configured                              0
65536
Number of IPv6 routes currently configured with prefix 0-64             4
13312
Number of IPv6 routes currently configured with prefix 65-127           2
510
```

```
switch# show capacities-status l3

System Capacities Status: Filter L3 resources
Capacities Status Name                                                 Value
Maximum
----------------------------------------------------------------------------------
--
Number of IP neighbor (IPv4+IPv6) entries                               4
49152
Number of IP Directed Broadcast neighbor entries                        0
4096
Number of IPv6 Long Prefix Routes currently configured                  3
5000
Number of IPv6 neighbor(ND) entries                                     4
49152
Number of L3 Groups for IP Tunnels and ECMP Groups currently configured 1
2047
Number of L3 Destinations for Routes, Nexthops in ECMP groups and
      Tunnels currently configured                                      4
2045
Number of routes (IPv4+IPv6) currently configured                       5
65536
Number of IPv4 routes currently configured                              0
65536
```

```
Number of IPv6 routes currently configured with prefix 0-64           4
13312
Number of IPv6 routes currently configured with prefix 65-127         2
510
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

Command History

Release	Modification
10.13	Updated to show newly supported configuration of IPv6 routes on the ASIC.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Manager (#)	Administrators or local user group members with execution rights for this command.

show object-group

```
show object-group [{ip|ipv6} address | port] [<OBJECT-GROUP-NAME>] [commands]
[configuration]
```

Description

Shows information about your defined object groups. When **show object-group** is entered without parameters, information for all object groups is shown. The parameters filter the list of object groups for which information is shown.

Parameter	Description
`[{ip|ipv6} address	port]`	Specifies the object group type, either **address** for an IP address, or **port**.
<OBJECT-GROUP-NAME>	Specifies the object group name.
`[commands]`	Specifies that the object group definition is to be shown as the commands and parameters used to create it rather than in tabular form.
`[configuration]`	Specifies that the user-configured object groups be shown as configured. The output of the command with this parameter may not be the same as what is active on the switch due to a misconfigured object group. See *Examples* in this topic.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not

Parameter	Description
	have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing configured object groups:

```
switch# show object-group
Type       Name
  Sequence L4 Port(s)/IP Address
--------------------------------------------------------------------------------
IPv4       my_address_group
        10 192.168.0.1
        20 192.168.0.3
Port       my_port_group
        10 eq 80
        20 gt 65525
switch#
switch# show object-group commands
object-group ip address my_address_group
    10 192.168.0.1
    20 192.168.0.3
object-group port my_port_group
    10 eq 80
    20 gt 65525
```

Showing a misconfigured object group:

```
switch# show object-group
Type       Name
  Sequence L4 Port(s)/IP Address
--------------------------------------------------------------------------------
! object-group ip address My_ip_object_group user configuration does not match
! the active hardware configuration. Run 'object-group ip address NAME reset'
! to reset the object group to match the active hardware configuration.
IPv4       my_address_group
switch#
switch#
Type       Name
  Sequence L4 Port(s)/IP Address
--------------------------------------------------------------------------------
! object-group ip address My_ip_object_group user configuration does not match
! the active hardware configuration. Run 'object-group ip address NAME reset'
! to reset the object group to match the active hardware configuration.
IPv4       my_address_group
switch#
switch# show object-group configuration
Type       Name
  Sequence L4 Port(s)/IP Address
--------------------------------------------------------------------------------
! object-group ip address My_ip_object_group user configuration does not match
! the active hardware configuration. Run 'object-group ip address NAME reset'
! to reset the object group to match the active hardware configuration.
IPv4       my_address_group
        10 192.168.0.1
        20 192.168.0.3
switch#
```

```
switch# show object-group commands
! object-group ip address My_ip_object_group user configuration does not match
! the active hardware configuration. Run 'object-group ip address NAME reset'
! to reset the object group to match the active hardware configuration.
switch#
switch# show object-group commands configuration
! object-group ip address My_ip_object_group user configuration does not match
! the active hardware configuration. Run 'object-group ip address NAME reset'
! to reset the object group to match the active hardware configuration.
object-group ip address my_address_group
    10 192.168.0.1
    20 192.168.0.3
```

Resetting a misconfigured object group:

```
switch(config)# object-group all reset
switch(config)# exit
switch# show object-group
Type       Name
  Sequence L4 Port(s)/IP Address
-------------------------------------------------------------------------------
IPv4       my_address_group
switch#
switch# show object-group configuration
Type       Name
  Sequence L4 Port(s)/IP Address
-------------------------------------------------------------------------------
IPv4       my_address_group
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

Chapter 6

ACL and Policy hardware resource commands

show resources

```
show resources [<SLOT-ID>] [vsx-peer]
```

Description

On the 6300 switch, shows hardware resource consumption for the specified VSF member or for all VSF members. On the 6400 switch, shows hardware resource consumption for the specified line module or for all line modules. Resource data is updated every 10 seconds.

Hardware resource consumption information is shown for:

- TCAM entries
- TCAM lookups
- Policers

Parameter	Description
<SLOT-ID>	Specifies the VSF member on the 6300 switch and the member and slot of the line module on the 6400 switch. For example, on the 6400 switch, to specify the line module in member 1, slot 2, enter `1/2`.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Usage

The widths for show resources can have features combined (IPv4 + IPv6) into one TCAM lookup. Therefore, the table widths for each ACL/classifier policy type are variable depending on what is applied. For example:

```
  "Ingress IP Port ACL" = Ingress v4 Port ACLs + Ingress v6 Port ACLs
                        = 1 TCAM entry + 4 TCAM entries
                        = 5 TCAM entries/  "Ingress IP Port ACL" = Ingress v4 Port
ACLs + Ingress v6 Port ACLs
                        = 1 TCAM entry + 4 TCAM entries
                        = 5 TCAM entriC(v2) /  "Ingress IP Port ACL" = Ingress v4
Port ACLs + Ingress v6 Port ACLs
                        = 1 TCAM entry + 4 TCAM entries
                        = 5 TCAM entries/  "Ingress IP Port ACL" = Ingress v4 Port
ACLs + Ingress v6 Port ACLs
                        = 1 TCAM entry + 4 TCAM entries
                        = 5 TCAM entriC(v2C(v2)/  "Ingress IP Port ACL" = Ingress
v4 Port ACLs + Ingress v6 Port ACLs
                        = 1 TCAM entry + 4 TCAM entries
                        = 5 TCAM entries/  "Ingress IP Port ACL" = Ingress v4 Port
ACLs + Ingress v6 Port ACLs
                        = 1 TCAM entry + 4 TCAM entries
                        = 5 TCAM entriC(v2C(v2) /  "Ingress IP Port ACL" = Ingress
v4 Port ACLs + Ingress v6 Port ACLs
                        = 1 TCAM entry + 4 TCAM entries
                        = 5 TCAM entries/  "Ingress IP Port ACL" = Ingress v4 Port
ACLs + Ingress v6 Port ACLs
                        = 1 TCAM entry + 4 TCAM entries
                        = 5 TCAM entriC(v2) /  "Ingress IP Port ACL" = Ingress v4
Port ACLs + Ingress v6 Port ACLs
                        = 1 TCAM entry + 4 TCAM entries
                        = 5 TCAM entries/  "Ingress IP Port ACL" = Ingress v4 Port
ACLs + Ingress v6 Port ACLs
                        = 1 TCAM entry + 4 TCAM entries
                        = 5 TCAM entriC(v2C(v2)/  "Ingress IP Port ACL" = Ingress
v4 Port ACLs + Ingress v6 Port ACLs
                        = 1 TCAM entry + 4 TCAM entries
                        = 5 TCAM entries/  "Ingress IP Port ACL" = Ingress v4 Port
ACLs + Ingress v6 Port ACLs
                        = 1 TCAM entry + 4 TCAM entries
                        = 5 TCAM entriC(v2C(v2C(v2)/  "Ingress IP Port ACL" =
Ingress v4 Port ACLs + Ingress v6 Port ACLs
                        = 1 TCAM entry + 4 TCAM entries
                        = 5 TCAM entries/  "Ingress IP Port ACL" = Ingress v4 Port
ACLs + Ingress v6 Port ACLs
                        = 1 TCAM entry + 4 TCAM entries
                        = 5 TCAM entriC(v2) /  "Ingress IP Port ACL" = Ingress v4
Port ACLs + Ingress v6 Port ACLs
                        = 1 TCAM entry + 4 TCAM entries
                        = 5 TCAM entries/  "Ingress IP Port ACL" = Ingress v4 Port
ACLs + Ingress v6 Port ACLs
                        = 1 TCAM entry + 4 TCAM entries
                        = 5 TCAM entriC(v2C(v2)/  "Ingress IP Port ACL" = Ingress
v4 Port ACLs + Ingress v6 Port ACLs
                        = 1 TCAM entry + 4 TCAM entries
                        = 5 TCAM entries/  "Ingress IP Port ACL" = Ingress v4 Port
ACLs + Ingress v6 Port ACLs
                        = 1 TCAM entry + 4 TCAM entries
                        = 5 TCAM entriC(v2C(v2C(v2)
```

Widths per feature are as follows:

```
MAC ACL    1
IPv4 ACL   1
IPv6 ACL   4
MAC Class  1
IPv4 Class 2
IPv6 Class 4
```

A MAC Class with an ethertype of "any" has a width of 7 because it uses one TCAM entry each for MAC, IPv4, and IPv6. Specifying the IPv4 (0x0800) or IPv6 (0x86DD) ethertypes in a MAC Class uses a TCAM entry equal to their respective size. IPv4 uses a width of 2 and IPv6 uses a width of 4.

```
  "Ingress IP Port ACL" = Ingress v4 Port ACLs + Ingress v6 Port ACLs
                        = 1 TCAM entry + 4 TCAM entries
                        = 5 TCAM entries
```

```
IPv4 ACL   2
MAC ACL    2
IPv6 ACL   4
IPv4 Class 2
IPv6 Class 4
```

Examples

Showing hardware resource consumption on a 6300 switch:

```
switch# show resources

Resource Usage:

Mod  Description
         Resource                                   Used Reserved    Free
-------------------------------------------------------------------------
1/1  Ingress IP Port ACL Lookup
         Ingress TCAM Entries                         20        0    5093
     Total
         Ingress Lookups                               1        0       4
         Egress Lookups                                0        0       4
```

Showing hardware resource consumption for all line modules on a 6405 switch:

```
switch# show resources

Resource Usage:

Mod  Description
         Resource                                   Used     Free
-------------------------------------------------------------------------
1/3  Total
         Ingress Lookups                               0        5
         Egress Lookups                                0        4
1/5  Total
         Ingress Lookups                               0        5
         Egress Lookups                                0        4
```

```
switch# show resources

Resource Usage:

Mod  Description
         Resource                                   Used Reserved    Free
-------------------------------------------------------------------------
1/1  Total
         Ingress TCAM Entries                          0        0    5120
         Egress TCAM Entries                           0        0    2048
         Ingress Lookups                               0                9
         Egress Lookups                                0                4
         Ingress Policers                              0             2047
         Egress Policers                               0             2047

Chapter 7

Application Recognition and Control commands

app-recognition

```
[no] app-recognition
   [no]enable
```

Description

The ARC feature recognize applications running on the network and control them based on user configurations. You can enable ARC globally, or on one or more interfaces and physical bridged ports.

The no form of this command deletes the ARC configuration context.

IP source lockdown resource extended mode needs to be disabled before you enable ARC feature. For more information, see the *IP Services Guide*.

Parameter	Description
`[no] enable`	Enable or disable ARC for both IPv4 and IPv6 Flows

Examples

The following example creates the ARC configuration context.

```
switch(config)# app-recognition
```

The following example deletes the ARC configuration context.

```
switch(config)# no app-recognition
```

The following example enables application traffic recognition globally.

```
switch(config)# app-recognition
switch(config-app-recognition)# enable
```

The following example disable application traffic recognition globally.

```
switch(config)# app-recognition
switch(config-app-recognition)# no enable
```

The following example enables application traffic recognition on interface **1/1/1**.

```
switch(config)# int 1/1/1
switch(config-if)# app-recognition enable
```

The following example disable application traffic recognition on interface **1/1/1**.

```
switch(config)# int 1/1/1
switch(config-if)# no app-recognition enable
```

The following example enables application traffic recognition for user role **guest**.

```
switch(config)# port-access role guest
switch(config-pa-role)# app-recognition enable
```

The following example disable application traffic recognition for user role **guest**.

```
switch(config)# port-access role guest
switch(config-pa-role)# no app-recognition enable
```

For more information on features that use this command, refer to the Security Guide for your switch model.

show app-recognition

```
show app-recognition
   [<IF-NAME> | <IF-RANGE>]
   app [<APP-NAME>]
   app-category [<APP-CATEGORY>]
```

Description

Displays ARC configuration and status.

Parameter	Description
`app-recognition`	Display ARC information globally.
`<IF-NAME>`	Display ARC information for an interface.
`<IF-RANGE>`	Display ARC information for the specified range of interface.
`app`	Display application information.
`app <APP-NAME>`	Display information for the specified application.
`app-category`	Display application category information.
`app-category <APP-CATEGORY>`	Display information for the specified application category. ■ **antivirus**: Antivirus updates ■ **any**: Any application category ■ **authentication**: Protocol used for authentification purposes ■ **behavioral**: Protocol classified by non-deterministic criteria based on statistical analysis of packet form and session behavior ■ **cloud-file-storage**: Cloud File Storage related applications ■ **collaboration**: Collaboration applications ■ **custom**: Custom family of applications ■ **encrypted**: Encryption protocol applications ■ **enterprise-apps**: Enterprise applications ■ **gaming**: Gaming protocol and applications ■ **im-file-transfer**: IM File Transfer application category ■ **instant-messaging**: Instant Messaging applications ■ **mail-protocols**: Email exchange protocol ■ **mobile**: Mobile applications ■ **mobile-app-store**: Mobile app store and applications ■ **network-service**: Low level network protocol and applications ■ **peer-to-peer**: Peer to Peer applications ■ **social-networking**: Social Networking applications ■ **standard**: Standard applications ■ **streaming**: Streaming applications ■ **thin-client**: Remote control protocol and applications ■ **tunneling**: Tunneling protocol and applications ■ **unified-communications**: Unified Communication protocols and applications ■ **unknown**: Unknown applications ■ **web**: Generic web traffic ■ **webmail**: Web email applications

Usage

ARC can be enabled directly on an interface or can be enabled via a port-access role. When ARC is enabled on a port-access role, all the interfaces associated with that role are enabled with ARC.

The names of the applications used in the document are the intellectual property of their respective companies that make them. The trademark names are used only as examples in the document.

Examples

The following example displays global application port configuration information. The **User-Config** column reflects the direct enablement on a specific port, **Port-Access-Config** column reflects the enablement on a port-access role and the **Oper-Status** column reflects the final state of the ARC on that port.

```
switch# show app-recognition
 Application Recognition Global Configuration
   Configuration status            : Enabled
   Operational Status              : Enabled
   ABP Session Limit Exceed Action : Drop New Flows
   Operational Mode                : Fast
   Failure Reason                  : NA

 Application Recognition Port Configuration

   Interface    User-Config   Port-Access-Config       Oper-Status
   ---------------------------------------------------------------
   1/1/1        Enabled           Disabled             Enabled
   1/2/3        Disabled          Disabled             Disabled
   1/2/4        Disabled          Enabled              Enabled
   1/2/5        Enabled           Enabled              Enabled
```

The following example displays the ARC configuration on interface **1/1/1**.

```
switch#show app-recognition 1/1/1

Application Recognition Port Configuration

 Interface    User-Config   Port-Access-Config         Oper-Status
 -----------------------------------------------------------------
 1/2/1        Enabled         Disabled                  Enabled
```

The following example displays the ARC configuration for the specified interface range **1/2/3-1/2/5**.

```
switch# show app-recognition 1/2/3-1/2/5

Application Recognition Port Configuration

 Interface    User-Config   Port-Access-Config         Oper-Status
 -----------------------------------------------------------------
 1/2/3        Enabled         Disabled                  Enabled
 1/2/4        Disabled        Enabled                   Enabled
 1/2/5        Enabled         Enabled                   Enabled
```

The following example displays a list of applications recognized by the traffic application feature.

```
switch# show app-recognition app

 NAME           ID    CATEGORY               DESCRIPTION
 -------------- ----- ---------------------- -------------------------------
 call-of-duty   3490  gaming                 Call of duty (aka COD) is a video
game ...
 facebook        244  social-networking      Facebook is a social network.
 twitter         503  social-networking      Online microblogging service that
enables...
```

```

 NAME           ID    CATEGORY                DESCRIPTION
 -------------- ----- ---------------------- --------------------------------
 call-of-duty   3490  gaming                  Call of duty (aka COD) is a video
game ...

   {app-category {any | <APP-CATEGORY>} {app {any | <APP-NAME>}} [count]

   [no] <SEQUENCE-NUMBER>

class {abp-ip | abp-ipv6} <CLASS-NAME> resequence <STARTING-SEQUENCE-NUMBER> <INCREMENT>
class {abp-ip | abp-ipv6} <CLASS-NAME> copy <DESTINATION-CLASS>
```

Description

Create and configure a class to match application-based packets.

The **no** keyword can be used to delete either a class or an individual class entry.

Parameter	Description
`abp-ip`	Create or configure an IPv4 application-based policy.
`abp-ipv6`	Create or configure an IPv6 application-based policy.
`app <APP-NAME>`	Configure a class for the specified application. **NOTE:** The **app <unknown>** under **app-category *<standard>*** matches all recognized flows whose application id is unknown or unmapped.
`app-category {<APP-CATEGORY>}`	Configure a class for the specified application category. **NOTE:** A class configured to match against the **unknown** app-category matches all recognized flows whose application id is unknown. A class configured to match against the **any** app-category matches all recognized flows regardless of their application id. Application-based policies can be applied to anyof the following application types: ■ **antivirus**— Antivirus updates ■ **any**— Matches all recognized flows irrespective of their application id ■ **authentication**— Protocol used for authentification purposes ■ **behavioral**— Protocol classified by non-deterministic criteria based on statistical analysis of packet form and session behavior ■ **cloud-file-storage**— Cloud File Storage related applications ■ **collaboration**— Collaboration applications ■ **custom**— Custom family of applications ■ **encrypted**— Encryption protocol applications ■ **enterprise-apps**—Enterprise applications

Parameter	Description
	■ **gaming**—Gaming protocol and applications ■ **im-file-transfer**— IM File Transfer application category ■ **instant-messaging**— Instant Messaging applications ■ **mail-protocols**— Email exchange protocol ■ **mobile**—Mobile applications ■ **mobile-app-store**—Mobile app store and applications ■ **network-service**—Low level network protocol and applications ■ **peer-to-peer**—Peer-to-Peer applications ■ **social-networking**—Social Networking applications ■ **standard**— Standard applications ■ **streaming**— Streaming applications ■ **thin-client**—Remote control protocol and applications ■ **tunneling**— Tunneling protocol and applications ■ **unified-communications**—Unified Communication protocols and applications ■ **unknown**—Unknown applications ■ **web**—Generic web traffic ■ **webmail**— Web email applications
`CLASS-NAME`	Define a class name for which the application-based policy is being created or configured.
`comment <`*`STRING`*`>>`	Add a comment to the traffic class.
`copy <DESTINATION-CLASS>`	Copy the settings of this traffic class to another specified traffic class. **NOTE:** Copying a class to a pre-existing class will overwrite the pre-existing entries with new entries.
`count`	Calculates the number of times the ABP was applied to the traffic.
`dst-ip-address`	Specify a destination IP address to classify traffic to this destination IP.
`/{<PREFIX-LENGTH>|<SUBNET-MASK>}`	Optional. Specify an address mask for the destination IP in one of the following formats: ■ **/<PREFIX-LENGTH>**: Subnet mask in CIDR notation.It is an integer between 1 to 32. ■ **<SUBNET-MASK>**: Subnet mask in dotted-decimal notation (for example, **255.255.255.0**).
`dst-l4-port`	Specify a destination L4 port or port range to classify traffic to this destination port. Only on selecting **tcp|udp** you get the option to configure the destination L4 port or port range.
`gt <port>`	Classify traffic to a layer 4 destination port with a port numbers greater than the specified layer 4 port number.

Parameter	Description
`lt <port>`	Classify traffic to a layer 4 destination port with a port numbers lesser than the specified layer 4 port number.
`eq <port>`	Classify traffic to layer 4 source port. ■ **PORT-NAME**—A single Layer 4 port name `{ftp-data|ftp|ssh|telnet|smtp|tacacs|dns|dhcp-server|dhcp-client|tftp|http|https|pop3|nntp|ntp|dce-rpc|netbios-ns|netbios-dgm|netbios-ssn|snmp|snmp-trap|bgp|ldap|microsoft-ds|isakmp|syslog|imap4|radius|radius-acct|iscsi|rdp|nat-t|vxlan}` ■ **PORT**—A single Layer 4 port
`range <min-port>-<max-port>`	Layer 4 port range. ■ **min-port**—The start of a Layer 4 port range. ■ **max-port**—The end of a Layer 4 port range.
`ignore`	Creates a rule that ignores traffic to the specified destination, application, or application category.
`match`	Creates a rule that matches traffic to the specified destination, application, or application category.
`no ...`	Negates any configured parameter.
`resequence <STARTING-SEQUENCE-NUMBER> <INCREMENT>`	By default, rules added to a traffic class are applied in the order in which they are created. You can also use the **sequence** parameter to define the sequence numbers for each rule in the traffic class. To change the order in which a rule is applied, you must change its sequence number. Use the **resequence** command and specify the current (starting) sequence number of the rule, and the number by which you want to increment the rule. For example, use the parameters **resequence 40 10** to change the rule with the sequence value of 40 to have a sequence value of 30 (an increase of 10).
`[all]reset`	Use this parameter to change the user-specified application-based policy configuration to match the active application-based policy configuration. ■ **class all reset**: reset all classes. ■ **class <name> reset**: reset only the specified class. ■ **class abp-ip reset**: reset all IPv4 application-based policy classes. ■ **class abp-ipv6 reset**: reset all IPv6 application-based policy classes.
`SEQUENCE-NUMBER`	Specify the class entry sequence number. Integer (1-4294967295)
`SRC-IP-ADDRESS`	Source IP Address parameter value must be set to **any** source.

Parameter	Description
`src-l4-port`	Specify a source L4 port or port range to classify traffic from this source port.
`eq <port>`	Classify traffic from the specified source port.
`gt <port>`	Classify traffic from source ports with port numbers greater than the specified port number.
`lt <port>`	Classify traffic from source ports with port numbers lesser than the specified port number.
`tcp`	Apply the application classification policy to TCP traffic
`udp`	Apply the application classification policy to UDF traffic

Usage

Application based classification works only for the ports that has application recognition enabled. For more information on enabling application recognition on a port, see app-recognition.

When a client initiates a new traffic flow, the AOS-CX app recognition module views the first few initial packets to learn the flow and identify the application. Application-based policy rules are applied only after this flow recognition phase. Application based policies have a default **deny** behavior that is applied to traffic flows that do not match any configured ABP rules. This implicit deny rule is added to the policy only after the flow recognition phase is completed.

It is possible to create redundant class entries for a class that have the same match criteria and actions. Avoid redundant class entries, as each redundant copy of the class will consume additional processing resources.

Examples

The following example creates a application IPv4 class **my_app_ipv4_cls** with four rule entries.

```
switch(config)# class abp-ip my_app_ipv4_cls
switch(config-class-abp-ip)# 10 match udp any any app-category web app youtube-
music count
switch(config-class-abp-ip)# 20 match tcp any eq 60 any app-category enterprise-
apps app workday
switch(config-class-abp-ip)# 30 match any any any app-category any app any count
switch(config-class-abp-ip)# 40 ignore any any 10.0.0.10/24 app-category standard
app unknown
```

The following example creates a application IPv6 class **my_app_ipv6_cls** with two rule entries.

```
switch(config)# class abp-ipv6 my_app_ipv6_cls
switch(config-class-abp-ipv6)# 10 match any any 2001:db8::1319:8a2e:370:7348 app-
category standard app unknown
switch(config-class-abp-ipv6)# 20 match udp any eq telnet any app-category social-
networking app instagram count
```

For more information on features that use this command, refer to the Security Guide for your switch model.

show class

```
show class {abp-ip | abp-ipv6} <CLASS-NAME> [commands] [configuration]
```

Description

Display information of the active classes that are configured and accepted by the system.

Parameter	Description
`abp-ip`	Display information for all IPv4 application classes that have been configured and accepted by the system.
`abp-ipv6`	Display information for all IPv6 application classes that have been configured and accepted by the system.
`commands`	Display the commands used to configure the current application-based policies.
`configuration`	Display a list of commands use to configure the active application-based policy classes.
`comment <string>`	Add a comment to the traffic class,
`copy <DESTINATION-CLASS>`	Copy the settings of this traffic class to another specified traffic class. **NOTE:** Copying a class to a pre-existing class will overwrite the pre-existing entries with new entries.
`dst-ip-address <DST-IP-ADDRESS>`	Specify a destination IP address to classify traffic to this destination IP.
`/<PREFIX-LENGTH>|<SUBNET-MASK>}`	Optional. Specify an address mask for the destination IP in one of the following formats: ■ /<PREFIX-LENGTH>: Subnet mask in

Parameter	Description
	CIDR notation. It is an integer between 1 to 32. ■ <SUBNET-MASK>: Subnet mask in dotted-decimal notation (for example, **255.255.255.0**).
`dst-l4-port`	Specify a destination L4 port or port range to classify traffic to this destination port.
`eq <port>`	Classify traffic to the specified destination port.
`gt <port>`	Classify traffic to destination ports with port numbers greater than the specified port number.
`lt <port>`	Classify traffic to destination ports with port numbers lesser than the specified port number.
`range <min-port>-<max-port>`	Classify traffic to destination ports within the specified range.
`ignore`	Creates a rule that ignores traffic to the specified destination, application, or application category.
`match`	Creates a rule that matches traffic to the specified destination, application, or application category.
no ..,	Negates any configured parameter.
`resequence <STARTING-SEQUENCE-NUMBER> <INCREMENT>`	By default, rules added to a traffic class are applied in the order in which they are created. You can also use the **sequence** parameter to define the sequence numbers for each rule in the traffic class. To change the order in which a rule is applied, you must change its sequence number. Use the **resequence** command and specify the current (starting) sequence number of the rule, and the number by which you want to increment the rule. For example, use the parameters **resequence 40 10** to change the rule with the sequence value of 40 to have a sequence value of 30 (an increase of 10).
`src-l4-port`	Specify a source L4 port or port range to classify traffic from this source port.
`eq <port>`	Classify traffic from the specified source port.
`gt <port>`	Classify traffic from source ports with port

Parameter	Description
	numbers greater than the specified port number.
`lt <port>`	Classify traffic from source ports with port numbers lesser than the specified port number.
`range <min-port>-<max-port>`	Classify traffic from source ports within the specified range.
`tcp`	Apply the application classification policy to TCP traffic
`udp`	Apply the application classification policy to UDF traffic

Usage

The **show class configuration** displays all configured classes. The output of this command may differ from the active application poicy configuration if a class is configured with an unsupported parameter, or if a the class was not applied due to a lack of hardware resources. To determine if there is a discrepancy between what was configured and what is active, compare the output of the **show class** and **show class configuratio**n commands. If an active class and configured class are not the same, the output of the **show class configuration** command can display a warning message to help troubleshooting the problem. For example:

```
 class abp-ip my_app_class user configuration does not match active configuration.
 run 'class TYPE NAME reset' to reset class to match active configuration.
```

If a new configured class is in the learning phase and currently getting processed, the output of the **show class configuration** command displays the following message:

```
class abp-ip my_app_class user configuration currently being processed run 'show
class [commands]' to display active class configuration.
```

It is possible to create redundant class entries in a class that have the same match criteria and action. Such a configuration is not recommended, as each redundant copy of the class entry will consume additional processing resources.

Examples

The following example displays all IPv4 traffic application classes configured on the switch.

```
switch# show class abp-ip

User Configured abp-ipv4 classes:
=================================

Type       Name
  Sequence Comment
           Action                          Application
           Destination IP Address          L3 Protocol
           Source L4 Port(s)               Destination L4 Port(s)
           Additional Parameters
--------------------------------------------------------------------------------
abp-ipv4    class1
        10
            match                          social-networking - facebook
        20
            ignore                         unknown
            10.0.0.10/24
        30
            match                          social-networking - instagram
                                           tcp
                                           443
--------------------------------------------------------------------------------
abp-ipv4   class2
        10
           match                           music
                                           udp
        20
           match                           news
                                           tcp
                                           443
```

The command output in the folloiwng example displays the commands used to configure the application classes shown in the output shown above.

```
switch# show class commands
class abp-ip class1
10 match any app-category social-networking app facebook
class abp-ip class2
10 ignore any app-category web
20 match any app-category any
```

For more information on features that use this command, refer to the Security Guide for your switch model.

abp-session-limit-exceed-action

```
[no] abp-session-limit-exceed-action {drop-new-flows | log-only}
```

Description

The CLI command configures the Application Based Policy (ABP) Session Limit Exceed Action. Using this configuration, the new flow entries are either dropped or logged without ABP inspection when the session table is full.

The **no** form of this command updates the ABP Session Limit Exceed Action to **drop-new-flows**.

Parameter	Description
`drop-new-flows`	This is the default action for the command **abp-session-limit-exceed-action**. If the session table is full all new flows associated with clients that have ABP configured are dropped.
`Log-only`	If the session table is full, it will log warnings. ABP inspection is not performed and the new traffic flows are not dropped.

Examples

When the session table is full, all new flows that have ABP configured are dropped.

```
switch(config)# app-recognition
switch(config-app-recognition)# abp-session-limit-exceed-action drop-new-flows
```

When the session table is full, only warnings are logged without ABP inspecting and the new client traffic flow passes through.

```
switch(config)# app-recognition
switch(config-app-recognition)# abp-session-limit-exceed-action log-only
```

For more information on features that use this command, refer to the Security Guide for your switch model.

mode

```
mode
   fast
   default
   no ...
```

Description

This command configures Application Recognition operational modes. The operational mode of the Application Recognition feature determines the number of packets processed for each flow and the extent to which attributes can be extracted. With the **default** setting enabled, more packets are processed for each flow, and Application Recognition can extract more attributes for those flows. With the **fast** setting enabled, Application Recognition reduces the number of packets processed for each flow, but will increase the number of connections per second.

Parameter	Description
`fast`	Relies on first packet classification to extract information only about the application name and application category.
`default`	This default setting allows the Application Recognition feature to process additional packets to determine the URL and TLS attributes.
`no ...`	The **no** form of this command sets the mode back to its default value.

Examples

The following example sets the Application Recognition mode to **fast**.

```
switch(config)# app-recognition
switch(config-app-recognition)# mode fast
```

The following example removes the **fast** option and returns the mode to the default value.

```
switch(config)# app-recognition
switch(config-app-recognition)#no mode fast
```

For more information on features that use this command, refer to the Security Guide for your switch model.

port-access abp

```
[no] port-access abp <POLICY-NAME>
   [no] [<SEQUENCE-NUMBER>] class {abp-ip | abp-ipv6} <CLASS-NAME> [action {drop | dscp
   <value> | local-priority <value> | mirror <value>}]
   [no] [<SEQUENCE-NUMBER>] comment <TEXT-STRING>

port-access abp <POLICY-NAME> resequence <STARTING-SEQUENCE-NUMBER> <INCREMENT>
port-access abp <POLICY-NAME> copy <DESTINATION-POLICY>
port-access abp <POLICY-NAME> reset

[no] port-access role <ROLE-NAME>
   [no] associate abp <POLICY-NAME>
```

Description

Create, configure and delete the application-based policy and its entries.

The **no** keyword can be used to delete either a class or an individual class entry.

Parameter	Description
`action {drop | dscp | local-priority | mirror}`	Specify the action Application Recognition will perform for the specified class. **drop:** Drops the traffic. The default action for a policy entry is **permit**, if the action is not specified. **dscp:** Specify the Differentiated Services Code Point value between 0 to 63 or a keyword as follows: **AF11** - DSCP 10 (Assured Forwarding Class 1, low drop probability) **AF12** - DSCP 12 (Assured Forwarding Class 1, medium drop probability) **AF13** - DSCP 14 (Assured Forwarding Class 1, high drop probability) **AF21** - DSCP 18 (Assured Forwarding Class 2, low drop probability) **AF22** - DSCP 20 (Assured Forwarding Class 2, medium drop probability)

Parameter	Description
	AF23 - DSCP 22 (Assured Forwarding Class 2, high drop probability) **AF31** - DSCP 26 (Assured Forwarding Class 3, low drop probability) **AF32** - DSCP 28 (Assured Forwarding Class 3, medium drop probability) **AF33** - DSCP 30 (Assured Forwarding Class 3, high drop probability) **AF41** - DSCP 34 (Assured Forwarding Class 4, low drop probability) **AF42** - DSCP 36 (Assured Forwarding Class 4, medium drop probability) **AF43** - DSCP 38 (Assured Forwarding Class 4, high drop probability) **CS0** - DSCP 0 (Class Selector 0: Default) **CS1** - DSCP 8 (Class Selector 1: Scavenger) **CS2** - DSCP 16 (Class Selector 2: OAM) **CS3** - DSCP 24 (Class Selector 3: Signaling) **CS4** - DSCP 32 (Class Selector 4: Real time) **CS5** - DSCP 40 (Class Selector 5: Broadcast video) **CS6** - DSCP 48 (Class Selector 6: Network control) **CS7** - DSCP 56 (Class Selector 7) **EF** - DSCP 46 (Expedited Forwarding) **local-priority:** Specify a valid local-priority value between 0 to 7. **mirror:** Specify the mirroring session. Only one mirroring session can be mapped to an application policy and only session 4 is supported.
`abp-ip`	Create or configure an IPv4 application-based policy.
`abp-ipv6`	Create or configure an IPv6 application-based policy.
`associate abp`	Applies the policy to a role
`CLASS-NAME`	Define a class name for which the application-based policy is being created or configured.

Parameter	Description
`comment <STRING>>`	Add or modify a comment to the application based policy entries.
`no`	Negates any configured parameter.
`POLICY NAME`	Name of the application based policy to associate with the role (maximum 128 characters).
`resequence <STARTING-SEQUENCE-NUMBER> <INCREMENT>`	By default, rules added to a traffic class are applied in the order in which they are created. You can also use the **sequence** parameter to define the sequence numbers for each rule in the traffic class. To change the order in which a rule is applied, you must change its sequence number. Use the **resequence** command and specify the current (starting) sequence number of the rule, and the number by which you want to increment the rule. For example, use the parameters **resequence 40 10** to change the rule with the sequence value of 40 to have a sequence value of 30 (an increase of 10).
`reset`	Resets the specified application based policy.
`ROLE NAME`	Name of the role to which the application based policy is associated.
`SEQUENCE-NUMBER`	Specify the class entry sequence number. Integer (1-4294967295)

Usage

Application policies comprise one or more policy entries. These policies are ordered and prioritized based on their sequence numbers. Each policy entry has the following:

- **abp-ip** (IPv4 traffic) or **abp-ipv6** (IPv6 traffic) class
- drop or permit policy actions

The application policy will examine a packet sequentially against all the policy entries and class entries until a match is made. If there are no matches, the packet will be dropped.

The application policies are applied to a role using the **associate abp** command.

If an application policy is associated with a role, it cannot be removed from the configuration. To remove the policy, it must be unassociated from roles that are currently using it.

Entering an existing *POLICY NAME* value will cause the existing policy to be modified. If no **SEQUENCE-NUMBER** is entered then an additional policy entry is created with a new **SEQUENCE-NUMBER**. If an existing **SEQUENCE-NUMBER** is entered then the values of the existing **SEQUENCE-NUMBER** is replaced with the new value.

If no **SEQUENCE-NUMBER** is specified, a new policy entry is added at the end of the entry list with a sequence number that is equal to the highest **SEQUENCE-NUMBER** of a policy entry currently in the list plus 10. The sequence numbers may be reordered with the **class resequence** command.

The **port-access role** command is used to associate a application policy with the source user role.

Examples

Creating a new application class on an application policy with the *POLICY-NAME* name **guest_policy**.

```
switch(config)# port-access abp guest_policy
switch(config-pa-app)# class abp-ip class1
                   10 match any any any app-category streaming app youtube count
switch(config-pa-app)# class abp-ipv6 class2
                    10 match any any any app-category web app http count
```

Associate the application policy on a port access source role with the *ROLE NAME* **role01**.

```
switch(config)# port-access role role01
switch(config-pa-role)# associate abp guest_policy
switch(config-pa-app)# exit
switch(config)# show port-access role name role01

Role Information:
Attributes overridden by RADIUS are prefixed by '*'.

Name  : role01
Type  : local
----------------------------------------------
Access VLAN                         : 3000
Access VLAN Name                    : hpe
App Recognition                     : enabled
*App Based Policy                    : guest_policy
```

Associate an existing policy **guest_policy** to the **EMPLOYEE** role.

```
switch(config)# port-access role EMPLOYEE
switch(config-pa-role)# associate abp guest_policy
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.13	The sub-paramaters, **dscp, local-priority, and mirror** were introduced.
10.12	Command introduced.

Command Information

Platforms	Command context	Authority

6300
6400 (v2 profile only
	`config`
	`config-class-abp-ip`
	`config-class-abp-ipv6`
		Administrators or local user group members with execution rights for this command.

show port-access abp

```
show [run] port-access abp
show port-access abp [<POLICY-NAME>]
```

Description

Displays the application policies and its current usages. If the command is used without specifying the *POLICY-NAME* then it displays the details of all the configured application policies on the switch.

Parameter	Description
Application Policy	Types of Application Policy: - Local—User configured policy - DUR—Downloadable User Role policies
Application policy status	The current running status of the Application policy: - Applied—Policy is successfully applied in the hardware - Rejected—Policy is not supported in the hardware. - In-Progress—Policy is being processed in the hardware.
POLICY-NAME	Name of the application based policy to associate with the role (maximum 128 characters).

Examples

The following example display all application policies configured on the switch:

```
switch# show port-access abp
Port Access Application Policy User Configured Policy Details:
==============================================================
App Policy Name   : app1
App Policy Type   : Local
App Policy Status : Applied

SEQUENCE    CLASS                            TYPE     ACTION
----------- -------------------------------- -------- -----------------------
10          class1                           abp-ipv4  permit
App Policy Name   : app-policy
App Policy Type   : local
App Policy Status : applied

SEQUENCE    CLASS                         TYPE       ACTION
----------- ----------------------------- ---------- -----------------------------
------
10          app-class                     abp-ipv4   drop
20          app-class                     abp-ipv4   dscp AF31
30          app-class                     abp-ipv4   local-priority 5
```

```
40          app-class                     abp-ipv4   mirror 4
50          app-class                     abp-ipv4   local-priority 3 dscp AF11
mirror 4
```

When no application policies are configured

```
switch# show port-access abp
Application policy is not configured.
```

When the specified application policy does not exist

```
switch# show port-access abp plcy
Application Based Policy does not exist.
```

Display the policy currently running on the port.

```
switch# show run port-access abp
port-access abp app1
    10 class abp-ip class1
```

Usage

The **show port-access abp** command displays all the active configuration. It providing the list of classes that are configured and accepted by the system.

The **show running-config port-access abp** command may not be the same as in active configuration. This is due to the following:

- unsupported command parameters
- class modified after the app policy was applied
- ABP configuration was unsuccessful due to a lack of hardware resources

Compare the output of the **show port-access abp** and **show running-config port-access abp** commands to see if there is a mismatch between what was configured and what is active. If the active abp and the configured abp are not the same, a warning message is displayed to help troubleshoot the problem.

If the port-access abp is being processed, an in-progress message will be displayed.

```
switch(config)# show run
...
! port-access abp <POLICY-NAME> user configuration currently being processed
! run 'show port-access abp' to display active application policy
! configuration.
port-access abp policy_1
...
switch(config)# show running-config port-access abp
! port-access abp <POLICY-NAME> user configuration currently being processed
! run 'show port-access abp' to display active application policy
! configuration.
port-access abp policy_1
10 class abp-ip app_ip_class action drop
```

If the warning or in-progress message is displayed, additional changes may be made until the error message is no longer displayed when **show port-access abp**, **show port-access abp commands**, **show port-access abp commands configuration**, or **run the port-access abp reset** commands are entered.

The **port-access abp reset** command changes the user-specified configuration to match the active configuration.

Display details of a particular application policy that needs reset:

```
switch(config-pa-abp)# show run port-access abp
! port-access abp plcy user configuration does not match active configuration.
! run 'port-access abp <POLICY-NAME> reset' to reset application policy to match
! the active configuration.
port-access abp plcy
    10 class abp-ip cs action drop
    20 class abp-ipv6 cls6

switch(config-pa-abp)# show port-access abp plcy
Port Access Application Policy User Configured Policy Details:
==============================================================

App Policy Name   : plcy
App Policy Type   : Local
App Policy Status : Rejected

SEQUENCE    CLASS                            TYPE     ACTION
----------- -------------------------------- -------- -----------------------
10          cs                               abp-ipv4 drop
20          cls6                             abp-ipv6 permit

switch# port-access abp plcy reset
Following abp entries will be removed:
30 class abp-ip cls2

Do you want to continue (y/n)? y

switch# sh running-config port-access abp
port-access abp plcy
    10 class abp-ip cls action drop
    20 class abp-ipv6 cls6
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.13	Command output modified to display the following actions: **dscp** **local-priority** **mirror**
10.12	Command introduced.

Command Information

Platforms	Command context	Authority
6300 6400 (v2 profile only	Manager (#)	Administrators or local user group members with execution rights for this command.

show port-access abp hitcounts

```
show port-access abp [<POLICY-NAME>] hitcounts
```

Description

This command is used to show the statistics of the application policy applied on the client. The output helps to identify the application policy entries that are currently matched.

Parameter	Description
hitcounts	The hit counts (statistics) of the application policy
POLICY-NAME	Name of this application policy

Usage

If a class entry is configured with the count action, then the show command will display the statistics of that entry. The class entries without the count action are not displayed in the hitcounts output. For collecting the statistics for a specific client, create a copy of the desired policy and attach it to the respective client.

Examples

The following example display show hitcounts of a Application Policy

```
 switch # show port-access abp app-policy hitcounts
Port Access ABP Hit-Counts Details:
======================================
App Policy Name   : app-policy
App Policy Type   : local
App Policy Status : applied

clear port-access abp hitcounts

`clear port-access abp [<POLICY-NAME>] hitcounts`

Description

This command is used to clear statistics of the application policy applied on the client.

Parameter	Description
hitcounts	The hit counts (statistics) of the application policy
POLICY-NAME	Name of this application policy

Examples

The following example clears the hitcounts of a Application Policy.

```
switch# show port-access abp app1 hitcounts

Port Access Application Policy Hit-Counts Details:
======================================

App Policy Name   : app1
App Policy Type   : Local
App Policy Status : Applied

6300 6400 (v2 profile only	Manager (#)	Administrators or local user group members with execution rights for this command.

Chapter 8
ARP commands

arp inspection

`arp inspection`

Description

Enables Dynamic ARP inspection on the current VLAN, which means that ARP packets received from untrusted interfaces are discarded if they have an Invalid IP-to-MAC address binding.

The **no** form of this command disables Dynamic ARP Inspection on the VLAN.

Examples

Enabling dynamic ARP inspection:

```
switch# configure terminal
switch(config)# vlan 1
switch(config-vlan)# arp inspection
```

Disabling dynamic ARP inspection:

```
switch# configure terminal
switch(config)# vlan 1
switch(config-vlan)# no arp inspection
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-vlan-<VLAN-ID>`	Administrators or local user group members with execution rights for this command.

arp inspection trust

```
arp inspection trust
no arp inspection trust
```

Description

Configures the interface as a trusted. All interfaces are untrusted by default.

The **no** form of this command returns the interface to the default state (untrusted).

Example

Setting an interface as trusted:

```
switch(config-if)# arp inspection trust
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

arp ip

```
arp ip <IP_ADDR> mac <MAC_ADDR>
no arp ip <IP_ADDR> mac <MAC_ADDR>
```

Description

Specifies a permanent static neighbor entry in the ARP table (for IPv4 neighbors).

The no form of this command deletes a permanent static neighbor entry from the ARP table.

Parameter	Description
`ip <IP-ADDR>`	Specifies the IP address of the neighbor or the virtual IP address of the cluster in IP format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. . Range: 4096 to 131072. Default: 131072.
`mac <MAC-ADDR>`	Specifies the MAC address of the neighbor or the multicast MAC address in IANA format (**xx:xx:xx:xx:xx:xx**), where **x** is a hexadecimal number from 0 to F. Range: 4096 to 131072. Default: 131072.

Example

On the 6400 Switch Series, interface identification differs.

Configuring a static ARP entry on a interface VLAN **10**:

```
switch(config)# interface vlan 10
switch(config-if-vlan)# arp ip 2.2.2.2 mac 01:00:5e:00:00:01
```

Removing a static ARP entry on interface VLAN**10**:

```
switch(config)# interface vlan 10
switch(config-if-vlan)# no arp ip 2.2.2.2 mac 01:00:5e:00:00:01
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.14	Replaced the **ipv4** parameter with the **ip** parameter. The **ipv4** parameter is deprecated.

arp process-grat-arp

```
arp process-grat-arp
no arp process-grat-arp
```

Description

Enables the processing of gratuitous ARP packets on the individual port or group of L3 ports together.

By default, the gratuitous ARP processing is enabled. When gratuitous ARP (GARP) processing is enabled, a switch that is advertising any changes in its MAC through the GARP will reflect in the neighbor table of the switch. However, the switch will not be able to learn the neighbor through the GARP.This configuration is applicable only on L3 interfaces such as ROPs, subinterfaces, and SVIs.

The **no** form of this command disables the processing of gratuitous ARP packets.

Example

Enabling the processing of gratuitous ARP packets on the interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# no shutdown
switch(config-if)# arp process-grat-arp
```

Enabling the processing of gratuitous ARP packets on interfaces **1/1/1** to **1/1/5**:

```
switch(config)# interface 1/1/1-1/1/5
switch(config-if<1/1/1-1/1/5>)# no shutdown
switch(config-if<1/1/1-1/1/5>)# arp process-grat-arp
```

Enabling the processing of gratuitous ARP packets on sub-interface **1/1/1.10**:

Applies only to the Aruba 6300, 6400, 8100, and 8360 Switch Series.

```
switch(config)# interface 1/1/1.10
switch(config-subif)# no shutdown
switch(config-subif)# arp process-grat-arp
```

Disabling the processing of gratuitous ARP packets on VLANs **2** to **100**:

```
switch(config)# interface vlan 2-100
switch(config-if-vlan<2-100>)# no shutdown
switch(config-if-vlan<2-100>)# no arp process-grat-arp
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

clear arp

```
clear arp
  port <PORT-ID> [ip <A.B.C.D>|all]|[ipv6 <X:X::X:X>|all]vla
  vrf [all-vrfs|{<VRF-NAME> [ip <A.B.C.D>]|[ipv6 <X:X::X:X>]}]
```

Description

Clears IPv4 and IPv6 neighbor entries from the ARP table. If you do not specify any VRF or port parameters, ARP table entries are cleared for the **default** VRF.

Parameter	Description
`port <PORT-ID>`	Specifies a port on the switch. For example: **1/1/1**.
`ip <A.B.C.D>|all]`	(Optional) Include an IP address to clear neighbor entries for that specific address, or use the **all** parameter to clear entries for all IP addresses.
`ipv6 <X:X::X:X>|all`	(Optional) Include an IPv6 address to clear neighbor entries for that specific address, or use the **all** parameter to clear entries for all IPv6 addresses.
`vrf`	Clears IPv4 and IPv6 neighbor entries for the specified VRF or for all VRFs. If no VRF is specified he **default** VRF is cleared.
`all-vrfs`	Clear neighbor entries for all VRFs
`<VRF-NAME>`	Clear neighbor entries for the specified VRF.
`ip <A.B.C.D>`	(Optional) Include an IP address to clear just the neighbor entries for the specified IP address.
`ipv6 <X:X::X:`	(Optional) Include an IPv6 address to clear the neighbor entries for the specified IPv6 address.

Examples

Clearing all IPv4 and IPv6 neighbor ARP entries for the default VRF:

```
switch# clear arp
```

Clearing all ARP neighbor entries for a port (*On the 6400 Switch Series, interface identification differs.*):

```
switch# clear arp 1/1/35
```

Clearing all IPv4 and IPv6 neighbor ARP entries for all VRFs:

```
switch# clear arp vrf all-vrfs
```

Clearing all IPv4 and IPv6 neighbor ARP entries for a specific VRF instance:

```
switch# clear arp vrf RED
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

debug arp-security

```
debug arp-security <LOG-CATEGORY> [severity <LEVEL>]
no debug arp-security [<LOG-CATEGORY>] [severity <LEVEL>]
```

Description

Enables ARP security debug logs. If <SEVERITY> is omitted, all severities are logged.

The **no** form of this command disables ARP security debug logs.

Parameter	Description
<LOG-CATEGORY>	Selects the ARP security debug log category. Available categories are: - **all**: Selects all ARP security debug log categories. - **config**: Selects the ARP security config debug log category. - **inspection**: Selects the ARP security inspection debug log category. - **packet**: Selects the ARP security packet debug log category.
severity *<LEVEL>*	Specifies how to filter the ARP security debug logging by setting the minimum severity level for which debug logging will be performed. The selected severity level and all severities above (more severe) will be included in the logging. - **emerg**: Sets ARP security debug log filtering to Emergency only. - **alert**: Sets ARP security debug log filtering to Alert and above. - **critical**: Sets ARP security debug log filtering to Critical and above. - **error**: Sets ARP security debug log filtering to Error and above. - **warning**: Sets ARP security debug log filtering to Warning and above. - **notice**: Sets ARP security debug log filtering to Notice and above. - **info**: Sets ARP security debug log filtering to Info and above. - **debug**: Sets ARP security debug log filtering to all severities.

Examples

Enable ARP security debug logging for all categories and all severities:

```
switch# debug arp-security all
```

Enable ARP security config debug log for severity level Error and above:

```
switch# debug arp-security config severity error
```

Enable ARP security inspection debug log for severity level Notice and above:

```
switch# debug arp-security inspection severity notice
```

Enable ARP security debug packet for severity level Critical and above:

```
switch# debug arp-security packet severity critical
```

Enable ARP security debug logging for all categories and severity level Alert and above:

```
switch# debug arp-security all severity alert
```

Disable ARP security debug logging:

```
switch# no debug arp-security
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

ip local-proxy-arp

```
ip local-proxy-arp
no ip local-proxy-arp
```

Description

Enables local proxy ARP on the specified interface. Local proxy ARP is supported on Layer 3 physical interfaces and on VLAN interfaces. To enable local proxy ARP on an interface, routing must be enabled on that interface.

The **no** form of this command disables local proxy ARP on the specified interface.

Examples

On the 6400 Switch Series, interface identification differs.

Enabling local proxy ARP on interface **1/1/1**:

```
switch# interface 1/1/1
switch(config-if)# ip local proxy-arp
```

Enabling local proxy ARP on interface VLAN **3**:

```
switch# interface vlan 3
switch(config-if-vlan)# ip local-proxy-arp
```

Disabling local proxy ARP on on interface **1/1/1**.

```
switch# interface 1/1/1
switch(config-if)# no ip local-proxy-arp
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

ip proxy-arp

```
ip proxy-arp
no ip proxy-arp
```

Description

Enables proxy ARP for the specified Layer 3 interface. Proxy ARP is supported on Layer 3 physical interfaces, LAG interfaces, and VLAN interfaces. It is disabled by default. To enable proxy ARP on an interface, routing must be enabled on that interface.

The **no** form of this command disables proxy ARP for the specified interface.

Examples

Enabling proxy ARP on interface **1/1/1**:

```
switch# interface 1/1/1
switch(config-if)# ip proxy-arp
```

Enabling proxy ARP on VLAN **3**:

```
switch# interface vlan 3
switch(config-if-vlan)# ip proxy-arp
```

Enabling proxy ARP on a LAG **11**:

```
switch(config)# int lag 11
switch(config-lag-if)# ip proxy-arp
```

Disabling proxy ARP on interface 1/1/1:

```
switch# interface 1/1/1
switch(config-if)# no ip proxy-arp
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

ipv6 neighbor mac

```
ipv6 neighbor <IPV6-ADDR> mac <MAC-ADDR>
no ipv6 neighbor <IPV6-ADDR> mac <MAC-ADDR>
```

Description

Specifies a permanent static neighbor entry in the ARP table (for IPv6 neighbors).

The **no** form of this command deletes a permanent static neighbor entry from the ARP table.

Parameter	Description
<IPV6-ADDR>>	Specifies an IP address in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F. Range: 4096 to 131072. Default: 131072.
mac *<MAC-ADDR>>*	Specifies the MAC address of the neighbor (xx:xx:xx:xx:xx:xx), where **x** is a hexadecimal number from 0 to F. Range: 4096 to 131072. Default: 131072.

Example

On the 6400 Switch Series, interface identification differs.

Creates a static ARP entry on interface **1/1/1**.

```
switch(config)# interface 1/1/1
switch(config-if)# arp ipv6 neighbor 2001:0db8:85a3::8a2e:0370:7334 mac
00:50:56:96:df:c8
```

show arp

```
show arp [vsx-peer]
```

Description

Shows the entries in the ARP (Address Resolution Protocol) table.

Parameter	Description
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Usage

This command displays information about ARP entries, including the IP address, MAC address, port, and state.

When no parameters are specified, the `show arp` command shows all ARP entries for the default VRF (Virtual Router Forwarding) instance.

Examples

```
switch# show arp

IPv4 Address     MAC                 Port         Physical Port
--------------------------------------------------------------------------------
192.168.1.2          00:50:56:96:7b:e0   vlan10        1/1/29           stale
192.168.1.3          00:50:56:96:7b:ac   vlan10        1/1/1            reachable

Total Number Of ARP Entries Listed- 2.
--------------------------------------------------------------------------------
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

show arp inspection interface

`show arp inspection interface [<IFNAME>] [vlan <VLAN-ID>] [vsx-peer]`

Description

Shows the current configuration of dynamic ARP inspection on an interface.

Parameter	Description
<IFNAME>	Specifies the interface.
<VLAN-ID>	Specifies the VLAN ID. Range: 1 to 4094.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

Showing current configuration of dynamic ARP inspection on all interfaces:

```
switch# show arp inspection interface

---------------------------------------------------------------------------
Interface           Trust-State
---------------------------------------------------------------------------
1/1/1               Untrusted
---------------------------------------------------------------------------
```

Showing current configuration of dynamic ARP inspection on all interfaces with VSX peer:

```
switch# show arp inspection interface vsx-peer
---------------------------------------------------------------------------
Interface           Trust-State
---------------------------------------------------------------------------
1/1/1               Untrusted
lag100              Trusted
---------------------------------------------------------------------------
```

Showing current configuration of dynamic ARP inspection on a particular interface:

```
switch# show arp inspection interface 1/1/1

---------------------------------------------------------------------------
Interface           Trust-State
---------------------------------------------------------------------------
1/1/1               Untrusted
---------------------------------------------------------------------------
```

Showing current configuration of dynamic ARP inspection on interface VLAN 2:

```
switch# show arp inspection interface vlan 2

-----------------------------------------------------------------
Interface           Trust-State
-----------------------------------------------------------------
vlan2               Trusted
-----------------------------------------------------------------
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

show arp inspection statistics

`show arp inspection statistics vlan [<VLAN-ID>] [vsx-peer]`

Description

Shows statistics about forwarded and dropped ARP packets. When *<VLAN-ID>* is not specified, information is shown for all configured VLANs.

Parameter	Description
<VLAN-ID>	Specifies the VLAN ID or range of IDs separated by a dash "-". Range: 1 to 4094.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing ARP packet statistics for a range of VLANs:

```
switch# show arp inspection statistics vlan 1-100

-----------------------------------------------------------------
VLAN   Name              Forwarded           Dropped
-----------------------------------------------------------------
1      DEFAULT_VLAN_1    0                   0
-----------------------------------------------------------------
```

Showing ARP packet statistics for VLANs with VSX peer:

```
switch# show arp inspection statistics vlan vsx-peer

-----------------------------------------------------------------
VLAN   Name              Forwarded           Dropped
-----------------------------------------------------------------
1      DEFAULT_VLAN_1    0                   0
200    VLAN200           0                   0
-----------------------------------------------------------------
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

show arp inspection vlan

`show arp inspection vlan [<VLAN-ID>] [vsx-peer]`

Description

Shows the current configuration of dynamic ARP inspection on a VLAN. When *<VLAN-ID>* is not specified, information is shown for all configured VLANs.

Parameter	Description
<VLAN-ID>	Specifies the VLAN ID or range of IDs separated by a dash "–". Range: 1 to 4094.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

Showing dynamic ARP configuration for all VLANs:

```
switch# show arp inspection vlan
------------------------------------------------------------------
VLAN   Name              ARP Inspection
------------------------------------------------------------------
1      DEFAULT_VLAN_1    -
100    VLAN100           -
200    VLAN200           Enabled
------------------------------------------------------------------
```

Showing dynamic ARP configuration for a particular VLAN:

```
switch# show arp inspection vlan 1
------------------------------------------------------------------
VLAN   Name              ARP Inspection
------------------------------------------------------------------
1      DEFAULT_VLAN_1    -
------------------------------------------------------------------
```

Showing dynamic ARP configuration for VLANs with VSX peer:

```
switch# show arp inspection vlan vsx-peer
-----------------------------------------------------------------
VLAN    Name                ARP Inspection
-----------------------------------------------------------------
1       DEFAULT_VLAN_1      -
-----------------------------------------------------------------
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

show arp state

```
show arp state {all | failed | incomplete | permanent | reachable | stale} [vsx-peer]
```

Description

Shows ARP (Address Resolution Protocol) cache entries that are in the specified state.

Parameter	Description
`all`	Shows the ARP cache entries for all VRF (Virtual Router Forwarding) instances.
`failed`	Shows the ARP cache entries that are in `failed` state. The neighbor might have been deleted.
`incomplete`	Shows the ARP cache entries that are in `incomplete` state. An incomplete state means that address resolution is in progress and the link-layer address of the neighbor has not yet been determined. A solicitation request was sent, and the switch is waiting for a solicitation reply or a timeout.
`permanent`	Shows the ARP cache entries that are in `permanent` state. ARP entries that are in a permanent state can be removed by administrative action only.

Parameter	Description
`reachable`	Shows the ARP cache entries that are in `reachable` state, meaning that the neighbor is known to have been reachable recently.
`stale`	Shows ARP cache entries that are in `stale` state. ARP cache entries are in the `stale` state if the elapsed time is in excess of the ARP timeout in seconds since the last positive confirmation that the forwarding path was functioning properly.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

```
switch# show arp state failed

IPv4 Address     MAC                Port         Physical Port    State
---------------------------------------------------------------------------
192.168.1.4                         vlan10                         failed
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

show arp summary

`show arp summary [all-vrfs | vrf <VRF-NAME>] [vsx-peer]`

Description

Shows a summary of the IPv4 and IPv6 neighbor entries on the switch for all VRFs or a specific VRF.

Parameter	Description
`all-vrfs`	Selects all VRFs.
`vrf <VRF-NAME>`	Specifies the name of a VRF.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing summary ARP information for all VRFs:

```
switch# show arp summary all-vrfs

ARP Entry's State                : IPv4     IPv6
-------------------------------------------------------

Number of Reachable ARP entries  : 2         0

Number of Stale ARP entries      : 0         0

Number of Failed ARP entries     : 2         2

Number of Incomplete ARP entries : 0         0

Number of Permanent ARP entries  : 0         0

-------------------------------------------------------

Total ARP Entries: 6             : 4         2

-------------------------------------------------------
```

Showing a summary of all IPv4 and IPv6 neighbor entries on the primary and secondary (peer) switches:

```
vsx-primary# show arp summary
ARP Entry's State                 IPv4        IPv6
---------------------------------------------------------
Number of Reachable ARP entries   25858       32231
Number of Stale ARP entries       0           1
Number of Failed ARP entries      0           257
Number of Incomplete ARP entries  0           0
Number of Permanent ARP entries   0           0
---------------------------------------------------------
Total ARP Entries- 58347          25858       32489

vsx-primary# show arp summary vsx-peer
ARP Entry's State                 IPv4        IPv6
---------------------------------------------------------
Number of Reachable ARP entries   25858       32168
Number of Stale ARP entries       0           3
Number of Failed ARP entries      0           317
Number of Incomplete ARP entries  0           0
Number of Permanent ARP entries   0           0
---------------------------------------------------------
Total ARP Entries- 58346          25858       32488
```

```
----------------------------------------------------------
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

show arp timeout

`show arp timeout [<INTERFACE>] [vsx-peer]`

Description

Shows the age-out period for each ARP (Address Resolution Protocol) entry for a port, LAG, or VLAN interface.

Parameter	Description
<INTERFACE>	Specifies a physical port, VLAN, or LAG on the switch. For physical ports, use the format `member/slot/port` (for example, `1/3/1`).
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing ARP timeout information for a port:

```
switch# show arp timeout 1/1/1
ARP Timeout:

------------------

Port             VRF                               Timeout

1/1/1            default                           600
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

show arp vrf

`show arp {all-vrfs | vrf <VRF-NAME>} [vsx-peer]`

Description

Shows the ARP table for all VRF instances, or for the named VRF.

Parameter	Description
`all-vrfs`	Specifies all VRFs.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Length: 1 to 32 alphanumeric characters.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing ARP entries for VRF **vrf1**.

```
switch# show arp vrf vrf1

IPv4 Address     MAC                 Port          Physical Port                State
    VRF
------------------------------------------------------------------------------------
------------
100.1.250.50     00:50:56:8d:44:13   vlan1001      1/1/2
reachable   vrf1
100.2.250.60     00:50:56:8d:45:63   vlan1002      vxlan1(1920:1680:1:1::2)
permanent   vrf1

Total Number Of ARP Entries Listed: 2.
------------------------------------------------------------------------------------
------------
```

This example from a different network shows ARP entries for all VRFs.

```
switch# show arp all-vrfs
ARP IPv4 Entries:
--------------------------------------------------------
IPv4 Address    MAC                Port    Physical Port  State      VRF
192.168.120.10  00:50:56:bd:10:be  1/1/32  1/1/32         reachable  red
10.20.30.40     00:50:56:bd:6a:c5  1/1/29  1/1/29         reachable  test
--------------------------------------------------------
Total Number Of ARP Entries Listed: 2.
--------------------------------------------------------
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

show ipv6 neighbors

`show ipv6 neighbors {all-vrfs | vrf <VRF-NAME>} [vsx-peer]`

Description

Shows entries in the ARP table for all IPv6 neighbors for all VRFs or for a specific VRF.

When no parameters are specified, this command shows all ARP entries for the default VRF, and state information for `reachable` and `stale` entries only.

Parameter	Description
`all-vrfs`	Specifies all VRFs.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Length: 1 to 32 alphanumeric characters.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

```
switch# show ipv6 neighbors
IPv6 Entries:

-------------------------------------------------------

IPv6 Address                 MAC                Port      Physical Port  State

fe80::a21d:48ff:fe8f:2700    a0:1d:48:8f:27:00  vlan2300  1/1/31         reachable

fe80::f603:43ff:fe80:a600    f4:03:43:80:a6:00  vlan2300  1/1/30         reachable

-------------------------------------------------------

Total Number Of IPv6 Neighbors Entries Listed: 2.

-------------------------------------------------------
```

```
switch# show ipv6 neighbors vrf vrf1
IPv6 Address                                   MAC                 Port
Physical Port   State      VRF
----------------------------------------------------------------------------------
------------
1000:2:1:1::250:60   00:50:56:8d:45:63  vlan1002    vxlan1(1920:1680:1:1::2)
permanent  vrf1
1000:1:1:1::250:50   00:50:56:8d:44:13  vlan1001    1/1/2
reachable  vrf1
Total Number Of IPv6 Neighbors Entries Listed: 2.
```

show ipv6 neighbors state

```
show ipv6 neighbors state {all | failed | incomplete | permanent | reachable | stale}
[vsx-peer]
```

Description

Shows all IPv6 neighbor ARP (Address Resolution Protocol) cache entries, or those cache entries that are in the specified state.

Parameter	Description
`all`	Shows all ARP cache entries.
`failed`	Shows ARP cache entries that are in `failed` state. The neighbor might have been deleted. Set the neighbor to be unreachable.
`incomplete`	Shows ARP cache entries that are in `incomplete` state. An incomplete state means that address resolution is in progress and the link-layer address of the neighbor has not yet been determined. This means that a solicitation request was sent, and you are waiting for a solicitation reply or a timeout.
`permanent`	Shows ARP cache entries that are in `permanent` state.
`reachable`	Shows ARP cache entries that are in `reachable` state, meaning that the neighbor is known to have been reachable recently.
`stale`	Shows ARP cache entries that are in `stale` state. ARP cache entries are in the `stale` state if the elapsed time is in excess of the ARP timeout in seconds since the last positive confirmation that the forwarding path was functioning properly.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

```
switch# show ipv6 neighbors state all

IPv6 Address                  MAC                Port     Physical Port    State
--------------------------------------------------------------------------------
100::2                        48:0f:cf:af:f1:cc  lag1     lag1
reachable
300::3                        48:0f:cf:af:33:be  vlan3    1/4/20
reachable
fe80::4a0f:cfff:feaf:f1cc     48:0f:cf:af:f1:cc  lag1     lag1
reachable
200::3                        48:0f:cf:af:33:be  1/4/11   1/4/11
reachable
fe80::4a0f:cfff:feaf:33be     48:0f:cf:af:33:be  vlan3    1/4/20
reachable

Total Number Of IPv6 Neighbors Entries Listed- 5.

Chapter 9

Aruba Intelligent Forwarding (FIB) commands

fib-optimization ageout-time

```
fib-optimization ageout-time <AGEOUT-TIME>
```

Description

Configures the host route age-out time. If a host route entry is designated for ageing, and no traffic is using the route for configured amount of age time, the host route entry will be removed form the hardware resource table. When traffic using that route resumes, the host route entry will be added back to the hardware resource table.

Host route age-out time is a global timer applicable to all types of host route entries, optimized by this feature.

Parameter	Description
<AGEOUT-TIME>	Specifies the age-out time for the route in seconds. Range: 60 to 3600 seconds. Default: 90 seconds.

Examples

Configuring the host route age-out time of 100 seconds

```
switch(config)# fib-optimization ageout-time 100
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

Command History

Release	Modification
10.10	Command Introduced.

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

fib-optimization evpn-vxlan exclude-nexthop

```
fib-optimization evpn-vxlan exclude-nexthop <IP-ADDRESS>
no fib-optimization evpn-vxlan exclude-nexthop <IP-ADDRESS>
```

Description

Excludes optimization of host routes for the identified next-hop hosting destination of frequent regular traffic. Any EVPN host route pointing to the configured next hops will not be optimized by FIB optimization. A maximum of 8 exclude next-hops can be configured.

The **no** form of this command removes the exclude next-hop configuration.

Parameter	Description
<IP-ADDRESS>	Specifies the IP address of the next hop to be excluded.

Examples

Excluding optimization of host routes for the identified next-hop:

```
switch(config)# fib-optimization evpn-vxlan exclude-nexthop 8.8.8.8
```

Disabling the next-hop configuration:

```
switch(config)# no fib-optimization evpn-vxlan exclude-nexthop 8.8.8.8
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

Command History

Release	Modification
10.10	Command Introduced.

fib-optimization evpn-vxlan host-route

```
fib-optimization evpn-vxlan host-route ip
no fib-optimization evpn-vxlan host-route ip
```

Description

Enable the FIB optimization process. This feature optimizes EVPN IPv4 host routes. In subnet stretched scenarios, after enabling FIB optimization, initial few packets are punted to CPU and traffic drop will be observed.

The **no** form of this command disables FIB optimization process.

Examples

Enabling FIB optimization:

```
switch(config)# fib-optimization evpn-vxlan host-route ip
```

Disabling FIB optimization:

```
switch(config)# no fib-optimization evpn-vxlan host-route ip
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

Command History

Release	Modification
10.14	Replaced the **ipv4** parameter with the **ip** parameter. The **ipv4** parameter is deprecated.
10.10	Command Introduced.

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

show fib-optimization configuration

```
show fib-optimization configuration
```

Description

Shows the EVPN data plane route optimization configurations.

Examples

Showing the EVPN data plane route optimization configurations.:

```
switch# show fib-optimization configuration
Address family       : EVPN IPv4
Operation status     : Enabled
Route age-out time   : 100
Excluded nexthops    : 5.5.5.5 , 6.6.6.6 , 8.8.8.8
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

Command History

Release	Modification
10.10	Command Introduced.

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Administrators or local user group members with execution rights for this command.

show ip route fib-optimization

```
show ip route fib-optimization [<IP-ADDRESS>] [summary] {all-vrfs | vrf <VRF-Name>}
```

Description

Shows the EVPN host routes removed from the data plane by the FIB optimization. The host routes are removed for the data plane if no traffic is using routes for configured age-out time.

The **show ip route** command displays all routes irrespective of optimization.

Parameter	Description
`<IP-ADDRESS>`	Specifies the longest prefix match. Syntax for IPv4: A.B.C.D
`summary`	Specifies the information for all VRFs.
`all-vrfs`	Specifies the information for all VRFs.
`vrf <vrf-name>`	Speifies a VRF by VRF name (if no *<VRF-NAME>* is specified, the default VRF is implied.

Examples

Showing the FIB optimized routes for all VRFs:

```
switch# show ip route fib-optimization all-vrfs

EVPN ipv4 host routes optimized by Aruba Intelligent ForwardingEVPN ipv4 host
routes optimized by Aruba Intelligent Forwarding

Origin Codes: C - connected, S - static, L - local

6300 6400	Operator (>) or Manager (#)	Administrators or local user group members with execution rights for this command.

AVB commands

avb

```
avb
no avb
```

Description

Enables the AVB feature and creates the AVB context. Enables user to exercise various configuration options available under AVB.

The **no** form of this command removed the AVB configuration in the global context.

Examples

Enable AVB:

```
switch(config)# avb
switch(config-avb)#
```

Disable AVB:

```
switch(config)# no avb
AVB configuration will be deleted.
Continue (y/n)? y
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

6300	`config`	Administrators or local user group members with execution rights for this command.

clear msrp statistics

`clear msrp statistics [<IF-NAME>]`

Description

Clears the MSRP counters for the given interfaces.

Parameter	Description
<IFNAME>	Specifies the interface name.

Examples

Clear the MSRP counter for interface 1/1/1:

```
switch# clear msrp statistics 1/1/1
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.13.1000	Featured introduced.

Command Information

Platforms	Command context	Authority
6300	Manager (#)	Administrators or local user group members with execution rights for this command.

enable

```
enable
no enable
```

Description

Enables AVB globally.
The **no** form of this command disables AVB globally.

Examples

Enable audio video bridging:

```
switch(config)# avb
switch(config-avb)# enable
```

Disable audio video bridging:

```
switch(config)# avb
switch(config-avb)# no enable
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.13.1000	Featured introduced.

Platforms	Command context	Authority
6300	`config`	Administrators or local user group members with execution rights for this command.

max fan in ports

```
max-fan-in-ports <NUMPORTS>
no max-fan-in-ports <NUMPORTS>
```

Description

Configures the AVB maximum number of fan in ports globally. The default maximum is 10. Whenever the max-fan-in-ports is changed, AVB disable and enable are required to make it operational.
The **no** form of this command sets the AVB maximum number of fan in ports to default.

Parameter	Description
<NUMPORTS>	Specifies the maximum number of fan in ports. Range: 1-10. Default: 10.

Examples

Enable AVB max-fan-in-ports 3:

```
switch(config)# avb
switch(config-avb)# max-fan-in-ports 3
Disable and Enable AVB to reflect max-fan-in-ports configuration as operational.
```

Disable AVB VLAN 3 max-fan-in-ports and setting to default:

```
switch(config)# avb
switch(config-avb)# no max-fan-in-ports 3
Disable and Enable AVB to reflect max-fan-in-ports configuration as operational.
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

msrp

```
msrp
no msrp
```

Description

Configures the MSRP protocol on the interface
The **no** form of this command disables the MSRP protocol on the interface.

Examples

Enable MSRP protocol on the interface:

```
switch(config-if)# msrp
```

Disable MSRP protocol on the interface:

```
switch(config-if)# no msrp
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

6300	`config-if`	Administrators or local user group members with execution rights for this command.

msrp timer join

```
msrp timer join <TIME-INTERVAL>
no msrp timer join <TIME-INTERVAL>
```

Description

Configures the MSRP join timer on a MSRP enabled interface. The timer configures the time to wait for the MSRP Protocol Data Units (PDUs) to be sent out of the interface. The timer units are in centiseconds. The default is 20 centiseconds.
The **no** form of this command sets the configuration back to the default value.

Parameter	Description
<TIME-INTERVAL>	Specifies the time interval in centiseconds. Range: 20-100. Default: 20.

Examples

Configure MSRP timer join to 50 centiseconds:

```
switch(config-if)# msrp timer join 50
```

Remove MSRP timer join configuration and set to default timers:

```
switch(config-if)# no msrp timer join 50
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Platforms	Command context	Authority
6300	`config-if`	Administrators or local user group members with execution rights for this command.

msrp timer leave

```
msrp timer leave <TIME-INTERVAL>
no msrp timer leave <TIME-INTERVAL>
```

Description

Configures the MSRP leave timer on a MSRP enabled interface. The timer configures the time to wait for the MSRP registrar state to move from LEAVE state to EMPTY state on the interface. The timer units are in centiseconds. The default is 300 centiseconds.
The **no** form of this command sets the configuration back to the default value.

Parameter	Description
<TIME-INTERVAL>	Specifies the time interval in centiseconds. Range: 40-1000000. Default: 300.

Examples

Configure MSRP timer leave to 500 centiseconds:

```
switch(config-if)# msrp timer leave 500
```

Remove MSRP timer leave configuration and set to the default configuration:

```
switch(config-if)# no msrp timer leave 500
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.13.1000	Featured introduced.

Command Information

msrp timer leaveall

```
msrp timer leaveall <TIME-INTERVAL>
no msrp timer leaveall <TIME-INTERVAL>
```

Description

Configures the MSRP leaveall timer on a MSRP enabled interface. The timer configures the time to wait for the leaveall messages to be sent on the interface. The timer units are in centiseconds. The default is 1000 centiseconds.
The **no** form of this command sets the configuration back to the default value.

Parameter	Description
<TIME-INTERVAL>	Specifies the time interval in centiseconds. Range: 500-1000000. Default: 1000.

Examples

Configure MSRP leaveall timer to 500 centiseconds:

```
switch(config-if)# msrp timer leaveall 500
```

Remove MSRP leaveall timer configuration and set to default configuration:

```
switch(config-if)# no msrp timer leaveall 500
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

show avb interface

`show avb interface [<IFNAME> | brief]`

Description

Displays the AVB interface information.

Parameter	Description
<IFNAME>	Specifies the interface name.
`brief`	Shows information in brief format.

Examples

Display the AVB interface status:

```
switch# show avb interface 1/1/2
AVB state                         : Enabled
MSRP State                        : Enabled
PTP State                         : Enabled, asCapable
  Neighbor Propogation Delay      : 98
  Port State                      : clock_source
  Peer Mean Path Delay            : 99
AVB readiness state               : operational
Allocated BW (Kbit/s)             : 7500000
Used BW (Kbits/s)                 : 27456
Available BW (Kbits/s)            : 7472544
Per-class value                   Class-A                Class-B
-----------------------------------------------------------------
Tx srClassVID                     2                      2
Rx srClassVID                     2                      2
Tx PCP                            3                      2
Rx PCP                            3                      -
Domain State                      Core                   Boundary
```

Display the AVB interface status in brief:

```
switch# show avb interface brief
Ethernet     Peer PCP      Peer    AVB Core       Allocated       Available
Used
Interface    A | B         VLAN    A | B          (Kbit/s)        (Kbit/s)
(Kbit/s)
----------------------------------------------------------------------------------
---------
1/1/1        3 | 2         2       YES | YES      0               0
0
1/1/2        3 | 2         2       YES | NO       7500000         7472544
27456
```

show msrp interface

`show msrp interface [<IFNAME> | brief]`

Description

Displays MSRP interface information.

Parameter	Description
<IFNAME>	Specifies the interface name.
brief	Shows information in brief format.

Examples

Display the MSRP interface 1/1/1 information:

```
switch# show msrp interface 1/1/1
Stream  Id                : 00:11:01:00:00:01:00:01
Stream  Age               : N/A
Peer Participant         : Talker
Registration Attribute
Type                  : Talker-advertise
Registrar State       : Registered(IN)
Last registered Event : JoinIn
Declaration Attribute
Type                  : Listener-ready
Applicant State       : Quiet Active(QA)
Last Declared Event   : JoinIn
Declared Failure Info : N/A
```

Display the MSRP interface 1/1/2 information in brief:

```
switch# show msrp interface 1/1/2 brief
Stream-Id                Peer        Applicant  Registrar  Reservation
Failure
                         Participant State      State      Status
-----------------------------------------------------------------------------------
---------
00:11:01:00:00:01:00:01  Listener    qa         in         Reserved
N/A
```

show msrp streams

`show msrp streams`

Description

Displays all information about MSRP streams.

Examples

Display the MSRP stream information:

```
switch# show msrp streams
Stream-Id                DMAC               VLAN  Priority Rank Accumulated
                                                  (class)       Latency
        Bandwidth   Status    Talker Port
        (Kbit/s)
-----------------------------------------------------------------------------------
---------
00:11:01:00:00:01:00:01  91:e0:f0:00:fe:00  2     3 (A)    low  150020
        9152        active    1/1/1
00:11:01:00:00:01:00:05  91:e0:f0:00:fe:02  2     3 (A)    low  150020
        9152        active    1/1/1
00:11:01:00:00:01:00:03  91:e0:f0:00:fe:01  2     3 (A)    low  150020
        9152        active    1/1/1

Note: One extra byte (per packet) is considered (to offset the clock diff from the
neighbor device) for MSRP stream bandwidth.
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

show running-config avb

```
show running-config avb
```

Description

Displays all configured commands under the AVB context.

Examples

Display configured commands under the AVB context:

```
switch# show running-config avb
avb
        enable
        vlan 3
        max-fan-in-ports 4
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Platforms	Command context	Authority
6300	Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

vlan

```
vlan <VLAN ID>
no vlan <VLAN ID>
```

Description

Configures the AVB VLAN globally. The default AVB VLAN is 2. Whenever the VLAN is changed, AVB disable and enable are required to make it operational.
The **no** form of this command sets the AVB VLAN to default.

Parameter	Description
<VLAN ID>	Specifies the VLAN. Range: 1-4094. Default: 2.

Examples

Enable AVB VLAN 3:

```
switch(config)# avb
switch(config-avb)# vlan 3
Disable and Enable AVB to reflect VLAN configuration as operational.
```

Disable AVB VLAN 3 and setting to default:

```
switch(config)# avb
switch(config-avb)# no vlan 3
Disable and Enable AVB to reflect VLAN configuration as operational.
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Chapter 10

Banner commands

banner

```
banner {motd | exec} <DELIMITER>
no banner {motd | exec} <DELIMITER>
```

Description

Enables the customization of the MOTD or the EXEC banner.

The **no** form of this command disables the MOTD or the EXEC banner.

Command context

`config`

Parameter	Description
`motd`	Configures the banner shown before the login prompt.
`exec`	Configures the banner shown after a successful login.
`<DELIMITER>`	Specifies the character used to terminate the input string.

Authority

Administrators or local user group members with execution rights for this command.

Usage

This command enables the customization of two types of banners:

- The MOTD banner. The banner displayed on attempting to connect to a management interface.
- The EXEC banner. The banner displayed upon successful authentication.

You can create a banner that spans multiple lines. The maximum length of a banner is 4,095 characters. This requirement includes any non-visible characters. The minimum number of characters allowed is an empty string, which displays no banner.

End the banner text with a chosen delimiter character. A delimiter character can be any non-whitespace character that does not have special meaning to the CLI, such as the caret (^). A question mark (?) is not permitted. Question marks can however be included as part of the banner text.

Examples

Configuring the banner displayed before login:

```
switch(config)# banner motd ^
Enter a new banner. Terminate the banner with the delimiter you have chosen.
(banner-motd)# This is an example of a banner text which a connecting user
```

```
(banner-motd)# will see before they are prompted for their password.
(banner-motd)#
(banner-motd)# As you can see it may span multiple lines and the input
(banner-motd)# will be terminated when the delimiter character is
(banner-motd)# encountered.^
```

Configuring the banner displayed after a successful login:

```
switch(config)# banner exec &
Enter a new banner. Terminate the banner with the delimiter you have chosen.
(banner-motd)# This is an example of different banner text. This time
(banner-motd)# the banner entered will be displayed after a user has
(banner-motd)# authenticated.
(banner-motd)#
(banner-motd)# & This text will not be included because it comes after the &
```

Disabling the MOTD banner:

```
switch(config)# no banner motd ^
```

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config`	Administrators or local user group members with execution rights for this command.

show banner

`show banner {motd | exec} [vsx-peer]`

Description

Shows the MOTD or EXEC banner message.

Parameter	Description
`motd`	Shows the banner displayed before the login prompt.
`exec`	Shows the banner displayed after a successful login.
`[vsx-peer]`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing the MOTD banner displayed before the login prompt:

```
switch(config)# show banner motd
This is an example of a banner text which a connecting user
will see before they are prompted for their password.

As you can see it may span multiple lines and the input
will be terminated when the delimiter character is
encountered.
```

Chapter 11
BFD Commands

bfd

```
bfd
no bfd
```

Description

Enables BFD support on the switch. BFD is disabled by default.

The **no** form of this command disables BFD and removes all related configuration settings. To disable BFD, but retain configuration settings, use the command bfd disable.

Examples

Enabling BFD support:

```
switch(config)# bfd
```

Disabling BFD support and removing all configuration settings:

```
switch(config)# no bfd
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

Command History

10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

bfd *<IPV4-ADDR>*

```
bfd <IPV4-ADDR>
no bfd <IPV4-ADDR>
```

Description

Enables BFD under VRRP for the specified IP address. BFD is asynchronous and echo mode is supported.

The **no** form of this command disables BFD under VRRP for the specified IP address.

Parameter	Description
<IPV4-ADDR>	Specifies the address on which to enable BFD in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.

Examples

On the 6400 Switch Series, interface identification differs.

Enabling BFD on the address **10.0.0.1** on VRRP **1**:

```
switch(config)# interface 1/1/1
switch(config-if)# routing
switch(config-if)# vrrp 1 address-family ipv4
switch(config-if-vrrp)# bfd 10.0.0.1
```

Disabling BFD on the address **10.0.0.1** on VRRP **1**:

```
switch(config)# interface 1/1/1
switch(config-if)# routing
switch(config-if)# vrrp 1 address-family ipv4
switch(config-if-vrrp)# no bfd 10.0.0.1
```

For more information on features that use this command, refer to the High Availability Guide or IP Routing Guide for your switch model.

bfd all-interfaces

```
bfd all-interfaces
no bfd all-interfaces
```

Description

Enables BFD on all OSPFv2 or OSPFv3 interfaces.

The **no** form of this command disables BFD on all active OSPFv2/OSPFv3 or IPv4/IPv6 interfaces, excluding those on which BFD was enabled at the interface level with the commands `ip ospf bfd` and `ipv6 ospfv3 bfd`.

Examples

Enabling BFD on all OSPFv2 interfaces:

```
switch(config)# router ospf 1
switch(config-ospf-1)# bfd all-interfaces
```

Disabling BFD on all OSPFv2 interfaces:

```
switch(config)# router ospf 1
switch(config-ospf-1)# no bfd all-interfaces
```

Enabling BFD on all OSPFv3 interfaces:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# bfd all-interfaces
```

Disabling BFD on all OSPFv3 interfaces:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# no bfd all-interfaces
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

bfd detect-multiplier

```
bfd detect-multiplier <MULTIPLIER>
no bfd detect-multiplier <MULTIPLIER>
```

Description

Sets BFD detection multiplier on an interface.

The **no** form of this command removes the configured BFD detection multiplier.

Parameter	Description
<MULTIPLIER>	Specifies the BFD detection multiplier. Range: 1 to 5. Default: 5.

Examples

Setting the BFD detection multiplier to **3**:

```
switch(config-if)# bfd detect-multiplier 3
```

Removing the BFD detection multiplier:

```
switch(config-if)# no bfd detect-multiplier 3
```

Setting the BFD detection multiplier to the default value:

```
switch(config-if)# no bfd detect-multiplier
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

bfd enable (Context: config-hsc)

```
switch(config-hsc)# bfd enable
switch(config-hsc)# no bfd enable
```

Description

Enables or disables BFD for HSC feature.

Usage

BFD must be enabled globally to work for HSC.

Examples

Enabling BFD support for HSC:

```
switch(config)# hsc
switch(config-hsc)# bfd enable
```

Disabling BFD support for HSC:

```
switch(config)# hsc
switch(config-hsc)# no bfd enable
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

bfd disable (Context: config-hsc)

```
switch(config-hsc)# bfd disable
```

Description

Disables BFD for HSC feature.

Example

Disabling BFD support for HSC:

```
switch(config)# hsc
switch(config-hsc)# bfd disable
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

6300 6400	`config`	Administrators or local user group members with execution rights for this command.

bfd echo disable

```
bfd echo disable
no bfd echo disable
```

Description

Disables support for BFD echo packets. Echo packet support is enabled by default.

The **no** form of this command enables support for BFD echo packets.

BFD IPv6 Echo is not supported.

Authority

Examples

On the 6400 Switch Series, interface identification differs.

Enabling BFD echo packet support on all interfaces:

```
switch(config)# no bfd echo disable
```

Disabling BFD echo packet support on all interfaces:

```
switch(config)# bfd echo disable
```

Enabling BFD echo packet support on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# bfd echo disable
```

Disabling BFD echo packet support on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# no bfd echo disable
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

bfd echo-src-ip-address

```
bfd echo-src-ip-address <IPV4-ADDR>
no bfd echo-src-ip-address <IPV4-ADDR>
```

Description

Sets the source IPv4 address for BFD echo packets. This address is used in all echo sessions.

The source IP address must not be on the same network segment as any switch interface, otherwise a large number of ICMP redirect packets may be sent by the remote device, causing network congestion.

The **no** form of this command removes the source IPv4 address for BFD echo packets, which causes the switch to stop sending echo packets. When a valid value is set, all sessions with a peer that is capable of receiving echo packets, will start transmitting echo packets. BFD control sessions continue to run concurrently with echo packets.

Parameter	Description
<IPV4-ADDR>	Specifies an IP address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.

Examples

Setting the source IP address to **198.51.100.1**:

```
switch(config)# bfd echo-src-ip-address 198.51.100.1
```

Removing the source IP address **198.51.100.1**:

```
switch(config)# no bfd echo-src-ip-address 198.51.100.1
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

bfd min-echo-receive-interval

```
bfd min-echo-receive-interval <INTERVAL>
no bfd min-echo-receive-interval <INTERVAL>
```

Description

Sets the minimum time interval between received BFD echo packets.

The **no** form of this command removes the configured BFD echo packets interval. If the interval is not set, the default interval is used.

BFD IPv6 Echo is not supported.

Parameter	Description
<INTERVAL>	Specifies the minimum reception interval in milliseconds. A value of 0 means that the switch does not support reception of BFD echo packets. Range: 0, 50 to 1000. Default: 500.

Examples

Setting the minimum reception interval to **1000** milliseconds:

```
switch(config)# bfd min-echo-receive-interval 1000
```

Removing the minimum reception interval:

```
switch(config)# no bfd min-echo-receive-interval 1000
```

Setting the minimum reception interval to the default value:

```
switch(config)# no bfd min-echo-receive-interval
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

bfd min-receive-interval

```
bfd min-receive-interval <INTERVAL>
no bfd min-receive-interval <INTERVAL>
```

Description

Sets the minimum time interval between received BFD control packets on an interface.

The **no** form of this command removes the configured BFD minimum interval on an interface. If the interval is not set, the default interval is used.

Parameter	Description
<INTERVAL>	Specifies the minimum receive interval in milliseconds. A value of 0 means that the switch does not support reception of BFD control packets. Range: 500 to 20000. Default: 3000.

Examples

Setting the minimum receive interval to **1000** milliseconds:

```
switch(config-if)# bfd min-receive-interval 1000
```

Removing the minimum receive interval:

```
switch(config-if)# no bfd min-receive-interval 1000
```

Setting the minimum receive interval to the default value:

```
switch(config-if)# no bfd min-receive-interval
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

bfd min-transmit-interval

```
bfd min-transmit-interval <INTERVAL>
no bfd min-transmit-interval <INTERVAL>
```

Description

Sets the minimum time interval between transmitted BFD control packets on an interface.

The **no** form of this command removes the configured BFD minimum transmitted interval on an interface. If the interval is not set, the default interval is used.

Parameter	Description
<INTERVAL>	Specifies the minimum transmit interval in milliseconds. Range: 500 to 20000 Default: 3000.

Usage

- If the minimum time interval is set between 500 ms and 1000 ms, then `bfd detect-multiplier` must be set to at least 3.
- If **bfd detect-multiplier** is set to 1, then the minimum transmit interval must be set to at least 3000 ms.
- Whenever the minimum time interval is set to a value less than 1000 ms, BFD automatically adjusts the transmission interval to 1000 ms if any of the following conditions apply:
  - The session is operating in asynchronous mode and echo is enabled.
  - The session state is in any other state than `up`.

As described in RFC 5880, this behavior occurs because BFD echo provides quick detection which allows the BFD asynchronous session to lower its traffic/resource requirements.

BFD IPv6 Echo is not supported.

Examples

Setting the minimum transmit interval to **500** ms:

```
switch(config-if)# bfd min-transmit-interval 500
```

Removing the minimum transmit interval:

```
switch(config-if)# no bfd min-transmit-interval 500
```

Setting the minimum transmit interval to the default value:

```
switch(config-if)# no bfd min-transmit-interval
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

clear bfd statistics

`clear bfd statistics [session <ID>]`

Description

Clears statistics for all BFD sessions or for a specific BFD session.

Parameter	Description
`session <ID>`	Specifies a session ID.

Examples

Clearing statistics for all BFD sessions:

```
switch# clear bfd statistics
```

Clearing statistics for BFD session 1:

```
switch# clear bfd statistics session 1
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

ip ospf bfd

```
ip ospf bfd
no ip ospf bfd
```

Description

Enables BFD for OSPFv2 on the current interface. The interface must have OSPFv2 enabled on it. This overrides the global settings defined with the command **bfd all-interfaces**.

The **no** form of this command sets the current interface to the global settings defined with the command **bfd all-interfaces**.

Examples

On the 6400 Switch Series, interface identification differs.

Enabling BFD on interface `1/1/1`:

```
switch(config)# interface 1/1/1
switch(config-if)# ip ospf bfd
```

Disabling BFD on interface `1/1/1`:

```
switch(config)# interface 1/1/1
switch(config-if)# no ip ospf bfd
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

ip route bfd

```
ip route <DEST-IPV4-ADDR>/<NETMASK> [<NEXT-HOP-IP-ADDR> | <INTERFACE>] [bfd]
no ip route <DEST-IPV4-ADDR>/<NETMASK> [<NEXT-HOP-IP-ADDR> | <INTERFACE>] [bfd]
```

Description

Enables or disables BFD on the specified static route. To disable BFD, issue the command without the `bfd` option.

Parameter	Description
<DEST-IPV4-ADDR>	Specifies a route destination in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.
<NETMASK>	Specifies the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128.
<NEXT-HOP-IP-ADDR>	Specifies the next hop address for reaching the destination in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.
<INTERFACE>	Specifies the next hop as an outgoing interface.
`bfd`	Enables BFD on the static route. Omit this parameter to disable BFD.

Examples

On the 6400 Switch Series, interface identification differs.

Enabling BFD on a static route:

```
switch(config)# interface 1/1/1
switch(config-if)# ip address 20.1.1.2/24
switch(config-if)# no shutdown
switch(config-if)# routing
switch(config-if)# exit
switch(config)# ip route 192.0.0.0/8 20.1.1.1 bfd
```

Disabling BFD on a static route:

```
switch(config)# ip route 192.0.0.0/8 20.1.1.1
```

For more information on features that use this command, refer to the High Availability Guide or IP Routing Guide for your switch model.

ipv6 ospfv3 bfd

```
ipv6 ospfv3 bfd
no ipv6 ospfv3 bfd
```

Description

Enables BFD for OSPFv3 on the current interface. The interface must have OSPFv3 enabled on it. This overrides the global settings defined with the command **bfd all-interfaces**.

The **no** form of this command sets the current interface to the global settings defined with the command **bfd all-interfaces**.

Examples

Enabling BFD:

```
switch(config-if)# ipv6 ospfv3 bfd
```

Disabling BFD:

```
switch(config-if)# no ipv6 ospfv3 bfd
```

Enabling BFD on a subinterface:

```
switch(config-subif)# ipv6 ospfv3 bfd
```

Disabling BFD on a subinterface:

```
switch(config-subif)# no ipv6 ospfv3 bfd
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

ipv6 ospfv3 bfd disable

`ipv6 ospfv3 bfd disable`

Description

Disables BFD on the current OSPFv3 interface. This overrides the global settings defined with the command bfd all-interfaces.

Examples

On the 6400 Switch Series, interface identification differs.

Enabling BFD on interface `1/1/1` :

```
switch(config)# interface 1/1/1
switch(config-if)# routing
switch(config-if)# ipv6 ospfv3 bfd disable
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

neighbor fall-over bfd

```
neighbor {<IP-ADDRESS>|<PEER-GROUP-NAME>} fall-over bfd
no neighbor {<IP-ADDRESS>|<PEER-GROUP-NAME>} fall-over bfd
```

Description

Enables BGP to register with BFD to receive fast peering session deactivation messages from BFD.

The **no** form of this command disables BGP for BFD.

BFD is supported with IPv6 neighbors on the 6300, 6400, , , , , , , and switch series.

Parameter	Description
<IP-ADDR>	Specifies an IP address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.
<PEER-GROUP-NAME>	Specifies a peer group.

Examples

```
switch(config-router)# neighbor 1.1.1.1 fall-over
switch(config-router)# no neighbor 1.1.1.1 fall-over bfd
```

```
switch(config-router)# neighbor PG fall-over
switch(config-router)# no neighbor PG fall-over bfd
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

show bfd

```
show bfd [session <ID>] [all-vrfs | vrf <NAME>] [vsx-peer]
```

Description

Shows information for all BFD sessions or for a specific BFD session.

Parameter	Description
`session <ID>`	Session ID.
`all-vrfs`	All VRFs.
`vrf <NAME>`	Specifies the name of a VRF.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Usage

Possible values for **State** are:

- Up
- Down
- AdminDown
- Init

Possible values for **Local diagnostic** and **Remote diagnostic** are:

- Control detection time expired (1): The session has stopped receiving BFD control packets from the peer after one detection time.
- Echo function failed: The session has stopped receiving BFD Echo packets, so the session was declared Down.
- Neighbor signaled session down: A packet from the peer was received with either AdminDown or Down state.
- Forwarding plane reset: Not set in this release.
- Path down: The forwarding path when Down.
- Concatenated path down: Not set in this release.
- Administratively down: The administrator has disabled BFD.
- Reverse concatenated path down: Not set in this release.

BFD IPv6 Echo is not supported.

Examples

Showing information for all BFD sessions:

```
switch# show bfd

Chapter 12

BGP commands

address-family

```
address-family {{ipv4 | ipv6} unicast | l2vpn evpn}
no address-family {{ipv4 | ipv6} unicast | l2vpn evpn}
```

Description

Specifies address family to use and changes to the configuration context for the specified family:

- **config-bgp-ipv4-uc** for IPv4 unicast
- **config-bgp-ipv6-uc** for IPv6 unicast
- **config-bgp-l2vpn-evpn** for L2VPN EVPN

The **no** form of this command removes the specified address family configuration.

Parameter	Description
`ipv4`	Selects the IPv4 address family.
`ipv6`	Selects the IPv6 address family.
`unicast`	Specifies unicast addresses.
`l2vpn evpn`	Selects the L2VPN EVPN address family. Route maps with the **match vni** clause can be used with L2VPN EVPN neighbors only.

Example

Setting the address family to IPv4 unicast.

```
switch(config-bgp)# address-family ipv4 unicast
switch(config-bgp-ipv4-uc)#
```

Setting the address family to L2VPN EVPN.

```
switch(config-bgp)# address-family l2vpn evpn
switch(config-bgp-l2vpn-evpn)#
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

aggregate-address

```
aggregate-address <IP-ADDR>/<MASK> [as-set] [summary-only]
        [suppress-map <MAP-NAME>] [advertise-map <MAP-NAME>]
        [attribute-map <MAP-NAME>]

no aggregate-address <IP-ADDR>/<MASK> [as-set] [summary-only]
        [suppress-map <MAP-NAME>] [advertise-map <MAP-NAME>]
        [attribute-map <MAP-NAME>]
```

Description

Creates an aggregate address entry in the BGP routing table.

The **no** form of this command removes the specified aggregate address entry.

Parameter	Description
<ADDRESS>	Specifies an aggregate address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255, or IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.
<MASK>	Specifies the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128.
`as-set`	The AS_PATH attribute advertised for this route will contain an AS_SET consisting of all AS numbers contained in all paths that are being summarized.
`summary-only`	Creates the aggregate route but also suppresses advertisements of more-specific routes to all neighbors.
`suppress-map` *<MAP-NAME>*	Specifies an aggregate route for creation, but suppresses the advertisement of the created route. Match clauses of route maps can be used to suppress some more-specific routes of the aggregate selectively, and leave others unsuppressed. IP prefix lists and as_path lists match clauses are supported.
`advertise-map` *<MAP-NAME>*	Specifies routes that will be used to build attributes of the aggregate route, such as AS_SET or community.
`attribute-map` *<MAP-NAME>*	Specifies that the attributes of the aggregate route can be changed.

Examples

```
switch(config-bgp-ipv4-uc)# aggregate-address 10.0.0.0/8
switch(config-bgp-ipv4-uc)# no aggregate-address 10.0.0.0/8
```

```
switch(config-bgp-ipv6-uc)# aggregate-address 2001:0db8:85a3::8a2e:0370:7334/24
switch(config-bgp-ipv6-uc)# no aggregate-address 2001:0db8:85a3::8a2e:0370:7334/24
```

```
switch(config-bgp-ipv4-uc)# aggregate-address 10.0.0.0/8 as-set summary-only
switch(config-bgp-ipv4-uc)# aggregate-address 10.0.0.0/8 attribute-map RMap
```

```
switch(config-bgp-ipv6-uc)# aggregate-address 2001:0db8:85a3::8a2e:0370:7334/24
as-set summary-only
switch(config-bgp-ipv6-uc)# aggregate-address 2001:0db8:85a3::8a2e:0370:7334/24
attribute-map RMap
```

bgp always-compare-med

```
bgp always-compare-med
no bgp always-compare-med
```

Description

Enables comparison of the Multi Exit Discriminator (MED) for paths from neighbors in different autonomous systems. Any changes in BGP configuration are applied by restarting the current BGP sessions on the VRFs.

The **no** form of this command sets comparison of MED to the default setting (disabled).

Usage

- MED is one of the parameters that is considered when selecting the best path among many alternative paths. The path with a lower MED is preferred over a path with a higher MED.
- During the best-path selection process, MED comparison is done only among paths from the same autonomous system. Use the command `bgp always-compare-med` to change this behavior by

enforcing MED comparison between all paths, regardless of the autonomous system from which the paths are received.

Examples

```
switch(config-bgp)# bgp always-compare-med
All current BGP sessions in VRF default will be restarted.
Do you want to continue (y/n)?
```

```
switch(config-bgp)# no bgp always-compare-med
All current BGP sessions in VRF default will be restarted.
Do you want to continue (y/n)?
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

bgp asnotation dotted

```
bgp asnotation dotted
no bgp asnotation dotted
```

Description

Specifies that Autonomous System (AS) numbers greater than 65535 be shown in dotted integer format for all show commands, including running-configuration.

The **no** form of this command restores the default format of non-dotted, simple integer.

Example

```
switch(config-bgp)# bgp asnotation dotted
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

bgp bestpath as-path ignore

```
bgp bestpath as-path ignore
no bgp bestpath as-path ignore
```

Description

Configures BGP to avoid considering the autonomous system (AS) path during best path route selection. By default, the AS-path is considered during BGP best path selection.

Any changes in BGP configuration are applied by restarting the current BGP sessions on the VRFs.

The **no** form of this command restores default behavior which configures BGP to consider the AS-path during route selection.

Examples

```
switch(config-bgp)# bgp bestpath as-path ignore
All current BGP sessions in VRF default will be restarted.
Do you want to continue (y/n)?
```

```
switch(config-bgp)# no bgp bestpath as-path ignore
All current BGP sessions in VRF default will be restarted.
Do you want to continue (y/n)?
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

bgp bestpath as-path multipath-relax

```
bgp bestpath as-path multipath-relax
no bgp bestpath as-path multipath-relax
```

Description

Configures Border Gateway Protocol (BGP) to treat two BGP routes as equal cost even if their AS-paths differ, as long as their AS-path lengths and other relevant attributes are the same. This allows routes with different AS-paths to be programmed into the forwarding table as equal cost multipath routes.

Any changes in BGP configuration are applied by restarting the current BGP sessions on the VRFs.

The **no** form of this command restores the default behavior which configures BGP to treat two BGP routes as different costs when their AS-paths differ.

Examples

```
switch(config-bgp)# bgp bestpath as-path multipath-relax
All current BGP sessions in VRF default will be restarted.
Do you want to continue (y/n)?
```

```
switch(config-bgp)# no bgp bestpath as-path multipath-relax
All current BGP sessions in VRF default will be restarted.
Do you want to continue (y/n)?
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

bgp bestpath compare-routerid

```
bgp bestpath compare-routerid
no bgp bestpath compare-routerid
```

Description

Configures a BGP routing process to compare identical routes received from different external peers during the best path selection process and selects the route with the lowest router ID as the best path. Defaults to disabled.

Any changes in BGP configuration are applied by restarting the current BGP sessions in the VRFs.

The **no** form of this command returns the BGP routing process to the default operation. By default, BGP selects the route that was received first when two routes with identical attributes are received.

Examples

```
switch(config-bgp)# bgp bestpath compare-routerid
All current BGP sessions in VRF default will be restarted.
Do you want to continue (y/n)?
```

```
switch(config-bgp)# no bgp bestpath compare-routerid
All current BGP sessions in VRF default will be restarted.
Do you want to continue (y/n)?
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

bgp bestpath med confed

```
bgp bestpath med confed
no bgp bestpath med confed
```

Description

Compares the identical routes received from the different confederation peers and selects the route with the lowest Multi Exit Discriminator (MED) value as the best path. This behavior is disabled by default.

The **no** form of this command prevents the routing process from considering the MED value.

The selection of other attributes like `as-multi-path relax` and `as-path ignore` will not affect the behavior of this command within a confederation.

Examples

Selecting the route with lowest MED value:

```
switch(config-bgp)#  bgp bestpath med confed
All active BGP sessions in the VRF %s will be restarted.
Do you want to continue (y/n)?
```

Preventing the routing process from selecting the MED value:

```
switch(config-bgp)# no bgp bestpath med confed
All active BGP sessions in the VRF %s will be restarted.
Do you want to continue (y/n)?
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

bgp bestpath med missing-as-worst

```
bgp bestpath med missing-as-worst
no bgp bestpath med missing-as-worst
```

Description

Configures a BGP routing process to assign a value of infinity (max possible) to routes that are missing the Multi Exit Discriminator (MED) attribute. The path without a MED value is the least desirable path. Any changes in BGP configuration are applied by restarting the current BGP sessions in the VRFs.

The **no** form of this command restores default behavior. The default behavior assigns a value of 0 to the missing MED.

Examples

```
switch(config-bgp)# bgp bestpath med missing-as-worst
All current BGP sessions in VRF default will be restarted.
Do you want to continue (y/n)?
```

```
switch(config-bgp)# no bgp bestpath med missing-as-worst
All current BGP sessions in VRF default will be restarted.
Do you want to continue (y/n)?
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

bgp cluster id

```
bgp cluster-id {<IPV4-ADDR> | <ID>}
no bgp cluster-id {<IPV4-ADDR> | <ID>}
```

Description

Specifies the cluster ID when the BGP router is used as a route-reflector. The cluster ID default is the router ID. Any changes in BGP configuration are applied by restarting the current BGP sessions on the VRFs.

The **no** form of this command sets the cluster ID to the default value, which is the router ID.

Parameter	Description
<IPV4-ADDR>	Specifies an IP address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. You can remove leading zeros. For example, the address **192.169.005.100** becomes **192.168.5.100**.
<ID>	Specifies the cluster ID as 32-bit number. Range: 1 to 4294967295.

Examples

```
switch(config-bgp)# bgp cluster-id 2.2.2.2
All current BGP sessions in VRF default will be restarted.
Do you want to continue (y/n)?
```

```
switch(config-bgp)# no bgp cluster-id 2.2.2.2
All current BGP sessions in VRF default will be restarted.
Do you want to continue (y/n)?
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

bgp confederation

```
 bgp confederation <AS-NUMBER>
no bgp confederation<AS-NUMBER>
```

Description

Configures a BGP confederation with the confederation identifier. The group of Autonomous Systems (ASs) will be presented as a single autonomous system with the confederation identifier as the AS number.

The **no** form of the command deletes the BGP confederation identifier.

Parameter	Description
<AS-NUMBER>	Sets the identifier for the confederation. Range:1-4294967295.

Examples

Configuring the BGP confederation with the AS number:

```
switch(config-bgp)# bgp confederation 100
```

Deleting BGP confederation identifier:

```
switch(config-bgp)# no bgp confederation 100
This will delete BGP confederation identifier on this device.
Do you want to continue (y/n)?
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

bgp confederation peers

```
bgp confederation peers <AS NUMBER>
no bgp bgp confederation peers <AS NUMBER>
```

Description

Configures BGP confederation peers with both same and different sub-autonomous system to establish an eBGP membership. You can configure a list of AS numbers separated by spaces.

The **no** form of this command disables the peer session and deletes the peer information.

Parameter	Description
<AS NUMBER>	Specifies the autonomous system numbers to establish an eBGP membership. Range: 64512-65535.

Examples

```
switch(config-bgp)# bgp confederation peers 64512 64513
```

```
switch(config-bgp)# no bgp confederation peers 64512
```

bgp dampening

```
bgp dampening {{half-life <HALF-TIME> reuse <LOW-THRESHOLD> suppress <HI-THRESHOLD> max-
suppress-time <MAX-TIME>}
| route-map <NAME>}
```

Description

Enables route flap dampening which reduces the propagation of unstable routes in the network.

Parameter	Description
`half-life <HALF-TIME>`	Specifies the half-life time in minutes. When the time expires, the penalty on a route gets reduced exponentially to half its current value. Default: 15.
`reuse <LOW-THRESHOLD>`	Specifies the lower threshold of penalty. On a suppressed route, when the penalty on a route falls below this value, the route is unsuppressed. Default: 750.
`suppress <HI-THRESHOLD>`	Specifies the upper threshold of penalty. When the penalty on a flapping route exceeds this value, the route is suppressed. Default: 2000.
`max-suppress-time <MAX-TIME>`	Specifies the maximum time to keep a route suppressed in minutes. Once this timer expires, the route is unsuppressed. Default: 60.
`route-map <NAME>`	Specifies the name of a route map.

These parameters can be configured at the router level for specific address families or the same parameters can be configured under a route map which can be applied to dampening command.

Usage

The dampening algorithm assigns a penalty of 1000 to a flapping route every time the route gets withdrawn. The penalty values accumulate on the route every time it flaps. However, the penalty decays and is reduced to half its value by the half-life time.

This feature is not applicable on IBGP routes.

Example

```
switch(config)# router bgp 1
switch(config-bgp)# address-family ipv4 unicast
switch(config-bgp-ipv4-uc)# bgp dampening

switch(config-bgp-ipv4-uc)# bgp dampening route-map abc

switch(config-bgp-ipv4-uc)# bgp dampening route-map xyz

switch(config-bgp-ipv4-uc)# bgp dampening half-life 10 reuse 100 suppress 250 max-
suppress-time 45
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

bgp default local-preference

```
bgp default local-preference <NUMBER>
no bgp default local-preference
```

Description

Default local preference value for BGP learned routes. Any changes in BGP configuration are applied by restarting the current BGP sessions on the VRFs.

The **no** form of this command sets the local preference to the default value of 100.

Parameter	Description
<NUMBER>	Specifies the local preference value. Range: 0 to 4294967295. Default: 100.

Examples

```
switch(config-bgp)# bgp default local-preference 20
All current BGP sessions in VRF default will be restarted.
Do you want to continue (y/n)?
```

```
switch(config-bgp)# no bgp default local-preference
All current BGP sessions in VRF default will be restarted.
Do you want to continue (y/n)?
```

bgp deterministic-med

```
bgp deterministic-med
no bgp deterministic-med
```

Description

Enables comparison of the Multi-Exit Discriminator (MED) attribute when selecting routes advertised by different peers in the same autonomous system. Any changes in BGP configuration are applied by restarting the current BGP sessions on the VRFs.

The **no** form of this command sets MED comparison to the default setting of disabled.

Examples

```
switch(config-bgp)# bgp deterministric-med
All current BGP sessions in VRF default will be restarted.
Do you want to continue (y/n)?
```

```
switch(config-bgp)# no bgp deterministic-med
All current BGP sessions in VRF default will be restarted.
Do you want to continue (y/n)?
```

bgp graceful-restart restart-time

```
bgp graceful-restart restart-time <DELAY>
no bgp graceful-restart restart-time
```

Description

Sets the graceful restart timer which determines how long the switch waits for a graceful-restart capable neighbor to re-establish BGP peering. Any changes in BGP configuration are applied by restarting the current BGP sessions on the VRFs.

The **no** form of this command resets to the default value of 120 seconds.

Parameter	Description
<DELAY>	Graceful restart timer delay in seconds. Range: 1 to 3600. Default: 1500.

Usage

- Graceful restart functionality is enabled by default, and there is no command to disable the functionality at the protocol level.
- However, the graceful-restart functionality can be disabled globally using the command **router graceful-restart**.

Examples

```
switch(config-bgp)# bgp graceful-restart restart-time 150
All current BGP sessions in VRF default will be restarted.
Do you want to continue (y/n)?
```

```
switch(config-bgp)# no bgp graceful-restart restart-time
All current BGP sessions in VRF default will be restarted.
Do you want to continue (y/n)?
```

bgp graceful-restart stalepath-time

```
bgp graceful-restart stalepath-time <TIME>
no bgp graceful-restart stalepath-time
```

Description

Sets the stale path timer. This timer determines how long BGP keeps stale routes from the restarting BGP peer. Any changes in BGP configuration are applied by restarting the current BGP sessions on the VRFs.

The **no** form of this command resets to the stale path timer to the default of 300 seconds.

Parameter	Description
<TIME>	Specifies the stale path timer in seconds. Range: 1 to 3600. Default: 300.

Examples

```
switch(config-bgp)# bgp graceful-restart stalepath-time 300
All current BGP sessions in VRF default will be restarted.
Do you want to continue (y/n)?
```

```
switch(config-bgp)# no bgp graceful-restart stalepath-time
All current BGP sessions in VRF default will be restarted.

bgp log-neighbor-changes

```
bgp log-neighbor-changes
no bgp log-neighbor-changes
```

Description

Enables logging of BGP neighbor session state changes.

The **no** form of this command disables logging of changes in BGP neighbor adjacencies.

Examples

```
switch(config-bgp)# bgp log-neighbor-changes
switch(config-bgp)# no bgp log-neighbor-changes
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

bgp maxas-limit

```
bgp maxas-limit <LENGTH>
no bgp maxas-limit
```

Description

Specifies the maximum size of AS paths in update messages. Routes with AS paths greater than the specified length are discarded.

The **no** form of this command sets the limit to the default of 32.

Parameter	Description
<LENGTH>	Specifies the number of AS segments. Length: 1 to 32 characters. Default: 32.

Example

```
switch(config-bgp)# bgp maxas-limit 20
switch(config-bgp)# no bgp maxas-limit
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

bgp router-id

```
bgp router-id <ROUTER-ID>
no bgp router-id <ROUTER-ID>
```

Description

Configures a fixed router ID for the BGP peer process running on the router. Any changes in BGP configuration are applied by restarting the current BGP sessions on the VRFs.

The **no** form of this command removes the fixed router ID from the running configuration and restores the default router ID selection.

Parameter	Description
<ROUTER-ID>	If router-id is changed, then all the active BGP peer sessions go down and restart with the newly configured router-id.

Usage

BGP determines the router ID as follows:

1. The address configured with the command `bgp router-id`.
2. The highest IP address on all the loopback interfaces.
3. The highest IP address on any interface.

Examples

```
switch(config-bgp)# bgp router-id 1.1.1.1
All current BGP sessions in VRF default will be restarted.
Do you want to continue (y/n)?
```

```
switch(config-bgp)# no bgp router-id 1.1.1.1
All current BGP sessions in VRF default will be restarted.
Do you want to continue (y/n)?
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

bgp update-group

```
bgp update-group
no bgp update-group
```

Description

Enables the update-group feature. Update-group is used to optimize BGP processing. With update-group enabled, neighbors that share same outbound policy are grouped under single update-group and update messages are shared to all peers within that group. Disabled by default.

On enabling/disabling update-group, all the current BGP sessions including dynamic peer sessions will be restarted. The dynamic peer sessions will get re-established based on the connect-retry timer configured on the peer device.

BGP determines the AS number size to be used with each individual peer based on the configured AS octet-size on the peers. If BGP is configured to use 2 octet ASN with peer A and 4 octet ASN with peer B, then BGP updates sends to peer A and peer B will be different. Therefore, they will form into two different update-groups.

This feature is supported for IBGP alone. It is not recommended to enable update-group on VPNv4 address families or configure update-group if an VPNv4 address family is configured. Update-group indices are created automatically and cannot be configured. Indices are ephemeral in nature. Update-group indices will not be retained across process restart. When update-group is configured, route reflector clients and non route reflector clients are parted into different update-groups. The use of update-groups imposes the following limitations in BGP processing:

1. While advertising routes to peers of the update-group, the check on route's next-hop is ignored. This means that, BGP routes can get advertised to a peer even if the next-hop IP of the routes is same as peer's IP, and the peer should discard such routes.
2. The use of ORF is restricted. BGP will continue to send outbound route filters to peers, but received filters are ignored.
3. Sender loop detection is delayed until the point where UPDATE messages are sent to the members of the update-group. This means route dropped by the sender due to loop detection will still count as advertised, as they have been advertised to the update-groups.

It is recommended to enable BGP update-group globally before configuring BGP neighbors. This ensures that toggling of BGP neighborship can be avoided and memory of the routing process can be optimized.

The **no** form of this command disables the update-group feature.

Examples

Enabling BGP update-group:

```
switch(config-bgp)# bgp update-group
All current BGP sessions in VRF default will be restarted.
 Do you want to continue (y/n)?
```

Disabling BGP update-group:

```
switch(config-bgp)# no bgp update-group
All current BGP sessions in VRF default will be restarted.
Do you want to continue (y/n)?
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

clear bgp

```
clear bgp [vrf <VRF-NAME>][ipv4 unicast | ipv6 unicast | all]
     {* | <NEIGHBOR-IP-ADDR>} [soft in]
```

Description

Resets BGP peer sessions. Sends a route refresh request when you have specified **soft in**. Optionally, you can specify reset for a specific VRF.

Parameter	Description
`ipv4 unicast`	Specifies the IPv4 address family.
`ipv6 unicast`	Specifies the IPv6 address family.
`l2vpn evpn`	Selects the L2VPN EVPN address family
`vrf` *`<VRF-NAME>`*	Specifies a VRF name.
`all`	Specifies all VRFs and address families.
`* |` *`<NEIGHBOR-IP-ADDRESS>`*	Specifies a neighbor IP address for which peer sessions are to be reset, or `*` to reset all sessions.
`soft in`	Send a route refresh request.

Examples

```
add descriptions for all examples
switch# clear bgp all *
switch# clear bgp ipv4 unicast 192.168.12.1 soft in
```

```
switch# clear bgp l2vpn evpn * soft in
switch# clear bgp l2vpn evpn 9.0.0.2 soft in
```

distance bgp

```
distance bgp <EXTERNAL> <INTERNAL>
no distance bgp <EXTERNAL> <INTERNAL>
```

Description

Configures the administrative distance for BGP.

The **no** form of this command restores the default settings, 20 for eBGP and 200 for iBGP,

Parameter	Description
<EXTERNAL>	Specifies the administrative distance for eBGP routes. Range: 1 to 255. Default: 20.
<INTERNAL>	Specifies the administrative distance for iBGP routes. Range: 1 to 255. Default: 200.

Example

```
switch(config-bgp-ipv4-uc)# distance bgp 100 150
switch(config-bgp-ipv4-uc)# no distance bgp 100 150
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

maximum-paths

```
maximum-paths <MAXPATHS>
no maximum-paths <MAXPATHS>
```

Description

Configures the maximum number of paths that BGP adds to the route table for equal-cost multipath (ECMP) load balancing for routes learned from both internal and external BGP. Any changes in BGP configuration are applied by restarting the current BGP sessions on the VRFs.

On 8325 and 10000 switch series, a maximum-paths configuration is supported globally as well as for **ipv4-unicast**, **ipv6-unicast** and **l2vpn-evpn** address families. For 6300, 6400, 8100, 8360, 8320, 8400 and 9300 switch series, this configuration is supported globally and for **l2vpn2-evpn address** families.

If address-family specific maximum-paths are configured, they take precedence over global configuration. Greater than eight maximum-paths at can be configured within the global context, but for **l2vpn-evpn** routes the supported maximum limit is still eight.

The **no** form of this command restores the default setting of 4.

Parameter	Description
<MAXPATHS>	Specifies the maximum number of paths. 1 to 32 paths can be set globally. 1 to 8 paths can be set for an individual address family. The default is 4.

Usage

When both global and address-family maximum paths are configured then the address family value takes precedence.

Global max-path	l2evpn, ipv4-unicast,or ipv6-unicast address-family Max-path	Operational Max-path	Comments
Default(4)	Default (4)	4	--
Configured (4)	configured (4)	4	Four is the configured value for address family paths
Default (4)	8 (max)	8	The address family value takes

Global max-path	l2evpn, ipv4-unicast,or ipv6-unicast address-family Max-path	Operational Max-path	Comments
			precedence
32 (max)	8 (max)	8	CLI configuration is limited to eight paths.
Default (8)	configured (4)	4	Four is the configured value for address family paths

Examples

Configuring the maximum number of global paths:

```
switch(config)# router bgp 1
switch(config-bgp)# maximum-paths 32
All current BGP sessions in VRF default will be restarted.
Do you want to continue (y/n)? y
```

Configuring the maximum-paths for the l2vpn-evpn address family:

```
switch(config-bgp)# address-family l2vpn evpn
switch(config-bgp-l2vpn-evpn)# maximum-paths 6
```

Removing the global maximum paths setting:

```
switch(config-bgp)# no maximum-paths
All current BGP sessions in VRF default will be restarted.
Do you want to continue (y/n)? y
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

Release	Modification
10.13.1000	On 8325 and 10000 switch series configuration is supported on **ipv4-unicast**, **ipv6-unicast** and **l2vpn-evpn** address families. For 6300, 6400, 8100, 8360, 8320, 8400 and 9300 switch series, this configuration is supported globally and for **l2vpn2-evpn address** families.
10.10	Increased upper limit of range of <*MAXPATHS*> parameter to 32.
10.07 or earlier	--

neighbor activate

```
neighbor <IP-ADDR> activate
no neighbor <IP-ADDR> activate
```

Description

This command enables the address-family capability and exchange of information specific to an address family with a BGP neighbor.

The **no** form of this command removes the address-family capability and disables the exchange of routes for the specified address-family with the BGP neighbor.

Parameter	Description
<IP-ADDR>	Specifies an IP address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255, or IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.

Examples

```
switch(config-bgp-ipv4-uc)# neighbor 1.1.1.1 activate
switch(config-bgp-ipv4-uc)# no neighbor 1.1.1.1 activate
```

```
switch(config-bgp-l2vpn-evpn)# neighbor 1.1.1.1 activate
switch(config-bgp-l2vpn-evpn)# no neighbor 1.1.1.1 activate
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

neighbor advertisement-interval

```
neighbor {<IP-ADDRESS>|<PEER-GROUP-NAME>} advertisement-interval <INTERVAL>
no neighbor {<IP-ADDRESS>|<PEER-GROUP-NAME>} advertisement-interval
```

Description

Sets the advertisement interval, which defines the length of time between transmission of BGP routing updates.

The **no** form of this command restores the default value. Default values are 30 seconds for external BGP peer and 5 seconds for internal BGP peer.

Parameter	Description
<IP-ADDR>	Specifies an IP address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255, or IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.
<PEER-GROUP-NAME>	Specifies a Peer-Group.
<INTERVAL>	Specifies the advertisement interval in seconds. Range: 0 to 600. Default: 30 for external BGP peer and 5 for internal BGP peer.

Examples

```
switch(config-bgp-ipv4-uc)# neighbor 1.1.1.1 advertisement-interval 20
switch(config-bgp-ipv4-uc)# no neighbor 1.1.1.1 advertisement-interval
```

```
switch(config-bgp-ipv4-uc)# neighbor pg advertisement-interval 50
switch(config-bgp-ipv4-uc)# no neighbor pg advertisement-interval
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

neighbor add-paths

```
neighbor {<IP-ADDR>|<PEER-GROUP-NAME>} add-paths {send | recv | both}
no neighbor {<IP-ADDR>|<PEER-GROUP-NAME>} add-paths {send | recv | both}
```

Description

Enables additional path capability for BGP as described in RFC 7911. This allows BGP peer to send, receive, or send and receive multiple paths for the same address prefix without the subsequent advertisements implicitly replacing any previous paths. The additional path includes the first (N-1) best paths, which means that the total paths for an address prefix received by a BGP speaker will include the best path and the additional paths determined by its BGP peer.

With additional path feature, each path is identified by a path identifier in addition to the address prefix. To use this command, the backup path of BGP next-hop must be different than the primary path.

The **no** form of this command disables the additional path feature.

Parameter	Description
<IP-ADDR>	Specifies an IP address.
<PEER-GROUP-NAME>	Specifies a peer group.
`add-paths {send | recv | both}`	Configures the additional paths in one of the following ways: `send`—Enables the neighbor to send the additional paths. `recv`—Enables the neighbor to receive the additional paths. `both`—Enables the neighbor to send and receive the additional paths.

Examples

Enabling BGP neighbor to send the additional paths:

```
switch(config)# router bgp 100
switch(config-bgp)# address-family ipv4 unicast
switch(config-bgp-ipv4-uc)# neighbor 1.1.1.1 add-paths send
```

Disabling BGP neighbor to send the additional paths:

```
switch(config)# router bgp 100
switch(config-bgp)# address-family ipv4 unicast
switch(config-bgp-ipv4-uc)# no neighbor 1.1.1.1 add-paths send
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

neighbor add-paths advertise-best

```
neighbor {<IP-ADDR>|<PEER-GROUP-NAME>} add-paths advertise-best <2-4>
no neighbor {<IP-ADDR>|<PEER-GROUP-NAME>} add-paths advertise-best <2-4>
```

Description

Controls the number of best BGP Paths to be advertised by a BGP speaker to a BGP peer. When enabled, it allows BGP speaker to advertise more than one best paths for the same address prefix. The total paths for an address prefix will include the best path and the additional paths.

The **no** form of this command removes the advertise best path configuration.

Parameter	Description
<IP-ADDR>	Specifies an IP address.
<PEER-GROUP-NAME>	Specifies a peer group.
`advertise-best` *<2-4>*	Specifies the number of best BGP paths to be advertised to a BGP Peer. Range: 2 to 4. Default: 2.

Examples

Setting the number of best paths to send to the neighbor:

```
switch(config)# router bgp 100
switch(config-bgp)# address-family ipv4 unicast
switch(config-bgp-ipv4-uc)# neighbor 1.1.1.1 add-paths advertise-best 3
```

Removing the advertise best path configuration:

```
switch(config)# router bgp 100
switch(config-bgp)# address-family ipv4 unicast
switch(config-bgp-ipv4-uc)# no neighbor 1.1.1.1 add-paths advertise-best 3
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

neighbor allowas-in

```
neighbor {<IP-ADDRESS> |<LIMIT>
no neighbor {<IP-ADDRESS> |<LIMIT>
```

Description

Specifies the number of times that the AS path of a received route can contain the AS number of the recipient BGP speaker and still be accepted. When this configuration is applied to a peer-group, all the neighbors that are part of the peer-group inherit this setting.

The **no** form of this command restores the default setting, which is to reject as a loop any route where the path contains the speaker AS number.

Parameter	Description
<IP-ADDRESS>	Specifies the neighbor IP address in the IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255, or in the IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F. **NOTE:** IPv6 MP-BGP peering must not be used for L2VPN EVPN address family, because VXLAN tunnel interface does not support IPv6 addresses.
<PEER-GROUP-NAME>	Specifies a peer group.
<LIMIT>	Specifies the number of times that the AS path of a received route can contain the AS number of the recipient BGP. Range: 1 to 10.

Examples

```
switch(config-bgp-ipv4-uc)# neighbor 1.1.1.1 allowas-in 5
switch(config-bgp-ipv4-uc)# no neighbor 1.1.1.1 allowas-in
```

```
switch(config-bgp-ipv6-uc)# neighbor 2001:0db8:85a3::8a2e:0370:7334 allowas-in 5
switch(config-bgp-ipv6-uc)# no neighbor 2001:0db8:85a3::8a2e:0370:7334 allowas-in
```

```
switch(config-bgp-ipv4-uc)# neighbor PG allowas-in 5
switch(config-bgp-ipv4-uc)# no neighbor PG allowas-in
```

```
switch(config-bgp-l2vpn-evpn)# neighbor 1.1.1.1 allowas-in 5
switch(config-bgp-l2vpn-evpn)# no neighbor 1.1.1.1 allowas-in
```

```
switch(config-bgp-l2vpn-evpn)# neighbor PG allowas-in 5
switch(config-bgp-l2vpn-evpn)# no neighbor PG allowas-in
```

```
switch(config-bgp-l2vpn-evpn)# neighbor 2001:0db8:85a3::8a2e:0370:7334 allowas-in
5
switch(config-bgp-l2vpn-evpn)# no neighbor 2001:0db8:85a3::8a2e:0370:7334 allowas-
in
```

neighbor ao

```
neighbor {<IP-ADDR>|<PEER-GROUP-NAME>} ao <keychain-name>
   accept-ao-mismatch
   include-tcp-options
   no ...
```

Description

Enables TCP Authentication Option (TCP-AO) authentication on a TCP connection between two BGP neighbors. To disable this function, use the **no** form of this command.

Parameter	Description
<IP-ADDRESS>	Specifies an IP address.
<PEER-GROUP-NAME>	Specifies a peer group.
`<keychain-name>`	Name of the keychain for the neighbor. The keychain allows keys to be configured with different valid lifetimes. This mechanism provides a way for a set of keys to be rotated and hence protect against long-lived-key attacks. At any given time only one key is selected as active-key and keys are valid for a duration of the defined send-lifetime. If the send-lifetime and the accept-lifetimes are not configured for the key, the key is considered to be valid for infinite lifetime. When multiple keys are configured, its recommended that keys overlap in their send-lifetimes so that the key rollover occurs at the start of the next key's send-lifetime. This allows for a continuous key usage by TCP-AO.
`accept-ao-mismatch`	Accept incoming TCP segments without TCP-AO option. If enabled, the device will accept a connection from the peer *even if the received TCP packets do not contain the TCP-AO option*.
`include-tcp-options`	Include the TCP header options for MAC calculation. Note that enabling this setting will immediately reset the neighbor session.

Parameter	Description
	This setting is disabled by default.
`no ...`	Negates any configured parameter.

Usage

TCP-AO authentication can not be used with the neighbor password feature. When TCP-AO is applied to a peer-group, all the neighbors in peer-group will inherit the peer-group configuration unless there is a configuration specific to an individual neighbor. If a peer-group is configured with the neighbor password feature but the neighbors that belong to that peer-group are configured with TCP-AO, the TCP-AO configuration will be rejected. Similarly, If a peer-group is configured to use TCP-AO authentication, the neighbors that belong to that peer-group will reject the neighbor password.

The neighbor connection must be reset using the **clear ip bgp** command for the TCP-AO configuration to take effect.

The TCP-AO feature takes a keychain as a parameter. The key will not be valid until a Recv-D, Send-ID, and send lifetime is configured. The supported cryptographic algorithms for TCP-AO are:

- HMAC-SHA-1-96 based on [RFC2104] and [FIPS-180-3]
- AES-128-CMAC-96 based on [NIST-SP800-38B][FIPS197]

Examples

```
switch(config)# keychain bgpkeys
switch(config-keychain)# key 1
switch(config-keychain-key)# send-lifetime start-time 10:10:10 10/25/2022 duration
infinite
switch(config-keychain-key)# accept-lifetime start-time 10:10:10 10/25/2022
duration infinite
switch(config-keychain-key)# send-id 10
switch(config-keychain-key)# recv-id 10
switch(config-keychain-key)# cryptographic-algorithm aes-cmac-128
switch(config-keychain-key)# key-string plaintext qwer
switch(config)# router bgp 1
switch(config-bgp)# neighbor 1.1.1.1 ao bgpkeys
switch(config-bgp)# no neighbor 1.1.1.1 ao accept-ao-mismatch
switch(config-bgp)# no neighbor 1.1.1.1 ao include-tcp-option
```

neighbor capability orf prefix-list

```
neighbor <IP-ADDRESS> capability orf prefix-list {send | receive | both}
no neighbor <IP-ADDRESS> capability orf prefix-list {send | receive | both}
```

Description

Enables the Outbound Route filtering (ORF) capability with the neighbor in one of the three available modes. The available modes are send, receive, and both. The ORF capability is executed based on prefix list only.

The Outbound Route Filtering (ORF) capability provides a mechanism for a BGP speaker to send a set of Outbound Route Filters (ORFs) that can be used by its BGP peer to filter its outbound routing updates to the speaker. This is a filtering method used to reduce the computation on the router receiving the route.

The **no** form of this command disables the ORF capability.

Parameter	Description
`<IP-ADDRESS>`	Specifies an IP address.
`capability orf prefix-list {send | receive | both}`	Enables ORF prefix list capability with the neighbor in one of the following modes: ■ **send** - Enables the ORF prefix list capability in send mode. ■ **receive** - Enables the ORF prefix list capability in receive mode. ■ **both**- Enables the ORF prefix list capability in both send and receive mode.

Examples

Enabling the ORF prefix list capability in both send and receive mode:

```
switch(config-bgp-ipv4-uc)# neighbor 1.1.1.1 capability orf prefix-list both
```

Enabling the ORF prefix list capability in send mode:

```
switch(config-bgp-ipv4-uc)# neighbor 1.1.1.1 capability orf prefix-list send
```

Disabling the ORF prefix list capability in both send and receive mode: :

```
switch(config-bgp-ipv4-uc)# no neighbor 1.1.1.1 capability orf prefix-list both
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

neighbor default-originate

```
neighbor {<IP-ADDR>|<PEER-GROUP-NAME>} default-originate [route-map <MAP-NAME>]
no neighbor {<IP-ADDRESS>|<PEER-GROUP-NAME>} default-originate [route-map <MAP-NAME>]
```

Description

Enables the local router to send the default route 0.0.0.0 to a neighbor. The neighbor can then use this route to reach the router when all other routes are unavailable. Use the `route-map` option to configure the route map to modify the default route attributes.

The **no** form of this command disables this feature.

Parameter	Description
<IP-ADDR>	Specifies an IP address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255, or IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.
<PEER-GROUP-NAME>	Specifies a peer group.
<MAP-NAME>	Sets the route map to modify the default route attributes.

Examples

```
switch(config-bgp-ipv4-uc)# neighbor 1.1.1.1 default-orginate
switch(config-bgp-ipv4-uc)# no neighbor 1.1.1.1 default-originate
```

```
switch(config-bgp-ipv4-uc)# neighbor PG default-originate
switch(config-bgp-ipv4-uc)# no neighbor PG default-originate
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

neighbor ebgp-multihop

```
neighbor {<IP-ADDR> | <PEER-GROUP-NAME>} ebgp-multihop <HOP-COUNT>
no neighbor {<IP-ADDRESS> |<HOP-COUNT>
```

Description

Enables BGP to establish a session with external peers residing on networks that are not directly connected. By default, BGP can only establish sessions with external BGP peers that are directly connected.

The neighbor connection must be reset using `clear bgp` to allow this configuration to take effect.

The **no** form of this command disables the peer ebgp-multihop feature.

Parameter	Description
<IP-ADDR>	Specifies an IP address.
<PEER-GROUP-NAME>	Specifies a peer group.
`ebgp-multihop` *<HOP-COUNT>*	Specifies the maximum number of hops to reach the peer.

Examples

Enabling BGP to establish connection with external peers residing on networks that are not directly connected:

```
switch(config-bgp)# neighbor 1.1.1.1 ebgp-multihop 5
switch(config-bgp)# no neighbor 1.1.1.1 ebgp-multihop
```

Disabling BGP to establish connection with external peers residing on networks that are not directly connected:

```
switch(config-bgp)# neighbor pg ebgp-multihop 5
switch(config-bgp)# no neighbor pg ebgp-multihop
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

neighbor fall-over

```
neighbor {<IP-ADDR>|<PEER-GROUP-NAME>} fall-over
no neighbor {<IP-ADDR>|<PEER-GROUP-NAME>} fall-over
```

Description

Enables BGP fast peering session deactivation. When neighbor fall-over is configured, the BGP process monitors the RIB and if the route to peer is not present in the routing table, it immediately deactivates the peer session without waiting for the hold down timer. It is disabled by default.

The **no** form of this command disables this feature.

Parameter	Description
<IP-ADDR>	Specifies an IP address.
<PEER-GROUP-NAME>	Specifies a peer group.

Usage

Neighbor fall-over does not track connected or static routes to peers. However, this is not an issue when IBGP peering is using a loopback interface. To force a fall-over for connected and static routes, use the command `neighbor fall-over bfd`.

Examples

```
switch(config-bgp)# neighbor 1.1.1.1 fall-over
switch(config-bgp)# no neighbor 1.1.1.1 fall-over
```

```
switch(config-bgp)# neighbor PG fall-over
switch(config-bgp)# no neighbor PG fall-over
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

neighbor fall-over bfd

```
neighbor {<IPV4-ADDR>|<IPV6-ADDR>|<PEER-GROUP-NAME>} fall-over bfd
no neighbor {<IPV4-ADDR>|<IPV6-ADDR>|<PEER-GROUP-NAME>} fall-over bfd
```

Description

Enables BGP to register with BFD to receive fast peering session deactivation messages from BFD. You can either configure BFD support for BGP per neighbor or peer-group.

The **no** form of this command disables BGP for BFD.

Multihop BFD is not supported for BGP.

Parameter	Description
<IPV4-ADDR>	Specifies the neighbor address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.
<IPV6-ADDR>	Specifies the neighbor address in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F. This parameter applies only to 6300 and 6400 switch series.
<PEER-GROUP-NAME>	Specifies a peer group.

Examples

Enabling BFD for BGP neighbor with IPv4 address:

```
switch(config-bgp)# neighbor 1.1.1.1 fall-over bfd
```

Enabling BFD for BGP neighbor with IPv6 address (applies only to 6300 and 6400 switch series):

```
switch(config-bgp)# neighbor 1000::1 fall-over bfd
```

Enabling BFD for peer group:

```
switch(config-bgp)# neighbor PG fall-over bfd
```

Disabling BFD for BGP per neighbor IPv4 address:

```
switch(config-bgp)# neighbor 1.1.1.1 fall-over bfd
```

Disabling BFD for BGP per neighbor with IPv6 address (applies only to 6300 and 6400 switch series):

```
switch(config-bgp)# no neighbor 1000::1 fall-over bfd
```

Disabling BFD for peer group:

```
switch(config-bgp)# no neighbor PG fall-over bfd
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

neighbor graceful-shutdown

```
neighbor {<IP-ADDR> | <PEER-GROUP-NAME>} graceful-shutdown
     [ local-preference <LOCAL-PREF>
     | <CONFIG-DELAY>
     |<LOCAL-PREF> ]

no neighbor {<IP-ADDR> | <PEER-GROUP-NAME>} graceful-shutdown
     [ local-preference <LOCAL-PREF>
     | <CONFIG-DELAY>
     |<LOCAL-PREF> ]
```

Description

Configures the wait time before shutting down the BGP neighbor session, and can also configure the local preference value to be advertised before graceful shutdown.

The **no** form of this command sets the wait time to the default value of 180 seconds and the local-preference value to the default of 0.

Parameter	Description
<IP-ADDR>	Specifies an IP address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255, or IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.
<PEER-GROUP-NAME>	Specifies a peer group.
local-preference*<LOCAL-PREF>*	Specifies the local preference value for exporting the iBGP routes

Parameter	Description
	during a graceful shutdown. The lower the value, the lower the local preference. A value of 0 indicates that the route is the least preferred. Range: 0 to 4294967295. Default: 0.
<CONFIG-DELAY>	Specifies the time to wait before shutting down the neighbor in seconds. Range: 10 to 1200. Default: 180.

Usage

If the graceful shutdown timer has already started and the administrator configures a command that triggers a session restart, traffic loss can occur if the graceful shutdown delay is not sufficient for the BGP peers to converge to a new route.

On each Autonomous System Boundary Router (ASBR) supporting the graceful shutdown receiver procedure, an inbound BGP route policy must be applied on all EBGP sessions of the ASBR.

The policy must match the GSHUT community and lower the precedence of the route by changing the route attributes.

The Graceful-Shutdown feature does not work for reflected routes because the route reflector (RR) does not modify local-preference attribute. The routes, originated by the RR, carry the GSHUT local-preference value. As per the RFC 4456, when an RR reflects a route, it should not modify the following path attributes:

- NEXT-HOP
- AS-PATH
- LOCAL-PREF
- MED

Their modification could potentially result in routing loops. In this situation, apply on the RR an inbound BGP route policy, meeting the following conditions:

- Match the graceful-shutdown community.
- Set the local preference attributes of the paths tagged with the graceful-shutdown community to a lower value than other routes to the same destination.

Examples

Setting the wait time delay:

```
switch(config-bgp)# neighbor 1.1.1.1 graceful-shutdown 10
```

Setting the local-preference value:

```
switch(config-bgp)# neighbor 1.1.1.1 graceful-shutdown local-preference 100
```

Setting the wait time delay and local-preference value:

```
switch(config-bgp)# neighbor 1.1.1.1 graceful-shutdown 10 local-preference 100
```

Setting the wait time delay to the default of 180 seconds:

```
switch(config-bgp)# no neighbor 1.1.1.1 graceful-shutdown 10
```

Setting the local-preference value to default of 0:

```
switch(config-bgp)# no neighbor 1.1.1.1 graceful-shutdown local-preference 100
```

Setting the wait time delay and local-preference value to defaults:

```
switch(config-bgp)# no neighbor 1.1.1.1 graceful-shutdown 10 local-preference 100
```

Complete deletion:

```
switch(config-bgp)# no neighbor 1.1.1.1 graceful-shutdown
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

neighbor listen ip-range

```
neighbor <PEER-GROUP-NAME> listen ip-range <IP-ADDR>/<MASK> {as-range <AS-RANGE> | limit
<LIMIT>}
no neighbor <PEER-GROUP-NAME> listen ip-range <IP-ADDR>/<MASK> {as-range <AS-RANGE> |
limit <LIMIT>}
```

Description

Configures BGP dynamic neighbors as ranges of remote addresses with associated peer groups.

The **no** form of this command restores default behavior.

- Each range of remote addresses is configured as a remote address prefix.
- Any BGP peer with a remote address that matches the remote address prefix becomes a member of the associated peer group.

Parameter	Description
<PEER-GROUP-NAME>	Specifies peer group.
<IP-ADDR>/*<MASK>*	Specifies subnet range.
<AS-RANGE>	Specifies AS number as a range in integer or dotted format.
<LIMIT>	Specifies maximum number of peers. Range: 1 to 256.

Restrictions

- Dynamic peers are always passive. Outbound connections to dynamic peers are not supported.
- Dynamic BGP peering is only compatible with peer-groups
- Disabling partial AS range is not supported. The exact value that is configured must be used.
  - When disabling AS range, CLI must use the same AS range that was used when first configured. For example, if AS range "1-4" is configured, when disabling, "1-4" must be used ("1,2,3,4" is not supported).

Configuring overlapping peer ranges with different remote address prefix lengths is not recommended. Peer range configuration is recommended when peer ranges do not overlap.

Usage

- All supported address-families are activated on a dynamic peer for negotiation by default.
- If an incoming connection matches multiple peer range entries, the entry with the longest remote address prefix is selected.
- AS ranges are used to match remote AS presented by connecting peers. Remote AS matching with ASes or AS ranges in this list will be accepted.
  - AS range only applies to dynamic peers.
- The limit option is used to set the maximum number of dynamic BGP peers within the peer range. The default is 512 if no limit is set.
  - If the limit is reached, BGP rejects incoming connections from new dynamic BGP peers until BGP session termination causes the number of dynamic BGP peers to fall below the limit.
  - If the limit is reduced below the current number of dynamic BGP peers, BGP will reject incoming connections from new dynamic BGP peers until the number of dynamic BGP peers falls below the new limit. BGP will not terminate existing BGP sessions with dynamic BGP peers in this case. If an existing BGP session gets terminated, that session will not re-establish until the number of BGP sessions falls below the limit.
- After dynamic peer is configured, additional configuration is required on the peer-group as a whole. Individual member groups are incompatible. For example, the neighbor shutdown command can be executed on a peer-group, but not on individual members of the peer-group.
- When a peer is configured as dynamic and is in an established state, a shutdown is required before reconfiguring as static.
- Connect-retry interval is recommended to be configured with a smaller value than the default value on the active peer.

- When a set of valid and invalid AS values are issued (separated by commas), only the valid values are accepted.
- When the AS range parameter is not explicitly configured in dynamic bgp peering, iBGP session comes up, eBGP session does not. If there are no configured remote AS or AS list entries, DC-BGP assumes that any peer is an iBGP peer.

Examples

```
switch(config-bgp)# neighbor pg listen ip-range 192.168.0.0/16
```

```
switch(config-bgp)# no neighbor pg listen ip-range 192.168.0.0/16
```

neighbor local-as

```
neighbor {<IP-ADDR>|<PEER-GROUP-NAME>} local-as <AS-NUMBER>
no neighbor {<IP-ADDR>|<PEER-GROUP-NAME>} local-as
```

Description

Configures an alternate local AS number that can be used to establish a session with a peer, allowing a router to appear to be a member of a second autonomous system (AS), and its real AS.

Local AS allows two autonomous systems to merge without modifying peering arrangements. This command is valid only for external peers.

The **no** form of this command restores the default, which is for a peering session to be established using the primary AS (primary AS is the AS number specified at the time of neighbor creation using the command `neighbor remote-as`).

Parameter	Description
<IP-ADDR>	Specifies an IP address.
<PEER-GROUP-NAME>	Specifies a peer group.
`local-as` *<AS-NUMBER>*	Specifies a 4-byte AS number in asplain format (z), or asdot format (x.y), where z is a number from 1 to 4294967295 and x and y are 16-bit numbers.

Examples

```
switch(config-bgp)# neighbor 1.1.1.1 local-as 200
switch(config-bgp)# no neighbor 1.1.1.1 local-as
```

```
switch(config-bgp)# neighbor pg local-as 200
switch(config-bgp)# no neighbor pg local-as
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

neighbor maximum-prefix

```
neighbor {<IP-ADDR>|<PEER-GROUP-NAME>}
        maximum-prefix <MAXIMUM> [threshold <THRESHOLD>]
        [restart <INTERVAL>] [warning-only]
no neighbor {<IP-ADDR>|<PEER-GROUP-NAME>} maximum-prefix
```

Description

Sets the maximum number of prefixes that can be received from a neighbor.

By default, the device accepts 128,000 prefixes from a BGP neighbor with a threshold value of 75%. A warning message is generated when the number of prefixes per neighbor reaches 75% of default prefix limit. Another warning message is generated when the default prefix limit is reached.

The session is re-established only if the number of routes received from the BGP peer does not exceed the configured prefix limit. When the restart timer is configured, sessions are automatically re-established when the timer expires.

The **no** form of this command disables the maximum number of prefixes limit.

Parameter	Description
<IP-ADDRESS>	Specifies the IP address of the neighbor in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255, or IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.
<PEER-GROUP-NAME>	Specifies a Peer-Group.
maximum-prefix *<MAXIMUM>*	Specifies the maximum number of prefixes allowed from the

Parameter	Description
	specified neighbor. Range: 1 to 128000. Default: 128000.
`threshold <THRESHOLD>`	Specifies at what percentage of `MAXIMUM` a warning message is generated. Range: 1 to 100. Default: 75. For example, if `MAXIMUM` is set to 1000 and threshold is 70, the router generates a warning message when the number of BGP learned routes from the neighbor exceeds 70 percent of 1000 (700) routes.
`restart <INTERVAL>`	Specifies interval in seconds for restarting the BGP connection when the prefix limit is exceeded. Range: 30 to 65535.
`warning-only`	Specifies generating and logging a warning message without disconnecting the BGP session when the prefix limit is exceeded.

Examples

Setting the prefix limit to 1000 prefixes:

```
switch(config-bgp-ipv4-uc)# neighbor 10.0.0.1 maximum-prefix 1000
```

Enabling logging of a warning message when more than 1000 prefixes are received:

```
switch(config-bgp-ipv4-uc)# neighbor 10.0.0.1 maximum-prefix 1000 warning-only
```

Setting the prefix limit to 1000 prefixes and enabling logging of a warning message when 500 prefixes are received:

```
switch(config-bgp-ipv4-uc)# neighbor 10.0.0.1 maximum-prefix 1000 threshold 50
```

Setting the prefix limit to 1000 prefixes and enabling logging of a warning message when 500 prefixes are received and a second warning when the prefix limit is exceeded without disconnecting the session:

```
switch(config-bgp-ipv4-uc)# neighbor 10.0.0.1 maximum-prefix 1000 threshold 50
warning-only
```

Removing the threshold value:

```
switch(config-bgp-ipv4-uc)# no neighbor 10.0.0.1 maximum-prefix 1000 threshold 50
```

Disabling the maximum-prefix feature:

```
switch(config-bgp-ipv4-uc)# no neighbor 10.0.0.1 maximum-prefix
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

neighbor next-hop-self

```
neighbor {<IP-ADDR>|<PEER-GROUP-NAME>} next-hop-self
no neighbor {<IP-ADDR>|<PEER-GROUP-NAME>} next-hop-self
```

Description

Configures the router as the next hop for a BGP-speaking neighbor or peer group, and enables BGP to send itself as the next hop for advertised routes.

The **no** form of this command resets the peer next-hop-self status to default. The next hop is generated based on the IP.

Parameter	Description
<IP-ADDR>	Specifies the neighbor's IP address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255, or IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.
<PEER-GROUP-NAME>	Specifies a peer group.
`all`	Applies the configuration to all route-reflector clients.

Usage

- An administrator uses this command to make a BGP speaker fill its address when advertising routes to a BGP peer.
- This command is useful in non-meshed networks where BGP neighbors may not have direct access to all other neighbors on the same IP subnet.
- While advertising routes to eBGP peers, the next-hop is set to self IP by default. The default behavior can be changed by configuring next-hop-unchanged.
- While advertising routes to iBGP peers, the next-hop is kept unchanged by default. The default behavior can be changed by configuring next-hop-self.

Examples

Setting and resetting the router as the next hop self for neighbor 1.1.1.1:

```
switch(config-bgp-ipv4-uc)# neighbor 1.1.1.1 next-hop-self
switch(config-bgp-ipv4-uc)# no neighbor 1.1.1.1 next-hop-self
```

Setting and resetting the router as the next hop self for its peer group:

```
switch(config-bgp-ipv4-uc)# neighbor pg next-hop-self
switch(config-bgp-ipv4-uc)# no neighbor pg next-hop-self
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

neighbor next-hop-unchanged

```
neighbor <IP-ADDRESS> next-hop-unchanged
no neighbor <IP-ADDRESS> next-hop-unchanged
```

Description

Enables the neighbor to preserve next-hop while advertising routes to eBGP peers, in the L2VPN EVPN address-family.

The **no** form of this command resets the peer next-hop-unchanged status to default.

Parameter	Description
<IP-ADDRESS>	Specifies the neighbor IP address in the IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255, or in the IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F. **NOTE:** IPv6 MP-BGP peering must not be used for L2VPN EVPN address family, because VXLAN tunnel interface does not support IPv6 addresses.

Examples

```
switch(config-bgp-l2vpn-evpn)# neighbor 1.1.1.1 next-hop-unchanged
```

```
switch(config-bgp-l2vpn-evpn)# neighbor 2001:0db8:85a3::8a2e:0370:7334 next-hop-
unchanged
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

neighbor orf prefix-list in

```
neighbor <IP-ADDRESS> orf-prefix-list <PREFIX-LIST-NAME> in
no neighbor <IP-ADDRESS> orf-prefix-list <PREFIX-LIST-NAME> in
```

Description

Applies an inbound prefix list filter to filter the distribution of BGP neighbor information.

The **no** form of this command restores the default behavior of not applying the prefix list filter.

This command must be used only along with the ORF capability to take effect.

Parameter	Description
<IP-ADDRESS>	Specifies an IP address.
`orf-prefix-list` *PREFIX-LIST-NAME>*	Sends the prefix list name to be filtered.

Usage

To use this command, the following conditions must be met:

- If route-map inbound is also applied on multiple neighbors along with ORF, then the route-map name must be common on all the neighbors.
- If route-map inbound is also applied on an IPv6 AF BGP neighbor, then the route-map sequence number with value 1 cannot be used.

Examples

Applying the inbound prefix list filter:

```
switch(config-bgp-ipv4-uc)# neighbor 1.1.1.1 orf-prefix-list ABC in
```

Removing the inbound prefix list filter:

```
switch(config-bgp-ipv4-uc)# no neighbor 1.1.1.1 orf-prefix-list ABC in
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

neighbor passive

```
neighbor {<IP-ADDR>|<PEER-GROUP-NAME>} passive
no neighbor {<IP-ADDR>|<PEER-GROUP-NAME>} passive
```

Description

Configures a specific neighbor, or all neighbors in a peer-group, as passive, which means that they will not initiate the TCP session.

The neighbor connection must be reset using `clear ip bgp` for this setting to take effect.

The **no** form of this command enables the neighbor to initiate the TCP session.

Parameter	Description
<IP-ADDRESS>	Specifies an IP address.
<PEER-GROUP-NAME>	Specifies a peer group.

Examples

```
switch(config-bgp)# neighbor 1.1.1.1 passive
switch(config-bgp)# no neighbor 1.1.1.1 passive
```

```
switch(config-bgp)# neighbor pg passive
switch(config-bgp)# no neighbor pg passive
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

neighbor password

```
neighbor {<IP-ADDR>|<PEER-GROUP-NAME>}
         password [{ciphertext | plaintext} <PASSWORD>]
no neighbor {<IP-ADDR>|<PEER-GROUP-NAME>}
            password [ciphertext <PASSWORD>]
```

Description

Enables message digest5 (MD5) authentication on a TCP connection between two BGP neighbors. When the password is applied to a peer-group, all the neighbors that are part of peer-group inherit the configured setting.

The neighbor connection must be reset using `clear ip bgp <NEIGHBOR-IP-ADDR>` to allow this configuration to take effect.

The **no** form of this command removes the neighbor password.

Parameter	Description
<IP-ADDR>	Specifies an IP address.
<PEER-GROUP-NAME>	Specifies a Peer-Group.
{ciphertext | plaintext}	Selects the password format.
<PASSWORD>	Specifies the password.

When the password is not provided on the command line, plaintext password prompting occurs upon pressing Enter. The entered password characters are masked with asterisks.

Examples

Enabling message digest5 (MD5) authentication for a neighbor with a provided plaintext password:

```
switch(config-bgp)# neighbor 1.1.1.1 password plaintext doubt_Plane#93
```

Enabling message digest5 (MD5) authentication for a neighbor with a prompted plaintext password:

```
switch(config-bgp)# neighbor 1.1.1.5 password
```

```
Enter the neighbor password: *************
Re-Enter the neighbor password: *************
```

Enabling message digest5 (MD5) authentication for a peer group with a provided plaintext password:

```
switch(config-bgp)# neighbor pg_3 password plaintext doubt_Plane#93
```

Disabling message digest5 (MD5) authentication for a neighbor:

```
switch(config-bgp)# no neighbor 1.1.1.5 password
```

Disabling message digest5 (MD5) authentication for a peer group:

```
switch(config-bgp)# no neighbor pg_3 password
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

neighbor port

```
neighbor {<IP-ADDR>|<PEER-GROUP-NAME>} port <NUMBER>
no neighbor {<IP-ADDR>|<PEER-GROUP-NAME>} port
```

Description

Sets a custom TCP port on which to communicate with the BGP neighbor.

When this configuration is applied for peer-group, all the neighbors that are part of peer-group will inherit this setting. Though the neighbor inherits the configuration from the peer-group, the neighbor-specific command, if configured, takes precedence.

This setting only takes effect after a hard reset of the session.

The **no** form of this command allows a random TCP port to be selected for the communication with the BGP neighbor.

Parameter	Description
<IP-ADDRESS>	Specifies an IP address.
<PEER-GROUP-NAME>	Specifies a peer group.
port *<NUMBER>*	Specifies a TCP port number. Range: 0 to 65535.

Examples

```
switch(config-bgp)# neighbor 1.1.1.1 port 1500
switch(config-bgp)# no neighbor 1.1.1.1 port
```

```
switch(config-bgp)# neighbor PG port 1500
switch(config-bgp)# no neighbor PG port
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

neighbor remote-as

```
neighbor {<IP-ADDR>|<PEER-GROUP-NAME>} remote-as <AS-NUMBER>
no neighbor {<IP-ADDR>|<PEER-GROUP-NAME>} remote-as <AS-NUMBER>
```

Description

Creates a peer, initiates the connection to the peer, and adds an entry to the BGP neighbor table. Specifies a neighbor with an autonomous system (AS) number that identifies the neighbor as internal to the local autonomous system. Otherwise, the neighbor is considered as external. By default, neighbors that are defined using this command, exchange only unicast address prefixes.

The **no** form of this command disables the peer session and deletes the peer information.

Parameter	Description
<IP-ADDR>	Speciies an IP address.

Parameter	Description
<PEER-GROUP-NAME>	Specifies a peer group.
`remote-as <AS-NUMBER>`	Specifies a 4-byte AS number in asplain format (z), or asdot format (x.y), where z is a number from 1 to 4294967295 and x and y are 16-bit numbers in the range 0 to 65535.

Usage

The configured peer AS number is compared with the AS number received in the open message and a peer session is initiated only if both the AS numbers match.

Examples

```
switch(config-bgp)# neighbor 1.1.1.1 remote-as 1
switch(config-bgp)# no neighbor 1.1.1.1 remote-as 1
```

```
switch(config-bgp)# neighbor pg remote-as 1
switch(config-bgp)# no neighbor pg remote-as 1
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

neighbor remove-private-AS

```
neighbor {<IP-ADDRESS>|<PEER-GROUP-NAME>} remove-private-AS
no neighbor {<IP-ADDRESS>|<PEER-GROUP-NAME>} remove-private-AS
```

Description

This command forces the BGP neighbor to drop the private AS numbers. When the outbound update contains a sequence of private AS numbers, this sequence is dropped. If the command is configured for peer-group, then all the neighbors that are part of peer-group will remove the private-AS before sending the BGP update message.

The **no** form of this command allows the private-AS number to be carried in BGP update message.

The neighbor connection must be reset using `clear ip bgp neighbor-ip-address` to allow this configuration to take effect.

Parameter	Description
<IP-ADDRESS>	Specifies an IP address.
<PEER-GROUP-NAME>	Specifies a peer group.

Examples

```
switch(config-bgp)# neighbor 1.1.1.1 remove-private-AS
switch(config-bgp)# no neighbor 1.1.1.1 remove-private-AS
```

```
switch(config-bgp)# neighbor PG remove-private-AS
switch(config-bgp)# no neighbor PG remove-private-AS
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

neighbor route-map

```
neighbor {<IP-ADDRESS>|<PEER-GROUP-NAME>} route-map <MAP-NAME> {in|out}
no neighbor {<IP-ADDRESS>|<PEER-GROUP-NAME>} route-map <MAP-NAME> {in|out}
```

Description

This command applies a route map to incoming or outgoing routes. It configures the route map for modifying the default attributes of the route.

When both peer group and neighbor configuration have route maps associated, then the following configuration applies:

- For outbound route maps, peer group configuration will override the configuration of the neighbor.
- For inbound route maps, neighbor configuration will override the peer group configuration.

The **no** form of this command removes a route map.

Parameter	Description
<IP-ADDRESS>	Specifies an IP address.
<PEER-GROUP-NAME>	Specifies a peer group.
<MAP-NAME>	Specifies the name of the route map.
`in|out`	Sets the route map policy to apply to either the received routes from the neighbor (`in`) or the advertised routes to the neighbor (`out`).

Examples

```
switch(config-bgp-ipv4-uc)# neighbor 1.1.1.1 route-map HPE in
switch(config-bgp-ipv4-uc)# no neighbor 1.1.1.1 route-map HPE in
```

```
switch(config-bgp-ipv4-uc)# neighbor PG route-map HPE in
switch(config-bgp-ipv4-uc)# no neighbor PG route-map HPE in
```

```
switch(config)# route-map Rmap permit seq 10
switch(config-route-map-Rmap-10)# match metric 100
switch(config-route-map-bgp-10)# router bgp 100
switch(config-bgp-ipv4-uc)# neighbor 1.1.1.1 remote-as 100
switch(config-bgp-ipv4-uc)# neighbor 1.1.1.1 route-map Rmap out
```

Configuring inbound route maps in L2VPN EVPN address family.

```
switch(config)# router bgp 100
switch(config-bgp)# neighbor 2.1.1.1 remote-as 100
switch(config-bgp)# neighbor 2.1.1.1 update-source loopback 1
switch(config-bgp)# address-family l2vpn evpn
switch(config-bgp-l2vpn-evpn)# neighbor 2.1.1.1 activate
switch(config-bgp-l2vpn-evpn)# neighbor 2.1.1.1 route-map Rmap in
switch(config-bgp-l2vpn-evpn)# neighbor 2.1.1.1 send-community extended
```

neighbor route-reflector-client

```
neighbor {<IP-ADDRESS>|<PEER-GROUP-NAME>} route-reflector-client
no neighbor {<IP-ADDRESS>|<PEER-GROUP-NAME>} route-reflector-client
```

Description

This command configures the router as a BGP route reflector and the specified peer as its client. The **no** form of this command disables this function.

Parameter	Description
<IP-ADDRESS>	Specifies the neighbor IP address in the IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255, or in the IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F. **NOTE:** Pv6 MP-BGP peering must not be used for L2VPN EVPN address family, because VXLAN tunnel interface does not support IPv6 addresses.
<PEER-GROUP-NAME>	Specifies a peer group.

Examples

```
switch(config-bgp-ipv4-uc)# neighbor 1.1.1.1 route-reflector-client
switch(config-bgp-ipv4-uc)# no neighbor 1.1.1.1 route-reflector-client
```

```
switch(config-bgp-ipv4-uc)# neighbor PG route-reflector-client
switch(config-bgp-ipv4-uc)# no neighbor PG route-reflector-client
```

neighbor send-community

```
neighbor {<IP-ADDRESS>|<PEER-GROUP-NAME>} send-community [standard | extended]
no neighbor {<IP-ADDRESS>|<PEER-GROUP-NAME>} send-community [standard | extended]
```

Description

This command allows community values to be sent to a specific neighbor. When this command is configured for the peer-group, then all the neighbors that are part of peer-group will send the community values to the peers. The parameters `standard` and `extended` send only the respective community numbers. When the command is issued without either of these parameters, both standard and extended communities will be sent to the neighbor.

The **no** form of this command will not allow the neighbor to send community values to the specific neighbors that are part of peer-group.

Parameter	Description
<IP-ADDRESS>	Specifies the neighbor IP address in the IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255, or in the IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F. **NOTE:** IPv6 MP-BGP peering must not be used for L2VPN EVPN address family, because VXLAN tunnel interface does not support IPv6 addresses.
<PEER-GROUP-NAME>	Specifies a peer group.

Examples

```
switch(config-bgp-ipv4-uc)# neighbor 1.1.1.1 send-community standard
switch(config-bgp-ipv4-uc)# no neighbor 1.1.1.1 send-community standard
```

```
switch(config-bgp-ipv4-uc)# neighbor 1.1.1.1 send-community extended
switch(config-bgp-ipv4-uc)# no neighbor 1.1.1.1 send-community
```

```
switch(config-bgp-ipv4-uc)# neighbor PG send-community standard
switch(config-bgp-ipv4-uc)# no neighbor PG send-community standard
```

```
switch(config-bgp-ipv4-uc)# neighbor PG send-community extended
switch(config-bgp-ipv4-uc)# no neighbor PG send-community
switch(config-bgp-l2vpn-evpn)# neighbor 1.1.1.1 send-community standard
switch(config-bgp-l2vpn-evpn)# no neighbor 1.1.1.1 send-community standard
```

```
switch(config-bgp-l2vpn-evpn)# neighbor 1.1.1.1 send-community extended
switch(config-bgp-l2vpn-evpn)# no neighbor 1.1.1.1 send-community
```

```
switch(config-bgp-l2vpn-evpn)# neighbor PG send-community standard
switch(config-bgp-l2vpn-evpn)# no neighbor PG send-community standard
```

```
switch(config-bgp-l2vpn-evpn)# neighbor PG send-community extended
switch(config-bgp-l2vpn-evpn)# no neighbor PG send-community
```

```
switch(config-bgp-l2vpn-evpn)# neighbor 2001:0db8:85a3::8a2e:0370:7334 send-
community extended
switch(config-bgp-l2vpn-evpn)# no neighbor 2001:0db8:85a3::8a2e:0370:7334 send-
community
```

neighbor shutdown

```
neighbor {<IP-ADDRESS>|<PEER-GROUP-NAME>} shutdown
no neighbor {<IP-ADDRESS>|<PEER-GROUP-NAME>} shutdown
```

Description

This command disables the peer session, terminates any active session for the specified neighbor or peer group, and removes all associated routing information. This action can cause the sudden termination of many peering sessions.

The **no** form of this command enables the peer session for the specified neighbor.

Parameter	Description
<IP-ADDRESS>	Specifies an IP address.
<PEER-GROUP-NAME>	Specifies a peer group.

Usage

Sessions are gracefully shut down when graceful-shutdown is enabled. Enter the `neighbor graceful-shutdown` command to enable graceful-shutdown. If graceful-shutdown is configured without delay or local-preference, the default values are used.

Examples

```
switch(config-bgp)# neighbor 1.1.1.1 shutdown
switch(config-bgp)# no neighbor 1.1.1.1 shutdown
```

```
switch(config-bgp)# neighbor pg shutdown
switch(config-bgp)# no neighbor pg shutdown
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

neighbor slow-peer

```
neighbor {<IP-ADDR>|<IPV6-ADDR>} slow-peer
no neighbor {<IPV4-ADDR>|<IPV6-ADDR>} slow-peer
```

Description

Slow peer configuration moves the peer from its normal update group to a slow update group. Removing slow peers allows the normal update group to function without being slowed down and enables faster convergence. Slow peer configuration is applicable only to explicitly configured BGP neighbors. All configured slow peers will be grouped into a slow update group. This group will converge based on the slowest group peer. Dynamic detection and splitting isn't supported. Peers can be statically configured as slow.

The **no** form of this command removes the slow peer configuration.

Parameter	Description
<IP-ADDR>	Specifies a neighbor IP address.
<IPV6-ADDR>	Specifies a neighbor IPv6 address.

Examples

Configuring a neighbor with an IP address of **1.1.1.1** as a slow peer:

```
switch(config-bgp)# neighbor 1.1.1.1 slow-peer
```

Removing the slow peer configuration for a neighbor with an IP address of **1.1.1.1**:

```
switch(config-bgp)# no neighbor 1.1.1.1 slow-peer
```

Configuring a neighbor with an IPv6 address of **2001::2** as a slow peer:

```
switch(config-bgp)# neighbor 2001::2 slow-peer
```

Removing the slow peer configuration for a neighbor with an IPv6 address of **2001::2**:

```
switch(config-bgp)# no neighbor 2001::2 slow-peer
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

neighbor soft-reconfiguration inbound

```
neighbor {<IP-ADDRESS>|<PEER-GROUP-NAME>} soft-reconfiguration inbound
no neighbor {<IP-ADDRESS>|<PEER-GROUP-NAME>} soft-reconfiguration inbound
```

Description

This command enables you to generate inbound updates from a neighbor and change and activate BGP policies without clearing the BGP session. Changes in BGP policies require the BGP session to be cleared which can have a large negative impact on network operations.

The **no** form of this command disables this setting.

Parameter	Description
<IP-ADDRESS>	Specifies an IP address.
<PEER-GROUP-NAME>	Specifies a peer group.

Usage

- To perform inbound soft reconfiguration, the BGP speaker must store all received route updates, regardless of the current inbound policy.
- When inbound soft reconfiguration is enabled, the stored updates are processed by the new policy configuration to create new inbound updates.

Examples

```
switch(config-bgp-ipv4-uc)# neighbor 1.1.1.1 soft-reconfiguration inbound
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

neighbor timers

```
neighbor {<IP-ADDRESS>|<PEER-GROUP-NAME>} timers <KEEPALIVE> <HOLDTIME>
no neighbor {<IP-ADDRESS>|<PEER-GROUP-NAME>} timers <KEEPALIVE> <HOLDTIME>
```

Description

This command sets the timers for a specific BGP neighbor or peer group. When the timer is applied to peer-group then all the neighbors that are part of peer-group will inherit the value configured.

The neighbor connection must be reset using `clear ip bgp <NEIGHBOR-IP-ADDRESS>` to allow this configuration to take effect.

The **no** form of this command clears the timers for a specific BGP neighbor or peer group.

Parameter	Description
<IP-ADDRESS>	Specifies an IP address.
<PEER-GROUP-NAME>	Specifies a peer group.
<KEEPALIVE>	Specifies the Keep-Alive timer value for the neighbor. Default: 60 seconds. Range: 0-65535.
<HOLDTIME>	Specifies the Hold-timer value. Default: 180 seconds. Range: 0-65535.

Examples

```
switch(config-bgp)# neighbor 1.1.1.1 timers 120 360
switch(config-bgp)# no neighbor 1.1.1.1 timers
```

```
switch(config-bgp)# neighbor pg timers 120 360
switch(config-bgp)# no neighbor pg timers
```

neighbor ttl-security-hops

```
neighbor {<IP-ADDRESS> | <PEER-GROUP-NAME>} ttl-security-hops <HOP-COUNT>
no neighbor {<IP-ADDRESS> | <PEER-GROUP-NAME>} ttl-security-hops <HOP-COUNT>
```

Description

This command enables BGP to establish connection with external peers residing on networks that are not directly connected. By enabling this feature, the received TTL from a BGP peer is compared with the difference "255 - *hop-count*". BGP messages coming with a TTL less than this value are not accepted. BGP peering will not be established if the TTL in the session establishment is received with a lower value. Also, by enabling this feature the router will send BGP packets with TTL value of 255 to the neighbor. For a neighbor, either TTL security or `ebgp-multihop` can be configured, not both together. If there are multiple paths to reach the node, then the hop count should be configured considering the longest route.

The **no** form of this command disables the peer ttl-security-hop feature.

Parameter	Description
<IP-ADDRESS>	Specifies an IP address.
<PEER-GROUP-NAME>	Specifies a peer group.
<HOP-COUNT>	Specifies the hop count to reach the neighbor for the eBGP session. Range: 1-255.

Examples

```
switch(config-bgp)# neighbor 1.1.1.1 ttl-security-hops 10
switch(config-bgp)# no neighbor 1.1.1.1 ttl-security-hops
```

```
switch(config-bgp)# neighbor pg ttl-security-hops 5
switch(config-bgp)# no neighbor pg ttl-security-hops
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

neighbor update-source

```
neighbor {<IP-ADDRESS>|<PEER-GROUP-NAME>}
     update-source {<IPv4>|<IPv6> | loopback <NUMBER>}
no neighbor {<IP-ADDRESS>|<PEER-GROUP-NAME>}
     update-source [<IPv4>|<IPv6> | loopback <NUMBER>]
```

Description

This command specifies the source address to reach the neighbor.

An iBGP connection can occur as long as there is a TCP/IP path between the routers. If multiple paths exist between the iBGP routers, using a loopback interface as the neighbor address can add stability to the network. With this command, stability can be achieved by providing the loopback interface address as the source address of the TCP/IP session.

The **no** form of this command negates the route updates of the neighbor.

Parameter	Description
<IP-ADDRESS>	Specifies an IP address.
<PEER-GROUP-NAME>	Specifies a peer group.
<IPV4>	Specifies an interface by IPv4 address.
<IPV6>	Specifies an interface by IPv6 address.
loopback *<NUMBER>*	Specifies a loopback interface number.

Examples

```
switch(config-bgp)# neighbor 1.1.1.1 update-source loopback 1
switch(config-bgp)# no neighbor 1.1.1.1 update-source
```

```
switch(config-bgp)# neighbor PG update-source loopback 1
switch(config-bgp)# no neighbor PG update-source
```

neighbor weight

```
neighbor {<IP-ADDRESS>|<PEER-GROUP-NAME>} weight <WEIGHT-VALUE>
no neighbor {<IP-ADDRESS>|<PEER-GROUP-NAME>} weight <WEIGHT-VALUE>
```

Description

This command assigns a weight to a neighbor connection. When the weight is applied to a peer-group then all the neighbors that are part of the peer-group will inherit the value configured.

The **no** form of this command removes a weight assignment.

Parameter	Description
<IP-ADDRESS>	Specifies an IP address.
<PEER-GROUP-NAME>	Specifies a peer group.
<WEIGHT-VALUE>	Specifies the weigh to be associated with the routes received from the neighbor. Range: 0-65535.

Examples

```
switch(config-bgp)# neighbor 1.1.1.1 weight 500
switch(config-bgp)# no neighbor 1.1.1.1 weight
```

```
switch(config-bgp)# neighbor pg weight 600
switch(config-bgp)# no neighbor pg weight
```

network

```
network {[<IPV4/MASK> | <IPV6/MASK>]} [route-map <ROUTE-MAP-NAME>]
no network {[<IPV4/MASK> | <IPV6/MASK>]} [route-map <ROUTE-MAP-NAME>]
```

Description

This command specifies the networks to be advertised by the Border Gateway Protocol (BGP) routing processes.

The **no** form of this command removes an entry from the routing table.

Parameter	Description
<IPV4/MASK>	Specifies the IPv4 network with mask. For example: 1.1.1.1/24
<IPV6/MASK>	Specifies the IPv6 network with mask. For example: 2001:0db8:85a3::8a2e:0370:7334/24

Parameter	Description
`route-map <ROUTE-MAP-NAME>`	Optional parameter. Specifies a route map to apply to the prefixes advertised by this specific network statement.

Usage

- This command is used to advertise prefixes currently installed in the routing table into the BGP table.
- Use the `route-map` keyword to apply the specified route map to network advertisements. The mask length as configured in the network statement must match the mask length of prefixes in the routing table.

Examples

```
switch(config-bgp-ipv4-uc)# network 11.11.11.0/24
switch(config-bgp-ipv4-uc)# no network 11.11.11.0/24
```

```
switch(config-bgp-ipv6-uc)# network 2001:0db8:85a3::8a2e:0370:7334/24
switch(config-bgp-ipv6-uc)# no network 2001:0db8:85a3::8a2e:0370:7334/24
```

redistribute

```
redistribute {connected|ospf <process ID> |static|local loopback} [route-map <ROUTE-MAP-NAME>]
no redistribute {connected|ospf <process ID> |static|local loopback} [route-map <ROUTE-MAP-NAME>]
```

Description

This command specifies routes to import into BGP. This command causes routes from the specified protocol to be considered for redistribution into BGP.

The **no** form of this command specifies no redistribution into BGP.

Parameter	Description
`connected`	Redistributes directly attached networks (directly attached to the subnet or host).
`ospf`	Redistributes Open Shortest Path First (OSPFv2) routes. It is optional to mention the process ID. Range: <1-65535>
`static`	Redistributes statically configured routes .
`local loopback`	Performs the following functions: ■ Redistributes local routes on loopback interfaces. ■ For EVPN enabled VRFs, it advertises the IP address of loopback interfaces as a EVPN Type-5 prefix route.
`route-map` *`<ROUTE-MAP-NAME>`*	Optional. Specifies a route map to match for redistribution.

Usage

- If a route map is specified, then routes that pass the match clause specified in the route map will be imported into the BGP peer Routing Information Base (RIB).
- Route-maps must be configured prior to being referenced in redistribution statements.
- Redistribute connected is required to redistribute connected subnet even if redistribute local loopback is already configured.

Examples

Redistribute directly attached networks:

```
switch(config-bgp-ipv4-uc)# redistribute connected
switch(config-bgp-ipv4-uc)# no redistribute connected
```

Redistributing local routes on loopback interfaces:

```
switch(config-bgp-ipv4-uc)# redistribute local loopback
switch(config-bgp-ipv4-uc)# no redistribute local loopback
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

Release	Modification
10.14	Supported process ID range expanded from 1-63 to 1-65535.

router bgp

```
router bgp <AS-NUMBER>
no router bgp <AS-NUMBER>
```

Description

This command configures the BGP instance on the router, configures the AS (Autonomous System) the router belongs to, and enters into the BGP router configuration mode. Only a single BGP AS number can be assigned for the entire system.

The **no** form of the command deletes the BGP instance from the router.

Parameter	Description
AS-NUMBER	Specifies a 4-byte AS number in the range 1-4294967295 in integer format or from 0.1-65535.65535 in dotted format.

Examples

Configuring the BGP instance with the AS number:

```

```

Deleting BGP configurations:

```
switch(config)# no router bgp 100
This will delete all BGP configurations on this device.
Continue (y/n)?
```

set extcommunity

```
set extcommunity "[rt <VALUE> | evpn-rmac <MAC-ADDRESS>]"
no set extcommunity [rt | evpn-mac]
```

Description

Sets the extended community number attribute for a route matching the route map. Extended communities are supported only on Route Targets. This command is applicable to OSPF, static, and connected routes which will be redistributed to the BGP protocol.

The **no** form of this command restores the default behavior of not modifying the extended community number attribute of the route.

Parameter	Description
<VALUE>	Sets the extended community number attribute. Specify the information in asn:nn format.
<MAC-ADDRESS>	Specifies MAC address of the Router-MAC extended community. When configuring a route map and using the **set ip next-hop** command. this value can be set for the OUT direction only.

Usage

- Multiple community numbers can be configured within the double quotes.
- 2-byte and 4-byte ASN values are supported in the global administrator component of the extended community attribute.
- 4-byte ASN values must be within the range of 1-4294967295.
- 4-byte ASN values do not support dotted notation.
- Extended communities are only supported on route targets.
- The

Examples

Configuring a set clause in a route-map to modify the community number attribute of the route:

```
switch(config)# route-map abc permit seq 10
switch(config-route-map-abc-10)# set extcommunity rt "1:1 2:2"
```

Configuring a set clause in a route-map to modify the router mac:

```
switch(config)# route-map abc permit seq 1
switch(config-route-map-abc-1)# set extcommunity evpn-mac 00:01:01:90:90:01
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command Information

Platforms	Command context	Authority
6400	config-route-map-abc-10	Administrators or local user group members with execution rights for this command.

show bgp

```
show bgp [{vrf <VRF-NAME>|all-vrf}] [{ipv4 unicast|ipv6 unicast
     |all}] [vsx-peer][update-group [<INDEX>]]
show bgp l2vpn evpn
```

Description

This command shows entries in the BGP routing table.

Parameter	Description
`ipv4`	Selects the IPv4 address family.
`ipv6`	Selects the IPv6 address family.
`unicast`	The subaddress family identifier.
`vrf <VRF-NAME>`	Select to display information by VRFs by specifying the VRF name.
`all-vrf`	Select to display the BGP summary information for all VRFs and address-families.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.
`update-group [<INDEX>]`	Select to display information about update-group and peers which are member of that update-group for given afi/safi. Specifying an integer defines the desired update-group index.

Examples

Showing BGP routing table information for VRF 1 IPv4 unicast:

```
switch# show bgp vrf v1 ipv4 unicast
Status codes: s suppressed, d damped, h history, * valid, > best, = multipath,
             i internal, e external S Stale, R Removed, a additional-paths
Origin codes: i - IGP, e - EGP, ? - incomplete

VRF : v1
Local Router-ID 9.0.0.1

show bgp <PREFIX>

```
show bgp [vrf <VRF-NAME>] {ipv4 unicast <A.B.C.D/M> |
     ipv6 unicast <X::Y/M>} [vsx-peer]
show bgp l2vpn evpn [RD-[ROUTE_TYPE]:[ESI]:[EthTag]:[MAC]:[OrigIP] |
                     RD-[ROUTE_TYPE]:[EthTag]:[OrigIP] |
                     RD-[ROUTE_TYPE]:[ESI]:[EthTag]:[IPAddrLen]:[IPAddr]]
```

Description

This command displays entries in the BGP routing table that are part of the specified network. For EVPN Route-type 2 with MAC only prefix as an input, displays all the prefixes containing the specific MAC address (MAC route, MAC/IP route, Host route).

Parameter	Description
`vrf <VRF-NAME>`	Shows the information for a specified VRF.
`ipv4 unicast <A.B.C.D/M>`	Shows the information for an IPv4 unicast family with an IP prefix (network/length such as 35.0.0.0/8) in the BGP routing table to display.
`ipv6 unicast <X::Y/M>`	Shows the information for an IPv6 unicast family an IPv6 prefix in the BGP routing table to display.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.
`l2vpn evpn`	Shows the information for L2VPN EVPN address family.
`RD-[ROUTE_TYPE]:[ESI]:[EthTag]:[MAC]:[OrigIP]`	EVPN Route-Type 2 prefix.
`RD-[ROUTE_TYPE]:[EthTag]:[OrigIP]`	EVPN Route-Type 3 prefix.
`RD-[ROUTE_TYPE]:[ESI]:[EthTag]:[IPAddrLen]:[IPAddr]`	EVPN Route-Type 5 prefix.

Examples

Showing the entries in the BGP routing table that are part of an IPv4 unicast network

```
switch# show bgp ipv4 unicast 10.0.0.0/16

10.08	Added l2vpn evpn route types
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show bgp community

`show bgp [{ipv4 | ipv6 | ipv4 {vrf <VRF-NAME>}} unicast] community [<VALUE> | <TYPE>]`

Description

This command shows routes that belong to BGP communities. Optionally you can specify displaying information by a specific community or by VRF.

Parameter	Description
`ipv4`	Shows the information for an IPv4 address family.
`ipv6`	Shows the information for an IPv6 address family.
`unicast`	Shows the information for a subaddress family identifier.
`ipv4 vrf <VRF-NAME>`	Shows the information for a specified VRF.
<VALUE>	Shows the information for a community number. Specify the information in `aa:nn` format.

<TYPE>	Shows a specified community type. Select the following well-known communities, as well as others:
	`internet`
	Advertise the prefix to all BGP neighbors.
	`local-as`

Parameter	Description

	Do not advertise the prefix outside the sub-AS.
	`no-advertise`
	Do not advertise the prefix to any BGP neighbors.
	`no-export`
	Do not advertise the prefix to any eBGP neighbors.

`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing information for routes that belong to all BGP communities:

```
switch# show bgp ipv4 unicast community
Status codes: s suppressed, d damped, h history, * valid, &gt; best, = multipath,i
internal, e external S Stale, R Removed, a additional-pathsVRF : defaultLocal
Router-ID 9.0.0.1
Network                Nexthop        Metric     LocPrf     Weight Path
-----------------------------------------------------------------------
*&gt;e 9.0.0.0/24      9.0.0.2        0          100        0      200 ?
*&gt;e 100.0.0.0/24    9.0.0.2        0          100        0      200 ?
*&gt;e 100.0.1.0/24    9.0.0.2        0          100        0      200 ?
*&gt;e 100.0.2.0/24    9.0.0.2        0          100        0      200 ?
*&gt;e 100.0.3.0/24    9.0.0.2        0          100        0      200 ?
*ae 100.0.3.0/24       9.0.0.3        0          100        0      200 ?
                       Total number of entries 6
```

Showing information for routes that belong to the 200:20 BGP community number:

```
switch# show bgp ipv4 unicast community 200:20
Status codes: s suppressed, d damped, h history, * valid, > best, = multipath,

show bgp flap-statistics

`show bgp {vrf <VRF_NAME> | all-vrf} [{ipv4 unicast | ipv6 unicast | all}] flap-statistics`

Description

Displays all the flapped and suppressed routes.

Usage

Status of the route with dampening enabled:

- If the route is available, the history flag is unset.
- If route has been flapping, is not suppressed and is withdrawn; the state of the route is `h`
- If route is currently available but is suppressed due to dampening, the state of the route is `d`
- If the route is unsuppressed and currently withdrawn, the state of the route is `h`

Examples

Showing all the flapped and suppressed routes:

```
switch# show bgp all
Status codes: s suppressed, d damped, h history, * valid, > best, = multipath,
              i internal, e external S Stale, R Removed, a additional-paths
Origin codes: i - IGP, e - EGP, ? - incomplete

VRF : default
Local Router-ID 1.1.1.1

Address-family : IPv4 Unicast
-----------------------------

show bgp neighbor advertised-routes

```
show bgp [vrf <VRF-NAME>] {ipv4 unicast | ipv6 unicast
      | all} neighbors <IP-ADDRESS>
      advertised-routes [vsx-peer]
show bgp l2vpn evpn neighbors <IP-ADDRESS> advertised-routes
```

Description

Shows all routes that have been advertised to the specified neighbor.

Parameter	Description
vrf *<VRF-NAME>*	Shows the information for a specified VRF.
ipv4 unicast	Shows the information for an IPv4 unicast address family.
ipv6 unicast	Shows the information for an IPv6 unicast address family.
l2vpn evpn	Shows the information for L2VPN EVPN address family.
all	Shows the information for all address families and subaddress families.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.
<IP-ADDRESS>	Shows the information for a neighbor IP address.

Examples

Showing routes that have been advertised to the specified IPv4 unicast neighbor:

```
switch# show bgp ipv4 unicast neighbors 9.0.0.1 advertised-routes
Status codes: s suppressed, d damped, h history, * valid, > best, = multipath,
              i internal, e external S Stale, R Removed
Origin codes: i - IGP, e - EGP, ? - incomplete

show bgp neighbor paths

```
show bgp [vrf <VRF-NAME>] {ipv4 unicast | ipv6 unicast
     | all} neighbors <IP-ADDRESS> paths [vsx-peer]
show bgp l2vpn evpn neighbors <IP-ADDRESS> paths
```

Description

Shows autonomous system paths learned from the specified neighbor.

Parameter	Description
`vrf <VRF-NAME>`	Shows the information for a specified VRF.
`ipv4 unicast`	Shows the information for an IPv4 unicast address family.
`ipv6 unicast`	Shows the information for an IPv6 unicast address family.
`all`	Shows the information for all address families and subaddress

Parameter	Description
	families.
<IP-ADDRESS>	Shows the information for a neighbor IP address.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.
l2vpn evpn	Shows the information for L2VPN EVPN address family.

Examples

Showing autonomous system paths learned from the specified IPv4 unicast neighbor:

```
switch# show bgp ipv4 unicast neighbors 192.168.12.2 paths
Status codes: s suppressed, d damped, h history, * valid, > best, = multipath,

show bgp neighbor received orf-prefix-list

`show bgp [vrf <VRF-NAME>]{ipv4 unicast | ipv6 unicast | all} neighbors` *`<IP-ADDRESS>`* `received orf-prefix-list`

Description

Shows all the prefix lists received from the specified neighbor.

Parameter	Description
`vrf` *`<VRF-NAME>`*	Shows the information for a specified VRF.
`ipv4 unicast`	Shows the information for an IPv4 unicast address family.
`ipv6 unicast`	Shows the information for an IPv6 unicast address family.
`all`	Shows the information for all address families and subaddress families.
`<IP-ADDRESS>`	Shows the information for a neighbor IP address.

Examples

Showing received prefix list from the specified neighbor:

```
switch# show bgp ipv4 unicast neighbors A.B.C.D received orf-prefix-list
Address family: IPv4 Unicast

  ip prefix-list 10.0.0.200: 4 entries

     seq 10 permit 28.119.16.0/24

     seq 15 deny 28.119.19.0/24

     seq 20 permit 28.119.17.0/24

  Address family: IPv6 Unicast

  ip prefix-list 10.0.0.200: 4 entries

       seq 30 permit 2000::/64

       seq 35 deny 3000::/64
```

```
        seq 40 permit 4000:0/64
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show bgp neighbor received-routes

```
show bgp [vrf <VRF-NAME>] {ipv4 unicast | ipv6 unicast
     | all} neighbors <IP-ADDRESS> received-routes [vsx-peer]
show bgp l2vpn evpn neighbors <IP-ADDRESS> received-routes
```

Description

Shows received routes from the specified neighbor.

Parameter	Description
`vrf <VRF-NAME>`	Shows the information for a specified VRF.
`ipv4 unicast`	Shows the information for an IPv4 unicast address family.
`ipv6 unicast`	Shows the information for an IPv6 unicast address family.
`all`	Shows the information for all address families and subaddress families.
`<IP-ADDRESS>`	Shows the information for a neighbor IP address.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing received routes from the specified IPv4 unicast neighbor:

```
switch# show bgp ipv4 unicast neighbors 192.168.12.1 received-routes
Status codes: s suppressed, d damped, h history, * valid, > best, = multipath,
              i internal, e external S Stale, R Removed, a additional-paths
Origin codes: i - IGP, e - EGP, ? - incomplete

VRF : default
Local Router-ID 9.0.0.2

show bgp neighbor routes

```
show bgp [vrf <VRF-NAME>] {ipv4 unicast | ipv6 unicast
     | all} neighbors <IP-ADDRESS> routes [vsx-peer]
```

Description

This command shows routes that are received and accepted from the specified neighbor.

Parameter	Description
`vrf <VRF-NAME>`	Shows the information for a specified VRF.
`ipv4 unicast`	Shows the information for an IPv4 unicast address family.
`ipv6 unicast`	Shows the information for an IPv6 unicast address family.
`all`	Shows the information for all address families and subaddress families.
`<IP-ADDRESS>`	Shows the information for a neighbor IP address.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing all routes that are received and accepted from the specified neighbor:

```
switch# show bgp ipv4 unicast neighbors 9.0.0.2 routes
Status codes: s suppressed, d damped, h history, * valid, > best, = multipath,
              i internal, e external S Stale, R Removed, a additional-paths
Origin codes: i - IGP, e - EGP, ? - incomplete

show bgp neighbors

```
show bgp [vrf <VRF-NAME>] {ipv4 unicast | ipv6 unicast | all}
     neighbors [vsx-peer]
show bgp l2vpn evpn neighbors
```

Description

This command shows information about BGP and TCP connections to neighbors. If neighbors are member of a peer-group, the command shows the configured values inherited from the peer-group. The configured values are postfixed with a caret (^) for inherited values.

Parameter	Description
`vrf <VRF-NAME>`	Shows the information for a specified VRF.

Parameter	Description
ipv4 unicast	Shows the information for an IPv4 unicast address family.
ipv6 unicast	Shows the information for an IPv6 unicast address family.
all	Shows the information for all address families and subaddress families.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.
l2vpn evpn	Shows the information for L2VPN EVPN address family.

Examples

Showing all information about BGP and TCP connections to neighbors:

```
switch# show bgp all neighbors
Codes: ^ Inherited from peer-group
VRF : default

show bgp paths

```
show bgp [vrf <VRF-NAME>] {ipv4 unicast | ipv6 unicast | all}
     paths [vsx-peer]
show bgp l2vpn evpn paths
```

Description

Shows received BGP path information in the database.

Parameter	Description
`vrf <VRF-NAME>`	Shows the information for a specified VRF.
`ipv4 unicast`	Shows the information for an IPv4 unicast address family.
`ipv6 unicast`	Shows the information for an IPv6 unicast address family.
`all`	Shows the information for all address families and subaddress families.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.
`l2vpn evpn`	Shows the information for L2VPN EVPN address family.

Examples

Showing received BGP path information from the specified IPv4 unicast neighbor:

```
switch# show bgp ipv4 unicast paths
Status codes: s suppressed, d damped, h history, * valid, > best, = multipath,
             i internal, e external S Stale, R Removed, a additional-paths
VRF : default
Local Router-ID 9.0.0.1
```

```
    Network                Nexthop          PathID      Path

show bgp peer-group summary

```
show bgp [vrf <VRF-NAME>] {ipv4 unicast |
     ipv6 unicast | all} peer-group <PEER-GROUP-NAME>
     summary [vsx-peer]
show bgp l2vpn evpn peer-group <PEER-GROUP-NAME> summary
```

Description

This command shows the peer-group information in the database.

Parameter	Description
`vrf <VRF-NAME>`	Shows the information for a specified VRF.
`ipv4 unicast`	Shows the information for an IPv4 unicast address family.
`ipv6 unicast`	Shows the information for an IPv6 unicast address family.
`all`	Shows the information for all address families and subaddress families.
`<PEER-GROUP-NAME>`	Shows the information for the BGP peer-group for the BGP instance.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.
`l2vpn evpn`	Shows the information for L2VPN EVPN address family. This parameter only applies to 8100, 8325, 9300, and 8360 series switches.

Examples

Showing the information from IPv4 unicast address families in `pg_name1` peer-group:

```
switch# show bgp ipv4 unicast peer-group pg_name1 summary
Codes: * Dynamic Neighbor
VRF : default
BGP Peer-Group Summary
=======================
 Local AS               : 1            BGP Router Identifier  : 2.2.2.2

6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show bgp summary

```
show bgp [vrf <VRF-NAME>] {ipv4 unicast | ipv6 unicast | all}
     summary [vsx-peer]
show bgp l2vpn evpn summary
```

Description

This command shows a summary of the status of Border Gateway Protocol (BGP) connections.

Parameter	Description
`ipv4 unicast`	Selects to display the BGP summary information for the IPv4 subaddress family identifier.
`ipv6 unicast`	Selects to display the BGP summary information for the IPv6 subaddress family identifier.
`all`	Selects to display the BGP summary information for all VRFs and address-families.
`vrf` *`<VRF-NAME>`*	Selects to display information by VRFs by specifying the VRF name.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.
`l2vpn evpn`	Shows the information for L2VPN EVPN address family. This parameter only applies to 8100, 8325, 9300, and 8360 series switches.

Examples

Showing BGP summary information for all address-families:

```
switch(config-bgp)# show bgp all summary
Codes: * Dynamic Neighbor

show bgp l2vpn evpn vni route-type

`show bgp l2vpn evpn vni <VNI-Value> route-type <ROUTE-TYPE-Value>`

Description

Shows the BGP L2VPN information for the particular EVPN VNI and routes type.

Parameter	Description
<VNI-Value>	Specifies the VNI.
<ROUTE-TYPE-Value>	Specifies the routes filtered by NLRI route type.

Examples

Showing BGP L2VPN information for the particular EVPN VNI and route type:

```
switch# show bgp l2vpn evpn vni 30000 route-type 5
Status codes: s suppressed, d damped, h history, * valid, > best, = multipath,
              i internal, e external S Stale, R Removed
Origin codes: i - IGP, e - EGP, ? - incomplete

show bgp l2vpn evpn vtep

`show bgp l2vpn evpn vtep <IP-address>`

Description

Shows the BGP L2VPN information for the particular EVPN VTEP IP address.

Parameter	Description
<IP-address>	Specifies the VTEP IP address.

Examples

Showing BGP L2VPN information for the particular EVPN VTEP IP:

```
switch# show bgp l2vpn evpn vtep 1.1.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, = multipath,
              i internal, e external S Stale, R Removed
Origin codes: i - IGP, e - EGP, ? - incomplete

EVPN Route-Type 2 prefix: [2]:[ESI]:[EthTag]:[MAC]:[OrigIP]
EVPN Route-Type 3 prefix: [3]:[EthTag]:[OrigIP]

show bgp l2vpn evpn vtep route-type

`show bgp l2vpn evpn vtep <IP-address> route-type <ROUTE-TYPE-Value>`

Description

Shows the BGP L2VPN information for the particular EVPN VTEP IP address and routes type.

Parameter	Description
<IP-address>	Specifies the VTEP IP address.
<ROUTE-TYPE-Value>	Specifies the routes filtered by NLRI route type.

Examples

Showing BGP L2VPN information for the particular EVPN VTEP and route type:

```
switch# show bgp l2vpn evpn vtep 1.1.1.1 route-type 5
Status codes: s suppressed, d damped, h history, * valid, > best, = multipath,

show running-config bgp

```
show running-config bgp [vsx-peer]
```

Description

This command shows all configured BGP commands.

Parameter	Description
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

EVPN only applies to 8100, 8325, 8360, 9300, 6300 and 6400 series switches.

```
switch# show running-config bgp
router bgp 65534.65535
    bgp asnotation dotted
    network 2.2.2.0/24
    neighbor 1.1.1.2 remote-as 65533.65535
    address-family ipv4 unicast
      neighbor 1.1.1.2 activate
      neighbor 1.1.1.2 route-map A out
      vrf v1
    address-family l2vpn evpn
      neighbor 1.1.1.2 activate
      neighbor 1.1.1.2 send-community extended
    exit-address-family
```

timers bgp

```
timers bgp <KEEPALIVE> <HOLDTIME>
no timers bgp <KEEPALIVE> <HOLDTIME>
```

Description

The command adjusts BGP network timers.

The **no** form of this command resets the BGP timers to defaults of 60 seconds for the keepalive timer and 180 seconds for the holdtime timer.

Parameter	Description
<KEEPALIVE>	Sets the value for keepalive timer. Default: 60 seconds. Range: 0-65535.
<HOLDTIME>	Sets the value for holdtime timer. Default: 180 seconds. Range: 0-65535.

Usage

- The keepalive timer is the number of seconds a BGP peer waits for a keep-alive message from a BGP peer before deciding the connection is down.

The holdtime timer is the number of seconds a BGP peer waits after not receiving a keepalive, update, or notification message before declaring that a connection with BGP peer is down.

- When a session is started, BGP negotiates holdtime with the neighbor, and selects the smaller value. The keepalive timer is then set based on the negotiated holdtime and the configured keepalive time.

Examples

```
switch(config-bgp)# timers bgp 100 150
switch(config-bgp)# no timers bgp
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

6300 6400	config-bgp	Administrators or local user group members with execution rights for this command.

vrf

```
vrf <VRF-NAME>
no vrf <VRF-NAME>
```

Description

Creates a VRF instance named <*VRF-NAME*> and then enters its context. Use **default** for <*VRF-NAME*> to enter the default VRF configure context.

Except for the default VRF, the **no** form of the command deletes the named VRF instance and any IP configuration for interfaces or SVI linked to default VRF. The default VRF cannot be deleted and a warning is given if attempted. To erase the Route-Distinguisher and Route-Targets, enter the default VRF context and delete them manually one by one.

Parameter	Description
<VRF-NAME>	Specifies the VRF name. Range: Up to 32 alphanumeric characters. The **mgmt** VRF cannot be used.

Examples

Creating the VRF named **cust_A** and then entering its context:

```
switch(config)# vrf cust_A
```

Entering the **default** VRF context:

```
switch(config)# vrf default
```

Deleting the VRF named **test**:

```
switch(config)# no vrf test
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

BIDIR-PIM commands

ip pim-bidir

```
ip pim-bidir [enable | disable]
```

Description

Enables or disables PIM-Bidir in the designated interface. This command works in the interface context, including loopback. The IP address must be configured on the interface to enable BIDIR-PIM.

Parameter	Description
`[enable]`	Enables PIM Bidirectional on the interface.
`[disable]`	Disables PIM Bidirectional on the interface.

Example

Enabling PIM-Bidir:

```
switch(config)# interface vlan40
switch(config-if-vlan)# ip address 40.0.0.4/24
switch(config-if-vlan)# ip pim-bidir enable
```

Disabling PIM-Bidir:

```
switch(config)# interface vlan40
switch(config-if-vlan)# ip address 40.0.0.4/24
switch(config-if-vlan)# ip pim-bidir disable
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

ip pim-bidir hello-delay

```
ip pim-bidir hello-delay <DELAY-VALUE>
no ip pim-bidir hello-delay <DELAY-VALUE>
```

Description

Changes the maximum time, in seconds, before the router transmits the initial PIM hello message on the current interface. The **no** form of this command removes the currently configured value and sets it to default. The default value is 5.

Parameter	Description
<DELAY-VALUE>	Configures the given value as the hello interval. Range: <0-5>.

Usage

In cases where a new L3 interface activates with connections to multiple routers, if all of the connected routers sent hello packets at the same time, the receiving router could momentarily become overloaded. This value randomizes the transmission delay to a time between 0 and the hello delay setting. Using 0 means no delay. After the router sends the initial hello packet to a newly detected L3 interface, it sends subsequent hello packets according to the current Hello Interval setting.

Example

Changing the maximum time before the router transmits the initial PIM hello message on the current interface to 4 seconds:

```
switch(config)# interface vlan40
switch(config-if-vlan)# ip pim-bidir hello-delay 4
```

Removing the maximum time before the router transmits the initial PIM hello message on the current interface from 4 seconds and reverting to the default:

Disabling hello-delay:

```
switch(config)# interface vlan40
switch(config-if-vlan)# no ip pim-bidir hello-delay
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

ip pim-bidir lan-prune-delay

```
ip pim-bidir lan-prune-delay
no ip pim-bidir lan-prune-delay
```

Description

Enables the LAN prune delay option on the current interface. The **no** form of this command disables the LAN prune delay option.

Usage

With LAN prune delay enabled, the router informs the downstream neighbors how long it waits before pruning a flow after receiving a prune request. Other downstream routers on the same subnet must send a join to override the prune before the LAN prune delay time for the flow to continue. This prompts any downstream neighbors with multicast receivers that continue to belong to the flow to reply with a join. If no joins are received after the LAN prune delay and override-interval period, the router prunes the flow. The propagation-delay and override-interval settings determine the LAN prune delay setting. It is enabled by default.

Example

Enabling the LAN prune delay option:

```
switch(config)# interface vlan40
switch(config-if-vlan)# ip pim-bidir lan-prune-delay
```

Disabling the LAN prune delay option:

```
switch(config)# interface vlan40
switch(config-if-vlan)# no ip pim-bidir lan-prune-delay
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.13	Command introduced

Command Information

ip pim-bidir override-interval

```
ip pim-bidir override-interval <INTERVAL-VALUE>
no ip pim-bidir override-interval <INTERVAL-VALUE>
```

Description

Configures the override interval that gets inserted into the Override Interval field of a LAN prune delay option. The no form of this command removes the currently configured value and sets it to the default. The default value is 2500 milliseconds.

Parameter	Description
<INTERVAL-VALUE>	Specifies override interval value. Range: 500-6000. Default: 2500.

Example

Configuring the override interval value to 4000:

```
switch(config)# interface vlan40
switch(config-if-vlan)# ip pim-bidir override-interval 4000
```

Removing the override interval value and setting to default:

```
switch(config)# interface vlan40
switch(config-if-vlan)# no ip pim-bidir override-interval
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ip pim-bidir propagation-delay

```
ip pim-bidir propagation-delay <DELAY-VALUE>
no ip pim-bidir propagation-delay <DELAY-VALUE>
```

Description

Configures the propagation delay that gets inserted into the propagation delay field of a LAN prune delay option. The **no** form of this command removes any configuration and resets to the default. Default: 500 milliseconds.

Parameter	Description
<DELAY-VALUE>	Specifies the propagation delay in milliseconds. Range: 250-2000. Default: 500.

Example

Configuring the propagation delay to to 400 milliseconds:

```
switch(config)# interface vlan40
switch(config-if-vlan)# ip pim-bidir propagation-delay 400
```

Removing the propagation delay and setting to default:

```
switch(config)# interface vlan40
switch(config-if-vlan)# no ip pim-bidir propagation-delay
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

show ip pim dfe

`show ip pim dfe [vrf <VRF-NAME> | all-vrfs]`

Description

Displays the Designated Forwarder information for a given interface and RP address in the topology. This prints the winner address along with winner metric details to reach RPA and its uptime details for a given VRF. If a VRF is not specified, the default is displayed.

Parameter	Description
<VRF-NAME>	Specifies the VRF.
[all-vrfs]	Specifies all VRFs.

Example

Displaying the Designated Forwarder information for the default VRF:

```
switch# show ip pim dfe
PIM BIDIR DFE Information

VRF                           : default
Total number of DFE entries   : 2

show ip pim dfe

`show ip pim dfe <INTERFACE-NAME> <RP-ADDRESS>`

Description

Displays the Designated Forwarder information for all interfaces of an RP address in the topology. This prints the winner address along with winner metric details to reach RPA and its uptime details for a given VRF. If a VRF is not specified, the default is displayed.

Parameter	Description
<INTERFACE-NAME>	Specifies the interface.
<RP-ADDRESS>	Specifies the RP address.

Example

Displaying the Designated Forwarder information for 1.1.1.1:

```
switch# show ip pim dfe vlan10 1.1.1.1
PIM BIDIR DFE Information

VRF                            : default

Interface         RPA              DF Winner        Metric           Uptime
(HH:MM:SS)
vlan10            1.1.1.1          10.1.1.3         100              00:33:15
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Chapter 13
Boot commands

boot fabric-module

```
boot fabric-module <SLOT-ID>
```

Description

Reboots the specified fabric module.

Parameter	Description
<SLOT-ID>	Specifies the member and slot of the module in the format **member/slot**. For example, to specify the module in member 1 slot 3, enter **1/3**.

Usage

The **boot fabric-module** command reboots the specified fabric module. Traffic performance is affected while the module is down.

If the specified module is the only fabric module in an up state, rebooting that module stops traffic switching between line modules and the line modules power down. The line modules power up when one fabric module returns to an up state.

This command is valid for fabric modules only.

Examples

Rebooting the fabric module in slot **1/3** when auto-confirm is not enabled:

```
switch# boot fabric-module 1/3
This command will reboot the specified fabric module.  Traffic performance may
be affected while the module is down.  Rebooting the last fabric module will
stop traffic switching between line modules.
Do you want to continue (y/n)? y

switch#
```

Rebooting the fabric module in slot **1/1** when auto-confirm is enabled:

```
switch# boot fabric-module 1/3
This command will reboot the specified fabric module.  Traffic performance may
be affected while the module is down.  Rebooting the last fabric module will
stop traffic switching between line modules.
Do you want to continue (y/n) y (auto-confirm)

switch#
```

For more information on features that use this command, refer to the Fundamentals Guide or the Monitoring Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	Manager (#)	Administrators or local user group members with execution rights for this command.

boot line-module

```
boot line-module <SLOT-ID>
```

Description

Reboots the specified line module.

Parameter	Description
<SLOT-ID>	Specifies the member and slot of the module in the format **member/slot**. For example, to specify the module in member 1 slot 3, enter **1/3**.

Usage

This command is supported on switches that have multiple line modules.

Reboots the specified line module. Any traffic for the switch passing through the affected module (SSH, TELNET, and SNMP) is interrupted. It can take up to 2 minutes to reboot the module. During that time, you can monitor progress by viewing the event log.

This command is valid for line modules only.

Examples

Reloading the module in slot 1/1:

```
switch# boot line-module 1/1
This command will reboot the specified line module and interfaces on this
module will not send or receive packets while the module is down. Any
traffic passing through the line module will be interrupted. Management
sessions connected through the line module will be affected. It might take
up to 2 minutes to complete rebooting the module. During that time, you can
monitor progress by viewing the event log.
Do you want to continue (y/n)? y
switch#
```

For more information on features that use this command, refer to the Fundamentals Guide or the Monitoring Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	Manager (#)	Administrators or local user group members with execution rights for this command.

boot management-module

```
boot management-module {active | standby | <SLOT-ID>}
```

Description

Reboots the specified management module. Choose the management module to reboot by role (active or standby) or by slot number.

Parameter	Description
active	Selects the active management module.
standby	Selects the standby management module.
<SLOT-ID>	Specifies the member and slot of the management module in the format **member/slot**. For example, to specify the module in member 1 slot 5, enter **1/5**.

Usage

This command is supported on switches that have multiple management modules.

This command reboots a single management module in a chassis. Choose the management module to reboot by role (active or standby) or by slot number.

You can use the **show images** command to show information about the primary and secondary system images.

If you reboot the active management module and the standby management module is available, the active management module reboots and the standby management module becomes the active management module.

If you reboot the active management module and the standby management module is not available, you are warned, you are prompted to save the configuration, and you are prompted to confirm the operation.

If you reboot the standby management module, the standby management module reboots and remains the standby management module.

If you attempt to reboot a management module that is not available, the **boot** command is aborted.

Saving the configuration is not required. However, if you attempt to save the configuration and there is an error during the save operation, the **boot** command is aborted.

Hewlett Packard Enterprise recommends that you use the **boot management-module** command instead of pressing the module reset button to reboot a management module because if you are rebooting the only available management module, the **boot management-module** command enables you to save the configuration, cancel the reboot, or both.

Examples

Rebooting the active management module when the standby management module is available:

```
switch# boot management-module active
The management-module in slot 1/5 is going down for reboot now.
```

Rebooting the active management module when the standby management module is not available:

```
switch# boot management-module 1/5
The management module in slot 1/5 is currently active and no
standby management module was found.
This will reboot the entire switch.

Do you want to save the current configuration (y/n)? n

This will reboot the entire switch and render it unavailable
until the process is complete.
Continue (y/n)? y
The system is going down for reboot.
```

command, refer to the Fundamentals Guide or the Monitoring Guide for your switch model.

6300 6400	Manager (#)	Administrators or local user group members with execution rights for this command.

boot management-module (recovery console)

`boot management-module {local|remote}`

Description

Reboots the specified management module by specified location (local or remote).

Parameter	Description
<local>	Reboots the local management module.
<remote>	Reboots the remote management module.

Usage

This command is supported on switches that have multiple management modules.

This command reboots a single management module in a chassis. Choose the management module to reboot by role (active or standby) or by slot number.

You can use the **show images** command to show information about the primary and secondary system images.

If you reboot the active management module and the standby management module is available, the active management module reboots and the standby management module becomes the active management module.

If you reboot the active management module and the standby management module is not available, you are warned, you are prompted to save the configuration, and you are prompted to confirm the operation.

If you reboot the standby management module, the standby management module reboots and remains the standby management module.

If you attempt to reboot a management module that is not available, the **boot** command is aborted.

Saving the configuration is not required. However, if you attempt to save the configuration and there is an error during the save operation, the **boot** command is aborted.

Hewlett Packard Enterprise recommends that you use the **boot management-module** command instead of pressing the module reset button to reboot a management module because if you are rebooting the only available management module, the **boot management-module** command enables you to save the configuration, cancel the reboot, or both.

Examples

Booting a remote management module:

```
switch# boot management-module remote
There is no other management module installed.
Aborting.
switch#
```

command, refer to the Fundamentals Guide or the Monitoring Guide for your switch model.

Command History

Release	Modification
10.12	Command introduced.

Platforms	Command context	Authority
6300 6400	Manager (#)	Administrators or local user group members with execution rights for this command.

boot set-default

```
boot set-default {primary | secondary}
```

Description

Sets the default operating system image to use when the system is booted.

Parameter	Description
`primary`	Selects the primary network operating system image.
`secondary`	Selects the secondary network operating system image.

Example

Selecting the primary image as the default boot image:

```
switch# boot set-default primary
Default boot image set to primary.
```

For more information on features that use this command, refer to the Fundamentals Guide or the Monitoring Guide for your switch model.

Command Information

Platforms	Command context	Authority
All platforms	Manager (#)	Administrators or local user group members with execution rights for this command.

boot system

```
boot system [primary | secondary | serviceos]
```

Description

Reboots all modules on the switch. By default, the configured default operating system image is used. Optional parameters enable you to specify which system image to use for the reboot operation and for future reboot operations.

Parameter	Description
`primary`	Selects the primary operating system image for this reboot and sets the configured default operating system image to **primary** for future reboots.
secondary	Selects the secondary operating system image for this reboot and sets the configured default operating system image to **secondary** for future reboots.
`serviceos`	Selects the service operating system for this reboot. Does not change the configured default operating system image. The service operating system acts as a standalone bootloader and recovery OS for switches running the AOS-CX operating system and is used in rare cases when troubleshooting a switch.

Usage

This command reboots the entire system. If you do not select one of the optional parameters, the system reboots from the configured default boot image.

You can use the **show images** command to show information about the primary and secondary system images.

Choosing one of the optional parameters affects the setting for the default boot image:

- If you select the **primary** or **secondary** optional parameter, that image becomes the configured default boot image for future system reboots. The command fails if the switch is not able to set the operating system image to the image you selected.

You can use the **boot set-default** command to change the configured default operating system image.

- If you select **serviceos** as the optional parameter, the configured default boot image remains the same, and the system reboots all management modules with the service operating system.

If the configuration of the switch has changed since the last reboot, when you execute the **boot system** command you are prompted to save the configuration and you are prompted to confirm the reboot operation.

Saving the configuration is not required. However, if you attempt to save the configuration and there is an error during the save operation, the **boot system** command is aborted.

Examples

Rebooting the system from the configured default operating system image:

```
switch# boot system
Do you want to save the current configuration (y/n)? y
The running configuration was saved to the startup configuration.
```

```
This will reboot the entire switch and render it unavailable
until the process is complete.
Continue (y/n)? y
The system is going down for reboot.
The system is going down for reboot.
```

Rebooting the system from the secondary operating system image, setting the secondary operating system image as the configured default boot image:

```
switch# boot system secondary
Default boot image set to secondary.

Do you want to save the current configuration (y/n)? n

This will reboot the entire switch and render it unavailable
until the process is complete.
Continue (y/n)? y
The system is going down for reboot.
```

Canceling a system reboot:

```
switch# boot system

Do you want to save the current configuration (y/n)? n

This will reboot the entire switch and render it unavailable
until the process is complete.
Continue (y/n)? n
Reboot aborted.
switch#
```

For more information on features that use this command, refer to the Fundamentals Guide or the Monitoring Guide for your switch model.

show boot-history

```
show boot-history [all|{vsf member <1-10>}]
```

Description

Shows boot history information. When no parameters are specified, shows the most recent information about the current boot operation, and the three previous boot operations for the switch. When the **all** parameter is specified, the output of this command shows the boot information for the active management module.

For switches that support line modules (such as 6400 switch series) including the **all** parameter displays information for the active management module and all available line modules.

To view boot-history on a standby, the command must be sent on the conductor console.

Parameter	Description
`all`	Optional. Shows boot information for the active management module. For switches that support line modules, including this parameter displays information for and all available line modules.
`vsf member <1-10>`	Optional. Display boot history for the specified VSF member

Usage

This command displays the boot-index, boot-ID, and up time in seconds for the current boot. If there is a previous boot, it displays boot-index, boot-ID, reboot time (based on the time zone configured in the system) and reboot reasons. Previous boot information is displayed in reverse chronological order.

The output of this command includes the following information:

Parameter	Description
`Index`	The position of the boot in the history file. Range: 0 to 3.
`Boot ID`	A unique ID for the boot . A system-generated 128-bit string.
`Current Boot, up for <time>`	For the current boot, the **show boot-history** command shows the number of seconds the module has been running on the current software.
`<Timestamp>: boot reason`	For previous boot operations, the **show boot-history** command shows the time at which the operation occurred and the reason for the boot. The reason for the boot is one of the following values: ■ ***<DAEMON-NAME>* crash**: The daemon identified by *<DAEMON-NAME>* caused the module to boot. ■ **Kernel crash**: The operating system software associated with the module caused the module to boot. ■ **Uncontrolled reboot**: The reason for the reboot is not known. ■ **Reboot requested through database**: The reboot occurred because of a request made through the CLI or other API. For details, see , show boot-history

Table 1: *Description of reboots handled through the database*

Boot History String	Description
Reboot requested by user	A user requested a switch reboot through the CLI or web UI.
Reset button pressed	The switch detected a short-press of the reset button
Backplane fault	A backplane fault occurred.
Configuration change	A configuration change resulted in a reboot.
Configuration version migration	A configuration version migration occurred which required a reboot.
Console error	The console failed to start.
Fabric fault	A fabric fault occurred.
All line modules faulted	A zero line card condition occurred.
Redundancy switchover requested	A user requested a redundancy switchover.
Redundant Management communication timeout	The standby management module has taken over from an unresponsive active management module.
Redundant Management election timeout	A failure to elect a standby management module in the allotted time.
Critical service fault (error)	A daemon critical to switch operation has stopped functioning. An extra error string may be present to describe the error in detail.
VSF autojoin renumber	Reset triggered by VSF autojoin.
VSF member renumbered	A user requested a renumber of a VSF member.
VSF switchover requested	A user requested a VSF switchover.
VSX software update	Reset triggered by a VSX software update.
Chassis critical temperature	Chassis operating temperature exceeded.
Chassis low critical temperature	Chassis temperature below the minimum operating threshold.
Chassis insufficient fans	Insufficient fans to cool the chassis.
Chassis unsupported PSUs/fans	Unsupported or misconfigured PSUs or system fans.
Management module critical temperature	Management module operating temperature exceeded.
ISSU SMM update	Standby management module reboot triggered by an In-Service Software Upgrade (ISSU).
ISSU switchover	Redundancy switchover triggered by an In-Service Software Upgrade.

Boot History String	Description
ISSU aborted	Standby management module reset triggered by failure during an In-Service Software Upgrade.
Rollback timer expired	Reset triggered by the ISSU rollback timer expiring.

Examples

Showing the boot history of the active management module:

```
switch# show boot-history

Chapter 14

Cable diagnostic commands

diag cable-diagnostic

```
diag cable-diagnostic
   test <IF-NAME>
   show <IF-NAME>
   clear <IF-NAME>
```

Description

Provides information about the cable health after running a diagnostic test on an interface.

If you run a new cable diagnostic command when a cable diagnostic is in progress for the interface, the new cable diagnostic command fails to execute. In such a scenario, an error message is displayed.

On executing a cable diagnostic test command, it automatically clears the old test results before the new test starts.

Parameter	Description
<IF-NAME>	Specifies the name of the interface.
`test` *<IF-NAME>*	Runs a cable diagnostic test on an interface.
`show` *<IF-NAME>*	Displays the diagnostic test result for an interface.
`clear` *<IF-NAME>*	Clears the cable diagnostic test results for an interface.

Examples

On the 6400 Switch Series, interface identification differs.

The following example displays running a cable diagnostic test on interface `1/3/1`:

```
switch# diag cable-diagnostic test 1/3/1
This command will cause a loss of link on the port under test and will take
several seconds to complete.
Continue (y/n)? y
```

The following example displays the error message on executing a cable diagnostic command while the current diagnostic test is in progress:

```
switch# diag cable-diagnostic test 1/3/1
A cable diagnostic test for interface 1/3/1 is already in progress.
```

The following example displays the error message when cable diagnostic test is requested for an unsupported port:

```
switch# diag cable-diagnostic test 1/3/1
Cable diagnostic is not supported on interface 1/3/1.
```

The following examples display the cable diagnostic test result for 1GbT interface:

```
switch# diag cable-diagnostic show 1/3/1
                          Cable        Impedance   Distance*   MDI
Interface        Pinout   Status       (Ohms)      (Meters)    Mode
--------------------------------------------------------------------
1/3/1            1-2      good         85-115       10 +/- 10  mdi
(1GbT)           3-6      good         85-115       10 +/- 10  mdi
                 4-5      good         85-115        5 +/- 10  mdi
                 7-8      good         85-115        3 +/- 10  mdi

* Full cable length for good cables or distance to fault for faulty cables.

Cable status legend (1GbT):

Cable        Impedance
Status       (Ohms)     Description
----------------------------------------------------------------
good         85-115     No cable faults found
open         >115       Open circuit detected
intra-short  <85        Short circuit within the same wire pair
inter-short  <85        Short circuit with another wire pair
high-imp     >115       Cable impedance higher than expected
low-imp      <85        Cable impedance lower than expected
unknown      --         Cable test inconclusive
```

The following examples display the cable diagnostic test result for 5G-SmartRate interface:

```
switch# diag cable-diagnostic show 1/1/20
                          Cable        Impedance   Distance*   MDI
Interface        Pinout   Status       (Ohms)      (Meters)    Mode
--------------------------------------------------------------------
1/1/20           1-2      good         85-115           --     mdi
(5G-SmartRate)   3-6      open         >300          4 +/- 5   mdi
                 4-5      open         >300          4 +/- 5   mdi
                 7-8      high-imp     >115          3 +/- 5   mdi

* Full cable length for good cables or distance to fault for faulty cables.

Cable status legend (5G-SmartRate):

Cable        Impedance
Status       (Ohms)     Description
----------------------------------------------------------------
good         85-115     No cable faults found
open         >300       Open circuit detected
intra-short  <30        Short circuit within the same wire pair
inter-short  <30        Short circuit with another wire pair
high-imp     >115       Cable impedance higher than expected
low-imp      <85        Cable impedance lower than expected
unknown      --         Cable test inconclusive
```

The following example displays the error message when you execute a cable diagnostic command while the current diagnostic test is in progress:

```
switch# diag cable-diagnostic show 1/3/1
A cable diagnostic test for interface 1/3/1 is currently in progress.
```

The following example displays the error message when cable diagnostic test result is not available:

```
switch# diag cable-diagnostic show 1/3/1
Cable diagnostic test results for interface 1/3/1 are not available.
```

The following example clears the cable diagnostic test results for the specified interface:

```
switch# diag cable-diagnostic clear 1/3/1
```

The following example displays the error message when you execute a cable diagnostic command while the current diagnostic test is in progress:

```
switch# diag cable-diagnostic clear 1/3/1
A cable diagnostic test for interface 1/3/1 is currently in progress.
```

Running a cable diagnostic test will result in a brief interruption in connectivity on all tested ports.

If a good cable is used on the SmartRate ports, the **Distance to Fault (Meters)** value is 0.

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

Chapter 15

Captive portal (RADIUS) commands

aaa authentication port-access captive-portal-profile

```
aaa authentication port-access captive-portal-profile <PROFILE-NAME>
no aaa authentication port-access captive-portal-profile <PROFILE-NAME>
```

Description

Creates the specified captive portal profile (if it does not yet exist) and then enters its context. For existing captive portal profiles, this command enters the context of the specified captive portal profile.

The **no** form of this command deletes the specified captive portal profile.

Parameter	Description
<PROFILE-NAME>	Specifies the captive portal profile name. From 2 to 64 characters.

Examples

Creating a captive portal profile named `employee` and entering its context for additional configuration:

```
switch(config)# aaa authentication port-access captive-portal-profile employee
switch(config-captive-portal)# url http://1.1.1.1/employee/captiveportal.php
switch(config-captive-portal)#
switch(config-captive-portal)# url-hash-key plaintext cjQrJ9#$erty
switch(config-captive-portal)#
switch(config-captive-portal)# exit
switch(config)#
```

Deleting the captive portal profile named `employee`:

```
switch(config)# no aaa authentication port-access captive-portal-profile employee
switch(config)#
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

show port-access captive-portal-profile

`show port-access captive-portal-profile [name <PROFILE-NAME>]`

Description

Shows the configuration information for all captive portal profiles or a particular captive portal profile.

Parameter	Description
<PROFILE-NAME>	Specifies the captive portal profile name. From 2 to 64 characters.

Example

Showing IPv4 local captive portal profile configuration information:

```
switch# show port-access captive-portal-profile name employee

Captive Portal Profile Configuration

    Name                            : employee
    Type                            : local
    URL                             : http://1.1.1.1/employee/captiveportal.php
    URL Hash Key                    : SWNGWyMeYubHPDgVIirpEUwNK5Uf+r1vmhBIncQPw1Y=
```

Showing IPv6 local captive portal profile configuration information:

```
switch# show port-access captive-portal-profile name CP6

Captive Portal Profile Configuration

    Name                            : CP6
    Type                            : local
    URL                             : https://[2000::3]/guest/captive_portal.php
    URL Hash Key                    : SWNGWyMeYubHPDgVIirpEUwNK5Uf+r1vmhBIncQPw1Y=
```

Showing IPv6 DUR captive portal profile configuration information):

```
switch# show port-access captive-portal-profile name CP6_DUR_GUEST_ROLE

Captive Portal Profile Configuration

    Name                            : CP6_DUR_GUEST_ROLE
    Type                            : downloaded
    URL                             : https://[2030:1::40]/guest/captive_portal_2.php
```

Showing IPv6 RADIUS VSA captive portal profile configuration information:

```
switch# show port-access captive-portal-profile name RADIUS_2259748436

Captive Portal Profile Configuration

    Name                           : RADIUS_2259748436
    Type                           : radius
    URL                            : https://[2030:1::40]/guest/captive_portal_2.php
```

Showing all captive portal profile configuration information):

```
switch# show port-access captive-portal-profile

Captive Portal Profile Configuration

    Name                           : CP6
    Type                           : local
    URL                            : https://[2000::3]/guest/captive_portal.php
    URL Hash Key                   : SWNGWyMeYubHPDgVIirpEUwNK5Uf+r1vmhBIncQPw1Y=

    Name                           : CP6_DUR_GUEST_ROLE
    Type                           : downloaded
    URL                            : https://[2030:1::40]/guest/captive_portal_2.php

    Name                           : RADIUS_2259748436
    Type                           : radius
    URL                            : https://[2030:1::40]/guest/captive_portal_2.php
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

url

```
url <URL>
no url
```

Description

Within the captive portal context, defines the captive portal URL.

The **no** form of this command deletes the captive portal URL.

Parameter	Description
<URL>	Specifies the captive portal URL as an IPv4 or IPv6 address or a fully-qualified domain name. Up to 1024 characters.

Examples

Creating a captive portal profile named `employee` and then setting its IPv4 redirect URL:

```
switch(config)# aaa authentication port-access captive-portal-profile employee
switch(config-captive-portal)# url http://1.1.1.1/employee/captiveportal.php
switch(config-captive-portal)#
switch(config-captive-portal)# exit
switch(config)#
```

Entering the captive portal profile `employee` and then deleting its URL:

```
switch(config)# aaa authentication port-access captive-portal-profile employee
switch(config-captive-portal)# no url
switch(config-captive-portal)#
switch(config-captive-portal)# exit
switch(config)#
```

Creating a captive portal profile named `CP6` and then setting its IPv6 redirect URL:

```
switch(config)# aaa authentication port-access captive-portal-profile CP6
switch(config-captive-portal)# url https://[2000::3]/guest/captive_portal.php
switch(config-captive-portal)#
switch(config-captive-portal)# exit
switch(config)#
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-captive-portal`	Administrators or local user group members with execution rights for this command.

url-hash-key

```
url-hash-key [{plaintext | ciphertext} <HASH-KEY>]
no url-hash-key
```

Description

Within the captive portal context, defines the captive portal URL hash key.

When this command is entered without parameters, plaintext hash key prompting occurs upon pressing Enter. The entered hash key characters are masked with asterisks.

The **no** form of this command deletes the captive portal URL hash key.

Parameter	Description
`{plaintext | ciphertext}`	Selects the URL hash key type as either `plaintext` or `ciphertext`.
`<HASH-KEY>`	Specifies the captive portal URL hash key. Up to 128 characters.

Examples

Creating a captive portal profile named `employee` and then setting its URL and URL hash key:

```
switch(config)# aaa authentication port-access captive-portal-profile employee
switch(config-captive-portal)# url http://1.1.1.1/employee/captiveportal.php
switch(config-captive-portal)#
switch(config-captive-portal)# url-hash-key plaintext cjQrJ9#$erty
switch(config-captive-portal)#
```

Creating a captive portal profile named `guest` and then setting its URL and entering the URL hash key when prompted:

```
switch(config)# aaa authentication port-access captive-portal-profile guest
switch(config-captive-portal)# url http://1.1.1.1/guest/captiveportal.php
switch(config-captive-portal)#
switch(config-captive-portal)# url-hash-key
Enter the URL Hash-Key: ****
Re-Enter the URL Hash-Key: ****
switch(config-captive-portal)#
```

Entering the captive portal profile `employee` and then deleting its URL hash key:

```
switch(config)# aaa authentication port-access captive-portal-profile employee
switch(config-captive-portal)# no url-hash-key
switch(config-captive-portal)#
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Chapter 16

CDP commands

cdp

`cdp`

Description

Configures CDP support globally on all active interfaces or on a specific interface. By default, CDP is enabled on all active interfaces.

When CDP is enabled, the switch adds entries to its CDP Neighbors table for any CDP packets it receives from neighboring CDP devices.

When CDP is disabled, the CDP Neighbors table is cleared and the switch drops all inbound CDP packets without entering the data in the CDP Neighbors table.

The **no** form of this command disables CDP support globally on all active interfaces or on a specific interface.

Examples

Enabling CDP globally:

```
switch(config)# cdp
```

Disabling CDP globally:

```
switch(config)# no cdp
```

Enabling CDP on interface **1/1/1**:

```
switch(config)# interface 1/1/1s
switch(config-if)# cdp
```

Disabling CDP on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# no cdp
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config` `config-if`	Administrators or local user group members with execution rights for this command.

clear cdp counters

```
clear cdp counters
```

Description

Clears CDP counters.

Examples

Clearing CDP counters:

```
switch(config) clear cdp counters
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config`	Administrators or local user group members with execution rights for this command.

clear cdp neighbor-info

```
clear cdp neighbor-info
```

Description

Clears CDP neighbor information.

Examples

Clearing CDP neighbor information:

```
switch(config) clear neighbor-info
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

show cdp

`show cdp`

Description

Shows CDP information for all interfaces.

Examples

On the 6400 Switch Series, interface identification differs.

Showing CDP information:

```
switch(config)# show cdp
CDP Global Information
======================
CDP           : Enabled
CDP Mode      : Rx only
CDP Hold Time : 180 seconds

Port         CDP
--------  --------------
1/1/1          Enabled
1/1/2          Enabled
1/1/3          Enabled
1/1/4          Enabled
1/1/5          Enabled
1/1/6          Enabled
1/1/7          Enabled
1/1/8          Enabled
1/1/9          Enabled
1/1/10         Enabled
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

All platforms	`config`	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show cdp neighbor-info

`show cdp neighbor-info <INTERFACE-ID>`

Description

Shows CDP information for all neighbors or for CDP information on a specific interface.

Parameter	Description
<INTERFACE-ID>	Specifies an interface. Format: **member/slot/port**.

Examples

On the 6400 Switch Series, interface identification differs.

Showing all CDP neighbor information:

```
switch(config)# show cdp neighbor-info
Total Neighbor Entries  : 1
Port        Device ID                 Platform                 Capability
---------------------------------------------------------------------------
1/1/1       Aruba-3810M-24G-1-slot... Aruba Sw                         S
```

Showing CDP information for interface **1/1/1**:

```
switch(config)# show cdp neighbor-info 1/1/1
Local Port           : 1/1/1
MAC                  : 70:10:6f:86:78:7f
Device ID            : Aruba-3810M-24G-1-slot(70106f-867800)
Address              : 127.0.0.1
Platform             : Aruba Sw
Duplex               : half
Version              : Revision KB.16.07.0002, ROM KB.16.01....
Capability           : switch
```

```
Native VLAN        : 1
Voice VLAN Support : No
Neighbor Port-ID   : 1
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config`	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show cdp traffic

`show cdp traffic`

Description

Shows CDP statistics for each interface.

Examples

On the 6400 Switch Series, interface identification differs.

Showing CDP traffic statistics:

```
switch(config)# show cdp traffic
CDP Statistics
====================
Port        Transmitted Frames       Received Frames          Discarded Frames
--------------------------------------------------------------------------------
1/1/1          0                        4                        0
1/1/2          0                        0                        0
1/1/3          0                        2                        0
1/1/4          0                        0                        0
1/1/5          0                        0                        0
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

show cdp voice-vlan mode

`show cdp voice-vlan mode`

Description

Shows CDP voice-vlan and mode.

Examples

On the 6400 Switch Series, interface identification differs.

Showing CDP voice-vlan and mode:

```
switch(config)# show cdp voice-vlan mode
CDP voice VLAN mode
====================
Port        Voice VLAN        Mode
--------    -----------       ----------
1/1/1       N/A               Rx only
1/1/2       N/A               Rx only
1/1/3       N/A               Rx only
1/1/4       N/A               Rx only
1/1/5       N/A               Rx only
1/1/6       N/A               Rx only
1/1/7       N/A               Rx only
1/1/8       N/A               Rx only
1/1/9       N/A               Rx only
```

Chapter 17
Checkpoint commands

checkpoint auto

`checkpoint auto <TIME-LAPSE-INTERVAL>`

Description

Starts auto checkpoint mode. In auto checkpoint mode, the switch temporarily saves the runtime configuration as a checkpoint only for the specified time lapse interval. Configuration changes must be saved before the interval expires, otherwise the runtime configuration is restored from the temporary checkpoint.

Parameter	Description
<TIME-LAPSE-INTERVAL>	Specifies the time lapse interval in minutes. Range: 1 to 60.

Usage

To save the runtime checkpoint permanently, run the **checkpoint auto confirm** command during the time lapse interval. The filename for the saved checkpoint is named **AUTO <YYYYMMDDHHSS>**. If the **checkpoint auto confirm** command is not entered during the specified time lapse interval, the previous runtime configuration is restored.

Examples

Confirming the auto checkpoint:

```
switch# checkpoint auto 20
Auto checkpoint mode expires in 20 minute(s)
switch# WARNING  Please "checkpoint auto confirm" within 2 minutes
switch# checkpoint auto confirm
checkpoint AUTO20170801011154 created
```

In this example, the runtime checkpoint was saved because the **checkpoint auto confirm** command was entered within the value set by the **time-lapse-interval** parameter, which was 20 minutes.

Not confirming the auto checkpoint:

```
switch# checkpoint auto 20
Auto checkpoint mode expires in 20 minute(s)
switch# WARNING  Please "checkpoint auto confirm" within 2 minutes
WARNING: Restoring configuration. Do NOT add any new configuration.
Restoration successful
```

In this example, the runtime checkpoint was reverted because the **checkpoint auto confirm** command was not entered within the value set by the **time-lapse-interval** parameter, which was 20 minutes.

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Manager (#)	Administrators or local user group members with execution rights for this command.

checkpoint auto confirm

```
checkpoint auto confirm
```

Description

Signals to the switch to save the running configuration used during the auto checkpoint mode. This command also ends the auto checkpoint mode.

Usage

To save the runtime checkpoint permanently, run the **checkpoint auto confirm** command during the time lapse value set by the **checkpoint auto TIME-LAPSE-INTERVAL** command. The generated checkpoint name will be in the format **AUTO <YYYYMMDDHHSS>**. If the **checkpoint auto confirm** command is not entered during the specified time lapse interval, the previous runtime configuration is restored.

Examples

Confirming the auto checkpoint:

```
switch# checkpoint auto confirm
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority

checkpoint diff

```
checkpoint diff {<CHECKPOINT-NAME1> | running-config | startup-config}
     {<CHECKPOINT-NAME2> | running-config | startup-config}
```

Description

Shows the difference in configuration between two configurations. Compare checkpoints, the running configuration, or the startup configuration.

Parameter	Description
`{<CHECKPOINT-NAME1> | running-config | startup-config}`	Selects either a checkpoint, the running configuration, or the startup configuration as the baseline.
`{<CHECKPOINT-NAME2> | running-config | startup-config}`	Selects either a checkpoint, the running configuration, or the startup configuration to compare.

Usability

The output of the **checkpoint diff** command has several symbols:

- The plus sign (+) at the beginning of a line indicates that the line exists in the comparison but not in the baseline.
- The minus sign (-) at the beginning of a line indicates that the line exists in the baseline but not in the comparison.

Examples

In the following example, the configurations of checkpoints **cp1** and **cp2** are displayed before the `checkpoint diff` command, so that you can see the context of the **checkpoint diff** command.

```
switch# show checkpoint cp1
Checkpoint configuration:
!
!Version AOS-CX XL.10.00.0002
!Schema version 0.1.8
module 1/1 product-number jl363a
!
!

checkpoint post-configuration

```
checkpoint post-configuration
```

```
no checkpoint post-configuration
```

Description

Enables creation of system generated checkpoints when configuration changes occur. This feature is enabled by default.

The **no** form of this command disables system generated checkpoints.

Usage

System generated checkpoints are automatically created by default. Whenever a configuration change occurs, the switch starts a timeout counter (300 seconds by default). For each additional configuration change, the timeout counter is restarted. If the timeout expires with no additional configuration changes being made, the switch generates a new checkpoint.

System generated checkpoints are named with the prefix **CPC** followed by a time stamp in the format **<YYYYMMDDHHMMSS>**. For example: **CPC20170630073127**.

System checkpoints can be applied using the checkpoint rollback feature or copy command.

A maximum of 32 system checkpoints can be created. Beyond this limit, the newest system checkpoint replaces the oldest system checkpoint.

Examples

Enabling system checkpoints:

```
switch(config)# checkpoint post-configuration
```

Disabling system checkpoints:

```
switch(config)# no checkpoint post-configuration
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

checkpoint post-configuration timeout

```
checkpoint post-configuration timeout <TIMEOUT>
```

```
no checkpoint post-configuration timeout <TIMEOUT>
```

Description

Sets the timeout for the creation of system checkpoints. The timeout specifies the amount of time since the latest configuration for the switch to create a system checkpoint.

The **no** form of this command resets the timeout to 300 seconds, regardless of the value of the **<TIMEOUT>** parameter.

Parameter	Description
`timeout <TIMEOUT>`	Specifies the timeout in seconds. Range: 5 to 600. Default: 300.

Examples

Setting the timeout for system checkpoints to 60 seconds:

```
switch(config)# checkpoint post-configuration timeout 60
```

Resetting the timeout for system checkpoints to 300 seconds:

```
switch(config)# no checkpoint post-configuration timeout 1
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

checkpoint rename

`checkpoint rename <OLD-CHECKPOINT-NAME> <NEW-CHECKPOINT-NAME>`

Description

Renames an existing checkpoint.

Parameter	Description
`<OLD-CHECKPOINT-NAME>`	Specifies the name of an existing checkpoint to be renamed.
`<NEW-CHECKPOINT-NAME>`	Specifies the new name for the checkpoint. The checkpoint name can be alphanumeric. It can also contain underscores (_) and dashes (-). **NOTE:** Do not start the checkpoint name with **CPC** because it is used for system-generated checkpoints.

Examples

Renaming checkpoint **ckpt1** to **cfg001**:

```
switch# checkpoint rename ckpt1 cfg001
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

checkpoint rollback

`checkpoint rollback {<CHECKPOINT-NAME> | startup-config}`

Description

Applies the configuration from a pre-existing checkpoint or the startup configuration to the running configuration.

Parameter	Description
<CHECKPOINT-NAME>	Specifies a checkpoint name.
`startup-config`	Specifies the startup configuration.

Examples

Applying a checkpoint named **ckpt1** to the running configuration:

```
switch# checkpoint rollback ckpt1
Success
```

Applying a startup checkpoint to the running configuration:

```
switch# checkpoint rollback startup-config
Success
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

copy checkpoint *<CHECKPOINT-NAME>* *<REMOTE-URL>*

```
copy checkpoint <CHECKPOINT-NAME> <REMOTE-URL> [vrf <VRF-NAME>]
```

Description

Copies a checkpoint configuration to a remote location as a file. The configuration is exported in checkpoint format, which includes switch configuration and relevant metadata.

Parameter	Description
<CHECKPOINT-NAME>	Specifies the name of a checkpoint.

<REMOTE-URL>	Specifies the remote destination and filename using the syntax:
	TFTP format:
	`tftp://<IP-ADDR>[:<PORT-NUM>]`
	`[;blocksize=<Value>]/<FILENAME>`
	SFTP format:
	`sftp://<USERNAME>@<IP-ADDR>`
	`[:<PORT-NUM>]/<FILENAME>`
	SCP format:
	`scp://USER@{IP|HOST}[:PORT]/FILE`

`vrf` *<VRF-NAME>*	Specifies a VRF name.

Examples

Copying checkpoint configuration to remote file through TFTP:

```
switch# copy checkpoint ckpt1 tftp://192.168.1.10/ckptmeta vrf default
########################################################################## 100.0%
Success
```

Copying checkpoint configuration to remote file through SFTP:

```
switch# copy checkpoint ckpt1 sftp://root@192.168.1.10/ckptmeta vrf default
The authenticity of host '192.168.1.10 (192.168.1.10)' can't be established.
ECDSA key fingerprint is SHA256:FtOm6Uxuxumil7VCwLnhz92H9LkjY+eURbdddOETy50.
Are you sure you want to continue connecting (yes/no)? yes
root@192.168.1.10's password:
sftp> put /tmp/ckptmeta ckptmeta
Uploading /tmp/ckptmeta to /root/ckptmeta
Warning: Permanently added '192.168.1.10' (ECDSA) to the list of known hosts.
Connected to 192.168.1.10.
Success
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

copy checkpoint <*CHECKPOINT-NAME*> {running-config | startup-config}

```
copy checkpoint <CHECKPOINT-NAME> {running-config | startup-config}
```

Description

Copies an existing checkpoint configuration to the running configuration or to the startup configuration.

Parameter	Description
<CHECKPOINT-NAME>	Specifies the name of an existing checkpoint.
	Selects whether the running configuration or the startup configuration receives the copied checkpoint configuration. If the startup configuration is already present, the command overwrites the startup configuration.

Examples

Copying **ckpt1** checkpoint to the running configuration:

```
switch# copy checkpoint ckpt1 running-config
Success
```

Copying **ckpt1** checkpoint to the startup configuration:

```
switch# copy checkpoint ckpt1 startup-config
Success
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

copy checkpoint <*CHECKPOINT-NAME*> <*STORAGE-URL*>

```
copy checkpoint <CHECKPOINT-NAME> <STORAGE-URL>
```

Description

Copies an existing checkpoint configuration to a USB drive. The file format is defined when the checkpoint was created.

Parameter	Description
<CHECKPOINT-NAME>	Specifies the name of the checkpoint to copy. The checkpoint name can be alphanumeric. It can also contain underscores (_) and dashes (-).
<STORAGE-URL>>	Specifies the name of the target file on the USB drive using the following syntax: `usb:/`*`<FILE>`* The USB drive must be formatted with the FAT file system.

Examples

Copying the **test** checkpoint to the **testCheck** file on the USB drive:

```
switch# copy checkpoint test usb:/testCheck
Success
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

copy *<REMOTE-URL>* checkpoint *<CHECKPOINT-NAME>*

```
copy <REMOTE-URL> checkpoint <CHECKPOINT-NAME> [vrf <VRF-NAME>]
```

Description

Copies a remote configuration file to a checkpoint. The remote configuration file must be in checkpoint format.

Parameter	Description
<REMOTE-URL>	Specifies a remote file using the following syntax: **TFTP format:**

Parameter	Description
	tftp://<IP-ADDR>[:<PORT-NUM>] [;blocksize=<Value>]/<FILENAME> **SFTP format:** sftp://<USERNAME>@<IP-ADDR> [:<PORT-NUM>]/<FILENAME> **SCP format:** scp://USER@{IP|HOST}[:PORT]/FILE
<CHECKPOINT-NAME>	Specifies the name of the target checkpoint. The checkpoint name can be alphanumeric. It can also contain underscores (_) and dashes (-). Required. **NOTE:** Do not start the checkpoint name with CPC because it is used for system-generated checkpoints.
vrf <VRF-NAME>	Specifies a VRF name. Default: default.

Examples

Copying a checkpoint format file to checkpoint **ckpt5** on the default VRF:

```
switch# copy tftp://192.168.1.10/ckptmeta checkpoint ckpt5
########################################################################## 100.0%
100.0%
Success
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority

copy <*REMOTE-URL*> {running-config \| startup-config}

```
copy <REMOTE-URL> {running-config | startup-config } [vrf <VRF-NAME>]
```

Description

Copies a remote file containing a switch configuration to the running configuration or to the startup configuration.

Parameter	Description

<REMOTE-URL>	Specifies a remote file with the following syntax:
	TFTP format:
	`tftp://<IP-ADDR>[:<PORT-NUM>]`
	`[;blocksize=<Value>]/<FILENAME>`
	SFTP format:
	`sftp://<USERNAME>@<IP-ADDR>`
	`[:<PORT-NUM>]/<FILENAME>`
	SCP format:
	`scp://USER@{IP|HOST}[:PORT]/FILE`

`{running-config | startup-config}`	Selects whether the running configuration or the startup configuration receives the copied checkpoint configuration. If the startup configuration is already present, the command overwrites the startup configuration.
`vrf` *<VRF-NAME>*	Specifies the name of a VRF. Default: default.

Usage

The switch copies only certain file types. The format of the file is automatically detected from contents of the file. The **startup-config** option only supports the JSON file format and checkpoints, but the **running-config** option supports the JSON and CLI file formats and checkpoints.

When a file of the CLI format is copied, it overwrites the running configuration. The CLI command does not clear the running configuration before applying the CLI commands. All of the CLI commands in the file are applied line-by-line. If a particular CLI command fails, the switch logs the failure and it continues to the next line in the CLI configuration. The event log (**show events -d hpe-config**) provides information as to which command failed.

Examples

Copying a JSON format file to the running configuration:

```
switch# copy tftp://192.168.1.10/runjson running-config
########################################################################## 100.0%
Configuration may take several minutes to complete according to configuration file
size
 --0%----10%----20%----30%----40%----50%----60%----70%----80%----90%----100%--
Success
```

Copying a CLI format file to the running configuration with an error in the file:

```
switch# copy tftp://192.168.1.10/runcli running-config
########################################################################## 100.0%
Configuration may take several minutes to complete according to configuration file
size
 --0%----10%----20%----30%----40%----50%----60%----70%----80%----90%----100%--
Some of the configuration lines from the file were NOT applied. Use 'show
events -d hpe-config' for more info.
########################################################################## 100.0%
Configuration may take several minutes to complete according to configuration file
size
 --0%----10%----20%----30%----40%----50%----60%----70%----80%----90%----100%--
Some of the configuration lines from the file were NOT applied. Use 'show
events -d hpe-config' for more info.
```

Copying a CLI format file to the startup configuration:

```
switch# copy tftp://192.168.1.10/startjson startup-config
######################################################################## 100.0%
100.0%
Success
```

Copying an unsupported file format to the startup configuration:

```
switch# copy tftp://192.168.1.10/startfile startup-config
######################################################################## 100.0%
100.0%
unsupported file format
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

copy running-config {startup-config | checkpoint <*CHECKPOINT-NAME*>}

`copy running-config {startup-config | checkpoint <CHECKPOINT-NAME>}`

Description

Copies the running configuration to the startup configuration or to a new checkpoint. If the startup configuration is already present, the command overwrites the existing startup configuration.

Parameter	Description
`startup-config`	Specifies that the startup configuration receives a copy of the running configuration.
`checkpoint <CHECKPOINT-NAME>`	Specifies the name of a new checkpoint to receive a copy of the running configuration. The checkpoint name can be comprised of alphanumeric character, underscores (_) and dashes (-), and must be 32 characters or fewer.

Parameter	Description
	NOTE: Do not start the checkpoint name with **CPC** because it is used for system-generated checkpoints.

Examples

Copying the running configuration to the startup configuration:

```
switch# copy running-config startup-config
Success
```

Copying the running configuration to a new checkpoint named **ckpt1**:

```
switch# copy running-config checkpoint ckpt1
Success
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

copy {running-config | startup-config} *<REMOTE-URL>*

`copy {running-config | startup-config} <REMOTE-URL> {cli | json} [vrf <VRF-NAME>]`

Description

Copies the running configuration or the startup configuration to a remote file in either CLI or JSON format.

Parameter	Description
`{running-config	startup-config}`	Selects whether the running configuration or the startup configuration is copied to a remote file.
<REMOTE-URL>	Specifies the remote file using the syntax:

Parameter	Description

	TFTP format:
	`tftp://<IP-ADDR>[:<PORT-NUM>]`
	`[;blocksize=<Value>]/<FILENAME>`
	SFTP format:
	`sftp://<USERNAME>@<IP-ADDR>`
	`[:<PORT-NUM>]/<FILENAME>`
	SCP format:
	`scp://USER@{IP|HOST}[:PORT]/FILE`

`{cli | json}`	Selects the remote file format: P: CLI or JSON.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Default: default.

Examples

Copying a running configuration to a remote file in CLI format:

```
switch# copy running-config tftp://192.168.1.10/runcli cli
######################################################################### 100.0%
Success
```

Copying a running configuration to a remote file in JSON format:

```
switch# copy running-config tftp://192.168.1.10/runjson json
######################################################################### 100.0%
Success
```

Copying a startup configuration to a remote file in CLI format:

```
switch# copy startup-config sftp://root@192.168.1.10/startcli cli
root@192.168.1.10's password:
sftp> put /tmp/startcli startcli
Uploading /tmp/startcli to /root/startcli
Connected to 192.168.1.10.
Success
```

Copying a startup configuration to a remote file in JSON format:

```
switch# copy startup-config sftp://root@192.168.1.10/startjson json
root@192.168.1.10's password:
sftp>
root@192.168.1.10's password:
sftp> put /tmp/startjson startjson
Uploading /tmp/startjson to /root/startjson
Connected to 192.168.1.10.
Success
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

copy {running-config | startup-config} *<STORAGE-URL>*

`copy {running-config | startup-config} <STORAGE-URL> {cli | json}`

Description

Copies the running configuration or a startup configuration to a USB drive.

Parameter	Description
`{running-config	startup-config}`	Selects the running configuration or the startup configuration to be copied to the switch USB drive.
`<STORAGE-URL>`	Specifies a remote file with the following syntax: **usb:/*<file>***
`{cli	json}`	Selects the format of the remote file: CLI or JSON.

Usage

The switch supports JSON and CLI file formats when copying the running or starting configuration to the USB drive. The USB drive must be formatted with the FAT file system.

The USB drive must be enabled and mounted with the following commands:

```
switch(config)# usb
switch(config)# end
switch# usb mount
```

Examples

Copying a running configuration to a file named **runCLI** on the USB drive:

```
switch# copy running-config usb:/runCLI cli
Success
```

Copying a startup configuration to a file named **startCLI** on the USB drive:

```
switch# copy startup-config usb:/startCLI cli
Success
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

copy <*STORAGE-URL*> running-config

```
copy <STORAGE-URL> {running-config | startup-config | checkpoint <CHECKPOINT-NAME>}
```

Description

This command copies a specified configuration from the USB drive to the running configuration, to a startup configuration, or to a checkpoint.

Parameter	Description
<STORAGE-URL>	Specifies the name of a configuration file on the USB drive with the syntax: **usb:/<*FILE*>**
running-config	Specifies that the configuration file is copied to the running configuration. The file must be in CLI, JSON, or checkpoint format or the copy will fail. the copy will not work.
startup-config	Specifies that the configuration file is copied to the startup configuration. The switch stores this configuration between reboots. The startup configuration is used as the operating configuration following a reboot of the switch. The file must be in JSON or checkpoint format or the copy will fail.
checkpoint *<CHECKPOINT-NAME>*	Specifies the name of a new checkpoint file to receive a copy of the configuration. The configuration file on the USB drive must be in checkpoint format. **NOTE:** Do not start the checkpoint name with **CPC** because it is used for system-generated checkpoints.

Usage

This command requires that the USB drive is formatted with the FAT file system and that the file be in the appropriate format as follows:

- **running-config**: This option requires the file on the USB drive be in CLI, JSON, or checkpoint format.
- **startup-config**: This option requires the file on the USB drive be in JSON or checkpoint format.
- **checkpoint <*checkpoint-name*>**: This option requires the file on the USB drive be in checkpoint format.

Examples

Copying the file **runCli** from the USB drive to the running configuration:

```
switch# copy usb:/runCli running-config
Configuration may take several minutes to complete according to configuration
file size
--0%----10%----20%----30%----40%----50%----60%----70%----80%----90%----100%--
Success
```

Copying the file **startUp** from the USB drive to the startup configuration:

```
switch# copy usb:/startUp startup-config
Success
```

Copying the file **testCheck** from the USB drive to the **abc** checkpoint:

```
switch# copy usb:/testCheck checkpoint abc
Success
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

erase

```
erase
   checkpoint <checkpont-name>
   core-dump all|daemon|dsm|kernel|vsf
   startup-config
   all
```

Description

Deletes an existing checkpoint, startup configuration, or core-dump.

Parameter	Description
`checkpoint <CHECKPOINT-NAME>`	Specifies the name of a checkpoint.

`core-dump`
`all|daemon <daemon-name>`
`|kernel|vsf`
	Erase one of the following sets of core-dump files:
	▪ all: Erase all core-dump files.
	▪ daemon <daemon-name>: Erase daemon core-dump files.
	▪ kerne:l Erase the kernel core-dump.
	▪ vsf Erase daemon core-dump files for VSF. (For 6300 Switches only.)

startup-config	Specifies the startup configuration.
all	Specifies all checkpoints.

Examples

Erasing checkpoint **ckpt1**:

```
switch# erase checkpoint ckpt1
```

Erasing the startup configuration:

```
switch# erase startup-config
```

Erasing all checkpoints:

```
switch# erase checkpoint all
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

show checkpoint <*CHECKPOINT-NAME*> hash

```
show checkpoint <CHECKPOINT-NAME> hash [cli | json]
```

Description

Shows a configuration checkpoint hash calculated with the SHA-256 algorithm. When the output format is not specified, the CLI format is used. This enables you to determine whether there has been a configuration change since a previous hash was calculated.

Parameter	Description
`<CHECKPOINT-NAME>`	Specifies an existing checkpoint name.
`[cli | json]`	Selects either the CLI or JSON format.

Examples

Showing a checkpoint SHA-256 hash in JSON format:

```
switch# show checkpoint ckpt1 hash json
Calculating the hash: [Success]

The SHA-256 hash of the checkpoint in JSON format, created in image XX.10.08.xxxx:

cc7a57a9bbb4e6600d3b4180296a35f6af9e797ce9c439955dfe5de58b06da9e

This hash is only valid for comparison to a baseline hash if the configuration has
not been explicitly changed (such as with a CLI command, REST operation, etc.)
or implicitly changed (such as by changing a hardware module, upgrading the
SW version, etc.).
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

show checkpoint

```
show checkpoint
```

Description

Shows a detailed list of all saved checkpoints.

Examples

Showing a detailed list of all saved checkpoints:

```
switch# show checkpoint

NAME             TYPE        WRITER  DATE(YYYY/MM/DD)      IMAGE VERSION
ckpt1            checkpoint  User    2017-02-23T00:10:02Z  XX.01.01.000X
ckpt2            checkpoint  User    2017-03-08T18:10:01Z  XX.01.01.000X
ckpt3            checkpoint  User    2017-03-09T23:11:02Z  XX.01.01.000X
ckpt4            checkpoint  User    2017-03-11T00:00:03Z  XX.01.01.000X
ckpt5            latest      User    2017-03-14T01:12:27Z  XX.01.01.000X
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.08	Command syntax `show checkpoint list all` is replaced with `show checkpoint`.

show checkpoint date

`show checkpoint date <START-DATE> <END-DATE>`

Description

Shows detailed list of all saved checkpoints created within the specified date range.

Parameter	Description
<START-DATE>	Specifies the starting date for the range of saved checkpoints to show. Format: **YYYY-MM-DD**.
<END-DATE>	Specifies the endingdate for the range of saved checkpoints to show. Format: **YYYY-MM-DD**.

Examples

Showing a detailed list of saved checkpoints for a specific date range:

```
switch# show checkpoint date 2017-03-08 2017-03-12

NAME                    TYPE        WRITER   DATE(YYYY/MM/DD)      IMAGE VERSION
ckpt2                   checkpoint  User     2017-03-08T18:10:01Z  XX.01.01.000X
ckpt3                   checkpoint  User     2017-03-09T23:11:02Z  XX.01.01.000X
ckpt4                   checkpoint  User     2017-03-11T00:00:03Z  XX.01.01.000X
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

show running-config hash

`show running-config hash [cli | json]`

Description

Shows the running-config checkpoint hash, calculated with the SHA-256 algorithm. When the output format is not specified, the CLI format is used. This enables you to determine whether there has been a configuration change since a previous hash was calculated.

Parameter	Description
`[cli	json]`	Selects either the CLI or JSON format.

Examples

Showing the running-config checkpoint SHA-256 hash in CLI format:

```
switch# show running-config hash cli
Calculating the hash: [Success]

SHA-256 hash of the config in CLI format:

8db4e7e10f4b7f1a6ab17ad2b4efe0e72f1849103eaf43da62aa1d715075b89e

This hash is only valid for comparison to a baseline hash if the configuration has
not been explicitly changed (such as with a CLI command, REST operation, etc.)
or implicitly changed (such as by changing a hardware module, upgrading the
SW version, etc.).
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

show startup-config hash

```
show startup-config hash [cli | json]
```

Description

Shows the startup-config checkpoint hash, calculated with the SHA-256 algorithm. When the output format is not specified, the CLI format is used. This enables you to determine whether there has been a configuration change since a previous hash was calculated.

Parameter	Description
`[cli	json]`	Selects either the CLI or JSON format.

Examples

Showing the startup-config checkpoint SHA-256 hash in CLI format:

```
switch# show startup-config hash cli
Calculating the hash: [Success]

SHA-256 hash of the config in CLI format:

8db4e7e10f4b7f1a6ab17ad2b4efe0e72f1849103eaf43da62aa1d715075b89e

This hash is only valid for comparison to a baseline hash if the configuration has
not been explicitly changed (such as with a CLI command, REST operation, etc.)
or implicitly changed (such as by changing a hardware module, upgrading the
SW version, etc.).
```

Chapter 18
Classifier policy commands

Classifier policy application

Classifier policies can be applied as follows ("Rt-In" = "Routed-In"):

Policy type Direction	IPv4+6 In	IPv4+6 Rt-In	IPv4+6 Out	MAC In	MAC Out
L2 interface (port)	Yes		Yes	Yes	Yes
L2 LAG	Yes		Yes	Yes	Yes
L3 interface (port)	Yes	Yes	Yes	Yes	Yes
L3 LAG	Yes	Yes	Yes	Yes	Yes
L3 interface (port) subinterface	Yes		Yes		
L3 LAG subinterface	Yes		Yes		
VLAN	Yes		Yes	Yes	Yes
Interface VLAN		Yes (PBR)			

The following match criteria is not supported. If this match criteria is attempted to be configured, an error message will be displayed and the action will not be completed.

```
PCP on MAC classes
```

apply policy (config-if, config-lag-if, config-if-vlan, config-vlan)

Context config-if, config-lag-if:

```
apply policy <POLICY-NAME> {in|out|routed-in} [per-interface]
no apply policy <POLICY-NAME> {in|out|routed-in} [per-interface]
```

Context config-vlan:

```
apply policy <POLICY-NAME> {in|out}
no apply policy <POLICY-NAME> {in|out}
```

Context config-if-vlan:

```
apply policy <POLICY-NAME> routed-in
no apply policy <POLICY-NAME> routed-in
```

Description

Applies a policy to the current physical interface port or LAG or VLAN context. Subinterfaces are supported on interfaces and LAGs.

Only one direction of a policy can be applied to an interface or VLAN at a time, thus using the apply command on an interface or VLAN with an already-applied policy of the same direction will replace the currently applied policy.

The VLAN context supports the **in** and **out** directions, which apply to both bridged and routed traffic. The Interface VLAN context only supports the **routed-in** direction which applies only to routed traffic.

The **no** form of this command removes a policy from the interface or VLAN specified by the current context.

Parameter	Description
<POLICY-NAME>	Specifies the policy to apply.
`in`	Selects the inbound (ingress) traffic direction.
`out`	Selects the outbound (egress) traffic direction.
`routed-in`	Selects routed in traffic.
`per-interface`	Specifies that unique instances of the policy be applied to each interface or LAG rather than the default of sharing the policy across all interfaces and LAGs.

Usage (applies to `config-if`, `config-lag-if` contexts)

- The subinterface can optionally be specified after the interface or LAG, preceded by a period. For example, **1/1/1.10** or **lag 125.4**.
- When `per-interface` is included, unique instances of the policy are applied to each physical interface port or LAG rather than the default of sharing the policy across all interfaces and LAGs. The unique instance of a policy has a parent-child relationship with the policy from which it was created. The **per-interface** option is useful when you want unique policers to be created for each interface or LAG rather than using shared policers. It is also useful when you want the statistics (hit counts and conform rate) to be specific to an interface or LAG rather than being aggregated. Because **per-interface** creates more hardware instances of a policy, resource consumption may increase significantly. It is recommended that you use **show resources** to monitor resource utilization as configuration is applied.

Usage (applies to config-vlan context)

- Only one policy type may be applied to a VLAN at a time. Therefore, using the **apply policy** command on a VLAN with an already-applied policy of the same type, will replace the applied policy.
- 6400 Switch Series only: When a policy is applied to a VLAN, it will create hardware entries on all line cards and stack members regardless of whether a VLAN member exists on any specific line card.

Examples

On the 6400 Switch Series, interface identification differs.

Applying a policy to an interface (ingress):

```
switch(config)# interface 1/1/1
switch(config-if)# apply policy MY_POLICY1 in
```

Applying a policy to an interface (ingress) specifying **per-interface**:

```
switch(config)# interface 1/1/2
switch(config-if)# apply policy MY_POLICY1 in per-interface
```

Applying a policy to an interface (egress):

```
switch(config)# interface 1/1/2
switch(config-if)# apply policy MY_POLICY2 out
```

Applying a policy to an interface (egress) specifying `per-interface`:

```
switch(config)# interface 1/1/2
switch(config-if)# apply policy MY_POLICY2 out per-interface
```

Applying a policy to an interface range (ingress):

```
switch(config)# interface 1/1/3-1/1/6
switch(config-if-<1/1/2-1/1/5>)# apply policy MY_POLICY3 in
```

Applying a policy to an interface range (ingress) specifying **per-interface**:

```
switch(config)# interface 1/1/7-1/1/9
switch(config-if-<1/1/2-1/1/5>)# apply policy MY_POLICY4 in per-interface
```

Removing a policy from an interface (ingress):

```
switch(config)# interface 1/1/1
switch(config-if)# no apply policy MY_POLICY1 in
```

Removing a policy from an interface range (ingress):

```
switch(config)# interface 1/1/3-1/1/6
switch(config-if-<1/1/3-1/1/6>)# no apply policy MY_POLICY3 in
```

Applying a policy to a subinterface (ingress):

```
switch(config)# interface 1/1/1.10
switch(config-if)# apply policy MY_POLICY1 in
```

Applying a policy to a subinterface (egress):

```
switch(config)# interface 1/1/2.8
switch(config-if)# apply policy MY_POLICY1_egr out
```

Applying a policy to a LAG (ingress):

```
switch(config)# interface lag 100
switch(config-lag-if)# apply policy MY_POLICY5 in
```

Applying a policy to a LAG (ingress) specifying **per-interface**:

```
switch(config)# interface lag 200
switch(config-lag-if)# apply policy MY_POLICY5 in per-interface
```

Removing a policy from a LAG (ingress):

```
switch(config)# interface lag 100
switch(config-lag-if)# no apply policy MY_POLICY5 in
```

Applying a policy to a LAG subinterface (ingress):

```
switch(config)# interface lag 125.4
switch(config-lag-if)# apply policy MY_POLICY5 in
```

Applying a policy to a LAG subinterface (egress):

```
switch(config)# interface lag 150.8
switch(config-lag-if)# apply policy MY_POLICY5 out
```

Applying a policy to a VLAN (ingress):

```
switch(config)# vlan 1
switch(config-vlan)# apply policy MY_POLICY6 in
```

Applying a policy to multiple VLANs (ingress):

```
switch(config)# vlan 10,20
switch(config-vlan-<10,20>)# apply policy MY_POLICY7 in
```

Applying a policy to an interface VLAN routed (ingress):

```
switch(config)# vlan 1
switch(config-if-vlan)# apply policy MY_POLICY8 routed-in
```

Applying a policy to an interface VLAN range routed (ingress):

```
switch(config)# vlan 2-5
switch(config-if-vlan-<2-5>)# apply policy MY_POLICY8 routed-in
```

Removing a policy from a VLAN (ingress):

```
switch(config)# vlan 1
switch(config-vlan)# no apply policy MY_POLICY6 in
```

Removing a policy from multiple VLANs (ingress):

```
switch(config)# vlan 10,20
switch(config-vlan-<10,20>)# no apply policy MY_POLICY7 in
```

Removing a policy from an interface VLAN routed (ingress):

```
switch(config)# vlan 1
switch(config-if-vlan)# no apply policy MY_POLICY8 routed-in
```

Removing a policy from an interface VLAN range routed (ingress):

```
switch(config)# vlan 2-5
switch(config-if-vlan-<2-5>)# no apply policy MY_POLICY8 routed-in
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

Command History

Release	Modification
10.10	Added subinterface egress support for interfaces and LAGs.
10.08	Added **[per-interface]** parameter.
10.07 or earlier	--

Command Information

apply policy

```
apply policy <POLICY-NAME> in
```

```
no apply policy <POLICY-NAME> in
```

Description

Applies a policy to the global config context.

Only one policy can be globally applied at a time. Applying a policy globally again, replaces the previous globally applied policy.

The **no** form of this command removes application of the global policy.

Parameter	Description
<POLICY-NAME>	Specifies the policy to apply.
in	Selects the inbound (ingress) traffic direction.

Examples

Applying policy global1 to the global config context:

```
switch(config)# apply policy global1 in
```

Removing application of policy global1 from the global config context:

```
switch(config)# no apply policy global1 in
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

6300 6400	config	Administrators or local user group members with execution rights for this command.

class copy

```
class {ip|ipv6|mac} <CLASS-NAME> copy <DESTINATION-CLASS>
```

Description

Copies a class to a new destination class or overwrites an existing class. Copying a class copies all entries as well.

Parameter	Description
{ip|ipv6|mac**}** *<CLASS-NAME>*	Specifies the type and name of the class to be copied.
<DESTINATION-CLASS>	Specifies the name of the destination class.

Examples

Copying an IPv4 class. Copying a class with entries copies all its entries as well:

```
switch(config)# class ip MY_IP_CLASS copy MY_IP_CLASS2
switch(config)# do show class
Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
-------------------------------------------------------------------------------
IPv4       MY_IP_CLASS
       11  ignore                          udp
           any
           any
       21  match                           tcp
           192.168.0.1
           192.168.0.2
-------------------------------------------------------------------------------
IPv4       MY_IP_CLASS2
       11  ignore                          udp
           any
           any
       21  match                           tcp
           192.168.0.1
           192.168.0.2
```

Copying an IPv6 class:

```
switch(config)# class ipv6 MY_IPV6_CLASS copy MY_IPV6_CLASS2
switch(config)# do show class
Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
-------------------------------------------------------------------------------
IPv6       MY_IPV6_CLASS
         2 ignore                          udp
           any
           any
-------------------------------------------------------------------------------
IPv6       MY_IPV6_CLASS2
         2 ignore                          udp
           any
           any
```

Copying a MAC class:

```
switch(config)# class mac MY_MAC_CLASS copy MY_MAC_CLASS2
switch(config)# do show class
Type       Name
  Sequence Comment
           Action                          EtherType
           Source MAC Address
           Destination MAC Address
           Additional Parameters
-------------------------------------------------------------------------------
MAC        MY_MAC_CLASS
         2 ignore                          arp
           any
           any
-------------------------------------------------------------------------------
MAC        MY_MAC_CLASS2
         2 ignore                          arp
           any
           any
```

class ip

Syntax to create an IPv4 class and enter its context. Plus syntax to remove a class:

```
class ip <CLASS-NAME>
no class ip <CLASS-NAME>
```

Syntax (within the class context) for creating or removing class entries for protocols **ah**, **gre**, **esp**, **igmp**, **ospf**, **pim** (**ip** is available as an alias for **any**):

```
  [<SEQUENCE-NUMBER>]
  {match|ignore}
  {any|ip|ah|gre|esp|igmp|ospf|pim|<IP-PROTOCOL-NUM>}
  {any|<SRC-IP-ADDRESS>[/{<PREFIX-LENGTH>|<SUBNET-MASK>}]}
  {any|<DST-IP-ADDRESS>[/{<PREFIX-LENGTH>|<SUBNET-MASK>}]}
  [dscp <DSCP-SPECIFIER>] [ecn <ECN-VALUE>] [ip-precedence <IP-PRECEDENCE-VALUE>]
  [tos <TOS-VALUE>] [fragment] [vlan <VLAN-ID>] [ttl <TTL-VALUE>] [count]

  no <SEQUENCE-NUMBER>
```

Syntax (within the class context) for creating or removing class entries for protocols **sctp**, **tcp**, **udp**:

```
[<SEQUENCE-NUMBER>]
{match|ignore}
{sctp|tcp|udp}
{any|<SRC-IP-ADDRESS>[/{<PREFIX-LENGTH>|<SUBNET-MASK>}]}
[{eq|gt|lt} <PORT>|range <MIN-PORT> <MAX-PORT>]
{any|<DST-IP-ADDRESS>[/{<PREFIX-LENGTH>|<SUBNET-MASK>}]}
[{eq|gt|lt} <PORT>|range <MIN-PORT> <MAX-PORT>]
[cwr][ece] [urg] [ack] [psh] [rst] [syn] [fin] [established]
[dscp <DSCP-SPECIFIER>] [ecn <ECN-VALUE>] [ip-precedence <IP-PRECEDENCE-VALUE>]
[tos <TOS-VALUE>]  [fragment] [vlan <VLAN-ID>] [ttl <TTL-VALUE>] [count]

no <SEQUENCE-NUMBER>
```

Syntax (within the class context) for creating or removing class entries for protocol **icmp**:

```
[<SEQUENCE-NUMBER>]
{match|ignore}
{icmp}
{any|<SRC-IP-ADDRESS>[/{<PREFIX-LENGTH>|<SUBNET-MASK>}]}
{any|<DST-IP-ADDRESS>[/{<PREFIX-LENGTH>|<SUBNET-MASK>}]}
[icmp-type {echo|echo-reply|<ICMP-TYPE-VALUE>}] [icmp-code <ICMP-CODE-VALUE>]
[dscp <DSCP-SPECIFIER>] [ecn <ECN-VALUE>] [ip-precedence <IP-PRECEDENCE-VALUE>]
[tos <TOS-VALUE>] [fragment] [vlan <VLAN-ID>] [ttl <TTL-VALUE>] [count]

no <SEQUENCE-NUMBER>
```

Syntax (within the class context) for class entry comments:

```
[<SEQUENCE-NUMBER>] comment <TEXT-STRING>

no <SEQUENCE-NUMBER> comment
```

Description

Creates or modifies an IPv4 traffic class to match specified packets. Class is composed of one or more class entries ordered and prioritized by sequence numbers. With this command, the class can classify traffic based on IPv4 header information.

The **no** form of the command can be used to delete either an IPv4 traffic class (use **no** with the class command) or an individual IPv4 traffic class entry (use **no** with the sequence number).

Parameter	Description
`ip`	Specifies create or modify an IPv4 class.
`<CLASS-NAME>`	Specifies the name of this class.
`<SEQUENCE-NUMBER>`	Specifies a sequence number for the class entry. Optional. Range: 1-4294967295.
`{match|ignore}`	Creates a rule to match or ignore specified packets.
`<IP-PROTOCOL-NUM>`	Specifies the protocol as its Internet Protocol number. For example, 2 corresponds to the IGMP protocol. Range: 0 to 255.
`{any|<SRC-IP-ADDRESS>[/{<PREFIX-LENGTH>|<SUBNET-MASK>}]}`	Specifies the source IPv4 address. ▪ **any** - specifies any source IPv4 address. ▪ **<SRC-IP-ADDRESS>** - specifies the source IPv4 host address. ○ **<PREFIX-LENGTH>** - specifies the address bits to mask (CIDR subnet mask

Parameter	Description
	notation). Range: 1 to 32. ◦ **<SUBNET-MASK>** - specifies the address bits to mask (dotted decimal notation).
`{any|<DST-IP-ADDRESS> [/{<PREFIX-LENGTH>|<SUBNET-MASK>}]}`	Specifies the destination IPv4 address. ▪ **any** - specifies any destination IPv4 address. ▪ **<DST-IP-ADDRESS>** - specifies the destination IPv4 host address. ◦ **<PREFIX-LENGTH>** - specifies the address bits to mask (CIDR subnet mask notation). Range: 1 to 32. ◦ **<SUBNET-MASK>** - specifies the address bits to mask (dotted decimal notation).
`[{eq|gt|lt} <PORT>|range <MIN-PORT><MAX-PORT>]`	Specifies the port or port range. Port numbers are in the range of 0 to 65535. ▪ **eq <PORT>** - specifies the Layer 4 port. ▪ **gt <PORT>** - specifies any Layer 4 port greater than the indicated port. ▪ **lt <PORT>** - specifies any Layer 4 port less than the indicated port. ▪ **range *<MIN-PORT>* *<MAX-PORT>*** - specifies the Layer 4 port range.
`cwr`	Specifies matching on the TCP Flag CWR : Congestion Window Reduced
`ece`	Specifies matching on the TCP Flag ECE : Explicit Congestion Notification [ECN]- Echo
`urg`	Specifies matching on the TCP Flag: Urgent.
`ack`	Specifies matching on the TCP Flag: Acknowledgment.
`psh`	Specifies matching on the TCP Flag: Push buffered data to receiving application.
`rst`	Specifies matching on the TCP Flag: Reset the connection.
`syn`	Specifies matching on the TCP Flag: Synchronize sequence numbers.
`fin`	Specifies matching on the TCP Flag: Finish connection.
`established`	Specifies matching on the TCP Flag: Established connection.
`dscp <DSCP-SPECIFIER>`	Specifies the Differentiated Services Code

Parameter	Description
	Point (DSCP), either a numeric **`<DSCP-VALUE>`** (0 to 63) or one of these keywords: ■ **AF11** - DSCP 10 (Assured Forwarding Class 1, low drop probability) ■ **AF12** - DSCP 12 (Assured Forwarding Class 1, medium drop probability) ■ **AF13** - DSCP 14 (Assured Forwarding Class 1, high drop probability) ■ **AF21** - DSCP 18 (Assured Forwarding Class 2, low drop probability) ■ **AF22** - DSCP 20 (Assured Forwarding Class 2, medium drop probability) ■ **AF23** - DSCP 22 (Assured Forwarding Class 2, high drop probability) ■ **AF31** - DSCP 26 (Assured Forwarding Class 3, low drop probability) ■ **AF32** - DSCP 28 (Assured Forwarding Class 3, medium drop probability) ■ **AF33** - DSCP 30 (Assured Forwarding Class 3, high drop probability) ■ **AF41** - DSCP 34 (Assured Forwarding Class 4, low drop probability) ■ **AF42** - DSCP 36 (Assured Forwarding Class 4, medium drop probability) ■ **AF43** - DSCP 38 (Assured Forwarding Class 4, high drop probability) ■ **CS0** - DSCP 0 (Class Selector 0: Default) ■ **CS1** - DSCP 8 (Class Selector 1: Scavenger) ■ **CS2** - DSCP 16 (Class Selector 2: OAM) ■ **CS3** - DSCP 24 (Class Selector 3: Signaling) ■ **CS4** - DSCP 32 (Class Selector 4: Realtime) ■ **CS5** - DSCP 40 (Class Selector 5: Broadcast video) ■ **CS6** - DSCP 48 (Class Selector 6: Network control) ■ **CS7** - DSCP 56 (Class Selector 7) ■ **EF** - DSCP 46 (Expedited Forwarding)
`ecn <ECN-VALUE>`	Specifies an Explicit Congestion Notification value. Range: 0 to 3.
`ip-precedence <IP-PRECEDENCE-VALUE>`	Specifies an IP precedence value. Range: 0 to 7.
`tos <TOS-VALUE>`	Specifies the Type of Service value. Range: 0 to 31.
`fragment`	Specifies a fragment packet.
`vlan <VLAN-ID>`	Specifies VLAN tag to match on. 802.1Q VLAN ID.

Parameter	Description
	NOTE: This parameter cannot be used in any class that will be applied to a VLAN.
`ttl <TTL-VALUE>`	Specifies a time-to-live (hop limit) value. Range: 0 to 255.
`count`	Keeps the hit counts of the number of packets matching this class entry.
`[<SEQUENCE-NUMBER>] comment <TEXT-STRING>`	Adds a comment to a class entry. The **no** form removes only the comment from the class entry.

Usage

- Entering an existing **<CLASS-NAME>** value will cause the existing class to be modified, with any new **<SEQUENCE-NUMBER>** value creating an additional class entry, and any existing **<SEQUENCE-NUMBER>** value replacing the existing class entry with the same sequence number.
- If no sequence number is specified, a new class entry will be appended to the end of the class with a sequence number equal to the highest class entry currently in the list plus 10.
- If the **<IP-PROTOCOL-NUM>** parameter is used instead of a protocol name, ensure that any needed class entry-definition parameters specific to the selected protocol are also provided.

Examples

Creating an IPv4 class with three entries:

```
switch(config)# class ip MY_IP_CLASS
switch(config-class-ip)# 10 match icmp any any10 match icmp any any
switch(config-class-ip)# 20 ignore udp any any
switch(config-class-ip)# 30 match tcp 192.168.0.1 192.168.0.2
switch(config-class-ip)# exit

switch(config)# do show class
Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
-------------------------------------------------------------------------------
IPv4       MY_IP_CLASS
        10 match                           icmp
           any
           any
        20 ignore                          udp
           any
           any
        30 match                           tcp
           192.168.0.1
           192.168.0.2
```

Adding a comment to an existing IPv4 class entry:

```
switch(config)# class ip MY_IP_CLASS
switch(config-class-ip)# 30 comment myipClass
switch(config-class-ip)# exit

switch(config)# do show class
Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
-------------------------------------------------------------------------------
IPv4       MY_IP_CLASS
        10 match                           icmp
           any
           any
        20 ignore                          udp
           any
           any
        30 myipClass
           match                           tcp
           192.168.0.1
           192.168.0.2
```

Removing a comment from an existing IPv4 class entry:

```
switch(config)# class ip MY_IP_CLASS
switch(config-class-ip)# no 30 comment
switch(config-class-ip)# exit

switch(config)# do show class
Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
-------------------------------------------------------------------------------
IPv4       MY_IP_CLASS
        10 match                           icmp
           any
           any
        20 ignore                          udp
           any
           any
        30 match                           tcp
           192.168.0.1
           192.168.0.2

Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
-------------------------------------------------------------------------------
IPv4       MY_IP_CLASS
        10 match                           icmp
           any
           any
        20 ignore                          udp
```

```
           any
           any
        30 match                           tcp
           192.168.0.1
           192.168.0.2
```

Replacing an IPv4 class entry in an existing class:

```
switch(config)# class ip MY_IP_CLASS
switch(config-class-ip)# 10 match igmp any any
switch(config-class-ip)# exit

switch(config)# do show class
Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
--------------------------------------------------------------------------------
IPv4       MY_IP_CLASS
        10 match                           igmp
           any
           any
        20 ignore                          udp
           any
           any
        30 match                           tcp
           192.168.0.1
           192.168.0.2
```

Removing an IPv4 class entry:

```
switch(config)# class ip MY_IP_CLASS
switch(config-class-ip)# no 10
switch(config-class-ip)# exit

switch(config)# do show class
Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
--------------------------------------------------------------------------------
IPv4       MY_IP_CLASS
       20  ignore                          udp
           any
           any
       30  match                           tcp
           192.168.0.1
           192.168.0.2
```

Removing an IPv4 class. Removing a class with entries removes all its entries as well. If a class associated with a policy entry (or multiple policy entries) is removed, the corresponding entries are also removed.

The corresponding entries are only removed if the class is unused by all policy entries.

```
switch(config)# no class ip MY_IP_CLASS

switch(config)# do show class
No Class found.
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config` **The class ip <CLASS-NAME> command takes you into the config-class-ipconfig-class-ip context where you enter the class entries.**	Administrators or local user group members with execution rights for this command.

class ipv6

Syntax to create an IPv6 class and enter its context. Plus syntax to remove a class:

```
class ipv6 <CLASS-NAME>
no class ipv6 <CLASS-NAME>
```

Syntax (within the class context) for creating or removing class entries for protocols `ah`, `gre`, `esp`, `igmp`, `ospf`, `pim` (`ipv6` is available as an alias for `any`):

```
  [<SEQUENCE-NUMBER>]
  {match|ignore}
  {any|ipv6|ah|gre|esp|igmp|ospf|pim|<IP-PROTOCOL-NUM>}
  {any|<SRC-IP-ADDRESS>[/{<PREFIX-LENGTH>|<SUBNET-MASK>}]}
  {any|<DST-IP-ADDRESS>[/{<PREFIX-LENGTH>|<SUBNET-MASK>}]}
  [dscp <DSCP-SPECIFIER>] [ecn <ECN-VALUE>] [ip-precedence <IP-PRECEDENCE-VALUE>]
  [tos <TOS-VALUE>] [fragment] [vlan <VLAN-ID>] [ttl <TTL-VALUE>] [count]

  no <SEQUENCE-NUMBER>
```

Syntax (within the class context) for creating or removing class entries for protocols `sctp`, `tcp`, `udp`:

```
  [<SEQUENCE-NUMBER>]
  {match|ignore}
  {sctp|tcp|udp}
  {any|<SRC-IP-ADDRESS>[/{<PREFIX-LENGTH>|<SUBNET-MASK>}]}
  [{eq|gt|lt} <PORT>|range <MIN-PORT> <MAX-PORT>]
  {any|<DST-IP-ADDRESS>[/{<PREFIX-LENGTH>|<SUBNET-MASK>}]}
  [{eq|gt|lt} <PORT>|range <MIN-PORT> <MAX-PORT>]
  [urg] [ack] [psh] [rst] [syn] [fin] [established]
```

```
[dscp <DSCP-SPECIFIER>] [ecn <ECN-VALUE>]  [ip-precedence <IP-PRECEDENCE-VALUE>]
[tos <TOS-VALUE>]  [fragment] [vlan <VLAN-ID>] [ttl <TTL-VALUE>] [count]

no <SEQUENCE-NUMBER>
```

Syntax (within the class context) for creating or removing class entries for protocol `icmpv6`:

```
[<SEQUENCE-NUMBER>]
{permit|deny}
{icmpv6}
{any|<SRC-IP-ADDRESS>[/{<PREFIX-LENGTH>|<SUBNET-MASK>}]}
{any|<DST-IP-ADDRESS>[/{<PREFIX-LENGTH>|<SUBNET-MASK>}]}
[icmp-type {echo|echo-reply|<ICMP-TYPE-VALUE>}] [icmp-code <ICMP-CODE-VALUE>]
[dscp <DSCP-SPECIFIER>] [ecn <ECN-VALUE>]  [ip-precedence <IP-PRECEDENCE-VALUE>]
[tos <TOS-VALUE>] [fragment] [vlan <VLAN-ID>] [ttl <TTL-VALUE>] [count]

no <SEQUENCE-NUMBER>
```

Syntax (within the class context) for class entry comments:

```
[<SEQUENCE-NUMBER>] comment <TEXT-STRING>

no <SEQUENCE-NUMBER> comment
```

Description

Creates or modifies an IPv6 traffic class to match specified packets. Class is composed of one or more class entries ordered and prioritized by sequence numbers. With this command, each class can classify traffic based on IPv6 header information.

The **no** form of the command deletes either an IPv6 traffic class (use **no** with the class command) or an individual IPv6 traffic class entry (use **no** with the sequence number).

Parameter	Description
`ipv6`	Specifies create or modify an IPv6 class.
<CLASS-NAME>	Specifies the name of this class.
<SEQUENCE-NUMBER>	Specifies a sequence number for the class entry. Optional. Range: 1-4294967295.
`{match|ignore}`	Creates a rule to match or ignore specified packets.
<IP-PROTOCOL-NUM>	Specifies the protocol as its Internet Protocol number. For example, 2 corresponds to the IGMP protocol. Range: 0 to 255.
`{any|<SRC-IP-ADDRESS>[/{<PREFIX-LENGTH>|<SUBNET-MASK>}]}`	Specifies the source IPv6 address. ■ **any** - specifies any source IPv6 address. ■ **<SRC-IP-ADDRESS>** - specifies the source IPv4 host address. ○ **<PREFIX-LENGTH>** - specifies the address bits to mask (CIDR subnet mask notation). Range: 1 to 32. ○ **<SUBNET-MASK>** - specifies the address bits to mask (dotted decimal notation).
`{any|<DST-IP-ADDRESS>[/{<PREFIX-LENGTH>|<SUBNET-MASK>}]}`	Specifies the destination IPv4 address. ■ **any** - specifies any destination IPv6 address. ■ **<DST-IP-ADDRESS>** - specifies the destination

Parameter	Description
	IPv6 host address. ◦ **<PREFIX-LENGTH>** - specifies the address bits to mask (CIDR subnet mask notation). Range: 1 to 32. ◦ **<SUBNET-MASK>** - specifies the address bits to mask (dotted decimal notation).
`[{eq|gt|lt} <PORT>|range <MIN-PORT><MAX-PORT>]`	Specifies the port or port range. Port numbers are in the range of 0 to 65535. ■ **eq <PORT>** - specifies the Layer 4 port. ■ **gt <PORT>** - specifies any Layer 4 port greater than the indicated port. ■ **lt <PORT>** - specifies any Layer 4 port less than the indicated port. ■ **range <MIN-PORT> <MAX-PORT>** - specifies the Layer 4 port range.
`cwr`	Specifies matching on the TCP Flag CWR : Congestion Window Reduced
`ece`	Specifies matching on the TCP Flag ECE : Explicit Congestion Notification [ECN]- Echo
`urg`	Specifies matching on the TCP Flag: Urgent.
`ack`	Specifies matching on the TCP Flag: Acknowledgment.
`psh`	Specifies matching on the TCP Flag: Push buffered data to receiving application.
`rst`	Specifies matching on the TCP Flag: Reset the connection.
`syn`	Specifies matching on the TCP Flag: Synchronize sequence numbers.
`fin`	Specifies matching on the TCP Flag: Finish connection.
`established`	Specifies matching on the TCP Flag: Established connection.
`dscp <DSCP-SPECIFIER>`	Specifies the Differentiated Services Code Point (DSCP), either a numeric **`<DSCP-VALUE>`** (0 to 63) or one of these keywords: ■ **AF11** - DSCP 10 (Assured Forwarding Class 1, low drop probability) ■ **AF12** - DSCP 12 (Assured Forwarding Class 1, medium drop probability) ■ **AF13** - DSCP 14 (Assured Forwarding Class 1, high drop probability)

Parameter	Description
	- **AF21** - DSCP 18 (Assured Forwarding Class 2, low drop probability) - **AF22** - DSCP 20 (Assured Forwarding Class 2, medium drop probability) - **AF23** - DSCP 22 (Assured Forwarding Class 2, high drop probability) - **AF31** - DSCP 26 (Assured Forwarding Class 3, low drop probability) - **AF32** - DSCP 28 (Assured Forwarding Class 3, medium drop probability) - **AF33** - DSCP 30 (Assured Forwarding Class 3, high drop probability) - **AF41** - DSCP 34 (Assured Forwarding Class 4, low drop probability) - **AF42** - DSCP 36 (Assured Forwarding Class 4, medium drop probability) - **AF43** - DSCP 38 (Assured Forwarding Class 4, high drop probability) - **CS0** - DSCP 0 (Class Selector 0: Default) - **CS1** - DSCP 8 (Class Selector 1: Scavenger) - **CS2** - DSCP 16 (Class Selector 2: OAM) - **CS3** - DSCP 24 (Class Selector 3: Signaling) - **CS4** - DSCP 32 (Class Selector 4: Real time) - **CS5** - DSCP 40 (Class Selector 5: Broadcast video) - **CS6** - DSCP 48 (Class Selector 6: Network control) - **CS7** - DSCP 56 (Class Selector 7) - **EF** - DSCP 46 (Expedited Forwarding)
`ecn` *`<ECN-VALUE>`*	Specifies an Explicit Congestion Notification value. Range: 0 to 3.
`ip-precedence` *`<IP-PRECEDENCE-VALUE>`*	Specifies an IP precedence value. Range: 0 to 7.
`tos` *`<TOS-VALUE>`*	Specifies the Type of Service value. Range: 0 to 31.
`fragment`	Specifies a fragment packet.
`vlan` *`<VLAN-ID>`*	Specifies VLAN tag to match on. 802.1Q VLAN ID. **NOTE:** This parameter cannot be used in any class that will be applied to a VLAN.
`ttl` *`<TTL-VALUE>`*	Specifies a time-to-live (hop limit) value. Range: 0 to 255.
`count`	Keeps the hit counts of the number of packets matching this class entry.
`[`*`<SEQUENCE-NUMBER>`*`] comment` *`<TEXT-STRING>`*	Adds a comment to a class entry. The **no** form removes only the comment from the class entry.

Usage

- If you enter an existing **<CLASS-NAME>** value, the existing class is modified with any new **<SEQUENCE-NUMBER>** value. This action creates an additional class entry. Any existing **<SEQUENCE-NUMBER>** value replaces the existing class entry with the same sequence number.
- If no sequence number is specified, a new class entry is appended to the end of the class with a sequence number equal to the highest class entry currently in the list plus 10.
- If the **<IP-PROTOCOL-NUM>** parameter is used instead of a protocol name, ensure that any needed class entry-definition parameters specific to the selected protocol are also provided.

Examples

Creating an IPv6 class with two entries:

```
switch(config)# class ipv6 MY_IPV6_CLASS
switch(config-class-ipv6)# 10 match icmpv6 any any
switch(config-class-ipv6)# 20 ignore udp any any
switch(config-class-ipv6)# exit

switch(config)# do show class
Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
-------------------------------------------------------------------------------
IPv6       MY_IPV6_CLASS
        10 match                           icmpv6
           any
           any
        20 ignore                          udp
           any
           any
```

Adding a comment to an existing IPv6 class entry:

```
switch(config)# class ipv6 MY_IPV6_CLASS
switch(config-class-ipv6)# 10 match icmpv6 any any
switch(config-class-ipv6)# 20 ignore udp any any
switch(config-class-ipv6)# 20 comment myipv6class
switch(config-class-ipv6)# exit

switch(config)# do show class
Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
-------------------------------------------------------------------------------
IPv6       MY_IPV6_CLASS
        10 match                           icmpv6
           any
           any
        20 myipv6class
           ignore                          udp
           any
           any
```

Removing a comment from an existing IPv6 class entry:

```
switch(config)# class ipv6 MY_IPV6_CLASS
switch(config-class-ipv6)# no 20 comment
switch(config-class-ipv6)# exit

switch(config)# do show class
Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
--------------------------------------------------------------------------------
IPv6       MY_IPV6_CLASS
        10 match                           icmpv6
           any
           any
        20 ignore                          udp
           any
           any

Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
--------------------------------------------------------------------------------
IPv6       MY_IPV6_CLASS
        10 match                           icmpv6
           any
           any
        20 ignore                          udp
           any
           any
```

Replacing an IPv6 class entry in an existing IPv6 class:

```
switch(config)# class ipv6 MY_IPV6_CLASS
switch(config-class-ipv6)# 10 match any any 1020::
switch(config-class-ipv6)# exit

switch(config)# do show class
Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
--------------------------------------------------------------------------------
IPv6       MY_IPV6_CLASS
        10 match                           any
           any
           1020::
        20 ignore                          udp
           any
           any
```

Removing an IPv6 class entry:

```
switch(config)# class ipv6 MY_IPV6_CLASS
switch(config-class-ipv6)# no 10
switch(config-class-ipv6)# exit

switch(config)# do show class
Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
-------------------------------------------------------------------------------
IPv6       MY_IPV6_CLASS
        20 ignore                          udp
           any
           any
```

Removing an IPv6 class. Removing a class with entries removes all its entries as well. If a class associated with a policy entry (or multiple policy entries) is removed, the corresponding entries are also removed.

The corresponding entries are only removed if the class is unused by all policy entries.

```
switch(config)# no class ipv6 MY_IPV6_CLASS

switch(config)# do show class
No Class found.
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

Command Information

Platforms	Command context	Authority
All platforms	`config` The **class ipv6 <CLASS-NAME>** command takes you into the **config-class-ipv6** command context where you enter the class entries.	Administrators or local user group members with execution rights for this command.

class mac

class mac *<CLASS-NAME>*

```
    [<SEQUENCE-NUMBER>]
    {match|ignore}
    {any|<SRC-MAC-ADDRESS>[/<ETHERNET-MASK>}]}
    {any|<DST-MAC-ADDRESS>[/<ETHERNET-MASK>}]}
    {any|aarp|appletalk|arp|fcoe|fcoe-init|ip|ipv6|ipx-arpa|ipx-non-arpa|is-is|
          lldp|mpls-multicast|mpls-unicast|q-in-q|rbridge|trill|wake-on-lan|
          <NUMERIC-ETHERTYPE>}
    [pcp <PCP-VALUE>] [vlan <VLAN-ID>] [count]

    [<SEQUENCE-NUMBER>] comment <TEXT-STRING>
```

Description

Creates or modifies a MAC traffic class to match specified packets. Class is composed of one or more class entries ordered and prioritized by sequence numbers. With this command, each class can classify traffic based on MAC header information.

The **no** form of the command can be used to delete either a MAC traffic class (use **no** with the class command) or an individual MAC traffic class entry (use **no** with the sequence number).

Parameter	Description
`mac`	Specifies create or modify a MAC class.
`<CLASS-NAME>`	Specifies the name of this class.
`<SEQUENCE-NUMBER>`	Specifies a sequence number for the class entry. Optional. Range: 1-4294967295.
`{match|ignore}`	Creates a rule to match or ignore specified packets.
`comment`	Stores the remaining entered text as a class comment.
`{any|<SRC-MAC-ADDRESS> [/<ETHERNET-MASK>}]}`	Specifies the source host MAC address (xxxx.xxxx.xxxx), OUI, or the keyword **any**. You can optionally include the following: **<ETHERNET-MASK>** - The address bits to mask (xxxx.xxxx.xxxx).
`{any|<DST-MAC-ADDRESS> [/<ETHERNET-MASK>}]}`	Specifies the destination host MAC address (xxxx.xxxx.xxxx), OUI, or the keyword **any**. You can optionally include the following: **<ETHERNET-MASK>** - The address bits to mask (xxxx.xxxx.xxxx).
`Protocol`	Select an ethertype protocol from the following (enter one only): ▪ **any** - Any ethertype protocol ▪ **<NUMERIC-ETHERTYPE>** - Enter an EtherType protocol number. Range: 0x600-0xffff. ▪ Or enter an EtherType protocol name from the following list: ◦ **aarp** ◦ **appletalk** ◦ **arp** ◦ **fcoe** ◦ **fcoe-init** ◦ **ip** ◦ **ipv6** ◦ **ipx-arpa**

Parameter	Description
	◦ **ipx-non-arpa** ◦ **is-is** ◦ **lldp** ◦ **mpls-multicast** ◦ **mpls-unicast** ◦ **q-in-q** ◦ **rbridge** ◦ **trill** ◦ **wake-on-lan**
`pcp <PCP-VALUE>`	Not supported.
`vlan <VLAN-ID>`	Specifies matching on a VLAN ID. Enter a VLAN ID or the VLAN name, if configured. **NOTE:** This parameter cannot be used in any class that will be applied to a VLAN.
`count`	Keeps the hit counts of the number of packets matching this class entry.

Examples

Creating a MAC class:

```
switch(config)# class mac MY_MAC_CLASS
switch(config-class-mac)# match any any lldp
switch(config-class-mac)# ignore any any arp
switch(config-class-mac)# exit
switch(config)# do show class
Type       Name
  Sequence Comment
           Action                          EtherType
           Source MAC Address
           Destination MAC Address
           Additional Parameters
--------------------------------------------------------------------------------
MAC        MY_MAC_CLASS
        10 match                           lldp
           any
           any
        20 ignore                          arp
           any
           any
```

Adding a comment to an existing MAC class entry:

```
switch(config)# class mac MY_MAC_CLASS
switch(config-class-mac)# 10 comment MY_CLASS_ENTRY10 comment MY_CLASS_ENTRY
switch(config-class-mac)# exit
switch(config)# do show class
```

```
Type       Name
  Sequence Comment
           Action                          EtherType
           Source MAC Address
           Destination MAC Address
           Additional Parameters
--------------------------------------------------------------------------------
MAC        MY_MAC_CLASS
        10 MY_CLASS_ENTRY
           match                           lldp
           any
           any
        20 ignore                          arp
           any
           any
```

Removing a comment from an existing MAC class entry:

```
switch(config)# class mac MY_MAC_CLASS
switch(config-class-mac)# no 10 comment MY_CLASS_ENTRY
switch(config-class-mac)# exit
switch(config)# do show class
Type       Name
  Sequence Comment
           Action                          EtherType
           Source MAC Address
           Destination MAC Address
           Additional Parameters
--------------------------------------------------------------------------------
MAC        MY_MAC_CLASS
        10 match                           lldp
           any
           any
        20 ignore                          arp
           any
           any
```

Replacing a MAC class entry in an existing MAC class:

```
switch(config)# class mac MY_MAC_CLASS
switch(config-class-mac)# 10 match any any any
switch(config-class-mac)# exit
switch(config)# do show class
Type       Name
  Sequence Comment
           Action                          EtherType
           Source MAC Address
           Destination MAC Address
           Additional Parameters
--------------------------------------------------------------------------------
MAC        MY_MAC_CLASS
        10 match                           any
           any
           any
        20 ignore                          arp
           any
           any
```

Removing a MAC class entry:

```
switch(config)# class mac MY_MAC_CLASS
switch(config-class-mac)# no 1
switch(config-class-mac)# exit
switch(config)# do show class
Type       Name
  Sequence Comment
           Action                          EtherType
           Source MAC Address
           Destination MAC Address
           Additional Parameters
-------------------------------------------------------------------------------
MAC        MY_MAC_CLASS
         2 ignore                          arp
           any
           any
```

Removing a MAC class. Removing a class with entries removes all its entries as well. If a class associated with a policy entry (or multiple policy entries) is removed, the corresponding entries are also removed.

The corresponding entries are only removed if the class is unused by all policy entries.

```
switch(config)# no class mac MY_MAC_CLASS
switch(config)# do show class
No Class found.
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config` The **class mac <CLASS-NAME>** command takes you into the **config-class-mac** context where you enter the class entries.	Administrators or local user group members with execution rights for this command.

class resequence

`class {ip|ipv6|mac} <CLASS-NAME> resequence <STARTING-SEQUENCE-NUMBER> <INCREMENT>`

bDescription

Resequence numering in an IPv4, or IPv6, or MAC class.

Parameter	Description
{ip|ipv6|mac**}** *<CLASS-NAME>*	Specifies the class where you want to resequence class entries.
<STARTING-SEQUENCE-NUMBER>	Specifies the sequence number to start resequencing from.
<INCREMENT>	Specifies how much to increment the sequence numbers by.

Examples

Resequencing an IPv4 class:

```
switch(config)# class ip MY_IP_CLASS resequence 1 10
switch(config)# do show class
Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
-------------------------------------------------------------------------------
IPv4       MY_IP_CLASS
        1  match                           igmp
           any
           any
       11  ignore                          udp
           any
           any
       21  match                           tcp
           192.168.0.1
           192.168.0.2
```

Resequencing an IPv6 class:

```
switch(config)# class ipv6 MY_IPV6_CLASS resequence 1 1
switch(config-class-ipv6)# exit
switch(config)# do show class
Type       Name
  Sequence Comment
           Action                          L3 Protocol
           Source IP Address               Source L4 Port(s)
           Destination IP Address          Destination L4 Port(s)
           Additional Parameters
-------------------------------------------------------------------------------
IPv6       MY_IPV6_CLASS
         1 match                           any
           any
           1020::
         2 ignore                          udp
           any
           any
```

Resequencing a MAC class:

```
switch(config)# class mac MY_MAC_CLASS resequence 1 1
switch(config)# do show class
Type       Name
  Sequence Comment
           Action                          EtherType
           Source MAC Address
           Destination MAC Address
           Additional Parameters
-------------------------------------------------------------------------------
MAC        MY_MAC_CLASS
         1 match                           any
           any
           any
         2 ignore                          arp
           any
           any
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

class reset

class { all | ip *<CLASS-NAME>* | ipv6 *<CLASS-NAME>* |mac *<CLASS-NAME>* } reset

Description

Changes the user-specified class configuration to match the active class configuration. Use this command when there is a discrepancy between what the user configured and what is active and accepted by the system.

Parameter	Description
{ all | ip *<CLASS-NAME>*| ipv6 *<CLASS-NAME>* |mac *<CLASS-NAME>* }	Specifies either **all** classes be reset or specifies the type (**ip** for IPv4, **ipv6** for IPv6 or **mac** for MAC ACL) and name of the class to be reset.

Examples

Resetting the user-specified configuration to the active configuration:

```
switch(config)# class all reset
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

Command History

Release	Modification

clear policy hitcounts

```
clear policy hitcounts { all | [<POLICY-NAME>] [[interface <IF-NAME> [in|out|routed-in]]
| [vlan <VLAN-ID> [in|out]]] | global }
```

Description

Clears the policy hit count statistics.

Parameter	Description
`all`	Selects all policies.
`<POLICY-NAME>`	Specifies the policy name.
`interface` *`<IF-NAME>`*	Specifies the interface name.
`vlan` *`<VLAN-ID>`*	Specifies the VLAN.
`in`	Specifies the inbound (ingress) traffic direction.
`out`	Selects the outbound (egress) traffic direction.
`routed-in`	Selects the routed in traffic direction. Not applicable to a policy applied to a VLAN.
`global`	Selects the globally applied policy.

Examples

On the 6400 Switch Series, interface identification differs.

Clearing policy hit counts and then showing the policy hit counts (statistics):

```
switch# clear policy hitcounts my_policy int 1/1/1 in
switch# show policy hitcounts my_policy
Statistics for Policy my_policy:
Interface 1/1/1* (in):
           Hit Count  Configuration
10 class ipv6 my_class1 action dscp af21 action drop
                   0  10 match any any any count
* policy statistics are shared among each context type (interface, VLAN).
  For routed ingress, they are only shared within the same VRF.
  Use 'policy NAME copy' to create a new policy for separate statistics.
```

Clearing the globally applied policy hit counts and then showing the global policy hit counts (statistics):

```
switch# clear policy hitcounts global
switch# show policy hitcounts global
Statistics for Policy global1:
Global Policy:
           Hit Count  Configuration
10 class ipv6 my_class1 action mirror
                   0  10 match any any any count
* policy statistics are shared among each context type (interface, VLAN).
  For routed ingress, they are only shared within the same VRF.
  Use 'policy NAME copy' to create a new policy for separate statistics.
```

Clearing hit counts for policy **MY_IPv6_Policy** applied to VLAN 10 (ingress):

```
switch# clear policy hitcounts My_IPv6_Policy vlan 10 in
```

Clearing hit counts for all policies:

```
switch# clear policy hitcounts all
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

policy

```
policy <POLICY-NAME>

    [<SEQUENCE-NUMBER>]
    class {ip|ipv6|mac} <CLASS-NAME>
          action {<REMARK-ACTIONS> | <POLICE-ACTIONS> | <OTHER-ACTIONS>}
          [{<REMARK-ACTIONS> | <POLICE-ACTIONS> | <OTHER-ACTIONS>}]

    [<SEQUENCE-NUMBER>]
    comment ...
```

Description

Creates or modifies classifier policy and policy entries. A policy is made up of one or more policy entries ordered and prioritized by sequence numbers. Each entry has an IPv4/IPv6/MAC class and zero or more policy actions associated with it.

A policy must be applied using the **apply** command.

The **no** form of the command can be used to delete either a policy (use **no** with the policy command) or an individual policy entry (use **no** with the sequence number).

Parameter	Description
`<POLICY-NAME>`	Specifies the name of the policy.
`<SEQUENCE-NUMBER>`	Specifies a sequence number for the policy entry. Optional. Range: 1 to 4294967295.
`comment`	Stores the remaining entered text as a policy entry comment.
`class {ip|ipv6|mac} <CLASS-NAME>`	Specifies a type of class, **ip** for IPv4, **ipv6** for IPv6 and **mac** for a MAC policy. And specifies a class name.
`<REMARK-ACTIONS>`	Remark actions can be any of the following options: {pcp **<PRIORITY>** | **ip-precedence <IP-PRECEDENCE_VALUE> | dscp <*DSCP-VALUE*> | local-priority <*LOCAL-PRIORITY-VALUE*>**} where:
`pcp <PCP-VALUE>`	Specifies the Priority Code Point (PCP) value. Range: 0 to 7.
`ip-precedence <IP-PRECEDENCE-VALUE>`	Specifies the numeric IP precedence value. Range: 0 to 7.
`dscp <DSCP-VALUE>`	Specifies a Differentiated Services Code Point (DSCP) value. Enter either a numeric value (0 to 63) or a keyword as follows: ▪ **AF11** - DSCP 10 (Assured Forwarding Class 1, low drop probability) ▪ ▪ **AF12** - DSCP 12 (Assured Forwarding Class 1, medium drop probability) ▪ **AF13** - DSCP 14 (Assured Forwarding Class 1, high drop probability) ▪ **AF21** - DSCP 18 (Assured Forwarding Class 2, low drop probability)

Parameter	Description
	- **AF22** - DSCP 20 (Assured Forwarding Class 2, medium drop probability) - **AF23** - DSCP 22 (Assured Forwarding Class 2, high drop probability) - **AF31** - DSCP 26 (Assured Forwarding Class 3, low drop probability) - **AF32** - DSCP 28 (Assured Forwarding Class 3, medium drop probability) - **AF33** - DSCP 30 (Assured Forwarding Class 3, high drop probability) - **AF41** - DSCP 34 (Assured Forwarding Class 4, low drop probability) - **AF42** - DSCP 36 (Assured Forwarding Class 4, medium drop probability) - **AF43** - DSCP 38 (Assured Forwarding Class 4, high drop probability) - **CS0** - DSCP 0 (Class Selector 0: Default) - **CS1** - DSCP 8 (Class Selector 1: Scavenger) - **CS2** - DSCP 16 (Class Selector 2: OAM) - **CS3** - DSCP 24 (Class Selector 3: Signaling) - **CS4** - DSCP 32 (Class Selector 4: Real time) - **CS5** - DSCP 40 (Class Selector 5: Broadcast video) - **CS6** - DSCP 48 (Class Selector 6: Network control) - **CS7** - DSCP 56 (Class Selector 7) - **EF** - DSCP 46 (Expedited Forwarding)
`local-priority` *`<LOCAL-PRIORITY-VALUE>`*	Specifies a local priority value. Range: 0 to 7.
`<POLICE-ACTIONS>`	Police actions can be the following **{cir <*RATE-BPS*>cbs <BYTES> exceed}** where:
`cir kbps` *`<RATE-KBPS>`*	Specifies a Committed Information Rate value in Kilobits per second. Range: 1 to 4294967295.
`cbs` *`<BYTES>`*	Specifies a Committed Burst Size value in bytes. Range: 1 to 4294967295.
`exceed`	Specifies action to take on packets that exceed the rate limit.
`<OTHER-ACTIONS>`	Other actions can be the following:
`drop`	Specifies drop traffic.

Usage

- An applied policy will process a packet sequentially against policy entries in the list until the last policy entry in the list has been evaluated or the packet matches an entry.
- Entering an existing **`<POLICY-NAME>`** value will cause the existing policy to be modified, with any new **`<SEQUENCE-NUMBER>`** value creating an additional policy entry, and any existing **`<SEQUENCE-NUMBER>`** value replacing the existing policy entry with the same sequence number.

- If no sequence number is specified, a new policy entry will be appended to the end of the entry list with a sequence number equal to the highest policy entry currently in the list plus 10.

Examples

Creating a policy with several entries:

```
switch(config)# policy MY_POLICY
switch(config-policy)# 10 class ipv6 MY_CLASS1 action dscp af21 action drop
switch(config-policy)# 20 class ip MY_CLASS3 action mirror 1
switch(config-policy)# exit
switch(config)# do show policy
           Name
  Sequence Comment
           Class Type
                    action
--------------------------------------------------------------------------------
           MY_POLICY
        10
           MY_CLASS1 ipv6
                    drop
                    dscp AF21

        20
           MY_CLASS3 ipv4
                    mirror 1
```

Adding a comment to an existing policy entry:

```
switch(config)# policy MY_POLICY
switch(config-policy)# 20 comment MY_TEST_POLICY
switch(config-policy)# exit
switch(config)# do show policy
           Name
  Sequence Comment
           Class Type
                    action
--------------------------------------------------------------------------------
           MY_POLICY
        10
           MY_CLASS1 ipv6
                    drop
                    dscp AF21

        20 MY_TEST_POLICY
           MY_CLASS3 ipv4
                    mirror 1
```

Removing a comment from an existing policy entry:

```
switch(config)# policy MY_POLICY
switch(config-policy)# no 20 comment
switch(config-policy)# exit
switch(config)# do show policy
           Name
  Sequence Comment
           Class Type
                    action
```

```
--------------------------------------------------------------------------------
           MY_POLICY
        10
           MY_CLASS1 ipv6
                    drop
                    dscp AF21

        20
           MY_CLASS3 ipv4
                    mirror 1
```

Adding/Replacing a policy entry in an existing policy:

```
switch(config)# policy MY_POLICY
switch(config-policy)# 10 class ip MY_CLASS3 action drop action dscp af21
switch(config-policy)# exit
switch(config)# do show policy
           Name
  Sequence Comment
           Class Type
                    action
--------------------------------------------------------------------------------
           MY_POLICY
        10
           MY_CLASS3 ipv4
                    drop
                    dscp AF21

        20
           MY_CLASS3 ipv4
                    mirror 1
```

Removing a policy entry:

```
switch(config)# policy MY_POLICY
switch(config-policy)# no 10
switch(config-policy)# exit
switch(config)# do show policy
           Name
  Sequence Comment
           Class Type
                    action
--------------------------------------------------------------------------------
           MY_POLICY
        20
           MY_CLASS3 ipv4
                    mirror 1
```

Removing a policy:

```
switch(config)# no policy MY_POLICY
switch(config)# do show policy
           Name
  Sequence Comment
           Class Type
                    action
```

```
-------------------------------------------------------------------------------
           MY_POLICY2
         2
           MY_CLASS3 ipv4
                    mirror 1
```

The policer **exceed** DSCP action cannot be combined with other actions in the same policy entry, but other entries in the policy may use other actions.

For example, this configuration is valid:

```
switch(config)# policy my_policy
switch(config-policy)# 10 class ip my_class action cir kbps 1000 cbs 15625 exceed
dscp EF
```

But this is not because it adds a secondary action within the same policy entry:

```
6300(config-policy)# 10 class ip my_class action cir kbps 1000 cbs 15625 exceed
dscp EF action mirror 1
```

Invalid input: action

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

Command Information

Platforms	Command context	Authority
All platforms	`config` The `policy` command takes you into the `config-policy` context where you enter the policy entries.	Administrators or local user group members with execution rights for this command.

policy copy

policy *<POLICY-NAME>* copy *<DESTINATION-POLICY>*

Description

Copies a policy to a new destination policy or overwrites an existing policy. Copying a policy copies all its entries as well.

Parameter	Description
<POLICY-NAME>	Specifies the policy to be copied.
<DESTINATION-POLICY>	Specifies the name of the destination policy.

Examples

Copying a policy:

```
switch(config)# policy MY_POLICY copy MY_POLICY2
switch(config)# do show policy
           Name
  Sequence Comment
           Class Type
                    action
-------------------------------------------------------------------------------
           MY_POLICY
         2
           my_class3 ipv4
                    mirror 1
-------------------------------------------------------------------------------
           MY_POLICY2
         2
           my_class3 ipv4
                    mirror 1
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

All platforms	config	Administrators or local user group members with execution rights for this command.

policy resequence

policy *<POLICY-NAME>* resequence *<STARTING-SEQ-NUM>* *<INCREMENT>*

Description

Resequences numbering in a policy.

Parameter	Description
<POLICY-NAME>	Specifies the policy where you want to resequence policy entries.
<STARTING-SEQ-NUM>	Specifies the sequence number to start resequencing from.
<INCREMENT>	Specifies how much to increment the sequence numbers by.

Examples

Resequencing a policy:

```
switch(config)# policy MY_POLICY resequence 1 1
switch(config)# do show policy
           Name
  Sequence Comment
           Class Type
                    action
-------------------------------------------------------------------------------
           MY_POLICY
         1
           MY_CLASS3 ipv4
                    drop
                    dscp AF21

         2
           MY_CLASS3 ipv4
                    mirror 1
```

policy reset

`policy <POLICY-NAME> reset`

Description

Changes the user-specified policy configuration to match the active policy configuration. Use this command when a discrepancy exists between what the user configured and what is active and accepted by the system.

Parameter	Description
<POLICY-NAME>	Specifies the policy to be reset.

Examples

Resetting a policy:

```
switch(config)# policy MY_POLICY reset
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

show class

```
show class [ip | ipv6 | mac] [<CLASS-NAME>] [commands] [configuration] [vsx-peer]
```

Description

Shows class configuration information.

All parameters are optional.

Parameter	Description
`[ip | ipv6 | mac]`	Selects the class type for the display: **ip** for IPv4, **ipv6** for IPv6, or **mac** for MAC classes.
<CLASS-NAME>	Specifies the class name.
`commands`	Specifies whether to display output as the CLI commands showing the configured class entries.
`configuration`	Specifies whether to display classes that have been configured by

Parameter	Description
	the user, even if they are not active due to issues with the command parameters or hardware issues. This parameter is useful during a mismatch between the entered configuration and the previous successfully programmed (active) classes.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing all class configuration:

```
switch# show class
Type Name
    Sequence Comment
           action                      L3 Protocol
           Source IP address           Source L4 Port(s)
           Destination IP address      Destination L4 Port(s)
           Additional Parameters
---------------------------------------------------------------
ipv4 MY_IPV4_CLASS
        10 my first class entry comment
           match                       icmp
           192.168.0.1/255.255.255.0
           192.168.1.1/255.255.255.0
           VLAN: 1
        20 my second class entry comment
           ignore                      tcp
           10.100.0.10/255.255.255.0   < 3000
           10.100.1.10/255.255.255.0   > 2000
           VLAN: 1
----------------------------------------------------------------------
```

Showing class configuration for the IPv4 class MY_IPV4_CLASS as CLI commands:

```
switch# show class ip MY_IPV4_CLASS commands
class ip "MY_IPV4_CLASS"
  10 match icmp 192.168.0.1/255.255.255.0 192.168.1.1/255.255.255.0 vlan 1
  10 comment my first class entry comment
  20 ignore tcp 10.100.0.10/255.255.255.0 lt 3000 10.100.1.10/255.255.255.0 gt
     2000 vlan 1
  20 comment my second class entry comment
```

For more information on features that use this command, refer to the ACLs and Classifiers Policy Guide for your switch model.

10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show policy

Syntax that shows information for all policies:

```
show policy [commands] [configuration] [vsx-peer]
```

Syntax that filters by policies applied to an interface or VLAN:

```
show policy [interface <IF-NAME> [in | out | routed-in] | vlan <VLAN-ID> [in | out] | vni
<VNI-ID> [routed-in]]
            [commands] [configuration] [vsx-peer]
show policy [interface <IF-NAME> [in | routed-in] | vlan <VLAN-ID> [in] | vni <VNI-ID>
[routed-in]]
            [commands] [configuration] [vsx-peer]
```

Syntax that filters by the named policy:

```
show policy <POLICY-NAME> [commands] [configuration] [vsx-peer]
```

Syntax that filters by the globally applied policy:

```
show policy global [commands] [configuration] [vsx-peer]
```

Syntax that shows statistical information in the form of hit counts:

```
show policy hitcounts <POLICY-NAME> [interface <IF-NAME> [in | out | routed-in] |
                      vlan <VLAN-ID> [in | out] | vni <VNI-ID> [routed-in]] [vsx-peer]
```

Syntax that shows statistical information in the form of hit counts for the globally applied policy:

```
show policy hitcounts global [vsx-peer]
```

Description

Shows information about your defined policies and where they have been applied. When **show policy** is entered without parameters, information for all policies is shown. The parameters filter the list of policies for which information is shown.

Available filtering includes:

- The content of a specific policy.
- All policies applied to a specific interface.
- All policies applied to a specific VLAN.
- All policies applied to a specific VNI.
- The globally applied policy.
- The inbound (ingress) or outbound (egress) direction.

To display policy statistics, use the **show policy hitcounts** form of this command.

When a policy is applied to a physical interface or lag using command **apply policy**, with the **per-interface** parameter included, unique instances of the policy are applied to each physical interface port or LAG. The unique instance of a policy has a parent-child relationship with the policy from which it was created. The **show policy** command shows information about the parent policy not the unique instances.

If a policy contains any class entries with the count keyword and policy entries with the **cir** action, and the policy is applied to multiple physical or virtual interfaces in the same direction, except for the routed ingress direction, the statistics will be aggregated. In the routed ingress direction, the statistics will be aggregated in multiple physical or virtual interfaces in the same VRF. If separate statistics for different physical or virtual interfaces are required, then another policy should be created. Alternatively, in the case of physical interfaces or LAGs, a policy applied with **per-interface** set can be used.

Parameter	Description
`interface <IF-NAME>`	Specifies the interface name.
`vlan <VLAN-ID>`	Specifies the VLAN.
`vni<VNI-ID>`	Specifies the VNI.
`in`	Selects the inbound (ingress) traffic direction.
`out`	Selects the outbound (egress) traffic direction.
`routed-in`	Selects the routed in traffic direction. Not applicable to a policy applied to a VLAN.
`<POLICY-NAME>`	Specifies the policy name.
`commands`	Causes the policy definition to be shown as the commands and parameters used to create it rather than in tabular form.
`configuration`	Causes the user-configured policies be shown as entered, even if the policies are not active due to policy-definition command issues or hardware issues. This parameter is useful if there is a mismatch between the entered configuration and the previous successfully programmed (active) policies configuration.
`global`	Selects the globally applied policy.
`hitcounts`	Selects the policy hit counts (statistics).
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

Showing information for all policies:

```
switch# show policy
           Name
  Sequence Comment
           Class Type
                    action
-------------------------------------------------------------------------------
           my_policy
        10 QOS class
           class1 ipv4
```

```
                    dscp af21
                    drop
        20 PBR policy.
           class2 ipv4
                    pbr mypbr
-------------------------------------------------------------------------------
```

Showing a policy as commands:

```
switch# show policy commands
policy my_policy
       10 class ip class1 action dscp af21 action drop
       20 class ip class2 action pbr mypbr
```

Showing the globally applied policy:

```
switch# show policy global commands
policy global1
    10 class ip my_class1 action drop
apply policy my_policy in
```

Showing policy hit counts (statistics) for the globally applied policy:

```
switch# show policy hitcounts global
Statistics for Policy My_Policy:
global (in):
     Matched Packets  Configuration
10 class ip My_ip_Class
                   0  10 match tcp any any ack count
                   -  20 match udp any lt 8 any
                   0  30 match icmp any 10.1.1.10 count
20 class ipv6 My_ipv6_Class action cir kbps 1000000 cbs 1000000 exceed drop  [ 0
kbps conform ]
                   -  10 match tcp any any ack
                   0  20 match icmpv6 1000::10 any count
```

Showing policy hit counts (statistics) for a policy applied everywhere (with 1/1/4 and 1/1/5 being applied per interface):

```
switch# show policy hitcounts My_Policy
Statistics for Policy My_Policy:

Interface 1/1/1,lag1 (in):
     Matched Packets  Configuration
10 class ip My_ip_Class
                   0  10 match tcp any any ack count
                   -  20 match udp any lt 8 any
                   0  30 match icmp any 10.1.1.10 count
20 class ipv6 My_ipv6_Class action cir kbps 1000000 cbs 1000000 exceed drop  [ 0
kbps conform ]
                   -  10 match tcp any any ack
                   0  20 match icmpv6 1000::10 any count

Interface 1/1/4 (in):
     Matched Packets  Configuration
```

```
10 class ip My_ip_Class
                   0  10 match tcp any any ack count
                   -  20 match udp any lt 8 any
                   0  30 match icmp any 10.1.1.10 count
20 class ipv6 My_ipv6_Class action cir kbps 1000000 cbs 1000000 exceed drop  [ 0
kbps conform ]
                   -  10 match tcp any any ack
                   0  20 match icmpv6 1000::10 any count

Interface 1/1/5 (in):
     Matched Packets  Configuration
10 class ip My_ip_Class
                   0  10 match tcp any any ack count
                   -  20 match udp any lt 8 any
                   0  30 match icmp any 10.1.1.10 count
20 class ipv6 My_ipv6_Class action cir kbps 1000000 cbs 1000000 exceed drop  [ 0
kbps conform ]
                   -  10 match tcp any any ack
                   0  20 match icmpv6 1000::10 any count

interface 1/1/2.10,1/1/3.10 (in):
     Matched Packets  Configuration
10 class ip My_ip_Class
                   0  10 match tcp any any ack count
                   -  20 match udp any lt 8 any
                   0  30 match icmp any 10.1.1.10 count
20 class ipv6 My_ipv6_Class action cir kbps 1000000 cbs 1000000 exceed drop  [ 0
kbps conform ]
                   -  10 match tcp any any ack
                   0  20 match icmpv6 1000::10 any count
...
```

Showing policy hit counts (statistics) for a policy applied on physical interfaces and LAGs:

```
switch# show policy hitcounts My_Policy interface 1/1/1
Statistics for Policy My_Policy:

Interface 1/1/1,lag1 (in):
     Matched Packets  Configuration
10 class ip My_ip_Class
                   0  10 match tcp any any ack count
                   -  20 match udp any lt 8 any
                   0  30 match icmp any 10.1.1.10 count
20 class ipv6 My_ipv6_Class action cir kbps 1000000 cbs 1000000 exceed drop  [ 0
kbps conform ]
                   -  10 match tcp any any ack
                   0  20 match icmpv6 1000::10 any count
```

Showing policy hit counts (statistics) for a policy applied on VLANs:

```
switch# show policy hitcounts My_Policy vlan 10
Statistics for Policy My_Policy:

vlan 10,20-30 (in):
     Matched Packets  Configuration
10 class ip My_ip_Class
                   0  10 match tcp any any ack count
                   -  20 match udp any lt 8 any
                   0  30 match icmp any 10.1.1.10 count
```

```
20 class ipv6 My_ipv6_Class action cir kbps 1000000 cbs 1000000 exceed drop  [ 0
kbps conform ]
                   -  10 match tcp any any ack
                   0  20 match icmpv6 1000::10 any count
Statistics for Policy My_Policy:

vlan 10,20-30 (in):
     Matched Packets  Configuration
10 class ip My_ip_Class
                   0  10 match tcp any any ack count
                   -  20 match udp any lt 8 any
                   0  30 match icmp any 10.1.1.10 count
20 class ipv6 My_ipv6_Class action cir kbps 1000000 cbs 1000000 exceed drop  [ 0

Chapter 19

Client Insight Commands

client-insight enable

```
client-insight enable
no client-insight enable
```

Description

Enables the Client Insight feature on the device. Client Insight is disabled by default at the device level.

The `no` form of the command disables Client Insight.

Examples

Enabling the Client Insight feature:

```
switch(config)# client-insight enable
```

Disabling the Client Insight feature:

```
switch(config)# no client-insight enable
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.11	Command introduced.

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

client-insight on-boarding event logs

```
client-insight
   event-log
   client-onboarding
```

Description

Enables generation of event logs that lists the onboarding status of each client. Onboarding event logs are disabled by default. For onboarding event logs to work, the Client Insight feature should be enabled before client onboarding. Use the no form of the command to disable onboarding event logs for clients.

Parameter	Description
`event-log`	Configure client onboarding event logs.
`client-onboarding`	Enable client onboarding event logs.

Examples

Enabling client onboarding event logs:

```
switch(config)# client-insight event-log client-onboarding
```

Disabling client onboarding event logs:

```
switch(config)# no client-insight event-log client-onboarding
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

diag-dump client-insight basic

`diag-dump client-insight basic`

Description

Displays the status of the Client Insight feature—whether enabled or disabled globally. It also displays latencies for all active clients that are onboarded.

Examples

```
switch# diag-dump client-in basic
=========================================================================
[Start] Feature client-insight Time : Tue Jul 25 05:32:14 2023
```

```
=========================================================================
-------------------------------------------------------------------------
[Start] Daemon client-insightd
-------------------------------------------------------------------------

show events -c client-insight

```
show events -c client-insight
```

Description

Displays all the events logged by the Client Insight feature.

Following events are logged by the Client Insight feature:

Table 1: *Events Logged by Client Insight*

Process	Event ID	Severity	Message	Description
client-insightd	14301	Info	`Client {mac} {vlans} on {port_name} successfully on-boarded. Client on-boarding started at {ob_start_ts}; L2 complete at {l2_end_ts}; L3 complete at {l3_end_ts}`	Client successfully on-boarded with given timestamp values.
client-insightd	14302	Info	`Client {mac} {vlans} on {port_name} partial success in on-boarding. L2 status: {l2_ob_state} L3 status: {l3_ob_state}. Client on-boarding started at {ob_start_ts};L2 complete at {l2_end_ts}; L3 complete at {l3_end_ts}`	Client on-boarding is partial-successful with given timestamp values.
client-insightd	14303	Info	`Client {mac} on {port_name} failed to on-board with status: {onboarding_status} reason_code: {failure_phase_id}`	Client failed to on-board with given status and reason code.
client-insightd	14304	Info	`Maximum system wide client limit {client-number} reached`	Maximum system wide client limit is reached
client-insightd	14305	Info	`Maximum system wide client`	Maxiumum system wide client limit is reached

Process	Event ID	Severity	Message	Description
			`limit {client-number} reached`	
client-insightd	14306	Info	`Client {mac} successfully on-boarded on VLAN {vlans}; Client on-boarding started at {ob_start_ts}; L2 complete at {l2_end_ts}; L3 complete at {l3_end_ts}; ARP to GW response received at {arp_end_ts}; DNS on-boarding to (dns_server_ip) completed at {dns_end_ts}`	Client successfully on-boarded with given timestamp values.
client-insightd	14307	Info	`Client {mac} on-boarded on VLANs {vlans} and failed on VLANs {failed_vlans}; Client on-boarding started at {ob_start_ts}; L2 complete at {l2_end_ts}; L3 complete at {l3_end_ts}; ARP to GW response received at {arp_end_ts}; DNS on-boarding to (dns_server_ip) completed at {dns_end_ts}; L2 status {l2_ob_state} failure_reason_code - {l2_failure_reason}; L3 status {l3_ob_state} failure_reason_code - {l3_failure_reason}; DNS on-boarding status {dns_status} failure_reason_code - {dns_failure_reason}`	Client on-boarding is partial-successful with given timestamp values.
client-insightd	14308	Info	`Client {mac} failed to on-board with status: {onboarding_status} in failure phase: {failure_phase_id} with reason: {failure_reason}`	Client failed to on-board with given status, phase_id and reason code.

show tech client-insight

`show tech client-insight`

Description

Displays if the global Client Insight and client on-boarding event log features are enabled or disabled. Also displays the latencies for all active clients that are onboarded.

Examples

```
switch# show tech client-insight

====================================================
Show Tech executed on Thu May 18 15:05:43 2022
====================================================
====================================================
[Begin] Feature client-insight
====================================================
*********************************
Command : show client-insight
*********************************
Client Insight Information:
Global client-insight         = ENABLED
Client on-boarding event logs = ENABLED
====================================================
[End] Feature client-insight
====================================================
====================================================
Show Tech commands executed successfully
====================================================
```

Displaying L2, L3 client latencies and details:

```
switch# show tech client-insight
====================================================
Show Tech executed on Thu Sep 22 06:34:16 2022
====================================================
====================================================
[Begin] Feature client-insight
====================================================

*********************************
Command : diag-dump client-insight basic
*********************************

Chapter 20

CLI session commands

alias

```
alias <ALIAS-NAME> <COMMAND-STRING>
no alias <ALIAS-NAME><COMMAND-STRING>
```

Description

Defines an alias for one or more CLI commands. The alias and its definition are valid only for the user that creates the alias. The alias name cannot be an existing token name.

The alias command should not be configured for CLI commands that contain sensitive information.

The **no** form of this command removes the specified alias.

Parameter	Description
<ALIAS-NAME>	Specifies the name of the alias you are defining.
<COMMAND-STRING>	Specifies one or more commands and their parameters. Separate commands with a semicolon (;). Length: 1 to 400 characters. For commands that require user-supplied parameters, use **$1** through $*n*, in order, as placeholders. These parameters are replaced by the corresponding arguments from the command line, and must match the number of parameters required by the original command. For alias definitions that include multiple commands, continue numbering parameters through all commands. Do not restart numbering for each command.

Examples

Defining an alias:

```
switch(config)# alias srci show running-config interface $1
switch(config)# srci?
  shv  Execute "show alias" to list the command list. Arguments to replace $1,
       $2 etc.
switch(config)# show alias
  Alias Name                     Alias Definition
  -------------------------------------------------------------------------------
  srci                           show running-config interface $1
```

Using **alias** in config context:

```
switch(config)# srci 1/1/1
interface 1/1/1
    no shutdown
```

```
  ip address 1.1.1.1/24
  exit
```

Using **alias** in enable context:

```
switch# srci 1/1/1
interface 1/1/1
    no shutdown
    ip address 1.1.1.1/24
    exit
```

Using **alias** in operator context:

```
switch> srci 1/1/1
interface 1/1/1
    no shutdown
    ip address 1.1.1.1/24
    exit
```

Removing an alias:

```
switch(config)# no alias srci show running-config interface $1
switch(config)# show alias
  Alias Name                     Alias Definition
  --------------------------------------------------------------------------------
```

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config`	Administrators or local user group members with execution rights for this command.

auto-confirm

```
auto-confirm
no auto-confirm
```

Description

Specifies that the CLI automatically enters the affirmative response (**y**) to all confirmation prompts, enabling commands to execute without waiting for user confirmation.

The **no** form of this command sets auto-confirmation to the default value disabled.

Usage

Some commands, such as **boot** command, prompt to confirm execution of the command or to save the current configuration. Typically, such commands display a confirmation message similar to the following:

```
Continue (y/n)?
```

This command is useful for automating switch configuration, but Hewlett Packard Enterprise recommends that you use the REST API instead of using CLI scripts to automate configuration operations.

When the switch reboots, auto-confirmation is set to the default (disabled).

Example

```
switch# auto-confirm
```

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Manager (#)	Administrators or local user group members with execution rights for this command.

configure terminal

```
configure [terminal]
```

Description

Enters the global configuration (**config**) context.

Parameter	Description
`terminal`	Configure from the terminal. This is the default parameter.

Example

```
switch# configure terminal
switch(config)#
```

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Manager (#)	Administrators or local user group members with execution rights for this command.

disable

`disable`

Description

Exits the manager context (**#**) and enters the operator context (**>**).

Example

```
switch# disable
switch>
```

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Manager (#)	Administrators or local user group members with execution rights for this command.

do

`do <COMMAND>`

Description

Executes a manager context (**#**) or operator context (**>**) command from a configuration (**config**) context.

You can execute **exec** commands from a configuration context with or without using the **do** command.

Parameter	Description
<COMMAND>	Specifies the manager context (**#**) or the operator context (**>**) command to execute.

Usage

You can execute **exec** commands from a configuration context with or without using the **do** command.

Use the **do** command to execute commands such as **clear**, **checkpoint**, **auto-confirm** and **show** commands while you are in a configuration context (such as **config** or **config-vlan-10**).

For all **exec** commands you can use with the **do** command, from the global configuration context (**config**), enter **do**, followed by a space, and then press the tab key twice.

Examples

Clearing LLDP neighbors from the global configuration context:

```
switch(config)# clear lldp neighbors
switch(config)# do clear lldp neighbors
switch(config)#
```

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	A configuration context such as `config` or `config-vlan-10`	Administrators or local user group members with execution rights for this command.

enable (manager context)

`enable`

Description

Exits the operator context (**>**) and enters the manager context (**#**).

Example

```
switch> enable
switch#
```

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Operator (>)	Administrators or local user group members with execution rights for this command.

end

```
end
```

Description

Exits the current context and enters the manager context (**#**).

Example

```
switch# configure terminal
switch(config)# vlan 10
switch(config-vlan-10)# vlan 22
switch(config-vlan-22)# end
switch#
```

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Any context	Administrators or local user group members with execution rights for this command.

exit

```
exit
```

Description

Exits the current context and enters its parent context.

Example

```
switch# configure terminal
switch(config)# vlan 10
switch(config-vlan-10)# vlan 22
switch(config-vlan-22)# exit
switch(config)# exit
switch#
```

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Any context	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

list

`list`

Description

Shows a list of commands available from the current context.

Example

```
switch> list
  list
  enable
  exit
  show session-timeout
...
```

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Any context	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

page

```
page [<LINES>]
no page
```

Description

Specifies the number of output lines the CLI displays before pausing to wait for a user to press a key. This value is the number of lines supported by the terminal session. This setting is not persistent and applies to the current session only.

The **page** command is enabled by default on the switch with the number of lines supported by the terminal. Change this default by using the **page** command to specify a different number of output lines.

The **no** form of this command sets the number of lines that are displayed to the default, which is the number of lines supported by the current terminal session.

Parameter	Description
<LINES>	Specifies the number to display before pausing. If not specified, the number of lines supported by the current terminal session is used. Range: 2-1000 lines. Default: The number of lines supported by the current terminal session

Examples

Setting the page size to an unlimited number of lines:

```
switch# no page
switch#
```

Example output of a command after setting the page size to 10 lines:

```
switch# page 10
switch# list
  show hostname
  show domain-name
  list
  configure { terminal }
  disable
  exit
  end
  page
  page <2-1000>
-- MORE --, next page: Space, next line: Enter, quit: q
```

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Manager (#)	Administrators or local user group members with execution rights for this command.

Pipe (|) command

```
show running-config | begin 2 "vlan" | redirect "abc.txt"
show running-config | include "vlan" | exclude "vlan2" | count
show vlan | include "up" | include "VLAN100"

list | include "show" | exclude "show" | count
```

Description

The pipe (|) command filters the output of **show** or **list** commands using the options **include**, **exclude**, **begin**, **count**, or **redirect**.

Usage

```
show {<SHOW-COMMAND-OPTIONS>}... [ | {include <PATTERN-STRING> |
                                      exclude <PATTERN-STRING> |
                                      begin {<LINES-TO-DISPLAY>} <PATTERN-STRING>}]...
                                  [ | {count [<PATTERN-STRING>] |
                                      redirect [<FILE-NAME>]}]

list [ | {include <PATTERN-STRING> |
          exclude <PATTERN-STRING> |
          begin {<LINES-TO-DISPLAY>} <PATTERN-STRING>}]...
     [ | {count [<PATTERN-STRING>] |
          redirect [<FILE-NAME>]}]
```

- The pipe (|) command is supported for use with the **show** and **list** commands only.
- You can use multiple pipe commands with a single **show** or **list** command.

Examples

```
show running-config | redirect "abc.txt"
show running-config | begin 2 "vlan" | begin -2 "vlan" | begin "vlan"
show running-config | include "vlan" | exclude "vlan2" | count
show vlan | include "up" | include "VLAN100"
list | include "show" | exclude "show" | count
```

Command Information

Platforms	Command context	Authority
All platforms	Manager (#)	Administrators or local user group members with execution rights for this command.

repeat

```
repeat [id <POSITION>] [<COUNT>] [<DELAY>]
```

Description

Repeatedly executes one or more commands. By default, the most recent command in the history is executed until you press Ctrl+C.

Parameter	Description
<POSITION>	Specifies the position of a command, or range of positions of multiple commands, in the history list as shown in the output of the **show history** command. *<POSITION>* can be a single number, a comma-separated list of numbers, or a range of numbers specified by the beginning and end of the range, separated by a hyphen. If the **id** parameter is not specified, the **repeat** command executes the command that was entered most recently. Default: 1.
<COUNT>	Specifies number of times to execute the command or commands. Default: The command repeats an infinite number of times.
<DELAY>	Specifies the number of seconds to delay before executing the command. Default: 2

Example

```
switch# repeat id 1-4,7-8,10 count 2 delay 3
```

Command History

10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Manager (#)	Administrators or local user group members with execution rights for this command.

session-timeout

```
session-timeout <MINUTES>
no session-timeout <MINUTES>
```

Description

Specifies the number of minutes a CLI session can be idle before the session is automatically terminated and the user is logged out.

The **no** form of this command sets the timeout to the default value of 30 minutes.

Parameter	Description
<MINUTES>	Specifies the number of minutes the CLI session can remain idle. Specify 0 to configure CLI sessions to never time out. Range: 0 to 4320. Default: 30

Example

```
switch(config)# session-timeout 15
```

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config`	Administrators or local user group members with execution rights for this command.

show session-timeout

```
show session-timeout [vsx-peer]
```

Description

Shows the configured session timeout value.

Parameter	Description
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

```
switch# show session-timeout
session-timeout: 30 minutes (Default)
```

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Manager (#)	Administrators or local user group members with execution rights for this command.

show alias

`show alias [vsx-peer]`

Description

Shows the command aliases that are defined on the switch.

Parameter	Description
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

```
switch# show alias
 Alias Name      Alias Definition
 -------------------------------------------------------------------------------
 hst             hostname int_config      interface $1; no shutdown; ip address
$2; lldp receive; mtu $3; exit

switch# show hst
 Alias Name      Alias Definition
 -------------------------------------------------------------------------------
 hst             hostname
```

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Manager (#)	Administrators or local user group members with execution rights for this command.

show history

`show history [all-sessions] [timestamp]`

Description

Shows all commands that have been executed by the user in the current session. By default, the output of this command will display up to 500 commands previously executed by the user in the current session.

This command will not display any commands entered by the user that contain sensitive information such as plain text passwords or keys. The output will only be valid for the current boot and not for commands executed in the previous boot.

Parameter	Description
`all-sessions`	Specifies that the output includes commands from the current session as well as previous sessions logged out of by the user. When you include the **all-sessions** parameter, the output of this command will display up to 1000 commands previously executed by the user.
`timestamp`	Specifies that the output include the time of execution of each command in the command history.

If you include the **all-sessions** and **timestamp** parameters in the same command, **timestamp** must always be entered after **all-sessions**. It cannot come before.

Example

Showing a list of commands executed during the current CLI session:

```
switch# show history
5     configure
4     session-timeout 0
3     exit
2     show feature-pack
1     show logging
```

Showing a list of commands executed during the current CLI session, with timestamps:

```
switch# show history timestamp
5     Mon May  6 18:42:05 2024        configure
4     Mon May  6 18:42:08 2024        session-timeout 0
3     Mon May  6 18:42:10 2024        exit
2     Mon May  6 18:42:19 2024        show feature-pack
1     Mon May  6 18:42:29 2024        show logging
```

Showing a list of commands executed by the user both in the current session and during all previous CLI sessions:

```
switch# show history all-sessions
12    configure
11    session-timeout 0
10    exit
9     show feature-pack
8     show logging
7     configure
```

```
6     exit
5     configure
4     alias abcd show running-config
3     abcd
2     show tech
1     exit
```

Showing a list of commands executed by the user both in the current session and during all previous sessions, with timestamps:

```
switch# show history all-sessions timestamp
12    Mon May  6 18:42:05 2024        configure
11    Mon May  6 18:42:08 2024        session-timeout 0
10    Mon May  6 18:42:10 2024        exit
9     Mon May  6 18:42:19 2024        show feature-pack
8     Mon May  6 18:42:29 2024        show logging
7     Mon May  6 18:42:44 2024        configure
6     Mon May  6 18:42:55 2024        exit
5     Mon May  6 18:45:41 2024        configure
4     Mon May  6 18:45:55 2024        alias abcd show running-config
3     Mon May  6 18:45:59 2024        abcd
2     Mon May  6 18:46:09 2024        show tech
1     Mon May  6 18:46:14 2024        exit
```

Attempting to specify the timestamp parameter before the all-sessions parameter:

```
switch# show history timestamp all-sessions
Invalid input: all-sessions
```

Command History

Release	Modification
10.14	The **all-sessions** parameter is introduced.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Manager (#)	Administrators or local user group members with execution rights for this command.

Chapter 21

CLI user session management commands

cli-session

```
cli-session
no cli-session
```

Description

Enters the CLI session context (shown in the switch prompt as **config-cli-session**) for the purpose of configuring CLI user session management. Session management enhances security by enforcing specific CLI user session requirements. The following information is provided at time of successful login:

- When applicable, the number of failed login attempts since the most recent successful login.
- The date, time, and location (console or IP address or hostname) of the most recent previous successful login.
- The count of successful logins within the past (configurable) time period.

For example:

```
switch login: admin
Password:

There were 3 failed login attempts since the last successful login
Last login: 2019-04-20 08:51:33 from the console
User "admin" has logged in 73 times in the past 30 days
```

The no form of this command disables concurrent CLI user session restrictions and reverts **timeout** and **tracking-range** to their default values.

To ensure that enhanced security is maintained, it is recommended that you keep CLI user session management fully enabled by setting **max-per-user** to a nondefault value.

The **cli-session** command applies only to SSH/console login connection types. It does not apply to other connection types such as REST.

Subcommands

These subcommands are available within the CLI session context.

```
[no] max-per-user  <SESSIONS>
```

Specifies the maximum number of concurrent CLI sessions per user. The no form of this subcommand disables concurrent CLI user session restrictions. Default: Disabled (no value). Range: 1 to 5.

When the same user name is configured for both local and remote authentication, both users, regardless of privilege level, are considered to be the same user for the purpose of counting concurrent CLI sessions. For example, with **max-per-user** set to 1 and user **admin1** configured for local and remote authentication, only the local user **admin1** or the remote user **admin1** can be logged in at any given moment. Both **admin1** users cannot be logged in simultaneously unless **max-per-user** is increased to at least 2.

`[no] timeout <MINUTES>`

Specifies the number of minutes a CLI session can be idle before the session is automatically terminated and the user is logged out. A value of 0 minutes disables the session timeout. The no form of this subcommand sets the timeout value to the default. Default 30: Range 0 to 4320.

This subcommand is the recommended replacement for the **session-timeout** command.

`[no] tracking-range <DAYS>`

Specifies the maximum number of days to track CLI user session logins. The no form of this subcommand resets the value to its default. Default 30: Range 1 to 30.

`exit`

Exits the CLI session context.

`end`

Exits the CLI session context and then the config context.

Examples

Configuring CLI user session settings for a maximum of one concurrent session, a 20-minute timeout, and tracking for a maximum of 25 days.

```
switch(config)# cli-session
switch(config-cli-session)# max-per-user 1
switch(config-cli-session)# timeout 20
switch(config-cli-session)# tracking-range 25
switch# exit
```

After successful earlier logins, logging in from the console without any intervening unsuccessful logins.

```
switch login: admin1
Password:

Last login: 2019-04-15 14:10:21 from the console
User 'admin1' has logged in 65 times in the past 25 days
```

Attempting to log in as `admin1` when already logged in as **admin1** from elsewhere.

```
switch login: admin1
Password:
Too many logins for 'admin1'
```

After successful earlier logins, attempting to log in twice with an invalid password, followed by a successful login.

```
switch login: admin1
Password:
```

```
Login incorrect
switch login: admin1
Password:

Login incorrect
switch login: admin1
Password:

There were 2 failed login attempts since the last successful login
Last login: 2019-04-15 17:22:45 from 192.168.1.1
User 'admin1' has logged in 72 times in the past 25 days
```

For more information on features that use this command, refer to the Security Guide for your switch model.

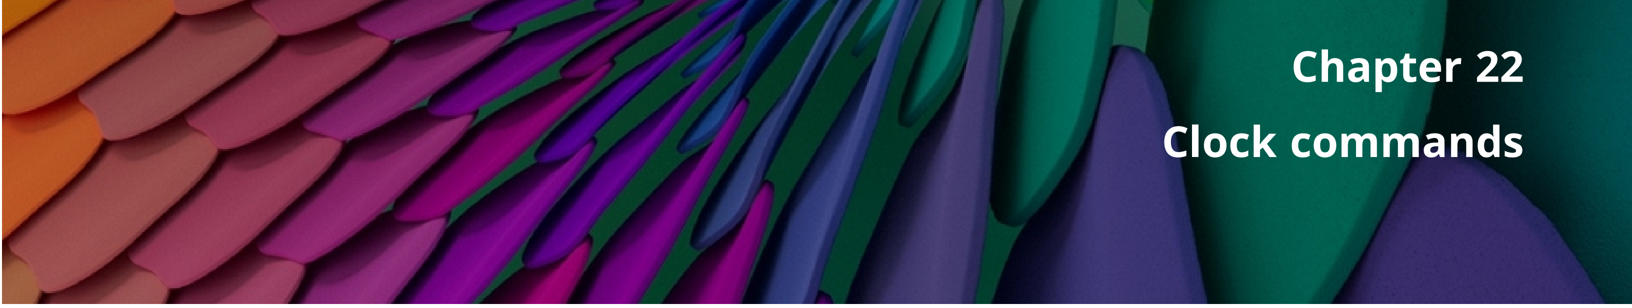
Platforms	Command context	Authority
All platforms	`config`	Administrators or local user group members with execution rights for this command.



Chapter 22
Clock commands

clock date

`clock date <DATE>`

Description

Sets the switch date.

Parameter	Description
<DATE>	Specifies the date. Format: **YYYY-MM-DD**.

Examples

This example sets the date to Dec 14, 2017.

```
switch(config)# clock date 2017-12-14
```

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config`	Administrators or local user group members with execution rights for this command.

clock datetime

`clock datetime <DATE> <TIME>`

Description

Sets the switch date and time.

Parameter	Description
<DATE>	Specifies the date. Format: **YYYY-MM-DD**.

Parameter	Description
<TIME>	Specifies the time in 24-hour clock format. Seconds are optional. Format: **HH:MM** or **HH:MM:SS**.

Examples

This example sets the date and time to Dec 13, 2017 at 15:00.

```
switch(config)# clock datetime 2017-12-13 14:15:00
```

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config`	Administrators or local user group members with execution rights for this command.

clock time

`clock time <TIME>`

Description

Sets the switch time.

Parameter	Description
<TIME>	Specifies the time in 24-hour clock format. Seconds are optional. Format: **HH:MM** or **HH:MM:SS**.

Examples

This example sets the time to 15:01:23.

```
switch(config)# clock time 15:01:23
```

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config`	Administrators or local user group members with execution rights for this command.

clock timezone

```
clock timezone <TIME-ZONE>
no clock timezone [<TIME-ZONE>]
```

Description

Sets the time zone and its associated daylight savings time rule.

The **no** form of this command sets the time zone to the default value of UTC.

Parameter	Description
<TIME-ZONE>	Specifies the time zone, **<TIME-ZONE>**, using a name defined in the IANA time zone database. See https://en.wikipedia.org/wiki/List_of_tz_database_time_zones.

Examples

Setting the time zone to Eastern Standard Time (EST):

```
switch(config)# clock timezone EST
```

Command History

Release	Modification
10.08	Added optional **<TIME-ZONE>** parameter to **no** form of the command.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config`	Administrators or local user group members with execution rights for this command.

show clock

```
show clock
```

Description

This command displays the current date, time, and time zone.

Example

```
switch# show clock
Wed Nov 22 23:29:10 PDT 2017
System is configured for timezone : US/Pacific
```

Command History

Chapter 23

Container management commands

container

```
container <CONTAINER-NAME>
no container <CONTAINER-NAME>
```

Description

Enters into the container configuration context.

The **no** form of this command removes the existing configurations of the specified container.

Example

Configures a new container:

```
switch(config)# container app
The feature being used requires a AOS-CX Advanced Software Feature Pack.
For more information,refer to the AOS-CX Feature Pack Deployment Guide.
```

AOS-CX does not enforce the requirement to own a feature pack prior to using container features. This warning message is displayed only during creation, subsequent calls to the container context will not display the message.

Command History

Release	Modification
10.12	Command introduced

Command Information

Platforms	Command context	Authority

6300, except for S3L75A, S3L76A and S3L77A
6400
	`config`
	`config-container-<CONTAINER-NAME>`
		Administrators or local user group members with execution rights for this command.

container exec

```
container <NAME> exec <PARAMS>
```

Description

Allows the execution of an endpoint script in the container. The location of this endpoint is provided to the container manager infrastructure through a manifest file in the image file system of the container.

This manifest file provides metadata related to the container application. When the exec command runs, the manifest information is used to determine the endpoint to execute and the user parameters are passed directly to the endpoint. The output of such execution is provided directly to the user through the CLI. In case the manifest information or the endpoint file are missing an error is presented to the user. User can interrupt the execution by using Ctrl+C.

If the container is not operational when the command is executed, the following error message is returned:
Failed to execute endpoint - The container is not operational.

Parameter	Description
<NAME>	Specifies a container name up to 64 characters long.
`exec`	Runs a container application command.
<PARAMS>	Specifies container command parameters.

Command History

Release	Modification
10.12	Command introduced

Command Information

Platforms	Command context	Authority
6300, except for S3L75A, S3L76A and S3L77A 6400	`config-container-<CONTAINER-NAME>`	Administrators or local user group members with execution rights for this command.

env

```
env <NAME> {value <VALUE>}|{encrypted [plaintext <VALUE>|ciphertext <VALUE>]}
no env <NAME> {value <VALUE>}|{encrypted {plaintext|ciphertext}<VALUE>}
```

Description

Configures an environment variable for a container that is composed of a key and a value pair. The key-value pair defines the behavior of the environment in a container and is used by the container processes. The value of the environment variable can be stored in the host system as an encrypted value. The container manager infrastructure provides the decrypted value to the container.

The **no** form of this command removes the configured environment variable from a container.

Configuring the **env** variable for an already operational container causes the container to restart.

Parameter	Description
`<NAME>`	Specifies the name of the container environment variables.
`value <VALUE>`	Specifies the variable value.
`encrypted`	Encrypts the environment variable value. If you press **<enter>** after the **encrypted** parameter, you will enter a variable configuration mode that allows you to securely enter a hidden value. *This is the recommended method for entering an encrypted variable*
`plaintext <VALUE>`	**Optional**. Specifies the variable value in plain text. *Not recommended for encrypted variables.*
`ciphertext <VALUE>`	**Optional**. Specifies the variable value as previously encrypted text. *Recommended for encrypted variables; specify the encrypted variable value as previously encrypted text.*

Example

Securely entering an encrypted variable:

```
6300(config-container-test)# env TEST encrypted
Enter environment variable value: ********
6300(config-container-test)# end
```

Command History

Release	Modification
10.13.1000	The **plaintext** and **ciphertext** options for the encrypted parameter are now optional. Starting with this release, you can use the **encrypted** option to encrypt the environment variable and specify the value in plaintext hidden from the CLI.
10.12	Command introduced

Command Information

Platforms	Command context	Authority
6300, except for S3L75A, S3L76A and S3L77A 6400	`config-container-<CONTAINER-NAME>`	Administrators or local user group members with execution rights for this command.

image-location

```
image-location <URL> [vrf <VRF-NAME>][allow-unsigned]
no image-location <URL> [<VRF-NAME>][allow-unsigned]
```

Description

Configures the image location for a container. Modifying image location prompts an image upgrade.

The **no** form of this command removes the configured location of a container.

- If the user sets a location value which does not follow the standard URL format, the following error message is returned: **Failure to configure image location: Invalid URL**
- If the user tries to use a VRF value that doesn't exist on the switch, the following error message is returned: **Failure to configure image location: Invalid VRF**
- If the image of the container exceeds 500mb the container won´t be deployed

By default, only container images with a valid HPE signature are allowed. To bypass this signature check and allow unsigned container images, include the **allow-unsigned** parameter when you define the image location. The **allow-unsigned** parameter cannot be used if you have issued the **secure-mode enhanced** command to set the switch to enhanced secure mode.

Parameter	Description
`URL`	Specifies the URL of the container application. URL supports HTTP protocol. The image-location URL can either be IPv4 or IPv6 address. The IPv6 address must be provided within square brackets.
`vrf` *`<VRF-NAME>`*	(Optional) Specifies the VRF of the image URL.
`allow-unsigned`	(Optional) Allow download and deployment of an unsigned container image.

Examples

Configures the image location for the IPv4 setting:

```
switch(config)# image-location http://10.0.0.1/container.img vrf mgmt
```

Appends the port to the address if the image server is running on a port other than HTTP for an IPv4 setting:

```
switch(config)# image-location http://10.0.0.1:9050/container.img vrf mgmt
```

Configures image location for IPv6 setting by wrapping IP address between square brackets:

```
switch(config)# image-location http://[2001::2]/container.img vrf mgmt
```

Specifies port number by appending it with the IPv6 address:

```
switch(config)# image-location http://[2001::2]:9050/container.img vrf mgmt
```

When you include the **allow-unsigned** parameter on a switch in standard secure mode, the following message will be displayed to inform this can be a potential security issue.

```
switch(config)# image-location http://10.0.0.1/container.img vrf mgmt allow-
unsigned
Allowing unsigned container images poses a potential security risk
that can impact both the current device and the entire network. By
allowing installation of unsigned applications you are acknowledging
and accepting these risks. HPE shall not be responsible for the
consequences of your actions and disclaims any and all liability.

Continue (y/n)? y
```

When you attempt to include the **allow-unsigned** parameter on a switch in enhanced secure mode, the following message will appear to indicate that this parameter is not supported.

```
switch(config)# image-location http://10.0.0.1/container.img vrf mgmt allow-
unsigned
Unsigned images are not permitted in the current secure mode, using the
allow-unsigned parameter will have no effect.
```

Release	Modification
10.14	The **allow-unsigned** parameter is introduced.
10.12	Command introduced.

Command Information

Platforms	Command context	Authority
6300, except for S3L75A, S3L76A and S3L77A 6400	`config-container-<CONTAINER-NAME>`	Administrators or local user group members with execution rights for this command.

restrict cpu

```
restrict cpu <PERCENTAGE>
no restrict cpu
```

Description

Configures limitations for the container CPU usage. The CPU constraint is set as a percentage of the total switch CPUs. A container can use up to 20% of the total CPU capacity of the device.

Configuring the CPU constraint for an already operational container will cause the container to restart.

The **no** form of this command removes restrictions on the CPU usage.

Parameter	Description
<PERCENTAGE>	Specifies percentage for the container CPU usage, The default value is 10%.

Command History

Release	Modification
10.12	Command introduced

Command Information

Platforms	Command context	Authority

restrict memory

```
restrict memory <MB>
no restrict memory
```

Description

Configures limitations for memory usage of the container. The memory constraint is set in MB, and the maximum 20% of the capacity of the device can be configured. Configuring the memory constraint for an already operational container restarts the container.

The **no** form of this command removes restrictions on the memory usage.

Parameter	Description
<MB>	Specifies the maximum memory usage in MB.The default value is 256 MB.

Command History

Release	Modification
10.12	Command introduced

6300, except for S3L75A, S3L76A and S3L77A 6400	`config-container-<CONTAINER-NAME>`	Administrators or local user group members with execution rights for this command.

show container

```
show container [<CONTAINER-NAME>]
```

Description

Shows the configuration and status information of the containers running in the system. If the container name is not specified, displays information of all the containers. When a container name is specified, displays information specific to the container.

Parameter	Description
<CONTAINER-NAME>	Specifies the name of the container for which information need to be specified.

Examples

The following example shows configured container information:

```
  switch# show container
  Container              : app
    Container status     : operational
    Manifest status      : success
    Image status         : verified
    Image version        : 1.0.0
    Image location VRF   : mgmt
    Image location URL   : http://30.0.0.2:8000/container.img
    CPU limit            : 10%
    Memory limit         : 512 MB
    VRFs                 : mgmt
    Environment variables:
      PYP=/usr/bin/python3
    Encrypted environment variables:
      encryptedVar1
      encryptedVar2
```

The following example shows additional error messages:

```
switch# show container
Container                : app
  Container status       : configuration failed
  Config failure reason  : Multiple definitions of environment variable PYP
  Manifest status        : error
  Manifest status reason : 'exec' file not found in container
  Image status           : verified
  Image version          : 1.0.0
  Image location VRF     : mgmt
  Image location URL     : http://30.0.0.2:8000/container.img
  CPU limit              : 10%
  Memory limit           : 512 MB
  VRFs                   : mgmt
  Environment variables  :
    PYP=/usr/bin/python3
  Encrypted environment variables:
    PYP
    encryptedVar2
```

The following example shows a configured container without signature validation:

```
switch# show container app1
```

```
Container              : app1
  Container status     : operational
  Manifest status      : success
  Image status         : allowed without signature
  Image version        : 1.0.0
  Image location VRF   : mgmt
  Image location URL   : http://30.0.0.2:8000/container.img
  CPU limit            : 10%
  Memory limit         : 512 MB
  Environment variables:
    PYP=/usr/bin/python3
  Encrypted environment variables:
    encryptedVar1
    encryptedVar2
  Network:
    VRF name  : mgmt
    Preferred : no
    Port map  : n/a

    VRF name  : default
    Preferred : yes
    Port map  :
      8080:80/tcp
      8080:8080/udp
```

The following example shows the command out when there are no configured containers:

```
switch# show container
No containers configured
```

show running-config container

```
show running-config container
```

Description

Shows the running configuration of all the containers.

Parameter	Description
`container`	Specifies that container running configuration must be displayed.

Examples

Shows the running configuration for the container:

```
container app1
    image-location http://30.0.0.2:8000/container.img vrf mgmt
    restrict cpu 10
    restrict memory 512
    vrf attach mgmt

Chapter 24

CoPP commands

Classes of traffic

The different classes of traffic that can be individually configured are:

- `acl-logging`: Access Control List logging packets.
- `arp-broadcast`: Address Resolution Protocol packets with a broadcast destination MAC address.
- `arp-protect`: Address Resolution Protocol packets intercepted and inspected for ARP protection.
- `arp-unicast`: Address Resolution Protocol packets with a switch system destination MAC address.
- `bfd-control`: Bidirectional Forwarding Detection (BFD) control packets with a destination IP address owned by the switch.

> The `bfd-control` class is not supported for 6200 switch.

- `bgp`: Border Gateway Protocol packets with a destination IPv4 or IPv6 address owned by the switch.

> The `bgp` class is not supported for 6200 switch.

- `captive-portal`: Packets intercepted in support of the Captive Portal feature.
- `dhcp`: Dynamic Host Configuration Protocol packets. Also includes snooped DHCP packets if DHCP snooping is enabled.
- `erps`: Ethernet Ring Protection Switching control packets with the destination MAC address 01:19:a7:00:00:XX, where XX can be any value.
- `icmp-broadcast-ipv4`: Internet Control Message Protocol packets with a broadcast or multicast destination IPv4 address.
- `icmp-multicast-ipv6`: Internet Control Message Protocol packets with a well-known multicast destination IPv6 address.
- `icmp-security-ipv6`: IPv6 Internet Control Message Protocol packets intercepted and inspected.
- `icmp-unicast-ipv4`: Internet Control Message Protocol packets with a destination IPv4 address owned by the switch
- `icmp-unicast-ipv6`: Internet Control Message Protocol packets with a destination IPv6 address owned by the switch.
- `ieee-8021x`: IEEE 802.1X protocol packets with EtherType 0x0888E.
- `igmp`: Internet Group Management Protocol packets.
- `ip-exceptions`: Routable packets that would exceed the MTU for the egress interface, packets that trigger ICMP redirects, and packets with TTL/hop_limit=1 that are discarded when routing through the switch.
- `ip-lockdown`: Packets denied and logged due to violation of allowed "IP address/VLAN/port/MAC address" association.

- `ip-tracker`: Track packets received for client IP address tracking.

  > The `ip-tracker` class is not supported for 6300 and 6400 switches.

- `ipsec`: Internet Protocol Security IPv4 or IPv6, unicast or configured multicast. All IPsec traffic received by the CPU will be regulated by the `ipsec` class regardless of the encapsulated protocol.
- `ipv4-options`: Unicast IPv4 packets including option headers.
- `lacp`: Link Aggregation Control Protocol packets with the destination MAC address 01:80:c2:00:00:02.
- `lldp`: Link Layer Discovery Protocol packets with the destination MAC address 01:80:c2:00:00:0e.
- `loop-protect`: Loop Protection packets with the destination MAC address 09:00:09:09:13:a6.
- `mac-lockout`: Packets denied and logged due to locked-out MAC address.
- `manageability`: Unicast IP packets addressed to the switch for specific protocols that do not have a dedicated CoPP class like HTTP, SSH, Telnet, and RADIUS.
- `mirror-to-cpu`: Packets from mirroring session configured to deliver to the console.
- `mld`: Multicast Listener Discovery packets of type V1 or V2 with an IPv6 address of FF00::/8, FF02::16 or FF02::2.
- `mvrp`: Multiple VLAN Registration Protocol packets with the destination MAC address 01:80:c2:00:00:20 or 01:80:c2:00:00:21
- `ntp`: Network Time Protocol packets with a destination IP address owned by the switch.
- `ospf-multicast`: Open Shortest Path First packets with the multicast destination IPv4 address 224.0.0.5 or 224.0.0.6, or IPv6 address FF02::5 or FF02::6.
- `ospf-unicast`: Open Shortest Path First packets with a local destination IPv4 address or IPv6 address.
- `pim`: Protocol Independent Multicast packets with the destination IPv4 address 224.0.0.13 or IPv6 address FF02::D, or with a destination IP address owned by the switch.
- `secure-learn`: Packets intercepted and inspected to see if source MAC address is allowed on the port.
- `sflow`: Packet headers sampled by the switch that will be sent to the sFlow collector.
- `stp`: Spanning Tree Protocol (STP) packets with the destination MAC address 01:80:c2:00:00:00 or Per-VLAN Spanning Tree (PVST) packets with the destination MAC address 01:00:0c:cc:cc:cd.
- `udld`: Unidirectional Link Detection packets with the destination MAC address 01:00:0c:cc:cc:cc or 00:e0:52:00:00:00, or Cisco Discovery Protocol packets with the destination MAC address 01:00:0c:cc:cc:cc.
- `unknown-multicast`: Packets with an unknown multicast destination IP address.
- `unresolved-ip-unicast`: Packets to be software forwarded by the management processor.
- `vrrp`: Virtual Router Redundancy Protocol packets with the destination IPv4 address 224.0.0.18 or IPv6 address FF02::12, or VSX-Keepalive packets.

To regulate any other traffic destined for the CPU, every CoPP policy has a class named `default` that can also be configured to regulate other traffic to the CPU or prevent other traffic from being delivered.

> All IPsec traffic received by the CPU will be regulated by the `ipsec` class regardless of the encapsulated protocol.
>
> When ARP protection is enabled on the system, all ARP traffic will be regulated by the `arp-protect` class, regardless of the ARP destination and configuration of `arp-broadcast` or `arp-unicast` CoPP classes.
>
> Packets for each of the CoPP classes above may have arrived through a tunnel, if tunneling was enabled.

apply copp-policy

```
apply copp-policy { <NAME> | default }
no apply copp-policy <NAME>
```

Description

Applies a CoPP policy to the switch, replacing the policy that is in effect. There may be a brief interruption in traffic flow to the management processor while the switch implements the change.

Enter the **no apply copp-policy <NAME>** command with the name of a CoPP policy to unapply a CoPP policy and apply the default CoPP policy. This will only take effect if the specified policy is actively applied. Since there must always be a CoPP policy applied, this command effectively attempts to replace the applied CoPP policy with the default CoPP policy. The default CoPP policy cannot be unapplied using this command.

Parameter	Description
<NAME>	Specifies the name of the policy to apply. Length: 1 to 64 characters.
default	Applies the default policy.

Usage

If the new policy cannot be applied (for example, due to a lack of hardware resources), the previous policy remains in effect. Use the show copp-policy command to determine which policy is in effect.

Examples

Applying a policy named My_CoppPolicy:

```
switch(config)# apply copp-policy My_CoppPolicy
```

Applying the default policy:

```
switch(config)# apply copp-policy default
```

Unapplying a policy named My_CoppPolicy:

```
switch(config)# no apply copp-policy My_CoppPolicy
```

For more information on features that use this command, refer to the CoPP Guide for your switch model.

class

```
class <CLASS> {drop | priority <PRIORITY> rate <RATE> [burst <BURST>]}
no class <CLASS> {drop | priority <PRIORITY> rate <RATE> [burst <BURST>]}
```

Description

Adds a class to a CoPP policy. If the class exists, the existing class is modified. Changes made to an active (applied) policy take effect immediately.

When adding or modifying a class in an active policy, CoPP immediately activates the change on the switch. In cases where insufficient hardware resources exist to support a class or its action, CoPP fails to activate the changed class on the switch. When this failure occurs, the active configuration on the switch will be out of sync with its definition. To diagnose and remedy this situation:

- Use the show copp-policy command to determine which classes are out of sync between the active policy and its definition.
- Use the reset copp-policy command to synchronize the active policy with its definition. This synchronization changes the classes in the definition to match the classes in the active policy.

The **no** form of this command removes the configuration for the class. Traffic for the class will be prioritized and regulated using the factory default configuration for the class. Use the **show copp-policy factory-default** command to display the factory default CoPP policy. To stop a class of traffic from reaching the processor, set the class action to drop.

Parameter	Description
`<CLASS>`	Specifies the class to add or edit.
`drop`	Drop packets matching the selected class.
`priority <PRIORITY>`	Specifies the priority for packets matching the selected class. Range: 0 to 6.
`rate <RATE>`	Specifies the maximum rate, in packets per second (pps), for packets matching the selected class. Range: 25 to 99999.
`burst <BURST>`	Specifies the maximum burst size, in packets, for packets matching the selected class. Range: 1 to 9999.

Examples

Adding a class to handle LACP traffic with priority of 2 and rate of 2000:

```
switch(config-copp)# class lacp priority 2 rate 2000
```

Modifying the class to drop LLDP packets:

```
switch(config-copp)# class lldp drop
```

Removing the class that handles LLDP packets.

```
switch(config-copp)# no class lldp
```

For more information on features that use this command, refer to the CoPP Guide for your switch model.

clear copp-policy statistics

```
clear copp-policy statistics
```

Description

Resets statistics for all CoPP classes to zero.

Examples

Displaying and then resetting statistics for all classes in the active policy:

```
switch# show copp-policy statistics
Statistics for CoPP policy 'default':
Totals:
    packets passed   : 1000               packets dropped  : 1500
Class: default
    packets passed   : 400                packets dropped  : 600
Class: acl-logging
    packets passed   : 100                packets dropped  : 100
Class: arp-broadcast
    packets passed   : 500                packets dropped  : 800
        <--OUTPUT OMITTED FOR BREVITY-->
switch# clear copp-policy statistics
switch# show copp-policy statistics
Statistics for CoPP policy 'default':
Totals:
    packets passed   : 0                  packets dropped  : 0
Class: default
    packets passed   : 0                  packets dropped  : 0
Class: acl-logging
```

```
    packets passed   : 0                   packets dropped  : 0
Class: arp-broadcast
    packets passed   : 0                   packets dropped  : 0
```

For more information on features that use this command, refer to the CoPP Guide for your switch model.

copp-policy

```
copp-policy {<NAME> | default [revert]}
no copp-policy <NAME>
```

Description

Creates a CoPP policy and switches to the **config-copp** context for the policy. Or, if the specified policy exists, switches to the **config-copp** context for the policy. A predefined policy, named **default**, contains factory default classes and is applied to the switch at first startup. This policy cannot be deleted, but its configuration can be changed.

The **no** form of this command removes a CoPP policy. If a policy is active (applied), it cannot be removed . It must be replaced with another policy before it can be removed.

Parameter	Description
<NAME>	Specifies the name of the policy to add or edit. Length: 1 to 64 characters. The name must not be a substring of any of the following reserved words: default, factory-default, commands, configuration, or statistics.
default	Specifies the default CoPP policy. Use this default policy to configure the default policy.
revert	Sets the default CoPP policy to its factory settings.

Examples

Creating a policy named My_CoppPolicy:

```
switch(config)# copp-policy My_CoppPolicy
switch(config-copp)#
```

Removing a policy named My_CoppPolicy:

```
switch(config)# no copp-policy My_CoppPolicy
```

Setting the default policy to its factory settings:

```
switch(config)# copp-policy default revert
```

Unapplying the policy named My_CoppPolicy:

```
switch(config)# no apply copp-policy My_CoppPolicy
```

For more information on features that use this command, refer to the CoPP Guide for your switch model.

default-class

`default-class priority <PRIORITY> rate <RATE> [burst <BURST>]`

Description

Configures the default class that is automatically defined for all CoPP policies. The default class cannot be removed, but its configuration can be changed. The default class is applied to traffic that does not match any other class defined for a policy.

Parameter	Description
`priority <PRIORITY>`	Specifies the priority for packets matching the selected class. Range: 0 to 6.
`rate <RATE>`	Specifies the maximum rate, in packets per second (pps), for packets matching the selected class. Range: 25 to 99999.

Parameter	Description
burst *<BURST>*	Specifies the maximum burst size, in packets, for packets matching the selected class. Range: 1 to 9999.

Example

Setting the default class to a priority of **2** and rate of **2000**:

```
switch(config-copp)# default-class priority 2 rate 2000
```

For more information on features that use this command, refer to the CoPP Guide for your switch model.

All platforms	config-copp	Administrators or local user group members with execution rights for this command.

reset copp-policy

reset copp-policy { *<NAME>* | default }

Description

Resets an active CoPP policy to match the settings that are currently in effect for the active policy on the switch. Changes made to the active policy that could not be activated are removed from the active policy. When the switch fails to add or modify a class in an active CoPP policy, it is possible the active policy settings on the switch may be out of sync with those defined in the policy.

Parameter	Description
<NAME>	Specifies the name of the policy to reset. Length: 1 to 64 characters.
default	Resets the default policy to match its active settings.

Examples

Resetting a policy named My_CoppPolicy:

```
switch# show copp-policy My_CoppPolicy
class                  drop priority rate pps burst pkts hardware rate pps
```

```
--------------------- ---- -------- -------- ---------- -----------------

All platforms	config	Administrators or local user group members with execution rights for this command.

show copp-policy

```
show copp-policy  [<NAME> | default] [commands] [configuration] [vsx-peer]
```

Description

Shows CoPP policy settings for a specific CoPP policy. When entered without specifying either a name or the `default` parameter, shows all the CoPP policy settings that are active on the switch and have successfully been programmed into the hardware.

A warning is displayed if:

- The active and user-specified applications of a policy do not match.
- The active and user-specified configurations of a policy do not match.

Parameter	Description
<NAME>	Specifies the name of the policy for which to display settings. Length: 1 to 64 characters.
`default`	Displays CoPP settings for the default policy.
`commands`	Displays output as CLI commands.
`configuration`	Displays user-specified CoPP settings and **not** the active settings.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Displaying the CoPP policies defined in the configuration and the active application:

```
switch#
show copp-policy
applied copp_policy_name
------- ----------------
        My_CoppPolicy
applied default
switch#
```

Displaying the active configuration of all CoPP policies as CLI commands:

```
switch# show copp-policy commands
copp-policy My_CoppPolicy
    class igmp priority 6 rate 5000 burst 60
    class lacp priority 2 rate 2000 burst 2050
    default-class priority 1 rate 6000 burst 70
copp-policy default
    class acl-logging priority 0 rate 25 burst 3
    class arp-broadcast priority 2 rate 1250 burst 1250
    class arp-protect priority 2 rate 2075 burst 2075
    class arp-unicast priority 3 rate 825 burst 825
    class bfd-control priority 5 rate 850 burst 850
        <--OUTPUT OMITTED FOR BREVITY-->
    default-class priority 2 rate 4225 burst 528
apply copp-policy default
switch#
```

Displaying the `default` policy:

```
switch# show copp-policy default
class                 drop priority rate pps burst pkts hardware rate pps
--------------------- ---- -------- -------- ---------- -----------------
acl-logging                0        25       3          25
arp-broadcast              2        1250     1250       1250
arp-protect                2        2075     2075       2075
arp-unicast                3        825      825        825
bfd-control                5        850      850        850
    <--OUTPUT OMITTED FOR BREVITY-->
default                    2        4225     528        4225
```

For more information on features that use this command, refer to the CoPP Guide for your switch model.

show copp-policy factory-default

```
show copp-policy factory-default [commands] [vsx-peer]
```

Description

Display the configuration for the factory-default CoPP policy.

Parameter	Description
`commands`	Displays output as CLI commands.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Displaying the factory-default policy:

```
switch# show copp-policy factory-default
class                 drop priority rate pps burst pkts
--------------------- ---- -------- -------- ----------
acl-logging                0        25       3
```

```
arp-broadcast              2        1250     1250
arp-protect                2        2075     2075
arp-unicast                3        825      825
bfd-control                5        850      850
    <--OUTPUT OMITTED FOR BREVITY-->
default                    2        4225     528
```

Displaying the active configuration of **My_CoppPolicy** (**My_CoppPolicy** is applied):

```
switch# config terminal
switch(config)# apply copp-policy My_CoppPolicy
switch(config)# do show copp-policy My_CoppPolicy
class                 drop priority rate pps burst pkts hardware rate pps
--------------------- ---- --------- -------- ---------- -----------------
igmp                       6        5000     60         5000
lacp                       2        2000     2050       2000
default                    1        6000     70         6000
```

Displaying the active configuration of **My_CoppPolicy** as CLI commands:

```
switch# show copp-policy My_CoppPolicy commands
copp-policy My_CoppPolicy
    class igmp priority 6 rate 5000 burst 60
    class lacp priority 2 rate 2000 burst 2050
    default-class priority 1 rate 6000 burst 70
apply copp-policy My_CoppPolicy
```

Displaying the user-specified configuration of **My_CoppPolicy**:

```
switch# show copp-policy My_CoppPolicy configuration
class                 drop priority rate pps burst pkts applied
--------------------- ---- --------- -------- ---------- -------
igmp                       6        5000     60         yes
lacp                       2        2000     2050       yes
default                    1        6000     70         yes
```

Displaying the user-specified configuration of **My_CoppPolicy** as CLI commands:

```
switch# show copp-policy My_CoppPolicy commands configuration
copp-policy My_CoppPolicy
    class igmp priority 6 rate 5000 burst 60
    class lacp priority 2 rate 2000 burst 2050
    default-class priority 1 rate 6000 burst 70
apply copp-policy My_CoppPolicy
```

For more information on features that use this command, refer to the CoPP Guide for your switch model.

show copp-policy statistics

```
show copp-policy statistics [class <CLASS> | default-class | non-zero] [vsx-peer]
```

Description

Displays statistics for all classes, a single class, or all classes with non-zero statistics in the active CoPP policy.

Parameter	Description
<CLASS>	Specifies the class for which to display statistics.
default-class	Displays statistics for the default class.
non-zero	Displays statistics for all classes with non-zero statistics.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Usage

If a single class is specified, the priority, rate, and burst size that has been programmed in hardware for that class will be shown.

Examples

Applying the **default** CoPP policy and displaying statistics for all classes in the actively applied policy:

The rate displayed is the actual rate in hardware.

```
switch# config terminal
switch(config)# apply copp-policy default
switch(config)# exit
switch# show copp-policy statistics
Statistics for CoPP policy 'default':
Totals:
    packets passed   : 1000               packets dropped   : 1500
Class: default
    packets passed   : 400                packets dropped   : 600
Class: acl-logging
    packets passed   : 100                packets dropped   : 100
Class: arp-broadcast
    packets passed   : 500                packets dropped   : 800
        <--OUTPUT OMITTED FOR BREVITY-->
```

Displaying statistics for the default class in the active policy:

```
switch(config)# show copp-policy statistics default-class
Statistics for CoPP policy 'default':
Class: default
Description: Default
    priority             : 2
    rate (pps)           : 4225
    burst size (pkts)    : 528

    packets passed   : 400                packets dropped  : 600
```

Displaying statistics for the class **arp-broadcast** in the actively applied policy:

```
switch# show copp-policy statistics class arp-broadcast
Statistics for CoPP policy 'default':
Class: arp-broadcast
Description: Address Resolution Protocol broadcast
    priority             : 2
    rate (pps)           : 1250
    burst size (pkts)    : 1250

    packets passed   : 500                packets dropped  : 800
```

For more information on features that use this command, refer to the CoPP Guide for your switch model.

show tech copp

```
show tech copp
```

Description

Displays the output of all show commands supported by CoPP.

Examples

Capturing the command output into a local file:

```
switch# show tech copp local-file
Show Tech output stored in local-file.  Please use 'copy show-tech local-file' to
copy-out this file.

switch# copy show-tech local-file ?
  REMOTE_URL   URL of syntax
               {tftp://|sftp://USER@}{IP|HOST}[:PORT][;blocksize=VAL]/FILE
  STORAGE_URL  URL of syntax usb:/file
switch# copy show-tech local-file
```

Chapter 25

Debug logging commands

clear debug buffer

`clear debug buffer`

Description

Clears all debug logs. Using the **show debug buffer** command will only display the logs generated after the **clear debug buffer** command.

Examples

Clearing all generated debug logs:

```
switch# show debug buffer
-----------------------------------------------------------------------------------
----------------------------
show debug buffer
-----------------------------------------------------------------------------------
----------------------------
2018-10-14:09:10:58.558710|lldpd|LOG_DEBUG|MSTR||LLDP|LLDP_CONFIG|No Port cfg
changes

debug {all | <MODULE-NAME>}

```
debug {all | <MODULE-NAME>} [<SUBMODULE-NAME>] [severity
   (emer|crit|alert|err|notice|warning|info|debug)] {port <PORT-NAME> |
    vlan <VLAN-ID> | ip <IP-ADDRESS> | mac <MAC-ADDRESS> |
    vrf <VRF-NAME> | instance <INSTANCE-ID>}
no debug {all | <MODULE-NAME>} [<SUBMODULE-NAME>] {port | vlan | ip | mac |
    vrf | instance}
```

Description

Enables debug logging for modules or submodules by name, with optional filtering by specific criteria.

The **no** form of this command disables debug logging.

Parameter	Description
`all`	Enables debug logging for all modules.
<MODULE-NAME>	Enables debug logging for a specific module. For a list of supported modules, enter the **debug** command followed by a space and a question mark (?).
<SUBMODULE-NAME>	Enables debug logging for a specific submodule. For a list of supported submodules, enter the **debug *<MODULE-NAME>*** command followed by a space and a question mark (?).
`severity (emer|crit|alert|err|notice|warning|info|debug)`	Selects the minimum severity log level for the destination. If a severity is not provided, the default log level is **debug**. Optional.
`emer`	Specifies storage of debug logs with a severity level of **emergency** only.
`crit`	Specifies storage of debug logs with severity level of **critical** and above.
`alert`	Specifies storage of debug logs with severity level of **alert** and above.
`err`	Specifies storage of debug logs with severity level of **error** and above.
`notice`	Specifies storage of debug logs with severity level of **notice** and above.
`warning`	Specifies storage of debug logs with severity level of **warning** and above.
`info`	Specifies storage of debug logs with severity level of **info** and above.

Parameter	Description
`debug`	Specifies storage of debug logs with severity level of **debug** (default).
`port`	Displays debug logs for the specified port, for example **1/1/1**.
`vlan <VLAN-ID>`	Displays debug logs for the specified VLAN. Provide a VLAN from 1 to 4094.
`ip <IP-ADDRESS>`	Displays debug logs for the specified IP Address.
`mac <MAC-ADDRESS>`	Displays debug logs for the specified MAC Address, for example **A:B:C:D:E:F**.
`vrf <VRF-NAME>`	Displays debug logs for the specified VRF.
`instance <INSTANCE-ID>`	Displays debug logs for the specified instance. Provide an instance ID from 1 to 255.

Examples

```
switch# debug all
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

debug db

```
debug db {all | sub-module} [level <MINIMUM-SEVERITY>] [filter]
```

```
no debug db {all | sub-module} [level <MINIMUM-SEVERITY>] [filter]
```

Description

Enables or disables debug logging for a db module or submodules, with an option to filter by specific criteria.

The **no** form of this command disables debug logging for the db module or submodule.

Parameter	Description
`all`	Enables all submodules for the db log.
`sub-module`	Enables debug logging for supported submodules. Specify **rx** or **tx** debug logs.
`filter`	Specifies supported filters for the db log. Specify **table**, **column**, or **client**. Optional
`severity (emer|crit|alert|err|notice|warning|info|debug)`	Selects the minimum severity log level for the destination. If a severity is not provided, the default log level is **debug**. Optional.
`emer`	Specifies storage of debug logs with a severity level of **emergency** only.
`crit`	Specifies storage of debug logs with severity level of **critical** and above.
`alert`	Specifies storage of debug logs with severity level of **alert** and above.
`err`	Specifies storage of debug logs with severity level of **error** and above.
`notice`	Specifies storage of debug logs with severity level of **notice** and above.
`warning`	Specifies storage of debug logs with severity level of **warning** and above.
`info`	Specifies storage of debug logs with severity level of **info** and above.
`debug`	Specifies storage of debug logs with severity level of **debug** (default).

Usage

DBlog is a high performance, configuration, and state database server logging infrastructure where a user can log the transactions which are sent or received by clients to the configuration and state database server. It can be enabled through the CLI and REST, and also supports filters where a user can filter out logs on the basis of table, column, or client. It is helpful for debugging when the user wants to debug an issue with a particular client, table, or column combination. It is not enabled by default. A combination of filters can also be applied to filter out messages based on table, column, and client.

There are three submodules for the "db" module:

1. **all**: When All is enabled, no filters are applied to any of the debug logs, even if other submodules are configured with filters.
2. **tx**: If enabled, only the replies and notifications sent out for the initial and incremental updates are logged.
3. **rx**: If enabled, only the transactions sent to the configuration and state database server are logged.

The keyword **all** may be used to enable or disable debug logging for all sub-modules. Also a combination of filters can be used to filter the message types.

If the table or client filter is applied, then the messages belonging to this specific table or client will be logged. The column filter can also be applied to further filter messages on a table, providing a mechanism to filter messages on a column. The table and client filter can be used in combination or separately, but column can only be used in conjunction with table.

Examples

Configuring all submodules with severity **debug**:

```
switch# debug db all severity debug
```

Configuring the **tx** submodule with **table Interface** filter and severity **debug**:

```
switch# debug db tx table Interface severity debug
```

Configuring the **rx** submodule with **table Interface column statistics** filter and severity **debug**:

```
switch# debug db rx table Interface column statistics severity debug
```

Disabling the **rx** submodule:

```
switch# no debug db rx
```

Disabling the **tx** submodule **table Interface**:

```
switch# no debug db tx table Interface
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

Command History

debug destination

```
debug destination {syslog | file | console | buffer} [severity
(emer|crit|alert|err|notice|warning|info|debug)]
no debug destination {syslog | file | console}
```

Description

Sets the destination for debug logs and the minimum severity level for each destination

The **no** form of this command unsets the destination for debug logs.

Parameter	Description
`{syslog | file | console | buffer}`	Selects the destination to store debug logs. Required.
`syslog`	Specifies that the debug logs are stored in the **syslog**.
`file`	Specifies that debug logs are stored in **file**.
`console`	Specifies that debug logs are stored in **console**.
`buffer`	Specifies that debug logs are stored in **buffer** (default).
`severity (emer|crit|alert|err| notice|warning|info|debug)`	Selects the minimum severity log level for the destination. If a severity is not provided, the default log level is**debug**. Optional.
`emer`	Specifies storage of debug logs with a severity level of **emergency** only.
`crit`	Specifies storage of debug logs with severity level of **critical** and above.
`alert`	Specifies storage of debug logs with severity level of **alert** and above.
`err`	Specifies storage of debug logs with severity level of **error** and above.
`notice`	Specifies storage of debug logs with severity level of **notice** and above.
`warning`	Specifies storage of debug logs with severity level of **warning** and above.
`info`	Specifies storage of debug logs with severity level of **info** and above.
`debug`	Specifies storage of debug logs with severity level of **debug** (default).

Usage

Events that have a severity equal to or higher than the configured severity level are stored in the designated destination. The product defaults to **buffer** for destination and **debug** as a severity level.

Examples

```
switch# debug destination syslog severity alert

switch# debug destination console severity info

switch# debug destination file severity warning
```

```
switch# debug destination buffer severity err
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

show debug

```
show debug [vsx-peer]
```

Description

Displays the enabled debug types.

Parameter	Description
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

```
switch# show debug
-----------------------------------------------------------------------------------
-
module sub_module severity vlan port    ip        mac                 instance  vrf

-----------------------------------------------------------------------------------
-
all     all          err    1   1/1/1   10.0.0.1  1a:2b:3c:4d:5e:6f   2
abcd
```

show debug buffer

```
show debug buffer [module <MODULE-NAME> | severity
(emer|crit|alert|err|notice|warning|info|debug)]
```

Description

Displays debug logs stored in the specified debug buffer with optional filtering by module or severity.

Parameter	Description
`<MODULE-NAME>`	Filters debug logs displayed by the specified module name.
`severity (emer|crit|alert|err| notice|warning|info|debug)`	Displays debug logs with a specified severity level. Defaults to**debug**. Optional.
`emer`	Displays debug logs with a severity level of **emergency** only.
`crit`	Displays debug logs with a severity level of **critical** and above.
`alert`	Displays debug logs with a severity level of **alert** and above.
`err`	Specifies storage of debug logs with severity level of **error** and above.
`notice`	Specifies storage of debug logs with severity level of **notice** and above.
`warning`	Displays debug logs with a severity level of **warning** and above.
`info`	Displays debug logs with a severity level of **info** and above.
`debug`	Displays debug logs with a severity level of **debug** (default).

Examples

```
switch# show debug buffer

------------------------------------------------------------------------------
show debug buffer
------------------------------------------------------------------------------
2017-03-06:06:51:15.089967|hpe-sysmond|SYSMON|SYSMON_CONFIG|LOG_INFO|Sysmon poll
```

```
interval changed to 20
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

Command History

show debug buffer vsf

Applicable for 6300 switches only.

```
show debug buffer vsf [member <MEMBER-ID>] [{conductor | standby}]
```

Description

Displays VSF member debug logs stored in the debug buffer, with an option to filter by VSF member and role.

Parameter	Description
<MEMBER-ID>	Displays debug logs for the specified member-id. Optional. Range: 1-10.
conductor	Display debug logs for the VSF conductor.
standby	Display debug logs for the VSF standby.

Examples

Displaying VSF member debug logs with member-id 1:

```
switch# show debug buffer vsf member 1
--------------------------------------------------------------------------------
show debug buffer
--------------------------------------------------------------------------------
2020-12-14:07:53:17.217919|hpe-ledarbd|LOG_DEBUG|MMBR|2|LED|LED|ledarbd_vsf_mbrs_
check: Checking VSF_Member table
```

Displaying VSF member debug logs for member state conductor:

```
switch# show debug buffer vsf conductor
-------------------------------------------------------------------------------
show debug buffer
-------------------------------------------------------------------------------
2020-12-14:07:54:20.469024|hpe-ledarbd|LOG_DEBUG|CDTR|1|LED|LED|ledarbd_pd_
subsystems_check: Checking Subsystem table
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

6300	Manager (#)	Administrators or local user group members with execution rights for this command.

show debug destination

`show debug destination [vsx-peer]`

Description

Displays the configured debug destination and severity.

Parameter	Description
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

```
switch# show debug destination
----------------------------------------------------------------------
show debug destination
----------------------------------------------------------------------
 CONSOLE:info
 FILE:warning
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

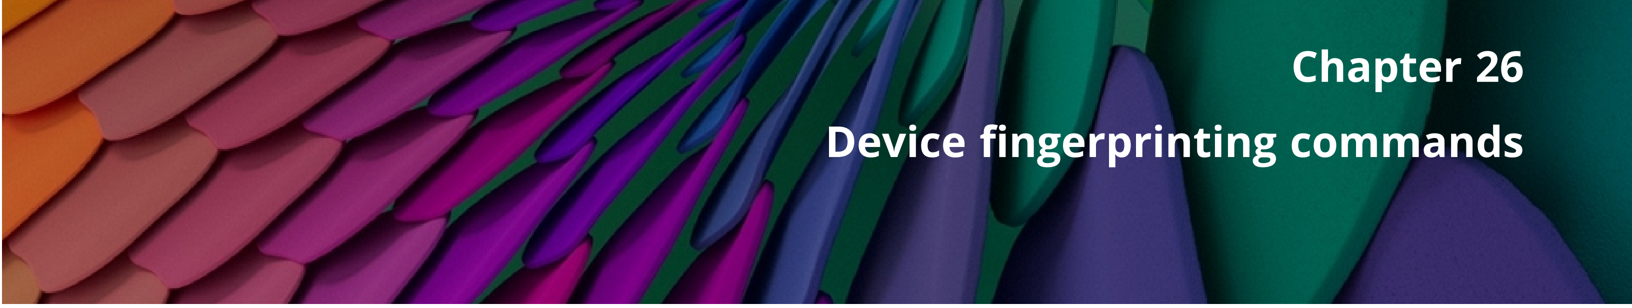
All platforms	Manager (#)	Administrators or local user group members with execution rights for this command.



Chapter 26

Device fingerprinting commands

cdp

```
cdp [tlv-name {chassis-id | address | port-id | capabilities | version | platform |
   native-vlan | duplex}] [tlv-num <TLV-NUMBER>]
no cdp [tlv-name {chassis-id | address | port-id | capabilities | version | platform |
   native-vlan | duplex}] [tlv-num <TLV-NUMBER>]
```

Description

Configures the CDP protocol attributes in the device fingerprinting profile context which the switch uses to collect information from the connected devices.

The **no** form of this command removes the CDP protocol configuration associated with the device fingerprinting profile.

Parameter	Description
`tlv-name`	Selects one of the available CDP TLV names. Default: **platform**.
<TLV-NUMBER>	Selects one of the available CDP TLV numbers. Supported values are 1 to 6, 10, and 11. Default: 6

Examples

Configuring the device fingerprinting profile **temp** using CDP with TLV name **capabilities** and TLV number **4**:

```
switch(config)# client device-fingerprint profile temp
switch(temp)# cdp tlv-name capabilities
switch(temp)# cdp tlv-num 4
```

Removing the device fingerprinting profile **temp** using CDP with TLV name **capabilities**:

```
switch(config)# client device-fingerprint profile temp
switch(temp)# no cdp tlv-name capabilities
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.08	Command introduced

Command Information

Platforms	Command context	Authority
6300 6400	*<DEVICE-FINGERPRINTING-PROFILE-NAME>*	Administrators or local user group members with execution rights for this command.

client device-fingerprint apply-profile

```
client device-fingerprint [apply-profile <PROFILE-NAME>]
no client device-fingerprint [apply-profile <PROFILE-NAME>]
```

Description

Associates a device fingerprinting profile on all interfaces. When a profile is configured on an interface, the configured profile will supersede the system-wide profile configuration.

The **no** form of this command removes the association of device fingerprinting profile from the ports.

The client-limit on the interface is governed by the configuration under the interface.

Parameter	Description
<PROFILE-NAME>	Specifies the name of the fingerprint profile. Range: Up to 128 characters.

Examples

Applying device fingerprinting profile named **frprnt01** at system level:

```
switch# configure
switch(config)# client device-fingerprint apply-profile fnprnt01
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.13	Command supported on all interfaces.
10.08	Command introduced for interface level.

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

client device-fingerprint client-limit

```
client device-fingerprint [client-limit <LIMIT>]
no client device-fingerprint [client-limit <LIMIT>]
```

Description

Set a maximum client-limit supported on a port or port list. The client-limit can be configured under the interface context.The **no** form of this command will remove the client-limit from the particular port/portlist.

Parameter	Description
<LIMIT>	Specifies the maximum client limit for a port. Range: ▪ 6300: **1** to **2048.** Default is **256.** An individual interface on the switch can support 1-2048 clients, with a default value of 256 clients. ▪ 6400: **1** to **4096.** Default is **256.** An individual interface on the switch can support 1-4096 clients, with a default value of 256 clients.

Examples

Applying a client limit of **200** on the interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# client device-fingerprint client-limit 200
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.08	Command introduced

Command Information

	Command context	Authority
6300 6400	`config-if`	Administrators or local user group members with execution rights for this command.

client device-fingerprint profile

```
client device-fingerprint profile <PROFILE-NAME>
no client device-fingerprint profile <PROFILE-NAME>
```

Description

Configures a device fingerprinting profile. You can configure a maximum of 32 profiles.

The **no** form of this command removes the device fingerprinting profile.

Parameter	Description
<PROFILE-NAME>	Specifies the name of the fingerprint profile. Range: Up to 128 characters.

Examples

Configuring fingerprint profile **fnprnt01**:

```
switch(config)# client device-fingerprint profile fnprnt01
```

Deleting the fingerprint profile **fnprnt01**:

```
switch(config)# no client device-fingerprint profile fnprnt01
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.08	Command introduced

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

dhcp

```
dhcp [option-num <OPTION-NUMBER>][options-list]
no dhcp [option-num <OPTION-NUMBER>][options-list]
```

Description

Configures the DHCP protocol attributes in the device fingerprinting profile context based on which the switch collects information from the connected devices. Default option numbers are 12, 55, and 60. The DHCP options-list is disabled by default. It can be manually enabled to extract the DHCP Options list in network order as they appear in a DHCP packet.

The **no** form of this command removes the DHCP protocol configuration associated with the device fingerprinting profile.

Parameter	Description
<OPTION-NUMBER>	Specifies the DHCP option number to match. Supported values are 1 to 255. Default option numbers: 12, 55, and 60.
[options-list]	Selects the DHCP options list for device fingerprinting.

Examples

Configuring the device fingerprinting profile **temp2** using DHCP with option **55**:

```
switch(config)# client device-fingerprint profile temp2
switch(config-device-fingerprint)# dhcp option-num 55
```

Removing the device fingerprinting profile **temp2** using **DHCP** with option **55**:

```
switch(config)# client device-fingerprint profile temp2
switch(config-device-fingerprint)# no dhcp option-num 55
```

Configuring the device fingerprinting profile **temp2** using DHCP default options and options-list:

```
switch(config)# client deivce-fingerprint profile temp2
switch(temp2)# dhcp options-list
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.10	Added **options-list** parameter.
10.08	Command introduced

Command Information

Platforms	Command context	Authority
6300 6400	config-device-fingerprint	Administrators or local user group members with execution rights for this command.

http user-agent

```
http user-agent
no http user-agent
```

Description

Configures the HTTP protocol in the device fingerprinting profile context based on which the switch collects information from the connected devices.

The **no** form of this command removes the HTTP protocol configuration associated with the device fingerprinting profile.

As of AOS-CX release 10.10 information from the last 3 user agents is provided as part of the device fingerprinting solution.

Examples

Configuring the device fingerprinting profile **temp3** using HTTP:

```
switch(config)# client device-fingerprint profile temp3
switch(temp3)# http user-agent
```

Removing the device fingerprinting profile **temp3** using HTTP:

```
switch(config)# client device-fingerprint profile temp3
switch(temp3)# no http user-agent
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

6300 6400	*<DEVICE-FINGERPRINTING-PROFILE-NAME>*	Administrators or local user group members with execution rights for this command.

lldp (device fingerprinting)

```
lldp [tlv-name {chassis-id | port-id | time-to-live | port-description |
   system-name | system-description | system-capabilities |
   management-address}] [tlv-num <TLV-NUMBER>]
no lldp [tlv-name {chassis-id | port-id | time-to-live | port-description |
   system-name | system-description | system-capabilities |
   management-address}] [tlv-num <TLV-NUMBER>]
```

Description

Configures the LLDP protocol attributes in the device fingerprinting profile context based on which the switch collects information from the connected devices.

The **no** form of this command removes the LLDP protocol configuration associated with the device fingerprinting profile.

Parameter	Description
`tlv-name`	Selects one of the available LLDP TLV names. Default: **system-description**.
`<TLV-NUMBER>`	Selects one of the available LLDP TLV numbers. Supported values are 1 to 8. Default: 6

Examples

Configuring the device fingerprinting profile **temp1** using LLDP with TLV name **system-name** and TLV number **5**:

```
switch(config)# client deivce-fingerprint profile temp1
switch(temp1)# lldp tlv-name system-name
switch(temp1)# lldp tlv-num 5
```

Removing the device fingerprinting profile **temp1** using LLDP with TLV name **system-name**:

```
switch(config)# client device-fingerprint profile temp1
switch(temp1)# no lldp tlv-name system-name
```

For more information on features that use this command, refer to the Security Guide for your switch model.

vsx-sync

```
vsx-sync
no vsx-sync
```

Description

Enables device fingerprint profile-level synchronization between primary to secondary switches in VSX.

The **no** form of this command disables device fingerprint profile-level synchronization between primary to secondary switches in VSX.

Examples

Enabling VSX synchronization at the device fingerprinting profile **fnprnt01**:

```
switch(config)# client device-fingerprint profile fnprnt01
switch(fnprnt01)# vsx-sync
```

Disabling VSX synchronization at the device fingerprinting profile **fnprnt01**:

```
switch(config)# client device-fingerprint profile fnprnt01
switch(fnprnt01)# no vsx-sync
```

For more information on features that use this command, refer to the Security Guide for your switch model.

vsx-sync device-fingerprint

```
vsx-sync device-fingerprint
no vsx-sync device-fingerprint
```

Description

Enables synchronization of device fingerprinting configuration between primary to secondary switches at the interface level.

The **no** form of this command disables synchronization of device fingerprinting configuration between primary to secondary switches in VSX at the interface level.

Examples

Enabling VSX synchronization for device fingerprinting:

```
switch(config)# interface 1/1/1
switch(config-if)# vsx-sync device-fingerprint
```

Disabling VSX synchronization for device fingerprinting:

```
switch(config)# interface 1/1/1
switch(config-if)# no vsx-sync device-fingerprint
```

For more information on features that use this command, refer to the Security Guide for your switch model.

10.08	Command introduced

Command Information

Platforms	Command context	Authority
6400	`config-if`	Administrators or local user group members with execution rights for this command.

show client device-fingerprint

`show client device-fingerprint <MAC-ADDRESS>`

Description

Shows fingerprinting attributes collected from all devices or a particular device using MAC address.

Parameter	Description
<MAC-ADDRESS>	Specifies the client MAC address.

Examples

Showing fingerprinting attributes collected from a device with MAC address **f8:40:f0:c9:70:40**:

```
switch (config)# show client device-fingerprint f8:60:f0:c9:70:40

Port        : 1/1/2
VLAN        : 30
Protocol : DHCP
   Host Name(12)                  : dut1
   Vendor-Class-Identifier(60) : Aruba JL678A
Protocol : HTTP
   User Agent1 : n/a
Protocol : LLDP
   Chassis-Name(1)              : 6100
   Chassis-Description(6)      : Aruba JL678A  PL.10.06.0001AAF-180-g9406d01
   System Capabilities(7)      : Bridge, Router
Protocol : CDP
   n/a
```

Showing fingerprinting attributes collected from all devices when the LLDP profile is not configured on port **1/1/1** and all the protocols are enabled on port **1/1/2**. CDP data was not collected on **1/1/2**, though it was configured:

```
switch (config)# show client device-fingerprint
Client MAC Address : f8:60:f0:c9:70:40
Port        : 1/1/1
VLAN        : 20

Protocol: DHCP
   Host Name(12)                : dut1
   Vendor-Class-Identifier(60) : Aruba JL678A
Protocol: HTTP
   User Agent1 : Aruba123
   User Agent2 : Aruba234
   User Agent3 : Aruba345
Protocol: LLDP
   n/a
Protocol: CDP
   Device-Id(1)       :  dut1
   Address(3)         :  10.1.1.2
   Platform(6)        :  cisco C9300-24T
   Version(5)         :  Cisco IOS Software [Gibraltar], Catal...
   Capabilities(4)    :  igmp_capable,router,switch

Client MAC Address : f8:40:f0:c9:70:40
Port        : 1/1/2
VLAN        : 30
Protocol : DHCP
   Host Name(12)                : dut1
   Vendor-Class-Identifier(60) : Aruba JL678A
Protocol : HTTP
   User Agent1 : ArubaCentral
   User Agent2 : Aruba234
Protocol : LLDP
   Chassis-Name(1)             : 6100
   Chassis-Description(6)      : Aruba JL678A  PL.10.06.0001AAF-180-g9406d01
   System Capabilities(7)      : Bridge, Router
Protocol: CDP
```

Showing fingerprinting attributes where all the protocols are enabled on port 1/1/3 along with DHCP options-list:

```
switch (config)# show client device-fingerprint
Client MAC Address : f8:40:f0:c9:70:50
Port        : 1/1/3
VLAN        : 40
Protocol : DHCP
   Host Name(12)                : dut1
   Vendor-Class-Identifier(60) : Aruba JL678A
   DHCP Options-List :
      Discover(1) : 53,116,61,50,12,60,55,255
      Request(3)  : 53,61,50,54,12,81,60,55,255
Protocol : HTTP
   User Agent1 : Aruba
Protocol : LLDP
   Chassis-Name(1)             : 6100
   Chassis-Description(6)      : Aruba JL678A  PL.10.06.0001AAF-180-g9406d01
   System Capabilities(7)      : Bridge, Router
Protocol: CDP
   Device-Id(1)       :  dut1
   Address(3)         :  10.1.1.2
```

For more information on features that use this command, refer to the Security Guide for your switch model.

show client device-fingerprint active

`show client device-fingerprint active`

Description

Shows status details of device fingerprinting profiles associated with the ports. Displays the protocols that are configured for a profile and whether the profile is enabled or disabled at that port.

Examples

Showing details of device fingerprinting profiles:

```
switch (config)# show client device-fingerprint active
Port    Profile                  Status            DHCP  HTTP  LLDP CDP
-----------------------------------------------------------------------
1/1/1   profile1                 Configured         Y     Y     N    N
1/1/2   profile2                 Not configured     N     N     Y    Y
1/1/3   profile3                 Configured         N     Y     N    Y
System  profile4                 Configured         Y     Y     Y    N
```

show client device-fingerprint profile

```
show client device-fingerprint profile [<PROFILE-NAME>]
```

Description

Shows details of protocol configuration for device fingerprinting profiles.

Parameter	Description
<PROFILE-NAME>	Specifies the name of the fingerprint profile. Range: Up to 128 characters.

Examples

Showing details of protocol configuration for device fingerprinting profile **Profile1**:

```
switch (config)# show client device-profile Profile1
DHCP Attributes
  Option Numbers  : 12,50,55,60
  Options List    : Enable

HTTP Attributes
  User-Agent      : Enable

LLDP Attributes
  TLV Names       : chassis-id, system-description
  TLV Numbers     : 4,5,7

CDP Attributes
  TLV Names       : n/a
  TLV Numbers     : 1-3,6
```

Chapter 27

Device profile commands

aaa authentication port-access allow-cdp-auth

```
aaa authentication port-access allow-cdp-auth
no aaa authentication port-access allow-cdp-auth
```

Description

Use this command to allow or block authentication on the CDP (Cisco Discovery Protocol) BPDU (Bridge Protocol Data Unit) . This is allowed by default. The **no** form of this command prevents authentication on CDP packets received on the port. This command can be issued from the interface (**config-if**) or Link Aggregation Group (**config-lag-if**) contexts.

Examples

On the 6400 Switch Series, interface identification differs.

Allowing authentication on a CDP CPDU on interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# aaa authentication port-access allow-cdp-auth
```

Allowing authentication on a CDP CPDU on a LAG port:

```
switch(config)# interface lag 1
switch(config-lag-if)# aaa authentication port-access allow-cdp-auth
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.13	This command can be issued from a Link Aggregation Group (LAG) context.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority

aaa authentication port-access allow-cdp-bpdu

```
aaa authentication port-access allow-cdp-bpdu
no aaa authentication port-access allow-cdp-bpdu
```

Description

Allows all packets related to the CDP (Cisco Discovery Protocol) BPDU (Bridge Protocol Data Unit) on a secure port or LAG. This command can be issued from the interface (**config-if**) or Link Aggregation Group (**config-lag-if**) contexts. The **no** form of this command blocks the CDP BPDU on a secure port. On a nonsecure port, the command has no effect.

Examples

On the 6400 Switch Series, interface identification differs.

Allowing a CDP BPDU on secure port **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# aaa authentication port-access allow-cdp-bpdu
switch(config-if)# do show running-config
Current configuration:
!
!Version AOS-CX 10.0X.0000
led locator on
!
!
vlan 1
aaa authentication port-access mac-auth
    enable
aaa authentication port-access dot1x authenticator
    enable
interface 1/1/1
    no shutdown
    vlan access 1
    aaa authentication port-access allow-cdp-bpdu
    aaa authentication port-access mac-auth
        enable
    aaa authentication port-access dot1x authenticator
    enable

switch(config-if)# do show port-access device-profile interface all
Port 1/1/1, Neighbor-Mac 00:0c:29:9e:d1:20
    Profile Name    : access_switches
    LLDP Group      :
    CDP Group       : aruba-ap_cdp
    Role            : test_ap_role
    Status          : In Progress
    Failure Reason  :
```

Blocking LLDP packet on secure port **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# no aaa authentication port-access allow-cdp-bpdu
switch(config-if)# do show running-config
Current configuration:
!
!Version AOS-CX 10.0X.0000
led locator on
```

```
!
!
vlan 1
aaa authentication port-access mac-auth
    enable
interface 1/1/1
    no shutdown
    vlan access 1
    aaa authentication port-access mac-auth
        enable
```

Allowing a CDP BPDU on LAG **1**:

```
switch(config)# interface lag 1
switch(config-lag-if)# aaa authentication port-access allow-cdp-bpdu
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.13	This command can be issued from a Link Aggregation Group (LAG) context.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority

aaa authentication port-access allow-cdp-proxy-logoff

```
aaa authentication port-access allow-cdp-proxy-logoff
no aaa authentication port-access allow-cdp-proxy-logoff
```

Description

Allows a client to be logged off from the system via a special TLV in the CDP packet. By default, proxy logoff via CDP packet support is disabled. When **allow-cdp-proxy-logoff** is enabled, TLV received from CDP packets corresponding to logoff processing will be read and logoff is issued to the clients. This only works on client authentication enabled ports and **aaa authentication port-access allow-cdp-bpdu** must be enabled to process. This command can be issued from the interface (**config-if**) or Link Aggregation Group (**config-lag-if**) contexts.

Examples

On the 6400 Switch Series, interface identification differs.

Allowing a client to be logged off from the system via a special TLV in the CDP packet:

```
switch(config)# interface 1/1/1
switch(config-if)# aaa authentication port-access allow-cdp-proxy-logoff
switch(config-if)# show running-config interface 1/1/1
interface 1/1/1
    no shutdown

    vlan access 1
    aaa authentication port-access allow-cdp-bpdu
    aaa authentication port-access allow-cdp-proxy-logoff
    aaa authentication port-access allow client-limit 2
    aaa authentication port-access dot1x authenticator
        enable
    aaa authentication port-accss mac-auth
        enable
    exit
```

The aaa authentication port-access allow-cdp-proxy-logoff command can also be issued from a LAG port context

```
switch(config)# interface lag 1
switch(config-lag if)# aaa authentication port-access allow-cdp-proxy-logoff
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.13	This command can be issued from a Link Aggregation Group (LAG) context.
10.09.1000	Command introduced.

Command Information

aaa authentication port-access allow-lldp-bpdu

```
aaa authentication port-access allow-lldp-bpdu
no aaa authentication port-access allow-lldp-bpdu
```

Description

Allows all packets related to the LLDP BPDU (Bridge Protocol Data Unit) on a secure port. This command can be issued from the interface (**config-if**) or Link Aggregation Group (**config-lag-if**) contexts.

The **no** form of this command blocks the LLDP BPDU on a secure port. On a nonsecure port, the command has no effect.

Examples

On the 6400 Switch Series, interface identification differs.

Allowing an LLDP BPDU on secure port **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# aaa authentication port-access allow-lldp-bpdu
switch(config-if)# do show running-config
Current configuration:
!
!Version AOS-CX 10.0X.0000
led locator on
!
!
vlan 1
aaa authentication port-access mac-auth
    enable
interface 1/1/1
    no shutdown

    vlan access 1
    aaa authentication port-access allow-lldp-bpdu
    aaa authentication port-access mac-auth
        enable

switch(config-if)# do show port-access device-profile interface all
Port 1/1/1, Neighbor-Mac 00:0c:29:9e:d1:20

    LLDP Group      : 2920-grp
    CDP Group       :
    Role            : local_2920_role
    Status          : Profile Applied
    Failure Reason  :
```

Blocking LLDP BPDU on secure port **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# no aaa authentication port-access allow-lldp-bpdu
switch(config-if)# do show running-config
Current configuration:
!
!Version AOS-CX 10.0X.0000led locator on
!
!
vlan 1
aaa authentication port-access mac-auth
    enable
interface 1/1/1
    no shutdown

    vlan access 1
    aaa authentication port-access mac-auth
    enable
```

Allowing an LLDP BPDU on a LAG port:

```
switch(config)# interface lag 1
switch(config-lag-if)#aaa authentication port-access allow-lldp-bpdu
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.13	This command can be issued from a Link Aggregation Group (LAG) context.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority

associate cdp-group

```
associate cdp-group <GROUP-NAME>
no associate cdp-group <GROUP-NAME>
```

Description

Associates a CDP (Cisco Discovery Protocol) group with a device profile. A maximum of two CDP groups can be associated with a device profile.

The **no** form of this command removes a CDP group from a device profile.

Parameter	Description
<GROUP-NAME>	Specifies the name of the CDP group to associate with this device profile. Range: 1 to 32 alphanumeric characters.

Examples

Associating the CDP group **my-cdp-group** with the device profile **profile01**:

```
switch(config)# port-access device-profile profile01
switch(config-device-profile)# associate cdp-group my-cdp-group
```

Removing the CDP group **my-cdp-group** from the device profile **profile01**:

```
switch(config)# port-access device-profile profile01
switch(config-device-profile)# no associate cdp-group my-cdp-group
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

associate lldp-group

```
associate lldp-group <GROUP-NAME>
no associate lldp-group <GROUP-NAME>
```

Description

Associates an LLDP group with a device profile. A maximum of two LLDP groups can be associated with a device profile

The **no** form of this command removes an LLDP group from a device profile.

Parameter	Description
<GROUP-NAME>	Specifies the name of the LLDP group to associate with the device profile. Range: 1 to 32 alphanumeric characters.

Examples

Associating the LLDP group **my-lldp-group** with the device profile **profile01**:

```
switch(config)# port-access device-profile profile01
switch(config-device-profile)# associate lldp-group my-lldp-group
```

Removing the LLDP group **my-lldp-group** from the device profile **profile01**:

```
switch(config)# port-access device-profile profile01
switch(config-device-profile)# no associate lldp-group my-lldp-group
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

associate mac-group

```
associate mac-group <GROUP-NAME>
no associate mac-group <GROUP-NAME>
```

Description

Associates a MAC group with a device profile. A maximum of two MAC groups can be associated with a device profile.

The **no** form of this command removes a MAC group from a device profile.

Parameter	Description
<GROUP-NAME>	Specifies the name of the MAC group to associate with this device profile. Range: 1 to 32 alphanumeric characters.

Examples

Associating the MAC group **mac01-group** with the device profile **profile01**:

```
switch(config)# port-access device-profile profile01
switch(config-device-profile)# associate mac-group mac01-group
```

Removing the MAC group **mac01-group** from the device profile **profile01**:

```
switch(config)# port-access device-profile profile01
switch(config-device-profile)# no associate mac-group mac01-group
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

associate role

```
associate role <ROLE-NAME>
no associate role <ROLE-NAME>
```

Description

Associates a role with a device profile. Only one role can be associated with a device profile. For information on how to configure a role, see the port access role information in the *Security Guide*.

The **no** form of this command removes a role from a device profile.

Parameter	Description
<ROLE-NAME>	Specifies the name of the role to associate with the device profile. Range: 1 to 64 alphanumeric characters.

Examples

Associating the role **my-role** with the device profile **profile01**:

```
switch(config)# port-access device-profile profile01
switch(config-device-profile)# associate role my-role
```

Removing the role **my-role** from the device profile **profile01**:

```
switch(config)# port-access device-profile profile01
switch(config-device-profile)# no associate role my-role
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

disable

```
disable
no disable
```

Description

Disables a device profile.

The **no** form of this command enables a device profile.

Examples

Disabling a device profile:

```
switch(config)# port-access device-profile profile01
switch(config-device-profile)# disable
```

Enabling a device profile named profile01:

```
switch(config)# port-access device-profile profile01
switch(config-device-profile)# no disable
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

ignore (for CDP groups)

```
ignore [seq <SEQ-NUM>] {platform <PLATFORM> | sw-version <SWVERSION> |
     voice-vlan-query <VLAN-ID>}
no ignore [seq <SEQ-ID>] {platform <PLATFORM> | sw-version <SWVERSION> |
     voice-vlan-query <VLAN-ID>}
```

Description

Defines a rule to ignore devices for a CDP (Cisco Discovery Protocol) group. Up to 64 match/ignore rules can be defined for a group.

The **no** form of this command removes a rule for ignoring devices from a CDP group.

Parameter	Description
`seq <SEQ-ID>`	Specifies the ID of the rule to create or modify. If no ID is specified when adding a rule, an ID is automatically assigned in increments of 10 in the order in which rules are added. When more than one rule matches the command entered, the rule with the lowest ID takes precedence.
`platform <PLATFORM>`	Specifies the hardware or model details of the neighbor. Range: 1 to 128 alphanumeric characters.
`sw-version <SWVERSION>`	Specifies the software version of the neighbor. Range: 1 to 128 alphanumeric characters.

Parameter	Description
`voice-vlan-query <VLAN-ID>`	Specifies the VLAN query value of the neighbor. Range: 1 to 65535.

Examples

Adding a rule to the CDP group **grp01** that ignores a device that transmits **PLATFORM01** in the platform TLV:

```
switch(config)# port-access cdp-group grp01
switch(config-cdp-group)# ignore platform PLATFORM01
```

Adding a rule to the CDP group **grp01** that ignores a device that transmits **SWVERSION** in software version TLV:

```
switch(config)# port-access cdp-group grp01
switch(config-cdp-group)# ignore sw-version SWVERSION
```

Removing the rule that matches the sequence number **25** from the CDP group named **grp01**.

```
switch(config)# port-access cdp-group grp01
switch(config-cdp-group)# no ignore seq 25
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

ignore (for LLDP groups)

```
ignore [seq <SEQ-ID>] {sys-desc <SYS-DESC> | sysname <SYS-NAME> |
     vendor-oui <VENDOR-OUI> [type <KEY> [value <VALUE>]]}
no ignore [seq <SEQ-ID>] {sys-desc <SYS-DESC> | sysname <SYS-NAME> |
     vendor-oui <VENDOR-OUI> [type <KEY> [value <VALUE>]]}
```

Description

Defines a rule to ignore devices for an LLDP group. Up to 64 match/ignore rules can be defined for a group.

The **no** form of this command removes a rule for ignoring devices from an LLDP group.

Parameter	Description
`seq <SEQ-ID>`	Specifies the ID of the rule to create or modify. If no ID is specified when adding a rule, an ID is automatically assigned in increments of 10 in the order in which rules are added. When more than one rule matches the command entered, the rule with the lowest ID takes precedence.
`sys-desc <SYS-DESC>`	Specifies the LLDP system description type-length-value (TLV). Range: 1 to 256 alphanumeric characters.
sysname *<SYS-NAME>*	Specifies the LLDP system name TLV. Range: 1 to 64 alphanumeric characters.
`vendor-oui <VENDOR-OUI>`	Specifies the LLDP system vendor OUI TLV. Range: 1 to 6 alphanumeric characters.
`type <KEY>`	Specifies the vendor OUI subtype key. Optional.
`value <VALUE>`	Specifies the vendor OUI subtype value. Range: 1 to 256 alphanumeric characters.

Examples

Adding a rule to the LLDP group **grp01** that ignores a device that transmits **PLATFORM01** in the system description TLV:

```
switch(config)# port-access lldp-group grp01
switch(config-lldp-group)# ignore sys-desc PLATFORM01
```

Removing the rule that matches the sequence number **25** from the LLDP group named **grp01**.

```
switch(config)# port-access lldp-group grp01
switch(config-lldp-group)# no match seq 25
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

ignore (for MAC groups)

```
[seq <SEQ-ID>] ignore {mac <MAC-ADDR> | mac-mask <MAC-MASK> | mac-oui <MAC-OUI>}
no [seq <SEQ-ID>] ignore {mac <MAC-ADDR> | mac-mask <MAC-MASK> | mac-oui <MAC-OUI>}
```

Description

Defines a rule to ignore devices for a MAC group based on the criteria of MAC address, MAC address mask, or MAC Organizational Unique Identifier (OUI). Up to 64 ignore rules can be defined for a group.

The **no** form of this command removes a rule for ignoring devices from a MAC group.

Parameter	Description
`seq` *`<SEQ-ID>`*	Specifies the entry sequence ID of the rule to create or modify a MAC group. If no ID is specified when adding a rule, an ID is automatically assigned in increments of 10 in the order in which rules are added. When more than one rule matches the command entered, the rule with the lowest ID takes precedence. Range: **1** to **4294967295**.
`mac` *`<MAC-ADDR>`*	Specifies the MAC address of the device to ignore.
`mac-mask` *`<MAC-MASK>`*	Specifies the MAC address mask to ignore devices in that range. Supported MAC address masks: **/32** and **/40**.
`mac-oui` *`<MAC-OUI>`*	Specifies the MAC OUI to ignore devices in that range. Supports MAC OUI address of maximum length of 24 bits.

Usage

To achieve the required configuration of matches for devices, it is recommended to first ignore the devices that you do not want to add. Then match the criteria for the rest of the devices that you want to add to the MAC group.

For example, if you want to ignore a specific device but add all the other devices that belong to a MAC OUI, then you must first configure the ignore criteria with a lower sequence number. And then configure match criteria with a higher sequence number.

Examples

Adding a rule to the MAC group **grp01** to ignore a device based on MAC address, but match all other devices belonging to a MAC OUI:

```
switch(config)# mac-group grp01
switch(config-mac-group)# ignore mac 1a:2b:3c:4d:5e:6f
switch(config-mac-group)# match mac-oui 1a:2b:3c
switch(config-mac-group)# exit
switch(config)# do show running-config
Current configuration:
!
!Version AOS-CX Virtual.10.0X.0001
!export-password: default
led locator on
!
!
!
!
ssh server vrf mgmtdefault
!
```

~~~~
!
!
!
!
vlan 1
interface mgmt
    no shutdown
    ip dhcp
mac-group grp01
     seq 10 ignore mac 1a:2b:3c:4d:5e:6f
     seq 20 match mac-oui 1a:2b:3c

```
~~~~

Adding a rule to the MAC group **grp01** to ignore devices based on MAC address mask, but match all other devices belonging to a MAC OUI:

~~~~
switch(config)# mac-group grp01
switch(config-mac-group)# ignore mac-mask 1a:2b:3c:4d/32
switch(config-mac-group)# match mac-oui 1a:2b:3c
switch(config-mac-group)# exit
switch(config)# do show running-config
Current configuration:
!
!Version AOS-CX Virtual.10.0X.0001
!export-password: default
led locator on
!
!
!
!
ssh server vrf mgmtdefault
!
!
!
!
!
vlan 1
interface mgmt
    no shutdown
    ip dhcp
mac-group grp01
     seq 10 ignore mac-mask 1a:2b:3c:4d/32
     seq 20 match mac-oui 1a:2b:3c

```
~~~~

Adding a rule to the MAC group **grp01** that ignores a device based on complete MAC address:

~~~~
switch(config)# mac-group grp01
switch(config-mac-group)# ignore mac 1a:2b:3c:4d:5e:6f
~~~~

Adding a rule to the MAC group **grp02** that ignores devices based on MAC mask:

~~~~
switch(config)# mac-group grp01
switch(config-mac-group)# ignore mac-mask 1a:2b:3c:4d:5e/40
switch(config-mac-group)# ignore mac-mask 18:e3:ab:73/32
~~~~

Adding a rule to the MAC group **grp03** that ignores devices based on MAC OUI:

````
switch(config)# mac-group grp03
switch(config-mac-group)# ignore mac-oui 81:cd:93
````

Adding a rule to the MAC group **grp01** that ignores devices with a sequence number and based on MAC address:

~~~
switch(config)# mac-group grp01
switch(config-mac-group)# seq 10 ignore mac b2:c3:44:12:78:11
switch(config-mac-group)# exit
switch(config)# do show running-config
Current configuration:
!
!Version AOS-CX Virtual.10.0X.0001
!export-password: default
led locator on
!
!
vlan 1
interface mgmt
    no shutdown
    ip dhcp
mac-group grp01
    seq 10 ignore mac b2:c3:44:12:78:11

```
~~~

Removing the rule from the MAC group **grp01** based on sequence number:

~~~
switch(config)# mac-group grp01
switch(config-mac-group)# no ignore seq 10
switch(config-mac-group)# exit
switch(config)# do show running-config
Current configuration:
!
!Version AOS-CX Virtual.10.0X.0001
!export-password: default
led locator on
!
!
vlan 1
interface mgmt
    no shutdown
    ip dhcp
mac-group grp01

```
~~~

Adding a rule to the MAC group **grp01** that ignores devices with MAC entry sequence number and based on MAC OUI:

````
switch(config)# mac-group grp01
switch(config-mac-group)# seq 10 ignore mac b2:c3:44:12:78:11
switch(config-mac-group)# seq 20 ignore mac-oui 1a:2b:3c
switch(config-mac-group)# seq 30 ignore mac-mask 71:14:89:f3/32
switch(config-mac-group)# exit
````

~~~
switch(config)# do show running-config
Current configuration:
!
!Version AOS-CX Virtual.10.0X.0001
!export-password: default
led locator on
!
!
vlan 1
interface mgmt
    no shutdown
    ip dhcp
mac-group grp01
     seq 10 ignore mac b2:c3:44:12:78:11
     seq 20 ignore mac-oui 1a:2b:3c
     seq 30 ignore mac-mask 71:14:89:f3/32

```
~~~

Removing the rule from the MAC group **grp01** based on sequence number and MAC OUI:

~~~
switch(config)# mac-group grp01
switch(config-mac-group)# no seq 20 ignore mac-oui 1a:2b:3c
switch(config-mac-group)# exit
switch(config)# do show running-config
Current configuration:
!
!Version AOS-CX Virtual.10.0X.0001
!export-password: default
led locator on
!
!
vlan 1
interface mgmt
    no shutdown
    ip dhcp
mac-group grp01
     seq 10 ignore mac b2:c3:44:12:78:11
     seq 30 ignore mac-mask 71:14:89:f3/32

```
~~~

Removing the rule that matches the sequence number **25** from the MAC group named **grp01**.

```
switch(config)# mac-group grp01
switch(config-mac-group)# no ignore seq 25
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification

Command Information

Platforms	Command context	Authority
6300 6400	`config-mac-group`	Administrators or local user group members with execution rights for this command.

mac-group

```
mac-group <MAC-GROUP-NAME>
no mac-group <MAC-GROUP-NAME>
```

Description

Creates a MAC group or modifies an existing MAC group. A MAC group is used to classify connected devices based on the MAC address details, such as mask or OUI.

A maximum of 32 MAC groups can be configured on the switch. A maximum of 2 MAC groups can be associated with a device profile. Each group accepts 64 match or ignore commands.

The **no** form of this command removes a MAC group.

Parameter	Description
<MAC-GROUP-NAME>	Specifies the name of the MAC group to create or modify. The maximum number of characters supported is 32.

Examples

Creating a MAC group named **grp01**:

```
switch(config)# mac-group grp01
switch(config-mac-group)# exit
```

Removing a MAC group named **grp01**:

```
switch(config)# no mac-group grp01
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

match (for CDP groups)

```
match [seq <SEQ-ID>] {platform <PLATFORM> | sw-version <SWVERSION> |
     voice-vlan-query <VLAN-ID>}
no match [seq <SEQ-ID>] {platform <PLATFORM> | sw-version <SWVERSION> |
     voice-vlan-query <VLAN-ID>}
```

Description

Defines a rule to match devices for a CDP group. A maximum of 32 CDP groups can be configured on the switch. Up to 64 match or ignore rules can be defined for each group.

The **no** form of this command removes a rule for adding devices to a CDP group.

Parameter	Description
`seq <SEQ-ID>`	Specifies the ID of the rule to create or modify. If no ID is specified when adding a rule, an ID is automatically assigned in increments of 10 in the order in which rules are added. When more than one rule matches the command entered, the rule with the lowest ID takes precedence.
`platform <PLATFORM>`	Specifies the hardware or model details of the neighbor. Range: 1 to 128 alphanumeric characters.
`sw-version <SWVERSION>`	Specifies the software version of the neighbor. Range: 1 to 128 alphanumeric characters.
`voice-vlan-query <VLAN-ID>`	Specifies the VLAN query value of the neighbor. Range: 1 to 65535.

Examples

Adding rules to match a Cisco device with a specific software version on VLAN **512** to the CDP group **grp01**:

```
switch(config)# port-access cdp-group grp01
switch(config-cdp-group)# match platform CISCO
switch(config-cdp-group)# match sw-version 11.2(12)P
switch(config-cdp-group)# match voice-vlan-query 512
switch(config-cdp-group)# match seq 50 platform cisco sw-version 11.2(12)P voice-
vlan-query 512
switch(config-cdp-group)# exit
switch(config)# do show running-config

Current configuration:
!
!Version AOS-CX Virtual.10.0X.000
!export-password: default
led locator on
!
!
vlan 1
port-access cdp-group grp01
```

```
      seq 10 match platform CISCO
      seq 20 match sw-version 11.2(12)P
      seq 30 match voice-vlan-query 512
      seq 50 match platform cisco sw-version 11.2(12)P voice-vlan-query 512
```

Removing a rule that matches the sequence number **25** from the CDP group named **grp01**:

```
switch(config)# port-access cdp-group grp01
switch(config-cdp-group)# no match seq 25
```

Adding a rule that matches the value of vendor-OUI **000b86** to the CDP group named **grp01**:

```
switch(config)# port-access cdp-group grp01
switch(config-cdp-group)# match vendor-oui 000b86
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

match (for LLDP groups)

```
match [seq <SEQ-ID>] {sys-desc <SYS-DESC> | sysname <SYS-NAME> |
     vendor-oui <VENDOR-OUI> [type <KEY> [value <VALUE>]]}
no match [seq <SEQ-ID>] {sys-desc <SYS-DESC> | sysname <SYS-NAME> |
     vendor-oui <VENDOR-OUI> [type <KEY> [value <VALUE>]]}
```

Description

Defines a rule to match devices for an LLDP group. Up to 64 match/ignore rules can be defined for a group.

The **no** form of this command removes a rule.

Parameter	Description
`seq <SEQ-ID>`	Specifies the ID of the rule to create or modify. If no ID is specified when adding a rule, an ID is automatically assigned in increments of 10 in the order in which rules are added. When more than one

Parameter	Description
	rule matches the command entered, the rule with the lowest ID takes precedence.
`sys-desc <SYS-DESC>`	Specifies the LLDP system description type-length-value (TLV). Range: 1 to 256 alphanumeric characters.
`sysname <SYS-NAME>`	Specifies the LLDP system name TLV. Range: 1 to 64 alphanumeric characters.
`vendor-oui <VENDOR-OUI>`	Specifies the LLDP system vendor OUI TLV. Range: 1 to 6 alphanumeric characters.
`type <KEY>`	Specifies the vendor OUI subtype key.
`value  <VALUE>`	Specifies the vendor OUI subtype value. Range: 1 to 256 alphanumeric characters.

Examples

Adding rules that match the LLDP system description **ArubaSwitch** and system name **Aruba** to the LLDP group named **grp01**:

```
switch(config)# port-access lldp-group grp01
switch(config-lldp-group)# match sys-desc ArubaSwitch
switch(config-lldp-group)# match sysname Aruba
switch(config)# do show running-config

Current configuration:
!
!Version AOS-CX Virtual.10.0X.000
!export-password: default
led locator on
!
!
vlan 1
port-access lldp-group grp01
     seq 10 match sys-desc ArubaSwitch
     seq 20 match sysname Aruba
```

Removing a rule that matches the sequence number **25** from an LLDP group named **grp01**:

```
switch(config)# port-access lldp-group grp01
switch(config-lldp-group)# no match seq 25
```

Adding a rule that matches the value of vendor-OUI **000b86** with type of **1** to the LLDP group named **grp01**:

```
switch(config)# port-access lldp-group grp01
switch(config-lldp-group)# match vendor-oui 000b86 type 1
```

Adding a rule that matches the value of vendor-OUI **000c34** to the LLDP group named **grp01**:

```
switch(config)# port-access lldp-group grp01
switch(config-lldp-group)# match vendor-oui 000c34
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command Information

Platforms	Command context	Authority
6300 6400	`config-lldp-group`	Administrators or local user group members with execution rights for this command.

match (for MAC groups)

```
[seq <SEQ-ID>] match {mac <MAC-ADDR> | mac-mask <MAC-MASK> | mac-oui <MAC-OUI>}
no [seq <SEQ-ID>] match {mac <MAC-ADDR> | mac-mask <MAC-MASK> | mac-oui <MAC-OUI>}
```

Description

Defines a rule to match devices for a MAC group based on the criteria of MAC address, MAC address mask, or MAC Organizational Unique Identifier (OUI). Up to 64 match rules can be defined for a group.

You must not configure the following special MAC addresses:

- Null MAC—For example, 00:00:00:00:00:00 or 00:00:00/32
- Multicast MAC
- Broadcast MAC—For example, ff:ff:ff:ff:ff:ff
- System MAC

Although the switch accepts these addresses, it will not process these addresses for the local MAC match feature.

The **no** form of this command removes a rule for adding devices to a MAC group.

The number of clients that can onboard based on the match criteria is configured in the **aaa authentication port-access client-limit** command. For information about this command, see the *Security Guide* for your switch.

Parameter	Description
`seq <SEQ-ID>`	Specifies the entry sequence ID of the rule to create or modify a MAC group. If no ID is specified when adding a rule, an ID is automatically assigned in increments of 10 in the order in which

Parameter	Description
	rules are added. When more than one rule matches the command entered, the rule with the lowest ID takes precedence. Range: **1** to **4294967295**.
`mac <MAC-ADDR>`	Specifies the MAC address of the device.
`mac-mask <MAC-MASK>`	Specifies the MAC address mask to add devices in that range. Supported MAC address masks: **/32** and **/40**.
`mac-oui <MAC-OUI>`	Specifies the MAC OUI to add devices in that range. Supports MAC OUI address of maximum length of 24 bits.

Examples

Adding a device to the MAC group **grp01** based on complete MAC address:

```
switch(config)# mac-group grp01
switch(config-mac-group)# match mac 1a:2b:3c:4d:5e:6f
switch(config-mac-group)# exit
```

Adding devices to the MAC group **grp02** based on MAC mask:

```
switch(config)# mac-group grp01
switch(config-mac-group)# match mac-mask 1a:2b:3c:4d:5e/40
switch(config-mac-group)# match mac-mask 18:e3:ab:73/32
switch(config-mac-group)# exit
```

Adding devices to the MAC group **grp03** based on MAC OUI:

```
switch(config)# mac-group grp03
switch(config-mac-group)# match mac-oui 81:cd:93
switch(config-mac-group)# exit
```

Adding devices to the MAC group **grp01** with MAC entry sequence number and based on MAC address:

```
switch(config)# mac-group grp01
switch(config-mac-group)# seq 10 match mac b2:c3:44:12:78:11
switch(config-mac-group)# exit
switch(config)# do show running-config
Current configuration:
!
!Version AOS-CX Virtual.10.0X.0001
!export-password: default
led locator on
!
!
vlan 1
interface mgmt
    no shutdown
    ip dhcp
mac-group grp01
    seq 10 match mac b2:c3:44:12:78:11
```

~~~
```
~~~

Removing devices from the MAC group **grp01** based on sequence number:

~~~
switch(config)# mac-group grp01
switch(config-mac-group)# no match seq 10
switch(config-mac-group)# exit
switch(config)# do show running-config
Current configuration:
!
!Version AOS-CX Virtual.10.0X.0001
!export-password: default
led locator on
!
!
vlan 1
interface mgmt
    no shutdown
    ip dhcp
mac-group grp01

```
~~~

Adding devices to the MAC group **grp01** with MAC entry sequence number and based on MAC address, MAC address mask, and MAC OUI:

~~~
switch(config)# mac-group grp01
switch(config-mac-group)# seq 10 match mac b2:c3:44:12:78:11
switch(config-mac-group)# seq 20 match mac-oui 1a:2b:3c
switch(config-mac-group)# seq 30 match mac-mask 71:14:89:f3/32
switch(config-mac-group)# exit
switch(config)# do show running-config
Current configuration:
!
!Version AOS-CX Virtual.10.0X.0001
!export-password: default
led locator on
!
!
vlan 1
interface mgmt
    no shutdown
    ip dhcp
mac-group grp01
     seq 10 match mac b2:c3:44:12:78:11
     seq 20 match mac-oui 1a:2b:3c
     seq 30 match mac-mask 71:14:89:f3/32

```
~~~

Removing devices from the MAC group **grp01** based on MAC OUI:

```
switch(config)# mac-group grp01
switch(config-mac-group)# no seq 20 match mac-oui 1a:2b:3c
switch(config-mac-group)# exit
switch(config)# do show running-config
Current configuration:
```

~~~
!
!Version AOS-CX Virtual.10.0X.0001
!export-password: default
led locator on
!
!
vlan 1
interface mgmt
    no shutdown
    ip dhcp
mac-group grp01
     seq 10 match mac b2:c3:44:12:78:11
     seq 30 match mac-mask 71:14:89:f3/32

```
~~~

Adding devices to the MAC group **grp03** with MAC entry sequence number and based on MAC address mask:

~~~
switch(config)# mac-group grp03
switch(config-mac-group)# seq 10 match mac-mask 10:14:a3:b7:55/40
switch(config-mac-group)# exit
switch(config)# do show running-config
Current configuration:
!
!Version AOS-CX Virtual.10.0X.0001
!export-password: default
led locator on
!
!
vlan 1
interface mgmt
    no shutdown
    ip dhcp
mac-group grp03
     seq 10 match mac-mask 10:14:a3:b7:55/40

```
~~~

Removing devices from the MAC group **grp03** based on MAC address mask:

```
switch(config)# mac-group grp03
switch(config-mac-group)# no seq 10 match mac-mask 10:14:a3:b7:55/40
switch(config-mac-group)# exit
switch(config)# do show running-config
Current configuration:
!
!Version AOS-CX Virtual.10.0X.0001
!export-password: default
led locator on
!
!
vlan 1
interface mgmt
    no shutdown
    ip dhcp
mac-group grp03
```

~~~
```
~~~

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-mac-group`	Administrators or local user group members with execution rights for this command.

port-access cdp-group

```
port-access cdp-group <CDP-GROUP-NAME>
no port-access cdp-group <CDP-GROUP-NAME>
```

Description

Creates a CDP (Cisco Discovery Protocol) group or modifies an existing CDP group. A CDP Group is used to classify connected devices based on the CDP packet details advertised by the device. A maximum of 32 CDP groups can be configured on the switch. Each group accepts 64 match/ignore commands.

The **no** form of this command removes a CDP group.

Parameter	Description
<CDP-GROUP-NAME>	Specifies the name of the CDP group to create or modify. The maximum number of characters supported is 32. Required.

Examples

Creating a CDP group named grp01:

```
switch(config)# port-access cdp-group grp01
switch(config-cdp-group)# match platform CISCO
switch(config-cdp-group)# match sw-version 11.2(12)P
switch(config-cdp-group)# match voice-vlan-query 512
switch(config-cdp-group)# seq 50 match platform cisco sw-version 11.2(12)P voice-
vlan-query 512
switch(config-cdp-group)# exit
switch(config)# do show running-config

Current configuration:
!
```

```
!Version AOS-CX Virtual.10.0X.000
!export-password: default
led locator on
!
!
vlan 1
port-access cdp-group grp01
     seq 10 match platform CISCO
     seq 20 match sw-version 11.2(12)P
     seq 30 match voice-vlan-query 512
     seq 50 match platform cisco sw-version 11.2(12)P voice-vlan-query 512
```

Removing a CDP group named grp01:

```
switch(config)# no port-access cdp-group grp01
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

port-access device-profile

```
port-access device-profile <DEVICE-PROFILE-NAME>
no port-access device-profile <DEVICE-PROFILE-NAME>
```

Description

Creates a new device profile and switches to the **config-device-profile** context. A maximum of 32 device profiles can be created. This command can be issued from the interface (**config-if**) or Link Aggregation Group (**config-lag-if**) contexts.

The **no** form of this command removes a device profile.

Parameter	Description
<DEVICE-PROFILE-NAME>	Specifies the name of a device profile. Range: 1 to 32 alphanumeric characters.

Examples

Creating a device profile named **profile01**:

```
switch(config)# port-access device-profile profile01
switch(config-device-profile)#
```

Removing a device profile named **profile01**:

```
switch(config)# no port-access device-profile profile01
```

Creating a device profile named **profile02** on a LAG port:

```
switch(config)#interface lag 1
switch(config-lag-if)# port-access device-profile profile01
switch(config-device-profile)#
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

port-access device-profile mode block-until-profile-applied

You must configure this mode in device profile only on standalone ports where there is no security configured and when you not want the port to be offline until one client is onboarded.

```
port-access device-profile mode block-until-profile-applied
no port-access device-profile mode block-until-profile-applied
```

Description

Configures the switch to block the port until a profile match occurs for a device. This configuration is required when no security feature is enabled on the port.

You must enable this mode or security on the port for local MAC match feature to operate. You must not enable both features on the same port at the same time.

You must not combine any other AAA configurations with the block-until-profile-applied mode.

This command can be issued from the interface (**config-if**) or Link Aggregation Group (**config-lag-if**) contexts. The **no** form of this command removes a rule for adding devices to a MAC group.

Example

On the 6400 Switch Series, interface identification differs.

Configuring block-until-profile applied mode on port 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# port-access device-profile
switch(config-if-deviceprofile)# mode block-until-profile-applied
switch(config-if-deviceprofile)# end
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

port-access lldp-group

```
port-access lldp-group <LLDP-GROUP-NAME>
no port-access lldp-group <LLDP-GROUP-NAME>
```

Description

Creates an LLDP group or modifies an existing LLDP group. An LLDP group is used to classify connected devices based on the LLDP type-length-values (TLVs) advertised by the device. A maximum of 32 LLDP groups can be configured on the switch. Each group accepts 64 match/ignore commands.

The **no** form of this command removes an LLDP group.

Parameter	Description
<LLDP-GROUP-NAME>	Specifies the name of the LLDP group to create or modify. The maximum number of characters supported is 32. Required.

Examples

Creating an LLDP group named grp01:

```
switch(config)# port-access lldp-group grp01
switch(config-lldp-group)#
```

Removing an LLDP group named grp01:

```
switch(config)# no port-access lldp-group grp01
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

show port-access device-profile

```
show port-access device-profile [[interface {all | <INTERFACE-ID>}
     [client-status <MAC-ADDR>]] | name <DEVICE-PROFILE-NAME>]
```

Description

Shows the client status for a specific MAC address or profile name.

Parameter	Description
interface {all | *<INTERFACE-ID>*}	Select **all** for all interfaces or specify the name of an interface in the format: **member/slot/port**.
client-status *<MAC-ADDR>*	Specifies a MAC address (**xx:xx:xx:xx:xx:xx**), where **x** is a hexadecimal number from 0 to F.
name *<DEVICE-PROFILE-NAME>*	Specifies the name of the device profile.

Examples

On the 6400 Switch Series, interface identification differs.

Showing the applied state of the device profiles:

```
switch# show port-access device-profile

    Profile Name    : accesspoints
    LLDP Groups     : 2920-grp
    CDP Groups      :
    MAC Groups      : 2920-mac-grp1,2920-iot-grp2
    Role            : local_role_1
    State           : Enabled

Chapter 28

DHCP client commands

ip dhcp

```
ip dhcp
no ip dhcp
```

Description

Enables the DHCP client on the management interface or any interface VLAN to automatically obtain an IP address from a DHCP server on the network. By default, the DHCP client is enabled on the management interface and VLAN 1.

The **no** form of the command disables DHCP mode and is supported only on interface VLANs; it is not supported on the management interface.

Examples

Enabling the DHCP client on the management interface:

```
switch(config)# interface mgmt
switch(config-if-mgmt)# ip dhcp
switch(config-if-mgmt)# no shutdown
```

Enabling the DHCP client on the interface vlan 1:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# ip dhcp
switch(config-if-vlan)# no shutdown
```

Disabling the DHCP client on the interface vlan 1:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# no ip dhcp
```

Enabling the DHCP client on the interface vlan 4 under non-default VRF:

```
switch(config)# interface vlan 4
switch(config-if-vlan)# vrf attach red
switch(config-if-vlan)# ip dhcp
```

If the interface is not enabled, you can enable it by entering the `no shutdown` command.

`ip dhcp` is supported only on one vlan at a time.

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config-if-mgmt` `config-if-vlan`	Administrators or local user group members with execution rights for this command.

ip dhcp option

```
ip dhcp option [host-name | broadcast-flag]
no ip dhcp option[host-name | broadcast-flag]
```

Description

This command enables the DHCP client host name and broadcast flag globally.

If the **ip dhcp option broadcast-flag** command is enabled, then the DHCP offer and ack packets in the DHCP requests will be treated as broadcast packets. These packets will not be forwarded due to the presence of a default static route.

The **no** form of this command globally disables the host name and DHCP client broadcast flag options.

The **ip dhcp option broadcast-flag** command should be configured before configuring the **ip dhcp** command.

Example

Enabling the DHCP client broadcast flag globally:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# ip dhcp option broadcast-flag
```

Enabling the DHCP client host name globally:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# ip dhcp option host-name
```

Disabling the DHCP client broadcast flag globally:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# no ip dhcp option broadcast-flag
```

Disabling the DHCP client host name globally:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# no ip dhcp option host-name
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Chapter 29
DHCPv4 relay commands

dhcp-relay

```
dhcp-relay
no dhcp-relay
```

Description

Enables DHCP relay support. DHCP relay is enabled by default. DHCP relay is not supported on the management interface.

The **no** form of this command disables DHCP relay (and DHCP relay option 82) support.

Examples

This example enables DHCP relay support.

```
switch(config)# dhcp-relay
```

This example removes DHCP relay support.

```
switch(config)# no dhcp-relay
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

dhcp-relay hop-count-increment

```
dhcp-relay hop-count-increment
no dhcp-relay hop-count-increment
```

Description

Enables the DHCP relay hop count increment feature, which causes the DHCP relay agent to increment the hop count in all relayed DHCP packets. Hop count is enabled by default.

The **no** form of this command disables the hop count increment feature.

Examples

Enabling the hop count increment feature.

```
switch(config)# dhcp-relay hop-count-increment
```

Disabling the hop count increment feature.

```
switch(config)# no dhcp-relay hop-count-increment
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

dhcp-relay l2vpn-clients

```
dhcp-relay l2vpn-clients
no dhcp-relay l2vpn-clients
```

Description

Enables forwarding of packets from L2 VPN clients. Forwarding is enabled by default. Best practices is to disable this configuration on all the VXLAN tunnel endpoints (VTEPs), to avoid forwarding duplicate DHCP requests to the server.

The **no** form of this command disables forwarding of packets from L2 VPN clients.

Usage

In Asymmetric/Symmetric Integrated Routing and Bridging (IRB) VXLAN deployments with a VLAN extension in subset of VTEPs , client DHCP broadcast requests are received by all the VTEPS where a client VLAN is configured. A DHCP-Relay agent on those VTEPs forward DHCP packets to configured DHCP server(s). As DHCP requests are forwarded by multiple DHCP relay agents, the DHCP server receives duplicate copies of the same packet. When this configuration is disabled, the DHCP relay agent on VTEPs ignores DHCP request packets that are received from client MACs addresses learned via EVPN.

Example

Enabling forwarding of packets from L2 VPN clients.

```
switch(config)# dhcp-relay l2vpn-clients
switch(config)# no dhcp-relay l2vpn-clients
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

dhcp-relay option 82

```
dhcp-relay option 82 {replace [validate] | drop [validate] |
               keep | source-interface | validate [replace | drop]} [ip | mac]
no dhcp-relay option 82 {replace [validate] | drop [validate] |
               keep | source-interface | validate [replace | drop]} [ip | mac]
```

Description

Configures the behavior of DHCP relay option 82. A DHCP relay agent can receive a message from another DHCP relay agent having option 82. The relay information from the previous relay agent is replaced by default.

The **no** form of this command disables the DHCP relay option 82 configurations. Option 82 is disabled when DHCP relay is disabled globally. When DHCP relay is re-enabled, option 82 also needs to be re-enabled using the **dhcp-relay option 82** command.

DHCP Relay is supported over VXLAN with both IPv4 and IPv6 underlay.

Parameter	Description
`replace`	Replace the existing option 82 field in an inbound client DHCP packet with the information from the switch. The remote ID and circuit ID information from the first relay agent is lost. Default.
`validate`	Validate option 82 information in DHCP server responses and drop invalid responses.
`drop`	Drop any inbound client DHCP packet that contains option 82

Parameter	Description
	information.
`keep`	Keep the existing option 82 field in an inbound client DHCP packet. The remote ID and circuit ID information from the first relay agent is preserved.
`source-interface`	Configures the DHCP relay to use a configured source IP address for inter-VRF server reachability. Set the source IP address with the command `ip source-interface`.
`ip`	Use the IP address of the interface on which the client DHCP packet entered the switch as the option 82 remote ID.
`mac`	Use the MAC address of the switch as the option 82 remote ID. Default.

Example

This example enables DHCP option 82 support and replaces all option 82 information with the values from the switch, with the switch MAC address as the remote ID.

```
switch(config)# dhcp-relay option 82 replace mac
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

6300 6400	`config`	Administrators or local user group members with execution rights for this command.

dhcp-smart-relay

```
dhcp-smart-relay
no dhcp-smart-relay
```

Description

Enables DHCP Smart Relay on the device and on all the interfaces where IP helper addresses are configured. Disabled by default at the device level. Not supported on the management interface.

The **no** form of this command disables DHCP Smart Relay.

Prior to enabling DHCP Smart Relay, enable IP helper address configuration and configure secondary IP addresses on the interface.

Examples

Enabling DHCP Smart Relay:

```
switch(config)# dhcp-smart-relay
```

Disabling DHCP Smart Relay support:

```
switch(config)# no dhcp-smart-relay
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

ip bootp-gateway

```
ip bootp-gateway <IPV4-ADDR>
no ip bootp-gateway <IPV4-ADDR>
```

Description

Configures a gateway address for the DHCP relay agent to use for DHCP requests. By default DHCP relay agent picks the lowest-numbered IP address on the interface.

The **no** form of this command removes the gateway address.

Parameter	Description
<IPV4-ADDR>	Specifies the IP address of the gateway in IPv4 format (**x.x.x.x**), where **x** is a is a decimal number from 0 to 255.

Examples

On the 6400 Switch Series, interface identification differs.

Setting the IP address of the gateway for interface 1/1/1 to 10.10.10.10:

```
switch(config)# interface 1/1/1
switch(config-if)# ip bootp-gateway 10.10.10.10
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

ip helper-address

```
ip helper-address <IPV4-ADDR> [vrf <VRF-NAME>]
no ip helper-address <IPV4-ADDR> [vrf <VRF-NAME>]
```

Description

Defines the address of a remote DHCP server or DHCP relay agent. Up to eight addresses can be defined. The DHCP relay agent forwards DHCP client requests to all defined servers.

If IP helper adddress is defined with VRF argument then this command requires you define a source IP address for DHCP relay with the command `ip source-interface`. The configured source IP on the VRF is used to forward DHCP packets to the server.

A helper address cannot be defined on the OOBM interface.

The **no** form of this command removes an IP helper address.

Parameter	Description
`helper-address <IPV4-ADDR>`	Specifies the helper IP address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Default: `default`.

Examples

On the 6400 Switch Series, interface identification differs.

Defining the IP helper address 10.10.10.209 on interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# ip helper-address 10.10.10.209
```

Removing the IP helper address 10.10.10.209 on interface 1/1/1:

```
switch(config-if)# no ip helper-address 10.10.10.209
```

Defining the IP helper address 10.10.10.209 on interface 1/1/2 on VRF myvrf:

```
switch(config)# interface 1/1/2
switch(config-if)# ip helper-address 10.10.10.209 vrf myvrf
```

Removing the IP helper address **10.10.10.209** on interface **1/1/2** on VRF `myvrf`:

```
switch(config-if)# no ip helper-address 10.10.10.209 vrf myvrf
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

show dhcp-relay

`show dhcp-relay [vsx-peer]`

Description

Shows DHCP relay configuration settings.

Parameter	Description
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing DHCP relay settings:

```
switch# show dhcp-relay

 DHCP Relay Agent                  : enabled
 DHCP Request Hop Count Increment : enabled
 L2VPN Clients                     : disabled
 Option 82                         : disabled
 Source-Interface                  : disabled
```

```
Response Validation              : disabled
Option 82 Handle Policy          : replace
Remote ID                        : mac

DHCP Relay Statistics:

 Valid Requests Dropped Requests Valid Responses Dropped Responses
 -------------- ---------------- --------------- -----------------
 60             10               60              10

DHCP Relay Option 82 Statistics:

 Valid Requests Dropped Requests Valid Responses Dropped Responses
 -------------- ---------------- --------------- -----------------
 50             8                50              8
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

show dhcp-relay bootp-gateway

`show dhcp-relay bootp-gateway [interface <INTERFACE-NAME>] [vsx-peer]`

Description

Shows the bootp gateway defined for all interfaces or a specific interface.

Parameter	Description
<INTERFACE-NAME>	Specifies an interface. Format: `member/slot/port`.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

Showing the designated bootp gateway for all interfaces:

```
switch# show dhcp-relay bootp-gateway

 BOOTP Gateway Entries

 Interface             Source IP
 -------------------- ---------------
 1/1/1                 1.1.1.1
 1/1/2                 1.1.1.2
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

show ip helper-address

`show ip helper-address [interface <INTERFACE-ID>] [vsx-peer]`

Description

Shows the IP helper addresses defined for all interfaces or a specific interface.

Parameter	Description
`interface <INTERFACE-ID>`	Specifies an interface. Format: `member/slot/port`.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

Showing the IP helper addresses for all interfaces:

```
switch# show ip helper-address
 IP Helper Addresses

 Interface: 1/1/1
```

```
  IP Helper Address     VRF
  -----------------     -----------------
  192.168.20.1          default
  192.168.10.1          default

 Interface: 1/1/2
  IP Helper Address     VRF
  -----------------     -----------------
  192.168.30.1          RED
```

Showing the IP helper addresses for interface 1/1/1:

```
switch# show ip helper-address interface 1/1/1
 IP Helper Addresses

 Interface: 1/1/1
  IP Helper Address     VRF
  -----------------     -----------------
  192.168.20.1          default
  192.168.10.1          default
```

Chapter 30

DHCP relay (IPv6) commands

dhcpv6-relay

```
dhcpv6-relay [l2vpn-clients|source-interface]
no dhcpv6-relay [l2vpn-clients|source-interface]
```

Description

Enables DHCPv6 relay support. DHCPv6 relay is disabled by default. DHCP relay is not supported on the management interface. Best practices is to disable this configuration on all the VXLAN tunnel endpoints (VTEPs), to avoid forwarding duplicate DHCPv6 requests to the server.

The **no** form of this command disables DHCP relay support.

DHCPv6 Relay requires that you configure the egress interface using the **ipv6 helper-address** command. The egress interface of a VTEP is used as an underlay, so a DHCPv6 Relay Multicast ipv6 address is not supported in a VXLAN topology.

Parameter	Description
`l2vpn-clients`	Enables packets from l2vpn clients to be forwarded to configured servers. Enabled by default.
`source-interface`	Enables DHCPv6 relay to use the configured source interface.

Usage

In Asymmetric/Symmetric Integrated Routing and Bridging (IRB) VXLAN deployments with a VLAN extension in subset of VTEPs , client DHCPv6 broadcast requests are received by all the VTEPS where a client VLAN is configured. A DHCPv6 relay agent on those VTEPs forward DHCPv6 packets to configured DHCPv6 server(s). As DHCPv6 requests are forwarded by multiple DHCPv6 relay agents, the DHCPv6 server receives duplicate copies of the same packet. When this configuration is disabled, the DHCPv6 relay agent on VTEPs ignores DHCPv6 request packets that are received from client MACs addresses learned via EVPN.

Examples

Enables DHCPv6 relay support.

```
switch(config)# dhcpv6-relay
```

Removes DHCPv6 relay support.

```
switch(config)# no dhcpv6-relay
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.12.1000	**l2vpn-clients** and **source-interface** added.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

dhcpv6-relay option 79

```
dhcpv6-relay option 79
no dhcpv6-relay option 79
```

Description

Enables support for DHCP relay option 79. When enabled, the DHCPv6 relay agent forwards the link-layer address of the client. This option is disabled by default.

The **no** form of this command disables support for DHCP relay option 79.

Examples

Enables DHCP option 79 support.

```
switch(config)# dhcpv6-relay option 79
```

Disables DHCP option 79 support.

```
switch(config)# no dhcpv6-relay option 79
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

6300 6400	`config`	Administrators or local user group members with execution rights for this command.

ipv6 helper-address

```
ipv6 helper-address unicast <UNICAST-IPV6-ADDR>
no ipv6 helper-address unicast <UNICAST-IPV6-ADDR>
ipv6 helper-address multicast {all-dhcp-servers | <MULTICAST-IPV6-ADDR>} egress <PORT-NUM>
no ipv6 helper-address multicast {all-dhcp-servers | <MULTICAST-IPV6-ADDR>} egress <PORT-NUM>
```

Description

Defines the address of a remote DHCPv6 server or DHCPv6 relay agent. Up to eight addresses can be defined. The DHCPv6 agent forwards DHCPv6 client requests to all defined servers.

Not supported on the OOBM interface.

The **no** form of this command removes an IP helper address.

Parameter	Description
<UNICAST-IPV6-ADDR>	Specifies the unicast helper IP address in IPv6 format (xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx), where **x** is a hexadecimal number from 0 to F.
<MULTICAST-IPV6-ADDR>	Specifies the multicast helper IP address in IPv6 format (xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx), where **x** is a hexadecimal number from 0 to F.
all-dhcp-servers	Specifies all the DHCP server IPv6 addresses for the interface.
egress *<PORT-NUM>*	Specifies the port number on which DHCPv6 service requests are relayed to a multicast destination. The egress port must be different than the one on which the multicast helper address is configured. Format: member/slot/port.
vrf *<VRF-NAME>*	Specifies the name of the VRF from which the specified protocol sets its source IP address.

Examples

On the 6400 Switch Series, interface identification differs.

Defining a multicast IPv6 helper address of **2001:DB8::1** on port **1/1/2**:

```
switch(config-if)# ipv6 helper-address multicast 2001:DB8:0:0:0:0:0:1 egress 1/1/2
```

Removing the IP helper address of **2001:DB8::1** on port **1/1/2**:

```
switch(config-if)# no ipv6 helper-address multicast 2001:DB8:0:0:0:0:0:1 egress
1/1/2
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

show dhcpv6-relay

`show dhcpv6-relay [vsx-peer]`

Description

Shows DHCP relay configuration settings.

Parameter	Description
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

```
switch# show dhcpv6-relay
  DHCPv6 Relay Agent : enabled
  Option 79          : disabled
  L2vpn-clients      : enabled
  Source-interface   : enabled
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

show ipv6 helper-address

```
show ipv6 helper-address [interface <INTERFACE-ID>] [vsx-peer]
```

Description

Shows the helper IP addresses defined for all interfaces or a specific interface.

Parameter	Description
`interface <INTERFACE-ID>`	Specifies an interface. Format: **member/slot/port**.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

```
switch# show ipv6 helper-address

 Interface: 1/1/1
 IPv6 Helper Address                             Egress Port
 ---------------------------------------------- -----------
 2001:db8:0:1::                                  -
 FF01::1:1000                                    1/1/2

 Interface: 1/1/2
 IPv6 Helper Address                             Egress Port
 --------------------------------------------   -----------
 2001:db8:0:1::                                  -

switch# show ipv6 helper-address interface 1/1/1

 Interface: 1/1/1
 IPv6 Helper Address                             Egress Port
 ---------------------------------------------- -----------
 2001:db8:0:1::                                  -

Chapter 31
DHCP server IPv4 commands

authoritative

```
authoritative
no authoritative
```

Description

Configures the DHCPv4 server as *authoritative* on the current VRF. This means that the server is the sole authority for the network on the VRF. Therefore, if a client requests an IP address lease for which the server has no record, the server responds with DHCPNAK, indicating that the client must no longer use that IP address. If the server is not authoritative, then it will ignore DHCPv4 requests received for unknown leases from unknown hosts.

The **no** form of this command disables authoritative mode on the current VRF.

Example

Configures DHCPv4 server authoritative mode on VRF **primary**.

```
switch(config)# dhcp-server vrf primary
switch(config-dhcp-server)# authoritative
```

Removes the DHCPv4 server authoritative mode on VRF **primary**.

```
switch(config)# dhcp-server vrf primary
switch(config-dhcp-server)# no authoritative
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-dhcp-server`	Administrators or local user group members with execution rights for this command.

bootp

```
bootp <REMOTE-URL>
no bootp <REMOTE-URL>
```

Description

Sets the BOOTP options that are returned by the DHCPv4 server for the current pool. BOOTP provides a way to distribute an IP address and boot image file to client stations. The DHCPv4 server returns the IP address and the location of the boot image file, which must be stored on an external TFTP server.

The **no** form of this command disables support for BOOTP.

Parameter	Description
<REMOTE-URL>	Specifies the name and location of a BOOTP file on a TFTP server in the format: `tftp://{<IP> | <HOST>}/<FILE>` ▪ *<IP>*: Specifies the IP address of the TFTP server hosting the file in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. You can remove leading zeros. For example, the address `192.169.005.100` becomes `192.168.5.100`. ▪ *<HOST>*: Specifies the fully-qualified domain name of the TFTP server hosting the file. Range: 1 to 64 printable ASCII characters. ▪ *<FILE>*: Specifies the name of the BOOTP file. Range: 1 to 64 printable ASCII characters.

Example

Defines BOOTP support on the DHCPv4 server pool **primary-pool** on VRF **primary**.

```
switch(config)# dhcp-server vrf primary
switch(config-dhcp-server)# pool primary-pool
switch(config-dhcp-server-pool)# bootp tftp://10.0.0.1/mybootfile
```

Deletes BOOTP support on the DHCPv4 server pool **primary-pool** on VRF **primary**.

```
switch(config)# dhcp-server vrf primary
switch(config-dhcp-server)# pool primary-pool
switch(config-dhcp-server-pool)# no bootp tftp://10.0.0.1/mybootfile
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

6300 6400	`config-dhcp-server-pool`	Administrators or local user group members with execution rights for this command.

clear dhcp-server leases

`clear dhcp-server leases [all-vrfs | <IPV4-ADDR> vrf <VRF-NAME>] | vrf <VRF-NAME>]`

Description

Clears DHCPv4 server lease information. The DHCPv4 server must be disabled before clearing lease information.

Parameter	Description
`all-vrfs`	Clears leases for all VRFs.
`<IPV4-ADDR> vrf <VRF-NAME>`	Clears the lease for a specific client on a specific VRF. Specify the client address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. You can remove leading zeros. For example, the address `192.169.005.100` becomes `192.168.5.100`.
`vrf <VRF-NAME>`	Clears leases for a specific VRF.

Examples

Clearing all DHCPv4 server leases.

```
switch(config)# dhcp-server vrf primary
switch(config-dhcp-server)# disable
switch(config-dhcp-server)# exit
switch(config)# exit
switch# clear dhcp-server leases
```

Clearing all DHCPv4 server leases for VRF **primary-vrf**.

```
switch(config)# dhcp-server vrf primary
switch(config-dhcp-server)# disable
switch(config-dhcp-server)# exit
switch(config)# exit
switch# clear dhcp-server leases vrf primary-vrf
```

Clear the DHCPv4 server lease for IP address **10.10.10.1** on VRF **primary-vrf**.

```
switch(config)# dhcp-server vrf primary
switch(config-dhcp-server)# disable
switch(config-dhcp-server)# exit
switch(config)# exit
switch# clear dhcp-server leases 10.10.10.1 vrf primary-vrf
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

default-router

```
default-router <IPV4-ADDR-LIST>
no default-router <IPV4-ADDR-LIST>
```

Description

Defines up to four default routers for the current DHCPv4 server pool.

The **no** form of this command removes the specified default routers from the pool.

Parameter	Description
<IPV4-ADDR-LIST>	Specifies the IP addresses of the default routers in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. You can remove leading zeros. For example, the address `192.169.005.100` becomes `192.168.5.100`. Separate addresses with a space. A maximum of four IP addresses can be defined.

Example

Defines two default routers, **10.0.0.1** and **10.0.0.10**, for the server pool **primary-pool** on VRF **primary**.

```
switch(config)# dhcp-server vrf primary
switch(config-dhcp-server)# pool primary-pool
switch(config-dhcp-server-pool)# default-router ip 10.0.0.1 10.0.0.10
```

Deletes the default router **10.0.0.1** from the server pool **primary-pool** on VRF **primary**.

```
switch(config)# dhcp-server vrf primary
switch(config-dhcp-server)# pool primary-pool
switch(config-dhcp-server-pool)# no default-router ip 10.0.0.1
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

dhcp-server external-storage

```
dhcp-server external-storage <VOLUME-NAME> file <LEASE-FILENAME> [delay <DELAY>]
no dhcp-server external-storage <VOLUME-NAME> file <LEASE-FILENAME> [delay <DELAY>]
```

Description

Configures the external storage file location for DHCPv4 server lease information. This file provides persistent storage, enabling DHCPv4 server settings to be restored when the switch is restarted. Lease information is stored in a flat file on the configured external device.

If external storage is not configured, then after a failure or reboot, all existing lease information is lost.

Lease information is saved to external storage each time the delay timer expires, which by default is every 300 seconds.

Lease information is not restored when issuing the command `dhcp-server enable`.

The **no** form of this command removes external storage support for the DHCPv4 server.

Parameter	Description
<VOLUME-NAME>	Specifies the external storage volume name. Range: 1 to 64 printable ASCII characters.
`file` *<LEASE-FILENAME>*	Specifies the external storage filename. Range: 1 to 255 printable ASCII characters.
`delay` *<DELAY>*	Specifies the interval in seconds between updates to the external storage file. Range: 15 to 86400. Default: 300.

Example

Stores the lease file on external storage volume **Storage1** in file **LeaseFile** at an interval of 600 seconds.

```
switch(config)# dhcp-server external-storage Storage1 file LeaseFile delay 600
```

Disables storage of the lease file on external storage volume **Storage1** in file **LeaseFile**.

```
switch(config)# no dhcp-server external-storage Storage1 file LeaseFile delay 600
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

dhcp-server vrf

```
dhcp-server vrf <VRF-NAME>
no dhcp-server vrf <VRF-NAME>
```

Description

Configures the DHCPv4 server to support a VRF and changes to the `config-dhcp-server` context for that VRF.

The **no** form of this command removes DHCPv4 server support on a VRF.

Parameter	Description
<VRF-NAME>	Name of a VRF.

Example

Configures DHCPv4 server support on VRF **primary**.

```
switch(config)# dhcp-server vrf primary
```

Removes DHCPv4 server support on VRF **primary**.

```
switch(config)# no dhcp-server vrf primary
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

disable

`disable`

Description

Disables the DHCPv4 server on the current VRF. The DHCPv4 server is disabled by default when configured on a VRF.

Example

Disables the DHCPv4 server on VRF **primary**.

```
switch(config)# dhcp-server vrf primary
switch(config-dhcp-server)# disable
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

dns-server

```
dns-server <IPV4-ADDR-LIST>
no dns-server <IPV4-ADDR-LIST>
```

Description

Defines up to four DNS servers for the current DHCPv4 server pool.

The **no** form of this command removes the specified DNS servers from the pool.

Parameter	Description
<IPV4-ADDR-LIST>	Specifies the IP addresses of the DNS servers in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.Separate addresses with a space.

Example

Defines DNS servers for the server pool **primary-pool** on VRF **primary**.

```
switch(config)# dhcp-server vrf primary
switch(config-dhcp-server)# pool primary-pool
switch(config-dhcp-server-pool)# dns-server 10.0.20.1
```

Deletes a DNS server from the server pool **primary-pool** on VRF **primary**.

```
switch(config)# dhcp-server vrf primary
switch(config-dhcp-server)# pool primary-pool
switch(config-dhcp-server-pool)# no dns-server 10.0.20.1
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

domain-name

```
domain-name  <DOMAIN-NAME>
no domain-name  <DOMAIN-NAME>
```

Description

Defines a domain name for the current DHCPv4 server pool.

The **no** form of this command removes the specified domain name from the pool.

Parameter	Description
<DOMAIN-NAME>	Specifies a domain name. Range: 1 to 255 printable ASCII characters.

Example

Defines a domain name for the server pool **primary-pool** on VRF **primary**.

```
switch(config)# dhcp-server vrf primary
switch(config-dhcp-server)# pool primary-pool
switch(config-dhcp-server-pool)# domain-name example.org.in
```

Deletes a domain name from the server pool **primary-pool** on VRF **primary**.

```
switch(config)# dhcp-server vrf primary
switch(config-dhcp-server)# pool primary-pool
switch(config-dhcp-server-pool)# no domain-name example.org.in
```

lease

```
lease {<TIME> | infinite}
no lease
```

Description

Sets the length of the DHCPv4 lease time for the current pool. The lease time determines how long an IP address is valid before a DHCPv4 client must request that it be renewed.

The **no** form of this command returns the DHCPv4 lease time to its default value 1 hour.

Parameter	Description
<TIME>	Sets the DHCPv4 lease time. Format: DD:HH:MM. Default: 01:00:00.
`infinite`	Sets the DHCPv4 lease time to infinite. This means that addresses do not need to be renewed.

Example

Sets the lease time for DHCPv4 server pool **primary-pool** on VRF **primary** to **12** hours.

```
switch(config)# dhcp-server vrf primary
switch(config-dhcp-server)# pool primary-pool
switch(config-dhcp-server-pool)# lease 00:12:00
```

Deletes the lease time for DHCPv4 server pool **primary-pool** on VRF **primary**.

```
switch(config)# dhcp-server vrf primary
switch(config-dhcp-server)# pool primary-pool
switch(config-dhcp-server-pool)# no lease 00:12:00
```

netbios-name-server

```
netbios-name-server <IPV4-ADDR-LIST>
no netbios-name-server <IPV4-ADDR-LIST>
```

Description

Defines up to four NetBIOS WINS servers for the current DHCPv4 server pool. WINS is used by Microsoft DHCP clients to match host names with IP addresses.

The **no** form of this command removes the specified WINS servers from the pool.

Parameter	Description
<IPV4-ADDR-LIST>	Specifies the IP addresses of NetBIOS (WINS) servers in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. Separate addresses with a space. A maximum of four IP addresses can be defined.

Example

Defines two WINS servers for the server pool **primary-pool** on VRF **primary**.

```
switch(config)# dhcp-server vrf primary
switch(config-dhcp-server)# pool primary-pool
switch(config-dhcp-server-pool)# netbios-name-server ip 10.0.20.1 10.0.30.10
```

Deletes a WINS server from the server pool **primary-pool** on VRF **primary**.

```
switch(config)# dhcp-server vrf primary
switch(config-dhcp-server)# pool primary-pool
switch(config-dhcp-server-pool)# no netbios-name-server ip 10.0.20.1
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

netbios-node-type

```
netbios-node-type <TYPE>
no netbios-node-type <TYPE>
```

Description

Defines the NetBIOS node type for the current DHCPv4 server pool.

The **no** form of this command removes the NetBIOS node type for the current pool.

Parameter	Description
<TYPE>	Specifies the NetBIOS node type: `broadcast`, `hybrid`, `mixed`, or `peer-to-peer`.

Examples

Defines the NetBIOS node type **broadcast** for the DHCPv4 server pool **primary-pool** on VRF **primary**.

```
switch(config)# dhcp-server vrf primary
switch(config-dhcp-server)# pool primary-pool
switch(config-dhcp-server-pool)# netbios-node-type broadcast
```

Deletes the NetBIOS node type **broadcast** from the DHCPv4 server pool **primary-pool** on VRF **primary**.

```
switch(config)# dhcp-server vrf primary
switch(config-dhcp-server)# pool primary-pool
switch(config-dhcp-server-pool)# no netbios-node-type broadcast
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

option

```
option <OPTION-NUM> {ascii "<ASCII-STR>" | hex <HEX-STR> | ip <IPV4-ADDR-LIST>}
no option <OPTION-NUM> {ascii <ASCII-STR> | hex <HEX-STR> | ip <IPV4-ADDR-LIST>}
```

Description

Defines custom DHCPv4 options for the current DHCPv4 server pool. DHCPv4 options enable the DHCPv4 server to provide additional information about the network when DHCPv4 clients request an address.

The **no** form of this command removes custom DHCPv4 options from the pool.

Parameter	Description
<OPTION-NUM>	Specifies a DHCPv4 option number. For a list of DHCPv4 option numbers, see https://www.iana.org/assignments/bootp-dhcp-parameters/bootp-dhcp-parameters.xhtml. Range: 2 to 254.
ascii *<ASCII-STR>*	Specifies a value for the selected option as an ASCII string. Range: 1 to 255 ASCII characters. **NOTE:** If you specify **18** as the **<OPTION-NUM>** parameter, the ASCII string must be enclosed within quotation marks (").
hex *<HEX-STR>*	Specifies a value for the selected option as a hexadecimal string. Range: 1 to 255 hexadecimal characters.
ip *<IPV4-ADDR-LIST>*	Specifies a list of IP addresses in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. Separate addresses with a space. A maximum of four IP addresses can be defined.

Example

Defines DHCPv4 option **3** for the server pool **primary-pool** on VRF **primary**.

```
switch(config)# dhcp-server vrf primary
switch(config-dhcp-server)# pool primary-pool
switch(config-dhcp-server-pool)# option 3 ip 192.168.1.1
```

Deletes DHCPv4 option **3** for the server pool **primary-pool** on VRF **primary**.

```
switch(config)# dhcp-server vrf primary
switch(config-dhcp-server)# pool primary-pool
switch(config-dhcp-server-pool)# no option 3 ip 192.168.1.1
```

Defines DHCPv4 option 18 for the server pool **mgmt-test** on VRF **mgmt**.

```
switch(config)# dhcp-server vrf mgmt
switch(config-dhcp-server)# pool mgmt-test
switch(config-dhcp-server-pool)# option 18 ascii "aswed"
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

pool

```
pool <POOL-NAME>
no pool <POOL-NAME>
```

Description

Creates a DHCPv4 server pool for the current VRF and switches to the `config-dhcp-server-pool` context for it. Multiple pools, each with a distinct range, can be assigned to a VRF. A maximum of 64 pools (IPv4 and IPv6), 64 address ranges, and 8182 clients are supported on the switch across all VRFs.

The **no** form of this command deletes the specified DHCPv4 server pool.

Parameter	Description
<POOL-NAME>	Specifies the DHCPv4 pool name. A maximum of 64 pools (IPv4 and IPv6) are supported across VRFs on the switch. Range: 1 to 32 printable ASCII characters. First character must be a letter or number.

Example

Creates the DHCPv4 server pool **primary-pool** on VRF **primary**.

```
switch(config)# dhcp-server vrf primary
switch(config-dhcp-server)# pool primary-pool
switch(config-dhcp-server-pool)#
```

Deletes the DHCPv4 server pool **primary-pool** on VRF **primary**.

```
switch(config)# dhcp-server vrf primary
switch(config-dhcp-server)# no pool primary-pool
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

range

```
range <LOW-IPV4-ADDR> <HIGH-IPV4-ADDR> [prefix-len <MASK>]
no range <LOW-IPV4-ADDR> <HIGH-IPV4-ADDR> [prefix-len <MASK>]
```

Description

Defines the range of IP addresses supported by the current DHCPv4 server pool. A maximum of 64 ranges are supported per switch across all VRFs.

The **no** form of this command deletes the address range for the current pool.

Parameter	Description
<LOW-IPV4-ADDR>	Specifies the lowest IP address in the pool in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.
<HIGH-IPV4-ADDR>	Specifies the highest IP address in the pool in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.

`prefix-len` *<MASK>*	Specifies the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 32.
	NOTE: When active gateway is configured on the interface serviced by the pool, you must specify a prefix length that matches the mask on the IP address assigned to the interface. Otherwise, client stations will get a prefix length from active gateway that may not be consistent with the configured range, and a DHCP error will occur. In the following example, the DHCP range prefix is set to 16 to match the mask on the IP address assigned to interface VLAN 2.
	`switch(config)# interface vlan 2`
	`switch(config-if-vlan)# ip address 200.1.1.1/16`
	`switch(config-if-vlan)# active-gateway ip 200.1.1.3 mac 00:aa:aa:aa:aa:aa`
	`switch(config-if-vlan)# exit`
	`switch(config)# dhcp-server vrf primary`
	`switch(config-dhcp-server)# pool primary-pool`
	`switch(config-dhcp-server-pool)# range 192.168.1.1 192.168.1.100 prefix-len 16`

Examples

Defines the address range **192.168.1.1** to **192.168.1.100** with a mask of **24** bits for the DHCPv4 server pool **primary-pool** on VRF **primary**.

```
switch(config)# dhcp-server vrf primary
switch(config-dhcp-server)# pool primary-pool
switch(config-dhcp-server-pool)# 192.168.1.1 192.168.1.100 prefix-len 24
```

Deletes the address range **192.168.1.1** to **192.168.1.100** with a mask of **24** bits from the DHCPv4 server pool **primary-pool** on VRF **primary**.

```
switch(config)# dhcp-server vrf primary
switch(config-dhcp-server)# pool primary-pool
switch(config-dhcp-server-pool)# no 192.168.1.1 192.168.1.100 prefix-len 24
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

show dhcp-server

```
show dhcp-server [all-vrfs]
show dhcp-server leases {all-vrfs | vrf <VRF-NAME>}
show dhcp-server pool <POOL-NAME> [vrf <VRF-NAME>]
```

Description

Shows configuration settings for the DHCPv4 server.

Parameter	Description
`all-vrfs`	Shows DHCPv4 server configuration settings for all VRFs.
`leases {all-vrfs | vrf <VRF-NAME>}`	Shows DHCPv4 server lease provided by the server for all VRFs or a specific VRF.
`pool <POOL-NAME> [vrf <VRF-NAME>]`	Shows DHCPv4 server pool configuration settings for all VRFs or a specific VRF.

Examples

Showing all DHCPv4 server configuration settings.

static-bind

```
static-bind {ip <IPV4-ADDR>}|{ mac <MAC-ADDR>} [hostname <HOST>]
no static-bind <IPV4-ADDR-LIST>
```

Description

Creates a static binding that associates an IP address in the current pool with a specific MAC address. This causes the DHCPv4 server to only assign the specified IP address to a client station with the specified MAC address.

The **no** form of this command removes the specified binding.

Parameter	Description
<IPV4-ADDR>	Specifies an IP address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. The IP address must be within the address range defined for the current pool.
mac *<MAC-ADDR>*	Specifies a client station MAC address (xx:xx:xx:xx:xx:xx), where **x** is a hexadecimal number from 0 to F.
hostname *<HOST>*	Specifies the host name of the client station. Range: 1 to 255 printable ASCII characters

Examples

Defines a static address for the server pool **primary-pool** on VRF **primary**.

```
switch(config)# dhcp-server vrf primary
switch(config-dhcp-server)# pool primary-pool
switch(config-dhcp-server-pool)# static-bind ip 10.0.0.1 mac 24:be:05:24:75:73
```

Deletes a static address from the server pool **primary-pool** on VRF **primary**.

```
switch(config)# dhcp-server vrf primary
switch(config-dhcp-server)# pool primary-pool
switch(config-dhcp-server-pool)# no static-bind ip 10.0.0.1 mac 24:be:05:24:75:73
```

Chapter 32

DHCP server IPv6 commands

authoritative

```
authoritative
no authoritative
```

Description

Configures the DHCPv6 server as *authoritative* on the current VRF. This means that the server is the sole authority for the network on the VRF. It responds to client solicit messages with advertise messages having a priority/preference value set to 255 (the maximum), instead of 0 (the minimum). Clients always choose the DHCPv6 server with the highest priority/preference value. If two DHCPv6 servers send an advertise message with the same priority/preference value, then the client picks one and discards the other.

The **no** form of this command disables authoritative mode on the current VRF.

Example

Configures DHCPv6 server authoritative mode on VRF **primary**.

```
switch(config)# dhcpv6-server vrf primary
switch(config-dhcpv6-server)# authoritative
```

Removes DHCPv6 server authoritative mode on VRF **primary**.

```
switch(config)# dhcpv6-server vrf primary
switch(config-dhcpv6-server)# no authoritative
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

clear dhcpv6-server leases

```
clear dhcpv6-server leases [all-vrfs | <IPV6-ADDR> vrf <VRF-NAME>] | vrf <VRF-NAME>]
```

Description

Clears DHCPv6 server lease information. The DHCPv6 server must be disabled before clearing lease information.

Parameter	Description
`all-vrfs`	Clears leases for all VRFs.
`<IPV6-ADDR> vrf <VRF-NAME>`	Clears the lease for a specific client on a specific VRF. Specify the client address in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F. You can use two colons (::) to represent consecutive zeros (but only once), remove leading zeros, and collapse a hextet of four zeros to a single 0. For example, this address `2222:0000:3333:0000:0000:0000:4444:0055` becomes `2222:0:3333::4444:55`.
`vrf <VRF-NAME>`	Clears leases for a specific VRF.

Examples

Clearing all DHCPv6 server leases.

```
switch(config)# dhcpv6-server vrf primary
switch(config-dhcpv6-server)# disable
switch(config-dhcpv6-server)# exit
switch(config)# exit
switch# clear dhcpv6-server leases
```

Clearing all DHCPv6 server leases for VRF **primary-vrf**.

```
switch(config)# dhcpv6-server vrf primary
switch(config-dhcpv6-server)# disable
switch(config-dhcpv6-server)# exit
switch(config)# exit
switch# clear dhcpv6-server leases vrf primary-vrf
```

Clear the DHCPv6 server lease for IP address **2001::1** on VRF **primary-vrf**.

```
switch(config)# dhcpv6-server vrf primary
switch(config-dhcpv6-server)# disable
switch(config-dhcpv6-server)# exit
switch(config)# exit
switch# clear dhcpv6-server leases 2001::1 vrf primary-vrf
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

dhcpv6-server external-storage

```
dhcpv6-server external-storage <VOLUME-NAME> file <LEASE-FILENAME> [delay <DELAY>]
no dhcpv6-server external-storage <VOLUME-NAME> file <LEASE-FILENAME> [delay <DELAY>]
```

Description

Configures the external storage file location for DHCPv6 server lease information. This file provides persistent storage, enabling DHCPv6 server settings to be restored when the switch is restarted. Lease information is stored in a flat file on the configured external device.

If external storage is not configured, then after a failure or reboot, all existing lease information is lost.

Lease information is saved to external storage each time the delay timer expires, which by default is every 300 seconds.

Lease information is not restored when issuing the command **dhcp-server enable**.

The **no** form of this command removes external storage support for the DHCPv6 server.

Parameter	Description
<VOLUME-NAME>	Specifies the external storage volume name. Range: 1 to 64 printable ASCII characters.
`file` *<LEASE-FILENAME>*	Specifies the external storage filename. Range: 1 to 255 printable ASCII characters.
`delay` *<DELAY>*	Specifies the interval in seconds between updates to the external storage file. Range: 15 to 86400. Default: 300.

Example

Stores the lease file on external storage volume **Storage1** in file **LeaseFile** at an interval of 600 seconds.

```
switch(config)# dhcpv6-server external-storage Storage1 file LeaseFile delay 600
```

Disables storage of the lease file on external storage volume **Storage1** in file **LeaseFile**.

```
switch(config)# no dhcpv6-server external-storage Storage1 file LeaseFile delay
600
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

dhcpv6-server vrf

```
dhcpv6-server vrf VRF-NAME
no dhcpv6-server vrf VRF-NAME
```

Description

Configures the DHCPv6 server to support a VRF and changes to the **config-dhcpv6-server** context for that VRF.

The **no** form of this command removes DHCPv6 server support on a VRF.

Parameter	Description
VRF-NAME	Name of a VRF.

Example

Configures DHCPv6 server support on VRF **primary**.

```
switch(config)# dhcpv6-server vrf primary
```

Removes the DHCPv6 server support on VRF **primary**.

```
switch(config)# no dhcpv6-server vrf primary
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

disable

```
disable
```

Description

Disables the DHCPv6 server on the current VRF. The DHCPv6 server is disabled by default when configured on a VRF.

Example

Disables the DHCPv6 server on VRF **primary**.

```
switch(config)# dhcpv6-server vrf primary
switch(config-dhcpv6-server)# disable
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

dns-server

```
dns-server <IPVv6-ADDR-LIST>
no dns-server <IPVv6-ADDR-LIST>
```

Description

Defines up to four DNS servers for the current DHCPv6 server pool.

The **no** form of this command removes the specified DNS servers from the pool.

Parameter	Description
<IPVv6-ADDR-LIST>	Specifies the IP addresses of the DNS servers in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F. Separate addresses with a space. A maximum of four IP addresses can be defined.

Example

Defines DNS server **2001::13** for the server pool **primary-pool** on VRF **primary**.

```
switch(config)# dhcpv6-server vrf primary
switch(config-dhcpv6-server)# pool primary-pool
switch(config-dhcpv6-server-pool)# dns-server 2001::13
```

Deletes DNS server **2001::13** from the server pool **primary-pool** on VRF **primary**.

```
switch(config)# dhcpv6-server vrf primary
switch(config-dhcpv6-server)# pool primary-pool
switch(config-dhcpv6-server-pool)# no dns-server 2001::13
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

enable

`enable`

Description

Enables the DHCPv6 server on the current VRF. The DHCPv6 server is disabled by default when configured on a VRF.

Example

Enables the DHCPv6 server on VRF **primary**.

```
switch(config)# dhcpv6-server vrf primary
switch(config-dhcpv6-server)# enable
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

6300 6400	`config-dhcpv6-server`	Administrators or local user group members with execution rights for this command.

lease

```
lease {<TIME> | infinite}
no lease
```

Description

Sets the length of the DHCPv6 lease time for the current pool. The lease time determines how long an IP address is valid before a DHCPv6 client must request that it be renewed.

The **no** form of this command returns the DHCPv6 lease time to the default value 1 hour.

Parameter	Description
<TIME>	Sets the DHCPv6 lease time. Format: DD:HH:MM. Default: 01:00:00.
`infinite`	Sets the DHCPv6 lease time to infinite. This means that addresses do not need to be renewed.

Example

Sets the lease time for DHCPv6 server pool **primary-pool** on VRF **primary** to **12** hours.

```
switch(config)# dhcpv6-server vrf primary
switch(config-dhcpv6-server)# pool primary-pool
switch(config-dhcpv6-server-pool)# lease 00:12:00
```

Sets the lease time for DHCP server pool **primary-pool** on VRF **primary** to the default value.

```
switch(config)# dhcpv6-server vrf primary
switch(config-dhcpv6-server)# pool primary-pool
switch(config-dhcpv6-server-pool)# no lease 00:12:00
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

6300 6400	`config-dhcpv6-server-pool`	Administrators or local user group members with execution rights for this command.

option

```
option <OPTION-NUM> {ascii <ASCII-STR> | hex <HEX-STR> | ip <IPV6-ADDR-LIST>}
no option <OPTION-NUM> {ascii <ASCII-STR> | hex <HEX-STR> | ip <IPV6-ADDR-LIST>}
```

Description

Defines custom DHCPv6 options for the current DHCPv6 server pool.

The **no** form of this command removes custom DHCPv6 options from the pool.

Parameter	Description
<OPTION-NUM>	Specifies a DHCPv6 option number. Range: 2 to 254.
ascii *<ASCII-STR>*	Specifies a value for the selected option as an ASCII string. Range: 1 to 255 ASCII characters.
hex *<HEX-STR>*	Specifies a value for the selected option as a hexadecimal string. Range: 1 to 255 hexadecimal characters.
ip *<IPV6-ADDR-LIST>*	Specifies a list of IP addresses for the option in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.

Example

Defines DHCPv6 option **22** for the server pool **primary-pool** on VRF **primary**.

```
switch(config)# dhcpv6-server vrf primary
switch(config-dhcpv6-server)# pool primary-pool
switch(config-dhcpv6-server-pool)# option 22 ipv6 2001::12
```

Deletes DHCPv6 option 22 for the server pool **primary-pool** on VRF **primary**.

```
switch(config)# dhcpv6-server vrf primary
switch(config-dhcpv6-server)# pool primary-pool
switch(config-dhcpv6-server-pool)# no option 22 ipv6 2001::12
```

Defines DHCPv6 option **18** for the server pool **mgmt-test** on VRF **mgmt**.

```
switch(config)# dhcpvv6-server vrf mgmt
switch(config-dhcpv6-server)# pool mgmt-test
switch(config-dhcpv6-server-pool)# option 18 ascii "aswed"
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

pool

```
pool <POOL-NAME>
no pool <POOL-NAME>
```

Description

Creates a DHCPv6 server pool for the current VRF and switches to the `config-dhcpv6-server-pool` context for it. Multiple pools, each with a distinct range, can be assigned to a VRF. A maximum of 64 pools (IPv4 and IPv6), 64 address ranges, and 8182 clients are supported on the switch across all VRFs.

The **no** form of this command deletes the specified DHCPv6 server pool.

Parameter	Description
<POOL-NAME>	Specifies the DHCPv6 pool name. A maximum of 64 pools (IPv4 and IPv6) are supported across VRFs on the switch. Range: 1 to 32 printable ASCII characters. First character must be a letter or number.

Example

Creates the DHCPv6 server pool **primary-pool** on VRF **primary**.

```
switch(config)# dhcpv6-server vrf primary
switch(config-dhcpv6-server)# pool primary-pool
switch(config-dhcpv6-server-pool)#
```

Deletes the DHCPv6 server pool **primary-pool** on VRF **primary**.

```
switch(config)# dhcpv6-server vrf primary
switch(config-dhcpv6-server)# no pool primary-pool
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

range

```
range <LOW-IPV6-ADDR> <HIGH-IPV6-ADDR> [prefix-len <MASK>]
no range <LOW-IPV6-ADDR> <HIGH-IPV6-ADDR> [prefix-len <MASK>]
```

Description

Defines the range of IP addresses supported by the current DHCPv6 server pool. A maximum of 64 ranges are supported per switch across all VRFs.

The **no** form of this command deletes the address range for the current pool.

Parameter	Description
<LOW-IPV6-ADDR>	Specifies the lowest IP address in the pool in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.
<HIGH-IPV6-ADDR>	Specifies the highest IP address in the pool in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.
prefix-len *<MASK>*	Specifies the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 64 to128.

Example

Defines an address range for the DHCPv6 server pool **primary-pool** on VRF **primary**.

```
switch(config)# dhcpv6-server vrf primary
switch(config-dhcpv6-server)# pool primary-pool
switch(config-dhcpv6-server-pool)# range 2001::1 2001::10 prefix-len 64
```

Deletes an address range for the DHCPv6 server pool **primary-pool** on VRF **primary**.

```
switch(config)# dhcpv6-server vrf primary
switch(config-dhcpv6-server)# pool primary-pool
switch(config-dhcpv6-server-pool)# no range 2001::1 2001::10 prefix-len 64
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

show dhcpv6-server

```
show dhcpv6-server [all-vrfs]
show dhcpv6-server leases {all-vrfs | vrf <VRF-NAME>}
show dhcpv6-server pool <POOL-NAME> [vrf <VRF-NAME>]
```

Description

Shows configuration settings for the DHCPv6 server.

Parameter	Description
`all-vrfs`	Shows DHCPv6 server configuration settings for all VRFs.
`leases {all-vrfs | vrf <VRF-NAME>}`	Shows DHCPv6 server lease provided by the server for all VRFs or a specific VRF.
`pool <POOL-NAME> [vrf <VRF-NAME>]`	Shows DHCPv6 server pool configuration settings for all VRFs or a specific VRF.

Examples

Showing all DHCPv6 server configuration settings.

```
switch# show dhcpv6-server

static-bind

```
static-bind ipv6 <IPVv6-ADDR> client-id <ID> [hostname <HOST>]
no static-bind ipv6 <IPVv6-ADDR-LIST>
```

Description

Creates a static binding that associates an IP address in the current pool with a client identifier or DUID. This causes the DHCPv6 server to only assign the specified IP address to a client station with the specified client identifier or DUID.

The **no** form of this command removes the specified static binding from the pool.

Parameter	Description
<IPV6-ADDR>	Specifies the IP address to assign in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F. For example, this address `2222:0000:3333:0000:0000:0000:4444:0055` becomes `2222:0:3333::4444:55`.
`client-id` *<ID>*	Specifies the client identifier or DUID.
`hostname` *<HOST>*	Specifies the host name of the client station. Range: 1 to 255 printable ASCII characters

Example

Defines a static address for the DHCPv6 server pool **primary-pool** on VRF **primary**.

```
switch(config)# dhcpv6-server vrf primary
switch(config-dhcpv6-server)# pool primary-pool
switch(config-dhcpv6-server-pool)# static-bind ipv6 2001::10 client-id
1:0:a0:24:ab:fb:9c
```

Deletes a static address from the DHCPv6 server pool **primary-pool** on VRF **primary**.

```
switch(config)# dhcpv6-server vrf primary
switch(config-dhcpv6-server)# pool primary-pool
switch(config-dhcpv6-server-pool)# no static-bind ipv6 2001::10 client-id
1:0:a0:24:ab:fb:9c
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Chapter 33

DHCP snooping commands

clear dhcp-snooping binding

`clear dhcp-snooping binding {all | ip <IP-ADDR> vlan <VLAN-ID> | port <PORT-NUM> | vlan <VLAN-ID>}`

Description

Clears DHCP snooping binding entries.

Parameter	Description
`all`	Specifies that all DHCP binding information is to be cleared.
`ip <IP-ADDR> vlan <VLAN-ID>`	Specifies the IP address and VLAN for which all DHCP binding information is to be cleared.
`port <PORT-NUM>`	Specifies the port number for which all DHCP binding information is to be cleared.
`vlan <VLAN-ID>`	Specifies the VLAN for which all DHCP binding information is to be cleared.

Examples

On the 6400 Switch Series, interface identification differs.

Clearing all DHCP binding information for IP address 192.168.2.4 and VLAN 5:

```
switch(config)# clear dhcp-snooping binding ip 192.168.2.4 vlan 5
```

Clearing all DHCP binding information for port 1/1/1:

```
switch(config)# clear dhcp-snooping binding port 1/1/1
```

Clearing all DHCP binding information for VLAN 10:

```
switch(config)# clear dhcp-snooping binding vlan 10
```

Clearing all DHCP binding information:

```
switch(config)# clear dhcp-snooping binding all
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.14	The **dhcpv4-snooping** keyword is deprecated and replaced with **dhcp-snooping**. The **ipv4** parameter is deprecated and replaced with **ip**.
10.09.1000	Command introduced for the 8360 Switch Series.
10.09	Command introduced for the 6000 and 6100 Switch Series.
10.07 or earlier	

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

clear dhcp-snooping statistics

```
clear dhcp-snooping statistics
```

Description

Clears all DHCP snooping statistics.

Examples

Clear all DHCP snooping statistics:

```
switch# clear dhcp-snooping statistics
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.14	The **dhcpv4-snooping** keyword is deprecated and replaced with **dhcp-snooping**.
10.09.1000	Command introduced for the 8360 Switch Series.
10.09	Command introduced for the 6000 and 6100 Switch Series.
10.07 or earlier	

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

dhcp-snooping

```
dhcp-snooping
no dhcp-snooping
```

Description

Enables DHCP snooping. DHCP snooping is disabled by default. DHCP snooping is not supported on the management interface.

The **no** form of the command disables DHCP snooping, flushing all the IP bindings learned since DHCP snooping was enabled.

Examples

Enabling DHCP snooping:

```
switch(config)# dhcp-snooping
```

Disabling DHCP snooping:

```
switch(config)# no dhcp-snooping
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.14	The **dhcpv4-snooping** keyword is deprecated and replaced with **dhcp-snooping**.
10.09.1000	Command introduced for the 8360 Switch Series.
10.09	Command introduced for the 6000 and 6100 Switch Series.
10.07 or earlier	

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

dhcp-snooping (in config-vlan context)

```
dhcp-snooping
no dhcp-snooping
```

Description

Enables DHCP snooping for the specified VLAN in the **config-vlan** context. DHCP snooping is disabled by default for all VLANs.

The no form of the command disables DHCP snooping on the specified VLAN, flushing all the IP bindings learned for this VLAN since DHCP snooping was enabled for this VLAN.

Examples

Enabling DHCP snooping on VLAN 100:

```
switch(config)# vlan 100
switch(config-vlan-100)# dhcp-snooping
switch(config-vlan-100)# exit
switch(config)#
```

Disabling DHCP snooping on VLAN 100:

```
switch(config)# vlan 100
switch(config-vlan-100)# no dhcp-snooping
switch(config-vlan-100)# exit
switch(config)#
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.14	The **dhcpv4-snooping** keyword is deprecated and replaced with **dhcp-snooping**.
10.09.1000	Command introduced for the 8360 Switch Series.
10.09	Command introduced for the 6000 and 6100 Switch Series.
10.07 or earlier	

Command Information

Platforms	Command context	Authority
6300 6400	`config-vlan`	Administrators or local user group members with execution rights for this command.

dhcp-snooping allow-overwrite-binding

```
dhcp-snooping allow-overwrite-binding
no dhcp-snooping allow-overwrite-binding
```

Description

Allows binding to be overwritten for the same IP address. When enabled, and a DHCP server offers a host an IP address that is already bound to an existing host in the binding table, the existing binding is overwritten for the new host if the new host is successfully able to acquire the same IP address. This overwriting is disabled by default, causing the DHCP server offers to be dropped.

The **no** form of the command disables DHCP snooping overwrite binding.

Examples

Enabling DHCP snooping overwrite binding:

```
switch(config)# dhcp-snooping allow-overwrite-binding
```

Disabling DHCP snooping overwrite binding:

```
switch(config)# no dhcp-snooping allow-overwrite-binding
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.14	The **dhcpv4-snooping** keyword is deprecated and replaced with **dhcp-snooping**.

dhcp-snooping authorized-server

```
dhcp-snooping authorized-server <IP-ADDR> [vrf <VRF-NAME>]
no dhcp-snooping authorized-server <IP-ADDR> [vrf <VRF-NAME>]
```

Description

Adds an authorized (trusted) DHCP server to a list of authorized servers for use by DHCP snooping. This command can be issued multiple times, adding a maximum of 20 authorized servers per VRF. By default, with an empty list of authorized servers, all DHCP servers are considered to be trusted for DHCP snooping purposes.

The **mgmt** VRF cannot be used with this command.

The no form of this command deletes the specified DHCP server from the authorized list.

Parameter	Description
<IP-ADDR>	Specifies the IP address of the trusted DHCP server.
vrf *<VRF-NAME>*	Specifies the VRF name. The name can be **default** or a configured VRF instance but it cannot be **mgmt**.

Usage

For authorized server lookup, the VRF is derived from the Switch Virtual Interface (SVI) configured for the incoming VLAN. If the SVI is not configured, the `default` VRF is assumed.

Examples

Adding DHCP servers 192.168.2.2, 192.168.2.3, and 192.168.2.10 to the authorized server list:

```
switch(config)# dhcp-snooping authorized-server 192.168.2.2
switch(config)# dhcp-snooping authorized-server 192.168.2.3 vrf default
switch(config)# dhcp-snooping authorized-server 192.168.2.10 vrf default
```

Removing DHCP server 192.168.2.3 from the authorized server list:

```
switch(config)# no dhcp-snooping authorized-server 192.168.2.3 vrf default
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

dhcp-snooping event-log client

```
dhcp-snooping event-log client
no dhcp-snooping event-log client
```

Description

This command enables or disables dhcp-snooping client level event logs that help with client telemetry on a remote management station such as Aruba Central. By default, client level event logs are disabled. The **no** form of this command disables client-level event logs for DHCP snooping after they are enabled. View these logged DHCP snooping events by issuing the command **show events -c dhcp-snooping**.

For additional information on DHCP-related event logging, please refer to the Event Log Message Reference Guide.

Examples

Enabling DHCP client level event logs:

```
switch(config)# # dhcp-snooping event-log client
```

Disabling external storage:

```
witch(config)# # no dhcp-snooping event-log client
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.14	The **dhcpv4-snooping** keyword is deprecated and replaced with **dhcp-snooping**.
10.10	Command introduced.

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

dhcp-snooping external-storage

```
dhcp-snooping external-storage volume <VOL-NAME> file <FILE-NAME>
no dhcp-snooping external-storage volume <VOL-NAME> file <FILE-NAME>
```

Description

Configures external storage to be used for backing up IP bindings (used by DHCP snooping) to a file. When configured, the switch stores all the IP bindings in an external storage file so that they are retained after the switch restarts. When the switch restarts, it reads the IP bindings from the configured external storage file to populate its local cache.

When both external storage and flash storage are configured to store DHCP snooping IP bindings, the external storage takes priority, and is used exclusively until it becomes unconfigured, at which time flash storage (if configured) is used. Later, if external storage is configured again, flash storage stops and external storage resumes.

The no form of this command disables the saving of IP bindings in an external storage file.

Parameter	Description
`volume <VOL-NAME>`	Specifies the name of the existing external storage volume where the IP bindings file will be saved. Before running the **dhcp-snooping external-storage volume** command, first create the external storage volume using command **external-storage <VOLUME-NAME>**. See *External storage commands* in the *Command-Line Interface Guide*.
`file <FILE-NAME>`	Specifies the file name to use for storing IP bindings. Maximum 255 characters.

Configuring IP bindings storage in file **dsnoop_ipbindings** on existing volume **dhcp_snoop**:

```
switch(config)# dhcp-snooping external-storage volume dhcp_snoop file dsnoop_
ipbindings
```

Disabling external storage:

```
switch(config)# no dhcp-snooping external-storage volume dhcp_snoop
```

Disabling external storage when flash storage is also configured (note the message indicating that flash storage will be used):

```
switch(config)# no dhcp-snooping external-storage volume dhcp_snoop
dhcp-snooping will use flash storage to store IP Binding database
switch(config)#
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.14	The **dhcpv4-snooping** keyword is deprecated and replaced with **dhcp-snooping**.

dhcp-snooping flash-storage

```
dhcp-snooping flash-storage [delay <DELAY>]
no dhcp-snooping flash-storage [delay <DELAY>]
```

Description

Configures switch flash storage to be used for backing up client IP bindings (used by DHCP snooping). When flash storage is configured (and external storage is not already configured for this purpose), the switch stores the IP bindings in switch flash storage. When the switch restarts, it reads the IP bindings from the switch flash storage to populate its local cache.

Writing the IP bindings to flash storage only occurs after the configured delay and if there has been a change in client IP bindings. Writing is skipped when client IP bindings have not changed since the previous write.

Omitting **delay <DELAY>** sets the default delay of 900 seconds.

To reduce switch flash aging it is recommended that you use external storage (command **dhcp-snooping external-storage**) to backup DHCP snooping IP bindings. Alternatively, consider configuring flash storage with a substantial delay between writes.

When both external storage and flash storage are configured to store DHCP snooping IP bindings, the external storage takes priority, and is used exclusively until it becomes unconfigured, at which time flash storage (if configured) is used. Later, if external storage is configured again, flash storage stops and external storage resumes.

The no form of this command disables the saving of IP bindings in flash storage.

Parameter	Description
`delay <DELAY>`	Specifies the delay in seconds between writes (when necessary) to the flash storage, Default: 900. Range: 300 to 86400.

Examples

Configuring switch flash storage for DHCP snooping IP binding storage with a write delay of 1200 seconds:

```
switch(config)# dhcp-snooping flash-storage delay 1200
Warning: Using flash storage reduces switch lifetime. It is recommended to use an
external-storage.
Do you want to continue  (y/n)? y
switch(config)#
```

Unconfiguring usage of switch flash storage for IP bindings :

```
switch(config)# no dhcp-snooping flash-storage
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.14	The **dhcpv4-snooping** keyword is deprecated and replaced with **dhcp-snooping**.

dhcp-snooping max-bindings

```
dhcp-snooping max-bindings <MAX-BINDINGS>
no dhcp-snooping max-bindings <MAX-BINDINGS>
```

Description

Sets the maximum number of DHCP bindings allowed on the selected interface. For all interfaces on which this command is not run, the default max binding is the maximum value of the range.

The no form of the command reverts max bindings for the selected interface to its default.

Parameter	Description
<MAX-BINDINGS>	Specifies the maximum number of DHCP bindings. Range 1 to 8192.

Examples

On the 6400 Switch Series, interface identification differs.

Set the DHCP max bindings to 256 on interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# dhcp-snooping max-bindings 256
switch(config-if)# exit
switch(config)#
```

Revert DHCP max bindings to its default on interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# no dhcp-snooping max-bindings 256
switch(config-if)# exit
switch(config)#
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.14	The **dhcpv4-snooping** keyword is deprecated and replaced with **dhcp-snooping**.
10.09.1000	Command introduced for the 8360 Switch Series.
10.09	Command introduced for the 6000 and 6100 Switch Series.

Command Information

Platforms	Command context	Authority
6300 6400	`config-if`	Administrators or local user group members with execution rights for this command.

dhcp-snooping option 82

```
dhcp-snooping option 82 [remote-id {mac | subnet-ip | mgmt-ip}]
                          [untrusted-policy {drop | keep | replace}]
no dhcp-snooping option 82 [remote-id {mac | subnet-ip | mgmt-ip}]
                          [untrusted-policy {drop | keep | replace}]
```

Description

Configures the addition of option 82 DHCP relay information to DHCP client packets that are being forwarded on trusted ports. DHCP relay is enabled by default.

In the switch default state and when this command is entered without parameters (**dhcp-snooping option 82**), this default configuration is used:

```
dhcp-snooping option 82 remote-id mac untrusted-policy drop
```

When **remote-id** is omitted, its default (**mac**) is used. When **untrusted-policy** is omitted, its default (**drop**) is used.

The no form of this command disables DHCP snooping option 82.

Parameter	Description
`remote-id`	Specifies what address to use as the remote ID for the `replace` option of `untrusted-policy`. Specify one of these address types:

Parameter	Description
`mac`	The default. Uses the switch MAC address as the remote ID.
`subnet-ip`	Uses the IP address of the client VLAN as the remote ID.
`untrusted-policy`	Specifies what action to take for DHCP packets (with option 82) that are received on untrusted ports. Specify one of these actions:
`drop`	The default. Drop DHCP packets (with option 82) without forwarding them.
`keep`	Forward DHCP packets (with option 82).
`replace`	Replace the option 82 information in the DHCP packets with whatever is set for **remote-id** (one of: **mac**, **subnet-ip**, or **mgmt-ip**) and forward the packets.

Examples

Configuring DHCP snooping option 82 with the keep action:

```
switch(config)# dhcp-snooping option 82 untrusted-policy keep
```

Configuring DHCP snooping option 82 with `mgmt-ip` as the `remote-id` and the `replace` action:

```
switch(config)# dhcp-snooping option 82 remote-id mgmt-ip untrusted-policy replace
```

Disabling DHCP snooping option 82:

```
switch(config)# no dhcp-snooping option 82 untrusted-policy keep
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

dhcp-snooping static-attributes

```
dhcp-snooping static-attributes
no dhcp-snooping static-attributes
```

Description

Enables storage of static attributes provided to the DHCP client by DHCP server during DHCP packet exchange. Disabled by default. When enabled, the following attributes are stored in OVSDB along with the client IP binding entry:

1. Name server IP addresses: DNS server IPs provided by the DHCP server to the client. Maximum: 3 per client.
2. Default gateway IP address: Router IP addresses provided by DHCP server to the client. Maximum: 3 per client.
3. Server IP address: IP address of the DHCP server that leased the IP to the client.

The **no** form of the command disables storing of client static attributes. After disabling, existing client static attributes will be flushed.

Examples

Enabling the storage of DHCP snooping static attributes:

```
switch(config)# dhcp-snooping static-attributes
```

Disabling the storage of DHCP snooping static attributes:

```
switch(config)# no dhcp-snooping static-attributes
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.14	The **dhcpv4-snooping** keyword is deprecated and replaced with **dhcp-snooping**.
10.10	Command introduced.

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

dhcp-snooping trust

```
dhcp-snooping trust
no dhcp-snooping trust
```

Description

Enables DHCP snooping trust on the selected port. Only server packets received on trusted ports are forwarded. All the ports are untrusted by default.

The **no** form of the command disables DHCP snooping trust on the selected port.

Examples

On the 6400 Switch Series, interface identification differs.

Enabling DHCP snooping trust on interface 2/2/1:

```
switch(config)# interface 2/2/1
switch(config-if)# dhcp-snooping trust
switch(config-if)# exit
switch(config)#
```

Disabling DHCP snooping trust on interface 2/2/1:

```
switch(config)# interface 2/2/1
switch(config-if)# no dhcp-snooping trust
switch(config-if)# exit
switch(config)#
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.14	The **dhcpv4-snooping** keyword is deprecated and replaced with **dhcp-snooping**.
10.09.1000	Command introduced for the 8360 Switch Series.

dhcp-snooping tunnel vxlan trust

```
dhcp-snooping tunnel vxlan trust
no dhcp-snooping tunnel vxlan trust
```

Description

Enables dhcp-snooping trust on all VxLAN tunnels.

The no form of the command to marks all VxLAN tunnels as untrusted.

By default, all VxLAN tunnel interfaces are trusted. When trust is disabled on VxLAN tunnel interfaces:

- DHCP broadcast packets are not forwarded on VxLAN tunnels.
- DHCP server packets received on VxLAN tunnel interfaces are discarded.

Examples

On the 6400 Switch Series, interface identification differs.

Enabling trust on all VxLAN tunnel interfaces:

```
switch(config)# dhcp-snooping tunnel vxlan trust
```

Disabling trust on all VxLAN tunnel interfaces:

```
switch(config)# no dhcp-snooping tunnel vxlan trust
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

dhcp-snooping verify mac

```
dhcp-snooping verify mac
no dhcp-snooping verify mac
```

Description

This command enables verification of the hardware address field in DHCP client packets. When enabled, the DHCP client hardware address field and the source MAC address must be the same for packets received on untrusted ports or else the packet is dropped. This DHCP snooping MAC verification is enabled by default.

The **no** form of the command disables DHCP snooping MAC verification.

Examples

Enabling DHCP snooping MAC verification:

```
switch(config)# dhcp-snooping verify mac
```

Disabling DHCP snooping MAC verification:

```
switch(config)# no dhcp-snooping verify mac
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

show dhcp-snooping

```
show dhcp-snooping [vsx-peer]
```

Description

Shows the DHCP snooping configuration.

Parameter	Description
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

Showing the DHCP snooping configuration:

```
switch# show dhcp-snooping

Command History

Release	Modification
10.14	The **dhcpv4-snooping** keyword is deprecated and replaced with **dhcp-snooping**.
10.10	Detail parameter added.

Release	Modification
10.09.1000	Command introduced for the 8360 Switch Series.
10.09	Command introduced for the 6000 and 6100 Switch Series.
10.07 or earlier	

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show dhcp-snooping statistics

```
show dhcp-snooping statistics [vsx-peer]
```

Description

Shows the DHCP snooping statistics.

Parameter	Description
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing the DHCP snooping statistics:

```
switch(config)# show dhcp-snooping statistics

 Packet-Type  Action   Reason                         Count
 -----------  -------  -----------------------------  ---------
 server       forward  from trusted port              5425
 client       forward  to trusted port                3895
 server       drop     received on untrusted port     117
 server       drop     unauthorized server            214
 client       drop     destination on untrusted port  78
 client       drop     untrusted option 82 field      85
 client       drop     bad DHCP release request       0
 client       drop     failed verify MAC check        5
 client       drop     failed on max-binding limit    15
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Chapter 34

DHCPv6 snooping commands

clear dhcpv6-snooping binding

```
clear dhcpv6-snooping binding {all | ip <IPV6-ADDR> vlan <VLAN-ID> | interface <IFNAME> |
vlan <VLAN-ID>}
```

Description

Clears DHCPv6 snooping binding entries.

Parameter	Description
`all`	Specifies that all DHCPv6 binding information is to be cleared.
`ip <IPV6-ADDR> vlan <VLAN-ID>`	Specifies the IPv6 address and VLAN for which all DHCPv6 binding information is to be cleared.
`interface <IFNAME>`	Specifies the interface for which all DHCPv6 binding information is to be cleared.
`vlan <VLAN-ID>`	Specifies the VLAN for which all DHCPv6 binding information is to be cleared. Range: 1 to 4094.

Examples

On the 6400 Switch Series, interface identification differs.

Clearing all DHCPv6 binding information for 5000::1 vlan 1:

```
switch(config)# clear dhcpv6-snooping binding ip 5000::1 vlan 1
```

Clearing all DHCPv6 binding information for interface 1/1/10:

```
switch(config)# clear dhcpv6-snooping binding interface 1/1/10
```

Clearing all DHCPv6 binding information for VLAN 10:

```
switch(config)# clear dhcpv6-snooping binding vlan 10
```

Clearing all DHCPv6 binding information:

```
switch(config)# clear dhcpv6-snooping binding all
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.09.1000	Command introduced for the 8360 Switch Series.
10.09	Command introduced for the 6000 and 6100 Switch Series.

clear dhcpv6-snooping guard-policy statistics

```
clear dhcpv6-snooping guard-policy statistics [vlan <VLAN-ID> | interface <INTERFACE-NAME>]
```

Description

Clears all DHCPv6 snooping guard policy statistics from the specified VLAN or interface.

Parameter	Description
<VLAN-ID>	Specifies the VLAN ID. Range: 1-4094.
<INTERFACE-NAME>	Specifies the interface name.

Examples

Clearing all DHCPv6 snooping guard policy statistics from VLAN 100:

```
switch# clear dhcpv6-snooping guard-policy statistics vlan 100
```

Clearing all DHCPv6 snooping guard policy statistics from interface 1/1/10:

```
switch# clear dhcpv6-snooping guard-policy statistics interface 1/1/10
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

clear dhcpv6-snooping statistics

```
clear dhcpv6-snooping statistics
```

Description

Clears all DHCPv6 snooping statistics.

Examples

Clear all DHCPv6 snooping statistics:

```
switch# clear dhcpv6-snooping statistics
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.09.1000	Command introduced for the 8360 Switch Series.
10.09	Command introduced for the 6000 and 6100 Switch Series.
10.07 or earlier	

Command Information

6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

dhcpv6-snooping

```
dhcpv6-snooping
no dhcpv6-snooping
```

Description

Enables DHCPv6 snooping. DHCPv6 snooping is disabled by default. DHCPv6 snooping is not supported on the management interface.

The no form of the command disables DHCPv6 snooping, flushing all the IP bindings learned since DHCPv6 snooping was enabled.

Examples

Enabling DHCPv6 snooping:

```
switch(config)# dhcpv6-snooping
```

Disabling DHCPv6 snooping:

```
switch(config)# no dhcpv6-snooping
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.09.1000	Command introduced for the 8360 Switch Series.
10.09	Command introduced for the 6000 and 6100 Switch Series.
10.07 or earlier

dhcpv6-snooping guard-policy

```
dhcpv6-snooping guard-policy <POLICY-NAME>
no dhcpv6-snooping guard-policy <POLICY-NAME>
```

Description

Configures a DHCPv6 snooping guard policy with the given name and enters the guard policy configuration context.

The no form of the command disables the specified guard policy.

Parameter	Description
<POLICY-NAME>	Specifies the name of the DHCPv6 snooping guard policy. Maximum length: 64.

Examples

Creating the DHCPv6 snooping guard policy name pol1:

```
switch(config)# dhcpv6-snooping guard-policy pol1
switch(config-guard-policy-pol1)#
```

Deleting the DHCPv6 snooping guard policy named pol1:

```
switch(config)# no dhcpv6-snooping guard-policy pol1
```

Creating the DHCPv6 snooping guard policy name pol1 on interface 1/1/1:

The DHCPv6 snooping guard policy applied on the port takes priority over the policy applied over VLAN.

```
switch(config)# interface 1/1/1
switch(config-if)# dhcpv6-snooping guard-policy pol1
```

Creating the DHCPv6 snooping guard policy name pol1 on a VLAN:

```
switch(config)# vlan 100
switch(config-vlan-100)# dhcpv6-snooping guard-policy pol1
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

		Administrators or local user group members with execution rights for this command.

dhcpv6-snooping (in config-vlan context)

```
dhcpv6-snooping
no dhcpv6-snooping
```

Description

Enables DHCPv6 snooping in the `config-vlan` context. DHCPv6 snooping is disabled by default for all VLANs.

The no form of the command disables DHCPv6 snooping on the specified VLAN, flushing all the IPv6 bindings learned for this VLAN since DHCPv6 snooping was enabled for this VLAN.

Examples

Enabling DHCPv6 snooping on VLAN 100:

```
switch(config)# vlan 100
switch(config-vlan-100)# dhcpv6-snooping
switch(config-vlan-100)# exit
switch(config)#
```

Disabling DHCPv6 snooping on VLAN 100:

```
switch(config)# vlan 100
switch(config-vlan-100)# no dhcpv6-snooping
switch(config-vlan-100)# exit
switch(config)#
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.09.1000	Command introduced for the 8360 Switch Series.
10.09	Command introduced for the 6000 and 6100 Switch Series.

dhcpv6-snooping authorized-server

```
dhcpv6-snooping authorized-server <IPV6-ADDR> [vrf <VRF-NAME>]
no dhcpv6-snooping authorized-server <IPV6-ADDR> [vrf <VRF-NAME>]
```

Description

Adds an authorized (trusted) DHCPv6 server to a list of authorized servers for use by DHCPv6 snooping. This command can be issued multiple times, adding a maximum of 20 authorized servers per VRF. By default, with an empty list of authorized servers, all DHCPv6 servers are considered to be trusted for DHCPv6 snooping purposes.

The `mgmt` VRF cannot be used with this command.

Configure the link local IPv6 address instead of global IPv6 address of the DHCPv6 server as the authorized-server. For example:

```
switch(config)# dhcpv6-snooping authorized-server fe80::2ca4:fa40:d4cd:bc2f
```

The no form of this command deletes the specified DHCPv6 server from the authorized list.

Parameter	Description
<IPV6-ADDR>	Specifies the IPv6 address of the trusted DHCPv6 server.
vrf *<VRF-NAME>*	Specifies the VRF name. The name can be `default` or a configured VRF instance but it cannot be `mgmt`.

Usage

For authorized server lookup, the VRF is derived from the Switch Virtual Interface (SVI) configured for the incoming VLAN. If the SVI is not configured, the `default` VRF is assumed.

Examples

Adding DHCP servers ABCD:5ACD::2000, and ABCD:5ACD::2010 to the authorized server list:

```
switch(config)# dhcpv6-snooping authorized-server ABCD:5ACD::2000 vrf default
switch(config)# dhcpv6-snooping authorized-server ABCD:5ACD::2010 vrf default
```

Removing DHCP server ABCD:5ACD::2000 from the authorized server list:

```
switch(config)# no dhcpv6-snooping authorized-server ABCD:5ACD::2000 vrf default
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	Command introduced

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

dhcpv6-snooping event-log client

```
dhcpv6-snooping event-log client
no dhcpv6-snooping event-log client
```

Description

This command enables or disables DHCPv6 snooping client level event logs that help with client telemetry on a remote management station such as Aruba Central. By default, client level event logs are disabled. The **no** form of this command disables client-level event logs for DHCPv6 snooping after they are enabled. View these logged DHCPv6 snooping events by issuing the command `show events -c dhcpv6-snooping`.

For additional information on DHCP-related event logging, please refer to the Event Log Message Reference Guide.

Examples

Enabling DHCPv6 client level event logs:

```
switch(config)# # dhcpv6-snooping event-log client
```

Disabling external storage:

```
witch(config)# # no dhcpv6-snooping event-log client
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.10	Command introduced.

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

dhcpv6-snooping external-storage

```
dhcpv6-snooping external-storage volume <VOL-NAME> file <FILE-NAME>
no dhcpv6-snooping external-storage volume <VOL-NAME> file <FILE-NAME>
```

Description

Configures external storage to be used for backing up IPv6 bindings (used by DHCPv6 snooping) to a file. When configured, the switch stores all the IP bindings in an external storage file so that they are retained after the switch restarts. When the switch restarts, it reads the IPv6 bindings from the configured external storage file to populate its local cache.

When both external storage and flash storage are configured to store DHCP snooping IP bindings, the external storage takes priority, and is used exclusively until it becomes unconfigured, at which time flash storage (if configured) is used. Later, if external storage is configured again, flash storage stops and external storage resumes.

The no form of this command disables the saving of IPv6 bindings in an external storage file.

Parameter	Description
`volume <VOL-NAME>`	Specifies the name of the existing external storage volume where the IPv6 bindings file will be saved. Before running the `dhcpv6-snooping external-storage volume` command, first create the external storage volume using command `external-storage <VOLUME-NAME>`. See *External storage commands* in the *Command-Line Interface Guide*.
`file <FILE-NAME>`	Specifies the file name to use for storing IPv6 bindings. Maximum 255 characters.

Examples

Configuring IPv6 bindings storage in file `ipv6Bindings` on existing volume `dhcp_snoop`:

```
switch(config)# dhcpv6-snooping external-storage volume dhcp_snoop file
ipv6Bindings
```

Disabling external storage:

```
switch(config)# no dhcpv6-snooping external-storage volume dhcp_snoop
```

Disabling external storage when flash storage is also configured (note the message indicating that flash storage will be used):

```
switch(config)#  no dhcpv6-snooping external-storage volume dhcp_snoop
DHCPv6-Snooping will use flash storage to store IP Binding database
switch(config)#
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.08	Updated example with flash storage information.
10.07 or earlier	Command introduced

dhcpv6-snooping flash-storage

```
dhcpv6-snooping flash-storage [delay <DELAY>]
no dhcpv6-snooping flash-storage [delay <DELAY>]
```

Description

Configures switch flash storage to be used for backing up client IP bindings (used by DHCPv6 snooping). When flash storage is configured (and external storage is not already configured for this purpose), the switch stores the IP bindings in switch flash storage. When the switch restarts, it reads the IP bindings from the switch flash storage to populate its local cache.

Writing the IP bindings to flash storage only occurs after the configured delay and if there has been a change in client IP bindings. Writing is skipped when client IP bindings have not changed since the previous write.

Omitting `delay <DELAY>` sets the default delay of 900 seconds.

To reduce switch flash aging it is recommended that you use external storage (command `dhcpv6-snooping external-storage`) to backup DHCP snooping IP bindings. Alternatively, consider configuring flash storage with a substantial delay between writes.

When both external storage and flash storage are configured to store DHCP snooping IP bindings, the external storage takes priority, and is used exclusively until it becomes unconfigured, at which time flash storage (if configured) is used. Later, if external storage is configured again, flash storage stops and external storage resumes.

The no form of this command disables the saving of IP bindings in flash storage.

Parameter	Description
`delay <DELAY>`	Specifies the delay in seconds between writes (when necessary) to the flash storage, Default: 900. Range: 300 to 86400.

Examples

Configuring switch flash storage for DHCP snooping IP binding storage with a write delay of 1200 seconds:

```
switch(config)# dhcpv6-snooping flash-storage delay 1200
Warning: Using flash storage reduces switch lifetime. It is recommended to use an
external-storage.
Do you want to continue  (y/n)? y
switch(config)#
```

Unconfiguring usage of switch flash storage for IP bindings :

```
switch(config)# no dhcpv6-snooping flash-storage
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.07	Command introduced

dhcpv6-snooping max-bindings

```
dhcpv6-snooping max-bindings <MAX-BINDINGS>
no dhcpv6-snooping max-bindings <MAX-BINDINGS>
```

Description

Sets the maximum number of DHCPv6 bindings allowed on the selected interface. For all interfaces on which this command is not run, the default max binding is the maximum value of the range.

The no form of the command reverts max bindings for the selected interface to its default.

Parameter	Description
<MAX-BINDINGS>	Specifies the maximum number of DHCP bindings. Range 1 to 8192.

Examples

On the 6400 Switch Series, interface identification differs.

Set the DHCPv6 max bindings to 256 on interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# dhcpv6-snooping max-bindings 256
switch(config-if)# exit
switch(config)#
```

Revert DHCPv6 max bindings to its default on interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# no dhcpv6-snooping max-bindings 256
switch(config-if)# exit
switch(config)#
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.07	Command introduced

Command Information

Platforms	Command context	Authority
6300 6400	`config-if`	Administrators or local user group members with execution rights for this command.

dhcpv6-snooping trust

```
dhcpv6-snooping trust
no dhcpv6-snooping trust
```

Description

Enables DHCPv6 snooping trust on the selected interface. Only server packets received on trusted interfaces are forwarded. All the interfaces are untrusted by default.

The no form of the command disables DHCPv6 snooping trust on the selected interface.

```
config-if
```

Examples

On the 6400 Switch Series, interface identification differs.

Enabling DHCPv6 snooping trust on interface 2/2/1:

```
switch(config)# interface 2/2/1
switch(config-if)# dhcpv6-snooping trust
switch(config-if)# exit
switch(config)#
```

Disabling DHCPv6 snooping trust on interface 2/2/1:

```
switch(config)# interface 2/2/1
switch(config-if)# no dhcpv6-snooping trust
switch(config-if)# exit
switch(config)#
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.07	Command introduced

Command Information

dhcpv6-snooping tunnel vxlan trust

```
dhcpv6-snooping tunnel vxlan trust
no dhcpv6-snooping tunnel vxlan trust
```

Description

Enables DHCPv6-snooping trust on all VxLAN tunnels.

The no form of the command to marks all VxLAN tunnels as untrusted.

By default, all VxLAN tunnel interfaces are trusted. When trust is disabled on VxLAN tunnel interfaces:

- DHCP broadcast packets are not forwarded on VxLAN tunnels.
- DHCP server packets received on VxLAN tunnel interfaces are discarded.

Examples

On the 6400 Switch Series, interface identification differs.

Enabling trust on all VxLAN tunnel interfaces:

```
switch(config)# dhcpv6-snooping tunnel vxlan trust
```

Disabling trust on all VxLAN tunnel interfaces:

```
switch(config)# no dhcpv6-snooping tunnel vxlan trust
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.11.1000	Command introduced.

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

match client prefix-list

```
match client prefix-list <PREFIX-LIST-NAME>
no match client prefix-list <PREFIX-LIST-NAME>
```

Description

Configures a prefix-list for the DHCPv6 snooping guard policy enabling the policy to allow the assigned IPv6 addresses within a specific prefix range.

The **no** form of the command removes a prefix list from the DHCPv6 snooping guard policy.

Parameter	Description
<PREFIX-LIST-NAME>	Specifies the name of the IPv6 prefix list.

Examples

Adding a prefix list named pref1 to the pol1 DHCPv6 snooping guard policy:

```
switch(config)# ipv6 prefix-list pref1 permit 2001:db8::/64 le 128
switch(config)# dhcpv6-snooping guard-policy pol1
switch(config-dhcpv6-guard-policy)# match client prefix-list pref1
```

Deleting the prefix list named prf1 from the pol1 DHCPv6 snooping guard policy:

```
switch(config)# dhcpv6-snooping guard-policy pol1
switch(config-dhcpv6-guard-policy)# no match client prefix-list <ipv6-prefix-list-
name>
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.10	Command introduced.

Command Information

Platforms	Command context	Authority
6300 6400	`config-dhcpv6-guard-policy`	Administrators or local user group members with execution rights for this command.

match server access-list

```
match server access-list <ACL-NAME>
no match server access-list <ACL-NAME>
```

Description

Configures an access list to a DHCPv6 snooping guard policy, enabling the DHCPv6 snooping guard policy to allow or deny the specific DHCP server to assign an IPv6 address. If no filters are applied, DHCP server traffic from any source IP address is allowed in the trusted port.

The **no** form of the command removes the specified access list from the DHCPv6 snooping guard policy.

Parameter	Description
<ACL-NAME>	Specifies the name of the IPv6 access list to be matched.

Examples

Creating an access-list acl1 on DHCPv6 snooping guard policy pol1 :

```
switch(config)# dhcpv6-snooping guard-policy pol1
switch(config-dhcpv6-guard-policy)# match server access-list acl1
```

Deleting the access list acl1 from the DHCPv6 snooping guard policy pol1:

```
switch(config)# dhcpv6-snooping guard-policy pol1
switch(config-dhcpv6-guard-policy)# no match server access-list acl1
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

6300 6400	`config-dhcpv6-guard-policy`	Administrators or local user group members with execution rights for this command.

preference

```
preference [minimum | maximum ] <VALUE>
no preference
```

Description

Enables a DHCPv6 snooping guard policy to allow or deny the DHCPv6 servers in the specified server preference range. If not configured the minimum preference is set to 0 and maximum preference is set to 255.

The **no** form of the command removes the server preference limits on the specified DHCPv6 snooping guard policy.

Parameter	Description
`minimum <VALUE>`	Specifies the minimum value for the server preference range. Range: 1-255.
`maximum <VALUE>`	Specifies the maximum value for the server preference range. Range: 1-255.

Examples

Setting the minimum and maximum server preference range to 6-250 on DHCPv6 snooping guard policy pol1:

```
switch(config)# dhcpv6-snooping guard-policy pol1
switch(config-dhcpv6-guard-policy)# preference min 6
switch(config-dhcpv6-guard-policy)# preference max 250
```

Disabling the server preference range on DHCPv6 snooping guard policy pol1:

```
switch(config)# dhcpv6-snooping guard-policy pol1
switch(config-dhcpv6-guard-policy)# no preference
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

show dhcpv6-snooping guard-policy

```
show dhcpv6-snooping guard-policy[<POLICY_NAME>] [vsx-peer]
```

Description

Shows the DHCPv6 snooping guard policy configuration.

Parameter	Description
<POLICY-NAME>	Specifies the DHCPv6 snooping guard policy for which the information is displayed.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

Showing the DHCPv6 snooping guard policy configuration:

```
switch# show dhcpv6-snooping guard-policy

 DHCPv6-Snooping guard-policy Information

    DHCPV6 Guard Policy name    : POL1

    DHCPV6 Guard Policy name    : POL3
    Attached Access List        : ACL3
    Attached Prefix List        : PRF3
    Preference Range            : 3-60
    Applied on VLAN             : 4,6
    Applied on Port
```

Showing the DHCPv6 snooping guard policy configuration for the policy named POLICY_NAME1:

```
switch# show dhcpv6-snooping guard-policy POLICY_NAME1

  DHCPv6-Snooping guard-policy Information
  ========================
    DHCPV6 Guard Policy name    : POLICY_NAME1
    Attached Access List        : ACL1
    Attached Prefix List        : PRF1
    Preference Range            : 0-255
        vsx-sync
    Applied on VLAN             : 5,7
    Applied on Port             : 1/1/1, 1/1/2
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.10	Command introduced.

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show dhcpv6-snooping guard-policy interface

`show dhcpv6-snooping guard-policy [interface <INTERFACE-NAME>] [vsx-peer]`

Description

Shows the DHCPv6 snooping guard policy configuration and statistics for the specified interface.

Parameter	Description
<INTERFACE-NAME>	Specifies the interface name for which the DHCPv6 guard counter information is displayed.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

Showing the DHCPv6 snooping guard policy configuration and statistics for interface 1/1/1:

```
switch# show dhcpv6-snooping guard-policy int 1/1/1
 DHCPv6 Guard Policy  Applied    : pol1
  DHCPv6 Guard Policy Counters
  ==========================

 DHCPv6 Packets Received         : 20
 DHCPv6 Packets Forwarded        : 5
 DHCPv6 Packets Dropped          : 15 [Total]
                                Access list error        [7]
                                Prefix list error        [8]
                                Server preference error  [0]
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.10	Command introduced.

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show dhcpv6-snooping guard-policy vlan

`show dhcpv6-snooping guard-policy [vlan <VLAN-ID>] [vsx-peer]`

Description

Shows the DHCPv6 snooping guard policy configuration and statistics for the specified VLAN.

Parameter	Description
<VLAN-ID>	Specifies the VLAN ID for which the DHCPv6 guard counter information is displayed.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

Showing the DHCPv6 snooping guard policy configuration and statistics for VLAN 100:

```
switch# show dhcpv6-snooping guard-policy vlan 2
 DHCPv6 Guard Policy  Applied    : pol1
  DHCPv6 Guard Policy Counters
  ==========================

 DHCPv6 Packets Received         : 20
 DHCPv6 Packets Forwarded        : 5
 DHCPv6 Packets Dropped          : 15 [Total]
                                Access list error        [0]
                                Prefix list error        [8]
                                Server preference error  [7]
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Chapter 35

DHCP options commands

http-proxy

```
http-proxy {<FQDN | IPV4-ADDR> | IPV6-ADDR[:PORT]} [vrf <VRF-NAME>]
no http-proxy [<FQDN | IPV4-ADDR>] [vrf <VRF-NAME>]
```

Description

Specifies HTTP proxy location and VRF.

When HTTP proxy location and VRF are configured on the switch, it overrides any existing HTTP proxy location and VRF as this has the highest priority over the values obtained from other sources.

Following locations can be used for the HTTP proxy location:

- A fully qualified domain name (FQDN).
- An IPv4 address with colon separated port number
- An IPv6 address with colon separated port number

When configuring an IPv6 address with a port number, the address must be specified inside square brackets. An example - [2001:0db8:85a3:0000:0000:8a2e:0370:7334]:8080.

If the command is entered without the VRF parameter, then the VRF used will be 'default' VRF.

The **no** form of this command removes a specified HTTP proxy location.

Parameter	Description
<FQDN>	Specifies FQDN for HTTP proxy location.
<IPV4-ADDR>	Specifies IPV4 address for HTTP proxy location.
<IPV6-ADDR>	Specifies IPV6 address for HTTP proxy location.
<VRF-NAME>	Specifies VRF for HTTP proxy.

A FQDN or IPV4 address are optional in the **no** form of the command.

Examples

Specifying a FQDN for HTTP proxy location and MGMT VRF:

```
switch(config)# http-proxy http-proxy.aruba.com vrf mgmt
switch(config)# http-proxy [2000::100]:8080 vrf mgmt
```

Removing HTTP proxy location

```
switch(config)# no http-proxy
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Chapter 36
DNS client commands

ip dns domain-list

```
ip dns domain-list <DOMAIN-NAME> [vrf <VRF-NAME>]
no ip dns domain-list <DOMAIN-NAME> [vrf <VRF-NAME>]
```

Description

Configures one or more domain names that are appended to the DNS request. The DNS client appends each name in succession until the DNS server replies. Domains can be either IPv4 or IPv6. By default, requests are forwarded on the default VRF.

The **no** form of this command removes a domain from the list.

Parameter	Description
`list <DOMAIN-NAME>`	Specifies a domain name. Up to six domains can be added to the list. Length: 1 to 256 characters.
`vrf <VRF-NAME>`	Specifies a VRF name. Default: default.

Examples

This example defines a list with two entries: **domain1.com** and **domain2.com**.

```
switch(config)# ip dns domain-list domain1.com
switch(config)# ip dns domain-list domain2.com
```

This example defines a list with two entries, **domain2.com** and **domain5.com**, with requests being sent on **mainvrf**.

```
switch(config)# ip dns domain-list domain2.com vrf mainvrf
switch(config)# ip dns domain-list domain5.com vrf mainvrf
```

This example removes the entry **domain1.com**.

```
switch(config)# no ip dns domain-list domain1.com
```

For more information on features that use this command, refer to the Fundamentals Guide or the IP Services Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config`	Administrators or local user group members with execution rights for this command.

ip dns domain-name

```
ip dns domain-name <DOMAIN-NAME> [ vrf <VRF-NAME> ]
no ip dns domain-name <DOMAIN-NAME> [ vrf <VRF-NAME> ]
```

Description

Configures a domain name that is appended to the DNS request. The domain can be either IPv4 or IPv6. By default, requests are forwarded on the default VRF. If a domain list is defined with the command `ip dns domain-list`, the domain name defined with this command is ignored.

The **no** form of this command removes the domain name.

Parameter	Description
<DOMAIN-NAME>	Specifies the domain name to append to DNS requests. Length: 1 to 256 characters.
`vrf` *<VRF-NAME>*	Specifies a VRF name. Default: default.

Examples

Setting the default domain name to `domain.com`:

```
switch(config)# ip dns domain-name domain.com
```

Removing the default domain name `domain.com`:

```
switch(config)# no ip dns domain-name domain.com
```

For more information on features that use this command, refer to the Fundamentals Guide or the IP Services Guide for your switch model.

ip dns host

```
ip dns host <HOST-NAME> <IP-ADDR> [ vrf <VRF-NAME> ]
no ip dns host <HOST-NAME> <IP-ADDR> [ vrf <VRF-NAME> ]
```

Description

Associates a static IP address with a hostname. The DNS client returns this IP address instead of querying a DNS server for an IP address for the hostname. Up to six hosts can be defined. If no VRF is defined, the default VRF is used.

The **no** form of this command removes a static IP address associated with a hostname.

Parameter	Description
`host <HOST-NAME>`	Specifies the name of a host. Length: 1 to 256 characters.
`<IP-ADDR>`	Specifies an IP address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255, or IPv6 format (`xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx`), where **x** is a hexadecimal number from 0 to F.
`vrf <VRF-NAME>`	Specifies a VRF name. Default: default.

Examples

This example defines an IPv4 address of **3.3.3.3** for **host1**.

```
switch(config)# ip dns host host1 3.3.3.3
```

This example defines an IPv6 address of **b::5** for **host 1**.

```
switch(config)# ip dns host host1 b::5
```

This example defines removes the entry for **host 1** with address **b::5**.

```
switch(config)# no ip dns host host1 b::5
```

For more information on features that use this command, refer to the Fundamentals Guide or the IP Services Guide for your switch model.

Command History

ip dns server address

```
ip dns server-address <IP-ADDR> [ vrf <VRF-NAME> ]
no ip dns server-address <IP-ADDR> [ vrf <VRF-NAME> ]
```

Description

Configures the DNS name servers that the DNS client queries to resolve DNS queries. Up to six name servers can be defined. The DNS client queries the servers in the order that they are defined. If no VRF is defined, the default VRF is used.

The **no** form of this command removes a name server from the list.

Parameter	Description
`<IP-ADDR>`	Specifies an IP address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255, or IPv6 format (`xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx`), where **x** is a hexadecimal number from 0 to F.
`vrf` *`<VRF-NAME>`*	Specifies a VRF name. Default: default.

Examples

This example defines a name server at **1.1.1.1**.

```
switch(config)# ip dns server-address 1.1.1.1
```

This example defines a name server at **a::1**.

```
switch(config)# ip dns server-address a::1
```

This example removes a name server at **a::1**.

```
switch(config)# no ip dns server-address a::1
```

For more information on features that use this command, refer to the Fundamentals Guide or the IP Services Guide for your switch model.

show ip dns

`show ip dns [vrf <VRF-NAME>][vsx-peer]`

Description

Shows all DNS client configuration settings or the settings for a specific VRF.

Parameter	Description
`vrf <VRF-NAME>`	Specifies the VRF for which to show information. If no VRF is defined, the default VRF is used.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

These examples define DNS settings and then show how they are displayed with the `show ip dns` command.

```
switch(config)# ip dns domain-name domain.com
switch(config)# ip dns domain-list domain5.com
switch(config)# ip dns domain-list domain8.com
switch(config)# ip dns server-address 4.4.4.4

```

DNS client arbitration on the MGMT interface on a MGMT VRF can be updated via three different methods.

1. Using the **domain-name <name>** or **nameservers <servers>** commands in the command-line interface.
2. Using the **ip dns domain-name <*DOMAIN-NAME*> vrf *MGMT*** or **ip dns server-address <SERVER> vrf MGMT** commands in the command-line interface.
3. Using the **ip dhcp** command in the command-line interface (dynamic enties).

AOS-CX gives the following priority levels to the these three update mothods.

- Priority 1 - standalone CLI configuration
- Priority 2 - static ip dns configuration
- Priority 3 - Dynamic config

For more information on features that use this command, refer to the Fundamentals Guide or the IP Services Guide for your switch model.

Chapter 37

ECMP commands

show ip ecmp

`show ip ecmp [vsx-peer]`

Description

Displays the Equal Cost Multipath (ECMP) configuration.

Parameter	Description
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

```
switch# show ip ecmp

ECMP Configuration
---------------------

 ECMP Status         : Enabled

ECMP Load Balancing by
------------------------
 Source IP           : Enabled
 Destination IP      : Enabled
 Source Port         : Enabled
 Destination Port    : Enabled
```

Chapter 38

ERPS Commands

clear erps ring <RINGID> instance <ID>

```
clear erps ring <RINGID> instance <ID>
```

Description

Removes the protection switching and triggers reversion both in revertive and non-revertive operation. This command will not change the configured revertive operation mode.

Parameter	Description
<RINGID>	Required, specifies the ID of the ring. Range: 1-239.
<ID>	Required, specifies the ID of the ring instance. Range: 1-2.

Examples

Removes the protection switching and triggers reversion for ring 3, instance 2:

```
switch# clear erps ring 3 instance 2
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

clear erps statistics

```
clear erps statistics [ring <ID>] [instance <ID>]
```

Description

This command clears the ERPS statistics for a ring or a ring instance.

Parameter	Description
<RINGID>	Optional, specifies the ID of the ring. Range: 1-239.
<ID>	Optional, specifies the ID of the ring instance. Range: 1-64.

Examples

Clear ERPS statistics for ring 1:

```
switch# clear erps statistics ring 1
```

Clear ERPS statistics for instance 1 of ring 1:

```
switch# clear erps statistics ring 1 instance 1
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

erps ring

```
erps ring <RINGID>
no erps ring <RINGID>
```

Description

This command creates an ERPS ring with a given ID.

The **no** form of this command removes all the configurations of the ring, including instances.

Parameter	Description
<RINGID>	Required, specifies the ID of the ring. Range: 1-239

Examples

Create an ERPS ring:

```
switch(config)# erps ring 2
switch(config-ring-2)#
```

Remove an ERPS ring:

```
switch(config)# no erps ring 2
switch(config-ring-2)#
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

erps ring <RINGID> <port0|port1> interface

```
erps ring <RINGID>
        <port0|port1> interface <ifname>
```

Description

This command configures the ERPS ring member port. An L2 interface in the switch is associated to one of the two member ports of an ERPS ring. In case of an interconnection node, only port0 is applicable for the sub-ring.

The **no** form of this command removes the association of the ring port to the L2 interface on the switch.

Parameter	Description
<RINGID>	Required, specifies the ID of the ring. Range: 1-239
<PORT0>	Required, set port0 of the ring.
<PORT1>	Required, set port1 of the ring.
<ifname>	Required, interface name (string).

Examples

Configure the ERPS ring member port:

```
switch(config)# erps ring 3
switch(config-erps-ring-3)# port0 interface 1/1/1
```

Remove the association of the ring port to the L2 interface on the switch:

```
switch(config)# erps ring 3
switch(config-erps-ring-3)# no port0
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

erps ring <RINGID> description

```
erps ring <RINGID>
        description <LINE>
```

Description

This command adds descriptive information to help administrators and operators understand the purpose of a ring. 1-64 printable ASCII characters are allowed.

The **no** form of this command removes the ring instance description.

Parameter	Description
<RINGID>	Required, specifies the ID of the ring. Range: 1-239
<LINE>	Required, specifies the description text. Maximum length is 64 characters.

Examples

Add descriptive information to a ring:

```
switch(config)# erps ring 3
switch(config-erps-ring-3) description HPE RnD ring
```

Remove descriptive information from a ring:

```
switch(config)# erps ring 3
switch(config-erps-ring-3) no description
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

erps ring <RINGID> guard-interval

```
erps ring <RINGID>
        guard-interval <10 milliseconds>
```

Description

Guard timer is used in nodes recovering from a local failure to avoid loops due to earlier Signal Fail (SF) messages that may be in the ring.

The configuration specifies the guard timer duration in units of 10 ms. The timer period must be greater than the maximum expected forwarding delay in which an R-APS message traverses the entire ring. The default value is 50.

The **no** form of this command removes the configured value of the guard interval and sets it to the default value of 50.

Parameter	Description
<RINGID>	Required, specifies the ID of the ring. Range: 1-239
<10 milliseconds>	Required, specifies the guard timer duration in units of 10 ms. Default: 50.

Examples

Specify the guard timer duration:

```
switch(config)# erps ring 3
switch(config-erps-ring-3)#  guard-interval 100
```

Remove the configured value of the guard interval and set it to the default value of 50:

```
switch(config)# erps ring 3
switch(config-erps-ring-3)# no guard-interval
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

erps ring <RINGID> hold-off-interval

```
erps ring <RINGID>
        hold-off-interval <100 milliseconds>
```

Description

Specifies hold-off interval in units of 100 ms. If specified, a defect is not reported immediately. Instead, the hold-off timer is started. On expiration of the timer, if the defect still exists, it is reported to protection switching. The default value for hold-off timer is 0.

The **no** form of this command removes the configured value of the hold-off interval and sets it to the default value of 0.

Parameter	Description
<RINGID>	Required, specifies the ID of the ring. Range: 1-239
<100 milliseconds>	Required, specifies the hold-off interval in units of 100 ms. Default: 0.

Examples

Specify the hold-off interval:

```
switch(config)# erps ring 3
switch(config-erps-ring-3)# hold-off-interval 100
```

Remove the configured value of the hold-off interval and set it to the default value of 0:

```
switch(config)# erps ring 3
switch(config-erps-ring-3)# no hold-off-interval
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

erps ring <RINGID> instance

```
erps ring <RINGID>
       instance <ID>
```

Description

On a common ERPS network, a physical ring can be configured with a single ERPS ring, and only one blocked port can be specified in the ring. When the ERPS ring is in normal state, the blocked port prohibits all service packets from passing through. As a result, all service data is transmitted through one path over the ERPS ring, and the other link on the blocked port becomes idle, leading to ineffective use of bandwidth.

To improve link use efficiency, logical rings can be configured in the same physical ring in the ERPS multi-instance. A port may have different roles in different ERPS rings and different ERPS rings use different control VLANs.

An ERPS ring must be configured with an ERP instance, and each ERP instance specifies a range of VLANs. The topology calculated for a specific ERPS ring only takes effect in the ERPS ring. Different VLANs can use separate paths, implementing traffic load balancing and link backup.

The **no** form of this command removes the instance of the ring.

Parameter	Description
<RINGID>	Required, specifies the ID of the ring. Range: 1-239
<ID>	Required, specifies the ERPS ring instance identifier. Range: 1-2.

Examples

Create a ring instance:

```
switch(config)# erps ring 3
switch(config-ring-3)# instance 2
```

Remove a ring instance:

```
switch(config)# erps ring 3
switch(config-ring-3)# no instance 2
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

erps ring <RINGID> instance <ID> control-vlan

```
erps ring <RINGID>
        instance <ID> control-vlan <VID>
```

Description

This command adds a control-channel VLAN to a ring instance. In an ERPS ring, the control VLAN should be used only to forward RAPS PDUs and not service packets. All the devices in an ERPS ring instance must be configured with the same control VLAN, and different ERPS ring instances must use different control VLANs.

The **no** form of this command removes the control-channel VLAN of the ring instance.

Parameter	Description
<RINGID>	Required, specifies the ID of the ring. Range: 1-239
<ID>	Required, specifies the ERPS ring instance identifier. Range: 1-2.
<VID>	Required, VLAN ID. Range: 1-4094.

Examples

Add a control-channel VLAN to a ring instance:

```
switch(config)# erps ring 3
switch(config-erps-ring-3)# instance 2
switch(config-erps-ring-3-inst-2) control-vlan 10
```

Remove the control-channel VLAN of the ring instance:

```
switch(config)# erps ring 3
switch(config-erps-ring-3)# instance 2
switch(config-erps-ring-3-inst-2) no control-vlan
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

erps ring <RINGID> instance <ID> description

```
erps ring <RINGID>
        instance <ID> description <LINE>
```

Description

This command adds descriptive information to help administrators and operators understand the purpose of a ring instance. 1-64 printable ASCII characters are allowed.

The **no** form of this command removes the ring instance description.

Command context

Parameter	Description
<RINGID>	Required, specifies the ID of the ring. Range: 1-239
<ID>	Required, specifies the ERPS ring instance identifier. Range: 1-2.
<LINE>	Required, descriptive information about the ring instance. 1-64 printable ASCII characters allowed.

Examples

Add ring instance description:

```
switch(config)# erps ring 3
switch(config-erps-ring-3)# instance 2
switch(config-erps-ring-3-inst-2) description HPE RnD DataVlan
```

Remove ring instance description:

```
switch(config)# erps ring 3
switch(config-erps-ring-3)# instance 2
switch(config-erps-ring-3-inst-2) no description
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

erps ring <RINGID> instance <ID> enable

```
erps ring <RINGID>
        instance <ID> enable
```

Description

This configuration enables protection switching on the given instance of the ring. It is disabled by default.

The **no** form of this command disables protection switching on the given instance of the ring.

Parameter	Description
<RINGID>	Required, specifies the ID of the ring. Range: 1-239
<ID>	Required, specifies the ERPS ring instance identifier. Range: 1-2.

Examples

Enable protection switching on the given instance of the ring:

```
switch(config)# erps ring 3
switch(config-erps-ring-3)# instance 2
switch(config-erps-ring-3-inst-2) enable
```

Disable protection switching on the given instance of the ring:

```
switch(config)# erps ring 3
switch(config-erps-ring-3)# instance 2
switch(config-erps-ring-3-inst-2) no enable
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

erps ring <RINGID> instance <ID> protected-vlans

```
erps ring <RINGID>
        instance <ID> protected-vlans <VID-LIST>
```

Description

This command specifies the set of VLANs that are protected by this ring instance.

The **no** form of this command removes a set of VLANs that are protected by this ring instance.

Parameter	Description
<RINGID>	Required, specifies the ID of the ring. Range: 1-239
<ID>	Required, specifies the ERPS ring instance identifier. Range: 1-2.
<VID-LIST>	Required, range of VLANs to be protected by this ring instance. Range: 1-4094.

Examples

Specify a set of VLANs that are protected by this ring instance:

```
switch(config)# erps ring 3
switch(config-erps-ring-3)# instance 2
switch(config-erps-ring-3-inst-2) protected-vlans 1,10-50
```

Remove a set of VLANs that are protected by this ring instance:

```
switch(config)# erps ring 3
switch(config-erps-ring-3)# instance 2
switch(config-erps-ring-3-inst-2) no protected-vlans 11,13
```

erps ring <RINGID> instance <ID> protection-switch {{manual|force} <PORT0>|<PORT1>}

```
erps ring <RINGID> instance <ID> protection-switch {{manual|force} <PORT0>|<PORT1>}
```

Description

Blocks a specific ring interface in one of the two following ways:

- Force: The switch blocks a specific ring interface regardless of the protection switching state of the ring instance.
- Manual: The switch blocks a specific ring interface if no other protection switch event is active on the ring instance.

The user can verify whether the protection-switch is successful by verifying the status of instance and port state over which this command is executed.

```
switch# erps ring 1 instance  1 protection-switch force port0
switch# show erps  status
Status for ERPS Ring 1 Instance 1:
====================================
Ring ID                       : 1
Instance ID                   : 1
Port0                         : 1/1/5 (Block)
Port1                         : 1/1/6 (Up)
Node Role (RPL)               : Owner (port0)
Control VLAN                  : 50
Protected VLAN                : 1-49
Subring (TCN)                 : No (No)
Revertive Operation           : Revertive
MEG Level                     : 7
Transmission Interval         : 5 sec
Guard Interval                : 0 sec 500 ms
Hold-Off Interval             : 0 sec 0 ms
WTR Interval                  : 1 min
Status                        : Forced-switch
Oper Down Reason              : None
```

Parameter	Description
<RINGID>	Required, specifies the ID of the ring. Range: 1-239
<ID>	Required, specifies the ERPS ring instance identifier. Range: 1-2.
manual	A type of protection switch event in which the switch blocks a specific ring interface if no other protection switch event is active on the ring instance.
force	A type of protection switch event in which the switch blocks a specific ring interface regardless of the protection switching state of the ring instance.

Examples

Block ring 3, interface 2, port 0 if no other protection switch event is active on the ring instance:

```
switch# erps ring 3 instance 2 protection-switch manual port0
```

Block ring 3, instance 2, regardless of the protection switching state of the ring instance:

```
switch# erps ring 3 instance 2 protection-switch force port1
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

erps ring <RINGID> instance <ID> revertive

```
erps ring <RINGID> instance <ID> revertive
```

Description

Configures the default revertive mode of operation for an ERPS ring. In revertive operation, after the conditions causing protection switching are cleared, traffic channels are restored to the recovered link blocking the RPL. This configuration is meaningful only on the RPL node.

The **no** form of this command configures non-revertive mode of operation for an ERPS ring. In non-revertive operation, the traffic channels continue to use the RPL, if it has not failed, after conditions causing protection switching are cleared. This configuration is meaningful only on the RPL node.

Parameter	Description
<RINGID>	Required, specifies the ID of the ring. Range: 1-239
<ID>	Required, specifies the ERPS ring instance identifier. Range: 1-2.

Examples

Configuring the default revertive mode of operation for ERPS ring 3, instance 2:

```
switch(config)# erps ring 3
switch(config-erps-ring-3)# instance 2
switch(config-erps-ring-3-inst-2)# revertive
```

Configuring non-revertive mode of operation for ERPS ring 3, instance 2:

```
switch(config)# erps ring 3
switch(config-erps-ring-3)# instance 2
switch(config-erps-ring-3-inst-2)# no revertive
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

erps ring <RINGID> instance <ID> role

```
erps ring <RINGID>
        instance <ID> role <RPL-OWNER|RPL-NEIGHBOR>
```

Description

In ERPS, there is a central node called RPL Owner Node which blocks one of the ports to ensure that there is no loop formed for the Ethernet traffic. The link blocked by the RPL owner node is called the Ring Protection Link or RPL. The node at the other end of the RPL is known as RPL Neighbor Node. It uses R-APS control messages to coordinate the activities of switching on/off the RPL link.

This command specifies the role of the node as owner or neighbor.

The **no** form of this command removes the configuration of the node role from the instance.

Parameter	Description
<RINGID>	Required, specifies the ID of the ring. Range: 1-239
<ID>	Required, specifies the ERPS ring instance identifier. Range: 1-2.
<RPL-OWNER>	Blocks traffic at one end of the RPL. The blocked end sends out periodic R-APS.
<RPL-NEIGHBOR>	Blocks traffic at one end of the RPL. The blocked end does not generate periodic R-APS.

Examples

Specify the role of the node as owner:

```
switch(config)# erps ring 3
switch(config-erps-ring-3)# instance 2
switch(config-erps-ring-3-inst-2) role rpl-owner
```

Specify the role of the node as neighbor:

```
switch(config)# erps ring 3
switch(config-erps-ring-3)# instance 3
switch(config-erps-ring-3-inst-2) role rpl-neighbour
```

Remove the configuration of the node role from the instance:

```
switch(config)# erps ring 3
switch(config-erps-ring-3)# instance 2
switch(config-erps-ring-3-inst-2) no role
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

Command History

erps ring <RINGID> instance <ID> rpl

```
erps ring <RINGID>
        instance <ID> rpl <port0|port1>
```

Description

In ERPS, there is a central node called RPL Owner Node which blocks one of the ports to ensure that there is no loop formed for the Ethernet traffic. The link blocked by the RPL owner node is called the Ring Protection Link or RPL. The node at the other end of the RPL is known as RPL Neighbor Node. It uses R-APS control messages to coordinate the activities of switching the RPL link on and off.

This command specifies which of the ERPS ring ports is the RPL.

The **no** form of this command removes the RPL port configuration from the ERPS ring instance.

Parameter	Description
<RINGID>	Required, specifies the ID of the ring. Range: 1-239
<ID>	Required, specifies the ERPS ring instance identifier. Range: 1-2.
<PORT0>	Required, configure port0 to be RPL port in this ERPS ring instance.
<PORT1>	Required, configure port1 to be RPL port in this ERPS ring instance.

Examples

Configure port0 to be RPL port in this ERPS ring instance:

```
switch(config)# erps ring 3
switch(config-erps-ring-3)# instance 2
switch(config-erps-ring-3-inst-2) role rpl-owner
switch(config-erps-ring-3-inst-2) rpl port0
```

Configure port1 to be RPL port in this ERPS ring instance:

```
switch(config)# erps ring 3
switch(config-erps-ring-3)# instance 3
switch(config-erps-ring-3-inst-2) role rpl-neighbour
switch(config-erps-ring-3-inst-2) rpl port1
```

Remove the RPL port configuration from the ERPS ring Instance:

```
switch(config)# erps ring 3
switch(config-erps-ring-3)# instance 2
switch(config-erps-ring-3-inst-2) no rpl port0
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

erps ring <RINGID> meg-level

```
erps ring <RINGID>
        meg-level <-0-7>
```

Description

The R-APS messages transmitted by ERPS take the form of OAM PDUs as defined in G.8013. Each OAM PDU is transmitted at a specified level known as the Maintenance Entity Group (MEG) level. This command configures the level with which the ERPS packets must be transmitted.

The **no** form of this command removes the configured MEG level and sets it to the default value of 7.

Parameter	Description
<RINGID>	Required, specifies the ID of the ring. Range: 1-239
<0-7>	Required, specifies the meg-level. Range: 0-7. Default: 7.

Examples

Specify the meg-level:

```
switch(config)# erps ring 3
switch(config-erps-ring-3)# meg-level 4
```

Remove the configured meg-level and set it to the default value of 7:

```
switch(config)# erps ring 3
switch(config-erps-ring-3)# no meg-level
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

erps ring <RINGID> parent-ring

```
erps ring <RINGID>
        parent-ring <RINGID>
```

Description

This command associates a sub-ring to a parent-ring and is required for the sub-ring to notify the parent-ring on change in topology.

The **no** form of this command removes the parent ring identifier.

Parameter	Description
<RINGID>	Required, specifies the ID of the ring. Range: 1-239
<RINGID>	Required, specifies the ID of the parent-ring. Range: 1-239

Examples

Associate a sub-ring to a parent-ring:

```
switch(config)# erps ring 3
switch(config-erps-ring-3)#  parent-ring 2
```

Remove a parent-ring identifier:

```
switch(config)# erps ring 3
switch(config-erps-ring-3)# no parent-ring 2
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

erps ring <RINGID> sub-ring

```
erps ring <RINGID>
        sub-ring
```

Description

This command is to configure a sub-ring. If not specified, the ring is a major-ring.

The **no** form of this command removes the sub-ring configuration of the ring and configures it to be a major-ring.

Parameter	Description
<RINGID>	Required, specifies the ID of the ring. Range: 1-239

Examples

Configure a sub-ring:

```
switch(config)# erps ring 2
switch(config-erps-ring-2)# sub-ring
```

Remove the sub-ring configuration from ring 2 and configure it to be a major-ring:

```
switch(config)# erps ring 2
switch(config-erps-ring-2)# no sub-ring
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-erps-ring-<ringid>`	Administrators or local user group members with execution rights for this command.

erps ring <RINGID> tcn-propogation

```
erps ring <RINGID>
        tcn-propogation
```

Description

This command is to configure a sub-ring interconnection node to pass a topology change notification to the ring instance for the parent ring whenever the topology of the sub-ring changes. The parent ring instance performs a Forwarding Database (FDB) flush and sends a protocol message to ensure that other nodes on the parent ring also perform an FDB flush.

The **no** form of this command disables topology change notifications.

Parameter	Description
<RINGID>	Required, specifies the ID of the ring. Range: 1-239

<RINGID>
Required, specifies the ID of the ring. Range: 1-239

Examples

Configure topology change notifications:

```
switch(config)# erps ring 2
switch(config-erps-ring-2)# tcn-propogation
```

Disable topology change notifications:

```
switch(config)# erps ring 2
switch(config-erps-ring-2)# no tcn-propogation
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

erps ring <RINGID> transmission-interval

```
erps ring <RINGID>
        transmission-interval <SECONDS>
```

Description

Specifies the R-APS periodic transmission interval in units of seconds. Default is 5 seconds.

The **no** form of this command removes the configured value of the transmission interval and sets it to the default value of 5 seconds.

Parameter	Description
<RINGID>	Required, specifies the ID of the ring. Range: 1-239
<SECONDS>	Required, specifies the R-APS periodic transmission interval in units of seconds. Range: 5 seconds.

Examples

Specify the R-APS periodic transmission interval as 10 seconds:

```
switch(config)# erps ring 3
switch(config-erps-ring-3)#  transmission-interval 10
```

Remove the configured value of the transmission interval and set it to the default value of 5 seconds:

```
switch(config)# erps ring 3
switch(config-erps-ring-3)# no transmission-interval
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

erps ring <RINGID> wtr-interval

```
erps ring <RINGID>
        wtr-interval <MINUTES>
```

Description

The RPL owner node uses a delay timer before initiating an RPL block in case of both revertive mode of operation or before reverting to idle state after clearing operator commands (FS, MS).

The Wait to Restore (WTR) timer can be configured in 1-minute increments up to 12 minutes. The default value is 5 minutes. When recovering from an SF, the delay timer must be long enough to allow the recovering network to become stable. In the default revertive mode of operation, the WTR timer is used to prevent frequent operation of protection switching due to intermittent SF defects.

The **no** form of this command removes the configured value of the wtr-interval and sets it to the default value of 5 minutes.

Parameter	Description
<RINGID>	Required, specifies the ID of the ring. Range: 1-239
<MINUTES>	Required, specifies the wtr-interval in minutes. Range: 1-12. Default: 5.

Examples

Specify the wtr-interval:

```
switch(config)# erps ring 3
switch(config-erps-ring-3)# wtr-interval 7
```

Remove the configured value of the wtr-interval and set it to the default value of 5 minutes:

```
switch(config)# erps ring 3
switch(config-erps-ring-3)# no wtr-interval
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

show erps statistics

`show erps statistics [ring <RINGID>] [instance <ID> [<PORT0>|<PORT1>]]`

Description

This command displays ERPS statistics. The statistics can be displayed for the ring, the instance, or the instance ports.

Parameter	Description
<RINGID>	Optional, specifies the ID of the ring. Range: 1-239.
<ID>	Optional, specifies the ID of the ring instance. Range: 1-2.
<PORT0>	Optional, specifies the ring member port 0.
<PORT1>	Optional, specifies the ring member port 1.

Examples

```
switch# show erps statistics ring 1

Statistics for ERPS ring 1 instance 1:
======================================
                Port0                  Port1
                -----                  -----
Local Failures  4                      1

R-APS           Port0(Tx/Rx)           Port1(Tx/Rx)
-----           ------------           ------------

show erps status

`show erps status [ring <RINGID>] [instance <ID>]`

Description

This command displays detailed information about a specific ring or all instances of a ring.

The ring instance may be in one of the following states:

- **Idle**: The ring instance is operational.
- **Initializing**: The ring instance is not operational.
- **Protection**: Protection switching has been triggered by a local or remote link failure.
- **Pending**: Pending clearance of a previous protection switch.
- **Down**: Ring instance is not active.
- **Manual-switch**: Manual protection switching triggered by Admin-down.
- **Force-switch**: Forced protection switching triggered by admin.

A ring instance has the following reasons for "down" state:

- **Disabled**: Ring instance is administratively disabled.
- **Inconsistent Port Config**: The same port is configured as port0 and port1 or RPL port is configured by Admin-down.
- **Incomplete Port Config**: Only one or no ring port is configured.
- **Protected VLANs Not Configured**: Protected VLAN list is empty.
- **Control VLAN Not Configured**: Control VLAN is not configured.

The ring ports can be in one of the following states:

- **Up**: Port forwards control and data traffic.
- **Blocked**: Port blocks both control and data traffic.

Parameter	Description
<RINGID>	Optional, specifies the ID of the ring. Range: 1-239.
<ID>	Optional, specifies the ID of the ring instance. Range: 1-2.

Examples

Show ERPS status for ring 1 and instance 1:

```
Status for ERPS Ring 1 Instance 1
=================================
Ring ID                         : 1
Ring description                : ring_1

Chapter 39 EVPN commands

active-gateway

```
active-gateway {ip | ipv6} [<IP-ADDRESS>] [mac <MAC-ADDRESS>]
no active-gateway {ip | ipv6} [<IP-ADDRESS>] [mac]
```

Description

Configures an EVPN Anycast gateway that can be used on multiple VTEPs. The Active Gateway supports both IPv4 and IPv6 addresses. The Active Gateway MAC address used along with an IPv4 and IPv6 address must match on a given interface, for the EVPN Anycast Gateway solution to work as expected. Active Gateway and SVI sharing the same IP is supported for both IPv4 and IPv6 addresses. The Active Gateway IP for IPv6 should be a Link-Local IPv6 address if the default Gateway is learned via RA messages.

The **no** form of this command removes the active gateway for active-active routing.

Parameter	Description
`ip`	Specifies the configuration of an IPv4 address.
`ipv6`	Specifies the configuration of an IPv6 address.
`<IP-ADDRESS>`	Specifies the IPv4 or IPv6 address. ▪ Syntax for IPv4: `A.B.C.D` ▪ Syntax for IPv6: `A:B::C:D`
`<MAC-ADDRESS>`	Specifies the Virtual MAC address. Syntax: `xx:xx:xx:xx:xx:xx`

Usage

Before configuring active gateway, confirm that an IP address is on the SVI that is in the same subnet as the active gateway IP you are trying to configure. If an active gateway IP does not have an SVI IP with the same subnet, the CLI allows the configuration, but the active gateway IP will not be programmed in the kernel, resulting the active gateway to be unreachable.

Active forwarding cannot be configured when ICMP redirect is enabled. Enter the `no ip icmp redirect` command for disabling ICMP redirect.

It is highly recommended that you use an IPv6 link-local address as a gateway (VIP) on the active gateway IPv6 configuration.

If VRRP or active forwarding is configured on an SVI, active gateway cannot be configured. Active gateway with overlapping networks is not allowed. Maximum of 16 unique virtual MACs are supported in a system.

The maximum number of supported active gateways per switch is 4,000. Since a maximum of 31 secondary IPv4 addresses can be configured on an SVI, 32 IPv4 active gateways (along with the primary

IPv4 address) can be configured per SVI with IP multinetting support. This support is also the same for IPv6 addresses.

Do not use peer system MAC address as an active-gateway VMAC. If same MAC address is used, the VSX synchronization will try to sync the configuration on secondary switch and cause traffic disruptions.

Examples

Configuring active-gateway when the IP address is different from the SVI IP address on both VSX peers (valid for IPv4 and IPv6):

Switch 1:

```
switch1(config-if-vlan)# ip address 192.168.1.250/24
switch1(config-if-vlan)# active-gateway ip 192.168.1.253 mac 00:00:00:00:00:01
switch1(config-if-vlan)# active-gateway ipv6 fe80::01 mac 00:00:00:01:00:01
```

Switch 2:

```
switch2(config-if-vlan)# ip address 192.168.1.251/24
switch2(config-if-vlan)# active-gateway ip 192.168.1.253 mac 00:00:00:00:00:01
switch2(config-if-vlan)# active-gateway ipv6 fe80::01 mac 00:00:00:01:00:01
```

Configuring active-gateway when the IP address is the same as the SVI IP address on both VSX peers (valid for IPv4 and IPv6):

Switch 1:

```
switch1(config-if-vlan)# ip address 192.168.1.250/24
switch1(config-if-vlan)# active-gateway ip 192.168.1.250 mac 00:00:00:00:00:01
switch1(config-if-vlan)# active-gateway ipv6 fe80::100 mac 00:00:00:00:00:01
switch1(config-if-vlan)# ipv6 address link-local fe80::100/64
```

Switch 2:

```
switch2(config-if-vlan)# ip address 192.168.1.250/24
switch2(config-if-vlan)# active-gateway ip 192.168.1.250 mac 00:00:00:00:00:01
switch2(config-if-vlan)# active-gateway ipv6 fe80::100 mac 00:00:00:00:00:01
switch2(config-if-vlan)# ipv6 address link-local fe80::100/64
```

Configuring only the active gateway address:

```
switch(config-if-vlan)# ip address 192.168.1.250/24
switch(config-if-vlan)# active-gateway ip 192.168.1.250
```

Configuring only the active gateway IP MAC address:

```
switch2(config-if-vlan)# ip address 192.168.1.250/24
switch2(config-if-vlan)# active-gateway ip mac 00:00:00:01:00:01
```

Removing the active gateway for active-active routing (IPv6 and IPv4):

```
switch(config-if-vlan)# no active-gateway ip
switch(config-if-vlan)# no active-gateway ipv6
```

Removing the active gateway for active-active routing for an IP address:

```
switch(config-if-vlan)# no active-gateway ip 192.168.1.250
```

Removing the active gateway for active-active routing for virtual MAC addresses:

```
switch(config-if-vlan)# no active-gateway ip mac
```

When configuring the virtual active gateway for IPv6 on an SVI, it is recommended to use the same global IPv6 and active gateway IPv6 address. Similarly, if you want to use the IPv6 link-local address for the virtual active gateway then the same address should be configured for both the SVI and the active gateway.

Global IPv6 address:

```
switch(config-if-vlan)# ipv6 address 1001::1/64
switch(config-if-vlan)# active-gateway ipv6 1001::1
switch(config-if-vlan)# active-gateway ipv6 mac 00:00:00:00:aa:01
```

IPv6-Link-Local address:

```
switch(config-if-vlan)# ipv6 address link-local fe80::1/64
switch(config-if-vlan)# active-gateway ipv6 fe80::1
switch(config-if-vlan)# active-gateway ipv6 mac 00:00:00:00:aa:01
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

Command History

Release	Modification
10.09.0010	Added IPv6 support for configuration of active gateway and SVI with the same IP address.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-if-vlan`	Administrators or local user group members with execution rights for this command.

arp-suppression

`arp-suppression`

```
no arp-suppression
```

Description

Enables ARP suppression for EVPN VXLAN globally across all Layer 2 VNIs configured on the VTEP. If the target address is present in the neighbor cache, the switch responds to the broadcast or unicast ARP request. ARP suppression is disabled by default. If the target IP/MAC is not present, the switch forwards arp request over the VXLAN data plane for neighbor resolution.

The **no** form of this command disables the ARP suppression.

Examples

Configuring ARP suppression in EVPN:

```
switch(config-evpn)# arp-suppression
switch(config-evpn)# no arp-suppression
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

6300 6400	`config-evpn` `config-evpn-vlan`	Administrators or local user group members with execution rights for this command.

disable (evpn vlan-aware-bundles)

```
disable
```

Description

Disables the VLAN aware bundle instance.

Examples

Disabling the VLAN aware bundle instance bundle_1.

```
switch(config-evpn)# vlan-aware-bundle bundle_1
switch(config-evpn-vlan-aware-bundle-bundle_1)# disable
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

Command History

Release	Modification
10.12	Command introduced.

Command Information

Platforms	Command context	Authority
6300 6400	`config-evpn-vlan-aware-bundle`	Administrators or local user group members with execution rights for this command.

enable(evpn vlan-aware-bundles)

```
enable
```

Description

Enables the VLAN aware bundle instance.

Examples

Enabling the VLAN aware bundle instance bundle_1.

```
switch(config-evpn)# vlan-aware-bundle bundle_1
switch(config-evpn-vlan-aware-bundle-bundle_1)# enable
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

Command History

Release	Modification
10.12	Command introduced.

Command Information

Platforms	Command context	Authority
6300 6400	`config-evpn-vlan-aware-bundle`	Administrators or local user group members with execution rights for this command.

evpn

```
evpn
no evpn
```

Description

Specifies the EVPN context which provides the configurations for VLAN-based EVPN service mode.

The **no** form of this command removes this configuration.

Examples

Configuring the EVPN context:

```
switch(config)# evpn
switch(config-evpn)#
```

Removing the EVPN configuration context:

```
switch(config-evpn)# no evpn
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

mac-move-detection count timer

```
mac-move-detection count <MAC-MOVE-COUNT> timer <MAC-MOVE-TIMER>
no mac-move-detection count <MAC-MOVE-COUNT> timer <MAC-MOVE-TIMER>
```

Description

Configures EVPN MAC dampening for duplicate MAC and MAC-move count and timer across VTEPs.

The **no** form of this command resets the value of the count and timer to the default values of `5` and `180` seconds respectively.

EVPN MAC dampening is always enabled. Links to the VTEPs must be always up for EVPN MAC dampening to be activated.

Parameter	Description
`count <MAC-MOVE-COUNT>`	Specifies the number of MAC-moves for MAC dampening to take effect. Range: 2 to 10. Default: 5.
`timer <MAC-MOVE-TIMER>`	Specifies the MAC-move time limit in seconds for MAC dampening to take effect. Range: 1 to 1000 seconds. Default: 180 seconds.

Examples

Configuring EVPN MAC dampening:

```
switch(config-evpn)# mac-move-detection count 6 timer 199
```

The above command dampens a MAC if the MAC moves six times within 199 seconds.

```
switch(config-evpn)# mac-move-detection count 8
```

The above command dampens a MAC if the MAC moves eight times within 180 seconds.

```
switch(config-evpn)# mac-move-detection timer 255
```

The above command dampens a MAC if the MAC moves five times within 255 seconds.

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

nd-suppression

```
nd-suppression
no nd-suppression
```

Description

Enables ND suppression for EVPN VXLAN globally. If the target address is present in the NDMD cache, the switch responds to the IPv6 multicast or unicast neighbor solicitation. ND suppression is disabled by default.

The **no** form of this command disables the ND suppression.

Examples

Configuring ND suppression in EVPN:

```
switch(config-evpn)# nd-suppression
switch(config-evpn)# no nd-suppression
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

rd

```
rd {auto | <AS-NUMBER:ID> | <IP-ADDRESS:ID>}
no rd {auto | <AS-NUMBER:ID> | <IP-ADDRESS:ID>}
```

Description

Specifies a unique number prepended to the advertised routes within the VLAN. It ensures support for overlapping IP addresses and MACs across different tenants. The default value is NULL. Route Distinguisher (RD) has to be manually configured by a user.

The **no** form of this command removes the currently configured value.

Parameter	Description
`auto`	Specifies automatic route filtering.
<AS-NUMBER:ID>	Specifies the AS number. It can be a 1-byte or 4-byte value. If the AS number is a 2-byte value, the administrative number is a 4-byte value and if the AS number is 4-byte value, the administrative number is a 2-byte value.
<IP-ADDRESS:ID>	Specifies the IP address. It is a 4-byte value and the ID is 2 bytes.

Examples

Configuring Route Distinguisher for EVPN VLAN:

```
switch(config-evpn)# vlan 10
switch(config-evpn-vlan-10)# rd 6800:1
switch(config-evpn)# vlan 20
switch(config-evpn-vlan-20)# rd auto
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

rd (evpn vlan-aware-bundles)

```
rd {<AS-NUMBER:NN> | <IP-ADDRESS:NN>}
no rd {<AS-NUMBER:NN> | <IP-ADDRESS:NN>}
```

Description

Specifies a unique number prepended to the EVPN routes, advertised in the context of any VLAN configured under an EVPN VLAN aware bundle instance.

The **no** form of this command removes this configuration.

Parameter	Description
<AS-NUMBER:NN>	Specifies the AS number. The AS number can be a 2-byte or 4-byte value. If the AS number is a 2-byte value, the administrative number is a 4-byte value and if the AS number is 4-byte value, the administrative number is a 2-byte value.
<IP-ADDRESS:NN>	Specifies the IP address. The IP address is a 4-byte value and the ID is a 2--byte value.

Usage

This command ensures the support for overlapping IPs and MACs across different tenants. `rd` should be manually configured. `rd` should be unique acorss all VLAN-based (VLANs) and VLAN-aware (bundles) service instances.

Examples

Configuring rd 6800:1.

```
switch(config-evpn)# vlan-aware-bundle bundle_1
switch(config-evpn-vlan-aware-bundle-bundle_1)# rd 6800:1
```

Removing rd 6800:1.

```
switch(config-evpn)# vlan-aware-bundle bundle_1
switch(config-evpn-vlan-aware-bundle-bundle_1)# no rd 6800:1
```

Configuring rd 1.2.3.4:55.

```
switch(config-evpn)# vlan-aware-bundle bundle_1
switch(config-evpn-vlan-aware-bundle-bundle_1)# rd 1.2.3.4:55
```

Removing rd 1.2.3.4:55.

```
switch(config-evpn)# vlan-aware-bundle bundle_1
switch(config-evpn-vlan-aware-bundle-bundle_1)# no rd 1.2.3.4:55
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

redistribute host-route

```
redistribute host-route
no redistribute host-route
```

Description

Enables type-2 route advertisement to include the L3VNI, RT, and router MAC of the associated IP-VRF. It is applicable only in Symmetric routing where L3VNI is configured.

The **no** form of this command disables the redistribution of host routes.

Parameter	Description
`host-route`	Specifies redistribution of host routes.

Examples

Configuring Redistribute host-route in EVPN:

```
switch(config-evpn)# vlan 10
switch(config-evpn-vlan-10)# redistribute host-route
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

redistribute host-route (evpn vlan-aware-bundles)

```
redistribute host-route
no redistribute host-route
```

Description

Enables EVPN Route Type-2 advertisement to include L3VNI, Route Target, and Router MAC of the associated IP-VRF in the EVPN VLAN Aware Bundles.

The **no** form of this command removes this configuration.

Usage

This is only applicable in cases of symmetric routing where L3VNI is configured.

Examples

Enabling route advertisement in VLAN aware bundle bundle_1.

```
switch(config-evpn)# vlan-aware-bundle bundle_1
switch(config-evpn-vlan-aware-bundle-bundle_1)# redistribute host-route
```

Removing the route advertisement in VLAN aware bundle bundle_1.

```
switch(config-evpn)# vlan-aware-bundle bundle_1
switch(config-evpn-vlan-aware-bundle-bundle_1)# no redistribute host-route
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

redistribute local-mac

```
redistribute local-mac
no redistribute local-mac
```

Description

Enables Type-2 route advertisement for local MAC address of the SVI interfaces corresponding to the EVPN-enabled VLANs.

The **no** form of this command disables the Type-2 route advertisement.

Examples

```
switch(config)# evpn
switch(config)# redistribute local-mac
switch(config)# vlan 20
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

Command Information

Platforms	Command context	Authority
All platforms	`config-evpn`	Administrators or local user group members with execution rights for this command.

redistribute local-svi

```
redistribute local-svi
no redistribute local-svi
```

Description

Enables type-2 route advertisement for the local IP address and MAC address of the SVI interfaces corresponding to the EVPN-enabled VLANs.

The **no** form of this command disables type-2 route advertisement for the local IP address and MAC address of the SVI interfaces corresponding to the EVPN-enabled VLANs.

Examples

Enabling type-2 route advertisement:

```
switch(config)# evpn
switch(config-evpn)# redistribute local-svi
```

Disabling type-2 route advertisement:

```
switch(config)# evpn
switch(config-evpn)# no redistribute local-svi
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

route-target

```
route-target {import | export | both} {auto | <AS-NUMBER:ID> | <IP-ADDRESS:ID>}
no route-target {import | export | both} {auto | <AS-NUMBER:ID> | <IP-ADDRESS:ID>}
```

Description

Controls the import and export of VPN routes only to the systems in the network for which routes are needed. The default value is NULL. Route Targets (RT) have to be manually configured by a user.

The **no** form of this command removes the currently configured value.

Parameter	Description
`import`	Configures the route-target to import EVPN routes.
`export`	Configures the route-target to export EVPN routes.
`both`	Configures the route-target to import and export EVPN routes.
`auto`	Specifies automatic route filtering.
<AS-NUMBER:ID>	Specifies the AS number. It can be a 1-byte or 4-byte value. If the AS number is a 2-byte value, the administrative number is a 4-byte value and if the AS number is 4-byte value, the administrative number is a 2-byte value.

Parameter	Description
<IP-ADDRESS:ID>	Specifies the IP address. It is a 4-byte value and the ID is 2 bytes.

Examples

Configuring Route Targets for EVPN VLAN:

```
switch(config-evpn)# vlan 10
switch(config-evpn-vlan-10)# route-target import 6800:1
switch(config-evpn-vlan-10)# route-target export 6800:1
switch(config-evpn)# vlan 20
switch(config-evpn-vlan-20)# route-target both 6900:1
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

Command History

route-target {evpn}

```
route-target {import | export | both} {auto | <AS-NUMBER:ID> | <IP-ADDRESS:ID>} evpn
no route-target {import | export | both} {auto | <AS-NUMBER:ID> | <IP-ADDRESS:ID>} evpn
```

Description

Configures the route target (RT) for EVPN VRF to control the import and export of VPN routes only to the systems in the network for which routes are needed. The default value is NULL. Route targets have to be manually configured by a user.

The **no** form of this command removes the RT in EVPN VRF.

Parameter	Description
import	Imports the VRF routes that match the RT.
export	Exports the RT in the VRF routes.
both	Configures both import and export of routes for the VRF.
auto	Specifies automatic route filtering.

Parameter	Description
<AS-NUMBER:ID>	Specifies the AS number. It can be a 1-byte or 4-byte value. If the AS number is a 2-byte value, the administrative number is a 4-byte value and if the AS number is 4-byte value, the administrative number is a 2-byte value.
<IP-ADDRESS:ID>	Specifies the IP address. It is a 4-byte value and the ID is 2 bytes.

Examples

Configuring Route Targets for EVPN VRF:

```
switch(config-vrf)# route-target import 6800:1 evpn
switch(config-vrf)# route-target export 6800:1 evpn
switch(config-vrf)# route-target both 6800:1 evpn
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

Command History

Command Information

Platforms	Command context	Authority
6300 6400	config-vrf	Administrators or local user group members with execution rights for this command.

route-target (evpn vlan-aware-bundles)

```
route-target {import | export | both} {<AS-NUMBER:ID> | <IP-ADDRESS:ID>}
no route-target {import | export | both} {<AS-NUMBER:ID> | <IP-ADDRESS:ID>}
```

Description

Enables the import and export of EVPN routes only to the systems in the network for which routes are needed.

The **no** form of this command removes this configuration.

Parameter	Description
import	Configures the route-target to import EVPN routes.
export	Configures the route-target to export EVPN routes.
both	Configures the route-target to import and export EVPN routes.

Parameter	Description
<AS-NUMBER:ID>	Specifies the AS number. It can be a 2-byte or 4-byte value. If the AS number is a 2-byte value, the administrative number is a 4-byte value and if the AS number is 4-byte value, the administrative number is a 2-byte value.
<IP-ADDRESS:ID>	Specifies the IP address. It is a 4-byte value and the ID is 2 bytes.

Usage

Route targets should be unique across all VLAN-based (VLANs) and VLAN-aware (bundles) service instances. `rt` should be manually configured.

Examples

Configuring the import of route target 6800:1.

```
switch(config-evpn)# vlan-aware-bundle bundle_1
switch(config-evpn-vlan-aware-bundle-bundle_1)# route-target import 6800:1
```

Removing the import of route target 6800:1.

```
switch(config-evpn)# vlan-aware-bundle bundle_1
switch(config-evpn-vlan-aware-bundle-bundle_1)# no route-target import 6800:1
```

Configuring the export of route target 6800:1.

```
switch(config-evpn)# vlan-aware-bundle bundle_1
switch(config-evpn-vlan-aware-bundle-bundle_1)# route-target export 6800:1
```

Removing the export of route target 6800:1.

```
switch(config-evpn)# vlan-aware-bundle bundle_1
switch(config-evpn-vlan-aware-bundle-bundle_1)# no route-target export 6800:1
```

Configuring the import and export of route target 6800:1.

```
switch(config-evpn)# vlan-aware-bundle bundle_1
switch(config-evpn-vlan-aware-bundle-bundle_1)# route-target both 6800:1
```

Removing the import and export of route target 6800:1.

```
switch(config-evpn)# vlan-aware-bundle bundle_1
switch(config-evpn-vlan-aware-bundle-bundle_1)# no route-target both 6800:1
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

show evpn evi *<EVI-ID>*

`show evpn evi <EVI-ID>`

Description

Shows the information for the particular EVPN instance.

Parameter	Description
<EVI-ID>	Specifies the EVPN instance ID.

Examples

Showing information for the particular EVPN instance:

```
switch# show evpn evi 100
L2VNI : 100
    Route Distinguisher         : 10.10.10.1:10
    VLAN                        : 10
    Status                      : Up
    RT Import                   : 1.1.1.1:1, 2.2.2.2:1, 3.3.3.3:1, 5:1
    RT Export                   : 4.4.4.4:61, 1000:21
    Local MACs                  : 30
    Remote MACs                 : 945
    Peer VTEPs                  : 8
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

show evpn vtep-neighbor

`show evpn vtep-neighbor {all-vrfs | vrf <VRF-Name>}`

Description

Shows the remote VTEPs MAC-IP binding. The state of the peer VTEP denotes whether VXLAN tunnel to the VTEP is Up or Down.

Parameter	Description
`all-vrfs`	Display information for all VRFs.
`vrf <vrf-name>`	Specify a VRF by VRF name (if no *<VRF-NAME>* is specified, the default VRF is implied.

Examples

Showing EVPN VTEP neighbor information for all VRFs:

```
switch# show evpn vtep-neighbor all-vrfs
VTEP-IP           L3VNI  MAC                  VRF      State
-------------------------------------------------------------------
2.2.2.2           1234   00:20:56:bd:27:bc  VRF1234  Up
2.2.2.2           6789   00:20:56:bd:27:bc  VRF6789  Up
3.3.3.3           1234   00:30:56:ef:aa:cc  VRF1234  Down
4.4.4.4           6789   00:40:56:12:34:44  VRF6789  Up
5.5.5.5           6789   00:50:56:ab:11:ee  VRF6789  Up
```

Showing EVPN VTEP neighbor information for the specified VRF name:

```
switch# show evpn vtep-neighbor vrf VRF1234
VTEP-IP           L3VNI  MAC                  VRF      State
------------------------------------------------------------------
2.2.2.2           1234   00:20:56:bd:27:bc  VRF1234  Up
3.3.3.3           1234   00:30:56:ef:aa:cc  VRF1234  Down
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

6300 6400	Operator (>) or Manager (#)	Administrators or local user group members with execution rights for this command.

show running-config evpn

```
show running-config evpn
```

Description

Shows all EVPN configurations.

Examples

Showing all EVPN configurations:

```
switch# show running-config evpn
evpn
    vlan 10
        rd 6800:1
        route-target import 6800:1
        route-target export 6800:1
    vlan 20
        rd 6900:1
        route-target import 6900:1
        route-target export 6900:1
```

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Administrators or local user group members with execution rights for this command.

virtual-mac

```
virtual-mac <MAC-ADDR>
no virtual-mac <MAC-ADDR>
```

Description

Configures the virtual MAC address for EVPN.

The **no** form of this command removes the virtual MAC address configuration.

Parameter	Description
<MAC-ADDR>	Specifies the virtual MAC address.

Examples

Configuring virtual MAC address for EVPN:

```
switch(config)# virtual-mac ab:12:33:33:03:22
```

Removing the configuration of the virtual MAC address for EVPN:

```
switch(config)# no virtual-mac ab:12:33:33:03:22
```

For EVPN symmetric IRB to work, `virtual-mac` must be configured and it must be unique for all the VTEPs involved in EVPN except for VSX nodes. In case of VSX VTEP (logical VTEP), the same `virtual-mac` must be configured in both the VSX peers. For ease of troubleshooting, it is also recommended to configure the same value of VSX `system MAC` in VSX VTEP (logical VTEP) peers.

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

vlan

```
vlan <ID>
no vlan <ID>
```

Description

Specifies the VLAN ID and enters the VLAN context under EVPN.

The **no** form of this command removes this configuration.

Parameter	Description
<ID>	Specifies the VLAN ID. Range: 2 - 4040.

Examples

```
switch(config-evpn)# vlan 10
switch(config-evpn-vlan-10)#
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-evpn-vlan`	Administrators or local user group members with execution rights for this command.

vlan-aware-bundle

```
vlan-aware-bundle<BUNDLE-NAME>
no vlan-aware-bundle<BUNDLE-NAME>
```

Description

Creates the VLAN aware bundle instance and enters the VLAN Aware Bundle context.

The **no** form of this command removes this configuration.

Parameter	Description
<BUNDLE-NAME>	Represents the VLAN Aware Bundle.

Usage

VLAN aware bundle and VLAN based service can coexist, but the same VLAN/VNI cannot be part of the VLAN aware bundle and VLAN based service. The VLAN/VNI part of the VLAN aware bundle should be part of the VLAN aware bundle on all vteps.

Examples

Creating the VLAN aware bundle instance bundle_1 and entering the VLAN Aware Bundle context.

```
switch(config-evpn)# vlan-aware-bundle bundle_1
switch(config-evpn-vlan-aware-bundle-bundle_1)#
```

Removing the VLAN aware bundle instance bundle_1 and exiting the VLAN Aware Bundle context.

```
switch(config-evpn)# vlan-aware-bundle bundle_1
switch(config-evpn-vlan-aware-bundle-bundle_1)# no vlan-aware-bundle bundle_1
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

Command History

Release	Modification
10.12	Command introduced.

Command Information

Platforms	Command context	Authority
6300 6400	`config-evpn-vlan-aware-bundle`	Administrators or local user group members with execution rights for this command.

vlan-ethernet-tag (evpn vlan-aware-bundles)

```
vlan-ethernet-tag <VLAN-ID> {ethernet tag}
no vlan-ethernet-tag <VLAN-ID> {ethernet tag}
```

Description

Associates the Ethernet Tag ID value to VLANs of the VLAN aware bundles.

The **no** form of this command removes this configuration.

Parameter	Description
<VLAN-ID>	Specifies the VLAN to which the ethernet tag is configuring. Range: 1-4094.
`{ethernet tag}`	Specifies the non-default ethernet tag for the VLAN. Range: 1-16777215.

Usage

The Ethernet Tag ID value should be unique and associated to only one VLAN of the VLAN aware bundle. The configuration of this command is not mandatory, but may be required for interoperability with some third-party vendors.

Examples

Associating the Ethernet tag ID value for vlan aware bundle bundle_1.

```
switch(config-evpn)# vlan-aware-bundle bundle_1
switch(config-evpn-vlan-aware-bundle-bundle_1)# vlan-ethernet-tag 10 20
```

Removing the Ethernet tag ID value for vlan aware bundle bundle_1.

```
switch(config-evpn)# vlan-aware-bundle bundle_1
switch(config-evpn-vlan-aware-bundle-bundle_1)# no vlan-ethernet-tag 10 20
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

Command History

Release	Modification
10.12	Command introduced.

Command Information

Platforms	Command context	Authority
6300 6400	`config-evpn-vlan-aware-bundle`	Administrators or local user group members with execution rights for this command.

vlan <ID-RANGE>

```
vlan <ID-RANGE>
no vlan <ID-RANGE>
```

Description

Specifies the list of VLANs that are part of the VLAN Aware Bundle.

The **no** form of this command removes this configuration.

Parameter	Description
<ID-RANGE>	Specifies the VLANS that are part of the bundle. Range: 1-4094.

Usage

If a VLAN is already part of VLAN based service, it cannot be configured under `vlan-aware-bundle` service and vice versa.

A VLAN cannot be part of more than one EVPN VLAN aware bundles.

Examples

Creating the VLAN aware bundle instance bundle_1 and entering the VLAN Aware Bundle context for vlan 5-10 and 15.

```
switch(config-evpn)# vlan-aware-bundle bundle_1
switch(config-evpn-vlan-aware-bundle-bundle_1)# vlan 5-10, 15
```

Removing the VLAN aware bundle instance bundle_1and exiting the VLAN Aware Bundle context for vlan 5-10 and 15.

```
switch(config-evpn)# vlan-aware-bundle bundle_1
switch(config-evpn-vlan-aware-bundle-bundle_1)# no vlan 5-10, 15
```

For more information on features that use this command, refer to the VXLAN Guide for your switch model.

Chapter 40

External storage commands

address

```
address {<IPV4-ADDR> | <IPV6-ADDR> | hostname <HOSTNAME>}
no address {<IPV4-ADDR> | <IPV6-ADDR> | hostname <HOSTNAME>}
```

Description

Specifies the NAS IP address or hostname.

The **no** form of this command deletes an IP address or hostname.

Parameter	Description
<IPV4-ADDR>	Specifies the NAS server IPv4 address, Global.
<IPV6-ADDR>	Specifies the IPv6 address of the NAS server.
<HOSTNAME>	Specifies the hostname of the NAS server. String.

Examples

Creating the logfiles storage volume with IP address 10.1.1.1:

```
switch(config)# external-storage logfiles
switch(config-external-storage-logfiles)# address 10.1.1.1
```

Deleting an external storage volume named logfiles:

```
switch(config)# external-storage logfiles
switch(config-external-storage-logfiles)# no address 10.1.1.1
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

Command History

10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-external-storage-<VOLUME-NAME>`	Administrators or local user group members with execution rights for this command.

directory

```
directory <DIRECTORY-NAME>
no directory <DIRECTORY-NAME>
```

Description

Selects an existing directory on the external storage volume.

The **no** form of this command clears a directory of an external storage volume.

Parameter	Description
<DIRECTORY-NAME>	Specifies the external storage directory for mapping the volume.

Examples

Creating a volume named logfiles that is mapped under /home on the server:

```
switch(config)# external-storage logfiles
switch(config-external-storage-logfiles)# directory /home
```

Clearing the directory /home:

```
switch(config)# external-storage logfiles
switch(config-external-storage-logfiles)# no directory /home
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

disable

```
disable
no disable
```

Description

Disables the external storage volume.

The **no** form of this command enables the external storage volume. This is identical to the `enable` command.

Examples

Disabling a volume named logfiles:

```
switch(config)# external-storage logfiles
switch(config-external-storage-logfiles)# disable
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

Command History

enable

```
enable
no enable
```

Description

Enables the external storage volume.

The **no** form of this command disables the external storage volume. This is identical to the `disable` command.

Examples

Creating and then enabling a volume named logfiles:

```
switch(config)# external-storage logfiles
switch(config-external-storage-logfiles)# enable
```

Disables the external storage volume:

```
switch(config)# external-storage logfiles
switch(config-external-storage-logfiles)# disable
```

external-storage

```
external-storage <VOLUME-NAME>
no external-storage <VOLUME-NAME>
```

Description

Creates or updates an external storage volume.

The **no** form of this command deletes an external storage volume.

Examples

Creating the logfiles storage volume:

```
switch(config)# external-storage logfiles
switch(config-external-storage-logfiles)#
```

Deleting the logfiles storage volume:

```
switch(config)# no external-storage logfiles
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

password (external-storage)

```
password [{plaintext | ciphertext} <PASSWORD>]
no password {plaintext | ciphertext} <PASSWORD>
```

Description

Sets the password for network attached storage server login.

The **no** form of this command clears the password for network attached storage server login.

Parameter	Description
`{ciphertext	plaintext}`	Selects the password format.
<PASSWORD>	Specifies the password. **NOTE:** When the password is not provided on the command line, plaintext password prompting occurs upon pressing Enter. The entered password characters are masked with asterisks.

Examples

Creating a volume named logfiles with password Xj#9:

```
switch(config)# external-storage logfiles
switch(config-external-storage-logfiles)# password plaintext Xj#9
```

Creating a volume named bak1 with a prompted plaintext password:

```
switch(config)# external-storage bak1
switch(config-external-storage-bak1)# password
Enter the NAS server password: **********
Re-Enter the NAS server password: **********
```

Clearing the password for volume logfiles:

```
switch(config)# external-storage logfiles
switch(config-external-storage-logfiles)# no password plaintext Xj#9
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

show external-storage

```
show external-storage [<VOLUME-NAME>]
```

Description

Shows external storage configuration and state for all volumes or for a specified volume.

Parameter	Description
<VOLUME-NAME>	Specifies the external storage volume name that the show command will use.

Examples

```
switch# show external-storage

-----------------------------------------------------------------------------------
--
           Address      VRF      Username      Type        Directory     State
-----------------------------------------------------------------------------------
--
nfsvol     10.1.1.1     nas      ---           NFSv3       /home
operational
nfsfiles   20.1.1.1     nas      netstorage    NFSv4       /netstor      disabled
scpdev     nasserver    nas      scpstor       SCP         /scp
unaccessible
```

show running-config external-storage

```
show running-config external-storage
```

Description

Shows the running configuration of the external storage.

Examples

```
switch# show running-config external-storage

external-storage nfsvol
      address   10.1.1.1
      vrf       nas
      type      nfsv4
      directoty /home
      enable
external-storage scpdev
      address   30.1.1.1
      vrf       nas
      username  switchuser
      password  ciphertext xxx
      type      scp
      directoty /home
      enable
```

type

```
type {nfsv3 | nfsv4 | scp}
no type {nfsv3 | nfsv4 | scp}
```

Description

Sets the network attached storage access type for reaching the external storage volume.

The **no** form of this command deletes an external storage volume.

Parameter	Description
`nfsv3`	Specifies the NFSv3 network access protocol.
`nfsv4`	Specifies the NFSv4 network access protocol.
`scp`	Specifies the SCP network access protocol.

Examples

Creating the logfiles volume using NFSV4:

```
switch(config)# external-storage logfiles
switch(config-external-storage-logfiles)# type nfsv4
```

Clearing the external storage access type:

```
switch(config)# external-storage logfiles
switch(config-external-storage-logfiles)# no type nfsv4
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

username

```
username <USER-NAME>
no username <USER-NAME>
```

Description

Sets the username for logging in to a network attached storage server.

The **no** form of this command clears a username.

Parameter	Description
<USER-NAME>	Specifies the username.

Examples

Creating a volume named logfiles with the user name nassuser:

```
switch(config)# external-storage logfiles
switch(config-external-storage-logfiles)# username nasuser
```

Clearing the user name nasuser from accessing the logfiles volume:

```
switch(config)# external-storage logfiles
switch(config-external-storage-logfiles)# no username nasuser
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

vrf

```
vrf <VRF-NAME>
no vrf <VRF-NAME>
```

Description

Setting a VRF to reach network attached storage.

The **no** form of this command clears access of a VRF to network attached storage.

Parameter	Description
<VRF-NAME>	Specifies the VRF name.

Examples

Creating the logfiles volume and setting a VRF named nas to access the network attached storage:

```
switch(config)# external-storage logfiles
switch(config-external-storage-logfiles)# vrf nas
```

Clearing access of a VRF named nas to the network attached storage:

```
switch(config)# external-storage logfiles
switch(config-external-storage-logfiles)# no vrf nas
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

Chapter 41
Feature pack commands

erase feature-pack

erase feature-pack [reset]

Description

Remove the installed feature pack and delete the feature pack file.

Parameter	Description
`reset`	*Optional*. Include this parameter if you do not want to use subscription features anymore and want to stop receiving honor mode warning logs messages. **Running this command will disable all subscription features and stop honor warnings**.

Example

Remove the feature pack. The switch will continue to operate in honor mode.

```
switch# erase feature-pack
```

Remove the feature pack and disable all subscription features.

```
switch# erase feature-pack reset

This operation will delete the feature pack subscription key and reset
feature pack enforcement to a factory default state. This will disable
advanced features that require a subscription to operate and may impact
network operation if those features are in use.

After running this command, advanced features can only be re-enabled
through one of the following:
1. Installing a new feature-pack subscription key.
2. Connecting to Aruba Central.
3. Configuring honor mode.

Continue (y/n)?
```

For more information on features that use this command, refer to the Feature Pack Configuration Guide for your switch model.

Command History

Release	Modification
10.14	The **reset** parameter is introduced.
10.13	Command introduced.

Command Information

Platforms	Command context	Authority
6300 6400	`manager`	Administrators or local user group members with execution rights for this command.

feature-pack mode

```
feature-pack mode
   cloud-managed
   file-based
   honor
   no ...
```

Description

Set the operation mode for a feature pack deployment.

HPE Aruba networking provides three modes for feature pack management: **cloud-managed**, **file-based**, and **honor**. In the event of a mismatch between the installed feature pack and the feature pack mode, the device will operate in honor mode.

Parameter	Description
`cloud-managed`	The device uses cloud-based feature pack management
`file-managed`	The device uses a manually installed feature pack file. This is the default feature pack mode.
`honor`	A valid feature pack has been obtained, but is not yet installed.
`no ...`	Resets the configuration back to the default file-based feature pack mode.

Usage

Switches using feature pack subscription keys in ***cloud mode*** share a pool of one or more feature pack subscription keys managed using the HPE Aruba Networking support portal. By default, a switch using an HPE Aruba Networking CX feature pack in cloud mode will contact the HPE Aruba Networking support portal once a day to automatically synchronize with the feature pack subscription key management database. With this deployment type, the HPE Aruba Networking support site can automatically distribute and manage feature packs for all devices in a group, making it a scalable solution for larger deployments and for global accounts across geographies.

Networks with a single switch, or with multiple switches on isolated networks that cannot contact the HPE Aruba Networking support site should use feature pack subscription keys in ***file-based mode***, where a feature pack is manually enabled on a switch using a non-sharable subscription key tied to that individual switch's serial number or MAC address.

Honor mode is intended for cases where a valid feature pack for advanced features has been purchased, but is not yet installed on the device. Advanced features on this device will be operational in Honor mode, but a warning message may be seen until a valid feature pack is installed. Please note that HPE Aruba Networking will remove support for Honor mode in a future release and advanced features will only be operational if the applicable subscription fees are paid and a valid feature pack is installed.

Examples

```
switch(config)# feature pack mode cloud-managed
```

For more information on features that use this command, refer to the Feature Pack Configuration Guide for your switch model.

Command History

Release	Modification
10.13	Command introduced

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

feature-pack server

```
feature-pack server
  block <block>
  credentials user <USER> password [{plaintext <PASSWORD>}|{ciphertext <PASSWORD>}]
  location <LOCATION> [vrf <VRF>]
  pool <pool>
```

Description

If the switch is in cloud-managed feature pack mode, use this command to define the switch's feature pack profile. A switch in cloud-managed mode uses the information in this profile to contact the feature pack management server and download and install any allocated feature packs.

Parameter	Description
`block <block>`	If the subscription pool for the profile contains more than one subscription block, specify the subscription block within that pool to be assigned.
`credentials`	Configures the credentials used by the device to contact and authenticate to the feature pack server.
`user <USER>`	The user name of a feature pack server account.

Parameter	Description
`password`	Select a mode for entering the feature pack server password. If you press **<enter>** after the **password** parameter, you will enter a secure prompt that allows you to securely enter a hidden password. *This is the recommended method for entering a plaintext password.* You can include the optional **plaintext** parameter to configure a plain text password (not recommended), or use the optional **ciphertext** parameter to enter previously encrypted ciphertext password.
`plaintext <PASSWORD>`	Optional. Enter a password in plain text without the secure prompt. *This option does not hide the password in the CLI, and is not recommended.*
`ciphertext <PASSWORD>`	Optional. Enter a password as previously encrypted text. *This is the recommended method for entering an encrypted password.*
`location <LOCATION>`	The FQDN of the feature pack server; https://cx-feature-pack.arubanetworks.com
`[vrf <VRF>]`	(Optional) Specify the VRF used to contact the feature pack server.
`pool <pool>`	Configures the feature pack server subscription pool. This information is used by the feature pack server to properly identify the subscription to be assigned to the device.

Examples

Defining a feature pack server by entering a hidden plain text user password.

```
switch(config)# feature-pack server
switch(config-feature-pack-server)# location https://cx-feature-
pack.arubanetworks.com vrf mgmt
switch(config-feature-pack-server)# credentials user myLMSUser1234 password
Enter password: *****
Confirm password: *****
```

Defining a feature pack server with an encrypted ciphertext user password.

```
switch(config)# feature-pack server
switch(config-feature-pack-server)# location https://cx-feature-
pack.arubanetworks.com vrf mgmt
switch(config-feature-pack-server)# credentials user myLMSUser1234 password
ciphertext
AQBapcmUTsCVdaTGkLA3mN2sslLgsNOdqFUP0j+CaCxVdz7oEwAA2OmsmBmgPHavS+6Gkgm2twE4NU1Y=
```

For more information on features that use this command, refer to the Feature Pack Configuration Guide for your switch model.

Command History

Release	Modification
10.13.1000	Plaintext passwords should now be configured using the secure prompt, which can be accessed by pressing **<enter>** after the **password** keyword. This makes the **plaintext** and **ciphertext** keywords optional. It is recommended to use either the secure prompt or the ciphertext option.
10.13	Command introduced

Command Information

Platforms	Command context	Authority
6300 6400	`config` `config-feature-pack-server`	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

feature-pack validate

`feature-pack validate`

Description

Manually trigger a feature pack validation on the HPE Aruba Networking support portal. (By default, automatic validation happens once every day.) This command is only applicable for feature packs in cloud-managed mode.

Examples

```
switch# feature-pack validate
```

For more information on features that use this command, refer to the Feature Pack Configuration Guide for your switch model.

Command History

Release	Modification
10.13	Command introduced

Command Information

```

The output of the **show feature-pack** command include the following information:

Value	Description
Name	Name of the feature pack
Expiration Date	The date that the feature pack subscription expires
Serial Numbers	Serial numbers for that feature pack. If the feature pack is used by multiple switches (for example, in a VSF deployment) then the **Serial Number(s)** field displays all the switch serial numbers for that feature pack.
MAC address	MAC address of the switch using the feature pack
Hostname	Host name of the switch using the feature pack
Type	Shows the feature pack file type: ■ **Device specific**: Feature pack was manually downloaded from a feature pack server account in local mode. Use this feature pack with a switch in file-based mode.. ■ **Floating**: The feature pack was automatically downloaded from a cloud mode feature pack account on the HPE Aruba Networking support portal. This feature pack should be used with the switch in cloud-managed mode.
Mode	Shows the feature pack configuration mode: ■ **Cloud management**: Switches using feature pack subscriptions in cloud-managed mode share a pool of one or more feature pack subscriptions. These subscriptions are managed through the HPE Aruba Networking support portal. ■ **File Based**: If a switch is using a feature pack in **file-based mode**, you must manually upload the feature pack using the **copy** command and enable it on a switch using a non-sharable subscription file tied to that individual switch's serial number or MAC address. ■ **Honor**: Honor mode is intended for cases where a valid feature pack for advanced features has been purchased, but is not yet installed on the device. Advanced features on this device will be operational in honor mode, but a warning message may be seen until a valid feature pack is installed. Please note that HPE Aruba Networking will remove support for Honor mode in a future release and advanced features will only be operational if the applicable subscription fees are paid and a valid feature pack is installed. This message is shown when the switch is configured to use a cloud-managed feature pack profile using the **feature pack mode cloud-managed** command.
Status	This message displays the current status of the feature pack: ■ **No feature pack installed**: No feature pack is detected on the switch. ■ **Feature pack installed and valid**: Feature pack installed with no errors.

Value	Description
	- **Feature pack install error**: The feature pack has invalid data. - **Feature pack expired**: The feature pack subscription has expired. - **Feature pack removed**: The feature pack was erased from the switch using the **erase** command. - **Subscription through Aruba Central is connected**: Switch is actively connected to HPE Aruba Networking Central. Subscription features are operational. The feature-pack on the switch will display this state only if *all* the following are true: ◦ The switch has a connection to Central. ◦ The switch is onboarded to the GreenLake for PrivateCloud (GLPC) device inventory . ◦ The switch is assigned to Central Application. ◦ The switch has a valid Central License assigned. - **Subscription through Aruba Central is disconnected**: Switch is disconnected from HPE Aruba Networking Central. Subscription features are still operational. The switch will appear in this state if any of the requirements for the status is not currently true, A switch may also display this feature pack status if the switch has connection to Central, is assigned to the Central application, but has no Central License attached. In this case the switch will be in disconnected state even if it never was previously in connected state. - **Feature pack mode honor configured**: The switch does not have a valid feature pack. Subscription features are operational, and is operating in honor mode until the feature pack is installed. - **Cloud managed server is disconnected**: The switch is managing feature packs in cloud mode, but the switch is no longer able to reach the HPE Aruba Networking support portal. The switch will continue to operate in honor mode. - **Cloud managed and subscription revoked from server**: The switch is managing the feature pack in cloud mode, but feature pack has been revoked from the switch through the HPE Aruba Networking support portal.The switch will continue to operate in honor mode until the feature pack is removed from the switch. - **Cloud managed server validation error**: Server validation failed. Issue the command **show feature pack server** for more information. - **Unexpected VSF member in stack**: A feature pack intended for a VSF stack is installed on a VSF member whose serial number is not covered under the current feature pack. - **Mode does not match installed feature pack type**: The feature pack type (device-locked or floating) does not match the configured mode. Device-locked feature packs should be

Value	Description
	used in file-based deployments only, and floating feature packs should be used by cloud-managed deployments.
Error Reason	If the feature pack **Status** field displays an error status, this field displays details about possible causes for the issue. ▪ **Serial number mismatch**: The serial number in the installed feature pack does not match the switch's serial number. ▪ **MAC address mismatch**: The MAC address in the installed feature pack does not match the switch's serial number. ▪ **Feature pack file parsing error**: The feature pack file has an invalid format. ▪ **Feature pack file signature invalid**: The feature pack file was modified.
Feature	Feature supported by the feature pack.
Subscription Status	Current subscription status; ▪ **active**: Subscrition is active ▪ **inactive**: Subscription is inactive or has expired ▪ **honor**: Installed feature pack has expired or cloud managed feature pack has encountered an error. Warnings will be logged periodically.
Feature Pack Status	Current status of the feature pack: ▪ **allowed**: Feature is functional ▪ **blocked**: Feature is not functional and will require a valid feature pack to be functional

The output of the **show feature-pack** server command include the following information:

Location URL	Fully qualified domain name of the feature pack subscription server, for example, **https://cx-feature-pack.arubanetworks.com**
Location VRF	VRF used to access the feature pack subscription server.
User Account	User name of the user account at the HPE Aruba Networking support portal associated with the feature pack.
Subscription Pool	Name of the subcription pool associated with the feature pack. This can be the **Default** subscription pool, or a user-defined subscription pool.
Subscription Block	Subscription block associated with the feature pack.
Status	Indicates whether the switch was able to contact the feature pack server.
Reason	If the switch is unable to contact the feature pack server, this field can display information about the cause for the connection failure.
Last validation time	Timestamp showing the date and time the switch last contacted

	the feature pack server.
Success Validation time	Timestamp showing the date and time of the last successful feature pack installation or validation against the feature pack server

For more information on features that use this command, refer to the Feature Pack Configuration Guide for your switch model.

Chapter 42

Fault monitor commands

(Fault enabling/disabling)

```
{all | <FAULT>}
no {all | <FAULT>}
```

Description

Within the selected fault monitor profile context, enables all faults or specific faults for monitoring.

By default, all faults are disabled in a profile and remain disabled until enabled as described here. Configuring the action and threshold does not enable the fault.

Faults enabled with this command use default actions and thresholds unless the actions and thresholds are configured. For information on configuring actions and thresholds for a fault, respectively see action and threshold.

The **no** form of this command disables faults for monitoring.

Parameter	Description
`all`	Selects all faults.

`<FAULT>`	Selects a specific fault. Available fault names:
	`excessive-broadcasts`
	`excessive-multicasts`
	`excessive-link-flaps`
	`excessive-oversize-packets`
	`excessive-jabbers`
	`excessive-fragments`
	`excessive-crc-errors`
	`excessive-late-collisions`
	`excessive-collisions`
	`excessive-tx-drops`

Examples

Enabling all faults:

```
switch(config-fault-monitor-profile)# all
```

Disabling all faults:

```
switch(config-fault-monitor-profile)# no all
```

Enabling individual faults:

```
switch(config-fault-monitor-profile)# excessive-broadcasts
switch(config-fault-monitor-profile)# excessive-multicasts
switch(config-fault-monitor-profile)# excessive-link-flaps
switch(config-fault-monitor-profile)# excessive-oversize-packets
switch(config-fault-monitor-profile)# excessive-jabbers
switch(config-fault-monitor-profile)# excessive-fragments
switch(config-fault-monitor-profile)# excessive-crc-errors
switch(config-fault-monitor-profile)# excessive-late-collisions
switch(config-fault-monitor-profile)# excessive-collisions
switch(config-fault-monitor-profile)# excessive-tx-drops
```

Disabling individual faults:

```
switch(config-fault-monitor-profile)# no excessive-broadcasts
switch(config-fault-monitor-profile)# no excessive-multicasts
switch(config-fault-monitor-profile)# no excessive-link-flaps
switch(config-fault-monitor-profile)# no excessive-oversize-packets
switch(config-fault-monitor-profile)# no excessive-jabbers
switch(config-fault-monitor-profile)# no excessive-fragments
switch(config-fault-monitor-profile)# no excessive-crc-errors
switch(config-fault-monitor-profile)# no excessive-late-collisions
switch(config-fault-monitor-profile)# no excessive-collisions
switch(config-fault-monitor-profile)# no excessive-tx-drops
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config-fault-monitor-profile`	Administrators or local user group members with execution rights for this command.

action

```
{all | <FAULT>} action {notify | notify-and-disable [auto-enable <TIMEOUT>]}
no {all | <FAULT>} action {notify | notify-and-disable [auto-enable <TIMEOUT>]}
```

Description

Within the selected fault monitor profile context, configures the fault monitoring action for the specified fault. Default action: **notify** with **auto-enable** disabled.

The no form of this command removes the action and disables **auto-enable**.

Parameter	Description
`all`	Selects all faults.

<FAULT>	Selects a specific fault. Available fault names:
	`excessive-broadcasts`
	`excessive-multicasts`
	`excessive-link-flaps`
	`excessive-oversize-packets`
	`excessive-jabbers`
	`excessive-fragments`
	`excessive-crc-errors`
	`excessive-late-collisions`
	`excessive-collisions`
	`excessive-tx-drops`

`notify`	Selects the `notify` action. Notifies through events, DLOGs, and SNMP trap. This action is enabled by default.
`notify-and-disable`	Selects the action as `notify-and-disable`. Notifies through events, DLOGs, and SNMP trap, and then disables the port.
`auto-enable` *<TIMEOUT>*	Sets the number of seconds after which a port disabled by the `notify-and-disable` action is automatically re-enabled. Range: 1 to 604800 seconds.

The fault parameter values are saved even after a fault is disabled in the profile. The saved values will be used if the fault is later re-enabled in the profile again.

Examples

Configuring the **notify** action for all faults within a given profile:

```
switch(config-fault-monitor-profile)# all action notify
```

Configuring the `notify-and-disable` action for all faults within a given profile:

```
switch(config-fault-monitor-profile)# all action notify-and-disable
```

Configuring the **notify-and-disable** action for all faults with **auto-enable** within a given profile:

```
switch(config-fault-monitor-profile)# all action notify-and-disable auto-enable 80
```

Disabling all fault monitoring for this profile:

```
switch(config-fault-monitor-profile)# no all
```

Restoring all fault monitoring to the default action **notify** within a given profile:

```
switch(config-fault-monitor-profile)# no all action
```

Unconfiguring the auto-enable timer for all fault monitoring within a given profile:

```
switch(config-fault-monitor-profile)# no all action notify-and-disable auto-enable
```

Configuring the **notify** action for specific faults within a given profile:

```
switch(config-fault-monitor-profile)# excessive-oversize-packets action notify
switch(config-fault-monitor-profile)# excessive-late-collisions action notify-and-
disable
switch(config-fault-monitor-profile)# excessive-collisions action notify-and-
disable
```

Configuring the **notify-and-disable** action for specific faults within a given profile:

```
switch(config-fault-monitor-profile)# excessive-link-flaps action notify-and-
disable
switch(config-fault-monitor-profile)# excessive-fragments action notify-and-
disable
switch(config-fault-monitor-profile)# excessive-crc-errors action notify-and-
disable
```

Configuring the **notify-and-disable** action with **auto-enable** for specific faults within a given profile:

```
switch(config-fault-monitor-profile)# excessive-broadcasts action notify-and-
disable auto-enable 80
switch(config-fault-monitor-profile)# excessive-multicasts action notify-and-
disable auto-enable 100
switch(config-fault-monitor-profile)# excessive-tx-drops action notify-and-disable
auto-enable 70
switch(config-fault-monitor-profile)# excessive-jabbers action notify-and-disable
auto-enable 60
```

Restoring fault monitoring to the default action **notify** within a given profile:

```
switch(config-fault-monitor-profile)# no excessive-oversize-packets action
switch(config-fault-monitor-profile)# no excessive-jabbers action
switch(config-fault-monitor-profile)# no excessive-oversize-packets action notify-
and-disable
```

Unconfiguring the auto-enable timer within a given profile:

```
switch(config-fault-monitor-profile)# no excessive-jabbers action notify-and-
disable auto-enable
switch(config-fault-monitor-profile)# no excessive-collisions action notify-and-
disable auto-enable
```

For more information on features that use this command, refer to the Security Guide for your switch model.

apply fault-monitor profile

```
apply fault-monitor profile <PROFILE-NAME>
no apply fault-monitor profile [<PROFILE-NAME>]
```

Description

Applies a fault monitoring profile to the selected interface or interface range.

The **no** form of this command removes the fault monitoring profile from the selected interface or interface range.

Parameter	Description
<PROFILE-NAME>	Specifies the fault monitor profile name. Range: Up to 64 alphanumeric and special characters.

Examples

Applying the fault monitoring profile to a interface:

```
switch(config)# interface 1/1/1
switch(config-if)# apply fault-monitor profile noisy-ports
```

Applying the fault monitoring profile to a interface range:

```
switch(config)# interface 1/1/2-1/1/24
switch(config-if)# apply fault-monitor profile quiet-ports
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.08	Made the *<PROFILE-NAME>* parameter optional in the **no** form of the command.

Release	Modification

Command Information

Platforms	Command context	Authority
All platforms	`config-if`	Administrators or local user group members with execution rights for this command.

fault-monitor profile

```
fault-monitor profile <PROFILE-NAME>
no fault-monitor profile <PROFILE-NAME>
```

Description

Creates a fault monitoring profile and enters its context which is indicated as **(config-fault-monitor-profile)**. If the profile already exists, this command enters the profile context. A maximum of 16 fault monitoring profiles are supported.

For information on enabling a fault within a fault monitor profile, see (Fault enabling/disabling).

For information on configuring actions and thresholds for a fault, respectively see action and threshold.

For information on applying a fault monitor profile to a interface or interface range, see apply fault-monitor profile.

The **no** form of this command deletes the fault monitoring profile.

By default, all faults are disabled in a profile.

Parameter	Description
<PROFILE-NAME>	Specifies the fault monitor profile name. Range: Up to 64 alphanumeric and special characters.

Examples

Creating a fault monitor profile and entering its context:

```
switch(config)# fault-monitor profile noisy-ports
switch(config-fault-monitor-profile)#
```

Deleting a fault monitor profile:

```
switch(config)# no fault-monitor profile noisy-ports
```

For more information on features that use this command, refer to the Security Guide for your switch model.

show fault-monitor profile

`show fault-monitor profile <PROFILE-NAME>`

Description

Shows fault monitoring profile information for all profiles or a specific profile.

Parameter	Description
<PROFILE-NAME>	Specifies the fault monitor profile name. Range: Up to 64 alphanumeric and special characters.

Example

Showing information for all fault monitoring profiles:

```
switch# show fault-monitor profile
-------------------------------------------------------------------------------
Fault monitor profile: noisy-ports
-------------------------------------------------------------------------------
Auto
Fault                           Enabled  Threshold   Action              Enable
-------------------------------------------------------------------------------
excessive-broadcasts            yes      5%          notify-and-disable  --
excessive-multicasts            yes      1000 pps    notify-and-disable  --
excessive-link-flaps            yes      7           notify-and-disable  --
excessive-oversize-packets      yes      25          notify-and-disable  --
excessive-jabbers               yes      25          notify-and-disable  --
excessive-fragments             yes      25          notify-and-disable  --

show interface fault-monitor profile

```
show interface [<INTERFACE>|<IF-RANGE>] fault-monitor profile
```

Description

Shows fault monitoring profile configuration information for all or specific interfaces.

Parameter	Description
<INTERFACE>	Specifies a single interface.

Parameter	Description
<IF-RANGE>	Specifies a interface range,

Example

Showing all interfaces with applied fault monitoring profiles:

```
switch# show interface fault-monitor profile
---------------------------------------------------------------------------
Port     Fault Monitor Profile
---------------------------------------------------------------------------
1/1/1    noisy-ports
1/1/2    quiet-ports
1/1/4    quiet-ports
1/1/5    noisy-ports
1/1/6    noisy-ports
1/1/7    quiet-ports
```

Showing a range of interfaces with applied fault monitoring profiles:

```
switch# show interface 1/1/1-1/1/2,1/1/6 fault-monitor profile
---------------------------------------------------------------------------
Port     Fault Monitor Profile
---------------------------------------------------------------------------
1/1/1    noisy-ports
1/1/2    quiet-ports
1/1/6    noisy-ports
```

show interface fault-monitor status

`show interface [<INTERFACE>|<IF-RANGE>] fault-monitor status`

Description

Shows active fault information for all or specific interfaces.

Parameter	Description
<INTERFACE>	Specifies a single interface.
<IF-RANGE>	Specifies a interface range,

Example

Showing active fault information for all interfaces with applied fault monitoring profiles:

```
switch# show interface fault-monitor status
                                                                 Port  Time
Port   Fault                       Fault Elapsed Time            State Left
--------------------------------------------------------------------------------
1/1/1  excessive-broadcasts        Tue Apr 14 14:29:09 UTC 2020  down  60
       excessive-jabbers           Tue Apr 15 14:29:09 UTC 2020  --    --
1/1/2  excessive-oversize-packets  Tue Apr 16 14:29:09 UTC 2020  down  --
```

Showing active fault information for a range of interfaces with applied fault monitoring profiles:

```
switch# show interface 1/3/1,1/3/3 fault-monitor status
                                                                 Port  Time
Port   Fault                       Occurring Since               State Left
--------------------------------------------------------------------------------
1/1/4  excessive-broadcasts        Tue Apr 14 14:29:09 UTC 2020  down  60
       excessive-jabbers           Tue Apr 15 14:29:09 UTC 2020  --    100
```

show running-config

```
show running-config [interface <IFNAME> | current-context | all]
```

Description

Shows the running configuration including any fault-monitor profile configurations and profile-names applied to an interface. The below examples focus on fault monitor-related configuration items. Other configuration items that may be present are represented by an ellipsis (. . .).

Parameter	Description
`interface <IFNAME>`	Shows running configuration information for only the specified interface.
`current-context`	Shows running configuration information for only the current context.
`all`	Shows all running configuration information.

Examples

Showing the running configuration for a particular interface:

```
switch# show running-config interface 1/1/1
interface 1/1/1
   ...
    apply fault-monitor profile noisy-ports
   ...
```

Showing the running configuration for a particular fault monitor profile current context:

```
switch# fault-monitor profile noisy-ports
switch(config-fault-monitor-profile)# show running-config current-context
fault-monitor profile noisy-ports
    excessive-broadcasts
    excessive-broadcasts threshold pps 10000
    excessive-broadcasts action notify-and-disable auto-enable 2000
    excessive-multicasts
    excessive-multicasts threshold pps 10000
    excessive-link-flaps
    excessive-link-flaps action notify-and-disable auto-enable 2000
```

Showing all running configuration:

```
switch# show running-config all
...
fault-monitor profile noisy-ports
    excessive-broadcasts
    excessive-broadcasts threshold pps 10000
    excessive-broadcasts action notify-and-disable auto-enable 2000
    excessive-multicasts
    excessive-multicasts threshold pps 10000
    excessive-multicasts action notify
    excessive-link-flaps
    excessive-link-flaps threshold count 7
    excessive-link-flaps action notify-and-disable auto-enable 2000
    no excessive-oversize-packets
    excessive-oversize-packets threshold value 25
    excessive-oversize-packets action notify
    no excessive-jabbers
    excessive-jabbers threshold value 25
    excessive-jabbers action notify
    no excessive-fragments
    excessive-fragments threshold value 25
    excessive-fragments action notify
    no excessive-crc-errors
    excessive-crc-errors threshold value 25
    excessive-crc-errors action notify
    no excessive-late-collisions
    excessive-late-collisions threshold value 25
    excessive-late-collisions action notify
    no excessive-collisions
    excessive-collisions threshold value 25
    excessive-collisions action notify
    no excessive-tx-drops
    excessive-tx-drops threshold value 25
    excessive-tx-drops action notify
...
interface 1/1/1
   ...
    apply fault-monitor profile noisy-ports
   ...
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Manager (#)	Administrators or local user group members with execution rights for this command.

threshold

```
<FAULT> threshold value <VALUE>
no <FAULT> threshold [value <VALUE>]

excessive-link-flaps threshold count <COUNT>
no excessive-link-flaps threshold [count <COUNT>]

excessive-fc-watchdog-triggers threshold count <COUNT>
no excessive-fc-watchdog-triggers threshold [count <COUNT>]

{excessive-broadcasts | excessive-multicasts}
   threshold {percent <BW-PERCENT> | pps <PPS>}
no {excessive-broadcasts | excessive-multicasts}
   threshold [{percent <BW-PERCENT> | pps <PPS>}]

no all threshold
```

Description

Within the selected fault monitor profile context, sets the specified fault threshold.

The **no** form of this command resets the threshold to its default value.

Parameter	Description

`<FAULT> threshold value <VALUE>`
With `<FAULT>` set to any of these names:
`excessive-oversize-packets`
`excessive-jabbers`
`excessive-fragments`
`excessive-crc-errors`
`excessive-late-collisions`
`excessive-collisions`
`excessive-tx-drops`
	Sets the threshold number of bad frames per 10000 good frames received or per 10000 good frames sent (depending on the fault), to be considered a fault. Range: 1 to 10000. Default: 25.

`excessive-link-flaps threshold count <COUNT>`	Sets the threshold count of interface link flaps, during a 10 second sampling interval, to be considered a fault. Range: 1 to 100. Default: 7.
`{excessive-broadcasts | excessive-multicasts} threshold percent <BW-PERCENT>`	Sets the fault threshold as a percentage of port bandwidth for minimum sized packets that is considered to be a fault. Range: 1 to 100. Default 5.
`{excessive-broadcasts | excessive-multicasts} threshold pps <PPS>`	Sets the fault threshold in packets per second. Range: 1 to 195312500.

If excessive-broadcast or excessive-multicast faults are configured with the threshold higher than the `rate-limit` threshold, the following occurs:

- Fault reporting still happens as the port has actually received packets at a rate that violated its threshold.
- Traffic gets shaped as per `rate-limit` configuration and any packet exceeding the `rate-limit` threshold gets dropped.

Examples

Setting thresholds:

```
switch(config-fault-monitor-profile)# excessive-oversize-packets threshold value
40
switch(config-fault-monitor-profile)# excessive-jabbers threshold value 30
switch(config-fault-monitor-profile)# excessive-fragments threshold value 50
switch(config-fault-monitor-profile)# excessive-crc-errors threshold value 35
switch(config-fault-monitor-profile)# excessive-late-collisions threshold value 30
switch(config-fault-monitor-profile)# excessive-collisions threshold value 40
switch(config-fault-monitor-profile)# excessive-tx-drops threshold value 20

switch(config-fault-monitor-profile)# excessive-link-flaps threshold count 14
switch(config-fault-monitor-profile)# excessive-broadcasts threshold percent 40
switch(config-fault-monitor-profile)# excessive-multicasts threshold pps 7500
```

Resetting all thresholds to their defaults:

```
switch(config-fault-monitor-profile)# no all threshold
```

Resetting individual thresholds to their defaults:

```
switch(config-fault-monitor-profile)# no excessive-oversize-packets threshold
switch(config-fault-monitor-profile)# no excessive-jabbers threshold
switch(config-fault-monitor-profile)# no excessive-fragments threshold
switch(config-fault-monitor-profile)# no excessive-crc-errors threshold
switch(config-fault-monitor-profile)# no excessive-late-collisions threshold
switch(config-fault-monitor-profile)# no excessive-collisions threshold
switch(config-fault-monitor-profile)# no excessive-tx-drops threshold

switch(config-fault-monitor-profile)# no excessive-link-flaps threshold

switch(config-fault-monitor-profile)# no excessive-broadcasts threshold
switch(config-fault-monitor-profile)# no excessive-multicasts threshold
```

For more information on features that use this command, refer to the Security Guide for your switch model.

All platforms	`config-fault-monitor-profile`	Administrators or local user group members with execution rights for this command.

vsx-sync (fault monitor)

```
vsx-sync
no vsx-sync
```

Description

Within the selected fault monitor profile context, configures VSX synchronization for the selected fault monitoring profile.

The **no** form of this command removes the VSX synchronization for a fault monitoring profile.

Example

Configuring VSX synchronization for a fault monitoring profile:

```
switch(config-fault-monitor-profile)# vsx-sync
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Chapter 43

Firmware management commands

copy {primary | secondary} *<REMOTE-URL>*

`copy {primary | secondary} <REMOTE-URL> [vrf <VRF-NAME>]`

Description

Uploads a firmware image to a TFTP or SFTP server.

Parameter	Description
`{primary | secondary}`	Selects the primary or secondary image profile to upload. Required

`<REMOTE-URL>`	Specifies the URL to receive the uploaded firmware using SFTP , TFTP or SCP.
	TFTP format:
	`tftp://<IP-ADDR>[:<PORT-NUM>] [;blocksize=<Value>]/<FILENAME>`
	SFTP format:
	`sftp://<USERNAME>@<IP-ADDR> [:<PORT-NUM>]/<FILENAME>`
	SCP format:
	`scp://USER@{IP|HOST}[:PORT]/FILE`

`vrf <VRF-NAME>`	Specifies a VRF name. Default: default.

Examples

TFTP upload:

```
switch# copy primary tftp://192.0.2.0/00_10_00_0002.swi
######################################################################## 100.0%
Verifying and writing system firmware...
```

SFTP upload:

```
switch# copy primary sftp://swuser@192.0.2.0/00_10_00_0002.swi
swuser@192.0.2.0's password:
Connected to 192.0.2.0.
sftp> put primary.swi XL_10_00_0002.swi
Uploading primary.swi to /users/swuser/00_10_00_0002.swi
primary.swi                              100%  179MB  35.8MB/s   00:05
```

copy {primary | secondary} *<FIRMWARE-FILENAME>*

`copy {primary | secondary} <FIRMWARE-FILENAME>`

Description

Copies a firmware image to USB storage.

Parameter	Description
`{primary	secondary}`	Selects the primary or secondary image from which to copy the firmware. Required
`<FIRMWARE-FILENAME>`	Specifies the name of the firmware file to create on the USB storage device. Prefix the filename with **usb:/**. For example: **usb:/firmware_v1.2.3.swi** For information on how to format the path to a firmware file on a USB drive, see USB URL.

Examples

```
switch# copy primary usb:/11.10.00.0002.swi
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

copy *<REMOTE-URL>*

```
copy <REMOTE-URL> {hot-patch|primary|secondary} [vrf <VRF-NAME>]
```

Description

Downloads a hot-patch or firmware image from a TFTP or SFTP server.

Parameter	Description
<REMOTE-URL>	Specifies the URL from which to download the firmware using SFTP or TFTP. **TFTP format:**

Parameter	Description

	`tftp://<IP-ADDR>[:<PORT-NUM>]`
	`[;blocksize=<Value>]/<FILENAME>`
	SFTP format:
	`sftp://<USERNAME>@<IP-ADDR>`
	`[:<PORT-NUM>]/<FILENAME>`
	SCP format:
	`scp://USER@{IP|HOST}[:PORT]/FILE`

`{hot-patch|primary|secondary}`	Select a hot-patch or a primary or secondary image profile for receiving the downloaded firmware. Required. **NOTE:** For more information about hot-patch, see hot-patch.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Default: default.

TFTP usage

To specify a URL with:

- an IPv4 address: **tftp://*192.0.2.1/a.txt***
- an IPv6 address: **tftp://*[2000::2]/a.txt***
- a hostname: **tftp://*hpe.com/a.txt***

To specify TFTP with:

- the port number of the server in the URL: **tftp://*192.0.2.1:12/a.txt***
- the blocksize in the URL: **tftp://*192.0.2.1*;blocksize=*1462/a.txt***

The valid blocksize range is 8 to 65464.

- the port number of the server and blocksize in the URL: **tftp://192.0.2.1:*12*;blocksize=*1462/a.txt***

To specify a file in a directory of URL: **tftp://*192.0.2.1/dir/a.txt***

SFTP usage

To specify:

- A URL with an IPv4 address: **sftp://*user@192.0.2.1/a.txt***
- A URL with an IPv6 address: **sftp://*user@[2000::2]/a.txt***
- A URL with a hostname: **sftp://*user@hpe.com/a.txt***
- SFTP port number of a server in the URL: **sftp://*user@192.0.2.1:12/a.txt***
- A file in a directory of URL: **sftp://*user@192.0.2.1/dir/a.txt***
- To specify a file with absolute path in the URL: **sftp://*user@192.0.2.1//home/user/a.txt***

SCP Usage

To specify:

- A username with an IP address: **scp://user@192.0.2.1:12/a.txt**
- A username with a remote host: **scp://user@hpe.com/a.txt**

Examples

TFTP download for a hot-patch:

```
switch# copy tftp://192.168.1.1/FL.10.12.0001-0002.patch hot-patch vrf vrf1

Fetching /users/swuser/FL.10.10.0001-0002.patch to hotpatch.dnld.uE2YT1

copy *<STORAGE-URL>*

`copy <STORAGE-URL> {hot-patch|primary|secondary}`

Description

Copies, verifies, and installs a hot-patch or firmware image from a USB storage device connected to the active management module.

Parameter	Description
<STORAGE-URL>	Specifies the name of the firmware file to copy from the storage device. Required. **USB format:** `usb:/<FILENAME>`
`{hot-patch|primary|secondary}`	Select a hot-patch image or a primary or secondary profile for receiving the copied firmware. **NOTE:** For more information about hot-patch, see hot-patch.

USB usage

To specify a file:

- In a USB storage device: **usb:/*a.txt***
- In a directory of a USB storage device: **usb:/*dir*/*a.txt***

Examples

```
switch# copy usb:/FL.10.12.0001-0002.patch
```

```
switch# copy usb:/FL.10.12.0001.swi primary
The primary image will be deleted.

Continue (y/n)? y

Verifying and writing system firmware...
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

copy hot-patch

```
copy hot-patch <Word> {<REMOTE-URL>|<Storage-URL>} [vrf <VRF-NAME>]
```

Description

Copies a hot-patch from a switch to the specified remote URL or storage URL.

Parameter	Description
<Word>	Name of the hot-patch software to upload.
<REMOTE-URL>	Specifies the URL to receive the uploaded patch using SFTP or TFTP. For information on how to format the remote URL, see URL formatting for copy commands.
vrf *<VRF-NAME>*	[Optional] specify the VRF instance to use for upload.
<STORAGE-URL>	Specifies the name of the patch file to create on the USB storage device. Prefix the filename with **usb:/**, for example, **usb:/firmware_FL_10_12_0001-0002.patch.**

Examples

```
switch# copy hot-patch FL_10_12_0001-0002.patch tftp:172.21.18.170/FL_10_12_0001-
0002.patch vrf vrf1
```

Related Commands

Command	Description
copy <REMOTE-URL>	Downloads a hot-patch image from a TFTP or SFTP server.
hot-patch	Apply a hot-patch image or remove it from the switch.

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.12	Hot-patch is now supported on all platforms.
10.10	Command introduced

Command Information

Platforms	Command context	Authority
All platforms	Manager (#)	Administrators or local user group members with execution rights for this command.

hot-patch

```
hot-patch apply|remove <name.patch>
no hot-patch apply <name.patch>
```

Description

Apply hot-patch software or remove it from the switch. The **no** form of the **hot-patch apply** command disables the hot-patch image, but does not remove it from the switch. Rebooting the system after disabling or removing the patch is not required.

Profile names	Description
`apply <name.patch>`	Apply the specified hot-patch image to a standalone switch or VSF stack. AOS-CX hot-patch software images can be obtained from Aruba customer support, and are identified with a **.patch** extension.
`remove <name.patch>`	Disables the hot-patch image and removes the patch from the switch. This removal will also disable the patch. Once removed, a hot-patch must be downloaded again in order to be applied.

Usage

A hot-patch can be downloaded from a remote server onto a switch then applied without rebooting the switch. When the hot-patch is disabled, the hot-patch will still remain on the system. The disabled hot-patch can be removed from the system without the need for a reboot of the system.

If a checkpoint configuration that does not contain a hot-patch is restored to a running configuration that does have a hot-patch, the patch is not deleted, it remains as not applied but is present in the device memory.

Examples

```
switch(config)# hot-patch apply FL_10_12_0001-0002.patch
```

Related Commands

Command	Description
`copy <REMOTE-URL>`	Downloads and installs a hot-patch image from a TFTP or SFTP server.

Command History

Release	Modification
10.11	Command introduced on 6300, 6400, 8100 and 8360 Switch series.

Command Information

Platforms	Command context	Authority
6300 6400 (v2 profile only)	Manager (#)	Administrators or local user group members with execution rights for this command.

flow exporter

```
flow exporter <name>
  destination
    <hostname> [vrf vrfname]
    <ipaddr> [vrf vrfname]
    <ip6addr>  [vrf vrfname]
    type  traffic-insight
  no ..
```

Description

A flow exporter is the part of the IP Flow Information Export (IPFIX) feature that defines how a flow monitor exports flow reports. You can assign the same flow exporter configuration to more than one flow monitor. Each flow exporter includes a destination setting that identifies the device to which the flow reports are sent. 6300 and 6400 series support a maximum of sixteen flow monitors with a limit of two flow exporters that can be applied to a single flow monitor.

Parameter	Description
`<name>`	Name of the flow exporter, up to 64 characters.
`dscp <0-63>`	DSCP value to be used by the flow exporter. The default value is **0**.
`export-protocol ipfix`	Define an export protocol for the flow exporter.The default **ipfix** protocol is the only protocol currently available.
`description <description>`	A description of the flow exporter, up to 256 characters and spaces.
`destination  <hostname>|<IPaddr>|<ip6addr>`	The exporter sends flow records to this destination. The destination can be defined as a hostname, or an IPv4 or IPv6 IP address.
`   [vrf vrfname]`	You can optionally include the name of the destination VRF in the destination definition.
`destination type {hostname-or-ip-addr | traffic-insight}`	The exporter sends flow reports to a traffic insight destination.
`destination traffic-insight <name>`	The exporter sends flow reports to a specific traffic insight destination.
`no ..`	Negate any configured parameter.
`template data timeout <timeout>`	A flow exporter template describes the format of exported flow reports. Therefore, flow reports cannot be decoded properly without the corresponding templates. This setting defines how often the flow exporter will resend templates to the flow monitor. The supported range is 1-86400 seconds, and the default is 600 seconds.
`transport udp <port>`	Transport protocol and port for sending flow record reports. The default port is port 4739,

Examples

The following example creates a flow exporter configuration named **exporter-1**.

```
switch(config)# flow exporter exporter-1
switch(config-flow-exporter)# dscp 34
switch(config-flow-exporter)# destination 192.0.2.1 vrf VRF1
switch(config-flow-exporter)# template data timeout 1200
switch(config-flow-exporter)# description Exports flows to 192.0.2.1
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

Related Commands

Command	Description
`flow record`	Define data to be included in a flow record by configuring flow record match and collect fields

10.11	Command introduced on 6300, 6400, 8100 and 8360 Switch series.

Command Information

Platforms	Command context	Authority
6300 6400 (v2 profile only)	`config` `config-flow-exporter`	Administrators or local user group members with execution rights for this command.

flow monitor

```
flow monitor <name>
   exporter <name>
   cache timeout active|inactive <timeout>
   description <description>
   record <name>
```

Description

On a 6300 and 6400 Switch series, a flow monitor is the part of the IP Flow Information Export (IPFIX) feature that performs network monitoring for the selected interface. A flow monitor configuration consists of a flow record, a flow cache, and one or more associated flow exporters. A flow monitor compiles data from the network traffic on the interface and stores it in the flow cache in a format defined by the flow record. The flow exporters associated with the monitor then export data from the flow cache to the flow exporter destination.

6300 and 6400 series support a maximum of sixteen flow monitors with a limit of two flow exporters that can be applied to a single flow monitor. If no software augmentation of flows is required, there is no need to configure a flow collector or flow monitor.

Parameter	Description
`<name>`	Name of the flow monitor , up to 64 characters.
`cache timeout active|inactive <timeout>`	Use the cache timeout parameter to define an active or inactive timeout for the flow monitor. A flow monitor closes a flow session that is active for longer than the active timeout or inactive for longer than the inactive timeout. The supported timeout range for both the active timeout and inactive timeout is 30-120 seconds, and the default is 30 seconds.
`description`	A description up to 256 characters long, including spaces.
`exporter <name>`	Assign a flow exporter to a flow monitor. Each flow monitor supports a maximum of two different flow exporters, sending flow records to up to two destinations.
`record <name>`	) Assigns a flow record to a flow monitor.

Examples

The following example creates a flow monitor configuration named **monitor-1**.

```
switch(config)# flow monitor monitor-1
switch(config-flow-monitor)# description Monitor for analyzing basic ipv4 traffic
switch(config-flow-monitor)# exporter flow-exporter-1
switch(config-flow-monitor)# exporter flow-exporter-2
switch(config-flow-monitor)# record flow-record-1
switch(config-flow-monitor)# cache timeout inactive 120
switch(config-flow-monitor)# cache timeout active 1500
```

The following workflow changes the flow record assigned to a flow monitor.

```
switch(config)# flow monitor flow-monitor-1
switch(config-flow-monitor)# record flow-record-2
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

6300 6400 (v2 profile only)	config config-flow-monitor	Administrators or local user group members with execution rights for this command.

flow record

```
flow record <name>
   match
      ip|ipv6 {protocol|version}|{source|destination address}
      transport {source|destination} port
   collect
      application name
      application https url
      dns response-code
      counter {packets|bytes}
      timestamp absolute {first|last}
      description <description>
```

Description

Define data to be included in a flow record by configuring flow record match and collect fields.

A flow record defines match (key) fields and collection (non-key) fields. Customers configure flow records with **match** (key) fields and **collect** (non-key) fields. Match fields are the set of fields that define a flow, such as IP address or UDP port. Collect fields are the set of fields that identify information to collect for a flow, such as packet and byte counters.

Traffic with matching attributes (for example, traffic coming from the same interface, sent to the same destination with the same protocol) are classified as a single flow. Information for some or all of the matched settings can be collected and exported to a destination defined by the flow exporter assigned to the flow monitor.

Traffic must match a match rule definition before it can be collected and sent. You cannot collect and send data that is not matched.

Parameter	Description
`<name>`	Name of the flow monitor, up to 64 characters.
`match`	match traffic according to one or more of the following key attributes: - **ip**: match traffic on an IPv4 network - **ipv6**: match traffic on an IPv6 network - **protocol**: Match traffic using the same IP protocol - **version**: Match traffic using the same IP version - **source**: Match traffic from the same source - **destination**: Match traffic to the same destination - **address**: Match traffic by source or destination IP address - **transport**: Match traffic by source or destination transport type - **port**: Match traffic by source or destination transport port
`description`	A description for the flow record up to 256 characters long, including spaces.
`collect`	Configures data fields to be included a flow record. - **application name:** Specify the application name as a non-key field in a flow record. - **application https url**: Specify the HTTP/HTTPS application URL as a non-key field in a flow record. - **dns response-code**: Specify the DNS parameters and DNS response code as a non-key field in the flow record. - **counter packets**: Collect counter data for packets in the flow - **counter bytes**: Collect counter data for bytes in the flow - **timestamp absolute first**: Collect absolute timestamp of the first packet observed. - **timestamp absolute last**: Collect absolute timestamp of the last packet observed.

Examples

Adding IPv4 and transport match fields to **flow-record-1:**

```
switch(config)# flow record flow-record-1
switch(config-flow-record)# match ip source address
switch(config-flow-record)# match ip destination address
switch(config-flow-record)# match ip protocol
switch(config-flow-record)# match ip version
switch(config-flow-record)# match transport source port
switch(config-flow-record)# match transport destination port
switch(config-flow-record)# description Record used for basic ipv4 traffic
analysis
```

Removing the IPv4 destination match field from the **flow-record-1**:

```
switch(config)# flow record flow-record-1
switch(config-flow-record)# no match ip destination address
```

Adding counter and timestamp collect fields to **flow-record-1**:

```
switch(config)# flow record flow-record-1
switch(config-flow-record)# collect counter packets
switch(config-flow-record)# collect counter bytes
switch(config-flow-record)# collect timestamp absolute first
switch(config-flow-record)# collect timestamp absolute last
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

Add a application name to **flow record 1** as a collect field:

```
switch(config)# flow record flow-record-1
switch(config-flow-record)# collect application name
switch(config-flow-record)# collect application https url
switch(config-flow-record)# collect application dns response-code
switch(config-flow-record)# collect application tls-attributes
```

Related Commands

Command	Description
flow exporter	Define how a flow monitor exports the flow reports.
flow monitor	Define a flow monitor configuration, including the flow exporter and flow record associated to that monitor.
show flow record	Display flow record configuration and status.

Command History

Release	Modification
10.14	The **ipv4** parameter is deprecated and replaced with **ip**.
10.13	Added **application https url** and **dns response-code** parameters.
10.11	Command introduced.

Command Information

Platforms	Command context	Authority
6300 6400 (v2 profile only)	config config-flow-record	Administrators or local user group members with execution rights for this command.

flow-tracking

```
flow-tracking
  enable
  icmp-ageout
  interface-flow-limit
```

```
no ...
tcp-ageout
track icmp
udp-ageout
```

Description

Configures flow tracking for TCP and UDP flows, and optionally, ICMP flows. The **no** form of this command deletes the flow tracking configuration context.

In order to optimize the flow removal process, flows that have aged-out are flushed in batches. A flow that has aged out is flushed only when the next batch processes. This can cause some flows to stay inactive for a slightly longer time than the value configured here.

Parameter	Description
`enable`	Enables flow tracking.
`icmp-ageout`	Configures an age-out time for ICMP flows, in seconds. Range: 10-86400. Default: 15.
`interface-flow-limit`	Configures global concurrent flow limit for flow tracking enabled interfaces. Range: 64-25000. Default: none.
`tcp-ageout`	Configures age-out time for established TCP flows in seconds. Range: 120-86400. Default: 600.
`track icmp`	Enable tracking of ICMP flows, in addition to the TCP/UDP flows tracked by default.
`udp-ageout`	Configures age-out time for established UDP flows in seconds. Range: 30-86400. Default: 30.

Examples

Configuring flow tracking:

```
switch(config)# flow-tracking
switch(config-flow-tracking)#
```

Deleting flow tracking:

```
switch(config)# no flow-tracking
switch(config)#
```

Enabling flow tracking:

```
switch(config)# flow-tracking
switch(config-flow-tracking)# enable
```

Disabling flow tracking:

```
switch(config)# flow-tracking
switch(config-flow-tracking)# no enable
```

Configuring an established ICMP flow age-out to 600 seconds:

```
switch(config)# flow-tracking
switch(config-flow-tracking)# icmp-ageout 600
```

Removing an established ICMP flow age-out of 600 seconds:

```
switch(config)# flow-tracking
switch(config-flow-tracking)# no icmp-ageout 600
```

Configuring an established TCP flow age-out to 1000 seconds:

```
switch(config)# flow-tracking
switch(config-flow-tracking)# tcp-ageout 1000
```

Removing an established TCP flow age-out of 1000 seconds:

```
switch(config)# flow-tracking
switch(config-flow-tracking)# no tcp-ageout 1000
```

Configuring an established UDP flow age-out to 1000 seconds:

```
switch(config)# flow-tracking
switch(config-flow-tracking)# udp-ageout 1000
```

Removing an established UDP flow age-out of 1000 seconds:

```
switch(config)# flow-tracking
switch(config-flow-tracking)# no udp-ageout 1000
```

Configuring global level interface flow limit to 256 interfaces:

```
switch(config)# flow-tracking
switch(config-flow-tracking)# interface-flow-limit 256
```

Removing global level interface flow limit to 256 interfaces:

```
switch(config)# flow-tracking
switch(config-flow-tracking)# no interface-flow-limit 256
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

ipv4|ipv6 flow monitor (interface)

```
[no] ip|ipv6 flow monitor <name> in
```

Description

Enable flow monitoring on inbound and outbound interfaces by assigning a flow monitor to that interface. Only physical interfaces and LAG interfaces can be monitored. A flow monitor cannot be applied to an interface that is part of a LAG. If an unsupported application is attempted, an error message will be displayed. If the flow monitor is associated with a flow record that contains application fields as collect fields, then Application Recognition should be enabled on the same interface.

The **[no]** form of command disables the flow monitoring.

Examples

Associate a flow monitor configuration named **flow-monitor-1** and **flow-monitor-2** for IPv4 or IPv6 traffic respectively on physical interface.

```
switch(config)# interface 1/1/1
switch(config-if)# ip flow monitor flow-monitor-1 in
switch(config-if)# ipv6 flow monitor flow-monitor-2 in
```

Associate a flow monitor configuration named **flow-monitor-3** and **flow-monitor-4** for IPv4 or IPv6 traffic respectively on a Lag interface.

```
switch(config)# interface lag 1
switch(config-lag-if)# ip flow monitor flow-monitor-3 in
switch(config-lag-if)# ipv6 flow monitor flow-monitor-4 in
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

show flow exporter

```
show flow exporter [<name>] [statistics]
```

Description

Displays flow exporter statistics, configuration and status. When no exporter name is specified, the output of this command displays information for all flow exporters.

The output of this command can indicate the following status types:

- Accepted
- Rejected (Internal error: exporter does not exist)
- Rejected (Internal error: destination type does not exist)
- Rejected (Destination type is hostname or IP address, but no destination is specified)
- Rejected (Destination type is hostname or IP address, but the specified hostname or IP address is invalid)
- Rejected (Destination type is Traffic Insight, but no destination is specified)
- Rejected (Destination type is Traffic Insight, but the specified Traffic Insight instance does not exist)
- Rejected (Destination type is Traffic Insight, but the specified Traffic Insight instance is not enabled)
- Rejected (Destination type is Traffic Insight, but the specified Traffic Insight instance source is not IPFIX)
- Rejected (Internal error: destination type is Traffic Insight, but the specified Traffic Insight instance is invalid)

Parameter	Description
`<name>`	Name of the flow exporter.
`statistics`	The `statistics` parameter adds statistical information about the flow exporter to the output.

Examples

Display the configuration of a flow exporter named **exporter-1**.

```
switch# show flow exporter exporter-1
--------------------------------------------------------------------------------
Flow exporter 'exporter-1'
--------------------------------------------------------------------------------
Description              : Exports to the first collector
Status                   : Accepted
Export Protocol          : ipfix
Destination Type         : Hostname or IP address
Destination              : 192.168.0.1
Transport Configuration
    Protocol             : UDP
    Port                 : 9995
```

Display statistics information for all flow exporters

```
switch# show flow exporter exporter-1 statistics

--------------------------------------------------------------------------------
Flow exporter 'exporter-1'
--------------------------------------------------------------------------------
Reports sent             : 14961
--------------------------------------------------------------------------------
Flow exporter 'exporter-2'
--------------------------------------------------------------------------------
Reports sent             : 5
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

show flow monitor

`show flow monitor [<name>]`

Description

Displays flow monitor configuration and status. When no monitor name is specified, the output of this command displays information for all flow monitors.

The output of this command can indicate the following status types:

- Accepted
- Rejected (Internal error: monitor does not exist)
- Rejected (The state of one or more of the assigned flow exporters is rejected)

Parameter	Description
`<name>`	Name of the flow monitor.

Examples

Display the configuration of a flow moitor named **flow-monitor-1**.

```
switch# show flow monitor monitor-1
--------------------------------------------------------------------------------
Flow monitor 'monitor-1'
--------------------------------------------------------------------------------
Description              : Used for IPv4 traffic analysis
Status                   : Accepted
Flow Exporter(s)         : exporter-1, exporter-2
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

show flow record

`show flow record [<name>]`

Description

Display flow record configuration and status. When no record name is specified, the output of this command displays information for all flow records.

The output of this command can indicate the following status types:

- Accepted
- Rejected (Internal error: failed to process record)
- Rejected (Mix of IPv4 and IPv6 match fields is not allowed. Specify match fields of the same IP version (IPv4 or IPv6))

Parameter	Description
`<name>`	Name of the flow record.

Examples

Display the configuration of a flow record named **flow-record-1**.

```
switch# show flow record record-1
--------------------------------------------------------------------------------
Flow record  'record-1'
--------------------------------------------------------------------------------
Description             : Used for IPv4 traffic analysis
Status                  : Accepted
Match Fields
    ipv4 destination address
    ipv4 protocol
    ipv4 source address
    ipv4 version
    transport destination port
    transport source port
Collect Fields
    application name
    counter bytes
    counter packets
```

Display the information of a specific flow record.

```
switch# show flow record record-1
--------------------------------------------------------------------------------
Flow record  'record-1'
--------------------------------------------------------------------------------
Description             : Used for IPv4 traffic analysis
Status                  : Accepted
Match Fields
    ipv4 destination address
    ipv4 protocol
    ipv4 source address
    ipv4 version
    transport destination port
    transport source port
Collect Fields
    application name
    counter bytes
    counter packets
```

show tech ipfix

`show tech ipfix`

Description

Shows the IPFIX configuration settings.

If applicable source IP address or source interface is configured for the IPFIX protocol, that configuration is used.

If a valid source is configured, the exporter sends flows to an external collector using the effective configured source IP address as the source IP address of the flow packets. In the context of this application, a valid source IP address is any IP address configured in the exporter's VRF namespace.

Examples

The example shows the IPFIX configuration settings.

```
switch#show tech ipfix

   [no] class gbp-ip <CLASS-NAME> resequence <STARTING-SEQUENCE-NUMBER> <INCREMENT>

   [no] class gbp-ip <CLASS-NAME> copy <DESTINATION-CLASS>
```

Description

Creates, deletes, or modifies an IPv4 Group-Based Policy (GBP) class to match specified protocol packets. A class consists of one or more class entries ordered and prioritized by sequence numbers. Each class can classify traffic based on IPv4 protocol header information.

The **no** keyword deletes either a class or an individual class entry.

Usage

- Entering an existing **<CLASS-NAME>** value modifies the existing class.
- Any new **<SEQUENCE-NUMBER>** value creates an additional class entry.
- Any existing **<SEQUENCE-NUMBER>** value replaces the existing class entry with the same sequence number.
- If no sequence number is specified, a new class entry will be appended with a sequence number equal to the highest policy entry currently in the list plus 10.
- Copying a class to an existing class overwrites the existing entries with new entries.
- Removing a GBP class with entries removes all its entries as well. If a GBP class, that is currently associated with a GBP policy, is attempted to be removed, then a warning message is presented to remove the association before removing the class.
- You can reorder the sequence numbers with the **class resequence** command.
- You can also create redundant class entries in a class that have the same match criteria and action. However, each redundant copy of the class entry will consume additional resources.

Parameter	Description
<CLASS-NAME>	Specifies the class name.
<SEQUENCE-NUMBER>	Specifies the class entry sequence number. Range: `1` to `4294967295`.
{match | ignore}	Creates a rule to ignore or match specified IPv4 packets.
<SRC-ROLE-NAME>	Specifies the source role name.
<DST-ROLE-NAME>	Specifies the destination role name.
<PORT-NUMBER>	Specifies the layer 4 port number. Range: `0` to `65535`.
<MIN-PORT>	Specifies the start port number in the range. Range: `0` to `65535`.
<MAX-PORT>	Specifies the end port number in the range. Range: `0` to `65535`.
<ICMP-TYPE-VALUE>	Specifies a valid ICMP type number. Range: `0` to `255`.
<ICMP-CODE-VALUE>	Specifies a valid ICMP code number. Range: `0` to `255`.
<app-category-name>	(For 6300 and 6400 Switch series) Application-based policies can be applied to any of the following application types: ■ antivirus— Antivirus updates ■ any— Matches all recognized flows irrespective of their application id ■ authentication— Protocol used for authentification purposes ■ behavioral— Protocol classified by non-deterministic criteria based on statistical analysis of packet form and session behavior ■ cloud-file-storage— Cloud File Storage related applications ■ collaboration— Collaboration applications ■ encrypted— Encryption protocol applications

Parameter	Description
	■ enterprise-apps—Enterprise applications ■ gaming—Gaming protocol and applications ■ im-file-transfer— IM File Transfer application category ■ instant-messaging— Instant Messaging applications ■ mail-protocols— Email exchange protocol ■ mobile—Mobile applications ■ mobile-app-store—Mobile app store and applications ■ network-service—Low level network protocol and applications ■ peer-to-peer—Peer-to-Peer applications ■ social-networking—Social Networking applications ■ standard— Standard applications ■ streaming— Streaming applications ■ thin-client—Remote control protocol and applications ■ tunneling— Tunneling protocol and applications ■ unified-communications—Unified Communication protocols and applications ■ unknown—Unknown applications ■ web—Generic web traffic ■ webmail— Web email applications
<app-name>	(For 6300 and 6400 Switch series) Configure a class for the specified application. **NOTE:** The app **<unknown>** under the app-category **<standard>** matches all recognized flows whose application id is unknown or unmapped.

Examples

Creating a group based policy IPv4 class with three entries:

```
switch(config)# class gbp-ip my_gbp_ip_class
switch(config-class-gbp-ip)# 1 match icmp any any
switch(config-class-gbp-ip)# 2 ignore udp default any
switch(config-class-gbp-ip)# 3 match tcp guest admin
switch(config-class-gbp-ip)# 4 count
```

Adding a comment to an existing GBP IPv4 class entry:

```
switch(config)# class gbp-ip my_gbp_ip_class
switch(config-class-gbp-ip)# 3 comment mygbpipClass
```

Removing a comment from an existing class entry:

```
switch(config)# class gbp-ip my_gbp_ip_class
switch(config-class-gbp-ip)# no 3 comment
```

Replacing an IPv4 class entry in an existing GBP IPv4 class:

```
switch(config)# class gbp-ip my_gbp_ip_class
switch(config-class-gbp-ip)# 1 match igmp any any
```

Resequencing a GBP IPv4 class:

```
switch(config)# class gbp-ip my_gbp_ip_class resequence 1 10
```

Removing a GBP IPv4 class entry:

```
switch(config)# class gbp-ip my_gbp_ip_class
switch(config-class-gbp-ip)# no 1
```

Copying a GBP class entries from the source to the destination:

```
switch(config)# class gbp-ip my_gbp_ip_class copy my_gbp_ip_class2
```

Removing a GBP IPv4 class:

```
switch(config)# no class gbp-ip my_gbp_ip_class
```

Configuring a GBP policy that allows an SSH connection from **employee** to **admin** but denies telnet and any other applications.

For more information on configuring a port-access GBP policy, refer to port-access gbp

```
class gbp-ip class-ssh
   10 match any employee admin app-category any app ssh count
class gbp-ip class-telnet
   10 match any employee admin app-category any app telnet count
class gbp-ip class-any-any
   10 match any employee admin app-category any app any count
class gbp-ip class-network-service
   10 match any employee admin app-category network-service app any count
class gbp-ip explicit-allow-for-app-rec
   10 match any employee admin
port-access gbp policy
   10 class gbp-ip class-ssh
   20 class gbp-ip class-telnet action drop
   30 class gbp-ip class-any-any action drop
   40 class gbp-ip explicit-allow-for-app-rec
```

NOTE: Class entry with sequence number 40 is required to enable application recognition for any flow that is not assigned an application ID yet. Once the application ID is assigned, subsequent packets from the flow will match the corresponding app based entry in the policy (if one is configured).

Configuring a GBP policy that denies telnet connections from **employee** to **admin** but allows SSH and other applications.

```
port-access gbp policy
   10 class gbp-ip class-ssh
   20 class gbp-ip class-telnet action drop
   40 class gbp-ip explicit-allow-for-app-rec
```

NOTE: In this example, a class entry with sequence number **40** is required to enable application recognition for any flow that is not assigned an application ID yet. Once the application ID is assigned, subsequent telnet flows will match entry 20 and be dropped while SSH and other applications will match entry **10** and **40** respectively. Entry **40** in this example will also match flows that have the application recognized and are not SSH or telnet.

OR

```
port-access gbp policy
10 class gbp-ip class-ssh
20 class gbp-ip class-telnet action drop
30 class gbp-ip class-any-any
40 class gbp-ip explicit-allow-for-app-rec
```

NOTE: In this case, an explicit entry, **30**, is added for allowing flows from any apps that are not SSH or telnet. Entry 40 will only be used when an application is yet to be recognised for a flow.

Configuring a GBP policy that denies telnet connections from **employee** to **admin** but allows SSH and other applications in the **network service** category.

```
port-access gbp policy
 10 class gbp-ip class-ssh
 20 class gbp-ip class-telnet action drop
 30 class gbp-ip class-network-service
 40 class gbp-ip explicit-allow-for-app-rec
```

Configuring a GBP policy that allows telnet connection from employee to admin but denies all other apps in the network service category.

```
 port-access gbp policy
  20 class gbp-ip class-telnet
  30 class gbp-ip class-network-service action drop
  40 class gbp-ip explicit-allow-for-app-rec
```

For more information on features that use this command, refer to the Security Guide for your switch model.

class gbp-ipv6

```
class gbp-ipv6 <CLASS-NAME>
   [no][<SEQUENCE-NUMBER>]
        {match | ignore}
        {any | <SRC-ROLE-NAME> | default}
        {any | <DST-ROLE-NAME>}
        [count]

    [no][<SEQUENCE-NUMBER>]
        {match | ignore}
        {sctp | tcp | udp}
        {any | <SRC-ROLE-NAME> | default}
        [{eq | gt | lt} <PORT-NUMBER> | range <MIN-PORT> <MAX-PORT>]
        {any | <DST-ROLE-NAME>}
        [{eq | gt | lt} <PORT-NUMBER> | range <MIN-PORT> <MAX-PORT>]
        [count]

    [no][<SEQUENCE-NUMBER>]
        {match | ignore}
        {icmpv6}
        {any | <SRC-ROLE-NAME> | default}
        {any | <DST-ROLE-NAME>}
        [icmp-type {echo | echo-reply | <ICMP-TYPE-VALUE>}] [icmp-code <ICMP-CODE-VALUE>]
        [count]

  [no]class gbp-ipv6 <CLASS-NAME> resequence <STARTING-SEQUENCE-NUMBER> <INCREMENT>

  [no] class gbp-ipv6 <CLASS-NAME> copy <DESTINATION-CLASS>
```

Description

Creates, deletes, or modifies an IPv6 Group-Based Policy (GBP) class to match specified protocol packets.. A class consists of one or more class entries ordered and prioritized by sequence numbers. Each class can classify traffic based on IPv6 protocol header information.

The **no** keyword deletes either a class or an individual class entry.

Usage

- Entering an existing **<CLASS-NAME>** value modifies the existing class.
- Any new **<SEQUENCE-NUMBER>** value creates an additional class entry.
- Any existing **<SEQUENCE-NUMBER>** value replaces the existing class entry with the same sequence number.
- If no sequence number is specified, a new class entry will be appended with a sequence number equal to the highest policy entry currently in the list plus 10.
- Copying a class to an existing class overwrites the existing entries with new entries.

- Removing a GBP class with entries removes all its entries as well. If a GBP class, that is currently associated with a GBP policy, is attempted to be removed, then a warning message is presented to remove the association before removing the class.
- You can reorder the sequence numbers with the **class resequence** command.
- You can also create redundant class entries in a class that have the same match criteria and action. However, each redundant copy of the class entry will consume additional resources.

Parameter	Description
<CLASS-NAME>	Specifies the class name.
<SEQUENCE-NUMBER>	Specifies the class entry sequence number. Range: `1` to `4294967295`.
{match | ignore}	Creates a rule to ignore or match specified IPv6 packets.
<SRC-ROLE-NAME>	Specifies the source role name.
<DST-ROLE-NAME>	Specifies the destination role name.
<PORT-NUMBER>	Specifies the layer 4 port number. Range: `0` to `65535`.
<MIN-PORT>	Specifies the start port number in the range. Range: `0` to `65535`.
<MAX-PORT>	Specifies the end port number in the range. Range: `0` to `65535`.
<ICMP-TYPE-VALUE>	Specifies a valid ICMP type number. Range: `0` to `255`.
<ICMP-CODE-VALUE>	Specifies a valid ICMP code number. Range: `0` to `255`.
<app-category-name>	(For 6300 and 6400 Switch series) Application-based policies can be applied to any of the following application types: ■ antivirus— Antivirus updates ■ any— Matches all recognized flows irrespective of their application id ■ authentication— Protocol used for authentification purposes ■ behavioral— Protocol classified by non-deterministic criteria based on statistical analysis of packet form and session behavior ■ cloud-file-storage— Cloud File Storage related applications ■ collaboration— Collaboration applications ■ encrypted— Encryption protocol applications ■ enterprise-apps—Enterprise applications ■ gaming—Gaming protocol and applications ■ im-file-transfer— IM File Transfer application category ■ instant-messaging— Instant Messaging applications ■ mail-protocols— Email exchange protocol ■ mobile—Mobile applications ■ mobile-app-store—Mobile app store and applications ■ network-service—Low level network protocol and applications

Parameter	Description
	- peer-to-peer—Peer-to-Peer applications - social-networking—Social Networking applications - standard— Standard applications - streaming— Streaming applications - thin-client—Remote control protocol and applications - tunneling— Tunneling protocol and applications - unified-communications—Unified Communication protocols and applications - unknown—Unknown applications - web—Generic web traffic - webmail— Web email applications
<app-name>	(For 6300 and 6400 Switch series) Configure a class for the specified application. **NOTE:** The app **<unknown>** under the app-category **<standard>** matches all recognized flows whose application id is unknown or unmapped.

Examples

Creating a group based policy IPv6 class with three entries:

```
switch(config)# class gbp-ipv6 my_gbp_ipv6_class
switch(config-class-gbp-ipv6)# 10 match icmpv6 any any
switch(config-class-gbp-ipv6)# 20 ignore udp default any
```

Adding a comment to an existing GBP IPv6 class entry:

```
switch(config)# class gbp-ipv6 my_gbp_ipv6_class
switch(config-class-gbp-ipv6)# 10 match icmpv6 any any
switch(config-class-gbp-ipv6)# 20 ignore udp default any
switch(config-class-gbp-ipv6)# 20 comment myipv6Class
```

Removing a comment from an existing class entry:

```
switch(config)# class gbp-ipv6 my_gbp_ipv6_class
switch(config-class-gbp-ipv6)# no 20 comment
```

Replacing an IPv6 class entry in an existing GBP IPv6 class:

```
switch(config)# class gbp-ipv6 my_gbp_ipv6_class
switch(config-class-gbp-ipv6)# 10 match any any admin
```

Resequencing a GBP IPv6 class:

```
switch(config)# class gbp-ipv6 my_gbp_ipv6_class resequence 1 1
```

Removing a GBP IPv6 class entry:

```
switch(config)# class gbp-ipv6 my_gbp_ipv6_class
switch(config-class-gbp-ipv6)# no 1
```

Copying a GBP class entries from the source to the destination:

```
switch(config)# class gbp-ipv6 my_gbp_ipv6_class copy my_gbp_ipv6_class2
```

Removing a GBP IPv6 class:

```
switch(config)# no class gbp-ipv6 my_gbp_ipv6_class
```

Configuring a GBP policy that allows an SSH connection from **employee** to **admin** but denies telnet and any other applications.

For more information on configuring a port-access GBP policy, refer to port-access gbp

```
class gbp-ipv6 class-ssh
   10 match any employee admin app-category any app ssh count
class gbp-ipv6 class-telnet
   10 match any employee admin app-category any app telnet count
class gbp-ipv6 class-any-any
   10 match any employee admin app-category any app any count
class gbp-ipv6 class-network-service
   10 match any employee admin app-category network-service app any count
class gbp-ipv6 explicit-allow-for-app-rec
   10 match any employee admin
port-access gbp policy
   10 class gbp-ipv6 class-ssh
   20 class gbp-ipv6 class-telnet action drop
   30 class gbp-ipv6 class-any-any action drop
   40 class gbp-ipv6 explicit-allow-for-app-rec
```

NOTE: Class entry with sequence number 40 is required to enable application recognition for any flow that is not assigned an application ID yet. Once the application ID is assigned, subsequent packets from the flow will match the corresponding app based entry in the policy (if one is configured).

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

class gbp-mac

```
class gbp-mac <CLASS-NAME>
      [<SEQUENCE-NUMBER>]
      {match | ignore}
      {any | <SRC-ROLE-NAME> | default}
      {any | <DST-ROLE-NAME>}
      {any | aarp | appletalk | arp | fcoe | fcoe-init | ip | ipv6 | ipx-arpa | ipx-non-
      arpa |is-is | lldp | mpls-multicast | mpls-unicast | q-in-q | rbridge | trill |wake-
      on-lan | <NUMERIC-ETHERTYPE>}
      [count]

[<SEQUENCE-NUMBER>] comment <TEXT-STRING>

class gbp-mac <CLASS-NAME> resequence <STARTING-SEQUENCE-NUMBER> <INCREMENT>

class gbp-mac <CLASS-NAME> copy <DESTINATION-CLASS>

no class gbp-mac <CLASS-NAME>
   no [<SEQUENCE-NUMBER>]
      {match | ignore}
      {any | <SRC-ROLE-NAME> | default}
      {any | <DST-ROLE-NAME>}
      {any | aarp | appletalk | arp | fcoe | fcoe-init | ip | ipv6 | ipx-arpa | ipx-non-
      arpa |is-is | lldp | mpls-multicast | mpls-unicast | q-in-q | rbridge | trill |wake-
      on-lan | <NUMERIC-ETHERTYPE>}[
      count]
   no [<SEQUENCE-NUMBER>] comment <TEXT-STRING>
```

Description

Creates, deletes, or modifies class to match specified protocol packets. A class consists of one or more class entries ordered and prioritized by sequence numbers. Each class can classify traffic based on MAC information.

The **no** keyword deletes either a class or an individual class entry.

Usage

- Entering an existing **<CLASS-NAME>** value modifies the existing class.
- Any new **<SEQUENCE-NUMBER>** value creates an additional class entry.
- Any existing **<SEQUENCE-NUMBER>** value replaces the existing class entry with the same sequence number.
- If no sequence number is specified, a new class entry will be appended with a sequence number equal to the highest policy entry currently in the list plus 10.
- Copying a class to an existing class overwrites the existing entries with new entries.
- Removing a GBP class with entries removes all its entries as well. If a GBP class, that is currently associated with a GBP policy, is attempted to be removed, then a warning message is presented to remove the association before removing the class.
- You can reorder the sequence numbers with the **class resequence** command.

- You can also create redundant class entries in a class that have the same match criteria and action. However, each redundant copy of the class entry will consume additional resources.

Parameter	Description
<CLASS-NAME>	Specifies the class name.
<SEQUENCE-NUMBER>	Specifies the class entry sequence number. Range: `1` to `4294967295`.
{match | ignore}	Creates a rule to ignore or match specified packets.
<SRC-ROLE-NAME>	Specifies the source role name.
<DST-ROLE-NAME>	Specifies the destination role name.
<NUMERIC-ETHERTYPE>	Specifies the EtherType number. Range: `0x600` to `0xffff`.

Examples

Creating a GBP MAC class with three entries:

```
switch(config)# class gbp-mac my_gbp_mac_class
switch(config-class-gbp-mac)# 1 match any any lldp
switch(config-class-gbp-mac)# 2 ignore default any arp
```

Adding a comment to an existing GBP MAC class entry:

```
switch(config)# class gbp-mac my_gbp_mac_class
switch(config-class-gbp-mac)# 10 comment myGbpMacClass
```

Removing a comment from an existing class entry:

```
switch(config)# class gbp-mac my_gbp_mac_class
switch(config-class-gbp-mac)# no 10 comment myGbpMacClass
```

Replacing a MAC class entry in an existing GBP MAC class:

```
switch(config)# class gbp-mac my_gbp_mac_class
switch(config-class-gbp-mac)# 10 match any any any
```

Resequencing a GBP MAC class:

```
switch(config)# class gbp-mac my_gbp_mac_class resequence 1 1
```

Removing a GBP MAC class entry:

```
switch(config)# class gbp-mac my_gbp_mac_class
switch(config-class-gbp-mac)# no 1
```

Copying a GBP class entries from the source to the destination:

```
switch(config)# class gbp-mac my_gbp_mac_class copy my_gbp_mac_class2
```

Removing a GBP MAC class:

```
switch(config)# no class gbp-mac my_gbp_mac_class
```

For more information on features that use this command, refer to the Security Guide for your switch model.

clear port-access gbp hitcounts

```
clear port-access gbp [<POLICY-NAME>] hitcounts {client}
```

Description

Clears the statistics of the group based policy applied on the client.

Parameter	Description
<TLV-NUMBER>	Specifies the CDP TLV number. Supported values are 1 to 6, 10, and 11.

Examples

Clearing statistics of GBP applied on the client:

```
switch(config)# clear port-access gbp policy01 hitcounts {client}
```

For more information on features that use this command, refer to the Security Guide for your switch model.

gbp enable

```
gbp enable
no gbp enable
```

Description

Enables group based policy (GBP).

The **no** form of this command disables group based policy (GBP).

Examples

Enabling group based policy:

```
switch(config)# gbp enable
```

Disabling group based policy:

```
switch(config)# no gbp enable
```

For more information on features that use this command, refer to the Security Guide for your switch model.

		Administrators or local user group members with execution rights for this command.

gbp role

```
gbp role <ROLE_NAME> <ROLE_ID>
```

```
no gbp role <ROLE_NAME> <ROLE_ID>
```

Description

Maps the role name to the role ID. This mapping is used in the GBP encapsulation.

Starting from 10.13, for 6300 and 6400 switch series, new default roles, internet and intranet are introduced to differentiate traffic from different fabrics or networks. It is necessary to ensure that the reserved system role names are available before upgrading to AOS-CX 10.13. Any existing user defined system roles that use the role names, internet and intranet should be removed and reconfigured with a different role name.

The **no** form of this command removes the mapping between the role name and ID.

Parameter	Description
<ROLE_NAME>	Specifies the role name to be mapped.
<ROLE_ID>	Specifies the role ID. Range: 100 to 8191.

Examples

Mapping the **employee** role to the role ID **130**:

```
switch(config)# gbp role employee 130
```

Removing the mapping for the role **employee**:

```
switch(config)# no gbp role employee 130
```

The following error message is displayed when user attempts to delete a GBP role which is used inside a policy:

```
switch(config)# no gbp role finance
Role 'finance' is present inside a class. Deletion of role mapping will impact the
traffic flow.
Do you want to continue (y/n)? y
```

For more information on features that use this command, refer to the Security Guide for your switch model.

gbp role infra

```
gbp role infra <TAG-VALUE>
no gbp role infra [<TAG-VALUE>]
```

Description

Sets the GBP infra (infrastructure) role tag value for CPU-generated packets. Prior to AOS-CX 10.09, CPU generated traffic and non-secure port traffic was tagged with a default tag of 0.

This does not apply to CPU re-forwarded packets (DHCP snooping (v4, v6), ND snooping, RA guard, captive portal, IGMP, MLD, and mDNS).

The **no** form of this command resets the GBP infra tag value to its default of 2.

The same GBP infra role tag value must be used across the VXLAN network fabric.

Parameter	Description
<TAG-VALUE>	Specifies the infra tag value to use for CPU-generated packets. Range: 1 to 8191. Default: 2.

Examples

Setting the GBP infra tag value to 10:

```
switch(config)# gbp role infra 10
```

Resetting the GBP infra tag value to its default of 2:

```
switch(config)# no gbp role infra
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.08	Command introduced.

Command Information

port-access gbp

```
port-access gbp <POLICY-NAME>
         [<SEQUENCE-NUMBER>]
         class {gbp-ip | gbp-ipv6 | gbp-mac} <CLASS-NAME> [action {drop | reflect}]
         [<SEQUENCE-NUMBER>] comment <TEXT-STRING>

port-access gbp <POLICY-NAME> resequence <STARTING-SEQUENCE-NUMBER> <INCREMENT>
port-access gbp <POLICY-NAME> copy <DESTINATION-POLICY>
port-access gbp <POLICY-NAME> reset

[no] [<SEQUENCE-NUMBER>]
       class {gbp-ip | gbp-ipv6 | gbp-mac} <CLASS-NAME> [action {drop | reflect}]
[no] [<SEQUENCE-NUMBER>] comment <TEXT-STRING>
```

Description

Creates, deletes, or modifies a group based policy and its entries. Group based policy consists of one or more policy entries that are ordered and prioritized by sequence numbers. Each entry has a GBP-IPv4, GBP-IPv6, or a GBP-MAC class, and corresponding drop or permit policy actions associated with it. A group-based policy has an implicit permit rule to allow any traffic originating from the source role **infra**.

The **no** form of the command deletes either a group based policy or an individual policy entry.

When configuring GBP-MAC class along with other classes, you must configure the GBP-MAC class entry at the end. For example, if you configure as shown below:

```
port-access gbp gbp1
          class gbp-mac class1
          class gbp-ip class2 action drop
```

Although, you would want to drop GBP-IPv4 traffic, it will be allowed because traffic will be allowed because of the MAC rule. In order to drop traffic, you must configure as show below:

```
port-access gbp gbp1
          class gbp-ip class2 action drop
          class gbp-mac class1
```

Usage

To use a GBP, you must associate the policy with a role using the **associate gbp** command.

- A group based policy that is in use cannot be removed from the configuration. To remove, the policy must be unassociated with the roles currently using the policy.
- Entering an existing *`<POLICY-NAME>`* value modifies the existing policy, with any new sequence number creating an additional policy entry, and any existing sequence number replacing the existing policy entry with the same sequence number.
- If no sequence number is specified, a new policy entry will be appended with a sequence number equal to the highest policy entry currently in the list plus 10.
- You can reorder the sequence numbers with the **class resequence** command.

Parameter	Description
<POLICY-NAME>	Specifies the class name.
<SEQUENCE-NUMBER>	Specifies the policy entry sequence number. Range: **1** to **4294967295**.
`class-type`	Specifies the type of class to associate with the policy.
<CLASS-NAME>	Specifies the class name.

`action`	Specifies the action for the class. The default action is to permit all traffic, if the action is not specified as drop explicitly.
	Other available actions are:
	`drop`
	Selects drop of all traffic.
	`reflect`
	Enables the switch to allow a packet destined to the client only if the flow is learned (the flow is initiated by the client).

Examples

Creating a policy and associating it with GBP IPv4 class to permit all traffic:

```
switch(config)# port-access gbp policy01
switch(config-pa-role)# 10 class my_gbp_ip_class
```

Creating a policy and associating it with GBP MAC class to deny all traffic:

```
switch(config)# port-access gbp policy01
switch(config-pa-role)# 10 class my_gbp_mac_class action drop
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.13	Added support for reflexive policies.
10.08	Command introduced

Command Information

Platforms	Command context	Authority
6300 6400	`config` `config-class-`*<CLASS-TYPE>*	Administrators or local user group members with execution rights for this command.

port-access reflexive

```
port-access reflexive
   {gbp|policy} enable
   no...
```

Description

This command enables the use of reflexive port access and group-based policies.

Regular stateless policies allow or deny traffic in the ingress or the egress direction. As a result, reverse traffic that belongs to the same flow will require a separate policy in the opposite direction. This can require complex policies that can be difficult to manage. When reflexive port access policies are enabled, the switch maintains an internal flow table for permitted traffic, and automatically allows return traffic for permitted flows.

When reflexive port access or group-based policies are enabled using this command, all existing port-access clients associated with a reflexive port-access policy, application based policy or group-based policy are logged off from the system.

The **no** form of the command disables reflexive policies and returns port access and group-based policies to the regular stateless status.

This feature can only be used with TCP/UDP Unicast traffic protocols. Protocols like TFTP, DHCP, and ICMP that use a different IP address or port in the request and the corresponding response must not be configured as a reflect entry.

Parameter	Description
gbp	Enables reflexive group-based policies.
policy	Enables reflexive port access policies.

Prerequisites

Before you can enable reflexive policies, you must first configure a role ID using the following command:

```
switch(config)# gbp role <ROLE_NAME> <ROLE_ID>
```

Next,, enable flow tracking using the following commands:

```
switch(config)# no ip source-lockdown resource-extended
   Do you want to continue (y/n)? y
switch(config)# flow-tracking
switch(config-flow-tracking)# enable
```

Examples

Enable reflexive port-access policies:

```
switch(config)# port-access reflexive policy enable
```

Enable reflexive group-based policies:

```
switch(config)# port-access reflexive gbp enable
```

Creating a policy with two entries with reflexive action:

```
switch(config)# port-access policy CPPM
switch(config-pa-policy)# 10 class ip dns action reflect
switch(config-pa-policy)# 20 class ip ssh action reflect
switch(config-pa-policy)# 30 class ip clearpass-web action cir kbps 1024 cbs 2048
exceed drop
switch(config-pa-policy)# 40 class ip web-traffic action redirect captive-portal
switch(config-pa-policy)# exit
switch(config)# show port-access policy

Access Policy Details:
======================

Policy Name   : CPPM
Policy Type   : Local
Policy Status : Applied

SEQUENCE     CLASS           TYPE ACTION
-------- ------------ ---- ---------------------------
10        dns                ipv4 reflect
20        ssh                ipv4 reflect
30        clearpass-web      ipv4 cir kbps 1024 cbs 2048 exceed drop
40        web-traffic        ipv4 redirect captive-portal
```

The **Reflect** action enables the switch to allow a packet destined to the client only if the flow is learned, that is, the flow is initiated by the client.

port-access role associate gbp

```
port-access role <ROLE-NAME>
       associate gbp <POLICY-NAME>
no port-access role <ROLE-NAME>
    no associate gbp <POLICY-NAME>
```

Description

Associates a group based policy with a role.

The **no** form of this command dissociates the policy from the role.

Parameter	Description
<ROLE-NAME>	Specifies the role name.
<POLICY-NAME>	Specifies the group based policy name to associate with the role.

Examples

Associating a policy with a role:

```
switch(config)# port-access role EMPLOYEE
switch(config-pa-role)# associate gbp GROUPPOLICY
```

Dissociating a policy from the role:

```
switch(config)# port-access role EMPLOYEE
switch(config-pa-role)# no associate GBP
```

show class

```
show class {gbp-ip | gbp-ipv6 | gbp-mac} <CLASS-NAME> [commands] [configuration]
```

Description

Shows details of class configuration and its entries. Displays the active configuration providing the list of classes that have been configured and accepted by the system.

Usage

The **show class** command along with the **configuration** option displays the classes that are configured. The output of this command may not be the same as what is active due to unsupported command parameters or if the class was modified after the GBP policy was applied and might have been unsuccessful due to a lack of hardware resources. To determine if there is a discrepancy between what was configured and what is active, compare the output of the **show class** and the **show class**

configuration commands. If the active class configuration and the configured class is not the same, a warning message is displayed to help troubleshoot the difference.

Parameter	Description
<CLASS-NAME>	Specifies the class name.

Examples

Showing configured GBP classes:

```
switch# show classshow class gbp-ip my_gbp_ip_class
Type       Name
  Sequence Comment
           Action                         L3 Protocol
           Source Role Name               Source L4 Port(s)
           Destination Role Name          Destination L4 Port(s)
           Additional Parameters
--------------------------------------------------------------------------------
GBP-IPv4   my_gbp_ip_class
        1  match                           icmp
           any
           admin
        2  ignore                          udp
           default

Chapter 45

High Availability Commands

redundancy switchover

```
redundancy switchover
```

Description

Causes the switch to immediately switch over to the Standby Management Module. This command must be executed from the Active Management Module and will fail if the Standby Management Module is in a failed state or not present.

Examples

This example shows the redundancy switchover command on an active management module with a standby management module that is present.

```
switch#redundancy switchover
This command causes the switch to immediately switchover to the Standby Management
Module.
Do you want to continue [y/n]?
```

This example shows the redundancy switchover command on an active management module with a standby management module that is absent.

```
switch#redundancy switchover
Standby Management Module not found, switchover request ignored.
```

This example shows the redundancy switchover command on a standby management module.

```
switch#redundancy switchover
Redundancy switchover must be performed from the Active Management Module,
switchover request ignored.
```

For more information on features that use this command, refer to the High Availability Guide for your switch model.

Chapter 46

HTTPS server commands

https-server authentication certificate

`https-server authentication certificate [authorization radius] [username {<CERT-FIELD>}]`

Description

Enables authentication using an x509 certificate for authentication. When this option is configured, the https-server uses the user specified certificate for authentication, and the specified authorization mechanism is used to obtain the corresponding user role. The username embedded in the certificate is used for authorization with a remote user database.

Enabling password authentication is the only way of disabling certificate authentication.

> Only one authentication method can be enabled at a time. If you want to disable certificate-based authentication, then the password-based authentication must be enabled.

Parameter	Description
<AUTHORIZATION-RADIUS>	Specifies that after certificate authentication succeeds, instead of prompting for a password, the HTTPS server checks the RADIUS server only for authorization. When this parameter is omitted, **authorization radius** is still the assumed active setting.
<CERT-FIELD>	Selects which certificate username field is to be used for authorization. ■ Specify **user_pincipal_name** to use the certificate UserPrincipalName (UPN) field. This is the default. ■ Specify **common_name** to use the certificate CommonName (CN) field. When this parameter is omitted, **user_pincipal_name** is assumed.

Example

Enabling authentication using the certificate:

```
switch(config)# https-server authentication certificate authorization radius
username common_name
```

Command History

Release	Modification
10.11	Command introduced.

Command Information

Platforms	Command context	Authority

https-server authentication password

`https-server authentication password`

Description

Enables authentication using username and password, which corresponds to the default authentication mechanism. Enabling the password authentication mode disables the certificate authentication mode.

Only one authentication method can be enabled at a time.

Example

Enabling authentication using the password:

```
switch(config)# https-server authentication password
```

Command History

Release	Modification
10.11	Command introduced.

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

https-server max-user-sessions

`https-server max-user-sessions <SESSION-AMT>`

Description

Sets the maximum amount of concurrent open sessions for any given user through the HTTPS server. The amount of concurrent open sessions may have an impact on system performance, so it is recommended to set this value to the minimum necessary.

Parameter	Description
<SESSION-AMT>	Specifies the maximum number of user sessions allowed. Default: 6. Maximum value: 8.

Example

Set the maximum number of concurrent user sessions to the maximum of 8:

```
switch(config)# https-server max-user-sessions 8
```

For more information on features that use this command, refer to the Network Analytics Engine Guide or the REST API Guide for your switch model.

Command History

Release	Modification
10.08	Command introduced

Command Information

Platforms	Command context	Authority
All platforms	`config`	Administrators or local user group members with execution rights for this command.

https-server rest access-mode

```
https-server rest access-mode {read-only | read-write}
```

Description

Changes the REST API access mode. The default mode is read-write. This command does not affect Central connections, which have permission to alter configurations regardless of the access mode set on the switch.

Parameter	Description
`read-write`	Selects the read/write mode. Allows POST, PUT, PATCH, and DELETE methods to be called on all configurable elements in the switch database.
`read-only`	Selects the read-only mode. Write access to most switch resources through the REST API is disabled.

Usage

Setting the mode to `read-write` on the REST API allows POST, PUT, PATCH, and DELETE methods to be called on all configurable elements in the switch database.

By default, REST APIs in the device are in the read-write mode. Some switch resources allow POST, PUT, PATCH, and DELETE regardless of REST API mode. REST APIs that are required to support the Web UI or the Network Analytics Engine expose POST, PUT, PATCH, or DELETE operations, even if the REST API access mode is set to read-only.

The REST API in read/write mode is intended for use by advanced programmers who have a good understanding of the system schema and data relationships in the switch database.

Because the REST API in read/write mode can access every configurable element in the database, it is powerful but must be used with extreme caution: No semantic validation is performed on the data you write to the database, and configuration errors can destabilize the switch.

On 6300 switches or 6400 switches, by default, the HTTPS server is enabled in `read-write` mode on the `mgmt` VRF. If you enable the HTTPS server on a different VRF, the HTTPS server is enabled in `read-only` mode.

Example

```
switch(config)# https-server rest access-mode read-only
```

For more information on features that use this command, refer to the Network Analytics Engine Guide or the REST API Guide for your switch model.

https-server rest firmware-site-distribution

```
https-server rest firmware-site-distribution
no https-server rest firmware-site-distribution
```

Description

Enables the firmware site distribution server.

The firmware site distribution allows you to use a switch to distribute a firmware image file to other switches in the same network. This prevents the switches from connecting to the cloud or an external network to download a firmware image file.

On enabling the firmware site distribution, it exposes a REST endpoint that allows the switches to download a switch primary or secondary firmware image.

As per the limitation, up to two switches can download the firmware image simultaneously.

This endpoint is to be used along with REST `/firmware` endpoint to handle the firmware download and installation process.

The **no** form of this command disables the firmware site distribution server.

Example

Enabling the firmware site distribution server:

```
switch(config)# https-server rest firmware-site-distribution
```

Disabling the firmware site distribution server:

```
switch(config)# no https-server rest firmware-site-distribution
```

For more information on features that use this command, refer to the Network Analytics Engine Guide or the REST API Guide for your switch model.

Command History

https-server session close all

```
https-server session close all
```

Description

Invalidates and closes all HTTPS sessions. All existing WebUI sessions (including sessions used for Central connections) will be logged out. REST and WebUI users will have to reauthenticate. and all real-time notification feature WebSocket connections are closed and must be resubscribed.

Usage

Typically, a user that has consumed the allowed concurrent HTTPS sessions and is unable to access the session cookie to log out manually must wait for the session idle timeout to start another session. This command is intended as a workaround to waiting for the idle timeout to close an HTTPS session. This command stops and starts the `hpe-restd` service, so using this command affects all existing REST sessions, Web UI sessions, and real-time notification subscriptions.

Example

```
switch# https-server session close all
```

For more information on features that use this command, refer to the Network Analytics Engine Guide or the REST API Guide for your switch model.

https-server session-timeout

`https-server session-timeout <MINUTES>`

Description

Configures the timeout, in minutes, for any given HTTPS server session. A value of 0 disables the timeout. This command does not affect sessions used for Central connections.

Parameter	Description
<MINUTES>	Specifies the maximum idle time, in minutes for an HTTPS session. Default: 20. Maximum: 480 (8 hours). 0 disables the timeout, but the maxium is still enforced.

Example

```
switch(config)# https-server session-timeout 10
```

For more information on features that use this command, refer to the Network Analytics Engine Guide or the REST API Guide for your switch model.

Command History

Release	Modification
10.08	Command introduced

Command Information

Platforms	Command context	Authority
All platforms	`config`	Administrators or local user group members with execution rights for this command.

https-server vrf

```
https-server vrf <VRF-NAME>
no https-server vrf <VRF-NAME>
```

Description

Configures and starts the HTTPS server on the specified VRF, allowing access to REST and the WebUI from ports assigned to that VRF. This command does not affect access to Central instances, as this feature has its own dedicated connection channel.

The **no** form of the command stops any HTTPS servers running on the specified VRF and removes the HTTPS server configuration.

Parameter	Description
<VRF-NAME>	Specifies the VRF name. Required. Length: Up to 32 alpha numeric characters.

Usage

By using this command, you enable access to both the Web UI and to the REST API on the specified VRF. You can enable access on multiple VRFs.

By default, the 6200, 6300, and 6400 Switch Series have an HTTPS server enabled on the `mgmt` VRF and on the `default` VRF.

When the HTTPS server is not configured and running, attempts to access the Web UI or REST API result in `404 Not Found` errors.

The VRF you select determines from which network the Web UI and REST API can be accessed.

For example:

- If you want to enable access to the REST API and Web UI through the OOBM port (management IP address), specify the built-in management VRF (`mgmt`).
- If you want to enable access to the REST API and Web UI through the data ports (for "inband management"), specify the built-in default VRF (`default`).
- If you want to enable access to the REST API and Web UI through only a subset of data ports on the switch, specify other VRFs you have created.

Aruba Network Analytics Engine scripts run in the default VRF, but you do not have to enable HTTPS server access on the default VRF for the scripts to run. If the switch has custom Aruba Network Analytics Engine scripts that require access to the Internet, then for those scripts to perform their functions, you must configure a DNS name server on the default VRF.

Examples

Enabling access on all ports on the switch, specify the default VRF:

```
switch(config)# https-server vrf default
```

Enabling access on the OOBM port (management interface IP address), specify the management VRF:

```
switch(config)# https-server vrf mgmt
```

Enabling access on ports that are members of the VRF named `vrfprogs`, specify `vrfprogs`:

```
switch(config)# https-server vrf vrfprogs
```

Enabling access on the management port and ports that are members of the VRF named `vrfprogs`, enter two commands:

```
switch(config)# https-server vrf mgmt
switch(config)# https-server vrf vrfprogs
```

For more information on features that use this command, refer to the Network Analytics Engine Guide or the REST API Guide for your switch model.

show https-server

```
show https-server [vsx-peer]
```

Description

Shows the status and configuration of the HTTPS server. The REST API and web user interface are accessible only on VRFs that have the HTTPS server features configured.

Parameter	Description
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Usage

Shows the configuration of the HTTPS server features.

`VRF`
Shows the VRFs, if any, for which HTTPS server features are configured.

`REST Access Mode`
Shows the configuration of the REST access mode:

`read-write`
POST, PUT, and DELETE methods can be called on all configurable elements in the switch database. This is the default value.

`read-only`
Write access to most switch resources through the REST API is disabled.

Examples

```
switch# show https-server

HTTPS Server Configuration
----------------------------

 VRF                  : default, mgmt
 REST Access Mode     : read-write

 Max sessions per user   : 6

 Session timeout         : 20
```

Chapter 47
ICMP commands

ip icmp redirect

```
ip icmp redirect
no ip icmp redirect
```

Description

Enables the sending of ICMPv4 and ICMPv6 redirect messages to the source host. Enabled by default.

The **no** form of this command disables ICMPv4 and ICMPv6 redirect messages to the source host.

Examples

Enabling ICMP redirect messages:

```
switch(config)# ip icmp redirect
```

Disabling ICMP redirect messages:

```
switch(config)# no ip icmp redirect
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

ip icmp throttle

```
ip icmp throttle <PACKET-INTERVAL>
no ip icmp throttle [<PACKET-INTERVAL>]
```

Description

Used to configure the throttle parameter for both ICMPv4 and ICMPv6 error messages and redirect messages.

The **no** form of this command disables the throttle parameter for both ICMPv4 and ICMPv6 error messages and redirect messages.

Parameter	Description
<PACKET-INTERVAL>	Specifies the ICMPv4/v6 packet interval in seconds. Default: 1 second. Range: 1-86400.

Examples

Enabling the throttle parameter for both ICMPv4 and ICMPv6 error messages and redirect messages:

```
switch(config)# ip icmp throttle 3000
```

Disabling the throttle parameter for both ICMPv4 and ICMPv6 error messages and redirect messages:

```
switch(config)# no ip icmp throttle
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.8	Added the optional *<PACKET-INTERVAL>* parameter to the **no** form of the command.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config`	Administrators or local user group members with execution rights for this command.

ip icmp unreachable

```
ip icmp unreachable
no ip icmp unreachable
```

Description

Enables the sending of ICMPv4 and ICMPv6 destination unreachable messages on the switch to a source host when a specific host is unreachable. The unreachable host address originates from the failed packed. Default setting.

The **no** form of this command disables the sending of ICMPv4 and ICMPv6 destination unreachable messages from the switch to a source host when a specific host is unreachable. This command does not prevent other hosts from sending an ICMP unreachable message.

Examples

Enabling ICMPv4 and ICMPv6 destination unreachable messages to a source host:

```
switch(config)# ip icmp unreachable
```

Disabling ICMPv4 and ICMPv6 destination unreachable messages to a source host:

```
switch(config)# no ip icmp unreachable
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Chapter 48

IGMP commands

For commands in the interface configuration context, the interface must be an L3 interface. The supported contexts include: `config-if`, `config-if-vlan`, `config-lag-if`, `config-sub-if`.

The sub-interface related configuration examples provided in this section apply only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

ip igmp

```
ip igmp {enable | disable}
no ip igmp [enable | disable]
```

Description

Enables or disables IGMP on the current interface. IGMP is disabled by default.

The **no** form of this command disables IGMP on the current interface.

Parameter	Description
`enable`	Enable IGMP.
`disable`	Disable IGMP.

Examples

Enabling IGMP on interface VLAN 2:

```
switch(config)# interface vlan 2
switch(config-if-vlan)# ip igmp enable
Disabling IGMP on interface VLAN 2:
```

```
switch(config)# interface vlan 2
switch(config-if-vlan)# ip igmp disable
```

Enabling IGMP on interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# no shutdown
switch(config-if)# routing

switch(config-subif)# ip igmp enable
```

Disabling IGMP on interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-subif)# ip igmp disable
```

```
switch(config)# interface 1/1/1
switch(config-subif)# no ip igmp enable
```

Enabling IGMP on sub-interface 1/1/1.1:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config)# interface 1/1/1.1
switch(config-subif)# no shutdown
switch(config-subif)# ip igmp enable
```

Disabling IGMP on sub-interface 1/1/1.1:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config)# interface 1/1/1.1
switch(config-subif)# ip igmp disable
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.11	Sub-interface support extended to 8325 and 10000 Switch Series.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority

All platforms	`config-if-vlan`
	`config-if`
	`config-lag-if`
	`config-subif`
		Administrators or local user group members with execution rights for this command.

ip igmp apply access-list

```
ip igmp apply access-list <ACL-NAME>
no ip igmp apply access-list <ACL-NAME>
```

Description

Configures the ACL on a particular interface to filter the IGMP join or leave packets based on rules set in the particular ACL name.

The **no** form of this command unconfigures the rules set for the ACL.

This configuration will override the ACL associated with IGMP snooping on the corresponding L2 VLAN.

Parameter	Description
`access-list`	Associates an ACL with the IGMP.
`<ACL-NAME>`	Specifies the name of the ACL.

Usage

- Existing classifier commands are used to configure the ACL.
- In case an IGMPv3 packet with multiple group addresses is received, the switch only processes the permitted group addresses based on the ACL rule set. The packet is forwarded to querier and PIM router even though one of the groups present in the packet is blocked by ACL. This avoids the delay in learning of the permitted groups. Since the access switch configured with ACL blocks the traffic for the groups which are denied, forwarding of joins has no impact. If all the groups in the packet are denied by the ACL rule, the packet is not forwarded to the querier and PIM router. Existing joins will timeout.
- In case of IGMPv2, if there is no match or if there is a deny rule match, the packet is dropped.

Examples

Configuring the ACL on a VLAN to filter IGMP packets based on permit/deny rules set in access list **mygroup**:

```
switch(config)# access-list ip mygroup
switch(config-acl-ip)# 10 deny igmp any 239.255.255.250
switch(config-acl-ip)# 20 deny igmp any 239.255.255.253
switch(config-acl-ip)# 30 permit igmp any 239.1.1.1
switch(config-acl-ip)# exit
switch(config)# interface vlan 2
switch(config-if-vlan)# ip igmp apply access-list mygroup
```

Configuring the ACL to remove the rules set in access list **mygroup**:

```
switch(config-if-vlan)# no ip igmp apply access-list mygroup
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ip igmp last-member-query-interval

```
ip igmp last-member-query-interval <INTERVAL-VALUE>
no ip igmp last-member-query-interval <INTERVAL-VALUE>
```

Description

Configures an IGMP last member query interval value in seconds on an interface, depending on the command context you are in.

The **no** form of this command sets the value to a default of 1 second on an interface.

Parameter	Description
<INTERVAL-VALUE>	Specifies an IGMP last-member-query-interval on the interface. Default: 1 second. Range: 1-2 seconds.

Examples

Configuring an IGMP last member query interval of 2 on interface VLAN 2:

```
switch(config)# interface vlan 2
switch(config-if-vlan)# ip igmp last-member-query-interval 2
switch(config-if-vlan)# no ip igmp last-member-query-interval
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ip igmp querier

```
ip igmp querier
no ip igmp querier
```

Description

Configures an IGMP querier on an interface, depending on the command context you are in. This functionality will allow an interface to join in the querier-election process.

The **no** form of this command disables IGMP querier on an interface.

Examples

Configuring an IGMP querier on interface VLAN 2:

```
switch(config)# interface vlan 2
switch(config-if-vlan)# ip igmp querier
```

Disabling an IGMP querier on interface VLAN 2:

```
switch(config)# interface vlan 2
switch(config-if-vlan)# no ip igmp querier
```

Configuring an IGMP querier on interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# no shutdown
switch(config-if)# routing
switch(config-subif)# ip igmp querier
```

Disabling an IGMP querier on interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-subif)# no ip igmp querier
```

Configuring an IGMP querier on sub-interface 1/1/1.1

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config)# interface 1/1/1.1
switch(config-subif)# no shutdown
switch(config-subif)# ip igmp querier
```

Disabling an IGMP querier on sub-interface 1/1/1.1:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config)# interface 1/1/1.1
switch(config-subif)# no ip igmp querier
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.11	Sub-interface support extended to 8325 and 10000 Switch Series.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority

All platforms	`config-if-vlan`
	`config-if`
	`config-lag-if`
	`config-subif`
		Administrators or local user group members with execution rights for this command.

ip igmp querier interval

```
ip igmp querier interval <INTERVAL-VALUE>
no ip igmp querier interval
```

Description

Configures the interval between IGMP queries on an interface, depending on the command context you are in.

The **no** form of this command sets the IGMP querier interval to the default value of 125 seconds on an interface.

Parameter	Description
<INTERVAL-VALUE>	Specifies the IGMP querier interval in seconds on the interface. Default: 125 seconds. Range: 5-300.

Examples

Configuring an IGMP querier interface interval of 100 on interface VLAN 2:

```
switch(config)# interface vlan 2
switch(config-if-vlan)# ip igmp querier interval 100
```

Resetting an IGMP querier interval to the default value:

```
switch(config-if-vlan)# no ip igmp querier interval
```

Configuring an IGMP querier interface interval of 100 on interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# no shutdown
switch(config-if)# routing
switch(config-subif)# ip igmp querier interval 100
```

Configuring an IGMP querier interface interval of 100 on sub-interface 1/1/1.1:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config)# interface 1/1/1.1
switch(config-subif)# no shutdown
switch(config-subif)# ip igmp querier interval 100
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.11	Sub-interface support extended to 8325 and 10000 Switch Series.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority

All platforms	`config-if-vlan`
	`config-if`
	`config-lag-if`
	`config-subif`
		Administrators or local user group members with execution rights for this command.

ip igmp querier-wait-time

```
ip igmp querier-wait-time <QUERIER-WAIT-TIME>
no ip igmp querier-wait-time <QUERIER-WAIT-TIME>
```

Description

Configures initial IGMP querier-wait-time value in seconds.

The **no** form of this command sets the IGMP querier-wait-time to the default value of 260 seconds. Note that the wait timer can be configured to any numbers within the 1-300 second range.

Parameter	Description
<QUERIER-WAIT-TIME>	Configures IGMP querier-wait-time to desired value.

Examples

Configuring IGMP querier-wait-time:

```
6200-1(config-if-vlan)# ip igmp querier-wait-time
<1-300>  Querier Wait value (Default: 260)
6200-1(config-if-vlan)#
```

When PIM is enabled, automated election will override querier-wait-time configuration. When PIM is disabled and **[no] igmp querier-wait-time** is configured, the initial wait timer will be configured at desired value.

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

ip igmp querier query-max-response-time

```
ip igmp querier query-max-response-time <RESPONSE-TIME>
no ip igmp querier query-max-response-time <RESPONSE-TIME>
```

Description

Configures the IGMP querier max response time value in seconds on an interface, depending on the command context you are in.

The **no** form of this command sets the querier max response time value to the default of 10 seconds on an interface.

Parameter	Description
<RESPONSE-TIME>	Specifies the IGMP querier max response time value on the interface. Default: 10 seconds. Range: 10-128 seconds.

Examples

Configuring the IGMP querier maximum response time of 50 for interface VLAN 2:

```
switch(config)# interface vlan 2
switch(config-if-vlan)# ip igmp query-max-response-time 50
```

Resetting an IGMP querier interval to the default value:

```
switch(config-if-vlan)# no ip igmp query-max-response-time
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ip igmp robustness

```
ip igmp robustness <VALUE>
no ip igmp robustness <VALUE>
```

Description

Configures IGMP robustness on an interface, depending on the command context. The robustness parameter allows tuning for the expected packet loss on a subnet.

The **no** form of this command sets the robustness value to the default of 2 on an interface.

Parameter	Description
<VALUE>	Specifies an IGMP robustness value on the interface. Default: 2. Range: 1-7.

Examples

Configuring an IGMP robustness of 5 on interface VLAN 2:

```
switch(config)# interface vlan 2
switch(config-if-vlan)# ip igmp robustness 5
```

Resetting the IGMP robustness to the default:

```
switch(config-if-vlan)# no ip igmp robustness
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ip igmp router-alert-check

```
ip igmp router-alert-check [enable | disable]
no ip igmp router-alert-check [enable | disable]
```

Description

Enables or disables IGMP router alert check for IGMP packets. IGMP packets without the router alert field set are dropped if router alert check is enabled. Router alert check is disabled by default.

The **no** form of this command disables router alert check for IGMP packets.

Parameter	Description
`enable`	Enable IGMP router alert check.
`disable`	Disable IGMP router alert check.

Examples

Enabling IGMP router alert check on interface VLAN 2:

```
switch(config)# interface vlan 2
switch(config-if-vlan)# ip igmp router-alert-check enable
```

Disabling IGMP router alert check on interface VLAN 2:

```
switch(config)# interface vlan 2
switch(config-if-vlan)# ip igmp router-alert-check disable
```

```
switch(config)# interface vlan 2
switch(config-if-vlan)# no ip igmp router-alert-check enable
```

ip igmp static-group

```
ip igmp static-group <MULTICAST-GROUP-IP>
no ip igmp static-group <MULTICAST-GROUP-IP>
```

Description

Configures an IGMP static multicast group on an interface, depending on the command context you are in. You can configure a maximum of 32 IGMP static groups.

The **no** form of the command unconfigures IGMP static multicast group on an interface.

Parameter	Description
<MULTICAST-GROUP-IP>	Specifies an IGMP static multicast group IP address on the interface. Format: A.B.C.D

Examples

Administrators or local user group members with execution rights for this command.

Configuring an IGMP static group on interface VLAN 2:

```
switch(config)# interface vlan 2
switch(config-if-vlan)# ip igmp static-group 239.1.1.1
```

Resetting an IGMP static group on an interface to the default (none):

```
switch(config-if)# no ip igmp static-group 239.1.1.10
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ip igmp version

```
ip igmp version <VERSION>
no ip igmp version <VERSION>
```

Description

Configures the IGMP version on an interface, depending on the command context you are in.

The **no** form of the command configures the default IGMP version, 3, on the interface.

Parameter	Description
<VERSION>	Specifies the IGMP version on the interface. Select 2 for IGMPv2 (RFC2236). Select 3 for IGMPv3 (RFC3376). Values: 2 or 3.

Examples

Configuring an IGMP version on interface VLAN 2:

```
switch(config)# interface vlan 2
switch(config-if-vlan)# ip igmp version 2
```

Configuring an IGMP version on interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# ip igmp version 2
```

Removing an IGMP version on interface VLAN 2:

```
switch(config)# interface vlan 2
switch(config-if-vlan)# no ip igmp version 2
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ip igmp version strict

```
ip igmp version <VERSION> strict
no ip igmp version <VERSION> strict
```

Description

Configures an IGMP strict version on an interface, depending on the command context you are in. Drops packets that do not match the configured version.

The **no** form of the command removes the strict version configuration from the interface.

Parameter	Description
`<VERSION>`	Specifies the IGMP version on the interface. Select 2 for IGMPv2 (RFC2236). Select 3 for IGMPv3 (RFC3376). Values: 2 or 3.

Examples

Configuring the IGMP strict version to 2 on interface VLAN 2:

```
switch(config)# interface vlan 2
switch(config-if-vlan)# ip igmp version 2 strict
```

Resetting the IGMP strict version to the default (none):

```
switch(config-if)# no ip igmp version 2 strict
```

no ip igmp

```
no ip igmp
```

Description

Disables all IGMP configurations on an interface or sub-interface, depending on the command context you are in.

Examples

Removing IGMP on interface VLAN 2:

```
switch(config)# interface vlan 2
switch(config-if-vlan)# no ip igmp
```

Removing IGMP on interface 1/1/1:

```
switch(config)# interface 1/1/1

switch(config-subif)# no ip igmp
```

Removing IGMP on sub-interface 1/1/1.1:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config)# interface 1/1/1.1
switch(config-subif)# no ip igmp
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

show ip igmp

`show ip igmp [vrf <VRF-NAME> | all-vrfs] [vsx-peer]`

Description

Shows IGMP configuration information and status, or shows information by VRF.

Parameter	Description
`vrf <VRF-NAME> | all-vrfs`	Optional. Used to show information

Parameter	Description
	by VRF. Specify the VRF by VRF name. With no **`<VRF-NAME>`** specified, the default VRF is implied. To show information for all VRFs, specify **all-vrfs**.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing IGMP configuration and status:

```
switch# show ip igmp

VRF Name  : default
Interface : vlan2
IGMP Configured Version    : 3
IGMP Operating Version     : 3
Querier State              : Querier

show ip igmp counters

`show ip igmp counters [vrf <VRF-NAME> | all-vrfs] [vsx-peer]`

Description

Shows IGMP counter details, or shows counters by VRF.

Parameter	Description
`vrf <VRF-NAME> | all-vrfs`	Optional. Used to show information by VRF. Specify the VRF by VRF name. With no **<VRF-NAME>** specified, the default VRF is implied. Specify **all-vrfs** to show information for all VRFs.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing IGMP counters:

```
switch# show ip igmp counters

IGMP Counters

Interface Name      : vlan2
VRF Name            : default
Membership Timeout  : 0
                                             Rx            Tx

show ip igmp group

`show ip igmp group <GROUP-IP> [source <SOURCE-IP>] [vrf <VRF-NAME> | all-vrfs] [vsx-peer]`

Description

Shows IGMP joined group information for the specified group, or shows joined group source and display information by VRF.

Parameter	Description
<GROUP-IP>	Specifies the IP address of the group. Format: A.B.C.D
`source <SOURCE-IP>`	Specifies the IP address of the source. Format: A.B.C.D
`vrf <VRF-NAME> | all-vrfs`	Optional. Used to show information by VRF. Specify the VRF by VRF name. With no **<VRF-NAME>** specified, the default VRF is implied. Specify **all-vrfs** to show information for all VRFs.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing IGMP joined group details for group 239.1.1.10:

```
switch# show ip igmp group 239.1.1.10

IGMP group information for group 239.1.1.10

Interface Name   : vlan2
VRF Name         : default

Group Address    : 239.1.1.10
Last Reporter    : 100.1.1.10

show ip igmp groups

`show ip igmp groups [vrf <VRF-NAME> | all-vrfs] [vsx-peer]`

Description

Shows IGMP group information, or you can display group information by VRF.

Parameter	Description
`vrf <VRF-NAME> | all-vrfs`	Optional. Used to show information by VRF. Specify the VRF by VRF name. With no **<VRF-NAME>** specified, the default VRF is implied. Specify **all-vrfs** to show information for all VRFs.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing IGMP group information:

```

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show ip igmp interface

```
show ip igmp interface [{<INTF-ID>|<INTF-ID.ID>|{vlan <VLAN-ID>}]
counters [vsx-peer]
group <A.B.C.D> [{source <A.B.C.D>}| [vsx-peer]
groups [vsx-peer]
statistics [vsx-peer]
[vsx-peer]
```

Description

Shows IGMP configuration information for a specific interface (VLAN, port or LAG).

Parameter	Description
`<INTF-ID>`	Specifies an interface (such as 1/1/2 or LAG10).
`<INTF-ID.ID>`	Required. Specifies a sub-interface. (Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.)
`vlan <VLAN-ID>`	Specifies a VLAN. Values: 1-4094.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing IGMP configuration information for interface VLAN 2:

```
switch# show ip igmp interface vlan 2

IGMP Configured Version   : 3
IGMP Operating Version    : 3
Querier State             : Querier
Querier IP [this switch] : 20.1.1.1
Querier Uptime            : 1m 46s
Querier Expiration Time   : 0m 1s
Snoop Enabled on VLAN     : True

switch# show ip igmp interface vlan  10

IGMP is not enabled
```

Showing IGMP configuration information for the specified interface 1/1/2:

```
switch# show ip igmp interface 1/1/2

IGMP Configured Version     : 3
IGMP Operating Version      : 3
Querier State               : Querier
Querier IP [this switch]    : 100.1.1.1
Querier Uptime              : 51m 44s
Querier Expiration Time     : 1m 51s
```

Showing IGMP configuration information for sub-interface 1/1/5.10:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch# show ip igmp interface 1/1/5.10

IGMP Configured Version     : 3
IGMP Operating Version      : 3
Querier State               : Querier
Querier IP [this switch]    : 200.1.1.1
Querier Uptime              : 11m 44s
Querier Expiration Time     : 1m 51s
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

show ip igmp interface counters

`show ip igmp interface {<INTF-ID> | <INTF-ID.ID>| vlan <VLAN-ID>} counters [vsx-peer]`

Description

Shows IGMP counter details for a specific interface or VLAN interface.

Parameter	Description
<INTF-ID>	Specifies an interface (such as 1/1/2).
<INTF-ID.ID>	Required: Specifies a sub-interface. (Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.)
vlan *<VLAN-ID>*	Specifies a VLAN. Values: 1-4094.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing IGMP counters for interface VLAN 2:

```
switch# show ip igmp interface vlan 2 counters

IGMP Counters

Interface Name      : vlan2
VRF Name            : default
Membership Timeout  : 0
                                             Rx            Tx

All platforms	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show ip igmp interface group

```
show ip igmp [interface {<INTF-ID> | <INTF-ID.ID> | vlan <VLAN-ID>} [group <GROUP-IP>
[source <SOURCE-IP>] [vsx-peer]]]
```

Description

Shows IGMP joined group information for a specific interface or VLAN interface, or specify a source IP.

Parameter	Description
<INTF-ID>	Specifies an interface (such as 1/1/2).
<INTF-ID.ID>	Required: Specifies the sub-interface. (Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.)
vlan *<VLAN-ID>*	Specifies a VLAN. Values: 1-4094.
<GROUP-IP>	Specifies the IP address of the group. Format: A.B.C.D
source *<SOURCE-IP>*	Specifies the IP address of the source. Format: A.B.C.D
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing IGMP joined group details for group 239.1.1.1 for interface VLAN 10:

```
switch# show ip igmp interface vlan 10 group 239.1.1.1

IGMP group information for group 239.1.1.1

Interface Name   : vlan10
VRF Name         : default

Group Address    : 239.1.1.1
Last Reporter    : 100.1.1.10

                              V1        V2        Sources   Sources

show ip igmp interface statistics

```
show ip igmp interface {<INTF-ID> | <INTF-ID.ID> | vlan <VLAN-ID>} statistics [vsx-peer]
```

Description

Shows IGMP statistics for a specific interface or VLAN interface, including groups joined.

Parameter	Description
<INTF-ID>	Specifies an interface (such as 1/1/2 or LAG1).
<INTF-ID.ID>	Required: Specifies the sub-interface. (Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.)
vlan *<VLAN-ID>*	Specifies a VLAN. Values: 1-4094.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing IGMP statistics for interface VLAN 2:

```
switch# show ip igmp interface vlan 2 statistics

IGMP statistics

Interface Name : vlan2
VRF Name       : default

Number of Include Groups       :   2
Number of Exclude Groups       :   0
Number of Static Groups        :   0
Total Multicast Groups Joined  :   2
```

Showing IGMP statistics for the sub-interface:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch# show ip igmp interface 1/1/5.10 statistics

IGMP statistics

Interface Name : 1/1/5.10
VRF Name       : default

Number of Include Groups       :   0
Number of Exclude Groups       :   2
Number of Static Groups        :   0
Total Multicast Groups Joined  :   2
```

show ip igmp static-groups

```
show ip igmp static-groups [vrf <VRF-NAME> | all-vrfs] [vsx-peer]
```

Description

Shows IGMP static groups, or shows information by VRF.

Parameter	Description
`vrf <VRF-NAME> | all-vrfs`	Optional. Used to show information by VRF. Specify the VRF by VRF name. With no **`<VRF-NAME>`** specified, the default VRF is implied. Specify **all-vrfs** to show information for all VRFs.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing IGMP static-group information:

```
switch# show ip igmp static-groups

IGMP Static Group Address Information

VRF Name    default
Interface Name   Group Address
--------------- -----------------
vlan10            238.1.1.1
```

Showing IGMP statics-group information for all VRFs:

```
switch# show ip igmp static-groups all-vrfs

IGMP Static Group Address Information
VRF Name   :test
Interface Name   Group Address
--------------- -----------------
vlan20            239.1.1.1
VRF Name   :default
Interface Name   Group Address
--------------- -----------------
vlan10            238.1.1.1
```

```
Showing IGMP static-group information for VRF test:
                 switch# show ip igmp static-groups vrf test

IGMP Static Group Address Information

VRF Name   :test
Interface Name   Group Address
--------------- -----------------
vlan20            239.1.1.1
```

show ip igmp statistics

`show ip igmp statistics [vrf <VRF-NAME> | all-vrfs] [vsx-peer]`

Description

Shows IGMP statistics, including groups joined, or shows statistics by VRF.

Parameter	Description
`vrf <VRF-NAME> | all-vrfs`	Optional. Used to show information by VRF. Specify the VRF by VRF name. With no **`<VRF-NAME>`** specified, the default VRF is implied. Specify **all-vrfs** to show information for all VRFs.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing IGMP statistics:

```
switch# show ip igmp statistics
IGMP statistics

VRF Name        : default

Number of Include Groups       :   1
Number of Exclude Groups       :   0
Number of Static Groups        :   0
Total Multicast Groups Joined  :   1
```

Showing IGMP statistics for all VRFs:

```
switch# show ip igmp statistics all-vrfs
IGMP statistics
VRF Name        : test

Number of Include Groups       :   2
Number of Exclude Groups       :   0
Number of Static Groups        :   0
```

```
Total Multicast Groups Joined  :   2
VRF Name        : default

Number of Include Groups       :   1
Number of Exclude Groups       :   0
Number of Static Groups        :   0
Total Multicast Groups Joined  :   1
```

Showing IGMP statistics for VRF test:

```
switch# show ip igmp statistics vrf test
IGMP statistics

VRF Name        : test

Number of Include Groups       :   2
Number of Exclude Groups       :   0

Chapter 49

IGMP snooping commands

ip igmp snooping apply access list

```
ip igmp snooping apply access list <ACL-NAME>
no ip igmp snooping apply access list <ACL-NAME>
```

Description

Configures the access list (ACL) in a particular interface to filter IGMP join or leave packets based on rules set in a particular access list name. The **no** form of this command removes the configuration.

Parameter	Description
<ACL-NAME>	Specifies the access list name.

Usage

Existing classifier commands are used to configure ACL. In case of IGMPv3 packets with multiple group addresses received, only permitted group addresses based on the ACL rule set are proccessed. The packet is forwarded to querier and PIM router even though one of the groups present in the packet is blocked by ACL to avoid the delay in learning of the permitted groups because the access switch configured with the ACL blocks the traffic for the groups which are denied forwarding of joins have no impact. If all of the groups in a packet are denied by the ACL rule packet, it is not forwarded to the querier and PIM router. If the ACE has the source address configured, the source address in the IGMPv3 report is matched against the ACL and corresponding action is taken. Existing joins timeout.

With IGMPv2, if there is no match or if there is a deny rule match, the packet is dropped.

If the access list is configured for both L2 VLAN and L3 VLAN, then the L3 VLAN configuration is applied.

Example

Configure the access list:

```
switch(config)# vlan 2
switch(config-vlan-2)# ip igmp snooping apply access-list mygroup
```

Remove the access list:

```
switch(config)# vlan 2
switch(config-vlan-2)# no ip igmp snooping apply access-list mygroup
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.13	Command introduced.

Command Information

Platforms	Command context	Authority
All platforms	`config-vlan`	Administrators or local user group members with execution rights for this command.

ip igmp snooping (config mode)

```
ip igmp snooping
   drop-unknown vlan-shared|vlan-exclusive
   fastlearn <PORT-LIST>
```

Description

Configures drop-unknown and fastlearn modes on the ports. While IGMP snooping is enabled, the traffic will be forwarded only to ports that made an IGMP request for the multicast. Drop unknown filters ensure that packets are not forwarded to ports that did not make a request for the traffic stream. This could either be a filter across all VLANs (**vlan-shared**) or per VLAN (**vlan-exclusive**). The default is **vlan-shared**. Fast learn enables the port to learn group information when receiving a topology change notification. By default, fast learn is not enabled on ports.

Parameter	Description
`drop-unknown`	Drop unknown filters ensure that packets are not forwarded to ports that did not make a request for the traffic stream.
`vlan-shared`	Enables a shared VLAN filter on the switch. Default is **vlan-shared.**
`vlan-exclusive`	Enables an exclusive drop unknown filter per VLAN.
`fastlearn <PORT-LIST>`	Enable fast learn on ports. This parameter specifies a list of one or more ports to be configured as fast learn ports. You can specify a single port, a comma-separated list of ports or a range of ports such as 1/1/1-1/1/3. You may also enter an L2 LAG (1-128)
`no ...`	Negates any configured parameter.

Example

On the 6400 Switch Series, interface identification differs.

Configuring fast learn ports:

```
switch(config)# ip igmp snooping fastlearn 1/1/3
switch(config)# ip igmp snooping fastlearn 1/1/1-1/1/2
switch(config)# ip igmp snooping fastlearn 1/1/5,1/1/6
```

Configuring a shared VLAN filter on the switch:

```
switch(config)# ip igmp snooping drop-unknown vlan-shared
```

Configuring a exclusive drop unknown filter per VLAN:

```
switch(config)# ip igmp snooping drop-unknown vlan-exclusive
```

Disabling drop unknown on the switch:

```
switch(config)# no ip igmp snooping drop-unknown
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ip igmp snooping filter unknown mcast

```
ip igmp snooping filter-unknown-mcast
no ip igmp snooping filter-unknown-mcast
```

Description

Enables the avoidance of initial flooding of unknown multicast traffic on IGMP-snooping-enabled VLANs.

The no form of this command returns to the default behavior of initial flooding of unknown multicast traffic.

Usage

In the default behavior, the unknown multicast traffic is flooded until the IP Multicast Flow programming is done on the hardware. This is known as initial flooding of unknown multicast. Use this command to filter unknown multicast instead of flooding.

Initial flooding of multicast traffic is observed for a few seconds after the device comes up from a reboot. This issue is only seen when the multicast source connected device is rebooted. Once the device is up after a reboot, it takes a few seconds for the CPU Rx rule to be programmed during the timeframe that the initial flooding is observed. This is an expected behavior.

Example

Configure the unknown multicast to steal globally on IGMP snooping enabled VLANs.

```
switch# configure terminal
switch(config)# ip igmp snooping filter-unknown-mcast
```

Removing the configuration of the unknown multicast to steal globally on IGMP snooping enabled VLANs.

```
switch# configure terminal
switch(config)# no ip igmp snooping filter-unknown-mcast
```

Command History

Release	Modification
10.11	Command introduced on the 6200, 6300, 6400, 8100, and 8360.

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

ip igmp snooping (interface mode)

```
ip igmp snooping
   auto vlan <VLAN-LIST>
   blocked vlan <VLAN-LIST>
   fastleave vlan <VLAN-LIST>
   forced-fastleave vlan <VLAN-LIST>
   forward vlan <VLAN-LIST>
   no ...
```

Description

Configure IP IGMP snooping for the VLAN on the interface. When IGMP snooping is enabled, the L2 snooping switch forwards multicast packets of known multicast groups to only the receivers. When IGMP snooping is not enabled, the snooping switch floods multicast packets to all hosts on the VLAN.

Parameter	Description
`auto vlan` *`<VLAN-LIST>`*	Instruct the device to monitor incoming multicast traffic on the specified ports on a VLAN or VLAN range. This is the default behavior. Enter the number of a single VLAN or a series of numbers for a range of VLANs, separated by commas (10, 20, 30, 40), dashes (10-40), or both (10-40,60).
`blocked vlan` *`<VLAN-LIST>`*	Configures the specified ports in blocked mode for the specified VLAN list. In blocked mode, joins and traffic are always

Parameter	Description
	blocked on this port. Enter the number of a single VLAN or a series of numbers for a range of VLANs, separated by commas (10, 20, 30, 40), dashes (10-40), or both (10-40,60).
`fastleave vlan <VLAN-LIST>`	IGMP fastleave is configured for ports on a per-VLAN basis. Upon receiving a Leave Group message, the querier sends an IGMP Group-Specific Query message out of the interface to ensure that no other receivers are connected to the interface. If receivers are directly attached to the switch, it is inefficient to send the membership query as the receiver wanting to leave is the only connected host. When a fastleave-enabled switch port is connected to a single host and receives a leave, the switch does not wait for the querier status update interval, but instead immediately removes the IGMP client from its IGMP table and ceases transmitting multicast traffic to the client. (If the switch detects multiple end nodes on the port, Fastleave does not activate regardless of whether one or more of these end nodes are IGMP clients.) This processing speeds up the overall leave process and also eliminates the CPU overhead of having to generate an IGMP Group-Specific Query message. This parameter specifies a list of VLANs on which the port should be configured as a fastleave port. Specifies the number of a single VLAN or a series of numbers for a range of VLANs, separated by commas (10, 20, 30, 40), dashes (10-40), or both (10-40,60).
`forced-fastleave vlan <VLAN-LIST>`	With forced fastleave enabled, IGMP speeds up the process of blocking unnecessary multicast traffic to a switch port that is connected to multiple end nodes. When a port having multiple end nodes receives a leave group request from one end node for a given multicast group, forced fastleave activates and waits for a second to receive a join request from any other member of the same group on that port. If the port does not receive a join request for that group within the forced fastleave interval, the switch then blocks any further traffic to that group on that port. This parameter specifies a list of VLANs on which the port should be configured as a forced fastleave port. Specifies the number of a single VLAN or a series of numbers for a range of VLANs, separated by commas (10, 20, 30, 40), dashes (10-40), or both (10-40,60). This command is available in **config-if** mode.
`forward vlan <VLAN-LIST>`	Configures the specified ports in forward mode in the given VLAN list. In forward mode, traffic is always forwarded on this port, irrespective of joins. Specify a list of VLANs on which the port should be configured as a forward port. Specifies the number of a single VLAN or a series of numbers for a range of VLANs, separated by commas (10, 20, 30, 40), dashes (10-40), or both (10-40,60). This command is available in **config-if** mode.
`no ...`	Negates any configured parameter.

Example

On the 6400 Switch Series, interface identification differs.

Configure auto ports for VLAN on the interface:

```
switch# configure terminal
switch(config)# int 1/1/1
switch(config-if)# no shut
switch(config-if)# no routing
switch(config-if)# vlan trunk allowed 10-20
switch(config-if)# ip igmp snooping auto vlan 10
switch(config-if)# ip igmp snooping auto vlan 10-20
```

Configuring fastleave ports for the VLAN on the interface:

```
switch# configure terminal
switch(config)# int 1/1/1
switch(config-if)# no shut
switch(config-if)# no routing
switch(config-if)# vlan trunk allowed 10-20
switch(config-if)# ip igmp snooping fastleave vlan 10
switch(config-if)# ip igmp snooping fastleave vlan 10-20
```

Configuring blocked ports for the VLAN on the interface:

```
switch# configure terminal
switch(config)# int 1/1/1
switch(config-if)# no shut
switch(config-if)# no routing
switch(config-if)# vlan trunk allowed 10-20
switch(config-if)# ip igmp snooping blocked vlan 10
switch(config-if)# ip igmp snooping blocked vlan 10-20
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

All platforms	`config-if`	Administrators or local user group members with execution rights for this command.

ip igmp snooping preprogram-starg-flow

`ip igmp snooping preprogram-starg-flow {enable | disable}`

Description

Configures preprogramming of the starg flow feature on the IGMP snooping enabled VLAN.

Parameter	Description
`enable`	Enables preprogramming starg flows on the VLAN.
`disable`	Disables preprogramming starg flows on the VLAN.

Usage

When this feature is enabled, a summarized multicast bridge entry is programmed into the hardware table when an IGMPv2 or IGMPv3 join is received on the IGMP snooping enabled VLAN. This enables multicast flow to be programmed in the hardware before the data packet arrives for a multicast flow. If an unknown packet is received for a multicast flow, having this feature enabled triggers programming of starg entry in the hardware on selected platforms, which is helpful in optimizing hardware resource utilization and PIM registration in deployments where a L2 device is connected along the PIM registration path.

This feature is currently supported for IGMPv2 and IGMPv3 joins, so IGMPv3 joins that are sent for a specific source are treated as IGMPv2 joins and summarized entry is programmed in the corresponding hardware.

Preprogramming of starg flows is supported only on the IGMP snooping enabled VLANs. If IGMP snooping is disabled on a VLAN, this feature is auto-disabled.

This feature is currently supported for IGMPv2 and IGMPv3 joins, as a result, summarized multicast flow is programmed in advance when an IGMPv2 join or IGMPv3 join for a specific group is received. For IGMPv3 deployments, traffic from all sources for a specific multicast group is sent to all clients, regardless of whether they send IGMPv2 or IGMPv3 joins for this group. Keeping this feature disabled is recommended on VLANs where traffic from the specific source is only expected for the IGMPv3 clients.

On the 6200, 6300, 6400, 8100, and 8360 switch series, a single starg entry is programmed in advance for each join received. Data driven programming of SG entries does not occur when traffic is received from a specific source for this group. A single starg entry is used to forward the traffic to the clients for all of the active joins in the feature enabled VLANs.

When an unknown multicast packet is received on a VLAN where this feature is enabled, it triggers programming of a starg entry in the hardware instead of the SG.

It is highly recommended to not enable this feature on devices where PIM or L3 multicast routing is enabled as it can lead to issues like permanent traffic loss.

Configuring this feature on devices where there are multiple sources sending traffic for the same group address is recommended.

This feature is mutually exclusive with the IGMP snooping static group feature.

Example

Enable preprogramming multicast starg flows:

```
switch(config)# vlan 2
switch(config-vlan-2)# ip igmp snooping preprogram-starg flow enable
```

Disable preprogramming multicast starg flows:

```
switch(config)# vlan 2
switch(config-vlan-2)# ip igmp snooping preprogram-starg flow disable
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.13	Command introduced.

Command Information

Platforms	Command context	Authority
6300 6400	`config-vlan`	Administrators or local user group members with execution rights for this command.

ip igmp snooping static group

```
ip igmp snooping static group <GROUP-NAME>
no ip igmp snooping static group <GROUP-NAME>
```

Description

Configures static multicast group. The **no** form of this command removes the configuration.

Parameter	Description
<GROUP-NAME>	Specifies the group name.

Example

Configure static multicast group on group 239.1.1.1:

```
switch(config)# vlan 2
switch(config-vlan-2)# ip igmp snooping static-group 239.1.1.1
```

Remove static multicast group on group 239.1.1.1:

```
switch(config)# vlan 2
switch(config-vlan-2)# no ip igmp snooping static-group 239.1.1.1
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.13	Command introduced.

Command Information

Platforms	Command context	Authority
All platforms	`config-vlan`	Administrators or local user group members with execution rights for this command.

ip igmp snooping (vlan mode)

```
ip igmp snooping
   apply access-list <ACL-NAME>
   enable|disable
   no ...
   static-group <MULTICAST-IP-ADDRESS>
   version <2-3> (vlan interface mode)
```

Description

These commands enable or disable IP IGMP snooping on the VLAN, create IGMP snooping static multicast groups, set the IGMP snooping version and configurethe ACL on a particular interface.

Disabling and enabling IGMP snooping on a VLAN causes IGMP querier re-election.

Parameter	Description
`access-list`	Associates an ACL with the IGMP.
`enable|disable`	Enables or disables IGMP snooping on the VLAN. By default, IGMP snooping is disabled.
`no ...`	Negates any configured parameter.
`static-group` *`<MULTICAST-IP-ADDRESS>`*	This parameter configures an IGMP snooping static multicast group. Specify the IGMP static multicast group IP address in A.B.C.D format. You can configure a maximum of 32 IGMP snooping static
`version <2-3>`	Configures the IGMP snooping version on the VLAN. Select **2** for IGMPv2 (RFC2236). Select **3** for IGMPv3 (RFC3376).

Usage

- Existing classifier commands are used to configure the ACL.
- In case an IGMPv3 packet with multiple group addresses is received, the switch only processes the permitted group addresses based on the ACL rule set. The packet is forwarded to querier and PIM router even though one of the groups present in the packet is blocked by the ACL. This avoids the delay in learning of the permitted groups. Since the access switch configured with ACL blocks the traffic for the groups which are denied, forwarding of joins has no impact. If all the groups in the packet are denied by the ACL rule, the packet is not forwarded to the querier and PIM router. Existing joins will timeout.
- In case of IGMPv2, if there is no match or if there is a deny rule match, the packet is dropped.

If the access list is configured for both L2 VLAN and L3 VLAN, the L3 VLAN configuration will be applied.

Example

On the 6400 Switch Series, interface identification differs.

Enable IGMP snooping on a VLAN:

```
switch(config)# vlan 2
switch(config-vlan)# ip igmp snooping enable
```

Disable IGMP snooping on a VLAN:

```
switch(config)# vlan 2
switch(config-vlan)# ip igmp snooping disable
```

Configuring an IGMP snooping static group:

```
switch(config)# vlan 2
switch(config-vlan)# ip igmp snooping static-group 239.1.1.1
switch(config-vlan)# no ip igmp snooping static-group 239.1.1.1
```

Configuring IGMP snooping version on the VLAN:

```
switch(config)# vlan 2
switch(config-vlan)# ip igmp snooping version 2
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config-vlan-<VLAN-ID>`	Administrators or local user group members with execution rights for this command.

show ip igmp snooping

```
show ip igmp snooping
   counters
   detail
   groups [vlan <vlan-id>]
   no ...
   packet-exceptions
   static-groups
   statistics
```

```
vlan <vlan-id> [group {<ip-addr> [client_details]}|{port <IF-NAME>}|{vtep-peer
<A.B.C.D>}]
vsx-peer
```

NOTE: The `vsx-peer` parameter is not supported by the 6300 Series Switch

Description

Shows IGMP snooping configuration information and status for all VLANs. Specify a VLAN ID or a VLAN and a group to display details for only that VLAN or VLAN group.

Parameter	Description
`counters`	Shows IGMP query packets transmitted (Tx), received (Rx), and error packet counters.
`detail`	Shows IGMP Snooping details for all VLANs, including joined ports or VXLAN tunnel endpoints (VTEPs) for each group in the VLAN.
`groups`	Shows IGMP snooping groups information. Include the optional **vlan <vlan-id>** parameter to display information for groups on a specific VLAN.
`no ...`	Negates any configured parameter.
`packet-exceptions`	Troubleshoot issues in L2 multicast bridge entries for data packets forwarded to the CPU.
`static-groups`	Shows MLD snooping static group details, including the number of static groups joined.
`statistics`	Shows MLD snooping statistics.
`vlan <vlan-id>`	Shows IGMP snooping protocol information and number of different groups joined for the VLAN.
`group`	Shows IGMP snooping group information for the specified VLAN, including the number of different groups joined for the VLAN. Identify the group by IP address or interface name.
`<ip-addr> [client-details]`	Shows IGMP snooping group address information. Include the optional **client details** parameter to display IGMP snooping client details.
`port <IF-NAME>`	Shows IGMP snooping group information for the interface name in **member**/**slot**/**port** format.
`vtep-peer <A.B.C.D>`	Shows IGMP snooping info for the specified VTEP.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing IGMP snooping configuration and status:

```
switch# show ip igmp snooping

IGMP Snooping Protocol Info

Total VLANs with IGMP enabled             : 1
IGMP Drop Unknown Multicast               : Global

VLAN ID : 1

Chapter 50

In-System Programming commands

clear update-log

```
clear update-log
```

Description

Clears stored log files of any In-System Programming updates on the system.

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Manager (#)	Administrators or local user group members with execution rights for this command.

show needed-updates

```
show needed-updates [next-boot [primary|secondary]]
```

Description

Displays whether any programmable devices are in need of an update.

Without the **next-boot** parameter, this command displays needed updates relative to the currently running AOS-CX image.

With the **next-boot** parameter, this command displays needed updates relative to an AOS-CX image file in the persistent storage of the switch, which might be different from the currently running image. If either the **primary** or **secondary** parameter is specified, this command queries that specific AOS-CX image file. Otherwise, it queries the default AOS-CX image file as set by the most recent **boot system** or **boot set-default** command.

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

Chapter 51
Interface commands

allow-unsupported-transceiver

```
allow-unsupported-transceiver [confirm | log-interval {none | <INTERVAL>}]
no allow-unsupported-transceiver
```

Description

Allows unsupported transceivers to be enabled or establish connections. Transceivers with speeds up to 100G are enabled by this command.

The following models will enable unsupported transceivers for speeds up to 100G when running AOS-CX 10.10 or later:

- 6300 Series Switches—Up to 50G
- 6400 Series Switches—Up to 100G

This command is enabled by default, allowing the use of third party transceiver products without adding the command in the configuration. Disabling this command with the **no** form will now disable the command in the running and stored configurations.

The **no** form of this command disallows using unsupported transceivers.

Parameter	Description
`confirm`	Specifies that unsupported transceiver warnings are to be automatically confirmed.
`log-interval none`	Disables unsupported transceiver logging.
`log-interval <INTERVAL>`	Sets the unsupported transceiver logging interval in minutes. Default: 1440 minutes. Range: 1440 to 10080 minutes.

Usage

When none of the parameters are specified it will display a warning message to accept the warranty terms. With **confirm** option the warning message is displayed but the user is not prompted to **(y/n)** answering. Warranty terms must be agreed to as part of enablement and the support is on best effort basis.

Examples

Allowing unsupported transceivers with follow-up confirmation:

```
switch(config)# allow-unsupported-transceiver
Warning: The use of unsupported transceivers, DACs, and AOCs is at your
own risk and may void support and warranty. Please see HPE Warranty terms
and conditions.

Do you agree and do you want to continue (y/n)? y
```

Allowing unsupported transceivers with confirmation in command syntax:

```
switch(config)# allow-unsupported-transceiver confirm
Warning: The use of unsupported transceivers, DACs, and AOCs is at your
own risk and may void support and warranty. Please see HPE Warranty terms
and conditions.
```

Configuring unsupported transceiver logging with an interval of every 48 hours:

```
switch(config)# allow-unsupported-transceiver log-interval 2880
```

Disabling unsupported transceiver logging:

```
switch(config)# allow-unsupported-transceiver log-interval none
```

Disallowing unsupported transceivers with follow-up confirmation:

```
switch(config)# no allow-unsupported-transceivers
Warning: Unsupported transceivers, DACs, and AOCs will be disabled,
which could impact network connectivity. Use 'show allow-unsupported-transceiver'
to identify unsupported transceivers, DACs, and AOCs.

Ccontinue (y/n)? y
```

Disallowing unsupported transceivers with confirmation in command syntax:

```
switch(config)# no allow-unsupported-transceiver confirm
Warning: Unsupported transceivers, DACs, and AOCs will be disabled,
which could impact network connectivity. Use 'show allow unsupported-transceiver'
to identify unsupported transceivers, DACs, and AOCs.

switch(config)#
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.10	Up to 100G support enabled for unsupported transceivers on 6300 (up to 50G) and 6400 (up to 100G) series switches in UT mode.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

default interface

`default interface <INTERFACE-ID>`

Description

Sets an interface (or a range of interfaces) to factory default values.

Parameter	Description
<INTERFACE-ID>	Specifies the ID of a single interface or range of interfaces. Format: **member/slot/port** or **member/slot/port**-**member/slot/port** to specify a range.

Examples

On the 6400 Switch Series, interface identification differs.

Resetting an interface:

```
switch(config)# default default interface 1/1/1
```

Resetting an range of interfaces:

```
switch(config)# default default interface 1/1/1-1/1/10
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command Information

Platforms	Command context	Authority
All platforms	`config`	Administrators or local user group members with execution rights for this command.

description

```
description <DESCRIPTION>
no description
```

Description

Associates descriptive information with an interface to help administrators and operators identify the purpose or role of an interface.

The **no** form of this command removes a description from an interface.

Parameter	Description
<DESCRIPTION>	Specify a description for the interface. Range: 1 to 64 ASCII characters (including space, excluding question mark).

Examples

Setting the description for an interface to **DataLink 01**:

```
switch(config-if)# description DataLink 01
```

Removing the description for an interface.

```
switch(config-if)# no description
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

energy-efficient-ethernet

```
energy-efficient-ethernet
```

Description

Enables auto-negotiation of Energy-Efficient Ethernet (EEE) on an interface. EEE Negotiation is established only on auto-link negotiation with supported link partners.

Examples

Configuring an interface:

```
switch(config)# interface 1/1/1
switch(config-if)# energy-efficient-ethernet
```

Disabling Energy Efficient Ethernet on an interface:

```
switch(config)# interface 1/1/1
switch(config-if)# no energy-efficient-ethernet
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

error-control

```
error-control {auto | none | base-r-fec | rs-fec}
no error-control {auto | none | base-r-fec | rs-fec}
```

Description

Configures the forward error correction (FEC) mode to use for an interface. When not configured, the system will automatically select the FEC mode based on the installed transceiver. In most cases, the standard FEC mode will work best, but certain link partners may require a non-standard mode.

The **no** and **auto** forms of this command configure the interface to automatically use the standard FEC mode of the currently installed transceiver.

FEC configuration only applies to transceivers, DACs, or AOCs running at 25G or 100G. 100G DACs are a special case. They can only set FEC to none when auto-negotiation is disabled through the **speed override** command. The default for the installed transceiver is used in all other cases.

Transceivers for which FEC is auto-negotiated will request the mode configured by this command, but may resolve to a different mode. The applied FEC mode is displayed as a commented line in the configuration shown with the **show run** command. It is also displayed with **show interface** command.

Parameter	Description
`auto`	Use the transceiver default.
`none`	Do not use any FEC.
`base-r-fec`	Use IEEE BASE-R (Firecode) FEC.
`rs-fec`	Use IEEE RS (Reed-Solomon) FEC.

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.11	Command enabled on 6400 and 8400 Switch Series.
10.08.1021	Command introduced.

Command Information

Platforms	Command context	Authority
6300 6400	`config-if`	Administrators or local user group members with execution rights for this command.

flow-control

```
flow-control rxtx
no flow-control rxtx
```

Description

Command **flow-control** enables negotiation of IEEE 802.3x link-level flow control on the current interface. The switch advertises link-level flow control support to the link partner. The final configuration is determined based on the capabilities of both partners.

Each invocation of this command replaces the previous configuration.

The **no** form of these commands disables any configured flow control on the selected interface.

Parameter	Description
`rxtx`	Enables the ability to honor received and to transmit IEEE 802.3x LLFC pause frames to the remote device.

Usage (flow control)

- For interfaces that auto-negotiate, link-level flow control is subject to negotiation, plus speed and other parameters. Both ends of the link must negotiate the same flow control mode for it to be applied.
- For interfaces that do not auto-negotiate, the configured link-level flow control mode is always applied and the user is responsible for ensuring that both ends of the link are configured for the same mode.
- All members of a LAG must have the same flow control configuration.
- Lossless flow control is only supported for single destination unicast traffic. Replicated traffic (for example, broadcast, multicast, mirroring) cannot be guaranteed to be lossless.
- Lossless behavior is not supported when operating in a VSF stack configuration.
- Lossless flow control will only operate correctly when both the ingress and egress interfaces have flow control enabled.

Examples

Enabling support for RXTX flow control:

```
switch(config)# interface 1/1/1
switch(config-if)# flow-control txrx
```

Disabling support for RXTX flow control:

```
switch(config)# interface 1/1/1
switch(config-if)# no flow-control txrx
```

hat use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config-if`	Administrators or local user group members with execution rights for this command.

interface

`interface <PORT-NUM>`

Description

Switches to the **config-if** context for a physical port. This is where you define the configuration settings for the logical interface associated with the physical port.

Parameter	Description
<PORT-NUM>	Specifies a physical port number. Format: **member/slot/port**.

Examples

On the 6400 Switch Series, interface identification differs.

Configuring an interface:

```
switch(config)# interface 1/1/1
switch(config-if)#
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config`	Administrators or local user group members with execution rights for this command.

interface loopback

```
interface loopback <ID>
no interface loopback <ID>
```

Description

Creates a loopback interface and changes to the **config-loopback-if** context. Loopback interfaces are layer 3.

The **no** form of this command deletes a loopback interface.

Parameter	Description
<INSTANCE>	Specifies the loopback interface ID. Range: 1 to 256

Examples

```
switch# config
switch(config)# interface loopback 1
switch(config-loopback-if)#
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

interface vlan

```
interface vlan <VLAN-ID>
no interface vlan <VLAN-ID>
```

Description

Creates an interface VLAN also know as an SVI (switched virtual interface) and changes to the **config-if-vlan** context. The specified VLAN must already be defined on the switch.

The **no** form of this command deletes an interface VLAN.

Parameter	Description
<VLAN-ID>	Specifies the loopback interface ID.
none	Do not reserve any internal VLANs.

Examples

```
switch# config
switch(config)# vlan 10
switch(config-vlan-10)# exit
switch(config)# interface vlan 10
switch(config-if-vlan)#
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

ip address

```
ip address <IP-ADDR>/<MASK> [secondary]
no ip address <IP-ADDR>/<MASK> [secondary]
```

Description

Sets an IPv4 address for the current layer 3 interface.

The **no** form of this command removes the IPv4 address from the interface.

Parameter	Description
<IP-ADDR>	Specifies an IP address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. You can remove leading zeros. For example, the address **192.169.005.100** becomes **192.168.5.100**.
<MASK>	Specifies the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128.
`secondary`	Specifies a secondary IP address.

Examples

On the 6400 Switch Series, interface identification differs.

Creating a layer 3 interface setting its IP address to **192.168.100.1** with a mask of **24** bits.

```
switch(config)# interface 1/1/1
switch(config-if)# routing
switch(config-if)# ip address 192.168.100.1/24
```

Assigning the IP address **192.168.20.1** with a mask of **24** bits to loopback interface **1**:

```
switch(config)# interface loopback 1
switch(config-loopback-if)# routing
switch(config-loopback-if)# ip address 192.168.20.1/24
```

Assigning the IP address **192.168.199.1** with a mask of **24** bits to interface VLAN **10**:

```
switch(config)# interface vlan 10
switch(config-if-vlan)# ip address 192.168.199.1/24
```

Removing the IP address **192.168.199.1** with a mask of **24** bits from interface VLAN **10**:

```
switch(config)# interface vlan 10
switch(config-if-vlan)# no ip address 192.168.199.1/24
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

ip mtu

```
ip mtu <VALUE>
```

```
no ip mtu
```

Description

Sets the IP MTU (maximum transmission unit) for an interface. This defines the largest IP packet that can be sent or received by the interface. This value should be less than or equal to the overall MTU for the interface.

The **no** form of this command sets the IP MTU to the default value 1500. This command is only allowed when routing is enabled on the interface.

Parameter	Description
<VALUE>	Specifies the IP MTU in bytes. Range: 68 to 9198. Default: 1500.

Usage

The IP MTU value for subinterface must be less than or equal to the parent MTU for the subinterface. The subinterface uses its IP MTU value and not the parent IP MTU value.

Examples

Setting the IP MTU to 576 bytes:

```
switch(config-if)# ip mtu 576
```

Setting the IP MTU to the default value:

```
switch(config-if)# no ip mtu
```

Setting the IP MTU value on a subinterface:

```
switch(config)# interface 1/1/1.10
switch(config-subif)# ip mtu 6000
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.08	Subinterface support added.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	config-if config-if-vlan config-subif	Administrators or local user group members with execution rights for this command.

ipv6 address

```
ipv6 address <IPV6-ADDR>/<MASK>{eui64 | [tag <ID>]}
no ipv6 address <IPV6-ADDR>/<MASK>
```

Description

Sets an IPv6 address on the interface.

The **no** form of this command removes the IPv6 address on the interface.

This command automatically creates an IPv6 link-local address on the interface. However, it does not add the **ipv6 address link-local** command to the running configuration. If you remove the IPv6 address, the link-local address is also removed. To maintain the link-local address, you must manually execute the **ipv6 address link-local** command.

Parameter	Description
<IPV6-ADDR>	Specifies the IP address in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F. You can use two colons (::) to represent consecutive zeros (but only once), remove leading zeros, and collapse a hextet of four zeros to a single 0. For example, this address **2222:0000:3333:0000:0000:0000:4444:0055** becomes **2222:0:3333::4444:55**.
<MASK>	Specifies the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128.
eui64	Configure the IPv6 address in the EUI-64 bit format.
tag *<ID>*	Configure route tag for connected routes. Range: 0 to 4294967295. Default: 0.

Examples

Setting the IPv6 address **2001:0db8:85a3::8a2e:0370:7334** with a mask of 24 bits:

```
switch(config-if)# ipv6 address 2001:0db8:85a3::8a2e:0370:7334/24
```

Removing the IP address **2001:0db8:85a3::8a2e:0370:7334** with mask of 24 bits:

```
switch(config-if)# no ipv6 address 2001:0db8:85a3::8a2e:0370:7334/24
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

l3-counters

```
l3-counters [rx | tx]
no l3-counters [rx | tx]
```

Description

Enables counters on a layer 3 interface. By default, all interfaces are layer 3. To change a layer 2 interface to layer 3, use the **routing** command.

The **no** form of this command, with no specification, disables both transmit and receive counters on a layer 3 interface. To disable transmit (**tx**) or receive (**rx**) counters only, specify the counter type you want to disable.

Parameter	Description
`rx`	Specifies receive counters.
`tx`	Specifies transmit counters.

Examples

Enabling layer 3 transmit counters

On the 6300 Switch Series:

```
switch(config)# interface 1/1/1
switch(config-if)# routing
switch(config-if)# l3-counters
```

On the 6400 Switch Series:

```
switch(config)# interface 1/3/1
switch(config-if)# routing
switch(config-if)# l3-counters
```

Enabling layer 3 transmit counters on subinterfaces

On the 6300 Switch Series:

```
switch(config)# interface 1/1/1.10
switch(config-if)# routing
switch(config-if)# l3-counters tx
```

On the 6400 Switch Series:

```
switch(config)# interface 1/3/1.10
switch(config-if)# routing
switch(config-if)# l3-counters tx
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.08	Added support for 13 counters on subinterfaces
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-if` `config-subif`	Administrators or local user group members with execution rights for this command.

mtu

```
mtu <VALUE>
no mtu
```

Description

Sets the MTU (maximum transmission unit) for an interface. This defines the maximum size of a layer 2 (Ethernet) frame. Frames larger than the MTU (1500 bytes by default) are dropped and cause an ICMP fragmentation-needed message to be sent back to the originator.

To support jumbo frames (frames larger than 1522 bytes), increase the MTU as required by your network. A frame size of up to 9198 bytes is supported.

The largest possible layer 1 frame will be 18 bytes larger than the MTU value to allow for link layer headers and trailers.

The **no** form of this command sets the MTU to the default value 1500.

Parameter	Description
<VALUE>	Specifies the MTU in bytes. Range: 46 to 9198. Default: 1500.

Examples

On the 6400 Switch Series, interface identification differs.

Setting the MTU on interface **1/1/1** to 1000 bytes:

```
switch(config)# interface 1/1/1
switch(config-if)# no routing
switch(config-if)# mtu 1000
```

Setting the MTU on interface **1/1/1** to the default value:

```
switch(config)# interface 1/1/1
switch(config-if)# no routing
switch(config-if)# no mtu
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

persona

```
persona {access | uplink | custom <PERSONA-NAME>} [copy | attach]
no persona {access | uplink | custom <PERSONA-NAME>} [copy | attach]
```

Description

Associates one of three persona types with an interface to classify the purpose or role of an interface. On the 10000 Switch Series, “access” persona ports are typically connected to workloads / VMs, and the “uplink” (fabric) persona ports are connected to the core / spine.

The **no** form of this command removes the interface persona.

Parameter	Description
`access`	Selects the **access** persona type.
`uplink`	Selects the **uplink** persona type.
`custom <PERSONA-NAME>`	Selects the **custom** persona type with a user-provided name. Range: 1 to 64 printable ASCII characters including space.
`copy`	Specifies the mode: copies settings from the persona interface of the same name.
`attach`	Specifies the mode: attaches the specified interface to the persona interface of the same name.

Usage

- If the mode is specified, either copy or attach, the interface configuration is dependent on the interface template whose name is "access", "uplink", or "<*PERSONA-NAME*>". On the other hand, if the mode is not specified, then the persona is just a label in the interface, and its configuration is not modified even if the interface persona exists. When configuring the mode, one of the following options is possible:

    - The **copy** option performs a one-time copy of the template interface. Subsequent changes to the template are not copied and the 'persona' setting is just a label. If the mode is set to **copy** and the interface persona does not exist, then the CLI command fails with the message "Interface persona not found".
    - The **attach** option performs a copy of the template interface, and subsequent changes to the template interface configuration are immediately applied to all attached interfaces. The template interface does not need to exist before attaching other interfaces to it. After attaching a template, the copied settings can be modified for an individual interface. However, any change in the attached template will overwrite the modified values with the new template values.
- When a mode is specified, it should match an interface created with the command interface persona <*PERSONA-NAME*>. The only exception to this rule is when the mode is set to `attach` and the persona does not already exist.
- The mode is only available to be configured for an interface that meets the following conditions:
    - IS a physical interface
    - IS NOT a LAG member
    - IS NOT a persona interface

Examples

Configuring an access persona:

```
switch(config)# interface 1/1/1
switch(config-if)# persona access
```

Configuring an uplink persona:

```
switch(config)# interface 1/1/1
switch(config-if)# persona uplink
```

Configuring a custom persona named "mypersona":

```
switch(config)# interface 1/1/1
switch(config-if)#persona custom mypersona
```

Removing the persona setting.

```
switch(config-if)# no persona
```

Copying a predefined persona name configuration to an interface:

1. Configuring the interface persona:

```
switch(config)# interface persona uplink
switch(config-if)# no shutdown
switch(config-if)# no routing
switch(config-if)# vlan access 100
switch(config-if)# exit
```

2. Applying the configuration from the persona named "mypersona" with **copy** mode:

```
switch(config)# interface 1/1/1
switch(config-if)# persona custom mypersona copy
switch(config-if)# exit
```

Attaching a custom persona name named "mypersona" to several interfaces simultaneously:

1. Configuring an interface persona named "mypersona":

```
switch(config)# interface persona mypersona
switch(config-if)# no shutdown
switch(config-if)# vrf attach upstream
switch(config-if)# exit
```

2. Applying the "mypersona" configuration with **attach** mode:

```
switch(config)# interface 1/1/1-1/1/24
switch(config-if)# persona custom mypersona attach
switch(config-if)# exit
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.10	Added optional parameters: attach, copy.
10.09	Command introduced.

Command Information

Platforms	Command context	Authority
All platforms	`config-if`	Administrators or local user group members with execution rights for this command.

rate-interval

```
rate-interval <VALUE>
no rate-interval
```

Description

This command sets the time interval to calculate interface rates. Lower intervals are more useful for detecting traffic bursts, but may increase computation load to the overall system. Intervals must be a multiple of five seconds. The command-line interface will not accept a rate interval value that is not a multiple of five.

The **no** form of this command sets the rate collection interval to the default value of 300 seconds.

Parameter	Description
<VALUE>	The statistics rate collection interval in seconds. The supported range is 5-300 seconds, where the number of seconds is a multiple of five. **NOTE:** The supported range for 6400 and 8400 switch series is 30 - 300 seconds.

Examples

Setting the rate collection interval to 50 seconds

```
switch(config)# interface 1/1/1
switch(config-if)# rate-interval 50
```

Setting the rate collection interval to the default value:

```
switch(config-if)# no rate-interval
```

The following example shows the command-line interface warning that appears while configuring an invalid rate-interval.

```
switch(config)# interface 1/1/1
switch(config-if)# rate interval 6
The interval must be a multiple of 5.
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Usage

The rate collection interval must be configured in the multiples of 5. Any other value will be rejected and the CLI will display the error message, **The interval must be a multiple of 5.**

Command History

Release	Modification
10.12.1000	Command supported on all platforms.
10.12	Command Introduced on 6300 and 8360 Switch series.

Command Information

Platforms	Command context	Authority
All platforms	`config-if`	Administrators or local user group members with execution rights for this command.

routing

```
routing
no routing
```

Description

Enables routing support on an interface, creating a L3 (layer 3) interface on which the switch can route IPv4/IPv6 traffic to other devices.

By default, routing is disabled on all interfaces.

The **no** form of this command disables routing support on an interface, creating a L2 (layer 2) interface.

If you enable this configuration, collection of flow tracking statistics is disabled.

Examples

Enabling routing support on an interface:

```
switch(config-if)# routing
```

Disabling routing support on an interface:

```
switch(config-if)# no routing
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

6300 6400	`config-if`	Administrators or local user group members with execution rights for this command.

show allow-unsupported-transceiver

```
show allow-unsupported-transceiver
```

Description

Displays configuration and status of unsupported transceivers.

Examples

Showing unallowed unsupported transceivers:

```
switch(config)# show allow-unsupported-transceiver
Allow unsupported transceivers : no
Logging interval               : 1440 minutes
---------------------------------------------
Port       Type           Status
---------------------------------------------
1/1/31     SFP-SX         unsupported
1/1/32     SFP-1G-BXD     unsupported
1/1/2      SFP28DAC3      unsupported
```

Showing allowed unsupported transceivers:

```
switch# show allow-unsupported-transceiver
Allow unsupported transceivers : yes
Logging interval               : 1440 minutes
---------------------------------------------
Port       Type           Status
---------------------------------------------
1/1/31     SFP-SX         unsupported-allowed
1/1/32     SFP-1G-BXD     unsupported-allowed
1/1/2      SFP28DAC3      unsupported
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

show interface

```
show interface [<IFNNAME>|<IFRANGE>] [brief | physical]
show interface [<IFNNAME>|<IFRANGE>] [extended [non-zero] | [human-readable]]
show interface [<IFNNAME>] monitor [human-readable]
show interface [lag | loopback | tunnel | vlan ] [<ID>] [brief]
show interface lag [<LAG-ID>] [extended [non-zero] | [human-readable]]
show interface lag [<LAG-ID>] monitor [human-readable]
```

Description

Shows active configurations and operational status information for interfaces.

Parameter	Description
<IFNAME>	Specifies a interface name.
<IFRANGE>	Specifies the port identifier range.
brief	Shows brief info in tabular format.
physical	Shows the physical connection info in tabular format.
extended	Shows additional statistics, including the **tx filtered** and **rx filtered** counters. ▪ Rx filter packets are protocol packets received when the protocol is disabled on the switch and there is only one port in the VLAN. Protocols include OSPF, PIM, RIP, LACP, and LLDP. ▪ An example of a Tx filtered packet would be a multicast packet being filtered from going out of the ingress port.
human-readable	Shows statistics rounded to the nearest power of 1000, for example, 1K, 345M, 2G. This is available only in the CLI interface output.
non-zero	Shows only non zero statistics.
LAG	Shows LAG interface information.
monitor	Continuously monitor interface statistics.
LOOPBACK	Shows loopback interface information.
TUNNEL	Shows tunnel interface information.
VLAN	Shows VLAN interface information.
<LAG-ID>	Specifies the LAG number. Range: 1-256
<LOOPBACK-ID>	Specifies the LOOPBACK number. Range: 0-255
<TUNNEL-ID>	Specifies the tunnel ID. Range: 1-255
<VLAN-ID>	Specifies the VLAN ID. Range: 1-4094
VXLAN	Shows the VXLAN interface information.
<VXLAN-ID>	Specifies the VXLAN interface identifier. Default: 1

Examples

Showing interface information when it is configured as a route-only port:

```
switch# show interface 1/1/1
Interface 1/1/1 is up
Admin state is up
Link state: up for 2 days (since Sun Jun 21 05:30:22 UTC 2020)
Link transitions: 1
Description: backup data center link
Hardware: Ethernet, MAC Address: 70:72:cf:fd:e7:b4
```

```
MTU 1500
Type 1GbT

```

Showing information when the interface is currently linked at a downshifted speed:

```
switch(config-if)# show interface 1/1/1
Interface 1/1/1 is up
...
Auto-negotiation is on with downshift active
```

Showing information when the interface is currently linked with energy-efficient-ethernet negotiated:

```
switch(config-if)# show interface 1/1/1
Interface 1/1/1 is up
...
Energy-Efficient Ethernet is enabled and active
```

Showing information when the interface is shut down during a VSX split:

```
switch(config-if)# show interface 1/1/1
Interface 1/1/1 is down
Admin state is up
State information: Disabled by VSX
Link state: down for 3 days (since Tue Mar 16 05:20:47 UTC 2021)
Link transitions: 0
Description:
Hardware: Ethernet, MAC Address: 04:09:73:62:90:e7
MTU 1500
Type SFP+DAC3
Full-duplex
qos trust none
Speed 0 Mb/s
Auto-negotiation is off
Flow-control: off
Error-control: off
VLAN Mode: native-untagged
Native VLAN: 1
Allowed VLAN List: 1502-1505
Rate collection interval: 300 seconds

Rate                               RX                   TX        Total (RX+TX)

Showing the output for interface 1/1/1 in human-readable format:

In human-readable format, the **< 1** symbol for **Utilization** indicates that the amount of packets is between zero and one. This is true in cases where the number of bytes increases but the number of packets and the **Utilization** value is not displayed even in the normal output, where the human-readable parameter is not included in the command.

```
switch(config-if)# show interface 1/1/1 human-readable
Interface 1/1/1 is up

```

For more information on features that use this command, refer to the Fundamentals Guide or the Monitoring Guide for your switch model.

Command History

Release	Modification
10.11	Added `monitor` parameter.
10.10	Added `human-readable` parameter.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show interface dom

```
show interface [<INTERFACE-ID>] dom [detail] [vsx-peer]
```

Description

Shows diagnostics information and alarm/warning flags for the optical transceivers (SFP, SFP+, QSFP+). This information is known as DOM (Digital Optical Monitoring). DOM information also consists of vendor determined thresholds which trigger high/low alarms and warning flags.

Parameter	Description
<INTERFACE-ID>	Specifies an interface. Format: **member/slot/port**.
detail	Show detailed information.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

On the 6400 Switch Series, interface identification differs.

```
switch# show interface dom
--------------------------------------------------------------------------------
Port     Type       Channel  Temperature Voltage  Tx Bias  Rx Power       Tx Power
                             (Celsius)   (Volts)  (mA)     (mW/dBm)       (mW/dBm)
--------------------------------------------------------------------------------
1/1/1    SFP+SR              47.65       3.31     8.40     0.08, -10.96   0.63, -2.49
1/1/2    SFP+SR              n/a         n/a      n/a      n/a            n/a
1/1/3    SFP+DA3             42.10       3.24     n/a      n/a            n/a
1/1/4    QSFP+SR4   1        44.46       3.30     6.12     0.08, -10.96   0.63, -1.95
2                            44.46       3.30     6.04     0.08, -10.96   0.63, -2.00
3                            44.46       3.30     6.51     0.08, -10.96   0.60, -2.16
4                            44.46       3.30     6.19     0.08, -10.96   0.63, -1.94
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show interface energy-efficient ethernet

`show interface [<IFNAME>|<IFRANGE>] energy-efficient-ethernet`

Description

Displays Energy-Efficient Ethernet information for the interface.

Parameter	Description
<IFNAME>	Specifies the name of an interface on the switch. Use the format **member/slot/port** (for example, **1/1/1**).
<IFRANGE>	Specifies the port identifier range of an interface on the switch. Use the format **member/slot/port** (for example, **1/1/1**).

Example

The following example shows when the interfaces are Energy-Efficient Ethernet capable.

```
switch# show interface energy-efficient-ethernet
-------------------------------------------------------------------
Port     Enabled    Negotiated    Speed       TX Wake     RX Wake
                                  (MB/s)      Time(us)    Time (us)
-------------------------------------------------------------------
1/1/1    no         no            --          --          --
1/1/2    yes        yes           100         36          36
1/1/3    yes        yes           1000        17          17
1/1/4    no         no            --          --          --
1/1/5    yes        no            1000        --          --
```

The following example shows when the interface is not Energy-Efficient Ethernet capable :

```
switch# show interface 1/1/1 energy-efficient-ethernet
Port 1/1/1 does not support Energy-Efficient-Ethernet
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show interface flow-control

`show interface [<IFNNAME>|<IFRANGE>] flow-control [detail]`

Description

Shows the flow control configuration, status, and statistics of the specified interface for interfaces on which flow control is enabled.

If **detail** is not specified, this command shows a summary of all flow controlled interfaces with one interface per line. If **detail** is specified, this command shows flow control detailed statistics.

As of AOS-CX 10.10, the separate **show flow-control** command has been removed, with it being effectively replaced by this command.

Parameter	Description
<IFNNAME>|*<IFRANGE>*	Specifies the interface (port) name or range. When no interface range is specified, only interfaces with flow control enabled in the configuration or status are shown.
`detail`	Shows detailed information.

Examples

Showing summary flow control information:

```
switch# show interface flow-control
----------- -------------------------------------
Port        Flow
            Control
----------- -------------------------------------
1/1/1       config: llfc rx
            status: llfc rx
1/1/2       config: llfc rx
            status: none
```

Showing summary flow control information with PFC:

```
switch# show interface flow-control
----------- -------------------------------------
Port        Flow
            Control
----------- -------------------------------------
```

```
1/1/1       config: pfc rxtx-1,2
            status: pfc rxtx-1,2
1/1/2       config: pfc rxtx-5
            status: none
```

Showing summary flow control information with PFC:

```
switch# show interface flow-control
  Flow Control Watchdog Settings
      Trigger Timeout:  100 milliseconds
      Resume Time:      100 milliseconds
----------- ------------------------------------- ------------- --------
Port        Flow                                  Watchdog      Watchdog
            Control                               Status        Timeouts
----------- ------------------------------------- ------------- --------
1/1/1       config: llfc rx
            status: llfc rx
1/1/2       config: llfc rx                       incompatible         0
            status: llfc rx
1/1/10      config: pfc rxtx-1,2                  enabled           1234
            status: pfc rxtx-1,2
1/1/12      config: pfc rxtx-1,2                  error                0
            status: pfc rxtx-1,2
1/1/32:4    config: pfc rxtx-5
            status: pfc rxtx-5
```

Showing summary flow control information where the configuration does not match status due to a reboot required to apply PFC configuration in hardware:

```
switch# show interface flow-control

 Flow Control Watchdog Settings
   Trigger Timeout:  100 milliseconds (actual: not applied)
   Resume Time:      100 milliseconds (actual: not applied)

 ----------- ------------------------------------- ------------- --------

 Priority 7 Pauses                       0                    0
 Total Pause Frames                      0                    0
 Queue        Watchdog Timeouts
 ------------ -----------------
 Queue 0                      0
 Queue 1                      0
 Queue 2                      0
 Queue 3                      0
 Queue 4                      0
 Queue 5                      0
 Queue 6                      0
 Queue 7                      0
```

Showing detailed flow control information when flow control watchdog is enabled in the configuration but it could not be applied because the configured flow control mode is not compatible with watchdog:

```
switch# show interface 1/1/1 flow-control detail
Interface 1/1/1 is up
 Admin state is up
 Link state: up for 3 minutes (since Thu Apr 07 16:38:02 UTC 2022)
 Flow-control: llfc rx
 Flow-control watchdog: incompatible
```

Showing detailed flow control information when flow control watchdog is enabled in the configuration but could not be applied because a compatible flow control mode first requires a reboot:

```
switch# show interface 1/1/1 flow-control detail
Interface 1/1/1 is up
 Admin state is up
 Link state: up for 3 minutes (since Thu Apr 07 16:38:02 UTC 2022)
 Flow-control: off
 Flow-control watchdog: pending
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.10	Examples updated with new and changed output elements.
10.08	Command introduced.

Command Information

Platforms	Command context	Authority
All platforms	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show interface statistics

```
show interface [<IFNAME>|<IFRANGE>] statistics [non-zero] [human-readable]
show interface [<IFNAME>|<IFRANGE>] statistics monitor [non-zero] [human-readable]
show interface [<IFNAME>|<IFRANGE>] error-statistics [non-zero] [human-readable]
show interface [<IFNAME>|<IFRANGE>] error-statistics monitor [non-zero] [human-readable]
show interface lag [<LAG-ID>] statistics [non-zero] [human-readable]
show interface lag [<LAG-ID>] statistics monitor [non-zero] [human-readable]
show interface lag [<LAG-ID>] error-statistics [non-zero] [human-readable]
show interface lag [<LAG-ID>] error-statistics monitor [non-zero] [human-readable]
show interface vxlan <VXLAN-ID> statistics [non-zero] [human-readable]
```

Description

Shows statistics for switch interfaces such as packets transmitted and received, bytes transmitted and received, broadcast and multicast packets.

Parameter	Description
<IFNAME>	Specifies a interface name.
<IFRANGE>	Specifies the port identifier range.
LAG	Shows LAG interface information.
<LAG-ID>	Specifies the LAG number. Range: 1-256
VXLAN	Shows the VXLAN interface information.
<VXLAN-ID>	Specifies the VXLAN interface identifier. Default: 1
monitor	Continuously monitor interface statistics.
human-readable	Shows statistics rounded to the nearest power of 1000, for example, 1K, 345M, 2G.
non-zero	Shows only non zero statistics.

Examples

Showing statistics of all interfaces:

```
show interface statistics
-----------------------------------------------------------------------------------------------------------------------------------------------------------
Interface                RX Bytes  RX Packets  RX Drops  TX Bytes  TX Packets  TX Drops  RX Broadcast RX Multicast  TX Broadcast TX Multicast  RX Pause  TX Pa

For more information on features that use this command, refer to the Fundamentals Guide or the Monitoring Guide for your switch model.

Command History

Release	Modification
10.11	Added `moitor` parameter.
10.10	Added `human-readable` parameter.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show interface transceiver

```
show interface [<INTERFACE-ID>] transceiver [detail | threshold-violations] [vsx-peer]
```

Description

Displays information about transceivers present in the switch. The information shown varies for different transceiver types and manufacturers. Only basic information is shown for unsupported HPE and third-party transceivers installed in the switch and they are also identified with an asterisk in the output.

Parameter	Description
<INTERFACE-ID>	Specifies the name or range of an interface on the switch. Use the format **member/slot/port** (for example, **1/3/1**).
`detail`	Show detailed information for the interfaces.
`threshold-violations`	Show threshold violations for transceivers.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

On the 6400 Switch Series, interface identification differs.

Showing summary transceiver information with identification of unsupported transceivers:

```
switch(config)# show interface transceiver

show interface utilization

```
show interface [<IFNNAME>|<IFRANGE>] utilization [non-zero]
```

Description

Displays physical port throughput and utilization.

Parameter	Description
<IFNAME>	Specifies an interface name.
<IFRANGE>	Specifies the port identifier range.
`utilization`	Displays utilization statistics.
`non-zero`	Displays non-zero statistics

Examples

The following example shows port utilization of all interfaces:

```
switch# show interface utilization
-------------------------|------------------------|------------------------|----------------
-----------|----------------------
Interval |              RX          |              TX          |    Total (RX+TX)          |

show ip interface

`show ip interface <INTERFACE-ID> [vsx-peer]`

Description

Shows status and configuration information for an IPv4 interface.

Parameter	Description
<INTERFACE-ID>	Specifies the name of an interface. Format: **member/slot/port**.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

On the 6400 Switch Series, interface identification differs.

```
switch# show ip interface 1/1/1
Interface 1/1/1 is up
 Admin state is up
 Hardware: Ethernet, MAC Address: 70:72:cf:fd:e7:b4
 IPv4 address 192.168.1.1/24
 MTU 1500
 RX
      0 packets, 0 bytes
 TX
      0 packets, 0 bytes
```

```
switch# show interface <intfid>.id
Interface 1/1/14.1 is up
Admin state is up
IP MTU 1500
Description:
Hardware: Ethernet, MAC Address: b8:6a:97:22:2f:42
Encapsulation dot1q ID: 20
IPv4 address 30.0.0.1/24
L3 Counters: Rx Disabled, Tx Disable
```

```
switch# show interface lag2.1
Interface lag2.1 is up
Admin state is up
IP MTU 1500
Description:
Hardware: Ethernet, MAC Address: b8:6a:97:22:2f:42
Encapsulation dot1q ID: 30
L3 Counters: Rx Disabled, Tx Disabled
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

show ip source-interface

```
show ip source-interface {sflow |  tftp |  radius | tacacs | all} [vrf <VRF-NAME>]
     [vsx-peer]
```

Description

Shows single source IP address configuration settings.

Parameter	Description
`sflow | tftp | radius | tacacs | all`	Shows single source IP address configuration settings for a specific protocol. The **all** option shows the global setting that applies to all protocols that do not have an address set.
`vrf <VRF-NAME>`	Specifies the name of a VRF.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

```
Showing single source IP address configuration settings for sFlow:
switch# show ip source-interface sflow
Source-interface Configuration Information
----------------------------------------
Protocol        Source Interface
--------        ----------------
sflow            10.10.10.1
```

Showing single source IP address configuration settings for all protocols:

```
switch# show ip source-interface all
Source-interface Configuration Information
----------------------------------------
Protocol        Source Interface
--------        ----------------
all             1/1/1
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

show ipv6 interface

```
show ipv6 interface <INTERFACE-ID> [vsx-peer]
```

Description

Shows status and configuration information for an IPv6 interface.

Parameter	Description
<INTERFACE-ID>	Specifies an interface ID. Format: **member/slot/port**.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

```
switch#
switch# show ipv6 interface 1/1/1
Interface 1/1/1 is up
  Admin state is up
  IPv6 address:
    2001:0db8:85a3:0000:0000:8a2e:0370:7334/24 [VALID]
  IPv6 link-local address: fe80::1e98:ecff:fee3:e800/64 (default)[VALID]
  IPv6 virtual address configured: none
  IPv6 multicast routing: disable
  IPv6 Forwarding feature: enabled
  IPv6 multicast groups locally joined:
    ff02::ff70:7334  ff02::ffe3:e800  ff02::1  ff02::1:ff00:0
    ff02::2
  IPv6 multicast (S,G) entries joined: none
  IPv6 MTU: 1524 (using link MTU)
  IPv6 unicast reverse path forwarding: none
  IPv6 load sharing: none
  RX
          0 packets, 0 bytes
  TX
          0 packets, 0 bytes
```

```
switch# show ipv6 interface <intfid>.id
Interface 1/1/14.1 is up
  Admin state is up
    IPv6 address:
      30::1/64 [VALID]
    IPv6 link-local address: fe80::b86a:97c0:122:2f42/64 [VALID]
    IPv6 virtual address configured: none
    IPv6 multicast routing: disable
    IPv6 Forwarding feature: enabled
    IPv6 multicast groups locally joined:
      ff02::1  ff02::1:ff22:2f42  ff02::1:ff00:1  ff02::1:ff00:0
      ff02::2
    IPv6 multicast (S,G) entries joined: none
    IPv6 MTU 1500
    IPv6 unicast reverse path forwarding: none
    IPv6 load sharing: none
Encapsulation dot1q ID: 20
```

```
switch# show ipv6 interface lag2.1
Interface lag2.1 is up
  Admin state is up
    IPv6 address:
      40::1/64 [VALID]
    IPv6 link-local address: fe80::b86a:97c0:122:2f42/64 [VALID]
    IPv6 virtual address configured: none
    IPv6 multicast routing: disable
    IPv6 Forwarding feature: enabled
    IPv6 multicast groups locally joined:
      ff02::1  ff02::1:ff22:2f42  ff02::1:ff00:1  ff02::1:ff00:0
      ff02::2
    IPv6 multicast (S,G) entries joined: none
    IPv6 MTU 1500
    IPv6 unicast reverse path forwarding: none
    IPv6 load sharing: none
  Encapsulation dot1q ID: 30
```

show ipv6 source-interface

```
show ipv6 source-interface {sflow |  tftp |  radius | tacacs | all} [vrf <VRF-NAME>]
     [vsx-peer]
```

Description

Shows single source IP address configuration settings.

Parameter	Description
`sflow	tftp	radius	tacacs	all`	Shows single source IP address configuration settings for a specific protocol. The **all** option shows the global setting that applies to all protocols that do not have an address set.
`vrf <VRF-NAME>`	Specifies the name of a VRF.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

Showing single source IP address configuration settings for sFlow:

```
switch# show ipv6 source-interface sflow

Source-interface Configuration Information
----------------------------------------
Protocol        Source Interface
--------        ----------------
 sflow            2001:DB8::1
```

Showing single source IP address configuration settings for all protocols:

```
switch# show ipv6 source-interface all

Source-interface Configuration Information
----------------------------------------
Protocol        Source Interface
--------        ----------------
 all             1/1/1
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

shutdown

```
shutdown
no shutdown
```

Description

Disables an interface. Interfaces are disabled by default when created.

The **no** form of this command enables an interface.

Examples

Disabling an interface:

```
switch(config-if)# shutdown
```

Enabling an interface:

```
switch(config-if)# no shutdown
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config`	Administrators or local user group members with execution rights for this command.

speed

```
speed {<SPEED> | <SPEED-DUPLEX> | auto [<SPEED>] }
no speed
```

Description

Configures the link speed, duplex, and auto-negotiation settings for an interface.

The no form of this command removes the configurations and returns to the defaults.

Parameter	Description
`Speed`	Configures interface speed, duplex, and auto-negotiation.
`10-full`	10 Mbps, full duplex, no auto-negotiation
`10-half`	10 Mbps, half duplex, no auto-negotiation
`100-full`	100 Mbps, full duplex, no auto-negotiation
`100-half`	100 Mbps, half duplex, no auto-negotiation
`1000-full`	1000 Mbps, full duplex, no auto-negotiation
`10g`	10 Gbps, full duplex, no auto-negotiation
`25g`	25 Gbps, full duplex, no auto-negotiation
`40g`	40 Gbps, full duplex, no auto-negotiation
`50g`	50 Gbps, full duplex, no auto-negotiation
`100g`	100 Gbps, full duplex, no auto-negotiation
`200g`	200 Gbps, full duplex, no auto-negotiation **NOTE:** Not applicable for override.
`400g`	400 Gbps, full duplex, no auto-negotiation **NOTE:** Not applicable for override.
`auto`	Auto-negotiate speed and duplex. More than one speed can be set at a time.
`10m`	Allow interface to link at 10 Mbps.
`100m`	Allow interface to link at 100 Mbps.
`1g`	Allow interface to link at 1 Gbps.
`2.5g`	Allow interface to link at 2.5 Gbps.
`5g`	Allow interface to link at 5 Gbps.
`10g`	Allow interface to link at 10 Gbps.

Parameter	Description
`25g`	Allow interface to link at 25 Gbps.
`40g`	Allow interface to link at 40 Gbps.
`50g`	Allow interface to link at 50 Gbps.
`100g`	Allow interface to link at 100 Gbps.
`200g`	Allow interface to link at 200 Gbps.
`400g`	Allow interface to link at 400 Gbps.

Usage

The following options can be configured for an interface. The option available is based on the interface type.

`speed` *`<SPEED-DUPLEX>`*

Uses a fixed speed and duplex mode with no auto-negotiation. Half-duplex is only supported for 10 Mbps and 100 Mbps link speeds.

`speed` *`<SPEED>`*

Uses a fixed speed with no auto-negotiation. If the currently installed transceiver does not support the speed, the setting is ignored and the port will use the highest speed that is supported.

`speed auto`

Uses auto-negotiation and offers all speeds supported by the port and transceiver. This is the default. If the link technology does not support auto-negotiation this setting is ignored, and the port uses the highest possible fixed speed.

`speed auto` *`<SPEED>`*

Uses auto-negotiation and offers the specified speeds only. For ports that support pluggable transceivers, only speeds supported by the transceiver are offered and other speeds are ignored. If the link technology does not support auto-negotiation, this setting is ignored and the port uses the highest possible fixed speed.

Examples

Configuring an interface to operate at a fixed speed of 1000 Mbps with full duplex and no auto-negotiation:

```
switch(config)# interface 1/1/1

switch(config-if)# speed 1000-full
```

Configuring an interface to operate at a fixed speed of 10 Gbps with no auto-negotiation:

```
switch(config)# interface 1/1

switch(config-if)# speed 10g
```

Configuring an interface to auto-negotiate and advertise only 1 Gbps and 2.5 Gbps speeds:

```
switch(config)# interface 1/1/1
switch(config-if)# speed auto 1g 2.5g
```

Configuring an interface to override the detected transceiver speed and use the configured speed if the installed transceiver does not support auto-negotiation:

```
switch(config)# interface 1/1/1
switch(config-if)#speed auto 50g override
```

Configuring an interface to use default settings for speed, duplex, and auto-negotiation:

```
switch(config)# interface 1/1/1
switch(config-if)#no speed
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.09.0001	Speeds not supported by hardware hidden by CLI.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-if`	Administrators or local user group members with execution rights for this command.

system interface-group

This command only applies to the following 6400 Switch Series modules:

R0X44A Aruba 6400 48p 10G/25G SFP28 Module

R0X44C Aruba 6400 48p 1G/10G/25G SFP28 v2 Module

```
system interface-group <GROUP> line-module <SLOT-ID> speed <SPEED>
no system interface-group <GROUP> line-module <SLOT-ID> speed <SPEED>
system interface group member <MEMBER-ID>
no system interface group member <MEMBER-ID>
```

Description

Configures the speed for an interface group. After changing group speed, only transceivers compatible with the new speed will be enabled.

- (Applies to the 6400 Switch Series): R0X44C (version 2) is the only module that can apply 50G speed as an option. If the command is attempted to any other type of module, the command is ignored.
- All speed-mismatched interfaces in the group will be disabled.
- This command can interrupt active network links, user confirmation is required to proceed.

The **no** form of this command resets the specified interface group to its default.

Parameter	Description
<GROUP>	Specifies the interface group to configure.
<SPEED>	Configures transceiver speed (10g, 25g or 50g) for a group. Default is 25g (see the *Transceiver Guide* for further detail). On 6400 Switch Series: 25g allows transceivers up to 25Gbps. 50g allows 50Gbps transceivers and DACs on the R0X44C version 2 module. This command is ignored on any other type of module (including R0X44A version 1).
<SLOT-ID>	Specifies the slot ID of the line module.
member *<MEMBER-ID>*	Specifies the VSF member ID of the VSF member of the group. (*For 6300 Switch Series only.*)

Examples

Configuring interface group 1 on line-module 1/1 to allow 10Gbps and slower transceivers:

```
switch(config)# system interface-group 1 line-module 1/1 speed 10g
Changing the group speed will disable all member interfaces that do not match the
new speed.

Continue (y/n)? y
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

6300 6400	Operator (>) or Manager (#)	Administrators or local user group members with execution rights for this command.

client track ip

`client track ip`

Description

Enables client IP address tracking on the switch. The default is disabled on global and VLAN levels.

Admin users can enable client IP address tracking at the VLAN level.

Tracking enabling will take effect only if the client IP address tracking is enabled at system and VLAN level.

The **no** form of the command disables client IP address tracking. If tracking is disabled at switch level, it will be stopped even if it is enabled at VLAN or port level.

Example

Enable client IP address tracking at switch level:

```
switch(config)# client track ip
```

Enable client IP address tracking on VLAN 100:

```
switch(config)# vlan 100
switch(config-vlan-100)# client track ip
```

Enable client IP address tracking on VLANs 10 to 100:

```
switch(config)# vlan 10-100
switch(config-vlan-<10-100>)# client track ip
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

client track ip { enable | disable | auto }

```
client track ip { enable | disable | auto }
```

Description

Enables client IP address tracking on the specified set of interfaces. Tracking will take effect only if client IP address tracking is enabled at both the system level and for the VLAN to which the port belongs. Default: auto.

The **no** form of the command disables client IP address tracking on the specified set of interfaces.

Parameter	Description
`enable`	Specifies that all client IP addresses will be tracked in the port.
`disable`	Specifies that client IP addresses will not be tracked in the port.
`auto`	Specifies the following: For LLDP devices: Only the specified client IP address will be tracked in the port and other client IP addresses will not be tracked. For non-LLDP devices: All client IP addresses will be tracked in the port.

Example

Enable client IP address tracking on interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# client track ip enable
```

Enable client IP address tracking on interfaces 1/1/1 to 1/1/5:

```
switch(config)# interface 1/1/1-1/1/5
switch(config-if-<1/1/1-1/1/5>)# client track ip enable
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

client track ip client-limit

`client track ip client-limit <CLIENT-LIMIT>`

Description

Configures the maximum number of clients to be tracked on the specified set of interfaces.

The **no** form of the command resets the client limit to the default value. Default values vary according to switch model:

- 6300: 2048
- 6400: 4096

Parameter	Description
CLIENT-LIMIT	Specifies the maximum number of clients tracked on a port. Required. Range: 1-2048 (6300) 1-4096 (6400). Default: 2048 (6300) 4096 (6400)..

Example

Configure the maximum number of clients to be tracked on interface 1/1/5:

```
switch(config)# interface 1/1/5
switch(config-if)# client track ip client-limit 32
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

client track ip update-interval

```
client track ip update-interval <INTERVAL>
```

Description

Configures how often client IP addresses are updated.

The **no** form of the command resets the update interval to the default of 1800 seconds.

Parameter	Description
INTERVAL	Specifies the update interval in seconds. Required. Range: 60-28000. Default: 1800.

Example

Configure the update interval for an interface:

```
switch(config)# interface 1/1/1
switch(config-if)# client track ip update-interval 600
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

client track ip update-method probe

```
client track ip update-method probe
```

Description

Enables probing the client to update the IP address.

The probe is sent to all clients on the tracking list that have an IP address in the following scenarios:

1. IP packets are not received from the clients during the IP address update cycle.
2. There is no IP packet from a learned IP address. In this case, a probe will be sent for the IP address to confirm if it is still owned by that client.

The **no** form of the command disables probing.

Example

Disable probing to update the client IP address:

```
switch(config)# no client track ip update-method probe
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

show client ip { count | port | vlan }

```
show client ip { count | port | vlan }
```

Description

Shows number of client IP addresses or information about client IP addresses tracked on ports and VLANs.

Parameter	Description
count	Displays number of clients tracked.
port	Displays client IP addresses tracked on the ports.
vlan	Displays client IP addresses tracked on the VLANs.

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Chapter 52
IP Directed Broadcast commands

copy support-file feature

```
copy support-file feature l3
```

Description

Captures support logs to debug any IP Directed Broadcast issues.

IP Directed Broadcast is not supported on subinterfaces on 8100, 6300, 6400, 8325, 8360 and 10000 Switch series.

Examples

Capturing the support logs into a local file:

```
switch# copy support-file feature l3 sftp
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	Manager (#)	Administrators or local user group members with execution rights for this command.

ip directed-broadcast

```
ip directed-broadcast
no ip directed-broadcast
```

Description

Turns on IP Directed Broadcast for the specified interface. The **no** form of this command turns it off.

This command is disabled by default.

IP Directed Broadcast is not supported on subinterfaces on 6300, 6400, 8100, 8325, 8360 and 10000 Switch series.

Examples

Enabling and disabling IP Directed Broadcast on an physical interface:

```
switch(config)# interface 1/1/1
switch(config-if)# ip directed-broadcast
switch(config-if)# no ip directed-broadcast
```

Enabling and disabling IP Directed Broadcast on a VLAN interface:

```
switch(config)# interface vlan 100
switch(config-if-vlan)# ip directed-broadcast
switch(config-if-vlan)# no ip directed-broadcast
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

show arp

`show arp`

Description

Shows IP directed broadcast verification.

IP Directed Broadcast is not supported on subinterfaces on 8100, 6300, 6400, 8325, 8360 and 10000 Switch series.

Examples

Showing IP directed broadcast verification:

```
switch# show arp
IPv4 Address     MAC                Port         Physical Port          State
----------------------------------------------------------------------------------
1.1.1.255        FF:FF:FF:FF:FF:FF  1/1/1        1/1/1                  permanent
3.1.1.255        FF:FF:FF:FF:FF:FF  vlan10                              permanent
```

```
Total Number Of ARP Entries Listed: 2.
----------------------------------------------------------------------------------
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

show ip interface

`show ip interface <INTERFACE-NAME>`

Description

Displays the status of IP Directed Broadcast on the specified interface along with other interface related attributes.

Parameter	Description
<INTERFACE-NAME>	Specifies the interface to use as a source for displaying the status of the IP Directed Broadcast.

Examples

Displaying the IP Directed Broadcast status on the specified interface:

```
switch# show ip interface vlan30

Interface vlan30 is up
 Admin state is up
 Hardware: Ethernet, MAC Address: 94:f1:28:21:63:00
 IP MTU 1500
 IP Directed Broadcast is Enabled
 IPv4 address 192.168.3.1/24
 L3 Counters: Rx Disabled, Tx Disabled

 Statistics                      RX                   TX               Total
 ------------- -------------------- -------------------- --------------------
```

```
L3 Packets                        0                    0                    0
L3 Bytes                          0                    0                    0
```

show ip directed-broadcast

```
show ip directed-broadcast
```

Description

Displays the summary of the interfaces on which IP Directed Broadcast is enabled.

Examples

On the 6400 Switch Series, interface identification differs.

Displaying the summary of the interfaces on which IP Directed Broadcast is enabled:

```
switch# show ip directed-broadcast

 IPv4 Directed Broadcast Configuration

 Interface       Status
 ----------     --------
 1/1/1           Enabled
 vlan10          Enabled
 vlan30          Enabled
```

Displaying IP Directed Broadcast Host entries installed in Neighbor cache:

```
switch# show arp state permanent
IPv4 Address     MAC                Port         Physical Port    State
---------------------------------------------------------------------------
52.1.1.255       FF:FF:FF:FF:FF:FF  1/1/1        1/1/1            permanent
40.0.0.255       FF:FF:FF:FF:FF:FF  vlan20       vlan20           permanent
Total Number Of ARP Entries Listed- 2.
-------------------------------------------------------------------------------
```

Chapter 53

IP Neighbor Flood commands

ip neighbor-flood

```
ip neighbor-flood
```

Description

Enables VLAN flooding for the specified VLAN interface when a neighbor link goes down.

The **no** form of this command disables VLAN flooding for the specified VLAN interface.

Examples

Enabling IP Neighbor Flood on a VLAN interface:

```
switch(config)# interface vlan 3
switch(config-if-vlan)# ip neighbor-flood
```

Disabling IP Neighbor Flood on a VLAN interface.

```
switch(config)# interface vlan 3
switch(config-if-vlan)# no ip neighbor-flood
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

show ip interface

```
show ip interface <IFNAME>
```

Description

Displays the status of IP Neighbor Flood on the specified interface along with other interface-related attributes.

Parameter	Description
<IFNAME>	Specifies the interface name (for example, `vlan30`). Optional.

Examples

```
switch# show ip interface vlan30

Interface vlan30 is up
 Admin state is up
 Hardware: Ethernet, MAC Address: 94:f1:28:21:63:00
 IP MTU 1500
 IP Neighbor Flood is Enabled
 IPv4 address 192.168.3.1/24
 L3 Counters: Rx Disabled, Tx Disabled
```

Chapter 54

IP Prefix priority commands

ip prefix-priority

```
ip prefix-priority <PREFIX-LENGTHS>
no ip prefix-priority [<PREFIX-LENGTHS>>]
```

Description

Configures custom IPv4 route prefix lengths for the exact prefix match tables of the switch. The switch must be rebooted to apply the change.

Following the reboot, IPv4 prefix priorities will remain in a pending state until at least one route is learned. A connected route counts so this can be as simple as having an L3 interface with an IP address in the up state.

The no form of this command resets the prefix lengths to their default

Parameter	Description
<PREFIX-LENGTHS>>	Specifies a space-separated list of exactly five or six prefix lengths, in descending order. Range: 8 to 31. On the 6300 Switch Series, six prefix lengths are used. On the 6400 Switch Series, six prefix lengths are used for profiles **default** and **V2-default**, and five prefix lengths are used for profile **v2-Core-High-Bandwidth**.

Examples

Configuring custom IPv4 route prefix lengths:

```
switch(config)# ip prefix-priority 29 28 27 24 23 16
Save this config and reboot the switch for the changes to take effect
...
```

Resetting IPv4 route prefix lengths to their default:

```
switch(config)# no ip prefix-priority
Save this config and reboot the switch for the changes to take effect
...
```

Attempting to configure custom IPv4 route prefix lengths with some lengths not in descending order:

```
switch(config)# ip prefix-priority 28 29 27 23 24 16
Prefix lengths must be specified in descending order
```

Attempting to configure eight prefix lengths:

```
switch(config)# ip prefix-priority 29 28 27 24 23 16 12 8
Invalid input: 12
```

Attempting to configure three prefix lengths:

```
switch(config)# ip prefix-priority 29 28 27
% Command incomplete.
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.10	Command introduced.

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

ipv6 prefix-priority

```
ipv6 prefix-priority <PREFIX-LENGTHS>
no ipv6 prefix-priority [<PREFIX-LENGTHS>>]
```

Description

Configures custom IPv6 route prefix lengths for the exact prefix match tables of the switch. The switch must be rebooted to apply the change.

Following the reboot, IPv6 prefix priorities will remain in a pending state until at least one route is learned. A connected route counts so this can be as simple as having an L3 interface with an IP address in the up state.

The no form of this command resets the prefix lengths to their default

Parameter	Description
<PREFIX-LENGTHS>>	Specifies a space-separated list of exactly five or six prefix lengths, in descending order. Range: 8 to 64. On the 6300 Switch Series, six prefix lengths are used. On the 6400 Switch Series, six prefix lengths are used for profiles **default** and **V2-default**, and five prefix lengths are used for profile **v2-Core-High-Bandwidth**.

Examples

Configuring custom IPv6 route prefix lengths:

```
switch(config)# ipv6 prefix-priority 64 63 62 32 31 28
Save this config and reboot the switch for the changes to take effect
...
```

Resetting IPv6 route prefix lengths to their default:

```
switch(config)# no ipv6 prefix-priority
Save this config and reboot the switch for the changes to take effect
...
```

Attempting to configure custom IPv6 route prefix lengths with some lengths not in descending order:

```
switch(config)# ipv6 prefix-priority 64 62 63 31 32 28
Prefix lengths must be specified in descending order
```

Attempting to configure eight prefix lengths:

```
switch(config)# ipv6 prefix-priority 64 63 62 32 31 28 24 23
Invalid input: 24
```

Attempting to configure three prefix lengths:

```
switch(config)# ipv6 prefix-priority 64 63 31
% Command incomplete.
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Chapter 55

IP-SLA commands

http

```
http {get | raw} URL [source {<SOURCE-IPV4-ADDR> | <IFNAME>} source-port <PORT-NUM>]
     [proxy proxy-url] [cache disable] [name-server <IPV4-ADDR-DNS-SERVER>]
     [probe-interval <30-604800>] [version<VERSION-NUMBER>] [http-raw-request <RAW-
PAYLOAD>]
```

Description

Configures HTTP as the IP-SLA test mechanism. Requires destination URL and type of HTTP request (raw/get).

Parameter	Description
`{get	raw}`	Selects HTTP request type as get or raw where the system will generate or provide HTTP payload.
`URL`	Specifies HTTP URL address of syntax. http://<HOST NAME/IP-ADDRESS>:<PORT>/<PATH>.
`source {<SOURCE-IPV4-ADDR>	<IFNAME>}`	Selects the source IPv4 address for SLA probes or the source interface to use for sending IP-SLA probes.
`source-port <PORT-NUM>`	Specifies the value of the source port for the IP-SLA probes.
`cache disable`	Selects cache option for the HTTP server. By default the option is enabled.
`name-server <IPV4-ADDR-DNS-SERVER>`	Specifies the IPv4 address of DNS server.
`probe-interval <PROBE-INTERVAL>`	Specifies the probe interval in seconds. Range: 30 to 604800.
`version <VERSION-NUMBER>`	Specifies the source interface to use for sending IP-SLA probes.
`http-raw-request <RAW-PAYLOAD>`	HTTP raw request. String.

Examples

```
switch(config-ipsla-1)# http get http://device.arubanetworks.com/root/home.html
switch(config-ipsla-1)# http raw http://device.arubanetworks.com/root/home.html
switch(config-ipsla-1)# http 2.2.2.2 source 1/1/1
switch(config-ipsla-1)# http http://device.arubanetworks.com  source 2.2.2.1
switch(config-ipsla-1)# http http://device.arubanetworks.com/root/home.html
source-interface 1/1/1
switch(config-ipsla-1)# http http://device.arubanetworks.com  name-server
```

```
10.10.10.2
switch(config-ipsla-1)# http raw raw-request "GET /en/US/hmpgs/index.html
HTTP/1.0\r\n\r\n"
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-ip-sla-<IP-SLA-NAME>`	Administrators or local user group members with execution rights for this command.

https

```
https {get | raw} URL [source {<SOURCE-IPV4-ADDR> | <IFNAME>} source-port <PORT-NUM>]
     [proxy proxy-url] [cache disable] [name-server <IPV4-ADDR-DNS-SERVER>]
     [probe-interval <<PROBE-INTERVAL>>] [version <VERSION-NUMBER>] [https-raw-request
<RAW-PAYLOAD>]
no https {get | raw} URL [source {<SOURCE-IPV4-ADDR> | <IFNAME>} source-port <PORT-NUM>]
     [proxy proxy-url] [cache disable] [name-server <IPV4-ADDR-DNS-SERVER>]
     [probe-interval <<PROBE-INTERVAL>>] [version <VERSION-NUMBER>] [https-raw-request
<RAW-PAYLOAD>]
```

Description

Configures HTTPS as the IP-SLA test mechanism. Requires destination URL and type of HTTPS request (get/raw).

The **no** form of this command removes the configuration.

For HTTPS IP-SLA sessions, it is not required to install a certificate on the switch.

Parameter	Description
`{get | raw}`	Selects HTTPS request type as get or raw where the system will generate or provide HTTPS payload.
`URL`	Specifies HTTPS URL address of syntax. https://<HOST NAME/IP-ADDRESS>:<PORT>/<PATH>.
`source {<SOURCE-IPV4-ADDR> | <IFNAME>}`	Selects the source IPv4 address for SLA probes or the source interface to use for sending IP-SLA probes.
`source-port <PORT-NUM>`	Specifies the value of the source port for the IP-SLA probes.

Parameter	Description
cache disable	Selects cache option for the HTTPS server. By default the option is enabled.
name-server *<IPV4-ADDR-DNS-SERVER>*	Specifies the IPv4 address of DNS server.
probe-interval *<PROBE-INTERVAL>*	Specifies the probe interval in seconds. Range: 30 to 604800.
version *<VERSION-NUMBER>*	Specifies the source interface to use for sending IP-SLA probes.
https-raw-request *<RAW-PAYLOAD>*	HTTPS raw request. String.

Examples

```
switch(config-ipsla-1)# https get https://device.arubanetworks.com/root/home.html
switch(config-ipsla-1)# https get https://2.2.2.2 source 1/1/1
switch(config-ipsla-1)# https get https://device.arubanetworks.com  source 2.2.2.1
switch(config-ipsla-1)# https get https://device.arubanetworks.com/root/home.html
source-interface 1/1/1
switch(config-ipsla-1)# https get https://device.arubanetworks.com  name-server
10.10.10.2
switch(config-ipsla-1)# https raw https://device.arubanetworks.com/root/home.html
raw-request “GET /en/US/hmpgs/index.html”
switch(config-ipsla-1)# no https get https://2.2.2.2 source 1/1/1
switch(config-ipsla-1)# no https raw
https://device.arubanetworks.com/root/home.html raw-request “GET
/en/US/hmpgs/index.html”
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

Command History

Release	Modification
10.12.1000	Command introduced.

Command Information

Platforms	Command context	Authority
6300 6400	config-ip-sla-*<IP-SLA-NAME>*	Administrators or local user group members with execution rights for this command.

icmp-echo

```
icmp-echo {<DEST-IPV4-ADDR>|<HOSTNAME>} [source {<SOURCE-IPV4-ADDR> | <IFNAME>}]
     [name-server <IPV4-ADDR-DNS-SERVER>] [payload-size <PAYLOAD-SIZE>]
     [tos <TYPE-OF-SERVICE>] [probe-interval <PROBE-INTERVAL>]
```

Description

Configures ICMP echo as the IP-SLA test mechanism. Requires destination address for the IP-SLA test.

Parameter	Description
`{<DEST-IPV4-ADDR> | <HOSTNAME>}`	Selects the destination IPv4 address for the IP-SLA or the hostname of the destination.
`[source {<SOURCE-IPV4-ADDR> | <IFNAME>}]`	Selects the source IPv4 address for SLA probes or the source interface to use for sending IP-SLA probes.
`name-server <IPV4-ADDR-DNS-SERVER>`	Specifies the DNS server for destination hostname resolution.
`payload-size <PAYLOAD-SIZE>`	Specifies the payload size of an SLA probe. Range: 0 to 1440.
`tos <TYPE-OF-SERVICE>`	Specifies the type of serve to be used in the probe packets. Range: 0 to 255.
`probe-interval <PROBE-INTERVAL>`	Specifies the probe interval in seconds. Range: 5 to 604800.

Examples

```
switch(config)# ip-sla test
switch(config-ip-sla-test)# icmp-echo 2.2.2.2
switch(config-ip-sla-test)# icmp-echo 2.2.2.2 source 3.3.3.3
    switch(config-ip-sla-test)# icmp-echo 2.2.2.2 source 3.3.3.3 payload-size 400
    switch(config-ip-sla-test)# icmp-echo 2.2.2.2 source 3.3.3.3 payload-size 400
name-server 4.4.4.4
    switch(config-ip-sla-test)# icmp-echo 2.2.2.2 source 3.3.3.3 payload-size 400
name-server 4.4.4.4  probe-interval 80
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-ip-sla-<IP-SLA-NAME>`	Administrators or local user group members with execution rights for this command.

ip-sla

```
ip-sla <IP-SLA-NAME>
no ip-sla <IP-SLA-NAME>
```

Description

Creates an IP Service Level Agreement (SLA) profile and switches to the **config-ip-sla** context.

The **no** form of this command deletes an IP-SLA profile. By default, all profile use the default VRF (default).

Parameter	Description
<IP-SLA-NAME>	Specifies an IP-SLA profile name. Length: 1 to 64 characters.

Examples

Creating an IP-SLA:

```
switch(config)# ip-sla 1
switch(config-ip-sla-1)#
```

Deleting an IP-SLA:

```
switch(config)# no ip-sla 1
switch(config)#
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

ip-sla responder

```
ip-sla responder <SLA-NAME> {udp-echo | tcp-connect | udp-jitter-voip} <PORT-NUM>
     [source {<SOURCE-IPV4-ADDR> | <IFNAME>}][vrf <VRF-NAME>]
no ip-sla responder <SLA-NAME> {udp-echo | tcp-connect | udp-jitter-voip} <PORT-NUM>
     [source {<SOURCE-IPV4-ADDR> | <IFNAME>}][vrf <VRF-NAME>]
```

Description

Selects the IP-SLA responder. The responder can be configured for udp-echo, tcp-connect, udp-jitter-voip type. It requires the SLA name, SLA type, and port number as arguments. Source IP/interface ID is a must for type udp-jitter-voip and optional for other types.

The **no** form of this command removes the IP-SLA responder.

Parameter	Description
<SLA-NAME>	Specifies the SLA name. Length: 1 to 64 characters.
udp-echo	Enables responder for udp-echo probes.
tcp-connect	Selects TCP connect as the IP-SLA test mechanism.
vrf *<VRF-NAME>*	Specifies the name of the VRF to use.
udp-jitter-voip	Selects VOIP jitter as the IP-SLA test mechanism.
<PORT-NUM>	Specifies the port number to listen for IP-SLA probes. Range: 1 to 65535.
[source {*<SOURCE-IPV4-ADDR>* | *<IFNAME>*}]	Selects the source IPv4 address for SLA probes or the source interface to use for sending IP-SLA probes.

Examples

```
switch(config)# ip-sla responder SLA1 udp-echo 8000 source 2.2.2.2
switch(config)# ip-sla responder SLA1 udp-echo 8000 source 1/1/1
```

```
switch(config)# no ip-sla responder SLA1 udp-echo 8000 source 2.2.2.2
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

show ip-sla responder

```
show ip-sla responder <SLA-NAME>
```

Description

Shows the given IP-SLA responder configuration and operation status.

Parameter	Description
<SLA-NAME>	Specifies the SLA name.

Examples

```
switch(config)# show ip-sla responder SLA3

    SLA Name            : SLA3
    IP-SLA Type         : Udp-echo
    VRF                 : Default
    Responder Port      : 8000
    Responder IP        : 2.2.2.3
    Responder Interface : 1/1/1
    Responder Status    : Running

switch(config)# show ip-sla responder 1

  SLA Name            : 1 (non-persistent)
  SLA Type            : udp-echo
  VRF Name            : default
  Responder Port      : 10
  Responder IP        :
  Responder Interface :
  Responder Status    : Running
```

show ip-sla responder results

`show ip-sla responder <SLA-NAME> <SOURCE-IPV4-ADDR> <PORT-NUM> results`

Description

Shows the given ip-sla responder statistics for a given source IP and port. This command is only applicable for the sources where source IP and port are configured.

Parameter	Description
<SLA-NAME>	Specifies the SLA name.
<SOURCE-IPV4-ADDR>	Specifies the source IPV4 address.
<PORT-NUM>	Specifies the port number. Range: 1 to 65535.

Examples

```
switch# show  ip-sla responder SLA1 2.2.2.1 8000 results

    IP-SLA Type          : Udp-echo
    VRF Name             : Default
    Source IP            : 2.2.2.1
    Source Port          : 8000
    Responder Port       : 8888
    Responder IP         : 2.2.2.3
    Responder Interface  :
    Responder Status     : Running
    Packets Received     : 2
    Packets Sent         : 2
```

show ip-sla

`show ip-sla {<SLA-NAME> [results] | all}`

Description

Shows the given IP-SLA source configuration and status.

Parameter	Description
<SLA-NAME>	Specifies the SLA name.
`results`	Shows the statistics calculated for an SLA type.
`all`	Shows all ip-sla source configurations and status.

Examples

```
switch# show ip-sla xyz results

    IP-SLA session status
```

```
       IP-SLA Name                     : xyz

Platforms	Command context	Authority
6300 6400	`config-ip-sla-<IP-SLA-NAME>`	Administrators or local user group members with execution rights for this command.

stop-test

```
stop-test
```

Description

Stops the IP-SLA probes.

Examples

```
switch(config)# ip-sla test
switch(config-ip-sla-test)# stop-test
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-ip-sla-<IP-SLA-NAME>`	Administrators or local user group members with execution rights for this command.

tcp-connect

```
tcp-connect {<DEST-IPV4-ADDR> | <HOSTNAME>} <PORT-NUM> [source {<SOURCE-IPV4-ADDR> |
     <IFNAME>} [source-port <PORT-NUM>]] [name-server <IPV4-ADDR-DNS-SERVER>]
     [probe-interval <PROBE-INTERVAL>]
```

Description

Configures TCP connect as the IP-SLA test mechanism. Requires destination address/hostname and destination port for the IP-SLA of tcp-connect IP-SLA type.

Parameter	Description
`{<DEST-IPV4-ADDR> | <HOSTNAME>}`	Selects the destination IPv4 address for the IP-SLA or the hostname of the destination.
`<PORT-NUM>`	Destination port for the IP-SLA. Range: 1 to 65535.
`[source {<SOURCE-IPV4-ADDR> | <IFNAME>}]`	Selects the source IPv4 address for SLA probes or the source interface to use for sending IP-SLA probes.
`[source-port <PORT-NUM>]`	Specifies the port for the IP-SLA test.
`[name-server <IPV4-ADDR-DNS-SERVER>]`	Specifies the DNS server for destination hostname resolution.
`[probe-interval <PROBE-INTERVAL>]`	Probe interval in seconds. Range: 30 to 604800.

Examples

```
switch(config-ipsla-1)# tcp-connect 2.2.2.2 8080
switch(config-ipsla-1)# tcp-connect 2.2.2.2 8080 source 2.2.2.1 source-port 6000
switch(config-ipsla-1)# tcp-connect 2.2.2.2 8080 source 1/1/1 source-port 6000
switch(config-ipsla-1)# tcp-connect https://device.arubanetworks.com 8080
switch(config-ipsla-1)# tcp-connect https://device.arubanetworks.com 8080 source
2.2.2.1 source-port 6000
switch(config-ipsla-1)# tcp-connect https://device.arubanetworks.com 8080 source
1/1/1 source-port 6000
switch(config-ipsla-1)# tcp-connect https://device.arubanetworks.com 8080 name-
server 10.10.10.2
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

Command Information

Platforms	Command context	Authority
6300 6400	`config-ip-sla-<IP-SLA-NAME>`	Administrators or local user group members with execution rights for this command.

udp-echo

```
udp-echo {<DEST-IPV4-ADDR>|<HOSTNAME>} <PORT-NUM> [source {<SOURCE-IPV4-ADDR> |
     <IFNAME>} [source-port <PORT-NUM>]] [name-server <IPV4-ADDR-DNS-SERVER>] [payload-
size
     <PAYLOAD-SIZE>] [tos <TYPE-OF-SERVICE>] [probe-interval <PROBE-INTERVAL>]
```

Description

Configures UDP echo as the IP-SLA test mechanism. Requires destination address/hostname and destination port number for the IP-SLA of udp-echo SLA type.

Parameter	Description
`{<DEST-IPV4-ADDR> | <HOSTNAME>}`	Selects the destination IPv4 address for the IP-SLA or the hostname of the destination.
`<PORT-NUM>`	Specifies the destination port for the IP-SLA. Range: 1 to 65535.
`[source {<SOURCE-IPV4-ADDR> | <IFNAME>}]`	Selects the source IPv4 address for SLA probes or the source interface to use for sending IP-SLA probes.
`[source-port <PORT-NUM>]`	Specifies source port for the IP-SLA test. Range: 1 to 65535.
`[name-server <IPV4-ADDR-DNS-SERVER>]`	Specifies the DNS server for destination hostname resolution.
`[payload-size <PAYLOAD-SIZE>]`	Specifies the payload size of an SLA probe. Range: 28 to 1440.
`[<TYPE-OF-SERVICE>]`	Type of service. Range: 0 to 255.
`probe-interval <PROBE-INTERVAL>`	Probe interval in seconds. Range: 5 to 604800.

Examples

```
switch(config-ipsla-1)# udp-echo 2.2.2.2 8080
    switch(config-ipsla-1)# udp-echo 2.2.2.2 8080 source 2.2.2.1
    switch(config-ipsla-1)# udp-echo https://device.arubanetworks.com 8080

udp-jitter-voip

```
udp-jitter-voip {<DEST-IPV4-ADDR> | <HOSTNAME>} <PORT-NUM> [codec-type <CODEC-TYPE>]
     [advantage-factor <VALUE>] [source {<SOURCE-IPV4-ADDR> | <IFNAME>} [source-port
<PORT-NUM>]]
     [name-server <IPV4-ADDR-DNS-SERVER>][probe-interval <PROBE-INTERVAL>] [tos <TYPE-OF-
SERVICE>]
```

Description

Configure UDP jitter voip as the IP-SLA test mechanism. Requires destination address/hostname and source address/interface for the IP-SLA of udp-jitter-voip IP-SLA type.

Parameter	Description
`{<DEST-IPV4-ADDR>|<HOSTNAME>}`	Selects the destination IPv4 address for the IP-SLA or the hostname of the destination.
`<PORT-NUM>`	Selects the port number for the IP-SLA. Range: 1 to 65535.
`[codec-type <CODEC-TYPE>]`	Selects the codec-type for the Voip IP-SLA test.
`[advantage-factor <ADVANTAGE-FACTOR>]`	Selects the value for the advantage factor. Default value is 0.
`[source {<SOURCE-IPV4-ADDR>	<IFNAME>}]`	Selects the source IPv4 address for SLA probes or the source interface to use for sending IP-SLA probes.
`[source-port <PORT-NUM>]`	Specifies the value of source port for the IP-SLA probes.
`[name-server <IPV4-ADDR-DNS-SERVER>]`	Specifies the DNS server for destination hostname resolution.
`tos <TYPE-OF-SERVICE>`	Specifies the type of service. Range: 0 to 255.
`probe-interval <PROBE-INTERVAL>`	Specifies the probe interval in seconds. Range: 120 to 604800.

Examples

```
switch(config-ipsla-1)# udp-jitter-voip  2.2.2.2 8080 advantage-factor 10 codec-
type g711a
    switch(config-ipsla-1)# udp-jitter-voip  2.2.2.2 8080 advantage-factor 10
codec-type g711a source 2.2.2.1
    switch(config-ipsla-1)# udp-jitter-voip  https://device.arubanetworks.com 8080
advantage-factor 10 codec-type g711a
    switch(config-ipsla-1)# udp-jitter-voip  2.2.2.2 8080 advantage-factor 10
```

```
codec-type g711a source 1/1/1
    switch(config-ipsla-1)# udp-jitter-voip  https://device.arubanetworks.com 8080

vrf

```
vrf <VRF-NAME>
no vrf [<VRF-NAME>]
```

Description

Configures the VRF on which the SLA will send or receive packets. By default, the default VRF is used.

The **no** form of the command removes VRF from SLA.

Parameter	Description
<VRF-NAME>	Specifies a VRF name. Length: Default: default.

Examples

```
switch(config-ip-sla-test)# vrf ipslasrc
```

```
switch(config-ip-sla-test)# no vrf
```

Chapter 56
IP tunnels commands

description

```
description <DESC>
no description
```

Description

Associates a text description with an IP tunnel for identification purposes.

The **no** form of this command removes the description from an IP tunnel.

Parameter	Description
<DESC>	Specifies the descriptive text to associate with the IP tunnel. Range: 1 to 64 printable ASCII characters.

Examples

Defines a description for GRE tunnel **33**.

```
switch(config)# interface tunnel 33 mode gre ipv4
switch(config-gre-if)# description Network A Tunnel C
```

Removes the description for GRE tunnel **33**.

```
switch(config)# interface tunnel 33
switch(config-gre-if)# no description
```

Defines a description for IPv6 in IPv4 tunnel **27**.

```
switch(config)# interface tunnel 27 mode ip 6in4
switch(config-ip-if)# description Network 3 Tunnel 27
```

Removes the description for IPv6 in IPv4 tunnel **27**.

```
switch(config)# interface tunnel 27
switch(config-ip-if)# no description
```

Defines a description for IPv6 in IPv6 tunnel **8**.

```
switch(config)# interface tunnel 8 mode ip 6in6
switch(config-ip-if)# description Network 4 Tunnel 8
```

Removes the description for IPv6 in IPv6 tunnel **8**.

```
switch(config)# interface tunnel 8
switch(config-ip-if)# no description
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

destination ip

```
destination ip <IPV4-ADDR>
no destination ip <IPV4-ADDR>
```

Description

Sets the destination IP address for an IP tunnel. Specify the address of the interface on the remote device to which the tunnel will be established.

The **no** form of this command deletes the destination IP address from an IP tunnel.

Parameter	Description
<IPV4-ADDR>	Specifies the destination IP address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.

Examples

Defines the destination IP address to be **10.10.10.1** for GRE tunnel **33**.

```
switch(config)# interface tunnel 33 mode gre ipv4
switch(config-gre-if)# destination ip 10.10.10.1
```

Deletes the destination IP address **10.10.10.1** from GRE tunnel **33**.

```
switch(config)# interface tunnel 33
 switch(config-gre-if)# no destination ip 10.10.10.1
```

Defines the destination IP address to be **10.10.20.1** for IPv6 in IPv4 tunnel **27**.

```
switch(config)# interface tunnel 27 mode ip 6in4
switch(config-ip-if)# destination ip 10.10.20.1
```

Deletes the destination IP address **10.10.20.1** from IPv6 in IPv4 tunnel **27**.

```
switch(config)# interface tunnel 27
 switch(config-ip-if)# no destination ip 10.10.20.1
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

destination ipv6

```
destination ipv6 <IPVv6-ADDR>
no destination ipv6 [IPV6-ADDR]
```

Description

Sets the destination IPv6 address for an IP tunnel. Specify the address of the interface on the remote device to which the tunnel will be established.

The **no** form of this command deletes the destination IPv6 address from an IP tunnel.

Parameter	Description
<IPV6-ADDR>	Specifies the tunnel IP address in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F. This is optional in the **no** form of the command.

Examples

Defines the destination IPv6 address to be **2001:DB8::1** for IPv6 in IPv6 tunnel

```
switch(config)# interface tunnel 8 mode ip 6in6
switch(config-ip-if)# destination ipv6 2001:DB8::1
```

Deletes the destination IPv6 address **2001:DB8::1** from IPv6 in IPv6 tunnel **8**.

```
switch(config)# interface tunnel 8
switch(config-ip-if)# no destination ipv6 2001:DB8::1
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

interface tunnel

```
interface tunnel <TUNNEL-NUMBER> mode {gre ip | ip 6in4 | ip 6in6 |ipsec ipv4}
interface tunnel <EXISTING-TUNNEL-NUMBER>
no interface tunnel <EXISTING-TUNNEL-NUMBER> [mode {gre ip | ip 6in4 | ip 6in6}]
```

Description

Creates or updates an IP tunnel. After you enter the command, the firmware switches to the configuration context for the tunnel.

If the specified tunnel exists, this command switches to the context for the tunnel.

By default, all tunnels are automatically assigned to the default VRF when they are created.

The **no** form of this command deletes an existing IP tunnel. It is optional to include a mode in the **no** form, but if a mode has been entered, selecting a mode is required.

Parameter	Description
`mode {gre ip | ip 6in4 | ip 6in6}`	Creates an IP tunnel. Choose one of the following options: - **gre ip**: Creates a GRE tunnel. - **ip 6in4**: Creates an IPv4 tunnel for IPv6 traffic. - **ip 6in6**: Creates an IPv6 tunnel for IPv6 traffic. This is optional in the **no** form, unless a mode has already been entered.
<TUNNEL-NUMBER>	Specifies the number for a new tunnel. Range: 1 to 127. Numbering is shared between all tunnels, so the same tunnel number cannot be used for an IPv6 in IPv4 tunnel and a GRE tunnel.
<EXISTING-TUNNEL-NUMBER>	Specifies the number for an existing IP tunnel. Range: 1 to 127.

Examples

Defines a new GRE tunnel with number **27**.

```
switch(config)# interface tunnel 27 mode gre ip
switch(config-gre-if)#
```

Switches to the `config-gre-if` context for existing tunnel **33**.

```
switch(config)# interface tunnel 33
switch(config-gre-if)#
```

Deletes GRE tunnel **33**.

```
switch(config)# no interface tunnel 33
```

Defines a new IPv6 in IPv4 tunnel with number **27**.

```
switch(config)# interface tunnel 27 mode ip 6in4
switch(config-ip-if)#
```

Switches to the `config-ip-if` context for existing tunnel **27**.

```
switch(config)# interface tunnel 27
switch(config-ip-if)#
```

DeletesIPv6 in IPv4 tunnel **27**.

```
switch(config)# no interface tunnel 27
```

Defines a new IPv6 in IPv6 tunnel with number **8**.

```
switch(config)# interface tunnel 8 mode ip 6in6
switch(config-ip-if)#
```

Deletes IPv6 in IPv6 tunnel with number **3**.

```
switch(config)# no interface tunnel 3 mode gre ip
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

ip address

```
ip address <IPV4-ADDR>/<MASK>
no ip address <IPV4-ADDR>/<MASK>
```

Description

Sets the local IP address of a GRE tunnel. This address identifies the tunnel interface for routing. It must be on the same subnet as the tunnel address assigned on the remote device.

The **no** form of this command deletes the local IP address assigned to a GRE tunnel.

Parameter	Description
<IPV4-ADDR>	Specifies the tunnel IP address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. You can remove leading zeros. For example, the address **192.169.005.100** becomes **192.168.5.100**.
<MASK>	Specifies the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 32.

Examples

Defines the local IP address **10.10.10.1** for GRE tunnel **33**.

```
switch(config)# interface tunnel 33 mode gre ipv4
switch(config-gre-if)# ip address 10.10.10.1/24
```

Deletes the local IP address **10.10.10.1** for GRE tunnel 33.

```
switch(config)# interface tunnel 33
switch(config-gre-if)# no ip address 10.10.10.1/24
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

ipv6 address

```
ipv6 address <IPV6-ADDR>/<MASK>
no ipv6 address <IPV6-ADDR>/<MASK>
```

Description

Sets the local IP address of an IPv6 to IPv4 tunnel or of an IPv6 to IPv6 tunnel. This address identifies the tunnel interface for routing. It must be on the same subnet as the tunnel address assigned on the remote device.

The **no** form of this command deletes the local IP address assigned to an IPv6 to IPv4 tunnel.

Parameter	Description
<IPV6-ADDR>	Specifies the tunnel IP address in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.
<MASK>	Specifies the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 32.

Examples

Defines the local IP address **2001:DB8:5::1/64** for tunnel **8** for an IPv6 to IPv6 tunnel.

```
switch(config)# interface tunnel 8 mode ip 6in6
switch(config-ip-if)# ipv6 address 2001:DB8:5::1/64
```

Deletes the local IP address **2001:DB8::1/32** for tunnel **8**.

```
switch(config)# interface tunnel 8
switch(config-ip-if)# no ipv6 address 2001:DB8:5::1/64
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

ip mtu

```
ip mtu <VALUE>
```

Description

Sets the MTU (maximum transmission unit) for an IP interface. The default value is 1500 bytes.

The **no** form of this command sets the MTU to the default value of 1500 bytes.

Parameter	Description
<VALUE>	Specifies the MTU in bytes. Range: 1,280 bytes to 9,192 bytes.

Usage

The IP MTU is the largest IP packet that can be sent or received by the interface. For a tunnel, the IP MTU is the maximum size of the IP payload. To enable jumbo packet forwarding through the tunnel, set the IP MTU of the tunnel to a value greater than 1500. Also set the MTU and the IP MTU values for the underlying physical interface that the tunnel is using to a value greater than 1,500 bytes. The IP MTU of the tunnel must also be greater than or equal to the MTU of the ingress interface on the switch. The IP MTU value of the tunnel must also be less than or equal to the IP MT of the underlying interface that the tunnel is using.

When defining a GRE tunnel, the MTU has to account for 28 bytes of IP layer overhead, plus a GRE header. It must be larger than the MTU of the interface that the tunnel is using. Packets larger than the MTU are dropped.

Examples

Sets the MTU on GRE interface **33** to **1300** bytes.

```
switch(config)# interface tunnel 33 mode gre ipv4
switch(config-gre-if)# mtu 1300
```

Sets the MTU on GRE interface **33** to the default value.

```
switch(config)# interface tunnel 33 mode gre ipv4
switch(config-gre-if)# ip mtu
```

Sets the MTU on IPv6 in IPv4 tunnel **27** to **1000** bytes.

```
switch(config)# interface tunnel 27 mode ip 6in4
switch(config-ip-if)# mtu 1000
```

Sets the MTU onIPv6 in IPv4 tunnel **27** to the default value.

```
switch(config)# interface tunnel 27 mode ip 6in4
switch(config-ip-if)# ip mtu
```

Sets the MTU on IPv6 in IPv6 tunnel **8** to **900** bytes.

```
switch(config)# interface tunnel 8 mode ip 6in6
switch(config-ip-if)# ip mtu 9000
```

Sets the MTU on IPv6 in IPv6 tunnel **8** to the default value.

```
switch(config)# interface tunnel 8 mode ip 6in6
switch(config-ip-if)# ip mtu
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

show interface tunnel

`show interface tunnel[<TUNNEL-NUMBER>] [vsx-peer]`

Description

Shows configuration settings for all IP tunnels, or a specific tunnel.

Parameter	Description
<TUNNEL-NUMBER>	Specifies the number of an IP tunnel. Range: 1 to 127.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Shows configuration settings for tunnel **10**, which is a GRE tunnel in the following example.

```
switch# show interface tunnel10

Interface tunnel10 is up
 Admin state is up
 tunnel type GRE IP
 tunnel interface IP address 192.0.2.0/24
 tunnel source IP address 1.1.1.1
 tunnel destination IP address 2.2.2.2
 tunnel ttl 60

Statistics                      RX                   TX                 Total
 ------------- -------------------- -------------------- --------------------
 L3 Packets                       0                    0                    0
 L3 Bytes                         0                    0                    0
```

Shows configuration settings for tunnel **12**, which is an IPv6 in IPv6 tunnel in the following example.

```
switch# show interface tunnel12

Interface tunnel12 is up
 Admin state is up
 tunnel type IPv6 in IPv6
 tunnel interface IPv6 address 4::1/64
 tunnel source IPv6 address 2::1
 tunnel destination IPv6 address 2::2
 tunnel ttl 60
 Description: Network2 Tunnel

Statistics                      RX                   TX                 Total
 ------------- -------------------- -------------------- --------------------
 L3 Packets                       0                    0                    0
 L3 Bytes                         0                    0                    0
```

Shows configuration settings for all tunnels.

```
switch# show interface tunnel

Interface tunnel10 is up
 Admin state is up
 tunnel type GRE IP
 tunnel interface IP address 192.0.2.0/24
 tunnel source IP address 1.1.1.1
 tunnel destination IP address 2.2.2.2
 tunnel ttl 60

Statistics                      RX                   TX                 Total

show running-config interface tunnel

`show running-config interface tunnel<TUNNEL-NUMBER> [vsx-peer]`

Description

Shows the commands used to configure a tunnel.

Parameter	Description
<TUNNEL-NUMBER>	Specifies the number of an IP tunnel. Range: 1 to 127.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Shows the configuration for a GRE tunnel.

```
switch# show running-config interface tunnel2
  interface tunnel 2 mode gre ipv4
  source ip 10.10.20.11
  destination ip 10.20.1.2
  ip address 10.10.10.1/24
  ttl 60
```

Shows the configuration for IPv6 in IPv4 tunnel.

```
switch# show running-config interface tunnel5
  interface tunnel5 mode ip 6in4
  source ip 10.10.10.12
  destination ip 22.20.20.20
  ip6 address 2001:DB8:5::1/64
  ttl 60
  no shutdown
  description Network10
```

Shows the configuration for IPv6 in IPv6 tunnel.

```
switch# show running-config interface tunnel1
  interface tunnel 1 mode ip 6in6
  description Network2 Tunnel
  source ipv6 2::1
  destination ipv6 2::2
  ipv6 address 4::1/64
  ttl 60
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

6300 6400	Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

shutdown

```
shutdown
no shutdown
```

Description

This command disables an IP interface. IP interfaces are disabled by default when created.

The **no** form of this command enables an IP interface.

Examples

Enables GRE interface **33**.

```
switch(config)# interface tunnel 33 mode gre ipv4
switch(config-gre-if)# no shutdown
```

Disables GRE interface **33**.

```
switch(config)# interface tunnel 33 mode gre ipv4
switch(config-gre-if)# shutdown
```

Enables IPv6 in IPv4 interface **27**.

```
switch(config)# interface tunnel 27 mode ip 6in4
switch(config-ip-if)# no shutdown
```

Disables IPv6 in IPv4 interface **27**.

```
switch(config)# interface tunnel 27 mode ip 6in4
switch(config-ip-if)# shutdown
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

source ip

```
source ip <IPV4-ADDR>
no source ip <IPV4-ADDR>
```

Description

Sets the source IP address for an IP tunnel. Specify the IP address of a layer 3 interface on the switch. Tunnels can have the same source IP address and different destination IP addresses.

The **no** form of this command deletes the source IP address for an IP tunnel.

Parameter	Description
<IPV4-ADDR>	Specifies the source IP address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.

Examples

Defines the source IP address to be **10.10.20.1** for GRE tunnel **33**.

```
switch(config)# interface tunnel 33 mode gre ipv4
switch(config-gre-if)# source ip 10.10.20.1
```

Deletes the source IP address **10.1.20.1** from GRE tunnel **33**.

```
switch(config)# interface tunnel 33
switch(config-gre-if)# no source ip 10.10.20.1
```

Defines the source IP address to be **10.10.10.1** for IPv6 in IPv4 tunnel **27**.

```
switch(config)# interface tunnel 27 mode ip 6in4
switch(config-ip-if)# source ip 10.10.10.1
```

Deletes the source IP address **10.1.10.1** from IPv6 in IPv4 tunnel **27**.

```
switch(config)# interface tunnel 27
switch(config-ip-if)# no source ip 10.10.10.1
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

source ipv6

```
source ipv6 <IPV6-ADDR>
no source ipv6 [IPV6-ADDR]
```

Description

Sets the source IPv6 address to be used for the encapsulation.

The **no** form of this command deletes the source IPv6 address for an IP tunnel.

Parameter	Description
<IPV6-ADDR>	Specifies the tunnel IP address in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F. This is optional in the **no** form of the command.

Examples

Defines the source IPv6 address to be **2001:DB8::1** for IPv6 in IPv6 tunnel **8**.

```
switch(config)# interface tunnel 8 mode ip 6in6
switch(config-ip-if)# source ipv6 2001:DB8::1
```

Deletes the source IP address **2001:DB8::1** from IPv6 in IPv6 tunnel **8**.

```
switch(config)# interface tunnel 8
switch(config-ip-if)# no source ipv6 2001:DB8::1
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

6300 6400	`config-ip-if`	Administrators or local user group members with execution rights for this command.

ttl

```
ttl <COUNT>
no ttl
```

Description

Sets the TTL (time-to-live), also known as the hop count, for tunneled packets. If not configured, the default value of 64 is used for the tunnel. (The hop count of the original packets is not changed.) A maximum of four different TTL values can be used at the same time by all tunnels on the switch. For example, if tunnel-1 has TTL 10, tunnel-2 has TTL 20, tunnel-3 has TTL 30, and tunnel-4 has TTL 40, then tunnel-5 cannot have a unique TTL value, it must reuse one of the values assigned to the other tunnels (10, 20, 30, 40).

The **no** form of this command sets TTL to the default value of 64.

Parameter	Description
<COUNT>	Specifies the hop count. Range: 1 to 255. Default: 64.

Examples

Defines a TTL of **99** for GRE tunnel **33**.

```
switch(config)# interface tunnel 33 mode gre ipv4
switch(config-gre-if)# ttl 99
```

Sets the TTL for GRE tunnel **33** to the default value of 64.

```
switch(config)# interface tunnel 33
switch(config-gre-if)# no ttl
```

Defines a TTL of **55** for IPv6 in IPv4 tunnel **27**.

```
switch(config)# interface tunnel 27 mode ip 6in4
switch(config-ip-if)# ttl 55
```

Sets the TTL for IPv6 in IPv4 tunnel **27** to the default value of 64.

```
switch(config)# interface tunnel 27
switch(config-ip-if)# no ttl
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

vrf attach

```
vrf attach <VRF-NAME>
no vrf attach <VRF-NAME>
```

Description

Assigns an IP tunnel to a VRF. By default, all tunnels are automatically assigned to the default VRF when they are created.

The **no** form of this command assigns a tunnel to the default VRF (**default**).

Parameter	Description
<VRF-NAME>	Specifies the VRF name to which to assign the tunnel.

Examples

Assigns GRE tunnel **33** to **vrf1**.

```
switch(config)# interface tunnel 33 mode gre ipv4
switch(config-gre-if)# vrf attach vrf1
```

Reassigns GRE tunnel **33** to the default VRF.

```
switch(config)# interface tunnel 33
switch(config-gre-if)# no vrf attach vrf1
```

Assigns IPv6 in IPv4 tunnel **27** to **vrf2**.

```
switch(config)# interface tunnel 27 mode gre ipv4
switch(config-ip-if)# vrf attach vrf2
```

Reassigns IPv6 in IPv4 tunnel **27** to the default VRF.

```
switch(config)# interface tunnel 27
switch(config-ip-if)# no vrf attach vrf2
```

Assigns IPv6 in IPv6 tunnel **8** to **vrf3**.

```
switch(config)# interface tunnel 8 mode ip 6in6
switch(config-ip-if)# vrf attach vrf3
```

Reassigns IPv6 in IPv6 tunnel **8** to the default VRF.

```
switch(config)# interface tunnel 8
switch(config-ip-if)# no vrf attach vrf3
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

IP source lockdown commands

IP source lockdown resource extended

```
[no] ip source-lockdown resource-extended
```

Description

Enables and disables IP source lockdown resource extended on the device. It supports dynamically sharing hardware resources of IP source lockdown with other features.

For example, on AOS-CX 6300 switches, 8000 IP source lockdown entries can be programmed in the hardware by default. By disabling IP resource-extended, the supported value will reduce to 4000, and the remaining resources are shared with other features.

If the resource-extended feature is disabled, all the existing IP source-bindings are flushed from the hardware and reprogrammed. As a result, some existing bindings do not get programmed to hardware, which existed before the configuration change. There is a disruption in traffic flow from the client during this transition.

The command is supported on 6300, 6400v1, and 6400v2 but not supported on 6400v2 extended profile.

Examples

The following example enables IP source lockdown resource extended globally:

```
switch(config)# ip source-lockdown resource-extended
   Do you want to continue (y/n)? y
```

On enabling IP source lockdown resource extended , application recognition gets disabled and stops sharing IP lockdown hardware resources.

The following example disables IP source lockdown resource extended globally:

```
switch(config)# no ip source-lockdown resource-extended
   Do you want to continue (y/n)? y
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.11	Command introduced for 6300 and 6400 series switches.

Command Information

Chapter 57
IPv4 source lockdown commands

ipv4 source-binding

```
ipv4 source-binding <VLAN-ID> <IPV4-ADDR> <MAC-ADDR> <IFNAME>
no ipv4 source-binding <VLAN-ID> <IPV4-ADDR> <MAC-ADDR> <IFNAME>
```

Description

Adds static IPv4 client source binding information to the switch IP binding database. Although DHCPv4 snooping is often used to dynamically populate the binding database, this command is available for manually adding entries to the switch IP binding database.

Statically configured IP binding information supersedes any dynamically collected binding information for the same client.

The no form of this command removes the specified binding that was statically configured with the **ipv4 source-binding** command. The no form has no effect on bindings that were dynamically configured with DHCPv4 snooping.

Parameter	Description
<VLAN-ID>	Specifies the ID of an existing VLAN on which the client is connected. Range: 1 to 4094.
<IPV4-ADDR>	Specifies the client IPv4 unicast address.
<MAC-ADDR>	Specifies the client MAC address.
<IFNAME>	Specifies the interface on which the client is connected.

Examples

On the 6400 Switch Series, interface identification differs.

Adding a static IPv4 binding:

```
switch(config)# ipv4 source-binding 1 10.2.1.4 00:50:56:96:e4:cf 1/1/1
```

Removing a IPv4 binding:

```
switch(config)# no ipv4 source-binding 1 10.2.1.4 00:50:56:96:e4:cf 1/1/1
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

ipv4 source-lockdown

```
ipv4 source-lockdown
no ipv4 source-lockdown
```

Description

Enables IPv4 source lockdown for all VLANs on the selected interface (port).

The no form of this command disables IPv4 source lockdown for the selected interface (port).

This configuration will disable flow tracking statistics collection.

Examples

On the 6400 Switch Series, interface identification differs.

Enabling IPv4 source lockdown on interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# ipv4 source-lockdown
```

Enabling IPv4 source lockdown on interface lag112:

```
switch(config)# interface lag112
switch(config-if)# ipv4 source-lockdown
```

Disabling IPv4 source lockdown on interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# no ipv4 source-lockdown
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

ipv4 source-lockdown hardware retry

`ipv4 source-lockdown hardware retry <VLAN-ID> <IPV4-ADDR>`

Description

Retries the IPv4 source lockdown hardware programming for a client identified by VLAN and IPv4 address.

Parameter	Description
<VLAN-ID>	Specifies the ID of an existing VLAN on which the client is connected. Range: 1 to 4094.
<IPV4-ADDR>	Specifies the client IPv4 unicast address.

Example

Configure IPv4 source lockdown hardware retry for the client on VLAN 10.

```
switch(config)# ipv4 source-lockdown hardware retry 10 1.1.2.1
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

show ipv4 source-binding

```
show ipv4 source-binding [vsx-peer]
```

Description

Shows all IPv4 static source binding information irrespective of source lockdown configuration..

Parameter	Description
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

Showing all IPv4 source binding information:

```
switch# show ipv4 source-binding

  PORT             VLAN        MAC-ADDRESS        HW-STATUS  FROM      IPv4-ADDRESS
  ---------------  ---------   -----------------  ---------  --------  -------------
  1/1/1            2           aa:bb:cc:dd:ee:ff  Yes        static    1.2.3.4
  1/1/2            12          aa:ab:cc:dd:ee:ff  Yes        static    10.20.30.40
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

show ipv4 source-lockdown

```
show ipv4 source-lockdown [binding [interface <IFNAME> | ip <IPV4-ADDR> | mac <MAC-ADDR>
| vlan <VLAN-ID>] | interface <IFNAME>] [vsx-peer]
```

Description

Shows summary or detailed IPv4 source lockdown information. When entered without parameters, summary status information for all interfaces (ports) in the binding database is shown.

Parameter	Description
`binding`	Specifies that detailed lockdown binding record information is to be displayed. The binding database record can be identified by any one of **interface** (port), **ip**, **mac**, or **vlan**.
`interface` *<IFNAME>*	Specifies the client interface (port). When entered without the **binding** parameter, the summary status information is displayed for the specified interface.
`ip` *<IPV4-ADDR>*	Specifies the client IPv4 unicast address.
`mac` *<MAC-ADDR>*	Specifies the client MAC address.
`vlan` *<VLAN-ID>*	Specifies the ID of an existing VLAN on which the client is connected. Range: 1 to 4094.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

Showing the summary status information for all interfaces in the binding database:

```
switch# show ipv4 source-lockdown

  INTERFACE  LOCKDOWN  HW-STATUS
  ---------  --------  ---------
  1/1/1      Yes       Yes
  1/1/2      Yes       No
  lag112     Yes       Yes
```

Showing the summary status information for the specified interface in the binding database:

```
switch# show ipv4 source-lockdown interface 1/1/2

  INTERFACE  LOCKDOWN  HW-STATUS
  ---------  --------  ---------
  1/1/2      Yes        No
```

Showing the detailed binding record and related information for all interfaces in the binding database:

```

 Time Remaining        : 115 seconds
 Lockdown Status       : Yes
 Hardware Status       : No
 Hardware Error Reason : Resource unavailable
```

Showing the detailed binding record and related information for interface lag112 (identified in this example command by the IP address):

```
switch# show ipv4 source-lockdown binding ip 120.168.76.182

 Interface Name        : lag112
 VLAN Id               : 12
 MAC Address           : 00:50:56:96:d8:3d
 IP Address            : 120.168.76.182
 Time Remaining        : static
 Lockdown Status       : Yes
 Hardware Status       : Yes
 Hardware Error Reason : --
```

Showing the detailed binding record and related information for interface 1/1/1 (identified in this example command by the MAC address):

```
switch# show ipv4 source-lockdown binding mac 00:50:56:96:e4:cf

 Interface Name        : 1/1/1
 VLAN Id               : 2000
 MAC Address           : 00:50:56:96:e4:cf
 IP Address            : 192.168.142.113
 Time Remaining        : static
 Lockdown Status       : Yes
 Hardware Status       : Yes
 Hardware Error Reason : --
```

Showing the detailed binding record and related information for interface 1/1/2 (identified in this example command by the VLAN):

```
switch# show ipv4 source-lockdown binding vlan 100

 Interface Name        : 1/1/2
 VLAN Id               : 100
 MAC Address           : 00:50:56:96:04:4d
 IP Address            : 120.168.43.52
 Time Remaining        : 115 seconds
 Lockdown Status       : Yes
 Hardware Status       : No
 Hardware Error Reason : Resource unavailable
```

Chapter 58

IPv6 destination guard commands

ipv6 destination guard

```
ipv6 destination-guard
no ipv6 destination-guard
```

Description

Enables IPv6 destination guard on a VLAN.

The **no** form of the command removes the IPv6 destination guard from a VLAN.

> To avoid dropping valid packets when destination guard is enabled, it is recommended to configure DHCPv6 snooping and ND snooping to populate the binding database.

Examples

Enabling IPv6 destination guard policy on a VLAN:

```
switch(config)# vlan 10
switch(config-vlan-10)# ipv6 destination-guard
```

Disabling IPv6 destination guard policy on a VLAN:

```
switch(config-vlan-10)# no ipv6 destination-guard
```

> For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.10	Command introduced.

Command Information

show ipv6 destination-guard statistics vlan

```
show ipv6 destination-guard statistics {vlan <VLAN-ID>}
```

Description

Shows IPv6 destination guard statistics for the specified VLAN.

Command context

Parameter	Description
`vlan <VLAN-ID>`	Specifies the VLAN for which all destination guard statisics are to be displayed. Range: 1 to 4094.

Examples

Showing IPv6 destination-guard statistics for VLAN 10:

```
switch# show ipv6 destination-guard statistics vlan 10
Packets dropped for VLAN 10 : 25467
```

Showing IPv6 destination-guard statistics for all VLANs:

```
switch# show ipv6 destination-guard statistics
Packets dropped for VLAN 10 : 25467
Packets dropped for VLAN 30 : 434
Packets dropped for VLAN 50 : 8767
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

clear ipv6 destination-guard statistics vlan

`clear ipv6 destination-guard statistics vlan <VLAN-ID>`

Description

Clears IPv6 destination guard statistics from the specified VLAN.

Command context

Parameter	Description
`vlan <VLAN-ID>`	Specifies the VLAN for which all destination guard statistics are to be cleared. Range: 1 to 4094.

Examples

Clearing all ipv6 destination-guard statistics for VLAN 10:

```
switch# clear ipv6 destination-guard statistics vlan 10
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.10	Command introduced.

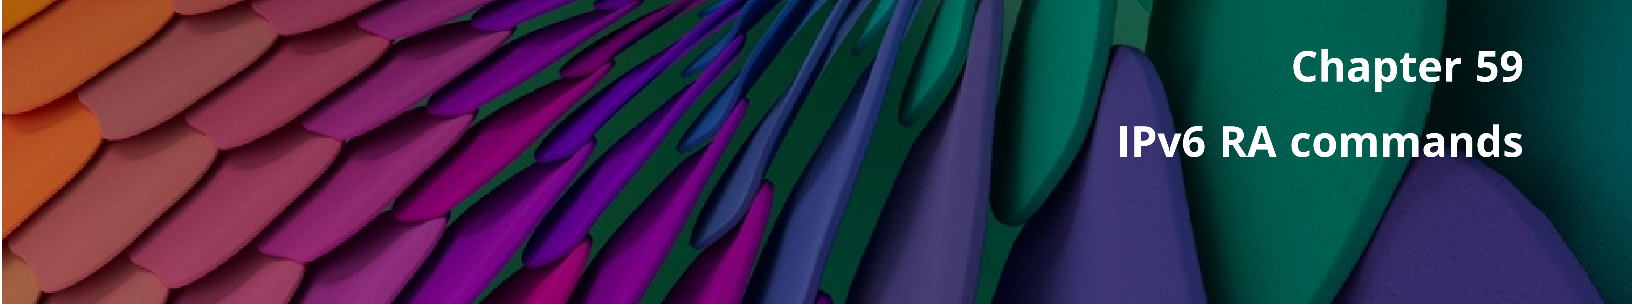
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.



Chapter 59

IPv6 RA commands

ipv6 address <global-unicast-address>

```
ipv6 address <global-unicast-address>
no ipv6 address <global-unicast-address>
```

Description

Sets a global unicast address on the interface.

The **no** form of this command removes the global unicast address on the interface.

This command automatically creates an IPv6 link-local address on the interface. However, it does not add the **ipv6 address link-local command** to the running configuration. If you remove the IPv6 address, the link-local address is also removed. To maintain the link-local address, you must manually execute the **ipv6 address link-local** command.

Example

On the 6400 Switch Series, interface identification differs.

Enabling a global unicast address:

```
switch(config)# interface 1/1/1
switch(config-if)#  ipv6 address 3731:54:65fe:2::a7
```

Disabling a global unicast address:

```
switch(config)# interface 1/1/1
switch(config-if)#  no ipv6 address 3731:54:65fe:2::a7
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

ipv6 address autoconfig

```
ipv6 address autoconfig
no ipv6 address autoconfig
```

Description

Enables the interface to automatically obtain an IPv6 address using router advertisement information and the EUI-64 identifier.

The **no** form of this command disables address auto-configuration.

- A maximum of 15 autoconfigured addresses are supported.
- This command automatically creates an IPv6 link-local address on the interface. However, it does not add the `ipv6 address link-local` command to the running configuration. If you remove the IPv6 address, the link-local address is also removed. To maintain the link-local address, you must manually execute the `ipv6 address link-local` command.

Usage

The IPv6 SLAAC feature lets the router obtain the IPv6 address for the interface it is configured through the SLAAC method. This feature is not available on the `mgmt` VRF.

Example

On the 6400 Switch Series, interface identification differs.

Enabling unicast autoconfiguring:

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 address autoconfig
```

Disabling unicast autoconfiguring:

```
switch(config)# interface 1/1/1
switch(config-if)# no ipv6 address autoconfig
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

ipv6 address link-local

`ipv6 address link-local [<IPV6-ADDR>/<MASK>]`

Description

Enables IPv6 on the current interface. If no address is specified, an IPv6 link-local address is auto-generated for the interface. If an address is specified, auto-configuration is disabled and the specified address/mask is assigned to the interface.

To disable IPv6 link-local on the interface, remove **ipv6 address link-local**, **ipv6 address <global-ipv6-address>**, and **ipv6 address autoconfig** from the interface.

This feature is not available on the management VRF.

Parameter	Description
<IPV6-ADDR>	Specifies the IP address in IPv6 format **(xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx)**, where **x** is a hexadecimal number from 0 to F. You can use two colons (::) to represent consecutive zeros (but only once), remove leading zeros, and collapse a hextet of four zeros to a single 0. For example, this address **2222:0000:3333:0000:0000:0000:4444:0055** becomes **2222:0:3333::4444:55**.
<MASK>	Specifies the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128.

Example

On the 6400 Switch Series, interface identification differs.

Enabling IPv6 link-local on the interface:

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 address link-local
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

ipv6 nd cache-limit

```
ipv6 nd cache-limit <CACHELIMIT>
no ipv6 nd cache-limit [<CACHELIMIT>]
```

Description

Configures the limit on the number of neighbor entries in the ND cache.

The **no** form of this command sets the cache limit to the default value.

Parameter	Description
<CACHELIMIT>	Specifies the neighbor cache entries limit. Range: 1-131072. Default: 131072.

Examples

Setting the cache limit to 20.

```
switch(config)# ipv6 nd cache-limit 20
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

ipv6 nd dad attempts

```
ipv6 nd dad attempts <NUM-ATTEMPTS>
no ipv6 nd dad attempts [<NUM-ATTEMPTS>]
```

Description

Configures the number of neighbor solicitations to be sent when performing duplicate address detection (DAD) for a unicast address configured on an interface. If the active gateway is configured with the same IP as an SVI IP, then IPv6 DAD cannot be configured.

The **no** form of this command sets the number of attempts to the default value.

Parameter	Description
dad attempts *<NUM-ATTEMPTS>*	Specifies the number of neighbor solicitations to send. Range: 0-15. Default: 1.

Examples

On the 6400 Switch Series, interface identification differs.

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 nd dad attempts 5
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

ipv6 nd hop-limit

```
ipv6 nd hop-limit <HOPLIMIT>
no ipv6 nd hop-limit [<HOPLIMIT>]
```

Description

Configures the hop limit to be sent in RAs.

The **no** form of this command resets the hop limit to 0. This reset eliminates the hop limit from the RAs that originate on the interface, so the host determines the hop limit.

Parameter	Description
hop-limit *<HOPLIMIT>*	Specifies the hop limit. Range: 0-255. Default: 64.

Examples

On the 6400 Switch Series, interface identification differs.

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 nd hop-limit 64
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

ipv6 nd mtu

```
ipv6 nd mtu <MTU-VALUE>
no ipv6 nd mtu [<MTU-VALUE>]
```

Description

Configures the MTU size to be sent in the RA messages.

The **no** form of this command sets hop limit to the default value.

Parameter	Description
<MTU-VALUE>	Specifies the MTU size. Range: 1280-65535 bytes. Default: 1500 bytes.

Examples

On the 6400 Switch Series, interface identification differs.

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 nd mtu 1300
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

ipv6 nd ns-interval

```
ipv6 nd ns-interval <TIME>
no ipv6 nd ns-interval [<TIME>]
```

Description

Configures the ND time in milliseconds between DAD neighbor solicitations sent for an unresolved destination. Increase the ns-interval time if the network is slow or if there are persistent retry failures. If the active gateway is configured with the same IP as an SVI IP, then IPv6 DAD cannot be configured

The **no** form of this command sets the ns-interval to the default value.

Parameter	Description
<TIME>	Specifies the neighbor solicitation interval. Range: 1000-3600000 milliseconds. Default: 1000 milliseconds.

Examples

On the 6400 Switch Series, interface identification differs.

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 nd ns-interval 1200
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

ipv6 nd prefix

```
ipv6 nd prefix <IPV6-ADDR>/<PREFIX-LEN>
     [no-advertise | [valid <LIFETIME-VALUE> preferred
     <LIFETIME-VALUE>] | no-autoconfig | no-onlink]

no ipv6 nd prefix <IPV6-ADDR>/<PREFIX-LEN> [no-advertise
     | [valid <LIFETIME-VALUE> preferred <LIFETIME-VALUE>
     ] | no-autoconfig | no-onlink]

ipv6 nd prefix default [no-advertise | [valid <LIFETIME-VALUE>
     preferred <LIFETIME-VALUE>] | no-autoconfig | no-onlink]}

no ipv6 nd prefix default [no-advertise | [valid <LIFETIME-VALUE>
     preferred <LIFETIME-VALUE>] | no-autoconfig | no-onlink]}
```

Description

Specifies prefixes for the routing switch to include in RAs transmitted on the interface. IPv6 hosts use the prefixes in RAs to autoconfigure themselves with global unicast addresses. The autoconfigured address of a host is composed of the advertised prefix and the interface identifier in the current link-local address of the host.

By default, advertise, autoconfig, and onlink are set.

The **no** form of this command removes the configuration on the interface.

Parameter	Description
<IPV6-ADDR>/<PREFIX-LEN>	Specifies the IPv6 prefix to advertise in RA. Format: X:X::X:X/M
default	Specifies apply configuration to all on-link prefixes that are not individually set by the **ipv6 ra prefix *<IPV6-ADDR>/<PREFIX-LEN>*** command. It applies the same valid and preferred lifetimes, link state, autoconfiguration state, and advertise options to the advertisements sent for all on-link prefixes that are not individually configured with a unique lifetime. This also applies to the prefixes for any global unicast addresses configured later on the same interface. Using default once, and then using it again with any new parameter values results in the new values replacing the former values in advertisements. If default is used without the **no–advertise**, **no–autoconfig**, or **no-onlink** parameter, the advertisement setting for the absent parameter is returned to its default setting.
no-advertise	Specifies do not advertise prefix in RA.
valid *<LIFETIME-VALUE>*	Specifies the total time, in seconds, the prefix remains available before becoming unusable. After preferred-lifetime expiration, any autoconfigured address is deprecated and used only for transactions only before preferred-lifetime expires. If the valid lifetime expires, the address becomes invalid. You can enter a value in seconds or enter **valid infinite** which sets infinite lifetime. Default: 2,592,000 seconds which is 30 days. Range: 0–4294967294 seconds.
preferred *<LIFETIME-VALUE>*	Specifies the span of time during which the address can be freely used as a source and destination for traffic. This setting must be less than or equal to the corresponding valid–lifetime setting. You can enter a value in seconds or enter **preferred infinite** which sets infinite lifetime. Default: 604,800 seconds which is seven days. Range: 0–4294967294 seconds.
no-autoconfig	Specifies do not use prefix for autoconfiguration.
no-onlink	Specifies do not use prefix for onlink determination.

Examples

On the 6400 Switch Series, interface identification differs.

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 nd prefix 4001::1/64 valid 30 preferred 10 no-autoconfig
no-onlink
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

ipv6 nd ra dns search-list

```
ipv6 nd ra dns search-list <DOMAIN-NAME>  [lifetime <TIME>]
no ipv6 nd ra dns search-list <DOMAIN-NAME>
```

Description

Configures the DNS Search List (DNSSL) to include in Router Advertisements (RAs) transmitted on the interface.

The **no** form of this command removes the DNS Search List from the RAs transmitted on the interface.

Parameter	Description
`<DOMAIN-NAME>`	Specifies the domain names for DNS queries.
`lifetime <TIME>`	Specifies lifetime in seconds. Range: 4-4294967295 seconds. Default: 1800 seconds.

Usage

- DNSSL contains the domain names of DNS suffixes or IPv6 hosts to append to short, unqualified domain names for DNS queries.
- Multiple DNS domain names can be added to the DNSSL by using the command repeatedly.
- A maximum of eight server addresses are allowed.

Examples

On the 6400 Switch Series, interface identification differs.

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 nd ra dns search-list test.com lifetime 500
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

ipv6 nd ra dns server

```
ipv6 nd ra dns server <IPV6-ADDR>  [lifetime <TIME>]
no ipv6 nd ra dns server <IPV6-ADDR>
```

Description

Configures the IPv6 address of a preferred Recursive DNS Server (RDNSS) to be included in Router Advertisements (RAs) transmitted on the interface.

The **no** form of this command removes the configured DNS server from the RAs transmitted on the interface.

Parameter	Description
<IPV6-ADDR>	Specifies the RDNSS address in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F. You can use two colons (::) to represent consecutive zeros (but only once), remove leading zeros, and collapse a hextet of four zeros to a single 0. For example, this address **2222:0000:3333:0000:0000:0000:4444:0055** becomes **2222:0:3333::4444:55**.
`lifetime` *<TIME>*	Specifies IPv6 DNS server lifetime in seconds. Range: 4-4294967295 seconds. Default: 1800 seconds.

Usage

- Including RDNSS information in RAs provides DNS server configuration for connected IPv6 hosts without requiring DHCPv6.
- Multiple servers can be configured on the interface by using the command repeatedly.
- A maximum of eight server addresses are allowed.

Examples

On the 6400 Switch Series, interface identification differs.

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 nd ra dns server 2001::1 lifetime 400
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

ipv6 nd ra lifetime

```
ipv6 nd ra lifetime <TIME>
no ipv6 nd ra lifetime [<TIME>]
```

Description

Configures the lifetime, in seconds, for the routing switch to be used as a default router by hosts on the current interface.

The **no** form of this command sets lifetime to the default of 1800 seconds.

Parameter	Description
<TIME>	Specifies lifetime in seconds of a default router. A setting of 0 for default router lifetime in an RA indicates that the routing switch is not a default router on the interface. Range: 0-9000 seconds. Default: 1800 seconds.

Usage

- A given host on an interface refreshes the default router lifetime for a specific router each time the host receives an RA from that router.
- A specific router ceases to be a default router candidate for a given host if the default router lifetime expires before the host is updated with a new RA from the router.

Examples

On the 6400 Switch Series, interface identification differs.

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 nd ra lifetime 1200
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

ipv6 nd ra managed-config-flag

```
ipv6 nd ra managed-config-flag
no ipv6 nd ra managed-config-flag
```

Description

Controls the M flag setting in RAs the router transmits on the current interface. Enable the M flag to indicate that hosts can obtain IP address through DHCPv6. The M flag is disabled by default.

The **no** form of this command turns off (disables) the M flag.

Usage

- Enabling the M flag directs hosts to acquire their IPv6 addressing for the current interface from a DHCPv6 server.
- When the M-bit is enabled, receiving hosts ignore the O flag setting, which is configured using the command **ipv6 nd ra other-config-flag**.
- When the M-bit is disabled (the default), receiving hosts expect to receive their IPv6 addresses from RA.

M flag	O flag	Description
0	0	Indicates that no information is available via DHCPv6.
0	1	Indicates that other configuration information is available via DHCPv6. Examples of such information are DNS-related information or information on other servers within the network.

M flag	O flag	Description
1	0	Indicates that addresses are available via Dynamic Host Configuration Protocol (DHCPv6).
1	1	If the M flag is set, the O flag is redundant and can be ignored because DHCPv6 will return all available configuration information.

Examples

On the 6400 Switch Series, interface identification differs.

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 nd ra managed-config-flag
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

ipv6 nd ra max-interval

```
ipv6 nd ra max-interval <TIME>
no ipv6 nd ra max-interval [<TIME>]
```

Description

Configures the maximum interval between transmissions of IPv6 RAs on the interface. The interval between RA transmissions on an interface is a random value that changes every time an RA is sent. The interval is calculated to be a value between the current max-interval and min-interval settings.

The **no** form of this command returns the setting to its default, provided the default value is less than the default lifetime value.

Parameter	Description
<TIME>	Specifies the maximum advertisement time in seconds. Range: 4-1800. Default: 600 seconds.

Usage

- This value has one setting per interface. The setting does not apply to RAs sent in response to a router solicitation received from another device.
- Attempting to set max-interval to a value that is not sufficiently larger than the current min-interval also results in an error message.

Examples

On the 6400 Switch Series, interface identification differs.

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 nd ra max-interval 30
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

ipv6 nd ra min-interval

```
ipv6 nd ra min-interval <TIME>
no ipv6 nd ra min-interval [<TIME>]
```

Description

Configures the minimum interval between transmissions of IPv6 RAs on the interface. The interval between RA transmissions on an interface is a random value that changes every time an RA is sent. The interval is calculated to be a value between the current max-interval and min-interval settings.

The **no** form of this command returns the setting to its default, provided the default value is less than the current max-interval setting.

Parameter	Description
<TIME>	Specifies a minimum advertisement time in seconds. Range: 3-1350. Default: 200 seconds.

Usage

- This value has one setting per interface and does not apply to RAs sent in response to a router solicitation received from another device.
- The min-interval must be less than the max-interval. Attempting to set min-interval to a higher value results in an error message.

Examples

On the 6400 Switch Series, interface identification differs.

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 nd ra  min-interval 25
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

ipv6 nd ra other-config-flag

```
ipv6 nd ra other-config-flag
no ipv6 nd ra other-config-flag
```

Description

Controls the O-bit in RAs the router transmits on the current interface; but is ignored unless the M-bit is disabled in RAs. Configure to set the O-bit in RA messages for host to obtain network parameters through DHCPv6. The other-config-flag is disabled by default.

For more information on configuring the M-bit, see **ipv6 nd ra managed-config-flag**.

The **no** form of this command turns off (disables) the setting for this command in RAs.

Usage

Enabling the O-bit while the M-bit is disabled directs hosts on the interface to acquire their other configuration information from DHCPv6. Examples of such information are DNS-related information or information on other servers within the network.

Examples

On the 6400 Switch Series, interface identification differs.

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 nd ra other-config-flag
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

ipv6 nd ra reachable-time

```
ipv6 nd ra reachable-time <TIME>
no ipv6 nd ra reachable-time [<TIME>]
```

Description

Sets the amount of time that the interface considers a device to be reachable after receiving a reachability confirmation from the device.

The **no** form of this command sets the reachable time to the default value of 0. (no limit).

Parameter	Description
<TIME>	Specifies the reachable time in milliseconds. Range: 1000-3600000. Default: 0 (no limit).

Examples

On the 6400 Switch Series, interface identification differs.

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 nd ra reachable-time 2000
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

ipv6 nd ra retrans-timer

```
ipv6 nd ra retrans-timer <TIME>
no ipv6 nd ra retrans-timer [<TIME>]
```

Description

Configures the period (retransmit timer) between ND solicitations sent by a host for an unresolved destination, or between DAD neighbor solicitation requests. By default, hosts on the interface use their own locally configured NS-interval settings instead of using the value received in the RAs.

Increase this timer when neighbor solicitation retries or failures are occur, or in a "slow" (WAN) network.

The **no** form of this command sets the value to the default of 0.

Parameter	Description
<TIME>	Specifies the retransmit timer value in milliseconds. Range: 0 - 4294967295 milliseconds. Default: 0 (Use locally configured NS-interval).

Examples

On the 6400 Switch Series, interface identification differs.

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 nd ra retrans-timer 400
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

ipv6 nd route

```
ipv6 nd route <IPV6-ADDR>/<PREFIX-LEN> [no-advertise | lifetime {<SECONDS> | infinite} |
preference {low | medium | high}]
no ipv6 nd route <IPV6-ADDR>/<PREFIX-LEN> [no-advertise | lifetime {<SECONDS> | infinite}
| preference {low | medium | high}]
```

Description

Configures the routing switch to include the routing information in the RAs transmitted on the interface. The routing switch includes the route information in the RA packets only if the configured routes are present in the routing table. After receiving the RA packets carrying the route information, the IPv6 host updates its routing table. The hosts lookup their routing table and selects the best possible route to forward packets.

The **no** form of this command removes the settings for including the routing information in the RA packets.

Parameter	Description
`<IPV6-ADDR>/<PREFIX-LEN>`	Specifies the IPv6 route prefix to advertise in RA. Format: X:X::X:X/M
`no-advertise`	Specifies to not advertise the route information.
`lifetime {<SECONDS> | infinite}`	Specifies the duration in seconds that the route is valid for the route determination. If this parameter is configured with **0**, the route becomes invalid. Default: **1800**. Range: **0**-4294967295.
`preference {low | medium | high}`	Specifies the preference for the hosts to choose the router associated with the route over other routers when multiple identical route prefixes from different routers are received. Default: **medium**

Examples

On the 6400 Switch Series, interface identification differs.

Configuring routing information on interface **1/1/1**.

```
switch(config)# int 1/1/1
switch(config-if)# ipv6 nd route 1::1/64 lifetime 200 preference high
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

ipv6 nd router-preference

```
ipv6 nd router-preference {high | medium | low}
no ipv6 nd router-preference [high | medium | low]
```

Description

Specifies the value that is set in the Default Router Preference (DRP) field of Router Advertisements (RAs) that the switch sends from an interface. An interface with a DRP value of high will be preferred by other devices on the network over interfaces with an RA value of medium or low.

The **no** form of this command set the value to the default of medium.

Parameter	Description
`high`	Sets DRP to high.
`medium`	Sets DRP to medium. Default.
`low`	Sets DRP to low.

Examples

On the 6400 Switch Series, interface identification differs.

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 nd router-preference high
```

ipv6 nd suppress-ra

```
ipv6 nd suppress-ra [<SUPPRESS-OPTION>]
```

```
no ipv6 nd ra supress-ra [<SUPPRESS-OPTION>]
```

Description

Configures suppression of IPv6 Router Advertisement transmissions on an interface.

The **no** form of this command restores transmission of IPv6 Router Advertisement and options.

Parameter	Description
`suppress-ra [<SUPPRESS-OPTION>]`	Specifies suppressing RA transmissions. Entering suppress-ra without any options, suppresses all RA messages (default). Or you can enter one of the following options.
`dnssl`	Specifies suppressing DNSSL options in RA messages.
`mtu`	Specifies suppressing MTU options in RA messages.
`rdnss`	Specifies suppressing RDNSS options in RA messages.

Examples

On the 6400 Switch Series, interface identification differs.

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 nd suppress-ra mtu dnssl rdnss
switch(config-if)# no ipv6 nd suppress-ra mtu dnssl rdnss
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

show ipv6 nd global traffic

```
show ipv6 nd global traffic [vsx-peer]
```

Description

Displays IPV6 Neighbor Discovery traffic details on a device.

Parameter	Description
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

```
switch# show ipv6 nd global traffic
  ICMPv6 packet Statistics (sent/received)
    Total Messages                 :        18/0
    Error Messages                 :        0/0
    Destination Unreachables       :        0/0

show ipv6 nd interface

`show ipv6 nd interface [<IF-NAME> | all-vrfs | vrf <VRF-NAME>] [vsx-peer]`

Description

Displays neighbor discovery information for an interface. If no options are specified, displays information for the default VRF.

Parameter	Description
<IF-NAME>	Displays information about the specified IPv6 enabled interface.
all-vrfs	Displays information about interfaces in all VRFs.
vrf *<VRF-NAME>*	Displays information about interfaces in a particular VRF. Or, if ***<VRF-NAME>*** is not specified, information for the default VRF is displayed.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

Showing information for all VRFs:

```
switch# show ipv6 nd interface all-vrfs

List of IPv6 Interfaces for VRF default
Interface 1/1/1 is up
  Admin state is up
  IPv6 address:
  IPv6 link-local address: fe80::7272:cfff:fee7:a8b9/64 [VALID]
  ICMPv6 active timers:
      Last Router-Advertisement sent:
      Next Router-Advertisement sent in:
  Router-Advertisement parameters:
      Periodic interval: 200 to 600 secs
      Router Preference: medium
      Send "Managed Address Configuration" flag: false
      Send "Other Stateful Configuration" flag: false
      Send "Current Hop Limit" field: 64
      Send "MTU" option value: 1500
      Send "Router Lifetime" field: 1800
      Send "Reachable Time" field: 0
      Send "Retrans Timer" field: 0
      Suppress RA: true
      Suppress MTU in RA: true
  ICMPv6 error message parameters:
      Send redirects: false
  ICMPv6 DAD parameters:
      Current DAD attempt: 1

List of IPv6 Interfaces for VRF red
Interface 1/1/2 is up
  Admin state is up
  IPv6 address:
    2001::1/64 [VALID]
  IPv6 link-local address: fe80::7272:cfff:fee7:a8b9/64 [VALID]

show ipv6 nd interface prefix

```
show ipv6 nd interface prefix [all-vrfs | vrf <VRF-NAME>] [vsx-peer]
```

Description

Shows IPv6 prefix information for all VRFs or a specific VRF. If no options are specified, shows information for the default VRF.

Parameter	Description
`all-vrfs`	Shows prefix information for all VRFs.
`vrf <VRF-NAME>`	Name of a VRF.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

Showing prefix information for the default VRF:

```
switch# show ipv6 nd interface prefix

List of IPv6 Interfaces for VRF default
List of IPv6 Prefix advertised on 1/1/1
   Prefix : 4545::/65
   Enabled : Yes
   Validlife time : 2592000
   Preferred lifetime : 604800
   On-link : Yes
   Autonomous : Yes
```

```
switch# show ipv6 nd interface prefix

List of IPv6 Interfaces for VRF default
List of IPv6 Prefix advertised on vlan2
   Prefix : 4545::/65
   Enabled : Yes
   Validlife time : 2592000
   Preferred lifetime : 604800
   On-link : Yes
   Autonomous : Yes
```

Showing information for VRF red:

```
switch# show ipv6 nd interface prefix vrf red

List of IPv6 Interfaces for VRF red
List of IPv6 Prefix advertised on 1/1/2
   Prefix : 2001::/64
   Enabled : Yes
   Validlife time : 2592000
   Preferred lifetime : 604800
   On-link : Yes
   Autonomous : Yes
```

```
switch# show ipv6 nd interface prefix vrf red

List of IPv6 Interfaces for VRF red
List of IPv6 Prefix advertised on vlan3
   Prefix : 2001::/64
   Enabled : Yes
   Validlife time : 2592000
   Preferred lifetime : 604800
   On-link : Yes
   Autonomous : Yes
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

show ipv6 nd interface route

`show ipv6 nd interface route [all-vrfs | vrf <VRF-NAME>]`

Description

Displays route information of all interfaces in the default VRF.

Parameter	Description
`all-vrfs`	Displays information about interfaces in all VRFs.
`vrf <VRF-NAME>`	Displays information about interfaces in a particular VRF. Or, if **<VRF-NAME>** is not specified, displays information for the default VRF.

Examples

On the 6400 Switch Series, interface identification differs.

Showing routing information for interface **1/1/1** in the default VRF:

```
switch# show ipv6 nd interface route

List of IPv6 Interfaces for VRF default
List of IPv6 Routes advertised on 1/1/1
   Route : 1::/64
   Enabled : Yes
   Route lifetime : 200
   Route preference : high
```

Showing routing information for interface **1/1/1** in VRF red:

```
switch# show ipv6 nd interface route vrf red

List of IPv6 Interfaces for VRF red
List of IPv6 Routes advertised on 1/1/2
   Route : 2::/64
   Enabled : No
   Route lifetime : 1800
   Route preference : low
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

show ipv6 nd ra dns search-list

```
show ipv6 nd ra dns search-list [vsx-peer]
```

Description

Displays domain name information on all interfaces.

Parameter	Description
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 nd ra dns search-list test.com
switch# show ipv6 nd ra dns search-list
Recursive DNS Search List on: 1
     Suppress DNS Search List: Yes
     DNS Search 1: test.com    lifetime  1800
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

show ipv6 nd ra dns server

```
show ipv6 nd ra dns server [vsx-peer]
```

Description

Displays DNS server information on all interfaces.

Parameter	Description
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 nd ra dns server 2001::1
switch# show ipv6 nd ra dns server
Recursive DNS Server List on: 1
     Suppress DNS Server List: Yes
     DNS Server 1: 2001::1    lifetime 1800
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Chapter 60

IPv6 source lockdown commands

ipv6 source-binding

```
ipv6 source-binding <VLAN-ID> <IPV6-ADDR> <MAC-ADDR> <IFNAME>
no ipv6 source-binding <VLAN-ID> <IPV6-ADDR> <MAC-ADDR> <IFNAME>
```

Description

Adds static IPv6 client source binding information to the switch IPv6 binding database. Although DHCPv6 snooping is often used to dynamically populate the binding database, this command is available for manually adding entries to the switch IPv6 binding database.

Statically configured IPv6 binding information supersedes any dynamically collected binding information for the same client.

The no form of this command removes the specified binding that was statically configured with the **ipv6 source-binding** command. The no form has no effect on bindings that were dynamically configured with DHCPv6 snooping.

Parameter	Description
<VLAN-ID>	Specifies the ID of an existing VLAN on which the client is connected. Range: 1 to 4094.
<IPV6-ADDR>	Specifies the client IPv6 address.
<MAC-ADDR>	Specifies the client MAC address.
<IFNAME>	Specifies the interface on which the client is connected.

Examples

On the 6400 Switch Series, interface identification differs.

Adding a static IPv6 binding:

```
switch(config)# ipv6 source-binding 2 2000::2 00:12:11:44:55:12 1/1/28
```

Removing a IPv6 binding:

```
switch(config)# no ipv6 source-binding 2 2000::2 00:12:11:44:55:12 1/1/28
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

ipv6 source-lockdown

```
ipv6 source-lockdown
no ipv6 source-lockdown
```

Description

Enables IPv6 source lockdown for all VLANs on the selected interface (port).

The no form of this command disables IPv6 source lockdown for the selected interface (port).

This configuration will disable flow tracking statistics collection.

Examples

On the 6400 Switch Series, interface identification differs.

Enabling IPv6 source lockdown on interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 source-lockdown
```

Enabling IPv6 source lockdown on interface lag112:

```
switch(config)# interface lag112
switch(config-if)# ipv6 source-lockdown
```

Disabling IPv6 source lockdown on interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# no ipv6 source-lockdown
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Platforms	Command context	Authority
6300 6400	`config-if`	Administrators or local user group members with execution rights for this command.

ipv6 source-lockdown hardware retry

`ipv6 source-lockdown hardware retry <VLAN-ID> <IPV6-ADDR>`

Description

Retries the IPV6 source lockdown hardware programming for a client identified by VLAN and IPv6 address.

Parameter	Description
<VLAN-ID>	Specifies the ID of an existing VLAN on which the client is connected. Range: 1 to 4094.
<IPV6-ADDR>	Specifies the client IPv6 address.

Example

Configure IPv6 source lockdown hardware retry for the client on VLAN 1.

```
switch(config)# ipv6 source-lockdown hardware retry 1 2000::2
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

show ipv6 source-binding

```
show ipv6 source-binding [vsx-peer]
```

Description

Shows all IPv6 static source binding information irrespective of source lockdown configuration.

Parameter	Description
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

Showing all IPv6 source binding information:

```
              switch# show ipv6 source-binding

PORT            VLAN       MAC-ADDRESS        HW-STATUS  FROM      IPv6-ADDRESS

--------------- ---------  -----------------  ---------  --------- -------------
1/1/1           1234        00:50:56:96:e4:cf  Yes/No     static    3000::1

1/1/1           1           00:50:56:96:04:4d  Yes/No     static    3000::2
1/1/24          1           00:01:01:00:00:01  Yes        static    1001::1
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

show ipv6 source-lockdown

```
show ipv6 source-lockdown [binding [interface <IFNAME> | ip <IPV6-ADDR> | mac <MAC-ADDR>
| vlan <VLAN-ID>] | interface <IFNAME>] [vsx-peer]
```

Description

Shows summary or detailed IPv6 source lockdown information. When entered without parameters, summary status information for all interfaces (ports) in the binding database is shown.

Parameter	Description
`binding`	Specifies that detailed lockdown binding record information is to be displayed. The binding database record can be identified by any one of **interface** (port), **ip**, **mac**, or **vlan**.
`interface <IFNAME>`	Specifies the client interface (port). When entered without the **binding** parameter, the summary status information is displayed for the specified interface.
`ip <IPV6-ADDR>`	Specifies the client IPv6 address.
`mac <MAC-ADDR>`	Specifies the client MAC address.
`vlan <VLAN-ID>`	Specifies the ID of an existing VLAN on which the client is connected. Range: 1 to 4094.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

Showing the summary status information for all interfaces in the binding database:

```
switch# show ipv6 source-lockdown

  INTERFACE  LOCKDOWN  HW-STATUS
  ---------  --------  ---------
  1/1/1      Yes       Yes
  1/1/2      Yes       Yes
  lag112     Yes       Yes
```

Showing the summary status information for the specified interface in the binding database:

```
switch# show ipv6 source-lockdown interface 1/1/2

  INTERFACE  LOCKDOWN  HW-STATUS
  ---------  --------  ---------
  1/1/2      Yes       No
```

Showing the detailed binding record and related information for all interfaces in the binding database:

```
switch# show ipv6 source-lockdown binding

 Interface Name        : 1/1/1
 VLAN Id               : 1234
 MAC Address           : 00:50:56:96:e4:cf
 IP Address            : aaaa:bbbb:cccc:dddd:eeee:1234
 Time Remaining        : static
 Lockdown Status       : Yes
 Hardware Status       : Yes

Chapter 61
IRDP commands

diag-dump irdp basic

`diag-dump irdp basic`

Description

Displays diagnostic information for IRDP.

Example

On the 6400 Switch Series, interface identification differs.

```
switch# diag-dump irdp basic
=========================================================================
[Start] Feature irdp Time : Thu Jun  8 09:50:28 2017

=========================================================================
-------------------------------------------------------------------------
[Start] Daemon hpe-rdiscd
-------------------------------------------------------------------------
Interface: 1/1/1 (state : Up)
rdisc ipv4 (enabled: 0, max:600, min:450, hold:1800, pref:0, isBcast:0)
Router IPs - 192.168.1.2,
Interface: 1/1/2 (state : Up)
rdisc ipv4 (enabled: 0, max:600, min:450, hold:1800, pref:0, isBcast:0)
Router IPs - 192.168.2.2,

-------------------------------------------------------------------------
[End] Daemon hpe-rdiscd
-------------------------------------------------------------------------
=========================================================================
[End] Feature irdp
=========================================================================
Diagnostic dump captured for feature irdp
```

```
switch# diag-dump irdp basic
=========================================================================
[Start] Feature irdp Time : Thu Jan  7 04:46:25 2021
=========================================================================
-------------------------------------------------------------------------
[Start] Daemon hpe-rdiscd
-------------------------------------------------------------------------
Interface: vlan2 (state : Down)
rdisc ipv4 (enabled: 1, max:600, min:450, hold:1800, pref:0, isBcast:0)
No advertisable IPv4 addresses on the interface
Interface: vlan1 (state : Down)
rdisc ipv4 (enabled: 0, max:600, min:450, hold:1800, pref:0, isBcast:0)
No advertisable IPv4 addresses on the interface

-------------------------------------------------------------------------
```

```
[End] Daemon hpe-rdiscd
-------------------------------------------------------------------------
=========================================================================
[End] Feature irdp
=========================================================================

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

ip irdp

```
ip irdp [broadcast | multicast]
no ip irdp
```

Description

Enables IRDP on an interface and specifies the packet type that is used to send advertisements. By default, the packet type is set to `multicast`. IRDP is only supported on layer 3 interfaces.

The **no** form of this command disables IRDP on an interface.

Parameter	Description
`broadcast`	Advertisements are sent as broadcast packets to IP address 255.255.255.255.
`multicast`	Advertisements are sent as multicast packets to the multicast group with IP address 24.0.0.1. Default.

Examples

On the 6400 Switch Series, interface identification differs.

Enabling IRDP on interface 1/1/1 with packet type set to the default value (multicast).

```
switch(config)# interface 1/1/1
switch(config-if)# ip irdp
```

Enabling IRDP on interface 1/1/1 with packet type set to broadcast.

```
switch(config)# interface 1/1/1
switch(config-if)# ip irdp broadcast
```

Disabling IRDP.

```
switch(config)# interface 1/1/1
switch(config-if)# no ip irdp
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

All platforms	`config-if`	Administrators or local user group members with execution rights for this command.

ip irdp holdtime

```
ip irdp holdtime <TIME>
no ip irdp holdtime <TIME>
```

Description

Specifies the maximum amount of time the host will consider an advertisement to be valid until a newer advertisement arrives. When a new advertisement arrives, hold time is reset. Hold time must be greater than or equal to the maximum advertisement interval. Therefore, if the hold time for an advertisement expires, the host can reasonably conclude that the router interface that sent the advertisement is no longer available. The default hold time is three times the maximum advertisement interval.

The **no** form of this command removes the specified maximum amount of time the host will consider an advertisement to be valid until a newer advertisement arrives and update it to the default value.

Parameter	Description
<TIME>	Specifies the lifetime of router advertisements sent from this interface. Range: 4 to 9000 seconds. Default: 1800 seconds.

Example

On the 6400 Switch Series, interface identification differs.

Setting the hold time for interface 1/1/1 to 5000 seconds:

```
switch(config)# interface 1/1/1
switch(config-if)# ip irdp holdtime 5000
```

Removing the the hold time for interface 1/1/1 to 5000 seconds:

```
switch(config)# interface 1/1/1
switch(config-if)# no ip irdp holdtime 5000
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

All platforms	`config-if`	Administrators or local user group members with execution rights for this command.

ip irdp maxadvertinterval

```
ip irdp maxadvertinterval <TIME>
no ip irdp maxadvertinterval <TIME>
```

Description

Specifies the maximum router advertisement interval.

The **no** form of this command removes the specified maximum router advertisement interval and reverts to the default value.

Parameter	Description
<TIME>	Specifies the maximum time allowed between the sending of unsolicited router advertisements. Range: 4 to 1800 seconds. Default: 600 seconds.

Example

On the 6400 Switch Series, interface identification differs.

Setting the advertisement interval for interface 1/1/1 to 30 seconds:

```
switch(config)# interface 1/1/1
switch(config-if)# ip irdp maxadvertinterval 30
```

Removing the advertisement interval for interface 1/1/1 to 30 seconds:

```
switch(config)# interface 1/1/1
switch(config-if)# no ip irdp maxadvertinterval 30
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

All platforms	`config-if`	Administrators or local user group members with execution rights for this command.

ip irdp minadvertinterval

```
ip irdp minadvertinterval <TIME>
no ip irdp minadvertinterval <TIME>
```

Description

Specifies the minimum amount of time the switch waits between sending router advertisements. By default, this value is automatically set by the switch to be 75% of the value configured for maximum router advertisement interval. Use this command to override the automatically configured value.

The **no** form of this command removes the specified minimum amount of time the switch waits between sending router advertisements and reverts to the default value.

Parameter	Description
<TIME>	Specifies the minimum time allowed between the sending of unsolicited router advertisements. Range: 3 to 1800 seconds. Default: 450 seconds (75% of the default value for maximum router advertisement interval).

Example

On the 6400 Switch Series, interface identification differs.

Setting the minimum advertisement interval for interface 1/1/1 to 25 seconds:

```
switch(config)# interface 1/1/1
switch(config-if)# ip irdp minadvertinterval 25
```

Removing the minimum advertisement interval for interface 1/1/1 to 25 seconds:

```
switch(config)# interface 1/1/1
switch(config-if)# no ip irdp minadvertinterval 25
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

ip irdp preference

```
ip irdp preference <LEVEL>
no ip irdp preference <LEVEL>
```

Description

Specifies the IRDP preference level. If a host receives multiple router advertisement messages from different routers, the host selects the router that sent the message with the highest preference as the default gateway.

The **no** form of this command removes the specified IRDP preference level and reverts to the default value.

Parameter	Description
<LEVEL>	Specifies the IRDP preference level. Range: -2147483648 to 2147483647. Default: 0.

Example

On the 6400 Switch Series, interface identification differs.

Setting the IRDP preference level for interface 1/1/1 to 25.

```
switch(config)# interface 1/1/1
switch(config-if)# ip irdp preference 25
```

Removing the IRDP preference level for interface 1/1/1 to 25.

```
switch(config)# interface 1/1/1
switch(config-if)# no ip irdp preference 25
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

All platforms	`config-if`	Administrators or local user group members with execution rights for this command.

show ip irdp

`show ip irdp [vsx-peer]`

Description

Displays IRDP configuration settings.

Parameter	Description
`<location>`	Specifies one of these values: ■ *`<FQDN>`*: a fully qualified domain name. ■ *`<IPV4>`*: an IPv4 address. ■ *`<IPV6>`*: an IPv6 address.

`vsx-peer`
Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

On the 6400 Switch Series, interface identification differs.

```
switch# show ip irdp

ICMP Router Discovery Protocol

 Interface Status   Advertising Minimum  Maximum  Holdtime Preference
                    Address     Interval Interval
 --------- -------- ----------- -------- -------- -------- -----------
 1/1/1     Enabled  multicast   6        8        10       10
 1/1/2     Disabled multicast   450      600      1800     0
 1/1/3     Enabled  broadcast   450      600      1800     115
```

```
switch# sh ip irdp
```

```
ICMP Router Discovery Protocol

Interface        Status   Advertising Minimum  Maximum  Holdtime Preference
                          Address     Interval Interval

Chapter 62
IVRF commands

address-family

```
address-family [<AFI> | <SAFI>] [ip | ipv6] [unicast]
[no] address-family <AFI> | <SAFI>
```

Description

Initializes the appropriate address-family and enters address-family configuration mode for IPv4 or IPv6. The unicast option is available to configure the subaddress family identifier.

The **no** form of the command removes the association of the specified address-family. The address-family specific routes that are leaked from this VRF will be withdrawn.

Parameter	Description
`AFI`	Required: Specifies address family identifier.
`SAFI`	Required: Specifies subaddress family identifier.
`ip`	Optional: IPv4 address family
`ipv6`	Optional: IPv6 address family
`unicast`	The subaddress family identifier. When the **unicast** option is used, the command context changes to **config-vrf-af-ipv4-uc**.

Examples

Address family command for IPv4 unicast:

```
switch(config-vrf)# address-family ipv4 unicast
switch(config-vrf)#no address-family ipv4 unicast
```

Address family command for IPv6 unicast:

```
switch(config-vrf)# address-family ipv6 unicast
switch(config-vrf)#no address-family ipv6 unicast
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

Release	Modification
10.14	The **ipv4** keyword is deprecated and replaced with **ip**.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-vrf`	Administrators or local user group members with execution rights for this command.

ip|ipv6 vrf

```
[ip|ipv6] route <PREFIX> <SRC-VRF-LOCAL-IFACE><SRC-VRF-NEXTHOP-IP> vrf <DST-VRF-NAME>
no [ip|ipv6] route <PREFIX> <SRC-VRF-LOCAL-IFACE><SRC-VRF-NEXTHOP-IP> vrf <DST-VRF-NAME>
```

Description

The IP/IPv6 route command sets the subnet mask, the reachable network interface, the next-hop IP for the reachable network, and the VRF route leak destination.

Parameter	Description
<PREFIX>	The subnet mask (prefix of the network).
<SRC-VRF-LOCAL-IFACE>	The interface which is reachable by the network.
<SRC-VRF-NEXTHOP-IP>	The next-hop IP for the reachable network.
<DST-VRF-NAME>	The VRF route leak destination.

Examples

Using the command, leak the named route Blue VRF, using prefix 100.0.0.0/24 which is reachable by the next-hop IP 20.0.0.1 on the interface 1/1/1 from VRF Red:

```
switch(config)# ip route 100.0.0.0/24 1/1/1 20.0.0.1 vrf blue
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

ipv6 route source interface

```
ipv6 route <IPv6 ADDR/MEMBER><IPv6 ADDR> source  <INTERFACE>
 [<DISTANCE> | <VRF INSTANCE-NAME>]
no ipv6 route
```

Description

Creates a route leak between the source VRF and destination VRF. Using the static method, the route must first be added to the destination VRF. The route is added to the local interface of the source VRF with a next-hop interface. The existing IPv6 route command takes the source interface only when next-hop IP is link-local. To support VRF route leaking for global IPv6 unicast addresses, the command takes next-hop interface information along with next-hop IP regardless of next-hop IP is link-local or not.

- Users must provide both the next-hop IP and the interface information to leak the global unicast IPv6 network routes (route that is not directly reachable).
- The next-hop IP information is not required to leak connected global unicast IPv6 routes (route that is directly reachable).

The **no** form of command deletes the static VRF leaked route.

Parameter	Description
`<IPv6 ADDR/MEMBER>`	Required: IPv6 IP-Address route destination.
`<IPv6 ADDR>`	Required: IPv6 route destination
`<INTERFACE>`	Required: The outgoing interface. Use the format `member/slot/port` (for example, `1/3/1`).
`<DISTANCE>`	Optional: administrative distance of static route
`<VRF INSTANCE-NAME>`	Optional: VRF instance

Options

```
nullroute
```

Discard packets to the destined route silently.

```
reject
```

Discard packets to the destined route and return ICMP error to the sender.

Examples

Configures a route leak between the source VRF and destination VRF:

```
switch(config)# show runn
Current configuration:
!
```

```
vrf blue
      vrf green
vrf red
      !

vlan 1
               interface 1/1/1
               no shutdown
                      vrf attach red
        ip address 2000::1/64
                      interface 1/1/2
                      no shutdown
                      vrf attach green
               ip address 3000::1/64
               interface 1/1/3
                      no shutdown
               vrf attach blue
               ip address 4000::1/64

      switch(config)# ipv6 route 5000::0/64 3000::2 source 1/1/2 vrf red
switch(config)# ipv6 route 6000::0/64 3000::3 source 1/1/2 vrf blue

      switch(config)# show runn
Current configuration:

ip route interface

```
ip route <IPv4 ADDR/MEMBER> interface <IPv4 ADDR>
 [<DISTANCE> | <VRF INSTANCE-NAME>]
no ip route
```

Description

Creates a route leak between the SRC-VRF and DST-VRF. Using the static method, the route must first be added to the destination VRF. The route is added to the local interface of the source VRF with a next-hop interface. The existing IP route command can then take either the next-hop IP or the next-hop interface.

- **INTERFACE** refers to the outgoing interface in an m/s/p format
- Users must provide both the next-hop IP and the interface information to leak network routes.
- The next-hop IP information is not required to leak connected routes.

The `[no]` form of command deletes the static VRF leaked route.

Parameter	Description
<IPv4 ADDR/MEMBER>	Required: IPv4 IP-Address route destination.

Parameter	Description
<IPv4 ADDR>	Required: IPv4 route destination
<DISTANCE>	Optional: administrative distance of static route
<VRF INSTANCE-NAME>	Optional: VRF instance

Options

nullroute

Discard packets to the destined route silently.

reject

Discard packets to the destined route and return ICMP error to the sender.

Example

Configures a route leak between the SRC-VRF and DST-VRF:

```
switch(config)# show runn
Current configuration:
!
vrf blue
      vrf green
vrf red
      !

vlan 1

6300 6400	`config`	Administrators or local user group members with execution rights for this command.

rd

```
rd <AS-NUMBER:NN>
no rd <AS-NUMBER:NN>
```

Description

Configures VRF table with specified route-distinguisher value. An RD ensures uniqueness of a route between multiple VRFs.

The **no** form of the command will delete RD from a specified VRF table. The VRF instance goes down when RD is deleted. All routes that are exported or leaked from the deleted VRF will be withdrawn.

Parameter	Description
<AS-NUMBER:NN>	Required: Enter an AS number and an arbitrary number.

Examples

Configures VRF for RD with an AS number 100:1.

```
switch(config-vrf)# rd 100:1
```

Deletes the RD from the specified VRF.

```
switch(config-vrf)# no rd
```

Deletes the RD and AS number from the specified VRF.

```
switch(config-vrf)# no rd 100:1
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

redistribute

```
redistribute <protocol> [route-map <route-map-name>]
[no] redistribute <protocol> [route-map <route-map-name>]
```

Description

Specifies the protocol routes to redistribute to BGP VRF context. Any routes existing in the BGP VRF context are leaked as a VPNv4 or VPNv6 prefixes to other VRFs based on BGP route-targets.

The **no** form of this command removes the protocol.

Parameter	Description
`redistribute`	Required: redistributes routes from another routing protocol.
`connected`	Optional: redistribute directly attached networks.
`ospfv3`	Optional: redistributes OSPFv3 routes.
`static`	Optional: redistributes static routes.
`route-map`	Optional: applies route map policy for redistribution.

Examples

The following is an example of redistributing OSPFv2 routes to a BGP **`vrf cust_a`** instance by creating a router BGP instance for **cust_a**.

1. Creating the router BGP instance for **cust_a**.

```
switch(config)# router bgp 1
switch(config-router) # vrf cust_a
```

2. Redistributing the router to BGP.

```
switch(config-router-bgp)# redistribute ospf
```

The following is an example of redistributing OSPFv3 routes to a BGP `vrf cust_a` instance by creating a router BGP instance for `cust_a`.

1. Creating the router BGP instance for **`cust_a`**

```
switch(config)# router bgp 100
switch(config-router)# vrf cust_a
```

2. Configuring the address family IPv6 unicast to the router

```
switch(config-router-bgp)# address-family ipv6 unicast
```

3. Redistributing the router to OSPFv3

```
switch(config-router-ipv6-uc)# redistribute ospfv3
```

4. Redistributing the router configured with `ipv6-af-us` to OSPFv3

```
switch(config-router-bgp-vrf-ipv6-af-uc)# redistribute ospfv3
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

route-target

```
route-target [import | export | both] <AS-NUMBER:NN>
no route-target [import | export | both] <AS-NUMBER:NN>
```

Description

BGP route targets are extended BGP communities that identify the VPNv4 or VPNv6 routes that are associated with a VRF. This command specifies the route targets used on the import or export of the routes to other VRFs. Multiple route targets can be associated with a VRF.

The **no** form of the command removes the association.

Parameter	Description
`import`	Specifies the RTs imported to the VRF. Import or export or both required Literal Specifies the route-target type.
`export`	Specifies the RT on VPNv4 or VPNv6 prefixes that are leaked to other VRFs.

Parameter	Description
both	Specifies the RT for both export and import types.
<AS-NUMBER:NN>	Specifies an AS number and an arbitrary number for the RT value.

Examples

Configuring route targets for several VRFs.

```
switch(config)# vrf default
switch(config-vrf)# rd 192.168.2.1:0
switch(config-vrf)# address-family ipv4 unicast
switch(config-vrf-ipv4-af-uc)# route-target export 65001:0
switch(config-vrf-ipv4-af-uc)# route-target import 65001:1
switch(config-vrf-ipv4-af-uc)# route-target import 65001:2
switch(config-vrf-ipv4-af-uc)# exit-address-family
switch(config-vrf)# exit
switch(config)# vrf VRF1
switch(config-vrf)# rd 192.168.2.1:1
switch(config-vrf)# address-family ipv4 unicast
switch(config-vrf-ipv4-af-uc)# route-target export 65001:1
switch(config-vrf-ipv4-af-uc)# route-target import 65001:0
switch(config-vrf-ipv4-af-uc)# exit-address-family
switch(config-vrf)# exit
switch(config)# vrf VRF2
switch(config-vrf)# rd 192.168.2.1:2
switch(config-vrf)# address-family ipv4 unicast
switch(config-vrf-ipv4-af-uc)# route-target export 65001:2
switch(config-vrf-ipv4-af-uc)# route-target import 65001:0
switch(config-vrf-ipv4-af-uc)# exit-address-family
switch(config-vrf)# exit
```

Configuring the route target for export. Removing the configuration for export.

```
switch(config-vrf-ipv4-af-uc)# route-target export 100:1
switch(config-vrf-ipv4-af-uc)# no route-target export 100:1
```

Configuring the route target for import. Removing the configuration for import.

```
switch(config-vrf-ipv4-af-uc)# route-target import 100:2
switch(config-vrf-ipv4-af-uc)# no route-target import 100:2
```

Configuring the route target for both import and export. Removing the configuration for import and export.

```
switch(config-vrf-ipv4-af-uc)# route-target both 100:3
switch(config-vrf-ipv4-af-uc)# no route-target both 100:3
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	Manager (#)	Administrators or local user group members with execution rights for this command.

route-target export

```
route-target export route-map <ROUTE-MAP-NAME>
no route-target export route-map <ROUTE-MAP-NAME>
```

Description

This command specifies the route-map to be used while exporting routes to VRF. Route target export route-map is configured to filter the routes those are leaked to VRF.

The **no** form of the command removes the specification.

Parameter	Description
route-map	Specifies route-map policy for export.
<ROUTE-MAP-NAME>	Specifies route-map policy name

VPNv4 SAFI is not supported.

Examples

Configuring route-map for route target export in IPv4:

```
switch(config)# vrf cust_a
switch(config-vrf)# address-family ipv4 unicast
switch(config-vrf-ipv4-af-uc)# route-target export route-map rmap
```

Removing the configuration for export in IPv4:

```
switch(config)# vrf cust_a
switch(config-vrf)# address-family ipv4 unicast
switch(config-vrf-ipv4-af-uc)# no route-target export route-map rmap
```

Configuring route-map for route target export in IPv6:

```
switch(config)# vrf cust_a
switch(config-vrf)# address-family ipv6 unicast
switch(config-vrf-ipv6-af-uc)# route-target export route-map rmap
```

Removing the configuration for export in IPv6:

```
switch(config)# vrf cust_a
switch(config-vrf)# address-family ipv6 unicast
switch(config-vrf-ipv6-af-uc)# no route-target export route-map rmap
```

Match prefix-list and set metric is only supported for route-target export route-map:

```
route-map rmap permit seq 1
       match ip address prefix-list prefx
       set metric 400
ip prefix-list seq 1 permit 14.1.1.0/24
```

Applies to both IPv4 and IPv6 address family only.

Only one route-target export route-map per VRF can be configured.

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

Release	Modification
10.12.1000	Command introduced.

Command Information

Platforms	Command context	Authority
6300 6400	`config-vrf`	Administrators or local user group members with execution rights for this command.

router bgp

```
router bgp <AS-NUMBER>
no router bgp <AS-NUMBER>
```

Description

This command configures the BGP instance on the router, configures the AS (Autonomous System) the router belongs to, and enters into the BGP router configuration mode. Only a single BGP AS number can be assigned for the entire system.

The **no** form of the command deletes the BGP instance from the router.

Parameter	Description
AS-NUMBER	Specifies a 4-byte AS number in the range 1-4294967295 in integer format or from 0.1-65535.65535 in dotted format.

Examples

Configuring the BGP instance with the AS number:

Deleting BGP configurations:

```
switch(config)# no router bgp 100
This will delete all BGP configurations on this device.
Continue (y/n)?
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

router bgp vrf

```
router bgp <AS-NUMBER> [vrf <VRF-NAME>]
[no] router bgp <AS-NUMBER> [vrf <VRF-NAME>]
```

Description

This command configures VRF for the BGP instance.

The **no** form of this command removes the configuration.

Parameter	Description
AS-NUMBER	Specifies a 4-byte AS number in the range 1-4294967295 in integer format or from 0.1-65535.65535 in dotted format.
<VRF-NAME>	String VRF name for the VRF.

Usage

- Use the command **vrf *vrf-name*** within the router BGP context.
- **address-family {ipv4 | ipv6}** nodes are only supported within the VRF context.
- **address-family {ipv4 | ipv6}** nodes are required to redistribute the OSPF static/connected IPv4 or IPv6 routes.

Examples

Configure the VRF for customer A, on the BGP instance 100:

```
switch(config)# router bgp 100
switch(config)# vrf cust_a
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

show bgp vpn unicast

```
show bgp [vrf <VRF-NAME>][{ipv4 unicast | ipv6 unicast| ipv4 unicast| all unicast}] [vsx-peer]
```

Description

Shows the BGP-VPN per VRF routes with additional route information like RD and extended community route targets.

Displays the BGP neighbor information for the specified VRF.

By default the default_vrf BGP instance information is displayed if the VRF is not specified.

Parameter	Description
`unicast`	Selects the subaddress family identifier
`all`	Displays VPNv4 address family routes for all VRFs
`vrf`	Displays VPNv4 address-family routes for specified VRF
`vpn-addr-family`	Required: Literal Select the VPNv4 or VPNv6 address family
`vrf-name`	Required: Literal or string. Specify **all** or **vrf-name**.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Required use of *vpn-addr-family*:

```
switch# show bgp <vpn-addr-family> unicast {all | [vrf <vrf-name> | A.B.C.D/M}
```

Show BGP VRF ipv4 unicast routes for vrf-name

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show bgp info vrf

```
show bgp info vrf <vrf-name> [vsx-peer]
```

Description

Displays BGP route-targets information for specified VRF.

Parameter	Description
`info`	Display BGP RT information.
`vrf-name`	Required string VRF name for the vrf.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Show BGP VRF information.

```
switch# show bgp info vrf red
 VRF : red
        VRF RD : 100:1

        Address-family IPv4 unicast info
        Redistribution : ospf
        Export RT list : 100:1 100:2
        Import RT list : 100:3
```

```
       Address-family IPv6 unicast info
       Redistribution : connected
 Export RT list : 100:11 100:12
 Import RT list : 100:15
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

show ip route vrf

`show ip route vrf <vrf-name> [vsx-peer]`

Description

Shows route information for specified VRF.

Parameter	Description
vrf-name	Required: string VRF name for the VRF.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

```
switch# show ip route vrf green

       Displaying ipv4 routes selected for forwarding
        '[x/y]' denotes [distance/metric]
               10.0.0.0/24, vrf green
                via 20.0.0.1[vrf red], [1/0], static
                30.0.0.0/24, vrf green
                via 1/1/2, [0/0], connected
   30.0.0.2/32, vrf green
                via 1/1/2, [0/0], local
                60.0.0.0/24, vrf green
                via 1/1/1[vrf red], [1/0], static
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show ipv6 route vrf

`show ipv6 route vrf <VRF-NAME> [vsx-peer]`

Description

Shows the route information for specified VRF.

Parameter	Description
<VRF-NAME>	Required: String VRF name for the VRF.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Displaying ipv6 routes selected for forwarding:

```
switch# show ipv6 route vrf red
  '[x/y]' denotes [distance/metric]
                1000::/64, vrf red
                via 1/1/1[vrf green], [0/0], connected
                1000::1/128, vrf red
                via 1/1/1[vrf green], [0/0], local
                3005::/64, vrf red
                via 1000::2[vrf green], [2/0], static
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

vrf

```
vrf <VRF-NAME>
no vrf <VRF-NAME>
```

Description

Creates a VRF instance named <*VRF-NAME*> and then enters its context. Use **default** for <*VRF-NAME*> to enter the default VRF configure context.

Except for the default VRF, the **no** form of the command deletes the named VRF instance and any IP configuration for interfaces or SVI linked to default VRF. The default VRF cannot be deleted and a warning is given if attempted. To erase the Route-Distinguisher and Route-Targets, enter the default VRF context and delete them manually one by one.

Parameter	Description
<VRF-NAME>	Specifies the VRF name. Range: Up to 32 alphanumeric characters. The **mgmt** VRF cannot be used.

Examples

Creating the VRF named **cust_A** and then entering its context:

```
switch(config)# vrf cust_A
```

Entering the **default** VRF context:

```
switch(config)# vrf default
```

Deleting the VRF named **test**:

```
switch(config)# no vrf test
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Chapter 63

Job Scheduler commands

job

In the config context:

```
job <JOB-NAME>
no job [<JOB-NAME>]
```

Subcommands available In the job config context (`config-job`):

```
[no] enable
[no] desc <DESCRIPTION>
[no] [<SEQ-NUM>] [delay <DELAY>] cli <COMMAND>
resequence <START-SEQ-NUM> <INCREMENT>
```

Description

If **<*JOB-NAME*>** does not exist, this command creates a job and then enters its context.

The no form of this command deletes the specified job. If no job is specified, all jobs are deleted.

Deleting a job also removes it from any schedule that uses the job, preventing further attempts to execute the job.

If **<*JOB-NAME*>** exists, this command enters the **config-job-<*NAME*>** context for the specified job.

Parameter	Description
<JOB-NAME>	Specifies the job name. Range 1 to 64 characters (alphanumeric and "_" (underscore)

Subcommands

These subcommands are available within the **config-job-<*NAME*>** context for configuring the job:

`enable`

Enables the job (the default). **no enable** disables the job.

`[no] desc <DESCRIPTION>`

Specifies a user-defined job description. **no desc** removes the description. Range: 1 to 128 characters. For example:

```
switch(config-job-PTog1)# desc Toggle port 1/1/1
```

`[no] [<SEQ-NUM>] [delay <DELAY>] cli <COMMAND>`

Adds a CLI command to the job. The no form removes the command from the job. When executed, commands with simple (y/n) prompts (such as **boot system**) will be automatically confirmed with "y." Other commands requiring more complex user input (such as password change) cannot be used.

<SEQ-NUM> specifies the job CLI command sequence number to facilitate ordering of commands within a job. When omitted, a sequence number that is 10 greater the highest existing sequence number is auto-assigned. The first auto-assigned sequence number is 10. Range: 1 to 4294967295.

[delay <*DELAY*>] specifies the delay in seconds before this CLI command is executed. The cumulative delay for all commands in a job must be no more than 300 seconds. Range 1 to 300.

cli <*COMMAND*> specifies the CLI command to be executed. Range 1 to 4096 characters.

These commands must not be used in a job: **copy**, **repeat**, **show boot-history**, **show core-dump**, **show events**, **show job**, **show tech**, **sleep**, **terminal-monitor**.

For example, adding a command as line 18 to a job:

```
switch(config-job-PTog1)# 18 cli interface 1/1/1
```

resequence *<START-SEQ-NUM> <INCREMENT>*

Resequences the CLI command line sequence numbers. Both **<START-SEQ-NUM>** and **<INCREMENT>** default to 10. For example, resequencing the CLI command list to start at 10 with an increment of 5.

```
switch(config-job-PTog1)# resequence 10 5
switch(config-job-PTog1)# show job PTog1

Job Name : PTog1
...
    Job CLI commands
    ----------------
    10 cli config
    15 cli interface 1/1/1
    20 cli shutdown
...
```

Usage

- A maximum of 20 commands can be used in a job.
- To see the maximum number of jobs and job execution output preserved instances for your particular switch, use command **show capacities job**.
- Jobs must complete execution in under five minutes and are force-stopped after five minutes if they do not.

Examples

Creating a port toggle job named **PTog1**:

```
switch(config)# job PTog1
switch(config-job-PTog1)# desc Toggle port 1/1/1
switch(config-job-PTog1)# 10 cli config
switch(config-job-PTog1)# 20 cli interface 1/1/1
switch(config-job-PTog1)# 30 cli shutdown
switch(config-job-PTog1)# 40 delay 10 cli no shutdown
switch(config-job-PTog1)# 50 cli end
switch(config-job-PTog1)# exit
switch(config)#
```

Creating a job named **Reboot_sw1** that saves the running configuration and then reboots the switch:

```
switch(config)# job Reboot_Sw1
switch(config-job-Reboot_sw1)# desc Save config then reboot switch
switch(config-job-Reboot_Sw1)# 10 cli config
switch(config-job-Reboot_Sw1)# 20 cli write mem
switch(config-job-Reboot_Sw1)# 30 cli boot system
switch(config-job-Reboot_Sw1)# exit
switch(config)#
```

For more information on features that use this command, refer to the Job Scheduler Guide for your switch model.

Command History

Release	Modification
10.08	Command introduced.

Command Information

Platforms	Command context	Authority

All platforms	`config`
	`config-job-<NAME>`
		Administrators or local user group members with execution rights for this command.

schedule

In the config context:

```
schedule <SCHEDULE-NAME> [transient]
no schedule [<SCHEDULE-NAME>]
```

Subcommands available In the schedule config context (`config-schedule`):

```
[no] enable
[no] desc <DESCRIPTION>
[no] [<SEQ-NUM>] job <JOB-NAME>
resequence <START-SEQ-NUM> <INCREMENT>
[no] trigger on HH:MM {daily | weekly <1-7> | monthly <1-31>}
     [count <1-1000>] [start YYYY-MM-DD]
[no] trigger every {days <1-365> | hours <1-8760> | minutes <30-525600>}
     [count <1-1000> ] [start HH:MM [YYYY-MM-DD]]
[no] trigger at HH:MM [YYYY-MM-DD]
```

Description

If ***<SCHEDULE-NAME>*** does not exist, this command creates a job schedule and then enters its context.

The **no** form of this command deletes the specified schedule. If no schedule is specified, all schedules are deleted.

If ***<SCHEDULE-NAME>*** exists, this command enters the **config-schedule-*<NAME>*** context for the specified job schedule.

Parameter	Description
<SCHEDULE-NAME>	Specifies the schedule name. Range 1 to 64 characters (alphanumeric and "_" (underscore)).
[transient]	Causes the schedule to be cleared upon switch reboot. By default, schedules are maintained after switch reboots.

Subcommands

These subcommands are available within the config-schedule-*<NAME>* context for scheduling jobs and controlling the order in which the jobs are executed:

enable

Enables the schedule (the default). no enable disables the schedule.

[no] desc *<DESCRIPTION>*

Specifies a user-defined schedule description. no desc removes the description. Range: 1 to 128 characters. For example:

```
switch(config-schedule-Monthly)# desc Monthly schedule
```

[no] [*<SEQ-NUM>*] job *<JOB-NAME>*

Associates an existing job with this schedule. The no form removes the job from the schedule.

<JOB-NAME> specifies an existing job name. Range: 1 to 64 characters (alphanumeric and "_" (underscore)).

<SEQ-NUM> specifies the job name sequence number to facilitate ordering of jobs within a schedule. When omitted, a sequence number that is 10 greater the highest existing sequence number is auto-assigned. The first auto-assigned sequence number is 10.

For example, associating two jobs with the selected schedule:

```
switch(config-schedule-Monthly)# 10 job PTog1
switch(config-schedule-Monthly)# 20 job PTog2
```

resequence *<START-SEQ-NUM>* *<INCREMENT>*

Resequences the job name sequence numbers in the schedule. Both <START-SEQ-NUM> and <INCREMENT> default to 10. For example, resequencing the job list to start at 5 with an increment of 10.

```
switch(config-schedule-Monthly)# resequence 5 10
switch(config-schedule-Monthly)# show schedule Monthly

Schedule Name: Monthly
...
    Scheduled Jobs
    --------------
    5    : PTog1
    15   : PTog2
```

[no] trigger on HH:MM {daily | weekly <1-7> | monthly <1-31>}
[count <1-1000>] [start YYYY-MM-DD]

Sets the job to trigger at a specific time. The no form removes the trigger.

HH:MM selects the time using a 24-hour clock (switch local time). Range: 00:00 to 23:59.

daily selects daily.

weekly <1-7> selects specific days of week or days-of-week ranges (with comma or hyphen separators) using numeric day-of-week numbers with Sunday equal 1. For example: `1,3,5-7` for Sunday, Tuesday, Thursday, Friday, Saturday.

monthly <1-31> selects specific days of month or days of month ranges (with comma or hyphen separators) using numeric day-of-month numbers. For example: `5,14-21,25,31`. For months with fewer days than the specified day number, the last day of the month is selected.

count <1-1000> selects the number of times the job will be executed. When omitted, job execution triggering is indefinite.

start YYYY-MM-DD selects the schedule first trigger date. When omitted, today's date is used for times at least 5 minutes into the future, otherwise tomorrow is selected as the first trigger date.

For example, setting the schedule to trigger monthly on the 15th, at 11:45 PM, starting on August 15, with an execution limit of 200:

```
switch(config-schedule-M)# trigger on 23:45 monthly 15 count 200 start 2021-08-15
```

**[no] trigger every {days <1-365> | hours <1-8760> | minutes <30-525600>}
[count <1-1000>] [start HH:MM [YYYY-MM-DD]]**

Sets the job trigger to a specific periodic interval. The no form removes the trigger. By default, the schedule is activated within 5 minutes from the configuration time. If the start time is specified, then the job is executed beginning at the specified start time and thereafter at the specified interval.

days <1-365> selects the interval in days. Range: 1 to 365.

hours <1-8760> selects the interval in minutes. Range: 1 to 8760.

minutes <30-525600> selects the interval in seconds. Range: 30 to 525600.

count <1-1000> selects the number of times the job will be executed. When omitted, job execution triggering is indefinite.

start HH:MM [YYYY-MM-DD] selects the schedule first trigger time and date.

For example, setting the schedule to trigger once every 14 days, starting on January 1, with an execution limit of 500:

```
switch(config-schedule-Ev14D)# trigger every days 14 count 500 start 2022-01-01
```

[no] trigger at HH:MM [YYYY-MM-DD]

Sets the job to trigger one time only on a specific date and time. When the date is omitted, today's date is used for times at least 5 minutes into the future, otherwise tomorrow is selected. The no form removes the trigger.

For example, setting the schedule to trigger once only on August 26 at midnight:

```
switch(config-schedule-Aug26)# trigger at 00:00 2021-08-26
```

Usage

- A job can be used only once per schedule.
- To see the maximum number of schedules and jobs per schedule for your particular switch, use command **show capacities schedule**.
- Configure the jobs to be executed (using the **job** command) before configuring a schedule.
- Jobs must complete execution in under five minutes and are force-stopped after five minutes if they do not.

- A job must be scheduled to execute at least five minutes after its previous execution. If the same job is scheduled to be executed again within less than five minutes, the execution is skipped.

Examples

Creating a schedule named **PT2xW** that runs the port toggle job **PTog1** on Mondays and Fridays at 11:45 PM, starting on August 2 2021, with a one-year duration:

```
switch(config)# schedule PT2xW
switch(config-schedule-PT2xW)# desc Monday & Friday 11:45 PM port toggles
switch(config-schedule-PT2xW)# 10 job PTog1
switch(config-schedule-PT2xW)# trigger on 23:45 weekly 2,6 count 104 start 2021-
08-02
switch(config-schedule-PT2xW)# exit
switch(config)#
```

Creating a schedule named **RB_LDM** that runs the switch reboot job on the last day of the month at 3:00 AM, starting on January 31 2022, with a two-year duration:

```
switch(config)# schedule RB_LDM
switch(config-schedule-RB_LDM)# desc Monthly reboot 3:00 AM
switch(config-schedule-RB_LDM)# 10 job Reboot_sw1
switch(config-schedule-RB_LDM)# trigger on 3:00 monthly 31 count 24 start 2022-01-
31
switch(config-schedule-RB_LDM)# exit
```

For more information on features that use this command, refer to the Job Scheduler Guide for your switch model.

Command History

Release	Modification
10.08	Command introduced.

Command Information

Platforms	Command context	Authority

All platforms	`config`
	`config-schedule-<NAME>`
		Administrators or local user group members with execution rights for this command.

show job

`show job [<JOB-NAME>] [execution-output <INSTANCE-ID>]`

Description

Shows information about a specific job or every job. Optionally shows the job execution output log.

Parameter	Description
<JOB-NAME>	Specifies an existing job name. When omitted, information is shown for every job. Range: 1 to 64 characters (alphanumeric and "_" (underscore)).
<INSTANCE-ID>	Selects the job execution output instance with 1 selecting the most recent. To see the maximum number of job execution output instances for your particular switch, use command **show capacities job**.

Usage

Job execution statistics such as execution counts are reset to zero upon switch reboot.

Examples

Showing port toggle job information before execution has occurred:

```
switch# show job PTog1

Job Name : PTog1

    Enabled                 : Yes
    Description             : Toggle port 1/1/1
    Status                  : waiting
    Number of commands      : 5
    Total execution count   : 0
    Failed execution count  : 0

    Job CLI commands
    ----------------
    10 cli config
    20 cli interface 1/1/1
    30 cli shutdown
    40 delay 10 cli no shutdown
    50 cli end
```

Showing port toggle job information after execution has occurred:

```
switch# show job PTog1

Job Name : PTog1

    Enabled                 : Yes
    Description             : Toggle port 1/1/1
    Status                  : waiting
    Number of commands      : 5
    Total execution count   : 1
    Failed execution count  : 0

    Job execution history
    ---------------------

    Instance number         : 1
    Execution status        : success
    Execution start time    : Mon Aug 2 23:45:00 2021
    Execution duration     : 10s

    Job CLI commands
    ----------------
    10 cli config
    20 cli interface 1/1/1
    30 cli shutdown
    40 delay 10 cli no shutdown
    50 cli end
```

Showing port toggle job most recent execution output:

```
switch# show job PTog1 execution-output 1
=================================================================================
Command: config
time: Mon Aug  2 23:45:00 2021
=================================================================================

=================================================================================
Command: interface 1/1/1
time: Mon Aug  2 23:45:00 2021
=================================================================================

=================================================================================
Command: shutdown
time: Mon Aug  2 23:45:00 2021
=================================================================================

=================================================================================
Command: cli no shutdown
time: Mon Aug  2 23:45:10 2021
=================================================================================

=================================================================================
Command: end
time: Mon Aug  2 23:45:10 2021
=================================================================================
```

show capacities (job, schedule)

```
show capacities {job | schedule}
```

Description

Shows either job or schedule capacities information for your switch model.

Examples

Showing job capacities information (8320 example shown):

```
switch# show capacities job

System Capacities: Filter Job
Capacities Name                                                              Value
-----------------------------------------------------------------------------------
Maximum number of job execution output preserved per job                        10
Maximum number of jobs configurable in a system                                 32
```

Showing schedule capacities information (8320 example shown):

```
switch# show capacities Schedule

System Capacities: Filter Schedule
Capacities Name                                                              Value
-----------------------------------------------------------------------------------
Maximum number of jobs configurable in a schedule                               10
Maximum number of schedules configurable in a system                            32
```

For more information on features that use this command, refer to the Job Scheduler Guide for your switch model.

Command History

Release	Modification
10.08	Command introduced.

Command Information

Platforms	Command context	Authority
All platforms	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show running-config (job, schedule)

```
show running-config [current-context]
```

Description

Shows the entire running configuration for the switch, including configuration details for the Job Scheduler job and schedule configuration.

Parameter	Description
`current-context`	When included from within the Job Scheduler job or schedule context, shows only the job or schedule configuration information for the selected job or schedule.

Examples

Showing the running configuration information for all jobs and schedules with unrelated configuration information omitted for clarity (omitted portions represented by ellipses("..."):

```
switch# show running-config

Current configuration:
...
!
job PTog1
    desc Toggle port 1/1/1
    10 cli config
    20 cli interface 1/1/1
    30 cli shutdown
    40 delay 10 cli no shutdown
    50 cli end
job Reboot_sw1
    desc Save config then reboot switch
    10 cli config
    20 cli write mem
    30 cli boot system
schedule PT2xW
    desc Monday & Friday 11:45 PM port toggles
    trigger on 23:45 weekly 2,6 count 104 start 2021-08-02
    10 job PTog1
schedule RB_LDM
    desc Monthly reboot 3:00 AM
    trigger on 3:00 monthly 31 count 24 start 2022-01-31
    10 job Reboot_sw1
...
```

From within the job **PTog1** context, showing the running configuration information for the job:

```
switch(config-job-PTog1)# show running-config current-context

Current configuration:
job PTog1
    desc Toggle port 1/1/1
    10 cli config
    20 cli interface 1/1/1
    30 cli shutdown
    40 delay 10 cli no shutdown
    50 cli end
```

From within the schedule **PT2xW** context, showing the running configuration information for the schedule:

```
switch(config-schedule-PT2xW)# show running-config current-context

Current configuration:
schedule PT2xW
    desc Monday & Friday 11:45 PM port toggles
    trigger on 23:45 weekly 2,6 count 104 start 2021-08-02
    10 job PTog1
```

For more information on features that use this command, refer to the Job Scheduler Guide for your switch model.

Command History

Release	Modification
10.08	Command introduced.

Command Information

Platforms	Command context	Authority

All platforms	Operator (>) or Manager (#)
	`config-job-<NAME>`
	`config-schedule-<NAME>`
		Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show schedule

`show schedule [<SCHEDULE-NAME>]`

Description

Shows information about a specific schedule or every schedule.

Parameter	Description
<SCHEDULE-NAME>	Specifies an existing job schedule name. When omitted, information is shown for every schedule. Range: 1 to 64 characters (alphanumeric and "_" (underscore)).

Usage

Schedule statistics such as **Triggered count** are reset to zero upon switch reboot.

Examples

Showing port toggle job schedule information before execution has occurred:

```
switch# show schedule PT2xW

Schedule Name: PT2xW
```

```
    Schedule config
    ---------------
    Description          : Monday & Friday 11:45 PM port toggles
    Enabled              : Yes
    Trigger type         : calendar
    Transient            : No
    Max trigger count    : 104
    Trigger start date   : 2021-08-02 23:45

    Schedule Status
    ---------------
    Trigger status       : active
    Next trigger time    : Mon Aug  2 23:45:00 2021

    Scheduled Jobs
    --------------
    10   : PTog1
```

Showing port toggle job schedule information after execution has occurred:

```
switch# show schedule PT2xW

Schedule Name: PT2xW

    Schedule config
    ---------------
    Description          : Monday & Friday 11:45 PM port toggles
    Enabled              : Yes
    Trigger type         : calendar
    Transient            : No
    Max trigger count    : 104
    Trigger start date   : 2021-08-02 23:45

    Schedule Status
    ---------------
    Trigger status       : active
    Next trigger time    : Fri Aug  6 23:45:00 2021
    Triggered count      : 1

    Scheduled Jobs
    --------------
    10   : PTog1
```

For more information on features that use this command, refer to the Job Scheduler Guide for your switch model.

Chapter 64

Key chain commands

accept-lifetime

```
accept-lifetime [start-time <time> <month>/<day>/<year>] {duration {<seconds> | infinite}
| end-time <time> <month>/<day>/<year>}
```

Description

Configures the duration for which the key is valid for receiving packets.

The **no** form of this command configures the key packet receiving duration to the default value of an infinite time.

Parameter	Description
`start-time`	Time at which the key chain lifetime starts. Required. Format: HH:MM:SS
`end-time`	Time at which the key chain lifetime expires. Required. Format: HH:MM:SS
`day`	Day of the month. Required. Range: 1-31.
`month`	Month of the year. Required.
`year`	Year. Required. Range: 2020-2050
`duration`	Time in seconds. Optional. Range: 1-2147483646.
`infinite`	Specifies infinite time for the key. Optional.

Examples

Configuring the duration for which the key is valid for receiving packets:

```
switch# configure terminal
switch(config)# keychain ospf_keys
switch(config-keychain)# key 1
switch(config-keychain-key)# accept-lifetime start-time 10:10:10 10/25/2020 end-
time 10:10:10 11/25/2020
switch(config-keychain-key)# accept-lifetime start-time 10:10:10 10/25/2020
duration 1000
switch(config-keychain-key)# accept-lifetime start-time 10:10:10 10/25/2020
duration infinite
switch(config-keychain-key)# accept-lifetime end-time 10:10:10 11/25/2020
switch(config-keychain-key)# accept-lifetime duration 1000
switch(config-keychain-key)# accept-lifetime duration infinite
```

Configuring the key packet receiving duration to the default value of an infinite time:

```
switch# configure terminal
switch(config)# keychain ospf_keys
switch(config-keychain)# key 1
switch(config-keychain-key)# no accept-lifetime
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config-keychain-key`	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

cryptographic-algorithm

```
recv-id cryptographic-algorithm {aes-cmac-128 |hmac-sha-1 | hmac-sha-256 | hmac-sha-384 |
hmac-sha-512 | md5}
no cryptographic-algorithm
```

Description

Configures the recv-id cryptographic algorithm for the key. The key will not be valid until the receive ID, the send ID, and send lifetime is configured for TCP-AO, Choose one of the authentication algorithms from the following parameters. The **no** form of this command configures the default cryptographic algorithm for a key, md5.

TCP Authentication Option (TCP-AO) authentication supports only the *aes-cmac-128* and *hmac-sha-1* algorithms. If you are configuring TCP-AO, you must select one of these options.

Parameter	Description
`aes-cmac-128`	Sets the authentication algorithm for the key to AES-CMAC-128. This parameter is only supported for TCP-AO.
`hmac-sha-1`	Sets the authentication algorithm for the key to SHA-1. This parameter is also supported for TCP-AO.
`hmac-sha-256`	Sets the authentication algorithm for the key to SHA-256.
`hmac-sha-384`	Sets the authentication algorithm for the key to SHA-384.
`hmac-sha-512`	Sets the authentication algorithm for the key to SHA-512.

Parameter	Description
md5	Sets the authentication algorithm for the key to md5. Maximum length of the key string supported: 16 bytes (**config**-if context), 64 bytes (**config-keychain-key context**).

Examples

Set the authentication algorithm for the key to **SHA-384**:

```
switch(config)# keychain ospf_keys
switch(config-keychain)# key 1
switch(config-keychain-key)# recv-id cryptographic-algorithm hmac-sha-384
```

Set the authentication algorithm to the default, **md5**:

```
switch(config)# keychain ospf_keys
switch(config-keychain)# key 1
switch(config-keychain-key)# no recv-id cryptographic-algorithm
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

Release	Modification
10.11	The **aes-cmac-128** parameter is introduced.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	config-keychain-key	Administrators or local user group members with execution rights for this command.

key

`key <KEY-ID>`

Description

Creates the key for a key chain and enters the key chain key context. A maximum of 64 keys can be configured per key chain.

The **no** form of this command deletes the key from the key chain.

Parameter	Description
<KEY-ID>	ID of the key. Required. Range: 1-255.

Examples

Creating a key for a key chain:

```
switch# configure terminal
switch(config)# keychain ospf_keys
switch(config-keychain)# key 1
```

Deleting a key from a key chain:

```
switch# configure terminal
switch(config)# keychain ospf_keys
switch(config-keychain)# no key 1
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config-keychain`	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

keychain

`keychain <KEYCHAIN-NAME>`

Description

Creates the key chain and enters the key chain context. A maximum of 64 key chains can be configured in the system.

The **no** form of this command removes the key chain if it is not used by any subscribers.

Parameter	Description
<KEYCHAIN-NAME>	Name of the key chain. Required.

Examples

Creating a key chain:

```
switch# configure terminal
switch(config)# keychain ospf_keys
```

Removing a key chain:

```
switch# configure terminal
switch(config)# keychain ospf_keys
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	config	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

key-string

`key-string [{ciphertext | plaintext} <PASSWORD>]`

Description

Sets the key password. The password is internally stored in encrypted form. The key is not valid until its password has been set.

The **no** form of this command deletes the password used for the key.

Parameter	Description
ciphertext	Specifies that the key password is provided as ciphertext.
plaintext	Specifies that the key password is provided as plaintext.
<PASSWORD>	Specifies the key password.

When the key password is not provided on the command line, plaintext password prompting occurs upon pressing Enter. The entered password characters are masked with asterisks.

Examples

Setting the key password with plaintext:

```
switch(config)# keychain ospf_keys
switch(config-keychain)# key 1
switch(config-keychain-key)# key-string plaintext F82#450bHP
```

Setting the key password with plaintext prompting:

```
switch(config)# keychain ospf_keys
switch(config-keychain)# key 1
switch(config-keychain-key)# key-string
Enter the key password: *************
Re-Enter the key password: *************
```

Setting the key password with ciphertext:

```
switch(config)# keychain ospf_keys
switch(config-keychain)# key 1
switch(config-keychain-key)# key-string ciphertext AQBpfciFZ/P...biAAAOjc0a8=
```

Deleting the password for the key:

```
switch(config)# keychain ospf_keys
switch(config-keychain)# key 1
switch(config-keychain-key)# no key-string
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config-keychain-key`	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

name

```
name <KEY-NAME>
no name <KEY-NAME>
```

Description

Configures a name for a numbered key in a key chain.

The **no** form of this command removes the name of the key.

Parameter	Description
<KEY-NAME>	Specifies the name of the key in alphanumeric characters. Range: 1-64.

Examples

Creating a name for a key in a key chain called **abcdef123456**:

```
switch# configure terminal
switch(config)# keychain macsec_keys
switch(config-keychain)# key 1
switch(config-keychain-key)# name abcdef123456
```

Removing the name of the key named **abcdef123456**:

```
switch# configure terminal
switch(config)# keychain macsec_keys
switch(config-keychain)# key 1
switch(config-keychain-key)# no name abcdef123456
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

Release	Modification
10.11	Command added.

Command Information

Platforms	Command context	Authority
All platforms	`config-keychain-key`	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

recv-id

`recv-id <0-255>`

Description

Configures the receive ID for a keychain key. The receive ID has to be unique across keys in the keychain.

The **no** form of this command configures removes the recv-id value. The receive ID can not be changed for an active key of a keychain which is associated with BGP neighbor.

Parameter	Description
`<0-255>`	Set the receive ID corresponding to the keychain key. Supported values are 0-255.

Examples

Configuring the receive ID for the keychain key.

```
switch# configure terminal
switch(config)# keychain ospf_keys
switch(config-keychain)# key 1
switch(config-keychain-key)# recv-id 1
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

send-lifetime

```
send-lifetime [start-time <time> <month>/<day>/<year>] {duration {<seconds> | infinite} |
end-time <time> <month>/<day>/<year>}
```

Description

Configures the duration for which the key is valid for sending packets.

The **no** form of this command configures the key packet sending duration to the default value of an infinite time.

Parameter	Description
`start-time`	Time at which the key chain lifetime starts. Required. Format: HH:MM:SS
`end-time`	Time at which the key chain lifetime expires. Required. Format: HH:MM:SS
`day`	Day of the month. Required. Range: 1-31.

Parameter	Description
`month`	Month of the year. Required.
`year`	Year. Required. Range: 2020-2050
`duration`	Time in seconds. Optional. Range: 1-2147483646.
`infinite`	Specifies infinite time for the key. Optional.

Examples

Configuring the duration for which the key is valid for sending packets:

```
switch# configure terminal
switch(config)# keychain ospf_keys
switch(config-keychain)# key 1
switch(config-keychain-key)# send-lifetime start-time 10:10:10 10/25/2020 end-time
10:10:10 11/25/2020
switch(config-keychain-key)# send-lifetime start-time 10:10:10 10/25/2020 duration
1000
switch(config-keychain-key)# send-lifetime start-time 10:10:10 10/25/2020 duration
infinite
switch(config-keychain-key)# send-lifetime end-time 10:10:10 11/25/2020
switch(config-keychain-key)# send-lifetime duration 1000
switch(config-keychain-key)# send-lifetime duration infinite
```

Configuring the key packet sending duration to the default value of an infinite time:

```
switch# configure terminal
switch(config)# keychain ospf_keys
switch(config-keychain)# key 1
switch(config-keychain-key)# no send-lifetime
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

show capacities keychain

`show capacities keychain`

Description

Shows the maximum number of key chains and keys configurable in a key chain.

Example

```
switch# show capacities keychain

System Capacities: Filter Keychain
Capacities Name
                   Value
```

```
----------------------------------------------------------------------------------
-------------------------
Maximum number of keychains supported in the system
                    64
Maximum number of Keys supported in a single Keychain
                    64
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

show keychain

`show keychain [<KEYCHAIN-NAME>]`

Description

Shows information about configured and active keys of a named key chain or (if **keychain-name** is not specified) all configured key chains.

Parameter	Description
<KEYCHAIN-NAME>	Name of the key chain. Optional.

Example

```
switch# show keychain
Keychain Name : macsec_keys
  Number of Keys      : 1
  Active Send Key ID  :
  Active Recv Key IDs :

  Key ID : 1
    Key name          : abcdef123456

Chapter 65

L1-100Mbps downshift commands

downshift enable

```
downshift-enable
no downshift-enable
```

Description

Enables/disables automatic speed downshift on an interface that supports downshift, generally 1GBASE-T ports. When enabled, downshift allows an interface to link at a lower advertised speed when unable to establish a stable link at the maximum speed. Downshifting only applies to physical interfaces that are not members of a LAG and is only available when auto-negotiation is enabled. When only one speed is advertised, downshift will not be triggered.

Examples

```
switch(config-if)# interface 1/1/1
switch(config-if)# downshift-enable

Warning: this is a non-standard mode for use only when standards-based
auto-negotiation is not able to establish a stable link. Enabling this
may cause the port to link at a lower than expected speed and should
not be used on ports that are members of a LAG. Support calls may require
this feature to be disabled

Continue (y/n)?

switch(config-if)#
```

When automatic downshift is enabled:

```
switch(config-if)# show running-config interface
interface 1/1/1
    downshift-enable
```

Disabling automatic speed downshift:

```
switch(config-if)# interface 1/1/1
switch(config-if)# no downshift-enable
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

Command History

Release	Modification

show interface

```
show interface [<IFNNAME>|<IFRANGE>] [brief | physical]
show interface [<IFNNAME>|<IFRANGE>] [extended [non-zero] | [human-readable]]
show interface [<IFNNAME>] monitor [human-readable]
show interface [lag | loopback | tunnel | vlan ] [<ID>] [brief]
show interface lag [<LAG-ID>] [extended [non-zero] | [human-readable]]
show interface lag [<LAG-ID>] monitor [human-readable]
```

Description

Shows active configurations and operational status information for interfaces.

Parameter	Description
<IFNAME>	Specifies a interface name.
<IFRANGE>	Specifies the port identifier range.
`brief`	Shows brief info in tabular format.
`physical`	Shows the physical connection info in tabular format.
`extended`	Shows additional statistics, including the **tx filtered** and **rx filtered** counters. ■ Rx filter packets are protocol packets received when the protocol is disabled on the switch and there is only one port in the VLAN. Protocols include OSPF, PIM, RIP, LACP, and LLDP. ■ An example of a Tx filtered packet would be a multicast packet being filtered from going out of the ingress port.
`human-readable`	Shows statistics rounded to the nearest power of 1000, for example, 1K, 345M, 2G. This is available only in the CLI interface output.
`non-zero`	Shows only non zero statistics.
`LAG`	Shows LAG interface information.
`monitor`	Continuously monitor interface statistics.
`LOOPBACK`	Shows loopback interface information.

Parameter	Description
`TUNNEL`	Shows tunnel interface information.
`VLAN`	Shows VLAN interface information.
`<LAG-ID>`	Specifies the LAG number. Range: 1-256
`<LOOPBACK-ID>`	Specifies the LOOPBACK number. Range: 0-255
`<TUNNEL-ID>`	Specifies the tunnel ID. Range: 1-255
`<VLAN-ID>`	Specifies the VLAN ID. Range: 1-4094
`VXLAN`	Shows the VXLAN interface information.
`<VXLAN-ID>`	Specifies the VXLAN interface identifier. Default: 1

Examples

Showing interface information when it is configured as a route-only port:

```
switch# show interface 1/1/1
Interface 1/1/1 is up
Admin state is up
Link state: up for 2 days (since Sun Jun 21 05:30:22 UTC 2020)
Link transitions: 1
Description: backup data center link
Hardware: Ethernet, MAC Address: 70:72:cf:fd:e7:b4
MTU 1500
Type 1GbT
Full-duplex
qos trust none
Speed 1000 Mb/s
Auto-negotiation is on
Flow-control: off
Error-control: off
Energy-Efficient Ethernet is enabledMDI mode: MDIX
L3 Counters: Rx Enabled, Tx Enabled
Rate collection interval: 300 seconds
Rates                           RX                   TX        Total (RX+TX)

```

Showing information when the interface is currently linked at a downshifted speed:

```
switch(config-if)# show interface 1/1/1
Interface 1/1/1 is up
...
Auto-negotiation is on with downshift active
```

Showing information when the interface is currently linked with energy-efficient-ethernet negotiated:

```
switch(config-if)# show interface 1/1/1
Interface 1/1/1 is up
...
Energy-Efficient Ethernet is enabled and active
```

Showing information when the interface is shut down during a VSX split:

```
switch(config-if)# show interface 1/1/1
Interface 1/1/1 is down
Admin state is up
State information: Disabled by VSX
Link state: down for 3 days (since Tue Mar 16 05:20:47 UTC 2021)
Link transitions: 0
Description:
Hardware: Ethernet, MAC Address: 04:09:73:62:90:e7
MTU 1500
Type SFP+DAC3
Full-duplex
qos trust none
Speed 0 Mb/s
Auto-negotiation is off
Flow-control: off
Error-control: off
VLAN Mode: native-untagged
Native VLAN: 1
Allowed VLAN List: 1502-1505
Rate collection interval: 300 seconds

Rate                               RX                   TX        Total (RX+TX)

Showing the output for interface 1/1/1 in human-readable format:

In human-readable format, the **< 1** symbol for **Utilization** indicates that the amount of packets is between zero and one. This is true in cases where the number of bytes increases but the number of packets and the **Utilization** value is not displayed even in the normal output, where the human-readable parameter is not included in the command.

```
switch(config-if)# show interface 1/1/1 human-readable
Interface 1/1/1 is up

All platforms	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show interface downshift-enable

```
show interface [<IFNNAME>|<IFRANGE>] downshift-enable
```

Description

Displays speed downshift information, including the interface speed status and configuration.

Parameter	Description
<IFNAME>	Specifies a interface name.
<IFRANGE>	Specifies the port identifier range.

Examples

Showing automatic downshift information:

```
switch(config-if)# show interface downshift-enable
-------------------------------------------------
              Downshift             Speed
Port      Enabled | Active    Status    | Config
-------------------------------------------------
1/1/1     yes       yes       100M-FDx   auto
1/1/2     yes       no        1G         auto
1/1/3     yes       no        100M-FDx   100M-FDx
1/1/4     no        no        --         auto
```

Showing automatic downshift information on per interface:

```
switch(config-if)# show interface 1/1/2 downshift-enable
-------------------------------------------------
              Downshift             Speed
Port      Enabled | Active    Status    | Config
-------------------------------------------------
1/1/2     yes       no        1G         auto
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

show running-config interface

```
show running-config interface [<IFNNAME>|<IFRANGE>]
show running-config interface [lag | loopback | tunnel | vlan ] [<ID>]
```

Description

Displays active configurations of various switch interfaces.

Parameter	Description
<IFNAME>	Specifies a interface name.
<IFRANGE>	Specifies the port identifier range.

Parameter	Description
LAG	Specifies LAG interface information
LOOPBACK	Specifies loopback interface information.
TUNNEL	Specifies tunnel interface information.
VLAN	Specifies VLAN interface information.
<LAG-ID>	Specifies the LAG number. Range: 1-256.
<LOOPBACK-ID>	Specifies the LOOPBACK number. Range: 0-255.
<TUNNEL-ID>	Specifies the tunnel ID. Range: 1-255.
<VLAN-ID>	Specifies the VLAN ID. Range: 1-4094.
VXLAN	Specifies the VXLAN interface information.
<VXLAN-ID>	Specifies the VXLAN interface identifier. Default: 1.

Examples

Showing 1/1/2 interface configuration:

```
switch(config-if)# show running-config interface 1/1/2

interface 1/1/2
   no shutdown
   description DC-23
   exit
```

Showing loopback interfaces configured:

```
switch(config-if)# show running-config interface loopback

interface loopback 1
    description lb interface 1
    exit
interface loopback 2
    description lb interface 2
    exit
```

Showing loopback interfaces not configured:

```
switch(config-if)# show running-config interface loopback

No loopback interfaces configured.
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

Chapter 66

LACP and LAG commands

description

```
description <TEXT>
no description <TEXT>
```

Description

Provides a brief description of the LAG interface. The description text is saved in the configuration of the LAG. It is available even after a reboot.

The no form of this command removes the description of the LAG interface from the configuration.

Parameter	Description
<TEXT>	Specifies the description of the LAG interface.

Example

```
switch(config)# interface lag 10
switch(config-lag-if)# description This LAG is used for an example.
switch(config-lag-if)# show running-config
...
vlan 1
interface lag 10
     description This LAG is used for an example.
interface lag 60
switch(config-lag-if)#
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

hash

```
hash [l2-src-dst | l3-src-dst | l4-src-dst]
```

Description

This command controls the selection of an interface in a group of aggregate interfaces. The hash type value helps transmit a frame. This configuration must be done at the LAG interface level.

Parameter	Description
`l2-src-dst`	Specifies the load-balancing calculation to include only layer 2 items, such as source and destination MAC addresses.
`l3-src-dst`	Specifies the load-balancing calculation to include only layer 3 items, such as source and destination IP addresses. Default setting.
`l4-src-dst`	Specifies the load-balancing calculation to include only layer 4 items, such as source and destination UDP/TCP ports.

Example

```
switch(config-lag-if)# hash l2-src-dst
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

interface lag

```
interface lag <ID>
no interface lag <ID>
```

Description

Creates a Link Aggregation Group (LAG) interface represented by an ID.

The **no** form of this command deletes a LAG interface represented by an ID.

Parameter	Description
<ID>	Specifies a LAG interface ID.

Usage

Keep in mind the following requirements when adding interfaces to a LAG:

- To determine the maximum number of LAG interfaces for your type of switch, look at the output from the **show capacities lag** command; however, the number of LAGs that can be created depends on the availability of the physical interface since each LAG interface needs at least one physical interface as a member link.
- After the maximum limit of members is reached in a LAG, an additional port cannot be added to the aggregation group. If a port belongs to a card type with a different speed than the other aggregation members, the port can still be added to the aggregation group. If dynamic LAG is enabled, any port member with a speed different than other aggregation members is blocked or ineligible from the same aggregation group. Any operational keys/attributes or configuration changes might affect the aggregation states of the member ports.
- The nondefaults configuration on an interface is removed automatically when the interface is added to a link aggregation. For example: Assume that you remove a member interface from an existing LAG and add it to another LAG. The software removes the nondefault configurations on the interface when it is added to the new LAG.

Examples

Creating a Link Aggregation Group (LAG) interface represented by an ID of 100:

```
switch(config)# interface lag 100
```

Deleting a Link Aggregation Group (LAG) interface represented by an ID of 100:

```
switch(config)# no interface lag 100
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

ip address

```
ip address <IPV4-ADDR>/<MASK> [secondary]
no ip address <IPV4-ADDR>/<MASK> [secondary]
```

Description

Sets an IPv4 address and subnet mask to a LAG interface. One primary and up to 31 secondary address can be configured per interface.

The **no** form of this command removes the IPv4 address from the interface.

Parameter	Description
`<IPV4-ADDR>`	Specifies an IP address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. You can remove leading zeros. For example, the address **192.169.005.100** becomes **192.168.5.100**.
`<MASK>`	Specifies the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 32.
`secondary`	Specifies a secondary IP address.

Examples

Setting an IP address on the LAG interface 1 to 198.51.100.1 with a mask of 24 bits:

```
switch(config)# interface lag 1
switch(config-lag-if)# ip address 198.51.100.1/24
```

Removing the IP address 198.51.100.1 with a mask of 24 bits from LAG interface 1:

```
switch(config)# interface lag 1
switch(config-lag-if)# no ip address 198.51.100.1/24
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

ipv6 address

```
ipv6 address <IPV6-ADDR>/<MASK>
no ipv6 address <IPV6-ADDR>/<MASK>
```

Description

Sets an IPv6 address and subnet mask to a LAG interface.

The **no** form of this command removes the IPv6 address from the interface.

Parameter	Description
<IPV6-ADDR>	Specifies the IP address in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F. You can use two colons (::) to represent consecutive zeros (but only once), remove leading zeros, and collapse a quartet of four zeros to a single 0. For example, this address **2222:0000:3333:0000:0000:0000:4444:0055** becomes **2222:0:3333::4444:55**.
<MASK>	Specifies the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128.

Examples

Setting the IPv6 address on LAG interface 1 to 2001:0db8:85a3::8a2e:0370:7334 with a mask of 24 bits:

```
switch(config)# interface lag 1
switch(config-lag-if)# ipv6 address 2001:0db8:85a3::8a2e:0370:7334/24
```

Removing the IP address 2001:0db8:85a3::8a2e:0370:7334 with mask of 24 bits with a mask of 24 bits from LAG interface 1:

```
switch(config)# interface lag 1
switch(config-lag-if)# no ipv6 address 2001:0db8:85a3::8a2e:0370:7334/24
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

lacp fallback

```
lacp fallback
no lacp fallback
```

Description

Configures the LACP fallback on LAG port.

The no form of this command sets the LAG to BLOCK state if no LACP partner is detected.

Usage

This makes members of the LAG function as non-bonded interfaces when no LACP partner is detected. This configuration is only applicable when the LAG is of type MCLAG. If the member port does not get an LACP frame, the port is in IE state.

Examples

Configuring LACP fallback on LAG port.

```
switch(config)# int lag 1 multi-chassis
switch(config-lag-if)# no sh
switch(config-lag-if)# lacp mode active
switch(config-lag-if)# lacp fallback
```

Configuring the LAG to BLOCK state when no LACP partner is detected.

```
switch(config)# int lag 1 multi-chassis
switch(config-lag-if)# no sh
switch(config-lag-if)# lacp mode active
switch(config-lag-if)# no lacp fallback
```

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6400	`config-if` `config-lag-if`	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

lacp fallback-static

```
lacp fallback-static
no lacp fallback-static
```

Description

Configures the LACP fallback-static on LAG port.

The no form of this command sets the LAG to BLOCK state if no LACP partner is detected.

Usage

This makes members of the LAG function as non-bonded interfaces when no LACP partner is detected. One member interface that is part of the LAG stays up and forwards traffic, while the other members are in lacp-block state. This configuration is applicable when the lag is of type LACP and ignored in other cases. When this command is configured, only one member of LAG is selected to be UP. Enabling multiple members results in configuration mismatch on peer, loop, mac-learning issues, and more.

Examples

Configuring LACP fallback-static on LAG port.

```
switch(config)# interface lag 1
switch(config-lag-if)# lacp mode active
switch(config-lag-if)# lacp fallback-static
```

Configuring the LAG to BLOCK state when no LACP partner is detected.

```
switch(config)# interface lag 1
switch(config-lag-if)# no lacp fallback-static
```

Configuring LACP fallback-static on static port.

```
switch(config-lag-if)# lacp fallback-static
Cannot enable LACP fallback-static on static LAG.
```

Release	Modification
10.11	Command introduced.

Command Information

Platforms	Command context	Authority
All platforms	`config-if` `config-lag-if`	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

lacp mode

```
lacp mode {active | passive}
no lacp mode {active | passive}
```

Description

Sets an LACP mode to active or passive.

The **no** form of this command sets the LACP mode to **off**, returning the LAG to a static mode aggregation.

Parameter	Description
`active`	Specifies that the local switch will transmit LACP Data Units

Parameter	Description
	(LACPDUs) to attempt to negotiate with the remote device.
`passive`	Specifies that the local switch will listen for LACPDUs from the remote device for LACP negotiation. **NOTE:** A momentary traffic drop occurs because LACP partners reconverge when changing the mode from active to passive or from passive to active.

Examples

Setting the LACP mode to `active`:

```
switch(config)# interface lag 1
switch(config-lag-if)# lacp mode active
```

Setting the LACP mode to `off`:

```
switch(config)# interface lag 1
switch(config-lag-if)# no lacp mode active
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

lacp port-id

```
lacp port-id <PORT-ID>
no lacp port-id
```

Description

Sets the LACP port ID value of the member interface of the LAG.

The **no** form of this command removes the LACP port ID value from the interface.

Parameter	Description
<PORT-ID>	Specifies a port ID value. Range: 1 to 65535.

Examples

Setting an LACP port ID to a value of 10:

```
switch(config-if)# lacp port-id 10
```

Removing the LACP port ID value:

```
switch(config-if)# no lacp port-id
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

lacp port-priority

```
lacp port-priority <PORT-PRIORITY>
no lacp port-priority
```

Description

Sets an LACP port priority value for the member interface of the LAG.

The **no** form of this command reverts the LACP port priority to the default, which is 1.

Parameter	Description
<PORT-PRIORITY>	Specifies a port priority value. Range: 1 to 65535.

Examples

Setting a LACP port priority value of 10:

```
switch(config-if)# lacp port-priority 10
```

Reverting the LACP port ID to the default:

```
switch(config-if)# no lacp port-priority
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

lacp rate

```
lacp rate {fast | slow}
no lacp rate {fast | slow}
```

Description

Sets an LACP heartbeat request time to fast or slow.

The **no** form of the command sets an LACP rate to **slow**.

Parameter	Description
`fast`	Specifies the heartbeat request to every second, and the timeout period is a three-consecutive heartbeat loss that is 3 seconds.
`slow`	Specifies the heartbeat request to every 30 seconds. The timeout period is three-consecutive heartbeat loss that is 90 seconds. Default setting.

Examples

Setting the LACP heartbeat request time to `fast`:

```
switch(config)# interface lag 1
switch(config-lag-if)# lacp rate fast
```

Resetting the LACP heartbeat request time to the default, which is `slow`:

```
switch(config)# interface lag 1
switch(config-lag-if)# no lacp rate
```

Another way to set the LACP heartbeat request time to the default, which is `slow`:

```
switch(config)# interface lag 1
switch(config-lag-if)# lacp rate slow
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

lacp system-priority

```
lacp system-priority <SYSTEM-PRIORITY-VALUE>
no lacp system-priority <SYSTEM-PRIORITY-VALUE>
```

Description

Sets a Link Aggregation Control Protocol (LACP) system priority.

The **no** form of this command sets an LACP system priority to the default, which is 65534.

Parameter	Description
<SYSTEM-PRIORITY-VALUE>	Specifies a system priority value. Range: 0 to 65535.

Examples

Setting a Link Aggregation Control Protocol (LACP) system priority to 100:

```
switch(config)# lacp system-priority 100
```

Setting an LACP system priority to the default (65534):

```
switch(config)# no lacp system-priority
```

A momentary traffic drop can be seen in case the LACP state machine must renegotiate.

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config`	Administrators or local user group members with execution rights for this command.

lag

```
lag <ID>
no lag <ID>
```

Description

Adds an interface to a specified LAG interface ID.

The **no** form of this command removes an interface from a specified LAG interface ID. The member loses its LACP configuration when removed from the LAG. The member also reaches the default state with an administrative shutdown. For 6300 and 6400 series switches, the administrative state is enabled. Configurations, such as MTU and UDLD, are retained.

Parameter	Description
<ID>	Specifies a LAG interface ID. Range: 1 to 256.

Usage

- All members of the LAG must have the same speed. If a member comes up late with a different speed, it will not participate in the LAG/LACP. The hardware restriction is applied before adding an interface to LAG. The member belongs to the card type that has the same maximum speed as the reference port card type.
- To move an interface from LagA to LagB, first remove the interface from LagA and then add it to LagB. When a member is attached to a LAG, the nondefault configurations on the member are removed silently.
- After removing a physical interface from a LAG, the interface associated with the LAG becomes L3 ports with default L3 configurations and administrative down. For example, suppose interface 1/1/1 was part of LAG 3 and you had administratively enabled the interface. If you later remove interface

1/1/1 from LAG 3, the administrative status automatically changes to down. If you want to use the interface again, you must administratively enable it again.

Examples

Adding an interface to a Link Aggregation Group (LAG) represented by an ID of 100:

```
switch(config)# interface 1/1/1
switch(config-if)# lag 100
```

Deleting an interface from a Link Aggregation Group (LAG) represented by an ID of 100:

```
switch(config)# interface 1/1/1
switch(config-if)# no lag 100
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

show interface

`show interfaces <LAG-NAME> [vsx-peer]`

Description

Displays information about a specific LAG.

Parameter	Description
<LAG-NAME>	Specifies a LAG name.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Displaying information about LAG 100:

```
switch# show interface lag100
Aggregate lag100 is up
 Admin state is up
 Description :
 MAC Address                 : 48:0f:cf:af:43:9c
 Aggregated-interfaces       : 1/1/2
 Aggregation-key             : 100
 Aggregate mode              : active
 Speed                       : 2000 Mb/s
 L3 Counters: Rx Disabled, Tx Disabled
 qos trust none
 VLAN Mode: access
 Access VLAN: 1

 Statistics                      RX                   TX                Total
 ------------- -------------------- -------------------- --------------------
 Packets                         20                   45                   65
   Unicast                        5                    5                   10
   Multicast                      5                   15                   20
   Broadcast                     10                   25                   35
 Bytes                         5658                 2584                 8242

All platforms	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show lacp aggregates

```
show lacp aggregates [<LAG-NAME>] [vsx-peer]
```

Description

Displays all LACP aggregate information configured for all LAGs, or for a specific LAG.

Parameter	Description
<LAG-NAME>	Optional: Specifies a lag name.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Displaying LACP aggregate information configured for lag10:

```
switch# show lacp aggregates lag10

Aggregate-name         : lag10
Aggregated-interfaces : 1/1/1 1/1/2
Heartbeat rate         : slow
Hash                   : l3-src-dst
Aggregate mode         : active
```

Displaying LACP aggregates:

```
switch# show lacp aggregates

Aggregate-name         : lag1
Aggregated-interfaces : 1/1/27 1/1/28 1/1/29
Heartbeat rate         : slow
Hash                   : l3-src-dst
Aggregate mode         : active

Aggregate-name         : lag2
Aggregated-interfaces : 1/1/48
Heartbeat rate         : slow
Hash                   : l2-src-dst
Aggregate mode         : passive
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

show lacp configuration

`show lacp configuration [vsx-peer]`

Description

Displays global LACP configuration.

Parameter	Description
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Displaying global LACP configuration:

```
switch# show lacp configuration
System-id       : 98:f2:b3:68:40:a0
System-priority : 65534
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

All platforms	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show lacp interfaces

`show lacp interfaces [<IFNAME>] [vsx-peer]`

Description

Displays an LACP configuration of the physical interfaces, including VSXs. If an interface name is passed as argument, it only displays an LACP configuration of a specified interface.

Parameter	Description
<IFNAME>	Optional: Specifies an interface name.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

This example displays an LACP configuration of the physical interfaces. One of the interfaces has the **lacp-block** forwarding state. If a VSX switch has loop protect enabled on an interface and a loop occurs, VSX blocks the interface to stop the loop. The forwarding state of the blocked interface is set to **lacp-block**.

```
switch# show lacp interfaces
State abbreviations :
A - Active        P - Passive      F - Aggregable I - Individual
S - Short-timeout L - Long-timeout N - InSync     O - OutofSync
C - Collecting    D - Distributing
X - State m/c expired              E - Default neighbor state

Actor details of all interfaces:
----------------------------------------------------------------------------------
--
Intf   Aggr    Port    Port   State   System-id          System  Aggr Forwarding
       name    id      Pri                               Pri     Key  State
----------------------------------------------------------------------------------
--
1/1/1  lag10   17      1      ALFOE   70:72:cf:37:a3:5c  20      10   lacp-block
1/1/2  lag128  69      1      ALFNCD  70:72:cf:37:a3:5c  20      128  up
1/1/3  lag128  14      1      ALFNCD  70:72:cf:37:a3:5c  20      128  up
1/1/4  lag128                                                         down
1/1/5  lag20                                                          up

Partner details of all interfaces:
------------------------------------------------------------------------------
Intf   Aggr    Partner Port     State     System-id       System   Aggr
       name    Port-id Pri                                Priority Key
------------------------------------------------------------------------------
1/1/1  lag10   0       65534    PLFOEX  00:00:00:00:00:00 65534    0
1/1/2  lag128  69      1        PLFNCD  70:72:cf:8c:60:a7 65534    128

show lag

```
show  lag <LAG-ID>
```

Description

Displays the lag.

Parameter	Description
<LAG-ID>	Specifies the lag ID.

Examples

Displaying the lag.

```
switch# show lag

System-ID       : f4:03:43:80:4a:00
System-priority : 65534
Hash            : l3-src-dst
Aggregate lag1 is down
   Admin state is down
   Description :
```

```
   Type                        : normal
   Lacp Fallback               : n/a
   MAC Address                 : f4:03:43:80:4a:00
   Aggregated-interfaces       :
   Aggregation-key             : 1
   Aggregate mode              : static
   LACP rate                   : n/a
   Speed                       : 0 Mb/s
   Mode                        : routed

Aggregate lag128 is down
  Admin state is down
  Description :
  Type                        : normal
  Lacp Fallback               : n/a
  MAC Address                 : f4:03:43:80:4a:00
-- MORE --, next page: Space, next line: Enter, quit: q
```

Displaying the lag when `lacp fallback-static` is enabled.

```
switch# show lag

System-ID       : 90:20:c2:24:60:00
System-priority : 65534

Aggregate lag1 is up
   Admin state is up
   Description :
   Type                        : normal
   Lacp Fallback               : Enabled
   MAC Address                 : 90:20:c2:24:60:00
   Aggregated-interfaces       : 1/1/1 1/1/2 1/1/3 1/1/46 1/1/47 1/1/48

All platforms	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show running-config interface lag

```
show running-config interface lag
```

Description

Displays the running configuration for interface lag.

Examples

Displaying the running configuration for interface lag.

```
switch# show running-config interface lag
interface lag 10 multi-chassis
   no shutdown
   no routing
   vlan trunk native 1
   vlan trunk allowed 10-12
   lacp mode active
   exit
interface lag 11 multi-chassis
   no shutdown
   no routing
   vlan trunk native 1
   vlan trunk allowed 10-12,2001
   lacp mode active
   exit
interface lag 256
   description VSX_ISL
   no shutdown
   no routing
   vlan trunk native 1 tag
   vlan trunk allowed all
   lacp mode active
   exit
```

Displaying the running configuration for interface lag with **lacp fallback-static** configured.

```
switch# show running-config interface lag
interface lag 1
   no shutdown
   no routing
   vlan trunk native 1
   vlan trunk allowed all
   lacp mode active
   lacp fallback-static
```

shutdown

```
shutdown
no shutdown
```

Description

Sets every interface in the LAG operationally down.

The **no** form of this command sets every interface operationally up.

Examples

Setting every interface in the LAG to shutdown:

```
switch(config)# interface lag 1
switch(config-lag-if)# shutdown
```

Resetting every interface in the LAG to the default (up):

```
switch(config)# interface lag 1
switch(config-lag-if)# no shutdown
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

All platforms	`config-lag-if`	Administrators or local user group members with execution rights for this command.

vlan trunk native

```
vlan trunk native <VLAN-ID>
no vlan trunk native [<VLAN-ID>]
```

Description

Assigns a native VLAN ID to a LAG interface.

The **no** form of this command removes a native VLAN from a LAG interface and assigns VLAN ID 1 as its native VLAN.

Parameter	Description
<VLAN-ID>	Specifies the number of the VLAN ID to assign. The VLAN ID must exist. Maximum number of VLANs supported: 4096 (6300, 6400) VLAN ID range: 2 to 4094.

Usage

By default, VLAN ID 1 is assigned as the LAG VLAN ID for all LAG interfaces. VLANs can only be assigned to a nonrouted (layer 2) interface or LAG interface.

Only one VLAN ID can be assigned as the native VLAN. For the interface to forward the native VLAN traffic, the interface has to be allowed explicitly by entering **vlan trunk allowed <ID>** where the ID is the native VLAN ID. This setting is also applicable to the physical interface.

Examples

Configuring a layer 2 dynamic aggregation group with native VLAN ID **1** assigned to LAG **1**:

For 6300, 6400, 8100, 8320, 8325, 8360, 8400, 9300, and 10000 switch series:

```
switch(config)# interface lag 1
switch(config-lag-if)# no shutdown
switch(config-lag-if)# no routing
switch(config-lag-if)# lacp mode active
switch(config-lag-if)# vlan trunk native 1
switch(config-lag-if)# vlan trunk allowed 1
```

Configuring a layer 2 dynamic aggregation group with native VLAN ID **20** assigned to LAG **1**:

For 6300, 6400, 8100, 8320, 8325, 8360, 8400, 9300, and 10000 switch series:

```
switch(config)# interface lag 1
switch(config-lag-if)# no shutdown
switch(config-lag-if)# no routing
switch(config-lag-if)# lacp mode active
switch(config-lag-if)# vlan trunk native 20
switch(config-lag-if)# vlan trunk allowed 20
```

Removing a native VLAN from LAG 1:

```
switch(config)# interface lag 1
switch(config-lag-if)# no vlan trunk native
```

For more information on features that use this command, refer to the Link Aggregation Guide for your switch model.

lldp

```
lldp
no lldp
```

Description

Enables LLDP support globally on all active interfaces. By default, LLDP is enabled.

The **no** form of this command disables LLDP support globally on all active interfaces. It does not remove any LLDP configuration settings.

Examples

Enabling LLDP:

```
switch(config)# lldp
```

Disabling LLDP:

```
switch(config)# no lldp
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

lldp dot3

```
lldp dot3 {poe | macphy}
no lldp dot3 {poe | macphy}
```

Description

Sets the 802.3 TLVs to be advertised. By default, advertisement of both POE and MAC/PHY TLVs is enabled. Not supported on the OOBM interface.

The **no** form of this command disables advertisement of 802.3 TLVs.

Parameter	Description
`poe`	Specifies advertisement of power over Ethernet data link classification.
`macphy`	Specifies advertisement of media access control and physical layer information.

Examples

Enabling advertisement of the POE TLV:

```
switch(config-if)# lldp dot3 poe
```

Disabling advertisement of the POE TLV:

```
switch(config-if)# no lldp dot3 poe
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

lldp dot3 eee

```
lldp dot3 eee
no lldp dot3 eee
```

Description

Sets the 802.3 TLVs for Energy-Efficient Ethernet (EEE) to be advertised. By default, advertisement of EEE TLVs is enabled. Not supported on the OOBM interface.

The **no** form of this command disables advertisement of 802.3 TLVs.

Parameter	Description
`eee`	Specifies advertisement of 802.3 TLVs for EEE.

Examples

Enabling advertisement of the EEE TLVs:

```
switch(config-if)# lldp dot3 eee
```

Disabling advertisement of the EEE TLVs:

```
switch(config-if)# no lldp dot3 eee
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

lldp dot3 mfs

```
lldp dot3 mfs
```

```
no lldp dot3 mfs
```

Description

Enables the 802.3 TLV list in LLDP to advertise for maximum frame size (MFS). Enabled by default.

The **no** form of this command disables the advertisement of maximum frame size TLVs.

Examples

Enabling advertisement of maximum frame size TLVs:

```
switch(config)# interface 1/1/1
switch(config-if)# lldp dot3 mfs
```

Disabling advertisement of maximum frame size TLVs:

```
switch(config)# interface 1/1/1
switch(config-if)# no lldp dot3 mfs
```

lldp holdtime-multiplier

```
lldp holdtime-multiplier <multiplier>
no lldp holdtime-multiplier
```

Description

Sets the holdtime TTL multiplier value that is used to calculate the LLDP Time-to-Live value. Time-to-Live defines the length of time that neighbors consider LLDP information sent by this agent as valid. When Time-to-Live expires, the information is deleted by the neighbor. Time-to-live is calculated by multiplying holdtime by the value of **lldp timer**.

The **no** form of this command sets the holdtime TTL multiplier to its default value of 4.

Parameter	Description
<multiplier>	Specifies the TTL multiplier in the range of 2 to 10. Default: 4.

Formula

TTL = Holdtime-multiplier x lldp timer

where:

TTL = Time-to-Live

Holdtime-multiplier = Multiplying holdtime value

lldp timer = Message transmission interval

Examples

Setting the holdtime to 8 times of the value of lldp timer:

```
switch(config)# lldp holdtime-multiplier 8
```

Setting the holdtime to the default value of 4 times of the value of lldp timer:

```
switch(config)# no lldp holdtime-multiplier
```

lldp management-address vlan

```
lldp management-address vlan <VLAN-ID>
no lldp management-address vlan <VLAN-ID>
```

Description

Sets the VLAN whose IPv4 or IPv6 address is advertised as the LLDP management authority.

The **no** form of this command removes the VLAN whose IPv4 or IPv6 address is advertised as the LLDP management authority.

The following is the precedence for the management IP address TLV in the LLDP packet (in order):

- LLDP management-IP-address and management-ipv6-address, if configured.
- LLDP management VLAN's IPv4 and IPv6 address, if configured.
- Loopback IP address from the smallest configured loopback interface identifier.
- Route-only-port IP address (Layer-3 interface) or IP address of the SVI (Layer-2 interface).
- OOBM IP address.
- Base MAC address of the switch.

Parameter	Description
<VLAN-ID>	Specifies the VLAN ID.

Examples

Setting the management authority for VLAN 10:

```
switch(config)# lldp management-address vlan 10
```

Removing the management authority for VLAN 10:

```
switch(config)# no lldp management-address vlan 10
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

lldp management-ip-address

```
lldp management-ip-address <IPV-ADDR>
no lldp management-ip-address
```

Description

Defines the IP management address of the switch which is sent in the management address TLV. One IPv4 and one IPv6 management address can be configured.

If you do not define an LLDP management address, then LLDP uses one of the following (in order):

- IP address of the port
- IP address of the management interface
- Base MAC address of the switch

The **no** form of this command removes the IPv4 management address of the switch.

Parameter	Description
<IPV4-ADDR>	Specifies the management address of the switch as an IPv4 format (**x.x.x.x**), where **x** is a decimal value from 0 to 255.

Examples

Setting the management address to **10.10.10.2**:

```
switch(config)# lldp management-ip-address 10.10.10.2
```

Removing the management address:

```
switch(config)# no lldp management-ip-address
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.14	The **management-ipv4-address** keyword is deprecated and replaced with **management-ip-address**.

lldp management-ipv6-address

```
lldp management-ipv6-address <IPV6-ADDR>
no lldp management-ipv6-address
```

Description

Defines the IPv6 management address of the switch. The management address is encapsulated in the management address TLV.

If you do not define an LLDP management address, then LLDP uses one of the following (in order):

- IP address of the port
- IP address of the management interface
- Base MAC address of the switch

The **no** form of this command removes the IPv6 management address of the switch.

Parameter	Description
<IPV6-ADDR>	Specifies an IP address in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.

Examples

Setting the management address to 2001:db8:85a3::8a2e:370:7334:

```
switch(config)# lldp management-ipv6-address 2001:0db8:85a3::8a2e:0370:7334
```

Removing the management address:

```
switch(config)# no lldp management-ipv6-address
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

lldp med

```
lldp med [poe [priority-override] | capability | network-policy]
no med [poe [priority-override] | capability | network-policy]
```

Description

Configures support for the LLDP-MED TLV. LLDP-MED (media endpoint devices) is an extension to LLDP developed by TIA to support interoperability between VoIP endpoint devices and other networking end-devices. The switch only sends the LLDP MED TLV after receiving a MED TLV from and connected endpoint device.

Not supported on the OOBM interface.

The **no** form of this command disables support for the LLDP MED TLV.

Parameter	Description
`poe [priority-override]`	Specifies advertisement of power over Ethernet data link classification. The **priority-override** option overrides user-configured port priority for Power over Ethernet. When both **lldp dot3 poe** and **lldp med poe** are enabled, the **lldp dot3 poe3** setting takes precedence. Default: enabled.
`capability`	Specifies advertisement of supported LLDP MED TLVs. The capability TLV is always sent with other MED TLVs, therefore it cannot be disabled when other MED TLVs are enabled. Default: enabled.
`network-policy`	Network policy discovery lets endpoints and network devices advertise their VLAN IDs, and IEEE 802.1p (PCP and DSCP) values for voice applications. This TLV is only sent when a voice VLAN policy is present. Default: enabled.

Examples

Enabling advertisement of the network policy TLV:

```
switch(config-if)# lldp med network-policy
```

Disabling advertisement of the network policy TLV:

```
switch(config-if)# no lldp med network-policy
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

lldp med location

```
lldp med location {civic-addr   elin-addr }
no med location {civic-addr  elin-addr }
```

Description

Configures support for the LLDP-MED TLV. Supports only civic address and emergency location information number (ELIN). Coordinate-based location is not supported.

The **no** form of this command disables support for the LLDP MED TLV.

Parameter	Description
`civic-addr`	Configures the LLDP MED civic location TLV.
`elin-addr`	Configures support for the LLDP MED emergency location TLV. This feature is intended for use in ECS applications to support class 3 LLDP-MED VoIP telephones connected to a switch in an MLTS infrastructure. An ELIN is a valid NANP format telephone number assigned to MLTS operators in North America by the appropriate authority. The ELIN is used to route emergency (E911) calls to a PSAP. (Range: 1-15 numeric characters)

The **lldp med location civic-addr** command requires a minimum of one type/value pair, but typically includes multiple type/value pairs as needed to configure a complete set of data describing a given location.

CA-TYPE: This is the first entry in a type/value pair and is a number defining the type of data contained in the second entry in the type/value pair (CA-VALUE.) Some examples of CA-TYPE specifiers include: 3=city 6=street (name) 25=building name (Range: 0 - 255)

CA-VALUE: This is the second entry in a type/value pair and is an alphanumeric string containing the location information corresponding to the immediately preceding CA-TYPE entry. Strings are delimited by either blank spaces, single quotes (' ... '), or double quotes ("... ".) Each string should represent a specific data type in a set of unique type/value pairs comprising the description of a location, and each string must be preceded by a CA-TYPE number identifying the type of data in the string.

The following LLDP-MED TLV values are supported. For details on these value types, refer to RFC 4776

- 1: national subdivisions (state, canton, region, province, prefecture)
- 2: county, parish, gun (JP), district (IN)
- 3: city, township, shi (JP)
- 4: city division, borough, city district, ward, chou (JP)
- 5: neighborhood, block
- 6: group of streets below the neighborhood level
- 16: leading street direction N
- 17: trailing street suffix SW
- 18: street suffix or type
- 19: house number
- 20: house number suffix
- 21: landmark or vanity
- 22: location
- 23: name
- 24: postal/zip code
- 25: building (structure)
- 26: unit (apartment, suite)

- 27: floor
- 28: room
- 29: type of place
- 30: postal community name
- 31: post office box
- 32: additional code 13203000003
- 33: seat (desk, cubicle workstation)
- 34: primary road name 35 road section
- 36: branch road name
- 37: sub-branch road name
- 38: street name pre-modifier
- 39: street name post-modifier

Examples

Enabling support for the LLDP MED emergency location TLV:

```
switch(config-if)# lldp med location elin-addr 408-555-1212
```

Disabling support for the LLDP MED emergency location TLV:

```
switch(config-if)# no lldp med location elin-addr 408-555-1212
```

Enabling support for the LLDP MED civic address TLV:

```
switch(config-if)# lldp med location civic-addr US 1 19 123 6 Fake 18 Street
```

Disabling support for the LLDP MED civic address TLV:

```
switch(config-if)# no lldp med location civic-addr US 1 19 123 6 Fake 18 Street
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

lldp receive

```
lldp receive
no lldp receive
```

Description

Enables reception of LLDP information on an interface. By default, LLDP reception is enabled on all active interfaces, including the OOBM interface.

The **no** form of this command disables reception of LLDP information on an interface.

Examples

On the 6400 Switch Series, interface identification differs.

Enabling LLDP reception on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# lldp receive
```

Disabling LLDP reception on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# no lldp receive
```

Enabling LLDP reception on the OOBM interface:

```
switch(config)# interface mgmt
switch(config-if)# lldp receive
```

Disabling LLDP reception on the OOBM interface:

```
switch(config)# interface mgmt
switch(config-if)# no lldp receive
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

lldp reinit

```
lldp reinit <TIME>
no lldp reinit
```

Description

Sets the amount of time (in seconds) to wait before performing LLDP initialization on an interface.

The **no** form of this command sets the reinitialization time to its default value of 2 seconds.

Parameter	Description
<TIME>	Specifies the reinitialization time in seconds. Range: 1 to 10. Default: 2 seconds.

Examples

Setting the reinitialization time to 5 seconds:

```
switch(config)# lldp reinit 5
```

Setting the reinitialization time to the default value of 2 seconds:

```
switch(config)# no lldp reinit
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

lldp select-tlv

```
lldp select-tlv <TLV-NAME>
no lldp select-tlv <TLV-NAME>
```

Description

Selects a TLV that the LLDP agent will send and receive. By default, all supported TLVs are sent and received.

The **no** form of this command stops the LLDP agent from sending and receiving a specific TLV.

LLDP supports Organization Unique Identifiers (OUI) with the following Organization-specific TLVs:

- IEEE 802.1 (DOT1) (oui:0x00, 0x80, 0xc2)
- IEEE 802.3 (DOT3) (oui:0x00, 0x12, 0x0f)
- Aruba, a Hewlett Packard Enterprise Company (oui:0x88, 0x3a, 0x30)

Parameter	Description
`select-tlv` *`<TLV-NAME>`*	Specifies the TLV name to send. The following TLV names are supported: ■ **management-address:** Selection is based on priority in the following list (for example if first TLV name isn't selected, the next will be, progressing through this list until a selection is made): 1. IPv4 or IPV6 management address. 2. IP address of the lowest configured loopback interface. 3. If layer 3, then the route-only port IP address. If layer 2, the IP address of the SVI. 4. OOBM interface IP address. 5. Base MAC address of the switch. ■ **port-description:** Select port-description TLV. ■ **port-vlan-id:** Select port-vlan-id TLV. ■ **port-vlan-name:** Select port-vlan-name TLV. ■ **system-capabilities:** Select system-capabilities TLV. ■ **system-description:** Select system-description TLV. ■ **system-name:** Select system-name TLV.

Examples

Stopping the LLDP agent from sending the **port-description** TLV:

```
switch(config)# no lldp select-tlv port-description
```

Enabling the LLDP agent to send the **port-description** TLV:

```
switch(config)# lldp select-tlv oui
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config`	Administrators or local user group members with execution rights for this command.

lldp timer

```
lldp timer <TIME>
no lldp timer
```

Description

Sets the interval (in seconds) at which local LLDP information is updated and TLVs are sent to neighboring network devices by the LLDP agent. The minimum setting for this timer must be four times the value of **lldp txdelay**.

For example, this is a valid configuration:

- **lldp timer** = 16
- **lldp txdelay** = 4

And, this is an invalid configuration:

- **lldp timer** = 5
- **lldp txdelay** = 2

When copying a saved configuration to the running configuration, the value for **lldp timer** is applied before the value of **lldp txdelay**. This can result in a configuration error if the saved configuration has a value of **lldp timer** that is not four times the value of **lldp txdelay** in the running configuration.

For example, if the saved configuration has the settings:

- **lldp timer** = 16
- **lldp txdelay** = 4

And the running configuration has the settings:

- **lldp timer** = 30
- **lldp txdelay** = 7

Then you will see an error indicating that certain configuration settings could not be applied, and you will have to manually adjust the value of **lldp txdelay** in the running configuration.

The **no** form of this command sets the update interval to its default value of 30 seconds.

Parameter	Description
<TIME>	Specifies the update interval (in seconds). Range: 5 to 32768. Default: 30.

Examples

Setting the update interval to 7 seconds:

```
switch(config)# lldp timer 7
```

Setting the update interval to the default value of 30 seconds:

```
switch(config)# no lldp timer
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

lldp transmit

```
lldp transmit
no lldp transmit
```

Description

Enables transmission of LLDP information on specific interface. By default, LLDP transmission is enabled on all active interfaces, including the OOBM interface.

The **no** form of this command disables transmission of LLDP information on an interface.

Examples

On the 6400 Switch Series, interface identification differs.

Enabling LLDP transmission on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# lldp transmit
```

Disabling LLDP transmission on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# no lldp transmit
```

Enabling LLDP transmission on the OOBM interface:

```
switch(config)# interface mgmt
switch(config-if)# lldp transmit
```

Disabling LLDP transmission on the OOBM interface:

```
switch(config)# interface mgmt
switch(config-if)# no lldp transmit
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

lldp txdelay

```
lldp txdelay <TIME>
no lldp txdelay
```

Description

Sets the amount of time (in seconds) to wait before sending LLDP information from any interface. The maximum value for **txdelay** is 25% of the value of **lldp tx timer**.

The **no** form of this command sets the delay time to its default value of 2 seconds.

Parameter	Description
<TIME>	Specifies the delay time in seconds. Range: 0 to 10. Default: 2.

Examples

Setting the delay time to 8 seconds:

```
switch(config)# lldp txdelay 8
```

Setting the delay time to the default value of 2 seconds:

```
switch(config)# no lldp txdelay
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

lldp trap enable

```
lldp trap enable
no lldp trap enable
```

Description

Enables sending SNMP traps for LLDP related events from a particular interface. LLDP trap generation is enabled by default on all the interfaces and has to be disabled for interfaces on which traps are not required to be generated.

The **no** form of this command disables the LLDP trap generation.

LLDP trap generation is disabled by default at the global level and must be enabled before any LLDP traps are sent.

Examples

Enabling LLDP trap generation on global level:

```
switch(config)# lldp trap enable
```

Enabling LLDP trap generation on interface level:

```
switch(config-if)# lldp trap enable
```

Disabling LLDP trap generation on global level:

```
switch(config)# no lldp trap enable
```

Disabling LLDP trap generation on interface level:

```
switch(config-if)# no lldp trap enable
```

Displaying LLDP global configuration:

```
switch# show lldp configuration

LLDP Global Configuration

show lldp configuration

`show lldp configuration [<INTERFACE-ID>][vsx-peer]`

Description

Shows LLDP configuration settings for all interfaces or a specific interface.

Parameter	Description
<INTERFACE-ID>	Specifies an interface. Format: **member/slot/port**.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

On the 6400 Switch Series, interface identification differs.

Showing configuration settings for all interfaces:

```
switch# show lldp configuration

LLDP Global Configuration
=========================
LLDP Enabled                 : No
LLDP Transmit Interval       : 30
LLDP Hold Time Multiplier    : 4
LLDP Transmit Delay Interval : 2
LLDP Reinit Timer Interval   : 2
LLDP Trap Enabled            : No

Command Information

Platforms	Command context	Authority
6300 6400	Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show lldp local-device

```
show lldp local-device[vsx-peer]
```

Description

Shows global LLDP information advertised by the switch, as well as port-based data. If VLANs are configured on any active interfaces, the VLAN ID is only shown for trunk native or untagged VLAN IDs on access interfaces.

Parameter	Description
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing global LLDP information only (all ports including OOBM port are administratively down):

```
switch# show lldp local-device

Global Data
===========

Chassis-ID              : 1c:98:ec:e3:45:00
System Name             : switch
System Description      : Aruba JL375A 8400X XL.01.01.0001
```

```
Management Address     : 192.168.10.1
Capabilities Available : Bridge, Router
Capabilities Enabled   : Bridge, Router
TTL                    : 120
```

Showing all ports except **1/1/11** and OOBM as administratively down:

```
switch# show lldp local-device

Global Data
===========

Chassis-ID             : 1c:98:ec:e3:45:00
System Name            : switch
System Description     : Aruba
Management Address     : 192.168.10.1
Capabilities Available : Bridge, Router
Capabilities Enabled   : Bridge, Router
TTL                    : 120

Port Based Data
===============

Port-ID           : 1/1/11
Port-Desc         : "1/1/11"
Port Mgmt-Address : 164.254.21.220
Port VLAN ID      : 1

Port-ID           : mgmt
Port-Desc         : "mgmt"
Port Mgmt-Address : 164.254.21.220
```

In this example, all the ports except **1/1/11** are administratively down, and VLAN ID 100 is configured on this access interface.

```
switch# show lldp local-device

Global Data
===========

Chassis-ID             : 1c:98:ec:e3:45:00
System Name            : switch
System Description     : Aruba
Management Address     : 192.168.10.1
Capabilities Available : Bridge, Router
Capabilities Enabled   : Bridge, Router
TTL                    : 120

Port Based Data
===============

Port-ID           : 1/1/11
Port-Desc         : "1/1/11"
Port VLAN ID      : 100
Parent Interface  : interface 1/1/11
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

show lldp neighbor-info

```
show lldp neighbor-info [<INTERFACE-NAME>][vsx-peer]
```

Description

Displays information about neighboring devices for all interfaces or for a specific interface. The information displayed varies depending on the type of neighbor connected and the type of TLVs sent by the neighbor.

Parameter	Description
<INTERFACE-NAME>	Specifies the interface for which to show information for neighboring devices. Use the format **member/slot/port** (for example, **1/3/1**).
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

Showing LLDP information for all interfaces:

```
switch# show lldp neighbor-info

LLDP Neighbor Information
=========================

Total Neighbor Entries          : 3
Total Neighbor Entries Deleted  : 0
Total Neighbor Entries Dropped  : 0
Total Neighbor Entries Aged-Out : 0
```

```
LOCAL-PORT  CHASSIS-ID         PORT-ID       PORT-DESC     TTL      SYS-NAME
--------------------------------------------------------------------------------
1/1/1       70:72:cf:a4:7d:50  1/1/1         1/1/1         32       switch
1/1/2       48:0f:cf:af:73:80  1/1/2         1/1/2         120      switch
1/1/46      48:0f:cf:af:73:80  1/1/46        1/1/46        120      switch
mgmt        48:0f:cf:af:73:80  mgmt          mgmt          120      switch
```

Showing information for interface **1/3/1** when it has only one switch connected as a neighbor:

```
switch# show lldp neighbor-info 1/3/1

Port                             : 1/1/1
Neighbor Entries                 : 1

Neighbor Entries Dropped         : 0
Neighbor Entries Aged-Out        : 0
Neighbor Chassis-Name            : HP-3800-24G-PoEP-2XG
Neighbor Chassis-Description     : HP J9587A 3800-24G-PoE+-2XG Switch, revision...
Neighbor Chassis-ID              : 10:60:4b:39:3e:80
Neighbor Management-Address      : 192.168.1.1
Chassis Capabilities Available : Bridge, Router
Chassis Capabilities Enabled     : Bridge
Neighbor Port-ID                 : 1/1/1
Neighbor Port-Desc               : 1/1/1
Neighbor Port VLAN ID            : 1
Neighbor Port VLAN Name          : DEFAULT_VLAN_1
Neighbor Port MFS                : 1500
TTL                              : 120
```

Showing information for interface **1/3/10** when the neighbor sends a DOT3 power TLV:

```
switch# show lldp neighbor-info 1/3/10
Port                             : 1/3/10
Neighbor Entries                 : 1
Neighbor Entries Deleted         : 0
Neighbor Entries Dropped         : 0
Neighbor Entries Aged-Out        : 0
Neighbor Chassis-Name            : 84:d4:7e:ce:5d:68
Neighbor Chassis-Description     : ArubaOS (MODEL: 325), Version Aruba IAP
Neighbor Chassis-ID              : 84:d4:7e:ce:5d:68
Neighbor Management-Address      : 169.254.41.250
Chassis Capabilities Available : Bridge, WLAN
Chassis Capabilities Enabled     : WLAN
Neighbor Port-ID                 : 84:d4:7e:ce:5d:68
Neighbor Port-Desc               : eth0
TTL                              : 120
Neighbor Port VLAN ID            : 1
Neighbor Port VLAN Name          : DEFAULT_VLAN_1
Neighbor Port MFS                : 1500
Neighbor PoE information         : DOT3
Neighbor Power Type              : TYPE2 PD
Neighbor Power Priority          : Unkown
Neighbor Power Source            : Primary
PD Requested Power Value         : 25.0 W
PSE Allocated Power Value: 25.0 W
```

```
Neighbor Power Supported       : Yes
Neighbor Power Enabled         : Yes
Neighbor Power Class           : 5
Neighbor Power Paircontrol     : No
PSE Power Pairs                : Signal
```

Showing information for interface **1/1/1** when it has multiple neighbors (displays a maximum of four):

```
switch# show lldp neighbor-info 1/1/1

Port                           : 1/1/1
Neighbor Entries               : 4

show lldp neighbor-info detail

```
show lldp neighbor-info detail [vsx-peer]
```

Description

Shows detailed LLDP neighbor information for all LLDP neighbor connected interfaces.

Parameter	Description
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

Showing detailed LLDP information for all interfaces:

```
switch# show lldp neighbor-info detail

show lldp statistics

`show lldp statistics [<INTERFACE-ID>][vsx-peer]`

Description

Shows global LLDP statistics or statistics for a specific interface.

Parameter	Description
<INTERFACE-ID>	Specifies an interface. Format: **member/slot/port**.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

On the 6400 Switch Series, interface identification differs.

Showing global statistics for all interfaces:

~~~
switch# show lldp statistics
LLDP Global Statistics
======================

Total Packets Transmitted             : 19
Total Packets Received                : 19
Total Packets Received And Discarded : 0
Total TLVs Unrecognized               : 0

LLDP Port Statistics
====================

Chapter 68

Local AAA commands

aaa accounting all-mgmt

```
aaa accounting all-mgmt <CONNECTION-TYPE> start-stop {local | group <GROUP-LIST>}
no aaa accounting all-mgmt <CONNECTION-TYPE>
```

Description

Defines accounting as being local (with the name **local**) (the default). Or defines a sequence of remote AAA server groups to be accessed for accounting purposes.

For remote accounting, the information is sent to the first reachable remote server that was configured with this command for remote accounting. If no remote server is reachable, local accounting remains available. Each available connection type (channel) can be configured individually as either local or using remote AAA server groups. All server groups named in your command, must exist. This command can be issued multiple times, once for each connection type. Local is always available for any connection type not configured for remote accounting.

> The system accounting log is not associated with any connection type (channel) and is therefore sent to the accounting method configured on the default connection type (channel) only.

The **no** form of this command removes for the specified connection type, any defined remote AAA server group accounting sequence. Local accounting is available for connection types without a configured remote AAA server group list (whether default or for the specific connection type).

Parameter	Description

<CONNECTION-TYPE>	One of these connection types (channels):
	`default`
	Defines a list of accounting server groups to be used for the **default** connection type. This configuration applies to all other connection types (**console**, **https-server**, **ssh**) that are not explicitly configured with this command. For example, if you do not use **aaa accounting all-mgmt console...** to define the console accounting list, then this default configuration is used for console.
	`console`
	Defines a list of accounting server groups to be used for the **console** connection type.
	`https-server`
	Defines a list of accounting server groups to be used for the **https-server** (REST, Web UI) connection type.
	`ssh`
	Defines a list of accounting server groups to be used for the **ssh** connection type.

`start-stop`	Selects accounting information capture at both the beginning and

Parameter	Description
	end of a process.
`local`	Selects local-only accounting when used without the **group** parameter.
`group` *`<GROUP-LIST>`*	Specifies the list of remote AAA server group names. Each name can be specified one time. Predefined remote AAA group names **tacacs** and **radius** are available. Although not a group name, predefined name **local** is available. User-defined TACACS+ and RADIUS server group names may also be used. The remote AAA server groups are accessed in the order that the group names are listed in this command. Within each group, the servers are accessed in the order in which the servers were added to the group. Server groups are defined using command **aaa group server** and servers are added to a server group with the command **server**. If the AAA server(s) in the group are not reachable, or the if there is a key mismatch error between the server and the switch, the next accounting method is attempted.

Usage

Local accounting is always active. It cannot be turned off.

Examples

Setting local accounting for the default connection type:

```
switch(config)# aaa accounting all-mgmt default start-stop local
```

Setting local accounting for the console connection type:

```
switch(config)# aaa accounting all-mgmt console start-stop local
```

For more information on features that use this command, refer to the Security Guide for your switch model.

aaa authentication console-login-attempts

```
aaa authentication console-login-attempts <ATTEMPTS> console-lockout-time <LOCKOUT-TIME>
no aaa authentication console-login-attempts
```

Description

For the console interface (channel) only, enables console login attempt limiting. If the number of failed console login attempts equals the configured threshold, the user is locked out for the configured duration.

The **no** form of this command disables console login attempt limits.

Important: If you enable the lockout using this command and also enable the SSH, REST, and Telnet lockout using command **aaa authentication limit-login-attempts**, and then enter too many consecutive wrong passwords, you may become locked out, and will have to wait for the configured lockout time to elapse before logging in on any interface.

This console login attempt limiting feature is only available when not using remote authentication through AAA servers (TACACS+ or RADIUS) on any interface. Remote authentication through AAA servers (TACACS+ or RADIUS) is not possible when limit login attempts is configured on any interface.

Parameter	Description
<ATTEMPTS>	Specifies the threshold of failed console login attempts that triggers user lockout. Range: 1 to 10. For example, if **<ATTEMPTS>** is set to **1**, a single failed login attempt triggers immediate user lockout.
<LOCKOUT-TIME>	Specifies the amount of time a user is locked out. Range: 1 to 3600 seconds.

Examples

Enabling console login attempt failure limiting with a 60 second lockout being triggered upon the third consecutive login attempt failure.

```
switch(config)# aaa authentication console-login-attempts 3 console-lockout-time
60
```

Disabling console login attempt failure limiting:

```
switch(config)# no aaa authentication console-login-attempts
```

For more information on features that use this command, refer to the Security Guide for your switch model.

aaa authentication limit-login-attempts

```
aaa authentication limit-login-attempts <ATTEMPTS> lockout-time <LOCKOUT-TIME>
no aaa authentication limit-login-attempts <ATTEMPTS> lockout-time <LOCKOUT-TIME>
```

Description

For the SSH, REST, and Telnet interface (channel), enables local login attempt limiting. If the number of failed local login attempts equals the configured threshold, the user is locked out for the configured duration.

The **no** form of this command disables local login attempt limits.

Important: If you enable the lockout using this command and also enable the console lockout using command **aaa authentication console-login-attempts**, and then enter too many consecutive wrong passwords, you may become locked out, and will have to wait for the configured lockout time to elapse before logging in on any interface.

This local login attempt limiting feature is only available when not using remote authentication through AAA servers (TACACS+ or RADIUS) on any interface. Remote authentication through AAA servers (TACACS+ or RADIUS) is not possible when limit login attempts is configured on any interface.

Parameter	Description
<ATTEMPTS>	Specifies the threshold of failed local login attempts that triggers user lockout. Range: 1 to 10. For example, if ***<ATTEMPTS>*** is set to **1**, a single failed login attempt triggers immediate user lockout.
<LOCKOUT-TIME>	Specifies the amount of time a user is locked out. Range: 1 to 3600 seconds.

Examples

Enabling local login attempt failure limiting with a 20 second lockout being triggered upon the fourth consecutive login attempt failure.

```
switch(config)# aaa authentication limit-login-attempts 4 lockout-time 20
```

Disabling login attempt failure limiting:

```
switch(config)# no aaa authentication limit-login-attempts
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.09	Added Telnet lockout support on the 6200, 6300, 6400 Switch Series.
10.07 or earlier	--

aaa authentication login

```
aaa authentication login <CONNECTION-TYPE> {local | group <GROUP-LIST>}
no aaa authentication login <CONNECTION-TYPE> {local | group <GROUP-LIST>}
```

Description

Defines authentication as being local (with the name **local**) (the default). Or defines a sequence of remote AAA server groups to be accessed for authentication purposes. Each available connection type (channel) can be configured individually as either local or using remote AAA server groups. All server groups named in your command, must exist. This command can be issued multiple times, once for each connection type. Local is always available for any connection type not configured for remote AAA authentication.

The **no** form of this command removes for the specified connection type, any defined remote AAA server group authentication sequence. Local authentication is available for connection types without a configured remote AAA server group list (whether default or for the specific connection type).

Parameter	Description

<CONNECTION-TYPE>	One of these connection types (channels):
	`default`
	Defines a list of accounting server groups to be used for the `default` connection type. This configuration applies to all other connection types (`console`, `https-server`, `ssh`) that are not explicitly configured with this command. For example, if you do not use `aaa accounting all-mgmt console...` to define the console accounting list, then this default configuration is used for console.
	`console`
	Defines a list of accounting server groups to be used for the **console** connection type.
	`https-server`
	Defines a list of accounting server groups to be used for the **https-server** (REST, Web UI) connection type.
	`ssh`
	Defines a list of accounting server groups to be used for the **ssh** connection type.

Parameter	Description
`local`	Selects local-only accounting when used without the **group** parameter.
`group <GROUP-LIST>`	Specifies the list of remote AAA server group names. Each name can be specified one time. Predefined remote AAA group names **tacacs** and **radius** are available. Although not a group name, predefined name **local** is available. User-defined TACACS+ and RADIUS server group names may also be used. The remote AAA server groups are accessed in the order that the group names are listed in this command. Within each group, the servers are accessed in the order in which the servers were added to the group. Server groups are defined using command **aaa group server** and servers are added to a server group with the command **server**. If no AAA server(s) in the group are reachable, or if there is a key mismatch error between the server and the switch, the next authentication method is attempted.

Examples

Setting local authentication for the default connection type:

```
switch(config)# aaa authentication login default local
```

Setting local authentication for the console connection type:

```
switch(config)# aaa authentication login console local
```

For more information on features that use this command, refer to the Security Guide for your switch model.

aaa authentication minimum-password-length

```
aaa authentication minimum-password-length <LENGTH>
no aaa authentication minimum-password-length <LENGTH>
```

Description

Enables minimum password length checking. Existing passwords shorter than the minimum length are unaffected. Length checking does not apply to ciphertext passwords. Length checking applies both to local and remote authentication.

The **no** form of this command disables minimum password length checking.

Parameter	Description
<LENGTH>	Specifies the minimum password length. Range: 1 to 32.

Examples

Enabling password length checking, with a minimum length of 12.

```
switch(config)# aaa authentication minimum-password-length 12
```

Disabling minimum password length checking:

```
switch(config)# no aaa authentication minimum-password-length
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config`	Administrators or local user group members with execution rights for this command.

aaa authorization commands (local)

```
aaa authorization commands <CONNECTION-TYPE> {local | none}
no aaa authorization commands <CONNECTION-TYPE> {local | none}
aaa authorization commands <CONNECTION-TYPE> group <GROUP-LIST>
no aaa authorization commands <CONNECTION-TYPE> group <GROUP-LIST>
```

Description

Defines authorization as being basic local RBAC (specified as **none**), or as full-fledged local RBAC specified as **local** (the default), or as remote TACACS+ (specified with `group` *<GROUP-LIST>*). Each available connection type (channel) can be configured individually. All server groups named in the command, must exist. This command can be issued multiple times, once for each connection type.

The **no** form of this command unconfigures authorization for the specified connection type, reverting to the default of **local**.

Although only TACACS+ servers are supported for remote authorization, local authorization (basic or full-fledged) can be used with remote RADIUS authentication. If your switch uses command authorization, best practices is to configure authorization fail-through before configuring authentication fail-through. If not, the switch may fall into an unusable state where authorization will fail for all commands.

Parameter	Description

<CONNECTION-TYPE>	One of these connection types (channels):
	`default`
	Selects the **default** connection type for configuration. This configuration applies to all other connection types (**console**, **ssh**) that are not explicitly configured with this command. For example, if you do not use **aaa authorization commands console...** to define the console authorization list, then this default configuration is used for console.
	`console`
	Selects the **console** connection type for configuration.
	`ssh`
	Selects the **ssh** connection type for configuration.

`local`	When used alone without `group` *<GROUP-LIST>*, selects local authorization which can be used to provide authorization for a purely local setup without any remote AAA servers and also for when RADIUS is used for remote Authentication and Accounting but Authorization is local. When used after `group`, provides for fallback (to full-fledged local authorization) when every server in every specified TACACS+ server group cannot be reached. **NOTE:** If any TACACS+ server in the specified groups is reachable, but the command fails to be authorized by that server, the command is rejected and local authorization is never attempted. Local authorization is only attempted if every TACACS+ server cannot be reached.
`none`	When used alone without `group` *<GROUP-LIST>*, selects basic local RBAC authorization, for use with the built-in user groups (**administrators**, **operators**, **auditors**). When used after `group`, provides for fallback (to basic local RBAC authorization) when every server in every specified TACACS+ server group cannot be reached. **NOTE:** With **none**, for users belonging to user-defined user groups, all commands can be executed regardless of what authorization rules are defined in such groups. For per-command local authorization, use **local** instead.
`group` *<GROUP-LIST>*	Specifies the list of remote AAA server group names. Predefined remote AAA group name **tacacs** is available. User-defined TACACS+ server group names may also be used. The remote AAA server groups are accessed in the order that the group names are listed in this command. Within each group, the servers are accessed in the order in which the servers were added to the group. Server groups are defined using command **aaa server group** and servers are added to a server group using command **server**. It is recommended to always include either the special name **local**

Parameter	Description
	or **none** as the last name in the group list. If both **local** or **none** are omitted, and no remote AAA server is reachable (or the first reachable server cannot authorize the command), command execution for the current user will not be possible. If no AAA server(s) in the group are reachable, or if there is a key mismatch error between the server and the switch, the next authorization method is attempted.

Examples

Setting the authorization for default to **local**:

```
switch(config)# aaa authorization commands default local
```

Setting the authorization for the SSH interface to **none**:

```
switch(config)# aaa authorization commands ssh none
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config`	Administrators or local user group members with execution rights for this command.

show aaa accounting

```
show aaa accounting [vsx-peer]
```

Description

Shows the accounting configuration per connection type (channel).

Parameter	Description
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Configuring and then showing local accounting for the default and console connection types:

```
switch(config)# aaa accounting all default start-stop local
switch(config)# aaa accounting all console start-stop local
switch(config)# exit
switch# show aaa accounting
AAA Accounting:
  Accounting Type                                : all
  Accounting Mode                                : start-stop

Accounting for default channel:
----------------------------------------------------------------------------------
GROUP NAME                        | GROUP PRIORITY
----------------------------------------------------------------------------------
local                             | 0
----------------------------------------------------------------------------------

Accounting for console channel:
----------------------------------------------------------------------------------
GROUP NAME                        | GROUP PRIORITY
----------------------------------------------------------------------------------
local                             | 0
----------------------------------------------------------------------------------
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show aaa authentication

`show aaa authentication [vsx-peer]`

Description

Shows the authentication configuration per connection type (channel).

Parameter	Description
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Configuring and then showing local authentication for the default and console connection types (channels):

```
switch(config)# aaa authentication login default local
switch(config)# aaa authentication login console local
switch(config)# exit
switch# show aaa authentication

AAA Authentication:
  Fail-through                          : Disabled
  Limit Login Attempts                  : Not set
  Lockout Time                          : 300
  Minimum Password Length               : Not set

Authentication for default channel:
---------------------------------------------------------------------------------
GROUP NAME                       | GROUP PRIORITY
---------------------------------------------------------------------------------
local                            | 0
---------------------------------------------------------------------------------

Authentication for console channel:
---------------------------------------------------------------------------------
GROUP NAME                       | GROUP PRIORITY
---------------------------------------------------------------------------------
local                            | 0
---------------------------------------------------------------------------------
```

For more information on features that use this command, refer to the Security Guide for your switch model.

show aaa authorization

```
show aaa authorization [vsx-peer]
```

Description

Shows the authorization configuration per connection type (channel).

Parameter	Description
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Configuring and then showing full-fledged local RBAC authorization for the default and console connection types (channels):

```
switch(config)# aaa authorization commands default none
switch(config)#
switch(config)# aaa authorization commands console none
switch(config)# exit
switch#
switch# show aaa authorization
Authorization for default channel:
---------------------------------------------------------------------------------
GROUP NAME                       | GROUP PRIORITY
---------------------------------------------------------------------------------
none                             | 0
---------------------------------------------------------------------------------

Authorization for console channel:
---------------------------------------------------------------------------------
GROUP NAME                       | GROUP PRIORITY
---------------------------------------------------------------------------------
none                             | 0
---------------------------------------------------------------------------------
```

show authentication locked-out-users

`show authentication locked-out-users`

Description

Shows a list of users currently locked out due to excessive failed login attempts. This applies to console, REST, SSH, WebUI, and telnet logins.

Example

Showing locked-out users.

```
switch# show authentication locked-out-users
 USER                             GROUP
 ---------------------------------------
 admin                            administrators
 admin-1                          administrators
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.11	The output of this command now also includes information for users locked out due to excessive REST login attempts.
10.09	Command introduced.

Command Information

Platforms	Command context	Authority
All platforms	Manager (#)	Administrators or local user group members with execution rights for this command.

show ssh authentication-method

```
show ssh authentication-method
```

Description

Shows the status of the SSH public key method and the local password-based (through SSH client) authentication method.

Example

Showing the authentication methods.

```
switch# show ssh authentication-method
SSH publickey authentication : Enabled
SSH password authentication : Enabled
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Platforms	Command context	Authority
All platforms	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show user

`show user <USERNAME> authorized-key`

Description

Shows the SSH client public key list for a specified user.

Parameter	Description
<USERNAME>	Specifies the username for which you want to show the SSH client public key list.

Usage

Any user can show their own public key list; however, administrators can also show a public key list of other users.

Examples

Showing a client public key:

```
switch# show user admin authorized-key

1. Key Type : RSA      Key size : 2048
ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAABAQDMtyMBmmAaF6r1zxf3DZNHSYVHBJhlbBlyAIqQ8DSHK
...
U+aE14UW/ifIukmK67sIHwK+FhhRYwPztQc5pjyOPk128a4pgKQaHCcOF169Z admin@switch
```

Showing two client public keys:

```
switch# show user admin authorized-key
1. Key Type : ECDSA     Curve : nistp256
ecdsa-sha2-nistp256 AAAAE2VjZHNhLXNoYTItbmlzdHAyNTYAAAAIbmlzdHAyNTYAAABBBEqEFevZ0
...
l76V+D0svdCJ9Wo32zqI9OeAdTJw/eZYp5qknhNgS81HjAI6J/4/kAqdZAjbqQUiCAk= admin@switch

2. Key Type : RSA      Key size : 2048
ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAABAQDXQHrqV7+/GcMdOhr//IRjJkX7TQKupW89j80bL7xq8
...
j8qKuHWSN0/h/HxjzQJuYDVmZN5vG3DhpXbBZUlZNnchVod13QLCesqA3VLKN admin@switch
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

All platforms	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

ssh password-authentication

```
ssh password-authentication
```

```
no ssh password-authentication
```

Description

Enables the password-based authentication method for use with SSH clients.

The **no** form of this command disables the password-based authentication method for use with SSH clients.

Usage

The switch ships with password-based authentication (for SSH clients) enabled. The maximum number of password retries is three.

Examples

Enabling password authentication for use with SSH clients:

```
switch(config)# ssh password-authentication
```

Disabling password authentication for use with SSH clients:

```
switch(config)# no ssh password-authentication
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority

ssh public-key-authentication

```
ssh public-key-authentication
no ssh public-key-authentication
```

Description

Enables the SSH public key authentication method. The switch ships with SSH public key authentication enabled.

The **no** form of this command disables the SSH public key authentication method.

Although SSH public key authentication is enabled by default, it cannot be used until SSH public keys are added with the **user authorized-key** command.

Examples

Enabling SSH public key authentication:

```
switch(config)# ssh public-key-authentication
```

Disabling SSH public key authentication:

```
switch(config)# no ssh public-key-authentication
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config`	Administrators or local user group members with execution rights for this command.

user authorized-key

```
user <USERNAME> authorized-key <PUBKEY>
no user <USERNAME> authorized-key [<KEYNUM>]
```

Description

Copies an SSH client public key into the key list. If the key list and the public key do not exist, it creates a list with the public key. If the SSH client public key exists, the command appends the new key to the existing list. The client public key list holds a maximum of 32 client keys.

The **no** form of the command removes either one or all SSH public keys from the key list.

Parameter	Description
<USERNAME>	Specifies the name of the user.
<PUBKEY>	Specifies the SSH client public key to be copied into the key list.
<KEYNUM>	Specifies the key number. The range is 1 to 32. Use the **show user *<USERNAME>* authorized-key** command to find the key number associated with the key.

Usage

Each key on the key list has a key identifier. The **show user <USERNAME> authorized-key** command displays the key identifier associated with the key.

Administrators can add and remove the public keys of themselves and other users. Operators can add and remove only their own public keys. If the public key authentication method is enabled, the client public key present is used by the SSH server to authenticate the client. The authentication method reverts to the password authentication method and prompts for a client password when one of the following occurs:

- The client public keys are not present.
- The server does not have the keys enabled.
- The public key method is disabled.

You can either remove all keys or a specific key. Each key on the key list has a key identifier. If you provide the key identifier in this command, the command removes the corresponding key from the list. If you provide no key identifier, the command removes all keys from the key list.

Examples

Adding a public key:

```
switch(config)#user admin authorized-key ecdsa-sha2-nistp256 AAAAE2VjZHNhLXNoYTIt
bmlzdHAyNTYAAAAIbmlzdHAyNTYAAABBBEqEFevZ0l76V+D0svdCJ9Wo32zqI9OeAIdTJwT/eZYp50qkA
nhZNgS81HBjAI6QJ/4/kAyqdZ9oAjbiqQUiCAk= root@switch
```

Removing all SSH public keys from the list:

```
switch(config)# no user admin authorized-key
```

Removing the specified SSH public key from the list:

```
switch(config)# no user admin authorized-key 2
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification

Chapter 69

Log rotation commands

logging threshold

```
logging threshold {audit-log | auth-log | commands-log |event-log | security-log | https-
server-log} <THRESHOLD%>
no logging threshold {audit-log | auth-log | commands-log | event-log |  security-log |
https-server-log} [<THRESHOLD%>]
```

Description

Selects the logging buffer notification threshold for the specified logging buffer. Whenever the logging buffer space consumption exceeds the selected threshold (percent of buffer capacity), a LOG_BUFFER_ALMOST_FULL event and SNMP RMON trap is triggered. This gives you the opportunity to save the logs elsewhere before the buffers are rotated with the oldest data being overwritten.

Also, a LOG_BUFFER_WRAPPED event and SNMP RMON trap is triggered if the logging buffer capacity is fully consumed and the log buffer is rotated with the oldest data being overwritten.

The **no** form of this command resets the logging buffer warning threshold to its default. All logs except **audit-log** have a default of 90 (percent) and **audit-log** has a default of 50 (percent).

The largest REST payload that can be sent to RADIUS/TACACS servers is 1024 characters, and the maximum REST payload that can be sent to syslog servers is 3500 characters. Once this limit is exceeded, the log will display three dots (...) to indicate the the message has exceeded the character limit and is incomplete. .

Parameter	Description
`audit-log`	Selects the audit log.
`auth-log`	Selects the authentication log.
`commands-log`	Configure the logging threshold for commands log buffer
`event-log`	Selects the event log.
`https-server-log`	Selects the HTTPS server log.
`security-log`	Selects the security log.
<THRESHOLD%>	Selects the notification threshold as a percent that the selected logging buffer is full. Available percent values for all logs except `audit-log`: **15 30 50 70 90 100** Available percent values for `audit-log`: **50 100**

Examples

Setting the audit log threshold:

```
switch(config)# logging threshold audit-log 100
```

Setting the authentication log threshold:

```
switch(config)# logging threshold auth-log 50
```

Setting the event log threshold:

```
switch(config)# logging threshold event-log 70
```

Setting the HTTPS server log threshold:

```
switch(config)# logging threshold https-server-log 50
```

Setting the security log threshold:

```
switch(config)# logging threshold security-log 70
```

Resetting the audit log threshold to its default of 50:

```
switch(config)# no logging threshold audit-log
```

Resetting the authentication log threshold to its default of 90:

```
switch(config)# no logging threshold auth-log
```

Resetting the event log threshold to its default of 90:

```
switch(config)# no logging threshold event-log
```

Resetting the HTTPS server log threshold to its default of 90:

```
switch(config)# no logging threshold https-server-log
```

Resetting the security log threshold to its default of 90:

```
switch(config)# no logging threshold security-log
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

Command History

Release	Modification
10.11	Introduced the **commands-log** parameter.
10.09	Command introduced.

Command Information

Platforms	Command context	Authority
All platforms	`config`	Administrators or local user group members with execution rights for this command.

logrotate maxsize

```
logrotate maxsize <MAX-SIZE>
no logrotate maxsize
```

Description

Specifies the maximum allowed log file size.

A log file that exceeds either the **logrotate maxsize** or the **logrotate period** (whichever happens first), triggers rotation of the log file.

The **no** form of this command resets the size of the log file to the default (100 MB).

Parameter	Description
<MAX-SIZE>	Specifies the allowed size the log file can reach before it is compressed and stored locally or transferred to a remote host. Range: 10 to 200 MB. Default: 100 MB.

Examples

Setting the maximum log file size:

```
switch(config)# logrotate maxsize 24
```

Resetting the maximum log file size to its default of 100 MB:

```
switch(config)# no logrotate maxsize
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config`	Administrators or local user group members with execution rights for this command.

logrotate period

```
logrotate period {daily | hourly | monthly | weekly}
no logrotate period
```

Description

Sets the log file rotation time period. Defaults to daily.

A log file that exceeds either the **logrotate maxsize** or the **logrotate period** (whichever happens first), triggers rotation of the log file.

The **no** form of this command resets the log rotation period to the default of daily.

Parameter	Description
`daily`	Rotates log files on a daily basis (default) at 0:01.
`hourly`	Rotates log files every hour at the first second of the hour.
`monthly`	Rotates log files monthly on the first day of the month at 00:01.
`weekly`	Rotates log files once a week on Sunday at 00:01.

Examples

Setting a weekly period:

```
switch(config)# logrotate period weekly
```

Resetting the period to its default of daily:

```
switch(config)# no logrotate period
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

logrotate target

```
logrotate target <URI> [vrf <VRF_NAME>]
no logrotate target [<URI>] [vrf <VRF_NAME>]
```

Description

Using TFTP, sends the rotated log files to a specified remote host identified by Universal Resource Identifier (URI).

The **no** form of this command resets the target to the default, which stores the rotated and compressed log files locally in **/var/log/**.

Command context

Parameter	Description
`<URI>`	Specifies the URI of the remote host. The default directory is `local`. `tftp://{{<IPV4_ADDR>|IPV6_ADDR>}|HOST}[/<DIRECTORY>]`
`<VRF_NAME>`	Specifies the VRF name (Default: `default`).

Usage

- Rotated log files are compressed and stored locally in the path /var/log/ regardless of the remote host configuration.

Examples

Setting an IPv4 target:

```
switch(config)# logrotate target tftp://192.168.1.132
```

Setting an IPv4 target with a directory:

```
switch(config)# logrotate target tftp://192.168.1.132/logrotate/
```

Setting an IPv4 target with the default VRF:

```
switch(config)# logrotate target tftp://192.168.1.132 vrf mgmt
```

Setting an IPv6 target with the default VRF:

```
switch(config)# logrotate target tftp://2001:db8:0:1::128 vrf default
```

Resetting the target to local:

```
switch(config)# no logrotate target
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

show logrotate

`show logrotate [vsx-peer]`

Description

Shows the log rotate configuration.

Parameter	Description
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

```
switch# show logrotate
Logrotate configurations :
Period                : weekly
Maxsize               : 20MB
Target                : tftp://2001:db8:0:1::128 vrf mgmt
```

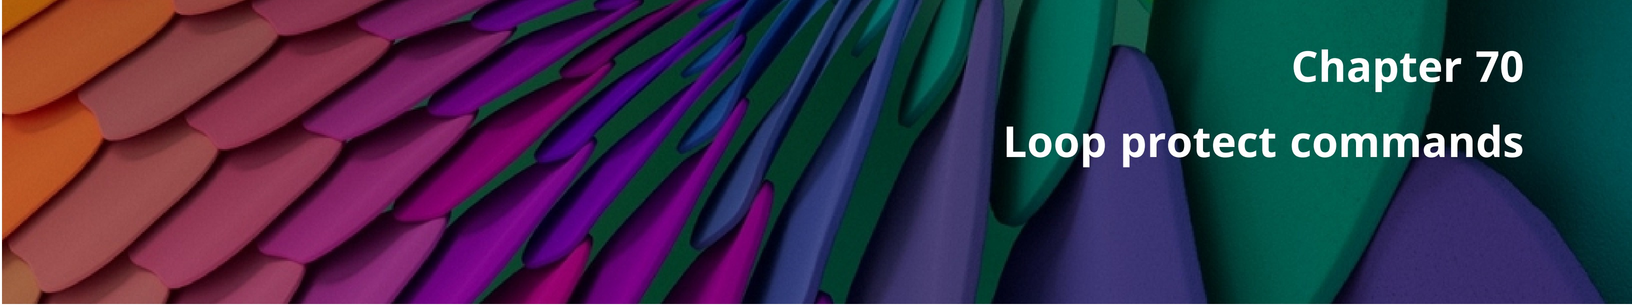
All platforms	Manager (#)	Administrators or local user group members with execution rights for this command.



Chapter 70

Loop protect commands

loop-protect

```
loop-protect
no loop-protect
```

Description

Enables loop protection on a layer 2 interface, VXLAN interface, or LAG. Loop protection packets are sent/received on the LAG and not the interface which are members of the LAG. Loop protection only works on layer 2 interfaces. If a layer 2 interface is changed to a layer 3 interface, all loop protection configuration settings are lost for that interface.

If loop protection is enabled on a VXLAN interface, the local VTEP will generate loop protect packets on the VXLAN tunnel. Remote VTEP will hardware forward the same loop protect packet. If a local VTEP receives its own packet on any L2 interface, it will be detected as a loop and will bring down the L2 interface on which the loop protect control packet was received.

The **no** form of this command disables loop protection on a layer 2 interface, VXLAN interface, or LAG.

> Loop protection on VXLAN interfaces is supported only on AOS-CX 6200,6300,6400,8360,8325,8400,9300,8100,10000 switch series.

Examples

On the 6400 Switch Series, interface identification differs.

Enabling loop protection on interface **1/1/1**:

```
switch# config
switch(config)# interface 1/1/1
switch(config-if)# loop-protect
```

Enabling loop protection on LAG **25**:

```
switch# config
switch(config)# interface lag 25
switch(config-lag-if)# loop-protect
```

Enabling loop protection on VXLAN interface:

```
switch# config
switch(config)# interface vxlan 1
switch(config-vxlan-if)# loop-protect
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

Command History

loop-protect action

```
loop-protect action {do-not-disable | tx-disable | tx-rx-disable}
no loop-protect action {do-not-disable | tx-disable | tx-rx-disable}
```

Description

Sets the action to be taken when a loop protection packet is received on a port.

If an action is configured after a loop is detected, then the new action only takes effect after the re-enable timer expires. To have the action take effect immediately, disable and then re-enable loop protect.

The **no** form of this command resets the action to the default (**tx-disable**).

This command is not supported on a VXLAN interface and the default action for a VXLAN interface is rx-disable .

Parameter	Description
`do-not-disable`	No ports are disabled. On every transmit interval, the loop will be detected and the detection will be reported via an SNMP trap and an event log message.
`tx-disable`	The port that transmitted the loop detection packet is disabled. When this setting is enabled, environments with N loops, must have loop protection be configured on at least N-1 ports to have a loop free topology. Default.
`tx-rx-disable`	The ports that transmitted and received the loop detection packet are disabled.

Example

```
switch(config-if)# loop-protect action do-not-disable
switch(config-if)# no loop-protect action do-not-disable
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

loop-protect re-enable-timer

```
loop-protect re-enable-timer <TIME>
no loop-protect re-enable-timer <TIME>
```

Description

Configures the time interval after which an interface disabled by loop protection is re-enabled. The loop protection timer is disabled by default.

The **no** form of this command disables the loop protect timer.

Parameter	Description
<TIME>	Specify the number of seconds after which a disabled interface is re-enabled. Range: 15 to 604800.

Example

```
switch# config
switch(config)# loop-protect re-enable-timer 60
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

loop-protect transmit-interval

```
loop-protect transmit-interval <TIME>
no loop-protect transmit-interval [<TIME>]
```

Description

Configures the time interval between successive loop protect packets sent on an interface.

The **no** form of this command sets the time interval to the default value of 5 seconds.

Parameter	Description
<TIME>	Configures the transmit interval in seconds. Range: 5 to 10. Default: 5.

Examples

```
switch(config)# loop-protect transmit-interval 10
switch(config)# no loop-protect transmit-interval
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

loop-protect trap loop-detected

```
loop-protect trap loop-detected
no loop-protect trap loop-detected
```

Description

Enables sending SNMP traps for loop-protect related events.

The **no** form of this command disables sending SNMP traps for loop-protect related events.

Examples

Enabling the sending of SNMP traps:

```
switch# loop-protect trap loop-detected
```

Disabling the sending of SNMP traps:

```
switch# no loop-protect trap loop-detected
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

loop-protect vlan

```
loop-protect vlan <VLAN-LIST>
no loop-protect vlan
```

Description

Specifies the trunk allowed VLANs on which loop protection packets are sent. By default, loop protection packets are only sent on access VLANs and native VLANs on a port. To send loop protection packets on trunk allowed VLANs, the VLANs must be explicitly added using this command.

When loop protection is enabled on VXLAN interfaces, the switch will start transmitting loop protect packets to each VTEP peer that are part of a VNI.

Loop protection can be configured on a maximum of 4094 VLANs across all interfaces.

Loop protection on VXLAN interfaces can be enabled on a maximum of 5000 (total of number of VTEPs * number of loop protect enabled VLANs). Loop protection will generate a maximum 5000 VXLAN encapsulated packets within the default loop protect time interval of 5 seconds.

The **no** form of this command removes loop protection from all VLANs on the interface.

Parameter	Description
<VLAN-LIST>	Specifies the number of a single VLAN, or a series of numbers for a range of VLANs, separated by commas (1, 2, 3, 4), dashes (1-4), or both (1-4, 6).

Example

```
switch(config-if)# loop-protect vlan 2-6,10,15-20
```

Enabling loop protection on VXLAN interface:

```
switch# config
switch(config)# interface vxlan 1
switch(config-lag-if)# loop-protect vlan 10
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

show loop-protect

Description

`show loop-protect [<INTERFACE-NAME>] [vsx-peer]`

This command shows the following global configurations.

- Transmit interval.
- Re-enable timer.
- Per-port configurations.
- Loop-protect enable or disable status.
- Loop detection.

- Loop detected count.
- Timestamp of latest loop detection.
- Loop is detected on VLAN.
- Interface status.
- List of configured VLAN's for that port.
- VTEP port information

Specify the interface name on display for the filter. When rebooting the switch or after switchover, The loop-detected count on the loop detected port is reset to zero.

Parameter	Description
<INTERFACE-NAME>	Specifies the name of a logical interface on the switch. This can be one of the following: ■ An Ethernet interface associated with a physical port. Format: **member/slot/port**. ■ A LAG (link aggregation group). Specify the ID of LAG . For example: **lag100**. ■ A VXLAN interface. Specify the VXLAN ID. For example: **vxlan 1**.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Loop protection on VXLAN interfaces is supported on AOS-CX 6200, 6300, 6400, 8360, 8325, 8400, 9300, 8100, 10000 switch series.

Examples

On the 6400 Switch Series, interface identification differs.

```
switch# show loop-protect

Transmit Interval (sec)             : 5
Port Re-enable Timer (sec)          : Disabled
Loop Detected Trap                  : Enabled

Interface 1/1/1
  Loop-protect enabled          : Yes

Loopback commands

interface loopback

```
interface loopback <INSTANCE>
no interface loopback <INSTANCE>
```

Description

Creates a loopback interface and enters loopback configuration mode.

The **no** form of this command deletes a loopback interface.

Parameter	Description
<INSTANCE>	Selects the loopback interface ID. Range: 0 to 255

Examples

```
switch(config)# interface loopback
switch(config-loopback-if)#
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

ip address

```
ip address <IPV4-ADDR/MASK> [secondary]
no ip address <IPV4-ADDR/MASK> [secondary]
```

Description

Sets the IPv4 address for a loopback interface.

The **no** form of this command reverses the set of the IPv4 address for a loopback interface.

Parameter	Description
<IPV4-ADDR>	Specifies an IP address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.
<MASK>	Specifies the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128.
secondary	Indicates that the IPv4 address is a secondary address.

Examples

```
switch(config)# interface loopback 1
switch(config-loopback-if)# ip address 16.93.50.2/24
switch(config-loopback-if)# ip address 20.1.1.1/24 secondary
```

ipv6 address

ipv6 address *<IPV6-ADDR/MASK>*

Description

Sets the IPv6 address for a loopback interface.

Parameter	Description
<IPV6-ADDR>	Specifies an IP address in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.
<MASK>	Specifies the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128.

Examples

switch(config)# **interface loopback 1**

switch(config-loopback-if)# **ipv6 address fd00:5708::f02d:4df6/64**

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

vrf attach

```
vrf attach <VRF-NAME>
no vrf attach <VRF-NAME>
```

Description

Attaches a non-default VRF to a loopback.

The **no** form of this command deletes a non-default VRF from a loopback and reattaches the default VRF.

Parameter	Description
<VRF-NAME>	Specifies the name of the non-default VRF to be attached/deleted to/from a loopback.

Examples

```
switch(config)# interface loopback 1
switch(config-loopback-if)#vrf attach test
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

show interface loopback

```
show interface loopback [brief | instance <ID>] [vsx-peer]
```

Description

This command displays the configuration and status of loopback interfaces.

Parameter	Description
`brief`	Displays brief information about all configured loopback interfaces.
`instance <ID>`	Displays the configuration and status of a loopback interface ID. Range: 1-255
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

```
switch# show interface loopback
 Interface loopback1 is up
 IPv4 address 192.168.1.1/24
 Interface loopback2 is up
 IPv4 address 182.168.1.1/24
```

```
switch# show interface loopback brief
----------------------------------------------------------------------
Loopback      IP Address                                     Status
Interface
----------------------------------------------------------------------
loopback1   10.1.1.1/24                                         up
loopback1   1111:2222:3333:4444::6666/128                       up
```

```
switch# show interface loopback 1
 Interface loopback1 is up
 IPv4 address 192.168.1.1/24
```

Chapter 72

MAC address table commands

clear mac-address

```
clear mac-address {interface <INTERFACE> | port <PORT-NUM> [vlan <VLAN-ID>] | vlan <VLAN-
ID> [port <PORT-NUM>] | <MAC-ADDR> [vlan <VLAN-ID>] [force]| <mac-address mac-move
[address <mac-address> vlan <vlan>] | [vlan <VLAN>]
<VLAN-ID>]}
```

Description

Clears the dynamic learned MAC addresses on the specified interface, combination of interface and VLAN, port, VLAN, combination of port and VLAN, MAC address, or combination of MAC address and VLAN. The command does not clear any port-security learned MAC addresses.

Port-security MAC addresses are cleared when the port on which the MAC addresses were learned are shut down or the port-access-security feature is disabled on the port or the switch.

Parameter	Description
<INTERFACE>	Specifies the list of interfaces, for example, **1/1/1** or **1/1/1-1/1/3** or **lag1** or **vxlan1**.
<PORT-NUM>	Specifies a physical port on the switch. Format: **member/slot/port**.
<VLAN-ID>	Specifies the number of a VLAN.
<MAC-ADDR>	Specifies the MAC address.
<mac-address mac-move>	Clears the MAC move count and move history for a specified list or range of VLANs, or for a specific MAC address and VLANs. When the MAC address and VLANs are not mentioned, the statistics for all MAC addresses are cleared.
force	Clears the specified MAC address even if the MAC address is internally programmed by MAC management.

Examples

On the 6400 Switch Series, interface identification differs.

Clearing the learned MAC addresses on a port:

```
switch# clear mac-address port 1/1/1
```

Clearing the learned MAC addresses on a combination of a VLAN and a port:

```
switch# clear mac-address port 1/1/1 vlan 20
```

```
switch# clear mac-address vlan 2 port 1/1/3
```

Clearing the learned MAC addresses on a combination of a VLAN and an interface or a list of interfaces:

```
switch# clear mac-address interface 1/1/1 vlan 10
```

```
switch# clear mac-address vlan 1 interface 1/1/1-1/1/3
```

Clearing the specified MAC addresses entry on the VLAN:

```
switch# clear mac-address 14:FA:01:F1:8B:8F vlan 1
```

Clearing the specified MAC addresses entry by force:

```
switch# clear mac-address 14:FA:01:F1:8B:8F force
```

Clearing the learned MAC move addresses on a port:

```
switch# clear mac-address mac-move
```

Clearing the learned MAC move addresses on a combination of a VLAN and an interface or a list of interfaces:

```
switch# clear mac-address mac-move address 00:00:00:00:00:01 vlan 10
```

Clearing the MAC move addresses entries on the VLAN:

```
switch# clear mac-address mac-move vlan 10-20
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

Command History

Release	Modification
10.13	The **mac-address mac-move** parameter was introduced.
10.09	Added parameters for interface and MAC address.
10.07 or earlier	--

Command Information

All platforms	Manager (#)	Administrators or local user group members with execution rights for this command.

clear mac address mac move

```
clear mac-address mac-move [address <mac-address> vlan <vlan>] | [vlan <VLAN>]
```

Description

Clears the MAC move count and move history for a specified list or range of VLANs, or for a specific MAC and VLAN.
When MAC and VLAN are not mentioned, it clears statistics for all MACs.

Parameter	Description
<address>	Clears information for a specific MAC address.
<vlan>	Clears mac-move entries on VLANs.

Examples

Clearing the learned MAC move addresses on a port:

```
switch# clear mac-address mac-move
```

Clearing the learned MAC move addresses on a combination of a VLAN and an interface or a list of interfaces:

```
switch# clear mac-address mac-move address 00:00:00:00:00:01 vlan 10
```

Clearing the MAC move addresses entries on the VLAN:

```
switch# clear mac-address mac-move vlan 10-20
```

Command History

Release	Modification
10.13	Command introduced

clear mac-address-table

```
clear mac-address-table
   address <mac-address>
   vlan <1-4094>
```

Description

This command is used to clear the MAC move count and move history for a single MAC address or VLAN, or for a range of VLANs. If no specific MAC address or VLAN is specified, this command clears statistics for all MAC addresses.

Parameter	Description
`address`	(Optional) Clear information for a specific MAC address.
`vlan <1-4094>`	(Optional) Clear move information for specific VLAN.

Examples

Clearing MAC move statistics for all MAC addresses.

```
switch# clear mac-address mac-move
```

Clearing MAC move statistics for MAC addresses in a range of VLANs.

```
switch# clear mac-address mac-move vlan 10-20
```

Clearing MAC move addresses from a specific MAC address and VLAN:

```
switch# clear mac-address mac-move address 00:00:00:00:00:01 vlan 10
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

Command History

Release	Modification
10.13 or earlier	Command introduced.

Command Information

mac-address-table age-time

```
mac-address-table age-time <SECONDS>
no mac-address-table age-time [<SECONDS>]
```

Description

Sets the maximum amount of time a MAC address remains in the MAC address table. When this time expires, the MAC address is removed.

The **no** form of this command resets the MAC aging timer to the default value (300 seconds).

Parameter	Description
`age-time <SECONDS>`	Specifies the MAC address aging time in seconds. Range: 60 to 3600. Default: 300.

Example

```
switch(config)# mac-address-table age-time 120
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config`	Administrators or local user group members with execution rights for this command.

mac-lockout

```
mac-lockout <MAC-ADDR>
no mac-lockout <MAC-ADDR>
```

Description

Locks a MAC address globally on the switch and all VLANS. The switch drops all data packets addressed to or from the given address.

The **no** form of this command unlocks the MAC address globally on the switch and all VLANs.

This configuration will disable flow tracking statistics collection.

Parameter	Description
<MAC-ADDR>	Specifies the MAC address.

Usage

MAC lockout is implemented on each switch individually. MAC lockout overrides MAC lockdown, port security (secure MAC), and 802.1X authentication. The MAC lockout feature is not intended to lock broadcast/multicast MAC addresses and switch agent MACs.

A maximum of 200 MAC lockouts can be configured on a switch.

Example

Enabling MAC lockout:

```
switch(config)# mac-lockout 00:00:00:00:00:01
```

Disabling MAC lockout:

```
switch(config)# no mac-lockout 00:00:00:00:00:01
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

Command History

Release	Modification
10.14	Added information related to role based IPFIX.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400 (v2 profile only)	`config`	Administrators or local user group members with execution rights for this command.

show mac-address-table

```
show mac-address-table [hsc] [vsx-peer]
```

Description

Shows MAC address table information. If HSC is enabled, MAC addresses discovered by the HSC manager are also displayed.

Parameter	Description
`[hsc]`	Displays only MAC address discovered by the HSC manager on the remote controller.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

Showing output when table entries exist:

```
switch# show mac-address-table
MAC age-time              : 300 seconds
Number of MAC addresses : 5

MAC Address          VLAN     Type       Port
--------------------------------------------------
00:00:00:00:00:05    1        dynamic    1/1/2
00:00:00:00:00:06    2        dynamic    1/1/1
00:00:00:00:00:08    3        hsc        vxlan1(10.1.1.1)
00:00:00:00:00:12    3        hsc        vxlan1(10.1.1.3)
00:00:00:00:00:34    3        hsc        vxlan1(10.1.1.4)
```

Showing output that includes information about an IPv6 VXLAN:

```
3C-T-6300-27# show mac-address-table
MAC age-time              : 300 seconds
Number of MAC addresses : 2
MAC Address          VLAN     Type                          Port
--------------------------------------------------------------
00:50:56:8d:44:13    1001     dynamic                       1/1/2
00:50:56:8d:45:63    1002     evpn                          vxlan1(1920:1680:1:1::2)
```

Showing output when there are no MAC table entries:

```
switch# show mac-address-table
No MAC entries found.
```

Showing only MAC address discovered by the HSC manager:

```
switch# show mac-address-table hsc
Number of MAC addresses : 3
MAC Address          VLAN     Type       Port
---------------------------------------------------------
00:00:00:00:00:08    3        hsc        vxlan1(10.1.1.1)
00:00:00:00:00:12    3        hsc        vxlan1(10.1.1.3)
00:00:00:00:00:34    3        hsc        vxlan1(10.1.1.4)
```

show mac-address-table address

`show mac-address-table address <MAC-ADDR> [vsx-peer]`

Description

Shows MAC address table information for a specific MAC address.

Parameter	Description
<MAC-ADDR>	Specifies the MAC address.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

On the 6400 Switch Series, interface identification differs.

```
switch# show mac-address-table address 00:00:00:00:00:01
MAC age-time            : 300 seconds
Number of MAC addresses : 2

MAC Address          VLAN     Type       Port
--------------------------------------------------
00:00:00:00:00:01    2        dynamic    1/1/1
00:00:00:00:00:01    1        dynamic    1/1/1
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

show mac-address-table count

```
show mac-address-table count
      [dynamic | port <PORT-NUM> | vlan <VLAN-ID>] [vsx-peer]
```

Description

Displays the number of MAC addresses.

Parameter	Description
dynamic	Show the count of dynamically learned MAC addresses.
<PORT-NUM>	Specifies a physical port on the switch. Format: **member/slot/port**.
vlan *<VLAN-ID>*	Specifies the number of a VLAN.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing the number of MAC addresses:

```
switch# show mac-address-table count
Number of MAC addresses : 8
```

Showing the number of dynamically learned MAC addresses:

```
switch# show mac-address-table count dynamic
Number of MAC addresses : 8
```

Showing the number of MAC addresses per physical port on the switch:

```
switch# show mac-address-table count port 1/1/1
Number of MAC addresses : 2
```

Showing the number of MAC addresses per VLAN:

```
switch# show mac-address-table count vlan 100
Number of MAC addresses : 5
```

Showing the number of MAC addresses on the VSX primary and secondary (peer) switch:

```
vsx-primary# show mac-address-table count
Number of MAC addresses : 26114
vsx-primary# show mac-address-table count vsx-peer
Number of MAC addresses : 26113
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

show mac-address-table dynamic

`show mac-address-table dynamic [port <PORT-NUM> | vlan <VLAN-ID>] [vsx-peer]`

Description

Shows MAC address table information about dynamically learned MAC addresses.

Parameter	Description
<PORT-NUM>	Specifies a physical port on the switch. Format: **member/slot/port**.
<VLAN-ID>	Specifies the number of a VLAN.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

Showing all dynamic MAC address table entries:

```
switch# show mac-address-table dynamic
MAC age-time             : 300 seconds
Number of MAC addresses : 2

MAC Address          VLAN     Type       Port
--------------------------------------------------
00:00:00:00:00:05    1        dynamic    1/1/2
00:00:00:00:00:06    2        dynamic    1/1/1
```

Showing dynamic MAC address table entries for VLAN 1:

```
switch# show mac-address-table dynamic vlan 1
MAC age-time             : 300 seconds
Number of MAC addresses : 1

MAC Address          VLAN     Type       Port
--------------------------------------------------
00:00:00:00:00:05    1        dynamic    1/1/2
```

Showing dynamic MAC address table entries for port **1/1/1**:

```
switch# show mac-address-table dynamic port 1/1/1
MAC age-time             : 300 seconds
Number of MAC addresses : 1

MAC Address          VLAN     Type       Port
--------------------------------------------------
00:00:00:00:00:06    2        dynamic    1/1/1
```

show mac-address-table interface

`show mac-address-table interface <INTERFACE>`

Description

Shows the MAC address table entries for the specified interface.

Parameter	Description
<INTERFACE>	Specifies an interface or a list of interfaces on the switch.

Examples

On the 6400 Switch Series, interface identification differs.

Showing the MAC address table entries for interface **1/1/1**:

```
switch# show mac-address-table interface 1/1/1
MAC age-time            : 300 seconds
Number of MAC addresses : 1

MAC Address          VLAN     Type       Interface
--------------------------------------------------
00:00:00:00:00:01    2        dynamic    1/1/1
```

show mac-address-table lockout

`show mac-address-table lockout [vsx-peer]`

Description

Shows MAC lockout table information.

Parameter	Description
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

```
switch# show mac-address-table lockout
Number of MAC lockout addresses :

2MAC Address          Type
------------------------------------------
00:00:00:00:01:10    static
00:00:00:00:10:03    static
```

show mac address table mac move

```
show mac-address-table mac-move [address <mac-address> vlan <vlan>] | [vlan <vlan>]
```

Description

Displays the MAC entries in the MAC address table that have moved at least once.

The output can be filtered based on a specific VLAN or specific MAC address and VLAN.

Parameter	Description
<address>	Displays information for a specific MAC address.
<vlan>	Displays information for specific VLANs.

Examples

Displaying the moved MAC addresses:

```
switch# show mac-address-table mac-move
Number of MAC addresses : 2

MAC Address        VLAN   Current Port    Previous Port   Move Count   Last Move
----------------------------------------------------------------------------------
```

```
-------------
00:00:00:00:00:bb  10     1/1/28          1/1/27          2            Fri Sep 15
19:11:52 2023
00:00:00:00:00:aa  10     1/1/27          1/1/28          2            Fri Sep 15
19:11:51 2023

switch# show mac-address-table mac-move address 00:00:00:00:00:aa vlan 10
Number of MAC Move addresses : 1

MAC Address        VLAN   Current Port    Previous Port   Move Count   Last Move
----------------------------------------------------------------------------------
------------
00:00:00:00:00:aa  10     1/1/27          1/1/28          2            Fri Sep 15
19:11:51 2023

switch# show mac-address-table mac-move vlan 10
Number of MAC Move addresses : 2

MAC Address        VLAN   Current Port    Previous Port   Move Count   Last Move
----------------------------------------------------------------------------------
------------
00:00:00:00:00:bb  10     1/1/28          1/1/27          2            Fri Sep 15
19:11:52 2023
00:00:00:00:00:aa  10     1/1/27          1/1/28          2            Fri Sep 15
19:11:51 2023
```

In case of MACs learnt on VXLAN tunnels or "port-access port-security" enabled ports, move scenario is handled by EVPN/port-access feature respectively and it performs the move by deleting the MAC from old port and installing it on new port. Thus, the MAC move data will be removed for the deleted MAC addresses.

show mac-address-table mac-move

```
show mac-address-table mac-move
   address <mac-address>
   vlan <1-4094>
```

Description

This command displays the MAC entries in the MAC address table that have moved at least one time. The output of this command can be filtered to display information for a specific VLAN or for a specific MAC address and VLAN.

Users will not be able to view mac-move count for clients that are transitioning between mac-auth enabled ports; however, users will be able to view the mac-move count when clients are transitioning from a mac-auth enabled port to a non-authenticated port.

Parameter	Description
`address`	(Optional) Show move information for a specific MAC address.
`vlan <1-4094>`	(Optional) Show move information for specific VLAN.

Examples

Showing the total number of MAC move addresses:

```
switch# show mac-address-table mac-move
Number of MAC Move addresses : 2

MAC Address        VLAN   Current Port    Previous Port   Move Count    Last Move
----------------------------------------------------------------------------------
------------
00:00:00:00:00:bb  10     1/1/28          1/1/27          2             Fri Sep 15
19:11:52 2023
00:00:00:00:00:aa  10     1/1/27          1/1/28          2             Fri Sep 15
19:11:51 2023
```

Showing the number MAC move addresses on a specific VLAN:

```
switch# show mac-address-table mac-move vlan 10
Number of MAC Move addresses : 2

MAC Address        VLAN   Current Port    Previous Port   Move Count    Last Move
----------------------------------------------------------------------------------
------------
00:00:00:00:00:bb  10     1/1/28          1/1/27          2             Fri Sep 15
19:11:52 2023
00:00:00:00:00:aa  10     1/1/27          1/1/28          2             Fri Sep 15
19:11:51 2023
```

Showing the number MAC move addresses on a specific MAC address and VLAN:

```
switch# show mac-address-table mac-move address 00:00:00:00:00:aa vlan 10
Number of MAC Move addresses : 1

MAC Address        VLAN   Current Port    Previous Port   Move Count    Last Move
----------------------------------------------------------------------------------
------------
00:00:00:00:00:aa  10     1/1/27          1/1/28          2             Fri Sep 15
19:11:51 2023
```

static-mac

```
static-mac
   <MAC-ADDR>
   vlan <VLAN-ID> port
   <PORT-NUM>
   workload
   no...
```

Description

Adds a static MAC address to the MAC address table and associates it with a port or existing VLAN. Static MAC addresses can only be assigned to layer 2 (non-routed) interfaces. Static MAC addresses are not affected by the MAC address aging time.

The **no** form of this command deletes a static MAC address.

Parameter	Description
<MAC-ADDR>	Specifies a MAC address (**xx:xx:xx:xx:xx:xx**), where **x** is a hexadecimal number from 0 to F.
`vlan` *<VLAN-ID>*	Specifies number of an existing VLAN.
`port` *<PORT-NUM>*	Specifies a physical port on the switch. Format: **member/slot/port**.

Examples

On the 6400 Switch Series, interface identification differs.

```
switch(config)# static-mac 00:00:00:00:00:01 vlan 1 port 1/1/1
switch(config)# no static-mac 00:00:00:00:00:01 vlan 1 port 1/1/1

switch(config)# static-mac 00:00:00:00:00:01 vlan 1 port 1/1/2
1/1/2 is not an L2 port

switch(config)# static-mac 00:00:00:00:00:01 vlan 2 port 1/1/1
VLAN 2 not found
```

Chapter 73

MACsec commands

apply macsec policy

```
apply macsec policy <MACSEC-POLICY-NAME>
no apply macsec policy
```

Description

Within the selected interface context, applies the specified MACsec policy to the selected port. When a MACsec policy is applied to a port, MACsec is enabled on the port and all data traffic is blocked on the port until a secure channel is successfully established.

A MACsec policy can be applied to a physical interface port that is not part of any LAG ports or to a lag port. It can also be applied to an interface that is configured as an MCLAG, VSX keep-alive, or VSX inter-switch-link.

If a MACsec policy is already applied to the selected port, this command replaces the existing policy application.

For MACsec to work, an MKA policy must also be configured and applied to the same ports.

The **no** form of this command dissociates the specified policy from the port.

Parameter	Description
<MACSEC-POLICY-NAME>	Specifies the MACsec policy name. Range: 1 to 128 alphanumeric characters including only the three special characters "." (period), "-" (hyphen), and "_" (underscore).

Usage

- When any MACsec or MKA policy parameter is updated, any active MACsec session on all interfaces running the MACsec or MKA policy is terminated and restarted. This is indicated with the following prompt that provides an opportunity to not execute the **apply** command.

```
This policy is currently in use by one or more interfaces.
Updating the policy will cause existing MACsec sessions using
the policy to restart.
Continue (y/n)?
```

- For non-LAG ports, a range of ports can be specified in the **interface** command used to enter the interface context. For example, entering the interface context for ports 1/1/1 through 1/1/2:

```
switch(config)# interface 1/1/1-1/1/2
switch(config-if-<1/1/1-1/1/2>)# apply macsec policy MS_Policy1
```

- Not all interfaces on a switch may support the MACsec capability. An error will be generated when a policy is applied to a physical interface that is not capable of MACsec. For LAG ports, any non-MACsec capable interfaces that are part of the LAG will be blocked.

Examples

Applying a MACsec policy to a range of two ports:

```
switch(config)# interface 1/1/1-1/1/2
switch(config-if-<1/1/1-1/1/2>)# apply macsec policy MS_Policy1
```

Attempting to apply a MACsec policy to a port that is not MACsec capable:

```
switch(config)# interface 1/1/25
switch(config-if)# apply macsec policy MS_Policy1

MACsec is not supported on the interface.
switch(config-if)#
```

Removing MACsec policy association from a port:

```
switch(config)# interface 1/1/1
switch(config-if)# no apply macsec policy
```

Applying a MACsec policy to a LAG port:

```
switch(config)# interface lag 1
switch(config-if)# apply macsec policy MS_Policy1
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.10	Command introduced on the 6300.

Command Information

Platforms	Command context	Authority
6300	`config-if`	Administrators or local user group members with execution rights for this command.

bypass

```
bypass {ieee-bpdu}
no bypass {ieee-bpdu}
```

Description

Configures the MACsec policy to bypass MACsec for specific features.

When bypass is enabled on the BPDU, packets with a destination MAC matching the IEEE BPDU MAC (01:80:c2:00:00:0*) will bypass MACsec on both the egress and ingress directions.

By default, when MACsec is enabled on an interface, all BPDU frames except EAPoL are protected by MACsec. However, when an interface configured is configured to initiate a MACsec tunnel, the BPDU frames that are essential to the next hop device are sent with MACsec protection. This causes protocols such as LLDP and LACP to fail on the local link since the next hop device will fail to read the MACsec protected frames. To enable these protocols to operate on such links, you must enable BPDU bypass in the MACsec policy.

The **no** form of the command disables MACsec bypass for the specified feature. When no feature is specified, MACsec bypass is disabled for all the features.

Examples

Enabling the MACsec bypass for IEEE BPDUs:

```
switch(config)# macsec policy Aggregator-Connect
switch(config-macsec-policy)# bypass ieee-bpdu
OR
switch(config)# macsec policy Aggregator-Connect bypass ieee-bpdu
```

Disabling the MACsec bypass for IEEE BPDU:

```
switch(config)# macsec policy Aggregator-Connect
switch(config-macsec-policy)# no bypass ieee-bpdu
OR
switch(config)# no macsec policy Aggregator-Connect bypass ieee-bpdu
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.13.1000	Added support for the 6400 Switch Series.
10.13	Command introduced.

Command Information

Platforms	Command context	Authority
6300 6400	`config` `config-macsec-policy`	Administrators or local user group members with execution rights for this command.

cipher-suite

```
cipher-suite {<CIPHER-SUITE>} [<CIPHER-SUITE>] ... [<CIPHER-SUITE>]
no cipher-suite [<CIPHER-SUITE>] ... [<CIPHER-SUITE>]
```

Description

Within the MACsec policy context, configures one or more cipher suites to be used to generate the SAK (Secure Authentication Key) for when the switch is the key server. When multiple cipher suites are configured, the most secure cipher suite is considered first during negotiation.

The no form of this command (without the ***<CIPHER-SUITE>*** parameter) resets to the default of considering (during negotiation) all supported cipher suites while giving priority to the most secure suite **gcm-aes-xpn-256**. Include the ***<CIPHER-SUITE>*** parameter to disable a particular cipher suite.

Parameter	Description
<CIPHER-SUITE>	Selects the cipher suite. Available cipher suites are: ■ gcm-aes-128: AES-128 encryption with Galois/Counter mode. ■ gcm-aes-256: AES-256 encryption with Galois/Counter mode. ■ gcm-aes-xpn-128: AES-128 encryption with Galois/Counter mode and extended packet numbering. ■ gcm-aes-xpn-256: AES-128 encryption with Galois/Counter mode and extended packet numbering. (The default and the most secure.)

Examples

Enabling a single cipher suite:

```
switch(config-macsec-policy)# cipher-suite gcm-aes-128
```

Enabling two cipher suites:

```
switch(config-macsec-policy)# cipher-suite gcm-aes-256 gcm-aes-xpn-256
```

Disabling a particular cipher suite:

```
switch(config-macsec-policy)# no cipher suite gcm-aes-128
```

Resetting to the default of considering all available cipher suites while giving priority to **gcm-aes-xpn-256**:

```
switch(config-macsec-policy)# no cipher-suite
```

For more information on features that use this command, refer to the Security Guide for your switch model.

clear macsec statistics

`clear macsec statistics [interface <IF-RANGE>]`

Description

Clears MACsec statistics on all MACsec-enabled interfaces or on a specific interface or interface range. MACsec statistics are cleared for the entire switch rather than just in the current user session.

Parameter	Description
`interface <IF-RANGE>`	Specifies one or more interfaces for which MACsec statistics information is to be cleared.

Examples

Clearing MACsec statistics on an interface range:

```
switch# clear macsec statistics interface 1/1/1-1/1/4
```

Clearing MACsec statistics on all MACsec-enabled interfaces:

```
switch# clear macsec statistics
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.10	Command introduced on the 6300.

Command Information

Platforms	Command context	Authority
6300	Manager (#)	Administrators or local user group members with execution rights for this command.

clear tag mode

```
clear tag mode {dot1q | none}
no clear tag mode {dot1q | none}
```

Description

Configures the part of the Ethernet payload in a MACsec protected frame that must precede the Security TAG (SecTAG) header in clear text.

The **dot1q** mode allows the 802.1q tag of a MACsec protected frame to be sent in clear text and placed before the MACsec SecTAG header. This enables the establishment of a MACsec tunnel between two MACsec endpoints over a non-MACsec Layer 2 network.

The **no** form of the command will configure the device to place the SecTAG header immediately after the destination and source MAC addresses.

Untagged traffic is not supported on a MACsec channel running clear-tag mode as **dot1q**. All untagged frames will be dropped on ingress.

Parameter	Description
`dot1q`	Specifies the encoding of a single 802.1q tag in clear text before Security TAG (SecTAG).
`none`	Specfies that the Security TAG (SecTAG) directly follows the Ethernet addresses. This is the default option.

Examples

Configuring the clear-tag mode as **dot1q.**:

```
switch(config)# macsec policy Aggregator-Connect
switch(config-macsec-policy)# clear-tag-mode dot1q
OR
switch(config)# macsec policy Aggregator-Connect clear-tag-mode dot1q
```

Resetting the clear-tag mode:

```
switch(config)# macsec policy Aggregator-Connect
switch(config-macsec-policy)# no clear-tag-mode dot1q
OR
switch(config)# no macsec policy Aggregator-Connect clear-tag-mode dot1q
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.13.1000	Added support for the 6400 Switch Series.
10.13	Command introduced.

Command Information

Platforms	Command context	Authority
6300 6400	`config` `config-macsec-policy`	Administrators or local user group members with execution rights for this command.

confidentiality

```
confidentiality [offset {0|30|50}]
no confidentiality
```

Description

Within the MACsec policy context, enables Ethernet packet encryption after the MACsec header, optionally including a start-of-encryption offset. Confidentiality is enabled by default with an offset of 0 bytes after the MACsec header.

An offset of 0 causes the entire packet (after the MACsec header) to be encrypted. It is sometimes desirable to offset the start of the encryption deeper into the packet to allow for fields such as MPLS labels and 802.1Q tags to remain unencrypted.

Omitting the **offset** parameter enables confidentiality with whatever offset was configured previously.

The **no** form of this command disables confidentiality.

Parameter	Description
`offset {0|30|50}`	Selects the start-of-encryption offset (in bytes) into the packet after the MACsec header. Default 0 bytes.

Examples

Enabling confidentiality with an offset of 30 bytes:

```
switch(config-macsec-policy)# confidentiality offset 30
```

Disabling confidentiality

```
switch(config-macsec-policy)# no confidentiality
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.10	Command introduced on the 6300.

Command Information

Platforms	Command context	Authority
6300	`config-macsec-policy`	Administrators or local user group members with execution rights for this command.

include-sci-tag

```
include-sci-tag
no include-sci-tag
```

Description

Within the MACsec policy context, enables inclusion of the Secure Channel Identifier (SCI) tag in the Security TAG (SecTAG) field of the MACsec header. This is the default.

Inclusion of the SCI tag is not required on point-to-point links if the transmitting link has only one MACsec peer.

On the 8360 Switch Series models JL700A and JL701A, inclusion (or exclusion) of the SCI tag must be set identically at both ends of a MACsec channel. Asymmetric SCI tag settings are not supported.

The **no** form of this command disables inclusion of the Secure Channel Identifier (SCI) tag in the Security TAG (SecTAG) field of the MACsec header.

Examples

Enabling the SCI tag:

```
switch(config-macsec-policy)# include-sci-tag
```

Disabling the SCI tag:

```
switch(config-macsec-policy)# no include-sci-tag
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.10	Command introduced on the 6300.

Command Information

Platforms	Command context	Authority
6300	`config-macsec-policy`	Administrators or local user group members with execution rights for this command.

macsec policy

```
macsec policy <MACSEC-POLICY-NAME>
no macsec policy <MACSEC-POLICY-NAME>
```

Description

Creates the specified MACsec policy and then enters its context (displayed in the CLI as **config-macsec-policy**). If the MACsec policy already exists, this command enters the specified MACsec policy context.

A MACsec policy can be applied to one or more switch ports, enabling MACsec on the ports. An MKA (MACsec Key Agreement) policy must be applied to the same ports.

The **no** form of this command deletes the MACsec policy.

6300 Switch Series models that support MACsec:

6300 model	Ports	Speed
R8S89A	Downlinks: 1/1/1-1/1/24	100M/1G/2.5G/5G/10G
	Uplinks: 1/1/27-1/1/28	10G/25G
R8S90A	Downlinks: 1/1/1-1/1/48	100M/1G/2.5G/5G
	Uplinks: 1/1/51-1/1/52	10G/25G
R8S91A	Downlinks: 1/1/1-1/1/48	100M/1G/2.5G/5G
	Uplinks: 1/1/51-1/1/52	10G
R8S92A	Downlinks: 1/1/1-1/1/24	1G/10G
	Uplinks: 1/1/27-1/1/28	100M / 1G / 10G

A MACsec policy cannot be deleted if it is currently applied to any ports. All application of the policy must be removed before the policy can be deleted.

Parameter	Description
<MACSEC-POLICY-NAME>	Specifies the MACsec policy name. Range: 1 to 128 alphanumeric characters including only the three special characters "." (period), "-" (hyphen), and "_" (underscore).

Examples

Creating a MACsec policy:

```
switch(config)# macsec policy MS_Policy1
switch(config-macsec-policy)#
```

Deleting a MACsec policy (the policy cannot be currently applied to any ports):

```
switch(config)# no macsec policy MS_Policy1
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.10	Command introduced on the 6300.

Command Information

Platforms	Command context	Authority
6300	`config`	Administrators or local user group members with execution rights for this command.

macsec selftest

```
macsec selftest
no macsec selftest
```

Description

Configures the system to run a self test for MACsec on all MACsec-capable interfaces.

The **no** form of the command disables the MACsec self test on the device.

When enabled, the system will drop traffic on all MACsec capable interfaces until the MACsec selftest completes successfully on the interface. A MACsec selftest will be run in the following scenarios:

- On a VSF stack, the self test will run on a newly added switch
- When member is removed and re-added to stack
- When interface is removed from VSF link
- After every reboot (if enabled)

Examples

Running a MACsec self test:

```
switch(config)# macsec selftest
```

Disabling the MACsec self test:

```
switch(config)# no macsec selftest
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.11	Command introduced.

Command Information

Platforms	Command context	Authority
6300	`config`	Administrators or local user group members with execution rights for this command.

replay-protection

```
replay-protection [window-size <WINDOW-SIZE>]
no replay-protection
```

Description

Within the MACsec policy context, enables replay protection with the default or specified window size. With replay protection enabled, packets are expected to arrive within the replay protection window number of packets. For example with a window size of 10, any packet arriving out-of-sequence by more than 10 packets will be discarded. A window size of 0 (the default) enforces strict order of packet reception, discarding all packets not received in perfect sequence.

The **no** form of this command disables replay protections and resets the window size to its 0 default.

Parameter	Description
<WINDOW-SIZE>	Specifies the replay protection window size in packets. Default 0 packets. Range: 0 to 4294967295 packets.

Examples

Enabling replay protection with the default window size of 0 (strict order of packet reception):

```
switch(config-macsec-policy)# replay-protection
```

Enabling replay protection with a windows size of 100 packets:

```
switch(config-macsec-policy)# replay-protection window-size 100
```

Disabling replay protection.

```
switch(config-macsec-policy)# no replay-protection
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.10	Command introduced on the 6300.

Command Information

Platforms	Command context	Authority
6300	`config-macsec-policy`	Administrators or local user group members with execution rights for this command.

secure-mode

```
secure-mode {should-secure|must-secure}
no secure-mode [should-secure|must-secure]
```

Description

Configures the MACsec protection behavior on the interface when a MACsec Key Agreement (MKA) session is not established. Use **should-secure** to enable fail open mode for MACsec. Fail open mode ensures that traffic continues to flow if the MKA session is not established. Use **must-secure** (the default) to use MACsec in fail closed mode.

The **no** form of the command resets the behavior to the default, **must-secure**.

Parameter	Description
`{should-secure | must-secure}`	With **should-secure** set: ■ If the MKA session is not established, traffic is still allowed in clear text without the MACsec header. ■ If the MKA session is established successfully, traffic is allowed with the MACsec header. With **must-secure** set: ■ If the MKA session is not established, traffic is blocked on the data-plane. ■ If the MKA session is established successfully, traffic is allowed with the MACsec header.

Examples

Configuring **should-secure**:

```
switch(config)# macsec policy Aggregator-Connect
switch(config-macsec-policy)# secure-mode should-secure
OR
switch(config)# macsec policy Aggregator-Connect secure-mode should-secure
```

Configuring **must-secure**:

```
switch(config)# macsec policy Aggregator-Connect
switch(config-macsec-policy)# secure-mode must-secure
```

```
OR
switch(config)# macsec policy Aggregator-Connect secure-mode must-secure
```

Resetting to the default (**must-secure**):

```
switch(config)# macsec policy Aggregator-Connect
switch(config-macsec-policy)# no secure-mode
OR
switch(config)# no macsec policy Aggregator-Connect secure-mode
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.10	Command introduced.

Command Information

6300	`config` `config-macsec-policy`	Administrators or local user group members with execution rights for this command.

show macsec policy

`show macsec policy [<MACSEC-POLICY-NAME>]`

Description

Shows information for one or all MACsec policies.

Parameter	Description
<MACSEC-POLICY-NAME>	Specifies the MACsec policy name. Range: 1 to 128 alphanumeric characters including only the three special characters "." (period), "-" (hyphen), and "_" (underscore).

Examples

Showing information for a specific MACsec policy:

```
switch# show macsec policy Aggregator-Connect

MACsec Policy Details

  Policy Name: Aggregator-Connect
  ----------------------------------------------------------------------------
    Cipher suite             : GCM-AES-128
    Include SCI              : Yes
    Confidentiality          : Enabled
    Confidentiality offset   : 0
    Replay protection        : Enabled
    Replay protection window : 0
    Data delay protection    : Enabled
    Secure mode              : Must-Secure
    Bypass                   : IEEE-BPDU
    Clear tag mode           : 802.1q
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.13.1000	Command introduced on the 6400 Switch Series.
10.13	Command output updated to display **Bypass** and **Clear tag mode** information.
10.10	Command introduced on the 6300.

show macsec selftest

`show macsec selftest [interface <IFRANGE>]`

Description

Shows the status of the MACsec selftest for MACsec capable interfaces. If an interface fails the self test then MACsec selftest should be disabled.

Parameter	Description
<IFRANGE>	Specifies the interface(s) for which to show MACsec selftest information.

Examples

Showing MACsec self test information for all interfaces that are MACsec capable:

```
switch# show macsec selftest
MACsec selftest status
```

```
Interface  Status          Failure Reason
---------  -----------     -----------------------
1/1/1      Initializing    --
1/1/2      Passed          --
1/1/3      Queued for run  --
1/1/4      Running
1/1/5      Failed          Encryption test failed
1/1/6      Failed          Decryption test failed
1/1/7      Failed          Initialization failed
1/1/8      Failed          Time out
1/1/9      Initialized
```

Showing MACsec self test information for a specific interface:

```
switch# show macsec selftest interface 1/1/1

MACsec selftest status

Interface  Status  Failure Reason
---------  ------  -----------------------------
1/1/1      Passed  --
```

Showing MACsec self test information for an interface range:

```
switch# show macsec selftest interface 1/1/1-1/1/3

MACsec selftest status

Interface   Status       Failure Reason
---------   -----------  -------------------------
1/1/1       Passed       --
1/1/2       Running      --
1/1/3       Failed       Decryption test failed
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

show macsec statistics

```
show macsec statistics [interface <IF-RANGE>]
```

Description

Shows MACsec statistics for all MACsec-enabled interfaces or a specific interface or interface range.

Parameter	Description
`interface <IF-RANGE>`	Specifies one or more interfaces for which MACsec statistics information is to be shown.

Examples

Showing MACsec statistics for a specific interface:

```
switch# show macsec statistics interface 1/1/1

Command History

Release	Modification
10.10	Command introduced on the 6300.

Command Information

Platforms	Command context	Authority
6300	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show macsec status

`show macsec status [interface <IF-RANGE>] [detailed]`

Description

Shows MACsec status information for all MACsec-enabled interfaces or a specific interface or interface range.

Parameter	Description
`interface <IF-RANGE>`	Specifies one or more interfaces for which MACsec status information is to be shown.
`detailed`	Specifies that detailed status information is to be shown.

Usage

Applicable to when the **detailed** parameter is included: The stop time for the MACsec secure channel and secure association is updated only when the secure channel or association entry is being deleted. Therefore, it is never shown as set in the **show macsec status detailed command** output.

Examples

Showing MACsec summary information for all interfaces:

```
switch# show macsec status

MACsec Protocol Status

 Interface  Port ID  Policy                    Protection        Status  State
 ---------- -------- ------------------------- ----------------- ------- ------
 1/1/1      0        MS_Policy1                Conf, Offset 0    Up      Retire
 1/1/2      0        MS_Policy1                IC                Down    Init
 ...
```

Showing detailed MACsec information for a specific interface:

```
switch# show macsec status interface 1/1/1 detailed

Interface 1/1/1
================

Port Identifier: 0
===========================

  Policy          : MS_Policy1

Chapter 74

Management interface commands

default-gateway

```
default-gateway <IP-ADDR>
no default-gateway <IP-ADDR>
```

Description

Assigns an IPv4 or IPv6 default gateway to the management interface. An IPv4 default gateway can only be configured if a static IPv4 address was assigned to the management interface. An IPv6 default gateway can only be configured if a static IPv6 address was assigned to the management interface. The default gateway should be on the same network segment.

The **no** form of this command removes the default gateway from the management interface.

Parameter	Description
<IP-ADDR>	Specifies an IP address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255, or IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.

Examples

Setting a default gateway with the IPv4 address of **198.168.5.1**:

```
switch(config)# interface mgmt
switch(config-if-mgmt)# default-gateway 198.168.5.1
```

Setting an IPv6 address of **2001:DB8::1**:

```
switch(config)# interface mgmt
switch(config-if-mgmt)# default-gateway 2001:DB8::1
```

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-if-mgmt`	Administrators or local user group members with execution rights for this command.

ip static

```
ip static <IP-ADDR>/<MASK>
no ip static <IP-ADDR>/<MASK>
```

Description

Assigns an IPv4 or IPv6 address to the management interface.

The **no** form of this command removes the IP address from the management interface and sets the interface to operate as a DHCP client.
