<IP-ADDR>	Specifies an IP address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255, or IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.
<MASK>	Specifies the number of bits in an IPv4 or IPv6 address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 32 for IPv4, and 0 to 128 for IPv6.

Examples

Setting an IPv4 address of **198.51.100.1** with a mask of **24** bits:

```
switch(config)# interface mgmt
switch(config-if-mgmt)# ip static 198.51.100.1/24
```

Setting an IPv6 address of **2001:DB8::1** with a mask of **32** bits:

```
switch(config)# interface mgmt
switch(config-if-mgmt)# ip static 2001:DB8::1/32
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Command Information

Platforms	Command context	Authority
6300 6400	`config-if-mgmt`	Administrators or local user group members with execution rights for this command.

nameserver

```
nameserver <PRIMARY-IP-ADDR> [ <SECONDARY-IP-ADDR> ]
no nameserver <PRIMARY-IP-ADDR> [ <SECONDARY-IP-ADDR> ]
```

Description

Assigns a primary or secondary IPv4 or IPv6 DNS server to the management interface. IPv4 DNS servers can only be configured if a static IPv4 address was assigned to the management interface. IPv6 DNS servers can only be configured if a static IPv6 address was assigned to the management interface. The default gateway should be on the same network segment.

The **no** form of this command removes the DNS servers from the management interface.

Parameter	Description
<PRIMARY-IP-ADDR>	Specifies the IP address of the primary DNS server. Specify the address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255, or IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.
<SECONDARY-IP-ADDR>	Specifies the IP address of the secondary DNS server. Specify the address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255, or IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.

Examples

Setting primary and secondary DNS servers with the IPv4 addresses of **198.168.5.1** and **198.168.5.2** :

```
switch(config)# interface mgmt
switch(config-if-mgmt)# nameserver 198.168.5.1 198.168.5.2
```

Setting primary and secondary DNS servers with the IPv6 addresses of **2001:DB8::1** and **2001:DB8::2**:

```
switch(config)# interface mgmt
switch(config-if-mgmt)# nameserver 2001:DB8::1 2001:DB8::2
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

show interface mgmt

```
show interface mgmt [vsx-peer]
```

Description

Shows status and configuration information for the management interface.

Parameter	Description
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

```
switch# show interface mgmt

  Address Mode                     : static
  Admin State                      : up
  Mac Address                      : 02:42:ac:11:00:02
  IPv4 address/subnet-mask         : 192.168.1.10/16
  Default gateway IPv4             : 192.168.1.1
  IPv6 address/prefix              : 2001:db8:0:1::129/64
  IPv6 link local address/prefix: fe80::7272:cfff:fefd:e485/64
  Default gateway IPv6             : 2001:db8:0:1::1
  Primary Nameserver               : 2001::1
  Secondary Nameserver             : 2001::2

Chapter 75

mDNS gateway commands

debug mdns

```
debug mdns {all | config | init | packet | timer}
```

Description

Enables mDNS gateway debug logs for all or specific debug modules.

Parameter	Description
`all`	Enables debug logs for all mDNS gateway modules.
`config`	Enables debug logs to trace mDNS gateway configuration changes.
`init`	Enables debug logs to trace mDNS gateway initialization.
`packet`	Enables debug logs to trace mDNS gateway packet processing.
`timer`	Enables debug logs to trace mDNS gateway timer events.

Examples

Enabling debug logs for all modules:

```
switch# debug mdns all
```

Enabling debug logs for config module:

```
switch# debug mdns config
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

description

```
description <SERVICE-DESCRIPTION>
no description <SERVICE-DESCRIPTION>
```

Description

Adds description to a service.

The **no** form of this command deletes the description of a service.

Parameter	Description
<SERVICE-DESCRIPTION>	Specifies the service description. Maximum 128 characters.

Examples

Add a service description:

```
switch(config-mdns-sd-service)# description students-airplay-service
```

Remove the service description from a service:

```
switch(config-mdns-sd-service)# no description students-airplay-service
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

6300 6400	`config-mdns-sd-service`	Administrators or local user group members with execution rights for this command.

id

```
id <SERVICE-ID>
no id <SERVICE-ID>
```

Description

Adds a service identifier to a service. The service ID configured here must be same as the service ID that is present in the packet.

The **no** form of this command removes a service ID from the service.

Parameter	Description
<SERVICE-ID>	Specifies the service ID. Maximum 128 characters.

Examples

Add a service ID:

```
switch(config-mdns-sd-service)# id _appletv-v2._tcp
```

Remove a service ID from a service:

```
switch(config-mdns-sd-service)# no id _appletv-v2._tcp
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

mdns-sd

```
mdns-sd
no mdns-sd
```

Description

Enables mDNS gateway on a VLAN interface.

The **no** form of this command disables mDNS gateway on a VLAN interface.

This command is applicable only to VLAN interfaces.

The switch will not process mDNS packets until the mDNS gateway is enabled globally.

Examples

Enabling mDNS gateway on VLAN 10:

```
switch(config)# interface vlan 10
switch(config-if-vlan)# mdns-sd
```

Disabling mDNS gateway on VLAN 10:

```
switch(config)# interface vlan 10
switch(config-if-vlan)# no mdns-sd
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

mdns-sd apply-profile tx

```
mdns-sd apply-profile <PROFILE-NAME> tx
no mdns-sd apply-profile <PROFILE-NAME> tx
```

Description

Configures mDNS gateway profile on the VLAN interface. When a profile is applied in the transmit direction, all the mDNS traffic transmitted on the VLAN interface will be filtered based on the rules specified in the transmit profile.

The **no** form of this command deletes the profile configuration from the VLAN interface in the transmit direction.

This command is applicable only to VLAN interfaces.
When no profile is configured on an interface then the default action is permit.

Parameter	Description
<PROFILE-NAME>	Specifies the profile name. Maximum 32 characters.

Examples

Configuring mDNS gateway profile on VLAN 10:

```
switch(config)# interface vlan 10
switch(config-if-vlan)# mdns-sd
switch(config-if-vlan)# mdns-sd apply-profile student tx
```

Deleting mDNS gateway profile on VLAN 10:

```
switch(config)# interface vlan 10
switch(config-if-vlan)# no mdns-sd apply-profile student tx
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

mdns-sd enable

```
mdns-sd enable
no mdns-sd enable
```

Description

Enables mDNS gateway.

The **no** form of this command disables mDNS gateway. Once the **no** form of this command is executed, all the SVI VLANs, even though enabled with mDNS gateway, will stop reflecting mDNS packets to the enabled VLANs.

Examples

Enable mDNS gateway:

```
switch(config)# mdns-sd enable
```

Disable mDNS gateway:

```
switch(config)# no mdns-sd enable
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

mdns-sd profile

`mdns-sd profile <PROFILE-NAME>`

Description

Creates a profile that can be applied on one or more L3 VLAN interfaces.

The profile contains a set of rules that define various match parameters such as service-name and service-instance-name.

Parameter	Description
<PROFILE-NAME>	Specifies the name of the profile. Maximum 32 characters.

Examples

Creating a profile:

```
switch(config)# mdns-sd profile student
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

mdns-sd service

```
mdns-sd service <SERVICE-NAME>
no mdns-sd service
```

Description

Configures a service for mDNS gateway. You can group multiple service IDs into a single user-defined service name.

The **no** form of this command deletes a service.

A service cannot be deleted if it is being used as a match parameter in a filter rule in any profile.

Parameter	Description
<SERVICE-NAME>	Specifies the name of the service. Maximum 32 characters.

Examples

Configure a service for mDNS gateway:

```
switch(config)# mdns-sd service students
```

Delete a service:

```
switch(config)# no mdns-sd service students
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

sequence-number

```
<SEQUENCE_NUMBER> {permit | deny}
 {service-name <SERVICE-NAME> | service-instance-name <SERVICE-INSTANCE-NAME>}
no <SEQUENCE-NUMBER> {permit | deny}
 {service-name <SERVICE-NAME> | service-instance-name <SERVICE-INSTANCE-NAME>}
```

Description

Adds a filter rule to the service profile. The sequence number configured determines the priority with which the rule is matched. Lower the sequence number, higher is the priority.

Following are the filter match parameters:

- **Service-name:** mDNS packets are matched against the service IDs configured under the service name.
- **Service-instance-name:** mDNS packets are matched against the service instance name present in the mDNS packets.

When no match criteria is specified in the rule, then the rule can be matched against any mDNS packet. Once the match is found then either the packet can be permitted or denied based on the action specified in the rule.

The **no** form of this command deletes the filter configured in the service profile.

When an mDNS packet does not match any of the filters configured in the profile, then the packet is denied.

Parameter	Description
<SERVICE-NAME>	Specifies the service name. Maximum 32 characters.
<SERVICE-INSTANCE-NAME>	Specifies the service instance name. Maximum 128 characters.

Examples

Adding filter rules to a service profile:

```
switch(config)# mdns-sd profile student
switch(config-mdns-sd-profile)# 10 permit service-name default-appletv
switch(config-mdns-sd-profile)# 20 deny service-name default-appletv service-
instance-name office._pdl-datastream._tcp.local
switch(config-mdns-sd-profile)# 30 permit service-instance-name library._pdl-
datastream._tcp.local
switch(config-mdns-sd-profile)# 40 deny
```

Deleting filter rules to a service profile:

```
switch(config)# mdns-sd profile student
switch(config-mdns-sd-profile)# 10 permit service-name default-appletv
switch(config-mdns-sd-profile)# 20 deny service-name default-appletv service-
instance-name office._pdl-datastream._tcp.local
switch(config-mdns-sd-profile)# 30 permit service-instance-name library._pdl-
datastream._tcp.local
switch(config-mdns-sd-profile)# no 30 permit service-instance-name library._pdl-
datastream._tcp.local
switch(config-mdns-sd-profile)# 40 deny
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

show mdns-sd service-entries

```
show mdns-sd service-entries {service-id <SERVICE-ID> | record-type <RECORD-TYPE>}
```

Description

Shows all the services exchanged in the mDNS gateway enabled VLANs.

Parameter	Description
<SERVICE-ID>	Specifies the service ID. Maximum 128 characters
<RECORD-TYPE>	Specifies the type of record. Record can be one of the following values: PTR SRV TXT A

Examples

Displaying service entries learnt from mDNS gateway enabled VLANS:

```
switch# show mdns-sd service-entries
MAC-Address : 01:00:00:0e:21:23
VLAN Id     : 10
Record Name : _touch-able._tcp.local
Record Type : PTR
TTL         : 4500

MAC-Address : 01:00:00:0e:21:23
VLAN Id     : 10
Record Name : 523899E219D4C562._touch-able._tcp.local
Record Type : SRV
TTL         : 4500

MAC-Address : 01:00:00:0e:21:23
VLAN Id     : 10
Record Name : 523899E219D4C562._touch-able._tcp.local
Record Type : TXT
TTL         : 4500
```

Displaying service entries for a service and record type:

```
switch# show mdns-sd service-entries service-id _touch-able._tcp record-type ptr
MAC-Address : 01:00:00:0e:21:23
VLAN Id     : 10
Record Name : _touch-able._tcp.local
Record Type : PTR
TTL         : 4500
```

show mdns-sd statistics

```
show mdns-sd statistics [vlan [<VLAN-ID>]]
```

Description

Shows the mDNS packets received and sent globally, and per VLAN.

Parameter	Description
<VLAN-ID>	Specifies the VLAN ID. Required. Range 1 to 4094.

Examples

Displays total packets:

```
switch# show mdns-sd statistics
Packets Recieved    : 100
Packets Sent        : 150
Packets Dropped     :  50
```

Displays total packets for all VLANs:

```
switch# show mdns-sd statistics vlan
VLAN 10
Packets Recieved    : 100
Packets Sent        : 100
Packets Dropped     :   0

VLAN 20
Packets Recieved    :   0
Packets Sent        :  50
Packets Dropped     :  50
```

show mdns-sd statistics profile

`show mdns-sd statistics profile <PROFILE-NAME>`

Description

Displays the number of packets permitted or denied by various filter rules in a profile.

Parameter	Description
<PROFILE-NAME>	Specifies the profile name. Maximum 32 characters.

Examples

Displaying statistics for a profile:

```
switch# show mdns-sd statistics profile student
--------------------------
Sequence-Number Hit-Count
--------------------------
10              100
20               25
30              150

Total number of packets permitted by the profile : 250
Total number of packets denied by the profile    :  50
```

show mdns-sd summary

`show mdns-sd summary`

Description

Shows whether mDNS gateway is enabled globally and at the VLAN interface level. It also shows the profile applied on various VLAN interfaces.

Examples

Displaying mDNS gateway summary:

```
switch# show mdns-sd summary
global mdns-sd status: enabled
----------------------------
VLAN-Id Status   Tx-Profile
----------------------------
1       enabled  student
2       enabled  employee
3       disabled teacher
```

show running-config interface

`show running-config interface <INTERFACE-NAME>`

Description

Shows the configuration of profiles for an interface.

Parameter	Description
<INTERFACE-NAME>	Specifies the interface name.

Examples

Displaying configuration of profile at VLAN 10:

```
switch# show running-config interface vlan10
interface vlan10
```

```
    mdns-sd
    mdns-sd apply-profile teacher tx
    ip address 10.1.1.1/24
```

show running-config mdns-sd profile

`show running-config mdns-sd profile <PROFILE-NAME>`

Description

Shows the configuration of all or a specific profile.

Parameter	Description
<PROFILE-NAME>	Specifies the profile name. Maximum 32 characters.

Examples

Displaying configuration of all profiles:

```
switch# show running-config mdns-sd profile
mdns-sd profile student
  10 deny service-type default-print service-instance-name office._pdl-
datastream._tcp.local
  50 permit service-type default-airplay
  51 permit service-type default-print

mdns-sd profile teacher
  10 deny service-type default-print service-instance-name office._pdl-
datastream._tcp.local
  50 permit service-type default-airplay
  51 permit service-type default-print
```

show running-config mdns-sd service

```
show running-config mdns-sd service <SERVICE-NAME>
```

Description

Shows the running configuration of all or a specific mDNS service.

Parameter	Description
<SERVICE-NAME>	Specifies the service name. Maximum 32 characters.

Examples

Displaying running configuration of all mDNS services:

```
switch# show running-config mdns-sd service
mdns-sd service default-airplay
  id _airplay._tcp
  id _appletv-v2._tcp
  id _roap._tcp

mdns-sd service itunes
  id _home-sharing._tcp

Chapter 76

Mirroring commands

clear mirror

```
clear mirror [all | <SESSION-ID>]
```

Description

Clears the mirror statistics for all configured mirror sessions or a specified session

Parameter	Description
`all`	Specifies all configured sessions.
`<SESSION-ID>`	Specifies a numeric identifier for the session. Range: 1 to 4

Examples

Clearing mirror statistics for all configured mirror sessions:

```
switch# clear mirror all
```

Clearing mirror statistics for mirror session 1:

```
switch# clear mirror 1
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Manager (#)	Administrators or local user group members with execution rights for this command.

clear mirror endpoint

```
clear mirror endpoint [<NAME>]
```

Description

Clears mirror endpoint statistics for all configured mirror endpoints. The optional parameter can be added to clear a specific mirror endpoint.

Parameter	Description
<NAME>	Specifies name of the mirror endpoint instance to be cleared.

Examples

Clearing statistics for all configured mirror endpoints:

```
switch# clear mirror endpoint
```

Clearing mirror statistics for mirror endpoint test:

```
switch# clear mirror endpoint test
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

Command History

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Administrators or local user group members with execution rights for this command.

comment

```
comment <COMMENT>
no comment
```

Description

Specifies a comment for the mirroring session.

When used in mirror endpoint command context, specifies a comment for the mirror endpoint.

The **no** form of this command removes the comment.

Parameter	Description
<COMMENT>	A comment string of up to 64 characters composed of letters, numbers, underscores, dashes, spaces, and periods.

Usage

Comments are optional and can be added or removed at any time without affecting the state of the mirroring session.

Adding a comment to a session that already has a comment replaces the existing comment.

Examples

Adding a comment to a mirror session:

```
switch(config-mirror-3)# comment This Mirror will be removed during next
maintenance window
```

Removing the comment from mirror session 3:

```
switch(config-mirror-3)# no comment
```

Adding a comment to a mirror endpoint:

```
switch(config-mirror-endpoint-test)# comment Monitor endpoint traffic
```

Replacing the existing comment for mirror endpoint:

```
switch(config-mirror-endpoint-test)# comment Monitor statistics on each endpoint
interfaces
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

copy tcpdump-pcap

```
copy tcpdump-pcap <FILE-NAME> <REMOTE-URL>
```

Description

Saves packet capture files to external storage.

Parameter	Description
<FILE-NAME>	Specifies the packet capture file to save.
<REMOTE-URL>	Specifies the external storage to which the packet capture file will be saved.

Usage

Only four files can be saved at any point on the switch. Packet capture files are not saved after a failover or reboot. View a list of saved files using **diag utilities list-files**.

Examples

Saving my_capture_file.pcap to sftp://root@10.0.0.2/file.pcap:

```
switch# copy tcpdump-pcap my_capture_file.pcap sftp://root@10.0.0.2/file.pcap
root@10.0.0.2's passowrd:
Connected to 10.0.0.2.
sftp > put my_capture_file.pcap file.pcap
Uploading my_capture_file.pcap to /root/file.pcap
my_capture_file.pcap                                        100%    156    219.8KB/s    00:00
Copied successfuly.
```

copy tshark-pcap

```
copy tshark-pcap <REMOTE-URL> [vrf <VRF-NAME>]
```

Description

Copies the tshark capture data to a file on a TFTP or SFTP server.

Parameter	Description
<REMOTE-URL>	Specifies the capture file on a remote TFTP or SFTP server. The URL syntax is: {tftp:// | sftp://**<USER>**@} {**<IP>**|**<HOST>**} [:**<PORT>**] [;blocksize=**<SIZE>**]/*<FILE>*
vrf *<VRF-NAME>*	Specifies the name of a VRF. Default: default.

Example

Copying the capture data to a file on SFTP server 10.0.0.2:

```
switch# copy tshark-pcap sftp://root@10.0.0.2/file.pcap

root@10.0.0.2's password:
Connected to 10.0.0.2.
sftp> put packets.pcap file.pcap
Uploading packets.pcap to /root/file.pcap
packets.pcap                                  100%  156   219.8KB/s   00:00
Copied successfully.
```

destination cpu

```
destination cpu
no destination cpu
```

Description

The command causes the mirror session to transmit mirrored packets to the switch CPU. This destination may be configured for multiple sessions, however only one such configured session may be active at a given time.

The diagnostic utility Tshark may be used to view and capture packets transmitted to the CPU through this route. Ctrl+C must be entered to terminate a Tshark capture session. More details can be found in the **Supportability Guide**.

The **no** form of this command will immediately stops mirroring traffic to the CPU, but will not remove any sources from the mirror configuration.

Examples

Configuring a mirror session with CPU as the destination.

```
switch# config
switch(config)# mirror session 1
switch(config-mirror-1)# destination cpu
```

Removing the destination entirely.

```
switch(config-mirror-1)# no destination cpu
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-mirror-<SESSION-ID>`	Administrators or local user group members with execution rights for this command.

destination interface

```
destination interface {<INTERFACE-ID>|<LAG-NAME>}
no destination interface {<INTERFACE-ID>|<LAG-NAME>}
```

Description

Configures the specified interface as the destination of the mirrored traffic.

The **no** form of this command immediately disables the mirroring session and removes the specified destination interface from the configuration.

Parameter	Description
<INTERFACE-ID>	Specifies a interface. Format: `member/slot/port`.
<LAG-NAME>	Specifies a LAG (link aggregation group) identifier.

Usage

Configuring a different destination interface in an enabled mirroring session causes all mirrored traffic to use the new destination interface. This action might cause a temporary suspension of mirrored source traffic during the reconfiguration.

Examples

On the 6400 Switch Series, interface identification differs.

Configuring a mirroring session and adding an interface as a destination:

```
switch(config)# mirror session 1
switch(config-mirror-1)# destination interface 1/1/1
```

Replacing the existing destination with different interface:

```
switch(config-mirror-1)# destination interface 1/1/12
```

Removing a destination:

```
switch(config-mirror-1)# no destination interface 1/1/12
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

Switch	Destination interface limit per mirror session (4 possible sessions)
6300	64
6400	64

destination tunnel

```
destination tunnel <TUNNEL-IPV4> source <SOURCE-IPv4-ADDR>
   dscp <DSCP-VALUE> vrf <VRF-NAME>
no destination tunnel
```

Description

Specifies the tunnel where all mirrored traffic for the session is transmitted. Only one tunnel destination is allowed per session.

You may configure multiple mirror sessions with the same source/destination IP address pair, however, only one of those sessions sharing the same source/destination IP address pair can be enabled at a given time.

ERSPAN is not supported leaving the switch by the OOB port. If VRF management is configured for an ERSPAN session, the session will be in "mirror_err_tunnel_oob_port_not_supported" operation status.

ERSPAN is not supported leaving the switch encapsulated within another tunnel (e.g. GRE IPv4). When the path to the destination IP address will leave via a tunnel, the session will be in "tunnel_route_resolution_not_populated" operation status.

The interface/LAG used to transmit ERSPAN packets should not be a source in the same mirror session.

The **no** form of this command will cease the use of the tunnel and disable the session.

Parameter	Description
<TUNNEL-IPV4-ADDR>	Specifies the tunnel address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.
<SOURCE-IPv4-ADDR>	Specifies the source address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.
<DSCP-VALUE>	Specifies the DSCP value to be carried within the DS field of ERSPAN packet header. Range: 0 to 63. Default: 0.
<VRF-NAME>	Specifies a VRF name. Default: default.

Examples

Creating a Mirror Session and adding tunnel destination, source, dscp, and VRF:

```
switch# config
switch(config)# mirror session 1
switch(config-mirror-1)# destination tunnel 1.1.1.1 source 2.2.2.2 dscp 10 vrf
default
```

Replacing the existing tunnel destination:

```
switch(config-mirror-1)# destination tunnel 11.12.13.14 source 2.2.2.2 dscp 10 vrf
default
```

Replacing the existing destination with a different DSCP value:

```
switch(config-mirror-1)# destination tunnel 11.12.13.14 source 2.2.2.2 dscp 2 vrf
default
```

Removing the destination:

```
switch(config-mirror-1)# no destination tunnel
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

Command History

10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-mirror-<SESSION-ID>`	Administrators or local user group members with execution rights for this command.

diagnostic

```
diagnostic

diag utilities tshark [file]
diag utilities tshark [delete-file]
```

Description

Captures packets from a mirror-to-cpu session, and save the most recent 32MB to pcap file which can then be copied and analyzed. When capturing a mirror-to-cpu session to a file, packets will not be dumped to the console.

The `diagnostic` command must be entered prior to the `diag utilities tshark` command.

Use the **delete-file** form of this command to delete the most recent capture file.

Since **file** and **delete-file** are optional, the behavior of the base command **diag utilities tshark** does **not** save anything to a file, and instead dumps the tshark session to the console until **CTRL + c** is entered.

Parameter	Description
`file`	Saves captured packets to a temporary file.
`delete-file`	Deletes the most recent captured file.

Example

Performing diagnostic:

```
switch# diagnostic

switch# diagnostic utilities tshark file
Inspecting traffic mirrored to the CPU until Ctrl-C is entered
^CEnding traffic inspection.
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Manager (#)	Administrators or local user group members with execution rights for this command.

diag utilities tcpdump

```
diag utilities tcpdump [command <TEXT> | delete file <FILE-NAME> | list-files |
  vrf <VRF-NAME> | count <COUNT-NUM> | proto <PROTO-NUM> | host-ip <IP-ADDR> | source-ip
  <IP-ADDR> | destination-ip <IP-ADDR> | host-port <PORT> | source-port <PORT> |
  destination-port <PORT> | verbosity <LEVEL> | print <DATA> | ethernet-type <ETH-NUM>]
```

Description

Captures traffic received or transmitted over a network.

Parameter	Description
`command <TEXT>`	Captures packets based on a specified tcpdump command string.
`delete file <FILE-NAME>`	Deletes specified tcpdump list files.
`list-files`	Lists all the tcpdump capture files saved on the device.
`vrf <VRF-NAME>`	Captures packets on the specified VRF. If no VRF is named, the default is used.
`count <COUNT-NUM>`	Runs the tcpdump command until the specified number of packets are captured. Range: 1-2147483647.
`proto <PROTO-NUM>`	Captures packets of a particular type based on IP protocol number. Range: 0-255.
`host-ip <IP-ADDR>`	Captures packets matching with the source or destination IP address.
`source-ip <IP-ADDR>`	Captures packets from the specified IP address.
`destination-ip <IP-ADDR>`	Captures packets sent to the specified IP address.
`host-port <PORT>`	Captures packets matching with the source or destination port.
`source-port <PORT>`	Captures packets from the specified IP port.
`destination-port <PORT>`	Captures packets sent to the specified IP port.
`verbosity <LEVEL>`	Captures packets of the specified verbosity. Range: level1-level4. If no verbosity is specified, the default is level1.
`print <DATA>`	Captures the data of each packet. The maximum is 262144 bytes

Parameter	Description
`ethernet-type <ETH-NUM>`	Captures packets based on the particular ethernet type. Range: 0-65535.

Usage

- When using the **command** option, the only traffic captured will be packets that have been mirrored to the CPU.
- When using the **command** option, command line sanitization is performed to prevent options that may cause harm or security issues. The following options are blocked:
  - -i/--interface
  - -Z
  - -B/--buffer-size
  - -C
  - -W
  - -Z/--relinquish privileges
- Non-word operators such as "&" or "|" are not allowed. Use boolean keywords such as "and," "or," and "not."
- When using **command -r** to read a file, do not provide any directory path characters. Use list-files command to get the list of file names currently saved on the device, and then use those file names.
- A total of four files can be saved at any given point on the device. Packet capture files are not saved after a failover or reboot, but can be saved to external storage using the **copy tcpdump-pcap** command.

Examples

Inspecting traffic mirrored to the CPU via tcpdump and saving the output to my_capture_file.pcap:

```
switch# diag utilities tcpdump command -c 2 -x -w my_capture_file.pcap
Inspecting traffic mirrored to the CPU via tcpdump until Ctrl-C is entered.
2 packets captured
2 packets received by filter
0 packets dropped by kernel
Ending traffic capture.
```

Listing saved capture files:

```
switch# diag utilities tcpdump list-files
my_capture_file.pcap
```

Reading my_capture_file.pcap:

```
switch# diag utilities tcpdump command -r my_capture_file.pcap
reading from file /tmp/tcpdump/my_capture_file1.pcap, link-type EN10MB (Ethernet)

10.08	Command introduced

Command Information

Platforms	Command context	Authority
6300 6400	Manager (#)	Administrators or local user group members with execution rights for this command.

disable

```
disable
```

Description

Disables the mirroring session specified by the current command context.

Usage

By default, mirroring sessions are disabled.

When a mirroring session is disabled, the **show mirror** command for that session ID shows an **Admin Status** of **disable** and an **Operation Status** of **disabled**.

Example

Disabling a mirroring session:

```
switch(config)# mirror session 3
switch(config-mirror-3)# disable
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config-mirror-<SESSION-ID>`	Administrators or local user group members with execution rights for this command.

enable

```
enable
```

Description

Enables the mirroring session for the current command context.

Usage

By default, mirroring sessions are disabled.

When a mirroring session is enabled, the **show mirror** command for that session ID shows an **Admin Status** of **enable** and an **Operation Status** of **enabled**.

If sFlow is enabled on an interface and a mirroring session specifies the same interface as the source of received traffic (the source is configured with a direction of **rx** or **both**):

- The attempt to enable the mirroring session fails and an error is returned.

When adding, removing, or changing the configuration of a source interface in an enabled mirroring session, packets from other mirror sources using the same destination interface might be interrupted.

Example

On the 6400 Switch Series, interface identification differs.

Configuring and enabling a mirroring session:

```
switch(config)# mirror session 3
switch(config-mirror-3)# source interface 1/1/2 rx
switch(config-mirror-3)# destination interface 1/1/3
switch(config-mirror-3)# comment Monitor router port ingress-only traffic
switch(config-mirror-3)# enable
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config-mirror-<SESSION-ID>`	Administrators or local user group members with execution rights for this command.

mirror endpoint

```
mirror endpoint <NAME>
no mirror endpoint <NAME>
```

Description

Creates the specified mirror endpoint or enters its context if it already exists. The specifics of a mirror endpoint are created or altered while in the mirror endpoint context and the mirror endpoint is enabled or disabled from this context. It may be possible to support different encapsulations by different ASICs. For example, UDP for PVOS compatibility. Termination of GRE encapsulation is also supported.

The **no** form of this command removes an existing mirror endpoint. An enabled mirror endpoint is automatically disabled first before removal.

Parameter	Description
<NAME>	Specifies mirror endpoint name.

Examples

Creating a mirror endpoint named test :

```
switch(config)# mirror endpoint test
```

Deleting mirror endpoint named test:

```
switch(config)# no mirror endpoint test
```

Configuring a mirror endpoint named test :

```
6100(config)# mirror endpoint test
6100(config-mirror-endpoint-test)#
6100(config-mirror-endpoint-test)# destination
  interface  Specify interfaces to send traffic
6100(config-mirror-endpoint-test)# destination interface
  IFNAMELIST  An interface, a range or a comma seperated list of interfaces
6100(config-mirror-endpoint-test)# destination interface 1/1/3
```

```
  <cr>
6100(config-mirror-endpoint-test)# destination interface 1/1/3
6100(config-mirror-endpoint-test)#
6100(config-mirror-endpoint-test)# source 1.1.1.1 destination 1.1.1.2 id 1 vrf
default
6100(config-mirror-endpoint-test)#
```

Only physical ports can be configured as interface for mirror-endpoint destination. LAG port is not supported as interface for mirror-endpoint destination.

The maximum allowed number of destination interfaces for both mirror-session and mirror-endpoint is 1.

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

Command History

Release	Modification
10.13.1000	Added support for 4100i, 6000, and 6100 switches.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

mirror session

```
mirror session <SESSION-ID>
no mirror session <SESSION-ID>
```

Description

Creates a mirroring session configuration context or enters an existing mirroring session configuration context.

From this context, you can enter commands to configure and enable or disable the mirroring session.

The **no** form of this command removes an existing mirroring session from the configuration.

Parameter	Description
<SESSION-ID>	Specifies the session identifier. Range: 1 to 4

Examples

```
switch(config)# mirror session 1
switch(config-mirror-1)#

switch(config)# mirror session 3
switch(config-mirror-3)#

switch(config)# no mirror session 1
switch(config)#
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config`	Administrators or local user group members with execution rights for this command.

show mirror

`show mirror [<SESSION-ID>] [vsx-peer]`

Description

Shows information about mirroring sessions. If **`<SESSION-ID>`** is not specified, then the command shows a summary of all configured mirroring sessions. If **`<SESSION-ID>`** is specified, then the command shows detailed information about the specified mirroring session.

Parameter	Description
`<SESSION-ID>`	Specifies the session identifier. Range: 1 to 4
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Usage

Admin Status indicates the configured status. Admin Status is one of the following values:

`enable`
The mirroring session is enabled.
`disable`
The mirroring session has been configured but not yet enabled, or has been disabled.

Operation Status indicates the status of the mirroring session. Operation Status is one of the following values:

`dest_doesnt_exist`

The configured destination interface is not found in the system. The mirroring session cannot be enabled.
`destination_shutdown`
The mirroring session is enabled, but the destination interface is shut down. No traffic can be monitored.
`disabled`
The mirroring session is disabled and is not in an error condition.
`enabled`
The mirroring session is enabled.
`external/driver_error`
An internal ASIC hardware error occurred.
`hit_active_sessions_capacity`
The mirroring session could not be enabled because the maximum number of supported mirroring sessions are already enabled.
`internal_error`
An invalid parameter was passed to the ASIC software layer.
`no_dest_configured`
The mirroring session does not have a destination interface configured.
`no_name_configured`
A software error occurred. The mirroring session does not have a session ID in its configuration.
`null_mirror`
A software error occurred. The session object reference is invalid.
`out_of_memory`
The system is out of memory, reboot recommended.
`tunnel_route_resolution_not_populated`
If the destination tunnel IP address is not reachable.
`unknown_error`
An unexpected error occurred.

Examples

On the 6400 Switch Series, interface identification differs.

Showing summary information about all configured mirroring sessions:

```
switch# show mirror
ID  Admin Status  Operation Status
--- ------------- ----------------------------------------------------
1   enable        enabled
2   disable       disabled
3   disable       disabled
4   enable        internal_error
```

Showing detailed information about a single mirroring session:

```
switch# show mirror 3
 Mirror Session: 3
 Admin Status: disable
 Operation Status: disabled
 Comment: Monitor router port ingress-only traffic
 Source: interface 1/1/2 rx
 Destination: interface 1/1/3
 Output Packets: 0
 Output Bytes: 0
switch#
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show mirror endpoint

`show mirror endpoint [<NAME>]`

Description

Shows a list of all configured mirror endpoints, their Admin Status and their Operation Status.

The optional parameter will display the details of the specified mirror endpoint if it exists.

Parameter	Description
<NAME>	Specifies name of the mirror endpoint instance to be displayed.

Examples

Showing a summary of all configured mirror endpoints on the switch:

```
switch# show mirror endpoint
Name    Admin Status   Operation Status
-----  -------------- ----------------------------------------------------
test    enable         enabled
monitor disable        disabled
```

Showing the details of enabled mirror endpoint test:

```
switch# show mirror endpoint test
Mirror Endpoint: audit
Admin Status: enable
Operation Status: enabled
Comment: Mirror Endpoint Audit
Type: gre
Tunnel: source 1.1.1.1 destination 1.1.1.2 id 1 vrf default
Interface: 1/1/3
Output Packets: 123456789
Output Bytes: 0
```

"Output Packets" in "show mirror endpoint [name]" is only supported for statistics.

"Output Bytes" in "show mirror endpoint [name]" is not supported due to ASIC limitation.

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

Command History

Release	Modification

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Administrators or local user group members with execution rights for this command.

shutdown

```
shutdown
no shutdown
```

Description

Enables mirror endpoint from its default disabled state. To verify the mirror endpoint was successfully activated, run the `show mirror endpoint NAME` command and verify that the **`Admin Status`** and **`Operational Status`** has changed from disabled to enabled. If the status value remains disabled, consult the system logs to determine the reason for activation failure. To disable the mirror endpoint, first disable the remote mirror session on the switch that's originating the data. Next, use the `shutdown` command to disable the mirror endpoint.

Examples

Enabling a mirror endpoint:

```
switch(config)# mirror endpoint test
switch(config-mirror-endpoint-test)# no shutdown
```

Disabling a mirror endpoint:

```
switch(config)# mirror endpoint test
switch(config-mirror-endpoint-test)# shutdown
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

source

```
source <SOURCE-IP> destination <DESTINATION-IP> id <1-4294967295> [vrf <VRF_NAME>] [type
{gre}]
no source
```

Description

Configures tunnel parameters of the mirror endpoint. Configuring a tunnel parameter to a mirror endpoint will replace the existing configuration. By default the VRF is **default**, users can also explicitly provide a custom VRF. The default tunnel type is considered to be GRE and users also have the option to explicitly give type as GRE.

The **no** form removes the tunnel parameters of the mirror endpoint.

Parameter	Description
<SOURCE-IP>	Specifies L3 encapsulated IPv4 source in the form A.B.C.D.
<DESTINATION-IP>	Specifies L3 encapsulated IPv4 destination in the form A.B.C.D.
`id`	Specifies tunnel identifier from the encapsulated packet.
<VRF_NAME>	Specifies the name of VRF for which the tunnel belongs to.

Examples

Configuring a tunnel parameter to a mirror endpoint:

```
switch(config-mirror-endpoint-test)# source 1.1.1.1 destination 7.7.7.7 id 1 vrf
default type gre
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

source interface

```
source interface {<PORT-NUM> | <LAG-NAME>} [<DIRECTION>]
no source interface {<PORT-NUM> | <LAG-NAME>} [<DIRECTION>]
```

Description

Configures the specified interface (either an Ethernet port or a LAG) as a source of traffic to be mirrored.

The **no** form of this command ceases mirroring traffic from the specified source interface and removes the source interface from the mirroring session configuration.

Parameter	Description
<PORT-NUM>	Specifies a physical port on the switch. Use the format **member/slot/port** (for example, **1/3/1**).
<LAG-NAME>	Specifies the identifier for the LAG (link aggregation group).
<DIRECTION>	Selects the direction of traffic to be mirrored from this source interface. There is no default for this parameter. Valid values are the following:
`both`	Mirror both transmitted and received packets.
`rx`	Mirror only received packets.
`tx`	Mirror only transmitted packets.

Usage

There is a limit of source interfaces in each direction of a given mirror session:

Switch	Source interface limit per mirror session (4 possible sessions)
6300	64
6400	64

However, there is a practical limit to the amount of traffic that a mirror destination can transmit. For example, mirroring session with multiple 10G sources can overwhelm a single 10G destination.

When adding, removing, or changing the configuration of a source port in an enabled mirroring session, packets from other mirror sources using the same destination port might be interrupted.

Examples

Configuring a mirrored traffic source interface:

```
switch(config-mirror-1)# source interface
  LAG-NAME      Enter a LAG name. For example, lag10
  PORT-NUM      Enter a port number
```

Creating a mirroring session and configuring a source interface to mirror both transmitted and received packets:

```
switch(config)# mirror session 1
switch(config-mirror-1)# source interface 1/1/1 both
```

Creating a second mirroring session and configuring two source interfaces. One port mirroring only transmitted packets and the other mirroring both transmitted and received packets:

```
switch(config)# mirror session 2
switch(config-mirror-2)# source interface 1/1/3 tx
switch(config-mirror-2)# source interface 1/2/1 both
```

Removing the first source interface:

```
switch(config-mirror-2)# no source interface 1/2/3
```

Configuring a source interface to mirror received packets only:

```
switch(config-mirror-3)# source interface 1/1/2 rx
```

Configuring a source interface to mirror both transmitted and received packets:

```
switch(config-mirror-1)# source interface 1/1/1 both
```

Configuring a LAG as source interface to mirror both transmitted and received packets:

```
switch(config-mirror-4)# source interface lag1 both
```

Stopping the mirroring of received packets from a configured source interface:

```
switch(config-mirror-4)# no source interface lag1 rx
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

source vlan

```
source vlan <VLAN-NUM> {rx | tx | both}
no source vlan <VLAN-NUM> {rx | tx | both}
```

Description

Mirroring with VLAN as a source is supported in the following traffic directions:

- **both** - traffic received and transmitted
- **rx** - only received traffic
- **tx** - only transmitted traffic

More than one source VLAN can be configured in a mirror session. Each such VLAN may specify its own direction.

There is a limit of 1024 source VLANs for a given mirror session. There is also a limit of 4096 source VLANs across all mirror sessions.

Same VLAN can be configured as a mirror source for multiple sessions.

> When changing a source VLAN in an enabled mirror session (i.e. adding, changing direction, or removing) mirrored packets being transmitted out of the mirror destination port from other mirror sources may be briefly interrupted during the reconfiguration.

Direction of an existing source VLAN can be updated in one of two ways.

- Reenter the **source vlan <VLAN-NUM> <direction>** command with the new preferred direction.
- Use the **no source vlan <VLAN-NUM> <direction>** form of the command with a direction (**rx** or **tx**) to selectively remove the specified direction.

Specifying the last remaining direction for that VLAN will remove the VLAN from the configuration entirely.

Mirroring allows configuration of VLAN as a source. When VLAN source is configured in the **rx** direction, all packets are mirrored as they are received in the switch. When VLAN source is configured in **tx** direction, all packets are mirrored as they are transmitted out of the switch.

For packets bridged through the switch:

- If the mirror is configured in 'both' direction, two copies of packets are mirrored, otherwise one copy of the packet will be mirrored.

For routed packets:

- If the mirror is configured in **rx** direction, packets are mirrored in the pre-routed form with the Destination MAC address as the switch address.
- If the mirror is configured in **tx** direction, packets are mirrored in post-routed form with the source MAC as the switch address. Destination MAC is the nexthop gateway or station.
- If the mirror is configured in **both** direction, one copy of the packet will be mirrored.

Control plane packets generated by the switch's CPU are processed both in theingress and the egress packet processing pipeline. The following are the behavior for mirroring with VLAN as source:

- If the mirror is configured in the **rx** or **tx** direction, the packets are mirrored to the mirror destination.
- If the mirror is configured in the **both** direction, two copies of the packets are mirrored to the mirror destination.

The **no** form command will cease mirroring traffic from the specified source VLAN and remove the source from the mirror configuration.

Parameter	Description
`VLAN-NUM`	Selects the VLAN number.
`direction`	Specifies the direction of mirroring. **tx** (transmit), **rx** (receive), or **both**.

Examples

Creating a mirror session and adding a VLAN as a source of traffic in both directions on that port:

```
switch# configure terminal
switch(config)# mirror session 1
switch(config-mirror-1)# source vlan 10 both
```

Creating a mirror session and adding two VLANs as sources of traffic:

directions:

```
switch# configure terminal
switch(config)# mirror session 2
switch(config-mirror-2)# source vlan 10 tx
switch(config-mirror-2)# source vlan 20 both
```

Configuring the source in session 2 to receive by specifying the source interface configuration:

```
switch(config-mirror-2)# source vlan 10 rx
```

Removing the first source interface in session 2 entirely, and removing the transmit direction from the other so that mirroring only occurs in the receive direction:

```
switch(config-mirror-2)# source vlan 10 rx
switch(config-mirror-2)# source vlan 20 tx
```

Showing maximum of 1024 mirror source VLANs allowed:

```
switch(config-mirror-2)# source vlan 2000 rx
The maximum number of source VLANs per mirror session is 1024 in each direction
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

Chapter 77

MKA commands (MACsec)

apply mka policy

```
apply mka policy <MKA-POLICY-NAME>
no apply mka policy
```

Description

Within the selected interface context, applies the specified MKA policy to the selected port. To start the MKA protocol on the port, a MACsec policy must also be applied to the port.

> An MKA policy can be applied to a physical interface port that is not part of any LAG ports or to a lag port. It can also be applied to an interface that is configured as an MCLAG, VSX keep-alive, or VSX inter-switch-link.

If an MKA policy is already applied to the selected port, this command replaces the existing policy application.

The **no** form of this command dissociates the specified policy from the port.

Parameter	Description
<MKA-POLICY-NAME>	Specifies the MKA policy name. Range: 1 to 32 alphanumeric characters including only the three special characters "." (period), "-" (hyphen), and "_" (underscore).

Usage

- When any MACsec or MKA policy parameter is updated, any active MACsec session on all interfaces running the MACsec or MKA policy is terminated and restarted. This is indicated with the following prompt that provides an opportunity to not execute the **apply** command.

```
This policy is currently in use by one or more interfaces.
Updating the policy will cause existing MACsec sessions using
the policy to restart.
Continue (y/n)?
```

- For non-LAG ports, a range of ports can be specified in the **interface** command used to enter the interface context. For example, entering the interface context for ports 1/1/1 through 1/1/4:

```
switch(config)# interface 1/1/1-1/1/4
switch(config-if-<1/1/1-1/1/4>)# apply mka policy MKA_Policy1
```

- Not all interfaces on a switch may support the MACsec capability. An error will be generated when a policy is applied to a physical interface that is not capable of MACsec. For LAG ports, any non-MACsec capable interfaces that are part of the LAG will be blocked.

Examples

Applying an MKA policy to a range of two ports:

```
switch(config)# interface 1/1/1-1/1/2
switch(config-if-<1/1/1-1/1/2>)# apply mka policy MKA_Policy1
```

Attempting to apply an MKA policy to a port that is not MACsec capable:

```
switch(config)# interface 1/1/25
switch(config-if)# apply mka policy MKA_Policy1

MACsec is not supported on the interface.
switch(config-if)#
```

Removing MKA policy association from a port:

```
switch(config)# interface 1/1/1
switch(config-if)# no apply mka policy
```

Applying an MKA policy to a LAG port:

```
switch(config)# interface lag 1
switch(config-if)# apply mka policy MKA_Policy1
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

10.10	Command introduced on the 6300.

Command Information

Platforms	Command context	Authority
6300	`config-if`	Administrators or local user group members with execution rights for this command.

clear mka statistics

```
clear mka statistics [interface <IF-RANGE>]
```

Description

Clears MKA statistics on all MACsec-enabled interfaces or on a specific interface or interface range. MKA statistics are cleared for the entire switch rather than just in the current user session.

Parameter	Description
`interface <IF-RANGE>`	Specifies one or more interfaces (ports) for which MKA statistics information is to be cleared.

Examples

Clearing MKA statistics on an interface range:

```
switch# clear mka statistics interface 1/1/1-1/1/4
```

Clearing MKA statistics on all MACsec-enabled interfaces:

```
switch# clear mka statistics
```

For more information on features that use this command, refer to the Security Guide for your switch model.

data-delay-protection

```
data-delay-protection
no data-delay-protection
```

Description

Configures the MACsec policy to use data delay protection. Data delay protection allows MKA participants to ensure that the data frames protected by MACsec are not delayed by more than 2 seconds.

Enabling data delay protection necessitates transmission of MKPDUs at a frequency of 0.5 second to meet a maximum data delay of 2 seconds while minimizing connectivity interruption due to the possibility of lost or delayed MKPDUs.

Data delay protection should be enabled only when there is a need to drop MACsec protected frames that are delayed by more than 2 seconds on the wire. It is recommended to not enable data delay protection unless absolutely required as it adds extra load on the system.

Disabled by default.

When data delay protection is enabled, a default of 0.5 second is used as transmit-interval and transmit-interval configuration under MKA policy is ignored.

Examples

Enabling data delay protection:

```
switch(config)# macsec policy Aggregator-Connect data-delay-protection
```

or

```
switch(config)# macsec policy Aggregator-Connect
switch(config-macsec-policy)# data delay protection
```

Disabling data delay protection:

```
switch(config)# no macsec policy Aggregator-Connect data-delay-protection
```

or

```
switch(config)# macsec policy Aggregator-Connect
switch(config-macsec-policy)# no data delay protection
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.11	Command introduced.

Command Information

Platforms	Command context	Authority
6300	`config` `config-macsec-policy`	Administrators or local user group members with execution rights for this command.

eapol-destination-mac

```
eapol-destination-mac <MAC-ADDRESS>
no eapol-destination-mac <MAC-ADDRESS>
```

Description

Configures the destination MAC address to use in EAPoL frames for MKA. When not configured, the switch uses the default EAPoL multicast address (01:80:C2:00:00:03) for MKA.

The **no** form of the command configures the switch to use the default EAPoL multicast address for MKA.

Parameter	Description
<MAC-ADDRESS>	Specifies the EAPoL destination MAC address for MKA.

Examples

Configuring the broadcast MAC as EAPoL destination address:

```
switch(config)# mka policy Agg-To-Agg
switch(config-mka-policy)# eapol-destination-mac ff:ff:ff:ff:ff:ff
OR
switch(config)# mka policy Agg-To-Agg eapol-destination-mac ff:ff:ff:ff:ff:ff
```

Resetting MKA policy to use untagged EAPoL MKA frames:

```
switch(config)# mka policy Agg-To-Agg
switch(config-mka-policy)# no eapol-destination-mac
OR
switch(config-if)# no mka policy Agg-To-Agg eapol-destination-mac
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

10.13.1000	Command introduced on the 6400 Switch Series.
10.13	Command introduced.

Command Information

Platforms	Command context	Authority
6300 6400	config-if config-mka-policy	Administrators or local user group members with execution rights for this command.

eapol-dot1q-tagged

```
eapol-dot1q-tagged
no eapol-dot1q-tagged
```

Description

Configures the EAPoL frames for MKA to be transmitted with an 802.1q tag. The native VLAN associated with the port is used in the MKA frames. This configuration enables the switch to establish a MACsec tunnel over a Layer 2 network with the next hop connected over non-MACsec, 802.1q tagged only link.

The **no** form of command configures the switch to send MKA frames as untagged.

- When the configuration is enabled, MKA is restarted on the port if the native VLAN associated with the port is updated.
- The 802.1q tag added to the MKA frame is also used in the computation of the ICV for the MKA frame. If the 802.1q tag is removed or modified in any way along the path, including changes in VLAN ID or PCP, the MKA frame will be discarded at the destination.

Examples

Configuring the MKA policy to use 802.1q tagged EAPoL MKA frames:

```
switch(config)# mka policy Agg-To-Agg
switch(config-mka-policy)# eapol-dot1q-tagged
OR
switch(config)# mka policy Agg-To-Agg eapol-dot1q-tagged
```

Resetting MKA policy to use untagged EAPoL MKA frames:

```
switch(config)# mka policy Agg-To-Agg
switch(config-mka-policy)# no eapol-dot1q-tagged
OR
switch(config-if)# no mka policy Agg-To-Agg eapol-dot1q-tagged
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.13.1000	Command introduced on the 6400 Switch Series.
10.13	Command introduced on the 8360 and 6300 Switch Series.

Command Information

Platforms	Command context	Authority
6300 6400	`config-if` `config-mka-policy`	Administrators or local user group members with execution rights for this command.

eapol-eth-type

```
eapol-eth-type <ETH-TYPE>
no eapol-eth-type <ETH-TYPE>
```

Description

Configures the Ether-Type for use in frames for MKA.

The **no** form of the command uses the default EAPoL ether-type 0x888e for MKA.

- Only values 0x876f and 0x888e are supported.
- Refer to the MACsec WAN extension

Parameter	Description
<ETH-TYPE>	Configures the Ether-Type in EAPoL frames for MKA.

Examples

Configuring the custom Ethernet type for MKA:

```
switch(config)# mka policy Agg-To-Agg eapol-eth-type 876f
OR
switch(config)# mka policy Agg-To-Agg
switch(config-mka-policy)# eapol-eth-type 876f
```

Resetting the custom EAPoL Ethernet Type:

```
switch(config)# no mka policy Agg-To-Agg eapol-eth-type 876f
OR
switch(config)# mka policy Agg-To-Agg
switch(config-mka-policy)# no eapol-eth-type 876f
```

Using an Ethernet Type value other than 876f or 888e:

```
switch(config)# mka policy Agg-To-Agg
switch(config-mka-policy)# eapol-eth-type 999F
Unsupported Ether-Type. Supported values are 888e and 876f
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.14	Command introduced on the 6300, 6400, and 8360 Switch Series.

Command Information

Platforms	Command context	Authority
6300 6400	`config-mka-policy`	Administrators or local user group members with execution rights for this command.

key-server-priority

`key-server-priority` *<PRIORITY>*

```
no key-server-priority
```

Description

In the **config-mka-policy** policy context, configures the MKA key server priority. The highest priority is 0 and indicates that this switch strongly wants to be the MKA key server. The lowest priority is 255 and indicates that switch does not want to be the MKA key server, allowing the switch at the other end of the link to be the key server. Set this priority on the switches at either end of the link to achieve the desired effect.

If the key server priority is 0 on both switches then the switch with the lowest system MACsec address is elected as key server.

The **no** form of this command resets the MKA key server priority to its default of 0.

Parameter	Description
<PRIORITY>	Selects the MKA key server priority for this switch. Default 0 (highest priority). Range: 0 to 255.

Examples

Setting the MKA key server priority:

```
switch(config-mka-policy)# key-server-priority 5
```

Resetting the MKA key server priority to its default of 0:

```
switch(config-mka-policy)# no key-server-priority
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.10	Command introduced on the 6300.

Command Information

Platforms	Command context	Authority
6300	`config-mka-policy`	Administrators or local user group members with execution rights for this command.

pre-shared-key

```
pre-shared-key keychain <NAME>
pre-shared-key ckn <CA-KEY-NAME> cak {plaintext [<PLAINTEXT-CAK>] | ciphertext
<CIPHERTEXT-CAK>}
```

Description

Configures the Pre-Shared Key (PSK) to use for an MKA policy.

A PSK can be configured one of two ways:

1. Configure the Connectivity Association Key Name (CKN) and Connectivity Association Key (CAK) directly in the PSK.
2. Configure the PSK to use an existing keychain for the CKN (key name) and CAK (key-string).

If both a key chain and a static CKN/CAK are configured in the PSK, then the key chain will be used for MKA operations.

When using a PSK with a key chain, only the send lifetime is considered for CAK lifetime. It is recommended to not configure an accept lifetime in the key chain used for MACsec.

The **no** form of this command deletes the PSK configuration including the key chain association, the CKN and the CAK.

Parameter	Description
<CA-KEY-NAME>	Specifies the CKN (Connectivity Association Key Name). Range: 1 to 64 hexadecimal characters.
<PLAINTEXT-CAK>	Specifies the CAK (Connectivity Association Key) in plaintext. Range: 1 to 64 hexadecimal characters.
<CIPHERTEXT-CAK>	Specifies the CAK (Connectivity Association Key) as ciphertext.
<NAME>	Specifies the keychain name.

Examples

Configuring the pre-shared key with a specified plaintext CAK:

```
switch(config-mka-policy)# pre-shared-key ckn abcdef12 cak plaintext 123abcdef
```

Configuring the pre-shared key with a prompted plaintext CAK:

```
switch(config-mka-policy)# pre-shared-key ckn abcdef12 cak plaintext
Enter CAK: ******
Confirm CAK: ******
```

Configuring the pre-shared key with a ciphertext CAK:

```
switch(config-mka-policy)# pre-shared-key ckn abcdef12 cak ciphertext
AQBapUvjDZgUxtTpgA4NLqnsn7CjXqbDch+BOS7y9fcWExLUBgAAAKUmDYdhew==
```

Configuring a key chain for an MKA policy:

```
switch(config)# mka policy Agg-To-Agg
switch(config-mka-policy)# pre-shared-key keychain macsec_keys
```

Deleting the PSK configuration including its CKN and CAK:

```
switch(config-mka-policy)# no pre-shared-key
```

Deleting a key chain from an MKA policy:

```
switch(config)# mka policy Agg-To-Agg
switch(config-mka-policy)# no pre-shared-key keychain macsec_keys
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.11	Command introduced on the 6300.

Command Information

Platforms	Command context	Authority
6300	`config-mka-policy`	Administrators or local user group members with execution rights for this command.

mka policy

```
mka policy  <MKA-POLICY-NAME>
no mka policy <MKA-POLICY-NAME>
```

Description

Creates the specified MKA (MACsec Key Agreement) policy and then enters its context (displayed in the CLI as **config-mka-policy**). If the MKA policy already exists, this command enters the specified MKA policy context.

An MKA policy can be applied to one or more switch ports, enabling MKA on the ports. A MACsec policy must be applied to the same ports.

The **no** form of this command deletes the MKA policy.

An MKA policy cannot be deleted if it is currently applied to any ports. All application of the policy must be removed before the policy can be deleted.

Parameter	Description
<MKA-POLICY-NAME>	Specifies the MKA policy name. Range: 1 to 32 alphanumeric characters including only the three special characters "." (period), "-" (hyphen), and "_" (underscore).

Examples

Creating an MKA policy:

```
switch(config)# mka policy MKA_Policy1
switch(config-mka-policy)#
```

Deleting an MKA policy (the policy cannot be currently applied to any ports):

```
switch(config)# no mka policy MKA_Policy1
```

For more information on features that use this command, refer to the Security Guide for your switch model.

show mka policy

`show mka policy [<MKA-POLICY-NAME>]`

Description

Shows information for one or all MKA policies.

Parameter	Description
<MKA-POLICY-NAME>	Specifies the MKA policy name. Range: 1 to 32 alphanumeric characters including only the three special characters "." (period), "-" (hyphen), and "_" (underscore).

Examples

Showing information for a specific MKA policy:

```
switch# show mka policy Agg-To-Agg

MKA Policy Details

  Policy Name: Agg-To-Agg
  ----------------------------------------------------------------------------
  Mode                     : Pre-shared key

6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show mka statistics

`show mka statistics [interface <IF-RANGE>]`

Description

Shows MKA statistics for all MACsec-enabled interfaces or a specific interface or interface range. The MKA statistics are refreshed periodically, approximately every five seconds.

Parameter	Description
`interface <IF-RANGE>`	Specifies one or more interfaces for which MKA statistics information is to be shown.

Examples

Showing MKA statistics information for a specific interface:

```
switch# show mka statistics interface 1/1/1

Interface 1/1/1
================

  KaY
  ----
    SCI : ec0273f72f4d0001

transmit-interval

```
transmit-interval <INTERVAL>
no transmit-interval
```

Description

In the **config-mka-policy** policy context, configures the MKA packet transmit interval.

The **no** form of this command resets the MKA packet transmit interval to its default of 2 seconds.

Parameter	Description
<INTERVAL>	Selects the MKA packet transmit interval. Default 2 seconds. Range: 2 to 6 seconds.

Examples

Setting the MKA packet transmit interval:

```
switch(config-mka-policy)# transmit-interval 4
```

Resetting the MKA packet transmit interval to its default of 2 seconds:

```
switch(config-mka-policy)# no transmit-interval
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification

6300	`config-mka-policy`	Administrators or local user group members with execution rights for this command.

Chapter 78

MLD snooping global configuration commands

ipv6 mld snooping

```
ipv6 mld snooping drop-unknown {vlan-shared | vlan-exclusive}
no ipv6 mld snooping drop-unknown {vlan-shared | vlan-exclusive}
```

Description

This command configures the drop unknown mode. While MLD snooping is enabled, the traffic will be forwarded only to ports that initiate an MLD request for multicast. Drop unknown mode can be a filter across all VLANs (vlan-shared) or per VLAN (exclusive-vlan). The default configuration is vlan-shared.

The **no** form of this command configures the drop unknown mode on the switch to the default **vlan-shared**.

Parameter	Description
`vlan-shared`	Required: Enable shared VLAN filter on the switch.
`vlan-exclusive`	Required: Enable exclusive drop unknown filter per VLAN.

Example

```
switch(config)# ipv6 mld snooping drop-unknown vlan-shared
switch(config)# ipv6 mld snooping drop-unknown vlan-exclusive
switch(config)# no ipv6 mld snooping drop-unknown
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

All platforms	`config`	Administrators or local user group members with execution rights for this command.

mgmd delayed-refresh timer

```
mgmd delayed-refresh timer <value>
no mgmd delayed-refresh timer <value>
```

Description

This command delays the refresh for some IGMP or MLD protocol-related values. When this command is enabled, IGMP/MLD **last_reporter value**, source, group, or querier uptime, and the **create time** and **expiry time** values will be updated based on the configured timer values. By default, the timer value is 30 seconds. This command is disabled by default, where the values listed above will be updated for every control packet. Best practices is to enable this feature when CPU utilization by the OVSDB server is increasing because of increased MGMD operations.

Parameter	Description
timer <value>	Number of seconds the timer will delay the update. Range: 5-30.

Example

Configuring the MGMD delayed refresh.

```
switch(config)# mgmd delayed-update timer 20
```

Disabling the MGMD delayed refresh.feature:

```
switch(config)# no mgmd delayed-update timer 20
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.10	Command Introduced

6400	config	Administrators or local user group members with execution rights for this command.

mgmd querier-offload

```
mgmd querier-offload
no mgmd querier-offload
```

Description

Configures the IGMP/MLD querier (mgmd) offload feature. When the querier offload is enabled, during VSX software upgrade or VSX querier node reboot, the querier responsibility is offloaded to the VSX peer which is up and running. This is enabled by default.

The **no** form of this command disables the querier offload functionality.

This feature is applicable only to the VSX switches not to standalone switches.

Example

Configuring the querier offload feature:

```
switch(config)# mgmd querier-offload
```

Disabling the querier offload feature:

```
switch(config)# no mgmd querier-offload
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Chapter 79

MLD snooping VLAN configuration commands

ipv6 mld snooping

```
ipv6 mld snooping {enable | disable}
no ipv6 mld snooping [enable | disable]
```

Description

This command enables or disables MLD snooping on the VLAN.

The **no** form of this command disables all MLD snooping configurations on the VLAN.

Parameter	Description
`enable`	Required: Enable MLD snooping on the VLAN.
`disable`	Required: Disable MLD snooping on the VLAN.

Example

Enable MLD snooping on VLAN 2:

```
switch(config)# vlan 2
switch(config-vlan)# ipv6 mld snooping enable
switch(config-vlan)# ipv6 mld snooping disable
```

Remove all MLD snooping configurations on VLAN 2:

```
switch(config)# vlan 2
switch(config-vlan)# no ipv6 mld snooping enable
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ipv6 mld snooping fastlearn

```
ipv6 mld snooping fastlearn <port-list>
```

Description

This command enables the port to learn group information on receiving topology change notification.

The **no** form of this command disables fastlearn on the ports.

Parameter	Description
`port-list`	Required: 1/1/1-1/1/2, ports to be configured as fastlearn ports.

Example

On the 6400 Switch Series, interface identification differs.

```
switch(config)# ipv6 mld snooping fastlearn 1/1/3
switch(config)# ipv6 mld snooping fastlearn 1/1/1-1/1/2
switch(config)# ipv6 mld snooping fastlearn 1/1/5,1/1/6
```

ipv6 mld snooping fastleave vlan

```
ipv6 mld snooping [fastleave vlan <VLAN-LIST>]
no ipv6 mld snooping [fastleave vlan <VLAN-LIST>]
```

Description

Configures the specified ports as fastleave ports. Enables the switch to immediately remove an interface from the bridge table upon receiving the leave group message.

The **no** form of this command disables fastleave configuration on the ports.

Parameter	Description
<VLAN-LIST>	Required: Specifies a list of VLANs on which the port should be configured as a fastleave port. Specifies the number of a single VLAN or a series of numbers for a range of VLANs, separated by commas (10, 20, 30, 40), dashes (10-40), or both (10-40,60).

Usage

MLD fastleave is configured for ports on a per-VLAN basis. By default, the querier sends a MLD Group-Specific Query message out of the interface, upon which the leave group message is received to ensure that no other receivers are connected to the interface. If receivers are directly attached to the switch, it is inefficient to send the membership query as the receiver wanting to leave is the only connected host. Fastleave processing eliminates the MLD Group-Specific Query message. Thus, it allows the switch to immediately remove an interface from the bridge table upon receiving the leave Group message. This processing speeds up the overall leave process and also eliminates the CPU overhead of having to generate an MLD Group-Specific Query message.

Example

On the 6400 Switch Series, interface identification differs.

Configuring fastleave ports for the VLAN:

```
switch# configure terminal
switch(config)# int 1/1/1
switch(config-vlan)# no shut
switch(config-vlan)# no routing
switch(config-vlan)# ipv6 mld snooping fastleave vlan 10
switch(config-vlan)# ipv6 mld snooping fastleave vlan 10-20
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ipv6 mld snooping filter-unknown-mcast

```
ipv6 mld snooping filter-unknown-mcast
no ipv6 mld snooping filter-unknown-mcast
```

Description

Configures the unknown multicast to steal when the MLD snooping is enabled.

The **no** form of this command returns to the default behavior of initial flooding of unknown multicast traffic.

Usage

In the default behavior, the unknown multicast traffic is flooded until the IP Multicast Flow programming is done on the hardware. This is known as initial flooding of unknown multicast. Use this command to filter unknown multicast instead of flooding.

> Initial flooding of multicast traffic is observed for a few seconds after the device comes up from a reboot. This issue is only seen when the multicast source connected device is rebooted. Once the device is up after a reboot, it takes a few seconds for the CPU Rx rule to be programmed during the timeframe that the initial flooding is observed. This is an expected behavior.

Example

Configure the unknown multicast to steal globally on IGMP snooping enabled VLANs.

```
switch# configure terminal
switch(config)# ipv6 mld snooping filter-unknown-multicast
```

Removing the configuration of the unknown multicast to steal globally on IGMP snooping enabled VLANs.

```
switch# configure terminal
switch(config)# no ipv6 mld snooping filter-unknown-multicast
```

Command History

Release	Modification

ipv6 mld snooping forced fastleave vlan

```
ipv6 mld snooping [forced-fastleave <VLAN-LIST>]
no ipv6 mld snooping [forced-fastleave <VLAN-LIST>]
```

Description

Configures the given ports in forced fastleave mode.

The **no** form of this command disables forced fastleave configuration on the ports.

Parameter	Description
<VLAN-LIST>	Required: Specifies a list of VLANs on which the port should be configured as a forced fastleave port. Specifies the number of a single VLAN or a series of numbers for a range of VLANs, separated by commas (10, 20, 30, 40), dashes (10-40), or both (10-40,60).

Usage

With forced fastleave enabled, MLD speeds up the process of blocking unnecessary multicast traffic to a switch port that is connected to multiple end nodes. When a port having multiple end nodes receives a leave group request from one end node for a given multicast group, forced fastleave activates and waits a small amount of time to receive a join request from any other member of the same group on that port. If the port does not receive a join request for that group within the forced fastleave interval, the switch then blocks any further traffic to that group on that port.

Example

On the 6400 Switch Series, interface identification differs.

Configuring forced-fastleave ports for the VLAN:

```
switch# configure terminal
switch(config)# int 1/1/1
switch(config-vlan)# no shut
switch(config-vlan)# no routing
switch(config-vlan)# ipv6 mld snooping forced-fastleave vlan 10
switch(config-vlan)# ipv6 mld snooping forced-fastleave vlan 10-20
```

ipv6 mld snooping apply access-list

```
ipv6 mld snooping apply access-list <ACL-NAME>
no ipv6 mld snooping apply access-list <ACL-NAME>
```

Description

Configures the ACL on a particular interface to filter the MLD join or leave packets based on rules set in the particular ACL name.

The **no** form of this command disables the rules set for the ACL.

This configuration will override the ACL associated with IGMP snooping on the corresponding L2 VLAN.

Parameter	Description
`access-list`	Associates an ACL with the IGMP.
`<ACL-NAME>`	Specifies the name of the ACL. **NOTE:** If the access list is configured for both L2 VLAN and L3 VLAN, the L3 VLAN configuration will be applied.

Usage

- Existing classifier commands are used to configure the ACL.
- In case an IGMPv3 packet with multiple group addresses is received, the switch only processes the permitted group addresses based on the ACL rule set. The packet is forwarded to querier and PIM router even though one of the groups present in the packet is blocked by ACL. This avoids the delay in learning of the permitted groups. Since the access switch configured with ACL blocks the traffic for the groups which are denied, forwarding of joins has no impact. If all the groups in the packet are denied by the ACL rule, the packet is not forwarded to the querier and PIM router. Existing joins will timeout.
- In case of IGMPv2, if there is no match or if there is a deny rule match, the packet is dropped.

Examples

Configuring the ACL to filter MLD packets based on permit/deny rules set in access list **mygroup**:

```
switch(config)# access-list ipv6 mygroup
switch(config-acl-ip)# 10 deny icmpv6 any ff55::2
switch(config-acl-ip)# 20 deny icmpv6 any ff55::3
switch(config-acl-ip)# 30 permit icmpv6 any ff55::1
switch(config-acl-ip)# exit
switch(config)# interface vlan 2
switch(config-vlan)# ipv6 mld snooping apply access-list mygroup
```

Configuring the ACL to remove the rules set in access list `mygroup`:

```
switch(config-vlan)# no ipv6 mld snooping apply access-list mygroup
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ipv6 mld snooping auto vlan

```
ipv6 mld snooping [auto vlan <VLAN-LIST>]
no ipv6 mld snooping [auto vlan <VLAN-LIST>]
```

Description

This command configures the given ports in auto mode, which is the default port mode.

The **no** form of this command disables auto ports.

Parameter	Description
<VLAN-LIST>	Required: Specifies a list of VLANs on which the port should be configured as an auto port. Specifies the number of a single VLAN or a series of numbers for a range of VLANs, separated by commas (10, 20, 30, 40), dashes (10-40), or both (10-40,60).

Example

On the 6400 Switch Series, interface identification differs.

Configuring auto ports for VLANs on the interface:

```
switch# configure terminal
switch(config)# int 1/1/1
switch(config-vlan)# no shut
switch(config-vlan)# no routing
switch(config-vlan)# ipv6 mld snooping auto vlan 10
switch(config-vlan)# ipv6 mld snooping auto vlan 10-20
```

ipv6 mld snooping blocked vlan

```
ipv6 mld snooping [blocked vlan <VLAN-LIST>]
no ipv6 mld snooping [blocked vlan <VLAN-LIST>]
```

Description

By default ports are configured in auto mode. This command configures the given ports in blocked mode.

The **no** form of this command removes blocked ports.

Parameter	Description
<VLAN-LIST>	Required: Specifies a list of VLANs on which the port should be configured as a blocked port. Specifies the number of a single VLAN or a series of numbers for a range of VLANs, separated by commas (10, 20, 30, 40), dashes (10-40), or both (10-40,60).

Example

On the 6400 Switch Series, interface identification differs.

Configuring blocked ports for the VLANs on the interface:

```
switch# configure terminal
switch(config)# int 1/1/1
switch(config-vlan)# no shut
switch(config-vlan)# no routing
switch(config-vlan)# ipv6 mld snooping blocked vlan 10
switch(config-vlan)# ipv6 mld snooping blocked vlan 10-20
```

ipv6 mld snooping forward vlan

```
ipv6 mld snooping [forward vlan <VLAN-LIST>]
no ipv6 mld snooping [forward vlan <VLAN-LIST>]
```

Description

By default ports are configured in auto mode. This command configures the given ports in forward mode.

The **no** form of this command disables forward ports.

Parameter	Description
<VLAN-LIST>	Required: Specifies a list of VLANs on which the port should be configured as a forward port. Specifies the number of a single VLAN or a series of numbers for a range of VLANs, separated by commas (10, 20, 30, 40), dashes (10-40), or both (10-40,60).

Example

On the 6400 Switch Series, interface identification differs.

Configuring forward ports for VLANs on the interface:

```
switch# configureterminal
switch(config)# int 1/1/1
switch(config-vlan)# no shut
switch(config-vlan)# no routing
switch(config-vlan)# ipv6 mld snooping forward vlan 10
switch(config-vlan)# ipv6 mld snooping forward vlan 10-20
```

ipv6 mld snooping preprogram-starg-flow

`ipv6 mld snooping preprogram-starg-flow {enable | disable}`

Description

This command configures the preprogramming of the starg flow feature on MLD snooping enabled VLANs.

Parameter	Description
`enable`	Enable preprogramming starg flows on the VLAN.
`disable`	Disable prprogramming starg flows on the VLAN.

Usage

When this feature is enabled, a summarized multicast bridge entry is programmed into the hardware table when a starg or sg MLD join is received on the MLD snooping enabled VLAN. This enables multicast flow to be programmed in the hardware even before the data packet arrives for multicast flow. MLDv2 joins that are sent for a specific source are treated similar to starg joins and a summarized entry is programmed in the corresponding hardware.

Preprogramming of Starg Flows is supported only on the MLD snooping enabled VLANs. If MLD snooping is disabled on a VLAN, this feature is auto-disabled.

This feature is currently supported for MLDv1 and MLDv2 joins, which means a summarized multicast flow is programmed in advance when a MLDv1 or MLDv2 join for a specific group is received. For MLDv2 deployments, traffic from all of the sources for a specific multicast group are sent to all of the clients, regardless of whether they are sending MLDv1 or MLDv2 joins for this group. Keeping this feature disabled is recommended on VLANs where traffic from the specific source is only expected for the MLDv2 clients.

On the 6200, 6300, 6400, and 8100 switch series, a single starg entry is programmed in advance for each join received. Data driven programming of SG entries does not occur when traffic is received from a specific source for this group. A single starg entry is used to forward the traffic to the clients for all of the active joins in the feature enabled VLANs.

When an unknown multicast packet is received on a VLAN where the feature is enabled, it triggers programming of a starg entry in the hardware instead of SG.

It is highly recommended to not enable this feature on devices where PIM or L3 multicast routing is enabled as it can lead to issues like permanent traffic loss.

Configuring this feature on devices where there are multiple sources sending traffic for the same group address is recommended.

This feature is mutually exclusive with the MLD snooping static group feature.

Optimization may vary environment to environment, based on scale.

Example

Enable preprogramming of starg flow on VLAN 2:

```
switch(config)# vlan 2
switch(config-vlan)# ipv6 mld snooping preprogramming-starg-flow enable
```

Remove all preprogramming of starg flow on VLAN 2:

```
switch(config)# vlan 2
switch(config-vlan)# ipv6 mld snooping preprogramming-starg-flow disable
```

Command History

Release	Modification
10.13	Command introduced.

ipv6 mld snooping static-group

```
ipv6 mld snooping [static-group <X:X::X:X>]
no ipv6 mld snooping [static-group <X:X::X:X>]
```

Description

This command configures static multicast group.

The **no** form of this command disables static multicast group.

Parameter	Description
`static-group`	Required: **<X:X::X:X>**, MLD static multicast group.

Example

Configuring static multicast group:

```
switch(config)# vlan 2
switch(config-vlan)# ipv6 mld snooping static-group ff12::c
```

Removing the configuration of static multicast group:

```
switch(config)# vlan 2
switch(config-vlan)# no ipv6 mld snooping static-group ff12::c
```

ipv6 mld snooping version

```
ipv6 mld snooping [version <ver>]
no ipv6 mld snooping [version <ver>]
```

Description

This command configures the MLD snooping version on the VLAN. MLD version 2 is the default.

The **no** form of the command configures the default MLD snooping version on the VLAN, **2**.

Parameter	Description
`ver`	Required: 1-2, MLD snooping version.

Example

```
switch(config)# vlan 2
switch(config-vlan)# ipv6 mld snooping version 2
```

```
switch(config-vlan)# no ipv6 mld snooping version 2
```

MLD snooping show commands

show ipv6 mld snooping

```
show ipv6 mld snooping [vlan <vlan-id> [group <ip-addr>|{port <IF-NAME>}]
   counters
   detail
   groups vlan <vlan-id>
   no ...
   packet-exceptions
   static-groups
   statistics
   vsx-peer vlan [<vlan-id>]
```

NOTE: The `vsx-peer` parameter is not supported by the 6300 Series Switch

Description

This command shows MLD snooping details for all VLANs. Specify a VLAN ID or a VLAN and a group to display details for only that VLAN or VLAN group.

Parameter	Description
`vlan <vlan-id>`	Shows MLD snooping protocol information and number of different groups joined for the VLAN.
`group`	Shows MLD snooping details for the specified VLAN, including the number of different groups joined for the VLAN. Identify the group by IP address or interface name.
`<ip-addr>`	Dispaly MLD snooping information for the selected group IP address.
`port <IF-NAME>`	Display information for a VLAN port. Specify the port name in **member**/**slot**/**port** format.
`counters`	Shows MLD query packets transmitted (Tx), received (Rx), and error packet counters.
`detail`	Shows the total VLANs with MLD enabled. When issued with the **vlan <vlan-id>** parameter, this command displays details for the selected VLAN.
`groups`	Show MLD snooping groups information.
`vlan <vlan-id>`	Display IGMP snooping operational information for specified VLAN
`no ...`	Negates any configured parameter.
`packet-exceptions`	Troubleshoot issues in an L2 multicast bridge entries for data

Parameter	Description
	packets forwarded to the CPU.
statistics	Show MLD snooping statistics.

show mgmd debug-counters

```
show mgmd debug-counters
```

Description

This command displays packet throttle counters and packet queue sizes for IGMP/MLD debug counters.

Example

```
switch# show mgmd debug-counters
Global MGMD Debug Counters
Group Throttle Count                          : 0
Dropped Packet Count                          : 100
Max Pkt Handler Queue Depth                   : 2048
Current Pkt Handler Queue Depth               : 1000
```

Chapter 81

MLD configuration commands for interface VLAN

ipv6 mld

```
ipv6 mld {enable | disable}
no ipv6 mld [enable | disable]
```

Description

This command enables or disables MLD on the interface VLAN.

The **no** form of this command disables MLD on the interface VLAN.

Parameter	Description
`enable`	Required: Enable MLD on the interface VLAN.
`disable`	Required: Disable MLD on the interface VLAN.

Example

```
switch(config)# interface vlan 2
switch(config-if-vlan)# ipv6 mld enable
switch(config-if-vlan)# ipv6 mld disable
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config-if-vlan`	Administrators or local user group members with execution rights for this command.

ipv6 mld apply access-list

```
ipv6 mld apply access-list <ACL-NAME>
no ipv6 mld apply access-list <ACL-NAME>
```

Description

Configures the ACL on a particular interface to filter the MLD join or leave packets based on rules set in the particular ACL name.

The **no** form of this command disables the rules set for the ACL.

Parameter	Description
`access-list`	Associates an ACL with the IGMP.
`<ACL-NAME>`	Specifies the name of the ACL.

Usage

- Existing classifier commands are used to configure the ACL.
- In case an IGMPv3 packet with multiple group addresses is received, the switch only processes the permitted group addresses based on the ACL rule set. The packet is forwarded to querier and PIM router even though one of the groups present in the packet is blocked by ACL. This avoids the delay in learning of the permitted groups. Since the access switch configured with ACL blocks the traffic for the groups which are denied, forwarding of joins has no impact. If all the groups in the packet are denied by the ACL rule, the packet is not forwarded to the querier and PIM router. Existing joins will timeout.
- In case of IGMPv2, if there is no match or if there is a deny rule match, the packet is dropped.

Examples

Configuring the ACL to filter MLD packets based on permit/deny rules set in access list **mygroup**:

```
switch(config)# access-list ipv6 mygroup
switch(config-acl-ip)# 10 deny icmpv6 any ff55::2
switch(config-acl-ip)# 20 deny icmpv6 any ff55::3
switch(config-acl-ip)# 30 permit icmpv6 any ff55::1
switch(config-acl-ip)# exit
switch(config)# interface vlan 2
switch(config-vlan)# ipv6 mld apply access-list mygroup
```

Configuring the ACL to remove the rules set in access list **mygroup**:

```
switch(config-vlan)# no ipv6 mld apply access-list mygroup
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Command Information

Platforms	Command context	Authority
All platforms	`config-vlan`	Administrators or local user group members with execution rights for this command.

no ipv6 mld

`no ipv6 mld`

Description

This command removes all MLD configurations on the interface.

Example

On the 6400 Switch Series, interface identification differs.

```
switch(config)# interface 1/1/1
switch(config-if)# no ipv6 mld
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ipv6 mld querier

`ipv6 mld querier`

Description

This command configures MLD querier.

The **no** form of this command disables MLD querier.

Example

```
switch(config)# interface vlan 2
switch(config-if-vlan)# ipv6 mld querier
switch(config-if-vlan)# no ipv6 mld querier
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ipv6 mld querier interval

`ipv6 mld querier [interval <interval-value>]`

Description

This command configures MLD querier interval. The default interval-value is 125.

Parameter	Description
`interval-value`	Required: 5-300, configures MLD querier interval. **NOTE:** Default interval-value is 125. Use the **no ipv6 mld querier interval** command to set interval-value to the default.

Example

```
switch(config)# interface vlan 2
switch(config-if-vlan)# ipv6 mld querier interval 100
switch(config-if-vlan)# no ipv6 mld querier interval
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

All platforms	`config-if-vlan`	Administrators or local user group members with execution rights for this command.

ipv6 mld querier-wait-time

```
ipv6 mld querier-wait-time <QUERIER-WAIT-TIME>
[no] ipv6 mld querier-wait-time <QUERIER-WAIT-TIME>
```

Description

Configures initial MLD querier-wait-time value in seconds.

The **no** form of this command sets the MLD querier-wait-time to the default value of 260 seconds. Note that the wait timer can be configured to any numbers within the 1-300 second range.

Parameter	Description
<QUERIER-WAIT-TIME-VALUE>	Configures MLD querier-wait-time to desired value.

Example

```
6200-1(config-if-vlan)# ipv6 mld querier-wait-time
<1-300>  Querier Wait value (Default: 260)
6200-1(config-if-vlan)#
```

When PIMv6 is enabled, automated election will override querier-wait-time configuration. When PIM is disabled and **[no] igmp querier-wait-time** is configured, the initial wait timer will be configured at desired value.

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.13	Command introduced.

Command Information

Platforms	Command context	Authority
All platforms	`config-if-vlan`	Administrators or local user group members with execution rights for this command.

ipv6 mld last-member-query-interval

```
ipv6 mld last-member-query-interval <interval-value>
```

Description

This command configures MLD last member query interval value in seconds. The default interval-value is 1 second.

Parameter	Description
`interval-value`	Required: 1-2, configures MLD last-member-query-interval.

Default interval-value is 1 second. Use the `no ipv6 mld last-member-query-interval` command to set interval-value to the default.

Example

```
switch(config)# interface vlan 2
switch(config-if-vlan)# ipv6 mld last-member-query-interval 2
switch(config-if-vlan)# no ipv6 mld last-member-query-interval
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ipv6 mld querier query-max-response-time

`ipv6 mld querier query-max-response-time <response-time>`

Description

This command configures MLD max response time value in seconds. The default max-response-time-value is 10 seconds.

Parameter	Description
`max-response-time-value`	Required: 10-128, configures MLD querier max-response-time. **NOTE:** Default max-response-time-value is 10 seconds. Use the **no ipv6 mld querier query-max-response-time** command to set max-response-time-value to the default.

Example

```
switch(config)# interface vlan 2
switch(config-if-vlan)# ipv6 mld query-max-response-time 50
switch(config-if-vlan)# no ipv6 mld query-max-response-time
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ipv6 mld robustness

`ipv6 mld robustness <VALUE>`

Description

This command configures MLD robustness. The robustness value represents the number of times the querier retries queries on the connected subnets. The default robustness-value is 2 seconds.

Parameter	Description
<VALUE>	Required: 1-7, configures MLD robustness. **NOTE:** Default robustness-value is 2 seconds. Use the **no ipv6 mld robustness** command to set robustness-value to the default.

Example

```
switch(config)# interface vlan 2
switch(config-if-vlan)# ipv6 mld robustness 5
switch(config-if-vlan)# no ipv6 mld robustness
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ipv6 mld static-group

```
ipv6 mld static-group <MULTICAST-GROUP-IP>
```

Description

This command configures MLD static group.

Parameter	Description
<MULTICAST-GROUP-IP>	Required: X:X::X:X, configures MLD static group.

Example

```
switch(config)# interface vlan 2
switch(config-if-vlan)# ipv6 mld static-group ff12::c
switch(config-if-vlan)# no ipv6 mld static-group ff12::c
```

ipv6 mld version

```
ipv6 mld version <VERSION>
no ipv6 mld version <VERSION>
```

Description

This command configures MLD version.

The **no** form of the command configures the default MLD version of **2**.

Parameter	Description
<VERSION>	Required: 1-2, configures MLD version.

Example

```
switch(config)# interface vlan 2
switch(config-if-vlan)# ipv6 mld version 2
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ipv6 mld version strict

```
ipv6 mld version <VERSION> [strict]
```

Description

This command configures MLD strict version. Packets that do not match the configured version will be dropped. By default, strict option is not enabled.

Parameter	Description
<VERSION>	Required: 1-2, configures MLD version.

Example

```
switch(config)# interface vlan 2
switch(config-if-vlan)# ipv6 mld version 2 strict
switch(config-if-vlan)# no ipv6 mld version 2 strict
```

Chapter 82

MLD show commands for interface VLAN

show ipv6 mld

```
show ipv6 mld
   all-vrfs
   counters
   group <x:x::x:x> [source x:x::x:x]
   groups
   interface {<INTF-ID>|<INTF-ID.ID>}|{vlan <vlan-id}}
   static-groups
   statistics [all-vrfs|{vrf <vrf-name>}]
   vrf <vrf-name}
```

Description

This command shows MLD groups joined details.

Parameter	Description
`all-vrfs`	Show MLD snooping info for all VRFs in all interfaces or groups, or for all VRFs in a specified group, interface or VLAN
`counters`	Show all MLD counters, or display counters for the specified interface or VLAN
`group <x:x::x:x> [source <x:x::x:x>]`	Show MLD group information for the specified group, group and interface, or group and vlan. Include the optional **source <x:x::x:x>** parameter to dislay source information for the group.
`groups`	Show MLD group information for all VRFs, or for groups in the specified interface or VLAN.
`interface`	Shows MLD configuration information for a specified interface , sub interface, or VLAN.
`<INTF-ID>`	Specify an Interface ID
`<INTF-ID.ID>`	Specify a sub-interface ID. (Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.)
`vlan <vlan-id>`	Specify a VLAN ID
`static-groups`	Display all static groups information, or include one of the additional parameters apply additional filters: ▪ **all-vrfs**: Display MLD static-group information for all VRFs ▪ **vrf <vrf-name>**: Display MLD static-group information for the selected VRF

Parameter	Description
`statistics`	Display all MLD statistics, or include one of the additional parameters apply additional filters: ■ **all-vrfs**: Display MLD statistics information for all VRFs ■ **vrf <vrf-name>**: Display MLD statistics information forthe selcted VRF
`vrf <vrf-name>`	Show MLD information for the specified VRF.

Examples

Showing the current MLD configuration and status

```
switch# show ipv6 mld

VRF Name                   : default
Interface                  : vlan10
MLD Configured Version     : 2
MLD Operating Version      : 2
Querier State              : Querier
Querier IP [this switch]   : fe80::7272:cfff:fe96:d3ec
Querier Uptime             : 39m 44s
Querier Expiration Time    : 0m 31s
MLD Snoop Enabled on VLAN  : True
```

Showing the MLD configuration on a specified VLAN or interface:

```
switch# show ipv6 mld interface vlan 10

MLD Configured Version   : 2
MLD Operating Version    : 2
Querier State              : Querier
Querier IP [this switch]   : fe80::7272:cfff:fe96:d3ec
Querier Uptime             : 40m 42s
Querier Expiration Time    : 1m 39s
MLD Snoop Enabled on VLAN  : True

switch# show ipv6 mld interface 1/1/2

MLD Configured Version   : 2
MLD Operating Version    : 2
Querier State              : Querier
Querier IP [this switch]   : fe80::7272:cfff:fe96:d3ec
Querier Uptime             : 40m 42s
Querier Expiration Time    : 1m 39s
MLD Snoop Enabled on VLAN  : True
```

Showing MLD configuration on sub-interface 1/1/2.10:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch# show ipv6 mld interface 1/1/2.10

MLD Configured Version   : 2
MLD Operating Version    : 2
Querier State              : Querier
Querier IP [this switch]   : fe80::7272:cfff:fe96:13ec
Querier Uptime             : 40m 42s
Querier Expiration Time    : 1m 39s
MLD Snoop Enabled on VLAN  : True
```

Showing MLD groups information for a specified interface:

```
switch# show ipv6 mld interface 1/1/1 groups

MLD group information for group ff55::1

Interface Name   : 1/1/1
VRF Name         : default

Group Address    : ff55::1
Last Reporter    : fe80::a00:9ff:fe77:1062

                              V1        Sources   Sources
Vers Mode Uptime    Expires   Timer     Forwarded Blocked
---- ---- --------- --------- --------- --------- --------
2    EXC  0m 14s    4m 6s
```

Showing MLD groups information for a specified sub-interface:

```
switch# show ipv6 mld interface 1/1/1.10 groups

MLD group information for group ff56::1

Interface Name   : 1/1/1.10
VRF Name         : default

Group Address    : ff56::1
Last Reporter    : fe80::a00:9ff:fe77:1062

                              V1        Sources   Sources
Vers Mode Uptime    Expires   Timer     Forwarded Blocked
---- ---- --------- --------- --------- --------- --------
2    EXC  1m 14s    2m 6s
```

Showing MLD static groups

```
switch# show ipv6 mld static-groups all-vrfs

MLD Static Group Address Information

VRF Name   :default
Interface Name   Group Address
--------------- -----------------------------------------
vlan2           ff12::c
vlan2           ff12::d
VRF Name   :test
Interface Name   Group Address
--------------- -----------------------------------------
vlan3           ff13::1
vlan3           ff13::2
```

Showing MLD counters

```
switch# show ipv6 mld counters

MLD Counters

Interface Name      : vlan2
VRF Name            : default
Membership Timeout  : 0
                                             Rx            Tx
                                             ------------- -------------

MLD configuration commands for interface

ipv6 mld

```
ipv6 mld {enable | disable}
no ipv6 mld {enable | disable}
```

Description

This command enables or disables MLD on the interface.

The **no** form of this command disables MLD on the interface.

Parameter	Description
`enable`	Required: Enable MLD on the interface.
`disable`	Required: Disable MLD on the interface.

Example

On the 6400 Switch Series, interface identification differs.

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 mld enable
switch(config-if)# ipv6 mld disable
```

ipv6 mld apply access-list

```
ipv6 mld apply access-list <ACL-NAME>
no ipv6 mld apply access-list <ACL-NAME>
```

Description

Configures the ACL on a particular interface to filter the MLD join or leave packets based on rules set in the particular ACL name.

The **no** form of this command removes the rules set for the ACL.

Parameter	Description
`access-list`	Associates an ACL with the IGMP.
`<ACL-NAME>`	Specifies the name of the ACL.

Usage

- Existing classifier commands are used to configure the ACL.
- In case an IGMPv3 packet with multiple group addresses is received, the switch only processes the permitted group addresses based on the ACL rule set. The packet is forwarded to querier and PIM router even though one of the groups present in the packet is blocked by ACL. This avoids the delay in learning of the permitted groups. Since the access switch configured with ACL blocks the traffic for the groups which are denied, forwarding of joins has no impact. If all the groups in the packet are denied by the ACL rule, the packet is not forwarded to the querier and PIM router. Existing joins will timeout.
- In case of IGMPv2, if there is no match or if there is a deny rule match, the packet is dropped.

Examples

On the 6400 Switch Series, interface identification differs.

Configuring the ACL to filter MLD packets based on permit/deny rules set in access list **mygroup**:

```
switch(config)# access-list ipv6 mygroup
switch(config-acl-ip)# 10 deny icmpv6 any ff55::2
switch(config-acl-ip)# 20 deny icmpv6 any ff55::3
switch(config-acl-ip)# 30 permit icmpv6 any ff55::1
switch(config-acl-ip)# exit
switch(config)# interface 1/1/1
switch(config-vlan)# ipv6 mld apply access-list mygroup
```

Configuring the ACL to remove the rules set in access list **mygroup**:

```
switch(config-vlan)# no ipv6 mld apply access-list mygroup
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

All platforms	`config-vlan`	Administrators or local user group members with execution rights for this command.

no ipv6 mld

`no ipv6 mld`

Description

This command removes all MLD configurations on the interface.

Example

On the 6400 Switch Series, interface identification differs.

```
switch(config)# interface 1/1/1
switch(config-if)# no ipv6 mld
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command Information

Platforms	Command context	Authority
All platforms	`config-if`	Administrators or local user group members with execution rights for this command.

ipv6 mld querier

`ipv6 mld querier`

Description

This command configures MLD querier. This functionality will allow the interface to join in the querier-election process.

Example

On the 6400 Switch Series, interface identification differs.

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 mld querier
switch(config-if)# no ipv6 mld querier
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ipv6 mld querier interval

`ipv6 mld querier [interval <interval-value>]`

Description

This command configures MLD querier interval. The default interval-value is 125.

Parameter	Description
`interval-value`	Required: 5-300, configures MLD querier interval. **NOTE:** Default interval-value is 125. Use the `no ipv6 mld querier interval` command to set interval-value to the default.

Example

On the 6400 Switch Series, interface identification differs.

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 mld querier interval 100
switch(config-if)# no ipv6 mld querier interval
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ipv6 mld last-member-query-interval

`ipv6 mld last-member-query-interval <`*`interval-value`*`>`

Description

This command configures MLD last member query interval value in seconds. The default interval-value is 1 second.

Parameter	Description
`interval-value`	Required: 1-2, configures MLD last-member-query-interval.

Default interval-value is 1 second. Use the `no ipv6 mld last-member-query-interval` command to set interval-value to the default.

Example

On the 6400 Switch Series, interface identification differs.

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 mld last-member-query-interval 2
switch(config-if)# no ipv6 mld last-member-query-interval
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ipv6 mld querier query-max-response-time

`ipv6 mld querier query-max-response-time <`*`response-time`*`>`

Description

This command configures MLD max response time value in seconds. The default max-response-time-value is 10 seconds.

Parameter	Description
`max-response-time-value`	Required: 10-128, configures MLD querier max-response-time. **NOTE:** Default max-response-time-value is 10 seconds. Use the **no ipv6 mld querier query-max-response-time** command to set max-response-time-value to the default.

Example

On the 6400 Switch Series, interface identification differs.

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 mld query-max-response-time 50
switch(config-if)# no ipv6 mld query-max-response-time
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ipv6 mld robustness

`ipv6 mld robustness <value>`

Description

This command configures MLD robustness. The robustness value represents the number of times the querier retries queries on the connected subnets. The default robustness-value is 2 seconds.

Parameter	Description
`robustness-value`	Required: 1-7, configures MLD robustness.

Default robustness-value is 2 seconds. Use the `no ipv6 mld robustness` command to set robustness-value to the default.

Example

On the 6400 Switch Series, interface identification differs.

```
switch(config)# interface 1/11/1
switch(config-if)# ipv6 mld robustness 5
switch(config-if)# no ipv6 mld robustness
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ipv6 mld static-group

`ipv6 mld static-group <multicast-group-ip>`

Description

This command configures MLD static group.

Parameter	Description
`multicast-group-ip`	Required: X:X::X:X, configures MLD static group.

Example

On the 6400 Switch Series, interface identification differs.

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 mld static-group ff12::c
switch(config-if)# no ipv6 mld static-group ff12::c
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ipv6 mld version

```
ipv6 mld version <version>
no ipv6 mld version <version>
```

Description

This command configures MLD version.

The **no** form of this command removes MLD version from the interface.

Parameter	Description
`version`	Required: 1-2, configures MLD version.

Example

On the 6400 Switch Series, interface identification differs.

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 mld version 2
```

```
switch(config)# interface 1/1/1
switch(config-if)# no ipv6 mld version 2
```

ipv6 mld version strict

```
ipv6 mld version <version> [strict]
```

Description

This command configures MLD strict version. Packets that do not match the configured version will be dropped. By default, strict option is not enabled.

Parameter	Description
`version`	Required: 1-2, configures MLD version.

Example

On the 6400 Switch Series, interface identification differs.

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 mld version 2 strict
switch(config-if)# no ipv6 mld version 2 strict
```

Chapter 84

MPLS commands

bind ipv4 (lsp label imposition)

```
bind ipv4 {<IP-ADDR>/<MASK> | <IP-ADDR> <MASK>} output <IFNAME> <IP-ADDR> <OUT-LABEL>
no bind ipv4 {<IP-ADDR>/<MASK> | <IP-ADDR><MASK>} output <IFNAME><IP-ADDR><OUT-LABEL>
```

Description

Performs LSP label imposition by adding label to an ingress packet (push operation).

The **no** form of this command removes the ingress packet label.

Parameter	Description
`ipv4 <IP-ADDR>/<MASK>`	Specifies the IPv4 destination in x.x.x.x format, where x is a decimal value from 0 to 255 and the number of bits in an IPv4 address mask in CIDR format (x), where x is a decimal number from 0 to 32.
`ipv4 <IP-ADDR> <MASK>`	Specifies the IPv4 destination in x.x.x.x format, where x is a decimal value from 0 to 255 and the destination IP subnet mask in x.x.x.x format, where x is a decimal value from 0 to 255.
`<IFNAME>`	Specifies the egress interface of the binding.
`<IP-ADDR>`	Specifies he next hop IP address of the binding.
`<OUT-LABEL>`	Specifies the MPLS label to apply. Range: 16-1048575.

Usage

- The **no** form of both the **mpls** and **static-lsp** commands deletes all static LSP bindings.
- The static LSP label range must be allocated before configuring static LSP bindings.
- Specifying an outgoing label outside the range of 16-1048575 is not allowed. An outgoing label is not bound by allocated static LSP label range.
- Types of valid egress interfaces are: System, LAG, VLAN, and Tunnel.
  - Routing must be enabled for egress interfaces.
  - Interfaces must be configured before performing the bind command.
  - LAG member interfaces are not allowed as egress interfaces.

Examples

Configuring binding:

```
switch(config-mpls-static-lsp)# bind ipv4 2.2.2.0/24 output 1/1/1 20.0.0.2 20
```

Unconfiguring binding:

```
switch(config-mpls-static-lsp)# no bind ipv4 2.2.2.0/24 output 1/1/1 20.0.0.2 20
```

Configuring binding with an invalid egress interface:

```
switch(config-mpls-static-lsp)# bind ipv4 2.2.2.0/24 output 1/1/1 20.0.0.2 20
 The output must be a layer 3 interface with routing enabled.
```

Configuring binding with an interface that does not have an IP address assigned:

```
switch(config-mpls-static-lsp)# bind ipv4 2.2.2.0/24 output 1/1/1 20.0.0.2 20
 The egress interface must have an IP address assigned.
```

Configuring binding with a next hop IP that is not in the same subnet as egress interface:

```
switch(config-if)# interface 1/1/1
switch(config-if)# no shutdown
switch(config-if)# ip address 10.0.0.1/24
switch(config-if)# mpls enable
switch(config-if)# mpls
switch(config-mpls)# static-lsp
switch(config-mpls-static-lsp)# bind ipv4 2.2.2.0/24 output 1/1/1 60.0.0.20 40
 The next hop IP address must be in the same subnet as interface 1/1/1.
```

Configuring binding with a next hop IP that is the same as the egress interface IP:

```
switch(config-if)# int 1/1/1
switch(config-if)# no shutdown
switch(config-if)# ip address 10.0.0.1/24
switch(config-if)# mpls enable
switch(config)# mpls
switch(config-mpls)# static-lsp
switch(config-mpls-static-lsp)# bind ipv4 2.2.2.0/24 output 1/1/1 10.0.0.1  40
 The next hop IP address cannot be the same as any interface 1/1/1 primary or
secondary addresses.
```

For more information on features that use this command, refer to the MPLS Guide for your switch model.

Command History

Release	Modification
10.11	Support for the Aruba 6400 Series Switch added.
10.09	Command introduced

Command Information

bind ipv4 input (static lsp binding)

```
bind ipv4 input <in-label>
no bind ipv4 input <in-label>
```

Description

Performs label disposition by removing label from an egress packet (pop operation).

The **no** form of this command removes the static LSP binding configuration.

Parameter	Description
<in-label>	Specifies the MPLS label to bind. Range: 16-1048575.

Usage

- The **no** form of both the **mpls** and **static-lsp** commands deletes all MPLS binding configurations.
- The static LSP label range must be allocated before configuring static LSP bindings.
- Specifying an incoming label outside the range of 16-1048575 is not allowed. An incoming label is bound by the allocated static LSP label range.

Examples

Configuring static LSP binding for label disposition:

```
switch(config)# mpls
switch(config-mpls)# static-lsp
switch(config-mpls-static-lsp)# bind ipv4 input 20
```

Removing the configuration for static LSP binding:

```
switch(config)# mpls
switch(config-mpls)# static-lsp
switch(config-mpls-static-lsp)# no bind ipv4 input 20
```

Configuring static LSP binding outside the label range:

```
switch(config-mpls-static-lsp)# bind ipv4 input 200
The input label must be within the range specified by label-range.
```

Configuring static LSP binding without first allocating a label range:

```
switch(config-mpls-static-lsp)# bind ipv4 input 20
A label range must be allocated before configuring bindings.
```

For more information on features that use this command, refer to the MPLS Guide for your switch model.

clear mpls statistics

```
clear mpls statistics {ingress | egress} <LABEL>
no syntax
```

Description

Clears MPLS statistics per label for all sessions.

Parameter	Description
`ingress`	Selects ingress statistics.
egress	Selects egress statistics.
`<LABEL>`	Specifies the label for which statistics will be cleared.

Examples

Clearing ingress MPLS statistics for a specific label:

```
switch# clear mpls statistics ingress 20
```

For more information on features that use this command, refer to the MPLS Guide for your switch model.

Command History

Release	Modification
10.11	Support for the Aruba 6400 Series Switch added.
10.09	Command introduced

Command Information

Platforms	Command context	Authority
6400	Operator (>) or Manager (#)	Administrators or local user group members with execution rights for this command.

crossconnect input (static lsp binding label swap)

```
crossconnect input <in-label> output <IFNAME> <ID-ADDR> {<out-label> | explicit-null}
no crossconnect input <in-label> output <IFNAME> <ID-ADDR> {<out-label> | explicit-null}
```

Description

Configures a static LSP binding to swap labels and route to the given next hop.

The **no** form of this command removes the static LSP binding label swap configuration.

Parameter	Description
<in-label>	Specifies the MPLS label to bind. Range: 16-1048575.
<IFNAME>	Specifies the egress interface of the binding.
<IP-ADDR>	Specifies the next hop IP address of the binding.
<out-label>	Specifies the MPLS label to apply. Range: 16-1048575.
`explicit-null`	Specifies an IETF MPLS IPv4 explicit null label (0).

Usage

- A static LSP label range must be allocated before configuring static LSP bindings.
- An incoming label must be within the allocated static LSP label range. Outgoing labels are not bound by the allocated static LSP label range, but must still be within the range of 16-1048575.
- The types of valid outgoing interfaces are: System, LAG, VLAN, and Tunnel.
  - Routing must be enabled for egress interfaces.
  - LAG member interfaces cannot be used with this command.
- Next hop and outgoing label pairs must be unique for each crossconnect binding.

Examples

Configuring crossconnect with an incoming and outgoing label:

```
switch(config)# mpls
switch(config-mpls)# static-lsp
switch(config-mpls-static-lsp)# crossconnect input 20 output 1/1/2 11.0.3.2 21
```

Configuring explicit-null PHP:

```
switch(config-mpls-static-lsp)# crossconnect input 20 output 1/1/2 11.0.3.2
explicit-null
```

Removing crossconnect binding:

```
switch(config-mpls-static-lsp)# no crossconnect input 20 output 1/1/2 11.0.3.2 21
```

Configuring crossconnect with an incoming label outside the allocated range:

```
switch(config-mpls-static-lsp)# crossconnect input 20 output 11.0.3.2 99
 Failed to configure static LSP binding. Incoming label not in range allocated for
static LSP.
```

Configuring crossconnect with an interface that does not have routing enabled:

```
switch(config-mpls-static-lsp)# crossconnect input 20 output 1/1/8 11.0.3.2 21
The egress interface must have an IP address assigned.
```

Configuring crossconnect with a nexthop IP that is not in the same subnet as egress interface:

```
switch(config-if)# int 1/1/1
switch(config-if)# no shutdown
switch(config-if)# ip address 10.0.0.1/24
switch(config-if)# mpls enable
switch(config)# mpls
switch(config-mpls)# static-lsp
switch(config-mpls-static-lsp)# crossconnect input 35 output 1/1/1 60.0.0.20 40
The next hop IP address must be in the same subnet as interface 1/1/1.
```

Configuring crossconnect with a nexthop IP that is the same as the egress interface IP:

```
switch(config-if)# int 1/1/1
switch(config-if)# no shutdown
switch(config-if)# ip address 10.0.0.1/24
switch(config-if)# mpls enable
switch(config)# mpls
switch(config-mpls)# static-lsp
switch(config-mpls-static-lsp)# crossconnect input 35 output 1/1/1 10.0.0.1  40
The next hop IP address cannot be the same as any interface 1/1/1 primary or
secondary addresses.
```

Configuring crossconect with a nexthop IP and outgoing label of an already existing binding:

```
switch(config-if)# int 1/1/1
switch(config-if)# no shutdown
switch(config-if)# ip address 10.0.0.1/24
switch(config-if)# mpls enable
switch(config)# mpls
switch(config-mpls)# static-lsp
switch(config-mpls-static-lsp)# crossconnect input 35 output 1/1/1 10.0.0.2 40
switch(config-mpls-static-lsp)# crossconnect input 36 output 1/1/1 10.0.0.2 40
 A static LSP binding with the same nexthop and outgoing label already exists.
```

For more information on features that use this command, refer to the MPLS Guide for your switch model.

Command History

Release	Modification
10.11	Support for the Aruba 6400 Series Switch added.
10.09	Command introduced

Platforms	Command context	Authority
6400	`config-mpls-static-lsp`	Administrators or local user group members with execution rights for this command.

enable (mpls globally)

```
enable
no enable
```

Description

Enables MPLS forwarding of IPv4 traffic globally.

The **no** form of this command disables MPLS forwarding of IPv4 traffic globally.

Examples

Enabling MPLS forwarding of IPv4 traffic:

```
switch(config)# mpls
switch(config-mpls)# enable
```

Disabling MPLS forwarding of IPv4 traffic:

```
switch(config)# mpls
switch(config-mpls)# no enable
```

For more information on features that use this command, refer to the MPLS Guide for your switch model.

Command History

Release	Modification
10.11	Support for the Aruba 6400 Series Switch added.
10.09	Command introduced

enable mpls (interface)

```
mpls enable
no mpls enable
```

Description

Enables MPLS forwarding of IP traffic for the interface.

The **no** form of this command disables MPLS forwarding of IP traffic for the interface.

Usage

- Routing must be configured before enabling MPLS on an interface.

Examples

Enabling MPLS forwarding:

```
switch(config)# interface 1/1/1
switch(config-if)# routing
switch(config-if)# mpls enable
```

Enabling MPLS on a layer 2 interface:

```
switch(config)# interface 1/1/2
switch(config-if)# mpls enable
Routing must be enabled on this interface to use MPLS
```

Disabling MPLS forwarding:

```
switch(config)# interface 1/1/2
switch(config-if)# no mpls enable
```

For more information on features that use this command, refer to the MPLS Guide for your switch model.

Command History

enable (mpls ldp)

```
enable
no enable
```

Description

Enables MPLS LDP.

The **no** form of this command disable MPLS LDP.

Usage

- The LDP back off timer cannot be configured. It is set to exponentially back off session retry attempts with initial value of 15 seconds and a maximum of 2 minutes.

Examples

Enabling MPLS LDP:

```
switch(config)# mpls
switch(config-mpls)# label-protocol ldp
switch(config-mpls-ldp)# enable
```

Disabling MPLS LDP:

```
switch(config)# mpls
switch(config-mpls)# label-protocol ldp
switch(config-mpls-ldp)# no enable
```

For more information on features that use this command, refer to the MPLS Guide for your switch model.

enable (mpls static lsp)

```
enable
no enable
```

Description

Enables MPLS static LSPs.

The **no** form of this command disables static LSPs.

Usage

A static LSP binding will be processed when MPLS is globally enabled, static LSP is enabled, and the ingress and egress interface has MPLS enabled.

Examples

Enabling MPLS static LSPs:

```
switch(config)# mpls
switch(config-mpls)# enable
switch(config-mpls)# static-lsp
switch(config-mpls-static-lsp)# enable
```

Disabling static LSPs:

```
switch(config)# mpls
switch(config-mpls)# static-lsp
switch(config-mpls-static-lsp)# no enable
```

For more information on features that use this command, refer to the MPLS Guide for your switch model.

graceful-restart (mpls ldp)

```
graceful-restart
```

Description

Enables LDP graceful restart. Graceful restart is enabled by default. With graceful restart enabled, the MPLS forwarding state will be temporarily retained if the control plane restarts. The switch will wait after losing LDP neighbors before deleting bindings from that neighbor. See graceful-restart-timers (mpls ldp) for details. Graceful restart is enabled for LDP sessions only when the LDP setting and the overall router setting are enabled. If either is disabled, then graceful restart will not occur for LDP sessions.

Upon being disabled or enabled, any LDP sessions will be restarted, which may result in temporary traffic loss.

The **no** form of this command disables LDP graceful restart

Examples

Enabling MPLS LDP graceful restart:

```
switch(config)# mpls
switch(config-mpls)# label-protocol ldp
switch(config-mpls-ldp)# graceful-restart
Enabling graceful restart will restart any LDP sessions.
This may result in traffic loss.

Continue (y/n)? y
```

Disabling MPLS LDP graceful restart:

```
switch(config)# mpls
switch(config-mpls)# label-protocol ldp
switch(config-mpls-ldp)# no graceful-restart
Enabling graceful restart will restart any LDP sessions.
This may result in traffic loss.

Continue (y/n)? y
```

For more information on features that use this command, refer to the MPLS Guide for your switch model.

Command History

Release	Modification
10.11	Command introduced.

Command Information

Platforms	Command context	Authority
6400	`config-mpls-ldp`	Administrators or local user group members with execution rights for this command.

graceful-restart-timers (mpls ldp)

```
graceful-restart-timers {forwarding-holding <SECONDS> | max-recovery <SECONDS> |
neighbor-liveness <SECONDS>}
no graceful-restart-timers {forwarding-holding <SECONDS> | max-recovery <SECONDS> |
neighbor-liveness <SECONDS>}
```

Description

Configures MPLS LDP discovery hold time for peers found via hello packets.

The **no** form of this command resets the discovery hello hold time to its default value of 15 seconds.

The BGP restart timer must be configured as 180 seconds or higher for graceful restart to work with MPLS.

It is recommended to configure the OSPF graceful restart timer as lower than the LDP forward-holding timer, which in turn should be configured as lower than the BGP graceful restart timer.

Parameter	Description
`forwarding-holding <SECONDS>`	Specifies the amount of time in seconds that the MPLS forwarding state should be preserved after the control plane restarts. Range: 30-600. Default: 150.
`max-recovery <SECONDS>`	Specifies the amount of time in seconds that the stale label bindings should be kept on the router after the LDP session has been reestablished. Range: 15-600. Default: 120.
`neighbor-liveness <SECONDS>`	Specifies the amount of time in seconds that the router will wait for the LDP session to be reestablished. If the router cannot reestablish the LDP session within that time, the router deletes all the stale LDP bindings received from that LDP neighbor. Range: 5-300. Default: 120.

Examples

Configuring the MPLS LDP graceful restart forwarding holding time for 30 seconds:

```
switch(config)# mpls
switch(config-mpls)# label-protocol ldp
switch(config-mpls-ldp)# graceful-restart-timers forwarding-holding 30
Changing the timer value will restart any LDP sessions.
This may result in traffic loss.
Continue (y/n)? y
```

Resetting the MPLS LDP graceful restart forwarding holding time to default:

```
switch(config)# mpls
switch(config-mpls)# label-protocol ldp
switch(config-mpls-ldp)# no graceful-restart-timers forwarding-holding
switch(config-mpls-ldp)# no graceful-restart-timers forwarding-holding 30
Changing the timer value will restart any LDP sessions.
This may result in traffic loss.
Continue (y/n)? y
```

Configuring the MPLS LDP graceful restart max recovery time for 30 seconds:

```
switch(config)# mpls
switch(config-mpls)# label-protocol ldp
switch(config-mpls-ldp)# graceful-restart-timers max-recovery 30
Changing the timer value will restart any LDP sessions.
```

```
This may result in traffic loss.

Continue (y/n)? y
```

Resetting the MPLS LDP graceful restart max recovery time to default:

```
switch(config)# mpls
switch(config-mpls)# label-protocol ldp
switch(config-mpls-ldp)# no graceful-restart-timers max-recovery
switch(config-mpls-ldp)# no graceful-restart-timers max-recovery 30
Changing the timer value will restart any LDP sessions.
This may result in traffic loss.

Continue (y/n)? y
```

Configuring the MPLS LDP graceful restart neighbor liveness timefor 30 seconds:

```
switch(config)# mpls
switch(config-mpls)# label-protocol ldp
switch(config-mpls-ldp)# graceful-restart-timers neighbor-liveness 30
Changing the timer value will restart any LDP sessions.
This may result in traffic loss.

Continue (y/n)? y
```

Resetting the MPLS LDP graceful restart neighbor liveness to default:

```
switch(config)# mpls
switch(config-mpls)# label-protocol ldp
switch(config-mpls-ldp)# no graceful-restart-timers neighbor-liveness
Changing the timer value will restart any LDP sessions.
This may result in traffic loss.

Continue (y/n)? y
```

For more information on features that use this command, refer to the MPLS Guide for your switch model.

Command History

Release	Modification
10.11	Support for the Aruba 6400 Series Switch added.
10.10	Command introduced.

Command Information

Platforms	Command context	Authority
6400	`config-mpls-ldp`	Administrators or local user group members with execution rights for this command.

label-protocol ldp

```
label-protocol ldp
no label-protocol ldp
```

Description

Configures the Label Distribution Protocol (LDP).

The **no** form of this command removes all LDP-related configuration.

Examples

Configuring LDP:

```
switch(config-mpls)# label-protocol ldp
```

Removing all LDP-related configuration:

```
switch(config-mpls)# no label-protocol ldp
All MPLS LDP configuration will be deleted.

Continue (y/n)? y
```

For more information on features that use this command, refer to the MPLS Guide for your switch model.

6400	`config-mpls`	Administrators or local user group members with execution rights for this command.

label-range (static lsp)

```
label-range <start-label-range> <end-label-range>
no label-range <start-label-range> <end-label-range>
```

Description

Allocates MPLS labels for use exclusively by static LSP.

The **no** form of this command removes the configured allocation, returning to the default state with no labels allocated for static LSP usage.

Parameter	Description
<start-label-range>	Selects the start of the static LSP label range. Range: 16-1048575.
<end-label-range>	Selects the end of the static LSP label range. Range: 16-1048575.

Usage

- The range arguments are inclusive. Configuring a range of 20-30 will allocate the labels 20, 21, ..., 29, 30.
- Static LSP labels must not overlap with labels used by any other protocol, i.e. LDP. This label range allocation command will fail if any labels are shared between protocols.
- Any change to the static LSP label allocation will fail if any static LSP bindings are configured. All bindings must be removed before the static LSP label range can be reallocated.
- Allocated label range affects only the ingress packets. Labels for the outgoing packets must be within the allocated label range of the next hop device.

Examples

Allocating a valid static LSP label range:

```
switch(config-mpls-static-lsp)# label-range 100 2000
```

Changing the static LSP label range while LSP bindings are configured:

```
switch(config-mpls-static-lsp)# label-range 100 2000
All static LSP bindings must first be deleted.
```

Deallocating static LSP label range; use either command:

```
switch(config-mpls-static-lsp)# no label-range 100 2000
switch(config-mpls-static-lsp)# no label-range
```

Configuring a static LSP range that intersects with LDP:

```
switch(config-mpls-static-lsp)# label-range 30 99
 The static LSP label range cannot overlap with any other MPLS range.
```

Deallocating static LSP range when bindings are still configured:

```
switch(config-mpls-static-lsp)# no label-range
 All static LSP bindings must be removed before removing the label range.
 All static LSP bindings must be removed before removing the label range.
```

For more information on features that use this command, refer to the MPLS Guide for your switch model.

Command History

Release	Modification
10.11	Support for the Aruba 6400 Series Switch added.
10.09	Command introduced

mpls

```
mpls
no mpls
```

Description

Configures MPLS forwarding of IPv4 traffic globally.

The **no** form of the command removes all MPLS-related configuration.

Examples

Configuring MPLS forwarding for IPv4 traffic:

```
switch(config)# mpls
```

Removing MPLS configuration for IPv4 traffic:

```
switch(config)# no mpls
All MPLS configuration will be deleted.

Continue (y/n)? y
```

For more information on features that use this command, refer to the MPLS Guide for your switch model.

mpls ldp discovery hello hold time (global)

```
discovery hello holdtime <SECONDS>
no discovery hello holdtime <SECONDS>
```

Description

Configures MPLS LDP discovery hold time for peers found via hello packets.

The **no** form of this command resets the discovery hello hold time to its default value of 15 seconds.

Parameter	Description
<SECONDS>	Specifies the discovery hold time in seconds. Range: 15-65535. Default: 15.

Usage

- The default value of discovery hello hold time is 15 seconds
- The discovery hello hold time configured on an interface supersedes the global configuration.
- The discovery hello interval time is auto-computed as one third of the hello hold time.

Examples

Configuring the MPLS LDP discovery hello hold time:

```
switch(config)# mpls
switch(config-mpls)# label-protocol ldp
switch(config-mpls-ldp)# discovery hello holdtime 30
```

Changing discovery hello hold time:

```
switch(config)# mpls
switch(config-mpls)# label-protocol ldp
switch(config-mpls-ldp)# discovery hello holdtime 50
```

For more information on features that use this command, refer to the MPLS Guide for your switch model.

mpls ldp discovery hello hold time (interface)

```
mpls ldp discovery hello holdtime <SECONDS>
no mpls ldp discovery hello holdtime <SECONDS>
```

Description

Overrides the global MPLS LDP discovery hold time for peers found via hello packets from the given interface.

The **no** form of this command resets the discovery hello hold time for the given interface to the global value (if configured) or default value of 15 seconds if global value is not specified.

Parameter	Description
<SECONDS>	Specifies the discover hello hold time on an interface. Range: 15-65535. Default: 15.

Usage

- The interface LDP discovery hello hold time overrides global hello hold time.
- Routing must be configured before changing the LDP discovery hold time on an interface.

Examples

Configuring the interface MPLS LDP discovery hello hold time:

```
switch(config)# interface 1/1/1
switch(config-if)# routing
switch(config-if)# mpls ldp discovery hello holdtime 30
```

Removing the interface MPLS LDP discovery hello hold time configuration:

```
switch(config)# interface 1/1/1
switch(config-if)# no mpls ldp discovery hello holdtime
```

Configuring the interface MPLS LDP discovery hello hold time on a Layer 2 interface:

```
switch(config)# interface 1/1/2
switch(config-if)# mpls ldp discovery hello holdtime 30
Routing must be enabled on this interface to use MPLS.
```

For more information on features that use this command, refer to the MPLS Guide for your switch model.

Command History

Release	Modification
10.11	Support for the Aruba 6400 Series Switch added.
10.09	Command introduced

Command Information

Platforms	Command context	Authority
6400	`config-if`	Administrators or local user group members with execution rights for this command.

mpls ldp enable

```
mpls ldp enable
no mpls ldp enable
```

Description

Enables LDP protocol in the interface level.

The **no** form of this command disables LDP.

Enabling/disabling interface level LDP will also enable/disable **php-mode-explicit-null** by default. **php-mode-explicit-null** is currently the only mode supported and there is no option to disable it when LDP is enabled on an interface.

Usage

- Routing must be configured before enabling LDP on an interface.
- MPLS must be enabled on the interface prior to enabling LDP.

Examples

Enabling the LDP protocol:

```
switch(config)# interface 1/1/1
switch(config-if)# routing
switch(config-if)# mpls enable
switch(config-if)# mpls ldp enable
```

Enabling LDP prior to enabling MPLS:

```
switch(config)# interface 1/1/2
switch(config-if)# routing
switch(config-if)# mpls ldp enable
MPLS must be enabled on this interface to use LDP.
```

Enabling MPLS on a layer 2 interface:

```
switch(config)# interface 1/1/2
switch(config-if)# mpls ldp enable
```

```
Routing must be enabled on this interface to use MPLS.
```

Disabling MPLS forwarding:

```
switch(config)# interface 1/1/2
switch(config-if)# no mpls ldp enable
```

For more information on features that use this command, refer to the MPLS Guide for your switch model.

Command History

Release	Modification
10.11	Support for the Aruba 6400 Series Switch added.

graceful-restart-timers (mpls ldp)

```
graceful-restart-timers {forwarding-holding <SECONDS> | max-recovery <SECONDS> |
neighbor-liveness <SECONDS>}
no graceful-restart-timers {forwarding-holding <SECONDS> | max-recovery <SECONDS> |
neighbor-liveness <SECONDS>}
```

Description

Configures MPLS LDP discovery hold time for peers found via hello packets.

The **no** form of this command resets the discovery hello hold time to its default value of 15 seconds.

The BGP restart timer must be configured as 180 seconds or higher for graceful restart to work with MPLS.

It is recommended to configure the OSPF graceful restart timer as lower than the LDP forward-holding timer, which in turn should be configured as lower than the BGP graceful restart timer.

Parameter	Description
`forwarding-holding <SECONDS>`	Specifies the amount of time in seconds that the MPLS forwarding state should be preserved after the control plane restarts. Range: 30-600. Default: 150.

Parameter	Description
`max-recovery <SECONDS>`	Specifies the amount of time in seconds that the stale label bindings should be kept on the router after the LDP session has been reestablished. Range: 15-600. Default: 120.
`neighbor-liveness <SECONDS>`	Specifies the amount of time in seconds that the router will wait for the LDP session to be reestablished. If the router cannot reestablish the LDP session within that time, the router deletes all the stale LDP bindings received from that LDP neighbor. Range: 5-300. Default: 120.

Examples

Configuring the MPLS LDP graceful restart forwarding holding time for 30 seconds:

```
switch(config)# mpls
switch(config-mpls)# label-protocol ldp
switch(config-mpls-ldp)# graceful-restart-timers forwarding-holding 30
Changing the timer value will restart any LDP sessions.
This may result in traffic loss.
Continue (y/n)? y
```

Resetting the MPLS LDP graceful restart forwarding holding time to default:

```
switch(config)# mpls
switch(config-mpls)# label-protocol ldp
switch(config-mpls-ldp)# no graceful-restart-timers forwarding-holding
switch(config-mpls-ldp)# no graceful-restart-timers forwarding-holding 30
Changing the timer value will restart any LDP sessions.
This may result in traffic loss.
Continue (y/n)? y
```

Configuring the MPLS LDP graceful restart max recovery time for 30 seconds:

```
switch(config)# mpls
switch(config-mpls)# label-protocol ldp
switch(config-mpls-ldp)# graceful-restart-timers max-recovery 30
Changing the timer value will restart any LDP sessions.
This may result in traffic loss.

Continue (y/n)? y
```

Resetting the MPLS LDP graceful restart max recovery time to default:

```
switch(config)# mpls
switch(config-mpls)# label-protocol ldp
switch(config-mpls-ldp)# no graceful-restart-timers max-recovery
switch(config-mpls-ldp)# no graceful-restart-timers max-recovery 30
Changing the timer value will restart any LDP sessions.
This may result in traffic loss.

Continue (y/n)? y
```

Configuring the MPLS LDP graceful restart neighbor liveness timefor 30 seconds:

```
switch(config)# mpls
switch(config-mpls)# label-protocol ldp
switch(config-mpls-ldp)# graceful-restart-timers neighbor-liveness 30
Changing the timer value will restart any LDP sessions.
This may result in traffic loss.

Continue (y/n)? y
```

Resetting the MPLS LDP graceful restart neighbor liveness to default:

```
switch(config)# mpls
switch(config-mpls)# label-protocol ldp
switch(config-mpls-ldp)# no graceful-restart-timers neighbor-liveness
Changing the timer value will restart any LDP sessions.
This may result in traffic loss.

Continue (y/n)? y
```

For more information on features that use this command, refer to the MPLS Guide for your switch model.

Command History

Release	Modification
10.11	Support for the Aruba 6400 Series Switch added.
10.10	Command introduced.

mpls ldp session holdtime (interface)

```
mpls ldp session holdtime <TIME>
no mpls ldp session holdtime <TIME>
```

Description

Configures MPLS LDP session hold time for an interface.

The **no** form of this command resets the session hold time to its default value of 15 seconds.

Parameter	Description
<TIME>	Specifies the session hold time for the interface in seconds. Range: 15-65535. Default: 40.

Usage

- The interface LDP session hold time overrides global hello hold time.
- Routing must be configured before changing LDP session holdtime on an interface.

Examples

Configuring the MPLS LDP session hold time for an interface:

```
switch(config)# interface 1/1/1
switch(config-if)# routing
switch(config-if)# mpls ldp session holdtime 30
```

Removing the MPLS LDP session hold time for the interface:

```
switch(config)# interface 1/1/1
switch(config-if)# no mpls ldp session holdtime 30
```

Configuring the MPLS LDP session hold time on a layer 2 interface:

```
switch(config)# interface 1/1/2
switch(config-if)# mpls ldp session holdtime 30
Routing must be enabled on this interface to use MPLS.
```

For more information on features that use this command, refer to the MPLS Guide for your switch model.

Command History

Release	Modification
10.11	Support for the Aruba 6400 Series Switch added.
10.09	Command introduced

ping mpls

```
ping mpls ipv4 <IP-ADDR/MASK> [source <IP-ADDR> | destination <IP-ADDR> | ttl <HOPS> |
size <BYTES> | repeat <NUMBER> | timeout <TIME> | interval <TIME>]
```

Description

Ping MPLS is a command which sends LSP ping packets on the MPLS network and displays the responses from the remote target. It is used as a debugging and analytics tool to verify connectivity within MPLS networks.

Parameter	Description
`ipv4 <IP-ADDR/MASK>`	Specifies target IP address and mask of the remote subnet to ping.
`source <IP-ADDR>`	Specifies the source IPv4 address for the request packet.
`destination <IP-ADDR>`	Specifies the destination address for the request packet. Default: 127.0.0.1.
`ttl <HOPS>`	Specifies the max number of hops a packet can take en route to its destination. Range: 1-255. Default: 64.
`size <BYTES>`	Specifies the size of the packet to be sent in bytes. Range: 0-9600. Default: 0.
`repeat <NUMBER>`	Specifies the number of packets to be sent. Range 1-10000. Default: 5.
`timeout <TIME>`	Specifies the amount of time in seconds after which a packet is considered dropped. Range 1-60. Default: 2.
`interval <TIME>`	Specifies the interval time between packets in seconds. Range: 1-60 seconds. Default: 1.

Examples

Sending 5 successful pings to the destination to the 10.10.10.10/32 subnet with a source IP address 20.20.20.1, a destination IP of 127.0.0.1, a zero byte payload, 64 hop time to live, 3 second interval between packets, and a 5 second timeout:

```
switch# ping mpls ipv4 10.10.10.10/32 source 20.20.20.1 destination 127.0.0.1
repeat 5 size 0 ttl 64 interval 3 timeout 5
Sending 5 MPLS Echo packets of size 0 bytes to 10.10.10.0/32 from source
20.20.20.1,
timeout is 5 sec, send interval is 3 sec:
Codes: '!' - success, 'Q' - request not sent, '.' - timeout,
       'U' - unreachable, 'M' - malformed request, 'T' - unsupported TLV,
       'E' - malformed response, 'R' - transit router
Type escape sequence (Ctrl + C) to abort.
!!!!!
1908 Success rate is 100 percent (5/5), round-trip min/avg/max = 7/10/13 ms
```

Sending an unsuccessful ping that fails because the network is unreachable:

```
switch# ping mpls ipv4 10.10.10.10/32 source 20.20.20.1 destination 127.0.0.1
repeat 5 size 0
Sending 5 MPLS Echo packets of size 0 bytes to 10.10.10.0/32 from source
20.20.20.1,
timeout is 2 sec, send interval is 1 sec:
Codes: '!' - success, 'Q' - request not sent, '.' - timeout,
       'U' - unreachable, 'M' - malformed request, 'T' - unsupported TLV,
       'E' - malformed response, 'R' - transit router
Type escape sequence (Ctrl + C) to abort.
Network unreachable
```

For more information on features that use this command, refer to the MPLS Guide for your switch model.

Command History

Release	Modification
10.11	Support for the Aruba 6400 Series Switch added.
10.10	Command introduced

Command Information

6400	Manager (#)	Administrators or local user group members with execution rights for this command.

router-id (mpls ldp)

```
router-id <IFNAME> [confirm]
no router-id <IFNAME> [confirm]
```

Description

Configures MPLS LDP router ID which is the IP address of a loopback interface.

The **no** form of this command removes the MPLS LDP router ID configuration.

Parameter	Description
<IFNAME>	Specifies the loopback interface for the MPLS LDP router ID.

Usage

- There is a possibility of MPLS traffic disruption whenever a router ID is deleted or updated to another loopback interface.
- The MPLS router ID interface must be a loopback interface with an IPv4 address configured.
- The confirmation prompt is skipped if the router ID is being configured for the first time by the user.
- Changing the IP address of the loopback interface may interrupt MPLS traffic.

Examples

Configuring an MPLS LDP router ID:

```
switch(config)# interface loopback 1
switch(config-loopback-if)# ip address 1.1.1.1/32

switch(config)# mpls
switch(config-mpls)# enable
switch(config-mpls)# label-protocol ldp
switch(config-mpls-ldp)# enable
switch(config-mpls-ldp)# router-id loopback1
```

Changing the MPLS LDP router ID loopback interface:

```
switch(config)# interface loopback 2
switch(config-loopback-if)# ip address 2.2.2.2/32

switch(config)# mpls
switch(config-mpls)# label-protocol ldp
switch(config-mpls-ldp)# router-id loopback2
Changing the router ID interface may disrupt MPLS traffic.

Continue (y/n)?
```

Changing the MPLS LDP router ID interface without prompting for confirmation:

```
switch(config)# interface loopback 2
switch(config-loopback-if)# ip address 2.2.2.2/24

switch(config)# mpls
switch(config-mpls)# label-protocol ldp
switch(config-mpls-ldp)# router-id loopback2 confirm
```

Removing the MPLS LDP router ID configuration:

```
switch(config-mpls)# label-protocol ldp
switch(config-mpls-ldp)# no router-id loopback2
Removing the router ID interface may disrupt MPLS traffic.

Continue (y/n)?
```

Removing the MPLS LDP router ID without providing loopback interface name:

```
switch(config-mpls)# label-protocol ldp
switch(config-mpls-ldp)# no router-id
Removing the router ID interface may disrupt MPLS traffic.

Continue (y/n)?
```

Removing the configuration of an MPLS LDP router ID with an interface name which is different than the one configured as router ID:

```
switch(config-mpls)# label-protocol ldp
switch(config-mpls-ldp)# router-id loopback1 confirm
switch(config-mpls-ldp)# no router-id loopback2
The value to disable does not match the currently configured value.
```

Removing the MPLS LDP router ID configuration prompting for confirmation:

```
switch(config-mpls)# label-protocol ldp
switch(config-mpls-ldp)# no router-id loopback2 confirm
```

Configuring an MPLS LDP router ID with system interface:

```
switch(config)# mpls
switch(config-mpls)# label-protocol ldp
switch(config-mpls-ldp)# enable
switch(config-mpls-ldp)# router-id 1/1/1
The router ID must be a loopback interface with an IP address assigned.
```

Configuring MPLS LDP router ID with a loopback interface without an IPv4 address configured:

```
switch(config)# interface loopback 1

switch(config)# mpls
switch(config-mpls)# label-protocol ldp
switch(config-mpls-ldp)# enable
switch(config-mpls-ldp)# router-id loopback1
The router ID interface must have an IP address assigned.
```

For more information on features that use this command, refer to the MPLS Guide for your switch model.

Command History

Release	Modification
10.11	Support for the Aruba 6400 Series Switch added.
10.09	Command introduced

session hold time (mpls ldp globally)

```
session holdtime <SECONDS>
no session holdtime <SECONDS>
```

Description

Configures MPLS LDP session hold time.

The **no** form of this command resets the session hold time to its default value of 40 seconds.

Parameter	Description
<SECONDS>	Specifies the session hold time in seconds. Range: 15-65535. Default: 40.

Usage

- The default session hold time is 40 seconds
- The session hold time configured on an interface supersedes the global configuration.
- The session keepalive interval time is auto computed as one sixth of the hold time.

Examples

Configuring the MPLS LDP session hold time:

```
switch(config)# mpls
switch(config-mpls)# label-protocol ldp
switch(config-mpls-ldp)# session holdtime 30
```

Changing the session hold time:

```
switch(config)# mpls
switch(config-mpls)# label-protocol ldp
switch(switch(config-mpls-ldp)# session holdtime 50)# session holdtime 50
```

For more information on features that use this command, refer to the MPLS Guide for your switch model.

Command History

Release	Modification
10.11	Support for the Aruba 6400 Series Switch added.

show bgp vpnv4 unicast

```
show bgp VPNv4 unicast [[<IP-ADDR>/<MASK>] | community | extcommunity |
neighbors [<IP-ADDR>] | paths | summary | vsx-peer]
```

Description

Shows all vpnv4 entries in the BGP routing table .

Parameter	Description
<IP-ADDR>/<MASK>	Specifies the IP network and mask of a specific BGP route in IPv4 format (x.x.x.x/M), where x is a decimal number from 0 to 255 and M is the number of bits in CIDR format from 0 to 32.

Parameter	Description
`community`	Selects routes that belong to specified BGP communities.
`extcommunity`	Selects unicast routes with extended communities.
`neighbors [<IP-ADDR>]`	Selects BGP neighbor connection parameters for all neighbors or the IP address of a specific neighbor in IPv4 format (x.x.x.x) where x is a decimal number from 0 to 255.
`paths`	Selects AS Path information of the vpnv4 routes in BGP RIB.
`summary`	Selects a summary of BGP neighbor status.
`vsx-peer`	Selects VSX peer switch information.

Examples

Showing all VPNv4 entries in the BGP routing table:

```
switch# show bgp vpnv4 unicast
VRF : default
BGP Summary
-----------
 Local AS               : 100          BGP Router Identifier  : 4.4.4.4
 Peers                  : 0            Log Neighbor Changes   : No

Showing a summary of BGP neighbor status:

```
switch(config-bgp)# show bgp vpnv4 unicast summary
VRF : default
BGP Summary
Local AS               : 100          BGP Router Identifier  : 4.4.4.4
Peers                  : 0            Log Neighbor Changes   : No
Cfg. Hold Time         : 180          Cfg. Keep Alive        : 60
Confederation Id       : 0
```

For more information on features that use this command, refer to the MPLS Guide for your switch model.

Command History

Release	Modification
10.11	Support for the Aruba 6400 Series Switch added.
10.09	Command introduced

Command Information

Platforms	Command context	Authority
6400	Operator (>) or Manager (#)	Administrators or local user group members with execution rights for this command.

show capacities mpls

```
show capacities mpls
show capacities-status mpls
```

Description

For capacities command, shows the maximum number of label endpoints, label switch entries, and service label entries that can be configured on the device. For capacities-status command, shows the total number of label endpoints, label switch entries, and service label entries that are currently configured on the device.

Examples

Showing capacities of configurable MPLS options:

```
switch# show capacities mpls
System Capacities: Filter MPLS
Capacities Name
                           Value
----------------------------------------------------------------------------------
---------------------------------
Maximum number of MPLS Label Endpoints configurable in a system
                            8192
Maximum number of MPLS Label Switch entries configurable in a system
                            8192
Maximum number of MPLS Service Label entries configurable in a system
                            8192
```

Showing the configuration of currently configured MPLS options in relation to their capacities:

```
switch# show capacities-status mpls
System Capacities Status: Filter MPLS
Capacities Status Name
                          Value Maximum
----------------------------------------------------------------------------------
-------
Number of MPLS Label Endpoints currently configured
                              0    8192
Number of MPLS Label Switch entries currently configured
                              0    8192
Number of MPLS Service Label entries currently configured
                              0    8192
```

For more information on features that use this command, refer to the MPLS Guide for your switch model.

Command History

Release	Modification
10.11	Support for the Aruba 6400 Series Switch added.
10.09	Command introduced

Command Information

Platforms	Command context	Authority
6400	Manager (#)	Administrators or local user group members with execution rights for this command.

show mpls forwarding

```
show mpls forwarding [detail]
```

Description

Shows the MPLS forwarding table.

Usage

- Forwarding table filters will be implemented at a later date.
- When running this command on a huge-scale setup, showing the full tables might take a while.

Examples

Showing the MPLS forwarding table:

```
switch# show mpls forwarding
MPLS Bindings
Entry Bindings   : 2
Exit Bindings    : 2

show mpls label-range static-lsp

```
show mpls label-range static-lsp
```

Description

Shows the range of MPLS labels allocated for use in static LSP bindings and the range of labels currently used by static LSP bindings.

Examples

Showing the range and usage of static LSp labels on the switch:

```
switch# show mpls label-range static-lsp

     Static LSP Labels

       Allocated : 16-100
       In use    : 16-30,35
```

For more information on features that use this command, refer to the MPLS Guide for your switch model.

show mpls ldp bindings

```
show mpls ldp bindings
```

Description

Shows information about all MPLS LDP bindings.

Examples

Showing information about MPLS LDP bindings:

```
switch# show mpls ldp bindings

10.10.2.0/24
        local binding: label: imp-null
        remote binding: lsr:10.255.255.255:0, label:16
        remote binding: lsr:10.256.256.256:0, label: exp-null
10.10.3.0/24
        local binding: label:20
        remote binding: lsr:10.256.256.256:0, label:22
```

```
5.43.9.98/32
        local binding: label:21
        No remote binding
```

For more information on features that use this command, refer to the MPLS Guide for your switch model.

6400	Operator (>) or Manager (#)	Administrators or local user group members with execution rights for this command.

show mpls ldp discovery

```
show mpls ldp discovery [<IP-ADDR>]
no syntax
```

Description

Shows information about discovered LDP peers.

Parameter	Description
<IP-ADDR>	Specifies the peer MPLS LDP router ID in x.x.x.x format, where x is a decimal value from 0 to 255.

Examples

Showing information about discovered LDP peers:

```
switch# show mpls ldp discovery
Local LDP Identifier: 10.44.44.44:0
Discovery Sources:
     Interfaces:
         1/1/1 : recv
         LDP Id: 10.33.33.33:0, Transport address: 10.33.33.33
                 Path vector limit: 10
                 Distribution type: Downstream-on-demand
                 Adjacency type: Link
                 Hold time: 15 sec (local: 15 sec, peer: 15 sec, remaining: 10s)
                 BFD status: Activating
         1/1/2 : recv
         LDP Id: 10.33.33.34:0, Transport address: 10.33.33.33
```

```
                 Path vector limit: 10
                 Distribution type: Downstream-unsolicited
                 Adjacency type: Targeted
                 Hold time: 15 sec (local: 15 sec, peer: 15 sec, remaining: 10s)
                 BFD status: Active

Local LDP Identifier: 10.44.44.44:2
Discovery Sources:
    Interfaces:
        1/1/3 : recv
        LDP Id: 10.33.38.33:0, Transport address: 10.43.33.33
                Path vector limit: 10
                Distribution type: Downstream-unsolicited
                Adjacency type: Link
                Hold time: 15 sec (local: 15 sec, peer: 15 sec, remaining: 10s)
                BFD status: Active
```

Showingu information about a specific LDP peer:

```
switch# show mpls ldp discovery 10.33.33.34
Local LDP Identifier: 10.44.44.44:0
Discovery Sources:
    Interfaces:
        1/1/2 : recv
        LDP Id: 10.33.33.34:0, Transport address: 10.33.33.33
                Path vector limit: 10
                Distribution type: Downstream-unsolicited
                Adjacency type: Targeted
                Hold time: 15 sec (local: 15 sec, peer: 15 sec, remaining: 10s)
                BFD status: Active
```

For more information on features that use this command, refer to the MPLS Guide for your switch model.

show mpls ldp graceful-restart

```
show mpls ldp graceful-restart
```

Description

Shows graceful restart parameters and status.

Examples

Showing graceful restart parameters and status when graceful restart is not configured:

```
switch# show mpls ldp graceful-restart
Max recovery time                        : 50 sec
Neighbor liveness time                   : 50 sec
Forwarding holding time                  : 70 sec
Number of graceful restart events        : 7
Graceful restart in progress             : true
Forwarding holding time remaining        : 300 sec
Current graceful restart status          : in-progress
Graceful restart exit history (last 5) : complete, complete, complete, cancelled,
cancelled
```

For more information on features that use this command, refer to the MPLS Guide for your switch model.

Command History

show mpls ldp neighbor

`show mpls ldp neighbor`

Description

Shows information about LDP neighbors in the current session(s). The reconnect and recovery time are the times advertised by the peer device.

Examples

Showing LDP neighbors:

```
switch# show mpls ldp neighbor
Local LDP Identifier: 10.44.44.44:0, Peer LDP Identifier: 10.22.22.22:0
    TCP connection: 10.22.22.22:646 - 10.33.33.33:65530
    Graceful Restart: No
    Session Holdtime: 180 sec
    State: Operational; Msgs sent/rcvd: 46/43
    Up time: 00:31:21
    LDP Discovery Sources: 1/1/1
    Addresses bound to this peer:
         10.22.22.22 10.10.2.1
```

Showing LDP neighbors when graceful restart has been configured:

```
switch# show mpls ldp neighbor
Local LDP Identifier: 1.1.1.1:0, Peer LDP Identifier: 11.1.1.2:0
    Graceful Restart: Yes
    Peer Reconnect Time: 120 sec
    Peer Recovery Time: 300 sec
    Session Holdtime: 40 sec
    Up time: 00:02:59
    State: operational
    LDP Discovery Sources: 1/1/32
    Addresses bound to this peer:
         11.1.1.2 12.1.1.1 2.2.2.2
```

For more information on features that use this command, refer to the MPLS Guide for your switch model.

Command History

static-lsp

```
static-lsp
no static-lsp
```

Description

Configures MPLS static Label Switched Paths (LSP).

The **no** form of this command removes all static LSP configurations including label range allocation and static LSP binding.

Examples

Configuring MPLS static LSP:

```
switch(config-mpls)# static-lsp
```

Removing MPLS static LSP configuration:

```
switch(config-mpls)# no static-lsp
```

For more information on features that use this command, refer to the MPLS Guide for your switch model.

Command History

Release	Modification
10.11	Support for the Aruba 6400 Series Switch added.
10.09	Command introduced

6400	`config-mpls`	Administrators or local user group members with execution rights for this command.

traceroute mpls

`traceroute mpls ipv4 <IP-ADDR/MASK> [source <IP-ADDR> | destination <IP-ADDR> | ttl <HOPS> | timeout <TIME> | fec-type ldp]`

Description

Send LSP ping packets on the MPLS network and display the responses all intermediate routers as well as the destination host. Use this command as a debugging and analytics tool to verify connectivity within the MPLS networks.

Parameter	Description
`ipv4 <IP-ADDR/MASK>`	Specifies the IP address and netmask of the remote subnet to traceroute.
`source <IP-ADDR>`	Specifies the source IPv4 address for the request packet.
`destination <IP-ADDR>`	Specifies the destination IPv4 address for the request packet
`ttl <HOPS>`	Specifies the max number of hops a packet can take en route to its destination. Range: 1-255. Default: 255.
`timeout <SECONDS>`	Specifies the number of seconds after which a packet is considered dropped. Range: 1-60 seconds. Default: 2.
`fec-type ldp`	Selects the target Forward Equivalence Class (FEC) type. The only supported option is the default value of ldp.

Example

Successfully tracing the route a target with IP address 1.1.4.1/32 with a maximum TTL of 3 hops and a 3 second timeout:

```
switch# traceroute mpls ipv4 1.1.4.1/32 ttl 3 timeout 3
Tracing MPLS Label Switched Path to 1.1.4.1/32 from source 10.0.0.2,
timeout is 3 seconds and ttl is 3

Codes: '!' - success, 'Q' - request not sent, '.' - timeout, 'N' - no label entry,
  'R' - transit router, 'D' - DS Map mismatch, 'F' - no FEC mapping,
  'M' - malformed request, ‘T' - unsupported tlvs, ‘Z' - return code 0

Type escape sequence to abort.
  0 10.0.0.2 MRU 1500 [Labels: 17]
R 1 10.0.0.1 MRU 1500 [Labels: explicit-null] 10 ms
! 2 10.0.1.2 1 ms
```

For more information on features that use this command, refer to the MPLS Guide for your switch model.

Chapter 85

MSDP router config commands

disable

`disable`

Description

Disables MSDP on the VRF.

Example

Disabling MSDP:

```
switch(config)# router msdp
switch(config-msdp)# disable
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-msdp`	Administrators or local user group members with execution rights for this command.

enable

`enable`

Description

Enables MSDP on the VRF.

Example

Enabling MSDP:

```
switch(config)# router msdp
switch(config-msdp)# enable
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-msdp`	Administrators or local user group members with execution rights for this command.

router msdp

```
router msdp [vrf <VRF-NAME>]
no router msdp [vrf <VRF-NAME>]
```

Description

Changes the current context to the MSDP router context. If no VRF is specified, the default VRF MSDP context of the router is assumed.

The **no** form of this command removes the MSDP configuration from the specified context or the default VRF.

Parameter	Description
`vrf <VRF-NAME>`	Specifies the context to the specified VRF.

Examples

Configuring default MSDP router context:

```
switch(config)# router msdp
switch(config-msdp)#
```

Configuring specified router MSDP:

```
switch(config-msdp)# router msdp vrf red
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

sa-interval

```
sa-interval <INTERVAL-VALUE>
no sa-interval
```

Description

Configures the sa-interval for the frequency at which MSDP source-active messages are sent.

The **no** form of this command sets the interval to the default value of 60 seconds.

Parameter	Description
<INTERVAL-VALUE>	Specifies the sa-interval in seconds. Default: 60 seconds. Range 60-65535.

Examples

Configuring the sa-interval:

```
switch(config)# router msdp
switch(config-msdp)# sa-interval 400
switch(config-msdp)# no sa-interval
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-msdp`	Administrators or local user group members with execution rights for this command.

sa-limit

```
sa-limit <LIMIT-VALUE>
no sa-limit <LIMIT-VALUE>
```

Description

Configures the SA (Source Active) cache limit for the MSDP peer.

The **no** form of this command sets the cache limit to the default value.

Parameter	Description
<LIMIT-VALUE>	Specifies the sa cache limit. MSDP peer limit: 64, Cache Limit: 8K

Usage

This command is used to limit the overall number of (S, G) entries that a device can accept from specified MSDP peers and store in a sa-cache. When configured, the device maintains a per-peer count of (S, G) messages stored in the SA cache and ignores new messages from a peer if the configured sa-limit for that peer has been reached. This command protects MSDP-enabled devices from denial of service (DOS) attacks.

By default, there is no limit configured per peer. All (S, G) entries within the system capacities are allowed. If there is a reboot or HA switchover, the (S, G) cache allocation occurs based on FCFS basis. When configured via CLI or REST, (S, G) entries are allocated until they reach the system capacity or peer limit based on whichever is reached first and new sets of (S, G) requests are discarded.

Examples

Configuring the sa cache limit to 1000:

```
switch(config)# router msdp
switch(config-msdp)# ip msdp peer 10.1.1.1
switch(config-msdp-peer)#
switch(config-msdp-peer)# sa-limit 1000
```

Removing the configured sa cache limit of 1000:

```
switch(config)# router msdp
switch(config-msdp)# ip msdp peer 10.1.1.1
switch(config-msdp-peer)#
switch(config-msdp-peer)# no sa-limit 1000
```

Configuring the sa cache limit outside system capacities:

```
switch(config)# router msdp
switch(config-msdp)# ip msdp peer 10.1.1.1
switch(config-msdp-peer)#
switch(config-msdp-peer)# sa-limit 20000
Specified value exceeds the system capacities. Maximum SA Allowed on the system is
16384.
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.11	Command introduced.

Command Information

Platforms	Command context	Authority
6300 6400	`config-msdp`	Administrators or local user group members with execution rights for this command.

Chapter 86

MSDP peer configuration commands

connection-retry-interval

```
connection-retry-interval <INTERVAL-VALUE>
no connection-retry-interval
```

Description

Configures the connection-retry-interval for which MSDP peers will wait after peering sessions are reset, before attempting to re-establish the peering sessions.

The **no** form of this command removes the currently configured value and sets it to the default value of 30 seconds.

Parameter	Description
<INTERVAL-VALUE>	Specify connection-retry-interval in seconds. Range: 1-65535.

Example

Configuring the connection-retry-interval:

```
switch(config-msdp-peer)# connection-retry-interval 120
switch(config-msdp-peer)# no connection-retry-interval
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-msdp-peer`	Administrators or local user group members with execution rights for this command.

connect-source

```
connect-source <INTERFACE-NAME>
```

Description

Configures the connection source interface for the MSDP Peer.

The **no** form of this command removes the existing connection source interface and resets the peer connection.

Parameter	Description
<INTERFACE-NAME>	Specifies the interface to use as a source.

Examples

Configuring the connection source interface:

```
switch(config-msdp-peer)# connect-source 1/1/1
```

Configuring the connection source as ROP:

```
switch(config)# router msdp
switch(config-msdp)# ip msdp peer 10.1.1.1
switch(config-msdp-peer)# connect-source 1/1/1
```

Configuring the connection source as a sub-interface:

Supported only on the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config)# router msdp
switch(config-msdp)# ip msdp peer 20.1.1.1
switch(config-msdp-peer)# connect-source 1/1/10.10
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.11	Sub-interface support extended to 8325 and 10000 Switch Series.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-msdp-peer`	Administrators or local user group members with execution rights for this command.

clear ip msdp peer statistics

```
clear ip msdp peer [all-vrfs | vrf <VRF-NAME> | <PEER-IP>]
```

Description

Clears MSDP SA counters of peer information for the given VRF. If VRF is not specified, it clears SA counters of peers in the default VRF. It also clears MSDP SA counters for a specified peer address.

Parameter	Description
`all-vrfs`	Clears MSDP peer information for all VRFs. Optional.
`vrf <VRF-NAME>`	Clears MSDP peer information for a particular VRF. If the **<VRF-NAME>** is not specified, it clears information for the default VRF. Optional
`<PEER-IP>`	Clears MSDP peer information for the specified Peer IP. Format: A.B.C.D. Optional.

Examples

Showing MSDP peer information for VRFs:

```
switch# clear ip msdp peer statistics all-vrfs
switch# clear ip msdp peer statistics 2.2.2.2
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Auditors or Administrators or local user group members with execution rights for this command. Auditors can execute this command from the auditor context (auditor>) only.

description

```
description <TEXT>
no description
```

Description

Configures a description for a specified MSDP peer to make it easier to identify in a configuration or show command output.

The **no** form of this command removes the peer description.

Parameter	Description
<TEXT>	Specifies a description for the MSDP Peer.

Example

Configuring the MSDP peer description:

```
switch(config-msdp)# ip msdp peer 10.1.1.1
switch(config-msdp-peer)#
switch(config-msdp-peer)# description Peer_1
switch(config-msdp-peer)# no description
```

disable

`disable`

Description

Disables MSDP peer on the L3 interface.

Example

Disabling MSDP peering:

```
switch(config)# router msdp
switch(config-msdp)#
switch(config-msdp)# ip msdp peer 10.1.1.1
switch(config-msdp-peer)#
switch(config-msdp-peer)# disable
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Platforms	Command context	Authority
6300 6400	`config-msdp-peer`	Administrators or local user group members with execution rights for this command.

enable (ip msdp peer)

```
enable
```

Description

Enables MSDP peer on the L3 interface.

Only one MSDP peering session per VRF should be configured between two routers to avoid loops.

Example

Enabling MSDP peering:

```
switch(config)# router msdp
switch(config-msdp)#
switch(config-msdp)# ip msdp peer 10.1.1.1
switch(config-msdp-peer)#
switch(config-msdp-peer)# enable
```

ip msdp peer

```
ip msdp peer <IP-ADDR>
no ip msdp peer
```

Description

Changes the current context to the MSDP peer context.

The **no** form of this command removes the MSDP peer configuration from the specified context.

Parameter	Description
<IP-ADDR>	Specifies the IPv4 address of the MSDP peer. Format: A.B.C.D

Examples

Enabling the MSDP peer context:

```
switch(config)# router msdp
switch(config-msdp)#
switch(config-msdp)# ip msdp peer 10.1.1.1
switch(config-msdp-peer)#
```

6300 6400	`config-msdp`	Administrators or local user group members with execution rights for this command.

keepalive

```
keepalive <KEEPALIVE-INTERVAL> <HOLD-TIME>
no keepalive
```

Description

Configures the interval at which a MSDP peer will send keepalive messages, and the interval at which the MSDP peer will wait for keepalive messages from other peers before declaring them down.

The **no** form of this command removes the currently configured value and sets it to the default value.

Parameter	Description
<KEEPALIVE-INTERVAL>	Specifies the value for the keepalive interval.
<HOLD-TIME>	Specifies the value for the hold time.

Example

Configuring the keepalive interval and the hold time for MSDP peer:

```
switch(config-msdp-peer)# keepalive 30 45
switch(config-msdp-peer)# no keepalive
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

mesh-group

```
mesh-group <MESH-NAME>
no mesh-group <MESH-NAME>
```

Description

Associates the given mesh group with the MSDP peer. This feature is used to reduce the amount of SA traffic in an intra-domain setting.

The **no** form of this command removes the peer from the currently configured mesh.

Parameter	Description
<MESH-NAME>	Specifies the MSDP mesh group name.

Usage

All MSDP peers on the router that participate in the mesh group must be fully meshed with all other peers in the mesh group. When MSDP mesh groups are used, SA messages are not flooded to other mesh group peers. It also eliminates RPF checks on arriving SA messages. With MSDP mesh group configured, SA messages are always accepted from mesh group peers.

Example

Associating a mesh group with an MSDP peer:

```
switch(config-msdp-peer)# mesh-group test-mesh-group
```

Removing the MSDP peer from the configured mesh:

```
switch(config-msdp-peer)# no mesh-group test-mesh-group
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification

6300 6400	`config-msdp-peer`	Administrators or local user group members with execution rights for this command.

password (router msdp)

```
password {ciphertext | plaintext} <password>
no password
```

Description

Enables MD5 password encryption for a TCP connection between two MSDP peers.

The **no** form of this command removes MD5 password encryption.

Parameter	Description
`{ciphertext | plaintext}`	Selects the password type.
`<password>`	Specifies the password.

When the password is not provided on the command line, plaintext password prompting occurs upon pressing Enter. The entered password characters are masked with asterisks.

Examples

Configuring MD5 password encryption with a provided plaintext password:

```
switch(config)# router msdp
switch(config-msdp)#
switch(config-msdp)# ip msdp peer 10.1.1.1
switch(config-msdp-peer)#
switch(config-msdp-peer)# password plaintext F82#4eva
```

Configuring MD5 password encryption with a prompted plaintext password:

```
switch(config)# router msdp
switch(config-msdp)#
switch(config-msdp)# ip msdp peer 10.1.1.1
switch(config-msdp-peer)#
switch(config-msdp-peer)# password
Enter the MD5 password: ********
Re-Enter the MD5 password: ********
```

Removing MD5 password encryption:

```
switch(config)# router msdp
switch(config-msdp)#
switch(config-msdp)# ip msdp peer 10.1.1.1
switch(config-msdp-peer)#
switch(config-msdp-peer)# no password
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

sa-filter access-list

```
sa-filter {in|out} access-list <ACL-RULE>
no sa-filter {in|out} access-list <ACL-RULE>
```

Description

Associates the given ACL to filter MSDP SA messages on the peer.

The **no** form of this command removes the currently configured ACL entry.

Parameter	Description
`{in|out}`	Enables the filter for incoming or outgoing SA messages.
`<ACL-RULE>`	Specifies the ACL rule name.

Usage

By default, the MSDP enabled router forwards all the SA messages, and the peer router processes all the received messages. This command allows the user to configure an ACL on the MSDP peer to filter SA messages. User can prevent the incoming/outgoing SA messages on MSDP router by creating incoming/outgoing filter lists using an ACL.

Example

Filtering incoming SA messages on the MSDP peer for the specified ACL:

```
switch(config-msdp-peer)# sa-filter in access-list msdp_sa_filter1
```

Filtering outgoing SA messages on the MSDP peer for the specified ACL:

```
switch(config-msdp-peer)# sa-filter out access-list msdp_sa_filter2
```

Removing filter on the MSDP peer for the specified ACL:

```
switch(config-msdp-peer)# no sa-filter in access-list msdp_sa_filter2
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Chapter 87

MSDP show commands

show ip msdp count

```
show ip msdp count [all-vrfs | vrf <VRF-NAME>]
```

Description

Shows MSDP Peer (S,G) learnt count for a given VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`all-vrfs`	Shows MSDP (S,G) entries count for all VRFs. Optional.
`vrf <VRF-NAME>`	Shows MSDP (S,G) entries count for a particular VRF. If the **<VRF-NAME>** is not specified, it shows information for the default VRF. Optional.

Examples

Showing the MSDP learnt count:

```
switch# show ip msdp count

VRF: default
SA state per Peer counters
<Peer>:<#SA learned>
10.1.1.1: 30
20.1.1.1: 100
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

show ip msdp peer

`show ip msdp peer [all-vrfs | vrf <VRF-NAME> | <PEER-IP>]`

Description

Shows MSDP Peer information for the given VRF. Optionally, you can show specific information by VRF.

Parameter	Description
`all-vrfs`	Shows MSDP peer information for all VRFs. Optional.
`vrf <VRF-NAME>`	Shows MSDP peer information for a particular VRF. If the **<VRF-NAME>** is not specified, it shows information for the default VRF. Optional.
`<PEER-IP>`	Shows MSDP Peer information for specified Peer IP. Format: A.B.C.D. Optional.

Examples

Showing MSDP peer information for VRFs:

(Sub-interface is supported only on the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series)

```
switch# show ip msdp peer

VRF: default

MSDP Peer: 10.1.1.1
Connection status
State: up  Resets: 0  Connection Source: 1/1/1
Uptime(Downtime): 0m 25s    SA Messages sent: 0
SA's learned from this peer: 0
SA Filtering
Input  (S,G) filter: msdp_sa_filter1  (S,G) entries dropped: 0
Output (S,G) filter: msdp_sa_filter2  (S,G) entries dropped: 30
Mesh group: test-mesh-group

MSDP Peer: 30.1.1.1
Connection status
State: up  Resets: 0  Connection Source: 1/1/10.10(30.1.1.2)
Uptime(Downtime): 0m 25s    SA Messages sent: 0
SA's learned from this peer: 0
Peer Keepalive interval: 70
Peer Hold time: 90
Peer Connection Retry interval: 40
SA Filtering
Input  (S,G) filter: msdp_sa_filter1  (S,G) entries dropped: 0
Output (S,G) filter: msdp_sa_filter2  (S,G) entries dropped: 30
Mesh group: test-mesh-group1

switch# show ip msdp peer 20.1.1.1

VRF: default

MSDP Peer: 20.1.1.1
Connection status
State: down  Resets: 0  Connection Source: 1/1/2
Uptime(Downtime): 1m 25s    SA Messages sent: 0
```

```
SA's learned from this peer: 0
SA Filtering
Input (S,G) filter: msdp_sa_filter1  (S,G) entries dropped: 0
Output (S,G) filter: msdp_sa_filter2  (S,G) entries dropped: 20
Mesh group: test-mesh-group
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

show ip msdp sa-cache

`show ip msdp sa-cache [all-vrfs | vrf <VRF-NAME> | <SRC-OR-GRP-IP>]`

Description

Shows MSDP Peer SA-Cache information for the given VRF. Optionally, you can show specific information by VRF. The SA-Cache output can be filtered based on the source or group IPv4 address.

Parameter	Description
`all-vrfs`	Shows MSDP SA-Cache information for all VRFs. Optional.
`vrf <VRF-NAME>`	Shows MSDP SA-Cache information for a particular VRF. If the **<VRF-NAME>** is not specified, it shows information for the default VRF. Optional.
`<SRC-OR-GRP-IP>`	Shows the filtered SA-cache output for the specified source or group IPv4 address. Format: A.B.C.D. Optional.

Examples

Showing MSDP SA-Cache information for VRFs:

```
switch# show ip msdp sa-cache

VRF: default
(30.0.0.1, 230.1.1.1)  RP: 10.1.1.1  Peer: 10.1.1.2
```

```
(20.0.0.1, 229.1.1.1)  RP: 10.1.1.1  Peer: 10.1.1.2
(10.0.0.1, 229.1.1.1)  RP: 10.1.1.1  Peer: 10.1.1.2

Total entries: 3

switch# show ip msdp sa-cache 229.1.1.1
(20.0.0.1, 229.1.1.1)  RP: 10.1.1.1  Peer: 10.1.1.2
(10.0.0.1, 229.1.1.1)  RP: 10.1.1.1  Peer: 10.1.1.2

Total entries: 2
```

show ip msdp summary

`show ip msdp summary [all-vrfs | vrf <VRF-NAME>]`

Description

Shows MSDP peer summary for a given VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`all-vrfs`	Shows the MSDP peer summary for all VRFs. Optional.
`vrf <VRF-NAME>`	Shows the MSDP peer summary for a particular VRF. If the **<VRF-NAME>** is not specified, it shows information for the default VRF. Optional.

Examples

Showing the MSDP peer summary:

```
switch# show ip msdp summary

VRF: default
```

```
MSDP Peer Status Summary
Peer address      State    Uptime(Downtime)      Reset Count      SA Count

10.1.1.1          down     34m 34s               0                0
20.1.1.1          up       50m 24s               0                50

show spanning-tree

```
show spanning-tree [vsx-peer]
```

Description

Shows priority, address, Hello-time, Max-age, and Forward-delay for bridge and root node.

Parameter	Description
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the

Parameter	Description
	VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

On the 6400 Switch Series, interface identification differs.

Showing spanning tree standard information:

show spanning-tree inconsistent-ports

`show spanning-tree inconsistent-ports [instance <INSTANCE-ID>]`

Description

Shows ports blocked by STP protection functions such as Root guard, Loop guard, BPDU guard, and RPVST guard in addition to MSTI information.

Parameter	Description
<INSTANCE-ID>	Specifies the MSTP instance ID. Range: 0 to 64.

Example

On the 6400 Switch Series, interface identification differs.

Showing spanning tree inconsistent ports:

```
switch# show spanning-tree inconsistent-ports
Instance ID  Blocked Port   Reason
------------ -------------- ------------
0            1/1/13         BPDU Guard
```

Showing inconsistent port information for instances 1-4:

```
switch# show spanning-tree inconsistent-ports instance 1-4
Instance ID  Blocked Port   Reason
------------ -------------- ------------
1            1/1/3          Root Guard
2            1/1/7          BPDU Guard
3            1/1/9          Loop Guard
4            1/1/37         RPVST Guard
```

show spanning-tree mst

```
show spanning-tree mst [vsx-peer]
```

Description

Shows MSTP configuration and status information for each instance.

Parameter	Description
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

Showing MSTP configuration and status information:

```
switch# show spanning-tree mst
#### MST0
Vlans mapped   : 2,4-4094
Bridge Address : 48:0F:CF:AF:04:76
Priority       : 32768
Root
Regional Root
Operational    Hello time    : 2 seconds                  Forward delay: 15 seconds
               Max-age       : 20 seconds                 TxHoldCount  : 6 pps

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

Command History

Release	Modification
10.09	A new state `Down` is added in the output.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show spanning-tree mst-config

```
show spanning-tree mst-config [vsx-peer]
```

Description

Shows MSTP instance and corresponding VLAN information.

Parameter	Description
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing configuration information for MST instances and corresponding VLANs:

```
switch# show spanning-tree mst-config
MST configuration information
```

```
   MST config ID        : reg
   MST config revision  : 1
   MST config digest    : 2D2BC9A32097B463C48EE1817673FA2D
   Number of instances  : 2

Instance ID     Member VLANs
--------------- ----------------------------------
0               2,4-4094
1               1
2               3
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show spanning-tree mst detail

```
show spanning-tree mst detail [vsx-peer]
```

Description

Shows detailed information for all MST instances.

Parameter	Description
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

On the 6400 Switch Series, interface identification differs.

Showing detailed information for all MST instances:

```
switch# show spanning-tree mst detail

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

Command History

Release	Modification
10.09	A new state **Down** is added in the output.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show spanning-tree mst <INSTANCE-ID>

```
show spanning-tree mst <INSTANCE-ID> [vsx-peer]
```

Description

Displays MSTP configurations for the given instance ID.

Parameter	Description
<INSTANCE-ID>	Specifies the MSTP instance number. Range: 0 to 64.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

```
switch# show spanning-tree mst 1

show spanning-tree mst <INSTANCE-ID> detail

`show spanning-tree mst <INSTANCE-ID> detail [vsx-peer]`

Description

Displays MSTP configurations for the given instance ID with corresponding port details.

Parameter	Description
<INSTANCE-ID>	Specifies the MSTP instance number. Range: 0 to 64.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

```
switch# show spanning-tree mst 1 detail

#### MST1
Vlans mapped:  1
Bridge         Address : 48:0F:CF:AF:04:76          Priority: 32768

show spanning-tree mst interface

`show spanning-tree mst <INSTANCE-ID> interface <IFNAME> [vsx-peer]`

Description

Shows MSTP configurations for the given instance ID with corresponding port details.

Parameter	Description
<INSTANCE-ID>	Specifies the MSTP instance number. Range: 0 to 64.
<IFNAME>	Specifies an interface.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

Showing MST configuration and port details:

```
switch# show spanning-tree mst 1 interface 1/1/1
Port 1/1/1

Instance       Role           State        Cost       Priority   Vlans mapped
-------------- -------------- ------------ ---------- ---------- ----------

spanning-tree

```
spanning-tree
no spanning-tree
```

Description

Enables the spanning tree protocol on the switch.

The **no** form of this command disables the spanning tree protocol on the switch.

Examples

Enabling spanning tree:

```
switch(config)# spanning-tree
```

Disabling spanning tree:

```
switch(config)# no spanning-tree
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

spanning-tree bpdu-filter

```
spanning-tree bpdu-filter
no spanning-tree bpdu-filter
```

Description

Enables the bpdu filter for the interface.

The BPDU filter feature allows control of spanning tree participation on a per-port basis. It can be used to exclude specific ports from becoming part of spanning tree operations. A port with the BPDU filter enabled will ignore incoming BPDU packets, does not transmit BPDU, and stays locked in the spanning tree forwarding state. All other ports maintain their role. Typical uses for this parameter include:

- To have MSTP operations running on selected ports of the switch rather than every port of the switch at a time.
- To prevent the spread of errant BPDU frames.
- To eliminate the need for a topology change when a port's link status changes. For example, ports that connect to servers and workstations can be configured to remain outside of spanning tree operations.
- To protect the network from denial of service attacks that use spoofing BPDUs by dropping incoming BPDU frames. For this scenario, BPDU protection offers a more secure alternative, implementing port shut down and a detection alert when errant BPDU frames are received.

Ports configured with the BPDU filter mode remain active (learning and forward frames). However, spanning tree cannot receive or transmit BPDUs on the port. The port remains in a forwarding state, permitting all broadcast traffic. This can create a network storm if there are any loops (that is, redundant links) using these ports. If you suddenly have a high load, disconnect the link and disable the BPDU filter (using the no command.)

The **no** form of the command sets the bpdu filter status to the default of disabled on the interface.

Examples

On the 6400 Switch Series, interface identification differs.

Enabling the bpdu filter on interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# spanning-tree bpdu-filter
```

Disabling bpdu filter on interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# no spanning-tree bpdu-filter
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

All platforms	`config-if`	Administrators or local user group members with execution rights for this command.

spanning-tree bpdu-guard

```
spanning-tree bpdu-guard
no spanning-tree bpdu-guard
```

Description

Enables the BPDU guard on the selected switch interface. When BPDU guard is enabled, interfaces receiving MSTP BPDUs become disabled.

BPDU protection is a security feature designed to protect the active MSTP topology by preventing spoofed BPDU packets from entering the MSTP domain. In a typical implementation, BPDU protection would be applied to edge ports connected to end user devices that do not run MSTP. If MSTP BPDU packets are received on a protected port, this feature disables that port and alerts the network manager using an SNMP trap.

Occasionally a hardware or software failure can cause MSTP to fail, creating forwarding loops that can cause network failures where unidirectional links are used. The non-designated port transitions in a faulty manner because the port is no longer receiving MSTP BPDUs.

The **no** form of the command disables BPDU guard on the selected interface.

Examples

On the 6400 Switch Series, interface identification differs.

Enabling the BPDU guard on interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# spanning-tree bpdu-guard
```

Disabling BPDU guard on interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# no spanning-tree bpdu-guard
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

spanning-tree bpdu-guard timeout

```
spanning-tree bpdu-guard timeout <INTERVAL>
no spanning-tree bpdu-guard timeout [<INTERVAL>]
```

Description

Enables and configures the auto re-enable timeout in seconds for all interfaces with BPDU guard enabled. When an interface is disabled after receiving an unauthorized BPDU it will automatically be re-enabled after the timeout expires. The default is for the interface to stay disabled until manually re-enabled.

The **no** form of the command disables BPDU guard timeout on the interface. This is the default.

Parameter	Description
<INTERVAL>	Specifies the re-enable timeout in seconds. Range: 1 to 65535.

Example

On the 6400 Switch Series, interface identification differs.

Enabling the BPDU guard timeout on interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# spanning-tree bpdu-guard timeout 10
```

Disabling BPDU guard timeout on interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# no spanning-tree bpdu-guard
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

Command History

Release	Modification

All platforms	`config`	Administrators or local user group members with execution rights for this command.

spanning-tree config-name

```
spanning-tree config-name <CONFIG-NAME>
no spanning-tree config-name [<CONFIG-NAME>]
```

Description

Sets the configuration name for the MST region in which the switch resides.

All switches within an MST region must have identical configuration names. For more than one MSTP switch in the same MST region, the identical region name must be configured on all such switches. If the default configuration name is retained on a switch, it cannot exist in the same MST region with another switch.

The **no** form of this command overwrites the currently configured name with the default name. The default name is a text string using the hexadecimal representation of the system MAC address.

Parameter	Description
<CONFIG-NAME>	Specifies the configuration name for the MST region in which the switch resides. Default: text string using the hexadecimal representation of the MAC address of the switch. Range: 1 - 32 nonblank characters (case-sensitive).

Examples

Setting the configuration name to MST0:

```
switch(config)# spanning-tree config-name MST0
```

Setting the configuration name to the default value:

```
switch(config)# no spanning-tree config-name
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

Command History

spanning-tree config-revision

```
spanning-tree config-revision <REVISION-NUMBER>
no spanning-tree config-revision [<REVISION-NUMBER>]
```

Description

Configures the revision number for the MST region in which the switch resides. All switches within an MST region must have identical revision numbers. Use this setting to differentiate between region configurations. For example, when changing configuration settings within a region where you want to track the configuration versions you use, or when creating a new region from a subset of switches in a current region and you want to maintain the same region name.

The **no** form of this command overwrites the currently configured revision number of the MST region and sets it to the default value of 0.

Parameter	Description
<REVISION-NUMBER>	Specifies the revision number for the MST region in which the switch resides.Range: 0 - 65535. Default: 0.

Examples

Setting the revision to 40:

```
switch(config)# spanning-tree config-revision 40
```

Setting the revision to the default value:

```
switch(config)# no spanning-tree config-revision
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

spanning-tree cost

```
spanning-tree cost <PORT-COST>
no spanning-tree cost [<PORT-COST>]
```

Description

Sets individual port cost for MSTI 0.

For a given port, the path cost setting can be different for different MSTIs to which the port may belong.

The switch uses the path cost to determine which ports are the forwarding ports in the MSTI; that is, which links to use for the active topology of the MSTI and which ports to block.

Cost gets calculated based on physical interface link speed. It is not based on cumulative speed of all physical links under a lag. Therefore, the cost will be same for a 1G interface and 2x1G lag interfaces.

The **no** form of the command sets the port cost for MSTI 0 instance to the default value.

Parameter	Description
<PORT-COST>	Specifies the cost of the port for MSTI 0. Range: 1-200,000,000. Default is calculated from the port link speed: ■ 10 Mbps link speed equals a path cost of 2,000,000. ■ 100 Mbps link speed equals a path cost of 200,000. ■ 1 Gbps link speed equals a path cost of 20,000. ■ 10 Gbps link speed equals a path cost of 2,000. ■ 100 Gbps link speed equals a path cost of 200. ■ 1 Tbps link speed equals a path cost of 20.

Examples

On the 6400 Switch Series, interface identification differs.

Setting the cost to **2000** on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# spanning-tree cost 2000
```

Setting the cost to the default on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# no spanning-tree cost
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

spanning-tree forward-delay

```
spanning-tree forward-delay <DELAY-IN-SECS>
no spanning-tree forward-delay [<DELAY-IN-SECS>]
```

Description

Configures the time the switch waits between transitions from listening to learning and from learning to forwarding states.

The **no** form of this command sets forward delay time for the bridge to the default of 15 seconds.

Parameter	Description
<DELAY-IN-SECS>	Specifies the forward delay time in seconds. Default: 15 seconds. Range: 4-30.

Examples

Setting forward delay to 6 seconds:

```
switch(config)# spanning-tree forward-delay 6
```

Setting forward delay to the default of 15 seconds:

```
switch(config)# no spanning-tree forward-delay
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

spanning-tree hello-time

```
spanning-tree hello-time <HELLO-IN-SECS>
no spanning-tree hello-time [<HELLO-IN-SECS>]
```

Description

Configures the transmission interval between consecutive Bridge Protocol Data Units (BPDU) that the switch sends as a root bridge. The hello time interval is inserted in outbound BPDUs.

The **no** form of this command sets hello time to the default of 2 seconds.

Parameter	Description
<HELLO-IN-SECS>	Specifies the hello time interval in seconds. Default: 2 seconds. Range: 2-10.

Examples

Setting the hello time interval to 6 seconds:

```
switch(config)# spanning-tree hello-time 6
```

Setting the hello time interval to the default of 2 seconds:

```
switch(config)# no spanning-tree hello-time
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

spanning-tree instance cost

```
spanning-tree instance <INSTANCE-ID> cost <PORT-COST>
no spanning-tree instance <INSTANCE-ID> cost [<PORT-COST>]
```

Description

Sets the individual port cost for an MSTI. The switch uses the path cost to determine which links to use for the active topology of the MSTI (forwarding ports) and which ports to block. The path cost setting for a port can be different on each MSTI to which the port belongs.

The **no** form of this command sets the port cost for an MSTI to the default value.

Parameter	Description
<INSTANCE-ID>	Specifies the MSTI number. Range: 1-64.
<PORT-COST>	Specifies the cost of the port for the MSTI. Range: 1-200000000. Default value is calculated from the port link speed: ▪ 10 Mbps link speed equals a path cost of 2000000. ▪ 100 Mbps link speed equals a path cost of 200000. ▪ 1 Gbps link speed equals a path cost of 20000.

Examples

On the 6400 Switch Series, interface identification differs.

Setting the port **1/1/1** cost for MSTI **1** to **2000**:

```
switch(config)# interface 1/1/1
switch(config-if)# spanning-tree instance 1 cost 2000
```

Setting the port **1/1/1** cost for MSTI **1** to the default:

```
switch(config)# interface 1/1/1
switch(config-if)# no spanning-tree instance 1 cost
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

spanning-tree instance port-priority

```
spanning-tree instance <INSTANCE-ID> port-priority <PRIORITY-MULTIPLIER>
no spanning-tree instance <INSTANCE-ID> port-priority [<PRIORITY-MULTIPLIER>]
```

Description

Configures the priority as a priority multiplier for the specified ports in the specified MST instance.

For a given port, the priority setting can be different for different MST instances to which the port may belong.

The **no** form of this command sets the port priority to the default value of 8 for the MST instance. The default priority value is derived by multiplying 8 by 16.

Parameter	Description
<INSTANCE-ID>	Specifies the MSTP instance number. Range: 1-64.
<PRIORITY-MULTIPLIER>	Specifies the priority as a multiplier. Default: 8. Range: 0 to 15. The priority range for a port in a given MST instance is 0 to 255. However, this command specifies the priority as a multiplier (0 to 15) of 16. When you specify a priority multiplier of 0 to 15, the actual priority assigned to the switch is: (priority-multiplier) x 16.

Examples

On the 6400 Switch Series, interface identification differs.

Setting the port **1/1/1** priority for instance **1** to **8**:

```
switch(config)# interface 1/1/1
switch(config-if)# spanning-tree instance 1 port-priority 8
```

Setting the port 1/1/1 priority for instance 1 to the default:

```
switch(config)# interface 1/1/1
switch(config-if)# no spanning-tree instance 1 port-priority
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

spanning-tree instance priority

```
spanning-tree instance <INSTANCE-ID> priority <PRIORITY-MULTIPLIER>
no spanning-tree instance <INSTANCE-ID> priority [<PRIORITY-MULTIPLIER>]
```

Description

Sets the switch priority for the specified MST instance.

The **no** form of this command sets the priority for the specified instance to the default of 8.

Parameter	Description
<INSTANCE-ID>	Specifies the MSTP instance number. Range: 1 to 64.
<PRIORITY-MULTIPLIER>	Specifies the priority as a multiplier. Default: 8. Range: 0 to 15. The priority range for an MSTP switch is 0-61440. However, this command specifies the priority as a multiplier (0 - 15) of 4096. That is, when you specify a priority multiplier value of 0 - 15, the actual priority assigned to the switch is: (priority-multiplier) x 4096. For example, with 2 as the priority-multiplier on a given MSTP switch, the switch priority setting is 8,192.

Examples

Setting the priority multiplier for instance 1 to 5:

```
switch(config)# spanning-tree instance 1 priority 5
```

Setting the priority multiplier for instance 1 to the default of 8:

```
switch(config)# no spanning-tree instance 1 priority
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

spanning-tree instance vlan

```
spanning-tree instance <INSTANCE-ID> vlan <VLAN-ID>
no spanning-tree instance <INSTANCE-ID> vlan <VLAN-ID>
```

Description

Creates a new instance with VLANs mapped or maps VLANs to an existing instance.

Each instance must have at least one VLAN mapped to it. When VLANs are mapped to an instance, they are automatically unmapped from the instance they were mapped to before. Any MSTP instance can have all the VLANs configured on the switch.

The **no** form of this command removes the specified VLAN from the MSTP instance.

Parameter	Description
<INSTANCE-ID>	Specifies the MSTP instance number. Range: 1 to 64.
<VLAN-ID>	Specifies a VLAN ID number.

Examples

Mapping VLAN 1 to instance 1:

```
switch(config)# spanning-tree instance 1 vlan 1
```

Removing VLAN 1 from instance 1:

```
switch(config)# no spanning-tree instance 1 vlan 1
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

spanning-tree link-type

`spanning-tree link-type {point-to-point|shared}`

Description

Specifies the link type of the interface, which is normally derived from the duplex setting of the port. The default setting depends on the duplex mode of the port: full-duplex ports are point-to-point, half-duplex ports are shared.

Parameter	Description
`point-to-point`	Specifies the link type as point-to-point.
`shared`	Specifies the link type as shared.

Examples

On the 6400 Switch Series, interface identification differs.

Setting the link type to point-to-point on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# spanning-tree link-type point-to-point
```

Setting the link type to shared on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# spanning-tree link-type shared
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

spanning-tree loop-guard

```
spanning-tree loop-guard
no spanning-tree loop-guard
```

Description

Enables the loop guard on the interface. STP loop guard is best applied on blocking or forwarding ports.

The **no** form of the command sets the loop guard status to the default of disabled on the interface.

Usage

Occasionally a hardware or software failure can cause MSTP to fail, creating forwarding loops that can cause network failures where unidirectional links are used. The non-designated port transitions in a faulty manner because the port is no longer receiving MSTP BPDUs.

Loop guard causes the non-designated port to go into the MSTP loop inconsistent state instead of the forwarding state. In the loop inconsistent state the port prevents data traffic and BPDU transmission through the link, therefore avoiding the loop creation. When BPDUs again are received on the inconsistent port, it resumes normal MSTP operation automatically.

In this example, the transmission from switch 1 port 10 to switch 2 port 20 is blocked due to a hardware failure. Switch 2 port 2 does not receive BPDUs and goes into a forwarding state, creating a loop.

When loop guard is configured for switch 2 port 20, this port goes from a forwarding state to an inconsistent state, and does not forward the traffic through the link, thus avoiding loop creation.

Examples

Enabling the loop guard on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# spanning-tree loop-guard
```

Disabling loop guard on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# no spanning-tree loop-guard
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

spanning-tree max-age

```
spanning-tree max-age <AGE-IN-SECS>
no spanning-tree max-age [<AGE-IN-SECS>]
```

Description

Sets the maximum age timer, which specifies the maximum age value that the switch inserts in outbound BPDU packets it sends as a root bridge. Max-age is the interval, specified in the BPDU, that BPDU data remains valid after its reception.

The bridge recomputes the spanning tree topology if it does not receive a new BPDU before max-age expiry.

The **no** form of this command sets the max-age value to the default of 20 seconds.

Parameter	Description
<AGE-IN-SECS>	Specifies the max-age in seconds. Range: 6 to 40. Default: 20.

Examples

Setting the max-age to 10 seconds:

```
switch(config)# spanning-tree max-age 10
```

Setting the max-age to the default of 20 seconds:

```
switch(config)# no spanning-tree max-age
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

spanning-tree max-hops

```
spanning-tree max-hops <HOP-COUNT>
no spanning-tree max-hops [<HOP-COUNT>]
```

Description

Configures the max hop setting that the switch inserts into BPDUs that it sends out as the root bridge. The max hop setting determines the number of bridges in an MST region that a BPDU can traverse before it is discarded.

The **no** form of this command sets the maximum number of hops to the default of 20.

Parameter	Description
<HOP-COUNT>	Specifies the maximum number of hops. Range: 1 to 40. Default: 20.

Examples

Setting the hop count to 10:

```
switch(config)# spanning-tree max-hops 10
```

Setting the max-age to the default of 20:

```
switch(config)# no spanning-tree max-hops
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

spanning-tree mode

```
spanning-tree mode {mstp|rpvst [auto-vlan-enable [priority <NUMBER>]]}
no spanning-tree mode {mstp|rpvst [auto-vlan-enable [priority <NUMBER>]]}
```

Description

Sets the spanning tree protocol (STP) mode to either MSTP mode (Multiple-instance Spanning Tree Protocol) or RPVST mode (Rapid Per VLAN Spanning Tree). Enabling the RPVST Auto VLAN feature will run RPVST on all VLANs currently configured on the switch. Default priority of 8 will be assigned to the VLANs being auto created.

The **no** form of this command sets the spanning tree mode to the default **mstp**.

Enabling auto-VLAN can lead to an undeterministic state if auto scaled beyond the max system limit mentioned in the capacity-status.

Parameter	Description
`mstp`	Sets the STP mode to MSTP which applies spanning tree separately for each set of VLANs called an MSTI (multiple spanning tree instance).
`rpvst`	Sets the STP mode to RPVST.
`auto-vlan-enable`	Selects RPVST auto VLAN mode.
`priority <NUMBER>`	Specifies the priorites for all auto created RPVST instances. Configured as a multiple of 4096. Default: 8.

Examples

Enabling MSTP mode:

```
switch(config)# spanning-tree mode mstp
```

Disabling MSTP mode:

```
switch(config)# no spanning-tree mode mstp
```

Enabling RPVST mode:

```
switch(config)# spanning-tree mode rpvst
```

Disabling RPVST mode:

```
switch(config)# no spanning-tree mode rpvst
```

Enabling RPVST auto VLAN with a priority of 1:

```
switch(config)# spanning-tree mode rpvst auto-vlan-enable priority 1
```

Disabling RPVST auto VLAN with a priority of 1:

```
switch(config)# no spanning-tree mode rpvst auto-vlan-enable priority 1
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

spanning-tree port-priority

```
spanning-tree port-priority <PRIORITY-MULTIPLIER>
no spanning-tree port-priority [<PRIORITY-MULTIPLIER>]
```

Description

Configures the port priority. The priority of a port can be different for each MST instance to which it belongs.

The **no** form of the command sets the port priority for MST instance 0 to the default of 8. The default priority value is derived by multiplying 8 by 8. For LAG interfaces the default is 4.

Parameter	Description
<PRIORITY-MULTIPLIER>	Specifies the port priority as a multiplier. Default: 8, except for LAG interfaces where the default is 4. Range: 0 to15. The priority range for a port in a given MSTI is 0 to 255. However, this command specifies the priority as a multiplier (0 to 15) of 16. When you specify a priority multiplier of 0 to15, the actual priority assigned to the switch is: (priority-multiplier) x 16.

Examples

On the 6400 Switch Series, interface identification differs.

Setting the port priority to 8 on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# spanning-tree port-priority 8
```

Setting the port priority to the default on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# no spanning-tree port-priority
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

Command History

spanning-tree port-type

```
spanning-tree port-type {admin-edge|admin-network}
no spanning-tree port-type [admin-edge|admin-network]
```

Description

Sets the STP port type for the interface.

Port types include: admin-edge and admin-network.

The **no** form of the command sets the port type to the default of admin-network.

Parameter	Description
`admin-edge`	Specifies the port type as administrative edge. During spanning tree establishment, ports with admin-edge enabled transition immediately to the forwarding state.
`admin-network`	Specifies the port type as administrative network. When this option is selected, the port looks for BPDUs for the first 3 seconds. If there are none, the port is classified as an edge port and immediately starts forwarding packets. If BPDUs are seen on the port, the port is classified as a non-edge port and normal STP operation commences on that port.

Examples

On the 6400 Switch Series, interface identification differs.

Setting the port type to admin-edge on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# spanning-tree port-type admin-edge
```

Setting the port type to admin-network on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# spanning-tree port-type admin-network
```

Setting the port type to the default of admin-network on interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# no spanning-tree port-type
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

spanning-tree priority

```
spanning-tree priority <PRIORITY-MULTIPLIER>
no spanning-tree priority [<PRIORITY-MULTIPLIER>]
```

Description

Configures the switch (bridge) priority for the designated region in which the switch resides.

The switch compares this priority with the priorities of other switches in the same region to determine the root switch for the region. The lower the priority value, the higher the priority.

The **no** form of this command sets the bridge priority to the default of 8. The default priority value is derived by multiplying 8 by 4096.

Parameter	Description
<PRIORITY-MULTIPLIER>	Specifies the priority as a multiplier. Range: 0 to 15. Default: 8.

Parameter	Description
	The priority range for an MSTP switch is 0-61440. However, this command specifies the priority as a multiplier (0 to 15) of 4096. That is, when you specify a priority multiplier value of 0 to 15, the actual priority assigned to the switch is: (priority-multiplier) x 4096. For example, with 2 as the priority-multiplier on a given MSTP switch, the switch priority setting is 8,192.

Usage

Every switch running an instance of MSTP has a Bridge Identifier, which is a unique identifier that helps distinguish this switch from all others. The switch with the lowest Bridge Identifier is elected as the root for the tree. The Bridge Identifier is composed of a configurable priority component (2 bytes) and the bridge's MAC address (6 bytes). You can change the priority component provides flexibility in determining which switch will be the root for the tree, regardless of its MAC address.

Examples

Setting the priority multiplier to 12:

```
switch(config)# spanning-tree priority 12
```

Setting the priority multiplier to the default of 8:

```
switch(config)# no spanning-tree priority
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

spanning-tree root-guard

```
spanning-tree root-guard
no spanning-tree root-guard
```

Description

Enables the root guard on the interface.

When a port is enabled as root-guard, it cannot be selected as the root port even if it receives superior STP BPDUs. The port is assigned an "alternate" port role and enters a blocking state if it receives superior MSTP BPDUs.

A superior BPDU contains both "better" information on the root bridge and path cost to the root bridge, which would normally replace the current root bridge selection.

The **no** form of the command sets the root guard status to the default of disabled on the interface.

Examples

On the 6400 Switch Series, interface identification differs.

Enabling the root guard on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# spanning-tree root-guard
```

Disabling root guard on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# no spanning-tree root-guard
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

All platforms	`config-if`	Administrators or local user group members with execution rights for this command.

spanning-tree rpvst-filter

```
spanning-tree rpvst-filter
no spanning-tree rpvst-filter
```

Description

Enables the RPVST filter for the interface. This command is only applicable to MSTP mode. It is not applicable to RPVST+ mode.

When the RPVST filter is enabled, the ingressing RPVST proprietary BPDUs are dropped after copying to CPU whereas the standard IEEE RPVST BPDUs are still allowed. This helps in preventing the flooding of RPVST proprietary BPDUs under an MSTP-RPVST interop environment.

If the neighboring switch is running RPVST then this pair of switches will not converge as RPVST BPDUs will not reach them.

If enabling RPVST filter causes a high traffic load, shutdown the port and reconfigure the BPDU filter with the CLI command: **no spanning tree rpvst-filter**.

RPVST filter is disabled by default.

Example

On the 6400 Switch Series, interface identification differs.

Enabling the RPVST filter on interface 1/1/1:

```
switch# configure terminal
switch(config)# interface 1/1/1
switch(config-if)# spanning-tree rpvst-filter
```

Disabling RPVST filter on interface 1/1/1:

```
switch# configure terminal
switch(config)# interface 1/1/1
switch(config-if)# no spanning-tree rpvst-filter
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

spanning-tree rpvst-guard

```
spanning-tree rpvst-guard
no spanning-tree rpvst-guard
```

Description

Enables RPVST guard on the switch interface. This command is only applicable to MSTP mode. It is not applicable to RPVST+ mode.

When RPVST guard is enabled on an interface, it will disable that interface if RPVST BPDUs are received on it.

The **no** form of the command sets the RPVST guard status to the default of disabled on the interface.

Example

On the 6400 Switch Series, interface identification differs.

Enabling RPVST guard on interface 1/1/1:

```
switch# configure terminal
switch(config)# interface 1/1/1
switch(config-if)# spanning-tree rpvst-guard
```

Disabling RPVST guard on interface 1/1/1:

```
switch# configure terminal
switch(config)# interface 1/1/1
switch(config-if)# no spanning-tree rpvst-guard
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

spanning-tree tcn-guard

```
spanning-tree tcn-guard
no spanning-tree tcn-guard
```

Description

Enables the TCN (Topology Change Notification) guard in the interface. When enabled for a port, the port stops propagating received topology change notifications and topology changes to other ports.

The **no** form of the command sets the TCN guard status to the default of disabled on the interface.

Examples

On the 6400 Switch Series, interface identification differs.

Enabling TCN guard on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# spanning-tree tcn-guard
```

Disabling TCN guard on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# no spanning-tree tcn-guard
```

spanning-tree transmit-hold-count

```
spanning-tree transmit-hold-count <COUNT>
no spanning-tree transmit-hold-count [<COUNT>]
```

Description

Sets the maximum number of BPDUs per second that the switch can send from an interface.

The **no** form of this command sets the transmit-hold-count to the default of 6.

Parameter	Description
<COUNT>	Specifies the number of BPDUs that can be sent per second. Range: 1 to 10. Default: 6.

Examples

Setting the transmit-hold-count to 5:

```
switch(config)# spanning-tree transmit-hold-count 5
```

Setting the transmit-hold-count to the default of 6:

```
switch(config)# no spanning-tree transmit-hold-count
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

spanning-tree trap

```
spanning-tree trap {new-root|topology-change [instance <INSTANCE-ID>] |
       errant-bpdu | root-guard-inconsistency | loop-guard-inconsistency}
no spanning-tree trap {new-root|topology-change [instance <INSTANCE-ID>] |
       errant-bpdu | root-guard-inconsistency | loop-guard-inconsistency}
```

Description

Enables SNMP traps for new root, topology change event, errant-bpdu received event, root-guard inconsistency, and loop-guard inconsistency notifications. It is disabled by default.

The **no** form of this command disables the notifications for SNMP traps.

Parameter	Description
`new-root`	Enabling SNMP notification when a new root is elected on any MST instance on the switch.
`topology-change`	Enabling SNMP notification when a topology change event occurs in the specified MST instance on the switch.
`<INSTANCE-ID>`	Specifies the instance ID for the topology change trap. Range: 0 to 64.
`errant-bpdu`	Enabling SNMP notification when an errant bpdu is received by any MST instance on the switch.
`root-guard-inconsistency`	Enabling SNMP notification when the root-guard finds the port inconsistent for any MST instance on the switch.
`loop-guard-inconsistency`	Enabling SNMP notification when the loop-guard finds the port inconsistent for any MST instance on the switch.

Examples

Enabling the notifications for the SNMP traps:

```
switch(config)# spanning-tree trap
  new-root                  Enable notifications which are sent when a new root is
elected
  topology-change           Enable notifications which are sent when a topology
change occurs
  errant-bpdu               Enable notifications which are sent when an errant
bpdu is received
  root-guard-inconsistency  Enable notifications which are sent when root guard
inconsistency occurs
  loop-guard-inconsistency  Enable notifications which are sent when loop guard
inconsistency occurs
switch(config)# spanning-tree trap new-root
  <cr>
switch(config)# spanning-tree trap topology-change
  instance  Enable topology change notification for the specified MST instance id.
switch(config)# spanning-tree trap topology-change instance
  <0-64>  Enable topology change information on the specified instance id.
switch(config)# spanning-tree trap topology-change instance 1
  <cr>
switch(config)# spanning-tree trap errant-bpdu
  <cr>
switch(config)# spanning-tree trap root-guard-inconsistency
  <cr>
switch(config)# spanning-tree trap loop-guard-inconsistency
  <cr>
```

Disabling the notifications for the SNMP traps:

```
switch(config)# no spanning-tree trap
  new-root                  Disable notifications which are sent when a new root
is elected
  topology-change           Disable notifications which are sent when a topology
change occurs
  errant-bpdu               Disable notifications which are sent when an errant
bpdu is received
  root-guard-inconsistency  Disable notifications which are sent when root guard
inconsistency occurs
  loop-guard-inconsistency  Disable notifications which are sent when loop guard
inconsistency occurs
switch(config)# no spanning-tree trap new-root
  <cr>
switch(config)# no spanning-tree trap topology-change
  instance  Disable topology change notification for the specified MST instance
switch(config)# no spanning-tree trap topology-change instance
  <0-64>  Disable topology change information on the specified instance id
switch(config)# no spanning-tree trap topology-change instance 1
  <cr>
switch(config)# no spanning-tree trap errant-bpdu
  <cr>
switch(config)# no spanning-tree trap root-guard-inconsistency
  <cr>
switch(config)# no spanning-tree trap loop-guard-inconsistency
  <cr>
```

Chapter 89

Multicast VXLAN commands

clear ip mroute

```
clear ip mroute
   all-vrfs
   group-prefix <group-prefix>
   <group-address>[<source-address>]
   <port>
   vrf <vrf-name>
```

Description

Clears the multicast routing information for a specified VRF or all VRFs. If you do not include VRF information in these commands, the **clear ip mroute** commands clear the **default** VRF.

Parameter	Description
`all-vrfs`	Clears multicast routing for all VRFs.
`<group-address>`	Clears the multicast routing information for the group address in the specified VRF or all VRFs. If the command does not include VRF information, it clears routing information for the group address in the **default** VRF.
`<source-address>`	Clears multicast routing information for the group and source addresses in the specified VRF or all VRFs. If the command does not include VRF information, it clears routing information for the group and source addresses in the **default** VRF.
`group-prefix <group-prefix>`	Clears the multicast routing information for the group prefix in the specified VRF or all VRFs. The group prefix must be in the format **A.B.C.D/length**. If the command does not include VRF information, it clears routing information for the group address in the **default** VRF.
`<port>`	Clears the multicast routing information for the port in the specified VRF or all VRFs. If the command does not include VRF information, it clears routing information for the port in the **default** VRF.
vrf *<VRF-NAME>*	Clears multicast routing information for a specific VRF.

Examples

Clears multicast routing information for the default VRF.

```
switch# clear ip mroute
```

Clears multicast routing information the group address **225.1.1.1** for the VRF **Lab2**.

```
switch# clear ip mroute 225.1.1.1 vrf Lab2
```

Clears multicast routing information the group address **225.1.1.1** and source address 192.0.2.6 for all VRFs

```
switch# clear ip mroute 225.1.1.1 192.0.2.6 all-vrfs
```

Clears multicast routing information for the port **VLAN10** on the **Default** VRF.

```
clear ip mroute vlan10
```

Clears multicast routing information for the port **VLAN10** for the group address **225.1.1.1** and source address **192.0.2.6** for the VRF **Lab3**.

```
switch# clear ip mroute vlan20 225.1.1.1 192.0.2.6 Lab3
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ip pim-sparse datapath-auto-include

```
ip pim-sparse datapath-auto-include
no ip pim-sparse datapath-auto-include
```

Description

Enables the router to forward multicast data received on the VXLAN L3VNI fabric to this interface, regardless of whether a multicast join was received on this interface or not. This allows the interface to be in the same multicast data path state on both the VSX peers.

This command must be enabled on the VSX VXLAN routers to support multicast receivers over ROP or P2P SVI extensions. This command can be enabled on a transit L3 peering between VSX peers. This command is optional when the uplink is an MCLAG SVI.

The **no** form of the command disables forwarding of multicast data on the interface.

- An IP address must be configured on the interface and `pim-sparse` must be enabled.
- This command must be enabled only on one interface per VRF.

PIM enabled VXLAN VTEPs can be extended to other routers that can be connected to sources or clients. The following types of L3 or L2 extensions are supported:

- L2 VSX LAG: Upstream or downstream routers are connected using L2 VSX LAG links.
- L3 VSX LAG: Upstream or downstream routers are connected using L3 VSX LAG links.
- ROP extension: L3 extension for sources or clients using ROPs is supported.
- Point-to-point SVI extension: L3 extension for sources or clients using point-to-point SVIs is supported.

If the source is connected using ROP or P2P SVIs, it is recommended to have an additional L3 link per VRF between the VSX devices for upstream redundancy. If the L3 link is an SVI, it is recommended to not add an ISL port in that VLAN.

Parameter	Description
`datapath-auto-include`	Includes the interface for multicast data forwarding.

Examples

Configuring interface 40.0.0.4/24 of the router to forward multicast data:

```
switch(config)# interface vlan40
switch(config-if-vlan)# ip address 40.0.0.4/24
switch(config-if-vlan)# ip pim-sparse enable
switch(config-if-vlan)# ip pim-sparse datapath-auto-include
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ip pim-sparse vsx-virtual-neighbor

`ip pim-sparse vsx-virtual-neighbor`

```
no ip pim-sparse vsx-virtual-neighbor
```

Description

Once configured, the router processes IGMP/MLD and PIM joins received on this interface regardless of its DR or Prime Neighbor role. The command must be enabled for VSX VXLAN leaf switches for both L2 and L3 extensions. This allows for the interface to be in the same multicast data path state on both the VSX peers.

The **no** form of the command disables the vsx-virtual-neighbor on the interface.

This command is applicable for normal SVI interfaces and L2 VNI mapped SVI interfaces. It is valid for VXLAN-enabled VLANs only and has no effect on non-VXLAN-enabled VLANs.

Examples

```
switch(config)# interface vlan40
switch(config-if-vlan)# ip address 40.0.0.4/24
switch(config-if-vlan)# ip pim-sparse enable
switch(config-if-vlan)# ip pim-sparse vsx-virtual-neighbor
```

register-source

```
register-source <INTERFACE-NAME>
no register-source <INTERFACE-NAME>
```

Description

Specifies the source interface to be used for PIM registration in the case of VXLAN anycast interfaces. When the PIM enabled anycast VLAN is directly connected to a multicast source, **register-source** is used to send registration messages to the RP and this interface receives the register-stop messages from the RP.

The **no** form of this command removes the register source configuration.

Parameter	Description
<INTERFACE-NAME>	Specifies the name of the interface to use.

Usage

- This is a global configuration under router-pim configuration and is required in Symmetric IRB with anycast IP address configuration.
- This configuration is required in the source connected switch only when the PIM-DR and RP are in two different switches.
- Without this configuration, there will be traffic loss as the registration sequence will not be successful. It is mandatory to have this source interface configured with a non-anycast IP address which is unique to the VTEP, and with PIM enabled.

Examples

Configuring the source interface for PIM registrations:

```
switch# config
switch(config)# router pim vrf vrf1
switch(config-pim)# register-source loopback1
```

Removing the **register-source** configuration:

```
switch(config-pim)# no register-source loopback1
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

show ip mroute

```
show ip mroute [all-vrfs | vrf <VRF-NAME>] [vsx-peer]
```

Description

Shows multicast routing information. Optionally, you can show specific information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`all-vrfs`	Shows all PIM neighbors information.
`vrf <VRF-NAME>`	Shows PIM neighbor information for a specific VRF.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Multicast route with L3VNI in Incoming Interface List:

```
switch# show ip mroute all-vrfs
IP Multicast Route Entries

VRF : red
Total number of entries : 1

Group Address            : 225.1.1.1
Source Address           : 80.1.1.11

show ip pim neighbor

```
show ip pim neighbor [<IP-ADDR>] [all-vrfs | vrf <VRF-NAME>]
show ip pim neighbor [<BRIEF>] [all-vrfs | vrf <VRF-NAME>]
```

Description

Displays the information about PIM interfaces currently configured in the router for the given VRF. If VRF is not given, it displays for default VRF.

Parameter	Description
<IP-ADDR>	Shows PIM neighbor information.
<BRIEF>	Shows brief PIM neighbor information.
`all-vrfs`	Shows all PIM neighbors information
`vrf` *<VRF-NAME>*	Shows PIM neighbor information for a specific VRF.

Examples

Show information for all VRFs:

```
switch# show ip pim neighbor all-vrfs

PIM Neighbor

VRF                          : Test_1
Total number of neighbors : 2

IP Address                   : 100.1.1.252
Interface                    : vlan100
Up Time (HH:MM:SS)           : 00:44:38
Expire Time (HH:MM:SS)       : 00:01:32
DR Priority                  : 1
Hold Time (HH:MM:SS)         : 00:01:45

IP Address                   : 172.1.1.1
Interface                    : vni1000
Up Time (HH:MM:SS)           : 00:44:35
Expire Time (HH:MM:SS)       : 00:03:25
DR Priority                  : 1
Hold Time (HH:MM:SS)         : 00:03:30
```

PIM supports both IPv4 and IPv6 as underlay VTEP IP addresses. In deployments with an IPv6 underlay, PIM forms an auto-generated link-local address to exchange control packets and forms a PIM neighborship over an L3VNI interface with other VTEPs. The auto generated IP will be a link local IP in case of overlay IPv6.

The following example displays L3VNI neighbors for an IPv6 underlay tunnel with an IPv4 overlay.

```
switch# show ip pim neighbor all-vrfs
PIM Neighbor
VRF                        : Test_1
Total number of neighbors : 1
IP Address                 : 169.254.125.33
Interface                  : vni1000
Up Time (HH:MM:SS)         : 00:44:35
Expire Time (HH:MM:SS)     : 00:03:25
DR Priority                : 1
Hold Time (HH:MM:SS)       : 00:03:30
```

In deployments with an IPv4 overlay, multicast route entries with an incoming L3VNI interface will have a neighbor ip address that is an auto-generated IPv4 address derived from the underlay V6 tunnel address,

```
switch# show ip mroute 230.1.1.1 vrf Test_1 detail
IP Multicast Route Entries
VRF : Test_1
Total number of entries : 1
Group Address                 : 230.1.1.1
Source Address                : 40.40.1.100
Neighbor                      : 169.254.125.33
Incoming interface            : vni1000
Unicast Routing Protocol      : BGP
Metric                        : 0
Metric  Pref                  : 200
Uptime (HH:MM:SS)             : 00:01:45
Downstream Interface
Interface       State
-----------     ----------
vlan20          forwarding
```

Show **brief** information for PIM neighbor:

```
switch# show ip pim neighbor brief

----------------------------------------------------------------------------------

show ipv6 mroute

```
show ipv6 mroute [all-vrfs | vrf <VRF-NAME>] [vsx-peer]
```

Description

Shows multicast routing information. Optionally, you can show specific information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`all-vrfs`	Shows all PIM neighbors information.
`vrf <VRF-NAME>`	Shows PIM neighbor information for a specific VRF.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing multicast route with L3VNI in Incoming Interface List:

show ipv6 pim6 interface vlan

```
show ipv6 pim6 interface vlan <vlan name>
```

Description

Displays the IPV6 information about PIM6 interfaces currently configured in the router for the given VLAN. If VLAN is not given, it displays for default VLAN.

Parameter	Description
`vlan <vlan name>`	Specifies the vlan.

Examples

Showing the IPV6 information about PIM6 interfaces currently configured in the router for VLAN 301:

```
switch(config)# show ipv6 pim6 interface vlan301
Interface                     : vlan301
Neighbor count                : 1
IPv6 Address                  : fe80::5480:2881:2dfc:b200/64
Mode                          : sparse
Designated Router             : fe80::5480:2881:2dfc:b200
Proxy DR                      : false

show ipv6 pim6 neighbor

`show ipv6 pim6 neighbor [<IP-ADDR>] [all-vrfs | vrf <VRF-NAME>]`

Description

Displays the information about PIM interfaces currently configured in the router for the given VRF. If VRF is not given, it displays for default VRF.

The overlay IPv6 address of the LRVNI is an autogenerated link local IP that is derived by PIM using the VXLAN source IP.

Parameter	Description
<IP-ADDR>	Shows PIM neighbor information.
`all-vrfs`	Shows all PIM neighbors information
`vrf` *<VRF-NAME>*	Shows PIM neighbor information for a specific VRF.

Examples

Show information for all VRFs:

```
switch# show ipv6 pim6 neighbor all-vrfs

PIM Neighbor

VRF                        : red
Total number of neighbors  : 2

IPv6 Address               : fe80::5:5:5:5
Interface                  : vni10000
Up Time (HH:MM:SS)         : 06:57:307
Expire Time (HH:MM:SS)     : 00:03:26
DR Priority                : 1
Hold Time (HH:MM:SS)       : 00:03:30

IPv6 Address               : fe80::3281:c780:a5c:18c0
Interface                  : vlan10
Up Time (HH:MM:SS)         : 00:01:46
Expire Time (HH:MM:SS)     : 00:01:29
DR Priority                : 1
Hold Time (HH:MM:SS)       : 00:01:45
Secondary IP Addresses     : 100:100::3
```

PIM supports both IPv4 and IPv6 as underlay VTEP IP addresses. If the outgoing interface is a L3VNI, the forwarded VTEP IP address will be displayed as the actual IPv6 underlay tunnel source IP address.

```
switch# show ipv6 mroute 230.1.1.1 vrf Test_1 detail
IP Multicast Route Entries
VRF : Test_1
Total number of entries : 1
Group Address                    : 230.1.1.1
Source Address                   : 40.40.1.100
Neighbor                         : 100.100.1.1
Incoming interface               : 1/1/6
Multicast Routing Protocol       : PIM-SM
Unicast Routing Protocol         : BGP
Metric                           : 0
Metric  Pref                     : 20
Uptime (HH:MM:SS)                : 00:02:06
Downstream Interface
```

```
Interface        State          Vteps
-----------      ----------     -----
vni1000          forwarding     5::5
```

The following example displays L3VNI neighbors for an underlay IPv6 tunnel with an IPv6 overlay

```
switch# show ipv6 pim6 neighbor all-vrfs
PIM Neighbor
VRF                        : Test_1
Total number of neighbors : 1
IP Address                 : fe80::165:72:119
Interface                  : vni1000
Up Time (HH:MM:SS)         : 00:40:38
Expire Time (HH:MM:SS)     : 00:01:32
DR Priority                : 1
Hold Time (HH:MM:SS)       : 00:01:45
```

In deployments with an IPv6 overlay, multicast route entries with an incoming L3VNI interface will have a neighbor IP that is an auto-generated IPv6 address derived from the IPv6 underlay tunnel. This example displays multicast routes for an IPv6 underlay tunnel with an IPV6 overlay.

```
switch# show ipv6 mroute ff55::1 vrf Test_1 detail
IP Multicast Route Entries
VRF : Test_1
Total number of entries : 1
Group Address                   : ff55::1
Source Address                  : 40:40::100
Neighbor                        : fe80::165:72:119
Incoming interface              : vni1000
Unicast Routing Protocol        : BGP
Metric                          : 0
Metric  Pref                    : 200
Uptime (HH:MM:SS)               : 00:01:45
Downstream Interface
Interface        State
-----------      ----------
vlan20           forwarding
```

If the outgoing interface is L3VNI, the forwarded VTEP IP address will be displayed as the actual underlay IPv6 tunnel source IP.

```
switch# show ipv6 mroute ff55::1 vrf Test_1 detail
IP Multicast Route Entries
VRF : Test_1
Total number of entries : 1
Source Address                  : 40:40::100
Neighbor                        : fe80::f860:f001:4057:6900
Incoming interface              : 1/1/6
Multicast Routing Protocol      : PIM-SM
Unicast Routing Protocol        : BGP
Metric                          : 0
Metric  Pref                    : 20
Uptime (HH:MM:SS)               : 00:02:06
Downstream Interface
Interface        State          Vteps
-----------      ----------     -----
```

```
vni1000         forwarding     5::5
Group Address                 : ff55::1
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Multicast VXLAN Multi-fabric commands

For a complete list of Multicast VXLAN commands, refer to Multicast VXLAN commands.

show ip mroute detail

```
show ip mroute <GROUP ADDRESS> <SOURCE ADDRESS> [all-vrfs | vrf <VRF-NAME>] detail
```

Description

Shows multicast routing information from a border router where traffic from a local site is forwarded to a remote site. Optionally, you can show specific information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`all-vrfs`	Shows all PIM neighbors information.
`vrf <VRF-NAME>`	Shows PIM neighbor information for a specific VRF.

Usage

The Intra-Inter Forwarded VTEP(s) tunnel field denotes which tunnel the traffic is routed to. This includes the intra or inter VTEPs based on where the joins are seen. If there is more than one site where the traffic needs to be forwarded, the corresponding site's VTEPs are listed. The Intra-Inter Forwarded VTEP(s) field is only visible at the Border router.

There are no outgoing interfaces listed in these Mroutes as they are routing withing the same L3VNI logical interface. If there are any local receivers at the border routers that are extended via L2/L3 extensions, then the same Mroute is updated with the outgoing list.

Examples

Multicast route where the border is routing from one VTEP to another VTEP. In this case, VTEP 1.1.1.1 to 3.3.3.3 in L3VNI:

```
switch# show ip mroute 225.0.0.1 100.100.1.4 all-vrfs detail
IP Multicast Route Entries

VRF : red

Group Address                  : 225.0.0.1
Source Address                 : 100.100.1.4
Neighbor                       : 1.1.1.1
Incoming interface             : vni10000
Intra-Inter Forwarded VTEP(s) : 3.3.3.3
Multicast Routing Protocol     : PIM-SM
Unicast Routing Protocol       : BGP
Metric                         : 0
Metric Pref                    : 200
Uptime (HH:MM:SS)              : 00:00:51
```

Multicast route where the border is routing from one VTEP to another VTEP in addition to an L3 interface:

```
switch# show ip mroute 225.0.0.1 100.100.1.4 all-vrfs detail
IP Multicast Route Entries

VRF : red

Group Address                  : 225.0.0.1
Source Address                 : 100.100.1.4
Neighbor                       : 1.1.1.1
Incoming interface             : vni10000
Intra-Inter Forwarded VTEP(s) : 3.3.3.3
Multicast Routing Protocol     : PIM-SM
Unicast Routing Protocol       : BGP
Metric                         : 0
Metric Pref                    : 200
Uptime (HH:MM:SS)              : 00:00:51

Outgoing Interface List
Interface       State
----------------------------
vlan1675        forwarding
```

Multicast route where the output is at the source connected leaf router. In this case, traffic ingresses on SVI10 and is routed to VTEP 2.2.2.2:

```
switch# show ip mroute 225.0.0.1 100.100.1.4 all-vrfs detail
IP Multicast Route Entries

VRF : red

Group Address                  : 225.0.0.1
Source Address                 : 100.100.1.4
Neighbor                       :
Incoming interface             : vlan10
Multicast Routing Protocol     : PIM-SM
```

```
Unicast Routing Protocol      : connected
Metric                        : 1
Metric Pref                   : 1
Uptime (HH:MM:SS)             : 00:00:56

Outgoing Interface List
Interface       State          Vteps
----------------------------------------
vni10000        forwarding     2.2.2.2
```

Multicast route where there is mixed L2-L3 VNI routing. In this case, traffic ingressed from VTEP 1.1.1.1 on L3VNI is routed to SVI 4007(L2VNI):

```
switch# show ip mroute 225.0.0.1 100.100.1.4 all-vrfs detail
IP Multicast Route Entries

VRF : red

Group Address                 : 225.0.0.1
Source Address                : 100.100.1.4
Neighbor                      : 1.1.1.1
Incoming interface            : vni10000
Intra-Inter Forwarded VTEP(s) :
Multicast Routing Protocol    : PIM-SM
Unicast Routing Protocol      : BGP
Metric                        : 0
Metric Pref                   : 200
Uptime (HH:MM:SS)             : 00:00:51

Outgoing Interface List
Interface       State

ip multicast multi-fabric border

```
ip multicast multi-fabric border
no ip multicast multi-fabric border
```

Description

Enables PIM's border router functionality. This command must be enabled on the border router when iBGP-eBGP is not used.

The **no** form of the command disables forwarding of multicast data on the interface.

This configuration is global and is applicable to all host's VRFs configured in that router.

Examples

Configuring **ip multicast multi-fabric border** command:

```
switch# configure terminal
switch(config)#
switch(config)# ip multicast multi-fabric border <cr>
switch(config)# no ip multicast multi-fabric border <cr>
switch(config)#
switch(config)# ipv6 multicast multi-fabric border <cr>
switch(config)# no ipv6 multicast multi-fabric border <cr>
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ip multicast multi-fabric identifier

```
ip multicast multi-fabric identifier-value <IDENTIFIER VALUE> <cr>
no ip multicast multi-fabric <IDENTIFIER-VALUE>
```

Description

Configures multicast fabric identifier (MFID) that uniquely represents the fabric/site to which this leaf router belongs. Shown in the PIM hello option field, this command is used by the border router to associate the neighbor to the fabric MFID. This command is applicable to all the regular leaf routers and not applicable at the shared border router.

The **no** form of the command disables forwarding of multicast data on the interface.

The same MFID value must be configured on all leaf routers belonging to the same fabric. However, the same MFID value cannot be reused between fabrics attached to the same border.

Configuration of an Identifier is optional on the VTEPs. If there is no manually configured Identifier, it will automatically use and announce the local AS Number as Identifier.

Parameter	Description
<IDENTIFIER VALUE>	Configures the given value as MFID

Examples

Configuring **ip multicast multi-fabric identifier-value** command:

```
switch(config)#
switch(config)# ip multicast multi-fabric identifier <identifier-value> <cr>
switch(config)# no ip multicast multi-fabric identifier <identifier-value> <cr>
switch(config)#
switch(config)# ipv6 multicast multi-fabric identifier <identifier-value> <cr>
switch(config)# no ipv6 multicast multi-fabric identifier <identifier-value> <cr>
```

Configuring MFID value of 1001 on two VTEPs using the same fabric:

```
On VTEP1:
vtep1(config)#
vtep1(config)# ip multicast multi-fabric identifier 1001 <cr>
```

```
On VTEP2:
vtep2(config)#
vtep2(config)# ip multicast multi-fabric identifier 1001 <cr>
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Chapter 90

Multicast datapath commands for IPv4

show ip multicast bridging datapath

```
show ip multicast bridging datapath {group <GROUP-IP> {source <SOURCE-IP>
{vlan <VLAN-ID>}}}[vrf <VRF_NAME>] [vsx-peer]
```

Description

Displays the multicast bridge control forwarding entries on a device including replication details and hardware programming status. Displays bridging datapath details for the specified multicast flow (the group, source, VLAN, and VRF).

Parameter	Description
`group <GROUP-IP>`	Specifies a group IP address in IPv4 format (x.x.x.x), where x is a decimal number from 0 to 255. Shows bridging datapath details for the specified group.
`source <SOURCE-IP>`	Specifies a source IP address in IPv4 format (x.x.x.x), where x is a decimal number from 0 to 255. Shows bridging datapath details for the specified source.
`vlan <VLAN-ID>`	Specifies a VLAN. Values: 1-4094. Shows bridging datapath details for the specified VLAN.
`vrf <VRF-NAME>`	Specifies a VRF. Shows datapath information for groups joined in the specified VRF. If the ***<VRF-NAME>*** is not specified, it shows the default VRF information.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Usage

A multicast bridge control forwarding table comprises of the IP multicast destination address, source address and its association with a list of ports on which the multicast packets are replicated in a Layer 2 domain. The switch floods/ replicates the multicast packet on these ports by matching the multicast destination address, source address, and the virtual local network identifier (VLAN ID). The **show ip multicast bridging datapath** command displays the multicast bridge control forwarding entries on a device including replication details and hardware programming status.

Examples

Showing detailed bridging datapath information for the specified multicast flow:

```
switch# show ip multicast bridging datapath group 232.1.1.10 source 100.100.1.10
vlan 10
Multicast Bridging Datapath Details
VRF                           : default
Source                        : 100.100.1.10/32
Group                         : 232.1.1.10/32
Replication Group Index       : 70
Hardware Status               : active
Error Code                    : None
Retries for programming       : 0
Vlan                          : VLAN10
State                         : forwarding

VNI                           : vni1000
State                         : operational
Replication Details:
Tunnel Endpoints     State
----------------     ----------
2.2.2.2              operational
4.4.4.4              operational
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.09.1000	Command introduced.

show ip multicast routing datapath

```
show ip multicast routing datapath {group <GROUP-IP> {source <SOURCE-IP>
{port <INCOMING-PORT>}}}[vrf <VRF_NAME>] [vsx-peer]
```

Description

Displays the multicast Layer 3 forwarding entries with replication details and hardware programming status. Displays routing datapath details for the specified multicast flow (group, source, incoming port, and VRF).

Parameter	Description
`group <GROUP-IP>`	Specifies a group IP address in IPv4 format (x.x.x.x), where x is a

Parameter	Description
	decimal number from 0 to 255. Shows datapath details for the specified group.
`source <SOURCE-IP>`	Specifies a source IP address in IPv4 format (x.x.x.x), where x is a decimal number from 0 to 255. Shows datapath details for the specified source.
`port <INCOMING-PORT>`	Specifies the incoming port. Shows datapath details for the specified port.
`vrf <VRF-NAME>`	Specifies a VRF. Shows datapath information for the specified VRF. If the ***<VRF-NAME>*** is not specified, it shows the default VRF information.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Usage

A multicast routing protocol such as PIM populates the multicast Layer 3 forwarding table and forwards multicast traffic to clients throughout the network. A multicast forwarding table comprises of the IP multicast destination address, source address, interface on which the traffic is received, and the list of interfaces on which multicast traffic is replicated. The **show ip multicast routing datapath** command displays the multicast Layer 3 forwarding entries with replication details and hardware programming status.

Examples

Showing detailed routing datapath information for the specified multicast flow:

```
switch# show ip multicast routing datapath group 225.20.0.1 source 20.0.0.2 port
vlan20

Chapter 91

Multicast datapath commands for IPv6

show ipv6 multicast bridging datapath

```
show ipv6 multicast bridging datapath {group <GROUP-IP> {source <SOURCE-IP>
{vlan <VLAN-ID>}}}[vrf <VRF_NAME>]]]] [vsx-peer]
```

Description

Displays the multicast bridge control forwarding entries on a device including replication details and hardware programming status. Displays bridging datapath details for the specified multicast flow (the group, source, VLAN, and VRF).

Parameter	Description
`group <GROUP-IP>`	Specifies a group IP address in IPv6 format (xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx), where x is a hexadecimal number from 0 to F. Shows bridging datapath details for the specified group.
`source <SOURCE-IP>`	Specifies a source IP address in IPv6 format (xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx), where x is a hexadecimal number from 0 to F. Shows bridging datapath details for the specified source.
`vlan <VLAN-ID>`	Specifies a VLAN. Range 1 to 4094. Shows bridging datapath details for groups joined in the specified VLAN.
`vrf <VRF-NAME>`	Specifies a VRF. Shows bridging datapath information for groups joined in the specified VRF. If the ***<VRF-NAME>*** is not specified, it shows the default VRF information.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Usage

A multicast bridge control forwarding table comprises of the IP multicast destination address, source address and its association with a list of ports on which the multicast packets are replicated in a Layer 2 domain. The switch floods/ replicates the multicast packet on these ports by matching the multicast destination address, source address, and the virtual local network identifier (VLAN ID). The **show ipv6 multicast bridging datapath** command displays the multicast bridge control forwarding entries on a device including replication details and hardware programming status.

Examples

Showing detailed bridging datapath information for the specified multicast flow:

```
switch# show ipv6 multicast bridging datapath group ff03::0 source 1010:22::4 vlan
10
Multicast Bridging Datapath Details
VRF                          : default
Source                       : 1010:22::4/128
Group                        : ff03::/128
Replication Group Index      : 70
Hardware Status              : active
Error Code                   : None
Retries for programming      : 0
Vlan                         : VLAN10
        State                : forwarding
        Replication Details:
        L2 Ports        State
        -----------     ----------
        1/1/6           forwarding
        1/1/7           forwarding
VNI                          : vni1000
        State                : operational
        Replication Details:
        Tunnel Endpoints     State
        ----------------     ----------
        2.2.2.2              operational
        4.4.4.4              operational
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.09.1000	Command introduced.

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show ipv6 multicast routing datapath

```
show ipv6 multicast routing datapath {group <GROUP-IP> {source <SOURCE-IP>
{port <INCOMING-PORT>}}} [vrf <VRF_NAME>] [vsx-peer]
```

Description

Displays the multicast Layer 3 forwarding entries with replication details and hardware programming status. Displays routing datapath details for the specified multicast flow (group, source, incoming port, and VRF).

Parameter	Description
`group <GROUP-IP>`	Specifies a group IP address in IPv6 format (xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx), where x is a hexadecimal number from 0 to F. Shows datapath details for the specified group.
`source <SOURCE-IP>`	Specifies a source IP address in IPv6 format (xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx), where x is a hexadecimal number from 0 to F. Shows datapath details for the specified source.
`port <INCOMING-PORT>`	Specifies the incoming port. Shows datapath details for the specified port.
`vrf <VRF-NAME>`	Specifies a VRF. Shows datapath information for groups joined in the specified VRF. If the ***<VRF-NAME>*** is not specified, it shows the default VRF information.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Usage

A multicast routing protocol such as PIM populates the multicast Layer 3 forwarding table and forwards multicast traffic to clients throughout the network. A multicast forwarding table comprises of the IP multicast destination address, source address, interface on which the traffic is received, and the list of interfaces on which multicast traffic is replicated. The **show ipv6 multicast routing datapath** command displays the multicast Layer 3 forwarding entries with replication details and hardware programming status.

Examples

Showing detailed routing datapath information for the specified multicast flow:

```
switch# show ip multicast routing datapath group 225.20.0.1 source 20.0.0.2 port
vlan20
Multicast Routing Datapath Details
VRF                           : default
Source                        : 20.0.0.2/32

Chapter 92

Static Route commands

ip multicast-static-route

ip multicast-static-route *<INCOMING-INTERFACE-NAME>* {*<SOURCE-ADDRESS* | *ANY>*} *<GROUP-ADDRESS>* [*<OUTGOING-INTERFACE-NAME>*] vrf *<VRF-NAME>*
no ip multicast-static-route *<INCOMING-INTERFACE-NAME>* {*<SOURCE-ADDRESS* | *ANY>*} *<GROUP-ADDRESS>* [*<OUTGOING-INTERFACE-NAME>*] vrf *<VRF-NAME>*

Description

Configures a multicast static route for (source, group) on an incoming interface with outgoing interface (s) not involving L3VNI. If a vrf is not specified, default vrf is used.

The **no** form of this command removes the configuration.

Parameter	Description
<INCOMING-INTERFACE-NAME>	Specifies the multicast stream incoming interface name.
<SOURCE-ADDRESS>	Selects the IPv4 source address.
<ANY>	Selects any source address.
<GROUP-ADDRESS>	Specifies the IPv4 multicast group address.
<OUTGOING-INTERFACE-NAME>	Specifies the outgoing interface name.
vrf *<VRF-NAME>*	Configures the specified VRF. The default is default vrf.

Usage

If the incoming interface is attached to different vrf than the vrf spcified in the multicast static route command, route will be made inactive. If the vrf mismatch occurs for the outgoing interface, that particular outgoing interface will be made inactive. If no outgoing interface is specified, the multicast traffic is not routed and is bridged on the interface (SVI) on which the traffic is received.

Examples

Configuring Multicast Static Route with a outgoing interface:

```
switch(config)# ip multicast-static-route vlan10 10.10.1.2 239.255.255.250 vlan20
```

Removing the configured Multicast Static Route with a outgoing interface:

```
switch(config)# no ip multicast-static-route vlan10 10.10.1.2 239.255.255.250
vlan20
```

Configuring Multicast Static Route without an outgoing interface to bridge traffic only in incoming interface in default vrf:

```
switch(config)# ip multicast-static-route vlan30 30.30.1.2 239.255.255.250
```

Removing the configured Multicast Static Route without an outgoing interface to bridge traffic only in incoming interface in default vrf:

```
switch(config)# no ip multicast-static-route vlan30 30.30.1.2 239.255.255.250
```

Configuring Multicast Static Route without an outgoing interface to bridge traffic only in incoming interface in non-default vrf:

```
switch(config)# ipv6 multicast-static-route vlan30 30.30.1.2 239.255.255.250 vrf
red
```

Removing the configured Multicast Static Route without an outgoing interface to bridge traffic only in incoming interface in non-default vrf:

```
switch(config)# ipv6 multicast-static-route vlan30 30.30.1.2 239.255.255.250 vrf
red
```

Configuring Multicast Static Route with multiple outgoing interfaces:

```
switch(config)# ip multicast-static-route vlan40 40.40.1.2 239.255.255.250 vlan50
vrf red
switch(config)# ip multicast-static-route vlan40 40.40.1.2 239.255.255.250 vlan60
vrf red
switch(config)# ip multicast-static-route vlan40 40.40.1.2 239.255.255.250 1/1/1
vrf red
```

Removing configured Multicast Static Route with multiple outgoing interfaces:

```
switch(config)# no ip multicast-static-route vlan40 40.40.1.2 239.255.255.250
vlan60 vrf red
switch(config)# no ip multicast-static-route vlan40 40.40.1.2 239.255.255.250 vrf
red
```

Configuring Static (*, Group) Multicast Route with multiple outgoing interfaces:

```
switch(config)# ip multicast-static-route vlan50 any 239.255.255.250 vlan70 vrf
red
switch(config)# ip multicast-static-route vlan50 any 239.255.255.250 vlan80 vrf
red
```

Removing configured Static (*, Group) Multicast Route with multiple outgoing interfaces:

```
switch(config)# no ip multicast-static-route vlan50 any 239.255.255.250 vlan70 vrf
red
switch(config)# no ip multicast-static-route vlan50 any 239.255.255.250 vlan80 vrf
red
```

Command History

ip multicast-static-route (l3vni)

```
ip multicast-static-route <INCOMING-INTERFACE-NAME> {<SOURCE-ADDRESS | ANY>} <GROUP-
ADDRESS>  vrf <VRF-NAME>
ip multicast-static-route <VXLAN1> {<SOURCE-ADDRESS | ANY>} <GROUP-ADDRESS> [<OUTGOING-
INTERFACE-NAME>]vrf <VRF-NAME>
no ip multicast-static-route <INCOMING-INTERFACE-NAME> {<SOURCE-ADDRESS | ANY>} <GROUP-
ADDRESS>  vrf <VRF-NAME>
no ip multicast-static-route {<SOURCE-ADDRESS | ANY>} <GROUP-ADDRESS> [<OUTGOING-
INTERFACE-NAME>]vrf <VRF-NAME>
```

Description

Configures a multicast static route for (source, group) involving L3VNI tunnels. If a vrf is not specified, default vrf is used.

The **no** form of this command removes the configuration.

Parameter	Description
<INCOMING-INTERFACE-NAME>	Specifies the multicast stream incoming interface name.
<SOURCE-ADDRESS>	Selects the IPv4 source address.
<ANY>	Selects any source address.
<GROUP-ADDRESS>	Specifies the IPv4 multicast group address.
<OUTGOING-INTERFACE-NAME>	Specifies the outgoing interface name.
vrf <*VRF-NAME*>	Configures the specified VRF. The default is default vrf.

Usage

If the incoming interface is attached to different vrf than the vrf spcified in the multicast static route command, route will be made inactive. If the vrf mismatch occurs for the outgoing interface, that particular outgoing interface will be made inactive.

Examples

Configuring Multicast Static Route with L2VN1 to SVI:

```
switch(config)# ip multicast-static-route vlan10 10.10.1.2 239.255.255.250 vlan30
```

Removing the configured Multicast Static Route with L2VN1 to SVI:

```
switch(config)# no ip multicast-static-route vlan10 10.10.1.2 239.255.255.250
vlan30
```

Command History

ipv6 multicast-static-route

```
ipvy multicast-static-route <INCOMING-INTERFACE-NAME> {<SOURCE-ADDRESS | ANY>} <GROUP-ADDRESS> [<OUTGOING-INTERFACE-NAME>] vrf <VRF-NAME>
no ipv6 multicast-static-route <INCOMING-INTERFACE-NAME> {<SOURCE-ADDRESS | ANY>} <GROUP-ADDRESS> [<OUTGOING-INTERFACE-NAME>] vrf <VRF-NAME>
```

Description

Configures a multicast static route for (source, group) on an incoming interface with outgoing interface (s) not involving L3VNI. If a vrf is not specified, default vrf is used.

The **no** form of this command removes the configuration.

Parameter	Description
<INCOMING-INTERFACE-NAME>	Specifies the multicast stream incoming interface name.
<SOURCE-ADDRESS>	Selects the IPv6 source address.

Parameter	Description
<ANY>	Selects any source address.
<GROUP-ADDRESS>	Specifies the IPv6 multicast group address.
<OUTGOING-INTERFACE-NAME>	Specifies the outgoing interface name.
vrf *<VRF-NAME>*	Configures the specified VRF. The default is default vrf.

Usage

If the incoming interface is attached to different vrf than the vrf spcified in the multicast static route command, route will be made inactive. If the vrf mismatch occurs for the outgoing interface, that particular outgoing interface will be made inactive.

Examples

Configuring Multicast Static Route with a outgoing interface:

```
switch(config)# ipv6 multicast-static-route vlan10 2001::1 ff02::c vlan20
```

Removing the configured Multicast Static Route with a outgoing interface:

```
switch(config)# no ipv6 multicast-static-route vlan10 2001::1 ff02::c vlan20
```

Configuring Static (*, Group) Multicast Route with multiple outgoing interfaces:

```
switch(config)# ipv6 multicast-static-route vlan50 any ff0e::c vlan70 vrf red
switch(config)# ipv6 multicast-static-route vlan50 any ff0e::c vlan80 vrf red
```

Removing configured Static (*, Group) Multicast Route with multiple outgoing interfaces:

```
switch(config)# no ipv6 multicast-static-route vlan50 any ff0e::c vlan70 vrf red
switch(config)# no ipv6 multicast-static-route vlan50 any ff0e::c vlan80 vrf red
```

redistribute static

```
redistribute static
no redistribute static
```

Description

Exports all static multicast routes configured on a VRF to the corresponding PIM router. The **no** form of this command disables the redistribution.

Usage

Static multicast routes give the flexibility to program a specific path for multicast traffic from the source to the client without having to rely on the underlying protocols to build a multicast route. They can be configured on all the routers in the path or on a specific section of routers. The remaining section of routers can be configured to run the native PIM protocol. In such cases, the static multicast route is exported to PIM domain as PIM joins using this command.

Examples

Configuring redistribute static routes to PIM for IPv4:

```
switch(config)# router pim
switch(config-pim)# redistribute static
```

Disabling redistribute static routes to PIM for IPv4:

```
switch(config)# router pim
switch(config-pim)# no redistribute static
```

Configuring redistribute static routes to PIM for IPv4 on vrf red:

```
switch(config)# router pim vrf red
switch(config-pim)# redistribute static
```

Disabling redistribute static routes to PIM for IPv4 on vrf red:

```
switch(config)# router pim vrf red
switch(config-pim)# no redistribute static
```

Configuring redistribute static routes to PIM for IPv6:

```
switch(config)# router pim6
switch(config-pim)# redistribute static
```

Disabling redistribute static routes to PIM for IPv6:

```
switch(config)# router pim6
switch(config-pim)# no redistribute static
```

Configuring redistribute static routes to PIM for IPv6 on vrf red:

```
switch(config)# router pim6 vrf red
switch(config-pim)# redistribute static
```

Disabling redistribute static routes to PIM for IPv6 on vrf red:

```
switch(config)# router pim6 vrf red
switch(config-pim)# no redistribute static
```

Command History

show capacities multicast static route

```
show capacities multicast-static-route
show capacities-status multicast-static route
```

Description

Displays the maximum number of IPv4 and IPv6 static multicast routes that can be configured on the devices.

Examples

Displaying the maximum number of multicast static routes configured on the device:

```
switch# show capacities static-multicast-route
System Capacities: Filter Static Multicast Route
Capacities Name                                                           Value
----------------------------------------------------------------------------------
---
Maximum number of IPv4/IPv6 Static multicast nexthops supported           65536
Maximum number of IPv4/IPv6 Static multicast routes supported             4096
Maximum number of IPv4/IPv6 Summarized static multicast routes supported  1024

switch# show capacities-status static-multicast-route
System Capacities Status: Filter Static Multicast Route
Capacities Status Name                                 Value    Maximum
----------------------------------------------------------------------------------
---
Number of IPv4/IPv6 Static multicast nexthops           10      65536
Number of IPv4/IPv6 Static multicast routes             33      4096
Number of IPv4/IPv6 Summarized static multicast routes  6       1024
```

show ip multicast-static-route

`show ip multicst-static-route [all vrfs | vrf <VRF-NAME>]`

Description

Displays the multicast static route and corresponding summarized route information for the specified VRF. If VRF is not specified, the default VRF is displayed.

Parameter	Description
[all vrfs]	Selects all VRFs to display.
[vrf *<VRF-NAME>*]	Specifies the VRF to display. The default is default vrf.

Examples

Displaying the multicast static route and corresponding summarized route information for all vrfs:

```
switch# show ip multicast-static-route all-vrfs
VRF : red
```

```
Group Address                  : 239.255.255.250
Source Address                 : 40.40.40.2
Route type                     : Static
Incoming interface             : 1/1/2
Outgoing Interface List        :
Interface      State
---------      -----
vlan10         forwarding

VRF : blue

Group Address                  : 239.255.255.250
Source Address                 : Any
Route type                     : Static-Summarized
Incoming interface             : 1/1/3
Outgoing Interface List        :

show ip multicast-static-route detail

```
show ip multicst-static-route <GROUP-ADDRESS> {<SOURCE-ADDRESS | ANY>} detail [all vrfs |
vrf <VRF-NAME>]
```

Description

Displays the multicast static route and corresponding summarized route information for the given group address in the given VRF detail. If VRF is not specified, the default VRF is displayed.

Parameter	Description
<GROUP-ADDRESS>	Specifies the group address.
<SOURCE-ADDRESS>	Specifies the source address.
<ANY>	Selects any source address.

Parameter	Description
[all vrfs]	Selects all VRFs to display.
[vrf <*VRF-NAME*>]	Specifies the VRF to display. The default is default vrf.

Examples

Displaying the multicast static route information for a specific group:

```
switch# show ip multicast-static-route 239.255.255.250 40.40.40.3 detail vrf red

VRF : red

Group Address                 : 239.255.255.250
Source Address                : 40.40.40.2
Route type                    : Static
Incoming interface            : 1/1/2
Outgoing Interface List       :
Interface      State        Vteps
---------      -----        -----
vni1000        forwarding   2.2.2.2, 3.3.3.3
```

Displaying the multicast static route information for any group on vrf red:

```
switch# show ip multicast-static-route 239.255.255.250 any detail vrf red
VRF : red

Group Address                 : 239.255.255.250
Source Address                : Any
Route type                    : Static
Incoming interface            : 1/1/2
Outgoing Interface List       :

Interface      State        Vteps
---------      -----        -----
vni1000        forwarding   2.2.2.2, 3.3.3.3
```

show ip multicast-static-route (group)

```
show ip multicast-static-route <GROUP-ADDRESS> {<SOURCE-ADDRESS | ANY>} [all vrfs | vrf
<VRF-NAME>]
```

Description

Displays the multicast static route and corresponding summarized route information for the given group address in the given VRF briefly. If VRF is not specified, the default VRF is displayed.

Parameter	Description
<GROUP-ADDRESS>	Specifies the group address.
<SOURCE-ADDRESS>	Specifies the source address.
<ANY>	Selects any source address.
[all vrfs]	Selects all VRFs to display.
[vrf *<VRF-NAME>*]	Specifies the VRF to display. The default is default vrf.

Examples

Displaying the multicast static route information for all vrfs:

```
switch# show ip multicast-static-route 239.255.255.250 all-vrfs

VRF : red

Group Address                  : 239.255.255.250
Source Address                 : 40.40.40.2
Route type                     : Static
Incoming interface             : 1/1/2
Outgoing Interface List        :
Interface      State
---------      -----
vlan10         forwarding

VRF : blue

Group Address                  : 239.255.255.250
Source Address                 : Any
Route type                     : Static-summarized
Incoming interface             : 1/1/3
Outgoing Interface List        :
Interface      State
---------      -----
vlan20         forwarding
vlan30         forwarding
```

Displaying the multicast static route information for a specific group on vrf red:

```
switch# show ip multicast-static-route 239.255.255.250 40.40.40.4 vrf red
VRF : red

Group Address                  : 239.255.255.250
Source Address                 : Any
Route type                     : Static
Incoming interface             : 1/1/2
```

```
Outgoing Interface List       :
Interface      State
---------      -----
vlan10         forwarding
```

Displaying the multicast static route information for a specific group and source :

```
switch# show ip multicast-static-route 239.255.255.250 40.40.40.2 all-vrfs
VRF : red

Group Address                 : 239.255.255.250
Source Address                : 40.40.40.2
Route type                    : Static
Incoming interface            : 1/1/2
Outgoing Interface List       :
Interface      State
---------      -----
vlan10         forwarding

VRF : blue

Group Address                 : 239.255.255.250
Source Address                : 40.40.40.2
Route type                    : Static
Incoming interface            : vlan40
Outgoing Interface List       :
Interface      State
---------      -----
vlan20         forwarding
vlan30         forwarding
```

Displaying the multicast static route information for a specific group and any source :

```
switch# show ip multicast-static-route 239.255.255.250 any all-vrfs
VRF : red

Group Address                 : 239.255.255.250
Source Address                : Any
Route type                    : Static-summarized
Incoming interface            : 1/1/2
Outgoing Interface List       :
Interface      State
---------      -----
vlan10         forwarding

VRF : blue

Group Address                 : 239.255.255.250
Source Address                : Any
Route type                    : Static-summarized
Incoming interface            : vlan40
Outgoing Interface List       :
Interface      State
---------      -----
vlan20         forwarding
vlan30         forwarding
```

show ipv6 multicast-static-route

`show ipv6 multicast-static-route [all vrfs | vrf <VRF-NAME>]`

Description

Displays the multicast static route and corresponding summarized route information for the specified VRF. If VRF is not specified, the default VRF is displayed.

Parameter	Description
[all vrfs]	Selects all VRFs to display.
[vrf <*VRF-NAME*>]	Specifies the VRF to display. The default is default vrf.

Examples

Displaying the multicast static route and corresponding summarized route information for all vrfs:

```
switch# show ipv6 multicast-static-route all-vrfs

VRF : red

Group Address                 : ff0e::c
Source Address                : 2001::2
Route type                    : Static
Incoming interface            : vlan200
Outgoing Interface List       :
Interface      State
---------      -----
vlan10         forwarding

VRF : blue

Group Address                 : ff0e::c
Source Address                : Any
Route type                    : Static-Summarized
Incoming interface            : vlan200
Outgoing Interface List       :
Interface      State
---------      ----------
vlan10        forwarding
```

Displaying the multicast static route information for a specific group:

```
switch# show ipv6 multicast-static-route ff0e::c all-vrfs

VRF : red

Group Address                 : ff0e::c
Source Address                : 2001::2
Route type                    : Static
Incoming interface            : vlan200
Outgoing Interface List       :
Interface      State
---------      -----
vlan10         forwarding

VRF : blue

Group Address                 : ff0e::c
Source Address                : Any
Route type                    : Static-Summarized
Incoming interface            : vlan200
Outgoing Interface List       :
Interface      State
---------      ----------
vlan10         forwarding
```

Displaying the multicast static route information for a specific group and source:

```
switch# show ipv6 multicast-static-route ff0e::c 2001::2 all-vrfs

VRF : red

Group Address                 : ff0e::c
Source Address                : 2001::2
Route type                    : Static
Incoming interface            : vlan100
Outgoing Interface List       :
Interface      State
---------      -----
vlan10         forwarding

VRF : blue

Group Address                 : ff0e::c
Source Address                : 200::2
Route type                    : Static
Incoming interface            : vlan200
Outgoing Interface List       :
Interface      State
---------      ----------
vlan10         forwarding
```

Displaying the multicast static route information for a specific group and any source:

```
switch# show ipv6 multicast-static-route ff0e::c any all-vrfs

VRF : red

Group Address                 : ff0e::c
Source Address                : Any
Route type                    : Static-summarized
```

```
Incoming interface              : 1/1/3
Outgoing Interface List         :
Interface      State
---------      -----
vlan10         forwarding

VRF : blue

Group Address                   : ff0e::c
Source Address                  : Any
Route type                      : Static-summarized
Incoming interface              : vlan200
Outgoing Interface List         :
Interface      State
---------      ----------
vlan10         forwarding
```

show ipv6 multicast-static-route (group)

```
show ipv6 multicst-static-route <GROUP-ADDRESS> {<SOURCE-ADDRESS> | ANY>} [all vrfs | vrf
<VRF-NAME>]
```

Description

Displays the multicast static route and corresponding summarized route information for the given group address in the given VRF briefly. If VRF is not specified, the default VRF is displayed.

Parameter	Description
<GROUP-ADDRESS>	Specifies the group address.
<SOURCE-ADDRESS>	Specifies the source address.
<ANY>	Selects any source address.
[all vrfs]	Selects all VRFs to display.
[vrf *<VRF-NAME>*]	Specifies the VRF to display. The default is default vrf.

Examples

Displaying the multicast static route information for a specific group:

```
switch# show ipv6 multicast-static-route ff0e::c 2002::2 vrf red

VRF : red

Group Address                  : ff0e::c
Source Address                 : 2002::2
Route type                     : Static
Incoming interface             : 1/1/2
Outgoing Interface List        :
Interface      State
---------      -----
vlan10         forwarding
```

show ipv6 multicast-static-route detail

`show ipv6 multicast-static-route <GROUP-ADDRESS> {<SOURCE-ADDRESS | ANY>} detail [all vrfs | vrf <VRF-NAME>]`

Description

Displays the multicast static route and corresponding summarized route information for the given group address in the given VRF detail. If VRF is not specified, the default VRF is displayed.

Parameter	Description
<GROUP-ADDRESS>	Specifies the group address.
<SOURCE-ADDRESS>	Specifies the source address.
<ANY>	Selects any source address.
[all vrfs]	Selects all VRFs to display.
[vrf <*VRF-NAME*>]	Specifies the VRF to display. The default is default vrf.

Examples

Displaying the multicast static route information for a specific group:

```
switch# show ipv6 multicast-static-route ff0e::c 2002::2 detail vrf red
VRF : red

Group Address                  : ff0e::c
Source Address                 : 2002:2
Route type                     : Static
Incoming interface             : 1/1/2
Outgoing Interface List        :
Interface       State         Vteps
---------       -----         -----
vni1000         forwarding    2.2.2.2, 3.3.3.3
```

Displaying the multicast static route information for any group on vrf red:

```
switch# show ipv6 multicast-static-route ff0e::c any detail vrf red
VRF : red

Group Address                  : ff0e::c
Source Address                 : Any
Route type                     : Static
Incoming interface             : 1/1/2
Outgoing Interface List        :
Interface       State         Vteps
---------       -----         -----
vni1000         forwarding    2.2.2.2, 3.3.3.3
```

Chapter 93
MVRP commands

clear mvrp statistics

```
clear mvrp statistics [<PORT-NUM> | <PORT-LIST> | LAG <LAG-NUM>]
```

Description

Resets the MVRP statistic counters globally or for the specified ports or LAG.

Parameter	Description
<PORT-NUM>	Specifies a port number.
<PORT-LIST>	Specifies a list of ports.
LAG *<LAG-NUM>*	Specifies a Link Aggregation number. Range: 1 to 128.

Examples

On the 6400 Switch Series, interface identification differs.

```
switch# clear mvrp statistics 1/1/1
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	Manager (#)	Administrators or local user group members with execution rights for this command.

mvrp

```
mvrp
no mvrp
```

Description

Enables the MVRP feature globally or on a specific interface. By default, MVRP is disabled.

The **no** form of this command disables MVRP.

MVRP and VLAN translation cannot be enabled on the same interface.

Examples

On the 6400 Switch Series, interface identification differs.

Enabling MVRP globally:

```
switch(config)# mvrp
```

Enabling MVRP on an interface:

```
switch(config)# interface 1/1/1
switch(config-if)# mvrp
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

mvrp registration

```
mvrp registration {normal | fixed | forbidden [<VLAN-LIST>]}
no mvrp registration forbidden {<VLAN-LIST>}
```

Description

Configures the MVRP registrar state which determines how an MVRP participant responds to MRP messages. The default registration mode is normal.

The `no` command removes the specified VLANs from the forbidden list.

Parameter	Description
`normal`	Enables dynamic registration and deregistration of VLANs on the interface, and propagates VLAN information to other switches on the network. Default.
`fixed`	Disables dynamic deregistration of VLANs and drops received MVRP frames. The interface does not deregister dynamic VLANs or register new dynamic VLANs.
`forbidden`	Disables dynamic registration of VLANs and drops received MVRP frames. The MVRP participant does not register new dynamic VLANs or re-register a deregistered dynamic VLAN.
`<VLAN-LIST>`	Disables dynamic registration of VLANs and drops received MVRP frames for specific VLANs only. Normal behavior applies to all other VLANs. Specify the number of a single VLAN, or a series of numbers for a range of VLANs, separated by commas (1, 2, 3, 4), dashes (1-4), or both (1-4,6).

Examples

```
switch(config)# switch(config-if)# mvrp registration forbidden 10
```

```
switch(config-if)# mvrp registration fixed
```

```
switch(config-if)# mvrp registration forbidden 1,2,10-20
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

mvrp timer

```
mvrp timer {join | leave | leaveall | periodic} <TIME>
no mvrp timer {join | leave | leaveall | periodic}
```

Description

Sets an MVRP timer.

The **no** form of this command sets the specified timer to its default value.

Parameter	Description
`join <TIME>`	Sets the join timer. You can use the timer to space MVRP join messages. To ensure that join messages are transmitted to other participants, an MRP participant waits for the specified period of the join timer before sending a join message. The Join timer must be less than half of the Leave Timer. Range: 20 to 100 in centiseconds. Default: 20.
`leave <TIME>`	Sets the leave timer for the port, specifying the time that the registrar state machine waits in the LV state before transiting to the MT state. The leave timer must be at least twice the join timer and must be less than the leave all timer. Range: 40 - 1000000 centiseconds. Default: 300 centiseconds.
`leaveall <TIME>`	Sets the leave all timer for the port, specifying the frequency with which the leave all state machine generates leave alll PDUs. Range: 500 to1000000 centiseconds. Default: 1000.
`periodic <TIME>`	Sets the periodic timer for the port, specifying the frequency with which the periodic transmission state machine generates periodic events. The periodic timer is set to 1 second when it is started. Range: 100 to 1000000 centiseconds. Default: 100.

Examples

```
switch(config-if)# mvrp timer join 22
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

show mvrp config

`show mvrp config [<PORT-NUM> | <PORT-LIST> | LAG <LAG-NUM>] [vsx-peer]`

Description

Displays the MVRP configuration for all L2 ports or optionally for the ports specified.

Parameter	Description
<PORT-NUM>	Specifies displaying information for a particular port number.
<PORT-LIST>	Specifies displaying information for a list of ports.
LAG *<LAG-NUM>*	Specifies displaying information by LAG. Range: 1 to 128.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

```
switch# show mvrp config
Configuration and Status - MVRP
Global MVRP status : Disabled
Port    Status    Registration Join  Leave  LeaveAll Periodic
                  Type         Timer Timer  Timer    Timer
------- -------- --------      -----  ----- ------   --------
1/1/1    Disabled  Normal         20   300   1000     100
1/1/2    Disabled  Normal         20   300   1000     100
1/1/3    Disabled  Normal         20   300   1000     100
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

show mvrp state

`show mvrp state [<VLAN-ID> | <VLAN-ID> <PORT-NUM>]  [vsx-peer]`

Description

Displays the MVRP Registrar and Applicant state machine information for all ports on which MVRP is enabled, or for specific ports.

Parameter	Description
<VLAN-ID>	Specifies the number of a VLAN.
<PORT-NUM>	Specifies a physical port on the switch. Forrmat: **member/slot/port**.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

```
switch# show mvrp state 1
Configuration and Status - MVRP state for VLAN 1
Port   VLAN Registrar Applicant
            State     State
----   ---- --------- ---------
1/1/1  1    MT       QA
```

```
switch# show mvrp state 10 1/1/1
Configuration and Status - MVRP state for VLAN 10
Port   VLAN Registrar Applicant Forbid
            State     State     Mode
----   ---- --------- --------- ---------
1/1/1  10   MT        LO        Yes
switch#
```

show mvrp statistics

`show mvrp statistics [<PORT-LIST>] [vsx-peer]`

Description

Displays MVRP statistics for all ports or on the ports specified in the list.

Parameter	Description
<PORT-LIST>	Specifies a list of ports. When specifying a list of ports, the ports for which there are no statistics will be listed in the output.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

```
switch# show mvrp statistics
Status and Counters - MVRP
MVRP statistics for port : 1/1/1
----------------------------

Chapter 94

ND snooping commands

clear nd-snooping binding

```
clear nd-snooping bindings {all | ipv6 <IPV6-ADDR> vlan <VLAN-ID> |
      port <PORT-NUM> | vlan <VLAN-ID>}
```

Description

Clears ND snooping binding entries.

Command context

Parameter	Description
`all`	Specifies that all ND binding information is to be cleared.
`ip <IPV6-ADDR> vlan <VLAN-ID>`	Specifies the IPv6 address and VLAN for which all ND binding information is to be cleared.
`port <PORT-NUM>`	Specifies the port (interface) for which all ND binding information is to be cleared.
`vlan <VLAN-ID>`	Specifies the VLAN for which all ND binding information is to be cleared. Range: 1 to 4094.

Examples

On the 6400 Switch Series, interface identification differs.

Clearing all ND binding information for 5000::1 vlan 1:

```
switch(config)# clear nd-snooping bindings ipv6 5000::1 vlan 1
```

Clearing all ND binding information for port 1/1/10:

```
switch(config)# clear nd-snooping bindings port 1/1/10
```

Clearing all ND binding information for VLAN 10:

```
switch(config)# clear nd-snooping bindings vlan 10
```

Clearing all ND binding information:

```
switch(config)# clear nd-snooping bindings all
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

clear nd-snooping ra-guard-policy statistics

```
clear nd-snooping ra-guard-policy statistics [vlan <VLAN-ID>]|[interface <IFNAME>]
```

Description

Clear all RA Guard policy statistics from the specified interface or VLAN.

Command context

Parameter	Description
`vlan <VLAN-ID>`	Clear all RA Guard policy information on the specified VLAN
`interface <IFNAME>`	Clear all RA Guard policy information on the specified interface

Examples

Clear all RA Guard policy statistics for VLAN 10:

```
switch# clear nd-snooping ra-guard-policy statistics vlan 10
```

Clear all RA Guard policy statistics for interface 1/1/10

```
switch# clear nd-snooping ra-guard-policy statistics interface 1/1/10
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

diag-dump nd-snooping basic

```
diag-dump nd-snooping basic
```

Description

This command displays information about the ND-Snooping configuration and runtime context.

Examples

The following example displays sample output for this command.

```
switch# diag-dump nd-snooping basic

nd-snooping

```
nd-snooping {enable|disable}
no nd-snooping {enable|disable}
```

Description

Enables or disables ND snooping. ND snooping is disabled by default. ND snooping is not supported on the management interface.

Examples

Enabling ND snooping:

```
switch(config)# nd-snooping enable
```

Disabling ND snooping:

```
switch(config)# nd-snooping disable
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

6300 6400	config	Administrators or local user group members with execution rights for this command.

nd-snooping (in config-vlan context)

```
nd-snooping
no nd-snooping
```

Description

Enables ND snooping in the **config-vlan** context. ND snooping is disabled by default for all VLANs.

The no form of the command disables ND snooping on the specified VLAN, flushing all the IPv6 bindings learned for this VLAN since ND snooping was enabled for this VLAN.

Examples

Enabling ND snooping on VLAN 100:

```
switch(config)# vlan 100
switch(config-vlan-100)# nd-snooping
switch(config-vlan-100)# exit
switch(config)#
```

Disabling ND snooping on VLAN 100:

```
switch(config)# vlan 100
switch(config-vlan-100)# no nd-snooping
switch(config-vlan-100)# exit
switch(config)#
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

6300 6400	`config-vlan`	Administrators or local user group members with execution rights for this command.

nd-snooping mac-check

```
nd-snooping mac-check
no nd-snooping mac-check
```

Description

This command enables verification of the hardware address field in ND snooping packets. When enabled, the ICMPv6 target link layer address field and the source MAC address must be the same for packets received on untrusted ports or else the packets are dropped. This ND snooping MAC verification is enabled by default.

The no form of the command disables ND snooping MAC verification.

Examples

Enabling ND snooping MAC verification:

```
switch(config)# nd-snooping mac-check
```

Disabling ND snooping MAC verification:

```
switch(config)# no nd-snooping mac-check
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

nd-snooping prefix-list

```
nd-snooping prefix-list <IPV6-ADDR>
no nd-snooping prefix-list <IPV6-ADDR>
```

Description

Configures the ND snooping prefix list for the selected VLAN and the specified IPv6 address prefix. ND snooping must be enabled both globally and on this VLAN before this prefix list configuration takes effect.

The no form of this command removes the prefix list configuration for the selected VLAN and IPv6 address.

Parameter	Description
<IPV6-ADDR>	Specifies the IPv6 address.

Examples

Configuring ND snooping prefix-list on VLAN 1:

```
switch(config)# vlan 1
switch(config-vlan-1)# nd-snooping prefix-list 2001::1/64
switch(config-vlan-1)# exit
switch(config)#
```

Remove configuration of ND snooping prefix-list on VLAN 100:

```
switch(config)# vlan 1
switch(config-vlan-1)# no nd-snooping prefix-list 2001::1/64
switch(config-vlan-1)# exit
switch(config)#
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-vlan-<VLAN-ID>`	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

nd-snooping max-bindings

```
nd-snooping max-bindings <MAX-BINDINGS>
no nd-snooping max-bindings
```

Description

Sets the maximum number of ND bindings allowed on the selected interface. For all interfaces on which this command is not run, the default max bindings applies.

The no form of the command reverts max bindings for the selected interface to its default.

Parameter	Description
<MAX-BINDINGS>	Specifies the maximum number of ND bindings. You can use the **show capacities** command to see the maximum available for your switch model.

Examples

On the 6400 Switch Series, interface identification differs.

Set the ND max bindings to 768 on interface 2/2/1:

```
switch(config)# interface 2/2/1
switch(config-if)# nd-snooping max-bindings 768
switch(config-if)# exit
switch(config)#
```

Revert ND max bindings to its default on interface 2/2/1:

```
switch(config)# interface 2/2/1
switch(config-if)# no nd-snooping max-bindings
switch(config-if)# exit
switch(config)#
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

nd-snooping nd-guard

```
nd-snooping nd-guard
no nd-snooping nd-guard
```

Description

This command enables ND guard on the selected VLAN.

The no form of the command disables ND guard and deletes all the IPv6 bindings learned on the VLAN.

ND snooping must be enabled in both the global context and the config-vlan context before this command can be used.

Examples

Enabling ND snooping ND guard on VLAN 100:

```
switch(config)# nd-snooping enable
switch(config)# vlan 100
switch(config-vlan-100)# nd-snooping nd-guard
switch(config-vlan-100)# exit
switch(config)#
```

Disabling ND snooping ND guard on VLAN 100:

```
switch(config)# vlan 100
switch(config-vlan-100)# no nd-snooping nd-guard
switch(config-vlan-100)# exit
switch(config)#
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

nd-snooping ra-guard

```
nd-snooping ra-guard [log]
no nd-snooping ra-guard
```

Description

This command enables Routing Advertisement (RA) guard on the selected VLAN. When enabled, ingress Routing Advertisement (RA) and Routing Redirect (RR) packets on the selected VLAN are blocked on untrusted ports. The packets are forwarded when received on trusted ports.

The no form of the command disables RA guard on the VLAN.

ND snooping must be enabled in both the global context and the config-vlan context before this command can be used.

Parameter	Description
`[log]`	Logs messages along with drop functionality.

Examples

Enabling ND snooping RA guard on VLAN 100:

```
switch(config)# nd-snooping enable
switch(config)# vlan 100
switch(config-vlan-100)# nd-snooping ra-guard
switch(config-vlan-100)# exit
switch(config)#
```

Enabling ND snooping RA guard on VLAN 100 with event logging on dropped packets:

```
switch(config)# nd-snooping enable
switch(config)# vlan 100
switch(config-vlan-100)# nd-snooping ra-guard log
switch(config-vlan-100)# exit
switch(config)#
```

Disabling ND snooping RA guard on VLAN 100:

```
switch(config)# vlan 100
switch(config-vlan-100)# no nd-snooping ra-guard
switch(config-vlan-100)# exit
switch(config)#
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-vlan-<VLAN-ID>`	Administrators or local user group members with execution rights for this command.

nd-snooping ra-drop

```
nd-snooping ra-drop
no nd-snooping ra-drop
```

Description

This command enables Routing Advertisement (RA) drop on the selected VLAN. When enabled, ingress RA packets on the selected VLAN are blocked on both trusted and untrusted ports. When disabled, RA packets are forwarded on the selected VLAN with ND snooping trusted port validation. RA drop is disabled by default.

ND snooping must be enabled in both the config context and the config-vlan context before this command can be used.

The no form of the command disables ND snooping RA drop on the selected VLAN.

Examples

Enabling ND snooping RA drop on VLAN 100:

```
switch(config)# nd-snooping enable vlan 100
switch(config-vlan-100)# nd-snooping ra-drop
switch(config-vlan-100)# exit
switch(config)#
```

Disabling ND snooping RA drop on VLAN 100:

```
switch(config)# vlan 100
switch(config-vlan-100)# no nd-snooping ra-drop
switch(config-vlan-100)# exit
switch(config)#
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority

nd-snooping trust

```
nd-snooping trust
no nd-snooping trust
```

Description

Enables ND snooping trust on the selected interface (port). Only server packets received on trusted ports are forwarded. All the ports are untrusted by default.

The no form of the command disables ND snooping trust on the selected port.

Examples

On the 6400 Switch Series, interface identification differs.

Enabling ND snooping trust on interface 2/2/1:

```
switch(config)# interface 2/2/1
switch(config-if)# nd-snooping trust
switch(config-if)# exit
switch(config)#
```

Disabling ND snooping trust on interface 2/2/1:

```
switch(config)# interface 2/2/1
switch(config-if)# no nd-snooping trust
switch(config-if)# exit
switch(config)#
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command Information

Platforms	Command context	Authority
6300 6400	`config-if`	Administrators or local user group members with execution rights for this command.

show nd-snooping

`show nd-snooping [vlan <VLAN-ID>] [vsx-peer]`

Description

Shows either all ND snooping configuration or the configuration for the specified VLAN.

Parameter	Description
`vlan <VLAN-ID>`	Specifies the VLAN for which the ND configuration is to be shown. Range: 1 to 4094.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not

Parameter	Description
	have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

(Applies to the 6200, 6300, 6400, 8100, and 8360.) Showing all ND snooping configuration:

```
switch(config)# show nd-snooping

  ND Snooping Information
  ========================

  ND Snooping                         : Enabled
  ND Snooping Enabled VLANs           : 10
  Trusted Port Bindings Enabled VLANs : 10
  ND Guard Enabled VLANs              : 10
  RA Guard Enabled VLANs              : 10
  RA Drop Enabled VLANs               :
  MAC Address Check                   : Disabled

  PORT    TRUST  MAX-BINDINGS  CURRENT-BINDINGS
  ------- ------ ------------- -----------------
  1/1/1   Yes
  1/1/2   Yes
  1/1/3   No     100           10
  1/1/4   No     200           10
  1/1/5   No     300           10
```

(Applies to the 6200, 6300, 6400, 8100, 8360.) Showing ND snooping configuration for VLAN 2:

```
switch(config)# show nd-snooping vlan 2

  ND Snooping Information

show nd-snooping statistics

```
show nd-snooping statistics [vsx-peer]
```

Description

Shows the global ND snooping statistics.

Parameter	Description
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

(Applies to the 6200, 6300, 6400, 8100, 8360.) Showing global ND snooping statistics:

```
switch(config)# show nd-snooping statistics

  PACKET-TYPE  ACTION   REASON                                          COUNT
  ------------ -------- ----------------------------------------------- --------
  RA           forward  RA packets received on trusted port              20
  RA           drop     RA packets received on untrusted port            45
  NS           forward  NS packets received on trusted port              52
  NS           forward  NS packets received on untrusted port            95
  NS           drop     NS packets failed MAC check                      14
  NS           drop     NS packets failed Prefix check                   12
  NS           drop     NS packets failed on max-binding limit           0
  NS           drop     NS packets failed ND snooping validation checks  20
  NA           forward  NA packets received on trusted port              17
  NA           forward  NA packets received on untrusted port            30
  NA           drop     NA packets failed Prefix check                   15
  NA           drop     NA packets failed on max-binding limit           2
  NA           drop     NA packets failed ND snooping validation checks  5
```

Chapter 95

Network Analytics Engine commands

nae cli-authorization

```
nae cli-authorization
no nae cli-authorization
```

Description

Configures the NAE agent action CLI commands to require authorization. By default, the NAE agent action CLI commands are subject to regular command authorization, including when TACACS+ is configured for authorization. Unless the configured authorization method allows the CLI commands sent by the NAE agent as user admin, the NAE agent action CLI commands will result in command failures.

The **no** form of the command disables the authorization required for NAE agent action CLI commands.

Examples

Enabling authorization requirement for NAE agent action CLI commands:

```
switch(config)# nae cli-authorization
```

Disabling authorization requirement for NAE agent action CLI commands:

```
switch(config)# no nae cli-authorization
```

For more information on features that use this command, refer to the Network Analytics Engine Guide for your switch model.

Command History

10.11	Command introduced

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

show nae-agent

```
show nae-agent [<AGENT-NAME>] [vsx-peer]
```

Description

Shows the details of the NAE Agent. If the agent name is specified, then shows the information details of the specified agent.

Parameter	Description
<AGENT-NAME>	Specifies the name of the agent. Length: 3 to 80 alphanumeric characters, including underscore (_).
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Usage

The output of this command shows the following information about the Aruba Network Analytics Engine agents that are configured and enabled on the switch:

Parameter	Description
Agent Name	The name of the agent. Length: 3 through 80 characters.
Script Name	The name of the script. Length: 3 through 80 characters. Example: **memory_monitor**
Version	The version number of the script.
Origin	The origin of the script: ▪ system: Indicates that the script is provided as part of the system software. ▪ user: Indicates that a user loaded the script. ▪ generated: Indicates that the agent is configured using the CLI.
Disabled	Indicates whether the agent is disabled or enabled on the switch: ▪ true: Indicates that the agent is disabled. ▪ false: Indicates that the agent is enabled on the switch.
Status	The current state of the agent. Status values are the following: ▪ CRITICAL :The agent has encountered a critical error during execution. For information about the error, see the Analytics Dashboard of the Web UI. ▪ MAJOR: The agent has encountered a major error during execution. For information about the error, see the Analytics Dashboard of the Web UI. ▪ MINOR: The agent has encountered a minor error during execution. For information about the error, see the Analytics Dashboard of the Web UI. ▪ NORMAL: Indicates that the agent is actively monitoring network conditions and handling events.
Time series count	Number of time series associated with agent.
Alerts count	Number of alerts generated by the agent.

Parameter	Description
Rules	Number of Prometheus rules associated with the agent.
Error	Current error state of the agent.
Recent alerts	Lists the recent alerts.

Example

Showing the details of all the NAE agents existing in the switch:

```
switch# show nae-agent
----------------------------------------------------------------------------------
--------------------------------------------------------------------------
Agent Name                           Script Name                      Version

show nae-agent alerts

`show nae-agent [<AGENT-NAME>] alerts`

Shows the alerts raised by all the NAE agents. If the agent name is specified, then shows the alerts raised by the specified agent.

Parameter	Description
<AGENT-NAME>	Specifies the name of the NAE-Lite agent.

Example

Showing the alerts raised by all the NAE agents:

```
switch# show nae-agent alerts
2021-06-13 07:53:56 An action has been triggered by NAE agent memory_monitor
2021-06-07 00:30:10 An action has been triggered by NAE agent system_resource_
monitor.default
2021-06-07 00:24:13 An action has been triggered by NAE agent system_resource_
monitor.default
2021-06-06 21:48:27 An action has been triggered by NAE agent memory_monitor
2021-06-06 18:44:41 An action has been triggered by NAE agent system_resource_
monitor.default
2021-06-06 18:31:53 An action has been triggered by NAE agent system_resource_
monitor.default
2021-06-06 20:19:03 An action has been triggered by NAE agent system_resource_
```

```
monitor.default
2021-06-06 20:15:05 An action has been triggered by NAE agent system_resource_
monitor.default
2021-06-03 07:45:36 An action has been triggered by NAE agent memory_monitor
```

Showing the alerts raised by the NAE agent named **memory_monitor**:

```
switch# show nae-agent memory_monitor alerts
2021-06-13 07:54:47 An action has been triggered by NAE agent memory_monitor
2021-06-13 07:53:56 An action has been triggered by NAE agent memory_monitor
2021-06-06 21:48:27 An action has been triggered by NAE agent memory_monitor
2021-06-03 07:45:36 An action has been triggered by NAE agent memory_monitor
```

For more information on features that use this command, refer to the Network Analytics Engine Guide for your switch model.

show nae-agent alerts details

```
show nae-agent [<AGENT-NAME>] alerts details [<INSTANCE-ID>]
```

Description

Shows the detailed information of a specific NAE agent alert raised by all the NAE agents.

Only CLI, alert, and system log specific action details are displayed as the output. For other action details, refer to the Web UI.

Parameter	Description
<AGENT-NAME>	Specifies the name of the NAE-Lite agent. Length: 3 to 80 alphanumeric characters, including underscore (_).
<INSTANCE-ID>	Specifies the instance of the alert. Number **1** represents the latest alert whereas **N** represents the Nth recent alert. By default, it displays the latest alert (*INSTANCE-ID*=1).

Example

Showing the details of the recent alert of the NAE-Lite agent named **memory_monitor**:

```
switch# show nae-agent memory_monitor alerts details 1
2Alert Message: 2021-06-13 07:54:47 An action has been triggered by NAE agent
memory_monitor
Action(s) performed: Alert, CLI, Syslog

Action Details:

show nae-script

```
show nae-script [vsx-peer]
```

Description

Shows information about the Aruba Network Analytics Engine scripts that are available on the switch.

Parameter	Description
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Usage

This command shows the following information about the Aruba Network Analytics Engine scripts that are available on the switch:

Script Name

The name of the script. Length: 3 through 80 characters.

Example: **system_resource_monitor_mm1.default**

Version

The version number of the script.

Origin

The origin of the script:

`system`

Indicates that the script is provided as part of the system software.

`user`

Indicates that a user loaded the script.

Status

The current state of the script. Status values are the following:

`CREATED`

The script has been uploaded to the switch, but script validation has not begun.

`ERROR`

The script validation process detected an error that would result in execution errors if an agent runs the script. Resolve the error by modifying the script. For information about the error, see the **Analytics Dashboard** of the Web UI.

`VALIDATING`

The script syntax and components (manifest, parameters, monitor, condition, and action) are in the process of being validated.

`VALIDATED`

The script syntax and components (manifest, parameters, monitor, condition, and action) have been validated and no errors have been found.

Example

```
switch# show nae-script
---------------------------------------------------------------------
Script Name                            Version   Origin    Status
---------------------------------------------------------------------
fan_monitor                            1.0       system    VALIDATED
interface_link_flap_monitor            1.0       system    VALIDATED
interface_link_state_monitor           1.0       system    VALIDATED
interface_tx_rx_stats_monitor          1.0       system    VALIDATED
lag_imbalance_monitor                  1.0       system    VALIDATED
lag_status_monitor                     1.0       system    VALIDATED
power_supply_monitor                   1.0       system    VALIDATED
stp_bpdu_tcn_rate_monitor              1.0       system    VALIDATED
system_resource_monitor_mm1.default    1.0       system    VALIDATED
```

```
system_resource_monitor_mm2.default    1.0       system    VALIDATED
temp_sensor_monitor                    1.0       system    VALIDATED
---------------------------------------------------------------------
Script Name                            Version   Origin    Status
---------------------------------------------------------------------
fan_monitor                            1.0       system    VALIDATED
interface_link_flap_monitor            1.0       system    VALIDATED
interface_link_state_monitor           1.0       system    VALIDATED
interface_tx_rx_stats_monitor          1.0       system    VALIDATED
lag_imbalance_monitor                  1.0       system    VALIDATED
lag_status_monitor                     1.0       system    VALIDATED
power_supply_monitor                   1.0       system    VALIDATED

uerieshow running-config (nae-lite)

`show running-config`

Description

Shows the NAE-Lite running configuration.

Example

Showing the NAE-Lite running configuration:

```
switch# show running-config
Current configuration:
!
!Version Halon 0.1.0 (Build: ridley-Halon-0.1.0-master-20161110190644-dev)
!Schema version 0.1.8
hostname switch
...
nae-agent memory_monitor
```

~~~~
    desc Memory resource monitor
    monitor memory system memory line-module 1/3
    set-condition monitor memory gt 80
        status major
        syslog "High memory usage detected"
        cli show system
        clear-condition monitor memory lt 40
            status normal
            syslog "Memory usage is recovered to normal limit"
exit
nae-agent crash_watch
    desc Watch the crash event
    tags crash, resource
    watch crash_event event-log 1201
    set-condition watch event-log crash_event
        status major
        cli show core-dump all
exit
nae-agent crash_watch activate
nae-agent memory_monitor activate
...
```
~~~~

Chapter 96

Network Analytics Engine Lite commands

actions

```
status {normal | minor | major | critical}
no status {normal | minor | major | critical}

syslog <MESSAGE> [facility {kern | user | mail | daemon | auth | syslog |
     lpr | uucp | authpriv | cron | ftp}]
     [severity {debug | info | notice | warning | err | crit | alert | emer}]
no syslog <MESSAGE> [facility {kern | user | mail | daemon | auth | syslog |
     lpr | uucp | authpriv | cron | ftp}]
     [severity {debug | info | notice | warning | err | crit | alert | emer}]

cli <COMMAND> {show system | redirect local-file} {show version | redirect tftp}
no cli <COMMAND>

schedule <SCHEDULE>
no schedule <SCHEDULE>

trap <TRAP>
no trap <TRAP>
```

Description

Configures different NAE-Lite agent actions to be performed when the set condition or the clear condition is met. The following NAE actions can be configured for the set and clear condition:

status—Set the alert level for the NAE-Lite Agent.

syslog—Create a syslog message and send it to the configured remote syslog servers.

cli—Execute a CLI command. Multiple CLI commands can be specified by using **\n** as the delimiter.

schedule—Execute a configured job CLI commands at the specific time.

trap—Create a snmp trap message and send it to the configured snmp servers.

The **no** form of this command removes the actions associated with the NAE-Lite agent condition.

Parameter	Description
`normal`	Sets the NAE-Lite agent status to **normal** (default).
`minor`	Sets the NAE-Lite agent status to **minor**.
`major`	Sets the NAE-Lite agent status to **major**.
`critical`	Sets the NAE-Lite agent status to **critical**.
<MESSAGE	Specifies the syslog message to be sent when the set condition or the clear condition is met. Length: 3 to 255 characters.

Parameter	Description
`facility {kern | user | mail | daemon | auth | syslog | lpr | uucp | authpriv | cron | ftp}`	Specifies the syslog facility code to denote the type of program that is logging the message. The default facility code is daemon. Optional. The valid facility code values are: ■ **kern**: Sets the syslog message source as kernel. ■ **user**: Sets the syslog message source as user space programs. ■ **mail**: Sets the syslog message source as mail system. ■ **daemon**: Sets the syslog message source as system daemon (default). ■ **auth**: Sets the syslog message source as authentication subsystem. ■ **syslog**: Sets the syslog message source as syslog daemon. ■ **lpr**: Sets the syslog message source as line printer subsystem. ■ **uucp**: Sets the syslog message source as unix-to-unix copy subsystem. ■ **authpriv**: Sets the syslog message source as security subsystem. ■ **cron**: Sets the syslog message source as cron scheduler subsystem. ■ **ftp**: Sets the syslog message source as FTP daemon.
`[severity {debug | info | notice | warning | err | crit | alert | emer}]`	Specifies the severity level for the syslog message. The severity level values are: ■ **debug**: Sets the syslog severity level as **debug**. ■ **info**: Sets the syslog severity as **information** (default). ■ **notice**: Sets the syslog severity as **notice**. ■ **warning**: Sets the syslog severity as **warning**. ■ **err**: Sets the syslog severity as **error**. ■ **crit**: Sets the syslog severity as **critical**. ■ **alert**: Sets the syslog severity as **alert**. ■ **emer**: Sets the syslog severity as **emergency**.
<COMMAND>	Specifies the CLI command to be executed when the set condition or the clear condition is met.
`{show system | redirect local-file}`	Specifies where to relocate local-file.
`{show version | redirect tftp}`	Specifies where to relocate tftp.

Usage

Take note of the following requirements and recommendations:

- SNMP trap messages should be a minimum of 3 and a maximum of 255 characters.
- Add the job configuration separately in the configuration node and execute the corresponding job name in the action schedule CLI.

- It is not recommended to use NAE-lite action schedule CLI commands in the NAE-lite action CLI.
- It is not recommended to add the job configuration CLI and schedule configuration CLI together in the action schedule CLI.

Example

Setting the status level for the NAE-Lite agent condition:

```
switch(config-nae-agent-condition)# status major
```

Creating the syslog message for the NAE-Lite agent condition:

```
switch(config-nae-agent-condition)# syslog "IPSLA server1 is down" severity err
```

Executing the CLI command for the NAE-Lite agent condition:

```
switch(config-nae-agent-condition)# cli show version\nshow image
```

Removing the different actions associated with the NAE-Lite agent condition:

```
switch(config-nae-agent-condition)# no status minor
```

```
switch(config-nae-agent-condition)# no syslog "Processing system event"
```

```
switch(config-nae-agent-condition)# no cli show logging
```

Executing the schedule CLI command:

```
switch(config-nae-agent-condition)# schedule
SCHEDULE  Set the job schedule CLI command. The CLI commands can be specified by
using `\n` as the separator.
```

Example of a scheduled CLI Command:

```
switch(config-nae-agent-condition)# schedule s1\n10 job j1\ntrigger every minutes
30 start 17:20 2023-11-21
```

Creating the snmp trap message:

```
switch(config-nae-agent-condition)# trap
TRAP      Set the trap message
```

Example of a trap message:

```
switch(config-nae-agent-condition)# trap High system CPU utilization
```

Removing the scheduled CLI command:

```
switch(config-nae-agent)# no schedule
```

Removing snmp trap message:

```
switch(config-nae-agent)# no trap
```

For more information on features that use this command, refer to the Network Analytics Engine Guide for your switch model.

Command History

Release	Modification

6300 6400	`config-nae-agent-condition`	Administrators or local user group members with execution rights for this command.

desc

```
desc <DESCRIPTION>
no desc <DESCRIPTION>
```

Description

Adds the description for the NAE-Lite agent.

The **no** form of this command removes the description from the NAE-Lite agent.

Parameter	Description
<DESCRIPTION>	Specifies the description for the NAE-Lite agent. Range: 3 to 255 characters

Example

Adding the description for the NAE-Lite agent:

```
switch(config-nae-agent)# desc Monitor system memory
```

Removing the description for the NAE-Lite agent:

```
switch(config-nae-agent)# no desc Monitor system memory
```

For more information on features that use this command, refer to the Network Analytics Engine Guide for your switch model.

Command History

Release	Modification
10.09	Command introduced

Command Information

disable

```
disable
no disable
```

Description

Disables the NAE-lite agent. The NAE-Lite agents are enabled by default.

The **no** form of this command enables the NAE-Lite agent.

Example

Disabling the NAE-Lite agent:

```
switch(config-nae-agent)# disable
```

Enabling the NAE-Lite agent:

```
switch(config-nae-agent)# no disable
```

For more information on features that use this command, refer to the Network Analytics Engine Guide for your switch model.

monitor resource

```
monitor <MONITOR-NAME> resource <RESOURCE> [group-by {count | sum | min | max | average}
[over {seconds | minutes | hours | days} <DURATION>]]
no monitor <MONITOR-NAME> resource <RESOURCE> [group-by {count | sum | min | max |
average} [over {seconds | minutes | hours | days} <DURATION>]]

monitor <MONITOR-NAME> resource <RESOURCE> group-by rate over {seconds | minutes | hours
| days} <DURATION>
no monitor <MONITOR-NAME> resource <RESOURCE> group-by rate over {seconds | minutes |
hours | days} <DURATION>
```

Description

Configures the monitor for the NAE-Lite agent. The monitor defines what system resource the agent must monitor. Monitors are defined using the time series function and it supports the grouping of data.

The **no** form of this command removes the monitor associated with the NAE-Lite agent. Before removing the monitor, you must remove the condition used in the monitor.

Parameter	Description
<MONITOR-NAME>	Specifies the name of the monitor. Length: 3 to 80 alphanumeric characters, including underscore (_).
<RESOURCE> The *<RESOURCE>* is defined as follows: ■ For 8400 and 6400 Switch Series: ○ `system {cpu | memory} {management-module | line-module} <SLOT-ID>` ○ `system storage {nos | security | coredump | logs | selftest} management-module <SLOT-ID>` ○ `system storage coredump line-module <SLOT-ID>` ■ For 6300 and 6200 Switch Series: ○ `system {cpu | memory} vsf member <MEMBER-ID>` ○ `system storage {nos | security | coredump | logs | selftest} vsf member <MEMBER-ID>`	Specifies the system resources such as memory, CPU, and storage utilization for specific modules that need to be monitored. Values are: ■ **cpu**: Configures the CPU monitoring. ■ **memory**: Configures the memory monitoring. ■ **storage**: Configures the storage utilization monitoring. ■ **management-module**: Monitors resources of the management module. ■ **line-module**: Monitors resources of the line module. ■ nos: Monitors the network operating system storage utilization. ■ **security**: Monitors the security storage utilization.

Parameter	Description
	- **coredump**: Monitors the coredump storage utilization. - **logs**: Monitors the log storage utilization. - **selftest**: Monitors the self-test storage utilization. - **<SLOT-ID>**: Configure the module slot ID. **<SLOT-ID>** is the mandatory parameter for representing the management module or line module. - **vsf member *<MEMBER-ID>***: Configures the VSF member ID. The member ID is the mandatory parameter.
`group-by {count | sum | min | max | average}`	Groups the monitored data based on the parameters specified. Values are: - **count**: Groups by distinct counts of monitored data. - **sum**: Groups by summing the monitored data. - **min**: Groups by minimum value of the monitored data. - **max**: Groups the data by maximum value of the monitored data. - **average**: Groups by average value of the monitored data.
`over {seconds | minutes | hours | days} <DURATION>`	Group over the specified time interval in the past instead of the current value. Values are: **seconds**: Sets the time interval in seconds. Range: 5 to 10000 **minutes**: Sets the time interval in minutes. Range: 1 to 10000. **hours**: Sets the time interval in hours. Range: 1 to 10000. **days**: Sets the time interval in days. Range: 1 to 365.
`rate over {seconds | minutes | hours | days} <DURATION>`	Groups by rate of change of the monitored data over the specified time interval.

Example

Configuring the monitor for the **system cpu** resource on the **1/1** module (8400 and 6400 Switch Series):

```
switch(config-nae-agent)# monitor sys_cpu resource system cpu management-module
1/1
```

Configuring the monitor for the calculating the average CPU usage over the 30 minutes (8400 and 6400 Switch Series):

```
switch(config-nae-agent)# monitor avg_sys_cpu resource system cpu line-module 1/4
group-by average over minutes 30
```

Configuring the monitor for the system CPU usage on the **vsf member 1** (6300 and 6200 Switch Series):

```
switch(config-nae-agent)# monitor sys_cpu resource system cpu vsf member 1
```

Removing the monitor named **sys_mem**:

```
switch(config-nae-agent)# no monitor sys_mem
```

For more information on features that use this command, refer to the Network Analytics Engine Guide for your switch model.

nae-agent lite

```
nae-agent lite <AGENT-NAME>
no nae-agent lite [<AGENT-NAME>]
```

Description

Configures the NAE-Lite agent. After the command is executed, the command prompt enters into the **nae-agent** context. The specified name of the agent is also used as the name of the NAE script generated from the agent configurations. Therefore the agent name must be unique and must not match with any existing NAE scripts or NAE-Lite agent names.

The **no** form of the command removes the NAE-Lite agent configuration. The **no nae-agent lite** command removes all the configured NAE-Lite agents.

Parameter	Description
<AGENT-NAME>	Specifies the name of the NAE-Lite agent. Length: 3 to 80 alphanumeric characters, including underscore (_).

Example

Configuring NAE-Lite agent named **mem_monitor** and entering into the **nae-agent** context:

```
switch(config)# nae-agent lite mem_monitor
switch(config-nae-agent)#
```

Removing the NAE-Lite agent named **mem_monitor**:

```
switch(config-nae-agent)# no nae-agent lite mem_monitor
```

Removing all the NAE-Lite agent configurations:

```
switch(config)# no nae-agent lite
```

For more information on features that use this command, refer to the Network Analytics Engine Guide for your switch model.

Command History

nae-agent lite activate

```
nae-agent lite <AGENT-NAME> activate
no nae-agent lite <AGENT-NAME> activate
```

Description

Activates the NAE-Lite agent creation. Once activated, the NAE-Lite agent gets generated, validated, and begins monitoring.

Whenever modifying the NAE-Lite agent configuration, after all the modifications are done, you must trigger the agent update process by executing **no nae-agent lite <*AGENT-NAME*> activate** followed by **nae-agent lite <*AGENT-NAME*> activate**. The agent will not be created or updated until the **nae-agent lite <*AGENT-NAME*> activate** command is executed.

The **no** form of the command deactivates the NAE-Lite agent. Once the command is executed, the NAE-Lite agent and its corresponding script will be deleted.

Parameter	Description
<AGENT-NAME>	Specifies the name of the NAE-Lite agent. Length: 3 to 80 alphanumeric characters, including underscore (_).

Example

Activating the NAE-Lite agent named **crash_watch** :

```
switch(config)# nae-agent lite crash_watch activate
```

Deactivating the NAE-Lite agent named **mem_monitor** :

```
switch(config)# no nae-agent lite mem_monitor activate
```

For more information on features that use this command, refer to the Network Analytics Engine Guide for your switch model.

2set-condition monitor

```
set-condition monitor <MONITOR-NAME> {{lt | le | eq | ne | gt | ge} <VALUE>[for {seconds
| minutes | hours | days} <DURATION>] | transition from <STRING-LIST> to <STRING-LIST>}
no set-condition monitor <MONITOR-NAME> {{lt | le | eq | ne | gt | ge} <VALUE> [for
{seconds | minutes | hours | days} <DURATION>] | transition from <STRING-LIST> to
<STRING-LIST>}

clear-condition monitor <MONITOR-NAME> {{lt | le | eq | ne | gt | ge} <VALUE> [for
{seconds | minutes | hours | days} <DURATION>] | transition from <STRING-LIST> to
<STRING-LIST>}
```

```
no clear-condition monitor <MONITOR-NAME> {{lt | le | eq | ne | gt | ge} <VALUE> [for
{seconds | minutes | hours | days} <DURATION>] | transition from <STRING-LIST> to
<STRING-LIST>}
```

Description

Defines the condition for the monitor resource events. Once the condition is met, one or more actions are executed based on the configuration.

The clear condition is an optional component of the condition and helps in identifying if an event, usually an issue in the system, is no longer occurring. Clear conditions also address the problem when data is fluctuating above and below the threshold, generating too many alerts. Initially, when an NAE-Lite agent is created, only the set-condition is active. Once the set-condition is met, the condition becomes inactive and the clear condition becomes active. The set-condition becomes active again once the clear condition is met.

The **no** form of this command removes the monitor condition associated with the NAE-Lite agent.

Parameter	Description
<MONITOR-NAME>	Specifies the monitor name used in the condition.
<VALUE>	Specifies the numeric value compared with the monitor value. The defined values are: ■ lt (less than) ■ le (less than or equal to) ■ eq (equal to) ■ ne (not equal to) ■ gt (greater than) ■ ge (greater than or equal to) ■ transition
<DURATION>	Specifies the time duration. The defined time duration are: ■ seconds (Range: 5-10000) ■ minutes (Range: 1-10000) ■ hours (Range: 1-10000) ■ day
<STRING-LIST>	Specifies the list of one or more strings representing the initial or final value of the monitor. The strings are comma-separated and each string must be contained within double-quotes.

Example

Configuring set conditions for the NAE-Lite agent:

```
switch(config-nae-agent)# set-condition monitor average_mem gt 70
```

Configuring the set and clear conditions for the NAE-Lite agent:

```
switch(config-nae-agent)# set-condition monitor cpu gt 70 for minutes 30
switch(config-nae-agent-condition)# clear-condition monitor cpu lt 30 for minutes
30
```

```
switch(config-nae-agent)# set-condition monitor line_mdl_state transition from
"ready" to "down","error"
switch(config-nae-agent-condition)# clear-condition monitor line_mdl_state
transition from "down","error" to "ready"
```

Removing the monitor conditions for the NAE-Lite agent:

```
switch(config-nae-agent)# no set-condition monitor line_mdl_state transition from
"ready" to "down","error"
```

```
switch(config-nae-agent-condition)# no clear-condition monitor cpu lt 30 for
minutes 30
```

For more information on features that use this command, refer to the Network Analytics Engine Guide for your switch model.

5set-condition watch

```
set-condition watch event-log <WATCH-NAME> [include {all | any} <REGEX-LIST>] [exclude
<REGEX-LIST>] [count <COUNT>]
no set-condition watch event-log <WATCH-NAME> [include {all | any} <REGEX-LIST>] [exclude
<REGEX-LIST>] [count <COUNT>]

clear-condition watch event-log <WATCH-NAME> [include {all | any} <REGEX-LIST>] [exclude
<REGEX-LIST>] [count <COUNT>]
no clear-condition watch event-log <WATCH-NAME> [include {all | any} <REGEX-LIST>]
[exclude <REGEX-LIST>] [count <COUNT>]
```

Description

Defines the condition for the watch resource events. Once the condition is met, one or more actions are executed based on the configuration.

The clear condition is an optional component of the condition and helps in identifying an event, usually an issue in the system, is no longer occurring. Clear conditions also address the problem when data is fluctuating above and below the threshold, and generating too many alerts. Initially, when an NAE-Lite agent is created, only the set-condition is active. Once the set-condition is met, the condition becomes inactive and the clear condition becomes active. The set-condition becomes active again once the clear condition is met.

The condition is met when any of the event logs watched by the **<WATCH-NAME>** has occurred and the event log message fits the include or exclude **<REGEX-LIST>** (if configured) and the condition has occurred for **<COUNT>** number of times (if configured).

The **no** form of this command removes the condition associated with the NAE-Lite agent.

Parameter	Description
<WATCH-NAME>	Specifies the name of the watch. This must be already defined using the watch command.
include {all | any} *<REGEX-LIST>*	Configures the list of strings matching the regular expression that must be included in the event log message. Optional.
all	Includes all of the specified lists of regular expressions in event-log messages.
any	Includes any of the specified lists of regular expressions in event-log messages
<REGEX-LIST>	Specifies the comma-separated list of one or more regular expressions that must be matched against the event log messages. Optional.
exclude	Configures the list of strings matching the regular expression that must be included in the event log message. Optional.
count *<COUNT>*	Limits the number of times that the condition to be met once in every specified count. Optional. For example, if you want to monitor mac movement in the VLAN for every 10**th** time, then the count must be specified as 10. Range: 1 to 4294967295.

Example

Defining the condition for the watch named **ipsla_status** including all the specified list:

```
switch(config-nae-agent)# set-condition watch event-log ipsla_status
include all "servername","failure" count 3
```

Clearing the condition for the watch named **ipsla_status** including all the specified list:

```
switch(config-nae-agent-condition)# clear-condition watch ipsla_status
include all "servername","success"
```

Defining the condition for the watch named **ipsla_status** excluding **snmpd**:

```
switch(config-nae-agent-condition)# set-condition watch event-log crash_event
exclude snmpd
```

Removing the conditions associated with the NAE-Lite agent:

```
switch(config-nae-agent)# no set-condition watch event-log ipsla_status  include
all "servername","failure"
```

```
switch(config-nae-agent-condition)# no clear-condition watch ipsla_status
include all "servername","success"
```

For more information on features that use this command, refer to the Network Analytics Engine Guide for your switch model.

show running-config nae-agent

```
show running-config nae-agent
```

Description

Shows the NAE-Lite agent current running configurations.

Example

Showing the NAE-Lite running configurations:

```
switch# show running-config nae-agent
Current configuration:
!
...
nae-agent lite memory_monitor
    desc Memory resource monitor
    monitor memory system memory line-module 1/3
    set-condition monitor memory gt 80
        status major
        syslog "High memory usage detected"
        cli show system
        clear-condition monitor memory lt 40
            status normal
            syslog "Memory usage is recovered to normal limit"

nae-agent lite crash_watch
```

~~~
    desc Watch the crash event
    tags crash, resource
    watch crash_event event-log 1201
    set-condition watch event-log crash_event
        status major
        cli show core-dump all
nae-agent lite crash_watch activate
nae-agent lite memory_monitor activate
...
```
~~~

tags

```
tags <TAG-LIST>
no tags <TAG-LIST>
```

Description

Configures the tags applicable for the NAE-Lite agent. The tags are used to categorize and group the agent.

The **no** form of this command removes the tag lists associated with the NAE-Lite agent.

Parameter	Description
<TAG-LIST>	Specifies the tag list for the NAE-Lite agent.*<TAG-LIST>* is the comma separated list of tags. Each tag can be a minimum of 3 to a maximum of 32 characters in length. A maximum of 16 tags are supported.

Example

Configuring the tags for the NAE-Lite agent:

```
switch(config-nae-agent)# tags memory,resource,ztag
```

Removing the tags for the NAE-Lite agent:

```
switch(config-nae-agent)# no tags
```

```
switch(config-nae-agent)# no tags memory,resource
```

watch event-log

```
watch <WATCH-NAME> event-log <EVENT-ID-LIST>
no watch <WATCH-NAME> event-log <EVENT-ID-LIST>
```

Description

Configures the watch source for the NAE-Lite agent. This enables the agent to watch for specific events occurring in the system. Event-driven monitoring can be performed by watching the event log of the system.

For information on event IDs, refer to the Event Log Message Reference Guide.

The **no** form of this command removes the watch associated with the NAE-Lite agent.

Parameter	Description
<WATCH-NAME>	Specifies the watch name for the NAE-Lite agent. Length: 3 to 80 alphanumeric characters, including underscore (_).
<EVENT-ID-LIST>	Specifies the list of one or more event IDs of the event log message. A maximum of five event IDs can be specified.

Example

Configuring the watch source for the NAE-Lite agent.

```
switch(config-nae-agent)# watch crash_event event-log 1201
```

Removing the watch source used by the NAE-Lite agent:

```
switch(config-nae-agent)# no watch high_mem
```

```
switch(config-nae-agent)# no watch high_mem_event event-log 1208,1209
```

Network configuration validation commands

switch config-validator

```
switch config-validator [config <CONFIG-NAME>] [feature <feature>] [mode {consistency |
vsx-sync}] [format {cli | json}]
```

`mode vsx-sync` is not supported on the 6300 switch series.

Description

Runs configuration validation to detect configuration anomalies.

Parameter	Description
config	Specifies configuration to be validated. The default configuration is **running-config**.
feature <feature>	Specifies the name of the feature to be validated. **NOTE:** Available features vary by switch type. The 6300 Series Switch supports **vsf** as an option for the **feature** parameter, and the 6400 Series Switch supports **vsx** as an option for the **feature** parameter.
mode	Specifies configuration validation mode. The default is **consistency**.
consistency	Validates feature configuration for consistency check.
vsx-sync	Validates VSX configuration synchronization between VSX peers for VSX enabled features. **vsx-sync** is not supported on the 6300 switch series.
format	Specifies the results display format. The default is **cli**.

Examples

Running configuration validation with all default values. (6300 Switch Series)

```
switch# switch config-validator
Line number 15: Split detect (MAD) is recommended for vsf stack.
Line number 18: VSF interface should be configured in the VSF link and the
interface should be up.
Line number 34: Configuration 'associate role <ROLE_NAME> is missing.
Line number 38: Configuration 'enable' is recommended.
Line number 43: Configuration 'enable' is recommended.
Line number 45: A group (LLDP, CDP, MAC) should be associated with only one device
profile.
```

Running configuration validation with switches for the vsx feature. (6400 Switch Series)

```
switch (config)# switch config-validator config running-config feature vsx
Line number 36: Configuration `system-mac <VSX_SYSTEM_MAC>` is recommended
Line number 36: Multi chassis configuration is recommended for VSX redundancy
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

Command History

Chapter 98

NLB commands

arp ip mac

```
arp ip <IP-ADDR> mac <MAC-ADDR>
no arp ip <IP-ADDR> mac <MAC-ADDR>
```

Description

Configures static ARP multicast on the interface.

The **no** form of this command removes the static ARP multicast configuration.

Parameter	Description
<IP-ADDR>	Specifies cluster's virtual IPv4 address.
<MAC-ADDR>	Specifies multicast MAC address in IANA format (xx:xx:xx:xx:xx:xx) and non IANA format (xxxx.xxxx.xxxx).

Examples

Configuring static ARP multicast on an interface:

```
switch(config)# vlan 10
switch(config-vlan-10)# no shutdown
switch(config-vlan-10)# ip igmp snooping enable
switch(config-vlan-10)# exit
switch(config)# interface vlan10
switch(config-if-vlan)# ip igmp enable
switch(config-if-vlan)# arp ip 10.1.30.254 mac 01:00:5e:7F:1E:FE
```

If your NLB Virtual IP address is 10.1.30.254, then the server will join the 239.255.30.254 IGMP group. This IGMP group is mapped to the destination MAC address of 01:00:5e:7F:1E:FE.

For more information on features that use this command, refer to the IP Services Guide for your switch model.

Command History

Release	Modification
10.14	Replaced the **ipv4** parameter with the **ip** parameter. The **ipv4** parameter is deprecated.

Release	Modification
10.08	Added NLB support for 6300 and 6400 Switch series.
10.07 or earlier	--

Platforms	Command context	Authority
6300 6400	`config-if` and `config-if-vlan`	Administrators or local user group members with execution rights for this command.

show arp

```
show arp
```

Description

Displays the static ARP multicast information.

Examples

Displaying the static ARP multicast information:

```
switch# show arp

IPv4 Address     MAC                Port         Physical Port    State
---------------------------------------------------------------------------
3.3.3.3          01:00:5e:00:00:02               1/1/1            permanent
2.2.2.2          01:00:5e:00:00:01  vlan10                        permanent

Total Number Of ARP Entries Listed- 2.
---------------------------------------------------------------------------
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

show ip igmp snooping vlan group

`show ip igmp snooping vlan <VLAN-ID> group IGMP-Group`

Description

Displays multicast joins (members of the cluster) participating in the IGMP group.

Examples

Displaying multicast joins participating in the IGMP group:

```
switch# show ip igmp snooping vlan 10 group 239.255.30.254

VLAN ID   : 10
VLAN Name : VLAN10

Group Address : 239.255.30.254
Last Reporter : 10.1.30.254
Group Type    : Filter

                                        V1        V2        Sources   Sources

NTP commands

ntp authentication

```
ntp authentication
no ntp authentication
```

Description

Enables support for authentication when communicating with an NTP server.

The **no** form of this command disables authentication support.

Examples

Enabling authentication support:

```
switch(config)# ntp authentication
```

Disabling authentication support:

```
switch(config)# no ntp authentication
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification

ntp authentication-key

```
ntp authentication-key <KEY-ID> {md5 | sha1}
    [{ <PLAINTXT-KEY> [trusted] | ciphertext <ENCRYPTED-KEY> }]
no ntp authentication-key <KEY-ID>  {md5 | sha1}
    [{ <PLAINTXT-KEY> [trusted] | ciphertext <ENCRYPTED-KEY> }]
```

Description

Defines an authentication key that is used to secure the exchange with an NTP time server. This command provides protection against accidentally synchronizing to a time source that is not trusted.

The **no** form of this command removes the authentication key.

Parameter	Description
<KEY-ID>	Specifies the authentication key ID. Range: 1 to 65534.
`md5`	Selects MD5 key encryption.
`sha1`	Specifies SHA1 key encryption.
<PLAINTXT-KEY>	Specifies the plaintext authentication key. Range: 8 to 40 characters. The key may contain printable ASCII characters excluding "#" or be entered in hex. Keys longer than 20 characters are assumed to be hex. To use an ASCII key longer than 20 characters, convert it to hex.
`trusted`	Specifies that this is a trusted key. When NTP authentication is enabled, the switch only synchronizes with time servers that transmit packets containing a trusted key.
`ciphertext` *<ENCRYPTED-KEY>*	Specifies the ciphertext authentication key in Base64 format. This is used to restore the NTP authentication key when copying configuration files between switches or when uploading a previously saved configuration. **NOTE:** When the key is not provided on the command line, plaintext key prompting occurs upon pressing Enter, followed by prompting as to whether the key is to be trusted. The entered key characters are masked with asterisks.

Examples

Defining key 10 with MD5 encryption and a provided plaintext trusted key:

```
switch(config)# ntp authentication-key 10 md5 F82#450b trusted
```

Defining key 5 with SHA1 encryption and a prompted plaintext trusted key:

```
switch(config)# ntp authentication-key 5 sha1
Enter the NTP authentication key: *********
Re-Enter the NTP authentication key: *********

Configure the key as trusted (y/n)? y
```

Removing key 10:

```
switch(config)# no ntp authentication-key 10
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

ntp enable

```
ntp enable
```

```
no ntp enable
```

Description

Enables the NTP client on the switch to automatically adjust the local time and date on the switch. The NTP client is disabled by default.

The **no** form of this command disables the NTP client.

Examples

Enabling the NTP client.

```
switch(config)# ntp enable
```

Disabling the NTP client.

```
switch(config)# no ntp enable
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

ntp conductor

```
ntp conductor vrf <VRF-NAME> [stratum <NUMBER>]
no ntp conductor vrf <VRF-NAME> [stratum <NUMBER>]
```

Description

Sets the switch as the conductor time source for NTP clients on the specified VRF. By default, the switch operates at stratum level 8. The switch cannot function as both NTP conductor and client on the same VRF.

The **no** form of this command stops the switch from operating as the conductor time source on the specified VRF.

Parameter	Description
`vrf <VRF-NAME>`	Specifies the VRF on which to act as conductor time source.
`stratum <NUMBER>`	Specifies the stratum level at which the switch operates. Range: 1 - 15. Default: 8.

Examples

Setting the switch to act as conductor time source on VRF **primary-vrf** with a stratum level of **9**.

```
switch(config)# ntp conductor vrf primary-vry statum 9
```

Stops the switch from acting as conductor time source on VRF **primary-vrf**.

```
switch(config)# no ntp conductor vrf primary-vry
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

ntp server

```
ntp server <IP-ADDR> [key <KEY-NUM>] [minpoll <MIN-NUM>] [maxpoll <MAX-NUM>][burst |
iburst][prefer] [version <VER-NUM>]
no ntp server <IP-ADDR> <IP-ADDR> [key <KEY-NUM>] [minpoll <MIN-NUM>] [maxpoll <MAX-NUM>]
[burst | iburst] [prefer] [version <VER-NUM>]
```

Description

Defines an NTP server to use for time synchronization, or updates the settings of an existing server with new values. Up to eight servers can be defined.

The **no** form of this command removes a configured NTP server.

The default NTP version is 4; it is backwards compatible with version 3.

Parameter	Description
`server <IP-ADDR>`	Specifies the address of an NTP server as a DNS name, an IPv4 address (**x.x.x.x**), where **x** is a decimal number from 0 to 255, or an IPv6 address (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F. When specifying an IPv4 address, you can remove leading zeros. For example, the address **192.169.005.100** becomes **192.168.5.100**. When specifying an IPv6 address, you can use two colons (::) to represent consecutive zeros (but only once), remove leading zeros, and collapse a hextet of four zeros to a single 0. For example, this address **2222:0000:3333:0000:0000:0000:4444:0055** becomes **2222:0:3333::4444:55** .
`key <KEY-NUM>`	Specifies the key to use when communicating with the server. A trusted key must be defined with the command **ntp authentication-key** and authentication must be enabled with the command **ntp authentication**. Range: 1 to 65534.
`minpoll <MIN-NUM>`	Specifies the minimum polling interval in seconds, as a power of 2. Range: 4 to 17. Default: 6 (64 seconds).
`maxpoll <MAX-NUM>`	Specifies the maximum polling interval in seconds, as a power of 2. Range: 4 to 17. Default: 10 (1024 seconds).
`burst`	Send a burst of packets instead of just one when connected to the server. Useful for reducing phase noise when the polling interval is long.
`iburst`	Send a burst of six packets when not connected to the server. Useful for reducing synchronization time at startup.
`prefer`	Make this the preferred server.
`version <VER-NUM>`	Specifies the version number to use for all outgoing NTP packets. Range: 3 or 4. Default: 4. **NOTE:** NTP is backwards compatible.

Usage

For features such as Activate and ZTP, a switch that has a factory default configuration will automatically be configured with pool.ntp.org. NTP server configurations via DHCP options are supported. The DHCP server can be configured with maximum of two NTP server addresses which will be supported on the switch. Only IPV4 addresses are supported.

NTP uses a stratum to describe the distance between a network device and an authoritative time source:

- A stratum 1 time server is directly attached to an authoritative time source (such as a radio or atomic clock or a GPS time source).
- A stratum 2 NTP server receives its time through NTP from a stratum 1 time server.

When using multiple servers with same stratum setting, the best practice to configure a preferred server, so NTP will attempt to use the preferred server as the primary NTP connection. If a preferred server is not manually set when NTP is enabled, the configured server with the lowest stratum will automatically be set as the preferred server. If there are servers with the same stratum, this auto prefer status will prevent AOS-CX from toggling between different servers as the primary server. Auto prefer selection of servers with same stratum (if not manually selected) may change after reconfiguring the switch, or after executing the **reboot** command.

Examples

Defining the ntp server pool.ntp.org, using iburst, and NTP version 4.

```
switch(config)# ntp server pool.ntp.org iburst version 4
```

Removing the ntp server pool.ntp.org.

```
switch(config)# no ntp server pool.ntp.org
```

Defining the ntp server my-ntp.mydomain.com and makes it the preferred server.

```
switch(config)# ntp server my-ntp.mydomain.com prefer
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

All platforms	`config`	Administrators or local user group members with execution rights for this command.

ntp trusted-key

```
ntp trusted-key <KEY-ID>
no ntp trusted-key <KEY-ID>
```

Description

Sets a key as trusted. When NTP authentication is enabled, the switch only synchronizes with time servers that transmit packets containing a trusted key.

The **no** form of this command removes the trusted designation from a key.

Parameter	Description
<KEY-ID>	Specifies the identification number of the key to set as trusted. Range: 1 to 65534.

Examples

Defining key 10 as a trusted key.

```
switch(config)# ntp trusted-key 10
```

Removing trusted designation from key 10:

```
switch(config)# no ntp trusted-key 10
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

ntp vrf

```
ntp vrf <VRF-NAME>
no ntp vrf <VRF-NAME>
```

Description

Specifies the VRF on which the NTP client communicates with an NTP server. The switch cannot function as both NTP conductor and client on the same VRF.
The **no** form of the command returns to default VRF.

Parameter	Description
<VRF-NAME>	Specifies the name of a VRF.

Example

Setting the switch to use the default VRF for NTP client traffic.

```
switch(config)# ntp vrf default
```

Setting the switch to use the default management VRF for NTP client traffic.

Returning the switch to use the default VRF for NTP client traffic.

```
switch(config)# no ntp vrf
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

show ntp associations

```
show ntp associations [vsx-peer]
```

Description

Shows the status of the connection to each NTP server. The following information is displayed for each server:

- Tally code : The first character is the Tally code:
  - (blank): No state information available (e.g. non-responding server)
  - x : Out of tolerance (discarded by intersection algorithm)
  - . : Discarded by table overflow (not used)
  - - : Out of tolerance (discarded by the cluster algorithm)
  - + : Good and a preferred remote peer or server (included by the combine algorithm)
  - # : Good remote peer or server, but not utilized (ready as a backup source)
  - * : Remote peer or server presently used as a primary reference
  - o : PPS peer (when the prefer peer is valid)
- ID: Server number.
- NAME: NTP server FQDN/IP address (Only the first 24 characters of the name are displayed).
- REMOTE: Remote server IP address.
- REF_ID: Reference ID for the remote server (Can be an IP address).
- ST: (Stratum) Number of hops between the NTP client and the reference clock.
- LAST: Time since the last packet was received in seconds unless another unit is indicated.
- POLL: Interval (in seconds) between NTP poll packets. Maximum (1024) reached as server and client sync.
- REACH: 8-bit octal number that displays status of the last eight NTP messages (377 = all messages received).

Parameter	Description
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

```
switch# show ntp associations
----------------------------------------------------------------------
 ID            NAME          REMOTE          REF-ID ST LAST POLL REACH
----------------------------------------------------------------------
  1       192.0.1.1       192.0.1.1          .INIT. 16    -   64     0
* 2  time.apple.com    17.253.2.253          .GPSs.  2   70  128   377
----------------------------------------------------------------------
```

show ntp statistics

```
show ntp statistics [vsx-peer]
```

Description

Shows global NTP statistics. The following information is displayed:

- Rx-pkts: Total NTP packets received.
- Current Version Rx-pkts: Number of NTP packets that match the current NTP version.
- Old Version Rx-pkts: Number of NTP packets that match the previous NTP version.
- Error pkts: Packets dropped due to all other error reasons.
- Auth-failed pkts: Packets dropped due to authentication failure.
- Declined pkts: Packets denied access for any reason.
- Restricted pkts: Packets dropped due to NTP access control.
- Rate-limited pkts: Number of packets discarded due to rate limitation.
- KOD pkts: Number of Kiss of Death packets sent.

Parameter	Description
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

```
switch(config)# show ntp statistics
                Rx-pkts 100
Current Version Rx-pkts 80
    Old Version Rx-pkts 20
               Err-pkts 2
```

```
       Auth-failed-pkts 1
          Declined-pkts 0
        Restricted-pkts 0
      Rate-limited-pkts 0
               KoD-pkts 0
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

show ntp status

```
show ntp status [vsx-peer]
```

Description

Shows the status of NTP on the switch.

Parameter	Description
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Displaying the status information when the switch is not synced to an NTP server:

```
switch# show ntp status
NTP is enabled.
NTP authentication is enabled.
NTP is using the default VRF for NTP server connections.

Wed Nov 23 23:29:10 PDT 2016
NTP uptime: 187 days, 1 hours, 37 minutes, 48 seconds

Not synchronized with an NTP server.
```

Displaying the status information when the switch is synced to an NTP server:

```
switch# show ntp status
NTP is enabled.
NTP authentication is enabled.
NTP is using the default VRF for NTP server connections.

Wed Nov 23 23:29:10 PDT 2016
NTP uptime: 187 days, 1 hours, 37 minutes, 48 seconds

Synchronized to NTP Server 17.253.2.253 at stratum 2.
Poll interval = 1024 seconds.
Time accuracy is within 0.994 seconds
Reference time: Thu Jan 28 2016 0:57:06.647 (UTC)
```

Chapter 100
OSPFv2 commands

active-backbone

```
active-backbone stub-default-route
no active-backbone stub-default-route
```

Description

This command enables the router to send a default route to stub areas if there is an active loopback link in the backbone area. The configuration is not required if backbone area has neighbors or passive interfaces configured. By default active backbone detection is enabled.

Examples

```
switch(config)# router ospf 1
switch(config-ospf-1)# active-backbone stub-default-route
```

```
switch(config)# no active-backbone stub-default-route
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

area (ospf)

```
area <AREA-ID>
no area <AREA-ID>
```

Description

Creates a normal area, with **<AREA-ID>** set if not present. If the area is already present and it is not a normal area, then this command changes the area type to normal.

The **no** form of this command deletes the area with the **<AREA-ID>** specified. Area can be of any type (nssa, nssa no-summary, stub, stub no-summary, and default normal area).

Parameter	Description
<AREA-ID>	Specifies the area ID in one of the following formats. OSPF area identifier in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. OSPF area identifier in decimal format. Range: 0 to 4294967295.

Examples

Creating a normal area:

```
switch(config)# router ospf 1
switch(config-ospf-1)# area 1
switch(config-ospf-1)# area 10.1.1.1
Switch(config-ospf-1)# show running-config current-context router ospf 1
       router-id 1.1.1.1
       area 0.0.0.0
       area 0.0.0.1
       area 0.0.0.2 stub
       area 0.0.0.3 nssa
```

Deleting an area:

```
switch(config)# router ospf 1
switch(config-ospf-1)# no area 1
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

area default-metric

```
area <AERA-ID> default-metric <COST>
no area <AREA-ID> default-metric
```

Description

Sets the cost of the default route announced to NSSA or stub areas.

The **no** form of this command resets the cost of the default route announced to NSSA or stub areas, to the default value of 1.

Parameter	Description
`<AREA-ID>`	Specifies area ID in one of the following formats. OSPF area identifier in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. OSPF area identifier in decimal format. Range: 0 to 4294967295.
`default-metric <COST>`	Sets the cost of default-summary LSAs announced to NSSA or stub areas, to the specified value. Default cost: 1. Range: 0 to 16777215.

Examples

Setting cost for default LSA summary:

```
switch(config)# router ospf 1
switch(config-ospf-1)# area 1 default-metric 2
switch(config-ospf-1)# area 0.0.0.1 default-metric 2
```

Setting cost for default LSA summary to default:

```
switch(config)# router ospf 1
switch(config-ospf-1)# no area 1 default-metric
switch(config-ospf-1)# no area 0.0.0.1 default-metric
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

area nssa

```
area <AREA-ID> nssa [no-summary]
no area <AREA-ID> nssa [no-summary]
```

Description

Creates the NSSA area (Not So Stubby Area) with **<AREA-ID>** if not present. If area is present and not NSSA area, this command changes the area type to NSSA area. If **no-summary** is used, area type will be NSSA No-Summary.

The **no** form of this command unsets the area type as NSSA. That is, the configured area will be changed to default normal area. The **no area <AREA-ID> nssa no-summary** command enables sending inter-area routes into NSSA, but will not unset the area as NSSA.

Parameter	Description
<AREA-ID>	Specifies the area ID in one of the following formats. OSPF area identifier in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. OSPF area identifier in decimal format. Range: 0 to 4294967295.
`nssa [no-summary]`	Specifies Not So Stubby Area (NSSA) area type. If area is present and not NSSA area, parameter changes the area type to NSSA area. If **no-summary** is specified, area type will be NSSA No-Summary, which means do not inject inter-area routes into NSSA.

Examples

Creating an NSSA area:

```
switch(config)# router ospf 1
switch(config-ospf-1)# area 1 nssa
switch(config-ospf-1)# area 1 nssa no-summary
```

Unsetting the area as NSSA

```
switch(config)# router ospf 1
switch(config-ospf-1)# no area 1 nssa
switch(config-ospf-1)# no area 1 nssa no-summary
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

area range

```
area <AREA-ID> range <IP-PREFIX> type {inter-area | nssa} [no-advertise]
no area <AREA-ID> range <IP-PREFIX> type {inter-area | nssa} [no-advertise]
```

Description

Summarizes the routes with the matching address or masks. This command only works for border routers.

The **no** form of this command removes route summarization for the configured IPv4 prefix address on the ABR. When using the **no** form of the command with the **no-advertise** option, enables advertising this range to other areas.

Parameter	Description
<AREA-ID>	Specifies the area ID in one of the following formats. OSPF area identifier in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. OSPF area identifier in decimal format. Range: 0 to 4294967295.
range *<IP-PREFIX>*	Specifies summarizing routes matching the area range prefix/mask.
type {inter-area | nssa}	Specifies the type this address aggregation applies to as either inter-area range prefix or NSSA range prefix.
no-advertise	Specifies the address range status as **DoNotAdvertise** (do not advertise this range to other areas).

Examples

Summarizing inter-area or NSSA paths:

```
switch(config)# router ospf 1
switch(config-ospf-1)# area 1
switch(config-ospf-1)# area 2 nssa
switch(config-ospf-1)# area 1 range 192.77.114.0/24 type inter-area
switch(config-ospf-1)# area 2 range 192.77.114.0/24 type nssa
switch(config-ospf-1)# area 2 range 192.77.114.0/24 type nssa no-advertise
```

Removing summarization:

```
switch(config)# router ospf 1
switch(config-ospf-1)# no area 1 range 192.77.114.0/24 type inter-area
switch(config-ospf-1)# no area 2 range 192.77.114.0/24 type nssa
switch(config-ospf-1)# no area 2 range 192.77.114.0/24 type nssa no-advertise
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

area stub

```
area <AREA-ID> stub [no-summary]
no area <AREA-ID> stub [no-summary]
```

Description

Creates the stub area with **<AREA-ID>** if not present. If the area is already present and it is not a normal stub area, then this command changes the stub area type to normal. If the **no-summary** parameter is used, area type will be stub No-Summary.

The **no** form of this command unsets the area as a stub type. That is, the configured area will be changed to a default normal area. The **no area <AREA-ID> stub no_summary** command enables sending inter-area routes into the stub area, but will not unset the area as stub.

ABR does not inject the default route in a Totally Stubby Area with loopback in Area 0.0.0.0. As a workaround, configure a passive interface or active neighbors in the backbone area.

Parameter	Description
<AREA-ID>	Specifies the area ID in one of the following formats. OSPF area identifier in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. OSPF area identifier in decimal format. Range: 0 to 4294967295.
`stub [no-summary]`	Specifies the stub area type. If the area is already present and it is not a stub area, this parameter changes the area type to stub. If **no-summary** is specified, area type will be stub No-Summary (totally stubby area), which means do not inject summary link advertisements into stub areas.

Examples

Creating a STUB area:

```
switch(config)# router ospf 1
switch(config-ospf-1)# area 1 stub
switch(config-ospf-1)# area 1 stub no-summary
```

Unsetting the area type as stub:

```
switch(config)# router ospf 1
switch(config-ospf-1) # no area 1 stub
switch(config-ospf-1) # no area 1 sub no-summary
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

area virtual-link

```
area <AREA-ID> virtual-link <ROUTER-ID>
no area <AREA-ID> virtual-link <ROUTER-ID>
```

Description

Creates an OSPF virtual link with a remote ABR and enters the vlink context.

The **no** form of this command deletes an OSPF virtual link with the specified router ID of the remote ABR. If no **<ROUTER-ID>** is specified, the **no** form of the command sets the virtual link to the default settings.

Parameter	Description
<AREA-ID>	Specifies the area ID in one of the following formats. OSPF area identifier in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. OSPF area identifier in decimal format. Range: 0 to 4294967295.
`virtual-link <ROUTER-ID>`	Configures a virtual link with the specified router ID of the remote ABR.

Examples

Configuring OSPF virtual links:

```
switch(config)# router ospf 1
switch(config-ospf-1)# area 100 virtual-link 100.0.1.1
switch(config-router-vlink)#
```

Deleting OSPF virtual links:

```
switch(config)# router ospf 1
switch(config-ospf-1)# no area 100 virtual-link 100.0.1.1
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

authentication

```
authentication {hmac-sha-1 | hmac-sha-256 | hmac-sha-384 | hmac-sha-512 | message-digest
| simple-text | null | keychain}
no authentication
```

Description

Sets the OSPF virtual-link authentication type that will be used for authentication with the remote ABR.

Choose one of the authentication types from the following parameters.

The **no** form of this command unconfigures the virtual-link authentication type used and sets it to Null authentication.

Parameter	Description
`hmac-sha-1`	Sets the authentication type as SHA-1.
`hmac-sha-256`	Sets the authentication type as SHA-256.
`hmac-sha-384`	Sets the authentication type as SHA-384.
`hmac-sha-512`	Sets the authentication type as SHA-512.
`message-digest`	Sets the authentication type to message-digest.
`simple-text`	Sets the authentication type to simple-text.
`null`	Sets the authentication type to null.
`keychain`	Sets authentication type to use the key chain.

Examples

Setting OSPF virtual links authentication type:

```
switch(config)# router ospf 1
switch(config-ospf-1)# area 100 virtual-link 100.0.1.1
switch(config-router-vlink)# authentication simple-text
```

Deleting OSPF virtual links authentication type:

```
switch(config)# router ospf 1
switch(config-ospf-1)# area 100 virtual-link 100.0.1.1
switch(config-router-vlink)# no authentication
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

authentication-key

```
authentication-key [{ciphertext | plaintext} <PASSWORD>]
no authentication-key
```

Description

Sets the OSPF virtual-link authentication password that is used for simple-text authentication. If the password is given in ciphertext, it will be decrypted and applied to the protocol.

The **no** form of this command deletes the virtual-link authentication password that is used for simple-text authentication.

Parameter	Description
`{ciphertext | plaintext}`	Selects the password format.
<PASSWORD>	Specifies the password.

When the password is not provided on the command line, plaintext password prompting occurs upon pressing Enter. The entered password characters are masked with asterisks.

Examples

Setting the OSPF virtual link simple-text authentication password in plaintext format:

```
switch(config)# router ospf 1
switch(config-ospf-1)# area 100 virtual-link 100.0.1.1
switch(config-router-vlink)# authentication-key plaintext F82#450b
```

Setting the OSPF virtual link simple-text authentication with a prompted plaintext password:

```
switch(config)# router ospf 1
switch(config-ospf-1)# area 100 virtual-link 100.0.1.1
switch(config-router-vlink)# authentication-key
Enter the authentication key: ********
Re-Enter the authentication key: ********
```

Setting the OSPF virtual link simple-text authentication password in ciphertext format:

```
switch(config)# router ospf 1
switch(config-ospf-1)# area 100 virtual-link 100.0.1.1
switch(config-router-vlink)# authentication-key ciphertext AQaAz05...RmH+4pg=
```

Deleting the OSPF virtual link simple-text authentication password:

```
switch(config)# router ospf 1
switch(config-ospf-1)# area 100 virtual-link 100.0.1.1
switch(config-router-vlink)# no authentication-key
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

clear ip ospf neighbors

```
clear ip ospf [<PROCESS-ID>] neighbor [<NEIGHBOR>] [interface [<INTERFACE-NAME>]]
[all-vrfs | vrf <VRF-NAME>]
```

Description

Resets the neighbor and clears the OSPF neighbor information.

Parameter	Description
<PROCESS-ID>	Specifies the OSPFv2 process ID to clear the statistics for the particular OSPFv2 process. Range: 1 to 65535.
<NEIGHBOR>	Specifies the router ID of a neighbor.
<INTERFACE-NAME>	Specifies the OSPFv2 statistics to clear for the specified interface.
all-vrfs	Select to clear the OSPFv2 statistics for all VRFs.
vrf *<VRF-NAME>*	Specifies the name of a VRF.

Example

Clearing the OSPFv2 neighbor information:

```
switch# clear ip ospf 1 neighbor
Performing clear ospf neighbor may result in traffic disruption.
Do you want to continue (y/n)? y
switch# clear ip ospf 1 neighbor 1.1.1.2
Performing clear ospf neighbor may result in traffic disruption.
Do you want to continue (y/n)? y
switch# clear ip ospf 1 neighbor interface 1/1/1
Performing clear ospf neighbor may result in traffic disruption.
Do you want to continue (y/n)? y
switch# clear ip ospf 1 neighbor 1.1.1.5 vrf red
Performing clear ospf neighbor may result in traffic disruption.
Do you want to continue (y/n)? y
switch# clear ip ospf neighbor
Performing clear ospf neighbor may result in traffic disruption.
Do you want to continue (y/n)? y
switch# clear ip ospf neighbor 1.1.1.4
Performing clear ospf neighbor may result in traffic disruption.
Do you want to continue (y/n)? y
switch# clear ip ospf neighbor interface 1/1/1
Performing clear ospf neighbor may result in traffic disruption.
Do you want to continue (y/n)? y
switch# clear ip ospf neighbor 1.1.1.5 vrf red
Performing clear ospf neighbor may result in traffic disruption.
Do you want to continue (y/n)? y
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

clear ip ospf statistics

```
clear ip ospf [<PROCESS-ID>] statistics [interface [<INTERFACE-NAME>]] [all-vrfs | vrf
<VRF-NAME>]
```

Description

Clear the OSPF event statistics.

Parameter	Description
<PROCESS-ID>	OSPF process ID. Clear the statistics for the particular OSPF process. Range: 1 to 65535.
<INTERFACE-NAME>	Clear the OSPF statistics for the specified interface.
all-vrfs	Optionally select to clear the OSPF statistics for all VRFs.
vrf *<VRF-NAME>*	Optionally select to clear the OSPF statistics for a particular VRF. If the VRF is not specified, information for the default VRF is cleared.

Examples

Clearing the OSPF event statistics:

```
switch# clear ip ospf statistics
switch# clear ip ospf statistics interface 1/1/1
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

dead-interval

```
dead-interval <INTERVAL>
no dead-interval
```

Description

Sets the interval after which a neighbor is declared dead if no hello packet comes in for virtual links.

The **no** form of this command sets the dead interval to default for virtual links. The default value is 40 seconds (generally four times the hello packet interval).

For proper operation, set the dead interval must be longer than the hello interval.

Parameter	Description
<INTERVAL>	Specifies the time interval for the dead interval, in seconds. Range: 1 to 65535. Default: 40.

Examples

Setting the OSPv2F virtual links dead interval:

```
switch(config)# router ospf 1
switch(config-ospf-1)# area 100 virtual-link 100.0.1.1
switch(config-router-vlink)# dead-interval 30
```

Setting the OSPFv2 virtual links dead interval to default:

```
switch(config)# router ospf 1
switch(config-ospf-1)# area 100 virtual-link 100.0.1.1
switch(config-router-vlink)# no dead-interval
```

default-information originate

```
default-information originate [metric <METRIC-VALUE>]
```

```
no default-information originate [metric <METRIC-VALUE>]
```

Description

Configures OSPF to advertise the default route (0.0.0.0/0) to its neighbors if it is present in the routing table. Optionally, the metric value can be set for default route ::/0. The default value is 1.

The **no** form of this command disables advertisement of the default route.

Parameter	Description
metric <METRIC-VALUE>	Specifies the OSPF metric value for the default route. Optional. Default: 1.

Examples

Setting advertisement of the default route:

```
switch(config)# router ospf 1
switch(config-ospf-1)# default-information originate
```

Disabling advertisement of the default route:

```
switch(config)# router ospf 1
switch(config-ospf-1)# no default-information originate
```

Setting advertisement of the default route and specifying an optional metric value of 20:

```
switch(config)# router ospf 1
switch(config-ospfv3-1)# default-information originate
switch(config-ospfv3-1)# default-information originate metric 20
```

Disabling advertisement of the default route and setting metric to the default value:

```
switch(config)# router ospf 1
switch(config-ospf-1)# no default-information originate metric
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

default-information originate always

```
default-information originate always [metric <METRIC-VALUE>]
no default-information originate always [metric <METRIC-VALUE>]
```

Description

Configures OSPF to advertise the default route (0.0.0.0/0) to its neighbors, regardless if it is present in the routing table or not. Optionally, metric can be set for default route 0.0.0.0/0. The default value is 1.

The **no** form of this command disables advertisement of the default route.

Parameter	Description
metric <METRIC-VALUE>	Specifies the OSPF metric value for the default route. Default: 1.

Examples

Setting advertisement of the default route:

```
switch(config)# router ospf 1
switch(config-ospf-1)# default-information originate always
```

Disabling advertisement of the default route:

```
switch(config)# router ospf 1
switch(config-ospf-1)# no default-information originate always
```

Setting advertisement of the default route with metric set to 20:

```
switch(config)# router ospf 1
switch(config-ospf-1)# default-information originate always metric 20
```

Disabling advertisement of the default route and setting the metric to the default value:

```
switch(config)# router ospf 1
switch(config-ospf-1)# no default-information originate always metric
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

default-metric

```
default-metric <METRIC-VALUE>
no default-metric
```

Description

Sets the default metric for redistributed routes in the OSPF.

The **no** form of this command sets the default metric to be used for redistributed routes into OSPF to the default of 25.

Parameter	Description
<METRIC-VALUE>	Specifies the default metric value to use for redistributed routes. Default: 25. Range: 0-1677214.

Examples

Setting default metric for redistributed routes:

```
switch(config)# router ospf 1
switch(config-ospf-1)# default-metric 37
```

Setting default metric for redistributed routes to the default:

```
switch(config)# router ospf 1
switch(config-ospf-1)# no default-metric
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

6300 6400	`config-ospf-<PROCESS-ID>`	Administrators or local user group members with execution rights for this command.

distance

```
distance [<DISTANCE-VAL> | intra-area [<DISTANCE-VAL>] | inter-area [<DISTANCE-VAL>] |
external [<DISTANCE-VAL>]]
no distance [intra-area | inter-area | external]
```

Description

Defines an Administrative Distance (AD) for OSPF. Administrative Distance is used as a criteria to select the best route when multiple routes are present from different routing protocols.

The **no** form of this command sets the OSPF administrative distance to the default of 110. Optionally, administrative distance can be set to default for the specific OSPF route type: intra-area, inter-area, or external type-5 and type-7 routes.

Parameter	Description
<DISTANCE-VAL>	Specifies the OSPF administrative distance. Range: 1 to 255. Default: 110.
intra-area	Specifies the OSPF distance for intra-area routes.
inter-area	Specifies the OSPF distance for inter-area routes.
external	Specifies the OSPF distance for external type 5 and type 7 routes.

Usage

Within a given OSPF process, intra-area routes are always given precedence even when distances are configured for inter-area or external type routes.

Examples

Setting OSPF administrative distance:

```
switch(config)# router ospf 1
switch(config-ospf-1)# distance 100
switch(config-ospf-1)# distance intra-area 24 external 55 inter-area 66
switch(config-ospf-1)# distance intra-area 24 external 55
switch(config-ospf-1)# distance external 55
switch(config-ospf-1)#exit

switch(config)# router ospf 2
switch(config-ospf-2)# distance 200
switch(config-ospf-2)# distance external 60
switch(config-ospf-2)# distance intra-area 24 inter-area 66
```

Setting OSPF administrative distance to the default:

```
switch(config)# router ospf 1
switch(config-ospf-1)# no distance
switch(config-ospf-1)# no distance external
switch(config-ospf-1)# no distance inter-area
switch(config-ospf-1)# no distance intra-area
switch(config-ospf-1)# no distance 100
switch(config-ospf-1)# no distance 220

switch(config)# router ospf 2 vrf blue
switch(config-ospf-2)# no distance 200
switch(config-ospf-2)# no distance external 60
switch(config-ospf-2)# no distance intra-area 24 inter-area 66
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

distribute-list prefix

```
distribute-list prefix <prefix-list-name> {in | out}
no distribute-list prefix <prefix-list-name> {in | out}
```

Description

This command uses an existing prefix list to filter routes that are being installed in the routing table or redistributed to another routing protocol.

The **distribute-list prefix** command filters routes in the inbound or the outbound direction. When this command is issued with the **in** parameter, it filters routes from being installed in the routing table, it does not filter LSAs. When this command is issued with the **out** parameter, it filters only the desired redistributed routes from other protocols.

This command requires that your prefix list is already defined using the ip prefix commands. Route-maps are not supported with the distribute-list feature.

Parameter	Description
`prefix <prefix-list-name>`	Specify the name of an existing prefix.
`{in | out}`	Select one of the following parameters to set the filter direction: ▪ **in**: Filter incoming routes into the routing table ▪ **out**: Filter outgoing routing updates

Examples

The following commands enable the filtering of OSPFv2 routes in an IPv4 network, so routes are no longer installed in the routing table or redistributed from another routing protocol.

```
switch(config)# router ospfv2 1
switch(config-ospfv2-1)# distribute-list prefix listA in
switch(config-ospfv2-1)# distribute-list prefix listB out
```

The following command disables the filtering of OSPFv2 routes in an IPv4 network, so routes can be installed in the routing table or redistributed from another routing protocol.

```
switch# configure terminal
switch(config)# router ospfv2 1
switch(config-ospfv2-1)# no distribute-list prefix listA in
switch(config-ospfv2-1)# no distribute-list prefix listB out
```

enable

`enable`

Description

Enables the OSPF process, if disabled. By default the OSPF process is enabled.

Examples

Enabling OSPF process:

```
switch(config)# router ospf 1
switch(config-ospf-1)# enable
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

graceful-restart

```
graceful-restart
   restart-interval <INTERVAL>
   helper [strict-lsa-check]
   ignore-lost-interface
   no...
```

Description

Configures graceful restart parameters for OSPF.

The **no** form of this command sets the restart interval to the default interval of 120 seconds or disables the helper mode, depending on the parameter specified.

Parameter	Description
`restart-interval <INTERVAL>`	Specifies the time another router waits for this router to gracefully restart and selects the maximum time to wait in seconds. Range: 5 to 1800. Default: 120.
`helper`	Specifies that the router will participate in the graceful restart of a neighbor router.
`strict-lsa-check`	(Optional). Use with the **helper** parameter to enable strict Link state Advertisement (LSA) checking when acting as a restart helper for a restarting peer. **NOTE:** OSPF neighbors must disable strict LSA checking. If the local node has fewer OSPF interfaces after restarting, then the neighbors that were adjacent on those interfaces will clear up their adjacencies to the restarting node and will send out link state updates to advertise the dropped adjacency. If strict LSA checking is enabled, the restarting router's neighbors will exit helper mode when they receive the updated LSAs and the graceful restart will still fail.
`ignore-lost-interface`	Enable the restarting router to ignore lost OSPF interfaces during a graceful restart process. This setting should be enabled on a high availability system to ensure a graceful restart completes successfully, even if OSPF-enabled links fail due to High Availability events like a switchover or failover. **NOTE:** Enabling this setting means that the hitless restart procedures do not strictly follow those defined in *RFC 3623, Graceful OSPF Restart*.
`no`	Negate any parameter or return the setting to its default.

Examples

Enabling OSPF graceful restart:

```
switch(config)# router ospf 1
switch(config-ospf-1)# graceful-restart restart-interval 40
switch(config-ospf-1)# graceful-restart helper strict-lsa-check
```

Enabling the switch to ignore lost OSPF interfaces during a graceful restart process:

```
switch(config)# router ospf 1
switch (config-ospf-1)# graceful-restart ignore-lost-interface
```

Setting the restart interval to default, and disabling helper mode:

```
switch(config)# router ospf 1
switch(config-ospfv3-1)# no graceful-restart restart-interval
switch(config-ospfv3-1)# no graceful-restart helper
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

hello-interval

```
hello-interval <INTERVAL>
no hello-interval
```

Description

Sets the time interval between OSPF hello packets for virtual links.

The **no** form of this command sets the hello interval to the default value of 10 seconds for virtual links.

For proper operation, the hello interval must be shorter than the dead interval.

Parameter	Description
<INTERVAL>	Specifies the time interval for the hello interval, in seconds. Range: 1 to 65535. Default: 10.

Examples

Setting the OSPF virtual links hello interval:

```
switch(config)# router ospf 1
switch(config-ospf-1)# area 100 virtual-link 100.0.1.1
switch(config-router-vlink)# hello-interval 30
```

Setting the OSPF virtual links hello interval to default:

```
switch(config)# router ospf 1
switch(config-ospf-1)# area 100 virtual-link 100.0.1.1
switch(config-router-vlink)# no hello-interval
```

ip ospf area

```
ip ospf <PROCESS-ID> area <AREA-ID>
no ip ospf <PROCESS-ID> area <AREA-ID>
```

Description

Runs the OSPF protocol on the interface with the configured IPv4 address for the area specified. The interfaces which have an IP address configured in this network or in a subset of this network, will participate in the OSPF protocol.

To move an interface to a new area, unmap the existing area and then associate a new area with the interface.

The **no** form of this command disables OSPF on the interface and removes the interface from the area. Interfaces which have an IP address configured on the network or in a subset of the network, stop participating in the OSPF protocol.

Parameter	Description
<PROCESS-ID>	Specifies the OSPF process Id. Range: 1 to 65535.
<AREA-ID>	Specifies the OSPF area ID in one of the following formats. Area identifier in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. Area identifier in decimal format. Range: 0 to 4294967295.

Examples

Setting OSPF network for the area:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# ip ospf 1 area 1
switch(config-if-vlan)# ip ospf 1 area 0.0.0.1
```

Disabling OSPF network for the area:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# no ip ospf 1 area 1
switch(config-if-vlan)# no ip ospf 1 area 0.0.0.1
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

ip ospf authentication

```
ip ospf authentication {message-digest | simple-text | null | keychain | hmac-sha-1 |
hmac-sha-256 | hmac-sha-384 | hmac-sha-512}
no ip ospf authentication
```

Description

Sets the authentication type that will be used for authentication with the neighbor router.

The **no** form of this command deletes the authentication type used for a particular authentication with the neighbor router and sets to null authentication.

Parameter	Description
`message-digest`	Sets authentication type as message-digest.
`simple-text`	Sets authentication type as simple-text.
`null`	Sets authentication type as null.
`keychain`	Sets the authentication type to use the key chain.
`hmac-sha-1`	Sets the authentication type to SHA-1.

Parameter	Description
`hmac-sha-256`	Sets the authentication type to SHA-256.
`hmac-sha-384`	Sets the authentication type to SHA-384.
`hmac-sha-512`	Sets the authentication type to SHA-512.

Examples

Setting OSPF authentication type on the interface:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# ip ospf authentication simple-text
```

Deleting OSPF authentication type on the interface and sets it to null:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# no ip ospf authentication
```

Setting OSPF authentication type to SHA-384 on the interface:

```
switch(config)# interface vlan 5
switch(config-if-vlan)# ip ospf authentication hmac-sha-384
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

ip ospf authentication-key

```
ip ospf authentication-key [{ciphertext | plaintext} <PASSWORD>]
no ip ospf authentication-key
```

Description

Sets the authentication password used for simple-text authentication. If the password is given in ciphertext it will be decrypted and applied to the protocol.

The **no** form of this command deletes the authentication password used for simple-text authentication.

Parameter	Description
`{ciphertext | plaintext}`	Selects the password format.
<PASSWORD>	Specifies the password.

When the password is not provided on the command line, plaintext password prompting occurs upon pressing Enter. The entered password characters are masked with asterisks.

Examples

Setting the OSPF simple-text authentication password in plaintext format:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# ip ospf authentication-key plaintext F82#450b
```

Setting the OSPF simple-text authentication password with a prompted plaintext password:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# ip ospf authentication-key
Enter the authentication key: ********
Re-Enter the authentication key: ********
```

Setting the OSPF simple-text authentication password in ciphertext format:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# ip ospf authentication-key ciphertext AQBaZ...ecopg=
```

Deleting the OSPF simple-text authentication password:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# no ip ospf authentication-key
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

ip ospf cost

```
ip ospf cost <INTERFACE-COST>
no ip ospf cost
```

Description

Sets the cost (metric) associated with a particular interface. The interface cost is used as a parameter to calculate the best routes.

The **no** form of this command sets the cost (metric) associated with a particular interface to the default cost 1.

Parameter	Description
<INTERFACE-COST>	Specifies the interface cost value. Range: 1 to 65535. Default: 1.

Examples

Setting OSPF interface cost

```
switch(config)# interface vlan 1
switch(config-if-vlan)# ip ospf cost 100
```

Setting the OSPF interface cost to default

```
switch(config)# interface vlan 1
switch(config-if-vlan)# no ip ospf cost
```

ip ospf dead-interval

```
ip ospf dead-interval <INTERVAL>
no ip ospf dead-interval
```

Description

Sets the interval after which a neighbor is declared dead if no hello packet is received on the OSPF interface.

The **no** form of this command sets the interval after which a neighbor is declared dead, to the default for the OSPF interface. The default value is 40 seconds (generally 4 times the hello packet interval).

Parameter	Description
<INTERVAL>	Specifies the time interval for the dead interval, in seconds. Range: 1 to 65535. Default: 40.

Examples

Setting OSPF dead interval on the interface:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# ip ospf dead-interval 30
```

Setting OSPF dead interval to default on the interface:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# no ip ospf dead-interval
```

ip ospf hello-interval

```
ip ospf hello-interval <INTERVAL>
no ip ospf hello-interval
```

Description

Sets the time interval between OSPF hello packets for the OSPF interface.

The **no** form of this command sets the time interval OSPF hello packets to the default of 10 seconds for the OSPF interface.

Parameter	Description
<INTERVAL>	Specifies the time interval for the hello interval, in seconds. Range: 1 to 65535. Default: 10.

Examples

Setting OSPF hello interval on the interface:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# ip ospf hello-interval 30
```

Setting OSPF hello interval to the default on the interface:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# no ip ospf hello-interval
```

ip ospf keychain

```
ip ospf keychain <KEYCHAIN-NAME>
no ip ospf keychain
```

Description

Sets the key chain for md5 authentication. A key chain configures rotating keys for packet authenticating, reducing the risk of keys being compromised.

The **no** form of this command deletes the key chain used for md5 authentication.

Parameter	Description
<KEYCHAIN-NAME>	Name of key chain to be used for md5 authentication.

Examples

Setting OSPFv2 key chain authentication:

```
switch(config)# interface 1/1/1
switch(config-if)# ip ospf keychain ospf_keys
```

Deleting OSPFv2 key chain authentication:

```
switch(config)# interface 1/1/1
switch(config-if)# no ip ospf keychain
```

ip ospf message-digest-key md5

```
ip ospf message-digest-key <KEY-ID> md5 [{ciphertext | plaintext} <KEY>]
no ip ospf message-digest-key <KEY-ID>
```

Description

Sets the md5 message digest authentication key. If the md5 key is given in ciphertext, it will be decrypted and applied to the protocol.

The **no** form of this command deletes the md5 authentication key.

Parameter	Description
<KEY-ID>	Specifies the md5 key ID. Range: 1 to 255.
`{ciphertext | plaintext}`	Selects the md5 key format.
<KEY>	Specifies the md5 authentication key.

When the authentication key is not provided on the command line, plaintext key prompting occurs upon pressing Enter. The entered key characters are masked with asterisks.

Examples

Setting the md5 key in plaintext format:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# ip ospf message-digest-key 1 md5 plaintext F82#450b
```

Setting the md5 key with a prompted plaintext key:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# ip ospf message-digest-key 1 md5
Enter the MD5 authentication key: ********
Re-Enter the MD5 authentication key: ********
```

Setting the md5 key in ciphertext format:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# ip ospf message-digest-key 1 md5 ciphertext AQt6e...7qEa4=
```

Deleting the md5 key:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# no ip ospf message-digest-key 1
```

ip ospf network

```
ip ospf network {broadcast | point-to-point}
no ip ospf network
```

Description

Configures the OSPF network type for the interface. Choose one of the following parameters as the interface network type.

The **no** form of this command sets the network type for the interface to the system default which is broadcast network.

Parameter	Description
`broadcast`	Specifies the OSPF network type as a broadcast multi-access network.
`point-to-point`	Specifies the OSPF network type as a point-to-point network.

Examples

Setting OSPF network type for the interface:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# ip ospf network broadcast
switch(config-if-vlan)# ip ospf network point-to-point
```

Disabling OSPF network type for the interface to system default of broadcast network:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# no ip ospf network
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

ip ospf passive

```
ip ospf passive
no ip ospf passive
```

Description

Configures the interface as an OSPF passive interface. With this setting, the interface participates in OSPF but does not send or receive packets on that interface.

The **no** form of this command resets the interface as active. With this setting, the interface starts sending and receiving OSPF packets.

Examples

Setting the interface as OSPF passive interface:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# ip ospf passive
```

Setting the interface as OSPF active interface:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# no ip ospf passive
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

ip ospf priority

```
ip ospf priority <PRIORITY-VALUE>
no ip ospf priority
```

Description

Sets the OSPF priority for the interface. The larger the numeric value of the priority, the higher the chances for it to become the designated router. Setting a priority of zero makes the router ineligible to become a designated router or back up designated router.

The **no** form of this command sets the OSPF priority for the interface to the default of 1.

Parameter	Description
<PRIORITY-VALUE>	Specifies the OSPF priority value. Range: 0 to 255. Default: 1.

Examples

Setting OSPF priority for the interface:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# ip ospf priority 50
```

Disabling OSPF priority for the interface to default:

```
switch(config)# interface vlan1
switch(config-if-vlan)# no ip ospf priority
```

ip ospf retransmit-interval

```
ip ospf retransmit-interval <INTERVAL>
no ip ospf retransmit-interval
```

Description

Sets the time between retransmitting lost link state advertisements for the OSPF interface.

The **no** form of this command sets the time between retransmitting lost link state advertisements to the default of 5 seconds for the OSPF interface.

Parameter	Description
<INTERVAL>	Specifies the retransmit interval, in seconds. Range: 1 to 3600. Default: 5.

Examples

Setting OSPF retransmit interval on the interface:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# ip ospf retransmit-interval 30
```

Setting OSPF retransmit interval to the default on the interface:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# no ip ospf retransmit-interval
```

ip ospf sha-key sha

```
ip ospf sha-key <KEY-ID> sha [{ciphertext | plaintext} <KEY>]
no ip ospf sha-key <KEY-ID>
```

Description

Sets the SHA (secure hash authentication) key for the selected interface. If the SHA key is given in ciphertext, it will be decrypted and applied to the protocol. This command accepts a key of up to 64 characters irrespective of the SHA version configured on the interface. OSPF will internally pad zeros to the key to obtain a 64-byte key. For all types of SHA, key length is adjusted to 64 bytes.

The **no** form of this command deletes the SHA authentication key.

Parameter	Description
<KEY-ID>	Specifies the SHA key ID. Range: 1 to 255.
`{ciphertext | plaintext}`	Selects the SHA key format.
<KEY>	Specifies the SHA authentication key.

When the authentication key is not provided on the command line, plaintext key prompting occurs upon pressing Enter. The entered key characters are masked with asterisks.

Examples

Setting the SHA authentication key in plaintext format:

```
switch(config)# interface 1/1/1
switch(config-if)# ip ospf sha-key 1 sha plaintext F82#450b
```

Setting the SHA authentication key in prompted plaintext format:

```
switch(config)# interface 1/1/1
switch(config-if)# ip ospf sha-key 1 sha
Enter the SHA authentication key: ********
Re-Enter the SHA authentication key: ********
```

Setting the SHA authentication key in ciphertext format:

```
switch(config)# interface 1/1/1
switch(config-if)# ip ospf sha-key 1 sha ciphertext AQapu...C2K47A=
```

Deleting the SHA authentication key:

```
switch(config)# interface 1/1/1
switch(config-if)# no ip ospf sha-key 1
```

ip ospf shutdown

```
ip ospf shutdown
no ip ospf shutdown
```

Description

Disables OSPF on the interface. The interface state changes to Down. It does not remove the interface from the OSPF area. To remove the interface, use the command **no ip ospf area**.

The **no** form of this command re-enables OSPF on the interface

Examples

Disabling OSPF on the interface:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# ip ospf shutdown
```

Re-enabling OSPF on the interface:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# no ip ospf shutdown
```

ip ospf transit-delay

```
ip ospf transit-delay <DELAY>
no ip ospf transit-delay
```

Description

Sets the time delay in link state transmission for the OSPF interface.

The **no** form of this command sets the delay in link state transmission to the default of 1 second for the OSPF interface.

Parameter	Description
<DELAY>	Specifies the transit delay in seconds. Range: 1 to 3600. Default: 1.

Examples

Setting OSPF transit delay on the interface:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# ip ospf transit-delay 30
```

Setting OSPF transit delay to the default on the interface:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# no ip ospf transit-delay
```

keychain

```
keychain <KEYCHAIN-NAME>
no keychain
```

Description

Sets the key chain for md5 authentication. A key chain configures rotating keys for packet authenticating, reducing the risk of keys being compromised.

The **no** form of this command deletes the key chain used for md5 authentication.

Parameter	Description
<KEYCHAIN-NAME>	Name of key chain to be used for md5 authentication.

Examples

Setting OSPF virtual link key chain authentication:

```
switch(config)# router ospf 1
switch(config-ospf-1)# area 100 virtual-link 100.0.1.1
switch(config-router-vlink)# keychain ospf_keys
```

Deleting OSPF virtual link key chain authentication:

```
switch# configure terminal
switch(config)# router ospf 1
switch(config-ospf-1)# area 100 virtual-link  100.0.1.1
switch(config-router-vlink)# no keychain
```

max-metric router-lsa

```
max-metric router-lsa [on-startup [<ADVERT-TIME>]]
no max-metric router-lsa [on-startup]
```

Description

Sets the protocol to advertise a maximum metric so that other routers do not prefer this router as an intermediate hop in their shortest path first (SPF) calculations. If the on-startup parameter is used, the router is configured to advertise a maximum metric at startup for the time mentioned in seconds or for a default value of 600 seconds.

The **no** form of this command advertises the normal cost metrics instead of advertising the maximized cost metric. This setting causes the router to be considered in traffic forwarding.

Parameter	Description
`on-startup <ADVERT-TIME>`	Specifies the time in seconds to advertise self as stub-router on startup. If no time is specified, the default time of 600 seconds is used. Range: 5 to 86400. Default: 600.

Examples

Setting to maximize the cost metrics for Router LSA:

```
switch(config)# router ospf 1
switch(config-ospf-1)# max-metric router-lsa
switch(config-ospf-1)# max-metric router-lsa on-startup
switch(config-ospf-1)# max-metric router-lsa on-startup 3000
```

Setting to advertise the normal cost metrics instead of advertising the maximized cost metric:

```
switch(config)# router ospf 1
switch(config-ospf-1)# no max-metric router-lsa
switch(config-ospf-1)# no max-metric router-lsa on-startup
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

maximum-paths

```
maximum-paths <MAX-VALUE>
no maximum-paths
```

Description

Sets the maximum number of ECMP routes that OSPF can support.

The **no** form of this command sets the maximum number of ECMP routes that OSPF can support to the default value of 4.

Parameter	Description
<MAX-VALUE>	Specifies the maximum number of ECMP routes. Range: 1 to 32. Default: 4.

Examples

Setting maximum number of ECMP routes:

```
switch(config)# router ospf 1
switch(config-ospf-1)# maximum-paths 32
```

Setting maximum number of ECMP routes to the default of 4:

```
switch(config)# router ospf 1
switch(config-ospf-1)# no maximum-paths
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

message-digest-key md5

```
message-digest-key <KEY-ID> md5 [{ciphertext | plaintext} <KEY>]
no message-digest-key <KEY-ID>
```

Description

Sets the virtual link md5 message digest authentication key. If the md5 key is given in ciphertext, it will be decrypted and applied to the protocol.

The **no** form of this command deletes the virtual link md5 authentication key.

Parameter	Description
<KEY-ID>	Specifies the virtual link md5 key ID. Range: 1 to 255.
`{ciphertext | plaintext}`	Selects the virtual link md5 key format.
<KEY>	Specifies the virtual link md5 authentication key.

When the authentication key is not provided on the command line, plaintext key prompting occurs upon pressing Enter. The entered key characters are masked with asterisks.

Examples

Setting virtual link md5 authentication key in plaintext format:

```
switch(config)# router ospf 1
switch(config-ospf-1)# area 100 virtual-link 100.0.1.1
switch(config-router-vlink)# message-digest-key 1 md5 plaintext F82#450b
```

Setting the virtual link md5 authentication key in prompted plaintext format:

```
switch(config)# router ospf 1
switch(config-ospf-1)# area 100 virtual-link 100.0.1.1
switch(config-router-vlink)# message-digest-key 1 md5
Enter the MD5 authentication key: ********
Re-Enter the MD5 authentication key: ********
```

Setting the virtual link md5 authentication key in ciphertext format:

```
switch(config)# router ospf 1
switch(config-ospf-1)# area 100 virtual-link 100.0.1.1
switch(config-router-vlink)# message-digest-key 1 md5 ciphertext AQapu...C2K47A=
```

Deleting the virtual link md5 authentication password:

```
switch(config)# router ospf 1
switch(config-ospf-1)# area 100 virtual-link 100.0.1.1
switch(config-router-vlink)# no message-digest-key 1
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

passive-interface default

```
passive-interface default
no passive-interface
```

Description

Configures all OSPF interfaces as passive.

The **no** form of this command sets all OSPF interfaces as active.

Examples

Setting OSPF-enabled interfaces as passive:

```
switch(config)# router ospf 1
switch(config-ospf-1)# passive-interface default
```

Setting OSPF-enabled interfaces as active:

```
switch(config)# router ospf 1
switch(config-ospf-1)# no passive-interface
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

redistribute

```
redistribute {bgp | connected | host-routes | local loopback | static | rip | ospf
<PROCESS-ID>[route-map <ROUTE-MAP-NAME>]
no redistribute {bgp | connected | host-routes | local loopback | static | rip | ospf
<PROCESS-ID>}[route-map <ROUTE-MAP-NAME>]
```

Description

Redistributes routes originating from other protocols, or from another OSPFv2 process, to the current OSPFv2 process.

If a route map is specified, then only the routes that pass the match clause specified in the route map are redistributed to OSPFv2. Configuration is not allowed if the referenced route map has not yet been configured.

If you try to redistribute routes from an OSPFv2 process which is not created, you are prompted to allow the OSPFv2 process to be auto-created before proceeding with redistribution. If you confirm at the prompt, the OSPFv2 process is created with defaults and redistribution configuration applied. If you deny at the prompt, redistribution configuration is skipped.

If command **route-redistribute active-routes-only** has been issued, only the routes from other protocols which are selected for forwarding are considered for redistribution into OSPFv2.

The **no** form of this command disables redistribution of routes to the current OSPFv2 process.

Parameter	Description
`bgp`	Specifies redistributing BGP (Border Gateway Protocol) routes.
`connected`	Specifies redistributing connected (directly attached subnet or host).
`local loopback`	Specifies redistributing local routes of the loopback interface.
`static`	Specifies redistributing static routes.
`rip`	Specifies redistributing RIP routes.

Parameter	Description
ospf *<PROCESS-ID>*	Specifies redistributing routes from the specified OSPFv2 process ID. Range: 1 to 65535.
route-map *<ROUTE-MAP-NAME>*	Specifies redistribution filtering by route map. To create a route map, use command **route-map**.

Examples

Redistributing routes to OSPFv2:

```
switch(config)# router ospf 1
switch(config-ospf-1)# redistribute bgp
switch(config-ospf-1)# redistribute bgp route-map BGP_routes
```

```
switch(config-ospf-1)# redistribute host-routes
switch(config-ospf-1)# redistribute connected
switch(config-ospf-1)# redistribute connected route-map connected_routes
switch(config-ospf-1)# redistribute local loopback
switch(config-ospf-1)# redistribute local loopback route-map local_routes
switch(config-ospf-1)# redistribute static
switch(config-ospf-1)# redistribute static route-map static_networks
switch(config-ospf-1)# redistribute rip
switch(config-ospf-1)# redistribute rip route-map rip-routes
switch(config-ospf-1)# redistribute ospf 2
```

Disabling redistributing routes to OSPFv2:

```
switch(config)# router ospf 1
switch(config-ospf-1)# no redistribute bgp
switch(config-ospf-1)# no redistribute bgp route-map BGP_routes
```

```
 switch(config-ospf-1)# no redistribute connected
switch(config-ospf-1)# no redistribute connected route-map connected_routes
switch(config-ospf-1)# no redistribute local loopback
switch(config-ospf-1)# no redistribute local loopback route-map local_routes
switch(config-ospf-1)# no redistribute static
switch(config-ospf-1)# no redistribute static route-map static_networks
switch(config-ospf-1)# no redistribute rip
switch(config-ospf-1)# no redistribute rip route-map rip-routes
switch(config-ospf-1)# no redistribute ospf 2
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

reference-bandwidth

```
reference-bandwidth <BANDWIDTH>
no reference-bandwidth
```

Description

Sets the reference bandwidth for OSPFv2. If the OSPFv2 interface cost is not explicitly set, then the cost of all the OSPFv2 interfaces is recalculated based on the reference bandwidth and link speed of the interface.

For VLAN interfaces the link speed value is taken as 1 Gbps (if the OSPFv2 interface cost is not explicitly set).

The **no** form of this command sets the reference bandwidth for OSPF to the default of 100000 Mbps.

Parameter	Description
`<BANDWIDTH>`	Specifies the reference bandwidth used to calculate the cost of an interface in Mbps. Range: 1 to 4000000. Default: 100000.

Examples

Setting the reference bandwidth:

```
switch(config)# router ospf 1
switch(config-ospf-1)# reference-bandwidth 40000
```

Setting the reference bandwidth to the default value:

```
switch(config)# router ospf 1
switch(config-ospf-1)# no reference-bandwidth
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

retransmit-interval

```
retransmit-interval <INTERVAL>
no retransmit-interval
```

Description

Sets the time between retransmitting lost link state advertisements for virtual links.

The **no** form of this command sets the time between retransmitting lost link state advertisements to the default of 5 seconds for virtual links.

Parameter	Description
<INTERVAL>	Specifies the retransmit interval in seconds. Range: 1 to 3600. Default: 5.

Examples

Setting OSPFv2 virtual links retransmit interval:

```
switch(config)# router ospf 1
switch(config-ospf-1)# area 100 virtual-link 100.0.1.1
switch(config-router-vlink)# retransmit-interval 30
```

Setting OSPFv2 virtual links retransmit interval to default:

```
switch(config)# router ospf 1
switch(config-ospf-1)# area 100 virtual-link 100.0.1.1
switch(config-router-vlink)# no retransmit-interval
```

rfc1583-compatibility

```
rfc1583-compatibility
no rfc1583-compatibility
```

Description

Enables OSPF compatibility with RFC1583 (backward compatibility). If RFC1583 compatibility is enabled, then the route cost calculation follows a different method.

The **no** form of this command disables OSPF compatibility with RFC1583 (backward compatibility). By default the RFC1583 compatibility is disabled.

Examples

Enabling OSPF RFC1583 compatibility:

```
switch(config)# router ospf 1
switch(config-ospf-1)# rfc1583-compatibility
```

Disabling OSPF RFC1583 compatibility:

```
switch(config)# router ospf 1
switch(config-ospf-1)# no rfc1583-compatibility
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

router ospf

```
router ospf <PROCESS-ID> [vrf <VRF-NAME>]
no router ospf <PROCESS-ID> [vrf <VRF-NAME>]
```

Description

Creates an OSPF process (if not created already) on a VRF, and switches to the OSPF router instance context. Up to eight OSPF processes are supported per VRF.

The **no** form of this command removes the OSPF instance.

Parameter	Description
<PROCESS-ID>	Specifies an OSPF process ID. Range: 1 to 65535.
vrf *<VRF-NAME>*	Specifies a VRF name for the OSPF process. Default: default.

Examples

```
switch(config)# router ospf 1
switch(config-ospf-1)#
```

```
switch(config)# router ospf 1 vrf vrf_red
```

```
switch(config)# no router ospf 1
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

6300 6400	config	Administrators or local user group members with execution rights for this command.

router-id

```
router-id <ROUTER-ADDR>
no router-id
```

Description

Sets an ID for the router in an IPv4 address format.

The **no** form of this command unconfigures the router-id for the instance and sets the router-id to the default as follows: the router-id is selected dynamically as equal to the highest loopback address on the router, or the highest active interface if there are no loopback addresses. If no IP address is configured on any interfaces on the router, OSPF will not form an adjacency.

Parameter	Description
<ROUTER-ADDR>	Specifies the Router ID in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.

Examples

Setting router-id in the OSPF context:

```
switch(config)# router ospf 1
switch(config-ospf-1)# router-id 1.1.1.1
```

Unconfiguring router-id:

```
switch(config)# router ospf 1
switch(config-ospf-1)# no router-id
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

sha-key sha

```
sha-key <KEY-ID> sha [{ciphertext | plaintext} <KEY>]
no sha-key <KEY-ID>
```

Description

Sets the SHA (secure hash authentication) key for the selected virtual link. If the SHA key is given in ciphertext, it will be decrypted and applied to the protocol. This command accepts a key of up to 64 characters irrespective of the SHA version configured on virtual link. OSPF will internally pad zeros to the key to obtain a 64-byte key. For all types of SHA, key length is adjusted to 64 bytes.

The **no** form of this command deletes the virtual link SHA authentication key.

Parameter	Description
<KEY-ID>	Specifies the virtual link SHA key ID. Range: 1 to 255.

Parameter	Description
{ciphertext | plaintext}	Selects the virtual link SHA key format.
<KEY>	Specifies the virtual link SHA authentication key.

When the authentication key is not provided on the command line, plaintext key prompting occurs upon pressing Enter. The entered key characters are masked with asterisks.

Examples

Setting virtual link SHA authentication key in plaintext format:

```
switch(config)# router ospf 1
switch(config-ospf-1)# area 100 virtual-link 100.0.1.1
switch(config-router-vlink)# sha-key 1 sha plaintext F82#450b
```

Setting the virtual link SHA authentication key in prompted plaintext format:

```
switch(config)# router ospf 1
switch(config-ospf-1)# area 100 virtual-link 100.0.1.1
switch(config-router-vlink)# sha-key 1 sha
Enter the SHA authentication key: ********
Re-Enter the SHA authentication key: ********
```

Setting the virtual link SHA authentication key in ciphertext format:

```
switch(config)# router ospf 1
switch(config-ospf-1)# area 100 virtual-link 100.0.1.1
switch(config-router-vlink)# sha-key 1 sha ciphertext AQapu...C2K47A=
```

Deleting the virtual link SHA authentication key:

```
switch(config)# router ospf 1
switch(config-ospf-1)# area 100 virtual-link 100.0.1.1
switch(config-router-vlink)# no sha-key 1
```

show ip ospf

`show ip ospf [<PROCESS-ID>] [all-vrfs | vrf <VRF-NAME>]`

Description

Displays general OSPF, area, state, and configuration information.

Parameter	Description
<PROCESS-ID>	Enter an OSPF process ID to display general OSPF information for a particular OSPF process. Range: 1 to 65535.
`all-vrfs`	Optionally select to display general OSPF information for all VRFs.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Default: default.

Examples

Showing general OSPF configurations:

```
switch# show ip ospf 200

show ip ospf interface

```
show ip ospf [<PROCESS-ID>] interface [<interface-name>] [brief]
[all-vrfs | vrf <VRF-NAME>]  [vsx-peer]
```

Description

Displays general OSPF, area, state, and configuration information.

Parameter	Description
<PROCESS-ID>	Enter an OSPF process ID to display general OSPF information for a particular OSPF process. Range: 1 to 65535.
<interface-name>]	Specify the name of an OSPF interface.
brief	Include this parameter to display a brief overview of the following OSPF configuration information. ■ Interface: OSPF interface name. ■ Area: OSPF area ID. ■ Cost: The metric OSPF uses to judge a path's feasibility, calculated as (reference bandwidth / interface bandwidth). ■ State: Indicates if the interface is a designated router (**Dr**) or a backup designated router (**Backup-dr**). ■ Status: Indicates if the interface is **up** or **down**. ■ Flags: P - Passive A - Active.

Parameter	Description
`all-vrfs`	Optionally select to display general OSPF information for all VRFs.
`vrf` *`<VRF-NAME>`*	Specifies the name of a VRF. Default: default.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing general OSPF configuration settings for the default VRF:

```
switch (config-if)# show ip ospf 1
VRF : default                          Process  : 1
----------------------------------------------------

RouterID               : 20.0.0.1           OSPFv2                 : Enabled

show ip ospf lsdb

```
show ip ospf [<process-id>] lsdb
   adv-router {<ROUTER-ID> | self}
   area <AREA-ID>
   lsid <link-state-id>
   all-vrfs |{vrf <VRF-NAME>}
      asbr-summary
      database-summary
      external
      lsid <LINK-STATE-ID>
      network
      nssa-external
      router
      summary
```

Description

Shows the OSPF link state database summary for different OSPF LSAs (Link State Advertisement). Use the parameters to get information for a particular LSA.

Parameter	Description
`<PROCESS-ID>`	Enter an OSPF process ID to display general OSPF information for a particular OSPF process. Range: 1 to 65535.
`adv-router {<ROUTER-ID>|self}`	Select to display link states for a particular advertising router. Specify either a Router ID of the advertising router or specify **self** to show self-originated link states.
`area <AREA-ID>`	Select to display information filtered for the specified area in one of the following formats. OSPF area identifier in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. OSPF area identifier in decimal format. Value: 0 to 4294967295.
`lsid <LINK-STATE-ID>`	Select to display information filtered by link state identifier specified in IPv4 address format (A.B.C.D).
`all-vrfs|{vrf <vrf-name>`	Select **all-vrfs** to display general OSPF information for all VRFs, or use the **vrf *<VRF-NAME>*** option to display information for a specific VRF. Optionally select one of the following parameters to filter the link state database information.
`asbr-summary`	Show ASBR summary link states (LSA type 4).
`database-summary`	Select to display the count of each type of LSA and each area in the database. **NOTE:** The **database-summary** parameter does not support the **area <area-id>**, **lsid <link-state-id>** or **adv-router {<router-id>|self}** parameters.
`external`	Show external link states (LSA type 5).

Parameter	Description
	NOTE: The **external** parameter does not support the area **area <area-id>** parameter.
`network`	Show network LSAs (LSA type 2).
`nssa-external`	Show NSSA external link states (LSA type 7).
`router`	Show router LSAs (LSA type 1).
`summary`	Show network-summary link states (LSA type 3).

Examples

Showing OSPF link state database (LSDB) general information:

show ip ospf neighbors

```
show ip ospf [<PROCESS-ID>] neighbors [<NEIGHBOR-ID>]
     [interface <INTERFACE-NAME>] [detail | summary]
     [all-vrfs | vrf <VRF-NAME>]
```

Description

Displays information about OSPF neighbors.

Parameter	Description
<PROCESS-ID>	Enter an OSPF process ID to display OSPF neighbor information for the particular OSPF process. Range: 1 to 65535.
`neighbors` *<NEIGHBOR-ID>*	Select to display information about a particular neighbor, specified in IPv4 format (A.B.C.D).
`interface` *<INTERFACE-NAME>*	Select to display neighbor information only for the specified interface.
`detail`	Select to display detailed information for all the neighbors.
`summary`	Select to display summary information for the neighbors.
`all-vrfs`	Select to display neighbor information for all VRFs.
`vrf` *<VRF-NAME>*	Specify the name of a VRF. Default: default.

Examples

Showing OSPF neighbors information for the default VRF:

```
switch# show ip ospf neighbors
OSPF Process ID 1 VRF default
==============================

Total Number of Neighbors: 1

Neighbor ID      Priority  State             Nbr Address       Interface
-------------------------------------------------------------------------
2.2.2.2          1         FULL/DR           10.1.1.2           1/1/1
```

Showing OSPF neighbors information for VRF red:

```
switch# show ip ospf neighbors vrf red
OSPF Process ID 1 VRF red
==========================

Total Number of Neighbors: 1

Neighbor ID      Priority  State             Nbr Address       Interface
-------------------------------------------------------------------------
1.1.1.1          1         FULL/BDR          10.1.1.1           1/1/1
```

Showing OSPF neighbors information for a specific neighbor:

```
switch# show ip ospf neighbors 2.2.2.2
switch# show ip ospf neighbors 2.2.2.2
VRF : default                         Process : 1
----------------------------------------------------------------
Router-Id      : 2.2.2.2              Area Id           : 0.0.0.0

show ip ospf routes

```
show ip ospf [<PROCESS-ID>] routes
     [<IPV4-ADDR>/<MASK>] [all-vrfs | vrf <VRF-NAME>]
```

Description

Displays OSPF routing table information.

Parameter	Description
<IPV4-ADDR>	Specify an IP address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.
<MASK>	Specifies the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 32.
<PROCESS-ID>	Enter an OSPF process ID to display OSPF neighbor information for the particular OSPF process. Range: 1 to 65535.
all-vrfs	Select to display neighbor information for all VRFs.
vrf *<VRF-NAME>*	Specify the name of a VRF. Default: default.

Examples

Showing OSPF routing table information:

```
switch# show ip ospf routes
Codes: i - Intra-area route, I - Inter-area route
       E1 - External type-1, E2 - External type-2

OSPF Process ID 1 VRF default, Routing Table
---------------------------------------------

Total Number of Routes : 2

10.1.1.0/24        (i) area: 0.0.0.0
     directly attached to interface 1/1/1, cost 1 distance 110
20.1.1.0/24        (I)
     via 10.1.1.2 interface 1/1/1, cost 2 distance 110
```

Showing OSPF routing table information for a specific subnet:

```
switch# show ip ospf routes 10.1.1.0/2
Codes: i - Intra-area route, I - Inter-area route
       E1 - External type-1, E2 - External type-2

OSPF Process ID 1 VRF default, Routing Table for prefixes 10.1.1.0/24
----------------------------------------------------------------------

Total Number of Routes : 1

10.1.1.0/24        (i) area: 0.0.0.0
     directly attached to interface 1/1/1, cost 1 distance 110
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

show ip ospf statistics

`show ip ospf [<PROCESS-ID>] statistics [all-vrfs | vrf <VRF-NAME>]`

Description

Displays OSPF statistics.

Parameter	Description
<PROCESS-ID>	Enter an OSPF process ID to display OSPF neighbor information for the particular OSPF process. Range: 1 to 65535.
`all-vrfs`	Select to display OSPF statistics information for all VRFs.
`vrf` *<VRF-NAME>*	Specify the name of a VRF. Default: default.

Examples

Showing OSPF statistics:

```
switch# show ip ospf statistics
OSPF Process ID 1 VRF default, Statistics (cleared 1h 16m 24s ago)
--------------------------------------------------------------

Unknown Interface Drops          : 0
Unknown Virtual Interface Drops : 0
Bad Instance ID Drops            : 0
Bad IP Header Length Drops       : 0
Wrong OSPF Version Drops         : 0
Bad Source IP Drops              : 0
Resource Failure Drops           : 0
Bad Header Length Drops          : 0
Total Drops                      : 0
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

show ip ospf statistics interface

```
show ip ospf [<PROCESS-ID>] statistics interface [<INTERFACE-NAME>]
     [all-vrfs | vrf <VRF-NAME>]
```

Description

Displays OSPF statistics for the OSPF-enabled interfaces.

Parameter	Description
<PROCESS-ID>	Enter an OSPF process ID to display OSPF-enabled interface statistics information on the specified OSPF process. Range: 1 to 65535.
<INTERFACE-NAME>	Select to display information only for the specified interface.
`all-vrfs`	Select to display OSPF-enabled interface statistics information for all VRFs.
`vrf` *<VRF-NAME>*	Specify the name of a VRF. Default: default.

Examples

Showing OSPF-enabled interfaces information:

```
switch# show ip ospf statistics interface 1/1/1
OSPF Process ID 1 VRF default, interface 1/1/1 statistics (cleared 0h 30m 28s ago)

show ip ospf virtual-links

`show ip ospf [<PROCESS-ID>] virtual-links [brief] [all-vrfs | vrf <VRF-NAME>]`

Description

Displays the current state and parameters of the OSPF virtual links.

Parameter	Description
<PROCESS-ID>	Enter an OSPF process ID to display information on the OSPF virtual links for the particular OSPF process. Range: 1 to 65535.
brief	Select to display brief overview information for the OSPF virtual links.
all-vrfs	Select to display OSPF virtual links information for all VRFs.
vrf *<VRF-NAME>*	Specify the name of a VRF. Default: default.

Examples

Showing OSPF virtual links information:

```
switch# show ip ospf virtual-links
Virtual link to router 40.40.40.40 is up
-----------------------------------------

VRF                 : default                        Process             : 21
Transit Area        : 0.0.0.1                        Authentication      : No
Hello Interval      : 10                             Dead Interval       : 40
Transit Delay       : 1                              Retransmit Interval : 5
Number of Link LSAs : 0                              Checksum Sum        : 0
Number of State Shanges : 4
```

Showing brief overview information for OSPF virtual links:

```
switch# show ip ospf virtual-links brief
OSPF Process ID 1 VRF default
==============================
Total Number of Virtual Links: 1

Remote Router    Transit Area      Status
-----------------------------------------
2.2.2.2          0.0.0.1           down
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

summary-address

```
summary-address  <IPV4-ADDR>/<MASK> [no-advertise | tag <TAG-VALUE>]
no summary-address <prefix/length> [no-advertise | tag <tag-value>
```

Description

Summarizes the external routes with the matching address and mask. When advertising this route, its metric is set to the lowest cost path from among the routes that were summarized.

The **no** form of this command disables route summarization.

This command only works for an ASBR (Autonomous System Boundary Router).

Parameter	Description
<IPV4-ADDR>	Specifies an IP address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.
<MASK>	Specifies the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 32.
`no-advertise`	Do not advertise the aggregate route. Suppress routes that match the specified prefix/mask pair.
`tag` *<TAG-VALUE>*	Specify the tag for the aggregate route. The summary prefix will be advertised along with the tag value in External LSAs. Range: 0 to 4294967295

Examples

Setting OSPF route summarization:

```
switch(config)# router ospf 1
switch(config-ospf-1)# summary-address 10.1.0.0/16
```

Disabling route summarization:

```
switch(config)# router ospf 1
switch(config-ospf-1)# no summary-address 10.1.0.0/16
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

timers lsa-arrival

```
timers lsa-arrival <DELAY>
no timers lsa-arrival
```

Description

Configures the minimum delay between receiving the same LSA from a peer. The same LSA is an LSA that contains the same LSA ID number, LSA type, and advertising router ID. If an instance of the same LSA arrives sooner before the delay expires, the LSA is dropped. Generally, the LSA arrival timer should be set to a value less than or equal to the start-time value for the command **timers throttle lsa start** on the neighbor.

The **no** form of this command sets the LSA timers to default values.

Parameter	Description
<DELAY>	Specifies the delay in milliseconds. Range: 0 to 600000. Default: 1000.

Examples

Setting the LSA arrival timer:

```
switch(config)# router ospf 1
switch(config-ospf-1)# timers lsa-arrival 10
```

Setting the LSA arrival timer to default:

```
switch(config)# router ospf 1
switch(config-ospf-1)# no timers lsa-arrival
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

timers throttle lsa

```
timers throttle lsa start-time <START-TIME> hold-time <HOLD-TIME> max-wait-time <WAIT-TIME>
no timers throttle lsa
```

Description

Configures the timers for LSA generation.

The **no** form of this command sets the LSA timers to default values.

Parameter	Description
`start-time <START-TIME>`	Specifies the initial wait time in milliseconds after which LSAs are generated. When set to 0, the LSAs are generated without any delay. Range: 0 to 600000. Default: 5000.
`hold-time <HOLD-TIME>`	Specifies the amount of time, in milliseconds, between regeneration of an LSA. The hold time doubles each time the same LSA must be regenerated, until **max-wait-time** is reached. When set to 0, LSA regeneration time is not increased. Range: 0 to 600000. Default: 0.
`max-wait-time <WAIT-TIME>`	Specifies the maximum wait time, in milliseconds, for regeneration of the same LSA. When set to 0, LSA regeneration time is not increased. Range: 0 to 600000. Default: 0.

Examples

Setting the LSA timers:

```
switch(config)# router ospf 1
switch(config-ospf-1)# timers throttle lsa start-time 100 hold-time 1000 max-wait-
time 10000
```

Setting LSA timers to default values:

```
switch(config)# router ospf 1
switch(config-ospf-1)# no timers throttle lsa
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

timers throttle spf

```
timers throttle spf start-time <START-TIME> hold-time <HOLD-TINME>
max-wait-time <WAIT-TIME>
no timers throttle spf
```

Description

Configures timers for SPF calculation. There are three timers:

- **start-time** Is the initial delay before an SPF calculation is started. Default is 200 milliseconds.
- **hold-time** Is the progressive backoff time to wait before next scheduled SPF calculation. Default is 1000 milliseconds. If a route change event occurs during this period, the value doubles until it reaches the *max-wait-time*.
- **max-wait-time** Is the maximum time to wait before the next scheduled SPF calculation. Default is 5000 milliseconds. This is used to limit the SPF hold timer and also defines the time to be considered for which the OSPF LSDB has to be stable, after which the SPF throttle mechanism is reset.

The **no** form of this command sets all the configured non-default timers to default value.

Parameter	Description
<START-TIME>	Time in milliseconds to set timer for initial SPF delay. Default: 200.
<HOLD-TINME>	Time in milliseconds to set the minimum hold time between two consecutive SPF calculations. Default: 1000.
<WAIT-TIME>	Time in milliseconds to set the maximum wait time between two consecutive SPF calculations. Default: 5000.

Examples

Setting non-default timer values for SPF throttling:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# timers throttling spf start-time 500 hold-time 3000 max-
wait-time 9000
Switch(config-ospfv3-1)# show running-config current-context
router ospfv3 1
               area 0.0.0.0
               area 0.0.0.1
               area 0.0.0.2 nssa no-summary
               area 0.0.0.3 stub
```

Setting default timer values for SPF throttling after configuring non-default values:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# no timers throttling spf
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

transit-delay

```
transit-delay <SECONDS>
no transit-delay
```

Description

Sets the time delay in Link state transmission for virtual links.

The **no** form of this command sets the delay in Link state transmission to the default of 1 second for virtual links.

Parameter	Description
<SECONDS>	Specifies the time delay for the transit delay, in seconds. Default: 1 second. Range: 1-3600.

Examples

Setting OSPFv2 virtual links transit delay:

```
switch(config)# router ospf 1
switch(config-ospf-1)# area 100 virtual-link 100.0.1.1
switch(config-router-vlink)# transit-delay 30
```

Setting OSPFv2 virtual links transit delay to default:

```
switch(config)# router ospf 1
switch(config-ospf-1)# area 100 virtual-link 100.0.1.1
switch(config-router-vlink)# no transit-delay
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

trap-enable

```
trap-enable
no trap-enable
```

Description

Enables the notification of the events to be sent as traps to the SNMP management stations for OSPF.

The **no** form of this command disables the notification of the events to be sent as traps to the SNMP management stations for OSPF.

Examples

Enabling sending notification of events as traps:

```
switch(config)# router ospf 1
switch(config-ospf-1)# trap-enable
```

Disabling sending notification of events as traps:

```
switch(config)# router ospf 1
switch(config-ospf-1)# no trap-enable
```

OSPFv3 commands

active-backbone

```
active-backbone stub-default-route
no active-backbone stub-default-route
```

Description

This command enables the router to send a default route to stub areas if there is an active loopback link in the backbone area. The configuration is not required if backbone area has neighbors or passive interfaces configured. By default active backbone detection is enabled.

Examples

```
switch(config)# router ospf 1
switch(config-ospf-1)# active-backbone stub-default-route
```

```
switch(config)# no active-backbone stub-default-route
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

area

```
area <AREA-ID>
no area <AREA-ID>
```

Description

Creates a normal area with **<AREA-ID>** set if not present. If area is present and is not the normal area, this command changes the area type to normal area.

The **no** form of this command deletes the area with the **<AREA-ID>** specified. The area can be of any type (stub, stub no-summary, and default normal area).

Parameter	Description
<AREA-ID>	Specifies the area ID is one of the following formats. OSPF area identifier in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. OSPF area identifier in decimal format. Range: 0 to 4294967295.

Examples

Creating a normal area:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# area 1
switch(config-ospfv3-1)# area 1.1.1.1
```

Deleting an area:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# no area 1
switch(config-ospfv3-1)# no area 1.1.1.1
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

area authentication ipsec

```
area <AREA-ID> authentication ipsec spi <SPI-INDEX> <AUTH-TYPE> [<KEY-TYPE> <AUTH-KEY>]
no area <AREA-ID> authentication
```

Description

Configures IPsec AH authentication for the specified area. OSPFv3 interfaces which have IPsec configured at the interface context will not use area level IPsec.

The **no** form of this command removes IPsec AH authentication for the specified area.

IPsec is not supported for 6in6 tunnel interfaces.

Parameter	Description
<AREA-ID>	Specifies the area ID is one of the following formats: OSPF area identifier in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. OSPF area identifier in decimal format. Range: 0 to 4294967295.
spi *<SPI-INDEX>*	Specifies the Security Parameters Index (SPI) to use. The SPI is an identification tag carried in the IPsec AH header. It enables the receiving OSPF process to select and use the Security Association (SA) from the SA table. The SPI must be unique on the switch. Range: 256 to 4294967295.
<AUTH-TYPE>	Specifies the authentication type: **md5** or **sha1**.
<KEY-TYPE>	Specifies the key type to use: **plaintext** (unencrypted), **hex-string** (encrypted) or **ciphertext** (encrypted).
<AUTH-KEY>	Specifies the authentication key.

When the authentication key is not provided on the command line, plaintext key prompting occurs upon pressing Enter. The entered key characters are masked with asterisks.

Examples

Setting area 0 to use IPsec authentication with a provided plaintext authentication key:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# area 0 authentication ipsec spi 256 sha1 plaintext
F82#450
```

Setting area 5 to use IPsec authentication with a prompted plaintext authentication key:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# area 5 authentication ipsec spi 256 sha1
Enter the IPsec authentication key: ********
Re-Enter the IPsec authentication key: ********
```

Removing IPsec authentication from area 1:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# no area 1 authentication
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

area encryption ipsec

```
area <AREA-ID> encryption ipsec spi <SPI-INDEX> <AUTH-TYPE>
    [<KEY-TYPE> <AUTH-KEY> <ENCR-TYPE> [<KEY-TYPE> <ENCR-KEY>]]
no area <AREA-ID> encryption
```

Description

Configures IPsec ESP with the authentication and encryption algorithm types and keys for the specified area. OSPFv3 interfaces with IPsec configured at the interface context will not use area level IPsec ESP configuration.

The **no** form of this command removes IPsec ESP from the specified area.

IPsec is not supported for 6in6 tunnel interfaces.

Parameter	Description
<AREA-ID>	Specifies the area ID is one of the following formats. OSPF area identifier in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. OSPF area identifier in decimal format. Range: 0 to 4294967295.
spi *<SPI-INDEX>*	Specifies the Security Parameters Index (SPI) to use. The SPI is an identification tag carried in the IPsec AH header. It enables the receiving OSPF process to select and use the Security Association (SA) from the SA table. The SPI must be unique on the switch. Range: 256 to 4294967295.
<AUTH-TYPE>	Specifies the authentication type: **md5** or **sha1**.
<KEY-TYPE>	Specifies the key type to use: **plaintext** (unencrypted), **hex-string** (encrypted) or **ciphertext** (encrypted).
<AUTH-KEY>	Specifies the authentication key.
<ENCR-TYPE>	Specifies the encryption type: **des**, **3des**, **aes**, or **null**. **NOTE:** Encryption type **aes** is considered to be AES128, AES192 or AES256 based on key length.
<ENCR-KEY>	Specifies the encryption key.

When the authentication key is not provided on the command line, plaintext authentication key prompting occurs upon pressing Enter, followed by encryption type prompting, and finally plaintext encryption key prompting. The entered key characters are masked with asterisks.

When the authentication key and encryption type are provided on the command line but the encryption key is not provided, plaintext encryption key prompting occurs upon pressing Enter. The entered key characters are masked with asterisks.

Examples

Setting area 0 to use IPSec ESP with provided authentication and encryption keys:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# area 0 encryption ipsec spi 256 md5 plaintext F824eva
                                des plaintext F82#450b
```

Setting area 5 to use IPSec ESP with prompted authentication and encryption keys:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# area 5 encryption ipsec spi 256 md5
Enter the IPsec authentication key: ********
Re-Enter the IPsec authentication key: ********

Enter the IPsec encryption type (3des/aes/des/null)? des

Enter the IPsec encryption key: ********
Re-Enter the IPsec encryption key: ********
```

Setting area 2 to use IPsec ESP with provided authentication password and encryption type but a prompted encryption key:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)#  area 2 encryption ipsec spi 256 md5 plaintext F82# des
Enter the IPsec encryption key: ********
Re-Enter the IPsec encryption key: ********
```

Setting area 0 to use IPSec ESP with provided plaintext authentication key and null encryption:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# area 0 encryption ipsec spi 256 md5 plaintext axtw null
```

Removing IPSec ESP from area 0:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# no area 0 encryption
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-ospfv3-<PROCESS-ID>`	Administrators or local user group members with execution rights for this command.

area nssa

```
area <AREA-ID> nssa [no-summary]
no area <AREA-ID> nssa [no-summary]
```

Description

Creates the NSSA area (Not So Stubby Area) with **<AREA-ID>** if not present. If area is present and not NSSA area, this command changes the area type to NSSA area. If **no-summary** is used, area type will be NSSA No-Summary.

The **no** form of this command clears the NSSA area type. That is, the configured area will be changed to default normal area. The **no area <AREA-ID> nssa no-summary** command enables sending inter-area routes into NSSA, but will not unset the area as NSSA.

Parameter	Description
<AREA-ID>	Specifies the area ID is one of the following formats. OSPF area identifier in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. OSPF area identifier in decimal format. Range: 0 to 4294967295.
`nssa [no-summary]`	Specifies Not So Stubby Area (NSSA) area type. If area is present and not NSSA area, parameter changes the area type to NSSA area. If **no-summary** is specified, area type will be NSSA No-Summary, which means do not inject inter-area routes into NSSA.

Examples

Creating an NSSA area for OSPFv3:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# area 1 nssa
switch(config-ospfv3-1)# area 1 nssa no-summary
```

Clearing the NSSA area for OSPFv3:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# no area 1 nssa
switch(config-ospfv3-1)# no area 1 nssa no-summary
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

area range

```
area <AREA-ID> range <IP-PREFIX> type {inter-area | nssa} [no-advertise]
no area <AREA-ID> range <IP-PREFIX> type {inter-area | nssa} [no-advertise]
```

Description

Summarizes the routes with the matching address or masks for OSPFv3. This command only works for border routers.

The **no** form of this command unsets the route summarization for the configured IPv4 prefix address on the ABR. When using the **no** form of the command with the **no-advertise** option, enables advertising this range to other areas.

Parameter	Description
<AREA-ID>	Specifies the area ID is one of the following formats. OSPF area identifier in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. OSPF area identifier in decimal format. Range: 0 to 4294967295.
`range <IP-PREFIX>`	Specifies summarizing routes matching the area range prefix/mask.
`type {inter-area	nssa}`	Specifies the type this address aggregation applies to as either inter-area range prefix or NSSA range prefix.
`no-advertise`	Specifies the address range status as **DoNotAdvertise** (do not advertise this range to other areas).

Examples

Summarizing inter-area or NSSA paths on OSPFv3:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# area 1 range fd00::/64 type inter-area
switch(config-ospfv3-1)# area 1 range fd00::/64 type nssa
switch(config-ospfv3-1)# area 1 range fd00::/64 type inter-area no-advertise
```

Unsetting summarization on OSPFv3:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# no area 1 range fd00::/64 type inter-area
switch(config-ospfv3-1)# no area 1 range fd00::/64 type nssa
switch(config-ospfv3-1)# no area 1 range fd00::/64 type inter-area no-advertise
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

area stub

```
area <AREA-ID> stub [no-summary]
no area <AREA-ID> stub [no-summary]
```

Description

Creates the stub area with **<AREA-ID>** if not present. If area is present and is not the stub area, this command changes the area type to stub area. If **no-summary** is used, area type will be totally stubby area.

The **no** form of this command unsets the area type as stub. The configured area will be changed to the default normal area. The **no area <AREA-ID> stub no-summary** command will start sending Area Border Router (ABR) summary link advertisements into the stub area, but will not unset the stub area.

ABR does not inject the default route in a Totally Stubby Area with loopback in Area 0.0.0.0. As a workaround, configure a passive interface or active neighbors in the backbone area.

Parameter	Description
<AREA-ID>	Specifies the area ID is one of the following formats. OSPF area identifier in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.

Parameter	Description
	OSPF area identifier in decimal format. Range: 0 to 4294967295.
`stub [no-summary]`	Specifies stub area type. If area is present and not stub area, this parameter changes the area type to stub area. If **no-summary** is specified, area type will be totally stubby area, which means do not inject interarea routes into stub.

Examples

Creating a stub area:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# area 1 stub
switch(config-ospfv3-1)# area 1 stub no-summary
```

Unsetting the stub area type:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1) # no area 1 stub
switch(config-ospfv3-1) # no area 1 sub no-summary
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

area virtual-link

```
area <AREA-ID> virtual-link <ROUTER-ID>
no area <AREA-ID> virtual-link <ROUTER-ID>
```

Description

Creates an OSPF virtual link with remote ABR (if not created already) and enters the vlink context.

The **no** form of this command deletes an OSPF virtual link with the specified router ID of the remote ABR. If no**<ROUTER-ID>** is specified, the **no** form of the command sets the virtual link to the default settings.

Parameter	Description
<AREA-ID>	Specifies the area ID is one of the following formats. OSPF area identifier in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. OSPF area identifier in decimal format. Range: 0 to 4294967295.
virtual-link *<ROUTER-ID>*	Configures a virtual link with the specified router ID of the remote ABR.

Examples

Configuring OSPF virtual links:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# area 100 virtual-link 100.0.1.1
```

Deleting OSPF virtual links:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# no area 100 virtual-link 100.0.1.1
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

area default-metric

```
area <AREA-ID> default-metric <METRIC>
no area <AREA-ID> default-metric
```

Description

Sets the cost of default-summary LSAs announced to the stub/nssa areas.

The **no** form of this command resets the cost of the default-summary LSAs announced to stub/nssa areas to the default of 1.

Parameter	Description
<AREA-ID>	Specifies the area ID is one of the following formats. OSPF area identifier in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. OSPF area identifier in decimal format. Range: 0 to 4294967295.
default-metric *<METRIC>*	Specifies the default metric of default-summary LSAs announced to the stub/nssa areas, to the specified value. Default: 1. Range: 0 to 16777215.

Examples

Setting cost for default LSA summary:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# area 1 default-metric 2
switch(config-ospfv3-1)# area 1.1.1.1 default-metric 2
```

Setting cost for default LSA summary to default:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# no area 1 default-metric
switch(config-ospfv3-1)# no area 0.0.0.1 default-metric
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

authentication ipsec

```
authentication ipsec spi <SPI-INDEX> <AUTH-TYPE> [<KEY-TYPE> <AUTH-KEY>]
no authentication
```

Description

Configures IPsec AH authentication for the selected Vlink.

The **no** form of this command removes IPsec AH authentication for the selected Vlink.

Parameter	Description
`spi <SPI-INDEX>`	Specifies the Security Parameters Index (SPI) to use. The SPI is an identification tag carried in the IPsec AH header. It enables the receiving OSPF process to select and use the Security Association (SA) from the SA table. The SPI must be unique on the switch. Range: 256 to 4294967295.
<AUTH-TYPE>	Specifies the authentication type: **md5** or **sha1**.
<KEY-TYPE>	Specifies the key type to use: **plaintext** (unencrypted), **hex-string** (encrypted) or **ciphertext** (encrypted).
<AUTH-KEY>	Specifies the authentication key.

When the authentication key is not provided on the command line, plaintext key prompting occurs upon pressing Enter. The entered key characters are masked with asterisks.

Examples

Setting area 1 to use IPsec AH authentication for Vlink with provided plaintext key:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# area 1
switch(config-ospfv3-1)# area 1 virtual-link 3.3.3.3
switch (config-router-vlink6)# authentication ipsec spi 256 sha1 plaintext F82#450
```

Setting area 1 to use IPsec AH authentication for Vlink with prompted plaintext key:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# area 1
switch(config-ospfv3-1)# area 1 virtual-link 3.3.3.3
switch (config-router-vlink6)# authentication ipsec spi 256 sha1
Enter the IPsec authentication key: ********
Re-Enter the IPsec authentication key: *******
```

Removing IPsec AH authentication for Vlink on area 1:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# area 1 virtual-link 3.3.3.3
switch(config-router-vlink6)# no authentication
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

clear ipv6 ospfv3 neighbors

```
clear ipv6 ospfv3 [<PROCESS-ID>] neighbor [<NEIGHBOR>] [interface [<INTERFACE-NAME>]]
[all-vrfs | vrf <VRF-NAME>]
```

Description

Resets the neighbor and clears the OSPF neighbor information.

Parameter	Description
<PROCESS-ID>	Specifies the OSPFv3 process ID to clear the statistics for the particular OSPFv3 process. Range: 1 to 65535.
<NEIGHBOR>	Specifies the router ID of a neighbor.
<INTERFACE-NAME>	Specifies the OSPFv3 statistics to clear for the specified interface.
`all-vrfs`	Select to clear the OSPFv3 statistics for all VRFs.
`vrf` *<VRF-NAME>*	Specifies the name of a VRF.

Example

Clearing the OSPFv3 neighbor information:

```
switch# clear ipv6 ospfv3 1 neighbor
Performing clear ospf neighbor may result in traffic disruption.
Do you want to continue (y/n)? y
switch# clear ipv6 ospfv3 1 neighbor 3.3.3.3
Performing clear ospf neighbor may result in traffic disruption.
Do you want to continue (y/n)? y
switch# clear ipv6 ospfv3 1 neighbor interface 1/1/1
Performing clear ospf neighbor may result in traffic disruption.
Do you want to continue (y/n)? y
switch# clear ipv6 ospfv3 1 neighbor 3.3.3.3 vrf red
Performing clear ospf neighbor may result in traffic disruption.
Do you want to continue (y/n)? y
switch# clear ipv6 ospfv3 neighbor
Performing clear ospf neighbor may result in traffic disruption.
Do you want to continue (y/n)? y
switch# clear ipv6 ospfv3 neighbor 5.5.5.5
Performing clear ospf neighbor may result in traffic disruption.
Do you want to continue (y/n)? y
switch# clear ipv6 ospfv3 neighbor interface 1/1/1
Performing clear ospf neighbor may result in traffic disruption.
Do you want to continue (y/n)? y
switch# clear ipv6 ospfv3 neighbor 5.5.5.5 vrf red
Performing clear ospf neighbor may result in traffic disruption.
Do you want to continue (y/n)? y
```

clear ipv6 ospfv3 statistics

```
clear ipv6 ospfv3 [<PROCESS-ID>] statistics [interface [<INTERFACE-NAME>]]
[all-vrfs | vrf <VRF-NAME>]
```

Description

Clears the OSPFv3 event statistics.

Parameter	Description
<PROCESS-ID>	Specifies the OSPFv3 process ID to clear the statistics for the particular OSPFv3 process. Range: 1 to 65535.
<INTERFACE-NAME>	Specifies the OSPFv3 statistics to clear for the specified interface.
all-vrfs	Select to clear the OSPFv3 statistics for all VRFs.
vrf *<VRF-NAME>*	Specifies the name of a VRF.

Example

Clearing the OSPFv3 event statistics:

```
switch# clear ipv6 ospfv3 statistics
switch# clear ipv6 ospfv3 statistics interface 1/1/1
switch# clear ipv6 ospfv3 statistics interface 1/1/1 vrf vrf_red
```

dead-interval

```
dead-interval <INTERVAL>
no dead-interval
```

Description

Sets the interval after which a neighbor is declared dead if no hello packet comes in for virtual links.

The **no** form of this command sets the dead interval to default for virtual links. The default value is 40 seconds (generally four times the hello packet interval).

Parameter	Description
<INTERVAL>	Specifies the time interval for the dead interval, in seconds. Range: 1 to 65535. Default: 40.

Examples

Setting OSPFv3 virtual links dead interval:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# area 100 virtual-link 100.0.1.1
switch(config-router-vlink6)# dead-interval 30
```

Setting OSPFv3 virtual links dead interval to default:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# area 100 virtual-link 100.0.1.1
switch(config-router-vlink6)# no dead-interval
```

default-information originate

```
default-information originate [metric <METRIC-VALUE>]
no default-information originate [metric <METRIC-VALUE>]
```

Description

Configures OSPFv3 to advertise the default route (::/0) to its neighbors if it is present in the routing table. Optionally, the metric value can be set for default route ::/0. The default value is 1.

The **no** form of this command disables advertisement of the default route.

Parameter	Description
metric <METRIC-VALUE>	Specifies the OSPF metric value for the default route. Optional. Default: 1.

Examples

Setting advertisement of the default route:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# default-information originate
```

Disabling advertisement of the default route:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# no default-information originate
```

Setting advertisement of the default route and specifying an optional metric value of 20:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# default-information originate
switch(config-ospfv3-1)# default-information originate metric 20
```

Disabling advertisement of the default route and setting metric to the default value:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# no default-information originate metric
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

default-metric

```
default-metric <METRIC-VALUE>
no default-metric
```

Description

Sets the default metric for redistributed routes in the OSPFv3.

The **no** form of this command sets the default metric to be used for redistributed routes into OSPFv3 to the default of 25.

Parameter	Description
<METRIC-VALUE>	Specifies the default metric value to use for redistributed routes. Range: 1 to 1677214. Default: 25.

Examples

Setting default metric for redistributed routes:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# default-metric 36
```

Setting default metric for redistributed routes to the default:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# no default-metric
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

disable

```
disable
```

Description

Disables the OSPFv3 process. By default OSPFv3 process is enabled.

This command does not remove the OSPFv3 configurations.

Example

Disabling OSPFv3 process:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# disable
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-ospfv3-<PROCESS-ID>`	Administrators or local user group members with execution rights for this command.

distance

```
distance [<DISTANCE-VAL> | intra-area [<DISTANCE-VAL>] | inter-area [<DISTANCE-VAL>] |
external [<DISTANCE-VAL>]]
no distance [<DISTANCE-VAL> | intra-area [<DISTANCE-VAL>] | inter-area [<DISTANCE-VAL>] |
external [<DISTANCE-VAL>]]
```

Description

Defines an administrative distance for OSPFv3. Administrative distance is used as a criteria to select the best route when the same route is learned by multiple routing protocols.

The **no** form of this command sets the OSPFv3 administrative distance to the default value of 110. Optionally, administrative distance can be set to default for the specific OSPF route type: intra-area, inter-area, or external type-5 and type-7 routes.

Parameter	Description
<DISTANCE-VAL>	Specifies the OSPFv3 administrative distance. Range: 1 to 255. Default: 110.
`intra-area`	Specifies the OSPFv3 distance for intra-area routes.

Parameter	Description
`inter-area`	Specifies the OSPFv3 distance for inter-area routes.
`external`	Specifies the OSPFv3 distance for external type 5 and type 7 routes.

Usage

Within a given OSPF process, intra-area routes are always given precedence even when distances are configured for inter-area or external type routes.

Examples

Setting OSPFv3 administrative distance:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# distance 100
switch(config-ospfv3-1)# distance intra-area 24 external 55 inter-area 66
switch(config-ospfv3-1)# distance intra-area 24 external 55
switch(config-ospfv3-1)# distance external 55
switch(config-ospfv3-1)#exit

switch(config)# router ospfv3 2
switch(config-ospfv3-2)# distance 200
switch(config-ospfv3-2)# distance external 60
switch(config-ospfv3-2)# distance intra-area 24 inter-area 66
```

Setting OSPFv3 administrative distance to the default:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# no distance
switch(config-ospfv3-1)# no distance external
switch(config-ospfv3-1)# no distance intra-area
switch(config-ospfv3-1)# no distance inter-area
switch(config-ospfv3-1)  # no distance 1
switch(config-ospfv3-1)#exit

switch(config)# router ospfv3 2 vrf blue
switch(config-ospfv3-2)# no distance 200
switch(config-ospfv3-2)# no distance external 60
switch(config-ospfv3-2)# no distance intra-area 24 inter-area 66
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

Release	Modification
10.14	Added capability to have individual admin distance for multiple OSPF processes in a VRF.
10.09	Added parameters: **intra-area**, **inter-area**, **external**
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-ospfv3-<PROCESS-ID>`	Administrators or local user group members with execution rights for this command.

distribute-list prefix

```
distribute-list prefix <prefix-list-name> {in | out}
no distribute-list prefix <prefix-list-name> {in | out}
```

Description

This command uses an existing prefix list to filter routes that are being installed in the routing table or redistributed to another routing protocol.

The **distribute-list prefix** command filters routes in the inbound or the outbound direction. When this command is issued with the **in** parameter, it filters routes from being installed in the routing table, it does not filter LSAs. When this command is issued with the **out** parameter, it filters only the desired redistributed routes from other protocols.

This command requires that your prefix list is already defined using the ipv6 prefix commands. Route-maps are not supported with the distribute-list feature.

Parameter	Description
`prefix <prefix-list-name>`	Specify the name of an existing prefix.
`{in | out}`	Select one of the following parameters to set the filter direction: ■ **in**: Filter incoming routes into the routing table ■ **out**: Filter outgoing routing updates

Examples

The following commands enable the filtering of OSPFv3 routes in an IPv6 network, so routes are no longer installed in the routing table or redistributed from another routing protocol.

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# distribute-list prefix listA in
switch(config-ospfv3-1)# distribute-list prefix listB out
```

The following command disables the filtering of OSPFv3 routes in an IPv6 network, so routes can be installed in the routing table or redistributed from another routing protocol.

```
switch# configure terminal
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# no distribute-list prefix listA in
switch(config-ospfv3-1)# no distribute-list prefix listB out
```

Command History

6300 6400	`config-ospfv3-<PROCESS-ID>`	Administrators or local user group members with execution rights for this command.

enable

```
enable
```

Description

Enables OSPFv3 process when disabled. By default OSPFv3 process is enabled.

Example

Enabling OSPFv3 process:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# enable
```

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-ospfv3-<PROCESS-ID>`	Administrators or local user group members with execution rights for this command.

encryption ipsec

```
encryption ipsec spi <SPI-INDEX> <AUTH-TYPE> [<KEY-TYPE> <AUTH-KEY>
   <ENCR-TYPE> [<KEY-TYPE> <ENCR-KEY>]]
no encryption
```

Description

Configures IPSec ESP authentication and encryption for the selected Vlink.

The **no** form of this command removes IPSec ESP authentication and encryption for the selected Vlink.

Parameter	Description
`spi <SPI-INDEX>`	Specifies the Security Parameters Index (SPI) to use. The SPI is an identification tag carried in the IPsec AH header. It enables the receiving OSPF process to select and use the Security Association (SA) from the SA table. The SPI must be unique on the switch. Range: 256 to 4294967295.
<AUTH-TYPE>	Specifies the authentication type: **md5** or **sha1**.
<KEY-TYPE>	Specifies the key type to use: **plaintext** (unencrypted), **hex-string** (encrypted) or **ciphertext** (encrypted).
<AUTH-KEY>	Specifies the authentication key.
<ENCR-TYPE>	Specifies the encryption type: **des**, **3des**, **aes**, or **null**. **NOTE:** Encryption type **aes** is considered to be AES128, AES192, or AES256 based on key length.
<ENCR-KEY>	Specifies the encryption key.

When the authentication key is not provided on the command line, plaintext authentication key prompting occurs upon pressing Enter, followed by encryption type prompting, and finally plaintext encryption key prompting. The entered key characters are masked with asterisks.

When the authentication key and encryption type are provided on the command line but the encryption key is not provided, plaintext encryption key prompting occurs upon pressing Enter. The entered key characters are masked with asterisks.

Examples

Setting area 1 to use IPSec ESP authentication and encryption for Vlink with provided plaintext keys:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# area 1
switch(config-ospfv3-1)# area 1 virtual-link 3.3.3.3
switch(config-router-vlink6)# encryption ipsec spi 256 md5 plaintext F82#
                              des plaintext Plane#88
```

Setting area 1 to use IPSec ESP authentication and encryption for Vlink with prompted plaintext keys and encryption type:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# area 1
switch(config-ospfv3-1)# area 1 virtual-link 3.3.3.3
switch(config-router-vlink6)# encryption ipsec spi 256 md5
Enter the IPsec authentication key: ********
Re-Enter the IPsec authentication key: *******

Enter the IPsec encryption type (3des/aes/des/null)? des

Enter the IPsec encryption key: ********
```

```
Re-Enter the IPsec encryption key: ********
```

Setting area 1 to use IPSec ESP authentication and encryption for Vlink provided plaintext authentication key and encryption type but prompted plaintext encryption key:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# area 1
switch(config-ospfv3-1)# area 1 virtual-link 3.3.3.3
switch(config-router-vlink6)# encryption ipsec spi 256 md5 plaintext Fx des
Enter the IPsec encryption key: ********
Re-Enter the IPsec encryption key: ********
```

Setting area 1 to use IPSec ESP authentication for Vlink with a provided plaintext authentication key and null encryption:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# area 1
switch(config-ospfv3-1)# area 1 virtual-link 3.3.3.3
switch(config-router-vlink6)# encryption ipsec spi 256 md5 plaintext Fx null
```

Removing IPSec ESP authentication and encryption for Vlink on area 1:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# area 1 virtual-link 3.3.3.3
switch(config-router-vlink6)# no encryption
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

6300 6400	`config-router-vlink`	Administrators or local user group members with execution rights for this command.

default-information originate

```
default-information originate [metric <METRIC-VALUE>]
no default-information originate [metric <METRIC-VALUE>]
```

Description

Configures OSPFv3 to advertise the default route (::/0) to its neighbors if it is present in the routing table. Optionally, the metric value can be set for default route ::/0. The default value is 1.

The **no** form of this command disables advertisement of the default route.

Parameter	Description
metric <METRIC-VALUE>	Specifies the OSPF metric value for the default route. Optional. Default: 1.

Examples

Setting advertisement of the default route:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# default-information originate
```

Disabling advertisement of the default route:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# no default-information originate
```

Setting advertisement of the default route and specifying an optional metric value of 20:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# default-information originate
switch(config-ospfv3-1)# default-information originate metric 20
```

Disabling advertisement of the default route and setting metric to the default value:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# no default-information originate metric
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

default-information originate always

```
default-information originate always [metric <METRIC-VALUE>]
no default-information originate always [metric <METRIC-VALUE>]
```

Description

Configures OSPFv3 to advertise the default route (::/0) to its neighbors, regardless if it is present in the routing table or not. Optionally, metric can be set for default route ::/0. The default value is 1.

The **no** form of this command disables advertisement of the default route.

Parameter	Description
metric <METRIC-VALUE>	Specifies the OSPFv3 metric value for the default route. Default: 1.

Examples

Setting advertisement of the default route:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# default-information originate always
```

Disabling advertisement of the default route:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# no default-information originate always
```

Setting advertisement of the default route with metric set to 20:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# default-information originate always metric 20
```

Disabling advertisement of the default route and setting the metric to the default value:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# no default-information originate always metric
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

graceful-restart

```
graceful-restart
  restart-interval <INTERVAL>
  helper [strict-lsa-check]
  ignore-lost-interface
  no...
```

Description

Configures graceful restart for OSPFv3. By default graceful restart is enabled on the OSPFv3 router.

The **no** form of this command sets the restart interval to the default of 120 seconds or disables helper mode depending on the specified parameters.

Parameter	Description
`restart-interval <INTERVAL>`	Specifies the time another router waits for this router to gracefully restart and selects the maximum time to wait in seconds. Range: 5 to 1800. Default: 120.
`helper`	Specifies that the router will participate in the graceful restart of a neighbor router.
`strict-lsa-check`	(Optional). Use with the **helper** parameter to enable strict Link state Advertisement (LSA) checking when acting as a restart helper for a restarting peer. **NOTE:** OSPF neighbors must disable strict LSA checking. If the local node has fewer OSPF interfaces after restarting, then the neighbors that were adjacent on those interfaces will clear up their adjacencies to the restarting node and will send out link state updates to advertise the dropped adjacency. If strict LSA checking is enabled, the restarting router's neighbors will exit helper mode when they receive the updated LSAs and the graceful restart will still fail.
`ignore-lost-interface`	Enable the restarting router to ignore lost OSPF interfaces during a graceful restart process. This setting should be enabled on a high availability system to ensure a graceful restart completes successfully, even if OSPF-enabled links fail due to High Availability events like a switchover or failover. **NOTE:** Enabling this setting means that the hitless restart procedures do not strictly follow those defined in *RFC 3623, Graceful OSPF Restart*.
`no`	Negate any parameter or return the setting to its default..

Examples

Enabling OSPF graceful restart:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# graceful-restart restart-interval 40
switch(config-ospfv3-1)# graceful-restart helper strict-lsa-check
```

Enabling the switch to ignore lost OSPF interfaces during a graceful restart process:

```
switch(config)# router ospfv3 1
switch (config-ospfv3-1)# graceful-restart ignore-lost-interface
```

Setting the restart interval to default, and disabling helper mode:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# no graceful-restart restart-interval
switch(config-ospfv3-1)# no graceful-restart helper
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

hello-interval

```
hello-interval <INTERVAL>
no hello-interval
```

For proper operation, the hello interval must be shorter than the dead interval.

Description

Sets the time interval between OSPF hello packets for virtual links.

The **no** form of this command sets the hello interval to the default value of 10 seconds for virtual links.

Parameter	Description
<INTERVAL>	Specifies the time interval for the hello interval, in seconds. Range: 1 to 65535. Default: 10.

Examples

Setting OSPF virtual links hello interval:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# area 100 virtual-link 100.0.1.1
switch(config-router-vlink6)# hello-interval 30
```

Setting OSPF virtual links hello interval to default:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# area 100 virtual-link 100.0.1.1
switch(config-router-vlink6)# no hello-interval
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

ipv6 ospfv3 area

```
ipv6 ospfv3 <PROCESS-ID> area <AREA-ID>
no ipv6 ospfv3 <PROCESS-ID> area <area-id>
```

Description

Runs the OSPFv3 protocol on the interface for the area specified.

To move an interface to a new area, unmap the existing area and then associate a new area with the interface.

The **no** form of this command disables OSPF on the interface and removes the interface from the area. Interfaces which have an IP address configured on the network or in a subset of the network, stop participating in the OSPF protocol

Parameter	Description
<AREA-ID>	Specifies the area ID is one of the following formats. Area ID in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. Area ID as a decimal value. Range: 0-4294967295.
<PROCESS-ID>	Specifies the OSPFv3 process ID. Range: 1 to 65535.

Examples

Setting OSPFv3 network for the area:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# ipv6 ospfv3 1 area 1
switch(config-if-vlan)# ipv6 ospfv3 1 area 0.0.0.1
```

Disabling OSPFv3 network for the area:

```
switch(config)# interface 1/1/1
switch(config-if-vlan)# no ipv6 ospfv3 1 area 1
switch(config-if-vlan)# no ipv6 ospfv3 1 area 0.0.0.1
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

ipv6 ospfv3 authentication null

`ipv6 ospfv3 authentication null`

Description

Configures null authentication on an interface which disables IPsec authentication.

Examples

Disabling IPsec on interface VLAN **1**:

```
switch(config)# interface van 1
switch(config-if-vlan)# ipv6 ospfv3 authentication null
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

ipv6 ospfv3 authentication ipsec

```
ipv6 ospfv3 authentication ipsec spi <SPI-INDEX> <AUTH-TYPE> [<KEY-TYPE> <AUTH-KEY>]
no ipv6 ospfv3 authentication
```

Description

Configures IPSec AH authentication. OSPFv3 interfaces that have IPsec configured at the interface context will not use area level IPsec.

The **no** form of this command removes IPsec AH authentication for the specified area.

Parameter	Description
`spi <SPI-INDEX>`	Specifies the Security Parameters Index (SPI) to use. The SPI is an identification tag carried in the IPsec AH header. It enables the receiving OSPF process to select and use the Security Association (SA) from the SA table. The SPI must be unique on the switch. Range: 256 to 4294967295.
<AUTH-TYPE>	Specifies the authentication type: **md5** or **sha1**.
<KEY-TYPE>	Specifies the key type to use: **plaintext** (unencrypted), **hex-string** (encrypted) or **ciphertext** (encrypted).
<AUTH-KEY>	Specifies the authentication key.

When the authentication key is not provided on the command line, plaintext key prompting occurs upon pressing Enter. The entered key characters are masked with asterisks.

Examples

Setting interface VLAN **1** to use IPsec authentication with a provided plaintext authentication key:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# ipv6 ospfv3 authentication ipsec spi 256 md5 plaintext
F82#
```

Setting interface VLAN **4** to use IPsec authentication with a prompted plaintext authentication key:

```
switch(config)# interface vlan 4
switch(config-if-vlan)# ipv6 ospfv3 authentication ipsec spi 256 md5
Enter the IPsec authentication key: ********
Re-Enter the IPsec authentication key: ********
```

Removing IPsec authentication from interface VLAN **1**:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# no ipv6 ospfv3 authentication
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

ipv6 ospfv3 cost

```
ipv6 ospfv3 cost <INTERFACE-COST>
no ipv6 ospfv3 cost
```

Description

Sets the cost (metric) associated with a particular interface. The interface cost is used as a parameter to calculate the best routes.

The **no** form of this command sets the cost (metric) associated with a particular interface to the default of 1.

Parameter	Description
<INTERFACE-COST>	Specifies the interface cost value. Range: 1 to 65535. Default: 1.

Examples

Setting OSPFv3 interface cost:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# ipv6 ospfv3 cost 100
```

Setting the OSPFv3 interface cost to default:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# no ipv6 ospfv3 cost
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

ipv6 ospfv3 dead-interval

```
ipv6 ospfv3 dead-interval <INTERVAL>
no ipv6 ospfv3 dead-interval
```

Description

Sets the interval after a neighbor is declared dead when no hello packet is received on the OSPFv3 interface.

The **no** form of this command sets the interval after which a neighbor is declared dead, to the default for the OSPFv3 interface. The default value is 40 seconds (generally four times the hello packet interval).

Parameter	Description
<INTERVAL>	Specifies the time interval for the dead interval, in seconds. Range: 1 to 65535. Default: 40.

Examples

Setting OSPFv3 dead interval on the interface:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# ipv6 ospfv3 dead-interval 30
```

Setting OSPFv3 dead interval to default on the interface:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# no ipv6 ospfv3 dead-interval
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

ipv6 ospfv3 encryption ipsec

```
ipv6 ospfv3 encryption ipsec spi <SPI-INDEX> <AUTH-TYPE>
    [<KEY-TYPE> <AUTH-KEY> <ENCR-TYPE> [<KEY-TYPE> <ENCR-KEY>]]
no ipv6 ospfv3 encryption
```

Description

Configures IPsec ESP authentication. OSPFv3 interfaces that have IPsec configured at the interface context will not use area level IPsec ESP.

The **no** form of this command removes IPsec ESP for the specified area.

Parameter	Description
spi *<SPI-INDEX>*	Specifies the Security Parameters Index (SPI) to use. The SPI is an identification tag carried in the IPsec AH header. It enables the receiving OSPF process to select and use the Security Association (SA) from the SA table. The SPI must be unique on the switch. Range: 256 to 4294967295.
<AUTH-TYPE>	Specifies the authentication type: **md5** or **sha1**.
<KEY-TYPE>	Specifies the key type to use: **plaintext** (unencrypted), **hex-string** (encrypted) or **ciphertext** (encrypted).
<AUTH-KEY>	Specifies the authentication key.
<ENCR-TYPE>	Specifies the encryption type: **des**, **3des**, **aes**, or **null**. **NOTE:** Encryption type **aes** is considered to be AES128, AES192, or AES256 based on key length.
<ENCR-KEY>	Specifies the encryption key.

When the authentication key is not provided on the command line, plaintext authentication key prompting occurs upon pressing Enter, followed by encryption type prompting, and finally plaintext encryption key prompting. The entered key characters are masked with asterisks.

When the authentication key and encryption type are provided on the command line but the encryption key is not provided, plaintext encryption key prompting occurs upon pressing Enter. The entered key characters are masked with asterisks.

Examples

Setting interface VLAN **1** to use IPsec ESP with provided authentication and encryption keys:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# ipv6 ospfv3 encryption ipsec spi 256 sha1 plaintext F82
                        des plaintext F82#450b
```

Setting interface VLAN **3** to use IPsec ESP with prompted authentication and encryption keys:

```
switch(config)# interface vlan 3
switch(config-if-vlan)# ipv6 ospfv3 encryption ipsec spi 256 sha1
Enter the IPsec authentication key: ********
Re-Enter the IPsec authentication key: ********

Enter the IPsec encryption type (3des/aes/des/null)? des

Enter the IPsec encryption key: ********
Re-Enter the IPsec encryption key: ********
```

Setting interface VLAN **4** to use IPsec ESP with provided authentication password and encryption type but a prompted encryption key:

```
switch(config)# interface vlan 4
switch(config-if-vlan)# ipv6 ospfv3 encryption ipsec spi 256 sha1 plaintext F82
des
Enter the IPsec encryption key: ********
Re-Enter the IPsec encryption key: ********
```

Setting interface VLAN **1** to use IPSec ESP with provided plaintext authentication key and null encryption:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# ipv6 ospfv3 encryption ipsec spi 256 sha1 plaintext F82
null
```

Removing IPsec from interface VLAN **1**:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# no ipv6 ospfv3 encryption
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

ipv6 ospfv3 hello-interval

```
ipv6 ospfv3 hello-interval <INTERVAL>
no ipv6 ospfv3 hello-interval
```

Description

Sets the time interval between OSPFv3 hello packets for the OSPFv3 interface.

The **no** form of this command sets the time interval between OSPFv3 hello packets to the default for the OSPFv3 interface of 10 seconds.

Parameter	Description
<INTERVAL>	Specifies the time interval between hello packets, in seconds. Range: 1 to 65535. Default: 10.

Examples

Setting OSPFv3 hello interval on the interface:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# ipv6 ospfv3 hello-interval 30
```

Setting OSPFv3 hello interval to default on the interface:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# no ipv6 ospfv3 hello-interval
```

ipv6 ospfv3 network

```
ipv6 ospfv3 network {broadcast|point-to-point}
no ipv6 ospfv3 network
```

Description

Configures the network type for the interface. By default the network type is broadcast network.

The **no** form of this command sets the network type for the interface to the system default of broadcast network.

Parameter	Description
broadcast	Specifies the OSPFv3 network type as a broadcast multiaccess

Parameter	Description
	network.
`point-to-point`	Specifies the OSPFv3 network type as a point-to-point network.

Examples

Setting OSPFv3 network type for the interface:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# ipv6 ospfv3 network broadcast
switch(config-if-vlan)# ipv6 ospfv3 network point-to-point
```

Disabling OSPFv3 network type for the interface to system default of broadcast network:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# no ipv6 ospfv3 network
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

ipv6 ospfv3 passive

```
ipv6 ospfv3 passive
no ipv6 ospfv3 passive
```

Description

Configures the interface as an OSPFv3 passive interface. With this setting, the interface participates in the OSPF, but does not send or receive OSPF packets on that interface.

The **no** form of this command resets the interface as active. With this setting, the interface starts sending and receiving OSPF packets.

Examples

Setting the interface as OSPFv3 passive interface:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# ipv6 ospfv3 passive
```

Setting the interface as OSPFv3 active interface:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# no ipv6 ospfv3 passive
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

ipv6 ospfv3 priority

```
ipv6 ospfv3 priority <number-value>
no ipv6 ospfv3 priority
```

Description

Sets the OSPFv3 priority for the interface. The larger the numeric value of the priority, the higher the chance it will become the designated router. Setting a priority of 0 makes the router ineligible to become a designated router or back up designated router.

The **no** form of this command sets the OSPFv3 priority for the interface to the default of 1.

Parameter	Description
<number-value>	Specifies the OSPFv3 priority value. Default: 1. Range: 0 to 255.

Examples

Setting the OSPFv3 priority for the interface:

```
switch(config)# interface vlan /1
switch(config-if-vlan)# ipv6 ospfv3 priority 50
```

Setting the OSPFv3 priority for the interface to the default of 1:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# no ipv6 ospfv3 priority
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

ipv6 ospfv3 retransmit-interval

```
ipv6 ospfv3 retransmit-interval <INTERVAL>
no ipv6 ospfv3 retransmit-interval
```

Description

Sets the time between retransmitting lost link state advertisements for the OSPFv3 interface.

The **no** form of this command sets the time between retransmitting lost link state advertisements to the default 5 seconds.

Parameter	Description
<INTERVAL>	Specifies the time interval for the retransmit interval, in seconds. Range: 1 to 3600. Default: 5

Examples

Setting OSPFv3 retransmit interval on the interface:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# ipv6 ospfv3 retransmit-interval 30
```

Setting OSPFv3 retransmit interval to the default on the interface:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# no ipv6 ospfv3 retransmit-interval
```

ipv6 ospfv3 shutdown

```
ipv6 ospfv3 shutdown
no ipv6 ospfv3 shutdown
```

Description

Disables OSPFv3 on the interface. The interface state changes to Down. It does not remove the interface from the OSPF area. To remove the interface, use the command **no ip ospf area**.

The **no** form of this command re-enables OSPFv3 on the interface.

Examples

Disabling OSPFv3 on the interface:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# ipv6 ospfv3 shutdown
```

Re-enabling OSPFv3 on the interface:

```
switch(config)# interface vlan 1
switch(config-if-vlan)# no ipv6 ospfv3 shutdown
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

ipv6 ospfv3 transit-delay

```
ipv6 ospfv3 transit-delay <DELAY>
no ipv6 ospfv3 transit-delay
```

Description

Sets the time delay in Link state transmission for the OSPFv3 interface.

The **no** form of this command sets the transit delay in Link state transmission to the default of 1 second.

Parameter	Description
<DELAY>	Specifies the time delay for the transit delay, in seconds. Range: 1 to 3600. Default: 1.

Examples

Setting OSPFv3 transit delay on the interface

```
switch(config)# interface vlan 1
switch(config-if-vlan)# ipv6 ospfv3 transit-delay 30
```

Setting OSPFv3 transit delay to default on the interface

```
switch(config)# interface vlan 1
switch(config-if-vlan)# no ipv6 ospfv3 transit-delay
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

maximum-paths

```
maximum-paths <MAXIMUM>
no maximum-paths
```

Description

Sets the maximum number of ECMP routes that OSPFv3 can support.

The **no** form of this command sets the maximum number of ECMP routes that OSPFv3 can support to the default value of 4.

Parameter	Description
<MAXIMUM>	Specifies the maximum number of ECMP routes. Range: 1 to 32. Default: 4.

Examples

Setting maximum number of parallel routes:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# maximum-paths 32
```

Setting maximum number of parallel paths to the default value of 4:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# no maximum-paths
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

Release	Modification
10.10	Increased upper limit of range of **<MAXIMUM>** parameter to 32.

max-metric router-lsa

```
max-metric router-lsa [on-startup <INTERVAL>]
no max-metric router-lsa [on-startup]
```

Description

Sets the protocol to advertise a maximum metric so that other routers do not prefer the router as an intermediate hop in their shortest path first (SPF) calculations. If the on-startup parameter is used, the router is configured to advertise a maximum metric at startup. That is, for the time specified in seconds, or the default value of 600 seconds.

To disable advertisement of the maximum metric, use the **no** form of the command.

The **no** form of this command advertises the normal cost metrics instead of advertising the maximized cost metric. This setting causes the router to be considered in traffic forwarding.

Parameter	Description
`on-startup  <INTERVAL>`	Automatically advertises the stub Router-LSA (or maximize the router-LSA cost metric) for a specified time interval upon OSPFv3 startup. Specifies the time in seconds. Range: 5 to 86400. Default: 600.

Examples

Setting to maximize the cost metrics for Router LSA:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# max-metric router-lsa
switch(config-ospfv3-1)# max-metric router-lsa on-startup 3000
```

Setting to advertise the normal cost metrics instead of advertising the maximized cost metric:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# no max-metric router-lsa
switch(config-ospfv3-1)# no max-metric router-lsa on-startup
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

passive-interface default

```
passive-interface default
no passive-interface default
```

Description

Sets all OSPFv3 interfaces as passive.

The **no** form of this command sets all the OSPFv3 interfaces as active.

Examples

Setting OSPFv3-enabled interfaces as passive:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# passive-interface default
```

Setting OSPFv3-enabled interfaces as active:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# no passive-interface default
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

redistribute

```
redistribute {bgp | connected | host-routes | local loopback | static | ripng | ospf
<PROCESS-ID>}
             [route-map <ROUTE-MAP-NAME>]
no redistribute {bgp | connected | host-routes | local loopback | static | ripng | ospf
<PROCESS-ID>}
                [route-map <ROUTE-MAP-NAME>]
```

Description

Redistributes routes originating from other protocols, or from another OSPFv3 process, to the current OSPFv3 process.

If a route map is specified, then only the routes that pass the match clause specified in the route map are redistributed to OSPFv3. Configuration is not allowed if the referenced route map has not yet been configured.

If you try to redistribute routes from an OSPFv3 process which is not created, you are prompted to allow the OSPFv3 process to be auto-created before proceeding with redistribution. If you confirm at the prompt, the OSPFv3 process is created with defaults and redistribution configuration applied. If you deny at the prompt, redistribution configuration is skipped.

If command **route-redistribute active-routes-only** has been issued, only the routes from other protocols which are selected for forwarding are considered for redistribution into OSPFv3.

The **no** form of this command disables redistribution of routes to the current OSPFv3 process.

Parameter	Description
bgp	Specifies redistributing BGP (Border Gateway Protocol) routes.
connected	Specifies redistributing connected (directly attached subnet or host).
local loopback	Specifies redistributing local routes of the loopback interface.
static	Specifies redistributing static routes.
ripng	Specifies redistributing RIPng routes.
ospf *<PROCESS-ID>*	Specifies redistributing routes from the specified OSPFv3 process ID. Range: 1 to 65535.
route-map *<ROUTE-MAP-NAME>*	Specifies redistribution filtering by route map. To create a route map, use command **route-map**.

Examples

Redistributing routes to OSPFv3:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# redistribute bgp
switch(config-ospfv3-1)# redistribute bgp route-map BGP_routes
```

```
switch(config-ospfv3-1)# redistribute connected
switch(config-ospfv3-1)# redistribute connected route-map connected_routes
switch(config-ospfv3-1)# redistribute local loopback
switch(config-ospfv3-1)# redistribute local loopback route-map local_routes
switch(config-ospfv3-1)# redistribute static
switch(config-ospfv3-1)# redistribute static route-map static_networks
switch(config-ospfv3-1)# redistribute ripng
switch(config-ospfv3-1)# redistribute ripng route-map rip-routes
switch(config-ospfv3-1)# redistribute ospf 2
```

Disabling redistributing routes to OSPFv3:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# no redistribute bgp
switch(config-ospfv3-1)# no redistribute bgp route-map BGP_routes
```

```

switch(config-ospfv3-1)# no redistribute connected
switch(config-ospfv3-1)# no redistribute connected route-map connected_routes
switch(config-ospfv3-1)# no redistribute local loopback
switch(config-ospfv3-1)# no redistribute local loopback route-map local_routes
switch(config-ospfv3-1)# no redistribute static
switch(config-ospfv3-1)# no redistribute static route-map static_networks
switch(config-ospfv3-1)# no redistribute ripng
switch(config-ospfv3-1)# no redistribute ripng route-map rip-routes
switch(config-ospfv3-1)# no redistribute ospf 2
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command Information

Platforms	Command context	Authority
6300 6400	`config-ospfv3-<PROCESS-ID>`	Administrators or local user group members with execution rights for this command.

reference-bandwidth

```
reference-bandwidth <BANDWIDTH>
no reference-bandwidth
```

Description

Sets the reference bandwidth for OSPFv3. If the OSPFv3 interface cost is not explicitly set, then the cost of all the OSPFv3 interfaces is recalculated based on the reference bandwidth and link speed of the interface.

For VLAN interfaces the calculated link speed value is 1 Gbps (if the OSPFv3 interface cost is not explicitly set).

The **no** form of this command sets the reference bandwidth for OSPF to the default of 100000 Mbps.

Parameter	Description
<BANDWIDTH>	Specifies the reference bandwidth used to calculate the cost of an interface in Mbps. Range: 1 to 4000000. Default: 100000.

Examples

Setting the reference bandwidth:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# reference-bandwidth 40000
```

Setting the reference bandwidth to the default value:

```
switch(config)# routerv3 ospf 1
switch(config-ospfv3-1)# no reference-bandwidth
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

retransmit-interval

```
retransmit-interval <INTERVAL>
no retransmit-interval
```

Description

Sets the time between retransmitting lost link state advertisements for virtual links.

The **no** form of this command sets the time between retransmitting lost link state advertisements to the default of 5 seconds for virtual links.

Parameter	Description
<INTERVAL>	Specifies the time interval for the retransmit interval, in seconds. Range: 1 to 3600. Default: 5.

Examples

Setting OSPFv3 virtual links retransmit interval:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# area 100 virtual-link 100.0.1.1
switch(config-router-vlink6)# retransmit-interval 30
```

Setting OSPFv3 virtual links retransmit interval to default:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# area 100 virtual-link 100.0.1.1
switch(config-router-vlink6)# no retransmit-interval
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

router-id

```
router-id <ROUTER-ADDRESS>
no router-id
```

Description

Sets an ID for the router in an IPv4 address format.

The **no** form of this command unconfigures the router-id for the instance and sets the router-id to the default. The router-id is changed to the dynamically selected router-id. The default router-id 0.0.0.0 updates to the routing stack that triggers to auto-elect a router-id based on the highest IP address of loopback interface, or the highest IP address of interfaces.

Parameter	Description
<ROUTER-ADDRESS>	Specifies the router address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.

Examples

Setting router-id in the OSPFv3 context:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1) # router-id 1.1.1.1
```

Unconfiguring router-id:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# no router-id
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

router ospfv3

```
router ospfv3 <PROCESS-ID> [vrf <VRF-NAME>]
no router ospfv3 <PROCESS-ID> [vrf <VRF-NAME>]
```

Description

Creates the OSPFv3 process (if not created already) and enters the router OSPFv3 instance context. Optionally if specified, you can specify a named VRF, or the default VRF if the <*vrf-name*> is not specified. Only one OSPFv3 process is allowed per VRF.

The **no** form of this command removes the OSPFv3 instance. If a VRF is specified, it removes the OSPF instance from the named VRF, or the default VRF if the <*var-name*> is not specified.

Parameter	Description
`<PROCESS-ID>`	Specifies an OSPFv3 process ID. Length: 1 to 65535.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Default: default.

Examples

Entering the router OSPFv3 instance:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)#
```

Setting the router OSPFv3 VRF instance:

```
switch(config)# router ospfv3 1 vrf vrf_red
```

Removing the router OSPFv3 instance:

```
switch#(config)# no router ospfv3 1
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

show ipv6 ospfv3

`show ipv6 ospfv3 [<PROCESS-ID>] [all-vrfs | vrf <VRF-NAME>]`

Description

Shows OSPFv3 information including area, state, and configuration information.

Parameter	Description
<PROCESS-ID>	Specifies an OSPFv3 process ID optionally to show OSPFv3 information for a particular OSPFv3 process. Range: 1 to 65535.
`all-vrfs`	Select to show OSPFv3 information for all VRFs.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Default: default.

Example

Showing general OSPFv3 configurations:

```
switch# show ipv6 ospfv3 200

show ipv6 ospfv3 border-routers

`show ipv6 ospfv3 [<PROCESS-ID>] border-routers [all-vrfs | vrf <VRF-NAME>]`

Description

Shows the OSPFv3 routing table entries for Area Border Router (ABR) and Autonomous System Border Router (ASBR).

Parameter	Description
`<PROCESS-ID>`	Specifies an OSPFv3 process ID to show the OSPFv3 routing table entries for ABR and ASBR for the particular OSPFv3 process. Range: 1 to 65535.
`all-vrfs`	Select to show OSPFv3 border router information for all VRFs.

Parameter	Description
vrf *<VRF-NAME>*	Specifies the name of a VRF. Default: default.

Example

On the 6400 Switch Series, interface identification differs.

Showing OSPFv3 border routers information for VRF **vrf_red**:

```
switch# show ipv6 ospfv3 border-routers vrf vrf_red
VRF : vrf_red       Process ID : 1
             Internal Routing Table
--------------------------------------------------------

Codes: i - Intra-area route, I - Inter-area route

show ipv6 ospfv3 interface

```
show ipv6 ospfv3 [<PROCESS-ID>] interface [<INTERFACE-NAME>] [brief]
[all-vrfs | vrf <VRF-NAME>]
```

Description

Shows information about OSPFv3 enabled interfaces.

Parameter	Description
<PROCESS-ID>	Specifies an OSPFv3 process ID optionally to show the OSPFv3 enabled interfaces for the particular OSPFv3 process. Range: 1 to 65535.
<INTERFACE-NAME>	Selects to show information only for the specified OSPFv3-enabled interface.

Parameter	Description
`brief`	Include this parameter to display a brief overview of the following OSPF configuration information. - Interface: OSPF interface name. - Area: OSPF area ID. - Cost: The metric OSPF uses to judge a path's feasibility, calculated as (reference bandwidth / interface bandwidth). - State: Indicates if the interface is a designated router (**Dr**) or a backup designated router (**Backup-dr**). - Status: Indicates if the interface is **up** or **down**. - Flags: P - Passive A - Active.
`all-vrfs`	Select to show OSPF-enabled interface information for all VRFs.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Default: default.

Examples

On the 6400 Switch Series, interface identification differs.

Showing OSPFv3 information for all interfaces in default VRF:

```
switch# show ipv6 ospfv3 interface
Codes: DR - Designated router  BDR - Backup Designated router

Command History

Release	Modification
10.14	Supported process ID range expanded from 1-63 to 1-65535.
10.09	Output of the **show ipv6 ospfv3 interface** command includes flags to indicate whether the interface is in passive or active mode.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show ipv6 ospfv3 lsdb

```
show ipv6 ospfv3 [<process-id>] lsdb
   adv-router {<ROUTER-ID>|self}
   area <AREA-ID>
   lsid <link-state-id>
   all-vrfs|vrf <VRF-NAME>}
      as-external
      asbr-summary
      database-summary
      inter-area-prefix
      inter-area-router
      intra-area-prefix
      link
      network
      nssa-external
      router
      summary
   vsx-peer
```

Description

Shows the OSPFv3 link state database summary for different OSPF LSAs (Link State Advertisement). Use the parameters to get information for a particular LSA.

Parameter	Description
`<PROCESS-ID>`	Enter an OSPFv3 process ID to display general OSPF information for a particular OSPF process. Range: 1 to 65535.
`adv-router {<ROUTER-ID>|self}`	Select to display link states for a particular advertising router. Specify either a Router ID of the advertising router or specify **self** to show self-originated link states.
`area <AREA-ID>`	Select to display information filtered for the specified area in one of the following formats. OSPFv3 area identifier in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. OSPFv3 area identifier in decimal format. Value: 0 to 4294967295.
`lsid <LINK-STATE-ID>`	Select to display information filtered by link state identifier specified in IPv4 address format (A.B.C.D).
`all-vrfs|{vrf <vrf-name>`	Select **all-vrfs** to display general OSPF information for all VRFs, or use the **vrf *<VRF-NAME>*** option to display information for a specific VRF. Optionally select one of the following parameters to filter the link state database information.
`as-external`	Show external link states (LSA type 5)

Parameter	Description
`database-summary`	Select to display the count of each type of LSA and each area in the database. **NOTE:** The **database-summary** parameter does not support the **area <area-id>**, **lsid <link-state-id>** or **adv-router {<router-id>|self}** parameters.
`inter-area-prefix`	Show inter-area prefix link states (LSA type 3)
`inter-area-router`	Show inter-area router link states (LSA type 4)
`intra-area-prefix`	Show intra-area prefix link states (LSA type 9
`link`	Show link states (LSA type 8)
`network`	Show network LSAs (LSA type 2).
`nssa-external`	Show NSSA external link states (LSA type 7).
`router`	Show router LSAs (LSA type 1).
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing OSPFv3 link state database (LSDB) general information:

```
switch# show ipv6 ospfv3 lsdb
OSPF Router with ID (50.50.50.50) (Process ID 1 VRF default)
============================================================

show ipv6 ospfv3 neighbors

```
show ipv6 ospfv3 [<PROCESS-ID>] neighbors [<NEIGHBOR-ID>]
     [interface <INTERFACE-NAME>] [detail | summary]
     [all-vrfs | vrf <VRF-NAME>]
```

Description

Shows information about OSPFv3 neighbors.

Parameter	Description
<PROCESS-ID>	Specifies an OSPFv3 process ID to show OSPFv3 neighbor information for the particular OSPFv3 process. Range: 1 to 65535.
neighbors *<NEIGHBOR-ID>*	Shows information about a particular neighbor, specified in IPv4 format (A.B.C.D).
interface *<INTERFACE-NAME>*	Shows neighbor information only for the specified interface.
detail	Shows detailed information for the neighbors.
summary	Shows summary information for the neighbors.
all-vrfs	Shows neighbor information for all VRFs.
vrf *<VRF-NAME>*	Specifies the name of a VRF. Default: default.

Examples

On the 6400 Switch Series, interface identification differs.

Showing OSPFv3 neighbors information:

Showing OSPFv3 neighbors information for a specific neighbor:

```
switch# show ipv6 ospfv3 neighbors 3.3.3.3
VRF : default                         Process : 1
--------------------------------------------------------------
Router-Id         : 3.3.3.3           Area              : 0.0.0.0
Interface         : 1/1/1             Address           :
fe80::7272:cfff:fe79:7510
State             : FULL              Neighbor Priority : 1
Dead Timer Due    : 00:00:36          Options           : 0x13
Time since last state change : 00h:14m:45s
```

Showing detail OSPFv3 neighbors information for a specific neighbor:

```
switch# show ipv6 ospfv3 neighbors 2.2.2.2 detail
VRF : default                         Process : 1
--------------------------------------------------------------
Router-Id         : 3.3.3.3           Area              : 0.0.0.0
Interface         : 1/1/1             Address           :
fe80::7272:cfff:fe79:7510
State             : FULL              Neighbor Priority : 1
DR                : 3.3.3.3           BDR               : 1.1.1.3
Dead Timer Due    : 00:00:36          Options           : 0x13
Retransmission Queue Length  : 0
Time Since Last State Change : 00h:14m:45s
```

Showing OSPFv3 neighbors information for interface **1/1/1**:

```
switch# show ipv6 ospfv3 neighbors 3.3.3.3 interface 1/1/1
VRF : default                         Process : 1
--------------------------------------------------------------
Router-Id         : 3.3.3.3           Area              : 0.0.0.0
Interface         : 1/1/1             Address           :
fe80::7272:cfff:fe79:7510
State             : FULL              Neighbor Priority : 1
Dead Timer Due    : 00:00:36          Options           : 0x13
Time Since Last State Change : 00h:14m:45s
```

Showing summary OSPFv3 neighbors information for a specific neighbor for all VRFs:

```
switch# show ipv6 ospfv3 neighbors 3.3.3.3 summary all-vrfs
OSPFv3 Process ID 1 VRF default, Neighbor Summary
==================================================

Interface    Down Attempt Init TwoWay ExStart Exchange Loading Full Total

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show ipv6 ospfv3 routes

```
show ipv6 ospfv3 [<PROCESS-ID>] routes [<PREFIX/LENGTH>]
     [all-vrfs | vrf <VRF-NAME>]
```

Description

Shows the OSPFv3 routing table information.

Parameter	Description
<PROCESS-ID>	Specifies an OSPFv3 process ID that shows information from the OSPFv3 routing table for the particular OSPFv3 process. Range: 1 to 65535.
<PREFIX/LENGTH>	Specifies the IPv6 destination prefix showing information about a particular destination prefix. For example, 2010:bd9::/32.
all-vrfs	Select to show OSPFv3 routing table information for all VRFs.
vrf *<VRF-NAME>*	Specifies the name of a VRF. Default: default.

Examples

On the 6400 Switch Series, interface identification differs.

Showing OSPFv3 routing table information:

```
switch# show ipv6 ospfv3 routes
Codes: i - Intra-area route, I - Inter-area route
       E1 - External type-1, E2 - External type-2

OSPFv3 Process ID 1 VRF default, Routing Table
-----------------------------------------------

Total Number of OSPFv3 Routes : 2

111::/64            (i) area:0.0.0.0
     directly attached to interface 1/1/1, cost 1 distance 110
fd00::/64           (i) area:0.0.0.1
     directly attached to interface vlan10, cost 1 distance 110
```

Showing OSPFv3 routing table information for VRF red:

```
switch# show ipv6 ospfv3 routes vrf red

Codes: i - Intra-area route, I - Inter-area route
       E1 - External type-1, E2 - External type-2

OSPFv3 Process ID 2 VRF red, Routing Table
-------------------------------------------

Total Number of OSPFv3 Routes : 1

222::/64            (i) area:0.0.0.1
     directly attached to interface 1/1/2, cost 1 distance 110
```

Showing OSPFv3 routing table information for destination prefix fd00::/64:

```
switch# show ipv6 ospfv3 1 routes fd00::/64
Codes: i - Intra-area route, I - Inter-area route
       E1 - External type-1, E2 - External type-2

OSPFv3 Process ID 1 VRF default, Routing Table for prefixes fd00::/64
----------------------------------------------------------------------

Total Number of OSPFv3 Routes : 1

fd00::/64           (i) area:0.0.0.1
     directly attached to interface vlan10, cost 1 distance 110
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

Release	Modification
10.14	Supported process ID range expanded from 1-63 to 1-65535.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show ipv6 ospfv3 statistics

```
show ipv6 ospfv3 [<PROCESS-ID>] statistics
     [all-vrfs | vrf <VRF-NAME>]
```

Description

Shows OSPFv3 statistics.

Parameter	Description
<PROCESS-ID>	Specifies an OSPFv3 process ID that shows information on the OSPFv3 SPF statistics for the particular OSPFv3 process. Range: 1 to 65535.
`all-vrfs`	Select to show OSPFv3 SPF statistics information for all VRFs.
`vrf` *<VRF-NAME>*	Specifies the name of a VRF. Default: default.

Examples

Showing OSPFv3 statistics information:

```
switch# show ipv6 ospfv3 statistics
OSPFv3 Process ID 1 VRF default, Statistics (cleared 3h 2m 21s ago)
---------------------------------------------------------------------

Unknown Interface Drops          : 0
Unknown Virtual Interface Drops : 0
Bad IPv6 Header Length Drops     : 0
Wrong OSPFv3 Version Drops       : 0
Bad Source IPv6 Drops            : 0
Resource Failure Drops           : 0
Bad Header Length Drops          : 0
Total Drops                      : 0
```

Showing OSPFv3 statistics information for VRF red:

```
switch# show ipv6 ospfv3 2 statistics vrf red

OSPFv3 Process ID 2 VRF red, Statistics (cleared 3h 2m 30s ago)
-----------------------------------------------------------------

Unknown Interface Drops          : 0
Unknown Virtual Interface Drops : 0
Bad IPv6 Header Length Drops     : 0
Wrong OSPFv3 Version Drops       : 0
Bad Source IPv6 Drops            : 0
```

```
Resource Failure Drops           : 0
Bad Header Length Drops          : 0
Total Drops                      : 0
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

Release	Modification
10.14	Supported process ID range expanded from 1-63 to 1-65535.
10.07 or earlier	--

Command Information

show ipv6 ospfv3 statistics interface

```
show ipv6 ospfv3 [<PROCESS-ID>] statistics interface [<INTERFACE-NAME>]
     [all-vrfs | vrf <VRF-NAME>]
```

Description

Shows the OSPFv3 statistics for the OSPFv3-enabled interfaces.

Parameter	Description
<PROCESS-ID>	Specifies an OSPFv3 process ID to show OSPF-enabled interface statistics information on the specified OSPFv3 process. Range: 1 to 65535.
<INTERFACE-NAME>	Selects to show information only for the specified interface.
`all-vrfs`	Select to show OSPF-enabled interface statistics information for all VRFs.
`vrf` *<VRF-NAME>*	Specifies the name of a VRF. Default: default.

Example

Showing OSPFv3-enabled interfaces information for interface 1/1/1:

```
switch# show ipv6 ospfv3 statistics interface all-vrfs
OSPFv3 Process ID 1 VRF default, Interface vlan2000 Statistics  (cleared 0h 2m 52s
ago)
```

```

show ipv6 ospfv3 virtual-links

```
show ipv6 ospfv3 [<PROCESS-ID>] virtual-links [brief]
   [all-vrfs | vrf <vrf-name>]
```

Description

Displays the current state and parameters of the OSPFv3 virtual links.

Parameter	Description
<PROCESS-ID>	Enter an OSPFv3 process ID to display information on the OSPFv3 virtual links for the particular OSPFv3 process. Range: 1 to 65535.
brief	Select to display brief overview information for the OSPFv3 virtual links.
all-vrfs	Select to display OSPFv3 virtual links information for all VRFs.
vrf *<VRF-NAME>*	Specifies the name of a VRF. Default: default.

Examples

Show OSPFv3 virtual links information:

```
switch# show ipv6 ospfv3 virtual-links
Virtual link to router 4.4.4.4 is down
---------------------------------------

Process ID 1 VRF default, Transit area 0.0.0.1
Transit delay 1 sec
Timer Intervals: hello 10, dead 40, retransmit 5
Number of Link LSAs: 0, checksum sum 0
0 state changes
AH Authentication: MD5, SPI: 256
```

Show brief overview information for OSPFv3 virtual links:

```
switch# show ospfv3 virtual-links brief
OSPFv3 Process ID 1 VRF default
```

```
================================

Total Number of Virtual Links: 1

Remote Router    Transit Area      Status
------------------------------------------
4.4.4.4          0.0.0.1           down
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

summary-address

```
summary-address  <IPV6-ADDR>/<MASK> [no-advertise | tag <TAG-VALUE>]
no summary-address <prefix/length> [no-advertise | tag <tag-value>
```

Description

Summarizes the external routes with the matching address and mask. When advertising this route, its metric is set to the lowest cost path from among the routes that were summarized.

The **no** form of this command disables route summarization.

This command only works for an ASBR (Autonomous System Boundary Router).

Parameter	Description
<IPV6-ADDR>	Specifies an IP address in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.
<MASK>	Specifies the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128.
no-advertise	Do not advertise the aggregate route. Suppress routes that match the specified prefix/mask pair.

Parameter	Description
`tag <TAG-VALUE>`	Specify the tag for the aggregate route. The summary prefix will be advertised along with the tag value in External LSAs. Range: 0 to 4294967295

Examples

Setting OSPF route summarization:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# summary-address 2001:DB8::1/32
```

Disabling route summarization:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# no summary-address 2001:DB8::1/32
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

timers lsa-arrival

```
timers lsa-arrival <DELAY>
no timers lsa-arrival
```

Description

Configures the minimum delay between receiving the same LSA from a peer. The same LSA is an LSA that contains the same LSA ID number, LSA type, and advertising router ID. If an instance of the same LSA arrives sooner before the delay expires, the LSA is dropped. Generally, the LSA arrival timer should be set to a value less than or equal to the start-time value for the command **timers throttle lsa start** on the neighbor.

The **no** form of this command sets the LSA timers to default values.

Parameter	Description
<DELAY>	Specifies the delay in milliseconds. Range: 0 to 600000. Default: 1000.

Examples

Setting the LSA arrival timer:

```
switch(config)# router ospf 1
switch(config-ospfv3-1)# timers lsa-arrival 10
```

Setting the LSA arrival timer to default:

```
switch(config)# router ospf 1
switch(config-ospfv3-1)# no timers lsa-arrival
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

timers throttle lsa

```
timers throttle lsa start-time <START-TIME> hold-time <HOLD-TIME> max-wait-time <WAIT-TIME>
no timers throttle lsa
```

Description

Configures the timers for LSA generation.

The **no** form of this command sets the LSA timers to default values.

Parameter	Description
start-time *<START-TIME>*	Specifies the initial wait time in milliseconds after which LSAs are generated. When set to 0, the LSAs are generated without any delay. Range: 0 to 600000. Default: 5000.

Parameter	Description
`hold-time <HOLD-TIME>`	Specifies the amount of time, in milliseconds, between regeneration of an LSA. The hold time doubles each time the same LSA must be regenerated, until **max-wait-time** is reached. When set to 0, LSA regeneration time is not increased. Range: 0 to 600000. Default: 0.
`max-wait-time <WAIT-TIME>`	Specifies the maximum wait time, in milliseconds, for regeneration of the same LSA. When set to 0, LSA regeneration time is not increased. Range: 0 to 600000. Default: 0.

Examples

Setting the LSA timers:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# timers throttle lsa start-time 100 hold-time 1000 max-
wait-time 10000
```

Setting LSA timers to default values:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# no timers throttle lsa
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

timers throttle spf

```
timers throttle spf start-time <START-TIME> hold-time <HOLD-TINME>
max-wait-time <WAIT-TIME>
no timers throttle spf
```

Description

Configures timers for SPF calculation. There are three timers:

- **start-time** Is the initial delay before an SPF calculation is started. Default is 200 milliseconds.
- **hold-time** Is the progressive backoff time to wait before next scheduled SPF calculation. Default is 1000 milliseconds. If a route change event occurs during this period, the value doubles until it reaches the *max-wait-time*.
- **max-wait-time** Is the maximum time to wait before the next scheduled SPF calculation. Default is 5000 milliseconds. This is used to limit the SPF hold timer and also defines the time to be considered for which the OSPF LSDB has to be stable, after which the SPF throttle mechanism is reset.

The **no** form of this command sets all the configured non-default timers to default value.

Parameter	Description
<START-TIME>	Time in milliseconds to set timer for initial SPF delay. Default: 200.
<HOLD-TINME>	Time in milliseconds to set the minimum hold time between two consecutive SPF calculations. Default: 1000.
<WAIT-TIME>	Time in milliseconds to set the maximum wait time between two consecutive SPF calculations. Default: 5000.

Examples

Setting non-default timer values for SPF throttling:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# timers throttling spf start-time 500 hold-time 3000 max-
wait-time 9000
Switch(config-ospfv3-1)# show running-config current-context
router ospfv3 1
               area 0.0.0.0
               area 0.0.0.1
               area 0.0.0.2 nssa no-summary
               area 0.0.0.3 stub
```

Setting default timer values for SPF throttling after configuring non-default values:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# no timers throttling spf
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

transit-delay

```
transit-delay <DELAY>
no transit-delay
```

Description

Sets the time delay in Link state transmission for virtual links.

The **no** form of this command sets the delay in Link state transmission to the default of 1 second for virtual links.

Parameter	Description
<DELAY>	Specifies the time delay for the transit delay, in seconds. Range: 1 to 3600. Default: 1.

Examples

Setting OSPFv3 virtual links transit delay:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# area 100 virtual-link 100.0.1.1
switch(config-router-vlink6)# transit-delay 30
```

Setting OSPFv3 virtual links transit delay to default:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# area 100 virtual-link 100.0.1.1
switch(config-router-vlink6)# no transit-delay
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

trap-enable

```
trap-enable
no trap-enable
```

Description

Enables the notification of the events to be sent as traps to the SNMP management stations for OSPFv3.

The **no** form of this command disables the notification of the events to be sent as traps to the SNMP management stations for OSPFv3.

Examples

Enabling sending notification of events as traps:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# trap-enable
```

Disabling sending notification of events as traps:

```
switch(config)# router ospfv3 1
switch(config-ospfv3-1)# no trap-enable
```

Chapter 102
PBR commands

apply policy

```
apply policy <POLICY-NAME> routed-in
no apply policy <POLICY-NAME> routed-in
```

Description

Applies a classifier policy containing a PBR action to an interface. A policy with PBR actions is only applicable to L3/routing interfaces.

The **no** form of this command removes a classifier policy containing a PBR action from an interface.

`config-if`

Parameter	Description
<POLICY-NAME>	Specifies name of the policy.

Restrictions

- Only Layer 3 interfaces are valid for PBR policy application, and only in the routed inbound direction.
- If a policy with an 'interface tunnel' PBR action is applied on a Layer 3 interface in VRF 'A', and that interface tunnel is a member of VRF 'B', the interface tunnel is considered down/unavailable in this policy application in VRF 'A'.

Usage

To use route-only ports (ROPs) as Layer 3 interfaces, an internal VLAN range must be configured first. A policy with PBR actions can be applied to ROPs.

Example

On the 6400 Switch Series, interface identification differs.

Applying a policy to an interface:

```
switch(config)# interface 1/1/10
switch(config-if)# routing
switch(config-if)# apply policy pbr_policy routed-in
switch(config-if)# exit
```

Applying a policy to a subinterface, inbound direction:

```
switch(config)# interface 1/1/1.0
switch(config-if)# apply policy my_policy in
switch(config-if)# exit
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

pbr-action-list

```
pbr-action-list <ACTION-LIST-NAME>

    [<SEQUENCE-NUMBER>]
      {nexthop | default-nexthop} <NEXT-HOP-IP-ADDR>
       interface {null | <TUNNEL-NAME>}

    no [<SEQUENCE-NUMBER>]
      {nexthop | default-nexthop} <IP-ADDR>
       interface {null | <TUNNEL-NAME>}

no pbr-action-list <ACTION-LIST-NAME>
```

Description

Creates a PBR action list or modifies its entries.

The **no** form of this command can be used to delete an action list or an individual action list entry.

Parameter	Description
<ACTION-LIST-NAME>	Specifies the action list name. An action list name can be 1 to 64 alphanumeric characters.
<SEQUENCE-NUMBER>	Specifies list entry sequence number. Range: 1-4294967295 {nexthop | default-nexthop} Selects a regular next-hop (**nexthop**) or a default next-hop (**default-nexthop**). These parameters specify the address of a next-hop router to forward traffic matched by a class under different conditions.
`nexthop`	Sets the next hop for routing the packet.
`default-nexthop`	Sets the next hop for routing the packet when there is no explicit route for its destination.
<NEXTHOP-IP-ADDR>	Specifies IPv4 or IPv6 address of the next-hop router.
`interface {null	<TUNNEL-NAME>`	Selects the type of keyword interface: **null** or the tunnel interface

Parameter	Description
	name.
`null`	Specifies to drop matching traffic.
`<TUNNEL-NAME>`	Specifies an IP tunnel interface name through which to forward the matching traffic.

Restrictions

The reachability of the next-hop routers/tunnel interfaces in the list is not guaranteed. Such reachability can change at any time due to the dynamic nature of the network environment.

Usage

Each action list may contain up to eight entries of four different entry types:

- `interface null`
- `interface tunnel`
- `nexthop`
- `default-nexthop`

List entries have a unique sequence number which, if not user specified, are automatically assigned beginning at 10 and continuing at intervals of 10 for each subsequent new list entry, for example 20, 30, and 40. Sequence numbers of any value can be specified manually, a different interval may be set, and new entries can be added to (or removed from) any location in the list at any time.

Specifying an existing sequence number causes the existing list entry to be replaced by the new details. The list entry with the lowest sequence number has the highest priority entry in the list. The sequence numbers may be renumbered with the pbr-action-list resequence command.

Only one next-hop router or interface from the list is used per packet matched. This router or interface is defined as the highest priority list entry that is reachable or available at the time of the traffic match. If the highest priority list entry next-hop router or tunnel interface is reachable - that list entry is chosen, the search is stopped, and the traffic is forwarded to the next-hop router or interface for the entry. If the highest priority list entry next-hop router or tunnel interface is not reachable, the next highest priority list entry reachability is determined and used if reachable, otherwise the process continues down the list. If none of the routers in the list are reachable, the packet may be dropped (through the null interface entry if configured) or forwarded according to a system route table entry.

An action list that contains a next-hop of one IP version cannot also contain an entry of another IP version. For example, an action list must contain only IPv4 or IPv6 next-hop addresses or tunnel interfaces.

Examples

The list name is included in the context prompt for easy current-list identification. Any list name over 10 characters will be truncated at 10 characters and terminated with the tilde character (~) to indicate a reduced list name display. This reduction affects the prompt display of the list name only:

```
switch(config)# pbr-action-list eighteenchars
switch(config-pbr-action-list-eighteench~)#
```

The following example creates an action list with two IPv4 next-hops, a default IPv4 next-hop, and a null interface. The example uses default sequence numbering for its list entries.

```
switch(config)# pbr-action-list test1
switch(config-pbr-action-list-test1)# nexthop 1.1.1.1
switch(config-pbr-action-list-test1)# nexthop 2.2.2.2
switch(config-pbr-action-list-test1)# default-nexthop 9.9.9.9
switch(config-pbr-action-list-test1)# interface null
switch(config-pbr-action-list-test1)# end

switch(config)# show pbr-action-list test1

           Name
  Sequence Type                            Address/Interface
------------------------------------------------------------------
           test1
       10  nexthop                         1.1.1.1
       20  nexthop                         2.2.2.2
       30  default-nexthop                 9.9.9.9
       40  interface                       null
```

The following example creates an action list with an IPv4 next-hop and a tunnel interface with manual sequence numbers for its entries.

```
switch(config)# pbr-action-list test2
switch(config-pbr-action-list-test2)# 6 ip default-nexthop 4.4.4.4
switch(config-pbr-action-list-test2)# 1 interface tunnel10
switch(config-pbr-action-list-test2)# end

switch(config)# show pbr-action-list test2

           Name
  Sequence Type                            Address/Interface
------------------------------------------------------------------
           test2
        1  interface                       tunnel10
        6  default-nexthop                 4.4.4.4
```

The following example creates an action list with two IPv4 tunnel interfaces, with default sequence numbering.

```
switch(config)# pbr-action-list test3
switch(config-pbr-action-list-test3)# interface tunnel10
switch(config-pbr-action-list-test3)# interface tunnel15
switch(config-pbr-action-list-test3)# end

switch(config)# show pbr-action-list test3

           Name
  Sequence Type                            Address/Interface
------------------------------------------------------------------
           test3
       10  interface                       tunnel10
       20  interface                       tunnel15
```

The following example creates an action list with two IPv6 next-hops and the null interface, with manual sequence numbers.

```
switch(config)# pbr-action-list test4
switch(config-pbr-action-list-test4)# 5 nexthop 2000:abcd::cccc:dddd
switch(config-pbr-action-list-test4)# 6 nexthop 1000:abcd::1234:5678
switch(config-pbr-action-list-test4)# 7 interface null
switch(config-pbr-action-list-test4)# end

switch(config)# show pbr-action-list test4

           Name
  Sequence Type                            Address/Interface
------------------------------------------------------------------
           test4
        5  nexthop                         2000:abcd::cccc:dddd
        6  nexthop                         1000:abcd::1234:5678
        7  interface                       null
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

Command Information

Platforms	Command context	Authority
6300 6400	`config` The `pbr-action-list` *`<ACTION-LIST-NAME>`* command takes you into the `config-pbr-action-list-`*`<ACTION-LIST-NAME>`* context where you modify entries for a PBR action list.	Administrators or local user group members with execution rights for this command.

pbr-action-list copy

`pbr-action-list <ACTION-LIST-NAME> copy <DESTINATION-ACTION-LIST-NAME>`

Description

Copies an existing PBR action list.

Parameter	Description
`<ACTION-LIST-NAME>`	Specifies the action list name to be copied.
`<DESTINATION-ACTION-LIST-NAME>`	Specifies the name of the copied action list. A destination action list name can be 1 to 64 alphanumeric characters.

Examples

The following example copies test4 action list to test 5.

```
switch(config)# show pbr-action-list test4

           Name
  Sequence Type                            Address/Interface
-------------------------------------------------------------------
           test4
         5  nexthop                         2000:abcd::cccc:dddd
         6  nexthop                         1000:abcd::1234:5678
         7  interface                       null

switch(config)# pbr-action-list test4 copy test5
switch(config-pbr-action-list-test4)# show pbr-action-list test5

           Name
  Sequence Type                            Address/Interface
-------------------------------------------------------------------
           test4
         1  nexthop                         2000.abcd::cccc.dddd
        11  nexthop                         1000.abcd::1234.5678
        21  interface                       null
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

6300 6400	`config`	Administrators or local user group members with execution rights for this command.

pbr-action-list resequence

`pbr-action-list <ACTION-LIST-NAME> resequence <STARTING-SEQUENCE-NUMBER> <INCREMENT>`

Description

Renumbers the entries in an action list. The list entry with the lowest sequence number has the highest priority entry in the list.

Parameter	Description
<ACTION-LIST-NAME>	Specifies the action list name to have its entries resequenced.

Parameter	Description
<STARTING-SEQUENCE-NUMBER>	Specifies the starting sequence number. Range: 1-4294967295
<INCREMENT>	Specifies the increment of the resequencing. Range: 1-4294967295

Examples

The following command shows how a PBR action list is resequenced. In the following example, an action list named **test4** is resequenced so that instead of its entries starting at 5 and being numbered sequentially, its entries start now at 1 and they are numbered in increments of 10:

```
switch(config)# show pbr-action-list test4

           Name
  Sequence Type                            Address/Interface
------------------------------------------------------------------
           test4
        5  nexthop                         2000.abcd::cccc.dddd
        6  nexthop                         1000.abcd::1234.5678
        7  interface                       null

switch(config)# pbr-action-list test4 resequence 1 10

           Name
  Sequence Type                            Address/Interface
------------------------------------------------------------------
           test4
        1  nexthop                         2000.abcd::cccc.dddd
       11  nexthop                         1000.abcd::1234.5678
       21  interface                       null
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

pbr-action-list reset

`pbr-action-list <ACTION-LIST-NAME> reset`

Description

Resets a specified PBR action list to its last successful configuration.

Parameter	Description
<ACTION-LIST-NAME>	Specifies the action list name to be reset.

Examples

```
switch(config)# pbr-action-list test reset
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

policy

```
policy <POLICY-NAME>

    [<SEQUENCE-NUMBER>]
      class {ip|ipv6|mac} <CLASS-NAME>
      action {<REMARK-ACTIONS> | <POLICE-ACTIONS> | <OTHER-ACTIONS>}
      [{<REMARK-ACTIONS> | <POLICE-ACTIONS> | <OTHER-ACTIONS>}]

    [<SEQUENCE-NUMBER>]
    comment ...

no policy <POLICY-NAME>
```

Description

Creates, modifies, or deletes a classifier policy. A policy contains one or more policy entries ordered and prioritized by sequence numbers. Each entry has an IPv4/IPv6/MAC class and one or more policy actions associated with it. An applied policy processes a packet sequentially against policy entries in the list until the last entry in the list has been evaluated or the packet matches an entry. If a match occurs the related entry, actions are taken.

The **no** form of this command is used to delete a policy or an individual policy entry.

Parameter	Description
<POLICY-NAME>	Specifies the name of the policy.
<SEQUENCE-NUMBER>	Specifies a sequence number for the policy entry. Optional. Range: 1 to 4294967295.
`comment`	Stores the remaining entered text as a policy entry comment.
`class {ip|ipv6|mac}` *<CLASS-NAME>*	Specifies a type of class, **ip** for IPv4, **ipv6** for IPv6 and **mac** for a MAC policy. And specifies a class name.
<REMARK-ACTIONS>	Remark actions can be any of the following options: **{pbr <ACTION-LIST> | pcp <PRIORITY> | ip-precedence <IP-PRECEDENCE-VALUE> | dscp <DSCP-VALUE> | local-priority <LOCAL-PRIORITY-VALUE>}** where: pbr *<ACTION-LIST>* Specifies the PBR action list to be used. pcp *<PCP-VALUE>* Specifies Priority Code Point (PCP) value. Range: 0 to 7. ip-precedence *<IP-PRECEDENCE-VALUE>* Specifies the numeric IP precedence value. Range: 0 to 7. dscp *<DSCP-VALUE>* Specifies a Differentiated Services Code Point (DSCP) value. Enter either a numeric value (0 to 63) or a keyword as follows: **AF11** - DSCP 10 (Assured Forwarding Class 1, low drop probability) **AF12** - DSCP 12 (Assured Forwarding Class 1, medium drop probability) **AF13** - DSCP 14 (Assured Forwarding Class 1, high drop probability) **AF21** - DSCP 18 (Assured Forwarding Class 2, low drop probability) **AF22** - DSCP 20 (Assured Forwarding Class 2, medium drop probability) **AF23** - DSCP 22 (Assured Forwarding Class 2, high drop probability) **AF31** - DSCP 26 (Assured Forwarding Class 3, low drop probability) **AF32** - DSCP 28 (Assured Forwarding Class 3, medium drop probability) **AF33** - DSCP 30 (Assured Forwarding Class 3, high drop probability) **AF41** - DSCP 34 (Assured Forwarding Class 4, low drop probability) **`AF42`** - DSCP 36 (Assured Forwarding Class 4, medium drop probability) **AF43** - DSCP 38 (Assured Forwarding Class 4, high drop probability) **CS0** - DSCP 0 (Class Selector 0: Default) **CS1** - DSCP 8 (Class Selector 1: Scavenger) **CS2** - DSCP 16 (Class Selector 2: OAM) **CS3** - DSCP 24 (Class Selector 3: Signaling) **CS4** - DSCP 32 (Class Selector 4: Real time) **CS5** - DSCP 40 (Class Selector 5: Broadcast video)

Parameter	Description
	CS6 - DSCP 48 (Class Selector 6: Network control) **CS7** - DSCP 56 (Class Selector 7) **EF** - DSCP 46 (Expedited Forwarding) `local-priority` *<LOCAL-PRIORITY-VALUE>* Specifies a local priority value. Range: 0 to 7.
<POLICE-ACTIONS>	Police actions can be the following **{cir <RATE-BPS> cbs <BYTES> exceed}** where: `cir` *<RATE-BPS>* Specifies a Committed Information Rate value in Kilobits per second. Range: 1 to 4294967295. `cbs` *<BYTES>* Specifies a Committed Burst Size value in bytes. Range: 1 to 4294967295. `exceed` Specifies action to take on packets that exceed the rate limit.
<OTHER-ACTIONS>	Other actions can be the following: `drop` Specifies drop traffic.

Restrictions

MAC classes are not applicable to policies containing PBR actions. Applying such policies to an interface are blocked.

Usage

- For Policy Based Routing, the policy action keyword is **pbr** which itself takes the name of a PBR action list as a parameter.
- A policy entry that contains a PBR action can contain other action types as well.
- An applied policy processes a packet sequentially against policy entries in the list until the last policy entry in the list has been evaluated or the packet matches an entry.
- Entering an existing **<POLICY-NAME>** value will cause the existing policy to be modified, with any new **<SEQUENCE-NUMBER>** value creating an additional policy entry, and any existing **<SEQUENCE-NUMBER>** value replacing the existing policy entry with the same sequence number.
- If no sequence number is specified, a new policy entry is appended to the end of the entry list with a sequence number equal to the highest policy entry currently in the list plus 10.

Examples

Create a policy with two PBR actions:

```
switch(config)# policy pbr_policy
switch (config-policy)# 10 class ip v4_class action pbr action_list1
switch (config-policy)# 20 class ipv6 v6_class action pbr action_list2
switch (config-policy)# exit
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

Platforms	Command context	Authority
6300 6400	`config` The `policy` command takes you into the `config-policy` context where you enter the policy entries.	Administrators or local user group members with execution rights for this command.

show pbr

```
show pbr {interface <INTERFACE-NAME>|vrf <VRF-NAME>|summary}
```

Description

Shows a detailed view of Policy Based Routing (PBR) in the system.

Parameter	Description
<VRF-NAME>	Specifies name of a VRF.
<INTERFACE-NAME>	Specifies an interface. Format: **member/slot/port**.

Usage

Show commands can only reference the default VRF.

Examples

Showing PBR summary information when there is no active next-hop in the system:

```
switch# show pbr summary
VRF      Port   Policy    PBR      Seq  Type       Nexthop
---------------------------------------------------------------------
No active PBR nexthop found
---------------------------------------------------------------------
```

Showing PBR summary information when there are active next-hops in the system:

```
switch# show pbr summary

VRF      Port   Policy    PBR      Seq  Type       Nexthop
---------------------------------------------------------------------
default  1/1/1  policy_1  pbr_1    10   nexthop    1.1.1.1 (active)
         1/1/2  policy_2  pbr_2    20   nexthop    5.5.5.5 (active)
---------------------------------------------------------------------
```

Showing PBR summary information when displaying a policy with a **pbr-action-list** applied on a VxLAN L3VNI:

```
switch# configure terminal
switch(config)# interface vxlan 1
switch(config-vxlan-if)# vni 10000
switch(config-vni-10000)# apply policy p1 routed-in
switch(config-vni-10000)# show pbr summary
VRF
      Port
                Policy
                          Class
                                    PBR
                                           Sequence  Type          Nexthop
-------------------------------------------------------------------------------
red
      vni10000
                p1
                          c1
                                    pbr1
                                                 10  nexthop       11.2.1.4
(active)
-------------------------------------------------------------------------------
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show pbr-action-list

```
show pbr-action-list [<ACTION-LIST-NAME>] [commands] [configuration] [vsx-peer]
```

Description

Shows the current PBR action list configuration. Action list entries are displayed in ascending order of their sequence number.

Parameter	Description
<ACTION-LIST-NAME>	Specifies the PBR action list name.

Parameter	Description
`commands`	Formats output as CLI commands.
`configuration`	Displays user-specified configuration.
`vsx-peer`	Displays VSX peer switch information.

Restrictions

If an action list entry is modified to an invalid value (for example through the REST interface), this command will indicate a mismatch for that action entry when run. In this event, use the **pbr-action-list <NAME> reset** command to restore it to the previous valid value.

Usage

- This command does not indicate whether the action list is configured in a policy or applied to an interface. Use the **show pbr** command for PBR status involving action lists.
- A single action list is shown by specifying its name or you can show all action lists by omitting a name argument.
- Using the additional commands keyword, you can change the tabulated output to a configuration style output for single or all list display.

Examples

Create two PBR action lists then run **show pbr-action-list** to display all configured action lists in the default configuration mode:

```
switch(config)# pbr-action-list v4_pbr
switch(config-pbr-action-list-v4_pbr)# 1 nexthop 1.1.1.1
switch(config-pbr-action-list-v4_pbr)# 5 default-nexthop 2.2.2.2
switch(config-pbr-action-list-v4_pbr)# 10 interface null
switch(config-pbr-action-list-v4_pbr)# exit
switch(config)#
switch(config)# pbr-action-list v6_pbr
switch(config-pbr-action-list-v6_pbr)# 20 nexthop 2000:abcd::cccc:dddd
switch(config-pbr-action-list-v6_pbr)# 40 default-nexthop 1000:abcd::1234:5678
switch(config-pbr-action-list-v6_pbr)# 60 interface null
switch(config-pbr-action-list-v6_pbr)# exit
switch#

switch# show pbr-action-list
           Name
           Additional PBR-Action-List Parameters
Sequence     Type                 Nexthop
-----------------------------------------------------------------------------------
-----
             v4_pbr
1            nexthop              1.1.1.1
5            default-nexthop      2.2.2.2
10           interface            null

             v6_pbr
20           nexthop              2000:abcd::cccc:dddd
40           default-nexthop      1000:abcd::1234:5678
60           interface            null
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show running-config current-context

`show running-config current-context`

Description

Displays the configuration of the PBR action list in the current configuration context, in commands mode.

Parameter	Description
`running-config`	Shows configuration currently running on switch.
`current-context`	Limits display to current config context only, in commands mode.

Usage

Useful for reexamining entries previously entered into the action list after its entries have scrolled off the terminal due to other output or upon reentering the context of an existing action list.

Examples

Creating two PBR action lists and running **show running-configuration curent-context** to display the action list configuration in commands mode:

```
switch(config)# pbr-action-list v4_pbr
switch(config-pbr-action-list-v4_pbr)# 1 nexthop 1.1.1.1
switch(config-pbr-action-list-v4_pbr)# 5 default-nexthop 2.2.2.2
switch(config-pbr-action-list-v4_pbr)# 10 interface null
switch(config-pbr-action-list-v4_pbr)# exit
switch(config)#
switch(config)# pbr-action-list v6_pbr
switch(config-pbr-action-list-v6_pbr)# 20 nexthop 2000:abcd::cccc:dddd
switch(config-pbr-action-list-v6_pbr)# 40 default-nexthop 1000:abcd::1234:5678
switch(config-pbr-action-list-v6_pbr)# 60 interface null
switch(config-pbr-action-list-v6_pbr)#
switch(config-pbr-action-list-v6_pbr)# show running-config current-context
```

```
pbr-action-list v6_pbr
    20 nexthop 2000:abcd::cccc:dddd
    40 default-nexthop 1000:abcd::1234:5678
    60 interface null
```

Switching context back to the first actionl ist and running the same command:

```
switch(config-pbr-action-list-v6_pbr)# pbr-action-list v4_pbr
switch(config-pbr-action-list-v4_pbr)#
switch(config-pbr-action-list-v4_pbr)# show running-config current-context
pbr-action-list v4_pbr
    1 nexthop 1.1.1.1
    5 default-nexthop 2.2.2.2
    10 interface null
```

Removing action list entry number 5 and running the command again:

```
switch(config-pbr-action-list-v4_pbr)# no 5
switch(config-pbr-action-list-v4_pbr)# show running-config current-context
pbr-action-list v4_pbr
    1 nexthop 1.1.1.1
    10 interface null
```

Chapter 103
PIM-DM commands for IPv4

disable

`disable`

Description

Disables PIM globally on the router. PIM is disabled by default.

Using the **disable** command will cause all the multicast routes to be erased from hardware.

Example

Disabling PIM router:

```
switch(config)# router pim
switch(config-pim)# disable
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

enable

`enable`

Description

Enables PIM globally on the router.

Example

Enabling PIM router:

```
switch(config)# router pim
switch(config-pim)# enable
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

ip pim-dense

```
ip pim-dense {enable|disable}
no ip pim-dense [enable]
```

Description

Enables or disables PIM-DM in the current interface. PIM-DM is disabled by default on an interface. IP address must be configured on the interface to enable PIM-DM.

Parameter	Description
`enable`	Specifies PIM-DM on the interface. IP address must be configured on the interface to enable PIM-DM (use the **ip address <A.B.C.D/M>** command).
`disable`	Disables PIM-DM on the interface.

Examples

Enabling and disabling PIM-DM in an interface:

```
switch(config)# interface vlan40
switch(config-if-vlan)# ip address 40.0.0.4/24
switch(config-if-vlan)# ip pim-dense enable
switch(config-if-vlan)#
switch(config-if-vlan)# ip pim-dense disable
```

Enabling and disabling PIM-DM in a sub-interface:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config)# interface 1/1/1.10
switch(config-subif)# ip address 10.0.0.1/24
switch(config-subif)# ip pim-dense enable
switch(config-subif)#
switch(config-subif)# ip pim-dense disable
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ip pim-dense bfd

```
ip pim-dense bfd [disable]
no ip pim-dense bfd
```

Description

Configures BFD on a per-interface basis for an interface associated with the PIM process.

The **no** form of this command removes the BFD configuration on the interface and sets it to the default configuration.

If BFD is enabled globally, it will be enabled by default on all interfaces. The only exception is when it is disabled specifically on an interface using the **ip pim-dense bfd disable** command.

If BFD is disabled globally, it will be disabled by default on all interfaces. The only exception is when it is enabled specifically on an interface using the **ip pim-dense bfd** command.

Parameter	Description
`disable`	Disables the BFD configuration on the interface.

Examples

Enabling the BFD configuration on the interface:

```
switch(config)# interface vlan40
switch(config-if-vlan)# ip pim-dense bfd
```

Removing the BFD configuration on the interface:

```
switch(config-if-vlan)# no ip pim-dense bfd
```

Disabling the BFD configuration on the interface and overriding the global setting:

```
switch(config-if-vlan)# ip pim-dense bfd disable
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

ip pim-dense graft-retry-interval

```
ip pim-dense graft-retry-interval <INTERVAL-VALUE>
no ip pim-dense graft-retry-interval
```

Description

Configures the interval for which the routing switch waits for the graft acknowledgment from another router before resending the graft request.

The **no** form of this command removes the currently configured value and sets to the default of 3 seconds.

Parameter	Description
<INTERVAL-VALUE>	Specifies the interval the routing switch waits for the graft acknowledgment. Default: 3 seconds. Range: 1-10 seconds.

Usage

Graft packets result when a downstream router transmits a request to join a flow. The upstream router responds with a graft acknowledgment packet. If the graft acknowledgment is not received within the time period of the graft-retry-interval, it resends the graft packet.

Example

Configuring and removing dense graft retry interval on the interface:

```
switch(config)# interface vlan40
switch(config-if-vlan)# ip pim-dense graft-retry-interval 5
switch(config-if-vlan)# no ip pim-dense graft-retry-interval
```

Configuring and removing dense graft retry interval on the sub-interface:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360 and 10000 Switch Series.

```
switch(config)# interface 1/1/1.10
switch(config-subif)# ip pim-dense graft-retry-interval 5
switch(config-subif)#
switch(config-subif)# no ip pim-dense graft-retry-interval
```

ip pim-dense hello-delay

```
ip pim-dense hello-delay <DELAY-VALUE>
no ip pim-dense hello-delay
```

Description

Configures the maximum time in seconds before the router actually transmits the initial PIM hello message on the current interface.

The **no** form of this command removes currently configured value and sets to the default of 5 seconds.

Parameter	Description
<DELAY-VALUE>	Specifies the hello-delay in seconds, which is the maximum time before a triggered PIM Hello message is transmitted on this interface. Default: 5 seconds. Range: 0-5 seconds.

Usage

In cases where a new interface activates connections with multiple routers, if all the connected routers send hello packets at the same time, the receiving router could become momentarily overloaded. This command randomizes the transmission delay to a time between zero and the hello delay setting. Using zero means no delay. After the router sends the initial hello packet to a newly detected interface, it sends subsequent hello packets according to the current hello interval setting.

Example

Configuring and removing hello-delay on the interface:

```
switch(config)# interface vlan40
switch(config-if-vlan)# ip pim-dense hello-delay 4
switch(config-if-vlan)# no ip pim-dense hello-delay
```

Configuring and removing hello-delay on the sub-interface:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360 and 10000 Switch Series.

```
switch(config)# interface 1/1/1.10
switch(config-subif)# ip pim-dense hello-delay 4
switch(config-subif)#
switch(config-subif)# no ip pim-dense hello-delay
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ip pim-dense hello-interval

```
ip pim-dense hello-interval <INTERVAL-VALUE>
no ip pim-dense hello-interval
```

Description

Configures the frequency at which the router transmits PIM hello messages on the current interface.

The **no** form of this command removes the currently configured value and sets to the default of 30 seconds.

Parameter	Description
<INTERVAL-VALUE>	Required: Specifies the frequency at which PIM Hello messages are transmitted on this interface. Default: 30 seconds. Range: 5-300 seconds.

Usage

- The router uses hello packets to inform neighbor routers of its presence.
- The router also uses this setting to compute the hello holdtime, which is included in hello packets sent to neighbor routers.
- Hello holdtime tells neighbor routers how long to wait for the next hello packet from the router. If another packet does not arrive within that time, the router removes the neighbor adjacency on that interface from the PIM adjacency table, which removes any flows running on that interface.
- Shortening the hello interval reduces the hello holdtime. If they do not receive a new hello packet when expected, it changes how quickly other routers stop sending traffic to the router.

Example

Configuring and removing dense hello-interval:

```
switch(config)# interface 1/1/4
switch(config-if)# ip pim-dense hello-interval 60
switch(config-if)# no ip pim-dense hello-interval
```

Configuring and removing dense hello-interval on the sub-interface:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config-subif)# interface 1/1/10.10
switch(config-subif)# ip pim-dense hello-interval 60
switch(config-subif)#
switch(config-subif)# no ip pim-dense hello-interval
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ip pim-dense ip-addr

```
ip pim-dense ip-addr {<IP-ADDR-VALUE> | any}
no ip pim-dense ip-addr
```

Description

Enables the router to dynamically determine the source IP address to use for PIM packets sent from the interface or to use the specific IP address.

The **no** form of this command removes the currently configured value and sets to the default of **any**.

Parameter	Description
<IP-ADDR-VALUE>	Specifies an IP address as the source IP for the interface.
`any`	Specifies dynamically determining the source IP from the current IP address of the interface.

Examples

Configuring and removing source IP address:

```
switch(config)# interface vlan40
switch(config-if-vlan)# ip pim-dense ip-addr 40.0.0.4
switch(config-if-vlan)# no ip pim-dense ip-addr
```

Configuring and removing source IP address on the sub-interface:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360 and 10000 Switch Series.

```
switch(config)# interface 1/1/1.10
switch(config-subif)# ip pim-dense ip-addr 10.1.1.1
switch(config-subif)#
switch(config-subif)# no ip pim-dense ip-addr
```

ip pim-dense lan-prune-delay

```
ip pim-dense lan-prune-delay
no ip pim-dense lan-prune-delay
```

Description

Enables the LAN prune delay option on the current interface. The default status is enabled.

The **no** form of this command disables the LAN prune delay option.

Usage

With LAN-prune-delay enabled, the router informs downstream neighbors how long it will wait before pruning a flow after receiving a prune request. Other downstream routers on the same interface must send a join to override the prune before the LAN-prune-delay time to continue the flow. Prompts any downstream neighbors with multicast receivers continuing to belong to the flow to reply with a join. If no joins are received after the LAN-prune-delay period, the router prunes the flow. The propagation-delay and override-interval settings determine the LAN-prune-delay setting.

Example

Enabling and disabling the LAN prune delay:

```
switch(config)# interface vlan40
switch(config-if-vlan)# ip pim-dense lan-prune-delay
switch(config-if-vlan)# no ip pim-dense lan-prune-delay
```

Enabling and disabling the LAN prune delay on the sub-interface:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config)# interface 1/1/1.10
switch(config-subif)# ip pim-dense lan-prune-delay
switch(config-subif)# no ip pim-dense lan-prune-delay
```

ip pim-dense max-graft-retries

```
ip pim-dense max-graft-retries <ATTEMPT-VALUE>
no ip pim-dense max-graft-retries
```

Description

Configures the number of attempts the routing switch will retry sending the same graft packet to join a flow.

The **no** form of this command removes the currently configured value and sets to the default of 3 attempts.

Parameter	Description
<INTERVAL-VALUE>	Specifies the number of retries for the routing switch to resend the graft packet. Default: 3 attempts. Range: 1-10 attempts.

Usage

If a graft acknowledgment response is not received after the specified number of retries, the routing switch ceases trying to join the flow. In this case the flow is removed until either a state-refresh from upstream re-initiates the flow or an upstream router floods the flow. Increasing this value helps to improve multicast reliability.

Example

Configuring and removing dense graft retry interval:

```
switch(config)# interface vlan40
switch(config-if-vlan)# ip pim-dense max-graft-retries 6
switch(config-if-vlan)# no ip pim-dense max-graft-retries
```

Configuring and removing dense graft retry interval on the sub-interface:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360 and 10000 Switch Series.

```
switch(config)# interface 1/1/1.10
switch(config-subif)# ip pim-dense max-graft-retries 6
switch(config-subif)#
switch(config-subif)# no ip pim-dense max-graft-retries
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ip pim-dense override-interval

```
ip pim-dense override-interval <INTERVAL-VALUE>
no ip pim-dense override-interval
```

Description

Configures the override interval that gets inserted into the Override Interval field of a LAN Prune Delay option.

The **no** form of this command removes the currently configured value and sets the value to the default of 2500 ms.

Parameter	Description
<INTERVAL-VALUE>	Specifies the override interval of a LAN Prune Delay option in ms. Default: 2500 ms. Range: 500-6000.

Usage

Each router on the LAN expresses its view of the amount of randomization necessary in the Override Interval field of the LAN Prune Delay option. When all routers on a LAN use the LAN Prune Delay Option, all routers on the LAN MUST set their Override_Interval to the largest Override value on the LAN.

Example

Configuring and removing the override interval:

```
switch(config)# interface vlan40
switch(config-if-vlan)# ip pim-dense override-interval 4000
switch(config-if-vlan)# no ip pim-dense override-interval
```

Configuring and removing the override interval on the sub-interface:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config)# interface 1/1/1.10
switch(config-subif)# ip pim-dense override-interval 4000
switch(config-subif)# no ip pim-dense override-interval
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ip pim-dense propagation-delay

```
ip pim-dense propagation-delay <DELAY-VALUE>
no ip pim-dense propagation-delay
```

Description

Configures the propagation delay that gets inserted into the LAN prune delay field of a LAN Prune Delay option.

The **no** form of this command removes currently configured value and sets to the default of 500 ms.

Parameter	Description
<DELAY-VALUE>	Specifies the propagation delay value in ms. Default: 500 ms. Range: 250-2000 ms.

Usage

The LAN Delay inserted by a router in the LAN Prune Delay option expresses the expected message propagation delay on the link. When all routers on a link use the LAN Prune Delay Option, all routers on the LAN MUST set Propagation Delay to the largest LAN Delay on the LAN.

Examples

Configuring and removing the propagation delay:

```
switch(config)# interface vlan40
switch(config-if-vlan)# ip pim-dense propagation-delay 400
switch(config-if-vlan)# no ip pim-dense propagation-delay
```

Configuring and removing the propagation delay on the sub-interface:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config)# interface 1/1/1.10
switch(config-subif)# ip pim-dense propagation-delay 400
switch(config-subif)# no ip pim-dense propagation-delay
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ip pim-dense ttl-threshold

```
ip pim-dense ttl-threshold <THRESHOLD-VALUE>
no ip pim-dense ttl-threshold
```

Description

Configures the multicast datagram time-to-live (router hop-count) threshold for the interface. A state-refresh packet with a TTL less than this threshold will not be forwarded out the interface.

The **no** form of this command removes the currently configured value and sets to the default of 3 attempts.

Parameter	Description
<THRESHOLD-VALUE>	Specifies the time to live threshold. Default: 3 attempts. Range: 0-255.

Usage

The interface connected to the multicast source does not receive state refresh packets and thus is not state-refresh capable. Downstream VLANs in the switches are state-refresh capable. This parameter provides a method for containing multicast traffic within a network, or even within specific areas of a network. Initially, the multicast traffic source sets a TTL value in the packets it transmits. Each time one of these packets passes through a multicast routing device, the TTL setting decrements by 1. If the packet arrives with a TTL lower than the ttl-threshold, the routing switch does not forward the packet. The following aspects of the TTL setting of incoming multicast packets must be considered, before changing this parameter on a routing switch:

- A value that is too high will allow multicast traffic to go beyond the internal network.
- A value that is too low may prevent some intended hosts from receiving the desired multicast traffic.
- A value of 0 will forward multicast traffic regardless of the packet TTL setting.

Example

Configuring and removing the time-to-live threshold:

```
switch(config)# interface vlan40
switch(config-if-vlan)# ip pim-dense ttl-threshold 8
switch(config-if-vlan)# no ip pim-dense ttl-threshold
```

Configuring and removing the time-to-live threshold on the sub-interface:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config)# interface 1/1/1.10
switch(config-subif)# ip pim-dense ttl-threshold 8
switch(config-subif)#
switch(config-subif)# no ip pim-dense ttl-threshold
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

router pim

```
router pim [vrf <VRF-NAME>]
  accept-register access-list <ACL-RULE>
  accept-rp <IP-ADDR> access-list <ACL-RULE>
  active-active
  bfd all-interfaces
  bsr-candidate {bsm-interval <INTERVAL-VALUE> | {hash-mask-length <LENGTH-VALUE> |
  priority <PRIORITY-VALUE> | source-ip-interface <INTERFACE-NAME>}
  enable|disable
  join-prune-interval <INTERVAL-VALUE>
  multicast-route-limit <limit>
  no ...
  register-rate-limit <limit>
  rp-address <IP-ADDR> [<GRP-ADDR/GRP-MASK>] [override]
  rp-candidate {group-prefix <GRP-ADDR/GRP-MASK>  |hold-time <TIME-VALUE> | priority
  <PRIORITY-VALUE> | source-ip-interface <INTERFACE-NAME> [group-prefix <GRP-ADDR/GRP-
  MASK>]}
  rpf-override <SRC-ADDR/SRC-MASK><RPF-ADDR|INTERFACE-NAME>
```

Description

Changes the current context to the PIM configuration context and enables PIM globally on the router. If no VRF is specified, the default VRF is assumed.

The **no** form of this command removes the PIM configuration from the specified context or the default VRF.

Parameter	Description
`vrf <VRF-NAME>`	Specifies the name of a VRF.
`accept-register access-list <ACL-RULE>`	Specify an ACL rule name to configures ACL on RP to filter PIM Register packets from unauthorized sources. The ACL specified will contain the (S,G) traffic in register packets to permitted or denied.
`accept-rp <IP-ADDR> access-list <ACL-RULE>`	Specify the IPv4 address of the static RP and ACL rule name to enable the PIM router to filter PIM join/prune messages destined for a specific RP and specific groups. The ACL specifies the group addresses which are allowed or denied. Up to 8 RP addresses and group ACL can be associated with the PIM router. PIM will store the accepted RP address and the associated group ACL. When a join or prune message is received, a RP look up is made for the packet. If the RP is in the configured list and if the group in the join/prune packet is allowed in the ACL, the packet is allowed. Otherwise the packet is dropped.

Parameter	Description
	To allow join/prune message from any groups, group address in the ACL can be wild-carded. In this case, only RP address check is performed. This parameter impacts only (*,G) join/prune messages. If there are any existing flows, the user will need to disable and enable PIM on the interface to apply the ACL. Loopback interfaces are special interfaces where only unicast PIM messages are updated. This includes Register, Register Stop, and Candidate RP Advertisements. When a loopback interface is configured as the RP, the ACL drop counters will be updated on the interface on which the packets are received. **NOTE:** If there is an active flow which is in the SPT, the traffic flow through the SPT will continue. Only (*,G) join/prune messages are dropped. (S,G) join/prune messages will not be impacted.
`active-active`	Enables the PIM active-active mechanism per VRF on VSX. The default is disabled. PIM active-active keeps the multicast forwarding state synchronized on both VSX peer devices. Synchronization is achieved by electing the VSX peer that has the highest IP address as a designated router (DR) and the other as Proxy-DR. If you want the multicast traffic to flow through VSX primary, assign higher IP addresses to the interfaces in VSX primary. When the VSX peer that is acting as the DR goes down, traffic is recovered faster since the multicast routes are synchronized.
`bfd all-interfaces`	Enables BFD on all PIM interfaces. BFD can be disabled at individual PIM interface using the **ip pim-sparse bfd disable** command.
`bsr-candidate`	Configure settings for a router that operates as the BSR in a domain.
`bsm-interval <INTERVAL-VALUE>`	Configures the interval in seconds to send periodic RP-Set messages to all PIM-SM interfaces on a router that operates as the BSR in a domain. This setting must be smaller than the **rp-candidate hold-time** settings (range of 30 to 255; default 150) configured in the RPs operating in the domain. Default: 60 seconds. Range: 5-300.
`hash-mask-length <LENGTH-VALUE>`	Controls the distribution of multicast groups among the C-RP, in a domain where there is overlapping coverage of the groups among the RPs. This value specifies the length (number of significant bits) when allocating this distribution. A longer hash-mask-length results in fewer multicast groups, for each block of group addresses assigned to the RPs. Multiple blocks of addresses assigned to each C-RP results in wider dispersal of addresses. Includes

Parameter	Description
	enhanced load-sharing for the multicast traffic for the different groups that are used in the domain at the same time. Default: 30 bits. Range: 1-32.
`priority <PRIORITY-VALUE>`	Configures the priority to apply to the router when a BSR election process occurs in the PIM-SM domain. The candidate with the highest priority becomes the BSR for the domain. If the highest priority is shared by multiple routers, the candidate having the highest IP address becomes the BSR of the domain. Zero (0) is the lowest priority. To make BSR selection easily predictable, use this command to assign a different priority to each candidate BSR in the PIM-SM domain. Default: 0. Range: 0-255
`source-ip-interface <INTERFACE-NAME>`	Configures the router to advertise itself as a candidate PIM-SM BSR on the interface specified, and enables BSR candidate operation. The result makes the router eligible to be elected as the BSR for the PIM-SM domain in which it operates. One BSR candidate interface is allowed per-router. The Interface can be a VLAN interface (such as vlan15) or routed interfaces (such as lag 1 or 1 / 1 / 19). PIM-SM must be enabled on this interface (use the **ip pim-sparse enable** command).
`enable|disable`	Enables or disables PIM globally on the router.
`join-prune-interval <INTERVAL-VALUE>`	Configures the frequency at which the router will send periodic join or prune-interval messages. Range 5 to 65535 Default: 60.
`multicast-route-limit <limit>`	Configures the limit on the maximum number of multicast route entries that can be programmed. When the limit is configured, multicast route entries created because of IGMP or MLD membership reports, and multicast route entries created because of multicast streams are restricted to the configured limit. Flows exceeding the configured multicast route limit will be programmed as a bridge entry and will not have the outgoing interfaces list populated. This configuration prevents creation of new multicast routes when limits are reached. At the time of configuration, if the device has more multicast routes than the configured limit, existing multicast routes continue to exist until they are removed. The flows are programmed in the HW on a FCFS basis. There could be scenarios where the flow is forwarded in neighbor router, but it may not be forwarded on the current router because of exceeding the limits configured on the current router. In such cases, it is recommended to configure higher limits to avoid traffic outage. Range: 1 to 4294967295.

Parameter	Description
`no...`	Negates any configured parameter.
`register-rate-limit <limit>`	Configures the limit on the maximum number of register messages sent per second for every unique (S,G) entry. By default, there is no maximum rate set. When the limit is configured, register messages generation is limited to the configured value. Range: 1 to 4294967295.
`rp-address`	Statically configures the router as the RP for a specified multicast group or range of multicast groups. When a static RP and a C-RP are configured to support the same multicast groups and the multicast group mask for the static RP is equal to or greater than the same mask for the applicable C-RPs, this command assigns the higher precedence to the static RP, resulting in the C-RP operating only as a backup RP for the configured group. Without override, the C-RP has precedence over a static RP configured for the same multicast group or groups. This must be configured on all PIM-SM routers in the domain. If group address is not specified, it applies to all IPv4 multicast addresses (224.0.0.0 - 239.255.255.255). PIM-SM supports a maximum of 8 static RPs per VRF.
`<IP-ADDR>`	Specifies the address of the static RP in IPv4 format (**x.x.x.x**).
`<GRP-ADDR/GRP-MASK>`	Specifies the multicast group address in IPv4 format (**x.x.x.x**) and the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128.
`override`	Specifies higher precedence to static RP over Candidate RP.
`rp-candidate`	Configure Candidate Rendezvous Point (C-RP) settings.
`group-prefix <GRP-ADDR/GRP-MASK>`	Adds multicast group address to the current Candidate Rendezvous Point (C-RP) configuration by specifying the the multicast group address in IPv4 format (**x.x.x.x**) and the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128.
`hold-time <TIME-VALUE>`	Changes the hold-time a C-RP includes in its advertisements to the BSR. Hold-time is included in the advertisements the C-RP periodically sends to the elected BSR for the domain. Also updates the BSR on how long to wait after the last advertisement from the reporting RP before assuming it has become unavailable. Range: 30 to 250. Default: 150.
`priority <PRIORITY-VALUE>`	Changes the current priority setting for a C-RP. Where multiple C-RP configurations are used to support the same multicast groups, the candidate

Parameter	Description
	having the highest priority is elected. Zero (0) is the highest priority, and 255 is the lowest priority. Range: 0 to 255. Default: 192.
`source-ip-interface`	Enables the Candidate Rendezvous Point (C-RP) operation, and configures the router to advertise itself as a C-RP to the Bootstrap Router (BSR) for the current domain. This step includes the option to allow the C-RP to be a candidate for all possible multicast groups, or for up to four multicast groups, or ranges of groups. If group-prefix is not given, it considers for all multicast group addresses.
`<INTERFACE-NAME>`	Specifies the interface to use as a source for the C-RP router IP address.
`group-prefix <GRP-ADDR/GRP-MASK>`	Specifies the multicast group address in IPv4 format (**x.x.x.x**) and the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128.
`rpf-override`	The Reverse Path Forward (RPF) override allows overriding the normal RPF lookup mechanism, and indicates to the router that it may accept multicast traffic on an interface other than the one that the RPF lookup mechanism would normally select. This includes accepting traffic from an invalid source IP address for the subnet or VLAN that is directly connected to the router. Traffic may also be accepted from a valid PIM neighbor that is not on the reverse path towards the source of the received multicast traffic.
`<SRC-ADDR/SRC-MASK>`	Specifies the multicast source IPv4 address in IPv4 format (**x.x.x.x**) and the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128.
`<RPF-ADDR|INTERFACE-NAME>`	Specifies the RPF override IP address or interface.

Usage

When a register ACL is associated with a PIM Router, the PIM protocol will store the source and destination address details along with the action (permit or deny). If there are any existing flows, the user will need to disable and enable PIM on the interface to apply the ACL.

Upon receiving the register messages, a look up is made to check if the S and G in the packet is in the permitted list. If there is no match or if there is a deny rule match, a register stop message is immediately sent and the packet is dropped and no further action is taken. Permitted packets will go through the normal flow.

Loopback interfaces are special interfaces where only unicast PIM messages are updated. This includes Register, Register Stop, and Candidate RP Advertisements.

When a loopback interface is configured as the RP, the ACL drop counters will be updated on the interface on which the packets are received.

Recommendations for the active-active mechanism:

- Do not configure the DR priority of interfaces when **active-active** is enabled. The DR priority will be set to high on DR and default on Proxy-DR and any user-configured DR priority will be ignored.
- Always configure **keepalive** between VSX peers. If the ISL goes down when **keepalive** is not configured, both VSX peers start acting independently as DRs, resulting in duplicate traffic.
- Do not configure IGMP joins on transit VLANS.
- RP redundancy is not supported on the **active-active** mechanism. If one of the VSX peers is configured as RP and it goes down, the new traffic flows will not be converged until the RP is elected. For a static RP, new flows will never be converged until the VSX peer is back up.

Reverse Path Forward (RPF) override usage details:

- Reverse Path Forward (RPF) checking is a core multicast routing mechanism. The RPF ensures that the multicast traffic received arrives on the expected router interface before further processing. If the RPF check fails for a multicast packet, the packet is discarded. For multicast traffic flow that arrives on the SPT, the expected incoming interface for a given source or group is the interface towards the source address of the traffic (determined by the unicast routing system). For traffic arriving on the RP tree, the expected incoming interface is the interface towards the RP.
- RPF checking is applied to all multicast traffic and is significant in preventing network loops. Up to eight manual RPF overrides can be specified. The RPF-address indicates one of two distinct RPF candidates:
    1. A valid PIM neighbor address from which forwarded multicast traffic is accepted with a source address of ***<source-addr/src-mask>***.
    2. A local router address on a PIM-enabled interface to which ***<source-addr/src-mask>*** is directly connected. If configured, the local router will assume the role of DR for this flow and registers the flow with an RP.

Examples

Configuring and enabling default router PIM:

```
switch(config)# router pim
switch(config-pim)#enable
```

Configuring specified router PIM:

```
switch(config)# router pim vrf green
switch(config-pim)#
```

Configuring ACL on RP with an ACL rule named **pim_reg_acl**:

```
switch(config)# access-list ip pim_reg_acl
switch(config-acl-ip)# 10 permit any 20.1.1.1 225.1.1.2
switch(config-acl-ip)# 20 deny any 30.1.1.1 225.1.1.3
switch(config)# router pim
switch(config-pim)# accept-register acces
```

Configuring ACL on a RP with an ACL rule named **pim_rp_grp_acl** to filter join/prune messages:

```
switch(config)# access-list ip pim_rp_grp_acl
switch(config-acl-ip)# 10 permit any any 225.1.1.2/255.255.255.0
switch(config-acl-ip)# 20 permit any any 239.1.1.2/255.255.255.0
switch(config)-acl-ip# router pim
switch(config-pim)# accept-rp 30.1
```

On the 6400 Switch Series, interface identification differs.

Configuring and removing the BSR-candidate interface:

```
switch(config)# router pim
switch(config-pim)# bsr-candidate source-ip-interface 1/1/4
switch(config-pim)# bsr-candidate source-ip-interface vlan5
switch(config-pim)# no rp-candidate source-ip-interface 1/1/4
```

Configuring and removing sub-interface 1/1/4.10 as the BSR-candidate:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config)# router pim
switch(config-pim)# bsr-candidate source-ip-interface 1/1/4.10
switch(config-pim)#
switch(config-pim)# no rp-candidate source-ip-interface 1/1/4.10
```

Configuring and removing the multicast route rate limit:

```
switch(config)# router pim
switch(config-pim)# multicast-route-limit 1024
switch(config-pim)# no multicast-route-limit
```

Configuring and removing the register rate limit:

```
switch(config)# router pim
switch(config-pim)# register-rate-limit 10
switch(config-pim)# no register-rate-limit
```

Configuring and removing candidate-RP router priority and hold times

```
switch(config)# router pim
switch(config-pim)# rp-candidate priority 250
switch(config-pim)# rp-candidate hold-time 200
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.11	Sub-interface support extended to 8325 and 10000 Switch Series.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

show ip mroute

`show ip mroute [all-vrfs | vrf <VRF-NAME>] [vsx-peer]`

Description

Shows multicast routing information. Optionally, you can show specific information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`all-vrfs`	Shows mroute information for all VRFs. Optional.
`vrf <VRF-NAME>`	Shows mroute information for a particular VRF. If the **<VRF-NAME>** is not specified, it shows information for the default VRF. Optional.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing IP mroute for all VRFs:

```
switch# show ip mroute  all-vrfs
VRF : blue
Total number of entries : 1

Group Address            : 239.1.1.1
Source Address           : 40.0.0.5
Incoming interface       : vlan3
Downstream Interface
Interface    State
---------    -----
vlan2        forwarding

VRF : green
Total number of entries : 2

Group Address            : 239.1.1.1
Source Address           : 40.0.0.4
Neighbor                 : 10.1.1.1
Incoming interface       : vlan2
Downstream Interface
Interface    State
---------    -----
vlan5        forwarding

Group Address            : 239.1.1.1
```

```
Source Address          : 40.0.0.5
Neighbor                : 10.1.1.2
Incoming interface      : vlan1
Downstream Interface
Interface   State
---------   -----
vlan6       forwarding

VRF : default
Total number of entries : 1

Group Address           : 10.1.1.14
Source Address          : 40.0.0.6
Neighbor                : 10.1.1.2
Incoming interface      : 1/1/5
Downstream Interface
Interface   State
---------   -----
1/1/3       forwarding
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show ip mroute group-addr

`show ip mroute <GROUP-ADDR> [<SOURCE-ADDR>] [all-vrfs | vrf <vrf-name>] [vsx-peer]`

Description

Shows the multicast routing information for the given group address. Optionally, you can specify display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
<GROUP-ADDR>	Specifies a group address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.
<SOURCE-ADDR>	Specifies show information for the group from this source in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.

Parameter	Description
`all-vrfs`	Shows mroute information for the group for all VRFs.
`vrf <VRF-NAME>`	Specifies the name of a VRF.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing information for group 239.1.1.1 and VRF green:

```
switch# show ip mroute 239.1.1.1 vrf green

VRF : green

Group Address                 : 239.1.1.1
Source Address                : 40.0.0.5
Neighbor                      : 10.1.1.2
Incoming interface            : vlan1
Unicast Routing Protocol      : connected
Metric                        : 1234
Metric  Pref                  : 1234
Downstream Interface
Interface   State
---------   -----
vlan6       forwarding
```

Showing information for group 239.1.1.1 from source 40.0.0.5 and all VRFs:

```
switch# show ip mroute 239.1.1.1 40.0.0.5 all-vrfs

VRF : blue

Group Address                 : 239.1.1.1
Source Address                : 40.0.0.5
Incoming interface            : vlan3
Unicast Routing Protocol      : connected
Metric                        : 1234
Metric  Pref                  : 1234
Downstream Interface
Interface   State
---------   -----
vlan2       forwarding

VRF : green

Group Address                 : 239.1.1.1
Source Address                : 40.0.0.5
Neighbor                      : 10.1.1.2
Incoming interface            : vlan1
Unicast Routing Protocol      : connected
Metric                        : 1234
Metric  Pref                  : 1234
Downstream Interface
```

```
Interface   State
---------   -----
vlan6       forwarding
```

show ip mroute brief

`show ip mroute brief [al-vrfs | vrf <VRF-NAME>] [vsx-peer]`

Description

Shows brief version of the multicast routing information. Optionally, you can specify the display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`all-vrfs`	Shows mroute information for all VRFs.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Default: default.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing the IP mroute brief:

```
switch# show ip mroute  brief
VRF : default
Total number of entries : 1

Group Address      Source Address     Neighbor           Interface
-------------      --------------     --------           ---------
239.1.1.1          40.0.0.6           10.1.1.2           vlan5
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

show ip pim

`show ip pim [all-vrfs | vrf <VRF-NAME>] [vsx-peer]`

Description

Shows the PIM router information. Optionally, you can specify display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`all-vrfs`	Optional. Shows PIM router information on all VRFs.
`vrf <VRF-NAME>`	Optional. Shows PIM router information for a particular VRF. If the **<VRF-NAME>** is not specified, it shows information for the default VRF.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing IP PIM router:

```
switch# show ip pim

PIM Global Parameters

VRF                           :   default
PIM Status                    :   Enabled
Join/Prune Interval (sec)     :   60
SPT Threshold                 :   Enabled
State Refresh Interval (sec) :   60
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

show ip pim interface

```
show ip pim interface [all-vrfs | vrf <VRF-NAME>] [vsx-peer]
```

Description

Shows the information about PIM interfaces currently configured in the router. Optionally, you can specify display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`all-vrfs`	(Optional) Shows PIM interface information for all VRFs.
`vrf <VRF-NAME>`	(Optional) Shows PIM interface information for a particular VRF. If the **<VRF-NAME>** is not specified, it shows the default VRF information.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing PIM interface for the 6200, 6300, 6400,8100, 8325, 8360, 9300, 10000 switch series:

```
switch# show ip pim interface

PIM Interfaces

VRF: default
Total Number of interfaces: 1

Interface                  : vlan10
Neighbor count             : 0
IP Address                 : 100.100.1.2/24
```

```
Mode                       : bidir
Proxy DF                   : false
Hello Interval(sec)        : 30
Hello Delay(sec)           : 5
Override Interval(msec) : 2500
Lan Prune Delay            : Yes
Propagation Delay (msec): 500
Neighbor Timeout           : 0
PIM Interfaces

VRF: default

Interface           IP Address          mode
------------------- ------------------ ----------
1/1/1               40.0.0.4/24         sparse
1/1/2               50.0.0.4/24         sparse
```

Showing PIM interface:

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.13	Added support for BIDIR PIM on the , 6300, 6400,, , , , switch series.
10.07 or earlier	--

Command Information

6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show ip pim interface interface-name

`show ip pim interface <INTERFACE-NAME> [vsx-peer]`

Description

Shows detailed information about the PIM interface currently configured.

Parameter	Description
<INTERFACE-NAME>	Specifies an interface for showing PIM interface information. Interface can also be a LAG or VLAN.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not

Parameter	Description
	have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing PIM interface information for interface 1/1/2:

```
switch# show ip pim interface 1/1/2

PIM Interfaces

VRF: default

Interface  : 1/1/2
IP Address : 50.0.0.4/24
Mode       : dense

Designated Router :
Hello Interval (sec)       : 30
Hello Delay (sec)          : 5
Graft Retry Interval(sec)  : 3
Max Graft Retries          : 5
SR TTL Threshold           : 8

Override Interval (msec)   : 2500              Lan Prune Delay     : Yes
Propagation Delay (msec)   : 500               DR Priority         : 1
Neighbor Timeout           : 105
```

show ip pim interface interface-name counters

`show ip pim interface <INTERFACE-NAME> counters [vsx-peer]`

Description

Shows the PIM packet counters information for the specified interface.

Parameter	Description
<INTERFACE-NAME>	Specifies the interface to show packet counter information.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing PIM packet counters:

```
switch# show ip pim interface vlan1 counters
Interface              : vlan1
VRF                    : default
                                        Rx        Tx        Drops
                                        --------  --------  --------
Hello                                    21        21        0

show ip pim rpf

```
show ip pim rpf [<IP-ADDRESS>][all-vrfs | vrf <VRF-NAME>] [vsx-peer]
```

Description

Displays PIM RPF details for the specified source or RP address in the given VRF and shows the nexthop and interface through which the shortest path to the source is available. It also displays if a PIM neighbor is present on the nexthop. Optionally, you can specify display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
<IP-ADDRESS>	(Optional) Specifies an IP address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. Shows PIM RPF details for the given IP address.
`all-vrfs`	(Optional) Shows PIM interface information for all VRFs.
`vrf` *<VRF-NAME>*	(Optional) Shows PIM interface information for a particular VRF. If the **<VRF-NAME>** is not specified, it shows the default VRF information.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing PIM RPF information for the default VRF:

```
switch# show ip pim rpf
Multicast RPF Details
Origin Codes: C - connected, SM - static-multicast, SU - static-unicast
              O - OSPF, B - BGP, R - RIP
VRF: default
IP Address       RPF Interface  RPF Nexthop   PIM Neighbor  RPF Route/Mask
Origin  In Use
---------------  -------------  ------------  ------------  ---------------  -----
-  ---
1.1.1.1          vlan10         10.1.1.1      yes           1.1.1.1/32       O
  yes
10.1.1.1         vlan10                       no            10.1.1.0/24      C
  yes
10.1.1.2         vlan10                       no            10.1.1.2/32      C
  yes
```

Showing PIM RPF information for the specified IP address:

```
switch# show ip pim rpf 1.1.1.1
Multicast RPF Details
Origin Codes: C - connected, SM - static-multicast, SU - static-unicast
O - OSPF, B - BGP, R - RIP

VRF: default
IP Address   RPF Interface  RPF Nexthop  PIM Neighbor  RPF Route/Mask    Origin
In Use
-----------  -------------  -----------  ------------  ----------------  ------  -

show ip pim neighbor

```
show ip pim neighbor [<IP-ADDRESS>] [brief | all-vrfs | vrf <VRF-NAME>] [vsx-peer]
```

Description

Shows PIM neighbor information. Optionally, you can specify display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
<IP-ADDRESS>	Specifies an IP address.
brief	Specifies PIM neighbor information display in brief format.
all-vrfs	Selects all VRFs.
vrf *<VRF-NAME>*	Specifies the name of a VRF. Default: default.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing PIM neighbor information for the , 6300, 6400,, , , , switch series.:

```
switch# show ip pim neighbor

PIM Neighbor

VRF                           : default
Total number of neighbors : 1

IP Address                    : 30.1.1.3
Interface                     : vlan30
Up Time (HH:MM:SS)            : 03:55:40
Expire Time (HH:MM:SS)        : 00:01:23
DR Priority                   : NA
Hold Time (HH:MM:SS)          : 00:01:45
Bidir Capable                 : True
```

Showing PIM neighbor information in brief for the default VRF:

```
switch# show ip pim neighbor brief
-----------------------------------------------------------------------------------
-
 VRF: default                 Total number of neighbor : 2
-----------------------------------------------------------------------------------
-
Interface    Neighbor    Uptime      Expires     DR        Hold Time   Secondary
Address
             (IPV4)     (HH:MM:SS)  (HH:MM:SS)  Priority  (HH:MM:SS)   (IPV4)
----------  --------   ---------   ---------   ------    ---------   ----------------
-
29091/1/1    40.0.0.5  11:54:21    00:01:31    NA        00:01:45    Nil
29101/1/2    50.0.0.5  00:03:23    00:01:23    NA        00:01:45
60.0.0.4,70.0.0.4
-----------------------------------------------------------------------------------
-
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.13	Added support for BIDIR PIM on the , 6300, 6400,, , , , switch series.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

state-refresh-interval

```
state-refresh <INTERVAL-VALUE>
no state-refresh
```

Description

Configures the interval between successive state-refresh messages originated by the routing switch. Only the routing switch connected directly to the multicast source initiates state-refresh packets. All other PIM routers in the network only propagate these state-refresh packets.

The **no** form of this command sets the interval to the default value of 60 seconds.

Parameter	Description
<INTERVAL-VALUE>	Specifies the state refresh interval in seconds. Default: 60 seconds. Range 10-100.

Examples

Configuring the state refresh interval:

```
switch(config)# router pim
switch(config-pim)# state-refresh 30
switch(config-pim)# no state-refresh
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Chapter 104

PIM-DM commands for IPv6

disable

`disable`

Description

Disables PIMv6 globally on the router.

Using the **disable** command will cause all the multicast routes to be erased from hardware.

Example

Disabling PIM router:

```
switch(config)# router pim6
switch(config-pim6)# disable
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification

6300 6400	`config-pim6`	Administrators or local user group members with execution rights for this command.

enable

`enable`

Description

Enables PIMv6 globally on the router.

Example

Enabling PIM router:

```
switch(config)# router pim6
switch(config-pim6)# enable
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

ipv6 pim6-dense

```
ipv6 pim6-dense {enable | disable}
no ipv6 pim6-dense [enable]
```

Description

Enables or disables PIM-DM on the current interface. PIM-DM is disabled by default on an interface. An IPv6 address must be configured on the interface to enable PIM-DM.

Parameter	Description
`enable`	Enables PIM-DM on the interface. IPv6 address must be configured on the interface to enable PIM-SM (use the **ipv6 address <X:X::X:X/M>** command).
`disable`	Disables PIM-DM on the interface.

Examples

Enabling and disabling PIM-DM on an interface:

```
switch(config)# interface vlan40
switch(config-if-vlan)# ipv6 address 2001::01/64
switch(config-if-vlan)# ipv6 pim6-dense enable
switch(config-if-vlan)# ipv6 pim6-dense disable
```

Enabling and disabling PIM-DM on a sub-interface:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config)# interface 1/1/1.10
switch(config-subif)# ipv6 address 1001::01/64
switch(config-subif)# ipv6 pim6-dense enable
switch(config-subif)# ipv6 pim6-dense disable
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.11	Sub-interface support extended to 8325 and 10000 Switch Series.

ipv6 pim6-dense bfd

```
ipv6 pim6-dense bfd [disable]
no ipv6 pim6-dense bfd
```

Description

Configures BFD on a per-interface basis for an interface associated with the PIM process.

The **no** form of this command removes the BFD configuration on the interface and sets it to the default configuration.

If BFD is enabled globally, it will be enabled by default on all interfaces. The only exception is when it is disabled specifically on an interface using the **ipv6 pim6-dense bfd disable** command.
If BFD is disabled globally, it will be disabled by default on all interfaces. The only exception is when it is enabled specifically on an interface using the **ipv6 pim6-dense bfd** command.

Parameter	Description
`disable`	Disables the BFD configuration on the interface.

Examples

Enabling the BFD configuration on the interface:

```
switch(config)# interface vlan40
switch(config-if-vlan)# ipv6 pim6-dense bfd
```

Disabling the BFD configuration on the interface:

```
switch(config-if-vlan)# ipv6 pim6-dense bfd disable
```

Removing the BFD configuration on the interface:

```
switch(config-if-vlan)# no ipv6 pim6-dense bfd
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ipv6 pim6-dense graft-retry-interval

```
ipv6 pim6-dense graft-retry-interval <INTERVAL-VALUE>
no ipv6 pim6-dense graft-retry-interval
```

Description

Configures the interval for which the routing switch waits for the graft acknowledgment from another router before resending the graft request.

The **no** form of this command removes the currently configured value and sets to the default of 3 seconds.

Parameter	Description
<INTERVAL-VALUE>	Specifies the interval the routing switch waits for the graft acknowledgment. Default: 3 seconds. Range: 1-10.

Usage

Graft packets result when a downstream router transmits a request to join a flow. The upstream router responds with a graft acknowledgment packet. If the graft acknowledgment is not received within the time period of the graft-retry-interval, it resends the graft packet.

Example

Configuring and removing dense graft retry interval:

```
switch(config)# interface vlan40
switch(config-if-vlan)# ipv6 pim6-dense graft-retry-interval 5
switch(config-if-vlan)# no ipv6 pim6-dense graft-retry-interval
```

Configuring and removing dense graft retry interval on the sub-interface:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config)# interface 1/1/1.10
switch(config-subif)# ipv6 pim6-dense graft-retry-interval 5
switch(config-subif)#
switch(config-subif)# no ipv6 pim6-dense graft-retry-interval
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.11	Sub-interface support extended to 8325 and 10000 Switch Series.

ipv6 pim6-dense hello-delay

```
ipv6 pim6-dense hello-delay <DELAY-VALUE>
no ipv6 pim6-dense hello-delay
```

Description

Configures the maximum time in seconds before the router actually transmits the initial PIM hello message on the current interface.

The **no** form of this command removes currently configured value and sets to the default of 5 seconds.

Parameter	Description
<DELAY-VALUE>	Specifies the hello-delay in seconds, which is the maximum time before a triggered PIM Hello message is transmitted on this interface. Default: 5 seconds. Range: 0-5.

Usage

- In cases where a new interface activates connections with multiple routers, if all the connected routers sent hello packets at the same time, the receiving router could become momentarily overloaded.
- This command randomizes the transmission delay to a time between zero and the hello delay setting. Using zero means no delay. After the router sends the initial hello packet to a newly detected interface, it sends subsequent hello packets according to the current hello interval setting.

Example

Configuring and removing hello-delay on the interface:

```
switch(config)# interface vlan40
switch(config-if-vlan)# ipv6 pim6-dense hello-delay 4
switch(config-if-vlan)# no ipv6 pim6-dense hello-delay
```

Configuring and removing hello-delay on the sub-interface:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config)# interface 1/1/1.10
switch(config-subif)# ipv6 pim6-dense hello-delay 4
switch(config-subif)#
switch(config-subif)# no ipv6 pim6-dense hello-delay
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.11	Sub-interface support extended to 8325 and 10000 Switch Series.

ipv6 pim6-dense hello-interval

```
ipv6 pim6-dense hello-interval <INTERVAL-VALUE>
no ipv6 pim6-dense hello-interval
```

Description

Configures the frequency at which the router transmits PIM hello messages on the current interface.

The **no** form of this command removes the currently configured value and sets to the default of 30 seconds.

Parameter	Description
<INTERVAL-VALUE>	Specifies the frequency at which PIM Hello messages are transmitted on this interface. Default: 30 seconds. Range: 5-300.

Usage

- The router uses hello packets to inform neighbor routers of its presence.
- The router also uses this setting to compute the hello holdtime, which is included in hello packets sent to neighbor routers.
- Hello holdtime tells neighbor routers how long to wait for the next hello packet from the router. If another packet does not arrive within that time, the router removes the neighbor adjacency on that interface from the PIM adjacency table, which removes any flows running on that interface.
- Shortening the hello interval reduces the hello holdtime. If they do not receive a new hello packet when expected, it changes how quickly other routers stop sending traffic to the router.

Example

Configuring and removing dense hello-interval:

```
switch(config)# interface 1/1/4
switch(config-if)# ipv6 pim6-dense hello-interval 60
switch(config-if)# no ipv6 pim6-dense hello-interval
```

Configuring and removing dense hello-interval on the sub-interface:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config-subif)# interface 1/1/10.10
switch(config-subif)# ipv6 pim6-dense hello-interval 60
switch(config-subif)#
switch(config-subif)# no ipv6 pim6-dense hello-interval
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ipv6 pim6-dense ipv6-addr

```
ipv6 pim6-dense ipv6-addr {<IPV6-ADDR-VALUE> | any}
no ipv6 pim6-dense ipv6-addr
```

Description

Enables the router to dynamically determine the source IP address to use for PIM packets sent from the interface or to use the specific IP address.

The **no** form of this command removes the currently configured value and sets to the default of **any**.

Parameter	Description
<IPV6-ADDR-VALUE>	Specifies an IPv6 address as the source IP for the interface.
`any`	Specifies dynamically determining the source IP from the current IPv6 address of the interface.

Examples

Configuring and removing the source IP address:

```
switch(config)# interface vlan40
switch(config-if-vlan)# ipv6 pim6-dense ip-addr 2001::02
switch(config-if-vlan)# no ipv6 pim6-dense ipv6-addr
```

Configuring and removing the source IP address for the sub-interface:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config)# interface 1/1/1.10
switch(config-subif)# ipv6 pim6-dense ipv6-addr 1001::01
switch(config-subif)#
switch(config-subif)# no ipv6 pim6-dense ipv6-addr
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

ipv6 pim6-dense lan-prune-delay

```
ipv6 pim6-dense lan-prune-delay
no ipv6 pim6-dense lan-prune-delay
```

Description

Enables the LAN prune delay option on the current interface. The default status is enabled.

The **no** form of this command disables the LAN prune delay option.

Usage

With LAN-prune-delay enabled, the router informs downstream neighbors how long it will wait before pruning a flow after receiving a prune request. Other downstream routers on the same interface must send a join to override the prune before the LAN-prune-delay time to continue the flow. Prompts any downstream neighbors with multicast receivers continuing to belong to the flow to reply with a join. If no joins are received after the LAN-prune-delay period, the router prunes the flow. The propagation-delay and override-interval settings determine the LAN-prune-delay setting.

Example

Enabling and disabling the LAN prune delay:

```
switch(config)# interface vlan40
switch(config-if-vlan)# ipv6 pim6-dense lan-prune-delay
switch(config-if-vlan)# no ipv6 pim6-dense lan-prune-delay
```

Enabling and disabling the LAN prune delay on the sub-interface:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config)# interface 1/1/1.10
switch(config-subif)# no ipv6 pim6-dense lan-prune-delay
switch(config-subif)#
switch(config-subif)# ipv6 pim6-dense lan-prune-delay
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification

ipv6 pim6-dense max-graft-retries

```
ipv6 pim6-dense max-graft-retries <ATTEMPT-VALUE>
no ipv6 pim6-dense max-graft-retries
```

Description

Configures the number of attempts the routing switch will retry sending the same graft packet to join a flow.

The **no** form of this command removes the currently configured value and sets to the default of 3 attempts.

Parameter	Description
<INTERVAL-VALUE>	Specifies the number of retries for the routing switch to resend the graft packet. Default: 3 attempts. Range: 1-10.

Usage

If a graft acknowledgment response is not received after the specified number of retries, the routing switch ceases trying to join the flow. In this case the flow is removed until either a state-refresh from upstream re-initiates the flow or an upstream router floods the flow. Increasing this value helps to improve multicast reliability.

Example

Configuring and removing the dense graft retry interval:

```
switch(config)# interface vlan40
switch(config-if-vlan)# ipv6 pim6-dense max-graft-retries 6
switch(config-if-vlan)# no ipv6 pim6-dense max-graft-retries
```

Configuring and removing the dense graft retry interval on the sub-interface:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config)# interface 1/1/1.10
switch(config-subif)# ipv6 pim6-dense max-graft-retries 6
switch(config-subif)# no ipv6 pim6-dense max-graft-retries
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ipv6 pim6-dense override-interval

```
ipv6 pim6-dense override-interval <INTERVAL-VALUE>
no ipv6 pim6-dense override-interval
```

Description

Configures the override interval that gets inserted into the Override Interval field of a LAN Prune Delay option.

The **no** form of this command removes the currently configured value and sets the value to the default of 2500 ms.

Parameter	Description
<INTERVAL-VALUE>	Specifies the override interval of a LAN Prune Delay option in ms. Default: 2500 ms. Range: 500-6000.

Usage

Each router on the LAN expresses its view of the amount of randomization necessary in the Override Interval field of the LAN Prune Delay option. When all routers on a LAN use the LAN Prune Delay Option, all routers on the LAN MUST set their Override_Interval to the largest Override value on the LAN.

Example

Configuring and removing the override interval:

```
switch(config)# interface vlan40
switch(config-if-vlan)# ipv6 pim6-dense override-interval 4000
switch(config-if-vlan)# no ipv6 pim6-dense override-interval
```

Configuring and removing the override interval on the sub-interface:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config)# interface 1/1/1.10
switch(config-subif)# ipv6 pim6-dense override-interval 4000
switch(config-subif)#
switch(config-subif)# no ipv6 pim6-dense override-interval
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.11	Sub-interface support extended to 8325 and 10000 Switch Series.
10.07 or earlier	--

ipv6 pim6-dense propagation-delay

```
ipv6 pim6-dense propagation-delay <DELAY-VALUE>
no ipv6 pim6-dense propagation-delay
```

Description

Configures the propagation delay that gets inserted into the LAN prune delay field of a LAN Prune Delay option.

The **no** form of this command removes currently configured value and sets to the default of 500 ms.

Parameter	Description
<DELAY-VALUE>	Specifies the propagation delay value in ms. Default: 500 ms. Range: 250-2000.

Usage

The LAN Delay inserted by a router in the LAN Prune Delay option expresses the expected message propagation delay on the link. When all routers on a link use the LAN Prune Delay Option, all routers on the LAN MUST set Propagation Delay to the largest LAN Delay on the LAN.

Examples

Configuring and removing the propagation delay:

```
switch(config)# interface vlan40
switch(config-if-vlan)# ipv6 pim6-dense propagation-delay 400
switch(config-if-vlan)# no ipv6 pim6-dense propagation-delay
```

Configuring and removing the propagation delay on the sub-interface:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config)# interface 1/1/1.10
switch(config-subif)# ipv6 pim6-dense propagation-delay 400
switch(config-subif)#
switch(config-subif)# no ipv6 pim6-dense propagation-delay
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.11	Sub-interface support extended to 8325 and 10000 Switch Series.
10.07 or earlier	--

ipv6 pim6-dense ttl-threshold

```
ipv6 pim6-dense ttl-threshold <THRESHOLD-VALUE>
no ipv6 pim6-dense ttl-threshold
```

Description

Configures the multicast datagram time-to-live (router hop-count) threshold for the interface. Any IP multicast datagrams or state-refresh packets with a TTL less than this threshold will not be forwarded out the interface.

The **no** form of this command removes the currently configured value and sets to the default of 3 attempts.

Parameter	Description
<THRESHOLD-VALUE>	Specifies the time-to-live threshold. Default: 3 attempts. Range: 0-255.

Usage

The VLAN connected to the multicast source does not receive state refresh packets and thus is not state-refresh capable. Downstream VLANs in the switches are state-refresh capable. This parameter provides a method for containing multicast traffic within a network, or even within specific areas of a network. Initially, the multicast traffic source sets a TTL value in the packets it transmits. Each time one of these packets passes through a multicast routing device, the TTL setting decrements by 1. If the packet arrives with a TTL lower than the ttl-threshold, the routing switch does not forward the packet. The following aspects of the TTL setting of incoming multicast packets must be considered, before changing this parameter on a routing switch:

- A value that is too high will allow multicast traffic to go beyond the internal network.
- A value that is too low may prevent some intended hosts from receiving the desired multicast traffic.
- A value of 0 will forward multicast traffic regardless of the packet TTL setting.

Example

Configuring and removing the time-to-live threshold:

```
switch(config)# interface vlan40
switch(config-if-vlan)# ipv6 pim6-dense ttl-threshold 8
switch(config-if-vlan)# no ipv6 pim6-dense ttl-threshold
```

Configuring and removing the time-to-live threshold on the sub-interface:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config)# interface 1/1/1.10
switch(config-subif)# ipv6 pim6-dense ttl-threshold 8
switch(config-subif)# no ipv6 pim6-dense ttl-threshold
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

no ipv6 pim6-dense

```
no ip pim-dense
```

Description

Removes PIM-DM for all IPv6 related configurations for the interface.

Examples

Removing all PIM-DM configurations on an interface:

```
switch(config)# interface vlan40
switch(config-if-vlan)# no ipv6 pim6-dense
```

Removing all PIM-DM configurations on a sub-interface:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config)# interface 1/1/1.10
switch(config-subif)# no ipv6 pim6-dense
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.11	Sub-interface support extended to 8325 and 10000 Switch Series.
10.07 or earlier	--

Platforms	Command context	Authority

6300
6400
	`config-if`
	`config-if-vlan`
	`config-lag-if`
	`config-subif`
		Administrators or local user group members with execution rights for this command.

register-source

```
register-source <INTERFACE-NAME>
no register-source <INTERFACE-NAME>
```

Description

Specifies the source interface to be used for PIM registration in the case of VXLAN anycast interfaces. When the PIM enabled anycast VLAN is directly connected to a multicast source, **register-source** is used to send registration messages to the RP and this interface receives the register-stop messages from the RP.

The **no** form of this command removes the register source configuration.

For PIMv6, both IPv6 link-local and active-gateway address of the anycast VLAN interface is configured with the anycast link-local address. Refer to **EVPN VXLAN distributed anycast gateway** in the Multicast Guide for more information.

Parameter	Description
<INTERFACE-NAME>	Specifies the name of the interface to use.

Usage

- This is a global configuration under router-pim configuration and is required in Symmetric IRB with anycast IP address configuration.
- This configuration is required in the source connected switch only when the PIM-DR and RP are in two different switches.
- Without this configuration, there will be traffic loss as the registration sequence will not be successful. It is mandatory to have this source interface configured with a non-anycast IP address which is unique to the VTEP, and with PIM enabled.

Examples

Configuring the source interface for PIM registrations:

```
switch# config
switch(config)# router pim6 vrf vrf1
switch(config-pim)# register-source loopback1
```

Removing the **register-source** configuration:

```
switch(config-pim)# no register-source loopback1
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.12	Command introduced for PIMv6.
10.09.1000	Command introduced

Command Information

Platforms	Command context	Authority
6300 6400	`config-pim`	Administrators or local user group members with execution rights for this command.

router pim6

```
router pim6 [vrf <VRF-NAME>]
no router pim6 [vrf <VRF-NAME>]
```

Description

Changes the current context to the PIMv6 configuration context. If no VRF is specified, the default VRF is assumed.

The **no** form of this command removes the PIM configuration from the specified context or the default VRF.

Parameter	Description
`vrf <VRF-NAME>`	Specifies the name of a VRF. Default: default.

Examples

Configuring default router PIM:

```
switch(config)# router pim6
switch(config-pim6)#
```

Configuring specified router PIM:

```
switch(config)# router pim6 vrf Green
switch(config-pim6)#
```

Removing router PIM:

```
switch(config)# no router pim6
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

show ipv6 pim6

```
show ipv6 pim6 [all-vrfs | vrf <VRF-NAME>] [vsx-peer]
```

Description

Shows the PIM router information. Optionally, you can specify display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`all-vrfs`	Shows information for all VRFs.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Default: default.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing the IPv6 PIM router:

```
switch# show ipv6 pim6

PIM Global Parameters

VRF                             :  default
PIM Status                      :  Enabled
Join/Prune Interval (sec)       :  46
SPT Threshold                   :  Disabled
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

show ipv6 pim6 interface

`show ipv6 pim6 interface [all-vrfs | vrf <VRF-NAME>] [vsx-peer]`

Description

Shows the information about PIM interfaces currently configured in the router. Optionally, you can specify display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`all-vrfs`	Optional. Shows mroute information for the group for all VRFs.
`vrf <VRF-NAME>`	Optional. Shows mroute information for the group for a particular VRF. If the **<VRF-NAME>** is not specified, it shows information for the default VRF.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing PIM interface:

```
switch# show ipv6 pim6 interface
PIM Interfaces

VRF: default

Interface          IP Address
mode
------------------ --------------------------------------------------------------
----------
1/1/1              fe80::a00:9ff:feec:dc0e/64
dense
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

show ipv6 pim6 interface <*INTERFACE-NAME*>

```
show ipv6 pim6 interface <INTERFACE-NAME> [vsx-peer]
```

Description

Shows detailed information about the PIM interface currently configured.

Parameter	Description
`<INTERFACE-NAME>`	Specifies an interface for showing PIM interface information. Interface can also be a LAG or VLAN.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing PIM interface information for interface 1/1/1:

```
switch# show ipv6 pim6 interface 1/1/1

PIM Interfaces

VRF: default

Interface              : 1/1/1
IPv6 Address           : fe80::a00:9ff:feec:dc0e/64
Mode                   : dense

Designated Router      : fe80::a00:9ff:febd:8364
Hello Interval         : 30 sec
Hello Delay            : 4 sec

Override Interval      : 500 msec                LAN Prune Delay     : Yes

show ipv6 pim6 rpf

`show ipv6 pim6 rpf [<IP-ADDRESS>][all-vrfs | vrf <VRF-NAME>] [vsx-peer]`

Description

Displays PIM RPF details for the specified source or RP address in the given VRF and shows the nexthop and interface through which the shortest path to the source is available. It also displays if a PIM neighbor is present on the nexthop. Optionally, you can specify display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
<IP-ADDRESS>	Optional. Specifies an IP address in IPv6 format (xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx), where x is a hexadecimal number from 0 to F. Shows PIM RPF details for the given IP address.
all-vrfs	Optional. Shows PIM interface information for all VRFs.
vrf *<VRF-NAME>*	Optional. Shows PIM interface information for a particular VRF. If the **<VRF-NAME>** is not specified, it shows the default VRF information.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing PIM RPF information for the VRF named 'red':

```
switch# show ipv6 pim6 rpf vrf red
Multicast RPF Details
Origin Codes: C - connected, SM - static-multicast, SU - static-unicast
O - OSPF, B - BGP, R - RIP
VRF: red
IP Address      : 2000::2
RPF Interface   : vlan20
RPF Nexthop     :
```

```
RPF Route/Mask  : 2000::2/128
Origin          : C
In Use          : yes
IP Address      : 2222::2
RPF Interface   : vlan20
RPF Nexthop     : fe80::94f1:2880:141d:a800(PIM Neighbor)
RPF Route/Mask  : 2222::2/128
Origin          : O
In Use          : yes
```

Showing PIM RPF information for the specified IP address:

```
switch# show ipv6 pim6 rpf 2222::2 vrf red
Multicast RPF Details
Origin Codes: C - connected, SM - static-multicast, SU - static-unicast
O - OSPF, B - BGP, R - RIP
VRF: red
IP Address      : 2222::2
RPF Interface   : vlan20
RPF Nexthop     : fe80::94f1:2880:141d:a800(PIM Neighbor)
RPF Route/Mask  : 2222::2/128
Origin          : O
In Use          : yes
```

Showing PIM RPF information for all VRFs:

```
switch# show ipv6 pim6 rpf all-vrfs
Multicast RPF Details

Origin Codes: C - connected, SM - static-multicast, SU - static-unicast
              O - OSPF, B - BGP, R - RIP

VRF: default
IP Address      : 1001::2

show ipv6 mroute

`show ipv6 mroute [all-vrfs | vrf <VRF-NAME>] [vsx-peer]`

Description

Shows multicast routing information. Optionally, you can show specific information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`all-vrfs`	Shows information for all VRFs.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Default: default.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing IPv6 mroute information for the default VRF:

```
Switch# show ipv6 mroute
IP Multicast Route Entries

VRF : default
Total number of entries : 1

Group Address              : ff32::10
Source Address             : fd00:192:168:20::2
```

```
SSM Mroute               : True
Neighbor                 : fe80::f403:4301:1422:2600
Uptime                   : 00:14:05
State                    : route
Incoming interface       : 1/1/5
Outgoing Interface List :
Interface       State
-----------     ----------
vlan20          forwarding
```

Showing IPv6 mroute information for all VRFs:

```
switch# do show ipv6 mroute all-vrfs
IP Multicast Route Entries

VRF : default
Total number of entries : 1

Group Address            : ff32::10
Source Address           : fd00:192:168:2::100
SSM Mroute               : True
Neighbor                 : fe80::eceb:b801:14e4:2900
Uptime                   : 00:19:20
State                    : route
Incoming interface       : 1/1/4
Outgoing Interface List :
Interface       State
-----------     ----------
vlan20          forwarding

VRF : red
Total number of entries : 1

Group Address            : ff32::11
Source Address           : 30::3
SSM Mroute               : True
Neighbor                 : fe80::eceb:b880:1fe4:2900
Uptime                   : 00:01:13
State                    : route
Incoming interface       : vlan31
Outgoing Interface List :
Interface       State
-----------     ----------
vlan32          forwarding
```

show ipv6 mroute brief

```
show ipv6 mroute brief [all-vrfs | vrf <VRF-NAME>] [vsx-peer]
```

Description

Shows brief version of the multicast routing information. Optionally, you can specify the display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`all-vrfs`	Shows mroute information for all VRFs.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Default: default.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing the IPv6 mroute brief:

```
switch# show ipv6 mroute brief all-vrfs
IP Multicast Route Entries

VRF : blu
Total number of entries : 2

Group Address  : ff08::1:3
Source Address : 2002::04
Neighbor       : 2003::04
Interface       : 1/1/2

Group Address  : ff08::1:4
Source Address : 2002::03
Neighbor       : 2003::05
Interface       : 1/1/3

VRF : default
Total number of entries : 1

Group Address  : ff08::1:5
Source Address : 2001::03
Neighbor       : 2002::01
Interface       : 1/1/1
```

show ipv6 mroute <GROUP-ADDR>

```
show ipv6 mroute <GROUP-ADDR> [<SOURCE-ADDR>]
     [all-vrfs | vrf <vrf-name>] [vsx-peer]
```

Description

Shows the multicast routing information for the given group address. Optionally, you can specify display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
<GROUP-ADDR>	Specifies show information for the group address. Format: X:X::X:X
<SOURCE-ADDR>	Optional. Specifies show information for the group from this source. Format: X:X::X:X
all-vrfs	Optional. Shows mroute information for the group for all VRFs.
vrf *<VRF-NAME>*	Optional. Shows mroute information for the group for a particular VRF. If the **<VRF-NAME>** is not specified, it shows information for the default VRF.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing information for group ff08::1:3 and VRF green:

```
switch# show ipv6 mroute  ff08::1:3 vrf green

IP Multicast Route Entries

VRF : green

Group Address                 : ff08::1:3

show ipv6 pim6 neighbor

`show ipv6 pim6 neighbor [<IPv6-ADDR>] [all-vrfs | vrf <VRF-NAME>] [vsx-peer]`

Description

Shows PIM neighbor information. Optionally, you can specify display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
<IPv6-ADDR>	Specifies a neighbor address in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.
`all-vrfs`	Shows information for all VRFs.
`vrf` *<VRF-NAME>*	Specifies the name of a VRF. Default: default.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

On the 6400 Switch Series, interface identification differs.

Showing PIM neighbor information:

```
switch# show ipv6 pim6 neighbor
```

```
PIM Neighbor

VRF                    : default
IP Address             : 2001::02
Interface              : 1/1/1
Up Time (sec)          : 0
Expire Time (sec)      : 0
DR Priority            : 44
```

Showing PIM neighbor information (including the presence of anycast neighbors) for all VRFs:

```
switch# show ipv6 pim6 neighbor all-vrfs

PIM Neighbor

VRF                          : red
Total number of neighbors : 2

IPv6 Address                 : fe80::5:5:5:5
Interface                    : vni10000
Up Time (HH:MM:SS)           : 06:57:07
Expire Time (HH:MM:SS)       : 00:03:26
DR Priority                  : 1
Hold Time (HH:MM:SS)         : 00:03:30

IPv6 Address                 : fe80::3821:c780:a5c:18c0
Interface                    : vlan10
Up Time (HH:MM:SS)           : 00:01:46
Expire Time (HH:MM:SS)       : 00:01:29
DR Priority                  : 1
Hold Time (HH:MM:SS)         : 00:01:45
Secondary IP Addresses      :100:100::3
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

state-refresh-interval

```
state-refresh <INTERVAL-VALUE>
no state-refresh
```

Description

Configures the interval between successive state-refresh messages originated by the routing switch. Only the routing switch connected directly to the unicast source initiates state-refresh packets. All other PIM routers in the network only propagate these state-refresh packets.

The **no** form of this command sets the interval to the default value of 60 seconds.

Parameter	Description
<INTERVAL-VALUE>	Specifies the state refresh interval in seconds. Default: 60 seconds. Range 10-100.

Examples

Configuring the state refresh interval:

```
switch(config)# router pim6
switch(config-pim6)# state-refresh 30
switch(config-pim6)# no state-refresh
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Chapter 105
PIM-SM commands for IPv4

accept-register access-list

```
accept-register access-list <ACL-RULE>
no accept-register access-list <ACL-RULE>
```

Description

Configures ACL on RP to filter PIM Register packets from unauthorized sources. The ACL specified will contain the (S,G) traffic in register packets to permitted or denied.

The **no** form of this command removes the currently configured ACL rule.

Parameter	Description
<ACL-RULE>	Specifies the ACL rule name.

Usage

When register ACL is associated with a PIM Router, PIM protocol will store the source and destination address details along with the action (permit or deny). If there are any existing flows, the user will need to disable and enable PIM on the interface to apply the ACL.

Upon receiving the register messages, a look up is made to check if the S and G in the packet is in the permitted list. If there is no match or if there is a deny rule match, a register stop message is immediately sent and the packet is dropped and no further action is taken. Permitted packets will go through the normal flow.

Loopback interfaces are special interfaces where only unicast PIM messages are updated. This includes Register, Register Stop, and Candidate RP Advertisements.

When a loopback interface is configured as the RP, the ACL drop counters will be updated on the interface on which the packets are received.

Examples

Configuring ACL on RP with an ACL rule named **pim_reg_acl**:

```
switch(config)# access-list ip pim_reg_acl
switch(config-acl-ip)# 10 permit any 20.1.1.1 225.1.1.2
switch(config-acl-ip)# 20 deny any 30.1.1.1 225.1.1.3
switch(config)# router pim
switch(config-pim)# accept-register access-list pim_reg_acl
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

accept-rp

```
accept-rp <IP-ADDR> access-list <ACL-RULE>
no accept-rp <IP-ADDR> access-list <ACL-RULE>
```

Description

Enables PIM router to filter PIM join/prune messages destined for a specific RP and specific groups. The ACL specifies the group addresses which are allowed or denied. Up to 8 RP addresses and group ACL can be associated with the PIM router.

The **no** form of this command removes the currently configured ACL rule.

Parameter	Description
<IP-ADDR>	Specifies the IPv4 address of the static RP. Format: A.B.C.D
<ACL-RULE>	Specifies the ACL rule name.

Usage

PIM will store the accepted RP address and the associated group ACL. When a join or prune message is received, a RP look up is made for the packet. If the RP is in the configured list and if the group in the join/prune packet is allowed in the ACL, the packet is allowed. Otherwise the packet is dropped.

To allow join/prune message from any groups, group address in the ACL can be wild-carded. In this case, only RP address check is performed.

This command impacts only (*,G) join/prune messages. If there are any existing flows, the user will need to disable and enable PIM on the interface to apply the ACL.

Loopback interfaces are special interfaces where only unicast PIM messages are updated. This includes Register, Register Stop, and Candidate RP Advertisements.

When a loopback interface is configured as the RP, the ACL drop counters will be updated on the interface on which the packets are received.

If there is an active flow which is in the SPT, the traffic flow through the SPT will continue. Only (*,G) join/prune messages are dropped. (S,G) join/prune messages will not be impacted.

Examples

Configuring ACL on a RP with an ACL rule named **pim_rp_grp_acl** to filter join/prune messages:

```
switch(config)# access-list ip pim_rp_grp_acl
switch(config-acl-ip)# 10 permit any any 225.1.1.2/255.255.255.0
switch(config-acl-ip)# 20 permit any any 239.1.1.2/255.255.255.0
switch(config)-acl-ip# router pim
switch(config-pim)# accept-rp 30.1.1.1 access-list pim_rp_grp_acl
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

active-active

```
active-active
no active-active
```

Description

Enables the PIM active-active mechanism per VRF on VSX. The default is disabled.

The **no** form of this command disables the PIM active-active mechanism.

Usage

PIM active-active keeps the multicast forwarding state synchronized on both VSX peer devices. Synchronization is achieved by electing the VSX peer that has the highest IP address as a designated router (DR) and the other as Proxy-DR.

If you want the multicast traffic to flow through VSX primary, assign higher IP addresses to the interfaces in VSX primary. When the VSX peer that is acting as the DR goes down, traffic is recovered faster since the multicast routes are synchronized.

Recommendations:

- Do not configure the DR priority of interfaces when **active-active** is enabled. The DR priority will be set to high on DR and default on Proxy-DR and any user-configured DR priority will be ignored.
- Always configure **keepalive** between VSX peers. If the ISL goes down when **keepalive** is not configured, both VSX peers start acting independently as DRs, resulting in duplicate traffic.
- Do not configure IGMP joins on transit VLANS.

- RP redundancy is not supported on the **active-active** mechanism. If one of the VSX peers is configured as RP and it goes down, the new traffic flows will not be converged until the RP is elected. For a static RP, new flows will never be converged until the VSX peer is back up.

Examples

Enabling the PIM active-active mechanism:

```
switch(config)# router pim
switch(config-pim)# active-active
```

Disabling the PIM active-active mechanism:

```
switch(config)# router pim
switch(config-pim)# no active-active
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

anycast-rp source-directly-connected

```
anycast-rp source-directly-connected
[no] anycast-rp source-directly-connected
```

Description

Use this command with an Anycast rendezvous point (RP) solution (for example, with MSDP) when the same multicast source is directly connected to two or more Anycast RP routers.

Usage

When configured this command allows only one RP who is the Designated Router (DR) in the segment to own the generation of the MSDP SA (Source Active) messages. If this command is not enabled, all Anycast RP routers where the source is directly connected would start advertising SA messages and form a loop. For example. when the source is directly connected to an Anycast RP VSX pair via VSX-LAG. Therefore this configuration is recommended when VSX pairs act as Anycast RPs. This command is optional when the source is directly connected to a single Anycast RP router or when the source is at least one hop away from the RP.

Examples

The following examples configure directly connected sources with Anycast RP, then remove the configuration.

```
switch(config)# router pim
switch(config-pim)# anycast-rp source-directly-connected
switch(config-pim)#
switch(config-pim)# no anycast-rp source-directly-connected
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

bfd all-interfaces

```
bfd all-interfaces
no bfd all-interfaces
```

Description

Enables BFD on all PIM interfaces. BFD can be disabled at individual PIM interface using the **ip pim-sparse bfd disable** command.

The **no** form of this command disables BFD for all the interfaces.

Examples

Enabling and disabling BFD on all PIM interfaces:

```
switch(config)# router pim
switch(config-pim)# bfd all-interfaces
switch(config-pim)# no bfd all-interfaces
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

bsr-candidate bsm-interval

```
bsr-candidate bsm-interval <INTERVAL-VALUE>
no bsr-candidate bsm-interval
```

Description

Configures the interval in seconds to send periodic RP-Set messages to all PIM-SM interfaces on a router that operates as the BSR in a domain. This setting must be smaller than the **rp-candidate hold-time** settings (range of 30 to 255; default 150) configured in the RPs operating in the domain.

The **no** form of this command removes the currently configured value and sets it to the default of 60 seconds.

Parameter	Description
<INTERVAL-VALUE>	Specifies the BSR-candidate BSM interval in seconds. Default: 60 seconds. Range: 5-300.

Example

Configuring and removing BSR-candidate BSM-interval:

```
switch(config)# router pim
switch(config-pim)# bsr-candidate bsm-interval 150
switch(config-pim)# no bsr-candidate bsm-interval
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

bsr-candidate hash-mask-length

```
bsr-candidate hash-mask-length <LENGTH-VALUE>
no bsr-candidate hash-mask-length
```

Description

Controls the distribution of multicast groups among the C-RP, in a domain where there is overlapping coverage of the groups among the RPs. This value specifies the length (number of significant bits) when allocating this distribution. A longer hash-mask-length results in fewer multicast groups, for each block of group addresses assigned to the RPs. Multiple blocks of addresses assigned to each C-RP results in wider dispersal of addresses. Includes enhanced load-sharing for the multicast traffic for the different groups that are used in the domain at the same time.

The **no** form of this command removes currently configured value and sets to the default of 30.

Parameter	Description
<LENGTH-VALUE>	Specifies the length (in bits) of the hash mask. Default: 30. Range: 1-32.

Example

Configuring and removing the BSR-candidate hash-mask-length:

```
switch(config)# router pim
switch(config-pim)# bsr-candidate hash-mask-length 4
switch(config-pim)# no bsr-candidate hash-mask-length
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

bsr-candidate priority

```
bsr-candidate priority <PRIORITY-VALUE>
no bsr-candidate priority
```

Description

Configures the priority to apply to the router when a BSR election process occurs in the PIM-SM domain. The candidate with the highest priority becomes the BSR for the domain. If the highest priority is shared by multiple routers, the candidate having the highest IP address becomes the BSR of the domain. Zero (0) is the lowest priority. To make BSR selection easily predictable, use this command to assign a different priority to each candidate BSR in the PIM-SM domain.

The **no** form of this command removes currently configured value and sets to the default of 0.

Parameter	Description
<PRIORITY-VALUE>	Specifies the priority for the Candidate Bootstrap router. Default: 0. Range: 0-255

Example

Configuring and removing the BSR-candidate priority:

```
switch(config)# router pim
switch(config-pim)# bsr-candidate priority 250
switch(config-pim)# no bsr-candidate priority
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

bsr-candidate source-ip-interface

```
bsr-candidate source-ip-interface <INTERFACE-NAME>
no bsr-candidate source-ip-interface <INTERFACE-NAME>
```

Description

Configures the router to advertise itself as a candidate PIM-SM BSR on the interface specified, and enables BSR candidate operation. The result makes the router eligible to be elected as the BSR for the PIM-SM domain in which it operates. One BSR candidate interface is allowed per-router.

The **no** form of this command removes the Candidate BSR configuration.

Parameter	Description
<INTERFACE-NAME>	Specifies the interface to use as a source for Candidate-BSR router IP address. Interface can be a VLAN interface (such as vlan15) or routed interfaces (such as lag 1 or 1 / 1 / 19). PIM-SM must be enabled on this interface (use the **ip pim-sparse enable** command).

Example

On the 6400 Switch Series, interface identification differs.

Configuring and removing the BSR-candidate interface:

```
switch(config)# router pim
switch(config-pim)# bsr-candidate source-ip-interface 1/1/4
switch(config-pim)# bsr-candidate source-ip-interface vlan5
switch(config-pim)# no rp-candidate source-ip-interface 1/1/4
```

Configuring and removing sub-interface 1/1/4.10 as the BSR-candidate:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config)# router pim
switch(config-pim)# bsr-candidate source-ip-interface 1/1/4.10
switch(config-pim)#
switch(config-pim)# no rp-candidate source-ip-interface 1/1/4.10
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ip mroute

`ip mroute <SRC-ADDR/SRC-MASK> <RPF-ADDRESS> | <INTERFACE-NAME>`

Description

Configures multicast reverse path (RPF) forwarding static routes. This command is an alias of the **rpf-override** command.

Parameter	Description
<SRC-ADDR>	Specifies the multicast source address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.
<SRC-MASK>	Specifies the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128.
<RPF-ADDR>	Specifies the RPF address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.
<INTERFACE-NAME>	Specifies the RPF interface name.

Usage

Reverse Path Forward (RPF) checking is a core multicast routing mechanism. The RPF ensures that the multicast traffic received arrives on the expected router interface before further processing. If the RPF check fails for a multicast packet, the packet is discarded. For multicast traffic flow that arrives on the SPT, the expected incoming interface for a given source or group is the interface towards the source address of the traffic (determined by the unicast routing system). For traffic arriving on the RP tree, the expected incoming interface is the interface towards the RP.

Example

Configuring and removing an IP mroute:

```
switch(config)# router pim
switch(config-pim)# ip mroute 40.0.0.4/24 30.0.0.4
switch(config-pim)# no ip mroute 40.0.0.4/24 30.0.0.4
```

Configuring and removing an IP mroute for an IPv6 address:

```
switch(config-pim)# router pim6
switch(config-pim6)# ipv6 mroute 50::4/24 tunnel1
switch(config-pim6)# no ipv6 mroute 50::4/24 tunnel1
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ip multicast boundary

```
ip multicast boundary access-list <acl_name>
no ip multicast boundary access-list <acl_name>
```

Description

This command configures administratively-scoped multicast boundaries on PIM-enabled Interfaces. A multicast boundary uses an Access Control List (ACL) to filter multicast traffic on the specified interface and prevent the routing of multicast traffic from that interface. This feature supports filtering based on IP, IGMP, and PIM protocols, and can filter both multicast data traffic and control packets, including **IGMP Join**, **PIM Join**, and **Prune** messages. The ACL can use the **any** filter to match traffic from any source to a specific IP multicast group (*,G), and can contain subnet masks to match a range of addresses.

Parameter	Description
`access-list` *`<acl_name>`*	Name of the boundary ACL to be applied on the interface.

Usage

When the multicast boundary is configured, MSDP is used to learn the multicast sources across the boundaries. Based on the ACL rules configured, the multicast traffic from one domain to other domain is permitted/denied. MSDP SA messages will always be forwarded across the boundaries regardless of multicast boundary ACL configurations. Anycast RP with MSDP mesh group across the boundaries is not supported. Multicast boundary feature is supported only for IPv4 currently. Multicast boundary feature is not supported on VXLAN based overlay networks.

Examples

The following example creates a boundary that denies multicast group IP addresses in 239.0.0.0/8 and permits group addresses in 224.0.0.0/4. Since the source address is **any**, it matches traffic from any multicast source (*,G).

```
access-list ip boundary1
    10 deny any any 239.0.0.0/255.0.0.0
    20 permit any any 224.0.0.0/240.0.0.0
interface vlan 40
    ip address 40.1.1.1/24
    ip pim-sparse enable
    ip multicast boundary access-list boundary1
```

The following example creates a boundary which permits traffic for specific multicast sources and groups IP addresses, and implicitly denies all other traffic.

```
access-list ip boundary2
    10 permit any 192.168.1.1 225.1.1.0/255.255.255.0
    20 permit any 172.168.1.1 239.1.1.0/255.255.255.0
interface vlan 40
    ip address 40.1.1.1/24
    ip pim-sparse enable
    ip multicast boundary access-list boundary2
```

The following boundary ACL creates a boundary based on protocols. The **PIM**, **IGMP**, **and IP** packets from the specified (S,G) are denied and all other traffic for 239.1.1.0/24 is allowed.

```
access-list ip boundary3
    30 deny pim 192.168.1.1 239.1.1.5
    40 deny igmp 192.168.1.1 239.1.1.5
    41 deny any 192.168.1.1 239.1.1.5
    50 permit any any 239.1.1.0/255.255.255.0
interface vlan 40
    ip address 40.1.1.1/24
    ip pim-sparse enable
    ip multicast boundary access-list boundary3
```

ip multicast multipath

```
ip multicast multipath {s-hash|s-g-hash}
no ip multicast multipath {s-hash|g-hash}
```

Description

This command configures the multipath hash mode, which allows the switch to determine the nexthop in the RPF path if there are multiple equal cost paths to a source address. PIM S,G join messages are sent to the selected nexthop which results in a multicast traffic flow in the selected paths. An even distribution of available nexthops across different multicast flows improves the utilization of ECMP paths.

Parameter	Description
`s-hash`	The hash to select the nexthop is based on only the source address. Flows originating from different sources will use different ECMP paths as the source is considered for selecting the nexthop. If the same source sends streams for multiple groups, then all the streams use only one of the ECMP paths. This is the default setting for this feature .
`s-g-hash`	This method uses both source and group address to select the nexthop. This allows better distribution of flows in scenarios where single source is streaming traffic for multiple groups.

Usage

Use this command only for route lookups for a source address and not for an Rendezvous Point (RP) address. The PIM *,G join messages which enable route lookup for the RP always uses the default **s-hash** mode, where nexthop is selected based on the RP IP address alone, and the group address is not part of the hash computation. Changes to the multipath has mode can result in traffic loss as the existing route cache is cleared and new route lookups are initiated. In topologies where PIM Assert messages are triggered, RPF lookups are not honored, and the packet forwarding path will be decided based on the assert winner.

Examples

Configuring the hash mode for an individual VRF:

```
switch(config)# vrf example
switch(config-vrf)# ip multicast multipath s-hash
```

Configuring the hash mode globally:

```
switch(config)# ip multicast multipath s-g-hash
```

ip pim-sparse

```
ip pim-sparse {enable|disable}
no ip pim-sparse [enable]
```

Description

Enables or disables PIM-SM in the current interface. PIM-SM is disabled by default on an interface. IP address must be configured on the interface to enable PIM-SM.

Parameter	Description
`enable`	Specifies PIM SM on the interface. IP address must be configured on the interface to enable PIM-SM.
`disable`	Disables PIM SM on the interface.

Examples

Enabling and disabling PIM-SM:

```
switch(config)# interface vlan 40
switch(config-if-vlan)# ip address 40.0.0.4/24
switch(config-if-vlan)# ip pim-sparse enable
switch(config-if-vlan)# ip pim-sparse disable
```

Configuring and disabling PIM-SM on the sub-interface:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config-if)# interface 1/1/10.10
switch(config-subif)# ip add 100.100.1.1/24
switch(config-subif)# ip pim-sparse enable
switch(config-subif)# switch(config-subif)# ip pim-sparse disable
```

ip pim-sparse bfd

```
ip pim-sparse bfd [disable]
no ip pim-sparse bfd
```

Description

Configures BFD on a per-interface basis for one interface associated with the PIM process.

The **no** form of this command removes the BFD configuration on the interface and sets it to the default configuration.

If BFD is enabled globally, it will be enabled by default on all interfaces. The only exception is when it is disabled specifically on an interface using the **ip pim-sparse bfd disable** command.
If BFD is disabled globally, it will be disabled by default on all interfaces. The only exception is when it is enabled specifically on an interface using the **ip pim-sparse bfd** command.

Parameter	Description
`disable`	Disables the BFD configuration on the interface.

Examples

Enabling the BFD configuration on the interface:

```
switch(config)# interface vlan 40
switch(config-if-vlan)# ip pim-sparse bfd
```

Removing the BFD configuration on the interface:

```
switch(config-if-vlan)# no ip pim-sparse bfd
```

Disabling the BFD configuration on the interface and overriding the global setting:

```
switch(config-if-vlan)# ip pim-sparse bfd disable
```

ip pim-sparse bsr-boundary

```
ip pim-sparse bsr-boundary
no ip pim-sparse bsr-boundary
```

Description

Prevent exchange of PIM Bootstrap messages across multicast boundaries.

Usage

Best practices is to avoid exchanging PIM Bootstrap messages across different multicast domains as it will lead to election of RP in a different domain. When this command is configured on a boundary interface, PIM BSMs originating from other domain will be dropped and PIM BSMs originated within this domain will not forwarded to other domain. Note that this command will filter only PIM BSMs and is recommended to be enabled along with ip multicast boundary.

Examples

Configuring and removing the BSR boundary:

```
switch(config-if)# interface 1/1/1
switch(config-if)# ip pim-sparse bsr-boundary
switch(config-if)# no ip pim-sparse bsr-boundary
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ip pim-sparse dr-priority

```
ip pim-sparse dr-priority <PRIORITY-VALUE>
no ip pim-sparse dr-priority
```

Description

Changes the router priority for the designated router (DR) election process in the current interface.

A numerically higher value means a higher priority. If multiple routes share the highest priority, the router with the highest IP address is selected as the DR.

The **no** form of this command removes currently configured value and sets to the default of 1.

Parameter	Description
<PRIORITY-VALUE>	Specifies the priority value to use on the interface in the DR election process. Required. Default: 1. Range: 0- to 0-4294967295.

Examples

Configuring and removing the interface priority value:

```
switch(config)# interface vlan 40
switch(config-if-vlan)# ip pim-sparse dr-priority 4444
switch(config-if-vlan)# no ip pim-sparse dr-priority
```

Configuring and removing the interface priority value in the sub-interface:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config-if)# interface 1/1/10.10
switch(config-subif)# ip pim-sparse dr-priority 1000
switch(config-subif)#
switch(config-subif)# no ip pim-sparse dr-priority
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ip pim-sparse hello-delay

```
ip pim-sparse hello-delay <DELAY-VALUE>
no ip pim-sparse hello-delay
```

Description

Configures the maximum time in seconds before the router actually transmits the initial PIM hello message on the current interface.

The **no** form of this command removes currently configured value and sets to the default of 5 seconds.

Parameter	Description
<DELAY-VALUE>	Specifies the hello-delay in seconds, which is the maximum time before a triggered PIM Hello message is transmitted on this interface. Default: 5. Range: 0 to 5.

Usage

- In cases where a new interface activates connections with multiple routers. If all the connected routers sent hello packets at the same time, the receiving router could become momentarily overloaded.
- This command randomizes the transmission delay to a time between zero and the hello delay setting. Using zero means no delay. After the router sends the initial hello packet to a newly detected interface, it sends subsequent hello packets according to the current hello interval setting.

Example

Configuring and removing hello-delay interface:

```
switch(config)# interface vlan 40
switch(config-if-vlan)# ip pim-sparse hello-delay 4
switch(config-if-vlan)# no ip pim-sparse hello-delay
```

Configuring and removing hello-delay on the sub-interface:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config-if)# interface 1/1/10.10
switch(config-subif)# ip pim-sparse hello-delay 4
switch(config-subif)#
switch(config-subif)# no ip pim-sparse hello-delay
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ip pim-sparse hello-interval

```
ip pim-sparse hello-interval <INTERVAL-VALUE>
no ip pim-sparse hello-interval
```

Description

Configures the frequency at which the router transmits PIM hello messages on the current interface.

The **no** form of this command removes the currently configured value and sets to the default of 30 seconds.

Parameter	Description
<INTERVAL-VALUE>	Specifies the frequency at which PIM Hello messages are transmitted on this interface. Range: 5 to 300. Default: 30.

Usage

- The router uses hello packets to inform neighbor routers of its presence.
- The router also uses this setting to compute the hello holdtime, which is included in hello packets sent to neighbor routers.

- Hello holdtime tells neighbor routers how long to wait for the next hello packet from the router. If another packet does not arrive within that time, the router removes the neighbor adjacency on that interface from the PIM adjacency table, which removes any flows running on that interface.
- Shortening the hello interval reduces the hello holdtime. If they do not receive a new hello packet when expected, it changes how quickly other routers stop sending traffic to the router.

Example

Configuring and removing sparse hello-interval:

```
switch(config)# interface vlan 20
switch(config-if-vlan)# ip pim-sparse hello-interval 60
switch(config-if-vlan)# no ip pim-sparse hello-interval
```

Configuring and removing sparse hello-interval on the sub-interface:

Applies only to the Aruba 6300, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config-if)# interface 1/1/10.10
switch(config-subif)# ip pim-sparse hello-interval 60
switch(config-subif)#
switch(config-subif)# no ip pim-sparse hello-interval
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ip pim-sparse ip-addr

```
ip pim-sparse ip-addr {<IP-ADDR-VALUE> | any}
no ip pim-sparse ip-addr
```

Description

Enables the router to dynamically determine the source IP address to use for PIM-SM packets sent from the interface or to use the specific IP address.

The **no** form of this command removes the currently configured value and sets to the default of **any**.

Parameter	Description
<IP-ADDR-VALUE>	Specifies an IP address as the source IP for the interface.
`any`	Specifies dynamically determining the source IP from the current IP address of the interface.

Examples

Configuring and removing source IP address:

```
switch(config)# interface vlan 40
switch(config-if-vlan)# ip pim-sparse ip-addr 40.0.0.4
switch(config-if-vlan)# no ip pim-sparse ip-addr
```

Configuring and removing source IP address on the sub-interface:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config-if)# interface 1/1/10.10
switch(config-subif)# ip pim-sparse ip-addr 10.0.0.1
switch(config-subif)#
switch(config-subif)# no ip pim-sparse ip-addr
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ip pim-sparse lan-prune-delay

```
ip pim-sparse lan-prune-delay
```

```
no ip pim-sparse lan-prune-delay
```

Description

Enables the LAN prune delay option on the current interface. The default is enabled.

With LAN-prune-delay enabled, the router informs downstream neighbors how long it will wait before pruning a flow after receiving a prune request. Other downstream routers on the same interface must send a join to override the prune before the LAN-prune-delay time to continue the flow. Prompts any downstream neighbors with multicast receivers continuing to belong to the flow to reply with a join. If no joins are received after the LAN-prune-delay period, the router prunes the flow. The propagation-delay and override-interval settings determine the LAN-prune-delay setting.

The **no** form of this command disables the LAN prune delay option.

Example

Enabling and disabling the LAN prune delay:

```
switch(config)# interface vlan 40
switch(config-if-vlan)# ip pim-sparse lan-prune-delay
switch(config-if-vlan)# no ip pim-sparse lan-prune-delay
```

Enabling and disabling the LAN prune delay on the sub-interface:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config-if)# interface 1/1/10.10
switch(config-subif)# no ip pim-sparse lan-prune-delay
switch(config-subif)#
switch(config-subif)# ip pim-sparse lan-prune-delay
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ip pim-sparse override-interval

```
ip pim-sparse override-interval <INTERVAL-VALUE>
no ip pim-sparse override-interval
```

Description

Configures the override interval that gets inserted into the Override Interval field of a LAN Prune Delay option.

The **no** form of this command removes the currently configured value and sets the value to the default of 2500 ms.

Parameter	Description
<INTERVAL-VALUE>	Specifies the override interval of a LAN Prune Delay option in ms. Range: 500 to 6000. Default: 2500.

Usage

A router sharing a VLAN with other multicast routers uses the override-interval value along with the propagation-delay value to compute the **lan-prune-delay** setting. The setting specifies how long to wait for a PIM-SM join after receiving a prune packet from downstream for a particular multicast group.

Example scenario:

A network may have multiple routers sharing VLAN X. When an upstream router is forwarding traffic from multicast group X to VLAN Y, if one of the routers on VLAN Y does not want this traffic, it issues a prune response to the upstream neighbor. The upstream neighbor then goes into a prune pending state for group X on VLAN Y. During this period, the upstream neighbor continues to forward the traffic. During the pending period, another router on VLAN Y can send a group X join to the upstream neighbor. If this happens, the upstream neighbor drops the prune pending status and continues forwarding the traffic. But if no routers on the VLAN send a join, the upstream router prunes.

Example

Configuring and removing the override interval:

```
switch(config)# interface vlan 40
switch(config-if-vlan)# ip pim-sparse override-interval 4000
switch(config-if-vlan)# no ip pim-sparse override-interval
```

Configuring and removing the override interval on the sub-interface:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config-if)# interface 1/1/10.10
switch(config-subif)# ip pim-sparse override-interval 4000
switch(config-subif)#
switch(config-subif)# no ip pim-sparse override-interval
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ip pim-sparse propagation-delay

```
ip pim-sparse propagation-delay <DELAY-VALUE>
no ip pim-sparse propagation-delay
```

Description

Configures the propagation delay that gets inserted into the LAN prune delay field of a LAN Prune Delay option.

The **no** form of this command removes currently configured value and sets to the default of 500 ms.

Parameter	Description
<DELAY-VALUE>	Specifies the propagation delay value in ms. Range: 250 to 2000. Default: 500.

Examples

Configuring and removing the propagation delay:

```
switch(config)# interface vlan 40
switch(config-if-vlan)# ip pim-sparse propagation-delay 400
switch(config-if-vlan)# no ip pim-sparse propagation-delay
```

Configuring and removing the propagation delay on the sub-interface:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config-if)# interface 1/1/10.10
switch(config-subif)# ip pim-sparse propagation-delay 400
switch(config-subif)#
switch(config-subif)# no ip pim-sparse propagation-delay
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

join-prune-interval

```
join-prune-interval <INTERVAL-VALUE>
no join-prune-interval
```

Description

Configures the frequency at which the router will send periodic join or prune-interval messages.

The **no** form of this command sets the interval to the default value of 60 seconds.

Parameter	Description
<INTERVAL-VALUE>	Specifies the join-prune-interval in seconds. Range 5 to 65535 Default: 60.

Examples

Configuring join prune interval:

```
switch(config)# router pim
switch(config-pim)# join-prune-interval 400
switch(config-pim)# no join-prune-interval
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

multicast-route-limit

```
multicast-route-limit <limit>
no multicast-route-limit <limit>
```

Description

Configures the limit on the maximum number of multicast route entries that can be programmed. When the limit is configured, multicast route entries created because of IGMP or MLD membership reports, and multicast route entries created because of multicast streams are restricted to the configured limit.

The **no** form of this command removes the currently configured limit value.

Parameter	Description
<limit>	Specifies the value to be configured as the multicast route limit. Range: 1 to 4294967295.

Usage

Flows exceeding the configured multicast route limit will be programmed as a bridge entry and will not have the outgoing interfaces list populated. This configuration prevents creation of new multicast routes when limits are reached. At the time of configuration, if the device has more multicast routes than the configured limit, existing multicast routes continue to exist until they are removed.

The flows are programmed in the HW on a FCFS basis. There could be scenarios where the flow is forwarded in neighbor router, but it may not be forwarded on the current router because of exceeding the limits configured on the current router. In such cases, it is recommended to configure higher limits to avoid traffic outage.

Examples

Configuring and removing the multicast route rate limit:

```
switch(config)# router pim
switch(config-pim)# multicast-route-limit 1024
switch(config-pim)# no multicast-route-limit
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

no ip pim-sparse

```
no ip pim-sparse
```

Description

Removes all the PIM-SM related configurations for the interface.

Example

Removing PIM-SM configuration:

```
switch(config)# interface vlan 40
switch(config-if-vlan)# no ip pim-sparse
```

Removing PIM-SM configuration on the sub-interface:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config)# interface 1/1/10.10
switch(config-subif)# no ip pim-sparse
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

register-rate-limit

```
register-rate-limit <limit>
no register-rate-limit <limit>
```

Description

Configures the limit on the maximum number of register messages sent per second for every unique (S,G) entry. By default, there is no maximum rate set. When the limit is configured, register messages generation is limited to the configured value.

The **no** form of this command removes the currently configured limit value.

Parameter	Description
<limit>	Specifies the value to be configured as the register rate limit. Range: 1 to 4294967295.

Examples

Configuring and removing the register rate limit:

```
switch(config)# router pim
switch(config-pim)# register-rate-limit 10
switch(config-pim)# no register-rate-limit
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

register-source

```
register-source <INTERFACE-NAME>
no register-source <INTERFACE-NAME>
```

Description

Specifies the source interface to be used for PIM registration in the case of VXLAN anycast interfaces. When the PIM enabled anycast VLAN is directly connected to a multicast source, **register-source** is used to send registration messages to the RP and this interface receives the register-stop messages from the RP.

The **no** form of this command removes the register source configuration.

Parameter	Description
<INTERFACE-NAME>	Specifies the name of the interface to use.

Usage

- This is a global configuration under router-pim configuration and is required in Symmetric IRB with anycast IP address configuration.
- This configuration is required in the source connected switch only when the PIM-DR and RP are in two different switches.
- Without this configuration, there will be traffic loss as the registration sequence will not be successful. It is mandatory to have this source interface configured with a non-anycast IP address which is unique to the VTEP, and with PIM enabled.

Examples

Configuring the source interface for PIM registrations:

```
switch# config
switch(config)# router pim vrf vrf1
switch(config-pim)# register-source loopback1
```

Removing the **register-source** configuration:

```
switch(config-pim)# no register-source loopback1
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

router pim

```
router pim [vrf <VRF-NAME>]
   accept-register access-list <ACL-RULE>
   accept-rp <IP-ADDR> access-list <ACL-RULE>
   active-active
   bfd all-interfaces
   bsr-candidate {bsm-interval <INTERVAL-VALUE> | {hash-mask-length <LENGTH-VALUE> |
   priority <PRIORITY-VALUE> | source-ip-interface <INTERFACE-NAME>}
   enable|disable
   join-prune-interval <INTERVAL-VALUE>
   multicast-route-limit <limit>
   no ...
   register-rate-limit <limit>
```

```
rp-address <IP-ADDR> [<GRP-ADDR/GRP-MASK>] [override]
rp-candidate {group-prefix <GRP-ADDR/GRP-MASK>  |hold-time <TIME-VALUE> | priority
<PRIORITY-VALUE> | source-ip-interface <INTERFACE-NAME> [group-prefix <GRP-ADDR/GRP-
MASK>]}
rpf-override <SRC-ADDR/SRC-MASK><RPF-ADDR|INTERFACE-NAME>
```

Description

Changes the current context to the PIM configuration context and enables PIM globally on the router. If no VRF is specified, the default VRF is assumed.

The **no** form of this command removes the PIM configuration from the specified context or the default VRF.

Parameter	Description
`vrf <VRF-NAME>`	Specifies the name of a VRF.
`accept-register access-list <ACL-RULE>`	Specify an ACL rule name to configures ACL on RP to filter PIM Register packets from unauthorized sources. The ACL specified will contain the (S,G) traffic in register packets to permitted or denied.
`accept-rp <IP-ADDR> access-list <ACL-RULE>`	Specify the IPv4 address of the static RP and ACL rule name to enable the PIM router to filter PIM join/prune messages destined for a specific RP and specific groups. The ACL specifies the group addresses which are allowed or denied. Up to 8 RP addresses and group ACL can be associated with the PIM router. PIM will store the accepted RP address and the associated group ACL. When a join or prune message is received, a RP look up is made for the packet. If the RP is in the configured list and if the group in the join/prune packet is allowed in the ACL, the packet is allowed. Otherwise the packet is dropped. To allow join/prune message from any groups, group address in the ACL can be wild-carded. In this case, only RP address check is performed. This parameter impacts only (*,G) join/prune messages. If there are any existing flows, the user will need to disable and enable PIM on the interface to apply the ACL. Loopback interfaces are special interfaces where only unicast PIM messages are updated. This includes Register, Register Stop, and Candidate RP Advertisements. When a loopback interface is configured as the RP, the ACL drop counters will be updated on the interface on which the packets are received. **NOTE:** If there is an active flow which is in the SPT, the traffic flow through the SPT will continue. Only (*,G) join/prune messages are dropped. (S,G) join/prune messages will not be impacted.
`active-active`	Enables the PIM active-active mechanism per VRF on VSX. The default is disabled. PIM active-active keeps the multicast forwarding state synchronized on both VSX peer devices.

Parameter	Description
	Synchronization is achieved by electing the VSX peer that has the highest IP address as a designated router (DR) and the other as Proxy-DR. If you want the multicast traffic to flow through VSX primary, assign higher IP addresses to the interfaces in VSX primary. When the VSX peer that is acting as the DR goes down, traffic is recovered faster since the multicast routes are synchronized.
`bfd all-interfaces`	Enables BFD on all PIM interfaces. BFD can be disabled at individual PIM interface using the **ip pim-sparse bfd disable** command.
`bsr-candidate`	Configure settings for a router that operates as the BSR in a domain.
`bsm-interval` *`<INTERVAL-VALUE>`*	Configures the interval in seconds to send periodic RP-Set messages to all PIM-SM interfaces on a router that operates as the BSR in a domain. This setting must be smaller than the **rp-candidate hold-time** settings (range of 30 to 255; default 150) configured in the RPs operating in the domain. Default: 60 seconds. Range: 5-300.
`hash-mask-length` *`<LENGTH-VALUE>`*	Controls the distribution of multicast groups among the C-RP, in a domain where there is overlapping coverage of the groups among the RPs. This value specifies the length (number of significant bits) when allocating this distribution. A longer hash-mask-length results in fewer multicast groups, for each block of group addresses assigned to the RPs. Multiple blocks of addresses assigned to each C-RP results in wider dispersal of addresses. Includes enhanced load-sharing for the multicast traffic for the different groups that are used in the domain at the same time. Default: 30 bits. Range: 1-32.
`priority <PRIORITY-VALUE>`	Configures the priority to apply to the router when a BSR election process occurs in the PIM-SM domain. The candidate with the highest priority becomes the BSR for the domain. If the highest priority is shared by multiple routers, the candidate having the highest IP address becomes the BSR of the domain. Zero (0) is the lowest priority. To make BSR selection easily predictable, use this command to assign a different priority to each candidate BSR in the PIM-SM domain. Default: 0. Range: 0-255
`source-ip-interface` *`<INTERFACE-NAME>`*	Configures the router to advertise itself as a candidate PIM-SM BSR on the interface specified, and enables BSR candidate operation. The result makes the router eligible to be elected as the BSR for the PIM-SM domain in which it operates. One BSR candidate interface is allowed per-router. The Interface can be a VLAN interface (such as vlan15) or routed interfaces (such as lag 1 or 1 / 1 / 19). PIM-

Parameter	Description
	SM must be enabled on this interface (use the **ip pim-sparse enable** command).
`enable|disable`	Enables or disables PIM globally on the router.
`join-prune-interval <INTERVAL-VALUE>`	Configures the frequency at which the router will send periodic join or prune-interval messages. Range 5 to 65535 Default: 60.
`multicast-route-limit <limit>`	Configures the limit on the maximum number of multicast route entries that can be programmed. When the limit is configured, multicast route entries created because of IGMP or MLD membership reports, and multicast route entries created because of multicast streams are restricted to the configured limit. Flows exceeding the configured multicast route limit will be programmed as a bridge entry and will not have the outgoing interfaces list populated. This configuration prevents creation of new multicast routes when limits are reached. At the time of configuration, if the device has more multicast routes than the configured limit, existing multicast routes continue to exist until they are removed. The flows are programmed in the HW on a FCFS basis. There could be scenarios where the flow is forwarded in neighbor router, but it may not be forwarded on the current router because of exceeding the limits configured on the current router. In such cases, it is recommended to configure higher limits to avoid traffic outage. Range: 1 to 4294967295.
`no...`	Negates any configured parameter.
`register-rate-limit <limit>`	Configures the limit on the maximum number of register messages sent per second for every unique (S,G) entry. By default, there is no maximum rate set. When the limit is configured, register messages generation is limited to the configured value. Range: 1 to 4294967295.
`rp-address`	Statically configures the router as the RP for a specified multicast group or range of multicast groups. When a static RP and a C-RP are configured to support the same multicast groups and the multicast group mask for the static RP is equal to or greater than the same mask for the applicable C-RPs, this command assigns the higher precedence to the static RP, resulting in the C-RP operating only as a backup RP for the configured group. Without override, the C-RP has precedence over a static RP configured for the same multicast group or groups. This must be configured on all PIM-SM routers in the domain. If group address is not specified, it applies to all IPv4 multicast addresses (224.0.0.0 - 239.255.255.255). PIM-SM supports a maximum of 8 static RPs per VRF.

Parameter	Description
<IP-ADDR>	Specifies the address of the static RP in IPv4 format (**x.x.x.x**).
<GRP-ADDR/GRP-MASK>	Specifies the multicast group address in IPv4 format (**x.x.x.x**) and the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128.
`override`	Specifies higher precedence to static RP over Candidate RP.
`rp-candidate`	Configure Candidate Rendezvous Point (C-RP) settings.
`group-prefix` *<GRP-ADDR/GRP-MASK>*	Adds multicast group address to the current Candidate Rendezvous Point (C-RP) configuration by specifying the the multicast group address in IPv4 format (**x.x.x.x**) and the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128.
`hold-time` *<TIME-VALUE>*	Changes the hold-time a C-RP includes in its advertisements to the BSR. Hold-time is included in the advertisements the C-RP periodically sends to the elected BSR for the domain. Also updates the BSR on how long to wait after the last advertisement from the reporting RP before assuming it has become unavailable. Range: 30 to 250. Default: 150.
`priority` *<PRIORITY-VALUE>*	Changes the current priority setting for a C-RP. Where multiple C-RP configurations are used to support the same multicast groups, the candidate having the highest priority is elected. Zero (0) is the highest priority, and 255 is the lowest priority. Range: 0 to 255. Default: 192.
source-ip-interface	Enables the Candidate Rendezvous Point (C-RP) operation, and configures the router to advertise itself as a C-RP to the Bootstrap Router (BSR) for the current domain. This step includes the option to allow the C-RP to be a candidate for all possible multicast groups, or for up to four multicast groups, or ranges of groups. If group-prefix is not given, it considers for all multicast group addresses.
<INTERFACE-NAME>	Specifies the interface to use as a source for the C-RP router IP address.
`group-prefix` *<GRP-ADDR/GRP-MASK>*	Specifies the multicast group address in IPv4 format (**x.x.x.x**) and the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128.
`rpf-override`	The Reverse Path Forward (RPF) override allows overriding the normal RPF lookup mechanism, and indicates to the router that it may accept multicast traffic on an interface other than the one that the RPF lookup mechanism would normally select. This

Parameter	Description
	includes accepting traffic from an invalid source IP address for the subnet or VLAN that is directly connected to the router. Traffic may also be accepted from a valid PIM neighbor that is not on the reverse path towards the source of the received multicast traffic.
`<SRC-ADDR/SRC-MASK>`	Specifies the multicast source IPv4 address in IPv4 format (**x.x.x.x**) and the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128.
`<RPF-ADDR|INTERFACE-NAME>`	Specifies the RPF override IP address or interface.

Usage

When a register ACL is associated with a PIM Router, the PIM protocol will store the source and destination address details along with the action (permit or deny). If there are any existing flows, the user will need to disable and enable PIM on the interface to apply the ACL.

Upon receiving the register messages, a look up is made to check if the S and G in the packet is in the permitted list. If there is no match or if there is a deny rule match, a register stop message is immediately sent and the packet is dropped and no further action is taken. Permitted packets will go through the normal flow.

Loopback interfaces are special interfaces where only unicast PIM messages are updated. This includes Register, Register Stop, and Candidate RP Advertisements.

When a loopback interface is configured as the RP, the ACL drop counters will be updated on the interface on which the packets are received.

Recommendations for the active-active mechanism:

- Do not configure the DR priority of interfaces when **active-active** is enabled. The DR priority will be set to high on DR and default on Proxy-DR and any user-configured DR priority will be ignored.
- Always configure **keepalive** between VSX peers. If the ISL goes down when **keepalive** is not configured, both VSX peers start acting independently as DRs, resulting in duplicate traffic.
- Do not configure IGMP joins on transit VLANS.
- RP redundancy is not supported on the **active-active** mechanism. If one of the VSX peers is configured as RP and it goes down, the new traffic flows will not be converged until the RP is elected. For a static RP, new flows will never be converged until the VSX peer is back up.

Reverse Path Forward (RPF) override usage details:

- Reverse Path Forward (RPF) checking is a core multicast routing mechanism. The RPF ensures that the multicast traffic received arrives on the expected router interface before further processing. If the RPF check fails for a multicast packet, the packet is discarded. For multicast traffic flow that arrives on the SPT, the expected incoming interface for a given source or group is the interface towards the source address of the traffic (determined by the unicast routing system). For traffic arriving on the RP tree, the expected incoming interface is the interface towards the RP.
- RPF checking is applied to all multicast traffic and is significant in preventing network loops. Up to eight manual RPF overrides can be specified. The RPF-address indicates one of two distinct RPF candidates:

1. A valid PIM neighbor address from which forwarded multicast traffic is accepted with a source address of ***<source-addr/src-mask>***.
2. A local router address on a PIM-enabled interface to which ***<source-addr/src-mask>*** is directly connected. If configured, the local router will assume the role of DR for this flow and registers the flow with an RP.

Examples

Configuring and enabling default router PIM:

```
switch(config)# router pim
switch(config-pim)#enable
```

Configuring specified router PIM:

```
switch(config)# router pim vrf green
switch(config-pim)#
```

Configuring ACL on RP with an ACL rule named **pim_reg_acl**:

```
switch(config)# access-list ip pim_reg_acl
switch(config-acl-ip)# 10 permit any 20.1.1.1 225.1.1.2
switch(config-acl-ip)# 20 deny any 30.1.1.1 225.1.1.3
switch(config)# router pim
switch(config-pim)# accept-register acces
```

Configuring ACL on a RP with an ACL rule named **pim_rp_grp_acl** to filter join/prune messages:

```
switch(config)# access-list ip pim_rp_grp_acl
switch(config-acl-ip)# 10 permit any any 225.1.1.2/255.255.255.0
switch(config-acl-ip)# 20 permit any any 239.1.1.2/255.255.255.0
switch(config)-acl-ip# router pim
switch(config-pim)# accept-rp 30.1
```

On the 6400 Switch Series, interface identification differs.

Configuring and removing the BSR-candidate interface:

```
switch(config)# router pim
switch(config-pim)# bsr-candidate source-ip-interface 1/1/4
switch(config-pim)# bsr-candidate source-ip-interface vlan5
switch(config-pim)# no rp-candidate source-ip-interface 1/1/4
```

Configuring and removing sub-interface 1/1/4.10 as the BSR-candidate:

Applies only to the Aruba 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series.

```
switch(config)# router pim
switch(config-pim)# bsr-candidate source-ip-interface 1/1/4.10
switch(config-pim)#
switch(config-pim)# no rp-candidate source-ip-interface 1/1/4.10
```

Configuring and removing the multicast route rate limit:

```
switch(config)# router pim
switch(config-pim)# multicast-route-limit 1024
switch(config-pim)# no multicast-route-limit
```

Configuring and removing the register rate limit:

```
switch(config)# router pim
switch(config-pim)# register-rate-limit 10
switch(config-pim)# no register-rate-limit
```

Configuring and removing candidate-RP router priority and hold times

```
switch(config)# router pim
switch(config-pim)# rp-candidate priority 250
switch(config-pim)# rp-candidate hold-time 200
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.11	Sub-interface support extended to 8325 and 10000 Switch Series.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	config	Administrators or local user group members with execution rights for this command.

rp-address

```
rp-address <IP-ADDR> [<GRP-ADDR/GRP-MASK>] [override]
no rp-address <IP-ADDR> [<GRP-ADDR/GRP-MASK>] [override]
```

Description

Statically configures the router as the RP for a specified multicast group or range of multicast groups. This must be configured on all PIM-SM routers in the domain. If group address is not specified, it applies to all IPv4 multicast addresses (224.0.0.0 - 239.255.255.255). PIM-SM supports a maximum of 8 static RPs per VRF. Optionally associates the specified access control list to the given static RP address.

The **no** form of this command removes static RP configuration and its precedence.

Parameter	Description
<IP-ADDR>	Specifies the address of the static RP in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.
<GRP-ADDR>	Specifies the multicast group address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.
<GRP-MASK>	Specifies the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128.
override	Specifies higher precedence to static RP over candidate RP.

Usage

Where a static RP and a C-RP are configured to support the same multicast groups and the multicast group mask for the static RP is equal to or greater than the same mask for the applicable C-RPs, this command assigns the higher precedence to the static RP, resulting in the C-RP operating only as a backup RP for the configured group. Without override, the C-RP has precedence over a static RP configured for the same multicast group or groups.

Examples

Configuring the static RP precedence over the candidate RP:

```
switch(config)# router pim
switch(config-pim)# rp-address 40.0.0.4 230.0.0.4/24 ovverride
switch(config-pim)# rp-address 40.0.0.8 222.0.0.4/24
switch(config-pim)# no rp-address 40.0.0.4 230.0.0.4/24
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

rp-address access list

```
rp-address <IP-ADDR> [access-list <ACL-NAME>][override]
no rp-address <IP-ADDR> [access-list <ACL-NAME>][override]
```

Description

Statically configures the router as the RP and associates the static RP to the specified ACL.

The **no** form of this command removes static RP ACL configuration.

Parameter	Description
<IP-ADDR>	Specifies the address of the static RP in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.
access-list <ACL-NAME>	Specifies the name of the access control list.
override	Specifies whether or not static RP configuration precedes the information learned by a BSR.

Usage

The ACL includes a list of permitted/ denied group addresses for the specified RP.

- When configured on a source DR, only permitted group addresses are registered to the RP. When applied on other routers, (*,G) PIM join/prune messages are filtered according to the applied ACL.
- Only destination group addresses in the ACEs are filtered and any other fields configured in the ACE are ignored. If only PIM (*,G) messages need to be filtered, configure **accept-rp** ACLs.
- When static RP ACL is configured, only one static RP can be configured per VRF and that configured RP handles all the multicast groups in range 224.0.0.0/4.

A change in the RP ACL does not impact the flows that have already switched to SPT. Only when the source information is expired and the RP is needed to establish the multicast tree, is the change in the ACL reflected. If the source is always active, PIM can be disabled and re-enabled to clear the learned sources information and re-establish multicast trees based on the latest RP ACL configurations.

Examples

Configuring the static RP ACL:

```
...
access-list ip static_rp_acl
    10 permit any any 225.1.1.1
    20 permit any any 239.1.1.0/255.255.255.0
    30 deny any any 226.1.1.0/255.255.255.0

switch(config)# router pim
switch(config-pim)# rp-address 40.0.0.4 access-list static_rp_acl
```

Removing the static RP ACL configuration:

```
switch(config-pim)# no rp-address 40.0.0.4 access-list static_rp_acl
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.10	Added optional access list parameter **[access-list <ACL-NAME>]**
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-pim`	Administrators or local user group members with execution rights for this command.

rp-candidate group-prefix

```
rp-candidate group-prefix <GRP-ADDR/GRP-MASK>
no rp-candidate group-prefix <GRP-ADDR/GRP-MASK>
```

Description

Adds multicast group address to the current Candidate Rendezvous Point (C-RP) configuration.

The **no** form of this command removes C-RP multicast group address.

Parameter	Description
<GRP-ADDR>	Specifies the multicast group address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.
<GRP-MASK>	Specifies the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128.

Examples

Configuring and removing candidate group prefix:

```
switch(config)# router pim
switch(config-pim)# rp-candidate group-prefix 230.0.0.4/24
switch(config-pim)# no rp-candidate group-prefix 230.0.0.4/24
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

rp-candidate hold-time

```
rp-candidate hold-time <TIME-VALUE>
no rp-candidate hold-time
```

Description

Changes the hold-time a C-RP includes in its advertisements to the BSR.

Hold-time is included in the advertisements the C-RP periodically sends to the elected BSR for the domain. Also updates the BSR on how long to wait after the last advertisement from the reporting RP before assuming it has become unavailable.

The **no** form of this command removes the currently configured value and sets it to the default value 150 seconds.

Parameter	Description
<TIME-VALUE>	Specifies the hold-time value in seconds to be sent in C-RP-Adv messages. Range: 30 to 250. Default: 150.

Example

Setting and removing the candidate holdtime:

```
switch(config)# router pim
switch(config-pim)# rp-candidate hold-time 250
switch(config-pim)# no rp-candidate hold-time
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

rp-candidate priority

```
rp-candidate priority <PRIORITY-VALUE>
```

```
no rp-candidate priority
```

Description

Changes the current priority setting for a C-RP. Where multiple C-RP configurations are used to support the same multicast groups, the candidate having the highest priority is elected. Zero (0) is the highest priority, and 255 is the lowest priority.

The **no** form of this command removes the currently configured value and sets it to the default of 192.

Parameter	Description
<PRIORITY-VALUE>	Specifies the priority value for the Candidate-RP router. Range: 0 to 255. Default: 192.

Example

Configuring and removing candidate priority:

```
switch(config)# router pim
switch(config-pim)# rp-candidate priority 250
switch(config-pim)# no rp-candidate priority
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

rp-candidate source-ip-interface

```
rp-candidate source-ip-interface <INTERFACE-NAME> [group-prefix <GRP-ADDR/GRP-MASK>]
no rp-candidate source-ip-interface <INTERFACE-NAME> [group-prefix <GRP-ADDR/GRP-MASK>]
```

Description

Enables the Candidate Rendezvous Point (C-RP) operation, and configures the router to advertise itself as a C-RP to the Bootstrap Router (BSR) for the current domain.

This step includes the option to allow the C-RP to be a candidate for all possible multicast groups, or for up to four multicast groups, or ranges of groups. If group-prefix is not given, it considers for all multicast group addresses.

The **no** form of this command removes the C-RP configuration.

Parameter	Description
<INTERFACE-NAME>	Specifies the interface to use as a source for the C-RP router IP address.
<GRP-ADDR>	Specifies the multicast group address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.
<GRP-MASK>	Specifies the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128.

Examples

Configuring and removing candidate source IP interface:

```
switch(config)# router pim
switch(config-pim)# rp-candidate source-ip-interface vlan40 group-prefix
230.0.0.4/24
switch(config-pim)# no rp-candidate source-ip-interface vlan20
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

rpf-override

```
rpf-override <SRC-ADDR/SRC-MASK> <RPF-ADDR|INTERFACE-NAME>
no rpf-override <SRC-ADDR/SRC-MASK> <RPF-ADDR|INTERFACE-NAME>
```

Description

The Reverse Path Forward (RPF) override, allows overriding the normal RPF lookup mechanism, and indicates to the router that it may accept multicast traffic on an interface other than the one that the RPF lookup mechanism would normally select. This includes accepting traffic from an invalid source IP address for the subnet or VLAN that is directly connected to the router. Traffic may also be accepted from a valid PIM neighbor that is not on the reverse path towards the source of the received multicast traffic.

The **no** form of this command removes currently configured RPF entry.

Parameter	Description
<SRC-ADDR/SRC-MASK>	Specifies the multicast source IPv4 address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255. And the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128.
<RPF-ADDR>	Specifies the RPF address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.
<INTERFACE-NAME>	Specifies the RPF interface name.

Usage

Reverse Path Forward (RPF) checking is a core multicast routing mechanism. The RPF ensures that the multicast traffic received arrives on the expected router interface before further processing. If the RPF check fails for a multicast packet, the packet is discarded. For multicast traffic flow that arrives on the SPT, the expected incoming interface for a given source or group is the interface towards the source address of the traffic (determined by the unicast routing system). For traffic arriving on the RP tree, the expected incoming interface is the interface towards the RP.

Example

Configuring and removing RPF override:

```
switch(config)# router pim
switch(config-pim)# rpf-override 40.0.0.4/24 30.0.0.4
switch(config-pim)# no rpf-override 40.0.0.4/24 30.0.0.4
```

show ip mroute

```
show ip mroute [all-vrfs | vrf <VRF-NAME>] [vsx-peer]
```

Description

Shows multicast routing information. Optionally, you can show specific information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`all-vrfs`	Shows mroute information for all VRFs.
`vrf` *`<VRF-NAME>`*	Specifies the name of a VRF. Default: default.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing IP mroute for the default VRF:

```
Switch(config-vlan-20)# show ip mroute
IP Multicast Route Entries

VRF : default
Total number of entries : 1

Group Address            : 232.10.10.10
Source Address           : 192.168.20.2
SSM Mroute               : True
Neighbor                 : 192.168.3.0
Uptime                   : 02:08:31
State                    : route
Incoming interface       : 1/1/5
Outgoing Interface List :
Interface       State
-----------     ----------
vlan20          forwarding
```

Showing IP mroute for all VRFs:

```
switch# do show ip mroute all-vrfs
IP Multicast Route Entries

VRF : default
Total number of entries : 1

Group Address            : 232.10.10.10
Source Address           : 192.168.2.100
SSM Mroute               : True
Neighbor                 : 192.168.3.0
Uptime                   : 00:38:24
State                    : route
Incoming interface       : 1/1/4
Outgoing Interface List :
Interface       State
-----------     ----------
vlan20          forwarding

VRF : red
Total number of entries : 1

Group Address            : 232.11.11.11
Source Address           : 30.0.0.3
SSM Mroute               : True
```

```
Neighbor                  : 31.0.0.1
Uptime                    : 00:32:55
State                     : route
Incoming interface        : vlan31
Outgoing Interface List :
Interface       State
-----------     ----------
vlan32          forwarding

switch#
```

show ip mroute brief

`show ip mroute brief [al-vrfs | vrf <VRF-NAME>] [vsx-peer]`

Description

Shows brief version of the multicast routing information. Optionally, you can specify the display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`all-vrfs`	Shows mroute information for all VRFs.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Default: default.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing the IP mroute brief:

```
switch# show ip mroute  brief
VRF : default
Total number of entries : 1

Group Address       Source Address      Neighbor            Interface
-------------       --------------      --------            ---------
239.1.1.1           40.0.0.6            10.1.1.2            vlan5
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

show ip mroute group-addr

`show ip mroute <GROUP-ADDR> [<SOURCE-ADDR>] [all-vrfs | vrf <vrf-name>] [vsx-peer]`

Description

Shows the multicast routing information for the given group address. Optionally, you can specify display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
<GROUP-ADDR>	Specifies a group address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.
<SOURCE-ADDR>	Specifies show information for the group from this source in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.
`all-vrfs`	Shows mroute information for the group for all VRFs.
`vrf` *<VRF-NAME>*	Specifies the name of a VRF.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing information for group 239.1.1.1 and VRF green:

```
switch# show ip mroute 239.1.1.1 vrf green

VRF : green

Group Address                 : 239.1.1.1
Source Address                : 40.0.0.5
Neighbor                      : 10.1.1.2
Incoming interface            : vlan1
Unicast Routing Protocol      : connected
Metric                        : 1234
Metric  Pref                  : 1234
Downstream Interface
Interface   State
---------   -----
vlan6       forwarding
```

Showing information for group 239.1.1.1 from source 40.0.0.5 and all VRFs:

```
switch# show ip mroute 239.1.1.1 40.0.0.5 all-vrfs

VRF : blue

Group Address                 : 239.1.1.1
Source Address                : 40.0.0.5
Incoming interface            : vlan3
Unicast Routing Protocol      : connected
Metric                        : 1234
Metric  Pref                  : 1234
Downstream Interface
Interface   State
---------   -----
vlan2       forwarding

VRF : green

Group Address                 : 239.1.1.1
Source Address                : 40.0.0.5
Neighbor                      : 10.1.1.2
Incoming interface            : vlan1

show ip multicast anomalies

```
show ip multicast anomalies (pim | igmp | msdp | data-path | all) {source <source_ip>}
{group <group_ip>} {interface <IFNAME>} {vrf <vrf_name>} {all-vrfs}
```

Description

This command is used to display IPv4 multicast anomalies occurring across all the multicast modules in the system. Use this issue to troubleshoot current issues, or to detect multicast issues that occurred in the past by capturing the list of anomalies occurring across the multicast stack.

Parameter	Description
`pim`	Display multicast anomalies specific to PIM.
`igmp`	Display multicast anomalies specific to IGMP.
`msdp`	Display multicast anomalies specific to MSDP.
`data-path`	Display multicast anomalies specific to the datapath.
`all`	Display anomalies of all muticast modules.
`group <group_ip>`	Display multicast anomalies specific to the group.
`interface <IFNAME>`	Display multicast anomalies specific to an interface
`source <source_ip>`	Display multicast anomalies specific to a source.
`vrf <vrf-name>`	Display multicast anomalies specific to a VRF.
`all-vrfs`	Display multicast anomalies for all VRFs.

Examples

Showing datapath multicast anomalies for a specified group, interface and VRF.

```
switch# show ip multicast anomalies all all-vrfs

2022-02-18T09:28:40.272639+00:00 8320 pimd[2206]: MCAST_ANOMALY|IPV4|PIM|-

show ip multicast boundary interface

```
show ip multicast boundary interface <interface-name>
```

Description

Displays IP Multicast boundary ACL configurations and packet drop counters for the specified interface.

Examples

The following example displays IP multicast boundary information for interface **1/1/1**.

```
switch# show ip multicast boundary interface vlan50
IP Multicast Boundary Configurations
------------------------------------
access-list ip permitssm
    20 permit any any 225.0.0.0/255.0.0.0
    30 permit any any 230.0.0.0/255.0.0.0
    40 permit any any 232.0.0.0/255.0.0.0

IP Multicast Boundary Rx packet drop counters
---------------------------------------------
PIM Joins/Prunes           0
PIM BSM                    0
PIM C-RP Advertisements    0
PIM Asserts                0
Multicast Data Packets     0
IGMP Joins                 0
```

Related Commands

Command	Description
ip multicast boundary	This command configures administratively-scoped multicast boundaries on PIM-enabled Interfaces.

show ip pim

```
show ip pim [all-vrfs | vrf <VRF-NAME>] [vsx-peer]
```

Description

Shows the PIM router information. Optionally, you can specify display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`all-vrfs`	Shows PIM router information on all VRFs.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Default: default.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Usage

- In the 6400 Switch Series, In-Service Software Upgrade (ISSU) and multicast NSF are not supported in mixed mode.
- Multicast NSF is not supported for PIM RP enabled switches, therefore some transient traffic loss is expected during ISSU on RP routers where both PIM and MSDP are enabled.
- When PIM NSF status is inactive, the PIM NSF Time Remaining information is not shown.

Example

Showing IP PIM router information:

```
switch# show ip pim
```

```
PIM Global Parameters

VRF                                 :  default

show ip pim rpf

show ip pim rpf [<source-ip-address> [<group-ip-address>]] [vrf <vrf-name> | all-vrfs]

Description

Shows PIM RPF details for the specified source or RP address in the given VRF. It shows the nexthop and interface through which shortest path to the source is available. Additionally, it prints if PIM neighborship is present on the nexthop. If VRF is not given, it displays for default VRF.

Parameter	Description
<IP-ADDR>	Show PIM RPF details for the given IPv4/IPv6 (X:X::X:X) address
`vrfs`	Shows PIM RPF information for specific VRF.
`vrf` *<VRF-NAME>*	Specifies the name of a VRF. Default: default.
`all-vrfs`	Shows PIM RPF details in all VRFs.

Examples

Showing PIM RPF for an IP address:

```
switch# [show ip pim rpf 1.1.1.1]

VRF: default
IP Address    RPF Interface  RPF Nexthop   PIM Neighbor  RPF Route/Mask   Origin
In Use
----------    -------------  -----------   ------------  --------------   ------
------
1.1.1.1       vlan10         10.1.1.1      yes           1.1.1.1/32       O
yes
```

Showing PIM RPF for all VRFs:

```
switch# [show ip pim rpf all-vrfs]

VRF: default
IP Address    RPF Interface  RPF Nexthop    PIM Neighbor  RPF Route/Mask   Origin
In Use
------------  -------------  -----------    ------------  --------------   ------

show ip pim bsr

```
show ip pim bsr [all-vrfs | vrf <VRF-NAME>] [vsx-peer]
```

Description

Shows the information about BSR candidates in the domain and multicast groups it supports. Optionally, you can specify the display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`all-vrfs`	Shows PIM candidate BSR information for all VRFs.
`vrf <VRF-NAME>`	Optional. Shows PIM candidate BSR information for a particular VRF. If the **<VRF-NAME>** is not specified, it shows information for the default VRF.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing information about BSR candidates:

```
switch# show ip pim bsr all-vrfs

show ip pim interface

```
show ip pim interface [brief | all-vrfs | vrf <VRF-NAME>] [vsx-peer]
```

Description

Shows the information about PIM interfaces currently configured in the router. Optionally, you can specify display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`brief`	Specifies brief interface information
`all-vrfs`	Selects all VRFs.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Default: default.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing the information about PIM interfaces currently configured in the router for the 6200, 6300, 6400, 8100, 8325, 8360, 9300, and 10000 switch series.

```
switch# show ip pim interface 1/1/2

PIM Interfaces

show ip pim interface interface-name

```
show ip pim interface {<INTERFACE-NAME> [vsx-peer] | lag | loopback | tunnel |  vlan
<VLAN-ID> | vxlan} [vrf <VRF-NAME>]
```

Description

Shows detailed information about the PIM interface currently configured.

Parameter	Description
<INTERFACE-NAME>	Specifies an interface for showing PIM interface information.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.
LAG	Shows LAG interface information.
loopback	Shows loopback interface information.
tunnel	Shows tunnel interface information.
vlan *<VLAN-ID>*	Specifies an interface for showing PIM interface information.
vrf *<VRF-NAME>*	Specifies the name of a VRF. Default: default.
vxlan	Shows the VXLAN interface information.

Example

Showing PIM interface information for interface 1/1/2:

```
switch# show ip pim interface 1/1/2

PIM Interfaces

VRF: default

Interface  : 1/1/2
IP Address : 50.0.0.4/24
Mode       : sparse

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show ip pim interface interface-name counters

`show ip pim interface <INTERFACE-NAME> counters [vsx-peer]`

Description

Shows the PIM packet counters information for the specified interface.

Parameter	Description
<INTERFACE-NAME>	Specifies the interface to show packet counter information.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Usage

Loopback interfaces are special interfaces where only unicast PIM messages are updated. This includes Register, Register Stop, and Candidate RP Advertisements.

When a loopback interface is configured as the RP, the ACL drop counters will be updated on the interface on which the packets are received.

Example

Showing PIM packet counters for interface 1/1/5:

```
Switch(config)# show ip pim interface 1/1/5 counters

Interface  : 1/1/5
VRF        : default

Tx Counters :

Hello                                    310
State Refresh                            0
Join/Prune                               141
SSM Join/Prune                           141
RP Advertisement                         0
Graft                                    0
Graft Ack                                0
Assert                                   0
Bsm                                      0
Register                                 0
Register Stop                            0
SSM Register Stop                        0

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show ip pim rp

```
show ip pim rp [<group-ip>] [{vrf <vrf-name>}|all-vrfs]
```

Description

Displays the rendezvous point (RP) address for a particular group in the given VRF. The output of this command also includes the type of RP (static or dynamic) and the uptime for the mapping. This information can help verify that Group-to-RP mapping is consistent across all routers in the network. If the **group-ip** parameter is not included, the output of this command displays the group-to-RP mappings of those groups with active multicast traffic in the given VRF. If a VRF name is not specified, the output of this command displays information for the default VRF.

Parameter	Description
`<group-ip>`	Display group-to-RP mappings for the specified group.
`vrf` *`<VRF-NAME>`*	Specifies the name of a VRF. The default VRF is named **default**.
`all-vrfs`	Selects all VRFs.

Example

Showing RP mapping information for a single group:

```
switch# show ip pim rp 239.1.1.1

VRF: default

PIM-SM Group-to-Resultant_RP Mapping Information
Group Address   RP Address   RP Type  Up Time(HH:MM:SS)
-------------   ----------   -------  ----------------
239.1.1.1       20.1.1.1     bsr      12:01:20
```

Showing RP mapping for all VRFs:

```
switch# show ip pim rp all-vrfs
VRF: default

PIM-SM Group-to-Resultant_RP Mapping Information
Group Address   RP Address   RP Type  Up Time(HH:MM:SS)
-------------   ----------   -------  ----------------
239.1.1.1       20.1.1.1     bsr      15:10:45
239.1.1.2       40.1.1.1     static   05:07:30
239.1.1.3       Not Found    -        -

VRF: red

PIM-SM Group-to-Resultant_RP Mapping Information
Group Address   RP Address   RP Type  Up Time(HH:MM:SS)
-------------   ----------   -------  ----------------
225.1.1.1       100.1.1.5    bsr      15:11:50
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show ip pim rp-registered-source

```
show ip pim rp-registered-sources <group-address> [source-address] [all-vrfs | vrf <vrf-name>]
```

Description

Displays the registered sources information on the RP router. This command shows information about the active multicast flows that are registered by the source designated router (DR) to this Rendezvous Point (RP). When the multicast source becomes inactive, the entry will be removed from this table. Note that this command displays only the set of flows that have been registered successfully for which the current router is the RP.

show ipv pim rp registered sources

```
show ip pim rp-registered-sources <group-address> [source-address] [all-vrfs | vrf <vrf-
name>]
```

Description

Shows information about active multicast flows that are registered by source DR to a specific RP.

Parameter	Description
`<group-address>`	Shows registered sources information for the group address. Format: **x.x.x.x**
`<source-address>`	(Optional) Shows registered sources information for the group from this source. Format: **x.x.x.x** Display registered sources information for group address.
`vrf` *`<VRF-NAME>`*	Displays registered sources information for a specific VRF.
`all-vrfs`	Displays registered sources information for all VRFs.

Example

The following example the registered sources information for all VRFs.

```
switch# show ip pim rp-registered-sources all-vrfs
Multicast flows registered with this RP
VRF : default
Total number of entries : 2
Source Address            Group Address           RP Address
--------------------      --------------------    --------------------
20.1.1.1                  225.1.1.4               2.2.2.2
20.1.1.1                  225.1.1.5               2.2.2.2

Multicast flows registered with this RP
VRF : red
Total number of entries : 2
Source Address            Group Address           RP Address
--------------------      --------------------    --------------------
30.1.1.1                  229.1.1.1               4.4.4.4
30.1.1.1                  229.1.1.2               4.4.4.4
```

The following example the registered sources information for a specific group and source address.

```
switch# show ip pim rp-registered-sources 229.1.1.10 30.1.1.1

Multicast flows registered with this RP
VRF : default
Total number of entries : 1
Source Address            Group Address           RP Address
--------------------      --------------------    --------------------
30.1.1.1                  229.1.1.10              4.4.4.4
```

```
PIM-SM Group-to-Resultant_RP Mapping Information
Group Address    RP Address    RP Type   Up Time(HH:MM:SS)
-------------    ----------    -------   ----------------
225.1.1.1        100.1.1.5     bsr       15:11:50
Showing RP mapping information for a single group:
```

```
Multicast flows registered with this RP

show ip pim neighbor

`show ip pim neighbor [<IP-ADDRESS>] [brief | all-vrfs | vrf <VRF-NAME>] [vsx-peer]`

Description

Shows PIM neighbor information. Optionally, you can specify display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
<IP-ADDRESS>	Specifies an IP address.
`brief`	Specifies PIM neighbor information display in brief format.

Parameter	Description
`all-vrfs`	Selects all VRFs.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Default: default.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing PIM neighbor information for the , 6300, 6400,, , , , switch series.:

```
switch# show ip pim neighbor

PIM Neighbor

VRF                       : default
Total number of neighbors : 1

IP Address                : 30.1.1.3
Interface                 : vlan30
Up Time (HH:MM:SS)        : 03:55:40
Expire Time (HH:MM:SS)    : 00:01:23
DR Priority               : NA
Hold Time (HH:MM:SS)      : 00:01:45
Bidir Capable             : True
```

Showing PIM neighbor information in brief for the default VRF:

```
switch# show ip pim neighbor brief
----------------------------------------------------------------------------------
-
 VRF: default                 Total number of neighbor : 2
----------------------------------------------------------------------------------
-
Interface   Neighbor   Uptime      Expires     DR       Hold Time   Secondary
Address
            (IPV4)    (HH:MM:SS)  (HH:MM:SS)  Priority (HH:MM:SS)  (IPV4)
----------  --------  ---------   ---------   ------   ---------  ----------------
-
29091/1/1   40.0.0.5  11:54:21    00:01:31    NA       00:01:45   Nil
29101/1/2   50.0.0.5  00:03:23    00:01:23    NA       00:01:45
60.0.0.4,70.0.0.4
----------------------------------------------------------------------------------
-
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.13	Added support for BIDIR PIM on the , 6300, 6400,, , , , switch series.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show ip pim pending

`show ip pim pending [<GROUP-ADDR>] [all-vrfs | vrf <VRF-NAME>] [vsx-peer]`

Description

Shows the pending joins on a PIM router. Optionally you can specify display information by VRF. If no options are specified, it shows information for the default VRF.

Use this command to determine what flows are being requested on the PIM network. If data availability for a flow is expected, and a join for the flow is pending, the troubleshooting search moves to the source of that flow, since the routers are verified to be seeing the request for data.

Parameter	Description
<GROUP-ADDR>	Specifies a group address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.
`all-vrfs`	Selects all VRFs.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Default: default.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

On the 6400 Switch Series, interface identification differs.

Showing pending PIM joins:

```
switch# show ip pim pending
Join Pending
VRF : default
   Group 234.0.20.4
       (*,G) Pending
            Incoming Interface:  1/1/32
   Group 234.0.20.5
```

```
       (*,G) Pending
            Incoming Interface:  1/2/32
   Group 234.0.20.6
       (*,G) Pending
            Incoming Interface:  1/1/32
   Group 234.0.20.7
       (*,G) Pending
            Incoming Interface:  1/1/2
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

show ip pim rp-candidate

`show ip pim rp-candidate [all-vrfs | vrf <VRF-NAME>] [vsx-peer]`

Description

Shows the candidate RP operational and configuration information. Optionally, you can specify display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`all-vrfs`	Selects all VRFs.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Default: default.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing PIM RP candidate:

```
switch# show ip pim rp-candidate all-vrfs

 Status and Counters- PIM-SM Candidate-RP Information
```

```
VRF                        : Green
C-RP Admin Status          : This system is a Candidate-RP

show ip pim rp-set

`show ip pim rp-set [all-vrfs | vrf <VRF-NAME>] [vsx-peer]`

Description

Shows the multicast group support for both the learned C-RP assignments and any statically configured RP assignments. Optionally, you can specify display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`all-vrfs`	Selects all VRFs.
`vrf` *`<VRF-NAME>`*	Specifies the name of a VRF. Default: default.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing PIM RP set information:

```
switch# show ip pim rp-set all-vrfs

VRF: default

Status and Counters - PIM-SM Static RP-Set Information
Group Address    Group Mask       RP Address       Override
---------------  ---------------  ---------------  --------
233.100.128.255  255.255.255.255  100.10.10.1      Yes
238.100.128.255  255.255.255.255  100.10.10.3      Yes

Status and Counters - PIM-SM Learned RP-Set Information
Group Address    Group Mask       RP Address       Hold Time  Expire Time
---------------  ---------------  ---------------  ---------  -----------
223.2.2.34       255.0.0.0        9.0.0.25         12         0

VRF: green

Status and Counters - PIM-SM Static RP-Set Information
Group Address    Group Mask       RP Address       Override
---------------  ---------------  ---------------  --------
226.102.128.255  255.255.255.255  105.10.10.3      Yes
234.102.128.255  255.255.255.255  110.10.10.3      Yes

Status and Counters - PIM-SM Learned RP-Set Information
Group Address    Group Mask       RP Address       Hold Time  Expire Time
---------------  ---------------  ---------------  ---------  -----------
223.2.2.34       255.0.0.0        9.0.0.25         12         0
229.2.2.34       255.0.0.0        9.0.0.25         10         0
```

show ip pim rp-set learned

`show ip pim rp-set learned [all-vrfs | vrf <VRF-NAME>] [vsx-peer]`

Description

Shows the multicast group support for dynamically learned RP assignments. Optionally, you can specify display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`all-vrfs`	Selects all VRFs.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Default: default.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing PIM RP set learned information:

```
switch# show ip pim rp-set learned all-vrfs

VRF: default

Status and Counters - PIM-SM Learned RP-Set Information
Group Address    Group Mask       RP Address       Hold Time  Expire Time
---------------  ---------------  ---------------  ---------  -----------
223.2.2.34       255.0.0.0        9.0.0.25         12         0

VRF: green

Status and Counters - PIM-SM Learned RP-Set Information
Group Address    Group Mask       RP Address       Hold Time  Expire Time
---------------  ---------------  ---------------  ---------  -----------
223.2.2.34       255.0.0.0        9.0.0.25         12         0
229.2.2.34       255.0.0.0        9.0.0.25         10         0
```

show ip pim rp-set static

```
show ip pim rp-set static [all-vrfs | vrf <VRF-NAME>] [vsx-peer]
```

Description

Shows the multicast group support for statically configured RP assignments. Optionally, you can specify display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`all-vrfs`	Selects all VRFs.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Default: default.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing PIM Static RP set information:

```
switch# show ip pim rp-set static all-vrfs

VRF: default

Status and Counters - PIM-SM Static RP-Set Information
Group Address    Group Mask       RP Address       Override
---------------  ---------------  ---------------  --------
233.100.128.255  255.255.255.255  100.10.10.1      Yes
238.100.128.255  255.255.255.255  100.10.10.3      Yes

VRF: green

Status and Counters - PIM-SM Static RP-Set Information
Group Address    Group Mask       RP Address       Override
---------------  ---------------  ---------------  --------
226.102.128.255  255.255.255.255  105.10.10.3      Yes
234.102.128.255  255.255.255.255  110.10.10.3      Yes
```

show ip pim rpf-override

`show ip pim rpf-override [all-vrfs | vrf <VRF-NAME>] [vsx-peer]`

Description

Shows the RPF override configuration, which can be useful information when troubleshooting potential RPF misconfigurations. Optionally, you can specify display information by VRF. If no options are specified, it shows information for the default VRF

Parameter	Description
`all-vrfs`	Optional. Shows PIM RPF override information for all VRFs.
`vrf <VRF-NAME>`	Optional. Shows PIM RPF override information for a particular VRF. If the **<VRF-NAME>** is not specified, it shows information for the default VRF.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

On the 6400 Switch Series, interface identification differs.

Showing PIM RPF override:

```
switch# show ip pim rpf-override all-vrfs

VRF                   : default
Static RPF Override
Multicast Source RPF IP Address
-------------------- ------------------
10.0.0.2/32           1.1.1.1

VRF                   : green
Static RPF Override
Multicast Source RPF IP Address
-------------------- ------------------
10.0.0.2/32           1.1.1.1
10.1.1.1/32           1.1.1.2
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show ip pim rp-registered-source

```
show ip pim rp-registered-sources <group-address> [source-address] [all-vrfs | vrf <vrf-
name>]
```

Description

Displays the registered sources information on the RP router. This command shows information about the active multicast flows that are registered by the source designated router (DR) to this Rendezvous Point (RP). When the multicast source becomes inactive, the entry will be removed from this table. Note that this command displays only the set of flows that have been registered successfully for which the current router is the RP.

show ipv pim rp registered sources

```
show ip pim rp-registered-sources <group-address> [source-address] [all-vrfs | vrf <vrf-
name>]
```

Description

Shows information about active multicast flows that are registered by source DR to a specific RP.

Parameter	Description
`<group-address>`	Shows registered sources information for the group address. Format: **x.x.x.x**
`<source-address>`	(Optional) Shows registered sources information for the group from this source. Format: **x.x.x.x** Display registered sources information for group address.
`vrf` *`<VRF-NAME>`*	Displays registered sources information for a specific VRF.
`all-vrfs`	Displays registered sources information for all VRFs.

Example

The following example the registered sources information for all VRFs.

```
switch# show ip pim rp-registered-sources all-vrfs
Multicast flows registered with this RP
VRF : default
Total number of entries : 2
Source Address           Group Address           RP Address
--------------------     --------------------    --------------------
20.1.1.1                 225.1.1.4               2.2.2.2
20.1.1.1                 225.1.1.5               2.2.2.2

Multicast flows registered with this RP
VRF : red
Total number of entries : 2
Source Address           Group Address           RP Address
--------------------     --------------------    --------------------
30.1.1.1                 229.1.1.1               4.4.4.4
30.1.1.1                 229.1.1.2               4.4.4.4
```

The following example the registered sources information for a specific group and source address.

```
switch# show ip pim rp-registered-sources 229.1.1.10 30.1.1.1

Multicast flows registered with this RP
VRF : default
Total number of entries : 1
Source Address           Group Address           RP Address
--------------------     --------------------    --------------------
30.1.1.1                 229.1.1.10              4.4.4.4

PIM-SM Group-to-Resultant_RP Mapping Information
Group Address   RP Address   RP Type  Up Time(HH:MM:SS)
-------------   ----------   -------  ----------------
225.1.1.1       100.1.5      bsr      15:11:50
Showing RP mapping information for a single group:
```

```
Multicast flows registered with this RP
VRF : default
Total number of entries : 2
Source Address           Group Address           RP Address
--------------------     --------------------    --------------------
20.1.1.1                 225.1.1.4               2.2.2.2
20.1.1.1                 225.1.1.5               2.2.2.2

Multicast flows registered with this RP
VRF : red
Total number of entries : 2
Source Address           Group Address           RP Address

show ip pim rpf-override source

`show ip pim rpf-override source <IP-ADDR> [all-vrfs | vrf <VRF-NAME>] [vsx-peer]`

Description

Shows the RPF override configuration for the specified source. Optionally, you can specify display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
source <IP-ADDR>	Specifies the RPF source address in IPv4 format (**x.x.x.x**), where **x** is a decimal number from 0 to 255.
all-vrfs	Selects all VRFs.
vrf *<VRF-NAME>*	Specifies the name of a VRF. Default: default.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

Showing PIM RPF override source:

```
switch# show ip pim rpf-override source 10.0.0.2

VRF                  : default
Static RPF Override
Multicast Source RPF IP Address
-------------------- ------------------
10.0.0.2             1.1.1.1
```

Showing PIM RPF override source for all VRFs:

```
switch# show ip pim rpf-override source 10.0.0.2 all-vrfs

VRF                  : default
```

```
Static RPF Override
Multicast Source RPF IP Address
-------------------- ------------------
10.0.0.2             1.1.1.1

VRF                  : green
Static RPF Override
Multicast Source RPF IP Address
-------------------- ------------------
10.0.0.2             1.1.1.1
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show ip pim tree-state

```
show ip pim tree-state {<group-ip> [<source-ip>]}|brief [{vrf <vrf-name>}| all-vrfs]
```

Description

Displays upstream join states for a specified group and source address in a VRF.

The command displays upstream state, upstream interface and RPF neighbor used to send join messages and a list of downstream interfaces from which join messages are received.

The set of downstream interfaces in this command may not show the final list of outgoing interfaces for a flow, which is computed from various internal states and is shown in the output of the command show ip mroute.

Parameter	Description
`<group-ip>`	Shows PIM Join details for the specified group IP address
`<source-ip>`	Shows PIM Join details for the specified source IP address. If a source address is **not** specified, only *,G states are displayed for the specified group. If a source **address** is specified, (S,G) states are displayed along with (*,G) states and (S,G,RPT) states wherever

Parameter	Description
	applicable.
`brief`	Display brief details for the multicast group and source in a table format.
`vrf` *`<VRF-NAME>`*	Show join state details for the specified VRF.
`all-vrfs`	Show join state details for all VRFs.

Usage

The output of this command can indicate one of the following two multicast group (*,G) and multicast source and group (S,G) upstream states:

- **Joined** : Join sent to upstream RPF neighbor.
- **Not Joined** : Joins not sent upstream.

The following states are applicable to the multicast group (*G), and root path tree (S,G,RPT) only:

- **Pruned** : Traffic from the source is arriving on the shortest path tree, (*,G) Joined, but (S,G,RPT) pruned.
- **Not Pruned** : Traffic from the multicast group (*,G) Joined, and (S,G,rpt) not pruned.
- **RPT Not Joined**' : The multicast group (*,G) has not joined.

Examples

Display multicast group (*,G) join information for the VRF **red**.

```
show ip pim tree-state 239.1.1.1 vrf red
(*,G) Information for Group 239.1.1.1
VRF: red
Upstream Information:
State                          : Joined
Joined Interface               : vlan50
RPF Neighbor                   : 20.1.1.2
Uptime                         : 01:58:30
Downstream Information:
Interfaces                     : vlan50, vlan201
```

Display group (*,G), source and group (S,G), and root-path tree (S,G, RPT) Information for group **239.1.1.1** and source IP **30.1.1.1**.

```
show ip pim tree-state 239.1.1.1 30.1.1.1 vrf red
(*,G) Information for Group 239.1.1.1
VRF: red
Upstream Information:
State                          : Joined
Joined Interface               : vlan50
RPF Neighbor                   : 20.1.1.2
Uptime                         : 01:58:30
Downstream Information:
Interfaces                     : vlan200
(S,G) Information for Group 239.1.1.1 Source 30.1.1.1
Upstream Information:
```

```
State                         : Joined
Joined Interface              : vlan30
RPF Neighbor                  : 40.1.1.2
Uptime                        : 01:57:30
SPT bit set                   : True
Downstream Information:
Interfaces                    : vlan200
(S,G,RPT) Information for Group 239.1.1.1 Source 30.1.1.1
Upstream Information:
State                         : Pruned
Joined Interface              : vlan50
RPF Neighbor                  : 20.1.1.2
Uptime                        : 01:58:30
Downstream Information:
Interfaces                    : vlan200
```

Display brief information for the IP PIM tree state.

```
switch# show ip pim tree-state brief

sources-per-group

```
sources-per-group <limit>
no sources-per-group <limit>
```

Description

Configures the total number of sources allowed for a group on the router. By default, there is no limit on the number of sources for a group. When the number of sources for a group exceeds the configured limit, multicast traffic from additional sources will be dropped.

The **no** form of this command removes the currently configured limit value.

Parameter	Description
<limit>	Specifies the value to be configured as the sources allowed per group. Range: 1 to 4294967295.

Usage

Flows exceeding the limit will be programmed as a bridge entry and will not have the outgoing interfaces list populated. This configuration does not allow new sources for the group. At the time of configuration, if the device has more sources for the given group than the configured value, already allowed sources continue to exist until they are removed.

The flows are programmed in the HW on a FCFS basis. There could be scenarios where the flow is forwarded in neighbor router, but it may not be forwarded on the current router because of exceeding the limits configured on the current router. In such cases, it is recommended to configure higher limits to avoid traffic outage.

Examples

Configuring and removing the sources allowed per group:

```
switch(config)# router pim
switch(config-pim)# sources-per-group 4
switch(config-pim)# no sources-per-group
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	config-pim	Administrators or local user group members with execution rights for this command.

spt-threshold

```
spt-threshold
no spt-threshold
```

Description

Enables the router to switch the multicast traffic flows to the shortest path tree. Default is enabled.

The **no** form of this command disables the routers ability to switch the multicast traffic flows to the shortest path tree.

To apply this configuration a user needs to apply disable/enable PIM globally.

Example

Enabling and disabling the SPT threshold:

```
switch(config)# router pim
switch(config-pim)# spt-threshold
switch(config-pim)# no spt-threshold
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Chapter 106

PIM-SM commands for IPv6

accept-register access-list

```
accept-register access-list <ACL-RULE>
no accept-register access-list <ACL-RULE>
```

Description

Configures ACL on RP to filter PIM Register packets from unauthorized sources. The ACL specified will contain the (S,G) traffic in register packets to permitted or denied.

The **no** form of this command removes the currently configured ACL rule.

Parameter	Description
<ACL-RULE>	Specifies the ACL rule name.

Usage

When register ACL is associated with a PIM Router, PIM protocol will store the source and destination address details along with the action (permit or deny).

Upon receiving the register messages, a look up is made to check if the S and G in the packet is in the permitted list. If there is no match or if there is a deny rule match, a register stop message is immediately sent and the packet is dropped and no further action is taken. Permitted packets will go through the normal flow.

Loopback interfaces are special interfaces where only unicast PIM messages are updated. This includes Register, Register Stop, and Candidate RP Advertisements.

When a loopback interface is configured as the RP, the ACL drop counters will be updated on the interface on which the packets are received.

Examples

Configuring ACL on RP with an ACL rule named **pim_regv6_acl**:

```
switch(config)# access-list ipv6 pim_regv6_acl
switch(config-acl-ipv6)# 10 permit any 20.::1 ff1e::1
switch(config-acl-ipv6)# 20 deny any 30::1 ff1e::3
switch(config)# router pim6
switch(config-pim6)# accept-register access-list pim_regv6_acl
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

accept-rp

```
accept-rp <IPv6-ADDR> access-list <ACL-RULE>
no accept-rp <IPv6-ADDR> access-list <ACL-RULE>
```

Description

Enables PIM router to filter PIM join/prune messages destined for a specific RP and specific groups. The ACL specifies the group addresses which are allowed or denied. Up to 8 RP addresses and group ACL can be associated with the PIM router.

The **no** form of this command removes the currently configured ACL rule.

Parameter	Description
<IPv6-ADDR>	Specifies an address in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.
<ACL-RULE>	Specifies the ACL rule name.

Usage

PIM will store the accepted RP address and the associated group ACL. When a join or prune message is received, a RP look up is made for the packet. If the RP is in the configured list and if the group in the join/prune packet is allowed in the ACL, the packet is allowed. Otherwise the packet is dropped.

To allow join/prune message from any groups, group address in the ACL can be wild-carded. In this case, only RP address check is performed.

This command impacts only (*,G) join/prune messages. If there are any existing flows, the user will need to disable and enable PIM on the interface to apply the ACL.

Loopback interfaces are special interfaces where only unicast PIM messages are updated. This includes Register, Register Stop, and Candidate RP Advertisements.

When a loopback interface is configured as the RP, the ACL drop counters will be updated on the interface on which the packets are received.

If there is an active flow which is in the SPT, the traffic flow through the SPT will continue. Only (*,G) join/prune messages are dropped. (S,G) join/prune messages will not be impacted.

Examples

Configuring ACL on RP with an ACL rule named **pim_rpv6_grp_acl** to filter join/prune messages:

```
switch(config-pim)# access-list ip pim_rpv6_grp_acl
switch(config-acl-ipv6)# 10 permit any any ff2e::2/64
switch(config-acl-ipv6)# 20 permit any any ff1e::1/64
switch(config-acl-ipv6)# router pim6
switch(config-pim6)# accept-rp 30::1 access-list pim_rpv6_grp_acl
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

bsr-candidate bsm-interval

```
bsr-candidate bsm-interval <INTERVAL-VALUE>
no bsr-candidate bsm-interval
```

Description

Configures the interval in seconds to send periodic RP-Set messages to all PIM-SM interfaces on a router that operates as the BSR in a domain. This setting must be smaller than the **rp-candidate hold-time** settings (range of 30 to 255; default 150) configured in the RPs operating in the domain.

The **no** form of this command removes the currently configured value and sets it to the default of 60 seconds.

Parameter	Description
<INTERVAL-VALUE>	Specifies the BSR-candidate BSM interval in seconds. Range: 5 to 300. Default: 60.

Example

Configuring and removing BSR-candidate BSM-interval:

```
switch(config)# router pim6
switch(config-pim6)# bsr-candidate bsm-interval 150
switch(config-pim6)# no bsr-candidate bsm-interval
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

bsr-candidate hash-mask-length

```
bsr-candidate hash-mask-length <LENGTH-VALUE>
no bsr-candidate hash-mask-length
```

Description

Controls the distribution of multicast groups among the C-RP, in a domain where there is overlapping coverage of the groups among the RPs. This value specifies the length (number of significant bits) when allocating this distribution. A longer hash-mask-length results in fewer multicast groups, for each block of group addresses assigned to the RPs. Multiple blocks of addresses assigned to each C-RP results in wider dispersal of addresses. Includes enhanced load-sharing for the multicast traffic for the different groups that are used in the domain at the same time.

The **no** form of this command removes currently configured value and sets to the default of 126.

Parameter	Description
<LENGTH-VALUE>	Specifies the length (in bits) of the hash mask. Range: 1 to 128. Default: 126.

Example

Configuring and removing the BSR-candidate hash-mask-length:

```
switch(config)# router pim6
switch(config-pim6)# bsr-candidate hash-mask-length 4
switch(config-pim6)# no bsr-candidate hash-mask-length
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

bsr-candidate priority

```
bsr-candidate priority <PRIORITY-VALUE>
no bsr-candidate priority
```

Description

Configures the priority to apply to the router when a BSR election process occurs in the PIM-SM domain. The candidate with the highest priority becomes the BSR for the domain. If the highest priority is shared by multiple routers, the candidate having the highest IP address becomes the BSR of the domain. Zero (0) is the lowest priority. To make BSR selection easily predictable, use this command to assign a different priority to each candidate BSR in the PIM-SM domain.

The **no** form of this command removes currently configured value and sets to the default of 0.

Parameter	Description
<PRIORITY-VALUE>	Specifies the priority for the Candidate Bootstrap router. Range: 0 to 255. Default: 0.

Example

Configuring and removing the BSR-candidate priority:

```
switch(config)# router pim6
switch(config-pim6)# bsr-candidate priority 250
switch(config-pim6)# no bsr-candidate priority
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

bsr-candidate source-ip-interface

```
bsr-candidate source-ip-interface <INTERFACE-NAME>
```

```
no bsr-candidate source-ip-interface <INTERFACE-NAME>
```

Description

Configures the router to advertise itself as a candidate PIM-SM BSR on the interface specified, and enables BSR candidate operation. The result makes the router eligible to be elected as the BSR for the PIM-SM domain in which it operates. One BSR candidate interface is allowed per-router.

The **no** form of this command removes the Candidate BSR configuration.

Parameter	Description
`<INTERFACE-NAME>`	Specifies the interface to use as a source for Candidate-BSR router IP address. Interface can be a VLAN interface, routed interface, or LAG. PIM-SM must be enabled on this interface with the command **ipv6 pimv6-sparse enable**.

Example

On the 6400 Switch Series, interface identification differs.

Configuring and removing the BSR-candidate interface:

```
switch(config)# router pim6
switch(config-pim6)# bsr-candidate source-ip-interface 1/1/4
switch(config-pim6)# no rp-candidate source-ip-interface 1/1/4
```

Configuring and removing the BSR-candidate sub-interface:

```
switch(config)# router pim6
switch(config-pim6)# bsr-candidate source-ip-interface 1/1/4
switch(config-pim6)# no rp-candidate source-ip-interface 1/1/4
```

Configuring sub-interface 1/1/19/10 as Candidate BSR:

```
switch(config)# router pim6
switch(config-pim6)# bsr-candidate source-ip-interface 1/1/19.10
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

disable

`disable`

Description

Disables PIMv6 globally on the router.

Using the **disable** command will cause all the multicast routes to be erased from hardware.

Example

Disabling PIM router:

```
switch(config)# router pim6
switch(config-pim6)# disable
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ipv6 mroute

```
ipv6 mroute <SRC-ADDR/SRC-MASK> <RPF-ADDRESS> | <INTERFACE-NAME>
```

Description

Configures multicast reverse path (RPF) forwarding static routes. This command is an alias of the **rpf-override** command.

The **no** form of this command removes the mroute configuration.

Parameter	Description
<SRC-ADDR>	Specifies the multicast source address in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.
<SRC-MASK>	Specifies the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128.
<RPF-ADDR>	Specifies the RPF address in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.
<INTERFACE-NAME>	Specifies the RPF interface name.

Usage

Reverse Path Forward (RPF) checking is a core multicast routing mechanism. The RPF ensures that the multicast traffic received arrives on the expected router interface before further processing. If the RPF check fails for a multicast packet, the packet is discarded. For multicast traffic flow that arrives on the SPT, the expected incoming interface for a given source or group is the interface towards the source address of the traffic (determined by the unicast routing system). For traffic arriving on the RP tree, the expected incoming interface is the interface towards the RP.

RPF checking is applied to all multicast traffic and is significant in preventing network loops. Up to eight manual RPF overrides can be specified. The RPF-address indicates one of two distinct RPF candidates:

1. A valid PIM neighbor address from which forwarded multicast traffic is accepted with a source address of **<source-addr/src-mask>**.

2. A local router address on a PIM-enabled interface to which **<source-addr/src-mask>** is directly connected. If configured, the local router will assume the role of DR for this flow and registers the flow with an RP.

Example

Configuring and removing IP mroute:

```
switch(config-pim)# router pim6
switch(config-pim6)# ipv6 mroute 50::4/24 tunnel1
switch(config-pim6)# no ipv6 mroute 50::4/24 tunnel1
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ipv6 pim6-sparse

```
ipv6 pim6-sparse {enable | disable}
no ipv6 pim6-sparse [enable]
```

Description

Enables or disables PIM-SM on the current interface. PIM-SM is disabled by default on an interface. An IPv6 address must be configured on the interface to enable PIM-SM.

Parameter	Description
`enable`	Enables PIM-SM on the interface. IPv6 address must be configured on the interface to enable PIM-SM (use the **ipv6 address <X:X::X:X/M>** command).
`disable`	Disables PIM SM on the interface.

Examples

Enabling and disabling PIM-SM on an interface:

```
switch(config)# interface vlan40
switch(config-if-vlan)# ipv6 address 2001::01/64
switch(config-if-vlan)# ipv6 pim6-sparse enable
switch(config-if-vlan)# ipv6 pim6-sparse disable
```

Enabling and disabling PIM-SM on a sub-interface:

```
switch(config)# interface 1/1/19.10
switch(config-subif)# ipv6 address 90::1/64
switch(config-subif)# ipv6 pim6-sparse enable
switch(config-subif)# ipv6 pim6-sparse disable
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ipv6 pim6-sparse bfd

```
ipv6 pim6-sparse bfd [disable]
no ipv6 pim6-sparse bfd
```

Description

Configures BFD on a per-interface basis for an interface associated with the PIM process.

The **no** form of this command removes the BFD configuration on the interface and sets it to the default configuration.

If BFD is enabled globally, it will be enabled by default on all interfaces. The only exception is when it is disabled specifically on an interface using the **ipv6 pim6-sparse bfd disable** command.
If BFD is disabled globally, it will be disabled by default on all interfaces. The only exception is when it is enabled specifically on an interface using the **ipv6 pim6-sparse bfd** command.

Parameter	Description
`disable`	Disables the BFD configuration on the interface.

Examples

Enabling the BFD configuration on the interface:

```
switch(config)# interface vlan 40
switch(config-if-vlan)# ipv6 pim6-sparse bfd
```

Disabling the BFD configuration on the interface:

```
switch(config-if-vlan)# ipv6 pim6-sparse bfd disable
```

Removing the BFD configuration on the interface:

```
switch(config-if-vlan)# no ipv6 pim6-sparse bfd
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ipv6 pim6-sparse dr-priority

```
ipv6 pim6-sparse dr-priority <PRIORITY-VALUE>
no ipv6 pim6-sparse dr-priority
```

Description

Changes the router priority for the designated router (DR) election process in the current interface.

A numerically higher value means a higher priority. If multiple routes share the highest priority, the router with the highest IP address is selected as the DR.

The **no** form of this command removes currently configured value and sets to the default of 1.

Parameter	Description
<PRIORITY-VALUE>	Specifies the priority value to use on the interface in the DR election process. Range: 0 to 4294967295. Default: 1.

Examples

Configuring and removing the interface priority value:

```
switch(config)# interface vlan 40
switch(config-if-vlan)# ipv6 pim6-sparse dr-priority 4444
switch(config-if-vlan)# no ipv6 pim6-sparse dr-priority
```

Configuring and removing the interface priority value:

```
switch(config)# interface 1/1/19.10
switch(config-if-vlan)# ipv6 pim6-sparse dr-priority 2000
switch(config-if-vlan)# no ipv6 pim6-sparse dr-priority
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ipv6 pim6-sparse hello-delay

```
ipv6 pim6-sparse hello-delay <DELAY-VALUE>
no ipv6 pim6-sparse hello-delay
```

Description

Configures the maximum time in seconds before the router actually transmits the initial PIM hello message on the current interface.

The **no** form of this command removes currently configured value and sets to the default of 5 seconds.

Parameter	Description
<DELAY-VALUE>	Specifies the hello-delay in seconds, which is the maximum time before a triggered PIM Hello message is transmitted on this interface. Range: 0 to 5. Default: 5.

Usage

- In cases where a new interface activates connections with multiple routers. If all the connected routers sent hello packets at the same time, the receiving router could become momentarily overloaded.

- This command randomizes the transmission delay to a time between zero and the hello delay setting. Using zero means no delay. After the router sends the initial hello packet to a newly detected interface, it sends subsequent hello packets according to the current hello interval setting.

Example

Configuring and removing hello-delay interface:

```
switch(config)# interface vlan 40
switch(config-if-vlan)# ipv6 pim6-sparse hello-delay 4
switch(config-if-vlan)# no ipv6 pim6-sparse hello-delay
```

Configuring and removing hello-delay on a sub-interface:

```
switch(config)# interface 1/1/19.10
switch(config-subif)# ipv6 pim6-sparse hello-delay 4
switch(config-subif)# no ipv6 pim6-sparse hello-delay
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ipv6 pim6-sparse hello-interval

```
ipv6 pim6-sparse hello-interval <INTERVAL-VALUE>
no ipv6 pim6-sparse hello-interval
```

Description

Configures the frequency at which the router transmits PIM hello messages on the current interface.

The **no** form of this command removes the currently configured value and sets to the default of 30 seconds.

Parameter	Description
<INTERVAL-VALUE>	Specifies the frequency at which PIM Hello messages are transmitted on this interface in seconds. Range: 5 to 300. Default: 30.

Usage

- The router uses hello packets to inform neighbor routers of its presence.
- The router also uses this setting to compute the hello holdtime, which is included in hello packets sent to neighbor routers.
- Hello holdtime tells neighbor routers how long to wait for the next hello packet from the router. If another packet does not arrive within that time, the router removes the neighbor adjacency on that interface from the PIM adjacency table, which removes any flows running on that interface.
- Shortening the hello interval reduces the hello holdtime. If they do not receive a new hello packet when expected, it changes how quickly other routers stop sending traffic to the router.

Example

Configuring and removing sparse hello-interval:

```
switch(config-if)# ipv6 pim6-sparse hello-interval 60
switch(config-if)# no ipv6 pim6-sparse hello-interval
```

Configuring and removing sparse hello-interval on a sub-interface:

```
switch)config)# interface 1/1/19.10
switch(config-subif)# ipv6 pim6-sparse hello-interval 100
switch(config-subif)# no ipv6 pim6-sparse hello-interval
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ipv6 pim6-sparse ipv6-addr

`ipv6 pim6-sparse ipv6-addr {<IPv6-ADDR-VALUE> | any}`

```
no ipv6 pim6-sparse ipv6-addr
```

Description

Enables the router to dynamically determine the source IP address to use for PIM-SM packets sent from the interface or to use the specific IPv6 address.

The **no** form of this command removes the currently configured value and sets to the default of **any**.

Parameter	Description
<IP-ADDR-VALUE>	Specifies the source IP address in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.
`any`	Specifies dynamically determining the source IP from the current IP address of the interface.

Examples

Configuring and removing source IP address:

```
switch(config)# interface vlan40
switch(config-if-vlan)# ipv6 pim6-sparse ipv6-addr 2001::02
switch(config-if-vlan)# no ipv6 pim6-sparse ipv6-addr
```

Configuring and removing source IP address on a sub-interface:

```
switch(config)# interface 1/1/19.10
switch(config-subif)# ipv6 pim6-sparse ipv6-addr 2001:1::1
switch(config-if-vlan)# no ipv6 pim6-sparse ipv6-addr 2001:1::1
```

ipv6 pim6-sparse lan-prune-delay

```
ipv6 pim6-sparse lan-prune-delay
no ipv6 pim6-sparse lan-prune-delay
```

Description

Enables the LAN prune delay option on the current interface. The default is enabled.

With LAN-prune-delay enabled, the router informs downstream neighbors how long it will wait before pruning a flow after receiving a prune request. Other downstream routers on the same interface must send a join to override the prune before the LAN-prune-delay time to continue the flow. Prompts any downstream neighbors with multicast receivers continuing to belong to the flow to reply with a join. If no joins are received after the LAN-prune-delay period, the router prunes the flow. The propagation-delay and override-interval settings determine the LAN-prune-delay setting.

The **no** form of this command disables the LAN prune delay option.

Example

Enabling and disabling the LAN prune delay:

```
switch(config)# interface vlan40
switch(config-if-vlan)# ipv6 pim6-sparse lan-prune-delay
switch(config-if-vlan)# no ipv6 pim6-sparse lan-prune-delay
```

Enabling and disabling the LAN prune delay on a sub-interface:

```
switch(config)# interface 1/1/19.10
switch(config-subif)# ipv6 pim6-sparse lan-prune-delay
switch(config-subif)# no ipv6 pim6-sparse lan-prune-delay
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ipv6 pim6-sparse override-interval

```
ipv6 pim6-sparse override-interval <INTERVAL-VALUE>
no ipv6 pim6-sparse override-interval
```

Description

Configures the override interval that gets inserted into the Override Interval field of a LAN Prune Delay option.

The **no** form of this command removes the currently configured value and sets the value to the default of 2500 ms.

Parameter	Description
<INTERVAL-VALUE>	Specifies the override interval of a LAN Prune Delay option in ms. Range: 500 to 6000. Default: 2500.

Usage

A router sharing a VLAN with other multicast routers uses the override-interval value along with the propagation-delay value to compute the **lan-prune-delay** setting. The setting specifies how long to wait for a PIM-SM join after receiving a prune packet from downstream for a particular multicast group.

Example scenario:

A network may have multiple routers sharing VLAN X. When an upstream router is forwarding traffic from multicast group X to VLAN Y, if one of the routers on VLAN Y does not want this traffic, it issues a prune response to the upstream neighbor. The upstream neighbor then goes into a prune pending state for group X on VLAN Y. During this period, the upstream neighbor continues to forward the traffic. During the pending period, another router on VLAN Y can send a group X join to the upstream neighbor. If this happens, the upstream neighbor drops the prune pending status and continues forwarding the traffic. But if no routers on the VLAN send a join, the upstream router prunes.

Example

Configuring and removing the override interval:

```
switch(config)# interface vlan40
switch(config-if-vlan)# ipv6 pim6-sparse override-interval 4000
switch(config-if-vlan)# no ipv6 pim6-sparse override-interval
```

Configuring and removing the override interval on a sub-interface:

```
switch(config)# interface 1/1/19.10
switch(config-subif)# ipv6 pim6-sparse override-interval 5000
switch(config-subif)# no ipv6 pim6-sparse override-interval
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

ipv6 pim6-sparse propagation-delay

```
ipv6 pim6-sparse propagation-delay <DELAY-VALUE>
no ipv6 pim6-sparse propagation-delay
```

Description

Configures the propagation delay that gets inserted into the LAN prune delay field of a LAN Prune Delay option.

The **no** form of this command removes currently configured value and sets to the default of 500 ms.

Parameter	Description
<DELAY-VALUE>	Specifies the propagation delay value in ms. Range: 250 to 2000. Default: 500.

Examples

Configuring and removing the propagation delay:

```
switch(config)# interface vlan 40
switch(config-if-vlan)# ipv6 pim6-sparse propagation-delay 400
switch(config-if-vlan)# no ipv6 pim6-sparse propagation-delay
```

Configuring and removing the propagation delay on a sub-interface:

```
switch(config)# interface 1/1/19.10
switch(config-subif)# ipv6 pim6-sparse propagation-delay 1000
switch(config-subif)# no ipv6 pim6-sparse propagation-delay
```

join-prune-interval

```
join-prune-interval <INTERVAL-VALUE>
no join-prune-interval
```

Description

Configures the frequency at which the router will send periodic join or prune-interval messages.

The **no** form of this command sets the interval to the default value of 60 seconds.

Parameter	Description
<INTERVAL-VALUE>	Specifies the join-prune-interval in seconds. Range 5 to 65535. Default: 60.

Examples

Configuring join prune interval:

```
switch(config)# router pim6
switch(config-pim6)# join-prune-interval 400
switch(config-pim6)# no join-prune-interval
```

rp-address access list

```
rp-address <IPv6-ADDR> [access-list <ACL-NAME>][override]
no rp-address <IPv6-ADDR> [access-list <ACL-NAME>][override]
```

Description

Statically configures the router as the RP and associates the static RP to the specified ACL.

The **no** form of this command removes static RP ACL configuration.

Parameter	Description
`<IPv6-ADDR>`	Specifies an address in IPv6 format (xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx), where x is a hexadecimal number from 0 to F.
`access-list <ACL-NAME>`	Specifies the name of the access control list.
`override`	Specifies whether or not static RP configuration precedes the information learned by a BSR.

Usage

The ACL includes a list of permitted/ denied group addresses for the specified RP.

- When configured on a source DR, only permitted group addresses are registered to the RP. When applied on other routers, (*,G) PIM join/prune messages are filtered according to the applied ACL.

- Only destination group addresses in the ACEs are filtered and any other fields configured in the ACE are ignored. If only PIM (*,G) messages need to be filtered, configure **accept-rp** ACLs.
- When static RP ACL is configured, only one static RP can be configured per VRF and that configured RP handles all the multicast groups in range ff00::/8.

A change in the RP ACL does not impact the flows that have already switched to SPT. Only when the source information is expired and the RP is needed to establish the multicast tree, is the change in the ACL reflected. If the source is always active, PIM can be disabled and re-enabled to clear the learned sources information and re-establish multicast trees based on the latest RP ACL configurations.

Examples

Configuring the static RP ACL:

```
...
access-list ip static_rp6_acl
10 permit any any ff2e::2/64
20 permit any any ff1e::1/64

switch(config)# router pim6
switch(config-pim6)# rp-address 30::1 access-list static_rp6_acl
```

Removing the static RP ACL configuration:

```
switch(config-pim)# no rp-address 30::1 access-list static_rp6_acl
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

6300 6400	`config-pim`	Administrators or local user group members with execution rights for this command.

rp-address

```
rp-address <IPv6-ADDR> [<GRP-ADDR/GRP-MASK>] [override]
no rp-address <IPv6-ADDR> [<GRP-ADDR/GRP-MASK>] [override]
```

Description

Statically configures the router as the RP for a specified multicast group or range of multicast groups. This must be configured on all PIM-SM routers in the domain. If group address is not specified, it applies to all IPv6 multicast addresses.

The **no** form of this command removes static RP configuration and its precedence.

Parameter	Description
<IPv6-ADDR>	Specifies an address in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.
<GRP-ADDR>	Specifies the range of multicast group addresses in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.
<GRP-MASK>	Specifies the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128.
`override`	Specifies higher precedence to static RP over Candidate RP.

Usage

Where a static RP and a C-RP are configured to support the same multicast groups and the multicast group mask for the static RP is equal to or greater than the same mask for the applicable C-RPs, this command assigns the higher precedence to the static RP, resulting in the C-RP operating only as a backup RP for the configured group. Without override, the C-RP has precedence over a static RP configured for the same multicast group or groups.

Examples

```
switch(config)# router pim6
switch(config-pim6)# rp-address 2001::01 ff08::1:3/64 ovverride
switch(config-pim6)# rp-address 2002::02 ff08::1:4/64
switch(config-pim6)# no rp-address 2002::02 ff08::1:4/64
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

rp-candidate group-prefix

```
rp-candidate group-prefix <GRP-ADDR/GRP-MASK>
no rp-candidate group-prefix <GRP-ADDR/GRP-MASK>
```

Description

Adds multicast group address to the current Candidate Rendezvous Point (C-RP) configuration.

The **no** form of this command removes C-RP multicast group address.

Parameter	Description
<GRP-ADDR>	Specifies the multicast group address in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.
<GRP-MASK>	Specifies the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128.

Examples

Configuring and removing candidate group prefix:

```
switch(config)# router pim6
switch(config-pim6)# rp-candidate group-prefix ff08::1:3/64
switch(config-pim6)# no rp-candidate group-prefix ff08::1:3/64
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

rp-candidate hold-time

```
rp-candidate hold-time <TIME-VALUE>
no rp-candidate hold-time
```

Description

Changes the hold-time a C-RP includes in its advertisements to the BSR.

Hold-time is included in the advertisements the C-RP periodically sends to the elected BSR for the domain. Also updates the BSR on how long to wait after the last advertisement from the reporting RP before assuming it has become unavailable.

The **no** form of this command removes the currently configured value and sets it to the default value 150 seconds.

Parameter	Description
<TIME-VALUE>	Specifies the hold-time value in seconds to be sent in C-RP-Adv messages. Range: 30 - 255. Default: 150.

Example

Setting and removing the candidate holdtime:

```
switch(config)# router pim6
switch(config-pim6)# rp-candidate hold-time 250
switch(config-pim6)# no rp-candidate hold-time
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

rp-candidate priority

```
rp-candidate priority <PRIORITY-VALUE>
no rp-candidate priority
```

Description

Changes the current priority setting for a C-RP. Where multiple C-RP configurations are used to support the same multicast groups, the candidate having the highest priority is elected. Zero (0) is the highest priority, and 255 is the lowest priority.

The **no** form of this command removes the currently configured value and sets it to the default of 192.

Parameter	Description
<PRIORITY-VALUE>	Specifies the priority value for the Candidate-RP router. Range: 0 to 255. Default: 192.

Example

Configuring and removing candidate priority:

```
switch(config)# router pim6
switch(config-pim6)# rp-candidate priority 250
switch(config-pim6)# no rp-candidate priority
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

rp-candidate source-ip-interface

```
rp-candidate source-ip-interface <INTERFACE-NAME> [group-prefix <GRP-ADDR/GRP-MASK>]
no rp-candidate source-ip-interface <INTERFACE-NAME> [group-prefix <GRP-ADDR/GRP-MASK>]
```

Description

Enables the Candidate Rendezvous Point (C-RP) operation, and configures the router to advertise itself as a C-RP to the Bootstrap Router (BSR) for the current domain.

This step includes the option to allow the C-RP to be a candidate for all possible multicast groups, or for up to four multicast groups, or ranges of groups. If group-prefix is not given, it considers for all multicast group addresses.

The **no** form of this command removes the C-RP configuration.

Parameter	Description
<INTERFACE-NAME>	Specifies the interface to use as a source for the C-RP router IP address.
`group-prefix` *<GRP-ADDR/GRP-MASK>*	Specifies the multicast group address in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F. And the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128.

Examples

Configuring a C-RP using VLAN 40 as the source for the C-RP router IP address and associating the ff08::1:3/64 multicast group with the C-RP router:

```
switch(config)# router pim6
switch(config-pim6)# rp-candidate source-ip-interface vlan40 group-prefix
ff08::1:3/64
```

Configuring a C-RP using loopback1 as the source for the C-RP router IP address and associating the ff08::1:3/64 multicast group with the C-RP router:

```
switch(config)# router pim6
switch(config-pim6)# rp-candidate source-ip-interface loopback1 group-prefix
ff08::1:3/64
```

Configuring sub-interface 1/1/19.10 as candidate RP:

```
switch(config)# router pim6
switch(config-pim6)# rp-candidate source-ip-interface 1/1/19.10
```

Removing the candidate source IP interface:

```
switch(config-pim6)# no rp-candidate source-ip-interface vlan20
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

rpf-override

```
rpf-override <SRC-ADDR/SRC-MASK> <RPF-ADDR|INTERFACE-NAME>
no rpf-override <SRC-ADDR/SRC-MASK> <RPF-ADDR|INTERFACE-NAME>
```

Description

The Reverse Path Forward (RPF) override, allows overriding the normal RPF lookup mechanism, and indicates to the router that it may accept multicast traffic on an interface other than the one that the RPF lookup mechanism would normally select. This includes accepting traffic from an invalid source IP address for the subnet or VLAN that is directly connected to the router. Traffic may also be accepted from a valid PIM neighbor that is not on the reverse path towards the source of the received multicast traffic.

The **no** form of this command removes currently configured RPF entry.

Parameter	Description
<SRC-ADDR>	Specifies the multicast source address in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.
<SRC-MASK>	Specifies the number of bits in the address mask in CIDR format (**x**), where **x** is a decimal number from 0 to 128.
<RPF-ADDR>	Specifies the RPF address in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.
<INTERFACE-NAME>	Specifies the RPF interface name.

Usage

Reverse Path Forward (RPF) checking is a core multicast routing mechanism. The RPF ensures that the multicast traffic received arrives on the expected router interface before further processing. If the RPF check fails for a multicast packet, the packet is discarded. For multicast traffic flow that arrives on the SPT, the expected incoming interface for a given source or group is the interface towards the source address of the traffic (determined by the unicast routing system). For traffic arriving on the RP tree, the expected incoming interface is the interface towards the RP.

RPF checking is applied to all multicast traffic and is significant in preventing network loops. Up to eight manual RPF overrides can be specified. The RPF-address indicates one of two distinct RPF candidates:

1. A valid PIM neighbor address from which forwarded multicast traffic is accepted with a source address of **<source-addr/src-mask>**.
2. A local router address on a PIM-enabled interface to which **<source-addr/src-mask>** is directly connected. If configured, the local router will assume the role of DR for this flow and registers the flow with an RP.

Example

Configuring and removing RPF override:

```
switch(config)# router pim6
switch(config-pim6)# rpf-override 50::4/24 40::1
switch(config-pim)# no rpf-override 50::4/24 40::1
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

show ipv6 mroute <*GROUP-ADDR*>

```
show ipv6 mroute <GROUP-ADDR> [<SOURCE-ADDR>] [all-vrfs | vrf <vrf-name>] [vsx-peer]
```

Description

Shows the multicast routing information for the given group address. Optionally, you can specify display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
<GROUP-ADDR>	Specifies a group address in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.
<SOURCE-ADDR>	Specifies a source IP address in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.
`all-vrfs`	Shows information for all VRFs.
`vrf` *<VRF-NAME>*	Specifies the name of a VRF. Default: default.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing information for group ff08::1:3 and VRF green:

```
switch# show ipv6 mroute  ff08::1:3 vrf green

VRF : green

Group Address           : ff08::1:3
Source Address          : 2001::03
Neighbor                : 2003::04
Incoming interface      : 1/1/1
Outgoing Interface List :
Interface      State
---------      -----
1/1/4          pruned
```

Showing information for group ff08::1:3 from source 2001::03 and all VRFs:

```
switch# show ipv6 mroute  ff08::1:3 2001::03 all-vrfs

VRF : blue
```

```
Group Address            : ff08::1:3
Source Address           : 2001::03
Neighbor                 : 2003::04
Incoming interface       : 1/1/1
Outgoing Interface List :
Interface      State
---------      -----
1/1/4          pruned

VRF : green

Group Address            : ff08::1:3
Source Address           : 2001::03
Neighbor                 : 2003::04
Incoming interface       : 1/1/2
Outgoing Interface List :
Interface      State
---------      -----
1/1/4          pruned
```

show ipv6 mroute

```
show ipv6 mroute [all-vrfs | vrf <VRF-NAME>] [vsx-peer]
```

Description

Shows multicast routing information. Optionally, you can show specific information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`all-vrfs`	Shows information for all VRFs.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Default: default.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not

Parameter	Description
	have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing IPv6 mroute information for the default VRF:

```
Switch# show ipv6 mroute
IP Multicast Route Entries

VRF : default
Total number of entries : 1

Group Address            : ff32::10
Source Address           : fd00:192:168:20::2
SSM Mroute               : True
Neighbor                 : fe80::f403:4301:1422:2600
Uptime                   : 00:14:05
State                    : route
Incoming interface       : 1/1/5
Outgoing Interface List :
Interface       State
-----------     ----------
vlan20          forwarding
```

Showing IPv6 mroute information for all VRFs:

```
switch# do show ipv6 mroute all-vrfs
IP Multicast Route Entries

VRF : default
Total number of entries : 1

Group Address            : ff32::10
Source Address           : fd00:192:168:2::100
SSM Mroute               : True
Neighbor                 : fe80::eceb:b801:14e4:2900
Uptime                   : 00:19:20
State                    : route
Incoming interface       : 1/1/4
Outgoing Interface List :
Interface       State
-----------     ----------
vlan20          forwarding

VRF : red
Total number of entries : 1

Group Address            : ff32::11
Source Address           : 30::3
SSM Mroute               : True
Neighbor                 : fe80::eceb:b880:1fe4:2900
Uptime                   : 00:01:13
State                    : route
Incoming interface       : vlan31
Outgoing Interface List :

show ipv6 mroute brief

`show ipv6 mroute brief [all-vrfs | vrf <VRF-NAME>] [vsx-peer]`

Description

Shows brief version of the multicast routing information. Optionally, you can specify the display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`all-vrfs`	Shows mroute information for all VRFs.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Default: default.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing the IPv6 mroute brief:

```
switch# show ipv6 mroute brief all-vrfs
IP Multicast Route Entries

VRF : blu
Total number of entries : 2

Group Address  : ff08::1:3
Source Address : 2002::04
Neighbor       : 2003::04
```

```
Interface       : 1/1/2

Group Address  : ff08::1:4
Source Address : 2002::03
Neighbor       : 2003::05
Interface       : 1/1/3

VRF : default
Total number of entries : 1

Group Address  : ff08::1:5
Source Address : 2001::03
Neighbor       : 2002::01
Interface       : 1/1/1
```

show ipv6 pim6 bsr

`show ipv6 pim6 bsr [all-vrfs | vrf <VRF-NAME>] [vsx-peer]`

Description

Shows the information about BSR candidates in the domain and multicast groups it supports. Optionally, you can specify the display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`all-vrfs`	Shows information for all VRFs.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Default: default.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing information about BSR candidates:

```
switch# show ipv6 pim6 bsr all-vrfs

show ipv6 pim6 bsr elected

```
show ipv6 pim6 bsr elected [all-vrfs | vrf <VRF-NAME>] [vsx-peer]
```

Description

Shows information about the elected BSR in the domain and multicast groups it supports. Optionally you can specify display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`all-vrfs`	Shows information for all VRFs.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Default: default.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing PIM elected bootstrap router information:

```
switch# show ipv6 pim6 bsr elected all-vrfs

Status and Counters - PIM-SM(IPv6) Elected Bootstrap Router Information

VRF                          : blu
E-BSR Address                : 2005::05
E-BSR Priority               : 0
E-BSR Hash Mask Length       : 0
E-BSR Up Time                : 0 secs
Next Bootstrap Message       : 0 secs

VRF                          : default
E-BSR Address                : 2002::02
E-BSR Priority               : 0
E-BSR Hash Mask Length       : 30
E-BSR Up Time                : 50 mins
Next Bootstrap Message       : 88 secs
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

show ipv6 pim6 bsr local

```
show ipv6 pim6 bsr local [all-vrfs | vrf <VRF-NAME>] [vsx-peer]
```

Description

Shows the information about BSR candidates on the local router and multicast groups it supports. Optionally, you can specify display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`all-vrfs`	Shows information for all VRFs.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Default: default.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing local Candidate BSR:

```
switch# show ipv6 pim6 bsr local all-vrfs

Status and Counters - PIM-SM(IPv6) Local Candidate-BSR Information

VRF                          : blu
C-BSR Admin Status           : This system is a Candidate-BSR
C-BSR Address                : 2007::01
C-BSR Priority               : 40
C-BSR Hash Mask Length       : 36
C-BSR Message Interval       : 50
C-BSR Source IP Interface : lag1
```

```
VRF                          : default
C-BSR Admin Status           : This system is a Candidate-BSR
C-BSR Address                : 2001::01
C-BSR Priority               : 40
C-BSR Hash Mask Length       : 36
C-BSR Message Interval       : 50
C-BSR Source IP Interface : 1/1/1
```

show ipv6 pim6 interface <*INTERFACE-NAME*>

```
show ipv6 pim6 interface <INTERFACE-NAME> [vsx-peer]
```

Description

Shows detailed information about the PIM interface currently configured.

Parameter	Description
<INTERFACE-NAME>	Specifies an interface for showing PIM interface information. Interface can also be a LAG or VLAN.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

On the 6400 Switch Series, interface identification differs.

Showing PIM interface information for interface 1/1/1:

```
switch# show ipv6 pim6 interface 1/1/1

PIM Interfaces
```

```
VRF: default

Interface   : 1/1/1
IPv6 Address : fe80::a00:9ff:feec:dc0e/64
Mode        : sparse

Designated Router :
Hello Interval (sec)   : 30
Hello Delay (sec)      : 4

Override Interval (msec)   : 500                 Lan Prune Delay      : Yes
Propagation Delay (msec)   : 350                 DR Priority          : 3
Neighbor Timeout           : 0
```

show ipv6 pim6 interface

```
show ipv6 pim6 interface [all-vrfs | vrf <VRF-NAME>] [vsx-peer]
```

Description

Shows the information about PIM interfaces currently configured in the router. Optionally, you can specify display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`all-vrfs`	Shows information for all VRFs.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Default: default.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing PIM interface:

```
switch# show ipv6 pim6 interface
PIM Interfaces

VRF: default

Interface           IP Address
mode
------------------- ---------------------------------------------------------------
----------
1/1/1               fe80::a00:9ff:feec:dc0e/64
sparse
```

show ipv6 pim6 neighbor

```
show ipv6 pim6 neighbor [<IPv6-ADDR>] [all-vrfs | vrf <VRF-NAME>] [vsx-peer]
```

Description

Shows PIM neighbor information. Optionally, you can specify display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
<IPv6-ADDR>	Specifies a neighbor address in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.
all-vrfs	Shows information for all VRFs.
vrf *<VRF-NAME>*	Specifies the name of a VRF. Default: default.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

On the 6400 Switch Series, interface identification differs.

Showing PIM neighbor information:

```
switch# show ipv6 pim6 neighbor

PIM Neighbor

VRF                   : default
IP Address            : 2001::02
Interface             : 1/1/1
Up Time (sec)         : 0
Expire Time (sec)     : 0
DR Priority           : 44
```

Showing PIM neighbor information (including the presence of anycast neighbors) for all VRFs:

```
switch# show ipv6 pim6 neighbor all-vrfs

PIM Neighbor

VRF                         : red
Total number of neighbors : 2

IPv6 Address                : fe80::5:5:5:5
Interface                   : vni10000
Up Time (HH:MM:SS)          : 06:57:07
Expire Time (HH:MM:SS)      : 00:03:26
DR Priority                 : 1
Hold Time (HH:MM:SS)        : 00:03:30

IPv6 Address                : fe80::3821:c780:a5c:18c0
Interface                   : vlan10
Up Time (HH:MM:SS)          : 00:01:46
Expire Time (HH:MM:SS)      : 00:01:29
DR Priority                 : 1

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show ipv6 pim6 pending

```
show ipv6 pim6 pending [<GROUP-ADDR>] [all-vrfs | vrf <VRF-NAME>] [vsx-peer]
```

Description

Shows the pending joins on a PIM router. Optionally you can specify display information by VRF. If no options are specified, it shows information for the default VRF.

Use this command to determine what flows are being requested on the PIM network. If data availability for a flow is expected, and a join for the flow is pending, the troubleshooting search moves to the source of that flow, since the routers are verified to be seeing the request for data.

Parameter	Description
<GROUP-ADDR>	Specifies a group address in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.
`all-vrfs`	Shows information for all VRFs.
`vrf` *<VRF-NAME>*	Specifies the name of a VRF. Default: default.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

On the 6400 Switch Series, interface identification differs.

Showing pending PIM joins:

```
switch# show ipv6 pim6 pending
Join Pending

VRF : default
   Group ff08::1:3
       (*,G) Pending
            Incoming Interface:  1/1/1
   Group ff08::1:4
       (*,G) Pending
            Incoming Interface:  1/1/1
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show ipv6 pim6 rp

```
show ipv6 pim6 rp [<group-ip>] [{vrf <vrf-name>}|all-vrfs]
```

Description

Displays the rendezvous point (RP) address for a particular group in the given VRF. The output of this command also includes the type of RP (static or dynamic) and the uptime for the mapping. This information can help verify that Group-to-RP mapping is consistent across all routers in the network. If the **group-ip** parameter is not included, the output of this command displays the group-to-RP mappings of those groups with active multicast traffic in the given VRF. If a VRF name is not specified, the output of this command displays information for the default VRF.

Parameter	Description
`<group-ip>`	Display group-to-RP mappings for the specified group.
`vrf` *<VRF-NAME>*	Specifies the name of a VRF. The default VRF is named **default**.
`all-vrfs`	Selects all VRFs.

Example

Showing RP mapping information for a single group:

```
switch# show ipv6 pim6 rp ff57::3

VRF: default

PIM-SM(IPv6) Group-to-Resultant_RP Mapping Information

Group Address       : ff57::3
RP Address          : Not Found
RP Type             : -
Up Time (HH:MM:SS)  : -
```

Showing RP mapping for all VRFs:

```
switch# show ipv6 pim6 rp all-vrfs

VRF: default

PIM-SM(IPv6) Group-to-Resultant_RP Mapping Information

Group Address       : ff56::7
RP Address          : 2002::2
RP Type             : bsr
Up Time (HH:MM:SS)  : 00:45:20
```

```
VRF: red

PIM-SM(IPv6) Group-to-Resultant_RP Mapping Information

Group Address       : ff55::5
RP Address          : 4001::1
RP Type             : static
Up Time (HH:MM:SS)  : 02:33:50

Group Address       : ff55::6
RP Address          : 3003::3
RP Type             : bsr
Up Time (HH:MM:SS)  : 01:30:05
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.10	Command introduced

show ipv6 pim6 rpf

show ipv6 pim6 rpf [<source-ip-address> [<group-ip-address>]] [vrf <vrf-name> | all-vrfs]

Description

Shows PIM RPF details for the specified source or RP address in the given VRF. It shows the nexthop and interface through which shortest path to the source is available. Additionally, it prints if PIM neighborship is present on the nexthop. If VRF is not given, it displays for default VRF.

Parameter	Description
<IP-ADDR>	Show PIM RPF details for the given IPv4/IPv6 (X:X::X:X) address
vrfs	Shows PIM RPF information for specific VRF.
vrf *<VRF-NAME>*	Specifies the name of a VRF. Default: default.
all-vrfs	Shows PIM RPF details in all VRFs.

Examples

Showing PIM RPF for VRF red:

```
switch# show ipv6 pim6 rpf vrf red

Multicast RPF Details
Origin Codes: C - connected, SM - static-multicast, SU - static-unicast
              O - OSPF, B - BGP, R - RIP
VRF: red
IP Address      : 2000::2
RPF Interface   : vlan20
RPF Nexthop     : -
PIM Neighbor    : no
RPF Route/Mask  : 2000::2/128
Origin          : C
In Use          : yes

IP Address      : 2222::2
RPF Interface   : vlan20
RPF Nexthop     : fe80::94f1:2880:141d:a800
PIM Neighbor    : yes
RPF Route/Mask  : 2222::2/128
Origin          : O
In Use          : yes
```

show ipv6 pim6 rp-candidate

```
show ipv6 pim6 rp-candidate [all-vrfs | vrf <VRF-NAME>] [vsx-peer]
```

Description

Shows the candidate RP operational and configuration information. Optionally, you can specify display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`all-vrfs`	Shows information for all VRFs.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Default: default.

Parameter	Description
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing PIM RP candidate:

```
switch# show ipv6 pim6 rp-candidate all-vrfs

 Status and Counters- PIM-SM(IPv6) Candidate-RP Information

VRF                          : blu
C-RP Admin Status            : This system is a Candidate-RP
C-RP Address                 : 2007::01

show ipv6 pim6 rpf-override

`show ipv6 pim6 rpf-override [all-vrfs | vrf <VRF-NAME>] [vsx-peer]`

Description

Shows the RPF override configuration, which can be useful information when troubleshooting potential RPF misconfigurations. Optionally, you can specify display information by VRF. If no options are specified, it shows information for the default VRF

Parameter	Description
`all-vrfs`	Shows information for all VRFs.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Default: default.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing PIM RPF override:

```
switch# show ipv6 pim6 rpf-override all-vrfs

VRF : Green
Static RPF Override
Multicast Source : 2003::1/128
RPF IPv6 Address : 2001::01
Multicast Source : 2005::1/128
RPF IPv6 Address : 2007::01
VRF : Red
Static RPF Override
Multicast Source : 2004::02/128
RPF IPv6 Address : 2002::02
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show ipv6 pim6 rp-registered-source

```
show ipv6 pim6 rp-registered-sources all-vrfs
```

Description

Displays the registered sources information on the RP router. This command shows information about the active multicast flows that are registered by the source designated router (DR) to this Rendezvous Point (RP). When the multicast source becomes inactive, the entry will be removed from this table. Note that this command displays only the set of flows that have been registered successfully for which the current router is the RP.

show ipv6 pim6 rp registered sources

```
show ipv6 pim6 rp-registered-sources <group-address> [source-address] [all-vrfs | vrf
<vrf-name>]
```

Description

Shows information about active multicast flows that are registered by source DR to a specific RP.

Parameter	Description	
`<group-address>`	Shows registered sources information for the group address. Format: **X:X::X:X** group-address	Shows registered sources information for the group address
`<source-address>`	(Optional) Shows registered sources information for the group from this source. Format **:X:X::X:X** source-address	Shows registered sources information for the group from selected source.
`vrf` *`<VRF-NAME>`*	Displays registered sources information for a specific VRF.	Shows registered sources information on all VRFs
`all-vrfs`	Displays registered sources information for all VRFs. all-vrfs	
vrf	Shows registered sources information for specific VRF	
vrf-name	Shows registered sources information for the given VRF	

Example

Showing information about rp-registered-sources in all-vrfs:

```
switch# show ipv6 pim6 rp-registered-sources all-vrfs

Multicast flows registered with this RP
VRF : default
Total number of entries : 1
Source Address           Group Address           RP Address
--------------------    --------------------    --------------------
2001::1                  ff55::5                 2002::2

Multicast flows registered with this RP
VRF : red
Total number of entries : 1
Source Address           Group Address           RP Address
---------------------    ---------------------    ---------------------
3001::1                  ff99::5                 3002::2
```

The following example the registered sources information for a specific group and source address.

```
switch# show ipv6 pim6 rp-registered-sources ff55::5 2001::1

Multicast flows registered with this RP
VRF : default
Total number of entries : 1
Source Address           Group Address           RP Address
---------------------    ---------------------    ---------------------
2001::1                  ff55::5                 3333::3
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

show ipv6 pim6 rpf-override source

```
show ipv6 pim6 rpf-override source <IPv6-ADDR> [all-vrfs | vrf <VRF-NAME>] [vsx-peer]
```

Description

Shows the RPF override configuration for the specified source. Optionally, you can specify display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`source <IPv6-ADDR>`	Specifies the RPF source address in IPv6 format (**xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx**), where **x** is a hexadecimal number from 0 to F.
`all-vrfs`	Shows information for all VRFs.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Default: default.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

Showing PIM RPF override source:

```
switch# show ipv6 pim6 rpf-override source 2004::02

VRF : default
Static RPF Override
Multicast Source : 2004::02/128
RPF IPv6 Address : 2002::02
```

Showing PIM RPF override source for all VRFs:

```
switch# show ipv6 pim6 rpf-override source 2004::02 all-vrfs

VRF : Red
Static RPF Override
Multicast Source : 2004::02/128
RPF IPv6 Address : 2002::02
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

show ipv6 pim6 rp-set

```
show ipv6 pim6 rp-set [all-vrfs | vrf <VRF-NAME>] [vsx-peer]
```

Description

Shows the multicast group support for both the learned C-RP assignments and any statically configured RP assignments. Optionally, you can specify display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`all-vrfs`	Shows information for all VRFs.
`vrf` *<VRF-NAME>*	Specifies the name of a VRF. Default: default.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing PIM RP set information:

```
switch# show ipv6 pim6 rp-set all-vrfs

VRF: blu

Status and Counters - PIM-SM(IPv6) Static RP-Set Information

Group Prefix  : ff00::/8
RP Address    : 2004::04
Override [No] : No

Status and Counters - PIM-SM(IPv6) Learned RP-Set Information

Group Prefix       : ff08::1:3/64

show ipv6 pim6 rp-set learned

```
show ipv6 pim6 rp-set learned [all-vrfs | vrf <VRF-NAME>] [vsx-peer]
```

Description

Shows the multicast group support for dynamically learned RP assignments. Optionally, you can specify display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
all-vrfs	Shows information for all VRFs.
vrf *<VRF-NAME>*	Specifies the name of a VRF. Default: default.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing PIM RP set learned information:

```
switch# show ipv6 pim6 rp-set learned all-vrfs

VRF: blu

Status and Counters - PIM-SM(IPv6) Learned RP-Set Information
Group Prefix        : ff08::1:3/64

show ipv6 pim6 rp-set static

```
show ipv6 pim6 rp-set static [all-vrfs | vrf <VRF-NAME>] [vsx-peer]
```

Description

Shows the multicast group support for statically configured RP assignments. Optionally, you can specify display information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`all-vrfs`	Shows information for all VRFs.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Default: default.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing PIM Static RP set information:

```
switch# show ipv6 pim6 rp-set static all-vrfs

VRF: blu

Status and Counters - PIM-SM(IPv6) Static RP-Set Information

Group Prefix  : ff00::/8

show ipv6 pim6 tree-state

```
show ipv6 pim6 tree-state {<group-ip> [<source-ip>]}|brief [{vrf <vrf-name>}| all-vrfs]
```

Description

Displays upstream join states for a specified group and source address in a VRF in an IPv6 network.

The command displays upstream state, upstream interface and RPF neighbor used to send join messages and a list of downstream interfaces from which join messages are received.

The set of downstream interfaces in this command may not show the final list of outgoing interfaces for a flow, which is computed from various internal states and is shown in the output of the command show ip mroute (PIM-SM.

Parameter	Description
`<group-ip>`	Shows PIM Join details for the specified group IPv6 address
`<source-ip>`	Shows PIM Join details for the specified source IPv6 address. If a source address is **not** specified, only *,G states are displayed for the specified group. If a source **address** is specified, (S,G) states are displayed along with (*,G) states and (S,G,RPT) states wherever applicable.
`brief`	Display brief details for the multicast group and source in a table format.
`vrf` *`<VRF-NAME>`*	Show join state details for the specified VRF.
`all-vrfs`	Show join state details for all VRFs.

Usage

The output of this command can indicate one of the following two multicast group (*,G) and multicast source and group (S,G) upstream states:

- **Joined** : Join sent to upstream RPF neighbor.
- **Not Joined** : Joins not sent upstream.

The following states are applicable to the multicast group (*G), and root path tree (S,G,RPT) only:

- **Pruned** : Traffic from the source is arriving on the shortest path tree, (*,G) Joined, but (S,G,RPT) pruned.
- **Not Pruned** : Traffic from the multicast group (*,G) Joined, and (S,G,rpt) not pruned.
- **RPT Not Joined**' : The multicast group (*,G) has not joined.

Examples

Display multicast group (*,G) join information for the VRF **red**.

```
show ipv6 pim6 tree-state ff55::1 vrf red
(*,G) Information for Group ff55::1
VRF: red
Upstream Information:
State                          : Joined
Joined Interface               : vlan50
RPF Neighbor                   : 20::2
Uptime                         : 01:58:30
Downstream Information:
Interfaces                     : vlan50, vlan201
```

Display group (*,G), source and group (S,G), and root-path tree (S,G, RPT) Information for group **ff55::1** and source IP **30::1**.

```
show ipv6 pim6 tree-state ff55::1 30::1 vrf red
(*,G) Information for Group ff55::1
VRF: red
```

```
Upstream Information:
State                         : Joined
Joined Interface              : vlan50
RPF Neighbor                  : 20::2
Uptime                        : 01:58:30
Downstream Information:
Interfaces                    : vlan200
(S,G) Information for Group ff55::1 Source 30::1
Upstream Information:
State                         : Joined
Joined Interface              : vlan30
RPF Neighbor                  : 40::2
Uptime                        : 01:57:30
SPT bit set                   : True
Downstream Information:
Interfaces                    : vlan200
(S,G,RPT) Information for Group ff55::1 Source 30::1
Upstream Information:
State                         : Pruned
Joined Interface              : vlan50
RPF Neighbor                  : 20::2
Uptime                        : 01:58:30
Downstream Information:
Interfaces                    : vlan200
```

Display brief information for the IPv6 PIM6 tree state.

```
show ipv6 pim6 tree-state brief

sources-per-group

```
sources-per-group <limit>
no sources-per-group <limit>
```

Description

Configures the total number of sources allowed for a group on the router. By default, there is no limit on the number of sources for a group. When the number of sources for a group exceeds the configured limit, multicast traffic from additional sources will be dropped.

The **no** form of this command removes the currently configured limit value.

Parameter	Description
<limit>	Specifies the value to be configured as the sources allowed per group. Range: 1 to 4294967295.

Usage

Flows exceeding the limit will be programmed as a bridge entry and will not have the outgoing interfaces list populated. This configuration does not allow new sources for the group. At the time of configuration, if the device has more sources for the given group than the configured value, already allowed sources continue to exist until they are removed.

The flows are programmed in the HW on a FCFS basis. There could be scenarios where the flow is forwarded in neighbor router, but it may not be forwarded on the current router because of exceeding the limits configured on the current router. In such cases, it is recommended to configure higher limits to avoid traffic outage.

Examples

Configuring and removing the sources allowed per group:

```
switch(config)# router pim6
switch(config-pim6)# sources-per-group 4
switch(config-pim6)# no sources-per-group
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.12	Command introduced for IPv6

Command Information

6300 6400	`config-pim6`	Administrators or local user group members with execution rights for this command.

spt-threshold

```
spt-threshold
no spt-threshold
```

Description

Enables the router to switch the multicast traffic flows to the shortest path tree. Default is enabled.

The **no** form of this command disables the routers ability to switch the multicast traffic flows to the shortest path tree.

To apply this configuration a user needs to apply disable/enable PIM globally.

Example

Enabling and disabling the SPT threshold:

```
switch(config)# router pim6
switch(config-pim6)# spt-threshold
switch(config-pim6)# no spt-threshold
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Chapter 107

PIM-SSM commands

ip igmp apply ssm-map access-list

```
ip igmp apply ssm-map access-list<ACL-NAME>
no ip igmp apply ssm-map access-list<ACL-NAME>
```

Description

Configures SSM-map ACL on a specific interface.

The **no** form of this command removes the currently configured ACL rule.

> Existing classifier commands are used to configure ACL.

Parameter	Description
<ACL-NAME>	Required. Specifies the ACL rule name.

Restrictions

- ACE using mask for source address will be ignored.
- ACE must include unicast source (address/source group) and multicast destination (address/destination group) as matching criteria. Entries using "any" for source address or destination address will be ignored.
- IGMPv3/MLDv2 dynamic joins will be ignored for groups in SSM-map (SSM-map is higher priority).

Usage

- When configured, every incoming IGMPv2/v1 join packet sent to the SSM range group address is converted to (S, G) channels where S is the source address specified in the SSM-map ACL.
- Object-groups can be used to group multiple sources or multiple destination addresses.

Recommendations related to SSM-map:

- Interfaces with SSM-map configured should use version 3 for IGMP and version 2 for MLD. If older versions are used, sources will not be learned.
- If SSM-map configuration is dynamically changed by adding or deleting sources associated with a group, the change will take effect when the next incoming join packet is received.
- SSM-map configuration must be consistent across all L3 nodes in the network.
- Multiple ACEs with same destination (address/destination object group) are not recommended as only the first match will be implemented. If a group must be mapped with multiple sources, source object group can be used instead of having multiple ACEs with the same destination match.

Examples

Creating SSM map ACL:

```
switch(config)# access-list ip SSM_MAP
switch(config-acl-ip)# permit ip 30.1.1.1 232.1.1.1
switch(config-acl-ip)# permit ip 20.1.1.1 232.1.1.2
```

Applying SSM_MAP ACL on a SVI:

```
switch(config)# interface vlan 2
switch(config-if-vlan)# ip igmp apply ssm-map access-list SSM_MAP
```

Creating SSM map ACL using object groups:

```
switch(config)# object-group ip address source-group
switch(config-addrgroup-ip)# 10.1.1.1
switch(config-addrgroup-ip)# 10.1.1.2
switch(config)# object-group ip address destination-group
switch(config-addrgroup-ip)# 232.2.1.1
switch(config-addrgroup-ip)# 232.3.1.1
switch(config)# access-list ip SSM_MAP_OB
switch(config-acl-ip)# permit ip source-group 232.1.1.3
switch(config-acl-ip)# permit ip 20.1.1.1 destination-group
```

In the above configuration:

- When lower version joins are received for group 232.1.1.3, they will be converted to (S,G) channels (10.1.1.1, 232.1.1.3) and (10.1.1.2, 232.1.1.3).
- When lower version joins are received from group 232.2.1.1 and 232.3.1.1, they will be converted to (S, G) channels (20.1.1.1, 232.2.1.1) and (20.1.1.1, 232.3.1.1)

Applying SSM_MAP_OB ACL on a SVI:

```
switch(config)# interface vlan 10
switch(config-if-vlan)# ip igmp apply ssm-map access-list SSM_MAP_OB
```

show ip igmp ssm-map

```
show ip igmp [ssm-map [vrf <VRF-NAME> | all-vrfs]]
```

Description

Shows IGMP SSM map.

Parameter	Description
<VRF-NAME>	(Optional) Shows SSM map in a specific VRF.
all-vrfs	(Optional) Shows SSM map in all VRFs.

Examples

Showing IGMP SSM map:

```
switch# show ip igmp ssm-map
IGMP SSM-map Information
VRF Name   :default
Interface Name   SSM-map ACL name
--------------- -----------------
vlan10            ssm-map-1
vlan20            ssm-map-2
1/1/1             ssm-map-1
2/1/1.1           ssm-map-3
```

Showing IGMP SSM map for all VRFs:

```
switch# show ip igmp ssm-map all-vrfs
IGMP SSM-map Information
VRF Name   :test
Interface Name   SSM-map ACL name
--------------- -----------------
vlan30            ssm-map-1
VRF Name   :default
Interface Name   SSM-map ACL name
--------------- ------------------
vlan10            ssm-map-1
vlan20            ssm-map-2
1/1/1             ssm-map-1
2/1/1.1           ssm-map-3
```

Chapter 108

PIM-SSM commands for IPv4

pim-ssm

```
pim-ssm
no pim-ssm
```

Description

Enables PIM source-specific multicast globally on the router. When PIM SSM is enabled, the RP configuration is ignored/ not required for a particular range of multicast addresses.

The **no** form of this command disables PIM-SSM globally on the router.

When PIM-SSM is enabled for the SSM range for multicast groups, the following behavior is observed:

- PIM joins and prunes are directly sent towards the source. No (*,G) joins or prunes are sent towards RP.
- Only IGMPv3/MLDv2 joins with source include filter are considered for SSM.

Usage

- PIM-SSM is recommended to be configured only on the last hop router or receiver DR if the topology contains a combination of IGMPv2 and IGMPv3, or MLDv1 and MLDv2, clients.
- Configuring or unconfiguring PIM SSM can lead to momentary traffic loss until PIM rebuilds the states.
- PIM-SSM is not supported with VxLAN.

Example

Enabling PIM-SSM on the router:

```
switch(config)# router pim
switch(config-pim)# pim-ssm
```

Disabling PIM-SSM on the router:

```
switch(config)# router pim
switch(config-pim)# no pim-ssm
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification
10.09	Command introduced

Command Information

Platforms	Command context	Authority
6300 6400	`config-pim`	Administrators or local user group members with execution rights for this command.

pim-ssm range-access-list

```
pim-ssm range-access-list <ACL-RULE>
no pim-ssm range-access-list <ACL-RULE>
```

Description

Enables the PIM router to modify the default SSM range. The IPv4 default PIM-SSM group range is 232.0.0.0/8.

The **no** form of this command removes the currently configured ACL rule.

Parameter	Description
<ACL-RULE>	(Required) Specifies the ACL rule name.

Usage

- In the ACL used to specify the PIM-SSM range, ACEs should contain only multicast group addresses in the destination IP field, else the ACE is ignored.
- Modifying the PIM-SSM range can lead to momentary traffic loss until PIM rebuilds the states.
- It is recommended to keep the SSM range the same across the network.

Examples

Creating an IPv4 ACL named **pim_ssm_grp_range_acl** and applying the ACL as a PIM-SSM range ACL:

```
switch# configure terminal
switch(config)# access-list ip pim_ssm_grp_range_acl
switch(config-acl-ip)# 10 permit any any 225.1.1.2/255.255.255.0
switch(config-acl-ip)# 20 permit any any 239.1.1.2/255.255.255.0

switch(config)# router pim
switch(config-pim)# pim-ssm range-access-list pim_ssm_grp_range_acl
switch(config-pim)# pim-ssm range-access-list pim_ssm_grp_range_acl_1
Failed to configure PIM-SSM Range ACL. ACL pim_ssm_grp_range_acl_1 does not exist.
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

show ip mroute

`show ip mroute [all-vrfs | vrf <VRF-NAME>] [vsx-peer]`

Description

Shows multicast routing information. Optionally, you can show specific information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`all-vrfs`	Shows mroute information for all VRFs.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Default: default.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing IP mroute for the default VRF:

```
Switch(config-vlan-20)# show ip mroute
IP Multicast Route Entries

VRF : default
Total number of entries : 1

Group Address            : 232.10.10.10
Source Address           : 192.168.20.2
SSM Mroute               : True
Neighbor                 : 192.168.3.0
Uptime                   : 02:08:31
State                    : route
Incoming interface       : 1/1/5
Outgoing Interface List :
Interface       State
-----------     ----------
vlan20          forwarding
```

Showing IP mroute for all VRFs:

```
switch# do show ip mroute all-vrfs
IP Multicast Route Entries

VRF : default
Total number of entries : 1

Group Address            : 232.10.10.10
Source Address           : 192.168.2.100
SSM Mroute               : True
Neighbor                 : 192.168.3.0
Uptime                   : 00:38:24
State                    : route
Incoming interface       : 1/1/4
Outgoing Interface List :
Interface       State
-----------     ----------
vlan20          forwarding

VRF : red
Total number of entries : 1

Group Address            : 232.11.11.11
Source Address           : 30.0.0.3
SSM Mroute               : True
Neighbor                 : 31.0.0.1
Uptime                   : 00:32:55
State                    : route
Incoming interface       : vlan31

show ip pim interface interface-name counters

`show ip pim interface <INTERFACE-NAME> counters [vsx-peer]`

Description

Shows the PIM packet counters information for the specified interface.

Parameter	Description
<INTERFACE-NAME>	Specifies the interface to show packet counter information.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not

Parameter	Description
	have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Usage

Loopback interfaces are special interfaces where only unicast PIM messages are updated. This includes Register, Register Stop, and Candidate RP Advertisements.

When a loopback interface is configured as the RP, the ACL drop counters will be updated on the interface on which the packets are received.

Example

Showing PIM packet counters for interface 1/1/5:

```
Switch(config)# show ip pim interface 1/1/5 counters

Interface  : 1/1/5
VRF        : default

Tx Counters :

Hello                                    310
State Refresh                            0
Join/Prune                               141
SSM Join/Prune                           141
RP Advertisement                         0

Chapter 109

PIM-SSM commands for IPv6

ipv6 mld apply ssm-map access-list

```
ipv6 mld apply ssm-map access-list <ACL-NAME>
no ipv6 mld apply ssm-map access-list <ACL-NAME>
```

Description

Configures SSM-map ACL on a specific interface.

The **no** form of this command removes the currently configured ACL.

> Existing calssifier commands are used to configure ACL.

Parameter	Description
<ACL-NAME>	Required. Specifies the ACL name.

Restrictions

- ACE using mask for source address will be ignored.
- ACE must include unicast source (address/source group) and multicast destination (address/destination group) as matching criteria. Entries using "any" for source address or destination address will be ignored.
- IGMPv3/MLDv2 dynamic joins will be ignored for groups in SSM-map (SSM-map is higher priority).

Usage

- When configured, every incoming MLDv1 join packet sent to the same SSMv6 range group address is converted to (S, G) channels where S is the source address specified in the SSM-map ACL.
- Object-groups can be used to group multiple sources or multiple destination addresses.

Recommendations related to SSM-map:

- Interfaces with SSM-map configured should use version 3 for IGMP and version 2 for MLD. If older versions are used, sources will not be learned.
- If SSM-map configuration is dynamically changed by adding or deleting sources associated with a group, the change will take effect when the next incoming join packet is received.
- SSM-map configuration must be consistent across all L3 nodes in the network.
- Multiple ACEs with same destination (address/destination object group) are not recommended as only the first match will be implemented. If a group must be mapped with multiple sources, source object group can be used instead of having multiple ACEs with the same destination match.

Examples

Creating SSM map v6 ACL:

```
switch(config)# access-list ipv6 SSM_MAP_V6
switch(config-acl-ip)# permit ipv6 2003::1 ff34::1
switch(config-acl-ip)# permit ipv6 2002::1 ff36::1
switch(config-acl-ip)# exit
```

Applying SSM_MAP_V6 ACL on SVI 2:

```
switch(config)# interface vlan 2
switch(config-if-vlan)# ipv6 mld apply ssm-map access-list SSM_MAP_V6
```

Creating SSM map V6 ACL with object groups:

```
switch(config)# object-group ipv6 address source-group-ipv6
switch(config-addrgroup-ipv6)# 2001::1
switch(config-addrgroup-ipv6)# 2001::2
switch(config)# object-group ipv6 address destination-group-ipv6
switch(config-addrgroup-ipv6)# ff31::1
switch((config-addrgroup-ipv6)# ff32::1
switch(config)# access-list ipv6 SSM_MAP_V6_OB
switch(config-acl-ip)# permit ipv6 source-group-ipv6 ff36::1
switch(config-acl-ip)# permit ipv6 2004::1 destination-group-ipv6
```

Applying SSM_MAP_V6_OB ACL on SVI 10:

```
switch(config)# interface vlan 10
switch(config-if-vlan)# ipv6 mld apply ssm-map access-list SSM_MAP_V6_OB
```

In the above configuration:

- When lower version joins are received for group ff36::1, they will be converted to (S, G) channels (2001::1, ff36::1) and (2001::2, ff36::1).
- When lower version joins are received for group ff31::1 and ff32::1, they will be converted to (S, G) channels (2003::1, ff31::1) and (2003::1, ff32::1).

Command History

Command Information

Platforms	Command context	Authority
6300 6400	`config-if-vlan`	Administrators or local user group members with execution rights for this command.

pim-ssm

```
pim-ssm
no pim-ssm
```

Description

Enables PIM-SSM globally on the router. When PIM-SSM is enabled, the RP configuration is ignored/ not required for a particular range of multicast addresses.

The **no** form of this command disables PIM-SSM globally on the router.

When PIM-SSM is enabled for the SSM range for multicast groups, the following behavior is observed:

- PIM joins and prunes are directly sent towards the source. No (*,G) joins or prunes are sent towards RP.
- Only IGMPv3/MLDv2 joins with source include filter are considered for SSM.

Usage

- PIM-SSM is recommended to be configured only on the last hop router or receiver DR if the topology contains a combination of IGMPv2 and IGMPv3, or MLDv1 and MLDv2, clients.
- Configuring or unconfiguring PIM SSM can lead to momentary traffic loss until PIM rebuilds the states.
- PIM-SSM is not supported with VxLAN.

Example

Entering the PIMv6 configuration context and enabling PIM-SSM on the router:

```
switch(config)# router pim6
switch(config-pim6)# pim-ssm
```

Disabling PIM-SSM on the router:

```
switch(config)# router pim6
switch(config-pim6)# no pim-ssm
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

Command History

Release	Modification

pim-ssm range-access-list

```
pim-ssm range-access-list <ACL-RULE>
no pim-ssm range-access-list <ACL-RULE>
```

Description

Enables the PIM router to modify the default SSM range. The IPv6 default PIM-SSM group range is FF3x::/32.

The **no** form of this command removes the currently configured ACL rule.

Parameter	Description
<ACL-RULE>	Required. Specifies the ACL rule name.

Usage

- In the ACL used to specify the PIM-SSM range, ACEs should contain only multicast group addresses in the destination IP field, else the ACE will be ignored.
- Modifying the PIM-SSM range can lead to momentary traffic loss until PIM rebuilds the states.
- It is recommended to keep the SSM range the same across the network.

Examples

Creating an IPv6 ACL named **pim_ssm_v6grp_range_acl** with two entries and applying the ACL as a PIM-SSM range ACL:

```
switch# configure terminal
switch(config-pim)# access-list ipv6 pim_ssm_v6grp_range_acl
switch(config-acl-ipv6)# 10 permit any any ff2e::2/64
switch(config-acl-ipv6)# 20 permit any any ff1e::1/64

switch(config)# router pim6
switch(config-pim6)# pim-ssm range-access-list pim_ssm_v6grp_range_acl
```

For more information on features that use this command, refer to the Multicast Guide for your switch model.

show ip multicast summary

```
show ip multicast summary
```

Description

Displays multicast summary information.

Example

Showing multicast summary information:

```
Switch# show ip multicast summary

Total number of IGMP interfaces                               : 1

show ipv6 pim interface counters

```
show ipv6 pim interface <INTERFACE-NAME> counters [vsx-peer]
```

Description

Shows the PIM packet counters information for the specified interface.

Parameter	Description
<INTERFACE-NAME>	Specifies the interface to show packet counter information.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Usage

Loopback interfaces are special interfaces where only unicast PIM messages are updated. This includes Register, Register Stop, and Candidate RP Advertisements.

When a loopback interface is configured as the RP, the ACL drop counters will be updated on the interface on which the packets are received.

Example

Showing IPv6 PIM packet counters:

```
Switch#
Switch# show ipv6 pim interface 1/1/5 counters

Interface  : 1/1/5
VRF        : default

Tx Counters :

Hello                                     275
State Refresh                             0
Join/Prune                                32
SSM Join/Prune                            32
RP Advertisement                          0
Graft                                     0
Graft Ack                                 0

show ipv6 mld ssm-map

`show ipv6 mld [ssm-map [vrf <VRF-NAME> | all-vrfs]]`

Description

Shows MLD SSM map.

Parameter	Description
<VRF-NAME>	Optional. Shows MLD SSM map in a specific VRF.
all-vrfs	Optional. Shows MLD SSM map in all VRFs.

Examples

Showing MLD SSM-map:

```
switch# show ipv6 mld ssm-map
MLD SSM-map Information
VRF Name   :default
Interface Name   SSM map ACL name
--------------- ------------------
```

```
vlan10           ipv6-ssm-map-1
vlan20           ipv6-ssm-map-2
1/1/1            ipv6-ssm-map-3
2/1/1.1          ipv6-ssm-map-1
```

Showing MLD SSM-map for all VRFs:

```
switch# show ipv6 mld ssm-map all-vrfs
MLD SSM-map Information
VRF Name   :test
Interface Name   SSM map ACL name
--------------- ------------------
vlan30           ipv6-ssm-map-1
VRF Name   :default
Interface Name   SSM map ACL name
--------------- ------------------
vlan10           ipv6-ssm-map-1
vlan20           ipv6-ssm-map-2
1/1/1            ipv6-ssm-map-3
2/1/1.1          ipv6-ssm-map-1
```

Release	Modification
10.11	Command introduced

6300 6400	Operator (>) or Manager (#)	Administrators or local user group members with execution rights for this command.

show ipv6 mroute

`show ipv6 mroute [all-vrfs | vrf <VRF-NAME>] [vsx-peer]`

Description

Shows multicast routing information. Optionally, you can show specific information by VRF. If no options are specified, it shows information for the default VRF.

Parameter	Description
`all-vrfs`	Shows information for all VRFs.
`vrf <VRF-NAME>`	Specifies the name of a VRF. Default: default.
`vsx-peer`	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Example

Showing IPv6 mroute information for the default VRF:

```
Switch# show ipv6 mroute
IP Multicast Route Entries

VRF : default
Total number of entries : 1

Group Address            : ff32::10
Source Address           : fd00:192:168:20::2
SSM Mroute               : True
Neighbor                 : fe80::f403:4301:1422:2600
Uptime                   : 00:14:05
State                    : route
Incoming interface       : 1/1/5
Outgoing Interface List :
Interface       State
-----------     ----------
vlan20          forwarding
```

Showing IPv6 mroute information for all VRFs:

```
switch# do show ipv6 mroute all-vrfs
IP Multicast Route Entries

VRF : default
Total number of entries : 1

Group Address            : ff32::10
Source Address           : fd00:192:168:2::100
SSM Mroute               : True
Neighbor                 : fe80::eceb:b801:14e4:2900
Uptime                   : 00:19:20
State                    : route
Incoming interface       : 1/1/4
Outgoing Interface List :
Interface       State
-----------     ----------
vlan20          forwarding

VRF : red
Total number of entries : 1

Group Address            : ff32::11
Source Address           : 30::3
SSM Mroute               : True
Neighbor                 : fe80::eceb:b880:1fe4:2900
Uptime                   : 00:01:13
State                    : route
Incoming interface       : vlan31
Outgoing Interface List :
Interface       State
-----------     ----------
vlan32          forwarding
```

Chapter 110 Ping commands

ping

```
ping <IPv4-ADDR> | <hostname> [data-fill <pattern> | datagram-size <size> |
   interval <time> | repetitions <number> | timeout <time> | tos <number> |
   ip-option {include-timestamp | include-timestamp-and-address | record-route} |
   vrf <vrfname> | do-not-fragment][source {IPv4-ADDR | IFNAME}]
```

> Ping on VXLAN with `ip-option` such as `include-timestamp-and-address`, `include-timestamp` and `record-route` is not supported.

Description

Pings the specified IPv4 address or hostname with or without optional parameters.

Parameter	Description
`ping <IPv4-ADDR>`	Selects the IPv4 address to ping.
`<HOSTNAME>`	Selects the hostname to ping. Range: 1-256 characters
`data-fill <PATTERN>`	Specifies the data pattern in hexadecimal digits to send. A maximum of 16 "pad" bytes can be specified to fill out the ICMP packet. Default: AB
`datagram-size <SIZE>`	Specifies the ping datagram size. Range: 0-65399, default: 100.
`interval <TIME>`	Specifies the interval between successive ping requests in seconds. Range: 1-60 seconds, default: 1 second.
`repetitions <NUMBER>`	Specifies the number of packets to send. Range: 1-10000 packets, default: Five packets.
`timeout <TIME>`	Specifies the ping timeout in seconds. Range: 1-60 seconds, default: 2 seconds.
`tos <NUMBER>`	Specifies the IP Type of Service to be used in Ping request. Range: 0-255
`ip-option {include-timestamp	include-timestamp-and-address	record-route}`	Specifies an IP option (**record-route** or **timestamp** option).
`include-timestamp`	Specifies the intermediate router time stamp.
`include-timestamp-and-address`	Specifies the intermediate router time stamp and IP address.
`record-route`	Specifies the intermediate router addresses.

Parameter	Description
`vrf` *`<VRF-NAME>`*	Specifies the virtual routing and forwarding (VRF) to use. When VRF option is not given, the default VRF is used.
`source {`*`IPv4-ADDR`*` | `*`IFNAME`*`}`	Specifies the source IPv4 address or interface to use.
`do-not-fragment`	Specifies the do-not-fragment (DF) bit in IP header of the Ping packet. This option does not allow the packet to be fragmented when it has to go through a segment with a smaller maximum transmission unit (MTU).

Examples

Pinging an IPv4 address:

```
switch# ping 10.0.0.0
PING 10.0.0.0 (10.0.0.0) 100(128) bytes of data.
108 bytes from 10.0.0.0: icmp_seq=1 ttl=64 time=0.035 ms
108 bytes from 10.0.0.0: icmp_seq=2 ttl=64 time=0.034 ms
108 bytes from 10.0.0.0: icmp_seq=3 ttl=64 time=0.034 ms
108 bytes from 10.0.0.0: icmp_seq=4 ttl=64 time=0.034 ms
108 bytes from 10.0.0.0: icmp_seq=5 ttl=64 time=0.033 ms

--- 10.0.0.0 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 3999ms
rtt min/avg/max/mdev = 0.033/0.034/0.035/0.000 ms
```

Pinging the localhost:

```
switch# ping localhost
PING localhost (127.0.0.1) 100(128) bytes of data.
108 bytes from localhost (127.0.0.1): icmp_seq=1 ttl=64 time=0.060 ms
108 bytes from localhost (127.0.0.1): icmp_seq=2 ttl=64 time=0.035 ms
108 bytes from localhost (127.0.0.1): icmp_seq=3 ttl=64 time=0.043 ms
108 bytes from localhost (127.0.0.1): icmp_seq=4 ttl=64 time=0.041 ms
108 bytes from localhost (127.0.0.1): icmp_seq=5 ttl=64 time=0.034 ms

--- localhost ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 3998ms
rtt min/avg/max/mdev = 0.034/0.042/0.060/0.011 ms
```

Pinging a server with a data pattern:

```
switch# ping 10.0.0.2 data-fill 1234123412341234acde123456789012
PATTERN: 0x1234123412341234acde123456789012
PING 10.0.0.2 (10.0.0.2) 100(128) bytes of data.
108 bytes from 10.0.0.2: icmp_seq=1 ttl=64 time=0.207 ms
108 bytes from 10.0.0.2: icmp_seq=2 ttl=64 time=0.187 ms
108 bytes from 10.0.0.2: icmp_seq=3 ttl=64 time=0.225 ms
108 bytes from 10.0.0.2: icmp_seq=4 ttl=64 time=0.197 ms
108 bytes from 10.0.0.2: icmp_seq=5 ttl=64 time=0.210 ms

--- 10.0.0.2 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 3999ms
rtt min/avg/max/mdev = 0.187/0.205/0.225/0.015 ms
```

Pinging a server with a datagram size:

```
switch# ping 10.0.0.0 datagram-size 200
PING 10.0.0.0 (10.0.0.0) 200(228) bytes of data.
208 bytes from 10.0.0.0: icmp_seq=1 ttl=64 time=0.202 ms
208 bytes from 10.0.0.0: icmp_seq=2 ttl=64 time=0.194 ms
208 bytes from 10.0.0.0: icmp_seq=3 ttl=64 time=0.201 ms
208 bytes from 10.0.0.0: icmp_seq=4 ttl=64 time=0.200 ms
208 bytes from 10.0.0.0: icmp_seq=5 ttl=64 time=0.186 ms

--- 10.0.0.0 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 4000ms
rtt min/avg/max/mdev = 0.186/0.196/0.202/0.016 ms
```

Pinging a server with an interval specified:

```
switch# ping 9.0.0.2 interval 2
PING 9.0.0.2 (9.0.0.2) 100(128) bytes of data.
108 bytes from 9.0.0.2: icmp_seq=1 ttl=64 time=0.199 ms
108 bytes from 9.0.0.2: icmp_seq=2 ttl=64 time=0.192 ms
108 bytes from 9.0.0.2: icmp_seq=3 ttl=64 time=0.208 ms
108 bytes from 9.0.0.2: icmp_seq=4 ttl=64 time=0.182 ms
108 bytes from 9.0.0.2: icmp_seq=5 ttl=64 time=0.194 ms

--- 9.0.0.2 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 7999ms
rtt min/avg/max/mdev = 0.182/0.195/0.208/0.008 ms
```

Pinging a server with a specified number of packets to send:

```
switch# ping 9.0.0.2 repetitions 10
PING 9.0.0.2 (9.0.0.2) 100(128) bytes of data.
108 bytes from 9.0.0.2: icmp_seq=1 ttl=64 time=0.213 ms
108 bytes from 9.0.0.2: icmp_seq=2 ttl=64 time=0.204 ms
108 bytes from 9.0.0.2: icmp_seq=3 ttl=64 time=0.201 ms
108 bytes from 9.0.0.2: icmp_seq=4 ttl=64 time=0.184 ms
108 bytes from 9.0.0.2: icmp_seq=5 ttl=64 time=0.202 ms
108 bytes from 9.0.0.2: icmp_seq=6 ttl=64 time=0.184 ms
108 bytes from 9.0.0.2: icmp_seq=7 ttl=64 time=0.193 ms
108 bytes from 9.0.0.2: icmp_seq=8 ttl=64 time=0.196 ms
108 bytes from 9.0.0.2: icmp_seq=9 ttl=64 time=0.193 ms
108 bytes from 9.0.0.2: icmp_seq=10 ttl=64 time=0.200 ms

--- 9.0.0.2 ping statistics ---
10 packets transmitted, 10 received, 0% packet loss, time 8999ms
rtt min/avg/max/mdev = 0.184/0.197/0.213/0.008 ms
```

Pinging a server with a specified timeout:

```
switch# ping 9.0.0.2 timeout 3
PING 9.0.0.2 (9.0.0.2) 100(128) bytes of data.
108 bytes from 9.0.0.2: icmp_seq=1 ttl=64 time=0.175 ms
108 bytes from 9.0.0.2: icmp_seq=2 ttl=64 time=0.192 ms
108 bytes from 9.0.0.2: icmp_seq=3 ttl=64 time=0.190 ms
108 bytes from 9.0.0.2: icmp_seq=4 ttl=64 time=0.181 ms
108 bytes from 9.0.0.2: icmp_seq=5 ttl=64 time=0.197 ms

--- 9.0.0.2 ping statistics ---
```

```
5 packets transmitted, 5 received, 0% packet loss, time 4000ms
rtt min/avg/max/mdev = 0.175/0.187/0.197/0.007 ms
```

Pinging a server with the specified IP Type of Service:

```
switch# ping 9.0.0.2 tos 2
PING 9.0.0.2 (9.0.0.2) 100(128) bytes of data.
108 bytes from 9.0.0.2: icmp_seq=1 ttl=64 time=0.033 ms
108 bytes from 9.0.0.2: icmp_seq=2 ttl=64 time=0.034 ms
108 bytes from 9.0.0.2: icmp_seq=3 ttl=64 time=0.031 ms
108 bytes from 9.0.0.2: icmp_seq=4 ttl=64 time=0.034 ms
108 bytes from 9.0.0.2: icmp_seq=5 ttl=64 time=0.031 ms

--- 9.0.0.2 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 3999ms
rtt min/avg/max/mdev = 0.031/0.032/0.034/0.006 ms
```

Pinging a local host with the specified VRF.

```
switch# ping localhost vrf red
PING localhost (127.0.0.1) 100(128) bytes of data.
108 bytes from localhost (127.0.0.1): icmp_seq=1 ttl=64 time=0.048 ms
108 bytes from localhost (127.0.0.1): icmp_seq=2 ttl=64 time=0.052 ms
108 bytes from localhost (127.0.0.1): icmp_seq=3 ttl=64 time=0.044 ms
108 bytes from localhost (127.0.0.1): icmp_seq=4 ttl=64 time=0.036 ms
108 bytes from localhost (127.0.0.1): icmp_seq=5 ttl=64 time=0.055 ms

--- localhost ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 4005ms
rtt min/avg/max/mdev = 0.036/0.047/0.055/0.006 ms
```

Pinging the localhost with the default VRF:

```
switch# ping localhost vrf mgmt
PING localhost (127.0.0.1) 100(128) bytes of data.
108 bytes from localhost (127.0.0.1): icmp_seq=1 ttl=64 time=0.085 ms
108 bytes from localhost (127.0.0.1): icmp_seq=2 ttl=64 time=0.057 ms
108 bytes from localhost (127.0.0.1): icmp_seq=3 ttl=64 time=0.047 ms
108 bytes from localhost (127.0.0.1): icmp_seq=4 ttl=64 time=0.038 ms
108 bytes from localhost (127.0.0.1): icmp_seq=5 ttl=64 time=0.059 ms

--- localhost ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 3999ms
rtt min/avg/max/mdev = 0.038/0.057/0.085/0.016 ms
```

Pinging a server with the intermediate router time stamp:

```
switch# ping 9.0.0.2 ip-option include-timestamp
PING 9.0.0.2 (9.0.0.2) 100(168) bytes of data.

ping6

```
ping6 {<IPv6-ADDR> | <HOSTNAME>} [data-fill <PATTERN> | datagram-size <SIZE> |
   interval <TIME> | repetitions <NUMBER> | timeout <TIME> | vrrp <VRID> |
   vrf <VRF-NAME> | source <IPv6-ADDR> | <IFNAME>]
```

Description

Pings the specified IPv6 address or hostname with or without optional parameters. The VRRP option is provided to self-ping the configured link-local address on the VRRP group.

Parameter	Description
`IPv6-ADDR`	Selects the IPv6 address to ping.
`HOSTNAME`	Selects the hostname to ping. Range: 1-256 characters
`data-fill <PATTERN>`	Specifies the data pattern in hexadecimal digits to send. A maximum of 16 "pad" bytes can be specified to fill out the ICMP packet. Default: AB
`datagram-size <SIZE>`	Specifies the ping datagram size. Range: 0-65399, default: 100.
`interval <TIME>`	Specifies the interval between successive ping requests in seconds. Range: 1-60 seconds, default: 1 second.
`repetitions <NUMBER>`	Specifies the number of packets to send. Range: 1-10000 packets, default: Five packets.
`timeout <TIME>`	Specifies the ping timeout in seconds. Range: 1-60 seconds, default: 2 seconds.
`vrrp <VRID>`	Specifies the VRRP group ID.
`vrf <VRF-NAME>`	Specifies the virtual routing and forwarding (VRF) to use. When this option is not provided, the default VRF is used.
`source <IPv6-ADDR> | <IFNAME>`	Specifies the source IPv6 address or interface to use.

Examples

Pinging an IPv6 address:

```
switch# ping6 2020::2
PING 2020::2(2020::2) 100 data bytes
108 bytes from 2020::2: icmp_seq=1 ttl=64 time=0.386 ms
108 bytes from 2020::2: icmp_seq=2 ttl=64 time=0.235 ms
108 bytes from 2020::2: icmp_seq=3 ttl=64 time=0.249 ms
108 bytes from 2020::2: icmp_seq=4 ttl=64 time=0.240 ms
108 bytes from 2020::2: icmp_seq=5 ttl=64 time=0.252 ms

--- 2020::2 ping statistics ---
```

```
5 packets transmitted, 5 received, 0% packet loss, time 4000ms
rtt min/avg/max/mdev = 0.235/0.272/0.386/0.059 ms
```

Pinging the localhost:

```
switch# ping6 localhost
PING localhost(localhost) 100 data bytes
108 bytes from localhost: icmp_seq=1 ttl=64 time=0.093 ms
108 bytes from localhost: icmp_seq=2 ttl=64 time=0.051 ms
108 bytes from localhost: icmp_seq=3 ttl=64 time=0.055 ms
108 bytes from localhost: icmp_seq=4 ttl=64 time=0.046 ms
108 bytes from localhost: icmp_seq=5 ttl=64 time=0.048 ms

--- localhost ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 3998ms
rtt min/avg/max/mdev = 0.046/0.058/0.093/0.019 ms
```

Pinging a server with a data pattern:

```
switch# ping6 2020::2 data-fill ab
PATTERN: 0xab
PING 2020::2(2020::2) 100 data bytes
108 bytes from 2020::2: icmp_seq=1 ttl=64 time=0.038 ms
108 bytes from 2020::2: icmp_seq=2 ttl=64 time=0.074 ms
108 bytes from 2020::2: icmp_seq=3 ttl=64 time=0.076 ms
108 bytes from 2020::2: icmp_seq=4 ttl=64 time=0.075 ms
108 bytes from 2020::2: icmp_seq=5 ttl=64 time=0.077 ms

--- 2020::2 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 3999ms
rtt min/avg/max/mdev = 0.038/0.068/0.077/0.015 ms
```

Pinging a server with a datagram size:

```
switch# ping6 2020::2 datagram-size 200
PING 2020::2(2020::2) 200 data bytes
208 bytes from 2020::2: icmp_seq=1 ttl=64 time=0.037 ms
208 bytes from 2020::2: icmp_seq=2 ttl=64 time=0.076 ms
208 bytes from 2020::2: icmp_seq=3 ttl=64 time=0.076 ms
208 bytes from 2020::2: icmp_seq=4 ttl=64 time=0.077 ms
208 bytes from 2020::2: icmp_seq=5 ttl=64 time=0.066 ms

--- 2020::2 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 3999ms
rtt min/avg/max/mdev = 0.037/0.066/0.077/0.016 ms
```

Pinging a server with an interval specified:

```
switch# ping6 2020::2 interval 5
PING 2020::2(2020::2) 100 data bytes
108 bytes from 2020::2: icmp_seq=1 ttl=64 time=0.043 ms
108 bytes from 2020::2: icmp_seq=2 ttl=64 time=0.075 ms
108 bytes from 2020::2: icmp_seq=3 ttl=64 time=0.074 ms
108 bytes from 2020::2: icmp_seq=4 ttl=64 time=0.075 ms
108 bytes from 2020::2: icmp_seq=5 ttl=64 time=0.075 ms
```

```
--- 2020::2 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 19999ms
rtt min/avg/max/mdev = 0.043/0.068/0.075/0.014 ms
```

Pinging a server with a specified number of packets to send:

```
switch# ping6 2020::2 repetitions 6
PING 2020::2(2020::2) 100 data bytes
108 bytes from 2020::2: icmp_seq=1 ttl=64 time=0.039 ms
108 bytes from 2020::2: icmp_seq=2 ttl=64 time=0.070 ms
108 bytes from 2020::2: icmp_seq=3 ttl=64 time=0.076 ms
108 bytes from 2020::2: icmp_seq=4 ttl=64 time=0.076 ms
108 bytes from 2020::2: icmp_seq=5 ttl=64 time=0.071 ms
108 bytes from 2020::2: icmp_seq=6 ttl=64 time=0.078 ms

--- 2020::2 ping statistics ---
6 packets transmitted, 6 received, 0% packet loss, time 4999ms
rtt min/avg/max/mdev = 0.039/0.068/0.078/0.015 ms
```

Pinging a local host with the specified VRF.

```
switch# ping6 localhost vrf red
PING localhost(localhost) 100 data bytes
108 bytes from localhost: icmp_seq=1 ttl=64 time=0.038 ms
108 bytes from localhost: icmp_seq=2 ttl=64 time=0.050 ms
108 bytes from localhost: icmp_seq=3 ttl=64 time=0.039 ms
108 bytes from localhost: icmp_seq=4 ttl=64 time=0.040 ms
108 bytes from localhost: icmp_seq=5 ttl=64 time=0.027 ms

--- localhost ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 4001ms
rtt min/avg/max/mdev = 0.027/0.038/0.050/0.010 ms
```

Pinging the localhost with the default VRF:

```
switch# ping6 localhost vrf mgmt
PING localhost(localhost) 100 data bytes
108 bytes from localhost: icmp_seq=1 ttl=64 time=0.032 ms
108 bytes from localhost: icmp_seq=2 ttl=64 time=0.022 ms
108 bytes from localhost: icmp_seq=3 ttl=64 time=0.040 ms
108 bytes from localhost: icmp_seq=4 ttl=64 time=0.022 ms
108 bytes from localhost: icmp_seq=5 ttl=64 time=0.046 ms

--- localhost ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 3998ms
rtt min/avg/max/mdev = 0.022/0.032/0.046/0.010 ms
```

Chapter 111
PKI commands

crypto pki application

```
crypto pki application <APP-NAME> certificate <CERT-NAME>
no crypto pki application <APP-NAME> certificate <CERT-NAME>
```

Description

Associates a leaf certificate with a feature (application) on the switch. By default, all features are associated with the default, self-signed certificate **local-cert**. This certificate is created by the switch the first time it starts.

The **no** form of this command associates the specified feature with the default certificate.

Parameter	Description
<APP-NAME>	Specifies the name of a feature on the switch: ■ **captive-portal**: Captive portal ■ **dot1x-supplicant**: 802.1X supplicant ■ **est-client**: EST client ■ **hsc**: Hardware switch controller ■ **https-server**: HTTPS server ■ **radsec-client**: RadSec client ■ **syslog-client**: Syslog client **syslog-client** communicates with syslog server over TLS. You can associate a certificate with the **syslog-client** application by enrolling the certificate manually or through EST.
<CERT-NAME>	Specifies the name of an installed leaf certificate.

Examples

Associating the EST client with leaf certificate **leaf-cert1**:

```
switch(config)# crypto pki application est-client certificate leaf-cert1
```

Associating the syslog client with leaf certificate **leaf-cert**:

```
switch(config)# crypto pki application syslog-client certificate leaf-cert
```

Setting the syslog client to use the default certificate:

```
switch(config)# no crypto pki application syslog-client certificate
```

Setting the RadSec client to use the default certificate:

```
switch(config)# no crypto pki application radsec-client certificate
```

Associating the RadSec client with leaf certificate **leaf-cert**:

```
switch(config)# crypto pki application radsec-client certificate leaf-cert
```

Associating the HTTPS server with leaf certificate **leaf-cert2**:

```
switch(config)# crypto pki application https-server certificate leaf-cert2
```

Associating the 802.1X supplicant with leaf certificate **cert1**:

```
switch(config)# crypto pki application dot1x-supplicant certificate cert1
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config`	Administrators or local user group members with execution rights for this command.

crypto pki certificate

```
crypto pki certificate <CERT-NAME>
no crypto pki certificate <CERT-NAME>
```

Description

Creates a leaf certificate and changes to its context **config-cert-<CERT-NAME>**. If the specified leaf certificate exists, this command changes to its context.

The first time the switch starts it creates a self-signed, default leaf certificate called **local-cert**. This certificate is used by any switch application that does not have an associated leaf certificate.

The **no** form of this command deletes the specified leaf certificate. The default leaf certificate **local-cert** cannot be deleted.

Parameter	Description
<CERT-NAME>	Specifies the name of a leaf certificate. Range: 1 to 32 alphanumeric characters (excluding ").

Examples

Creating leaf certificate **leaf-cert**:

```
switch(config)# crypto pki certificate leaf-cert
switch(config-cert-leaf-cert)#
```

Deleting leaf certificate **leaf-cert**:

```
switch(config)# no crypto pki certificate leaf-cert
The leaf certificate has associated applications. Deleting the certificate
will make the applications use the default certificate local-cert.
Continue (y/n)? y
switch(config)#
```

For more information on features that use this command, refer to the Security Guide for your switch model.

All platforms	`config`	Administrators or local user group members with execution rights for this command.

crypto pki ta-profile

```
crypto pki ta-profile <TA-NAME>
no crypto pki ta-profile <TA-NAME>
```

Description

Creates a trust anchor (TA) profile and changes to the **config-ta-<TA-NAME>** context for the profile. Each TA profile stores the certificate for a trusted CA. Up to 64 profiles can be defined.

If the specified TA profile exists, this command changes to the **config-ta-<TA-NAME>** context for the profile.

The **no** form of this command removes the specified TA profile.

When creating a new profile, If you exit the **config-ta-<TA-NAME>** context without importing the TA certificate, the profile is discarded.

Parameter	Description
<TA-NAME>	Specifies the TA profile name. Range: 1 to 48 alphanumeric characters excluding ". **NOTE:** The TA profile name cannot end with **est-ta<nn>** where **<nn>** is **00** to **99**. For example, **company-trust-anchor-est-ta01** is not allowed. This TA profile name suffix is reserved for TA profiles that are created for CA certificates from EST servers.

Examples

Creating the TA profile **root-cert**:

```
switch(config)# crypto pki ta-profile root-cert
switch(config-ta-root-cert)#
```

Removing TA profile **root-cert**:

```
switch(config)# no crypto pki ta-profile root-cert
```

For more information on features that use this command, refer to the Security Guide for your switch model.

All platforms	`config`	Administrators or local user group members with execution rights for this command.

enroll self-signed

```
enroll self-signed
```

Description

Generates a key pair and generates a self-signed certificate with it.

The subject fields and key type of the current leaf certificate must be defined before running this command. If not, you are prompted to fill in the subject fields, and the key type is set to **RSA 2048**.

Example

Enrolling the leaf certificate **leaf-cert**:

```
switch(config-cert-leaf-cert)# enroll self-signed
You are enrolling a certificate with the following attributes:
Subject: C=US, ST=CA, L=Rocklin, OU=Site, O=Comp,
         CN=Leaf01
Key Type: RSA (2048)

Continue (y/n)? y
Self-signed certificate is created and enrolled successfully.

switch(config-cert-leaf-cert)#
```

For more information on features that use this command, refer to the Security Guide for your switch model.

10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config-cert-<CERT-NAME>`	Administrators or local user group members with execution rights for this command.

enroll terminal

`enroll terminal`

Description

Generates a key pair and certificate signing request (CSR) for the current leaf certificate. Use the CSR to obtain a signed certificate from a certificate authority (CA), and then import the certificate onto the switch with the command **import terminal**.

The key type, and the certificate common name in the subject fields of the current leaf certificate must be completed before running this command.

Example

Enrolling the leaf certificate **leaf-cert**:

```
switch(config-cert-leaf-cert)# enroll terminal
You are enrolling a certificate with the following attributes:
Subject: C=US, ST=CA, L=Rocklin, OU=Site, O=Comp,
         CN=Leaf01
Key Type: RSA (2048)

Continue (y/n)? y
```

Command Information

Platforms	Command context	Authority
All platforms	`config-cert-<CERT-NAME>`	Administrators or local user group members with execution rights for this command.

import (CA-signed leaf certificate)

```
import terminal ta-profile <TA-NAME> [password <PW>]
import <REMOTE-URL> ta-profile <TA-NAME> [password <PW>][vrf <VRF-NAME>]
import <STORAGE-URL> ta-profile <TA-NAME> [password <PW>]
```

Description

Imports a CA-signed leaf certificate and then validates the certificate against the specified TA profile. If the imported data includes a private key, the private key must match the leaf certificate being imported. If the imported data does not include a private key, the certificate must match a CSR that was previously generated with the command **enroll terminal** and must be signed by the CA whose root certificate is installed in the specified TA profile. The TA profile must exist and have a TA certificate configured.

Parameter	Description
`terminal`	Import the certificate by pasting PEM-format data at the console. Upon execution, the **config-cert-import** context is entered for certificate pasting. To complete certificate data entry press Control-D in your terminal program. Alternatively, the pasted certificate data can include at its end the delimiter **END_OF_CERTIFICATE** (after the **-----END CERTIFICATE-----** line), making entry of Control-D unnecessary.
`ta-profile <TA-NAME>`	Specifies the TA profile name. Range: 1 to 48 alphanumeric

Parameter	Description
	characters excluding ".
`password <PW>`	Specifies the plaintext password used to decrypt the private key in the imported certificate data. When this parameter is omitted, the password is prompted for as required. Range: 1 to 32 alphanumeric characters.

<REMOTE-URL>	Specifies a certificate data file on a remote TFTP or SFTP server. The URL syntax is:
	`{tftp:// | sftp://<USER>@} {<IP>|<HOST>}`
	`[:<PORT>] [;blocksize=<SIZE>]/<FILE>`

`vrf <VRF-NAME>`	Specifies the name of the VRF to use for the remote URL file transfer. The default is **mgmt**.
<STORAGE-URL>	Available on switch families that provide USB device file import capability, specifies a certificate data file on a USB storage device inserted in the switch USB port. The URL syntax is **usb:/<FILE>**.

Usage

- The imported data must include all the intermediate CA certificates in the certificate chain leading to the certificate imported into the specified TA profile.
- This command cannot be used with the default certificate **local-cert**.
- The PEM data format is supported for all import sources. The PKCS#12 data format is supported for **<REMOTE-URL>** and **<STORAGE-URL>**.
- The PEM data must be delimited with these lines for the certificate data:

```
-----BEGIN CERTIFICATE-----
-----END CERTIFICATE-----
```

And the PEM data must be delimited with either of these line pairs for the private key data:

```
-----BEGIN PRIVATE KEY-----
-----END PRIVATE KEY-----

-----BEGIN ENCRYPTED PRIVATE KEY-----
-----END ENCRYPTED PRIVATE KEY-----
```

Examples

Importing a leaf certificate from the console:

```
switch(config)# crypto pki certificate leaf-cert
switch(config-cert-leaf-cert1)# import terminal ta-profile root-cert
Paste the certificate in PEM format below, then hit enter and ctrl-D:
switch(config-cert-import)# -----BEGIN CERTIFICATE-----
switch(config-cert-import)# MIIFRDCCAyygAwIBAgQP8nS2Vp15u0xXMdkDJzANBgkqhkiG9w0Bv
switch(config-cert-import)# MQswCQYDVQGEwJVUEOMAwGA1UCgwFXJ1YmDAgNBAMM1Jvb3QgQ0Ew
switch(config-cert-import)# HhcNMTkNDEwMjIwNT1WhcjIwMT0MjwNE1WjzQswQDVQQGEwJVUzEL
...
switch(config-cert-import)# 1fIYZYGQyla0AwFuPTTxBXHYwRxTPbUYU5umJfRPmE4VY8S9DQgcr
switch(config-cert-import)# 1NGNm3NG03GqPScs/TF9bVyFA5BOS5lmmkfRYK8D/kMTfRreSdxis
switch(config-cert-import)# YQ1u1NqShps=
switch(config-cert-import)# -----END CERTIFICATE-----
switch(config-cert-import)# -----BEGIN ENCRYPTED PRIVATE KEY-----

switch(config-cert-import)# IJ6L/UhEtH523nUkdV6gvAgoYaD83PswToAGv5VS8OMFTPttrn5/K
...
switch(config-cert-import)# OgSecqZsG6arbx0ESaYBir1c/6rPspcjbx283iD1MWOpeoS2aEmOX
switch(config-cert-import)# iKnXnUMpVPfLc74ty2S41DtH0X9gf6aa1jStg+7cND9XfGtjaV2+/
switch(config-cert-import)# cb4=
switch(config-cert-import)# -----END ENCRYPTED PRIVATE KEY-----
switch(config-cert-import)#
Enter import password: *******
Leaf certificate is validated with root-cert and imported successfully.
switch(config-cert-leaf-cert)#
```

Importing a leaf certificate from a remote file:

```
switch(config)# crypto pki certificate leaf-cert2
switch(config-cert-leaf-cert2)# import tftp://1.1.1.2/c2.p12 ta-profile root-cert
% Total    % Received % Xferd  Average Speed   Time    Time     Time  Current
                                 Dload  Upload   Total   Spent    Left  Speed
100  3722  100  3722    0     0   391k      0 --:--:-- --:--:-- --:--:--  391k
100  3722  100  3722    0     0   376k      0 --:--:-- --:--:-- --:--:--  376k
Enter import password: *******
Leaf certificate is validated with root-cert and imported successfully.
switch(config-cert-leaf-cert2)#
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command Information

Platforms	Command context	Authority
All platforms	`config-cert-<CERT-NAME>`	Administrators or local user group members with execution rights for this command.

import (self-signed leaf certificate)

```
import terminal self-signed [password <PW>]
import <REMOTE-URL> self-signed [password <PW>][vrf <VRF-NAME>]
import <STORAGE-URL> self-signed [password <PW>]
```

Description

Imports a self-signed leaf certificate including its matching private key.

Parameter	Description
`terminal`	Import the certificate by pasting PEM-format data at the console.

Parameter	Description
	Upon execution, the **config-cert-import** context is entered for certificate pasting. To complete certificate data entry press Control-D in your terminal program. Alternatively, the pasted certificate data can include at its end the delimiter **END_OF_CERTIFICATE** (after the **-----END CERTIFICATE-----** line), making entry of Control-D unnecessary.
`password` *`<PW>`*	Specifies the plaintext password used to decrypt the private key in the imported certificate data. When this parameter is omitted, the password is prompted for as required. Range: 1 to 32 alphanumeric characters.

`<REMOTE-URL>`	Specifies a certificate data file on a remote TFTP or SFTP server. The URL syntax is:
	`{tftp:// | sftp://<USER>@} {<IP>|<HOST>}`
	`[:<PORT>] [;blocksize=<SIZE>]/<FILE>`

`vrf` *`<VRF-NAME>`*	Specifies the name of the VRF to use for the remote URL file transfer. The default is **mgmt**.
`<STORAGE-URL>`	Available on switch families that provide USB device file import capability, specifies a certificate data file on a USB storage device inserted in the switch USB port. The URL syntax is **usb:/<FILE>**.

Usage

- This command cannot be used with the default certificate **local-cert**.
- The PEM data format is supported for all import sources. The PKCS#12 data format is supported for **<REMOTE-URL>** and **<STORAGE-URL>**.
- The PEM data must be delimited with these lines for the certificate data:

```
-----BEGIN CERTIFICATE-----
-----END CERTIFICATE-----
```

And the PEM data must be delimited with either of these line pairs for the private key data:

```
-----BEGIN PRIVATE KEY-----
-----END PRIVATE KEY-----

-----BEGIN ENCRYPTED PRIVATE KEY-----
-----END ENCRYPTED PRIVATE KEY-----
```

Example

Importing a self-signed leaf certificate from the console:

```
switch(config)# crypto pki certificate ss-leaf-cert
switch(config-cert-ss-leaf-cert)# import terminal self-signed
Paste the certificate in PEM format below, then hit enter and ctrl-D:
switch(config-cert-import)# -----BEGIN CERTIFICATE-----
switch(config-cert-import)# MIID2TCCAsGgAwIBAgIJAKcrqokm6p9GMA0GCSqGSIb3DQEBCwUAM

switch(config-cert-import)# -----END ENCRYPTED PRIVATE KEY-----
switch(config-cert-import)#
Enter import password: *******
Leaf certificate is validated as self-signed certificate and imported
successfully.
switch(config-cert-ss-leaf-cert)#
```

Importing a leaf certificate from a remote file:

```
switch(config)# crypto pki certificate ss-leaf-cert2
switch(config-cert-ss-leaf-cert2)# import tftp://1.1.1.2/ss2.p12 self-signed
  % Total    % Received % Xferd  Average Speed   Time    Time     Time  Current
                                 Dload  Upload   Total   Spent    Left  Speed
100  3230  100  3230    0     0   875k      0 --:--:-- --:--:-- --:--:--  875k
100  3230  100  3230    0     0   831k      0 --:--:-- --:--:-- --:--:--  831k
Enter import password: *******
Leaf certificate is validated as self-signed certificate and imported
successfully.
switch(config-cert-ss-leaf-cert2)#
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config-cert-`*<CERT-NAME>*	Administrators or local user group members with execution rights for this command.

key-type

key-type {rsa [key-size *<K-SIZE>*] | ecdsa [curve-size *<C-SIZE>*]}

Description

Sets the key type and key size for the current leaf certificate. The key type of the default certificate **local-cert** cannot be changed.

Parameter	Description
`rsa`	Selects the RSA key type.
`key-size <K-SIZE>`	Specifies the RSA key size in bits. Supported values: 2048, 3072, 4096. Default: 2048
`ecdsa`	Selects the ECDSA key type.
`curve-size <C-SIZE>`	Specifies the ECDSA elliptic curve size in bits. Supported values: 256, 348, 521. Default: 256

Examples

Setting RSA encryption on the leaf certificate **leaf-cert**:

```
switch(config)# crypto pki certificate leaf-cert
switch(config-cert-leaf-cert)# key-type rsa key-size 3072
```

Setting ECDSA encryption on the leaf certificate **leaf-cert**:

```
switch(config)# crypto pki certificate leaf-cert
switch(config-cert-leaf-cert)# key-type ecdsa curve-size 521
```

For more information on features that use this command, refer to the Security Guide for your switch model.

ocsp disable-nonce

```
ocsp disable-nonce
no ocsp disable-nonce
```

Description

Configures exclusion of the nonce from OCSP requests. A nonce is a unique identifier that an OCSP client inserts in an OCSP request and expects the OCSP responder to include it in the corresponding OCSP response. The nonce mechanism helps prevent replay attacks in which a malicious player attempts to masquerade as the OCSP responder. Although the nonce is included by default, it can be excluded. Some OCSP responders choose to not support the use of the nonce due to performance considerations.

The **no** form of this command re-enables nonce inclusion in OCSP requests.

Examples

Disable inclusion of the nonce in OCSP requests for TA profile **root-cert**:

```
switch(config)# crypto pki ta-profile root-cert
switch(config-ta-root-cert)# ocsp disable-nonce
```

Enable inclusion of the nonce in OCSP requests for TA profile **root-cert**:

```
switch(config)# crypto pki ta-profile root-cert
switch(config-ta-root-cert)# no ocsp disable-nonce
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config-ta-<TA-NAME>`	Administrators or local user group members with execution rights for this command.

ocsp enforcement-level

```
ocsp enforcement-level {strict | optional}
no enforcement-level
```

Description

Sets either strict or reduced enforcement of the OCSP check of certificates. Strict enforcement is enabled by default.

The **no** form of this command resets enforcement to its default of **strict**.

Parameter	Description
`strict`	Sets strict OCSP checking of certificates. The certificate is accepted only if all possible checking (including validation failures, software system errors, configuration errors, transactional errors) is successful.
`optional`	Sets reduced OCSP checking of certificates. The certificate is

Parameter	Description
	accepted unless one or more of these validation errors occur: ■ Response signature invalid. ■ Nonce in response mismatch. ■ Certificate revoked, but only when revocation checking is possible. if revocation check is not possible, the certificate is still accepted if there are no other validation errors.

Examples

Setting reduced OCSP checking of certificates:

```
switch(config)# crypto pki ta-profile root-cert
switch(config-ta-root-cert)# ocsp enforcement-level optional
```

Setting strict OCSP checking of certificates:

```
switch(config)# crypto pki ta-profile root-cert
switch(config-ta-root-cert)# ocsp enforcement-level strict
```

For more information on features that use this command, refer to the Security Guide for your switch model.

All platforms	`config-ta-<TA-NAME>`	Administrators or local user group members with execution rights for this command.

ocsp url

```
ocsp url {primary | secondary} <URL>
no ocsp url {primary | secondary}
```

Description

Configures the OCSP responder URLs that the current TA profile uses to verify the revocation status of an X.509 digital certificate. These URLs override the OCSP responder URL contained within the peer certificate being verified (as well as URLs defined in any intermediate CAs in the chain of trust).

If no OCSP responder URLs are defined for a TA profile (default setting), then the OCSP responder URL in the peer certificate is used for revocation status checking. (The OCSP responder URL is contained in a certificate's Authority Information Access field, which is an X.509 v3 certificate extension.)

The **no** form of this command deletes the specified OCSP responder URL (primary or secondary) from the current TA profile.

Parameter	Description
`{primary | secondary} <URL>`	Specify the HTTP URL of the primary or secondary OCSP responder using either a fully qualified domain name or IPv4 address.

Examples

Defining the primary OCSP URL for the TA profile **root-cert**:

```
switch(config)# crypto pki ta-profile root-cert
switch(config-ta-root-cert)# revocation-check ocsp
switch(config-ta-root-cert)# ocsp url primary http://ocsp-server.site.com
```

Removing the primary OCSP URL from the TA profile **root-cert**:

```
switch(config)# crypto pki ta-profile oot-cert
switch(config-ta-root-cert)# revocation-check ocsp
switch(config-ta-root-cert)# no ocsp url primary
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

All platforms	`config-ta-<TA-NAME>`	Administrators or local user group members with execution rights for this command.

ocsp vrf

```
ocsp vrf <VRF-NAME>
no ocsp vrf
```

Description

Sets the VRF that the switch uses to communicate with OCSP responders for OCSP checking. VRF mgmt is used by default.

The **no** form of this command resets the VRF to its default **mgmt**.

Parameter	Description
<VRF-NAME>	Specifies the name of the VRF the switch uses to communicate with OCSP responders. Default: **mgmt**.

Examples

Setting the OCSP responder VRF to **corp1**:

```
switch(config)# crypto pki ta-profile root-cert
switch(config-ta-root-cert)# ocsp vrf corp1
```

Reverting the OCSP responder VRF to its default:

```
switch(config)# crypto pki ta-profile root-cert
switch(config-ta-root-cert)# no ocsp vrf
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	config-ta-*<TA-NAME>*	Administrators or local user group members with execution rights for this command.

revocation-check ocsp

```
revocation-check ocsp
no revocation-check
```

Description

Enables certificate revocation checking for the current profile using the online certificate status protocol (OCSP).

The **no** form of this command disables certificate revocation checking for the current profile.

Examples

Enabling revocation checking for the TA profile **root-cert**:

```
switch(config)# crypto pki ta-profile root-cert
switch(config-ta-root-cert)# revocation-check ocsp
```

Disabling revocation checking for the TA profile **root-cert**:

```
switch(config)# crypto pki ta-profile root-cert
switch(config-ta-root-cert)# no revocation-check
```

For more information on features that use this command, refer to the Security Guide for your switch model.

show crypto pki application

`show crypto pki application`

Description

Shows certificate information for all features (applications) using leaf certificates that are managed by PKI.

Examples

Showing certificate information for all features (applications) using leaf certificates:

```
switch# show crypto pki application1

Associated Applications  Certificate Name       Cert Status
------------------------ ---------------------- --------------------------------
https-server                                    not configured, using local-cert
syslog-client            local-cert             valid
hsc                      xhsccert               invalid, using local-cert
radsec-client            device-identity        valid
```

For more information on features that use this command, refer to the Security Guide for your switch model.

show crypto pki certificate

`show crypto pki certificate [<CERT-NAME> [plaintext | pem]]`

Description

Shows a list of all configured leaf certificates, or detailed information for a specific leaf certificate.

Possible values for Cert Status are: **CSR pending**, **expired**, **expires soon**, **installed**, **malformed**, **not yet known**.

Possible values for EST Status are: **enroll failed**, **enroll pending**, **enroll retrying**, **enroll success**, **n/a** (certificate is not EST-enrolled), **reenroll failed**, **reenroll pending**, **reenroll retrying**.

Parameter	Description
<CERT-NAME>	Specifies the leaf certificate name. Range: 1 to 32 alphanumeric characters excluding ".
`plaintext`	Shows certificate information in plain text.
`pem`	Shows certificate information in PEM format.

Examples

Showing a list of all configured leaf certificates:

```
switch# show crypto pki certificate

Certificate Name     Cert Status    EST Status        Associated Applications
-------------------- -------------- ----------------- ----------------------------
--
local-cert           installed      n/a               radsec-client, captive-
portal
device-identity      installed      n/a               none
pod01-test-1         installed      n/a               dot1x-supplicant
pod01-99-1           installed      n/a               https-server, est-client
syslog-1             CSR pending    enroll retrying   syslog-client
leaf-cert1           installed      enroll success    none
leaf-cert2           CSR pending    enroll failed     none
```

Showing detailed information (in plaintext format) for leaf certificate **pod01-99-1**:

```
switch# show crypto pki certificate pod01-99-1 plaintext

  Certificate Name: pod01-99-1
  Associated Applications:

show crypto pki ta-profile

```
show crypto pki ta-profile [<TA-NAME>]
```

Description

Shows a list of all configured TA profiles, or detailed information for a specific profile.

This command shows information for both directly-configured TA profiles and TA profiles that were dynamically downloaded from EST servers.

Parameter	Description
<TA-NAME>	Specifies the TA profile name. Range: 1 to 48 alphanumeric characters excluding ".

Examples

Showing a list of all configured TA profiles:

```
switch# show crypto pki ta-profile

Profile Name                     TA Certificate     Revocation Check
-------------------------------- ------------------ ----------------
BASE_CA                          Installed,valid    disabled
BASE02_CA                        Installed,expired  disabled
root-cert                        Installed,valid    OCSP
ROOT-A_CA                        Not Installed      OCSP
EST-Service1                     Installed,valid    None
EST-Service2                     Installed,valid    None
```

Showing detailed information for TA profile **root-cert**:

```
switch# show crypto pki ta-profile root-cert

  TA Profile Name         : root-cert
  Revocation Check        : OCSP
    OSCP Primary URL      : http://ocsp1.domain.com
    OCSP Secondary URL    : Not Configured
    OCSP Disable-nonce    : false
    OCSP Enforcement Level: strict
    OCSP VRF              : mgmt
  TA Certificate: Installed and valid

ta-certificate

`ta-certificate { [import [terminal]] | import {<REMOTE-URL> | <STORAGE-URL>} }`

Description

Imports a CA certificate for use in the current TA profile. The certificate must be in PEM format. The PEM data must be delimited with these lines:

```
-----BEGIN CERTIFICATE-----
-----END CERTIFICATE-----
```

Only the first certificate in the PEM data is imported. Any additional certificates are ignored.

Parameter	Description
`[import [terminal]]`	Import the certificate by pasting PEM-format data at the console. Upon execution, the **config-cert-import** context is entered for certificate pasting. To complete certificate data entry press Control-D in your terminal program. Alternatively, the pasted certificate data can include at its end the delimiter **END_OF_CERTIFICATE** (after the **-----END CERTIFICATE-----** line), making entry of Control-D unnecessary.

`import <REMOTE-URL>`	Import the certificate from a file on a remote TFTP or SFTP server. The URL syntax is:
	`{tftp:// | sftp://<USER>@} {<IP>|<HOST>}`
	`[:<PORT>] [;blocksize=<SIZE>]/<FILE>`

`import <STORAGE-URL>`	Available on switch families that provide USB device file import capability, import the certificate from a file on a USB storage device inserted in the switch USB port. The URL syntax is **usb:/<FILE>**.

Example

Importing a certificate into the TA profile **root-cert** by pasting PEM-format certificate data at the console:

```
switch(config)# crypto pki ta-profile root-cert
switch(config-ta-root-cert)# ta-certificate import terminal
Paste the certificate in PEM format below, then hit enter and ctrl-D:
switch(config-ta-cert)# -----BEGIN CERTIFICATE-----
switch(config-ta-cert)# MIIDuTCCAqECCQCuoxeJ2ZNYcjANBgkqhkiG9w0BAQsFADCBqzELMAEBh
switch(config-ta-cert)# VVMxEzARBgNVBAgMCkNhbGlmb3JuaWExEDAOBgNVBAcMB1JvY2tsDAKBg
switch(config-ta-cert)# BAoMA0hQTjEVMBMGA1UECwwMSFBOUm9zZXZpbGxlMSowKAYDVQocG5zdz
...
switch(config-ta-cert)# x3WFf3dFZ8o9sd5LVAHneH/ztb9MP34z+le1V346r12L2kpxmTOVJVyTO
switch(config-ta-cert)# BIzD/ST/HaWI+0S+S80rm93PSscEbb9GWk7vshh5EnW/moehBKcE4O1zy
switch(config-ta-cert)# 3LvMLZcssSe5J2Ca2XIhfDme8UaNZ7syGYMsAW0nG7yYHWkEOQu9s
switch(config-ta-cert)# -----END CERTIFICATE-----
switch(config-ta-cert)#
```

```
The certificate you are importing has the following attributes:
Issuer:  C=US, ST=CA, L=Rocklin, O=Company, OU=Site,
         CN=site.com/emailAddress=test.ca@site.com
Subject: C=US, ST=CA, L=Rocklin, O=Company, OU=Site,
         CN=9000/emailAddress=test.ca@site.com
Serial Number: 12121221634631568498 (0xaea51217d5945772)

TA certificate import is allowed only once for a TA profile
Do you want to accept this certificate (y/n)? y
TA certificate accepted.
switch(config-ta-root-cert)#
```

Importing a certificate into the TA profile **root-cert2** from file **rcert2-data** on the USB device:

```
switch(config)# crypto pki ta-profile root-cert2
switch(config-ta-root-cert2)# ta-certificate import usb:/rcert2-data
The certificate you are importing has the following attributes:
Issuer: C=US, ST=California, L=Rocklin, O=Company, OU=Site,
CN=site.com/emailAddress=test.ca@site.com
Subject: C=US, ST=California, L=Rocklin, O=Company, OU=Site,
CN=9000/emailAddress=test.ca@site.com
Serial Number: 12121221634631568498 (0xaea51217d5945772)

TA certificate import is allowed only once for a TA profile
Do you want to accept this certificate (y/n)? y
TA certificate accepted.
switch(config-ta-root-cert2)#
```

For more information on features that use this command, refer to the Security Guide for your switch model.

subject

```
subject [common-name <COMMON-NAME>] [country <COUNTRY>] [locality <LOCALITY>]
        [org <ORG-NAME>] [org-unit <ORG-UNIT>] [state <STATE>]
```

Description

Sets the subject fields for the current leaf certificate. If the **common-name** parameter is not specified, then you are prompted to define a value for each field. If a configured value exists for any field, it is presented as the default.

The subject fields of the default certificate **local-cert** cannot be changed.

Parameter	Description
`common-name <COMMON-NAME>`	Specifies the common name.
`country <COUNTRY>`	Specifies the country or region.
`locality <LOCALITY>`	Specifies the locality such as city.
`org <ORG-NAME>`	Specifies the organization.
`org-unit <ORG-UNIT>`	Specifies the organizational unit.
`state <STATE>`	Specifies the state.

Examples

Setting subject fields for the leaf certificate **leaf-cert**:

```
switch(config-cert-leaf-cert)# subject common-name Leaf01 country US
locality CA org Company org-unit Site state CA
```

Setting subject fields for the leaf certificate **leaf-cert** interactively:

```
switch(config-cert-leaf-cert)# subject
Do you want to use the switch serial number as the common name (y/n)? n
Enter Common Name : Leaf01
Enter Org Unit : Site
Enter Org Name : Company
Enter Locality : Rocklin
Enter State : CA
Enter Country : US
switch(config-cert-leaf-cert)#
```

Chapter 112

PKI EST commands

arbitrary-label

```
arbitrary-label <LABEL>
no arbitrary-label
```

Description

Within the EST profile context, configures the generic optional label (also known as arbitrary label) to be concatenated to the EST server URL that is configured with the **url** command. There is no arbitrary label configured by default. Any existing arbitrary label is replaced by this command. The use of arbitrary labels is optional.

RFC 7030 allows the use of arbitrary labels so that one EST server may serve multiple CAs with the same server URL that gets concatenated with different arbitrary labels. The same label is used for every request made under a particular EST profile.

Some EST schemes use arbitrary labels in a more sophisticated way, defining different labels for different types of requests under the same EST profile. For example, the CA certificate request could use the generic label (configured with this **arbitrary-label** command) , the certificate enrollment request could use the enrollment label (configured with the **arbitrary-label-enrollment** command), and the re-enrollment request could use the re-enrollment label (configured with the **arbitrary-label-reenrollment** command). Note that only one label of each of the three available types can be configured in any EST profile.

The **no** form of this command removes the generic arbitrary label.

Parameter	Description
<LABEL>	Specifies the generic arbitrary label. Range: Up to 64 characters.

Examples

Configuring the URL and generic arbitrary label. Note that with the URL and arbitrary label configured in this example, the final URL the switch uses to request CA certificates from the EST server is https://est-service999.com/.well-known/est/rsa2048/cacerts.

```
switch(config)# crypto pki est-profile EST-service1
switch(config)# url https://est-service999.com/.well-known/est
switch(config-est-EST-service1)# arbitrary-label rsa2048
```

Removing the generic arbitrary label:

```
switch(config)# crypto pki est-profile EST-service1
switch(config-est-EST-service1)# no arbitrary-label
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

All platforms	`config-est-<EST-NAME>`	Administrators or local user group members with execution rights for this command.

arbitrary-label-enrollment

```
arbitrary-label-enrollment <LABEL>
no arbitrary-label-enrollment
```

Description

Within the EST profile context, configures the arbitrary enrollment label to be concatenated to the EST server URL that is configured with the **url** command. This label is specific to the enrollment operation. There is no arbitrary enrollment label configured by default. Any existing arbitrary enrollment label is replaced by this command. The use of arbitrary enrollment labels is optional.

When the enrollment label is not configured, the generic arbitrary label (created with the **arbitrary-label** command) is used (if configured) for enrollment.

RFC 7030 allows the use of arbitrary labels so that one EST server may serve multiple CAs with the same server URL that gets concatenated with different arbitrary labels. The same label is used for every request made under a particular EST profile.

Some EST schemes use arbitrary labels in a more sophisticated way, defining different labels for different types of requests under the same EST profile. For example, the CA certificate request could use the generic label (configured with the **arbitrary-label** command) , the certificate enrollment request could use the enrollment label (configured with this **arbitrary-label-enrollment** command), and the re-enrollment request could use the re-enrollment label (configured with the **arbitrary-label-reenrollment** command). Note that only one label of each of the three available types can be configured in any EST profile.

The **no** form of this command removes the arbitrary enrollment label.

Parameter	Description
<LABEL>	Specifies the arbitrary enrollment label. Range: Up to 64 characters.

Examples

Configuring the arbitrary enrollment label:

```
switch(config)# crypto pki est-profile EST-service1
switch(config-est-EST-service1)# arbitrary-label-enrollment ipsec-v7
```

Removing the arbitrary enrollment label :

```
switch(config)# crypto pki est-profile EST-service1
switch(config-est-EST-service1)# no arbitrary-label-enrollment
```

For more information on features that use this command, refer to the Security Guide for your switch model.

arbitrary-label-reenrollment

```
arbitrary-label-reenrollment <LABEL>
no arbitrary-label-reenrollment
```

Description

Within the EST profile context, configures the arbitrary re-enrollment label to be concatenated to the EST server URL that is configured with the **url** command. This label is specific to the re-enrollment operation. There is no arbitrary re-enrollment label configured by default. Any existing arbitrary re-enrollment label is replaced by this command. The use of arbitrary re-enrollment labels is optional.

When the re-enrollment label is not configured, the generic arbitrary label (created with the **arbitrary-label** command) is used (if configured) for re-enrollment.

RFC 7030 allows the use of arbitrary labels so that one EST server may serve multiple CAs with the same server URL that gets concatenated with different arbitrary labels. The same label is used for every request made under a particular EST profile.

Some EST schemes use arbitrary labels in a more sophisticated way, defining different labels for different types of requests under the same EST profile. For example, the CA certificate request could use the generic label (configured with the **arbitrary-label** command) , the certificate enrollment request could use the enrollment label (configured with the **arbitrary-label-enrollment** command), and the re-enrollment request could use the re-enrollment label (configured with this **arbitrary-label-reenrollment** command). Note that only one label of each of the three available types can be configured in any EST profile.

The **no** form of this command removes the arbitrary re-enrollment label.

Parameter	Description
<LABEL>	Specifies the arbitrary re-enrollment label. Range: Up to 64 characters.

Examples

Configuring the arbitrary re-enrollment label:

```
switch(config)# crypto pki est-profile EST-service1
switch(config-est-EST-service1)# arbitrary-label-reenrollment ipsec-v7
```

Removing the arbitrary re-enrollment label :

```
switch(config)# crypto pki est-profile EST-service1
switch(config-est-EST-service1)# no arbitrary-label-reenrollment
```

For more information on features that use this command, refer to the Security Guide for your switch model.

crypto pki est-profile

```
crypto pki est-profile <EST-NAME>
no crypto pki est-profile <EST-NAME>
```

Description

Creates a certificate Enrollment over Secure Transport (EST) profile and changes to the **config-est-<EST-NAME>** context for the profile. Each EST profile stores information about the EST service, including EST server URL Up to 16 profiles can be created.

If the specified EST profile exists, this command changes to the **config-est-<EST-NAME>** context for the profile.

The **no** form of this command deletes the specified EST profile. It also deletes the TA profiles whose CA certificates were downloaded from the corresponding EST server, and the leaf certificates that were enrolled using this EST profile.

The deletion of the related TA profiles and enrolled certificates is permanent. If the EST profile is in the startup configuration and the EST profile is deleted but this deletion is not updated in the startup configuration before a switch reboot, the EST profile will still exist after the reboot but the related TA profiles and enrolled certificates will not exist.

Parameter	Description
<EST-NAME>	Specifies the EST profile name. Range: Up to 32 alphanumeric characters (excluding ").

Examples

Creating EST profile **EST-Service1**:

```
switch(config)# crypto pki est-profile EST-Service1
switch(config-est-service1)#
```

Removing EST profile **service1**:

```
switch(config)# no crypto pki est-profile EST-Service1
```

For more information on features that use this command, refer to the Security Guide for your switch model.

enroll est-profile

`enroll est-profile <EST-NAME>`

Description

Enrolls a leaf certificate through a remote EST (Enrollment over Secure Transport) server.

Per RFC 7030, EST enables clients to request certificate signing services over secure TLS connections. The switch generates a key pair and the corresponding CSR. The CSR is sent to the EST server to request signing, and the signed certificate is be returned to the switch where it is validated. If the whole process succeeds, the certificate can be used as a leaf certificate on the switch. When the leaf certificate approaches its expiry date, it will be renewed automatically through the same EST server.

Each enrollment or re-enrollment attempt starts with a **/cacerts** request sent to the EST server to get the latest chain of CA certificates. After the enrollment or re-enrollment succeeds, this chain of CA certificates will be compared with those downloaded previously from the same EST server. Updates will be made as appropriate.

The subject fields of the current leaf certificate must be defined before running this command. If the common name subject field is not configured, this command is rejected.

This command cannot be used to enroll or renew the default certificate "local-cert."

Parameter	Description
<EST-NAME>	Specifies an existing EST profile name. Range: Up to 32 alphanumeric characters (excluding ").

Example

Enrolling leaf certificate **leaf-cert1** through the EST server identified in EST profile **EST-service1**:

```
switch(config-cert-leaf-cert1)# enroll est-profile EST-service1
You are enrolling a certificate with the following attributes:
  Subject: C=US, ST=CA, L=Roseville, OU=Aruba-Roseville, O=Aruba,
         CN=leaf-cert1
  Key Type: RSA (2048 bits)

Continue (y/n)? y
Certificate enrollment via EST-service1 has been initiated.
Please use `show crypto pki certificate leaf-cert1` to check its status.

switch(config-cert-leaf-cert1)#
```

For more information on features that use this command, refer to the Security Guide for your switch model.

reenrollment-lead-time

```
reenrollment-lead-time <LEAD-TIME>
no reenrollment-lead-time
```

Description

Within the EST profile context, sets the certificate re-enrollment lead time which is the number of days before certificate expiry date that certificate re-enrollment will be initiated.

The **no** form of this command resets the EST server re-enrollment lead time to its default of 2 days.

Parameter	Description
<LEAD-TIME>	Specifies the certificate re-enrollment lead time in days. Range: 0 to 30 days. Default: 2 days.

Examples

Setting the certificate re-enrollment lead time to 15 days:

```
switch(config)# crypto pki est-profile EST-service1
switch(config-est-EST-service1)# reenrollment-lead-time 15
```

Resetting the certificate re-enrollment lead time to its default of 2 days :

```
switch(config)# crypto pki est-profile EST-service1
switch(config-est-EST-service1)# no reenrollment-lead-time
```

retry-count

```
retry-count <RETRIES>
no retry-count
```

Description

Within the EST profile context, sets the maximum number of retires to be attempted after the initial certificate enrollment request fails.

The **no** form of this command resets the maximum number of certificate enrollment request retries to its default of 3.

Parameter	Description
<RETRIES>	Specifies the maximum number of certificate enrollment request retries. Range: 0 to 32 retries. Default: 3 retries.

Examples

Setting the retry count to 5 retries:

```
switch(config)# crypto pki est-profile EST-service1
switch(config-est-EST-service1)# retry-count 5
```

Resetting the retry count to its default of 3 retries:

```
switch(config)# crypto pki est-profile EST-service1
switch(config-est-EST-service1)# no retry-count
```

retry-interval

```
retry-interval <INTERVAL>
no retry-interval
```

Description

Within the EST profile context, sets the interval at which a failed certificate enrollment request is retried.

The **no** form of this command resets the enrollment request retry interval to its default of 30 seconds.

Parameter	Description
<INTERVAL>	Specifies the enrollment request retry interval in seconds. Range: 30 to 600 seconds. Default: 30 seconds.

Examples

Setting the certificate enrollment request retry interval to 45 seconds:

```
switch(config)# crypto pki est-profile EST-service1
switch(config-est-EST-service1)# retry-interval 45
```

Resetting the retry interval to its default of 30 seconds:

```
switch(config)# crypto pki est-profile EST-service1
switch(config-est-EST-service1)# no retry-interval
```

Command Information

Platforms	Command context	Authority
All platforms	Manager (#)	Administrators or local user group members with execution rights for this command.

url

```
url <URL>
no url
```

Description

Within the EST profile context, configures the URL of the certificate enrollment EST server. This is not configured by default. Any existing URL is replaced by this command.

The **no** form of this command removes the EST server URL within the selected EST profile. The removal of the URL does not affect the TA profiles and enrolled certificates from the EST server.

Parameter	Description
<URL>	Specifies the EST server URL. Range: Up to 192 characters.

Usage

- The configuration and update of the EST profile URL triggers the sending of a **/cacerts** request to the EST server. A successful request will result in a chain of trusted CA certificates being downloaded from the EST server. Each CA certificate, either root CA certificates or intermediate CA certificates, will be saved as a TA profile, with TA profile name **<est-name>-est-taNN** with **NN** representing two numerical digits. This TA profile naming scheme with the **-est-taNN** suffix is reserved for TA profiles downloaded from EST servers.
- Upon connection with an EST server, the switch authenticates the server by validating the server certificate. For this validation to succeed, a TA profile needs to pre-exist in the switch with a CA certificate from the issuer chain of the server certificate. Once the server is authenticated, all CA certificates in its **/cacerts** response will be trusted, with no further validation occurring for them.
- The TA profiles with CA certificates downloaded from an EST server will have their revocation check set to OCSP, enforcement set to optional, and the OCSP VRF set to the same as that of the EST profile.

Examples

Configuring the EST server URL:

```
switch(config)# crypto pki est-profile EST-service1
switch(config-est-EST-service1)# url https://est-service999.com/.well-known/est
```

Removing the EST server URL:

```
switch(config)# crypto pki est-profile EST-service1
switch(config-est-EST-service1)# no url
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config-est-<EST-NAME>`	Administrators or local user group members with execution rights for this command.

username

```
username <USERNAME> password [ciphertext <CIPHERTEXT-PASSWORD> |
         plaintext <PLAINTEXT-PASSWORD>]
no username
```

Description

Within the EST profile context, configures the user account information for the EST server that is used to authenticate the switch before accepting requests from the switch. This is not configured by default. Any existing username and password is replaced by this command.

When entered without either optional **ciphertext** or **plaintext** parameters, the plaintext password is prompted for twice, with the characters entered masked with "*" symbols.

The **no** form of this command removes the user account information within the selected EST profile.

There are two ways the EST client on a CX switch can prove itself to an EST server: a certificate, and/or username and password. At least one of the two must be configured for the EST request to succeed. If both are configured, certificate authentication will be used. If a certificate is not configured or certificate authentication fails, and username and password is configured, the username and password will be sent to the EST server for authentication.

Parameter	Description
`<USERNAME>`	Specifies the EST server account user name. The exact user name requirements are set by the chosen EST service. Range: Up to 32 alphanumeric characters.
`ciphertext <CIPHERTEXT-PASSWORD>`	Specifies the EST server account password as Base64 ciphertext. No password prompts are provided and the ciphertext password is validated before the configuration is applied for the user. **NOTE:** The ciphertext password must be gotten from the EST service.
`plaintext <PLAINTEXT-PASSWORD>`	Specifies the password without prompting. The password is visible as cleartext when entered but is encrypted thereafter. The exact password requirements are set by the chosen EST service. Range: Up to 64 alphanumeric characters.

Examples

Configuring an EST user with prompted cleartext password entry :

```
switch(config)# crypto pki est-profile EST-service1
switch(config-est-EST-service1)# username est1 password
Enter password: ********
Confirm password: ********
switch(config-est-EST-service1)#
```

Configuring an EST user with direct cleartext password entry:

```
switch(config)# crypto pki est-profile EST-service2
switch(config-est-EST-service2)# username est1 password plaintext concept_leap739
```

Configuring an EST user with ciphertext password entry :

```
switch(config)# crypto pki est-profile EST-service3
switch(config-est-EST-service3)# username est1 password ciphertext
AQBpRALpWYm2z7L1LanOtR3vGkqhN1hBU2CuvQXUF/ggYgAAAHWaPqxU6nAnGTnKq49P4cdNQ6U
qPbjHL4XzO0T04djkUPKGfnsWuFEONveh+JbEobq63+1k80qBKImfwJjc3eWHiaUbeNpPx2zN2Q
1DdyxAAQi4rmKr8LITMTTMd7qr
```

Removing the EST user account information for EST profile EST-service2:

```
switch(config)# crypto pki est-profile EST-service2
switch(config-est-EST-service2)# no username
```

For more information on features that use this command, refer to the Security Guide for your switch model.

vrf

```
vrf <VRF-NAME>
no vrf
```

Description

Within the EST profile context, selects the VRF through which the EST server can be reached. Any existing VRF selection is replaced by this command. When this command is not used, VRF **mgmt** is used by default on switch families supporting the **mgmt** VRF, otherwise the default VRF named **default** is used.

The **no** form of this command selects the default VRF either **mgmt** or **default**.

Parameter	Description
<VRF-NAME>	Specifies the name of the VRF to use for EST server communication.

Examples

Selecting VRF **it-services** for EST server communications:

```
switch(config)# crypto pki est-profile EST-service1
switch(config-est-EST-service1)# vrf it-services
```

Resetting the VRF to its default of **mgmt** for EST server communications:

```
switch(config)# crypto pki est-profile EST-service1
switch(config-est-EST-service1)# no vrf
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Chapter 113
PoE commands

All PoE configuration commands except **threshold configuration** and **always-on poe configuration** are entered at the **config-if** context. The PoE threshold command is used at the system level whereas the **always-on poe**and **power-over-ethernet quick-poe** commands are set at the slot level. These commands can only be configured in the global configuration context.

lldp dot3 poe

```
lldp dot3 poe
no lldp dot3 poe
```

Description

Enables 802.3 TLV list in LLDP to advertise for Power over Ethernet Data Link Layer Classification. LLDP dot3 TLV is by default enabled for PoE.

The **no** form of this command disables 802.3 TLV list in LLDP.

Examples

On the 6400 Switch Series, interface identification differs.

Enabling 802.3 TLV list in LLDP:

```
switch(config)# interface 1/1/1
switch(config-if)# lldp dot3 poe
```

Disabling 802.3 TLV list in LLDP:

```
switch(config-if)# no lldp dot3 poe
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

lldp med poe

```
lldp med poe [priority-override]
no lldp med poe [priority-override]
```

Description

Enables MED TLV list in LLDP to advertise for Power over Ethernet Data Link Layer Classification. Also enables the lldp-MED TLV priority to override user configured port priority for Power over Ethernet. When both dot3 and MED are enabled, dot 3 will take precedence. MED TLV is by default enabled for PoE. Priority over-ride is by default disabled.

The **no** form of this command disables MED TLV list in LLDP.

Parameter	Description
`[priority-override]`	System defined name of the interface.

Examples

On the 6400 Switch Series, interface identification differs.

Enabling and disabling LLDP MED PoE:

```
switch(config)# interface 1/1/1
switch(config-if)# lldp med poe
switch(config-if)# no lldp med poe
```

Enabling and disabling LLDP MED PoE priority override:

```
switch(config-if)# lldp med poe priority-override
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

power-over-ethernet

```
power-over-ethernet
no power-over-ethernet
```

Description

Enables per-interface power distribution. Per-port power is enabled by default with priority low. PoE cannot be disabled for individual ports when Quick PoE is enabled for the entire switch or line module.

The **no** form of this command disables per-interface power distribution.

Examples

On the 6400 Switch Series, interface identification differs.

Enabling per-interface power distribution:

```
switch(config)# interface 1/1/1
switch(config-if)# power-over-ethernet
```

Disabling per-interface power distribution:

```
switch(config-if)# no power-over-ethernet
```

Showing Quick PoE enabled:

```
switch(config-if)# power-over-ethernet quick-poe 1/1
switch(config-if)# interface 1/1/1
switch(config-if)# no power-over-ethernet
Interface PoE cannot be disabled when Quick PoE is enabled.
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

power-over-ethernet allocate-by

```
power-over-ethernet allocate-by {usage | class}
no power-over-ethernet allocate-by {usage | class}
```

Description

Configures the power allocation method. Power allocation method is initially based on usage. PSE Allocated power value will change to LLDP negotiated power if and when LLDP exchange takes place between PSE and PD. When there is no LLDP negotiation, PSE Allocated Power Value will be the actual instantaneous power draw and reserve power based on actual consumption. In allocate-by class, power allocation is based on PD requested class and PSE allocated power value will be the LLDP negotiated power when LLDP exchange takes place between PSE and PD. When there is no LLDP negotiation, PSE Allocate Power will be based on PD class. Reserve power is based on PD Class. By default, power allocation is by usage.

The power allocation method can be changed on an interface through port-access (User roles or RADIUS). An allocation method when configured through port-access will replace the user configured method.

The **no** form of this command resets the action to default.

Parameter	Description
`usage`	Configures the usage-based allocation method.
`class`	Configures the class-based allocation method.

Usage

If you enable **pd-class-override** for an interface, the **allocate-by** configuration of that interface will be automatically changed to **class**. However, if you change the allocation method to **usage** when **pd-class-override** is still enabled, you will receive an error message stating that "The power allocation method cannot be changed when pd-class-override is enabled."

To remove **pd-class-override**, you can use the **no power-over-ethernet pd-class-override** command . It is important to note that **pd-class-override** requires the allocation method to be set to **class** and is enforced when configured through CLI. However, if you override the allocation method to **usage** via port-access, **pd-class-override** will not be in effect. Therefore, it is recommended that you do not override the allocation method to **usage** through port-access on interfaces configured with **pd-class-override**.

Examples

On the 6400 Switch Series, interface identification differs.

Configuring the power allocation method:

```
switch(config)# interface 1/1/1
switch(config-if)# power-over-ethernet allocate-by usage
switch(config-if)# power-over-ethernet allocate-by class
```

Resetting power allocation method:

```
switch(config-if)# no power-over-ethernet allocate-by class
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

power-over-ethernet always-on

```
power-over-ethernet always-on <MODULE-ID>
no power-over-ethernet always-on <MODULE-ID>
```

Description

Always-on PoE is a feature that provides the ability to the switch to continue to provide power across a soft reboot. It is applicable only to the interfaces which were connected and delivering before the soft reboot. Also, power will not be delivered if power to the switch is interrupted. This command enables or disables the always-on PoE feature at the switch or the slot level. By default, always-on PoE is enabled at the switch or the slot level.

The **no** form of this command disables power distribution on soft reboot.

Parameter	Description
<MODULE-ID>	Module number to apply always-on PoE configuration.

Examples

Enabling per-interface power distribution:

```
switch(config)# power-over-ethernet always-on 1/1
```

Disabling per-interface power distribution:

```
switch(config)# no power-over-ethernet always-on 1/1
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

power-over-ethernet assigned-class

```
power-over-ethernet assigned-class {3 | 4 | 6}
no power-over-ethernet assigned-class
```

Description

Limit PoE power based on the assigned class. When an user assigns a maximum class to an interface, the PSE will limit the maximum power delivered to the PD up to a total power draw not exceeding the PSE assigned-class power. Power demotion occurs when a PD requested class is higher than the PSE assigned class, permitting the PD to receive power and operate in a reduced power mode. PoE ports cannot set an assigned class when Quick PoE is enabled on the sybsystem. The default assigned class is 4 for 2-pair capable PSE and 6 for 4-pair capable PSE.

The **no** form of this command resets the action to default.

Examples

On the 6400 Switch Series, interface identification differs.

Setting PoE assigned class:

```
switch(config)# interface 1/1/1
switch(config-if)# power-over-ethernet assigned-class 4
```

Resetting PoE assigned class to default:

```
switch(config-if)# no power-over-ethernet assigned-class 4
```

Showing Quick PoE enabled:

```
switch(config)# power-over-ethernet quick-poe 1/1
switch(config)# interface 1/1/1
switch(config)# power-over-ethernet assigned-class 4
Interface assigned class cannot be configured when Quick PoE is enabled.
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

Command History

Release	Modification

power-over-ethernet power-pairs

```
power-over-ethernet power-pairs {alt-a | alt-a-and-alt-b}
no power-over-ethernet power-pairs {alt-a | alt-a-and-alt-b}
```

Description

Configures the four-pair capable switch to operate in a mode, that restricts the power delivery for class 0 to class 4 single signature devices to operate only on ALT-A power pair.

When configured, a warning message is displayed. User must accept the warning by entering **Y** to enable the mode.

The **no** form of this command resets the power pairs to default PoE pairs.

Parameter	Description
`alt-a`	Delivers power only on the ALT-A pair.
`alt-a-and-alt-b`	Delivers power on the ALT-A and ALT-B pairs. This is the default configuration on all PoE interfaces.

Usage

IEEE 802.3bt devices such as four-pair (class 5 and higher) and dual signature powered devices require power on both pairs. However, there is no such restriction on IEEE 802.3af (class 0 to class 3) and IEEE 802.3at (class 4) powered devices not to draw power on both pairs if the overall consumption does not violate the power class limit. For such powered devices, a **power-pairs** configuration is provided to configure the 4-pair capable switch to restrict power on only one power pair.

Examples

Configuring PoE power pairs:

```
switch(config)# interface 1/1/1
switch(config-if)# power-over-ethernet power-pairs alt-a

This setting configures the interface to deliver power only on the ALT-A
cable pair when a Class 0-4 device is connected. Devices that require power
on all pairs may not operate correctly.

Continue (y/n)? y
```

Resetting the PoE power pair to default:

```
switch(config-if)# no power-over-ethernet power-pairs alt-a

This setting configures the interface to deliver power on the ALT-A
and ALT-B cable pairs. This is the default and most devices work
properly with this setting, however some older Class 0-4 devices may
not operate correctly.

Continue (y/n)? y
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

power-over-ethernet pre-std-detect

```
power-over-ethernet pre-std-detect
no power-over-ethernet pre-std-detect
```

Description

Before IEEE 802.3 released the first Power over Ethernet standard (802.3af), vendors had shipped PoE capable switches and PD's. As we are backward compatible Aruba will support both IEEE standard and pre-standard 802.3af Power over Ethernet PD's concurrently. This CLI allows the user to enable or disable pre-802.3af-standard device detection and powering on the specific port. When pre-std-detect is enabled, power will be delivered on PairA only. Default is disabled.

The **no** form of this command resets the action to default.

Examples

On the 6400 Switch Series, interface identification differs.

Enabling standard device detection:

```
switch(config)# interface 1/1/1
switch(config-if)# power-over-ethernet pre-std-detect
```

Disabling standard device detection:

```
switch(config-if)# no power-over-ethernet pre-std-detect
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

power-over-ethernet priority

```
power-over-ethernet priority {critical | high | low}
no power-over-ethernet priority {critical | high | low}
```

Description

Sets PoE priority for an interface Specifying critical, high, or low indicates the priority of the interface in the event of power over-subscription. Within the same priority level, higher power-priority line-module ports have higher precedence. With same PoE priority and same line-module priority, lower numbered line-module ports have higher precedence. Per-interface PoE priority is low by default.

The **no** form of this command resets the priority to default PoE priority "low".

Examples

Configuring PoE priority:

```
switch(config)# interface 1/1/1
switch(config-if)# power-over-ethernet priority critical
switch(config-if)# power-over-ethernet priority high
```

Resetting the PoE priority to default:

```
switch(config-if)# no power-over-ethernet priority high
```

power-over-ethernet quick-poe

```
power-over-ethernet quick-poe <MODULE-ID>
```

```
no power-over-ethernet
```

Description

Quick PoE is a feature that provides the ability for the switch to provide power to the connected powered device as soon as switch goes through cold reboot. When quick PoE is enabled on the subsystem PoE port disablement and PD demotion is not allowed. also quick PoE enablement is not allowed if any of the port is disabled on the subsystem. User should not over-subscribe the PoE power when quick PoE is enabled. Quick PoE saved configuration will work irrespective of the configuration change at reboot.

Enables quick PoE feature on the switch or the subsystem level. By default, quick-PoE is disabled for the subsystem.

The **no** form of this command disables quick PoE.

Parameter	Description
<MODULE-ID>	Specifies module number for quick PoE configuration .

Examples

On the 6400 Switch Series, interface identification differs.

Enabling and disabling quick PoE:

```
switch(config)# power-over-ethernet quick-poe 1/2
switch(config)# no power-over-ethernet quick-poe 1/2
```

```
switch(config-if)# power-over-ethernet quick-poe 1/1
PoE must be enabled on all interfaces before enabling Quick PoE
```

```
switch(config-if)# power-over-ethernet quick-poe 1/3
All interfaces must use the default assigned class before enabling Quick PoE
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

power-over-ethernet threshold

```
power-over-ethernet threshold <PERCENTAGE>
no power-over-ethernet threshold <PERCENTAGE>
```

Description

Sets the threshold at which the system will send an excess power consumption notification trap. Default value is 80 percentage.

The **no** form of this command resets the action to default.

Parameter	Description
<PERCENTAGE>	Excess power consumption trap threshold. Range 1-99.

Examples

Setting the power-over-ethernet threshold:

```
switch(config)# power-over-ethernet threshold 75
```

Resetting the power-over-ethernet threshold to default:

```
switch(config-if)# no power-over-ethernet threshold 75
```

power-over-ethernet trap

```
power-over-ethernet trap
no power-over-ethernet trap
```

Description

This command enables/disables the SNMP trap generation for PoE related events at system level. PoE trap generation is enabled by default.

The **no** form of this command resets the priority to default PoE priority "low".

Examples

Enabling SNMP trap generation for PoE:

```
switch(config)# power-over-ethernet trap
```

Disabling SNMP trap generation for PoE:

```
switch(config-if)# no power-over-ethernet trap
```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show power-over-ethernet

6300 Switch Series:

```
show power-over-ethernet [member <MEMBER-ID>] [brief]
```

6400 Switch Series:

```
show power-over-ethernet [<MODULE-ID>] [brief]
```

6300, 6400 Switch Series:

```
show power-over-ethernet [<IFRANGE>] [brief]
```

Description

Displays the status information of the full system. Displays the brief status of all port or given port if parameter brief is used. Displays the detailed status of given port.

Parameter	Description
<MODULE-ID>	Displays detailed status for the given module.
<IFRANGE>	Port identifier range.

Parameter	Description
<IFNAME>	Display the detailed status of given port.
`brief`	Display the brief status of all ports or the given port.

Examples

Showing sample output for show power-over-ethernet on standalone box with VSF capabiity:

```
switch# show power-over-ethernet

System Power Status for member 1

  Configured  Power Status     : No redundancy
  Operational Power Status     : No redundancy

```

For more information on features that use this command, refer to the Monitoring Guide for your switch model.

Command History

Release	Modification
10.09	Added power-pairs configuration in the **show power-over-ethernet <IFRANGE>** output.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

Chapter 114

Port access 802.1X authentication commands

aaa authentication port-access dot1x authenticator

```
aaa authentication port-access dot1x authenticator {enable | disable}
no aaa authentication port-access dot1x authenticator {enable | disable}
```

Description

Enables or disables 802.1X authentication globally or at the port-level.

The **no** form of the command deletes global 802.1X configuration details and disables 802.1X authentication.

Examples

Enabling 802.1X authentication globally:

```
switch(config)# aaa authentication port-access dot1x authenticator enable
```

Disabling 802.1X authentication globally:

```
switch(config)# aaa authentication port-access dot1x authenticator disable
```

Deleting and disabling global 802.1X authentication:

```
switch(config)# no aaa authentication port-access dot1x authenticator
```

Enabling 802.1X authentication on a port:

```
switch(config-if)# aaa authentication port-access dot1x authenticator enable
```

Disabling 802.1X authentication on a port:

```
switch(config-if)# aaa authentication port-access dot1x authenticator disable
```

Deleting and disabling 802.1X authentication configuration on a port:

```
switch(config-if)# no aaa authentication port-access dot1x authenticator
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config` `config-if`	Administrators or local user group members with execution rights for this command.

aaa authentication port-access dot1x authenticator auth-method

```
aaa authentication port-access dot1x authenticator auth-method eap-radius
no aaa authentication port-access dot1x authenticator auth-method eap-radius
```

Description

Configures the authentication mechanism used to control access to the network. The configured authentication method will be used to authenticate 802.1X clients.

The **no** form of the command resets the authentication mechanism to the default, **eap-radius**.

Parameter	Description
`eap-radius`	Specifies the EAP RADIUS as the 802.1X authentication method.

Examples

Enabling the EAP RADIUS 802.1X authentication method on the switch:

```
switch(config)# aaa authentication port-access dot1x authenticator auth-method
eap-radius
```

Resetting the EAP RADIUS 802.1X authentication method on the switch:

```
switch(config)# no aaa authentication port-access dot1x authenticator auth-method
eap-radius
```

For more information on features that use this command, refer to the Security Guide for your switch model.

aaa authentication port-access dot1x authenticator cached-reauth

```
aaa authentication port-access dot1x authenticator cached-reauth
no aaa authentication port-access dot1x authenticator cached-reauth
```

Description

Enables cached reauthentication on a port. Cached reauthentication allows 802.1X reauthentications to succeed when the RADIUS server is unavailable. Users already authenticated retain their currently assigned RADIUS attributes.

The **no** form of the command disables the cached reauthentication on a port.

Examples

Enabling cached reauthentication on a port:

```
switch(config-if)# aaa authentication port-access dot1x authenticator cached-
reauth
```

Disabling cached reauthentication on a port:

```
switch(config-if)# no aaa authentication port-access dot1x authenticator cached-
reauth
```

For more information on features that use this command, refer to the Security Guide for your switch model.

aaa authentication port-access dot1x authenticator cached-reauth-period

```
aaa authentication port-access dot1x authenticator cached-reauth-period <PERIOD>
```

```
no aaa authentication port-access dot1x authenticator cached-reauth-period
```

Description

Configures the period during which an authenticated client, which has failed to reauthenticate because the RADIUS server is unreachable, remains authenticated.

The **no** form of the command resets the cached reauthentication period to the default, 30 seconds.

Parameter	Description
<PERIOD>	Specifies the cached reauthentication period (in seconds). Default: 3600. Range: 1 to 4294967295.

Examples

Configuring the cached reauthentication period on a port:

```
switch(config-if)# aaa authentication port-access dot1x authenticator cached-
reauth-period 300
```

Resetting the cached reauthentication period to the default value:

```
switch(config-if)# no aaa authentication port-access dot1x authenticator cached-
reauth-period
```

For more information on features that use this command, refer to the Security Guide for your switch model.

aaa authentication port-access dot1x authenticator discovery-period

```
aaa authentication port-access dot1x authenticator discovery-period <PERIOD>
no aaa authentication port-access dot1x authenticator discovery-period
```

Description

Configures the period the port waits to retransmit the next EAPOL request identity frame on an 802.1X enabled port that has no authenticated clients.

The **no** form of the command resets the discovery period to the default, 30 seconds.

Parameter	Description
<PERIOD>	Specifies the discovery period (in seconds). Default: 30. Range: 1 to 65535.

Examples

Configuring the discovery period on a port:

```
switch(config-if)# aaa authentication port-access dot1x authenticator discovery-
period 120
```

Resetting the discovery period to the default value:

```
switch(config-if)# no aaa authentication port-access dot1x authenticator
discovery-period
```

aaa authentication port-access dot1x authenticator eap-tls-fragment

```
aaa authentication port-access dot1x authenticator eap-tls-fragment towards-server <max-
fragment-size>
no aaa authentication port-access dot1x authenticator eap-tls-fragment towards-server
```

Description

Configure the maximum size in bytes of an EAP-TLS fragment encoded in a single RADIUS request packet. The **no** form of the command resets the size to the default value of 3072 bytes.

Examples

Setting the EAP-TLS fragment size for RADIUS request to 1024 bytes:

```
switch(config)# aaa authentication port-access dot1x authenticator eap-tls-fragment towards-server 1024
```

Resetting EAP-TLS fragment size back to the default value of 3072 bytes

```
switch(config-if)# no aaa authentication port-access dot1x authenticator eap-tls-fragment towards-server
```

For more information on features that use this command, refer to the Security Guide for your switch model.

aaa authentication port-access dot1x authenticator eapol-timeout

```
aaa authentication port-access dot1x authenticator eapol-timeout <EAPOL-TIMEOUT>
no aaa authentication port-access dot1x authenticator eapol-timeout
```

Description

Configure the period the switch waits for a response from a client before retransmitting an EAPOL PDU. If the value is **0**, the time period is calculated as per RFC 2988.

As per RFC 2988 2.1: Before Round-Trip Time (RTT) measurement, set Retransmission Timeout (RTO) to 3 seconds for initial retransmission and then double the RTO to provide back off as per section 5.5. Limit the maximum RTO (RTOmax) to 20 seconds as per section 4.3 of RFC 3748.

The **no** form of the command resets the timeout period to the default.

Parameter	Description
<EAPOL-TIMEOUT>	Specifies the EAPOL timeout period (in seconds). Range: 1 to 65535.

Examples

Configuring EAPOL timeout on a port:

```
switch(config-if)# aaa authentication port-access dot1x authenticator eapol-
timeout 120
```

Resetting the EAPOL timeout to the default value:

```
switch(config-if)# no aaa authentication port-access dot1x authenticator eapol-
timeout
```

For more information on features that use this command, refer to the Security Guide for your switch model.

aaa authentication port-access dot1x authenticator initial-auth-response-timeout

```
aaa authentication port-access dot1x authenticator
    initial-auth-response-timeout <TIMEOUT>
no aaa authentication port-access dot1x authenticator
    initial-auth-response-timeout [<TIMEOUT>]
```

Description

Configures the period of time (in seconds) the switch waits for the first EAPOL frame from a client before deeming the client to be incapable of 802.1X and therefore attempting the next authentication method, if any. The default is for this timeout to be disabled.

The **no** form of this command disables the timeout.

Parameter	Description
<TIMEOUT>	Specifies the timeout period (in seconds). Range: 1 to 65535.

Examples

Setting a 30 second timeout:

```
switch(config-if)# aaa authentication port-access dot1x authenticator
   initial-auth-response-timeout 30
```

Disabling the timeout:

```
switch(config-if)# no aaa authentication port-access dot1x authenticator
   initial-auth-response-timeout
```

For more information on features that use this command, refer to the Security Guide for your switch model.

aaa authentication port-access dot1x authenticator macsec

```
aaa authentication port-access dot1x authenticator macsec
no aaa authentication port-access dot1x authenticator macsec
```

Description

Enables the switch to provision a MACsec channel dynamically when the 802.1X client is authenticated using an EAP method that supports mutual authentication. MACsec is supported in device mode and in client mode with a client limit of one on MACsec-capable ports.

If a MACsec policy is not associated with the role applied to the client on the port with MACsec enabled, a MACsec channel will not be established and the port will be blocked on the data-plane.

The **no** form of the command disables MACsec using EAP on the port.

Examples

Enabling MACsec using EAP on a port:

```
switch(config)# interface 1/1/1
switch(config-if)# aaa authentication port-access dot1x authenticator macsec
OR
switch(config)# interface 1/1/1
switch(config-if)# aaa authentication port-access dot1x authenticator
switch(config-if-dot1x-auth)# macsec
```

Disabling MACsec using EAP on a port:

```
switch(config)# interface 1/1/1
switch(config-if)# no aaa authentication port-access dot1x authenticator macsec
OR
switch(config)# interface 1/1/1
switch(config-if)# aaa authentication port-access dot1x authenticator
switch(config-if-dot1x-auth)# no macsec
```

For more information on features that use this command, refer to the Security Guide for your switch model.

aaa authentication port-access dot1x authenticator max-eapol-requests

```
aaa authentication port-access dot1x authenticator max-eapol-requests <MAX-EAPOL-REQUESTS>
no aaa authentication port-access dot1x authenticator max-eapol-requests
```

Description

Configures the number of EAPOL requests to send to a supplicant that must time out before authentication fails and the authentication session ends.

The **no** form of the command resets the maximum number of EAPOL requests to the default, 5.

Parameter	Description
<MAX-EAPOL-REQUESTS>	Specifies the maximum number of EAPOL requests. Default: 5. Range: 1 to 10.

Examples

Configuring maximum EAPOL requests on a port:

```
switch(config-if)# aaa authentication port-access dot1x authenticator max-eapol-requests 3
```

Resetting the maximum EAPOL requests on a port to default:

```
switch(config-if)# no aaa authentication port-access dot1x authenticator max-
eapol-requests
```

For more information on features that use this command, refer to the Security Guide for your switch model.

aaa authentication port-access dot1x authenticator max-retries

```
aaa authentication port-access dot1x authenticator max-retries <max-retries>
no aaa authentication port-access dot1x authenticator max-retries
```

Description

Configures the maximum number of retries that the switch attempts to authenticate a client on a port before marking the client as unauthenticated.

The **no** form of the command resets the maximum number of retries to the default, 2.

Parameter	Description
<max-retries>	Indicates the number of authentication attempts. Default: 2. Range: 1 to 10.

Examples

Configuring maximum authentication attempts on a port:

```
switch(config-if)# aaa authentication port-access dot1x authenticator max-retries
5
```

Resetting the maximum authentication attempts on a port to default:

```
switch(config-if)# no aaa authentication port-access dot1x authenticator max-
retries
```

aaa authentication port-access dot1x authenticator mka cak-length

```
aaa authentication port-access dot1x authenticator mka cak-length {16|32}
no aaa authentication port-access dot1x authenticator mka cak-length {16|32}
```

Description

Configures the length of the Connectivity Association Key (CAK) to generate for EAP based MACsec.

The **no** form of this command resets the length to the default value of 32 bytes.

Parameter	Description
`{16|32}`	Specifies the CAK length. Default: 32.

Examples

Configuring the CAK length to 16 bytes:

```
switch(config)# interface 1/1/1
switch(config-if)# aaa authentication port-access dot1x authenticator mka cak-
length 16
OR
switch(config)# interface 1/1/1
switch(config-if)# aaa authentication port-access dot1x authenticator
switch(config-if-dot1x-auth)# mka cak-length 16
```

Configuring the CAK length to default:

```
switch(config)# interface 1/1/1
switch(config-if)# no aaa authentication port-access dot1x authenticator mka cak-
length
OR
switch(config)# interface 1/1/1
switch(config-if)# aaa authentication port-access dot1x authenticator
switch(config-if-dot1x-auth)# no mka cak-length
```

```
OR
switch(config)# interface 1/1/1
switch(config-if)# aaa authentication port-access dot1x authenticator
switch(config-if-dot1x-auth)# no mka cak-length 16
```

aaa authentication port-access dot1x authenticator quiet-period

```
aaa authentication port-access dot1x authenticator quiet-period <PERIOD>
no aaa authentication port-access dot1x authenticator quiet-period
```

Description

Configures the period during which the port does not try to acquire a supplicant. This period begins after the last authentication attempt, authorized by the maximum retries parameter, fails.

You can configure the number of maximum retries with the **aaa authentication port-access dot1x authenticator max-retries** command.

The **no** form of the command resets the quiet period to the default, 60 seconds.

Parameter	Description
<PERIOD>	Specifies the quiet period (in seconds). Default: 60. Range: 0 to 65535.

Examples

Configuring quiet period on a port:

```
switch(config-if)# aaa authentication port-access dot1x authenticator quiet-period
100
```

Resetting the quiet period on a port to default:

```
switch(config-if)# no aaa authentication port-access dot1x authenticator quiet-period
```

aaa authentication port-access dot1x authenticator radius server-group

```
aaa authentication port-access dot1x authenticator radius server-group <GROUP-NAME>
no aaa authentication port-access dot1x authenticator radius server-group <GROUP_NAME>
```

Description

Configures the switch to use an existing RADIUS server group for 802.1X authentication globally or for a particular port.

The **no** form of the command resets the server group to the default, **radius**.

When configured on a port, the **no** form of the command resets the server group on that port to the globally configured group. If no global RADIUS server group is configured, the **no** form of the command resets the configuration to the default group, **radius**.

When the RADIUS server group for 802.1X authentication is updated on a port, any existing clients on the port that were authenticated using the previous globally configured group will associate with the new group for the port during the next re-authentication cycle. Any new client that is onboarding on the port after the server group update will associate with the new group immediately.

Parameter	Description
<GROUP-NAME>	Specifies the name of the RADIUS server group.

Examples

Configuring the switch to use RADIUS server group **employee**:

```
switch(config)# aaa authentication port-access dot1x authenticator radius server-
group employee
```

Resetting RADIUS server group configuration to default:

```
switch(config)# no aaa authentication port-access dot1x authenticator radius
server-group
```

Configuring the RADIUS authentication server group on **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# aaa authentication port-access dot1x authenticator
switch(config-if-dot1x-auth)# radius server-group group2
```

Resetting 802.1X RADIUS server group configuration on **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# aaa authentication port-access dot1x authenticator
switch(config-if-dot1x-auth)# no radius server-group
```

For more information on features that use this command, refer to the Security Guide for your switch model.

aaa authentication port-access dot1x authenticator reauth

```
aaa authentication port-access dot1x authenticator reauth
no aaa authentication port-access dot1x authenticator reauth
```

Description

Enables periodic reauthentication of authenticated clients on the port.

The **no** form of the command disables periodic reauthentication.

Examples

Enabling periodic reauthentication on a port:

```
switch(config-if)# aaa authentication port-access dot1x authenticator reauth
```

Disabling periodic reauthentication on a port:

```
switch(config-if)# no aaa authentication port-access dot1x authenticator reauth
```

aaa authentication port-access dot1x authenticator reauth-period

```
aaa authentication port-access dot1x authenticator reauth-period <PERIOD>
no aaa authentication port-access dot1x authenticator reauth-period
```

Description

Configures the period after which the authenticated clients are reauthenticated on the port. You must enable reauthentication on the port before configuring the reauthentication period.

The **no** form of the command resets the reauthentication period to the default, 3600 seconds.

Parameter	Description
<PERIOD>	Specifies the reauthentication period (in seconds). Default: 3600. Range: 1 to 4294967295.

Examples

Configuring reauthentication period on a port:

```
switch(config-if)# aaa authentication port-access dot1x authenticator reauth-
period 100
```

Resetting the reauthentication period to the default value:

```
switch(config-if)# no aaa authentication port-access dot1x authenticator reauth-
period
```

clear dot1x authenticator statistics interface

`clear dot1x authenticator statistics [interface <IF-NAME>]`

Description

Clears the 802.1X authentication statistics associated with the port and all the authenticator clients attached to this port.

If no interface is specified, the statistics is cleared for all 802.1X enabled ports.

Parameter	Description
<IF-NAME>	Specifies the interface name.

Examples

Clearing authentication statistics on a port:

```
switch# clear dot1x authenticator statistics interface 1/3/1
```

Clearing authentication statistics on all ports:

```
switch# clear dot1x authenticator statistics
```

For more information on features that use this command, refer to the Security Guide for your switch model.

aaa authentication port-access dot1x supplicant (port)

`aaa authentication port-access dot1x supplicant`

Description

Enters the 802.1X supplicant port context.

The 802.1X supplicant is only supported on L2 physical interfaces that are not members of a LAG.

Example

Enter the 802.1X supplicant port context:

```
switch(config)# interface 1/1/1
switch(config-if)# no routing
switch(config-if)# aaa authentication port-access dot1x supplicant
switch(config-if-dot1x-supp)#
```

When entering the context on a L3 port, an error message displays:

```
switch(config)# interface 1/1/1
switch(config-if)# aaa authentication port-access dot1x supplicant
The operation is allowed only on a L2 physical interface.
```

When entering the context on a LAG, an error message displays:

```
switch(config)# interface lag 1
switch(config-if)# aaa authentication port-access dot1x supplicant
The operation is allowed only on a L2 physical interface.
```

For more information on features that use this command, refer to the Security Guide for your switch model.

	`config-if`
	`config-dot1x-supp`
		Administrators or local user group members with execution rights for this command.

associate policy

```
associate policy <POLICY-NAME>
no associate policy <POLICY-NAME>
```

Description

Associates a supplicant policy with the port.

The **no** form of the command dissociates the policy from the port and reverts to the default policy.

If an 802.1X supplicant is enabled on the port without associating a policy or dissociating a policy from the port, it results in the port using the default policy.

Parameter	Description
<POLICY-NAME>	Specifies the name of the policy. (Maximum 32 characters).

Examples

Associating a supplicant policy with the port:

```
switch(config)# interface 1/1/1
switch(config)# no routing
switch(config-if)# aaa authentication port-access dot1x supplicant
switch(config-if-dot1x-supp)# associate policy CX_Policy
```

Removing the supplicant policy on the port:

```
switch(config)# interface 1/1/1
switch(config-if)# aaa authentication port-access dot1x supplicant
switch(config-if-dot1x-supp)# no associate policy
OR

switch(config)# interface 1/1/1
switch(config-if)# aaa authentication port-access dot1x supplicant
switch(config-if-dot1x-supp)# no associate policy CX_Policy
```

When the policy being associated does not exist:

```
switch(config)# interface 1/1/1
switch(config-if)# aaa authentication port-access dot1x supplicant
switch(config-if-dot1x-supp)# associate policy New_Supp_Policy
The policy does not exist.
```

When the policy being dissociated is not the one configured on the port:

```
switch(config)# interface 1/1/1
switch(config-if)# aaa authentication port-access dot1x supplicant
switch(config-if-dot1x-supp)# associate policy New_Supp_Policy
The input value does not match the currently configured value.
```

For more information on features that use this command, refer to the Security Guide for your switch model.

canned-eap-success

```
canned-eap-success
no canned-eap-success
```

Description

Configures the switch to accept an EAP success from the authenticator without going through the complete authentication cycle. Default: disabled.

The **no** form of the command resets it to the default.

Examples

Configuring the switch to accept a canned EAP success:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# canned-eap-success
```

Resetting the allow canned EAP success configuration to the default value in the system:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)#policy CX_Policy
switch(config-dot1x-supp-policy)# no canned-eap-success
```

For more information on features that use this command, refer to the Security Guide for your switch model.

clear dot1x supplicant statistics

```
clear dot1x supplicant statistics [interface <IFRANGE>]
```

Description

Clears the 802.1X supplicant statistics associated with the interface. If no interface is specified, the statistics are cleared for all 802.1X supplicant-enabled interfaces.

Parameter	Description
<IFRANGE>	Specifies the range of VLAN interfaces for which the supplicant statistics are cleared.

Examples

Clearing authenticator statistics on a specific interface:

```
switch# clear dot1x supplicant statistics 1/1/1
```

Clearing authenticator statistics on all interfaces:

```
switch# clear dot1x supplicant statistics
```

Showing the message when the feature is not enabled on any interface of the system:

```
switch# clear dot1x supplicant statistics
802.1X supplicant is not configured.
```

Showing the message when the feature is not enabled on the interface:

```
switch# clear dot1x supplicant statistics 1/1/1
802.1X supplicant is not configured.
```

Showing the message when there are no 802.1X supplicants on the system:

```
switch# clear dot1x supplicant statistics
No 802.1X supplicants found.
```

Showing the message when there are no 802.1X supplicants on the interface:

```
switch# clear dot1x supplicant statistics 1/1/1
No 802.1X supplicants found.
```

For more information on features that use this command, refer to the Security Guide for your switch model.

6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

discovery-timeout

```
discovery-timeout <DISCOVERY-TIMEOUT>
no discovery-timeout <DISCOVERY-TIMEOUT>
```

Description

Configures the time period (in seconds) to wait for a potential 802.1X authenticator on the other end before considering the link to be non-802.1X-capable and opening the interface on the data-plane. On a timeout, the switch will not use the authentication result to determine the forwarding behavior of the interface until a link flap. If not set, the switch will wait for the 802.1X authentication cycle to complete before determining the forwarding state of the interface.

The **no** form of the command removes the configuration.

Parameter	Description
<DISCOVERY-TIMEOUT>	Specifies discovery timeout in seconds. Range: 0-300 seconds.

Examples

Configuring a discovery timeout of 15 seconds in the supplicant policy:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# discovery-timeout 15
```

Removing the discovery timeout from the policy:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp)# no discovery-timeout

OR

switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# no discovery-timeout 15
```

When the value entered does not match the currently configured non-default value for EAPoL timeout, the following message is displayed:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# discovery-timeout 15
switch(config-dot1x-supp-policy)# no discovery-timeout 5
The input value does not match the currently configured value.
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.09	Command introduced.

Command Information

Platforms	Command context	Authority

6300
6400
	`config`
	`config-dot1x-supp`
	`config-dot1x-supp-policy`
		Administrators or local user group members with execution rights for this command.

eap-identity

```
eap-identity identity <IDENTITY>
no eap-identity identity <IDENTITY>
eap-identity password {plaintext [<PLAINTEXT-PASSWORD>] | ciphertext <CIPHERTEXT-PASSWORD>}
no eap-identity password {plaintext [<PLAINTEXT-PASSWORD>] | ciphertext <CIPHERTEXT-PASSWORD>}
```

Description

Configures the EAP identity to use for authentication including an identity name and an optional password.

The **no** form of the command removes the configuration.

Parameter	Description
<IDENTITY>	Specifies the EAP identity name. Maximum: 64 characters.
<PLAINTEXT-PASSWORD>	Specifies the password associated with the EAP identity in plaintext. Maximum: 32 characters. Specifies the password without prompting. The password is visible as cleartext when entered but is encrypted thereafter. Command history does show the password as cleartext.
<CIPHERTEXT-PASSWORD>	Specifies a ciphertext password. No password prompts are provided and the ciphertext password is validated before the configuration is applied for the user. The variable *<CIPHERTEXT-PASSWORD>* is Base64 and is typically copied from another switch using the `show running-config` command output and then pasted into this command.

Parameter	Description
	NOTE: The administrator cannot construct ciphertext passwords themselves. The ciphertext is only created by an AOS-CX switch. The ciphertext is created by setting a password for a user with the `user` command. The ciphertext is available for copying from the `show running-config` output and pasting into the configuration on any other AOS-CX switch. The target switch must have the same export password (default or otherwise) as the source switch.

Examples

Configuring the EAP identity and password:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# eap-identity identity John Doe
switch(config-dot1x-supp-policy)# eap-identity password plaintext johndoe

OR

switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# eap-identity identity John Doe
switch(config-dot1x-supp-policy)# eap-identity password plaintext
Enter password: ******
Confirm password: ******

OR

switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# eap-identity identity John Doe
switch(config-dot1x-supp-policy)# eap-identity password ciphertext
AQBapUwNK5Uf+r1vmhBIncQPw1YPVH0V1nYr7Yjm/bPn3bBVCgAAAHFKt8mcSv/A/g8=
```

Removing the EAP identity configuration:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp)# no eap-identity identity

OR

switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# no eap-identity identity John Doe
```

Removing the EAP identity password configuration:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# no eap-identity password

OR

switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# no eap-identity ciphertext
AQBapUwNK5Uf+r1vmhBIncQPw1YPVH0V1nYr7Yjm/bPn3bBVCgAAAHFKt8mcSv/A/g8=
```

When the EAP identity string is longer than 64 characters, the following message is displayed:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# eap-identity identity This is a really long
string with more than sixty four characters in it
The EAP identity string is more than 64 characters long.
```

When the EAP identity password string is longer than 32 characters, the following message is displayed:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# eap-identity password plaintext This is a
password with more than 32 characters
The password is more than 32 characters long.
```

For more information on features that use this command, refer to the Security Guide for your switch model.

eapol-force-multicast

```
eapol-force-multicast
no eapol-force-multicast
```

Description

Configures the switch to send only multicast EAPoL packets irrespective of receiving unicast EAPoL packets from the authenticator. Default: disabled.

The **no** form of the command resets it to the default.

Examples

Configuring the switch to always send EAPoL multicast packets:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# eapol-force-multicast
```

Resetting the EAPoL force multicast setting to the default value in the system:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# no eapol-force-multicast
```

For more information on features that use this command, refer to the Security Guide for your switch model.

eapol-method

```
eapol-method {eap-tls | eap-md5}
no eapol-method {eap-tls | eap-md5}
```

Description

Configures the Extensible Authentication Protocol (EAP) method to use for authentication.

The **no** form of the command resets it to the default. The default is EAP-TLS.

Parameter	Description
`eapol-method`	Specifies the EAPoL method to use for authentication. Default: eap-tls.
`eap-tls`	Specifies the EAP method as EAP with TLS (EAP with transport layer security)
`eap-md5`	Specifies the EAP method as EAP with MD5 digest.

Examples

Configuring the EAP method as EAP-MD5:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# eap-method eap-md5
```

Resetting the EAP method to the default value in the system:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp)# no eap-method

OR

switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# no eap-method eap-md5
```

When the value entered does not match the currently configured non-default value for EAP method, the following message is displayed:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# eap-method eap-md5
switch(config-dot1x-supp-policy)# no eap-method eap-tls
The input value does not match the currently configured value.
```

For more information on features that use this command, refer to the Security Guide for your switch model.

eapol-protocol-version

```
eapol-protocol-version
no eapol-protocol-version
```

Description

Configures the EAPoL protocol version to use in EAPoL frames transmitted by the supplicant.

The **no** form of the command resets it to the default.

When the EAPoL protocol version is modified while the policy is in use on one or more ports, all the supplicant sessions on such ports are restarted.

Parameter	Description
protocol-version	Required. Specifies the protocol-version. Options: 2 or 3. Default: 3.

Examples

Configuring the EAPoL protocol version as 2 in the supplicant policy:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# eapol-protocol-version 2
```

Reset the EAPoL protocol version to the default value:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp)# no eapol-protocol-version

OR

switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# no eapol-protocol-version 2
```

When the value entered does not match the currently configured non-default value for EAPoL protocol version, the following message is displayed:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# eapol-protocol-version 2
switch(config-dot1x-supp-policy)# no eapol-protocol-version 3
The input value does not match the currently configured value.
```

For more information on features that use this command, refer to the Security Guide for your switch model.

eapol-source-mac

```
eapol-source-mac (interface-mac | system-mac)
no eapol-source-mac (interface-mac | system-mac)
```

Description

Configures the source MAC address to use in the EAPoL frames transmitted by the 802.1X supplicant. The default is interface MAC address.

The **no** form of the command resets to its default EAPoL source MAC value.

Parameter	Description
`interface-mac`	Specifies the interface MAC address.
`system-mac`	Specifies the system MAC address.

Examples

Configuring the EAPoL source MAC as system MAC address:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# eapol-source-mac system-mac
```

Resetting the EAPoL source MAC to its default address:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# no eapol-source-mac system-mac
```

Removing the source MAC address that is not configured for EAPoL source MAC:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# eapol-source-mac system-mac
switch(config-dot1x-supp-policy)# no eapol-source-mac interface-mac
The input value does not match the currently configured value.
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.10.1000	Command introduced on the 6300 Switches.

Command Information

Platforms	Command context	Authority

6300	`config`

	`config-dot1x-supp-policy`
		Administrators or local user group members with execution rights for this command.

eapol-timeout

```
eapol-timeout <EAPOL-TIMEOUT>
no eapol-timeout <EAPOL-TIMEOUT>
```

Description

Configures the time period (in seconds) to wait for a response from an authenticator before reattempting authentication.

The **no** form of the command resets it to the default.

Parameter	Description
<EAPOL-TIMEOUT>	Specifies EAPoL timeout in seconds. Default: 30 seconds.

Examples

Configuring an EAPoL timeout of 10 seconds in the supplicant policy:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# eapol-timeout 10
```

Resetting the EAPoL timeout to the default value in the system:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp)# no eapol-timeout

OR

switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# no eapol-timeout 10
```

When the value entered does not match the currently configured non-default value for EAPoL timeout, the following message is displayed:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# eapol-timeout 10
switch(config-dot1x-supp-policy)# no eapol-timeout 5
The input value does not match the currently configured value.
```

For more information on features that use this command, refer to the Security Guide for your switch model.

6300 6400	config config-dot1x-supp config-dot1x-supp-policy	Administrators or local user group members with execution rights for this command.

enable

```
enable
no enable
```

Description

Enables the 802.1X supplicant on the port. By default, the 802.1X supplicant is disabled on the port.

The **no** form of the command disables the 802.1X supplicant on the port.

Example

Enable the 802.1X supplicant on the port:

```
switch(config)# interface 1/1/1
switch(config)# no routing
switch(config-if)# aaa authentication port-access dot1x supplicant
switch(config-if-dot1x-supp)# enable
```

Disable the 802.1X supplicant on the port:

```
switch(config)# interface 1/1/1
switch(config-if)# no aaa authentication port-access dot1x supplicant
switch(config-if-dot1x-supp)# no enable
```

For more information on features that use this command, refer to the Security Guide for your switch model.

fail-mode

```
fail-mode [fail-closed | fail-open]
no fail-mode [fail-closed | fail-open]
```

Description

Configures the forwarding behavior of the when the 802.1X authentication fails. Default: fail-open.

The **no** form of the command resets it to the default.

Examples

Configuring the fail mode as fail-closed:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# fail-mode fail-closed
```

Resetting the fail mode to the default value in the system:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)#policy CX_Policy
switch(config-dot1x-supp-policy)# no fail-mode

OR

switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)#policy CX_Policy
switch(config-dot1x-supp-policy)# no fail-mode fail-closed
```

When the fail-mode value entered does not match the currently configured non-default value:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# fail-mode fail-closed
switch(config-dot1x-supp-policy)# no fail-mode fail-open
The input value does not match the currently configured value.
```

For more information on features that use this command, refer to the Security Guide for your switch model.

held-period

```
held-period <HELD-PERIOD>
no held-period <HELD-PERIOD>
```

Description

Configure the time period (in seconds) to wait after a failed authentication attempt before another attempt is permitted.

The **no** form of the command resets it to default.

Parameter	Description
<HELD-PERIOD>	Specifies the held period in seconds. Default: 60 seconds.

Usage

When the value entered does not match the currently configured non-default value for held-period, the following message is displayed:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# held-period 30
switch(config-dot1x-supp-policy)# held-period 50
The input value does not match the currently configured value.
```

Examples

Configuring a held period of 30 seconds in the supplicant policy:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# held-period 30
```

Resetting the held period to the default value in the system:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp)# no held-period

OR

switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# no held-period 30
```

When the value entered does not match the currently configured non-default value for held-period, the following message is displayed:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# held-period 30
switch(config-dot1x-supp-policy)# held-period 50
The input value does not match the currently configured value.
```

For more information on features that use this command, refer to the Security Guide for your switch model.

macsec

```
macsec
no macsec
```

Description

Enables the switch to provision a MACsec channel dynamically when the 802.1X supplicant is authenticated using an EAP method that supports mutual authentication. By default, MACsec is disabled on the port.

The **no** form of the command disables MACsec for an 802.1X supplicant on the port.

A MACsec policy must be associated with the supplicant policy attached to the port with MACsec enabled. Otherwise, a MACsec channel will not be established and the port will be blocked on the data plane.

Example

Enabling MACsec using EAP for an 802.1X supplicant on the port:

```
switch(config)# interface 1/1/1
switch(config)# no routing
switch(config-if)# aaa authentication port-access dot1x supplicant
switch(config-if-dot1x-supp)# macsec
```

Disabling MACsec using EAP for an 802.1X supplicant on the port:

```
switch(config)# interface 1/1/1
switch(config-if)# aaa authentication port-access dot1x supplicant
switch(config-if-dot1x-supp)# no macsec
```

Attempting to enable MACsec on a port that is not MACsec capable:

```
switch(config)# interface 1/1/10
switch(config)# no routing
switch(config-if)# aaa authentication port-access dot1x supplicant
switch(config-if-dot1x-supp)# macsec
MACsec is not supported on the interface.
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.10	Command introduced.

Command Information

Platforms	Command context	Authority
6300	`config-if-dot1x-supp`	Administrators or local user group members with execution rights for this command.

macsec-policy

```
macsec-policy <POLICY-NAME>
no macsec-policy <POLICY-NAME>
```

Description

Associates a MACsec policy with a supplicant policy for the supplicant to use when the supplicant is running MACsec on a port.

The **no** form of the command disassociates the MACsec policy from the supplicant policy.

Parameter	Description
<POLICY-NAME>	Specifies the name of the MACsec policy. (Maximum 128 characters).

Examples

Associating a MACsec policy with the supplicant policy:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy Supp_Policy
switch(config-dot1x-supp-policy)# macsec-policy MSec_Policy1
```

Disassociating a MACsec policy from the supplicant policy:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy Supp_Policy
switch(config-dot1x-supp-policy)# no macsec-policy
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.10	Command introduced.

Command Information

Platforms	Command context	Authority
6300	`config-dot1x-supp-policy`	Administrators or local user group members with execution rights for this command.

max-retries

```
max-retries <MAX-RETRIES>
no max-retries <MAX-RETRIES>
```

Description

Configures the maximum number of authentication attempts before authentication fails.

The **no** form of the command resets it to the default.

Parameter	Description
<MAX-RETRIES>	Specifies the maximum retry attempts allowed. Range: 1-5. Default: 2.

Examples

Configuring the maximum retries to 5 in the supplicant policy:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# max-retries 5
```

Resetting the max retries to the default value in the system:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp)# no max-retries

OR
```

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# no max-retries 5
```

When the value entered does not match the currently configured non-default value for max-retries, the following message is displayed:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# max-retries 5
switch(config-dot1x-supp-policy)# max-retries 3
The input value does not match the currently configured value.
```

For more information on features that use this command, refer to the Security Guide for your switch model.

		Administrators or local user group members with execution rights for this command.

mka cak-length

```
mka cak-length {16|32}
no mka cak-length {16|32}
```

Description

Configures the length of the Connectivity Association Key (CAK) to generate for EAP based MACsec.

The **no** form of this command resets it to the default length of 32 bytes.

Parameter	Description
`{16|32}`	Specifies the CAK length. Default: 32.

Examples

Configuring the CAK length to 16 bytes:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# mka cak-length 16
```

Configuring the CAK length to default:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# no mka cak-length
OR
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# no mka cak-length 16
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.10.1000	Command introduced on the 6300 switch series.

Command Information

policy (supplicant)

```
policy <POLICY-NAME>
no policy <POLICY-NAME>
```

Description

Creates an 802.1X supplicant policy on the system.

The **no** form of the command deletes the 802.1X supplicant policy on the system.

Parameter	Description
<POLICY-NAME>	Specifies the name of the policy. (Maximum 32 characters).

Usage

Configure an 802.1X supplicant policy on the system:

Examples

Configure an 802.1X supplicant policy on the system:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)#
```

Delete the 802.1X supplicant policy from the system:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# no policy CX_Policy
```

For more information on features that use this command, refer to the Security Guide for your switch model.

port-access dot1x supplicant restart

`port-access dot1x supplicant restart [interface <IFRANGE>]`

Description

Restarts the 802.1X supplicant on the specified interface. The current authentication state is discarded and the supplicant restarts the authentication process.

Parameter	Description
<IFRANGE>	Optional. Specifies the range of physical interfaces for which the supplicant is restarted.

Examples

Restarting the 802.1X supplicant on a specific interface:

```
switch# port-access dot1x supplicant restart interface 1/1/1
switch#
```

Restarting the 802.1X supplicant on all interfaces:

```
switch# port-access dot1x supplicant restart
switch#
```

Showing the message when the feature is not enabled on any interface of the system:

```
switch# port-access dot1x supplicant restart
802.1X supplicant is not configured.
```

Showing the message when the feature is not enabled on the given interface:

```
switch# port-access dot1x supplicant restart 1/1/1
802.1X supplicant is not configured.
```

Showing the message when there are no 802.1X supplicants on the system:

```
switch# port-access dot1x supplicant restart
No 802.1X supplicants found.
```

Showing the message when there are no 802.1X supplicants on the interface:

```
switch# port-access dot1x supplicant restart 1/1/1
No 802.1X supplicants found.
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.09	Command introduced.

show aaa authentication port-access dot1x supplicant policy

```
show aaa authentication port-access dot1x supplicant policy <POLICY-NAME>
```

Description

Shows information about the 802.1X supplicant policies on the system.

Parameter	Description
<POLICY-NAME>	Specifies the name of the policy. (Maximum 32 characters).

Examples

Showing all 802.1X supplicant policies on the system:

```
switch# show aaa authentication port-access dot1x supplicant policy

802.1X Supplicant Policy Details

  Policy Name: default
  ----------------------------------------------------------------------------
  Type                       : Default

6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show aaa authentication port-access dot1x supplicant statistics

```
show aaa authentication port-access dot1x supplicant statistics
[interface {<IFRANGE> | vlan <VLAN-ID>}]
```

Description

Shows the 802.1X supplicant statistics on each 802.1X supplicant-enabled interface.

Parameter	Description
<IFRANGE>	Specifies the range of VLAN interfaces for which the supplicant status is shown.
vlan *<VLAN-ID>*	Specifies a VLAN interface for which the supplicant status is shown.

Examples

Showing the 802.1X supplicant statistics on all enabled interfaces:

```
switch# show aaa authentication port-access dot1x supplicant statistics

802.1X Supplicant Statistics

Interface 1/1/1
===================

  EAP-Logoff When Authenticated            : 0
```

Showing the message when the feature is not enabled on any interface of the system:

```
switch# show aaa authentication port-access dot1x supplicant statistics
802.1X supplicant is not configured.
```

Showing the message when the feature is not enabled on the interface:

```
switch# show aaa authentication port-access dot1x supplicant statistics interface
1/1/1
802.1X supplicant is not configured.
```

Showing the message when there are no 802.1X supplicants on the system:

```
switch# show aaa authentication port-access dot1x supplicant status
No 802.1X supplicants found.
```

Showing the message when there are no 802.1X supplicants on the interface:

```
switch# show aaa authentication port-access dot1x supplicant status interface
1/1/1
No 802.1X supplicants found.
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.09	Command introduced.

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show aaa authentication port-access dot1x supplicant status

```
show aaa authentication port-access dot1x supplicant status
[interface {<IFRANGE> | vlan <VLAN-ID>}]
```

Description

Shows the 802.1X supplicant status on each 802.1X supplicant-enabled interface.

Parameter	Description
`<IFRANGE>`	Specifies the range of VLAN interfaces for which the supplicant status is shown.
`vlan <VLAN-ID>`	Specifies a VLAN interface for which the supplicant status is shown.

Usage

- Physical Address Extension (PAE) state:
  - **Initialize**—Authentication is yet to start for the PAE.
  - **Authenticating**—Authentication is in-progress for the PAE.
  - **Authenticated**—Authentication is successful for the PAE.
  - **Held**—Authentication has failed for the PAE and no further authentication attempts will be made till the held period expires.
  - **Unauthenticated**—Authentication has failed for the PAE and no further authentication attempts will be made.
  - **Logoff**—The PAE no longer wishes to be authenticated.
- Status and forwarding state (FS):
  - **Open**—The PAE did not find a 802.1X authenticator within the discovery period. FS: Forwarding
  - **Blocked**—The PAE is currently authenticating and the port is operating in start-mode start-closed or has failed authentication and the port is operating in fail-mode fail-closed. FS: Blocked
  - **Disabled**—The port to which the interface is attached is not ready or has an invalid configuration. FS: Blocked
  - **Secured**—The PAE is authenticated. FS: Forwarding
  - **Start-Open**—The PAE is currently authenticating and the port is operating in start-mode start-open. FS: Forwarding
  - **Fail-Open**—The PAE has failed authentication and the port is operating in fail-mode fail-open. FS: Forwarding

Examples

Showing the 802.1X supplicant status on all enabled interfaces:

```
switch# show aaa authentication port-access dot1x supplicant status

802.1X Supplicant Status

 Interface  Policy         PAE State        Authenticator      EAP Method  Status
 -------- --------------- ---------------- ------------------ ----------- --------
--
 1/1/1     CX_Policy_01    Authenticated    38:21:c7:59:ad:27  EAP-TLS     Secured
 1/1/2     CX_Policy_02    Authenticating   38:21:c7:59:ad:28  EAP-MD5     Blocked
 1/1/3     CX_Policy_01    Unauthenticated  38:21:c7:59:ad:29  EAP-TLS     Fail-
Open
 1/1/4     CX_Policy_03    Unauthenticated  --                 --          Open
```

Showing the 802.1X supplicant status on a specific interface:

```
switch# show aaa authentication port-access dot1x supplicant status interface
1/1/1

802.1X Supplicant Status

 Interface  Policy          PAE State        Authenticator      EAP Method  Status
 ---------- --------------- --------------- ------------------ ----------- -------
---
 1/1/1      CX_Policy_01    Authenticated    38:21:c7:59:ad:27  EAP-TLS
Secured
```

Showing the message when the feature is not enabled on any interface of the system:

```
switch# show aaa authentication port-access dot1x supplicant status
802.1X supplicant is not configured.
```

Showing the message when the feature is not enabled on the interface:

```
switch# show aaa authentication port-access dot1x supplicant status interface
1/1/1
802.1X supplicant is not configured.
```

When an interface range is entered, this message is displayed only if the 802.1X supplicant is disabled either globally or on each interface specified in the user input.

Showing the message when there are no 802.1X supplicants on the system:

```
switch# show aaa authentication port-access dot1x supplicant status
No 802.1X supplicants found.
```

Showing the message when there are no 802.1X supplicants on the interface:

```
switch# show aaa authentication port-access dot1x supplicant status interface
1/1/1
No 802.1X supplicants found.
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.09	Command introduced.

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

start-mode

```
start-mode[start-closed | start-open]
no start-mode [start-closed | start-open]
```

Description

Configures the forwarding behavior of the interface on the data-plane when the authentication is in-progress during the first run of the supplicant. Default: start-open.

The **no** form of the command resets it to the default.

Examples

Configuring the start mode as start-closed:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# start-mode start-closed
```

Resetting the start mode to the default value in the system:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# no start-mode

OR

switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)#policy CX_Policy
switch(config-dot1x-supp-policy)# no start-mode start-closed
```

When the value does not match the currently configured non-default value for start-mode:

```
switch(config)# aaa authentication port-access dot1x supplicant
switch(config-dot1x-supp)# policy CX_Policy
switch(config-dot1x-supp-policy)# start-mode start-closed
switch(config-dot1x-supp-policy)# no start-mode start-open
The input value does not match the currently configured value.
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Chapter 116

Port access cached-critical role commands

aaa authentication port-access cached-critical-role (global)

```
aaa authentication port-access cached-critical-role
   enable
   disable
   cache-timeout <HOURS>
   cache-replace-mode {fifo|none}
   no ...
   persistent-storage {enable |write-interval <INTERVAL>}
```

Description

Enters the cached-critical role context (shown in the switch prompt as config-aaa-ccr). The cached-critical role allows the authorization of authenticated clients with the previously applied roles when the RADIUS server is unreachable.

By default, the cached-critical role is disabled at the global level. When the cached-critical user role is enabled, the MAC address of clients and their applied roles are cached in the following cases:

- During the client log-off.
- When a client fails to reach the server during reauthentication.
- All the RADIUS servers in the server group are not reachable. In this case, the details of the clients authenticated with the server group are cached.

When the RADIUS server is unreachable, the cached-critical role is applied as a special role. The cached-critical role can be applied only on authentication-enabled ports.

> If a server group configured on a port becomes unreachable, caching is not performed for individual clients dependent that group.

By enabling the **persistent-storage** configuration, the cached-critical role support for the clients will be available across switch reboots. With this configuration enabled, the client information is cached in the persistent memory of the switch. The information stored in the persistent storage is updated periodically and the interval between the updates is configurable using the **write-interval** CLI option, with a default interval of 3600 seconds. The update to the persistent storage is only done if there is a difference in the client information since the last write.

The **no** form of the command disables the cached-critical role. This is the default.

- The **persistent-storage** option must be enabled *before* the clients are onboarded. If the configuration is disabled after a client has onboarded, the feature might not work across a reboot for the clients which are onboarded with DUR/RADIUS roles.
- If the cached-critical user role needs to be modified to add a captive portal profile, use the **port-access clear cached-client role <ROLE>** command to clear the cached clients on the role before it is modified.
- Enabling **persistent-storage** on the switch might reduce the lifespan of persistent memory.

Parameter	Description
`enable`	Enables the cached-critical role on the authentication-enabled ports.
`disable`	Disables the cached-critical role. (Default)
`cache-timeout <HOURS>`	Specifies the timeout period for the client details to be cached in the switch. A timer runs for every 30 minutes interval to check whether the client is valid to stay cached. On a timeout, the cached entry is removed from the switch within the buffer time of 30 minutes. Default: 96 hours. Range: 1 to 168 hours.
`cache-replace-mode {fifo|none}`	Sets the cache replacement mode. ■ **fifo**: Sets the cache replace mode to **fifo** (First in, first out). If the number of cached clients in the system exceeds the limit of 1024, the oldest cache entry of the client is replaced with a new entry. ■ **none**: Sets the cache replace mode to **none**. If the number of cached clients in the system exceeds the limit of 1024, the new client details will not be cached. This is the default.
`no ...`	Negates any existing parameter.
`persistent-storage {enable |write-interval <900-86400>}`	Configures the persistent storage for cached clients. ■ **enable**: Enables persistent storage for the cached clients. ■ **write-interval**: Configures the interval between consecutive writes to persistent storage in seconds. Range: 900 to 86400 seconds. Default: 3600 seconds.

Examples

Enabling the cached-critical-role at the global level with a cache timeout period of **72** hours and cache replace mode as **fifo**:

```
switch(config)# aaa authentication port-access cached-critical-role
switch(config-aaa-ccr)# enable
switch(config-aaa-ccr)# cache-timeout 72
switch(config-aaa-ccr)# cache-replace-mode fifo
```

Disabling the cached-critical role at the global level:

```
switch(config)# aaa authentication port-access cached-critical-role
switch(config-aaa-ccr)# disable
```

Enabling and configuring persistent storage:

```
switch(config)#aaa authentication port-access cached-critical-role
switch(config-aaa-ccr)# persistent-storage
switch(config-aaa-ccr-ps)# enable
switch(config-aaa-ccr-ps)# write-interval 7200
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.11.1000	The **persistent-storage** parameter is added.
10.10	Command introduced on the 4100i, 6200, 6300, 6400, 8100, 8360.

Command Information

Platforms	Command context	Authority
6300 6400	`config` `config-aaa-ccr`	Administrators or local user group members with execution rights for this command.

aaa authentication port-access cached-critical-role (per interface)

```
aaa authentication port-access cached-critical-role
no aaa authentication port-access cached-critical-role
```

Description

Enables or disables cached-critical role feature on a specific interface. The cached-critical role allows the authenticated client to be authorized with the previously applied roles when the RADIUS server is unreachable.

By default, the cached-critical role feature is enabled at the port level if the cached-critical role is already enabled globally. This command can be used to configure the cached-user role on the specific ports where the caching is needed.

The **no** form of the command disables the cached-critical role on a specific interface.

Examples

Enabling the cached-critical role on the specific port:

```
switch(config)# interface 1/1/1
switch(config-if)# aaa authentication port-access cached-critical-role
```

Disabling the cached-critical role on the specific port:

```
switch(config)# interface 1/1/1
switch(config-if)# no aaa authentication port-access cached-critical-role
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.10	Command introduced on the 4100i, 6200, 6300, 6400, 8100, 8360.

6300 6400	`config-if`	Administrators or local user group members with execution rights for this command.

port-access clear cached-client

`port-access clear cached-client [all | mac <MACADDR> | role <ROLENAME>]`

Description

Clears all the cached clients or clears cached clients based on the MAC address or role name.

Parameter	Description
`all`	Clears all the cached clients.
`mac <MACADDR>`	Clears cached clients based on the MAC address.
`role <ROLENAME>`	Clears cached clients based on the role.

Examples

Clearing all the cached clients:

```
switch# port-access clear cached-client all
```

Clearing the cached clients based on the MAC address:

```
switch# port-access clear cached-client mac 00:0a:0b:0c:0d:0e
```

Clearing the cached clients based on the role:

```
switch# port-access clear cached-client ap_role
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.10	Command introduced on the 4100i, 6200, 6300, 6400, 8100, 8360.

Command Information

Platforms	Command context	Authority
6300 6400	`config`	Administrators or local user group members with execution rights for this command.

show port-access cached-clients

```
show port-access cached-clients [mac <MAC-ADDRESS>][role <ROLE-NAME>]
```

Description

Shows summarized information of all cached port-access clients on the system. The output can be filtered by MAC address or role.

The role name is not displayed for clients that use a RADIUS role without a base role.

Parameter	Description
<MAC-ADDRESS>	Specifies the MAC address of the client.
<ROLE-NAME>	Specifies the role of the client.

Examples

Showing summarized information for all cached port-access clients on the system:

```
switch# show port-access cached-clients
Port Access Cached-Clients
RADIUS overridden user roles are suffixed with '*'
----------------------------------------------------------------------------
MAC-Address        Role              Cached-Duration
----------------------------------------------------------------------------
00:50:56:bd:04:c8  ap-role           3 Days, 22 Hours, 33 Minutes, 44 Seconds
00:50:56:bd:32:07                    1 Day, 1 Hour, 1 Minute, 1 Second
00:50:56:bd:32:08                    12 Hours, 34 Minutes, 56 Seconds
00:50:56:cd:32:09  ap-role           12 Hours, 56 Seconds
00:50:56:bd:50:43  employee          12 Hours
00:50:56:bd:50:45  printer           34 Minutes
08:97:34:ad:e4:00  role_01_Student   56 Seconds
10:2f:09:89:00:35  A-Role*           54 Minutes, 26 Seconds
```

Showing information for a specific client based on the MAC address:

```
switch# show port-access cached-clients clients mac 00:50:57:bd:32:09
Port Access Cached-Clients
RADIUS overridden user roles are suffixed with '*'
---------------------------------------------------------------------------
MAC-Address        Role               Cached-Duration
---------------------------------------------------------------------------
00:50:56:bd:32:08                     12 Hours, 34 Minutes, 56 Seconds
```

Showing information for a specific client based on the role:

```
switch# show port-access cached-clients role
ROLE  The role name.
switch# show port-access cached-clients role intern
No port-access cached-clients found
switch# show port-access cached-clients role ap-role
Port Access Cached-Clients
RADIUS overridden user roles are suffixed with '*'
---------------------------------------------------------------------------
MAC-Address        Role               Cached-Duration
---------------------------------------------------------------------------
00:50:56:bd:04:c8  ap-role            3 Days, 22 Hours, 33 Minutes, 44 Seconds
00:50:56:cd:32:09  ap-role            12 Hours, 56 Seconds
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.12	Command output modified to be suffixed with * for RADIUS overridden user roles. The role name will not displayed for clients that use a RADIUS role without a base role.
10.10	Command introduced on the 4100i, 6200, 6300, 6400, 8100, 8360.

show port-access cached-critical-role info

```
show port-access cached-critical-role info
```

Description

Shows summarized information of port-access cached-critical role configuration.

Examples

Showing summarized information of the cached-critical role configuration with the status of cached-critical role **Disabled**:

```
switch# show port-access cached-critical-role info

Port Access Cached-Critical-Role
=================================

  Cached-Critical-Role Status          : Disabled
  Cache-Timeout                        : 96 Hours
  Cache Replace Mode                   : None
  Cached-Critical-Role Disabled Ports :
  Persistent Storage Status            : Disabled
  Persistent Storage Write Interval    : 900 Seconds
  Last Write To Persistent Storage     : N/A
```

Showing summarized information of the cached-critical role configuration with the status of cached-critical role **Enabled**:

```
switch# show port-access cached-critical-role info

Port Access Cached-Critical-Role
=================================

  Cached-Critical-Role Status          : Enabled
  Cache-Timeout                        : 100 Hours
  Cache Replace Mode                   : FIFO
  Cached-Critical-Role Disabled Ports : 1/1/1-1/1/5,1/1/10
  Persistent Storage Status            : Enabled
  Persistent Storage Write Interval    : 7200 Seconds
  Last Write To Persistent Storage     : Mon Aug 08 04:40:49 UTC 2022
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.11.1000	The output is updated to display persistent storage related information.
10.10	Command introduced on the 4100i, 6200, 6300, 6400, 8100, 8360.

6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

Chapter 117

Port access general commands

aaa authentication port-access allow-lldp-auth

```
aaa authentication port-access allow-lldp-auth [mac chassis-mac|source-mac]
no aaa authentication port-access allow-lldp-auth [mac chassis-mac|source-mac]
```

Description

This command is an extension of **aaa authentication port-access allow-lldp-auth**.

By default, authentication on chassis-mac is allowed via LLDP packets which are received on the port. Use the Chassis MAC shown in the LLDP TLV or the source MAC in the LLDP frame.

Use the **no** version of this command to prevent authentication using LLDP packets received on the port. This command can be issued from the interface (**config-if**) or Link Aggregation Group (**config-lag-if**) contexts along with the following commands:

```
interface lag 1
        aaa authentication port access
allow-lldp-bpdu
        aaa authentiction port access
allow-lldp-auth mac source-mac
```

Parameter	Description
`mac`	(Optional) Specify the LLDP authentication-mac type.
`chassis-mac`	Configure LLDP authentication-mac type as a chassis MAC address. This is the default value.
`source-mac`	Configure LLDP authentication-mac type as an interface MAC address

Examples

Configuring authentication via LLDP packets:

```
switch(config)# interface 1/1/1
switch(config-if)# aaa authentication port-access allow-lldp-auth
switch(config)# interface lag 1
switch(config-lag-if)# aaa authentication port-access allow-lldp-auth
```

Enabling/disabling authentication via LLDP BPDU packets:

```
switch(config-if)# aaa authentication port-access
allow-lldp-auth Allow or block authentication on LLDP BPDU. (Default:
allow)
```

```
switch(config-if)# no aaa authentication port-access
allow-lldp-auth Allow or block authentication on LLDP BPDU. (Default:
allow)
switch(config-if)# aaa authentication port-access allow-lldp-auth
switch(config-if)# no aaa authentication port-access allow-lldp-auth

switch(config-if)# aaa authentication port-access
block-lldp-auth Allow or block authentication on LLDP BPDU. (Default:
block)
switch(config-if)# no aaa authentication port-access
block-lldp-auth Allow or block authentication on LLDP BPDU. (Default:
block)
```

Configuring the MAC to use for authentication:

```
switch(config)# interface 1/1/1
switch(config-if)# aaa authentication port-access allow-lldp-auth mac source-mac
switch(config-if)# aaa authentication port-access allow-lldp-auth mac chassis-mac
```

```
switch(config-if)# aaa authentication port-access allow-lldp-auth
mac    Configure the MAC to use for LLDP based authentication (Default:
chassismac)

switch(config-if)# aaa authentication port-access allow-lldp-auth mac
chassis-mac   Use the chassis MAC in LLDP TLV.
source-mac       Use the source MAC in the LLDP frame.
```

Disabling authentication via LLDP packets based on MAC source:

```
switch(config-if)# no aaa authentication port-access allow-lldp-auth mac
chassis-mac     Use the chassis MAC in LLDP TLV.
source-mac      Use the source MAC in the LLDP frame.
```

Disabling authentication via LLDP packets on a LAG port:

```
switch (config) interface lag 1
switch(config-lag if)# no aaa authentication port-access allow-lldp-auth
```

When a client such as dual-homed access points and switches, connects to the switch over multiple physical interfaces and use LLDP packets to onboard, it is recommended to use LLDP authentication MAC as the source MAC on the interfaces. This prevents the switch from learning the client MAC from the chassis MAC in the LLDP TLV (default), similarly to the LLDP BPDUs received on all interfaces connected to the same device. If the MAC learned is the chassis MAC, it will cause the switch to treat the client as moving between the different interfaces each time a LLDP BPDU is received on an interface. Additionally, using a different LLDP authentication MAC type on interfaces connecting to the same device may lead to undesired behavior.

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.13	This command can be issued from a Link Aggregation Group (LAG) context.
10.09	Command introduced

Command Information

Platforms	Command context	Authority
6300 6400	`config-if` `config-lag-if`	Administrators or local user group members with execution rights for this command.

aaa authentication port-access allow-cdp-auth

```
aaa authentication port-access allow-cdp-auth
no aaa authentication port-access allow-cdp-auth
```

Description

By default authentication is allowed via CDP packets which are received on the port. Use the **no** version of this command to prevent authentication using CDP packets received on the port. This command can be issued from the interface (**config-if**) or Link Aggregation Group (**config-lag-if**) contexts.

Examples

Disabling authentication via CDP packets:

```
switch(config-if)# no aaa authentication port-access allow-cdp-auth
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.13	This command can be issued on a LAG port
10.09	Command introduced

Command Information

Platforms	Command context	Authority
6300 6400	`config-if` `config-lag-if`	Administrators or local user group members with execution rights for this command.

aaa authentication port-access auth-mode

```
aaa authentication port-access auth-mode {client-mode | device-mode | multi-domain}
```

Description

Configures the authentication mode for the port. By default, client mode is enabled. This command can be issued from the interface (**config-if**) or Link Aggregation Group (**config-lag-if**) contexts.

Parameter	Description
`client-mode`	Selects client mode. In this mode, all clients connecting to the port are sent for authentication. The maximum number of clients allowed to connect to the port is limited by the client limit value configured with the **aaa authentication port-access client-limit** command.
`device-mode`	Selects device mode. In this mode, only the first client connecting to the port is sent for authentication. Once this client is authenticated, the port is considered as open and all subsequent clients trying to connect on that port are not sent for authentication.
`multi-domain`	Selects multidomain mode. In this mode only one voice device is allowed to be authenticated in addition to the configured data devices on a port. By default only one data device is allowed to be authenticated on the multidomain mode along with one voice device. You can configure the maximum number of data devices allowed with the **aaa authentication port-access client-limit multi-domain** command. If a second voice device or a data device greater than the configured data client limit onboards, a violation is triggered. You must configure a voice VLAN for IP phones to onboard a voice device in the multidomain authentication mode. To authorize a voice device, you must perform one of the following: ▪ Configure the AAA server to send the **Aruba-Device-Traffic-Class** Aruba VSA with value **1**. ▪ Configure the **device-traffic-class** parameter in the role to be applied to indicate a voice device. Without this VSA value or the device type in the role, the switch considers the voice device as a data device. **NOTE:** This parameter is not supported when the command is issued from the LAG (**config-lag-if**) context.

Examples

Configuring device mode authentication for interface 1/1/1:

```
switch(config)# interface  1/1/1
switch(config-if)# aaa authentication port-access auth-mode device-mode
```

Configuring device mode authentication for a LAG port:

```
switch(config)# interface lag 1
switch(config-lag if)# aaa authentication port-access auth-mode device-mode
```

Configuring multidomain mode authentication for a port:

```
switch(config)# interface  1/1/1
switch(config-if)# aaa authentication port-access auth-mode multi-domain
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.13	This command can be issued from a Link Aggregation Group (LAG) context.
10.08	Added **multi-domain** parameter
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-if` `config-lag-if`	Administrators or local user group members with execution rights for this command.

aaa authentication port-access auth-precedence

```
aaa authentication port-access auth-precedence [dot1x mac-auth | mac-auth dot1x]
no aaa authentication port-access auth-precedence [dot1x mac-auth | mac-auth dot1x]
no aaa authentication port-access auth-precedence
```

Description

Configures the per port authentication precedence using the space separator.

By default, 802.1X authentication (**dot1x**) takes a higher precedence than MAC authentication (**mac-auth**).

The **no** form of the command resets the port access authentication precedence to the default, 802.1X authentication followed by MAC authentication.

Parameter	Description
`dot1x mac-auth`	Specifies that the port access authentication precedence is 802.1X authentication followed by MAC authentication.
`mac-auth dot1x`	Specifies that the port access authentication precedence is MAC authentication followed by 802.1X authentication.

Examples

Configuring MAC authentication precedence on a port:

```
switch(config-if)# aaa authentication port-access auth-precedence mac-auth dot1x
```

Resetting the authentication precedence to the default value:

```
switch(config-if)# no aaa authentication port-access auth-precedence mac-auth
dot1x
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

6300 6400	`config-if`	Administrators or local user group members with execution rights for this command.

aaa authentication port-access auth-priority

```
aaa authentication port-access auth-priority [dot1x mac-auth | mac-auth dot1x]
no aaa authentication port-access auth-priority [dot1x mac-auth | mac-auth  dot1x]
no aaa authentication port-access auth-priority
```

Description

Configures the authentication priority using the space separator to specific interface.

Default **auth-priority** with concurrent onboarding is 802.1X followed by MAC authentication. With authentication precedence, the default **auth-priority** follows the **auth-precedence** order.

The **no** form of the command resets the port access authentication priority to the default, is same as the configured **auth-precedence** order.

The authentication priority is useful in deployments where clients such as wireless access points (APs), IT-compliant-laptops or phones, or laptops without pre-loaded supplicant software must download the supplicant software or firmware patches before attempting 802.1X authentication. In such cases, configure the MAC authentication as the primary authentication method followed by 802.1X for the authentication order. Meanwhile, configure 802.1X as the primary authentication priority and MAC authentication as secondary to enforce access based on 802.1X. Thus the client (or end access device) will initially be authenticated by MAC authentication with the access required to onboard and install the software or patches, and subsequently attempt the 802.1X authentication.

Reauthentication will be triggered for all high priority methods and not just the final successful authentication method.

Parameter	Description
`dot1x mac-auth`	Specifies that the port access authentication precedence is 802.1X authentication followed by MAC authentication.

Parameter	Description
`mac-auth dot1x`	Specifies that the port access authentication precedence is MAC authentication followed by 802.1X authentication.

Examples

Configuring MAC authentication priority on a port:

```
switch(config-if)# aaa authentication port-access auth-priority mac-auth dot1x
```

Resetting the authentication priority to the default value:

```
switch(config-if)# no aaa authentication port-access auth-priority mac-auth dot1x
switch(config-if)# no aaa authentication port-access auth-priority
```

Sample configuration:

```
interface 1/1/1
    no shutdown
    no routing
    vlan access 1
    aaa authentication port-access auth-precedence mac-auth dot1x
    aaa authentication port-access auth-priority dot1x mac-auth
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

aaa authentication port-access auth-role

```
aaa authentication port-access [critical-role|preauth-role|reject-role|
   auth-role|critical-voice-role] <ROLE-NAME>
no aaa authentication port-access [critical-role|preauth-role|reject-role|
   auth-role|critical-voice-role]
```

Description

Configures the role to assign to the clients depending on the client authentication state.

The **no** form of the command disassociates the roles that you assign to clients based on the authentication state.

Parameter	Description
`critical-role`	Specifies the role that is applied when the RADIUS server is unreachable for authentication or when there is a request timeout.
`preauth-role`	Specifies the role that is applied when authentication is still in progress.
`reject-role`	Specifies the role that is applied when authentication has failed.
`auth-role`	Specifies the role that is applied to authenticated clients when a specific role is not assigned in the RADIUS server.
`critical-voice-role`	Specifies the role for a voice client when the RADIUS server is unreachable for authentication during reauthentication period. This is applicable when multidomain authentication mode is enabled with the **aaa authentication port-access auth-mode** command.
`<ROLE-NAME>`	Specifies the role name.

Examples

Configuring critical role for clients:

```
switch(config-if)# aaa authentication port-access critical-role role1
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

aaa authentication port-access client-auto-log-off final-authentication-failure

```
aaa authentication port-access client-auto-log-off final-authentication-failure
no aaa authentication port-access client-auto-log-off final-authentication-failure
```

Description

Use this command to automatically remove a client when authentication fails due to any reason except **server-reject** or **server-timeout**. This feature is disabled by default.

The **no** form of this command disables this feature if it has been previously enabled.

Automatic client log-off is not supported on Layer-3 interfaces.

Examples

Configuring the client-auto-log-off feature on interface 1/1/1:

```
switch(config)# interface  1/1/1
switch(config-if)# aaa authentication port-access client-auto-log-off final-
authentication-failure
```

For more information on features that use this command, refer to the Security Guide for your switch model.

aaa authentication port-access client-limit

```
aaa authentication port-access client-limit <CLIENTS>
no aaa authentication port-access client-limit
```

Description

Configures the maximum number of clients that can simultaneously connect to a port. This command can be issued from the interface (**config-if**) or Link Aggregation Group (**config-lag-if**) contexts.

The **no** form of this command resets the number of clients to the default.

Parameter	Description
<CLIENTS>	Specifies the maximum number of clients. Default: 1. Range: 1 to 256 (6300, 6400).

Examples

Configuring the client limit for on port **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# aaa authentication port-access client-limit 25
```

Configuring the client limit for on a LAG port:

```
switch(config)# interface lag 1
switch(config-lag-if)# aaa authentication port-access client-limit 25
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

aaa authentication port-access client-limit multi-domain

`aaa authentication port-access client-limit multi-domain <DATA-CLIENT-LIMIT>`

Description

Configures the data client limit on the multidomain enabled interface. By default, the data client limit on a multidomain enabled interface is **1**, and the maximum number of data clients supported on a multidomain enabled port is **5**.

Parameter	Description
<DATA-CLIENT-LIMIT>	Specifies the maximum data client limit on the multidomain enabled interface. Range: **1** to **5**.

Examples

Configuring data client limit of **4** on the multidomain enabled interface **1/1/4**:

```
switch(config)# interface  1/1/1
switch(config-if)# aaa authentication port-access client-limit multi-domain 4
```

For more information on features that use this command, refer to the Security Guide for your switch model.

aaa authentication port-access radius-override

```
aaa authentication port-access radius-override {enable | disable}
no aaa authentication port-access radius-override {enable | disable}
```

Description

Enables or disables **radius-override** support at the interface context. When **radius-override** support is enabled, a new RADIUS overridden role is created with a combination of LUR/DUR along with RADIUS attributes for the corresponding client-role attributes such as VLANs, captive portal URL, and downloadable gateway role. When the RADIUS override support is disabled, then only the user-roles get applied to the client.

The **no** form of this command disables the support for **radius-override**.

The **radius-override** support is applicable only for Auth-role.

Usage

The following table describes the access-response for the combination of roles with **radius-override** enabled and disabled:

Combination of roles in Access-Accept	Action with *radius-override* disabled	Action with *radius-override* enabled
Local User Role and RADIUS attributes	Local User Role is applied	New RADIUS Overridden role with Local User Role and RADIUS attributes is created and applied
Downloadable User Role and RADIUS attributes	Downloadable User Role is applied	New RADIUS Overridden role with Downloadable User Role and RADIUS attribute is created and applied
Local User Role and Downloadable User Role	Local User Role is applied	Local User Role is applied

Combination of roles in Access-Accept	Action with *radius-override* disabled	Action with *radius-override* enabled
Local User Role, Downloadable User Role, and RADIUS attributes	Local User Role is applied	New RADIUS Overridden role with Local User Role and RADIUS attributes is created and applied

Examples

Enabling radius-override support:

```
switch(config-if)# aaa authentication port-access radius-override enable
```

```
switch(config-if)# no aaa authentication port-access radius-override disable
```

Disabling radius-override support:

```
switch(config-if)# aaa authentication port-access radius-override disable
```

```
switch(config-if)# no aaa authentication port-access radius-override enable
```

For more information on features that use this command, refer to the Security Guide for your switch model.

port-access allow-flood-traffic

```
port-access allow-flood-traffic {enable | disable}
```

Description

Enables or disables transmission of flood traffic, such as broadcast, multicast, and unknown unicast messages through a security enabled port on which no client has been authenticated. This command can be issued from the interface (**config-if**) or Link Aggregation Group (**config-lag-if**) contexts. By default, transmission of flood traffic is disabled.

Usage

This command can be used to allow Wake-on-LAN packets on security enabled ports, before a client is authenticated.

Examples

Enabling flood traffic on a port on interface 1/1/1:

```
switch(config)# interface  1/1/1
switch(config-if)# port-access allow-flood-traffic
```

Enabling flood traffic on a port on a LAG port:

```
switch(config)# interface lag 1
switch(config-lag-if)# port-access allow-flood-traffic
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

port-access auto-vlan

```
port-access auto-vlan
no port-access auto-vlan
```

Description

Creates VLAN automatically for the port-access clients globally, if the VLAN is not configured statically on the switch. By default, **port-access auto-vlan** is disabled.

The **no** form of this command disables the port-access automatic VLAN creation globally on the switch.

The type for the VLAN created using the auto-vlan feature is displayed as **port-access** in the **show vlan** command.

Examples

Enabling automatic VLAN creation for clients:

```
switch(config)# port-access auto-vlan
```

Disabling automatic VLAN creation for clients(default):

```
switch(config)# no port-access auto-vlan
```

For more information on features that use this command, refer to the Security Guide for your switch model.

port-access client-move

```
port-access client-move {enable | disable | secure}
```

Description

When client move is enabled (the default), a port access client can move to other port access-enabled interfaces, at which time they will be re-authenticated on the new interface.

When client move is disabled, a client cannot move to other port access-enabled interfaces.

An authenticated client will be moved immediately if the new port to which the client will move has a pre-auth role configured, even when client move is enabled as secure.

Parameter	Description
enable	Enables this feature so port access clients can move to other port access-enabled interfaces.
disable	Disables this feature so port access clients cannot move to other port access-enabled interfaces.
secure	Use this configuration setting to stop a potential attacker from denying a genuine client access by spoofing the client's MAC on a different port-access enabled port of the switch. An authenticated client will be moved immediately if the new port to which the client moved has a pre-authentication role configured, even when client-move is enabled as secure.

Parameter	Description
	NOTE: Secure client move is enabled by default.

Examples

Enabling client move:

```
switch(config)# port-access client-move enable
```

Enabling secure client move:

```
switch(config)# port-access client-move enable secure
```

Disabling client move:

```
switch(config)# port-access client-move disable
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

port-access event-log client

```
port-access event-log client
no port-access event-log client
```

Description

Enables port access informational event logs for the client. These event logs help with client telemetry on a remote management station such as Aruba Central. By default, these informational event logs are disabled.

Starting with AOS-CX 10.10, the event IDs 10510 and 10511 are logged when the port access informational event log configuration is enabled.

The **no** form of the command disables port access informational event logs for the client.

Example

Enabling port access event log:

```
switch(config)# port-access event-log client
```

Disabling port access event log:

```
switch(config)# no port-access event-log client
```

For more information on features that use this command, refer to the Security Guide for your switch model.

port-access fallback-role

```
port-access fallback-role <ROLE-NAME>
no port-access fallback-role <ROLE-NAME>
```

Description

Configures the fallback role to assign to the clients onboarding on a port. This role is applied only when no derived role is applied to the clients.

The **no** form of the command resets the fallback role.

Parameter	Description
<ROLE-NAME>	Specifies the fallback role name. The maximum number of characters supported is 64.

Usage

Following are the conditions for the fallback role to be applied on onboarding devices:

- The device profile local MAC match feature with block-until-profile-applied mode is configured.
- Device profile along with AAA is configured but no match was found for the device profile client.
- AAA method with no reject or critical role is configured, and the connection to RADIUS server failed.

- 802.1X authentication is enabled on the port, but the supplicant of the device timed out to respond to the authentication request.

Example

On the 6400 Switch Series, interface identification differs.

Configuring fallback role for a port:

```
switch(config)# interface  1/1/3
switch(config-if)# port-access fallback-role fallback01
```

For more information on features that use this command, refer to the Security Guide for your switch model.

port-access log-off client

```
port-access log-off client mac <MAC-ADDRESS>
port-access log-off client interface <INTERFACE-NAME>
port-access log-off client role <ROLE-NAME>
```

Description

Logs off the client connected to a port access-enabled interface.

Parameter	Description
<MAC-ADDRESS>	Specifies the client MAC address.
<INTERFACE-NAME>	Specifies the client interface.
<ROLE-NAME>	Specifies the client MAC address.

Example

Logging a client off from the switch, specifying the MAC address:

```
switch# port-access log-off client mac 00:50:56:bd:04:2d
```

Logging a client off from the switch, specifying the interface:

```
switch# port-access log-off client interface 1/1/1
```

Logging a client off from the switch, specifying the role:

```
switch# port-access log-off client role r1
```

For more information on features that use this command, refer to the Security Guide for your switch model.

port-access onboarding-method precedence

```
port-access onboarding-method precedence [aaa device-profile | device-profile aaa]
no port-access onboarding-method precedence [aaa device-profile | device-profile aaa]
```

Description

Configures the precedence for the method to be used to authenticate onboarding devices for each interface.

The **no** form of the command resets the authentication method precedence to the default precedence of AAA followed by device profile.

AAA includes the 802.1X and MAC authentication methods whose precedence can be configured using the **aaa authentication port-access auth-precedence** command. Here, the default precedence is 802.1X authentication.

For example, if you configure AAA (both 802.1X and MAC) authentication methods and device profile on a port, by default, the authentication precedence would be 802.1X, then MAC, and lastly device profile.

aaa in the parameters refers to the authentication precedence configured using the **aaa authentication port-access auth-precedence** command.

Parameter	Description
`aaa device-profile`	Specifies that the precedence for per port onboarding authentication method is AAA followed by device profile.
`device-profile aaa`	Specifies that the precedence for per port onboarding authentication method is device profile followed by AAA.

Examples

On the 6400 Switch Series, interface identification differs.

Configuring AAA method precedence on a port:

```
switch(config)# interface  1/1/1
switch(config-if)# port-access onboarding-method precedence device-profile aaa
```

Resetting the authentication method precedence:

```
switch(config)# interface  1/1/1
switch(config-if)# no port-access onboarding-method precedence device-profile aaa
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

port-access onboarding-method concurrent

```
port-access onboarding-method concurrent <enable | disable>
```

Description

Configures all methods to start concurrently for faster onboarding process. If authentication priority is not configured when enabling concurrent onboarding, the priority will be 802.1X followed by **mac-auth** and **device-profile**.

Default priority for concurrent onboarding is 802.1X followed by **mac-auth** and **device-profile**.

When enabling concurrent onboarding on the port, existing clients will be de-authenticated and freshly onboarded concurrently.

When concurrent onboarding is enabled, then auth-precedence will be ignored.

If concurrent onboarding is configured, the client will stay in pre-auth role till it gets succeeded by one authentication method or gets failed by all the authentication methods.

When the authentication method with the highest priority fails, the profile of the next successful authentication method is applied.

If all methods fail, the reject or critical role is applied based on the 802.1X authentication failure reason and continues to reauthenticate with the 802.1X method.

Reauthentication will be triggered for all high priority methods and not just the final successful authentication method.

Some RADIUS server may block the client when it receives two requests, **mac-auth** and 802.1X, from the same client at the same time. This is because the RADIUS server allows only one authentication request. In such cases, concurrent onboarding is not feasible. To prevent such scenarios, configure **auth-precedence** with **auth-priority**.

Parameter	Description
`enable`	Enable clients to be onboarded concurrently.
`disable`	Disable clients to be onboarded concurrently.

Examples

On the 6400 Switch Series, interface identification differs.

Enabling concurrent onboarding on a port:

```
switch(config)# interface  1/1/1
switch(config-if)# port-access onboarding-method concurrent enable
```

Disabling concurrent onboarding on a port:

```
switch(config)# interface  1/1/1
switch(config-if)# port-access onboarding-method concurrent disable
```

Sample configuration:

```
interface 1/1/1
    no shutdown
    no routing
    vlan access 999
    !aaa authentication port-access auth-precedence mac-auth dot1x
    port-access onboarding-method concurrent enable
```

For more information on features that use this command, refer to the Security Guide for your switch model.

port-access reauthenticate interface

```
port-access reauthenticate interface <INTERFACE-NAME>
```

Description

Forcefully reauthenticates all clients connected to an interface.

Clients that are in the **HELD** state are ignored.

Parameter	Description
<INTERFACE-NAME>	Specifies the interface name.

Examples

Configuring reauthentication of all clients on a port:

```
switch# port-access reauthenticate interface 1/1/1
```

For more information on features that use this command, refer to the Security Guide for your switch model.

port-access ubt-fallback-role

```
port-access ubt-fallback-role <ROLE-NAME>
no port-access ubt-fallback-role <ROLE-NAME>
```

Description

Configures the UBT fallback role to assign to the clients on a port. This role is applied to a client only when the corresponding UBT zone is not reachable. The role on the client is reverted to the previous role to which it was assigned to when the UBT zone is reachable.

The **no** form of the command deletes the UBT fallback role on a port.

Parameter	Description
<ROLE-NAME>	Specifies the UBT fallback role name. The maximum number of characters supported is 64.

Usage

The UBT fallback role is applied to a client only when the corresponding UBT zone is not reachable. When the UBT zone is reachable, the role on the client is reverted to the previous role to which it was assigned.

The UBT fallback role is configurable at the port level. In deployments where a single controller or cluster setup is used, it is required to provide access to end clients even when the controller or the cluster failure occurs.

The application of the UBT fallback role depends on the authentication state of the client. That is, if the reauthentication of a client, with UBT fallback role applied, fails because of RADIUS reject or timeout reason, then the corresponding special role, reject or critical role, is applied.

Following are some of the scenarios where the UBT fallback role will be applied depending on the UBT operational state:

UBT Operational State	UBT Fallback Role Applied?
Down (UBT zone not ready)	Yes
Up (UBT zone ready)	No
Up --> Down (Controller not reachable)	Yes
Down --> Up (Controller reachable)	No
Up --> Down (UBT profile disabled)	Yes
Down --> Up (UBT profile enabled)	No
Up --> Down (MM/VSF switchover after 25 seconds)	Yes

- This configuration is supported in both UBT versions 1.0 and 2.0.
- UBT fallback role is assigned to only those clients within the UBT client limit. Any clients beyond this limit will not be associated with this role.
- When a client is already assigned with the UBT fallback role, you cannot remove the UBT fallback role configuration on a port. To remove the configuration, no clients must be associated with this role.
- Accounting stop and start events are generated when a client transitions from UBT role to a UBT fallback role.

Example

On the 6400 Switch Series, interface identification differs.

Configuring UBT fallback role on a port:

```
switch(config)# interface 1/1/3
switch(config-if)# port-access ubt-fallback-role fallback01
```

For more information on features that use this command, refer to the Security Guide for your switch model.

show aaa authentication port-access interface client-status

```
show aaa authentication port-access interface {all | <IFRANGE>}
client-status [mac <MAC-ADDRESS>]
```

Description

Shows information about the status of the role applied on ports. RADIUS overridden user roles are suffixed with *. The role name is not displayed for clients that do not use local, downloaded, or RADIUS overridden role.

Parameter	Description
`all`	Specifies all interfaces.
<IFRANGE>	Specifies the interface name.
<MAC-ADDRESS>	Specifies the client MAC address.

Examples

Showing information about a client:

```
switch# show aaa authentication port-access interface all client-status

show port-access clients

```
show port-access clients [dhcp-info|ubt|vxlan] [interface <INTERFACE-NAME>] [mac <MAC-
ADDRESS>]
```

Description

Shows summarized active port access client information.

The **User-Role** column in the output will not display any value for clients not using local, downloaded or RADIUS overridden role. When an explicit client name is not available, only the MAC address of the client will be displayed.

The VLANs in the output display the tags, **u, t**, and **multi** to indicate untagged VLAN, single tagged VLAN, and multiple VLANs respectively.

Parameter	Description
dhcp	Shows DHCP information of port access clients. **NOTE:** To view the DHCP information of port access clients, either client IP tracker or DHCP snooping must be enabled. If client IP tracker is enabled, then the command does not display the lease time. This command does not display information about tagged VLAN.
ubt	Shows port access information about UBT clients. **NOTE:** The output displays information only about untagged VLAN.
vxlan	Shows port access information about VXLAN clients. **NOTE:** The output displays information about both tagged and untagged VLAN without the tags, **u** and **t**.
<INTERFACE-NAME>	Specifies the interface name.
<MAC-ADDRESS>	Specifies the client MAC address.

Examples

On the 6400 Switch Series, interface identification differs.

Command History

Release	Modification
10.12	The following changes were introduced: ■ Command output modified to display RADIUS attributes for clients not using local, downloaded or RADIUS overridden role. ■ Command output modified to display **Base Policy** and **ACL Names.** ■ Command output modified to display **PoE Allocation method**.
10.08	Added RADIUS overridden role to example
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show port-access clients onboarding-method

```
show port-access clients onboarding-method <METHOD>
```

Description

Shows active port access client information for the specified onboarding method.

Parameter	Description
<METHOD>	Selects the onboarding method. Available methods: **device-profile**, **dot1x**, **mac-auth**, **port-security**.

Examples

On the 6400 Switch Series, interface identification differs.

Showing information for clients onboarded using MAC authentication.

```
switch# show port-access clients onboarding-method mac-auth

Port Access Clients

Status codes: device-mode

--------------------------------------------------------------------------------
-
   Port      MAC-Address        Onboarding      Status       Role
                                Method

show port-access interface

```
show port-access interface all|<ifrange> status
```

Description

Display the interface status for port-access enabled interfaces. It includes the name of the port, the member interfaces associated with the port along with the security state of the interface.

A port-access interface can be in one of the following states:

1. Blocked: Indicates that the interface is blocked by port-access.
2. Secured: Indicates the interface is secured by port-access.
3. Down: Indicates port-access is not yet operational on the interface

Parameter	Description
all	Display port-access information for all interfaces.
<ifrange>	Display port-access information for the specified interface.

Examples

Showing the port-access status for all interfaces:

```
switch# show port-access interface all status
Port      Interface  Status
--------- ---------- -------
1/1/1     1/1/1      Blocked
lag1      1/1/3      Secured
lag1      1/1/4      Down
```

Showing port-access status for interface 1/1/1:

```
switch# show port-access interface 1/1/1 status
Port      Interface  Status
--------- ---------- -------
1/1/1     1/1/1      Blocked
```

Showing port-access status for LAG 1:

```
switch# show port-access interface lag1 status
Port      Interface  Status
--------- ---------- -------
lag1      1/1/3      Secured
lag1      1/1/4      Down
```

When port-access is not configured on an interface, following message will be displayed:

```
switch# show port-access interface all status
Port-access is not configured
```

Release	Modification
10.13	Command introduced.

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

Chapter 118

Port access MAC authentication commands

aaa authentication port-access allow-lldp-auth [mac {source-mac|chassis-mac}]

```
aaa authentication port-access allow-lldp-auth [mac {source-mac|chassis-mac}]
[no] aaa authentication port-access allow-lldp-auth [mac {source-mac|chassis-mac}]
```

Description

By default authentication is allowed via LLDP packets which are received on the port. Use the **no** version of this command to prevent authentication using LLDP packets received on the port. Chassis MAC and Source MAC addresses can be used for authentication via LLDP frames.

Examples

Configuring authentication via LLDP packets:

```
switch(config)# interface  1/1/1
switch(config-if)# aaa authentication port-access allow-lldp-auth
< pd platform="4100i,6000,6100,6200,6300,6400,8100,8360" >
switch(config)# interface lag 1
switch(config-lag-if)# aaa authentication port-access allow-lldp-auth
< /pd >
```

Enabling authentication via LLDP packets on a MAC source:

```
switch(config)# interface  1/1/1
switch(config-if)# aaa authentication port-access allow-lldp-auth mac
source-mac

switch(config-if)# aaa authentication port-access allow-lldp-auth mac
chassis-mac
```

Enabling authentication via LLDP BDU packets:

```
switch(config-if)# aaa authentication port-access
allow-lldp-auth          Allow or block authentication on LLDP BPDU. (Default:
allow)

switch(config-if)# no aaa authentication port-access
allow-lldp-auth          Allow or block authentication on LLDP BPDU. (Default:
allow)

switch(config-if)# aaa authentication port-access allow-lldp-auth
switch(config-if)# no aaa authentication port-access allow-lldp-auth
```

Configuring MAC via LLDP packets:

```
switch(config-if)# aaa authentication port-access allow-lldp-auth
mac       Configure the MAC to use for LLDP based authentication (Default: chassis-
mac)

switch(config-if)# aaa authentication port-access allow-lldp-auth mac
chassis-mac      Use the chassis MAC in LLDP TLV.
source-mac       Use the source MAC in the LLDP frame.
```

Disabling authentication via LLDP packets on a MAC source:

```
switch(config-if)# no aaa authentication port-access allow-lldp-auth mac
chassis-mac      Use the chassis MAC in LLDP TLV.
source-mac       Use the source MAC in the LLDP frame.
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

10.13	Command introduced

Command Information

Platforms	Command context	Authority
6300 6400	`config-if`	Administrators or local user group members with execution rights for this command.

aaa authentication port-access mac-auth

```
aaa authentication port-access mac-auth {enable | disable}
no aaa authentication port-access mac-auth {enable | disable}
```

Description

Enables or disables MAC authentication globally or at the port-level.

Examples

Enabling MAC authentication on all interfaces:

```
switch(config)# aaa authentication port-access mac-auth
switch(config-macauth)# enable
```

Disabling MAC authentication on all interfaces:

```
switch(config)# aaa authentication port-access mac-auth
switch(config-macauth)# disable
```

Enabling MAC authentication on an interface:

```
switch(config-if)# aaa authentication port-access mac-auth
switch(config-if-macauth)# enable
```

Disabling MAC authentication on an interface:

```
switch(config-if)# aaa authentication port-access mac-auth
switch(config-if-macauth)# disable
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

6300 6400	config config-if	Administrators or local user group members with execution rights for this command.

aaa authentication port-access mac-auth addr-format

```
aaa authentication port-access mac-auth addr-format {no-delimiter | single-dash |
     multi-dash |multi-colon | no-delimiter-uppercase | single-dash-uppercase |
     multi-dash-uppercase | multi-colon-uppercase}
no aaa authentication port-access mac-auth addr-format {no-delimiter | single-dash |
       multi-dash |multi-colon | no-delimiter-uppercase | single-dash-uppercase |
       multi-dash-uppercase | multi-colon-uppercase}
```

Description

Configures the MAC address format that the switch must use in the RADIUS request message.

The **no** form of the command resets the MAC address format to the default, **no-delimiter**.

Examples

Setting the MAC address format on the switch:

```
switch(config)# aaa authentication port-access mac-auth
switch(config-macauth)# addr-format single-dash
```

Resetting the MAC address format on the switch to its default:

```
switch(config)# aaa authentication port-access mac-auth
switch(config-macauth)# no addr-format
```

For more information on features that use this command, refer to the Security Guide for your switch model.

aaa authentication port-access mac-auth auth-method

```
aaa authentication port-access mac-auth auth-method {chap | pap}
no aaa authentication port-access mac-auth auth-method
```

Description

Configures the RADIUS authentication method for MAC authentication.

Following are the MAC authentication methods supported:

- CHAP
- PAP

The PEAP-MSCHAPv2 method of authentication is not supported.

The **no** form of the command resets the authentication method to the default, **chap**.

Examples

Configuring the RADIUS authentication method on the switch:

```
switch# config
switch(config)# aaa authentication port-access mac-auth
switch(config-macauth)# auth-method pap
```

Resetting the RADIUS authentication method on the switch:

```
switch(config)# no aaa authentication port-access mac-auth auth-method
```

For more information on features that use this command, refer to the Security Guide for your switch model.

aaa authentication port-access mac-auth cached-reauth

```
aaa authentication port-access mac-auth cached-reauth
no aaa authentication port-access mac-auth cached-reauth
```

Description

Enables cached reauthentication on a port. Cached reauthentication allows MAC reauthentications to succeed when the RADIUS server is unavailable. Users who are already authenticated, retain their currently assigned RADIUS attributes.

The **no** form of the command disables cached reauthentication.

Examples

Enabling cached reauthentication on a port:

```
switch(config-if)# aaa authentication port-access mac-auth
switch(config-if-macauth)# cached-reauth
```

Disabling cached reauthentication on a port:

```
switch(config-if)# aaa authentication port-access mac-auth
switch(config-if-macauth)# no cached-reauth
```

For more information on features that use this command, refer to the Security Guide for your switch model.

aaa authentication port-access mac-auth cached-reauth-period

```
aaa authentication port-access mac-auth cached-reauth-period <PERIOD>
no aaa authentication port-access mac-auth cached-reauth-period
```

Description

Configures the period during which an authenticated client, which has failed to reauthenticate because the RADIUS server is unreachable, remains authenticated.

The **no** form of the command resets the cached reauthentication period to the default, 3600 seconds.

Parameter	Description
<PERIOD>	Specifies the cached reauthentication period (in seconds). Default: 3600. Range: 1 to 4294967295.

Examples

Configuring cached reauthentication period on a port:

```
switch(config-if)# aaa authentication port-access mac-auth
switch(config-if-macauth)# cached-reauth-period 300
```

Resetting the cached reauthentication period to the default value:

```
switch(config-if)# aaa authentication port-access mac-auth
switch(config-if-macauth)# no cached-reauth-period
```

For more information on features that use this command, refer to the Security Guide for your switch model.

aaa authentication port-access mac-auth password

```
aaa authentication port-access mac-auth password {plaintext|ciphertext}<PASSWORD>
no aaa authentication port-access mac-auth password
```

Description

Enables and configures the global password that the switch must use for MAC authentication. The password can be either in ciphertext or plaintext format.

The **no** form of the command disables the password for MAC authentication.

Parameter	Description
`{plaintext|ciphertext}<PASSWORD>`	Specifies the global password to be used by all MAC authenticating devices in either plaintext or ciphertext format.

Examples

Setting the MAC authentication password:

```
switch(config)# aaa authentication port-access mac-auth
switch(config-macauth)# password plaintext maX99J#
```

Disabling the MAC authentication password:

```
switch(config)# aaa authentication port-access mac-auth
switch(config-macauth)# no password
```

For more information on features that use this command, refer to the Security Guide for your switch model.

aaa authentication port-access mac-auth quiet-period

```
aaa authentication port-access mac-auth quiet-period <PERIOD>
no aaa authentication port-access mac-auth quiet-period
```

Description

Configures the period during which the switch does not try to authenticate a rejected client.

The **no** form of the command resets the quiet period to the default, 60 seconds.

Parameter	Description
<PERIOD>	Specifies the quiet period (in seconds). Default: 60. Range: 0 to 65535.

Examples

Configuring the quiet period on a port:

```
switch(config-if)# aaa authentication port-access mac-auth
switch(config-if-macauth)# quiet-period 65
```

Resetting the quiet period on a port to default:

```
switch(config-if)# aaa authentication port-access mac-auth
switch(config-if-macauth)# no quiet-period
```

For more information on features that use this command, refer to the Security Guide for your switch model.

6300 6400	`config-if`	Administrators or local user group members with execution rights for this command.

aaa authentication port-access mac-auth radius server-group

```
aaa authentication port-access mac-auth radius server-group <GROUP-NAME>
no aaa authentication port-access mac-auth radius server-group <GROUP-NAME>
```

Description

Configures the MAC authentication server group globally or for a particular port.

The **no** form of the command resets the authentication server group to the default value, **radius**.

When configured on a port, the **no** form of the command resets the server group on that port to the globally configured group. If no global RADIUS server group is configured, the **no** form of the command resets the configuration to the default group, **radius**.

When the RADIUS server group for MAC authentication is updated on a port, any existing clients on the port that were authenticated using the previous globally configured group will associate with the new group for the port during the next re-authentication cycle. Any new client that is onboarding on the port after the server group update will associate with the new group immediately.

Parameter	Description
<GROUP-NAME>	Specifies the name of the MAC authentication server group.

Examples

Configuring the RADIUS server group for MAC authentication globally:

```
switch# config
switch(config)# aaa authentication port-access mac-auth
switch(config-macauth)# radius server-group group1
```

Configuring the RADIUS server group for MAC authentication on **1/1/5**:

```
switch(config)# interface 1/1/5
switch(config-if)# aaa authentication port-access mac-auth
switch(config-if-macauth)# radius server-group group2
```

Resetting the RADIUS server group configuration on **1/1/5**:

```
switch(config)# interface 1/1/5
switch(config-if)# aaa authentication port-access mac-auth
switch(config-if-macauth)# no radius server-group
```

For more information on features that use this command, refer to the Security Guide for your switch model.

aaa authentication port-access mac-auth reauth

```
aaa authentication port-access mac-auth reauth
no aaa authentication port-access mac-auth reauth
```

Description

Enables periodic MAC reauthentication of authenticated clients on the port.

The **no** form of the command disables periodic MAC reauthentication on the port.

Examples

Enabling reauthentication on a port:

```
switch(config-if)# aaa authentication port-access mac-auth
switch(config-if-macauth)# reauth
```

Disabling reauthentication on a port:

```
switch(config-if)# aaa authentication port-access mac-auth
switch(config-if-macauth)# no reauth
```

aaa authentication port-access mac-auth reauth-period

```
aaa authentication port-access mac-auth reauth-period <PERIOD>
no aaa authentication port-access mac-auth reauth-period
```

Description

Configures the period after which MAC authenticated clients must be reauthenticated on the port. You must first enable MAC reauthentication on the port before configuring the MAC reauthentication period.

The **no** form of the command resets the MAC reauthentication period to the default, 3600 seconds.

Parameter	Description
<PERIOD>	Specifies the MAC reauthentication period (in seconds). Default: 3600. Range: 1 to 4294967295.

Examples

Configuring the MAC reauthentication period on a port:

```
switch(config-if)# aaa authentication port-access mac-auth
switch(config-if-macauth)# reauth-period 60
```

Resetting the MAC reauthentication period to its default:

```
switch(config-if)# aaa authentication port-access mac-auth
switch(config-if-macauth)# no reauth-period
```

For more information on features that use this command, refer to the Security Guide for your switch model.

clear mac-auth statistics

```
clear mac-auth statistics [interface <IF-NAME>]
```

Description

Clears the MAC authentication statistics associated with the port and all the authenticator state machines associated to this port.

If no interface is specified, the statistics is cleared for all MAC authentication enabled ports.

Parameter	Description
<IF-NAME>	Specifies the interface name.

Examples

Clearing MAC authentication statistics on a port (6400 Switch Series):

```
switch# clear mac-auth statistics interface 1/3/1
```

Clearing MAC authentication statistics on all ports:

```
switch# clear mac-auth statistics
```

show aaa authentication port-access mac-auth interface client-status

```
show aaa authentication port-access mac-auth interface {all|<IF-NAME>}
 client-status [mac <MAC-ADDRESS>]
```

Description

Shows information about MAC authentication clients status. The output can be filtered by interface or MAC address.

Parameter	Description
all	Specifies all interfaces.
<IF-NAME>	Specifies the interface name.
<MAC-ADDRESS>	Specifies the client MAC address.

Examples

On the 6400 Switch Series, interface identification differs.

Showing client status information for all ports:

```
switch# show aaa authentication port-access mac-auth interface all client-status

```

```

show aaa authentication port-access mac-auth interface port-statistics

```
show aaa authentication port-access mac-auth interface {all|<IF-NAME>} port-statistics
```

Description

Shows information about MAC authentication ports. The output can be filtered by interface.

Parameter	Description
`all`	Specifies all interfaces.
`<IF-NAME>`	Specifies the interface name.

Examples

On the 6400 Switch Series, interface identification differs.

Showing information for all ports.

```
switch# show aaa authentication port-access mac-auth interface all port-statistics

Port 1/1/1
```

```

Chapter 119

Port access policy commands

port-access policy

```
port-access policy <POLICY-NAME>
   [<SEQUENCE-NUMBER>]
   class {ip|ipv6} <CLASS-NAME> action {<REMARK-ACTIONS> | <POLICE-ACTIONS> | <OTHER-
   ACTIONS>}
   comment <text>
```

Description

Creates or modifies a policy and policy entries. A policy is made up of one or more policy entries ordered and prioritized by sequence numbers. Each entry has an IPv4/IPv6 class and one or more policy actions associated with it.

A policy must be applied to a role using the **associate policy** command.

The **no** form of the command can be used to delete either a policy (use **no** with the policy command) or an individual policy entry (use **no** with the sequence number).

Parameter	Description
<POLICY-NAME>	Specifies the policy name.
<SEQUENCE-NUMBER>	Specifies the policy entry sequence number. Range: 1 to 4294967295.
`class {ip|ipv6}` *<CLASS-NAME>*	Specifies the class type and name.
<REMARK-ACTIONS>	These remark actions are available: `ip-precedence <IP-PRECEDENCE-VALUE>` Specifies the numeric IP precedence value. Range: 0 to 7. `dscp` *<DSCP-VALUE>* Specifies a Differentiated Services Code Point (DSCP) value. Enter either a keyword or numeric value (0 to 63). See *DSCP keywords and corresponding values* below. `pcp` *<PCP-VALUE>* Specifies a pcp value. `local-priority` *<LOCAL-PRIORITY-VALUE>* Specifies a local priority value. Range: 0 to 7.
<POLICE-ACTIONS>	These police actions are available: `cir kbps` *<RATE-KBPS>* Specifies a Committed Information Rate (CIR) value in kbps. Range: 1 to 4294967295. `cbs` *<BYTES>* Specifies a Committed Burst Size (CBS) value in bytes. Range: 1 to 4294967295.

Parameter	Description
	`exceed` Specifies the action to take on packets that exceed the rate limit.

`<OTHER-ACTIONS>`	These other actions are available:
	`drop`
	Selects drop of all traffic.
	`redirect`
	Selects redirect of all traffic to a captive portal server.
	`reflect`
	Enables the switch to allow a packet destined to the client only if the flow is learned (the flow is initiated by the client).

`comment`	Specifies a policy entry comment.

DSCP keywords and corresponding values

Keyword	Value	Description
`AF11`	10	DSCP 10 (Assured Forwarding Class 1, low drop probability)
`AF12`	12	DSCP 12 (Assured Forwarding Class 1, medium drop probability)
`AF13`	14	DSCP 14 (Assured Forwarding Class 1, high drop probability)
`AF21`	18	DSCP 18 (Assured Forwarding Class 2, low drop probability)
`AF22`	20	DSCP 20 (Assured Forwarding Class 2, medium drop probability)
`AF23`	22	DSCP 22 (Assured Forwarding Class 2, high drop probability)
`AF31`	26	DSCP 26 (Assured Forwarding Class 3, low drop probability)
`AF32`	28	DSCP 28 (Assured Forwarding Class 3, medium drop probability)
`AF33`	30	DSCP 30 (Assured Forwarding Class 3, high drop probability)
`AF41`	34	DSCP 34 (Assured Forwarding Class 4, low drop probability)
`AF42`	36	DSCP 36 (Assured Forwarding Class 4, medium drop probability)
`AF43`	38	DSCP 38 (Assured Forwarding Class 4, high drop probability)
`CS0`	0	DSCP 0 (Class Selector 0: Default)
`CS1`	8	DSCP 8 (Class Selector 1: Scavenger)
`CS2`	16	DSCP 16 (Class Selector 2: OAM)
`CS3`	24	DSCP 24 (Class Selector 3: Signaling)

Keyword	Value	Description
CS4	32	DSCP 32 (Class Selector 4: Real time)
CS5	40	DSCP 40 (Class Selector 5: Broadcast video)
CS6	48	DSCP 48 (Class Selector 6: Network control)
CS7	56	DSCP 56 (Class Selector 7)
EF	46	DSCP 46 (Expedited Forwarding)

Usage

- An applied policy processes the packet sequentially against policy and class entries in the list, until either the last policy entry in the list has been evaluated or the packet matches an entry. If there is no match, the packet will be dropped by one of the implicit **deny all** IPv4 and IPv6 entries.
- Entering an existing **<POLICY-NAME>** value will cause the existing policy to be modified, with any new **<SEQUENCE-NUMBER>** value creating an additional policy entry, and any existing **<SEQUENCE-NUMBER>** value replacing the existing policy entry with the same sequence number.
- If no sequence number is specified, a new policy entry will be appended to the end of the entry list with a sequence number equal to the highest policy entry currently in the list plus 10. The sequence numbers may be reordered with the **port-access policy <POLICY-NAME> resequence <STARTING-SEQ-NUM> <INCREMENT>** command.
- If a policy is configured without any action, the default action, **permit**, is applied for that policy.

Examples

Creating a policy with several class entries:

```
switch(config)# port-access policy POL1
switch(config-pa-policy)# 10 class ip dns
switch(config-pa-policy)# 20 class ip dhcp
switch(config-pa-policy)# 30 class ip test action cir kbps 1024 exceed drop
switch(config-pa-policy)# exit
switch(config)# show port-access policy POL1

Access Policy Details:
======================

Policy Name   : POL1
Policy Type   : Local
Policy Status :
SEQUENCE    CLASS                       TYPE ACTION
----------- --------------------------- ---- ----------------------------------
10          dns                         ipv4 permit
20          dhcp                        ipv4 permit
30          test                        ipv4 cir kbps 1024 cbs 2048 exceed drop
```

Adding a comment to an existing class entry:

```
switch(config)# port-access policy POL1
switch(config-pa-policy)# 20 comment DHCP-PERMIT
switch(config-pa-policy)# exit
switch(config)# show run port-access policy POL1

port-access policy POL1
    10 class ip dns
    20 class ip dhcp
    20 comment DHCP-PERMIT
    30 class ip test action cir kbps 1024 cbs 2048     exceed drop
```

Removing a comment from an existing class entry:

```
switch(config)# port-access policy POL1
switch(config-pa-policy)# no 20 comment
switch(config-pa-policy)# exit
switch(config)# show run port-access policy POL1

port-access policy POL1
    10 class ip dns
    20 class ip dhcp
    30 class ip test action cir kbps 1024 cbs 2048 exceed drop
```

Modifying a policy by replacing one class with another at the same sequence number:

```
switch(config)# port-access policy POL1
switch(config-pa-policy)# 10 class ip mds action dscp af21
switch(config-pa-policy)# exit
switch(config)# show port-access policy POL1

Access Policy Details:
======================

Policy Name   : POL1
Policy Type   : Local
Policy Status : Applied

SEQUENCE    CLASS                        TYPE ACTION
----------- ---------------------------- ---- ----------------------------------
10          mds                          ipv4 dscp AF21
20          dhcp                         ipv4 permit
30          test                         ipv4 cir kbps 1024 cbs 2048 exceed drop
```

Removing a class:

```
switch(config)# port-access policy POL1
switch(config-pa-policy)# no 10
switch(config-pa-policy)# exit
switch(config)# show port-access policy POL1

Access Policy Details:
======================

Policy Name   : POL1
Policy Type   : Local
Policy Status : Applied

SEQUENCE    CLASS                        TYPE ACTION
----------- ---------------------------- ---- ----------------------------------
```

```
20          dhcp                         ipv4 permit
30          clearpass-web                ipv4 cir kbps 1024 cbs 2048 exceed drop
```

For more information on features that use this command, refer to the Security Guide for your switch model.

port-access policy copy

`port-access policy <POLICY-NAME> copy <DESTINATION-POLICY>`

Description

Copies an existing policy to a new policy.

Parameter	Description
<POLICY-NAME>	Specifies the existing policy name.
<DESTINATION-POLICY>	Specifies the destination policy name.

Examples

Copying a policy:

```
switch(config)# port-access policy POL1 copy POL1_copy
switch(config)# show port-access policy

Access Policy Details:

port-access policy resequence

`port-access policy <POLICY-NAME> resequence <STARTING-SEQ-NUM> <INCREMENT>`

Description

Resequences numbering in a policy.

Parameter	Description
<POLICY-NAME>	Specifies the policy to be resequenced.
<STARTING-SEQ-NUM>	Specifies the starting sequence number. Range: 1 to 4294967295.
<INCREMENT>	Specifies the sequence number increment.

Examples

Resequencing a policy starting at 5 with an increment of 10:

```
switch(config)# port-access policy POL1 resequence 5 10
switch(config)# show port-access policy POL1

Access Policy Details:
======================
Policy Name   : POL1
Policy Type   : Local
Policy Status : Applied

SEQUENCE    CLASS                       TYPE ACTION
----------- --------------------------- ---- ----------------------------------

port-access policy reset

`port-access policy <POLICY-NAME> reset`

Description

Resets the policy configuration to match the current hardware configuration of the policy.

Parameter	Description
<POLICY-NAME>	Specifies the name of the policy to be reset.

Examples

Resetting a policy:

```
switch(config)# port-access policy POL2
switch(config-pa-policy)# 20 class ip dhcp
switch(config-pa-policy)# 40 class test2 action cir kbps 1024 exceed drop
switch(config-pa-policy)# exit
switch(config)# show port-access policy POL1-V2

Access Policy Details:

port-access reflexive

```
port-access reflexive
   {gbp|policy} enable
   no...
```

Description

This command enables the use of reflexive port access and group-based policies.

Regular stateless policies allow or deny traffic in the ingress or the egress direction. As a result, reverse traffic that belongs to the same flow will require a separate policy in the opposite direction. This can require complex policies that can be difficult to manage. When reflexive port access policies are enabled, the switch maintains an internal flow table for permitted traffic, and automatically allows return traffic for permitted flows.

When reflexive port access or group-based policies are enabled using this command, all existing port-access clients associated with a reflexive port-access policy, application based policy or group-based policy are logged off from the system.

The **no** form of the command disables reflexive policies and returns port access and group-based policies to the regular stateless status.

This feature can only be used with TCP/UDP Unicast traffic protocols. Protocols like TFTP, DHCP, and ICMP that use a different IP address or port in the request and the corresponding response must not be configured as a reflect entry.

Parameter	Description
`gbp`	Enables reflexive group-based policies.
`policy`	Enables reflexive port access policies.

Prerequisites

Before you can enable reflexive policies, you must first configure a role ID using the following command:

```
switch(config)# gbp role <ROLE_NAME> <ROLE_ID>
```

Next,, enable flow tracking using the following commands:

```
switch(config)# no ip source-lockdown resource-extended
   Do you want to continue (y/n)? y
switch(config)# flow-tracking
switch(config-flow-tracking)# enable
```

Examples

Enable reflexive port-access policies:

```
switch(config)# port-access reflexive policy enable
```

Enable reflexive group-based policies:

```
switch(config)# port-access reflexive gbp enable
```

Creating a policy with two entries with reflexive action:

```
switch(config)# port-access policy CPPM
switch(config-pa-policy)# 10 class ip dns action reflect
switch(config-pa-policy)# 20 class ip ssh action reflect
switch(config-pa-policy)# 30 class ip clearpass-web action cir kbps 1024 cbs 2048
exceed drop
switch(config-pa-policy)# 40 class ip web-traffic action redirect captive-portal
switch(config-pa-policy)# exit
switch(config)# show port-access policy

Access Policy Details:
======================

Policy Name   : CPPM
Policy Type   : Local
Policy Status : Applied

SEQUENCE     CLASS           TYPE ACTION
-------- ------------ ---- ---------------------------
10        dns                ipv4 reflect
20        ssh                ipv4 reflect
30        clearpass-web      ipv4 cir kbps 1024 cbs 2048 exceed drop
40        web-traffic        ipv4 redirect captive-portal
```

The **Reflect** action enables the switch to allow a packet destined to the client only if the flow is learned, that is, the flow is initiated by the client.

Command History

clear port-access policy hitcounts

`clear port-access policy <POLICY-NAME> hitcounts {port|client}`

Description

Clears statistics and conform rate of a policy applied on a port or client.

Parameter	Description
<POLICY-NAME>	Specifies the policy name.
port	Selects port mode.
client	Selects client mode.

Examples

Clearing policy hit counts:

```
switch# show port-access policy POL6 hitcounts port

show port-access policy

`show port-access policy [<POLICY-NAME>]`

Description

Shows various aspects of policies and their current usage. Details of a policy including the content of a specific policy is shown.

Policy type values:

- **Local**—User configured policy
- **Downloaded**—Downloaded user policy
- **RADIUS**—Policy obtained from the RADIUS server

Policy status values:

- **Applied**—Policy is successfully applied in the hardware.
- **Rejected**—Policy is not supported in the hardware.
- **In-Progress**—Policy is being processed in the hardware.
- **Failed**—Displayed when the switch fails to apply the policy configuration because the TCAM resources are unavailable or full.

Base Policy Values:

- **Name of the policy**—Policy associated with the RADIUS overridden base role.
- **N/A**—Non-RADIUS policy or policy derived from RADIUS attributes such as Filter ID or [Aruba-]NAS-Filter-Rule

ACL Names Values:

- **Name of the ACL**—Name of the ACL associated with the RADIUS policy derived from RADIUS Filter-ID attribute.
- **N/A**—Non-RADIUS policy or policy derived from [Aruba-]NAS-Filter-Rule RADIUS attribute.

If a policy is configured without any action, the **show** command will represent such an entry with the **permit** action .

Parameter	Description
<POLICY-NAME>	Specifies the policy name.

Examples

Showing information for all policies:

```
switch(config)# show port-access policy

Access Policy Details:
======================

Policy Name    : POL1
Policy Type    : Local
Policy Status : Applied
Base Policy:  N/A
ACL Name:  N/A

SEQUENCE    CLASS                       TYPE ACTION
----------- --------------------------- ---- ----------------------------------
20          dhcp                        ipv4 permit
30          test                        ipv4 cir kbps 1024 exceed drop

Chapter 120
Port access role commands

app-recognition enable

`[no] app-recognition enable`

Description

Enable the application recognition role on a port. The **app-recognition** is disabled by default.

The **no** form of this command disables the application recognition role.

Examples

Configuring application recognition port for a role:

```
switch(config)# port-access role role01
switch(config-pa-role)# app-recognition enable
```

Disable application recognition for a role:

```
switch(config)# port-access role role01
switch(config-pa-role)# no app-recognition enable
```

For more information on features that use this command, refer to the Security Guide for your switch model.

For more information on application recognition feature, refer to the *Application Visibility and Control Guide* for your switch model.

Command History

Release	Modification
10.11	Command introduced

Command Information

Platforms	Command context	Authority
6300 6400	`config-pa-role` The `port-access role` command takes you into	Administrators or local user group members with execution rights for this command.

Platforms	Command context	Authority
	the `config-pa-role` context.	

associate captive-portal-profile

```
associate captive-portal-profile <PROFILE-NAME>
no associate captive-portal-profile <PROFILE-NAME>
```

Description

Associates the captive portal profile with the current role.

The **no** form of this command dissociates the captive portal profile with the role.

Parameter	Description
<PROFILE-NAME>	Specifies the captive portal profile name to associate with the current role. The profile must be present in the switch before associating it with a role. Length: 1 to 64 characters.

Examples

Associating a captive portal profile with a role:

```
switch(config)# port-access role role01
switch(config-pa-role)# associate captive-portal-profile prof01
```

Dissociating a captive portal profile from the role:

```
switch(config-pa-role)# no associate captive-portal-profile
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-pa-role` The `port-access role` command takes you into the `config-pa-role` context.	Administrators or local user group members with execution rights for this command.

associate macsec-policy

```
associate macsec-policy <POLICY-NAME>
no associate macsec-policy [<POLICY-NAME>]
```

Description

Associates a MACsec policy with a role. When a role that has a MACsec policy associated is applied to a port, all data traffic is blocked on the port until a secure channel is successfully established.

If a MACsec policy is associated with a role that is applied on a non-MACsec capable interface, the client will be in an unauthorized state and the port will remain in a blocked state.

The **no** form of this command disassociates the policy from the role.

Parameter	Description
<POLICY-NAME>	Specifies the MACsec policy name. Range: Up to 128 characters.

Examples

Associating a MACsec policy with a role.:

```
switch(config)# port-access role role01
switch(config-pa-role)# associate macsec-policy Client-Connect
```

Disassociating a MACsec policy from a role:

```
switch(config-pa-role)# no associate macsec-policy
```

For more information on features that use this command, refer to the Security Guide for your switch model.

6300	`config-pa-role` The `port-access role` command takes you into the `config-pa-role` context.	Administrators or local user group members with execution rights for this command.

associate policy

```
associate policy <POLICY-NAME>
```

`no associate policy <POLICY-NAME>`

Description

Associates the policy with the current role.

The **no** form of this command dissociates the policy from the role.

Parameter	Description
<POLICY-NAME>	Specifies the policy name to associate with the current role. Range: Up to 64 characters. **NOTE:** Only those policies created by using the **port-access policy** command are allowed to be associated with a role. Policies created using the **policy** command are not allowed to be associated with a role. Policies that are of the downloaded type are not allowed to be associated with a role.

Examples

Associating a policy with a role:

```
switch(config)# port-access role role01
switch(config-pa-role)# associate policy policy01
```

Dissociating a policy from the role:

```
switch(config-pa-role)# no associate policy poilcy01
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-pa-role` The `port-access role` command takes you into the `config-pa-role` context.	Administrators or local user group members with execution rights for this command.

auth-mode

`auth-mode {client-mode | device-mode | multi-domain}`

Description

Configures the authentication mode for the clients that are associated with the current role.

Parameter	Description
`client-mode`	Selects client mode. In this mode, all clients connecting to the port are sent for authentication.
`device-mode`	Selects device mode. In this mode, only the first client connecting to the port is sent for authentication. Once this client is authenticated, the port is considered as open and all subsequent clients trying to connect on that port are not sent for authentication.
`multi-domain`	Selects multidomain mode. In this mode only one voice device is allowed to be authenticated in addition to the configured data devices on a port. By default only one data device is allowed to be authenticated on the multidomain mode along with one voice device. You can configure the maximum number of data devices allowed with the **aaa authentication port-access client-limit multi-domain** command. If a second voice device or a data device greater than the configured data client limit onboards, a violation is triggered. You must configure a voice VLAN for IP phones to onboard a voice device in the multidomain authentication mode. To authorize a voice device, you must perform one of the following: ■ Configure the AAA server to send the **Aruba-Device-Traffic-Class** Aruba VSA with value **1**. ■ Configure the **device-traffic-class** parameter in the role to be applied to indicate a voice device. Without this VSA value or the device type in the role, the switch considers the voice device as a data device.

Examples

Configuring the client authentication mode:

```
switch(config-pa-role)# auth-mode client-mode
```

For more information on features that use this command, refer to the Security Guide for your switch model.

cached-reauth-period

```
cached-reauth-period [<PERIOD>]
no cached-reauth-period
```

Description

Enables cached reauthentication, setting the period after which clients that associated with the current role must be reauthenticated.

The **no** form of this command disables cached authentication.

Parameter	Description
<PERIOD>	Specifies the cached reauthentication period (in seconds) for clients associated with the role. Default: 30. Range: 30 to 4294967295.

Examples

Enabling cached reauthentication and setting its period to 200 seconds:

```
switch(config-pa-role)# cached-reauth-period 200
```

Disabling cached reauthentication:

```
switch(config-pa-role)# no cached-reauth-period
```

For more information on features that use this command, refer to the Security Guide for your switch model.

	command takes you into the `config-pa-role` context.	

client-inactivity timeout

```
client-inactivity timeout {<CLIENT-INACTIVITY-PERIOD> | none}
no client-inactivity timeout
```

Description

Configures the period that the switch waits for a response from a client after which it removes the client from the role.

The **no** form of the command resets the timeout period to the default.

Parameter	Description
<CLIENT-INACTIVITY-PERIOD>	Specifies the client inactivity time (in seconds). Default: Dynamic client age-out. Range: 60 to 4294967295
`none`	Selects no client deletion due to inactivity.

Examples

Configuring client inactivity timer for a role:

```
switch(config-pa-role)# client-inactivity timeout 3600
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.14	The range of the command has been modified from 60 to 4294967295 seconds.

Platforms	Command context	Authority
6300 6400	`config-pa-role` The `port-access role` command takes you into the `config-pa-role` context.	Administrators or local user group members with execution rights for this command.

description

`description <ROLE-DESCRIPTION>`

Description

Configures the role description.

Parameter	Description
<ROLE-DESCRIPTION>	Specifies the role description. Range: Up to 255 characters.

Examples

Configuring the role description:

```
switch(config-pa-role)# description student role
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-pa-role` The `port-access role` command takes you into the `config-pa-role` context.	Administrators or local user group members with execution rights for this command.

device-traffic-class

```
device-traffic-class voice
no device-traffic-class [voice]
```

Description

Configures the voice class of client to associate with the role.

This attribute is applicable only to **critical-voice-role** role. It is not applicable to other special roles such as, **preauth-role**, **reject-role**, and **fallback-role**.

The **no** form of the command resets the class of client to the default, data.

Usage

Traffic class of a client will not be considered as voice unless **device-traffic-class** is set to **voice** the role. In the multidomain mode, clients with a role that do not have the value of the **device-traffic-class** attribute set to voice will be considered as data device.

Examples

Configuring voice device traffic class for role **role01**:

```
switch(config)# port-access role role01
switch(config-pa-role)# device-traffic-class voice
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.08	Command introduced

Platforms	Command context	Authority
6300 6400	`config-pa-role` The **port-access role** command takes you into the **config-pa-role** context.	Administrators or local user group members with execution rights for this command.

gateway-zone zone gateway-role

```
gateway-zone zone <ZONE-NAME> gateway-role <GATEWAY-ROLE-NAME>
```

Description

Configures the per-role gateway zone details needed for user-based tunneling (UBT). For information on UBT, see the *Fundamentals Guide*.

Parameter	Description
<ZONE-NAME>	Specifies the role gateway zone name.
<GATEWAY-ROLE-NAME>	Specifies an existing gateway role name.

Examples

Configuring role gateway zone details:

```
switch(config-pa-role)# gateway-zone zone zone1 gateway-role role1
```

For more information on features that use this command, refer to the Security Guide for your switch model.

mtu

`mtu <MTU-SIZE>`

Description

Configures the MTU (maximum transmission unit) size of a client for a role.

Parameter	Description
<MTU-SIZE>	Specifies the MTU size in bytes. Range: 68 to 9198.

Examples

Configuring client MTU size:

```
switch(config-pa-role)# mtu 9198
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

poe-allocate-by

```
poe-allocate-by {class | usage}
no poe-allocate-by {class | usage}
```

Description

Configures the PoE allocation method for the configured port-access role. If the allocation method is not configured, the power allocation method configured on the interface is used.

The **no** form of this command removes the configuration.

Parameter	Description
`class`	Configures the PoE class-based allocation method.
`usage`	Configures the PoE usage-based allocation method.

Examples

Configuring **class** as PoE allocation method for the role **role01**:

```
switch(config)# port-access role role01
switch(config-pa-role)# poe-allocate-by class
```

Removing PoE allocation method configured for the port-access role:

```
switch(config)# port-access role role01
switch(config-pa-role)# no poe-allocate-by
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.12	Command introduced.

Command Information

Platforms	Command context	Authority
6300 6400	`config-pa-role` The `port-access role` command takes you into the `config-pa-role` context.	Administrators or local user group members with execution rights for this command.

poe-priority

```
poe-priority {critical | high | low}
no poe-priority
```

Description

Configures the power distribution priority for the port access roles. High power consumption can be prevented using the **poe-priority** control mechanism.

The **no** form of this command restores the power distribution to its default priority.

Parameter	Description
`critical`	Selects critical priority.
`high`	Selects high priority.
`low`	Selects low priority.

Examples

Configuring PoE priority for a new role:

```
switch(config)# port-access role role01
switch(config-pa-role)# poe-priority critical
```

Resetting PoE priority for the role to its default:

```
switch(config)# port-access role role01
switch(config-pa-role)# no poe-priority
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Command Information

Platforms	Command context	Authority
6300 6400	`config-pa-role` The `port-access role` command takes you into the `config-pa-role` context.	Administrators or local user group members with execution rights for this command.

port-access role

```
port-access role <ROLE-NAME>
no port-access role <ROLE-NAME>
```

Description

Creates a new port access role or modifies an existing role. This command takes you into the **config-pa-role** context. A maximum of 32 port access roles can be created.

The **no** form of this command deletes a role.

Parameter	Description
<ROLE-NAME>	Specifies the role name. Range: Up to 64 characters.

Examples

Creating a new role:

```
switch(config)# port-access role basic01
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

6300 6400	`config`	Administrators or local user group members with execution rights for this command.

reauth-period

```
reauth-period <PERIOD>
no reauth-period
```

Description

Configures the period after which clients that associated with the current role must be reauthenticated.

The reauthentication period configured here takes precedence over the reauthentication period configured at the port level.

Parameter	Description
<PERIOD>	Specifies the reauthentication period (in seconds) for clients associated with the role. Default: None. Range: 1 to 4294967295. A reauthentication period of less than 60 seconds is not recommended.

Examples

Configuring reauthentication period:

```
switch(config-pa-role)# reauth-period 3000
```

For more information on features that use this command, refer to the Security Guide for your switch model.

show aaa authentication port-access interface client-status

```
show aaa authentication port-access interface {all | <IF-NAME>}
client-status [mac <MAC-ADDRESS>]
```

Description

Shows information about the status of the role applied on ports.

Parameter	Description
`all`	Specifies all interfaces.
<IF-NAME>	Specifies the interface name.
<MAC-ADDRESS>	Specifies the client MAC address.

Examples

Showing information about a client:

```
switch# show aaa authentication port-access interface all client-status mac
00:00:00:00:00:01

Port Access Client Status Details

Client 00:00:00:00:00:01
============================
Session Details
---------------
  Port         : 1/7/24
  Session Time : 151s

Authentication Details
----------------------
  Status          : mac-auth Authenticated
  Auth Precedence : mac-auth - Authenticated, dot1x - Not attempted

Authorization Details
----------------------
  Role   : UserRole_1
  Status : Applied
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

show port-access role

```
show port-access role {local | clearpass | radius | name <ROLE-NAME>}
```

Description

Shows information about roles configured locally, or downloaded from ClearPass Policy Manager and the RADIUS server.

Displays information only about the attributes defined for the role. The base policy name will be suffixed with * for RADIUS overridden roles.

Parameter	Description
`local`	Shows information about locally configured roles.
`clearpass`	Shows information about roles downloaded from ClearPass Policy Manager.
`radius`	Shows information about roles downloaded from the RADIUS server.
<ROLE-NAME>	Specifies the role name.

Examples

Showing locally configured role information:

```
switch# show port-access role local
Role Information:
Name  : local_role_01
Type  : local
----------------------------------------------
Reauthentication Period             : 333 secs
Cached Reauthentication Period      : 300 secs
Access VLAN Name                    : Hpe
VLAN Group Name                     : group1
PoE Priority                        : low
Policy                              : deny-http-policy
Private-VLAN Port-Type              : secondar
```

Showing information for roles downloaded from ClearPass Policy Manager:

```
switch# show port-access role clearpass

Role Information:

Name  : CP_GIRI_DUR_GUEST_ROLE-3058-7
Type  : clearpass
Status: Completed
----------------------------------------------
    Reauthentication Period             : 300 secs
    Authentication Mode                 :
    Session Timeout                     : 1000000 secs
    Client Inactivity Timeout           :
    Description                         : Guest role for CP6
    Gateway Zone                        :
    UBT Gateway Role                    :
    Access VLAN                         : 20
    Native VLAN                         :
    Allowed Trunk VLANs                 :
    Access VLAN Name                    : vlan20
    Native VLAN Name                    :
    Allowed Trunk VLAN Names            :
    MTU                                 :
    QOS Trust Mode                      :
    STP Administrative Edge Port        : true
    PoE Priority                        :
    Captive Portal Profile              : CP6_CP_GIRI_DUR_GUEST_ROLE-3058-7
    Policy                              : CP6_CP_GIRI_DUR_GUEST_ROLE-3058-7
```

Showing locally configured role information:

```
switch# show port-access role local

Role Information:

   Name  : local_role_01
   Type  : local
   ----------------------------------------------
     Reauthentication Period             : 333 secs
     Cached Reauthentication Period      : 300 secs
     Access VLAN Name                    : Hpe
     VLAN Group Name                      : group1
     PoE Priority                         : low
     Policy                               : deny-http-policy
     Private-VLAN Port-Type               : secondary
```

Showing information for roles downloaded from a RADIUS server:

```
switch# show port-access role radius
Role Information:
Attributes overridden by RADIUS are prefixed by '*'.

Name : RADIUS_21963402
Type : radius
----------------------------------------------
Reauthentication Period: 333 secs
Access VLAN: 10
VLAN Group Name: group1
STP Administrative Edge Port : true
PoE Priority : low
PoE Allocation Method: class
Captive Portal Profile : testcpprof_29451201
Policy : PERMIT-ALL_87364653
Private-VLAN Port-Type : secondary
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.12	The following changes were introduced: ■ Command output updated to display information only about the attributes defined for the role. ■ Updated output to display **PoE Allocation method**. ■ The base policy name will be suffixed with * for RADIUS overridden roles.
10.08	Updated RADIUS role example with radius-overridden attributes
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

stp-admin-edge-port

```
stp-admin-edge-port
no stp-admin-edge-port
```

Description

Configures the port as a spanning tree administrative edge port for the role. This configuration removes the port participation from STP interactions when onboarding devices. This in turn helps in faster onboarding of devices.

The **no** form of the command disables STP edge port functionality.

If the port receives STP BPDU on the STP administrative edge configured port, the port will move to the STP state. You must configure the port as an STP administrative edge port only if you are sure that the connected device will not participate in STP interactions.

Example

Configuring STP edge port for a role:

```
switch(config)# port-access role role01
switch(config-pa-role)# stp-admin-edge-port
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-pa-role` The `port-access role` command takes you into the `config-pa-role` context.	Administrators or local user group members with execution rights for this command.

trust-mode

```
trust-mode [dscp | cos | none]
no trust-mode
```

Description

Configures QoS trust mode for the role.

The **no** form of this command configures the default trust mode for the role.

Parameter	Description
`dscp`	Selects trust DSCP and retain 802.1p priority.
`cos`	Selects trust 802.1p and retain DSCP or IP-ToS.
`none`	Selects no trusting of priority fields.

Examples

Configuring DSCP trust mode for a role:

```
switch(config)# port-access role role01
switch(config-pa-role)# trust-mode dscp
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-pa-role` The `port-access role` command takes you into the `config-pa-role` context.	Administrators or local user group members with execution rights for this command.

vlan

```
vlan {access | trunk native | trunk allowed} <VLAN-ID>
no vlan {access | trunk native | trunk allowed} <VLAN-ID>

vlan {access name | trunk native name | trunk allowed name} <VLAN-NAME>
no vlan {access name | trunk native name | trunk allowed name} [<VLAN-NAME>]
```

Description

Configures VLAN IDs or VLAN names, and VLAN modes for a port access role. You can configure either VLAN IDs or VLAN names, or a combination of both for a role.

The **no** form of the command deletes the VLAN configuration from the role. For trunk allowed VLAN names, you can delete the VLAN names individually or all names at once.

Parameter	Description
`access <VLAN-ID>`	Specifies the VLAN ID for the access VLAN. Supports a single VLAN ID in the range 1 to 4094.
`trunk native <VLAN-ID>`	Specifies the native VLAN ID on the trunk interface. Supports a single VLAN ID. Range: 1 to 4094.
`trunk allowed <VLAN-ID>`	Specifies the list of tagged or allowed VLANs on the trunk interface. Supports a list of VLAN IDs. Range: 1 to 4094.
`access name <VLAN-NAME>`	Specifies the VLAN name for the access VLAN. Supports a single VLAN name. Range: Up to 32 characters.
`trunk native name <VLAN-NAME>`	Specifies the native VLAN name on the trunk interface. Supports a single VLAN name. Range: Up to 32 characters
`trunk allowed name <VLAN-NAME>`	Specifies the tagged or allowed VLAN name on the trunk interface. Supports a single VLAN name. Range: Up to 32 characters. The switch supports a maximum of 50 trunk allowed VLAN names.

Usage

Note the following points when configuring the VLAN IDs and names for a role:

- For VLAN access and VLAN trunk native respectively, it is recommended to configure only one of either VLAN ID or name for a role. In case both VLAN ID and name are configured, then VLAN ID takes precedence and is applied with the role.
- For VLAN trunk allowed, you can collectively configure a maximum of 50 names and 1024 VLAN IDs. In case this limit is exceeded in the role, then that role is rejected when applying it to an onboarding device.

Platform	Maximum VLAN IDs per role	Maximum VLAN Namesper role	Total VLANs (ID + Name) per role
6300	1024	50	1024
6400	1024	50	1024

Examples

Configuring VLAN modes and VLAN IDs for a new role:

```
switch(config)# port-access role role01
switch(config-pa-role)# vlan trunk native 10
switch(config-pa-role)# vlan trunk allowed 11-15
switch(config-pa-role)# vlan access 50
```

Configuring VLAN modes and VLAN names for a new role:

```
switch(config)# port-access role role10
switch(config-pa-role)# vlan trunk native name hpe01
switch(config-pa-role)# vlan trunk allowed name data
switch(config-pa-role)# vlan trunk allowed name voice
switch(config-pa-role)# vlan trunk allowed name video
```

Deleting VLAN configuration from a role:

```
switch(config-pa-role)# no vlan trunk native 10
switch(config-pa-role)# no vlan trunk allowed 10-15
switch(config-pa-role)# no vlan access 50
```

Deleting trunk allowed VLAN names from a role individually:

```
switch(config-pa-role)# no vlan trunk native name hpe01
switch(config-pa-role)# no vlan trunk allowed name data
switch(config-pa-role)# no vlan trunk allowed name voice
switch(config-pa-role)# no vlan trunk allowed name video
```

Deleting trunk allowed VLAN names from a role all at once:

```
switch(config-pa-role)# no vlan trunk native name hpe01
switch(config-pa-role)# no vlan trunk allowed name
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Chapter 121

Port access security violation commands

port-access security violation action

```
port-access security violation action {notify | shutdown}
no port-access security violation action
```

Description

Configures the action that the switch must take whenever a security violation occurs at a port, such as the number of clients exceeding the configured client limit. This command can be issued from the interface (**config-if**) or Link Aggregation Group (**config-lag-if**) contexts.

The **no** form of the command resets the action to the default action, notify.

Parameter	Description
`notify`	Specifies that the switch notifies any security violation as an event or log in the syslog server, and also sends an SNMP trap notification. This action is the default. The format of the event log that is generated for notifying the security violation is: `Client limit exceeded on port` **`<PORT>`**`, caused by an unauthenticated client` **`<MAC-ADDRESS>`**.
`shutdown`	Specifies that the switch shuts down the port where the client limit has exceeded. A port that is shut down can be configured to auto-recover after a recovery period that can be configured with the **port-access security violation action shutdown auto-recovery** and **port-access security violation action shutdown recovery-timer** commands.

Examples

Configuring the shutdown security violation action for interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# port-access security violation action shutdown
```

Resetting the security violation action to the default value:

```
switch(config-if)# no port-access security violation action
```

Configuring the shutdown security violation action for a LAG port:

```
switch(config)# interface lag 1
switch(config-lag-if)# port-access security violation action shutdown
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.13	This command can be issued from a Link Aggregation Group (LAG) context.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-if` `config-lag-if`	Administrators or local user group members with execution rights for this command.

port-access security violation action shutdown auto-recovery

```
port-access security violation action shutdown auto-recovery {enable | disable}
no port-access security violation action shutdown auto-recovery {enable | disable}
```

Description

Configures auto-recovery of the port when the security violation action is configured as shutdown.

This configuration allows the port, that is shut down when a security violation occurs, to be automatically enabled after the recovery timer expires.

The **no** form of the command resets auto-recovery to the default, disable.

Parameter	Description
`enable`	Enables auto-recovery of port when the security violation action is configured as shutdown.
`disable`	Disables auto-recovery of port when the security violation action is configured as shutdown.

Examples

Enabling auto-recovery of port:

```
switch(config-if)# port-access security violation action shutdown auto-recovery
enable
```

Disabling auto-recovery of port:

```
switch(config-if)# no port-access security violation action shutdown auto-recovery
```

For more information on features that use this command, refer to the Security Guide for your switch model.

port-access security violation action shutdown recovery-timer

```
port-access security violation action shutdown recovery-timer <RECOVERY-TIME>
no port-access security violation action shutdown recovery-timer
```

Description

Configures security violation recovery timer for the port when the security violation action is configured as shutdown.

The **no** form of the command resets the shutdown recovery timer to the default, 10.

Parameter	Description
<RECOVERY-TIME>	Specifies the recovery timer (in seconds) after which the port, which is shut down because of security violation, is automatically enabled. Default: 10. Range: 10 to 600.

Examples

Configuring the shutdown recovery-timer on a port:

```
switch(config-if)# port-access security violation action shutdown recovery-timer
60
```

Resetting the shutdown recovery-timer to the default value:

```
switch(config-if)# no port-access security violation action shutdown recovery-
timer
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command Information

Platforms	Command context	Authority
6300 6400	`config-if`	Administrators or local user group members with execution rights for this command.

show interface

`show interface <INTERFACE-NAME>`

Description

Displays active configurations and operational status information for interfaces including the reason for the port shutdown because of a security violation at the port.

Parameter	Description
<INTERFACE-NAME>	Specifies the interface name.

Examples

The following example shows the status of the interface when it is shutdown because of security violation:

```
switch# show interface 3/1/35

Interface 3/1/25 is down
 Admin state is up
 State information: Disabled by port-access
 Link state: down for 53 minutes (since Tue Jun 01 01:27:28 UTC 2021)
```

For more information on features that use this command, refer to the Security Guide for your switch model.

show port-access aaa violation interface

`show port-access aaa violation interface {all|<INTERFACE>}`

Description

Shows information about violations that have occurred and the count of violations for port access authentication methods at the interfaces.

Parameter	Description
`all`	Specifies all interfaces.
`<INTERFACE>`	Specifies the interface name or a comma-separated list of interfaces, or a hyphen-separated interface range.

Examples

On the 6400 Switch Series, interface identification differs.

Showing information for violations for all interfaces:

```
switch# show port-access aaa violation interface all

Client limit exceeded violation status

----------------------------------------------------
   Port      Violation      Violation-Count
----------------------------------------------------
   1/1/1       No                 0
   1/1/2       Yes                10
   1/1/5       No                 10
```

Showing information for violations on interfaces 1/1/1 to 1/1/2:

```
switch# show port-access aaa violation interface 1/1/1-1/1/2

Client limit exceeded violation status

----------------------------------------------------
   Port      Violation      Violation-Count
----------------------------------------------------
   1/1/1       No                 0
   1/1/2       Yes                10
```

Showing information when no violation action is configured:

```
switch# show port-access aaa violation interface 1/1/1

Port-access aaa violation is not configured
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.08	Command introduced

show port-access port-security violation client-limit-exceeded interface

```
show port-access port-security violation client-limit-exceeded interface
{all|<INTERFACE>}
```

Description

Shows information on the number of client-limit-exceeded security violations that have occurred. The output can be filtered by interface.

Parameter	Description
`all`	Specifies all interfaces.
`<INTERFACE>`	Specifies the interface name or a comma-separated list of interfaces, or a hyphen-separated interface range.

Examples

On the 6400 Switch Series, interface identification differs.

Showing information for all ports:

```
switch# show port-access port-security violation client-limit-exceeded interface
all

Client limit exceeded violation status

-----------------------------------------------------
   Port      Violation      Violation-Count
-----------------------------------------------------
   1/1/1       No                   0
   1/1/2       Yes                  10
   1/1/5       No                   10
```

Showing information for a port range:

```
switch# show port-access port-security violation client-limit-exceeded interface
1/1/1-1/1/2

Client limit exceeded violation status
```

```
----------------------------------------------------
   Port      Violation      Violation-Count
----------------------------------------------------
   1/1/1       No                 0
   1/1/2       Yes                10
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.08	Syntax modified from **show port-access security violation client-limit-exceeded interface {all|<INTERFACE-NAME>}** to **show port-access port-security violation client-limit-exceeded interface {all|<INTERFACE-NAME>}**

Chapter 122

Port access VLAN group commands

associate-vlan

```
associate-vlan <VLAN-ID>
no associate-vlan <VLAN-ID>
```

Description

Associates VLANs with an existing VLAN group.

The **no** form of this command removes the association of the VLAN with the specified VLAN group.

Parameter	Description
<VLAN-ID>	Specifies the VLAN or a specific set of VLANs. Range 1 to 4094.

Examples

Associating VLANs with **group1**:

```
switch(config)# port-access vlan-group group1
switch(config-pa-vlan-group)# associate-vlan 5,10-15,20,21
```

Associating additional VLANs with **group1**:

```
switch(config)# port-access vlan-group group1
switch(config-pa-vlan-group)# associate-vlan 30-40
```

Dissociating VLANs 10-15 from VLAN **group1**:

```
switch(config-pa-vlan-group)# no associate-vlan 10-15
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

Release	Modification
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
6300 6400	`config-pa-vlan-group`	Administrators or local user group members with execution rights for this command.

port-access vlan-group

```
port-access vlan-group <NAME>
no port-access vlan-group <NAME>
```

Description

Creates the specified VLAN group (if it does not already exist) and then enters its context **config-pa-vlan-group**. For an existing VLAN group, this command enters the context of the specified VLAN group.

The **no** form of this command removes the specified VLAN group.

In order for the group to be applied to a client, VLANs associated to the group should be configured on the switch. If not, the role displays an error.

Parameter	Description
<NAME>	Specifies the name of the VLAN group. Range 2 to 32 characters.

Examples

Creating VLAN **group1** and associating VLANs with it:

```
switch(config)# port-access vlan-group group1
switch(config-pa-vlan-group)# associate-vlan 5,10-15,20,21
```

Dissociating VLANs 10-15 from VLAN **group1**:

```
switch(config-pa-vlan-group)# no associate-vlan 10-15
```

For more information on features that use this command, refer to the Security Guide for your switch model.

6300 6400	`config`	Administrators or local user group members with execution rights for this command.

show running-config port-access vlan-group

```
show running-config port-access vlan-group
```

Description

Shows information for all configured VLAN groups.

Example

Showing the port access VLAN group configuration:

```
switch# show running-config port-access vlan-group
...
port-access vlan-group group1
    associate-vlan 5,20,21,30-40
port-access vlan-group group2
    associate-vlan 50-60,75-85
...
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command History

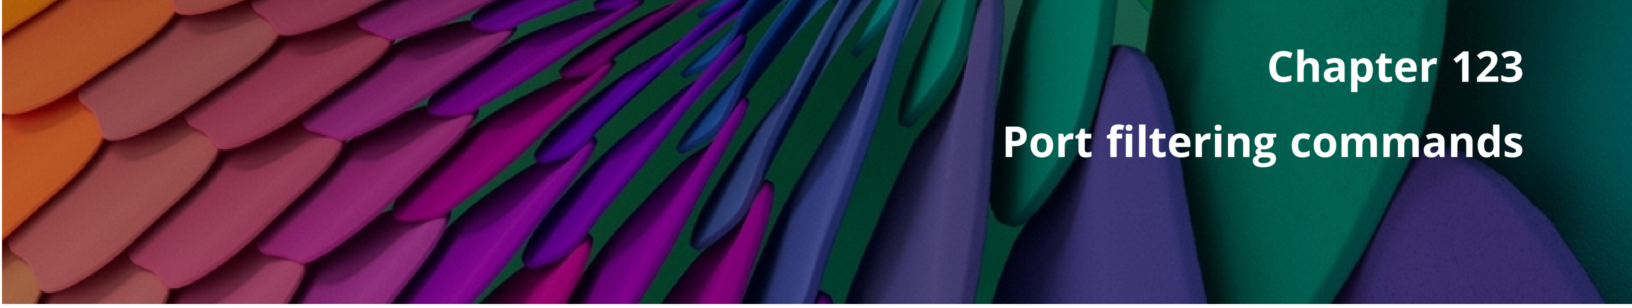
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.



Chapter 123

Port filtering commands

portfilter

```
portfilter <INTERFACE-LIST>
no portfilter [<INTERFACE-LIST>]
```

Description

Configures the specified ports so they do not egress any packets that were received on the source port specified in interface context.

The **no** form of this command removes the port filter setting from one or more ingress ports/LAGs.

This configuration will disable flow tracking statistics collection.

Parameter	Description
<INTERFACE-LIST>	Specifies a list of ports/LAGs to be blocked for egressing. Specify a single interface or LAG, or a range as a comma-separated list, or both. For example: `1/1/1`, `1/1/3-1/1/6`,`lag2`, `lag1-lag4`. *On the 6400 Switch Series, interface identification differs.*

Usage

When a port filter configuration is applied on the same ingress physical port/LAG, the configuration is updated with the new sets of egress ports/LAGs that are to be blocked for egressing and that are not a part of its previous configuration. Duplicate updates on an existing port filter configuration are ignored.

When egress ports/LAGs are removed from the existing port filter configuration of an ingress port/LAG, egressing is allowed again on those egress ports/LAGs for all packets originating from the ingress port/LAG.

The **no portfilter [<*IF-NAME-LIST*>]** command removes port filter configurations from the egress ports/LAGs listed in the <*IF-NAME-LIST*> parameter only. All other egress ports/LAGs in the port filter configuration of the ingress port/LAG remain intact.

If no physical ports or LAGs are provided for the **no portfilter** command, the command removes the entire port filter configuration for the ingress port/LAG.

Examples

On the 6400 Switch Series, interface identification differs.

Creating a filter that prevents packets received on port **1/1/1** from forwarding to ports **1/1/3-1/1/6** and to LAGs **1** through **4**:

```
switch(config)# interface 1/1/1
switch(config-if)# portfilter 1/1/3-1/1/6,lag1-lag4
```

Creating a filter that prevents packets received on LAG **1** from forwarding to ports **1/1/6** and LAGs **2** and **4**:

```
switch(config)# interface lag 1
switch(config-lag-if)# portfilter 1/1/6,lag2,lag4
```

Removing filters from an existing configuration that allows back packets received on port **1/1/1** to forward to ports **1/1/6** and LAGs **3** and **4**:

```
switch(config)# interface 1/1/1
switch(config-if)# no portfilter 1/1/6,lag3,lag4
```

Removing all filters from an existing configuration that allows back packets received on LAG **1** to forward to all the ports and LAGs:

```
switch(config)# interface lag 1
switch(config-lag-if)# no portfilter
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.14	Added information related to role based IPFIX.
10.07 or earlier	--

Command Information

Platforms	Command context	Authority
All platforms	`config-if` `config-lag-if`	Administrators or local user group members with execution rights for this command.

show portfilter

`show portfilter [<IFNAME>][vsx-peer]`

Description

Displays filter settings for all interfaces or a specific interface.

Parameter	Description
<IFNAME>	Specifies the ingress interface name. Specifies one of these values: ■ *<FQDN>*: a fully qualified domain name. ■ *<IPV4>*: an IPv4 address. ■ *<IPV6>*: an IPv6 address.
vsx-peer	Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX.

Examples

On the 6400 Switch Series, interface identification differs.

Displaying all port filter settings on the switch:

```
switch# show portfilter
Incoming   Blocked
Interface  Outgoing Interfaces
--------------------------------------------------------------------------------
1/1/1      1/1/3-1/1/6,lag1-lag2
1/1/3      1/1/1,1/1/5,1/1/7,1/1/9,1/1/11,1/1/13,1/1/15,1/1/17,1/1/19,1/1/21,
           1/1/23,1/1/25,1/1/27,1/1/29,1/1/31,1/1/33,1/1/35
lag2       1/1/1,1/1/3-1/1/6
```

Displaying the port filter settings for port **1/1/1**:

```
switch# show portfilter 1/1/1
Incoming   Blocked
Interface  Outgoing Interfaces
--------------------------------------------------------------------------------
1/1/1      1/1/3-1/1/6,lag1-lag2
```

Displaying the port filter settings for **LAG2**:

```
switch# show portfilter lag2
Incoming   Blocked
Interface  Outgoing Interfaces
--------------------------------------------------------------------------------
lag2       1/1/1,1/1/3-1/1/6
```

Chapter 124

Port security commands

port-access port-security

```
port-access port-security {enable | disable}
no port-access port-security {enable | disable}
```

Description

Enables or disables port security globally or at the port level.

Examples

Enabling port security globally:

```
switch(config)# port-access port-security enable
```

Disabling port security globally:

```
switch(config)# port-access port-security disable
```

Enabling port security on a port:

```
switch(config-if)# port-access port-security enable
```

Disabling port security on a port:

```
switch(config-if)# port-access port-security disable
```

For more information on features that use this command, refer to the Security Guide for your switch model.

Command Information

Platforms	Command context	Authority
6300 6400	`config` `config-if`	Administrators or local user group members with execution rights for this command.

port-access port-security client-limit

```
port-access port-security client-limit <CLIENTS>
no port-access port-security client-limit
```

Description

Configures the maximum number of clients that are allowed on a port. After configuring the maximum clients limit, the MAC addresses of the clients can be learned by one of the following methods:

- User can manually configure all MAC addresses by using the **mac-address** command.
- User can allow the port to dynamically learn all MAC addresses.
- User can configure a fixed number of MAC addresses and allow the switch to learn the remaining addresses dynamically.

The **no** form of the command resets the number of clients to the default, 1.

Parameter	Description
<CLIENTS>	Specifies the maximum number of clients. Default: 1. Range: **0 to 32 (4100i, 6000, 6100). 0 to 64 (8325, 10000). 0 to 32 (6200). 0 to 64 (6300, 6400).** **NOTE:** If client limit is configured to 0, the port will not learn any MAC address from inbound traffic and will be blocked indefinitely. An administrator can use this along with the port-access security violation configuration to get notified of a client attempting to connect to a port.

Examples

Configuring client limit on a port:

```
switch(config-if)# port-access port-security enable
switch(config-if-port-security)# client-limit 24
```

For more information on features that use this command, refer to the Security Guide for your switch model.

port-access port-security mac-address

```
port-access port-security mac-address <MAC-ADDRESS>
no port-access port-security mac-address <MAC-ADDRESS>
```

Description

Configures a static client (current interface (port) context) MAC address.

The **no** form of this command removes an authorized static client from the port.

Parameter	Description
<MAC-ADDRESS>	Specifies the static client MAC address.

Examples

Configuring a static client on a port:

```
switch(config-if)# port-access port-security
switch(config-if-port-security)# mac-address aa:bb:cc:dd:ee:ff
```

Deleting a static client on a port:

```
switch(config-if)# port-access port-security
switch(config-if-port-security)# no mac-address aa:bb:cc:dd:ee:ff
```

For more information on features that use this command, refer to the Security Guide for your switch model.

show port-access port-security interface client-status

```
show port-access port-security interface {all|<IF-NAME>}
     client-status [mac <MAC-ADDRESS>]
```

Description

Shows port security clients status information for the ports. The output can be filtered by interface or MAC address.

Parameter	Description
`all`	Selects all interfaces.
<IF-NAME>	Specifies the interface name.
<MAC-ADDRESS>	Specifies the client MAC address.

Examples

On the 6400 Switch Series, interface identification differs.

Showing client status information for all ports:

```
switch# show port-access port-security interface all client-status

Port Security Client Status Details

  Authorized-Clients    Type           Port
  -------------------------------------------
  AB:CD:DE:FF:AA:BB     static         1/1/1
  DD:CD:AB:CD:EE:01     dynamic        1/1/2
  00:50:56:96:7e:fc     sticky-dynamic 1/3/2
```

Showing client status information with sticky-learning enabled for all ports:

```
switch# show port-access port-security interface all client-status

Port Security Client Status Details

  Authorized-Clients    Type              Port
  ---------------------------------------------
  AB:CD:DE:FF:AA:BB     sticky-static     1/1/1
  DD:CD:AB:CD:EE:01     sticky-dynamic    1/1/2
  DE:CD:AB:BB:EE:02     sticky-dynamic    1/1/2
```

Showing client status information for a client:

```
switch# show port-access port-security interface 1/3/2 client-status mac
00:50:56:96:7e:fc

Port Security Client Status Details

  Authorized-Clients       Type           Port
  --------------------------------------------------
  00:50:56:96:7e:fc        sticky-dynamic 1/3/2
```

Showing client status information for a port:

```
switch# show port-access port-security interface 1/3/2 client-status

Port Security Client Status Details

  Authorized-Clients       Type           Port
  --------------------------------------------------
  00:50:56:96:7e:fc        sticky-dynamic 1/3/2
```

For more information on features that use this command, refer to the Security Guide for your switch model.

show port-access port-security interface port-statistics

```
show port-access port-security interface {all|<IF-NAME>} port-statistics
```

Description

Shows port security statistics for the ports in a switch. The output can be filtered by interface.

Parameter	Description
`all`	Selects all interfaces.
`<IF-NAME>`	Specifies the interface name.

Examples

On the 6400 Switch Series, interface identification differs.

Showing information for all ports.

```
switch# show port-access port-security interface all port-statistics

Port 1/1/1
==========

  Client Details
  --------------
    Number of authorized clients            : 0
    Number of sticky authorized clients     : 2
```

For more information on features that use this command, refer to the Security Guide for your switch model.

show port-access security violation sticky-mac-client-move interface

```
show port-access security violation sticky-mac-client-move interface {all|<IF-NAME>}
```

Description

Shows information about the sticky-mac client move violation. The output can be filtered by interface.

Parameter	Description
`all`	Selects all interfaces.
`<IF-NAME>`	Specifies the interface name.

Examples

On the 6400 Switch Series, interface identification differs.

Showing information for all ports.

```
switch# show port-access port-security violation sticky-mac-client-move
        interface all

Sticky MAC Client Move Violation Status Details

----------------------------------------------------
   Port      Violation      Violation-Count
----------------------------------------------------
   1/1/1       No                 0
   1/1/2       Yes                10
   1/1/5       No                 10
```

Showing information for a particular port.

```
switch# show port-access port-security violation sticky-mac-client-move
        interface 1/1/1

Sticky MAC Client Move Violation Status Details

----------------------------------------------------
   Port      Violation      Violation-Count
```

```
---------------------------------------------------
   1/1/1       No                 10
```

sticky-learn enable

```
sticky-learn enable
no sticky-learn enable
```

Description

Enables sticky learning on the port. All the existing and new MACs learned on the port are made sticky.

The **no** form of this command disables the sticky learning on the port.

Examples

Enabling sticky learning on the port:

```
switch(config)# interface 1/1/1
switch(config-if)# port-access port-security
switch(config-if-port-security)# sticky-learn enable
```

Disabling sticky learning on the port:

```
switch(config)# interface 1/1/1
switch(config-if)# port-access port-security
switch(config-if-port-security)# no sticky-learn enable
```

For more information on features that use this command, refer to the Security Guide for your switch model.

sticky-learn mac

```
sticky-learn mac <MAC-ADDRESS> [vlan <VLAN-ID>]
no sticky-learn mac <MAC-ADDRESS> [vlan <VLAN-ID>]
```

Description

Configures the MAC addresses of sticky static clients. After configuring, clients are directly added to the MAC address table.

The **no** form of this command removes an authorized sticky static client from the port.

Parameter	Description
<MAC-ADDRESS>	Specifies the static sticky client MAC address.
vlan *<VLAN-ID>*	Specifies the static sticky client VLAN ID.

Examples

Configuring a sticky static client on a port:

```
switch(config)# interface 1/1/1
switch(config-if)# port-access port-security
switch(config-if-port-security)# sticky-learn mac-address aa:bb:cc:dd:ee:ff
```

Configuring a sticky static client with a VLAN ID on a port:

```
switch(config)# interface 1/1/1
switch(config-if)# port-access port-security
switch(config-if-port-security)# sticky-learn mac-address aa:bb:cc:dd:ee:ff vlan 4
```

Removing a sticky static client from a port:

```
switch(config)# interface 1/1/1
switch(config-if)# port-access port-security
switch(config-if-port-security)# no sticky-learn mac-address aa:bb:cc:dd:ee:ff
```

Chapter 125

PTP commands

clear ptp statistics

`clear ptp statisctics [<IFNAME>]`

Description

Clears PTP counters for the given interface.

Parameter	Description
<IFNAME>	Optional: Specifies the interface name.

Examples

Clearing PTP counters for the given interface:

```
switch# clear ptp statistics 1/1/8
switch# clear ptp statistics lag1
switch# clear ptp statistics
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.10.1000	Added boundary clock support on the 6300 Switch Series.
10.10	Command introduced on the 6300 Switch Series for transparent clock.
10.08	Command introduced.

Command Information

Platforms	Command context	Authority
6300	Manager (#)	Administrators or local user group members with execution rights for this command.

clock-domain

```
clock-domain <DOMAIN-NUMBER>
no clock-domain
```

Description

Configures the PTP clock domain to a specified value.

The **no** form of this command removes the PTP domain configuration of the PTP clock.

Parameter	Description
<DOMAIN-NUMBER>	Sets the PTP clock domain. Range: 0 to 254. Value configurable subject to limits established by the PTP profile.

Usage

- The one-step end-to-end transparent clock works across domains.
- For boundary clocks, the clock-domain has to be identical with the domain used in the network.
- All PTP devices must be within same domain to be able to sync with each other.
- This command is only enabled in the PTP profile context.
- For PTP transparent clock, you must configure the same clock-domain as on clients and GM to synchronize.

Examples

Entering the PTP profile context and setting the PTP clock domain value:

```
switch(config)# ptp profile aes-r16
switch(config-ptp)#
switch(config-ptp)#clock-domain 4
switch(config-ptp)#
```

Removing the PTP clock domain value:

```
switch(config-ptp)# no clock-domain
switch(config-ptp)#
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.10.1000	Command introduced on the 6300 Switch series.

Command Information

Platforms	Command context	Authority
6300 (only R8S89A, R8S90A)	`config-ptp`	Administrators or local user group members with execution rights for this command.

clock-step

```
clock-step {one-step|two-step}
no clock-step
```

Description

Configures the clock step mode that determines when the egress-time information is sent.

The 6300 Switch Series (models R8S89A and R8S90A) support both one-step and two-step modes for boundary clocks. Transparent clocks only support one-step mode. All other 6300 Switch Series models support only transparent clock one-step mode

The **no** form of this command removes the PTP clock-step configuration of the PTP clock.

Parameter	Description
`one-step`	Sets the PTP clock-step mode to one-step messaging in which egress-time information is sent along with the SYNC message.
`two-step`	Sets the PTP clock-step mode to two-step messaging in which egress-time information is sent a subsequent follow-up message with the egress timestamp of the previously sent SYNC message.

Usage

- Mandatory command to start the PTP clock.
- Boundary clocks can inter-operate with different step modes upstream or downstream.

Example

Setting the clock-step mode to one-step messaging:

```
switch(config-ptp)# clock-step one-step
```

Removing the clock-step mode configuration:

```
switch(config-ptp)# no clock-step
```

Setting the clock-step mode to two-step messaging:

```
switch(config-ptp)# clock-step two-step
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.11	For boundary clock, added support for the **two-step** parameter on the 6300 Switch Series (models R8S89A and R8S90A).
10.08	Command introduced.

Command Information

Platforms	Command context	Authority
6300	`config-ptp`	Administrators or local user group members with execution rights for this command.

enable

```
enable
no enable
```

Description

Enables the PTP profile globally. However, the PTP clock is started only when all the mandatory commands are set.

The **no** form of this command disables the PTP profile globally.

Usage

Mandatory command to start the PTP clock.

Examples

Enabling the PTP profile:

```
switch(config)# ptp profile 1588v2
switch(config-ptp)# enable
```

Disabling the PTP profile:

```
switch(config)# ptp profile 1588v2
switch(config-ptp)# no enable
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.08	Command introduced.

Command Information

Platforms	Command context	Authority
6300	`config-ptp`	Administrators or local user group members with execution rights for this command.

mode

```
mode boundary {end-to-end | peer-to-peer}
no mode boundary {end-to-end | peer-to-peer}
mode transparent {end-to-end | peer-to-peer}
no mode transparent {end-to-end | peer-to-peer}
no mode
```

Description

Configures the switch PTP clock mode, either boundary or transparent, with a delay-request mechanism of either end-to-end or peer-to-peer. A device in transparent clock mode does not synchronize (syntonize) itself to a grandsource clock.

> On the Aruba 6300 Switch Series, boundary clock (one-step and two-step modes) are available only on models R8S89A and R8S90A. All other Aruba 6300 Switch Series models support only transparent clock (E2E and P2P). A VSF stack only supports E2E mode.

The **no** form of this command unconfigures the PTP clock mode and delay-request mechanism.

Parameter	Description
`boundary`	Selects boundary clock mode.
`transparent`	Selects transparent clock mode.
`end-to-end`	Selects the end-to-end delay-request mechanism.
`peer-to-peer`	Selects the peer-to-peer delay-request mechanism. Not supported with VSF.

Examples

Configuring PTP boundary clock mode with the end-to-end delay-request mechanism:

```
switch(config-ptp)# mode boundary end-to-end
```

Unconfiguring PTP boundary clock mode with the end-to-end delay-request mechanism:

```
switch(config-ptp)# no mode boundary end-to-end
```

Configuring PTP boundary clock mode with the peer-to-peer delay-request mechanism:

```
switch(config-ptp)# mode boundary peer-to-peer
```

Unconfiguring PTP boundary clock mode with the peer-to-peer delay-request mechanism:

```
switch(config-ptp)# no mode boundary peer-to-peer
```

Configuring PTP transparent with the end-to-end delay-request mechanism:

```
switch(config-ptp)# mode transparent end-to-end
```

Unconfiguring PTP transparent with the end-to-end delay-request mechanism:

```
switch(config-ptp)# no mode transparent end-to-end
```

Configuring PTP transparent with the peer-to-peer delay-request mechanism:

```
switch(config-ptp)# mode transparent peer-to-peer
```

Unconfiguring PTP transparent with the peer-to-peer delay-request mechanism:

```
switch(config-ptp)# no mode transparent peer-to-peer
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.11	Added support for the **peer-to-peer** delay-request mechanism.
10.10.1000	Added boundary clock to the 6300 Switch Series models R8S89A and, R8S90A.
10.08	Command introduced.

Command Information

Platforms	Command context	Authority
6300	`config-ptp`	Administrators or local user group members with execution rights for this command.

priority1

```
priority1 <PRIORITY>
no priority1
```

Description

Configures the PTP clock **priority1** value of the device. This value is operational when the device is in boundary clock mode and participating in the Best Clock Source Algorithm (BMCA). This value is used to indicate priority to its downstream clock-aware devices.

The **no** form of this command removes the PTP **priority1** configuration of the PTP clock and sets it to the default value of 128.

Parameter	Description
<PRIORITY>	Sets the priority value. Default 128.

Usage

This value can be configured only for the boundary clock.

Examples

Configuring PTP priority1 value:

```
switch(config-ptp)# priority1 129
```

Removing PTP priority1 configuration:

```
switch(config-ptp)# no priority1
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.10.1000	Command introduced on the 6300 Switch Series.

Command Information

Platforms	Command context	Authority
6300 (only R8S89A, R8S90A)	config-ptp	Administrators or local user group members with execution rights for this command.

priority2

```
priority2 <PRIORITY>
no priority2 <PRIORITY>
```

Description

Configures the PTP clock **priority2** value of the device. This value is operational when the device is in boundary clock mode and participating in the Best Clock Source Algorithm (BMCA). This value is used to indicate priority to its downstream clock-aware devices.

The **no** form of this command removes the PTP **priority2** configuration of the PTP clock and sets it to the default value of 128.

Parameter	Description
<PRIORITY>	Sets the priority value. Default 128.

Usage

This value can be configured only for the boundary clock.

Examples

Configuring PTP `priority2` value:

```
switch(config-ptp)# priority2 129
```

Removing PTP priority2 configuration:

```
switch(config-ptp)# no priority2
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.10.1000	Command introduced on the 6300 Switch Series.

Command Information

Platforms	Command context	Authority
6300 (only R8S89A, R8S90A)	`config-ptp`	Administrators or local user group members with execution rights for this command.

ptp announce-interval

```
ptp announce-interval {1588v2| aes67 | aes-r16 | dot1as | smpte} <LOG-SECONDS>
no ptp announce-interval {1588v2| aes67 | aes-r16 | dot1as | smpte}
```

Description

Sets the announce message transmit interval on a PTP-enabled interface for a specific PTP profile.

The **no** form of this command removes the announce message transmit interval configuration on a PTP-enabled interface and sets a profile specific default value.

Parameter	Description
`1588v2`	Specifies the PTP 1588v2 profile timers. Default: 1.
`aes67`	Specifies the PTP AES67 profile timers. Default: 1.
`aes-r16`	Specifies the PTP AES-R16 profile timers. Default: 1.
`dot1as`	Specifies the PTP 802.1 AS profile timers. Default: 0.
`smpte`	Specifies the PTP SMTPE profile timers. Default: -2.
`<LOG-SECONDS>`	Sets the announce message interval in log seconds.

Usage

This value can be configured only for the boundary clock.

Examples

Setting the PTP 1588v2 profile timers:

```
switch(config)# interface 1/1/1
switch(config-if)# ptp announce-interval 1588v2 1
```

Setting the PTP AES67 profile timers:

```
switch(config)# interface 1/1/1
switch(config-if)# ptp announce-interval aes67 2
```

Removing the PTP AES67 profile timer configuration:

```
switch(config)# interface 1/1/1
switch(config-if)# no ptp announce-interval aes67
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.13	Support extended for 802.1AS profile.
10.10.1000	Command introduced on the 6300 Switch Series.

Command Information

Platforms	Command context	Authority
6300 (only R8S89A, R8S90A)	`config-if`	Administrators or local user group members with execution rights for this command.

ptp announce-timeout

```
ptp announce-timeout {1588v2| aes67 | aes-r16 | dot1as | smpte} <COUNT>
no ptp announce-timeout {1588v2| aes67 | aes-r16 | dot1as | smpte}
```

Description

Sets the announce message receipt timeout on a PTP-enabled interface for a specific PTP profile.

The **no** form of this command resets the announce message receipt timeout configuration on a PTP-enabled interface and sets a profile-specific default value.

Parameter	Description
`1588v2`	Specifies the PTP 1588v2 profile timers. Default: 3.
`aes67`	Specifies the PTP AES67 profile timers. Default: 3.
`aes-r16`	Specifies the PTP AES-R16 profile timers. Default: 3.
`dot1as`	Specifies the PTP 802.1AS profile timers. Default: 3.
`smpte`	Specifies the PTP SMTPE profile timers. Default: 3.
`<LOG-SECONDS>`	Specifies the number of announcement intervals.

Usage

This value can be configured only for the boundary clock.

Examples

Setting the PTP 1588v profile timer:

```
switch(config)# interface 1/1/1
switch(config-if)# ptp announce-timeout 1588v2
```

Setting the PTP AES67 profile timer:

```
switch(config)# interface 1/1/1
switch(config-if)# ptp announce-timeout aes67 4
```

Resetting the PTP AES67 profile timer:

```
switch(config)# interface 1/1/1
switch(config-if)#no ptp announce-timeout aes67
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.13	Support extended for 802.1AS profile.
10.10.1000	Command introduced on the 6300 Switch Series.

Command Information

Platforms	Command context	Authority
6300 (only R8S89A, R8S90A)	`config-if`	Administrators or local user group members with execution rights for this command.

ptp clock-source-only

```
ptp clock-source-only
no ptp clock-source-only
```

Description

Configures the PTP port state to clock_source state. This prohibits the port from entering into a clock_ sink or passive state.

The **no** form of this command removes the clock_source state configuration on the port and returns it to normal BMCA operation.

Usage

This can only be configured for the boundary clock.

Examples

Configuring the clock_source only role for the port:

```
switch(config)# interface 1/1/1
switch(config-if)# ptp clock-source-only
```

Removing the configuration of clock_source only role for the port:

```
switch(config)# interface 1/1/1
switch(config-if)# no ptp clock-source-only
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.10.1000	Command introduced on the 6300 Switch Series.

Command Information

Platforms	Command context	Authority
6300 (only R8S89A, R8S90A)	`config-if`	Administrators or local user group members with execution rights for this command.

ptp delay-req-interval

```
ptp delay-req-interval {1588v2 | aes67 | aes-r16 | smpte} <LOG-SECONDS>
no ptp delay-req-interval {1588v2 | aes67 | aes-r16 | smpte}
```

Description

Sets the **delay_req** message transmit interval on a PTP-enabled interface for a specific PTP profile.

The **no** form of this command removes the **delay_req** message transmit interval configuration on a PTP-enabled interface and sets a profile specific default value.

Parameter	Description
`1588v2`	Specifies the PTP 1588v2 profile timers. Default 0.
`aes67`	Specifies the PTP AES67 profile timers. Default 0.
`aes-r16`	Specifies the PTP AES-R16 profile timers. Default 0.
`smpte`	Specifies the PTP SMTPE profile timers. Default -3.
`<LOG-SECONDS>`	Sets the **delay_req** message interval in log seconds.

Usage

- Use this command for end-to-end (E2E) mode and use command **ptp pdelay-interval** for peer-to-peer mode.
- This command is only for boundary clock.

Examples

Setting the PTP 1588v2 profile timers:

```
switch(config)# interface 1/1/1
switch(config-if)# ptp delay-req-interval 1588v2 2
```

Removing a PTP 1588v2 profile timer configuration:

```
switch(config)# interface 1/1/1
switch(config-if)# no ptp delay-req-interval 1588v2
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.10.1000	Command introduced on the 6300 Switch Series.

Command Information

Platforms	Command context	Authority
6300 (only R8S89A, R8S90A)	`config-if`	Administrators or local user group members with execution rights for this command.

ptp enable

```
ptp enable
no ptp enable
```

Description

Enables PTP on the interface. The **no** form of this command disables PTP on the interface. PTP can be enabled only on physical L2 or L3 interfaces and LAG L2 or L3 interfaces.

Examples

Enabling PTP on a physical interface:

```
switch(config)# interface 1/1/1
switch(config-if)# ptp enable
```

Disabling PTP on the interface context:

```
switch(config)# interface 1/1/1
switch(config-if)# no ptp enable
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.08	Command introduced.

Command Information

Platforms	Command context	Authority
6300	`config-if`	Administrators or local user group members with execution rights for this command.

ptp lag-role

```
ptp lag-role {primary | secondary}
no ptp lag-role
```

Description

Configures the PTP role for the member interfaces of a Link Aggregation (LAG) . When there are two or more member interfaces for a LAG, only one link can be configured as primary and only one other link can be configured as secondary. The primary member interface is used for transmitting the PTP packets generated by the boundary clock. When the primary member goes down, the secondary member is used for PTP packet transmission. If both primary and secondary members go down, PTP does not flip over to the other links of the LAG.

The **no** form of this command removes the PTP role configuration for the LAG member interface.

This command is not supported when configured as a transparent clock.

Parameter	Description
`primary`	Sets the primary PTP lag-role for the LAG member interface.
`secondary`	Sets the secondary PTP lag-role for the LAG member interface.

Usage

- LAG roles must be configured for boundary clock.
- For the primary or secondary LAG roles, ensure that the same link ports are configured on both ends of the LAG.

Examples

Setting the primary PTP lag-role for the LAG member interface:

```
switch(config)# interface 1/1/1
switch(config-if)# ptp lag-role primary
```

Setting the secondary PTP lag-role for the LAG member interface:

```
switch(config)# interface 1/1/2
switch(config-if)# ptp lag-role secondary
```

Removing the PTP lag-role configuration for the LAG member interface:

```
switch(config)# interface 1/1/1
switch(config-if)# no ptp lag-role
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.10.1000	Command introduced on the 6300 Switch Series.

Command Information

6300 (only R8S89A, R8S90A)	`config-if`	Administrators or local user group members with execution rights for this command.

ptp neighbor-propagation-delay-threshold

`ptp neighbor-propagation-delay-threshold <threshold value>`

Description

Configures PTP neighbor propagation delay threshold in nanoseconds.

The **no** form of this command removes the PTP neighbor propagation delay threshold configuration.

Parameter	Description
<threshold value>	Sets the PTP neighbor propagation delay threshold in nanoseconds. The supported range is 0-2147483648. Default threshold value: 800 nanoseconds.

Examples

Setting the PTP neighbor-propagation-delay-threshold:

```
switch(config)# interface 1/1/1
switch(config-if)# ptp neighbor-propagation-delay-threshold 200
```

Removing the PTP neighbor-propagation-delay-threshold:

```
switch(config)# interface 1/1/1
switch(config-if)# no ptp neighbor-propagation-delay-threshold
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.13	Command introduced.

Command Information

Platforms	Command context	Authority
6300 (only R8S89A, R8S90A)	`config-if`	Administrators or local user group members with execution rights for this command.

ptp pdelay-req-interval

```
ptp pdelay-req-interval {1588v2| aes67 | aes-r16 | dot1as | smpte} <LOG-SECONDS>
no ptp pdelay-req-interval {1588v2| aes67 | aes-r16 | dot1as | smpte}
```

Description

Sets the **pdelay_req** message transmit interval on a PTP-enabled interface for a specific PTP profile.

The **no** form of this command removes the **pdelay_req** message transmit interval configuration on a PTP-enabled interface and sets a profile specific default value.

Parameter	Description
`1588v2`	Specifies the PTP 1588v2 profile timers. Default 0.
`aes67`	Specifies the PTP AES67 profile timers. Default 0.
`aes-r16`	Specifies the PTP AES-R16 profile timers. Default 0.
`dot1as`	Specifies the PTP 802.1AS profile timers. Default: 0.
`smpte`	Specifies the PTP SMTPE profile timers. Default -3.
<LOG-SECONDS>	Sets the delay_req message interval in log seconds.

Usage

- Use this command for peer-to-peer (P2P) mode and use command **ptp delay-interval** for end-to-end (E2E) mode.

Examples

Setting the PTP 1588v2 profile timers:

```
switch(config)# interface 1/1/1
switch(config-if)# ptp pdelay-req-interval 1588v2 2
```

Removing the PTP 1588v2 profile timer configuration:

```
switch(config)# interface 1/1/1
switch(config-if)# no ptp pdelay-req-interval 1588v2
```

Setting the PTP AES67 profile timers:

```
switch(config)# interface 1/1/1
switch(config-if)# ptp pdelay-req-interval aes67 1
```

Removing the PTP AES67 profile timer configuration:

```
switch(config)# interface 1/1/1
switch(config-if)# no ptp pdelay-req-interval aes67
```

Setting the PTP smpte profile timers:

```
switch(config)# interface 1/1/1
switch(config-if)# ptp pdelay-req-interval smpte 1
```

```
Removing the PTP smpte  profile timer configuration:
```

```
switch(config)# interface 1/1/1
switch(config-if)# no ptp pdelay-req-interval smpte
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.13	Support extended for 802.1AS profile.
10.11	Command introduced.

Command Information

Platforms	Command context	Authority
6300 (only R8S89A, R8S90A)	`config-if`	Administrators or local user group members with execution rights for this command.

ptp peer ip

```
ptp peer ip <IP-ADDRESS>
no ptp peer ip <IP-ADDRESS>
```

Description

Configures destination IP addresses for the interfaces in unicast transmission. The **no** form of this command removes the PTP destination IP address configuration for the interfaces in unicast transmission.

Parameter	Description
`ip <IP-ADDRESS>`	Specifies the peer IPv4 address. Syntax: A.B.C.D

Usage

- This command has no effect when configured as a transparent clock.

Example

Configuring `ptp peer ip` on the interface:

```
switch(config)# interface 1/1/1
switch(config-if)# ptp peer ip 10.0.0.1
```

Removing `ptp peer ip` on the interface:

```
switch(config-if)# no ptp peer ip 10.0.0.1
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.10.1000	Command introduced on the 6300 Switch Series.

Platforms	Command context	Authority
6300 (only R8S89A, R8S90A)	`config-if`	Administrators or local user group members with execution rights for this command.

ptp profile

```
ptp profile {<PROFILE NAME>}
no ptp profile
```

Description

Enters the PTP context to configure the PTP profile in which the device will operate.

Configure PTP profile before configuring mode or other profile-specific parameters. The device can be operating in any one profile at a given point of time. The **no** form of this command removes the PTP profile configuration in which the device will operate. This command clears the PTP profile and all parameters related to that profile.

Parameter	Description
<PROFILE NAME>	Specifies the profile to be used. Profiles include: ▪ 1588v2: Specifies the IEEE 1588-2008 profile to be used. ▪ aes-r16: Specifies the IEEE AES-R16-2016 profile to be used. ▪ aes67: Specifies the IEEE AES67 profile to be used. ▪ dot1as: Specifies the IEEE 802.1AS profile to be used. ▪ smpte: Specifies the IEEE SMPTE-ST-2059-2 profile to be used. **NOTE:** The 802.1AS (2011) PTP profile specification supports only two-step clock, Ethernet transport, and peer-to-peer delay mechanism. The 802.1AS PTP profile is supported only on following SKUs: JL717C, JL718C, JL719C, JL721C, JL722C, R8S89A, and R8S90A.

Usage

Configure PTP profile before configuring mode or other profile-specific parameters.

Example

Configuring PTP profiles:

```
switch(config)# ptp profile 1588v2
```

Configuring PTP profiles:

```
switch(config)# ptp profile dot1as
```

Configuring more than one PTP profile:

```
switch(config)# ptp profile 1588v2
switch(config-ptp)# exit
switch(config)# ptp profile smpte
switch(config-ptp)#
The existing profile must be removed using the 'no ptp profile' command before
configuring a different profile.
```

Configuring Ethernet transport for the 802.1AS PTP profile:

```
switch(config)# ptp profile dot1as
switch(config-ptp)# transport-protocol ethernet
```

Configuring peer-to-peer delay mechanism for the 802.1AS PTP profile:

```
switch(config)# ptp profile dot1as
switch(config-ptp)# mode boundary peer-to-peer
```

Configuring two-setp clock for the 802.1AS PTP profile:

```
switch(config)# ptp profile dot1as
switch(config-ptp)# clock-step two-step
```

Removing the PTP profile:

```
switch(config-ptp)# no ptp profile
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.13	Support extended for 802.1AS profile.
10.08	Command introduced.

Command Information

Platforms	Command context	Authority
6300	`config`	Administrators or local user group members with execution rights for this command.

ptp sync-interval

```
ptp sync-interval {1588v2 | dot1as | aes67 | smpte} <LOG-SECONDS>
no ptp sync-interval {1588v2 | dot1as | aes67 | smpte} <LOG-SECONDS>
```

Description

Sets the sync message transmit interval on a PTP-enabled interface for a specific PTP profile.

The **no** form of this command removes the sync message transmit interval configuration on a PTP enabled interface and sets it to a profile-specific default value.

Parameter	Description
`1588v2`	Specifies the PTP 1588v2 profile timers. Default 0.
`dot1as`	Specifies the PTP 802.1 AS profile timers. Default -3.
`aes67`	Specifies the PTP AES67 profile timers. Default -3.
`smpte`	Specifies the PTP SMTPE profile timers. Default -3
`<LOG-SECONDS>`	Sets the sync message interval in log seconds.

Examples

Setting the PTP 802.1 AS sync interval :

```
switch(config)# interface 1/1/1
switch(config-if)# ptp sync-interval dot1as -2
```

Setting the PTP 1588v2 sync interval :

```
switch(config)# interface 1/1/1
switch(config-if)# ptp sync-interval 1588v2 2
```

Setting the PTP AES67 sync interval :

```
switch(config)# interface 1/1/1
switch(config-if)# ptp sync-interval aes67 -2
```

Removing the PTP AES67 sync interval:

```
switch(config)# interface 1/1/1
switch(config-if)# no ptp sync-interval aes67
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.13	Support extended for 802.1AS profile.
10.10.1000	Command introduced on the 6300 Switch Series.

Command Information

Platforms	Command context	Authority
6300 (only R8S89A, R8S90A)	`config-if`	Administrators or local user group members with execution rights for this command.

ptp sync-timeout

```
ptp sync-timeout dot1as <COUNT>
no ptp sync-timeout dot1as
```

Description

Sets the synchronization message receipt timeout on a PTP enabled interface.

The **no** form of this command resets the synchronization message receipt timeout configuration on a PTP-enabled interface and sets a profile-specific default value.

Parameter	Description
`dot1as`	Specifies the PTP 802.1AS profile timers. Default: 3.
`<LOG-SECONDS>`	Specifies the number of announcement intervals.

Examples

Setting the PTP 802.1 AS profile timer:

```
switch(config)# interface 1/1/1
switch(config-if)# ptp sync-timeout dot1as 4
```

Resetting the PTP 802.1 AS profile timer:

```
switch(config)# interface 1/1/1
switch(config-if)# no ptp sync-timeout dot1as
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.13	Command introduced.

Command Information

Platforms	Command context	Authority
6300 (only R8S89A, R8S90A)	`config-if`	Administrators or local user group members with execution rights for this command.

ptp vlan

```
ptp vlan <VLAN-ID>
no ptp vlan
```

Description

Configures a VLAN for PTP messages. It is necessary when the boundary clock port is a VLAN trunk L2 interface (**no routing**). The **no** form of this command removes the VLAN configuration for PTP messages.

Parameter	Description
<VLAN-ID>	Specifies a VLAN. Range: 1-4094.

Usage

- This configuration has no bearing on the one-step transparent clock.
- In boundary clock mode, only PTP packets in PTP VLAN are processed; PTP packets from other VLANs are dropped.
- **ptp vlan** should be configured on interfaces only when the specific VLAN is a trunk/tagged member of that port. This configuration should not be performed on an access port.

Examples

Configuring a specific VLAN for PTP messages:

```
switch(config)# interface 1/1/1
switch(config-if)# ptp vlan 4
```

Removing the VLAN configuration for PTP messages:

```
switch(config)# interface 1/1/1
switch(config-if)# no ptp vlan
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.10.1000	Command introduced on the 6300 Switch Series.

Command Information

Platforms	Command context	Authority
6300 (only R8S89A, R8S90A)	`config-if`	Administrators or local user group members with execution rights for this command.

show ptp clock

```
show ptp clock
```

Description

Shows PTP clock-related information.

Example

Showing PTP transparent clock information:

```
switch# show ptp clock
PTP Profile                          : smpte
PTP Mode                             : transparent
Delay Mechanism                      : end-to-end
Clock Identity                       : NA
Network Transport Protocol           : ipv4
Clock Step                           : One
Clock Domain                         : NA
Number of PTP Ports                  : 1
Priority1                            : NA
Priority2                            : NA
Clock Quality :
  Class                              : NA
  Accuracy                           : NA
  Offset (log variance)              : NA
Offset From Clock-Source             : NA
Mean Delay                           : NA
Steps Removed                        : NA
```

Showing PTP boundary clock information (boundary clock is available only on the 6300 Switch Series models R8S89A and R8S90A that first released with AOS-CX 10.10.1000):

```
switch# show ptp clock
PTP Profile                          : aes67
PTP Mode                             : boundary
Delay Mechanism                      : end-to-end
Clock Identity                       : 00:fd:45:ff:fe:68:f3:00
Network Transport Protocol           : ipv4
Clock Step                           : Two
Clock Domain                         : 0
Number of PTP Ports                  : 3
Priority1                            : 128
```

```
Priority2                                    : 128

Clock Quality :
  Class                                      : 248
  Accuracy                                   : 49
  Offset (log variance)                      : 52592

Offset From Clock-Source                     : - 0.000000006  (s)
Mean Delay                                   : + 0.000000277  (s)
Steps Removed                                : 1
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.08	Command introduced.

Command Information

Platforms	Command context	Authority
6300	Manager (#)	Auditors or Administrators or local user group members with execution rights for this command. Auditors can execute this command from the auditor context (auditor>) only.

show ptp foreign-clock-sources

```
show ptp foreign-clock-sources
```

Description

Shows the priority1, priority2, class, accuracy, offset-scaled-log-variance (OSLV), and steps removed information for foreign clock-source nodes.

Example

Showing PTP foreign clock-source information:

```
switch(config-if)# show ptp foreign-clock-sources
P1=Priority1, P2=Priority2, C=Class, A=Accuracy,
OSLV=Offset-scaled-log-variance, SR=Steps-removed

---------- -------------------------------- ------------------------ ---- ---- ---- ---- ------ ---
Interface  Foreign Port ID                  Clock Source ID          P1   P2   C    A    OSLV   SR
---------- -------------------------------- ------------------------ ---- ---- ---- ---- ------ ---
1/1/4      00:00:00:00:00:00:00:01(0x0001)  00:00:00:00:00:00:00:01  0    0    6    35   0      1
1/1/5      b4:99:ba:ff:fe:54:2b:00(0x0002)  00:00:00:00:00:00:00:01  0    0    6    35   0      2
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.10.1000	Command introduced on the 6300 Switch Series.

Command Information

Platforms	Command context	Authority
6300 (only R8S89A, R8S90A)	Manager (#)	Auditors or Administrators or local user group members with execution rights for this command. Auditors can execute this command from the auditor context (auditor>) only.

show ptp interface

```
show ptp interface [<IFNAME> profile-data dot1as | [brief]
```

Description

Shows PTP port-related information.

Parameter	Description
<IFNAME>	Specifies the interface name.
`profile-data`	Shows additional information of the profile.
`dot1as`	Shows port data specific to the 802.1 AS profile.
`brief`	Shows information in a brief format.

Examples

Showing PTP port information when the switch is acting as a transparent clock:

```
switch# show ptp interface 1/1/1
Port Identity                           : 00:00:00:00:00:00:00:00 (0x0000)
Port Number                             : 0
PTP Version                             : 2
PTP Enable                              : Enabled
PTP Transport                           : ipv4
Port State                              : Disabled
Delay Mechanism                         : peer-to-peer
Announce Interval (log mean)            : 0
Announce Receipt Timeout                : 0
Sync Interval (log mean)                : 0
Sync Timeout                            : NA
Delay Request Interval (log mean)       : NA
Peer Delay Request Interval (log mean)  : 0
```

```
Mean Path Delay                          : 0 (ns)
switch#

switch# show ptp interface lag20
Port Identity                            : NA
Port Number                              : NA
PTP Version                              : 2
PTP Enable                               : Enabled

Command History

Release	Modification
10.13	Support extended for 802.1AS profile.
10.08	Command introduced.

Command Information

Platforms	Command context	Authority
6300	Manager (#)	Auditors or Administrators or local user group members with execution rights for this command. Auditors can execute this command from the auditor context (auditor>) only.

show ptp parent

`show ptp parent`

Description

Shows parent node information for the PTP device.

Example

Showing PTP parent node information:

```
switch# show ptp parent
PTP Parent Properties

Parent Clock
----------------------------
Parent Clock Identity                  : 00:00:00:00:00:00:00:01
Parent Port Number                     :  0x0001
Observed Parent Offset (log variance)  : 65535
Observed Parent Clock Phase Change Rate: 2147483647

Grandsource Clock
----------------------------
Grandsource Clock Identity             : 00:00:00:00:00:00:00:01
Grandsource Clock Quality
  Class                                : 6
  Accuracy                             : 35
  Offset (log variance)                : 0
Priority1                              : 0
Priority2                              : 0
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.10.1000	Command introduced on the 6300 Switch Series.

Command Information

Platforms	Command context	Authority
6300 (only R8S89A, R8S90A)	Manager (#)	Auditors or Administrators or local user group members with execution rights for this command. Auditors can execute this command from the auditor context (auditor>) only.

show ptp statistics

```
show ptp statistics [<IFNAME>]
```

Description

Shows PTP port statistics.

Parameter	Description
<IFNAME>	Optional. Specifies the interface name.

Examples

Showing PTP port statistics:

```
switch# show ptp statistics

PTP Interface Statistics

                 Received Packets    Sent Packets    Discarded Packets    Lost Packets

```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.08	Command introduced.

Command Information

Platforms	Command context	Authority
6300	Manager (#)	Administrators or local user group members with execution rights for this command.

show ptp time-property

```
show ptp time-property
```

Description

Shows PTP clock-time properties for the PTP device.

Parameter	Description

Example

Showing PTP clock time properties:

```
switch # show ptp time-property
PTP Clock Time Property
----------------------------
Current UTC Offset Valid  : FALSE
Current UTC Offset        : 37
```

```
Leap59                      : FALSE
Leap61                      : FALSE
Time Traceable              : FALSE
Frequency Traceable         : FALSE
PTP Timescale               : FALSE
Synchronization Uncertain   : FALSE
Time Source                 : 160
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.10.1000	Command introduced on the 6300 Switch Series.

Command Information

Platforms	Command context	Authority
6300 (only R8S89A, R8S90A)	Manager (#)	Auditors or Administrators or local user group members with execution rights for this command. Auditors can execute this command from the auditor context (auditor>) only.

show running-config ptp

`show running-config ptp`

Description

Shows PTP running configuration related information.

Example

Showing PTP running configuration information (boundary clock is available only on the 6300 Switch Series models R8S89A and R8S90A that first released with AOS-CX 10.10.1000):

```
switch# show running-config ptp
ptp profile smpte
    enable
    clock-step two-step
    transport-protocol ipv4
    mode boundary peer-to-peer
interface 1/1/15
    no shutdown
    ip address 30.1.1.1/16
    ptp enable
```

For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.08	Command introduced.

Command Information

Platforms	Command context	Authority
6300	Manager (#)	Auditors or Administrators or local user group members with execution rights for this command. Auditors can execute this command from the auditor context (auditor>) only.

transport-protocol

```
transport-protocol {ethernet | ip}
no transport-protocol
```

Description

Sets the transport protocol for PTP packets. In the case of IPv4, the UDP check-sum is reset. There is no default transport-protocol. The **no** form of this command disconnects the clock from its source.

Parameter	Description
`ethernet`	Specifies the Ethernet (Layer 2) transport protocol.
`ip`	Specifies the IPv4 transport protocol.

Usage

Mandatory command to start the PTP clock.

Example

Setting the Ethernet transport protocol for PTP packets:

```
switch(config-ptp)# transport-protocol ethernet
```

Removing the transport protocol for PTP packets:

```
switch(config-ptp)# no transport-protocol
```

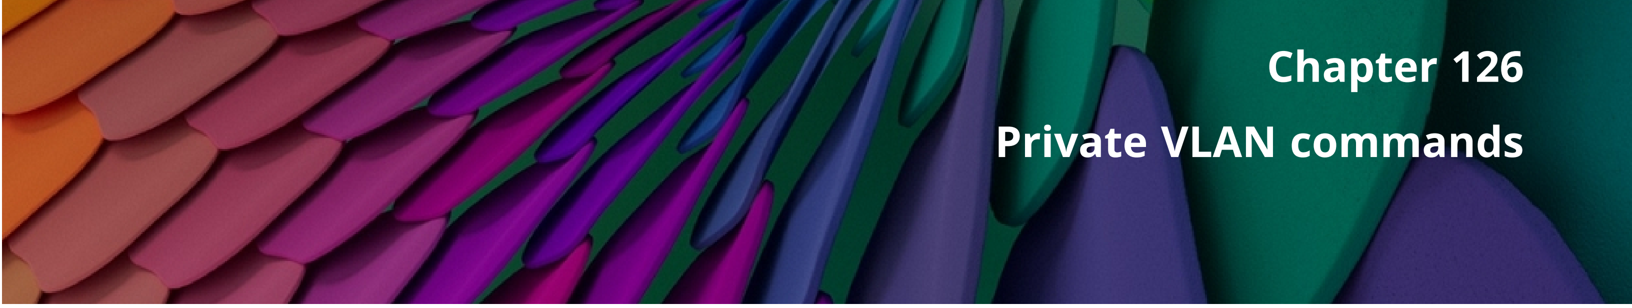
For more information on features that use this command, refer to the Fundamentals Guide for your switch model.

Command History

Release	Modification
10.14	Replaced the **ipv4** parameter with the **ip** parameter. The **ipv4** parameter is deprecated.
10.08	Command introduced.

Command Information

Platforms	Command context	Authority
6300	`config-ptp`	Administrators or local user group members with execution rights for this command.



Chapter 126

Private VLAN commands

diag-dump private-vlan basic

```
diag-dump private-vlan basic
```

Description

Collects the debug information in the case of any issue in the PVLAN feature.

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

Command History

Release	Modification
10.08	Command introduced for 6200, 6300, 6400, 8100, 8360 Switch series

Command Information

Platforms	Command context	Authority
6300 6400	Operator (>) or Manager (#)	Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only.

private-vlan

```
private-vlan {primary | isolated | community} primary-vlan <VLAN-ID>
no private-vlan {primary | isolated | community} primary-vlan <VLAN-ID>
```

Description

Configures a VLAN as either a primary, isolated, or community private VLAN and associates secondary VLANs to a primary VLAN.

The **no** form of this command removes the private VLAN configuration of a VLAN.

Parameter	Description
`primary`	Configures the VLAN as PVLAN type primary. **NOTE:** The number of primary VLANs are restricted to 512

Parameter	Description
	instances for the Aruba 10000 Switch Series. All other switches that support PVLAN support up to 32 primary VLAN instances. Up to 8 secondary VLANs can be configured under a primary VLAN for the Aruba 4100i, 6000, and 6100 Switch Series. Up to 24 secondary VLANs can be configured under a primary VLAN for the Aruba 6200, 6300, 6400, 8325, 8360, and 10000 Switch Series.
`isolated`	Configures the VLAN as PVLAN type isolated.
`community`	Configures the VLAN as PVLAN type community.
<VLAN-ID>	Specifies the primary VLAN ID to be associated. Range: 2-4094.

Examples

Configuring VLAN 100 as PVLAN type primary

```
switch(config)# vlan 100
switch(config-vlan-100)# private-vlan primary
```

Removing the private VLAN configuration from VLAN 100

```
switch(config)# vlan 100
switch(config-vlan-100)# no private-vlan primary
```

Associating community VLAN 200 with primary VLAN 100

```
switch(config)# vlan 200
switch(config-vlan-200)# private-vlan community primary-vlan 100
```

Removing the association of community VLAN 200 from primary VLAN 100

```
switch(config)# vlan 200
switch(config-vlan-200)# no private-vlan community primary-vlan 100
```

Associating isolated VLAN 300 with primary VLAN 100

```
switch(config)# vlan 300
switch(config-vlan-300)# private-vlan isolated primary-vlan 100
```

Removing the association of isolated VLAN 300 from primary VLAN 100

```
switch(config)# vlan 300
switch(config-vlan-300)# no private-vlan isolated primary-vlan 100
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

Command History

Release	Modification
10.08	Command introduced for 6200, 6300, 6400, 8100, 8360 Switch series

Command Information

Platforms	Command context	Authority
6300 6400	`config-vlan-<VLAN-ID>`	Administrators or local user group members with execution rights for this command.

private-vlan port-type

```
private-vlan port-type {promiscuous | secondary}
no private-vlan port-type {promiscuous | secondary}
```

Description

Configures a port as either promiscuous or secondary when in the **interface** context. Configures PVLAN port type for a role when in the **config-pa-role** context. Multiple secondary VLANs associated with the same primary VLAN cannot be tagged under a secondary port.

The **no** form of this command removes the PVLAN port type configuration.

When an interface has been configured as "vlan trunk allowed all" `private-vlan port-type` cannot be configured.

Parameter	Description
`promiscuous`	Configures the port as promiscuous.
`secondary`	Configures the port as secondary.

Examples

Configuring interface 1/1/1 as promiscuous:

```
switch(config)# interface 1/1/1
switch(config-if)# private-vlan port-type promiscuous
```

Configuring port type as secondary for the port access role:

```
switch(config)# port-access role Role1
switch(config-pa-role)# private-vlan port-type secondary
```

Removing the promiscuous configuration from interface 1/1/1:

```
switch(config)# interface 1/1/1
switch(config-if)# no private-vlan port-type promiscuous
```

Removing port type as secondary for the port access role:

```
switch(config)# port-access role Role1
switch(config-pa-role)# no private-vlan port-type secondary
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

Command History

Release	Modification
10.08	Command introduced for 6200, 6300, 6400, 8100, 8360 Switch series

Command Information

Platforms	Command context	Authority
6300 6400	`config-if` `config-pa-role`	Administrators or local user group members with execution rights for this command.

show capacities private-vlan

`show capacities private-vlan`

Description

Shows the maximum number of primary and secondary VLANs per domain and secondary ports per LC that can be configured.

Examples

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

Command History

Release	Modification
10.08	Command introduced for 6200, 6300, 6400, 8100, 8360 Switch series

show capacities-status private-vlan

```
show capacities-status private-vlan
```

Description

Shows the number of primary VLANs currently configured and the maximum capacity of primary VLANs on the switch.

Examples

Showing the current capacity status of private-VLAN on the switch

```
switch# show capacities-status private-vlan
System Capacities Status: Filter Private-VLAN
Capacities Status Name                                          Value Maximum
---------------------------------------------------------------
Number of Private-VLAN domains currently configured                 2       32
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

Command History

Release	Modification
10.08	Command introduced for 6200, 6300, 6400, 8100, 8360 Switch series

show private-vlan

```
show private-vlan [type {<VLAN-ID> | primary | isolated | community}]
```

Description

Shows the private VLAN configuration for all private VLANs or the private VLAN type specified.

Parameter	Description
`<VLAN-ID>`	Specifies a list of VLANs. Range: 2-4094.
`primary`	Shows primary private VLANs.
`isolated`	Shows isolated private VLANs.
`community`	Shows community private VLANs.

Examples

Showing all private VLANs

```
switch# show private-vlan
----------------------------------------------
Primary   Isolated          Community
----------------------------------------------
100       201               -
342       -                 1342,3000-3022
343       -                 1343
344       -                 1344
345       -                 1345
```

Showing private VLANs 100 through 102

```
switch# show private-vlan type 100-102
-------------------
VLAN       Type
-------------------
100        Primary
101        Isolated
102        Community
```

Showing all primary VLANs

```
switch# show private-vlan type primary
-------------------
VLAN       Type
-------------------
100        Primary
200        Primary
300        Primary
400        Primary
500        Primary
600        Primary
605        Primary
700        Primary
705        Primary
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

Command History

Release	Modification
10.08	Command introduced for 6200, 6300, 6400, 8100, 8360 Switch series

show private-vlan association

```
show private-vlan association <VLAN-ID>
```

Description

Shows primary and secondary VLAN associations for all private VLANs or a specified private VLAN.

Parameter	Description
<VLAN-ID>	Specifies a list of VLANs. Range: 2-4094.

Examples

Showing all private VLAN associations

```
switch# show private-vlan association
----------------------------------------------------
Primary   Isolated   Community
----------------------------------------------------
100       101        102,103
200       201        205,210-214
300       301        -
400       -          405-410,411
500       -          502,504,506-508,510,512,514,
                     516,518
600       601,603,   -
605
700       701,703,   707-709,711,713-715,717-719,
          705        721,723-724
```

Showing private VLAN associations for VLAN 100

```
switch# show private-vlan association 100
```

```
---------------------------------------------------
Primary   Isolated   Community
---------------------------------------------------
100       101        102,103
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

show private-vlan inconsistency

```
show private-vlan inconsistency
```

Description

Shows the list of interfaces and VLANs which are disabled or ignored by private VLAN due to private VLAN configuration and operational inconsistencies.

Possible interface inconsistencies:

- Hardware resource allocation failure
- Interface is a member of multiple secondary VLANs in the same domain
- Interface is a member of both primary and secondary VLAN
- Interface of private vlan port-type promiscuous is not allowed to join secondary VLAN
- Protocol VLANs and private VLANs are mutually exclusive features
- Interface of private vlan port-type secondary is not allowed to join the primary VLAN
- Interface has reached the private-vlan port limit of 24 ports
- Interface is a member of a secondary VLAN which has an SVI configured on it
- Interface **trunk-allowed-all** configuration is not allowed on promiscuous or secondary private-vlan port-type
- VSX ISL configuration is not allowed on private-vlan ports

Possible VLAN inconsistencies:

- Default VLAN is not allowed to join private-vlan domain
- ERPS instances must match for all VLANs in a private-VLAN domain
- VLAN has invalid or no private-vlan primary VLAN association
- MSTP instances must match for all VLANs in a private-VLAN domain
- MVRP and private-VLAN are mutually exclusive features
- VLAN has no primary associated VLAN
- VLAN has reached the private VLAN limit of 32 primary VLANs for the Aruba 4100i, 6000, 6100, 6200, 6300, 6400, 8325, and 8360 Switch Series. (The private VLAN limit is 512 on the Aruba 10000 Switch Series).
- RPVST and private VLAN are mutually exclusive features
- VLAN has reached the private VLAN limit of 24 secondary VLANs on the Aruba 6200, 6300, 6400, 8325, 8360, and 10000 Switch Series or 8 secondary VLANs on the Aruba 4100i, 6000, or 6100 Switch Series.
- Smartlink groups must match for all VLANs in a private-VLAN domain
- VLAN translation and private-VLAN are mutually exclusive features
- VLAN is a secondary VLAN with SVI configured
- Primary VLAN’s IGMP snooping configuration is applied
- Primary VLAN’s MLD snooping configuration is applied
- Primary VLAN’s ND snooping configuration is applied
- Primary VLAN’s DHCPV4 snooping configuration is applied
- Primary VLAN’s DHCPV6 snooping configuration is applied
- Primary VLAN’s CIPT configuration is applied

Examples

Showing interfaces which have been disabled due to private VLAN inconsistencies. In the example below vlan101, vlan201, and vlan301 are secondary VLANs:

```
switch# show private-vlan inconsistency
-------------------------------------------------------------------------
Interface/VLAN   Action    Inconsistency-Reason
-------------------------------------------------------------------------
1/1/1            Down      Interface is a member of multiple secondary VLANs
1/2/5            Down      Interface is a member of both primary and secondary
VLAN
vlan20           Down      VLAN has invalid or no private-vlan primary VLAN
association
vlan101          Ignore    Primary VLAN’s IGMP snooping config is applied.
vlan201          Ignore    Primary VLAN’s ND snooping config is applied.
vlan301          Ignore    Primary VLAN’s DHCPV4 snooping config is applied.
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

Command History

Release	Modification
10.08	Command introduced for 6200, 6300, 6400, 8100, 8360 Switch series

show running-configuration private-vlan

```
show running-configuration private-vlan
```

Description

Shows all private VLAN configurations on the switch.

Examples

Showing the current private VLAN configuration

~~~~~~
switch# show running-configuration private-vlan
vlan 300
private-vlan type primary
vlan 100
private-vlan type isolated primary-vlan 300
vlan 200
private-vlan type community primary-vlan 300
interface 1/1/1
vlan trunk allowed 300
private-vlan port-type promiscuous
interface 1/1/2
vlan trunk allowed 100
private-vlan port-type secondary
interface 1/1/3
vlan trunk allowed 200
private-vlan port-type secondary

## system private-vlan share-hw-resource

```
system private-vlan share-hw-resource
no system private-vlan share-hw-resource
```

### Description

Enables hardware resource sharing for private VLAN (PVLAN) secondary ports and enables you to configure additional secondary ports beyond the capacity limit.

There are no parameters for this command.

The **no** form of this command turns off the hardware resource sharing mode for PVLAN.

### Examples

Configure PVLAN default mode :

```
switch(config)# system private-vlan share-hw-resource
```

Unconfigure PVLAN default mode:

```
switch(config)# no system private-vlan share-hw-resource
```

This command will be available only on the platforms which had a limit of 24 PVLAN secondary ports in the legacy mode. For more information on features that use this command, refer to the *Private VLAN* topic in Layer 2 Bridging Guide for your switch model.

# Chapter 127
# QoS commands

## apply qos

```
apply qos [queue-profile <QUEUE-NAME>] schedule-profile <SCHEDULE-NAME>
no apply qos [queue-profile <QUEUE-NAME>] schedule-profile <SCHEDULE-NAME>
```

### Description

Applies a queue profile and schedule profile globally to all Ethernet and LAG interfaces on the switch, or applies a schedule profile to a specific interface. When applied globally, the specified schedule profile is configured only on Ethernet interfaces and LAGs that do not already have their own schedule profile.

The same profile can be applied both globally and locally to an interface. This guarantees that an interface always uses the specified profile, even if the global profile is changed.

The **no** form of this command removes the specified schedule profile from an interface and the interface uses the global schedule profile. This is the only way to remove a schedule profile override from the interface.

Interfaces may shut down briefly during reconfiguration.

| Parameter | Description |
|---|---|
| `queue-profile <QUEUE-NAME>` | Specifies the name of the queue profile to apply. Range: 1 to 64 alphanumeric characters, including period (.), underscore (_), and hyphen (-). This parameter is not supported in the **config-if** context. |
| `schedule-profile <SCHEDULE-NAME>` | Specifies the name of the schedule profile to apply. Range: 1 to 64 alphanumeric characters, including period (.), underscore (_), and hyphen (-). |

### Usage

- The switch must always have a globally-applied queue and schedule profile. To stop using a given profile, apply a different profile.
- For a queue profile to be complete and ready to be applied, all eight local priorities must be mapped to a queue.
- For a schedule profile to be complete and ready to be applied, it must define all queues specified in the queue profile. All queues must use the same algorithm, except for the highest numbered queue, which can be **strict**.
- Both the queue profile and the schedule profile must specify the same number of queues.
- Schedule profiles can be modified while applied, but only in ways where a single command will not result in the profile becoming invalid. For example, queue 7 can have the algorithm changed, and weighted queues can have their weights changed.

- Queues must be consecutively defined starting at queue number zero. For example, a four-queue profile with priority values defined for queues 0, 1, 2, 3 is valid, but a four-queue profile which defines priority values for queues 1, 3, 5, and 7 is not.

If the number of queues was changed from the previous queue profile to the new one, any Ethernet or LAG interfaces with locally applied schedule profiles will program the newly applied global schedule-profile. The *show running-config interface* command will list the existing *apply qos schedule-profile* command with a comment describing the actual profile applied:

```
apply qos schedule-profile Old_Schedule
!actual schedule-profile New_Schedule
```

## Examples

The following commands illustrate a valid configuration where every local priority value is assigned to a queue and all assigned queues are defined:

```
switch(config)# qos cos-map 1 local-priority 1
switch(config)# qos queue-profile Q1
switch(config)# map queue 0 local-priority 0
switch(config)# map queue 1 local-priority 1
switch(config)# map queue 2 local-priority 2
switch(config)# map queue 3 local-priority 3
switch(config)# map queue 4 local-priority 4
switch(config)# map queue 5 local-priority 5
switch(config)# map queue 6 local-priority 6
switch(config)# map queue 7 local-priority 7
switch(config)# qos schedule-profile S1
switch(config)# dwrr queue 0 weight 5
switch(config)# dwrr queue 1 weight 10
switch(config)# dwrr queue 2 weight 15
switch(config)# dwrr queue 3 weight 20
switch(config)# dwrr queue 4 weight 25
switch(config)# dwrr queue 5 weight 50
```

The following commands illustrate an invalid configuration because local priority 2 is not assigned to a queue:

```
switch(config)# qos cos-map 1 local-priority 1
switch(config)# qos queue-profile Q1
switch(config)# map queue 0 local-priority 0
switch(config)# map queue 1 local-priority 1
switch(config)# map queue 3 local-priority 3
switch(config)# map queue 4 local-priority 4
switch(config)# map queue 5 local-priority 5
switch(config)# map queue 5 local-priority 6
switch(config)# map queue 5 local-priority 7
switch(config)# qos schedule-profile S1
switch(config)# dwrr queue 0 weight 5
switch(config)# dwrr queue 1 weight 10
switch(config)# dwrr queue 3 weight 15
switch(config)# dwrr queue 4 weight 25
switch(config)# dwrr queue 5 weight 50
```

Applying the QoS profile **Q1** and the schedule profile **S1** to all interfaces that do not have an applied interface-specific schedule profile:

```
switch(config)# apply qos queue-profile Q1 schedule-profile S1
```

For more information on features that use this command, refer to the Quality of Service Guide for your switch model.

### Command History

| Release | Modification |

# dwrr queue

```
dwrr queue <QUEUE-NUMBER> [weight <WEIGHT>]
no dwrr queue <QUEUE-NUMBER>
```

### Description

Assigns the deficit weighted round robin (DWRR) algorithm and its weight to a queue in a schedule profile. DWRR allocates available bandwidth among all non-empty queues in relation to the queue weights.

Use **show qos schedule-profile <NAME>** to view the settings of a specific schedule profile.

The **no** form of this command removes the DWRR algorithm from a queue in a schedule profile.

| Parameter | Description |
|---|---|
| `<QUEUE-NUMBER>` | Specifies the queue number. Range: 0 to 7. |
| `weight <WEIGHT>` | Specifies the scheduling weight. Range: 1 to 1023. |

### Examples

Assigning DWRR with a weight of **17** to queue **2** in the schedule profile **MySchedule**:

```
switch(config)# qos schedule-profile MySchedule
switch(config-schedule)# dwrr queue 2 weight 17
```

Deleting DWRR for queue **2** from the schedule profile **MySchedule**:

```
switch(config)# qos schedule-profile MySchedule
switch(config-schedule)# no dwrr queue 2
```

For more information on features that use this command, refer to the Quality of Service Guide for your switch model.

## map queue

`map queue <QUEUE-NUMBER> local-priority <PRIORITY-NUMBER>`

### Description

Assigns a local priority to a queue in a queue profile. By default, the larger the queue number the higher its priority. A queue without a local priority value assigned to it is not used to store packets. The same queue can be assigned multiple local priorities.

The **no** form of this command removes the specified local priority from a specific queue. If no local priority number is specified, then all local priorities are removed from the queue.

| Parameter | Description |
|---|---|
| *<QUEUE-NUMBER>* | Specifies the queue number. Range: 0 to 7. |
| *<PRIORITY-NUMBER>* | Specifies the local priority. Range: 0 to 7, where 0 is the lowest priority and 7 is the highest. |

### Usage

The following commands illustrate a valid configuration, where every local priority value is assigned to a queue:

```
map queue 0 local-priority 0
map queue 1 local-priority 1
map queue 1 local-priority 2
map queue 3 local-priority 3
map queue 4 local-priority 4
map queue 5 local-priority 5
map queue 5 local-priority 6
map queue 5 local-priority 7
```

The following commands illustrate an invalid configuration, because local priority 2 is not assigned to a queue:

```
map queue 0 local-priority 0
map queue 1 local-priority 1
map queue 2 local-priority 3
map queue 3 local-priority 4
map queue 4 local-priority 5
map queue 5 local-priority 6
map queue 5 local-priority 7
```

### Examples

Assigning priority **7** to queue **7** in profile **myprofile**:

```
switch(config)# qos queue-profile myprofile
switch(config-queue)# map queue 7 local-priority 7
```

Removing priority **7** from queue **7** in profile **myprofile**:

```
switch(config)# qos queue-profile myprofile
switch(config-queue)# no map queue 7 local-priority 7
```

For more information on features that use this command, refer to the Quality of Service Guide for your switch model.

### Command History

| All platforms | `config-queue` | Administrators or local user group members with execution rights for this command. |

## min-bandwidth

The min-bandwidth command only applies to Aruba 6200 and 6300 Series Switches.

```
min-bandwidth queue <QUEUE-NUMBER> percent <PERCENTAGE> [max-bandwidth <RATE>
{kbps|percent}]
no min-bandwidth queue <QUEUE-NUMBER> percent <PERCENTAGE> [max-bandwidth <RATE>
{kbps|percent}]
```

## Description

Assigns the Guaranteed Minimum Bandwidth (GMB) algorithm and a percentage of bandwidth to a queue. GMB allocates available bandwidth among all non-empty queues in relation to their configured minimum bandwidth. Non-empty queues are serviced first in strict order up to their minimum bandwidth. If there is any remaining bandwidth, the scheduler will strictly service any remaining non-empty queues.

Egress queue shaping can be configured using the **max-bandwidth** option to limit the amount of traffic transmitted per output queue at all times, even when there is leftover bandwidth available on the port. The buffer associated with each egress queue stores the excess traffic to smooth the output rate. Sustained rates of traffic above the maximum bandwidth will eventually fill the output queue, causing tail drops. Use **show interface <*IF-NAME*> queues** to determine if any tail-drop errors have occurred.

To remove only egress queue shaping, re-enter the **min-bandwidth queue** command without the **max-bandwidth** parameter.

The **no** form of this command only clears the algorithm for a queue if GMB has been assigned.

Occasionally, the following errors may occur:

- *The schedule profile total sum of GMB percentages must not exceed 100.*

This error occurs when attempting to apply a schedule profile with sum of GMB percentages of queues exceed 100 percentage. The solution is to configure GMB perecntage for queues, so that the sum of percentage must not exceed 100.

- *The max-bandwidth cannot be greater than 100 percent.*

This error occurs when a max-bandwidth value greater than 100 percent is configured on a queue.

- *The max-bandwidth cannot be less than <*NUM*> kbps.*

This error occurs when a kbps max-bandwidth value less than the supported minimum kbps shape value is configured on a queue. The supported minimum kbps shape value can be retrieved using the **show capacities** command.

| Parameter | Description |
|---|---|
| *<QUEUE-NUMBER>* | Specifies the queue number. Range: 0 to 7. |
| *<PERCENTAGE>* | Specifies bandwidth percentage used for GMB scheduling. Range: 0 to 100. |
| max-bandwidth *<RATE>* | Specifies the maximum bandwidth rate allowed on the queue in Kbps. Range: 64 to 100000000. Alternatively, the maximum bandwidth rate can be configured on the queue as a percentage of the port shape or link bandwidth if a port shape is not configured. The allowed range is 1-100. |

## Examples

Assigning queue **0** of schedule profile **S1** the GMB scheduling algorithm with minimum bandwidth of **5 percent**:

```
switch(config)# qos schedule-profile S1
switch(config-schedule)# min-bandwidth queue 0 percent 5
```

Removing GMB from queue 0:

```
switch(config)# qos schedule-profile s1
switch(config-schedule)# no min-bandwidth queue 0
```

For more information on features that use this command, refer to the Quality of Service Guide for your switch model.

### Command History

## name queue

```
name queue  <QUEUE-NUMBER> <DESCRIPTION>
no name queue  <QUEUE-NUMBER>
```

### Description

Assigns a description to a queue in a queue profile. This is for identification purposes and has no effect on configuration.

The **no** form of this command removes the description associated with a queue.

| Parameter | Description |
|---|---|
| *<QUEUE-NUMBER>* | Specifies the queue number. Range: 0 to 7. |
| *<DESCRIPTION>* | Specifies a queue description for identification purposes. Range: 1 to 64 alphanumeric characters, including period (.), underscore (_), and hyphen (-). |

### Examples

Assigning the description **priority-traffic** to queue **7**:

```
switch(config)# qos queue-profile myprofile
switch(config-queue)# name queue 7 priority-traffic
```

Removing the description from queue **7**:

```
switch(config)# qos queue-profile myprofile
switch(config-queue)# no name queue 7
```

For more information on features that use this command, refer to the Quality of Service Guide for your switch model.

## qos cos

```
qos cos <CODE-POINT>
no qos cos
```

### Description

Configures a CoS PCP remark for an Ethernet or LAG interface. Packets that ingress on the interface are remarked at egress using the configured CoS PCP value.

The remark only occurs when QoS trust mode on the interface is set to **none**.

If QoS trust mode is not set to **none**, then the remark is ignored, and the following commands will show the CoS remark status as **ignored (incompatible Port Access Trust configuration**) or **not applied' (incompatible QoS global/port Trust configuration)**:

- show running-configuration
- show interface <*PORT-NUM*>
- show interface <*PORT-NUM*> qos

The **no** form of this command removes a CoS remark on an interface.

| Parameter | Description |
|---|---|
| *`<CODE-POINT>`* | Specifies an 802.1 VLAN priority CoS value. Range: 0 to 7. |

### Examples

*On the 6400 Switch Series, interface identification differs.*

Configuring a CoS remark of **3** on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# qos trust none
switch(config-if)# qos cos 3
```

Deleting a CoS remark of **3** on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# no qos cos
```

For more information on features that use this command, refer to the Quality of Service Guide for your switch model.

## qos cos-map

`qos cos-map <CODE-POINT> local-priority <PRIORITY-NUMBER> [color <COLOR>] [name <DESCRIPTION>]`
`no qos cos-map <CODE-POINT>`

### Description

Defines the local priority assigned to incoming packets for a specific 802.1 VLAN priority code point (CoS) value. The CoS map values are used to mark incoming packets when QoS trust mode is set to **cos**. In **trust none** mode, CoS map entry 0 is used to set the port default local priority and color.

To see the default CoS map settings, use the following command:

```
switch# show qos cos-map default
code_point local_priority color   name
---------- -------------- ------- ----
0          1              green   Best_Effort
1          0              green   Background
2          2              green   Excellent_Effort
3          3              green   Critical_Applications
4          4              green   Video
5          5              green   Voice
6          6              green   Internetwork_Control
7          7              green   Network_Control
```

The **no** form of this command restores the assignments for a CoS map value to the default setting.

| Parameter | Description |
|---|---|
| *<CODE-POINT>* | Specifies an 802.1 VLAN priority CoS value. Range: 0 to 7. Default 0. |
| local-priority *<PRIORITY-NUMBER>* | Specifies a local priority value to associate with the CODE-POINT value. Range: 0 to 7. Default: 0. |
| color *<COLOR>* | Reserved for future use. |
| name *<DESCRIPTION>* | Specifies a description for the CoS setting. The name is for identification only, and has no effect on queue configuration. Range: 1 to 64 alphanumeric characters, including period (.), underscore (_), and hyphen (-). |

## Usage

## Examples

Mapping CoS value **1** to a local priority of **2**:

```
switch(config)# qos cos-map 1 local-priority 2
```

Mapping CoS value **1** to the default local priority value:

```
switch(config)# no qos cos-map 1
```

For more information on features that use this command, refer to the Quality of Service Guide for your switch model.

# qos dscp

qos dscp *<CODE-POINT>*
no qos dscp

## Description

Configures a differentiated services code point (DSCP) remark for an Ethernet or LAG interface. IPV4 and IPV6 packets that ingress on the interface are remarked at egress using the configured DSCP value.

The remark only occurs when QoS trust mode on the interface is set to **none**. If a DSCP remark is configured and then trust mode is subsequently set to **cos** or **dscp**, then the DSCP remark is ignored.

The following commands will show the remark status as *ignored* (incompatible Port Access Trust configuration) or *not applied* (incompatible QoS global or port trust configuration):

- **show running-configuration**
- **show interface <INTERFACE-NAME>**
- **show interface <INTERFACE-NAME> qos**

The **no** form of this command removes a CoS remark on an interface.

| Parameter | Description |
|---|---|
| *<CODE-POINT>* | Specifies an IP differentiated services code point value. Range: 0 to 63. |

## Usage

Order of operation for arriving IPv4 or IPv6 packets:

1. Trust none is applied with initial local-priority and color metadata assigned from the CoS Map entry index 0.
2. The local-priority value and the queue profile are then used to determine the queue for the packet.
3. The remark of the packet's DSCP metadata field is performed. When the packet is transmitted, its IPv4 or IPv6 DS header is remarked with the DSCP metadata.

For arriving non-IP packets:

Trust none is applied with initial local-priority and color metadata assigned from the CoS Map entry index 0. This selects the queue for packet scheduling. The PCP of any tagged non-IP packets is unchanged.

## Examples

*On the 6400 Switch Series, interface identification differs.*

Configuring a DSCP remark of **43** on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# qos trust none
switch(config-if)# qos dscp 43
```

Deleting a DSCP remark of **43** on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# no dscp 43
```

For more information on features that use this command, refer to the Quality of Service Guide for your switch model.

### Command History

## qos dscp-map

```
qos dscp-map <CODE-POINT> local-priority <PRIORITY-NUMBER> [color <COLOR>] [cos <PCP-
VALUE>] [name <DESCRIPTION>]
no qos dscp-map <CODE-POINT>
```

### Description

Defines the local priority color assigned to incoming packets for a specific IP differentiated services code point (DSCP) value. The DSCP map values are used to prioritize incoming packets when QoS trust mode is set to **dscp**.

The **no** form of this command restores the assignments for a code point to the default setting.

Use **show qos dscp-map** to view the current settings. To see the default DSCP map settings, use the following command:

```
switch# show qos dscp-map default
code_point local_priority cos color    name
---------- -------------- --- -------- ----
0          1                  green    CS0
1          1                  green
2          1                  green
3          1                  green
4          1                  green
5          1                  green
...
45         5                  green
46         5                  green    EF
47         5                  green
48         6                  green    CS6
...
61         7                  green
62         7                  green
63         7                  green
```

| Parameter | Description |
|---|---|
| *<CODE-POINT>* | Specifies an IP differentiated services code point. Range: 0 to 63. Default: 0. |
| `local-priority` *<PRIORITY-NUMBER>* | Specifies a local priority value to associate with the **CODE-POINT** value. Range: 0 to 7. Default: 0. |

| Parameter | Description |
|---|---|
| `color <COLOR>` | Configures the QoS CoS map color. The supported colors are green, red, and yellow. The default color is green. |
| `cos <PCP-VALUE>` | Specifies an optional 802.1p VLAN Priority Code Point remark value. Range: 0 to 7. Default: No remark. |
| `name <DESCRIPTION>` | Specifies a description for the DSCP setting. The name is used for identification only, and has no effect on queue configuration. Range: 1 to 64 alphanumeric characters, including period (.), underscore (_), and hyphen (-). |

### Examples

Setting code point **1** to a local priority of **2** and a CoS of **0**:

```
switch(config)# qos dscp-map 1 local-priority 2 cos 0
```

Setting code point **1** to the default value:

```
switch(config)# no qos dscp-map 1
```

For more information on features that use this command, refer to the Quality of Service Guide for your switch model.

# qos queue-profile

```
qos queue-profile <NAME>
no qos queue-profile <NAME>
```

### Description

Creates a new QoS queue profile and switches to the **config-queue** context for the profile. Or, if the specified QoS queue profile exists, this command switches to the **config-queue** context for the profile.

A queue profile maps queues to local-priority values.  Each profile has one to eight queues numbered 0 to 7. The larger the queue number, the higher its priority during transmission scheduling.

The **no** form of this command removes the specified QoS queue profile. Only profiles that are not currently applied can be removed.

| Parameter | Description |
|---|---|
| *<NAME>* | Specifies the name of the QoS queue profile to create or configure. Range: 1 to 64 alphanumeric characters, including period (.), underscore (_), and hyphen (-). |

### Examples

Creating the profile **myprofile**:

```
switch(config)# qos queue-profile myprofile
switch(config-queue)#
```

Deleting the profile **myprofile**:

```
switch(config)# no qos queue-profile myprofile
```

For more information on features that use this command, refer to the Quality of Service Guide for your switch model.

### Command History

|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## qos schedule-profile

```
qos schedule-profile <NAME>
no qos schedule-profile <NAME>
```

### Description

Creates a QoS schedule profile and switches to the **config-schedule** context for the profile. If the specified schedule profile exists, this command switches to the **config-schedule** context for the profile. The schedule profile determines the order in which queues are selected to transmit a packet, and the amount of service defined for each queue.

| Parameter | Description |
|---|---|
| *<NAME>* | Specifies the name of the QoS queue profile to create or configure. Range: 1 to 64 alphanumeric characters, including period (.), underscore (_), and hyphen (-). |

## Usage

Queues in a schedule profile are numbered consecutively starting from zero. Queue zero is the lowest priority queue. The larger the queue number, the higher priority the queue has in scheduling algorithms.

A profile named **factory-default** is defined by default and applied to all interfaces. It cannot be edited or deleted. To see its settings, use the command:

```
switch# show qos schedule-profile factory-default
queue_num algorithm weight
--------- --------- ------
0         dwrr      1
1         dwrr      1
2         dwrr      1
3         dwrr      1
4         dwrr      1
5         dwrr      1
6         dwrr      1
7         dwrr      1
```

A profile named **strict** is predefined and cannot be edited or deleted. The strict profile services all queues of the queue profile to which it is applied, using the strict priority algorithm.

A schedule profile must be defined on all interfaces at all times.

There are two permitted configurations for a schedule profile:

1. All queues use the same scheduling algorithm (for example, DWRR).
2. The highest queue number uses strict priority, and all remaining (lower) queues use the same algorithm (for example, DWRR). This supports priority scheduling behavior necessary for the IETF RFC 3246 Expedited Forwarding specification (https://tools.ietf.org/html/rfc3246).

Only limited changes can be made to an applied schedule profile:

- The weight of a dwrr queue.
- The bandwidth of a strict queue or a min-bandwidth queue.
- The algorithm of the highest numbered queue can be swapped between dwrr and strict, and vice versa.

Applicable to REST: Any other changes will result in an unusable schedule profile, and the switch will revert to the **factory-default** profile until the profile is corrected.

The **no** form of this command removes the specified QoS schedule profile when it is not applied. Only profiles that are not currently applied to an interface can be removed.

## Examples

Creating the schedule profile **MySchedule**:

```
switch(config)# qos schedule-profile MySchedule
switch(config-schedule)#
```

Deleting the schedule profile **MySchedule**:

```
switch(config)# no qos schedule-profile MySchedule
```

For more information on features that use this command, refer to the Quality of Service Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## qos shape

```
qos shape <RATE> [kbps|percent]
no qos shape
```

### Description

Limits the egress bandwidth on an interface to a value that is lower than its line rate.

Errors will be generated in the following events:

- A user configures a port-shaping value that is greater than 100 percent
- A user configures a kbps port-shaping value that is less than the supported minimum kbps value. The supported minimum kbps shaping value can be retrieved using the **show capacities** command.

The **no** form of this command removes shaping from an interface.

| Parameter | Description |
|---|---|
| *<RATE>* | Specifies the maximum traffic rate in kbps. Range: 1 to 100000000. Alternatively, the bandwidth can also be configured as a percentage of link bandwidth. The supported range is 1-100. Default units are kilobits per second. |

### Usage

When the traffic rate destined for the port exceeds the configured egress bandwidth, the switch will buffer the excess up to the limit of the queues. Rates larger than the interface's link rate will have no effect. When set on a LAG, each member Ethernet port independently shapes its egress bandwidth to the specified rate.

### Examples

*On the 6400 Switch Series, interface identification differs.*

Configuring an egress port shaping rate of 400 Mbps on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# qos shape 400000 kbps
```

Configuring an egress port-shaping rate of 40% on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# qos shape 40 percent
```

Deleting egress port shaping on interface **1/1/1**:

```
switch(config)# interface 1/1/1
switch(config-if)# no qos shape
```

For more information on features that use this command, refer to the Quality of Service Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.13 | Added optional **kbps** and **percent** parameters. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-if` | Administrators or local user group members with execution rights for this command. |

## qos trust

```
qos trust {none|cos|dscp}
no qos trust
```

### Description

In the **config** context:

- This command sets the trust mode that is globally applied to all interfaces that do not have a trust mode configured.

- The **no** form of this command restores all interfaces that do not currently have a trust mode configured to the default setting.

In the **config-if** context:

- This command sets the trust mode override for a specific interface.
- The **no** form of this command clears a trust mode override. The interface then uses the global setting. This is the only way to remove a trust mode override.

| Parameter | Description |
|---|---|
| `none` | Ignores all packet headers. Ingress packets are assigned the local priority and color values configured for CoS map entry 0. Default. |
| `cos` | For 802.1 VLAN tagged packets, use the priority code point field from the outermost VLAN header as the index into the CoS map to obtain the local priority and color values for the packet. If the packet is untagged, use the local priority and color values configured for CoS map entry 0. |
| `dscp` | For IP packets, use the DSCP field from the IP header as the index into the DSCP Map. For non-IP packets with 802.1 VLAN tags, use the priority code point field from the outermost VLAN header as the index into the CoS map to obtain the local priority and color values for the packet. For untagged, non-IP packets, use the local priority and color values configured for CoS map entry 0. |

## Example

Setting the global trust mode to **dscp**, which is applied to all interfaces that do not already have an individual trust mode configured. An override is then applied to interface **2/2/2**, and LAG 100, setting trust mode to **cos**:

```
switch(config)# qos trust dscp
switch(config)# interface 2/2/2
switch(config-if)# qos trust cos
switch(config-if)# interface lag 100
switch(config-if)# qos trust cos
```

**WARNING:** QoS port remark configurations are not applied when the QoS trust mode is *mode*. This warning message is seen if a port trust command other than *trust none* is attempted when there is already a remark configuration on the port. To restore the old remark configuration, configure the port trust mode to *none*.

**WARNING:** QoS port remark configurations are not applied when the global QoS trust mode is *mode*. This warning message is seen if a port *no qos trust* command is attempted when there is already a remark configuration on the port and the global trust mode is not *none*. To re-apply the remark configuration, set the port trust mode to *none*.

For more information on features that use this command, refer to the Quality of Service Guide for your switch model.

## queue action

### WRED

#### 6200, 6300, 6400v1 Switch Series

```
queue <0-7> action wred-resp { green | yellow | red } min-threshold <WRED-MIN-LIMIT>
percent max-threshold <WRED-MAX-LIMIT> percent
queue <0-7> action wred-non-resp { green | yellow | red } min-threshold <WRED-MIN-LIMIT>
percent max-threshold <WRED-MAX-LIMIT> percent
```

#### 6400v2 Switch Series

```
queue <0-7> action wred-resp { green | yellow | red } min-threshold <WRED-MIN-LIMIT>
percent max-threshold <WRED-MAX-LIMIT> percent max-prob <WRED-MAX-PROB> percent
queue <0-7> action wred-non-resp { green | yellow | red } min-threshold <WRED-MIN-LIMIT>
percent max-threshold <WRED-MAX-LIMIT> percent max-prob <WRED-MAX-PROB> percent
```

### Description

Defines the threshold settings and action for a specified queue in a threshold-profile. For ECN, when queue utilization exceeds the threshold value, ECT (ECN-Capable Transport) packets will be CE (Congestion Encountered) marked when transmitted.

For WRED, when queue utilization exceeds the threshold value, WRED action will randomly early-drop packets to signal congestion. More than one WRED action can be configured on a single queue for different packet colors.

The **no** form of this command removes the settings for a queue.

| Parameter | Description |
|---|---|
| *<0-7>* | Specifies the queue number. Range: 0 to 7. |
| *<WRED-MIN-LIMIT>* | Specifies the queue minimum utilization threshold value for WRED to probabilistically start dropping packets. |
| *<WRED-MAX-LIMIT>* | Specifies the queue maximum utilization threshold value for |

| Parameter | Description |
|---|---|
| | WRED, after which every packet is dropped. |
| *<WRED-MAX-PROB>* | Specifies the maximum WRED probability of dropping a packet for the specified queue.<br>**NOTE:** Applicable only on the 6400v2, 8100, 8360v2, 8320, 8325, 8400, 9300, and 10000 Switch Series. |

## Examples

Configuring a responsive WRED action on queue 2 for red-, yellow-, and green-colored packets:

*Applicable only on the 6200, 6300, and 6400v1 Switch Series*

```
switch(config)# qos threshold-profile threshprofile
switch(config-threshold)# queue 2 action wred-resp green min-threshold 70 percent
max-threshold 100 percent
switch(config-threshold)# queue 2 action wred-resp yellow min-threshold 60 percent
max-threshold 95 percent
switch(config-threshold)# queue 2 action wred-resp red min-threshold 50 percent
max-threshold 80 percent
```

*Applicable only on the 6400v2 Switch Series*

```
switch(config)# qos threshold-profile threshprofile
switch(config-threshold)# queue 2 action wred-resp green min-threshold 70 percent
max-threshold 100 percent max-prob 70 percent
switch(config-threshold)# queue 2 action wred-resp yellow min-threshold 60 percent
max-threshold 95 percent max-prob 85 percent
switch(config-threshold)# queue 2 action wred-resp red min-threshold 50 percent
max-threshold 80 percent max-prob 90 percent
```

Configuring a non-responsive WRED action on queue 4 for red-, yellow-, and green-colored packets:

*Applicable only on the 6200, 6300, and 6400v1 Switch Series*

```
switch(config)# qos threshold-profile threshprofile
switch(config-threshold)# queue 4 action wred-non-resp green min-threshold 70
percent max-threshold 100 percent
switch(config-threshold)# queue 4 action wred-non-resp yellow min-threshold 65
percent max-threshold 95 percent
switch(config-threshold)# queue 4 action wred-non-resp red min-threshold 50
percent max-threshold 80 percent
```

*Applicable only on the 6400v2 Switch Series*

```
switch(config)# qos threshold-profile threshprofile
switch(config-threshold)# queue 4 action wred-non-resp green min-threshold 70
percent max-threshold 100 percent max-prob 71 percent
switch(config-threshold)# queue 4 action wred-non-resp yellow min-threshold 65
percent max-threshold 95 percent max-prob 82 percent
switch(config-threshold)# queue 4 action wred-non-resp red min-threshold 50
percent max-threshold 80 percent max-prob 95 percent
```

Removing a threshold from queue **7** in profile **mythreshold**:

```
switch(config)# qos threshold-profile mythreshold
switch(config-threshold)# no queue 7
```

For more information on features that use this command, refer to the Quality of Service Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-threshold` | Administrators or local user group members with execution rights for this command. |

## rate-limit

```
rate-limit {broadcast|multicast|unknown-unicast|icmp {ip-all|ip|ipv6}} <RATE>
{kbps|percent|pps}
no rate-limit {broadcast|multicast|icmp}
```

### Description

Sets the amount of traffic of a specific type that can ingress on an Ethernet interface, or on each port of a LAG interface. Rate limits are enforced separately on each individual member of a LAG, not on the LAG as a whole.

The **no** form of this command removes the traffic limit for the specified traffic type.

| Parameter | Description |
|---|---|
| `{broadcast|multicast|unknown-unicast|icmp {ip-all|ip|ipv6}` | Specifies the type of ingress traffic to which the rate limit applies: broadcast, multicast, unknown-unicast, or ICMP.<br>The multicast rate limit affects multicast and broadcast traffic. The broadcast rate limit only affects broadcast traffic. When both types are applied to the same interface, broadcast packets are limited to the lower of the two rate values. Layer 2 BPDU packets, like spanning tree, are also included in the multicast rate limit.<br>The ICMP rate limit can be configured to apply to IPv4, IPv6, or all IP traffic. Only one |

| Parameter | Description |
|---|---|
| | ICMP rate-limit can be configured at a time. Applying a new ICMP rate-limit replaces any previous ICMP rate-limit. |
| `<RATE> {kbps|percent|pps}` | Specifies the rate limit in kilobits per second, packets per second, or as a percentage of link bandwidth. Range: 64 to 100000000 kbps (in steps of 64 kbps), 64 to 209090910 pps (in steps of 64 pps), or 1-100 percent. The actual rate limit will be approximately equivalent to the minimum of the two step values that are closest to the configured rate (or for percent mode, the kbps-converted rate). The actual applied rate limit can be verified using the **show interface <IF-NAME> qos** command.<br>For percentage mode, rate-limits may be shown as "not applied" until after link-up has occurred on the configured port or LAG. |

## Examples

*On the 6400 Switch Series, interface identification differs.*

Limiting broadcast traffic to **2000pps** on interface **1/1/3**:

```
switch(config)# interface 1/1/3
switch(config-if)# rate-limit broadcast 500 kbps
```

Limiting all ICMP IPv4 traffic to **10000kbps** on interface **1/1/3**:

```
switch(config)# interface 1/1/3
switch(config-if)# rate-limit icmp ip 10000 kbps
```

Viewing the results of the previous configuration settings:

```
switch# show interface 1/1/3 qos
 Interface 1/1/3 is up
 Admin state is up
 Description:
 Hardware: Ethernet, MAC Address: 08:97:34:b1:20:00
 MTU 1500
 Type 1000BT
 qos trust none
 rate-limit broadcast 2000 pps (2000 actual)
 rate-limit icmp ip-all 10000 kbps (10000 actual)
 Speed 1000 Mb/s
```

```
L3 Counters: Rx Disabled, Tx Disabled
Auto-Negotiation is on
Flow-control: off
Rx
           0 input packets               0 bytes
           0 input error                 0 dropped
           0 CRC/FCS
      L3:
           0 packets, 0 bytes
Tx
         127 output packets          16510 bytes
           0 input error                 0 dropped
           0 collision
      L3:
           0 packets, 0 bytes
```

Configuring a multicast rate-limit as a percentage of link bandwidth:

```
switch(config)# interface 1/1/3
switch(config-if)# rate-limit multicast 1 percent
```

Configuring an unknown-unicast rate-limit in packets per second:

```
switch(config)# interface 1/1/4
switch(config-if)# rate-limit unknown-unicast 100 pps
```

For more information on features that use this command, refer to the Quality of Service Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.14 | Replaced the **ipv4** parameter with the **ip** parameter. The **ipv4** parameter is deprecated. |
| 10.13 | Added the **percent** parameter. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-if` | Administrators or local user group members with execution rights for this command. |

## show interface queues

`show interface <INTERFACE-NAME> queues`

### Description

Displays interface-level queue statistics.

| Parameter | Description |
|---|---|
| *<INTERFACE-NAME>* | Specifies the name of an Ethernet port or LAG on the switch. Format: **member/slot/port** or **lag number**. |

## Usage

Statistics include:

- **Tx Bytes**: Total bytes transmitted. The byte count may include packet headers and internal metadata that are removed before the packet is transmitted. Packet headers added when the packet is transmitted may not be included. The byte count includes any packets subsequently dropped by an egress ACL (6300 Series Switch only).
- **Tx Packets:** Total packets transmitted. The count includes packets subsequently dropped by an egress ACL (6300 Series Switch only).
- **Tx Drops:**For the 6300 Series Switch total packets dropped by an egress queue due to insufficient capacity. For the 6400 Series Switch sum of packets that were dropped across all line modules by Virtual Output Queues (VOQs) destined for the egress port queue due to insufficient capacity. As the counts are read separately from each line module, the sum is not an instantaneous snapshot.

## Examples

*On the 6400 Switch Series, interface identification differs.*

Showing queue statistics for interface **1/1/5**:

```
switch# show interface 1/1/5 queues
Interface 1/1/5 is down
Admin state is up
                Tx Bytes      Tx Packets        Tx Drops
Q0                     0               0               3
Q1                 15356              73               0
Q2                     0               0               0
Q3                     0               0               0
Q4                     0               0               0
Q5                     0               0               0
Q6                     0               0               0
Q7                     0               0               0
```

Showing queue statistics for interface **lag 1**:

```
switch# show interface lag 1 queues
Aggregate-name lag1
Aggregated-interfaces :
1/1/6  1/1/7
Speed 20000 Mb/s
                Tx Bytes      Tx Packets        Tx Drops
Q0                     0               0               0
Q1                     0               0               0
Q2                     0               0               0
Q3                     0               0               0
Q4                     0               0               0
Q5                     0               0               0
Q6                     0               0               0
```

```
Q7                  3450              25               0
```

For more information on features that use this command, refer to the Quality of Service Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## show interface qos

`show interface <INTERFACE-NAME> qos`

### Description

Shows various QoS settings for a specific interface.

| Parameter | Description |
|---|---|
| *<INTERFACE-NAME>* | Specifies the name of an interface on the switch. Format: **member/slot/port** or **lag number**. |

### Examples

*On the 6400 Switch Series, interface identification differs.*

Showing QoS settings for interface **1/1/5**:

```
switch# show interface 1/1/5 qos
Interface 1/1/5 is up
 Admin state is up
 qos trust none (global)
 qos queue-profile factory-default (global)
 qos schedule-profile factory-default (global)
 qos cos 5
 qos dscp 47
 rate-limit broadcast 4 percent (40000 actual)
 rate-limit icmp ip-all 10000 kbps (10000 actual)
                          Forwarded Pkts         Dropped Pkts      Forwarded Bytes
       Dropped Bytes
   Broadcast:                     944468                 1044           1044658890
            85662408
   ICMP:                           82210                    0              2689008
                   0
 qos shape 200000 kbps (199999 kbps actual)
```

Showing QoS settings for a two-member lag:

```
switch# **show interface lag1 qos**
Aggregate-name lag1
 Admin state is up
 qos trust cos (global)
 qos queue-profile factory-default (global)
 qos schedule-profile test (override)
 qos cos 5
 qos dscp 47
 rate-limit broadcast 4 percent (40000 actual)
 rate-limit icmp ip-all 10000 kbps (10000 actual)
                          Forwarded Pkts         Dropped Pkts      Forwarded Bytes
       Dropped Bytes
   Broadcast:                     944468                 1044           1044658890
            85662408
   ICMP:                           82210                    0              2689008
                   0
 qos shape 200000 kbps (199999 kbps actual per interface, 399998 kbps total for
LAG)

Per Interface Status

                Maximum  Bandwidh
 Queue        Bandwidth  Units
 --------------------------------
 Q1               20000  kbps
 Q4               30000  kbps
 Q7               40000  kbps
```

Showing QoS settings for the VSF interface 1/1/49:

The following example applies only to the 6300 Switch Series.

```
switch# **show interface 1/1/49 qos**
Interface 1/1/49 is up
 Admin state is up
 qos trust none (global)
 qos queue-profile factory-default (global)
 qos schedule-profile factory-default (global)
 qos shape 10000000 kbps (10000000 kbps actual)
```

For more information on features that use this command, refer to the Quality of Service Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.13.1000 | Command updated to display qos shape <*SPEED*>. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show qos cos-map

```
show qos cos-map [default] [vsx-peer]
```

NOTE: The **vsx-peer** parameter is not supported by the 6300 Series Switch

### Description

Shows the global QoS CoS code point settings, or the factory default settings.

| Parameter | Description |
|---|---|
| `default` | Shows the factory default CoS code point settings. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Examples

Showing the current CoS map:

```
switch# show qos cos-map
code_point local_priority color   name
---------- -------------- ------- ----
0          2              green   Best_Effort
1          0              green   Background
2          1              green   Spare
3          3              green   Excellent_Effort
4          4              green   Controlled_Load
5          5              green   Video
6          6              green   Voice
7          7              green   Network_Control
```

Showing the default CoS map:

```
switch# show qos cos-map default
code_point local_priority color   name
```

```
---------- -------------- ------- ----
0          1              green   Best_Effort
1          0              green   Background
2          2              green   Excellent_Effort
3          3              green   Critical_Applications
4          4              green   Video
5          5              green   Voice
6          6              green   Internetwork_Control
7          7              green   Network_Control
```

For more information on features that use this command, refer to the Quality of Service Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show qos dscp-map

```
show qos dscp-map [default] [vsx-peer]
```

NOTE: The **vsx-peer** parameter is not supported by the 6300 Series Switch

### Description

Displays the current or default global QoS dscp-map.

| Parameter | Description |
|---|---|
| `default` | Shows the factory default DSCP code point settings. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Examples

Showing the current QoS DSCP map:

```
switch# show qos dscp-map
code_point local_priority cos color   name
---------- -------------- --- ------- ----
0          1                  green   CS0
1          1                  green
2          1               3  green
3          1                  green
4          1                  green
5          1                  green
6          1                  green
7          1                  green
8          0                  green   CS1
...
45         5                  green
46         7                  green   EF
47         5               7  green
48         6                  green   CS6
...
61         7                  green
62         7                  green
63         7                  green
```

Showing the default QoS DSCP map:

```
switch# show qos dscp-map default
code_point local_priority cos color   name
---------- -------------- --- ------- ----
0          1                  green   CS0
1          1                  green
2          1                  green
3          1                  green
4          1                  green
5          1                  green
...
45         5                  green
46         5                  green   EF
47         5                  green
48         6                  green   CS6
...
61         7                  green
62         7                  green
63         7                  green
```

For more information on features that use this command, refer to the Quality of Service Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show qos queue-profile

```
show qos queue-profile [<NAME> | factory-default] [vsx-peer]
```

**NOTE:** The **vsx-peer** parameter is not supported by the 6300 Series Switch

### Description

Shows the status of all queue profiles, or a specific queue profile.

| Parameter | Description |
|---|---|
| *<NAME>* | Specifies the name of a queue profile. Range 1 to 64 alphanumeric characters, including period (.), underscore (_), and hyphen (-). |
| `[factory-default]` | Specifies the factory default queue profile. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Usage

The status of a queue profile can be:

- Applied - The profile is actively being used by the switch.
- Complete - The profile meets the criteria to be applied.
- Incomplete - The profile does not meet the criteria to be applied.

For a queue profile to be complete and ready to be applied:

- All eight local priorities must be mapped to some queue.
- There can be 1 to 8 queues.
- The queues must be consecutively numbered starting at zero.

### Examples

Showing the settings of the factory default queue profile:

```
switch# show qos queue-profile factory-default
queue_num local_priorities name
--------- ---------------- ----
0         0
1         1
2         2
3         3
```

```
4           4
5           5
6           6
7           7
```

For more information on features that use this command, refer to the Quality of Service Guide for your switch model.

## show qos schedule-profile

```
show qos schedule-profile [<NAME> | factory-default | strict] [vsx-peer]
```

NOTE: The **vsx-peer** parameter is not supported by the 6300 Series Switch

### Description

Shows the status of all schedule profiles, or a specific schedule profile.

| Parameter | Description |
|---|---|
| *<NAME>* | Specifies the name of a queue or schedule profile. Range: 1 to 64 alphanumeric characters, including period (.), underscore (_), and hyphen (-). |
| `[factory-default]` | Specifies the factory default queue profile. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Usage

The status of a schedule profile can be:

- Applied - The profile is actively being used by one or more ports.
- Complete - The profile meets the criteria to be applied.
- Incomplete - The profile does not meet the criteria to be applied.

For a schedule profile to be complete and ready to be applied it must have:

- An algorithm for each queue defined by the applied queue profile.
- All queues must use the same algorithm except for the highest numbered queue, which may be strict.

### Example

Showing the status of all schedule profiles:

```
switch# show qos schedule-profile
profile_status profile_name
-------------- ------------
applied        MySchedule
complete       factory-default
complete       Test
```

Showing the configuration of factory default schedule profile:

```
switch# show qos schedule-profile factory-default
Queue
Number  Algorithm      Weight
------- -------------- --------
0       dwrr           1
1       dwrr           1
2       dwrr           1
3       dwrr           1
4       dwrr           1
5       dwrr           1
6       dwrr           1
7       dwrr           1
```

For more information on features that use this command, refer to the Quality of Service Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

# show qos trust

```
show qos trust [default] [vsx-peer]
```

**NOTE:** The **vsx-peer** parameter is not supported by the 6300 Series Switch

## Description

Shows the global QoS trust settings, or the factory default settings.

| Parameter | Description |
|---|---|
| `default` | Shows the factory default QoS trust settings. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

## Examples

Showing the current QoS trust settings:

```
switch# show qos trust
qos trust cos
```

Showing the default QoS trust settings:

```
switch# show qos trust default
qos trust none
```

For more information on features that use this command, refer to the Quality of Service Guide for your switch model.

## Command History

# strict queue

```
strict queue <0-7> [max-bandwidth <RATE> [kbps|percent]
no strict queue <0-7> [max-bandwidth <RATE> [kbps|percent]
```

## Description

Assigns the strict priority algorithm to a queue. Strict priority services all packets waiting in a queue, before servicing the packets in lower priority queues.

Egress queue shaping can be configured using the **max-bandwidth** option to limit the amount of traffic transmitted per output queue. The buffer associated with each egress queue stores the excess traffic to smooth the output rate. Sustained rates of traffic above the maximum bandwidth will eventually fill the output queue, causing tail drops. Use **show interface <IF-NAME> queues** to determine if any tail-drop errors have occurred.

The **no** form of this command removes the queue configuration from the schedule profile. To remove only egress queue shaping, re-enter the strict queue command without the **max-bandwidth** parameter.

| Parameter | Description |
|---|---|
| `<QUEUE-NUMBER>` | Specifies the number of the queue. Range: 0 to 7. |
| `max-bandwidth <BANDWIDTH>` | Specifies the maximum bandwidth allowed on the queue in Kbps. Range: 64 to 100000000. Alternatively, the maximum bandwidth rate can also be configured on the queue as a percentage of the port shape or link bandwidth if a port shape is not configured. The allowed range is 1-100. |

## Usage

Either all the queues of the schedule profile can be *strict* or just the highest numbered queue. When applied to a LAG, each member Ethernet port independently schedules its egress transmissions using the strict settings. Only limited changes can be made to a *strict* queue that is part of an applied schedule profile:

- The max-bandwidth settings.
- The highest numbered queue can be swapped between *strict* and *dwrr*` or *min-bandwidth* (only applicable for the Aruba 6300 Series Switch)
- The highest numbered queue can be swapped between *strict* and *dwrr* (only applicable for the Aruba 6400 Series Switch)

Any other changes or removing a queue (**no strict queue**) will result in an unusable schedule profile. If that schedule profile is applied in the interface context, the switch will revert to the schedule profile applied in the global context until the profile is corrected. If that schedule profile is applied in the global context, the switch will revert to using the factory-default profile until the profile is corrected.

It is possible for the following errors to occur:

- **The max-bandwidth cannot be greater than 100 percent.**

This error occurs when a max-bandwidth value greater than 100 percent is configured on a queue.

- **The max-bandwidth cannot be less than <*NUM*> kbps.**

This error occurs when a kbps max-bandwidth value less than the supported minimum kbps shape value is configured on a queue. The supported minimum kbps shape value can be retrieved using the **show capacities** command.

## Examples

Assigning strict priority to queue **7** in the schedule profile **MySchedule**:

```
switch(config)# qos schedule-profile MySchedule
switch(config-schedule)# strict queue 7
```

Deleting strict priority from queue **7** in the schedule profile **MySchedule**:

```
switch(config)# qos schedule-profile MySchedule
switch(config-schedule)# no strict queue 7
```

Assigning strict priority to queue **7** in the schedule profile **MySchedule** with a maximum bandwidth of 10000 Kbps:

```
switch(config)# qos schedule-profile MySchedule
switch(config-schedule)# strict queue 7 max-bandwidth 10000 kbps
```

For more information on features that use this command, refer to the Quality of Service Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.13 | Added the **kbps** and **percent** parameters. |

# Chapter 128

# QinQ commands

## debug vlan qinq

`debug vlan qinq severity`

### Description

Enables the VLAN debug logs to trace the QinQ changes and filtering with minimum log severity.

### Examples

Enabling the debug logs for QinQ

```
switch# debug vlan qinq
severity        Minimum log severity to filter debug logs
<cr>
switch# debug vlan qinq severity
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.10 | Command introduced |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## diag-dump l2vlan basic

`diag-dump l2vlan basic`

### Description

Collects the debug information in the case of any issue in the QinQ daemon. Diagnostic for QinQ is part of VLAN daemon.

### Examples

Configuring diagnostic dump for QinQ

```
switch# diag-dump l2vlan basic
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

### Command History

## show running-config qinq

`show running-config qinq`

### Description

Shows all the QinQ configurations in the switch.

### Examples

Showing the QinQ running configuration

~~~
switch# show running-config qinq
Current configuration:
...
vlan 300
    svlan

```
~~~

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## svlan

```
svlan
no svlan
```

### Description

Configures a VLAN as a service VLAN. A port will implicitly become customer-network port, when it is an access member (untagged) of SVLAN. A port will implicitly become provider-network port, when it is a trunk member (tagged) of SVLAN.

The **no** form of this command removes the service VLAN configuration.

A QinQ CN or PN port, which was a member of the SVLAN, will become normal VLAN port after removing service VLAN configuration from VLAN.

### Usage

- VLAN 1 cannot be configured as an SVLAN.
- An L2 port can be a member of either service VLANs or normal VLANs but cannot be used on both the VLANs.
- An L2 port with **vlan trunk allowed all** will not include service VLANs.
- Native VLAN configuration will be non-operational on PN port.

### Examples

Configuring VLAN 300 and enabling service VLAN mode

```
switch(config)# vlan 300
switch(config-vlan-300)# svlan
```

Removing the service VLAN mode configuration from VLAN 300

```
switch(config)# vlan 100
switch(config-vlan-100)# no svlan
```

For more information on features that use this command, refer to the Layer 2 Bridging Guide for your switch model.

# Chapter 129

# Configurable RADIUS attribute commands

## aaa radius-attribute group

```
aaa radius-attribute group <GROUP-NAME>
no aaa radius-attribute group <GROUP-NAME>
```

### Description

Configures an existing RADIUS server group for which the configured RADIUS attributes will be included in request packets. Enters the **config-radius-attr** context.

The **no** form of this command unconfigures the RADIUS server group for the configured RADIUS attributes.

Nas-id and tunnel-private-group-id attributes only apply to port access requests. Nas-ip-addr attributes only apply to management user requests.

| Parameter | Description |
|---|---|
| *<GROUP-NAME>* | Specifies an existing RADIUS server group name. |

### Examples

Configuring port access request RADIUS attributes for **rad_group1**:

```
switch(config)# aaa radius-attribute group rad_group1
switch(config-radius-attr)# nas-id value ARUBA_NAS-01
switch(config-radius-attr)# nas-id request-type authentication
switch(config-radius-attr)# tunnel-private-group-id value static
switch(config-radius-attr)# tunnel-private-group-id request-type authentication
```

Configuring management user request RADIUS attributes for **rad_group2**:

```
switch(config)# aaa radius-attribute group rad_group2
switch(config-radius-attr)# nas-ip-addr request-type authentication
switch(config-radius-attr)# nas-ip-addr service-type user-management
```

Unconfiguring RADIUS attributes for **rad_group1**:

```
switch(config)# no aaa radius-attribute group rad_group1
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## nas-id request-type

```
nas-id request-type {authentication | accounting | both}
no nas-id request-type {authentication | accounting | both}
```

### Description

For the selected (by context) RADIUS server group, configures the Network Access Server (NAS) ID request type for which the attribute configured with command **nas-id value** will be included.

The no form of this command unconfigures the specified request type.

Nas-id attributes only apply to port access requests.

| Parameter | Description |
|---|---|
| `authentication` | Selects the authentication request type. |
| `accounting` | Selects the accounting request type. |
| `both` | Selects both the authentication and accounting request types. |

### Examples

Configuring the authentication request type for **rad_group1**:

```
switch(config)# aaa radius-attribute group rad_group1
switch(config-radius-attr)# nas-id request-type authentication
```

Configuring both the authentication and accounting request types for **rad_group2**:

```
switch(config)# aaa radius-attribute group rad_group2
switch(config-radius-attr)# nas-id request-type both
```

Unconfiguring the authentication request type for **rad_group1**:

```
switch(config)# aaa radius-attribute group rad_group1
switch(config-radius-attr)# no nas-id request-type authentication
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-radius-attr` | Administrators or local user group members with execution rights for this command. |

## nas-id value

```
nas-id value <NAS-ID>
no nas-id [value <NAS-ID>]
```

### Description

For the selected (by context) RADIUS server group, configures the Network Access Server Identifier (NAS ID) (type 32, RFC 2865). The NAS ID is sent in the RADIUS access request and accounting packets to notify the source of the RADIUS access request.

The **no** form of this command unconfigures the specified NAS ID.

Nas-id attributes only apply to port access requests.

| Parameter | Description |
|---|---|
| *<NAS-ID>* | Specifies the FQDN or other unique identifying name of the Network Access Server (NAS). Range 1 to 253 characters. |

### Examples

Configuring the Network Access Server (NAS) ID for **rad_group1**:

```
switch(config)# aaa radius-attribute group rad_group1
switch(config-radius-attr)# nas-id value ARUBA_NAS-01
```

Unconfiguring the NAS ID for **rad_group1**:

```
switch(config)# aaa radius-attribute group rad_group1
switch(config-radius-attr)# no nas-id value ARUBA_NAS-01
```

Unconfiguring both the NAS-ID value and the request type for **rad_group2**:

```
switch(config)# aaa radius-attribute group rad_group2
switch(config-radius-attr)# no nas-id
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-radius-attr` | Administrators or local user group members with execution rights for this command. |

## nas-ip-addr request-type authentication

```
nas-ip-addr request-type authentication
no nas-ip-addr request-type authentication
```

### Description

For the selected (by context) RADIUS server group, configures the **NAS-IP-Address** attribute for inclusion in management user request packets.

The no form of this command unconfigures the **NAS-IP-Address** attribute for inclusion in management user request packets.

Nas-ip-addr attributes only apply to management user requests.

### Examples

Configuring the **NAS-IP-Address** attribute for inclusion in management user request packets for **rad_group1**:

```
switch(config)# aaa radius-attribute group rad_group1
switch(config-radius-attr)# nas-ip-addr request-type authentication
```

Unconfiguring the **NAS-IP-Address** attribute for inclusion in management user request packets for **rad_group1**:

```
switch(config)# aaa radius-attribute group rad_group1
switch(config-radius-attr)# no nas-ip-addr request-type authentication
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.09 | Command introduced |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-radius-attr` | Administrators or local user group members with execution rights for this command. |

## nas-ip-addr service-type user-management

```
nas-ip-addr service-type user-management
no nas-ip-addr service-type user-management
```

### Description

For the selected (by context) RADIUS server group, configures the **NAS-IP-Address** attribute for inclusion in management user service type request packets.

The no form of this command unconfigures the **NAS-IP-Address** attribute for inclusion in management user service type request packets.

Nas-ip-addr attributes only apply to management user requests.

### Examples

Configuring the **NAS-IP-Address** attribute for inclusion in management user service type request packets for **rad_group1:**

```
switch(config)# aaa radius-attribute group rad_group1
switch(config-radius-attr)# nas-ip-addr service-type user-management
```

Unconfiguring the **NAS-IP-Address** attribute for inclusion in management user service type request packets for **rad_group1:**

```
switch(config)# aaa radius-attribute group rad_group1
switch(config-radius-attr)# no nas-ip-addr service-type user-management
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.09 | Command introduced |

# tunnel-private-group-id request-type

```
tunnel-private-group-id request-type {authentication | accounting | both}
no tunnel-private-group-id request-type {authentication | accounting | both}
```

### Description

For the selected (by context) RADIUS server group, configures the request type for which the attribute configured with command **tunnel-private-group-id value** will be included.

The **no** form of this command unconfigures the specified request type.

Tunnel-private-group-id attributes only apply to port access requests.

| Parameter | Description |
|---|---|
| `authentication` | Selects the authentication request type. |
| `accounting` | Selects the accounting request type. |
| `both` | Selects both the authentication and accounting request types. |

### Examples

Configuring the authentication request type for **rad_group1**:

```
switch(config)# aaa radius-attribute group rad_group1
switch(config-radius-attr)# tunnel-private-group-id request-type authentication
```

Configuring both the authentication and accounting request types for **rad_group2**:

```
switch(config)# aaa radius-attribute group rad_group2
switch(config-radius-attr)# tunnel-private-group-id request-type both
```

Unconfiguring the authentication request type for **rad_group2**:

```
switch(config)# aaa radius-attribute group rad_group2
switch(config-radius-attr)# no tunnel-private-group-id request-type authentication
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-radius-attr` | Administrators or local user group members with execution rights for this command. |

## tunnel-private-group-id value

```
tunnel-private-group-id value {static | dynamic}
no tunnel-private-group-id value {static | dynamic}
```

### Description

For the selected (by context) RADIUS server group, configures the **tunnel-private-group-id** value (type 81, RFC 2868) that will be sent in RADIUS access-request packets. This is used for VLAN identification.

The no form of this command unconfigures specified **tunnel-private-group-id** value.

Tunnel-private-group-id attributes only apply to port access requests.

| Parameter | Description |
|---|---|
| `static` | Causes the switch to send (as an attribute value) the native VLAN of the client port. |
| `dynamic` | Causes the switch to send (as an attribute value) the client VLAN assigned by server. This is applicable during re-authentication scenarios. |

### Examples

Configuring **rad_group1** for the RADIUS attribute to identify the native VLAN of the client port:

```
switch(config)# aaa radius-attribute group rad_group1
switch(config-radius-attr)# tunnel-private-group-id value static
```

Configuring **rad_group2** for the RADIUS attribute to identify the client VLAN assigned by the server:

```
switch(config)# aaa radius-attribute group rad_group2
switch(config-radius-attr)# tunnel-private-group-id value dynamic
```

Unconfiguring (for **rad_group1**) the RADIUS attribute to identify the native VLAN of the client port:

```
switch(config)# aaa radius-attribute group rad_group1
switch(config-radius-attr)# no tunnel-private-group-id value static
```

Unconfiguring (for **rad_group3**) both the group-ID value and request type:

```
switch(config)# aaa radius-attribute group rad_group3
switch(config-radius-attr)# no tunnel-private-group-id
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

|---|---|---|
| 6300<br>6400 | `config-radius-attr` | Administrators or local user group members with execution rights for this command. |

## vsa vendor

```
vsa vendor aruba type avpair group dfp-client-info
{no} vsa vendor aruba type avpair group dfp-client-info
```

### Description

This command enables AOS-CX integration with Aruba Clearpass by allowing the switch to send Vendor-Specific Attributes (VSAs) for the **Aruba** vendor in RADIUS interim packets (such as accounting packets). Device fingerprints are sent to a ClearPass RADIUs server through accounting updates using Aruba-AVPair(67) VSAs. When configured, device fingerprint information for an authenticated port-access client is obtained from protocols such as LLDP, DHCP, CDP, and HTTP and sent to RADIUS accounting interim packets.

### Examples

The following command configures Clearpass integration using device fingerprinting information sent through RADIUS accounting updates.

```
switch(config)# aaa radius-attribute group radius
switch(config-radius-attr)#vsa vendor aruba type avpair group dfp-client-info
```

The following command stops the switch from sending device fingerprinting infromation through RADIUS accounting updates.

```
switch(config-radius-attr)#no vsa vendor aruba type avpair group dfp-client-info
```

For more information on features that use this command, refer to the Security Guide for your switch model.

# Chapter 130

# RADIUS dynamic authorization commands

## radius dyn-authorization enable

```
radius dyn-authorization enable
no radius dyn-authorization enable
```

### Description

Enables RADIUS dynamic authorization. This command must be issued before the configuration set with other **radius dyn-authorization** commands takes effect.

The no form of this command disables RADIUS dynamic authorization.

### Examples

Enabling RADIUS dynamic authorization:

```
switch(config)# radius dyn-authorization enable
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |

## radius dyn-authorization client

```
radius dyn-authorization client {<IPV4> | <IPV6> | <HOSTNAME>}
   [secret-key [plaintext <PASSKEY> | ciphertext <PASSKEY>]]
   [time-window <WIDTH>] [vrf <VRF-NAME>] [replay-protection {enable|disable}]
   [rfc5176-enforcement-mode <strict|loose>]
   no...
```

### Description

Configures RADIUS dynamic authorization for the specified client on the specified (or **default**) VRF.

The **no** form of this command unconfigures RADIUS dynamic authorization for the specified client on the specified (or **default**) VRF.

## Guidelines

Configure **rfc5176-enforcement-mode loose** when integrating with the Adaptive Network Control (ANC) feature of Cisco ISE, as authorization attributes are sent as part of Disconnect-Requests (code 40) instead of CoA-Requests(code 43).

The following are the only authorization attributes that are accepted in the disconnect requests in the loose mode:

1. Cisco-AVPair='subscriber:command=bounce-host-port'
2. Cisco-AVPair='subscriber:command=disable-host-port'
3. Cisco-AVPair='subscriber:command=reauthenticate' and Cisco-AVPair='subscriber:reauthenticate-type=<last|rerun>

The **reauthenticate-type=rerun** option is not supported if concurrent onboarding is enabled for the client.

| Parameter | Description |
|---|---|
| `<IPV4> \| <IPV6> \| <HOSTNAME>` | Specifies the client IPv4 address, IPv6 address, or host name. |
| `secret-key [plaintext <PASSKEY> \| ciphertext <PASSKEY>]` | Specifies the dynamic authorization server (RADIUS server) shared secret key required for client access. Provide either a plaintext or an encrypted shared-secret passkey. As per RFC 2865, the shared-secret can be a mix of alphanumeric and special characters. Plaintext passkeys are between 1 and 32 alphanumeric and special characters.<br>**NOTE:** When **secret-key** is entered without either sub-parameter, plaintext shared secret prompting occurs upon pressing Enter. Enter must be pressed immediately after the **secret-key** parameter without entering other parameters. The entered shared secret characters are masked with asterisks. |
| `rfc5176-enforcement-mode <strict\|loose)` | Configure the enforcement mode of RFC5176. The default mode is **strict** and in this mode, no authorization attributes are allowed as part of disconnect requests. When configured mode is **loose**, then the authorization attributes are accepted in disconnect requests. |
| `time-window <WIDTH>` | Specifies the width of the synchronization window (in seconds) between the RADIUS dynamic authorization client and the RADIUS dynamic authorization server. Default 300. Range: 1 to 65535. |
| `replay-protection {enable\|disable}` | Enables or disables RADIUS dynamic authorization replay protection for the specified client on the specified (or **default**) VRF. By default, the replay-protection is set to disabled. |
| `vrf <VRF-NAME>` | Specifies the VRF on which the identified client is connected. When omitted, VRF **default** is assumed. |

### Examples

Configuring RADIUS dynamic authorization with replay protection for a client on the default VRF:

```
switch(config)# radius dyn-authorization client 1.1.2.5 replay-protection enable
```

Configuring RADIUS dynamic authorization with time window and shared secret for a client on the default VRF:

```
switch(config)# radius dyn-authorization client 1.1.2.7 time-window 8
                secret-key plaintext skF82#450
```

Configuring loose enforcement of RFC5176:

```
switch(config)# radius dyn-authorization client 1.1.1.1 rfc5176-enforcement-mode
loose
```

Configuring RADIUS dynamic authorization with a prompted shared secret:

```
switch(config)# radius dyn-authorization client 1.1.2.7 secret-key
Enter the RADIUS dyn-authorization key: *********
Re-Enter the RADIUS dyn-authorization key: *********
```

Configuring RADIUS dynamic authorization for a client on the adm2 VRF:

```
switch(config)# radius dyn-authorization client 1.1.2.1 vrf adm2
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.13 | The **rfc5176-enforcement-mode** parameter was introduced. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## radius dyn-authorization client tls (RadSec)

```
radius dyn-authorization client [<IPV4> | <IPV6> | <HOSTNAME>]
   tls [replay-protection {enable|disable}][time-window <WIDTH>] [vrf <VRF-NAME>]
[rfc5176-enforcement-mode <strict|loose>]
```

```
no radius dyn-authorization client [<IPV4> | <IPV6> | <HOSTNAME>]
   tls [replay-protection {enable|disable}][time-window <WIDTH>] [vrf <VRF-NAME>]
[rfc5176-enforcement-mode <strict|loose>]
```

## Description

Enables TLS protection for a RADIUS dynamic authorization client on the specified (or **default**) VRF. RadSec is a protocol that supports RADIUS over TLS. The **no** form of this command deletes TLS protection for the dynamic authorization client.

RadSec server must be configured before configuring dynamic authorization.

## Guidelines

Configure **rfc5176-enforcement-mode loose** when integrating with the Adaptive Network Control (ANC) feature of Cisco ISE, as authorization attributes are sent as part of Disconnect-Requests (code 40) instead of CoA-Requests(code 43).

The following are the only authorization attributes that are accepted in the disconnect requests in the loose mode:

1. Cisco-AVPair='subscriber:command=bounce-host-port'
2. Cisco-AVPair='subscriber:command=disable-host-port'
3. Cisco-AVPair='subscriber:command=reauthenticate' and Cisco-AVPair='subscriber:reauthenticate-type=<last|rerun>

The **reauthenticate-type=rerun** option is not supported if concurrent onboarding is enabled for the client.

| Parameter | Description |
|---|---|
| `<IPV4> \| <IPV6> \| <HOSTNAME>` | Specifies the client IPv4 address, IPv6 address, or host name. |
| `replay-protection {enable\|disable}` | Enables or disables RADIUS dynamic authorization replay protection for the specified client on the specified (or **default**) VRF. By default, the replay-protection is set to disabled. |
| `time-window <WIDTH>` | Specifies the width of the synchronization window (in seconds) between the RADIUS dynamic authorization client and the RADIUS dynamic authorization server. Default 300. Range: 1 to 65535. |
| `vrf <VRF-NAME>` | Specifies the VRF on which the identified client is connected. When omitted, VRF **default** is assumed. |
| `rfc5176-enforcement-mode <strict\|loose>` | Configure the enforcement mode of RFC5176. The default mode is **strict** and in this mode, no authorization attributes are allowed as part of disconnect requests. When configured mode is **loose**, then the authorization attributes are accepted in disconnect requests. |

## Examples

Enables TLS protection for a RADIUS dynamic authorization client with replay protection and time window for a client on the default VRF:

```
switch(config)# radius dyn-authorization client 1.1.2.5 tls replay-protection
enable time-window 8
```

Configuring loose enforcement of RFC5176:

```
switch(config)# radius dyn-authorization client 1.1.1.1 tls rfc5176-enforcement-
mode loose
```

Deleting TLS protection for a dynamic authorization client on the adm2 VRF:

```
switch(config)# no radius dyn-authorization client 1.1.2.7 tls VRF adm2
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

## radius dyn-authorization port

`radius dyn-authorization port <PORT-NUMBER>`

### Description

Sets the RADIUS dynamic authorization server UDP or TCP port.

| Parameter | Description |
|---|---|
| *<PORT-NUMBER>* | Specifies the UDP or TCP port. Default UDP: 3799 and TCP:2083. |

### Examples

Setting the RADIUS dynamic authorization server UDP port back to its default 3799:

```
switch(config)# radius dyn-authorization port 3799
```

Setting the RADIUS dynamic authorization server TCP port back to its default 2083:

```
switch(config)# radius dyn-authorization port 2083
```

For more information on features that use this command, refer to the Security Guide for your switch model.

## show radius dyn-authorization

```
show radius dyn-authorization
```

### Description

Shows RADIUS dynamic authorization configuration and summarized statistics for all clients configured for dynamic authorization.

### Usage

Show command output item identification:

- **Radius Dynamic Authorization**: Enabled or Disabled status, system wide.
- **Radius Dynamic Authorization Port**: The UDP or TCP port used for dynamic authorization (default 3799).
- **Invalid Client Address in CoA Requests**: The number of CoA (change of authorization) requests received with an incorrect DAC (dynamic authorization client) address.
- **Invalid Client Address in Disconnect Requests**: The number of disconnect requests received with incorrect DAC address.
- **Disconnect Requests**: The number of disconnect requests received from the DAC.
- **Disconnect ACKs**: The number of Disconnect-ACKs sent to the DAC.
- **Disconnect NAKs**: The number of Disconnect-NAKs sent to the DAC.
- **CoA Requests**: The number of CoA-requests received from the DAC.
- **CoA ACKs**: The number of CoA-ACKs sent to the DAC.
- **CoA NAKs**: The number of CoA-NAKs sent to the DAC.

### Example

Showing RADIUS dynamic authorization summarized statistics for all clients configured for dynamic authorization:

```
switch# show radius dyn-authorization
Status and Counters - RADIUS Dynamic Authorization Information

  RADIUS Dynamic Authorization                       : Enabled
  RADIUS Dynamic Authorization UDP Port              : 3799
  Invalid Client Addresses in CoA Requests           : 0
  Invalid Client Addresses in Disconnect Requests: 0

Dynamic Authorization Client Information
==========================================

IP Address           : 1.1.2.1

```

For more information on features that use this command, refer to the Security Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show radius dyn-authorization client

```
show radius dyn-authorization client <IP-ADDR> [vrf <VRF-NAME>]
```

### Description

Shows RADIUS dynamic authorization statistics for the specified client on the specified VRF.

| Parameter | Description |
|---|---|
| *<IP-ADDR>* | Specifies the client IPv4 or IPv6 address. |
| vrf *<VRF-NAME>* | Specifies the VRF on which the identified client is connected. When omitted, VRF **default** is assumed. |

### Usage

Show command output item identification:

- **Total Requests**: The number of Disconnect and CoA (change of authorization) requests received from the DAC (dynamic authorization client).
- **Authorize Only Requests**: The number of Disconnect and CoA requests received from the DAC with an "Authorize only" Service-Type attribute.
- **Malformed Requests**: The number of malformed Disconnect and CoA requests received from the DAC.
- **Bad Authenticator Requests**: The number of Disconnect and CoA requests received from this DAC with an invalid authenticator field.
- **Dropped Requests**: The number of Disconnect and CoA requests from this DAC that have been silently discarded for reasons other than malformed, bad authenticators, or unknown type.
- **Total ACK Responses**: The number of Disconnect-ACKs sent to the DAC.
- **Total NAK Responses**: The number of Disconnect-NAKs sent to the DAC.
- **Session Not Found Responses**: The number of Disconnect-NAKs sent to the DAC because no session context could be found.
- **User Sessions Modified**: The number of user sessions for which authorization changed due to Disconnect and CoA requests received from the DAC.

### Example

Showing RADIUS dynamic authorization statistics for client 1.1.2.1 on VRF default:

```
switch# show radius dyn-authorization client 1.1.2.1 vrf default
Status and Counters - RADIUS Dynamic Authorization Client Information

  VRF Name                  : default
  Authorization Client      : 1.1.2.1
  Unknown Packets           : 55
  Message-Type                  Disconnect       CoA
  ---------------------------------------------------------------
  Total Requests                2147483647       10
  Authorize Only Requests       10               10
  Malformed Requests            10               10
  Bad Authenticator Requests    2147483647       2147483647
  Dropped Requests              10               10
  Total ACK Responses           10               10
  Total NAK Responses           10               10
  Session Not Found Responses   10               10
  User Sessions Modified        20               20
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |

## show radius dyn-authorization client tls (RadSec)

`show radius dyn-authorization client <IP-ADDR> tls [vrf <VRF-NAME>]`

### Description

Shows RADIUS dynamic authorization statistics for the specified client (with TLS) on the specified VRF.

| Parameter | Description |
|---|---|
| *<IP-ADDR>* | Specifies the client IPv4 or IPv6 address. |
| vrf *<VRF-NAME>* | Specifies the VRF on which the identified client is connected. When omitted, VRF **default** is assumed. |

### Usage

Show command output item identification:

- **Total Requests**: The number of Disconnect and CoA (change of authorization) requests received from the DAC (dynamic authorization client).
- **Authorize Only Requests**: The number of Disconnect and CoA requests received from the DAC with an "Authorize only" Service-Type attribute.
- **Malformed Requests**: The number of malformed Disconnect and CoA requests received from the DAC.
- **Bad Authenticator Requests**: The number of Disconnect and CoA requests received from this DAC with an invalid authenticator field.
- **Dropped Requests**: The number of Disconnect and CoA requests from this DAC that have been silently discarded for reasons other than malformed, bad authenticators, or unknown type.
- **Total ACK Responses**: The number of Disconnect-ACKs sent to the DAC.
- **Total NAK Responses**: The number of Disconnect-NAKs sent to the DAC.
- **Session Not Found Responses**: The number of Disconnect-NAKs sent to the DAC because no session context could be found.
- **User Sessions Modified**: The number of user sessions for which authorization changed due to Disconnect and CoA requests received from the DAC.

### Example

Showing RADIUS dynamic authorization statistics for client 1.1.2.1 with TLS enabled on VRF default:

```
switch# show radius dyn-authorization client 1.1.2.1 vrf default
Status and Counters - RADIUS Dynamic Authorization Client Information

  VRF Name                 : default
  Authorization Client     : 1.1.2.1
  TLS Enabled              : Yes
  Unknown Packets          : 55
  Message-Type                   Disconnect       CoA
  ---------------------------------------------------------------
  Total Requests                 2147483647       10
  Authorize Only Requests        10               10
  Malformed Requests             10               10
  Bad Authenticator Requests     2147483647       2147483647
  Dropped Requests               10               10
  Total ACK Responses            10               10
  Total NAK Responses            10               10
  Session Not Found Responses    10               10
  User Sessions Modified         20               20
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |

# Chapter 131

# RA guard policy commands

## hop limit

```
hop limit [minimum | maximum] <HOP-LIMIT>
no hop limit [minimum | maximum] <HOP-LIMIT>
```

### Description

Enables verification of the advertised hop count limit if the RA guard policy is applied on a VLAN or interface. RA packets with the hop limit within the specified minimum and maximum values are processed. If none of the values are specified for hop limit, the default range is 1-255. If hop limit is not enabled, packets are not validated for hop limit.

The **no** form of the command disables the hop limit on the specified RA guard policy.

ND snooping must be enabled in both the global context and the config-vlan context before this command can be used.

| Parameter | Description |
|---|---|
| *<HOP-LIMIT>* | Specifies the hop-limit value. Range: 1-255. |
| `minimum` | Specifies the minimum value for the hop-limit range. Default: 1, Range 1-255.<br>The range is minimum–255 if only a minimum value is specified. |
| `maximum` | Specifies the maximum value for the hop-limit range. Default: 255, Range 1-255.<br>The range is 1–maximum if only a maximum value is specified. |

### Examples

Enabling the hop limit on the RA guard policy and adding minimum and maximum values for hop limit on the policy:

```
switch(config)# ipv6 nd-snooping ra-guard policy <POLICY-NAME>
switch(config-raguard-policy)# hop-limit enable
switch(config-raguard-policy)# hop-limit maximum 150
switch(config-raguard-policy)# hop-limit minimum 50
```

Disabling the hop limit on the RA guard policy:

```
switch(config)# ipv6 nd-snooping ra-guard policy <POLICY-NAME>
switch(config-raguard-policy)# no hop-limit enable
```

Removing minimum and maximum values for the hop limit on the RA guard policy:

```
switch(config)# ipv6 nd-snooping ra-guard policy <POLICY-NAME>
switch(config-raguard-policy)# no hop-limit maximum 150
switch(config-raguard-policy)# no hop-limit minimum 50
switch(config-raguard-policy)# no hop-limit maximum
switch(config-raguard-policy)# no hop-limit minimum
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.10 | Command introduced. |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-raguard-policy` | Administrators or local user group members with execution rights for this command. |

## ipv6 nd-snooping ra-guard policy

```
ipv6 nd-snooping ra-guard policy <POLICY-NAME>
no ipv6 nd-snooping ra-guard policy <POLICY-NAME>
```

### Description

Creates the Router Advertisement (RA) guard policy with the given name and enters the RA guard policy configuration context.

The **no** form of the command removes the specified RA guard policy from the switch.

ND snooping must be enabled in both the global context and the config-vlan context before this command can be used.

| Parameter | Description |
|---|---|
| *<POLICY-NAME>* | Specifies the name of the RA guard policy. Maximum length: 64. |

### Examples

Creating the RA guard policy globally with a specified name:

```
switch(config)# ipv6 nd-snooping ra-guard policy <POLICY-NAME>
switch(config-raguard-policy)#
```

Deleting the specified RA guard policy:

```
switch(config)# no ipv6 nd-snooping ra-guard policy <POLICY-NAME>
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.10 | Command introduced. |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## managed-config-flag

```
managed-config-flag [on | off]
no managed-config-flag [on | off]
```

### Description

Enables the verification of the advertised manage configuration flag. Verifies that the advertised managed address configuration flag is On or Off based on the configured value.

The **no** form of the command disables the manage configuration flag verification.

ND snooping must be enabled in both the global context and the config-vlan context before this command can be used.

| Parameter | Description |
|---|---|
| `on` | Verifies that the advertised managed address configuration flag is On. |
| `off` | Verifies that the advertised managed address configuration flag is Off. |

### Examples

Enabling managed configuration flag verification:

```
switch(config)# ipv6 nd-snooping ra-guard policy <POLICY-NAME>
switch(config-raguard-policy)# managed-config-flag off
switch(config-raguard-policy)# managed-config-flag on
```

Disabling managed configuration flag verification:

```
switch(config)# ipv6 nd-snooping ra-guard policy <POLICY-NAME>
switch(config-raguard-policy)# no managed-config-flag
switch(config-raguard-policy)# no managed-config-flag off
switch(config-raguard-policy)# no managed-config-flag on
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.10 | Command introduced. |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-raguard-policy` | Administrators or local user group members with execution rights for this command. |

## match access-list

```
match access-list <ACL-NAME>
no match access-list <ACL-NAME>
```

### Description

Configures the access list to an RA guard policy. The access list has to be created with the desired match criteria before adding it into RA guard policy. Advertised packets are verified for the match criteria when an RA guard policy with matched access list is enabled on a trusted port or VLANs.

The **no** form of the command removes the access list from the RA guard policy.

ND snooping must be enabled in both the global context and the config-vlan context before this command can be used.

| Parameter | Description |
|---|---|
| *<ACL-NAME>* | Specifies the name of the access list to be matched. |

### Examples

Adding an access list named Example_ACL to the RA guard policy POL1:

```
switch(config)# ipv6 nd-snooping ra-guard policy POL1
switch(config-raguard-policy)# match access-list Example_ACL
```

Deleting the access list named Example_ACL from the RA guard policy POL1:

```
switch(config)# ipv6 nd-snooping ra-guard policy POL1
switch(config-raguard-policy)# no match access-list Example_ACL
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.10 | Command introduced. |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-raguard-policy` | Administrators or local user group members with execution rights for this command. |

## match prefix-list

```
match prefix-list <PREFIX-LIST-NAME>
no match prefix-list <PREFIX-LIST-NAME>
```

### Description

Configures a prefix-list for the RA guard policy. Advertised prefixes in RA packets are compared against the configured prefix-list and if there is no match, the RA packets are dropped. If the RA prefix list is not configured, this check is not performed.

The **no** form of the command removes the prefix list from the RA guard policy.

ND snooping must be enabled in both the global context and the config-vlan context before this command can be used.

| Parameter | Description |
|---|---|
| *<PREFIX-LIST-NAME>* | Specifies the name of the prefix list to be matched. |

### Examples

Adding a prefix list named PREFIX_LIST_EXAMPLE to the POLICY1 RA guard policy:

```
switch(config)# ipv6 nd-snooping ra-guard policy POLICY1
switch(config-raguard-policy)# match prefix-list PREFIX_LIST_EXAMPLE
```

Deleting the prefix list named PREFIX_LIST_EXAMPLE from the POLICY1 RA guard policy:

```
switch(config)# ipv6 nd-snooping ra-guard policy POLICY1
switch(config-raguard-policy)# no match pefix-list PREFIX_LIST_EXAMPLE
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.10 | Command introduced. |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-raguard-policy` | Administrators or local user group members with execution rights for this command. |

## nd-snooping ra-guard attach-policy

```
nd-snooping ra-guard attach-policy <POLICY-NAME>
no nd-snooping ra-guard attach-policy <POLICY-NAME>
```

### Description

Applies the created RA guard policy to a specific L2 port or VLAN.

The **no** form of the command detaches the specified RA guard policy from the L2 port or VLAN.

| Parameter | Description |
|---|---|
| *<POLICY-NAME>* | Specifies the name of the RA guard policy. |

### Usage

In the interface configuration (config-if) context:

- RA guard must be enabled on member VLANs of the port for which RA packets need to be inspected using the policy.

In the interface configuration (config-if) and VLAN configuration (config-vlan) contexts:

- RA packets received on untrusted ports are dropped without any inspection.
- RA packets received on trusted ports are validated against the policy.
- The applied policy takes effect only if ND snooping is enabled globally and both ND snooping and RA guard are enabled under the VLAN context.

Policy precedence between VLAN and port:

- If the policy is attached to both VLAN and port, the port policy takes precedence over the VLAN policy.

- Only one policy can be attached per VLAN or port.
- If the port belongs to a different VLAN (for example, in the case of a trunk port) the tagged VLAN takes priority. If the packets are untagged, the native VLAN policy takes precedence.

## Examples

Attaching the RA guard policy to an L2 port:

```
switch(config)# interface 1/1/10
switch(config-if)# nd-snooping ra-guard attach-policy POLICY_NAME
```

Attempting to attach the RA guard policy to a port where routing is enabled, the policy is not configured, or it is an untrusted port:

(When prompted, enter "Y" to create the policy and attach it to the interface. )

```
switch(config)# interface 1/1/10
switch(config-if)# nd-snooping ra-guard attach-policy POLICY_NAME
RA Guard policy can't be attached to an interface with routing enabled.

switch(config-if)# no routing
switch(config-if)# nd-snooping trust
switch(config-if)# nd-snooping ra-guard attach-policy POLICY_NAME
switch(config-if)#6300(config-if)# nd-snooping ra-guard attach-policy POLICY_NOT_
CREATED
RA guard policy does not exist.
Do you want to create (y/n)?

switch(config)# interface 1/1/10
switch(config-if)# nd-snooping ra-guard attach-policy AA
RA Guard policy is ineffective, as 1/1/10 is configured as untrusted port.
```

Attaching the RA guard policy to a VLAN:

```
switch(config)# vlan 10
switch(config-vlan-10)# nd-snooping ra-guard attach-policy POLICY_NAME
```

Detaching the RA guard policy:

```
switch(config)# interface 1/1/10
switch(config-if)# no nd-snooping ra-guard attach-policy POLICY_NAME
```

Attempting to detach a RA guard policy which is not applied on the port or VLAN:

```
switch(config)# interface 1/1/10
switch(config-if)# no nd-snooping ra-guard attach-policy POLICY_NAME
RA Guard Policy POLICY_NAME is not applied on this port.
```

Attempting to detach a non-existent RA guard policy:

```
switch(config-if)# no nd-snooping ra-guard attach-policy POLICY_NOT_CREATED
Could not find the policy POLICY_NOT_CREATED.
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.10 | Command introduced. |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-if`<br>`config-vlan-<VLAN-ID>` | Administrators or local user group members with execution rights for this command. |

## other-config-flag

```
other-config-flag [on | off]
no other-config-flag [on | off]
```

### Description

Enables the verification of the advertised other configuration flag. Verifies that the advertised Other Stateful Configuration flag is On or Off based on the configured value.

The **no** form of the command disables other configuration flag verification.

ND snooping must be enabled in both the global context and the config-vlan context before this command can be used.

| Parameter | Description |
|---|---|
| `on` | Verifies that the advertised Other Stateful Configuration flag is On. |
| `off` | Verifies that the advertised Other Stateful Configuration flag is Off. |

### Examples

Enabling other configuration flag verification:

```
switch(config)# ipv6 nd-snooping ra-guard policy <POLICY-NAME>
switch(config-raguard-policy)# other-config-flag off
switch(config-raguard-policy)# other-config-flag on
```

Disabling other configuration flag verification:

```
switch(config)# ipv6 nd-snooping ra-guard policy <POLICY-NAME>
switch(config-raguard-policy)# no other-config-flag
switch(config-raguard-policy)# no other-config-flag off
switch(config-raguard-policy)# no other-config-flag on
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.10 | Command introduced. |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-raguard-policy` | Administrators or local user group members with execution rights for this command. |

## router-preference

```
router-preference {high | medium | low}
no router-preference [high | medium | low]
```

### Description

Enables the router preference verification on the RA guard policy for advertised packets and processes the packets only if the router preference is lower than the configured value. If the router preference is not configured, this validation is bypassed.

The **no** form of this command disables router preference verification on the RA guard policy.

| Parameter | Description |
|---|---|
| `high` | Sets the maximum router preference to high. |
| `medium` | Sets the maximum router preference to medium. |
| `low` | Sets the maximum router preference to low. |

### Examples

Enabling router preference verification with the maximum router preference set to high:

```
switch(config)# ipv6 nd-snooping ra-guard policy <POLICY-NAME>
switch(config-raguard-policy)# router-preference high
```

Disabling router preference verification:

```
switch(config)# ipv6 nd-snooping ra-guard policy <POLICY-NAME>
switch(config-raguard-policy)# no router-preference
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

## show nd-snooping ra-guard interface

`show nd-snooping ra-guard interface <INTERFACE-ID>`

### Description

Shows RA guard counters for the specified interface. Counters are cleared once the RA guard policy is detached from the interface.

| Parameter | Description |
|---|---|
| *<INTERFACE-ID>* | Specifies the interface for which the RA guard counters are displayed. |

### Examples

Showing RA guard counters for interface 1/1/1:

```
switch# show nd-snooping ra-guard interface 1/1/1

  RA Guard Policy Counters
  ========================

  RA Guard Policy Applied       : POLICY_2
  RA Packets Received           : 10
  RA Packets Forwarded          : 5
  RA Packets Dropped            : 5 [Total]

                         reason : Managed flag error     [0]
                                  Other flag error       [0]
                                  Access list error      [0]
                                  Prefix list error      [0]
                                  Router preference error[0]
                                  Hop limit error        [5]
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

### Command History

| Release | Modification |

| 10.10 | Command introduced. |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

# show nd-snooping ra-guard policy

```
show nd-snooping ra-guard policy [<POLICY-NAME>]
```

### Description

Shows the RA guard policy configuration.

| Parameter | Description |
|---|---|
| *<POLICY-NAME>* | Specifies the name of the RA guard policy to be displayed. |

### Examples

Showing RA guard configuration:

```
switch# show nd-snooping ra-guard policy
RA Guard Policy                  Applied Ports                 Applied VLANs
----------------------------------------------------------------------------------
--------
POLICY_NAME1       1/1/25,1/1/27,1/1/29-1/1/44,1/1/46          10,20,50-100
POLICY_NAME2       1/1/1-1/1/24
```

```
switch# show nd-snooping ra-guard policy POLICY_NAME1

RA Guard policy Information
========================
Policy name             : POLICY_NAME1
Policy Applied Ports    : 1/1/25,1/1/27,1/1/29-1/1/44,1/1/46
Policy Applied VLANs    : 10,20,50-100
Hop Limit               : enabled
    minimum             : 50
    maximum             : 150
Managed config flag     : On
Other config flag       : On
Access List             : ACL1
Prefix List             : PREFIX_LIST_NAME
Router Preference       : high
```

For more information on features that use this command, refer to the IP Services Guide for your switch model.

### Command History

## show nd-snooping ra-guard vlan

```
show nd-snooping ra-guard vlan <VLAN-ID>]
```

### Description

Shows RA guard counters for the specified VLAN. Counters are cleared once the RA guard policy is detached from the VLAN.

| Parameter | Description |
|---|---|
| *<VLAN-ID>* | Specifies a VLAN ID for which the RA guard counters are displayed. Range: 1 to 4094. |

### Examples

Showing RA guard counters for VLAN 2:

```
switch# show nd-snooping ra-guard vlan 2

  RA Guard Policy Counters
  ========================

  RA Guard Policy  Applied      : POLICY_1
  RA Packets Received           : 20
  RA Packets Forwarded          : 5
  RA Packets Dropped            : 15 [Total]

                       reason : Managed flag error     [1]
                                Other flag error       [4]
                                Access list error      [1]
                                Prefix list error      [4]
                                Router preference error[0]
                                Hop limit error        [5]
```

# Chapter 132

# Remote AAA (TACACS+, RADIUS) commands

## aaa accounting allow-fail-through

```
aaa accounting allow-fail-through
no aaa accounting allow-fail-through
```

### Description

Enables accounting fail-through. When this option is enabled, the next server or accounting method is attempted after an accounting failure.

The **no** form of this command disables accounting fail-through.The system only attempts to reach the next server or accounting method if there is an accounting failure due to an unreachable TACACS+ or RADIUS server or a shared key mismatch error between the switch and the server.

### Example

Enabling accounting fail-through:

```
switch(config)# aaa accounting allow-fail-through
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.12.1000 | Command introduced. |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## aaa accounting all-mgmt

```
aaa accounting all-mgmt <CONNECTION-TYPE> start-stop {local | group <GROUP-LIST>}
no aaa accounting all-mgmt <CONNECTION-TYPE> start-stop {local | group <GROUP-LIST>}
```

### Description

Defines accounting as being local (with the name **local**) (the default). Or defines a sequence of remote AAA server groups to be accessed for accounting purposes.

For remote accounting, the information is sent to the first reachable remote server that was configured with this command for remote accounting. If no remote server is reachable, local accounting remains available. Each available connection type (channel) can be configured individually as either local or using remote AAA server groups. All server groups named in your command, must exist. This command can be issued multiple times, once for each connection type. Local is always available for any connection type not configured for remote accounting.

The system accounting log is not associated with any connection type (channel) and is therefore sent to the accounting method configured on the default connection type (channel) only.

The **no** form of this command removes for the specified connection type, any defined remote AAA server group accounting sequence. Local accounting is available for connection types without a configured remote AAA server group list (whether default or for the specific connection type).

| Parameter | Description |
|---|---|
| *<CONNECTION-TYPE>* | One of these connection types (channels):<br>**default**<br>Defines a list of accounting server groups to be used for the **default** connection type. This configuration applies to all other connection types (**console**, **ssh**, **https-server**, **telnet**) that are not explicitly configured with this command. For example, if you do not use **aaa accounting all-mgmt console...** to define the console accounting list, then this default configuration is used for console.<br>**console**<br>Defines a list of accounting server groups to be used for the **console** connection type.<br>**ssh**<br>Defines a list of accounting server groups to be used for the **ssh** connection type.<br>**https-server**<br>Defines a list of accounting server groups to be used for the **https-server** (REST, Web UI) connection type.<br>**telnet**<br>Defines a list of accounting server groups to be used for the **telnet** connection type. |
| `start-stop` | Selects accounting information capture at both the beginning and end of a process. |
| `local` | Selects local-only accounting when used without the **group** parameter. |
| `group` *<GROUP-LIST>* | Specifies the list of remote AAA server group names. Each name can be specified one time. Predefined remote AAA group names **tacacs** and **radius** are available. Although not a group name, predefined name **local** is available. User-defined TACACS+ and RADIUS server group names may also be used.<br>The remote AAA server groups are accessed in the order that the group names are listed in this command. Within each group, the servers are accessed in the order in which the servers were added to the group. Server groups are defined using command **aaa** |

| Parameter | Description |
|---|---|
| | **group server** and servers are added to a server group with the command **server**.<br>If the remote server(s) in the group is unreachable or if there is a key mismatch error between the switch and the AAA Server, then the next accounting method is attempted. |

## Usage

Local accounting is always active. It cannot be turned off.

## Examples

Defining the default accounting sequence based on two user-defined TACACS+ server groups, then the default TACACS+ server group, and finally (if needed), local accounting.

```
switch(config)# aaa accounting all-mgmt default start-stop group tg1 tg2 tacacs
local
```

Defining the console accounting sequence based on two user-defined TACACS+ server groups, then the default TACACS+ server group, and finally (if needed), local accounting.

```
switch(config)# aaa accounting all-mgmt console start-stop group tg2 tg3 tacacs
local
```

Defining the ssh accounting sequence based on one user-defined TACACS+ server group and then the default TACACS+ server group.

```
switch(config)# aaa accounting all-mgmt ssh start-stop group tg2 tacacs
```

Defining the Telnet accounting sequence based on one user-defined TACACS+ server group and then the default TACACS+ server groups.

```
switch(config)# aaa accounting all-mgmt telnet start-stop group tg1 tacacs
```

Defining the default accounting sequence based on two user-defined RADIUS server groups, then the default RADIUS server group, and finally (if needed), local accounting.

```
switch(config)# aaa accounting all-mgmt default start-stop group rg1 rg2 radius
local
```

Defining the https-server accounting sequence based on one user-defined RADIUS server group and then the default RADIUS server group.

```
switch(config)# aaa accounting all-mgmt https-server start-stop group rg1 radius
```

Setting local accounting for the default connection type:

```
switch(config)# aaa accounting all-mgmt default start-stop local
```

For more information on features that use this command, refer to the Security Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.08.0001 | Added the **telnet** parameter for the 6200, 6300, 6400 Switch Series. |
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

# aaa accounting port-access (RADIUS only)

General syntax definition:

```
aaa accounting port-access {start-stop {{local | group <GROUP-NAME>} |{interim <INTERVAL>
group <GROUP-NAME>}}}
aaa accounting port-access {stop-only {local | group <GROUP-NAME>}}
no aaa accounting port-access [local | group | interim]
```

List of all possible syntax for this command:

```
aaa accounting port-access start-stop local
aaa accounting port-access start-stop group <GROUP-NAME>
aaa accounting port-access start-stop interim <INTERVAL> group <GROUP-NAME>
aaa accounting port-access stop-only local
aaa accounting port-access stop-only group <GROUP-NAME>

no aaa accounting port-access
no aaa accounting port-access local
no aaa accounting port-access group
no aaa accounting port-access interim
```

## Description

Configures port access accounting information that is captured for 802.1X and MAC-authenticated clients.

Defines port access accounting as being local (with the parameter **local**) (the default). Or defines port access accounting as being remote (with the parameter group <*GROUP-NAME*>) with a sequence of remote RADIUS servers in a single RADIUS server group to be accessed for port access accounting purposes.

For remote RADIUS port access accounting, the information is sent to the first reachable remote RADIUS server in the specified group. If a user-defined RADIUS server group is named in your command, it must exist.

The **no** form of this command works as follows:

- **no aaa accounting port-access**: Globally unconfigures port access accounting.
- **no aaa accounting port-access local**: Unconfigures local port access accounting.
- **no aaa accounting port-access group**: Unconfigures remote port access accounting.
- **no aaa accounting port-access interim**: Unconfigures interim accounting updates.

| Parameter | Description |
|---|---|
| `start-stop` | Selects accounting information capture from the point at which the client is authenticated until the client disconnects. |
| `stop-only` | Selects accounting information capture only at the time when a client disconnects. |
| `local` | Selects local-only accounting. |
| `group` *<GROUP-NAME>* | Specifies a single RADIUS server group, either the built-in group named `radius` or a user-defined RADIUS server group. Only one RADIUS server group name can be provided. |
| `interim` *<INTERVAL>* | Enables interim accounting updates (between the start and stop) and specifies the interval at which the interim updates will be provided. Default: 60 minutes. Range: 1 to 525600 minutes. |

## Examples

Configuring start-stop port access local accounting:

```
switch(config)# aaa accounting port-access start-stop local
```

Configuring start-stop port access remote accounting using the built-in **radius** server group:

```
switch(config)# aaa accounting port-access start-stop group radius
```

Configuring start-stop port access remote accounting using the built-in **radius** server group and enabling interim accounting updates with an interval of 60 minutes:

```
switch(config)# aaa accounting port-access start-stop interim 60 group radius
```

Configuring stop-only port access remote accounting using the built-in **radius** server group:

```
switch(config)# aaa accounting port-access stop-only group radius
```

Unconfiguring remote port access accounting:

```
switch(config)# no aaa accounting port-access group
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## aaa authentication allow-fail-through

```
aaa authentication allow-fail-through
no aaa authentication allow-fail-through
```

### Description

Enables authentication fail-through. If this feature is enabled, the next server or authentication method is tried after an authentication failure.

The **no** form of this command disables authentication fail-through. The system only attempts to reach the next server or authentication method if there is an accounting failure due to an unreachable TACACS+/RADIUS server or a shared key mismatch error between the switch and the server.

If your switch uses command authorization, best practices is to configure authorization fail-through before configuring authentication fail-through. If not, the switch may fall into an unusable state where authorization will fail for all commands.

### Example

Enabling authentication fail-through:

```
switch(config)# aaa authentication allow-fail-through
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

# aaa authentication login

```
aaa authentication login <CONNECTION-TYPE> {local | group <GROUP-LIST>}
no aaa authentication login <CONNECTION-TYPE> {local | group <GROUP-LIST>}
```

## Description

Defines authentication as being local (with the name **local**) (the default). Or defines a sequence of remote AAA server groups to be accessed for authentication purposes. Each available connection type (channel) can be configured individually as either local or using remote AAA server groups. All server groups named in your command, must exist. This command can be issued multiple times, once for each connection type. Local is always available for any connection type not configured for remote AAA authentication.

If you do not want local authentication to occur in cases where all AAA servers contacted reject the user's credentials, do not enable authentication fail-through (command **aaa authentication allow-fail-through**).

The **no** form of this command removes for the specified connection type, any defined remote AAA server group authentication sequence. Local authentication is available for connection types without a configured remote AAA server group list (whether default or for the specific connection type).

| Parameter | Description |
|---|---|
| *<CONNECTION-TYPE>* | One of these connection types (channels):<br>**default**<br>Defines a list of AAA server groups to be used for the **default** connection type. This configuration applies to all other connection types (**console**, **ssh**, **https-server**, **telnet**) that are not explicitly configured with this command. For example, if you do not use **aaa accounting all-mgmt console...** to define the console accounting list, then this default configuration is used for console.<br>**console**<br>Defines a list of AAA server groups to be used for the **console** connection type.<br>**ssh**<br>Defines a list of AAA server groups to be used for the **ssh** connection type.<br>**https-server**<br>Defines a list of AAA server groups to be used for the **https-server** (REST, Web UI) connection type.<br>**telnet**<br>Defines a list of AAA server groups to be used for the **telnet** connection type. |
| `local` | Selects local-only authentication when used without the **group** parameter. |

| Parameter | Description |
|---|---|
| `group <GROUP-LIST>` | Specifies the list of remote AAA server group names. Each name can be specified one time. Predefined remote AAA group names **tacacs** and **radius** are available. Although not a group name, predefined name **local** is available. User-defined TACACS+ and RADIUS server group names may also be used.<br>The remote AAA server groups are accessed in the order that the group names are listed in this command. Within each group, the servers are accessed in the order in which the servers were added to the group. Server groups are defined using command **aaa group server** and servers are added to a server group with the command **server**. If the remote server(s) in the group is unreachable or if there is a key mismatch error between switch and the AAA Server, then the next authentication method is attempted. |

## Examples

Defining the default authentication sequence based on two user-defined TACACS+ server groups, then the default TACACS+ server group, and finally (if needed), local authentication.

```
switch(config)# aaa authentication login default group tg1 tg2 tacacs local
```

Defining the default authentication sequence based on two user-defined TACACS+ server groups, then the default TACACS+ server group, and finally (if needed), local authentication.

```
switch(config)# aaa authentication login console group tg2 tg3 tacacs local
```

Defining the ssh authentication sequence based on one user-defined TACACS+ server group and then the default TACACS+ server group.

```
switch(config)# aaa authentication login ssh group tg2 tacacs
```

Defining the Telnet authentication sequence with two user-defined TACACS+ server groups, the default TACACS+ server group, and finally (if needed), local authentication.

```
switch(config)# switch(config)# aaa authentication login telnet group tg1 tg2
tacacs local
```

Defining the default authentication sequence based on two user-defined RADIUS server groups, then the default RADIUS server group, and finally (if needed), local authentication.

```
switch(config)# aaa authentication login default group rg1 rg2 radius local
```

Defining the https-server authentication sequence based on one user-defined RADIUS server group and then the default RADIUS server group.

```
switch(config)# aaa authentication login https-server group rg1 radius
```

Setting local authentication for the default connection type:

```
switch(config)# aaa authentication login default local
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.08.0001 | Added the **telnet** parameter for the 6200, 6300, 6400 Switch Series. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## aaa authorization allow-fail-through

```
aaa authorization allow-fail-through
no aaa authorization allow-fail-through
```

### Description

Enables authorization fail-through. When this option is enabled, the next server or authorization method is attempted after an authorization failure.

The **no** form of this command disables authorization fail-through. The system only attempts to reach the next server or authorization method if there is an authorization failure due to an unreachable TACACS+ server or a shared key mismatch error between the switch and the server.

If your switch uses command authorization, best practices is to configure authorization fail-through before configuring authentication fail-through. If not, the switch may fall into an unusable state where authorization will fail for all commands.

### Example

Enabling authorization fail-through:

```
switch(config)# aaa authorization allow-fail-through
```

The following configurations use authorization fail-through in different scenarios.

Example configuration one:

```
aaa authentication allow-fail-through
aaa authorization allow-fail-through
aaa group server tacacs CPPM-TACACS
server 172.16.1.12
aaa authentication login ssh group CPPM-TACACS local
aaa authorization commands ssh group CPPM-TACACS local
```

Example configuration one does not support authentication via the TACACS+ server for a locally configured user. If the user is configured locally and that user does not have a profile present in the TACACS+ server, authentication fails with TACACS+, but the user is authenticated successfully with local authentication. Similarly, if authorization is rejected, the user is authorized locally with a fail-through configuration.

Example configuration two:

```
aaa group server tacacs CPPM-TACACS
server 172.16.1.12
aaa authentication allow-fail-through
aaa authorization allow-fail-through
aaa authentication login ssh group CPPM-TACACS local
aaa authorization commands ssh group local CPPM-TACACS
```

With configuration two, if a user's profile is configured only in the TACACS+ server, user authorization is rejected locally and is authorized with TACACS using the fail-through configuration. When authentication fail-through is configured, if the first authentication method fails, authentication is attempted using the next server or authentication method. The authorization fail-through is based on the authorization sequence, and is independent of the authentication method of the user.

Example configuration three:

```
aaa group server tacacs CPPM-TACACS
server 172.16.1.12
aaa group server tacacs TACACS
server 192.168.10.15
aaa authentication allow-fail-through
aaa authorization allow-fail-through
aaa authentication login ssh group CPPM-TACACS local
aaa authorization commands ssh group TACACS local
```

Example configuration four:

```
aaa group server radius RAD-GRP
server 172.16.1.12
aaa group server tacacs TACACS
server 192.168.10.15
aaa authentication allow-fail-through
aaa authorization allow-fail-through
aaa authentication login ssh group RAD-GRP  local
aaa authorization commands ssh group TACACS local
```

With configurations three and four, the **CPPM-TACACS** or **RAD-GRP** groups reject authentication requests for locally configured users, and the users are authenticated locally with fail-through. Authorization is attempted with the TACACS group in these configurations, and if this authorization attempt fails, the user will be authorized locally due to the fail-through configuration.

When authorization is rejected by multiple servers/server groups due to the fail-through configuration, a delay may be seen while executing commands.

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.12.1000 | Command introduced. |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## aaa authorization commands

```
aaa authorization commands <CONNECTION-TYPE> {local | none}
no aaa authorization commands <CONNECTION-TYPE> {local | none}
aaa authorization commands <CONNECTION-TYPE> group <GROUP-LIST>
no aaa authorization commands <CONNECTION-TYPE> group <GROUP-LIST>
```

### Description

Defines authorization as being basic local RBAC (specified as **none**), or as full-fledged local RBAC specified as **local** (the default), or as remote TACACS+ (specified with group <*GROUP-LIST*>). Each available connection type (channel) can be configured individually. All server groups named in the command, must exist. This command can be issued multiple times, once for each connection type.

The **no** form of this command unconfigures authorization for the specified connection type, reverting to the default of **local**.

Although only TACACS+ servers are supported for remote authorization, local authorization (basic or full-fledged) can be used with remote RADIUS authentication. If your switch uses command authorization, best practices is to configure authorization fail-through before configuring authentication fail-through. If not, the switch may fall into an unusable state where authorization will fail for all commands.

| Parameter | Description |
|---|---|
| *<CONNECTION-TYPE>* | One of these connection types (channels):<br>**default**<br>Selects the **default** connection type for configuration. This configuration applies to all other connection types (**console**, **ssh**, **telnet**) that are not explicitly configured with this command. For example, if you do not use **aaa authorization commands console...** to define the console authorization list, then this default configuration is used for console. |

| Parameter | Description |
|---|---|
|  | **console**<br>Selects the **console** connection type for configuration.<br>**ssh**<br>Selects the **ssh** connection type for configuration.<br>**telnet**<br>Selects the **telnet** connection type for configuration. |
| `local` | When used alone without group *<GROUP-LIST>*, selects local authorization which can be used to provide authorization for a purely local setup without any remote AAA servers and also for when RADIUS is used for remote Authentication and Accounting but Authorization is local. When used after **group**, provides for fallback (to full-fledged local authorization) when every server in every specified TACACS+ server group cannot be reached.<br>**NOTE:** If any TACACS+ server in the specified groups is reachable, but the command fails to be authorized by that server, the command is rejected and local authorization is never attempted. Local authorization is only attempted if every TACACS+ server cannot be reached. |
| `none` | When used alone without group *<GROUP-LIST>*, selects basic local RBAC authorization, for use with the built-in user groups (**administrators**, **operators**, **auditors**). When used after **group**, provides for fallback (to basic local RBAC authorization) when every server in every specified TACACS+ server group cannot be reached.<br>**NOTE:** With **none**, for users belonging to user-defined user groups, all commands can be executed regardless of what authorization rules are defined in such groups. For per-command local authorization, use **local** instead. |
| `group` *`<GROUP-LIST>`* | Specifies the list of remote AAA server group names. Predefined remote AAA group name **tacacs** is available. User-defined TACACS+ server group names may also be used. The remote AAA server groups are accessed in the order that the group names are listed in this command. Within each group, the servers are accessed in the order in which the servers were added to the group. Server groups are defined using command **aaa server group** and servers are added to a server group using command **server**.<br>It is recommended to always include either the special name **local** or **none** as the last name in the group list. If both **local** and **none** are omitted, and no remote AAA server is reachable (or the first reachable server cannot authorize the command), command execution for the current user will not be possible.<br>If the AAA server(s) in the group are not reachable, or if there is a key mismatch error between the server and the switch, the next authorization method is attempted. |

## Usage

### TACACS+ server authorization considerations

Use caution when configuring authorization, as it has no fail through. If the switch is not configured properly, the switch might get into an unusable state in which all command execution is prohibited.

To prevent authorization difficulties:

- Make sure that all listed TACACS+ servers can authorize users for command execution.
- Make sure that credential database changes are promptly synchronized across all TACACS+ servers.
- Make sure either **local** or **none** is included as the last name in the group list. If both **local** and **none** are omitted, and no remote TACACS+ server is reachable (or the first reachable server cannot authorize), authorization will not be possible.
- Although not recommended, if you choose to omit both **local** and **none** from the list, and are manipulating configuration files, special caution is necessary. If the source configuration includes TACACS+ authorization and you are copying configuration from an existing switch into the running configuration of a new switch, and you have not yet configured the interface or routing information to reach the TACACS+ server, the switch will enter an unusable state, requiring hard reboot.

  To avoid getting into this situation that can occur when **local** and **none** have been omitted, do either of the following:

  - In the configuration source, delete or comment-out the line configuring remote authorization. Then, after the configuration copy and paste, manually configure authorization.
  - Move the line configuring the authorization to the end of the source configuration before copying and pasting.

### Examples

Defining the default authorization sequence based on a user-defined TACACS+ server group, then the default TACACS+ server group, and finally (as a precaution), **local** authorization:

```
switch(config)# aaa authorization commands default group tg1 tacacs local
All commands will fail if none of the servers in the group list are reachable.
Continue (y/n)? y
```

Defining the Telnet authorization sequence based on a user-defined TACACS+ server group, then the default TACACS+ server group, and finally (as a precaution), **local** authorization:

```
switch(config)# aaa authorization commands telnet group tg1 tacacs local
All commands will fail if none of the servers in the group list are reachable.
Continue (y/n)? y
```

Defining the console authorization sequence based on two user-defined TACACS+ server groups, and finally (as a precaution), **local** authorization:

```
switch(config)# aaa authorization commands console group tg1 tg2 local
All commands will fail if none of the servers in the group list are reachable.
Continue (y/n)? y
```

Setting the authorization for default to **local**:

```
switch(config)# aaa authorization commands default local
```

Setting the authorization for the SSH interface to **none**:

```
switch(config)# aaa authorization commands ssh none
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.08.0001 | Added the **telnet** parameter for the 6200, 6300, 6400 Switch Series. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## aaa group server

```
aaa group server {tacacs | radius} <SERVER-GROUP-NAME>
no aaa group server {tacacs | radius} <SERVER-GROUP-NAME>
```

### Description

Creates an AAA server group that is either empty or contains preconfigured RADIUS/TACACS+ servers. You can create a maximum of 28 server groups.

The **no** form of this command deletes a server group. Only a preconfigured user-defined RADIUS/TACACS+ server group can be deleted. RADIUS or TACACS+ servers that were in a deleted server group remain a part of their default server group. The default server group for TACACS+ servers is **tacacs**. The default server group for RADIUS servers is **radius**.

| Parameter | Description |
|---|---|
| `server {tacacs | radius}` | Select either **tacacs** or **radius** for the server type. |
| *<SERVER-GROUP-NAME>* | Specifies the name of the server group to be created. The name of the server group can have a maximum of 32 characters. |

### Examples

Creating TACACS+ server group sg1:

```
switch(config)# aaa group server tacacs sg1
```

Creating RADIUS server group sg3:

```
switch(config)# aaa group server radius sg3
```

Deleting TACACS+ server group sg1:

```
switch(config)# no aaa group server tacacs sg1
```

Deleting RADIUS server group sg3:

```
switch(config)# no aaa group server radius sg3
```

For more information on features that use this command, refer to the Security Guide for your switch model.

## radius-server auth-type

```
radius-server auth-type {pap | chap}
no radius-server auth-type {pap | chap}
```

### Description

Enables the CHAP or PAP authentication protocol, which is used for communication with the RADIUS servers, at the global level. You can override this command with a fine-grained per server **auth-type** configuration.

The **no** form of this command resets the global authentication mechanism for RADIUS to PAP or CHAP. PAP is the default authentication mechanism for RADIUS.

| Parameter | Description |
|---|---|
| `auth-type {pap | chap}` | Selects either the PAP or CHAP authentication protocol. |

### Examples

Authenticating CHAP:

```
switch(config)# radius-server auth-type chap
```

Authenticating PAP:

```
switch(config)# radius-server auth-type pap
```

Removing CHAP authentication:

```
switch(config)# no radius-server auth-type chap
```

For more information on features that use this command, refer to the Security Guide for your switch model.

## radius-server host

```
radius-server host {<FQDN> | <IPV4> | <IPV6>}
   [key [plaintext <PASSKEY> | ciphertext <PASSKEY>]]
   [timeout <TIMEOUT-SECONDS>] [port <PORT-NUMBER>]
   [auth-type {pap | chap}] [acct-port <ACCT-PORT>] [retries <RETRY-COUNT>]
   [tracking {enable | disable}] [tracking-mode {any | dead-only}][vrf <VRF-NAME>]
no radius-server host {<FQDN> | <IPV4> | <IPV6>}
   [key [plaintext <PASSKEY> | ciphertext <PASSKEY>]]
   [timeout <TIMEOUT-SECONDS>] [port <PORT-NUMBER>]
   [auth-type {pap | chap}] [acct-port <ACCT-PORT>] [retries <RETRY-COUNT>]
   [tracking {enable | disable}] [tracking-mode {any | dead-only}][vrf <VRF-NAME>]
```

### Description

Adds a RADIUS server. By default, the RADIUS server is associated with the server group named **radius**.

The **no** form of this command removes a previously added RADIUS server.

For enhanced security with IPsec, the alternative command **radius-server host secure ipsec** is available. The standard non-IPsec **radius-server host** command does not modify any existing IPsec configuration. If IPsec is already configured for the RADIUS server, then IPsec will remain enabled for the server.

| Parameter | Description |
|---|---|
| `{<FQDN> \| <IPV4> \| <IPv6>}` | Specifies the RADIUS server as: |

| Parameter | Description |
|---|---|
| | ■ *<FQDN>*: a fully qualified domain name.<br>■ *<IPV4>*: an IPv4 address.<br>■ *<IPV6>*: an IPv6 address. |
| `key [plaintext <PASSKEY> \| ciphertext <PASSKEY>]` | Selects either a plaintext or an encrypted local shared-secret passkey for the server. As per RFC 2865, shared-secret can be a mix of alphanumeric and special characters. Plaintext passkeys are between 1 and 32 alphanumeric and special characters.<br>**NOTE:** When **key** is entered without either sub-parameter, plaintext passkey prompting occurs upon pressing Enter. Enter must be pressed immediately after the **key** parameter without entering other parameters. The entered passkey characters are masked with asterisks. When **key** is omitted, the server uses the global passkey. This command requires either the global or local passkey to be set; otherwise the server will not be contacted. Command **radius-server key** is available for setting the global passkey. |
| `timeout <TIMEOUT-SECONDS>` | Specifies the timeout. Range: 1 to 60 seconds. If a timeout is not specified, the value from the global timeout for RADIUS is used. |
| `port <PORT-NUMBER>` | Specifies the authentication port number. Range: 1 to 65535. Default: 1812. |
| `auth-type {pap \| chap}` | Selects either the PAP (the default) or CHAP authentication types. If this parameter is not specified, the RADIUS global default is used. |
| `acct-port <ACCT-PORT>` | Specifies the UDP accounting port number. Range: 1 to 65535. Default: 1813. |
| `retries <RETRY-COUNT>` | Specifies the number of retry attempts for contacting the specified RADIUS server. Range is 0 to 5 attempts. If no retry value is provided, the default value of 1 is used. |
| `tracking {enable \| disable}` | Enables or disables server tracking for the RADIUS server. Tracked servers are probed at the start of each server tracking interval to check if they are reachable.<br>Use command **radius-server tracking** to configure RADIUS server tracking globally.<br>**NOTE:** Server tracking uses authentication request and response packets to determine server reachability status. The server tracking user name and password are used to form the request packet which is sent to the server with tracking enabled. Upon receiving a response to the request packet, the server is considered to be reachable. |
| `tracking-mode {any \| dead-only}` | Configures tracking mode for the RADIUS server that has tracking enabled with the server. The tracking mode is used to monitor the status of RADIUS server reachability The default tracking mode is **any**.<br>**any**<br>Track the RADIUS server irrespective of its server reachability.<br>**dead-only** |

| Parameter | Description |
|---|---|
| | Track the RADIUS server only when the server is marked as unreachable. |
| `vrf <VRF-NAME>` | Specifies the VRF name to be used for communicating with the server. If no VRF name is provided, the default VRF named **default** is used. |

## Usage

If the fully qualified domain name is provided for the RADIUS server, a DNS server must be configured and accessible through the same VRF which is configured for the RADIUS server. This configuration is required for the resolution of the RADIUS server hostname to its IP address. If a DNS server is not available for this VRF, the RADIUS servers reachable through this VRF must be configured by means of their IP addresses only.

## Examples

Adding a RADIUS server with an IPv4 address and a prompted passkey:

```
switch(config)# radius-server host 1.1.1.5 key
Enter the RADIUS server key: *********
Re-Enter the RADIUS server key: *********
```

Deleting a RADIUS server with an IPv4 address and a prompted passkey:

```
switch(config)# no radius-server host 1.1.1.5 key
Enter the RADIUS server key: *********
Re-Enter the RADIUS server key: *********
```

Adding a RADIUS server with an IPv4 address and a named VRF:

```
switch(config)# radius-server host 1.1.1.1 vrf mgmt
```

Deleting a RADIUS server with an IPv4 address and a named VRF:

```
switch(config)# no radius-server host 1.1.1.1 vrf mgmt
```

Adding a RADIUS server with an IPv4 address, a port, and a named VRF:

```
switch(config)# radius-server host 1.1.1.2 port 32 vrf mgmt
```

Deleting a RADIUS server with an IPv4 address, a port, and a named VRF:

```
switch(config)# no radius-server host 1.1.1.2 port 32 vrf mgmt
```

Adding a RADIUS server with an FQDN, a timeout, port number, and a named VRF:

```
switch(config)# radius-server host abc.com timeout 15 port 32 vrf vrf_blue
```

Deleting a RADIUS server with an FQDN, a timeout, port number, and a named VRF:

```
switch(config)# no radius-server host abc.com timeout 15 port 32 vrf vrf_blue
```

Adding a RADIUS server with an IPv6 address:

```
switch(config)# radius-server host 2001:0db8:85a3:0000:0000:8a2e:0370:7334
```

Deleting a RADIUS server with an IPv6 address:

```
switch(config)# no radius-server host 2001:0db8:85a3:0000:0000:8a2e:0370:7334
```

Adding a RADIUS server with tracking enabled and tracking mode is set to dead-only:

```
switch(config)# radius-server host 1.1.1.1 tracking enable tracking-mode dead-only
```

Deleting a RADIUS server with tracking enabled and tracking mode is set to dead-only:

```
switch(config)# no radius-server host 1.1.1.1 tracking enable tracking-mode dead-
only
```

Adding a RADIUS server with tracking disabled:

```
switch(config)# radius-server host 1.1.1.1 tracking disable
```

Deleting a RADIUS server with tracking disabled:

```
switch(config)# no radius-server host 1.1.1.1 tracking disable
```

Adding a RADIUS server with an IPv4 address, key, encrypted passkey, number of retries, and VRF name:

```
switch(config)# radius-server host 1.1.1.6 key ciphertext AQBapStbgHt1X2JlbcEcQl
xbbzWjrFr9UsfH3+00x5Qj0qcQBAAAAJ5WZBQ= retries 3 vrf vrf_red
```

Deleting a RADIUS server with an IPv4 address, key, encrypted passkey, number of retries, and VRF name:

```
switch(config)# no radius-server host 1.1.1.6 key ciphertext
AQBapStbgHt1X2JlbcEcQl
xbbzWjrFr9UsfH3+00x5Qj0qcQBAAAAJ5WZBQ= retries 3 vrf vrf_red
```

Deleting a RADIUS server with an IPv4 address and specified VRF:

```
switch(config)# no radius-server host 1.1.1.1 vrf mgmt
```

Deleting a RADIUS server with an FQDN, port, and specified VRF:

```
switch(config)# no radius-server host abc.com port 32 vrf vrf_blue
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |

## radius-server host (ClearPass)

```
radius-server host {<FQDN> | <IPV4> | <IPV6>} clearpass-username <CP-USERNAME>
   clearpass-password [plaintext <PLAINTEXT-PASSWORD> | ciphertext <CIPHERTEXT-PASSWORD>]
```

### Description

Configures the ClearPass username and password for a radius server.

| Parameter | Description |
|---|---|
| `{<FQDN> \| <IPV4> \| <IPv6>}` | Specifies the RADIUS server as:<br>■ *<FQDN>*: a fully qualified domain name.<br>■ *<IPV4>*: an IPv4 address.<br>■ *<IPV6>*: an IPv6 address. |
| `clearpass-username <CP-USERNAME>` | Specifies the ClearPass username. |
| `clearpass-password plaintext <PLAINTEXT-PASSWORD>` | Specifies the password as plaintext. The password is visible as cleartext when entered but is encrypted thereafter. Command history does show the password as cleartext. |
| `clearpass-password ciphertext <CIPHERTEXT-PASSWORD>` | Specifies the password as Base64 ciphertext.<br>**NOTE:** When **clearpass-password** is entered without a following sub-parameter, plaintext password prompting occurs upon pressing Enter. The entered password characters are masked with asterisks. |

### Examples

Configuring a ClearPass username and password for a radius server with a plaintext password:

```
switch(config)# radius-server host 1.1.1.2 clearpass-username admn1
   clearpass-password plaintext uni@#1
```

Configuring a ClearPass username and password for a radius server with a prompted plaintext password:

```
switch(config)# radius-server host 1.1.1.3 clearpass-username op clearpass-
password
Enter the ClearPass server password: *********
Re-Enter the ClearPass server password: *********
```

Configuring a ClearPass username and password for a radius server with a ciphertext password:

```
switch(config)# radius-server host 1.1.1.4 clearpass-username bx clearpass-
password
   ciphertext AQBpXz13c1U1Jt7KMjAIOgjE/lPDfgrYxT6SCi+Di2B+CAAAOnPZmUvMVpq
```

For more information on features that use this command, refer to the Security Guide for your switch model.

# radius-server host secure ipsec

Syntax for a RADIUS server that uses IPsec for authentication:

```
radius-server host {<FQDN> | <IPV4> | <IPV6>}
   [key [plaintext <PASSKEY> | ciphertext <PASSKEY>]]
   [timeout <TIMEOUT-SECONDS>] [port <PORT-NUMBER>]
   [auth-type {pap | chap}] [acct-port <ACCT-PORT>] [retries <RETRY-COUNT>]
   [tracking {enable | disable}] [tracking-mode {any | dead-only}] [vrf <VRF-NAME>]
   secure ipsec authentication spi <SPI-INDEX> <AUTH-TYPE> <AUTH-KEY-TYPE> [<AUTH-KEY>]
no radius-server host {<FQDN> | <IPV4> | <IPV6>}
   [key [plaintext <PASSKEY> | ciphertext <PASSKEY>]]
   [timeout <TIMEOUT-SECONDS>] [port <PORT-NUMBER>]
   [auth-type {pap | chap}] [acct-port <ACCT-PORT>] [retries <RETRY-COUNT>]
   [tracking {enable | disable}] [tracking-mode {any | dead-only}] [vrf <VRF-NAME>]
   secure ipsec authentication spi <SPI-INDEX><AUTH-TYPE><AUTH-KEY-TYPE> [<AUTH-KEY>]
```

Syntax for a RADIUS server that uses IPsec for both authentication and encryption:

```
radius-server host {<FQDN> | <IPV4> | <IPV6>}
   [key [plaintext <PASSKEY> | ciphertext <PASSKEY>]]
   [timeout <TIMEOUT-SECONDS>] [port <PORT-NUMBER>]
   [auth-type {pap | chap}] [acct-port <ACCT-PORT>] [retries <RETRY-COUNT>]
   [tracking {enable | disable}] [tracking-mode {any | dead-only}] [vrf <VRF-NAME>]
   secure ipsec encryption spi <SPI-INDEX> <AUTH-TYPE> <AUTH-KEY-TYPE>
   [<AUTH-KEY>] <ENCRYPT-TYPE> <ENCRYPT-KEY-TYPE> [<ENCRYPT-KEY>]
no radius-server host {<FQDN> | <IPV4> | <IPV6>}
   [key [plaintext <PASSKEY> | ciphertext <PASSKEY>]]
   [timeout <TIMEOUT-SECONDS>] [port <PORT-NUMBER>]
   [auth-type {pap | chap}] [acct-port <ACCT-PORT>] [retries <RETRY-COUNT>]
   [tracking {enable | disable}] [tracking-mode {any | dead-only}] [vrf <VRF-NAME>]
   secure ipsec encryption spi <SPI-INDEX><AUTH-TYPE><AUTH-KEY-TYPE>
   [<AUTH-KEY>] <ENCRYPT-TYPE><ENCRYPT-KEY-TYPE> [<ENCRYPT-KEY>]
```

## Description

Adds a RADIUS server that uses IPsec for enhanced security (authentication and possibly encryption). By default, the RADIUS server is associated with the server group named **radius**.

The **no** form of this command removes a previously added RADIUS (with IPsec) server.

Unless enhanced security with IPsec is required, use the **radius-server host** command instead.

| Parameter | Description |
|---|---|
| `{<FQDN> \| <IPV4> \| <IPv6>}` | Specifies the RADIUS server as:<br>- *<FQDN>*: a fully qualified domain name.<br>- *<IPV4>*: an IPv4 address.<br>- *<IPV6>*: an IPv6 address. |
| `key [plaintext <PASSKEY> \| ciphertext <PASSKEY>]` | Selects either a plaintext or an encrypted local shared-secret passkey for the server. As per RFC 2865, shared-secret can be a mix of alphanumeric and special characters. Plaintext passkeys are between 1 and 32 alphanumeric and special characters.<br>**NOTE:** When **key** is entered without either sub-parameter, plaintext passkey prompting occurs upon pressing Enter. Enter must be pressed immediately after the **key** parameter without entering other parameters. The entered passkey characters are masked with asterisks. When **key** is omitted, the server uses the global passkey. This command requires either the global or local passkey to be set; otherwise the server will not be contacted. Command **radius-server key** is available for setting the global passkey. |
| `timeout <TIMEOUT-SECONDS>` | Specifies the timeout. Range: 1 to 60 seconds. If a timeout is not specified, the value from the global timeout for RADIUS is used. |
| `port <PORT-NUMBER>` | Specifies the authentication port number. Range: 1 to 65535. Default: 1812. |
| `auth-type {pap \| chap}` | Selects either the PAP (the default) or CHAP authentication types. If this parameter is not specified, the RADIUS global default is used. |

| Parameter | Description |
|---|---|
| `acct-port <ACCT-PORT>` | Specifies the UDP accounting port number. Range: 1 to 65535. Default: 1813. |
| `retries <RETRY-COUNT>` | Specifies the number of retry attempts for contacting the specified RADIUS server. Range is 0 to 5 attempts. If no retry value is provided, the default value of 1 is used. |
| `tracking {enable \| disable}` | Enables or disables server tracking for the RADIUS server. Tracked servers are probed at the start of each server tracking interval to check if they are reachable.<br>Use command **radius-server tracking** to configure RADIUS server tracking globally.<br>**NOTE:** Server tracking uses authentication request and response packets to determine server reachability status. The server tracking user name and password are used to form the request packet which is sent to the server with tracking enabled. Upon receiving a response to the request packet, the server is considered to be reachable. |
| `tracking-mode {any \| dead-only}` | Configures tracking mode for the RADIUS server that has tracking enabled with the server. The tracking mode is used to monitor the status of RADIUS server reachability The default tracking mode is **any**.<br>**any**<br>Track the RADIUS server irrespective of its server reachability.<br>**dead-only**<br>Track the RADIUS server only when the server is marked as unreachable. |
| `vrf <VRF-NAME>` | Specifies the VRF name to be used for communicating with the server. If no VRF name is provided, the default VRF named **default** is used. |
| `spi <SPI-INDEX>` | Specifies the Security Parameters Index. The SPI is an identification tag carried in the IPsec AH header. The SPI must be unique on the switch. Range: 256 to 4294967295. |
| *<AUTH-TYPE>* | Specifies the authentication algorithm: **md5**, **sha1**, or **sha256**. |
| *<AUTH-KEY-TYPE>* | Specifies the authentication key type: **plaintext**, **hex-string**, or **ciphertext**. |
| [*<AUTH-KEY>*] | Specifies the authentication key. For *<AUTH-TYPE>* of **ciphertext**, this is the ciphertext string.<br>For *<AUTH-TYPE>* of **plaintext** or **hex-string**:<br>▪ **md5 (plaintext)**: 1 to 16 characters, **(hex-string)**: 2 to 32 hexadecimal digits.<br>▪ **sha1 (plaintext)**: 1 to 20 characters, **(hex-string)**: 2 to 40 hexadecimal digits.<br>▪ **sha256 (plaintext)**: 1 to 32 characters, **(hex-string)**: 2 to 64 hexadecimal digits.<br>**NOTE:** When **<AUTH-KEY-TYPE>** is not followed by **<AUTH-KEY>**, plaintext authentication key prompting occurs upon pressing |

| Parameter | Description |
|---|---|
|  | Enter. Enter must be pressed immediately after the **<AUTH-KEY-TYPE>** parameter without entering other parameters. The entered authentication key characters are masked with asterisks. |
| *<ENCRYPT-TYPE>* | Specifies the encryption algorithm: **3des**, **aes**, **des**, or **null**. |
| *<ENCRYPT-KEY-TYPE>* | Specifies the encryption key type: **plaintext**, **hex-string**, or **ciphertext**. |
| [*<ENCRYPT-KEY>*] | Specifies the encryption key. For *<ENCRYPT-TYPE>* of **ciphertext**, this is the ciphertext string.<br>For *<ENCRYPT-TYPE>* of **plaintext** or **hex-string**:<br>■ **3des (plaintext)**: 24 characters, **(hex-string)**: 48 hexadecimal digits.<br>■ **aes (plaintext)**: 16, 24, or 32 characters, **(hex-string)**: 32, 48, or 64 hexadecimal digits.<br>■ **des (plaintext)**: 8 characters, **(hex-string)**: 16 hexadecimal digits.<br>**NOTE:** When **<ENCRYPT-KEY-TYPE>** is not followed by **<ENCRYPT-KEY>**, plaintext encryption key prompting occurs upon pressing Enter. Enter must be pressed immediately after the **<ENCRYPT-KEY-TYPE>** parameter without entering other parameters. The entered encryption key characters are masked with asterisks. |

## Usage

If the fully qualified domain name is provided for the RADIUS server host, a DNS server must be configured and accessible through the same VRF as mentioned for the server host. This configuration is required for the resolution of the RADIUS server hostname to its IP address. If a DNS server is not available for this VRF, the RADIUS servers reachable through this VRF must be configured by means of their IP addresses only.

## Examples

Adding a RADIUS server with an IPv4 address, a plaintext passkey, and IPsec authentication (md5 plaintext).

```
switch(config)# radius-server host 1.1.1.1 key plaintext 98ab vrf mgmt secure
   ipsec authentication spi 261 md5 plaintext 1abc
```

Deleting a RADIUS server with an IPv4 address, a plaintext passkey, and IPsec authentication (md5 plaintext).

```
switch(config)# no radius-server host 1.1.1.1 key plaintext 98ab vrf mgmt secure
   ipsec authentication spi 261 md5 plaintext 1abc
```

Adding a RADIUS server with an IPv4 address and a prompted IPsec authentication (md5) plaintext authentication key.

```
switch(config)# radius-server host 1.1.1.1  secure ipsec authentication spi 261
md5
Enter the IPsec authentication key: ********
Re-Enter the IPsec authentication key: ********
```

Deleting a RADIUS server with an IPv4 address and a prompted IPsec authentication (md5) plaintext authentication key.

```
switch(config)# no radius-server host 1.1.1.1 secure ipsec authentication spi 261
md5
Enter the IPsec authentication key: ********
Re-Enter the IPsec authentication key: ********
```

Adding a RADIUS server with an IPv4 address, IPsec authentication (MD5 plaintext), and IPsec encryption (AES plaintext):

```
switch(config)# radius-server host 1.1.1.2 vrf mgmt secure
   ipsec encryption spi 262 md5 plaintext 9xyz aes plaintext 1234567890abcdef
```

Deleting a RADIUS server with an IPv4 address, IPsec authentication (MD5 plaintext), and IPsec encryption (AES plaintext):

```
switch(config)# no radius-server host 1.1.1.2 vrf mgmt secure
   ipsec encryption spi 262 md5 plaintext 9xyz aes plaintext 1234567890abcdef
```

Adding a RADIUS server by providing an IPv4 address and IPsec MD5 authentication type, and then responding to prompts for the keys and encryption type:

```
switch(config)# radius-server host 1.1.1.6 secure ipsec encryption spi 262 md5
Enter the IPsec authentication key: ********
Re-Enter the IPsec authentication key: ********

Enter the IPsec encryption type (3des/aes/des/null)? aes

Enter the IPsec encryption key: ********
Re-Enter the IPsec encryption key: ********
```

Deleting a RADIUS server by providing an IPv4 address and IPsec MD5 authentication type, and then responding to prompts for the keys and encryption type:

```
switch(config)# no radius-server host 1.1.1.6 secure ipsec encryption spi 262 md5
Enter the IPsec authentication key: ********
Re-Enter the IPsec authentication key: ********

Enter the IPsec encryption type (3des/aes/des/null)? aes

Enter the IPsec encryption key: ********
Re-Enter the IPsec encryption key: ********
```

Adding a RADIUS server with an IPv4 address, tracking enabled, tracking mode, IPsec authentication (MD5 plaintext), IPsec encryption (AES plaintext) is set to dead-only:

```
switch(config)# radius-server host 1.1.1.1 tracking enable tracking-mode dead-only
   vrf mgmt secure ipsec encryption spi 262 md5 plaintext 9xyz
   aes plaintext 1234567890abcdef
```

Deleting a RADIUS server with an IPv4 address, tracking enabled, tracking mode, IPsec authentication (MD5 plaintext), IPsec encryption (AES plaintext) is set to dead-only:

```
switch(config)# no radius-server host 1.1.1.1 tracking enable tracking-mode dead-
only
   vrf mgmt secure ipsec encryption spi 262 md5 plaintext 9xyz
   aes plaintext 1234567890abcdef
```

Removing a RADIUS server:

```
switch(config)# no radius-server host 1.1.1.1 vrf mgmt
```

Removing the ipsec configuration from a RADIUS server:

```
switch(config)# no radius-server host 1.1.1.2 vrf mgmt secure ipsec encryption
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |

| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## radius-server host tls (RadSec)

```
radius-server host {<FQDN> | <IPV4> | <IPV6>}tls [timeout <TIMEOUT-SECONDS>] [port <PORT-
  NUMBER>][auth-type {pap | chap}] [tracking {enable | disable}] [tracking-mode {any |
dead-
  only}] [vrf <VRF-NAME>]

no radius-server host {<FQDN> | <IPV4> | <IPV6>}tls [timeout <TIMEOUT-SECONDS>] [port
<PORT-
  NUMBER>][auth-type {pap | chap}] [tracking {enable | disable}] [tracking-mode {any |
dead-
  only}] [vrf <VRF-NAME>]
```

### Description

Adds a RadSec server. By default, the RADIUS server is associated with the server group named **radius**. RadSec is used to secure the communication between RADIUS server and RADIUS client using TLS.

The **no** form of this command removes a previously added RadSec server.

The shared key will be added as **radsec** for connection establishment.

| Parameter | Description |
|---|---|
| `{<FQDN> \| <IPV4> \| <IPv6>}` | Specifies the RADIUS server as:<br>■ *<FQDN>*: a fully qualified domain name.<br>■ *<IPV4>*: an IPv4 address.<br>■ *<IPV6>*: an IPv6 address. |
| `tls` | Establishes RADIUS connection over TLS. |
| `timeout <TIMEOUT-SECONDS>` | Specifies the timeout. Range: 1 to 60 seconds. If a timeout is not specified, the value from the global timeout for RADIUS is used. |
| `port <PORT-NUMBER>` | Specifies the authentication port number. Range: 1 to 65535. Default: 1812. |
| `auth-type {pap \| chap}` | Selects either the PAP (the default) or CHAP authentication types. If this parameter is not specified, the RADIUS global default is used. |
| `acct-port <ACCT-PORT>` | Specifies the UDP accounting port number. Range: 1 to 65535. Default: 1813. |
| `tracking {enable \| disable}` | Enables or disables server tracking for the RADIUS server. Tracked servers are probed at the start of each server tracking interval to check if they are reachable.<br>Use command **radius-server tracking** to configure RADIUS server tracking globally.<br><br>**NOTE:** Server tracking uses authentication request and response packets to determine server reachability status. The server tracking user name and password are used to form the request packet which is sent to the server with tracking enabled. Upon receiving a response to the request packet, the server is considered to be reachable. |
| `tracking-mode {any \| dead-only}` | Configures tracking mode for the RADIUS server that has tracking enabled with the server. The tracking mode is used to monitor the status of RADIUS server reachability The default tracking mode is **any**.<br>**any**<br>Track the RADIUS server irrespective of its server reachability.<br>**dead-only**<br>Track the RADIUS server only when the server is marked as unreachable. |
| `vrf <VRF-NAME>` | Specifies the VRF name to be used for communicating with the server. If no VRF name is provided, the default VRF named **default** is used. |

## Examples

Adding a RADIUS server over TLS with an IPv4 address and a named VRF:

```
switch(config)# radius-server host 1.1.1.1 tls vrf mgmt
```

Deleting a RADIUS server over TLS with an IPv4 address and a named VRF:

```
switch(config)# no radius-server host 1.1.1.1 tls vrf mgmt
```

Adding a RADIUS server over TLS with an IPv4 address and default port:

```
switch(config)# radius-server host 1.1.1.1 tls port
```

Deleting a RADIUS server over TLS with an IPv4 address and default port:

```
switch(config)# no radius-server host 1.1.1.1 tls port
```

Adding a RADIUS server over TLS with tracking enabled and tracking mode is set to dead-only:

```
switch(config)# radius-server host 1.1.1.1 tls tracking enable tracking-mode dead-
only
```

Deleting a RADIUS server over TLS with tracking enabled and tracking mode is set to dead-only:

```
switch(config)# no radius-server host 1.1.1.1 tls tracking enable tracking-mode
dead-only
```

Adding a RADIUS server over TLS with an IPv4 address, a port, and a named VRF:

```
switch(config)# radius-server host 1.1.1.2 tls port 32 vrf mgmt
```

Deleting a RADIUS server over TLS with an IPv4 address, a port, and a named VRF:

```
switch(config)# no radius-server host 1.1.1.2 tls port 32 vrf mgmt
```

Adding a RADIUS server over TLS with an IPv6 address:

```
switch(config)# radius-server host 2001:0db8:85a3:0000:0000:8a2e:0370:7334 tls
```

Deleting a RADIUS server over TLS with an IPv6 address:

```
switch(config)# no radius-server host 2001:0db8:85a3:0000:0000:8a2e:0370:7334 tls
```

For more information on features that use this command, refer to the Security Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## radius-server host tls port-access

```
radius-server host {<FQDN> | <IPV4> | <IPV6>} tls port-access {status-server | keep-
alive}
no radius-server host {<FQDN> | <IPV4> | <IPV6>} tls port-access {status-server | keep-
alive}
```

### Description

Configures the type of messages to be sent inside RadSec sessions for port access authentication. Default message type for port access authentication sessions is `status-server`.

The **no** form of this command removes the message type configured for port access authentication sessions and sets the default, **status-server**.

| Parameter | Description |
|---|---|
| `{<FQDN> \| <IPV4> \| <IPv6>}` | Specifies the RADIUS server as:<br>- *<FQDN>*: a fully qualified domain name.<br>- *<IPV4>*: an IPv4 address.<br>- *<IPV6>*: an IPv6 address. |
| `port-access {status-server \| keep-alive}` | Specifies the message type to be used for port access authentication in RadSec sessions. Following message types are supported:<br>- **status-server:** Sets status server message type for authentication.<br>- **keep-alive:** Sets keep-alive message type for authentication.<br>**NOTE:** Keep-alive as tracking method and for port access sessions is recommended in networks where a RadSec server is connected to more number of RadSec clients. The server requires additional resources to process status-server and access-request messages when compared to keep-alive messages. This is because status-server and access-request messages are RADIUS protocol packets. However, keep-alive packets are TCP control packets that does not require any additional resources for processing by the RadSec server. |

### Examples

Configuring the **keep-alive** messages for port access authentication in RadSec session on host **1.1.1.1**:

```
switch(config)# radius-server host 1.1.1.1 tls port-access keep-alive
```

Deleting the message type configured on host **1.1.1.1** for port access authentication session and setting the method to the default, **status-server**:

```
switch(config)# no radius-server host 1.1.1.1 tls port-access status-server
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.10 | Command introduced |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## radius-server host tls tracking-method

```
radius-server host {<FQDN> | <IPV4> | <IPV6>} tls tracking-method {status-server | keep-
alive | access-request}
no radius-server host {<FQDN> | <IPV4> | <IPV6>} tls tracking-method {status-server |
keep-alive | access-request}
```

### Description

Configures the tracking method to be used for RADIUS server tracking. RADIUS server tracking must be configured for enabling the tracking method. Default tracking method is **access-request**.

The **no** form of this command sets the tracking method to the default option, **access-request**.

| Parameter | Description |
|---|---|
| `{<FQDN> | <IPV4> | <IPv6>}` | Specifies the RADIUS server as:<br>- *<FQDN>*: a fully qualified domain name.<br>- *<IPV4>*: an IPv4 address.<br>- *<IPV6>*: an IPv6 address. |
| `tracking-method {status-server | keep-alive | access-request}` | Specifies the tracking method for RadSec tracking. Following methods are supported:<br>- **status-server:** Status server responses are used to update the reachability status of the RadSec server.<br>- **keep-alive:** Server socket status is verified to update the reachability status of the RadSec server. |

| Parameter | Description |
|---|---|
| | **NOTE: keep-alive** as tracking method and for port access sessions is recommended in networks where a RadSec server is connected to more number of RadSec clients. The server requires additional resources to process **status-server** and **access-request** messages when compared to **keep-alive** messages. This is because **status-server** and **access-request** messages are RADIUS protocol packets. However, **keep-alive packets** are TCP control packets that does not require any additional resources for processing by the RadSec server.<br>■ **access-request:** Access response messages are used to update the reachability status of the RadSec server. |

## Usage

- If the network has a RADIUS proxy, then it is recommended to use the **access-request** tracking method to track the RadSec server.
- If **keep-alive** is the tracking method, then make sure to check whether the server has the capability to treat the **keep-alive** messages sent in RadSec sessions as valid RadSec messages to keep the session active.

## Examples

Configuring the RADIUS server tracking method on host **1.1.1.1**:

```
switch(config)# radius-server host 1.1.1.1 tls tracking-method status-server
```

Deleting the RADIUS server tracking method on host **1.1.1.1** and setting the method to the default, **access-request**:

```
switch(config)# no radius-server host 1.1.1.1 tls tracking-method access-request
```

For more information on features that use this command, refer to the Security Guide for your switch model.

## Command History

# radius-server key

```
radius-server key [plaintext <GLOBAL-PASSKEY> | ciphertext <GLOBAL-PASSKEY>]
no radius-server key [plaintext <GLOBAL-PASSKEY> | ciphertext <GLOBAL-PASSKEY>]
```

## Description

Creates or modifies a RADIUS global passkey. The RADIUS global passkey is used as a shared-secret for encrypting the communication between all RADIUS servers and the switch. The RADIUS global passkey is required for authentication unless local passkeys have been set. By default, the RADIUS global passkey is empty. If the administrator has not set this key, the switch will not be able to perform RADIUS authentication. The switch will instead rely on the authentication mechanism configured with **aaa authentication login**.

When this command is entered without parameters, plaintext passkey prompting occurs upon pressing Enter. The entered passkey characters are masked with asterisks.

The **no** form of the command removes the global passkey.

| Parameter | Description |
|---|---|
| `plaintext <GLOBAL-PASSKEY>` | Specifies the RADIUS global passkey in plaintext format with a length of 1 to 31 characters. As per RFC 2865, a shared-secret can be a mix of alphanumeric and special characters. |
| `ciphertext <GLOBAL-PASSKEY>` | Specifies the RADIUS global passkey in encrypted format. |

## Examples

Adding the global passkey:

```
switch(config)# radius-server key plaintext mypasskey123
```

Adding the global passkey with prompting:

```
switch(config)# radius-server key
Enter the RADIUS server key: *********
Re-Enter the RADIUS server key: *********
```

Removing the global passkey:

```
switch(config)# no radius-server key
```

For more information on features that use this command, refer to the Security Guide for your switch model.

| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## radius-server retries

```
radius-server retries <0-5>
no radius-server retries <0-5>
```

### Description

Sets at the global level the number of retries the switch makes before concluding that the RADIUS server is unreachable.

You can override this setting with a fine-grained per RADIUS server retries configuration.

The **no** form of this command resets the RADIUS global retries to the default retries value of 1.

| Parameter | Description |
|---|---|
| `retries <0-5>` | Specifies the number of retry attempts for contacting RADIUS servers. Range is 0 to 5 retries. |

### Example

```
switch(config)# radius-server retries 3
```

For more information on features that use this command, refer to the Security Guide for your switch model.

# radius-server status-server interval

```
radius-server status-server interval <10-86400>
no radius-server status-server interval <10-86400>
```

## Description

Configures the time interval in seconds to send the status server requests to the RADIUS server.

The **no** form of this command configures the default time interval, **300** seconds.

| Parameter | Description |
|---|---|
| *<10-86400>* | Specifies the status server time interval in seconds. Default: **300**. |

## Examples

Configuring the status server time interval of 200 seconds:

```
switch(config)# radius-server status-server interval 200
```

Resetting the status server time interval to the default, 300 seconds:

```
switch(config)# no radius-server status-server interval 200
```

For more information on features that use this command, refer to the Security Guide for your switch model.

# radius-server timeout

```
radius-server timeout [<1-60>]
no radius-server timeout [<1-60>]
```

## Description

Specifies the number of seconds to wait for a response from the RADIUS server before trying the next RADIUS server. If a value is not specified, a default value of 5 seconds is used. You can override this value with a fine-grained per server timeout configured for individual servers.

The **no** form of this command resets the RADIUS global authentication timeout to the default of 5 seconds.

| Parameter | Description |
|---|---|
| `timeout <1-60>` | Specifies the timeout interval of 1 to 60 seconds. Default: 5 seconds. |

### Examples

Setting the RADIUS server timeout:

```
switch(config)# radius-server timeout 10
```

Resetting the timeout for the RADIUS server to the default:

```
switch(config)# no radius-server timeout
```

For more information on features that use this command, refer to the Security Guide for your switch model.

## radius-server tls timeout (RadSec)

```
radius-server tls timeout [<1-60>]
no radius-server tls timeout [<1-60>]
```

### Description

Specifies the number of seconds to wait for a response from the RadSec server before trying the next RADIUS or RadSec server. If a value is not specified, a default value of 5 seconds is used. You can override this value with a fine-grained per server timeout configured for individual servers.

The **no** form of this command resets the RadSec global authentication timeout to the default of 5 seconds.

| Parameter | Description |
|---|---|
| `timeout <1-60>` | Specifies the timeout interval of 1 to 60 seconds. Default: 5 seconds. |

### Examples

Setting the RadSec server timeout:

```
switch(config)# radius-server tls timeout 10
```

Resetting the timeout for the RadSec to the default:

```
switch(config)# no radius-server tls timeout
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## radius-server tracking

```
radius-server tracking interval <INTERVAL>
no radius-server tracking interval

radius-server tracking retries <RETRIES>
no radius-server tracking retries

radius-server tracking user-name <NAME>
   [password [plaintext <PASSWORD> | ciphertext <PASSWORD>]]
no radius-server tracking user-name <NAME>
   [password [plaintext <PASSWORD> | ciphertext <PASSWORD>]]
```

### Description

Configures RADIUS server tracking settings globally for all configured RADIUS servers that have tracking enabled with the **radius-server host** command on individual servers.

The **no** form of the command removes the specified configuration, reverting it to its default. The no form with **user-name** also clears the password (resets it to empty).

| Parameter | Description |
|---|---|
| `interval <INTERVAL>` | Specifies the time interval, in seconds, to wait before checking the server reachability status. Default: 300. Range 60 to 84600. |
| `retries <RETRIES>` | Specifies the number of server retries. Default: Global RADIUS retries. Range: 0 to 5. |
| `user-name <NAME> [password [plaintext <PASSWORD> \| ciphertext <PASSWORD>]]` | Specifies the user name (and optionally a password) to be used for server checking. The default user name is **radius-tracking-user** with an empty password.<br>The password is optional and may be entered as **plaintext** or pasted in as **ciphertext**. The plaintext password is visible as cleartext when entered but is encrypted thereafter. Command history does show the password as cleartext.<br>**NOTE:** When **password** is entered without a following sub-parameter, plaintext password prompting occurs upon pressing Enter. The entered password characters are masked with asterisks.<br>**NOTE:** The user does not have to be configured on the server. Server tracking can still be performed with a user which is not configured on the server because authentication failure on the server achieves confirmation that the server is reachable.<br>**NOTE:** Server tracking uses authentication request and response packets to determine server reachability status. The server tracking user name and password are used to form the request packet which is sent to the server with tracking enabled. Upon receiving a response to the request packet, the server is considered to be reachable. |

## Examples

Configuring a tracking interval of 120 seconds:

```
switch(config)# radius-server tracking interval 120
```

Reverting the tracking interval to its default of 300 seconds:

```
switch(config)# no radius-server tracking interval
```

Configuring three retries:

```
switch(config)# radius-server tracking retries 3
```

Configuring user **radius-tracker** with a plaintext password.

```
switch(config)# radius-server tracking user-name radius-tracker
    password plaintext track$1
```

Configuring user **radius-tracker** with a prompted plaintext password.

```
switch(config)# radius-server tracking user-name radius-tracker password
Enter the RADIUS server tracking password: *******
Re-Enter the RADIUS server tracking password: *******
```

Reverting the tracking user name to its default of **radius-tracking-user**:

```
switch(config)# no radius-server tracking user-name
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## server

```
server {<FQDN> | <IPV4> | <IPV6>} [tls] [port <PORT-NUMBER>] [vrf <VRF-NAME>]
no server {<FQDN> | <IPV4> | <IPV6>} [tls] [port <PORT-NUMBER>] [vrf <VRF-NAME>]
```

### Description

Adds a TACACS+ or RADIUS server to a server group. Only the configured TACACS+ or RADIUS servers are allowed to be added within the server group. If the same server name exists with multiple ports or multiple VRFs, specify the server name, port, and VRF when adding the server to the server-group.

The **no** form of this command removes a TACACS+/RADIUS server from a server-group.

On the 4100i, 6000, 6100, 6200, 6300, 6400, 8100, 8325, 8360, and 10000 Switch Series, a RADIUS server can be associated with a maximum of four different user-defined server groups.

On the 8320, 8400, and 9300 Switch Series, a RADIUS server can be associated with only one user-defined server group.

| Parameter | Description |
|---|---|
| `{<FQDN> | <IPV4> | <IPv6>}` | Specifies the RADIUS server as:<br>▪ *<FQDN>*: a fully qualified domain name. |

| Parameter | Description |
|---|---|
| | ■ *<IPV4>*: an IPv4 address.<br>■ *<IPV6>*: an IPv6 address. |
| `tls` | Specifies the TLS protection for the RADIUS server.<br>If TLS is configured without a port number, the system searches the RADIUS server by host name and sets the default authentication port (2083). Group server priority is assigned based on the sequence in which the servers are added. |
| `port` *`<PORT-NUMBER>`* | Specifies the authentication port number. Range: 1 to 65535. Default TACACS+ (TCP): 49, RADIUS (UDP): 1812 and RadSec: 2083.<br>If a port number is not provided, the system searches the TACACS+/RADIUS server by host name and sets the default authentication port. Group server priority is assigned based on the sequence in which the servers are added. |
| `vrf` *`<VRF-NAME>`* | Specifies the VRF name to be used for communicating with the server. If no VRF name is provided, the default VRF named **default** is used. |

## Examples

Adding a server to TACACS+ server group sg1 by providing an IPv4 address, port number, and VRF name:

```
switch(config)# aaa group server tacacs sg1
switch(config-sg)# server 1.1.1.2 port 32 vrf default
```

Adding a server to TACACS+ server group sg2 by providing an IPv6 address and default VRF:

```
switch(config)# aaa group server tacacs sg2
switch(config-sg)# server 2001:0db8:85a3:0000:0000:8a2e:0370:7334 vrf default
```

Adding a server to RADIUS server group sg3 by providing an IPv4 address, port number, and VRF name:

```
switch(config)# aaa group server radius sg3
switch(config-sg)# server 1.1.1.5 port 12 vrf default
```

Adding a server to RADIUS server group sg3 with TLS protection by providing an IPv4 address, port number, and VRF name:

```
switch(config)# aaa group server radius sg3
switch(config-sg)# server 1.1.1.5 tls port 12 vrf default
```

Adding a server to RADIUS server group sg4 by providing an IPv6 address and default VRF:

```
switch(config)# aaa group server radius sg4
switch(config-sg)# server 2001:0db8:85a3:0000:0000:8a2e:0371:7334 vrf default
```

Adding a server to RADIUS server group sg4 by providing an IPv4 address, port number, and VRF name:

```
switch(config)# aaa group server radius sg4
switch(config-sg)# server 1.1.1.6 port 32 vrf vrf_red
```

Specifying an IPv4 address when removing a TACACS+ server from server group sg1:

```
switch(config)# aaa group server tacacs sg1
switch(config-sg)# no server 1.1.1.2 port 12 vrf default
```

Specifying an IPv6 address when removing a TACACS+ server from server group sg2 with the default VRF:

```
switch(config)# aaa group server tacacs sg2
switch(config-sg)# no server 2001:0db8:85a3:0000:0000:8a2e:0370:7334 vrf default
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config-sg` | Administrators or local user group members with execution rights for this command. |

## show aaa accounting

`show aaa accounting [vsx-peer]`

### Description

Shows the accounting configuration per connection type (channel).

| Parameter | Description |
|---|---|
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Examples

Configuring and then showing the accounting sequence for TACACS+ groups and local:

```
(config)# aaa accounting all-mgmt default start-stop group sg1 tacacs radius
(config)# aaa accounting all-mgmt console start-stop local
(config)# aaa accounting all-mgmt ssh start-stop group radius tacacs local
(config)# aaa accounting all-mgmt https-server start-stop group sg1 tacacs
(config)# aaa accounting all-mgmt telnet start-stop group radius tacacs local
(config)# show aaa accounting
AAA Accounting:
Accounting Type              : all
Accounting Mode              : start-stop
Accounting Failthrough       : Enabled

Accounting for https-server channel:
--------------------------------------------------------------------------------
GROUP NAME                       | GROUP PRIORITY
--------------------------------------------------------------------------------
sg1                              | 0
tacacs                           | 1
--------------------------------------------------------------------------------
Accounting for console channel:
--------------------------------------------------------------------------------
GROUP NAME                       | GROUP PRIORITY
--------------------------------------------------------------------------------
local                            | 0
--------------------------------------------------------------------------------
Accounting for default channel:
--------------------------------------------------------------------------------
GROUP NAME                       | GROUP PRIORITY
--------------------------------------------------------------------------------
sg1                              | 0
tacacs                           | 1
radius                           | 2
--------------------------------------------------------------------------------
Accounting for ssh channel:
--------------------------------------------------------------------------------
GROUP NAME                       | GROUP PRIORITY
--------------------------------------------------------------------------------
radius                           | 0
tacacs                           | 1
local                            | 2
--------------------------------------------------------------------------------
Accounting for telnet channel:
--------------------------------------------------------------------------------
GROUP NAME                       | GROUP PRIORITY
--------------------------------------------------------------------------------
radius                           | 0
tacacs                           | 1
local                            | 2
--------------------------------------------------------------------------------
```

Configuring and then showing the accounting sequence for RADIUS groups and local:

```
switch(config)# aaa accounting all default start-stop group rg1 rg2 radius local
switch(config)# aaa accounting all console start-stop group rg4 radius local
switch(config)# exit
switch# show aaa accounting
AAA Accounting:
Accounting Type                              : all
Accounting Mode                              : start-stop
Accounting Failthrough                       : Enabled
Accounting for default channel:
---------------------------------------------------------------------------------
```

```
GROUP NAME                       | GROUP PRIORITY
--------------------------------------------------------------------------------
rg1                              | 0
rg2                              | 1
radius                           | 2
local                            | 3
--------------------------------------------------------------------------------
Accounting for console channel:
--------------------------------------------------------------------------------
GROUP NAME                       | GROUP PRIORITY
--------------------------------------------------------------------------------
tg4                              | 0
radius                           | 1
local                            | 2
--------------------------------------------------------------------------------
```

Configuring and then showing only local accounting for default:

```
switch(config)# aaa accounting all default start-stop local
switch(config)# exit
switch# show aaa accounting
AAA Accounting:
Accounting Type                                       : all
Accounting Mode                                       : start-stop
Accounting for default channel:
--------------------------------------------------------------------------------
GROUP NAME                       | GROUP PRIORITY
--------------------------------------------------------------------------------
local                            | 0
--------------------------------------------------------------------------------
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show aaa accounting port-access (RADIUS only)

```
show aaa accounting port-access [interface {<IF-NAME> | all}
     client-status [mac <MAC-ADDR>]] [vsx-peer]
```

### Description

Shows overall or specific port access accounting information.

| Parameter | Description |
|---|---|
| `interface {<IF-NAME> \| all}` | Selects either one interface or all interfaces for showing. |
| `mac <MAC-ADDR>` | Specifies a client station MAC address (xx:xx:xx:xx:xx:xx), where x is a hexadecimal number from 0 to F. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

## Examples

*On the 6400 Switch Series, interface identification differs.*

Showing the overall port access accounting information:

```
switch# show aaa accounting port-access

AAA Accounting Port Access
===========================
  Radius Accounting Enabled      : yes
  Radius Server Group            : acct_group
  Local Accounting Enabled       : no
  Accounting Mode                : start-stop
  Interim Update Enabled         : yes
  Interim Interval               : 12 minutes
```

Showing the port access accounting information for a client.

```
switch# show aaa accounting port-access interface 1/1/1 client-status

Port Access Client Status Details

Client a6:4f:1e:6a:3d:2c, test1
============================
  Session Details
  ---------------
    Port                 : 1/1/1
    Session Time         : 100s

  Accounting Details
  ------------------
    Accounting Session ID  : 1234
    Input Packets          : 1028
    Input Octets           : 8224
    Output Packets         : 2048
    Output Octets          : 8000
    Input Gigaword         : 0
    Output Gigaword        : 0
```

For more information on features that use this command, refer to the Security Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.04 | Command introduced |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show aaa authentication

```
show aaa authentication [vsx-peer]
```

### Description

Shows the authentication configuration per connection type (channel).

| Parameter | Description |
|---|---|
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Example

Configuring TACACS+ authentication sequences and then showing the configuration per connection type (channel):

```
switch(config)# aaa authentication login default group sg1 sg2 sg3 sg4 tacacs
local
switch(config)# aaa authentication login ssh group sg1 sg2
switch(config)# aaa authentication login console group sg4 tacacs local
switch(config)# aaa authentication login https-server local group tacacs sg3
switch(config)# aaa authentication login telnet group sg1 sg2
switch(config)# exit

switch# show aaa authentication
AAA Authentication:
  Fail-through               : Enabled
  Limit Login Attempts       : Not set
  Lockout Time               : 300
  Minimum Password Length    : Not set

Authentication for ssh channel:
----------------------------------------------------------------------------------
GROUP NAME                        | GROUP PRIORITY
----------------------------------------------------------------------------------
sg1                               | 0
sg2                               | 1
----------------------------------------------------------------------------------

Authentication for https-server channel:
```

```
----------------------------------------------------------------------------------
GROUP NAME                        | GROUP PRIORITY
----------------------------------------------------------------------------------
local                             | 0
tacacs                            | 1
sg3                               | 2
----------------------------------------------------------------------------------

Authentication for console channel:
----------------------------------------------------------------------------------
GROUP NAME                        | GROUP PRIORITY
----------------------------------------------------------------------------------
sg4                               | 0
tacacs                            | 1
local                             | 2
----------------------------------------------------------------------------------

Authentication for default channel:
----------------------------------------------------------------------------------
GROUP NAME                        | GROUP PRIORITY
----------------------------------------------------------------------------------
sg1                               | 0
sg2                               | 1
sg3                               | 2
sg4                               | 3
tacacs                            | 4
local                             | 5
----------------------------------------------------------------------------------
Authentication for telnet channel:
----------------------------------------------------------------------------------
GROUP NAME                        | GROUP PRIORITY
----------------------------------------------------------------------------------
sg1                               | 0
sg2                               | 1
----------------------------------------------------------------------------------
```

Configuring RADIUS authentication sequences and then showing the configuration per connection type (channel):

```
switch(config)# aaa authentication login default group rg1 rg2 rg3 rg4 radius
local
switch(config)# aaa authentication login console group rg4 radius local
switch(config)# exit
switch# show aaa authentication
AAA Authentication:
  Fail-through                : Enabled
  Limit Login Attempts        : Not set
  Lockout Time                : 300
  Minimum Password Length     : Not set

Authentication for default channel:
---------------------------------------------------------------------------------
GROUP NAME                        | GROUP PRIORITY
---------------------------------------------------------------------------------
rg1                               | 0
rg2                               | 1
rg3                               | 2
rg4                               | 3
radius                            | 4
local                             | 5
---------------------------------------------------------------------------------
```

```
Authentication for console channel:
---------------------------------------------------------------------------------
GROUP NAME                       | GROUP PRIORITY
---------------------------------------------------------------------------------
rg4                              | 0
radius                           | 1
local                            | 2
---------------------------------------------------------------------------------
```

Configuring only default authentication and then showing the default connection type (channel):

```
switch(config)# aaa authentication login default local
switch(config)# exit
switch# show aaa authentication

AAA Authentication:
  Fail-through                            : Disabled
  Limit Login Attempts                    : Not set
  Lockout Time                            : 300
  Minimum Password Length                 : Not set

Authentication for default channel:
---------------------------------------------------------------------------------
GROUP NAME                       | GROUP PRIORITY
---------------------------------------------------------------------------------
local                            | 0
---------------------------------------------------------------------------------
```

For more information on features that use this command, refer to the Security Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

# show aaa authorization

```
show aaa authorization [vsx-peer]
```

## Description

Shows the authorization configuration per connection type (channel).

| Parameter | Description |
|---|---|
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Example

Configuring and then showing the authorization sequence for default and console connection types (channels):

```
(config)# aaa authorization commands default group sg1 tacacs local
All commands will fail if none of the servers in the group list are reachable.
Continue (y/n)? y
(config)# aaa authorization commands ssh group sg2
All commands will fail if none of the servers in the group list are reachable.
Continue (y/n)? y
(config)# aaa authorization commands telnet group sg2
All commands will fail if none of the servers in the group list are reachable.
Continue (y/n)? y
(config)# aaa authorization commands console group sg1 local
All commands will fail if none of the servers in the group list are reachable.
Continue (y/n)? y
(config)# aaa authorization radius ssh group sg1
All commands will fail if none of the radsec servers in the group list are
reachable.
Continue (y/n)? y
(config)# aaa authorization radius https-server group sg2
All commands will fail if none of the radsec servers in the group list are
reachable.
Continue (y/n)? y

(config)# show aaa authorization

******* Command authorization *******
Authorization for console channel:
---------------------------------------------------------------------------------
GROUP NAME                        | GROUP PRIORITY
---------------------------------------------------------------------------------
sg1                               | 0
local                             | 1
---------------------------------------------------------------------------------

Authorization for default channel:
---------------------------------------------------------------------------------
GROUP NAME                        | GROUP PRIORITY
---------------------------------------------------------------------------------

## show aaa server-groups

```
show aaa server-groups [tacacs | radius] [vsx-peer]
```

### Description

Shows TACACS+ and RADIUS AAA server group information for all server types or for the specified server type.

| Parameter | Description |
|---|---|
| `tacacs` | Narrows the command output to only TACACS+ servers. |
| `radius` | Narrows the command output to only RADIUS servers. |

| Parameter | Description |
|---|---|
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Example

Showing all AAA server group information:

```
switch# show aaa server-groups

******* AAA Mechanism TACACS+ *******
---------------------------------------------------------------------------------
GROUP NAME       | SERVER NAME                        | PORT | VRF     | PRIORITY
---------------------------------------------------------------------------------
sg2              | 2001:0db8:85a3:0000:0000:8a2e:
                   0370:7334                          | 49   | default | 1
---------------------------------------------------------------------------------
sg1              | 1.1.1.2                            | 12   | mgmt    | 1
---------------------------------------------------------------------------------
tacacs (default) | FQDN.com                           | 32   | mgmt    | 1
tacacs (default) | 1.1.1.1                            | 49   | mgmt    | 2
tacacs (default) | 1.1.1.2                            | 12   | mgmt    | 3

| All platforms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show accounting log

```
show accounting log [last <QTY-TO-SHOW> | all]
```

### Description

Entered without optional parameters, this command shows all accounting log records for the current boot. Sensitive information is masked from the log, by being represented as asterisks.

This **show accounting log** command replaces the **show audit-log** command that is supported only in 10.00 releases.

| Parameter | Description |
|---|---|
| `last <QTY-TO-SHOW>` | Specifies how many most-recent accounting log records to show for the current boot. Range: 1 to 1000. |
| `all` | Selects for showing, all accounting records from the current boot and the previous boot. |

## Usage

The log message starts with the record type, which is specific to AOS-CX. Values are the following:

`USER_START`

Record of a user login action.

`USER_END`

Record of a user logout action.

`USYS_CONFIG`

Record of a command executed by the user.

The three types of accounting log information are identified by the **msg=** element starting with the **rec=** item as follows:

- Exec is identified with: **msg='rec=ACCT_EXEC**
- Command is identified with: **msg='rec=ACCT_CMD**
- System is identified with: **msg='rec=ACCT_SYSTEM**

The user group is indicated by **priv-lvl**, which is specific to AOS-CX. Values are the following:

| Privilege level | User group |
|---|---|
| 1 | **operators** |
| 15 | **administrators** |
| 19 | **auditors** |

The value of **service** indicates which user interface was used:

`service=shell`

Indicates that the log entry is a result of a CLI command.

`service=https-server`

Indicates that the log entry is a result of a REST API request or a Web UI action.

The string value of **data** identifies the CLI command or REST API request that was executed.

These elements are shown in context under *Examples*.

## Examples

Showing the accounting log for the previous and current boot. Line breaks have been added for readability.

```
switch# show accounting log all

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | Manager (`#`) or Auditor (`auditor`) | Auditors or Administrators or local user group members with execution rights for this command. Auditors can execute this command from the auditor context (auditor>) only. |

## show accounting log port-access

`show accounting log port-access [last <QTY-TO-SHOW> | all]`

### Description

Shows network user accounting log records.

| Parameter | Description |
|---|---|
| `last <QTY-TO-SHOW>` | Specifies how many most-recent accounting log records to show for the current boot. Range: 1 to 1000. |
| `all` | Selects for showing, all accounting records from the current boot and the previous boot. |

### Examples

Showing port access log output. Line breaks have been added for readability.

```
switch# show accounting log port-access all
...

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Manager (#) or Auditor (auditor) | Auditors or Administrators or local user group members with execution rights for this command. Auditors can execute this command from the auditor context (auditor>) only. |

## show radius-server

```
show radius-server [detail] [vsx-peer]
```

### Description

Shows configured RADIUS servers information.

| Parameter | Description |
|---|---|
| detail | Selects additional RADIUS server details and global parameters for showing. |
| vsx-peer | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Usage

- When the **show radius-server** command shows **None** for the shared-secret, the passkey is missing.
- The **Tracking-Last-Attempted** and **Next-Tracking-Request** fields are applicable only when the RADIUS server tracking method is **access-request**.
- The **TLS Connection Status** section of the output of the **show radius-server detail** command displays the connection status of the TLS connection created for port-access (network client) authentication. If no port-access related configuration is present, the TLS Connection Status field displays a status of **N/A**.

## Examples

Showing a summary of the global RADIUS configuration:

```
switch# show radius-server
******* Global RADIUS Configuration *******

## show radius-server secure ipsec

```
show radius-server secure ipsec { server-list | host {<FQDN> | <IPV4> |  <IPv6>}
     [port <PORT-NUMBER>] [vrf <VRF-NAME>] [vsx-peer] }
```

### Description

Shows information for one or all RADIUS servers configured with IPsec.

| Parameter | Description |
|---|---|
| `server-list` | Selects all servers for showing. |
| `{<FQDN> \| <IPV4> \| <IPv6>}` | Specifies the RADIUS server as:<br>▪ *<FQDN>*: a fully qualified domain name.<br>▪ *<IPV4>*: an IPv4 address.<br>▪ *<IPV6>*: an IPv6 address. |
| `port <PORT-NUMBER>` | Specifies the authentication port number. Range: 1 to 65535. Default: 1812. |
| `vrf <VRF-NAME>` | Specifies the VRF name to be used for communicating with the server. If no VRF name is provided, the default VRF named **default** is used. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Usage

The IPsec key is shown in an exportable ciphertext format.

### Examples

Showing information for RADIUS server 1.1.1.1 secured with IPsec:

```
switch# show radius-server secure ipsec host 1.1.1.1
IPsec                         : enabled
Protocol                      : ESP
Authentication                : MD5
Encryption                    : AES
SPI                           : 1234
```

Showing information for all RADIUS servers secured with IPsec:

```
switch# show radius-server secure ipsec server-list
Server                        : 1.1.1.1
IPsec                         : enabled
Protocol                      : ESP
Authentication                : MD5
Encryption                    : AES
SPI                           : 1234

Server                        : 1.1.1.2
IPsec                         : enabled
Protocol                      : ESP
Authentication                : MD5
Encryption                    : AES
SPI                           : 12341
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platorms | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show radius-server statistics

```
show radius-server statistics {authentication | accounting} [vsx-peer]
```

### Description

Shows authentication or accounting statistics for all configured RADIUS servers.

The accounting statistics are only for port access.

| Parameter | Description |
|---|---|
| `{authentication \| accounting}` | Selects the type of statistics to show. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

## Examples

Showing RADIUS server authentication statistics:

```
switch# show radius-server statistics authentication
 Server Name     : rad1
 Auth-Port       : 1812
 Accounting-Port : 1813
 VRF             : mgmt
 TLS Enabled     : Yes

  Authentication Statistics
  -------------------------
    Round Trip Time            : 100
    Pending Requests           : 0
    Timeouts                   : 6
    Bad Authenticators         : 2
    Packets Dropped            : 0
    Access Requests            : 20
    Access Challenge           : 8
    Access Accepts             : 14
    Access Rejects             : 0
    Access Response Malformed  : 0
    Access Retransmits         : 0
    Tracking Requests          : 5
    Tracking Responses         : 5
    Unknown Response Code      : 0
```

Showing RADIUS server accounting statistics:

```
switch# show radius-server statistics accounting
 Server Name     : rad1
 Auth-Port       : 1812
 Accounting-Port : 1813
 VRF             : mgmt
 TLS Enabled     : No

  Accounting Statistics
  -------------------------
    Round Trip Time                : 100
    Pending Requests               : 0
    Timeouts                       : 5
    Bad Authenticators             : 1
    Packets Dropped                : 0
    Accounting Requests            : 15
    Accounting Responses           : 10
    Accounting Response Malformed  : 0
    Accounting Retransmits         : 0
    Unknown Response Code          : 0
```

Showing RADIUS server authentication statistics when RADIUS server tracking method is configured:

```
switch# show radius-server statistics authentication
 Server Name      : 10.93.48.200
 Auth-Port        : 2083
 Accounting-Port  : 2083
 VRF              : mgmt
 TLS Enabled      : yes

  Authentication Statistics
  -------------------------
    Round Trip Time                                        : 101
    Pending Requests                                       : 0
    Timeouts                                               : 342
    Bad Authenticators                                     : 0
    Packets Dropped                                        : 0
    Access Requests                                        : 779
    Access challenge                                       : 182
    Access Accepts                                         : 4
    Access Rejects                                         : 251
    Access Response Malformed                              : 0
    Access Retransmits                                     : 200
    Tracking Requests                                      : 280
    Tracking Responses                                     : 142
    Status-Server Requests   (Tracking session)            : 280
    Status-Server Responses  (Tracking session)            : 280
    Status-Server Requests   (port-access session)         : 280
    Status-Server Responses  (port-access session)         : 280
    Unknown Response Code                                  : 0
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

## show radius-server statistics host

```
show radius-server statistics {authentication | accounting}
     host {<FQDN> | <IPV4> |  <IPv6>}
     [tls] [port <PORT-NUMBER>] [vrf <VRF-NAME>] [vsx-peer]
```

### Description

Shows authentication or accounting statistics for the specified RADIUS server.

The accounting statistics are only for port access.

| Parameter | Description |
|---|---|
| `{authentication \| accounting}` | Selects the type of statistics to show. |
| `{`*`<FQDN>`*` \| `*`<IPV4>`*` \| `*`<IPv6>`*`}` | Specifies the RADIUS server as:<br>■ *<FQDN>*: a fully qualified domain name.<br>■ *<IPV4>*: an IPv4 address.<br>■ *<IPV6>*: an IPv6 address. |
| `tls` | Selects TLS. |
| `port `*`<PORT-NUMBER>`* | Specifies the authentication port number. Range: 1 to 65535. Default: 1812. |
| `vrf `*`<VRF-NAME>`* | Specifies the VRF name to be used for communicating with the server. If no VRF name is provided, the default VRF named **default** is used. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

## Examples

Showing RADIUS server authentication statistics with TLS enabled:

```
switch# show radius-server statistics authentication host 20.1.1.49 tls
 Server Name     : 20.1.1.49
 Auth-Port       : 2083
 Accounting-Port : 2083
 VRF             : default
 TLS Enabled     : Yes

  Authentication Statistics
  -------------------------
    Round Trip Time           : 3
    Pending Requests          : 0
    Timeouts                  : 0
    Bad Authenticators        : 0
    Packets Dropped           : 0
    Access Requests           : 13
    Access challenge          : 6
    Access Accepts            : 3
    Access Rejects            : 4
    Access Response Malformed : 0
```

For more information on features that use this command, refer to the Security Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Operators or Administrators or local user group members with execution rights for this command. Operators can execute this command from the operator context (>) only. |

# show tacacs-server

`show tacacs-server [detail] [vsx-peer]`

## Description

Shows the configured TACACS+ servers.

| Parameter | Description |
|---|---|
| `detail` | Selects additional TACACS+ server details and global parameters for showing. |
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

## Examples

Showing a summary of a global TACACS+ configuration with a shared-secret:

```
switch# show tacacs-server
******* Global TACACS+ Configuration *******

Shared-Secret: AQBapb+HsdpqV1Q3CPCBMQTG8e1cA+CyD0RvfbeA8BEgikCgAAAJOwZSNzA2SWrLA=
Timeout: 5
Auth-Type: pap
Number of Servers: 5

--------------------------------------------------------------------------------
SERVER NAME                                    | PORT | VRF
--------------------------------------------------------------------------------
1.1.1.1                                        | 49   | mgmt
1.1.1.2                                        | 12   | mgmt
abc.com                                        | 32   | vrf_blue
2001:0db8:85a3:0000:0000:8a2e:0370:7334        | 49   | default
1.1.1.3                                        | 32   | vrf_red
--------------------------------------------------------------------------------
```

Showing details of a global TACACS+ configuration:

```
switch# show tacacs-server detail
******* Global TACACS+ Configuration *******

Shared-Secret: AQBapb+HsdpqV1Q3CPCBMQTG8e1cA+CyD0RvfbeA8BEgikCgAAAJOwZSNzA2SWrLA=
Timeout: 5
Auth-Type: pap
Number of Servers: 5
```

```

Server-Group (default)   : tacacs
Default-Priority         : 5
```

Showing TACACS+ server when per-server shared key and global TACACS+ shared key is not set:

```
switch# show tacacs-server
******* Global TACACS+ Configuration *******

Shared-Secret: None
Timeout: 5
Auth-Type: pap
Number of Servers: 1

--------------------------------------------------------------------------------
SERVER NAME                                   | PORT | VRF
--------------------------------------------------------------------------------
1.1.1.1                                       | 49   | default
--------------------------------------------------------------------------------
```

Showing TACACS+ server details when per-server shared key and global TACACS+ shared key is not set:

```
switch# show tacacs-server detail
******* Global TACACS+ Configuration *******

Shared-Secret: None
Timeout: 5
Auth-Type: pap
Number of Servers: 1

****** TACACS+ Server Information ******
Server-Name                 : 1.1.1.1
Auth-Port                   : 49
VRF                         : default
Shared-Secret (default)     : None
Timeout (default)           : 5
Auth-Type (default)         : pap
Server-Group (default)      : tacacs
Default-Priority            : 1
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## show tacacs-server statistics

`show tacacs-server statistics [vsx-peer]`

### Description

Shows authentication statistics for all configured TACACS+ servers.

| Parameter | Description |
|---|---|
| `vsx-peer` | Shows the output from the VSX peer switch. If the switches do not have the VSX configuration or the ISL is down, the output from the VSX peer switch is not displayed. This parameter is available on switches that support VSX. |

### Examples

Showing TACACS+ server authentication statistics:

```
switch# show tacacs-server statistics
Server Name      : tac1
Auth-Port        : 49
VRF              : mgmt
Authentication Statistics
----------------------------------------------
Round Trip Time            : 1
Pending Requests           : 0
Timeout                    : 0
Unknown Types              : 0
Packet Dropped             : 0
Auth Start                 : 8
Auth challenge             : 0
Auth Accepts               : 4

# show tech aaa

`show tech aaa`

## Description

Shows the AAA configuration settings.

## Example

Showing the AAA configuration settings:

```
switch# show tech aaa

====================================================
Show Tech executed on Tue Feb 14 02:19:11 2017
====================================================
====================================================
[Begin] Feature aaa
```

```
====================================================

*********************************
Command : show aaa authentication
*********************************
AAA Authentication:
  Fail-through              : Enabled
  Limit Login Attempts      : Not set
  Lockout Time              : 300
  Minimum Password Length   : Not set

Authentication for ssh channel:

## tacacs-server auth-type

```
tacacs-server auth-type {pap | chap}
no tacacs-server auth-type [pap | chap]
```

### Description

Enables the CHAP or PAP authentication protocol, which is used for communication with the TACACS+ servers, at the global level. You can override this command with a fine-grained per server **auth-type** configuration.

The **no** form of this command resets the global authentication mechanism for TACACS+ to PAP, which is the default authentication mechanism for TACACS+.

| Parameter | Description |
|---|---|
| `auth-type {pap \| chap}` | Selects either the PAP or CHAP authentication protocol. |

### Examples

Enabling command for CHAP authentication:

```
switch(config)# tacacs-server auth-type chap
```

Enabling command for PAP authentication:

```
switch(config)# tacacs-server auth-type pap
```

For more information on features that use this command, refer to the Security Guide for your switch model.

## tacacs-server host

```
tacacs-server host {<FQDN> | <IPV4> | <IPV6>}
    [key [plaintext <PASSKEY> | ciphertext <PASSKEY>]]
    [timeout <TIMEOUT-SECONDS>] [port <PORT-NUMBER>]
    [auth-type {pap | chap}] [tracking {enable | disable}] [vrf <VRF-NAME>]

no tacacs-server host {<FQDN> | <IPV4> | <IPV6>}
    [key [plaintext <PASSKEY> | ciphertext <PASSKEY>]]
    [timeout <TIMEOUT-SECONDS>] [port <PORT-NUMBER>]
    [auth-type {pap | chap}] [tracking {enable | disable}] [vrf <VRF-NAME>]
```

### Description

Adds a TACACS+ server. By default, the TACACS+ server is associated with the server group named **tacacs**.

The **no** form of this command removes a previously added TACACS+ server.

| Parameter | Description |
|---|---|
| `{<FQDN> \| <IPV4> \| <IPv6>}` | Specifies the TACACS+ server as:<br>■ *<FQDN>*: a fully qualified domain name.<br>■ *<IPV4>*: an IPv4 address.<br>■ *<IPV6>*: an IPv6 address. |
| `key [plaintext <PASSKEY> \|` | Selects either a plaintext or an encrypted local shared-secret |

| Parameter | Description |
|---|---|
| `ciphertext <PASSKEY>]` | passkey for the server. As per RFC 2865, shared-secret can be a mix of alphanumeric and special characters. Plaintext passkeys are between 1 and 32 alphanumeric and special characters.<br>**NOTE:** When **key** is entered without either sub-parameter, plaintext passkey prompting occurs upon pressing Enter. Enter must be pressed immediately after the **key** parameter without entering other parameters. The entered passkey characters are masked with asterisks. When **key** is omitted, the server uses the global passkey. This command requires either the global or local passkey to be set; otherwise the server will not be contacted. Command **tacacs-server key** is available for setting the global passkey. |
| `timeout <TIMEOUT-SECONDS>` | Specifies the timeout. Range: 1 to 60 seconds. Default : 5 seconds. |
| `port <PORT-NUMBER>` | Specifies the TCP authentication port number. Range: 1 to 65535. Default: 49. |
| `auth-type {pap \| chap}` | Selects either the PAP (the default) or CHAP authentication types. If this parameter is not specified, the TACACS+ global default is used. |
| `tracking {enable \| disable}` | Enables or disables server tracking for the RADIUS server. Tracked servers are probed at the start of each server tracking interval to check if they are reachable.<br>Use command **tacacs-server tracking** to configure TACACS+ server tracking globally. |
| `vrf <VRF-NAME>` | Specifies the VRF name to be used for communicating with the server. If no VRF name is provided, the default VRF named **default** is used. |

## Usage

If the fully qualified domain name is provided for the TACACS+ server, a DNS server must be configured and accessible through the same VRF which is configured for the TACACS+ server. This configuration is required for the resolution of the TACACS+ server hostname to its IP address. If a DNS server is not available for this VRF, the TACACS+ servers reachable through this VRF must be configured by means of their IP addresses only.

## Examples

Adding a TACACS+ server with an IPv4 address, plaintext passkey, timeout, port, authentication type, and VRF name:

```
switch(config)# tacacs-server host 1.1.1.3 key plaintext test-123 timeout 15 port
32 auth-type chap vrf vrf_red
```

Adding a TACACS+ server with an IPv4 address and prompted plaintext passkey:

```
switch(config)# tacacs-server host 1.1.1.5 key
Enter the TACACS server key: *********
Re-Enter the TACACS server key: *********
```

Adding a TACACS+ server with an IPv4 address and a named VRF:

```
switch(config)# tacacs-server host 1.1.1.1 vrf mgmt
```

Adding a TACACS+ server with an IPv4 address, a port, and a named VRF:

```
switch(config)# tacacs-server host 1.1.1.2 port 32 vrf mgmt
```

Adding a TACACS+ server with an FQDN, a timeout, port number, and a named VRF:

```
switch(config)# tacacs-server host abc.com timeout 15 port 32 vrf vrf_blue
```

Adding a TACACS+ server with an IPv6 address:

```
switch(config)# tacacs-server host 2001:0db8:85a3:0000:0000:8a2e:0370:7334
```

Deleting a TACACS+ server with an IPv4 address and specified VRF:

```
switch(config)# no tacacs-server host 1.1.1.1 vrf mgmt
```

Deleting a TACACS+ server with an FQDN, port, and specified VRF:

```
switch(config)# no tacacs-server host abc.com port 32 vrf vrf_blue
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |

## tacacs-server key

```
tacacs-server key [plaintext <GLOBAL-PASSKEY> | ciphertext <GLOBAL-PASSKEY>]
no tacacs-server key [plaintext <GLOBAL-PASSKEY> | ciphertext <GLOBAL-PASSKEY>]
```

### Description

Creates or modifies a TACACS+ global passkey. The TACACS+ global passkey is used as a shared-secret for encrypting the communication between all TACACS+ servers and the switch. The TACACS+ global passkey is required for authentication unless local passkeys have been set. By default, the TACACS+ global passkey is empty. If the administrator has not set this key, the switch will not be able to perform TACACS+ authentication. The switch will instead rely on the authentication mechanism configured with **aaa authentication login**.

When this command is entered without parameters, plaintext passkey prompting occurs upon pressing Enter. The entered passkey characters are masked with asterisks.

The **no** form of the command removes the global passkey.

| Parameter | Description |
|---|---|
| `plaintext` *<GLOBAL-PASSKEY>* | Specifies the TACACS+ global passkey in plaintext format with a length of 1 to 31 characters. As per RFC 2865, a shared-secret can be a mix of alphanumeric and special characters. |
| `ciphertext` *<GLOBAL-PASSKEY>* | Specifies the TACACS+ global passkey in encrypted format. |

### Examples

Adding the global passkey:

```
switch(config)# tacacs-server key plaintext mypasskey123
```

Adding the global passkey with prompting:

```
switch(config)# tacacs-server key
Enter the TACACS server key: *********
Re-Enter the TACACS server key: *********
```

Removing the global passkey:

```
switch(config)# no tacacs-server key
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## tacacs-server timeout

```
tacacs-server timeout [<1-60>]
no tacacs-server timeout [<1-60>]
```

### Description

Specifies the number of seconds to wait for a response from the TACACS+ server before trying the next TACACS+ server. If a value is not specified, a default value of 5 seconds is used. You can override this value with a fine-grained per server timeout configured for individual servers.

The **no** form of this command resets the TACACS+ global authentication timeout to the default of 5 seconds.

| Parameter | Description |
|---|---|
| `timeout <1-60>` | Specifies the timeout interval of 1 to 60 seconds. Default: 5 seconds. |

### Examples

Specifying the TACACS+ server timeout:

```
switch(config)# tacacs-server timeout 10
```

Resetting the timeout for the TACACS+ server to the default:

```
switch(config)# no tacacs-server timeout
```

For more information on features that use this command, refer to the Security Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

|---|---|---|
| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

# tacacs-server tracking

```
tacacs-server tracking interval <INTERVAL>
no tacacs-server tracking interval [<INTERVAL>]

tacacs-server tracking user-name <NAME>
   [password [plaintext <PASSWORD> | ciphertext <PASSWORD>]]
no tacacs-server tracking [user-name [<NAME>] [ciphertext <PASSWORD>]]
```

## Description

Configures TACACS+ server tracking settings globally for all configured TACACS+ servers that have tracking enabled with the **tacacs-server host** command on individual servers.

The **no** form of the command removes the specified configuration, reverting it to its default. The no form with **user-name** also clears the password (resets it to empty).

| Parameter | Description |
|---|---|
| `interval <INTERVAL>` | Specifies the time interval, in seconds, to wait before checking the server reachability status. Default: 300. Range 60 to 84600. |
| `user-name <NAME> [password [plaintext <PASSWORD> \| ciphertext <PASSWORD>]]` | Specifies the user name (and optionally a password) to be used for server checking. The default user name is **tacacs-tracking-user** with an empty password.<br>The password is optional and may be entered as **plaintext** or pasted in as **ciphertext**. The plaintext password is visible as cleartext when entered but is encrypted thereafter. Command history does show the password as cleartext.<br>**NOTE:** When **password** is entered without a following sub-parameter, plaintext password prompting occurs upon pressing Enter. The entered password characters are masked with asterisks.<br>**NOTE:** The user does not have to be configured on the server. Server tracking can still be performed with a user which is not configured on the server because authentication failure on the server achieves confirmation that the server is reachable.<br>**NOTE:** Server tracking uses authentication request and response packets to determine server reachability status. The server tracking user name and password are used to form the request packet which is sent to the server with tracking enabled. Upon receiving a response to the request packet, the server is considered to be reachable. |

## Examples

Configuring a tracking interval of 120 seconds:

```
switch(config)# tacacs-server tracking interval 120
```

Reverting the tracking interval to its default of 300 seconds:

```
switch(config)# no tacacs-server tracking interval
```

Configuring user **tacacs-tracker** with a plaintext password.

```
switch(config)# tacacs-server tracking user-name tacacs-tracker password plaintext
track$1
```

Configuring user **tacacs-tracker** with a prompted plaintext password.

```
switch(config)# tacacs-server tracking user-name tacacs-tracker password
Enter the TACACS server tracking password: *******
Re-Enter the TACACS server tracking password: *******
```

Reverting the tracking user name to its default of **tacacs-tracking-user**:

```
switch(config)# no tacacs-server tracking user-name
```

For more information on features that use this command, refer to the Security Guide for your switch model.

# Chapter 133

# Remote syslog commands

## clear accounting-logs

```
clear accounting-logs
```

### Description

Use this command to clear accounting logs. Once issued, only logs generated after this command is run will be displayed in the output of the **show accounting log** commands.

This command will not clear logs when the logging accounting-format-native feature is configured. To clear accounting logs on switches with this feature enabled, users should first revert the native accounting format back to the default AOS-CX format by executing the **no logging accounting-format-native** command.

### Example

```
switch(config)# clear accounting-logs
```

The following example shows that accounting logs cannot be cleared using the clear accounting-logs command if the **logging accounting-native-format** command has been enabled, and that disabling this option with the **no logging accounting-format-native** command again allows the accounting logs to be cleared.

```
switch# logging audit-format-native
switch# clear accounting-logs
Warning: Clear accounting-logs is not supported for 'audit-format-native'.
switch# no logging audit-format-native
switch# clear accounting-logs
switch# show accounting log last 5
---------------------------------------------------
Command logs from current boot
---------------------------------------------------
No command logs has been logged in the system
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

### Command History

| Release | Modification |

## logging

```
logging {<IPV4-ADDR> | <IPV6-ADDR> | <FQDN | HOSTNAME>} {udp [<PORT-NUM>]}|{tcp [<PORT-
NUM>]}|{|tls [<PORT-NUM>]}
   auth-mode {certificate|subject-name}
   disable
   filter <FILTER-NAME>
   include-auditable-events
   legacy-tls-renegotiation]
   rate-limit-burst <BURST>
   rate-limit-interval <INTERVAL>] ]
   severity <LEVEL>]
   vrf <VRF-NAME>]

no logging {<IPV4-ADDR> | <IPV6-ADDR> | <FQDN | HOSTNAME> }
```

### Description

Enables syslog forwarding to a remote syslog server.

The **no** form of this command disables syslog forwarding to a remote syslog server.

Starting with AOS-CX 10.11, payload information is present in accounting logs.

The maximum REST payload that can be sent to RADIUS/TACACS server is 1024 characters, and the maximum of REST payload that can be sent to syslog server is 3500 characters. If this limit is is reached, the log will display three dots (...) to indicate that the log an exceeded the character limit and is incomplete.

| Parameter | Description |
|---|---|
| `{<IPV4-ADDR> \| <IPV6-ADDR> \| <HOSTNAME>}` | Selects the IPv4 address, IPv6 address, or host name of the remote syslog server. Required. |
| `[udp [<PORT-NUM>] \| tcp [<PORT-NUM> \| tls [<PORT-NUM>]]` | Specifies the UDP port, TCP port, or TLS port of the remote syslog server to receive the forwarded syslog messages. |
| `udp [<PORT-NUM>]` | Range: 1 to 65535. Default: 514 |
| `tcp [<PORT-NUM>]` | Range: 1 to 65535. Default: 1470 |
| `tls [<PORT-NUM>]` | Range: 1 to 65535. Default: 6514 |
| `auth-mode` | Specifies the TLS authentication mode used to validate the certificate.<br>■ **certificate**: Validates the peer using trust anchor certificate based authentication. Default.<br>■ **subject-name**: Validates the peer using trust anchor certificates as well as subject-name based authentication. |

| Parameter | Description |
|---|---|
| `disable` | Disable remote syslog confguration. This does not delete the configuration, just disables/pauses the forwarding of syslog messagesto the remote server. The config/forwarding can be reenabled (un-paused) again using the **no logging <hostname> disable** command. |
| `filter <FILTER-NAME>` | Specifies the name of the filter to be applied on the syslog messages. |
| `include-auditable-events` | Specifies that auditable messages are also logged to the remote syslog server. |
| `legacy-tls-renegotiation` | Enables the TLS connection with a remote syslog server supporting legacy renegotiation. |
| `rate-limit-burst <BURST>` | Specifies the rate limit for the messages sent to the remote syslog server. |
| `rate-limit-interval <INTERVAL>` | Specifies the rate limit interval in seconds. Default: 30 Seconds |
| `severity <LEVEL>` | Specifies the severity of the syslog messages:<br>■ **alert**: Forwards syslog messages with the severity of **alert (6)** and **emergency (7)**.<br>■ **crit**: Forwards syslog messages with the severity of **critical (5)** and above.<br>■ **debug**: Forwards syslog messages with the severity of **debug (0)** and above.<br>■ **emerg**: Forwards syslog messages with the severity of **emergency (7)** only.<br>■ **err**: Forwards syslog messages with the severity of **err (4)** and above<br>■ **info**: Forwards syslog messages with the severity of **info (1)** and above. Default.<br>■ **notice**: Forwards syslog messages with the severity of **notice (2)** and above.<br>■ **warning**: Forwards syslog messages with the severity of **warning (3)** and above. |
| `vrf <VRF-NAME>` | Specifies the VRF used to connect to the syslog server. Optional. Default: `default` |

## Examples

Enabling the syslog forwarding to remote syslog server 10.0.10.2:

```
switch(config)# logging 10.0.10.2
```

Enabling the syslog forwarding of messages with a severity of **err (4)** and above to TCP port 4242 on remote syslog server 10.0.10.9 with VRF **lab_vrf**:

```
switch(config)# logging 10.0.10.9 tcp 4242 severity err vrf lab_vrf
```

Disabling syslog forwarding to a remote syslog server:

```
switch(config)# no logging
```

Enabling syslog forwarding over TLS to a remote syslog server using subject-name authentication mode:

```
switch(config)#logging example.com tls auth-mode subject-name
```

Applying log filtering for syslog server forwarding:

```
switch(config)# logging 10.0.10.6 severity info filter filter_lldp_logs vrf mgmt
```

Applying log filtering and enabling the rate limit for syslog server forwarding over TCP port:

```
switch(config)# logging 10.0.10.2 tcp 3440 severity err vrf mgmt include-
auditable-events filter filter_lldp_logs rate-limit-burst 3 rate-limit-interval 35
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

### Command History

| All platforms | `config` | Administrators or local user group members with execution rights for this command. |

## logging accounting-format-native

```
logging accounting-format-native
[no] logging accounting-format-native
```

### Description

Change the accounting log message format to native Linux format. (Default: ArubaOS-CX format)

The 'no' form of this command will change the accounting log message format to ArubaOS-CX format.

### Usage

This option enables the switch to show all types of accounting records to the user. When configured, the same format will be used while sending messages to syslog servers. When upgrading from an earlier version of AOS-CX to AOS-CX 10.11 or later versions, if native accounting logs are preferred, then best practices is to issue this command as a part of the upgrade. If the switch upgrades from an earlier version to AOS-CX 10.11 or later without configuring this setting, by default, the accounting log message format will be ArubaOS-CX Format.

### Example

This example changes the accounting log message format to native Linux format.

```
switch(config)# logging accounting-format-native
```

The following example returns the accounting log message format to the default ArubaOS-CX format.

```
switch(config)# no logging accounting-format-native
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

### Command History

| Release | Modification |

## logging filter

```
logging filter <FILTER-NAME>

   [{enable | disable}]

   [<SEQUENCE-ID>] {permit | deny} [event-id <EVENT-ID-RANGE>] [includes <REGEX>]
   [severity <COMPARISON-OPERATOR> <LEVEL>]

   no <SEQUENCE-ID>

   resequence <OLD-SEQUENCE-ID> <NEW-SEQUENCE-ID>

no logging filter <FILTER-NAME>
```

### Description

Creates a filter to restrict what event or debug logs are logged. A filter can be used to either permit or deny:

- The event logs from being generated on the switch, or
- The event or debug logs generated on the switch from being forwarded to a syslog server.

A filter is identified by a filter name and can have up to 20 rules or entries, each with a different sequence number, matching criteria, and corresponding action (deny or permit). When a filter is applied on a log, the log is matched against the criteria mentioned in the rules or entries in ascending numerical order of their sequence numbers until a matching entry is found. Once a matching entry is found, its corresponding action is applied on the log. If no matching rule is found, the default action (permit) is applied.

The **no** form of this command removes the filter.

| Parameter | Description |
|---|---|
| `<FILTER-NAME>` | Specifies the unique name to identify the filter. |
| `enable` | Filter event logs generated on the switch. |
| `<SEQUENCE-ID>` | Specifies the filter criteria sequence number. Default: Increments by 10 from the largest sequence-id currently used in this filter. |
| `deny` | Prevents the matching log from being logged. |
| `permit` | Allows the matching log. |
| `<event-id>` | Matches logs by event ID. Specify an event ID or a range of event IDs. It supports a maximum of 100 event IDs. |
| `includes <REGEX>` | Matches the log message against a regular expression string. |
| `severity` | Matches the logs by severity level.<br>The following options are used to compare the severity:<br>■ **eq**: Match events of severity equal to the specified.<br>■ **ge**: Match events of severity greater than or equal to the specified.<br>■ **gt**: Match events of severity greater than the specified.<br>■ **le**: Match events of severity lesser than or equal to the specified.<br>■ **lt**: Match events of severity lesser than the specified.<br>The following are the severity levels:<br>■ **alert**: Logs with the severity **alert (6)**.<br>■ **crit**: Logs with the severity **critical (5)**.<br>■ **debug**: Logs with the severity **debug (0)**.<br>■ **emerg**: Logs with the severity **emergency (7)**.<br>■ **err**: Logs with the severity **err (4)**.<br>■ **info**: Logs with the severity **info (1)**.<br>■ **notice**: Logs with the severity **notice (2)**.<br>■ **warning**: Logs with the severity **warning (3)**. |

## Usage

**Filtering event logs on the switch**: To permit or deny event logs from being generated on the switch. In this case, the matching event logs are filtered at generation. The denied event logs are neither logged to the switch events nor forwarded to any remote syslog servers. Multiple filters can be configured, but only one filter can be applied to filter the events on the switch. Such a filter can be chosen by adding the **enable** command under its configuration. Configuring the **enable** command under a new filter automatically removes it from the filter where it was previously used.

For example:

```
logging filter low_severity_logs

enable

10 deny severity lt info
```

This configuration denies the event logs which have a severity less than info.

If a filter contains **enable** command, it is not recommended to configure this filter in the **logging** command used for remote syslog server configuration. This is because, any event logs denied by the filter are already not available for forwarding to a remote server.

A filter with **enable** command will not affect debug logs. Consider the configuration in the following example of a filter with **enable** command and two rules applied **10 permit severity ge info** and **20 deny**. This implies permit only those event logs which have severity greater than or equal to **info**.

**Example:**

```
logging filter low_severity_logs
enable
10 permit severity ge info
20 deny
```

**Filtering event or debug logs when forwarding to a remote syslog server**: The filter name must be configured in the logging command that is used to configure remote syslog server. The logs will be generated on the switch and the filter only decides whether to deny or permit the syslog forwarding for the matching log. For example: **logging 10.0.10.6 filter filter_lldp_logs**

The filter affects debug logs only when the command **debug destination syslog** is configured on the switch.

The severity mentioned in the remote syslog server configuration using logging command under configuration context has more precedence than the severity mentioned in a filter entry. If a log with **warning** severity is permitted by a filter, but the remote syslog configuration has severity **err** mentioned in it, the log will not be forwarded to the remote syslog server (since warning(3) is lesser than err(4)). On the other hand, if a log with **err** severity is permitted by a filter and the remote syslog configuration has severity **warning** mentioned in it, the log will be forwarded to the remote syslog server.

## Examples

Configuring a new logging filter:

```
switch(config)# logging filter example_filter
```

To deny logs having event ID 1301 and a range of event IDs from 1305 to 1309:

```
switch(config-logging-filter)# 20 deny event-id 1301,1305-1309
```

To permit logs having event ID 1300:

```
switch(config-logging-filter)# 30 permit event-id 1300
```

To permit logs with severity greater than or equal to `err`:

```
switch(config-logging-filter)# 30 permit severity ge err
```

To deny logs with severity greater than info:

```
switch(config-logging-filter)# 30 deny severity gt info
```

To deny logs with event ID 1024 and a message matching the regular expression LLDP:

```
switch(config-logging-filter)# 40 deny event-id 1024 includes LLDP
```

Denying all logs:

```
switch(config-logging-filter)# 40 deny
```

Changing the sequence ID of an existing rule:

```
switch(config-logging-filter)# resequence 20 70
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

## Command History

# logging facility

```
logging facility {local0 | local1 | local2 | local3 | local4 | local5 | local6 | local7}
no logging facility
```

## Description

Sets the logging facility to be used for remote syslog messages. Default: `local7`

The **no** form of this command disables the logging facility to be used for remote syslog messages.

| Parameter | Description |
|---|---|
| `{local0 \| local1 \| local2 \| local3 \| local4 \| local5 \| local6 \| local7}` | Selects the logging facility to be used for remote syslog messages. Required.<br>Specifies the severity of the syslog messages:<br>■ **local0**<br>■ **local1**<br>■ **local2**<br>■ **local3**<br>■ **local4**<br>■ **local5**<br>■ **local6**<br>■ **local7** |

## Examples

Sets the local5 logging facility to be used for remote syslog messages:

```
switch(config)# logging facility local5
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

## Command History

# logging persistent-storage

```
logging persistent-storage [severity {alert|crit|debug|emerg|err|info|notice|warning}]
no logging persistent-storage
```

## Description

Enables or disables storage of logs in storage. Only logs of the specified severity and above will be preserved in the storage.

The **no** form of this command disables storage of logs in storage.

| Parameter | Description |
|---|---|
| `severity <LEVEL>` | Specifies the severity of the syslog messages:<br>▪ **alert**: Preserves syslog messages with the severity of **alert (6)** and **emergency (7)**<br>▪ **crit**: Preserves syslog messages with the severity of **critical (5)** and above. Default.<br>▪ **debug**: Preserves syslog messages with the severity of **debug (0)** and above.<br>▪ **emerg**: Preserves syslog messages with the severity of **emergency (7)** only.<br>▪ **err**: Preserves syslog messages with the severity of **err (4)** and above.<br>▪ **info**: Preserves syslog messages with the severity of **info (1)** and above.<br>▪ **notice**: Preserves syslog messages with the severity of **notice (2)** and above.<br>▪ **warning**: Preserves syslog messages with the severity of **warning (3)** and above. |

## Usage

These logs can be copied out by using the **copy support-files all** or **copy support-files previous-boot**.

## Examples

Enabling storage of logs in storage with severity **info**:

```
switch(config)#logging persistent-storage severity info
Logs will be written to storage and made available across reboot.
Do you want to continue (y/n)?
```

Disabling storage of logs in storage:

```
switch(config)# no logging persistent-storage
```

For more information on features that use this command, refer to the Diagnostics and Supportability Guide for your switch model.

# Chapter 134

# RIPv2 (IPv4) commands

## Configuration commands

### router rip

```
router rip <PROCESS-ID> [vrf <VRF-NAME>]
no router rip <PROCESS-ID> [vrf <VRF-NAME>]
```

#### Description

Creates RIP process if not already created and enters the **router rip <PROCESS-ID>** context for the VRF mentioned. If no VRF is mentioned, a default is used. Only one RIP process is allowed per VRF.

The **no** form of this command deletes the RIP instance for the VRF. If no VRF is mentioned the default is deleted.

| Parameter | Description |
|---|---|
| *<PROCESS-ID>* | Specifies name of the RIP process ID. Range: 1-63. |
| *vrf <VRF-NAME>* | Specifies VRF name. |

#### Examples

Creating RIP process and naming the VRF:

```
switch(config)# router rip 2 vrf red
```

Deleting RIP process:

```
switch(config)# no router rip 2 vrf red
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

#### Command History

# Interface commands

## ip rip

```
ip rip <PROCESS-ID> {all-ip | ip-address}
no ip rip <PROCESS-ID> {all-ip | ip-address}
```

### Description

Enables RIP process on an interface.

The **no** form of this command deletes the RIP process from an interface.

| Parameter | Description |
|---|---|
| `ip rip <PROCESS-ID>` | Specifies RIP process ID. Range: 1-63. |
| `all-ip` | Specifies RIP for all IP addresses configured on the interface. |
| `ip-address` | Specifies IP address for RIP on the interface. |

### Usage

- If an IP address is removed from an interface configured with RIP, all RIP configurations will be removed from the interface.
- If **ip rip *1* all-ip** is configured and a new IP address is added to the interface, RIP configurations will not be applicable for the newly added IP address.

### Examples

Configuring RIP for all IP addresses configured on the interface:

```
switch(config)# interface 1/1/1
switch(config-if)# ip rip 1 all-ip
```

Deleting RIP for all IP addresses configured on the interface:

```
switch(config)# interface 1/1/1
switch(config-if)# no ip rip 1 all-ip
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

## ip rip all-ip enable

```
ip rip all-ip enable
no ip rip all-ip enable
```

### Description

Enables RIP process for all RIP enabled IP addresses configured on interface.

The **no** form of this command disables RIP process on the interface.

### Usage

- Default settings allow an interface to receive RIP packets.
- If an IP address is removed from an interface configured with RIP, all RIP configurations will be removed from the interface.

### Examples

Enabling RIP process for all RIP enabled IP addresses on interface:

```
switch(config)# interface 1/1/1
switch(config-if)# ip rip all-ip enable
```

Disabling RIP process on interface:

```
switch(config)# interface 1/1/1
switch(config-if)# no ip rip all-ip enable
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

## ip rip all-ip disable

```
ip rip all-ip disable
no ip rip all-ip disable
```

### Description

Disables RIP process for all RIP enabled IP addresses configured on the interface.

The **no** form of this command enables RIP process for all RIP enabled IP addresses configured on the interface.

### Usage

- Default settings allow an interface to receive RIP packets.
- If an IP address is removed from an interface configured with RIP, all RIP configurations will be removed from the interface.

### Examples

Disabling RIP process for all RIP enabled IP addresses on interface:

```
switch(config)# interface 1/1/1
switch(config-if)# ip rip all-ip enable
```

Enabling RIP process for all RIP enabled IP addresses on interface:

```
switch(config)# interface 1/1/1
switch(config-if)# no ip rip all-ip enable
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

# ip rip all-ip send disable

```
ip rip all-ip send disable
no ip rip all-ip send disable
```

## Description

Disables interface from sending RIP packets for all RIP enabled IP addresses.

The **no** form of this command enables interface to send RIP packets for all RIP enabled IP addresses.

## Usage

- Default settings allow an interface to send RIP packets.
- If an IP address is removed from an interface configured with RIP, all RIP configurations will be removed from the interface.

## Examples

Disabling interface from sending RIP packets for all RIP enabled IP addresses on interface:

```
switch(config)# interface 1/1/1
switch(config-if)# ip rip all-ip send disable
```

Enabling interface to send RIP packets for all RIP enabled IP addresses on interface:

```
switch(config)# interface 1/1/1
switch(config-if)# no ip rip all-ip send disable
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

# ip rip all-ip receive disable

```
ip rip all-ip receive disable
no ip rip all-ip receive disable
```

## Description

Disables interface from receiving RIP packets for all enabled IP addresses.

The **no** form of this command enables interface to receive RIP packets for all RIP enabled IP addresses.

### Usage

- Default settings allow an interface to receive RIP packets.
- If an IP address is removed from an interface configured with RIP, all RIP configurations will be removed from the interface.

### Examples

Disabling interface from receiving RIP packets for all RIP enabled IP addresses on interface:

```
switch(config)# interface 1/1/1
switch(config-if)# ip rip all-ip receive disable
```

Enabling interface to receive RIP packets for all RIP enabled IP addresses on interface:

```
switch(config)# interface 1/1/1
switch(config-if)# no ip rip all-ip receive disable
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

# Routing commands

## enable

```
enable
no enable
```

### Description

Enables RIP process if disabled. By default RIP process is enabled.

The **no** form of this command disables the RIP process.

### Examples

Enabling RIP process when disabled:

```
switch(config)# router rip 1
switch(config-rip-1)# enable
```

Disabling RIP process when enabled:

```
switch(config)# router rip 1
switch(config-rip-1)# no enable
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |

|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## disable

```
disable
no disable
```

### Description

Disables RIP process.

The **no** form of this command enables the RIP process.

### Examples

Disabling RIP process:

```
switch(config)# router rip 1
switch(config-rip-1)# disable
```

Enabling RIP process:

```
switch(config)# router rip 1
switch(config-rip-1)# no disable
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## distance

```
distance <DISTANCE>
no distance
```

### Description

Configures administrative distance for RIP. Administrative distance is used as criteria to select the best route when multiple protocols have the same route.

The **no** form of this command sets the RIP administrative distance to the default. Default: 120.

| Parameter | Description |
|---|---|
| *<DISTANCE>* | Specifies RIP administrative distance. Range: 1 to 255. |

### Examples

Configuring administrative distance for RIP:

```
switch(config)# router rip 1
switch(config-rip-1)# distance 100
```

Setting administrative distance for RIP to default values:

```
switch(config)# router rip 1
switch(config-rip-1)# no distance
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |

| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## maximum-paths

```
maximum-paths <MAX-VALUE>
no maximum-paths
```

### Description

Sets the maximum number of ECMP routes that RIP can support.

The **no** form of this command sets the maximum number of ECMP routes to the default value of 4.

| Parameter | Description |
|---|---|
| *<MAX-VALUE>* | Sets the number of RIP ECMP routes. Range: 1-8. |

### Examples

Setting maximum number of RIP ECMP routes:

```
switch(config)# router rip 1
switch (config-rip-1)# maximum-paths 8
```

Setting maximum number of RIP ECMP routes to default:

```
switch(config)# router rip 1
switch (config-rip-1)# no maximum-paths
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## redistribute

```
redistribute {bgp | connected | ospf <PROCESS-ID> | static}
no redistribute {bgp | connected | ospf <PROCESS-ID> | static}
```

### Description

Redistributes routes originating from other protocols into RIP.

The **no** form of this command disables redistribution of routes originating from other protocols into RIP.

| Parameter | Description |
|---|---|
| `bgp` | Specifies BGP routes to redistribute into RIP. |
| `connected` | Specifies connected routes (directly attached subnet or host) to redistribute into RIP. |
| `ospf` *`<PROCESS-ID>`* | Specifies the OSPF route to redistribute into RIP. Range: <1-65535> |
| `static` | Specifies static route to redistribute into RIP. |

### Examples

Redistributing BGP routes into RIP:

```
switch(config)# router rip 1
switch(config-rip-1)# redistribute bgp
```

Disabling BGP routes that originate from other protocols and redistribute into RIP:

```
switch(config)# router rip 1
switch(config-rip-1)# no redistribute bgp
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.14 | Supported process ID range expanded from 1-63 to 1-65535. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## timers update

```
timers update <INTERVAL> timeout <DURATION> garbage-collection <PERIOD>
no timers
```

### Description

Configures RIP timers with specific values.

The **no** form of this command sets all RIP timers to default values.

| Parameter | Description |
|---|---|
| `timers update <INTERVAL>` | Specifies frequency at which RIP sends updates to all of its peers. Range: 1 to 2147484. Default: 30. |
| `timeout <DURATION>` | Specifies timeout duration from the point of the last refresh after a route is received from a peer timeout and is marked as expired. Range: 1 to 255. Default: 180. |
| `garbage-collection <PERIOD>` | Specifies amount of time route remains in routing table after route expiration. Range: 1 to 255. Default: 120. |

### Examples

Configuring RIP timers with specific values:

```
switch(config)# router rip 1
switch(config-rip-1)# timers update 40 timeout 200 garbage-collection 150
```

Configuring RIP timers with default values:

```
switch(config)# router rip 1
switch(config-rip-1)# no timers
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

# RIPv2 clear commands

## clear ip rip statistics

`clear ip rip [<PROCESS-ID>] statistics [all-vrfs | vrf <VRF-NAME>]`

### Description

Clears RIP event statistics.

| Parameter | Description |
|---|---|
| *<PROCESS-ID>* | Specifies RIP process ID. Range: 1-63 |
| all-vrfs | Clears statistics for all VRFs. |
| vrf | Selects VRF to clear statistics for. |
| *<VRF-NAME>* | Specifies VRF name. |

### Examples

Clearing RIP event statistics:

```
switch# clear ip rip statistics
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Administrators or local user group members with execution rights for this command. |

# RIPv2 interface commands

## enable

```
enable
no enable
```

### Description

Enables RIP process for RIP enabled IP address configured on interface.

The **no** form of this command disables RIP process on interface.

### Usage

- Default settings allow an interface to receive RIP packets.
- If an IP address is removed from an interface configured with RIP, all RIP configurations will be removed from the interface.

### Examples

Enabling RIP process for RIP enabled IP address:

```
switch(config)# interface 1/1/1
switch(config-if)# ip rip 1 10.1.1.1
switch(config-if-rip)# enable
```

Disabling RIP process on interface:

```
switch(config)# interface 1/1/1
switch(config-if)# ip rip 1 10.1.1.1
switch(config-if-rip)# no enable
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-if` | Administrators or local user group members with execution rights for this command. |

## disable

```
disable
no disable
```

### Description

Disables RIP process for RIP enabled IP addresses configured on interface.

The **no** form of this command enables RIP process on interface.

### Examples

Disabling RIP process for RIP enabled IP addresses configured on interface:

```
switch(config)# interface 1/1/1
switch(config-if)# ip rip 1 10.1.1.1
switch(config-if-rip)# disable
```

Enabling RIP process on interface:

```
switch(config)# interface 1/1/1
switch(config-if)# ip rip 1 10.1.1.1
switch(config-if-rip)# no disable
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-if` | Administrators or local user group members with execution rights for this command. |

## send disable

```
send disable
no send disable
```

### Description

Disables an interface from sending RIP packets for a specific IP address.

The **no** form of this command enables interface for sending RIP packets for a specific IP address.

### Usage

- Default settings allow an interface to send and receive RIP packets.
- If an IP address is removed from an interface configured with RIP, all RIP configurations will be removed from the interface.

### Examples

Disabling interface from sending RIP packets for a specific IP address :

```
switch(config)# interface 1/1/1
switch(config-if)# ip rip 1 10.1.1.1
switch(config-if-rip)# send disable
```

Enabling interface to send RIP packets for a specific IP address:

```
switch(config)# interface 1/1/1
switch(config-if)# ip rip 1 10.1.1.1
switch(config-if-rip)# no send disable
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-if` | Administrators or local user group members with execution rights for this command. |

## receive disable

```
receive disable
no receive disable
```

### Description

Disables interface from receiving RIP packets for a specific IP address.

The **no** form of this command enables interface for receiving RIP packets for a specific IP address.

### Usage

- Default settings allow an interface to receive RIP packets.
- If an IP address is removed from an interface configured with RIP, all RIP configurations will be removed from the interface.

### Examples

Disabling interface from receiving RIP packets for a specific IP address:

```
switch(config)# interface 1/1/1
switch(config-if)# ip rip 1 10.1.1.1
switch(config-if-rip)# receive disable
```

Enabling interface for receiving RIP packets for a specific IP address:

```
switch(config)# interface 1/1/1
switch(config-if)# ip rip 1 10.1.1.1
switch(config-if-rip)# no receive disable
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |

| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-if` | Administrators or local user group members with execution rights for this command. |

# RIPv2 show commands

## show capacities rip

```
show capacities rip
```

### Description

Displays maximum number of RIP interfaces, routes and process.

### Examples

Displaying maximum number of RIP interfaces, routes and process:

```
switch# show capacities rip

System Capacities: Filter RIP
Capacities Name                                                             Value
----------------------------------------------------------------------------------
Maximum number of RIP interfaces configurable in the system                 32
Maximum number of RIP processes supported across each VRF                   1
Maximum number of routes in RIP supported across all VRFs                   2540
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Auditors or Administrators or local user group members with execution rights for this command. Auditors can execute this command from the auditor context (auditor>) only. |

## show capacities-status rip

```
show capacities-status rip
```

### Description

Displays number of RIP interfaces, routes and process configured in the system.

## Examples

Displaying number of RIP interfaces, routes and process:

```
switch# show capacities-status rip

System Capacities Status: Filter RIP
Capacities Name                                          Value Maximum
----------------------------------------------------------------------
Number of RIP interfaces configured in the system            0      32
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Auditors or Administrators or local user group members with execution rights for this command. Auditors can execute this command from the auditor context (auditor>) only. |

# show ip rip

```
show ip rip [<PROCESS-ID>] [all-vrfs | vrf <VRF-NAME>]
```

## Description

Displays general RIP configuration.

| Parameter | Description |
|---|---|
| *<PROCESS-ID>* | Specifies RIP process ID. Range: 1-63. |
| all vrfs | Displays general RIP information for all VRFs. |
| vrf | Selects VRF to display general RIP information for. |
| *<VRF-NAME>* | Specifies VRF name. |

## Usage

- Parameters display general RIP information for a specific RIP process.
- Parameters display general RIP information for a specific or all VRFs.
- If a VRF is not mentioned, information for the default VRF is displayed.

## Examples

Displaying general RIP configuration for all VRFs:

```
switch# show ip rip 34 all-vrfs
VRF : Default                       Process-ID : 34
---------------------------------------------------------------------
RIP Version             : RIPv2     Protocol Status : Enabled
Update Time             : 60  sec   Timeout Time    : 240 sec
Garbage Collection Time : 250 sec   ECMP            : 6
Distance                : 100       Redistribution  : static,
                                                      ospf 1

VRF : vrf_1                         Process-ID : 34
---------------------------------------------------------------------
RIP Version             : RIPv2     Protocol Status : Enabled
Update Time             : 30  sec   Timeout Time    : 180 sec
Garbage Collection Time : 120 sec   ECMP            : 4
Distance                : 120       Redistribution  : None
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Auditors or Administrators or local user group members with execution rights for this command. Auditors can execute this command from the auditor context (auditor>) only. |

## show ip rip interface

show ip rip [*<PROCESS-ID>*] interface [*<INTERFACE-NAME>*] [brief] [all-vrfs | vrf *<VRF-NAME>*]

### Description

Displays information about RIP enabled interfaces.

| Parameter | Description |
|---|---|
| *<PROCESS-ID>* | Specifies RIP process ID. Range: 1-63. |
| *<INTERFACE-NAME>* | Specifies interface. |
| brief | Shows brief overview information for the RIP interface. |
| all-vrfs | Displays interface information for all VRFs. |

| Parameter | Description |
|---|---|
| `vrf` | Selects specific VRF. |
| *<VRF-NAME>* | Specifies VRF. |

## Usage

- Parameters display general RIP information for a specific RIP process.
- If a VRF is not mentioned, information for the default VRF is displayed.

## Examples

```
switch# show ip rip interface
Interface 1/1/1 is up, IP Address is 10.10.10.1/24
-----------------------------------------------------------------------
VRF             : Default            Process-ID     : 1
Status          : Oper Up            Mode           : Send and Receive
MTU             : 500                Version        : RIPv2
Poision Reverse : Enabled

Interface 1/1/2 is up, IP Address is 20.10.10.1/24
-----------------------------------------------------------------------
VRF             : Default            Process-ID     : 1
Status          : Admin Down         Mode           : Receive
MTU             : 500                Version        : RIPv2
Poision Reverse : Enabled

Interface 1/1/3 is up, IP Address is 30.10.10.1/24
-----------------------------------------------------------------------
VRF             : Default            Process-ID     : 1
Status          : Admin Down         Mode           : Send
MTU             : 500                Version        : RIPv2
Poision Reverse : Enabled

switch# show ip rip interface brief
VRF : default   Process-ID : 1
-------------------------------

Total Number of Interfaces: 2

Interface     IP-Address/Mask    Status    MTU
--------------------------------------------------
1/1/1         10.10.10.1/24       up       500
1/1/2         20.10.10.1/24       up       500
1/1/3         30.10.10.1/24       up       500
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

## Command History

| Release | Modification |

|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Auditors or Administrators or local user group members with execution rights for this command. Auditors can execute this command from the auditor context (auditor>) only. |

## show ip rip neighbors

`show ip rip [<PROCESS-ID>] neighbors [<IP-ADDRESS>] [all-vrfs | vrf <VRF-NAME>]`

### Description

Displays information about RIP neighbors.

| Parameter | Description |
|---|---|
| *<PROCESS-ID>* | Specifies RIP process ID. Range: 1-63. |
| *<IP-ADDRESS>* | Specifies IP address of a specific neighbor to display information on. |
| `all-vrfs` | Displays neighbor information for all VRFs. |
| `vrf` | Selects VRF to display neighbor information. |
| *<VRF-NAME>* | Specifies VRF name. |

### Usage

- Parameters display RIP neighbor information for a specific RIP process.
- Parameters display RIP neighbor information for a specific neighbor.
- If a VRF is not mentioned, information for the default VRF is displayed.

### Examples

Displaying RIP neighbor information for all VRFs:

```
switch# show ip rip neighbors all-vrfs
VRF : default            Process-ID : 1
----------------------------------------

Total Number of Neighbors: 1

Peer-Address   Type    Last-Update  Rcvd-Bad-Pkts    Rcvd-Bad-Routes
------------------------------------------------------------------
1.1.1.2        RIPv2   0:0:7        4                5
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Auditors or Administrators or local user group members with execution rights for this command. Auditors can execute this command from the auditor context (auditor>) only. |

## show ip rip routes

```
show ip rip [<PROCESS-ID>] routes [<PREFIX/LENGTH>] [all-vrfs | vrf <VRF-NAME>]
```

### Description

Displays RIP routing table for a specific RIP process.

| Parameter | Description |
|---|---|
| *<PROCESS-ID>* | Specifies RIP process ID to display information for a specific RIP process. Range: 1-63. |
| *<PREFIX/LENGTH>* | Specifies the network prefix. |
| all-vrfs | Displays RIP routing information for all VRFs. |
| vrf | Selects VRF to display RIP routing information. |
| *<VRF-NAME>* | Specifies VRF name. |

### Usage

- *<PREFIX/LENGTH>* is an optional parameter that displays RIP routing table information for a specific subnet.
- If a VRF is not mentioned, information for the default VRF is displayed.

### Examples

Displaying RIP routing table for all VRFs:

```
switch# show ip rip routes all-vrfs
VRF : default              Process-ID : 1
----------------------------------------
Total Number of Routes : 6

Prefix              Metric     Interface      Nexthop
--------------------------------------------------------
10.1.0.0/16           2          1/1/1         30.1.1.2
20.1.2.0/24           3          1/1/1         30.1.1.2
30.1.1.0/24           1          1/1/1

VRF : vrf_1                Process-ID : 34
----------------------------------------

Prefix               Metric     Interface      Nexthop
--------------------------------------------------------
20.1.0.0/16           10         1/1/2          50.1.1.2
```

```
40.1.2.0/24          14        1/1/2         50.1.1.2
50.1.1.0/24           1        1/1/2

```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Auditors or Administrators or local user group members with execution rights for this command. Auditors can execute this command from the auditor context (auditor>) only. |

## show ip rip statistics

```
show ip rip [<PROCESS-ID>] statistics [all-vrfs | vrf <VRF-NAME>]
```

### Description

Displays RIP statistics.

| Parameter | Description |
|---|---|
| *<PROCESS-ID>* | Specifies RIP process ID. Range: 1-63. |
| all-vrfs | Displays statistics information for all VRFs. |
| vrf | Selects VRF to display RIP statistics information for. |
| *<VRF-NAME>* | Specifies VRF name. |

### Usage

- Parameters can display information for all VRFs or a specific VRF.
- If a VRF is not mentioned, information for the default VRF is displayed.

### Examples

Displaying RIP statistics for all VRFs:

```
switch# show ip rip statistics all-vrfs
VRF : default  Process-ID : 1
-------------------------------------

Global Route Changes : 50
Global Queries       : 2
```

```
Last Cleared         : 0h 30m 28s ago

VRF : vrf_1    Process-ID : 34
-------------------------------------

Global Route Changes : 20
Global Queries       : 0
Last Cleared         : 0h 30m 28s ago
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|

| 6300<br>6400 | Operator (>) or Manager (#) | Auditors or Administrators or local user group members with execution rights for this command. Auditors can execute this command from the auditor context (auditor>) only. |

## show ip rip statistics interface

`show ip rip [<PROCESS-ID>] statistics interface [<INTERFACE-NAME>] [all-vrfs | vrf <VRF-NAME>]`

### Description

Displays RIP statistics for RIP enabled interfaces.

| Parameter | Description |
|---|---|
| *<PROCESS-ID>* | Specifies RIP process ID. Range: 1-63. |
| *<INTERFACE-NAME>* | Specifies name of interface. |
| `all-vrfs` | Displays RIP interface statistics for all VRFs. |
| `vrf` | Selects VRF to display RIP interface statistics. |
| *<VRF-NAME>* | Specifies VRF name. |

### Usage

- Parameters can display information for all VRFs or a specific VRF.
- If a VRF is not mentioned, information for the default VRF is displayed.

### Examples

Displaying RIP statistics for a RIP enabled interface:

```
switch# show ip rip statistics interface 1/1/1
VRF : default  Process-ID : 1      interface 1/1/1
--------------------------------------------------

IP-Address    Trigger-Updates    Rcvd-Bad-Packets    Rcvd-Bad-Routes
-----------------------------------------------------------------------
10.1.1.1      15                 3                   4

Last Cleared : 0h 30m 28s ago
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |

# Chapter 135

# RIPng (IPv6) commands

## Configuration commands

### router ripng

```
router ripng <PROCESS-ID> [vrf <VRF-NAME>]
no router ripng <PROCESS-ID> [vrf <VRF-NAME>]
```

#### Description

Creates RIPng process if not already created and enters the **router ripng <PROCESS-ID>** context for the VRF mentioned. If no VRF is mentioned, a default is used. Only one RIPng process is allowed per VRF.

The **no** form of this command deletes the RIPng instance for the VRF. If no VRF is mentioned the default is deleted.

| Parameter | Description |
|---|---|
| *<PROCESS-ID>* | Specifies name of the RIPng process ID. Range: <1-63> |
| vrf | Sets VRF name for RIPng process. |
| *<VRF-NAME>* | VRF name for VRF. |

#### Examples

Creating RIPng process and naming the VRF:

```
switch(config)# router ripng 2 vrf red
```

Deleting RIPng process:

```
switch(config)# no router ripng 2 vrf red
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

#### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

#### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

# Interface commands

## ipv6 ripng

```
ipv6 ripng <PROCESS-ID>
no ipv6 ripng <PROCESS-ID>
```

### Description

Enables RIPng process on interface and creates a new context.

The **no** form of this command deletes RIPng process on interface.

| Parameter | Description |
|---|---|
| *<PROCESS-ID>* | Specifies RIPng process ID. Range: 1-63. |

### Examples

Enabling RIPng process on an interface:

```
switch(config)# interface 1/1/1
switch (config-if)# ipv6 ripng 1
switch (config-if-ripng)#
```

Deleting RIPng process on an interface:

```
switch(config)# interface 1/1/1
switch (config-if)# no ipv6 ripng 1
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-if` | Administrators or local user group members with execution rights for this command. |

# Routing commands

## enable

```
enable
no enable
```

### Description

Enables RIPng process if disabled. By default RIPng process is enabled.

The **no** form of this command disables the RIPng process.

### Examples

Enabling RIPng process when disabled:

```
switch(config)# router ripng 1
switch(config-ripng-1)# enable
```

Disabling RIPng process when enabled:

```
switch(config)# router ripng 1
switch(config-ripng-1)# no enable
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | config | Administrators or local user group members with execution rights for this command. |

## disable

```
disable
no disable
```

### Description

Disables RIPng process.

The **no** form of this command enables the RIPng process.

### Examples

Disabling RIPng process:

```
switch(config)# router ripng 1
switch(config-ripng-1)# disable
```

Enabling RIPng process:

```
switch(config)# router ripng 1
switch(config-ripng-1)# no disable
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## distance

```
distance <DISTANCE>
no distance
```

### Description

Configures administrative distance for RIPng. Administrative distance is used as criteria to select the best route when multiple protocols have the same route.

The **no** form of this command sets the RIPng administrative distance to the default. Default: 120.

| Parameter | Description |
|---|---|
| *<DISTANCE>* | Specifies RIPng administrative distance. Range: 1 to 255. |

### Examples

Configuring administrative distance for RIPng:

```
switch(config)# router ripng 1
switch(config-ripng-1)# distance 100
```

Setting administrative distance for RIPng to default values:

```
switch(config)# router ripng 1
switch(config-ripng-1)# no distance
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## maximum-paths

```
maximum-paths <MAX-VALUE>
no maximum-paths
```

### Description

Sets the maximum number of ECMP routes that RIPng can support.

The **no** form of this command sets the maximum number of ECMP routes to the default value of 4.

| Parameter | Description |
|---|---|
| *<MAX-VALUE>* | Sets the number of RIPng ECMP routes. Range: 1-8. |

### Examples

Setting maximum number of RIPng ECMP routes:

```
switch(config)# router ripng 1
switch (config-ripng-1)# maximum-paths 8
```

Setting maximum number of RIPng ECMP routes to default:

```
switch(config)# router ripng 1
switch (config-ripng-1)# no maximum-paths
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## redistribute

```
redistribute {bgp | connected | ospfv3 <PROCESS-ID> | static}
no redistribute {bgp | connected | ospfv3 <PROCESS-ID> | static}
```

### Description

Redistributes routes originating from other protocols into RIPng.

The **no** form of this command disables redistribution of routes originating from other protocols into RIPng.

| Parameter | Description |
|---|---|
| `bgp` | Specifies BGP routes to redistribute into RIPng. |
| `connected` | Specifies connected routes (directly attached subnet or host) to redistribute into RIPng. |
| `ospfv3 <PROCESS-ID>` | Specifies the OSPFv3 route to redistribute into RIPng. Range: <1-65535> |
| `static` | Specifies static route to redistribute into RIPng. |

### Examples

Redistributing BGP routes into RIPng:

```
switch(config)# router ripng 1
switch(config-ripng-1)# redistribute bgp
```

Disabling BGP routes that originate from other protocols and redistribute into RIPng:

```
switch(config)# router ripng 1
switch(config-ripng-1)# no redistribute bgp
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.14 | Supported process ID range expanded from 1-63 to 1-65535. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## timers update

```
timers update <INTERVAL> timeout <DURATION> garbage-collection <PERIOD>
no timers
```

### Description

Configures RIPng timers with specific values.

The **no** form of this command sets all RIPng timers to default values.

| Parameter | Description |
|---|---|
| `timers update <INTERVAL>` | Specifies frequency at which RIPng sends updates to all of its peers. Range: 1 to 2147484. Default: 30. |
| `timeout <DURATION>` | Specifies timeout duration from the point of the last refresh after a route is received from a peer timeout and is marked as expired. Range: 1 to 255. Default: 180. |
| `garbage-collection <PERIOD>` | Specifies amount of time route remains in routing table after route expiration. Range: 1 to 255. Default: 120. |

### Examples

Configuring RIPng timers with specific values:

```
switch(config)# router ripng 1
switch(config-ripng-1)# timers update 40 timeout 200 garbage-collection 150
```

Configuring RIPng timers with default values:

```
switch(config)# router ripng 1
switch(config-ripng-1)# no timers
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

# RIPng clear commands

## clear ipv6 ripng statistics

```
clear ipv6 ripng [<PROCESS-ID>] statistics [all-vrfs | vrf <VRF-NAME>]
```

### Description

Clears RIPng event statistics.

| Parameter | Description |
|---|---|
| *<PROCESS-ID>* | Specifies RIPng process ID. Range: 1-63 |
| `all-vrfs` | Clears statistics for all VRFs. |
| `vrf` | Selects VRF to clear statistics for. |
| *<VRF-NAME>* | Specifies VRF name. |

### Examples

Clearing RIPng event statistics:

```
switch# clear ipv6 ripng statistics
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Administrators or local user group members with execution rights for this command. |

# RIPng interface commands

## enable

```
enable
no enable
```

### Description

Enables RIPng process on interface.

The **no** form of this command disables RIPng process on interface.

### Examples

Enabling RIPng process on interface:

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 ripng 1
switch(config-if-ripng)# enable
```

Disabling RIPng process on interface:

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 ripng 1
switch(config-if-ripng)# no enable
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-if` | Administrators or local user group members with execution rights for this command. |

## disable

```
disable
no disable
```

### Description

Disables RIPng process on interface.

The **no** form of this command enables RIPng process on interface.

### Examples

Disabling RIP process for all RIP enabled IP addresses on interface:

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 ripng 1
switch(config-if-ripng)# disable
```

Enabling RIP process for all RIP enabled IP addresses on interface:

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 ripng 1
switch(config-if-ripng)# no disable
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-if` | Administrators or local user group members with execution rights for this command. |

## send disable

```
send disable
no send disable
```

### Description

Disables interface from sending RIPng packets. An interface can send RIPng packets by default.

The **no** form of this command enables interface to send RIPng packets, if disabled.

### Examples

Disabling interface from sending RIPng packets:

```
switch(config)# interface 1/1/1
switch (config-if)# ipv6 ripng 1
switch (config-if-ripng)# send disable
```

Enabling interface to send RIPng packets:

```
switch(config)# interface 1/1/1
switch (config-if)# ipv6 ripng 1
switch (config-if-ripng)# no send disable
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-if` | Administrators or local user group members with execution rights for this command. |

## receive disable

```
receive disable
no receive disable
```

### Description

Disables interface from receiving RIPng packets for all enabled IP addresses. An interface can receive RIPng packets by default.

The **no** form of this command enables interface to receive RIPng packets, if disabled.

### Examples

Disabling interface from receiving RIPng packets:

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 ripng 1
switch (config-if-ripng)# receive disable
```

Enabling interface to receive RIPng packets when disabled:

```
switch(config)# interface 1/1/1
switch(config-if)# ipv6 ripng 1
switch (config-if-ripng)# no receive disable
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-if` | Administrators or local user group members with execution rights for this command. |

# RIPng show commands

## show capacities ripng

```
show capacities ripng
```

### Description

Displays the maximum number of RIPng interfaces, routes and process.

### Examples

Displaying maximum number of RIPng interfaces, routes and process:

```
switch# show capacities ripng

System Capacities: Filter RIPng
Capacities Name                                                       Value
----------------------------------------------------------------------------
Maximum number of RIPng interfaces configurable in the system         32
Maximum number of RIPng processes supported across each VRF           1
Maximum number of routes in RIPng supported across all VRFs           2540
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Auditors or Administrators or local user group members with execution rights for this command. Auditors can execute this command from the auditor context (auditor>) only. |

## show capacities-status ripng

```
show capacities-status ripng
```

### Description

Displays number of RIPng interfaces, routes and process configured in the system.

### Examples

Displaying number of RIPng interfaces, routes and process:

```
switch# show capacities-status ripng

System Capacities Status: Filter RIPng
Capacities Name
          Value  Maximum
----------------------------------------------------------------------------------
-------------------------
Number of RIPng interfaces configured in the system
              0       32
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Auditors or Administrators or local user group members with execution rights for this command. Auditors can execute this command from the auditor context (auditor>) only. |

## show ipv6 ripng

```
show ipv6 ripng [<PROCESS-ID>] [all-vrfs | vrf <VRF-NAME>]
```

### Description

Displays general RIPng configuration.

| Parameter | Description |
|---|---|
| *<PROCESS-ID>* | Specifies RIPng process ID. Range: 1-63. |
| `all vrfs` | Displays general RIPng information for all VRFs. |
| `vrf` | Selects VRF to display general RIPng information for. |
| *<VRF-NAME>* | Specifies VRF name. |

### Usage

- Parameters display general RIPng information for a specific RIPng process.
- Parameters display general RIPng information for a specific or all VRFs.
- If a VRF is not mentioned, information for the default VRF is displayed.

### Examples

Displaying general RIPng configuration for all VRFs:

```
switch# show ipv6 ripng 34 all-vrfs
VRF : Default                       Process-ID : 34
---------------------------------------------------------------------
Protocol Status         : Enabled   ECMP            : 6
Update Time             : 60   sec  Timeout Time    : 240 sec
Garbage Collection Time : 250 sec   Distance        : 100
Redistribution          : static,
                          ospfv3 1

VRF : vrf_1                         Process-ID : 34
---------------------------------------------------------------------
Protocol Status         : Enabled   ECMP            : 4
Update Time             : 30   sec  Timeout Time    : 180 sec
Garbage Collection Time : 120 sec   Distance        : 120
Redistribution          : None
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Auditors or Administrators or local user group members with execution rights for this command. Auditors can execute this command from the auditor context (auditor>) only. |

## show ipv6 ripng interface

`show ipv6 ripng [<PROCESS-ID>] interface [<INTERFACE-NAME>] [brief] [all-vrfs | vrf <VRF-NAME>]`

### Description

Displays information about RIPng enabled interfaces.

| Parameter | Description |
|---|---|
| *<PROCESS-ID>* | Specifies RIPng process ID. Range: 1-63. |

| Parameter | Description |
|---|---|
| *<INTERFACE-NAME>* | Specifies interface. |
| brief | Shows brief overview information for RIPng interface. |
| all-vrfs | Displays interface information for all VRFs. |
| vrf | Selects specific VRF. |
| *<VRF-NAME>* | Specifies VRF. |

## Usage

- Parameters display general RIPng information for a specific RIPng process.
- Parameters display general RIPng information for a specific or all VRFs.
- If a VRF is not mentioned, information for the default VRF is displayed.

## Examples

```
switch# show ipv6 ripng interface
Interface 1/1/1 is up, IPv6 Address is fe80::7272:cfff:fe70:67a
-----------------------------------------------------------------------
VRF             : Default            Process-ID      : 1
Status          : Oper Up            Mode            : Send and Receive
MTU             : 500                Poision Reverse : Enabled

Interface 1/1/2 is up, IPv6 Address is fe80::7272:cfff:fe70:67a
-----------------------------------------------------------------------
VRF             : Default            Process-ID      : 1
Status          : Admin Down         Mode            : Receive
MTU             : 500                Poision Reverse : Enabled

Interface 1/1/3 is up, IPv6 Address is fe80::7272:cfff:fe70:67a
-----------------------------------------------------------------------
VRF             : Default            Process-ID      : 1
Status          : Admin Down         Mode            : Send
MTU             : 500                Poision Reverse : Enabled

switch# show ipv6 ripng interface brief
VRF : default   Process-ID : 1
-------------------------------

Total Number of Interfaces: 2

Interface     IPv6-Address                   Status    MTU
-----------------------------------------------------------
1/1/1         fe80::7272:cfff:fe70:67a       up        500
1/1/2         fe80::7272:cfff:fe71:67a       up        500
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Auditors or Administrators or local user group members with execution rights for this command. Auditors can execute this command from the auditor context (auditor>) only. |

## show ipv6 ripng neighbors

`show ipv6 ripng [<PROCESS-ID>] neighbors [<LINK-LOCAL-ADDRESS>] [all-vrfs | vrf <VRF-NAME>]`

### Description

Displays information about RIPng neighbors.

| Parameter | Description |
|---|---|
| *<PROCESS-ID>* | Specifies RIPng process ID. Range: 1-63. |
| `neighbors` | Specifies neighbor IP address. |
| *<LINK-LOCAL-ADDRESS>* | Specifies link-local address. |
| `all-vrfs` | Displays neighbor information for all VRFs. |
| `vrf` | Selects VRF to display neighbor information. |
| *<VRF-NAME>* | Specifies VRF name. |

### Usage

- Parameters display RIPng neighbor information for a specific RIPng process.
- Parameters display RIPng neighbor information for a specific neighbor.
- Parameters display general RIPng information for a specific or all VRFs.
- If a VRF is not mentioned, information for the default VRF is displayed.

### Examples

Displaying RIPng neighbor information for all VRFs:

```
switch# show ipv6 ripng neighbors all-vrfs
VRF : default            Process-ID : 1
----------------------------------------

Total Number of Neighbors: 1

Peer-Address      Type    Last-Update  Rcvd-Bad-Pkts    Rcvd-Bad-Routes
----------------------------------------------------------------------
```

```
fe80::7272:cfff:fe70:86ae
                 RIPng   0:0:7        4                5
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Auditors or Administrators or local user group members with execution rights for this command. Auditors can execute this command from the auditor context (auditor>) only. |

## show ipv6 ripng routes

```
show ipv6 ripng [<PROCESS-ID>] routes [<PREFIX/LENGTH>] [all-vrfs | vrf <VRF-NAME>]
```

### Description

Displays RIPng routing table for a specific RIPng process.

| Parameter | Description |
|---|---|
| *<PROCESS-ID>* | Specifies RIPng process ID to display information for a specific RIPng process. Range: 1-63. |
| *<PREFIX/LENGTH>* | Specifies the network prefix. |
| all-vrfs | Displays RIPng routing information for all VRFs. |
| vrf | Selects VRF to display RIPng routing information. |
| *<VRF-NAME>* | Specifies VRF name. |

### Usage

- *<PREFIX/LENGTH>* is an optional parameter that displays RIPng routing table information for a specific subnet.
- If a VRF is not mentioned, information for the default VRF is displayed.

### Examples

Displaying RIPng routing table for all VRFs:

```
switch# show ipv6 ripng routes all-vrfs
VRF : default              Process-ID : 1
------------------------------------------

Prefix              Metric     Interface      Nexthop
-----------------------------------------------------------------------
2001:DB8:10::/64      2         1/1/1         FE80::2E0:E6FF:FE1B:8242
2002:DB8:10::/64      3         1/1/1         FE80::2E0:E6FF:FE1B:8242
2003:DB8:10::/64      1         1/1/1

VRF : vrf_1                Process-ID : 34
-------------------------------------------

Prefix               Metric     Interface      Nexthop
------------------------------------------------------------------------
3001:DB8:10::/64      10         1/1/2         FE80::2E0:E6FF:FE1B:8232
3002:DB8:10::/64      14         1/1/2         FE80::2E0:E6FF:FE1B:8232
3003:DB8:10::/64       1         1/1/2
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Auditors or Administrators or local user group members with execution rights for this command. Auditors can execute this command from the auditor context (auditor>) only. |

## show ipv6 ripng statistics

`show ipv6 ripng [<PROCESS-ID>] statistics [all-vrfs | vrf <VRF-NAME>]`

### Description

Displays RIPng statistics.

| Parameter | Description |
|---|---|
| *<PROCESS-ID>* | Specifies RIPng process ID. Range: 1-63. |
| all-vrfs | Displays statistics information for all VRFs. |
| vrf | Selects VRF and displays RIPng statistics for it. |
| *<VRF-NAME>* | Specifies VRF name. |

### Usage

- Parameters can display information for all VRFs or a specific VRF.
- If a VRF is not mentioned, information for the default VRF is displayed.

### Examples

Displaying RIPng statistics for all VRFs:

```
switch# show ipv6 ripng statistics all-vrfs
VRF : default  Process-ID : 1
-------------------------------------

Global Route Changes : 50
Global Queries       : 2
Last Cleared         : 0h 30m 28s ago

VRF : vrf_1    Process-ID : 34
-------------------------------------

Global Route Changes : 20
Global Queries       : 0
Last Cleared         : 0h 30m 28s ago
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | Operator (>) or Manager (#) | Auditors or Administrators or local user group members with execution rights for this command. Auditors can execute this command from the auditor context (auditor>) only. |

## show ipv6 ripng statistics interface

`show ipv6 ripng [<PROCESS-ID>] statistics interface [<INTERFACE-NAME>] [all-vrfs | vrf <VRF-NAME>]`

### Description

Displays RIPng statistics for RIPng enabled interfaces.

| Parameter | Description |
|---|---|
| *<PROCESS-ID>* | Specifies RIPng process ID. Range: 1-63. |
| *<INTERFACE-NAME>* | Specifies name of interface. |

| Parameter | Description |
|---|---|
| `all-vrfs` | Displays RIPng interface statistics for all VRFs. |
| `vrf` | Selects VRF to display RIPng interface statistics. |
| *`<VRF-NAME>`* | Specifies VRF name. |

### Usage

- Parameters can display information for all VRFs or a specific VRF.
- If a VRF is not mentioned, information for the default VRF is displayed.

### Examples

Displaying RIPng statistics for a RIPng enabled interface:

```
switch# show ipv6 ripng statistics interface 1/1/1
VRF : default  Process-ID : 1      interface 1/1/1
--------------------------------------------------

IPv6-Address         Trigger-Updates    Rcvd-Bad-Packets    Rcvd-Bad-Routes
-----------------------------------------------------------------------------
fe80::7272:cfff:fe70:86ae
                     15                 3                   4

Last Cleared: 0h 30m 28s ago
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

## show running-config

`show running config`

### Description

Displays all running configurations for all protocols including RIPng.

### Examples

Displaying all running configurations for all protocols including RIPng:

```
switch# show running-config
Current configuration:
!
!Version Halon 0.1.0 (Build: genericx86-64-Halon-0.1.0-master-20170309054955-dev)

# Chapter 136

# Route policy and route map commands

This section describes general and filtering commands, as well as match, set and show commands for configuring route policies and route maps.

## General or filtering commands

### ip aspath-list

```
ip aspath-list <ASPATH-LIST-NAME> [seq <SEQ>] {permit | deny} <REGEXP>
no ip aspath-list <ASPATH-LIST-NAME> [seq <SEQ>] {permit | deny} <REGEXP>
```

#### Description

Configures an AS Path list to match a specific AS path. AS Path lists are named lists of regular expression rules. They are used to match AS Path attributes in the routes for inclusion in or exclusion from route policies. The sequence number is optional and is autogenerated whenever it is not explicitly mentioned. All AS Path list rules with the same name are grouped together.

The **no** form of this command removes the AS Path list configuration.

| Parameter | Description |
|---|---|
| `<ASPATH-LIST-NAME>` | Specifies the name of the AS Path list. |
| `seq <SEQ>` | Specifies the order of reference of the regular expression rules. |
| `{permit \| deny}` | Specifies whether the route is available for further processing when there is a match. |
| `<REGEXP>` | Specifies the regular expression to match the AS Path. Standard regular expression wildcards are supported. The _ character can be used to match the AS Path boundary. |

#### Examples

Configuring an AS Path list with sequence numbering:

```
switch(config)# ip aspath-list ASLst seq 5 permit _4*
```

Configuring a prefix list without sequence numbering:

```
switch(config)# ip aspath-list ASLst permit _4*
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

#### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | config | Administrators or local user group members with execution rights for this command. |

## ip community-list

```
ip community-list standard <COMM-LIST-NAME> <DESCRIPTION> [seq <SEQ>] {permit | deny}
<COMMUNITY-NUMBER>
no ip community-list standard <COMM-LIST-NAME> <DESCRIPTION> [seq <SEQ>] {permit | deny}
<COMMUNITY-NUMBER>
```

### Description

Configures a community list to match a specific community number attribute. Community-list is a named list of regular expressions. They are used to match the community number attributes in the routes for inclusion in, or exclusion from route policies. The sequence number is optional and is autogenerated whenever it is not explicitly mentioned. All community-list rules with the same name are grouped.

The **no** form of this command removes the community list configuration.

| Parameter | Description |
|---|---|
| *<COMM-LIST-NAME>* | Specifies the name of the community list that matches community number of a route. |
| *<DESCRIPTION>* | Specifies the description of the community list. Maximum character limit is 80. |
| seq *<SEQ>* | Specifies the order of reference of the regular expression rules. |
| {permit \| deny} | Specifies whether the route is available for further processing when there is a match. |
| *<COMMUNITY-NUMBER>* | Specifies the community number. The community number must be in AA: NN format or from the list of well-known community. |

### Examples

Configuring a community list with sequence numbering:

```
switch(config)# ip community-list standard CommLst seq 5 permit 101:41
```

Configuring a community list without sequence numbering:

```
switch(config)# ip community-list standard CommLst no-export permit
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## ip prefix-list

```
ip prefix-list <PREFIX-LIST-NAME> [seq <SEQ>] <IP-PREFIX/MASK> [ge <0-32>] [le <0-32>]
no ip prefix-list <PREFIX-LIST-NAME> [seq <SEQ>] <IP-PREFIX/MASK> [ge <0-32>] [le <0-32>]
```

### Description

Configures a prefix list to match a set of prefixes. Prefix lists are named lists of route prefixes. They are used to match routes for inclusion in or exclusion from route policies. The sequence number determines the order of matching. The matches are performed starting from the lowest sequence number to the highest sequence number until there is a match. The sequence number is however optional and is autogenerated whenever it is not explicitly mentioned. All prefixes with the same prefix list name are grouped.

The autogenerated sequence number is derived by adding 10 to the highest sequence number available. This technique makes it possible to insert new prefix list sequence number in between.

The **ge** and **le** parameters are used to combine prefixes with a range of network mask. For example, **172.131.0.0/16 ge 16 le 24** will match all prefixes within the 172.131.0.0/16 network that have a mask greater than or equal to 16 bits and less than or equal to 24 bits in length. For instance, 172.131.1.0/18 would match, because its length is between 16 and 24 but 172.0.0.0/8 or 172.131.1.128/25 would not match.

The **no** form of this command removes the prefix list configuration. Prefix-list commands which generate sequence numbers must explicity use sequence numbers in the **no** form.

| Parameter | Description |
|---|---|
| *<PREFIX-LIST-NAME>* | Specifies the name of the prefix list. |
| `seq` *<SEQ>* | Specifies the order of reference of the prefix rules. |
| `{permit | deny}` | Specifies whether the route is available for further processing when there is a match. |
| *IP-PREFIX/MASK>* | Specifies the IP prefix or mask. |
| `ge` *<0-32>* | Specifies the minimum prefix length to be matched. |
| `le` *<0-32>* | Specifies the maximum prefix length to be matched. |

### Examples

Configuring a prefix list with sequence numbering:

```
switch(config)# ip prefix-list PFXLST seq 5 permit 4.0.0.0/8 ge 9 le 12
```

Configuring a prefix list without sequence numbering:

```
switch(config)# ip prefix-list PSXLST permit 5.0.0.0/8
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | config | Administrators or local user group members with execution rights for this command. |

## ipv6 prefix-list

```
ipv6 prefix-list <PREFIX-LIST-NAME> [seq <SEQ>] <IPV6-PREFIX/MASK> [ge <0-128>] [le <0-128>]
no ipv6 prefix-list <PREFIX-LIST-NAME> [seq <SEQ>] {ip | ipv6} <IPV6-PREFIX/MASK> [ge <0-128>] [le <0-128>]
```

### Description

Configures a prefix list to match a set of prefixes. Prefix lists are named lists of route prefixes. They are used to match routes for inclusion in or exclusion from route policies. The sequence number determines the order of matching. The matches are performed starting from the lowest sequence number to the highest sequence number until there is a match. The sequence number is however optional and is autogenerated whenever it is not explicitly mentioned. All prefixes with the same prefix list name are grouped.

The autogenerated sequence number is derived by adding 10 to the highest sequence number available. This technique makes it possible to insert new prefix list sequence number in between.

The **ge** and **le** parameters are used to combine prefixes with a range of network mask. For example, **2000::/64 ge 65 le 70** will match all prefixes within the 2000::/64 network that have a mask greater than or equal to 65 bits and less than or equal to 70 bits in length.

The **no** form of this command removes the prefix list configuration. Prefix-list commands which generate sequence numbers must explicity use sequence numbers in the **no** form.

| Parameter | Description |
|---|---|
| *<PREFIX-LIST-NAME>* | Specifies the name of the prefix list. |
| seq *<SEQ>* | Specifies the order of reference of the prefix rules. |
| {permit \| deny} | Specifies whether the route is available for further processing when there is a match. |
| *IP-PREFIX/MASK>* | Specifies the IP prefix or mask. |
| ge *<0-128>* | Specifies the minimum prefix length to be matched. |
| le *<0-128>* | Specifies the maximum prefix length to be matched. |

### Examples

Configuring a prefix list with sequence numbering:

```
switch(config)# ipv6 prefix-list PFXLST seq 10 permit 2000::64 ge 65 le 70
```

Configuring a prefix list without sequence numbering:

```
switch(config)# ipv6 prefix-list PSXLST permit 2000::1/128
```

Removing the configuring of a prefix list:

```
switch(config)# no ipv6 prefix-list P2 seq 10 permit any
```

Removing the configuring of a prefix list:

```
switch(config)# no ipv6 prefix-list P1 seq 10
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | config | Administrators or local user group members with execution rights for this command. |

## route-map

```
route-map <NAME> {permit | deny} seq <NUMBER>
no route-map <NAME> {permit | deny} seq <NUMBER>
```

### Description

Configures a route map entry with the given name and action by taking the CLI in the route map context. All route map entries with the same name belong to the same route map. The route map entry rules are processed in order by sequence number, until a match is found.

The **no** form of this command removes the route map entry configuration.

| Parameter | Description |
|---|---|
| `<NAME>` | Specifies the name of the route map. Required. |
| `{permit \| deny}` | Specifies whether the route is available for further processing when there is a match. Required. |
| `<NUMBER>` | Specifies the sequence number of the entry. Required. |

### Examples

Configuring a route map entry:

```
switch(config)# route-map GlobalMap permit seq 10
```

Removing a route map entry configuration:

```
switch(config)# no route-map GlobalMap permit seq 10
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## continue

```
continue <SEQUENCE NUMBER>
no continue
```

### Description

Allows you to execute additional entries in a route map. The sequence number specifies the route-map entry's sequence number that will be executed next if the existing entry's match clause is successful.

If a successful match occurs and continue command exists, the route map saves the set value first and then jumps to the specified route map entry.

Set clauses are saved during the match clause evaluation and are executed only after the route map evaluation is completed. The set clauses are executed in the order in which they were configured.

Set clauses can be accumulative or additive as **set as-path prepend** or it can be absolute as **set metric**. For set commands that configures an accumulative value, subsequent values are added in order in which they were configured. For set commands that configures an absolute value, The values from the last instance will be applied.

The **no** form of this command removes the route map continue configuration.

If the specified route-map sequence entry does not exist, route-map processing will be terminated at the current sequence number if its clause is matched. The continue sequence number must be higher than the current route map sequence number for this command to take effect.

| Parameter | Description |
|---|---|
| *<SEQUENCE NUMBER>* | Specifies the value of the route map entry to be executed next after a successful match clause. |

## Examples

Configuring a route map to continue to execute an additional entry:

```
switch(config)# route-map GlobalMap permit 10
switch(config-route-map-GlobalMap-10)# continue 40
```

Removing a route map continue configuration:

```
switch(config)# route-map GlobalMap permit seq 10
switch(config-route-map-GlobalMap-10)# no continue 40
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

# Match commands

## match aspath-list

```
match aspath-list <ASPATH-LIST-NAME>
no match aspath-list <ASPATH-LIST-NAME>
```

### Description

Matches the AS path attribute of the route with one or more regular expressions in the AS path list.

The **no** form of this command restores the default behavior of not matching the AS path attribute of the route.

| Parameter | Description |
|---|---|
| *<ASPATH-LIST-NAME>* | Specifies the name of the AS path list to match the AS path attribute of the route. |

### Example

Configuring a match clause in the route map to match the AS path list:

```
switch(config)# ip aspath-list ASLst permit 1001
switch(config)# route-map GlobalMap permit seq 11
switch(config-route-map-GlobalMap-11)# match aspath-list ASLst
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-route-map` | Administrators or local user group members with execution rights for this command. |

## match community-list

```
match community-list <COMMUNITY-LIST-NAME> [exact-match]
no match community-list <COMMUNITY-LIST-NAME> [exact-match]
```

### Description

Matches the community number attribute of the route with one, or more regular expressions in the community-list.

The **no** form of this command restores the default behavior of not matching the community number attribute of the route.

| Parameter | Description |
|---|---|
| *<COMMUNITY-LIST-NAME>* | Specifies the name of the community-list to match the community number attribute of the route. |
| [exact-match] | Indicates that the community number attribute must match exactly with the expressions in the community-list. However, the order of the communities in the community-list is of no significance. |

### Example

Configuring a match clause in the route map to match the community list:

```
switch(config)# ip community-list standard CommLst 101:41 permit 12:201
switch(config)# route-map GlobalMap permit seq 11
switch(config-route-map-GlobalMap-11)# match community-list CommLst
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | config-route-map | Administrators or local user group members with execution rights for this command. |

## match interface

```
match interface <INTERFACE-NAME>
no match interface <INTERFACE-NAME>
```

### Description

Matches the outgoing interface value of the route with the value configured in the match clause. This command is applicable to static and connected routes which will be redistributed to the BGP protocol.

The **no** form of this command restores the default behavior of not matching the outgoing interface value of the route.

| Parameter | Description |
|---|---|
| *<INTERFACE-NAME>* | Specifies the value to be matched with the outgoing interface of the route entry. |

### Example

Configuring a match clause in the route map to match the outgoing interface of the route:

```
switch(config)# route-map GlobalMap permit seq 11
switch(config-route-map-GlobalMap-11)# match interface  1/1/1
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-route-map` | Administrators or local user group members with execution rights for this command. |

## match ip address prefix-list

```
match ip address prefix-list <PREFIX-LIST-NAME>
no match ip address prefix-list <PREFIX-LIST-NAME>
```

### Description

Matches the destination IP address prefix of the routes with one or more addresses in the prefix list.

The **no** form of this command restores the default behavior of not matching the destination IP address prefix of the routes to their default value. This command is applicable to OSPF, static, and connected routes which will be redistributed to the BGP protocol.

| Parameter | Description |
|---|---|
| *<PREFIX-LIST-NAME>* | Specifies the name of the prefix list to be matched with the network address of the route. |

### Example

Configuring a prefix list and a match clause in route map to match the prefix list:

```
switch(config)# ip prefix-list PfxLst permit 4.0.0.0/8
switch(config)# route-map GlobalMap permit seq 11
switch(config-route-map-GlobalMap-11)# match ip address prefix-list PfxLst
```

When the IP prefix list with prefix and mask-length of *0.0.0.0/0* is used, the route matches default-route *0.0.0.0/0* as well as any other route. This behavior would be changed to match only the default-route in the next release.

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-route-map` | Administrators or local user group members with execution rights for this command. |

## match ip next-hop

```
match {ip | ipv6} next-hop {<ADDRESS> | prefix-list <PREFIX-LIST-NAME>}
no match {ip | ipv6} next-hop [<ADDRESS> | prefix-list <PREFIX-LIST-NAME>]
```

### Description

Matches the next-hop address of the route with the configured address in the match clause. This command is applicable to static routes which will be redistributed to BGP protocol.

The **no** form of this command restores the default behavior of not matching the next-hop address of the route.

| Parameter | Description |
|---|---|
| *<ADDRESS>* | Specifies the IPv4 address to match with the next-hop address of the route. |
| `prefix-list` *<PREFIX-LIST-NAME>* | Specifies the name of the IP prefix list to be matched with the next-hop address of the route. |

### Example

Configuring a match clause in the route map to match the next-hop address of the route:

```
switch(config)# route-map GlobalMap permit seq 11
switch(config-route-map-GlobalMap-11)# match ip next-hop 1.1.1.2
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-route-map` | Administrators or local user group members with execution rights for this command. |

## match ip route-source

```
match ip route-source prefix-list <PREFIX-LIST-NAME>
no match ip route-source prefix-list <PREFIX-LIST-NAME>
```

### Description

Matches the IP address of the source of the route using IP prefix lists.

The **no** form of this command restores the default behavior of not matching the IP address of the route.

| Parameter | Description |
|---|---|
| *<PREFIX-LIST-NAME>* | Specifies the name of the prefix list to match the IP address of the source of the route. |

### Example

Configuring a match clause in the route map to match the source of the route:

```
switch(config)# ip prefix-list RouterLst 4.4.4.4/32
switch(config)# route-map GlobalMap permit seq 11
switch(config-route-map-GlobalMap-11)# match ip route-source prefix-list RouterLst
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-route-map` | Administrators or local user group members with execution rights for this command. |

## match local-preference

```
match local-preference <VALUE>
no match local-preference <VALUE>
```

### Description

Matches the local preference value of the route with the value configured in the match clause.

The **no** form of this command restores the default behavior of not matching the local preference value of the route.

| Parameter | Description |
|---|---|
| *<VALUE>* | Specifies the value to be matched with the route entry local preference in the range of 1 to 4294967295. |

### Example

Configuring a match clause in the route map to match the local preference of the route:

```
switch(config)# route-map GlobalMap permit seq 11
switch(config-route-map-GlobalMap-11)# match local-preference 100
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | config-route-map | Administrators or local user group members with execution rights for this command. |

## match metric

```
match metric <VALUE>
no match metric <VALUE>
```

### Description

Matches the MED value of the route with the value configured in the match clause.

The **no** form of this command restores the default behavior of not matching the MED value of the route.

| Parameter | Description |
|---|---|
| *<VALUE>* | Specifies the value to be matched with the route entry MED. |

### Example

Configuring a match clause in the route map to match the metric of the route:

```
switch(config)# route-map GlobalMap permit seq 11
switch(config-route-map-GlobalMap-11)# match metric 10
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-route-map` | Administrators or local user group members with execution rights for this command. |

## match origin

```
match origin {igp | egp | incomplete}
no match origin [igp | egp | incomplete]
```

### Description

Matches the route origin attribute of the route with route configured in the match clause.

The **no** form of this command restores the default behavior of not matching the route origin attribute of the route.

| Parameter | Description |
|---|---|
| `{igp \| egp \| incomplete}` | Specifies if the route origin attribute is matched with a match clause which originated as IGP, EGP, or has unknown origin. The unknown origin is typically redistributed from another routing protocol. |

### Example

Configuring a match clause in the route map to match the origin:

```
switch(config)# route-map GlobalMap permit seq 11
switch(config-route-map-GlobalMap-11)# match origin igp
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-route-map` | Administrators or local user group members with execution rights for this command. |

## match route-type

```
match route-type {external <type-1|type-2> | <evpn-type-2|evpn-type-3|evpn-type-5>}
no match route-type {external <type-1|type-2> | <evpn-type-2|evpn-type-3|evpn-type-5>}
```

### Description

This command matches the OSPF external route or EVPN route-type against the value configured in the match clause. Furthermore, the **type-1** and **type-2** metric can be matched for OSPF external route.

The **no** form of this command restores the default behavior of not matching the metric-type value of the OSPF external route.

| Parameter | Description |
|---|---|
| `{type-1 \| type-2}` | Specifies the *type-1* or *type-2* OSPF value to be matched with the external route. |
| `evpn-type-2` | Match MAC/IP advertisement routes |
| `evpn-type-3` | Match inclusive multicast ethernet tag routes |
| `evpn-type-5` | Match IP prefix routes |

### Example

Configuring a match clause in the route map to match the metric-type value of the OSPF external route:

```
switch(config)# route-map GlobalMap permit seq 11
switch(config-route-map-GlobalMap-11)# match route-type external type-1
```

Configure a match clause in route-map to match EVPN route-type's.

```
switch(config)# route-map GlobalMap permit 11
switch(config-route-map)# match route-type evpn-type-2
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.14 | Additional EVPN type parameters are introduced. |
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-route-map` | Administrators or local user group members with execution rights for this command. |

## match source-protocol

```
match source-protocol {bgp | connected | ospf | static}
no match source-protocol [bgp | connected | ospf | static]
```

### Description

Matches the source routing protocol value of the route with the value configured in the match clause.

The **no** form of this command restores the default behavior of not matching the source routing protocol value of the route.

| Parameter | Description |
|---|---|
| `{bgp | connected | ospf | static}` | Specifies the *bgp*, *connected*, *ospf*, or *static* value to be matched with the route entry source protocol. |

### Example

Configuring a match clause in the route map to match the source protocol route:

```
switch(config)# route-map GlobalMap permit seq 11
switch(config-route-map-GlobalMap-11)# match source-protocol ospf
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-route-map` | Administrators or local user group members with execution rights for this command. |

## match tag

```
match tag <value>
no match tag <value>
```

### Description

Matches the tag value of the route with the one configured in the match clause. Applies to static routes that will be redistributed to BGP, OSPFv3 and OSPFv3 protocols.

The **no** form of this command removes the tag value of the route.

| Parameter | Description |
|---|---|
| `value` | Numeric value to match with the route tag. Required. |

### Example

Configuring a match clause in route-map to match the tag value of the route:

```
switch(config)# route-map GlobalMap permit 11
switch(config-route-map)# match tag 20
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-route-map` | Administrators or local user group members with execution rights for this command. |

## match vni

```
match vni <value>
no match vni <value>
```

### Description

Matches the VNI value of the route with the one configured in the `match` clause. Applies to matching L2VNIs or L3VNIs. Use the `continue` clause if both L2VNI and L3VNI are to be matched. Route maps with the `match vni` clause can be used with L2VPN EVPN neighbors only.

The **no** form of this command removes the match for the VNI value of the route.

| Parameter | Description |
|---|---|
| *<value>* | Numeric value to match with the route tag. Required.<br>Range: 1 to 16777214 |

### Example

Configuring a match clause in route map to match the VNI value of the route:

```
switch(config)# route-map GlobalMap permit 11
switch(config-route-map)# match vni 10000
```

Configuring a match clause in route map to match both L2VNI and L3VNI in a single route map:

```
switch(config)# route-map GlobalMap permit 11
switch(config-route-map)# match vni 10000
switch(config-route-map)# continue 12
switch(config)# route-map GlobalMap permit 12
switch(config-route-map)# match vni 10
```

The following example is different from the one above, as it configures a match clause in route map to match any one of the two VNIs:

```
switch(config)# route-map GlobalMap permit 10
switch(config-route-map)# match vni 10000
switch(config)# route-map GlobalMap permit 20
switch(config-route-map)# match vni 10
switch(config)# route-map GlobalMap deny 30
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.09 | Command introduced |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-route-map` | Administrators or local user group members with execution rights for this command. |

# Set commands

## set as-path exclude

```
set as-path exclude <AS>
no set as-path exclude <AS>
```

### Description

Removes all occurrences of the configured AS Path from the AS Path attribute of the route.

The **no** form of this command restores the default behavior of not modifying the AS Path attribute list.

| Parameter | Description |
|---|---|
| *<AS>* | Specifies the AS number to be removed from the AS Path attribute of the route. |

## Example

Configuring a set clause in the route map to remove the AS from the AS Path attribute of the route:

```
switch(config)# route-map GlobalMap permit seq 11
switch(config-route-map-GlobalMap-11)# set as-path exclude 1001
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

## Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

## Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-route-map` | Administrators or local user group members with execution rights for this command. |

# set as-path prepend

```
set as-path prepend <AS> <AS>...
no set as-path prepend <AS> <AS>...
```

## Description

Pretends the list of the configured AS numbers to the AS Path attribute of the routes. To ensure that the AS path conforms to standards, the local AS is prepended after this command is executed.

The **no** form of this command restores the default behavior of not modifying the AS Path attribute list.

| Parameter | Description |
|---|---|
| *<AS> <AS>...* | Specifies the AS numbers to be prepended from the AS Path attribute of the route. |

## Example

Configuring a set clause in the route map to prepend the AS from the AS Path attribute of the route:

```
switch(config)# route-map GlobalMap permit seq 11
switch(config-route-map-GlobalMap-11)# set as-path prepend 1
switch(config-route-map-GlobalMap-11)# no set as-path prepend 102
```

The **no** form of the command deletes the entire list of AS-Path prepend configuration regardless of the parameter list. In this example, the **no** form command would result in deletion of all the three AS numbers that were earlier configured.

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-route-map` | Administrators or local user group members with execution rights for this command. |

## set community

```
set community {<AA:NN> | internet | no-export | no-advertise | local-as} [additive |
delete]
no set community [<AA:NN> | internet | no-export | no-advertise | local-as] [additive |
delete]
```

### Description

Modifies the community number attribute of the route with the value configured in the set clause. This command is applicable to OSPF, static, and connected routes which will be redistributed to the BGP protocol.

The **no** form of this command restores the default behavior of not modifying the community number attribute of the route.

| Parameter | Description |
|---|---|
| `{<AA:NN> | internet | no-export | no-advertise | local-as}` | Selects the value to be set as the community number attribute of the route in the **AA:NN** format (quotation marks required when multiple communities are listed, for example: **set community "65001:100 65001:200"**) or as a known community name **internet**, **no-export**, **no-advertise**, and **local-as**. |
| `[additive]` | Specifies that the specified community number is added to the existing community number attribute of the route. |
| `[delete]` | Specifies that the specified community number is removed from the existing community number attribute of the route. |

### Example

Configuring a set clause in the route map to modify the community number attribute of the route:

```
switch(config)# route-map GlobalMap permit seq 11
switch(config-route-map-GlobalMap-11)# no set community 11:101
switch(config-route-map-GlobalMap-11)# set community no-advertise
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-route-map` | Administrators or local user group members with execution rights for this command. |

## set dampening

```
set dampening {half-life <VALUE> reuse <VALUE> suppress <VALUE> max-suppress-time
<VALUE>}
no set dampening
```

### Description

Sets parameters of route flap dampening feature.

| Parameter | Description |
|---|---|
| `half-life` | Time to reduce the penalty to half. |
| `reuse` | Lower threshold of penalty. |
| `suppress` | Upper threshold of penalty. |
| `max-suppress-time` | Max time to keep route suppressed. |

### Example

```
switch(config-route-map-abc-20)# set dampening half-life 5 reuse 50 suppress 125
max-suppress-time 255

switch(config-route-map-abc-20)# no set dampening half-life 5 reuse 50 suppress
125 max-suppress-time 255

switch(config-route-map-abc-20)# set dampening

switch(config-route-map-abc-20)# no set dampening
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-route-map` | Administrators or local user group members with execution rights for this command. |

## set ip nexthop

```
set {ip | ipv6} nexthop {global} <IP-ADDR>
no set {ip | ipv6} nexthop {global} <IP-ADDR>
```

### Description

Sets the IP address of the next-hop of the route with the value configured in the set clause.

The **no** form of this command restores the default behavior of not modifying the IP address of the next-hop of the route.

| Parameter | Description |
|---|---|
| *<IP-ADDR>* | Specifies the IPv4 address to be set as the next-hop address of the route. |

### Example

Configuring a set clause in the route map to modify the next-hop address of the route entry:

```
switch(config)# route-map GlobalMap permit seq 11
switch(config-route-map-GlobalMap-11)# set ip nexthop 1.1.1.2
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-route-map` | Administrators or local user group members with execution rights for this command. |

## set ipv6 nexthop global

```
set ipv6 nexthop global <IP-ADDRESS>
no set ip nexthop global <IP-ADDRESS>
```

### Description

Sets the IPv6 address of the nexthop of the routes with the IPv6 address configured in the set clause.

The **no** form of this command removes this configuration.

| Parameter | Description |
|---|---|
| *<IP-ADDRESS>* | Specifies the IPv6 address of the nexthop router. |

### Examples

Configuring a set clause in route-map to modify the nexthop address of route entry:

```
switch(config)# route-map GlobalMap premit 11
switch(config-route-map)# set ipv6 nexthop global 1.1.1.2
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config` | Administrators or local user group members with execution rights for this command. |

## set local-preference

```
set local-preference <VALUE>
no set local-preference <VALUE>
```

### Description

Modifies the local-preference attribute of the route entry with the value configured in the set clause.

The **no** form of this command restores the default behavior of not modifying the local-preference attribute of the route entry.

| Parameter | Description |
|---|---|
| *<VALUE>* | Specifies the value to be set as the local-preference attribute of the route entry. Range: 0 to 4294967295. |

### Example

Configuring a set clause in the route map to modify the metric value of the route:

```
switch(config)# route-map GlobalMap permit seq 11
switch(config-route-map-GlobalMap-11)# set local-preference 100
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-route-map` | Administrators or local user group members with execution rights for this command. |

## set metric

```
set metric <VALUE>
no set metric <VALUE>
```

### Description

Modifies the metric value of the route with the value configured in the set clause. This command is applicable to OSPF, static, and connected routes which will be redistributed to the BGP protocol.

The **no** form of this command restores the default behavior of not modifying the metric value of the route.

| Parameter | Description |
|---|---|
| *<VALUE>* | Specifies the value to be set as the metric value of the route. Range: 0 to 4294967295. |

### Example

Configuring a set clause in the route map to modify the metric value of the route:

```
switch(config)# route-map GlobalMap permit seq 11
switch(config-route-map-GlobalMap-11)# set metric 10
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-route-map` | Administrators or local user group members with execution rights for this command. |

## set origin

```
set origin [igp | egp | incomplete]
no set origin [igp | egp | incomplete]
```

### Description

Modifies the route origin attribute of the route update with the value configured in the set clause.

The **no** form of this command restores the default behavior of not modifying the route origin attribute of the route.

| Parameter | Description |
|---|---|
| `{igp | egp | incomplete}` | Selects the route update originated to IGP, EGP, or incomplete. When incomplete is selected, the route update origin is set to unknown. |

### Example

Configuring a set clause in the route map to modify the origin attribute of the route:

```
switch(config)# route-map GlobalMap permit seq 11
switch(config-route-map-GlobalMap-11)# set origin igp
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |
|---|---|
| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-route-map` | Administrators or local user group members with execution rights for this command. |

## set tag

```
set tag <value>
[no] set tag <value>
```

### Description

Modifies the tag value of the route with the one configured in the set clause. Applicable to static routes that will be redistributed to ospfv2 and ospfv3 protocols.

The **no** form of this command removes the set clause tag value.

| Parameter | Description |
|---|---|
| `value` | Numeric value to change the route entry tag. Range: 0-4294967295. Required. |

### Example

Configuring a set clause in route-map to modify the tag value of the route:

```
switch(config)# route-map GlobalMap permit 11
switch(config-route-map)# set tag 10
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.

### Command History

| Release | Modification |

| 10.07 or earlier | -- |

### Command Information

| Platforms | Command context | Authority |
|---|---|---|
| 6300<br>6400 | `config-route-map` | Administrators or local user group members with execution rights for this command. |

## set weight

```
set weight <VALUE>
no set weight <VALUE>
```

### Description

Modifies the weight attribute of the route with the value configured in the set clause.

The **no** form of this command restores the default behavior of not modifying the weight attribute of the route.

| Parameter | Description |
|---|---|
| *<VALUE>* | Specifies the value to be set as the weight attribute of the route. Range: 0 to 65535. |

### Example

Configuring a set clause in the route map to modify the metric value of the route:

```
switch(config)# route-map GlobalMap permit seq 11
switch(config-route-map-GlobalMap=11)# set weight 100
```

For more information on features that use this command, refer to the IP Routing Guide for your switch model.
