

# **fx-83/85GT CW Interactive Manual**

Scientific ClassWiz

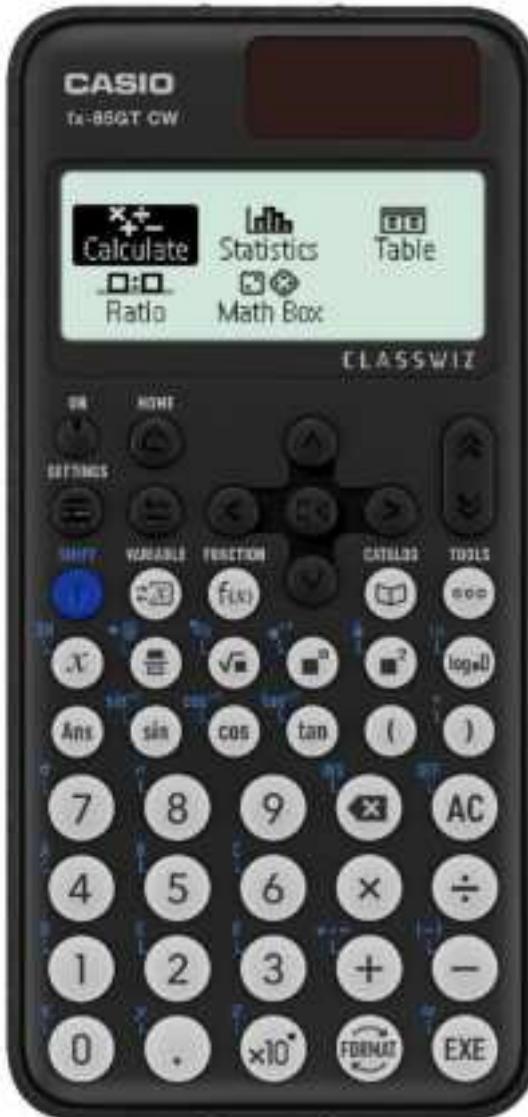

**CASIO**<sup>®</sup>

- [Training video](#)
  - This is a recording from a live training webinar.
  - The video introduces the key features of the fx-83GT CW and fx-85GT CW ClassWiz calculators.
  - If you're new to using one of these calculators, you've come to the right place!
- ClassWiz Practice (worksheets/teaching slides)
  - [Revision Mat](#) - fx-83GT CW and fx-85GT CW teaching resources for KS3 and Foundation GCSE.
  - [Cross Number Puzzles](#) - teaching resources focusing on Cross Number for fx-83GT CW and fx-85GT CW calculators (KS3 and Foundation GCSE)
  - [Teaching Resources page](#) – general resources page including skills videos.

# How to navigate around the manual

CASIO®

- Open the slideshow
- Press any key/label on the handset to access the user guide
- Use the mini calculator icon to return to the handset

Use the mini calculator icon to return

[Online User Guide Video](#)

**ON**

Turn the handset on. Defaults to the last used application/menu screen.

**Example:** Always useful before attempting a calculation.

*Notice the slight recess, so that if placed face down without the cover the handset will not turn on.*

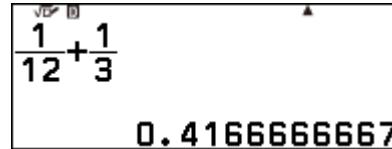

## ( ) Decimal Approximation

Evaluate a decimal from a calculation instead of using FORMAT.

**Example:** From the default settings, find the decimal value  $\frac{1}{12} + \frac{1}{3}$

$$\frac{1}{12} + \frac{1}{3}$$
  

1  
12 + 1  
3  
0.4166666667

Make sure to press SHIFT first.

Using decimal approximation after calculating a value with  performs another calculation, so be careful when using .

## ((-)) Negative

Negate a number in a calculation, list or table.

**Example:** Evaluate  $-3^2$

( $\uparrow$ ) ( $\ominus$ ) 3  $\blacksquare^2$  EXE

$\sqrt{-3}^2$   
9

*Be careful to interpret the question correctly, this isn't the negative of three squared, hence parentheses.  
Notice that the screen character is shorter than subtract.*

**X**

The default key to enter the variable  $x$ .

**Example:** Define  $g(x) = x^2 - 2x - 3$

f(x) three times x 2 x 3

g(x)= $x^2-2x-3$

The variable (x) can also be entered using .

## ( -1) Reciprocal

Equivalent to “one over” your entry.

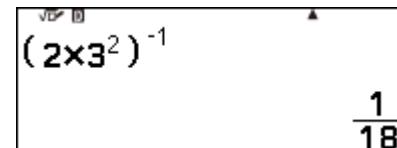

**Example:**

(a) Take the reciprocal of the calculation  $2 \times 3^2$

(b) Enter  $\frac{1}{5}$

(a)  $(2 \times 3 \square^2) \uparrow \square^- \text{EXE}$

(b)  $5 \uparrow \square^- \text{EXE}$

  
 $(2 \times 3^2)^{-1}$   
 $\frac{1}{18}$

  
 $5^{-1}$   
 $\frac{1}{5}$

Use parentheses to take the reciprocal of the whole calculation.

Remember  $x^{-1} = \frac{1}{x}$ .

## Logarithm

Take a logarithm with a defined base.

**Example:** Find (a)  $\log_2 64$  (b)  $\log_{64} 2$

(a)  2 > 64 EXE

 log<sub>2</sub>(64)

6

(b)  64 > 2 EXE

 log<sub>64</sub>(2)

1  
6

*Taking logarithms is the opposite of raising something to a power.*

## Fraction template

Easily enter a fraction.

**Example:** Find (a)  $\frac{7}{12} \div \frac{2}{3}$  (b)  $\frac{1.3 \times 4.7}{3}$

(a)  $7 \text{ } \square \text{ } 12 \text{ } \textcircled{>} \text{ } \div \text{ } 2 \text{ } \textcircled{=} \text{ } 3 \text{ } \textcircled{EXE}$

$\frac{7}{12} \div \frac{2}{3}$   
 $\frac{7}{8}$

(b)  $(1.3 \times 4.7) \text{ } \textcircled{=} \text{ } 3 \text{ } \textcircled{EXE}$

$(1.3 \times 4.7) \text{ } \textcircled{=} \text{ } 3$   
 $\frac{611}{300}$

*Be careful to scroll away from the first denominator, otherwise*

*Use parentheses to define the numerator.*

$\frac{7}{12 \div \frac{2}{3}}$   
 $\frac{7}{18}$

[Using FRACTIONS video](#)

## Square Root

Find the square root of a value or a calculation.

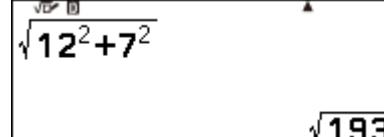

**Example:** Find (a)  $\sqrt{5.6}$  (b)  $\sqrt{12^2 + 7^2}$

(a) 

(b) 

*Only the positive root is given.*

*Notice the surd answers, use  or  for decimal values.*

## ( $\sqrt[n]{\square}$ ) Nth Root

Find the nth root of a value or a calculation.

**Example:**

Find  $\sqrt[3]{\frac{29}{113}}$

↑  $\sqrt[n]{\square}$  3 > 29 = 113 EXE

3  
29  
113  
0.6354867767

Notice that  $n$  can also be negative.

## Index

Enter an exponent for an expression or value.

**Example:** Find (a)  $1.75^5$  (b)  $(1.6 \times 4.3)^{-3}$

(a) 1.75 5

1.75<sup>5</sup>  
16.41308594

(b) (1.6×4.3) -3

(1.6×4.3)<sup>-3</sup>  
0.00307068088

*Use this key either before or after entering the base value.  
Useful for entering fractional and negative exponentials.*

## (ln) Natural logarithm

Evaluate a logarithm with base **e** (Euler's constant).

**Example:** Find ln 3.4

↑ log-e 3.4 EXE

ln(3.4)

1.223775432

*It's good practice to close the parentheses, but not necessary.*

## ( $\pi$ ) Irrational constants

( $e$ ) evaluate a logarithm with base  $e$  (Euler's constant).

**Example:** Find (a)  $4+\pi$  (b)  $e^2$

(a)  $4+\uparrow 7 \text{ EXE}$

(b)  $\uparrow 8 \blacksquare^2 \text{ EXE}$

$4+\pi$   
7.141592654

$e^2$   
7.389056099

Although irrational, both of these values are used in calculations to 22 d.p accuracy.

## ( $\bullet$ , '') Hours:Minutes:Seconds

Enter decimal time and angles and convert to sexagesimal.

**Example:** Express (a) 2.4 hrs as H:M:S      (b) 3hrs 54 mins 36 secs as a decimal

(a)      2.4  $\uparrow$  + EXE

2.4  
2° 24' 0"

(b)      3( $\bullet$ , '')54( $\bullet$ , '')36( $\bullet$ , '')  $\uparrow$  EXE

3° 54' 36"  
3.91

*Always enter a value for H:M even if it is zero.*

sin  
cos  
tan

## Trigonometric ratios

Evaluate ratios for given angles.

**Example:** Find (a)  $\sin 75$  (b)  $3\cos 45$

(a)  $\sin(75)$  EXE

$\sin(75)$   
 $\frac{\sqrt{6} + \sqrt{2}}{4}$

(b)  $3\cos(45)$  EXE

$3\cos(45)$   
 $\frac{3\sqrt{2}}{2}$

*It's good practice to close the parentheses, but not necessary.*

*For multiple calculations, it may be more useful to have decimal values, so change to Math/DecimalO.*

## Parentheses (brackets)

Essential to ensure correct BIDMAS operation order.

**Example:** Find (a)  $2 \times (3 + 4)$  (b)  $1.2 \times 10^2 \div 3.6 \times 10^3$

(a)  $2 \times (3+4)$  EXE

 2x(3+4)

14

(b)  $(1.2 \times 10^2) \div (3.6 \times 10^3)$  EXE

 (1.2x10<sup>2</sup>)÷(3.6x10<sup>3</sup>)

1  
30

The calculator follows BIDMAS strictly, so inserting parentheses is key for correct calculations.  
Make sure to scroll after entering the exponent.

**ABCDEF Stored Variables A-F,  $x$ ,  $y$  and  $z$**

**(x) (y) (z)** Store calculations and values for later recall and manipulation.

**Example:** (a) Evaluate  $\tan 35$  and store as B (b) Evaluate  $5.2 \times \tan 35$

(a)  $\text{tan} 35 \text{ EXE } \text{STO } > \text{OK}$  twice

$\text{tan}(35)$

0.7002075382

(b)  $5.2 \uparrow 5 \text{ EXE}$

$5.2\text{B}$

3.641079199

*Manipulate stored variables using normal rules of arithmetic.*

*Press  $\text{STO}$  to see the values of all stored variables.*

# (,) Comma

Use to separate entries.

**Example:** Find LCM of 27 and 15

BOOK 27 15 EXE

LCD(27, 15)

135

*Can also be used when generating random numbers, GCD etc.*

( Mixed number template

Use to enter a mixed number.

**Example:** Enter  $3\frac{1}{6}$

3   1  6 

Use  to change the appearance of the final value.

## Exponent

Use when entering standard form.

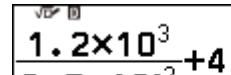

**Example:** Find (a)  $3.65 \times 10^4$       (b)  $1.2 \times 10^3 \div 2.7 \times 10^{-2} + 4$

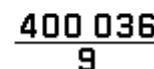

(a)  $3.65 \textcircled{x10^} 4 \textcircled{EXE}$

 3.65×10<sup>4</sup>

36 500

(b)  $\textcircled{1} 1.2 \textcircled{x10^} 3 \textcircled{\text{V}} 2.7 \textcircled{x10^} \textcircled{\text{U}} \textcircled{-} 2 \textcircled{>} \textcircled{>} +4$

 1.2×10<sup>3</sup>  
2.7×10<sup>-2</sup>

 400 036  
9

*The fraction template avoids the need to use parentheses.*

[Using STANDARD FORM video](#)

## (Ans) Answer memory

Recall and manipulate the previously calculated value.

**Example:** (a) multiply  $\sin 60 + 4$  by 3.2 (b) find  $x_4$  for the iteration  $x_{n+1} = 1 + \frac{1}{x_n}$ ,  $x_1 = 2$

(a)  $\text{sin } 60 + 4 \text{ EXE } \times 3.2 \text{ EXE}$

Ans × 3.2  
 $\frac{64+8\sqrt{3}}{5}$

(b)  $2 \text{ EXE } 1 + (\text{Ans}) (\text{■}^{-1}) \text{ EXE}$  three times

1 + Ans<sup>-1</sup>  
 $\frac{8}{5}$

Notice that (Ans) doesn't actually need pressing in the first example.

A very useful method for approximating solutions to equations.

## HOME

Displays the app screen, where applications can be selected.

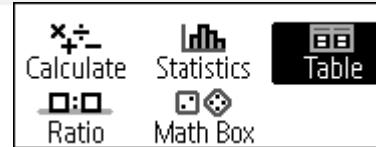

Normal calculation e.g.  
addition, multiplication,  
square roots etc.

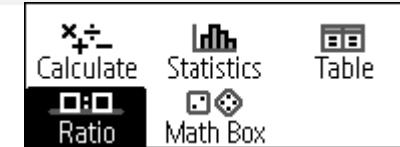

**You will use this the  
most.**

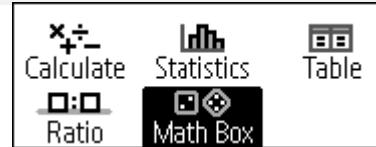

Calculate using data  
and frequency tables.  
Find the mean,  
standard deviations,  
quartiles etc.  
Perform regression  
analysis to find the  
equation of regression  
lines (lines of best fit).

Create a table of  
values for one or two  
functions.  
Specify your own  
range and step  
interval.

Find a missing variable  
value from 2 equivalent  
ratios e.g.  $\frac{A}{B} = \frac{x}{D}$

Simulate dice rolls  
and coin tosses.  
Investigate up to  
three number lines.  
Examine angles and  
corresponding  
trigonometric values.

*These 4 apps should be familiar, but Math Box is brand new. Why not have a play?*

## BACK

Move back or return up a menu level.

**Example:** Return from setting the Table Type in Table.

⟳ twice

⌚ f(x)/g(x)  
⌚ f(x)  
⌚ g(x)

JDF 13  
x | f(x) | g(x)  
1 | |  
2 | |  
3 | |  
4 | |  
f(x)/g(x) : None

*Also useful for returning the cursor to the end of the input line after a calculation to edit or replay.  
See ⓘ for how to set the Table Type.*

## Scroll

Navigate through menus, check calculation history and move the cursor.

**Example:**

(a) change  $2 \times 13$  to  $21 \times 3$

(b) navigate to LCM in Calculate

(a)  $2 \times 13 \leftarrow \text{OK} \leftarrow 1$

$21 \times 3$

(b)

LCM

Press after a calculation to move the cursor to the end of the input line, to edit or replay.

Press to scroll through the calculation history on screen.

**OK**

Confirm data entry, a menu choice or perform a calculation.

**Example:** Find 5!

5

5!  
120

and are interchangeable.

## Page Scroll

Use when a scroll bar appears, to scroll a page at a time.

**Example:** Scroll through to find Degrees.

*If there are too many menu options to fit on the screen, a scroll bars appears to the right.*

## SHIFT

Use to access the modifying key labels.

**Example:** (a) Enter the reciprocal  $\frac{1}{7}$  (b) Turn the calculator off

(a)   7 

The image shows a calculator screen with a blue indicator at the top left. The display shows two lines of text: "7<sup>-1</sup>" on the first line and "1/7" on the second line. There is a small upward-pointing arrow icon above the "7" in "7<sup>-1</sup>".

(b)  

Notice the  indicator at the top of the screen, before pressing the modified key.

## Variable

Access and edit stored variables.

**Example:** (a) Store  $3.5^3$  as A      (b) Change the value of A to 43

(a)

A=42.875      B=0  
C=0      D=0  
E=0      F=0  
x=0      y=0  
z=0

(b) 43 twice

43  
43

See [Stored Variables](#).

The values are shown in Norm1 format.

[Using MEMORY video](#)

## Square

Easily square expressions and values.

**Example:** Find (a)  $2.675^2$  (b)  $(3.27 + 1.49)^2$

(a) 2.675

2.675<sup>2</sup>  
11449  
1600

(b) (3.27+1.49)

(3.27+1.49)<sup>2</sup>  
14161  
625

See to enter other exponentials including negatives and fractions.

## Number digits

Enter numbers, obviously.

**Example:** Enter 12345.6789

12345.6789

12345.6789

12 345.6789

*Notice the digit separation, change to turn off.*

## Backspace

Delete entries.

**Example:** Enter 513 and then edit it to 523

512 twice 23

523  
523

Compare with for undoing the last key press.

## All Clear

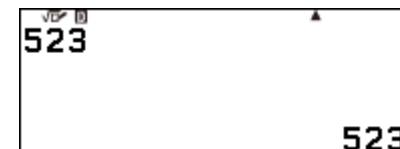

Close a selected menu or clear the screen.

**Example:** (a) Clear the Calculate screen      (b) Close menus

(a)

(b)

*Calculation history is still available by pressing . Closing a menu, returns to the previously displayed screen. Alternatively press repeatedly to return back through the menus. Also used to turn the calculator OFF.*

**Addition, multiplication, subtraction and division.**

Add, multiply, subtract and divide, obviously.

**Example:** Find  $1 + 2 \times 3 - 4 \div 5$

1+2×3-4÷5 

1+2×3-4÷5

31  
5

Notice the order of operations is not left to right and follows BIDMAS.

## Decimal point.

For when you absolutely must utilise all of the decimal number system.

**Example:** Find  $\frac{3}{7} + 3.7$

3 7 > +3.7

3  
7  
+3.7  
289  
70

Change for a comma decimal mark.

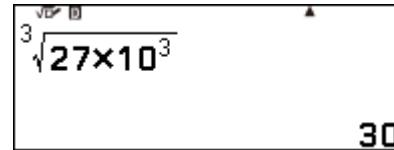

## Execute

Perform calculations or confirm data entry.

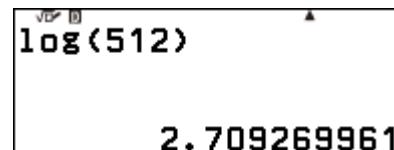

**Example:** Find (a)  $\sqrt[3]{27 \times 10^3}$  (b)  $\log 512$

(a)  (Up arrow)  3  27  3 

A screenshot of a calculator screen showing the input  $\sqrt[3]{27 \times 10^3}$  and the result 30.

(b)  (Left arrow)    512) 

A screenshot of a calculator screen showing the input  $\log(512)$  and the result 2.709269961.

See  as they are interchangeable with each other.

See also .

## QR Quick Read

Create a QR code from a calculation or Table.

**Example:** (a) Create a QR code from  $\sqrt{25.9}$  (b) Create a QR code from a Table of  $f(x) = x^2$   $1 \leq x \leq 5$

(a) 

(b) 

Scan the QR code on the calculator screen with a smart device. This can then take you to ClassPad.net.  
Click the QR codes above to simulate scanning.

## Recurring decimal

Enter recurring decimals of various formats.

**Example:** Enter (a)  $0.\dot{3}$  (b)  $0.\dot{4}1\dot{6}$

(a)  $0.\uparrow \blacksquare^2 3 \text{EXE}$

(b)  $0.\uparrow \blacksquare^2 416 \text{EXE}$

$0.\dot{3}$   
 $\frac{1}{3}$

$0.\dot{4}1\dot{6}$   
 $\frac{416}{999}$

Compare using to convert between fractions and decimals.

[Using Recurring Decimals video](#)

( $\sin^{-1}$ )

( $\cos^{-1}$ )

( $\tan^{-1}$ )

## Inverse trigonometric function

Find an angle from a value.

**Example:** Find (a)  $\sin^{-1} 0.75$  (b)  $\tan^{-1} -35$

(a)  $\uparrow \sin 0.75$  EXE

$\sin^{-1}(0.75)$

48.59037789

(b)  $\uparrow \tan \uparrow -35$  EXE

$\tan^{-1}(-35)$

-88.36342296

Notice that only a single value is given, in the range  $-90^\circ \leq x \leq 90^\circ$ .

## INS Insert

Edit calculations using existing arguments.

**Example:** Edit  $1 + \frac{1}{9}$  to  $1 + \sqrt{\frac{1}{9}}$

1+1 $\begin{matrix} \text{a/b} \\ \text{9} \end{matrix}$  $\leftarrow$ twice $\begin{matrix} \uparrow \\ \leftarrow \end{matrix}$  $\begin{matrix} \sqrt \\ \square \end{matrix}$  EXE

1+ $\begin{matrix} \sqrt \\ \frac{1}{9} \end{matrix}$   
4  
3

Notice the **INS** cursor changes to ►.  
This saves deleting and re-entering parts of the calculation.

**OFF** **Off**

When you have had enough ...

**Example:** Turn the calculator off

*That's all folks ...*

## Function

Define and evaluate 2 functions and use in calculations.

**Example:** (a) Define  $f(x) = x^2 - 2x - 3$  and  $g(x) = f(2x) + 4$  (b) Evaluate  $4g(2)$

(a)  $f(x) \downarrow$  twice OK  $x$   $\square^2$   $-2x$   $-3$  OK  
 $f(x) \downarrow$  three times OK  $f(x)$  OK  $2x$   $+4$  OK  
(b)  $4$   $f(x)$   $\downarrow$  OK  $2$  ) EXE

g(x)=f(2x)+4

4g(2)

36

Compare to using  $\text{○○}$  for defining functions in Table.

[Using FUNCTION video](#)

## Format

Display the most appropriate value format.

**Example:** Enter (a)  $\frac{5}{12}$  (b) 32292 then press and choose a format.

A sequence of seven screenshots from a Casio calculator illustrating the use of the FORMAT key. 1. Top left: Shows the fraction  $\frac{5}{12}$ . 2. Top middle: A menu for entering  $\frac{5}{12}$  appears, with 'Decimal' highlighted. 3. Top right: A menu for displaying  $\frac{5}{12}$  appears, with 'Decimal' highlighted. 4. Bottom left: The calculator displays the decimal value 0.4166666667. 5. Bottom middle: The calculator displays the decimal value 0.416. 6. Bottom right: The calculator displays the angle 0°25'0". 7. Far right: Shows the integer 32292 followed by a menu for displaying it, with 'Prime Factor' highlighted.

Use to swap between different representations of the same value, the default is Standard.

Notice how the menu changes depending on the input.

Useful for individual calculations, change to always get decimals or mixed fractions. [Using FORMAT video](#)
