#### 1. Quick Start Guide

The IP core provides a design example which allows the user to:

- Compile the design to get an estimate IP core area and timing
- ullet Simulate the design to verify the IP core functionality through simulation
- Test the design on hardware to test the design on the Intel<sup>®</sup> Stratix<sup>®</sup> 10 GX
   Transceiver Signal Integrity Development Kit

When you generate the design example, the parameter editor automatically creates the files necessary to simulate, compile, and test the design in hardware.

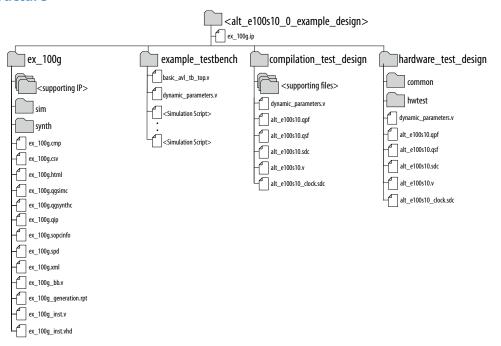

Figure 1. Development Steps for the Design Example

#### 1.1. Directory Structure

Figure 2. Low Latency 100G Ethernet Intel Stratix 10 FPGA Design Example Directory Structure

The hardware configuration and test files (the hardware design example) are located in < design\_example\_dir>/hardware\_test\_design. The simulation files (testbench for simulation only) are located in < design\_example\_dir>/example\_testbench. The compilation-only design example is located in < design\_example\_dir>/compilation\_test\_design.

#### 1.2. Simulation Design Example Components

Figure 3. Low Latency 100G Ethernet Intel Stratix 10 FPGA Simulation Design Example Block Diagram

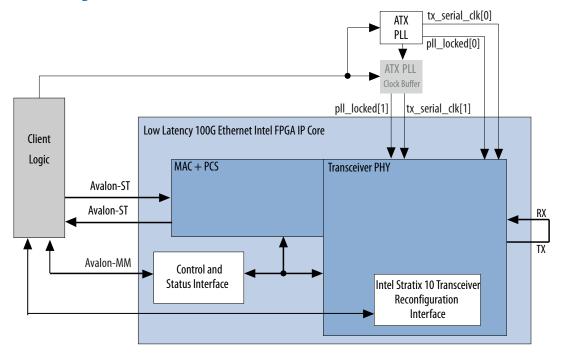

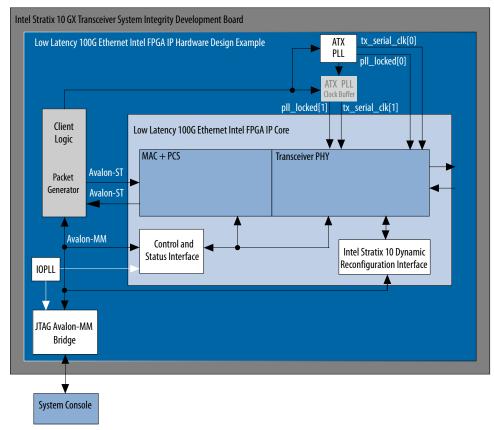

Table 1. Low Latency 100G Ethernet Intel Stratix 10 FPGA Core Testbench File Descriptions

File Names	Description				
Key Testbench and Simul	ation Files				
basic_avl_tb_top.v	Top-level testbench file. The testbench instantiates the DUT and runs Verilog HDL tasks to generate and accept packets.				
Testbench Scripts					
run_vsim.do	he Mentor Graphics* ModelSim* script to run the testbench.				
run_vcs.sh	The Synopsys* VCS* script to run the testbench.				
run_vcsmx.sh	The Synopsys VCS MX script (combined Verilog HDL and SystemVerilog with VHDL) to run the testbench.  Note: Use run_vcsmx.sh when RS-FEC is enabled.				
run_ncsim.sh	The Cadence NCSim script to run the testbench.				
run_xcelium.sh	The Cadence Xcelium* script to run the testbench.				

#### 1.3. Hardware Design Example Components

Figure 4. Low Latency 100G Ethernet Intel Stratix 10 FPGA Hardware Design Example High Level Block Diagram

The Low Latency 100G Ethernet Intel Stratix 10 FPGA hardware design example includes the following components:

- Low Latency 100G Ethernet Intel Stratix 10 FPGA core.
- Client logic that coordinates the programming of the IP core and packet generation.
- One ATX PLL and one clock buffer to drive the device transceiver channels.
- IOPLL to generate a 100 MHz clock from a 50 MHz input clock to the hardware design example.
- JTAG controller that communicates with the System Console. You communicate with the client logic through the System Console.

The hardware design example uses run\_test command to initiate packet transmission from packet generator to the IP core. Use the  $loop_on$  command to turn on internal serial loopback for this design example. If the internal serial loopback is turned on, the IP core receives the packets and transmit to the packet generator. The MAC checks the received packets and updates the statistic counters. Use the chkmac\_stats command in the system console to read and print out the MAC statistic registers once the packet transmissions completed.

Table 2. Low Latency 100G Ethernet Intel Stratix 10 FPGA Core Hardware Design Example File Descriptions

File Names	Description	
alt_e100s10.qpf	Intel Quartus® Prime project file	
alt_e100s10.qsf	Intel Quartus Prime project settings file

#### 1.4. Generating the Design

#### Figure 5. Procedure

### Figure 6. Example Design Tab in the Low Latency 100G Ethernet Intel Stratix 10 FPGA Parameter Editor

Follow these steps to generate the Low Latency 100G Ethernet Intel Stratix 10 FPGA hardware design example and testbench:

- If you do not already have an Intel Quartus Prime Pro Edition project in which to integrate your Low Latency 100G Ethernet Intel Stratix 10 FPGA core, you must create one.
  - a. In the Intel Quartus Prime Pro Edition, click File ➤ New Project Wizard to create a new Quartus Prime project, or File ➤ Open Project to open an existing Intel Quartus Prime project. The wizard prompts you to specify a device.
  - b. Specify the device family **Intel Stratix 10** and select a device that meets all of these requirements:
    - Transceiver tile is L-tile or H-tile (any transceiver tile)
    - Transceiver speed grade is -1 or -2
    - Core speed grade is -1 or -2
    - Production version devices
  - c. Click Finish.
- In the IP Catalog, locate and select Low Latency 100G Ethernet. The New IP Variation window appears.
- 3. Specify a top-level name < your\_ip> for your custom IP variation. The parameter editor saves the IP variation settings in a file named < your\_ip>.ip.
- 4. Click **OK**. The parameter editor appears.
- 5. On the **IP** tab, specify the parameters for your IP core variation.
  - *Note:* **Enable RX/TX statistics counters** parameter is enabled by default.
- 6. On the **Example Design** tab, under **Example Design Files**, select the **Simulation** option to generate the testbench, and select the **Synthesis** option to generate the compilation-only and hardware design examples.
  - *Note:* You must select at least one of the **Simulation** and **Synthesis** options to generate the design example.
- 7. On the **Example Design** tab, under **Generated HDL Format**, only Verilog HDL is available. This IP core does not support VHDL.
- 8. Under Target Development Kit select the Stratix 10 GX Transceiver Signal Integrity Development Kit (Production), Stratix 10 GX Transceiver Signal Integrity Development Kit (ES), or None.

Note: When you select Stratix 10 GX Transceiver Signal Integrity
Development Kit (Production) or Stratix 10 GX Transceiver Signal
Integrity Development Kit (ES) as the Target Development Kit, the
design example is generated based on a specific device and it overwrites the
device you selected in your project file. If you select None as the Target
Development Kit, ensure the device you selected is the correct device and
make changes to the pins assignment in the .qsf file. By default, the .qsf
file is generated based on the device used in Stratix 10 GX Transceiver
Signal Integrity Development Kit.

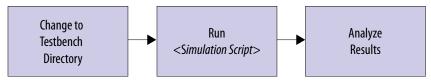

- 9. Click the **Generate Example Design** button. The **Select Example Design Directory** window appears.
- 10. If you want to modify the design example directory path or name from the defaults displayed (alt\_e100s10\_0\_example\_design), browse to the new path and type the new design example directory name (<design\_example\_dir>).

#### 1.5. Simulating the Design Example Testbench

Figure 7. Procedure

Follow these steps to simulate the testbench:

- 1. Change to the testbench simulation directory <design\_example\_dir>/ example testbench.
- 2. Run the simulation script for the supported simulator of your choice. The script compiles and runs the testbench in the simulator. Refer to the table *Steps to Simulate the Testbench*.
- 3. Analyze the results. The successful testbench sends ten packets, receives ten packets, and displays "Testbench complete."

Table 3. Steps to Simulate the Testbench

Simulator	Instructions
Mentor Graphics ModelSim	In the command line, type <code>vsim -do run_vsim.do</code> If you prefer to simulate without bringing up the ModelSim GUI, type <code>vsim -c -do run_vsim.do</code>
	continued

Simulator	Instructions			
	Note: The ModelSim - Intel FPGA Edition simulator does not have the capacity to simulate this IP core. You must use another supported ModelSim simulator such as ModelSim SE.			
Cadence NCSim	In the command line, type sh run_ncsim.sh			
Cadence Xcelium	In the command line, type sh run_xcelium.sh			
Synopsys VCS/ VCS MX	In the command line, type sh run_vcs.sh or sh run_vcsmx.sh  Note: run_vcs.sh is only available if you select Verilog as the Generated HDL Format. If  RS-FEC is enabled or you select VHDL as the Generated HDL Format, you must simulate the testbench with a mixed language simulator using run_vcsmx.sh.			

The successful test run displays output confirming the following behavior:

- 1. Waiting for the ATX PLLs to lock.
- 2. Waiting for RX transceiver reset to complete.
- 3. Waiting for RX alignment.
- 4. Sending ten packets.
- 5. Receiving ten packets.
- 6. Displaying Testbench complete.

The following sample output illustrates a successful simulation test run:

```
ATX PLLs Locked

#### 1.6. Compiling the Compilation-Only Project

To compile the compilation-only example project, follow these steps:

- 1. Ensure compilation design example generation is complete.
- 2. In the Intel Quartus Prime software, open the Intel Quartus Prime project <design\_example\_dir>/compilation\_test\_design/alt\_e100s10.qpf.
- 3. On the Processing menu, click **Start Compilation**.

After successful compilation, reports for timing and for resource utilization are available in your Intel Quartus Prime Pro Edition session.

#### **Related Information**

Block-Based Design Flows

#### 1.7. Compiling and Configuring the Design Example in Hardware

To compile the hardware design example and configure it on your Intel Stratix 10 device, follow these steps:

- 1. Ensure hardware design example generation is complete.
- 2. In the Intel Quartus Prime Pro Edition software, open the Intel Quartus Prime project <design\_example\_dir>/hardware\_test\_design/alt\_e100s10.qpf.
- 3. On the Processing menu, click **Start Compilation**.
- 4. After successful compilation, a .sof file is available in your <design\_example\_dir>/hardware\_test\_design/output\_files directory. Follow these steps to program the hardware design example on the Intel Stratix 10 device:
  - a. On the **Tools** menu, click **Programmer**.
  - b. In the Programmer, click **Hardware Setup**.
  - c. Select a programming device.
  - d. Select and add the Intel Stratix 10 Transceiver Signal Integrity Development Kit to which your Intel Quartus Prime Pro Edition session can connect.
  - e. Ensure that Mode is set to JTAG.
  - f. Select the Intel Stratix 10 device and click **Add Device**. The Programmer displays a block diagram of the connections between the devices on your board.
  - g. In the row with your .sof, check the box for the .sof.
  - h. Check the box in the **Program/Configure** column.
  - i. Click Start.

Analyzing and Debugging Designs with System Console

#### 1.8. Testing the Hardware Design Example

After you compile the Low Latency 100G Ethernet Intel Stratix 10 FPGA core design example and configure it on your Intel Stratix 10 device, you can use the System Console to program the IP core and its embedded Native PHY IP core registers.

To turn on the System Console and test the hardware design example, follow these steps:

- After the hardware design example is configured on the Intel Stratix 10 device, in the Intel Quartus Prime Pro Edition software, on the **Tools** menu, click **System Debugging Tools** ➤ **System Console**.
- 2. In the Tcl Console pane, type cd hwtest to change directory to <design example dir>/hardware test design/hwtest.
- 3. Type source main.tcl to open a connection to the JTAG master.

You can program the IP core with the following design example commands:

- chkphy\_status: Displays the clock frequencies and PHY lock status.
- chkmac\_stats: Displays the values in the MAC statistics counters.
- clear\_all\_stats: Clears the IP core statistics counters.
- start\_pkt\_gen: Starts the packet generator.
- stop\_pkt\_gen: Stops the packet generator.
- loop\_on: Turns on internal serial loopback
- loop\_off: Turns off internal serial loopback.
- reg\_read <addr>: Returns the IP core register value at <addr>.
- reg\_write <addr> <data>: Writes <data> to the IP core register at address <addr>.

The successful test run displays output confirming the following behavior:

- 1. Turning off packet generation
- 2. Enabling loopback
- 3. Waiting for RX clock to settle
- 4. Printing PHY status
- 5. Clearing MAC statistics counters
- 6. Sending packets
- 7. Reading MAC statistics counters
- 8. Printing MAC statistics counters, which show 0 in all error counters

The following sample output illustrates a successful test run:

```
--- Turning off packet generation ----
------ Enabling loopback ------
```

#### **Related Information**

- Analyzing and Debugging Designs with System Console
- Testing the Hardware Design Example using Ethernet Link Inspector on page 14

## **1.8.1. Testing the Hardware Design Example using Ethernet Link Inspector**

You can also test your design using the Ethernet Link Inspector (ELI) tool available in System console.

Design examples have built-in JTAG to AVMM bridge allowing you to use the Ethernet Link Inspector. Refer to the user guide on how to use the ELI to test your design. The ELI tool is accessible via **System Console** in the **Tools ➤ Legacy Toolkits** in the Intel Quartus Prime Pro Edition software.

#### **Related Information**

Ethernet Link Inspector User Guide for Intel Stratix 10 Devices

#### 1.8.2. Testing the Hardware Design Example using Ethernet Toolkit

The Ethernet Toolkit (ETK) is a tool that continuously monitors an Ethernet link.

Available in the Intel Quartus Prime Pro Edition software version 19.4 and later, the toolkit features list follows the standalone Ethernet Link Inspector tool. The toolkit allows you to review the PHY status, PCS status, MAC status, RS-FEC status, and AN and LT status.

Follow these steps to test your design using the Ethernet Toolkit:

- 1. In the **IP** tab of the Low Latency 100G Ethernet Intel Stratix 10 FPGA IP, select **Enable JTAG to Avalon Master Bridge**.
- Compile your design.
- In the Intel Quartus Prime Pro Edition, click Tools ➤ Programmer, click Hardware Setup.
  - Select a programming hardware setup from currently selected hardware or add new hardware. Click Close.
  - b. Click **Start** to program your design onto the device.
- Click Tools ➤ System Debugging Tools ➤ System Console to open a new system console window.
- 5. In the **System Console**, follow these steps to open the Ethernet Toolkit:
  - a. Select File ➤ Load Design to load the programming file (\*.sof). Click OK.
  - b. In the Instances pane, select the Ethernet IP instance.
  - In the Details pane, select Low Latency 100G EthernetIP Toolkit from the toolkit list.

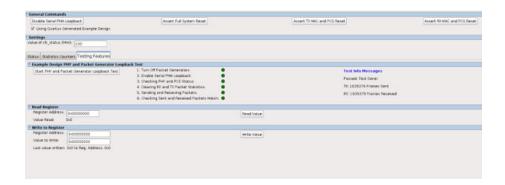

#### Figure 8. Ethernet Toolkit Explorer View

- d. In the **General Commands** tab, click **Enable Serial PMA Loopback** to establish the serial loopback.
- e. The **Settings** ➤ **Status** tab provides link status enable and control options such as PCS and PHY Status, MAC settings, and AN and LT status. Click **Start Reading All Status** to start reading the link status.
- f. The **Settings** ➤ **Statistics Counters** tab provides the example design packet generator settings, transmitter and receiver statistics.
  - i. Deselect MAC Loopback Mode.
  - ii. Select your preferred Packet Generator Modes option.
  - iii. Click **Start Packet Generator**. This enables the packet generator.
  - iv. Click Start Reading Transmitter Statistics and Start Reading Receiver Statistics.
- g. The Settings ➤ Testing Features tab provides a series of testing features to test the Ethernet link.
  - Click Start PHY and Packet Generator Loopback Test to test your Ethernet link.

#### 2. Design Example Description

The design example demonstrates the functions of the Low Latency 100G Ethernet Intel Stratix 10 FPGA core with transceiver interface compliant with the IEEE 802.3ba standard CAUI-4 specification. You can generate the design from the **Example Design** tab in the Low Latency 100G Ethernet Intel Stratix 10 FPGA parameter editor.

To generate the design example, you must first set the parameter values for the IP core variation you intend to generate in your end product. Generating the design example creates a copy of the IP core; the testbench and hardware design example use this variation as the DUT. If you do not set the parameter values for the DUT to match the parameter values in your end product, the design example you generate does not exercise the IP core variation you intend.

Note:

The testbench demonstrates a basic test of the IP core. It is not intended to be a substitute for a full verification environment. You must perform more extensive verification of your own Low Latency 100G Ethernet Intel Stratix 10 FPGA design in simulation and in hardware.

#### **Related Information**

Low Latency 100G Ethernet Intel Stratix 10 FPGA IP User Guide

#### 2.1. Features

#### **DUT** features:

- Standard CAUI-4 external interface consisting of four FPGA hard serial transceiver lanes operating at 25.78125 Gbps.
- Avalon Memory-Mapped (Avalon-MM) management interface to access the IP core control and status registers.
- RX CRC checking and error reporting.
- TX error insertion capability to transmit error frame at the end of a packet cycle.
- Hardware and software reset control.

#### 2.2. Design Example Behavior

The testbench sends traffic through the IP core, exercising the transmit side and receive side of the IP core. In the hardware design example, you can program the IP core in internal serial loopback mode and generate traffic on the transmit side that loops back through the receive side.

To speed up simulation, the IP core simulation model sends alignment marker tags at shorter intervals than required by the IEEE Ethernet standard. The standard specifies an alignment marker interval of 16384 words in each virtual lane. The simulation model with the testbench implements an alignment marker interval of 512 words.

#### 2.3. Design Example Interface Signals

The Low Latency 100G Ethernet Intel Stratix 10 FPGA testbench is self-contained and does not require you to drive any input signals.

Table 4. Low Latency 100G Ethernet Intel Stratix 10 FPGA Hardware Design Example Interface Signals

Signal	Direction	Comments
clk50	Input	Drive at 50 MHz. The intent is to drive this input from a 50 MHz oscillator on the board.
clk_ref_r	Input	Drive at 644.53125 or 322.265625 MHz.
cpu_resetn	Input	Resets the IP core. Active low. Drives the global hard reset csr_reset_n to the IP core.
tx_serial[3:0]	Output	Transceiver PHY output serial data.
rx_serial[3:0]	Input	Transceiver PHY input serial data.
user_led[7:0]	Output	Status signals. Currently the design example drives all of these signals to a constant value of 0.

#### **Related Information**

Interfaces and Signal Descriptions

Provides detailed descriptions of the Low Latency 100G Ethernet Intel Stratix 10 FPGA core signals and the interfaces to which they belong.

#### 2.4. Design Example Registers

## Table 5. Low Latency 100G Ethernet Intel Stratix 10 FPGA Hardware Design Example Register Map

Lists the memory mapped register ranges for the hardware design example. You access these registers with the  $reg\_read$  and  $reg\_write$  functions in the System Console.

Word Offset	Register Type
0x000000	KR4 registers
0x000300	PHY registers
0x000400	TX MAC registers
0x000500	RX MAC registers
0x000800	TX Statistics Counter registers
0x000900	RX Statistics Counter registers
0x001000	Packet Client registers
0x004000	PMA registers <sup>(1)</sup>

<sup>(1)</sup> Each PHY channel has its PMA registers set. PMA registers sets are offset from each other by 0x800 channel offset, starting at the 0x4000 word offset.

#### **Table 6. Packet Client Registers**

You can customize the Low Latency 100G Ethernet Intel Stratix 10 FPGA hardware design example by programming the packet client registers.

Addr	Name	Bit	Description	HW Reset Value	Access
0x1000	PKT_CL_SCRA TCH	[31:0]	Scratch register available for testing.		RW
0x1001	PKT_CL_CLNT	[31:0]	Four characters of IP block identification string "CLNT"		RO
0x1008	Packet Size Configure	[29:0]	Specify the transmit packet size in bytes. These bits have dependencies to PKT_GEN_TX_CTRL register.  • Bit [29:16]: Specify the upper limit of the packet size in bytes. This is only applicable to incremental mode.  • Bit [13:0]:  — For fixed mode, these bits specify the transmit packet size in bytes.  — For incremental mode, these bits specify the lower limit of the transmit packet size in bytes.	0x25800040	RW
0x1009	Packet Number Control	[31:0]	Specify the number of packets to transmit from the packet generator. These bits have dependencies to PKT_GEN_TX_CTRL register.  • Bit [31]:  — 1: For fixed/incremental mode with fixed number of packets, this is the number of packets enable bit.  — 0: For random mode or fixed/incremental mode without fixed number of packets.  • Bits [30:0]:  — If bit [31] is set, specifies the number of packets to be sent by the packet generator. For more information, refer to the Packet Generator Programming Sequence on page 20.	0xA	RW
0x1010	PKT_GEN_TX_ CTRL	[7:0]	<ul> <li>Bit [0]: Reserved.</li> <li>Bit [1]: Packet generator status control bit.  — 0: Packet generator starts sending out the packets.</li> <li>— 1: Packet generator stops sending out the packets.</li> <li>Bit [2]: Reserved.</li> <li>Bit [3]: Has the value of 1 if the IP core is in MAC loopback mode; has the value of 0 if the packet client uses the packet generator.</li> <li>Bit [5:4]:  — 00: Random mode  — 01: Fixed mode  — 10: Incremental mode</li> <li>Bit [6]:  — 1: For transmission without gap in between packets.</li> <li>— 0: For transmission with random gap in between packets.</li> <li>Bit [7]: Reserved.</li> </ul>	0x6	RW

Addr	Name	Bit	Description	HW Reset Value	Access
0x1011	Destination address lower 32 bits	[31:0]	Destination address (lower 32 bits)	0x56780ADD	RW
0x1012	Destination address upper 16 bits	[15:0]	Destination address (upper 16 bits)	0x1234	RW
0x1013	Source address lower 32 bits	[31:0]	Source address (lower 32 bits)	0x43210ADD	RW
0x1014	Source address upper 16 bits	[15:0]	Source address (upper 16 bits)	0x8765	RW
0×1016	PKT_CL_LOOP BACK_RESET	[0]	MAC loopback reset. Set to the value of 1 to reset the design example MAC loopback.	1'b0	RW

- Low Latency 100G Ethernet Intel Stratix 10 FPGA core register descriptions

#### 2.4.1. Packet Generator Programming Sequence

You can initiate the packet transmission from the packet generator to the IP core by programming Packet Size Configure, Packet Number Control, and PKT\_GEN\_TX\_CTRL registers.

The programming sequence varies based on a selected mode  $PKT\_GEN\_TX\_CTRL[5:4]$ :

#### **In Random Mode:**

- 1. Set Packet Number Control[31] to 0.
- 2. Set PKT\_GEN\_TX\_CTRL[1] to 0 to start the packet transmission through the packet generator.
- 3. Set PKT\_GEN\_TX\_CTRL[1] to 1 to stop the packet generator.

#### In Fixed/Incremental Mode—with fixed number of packets:

- 1. Configure Packet Size Configure.
- 2. Configure the number of packets: Bit [31] must be set to specify Packet Number Control[30:0]
- 3. Set PKT\_GEN\_TX\_CTRL[1] to 0 to start the packet transmission through the packet generator.
- 4. The packet generator stops when the number of packets reaches 0.

UG-20086 | 2020.04.13

#### In Fixed/Incremental Mode— without fixed number of packets:

- 1. Configure Packet Size Configure.
- 2. Set Packet Number Control[31] to 0.
- 3. Set PKT\_GEN\_TX\_CTRL[1] to 0 to start the packet transmission through the packet generator.
- 4. Set PKT\_GEN\_TX\_CTRL[1] to 1 to stop the packet generator.

# 3. Low Latency 100G Ethernet Intel Stratix 10 FPGA IP Design Example User Guide Archives

IP versions are the same as the Intel Quartus Prime Design Suite software versions up to v19.1. From Intel Quartus Prime Design Suite software version 19.2 or later, IPs have a new IP versioning scheme.

Intel Quartus Prime Version	IP Core Version	User Guide
19.4	19.1.1	Low Latency 100G Ethernet Intel Stratix 10 FPGA IP Design Example User Guide
19.3	19.1.1	Low Latency 100G Ethernet Intel Stratix 10 FPGA IP Design Example User Guide
19.1	19.1	Low Latency 100G Ethernet Intel Stratix 10 FPGA IP Design Example User Guide
18.0	18.0	Low Latency 100G Ethernet Intel Stratix 10 FPGA IP Design Example User Guide
17.1	17.1	Intel Stratix 10 Low Latency 100G Ethernet Design Example User Guide

# 4. Document Revision History for the Low Latency 100G Ethernet Intel Stratix 10 FPGA IP Design Example User Guide

Document Version	Intel Quartus Prime Version	IP version	Changes
2020.04.13	20.1	19.2.0	Updated the Low Latency 100G Ethernet Intel Stratix 10 FPGA Simulation Design Example Block Diagram and the Low Latency 100G Ethernet Intel Stratix 10 FPGA Hardware Design Example High Level Block Diagram to emphasize that the 2nd ATX PLL configures as a clock buffer.  Corrected the register type in the Design Example Registers section. The 0x000300 word offset represents PHY registers, not RX PHY registers.  Added PMA registers word offset in the Design Example Registers section.
2019.12.16	19.4	19.1.1	Added note to clarify run_vcs.sh and run_vcsmx.sh usage.      Updated sample output in the Testing the Hardware Design Example section.      Added a new topic: Testing the Hardware Design Example using System Debugging Toolkits
2019.09.30	19.3	19.1.1	<ul> <li>Added Synopsys VCS script option run_vcsmx.sh in Low Latency 100G Ethernet Intel Stratix 10 FPGA Core Testbench File Descriptions and Steps to Simulate the Testbench tables.</li> <li>Added support for Xcelium* simulator.</li> <li>Updated Generating the Design section.</li> <li>Updated .sof file path in the Compiling and Configuring the Design Example in Hardware section.</li> <li>Added Ethernet Link Inspector in the Testing the Hardware Design Example section.</li> <li>Updated Packet Number Control and PKT_GEN_TX_CTRL registers in the Packet Client Registers table.</li> <li>Added Packet Generator Programming Sequence section.</li> </ul>
2019.05.15	19.1	19.1	Changed word "lower" to "upper" in the Source address register.
2018.06.29	18.0	18.0	<ul> <li>Added flow control feature in the <i>DUT features</i> list.</li> <li>Added 322.2625 MHz support for PHY reference clock.</li> <li>Added packet client registers description in the <i>Packet Client Registers</i> table.</li> </ul>
2017.11.06	17.1	17.1	Initial release.
