YC/YD/YE/PC/PE Outdoor Units

NC/ND/NL/NM Indoor Units

YC/YD/PC/PD Outdoor Units

Description

Condensing units and heat pumps are completely assembled, piped and wired at the factory to provide a single-piece unit for shipment and rigging. Each unit is pressurized with a holding charge of refrigerant R-410A for storage and/or shipping.

The compact design, clean styling, small footprint, and quiet operation make these condensing units and heat pumps suitable for almost any outdoor location. On rooftops... because they weigh much less than a single package unit of similar capacity and are much easier to rig and support. On the ground... because the footprint is compact allowing a variety of applications.

Both the condensing units and heat pumps are equipped with reliable Smart Equipment™ microprocessor controls to assure proper operation and unit protection for long product life. Products from 10 to 20 tons are available in single or dual (2 or 4 pipe) refrigerant circuits for redundancy in operation and various applications.

The air handling units are completely assembled units, including a well-insulated cabinet, a DX cooling coil with copper tubing, aluminum fins, expansion valve(s), distributor(s), 2" throwaway filters, a centrifugal blower, a blower motor, an adjustable belt drive, a blower motor contactor and a small holding charge of nitrogen.

Units are shipped in the vertical position ready for field installation, but can be easily converted to horizontal position. An added benefit of the air handling units is they are designed to operate with either a condensing unit or a heat pump and no field modification or special unit is required for heat pump applications.

(Except YC300)

Condensing Unit Features and Benefits

Features

- Meets or exceeds ASHRAE 90.1 standards.
- Scroll compressors provide both high efficiency and reliability. Single two-stage scroll available on the 7.5 ton OD unit.
- Smart Equipment™ Controls
- Dual refrigerant circuits on PD and YD models.
- Condensing unit coils are constructed of reliable and durable Micro-Channel aluminum tube and fins for long lasting, efficient operation. Micro-Channel technology provides exceptional durability along with reduced product weight and less refrigerant charge. Heat pumps units are equipped with aluminum fin, copper tube coils providing durability, reliability and value.
- Crankcase heaters that de-energize when compressors are operating.
- Both high and low pressure controls. Since these controls are self-contained, there are no capillary lines to be damaged.
- Internal compressor motor protection.
- Class 2, 24-volt thermostat control circuit protected by a re-settable breaker.
- Standard factory installed service valves.

- Filter-driers are shipped in the unit's control box for field installation in the liquid line leaving the outdoor unit.
- Copper stub-outs are factory mounted on the suction and liquid lines to simplify the field piping connections.
- Smart Equipment™ Controls provide stable cooling operation at ambient temperatures down to 45°F with low ambient kits available for operation to 0°F.
- Capacity staging for more economical operation and stable temperature levels within the conditioned space.
- Smart Equipment™ Controls control board uses a three times, you're out philosophy. The high, low-pressure switch, anti-freeze protection, low voltage or heating high limit must trip three times within two hours before the unit control board will lock out the associated compressor. An alarm message will be displayed on the LCD screen
- Smart Equipment™ Controls monitor each safety independently (High pressure, low pressure, low voltage) allowing ease of troubleshooting if any problems arise.
- Inherently protected condenser fan motors.
- E-coat coated outdoor coils for sea coast or corrosive environment applications.

- Factory installed disconnect to allow power to be removed from the unit when performing periodic maintenance or for service.
- Factory installed powered or non-powered 115 volt GFI outlet.
- Factory installed phase monitor to protect the unit from phase loss or phase reversal.

Benefits

The condensing units and heat pumps can be applied on a rooftop or at ground level... due to their ample sub-cooling capacity which allows them to be located three or more stories below the evaporator coil.

After assembly, the unit is pressurized with a combination of Refrigerant R-410A and nitrogen for pressure testing and additional leak testing. During this pressure test, the operation of the high pressure control is checked. As the unit is being evacuated and dehydrated, the operation of the low pressure control is also checked.

Every compressor, condenser fan motor, crankcase heater, and electrical control circuit is checked to assure a trouble-free start-up and years of reliable operation. The condenser fan guards are vinyl-coated to provide additional rust protection and to enhance the appearance of the unit. Compressors are mounted on rubber isolators to reduce the transmission of vibration. Vertical discharge condenser fans direct sound upward and away from any surrounding structures.

All sheet metal parts are constructed of commercial grade galvanized steel. After fabrication, each part is thoroughly cleaned to remove any grease or dirt from its surfaces. The external parts are coated with a powder paint to assure a quality finish for many years. This UL approved coating system has passed the 750-hour, 20% salt spray test per ASTM Standard B117.

All condensing unit and heat pump models include a 5-year limited warranty on the compressor(s) and 1-year limited warranty on all other parts. The matching line of air handling units carries a 1-year limited parts warranty.

Outdoor Unit Accessories

Coil Guards: Wire-form coil guards for added protection of outdoor coils. Designed to mount on each side of the product if required to provide protection from minor impacts or large debris.

Hail Guards: Hood type hail guards designed to protect the outdoor coils from hail. Can be installed on a single side or both to provide protection from storms that may produce hail.

Low Ambient Kits: Kits designed to allow the cooling only units to operate between 0°F and 40°F in the cooling mode. Standard cooling is allowed to 45°F. (Not designed for operation on heat pump units).

Air Handling Unit Features and Benefits

Features

These air handlers can be arranged for a variety of air discharge patterns in either the horizontal or vertical position. Refer to the unit installation instructions for other application possibilities.

Benefits

Air handling units are designed with two distinct modules to provide maximum application flexibility. All are shipped as single packages with the blower module mounted on top of the coil module. The blower module can be repositioned in the field to meet a large number of vertical and horizontal applications.

The 7.5 thru 20 Ton blower module includes the blower wheels along with factory-mounted motor and drive. The 25 Ton blower module includes the blower wheels with field mounted motor and drives. All models offer two motor horsepower options to meet both standard and high static airflow requirements.

The coil module includes direct expansion coils, 2 in. throwaway filters with the option to accept 4" filters (25 Ton 2" only), liquid line solenoid valves for capacity reduction, thermal expansion valves, distributors and a non-corrosive, composite condensate drain pan.

After the headers are brazed onto the coil and the coil is installed in the unit, the coil is pressurized with nitrogen for pressure testing and additional leak testing. After the coil is evacuated and dehydrated, it is pressurized with a holding charge of nitrogen for storage and/or shipping.

These air handlers, combined with condensing units, provide years of quiet, efficient and dependable operation.

Unit Installation

Units may be bottom-supported or ceiling-suspended and can be arranged to meet almost any space or duct requirements. Each unit is available with a choice of blower motors horsepower and other accessories to make them suitable for most applications.

Air Handling units from 10 to 20 tons are available in either two or four pipe configurations. 7.5 and 25 ton are two pipe (only) configurations. The dual and single circuit options provide a wide variety of application and unit match-up possibilities.

Blower Motors: Different HP motors are available for each unit to meet almost any air delivery requirement. All motors are UL approved, have permanently lubricated ball bearings and are mounted within the insulated cabinet of the units to minimize the transmission of sound to the surrounding space. 1.5-5 HP motors are inherently protected. 7.5 HP motors require motor overload protection.

Overload Relay (7.5 HP): These blower motors do not have inherent protection and require external motor overload protection. NC/ND240 "F" models overload relays are factory installed. NC300 models overload relays are field installed. Power wiring for blower motor is supplied in the overload

relay kit. See details in the overload relay kit and *NC300 Overload Relay Setting (All)* on page 63.

Factory-Mounted Components

Part Load Operation: These air handlers with DX (Direct Expansion) coils rated at 10 tons of capacity and above have multiple coils with pre-piped distributors, expansion valves and solenoid valves. Field modifications are not required for part load operations. Capacity reduction not only provides economical operation, but also maintains stable temperature and humidity levels in the conditioned space.

BAS Control: Smart Equipment™ with Communication Option Control - The York® Smart Equipment™ with Communication Option Control is factory installed. It includes all the features of the Smart Equipment™ control with an additional gateway to BACnet MS/TP (programmable to Modbus or N2 protocols).

IntelliSpeed™ Supply Fan Control Option: (ASHRAE 90.1 Compliant) AHU units configured with the IntelliSpeed option will contain a VFD for multi-speed supply fan operation. This option allows the supply fan RPM to vary based on the number compressors or heating stages energized.

Easy Service: Serviceable expansion valves are provided on every unit. These valves are factory-installed to provide many years of trouble-free operation. The expansion valves also include a tee fitting to allow easy installation of hot gas bypass if required.

Coil Protection: The indoor coils of these air handlers can have factory applied Electrofin coating to provide extended life to the indoor coil in standard applications and additional corrosion protection on those applications in sea coast or corrosive environments.

Accessories

IntelliSpeed™ VFD: Field installed VFD for 25 ton AHU IntelliSpeed multi-speed fan function. The field installed VFD will allow staged fan and will meet ASHRAE 90.1 or IECC two speed fan requirements.

Base Sections: Base sections can be used to elevate units above the floor. If desired, a moderate percentage of outdoor air may be introduced through these sections by cutting an access opening to accommodate the outdoor air duct connection. These bases include a durable finish to match the evaporator blower unit. The base may have to be insulated for certain applications.

Hot Water Coils: Drain-able water coils are available for field installation between the blower and the coil modules of both horizontal and vertical units. Since their casings match the dimensions and the finish of the basic units, they become an integral part of the unit after installation. The coils slide out of their casings for easy installation. Hot water coils have copper tubes that have been mechanically expanded into aluminum fins. Both headers are located on the same end of the coil.

Steam Coils: Steam coils are available for installation between the blower and coil modules of both horizontal and vertical units. Since the casing matches the dimensions and

the finish of the basic unit, it becomes an integral part of the unit after installation. The coil slides out of the casings for easy installation and is pitched in the casings to facilitate condensate drainage. The coil has copper tubes that have been mechanically expanded into aluminum fins. Both headers are located on the same end of the coil. The coil is leak-tested at 325 psig and dried before the connections are capped for storage and shipping.

Bottom Return: Air handling unit can be quickly converted to bottom return for both vertical and horizontal applications. All that is required is the removal of several screws and a single panel on 7.5-15 ton and two panels on the 20 ton AHU. Optional painted panel can be ordered to cover the side return opening when utilizing the bottom return.

Supply Air Plenums: These fully insulated plenums are available for free standing units located within the conditioned space. They are shipped fully assembled for easy field installation, are finished to match the exterior of the basic unit, and include double deflection grills that can be adjusted to vary the throw, spread and drop of the supply air.

Guide Specifications

Split System Cooling Only Condensing Units

Models: YC090-300, YD120-240, YE090 & Split
System Heat Pump Models: PC090-180, PD180-240, PE090

General

- Factory assembled, single piece, air cooled condensing unit designed for outdoor installation.
- Factory wired, piped, and tested for leakage and functionality to assure trouble-free installation and start-up.
- Rated in accordance with AHRI Standard 340/360.
- Designed and tested in accordance with ASHRAE 15 Safety Code for Mechanical Refrigeration and comply with NEC.
- Cooling performance rated in accordance with DOE and AHRI test procedures.
- CSA listed and classified to UL 1995/CAN/CSA No. 236- M90 standards.
- One year limited parts warranty on complete unit with an additional four year compressor warranty.

Unit Operating Characteristics

Operating Range shall be between 125° F to 40° F in cooling as standard from factory.

- The capacity of the condensing unit shall meet or exceed _____ Btuh at a suction temperature of _____ F. The power consumption at full load shall not exceed _____ kW.
- The combination of the condensing unit and the evaporator or fan coil unit shall have a total net cooling capacity of _____ Btuh or greater at conditions of _____ cfm entering-air temperature at the evaporator at

_____ F wet bulb and _____ F dry bulb, and air entering the condensing unit at _____ F.

- The system shall have an EER of _____ Btuh/ Watt or greater at standard AHRI conditions.

Installer Shall

- Furnish York® air-cooled condensing units, heat pump or equivalent in accordance with the performance schedule shown on the plans, and
- Unit shall be stored and handled in accordance with unit manufacturer's instructions.
- Install each unit as shown on the plans in accordance with the manufacturer's recommendations and all applicable national and local codes

Unit Construction

- Constructed of zinc-coated, galvanized steel.
- Exterior surfaces bonded and coated with baked enamel finish by a powder paint process capable of withstanding a minimum of 750 salt spray hours according to ASTM B117.
- Cabinet screws that comply with ASTM B117 salt spray test for a minimum of 750 hours.
- Permanently attached heavy-gage perimeter base rails with forklift slots and lifting holes.
- Removable access panels to all internal components.
- Separate access panel to controls.
- Access panels to allow outdoor coil cleaning.

Compressor(s)

- Hermetic scroll type, internally protected with high-pressure relief and over temperature protection.
- Two stage units operate in 50% capacity increments.
- Suction gas cooled
- Voltage range of $\pm 10\%$ of unit nameplate voltage.
- Neoprene isolators minimize sound transmission and vibration.
- Belly-band crankcase heaters keep refrigerant from diluting sump oil.
- Full charge of compressor oil

Outdoor Condenser Unit Coils

- Draw thru configuration
- Constructed with Micro-channel aluminum fins and aluminum tubing.

Heat Pump Unit Outdoor Unit Coils

- Draw thru configuration
- Constructed with aluminum plate fins mechanically bonded to seamless internally enhanced copper tubes with all joints brazed.

Condenser Fans

- Direct driven propeller-type fans
- Aluminum blades riveted to corrosion resistant steel spider brackets.
- Arranged for vertical air discharge.
- Equipped with PVC coated steel wire safety guards.

Condenser Motors

- Totally enclosed, air over cooled.
- Inherent overload protection.
- Permanently lubricated bearings.
- Must cycle to allow cooling operation down to 45°F.

Refrigerant Piping

- Solid core filter-drier(s) ship loose for field installation.
- Liquid and suction line service valves with gauge ports.
- Suction and discharge line service ports accessible from unit. Ports capped for leak prevention.
- Liquid line magnetic check valves
- Holding charge of R410A refrigerant.

Electrical Requirements

- Single-point connection electrical power.
- Nominal unit electrical characteristics shall be _____ v, 3-ph, 60 Hz. The unit shall be capable of satisfactory operation within voltage limits of _____ v to _____ v.
- Condenser fan motors and secondary of transformers shall be grounded.

Unit Controls

- All 24-volt control circuit, powered by a 24 volt transformer(s) and protected by a resettable breaker.
- Conventional thermostat must provide operation for both condensing units and heat pumps without an "O" output from the thermostat.
- Low voltage terminal strip for simple hook-up.
- Compressor motor protection shuts down unit for motor over-current, over-temperature or low voltage conditions.
- Safety lockouts provide reset capability at the space thermostat or base unit should any of the following standard safety devices trip and shut off compressor:
 - a. Loss-of-charge/Low-pressure switch.
 - b. High-pressure switch.
 - c. Control board diagnostics and fault message display.
 - d. Safety lockouts send a 24 volt signal to the control board's "X" terminal, allowing notification to the user via the thermostat fault light (if present).

- e. In the unlikely event any faults should occur, the unit control board will store the faults in its internal memory. The LCD display will scroll the 5 MOST critical faults, however, all fault messages can be extracted via USB device, displayed real-time via the MAP Gateway as well as be broad-casted through a BAS system (if applicable). The UCB will provide fault messages in plain English to ensure the user can easily understand the specific fault.

Non-fused Disconnect Switch

- Factory-installed, internally mounted.
- Accessible from outside the unit.
- NEC and UL approved non-fused switch.
- Provides power off lockout capability.

Convenience Outlet

- Factory-installed, internally mounted.
- Accessible from outside the unit.
- 115V, 15 amp GFI receptacle with independent fuse protection.
- Required voltage provided by factory-installed step-down transformer or field supplied 115v circuit.

Low-ambient Head Pressure Control

- Standard operation down to 45 °F without a low ambient kit.
- Operation down to 0°F with a factory-installed or field-installed low ambient kit accessory. The controller modulates the fan motor speed in response to liquid line temperature or pressure.

Coil Guard

Factory or field installed decorative grille shall be placed on the units to protect condenser coil after installation.

Hail Guard Package

Field installed hail guard package shall protect coils against damage from hail and other flying debris.

Coated Condenser Coils

Special phenolic or epoxy polymer coating available as a factory option on both outdoor and indoor coils.

Each Unit Shall Be:

- Covered by a 1-year limited parts warranty on the complete unit and 5-year on compressor(s).

- In current production with published literature available to check performance, limitations, specifications, power requirements, dimensions, operation and appearance.
- Indoor unit shall be equipped with a V-belt drive option that will permit the blower RPM to be adjusted to meet the CFM requirements of the air delivery system. (Refer to Technical Guide for Airflow Capabilities.)

Each Unit Enclosure Shall Have:

- Exterior panels of 18 gauge steel, finished with baked enamel to provide a long lasting quality appearance
- Removable panels to provide easy access to the internal components for maintenance and service on condensing units, heat pumps and air handlers
- Air handling units must have a filter rack that accepts both 2" and 4" filters (7.5 - 20 Ton only).
- The dimensions of each unit shall not exceed those specified in the manufacturers literature.
- The minimum application clearances for condensing units, heat pumps and air handlers must meet those specified in the manufacturer's literature.

The Blower Motor Shall:

- Be mounted within the insulated cabinet to minimize the transmission of sound to the surrounding space, and any motor 7.5 HP or greater must have a service factor of 1.15.

IntelliSpeed discrete fan control shall:

- Control fan speed with a VFD (Variable Frequency Drive)
- Drive fan speed based on the number of cooling or heating stages.
- Maximum airflow on first stage cooling not to exceed 67%.

The Evaporator Coil Shall:

- Consist of copper tubes arranged in staggered rows, mechanically expanded into aluminum fins,
- Be draw-through, and
- Include factory-mounted distributors, expansion valves and solenoid valves for capacity reduction.

The Blower Wheels Shall:

Be dynamically balanced to minimize the levels of sound and vibration generated by the unit.

¹ Motors, Drive and Overload Kits must be ordered separately for the NC300. The Motor Drive and Overload Kits are to be field installed.

² IntelliSpeed discrete fan control option for NC300 is field installed only. Refer to price pages or equipment selection tools to select the proper motor, drive, and IntelliSpeed VFD kit.

¹ These capacities are gross ratings. For net capacity, deduct supply air blower motor, MBh. Example: Refer to the appropriate Blower Performance Table for the BHP of the supply air blower motor, MBh = 3.415 x kW and kW = BHP x 0.746 ÷ nameplate rated motor efficiency.

² These ratings include the condenser fan motors and the compressor motors but not the supply air blower motor.

¹ These capacities are gross ratings. For net capacity, deduct supply air blower motor, MBh. Example: Refer to the appropriate Blower Performance Table for the BHP of the supply air blower motor, MBh = 3.415 x kW and kW = BHP x 0.746 ÷ nameplate rated motor efficiency.

² These ratings include the condenser fan motors and the compressor motors but not the supply air blower motor.

¹ These capacities are gross ratings. For net capacity, deduct supply air blower motor, MBh. Example: Refer to the appropriate Blower Performance Table for the BHP of the supply air blower motor, MBh = 3.415 x kW and kW = BHP x 0.746 ÷ nameplate rated motor efficiency.

² These ratings include the condenser fan motors and the compressor motors but not the supply air blower motor.

¹ These capacities are gross ratings. For net capacity, deduct supply air blower motor, MBh. Example: Refer to the appropriate Blower Performance Table for the BHP of the supply air blower motor, MBh = 3.415 x kW and kW = BHP x 0.746 ÷ nameplate rated motor efficiency.

² These ratings include the condenser fan motors and the compressor motors but not the supply air blower motor.

¹ These capacities are gross ratings. For net capacity, deduct supply air blower motor, MBh. Example: Refer to the appropriate Blower Performance Table for the BHP of the supply air blower motor, MBh = 3.415 x kW and kW = BHP x 0.746 ÷ nameplate rated motor efficiency.

² These ratings include the condenser fan motors and the compressor motors but not the supply air blower motor.

¹ These capacities are gross ratings. For net capacity, deduct supply air blower motor, MBh. Example: Refer to the appropriate Blower Performance Table for the BHP of the supply air blower motor, MBh = 3.415 x kW and kW = BHP x 0.746 ÷ nameplate rated motor efficiency.

² These ratings include the condenser fan motors and the compressor motors but not the supply air blower motor.

¹ These capacities are gross ratings. For net capacity, deduct supply air blower motor, MBh. Example: Refer to the appropriate Blower Performance Table for the BHP of the supply air blower motor, MBh = 3.415 x kW and kW = BHP x 0.746 ÷ nameplate rated motor efficiency.

² These ratings include the condenser fan motors and the compressor motors but not the supply air blower motor.

¹ These capacities are gross ratings. For net capacity, deduct supply air blower motor, MBh. Example: Refer to the appropriate Blower Performance Table for the BHP of the supply air blower motor, MBh = 3.415 x kW and kW = BHP x 0.746 ÷ nameplate rated motor efficiency.

² These ratings include the condenser fan motors and the compressor motors but not the supply air blower motor

Air Handling and Hot Water Coil Accessory Heating Capacity

NC300 / 1HW0406¹

UNIT MODEL	HOT WATER COIL MODEL	GPM	CFM	CAPACITY (MBH)				
				ENTERING WATER TEMPERATURE MINUS ENTRY AIR TEMPERATURE °F.				
				70	90	110	130	150
NC300	1HW0406	50	6,000	204	263	325	384	443
			8,000	236	304	372	440	508
			10,000	265	341	416	492	568
			12,000	291	374	457	540	623

¹ These capacities do not include any blower motor heat.
NOTE: Temperature Water Drop (°F) = (2 X MBH) / GPM.

Hot Water Coil Capacity Correction And Pressure Drop Vs GPM¹

HOT WATER COIL MODEL	GPM	PRESSURE DROP PSI	CAPACITY CORRECTION FACTOR
1HW0406	25	0.4	0.79
	50	1.0	1.00
	75	1.8	1.04
	100	3.4	1.07

¹ For pressure drop in feet (water), multiply these values by 2.31.

Air Handling and Steam Coil Accessory Heating Capacity

NC300 / 1NF0454

UNIT MODEL	STEAM COIL MODEL	CAPACITY (MBH) @ 2 PSIG ¹				
		CFM	DRY BULB TEMPERATURE OF AIR ENTERING COIL (°F)			
			10	30	50	70
NC300	1NF0454	6,000	471	424	380	330
		8,000	535	483	432	380
		10,000	592	535	478	422
		12,000	642	580	518	456

¹ These capacities do not include any blower motor heat.

Steam Coil Capacity Correction Factors For High Steam Pressure

STEAM PRESSURE (PSIG)	5	10	15	20	25
CAPACITY CORRECTION FACTOR	1.05	1.12	1.19	1.25	1.30

NOTE: Steam Rate = (lbs/Hr.) = 1.025 x MBH

CFM Static Pressure and Power-Altitude and Temperature Corrections

The information below should be used to assist in application of product when being applied at altitudes at or exceeding 1000 feet above sea level.

The air flow rates listed in the standard blower performance tables are based on standard air at sea level. As the altitude or temperature increases, the density of air decreases. In

order to use the indoor blower tables for high altitude applications, certain corrections are necessary.

A centrifugal fan is a "constant volume" device. This means that, if the rpm remains constant, the CFM delivered is the same regardless of the density of the air. However, since the air at high altitude is less dense, less static pressure will be generated and less power will be required than a similar application at sea level. Air density correction factors are shown in Altitude Factors Table and Temperature Correction Figure.

Altitude/Temperature Correction Factors Table

Air Temp.	Altitude (Ft.)										
	0	1000	2000	3000	4000	5000	6000	7000	8000	9000	10000

**Altitude/Temperature Correction Factors Figure**

The examples below will assist in determining the airflow performance of the product at altitude.

Example 1: What are the corrected CFM, static pressure, and BHP at an elevation of 5,000 ft. if the blower performance data is 6,000 CFM, 1.5 IWC and 4.0 BHP?

Solution: At an elevation of 5,000 ft. the indoor blower will still deliver 6,000 CFM if the rpm is unchanged. However, the Altitude/Temperature Correction Factors table must be used to determine the static pressure and BHP. Since no temperature data is given, we will assume an air temperature of 70°F. The table shows the correction factor to be 0.832.

$$\text{Corrected static pressure} = 1.5 \times 0.832 = 1.248 \text{ IWC}$$

$$\text{Corrected BHP} = 4.0 \times 0.832 = 3.328$$

Example 2: A system, located at 5,000 feet of elevation, is to deliver 6,000 CFM at a static pressure of 1.5". Use the unit

blower tables to select the blower speed and the BHP requirement.

Solution: As in the example above, no temperature information is given so 70°F is assumed.

The 1.5" static pressure given is at an elevation of 5,000 ft. The first step is to convert this static pressure to equivalent sea level conditions.

$$\text{Sea level static pressure} = 1.5 / .832 = 1.80"$$

Enter the blower table at 6000 sCFM and static pressure of 1.8". The rpm listed will be the same rpm needed at 5,000 ft.

Suppose that the corresponding BHP listed in the table is 3.2. This value must be corrected for elevation.

$$\text{BHP at 5,000 ft.} = 3.2 \times .832 = 2.66$$

Drive Selection

1. Determine Upflow or Horizontal supply duct Application.
2. Determine desired airflow.
3. Calculate or measure the amount of external static pressure.
4. Using the operating point, determined from steps 1, 2 & 3, locate this point on the appropriate supply air blower performance table. (Linear interpolation may be necessary.)
5. Noting the RPM and BHP from step 4, locate the appropriate motor and/or drive on the RPM selection table.
6. Review the BHP compared to the motor options available. Select the appropriate motor and, or drive.
7. Review the RPM range for the motor options available. Select the appropriate drive if multiple drives are available for the chosen motor.
8. Determine turns open to obtain the desired operation point.

Example

1. 3250 CFM
2. 1.4 iwg
3. Using the supply air blower performance table below, the following data point was located: 1100 RPM & 1.8 BHP.
4. Using the RPM selection table below, Model X is found.
5. 1.8 BHP exceeds the maximum continuous BHP rating of the 1.5 HP motor. The 2 HP motor is required.
6. 1100 RPM is within the range of the 2 HP drives.
7. Using the 2 HP motor and drive, 1 turn open will achieve 1128 RPM.

¹ Based on three, 75°C insulated copper conductors in conduit and ambient of 30°C.

² Maximum fuse or maximum circuit breaker (HACR type per NEC).

Refer to NEC/NFPA No. 70, Articles 440-11, 12 for information on minimum disconnect sizing.

With the piping connections being made at the rear of 7.5 thru 12.5 Ton units and the front of 15 thru 20 Ton units, the piping can be routed to the units from the left or right side.

Electrical connections for power and control wiring are made from the front of the units, right or left of 7.5 thru 12.5 Ton electrical control box access or left of the electrical control box access on 15 thru 20 Ton units. See Unit Dimensions and Piping and Electrical Connection Sizes tables for piping sizes and electrical knockout details.

PIPING AND ELECTRICAL CONNECTIONS

Piping connections are made from the rear of 7.5 thru 12.5 Ton units and the front of 15 thru 20 Ton units. Connections can be made directly to the suction and liquid line service valves.

Right Side with access for Piping, Power & Control Wiring Connections ²	24"
Left Side	24"
Rear ³	N/A
Bottom ⁴	N/A

¹ This dimension will vary if an electric heater, a supply air plenum or a base is used.

² This dimension is required for normal installation and service.

³ Although no clearance is required for service and operation, some clearance may be required for routing the power and control wiring.

⁴ Allow enough clearance to trap the condensate drain line.

Note: If the coil has to be removed, the blower section can be unbolted and set aside and the coil can be lifted out the top of the evaporator section.

Unit Mounting - NC/ND/NL/NM 090 Thru 240

The split air handling units can be applied in various horizontal positions. The Typical Suspension of AHU's From Ceiling Figure shows recommended suspension rigging using properly sized all-thread and metal c-channel. All components to suspend an AHU must be field supplied. Please refer to the units total weight, center of gravity and corner weights. (Horizontal position) shown in the appropriate table for proper support sizing.

Typical Suspension of AHU's From Ceiling

Unit Mounting - NC300

The NC300 evaporator blower may be suspended from the joists with isolation type hangers or hooks. Suspension accessories 1HH0403 (NC300) may be ordered separately. All Suspension accessories include three suspension

channels and hardware. The channels extend across the evaporator coil section, the heating coil section (if included) and the blower section. Each channel is to be bolted to each section as shown.

HORIZONTAL UNIT SUSPENDED FROM ABOVE ③

VERTICAL UNIT SUPPORTED FROM BELOW

- ① The same channels can be used in either position. When used to support a vertical unit, these channels should be cut to match the bottom dimension of the evaporator section.
- ② The suspension channels have two sets of mounting holes to accommodate horizontal units with or without a heating coil. On a horizontal unit without a heating coil, the suspension channels will extend 3" beyond both ends of the unit.
- ③ The same channels can be used to support a horizontal, floor-mounted unit from below.
- ④ After these bottom channels are cut per Note 1, a new hole will have to be drilled at the cut end if the unit is to be mounted on isolators.
