## 1 Introduction

The WT901BLE BLE5.0 is a multi-sensor device detecting acceleration, angular velocity, angle as well as magnetic field. The small outline makes it perfectly suitable for industrial retrofit applications such as condition monitoring and predictive maintenance. Configuring the device enables the customer to address a broad variety of use cases by interpreting the sensor data by smart algorithms.

WT901BLE BLE5.0's scientific name is AHRS IMU sensor. A sensor measures 3-axis angle, angular velocity, acceleration, magnetic field. Its strength lies in the algorithm which can calculate the three-axis angle accurately.

It is employed where the highest measurement accuracy is required. WT901BLE BLE5.0 offers several advantages over competing sensor:

- Heated for best data availability: new WITMOTION patented zero-bias automatic detection calibration algorithm outperforms traditional accelerometer sensor
- High precision Roll Pitch Yaw (X Y Z axis) Acceleration + Angular Velocity + Angle + Magnetic Field output
- Low cost of ownership: remote diagnostics and lifetime technical support by WITMOTION service team
- Developed tutorial: providing manual, datasheet, demo video, free software for Windows computer, APP for Android smartphones, iOS APP for iPhone, communication protocol for project development
- WITMOTION sensors have been praised by thousands of engineers as a recommended attitude measurement solution

## 1.1 Warning Statement

- Putting more than 5 Volt across the sensor wiring of the main power supply can lead to permanent damage to the sensor.
- VCC cannot connect with GND directly, otherwise it will lead to the burning of the circuit board.
- For proper instrument grounding: use WITMOTION with its original factory-made cable or accessories.
- Do not change the baud rate because WITMOTION BLUETOOTH sensor's baud rate is fixed.
- For secondary developing project or integration: use WITMOTION with its compiled sample code.

## 1.2 LED Status

LED	Status	Remark
Blue	Flashing (connect with adapter)	Pairing succeeds
	Flashing (connect with Android APP)	Pairing succeeds

## 2 Use Instructions with PC

### 2.1 PC Connection

PC software is only compatible with Windows system.

[Link to download software](#)

#### 2.1.1 Serial Connection

**Step 1.** Connect the sensor with a serial converter

PIN Connection:

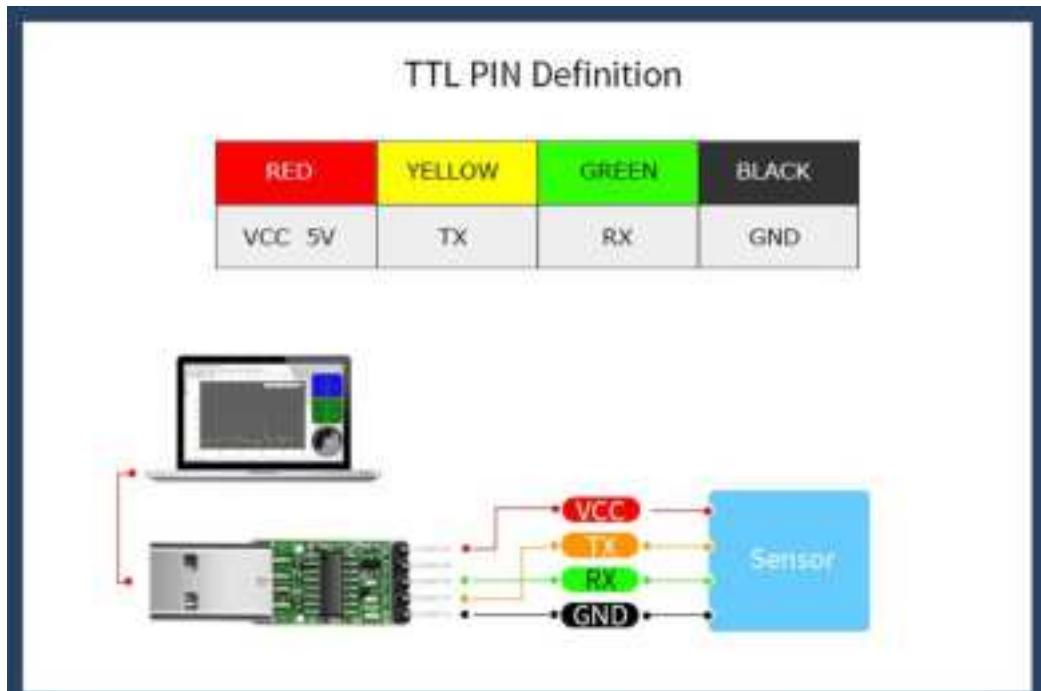

VCC - 5V

TX - RX

RX - TX

GND - GND

(When connecting with computer, VCC-5V is recommended.)

### Recommended tools:

3-in-1 converter

6-in-1 converter

TTL serial cable

**Step 2.** Unzip the software and install the driver CH340 or CP2102  
(Depending on which accessory for usage.)

[Link to tutorial of 3-in-1 serial converter/ TTL serial cable \(CH340 driver\)](#)

[Link to tutorial of 6-in-1 serial converter \(CP2102 driver\)](#)

Step 3. Confirm the com port in device manager

Step 4. Open the software(Minimu.exe)  
Data will appear after auto-search finishes

**Notice:** If not successful, please operate manually  
Choose the com port and baud rate 115200, data will be shown on the software.

## 2.1.2 BLE 5.0 Adapter Connection

[Adapter's CP2102 driver link](#)

Step 1. Insert adapter into the USB port in the beginning

Step 2. Power on the sensor after blue light of adapter flashes

Step 3. Wait till the adapter's blue LED light keeps on--  
means pairing succeeded

Step 4. Open the software, Minimu.exe

Step 5. Data will appear once the auto-search finished

## 2.3 Calibration

Preparation: Ensuring the sensor is "Online".

Calibration on PC software:

It is required to calibrate for the first time usage.

### 2.3.1 Accelerometer Calibration

#### Purpose:

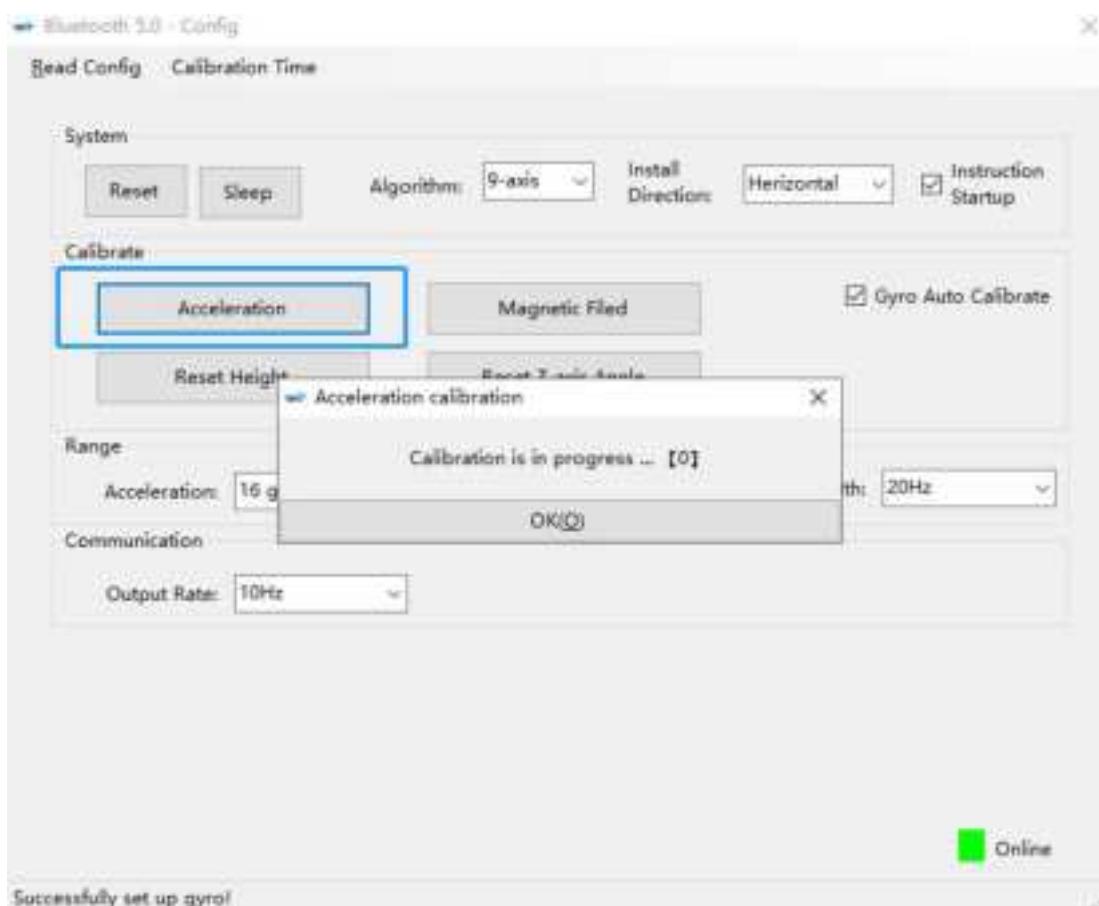

The accelerometer calibration is used to remove the zero bias of the accelerometer. Before calibration, there will be different degrees of bias error. After calibration, the measurement will be accurate.

#### Methods:

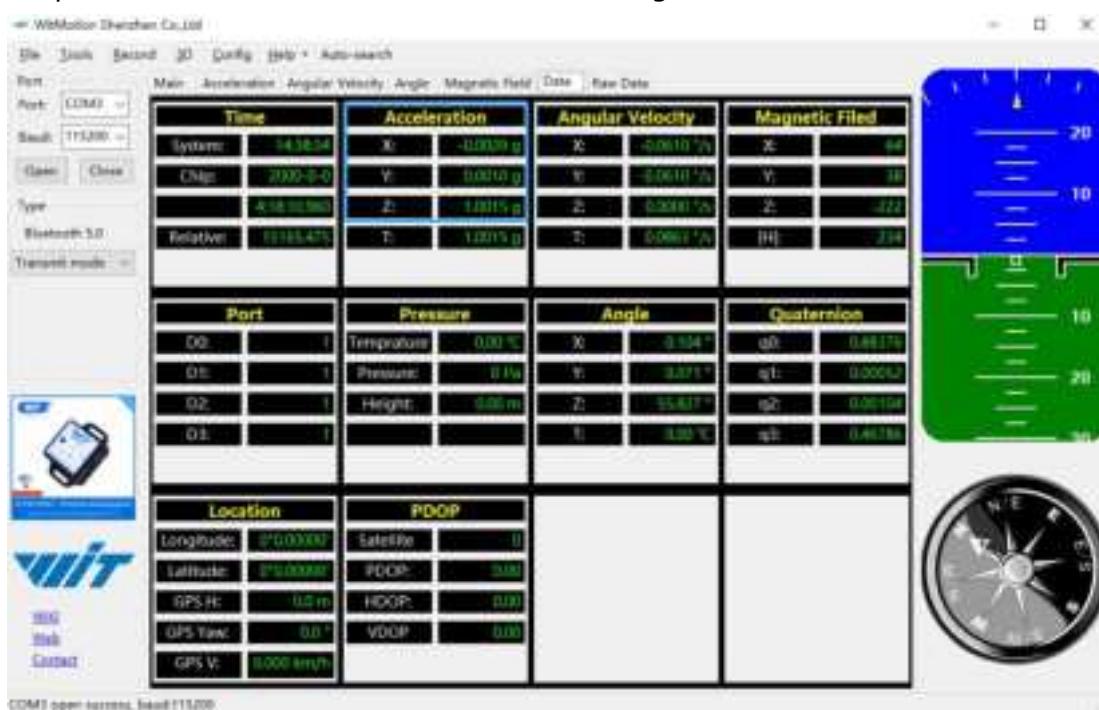

Step 1. Keep the module horizontally stationary

Step 2. Click the acceleration in the "Config" and wait for 5 seconds

Step 3. Calibration done if OK shows

#### Step 4. Check the result--confirm if there is 1g on Z-axis acceleration

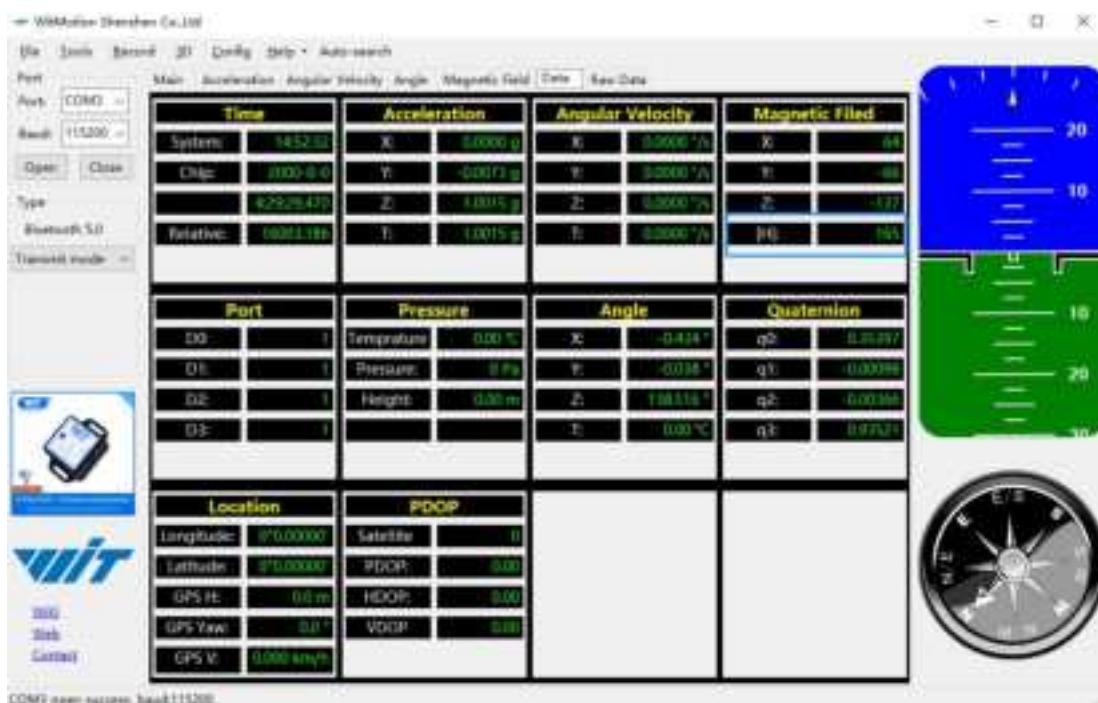

## 2.3.2 Magnetic Field Calibration

### Purpose:

Magnetic calibration is used to remove the zero bias of the magnetic field sensor. Usually, the magnetic field sensor will have a large zero error when it is manufactured. If it is not calibrated, it will bring a large measurement error, which will affect the accuracy of the measurement of the z-axis angle of the heading angle.

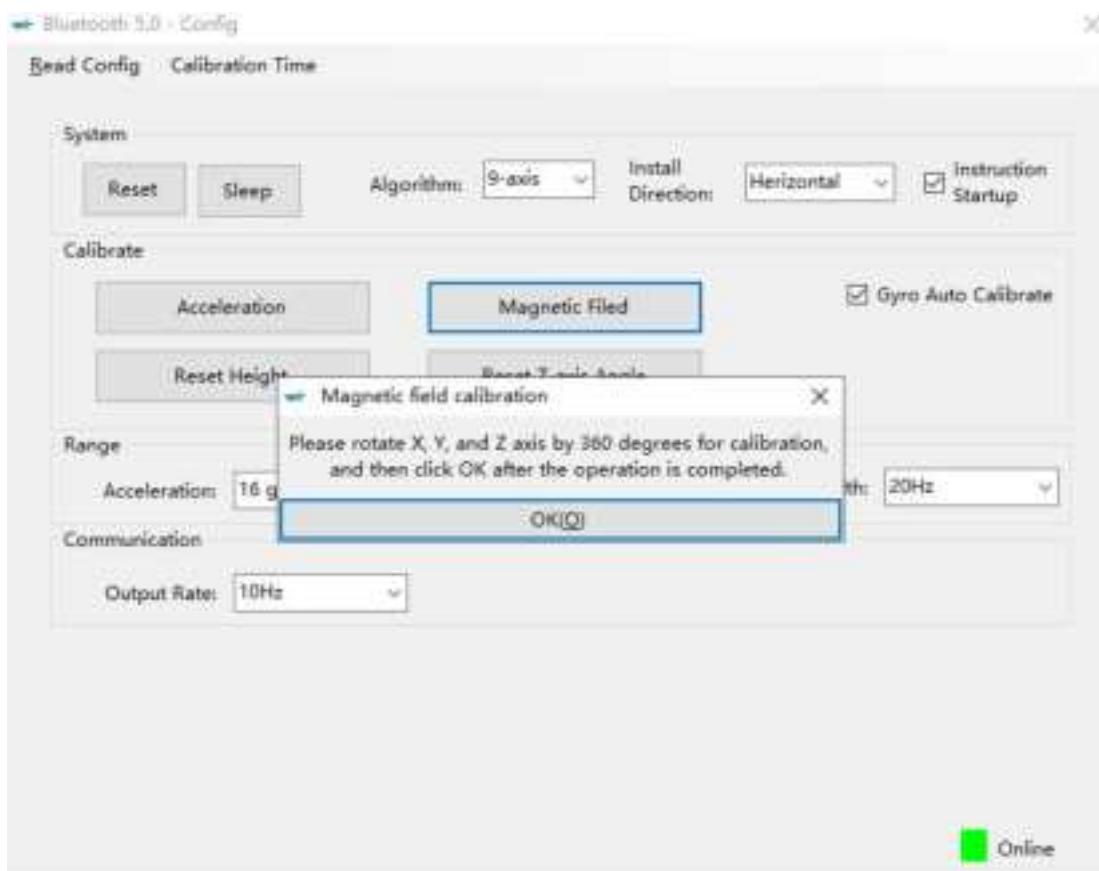

### Preparation:

1. Sensors should be 20cm away from magnetic and iron and other materials
2. The value of H in magnetic field must be lower than 350.

### Methods:

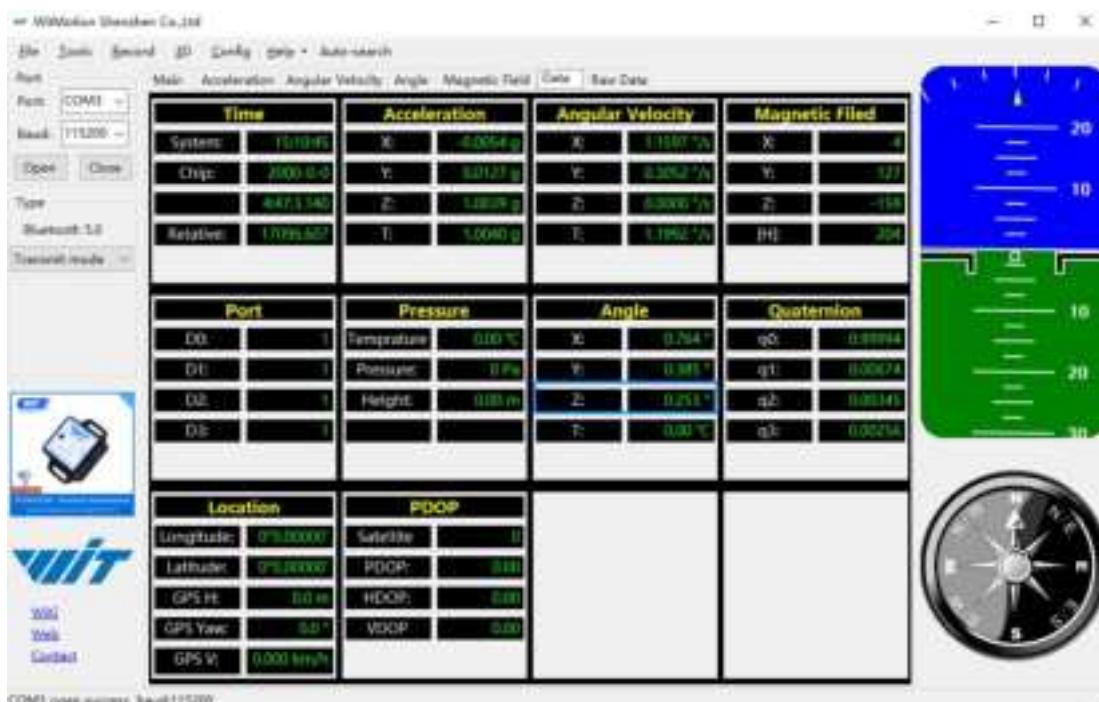

- Step 1. Open the Config menu.
- Step 2. Click the “magnetic field” and slowly rotate the sensor 360° around X, Y, Z, 3-axis accordingly.

Step 3. Click OK once the calibration done.

Step 4. Place the sensor horizontally stationary and make the Y axis point to the north.

Step 5. Check the data of Z axis angle, it's ok if the value is about  $0^\circ$ .

COM3 open success, baud:115200

WT901BLE BLE5.0 | manual v0707 | <http://wiki.wit-motion.com/english>

### 2.3.3 Gyroscope Automatic Calibration

The gyroscope calibration is to calibrate the angular velocity, and the sensor will calibrate automatically.

It is recommended that the automatic calibration of gyroscopes can be inactivated only if the module rotates at a constant speed.

### 2.3.4 Reset Z-axis Angle

Note: If you want to avoid magnetic interference, you can change the algorithm to 6-axis, function of resetting Z-axis angle can be used.

The z-axis angle is an absolute angle, and it takes the northeast sky as the coordinate system can not be relative to 0 degree.

Z axis to 0 is to make the initial angle of the z axis angle is relative 0 degree. When the module is used before and z - axis drift is large, the z - axis can be calibrated. When the module is powered on, the Z axis will automatically return to 0.

Calibration methods as follow: firstly keep the module static, click the "Reset Z-axis Angle" in the "Config", you will see the angle of the Z axis backs to 0 degree in the module data bar.

### 2.3.5 Reset Height to 0

Only available for the module built-in barometer like WT901B, HWT901B, WTGAHRS1, WTGAHRS2.

## 2.4 Configuration

### 2.4.1 Data Recording

There is no memory chip in the sensor module, and the data can be recorded and saved on the computer.

Method is as follows: Click "Record" and "Start" will save the data as a TXT file. The saved file is in the directory of the upper computer program Data.tsv: the beginning of the file has the value corresponding to the data.

It is highly recommended that data can be pasted to a Excel file. In this way, all data will be shown in order.

## 2.4.2 Data Playback

New function: When creating recorded file each time, there will a BIN file created in the folder of record file in path of installed software meanwhile.

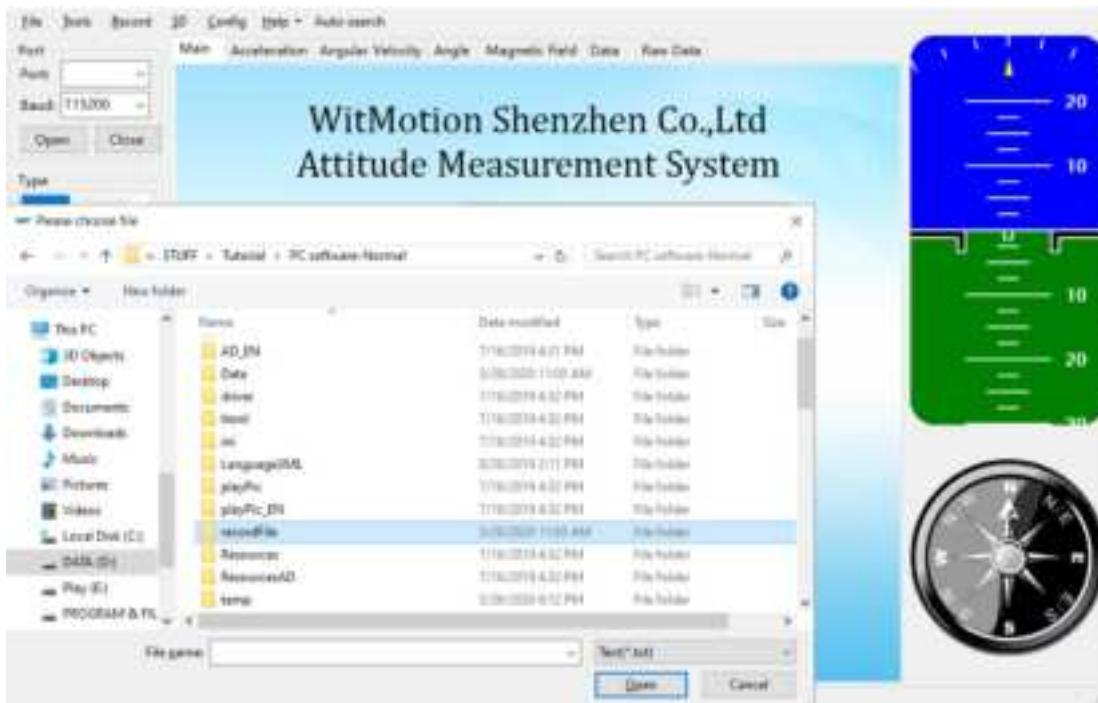

Recorded data playback method:

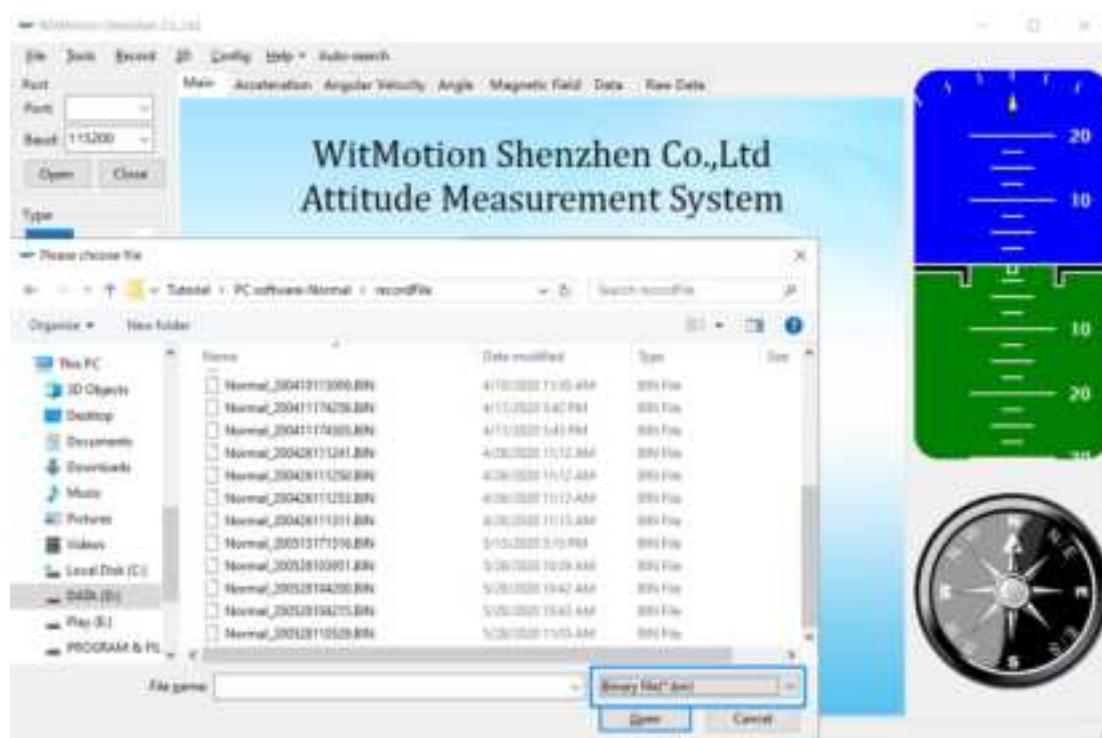

Step 1: Disconnect the sensor

Step 2: Click "File" Button and then click "Load"

Step 3: Choose the original path of software installation and load the Bin file

Step 4: Click "Run" and the Binary file will be playback  
When playback, the rate can be editable.

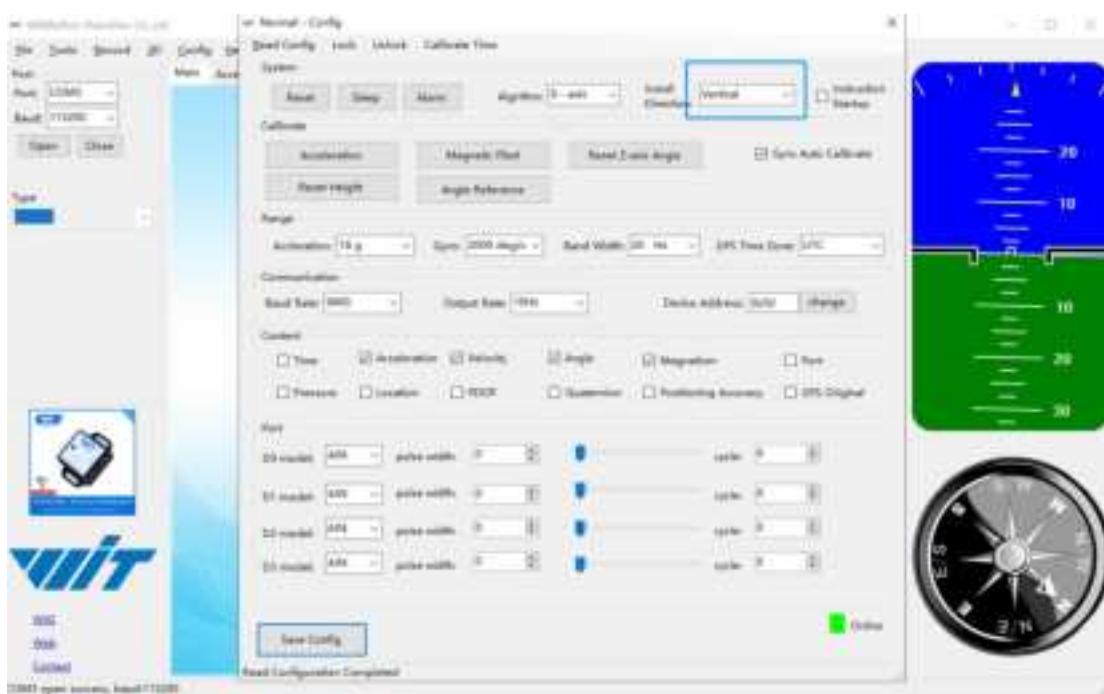

### 2.4.3 Placement Direction

The default installation direction of the module is horizontal. When the module needs to be installed vertically, the vertical installation can be set.

Step 1: Rotate the module 90 degrees around the X-axis

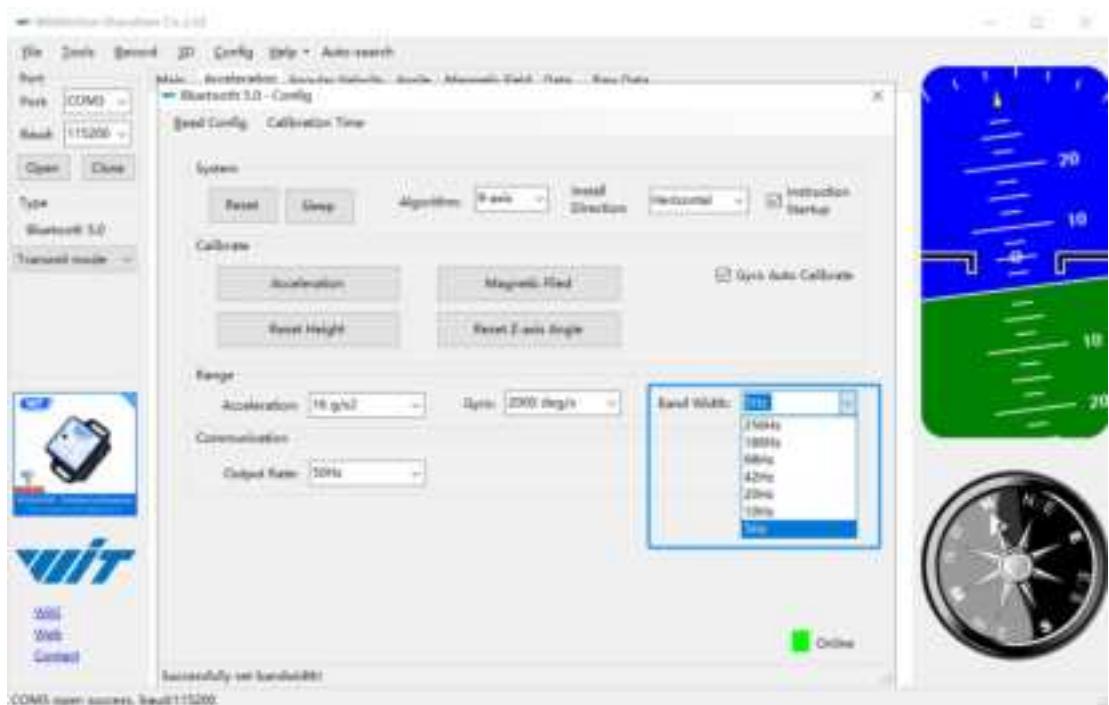

Step 2: Place the sensor 90 degrees vertically

Step 3: Click "Vertical" as install directions on the "Config" menu

## 2.4.4 Bandwidth

Default bandwidth is 20Hz.

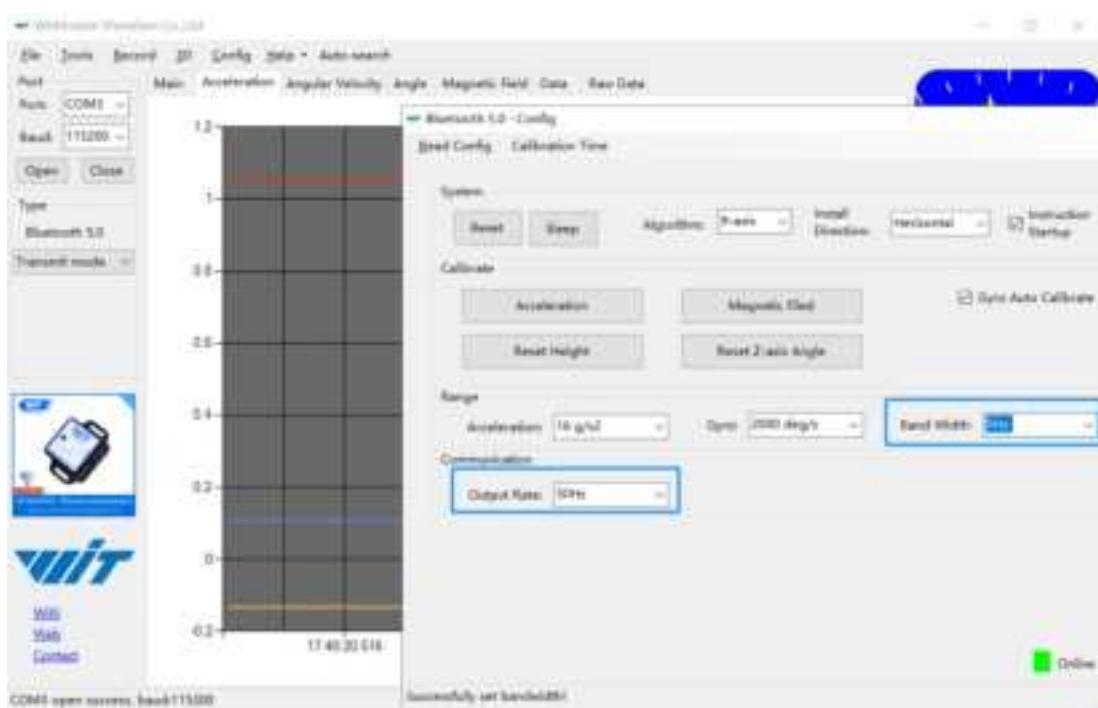

Explanation:

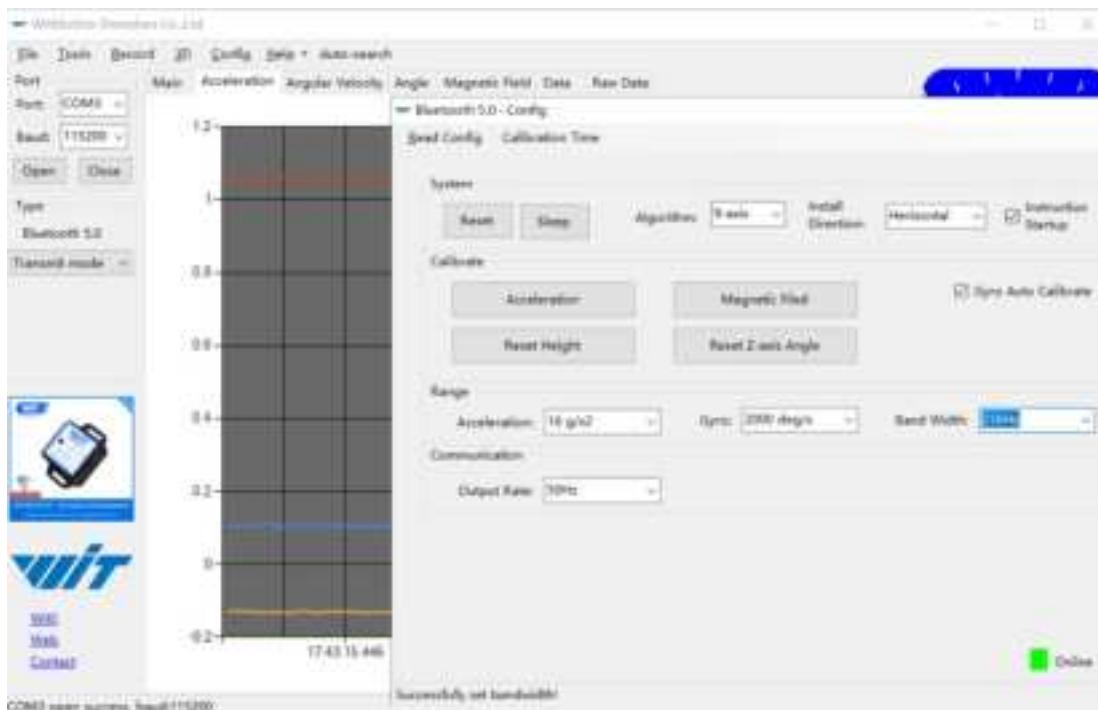

1. The higher rate of bandwidth setting will lead to higher fluctuation in data waveform. Conversely, the lower rate of bandwidth, data will become more fluent.

For example:

Bandwidth as 50Hz, Output rate as 5Hz. The waveform is very steady.

Bandwidth as 256Hz, Output rate as 50Hz. The waveform will show more fluctuation.

2. The higher rate of bandwidth will solve the data-repeating problem.  
For example, if the bandwidth setting is 20Hz, retrieval rate as 50Hz, there will be 5 repeating data.  
If you prefer there is no repeating data, it is required to increase the bandwidth more than 50Hz.

## 2.4.5 6-axis/ 9-axis Algorithm

6-axis algorithm: Z-axis angle is mainly calculated based on angular velocity integral. There will be calculated error on Z-axis angle.

9-axis algorithm: Z-axis angle is mainly calculated and analyzed based on the magnetic field. Z-axis angle will have few drift.

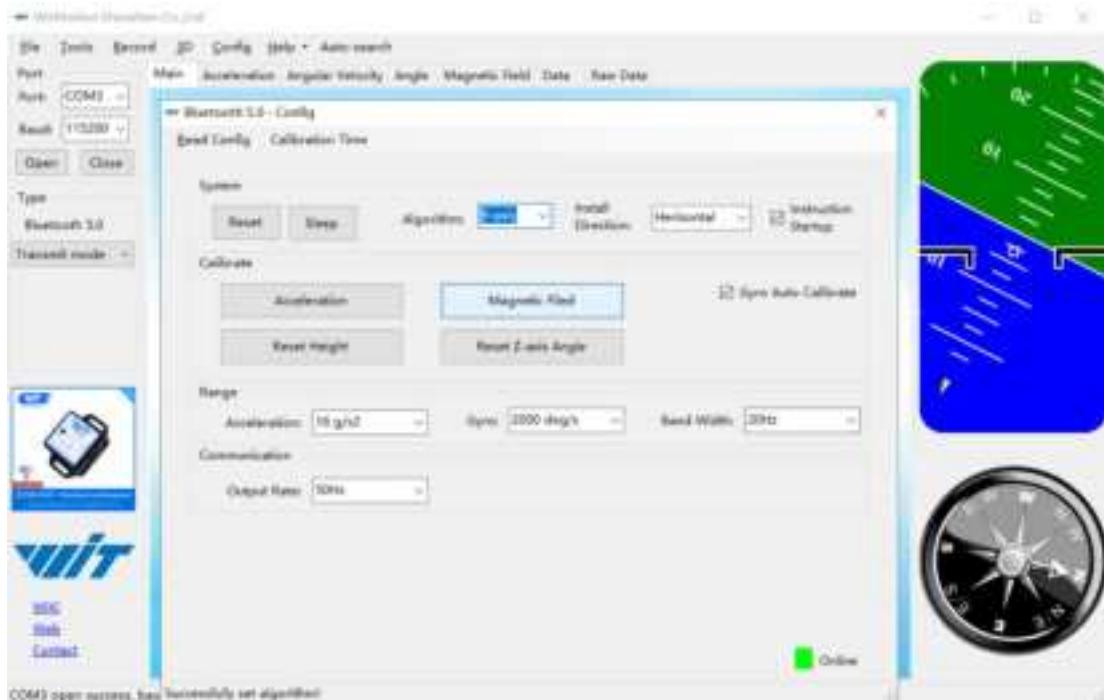

The default algorithm of WT901BLECL is 9-axis. If there is magnetic field interference around installed environment, it is recommended to switch to 6-axis algorithm to detect the angle.

Method:

Step 1: Switch to the "6-axis" algorithm on the "Config" menu.

Step 2: Proceed with the "Accelerometer calibration" and "Reset Z-axis angle" calibration.

After the calibration is completed, it can be used normally.

## 3 Use Instructions with Android phone

For APP configuration introduction, please referring to the Chapter 2.2

### 3.1 APP Installation

Install the APK file, give permission of Location and Storage

[APP download link](#)

- WT901BLE 7 items
  - AD Package
  - Android APP
  - Sample-Code
  - BLE 5.0 PC Software By Bluetooth 5 Cable.zip
  - iOS APP.tst
  - The WitMotion app on APP Store.jpg
  - WT901BLE Usermanual.pdf

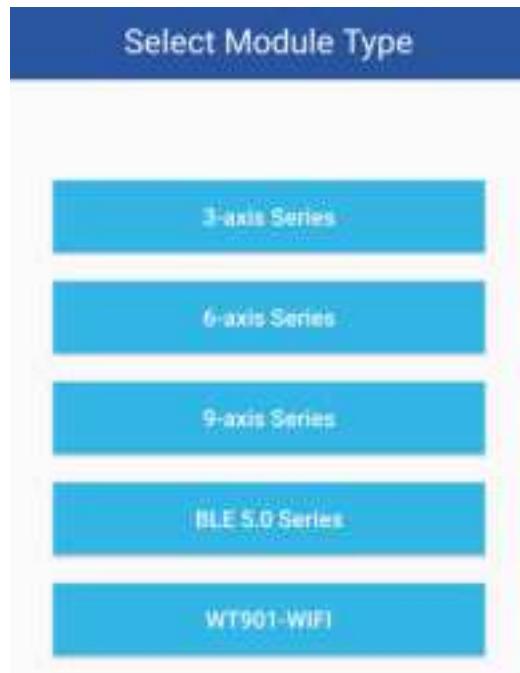

#### About Android APP:

1. It is required to allow for application positioning (Always allowed), and power on the positioning function and Bluetooth  
Note: Paired devices can be searched without turning on positioning, but according to Google's requirements, if APP installed on a higher version of Android (6.0) mobile phone is paired with a Bluetooth device, positioning must be allowed when using Bluetooth at the same time.
2. After turning on Bluetooth, it takes about one minute to search for authorization to find Bluetooth.

## 3.2 Connection

Step 1. Install the APK file, give permission of Location and Storage

Step 2. Open APP and choose "BLE 5.0 Series" as sensor series

Step 3: power on the sensor and scan the device

Step 4. When pairing is done, the blue LED light of the sensor will flash and keep about one second

After a few seconds, the data will show automatically

## 3.3 Calibration

[Link to calibration demo](#)

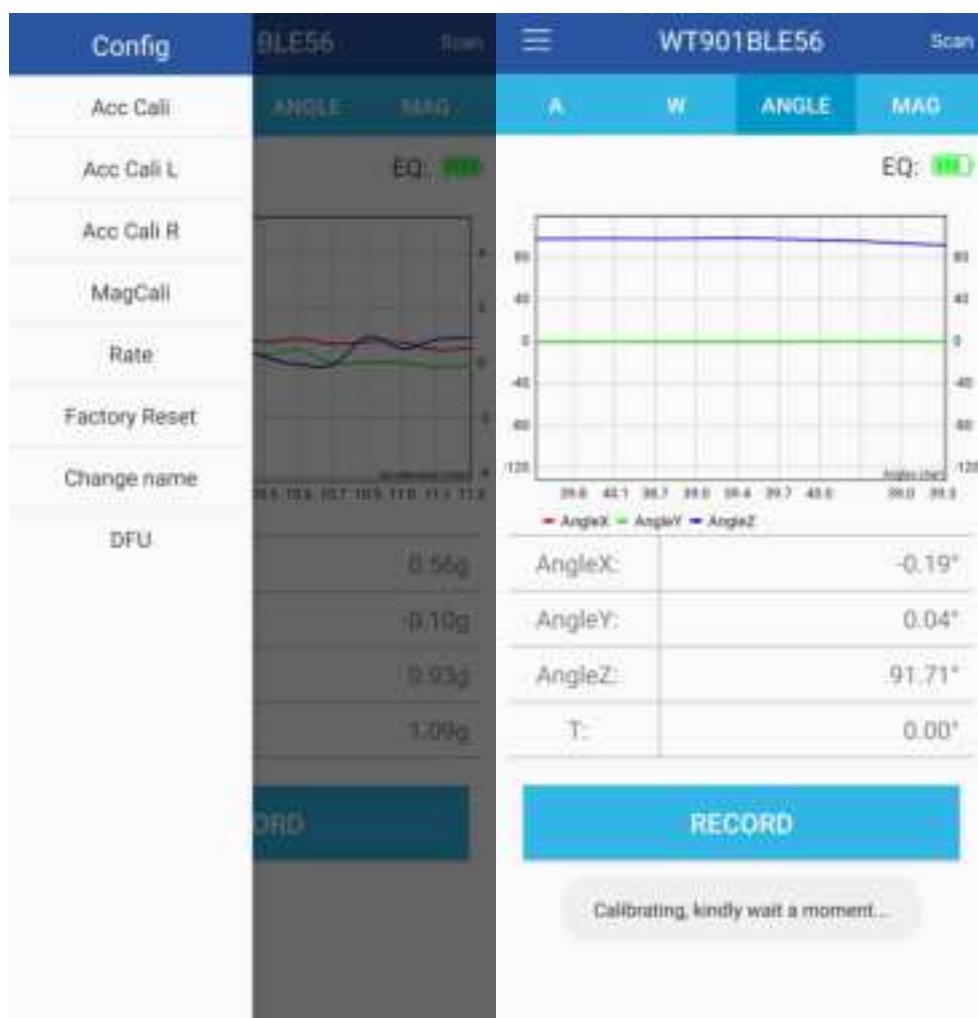

### 3.3.1 Acceleration Calibration

Step 1. Keep the module horizontally stationary

Step 2. Click the "Calibration" menu

Step 3. Click the "Acceleration Calibration" and wait for 3 seconds

Step 5. Check the result--confirm if there is 1g on Z-axis acceleration

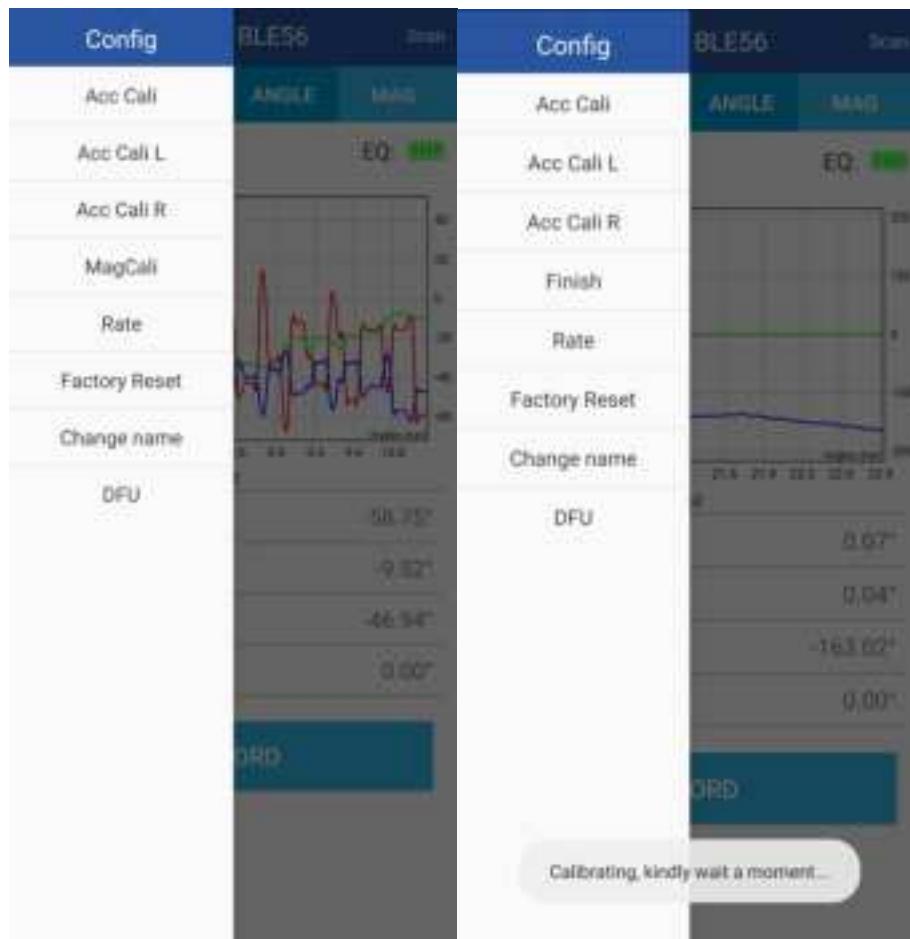

### 3.3.2 Magnetic Field Calibration

Step 1. Click the "Calibration" menu

Step 2. Click the "Magnetic calibration" button

Step 3. Slowly rotate the module 360° around X, Y, Z, 3-axis accordingly

Step 4. After rotation, click "Finish"

Check the result: The Z-axis angle will have less drift than before.

Notice: If not successful, please stay away from the objective that can create magnetic field interference.
