

JITTERBUG FMJ

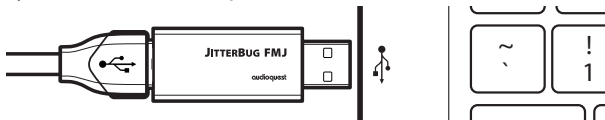

USB 2.0 Data & Power Noise Filter

Quick-Start Guide

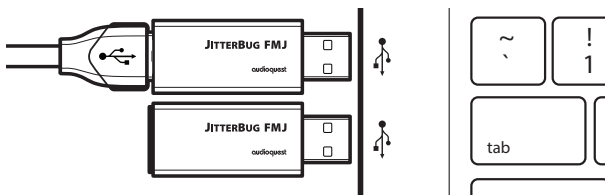

JitterBug FMJ (Full Metal Jacket) is easy to use:

Place one JitterBug in-line (in-series) between any computer, smartphone, NAS, streamer, or car audio system and a USB input.

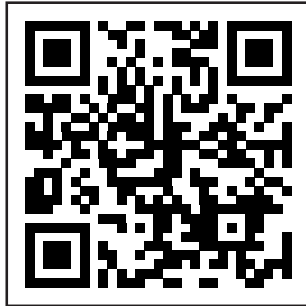

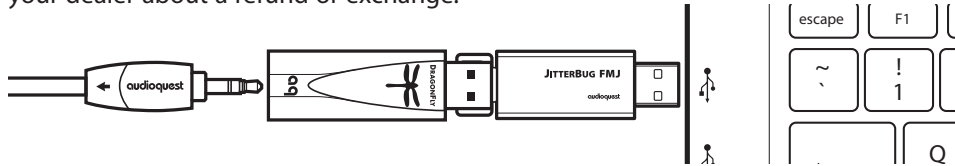

For an additional improvement in audio performance, you can use a second JitterBug in another unoccupied USB port—that is, in *parallel* to the first.

When using Ethernet, digital coax, Wi-Fi, or Bluetooth (at home or in a car), plug JitterBug FMJ into an available USB port to reduce noise.

Note: We always recommend using a JitterBug in-line (in-series) with DragonFlys Black and Red. However, because two filters in-series can degrade performance,

the special filtering in the DragonFly Cobalt might improve or hurt performance depending on the connected source. We recommend first trying JitterBug in-line, and if performance suffers, then using JB in-parallel if possible. If there is no other USB input on the same device, and no USB input in a car or other candidate, please see your dealer about a refund or exchange.

For more detailed information on ways to use JitterBug, scan the QR code or visit the link below.
