Micro Lumbar Discectomy System

Micro Lumbar Discectomy System

The Caspar MLD system is utilized during a microsurgical approach to retract the posterior soft tissues during lumbar discectomy procedures. The system is comprised of narrow, lateral, variable blades which mount on an easy to use, highly stable, ratcheted retractor instrument.

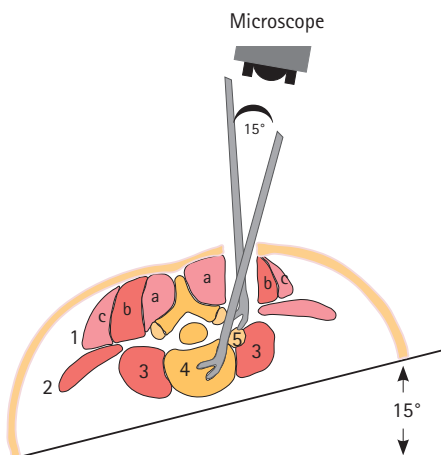

The paraspinous, muscle-splitting approach described by Wiltse has been miniaturized. This enables a minimally invasive approach to the extraforaminal disc herniation, generally preserving the facet joint.

The MLD System is designed to:

- Reduce the size of the incision
- Limit trauma to the surrounding tissue
- Reduce operating time
- Reduce blood loss
- Reduce length of hospital stay

Features and Benefits

- Non-slip fenestrated retractors
 - Secure fit in muscles
- Ball snap closure
 - Secure connection
 - Compatibility with all CASPAR blades and retractors
- Autoclavable lightweight tray
 - For sterile presentation and efficient storage of the instruments
- Special retractors and blades for the treatment of extraforaminal disc herniations
 - Classic medial and special lateral paraspinous approach

Paraspinous Approach

1. M. sacrospinalis:
 - a. M. multifidus
 - b. M. longissimus
 - c. M. iliocostalis
2. M. intertransversarius
3. M. psoas major
4. Intervertebral disc
5. Disc herniation
