# Table of Contents

Part I	Overview .....	2
Chapter 1	Quick Start .....	3
1.1	Check Your Package Contents .....	3
1.2	Five steps to configure DFL-900 quickly .....	3
1.3	Wiring the DFL-900 .....	6
1.4	Default Settings and architecture of DFL-900 .....	7
1.5	Using the Setup Wizard .....	8
1.6	Internet Connectivity .....	11
1.6.1	LAN1-to-WAN1 Connectivity .....	12
1.6.2	WAN1-to-DMZ1 Connectivity .....	13
Chapter 2	System Overview .....	17
2.1	Typical Example Topology .....	17
2.2	Changing the LAN1 IP Address .....	18
2.2.1	From LAN1 to configure DFL-900 LAN1 network settings .....	18
2.2.2	From CLI (command line interface) to configure DFL-900 LAN1 network settings .....	19
2.3	The design principle .....	20
2.3.1	Web GUI design principle .....	20
2.3.2	Rule principle .....	20
Part II	Basic Configuration .....	22
Chapter 3	Basic Setup .....	23
3.1	Demand .....	23
3.2	Objectives .....	23
3.3	Methods .....	23
3.4	Steps .....	23
3.4.1	Setup WAN1 IP .....	23
3.4.2	Setup DMZ1, LAN1 Status .....	25
3.4.3	Setup WAN1 IP alias .....	27
Chapter 4	System Tools .....	29
4.1	Demand .....	29
4.2	Objectives .....	29
4.3	Methods .....	29
4.4	Steps .....	32
4.4.1	General settings .....	32
4.4.2	DDNS setting .....	35
4.4.3	DNS Proxy setting .....	36
4.4.4	DHCP Relay setting .....	36
4.4.5	SNMP Control .....	37
Chapter 5	Remote Management .....	38
5.1	Demands .....	38
5.2	Methods .....	38
5.3	Steps .....	39
5.3.1	Telnet .....	39

5.3.2	WWW .....	39
5.3.3	SNMP .....	39
5.3.4	ICMP .....	40
<b>Part III</b>	<b>NAT 、 Routing &amp; Firewall .....</b>	<b>42</b>
<b>Chapter 6</b>	<b>NAT .....</b>	<b>43</b>
6.1	Demands .....	43
6.2	Objectives .....	44
6.3	Methods .....	44
6.4	Steps .....	45
6.4.1	Setup Many-to-one NAT rules .....	45
6.4.2	Setup Virtual Server for the FtpServer1 .....	49
6.5	NAT modes introduction .....	52
6.5.1	Many-to-One type .....	52
6.5.2	Many-to-Many type .....	53
6.5.3	One-to-One type .....	54
6.5.4	One-to-One (bidirectional) type .....	54
6.5.5	NAT modes & types .....	55
<b>Chapter 7</b>	<b>Routing .....</b>	<b>57</b>
7.1	Demands .....	57
7.2	Objectives .....	58
7.3	Methods .....	58
7.4	Steps .....	58
7.4.1	Add a static routing entry .....	58
7.4.2	Add a policy routing entry .....	60
<b>Chapter 8</b>	<b>Firewall .....</b>	<b>63</b>
8.1	Demands .....	63
8.2	Objectives .....	63
8.3	Methods .....	63
8.4	Steps .....	64
8.4.1	Block internal PC session (LAN → WAN) .....	64
8.4.2	Setup Alert detected attack .....	67
<b>Part IV</b>	<b>Virtual Private Network .....</b>	<b>70</b>
<b>Chapter 9</b>	<b>VPN Technical Introduction .....</b>	<b>71</b>
9.1	VPN benefit .....	71
9.2	Related Terminology Explanation .....	71
9.2.1	VPN .....	71
9.2.2	IPSec .....	71
9.2.3	Security Association .....	71
9.2.4	IPSec Algorithms .....	71

# Part I

## Overview

# Chapter 1

## Quick Start

*This chapter introduces how to quick setup the DFL-900.*

DFL-900 is an integrated all-in-one solution that can facilitate the maximum security and the best resource utilization for the enterprises. It contains a high-performance stateful packet inspection (SPI) **Firewall**, policy-based **NAT**, ASIC-based wire-speed **VPN**, upgradeable **Intrusion Detection System**, **Dynamic Routing**, **Content Filtering**, **Bandwidth Management**, **WAN Load Balancer**, and other solutions in a single box. It is one of the most cost-effective all-in-one solutions for enterprises.

### 1.1 Check Your Package Contents

These are the items included with your DFL-900 purchase as Figure 1-1. They are the following items

1. DFL-900 Device \* 1
2. Ethernet cable (RJ-45) \* 2
3. RS-232 console \* 1
4. CD (include User's manual and Quick Guide) \* 1
5. Power cord \* 1

Figure 1-1 All items in the DFL-900 package

### 1.2 Five steps to configure DFL-900 quickly

Let's look at the common network topology without DFL-900 applying like Figure 1-2. This is a topology which is almost used by all the small/medium business or SOHO use as their internet connectivity. Although that your topology is not necessarily the same diagram below, but it still can give you a guideline to configure DFL-900 quickly.

# Part I

## Overview

---

Now you can pay attention at the IP Sharer in the diagram. The IP Sharer can provide you with NAT (Network Address Translation), PAT (Port Address Translation) and other functions.

Figure 1-2 The example before DFL-900 applies on it

Figure 1-3 The example after DFL-900 applies on it

Here we would like to alter the original IP Sharer with the DFL-900 like Figure 1-3. If we hope to have DFL-900 to replace the IP Sharer, we just need to simply execute the following five steps as Figure 1-4 showed. By these steps, we hope to build an image to tell you how to let DFL-900 work basically.

Figure 1-4 Five steps to configure DFL-900

As the Figure 1-4 illustrated, with the five-step configurations, DFL-900 will have the same functions with the original IP Sharer. Please see the following description of the five-step configurations.

1. **Setup:**  
Install three physical lines inclusive of the power cord, outbound link (connected WAN1 port) and inbound direction (connected LAN1 port). For the details, please refer section 1.3.  
Continually, we will connect to the web GUI of DFL-900. So you must make sure that you have a PC which is located in the same subnet with DFL-900 before this step. Note: The default LAN1 port is (192.168.1.254 / 255.255.255.0). Refer to section 1.5 for more information.
2. **LAN:**  
Configure the LAN1 port of DFL-900. You can refer to section 1.4 for the default network configurations of DFL-900. Note: If you were connected from LAN1 port and changed the LAN1 IP address settings of DFL-900. The network will be disconnected since the IP address is different between your pc and DFL-900 LAN1 port.
3. **WAN:**  
Configure the WAN1 port of DFL-900. You can refer to section 1.4 for the default network configurations of DFL-900.
4. **NAT:**  
Configure the connection of LAN to WAN direction. It will make all the client pc access the internet through DFL-900. For more information, please refer to section 1.6.1.

### 5. Virtual Server:

If there is any server located inside the DFL-900. You may hope these servers can provide services outside. So you should configure the Virtual Server which provides connections of WAN to LAN direction. For more information, please refer to section 1.6.2.

After you completely finished the above steps, the connectivity function of DFL-900 is probably well-done.

## 1.3 Wiring the DFL-900

- A.** First, connect the power cord to the socket at the back panel of the DFL-900 as in Figure 1-5 and then plug the other end of the power adapter to a wall outlet or power strip. The Power LED will turn **ON** to indicate proper operation.

Figure 1-5 Back panel of the DFL-900

- B.** Using an Ethernet cable, insert one end of the cable to the WAN port on the front panel of the DFL-900 and the other end of the cable to a DSL or Cable modem, as in Figure 1-6.
- C.** Computers with an Ethernet adapter can be directly connected to any of the LAN ports using a cross-over Ethernet cable, as in Figure 1-6.
- D.** Computers that act as servers to provide Internet services should be connected to the DMZ port using an Ethernet Cable, as in Figure 1-6.

Figure 1-6 Front end of the DFL-900

### 1.4 Default Settings and architecture of DFL-900

You should have an Internet account already set up and have been given most of the following information as Table 1-1. Fill out this table when you edit the web configuration of DFL-900.

Items		Default value	New value
Password:		admin	
WAN1 (Port 1)	Fixed IP	IP Address	____.____.____.____
		Subnet Mask	____.____.____.____
		Gateway IP	____.____.____.____
		Primary DNS	____.____.____.____
		Secondary DNS	____.____.____.____
	PPPoE	PPPoE Username	____.____.____.____
		PPPoE Password	____.____.____.____
DHCP			
LAN 1(Port 2)	IP Address	192.168.1.254	____.____.____.____
	IP Subnet Mask	255.255.255.0	____.____.____.____
DMZ 1(Port 3)	IP Address	10.1.1.254	____.____.____.____
	IP Subnet Mask	255.255.255.0	____.____.____.____

Table 1-1 DFL-900 related network settings

## Organization\_1

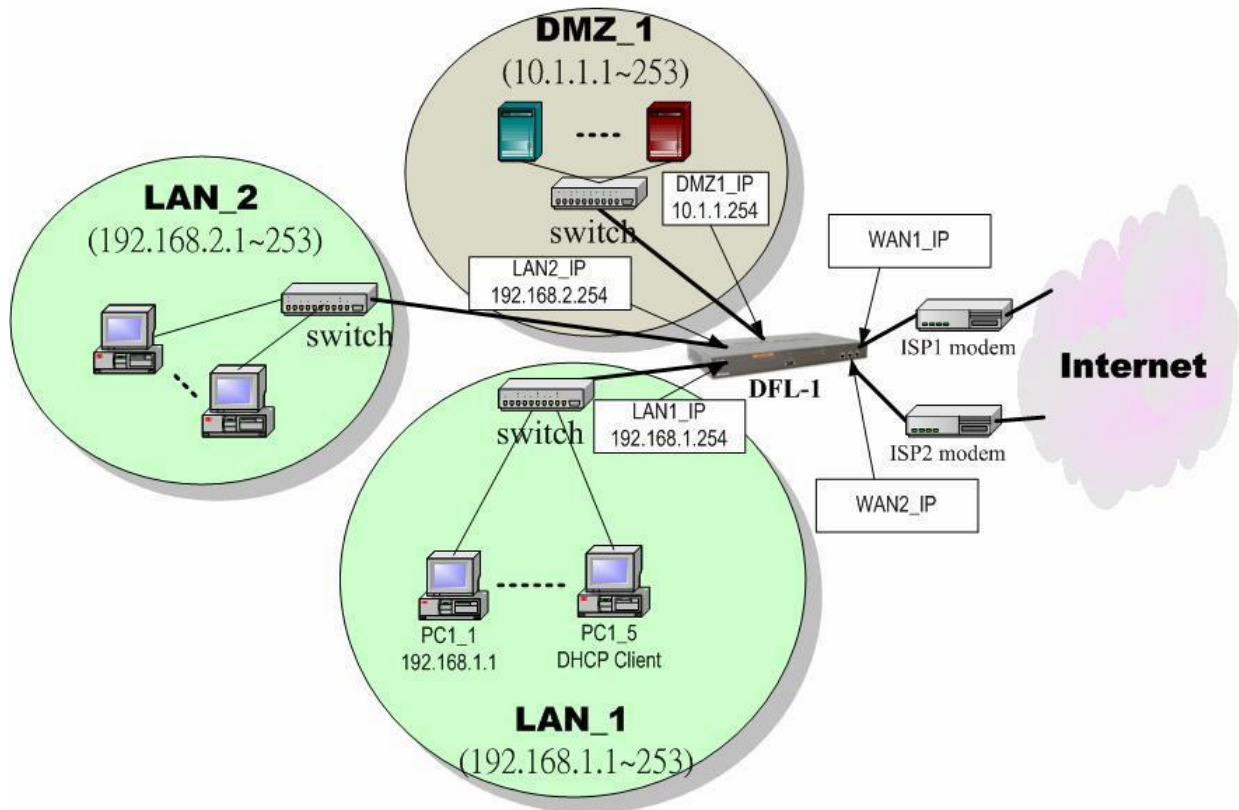

Figure 1-7 The default settings of DFL-900

As the above diagram Figure 1-7 illustrated, this diagram shows the default topology of DFL-900. And you can configure the DFL-900 by connecting to the LAN1\_IP (192.168.1.254) from the PC1\_1 (192.168.1.1). In the following sections, we will teach you how to quickly setup the DFL-900 in the basic appliances.

### 1.5 Using the Setup Wizard

A computer on your LAN1 must be assigned an IP address and Subnet Mask from the same range as the IP address and Subnet Mask assigned to the DFL-900 in order to be able to make an HTTPS connection using a web browser. The DFL-900 is assigned an IP address of 192.168.1.254 with a Subnet Mask of 255.255.255.0 by default. The computer that will be used to configure the DFL-900 must be assigned an IP address between 192.168.1.1 and 192.168.1.253 with a Subnet Mask of 255.255.255.0 to be able to connect to the DFL-900. This address range can be changed later. There are instructions in the DFL-900 Quick Installation Guide, if you do not know how to set the IP address and Subnet Mask for your computer.

<p><b>Step 1. Login</b> Type "admin" in the account field, "admin" in the Password field and click Login.</p>	<p>Connect to <a href="https://192.168.1.254">https://192.168.1.254</a></p> 
<p><b>Step 2. Run Setup Wizard</b> Click the Run Setup Wizard.</p>	<p>After login to <a href="https://192.168.1.254">https://192.168.1.254</a> <b>BASIC SETUP &gt; Wizard</b></p> <p style="text-align: center;"><b>Welcome to the DFL-900 Web-Based Configuration !</b></p> <div style="display: flex; justify-content: space-between;"> <div style="width: 45%;"> <p><b>Basic Setup</b> Connect to the Internet and configure your Intranet with the Setup Wizard (WAN, LAN and DMZ settings, routing protocol and DHCP server settings).</p> <p><b>System Tools</b> Setup DDNS, DNS proxy, DHCP relay, system password/time/date/timeouts, protocol services, interface types, perform firmware upgrade, save running configurations, backup/restore configurations, reset to factory defaults, customize remote management and SNMP, schedule database update.</p> <p><b>Help</b> Get help about your VPN/Firewall Router.</p> <p><b>Setup Wizard</b> A step-by-step setup wizard will guide you to configure your VPN/Firewall Router to connect to your ISP (Internet Service Provider).</p> </div> <div style="width: 45%;"> <p><b>Advanced Settings</b> Access advanced features, including IPSec/L2TP/PPTP VPNs, VPN pass through, NAT, virtual servers, static/policy route, firewall, attack alert, web/mail/ftp filters, intrusion detection, and bandwidth management.</p> <p><b>Device Status</b> Display system name, firmware version, interface IP settings, network status, CPU/memory utilization, DHCP/Routing table, active/top20/IPSec sessions. Setup logging systems, including system/firewall/IDS/content-filter/VPN logs.</p> </div> </div> <p style="text-align: center;"><b>Run Setup Wizard</b></p>
<p><b>Step 3. System Name</b> Enter the Host Name and the Domain Name, followed by clicking the Next.</p>	<p><b>BASIC SETUP &gt; Wizard</b></p> 

**Step 4. WAN Connectivity**

Choose the type of IP Address Assignment provided by your ISP to access the Internet. Here we have four types to select. This will determine how the IP address of WAN1 is obtained. Click *Next* to proceed.

**BASIC SETUP > Wizard > Next**

The screenshot shows the 'BASIC SETUP > Wizard > Next' screen. At the top, there are tabs for 'System Name', 'WAN1 IP', and 'System Status'. The 'IP Address Assignment' dropdown menu is open, showing five options: 'Get IP Automatically (DHCP)', 'Get IP Automatically (DHCP)', 'Fixed IP Address', 'PPP over Ethernet', and 'Not initialized'. Below the dropdown, the 'IP Address' and 'Gateway IP' fields both contain '0.0.0.0'. There are radio buttons for 'DNS IP Address' (selected) and 'Get DNS Automatically'. The 'Primary DNS' and 'Secondary DNS' fields both contain '0.0.0.0'. The 'Routing Protocol' is set to 'None' and the 'OSPF Area ID' field is empty. 'Back' and 'Next' buttons are at the bottom right.

**Step 4.a — DHCP client**

If *Get IP Automatically (DHCP)* is selected, DFL-900 will request for IP address, netmask, and DNS servers from your ISP. You can use your preferred DNS by clicking the *DNS IP Address* and then completing the *Primary DNS* and *Secondary DNS* server IP addresses. Click *Next* to proceed.

**BASIC SETUP > Wizard > Next > DHCP**

The screenshot shows the 'BASIC SETUP > Wizard > Next > DHCP' screen. The 'IP Address Assignment' dropdown is set to 'Get IP Automatically (DHCP)'. There are radio buttons for 'Get DNS Automatically' and 'DNS IP Address' (selected). The 'Primary DNS' field contains '168.95.1.1' and the 'Secondary DNS' field contains '0.0.0.0'. The 'Routing Protocol' is 'None' and the 'OSPF Area ID' field is empty. 'Back' and 'Next' buttons are at the bottom right.

**Step 4.b — Fixed IP**

If *Fixed IP Address* is selected, enter the ISP-given IP Address, Subnet Mask, Gateway IP, Primary DNS and Secondary DNS IP. Click *Next* to proceed.

**BASIC SETUP > Wizard > Next > Fixed IP**

The screenshot shows the 'BASIC SETUP > Wizard > Next > Fixed IP' screen. The 'IP Address Assignment' dropdown is set to 'Fixed IP Address'. The 'IP Address' field contains '61.2.1.1', the 'Subnet Mask' field contains '255.255.255.248', and the 'Gateway IP' field contains '61.2.1.6'. There are radio buttons for 'DNS IP Address' (selected) and 'Get DNS Automatically'. The 'Primary DNS' field contains '168.95.1.1' and the 'Secondary DNS' field contains '0.0.0.0'. The 'Routing Protocol' is 'None' and the 'OSPF Area ID' field is empty. 'Back' and 'Next' buttons are at the bottom right.

**Step 4.c — PPPoE client**

If PPP over Ethernet is selected, enter the ISP-given User Name, Password and the optional Service Name. Click Next to proceed.

Notice: On the current firmware version, if you select PPPoE method as the WAN link connection. The bandwidth management feature will not be supported.

**BASIC SETUP > Wizard > Next > PPPoE**
**Step 4.d — Alert Message**

Please Note that an alert message box "When changing to none fixed ip mode, system will delete all ip alias!" will appear while you change Get IP Automatically (DHCP) or PPP over Ethernet but not Fixed IP Address as your WAN link.

**Step 5. System Status**

Here we select Fixed IP method in WAN1 port. Then the DFL-900 provides a short summary of the system. Please check if anything mentioned above is properly set into the system. Click Finish to close the wizard.

**BASIC SETUP > Wizard > Run Setup Wizard > Next > Next**

Port	IP Address	Subnet Mask
Port1: WAN1 (Static IP)[Default]	61.2.1.1	255.255.255.248
Port2: LAN1	192.168.1.254	255.255.255.0
Port3: DMZ1	10.1.1.254	255.255.255.0

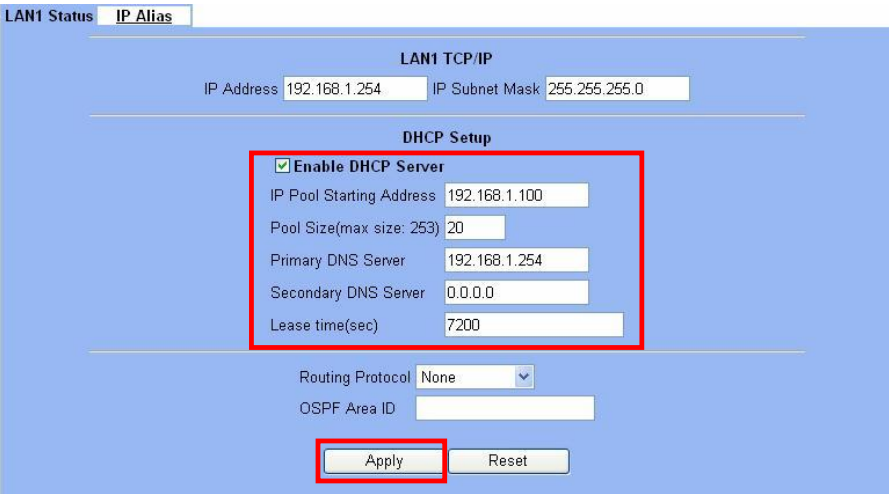

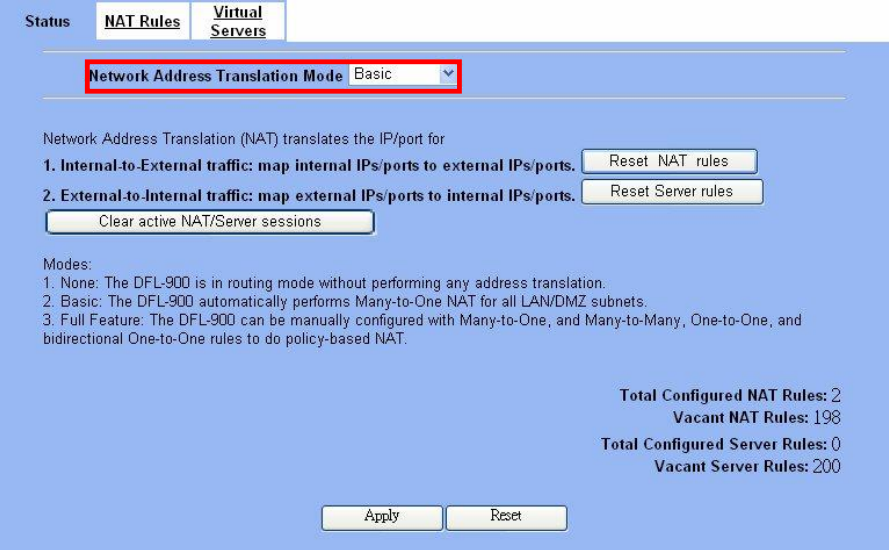

**1.6 Internet Connectivity**

After setting up DFL-900 with the wizard, DFL-900 can connect to the ISP. In this chapter, we introduce LAN1-to-WAN1 Connectivity to explain how the computers under LAN1 can access the Internet at WAN1 through DFL-900. Subsequently, we introduce WAN1-to-DMZ1 Connectivity to explain how the servers under DMZ1 can be accessed by the LAN1 users and other Internet users on the WAN1 side.

**You MUST press Apply to proceed to the next page. Once applying any changes, the settings are immediately updated into the flash memory.**

### 1.6.1 LAN1-to-WAN1 Connectivity

The LAN Settings page allows you to modify the IP address and Subnet Mask that will identify the DFL-900 on your LAN. This is the IP address you will enter in the URL field of your web browser to connect to the DFL-900. It is also the IP address that all of the computers and devices on your LAN will use as their Default Gateway.

<p><b>Step 1. Device IP Address</b> Setup the IP Address and IP Subnet Mask for the DFL-900.</p>	<p><b>BASIC SETUP &gt; LAN Settings &gt; LAN1 Status</b></p>  <p><b>Note:</b> The IP Pool Starting Address must be on the same subnet specified in the IP Address and the IP Subnet Mask field. For example, the addresses given by the 192.168.1.100 with a pool size of 20 (192.168.1.100 ~ 192.168.1.119) are all within the same range of 192.168.1.254 / 255.255.255.0</p>
<p><b>Step 2. Client IP Range</b> Enable the DHCP server if you want to use DFL-900 to assign IP addresses to the computers under LAN1. Specify the Pool Starting Address, Pool Size, Primary DNS, and Secondary DNS that will be assigned to them. Example: in the figure, the DFL-900 will assign one IP address from 192.168.1.100 ~ 192.168.1.119, together with the DNS server 192.168.1.254, to the LAN1 PC that requests for an IP address.</p>	<p><b>ADVANCED SETTINGS &gt; NAT &gt; Status</b></p>  <p><b>Modes:</b> 1. None: The DFL-900 is in routing mode without performing any address translation. 2. Basic: The DFL-900 automatically performs Many-to-One NAT for all LAN/DMZ subnets. 3. Full Feature: The DFL-900 can be manually configured with Many-to-One, and Many-to-Many, One-to-One, and bidirectional One-to-One rules to do policy-based NAT.</p>
<p><b>Step 3. Apply the Changes</b> Click Apply to save. Now you can enable the DHCP clients on your LAN1 PCs to get an IP.</p>	
<p><b>Step 4. Check NAT Status</b> The default setting of NAT is in Basic Mode. After completing Step 3, the NAT is automatically configured related rules to let all private-IP LAN/DMZ-to-WAN requests to be translated with the public IP assigned by the ISP.</p>	

**Step 5. Check NAT Rules**

The DFL-900 has added the NAT rules as the right diagram. The rule `Basic-LAN1` means that, when matching the condition (requests of LAN/DMZ-to-WAN direction with its source IP falling in the range of 192.168.1.254 / 255.255.255.0), the request will be translated into a public-source-IP requests, and then be forwarded to the destinations.

**ADVANCED SETTINGS > NAT > NAT Rules**

**Status** **NAT Rules** **Virtual Servers**

NAT->Edit Rules

Packets are top-down matched by the rules.

Item #	Status		Condition		Action	
	Active	Name	Direction	Source IP Address	Translate Src IP into	Type
1	Y	Basic-DMZ1	LAN/DMZ to WAN	10.1.1.254/255.255.255.0	Auto (device WAN IP)	M-1
2	Y	Basic-LAN1	LAN/DMZ to WAN	192.168.1.254/255.255.255.0	Auto (device WAN IP)	M-1

Page 1/1

Insert Edit Delete Move Before: 1

**1.6.2 WAN1-to-DMZ1 Connectivity**

This section tells you how to provide an FTP service with a server installed under your DMZ1 to the public Internet users. After following the steps, users at the WAN side can connect to the FTP server at the DMZ1 side.

**Step 1. Device IP Address**

Setup the IP Address and IP Subnet Mask for the DFL-900 of the DMZ1 interface.

**Step 2. Client IP Range**

Enable the DHCP server if you want to use DFL-900 to assign IP addresses to the computers under DMZ1.

**Step 3. Apply the Changes**

Click `Apply` to save your settings.

**BASIC SETUP > DMZ Settings > DMZ1 Status**

**DMZ1 Status** **IP Alias**

**DMZ1 TCP/IP**

IP Address 10.1.1.254 IP Subnet Mask 255.255.255.0

**DHCP Setup**

**Enable DHCP Server**

IP Pool Starting Address 10.1.1.1

Pool Size(max size: 253) 20

Primary DNS Server 10.1.1.254

Secondary DNS Server 0.0.0.0

Lease time(sec) 7200

Routing Protocol None

OSPF Area ID

Apply Reset

**Step 4. Check NAT Status**

The default setting of NAT is in Basic Mode. After applying the Step 3, the NAT is automatically configured related rules to let all private-IP LAN/DMZ-to-WAN requests to be translated with the public IP assigned by the ISP.

**ADVANCED SETTINGS > NAT > Status**

Network Address Translation Mode: **Basic**

Network Address Translation (NAT) translates the IP/port for

1. Internal-to-External traffic: map internal IPs/ports to external IPs/ports.

2. External-to-Internal traffic: map external IPs/ports to internal IPs/ports.

Modes:

- None: The DFL-900 is in routing mode without performing any address translation.
- Basic: The DFL-900 automatically performs Many-to-One NAT for all LAN/DMZ subnets.
- Full Feature: The DFL-900 can be manually configured with Many-to-One, and Many-to-Many, One-to-One, and bidirectional One-to-One rules to do policy-based NAT.

Total Configured NAT Rules: 2  
Vacant NAT Rules: 198  
Total Configured Server Rules: 0  
Vacant Server Rules: 200

**Step 5. Check NAT Rules**

The DFL-900 has added the NAT rules as the right diagram. The rule Basic-DMZ1 (number 1) means that, when matching the condition (requests of LAN/DMZ-to-WAN direction with its source IP falling in the range of 10.1.1.254 / 255.255.255.0), the request will be translated into a public-source-IP requests, and then be forwarded to the destinations.

**ADVANCED SETTINGS > NAT > NAT Rules**

NAT->Edit Rules

Packets are top-down matched by the rules.

Item	Status	Name	Direction	Condition	Action
1	Y	Basic-DMZ1	LAN/DMZ to WAN	10.1.1.254/255.255.255.0	Auto (device WAN IP) M-1
2	Y	Basic-LAN1	LAN/DMZ to WAN	192.168.1.254/255.255.255.0	Auto (device WAN IP) M-1

Page 1/1

1     1

**Step 6. Setup IP for the FTP Server**

Assign an IP of 10.1.1.5/255.255.255.0 to the FTP server under DMZ1. Assume the FTP Server is at 10.1.1.5. And it is listening on the well-known port (21).

**Step 7. Setup Server Rules**

Insert a virtual server rule by clicking the Insert button.

**ADVANCED SETTINGS > NAT > Virtual Servers**

Virtual Server->Edit Rules

Packets are top-down matched by the rules.

Item	Status	Name	Direction	Condition	Action		
#	Active	Name	Direction	Dest. IP Address	Service	Redirect to	through

Page 1/1

1

**Step 8. Customize the Rule**

Customize the rule name as the ftpServer. For any packets with its destination IP address equaling to the WAN1 IP (61.2.1.1) and destination port equaling to 44444. DFL-900 will translate the packet's destination IP/port into 10.1.1.5/21. Check the Passive FTP client to maximize the compatibility of the FTP protocol. This is useful if you want to provide connectivity to passive FTP clients. For passive FTP clients, the server at DMZ will return them the private IP address (10.1.1.5) and the port number for the clients to connect back for data transmissions. Since the FTP clients at the WAN side cannot connect to a private-IP (ex.10.1.1.5) through the internet. The data connections would be fail. After enabling this feature, the DFL-900 will translate the private IP/port into an IP/port of its own. Thus the problem is gracefully solved. Another point is to be sure to check "Auto update to Firewall rules when you Apply this page?" or "Auto update to NAT rules when you Apply this page?". Then, the virtual server rule will add a Firewall or NAT rule automatically. Click Apply to proceed.

**ADVANCED SETTINGS > NAT > Virtual Servers > Insert**

Virtual Server->Edit Rules->Insert

Insert a new Virtual Server rule

Status:  Activate this rule

Rule name: ftpServer

Condition

Sessions from Internet connecting to: WAN1

External IP: 61.2.1.1

Service: TCP

Type:  Single  Range

Dest. Port: 44444  Passive FTP client?

to: 0

Well known port: FTP (21) Copy To Dest. Port

Action

Redirect to internal server under: DMZ1

Internal IP: 10.1.1.5 Port: 21

Auto update to Firewall rules when you Apply this page?

Auto update to NAT rules when you Apply this page?

Note: Check this if your virtual server is mapped to an aliased WAN IP, you need to set up an 1-to-1 NAT rule for that server. Thus, the server will use the aliased IP instead of the actual WAN IP. Note that if your NAT is in Basic Mode, checking this will automatically change the NAT into Full Feature Mode.

Back Apply Reset

**Step 9. View the Result**

Now any request towards the DFL-900's WAN1 IP (61.2.1.1) with dest. port 44444 will be translated into a request towards 10.1.1.5 with port 21, and then be forwarded to the 10.1.1.5. The FTP server listening at port 21 in 10.1.1.5 will pick up the request.

**ADVANCED SETTINGS > NAT > Virtual Servers**

Virtual Server->Edit Rules

Packets are top-down matched by the rules.

Item	Status	Name	Direction	Condition	Service	Redirect to	through
1	Y	ftpServer	From WAN1	61.2.1.1/255.255.255.255	TCP:44444	10.1.1.5:21	DMZ1

Page 1/1

Prev. Page Next Page Move Page 1

Insert Edit Delete Move Before: 1

**Step 10. View the NAT Rules**

In the previous Step 8, we have already checked "Auto update to Firewall/NAT rules when you Apply this page", so it will automatically add one NAT rule to transfer the IP address of virtual server when server responses packet back to the client.

**ADVANCED SETTINGS > NAT > NAT Rules**

NAT->Edit Rules

Packets are top-down matched by the rules.

Item	Status	Name	Direction	Source IP Address	Translate Src IP into	Type
1	Y	ftpServer	LAN/DMZ to WAN	10.1.1.5/255.255.255.255	61.2.1.1/255.255.255.255	1-1
2	Y	Basic-DMZ1	LAN/DMZ to WAN	10.1.1.254/255.255.255.0	Auto (device WAN IP)	M-1
3	Y	Basic-LAN1	LAN/DMZ to WAN	192.168.1.254/255.255.255.0	Auto (device WAN IP)	M-1

Page 1/1

Insert Edit Delete Move Before: 1

# Part I Overview

## Step 11. View the Firewall Rules

The same as Step 10. When we check “Auto update to Firewall/NAT rules when you Apply this page”, it will automatically add one Firewall rule in the WAN1 to DMZ1 direction. This firewall rule will let the packets with dest. IP address/port be matched with virtual server rule in order to pass through DFL-900.

## ADVANCED SETTINGS > Firewall > Edit Rules

The screenshot shows the 'Edit Rules' page in a web interface. At the top, there are tabs for 'Status', 'Edit Rules', 'Show Rules', 'Attack Alert', and 'Summary'. Below the tabs, the page title is 'Firewall->Edit Rules'. A red box highlights the 'Edit WAN1 to DMZ1 rules' link. Below this, there is a 'Default action for this packet direction:' section with a 'Block' dropdown, a checked 'Log' checkbox, and an 'Apply' button. A note states 'Packets are top-down matched by the rules.' Below this is a table with columns: Item, Status, Name, Direction, Source IP Address, Dest. IP Address, Service, Action, and Log. Rule 1 is highlighted with a red box. At the bottom, there are navigation buttons: 'Prev. Page', 'Next Page', 'Move Page', '1', 'Insert', 'Edit', 'Delete', and 'Move Before: 1'.

Item #	Status		Condition				Action	
	Active	Name	Direction	Source IP Address	Dest. IP Address	Service	Action	Log
1	Y	ftpServer	WAN1 to DMZ1	Any	10.1.1.5/255.255.255.255	TCP:21	Forward	N
2	Y	Default	WAN1 to DMZ1	Any	Any	Any	Block	Y

## Chapter 2 System Overview

*In this chapter, we will introduce the network topology for use with later chapters.*

### 2.1 Typical Example Topology

In this chapter, we introduce a typical network topology for the DFL-900. In Figure 2-1, the left half side is a DFL-900 with one LAN, one DMZ, and one WAN link. We will demonstrate the administration procedure in the later chapters by using the below Figure 2-1.

The right half side contains another DFL-900 connected with one LAN, one DMZ, and one WAN. You can imagine this is a branch office of Organization\_1. In this architecture, all the users under Organization can access sever reside in the Internet or DMZ region smoothly. Besides, Organization\_1 communicates with Organization\_2 with a VPN tunnel established by the two DFL-900 VPN/Firewall routers. The VPN tunnel secures communications between Organizations more safely.

We will focus on how to build up the topology using the DFL-900 as the following Figure 2-1. In order to achieve this purpose, we need to know all the administration procedure.

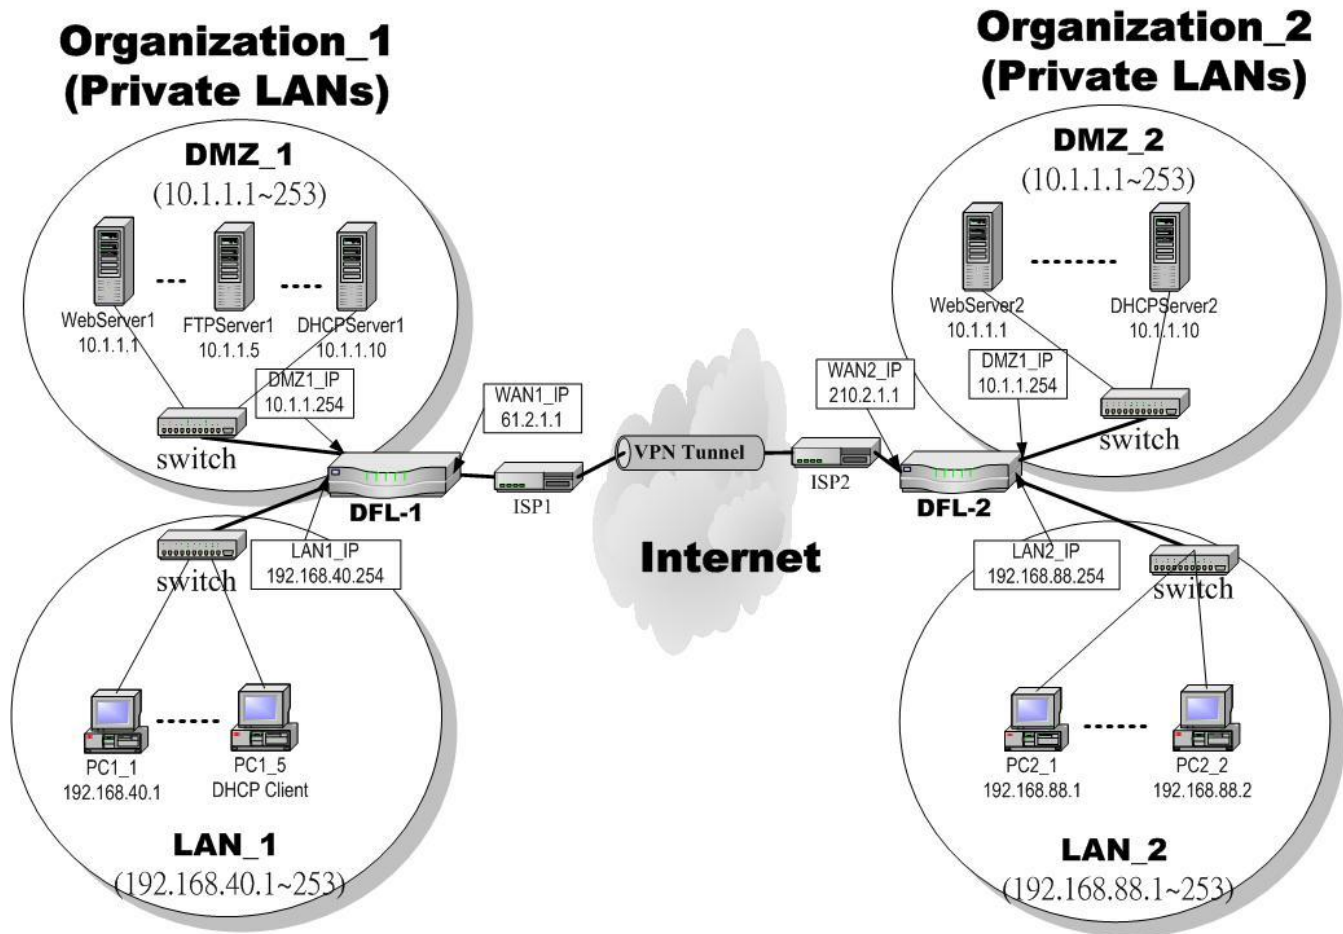

Figure 2-1 Typical topology for deploying DFL-900

# Part I

## Overview

---

Continually, we will introduce all the needed administration procedure in the following section.

1. Part II Basic Configuration  
How to configure the WAN/DMZ/LAN port settings..
2. Part III NAT、Routing & Firewall  
Introducing the NAT, Routing, Firewall features.
3. Part IV Virtual Private Network  
If you need to build a secure channel with your branch office, or wish to access the inside company resource as usual while outside your company, the Virtual Private Network (VPN) function can satisfy you.
4. Part V Content Filters  
If you hope to restrict the web contents, mail attachments, downloaded ftp file from intranet region, try this feature to fit your requirement.
5. Part VI Intrusion Detection System  
Use the Intrusion Detection System (IDS) to detect all the potential DoS attacks, worms, hackers from Internet.
6. Part VII Bandwidth Management  
If you wish to make your inbound/outbound bandwidth utilized more efficiently, you may use the Bandwidth Management feature to manage your bandwidth.
7. Part VIII System Maintenance  
In this part, we provide some useful skills to help you to justify DFL-900 more securely and steadily.

## 2.2 Changing the LAN1 IP Address

The default settings of DFL-900 are listing in Table 1-1. However, the original LAN1 setting is 192.168.1.254/255.255.255.0 instead of 192.168.40.254/255.255.255.0 as in Figure 2-1. We will change the LAN1 IP of the DFL-900 to 192.168.40.254.

We provide two normal ways to configure the LAN1 IP address. One is to configure the LAN1 IP from LAN1 port. The other way is to configure the LAN1 IP through console.

### 2.2.1 From LAN1 to configure DFL-900 LAN1 network settings

<b>Step 1. Connect to the DFL-900</b>	<b>Use an IE at 192.168.1.1 to connect to <a href="https://192.168.1.254">https://192.168.1.254</a></b>
Using a network line to connect DFL-900 with LAN1 port. The PC which connected to DFL-900 must be assigned 192.168.1.X address (LAN1 default IP address is 192.168.1.254/24). Type <a href="https://192.168.1.254">https://192.168.1.254</a> or <a href="http://192.168.1.254:8080">http://192.168.1.254:8080</a> to configure the DFL-900 in the web browser.	

**Step 2. Setup LAN1 IP information**

Enter the IP Address and IP Subnet Mask with 192.168.40.254 / 255.255.255.0 and click Apply.

Warning: After you apply the changed settings, the network will be disconnected instantly since the network IP address you are logging is changed.

**BASIC SETUP > LAN Settings > LAN1 Status**

LAN1 Status **IP Alias**

LAN1 TCP/IP

IP Address 192.168.40.254 IP Subnet Mask 255.255.255.0

DHCP Setup

Enable DHCP Server

IP Pool Starting Address 192.168.40.100

Pool Size(max size: 253) 20

Primary DNS Server 192.168.40.254

Secondary DNS Server 0.0.0.0

Lease time(sec) 7200

Routing Protocol None

OSPF Area ID

Apply Reset

**2.2.2 From CLI (command line interface) to configure DFL-900 LAN1 network settings****Step 1. Use Console port to configure DFL-900**

Use the supplied console line to connect the PC to the Diagnostic RS-232 socket of the DFL-900. Start a new connection using the HyperTerminal with parameters: No Parity, 8 Data bits, 1 stop bit, and baud rate 9600. Enter admin for user name and admin for password to login. After logging into DFL-900, enter the commands "en" to enter the privileged mode. Enter the command "ip ifconfig INTF1 192.168.40.254 255.255.255.0" to change the IP of the LAN1 interface.

```
DFL-900> en
DFL-900# ip ifconfig INTF1 192.168.40.254 255.255.255.0
```

```
DFL-900# ip ifconfig INTF1
```

```
=====
Port Interface IP Address      Netmask      Status Type
-----
  2   LAN1    192.168.40.254  255.255.255.0  UP
=====
```

```
DFL-900# _
```

## 2.3 The design principle

### 2.3.1 Web GUI design principle

Figure 2-2 You can select the functional area by the sequence in Web GUI

If we want to configure DFL-900, we can follow the sequence as the

Figure 2-2 illustrated.

Step1. Select Main-function

Step2. Select Sub-function

Step3. Select Tag

Step4. Configure the real parameters

### 2.3.2 Rule principle

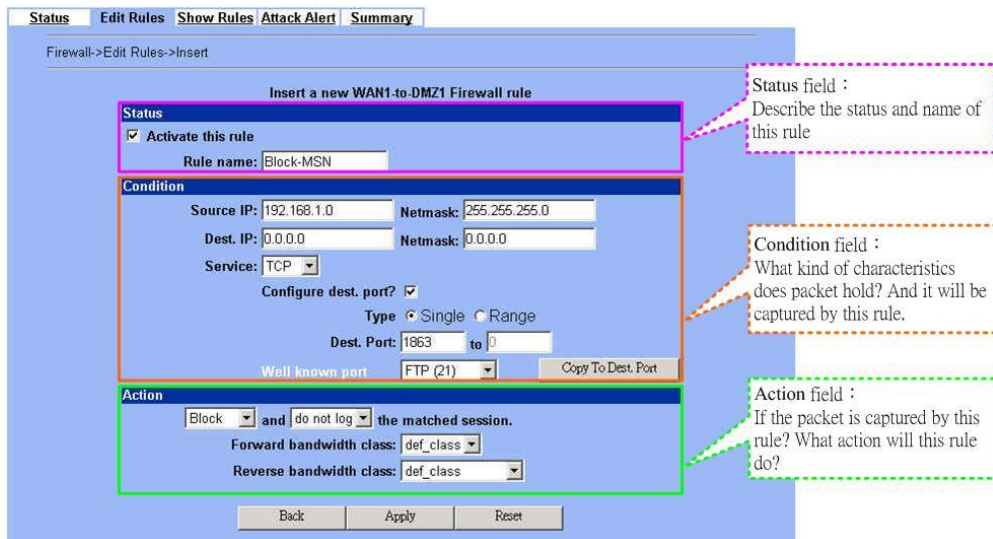

Figure 2-3 The rule configuration is divided into three parts

You may find many rules configuration in the DFL-900. They are distributed in the respective feature. These rules include

1. NAT rule
2. Virtual Server rule
3. Firewall rule
4. Policy route rule
5. Bandwidth management rule

The behavior of each rule is different, and so are their configuration parameters. But the designed principle of each rule is the same. The configuration is divided into three parts as Figure 2-3 illustrated. You just need to enter the necessary information onto each part according to your requirement. As for the definitions of the three-part configuration, please refer to the following description.

1. **Status:** Describe the status and name of this rule.
2. **Condition:** What kind of characteristics does packet hold? And it will be captured by this rule.
3. **Action:** If the packet is captured by this rule? What action will this rule do?

As the Figure 2-4 illustrated, the page of the rule edition is also divided into three parts. Their definitions are also the same as we have discussed in Figure 2-3.

Additionally, please note that there is a button named “Move Before” in the Figure 2-4. If you are not satisfied with the current rule sequence, you can adjust the rule sequence by using the “Move Before” button.

**Status field :**  
Describe the status and name of this rule

**Condition field :**  
What kind of characteristics does packet hold? And it will be captured by this rule.

**Action field :**  
If the packet is captured by this rule? What action will this rule do?

Firewall->Edit

Edit LAN1 to WAN1 rules

Default action for this packet direction: Forward  Log Appl.

Packets are top-down matched by the rules.

Item #	Status		Condition				Action	
	Active	Name	Direction	Source IP Address	Dest. IP Address	Service	Action	Log
1	Y	Block-MSN	LAN1 to WAN1	192.168.1.0/255.255.0	Any	TCP:1863	Block	Y
2	Y	Default	LAN1 to WAN1	Any	Any	Any	Forward	N

Page 1/1

Prev. Page Next Page Move Page 1

Insert Edit Delete Move Before: 1

If you are not satisfied with the current rule sequence, you can adjust the rule sequence by using the Move Before button.

Figure 2-4 The rules in the page of the rule edition are also divided into three parts.

# Part II

## Basic Configuration

## Chapter 3 Basic Setup

*In this chapter, we will introduce how to setup network settings for each port separately*

### 3.1 Demand

1. For the external network, suppose your company uses DSL to connect Internet via fixed-IP. By this way, you should setup WAN port of the DFL-900 in advance.
2. There are some adjustment within your company, so the original network structure has been changed. Now, you should modify the configuration between the internal network (DMZ, LAN).
3. Your company needs more network bandwidth if it is insufficient for your company to connect to the external network. Suppose there are many public IPs in your company. You would like to specify a unique public IP to a local server.

### 3.2 Objectives

1. Configure the network settings of the DFL-900 WAN1 port.
2. Configure the network settings of the DFL-900 DMZ1 and LAN1 ports.
3. We hope to assign another IP address to the same WAN port we have configured an existed IP address before.

### 3.3 Methods

1. Select the Fixed IP Address method in the DFL-900 Basic Setup/WAN settings/WAN1 IP, and then configure the related account and password in order to connect to the internet.
2. Configure the related network settings in the pages of the DFL-900 Basic Setup / DMZ settings / DMZ1 Status 、 Basic Setup / LAN settings / LAN1 Status.
3. Configure the IP alias in WAN1 port.

### 3.4 Steps

#### 3.4.1 Setup WAN1 IP

##### Step 1. Setup WAN1 port

Here we select Fixed IP Address method in WAN1 port. Fill in the IP Address, Subnet Mask, Gateway IP. And then enter the other DNS IP Address, Routing Protocol fields. Click Apply to finish this setting.

##### BASIC SETUP > WAN Settings > WAN1 IP > Fixed IP Address

The screenshot shows the configuration page for WAN1 IP Fixed IP Address. The page has a blue header with the breadcrumb 'BASIC SETUP > WAN Settings > WAN1 IP > Fixed IP Address'. Below the header, there are two tabs: 'WAN1 IP' (selected) and 'IP Alias'. The main content area is light blue and contains the following fields:

- IP Address Assignment:** Fixed IP Address (dropdown menu)
- IP Address:** 61.2.1.1
- Subnet Mask:** 255.255.255.248
- Gateway IP:** 61.2.1.6
- DNS IP Address:** (radio button selected)
  - Primary DNS:** 168.95.1.1
  - Secondary DNS:** 0.0.0.0
- Routing Protocol:** None (dropdown menu)
- OSPF Area ID:** (empty text field)

At the bottom of the form, there are two buttons: 'Apply' and 'Reset'.

## Part II Basic Configuration

IP Address Assignment	FIELD	DESCRIPTION	Range / Format	EXAMPLE
Get IP Automatically (DHCP)	Get DNS Automatically / DNS IP Address	Get DNS Automatically → Get DNS related information from DHCP Server DNS IP Address → manually specify these Primary and Secondary DNS Server information	Get DNS Automatically / DNS IP Address	Get DNS Automatically
	Routing Protocol	Determine to enable the dynamic routing protocol, to receive RIP message, to send out the RIP message if the RIP message is received or not.	None, RIPv1/In, RIPv1/In+Out, RIPv2/In, RIPv2/In+Out, OSPF	None
	OSPF Area ID	Specify OSPF area ID number	IPv4 format or digit string (Max 9 bits)	
Fixed IP Address	IP Address	Specified IP address	IPv4 format	61.2.1.1
	Subnet Mask	Specified subnet mask	IPv4 format	255.255.255.248
	Gateway IP	Default gateway IP address	IPv4 format	61.2.1.6
	DNS IP Address: Primary DNS Secondary DNS	Specified Primary and Secondary DNS Server address	IPv4 format	Primary DNS: 168.95.1.1 Secondary DNS: 0.0.0.0
	Routing Protocol	Determine to enable the dynamic routing protocol, to receive RIP message, to send out the RIP message if the RIP message is received or not.	None, RIPv1/In, RIPv1/In+Out, RIPv2/In, RIPv2/In+Out, OSPF	None
PPP over Ethernet	OSPF Area ID	Specify OSPF area ID number	IPv4 format or digit string (Max 9 bits)	
	Service Name	ISP vendor (Optional)	text string	So-Net
	User Name	The user name of PPPoE account	text string	Hey
	Password	The password of PPPoE account	text string	G54688
	Get DNS Automatically / DNS IP Address	Get DNS Automatically → Get DNS related information from PPPoE ISP DNS IP Address → manually specify these Primary and Secondary DNS Server information	Get DNS Automatically / DNS IP Address	Get DNS Automatically
Disconnect button	Through click Disconnect button to disconnect PPPoE link	Disconnect	Click Disconnect	

Table 3-1 Detailed information of setup WAN port configuration

**Step 2. Bandwidth Management is not supported by PPPoE**

Notice, if you select PPPoE type as IP Address Assignment. You may probably see the message as the right dialog box. That is because of you have already enabled bandwidth management (ADVANCED SETTINGS>Bandwidth Mgt>Enable Bandwidth Management) and then select PPPoE type as your internet connection. It will show you a message indicated as right column to tell you that Bandwidth management will not support PPPoE in this version. If you still like to use bandwidth management, please try to use another method, such as DHCP or Fixed IP, to connect Internet.

**BASIC SETUP > WAN Settings > WAN1 IP > PPPoE**

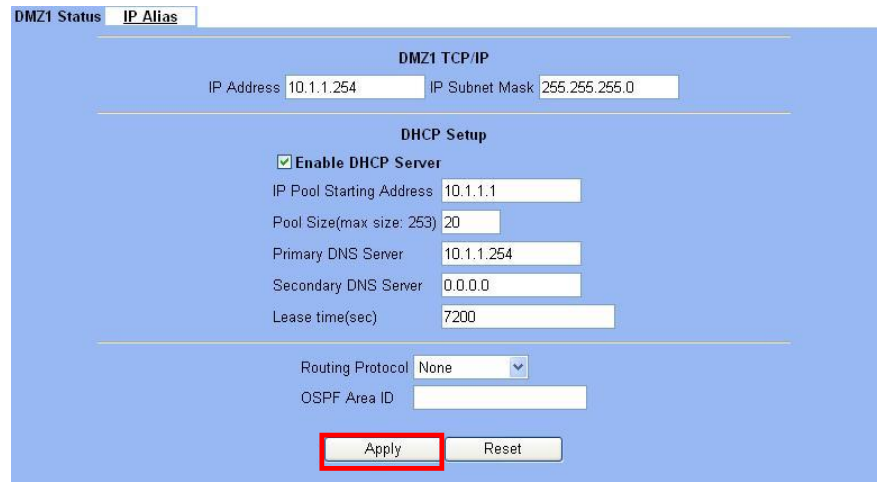

**3.4.2 Setup DMZ1, LAN1 Status**

**Step 1. Setup DMZ port**

Here we are going to configure the DMZ1 settings. Setup IP Address and IP Subnet Mask, and determine if you would like to enable the DHCP Server. And then select Routing Protocol. Click Apply to finish this setting.

**BASIC SETUP > DMZ Settings > DMZ1 Status**

FIELD	DESCRIPTION	Range / Format	EXAMPLE
IP Address	DMZ port IP address	IPv4 format	10.1.1.254
IP Subnet Mask	DMZ port IP subnet mask	netmask format	255.255.255.0
Enable DHCP Server	Enable DMZ port of the DHCP Sever or not	Enable/Disable	Enabled
IP Pool Starting Address	Specify the starting address of the DHCP IP address.	IPv4 format in the DMZ address range	10.1.1.1
Pool Size(max size: 253)	Specify the numbers of the DHCP IP address.	1 ~253	20
Primary DNS Server	Specify the Primary DNS Server IP address of the DHCP information.	IPv4 format	10.1.1.254
Secondary DNS Server	Specify the Secondary DNS Server IP address of the DHCP information.	IPv4 format	0.0.0.0

## Part II Basic Configuration

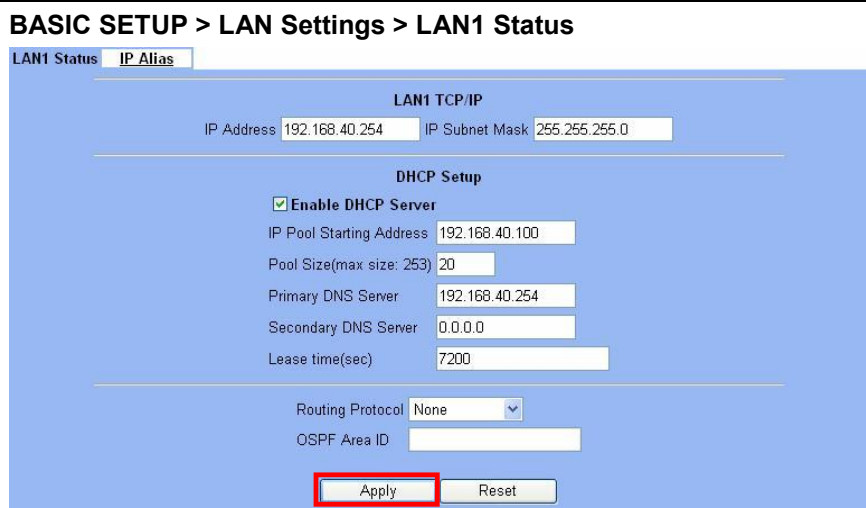

Lease time(sec)	Specify DHCP information lease time	greater than 0	7200
Routing Protocol	Determine to enable the dynamic routing protocol (RIP), to receive RIP message, to send out RIP message if the message is received or not.	None / RIPv1In / RIPv1In+out / RIPv2In / RIPv2In+out / OSPF	None
OSPF Area ID	Specify OSPF area ID number	IPv4 format or digit string (Max 9 bits)	N/A

Table 3-2 Configure DMZ network settings

**Step 2. Setup LAN port**

Here we are going to configure the LAN1 settings. Setup IP Address and IP Subnet Mask, and determine if you would like to enable the DHCP Server. And then select Routing Protocol. Click Apply to finish this setting.

**BASIC SETUP > LAN Settings > LAN1 Status**

FIELD	DESCRIPTION	Range / Format	EXAMPLE
IP Address	LAN1 port IP address	IPv4 format	192.168.40.254
IP Subnet Mask	LAN1 port IP subnet mask	netmask format	255.255.255.0
Enable DHCP Server	Enable LAN1 port of the DHCP Server or not	Enable/Disable	Enabled
IP Pool Starting Address	Specify the starting address of the DHCP IP address.	IPv4 format in the LAN1 address range	192.168.40.100
Pool Size(max size: 253)	Specify the numbers of the DHCP IP address.	1 ~253	20
Primary DNS Server	Specify the Primary DNS Server IP address of the DHCP information.	IPv4 format	192.168.40.254
Secondary DNS Server	Specify the Secondary DNS Server IP address of the DHCP information.	IPv4 format	0.0.0.0
Lease time(sec)	Specify DHCP information lease time	greater than 0	7200
Routing Protocol	Determine to enable the dynamic routing protocol (RIP), to receive RIP message, to send out RIP message if the message is received or not.	None / RIPv1In / RIPv1In+out / RIPv2In / RIPv2In+out / OSPF	None

OSPF Area ID	Specify OSPF area ID number	IPv4 format or digit string (Max 9 bits)	N/A
--------------	-----------------------------	--	-----

Table 3-3 Configure LAN network settings

### 3.4.3 Setup WAN1 IP alias

#### Step 1. Add WAN1 IP alias

Suppose you apply 8 IP addresses from ISP. The range of the ISP-given IP address is from 61.2.1.0 to 61.2.1.7. Now you would like to add three WAN1 IP aliases. Select WAN1 in the Interface field. Enter the IP alias and Netmask with 61.2.1.2/255.255.255.248. Key in 3 into the Alias size field. And then click Apply.

Notice : It's the same way to set IP alias in DMZ or LAN.

#### BASIC SETUP > WAN Settings > IP Alias > Add

FIELD	DESCRIPTION	Range / Format	EXAMPLE
Interface	The interface which we set for the IP alias	WAN interfaces	WAN1
IP alias	The alias IP address	IPv4 format	61.2.1.2
Netmask	The netmask of the IP alias	netmask format	255.255.255.248
Alias size	The size of IP alias address	Max 60	3

Table 3-4 Add a IP alias record

#### Step 2. Edit, Delete IP alias record

You can easily add, edit, or delete IP alias records by the Add, Edit, or Delete button.

#### BASIC SETUP > WAN Settings > IP Alias

## Part II Basic Configuration

FIELD	DESCRIPTION	EXAMPLE
Prev. Page	If there are more than one IP alias pages, you can press Prev. Page to back to the previous page.	N/A
Add	Insert a new IP alias record.	N/A
Edit	Edit the properties of the existent record.	N/A
Delete	Delete the indicated record.	N/A
Next Page	If there are more than one action records, you can press Next Page to go to the next page.	N/A

Table 3-5 Show the entered IP alias records

Maximize IP alias records of DFL-900	WAN port	60 records
	DMZ port	10 records
	LAN port	10 records

Table 3-6 IP alias limitation of each port

### Step 3. See the IP alias setting in the “WAN1 IP” page

After entering the IP alias address, it will show the result in the “WAN1 IP” page.

Warning: If you select Fixed IP Address as your WAN link type and set any IP alias, the previous set IP aliases will disappear when you try to exchange the WAN link type to other type such as DHCP or PPPoE.

### BASIC SETUP > WAN Settings > WAN1 IP > Fixed IP Address

WAN1 IP **IP Alias**

IP Address Assignment Fixed IP Address

IP Address 61.2.1.1 Subnet Mask 255.255.255.248

Gateway IP 61.2.1.6

IP Aliased 61.2.1.2/255.255.255.248

IP Aliased 61.2.1.3/255.255.255.248

IP Aliased 61.2.1.4/255.255.255.248

DNS IP Address

Primary DNS 168.95.1.1

Secondary DNS 0.0.0.0

Routing Protocol None

OSPF Area ID

Apply Reset

# Chapter 4

## System Tools

*This chapter introduces System Management and explains how to implement it.*

### 4.1 Demand

1. Basic configurations for domain name, password, system time, timeout and services.
2. DDNS: Suppose the DFL-900's WAN uses dynamic IP but needs a fixed host name. When the IP is changed, it is necessary to have the DNS record updated accordingly. To use this service, one has to register the account, password, and the wanted host name with the service provider.
3. DNS Proxy: Shorten the time of DNS lookup performed by applications.
4. DHCP Relay: It is to solve the problem that when the DHCP client is not in the same domain with the DHCP server, the DHCP broadcast will not be received by the server. If the client is in the LAN (192.168.40.X) while the server is located in the DMZ (10.1.1.4), the server will not receive any broadcast packet from the client.
5. The System Administrator would like to monitor the device from remote side efficiently.

### 4.2 Objectives

1. Configure the general properties, such as domain name, password, system time, and connection timeout correctly. Besides, we can configure the preferred service name as the service name/numeric mapping list.
2. DDNS: By using the DDNS (Dynamic DNS), the DFL-900 will send the request for modification of the corresponding DNS record to the DDNS server after the IP is changed.
3. DNS Proxy: Reduce the number of DNS requests and the time for DNS lookup.
4. DHCP Relay: Enable the DHCP client to contact with the DHCP server located in different domain and get the required IP.
5. Through the SNMP manager, we can easily monitor the device status.

### 4.3 Methods

1. Configure the domain name, password, system time, connection timeout and service name.
2. DDNS: Configure the DFL-900 so that whenever the IP of the DFL-900 is changed, it will send requests to the DDNS server to refresh the DNS record. As the following Figure 4-1 demonstrated, the original DFL-1 has registered WAN1 IP address "61.2.1.1" on the DDNS server (www.dyndns.org). Its domain name address is "me.dyndns.org". If the WAN1 IP address is reassigned by the ISP, DFL-1 will update the registered IP address "61.2.1.1" as the assigned one. This is the base mechanism of the DDNS.

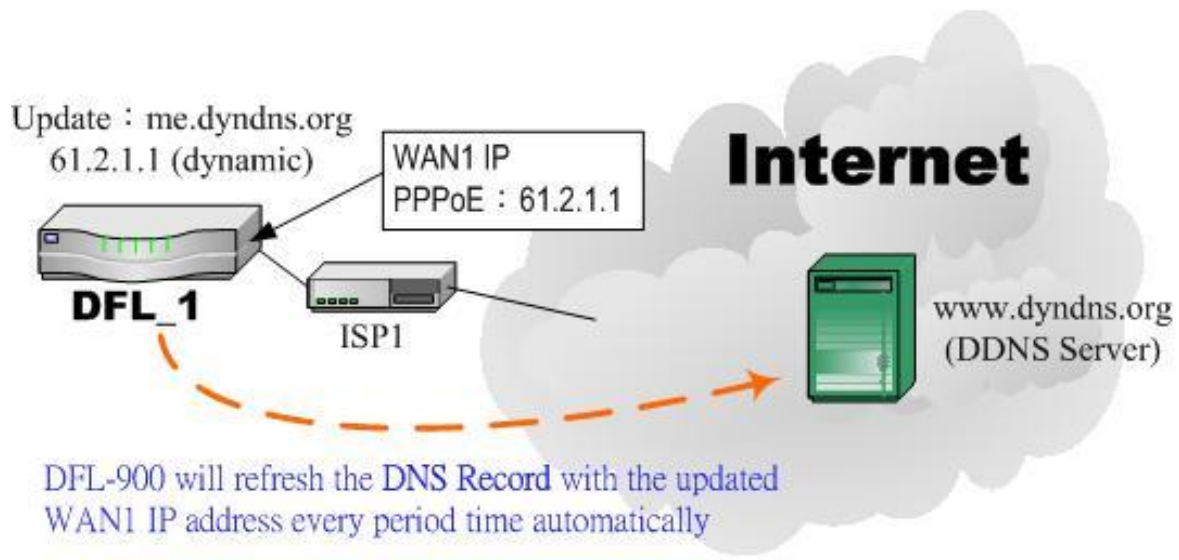

Figure 4-1 DDNS mechanism chart

3. **DNS Proxy:** After activating the DNS proxy mode, the client can set its DNS server to the DFL-900 (that is, send the DNS requests to the DFL-900). The DFL-900 will then make the enquiry to the DNS server and return the result to the client. Besides, the caching mechanism performed by the DNS proxy can also help reduce possible duplicate DNS lookups. As the following Figure 4-2 described, DFL-1 redirects the DNS request from PC1\_1 to the real DNS server (140.113.1.1).

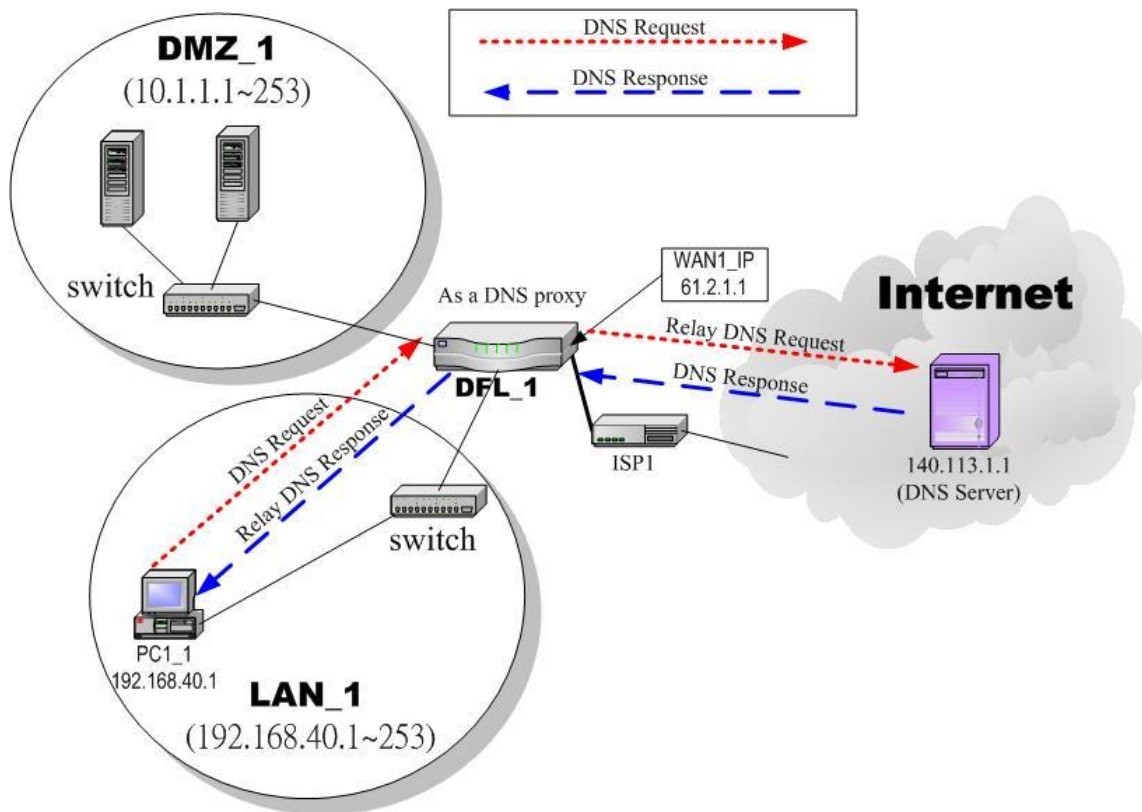

Figure 4-2 DNS Proxy mechanism chart

4. DHCP Relay: Activate the DHCP relay mode of DFL-900 so that the DFL-900 will become the relay agent and relay the DHCP broadcast to the configured DHCP server. As the following Figure 4-3 described, DFL-1 redirects the DHCP request from the preconfigured port (LAN1) to the real DHCP server (10.1.1.4). Besides, in this diagram, we can find that the PC of DMZ region communicated with the DHCP server directly.

Figure 4-3 DHCP Relay mechanism chart

5. As the following Figure 4-4 demonstrated, there is an embedded snmp agent in the DFL-900. So you can use SNMP manager to monitor the DFL-900 system status, network status ,etc. from either LAN or internet.

Figure 4-4 It is efficient to use SNMP Manager to monitor DFL-900 device

## 4.4 Steps

### 4.4.1 General settings

<p><b>Step 1. General Setup</b></p> <p>Enter the Host Name as DFL-1, Domain Name as the domain name of your company Click Apply.</p>	<p><b>SYSTEM TOOLS &gt; Admin Settings &gt; General</b></p> <p>General DDNS DNS Proxy DHCP Relay Password Time/Date Timeout Services</p> <p>Host Name <input type="text" value="DFL-1"/></p> <p>Domain Name <input type="text" value="dlink.com"/></p> <p>Apply Reset</p>
--	---

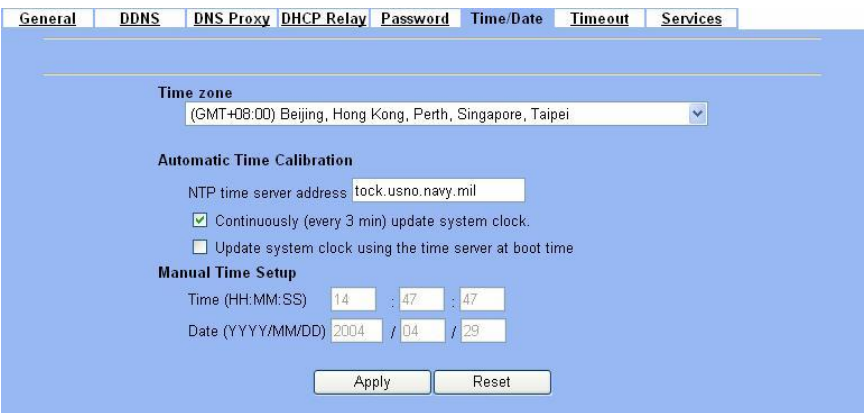

FIELD	DESCRIPTION	EXAMPLE
Host Name	The host name of the DFL-900 device	DFL-1
Domain Name	Fill in the domain name of company	dlink.com

Table 4-1 System Tools - General Setup menu

<p><b>Step 2. Change Password</b></p> <p>Enter the current password in the Old Password field. Enter the new password in the New Password and retype it in the Confirm Password field. Click Apply.</p>	<p><b>SYSTEM TOOLS &gt; Admin Settings &gt; Password</b></p> 
---	---

FIELD	DESCRIPTION	EXAMPLE
Old Password	The original password of administrator	admin
New Password	The new selected password	12345
Confirm Password	Double confirm the new selected password	12345

Table 4-2 Enter new password

<p><b>Step 3. Setup Time/Date</b></p> <p>Select the Time Zone where you are located. Enter the nearest NTP time server in the NTP time server address. Note that your DNS must be set if the entered address requires domain name lookup. You can also enter an IP address instead. Check the Continuously (every 3 min) update system clock and click Apply. The DFL-900 will immediately update the system time and will periodically update it. Check the Update system clock using the time server at boot time and click Apply if you want to update the clock at each boot. If you want to manually change the system time, uncheck the Continuously (every 3 min) update system clock and proceed by entering the target date.</p>	<p><b>SYSTEM TOOLS &gt; Admin Settings &gt; Time/Date</b></p> 
---	---

FIELD	DESCRIPTION	EXAMPLE
Time zone	the time zone of your area	N/A
NTP time server address	Use NTP time server to auto update date/time value	tock.usno.navy.mil
Continuously (every 3 min) update system clock	System will update system date/time value every 3 minutes to NTP time sever.	Enabled
Update system clock using the time server at boot time	System will update system date/time value to the NTP time server at boot time.	disabled
Manual Time Setup	Manual setting Time & Date value.	N/A

Table 4-3 System Tools – Time Data menu

BUTTON	DESCRIPTION
Add	Add a service name record
Edit	Edit an existing service name record
Delete	Delete an existing service name record

Table 4-5 Setup the service name record

### 4.4.2 DDNS setting

#### Step 1. Setup DDNS

If the IP address of DFL-900 WAN port is dynamic allocated, you may want to have the Dynamic DNS mechanism to make your partner always use the same domain name (like xxx.com) to connect to you. Select a WAN interface to update the DDNS record. Here we supply three DDNS Service Providers. Fill in the Host Name, Username, Password supplied by the DDNS web site. Please refer to the DDNS web site for the detailed information. Click Apply to activate the settings.

Before setting the DDNS information in this page. Make sure that you have registered an account in the indicated Service Provider. Then you can enter the related information in the DDNS page.

Note: If you choose “WWW.ORAY.NET” as your DDNS service provider, a default port number 5050 will show in the Port field. It means that if you use this port to connect to WWW.ORAY.NET, it will be free charge.

#### SYSTEM TOOLS > Admin Settings > DDNS

FIELD	DESCRIPTION	EXAMPLE
Enable DDNS for WAN1	Enable DDNS feature of DFL-900	Enabled
Interface	Assign which public IP address of interface to the DDNS server.	WAN1
Service Provider	The domain address of DDNS server. In the DFL-900, we provide WWW.DYNDNS.ORG, WWW.DHS.ORG and WWW.ORAY.NET three websites for choice.  If you choose WWW.ORAY.NET as DDNS service provider, it would register the source IP address which is connected to the DDNS server. It means that the WAN1 IP address must be public address.	WWW.ORAY.NET
Hostname	The registered Hostname in the DDNS server.	abc.vicp.net
Username	The registered username in the DDNS server.	john
Password	The registered password in the DDNS server.	123456
Port	The default port number to connect to WWW.ORAY.NET for free charge	5050

Table 4-6 System Tools – DDNS setting page

### 4.4.3 DNS Proxy setting

<p><b>Step 1. Setup DNS Proxy</b></p> <p>Check the <i>Enable DNS Proxy</i> and click the <i>Apply</i> to store the settings. From now on, your LAN/DMZ PCs can use DFL-900 as their DNS server, as long as the DNS server for DFL-900 has been set in its WAN settings.</p>	<p><b>SYSTEM TOOLS &gt; Admin Settings &gt; DNS Proxy</b></p> 
---	--

FIELD	DESCRIPTION	EXAMPLE
Enable DNS Proxy	When the host which resides at the LAN/DMZ region sends a DNS Request to the DNS server (DFL-900). DFL-900 will request for forwarding it to the assigned DNS server. When there is a response from assigned DNS server, then DFL-900 will forward it back to the host of the LAN/DMZ.	Enabled

Table 4-7 System Tools – DNS Proxy menu

### 4.4.4 DHCP Relay setting

<p><b>Step 1. Setup DHCP Relay</b></p> <p>Check the <i>Enable DHCP Relay</i>. Enter the IP address of your DHCP server. Here we enter the DHCP Server address 10.1.1.4. Check the relay domain of DFL-900 that needs to be relayed. Namely, check the one where the DHCP clients are located. And click the <i>Apply</i> button finally.</p> <p>Notice, the DHCP Server can not be located with the subnet range of <i>Relay Domain</i>.</p>	<p><b>SYSTEM TOOLS &gt; Admin Settings &gt; DHCP Relay</b></p> 
--	---

FIELD	DESCRIPTION	EXAMPLE
Enable DHCP Relay	When the host of the LAN/DMZ in the DFL-900 internal network sends a DHCP request, DFL-900 will forward it automatically to the specified DHCP server (different subnet from the network segment of the DHCP client).	Enabled
DHCP Server	Current location of the DHCP server.	10.1.1.4
Relay Domain	The locations of the DHCP clients.	Enable LAN1

Table 4-8 System Tools – DHCP Relay menu

### 4.4.5 SNMP Control

#### Step 1. Setup SNMP Control

Through setting the related information in this page, we can use SNMP manager to monitor the system status, network status of DFL-900.

#### SYSTEM TOOLS > SNMP Control

FIELD	DESCRIPTION	EXAMPLE
Enable SNMP	Enable the SNMP function or not.	Enabled
System Name	The device name of DFL-900.	DFL-1.dlink.com
System Location	The settled location of DFL-900.	Office
Contact Info	The person who takes charge of the DFL-900.	mis
Get community	The community which can get the SNMP information. Here “community” is something like password.	public-ro
Set Community	The community which can get the SNMP information. Here “community” is something like password.	private-rw
Trusted hosts	The IP address which can get or set community from the DFL-900.	192.168.1.5
Trap community	The community which will send SNMP trap. Here “community” is something like password.	trap-comm
Trap destination	The IP address which will send SNMP trap from the DFL-900.	192.168.1.5

# Chapter 5 Remote Management

*This chapter introduces remote management and explains how to implement it.*

## 5.1 Demands

Administrators may want to manage the DFL-900 remotely from any PC in LAN\_1 with HTTP at port 8080, and from WAN\_PC with TELNET. In addition, the DFL-900 may be more secure if monitored by a trusted host (PC1\_1). What is more, the DFL-900 should not respond to ping to hide itself. The remote management function in DFL-900 devices is implemented by hidden Firewall rules.

## 5.2 Methods

1. Only allow management by WAN\_PC (140.2.5.1) at the WAN1 side.
2. Administrators can use browsers to connect to <http://192.168.40.254:8080> for management.
3. Allow SNMP monitoring by PC1\_1 (192.168.40.1) at the LAN1 side.
4. Do not respond to ICMP ECHO packets at the WAN1 side.

Figure 5-1 Some management methods of DFL-900

## 5.3 Steps

### 5.3.1 Telnet

#### Step 1. Setup Telnet

Enter 23 instead of the default 2323 in the Server Port field. Check the WAN1 checkbox. Click the Selected of Secure Client IP Address, and then enter the specified IP address (140.2.5.1) for accessing DFL-900. And click the Apply button.

Note that the Secure Client IP Address is the IP Address to be used to configure the DFL-900.

#### SYSTEM TOOLS > Remote Mgt. > TELNET

### 5.3.2 WWW

#### Step 1. Setup WWW

Check the LAN1 checkbox, and enter the new Server Port 8080 that will be accessed by the user's browser (http://192.168.40.254:8080). Here we click All for all no IP range limitation of clients. And click the Apply button.

#### SYSTEM TOOLS > Remote Mgt. > WWW

#### Step 2. Warning message

If you click the Selected of Secure Client IP Address and then enter the specified IP address, a warning message will appear to notice you that "Warning! If you are connecting to this Firewall with HTTP, this action may disconnect your session. Please remember the settings and reconnect to the firewall again." after applying the settings.

### 5.3.3 SNMP

#### Step 1. Setup SNMP

Check the LAN1 checkbox. In the Secure Client IP Address field. If you prefer indicated specified IP address. Just click the Selected, and enter the valid IP address for reading the SNMP MIBs at the DFL-900. Finally click the Apply button.

#### SYSTEM TOOLS > Remote Mgt. > SNMP

### 5.3.4 ICMP

#### Step 1. Setup ICMP

Uncheck the WAN1 checkbox and make others checked. Then click the Apply button.

#### SYSTEM TOOLS > Remote Mgt. > MISC

TELNET SSH WWW HTTPS SNMP MISC

Respond to Ping on

WAN1  DMZ1  LAN1

Apply Reset

# Part III

## NAT、Routing & Firewall

# Chapter 6

## NAT

*This chapter introduces NAT and explains how to implement it in DFL-900.*

To facilitate the explanation on how DFL-900 implements NAT and how to use it, we zoom in the left part of Figure 1-7 into Figure 6-1.

### 6.1 Demands

1. The number of public IP address allocated to each Internet subscribers is often very limited compared to the number of PCs in the LAN1. Additionally, public-IP hosts are directly exposed to the Internet and have more chances to be cracked by intruders. As the Figure 6-1 illustrated, you hope all the pcs located at LAN1 and DMZ1 can connect internet through limited IP address (61.2.1.1).

Figure 6-1 All the internal PCs can connect internet through limited WAN IP address by using NAT technology

2. Internet servers provided by your company may open many ports in default that may be dangerous if exposed to the public Internet. As the Figure 6-2 illustrated, we make the real servers hide behind the DFL-900. And all the internet clients can still access the service of servers.

Figure 6-2 Internet clients can access the server behind the DFL-900

## 6.2 Objectives

1. Let PC1\_1~PC1\_5 connect to the Internet.
2. As the Figure 6-2 illustrated, the clients will connect to the DFL-900. Then DFL-900 will forward the packet to the real server. So FTPServer1 (10.1.1.5) will be accessed by other Internet users.

## 6.3 Methods

1. Assign private IP addresses to the PC1\_1~PC1\_5. Setup NAT at DFL-900 to map those assigned private hosts under LAN1 to the public IP address WAN1\_IP at the WAN1 side.
2. Assign a private IP address to the FTPServer1. Setup Virtual Server at DFL-900 to redirect “any connections towards some port of WAN1” to the port 21 at the FTPServer1.

Figure 6-3 DFL-900 plays the role as Virtual Server

As the above Figure 6-3 illustrates, the server 10.1.1.5 provides FTP service. But it is located on the DMZ region behind DFL-900. And DFL-900 will act as a Virtual Server role which redirects the packets to the real server 10.1.1.5. And you can announce to the internet users that there exists a ftp server IP/port is 61.2.1.1/44444. So, all the internet users will just connect the 61.2.1.1/44444 to get ftp service.

## 6.4 Steps

### 6.4.1 Setup Many-to-one NAT rules

#### Step 1. Enable NAT

Select the Basic from the list of Network Address Translation Mode. Click Apply. Now the DFL-900 will automatically set the NAT rules for LAN/DMZ zones. Namely, all internal networks can establish connections to the outside world if the WAN settings are correct.

#### ADVANCED SETTINGS > NAT > Status

Status **NAT Rules** Virtual Servers

Network Address Translation Mode: Basic

Network Address Translation (NAT) translates the IP/port for

1. Internal-to-External traffic: map internal IPs/ports to external IPs/ports.
2. External-to-Internal traffic: map external IPs/ports to internal IPs/ports.

Modes:

1. None: The DFL-900 is in routing mode without performing any address translation.
2. Basic: The DFL-900 automatically performs Many-to-One NAT for all LAN/DMZ subnets.
3. Full Feature: The DFL-900 can be manually configured with Many-to-One, and Many-to-Many, One-to-One, and bidirectional One-to-One rules to do policy-based NAT.

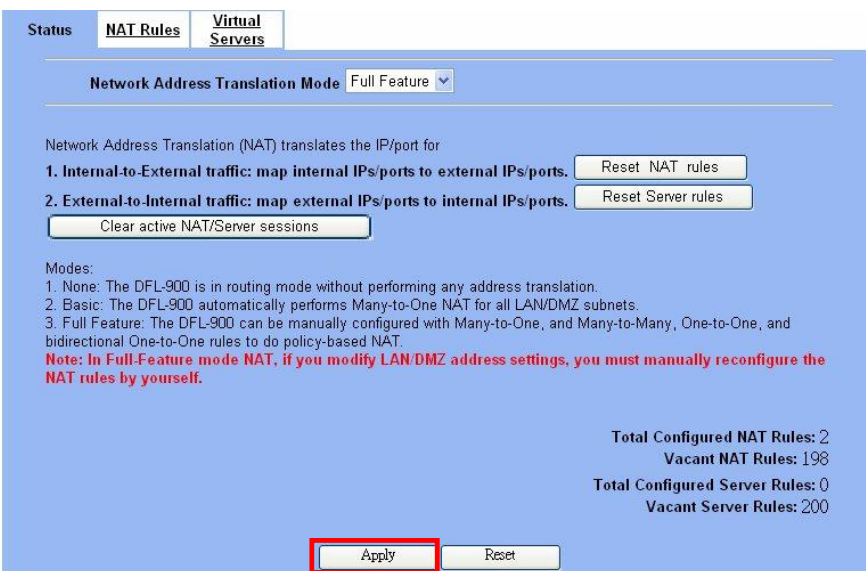

Total Configured NAT Rules: 2  
Vacant NAT Rules: 198  
Total Configured Server Rules: 0  
Vacant Server Rules: 200

# Part III

## NAT、Routing & Firewall

FIELD	DESCRIPTION	Range / Format	EXAMPLE
Network Address Translation Mode	Determine what NAT type you are using in your network topology. Refer more information in the section 6.5.5.	None / Basic / Full Feature	Basic
BUTTON	DESCRIPTION		
Reset NAT Rules	Reset NAT rules to the default status		
Reset Server Rules	Clear all the Virtual Server rules.		
Clear active NAT/Server sessions	Clear all the active NAT/Virtual Server sessions.		
Apply	Apply the settings which have been configured.		
Reset	Clean the filled data and restore the original.		

Table 6-1 Determine Network Address Translation Mode

<p><b>Step 2. Check NAT Rules</b></p> <p>As described in the above, the DFL-900 has set the rules for the LAN/DMZ zones. They all belong to the Many-to-One (M-1) type that will map many private addresses to the automatically chosen public IP address. When the WAN interfaces change the IP, these rules do not require any manual modifications for the changed public IP addresses. The rules will reload the new settings automatically. Besides, you cannot insert/edit any rules under the Basic mode.</p>	<p><b>ADVANCED SETTINGS &gt; NAT &gt; NAT Rules</b></p> 
<p><b>Step 3. Switch the NAT Mode</b></p> <p>Select the Full Feature from the list of Network Address Translation Mode. Click Apply. After applying the setting, the page will highlight a warning saying that the rules are no more automatically maintained by the DFL-900. If you change the LAN/DMZ IP settings, you have to manually update related rules by yourself. Otherwise, hosts in your LAN/DMZ cannot establish connections to the hosts in the WAN side.</p>	<p><b>ADVANCED SETTINGS &gt; NAT &gt; Status</b></p> 

**Step 4. Customize NAT Rules**

In the full-feature mode, the rules can be further customized. Incoming packets from LAN/DMZ zones are top-down matched by the NAT rules. Namely, NAT implements first match. Select the rule item that you want to do with: insert a new rule before it; delete it; move it before the list-box chosen item.

**ADVANCED SETTINGS > NAT > NAT Rules**

The screenshot shows the 'NAT Rules' configuration page. At the top, there are tabs for 'Status', 'NAT Rules', and 'Virtual Servers'. Below the tabs, there is a breadcrumb 'NAT->Edit Rules' and a note: 'Packets are top-down matched by the rules.' A table lists three NAT rules:

Item #	Active	Name	Direction	Source IP Address	Translate Src IP into	Type
1	Y	ftpServer	LAN/DMZ to WAN	10.1.1.5/255.255.255.255	61.2.1.1/255.255.255.255	1-1
2	Y	Basic-DMZ1	LAN/DMZ to WAN	10.1.1.254/255.255.255.0	Auto (device WAN IP)	M-1
3	Y	Basic-LAN1	LAN/DMZ to WAN	192.168.40.254/255.255.255.0	Auto (device WAN IP)	M-1

At the bottom of the screenshot, there are navigation buttons: 'Prev. Page', 'Next Page', 'Move Page', and a dropdown menu showing '1'. Below these are buttons for 'Insert', 'Edit', 'Delete', and 'Move Before: 1'.

**Step 5. Insert NAT Rule**

**Step 5.a — Insert an Many-to-One Rule**

As described in the above, Many-to-One NAT is the default NAT rule type in the Basic mode. If you have other alias LAN/DMZ subnets, you can manually add a Many-to-One NAT rule for them. First select the Type as Many-to-One, check the Activate this rule, enter a Rule name for this rule, enter the private-IP subnet (an IP address with a netmask) to be translated, and enter the public IP address for being translated into. You can check the Auto choose IP from WAN ports. The DFL-900 will automatically determine which WAN IP is to be translated into.

**ADVANCED SETTINGS > NAT > NAT Rules > Insert**

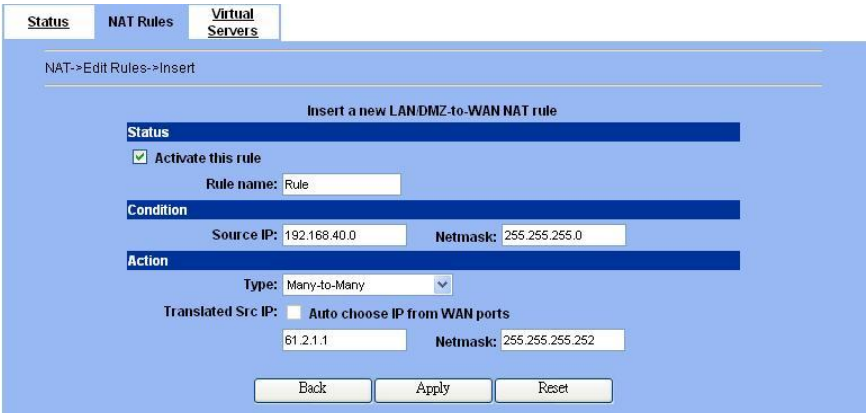

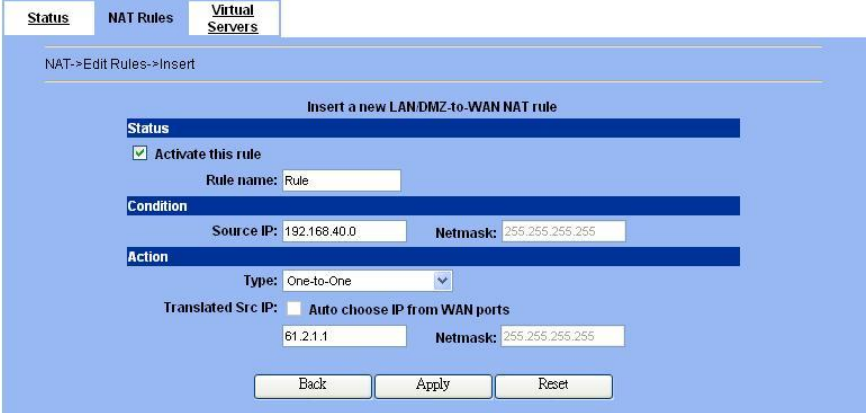

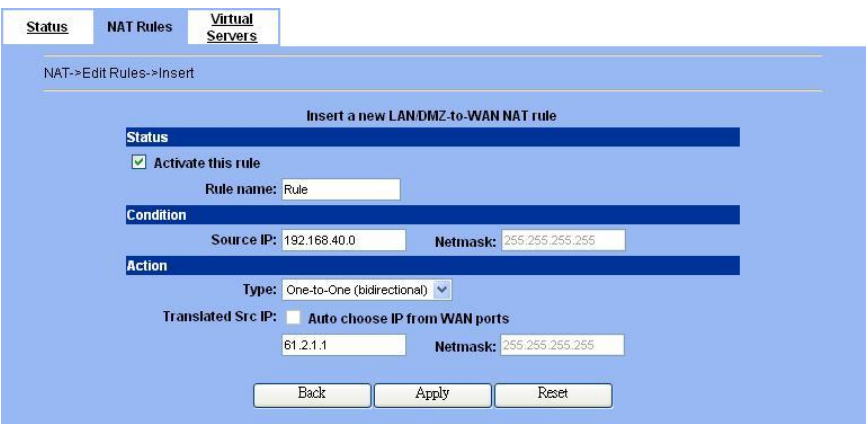

The screenshot shows the 'Insert' form for a new NAT rule. The breadcrumb is 'NAT->Edit Rules->Insert'. The form title is 'Insert a new LAN/DMZ-to-WAN NAT rule'. It has sections for 'Status', 'Condition', and 'Action':

- Status:** 'Activate this rule' is checked. 'Rule name' is 'Rule'.
- Condition:** 'Source IP' is '192.168.40.0' and 'Netmask' is '255.255.255.0'.
- Action:** 'Type' is 'Many-to-One'. 'Translated Src IP' is checked with 'Auto choose IP from WAN ports'. 'Netmask' is '255.255.255.255'.

Buttons for 'Back', 'Apply', and 'Reset' are at the bottom.

	FIELD	DESCRIPTION	Range / Format	EXAMPLE
Status	Activate this rule	The NAT rule is enabled or not	Enabled / Disabled	Enabled
	Rule name	The NAT rule name	text string	Rule
Condition	Source IP / Netmask	Compared with the incoming packets, whether Source IP/Netmask is matched or not.	IPv4 format	192.168.40.0 / 255.255.255.0
Action	Type	Determine what NAT method you are using in the specified NAT rule. Refer more information in the section 6.5.	Many-to-One / Many-to-Many / One-to-One / One-to-One (bidirectional)	Many-to-One
	Translated Src IP (Auto choose IP from WAN ports)	Only work in Many-to-One type, the public IP address will be assigned by the wan link.	Enabled / Disabled	Enabled
	Space / Netmask	When NAT type is not Many-to-One, we must specify IP address / Netmask directly.	IPv4 format	N/A

Table 6-2 Add a NAT rule

<p><b>Step 5.b — Insert an Many-to-Many Rule</b></p> <p>If your ISP has assigned a range of public IP to your company, you can tell DFL-900 to translate the private IP addresses into the pool of public IP addresses. The DFL-900 will use the first public IP until DFL-900 uses up all source ports for the public IP. DFL-900 will then choose the second public IP from the address pool. Select <i>Many-to-Many</i> from the <i>Type</i>. Enter the subnet with an IP address and a netmask. Other fields are the same with those of <i>Many-to-One</i> rules. However, the DFL-900 will no longer choose the device IP for you. It will choose the IP from the address pool you have entered.</p>	<p><b>ADVANCED SETTINGS &gt; NAT &gt; NAT Rules &gt; Insert</b></p> 
<p><b>Step 5.c — Insert an One-to-One Rule</b></p> <p>Though you may have many public IP address for translation, you may want to make some private IP to always use a public IP. In this case, you can select <i>One-to-One</i> from the <i>Type</i>, and enter the private-public IP address pair in the <i>Source IP</i> and the <i>Translated Source IP</i> fields.</p>	<p><b>ADVANCED SETTINGS &gt; NAT &gt; NAT Rules &gt; Insert</b></p> 
<p><b>Step 5.d — Insert a One-to-One (Bidirectional) Rule</b></p> <p>The above three modes allow LAN/DMZ-to-WAN sessions establishment but do not allow WAN-to-LAN/DMZ sessions. WAN-to-LAN/DMZ sessions are allowed by Virtual Server rules. You can make the <i>One-to-One</i> NAT in the above to incorporate the WAN-to-LAN/DMZ feature by selecting the <i>One-to-One (Bidirectional)</i> from the <i>Type</i>. Note that WAN-to-LAN/DMZ traffic will be blocked by the Firewall in default. You have to add a Firewall rule to allow such traffic. If you expect a LAN/DMZ host to be fully accessed by public Internet users, use this mode. Note that this mode is extremely dangerous because the host is fully exposed to the Internet and may be cracked. Always use Virtual Server rules first.</p>	<p><b>ADVANCED SETTINGS &gt; NAT &gt; NAT Rules &gt; Insert</b></p> 

### 6.4.2 Setup Virtual Server for the FtpServer1

<p><b>Step 1. Device IP Address</b> Setup the IP Address and IP Subnet Mask for the DFL-900 of the DMZ1 interface.</p> <p><b>Step 2. Client IP Range</b> Enable the DHCP server if you want to use DFL-900 to assign IP addresses to the computers under DMZ1. Here we make the DHCP feature enabled.</p> <p><b>Step 3. Apply the Changes</b> Click Apply to save your settings.</p>	<p><b>BASIC SETUP &gt; DMZ Settings &gt; DMZ1 Status</b></p> <p>DMZ1 Status <b>IP Alias</b></p> <p><b>DMZ1 TCP/IP</b></p> <p>IP Address: 10.1.1.254 IP Subnet Mask: 255.255.255.0</p> <p><b>DHCP Setup</b></p> <p><input checked="" type="checkbox"/> Enable DHCP Server</p> <p>IP Pool Starting Address: 10.1.1.1</p> <p>Pool Size(max size: 253): 20</p> <p>Primary DNS Server: 10.1.1.254</p> <p>Secondary DNS Server: 0.0.0.0</p> <p>Lease time(sec): 7200</p> <p>Routing Protocol: None</p> <p>OSPF Area ID: </p> <p>Apply Reset</p>																		
<p><b>Step 4. Check NAT Status</b> The default setting of NAT is in Basic Mode. After applying the Step 3, the NAT is automatically configured with the rules to let all private-IP LAN/DMZ-to-WAN requests to be translated with the public IP assigned by the ISP.</p>	<p><b>ADVANCED SETTINGS &gt; NAT &gt; Status</b></p> <p>Status <b>NAT Rules</b> <b>Virtual Servers</b></p> <p>Network Address Translation Mode: Basic</p> <p>Network Address Translation (NAT) translates the IP/port for</p> <p>1. Internal-to-External traffic: map internal IPs/ports to external IPs/ports. Reset NAT rules</p> <p>2. External-to-Internal traffic: map external IPs/ports to internal IPs/ports. Reset Server rules</p> <p>Clear active NAT/Server sessions</p> <p>Modes:</p> <p>1. None: The DFL-900 is in routing mode without performing any address translation.</p> <p>2. Basic: The DFL-900 automatically performs Many-to-One NAT for all LAN/DMZ subnets.</p> <p>3. Full Feature: The DFL-900 can be manually configured with Many-to-One, and Many-to-Many, One-to-One, and bidirectional One-to-One rules to do policy-based NAT.</p> <p>Total Configured NAT Rules: 2 Vacant NAT Rules: 198</p> <p>Total Configured Server Rules: 0 Vacant Server Rules: 200</p> <p>Apply Reset</p>																		
<p><b>Step 5. Check NAT Rules</b> The DFL-900 has added the NAT rules automatically as right diagram described. The rule Basic-DMZ1 (number 1) means that, when matching the condition (requests of LAN/DMZ-to-WAN direction with its source IP falling in the range of 10.1.1.254/255.255.255.0), the request will be translated into a public-source-IP requests, and then be forwarded to the destinations.</p>	<p><b>ADVANCED SETTINGS &gt; NAT &gt; NAT Rules</b></p> <p>Status <b>NAT Rules</b> <b>Virtual Servers</b></p> <p>NAT-&gt;Edit Rules</p> <p>Packets are top-down matched by the rules.</p> <table border="1"> <thead> <tr> <th>Item</th> <th>Status</th> <th>Name</th> <th>Direction</th> <th>Condition</th> <th>Action</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Y</td> <td>Basic-DMZ1</td> <td>LAN/DMZ to WAN</td> <td>10.1.1.254/255.255.255.0</td> <td>Auto (device WAN IP) M-1</td> </tr> <tr> <td>2</td> <td>Y</td> <td>Basic-LAN1</td> <td>LAN/DMZ to WAN</td> <td>192.168.40.254/255.255.255.0</td> <td>Auto (device WAN IP) M-1</td> </tr> </tbody> </table> <p>Page 1/1</p> <p>Prev. Page Next Page Move Page 1</p> <p>Insert Edit Delete Move Before: 1</p>	Item	Status	Name	Direction	Condition	Action	1	Y	Basic-DMZ1	LAN/DMZ to WAN	10.1.1.254/255.255.255.0	Auto (device WAN IP) M-1	2	Y	Basic-LAN1	LAN/DMZ to WAN	192.168.40.254/255.255.255.0	Auto (device WAN IP) M-1
Item	Status	Name	Direction	Condition	Action														
1	Y	Basic-DMZ1	LAN/DMZ to WAN	10.1.1.254/255.255.255.0	Auto (device WAN IP) M-1														
2	Y	Basic-LAN1	LAN/DMZ to WAN	192.168.40.254/255.255.255.0	Auto (device WAN IP) M-1														

<p><b>Step 6. Setup IP for the FTP Server</b> Assign an IP of 10.1.1.1/255.255.255.0 to the FTP server under DMZ1. Assume the FTP Server is at 10.1.1.5. And it is listening on the well-known port (21).</p>	
<p><b>Step 7. Setup Server Rules</b> Insert a virtual server rule by clicking the Insert button.</p>	<p><b>ADVANCED SETTINGS &gt; NAT &gt; Virtual Servers</b></p> 
<p><b>Step 8. Customize the Rule</b> Customize the rule name as the ftpServer. For any packets with its destination IP equaling to the WAN1 IP (61.2.1.1) and destination port equaling to 44444, ask DFL-900 to translate the packet's destination IP/port into 10.1.1.5/21. Check the Passive FTP client? to maximize the compatibility of the FTP protocol. This is useful if you want to provide connectivity to passive FTP clients. For passive FTP clients, the server will return them the private IP address and the port number for them to connect back to do data transmissions. Since the private IP from them cannot be routed to our zone, the data connections would fail. After enabling this feature, the DFL-900 will translate the private IP/port into an IP/port of its own. Thus the problem is gracefully solved. Another point is to be sure to check "Auto update to Firewall rules when you Apply this page?" or "Auto update to NAT rules when you Apply this page?". Then, the virtual server rule will add a Firewall or NAT rules automatically. Click Apply to proceed.</p>	<p><b>ADVANCED SETTINGS &gt; NAT &gt; Virtual Servers &gt; Insert</b></p> 

	FIELD	DESCRIPTION	Range / Format	EXAMPLE
Status	Activate this rule	The Virtual Server rule is enabled or not	Enabled / Disabled	Enabled
	Rule name	The Virtual Server rule name	text string	ftpServer
Condition	Sessions from Internet connecting to	Which interface does the connected session come from?	WAN interfaces	WAN1
	External IP	The public IP address of the Virtual Server.	IPv4 format	61.2.1.1

	Service	The service which is provided by the real server.	TCP / UDP	TCP
	Type	Port is Single or Range	Single / Range	Single
	Dest Port	The TCP/UDP port number which is provided by the real server.	1 ~65534	44444
	Passive FTP client	If the Passive FTP client is checked, it will connect to the internal DMZ FTP server of DFL-900 when FTP client uses passive mode. Otherwise, it will not work.	Enabled / Disabled	Enabled
Action	Redirect to internal server under	The subnet which is located the virtual server.	LAN / DMZ regions	DMZ1
	Internal IP	The IP address which is actually transferred to the internal DMZ	IPv4 format	10.1.1.5
	Port	The port number which is actually transferred to the internal DMZ. If you filled 0 in this field, it means that the real connected port is the same as the translated destination port.	0 ~ 65534	21
	Auto update to Firewall rules when you Apply this page?	If you checked this, it will add a Firewall rule automatically when you add a virtual server rule.	Enabled / Disabled	Enable
	Auto update to NAT rules when you Apply this page?	If you checked this, it will add a NAT rule automatically when you add a virtual server rule.	Enabled / Disabled	Enable

Table 6-3 Add a Virtual Server rule

**Step 9. View the Result**

Now any request towards the DFL-900's WAN1 IP (61.2.1.1) with port 44444 will be translated into a request towards 10.1.1.5 with port 21, and then be forwarded to the 10.1.1.5. The FTP server listening at port 21 in 10.1.1.5 will pick up the request.

**ADVANCED SETTINGS > NAT > Virtual Servers**

Virtual Server->Edit Rules

Packets are top-down matched by the rules.

#	Status		Condition			Action	
	Active	Name	Direction	Dest. IP Address	Service	Redirect to	through
1	Y	ftpServer	From WAN1	61.2.1.1/255.255.255.255	TCP:44444	10.1.1.5:21	DMZ1

Page 1/1

**6.5 NAT modes introduction**

**6.5.1 Many-to-One type**

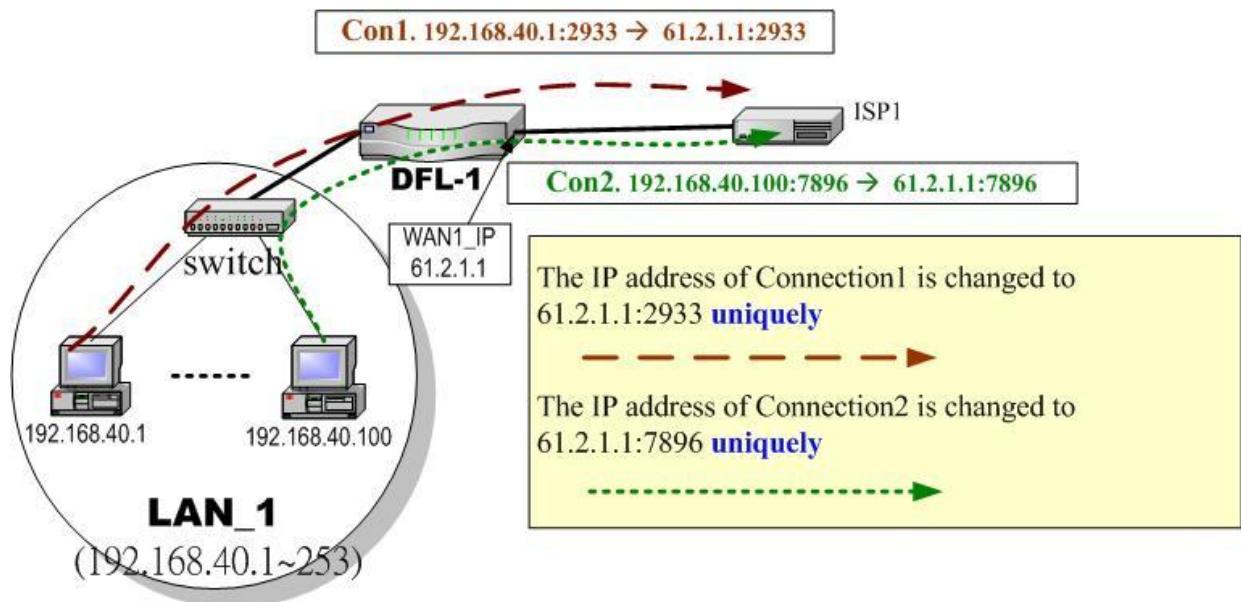

Figure 6-4 NAT Many-to-One type

As the above Figure 6-4 illustrated, NAT Many-to-One type means that many local PCs are translated into only one public IP address when the packets are forwarded out through the DFL-900. Take Connection1 for example. Its IP address and port are translated from 192.168.40.1:2933 to 61.2.1.1:2933. In the same way, when the packets of Connection2 are forwarded out, its IP address is still translated to the same public IP address (61.2.1.1:7896).

### 6.5.2 Many-to-Many type

Figure 6-5 NAT Many-to-Many type

As the above Figure 6-5 illustrated, NAT Many-to-Many type means that many local PCs are translated into multiple public IP addresses when the packets are forwarded out through the DFL-900. Take Connection1 for example. Its IP address and port are translated from 192.168.40.1:2933 to 61.2.1.1:2933. Until DFL-900 uses out of all source ports of the public (61.2.1.1), DFL-900 will then choose the second public IP (such as 61.2.1.2) from the address pool. For example, Connection2 are forwarded out, the source IP address will be translated into the second public IP address (61.2.1.2) from the public IP address pools. So the translated IP address (61.2.1.2:7896) is different from Connection1 one (61.2.1.1:2933).

### 6.5.3 One-to-One type

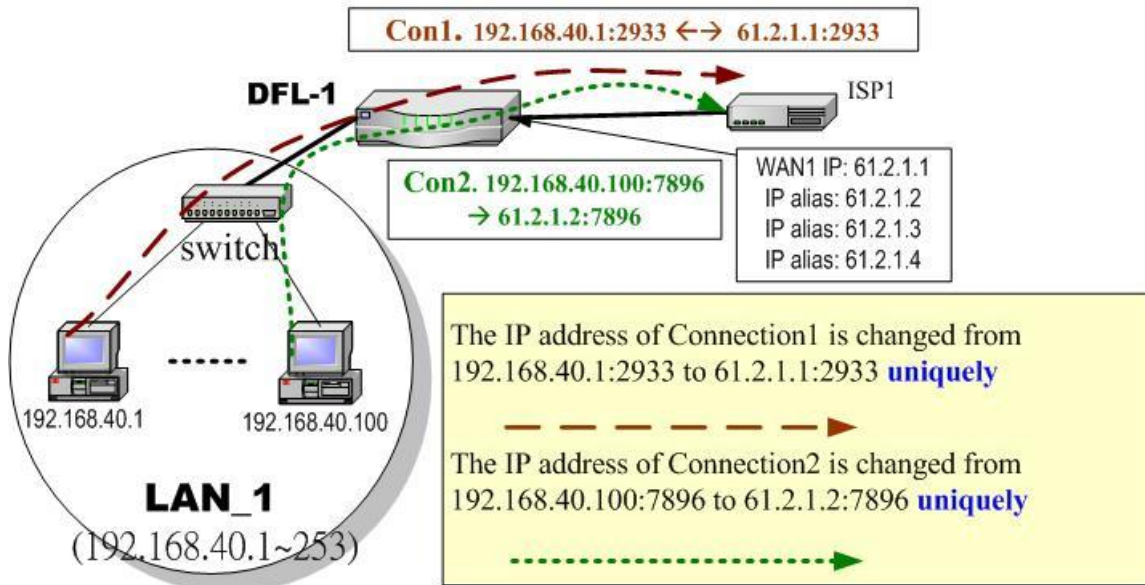

Figure 6-6 NAT One-to-One type

As the above Figure 6-6 illustrated, NAT One to One type means that each local PC is translated into a unique public IP address when the packets are forwarded through the DFL-900. Take Connection1 for example. Its IP address and port are translated from 192.168.40.1:2933 to 61.2.1.1:2933. But, when the packets of Connection2 are forwards out, the source IP address is translated to another dedicated public IP address(61.2.1.2:7896).

### 6.5.4 One-to-One (bidirectional) type

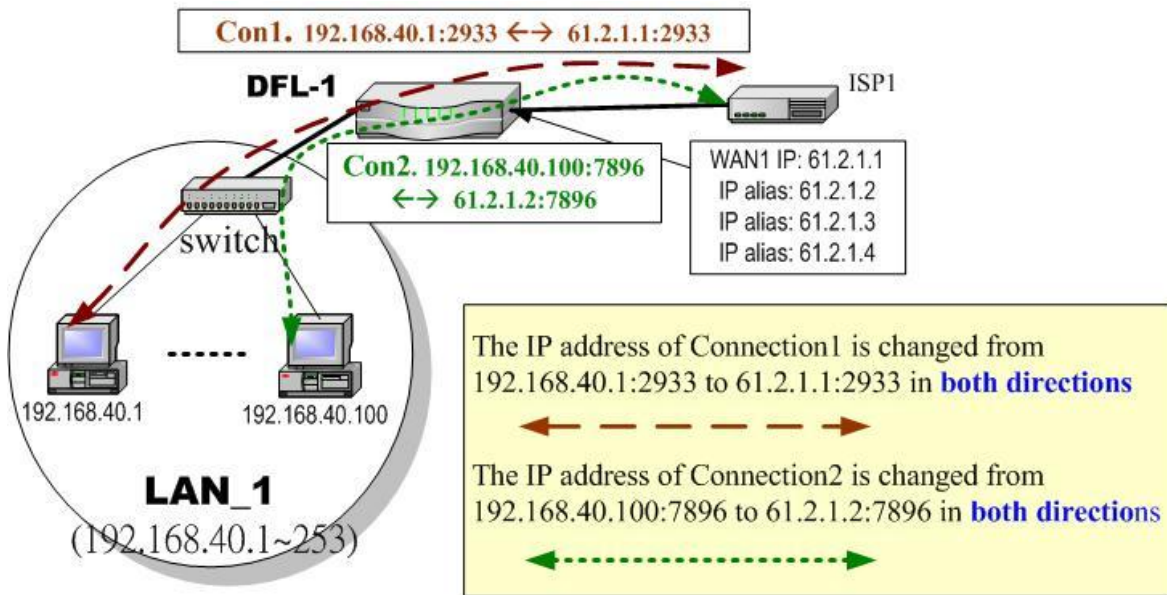

Figure 6-7 NAT One-to-One (bidirectional) type

As the above Figure 6-7 illustrated, NAT One to One (bidirectional) type means that each local PC is translated into a unique public IP address when the packets are forwarded out through the DFL-900. Besides when packets came from internet to LAN, they were

translated to the same private IP address too. Take Connection1 for example. Its IP address and port are translated from 192.168.40.1:2933 to 61.2.1.1:2933 in both ways. Accordingly, the source IP address and port of the Connection2 are translated from 192.168.40.100:7896 to 61.2.1.2:7896 in both ways.

### 6.5.5 NAT modes & types

The following three NAT modes are supported by DFL-900 now as the following Table 6-4.

NAT mode	Description
None	The DFL-900 is in routing mode without performing any address translation.
Basic	The DFL-900 automatically performs Many-to-One NAT for all LAN/DMZ subnets.
Full Feature	The DFL-900 can be manually configured with Many-to-One, and Many-to-Many, One-to-One, and bidirectional One-to-One rules to do policy-based NAT.

Table 6-4 NAT modes overview

If you choose Full Feature mode of NAT at Table 6-4, you may need to edit the rule by yourself. Then you must determine the NAT type in the NAT rule. What meaning does each NAT type represent? How to determine which NAT type is best choice for you. You can lookup the explanations and suggestions at Table 6-5.

Type	Description	Usage moment
Many-to-One	Map a pool of private IP addresses to a single public IP address chosen from the WAN ports.	If the public IP addresses of your company is insufficient, and you prefer to increase the node which can connect to the internet. You can just choose the Many-to-One type to fit your request.
Many-to-Many	Map a pool of private IP addresses to a subnet range of public IP addresses chosen from the WAN ports. Only when all ports of the first public IP are used, it will then use the next public IP address for transferring by all private IPs.	If the public IP address of your company is not only one node (ex. you have applied extra-one ISP). You may use the Many-to-Many type to make the multiple public addresses sharing the outbound bandwidth. So your inbound and outbound traffic will be more flexible.
One-to-One	Map a single private IP address to a single public IP address chosen from the WAN ports. This was useful when you have multiple public IPs in the WAN ports. And you intended to map each local server to a unique public IP on the WAN port.	If you wish to specify a unique internal IP address to transfer a fixed external IP address. You can specify the One-to-One type.
One-to-One (bidirectional)	An internal host is fully mapped to a WAN IP address. Notice that you must add a firewall rule to forward WAN to LAN/DMZ traffic.	If you wish to expose the local pc onto the internet, and open all internet services outside. You can specify the One-to-One (bidirectional) type. This will make the local pc you specified fully exposed to the internet. Additionally you must add a firewall rule to allow WAN to LAN (or DMZ) traffic forward. Then you can finish the settings. Be careful to use this type, or it will endanger your network security.

Table 6-5 The NAT type comparison

# Chapter 7

## Routing

*This chapter introduces how to add static routing and policy routing entries*

To facilitate the explanation on how DFL-900 implements routing and how to use it. We zoom in the left part of Figure 2-1 into Figure 7-1 and increase some devices for description.

### 7.1 Demands

1. There is only one local area (192.168.40.0/24) inside the LAN1 port. Now there is a new financial area (192.168.50.0/24) in the Figure 7-1. The financial area is connected with a router which is inside the LAN1 port of DFL-900. So we need to add the configurations for the financial department.
2. Refer to the Figure 7-1 description. The bandwidth subscribed from ISP1 is insufficient so that some important traffic, say the traffic from PCs belonging to the General-Manager-Room department (192.168.40.192/255.255.255.192), is blocked by the other traffic. We hope that the employees of General-Manager-Room can have a dedicated bandwidth to improve the quality of connecting internet.

Figure 7-1 Add policy routing entry for the General-Manager-Room department

## 7.2 Objectives

1. We need to let DFL-900 knows how to forward the packets which is bound for financial department (192.168.50.0/24).
2. The network administrator plans to solve the problem by subscribing the second link (ISP2). He hopes that all the packets from the General-Manager-Room (192.168.40.192/26) will pass through the ISP2 link instead of the default ISP1 link.

## 7.3 Methods

1. Add a static routing entry to direct the packets towards 192.168.50.0/24 through the router (192.168.40.253).
2. Add a policy routing entry for the packets coming from General-Manager-Room department (192.168.40.192 / 255.255.255.192) through the ISP2 link.

## 7.4 Steps

### 7.4.1 Add a static routing entry

<p><b>Step 1. Add a static routing rule</b> Click the Add button to the next process.</p>	<p><b>Advanced Settings &gt; Routing &gt; Static Route</b></p> <p>Static Route Policy Route</p> <table border="1"> <thead> <tr> <th>#</th> <th>Type</th> <th>Destination/Netmask</th> <th>Gateway</th> <th>Activated</th> </tr> </thead> <tbody> <tr><td>1</td><td>-</td><td>-</td><td>-</td><td>-</td></tr> <tr><td>2</td><td>-</td><td>-</td><td>-</td><td>-</td></tr> <tr><td>3</td><td>-</td><td>-</td><td>-</td><td>-</td></tr> <tr><td>4</td><td>-</td><td>-</td><td>-</td><td>-</td></tr> <tr><td>5</td><td>-</td><td>-</td><td>-</td><td>-</td></tr> <tr><td>6</td><td>-</td><td>-</td><td>-</td><td>-</td></tr> <tr><td>7</td><td>-</td><td>-</td><td>-</td><td>-</td></tr> <tr><td>8</td><td>-</td><td>-</td><td>-</td><td>-</td></tr> <tr><td>9</td><td>-</td><td>-</td><td>-</td><td>-</td></tr> <tr><td>10</td><td>-</td><td>-</td><td>-</td><td>-</td></tr> </tbody> </table> <p>Prev. 3	Net	61.2.1.0/255.255.255.248	61.2.1.1	WAN1																																																				
4	Net	192.168.1.0/255.255.255.0	192.168.1.254	LAN1																																																				
5	Net/Static	192.168.50.0/255.255.255.0	192.168.40.253	WAN1																																																				

### 7.4.2 Add a policy routing entry

#### Step 1. Setup the ISP2 link

We must add an IP alias record to the WAN1 port because a new ISP link has been applied. So. See section 3.4.3 for the full procedures. Here we add an IP alias of WAN1 as 210.2.1.1/255.255.255.248.

#### Basic Setup > WAN Settings > IP Alias

#	Interface	Aliases	Netmask
1	WAN1	210.2.1.1	255.255.255.248
2	...	...	...
3	...	...	...
4	...	...	...
5	...	...	...
6	...	...	...
7	...	...	...
8	...	...	...
9	...	...	...
10	...	...	...

#### Step 2. Insert a policy routing entry

Click Insert button to add a policy routing entry.

#### Advanced Settings > Routing > Policy Route

Item #	Status	Name	Direction	Source IP Address	Dest. IP Address	Service	Forward to next-hop	Through
1	Active							

#### Step 3. Fill out the related field

For the General-Manager-Room department, we need to set an extra policy routing entry for them. So in the Status region, make sure the Activate this rule is enabled, and then fill in GenlManaRoom in the Rule name field. In the Condition region, we fill 192.168.40.192 in Source IP field. Fill 255.255.255.192 in the Netmask field. In the Action region, fill forward to WAN1 with next-hop gateway 210.2.1.6. After setting as above, the packets which match the condition, they will follow the predefined action to forward to the next hop.

#### Advanced Settings > Routing > Policy Route > Insert

	FIELD	DESCRIPTION	Range / Format	EXAMPLE
Status	Activate this rule	The policy routing rule is enabled or not.	Enabled / Disabled	Enabled
	Rule name	The policy routing rule name.	text string	GenlManaRoom
Condition	Incoming packets from	Packets comes from which interface	LAN / DMZ regions	LAN1
	Source IP & Netmask	Verify if the incoming packets belong to the range of the Source IP/Netmask in the policy routing rule.	IPv4 format / IPv4 format	192.168.40.192 / 255.255.255.192
	Dest IP & Netmask	Verify if the incoming packets belong to the range of the Dest IP/Netmask in the policy routing rule.	IPv4 format / IPv4 format	0.0.0.0 / 0.0.0.0
	Service	Verify what is the service of this packet?	ANY / TCP / UDP / ICMP	Any
	Configure src. port? Type Src. port	If the service is TCP or UDP, we can choose to configure or not to configure source port.	Enabled / Disabled	No
	Type	If we decide to configure source port, we must choose the port to be single or range.	Single / Range	N/A
	Src. Port	If we select single at above field, we just have to fill a port in the first blank space. If we select range at above field, we need to fill the range of the ports.	1 ~ 65534	N/A
	Configure dest. port? Type Dest. port	If the service is TCP or UDP, we can choose to configure or not to configure destination port.	Enabled / Disabled	No
	Type	If we decide to configure destination port, we must choose the port to be single or range.	Single / Range	N/A
	Dest. Port	If we select single at above field, we just have to fill a port in the first blank space. If we select range at above field, we need to fill the range of the ports.	1 ~ 65534	N/A
Action	Forward to	If the packet is matched to this rule, which interface does this packet sent out to?	WAN interfaces	WAN1
	Nexthop gateway IP	The next gateway IP address of forwarding interface.	IPv4 format	210.2.1.6

Table 7-2 Add a policy routing entry

**Step 4. View the result**

After filling data completely, view the policy routing entries which have been set.

**Advanced Settings > Routing > Policy Route**

Static Route Policy Route

Policy Routing->Edit Rules

Packets are top-down matched by the rules.

Item	Status		Condition				Action	
#	Active	Name	Direction	Source IP Address	Dest. IP Address	Service	Forward to next-hop	Through
1	Y	GenlManaRoom	From LAN1	192.168.40.192/255.255.255.192	Any	Any	210.2.1.6	WAN1

Page 1/1

Prev. Page Next Page Move Page 1

Insert Edit Delete Move Before: 1

**Step 5. View the routing table**

Finally click the "Routing Table" to see all the current routing table information.

**Device Status > System Status > Routing Table**

System Status	Network Status	CPU & Memory	DHCP Table	Routing Table	Active Sessions	Top20 Sessions	IPSec Sessions
#	Type	Destination/Netmask		Gateway	Interface		
1	Default/Static	0.0.0.0/0.0.0.0		61.2.1.6	WAN1		
2	Net	10.1.1.0/255.255.255.0		10.1.1.254	DMZ1		
3	Net	61.2.1.0/255.255.255.248		61.2.1.1	WAN1		
4	Net	192.168.1.0/255.255.255.0		192.168.1.254	LAN1		
5	Net/Static	192.168.50.0/255.255.255.0		192.168.40.253	WAN1

# Chapter 8 Firewall

*This chapter introduces firewall and explains how to implement it.*

## 8.1 Demands

1. Administrators detect that PC1\_1 in LAN\_1 is doing something that may hurt our company and should instantly block his traffic towards the Internet.
2. A DMZ server was attacked by SYN-Flooding attack and requires the DFL-900 to protect it.

## 8.2 Objectives

1. Block the traffic from PC1\_1 in LAN1 to the Internet in WAN1.
2. Start the SYN-Flooding protection.

Figure 8-1 Setting up the firewall rule

## 8.3 Methods

1. Add a LAN1-to-WAN1 Firewall rule to block PC1\_1.
2. Start the SYN-Flooding protection by detecting statistical half-open TCP connections.

## 8.4 Steps

### 8.4.1 Block internal PC session (LAN → WAN)

#### Step 1. Setup NAT

Check the Enable Stateful Inspection Firewall checkbox, and click the Apply.

#### ADVANCED SETTINGS > Firewall > Status

FIELD	DESCRIPTION	Range / Format	EXAMPLE
Enable Stateful Inspection Firewall	Enable Firewall feature of DFL-900	Enabled / Disabled	Enabled
Block all fragment packets	Enable this feature will block the fragmented packets by the firewall of DFL-900. Warning: Enable this feature will cause problem in some applications.	Enabled / Disabled	Disabled
BUTTON	DESCRIPTION		
Reset Rules	Reset Firewall rules to the default status		
Clear States	Clear all the active Firewall states		
Apply	Apply the settings which have been configured.		
Reset	Clean the filled data and restore the original.		

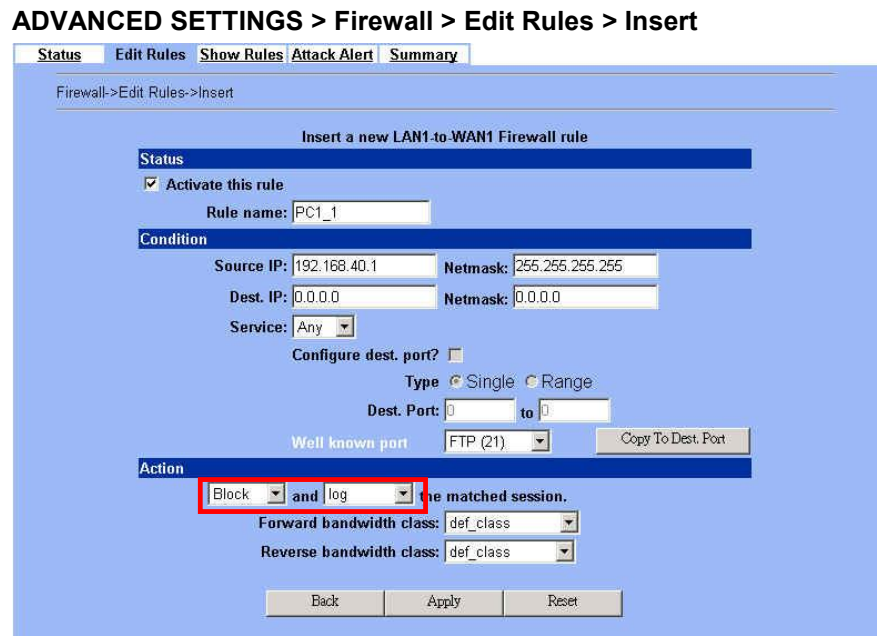

Table 8-1 Configure Firewall status

#### Step 2. Add a Firewall Rule

Select LAN1 to WAN1 traffic direction. The default action of this direction is to forward all traffic without logging anything. Click Insert to add a Firewall block rule before the default rule to stop the bad traffic.

#### ADVANCED SETTINGS > Firewall > Edit Rules

**Step 3. Customize the rule**  
 Check the Activate this rule checkbox. Enter the rule name as PC1\_1, and enter the IP address of PC1\_1 (192.168.40.1 / 255.255.255.255). Select Block and Log to block and log the matched traffic. Click the Apply to apply the changes.

	FIELD	DESCRIPTION	Range / Format	EXAMPLE
Status	Activate this rule	Enable the firewall rule for later using	Enabled / Disabled	Enabled
	Rule name	The name of the Firewall rule	text string	PC1_1
Condition	Source IP & Netmask	Compared with the incoming packets, whether Source IP/Netmask is matched or not.	IPv4 format / IPv4 format	192.168.40.1 255.255.255.255
	Dest IP & Netmask	Compared with the incoming packets, whether Dest IP/Netmask is matched or not.	IPv4 format / IPv4 format	0.0.0.0 0.0.0.0
	Service	Verified the service of incoming packet is belong to each TCP、UDP、ICMP.	TCP / UDP / ICMP	Any
	Configure dest. Port?	If the service is TCP or UDP, we can choose to configure or not to configure destination port.	Enabled / Disabled	Disabled
	Type	If we decide to configure destination port, we must choose the port to be single or range.	Single / Range	N/A
	Dest. Port	If we select single at above field, we just have to fill a port in the first blank space. If we select range at above field, we need to fill the range of the ports.	1 ~ 65534	N/A
Action	Forward / Block the matched session	If packet is matched the rule condition, Forward or Block this matched packet?	Forward / Block	Block
	Don't log / Log the matched session	If packet is matched the rule condition, Log or Don't log this matched packet?	Log / Don't log	Log
	Forward bandwidth class	Forward bandwidth class if any.	def_class	def_class

Part III  
NAT、Routing & Firewall

	Reverse bandwidth class	Reverse bandwidth class if any.	def_class	def_class
--	-------------------------	---------------------------------	-----------	-----------

Table 8-2 Insert a Firewall rule

<p><b>Step 4. View the Firewall Log</b></p> <p>You can go to DEVICE Status&gt;Firewall Logs &gt;Firewall Logs to view the firewall logs. If you prefer to download these logs, please click the “Download To Local” button to save the logs to localhost.</p>	<p><b>DEVICE Status &gt; Firewall Logs &gt; Firewall Logs</b></p>  <p>The screenshot shows a web interface for viewing firewall logs. At the top, there are tabs for 'Firewall Logs' and 'Alert Logs'. Below is a table with columns: No., Time, From, To, Protocol/(Service), From(Interface), To, Action, and Rule. The table contains 10 rows of log entries. At the bottom, there are buttons for 'Download To Local', 'Prev. Page', 'Refresh', 'Clear', and 'Next Page'. There is also a 'List' dropdown menu set to '10' and 'Per Page Page: 1/14'.</p>
---	---

FIELD	DESCRIPTION
No	The indicated firewall log sequence number.
Time	The record time of indicated firewall log.
From	The source IP address (include port) which the indicated log event come from.
To	The destination IP address (include port) for the indicated log event bound.
Protocol/(Service)	The recorded log is TCP, UDP or ICMP / which service it will be.
Direction	The firewall log direction is OUT or IN. The direction is based on the DFL-900. For example, “OUT” means the packet is forwarded out to the internet. “IN” means the packet is forwarded into intranet.
Action	The status of indicated firewall log is Block or Forward.
Rule	The log is produced by which firewall rule. “Default” means the default rule of the selected firewall direction. “RM XXX” means the log is produced by remote management function (Almost it is the illegal user who wants to use the Non-Opened remote management functions. Other condition, it will be marked at the rule number (ex. Rule0, Rule1 ...).

Table 8-3 Firewall log field description

## 8.4.2 Setup Alert detected attack

### Step 1. Setup Attack Alert

With the Firewall enabled, the DFL-900 is already equipped with an Anti-DoS engine within it. Normal DoS attacks will show up in the log when detecting and blocking such traffic. However, Flooding attacks require extra parameters to recognize. Check the `Enable Alert when attack detected` checkbox. Enter 100 in the `One Minute High` means that DFL-900 starts to generate alerts and delete the half-open states if 100 half-open states are established in the last minute. Enter 100 in the `Maximum Incomplete High` means that DFL-900 starts to generate alerts and delete half-open states if the current number of half-open states reaches 100. Enter 10 in the `TCP Maximum Incomplete` means that DFL-900 starts to generate alerts and delete half-open states if the number of half-open states towards a server (SYN-Flooding attack) reaches 10. Check the `Blocking time` if you want to stop the traffic towards the server. During this blocking time, the server can digest the loading.

### ADVANCED SETTINGS > Firewall > Attack Alert

FIELD	DESCRIPTION	EXAMPLE
Enable Alert when attack detected	Enable the firewall alert to detect Denial of Service (DoS) attack.	Enabled
Denial of Service Thresholds		
One Minute High	This is the rate of new half-open sessions that causes the firewall to start deleting half open sessions. When the rate of new connection attempts rises above this number, the DFL-900 deletes half-open sessions as required to accommodate new connection attempts.	100
Maximum Incomplete High	This is the number of existing half-open sessions that causes the firewall to start deleting half-open sessions. When the number of existing half-open sessions rises above this number, the DFL-900 deletes half-open sessions as required to accommodate new connection requests.	100
TCP Maximum Incomplete	This is the number of existing half-open TCP sessions with the same destination host IP address that causes the firewall to start dropping half-open sessions to the same destination host IP address. Enter a number between 1 and 999. As a general rule, you should choose a smaller number for a smaller network, a slower system or limited bandwidth.	10
Blocking Time	When TCP Maximum Incomplete is reached you can choose if the next session should be allowed or blocked. If you check Blocking Time any new sessions will be blocked for the length of time you specified in the next field (min) and all old incomplete sessions will be cleared during this period. If you want strong security, it is better to block the traffic for a short time, as will give the server some time to digest the loading.	disabled

(min)	Enter the length of Blocking Time in minutes.	0
-------	---	---

Table 8-4 Setup the Denial of Service Thresholds of attack alert

# Part IV

## Virtual Private Network

# Chapter 9

## VPN Technical Introduction

*This chapter introduces VPN related technology*

### 9.1 VPN benefit

If you choose to implement VPN technology in your enterprise, then it may bring the following benefits to your company.

1. Authentication

Ensure the data received is the same as the data that was sent and that the claimed sender is in fact the actual sender.

2. Integrity

Ensure that data is transmitted from source to destination without undetected alteration.

3. Confidentiality

Guarantee the intended recipients know what was being sent but unintended parties cannot determine what was sent. This is almost provided by data encryption.

4. Non-repudiation

The receiver being able to prove that the sender of some data did in fact send the data even though the sender might later desire to deny ever having sent that data.

### 9.2 Related Terminology Explanation

#### 9.2.1 VPN

A VPN (Virtual Private Network) logically provides secure communications between sites without the expense of leased site-to-site lines. A secure VPN is a combination of encryption, tunneling, authentication, and access control used to transport traffic over the Internet or any insecure TCP/IP networks.

#### 9.2.2 IPSec

Internet Protocol Security (IPSec) is a standard-based VPN that offers flexible solutions for secure data communications across a public network like the Internet. IPSec is built around a number of standardized cryptographic techniques to provide confidentiality, data integrity and authentication at the IP layer.

#### 9.2.3 Security Association

A Security Association (SA) is an agreement between two parties indicating what security parameters, such as keys and algorithms they will use.

#### 9.2.4 IPSec Algorithms

There are two types of the algorithms in the IPSec, including (1) Encryption Algorithms such as DES (Data Encryption Standard), and 3DES (Triple DES) algorithms, and (2) Authentication Algorithms such as HMAC-MD5 (RFC 2403), and HMAC-SHA1 (RFC 2404).

### 9.2.5 Key Management

Key Management allows you to determine whether to use IKE (ISAKMP) or manual key configuration in order to setup a VPN.

#### ➤ IKE Phases

There are two phases to every IKE (Internet Key Exchange) negotiation – phase 1 (Authentication) and phase 2 (Key Exchange). A phase 1 exchange established an IKE SA and the second one uses that SA to negotiate SAa for IPSec.

In phase 1 you must :

- Choose a negotiation mode
- Authenticate the connection by entering a pre-shared key
- Choose an encryption algorithm
- Choose an authentication algorithm
- Choose a Diffie-Hellman public-key cryptography key group (DH1 or DH2).
- Set the IKE SA lifetime. This field allows you to determine how long IKE SA negotiation should proceed before it times out. A value of 0 means IKE SA negotiation never times out. If IKE SA negotiation times out, then both IKE SA and IPSec SA must be renegotiated.

In phase 2 you must :

- Choose which protocol to use (ESP or AH) for the IKE key exchange
- Choose an encryption algorithm
- Choose an authentication algorithm
- Choose whether to enable Perfect Forward Security (PFS) using Diffie-Hellman public-key cryptography
- Choose Tunnel mode or Transport mode
- Set the IPSec SA lifetime. This field allows you to determine how long IPSec SA setup should proceed before it times out. A value of 0 means IPSec SA never times out. If IPSec SA negotiation times out, then the IPSec SA must be renegotiated (but not the IKE SA).

#### ➤ Negotiation Mode

The phase 1 Negotiation Mode you select determines how the Security Association (SA) will be established for each connection through IKE negotiations.

- Main Mode ensures the highest level of security when the communicating parties are negotiating authentication (phase 1). It uses 6 messages in three round trips (SA negotiation, Diffie-Hellman exchange and an exchange of nonces (a nonce is a random number)). This mode features identity protection (your identity is not revealed in the negotiation).
- Aggressive Mode is quicker than Main Mode because it eliminates several steps when the communicating parties are negotiating authentication (phase 1). However the trade-off is that fast speed limits its negotiating power and it also does not provide identity protection. It is useful in remote access situation where the address of the initiator is not known by the responder and both parties want to use pre-shared key authentication.

#### ➤ Pre-Shared Key

A pre-shared key identifies a communicating party during a phase 1 IKE negotiation. It is called “pre-shared” because you have to share it with another party before you can communicate with them over a secure connection.

#### ➤ Diffie-Hellman (DH) Key Groups

Diffie-Hellman (DH) is a public-key cryptography protocol that allows two parties to establish a shared secret over an unsecured communications channel. Diffie-Hellman is used within IKE SA setup to establish session keys. 768-bit (Group 1 – DH1) and 1024-bit (Group 2 – DH2) Diffie-Hellman groups are supported. Upon completion of the Diffie-Hellman exchange, the two peers have a shared secret, but the IKE SA is not authenticated. For authentication, use pre-shared keys.

➤ Perfect Forward Secrecy (PFS)

Enabling PFS means that the key is transient. The key is thrown away and replaced by a brand new key using a new Diffie-Hellman exchange for each new IPSec SA setup. With PFS enabled, if one key is compromised, previous and subsequent keys are not compromised, because subsequent keys are not derived from previous keys. The (time-consuming) Diffie-Hellman exchange is the trade-off for this extra security.

This may be unnecessary for data that does not require such security, so PFS is disabled (None) by default in the DFL-900.

Disabling PFS means new authentication and encryption keys are derived from the same root secret (which may have security implications in the long run) but allows faster SA setup (by bypassing the Diffie-Hellman key exchange).

## 9.2.6 Encapsulation

➤ Transport Mode

Transport mode is used to protect upper layer protocols and only affects the data in the IP packets. In Transport mode, the IP packets contains the security protocol (AH or ESP) located after the original IP header and options, but before any upper layer protocols contains in the packet (such as TCP and UDP).

With ESP, protection is applied only to the upper layer protocols contained in the packet. The IP header information and options are not used in the authentication process. Therefore, the originating IP address cannot be verified for integrity against the data.

With the use of AH as the security protocol, protection is extended forward into the IP header to verify the integrity of the entire packet by use of portions of the original IP header in the hashing process.

➤ Tunnel Mode

Tunnel mode encapsulates the entire IP packet to transmit it securely. A Tunnel mode is required for gateway services to provide access to internal system. Tunnel mode is fundamentally an IP tunnel with authentication and encryption. This is the most common mode of operation. Tunnel mode is required for gateway to gateway and host to gateway communications. Tunnel mode communication have two sets of IP headers :

- Outside header : The outside IP header contains the destination IP address of the VPN gateway.
- Inside header : The inside IP header contains the destination IP address of the final system behind the VPN gateway. The security protocol appears after the outer IP header and before the inside IP header.

## 9.2.7 IPSec Protocols

The ESP and AH protocols are necessary to create a Security Association (SA), the foundation of an IPSec VPN. An SA is built from the authentication provided by AH and ESP protocols. The primary function of key management is to establish and maintain the SA between systems. Once the SA is established, the transport of data may commence.

➤ AH (Authentication Header) Protocol

AH protocol (RFC 2402) was designed for integrity, authentication, sequence integrity (replay resistance), and non-repudiation but not for confidentiality, for which the ESP was designed.

In applications where confidentiality is not required or not sanctioned by government encryption restrictions, an AH can be employed to ensure integrity. This type of implementation does not protect the information from dissemination but will allow for verification of the integrity of the information and authentication of the originator.

➤ ESP (Encapsulating Security Payload) Protocol

The ESP protocol (RFC 2406) provides encryption as well as some of the services offered by AH. ESP authenticating properties are limited compared to the AH due to the non-inclusion of the IP header information during the authentication process. However, ESP is sufficient if only the upper layer protocols need to be authenticated.

An added feature of the ESP is payload padding, which further protects communications by concealing the size of the packet being transmitted.

### 9.3 Make VPN packets pass through DFL-900

#### Step 1. Enable IPSec

If we need to setup DFL-900 between the existed IPSec / PPTP / L2TP connections. We need to open up the Firewall blocking port of DFL-900 in advance. Here we provide a simple way. You can through enable the IPSec / PPTP / L2TP pass through checkbox on this page. Then the VPN connections of IPSec / PPTP / L2TP will pass through DFL-900. As well as DFL-900 will play the middle forwarding device role.

#### ADVANCED SETTINGS > VPN Settings > Pass Through

IPSec PPTP L2TP Pass Through

Enable IPSec pass through  
 Enable PPTP pass through  
 Enable L2TP pass through

IPSec/PPTP/L2TP pass through make the DFL-900 device as a middle forwarding device between

1. Two IPSec devices.
2. Two PPTP devices.
3. Two L2TP devices.

Apply Reset

# Chapter 10 Virtual Private Network – IPsec

*This chapter introduces IPsec VPN and explains how to implement it.*

As described in the Figure 2-1, we will extend to explain how to make a VPN link between LAN\_1 and LAN\_2 in this chapter. The following Figure 10-1 is the real structure in our implemented process.

## 10.1 Demands

1. When a branch office subnet LAN\_1 wants to connect with another branch office subnet LAN\_2 through the public Internet instead of the expensive private leased lines, VPN can provide encryption and authentication to secure the tunnel that connects these two LANs.

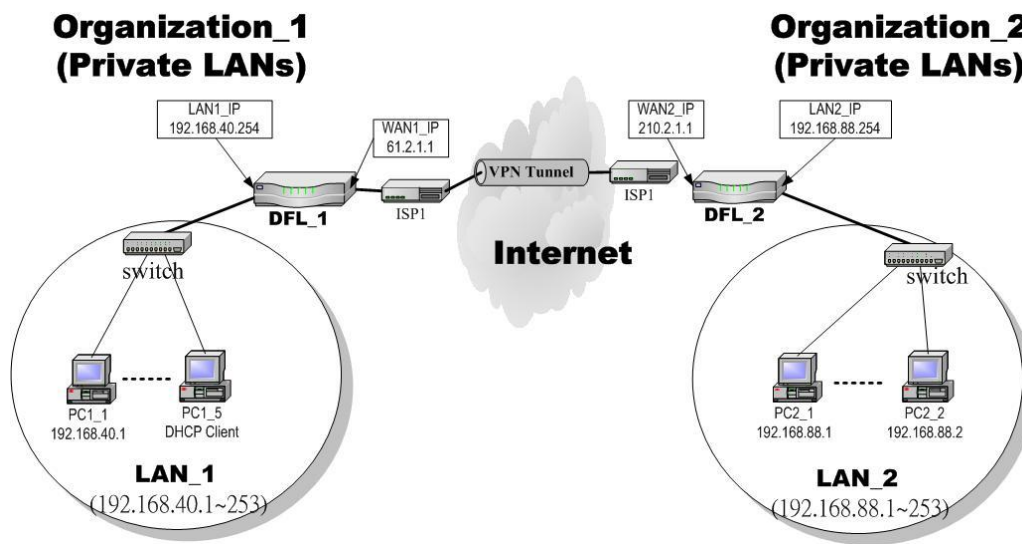

Figure 10-1 Organization\_1 LAN\_1 is making VPN tunnel with Organization\_2 LAN\_2

## 10.2 Objectives

1. Let the users in LAN\_1 and LAN\_2 share the resources through a secure channel established using the public Internet.

## 10.3 Methods

1. Separately configure DFL-1 and DFL-2 which are the edge gateways of LAN\_1 and LAN\_2 respectively. You have to determine a key management method between IKE (Internet Key Exchange) and Manual Key. The following table compares the settings between IKE and Manual Key. In the following, we will describe them separately.

	IKE	Manual Key
Same	“Local Address” means the local LAN subnet; “Remote Address” means the remote LAN subnet; “My IP Address” means the WAN IP address of the local VPN gateway while the “Peer’s IP Address” means the WAN IP address of the other VPN gateway.	

Difference	The “Pre-Shared Key” must be the same at both DFL-900s.	The types and keys of “Encryption” and “Authenticate” must be set the same on both DFL-900s. However, the “Outgoing SPI” at DFL-1 must equal to “Incoming SPI” at DFL-2, and the “Outgoing SPI” at DFL-2 must equal to “Incoming SPI” at DFL-1.
------------	---	---

Table 10-1 Compared IKE and Manual Key methods

## 10.4 Steps

In the following we will separately explain the ways to set up a secure DES/MD5 tunnel with IKE and Manual key.

### ➤ DES/MD5 IPsec tunnel: the IKE way

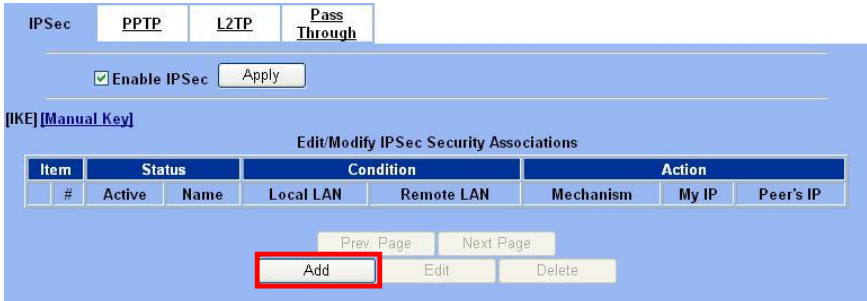

At DFL-1:

At the first, we will install the IPsec properties of DFL-1.

<p><b>Step 2. Enable IPsec</b> Check the <code>Enable IPsec</code> checkbox and click <code>Apply</code>.</p>	<p><b>ADVANCED SETTINGS &gt; VPN Settings &gt; IPsec</b></p> 
---	--

FIELD	DESCRIPTION	EXAMPLE
Enable IPsec	Enable IPsec feature of DFL-900	Enabled
BUTTON	DESCRIPTION	
Apply	Apply the settings which have been configured.	

Table 10-2 Enable the IPsec feature

<p><b>Step 3. Add an IKE rule</b> Click the <code>IKE</code> hyperlink and click <code>Add</code> to add a new IPsec VPN tunnel endpoint.</p>	<p><b>ADVANCED SETTINGS &gt; VPN Settings &gt; IPsec &gt; IKE</b></p> 
---	--

FIELD	DESCRIPTION	EXAMPLE
IKE	Use the IKE (Internet Key Exchange) method to negotiate the key used in building IPsec tunnel.	Selected
Manual Key	Use the key which you have been designated to build IPsec tunnel in peer VPN device.	Non selected
BUTTON	DESCRIPTION	
Prev. Page	If there are more than one action pages, you can press Prev. Page to back to the previous page.	
Next Page	If there are more than one action pages, you can press Next Page to go to the next page.	
Add	Insert a new IPsec rule.	
Edit	Edit the properties of the indicated IPsec rule.	
Delete	Delete the indicated IPsec rule.	

Table 10-3 Add an IPsec policy rule

**Step 4. Customize the rule**

Check the Active checkbox. Enter a name for this rule like IKErule. Enter the Local IP Address (192.168.40.0/255.255.255.0) and the Remote IP Address (192.168.88.0/255.255.255.0). Select the Outgoing Interface of this VPN/Firewall Router. Enter the public IP of the opposite-side VPN gateway (210.2.1.1) in the Peer's IP Address. Click the ESP Algorithm and select Encrypt and Authenticate (DES, MD5). Enter the Pre-Shared Key as 1234567890. Click the Apply button to store the settings. Note, In the Action region. It should choose either ESP Algorithm or AH Algorithm, or system will show error message. If you hope to set the detailed item of IKE parameter. Click the Advanced button in this page. Otherwise it is ok to just leave the value default.

**ADVANCED SETTINGS > VPN Settings > IPsec > IKE > Add**

The screenshot shows the configuration page for an IPsec IKE rule. The 'Status' section has the 'Active' checkbox checked. The 'IKE Rule Name' is 'IKErule'. The 'Condition' section has 'Local Address Type' set to 'Subnet Address' with 'IP Address' 192.168.40.0 and 'PrefixLen / Subnet Mask' 255.255.255.0. The 'Remote Address Type' is also 'Subnet Address' with 'IP Address' 192.168.88.0 and 'PrefixLen / Subnet Mask' 255.255.255.0. The 'Action' section has 'Negotiation Mode' set to 'Main', 'Encapsulation Mode' set to 'Tunnel', 'Outgoing Interface' set to 'WAN1', and 'Peer's IP Address' set to 'Static IP' with value '210.2.1.1'. There are also fields for 'My Identifier' and 'Peer's Identifier' (both optional IP addresses), 'ESP Algorithm' set to 'Encrypt and Authenticate (DES, MD5)', 'AH Algorithm' set to 'Authenticate (MD5)', and 'Pre-Shared Key' set to '1234567890'. Buttons for 'Advanced', 'Back', 'Apply', and 'Reset' are visible at the bottom.

## Part IV Virtual Private Network

	FIELD	DESCRIPTION	Range / Format	EXAMPLE
Status	Active	This field will activate this IPsec policy rule	Enable/Disable	Enabled
	IKE Rule Name	The name of this IPsec policy	text string	IKErule
Condition	Local Address Type	Determine the method to connect to the remote side of VPN by using the local subnet or the local single host.	Subnet Address / Single Address	Subnet Address
	IP Address	The local IP address	IPv4 format	192.168.40.0
	Prefix Len/Subnet Mask	The local IP Netmask	IPv4 format	255.255.255.0
	Remote Address Type	Determine the method to connect to the local side of VPN by using the remote subnet or the remote single host.	Subnet Address / Single Address	Subnet Address
	IP Address	The remote IP address	IPv4 format	192.168.88.0
	Prefix Len/Subnet Mask	The remote IP Netmask	IPv4 format	255.255.255.0
Action	Negotiation Mode	Choose Main or Aggressive mode, see Chapter 9 for details.	Main / Aggressive	Main
	Encapsulation Mode	Choose Tunnel or Transport mode, see Chapter 9 for details.	Tunnel / Transport	Tunnel
	Outgoing Interface	The WAN interface you are going to build IPsec tunnel with.	WAN interfaces	WAN1
	Peer's IP Address	The IP address of remote VPN device. The IP address may be fixed (Static) or dynamic.	Static IP / Dynamic IP	Static IP 210.2.1.1
	My Identifier	Fill your information in this field. The filled information will be provided for the IPsec tunnel establishment.	IP Address / FQDN (domain name) / User FQDN (mail box)	IP Address
	Peer's Identifier	Fill the information of peer VPN device in this field. The filled information will be provided for the IPsec tunnel establishment.	IP Address / FQDN (domain name) / User FQDN (mail box)	IP Address

	ESP Algorithm	<p>ESP Algorithm may be grouped by the items of the Encryption and Authentication Algorithms or execute separately.</p> <p>We can select below items, the Encryption and Authentication Algorithm combination or the below item Authentication Algorithm singly.</p> <p>Here Encryption Algorithms include DES(64 bits), 3DES(192 bits) and AES(128/192/256 bits) Authentication Algorithms include MD5(128 bits) and SHA1(160 bits)</p>	<p>Encrypt and Authenticate (DES, MD5) /</p> <p>Encrypt and Authenticate (DES, SHA1) /</p> <p>Encrypt and Authenticate (3DES, MD5) /</p> <p>Encrypt and Authenticate (3DES, SHA1) /</p> <p>Encrypt and Authenticate (AES, MD5) /</p> <p>Encrypt and Authenticate (AES, SHA1) /</p> <p>Encrypt only (DES) /</p> <p>Encrypt only (3DES) /</p> <p>Encrypt only (AES) /</p> <p>Authenticate only (MD5) /</p> <p>Authenticate only (SHA1)</p>	Encrypt and Authenticate (DES, MD5)
	AH Algorithm	Select Authentication Algorithm	<p>Authenticate (MD5) /</p> <p>Authenticate (SHA1)</p>	Disabled
	Pre-Shared Key	The key which is pre-shared with remote side.	text string	1234567890

Table 10-4 Related field explanation of adding an IPsec policy rule

**Step 5. Detail settings of IPSec IKE**

In this page, we will set the detailed value of IKE parameter. Fill in the related field as Table 10-5 indicated to finish these settings.

**ADVANCED SETTINGS > VPN Settings > IPSec > IKE > Add > Advanced**

	FIELD	DESCRIPTION	Range / Format	EXAMPLE
Condition	Transport Layer Protocol	Utilize this field to select some packets which are specified protocol (ANY, TCP, UDP). If the packets are not the specified protocol will not be allowed to pass through IPSec tunnels.	ANY / TCP / UDP	TCP
Action	Enable Replay Detection	Whether is the “Replay Detection” enabled?	NO / YES	NO
	<b>Phase1</b>			
	Negotiation Mode	View only, it is set previously and can not be edited again.	Can not be edited	Main
	Pre-Shared Key	View only, it is set previously and can not be edited again.	Can not be edited	1234567890
	Encryption Algorithm	Choose a type of encryption and authentication algorithm combination.	Encrypt and Authenticate (DES, MD5) / Encrypt and Authenticate (DES, SHA1) / Encrypt and Authenticate (3DES, MD5) / Encrypt and Authenticate (3DES, SHA1)	Encrypt and Authenticate (DES、MD5)
SA Life Time	Set the IKE SA lifetime. A value of 0 means IKE SA negotiation never times out. See Chapter 9 for details.	0 ~ 9999999999 sec/min/hour	28800 sec	

Key Group	Choose a Diffie-Hellman public-key cryptography key group	DH1 / DH2 / DH5	DH2
<b>Phase2</b>			
Encapsulation	View only, it is set previously and can not be edited again.	Can not be edited	Tunnel
Active Protocol	View only, it is set previously and can not be edited again.	Can not be edited	ESP
Encryption Algorithm	Choose a type of encryption and authentication algorithm combination or singly.	Encrypt and Authenticate (DES, MD5) / Encrypt and Authenticate (DES, SHA1) / Encrypt and Authenticate (3DES, MD5) / Encrypt and Authenticate (3DES, SHA1) / Encrypt and Authenticate (AES, MD5) / Encrypt and Authenticate (AES, SHA1) / Encrypt only (DES) / Encrypt only (3DES) / Encrypt only (AES) / Authenticate only (MD5) / Authenticate only (SHA1)	Encrypt and Authenticate (DES · MD5)
SA Life Time	Set the IPsec SA lifetime. A value of 0 means IKE SA negotiation never times out. See Chapter 9 for details.	0 ~ 9999999999 sec/min/hour	28800 sec
Perfect Forward Secrecy(PFS)	Enabling PFS means that the key is transient. This extra setting will cause more security.	None / DH1 / DH2 / DH5	DH1

Table 10-5 Setup Advanced feature in the IPsec IKE rule

**Step 6. Remind to add a Firewall rule**

After finishing IPsec rule settings, we need to add a firewall rule. Here system shows a window message to remind you of adding a firewall rule. Just press the OK button to add a firewall rule.

**ADVANCED SETTINGS > VPN Settings > IPsec > IKE > Add**

IPsec  PPTP  L2TP  Pass Through

1. If you enable the firewall, please check whether these firewall rules would block packets in tunnel.
2. Packets are blocked by default in the "WAN to LAN" direction, please add a rule to forward these tunneled packets.
3. The source address/mask and the destination address/mask of the firewall rules are 192.168.88.0/255.255.255.0 and 192.168.40.0/255.255.255.0 respectively.

OK

**Step 7. Add a Firewall rule**

Beforehand, please make sure that the Firewall is enabled. Select WAN1-to-LAN1 to display the rules of this direction. The default action of this direction is Block with Logs. We have to allow the VPN traffic from the WAN1 side to enter our LAN1 side. So we click the Insert button to add a Firewall rule before the default rule.

**ADVANCED SETTINGS > Firewall > Edit Rules**

Firewall->Edit Rules

Default action for this packet direction: Block  Log Apply

Packets are top-down matched by the rules.

Item	Status	Condition					Action	
#	Active	Name	Direction	Source IP Address	Dest. IP Address	Service	Action	Log
1	Y	Default	WAN1 to LAN1	Any	Any	Any	Block	Y

Page 1/1

Prev. Page Next Page Move Page 1

Insert Edit Delete Move Before: 1

**Step 8. Customize the Firewall rule**

Check the Activate this rule. Enter the Rule Name as AllowVPN, Source IP as 192.168.88.0, and Dest. IP as 192.168.40.0. Click Apply to store this rule.

**ADVANCED SETTINGS > Firewall > Edit Rules > Insert**

Firewall->Edit Rules->Insert

Insert a new WAN1-to-LAN1 Firewall rule

Status

Activate this rule

Rule name: AllowVPN

Condition

Source IP: 192.168.88.0 Netmask: 255.255.255.0

Dest. IP: 192.168.40.0 Netmask: 255.255.255.0

Service: Any

Configure dest. port?

Type  Single  Range

Dest. Port: 0 to 0

Well known port FTP (21) Copy To Dest. Port

Action

Forward and do not log the matched session.

Forward bandwidth class: def\_class

Reverse bandwidth class: def\_class

Back Apply Reset

**Step 9. View the result**

Here we have a new rule before the default firewall rule. This rule will allow packets from 192.168.88.0 / 255.255.255.0 pass through DFL-900. And accomplish the VPN tunnel establishment.

**ADVANCED SETTINGS > Firewall > Edit Rules**

Firewall->Edit Rules

Default action for this packet direction: Block  Log Apply

Packets are top-down matched by the rules.

Item	Status	Condition					Action	
#	Active	Name	Direction	Source IP Address	Dest. IP Address	Service	Action	Log
1	Y	AllowVPN	WAN1 to LAN1	192.168.88.0/255.255.255.0	192.168.40.0/255.255.255.0	Any	Forward	N
2	Y	Default	WAN1 to LAN1	Any	Any	Any	Block	Y

Page 1/1

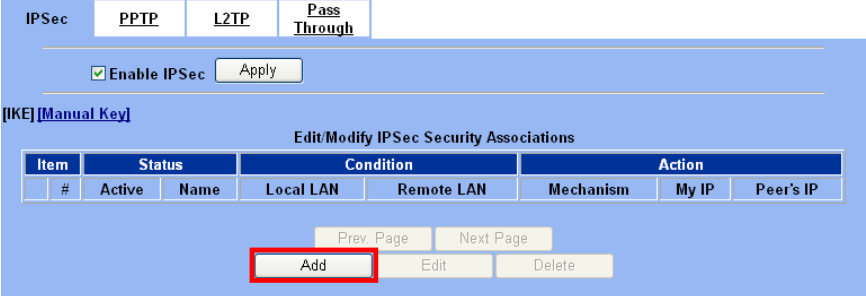

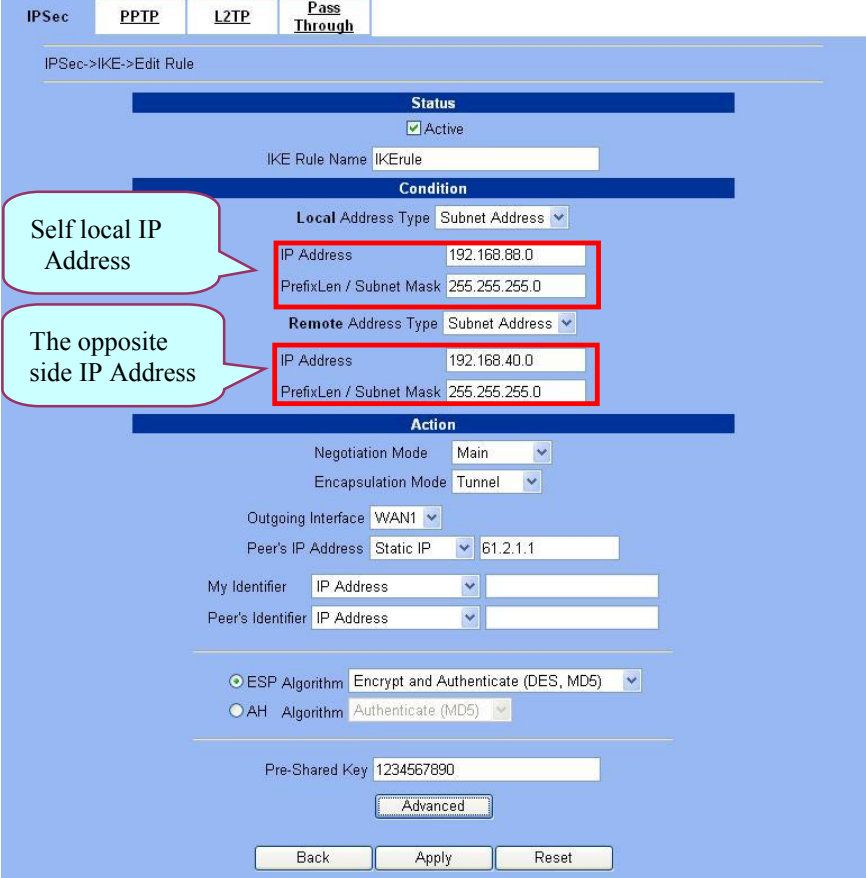

Prev. Page Next Page Move Page 1

Insert Edit Delete Move Before: 1

**At DFL-2:**

Here we will install the IPSec properties of DFL-2. Note that the “Local Address” and “Remote address” field are opposite to the DFL-1, and so are “My IP Address” and “Peer’s IP Address” field.

<p><b>Step 10. Enable IPsec</b> Check the <code>Enable IPsec</code> checkbox and click <code>Apply</code>.</p>	<p><b>ADVANCED SETTINGS &gt; VPN Settings &gt; IPsec</b></p> 
<p><b>Step 11. Add an IKE rule</b> Click the <code>IKE</code> hyperlink and click <code>Add</code> to add a new IPsec VPN tunnel endpoint.</p>	<p><b>ADVANCED SETTINGS &gt; VPN Settings &gt; IPsec &gt; IKE</b></p> 
<p><b>Step 12. Customize the rule</b> Check the <code>Active</code> checkbox. Enter a name for this rule like <code>IKERule</code>. Enter the <code>Local IP Address</code> (192.168.88.0/255.255.255.0) and the <code>Remote IP Address</code> (192.168.40.0/255.255.255.0). Select the <code>Outgoing interface</code> of this VPN/Firewall Router. Enter the public IP of the opposite-side VPN gateway (61.2.1.1) in the <code>Peer's IP Address</code>. Click the <code>ESP Algorithm</code> and select <code>Encrypt and Authenticate (DES, MD5)</code>. Enter the <code>Pre-Shared Key</code> as 1234567890. Click the <code>Apply</code> button to store the settings. Note, in the <code>Action</code> region, you should choose either <code>ESP Algorithm</code> or <code>AH Algorithm</code>, or system will show error message.</p>	<p><b>ADVANCED SETTINGS &gt; VPN Settings &gt; IPsec &gt; IKE &gt; Add</b></p> 

**Step 13. Remind to add a Firewall rule**

After finishing IPSec rule settings, we need to add a firewall rule. Here system shows a window message to remind you of adding a firewall rule. Just press the OK button to add a firewall rule.

**ADVANCED SETTINGS > VPN Settings > IPSec > IKE > Add**

IPSec   PPTP   L2TP   Pass Through

- If you enable the firewall, please check whether these firewall rules would block packets in tunnel.
- Packets are blocked by default in the "WAN to LAN" direction, please add a rule to forward these tunneled packets.
- The source address/mask and the destination address/mask of the firewall rules are 192.168.40.0/255.255.255.0 and 192.168.88.0/255.255.255.0 respectively.

OK

**Step 14. Add a Firewall rule**

Same as at DFL-1. We need to add an extra firewall rule to allow IPSec packets to come from internet. So here we select WAN1-to-LAN1 direction, and click Insert button.

**ADVANCED SETTINGS > Firewall > Edit Rules**

Status   Edit Rules   Show Rules   Attack Alert   Summary

Firewall->Edit Rules

Edit WAN1 to LAN1 rules

Default action for this packet direction: Block  Log Apply

Packets are top-down matched by the rules.

Item	Status	Condition					Action	
#	Active	Name	Direction	Source IP Address	Dest. IP Address	Service	Action	Log
1	Y	Default	WAN1 to LAN1	Any	Any	Any	Block	Y

Page 1/1

Prev. Page   Next Page   Move Page: 1

Insert   Edit   Delete   Move Before: 1

**Step 15. Customize the Firewall rule**

Check the Activate this rule. Enter the Rule Name as AllowVPN, Source IP as 192.168.40.0, and Dest. IP as 192.168.88.0. Click Apply to store this rule.

**ADVANCED SETTINGS > Firewall > Edit Rules > Insert**

Status   Edit Rules   Show Rules   Attack Alert   Summary

Firewall->Edit Rules->Insert

Insert a new WAN1-to-LAN1 Firewall rule

Status

Activate this rule

Rule name: AllowVPN

Condition

Source IP: 192.168.40.0   Netmask: 255.255.255.0

Dest. IP: 192.168.88.0   Netmask: 255.255.255.0

Service: Any

Configure dest. port?

Type  Single  Range

Dest. Port: 0 to 0

Well known port: FTP (21)   Copy To Dest. Port

Action

Forward and do not log the matched session.

Forward bandwidth class: def\_class

Reverse bandwidth class: def\_class

Back   Apply   Reset

**Step 16. View the result**

Now we have inserted a new rule before the default firewall rule. Any packets from 192.168.40.0/24 to 192.168.88.0/24 will be allowed to pass through the DFL-900 and successfully access the 192.168.88.0/24 through the VPN tunnel.

**ADVANCED SETTINGS > Firewall > Edit Rules**

Firewall->Edit Rules

Edit WAN1 to LAN1 rules

Default action for this packet direction: Block  Log  Apply

Packets are top-down matched by the rules.

Item #	Status	Name	Direction	Source IP Address	Dest. IP Address	Service	Action	Log
1	Y	AllowVPN	WAN1 to LAN1	192.168.40.0/255.255.255.0	192.168.88.0/255.255.255.0	Any	Forward	N
2	Y	Default	WAN1 to LAN1	Any	Any	Any	Block	Y

### ➤ DES/MD5 IPsec tunnel: the Manual-Key way

In the previous section, we have introduced IKE method. Here we will introduce another method using Manual-Key way instead of IKE to install DFL-1.

**At DFL-1:**

At the first, we will use the Manual-Key way to install the IPsec properties of DFL-1.

**Step 1. Enable IPsec**

Check the `Enable IPsec` checkbox and click `Apply`.

**ADVANCED SETTINGS > VPN Settings > IPsec**

IPsec PPTP L2TP Pass Through

Enable IPsec

[[IKE]] [\[Manual Key\]](#)

Edit/Modify IPsec Security Associations

Item #	Status	Name	Local LAN	Remote LAN	Mechanism	My IP	Peer's IP
--------	--------	------	-----------	------------	-----------	-------	-----------

Prev. Page Next Page

Add Edit Delete

**Step 2. Add a Manual Key rule**

Click the `Manual Key` hyperlink and click `Add` to add a new IPsec VPN tunnel endpoint.

**ADVANCED SETTINGS > VPN Settings > IPsec > Manual Key**

IPsec PPTP L2TP Pass Through

Enable IPsec

[[IKE]] [\[Manual Key\]](#)

Edit/Modify IPsec Security Associations

Item #	Status	Name	Local LAN	Remote LAN	Mechanism	My IP	Peer's IP
--------	--------	------	-----------	------------	-----------	-------	-----------

Prev. Page Next Page

Add Edit Delete

**Step 3. Customize the rule**

Same as those in IKE. But there is no pre-shared key in the manual-key mode. Enter the Key for encryption, such as 1122334455667788. Enter the Key for authentication, such as 11112222333344445555666677778888. Additionally, the Outgoing SPI and Incoming SPI have to be manually specified. Enter 2222 and 1111 respectively to the Outgoing SPI and the Incoming SPI. Click Apply to store the rule.

**ADVANCED SETTINGS > VPN Settings > IPSec > Manual Key > Add**

The screenshot shows the configuration interface for adding a new IPSec Manual Key rule. The 'Status' section is set to 'Active'. The 'Manual Key Rule Name' is 'ManualKeyrule'. Under 'Condition', both 'Local Address Type' and 'Remote Address Type' are set to 'Subnet Address'. The local IP address is 192.168.40.0 with a prefix length of 255.255.255.0. The remote IP address is 192.168.88.0 with a prefix length of 255.255.255.0. Under 'Action', the 'Outgoing Interface' is 'WAN1' and the 'Peer's IP Address' is 210.2.1.1. The 'Outgoing SPI' is 2222 and the 'Incoming SPI' is 1111. The 'Encapsulation Mode' is 'Tunnel'. For encryption, 'ESP - Encryption' is set to 'DES' with a key of 112233445566778899. For authentication, 'AH - Authentication' is set to 'MD5' with a key of 11112222333344445555666677778888. There are 'Advanced', 'Back', 'Apply', and 'Reset' buttons at the bottom.

	FIELD	DESCRIPTION	Range / Format	EXAMPLE
Status	Active	This field will activate this IPSec policy rule	Enable / Disable	Enabled
	Manual Key Rule Name	The name of this IPSec policy	text string	ManualKeyrule
Condition	Local Address Type	Determine the method to connect to the remote side of VPN by using the local subnet or the local single host.	Subnet Address / Single Address	Subnet Address
	IP Address	The local IP address	IPv4 format	192.168.40.0
	PrefixLen / Subnet Mask	The local IP Netmask	IPv4 format	255.255.255.0
	Remote Address Type	Determine the method to connect to the local side of VPN by using the remote subnet or the remote single host.	Subnet Address / Single Address	Subnet Address
	IP Address	The remote IP address	IPv4 format	192.168.88.0
	PrefixLen / Subnet Mask	The remote IP Netmask	IPv4 format	255.255.255.0

Action	Outgoing Interface	The WAN interface you are going to build IPsec tunnel with.	WAN interfaces	WAN1
	Peer's IP Address	The IP address of remote site device, like DFL-900 VPN/Firewall Router.	IPv4 format	210.2.1.1
	Outgoing SPI	The Outgoing SPI (Security Parameter Index) value.	hex(600 ~ 600000) / dec(1500 ~ 6300000)	hex: 2222
	Incoming SPI	The Incoming SPI (Security Parameter Index) value.	hex(600 ~ 600000) / dec(1500 ~ 6300000)	hex: 1111
	Encapsulation Mode	Choose Tunnel or Transport mode, see Chapter 9 for details.	Transport / Tunnel	Tunnel
	ESP – Encryption / Authentication	Select the Encryption (DES, 3DES, AES or Null) and Authentication (MD5, SHA1 or NULL) Algorithm combination. And enter the key either hex or string form separately.  Notice: You can not select both Encryption and Authentication “NULL” type.	Encryption: DES(64bits) / 3DES(192bits) / AES(128, 192, 256bits) / NULL Authentication: MD5(128bits) / SHA1(160bits) / NULL Input format: hex {0-9,a-f,A-F} / str {text string}	ESP – Encryption (DES) / Authentication (MD5)
	AH - Authentication	Use the Authentication method only. And enter the key either hex or string form.	MD5(128bits) / SHA1(160bits) Input format: hex {0-9,a-f,A-F} / str {text string}	Disabled

Table 10-6 Add a IPsec Manual Key rule

**Step 4. Detail settings of IPsec Manual Key**

For the detailed setting in the Manual Key. We can press the *Advanced* button in the previous page. Then set the parameter separately.

**ADVANCED SETTINGS > VPN Settings > IPsec > Manual Key > Add > Advanced**

IPsec   PPTP   L2TP   **Pass Through**

IPsec->Manual Key->Edit Rule->Advance

**Condition**

Transport Layer Protocol ANY

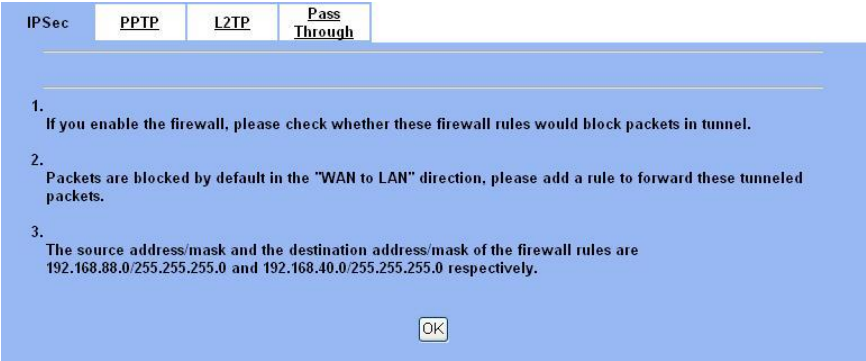

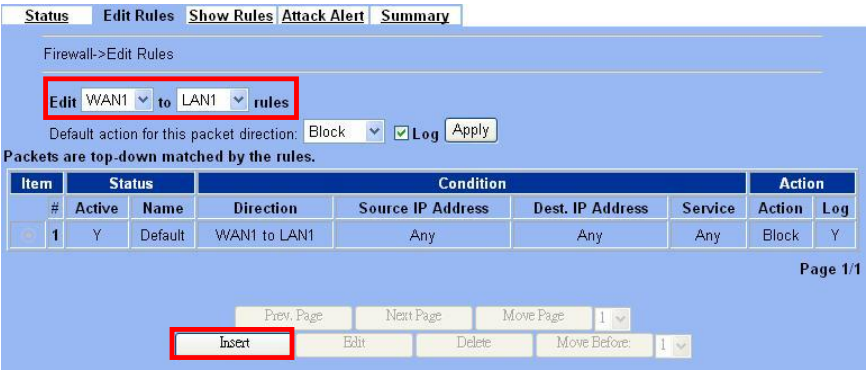

**Action**

Enable Replay Detection NO

Back   Apply   Reset

	FIELD	DESCRIPTION	Range / Format	EXAMPLE
Condition	Transport Layer Protocol	Utilize this field to select some packets which are specified protocol (ANY, TCP, UDP). If the packets are not the specified protocol will not be allowed to pass through IPSec tunnels.	ANY / TCP / UDP	ANY
Action	Enable Replay Detection	Whether is the "Replay Detection" enabled ?	NO / YES	NO

Table 10-7 Setup Advanced feature in the IPSec Manual Key rule

<p><b>Step 5. Remind to add a Firewall rule</b></p> <p>After finishing IPSec rule settings, we need to add a firewall rule. Here system shows a window message to remind you of adding a firewall rule. Just press the <b>OK</b> button to add a firewall rule.</p>	<p><b>ADVANCED SETTINGS &gt; VPN Settings &gt; IPSec &gt; Manual Key &gt; Add</b></p> 
<p><b>Step 6. Add a Firewall rule</b></p> <p>Same as that in IKE method. Please make sure that the Firewall is enabled. Select WAN1-to-LAN1 to display the rules of this direction. The default action of this direction is Block with Logs. We have to allow the VPN traffic from the WAN1 side to enter our LAN1 side. So we click the <b>Insert</b> button to add a Firewall rule before the default rule.</p>	<p><b>ADVANCED SETTINGS &gt; Firewall &gt; Edit Rules</b></p> 

**Step 7. Customize the Firewall rule**

Check the **Activate this rule**. Enter the Rule Name as **AllowVPN**, Source IP as 192.168.88.0, and Dest. IP as 192.168.40.0. Click **Apply** to store this rule.

**ADVANCED SETTINGS > Firewall > Edit Rules > Insert**

---

**Step 8. View the result**

Here we have a new rule before the default firewall rule. This rule will allow packets from 192.168.88.0 / 255.255.255.0 pass through DFL-900. And accomplish the VPN tunnel establishment.

**ADVANCED SETTINGS > Firewall > Edit Rules**

Item	Status	Name	Direction	Source IP Address	Dest. IP Address	Service	Action	Log
1	Y	AllowVPN	WAN1 to LAN1	192.168.88.0/255.255.255.0	192.168.40.0/255.255.255.0	Any	Forward	N
2	Y	Default	WAN1 to LAN1	Any	Any	Any	Block	Y

**At DFL-2:**

Second, we will use the Manual-Key way to install the IPsec properties of DFL-1.

**Step 1. Enable IPsec**

Check the **Enable IPsec** checkbox and click **Apply**.

**ADVANCED SETTINGS > VPN Settings > IPsec**

Item	Status	Condition		Action			
#	Active	Name	Local LAN	Remote LAN	Mechanism	My IP	Peer's IP
<div style="display: flex; justify-content: center; gap: 10px;"> <span>Prev. Page</span> <span>Next Page</span> <span>Move Page</span> <span>1</span> </div> <div style="display: flex; justify-content: center; gap: 10px; margin-top: 5px;"> <span>Add</span> <span>Edit</span> <span>Delete</span> </div>							

**Step 2. Add a Manual Key rule**

Click the Manual Key hyperlink and click Add to add a new IPSec VPN tunnel endpoint.

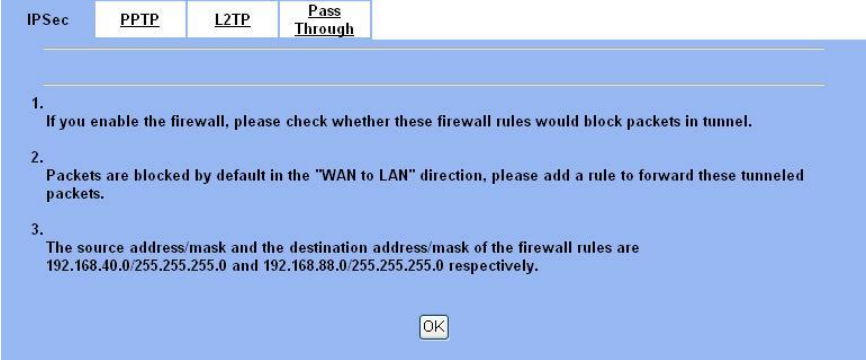

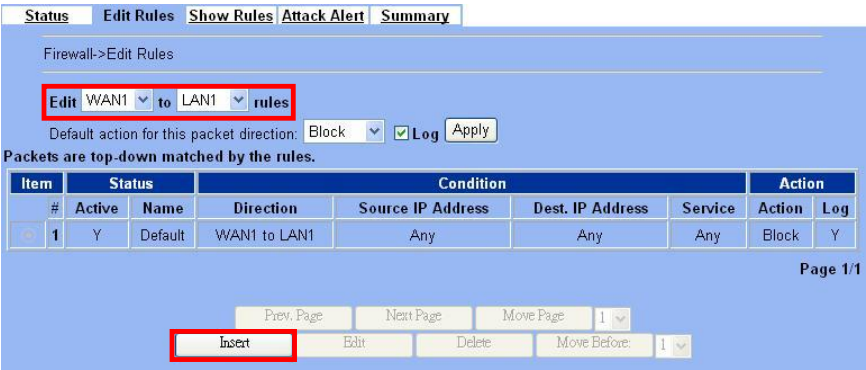

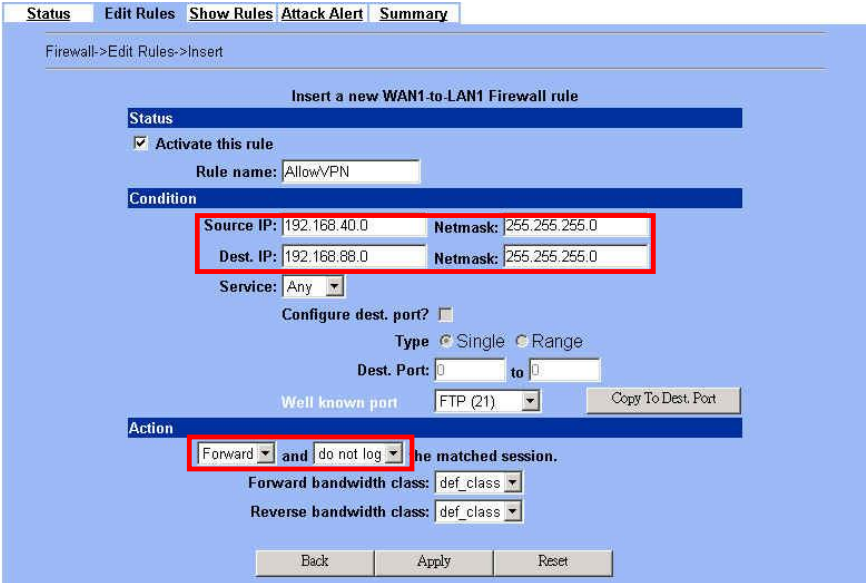

**ADVANCED SETTINGS > VPN Settings > IPSec > Manual Key**

**Step 3. Customize the rule**

Similar to those in DFL-1, except that you should interchange the Local IP Address with Remote IP Address in the Condition part and the Outgoing SPI with the Incoming SPI in the Action part. Besides, set the Peer's IP Address with the WAN1 IP address of DFL-1.

**ADVANCED SETTINGS > VPN Settings > IPSec > Manual Key > Add**

<p><b>Step 4. Remind to add a Firewall rule</b></p> <p>After finishing IPsec rule settings, we need to add a firewall rule. Here system shows a window message to remind you of adding a firewall rule. Just press the OK button to add a firewall rule.</p>	<p><b>ADVANCED SETTINGS &gt; VPN Settings &gt; IPsec &gt; Manual Key &gt; Add</b></p> 																		
<p><b>Step 5. Add a Firewall rule</b></p> <p>Same as that in IKE method. Please make sure that the Firewall is enabled. Select WAN1-to-LAN1 to display the rules of this direction. The default action of this direction is Block with Logs. We have to allow the VPN traffic from the WAN1 side to enter our LAN1 side. So we click the Insert button to add a Firewall rule before the default rule.</p>	<p><b>ADVANCED SETTINGS &gt; Firewall &gt; Edit Rules</b></p>  <table border="1"> <thead> <tr> <th>Item</th> <th>Status</th> <th>Name</th> <th>Direction</th> <th>Source IP Address</th> <th>Dest. IP Address</th> <th>Service</th> <th>Action</th> <th>Log</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Y</td> <td>Default</td> <td>WAN1 to LAN1</td> <td>Any</td> <td>Any</td> <td>Any</td> <td>Block</td> <td>Y</td> </tr> </tbody> </table>	Item	Status	Name	Direction	Source IP Address	Dest. IP Address	Service	Action	Log	1	Y	Default	WAN1 to LAN1	Any	Any	Any	Block	Y
Item	Status	Name	Direction	Source IP Address	Dest. IP Address	Service	Action	Log											
1	Y	Default	WAN1 to LAN1	Any	Any	Any	Block	Y											
<p><b>Step 6. Customize the Firewall rule</b></p> <p>Check the Activate this rule. Enter the Rule Name as AllowVPN, Source IP as 192.168.40.0, and Dest. IP as 192.168.88.0. Click Apply to store this rule.</p>	<p><b>ADVANCED SETTINGS &gt; Firewall &gt; Edit Rules &gt; Insert</b></p> 																		

## Part IV Virtual Private Network

### Step 7. View the result

Now we have inserted a new rule before the default firewall rule. Any packets from 192.168.40.0/24 to 192.168.88.0/24 will be allowed to pass through the DFL-900 and successfully access the 192.168.88.0/24 through the VPN tunnel.

### ADVANCED SETTINGS > Firewall > Edit Rules

Firewall->Edit Rules

Edit WAN1 to LAN1 rules

Default action for this packet direction: Block  Log Apply

Packets are top-down matched by the rules.

Item #	Status	Name	Direction	Source IP Address	Dest. IP Address	Service	Action	Log
1	Y	AllowVPN	WAN1 to LAN1	192.168.40.0/255.255.255.0	192.168.88.0/255.255.255.0	Any	Forward	N
2	Y	Default	WAN1 to LAN1	Any	Any	Any	Block	Y

# Chapter 11

## Virtual Private Network –Dynamic IPsec

*This chapter introduces Dynamic IPsec VPN and explains how to implement it.*

As described in the Figure 2-1, we will extend to explain how to make a dynamic VPN link between LAN\_1 and LAN\_2 in this chapter. The following Figure 11-1 is the real structure in our implemented process.

### 11.1 Demands

1. When a branch office subnet LAN\_1 wants to connect with another branch office subnet LAN\_2 through the public Internet instead of the expensive private leased lines, VPN can provide encryption and authentication to secure the tunnel that connects these two LANs. If the remote VPN peer has a dynamically assigned IP address (DHCP or PPPoE) like Organization\_2, we have to use the Dynamic IPsec for the tunnel connection.

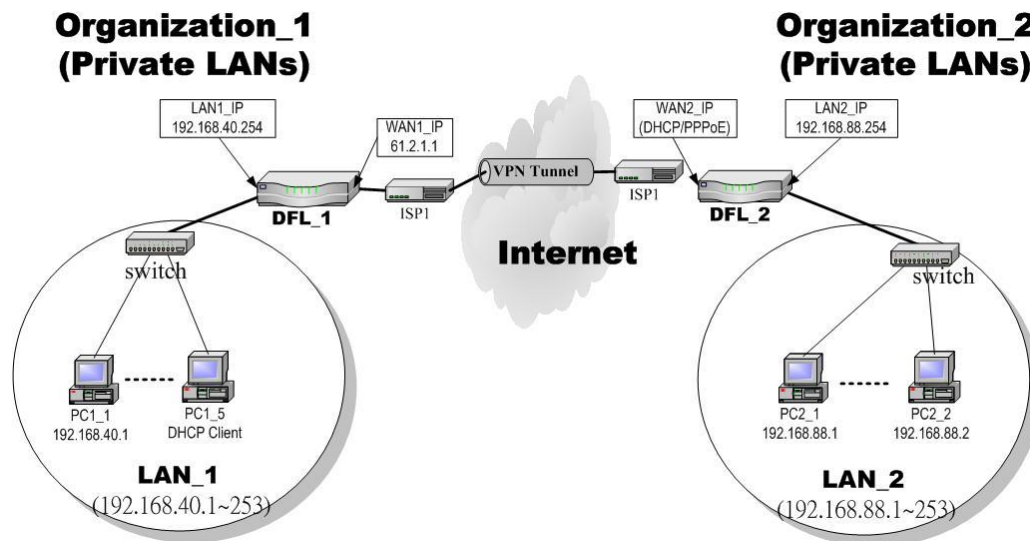

Figure 11-1 Organization\_1 LAN\_1 is making dynamic VPN tunnel with Organization\_2 LAN\_2

### 11.2 Objectives

1. Let the users in LAN\_1 and LAN\_2 share the resources through a secure channel established using the dynamic IPsec VPN.

### 11.3 Methods

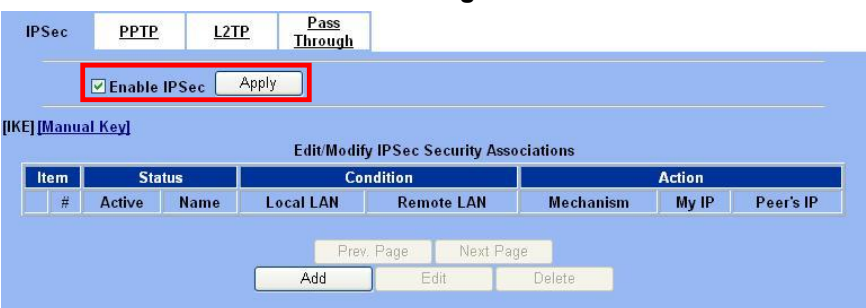

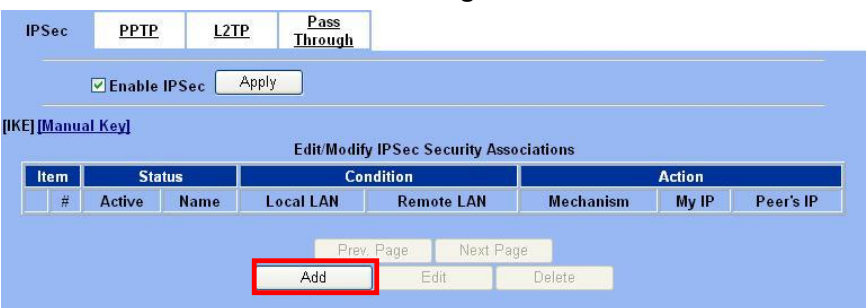

1. Separately configure DFL-1 and DFL-2 which are the edge gateways of LAN\_1 and LAN\_2 respectively.

### 11.4 Steps

In the following we will separately explain how to set up a secure DES/MD5 tunnel with the dynamic remote gateway IP address type.

**At DFL-1:**

At the first, we will install the IPSec properties of DFL-1. For the related explanation, please refer to Chapter 9 and Chapter 10.

<p><b>Step 1. Enable IPSec</b> Check the <code>Enable IPSec</code> checkbox and click <code>Apply</code>.</p>	<p><b>ADVANCED SETTINGS &gt; VPN Settings &gt; IPSec</b></p>  <p>IPSec <code>PPTP</code> <code>L2TP</code> <code>Pass Through</code></p> <p><input checked="" type="checkbox"/> <code>Enable IPSec</code> <code>Apply</code></p> <p><a href="#">[IKE] [Manual Key]</a></p> <p>Edit/Modify IPSec Security Associations</p> <table border="1"><thead><tr><th>Item</th><th>Status</th><th colspan="2">Condition</th><th>Action</th></tr><tr><th>#</th><th>Active</th><th>Name</th><th>Local LAN</th><th>Remote LAN</th><th>Mechanism</th><th>My IP</th><th>Peer's IP</th></tr></thead><tbody></tbody></table> <p><code>Prev. Item	Status	Condition		Action										
#	Active	Name	Local LAN	Remote LAN	Mechanism	My IP	Peer's IP							
<p><b>Step 2. Add an IKE rule</b> Click the <code>IKE</code> hyperlink and click <code>Add</code> to add a new IPSec VPN tunnel endpoint.</p>	<p><b>ADVANCED SETTINGS &gt; VPN Settings &gt; IPSec &gt; IKE</b></p>  <p>IPSec <code>PPTP</code> <code>L2TP</code> <code>Pass Through</code></p> <p><input checked="" type="checkbox"/> <code>Enable IPSec</code> <code>Apply</code></p> <p><a href="#">[IKE] [Manual Key]</a></p> <p>Edit/Modify IPSec Security Associations</p> <table border="1"><thead><tr><th>Item</th><th>Status</th><th colspan="2">Condition</th><th>Action</th></tr><tr><th>#</th><th>Active</th><th>Name</th><th>Local LAN</th><th>Remote LAN</th><th>Mechanism</th><th>My IP</th><th>Peer's IP</th></tr></thead><tbody></tbody></table> <p><code>Prev. Page</code> <code>Next Page</code></p> <p><code>Add</code> <code>Edit</code> <code>Delete</code></p>	Item	Status	Condition		Action	#	Active	Name	Local LAN	Remote LAN	Mechanism	My IP	Peer's IP
Item	Status	Condition		Action										
#	Active	Name	Local LAN	Remote LAN	Mechanism	My IP	Peer's IP							

**Step 3. Customize the rule**

Check the Active checkbox. Enter a name for this rule like IKErule. Enter the Local IP Address (192.168.40.0/255.255.255.0) and the Remote IP Address (192.168.88.0/255.255.255.0). Select the Outgoing Interface of this VPN/Firewall Router. Select Dynamic IP in the Peer's IP Address. Be sure to select Aggressive mode for the dynamic remote gateway address type. Click the ESP Algorithm and select Encrypt and Authenticate (DES, MD5). Enter the Pre-Shared Key as 1234567890. Click the Apply button to store the settings. Note, In the Action region. It should choose either ESP Algorithm or AH Algorithm, or system will show error message. If you hope to set the detailed item of IKE parameter. Click the Advanced button in this page. Otherwise it is ok to just leave the value default.

Note that Peers Identifier must NOT be IP Address type in the Dynamic IP type. So, you have to select FQDN (domain name) or user FQDN (mailbox) as the Peer's Identifier.

**ADVANCED SETTINGS > VPN Settings > IPsec > IKE > Add**

Self local IP Address

The opposite side IP Address

**Step 4. Detail settings of IPsec IKE**

In this page, we will set the detailed value of IKE parameter. For the related field, please refer to Table 10-5 indicated.

**ADVANCED SETTINGS > VPN Settings > IPsec > IKE > Add > Advanced**

**Step 5. Remind to add a Firewall rule**

After finishing IPSec rule settings, we need to add a firewall rule. Here system shows a window message to remind you of adding a firewall rule. Just press the **OK** button to add a firewall rule.

**ADVANCED SETTINGS > VPN Settings > IPSec > IKE > Add**

**Step 6. Add a Firewall rule**

Beforehand, please make sure that the Firewall is enabled. Select **WAN1-to-LAN1** to display the rules of this direction. The default action of this direction is **Block with Logs**. We have to allow the VPN traffic from the WAN1 side to enter our LAN1 side. So we click the **Insert** button to add a Firewall rule before the default rule.

**ADVANCED SETTINGS > Firewall > Edit Rules**

**Step 7. Customize the Firewall rule**

Check the **Activate this rule**. Enter the Rule Name as **AllowVPN**, Source IP as **192.168.88.0**, and Dest. IP as **192.168.40.0**. Click **Apply** to store this rule.

**ADVANCED SETTINGS > Firewall > Edit Rules > Insert**

**Step 8. View the result**

Here we have a new rule before the default firewall rule. This rule will allow packets from 192.168.88.0 / 255.255.255.0 pass through DFL-900. And accomplish the VPN tunnel establishment.

**ADVANCED SETTINGS > Firewall > Edit Rules**

Item #	Status	Name	Direction	Source IP Address	Dest. IP Address	Service	Action	Log
1	Y	AllowVPN	WAN1 to LAN1	192.168.88.0/255.255.255.0	192.168.40.0/255.255.255.0	Any	Forward	N
2	Y	Default	WAN1 to LAN1	Any	Any	Any	Block	Y

**At DFL-2:**

Here we will install the IPsec properties of DFL-2. Note that the “Local Address” and “Remote address” field are opposite to the DFL-1, and so are “My IP Address” and “Peer’s IP Address” field.

**Step 9. Enable IPsec**

Check the Enable IPsec checkbox and click Apply.

**ADVANCED SETTINGS > VPN Settings > IPsec**

**Step 10. Add an IKE rule**

Click the IKE hyperlink and click Add to add a new IPsec VPN tunnel endpoint.

**ADVANCED SETTINGS > VPN Settings > IPsec > IKE**

**Step 11. Customize the rule**

Check the Active checkbox. Enter a name for this rule like IKErule. Enter the Local IP Address (192.168.88.0/255.255.255.0) and the Remote IP Address (192.168.40.0/255.255.255.0). Be sure to select Aggressive mode to match the DFL-1 settings. Select the Outgoing interface of this VPN/Firewall Router. Enter the public IP of the opposite-side VPN gateway (61.2.1.1) in the Peer's IP Address. Click the ESP Algorithm and select Encrypt and Authenticate (DES, MD5). Enter the Pre-Shared Key as 1234567890. Select User FQDN (mailbox) and enter dlink.com in My Identifier field. Click the Apply button to store the settings. Note, in the Action region, you should choose either ESP Algorithm or AH Algorithm, or system will show error message.

Note that one of the Peer's IP Addresses is Static IP, and the other must be the Dynamic IP while using Dynamic IPsec VPN type to establish the VPN tunnel.

**ADVANCED SETTINGS > VPN Settings > IPsec > IKE > Add**

**Step 12. Remind to add a Firewall rule**

After finishing IPsec rule settings, we need to add a firewall rule. Here system shows a window message to remind you of adding a firewall rule. Just press the OK button to add a firewall rule.

**ADVANCED SETTINGS > VPN Settings > IPsec > IKE > Add**

**Step 13. Add a Firewall rule**

Same as at DFL-1. We need to add an extra firewall rule to allow IPsec packets to come from internet. So here we select WAN1-to-LAN1 direction, and click Insert button.

**ADVANCED SETTINGS > Firewall > Edit Rules**

Firewall->Edit Rules

Default action for this packet direction: Block  Log  Apply

Packets are top-down matched by the rules.

Item	Status	Condition					Action	
#	Active	Name	Direction	Source IP Address	Dest. IP Address	Service	Action	Log
1	Y	Default	WAN1 to LAN1	Any	Any	Any	Block	Y

Page 1/1

Prev. Page Next Page Move Page 1

Insert Edit Delete Move Before: 1

**Step 14. Customize the Firewall rule**

Check the Activate this rule. Enter the Rule Name as AllowVPN, Source IP as 192.168.40.0, and Dest. IP as 192.168.88.0. Click Apply to store this rule.

**ADVANCED SETTINGS > Firewall > Edit Rules > Insert**

Firewall->Edit Rules->Insert

Insert a new WAN1-to-LAN1 Firewall rule

Status

Activate this rule

Rule name: AllowVPN

Condition

Source IP: 192.168.40.0 Netmask: 255.255.255.0

Dest. IP: 192.168.88.0 Netmask: 255.255.255.0

Service: Any

Configure dest. port?

Type  Single  Range

Dest. Port: 0 to 0

Well known port FTP (21) Copy To Dest. Port

Action

Forward and do not log the matched session.

Forward bandwidth class: def\_class

Reverse bandwidth class: def\_class

Back Apply Reset

**Step 15. View the result**

Now we have inserted a new rule before the default firewall rule. Any packets from 192.168.40.0/24 to 192.168.88.0/24 will be allowed to pass through the DFL-900 and successfully access the 192.168.88.0/24 through the VPN tunnel.

**ADVANCED SETTINGS > Firewall > Edit Rules**

Firewall->Edit Rules

Default action for this packet direction: Block  Log  Apply

Packets are top-down matched by the rules.

Item	Status	Condition					Action	
#	Active	Name	Direction	Source IP Address	Dest. IP Address	Service	Action	Log
1	Y	AllowVPN	WAN1 to LAN1	192.168.40.0/255.255.255.0	192.168.88.0/255.255.255.0	Any	Forward	N
2	Y	Default	WAN1 to LAN1	Any	Any	Any	Block	Y

## Chapter 12

# Virtual Private Network – DS-601 VPN client

*This chapter introduces IPSec VPN using DS-601 VPN client and explains how to implement it.*

As described in the Figure 2-1, we will extend to explain how to make a VPN link between LAN\_1 and a remote client in this chapter. The following Figure 12-1 is the real structure in our implemented process.

### 12.1 Demands

1. When someone is on a business trip and need to connect back to the company by using VPN function. If he uses the DS-601 VPN client to make IPSec VPN tunnel with Organization\_1 LAN\_1, please refer to the following diagram to configure the settings.

Figure 12-1 The client DS-601 is making IPSec VPN tunnel with Organization\_1 LAN\_1

### 12.2 Objectives

1. Let the users in LAN\_1 and the client DS-601 share the resources through a secure channel established using the IPSec.

### 12.3 Methods

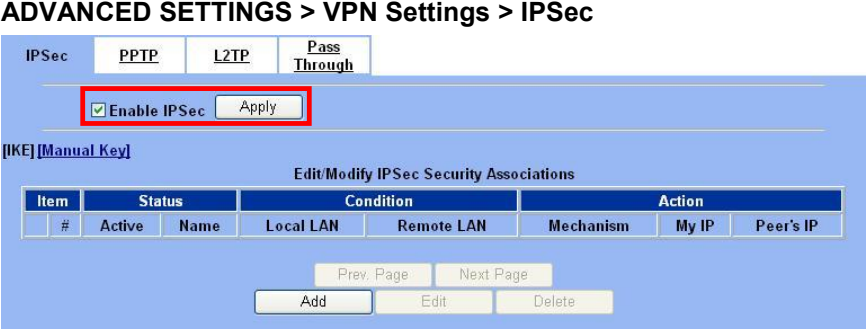

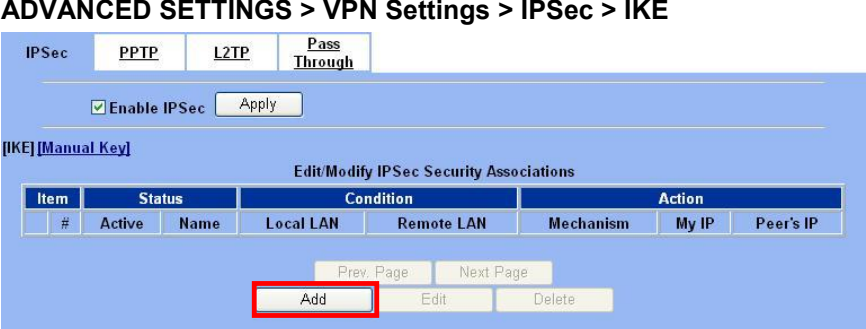

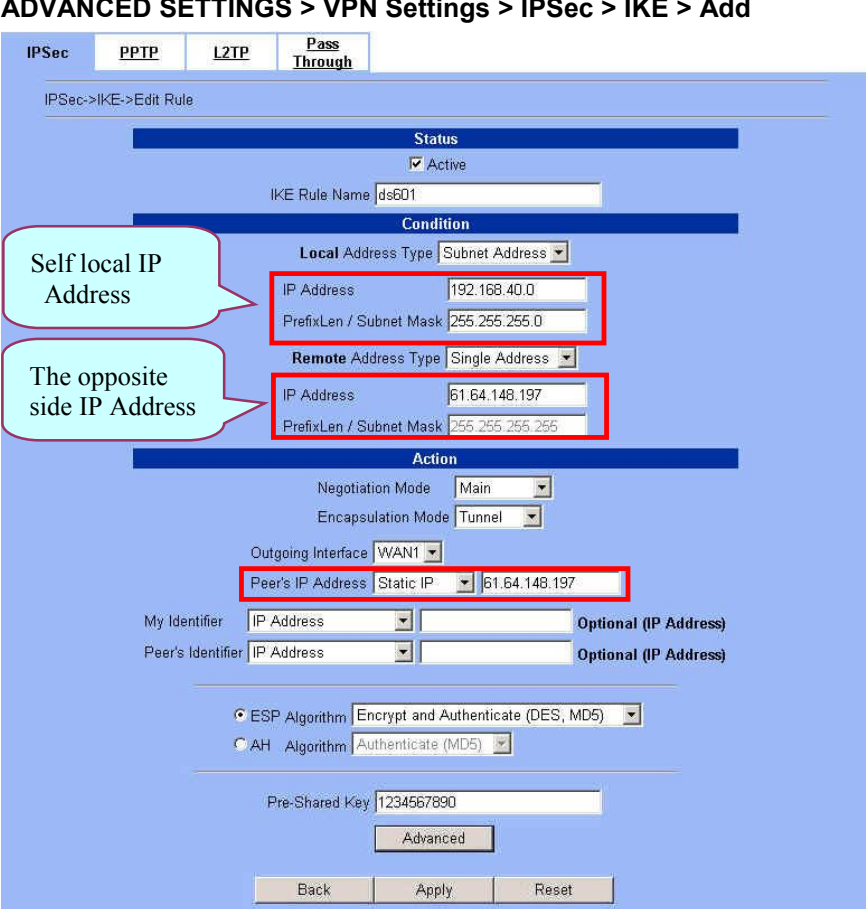

1. Separately configure DFL-1 and DS-601 VPN client to make IPSec VPN tunnel..

### 12.4 Steps

In the following, we will introduce you how to setup the IPSec between Organization\_1 LAN\_1 and DS-601 VPN client.

**At DFL-1:**

At the first, we will install the IPsec properties of DFL-1.

<p><b>Step 1. Enable IPsec</b> Check the <code>Enable IPsec</code> checkbox and click <code>Apply</code>.</p>	<p><b>ADVANCED SETTINGS &gt; VPN Settings &gt; IPsec</b></p> 
<p><b>Step 2. Add an IKE rule</b> Click the <code>IKE</code> hyperlink and click <code>Add</code> to add a new IPsec VPN tunnel endpoint.</p>	<p><b>ADVANCED SETTINGS &gt; VPN Settings &gt; IPsec &gt; IKE</b></p> 
<p><b>Step 3. Customize the rule</b> Check the <code>Active</code> checkbox. Enter a name for this rule like <code>IKerule</code>. Enter the <code>Local IP Address</code> (192.168.40.0/255.255.255.0) and the <code>Remote IP Address</code> (61.64.148.197/255.255.255.0). Select the <code>Outgoing Interface</code> of this VPN/Firewall Router. Enter the public IP of the opposite-side VPN gateway (61.64.148.197) in the <code>Peer's IP Address</code>. Click the <code>ESP Algorithm</code> and select <code>Encrypt and Authenticate (DES, MD5)</code>. Enter the <code>Pre-Shared Key</code> as 1234567890. Click the <code>Apply</code> button to store the settings. Note, In the <code>Action</code> region. It should choose either <code>ESP Algorithm</code> or <code>AH Algorithm</code>, or system will show error message. If you hope to set the detailed item of IKE parameter. Click the <code>Advanced</code> button in this page. Otherwise it is ok to just leave the value default.</p>	<p><b>ADVANCED SETTINGS &gt; VPN Settings &gt; IPsec &gt; IKE &gt; Add</b></p> 

**Step 4. Detailed settings of IPSec IKE**

In this page, we will set the detailed value of IKE parameter.

**ADVANCED SETTINGS > VPN Settings > IPSec > IKE > Add > Advanced**

**Step 5. Remind to add a Firewall rule**

After finishing IPSec rule settings, we need to add a firewall rule. Here system shows a window message to remind you of adding a firewall rule. Just press the OK button to add a firewall rule.

**ADVANCED SETTINGS > VPN Settings > IPSec > IKE > Add**

**Step 6. Add a Firewall rule**

Beforehand, please make sure that the Firewall is enabled. Select WAN1-to-LAN1 to display the rules of this direction. The default action of this direction is Block with Logs. We have to allow the VPN traffic from the WAN1 side to enter our LAN1 side. So we click the Insert button to add a Firewall rule before the default rule.

**ADVANCED SETTINGS > Firewall > Edit Rules**

Item	Status	Name	Direction	Source IP Address	Dest. IP Address	Service	Action	Log
1	Y	Default	WAN1 to LAN1	Any	Any	Any	Block	Y

<p><b>Step 7. Customize the Firewall rule</b></p> <p>Check the <b>Activate this rule</b>. Enter the Rule Name as <b>AllowDS-601</b>, Source IP as <b>61.64.148.197</b>, and Dest. IP as <b>192.168.40.0</b>. Click <b>Apply</b> to store this rule.</p>	<p><b>ADVANCED SETTINGS &gt; Firewall &gt; Edit Rules &gt; Insert</b></p>																											
<p><b>Step 8. View the result</b></p> <p>Here we have a new rule before the default firewall rule. This rule will allow packets from 61.64.148.197 / 255.255.255.255 pass through DFL-900. And accomplish the VPN tunnel establishment.</p>	<p><b>ADVANCED SETTINGS &gt; Firewall &gt; Edit Rules</b></p> <table border="1" style="width: 100%; border-collapse: collapse; margin-top: 10px;"> <thead> <tr> <th>Item</th> <th>Status</th> <th>Name</th> <th>Direction</th> <th>Source IP Address</th> <th>Dest. IP Address</th> <th>Service</th> <th>Action</th> <th>Log</th> </tr> </thead> <tbody> <tr style="border: 2px solid red;"> <td>1</td> <td>Y</td> <td>AllowDS-601</td> <td>WAN1 to LAN1</td> <td>61.64.148.197/255.255.255.255</td> <td>192.168.40.0/255.255.255.0</td> <td>Any</td> <td>Forward</td> <td>N</td> </tr> <tr> <td>2</td> <td>Y</td> <td>Default</td> <td>WAN1 to LAN1</td> <td>Any</td> <td>Any</td> <td>Any</td> <td>Block</td> <td>Y</td> </tr> </tbody> </table>	Item	Status	Name	Direction	Source IP Address	Dest. IP Address	Service	Action	Log	1	Y	AllowDS-601	WAN1 to LAN1	61.64.148.197/255.255.255.255	192.168.40.0/255.255.255.0	Any	Forward	N	2	Y	Default	WAN1 to LAN1	Any	Any	Any	Block	Y
Item	Status	Name	Direction	Source IP Address	Dest. IP Address	Service	Action	Log																				
1	Y	AllowDS-601	WAN1 to LAN1	61.64.148.197/255.255.255.255	192.168.40.0/255.255.255.0	Any	Forward	N																				
2	Y	Default	WAN1 to LAN1	Any	Any	Any	Block	Y																				

**At DS-601 VPN client:**

Here we will introduce you how to setup DS-601 VPN client properties. Before that, please install the DS-601 VPN client into the remote client first.

**Step 1. Enter a Connection Name**

Enter DFL-900 in the Name of the connection field and click Next to proceed.

**Configuration > Profile Settings > New Entry**

**Destination Assistant**

**Connection Name**  
Enter the name of the connection

The connection may be given a descriptive name; enter a name in the following field.

Name of the connection: DFL-900

< Back   Next   Cancel

**Step 2. Select Link Type**

Select LAN (over IP) in the Communication media field and the click Next to proceed.

**Configuration > Profile Settings > New Entry**

**Destination Assistant**

**Link type (Dial up configuration)**  
Select the media type of the connection.

Determine how the connection to the corporate network should be established. If the internet is to be used via modem, set the communication media to "modem" and then select the appropriate modem.

Communication media: LAN (over IP)

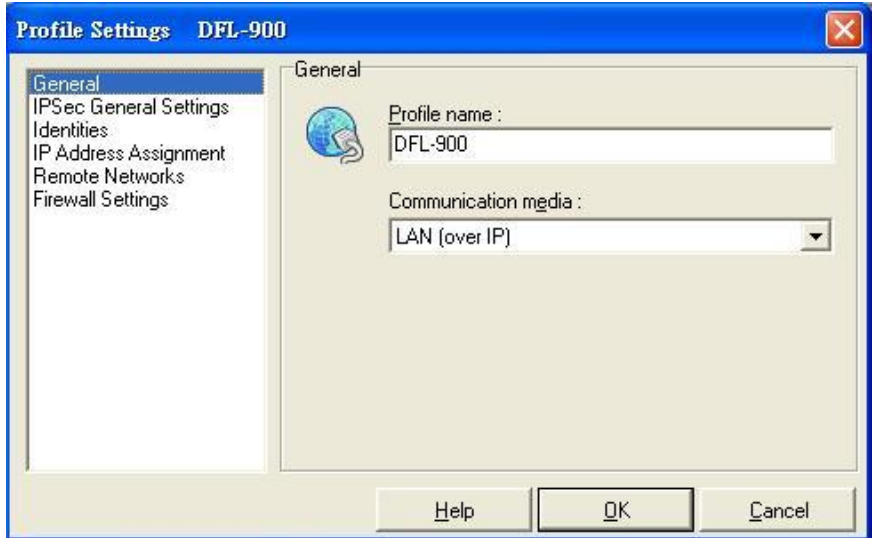

< Back   Next >   Cancel

**Step 5. General information**

After finishing the previous setting, we can view the general information here.

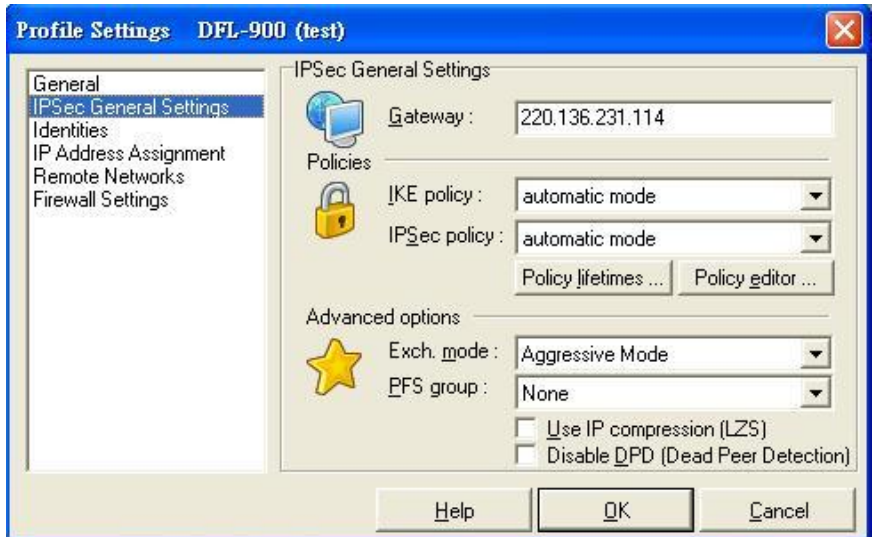

**Configuration > Profile Settings > Configure > General**

**Step 6. IPSec General Settings**

Check if the Gateway IP is correct, and then click the Policy editor to edit IKE and IPSec policy.

**Configuration > Profile Settings > Configure > IPSec General Settings**

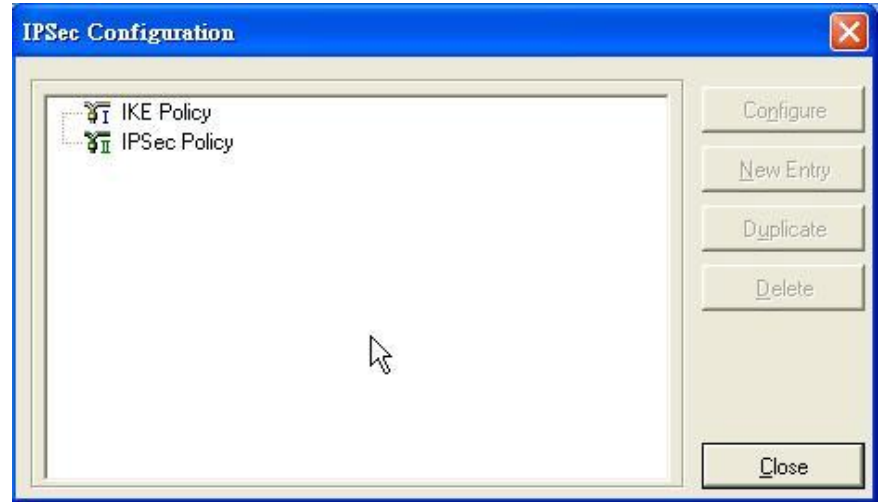

**Step 7. Policy editor**

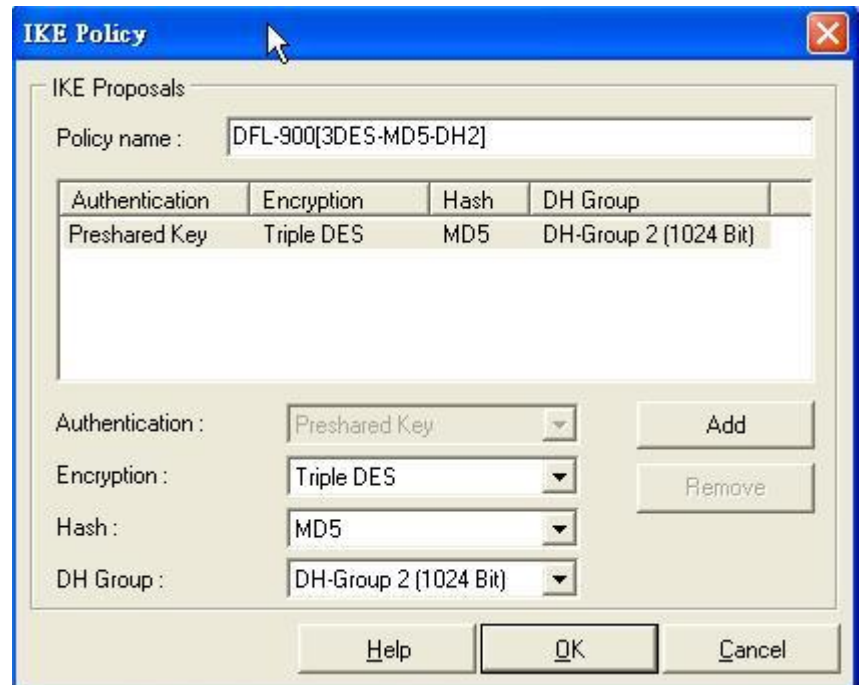

Click **IKE Policy** to edit the IKE policy.

**Configuration > Profile Settings > Configure > IPSec General Settings > Policy editor**

**Step 8. Setup IKE Policy**

Enter **DFL-900[3DES-MD5-DH2]** as the IKE Policy name. Select **Triple DES/MD5/DH-Group 2 [1024 Bit]** in the Encryption/Hash/DH Group field. Click **OK** to finish the settings.

**Configuration > Profile Settings > Configure > IPSec General Settings > Policy editor > IKE Policy**

**Step 9. Setup IPSec Policy**

Enter DFL-900 [3DES-MD5] as the IPSec Policy name. Select Triple DES and MD5 in the Transform and Authentication field. Click OK to finish the settings.

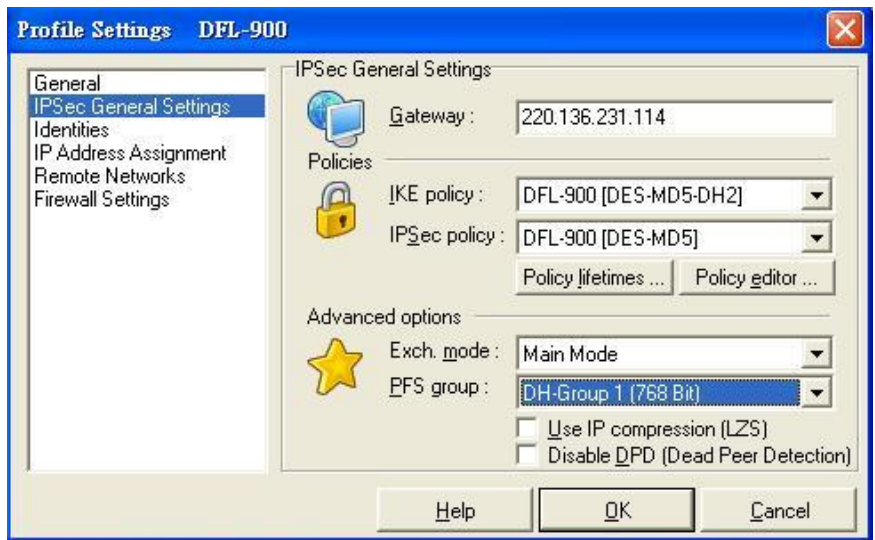

Configuration > Profile Settings > Configure > IPSec General Settings > Policy editor > IPSec Policy

**Step 10. IPSec advanced options**

In the Advanced options area, please select Main Mode in the Exch. mode and DH-Group 1 [768 Bit] in the PFS group.

Configuration > Profile Settings > Configure > IPSec General Settings > Advanced Options

**Step 11. View Identities**

Check if the Local Identity and the Pre-shared key are correct or not. If yes, click OK to finish the settings.

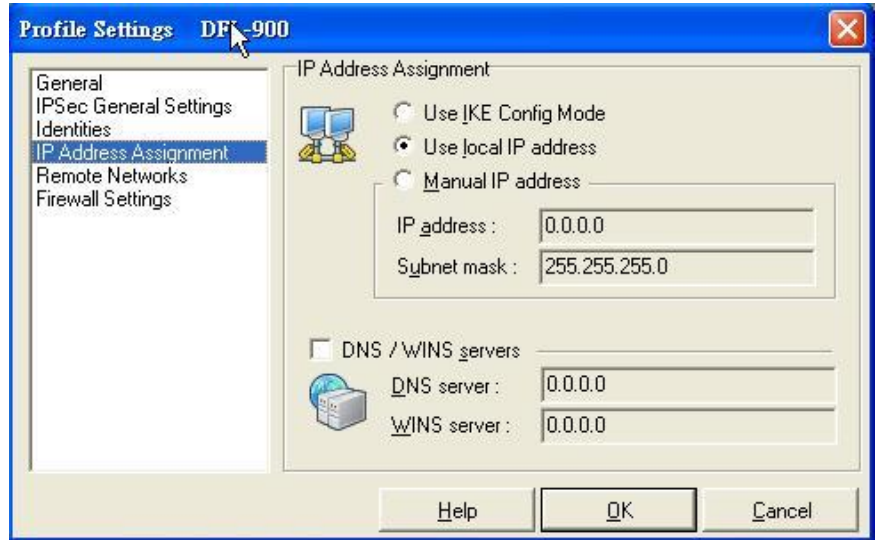

**Configuration > Profile Settings > Configure > Identities**

**Step 12. IP Address Assignment**

Select Use local IP address and then click OK to finish this settings.

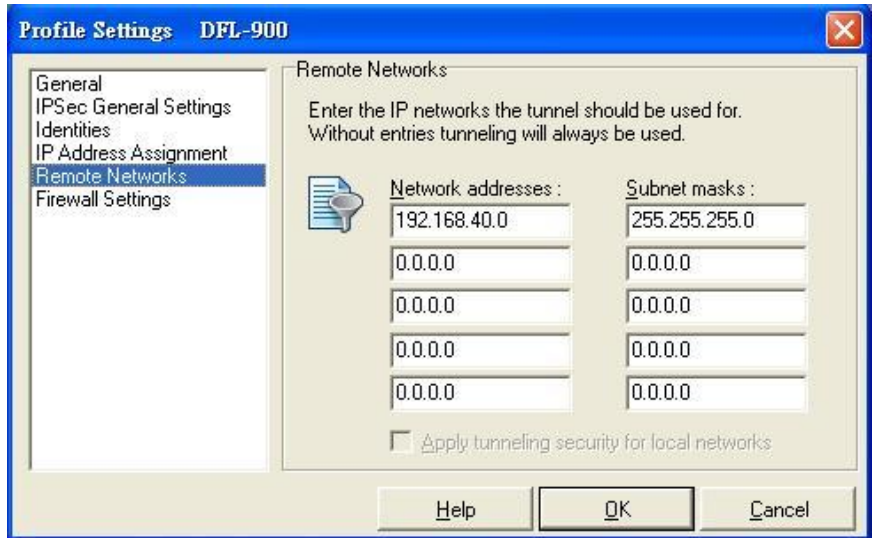

**Configuration > Profile Settings > Configure > IP Address Assignment**

**Step 13. Setup Remote Networks**

Enter the IP network address 192.168.40.0 and subnet masks 255.255.255.0, and then click OK to finish the settings.

**Configuration > Profile Settings > Configure > Remote Networks**

**Step 14. Firewall Settings**

In order to avoid any conflict, we recommend you to disable the Stateful Inspection.

**Configuration > Profile Settings > Configure > Firewall Settings**

**Step 15. Connect the IPSec VPN**

Click **Connect** to establish the IPSec VPN tunnel with **Organization\_1 LAN\_1**. If connection is established, you can view it like right diagram.

**Connection > Connect**

## Chapter 13 Virtual Private Network – PPTP

*This chapter introduces PPTP and explains how to implement it.*

### 13.1 Demands

1. One employee in our company may sometimes want to connect back to our corporate network to work on something. His PC is PC1\_1 in LAN\_1 instead of DMZ\_1 so he cannot directly access the host by simply with virtual server settings. This causes inconvenience for the employee to work remotely.
2. In our branch office, we need to provide PPTP connection methods to connect back to headquarter for the internal company employees.

### 13.2 Objectives

1. With PPTP tunneling, emulate the mobile employee as a member in LAN1 after he dials in the corporate network. Then he can access all computers in LAN\_1 just as if he stays in the office covered by LAN1.
2. Make sure every employee in the branch office can use the network resource in the headquarter. Suppose they are in the same internal network, and keep the communication security.

Figure 13-1 PPTP method connection

### 13.3 Methods

1. Setup the PPTP server at DFL-900. Setup the remote PC as the PPTP client. After dialing up to DFL-1, DFL-1 will assign a private IP which falls in the range of the settings in the PPTP server at DFL-1. Suppose the range is defined as 192.168.40.180 ~ 192.168.40.199, the remote host may get an IP of 192.168.40.180 and logically become a member in LAN1.

2. Setup the DFL-900 as the PPTP client. Let all the client PCs behind the DFL-900. They can connect to the network behind PPTP Server by passing through DFL-900. It sounds like no Internet exists but can connect with each other.

## 13.4 Steps

### 13.4.1 Setup PPTP Network Server

#### Step 1 – Enable PPTP Server

Check the **Enable PPTP** checkbox, enter the **LAN1\_IP** of the DFL-1(192.168.40.254) in the **Local IP**, and enter the IP range that will be assigned to the PPTP clients in the **Start IP** and the **End IP** fields. Enter the **Username** and **Password** that will be used by the employees during dial-up. Click the **Apply** to finish configurations.

#### ADVANCED SETTINGS > VPN Settings > PPTP

The screenshot shows the PPTP configuration page with the following fields and values:

- IPSec** (selected tab)
- PPTP** (selected tab)
- L2TP** (tab)
- Pass Through** (tab)
- Enable PPTP Server**
- [Server] [Client]** (radio buttons)
- Local IP:** 192.168.40.254
- Assigned IP Range:**
  - Start:** 192.168.40.180
  - End:** 192.168.40.199
- Username:** PptpUsers
- Password:** [masked]
- Apply** and **Reset** buttons

FIELD	DESCRIPTION	EXAMPLE
Enable PPTP Server	Enable PPTP feature of the DFL-900	Enabled
Local IP	The Local IP is the allocated IP address in the internal Network after PPTP client dials in the DFL-900.	192.168.40.254
Start IP	The Start IP is the allocated starting IP address in the internal network after PPTP client dials in the DFL-900.	192.168.40.180
End IP	The End IP is the allocated ending IP address in the internal network after PPTP client dials in the DFL-900.	192.168.40.199
Username	The account which allow PPTP client user to dial in DFL-900.	PptpUsers
Password	The password which allow PPTP client user to dial in DFL-900.	Dif3wk

Table 13-1 Setup PPTP Server

<p><b>Step 2 – Setup Windows XP/2000 PPTP clients</b></p>	<p><b><u>Configuring A PPTP Dial-Up Connection</u></b></p> <ol style="list-style-type: none"> <li>1. Configuring a PPTP dial-up connection</li> <li>2. Go to Start &gt; Control Panel &gt; Network and Internet Connections &gt; Make new connection.</li> <li>3. Select Create a connection to the network of your workplace and select Next.</li> <li>4. Select Virtual Private Network Connection and select Next.</li> <li>5. Give a Name the connection and select Next.</li> <li>6. If the Public Network dialog box appears, choose the Don't dial up initial connection and select Next.</li> <li>7. In the VPN Server Selection dialog, enter the public IP or hostname of the DFL-900 to connect to and select Next.</li> <li>8. Set Connection Availability to Only for myself and select Next.</li> <li>9. Select Finish.</li> </ol>
	<p><b><u>Customize the VPN Connection</u></b></p> <ol style="list-style-type: none"> <li>1. Right-click the icon that you have created.</li> <li>2. Select Properties &gt; Security &gt; Advanced &gt; Settings.</li> <li>3. Select No Encryption from the Data Encryption and click Apply.</li> <li>4. Select the Properties &gt; Networking tab.</li> <li>5. Select PPTP VPN from the VPN Type. Make sure the following are selected: TCP/IP QoS Packet Scheduler</li> <li>6. Select Apply.</li> </ol>
	<p><b><u>Connecting to the PPTP VPN</u></b></p> <ol style="list-style-type: none"> <li>1. Connect to your ISP.</li> <li>2. Start the dial-up connection configured in the previous procedure.</li> <li>3. Enter your PPTP VPN User Name and Password.</li> <li>4. Select Connect.</li> </ol>

### 13.4.2 Setup PPTP Network Client

<p><b>Step 1 – Enable PPTP Client</b></p> <p>Fill in the IP address of PPTP Server and allocates Username/Password. When connecting to the PPTP Server successfully, it will appear the allocated IP address for the PPTP client in the "Assigned IP" field.</p>	<p><b>ADVANCED SETTINGS &gt; VPN Settings &gt; PPTP &gt; Client</b></p> 
--	--

FIELD	DESCRIPTION	EXAMPLE
Enable PPTP Client	Enable PPTP Client feature of DFL-900	Enabled
Server IP	The IP address of PPTP server.	61.2.1.1
Username	The designed account which allows PPTP client to dial in.	PptpUsers
Password	The designed password which allows PPTP client to dial in.	Dif3wk
Assigned IP	The allocated IP address when PPTP client connects to the PPTP server.	192.168.40.180

Table 13-2 Setup PPTP Client settings

## Chapter 14

# Virtual Private Network – L2TP

*This chapter introduces L2TP and explains how to implement it.*

### 14.1 Demands

1. One employee in our company may sometimes want to connect back to our corporate network to work on something. His PC is PC1\_1 in LAN1 instead of DMZ1 so he cannot directly access the host by simply with virtual server settings. This causes inconvenience for the employee to work remotely.

### 14.2 Objectives

1. With L2TP tunneling, emulate the mobile employee as a member in LAN\_1 after he dials in the corporate network. Then he can access all computers in LAN\_1 just as if he stays in the office covered by LAN\_1.

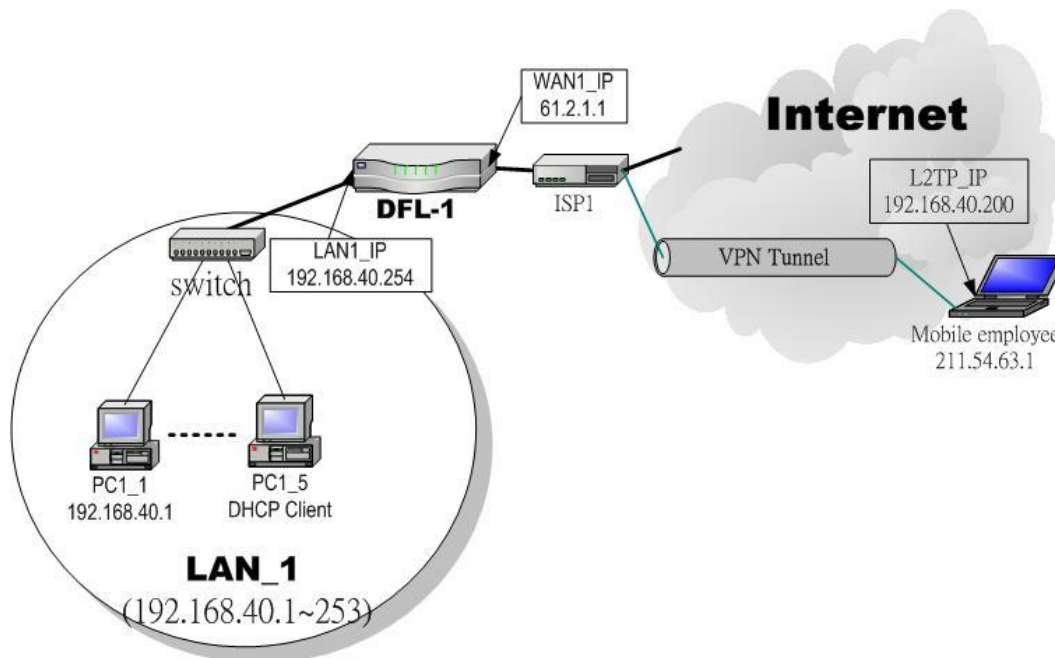

Figure 14-1 L2TP method connection

### 14.3 Methods

1. Setup the L2TP server at DFL-900 (LNS: L2TP Network Server). After dialing up to DFL-900, DFL-900 will assign a private IP which falls in the range of the settings in the L2TP server at DFL-900. Suppose the range is defined as 192.168.40.200 ~ 192.168.40.253, the remote host may get an IP of 192.168.40.200 and logically become a member in LAN\_1.

## 14.4 Steps

### 14.4.1 Setup L2TP Network Server

#### Step 1 – Enable L2TP LNS

Check the **Enable L2TP LNS** checkbox, enter the **LAN1\_IP** of the DFL-1 (192.168.40.254) in the **Local IP**, and enter the IP range that will be assigned to the L2TP clients in the **Start IP** and the **End IP** fields. Enter the IP range in the **LAC Start IP** and the **LAC End IP** that will cover the real IP of the remote users. In our case, since the employee uses 211.54.63.1 so we can fill 211.54.63.1~211.54.63.5 to cover 211.54.63.1. Enter the **Username** and **Password** that will be used by the employees during dial-up. Click the **Apply** to finish configurations.

#### ADVANCED SETTINGS > VPN Settings > L2TP

The screenshot shows the configuration page for L2TP. At the top, there are tabs for IPsec, PPTP, L2TP, and Pass Through. The L2TP tab is selected. Below the tabs, there is a checkbox labeled 'Enable L2TP LNS' which is checked. The configuration fields are as follows:

- Local IP:** 192.168.40.254
- Assigned IP Range:** Start: 192.168.40.200, End: 192.168.40.253
- Secure Client IP Range:** Start: 211.54.63.1, End: 211.54.63.5
- Username:** L2tpUsers
- Password:** Dif3wk

At the bottom, there are 'Apply' and 'Reset' buttons.

FIELD	DESCRIPTION	EXAMPLE	
Enable L2TP LNS	Enable L2TP LNS feature of DFL-900	Enabled	
Local IP	The Local IP is the allocated IP address in the internal network after default gateway of L2TP client dials in the DFL-900.	192.168.40.254	
Assigned IP Range	Start	The Start IP is the allocated starting IP address in the internal network after L2TP client dials in the DFL-900.	192.168.40.200
	End	The End IP is the allocated ending IP address in the internal network after L2TP client dials in the DFL-900.	192.168.40.253
Secure Client IP Range	Start	The IP address starting range which is allowed user to dial in LNS server by using L2TP protocol.	211.54.63.1
	End	The IP address ending range which is allowed user to dial in LNS server by using L2TP protocol.	211.54.63.5
Username	The account which allows L2TP client user to dial in DFL-900.	L2tpUsers	
Password	The password which allows L2TP client user to dial in DFL-900.	Dif3wk	

Table 14-1 Setup L2TP LNS Server settings

**Step 2 – Setup Windows XP/2000 L2TP clients****Configuring A L2TP Dial-Up Connection**

1. Configure a L2TP dial-up connection
2. Go to Start > Control Panel > Network and Internet Connections > Make new connection.
3. Select Create a connection to the network of your workplace and select Next.
4. Select Virtual Private Network Connection and select Next.
5. Give a Name the connection and select Next.
6. If the Public Network dialog box appears, choose the Don't dial up initial connection and select Next.
7. In the VPN Server Selection dialog, enter the public IP or hostname of the DFL-900 to connect to and select Next.
8. Set Connection Availability to Only for myself and select Next.
9. Select Finish.

**Customize the VPN Connection**

1. Right-click the icon that you have created.
2. Select Properties > Security > Advanced > Settings.
3. Select No Encryption from the Data Encryption and click Apply.
4. Select the Properties > Networking tab.
5. Select L2TP VPN from the VPN Type.  
Make sure the following are selected:  
TCP/IP  
QoS Packet Scheduler
6. Select Apply.

**Editing Windows Registry**

The default Windows 2000 L2TP traffic policy does not allow L2TP traffic without IPSec encryption. You can disable default behavior by editing the Windows 2000 Registry as described in the following steps. Please refer to the Microsoft documentation for editing the Windows Registry.

1. Use the registry editor (regedit) to locate the following key in the registry: HKEY\_LOCAL\_MACHINE \ System \ CurrentControlSet \ Services \ Rasman \ Parameters
2. Add the following registry value to this key:
  - Value Name: ProhibitIpSec
  - Data Type: REG\_DWORD
  - Value: 1
3. Save your changes and restart the computer.

You must add the ProhibitIpSec registry value to each Windows 2000-based endpoint computer of an L2TP or IPSec connection to prevent the automatic filter for L2TP and IPSec traffic from being created. When the ProhibitIpSec registry value is set to 1, your Windows 2000-based computer does not create the automatic filter that uses CA authentication. Instead, it checks for a local or Active Directory IPSec policy.

**Connecting to the L2TP VPN**

1. Connect to your ISP.
2. Start the dial-up connection configured in the previous procedure.
3. Enter your L2TP VPN User Name and Password.
4. Select Connect.

# Part V

## Content Filters

## Chapter 15

# Content Filtering – Web Filters

*This chapter introduces web content filters and explains how to implement it.*

### 15.1 Demands

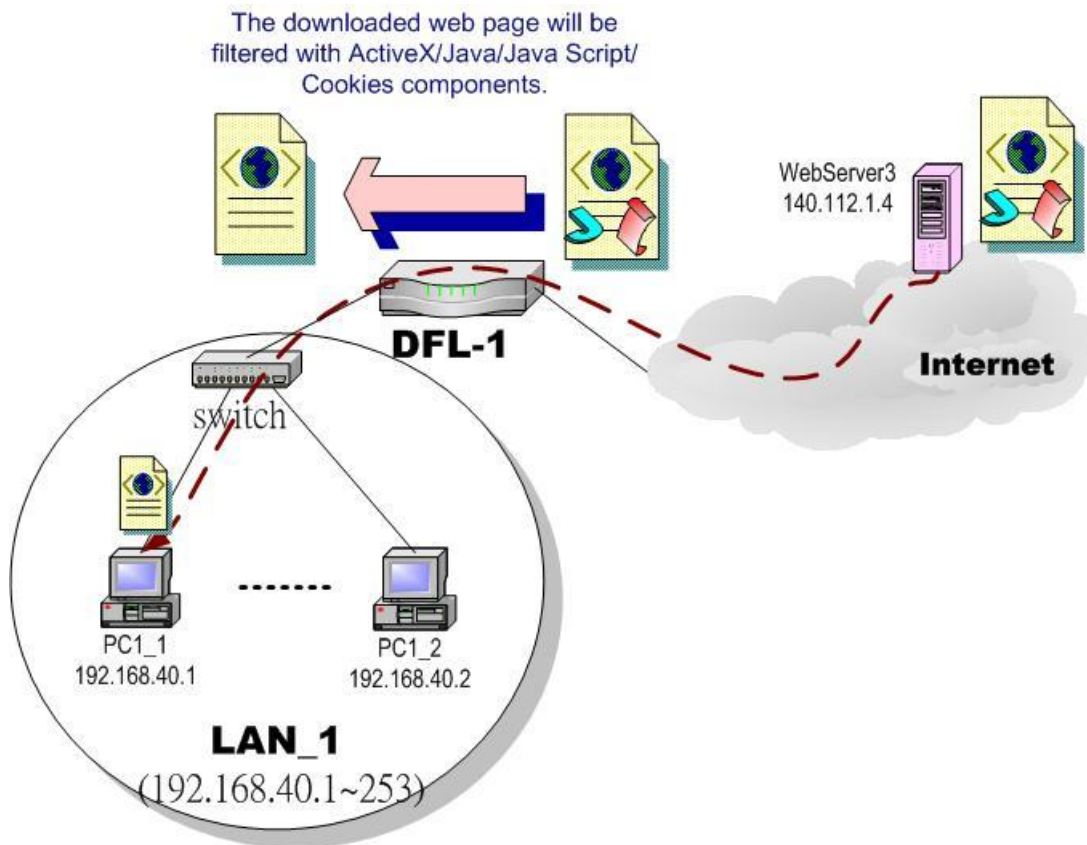

Figure 15-1 Use web filter functionality to avoid users browsing the forbidden web site

1. As the above Figure 15-1 illustrates, someone (PC1\_1) is browsing the web pages at the WebServer3. The contents of the web pages may include cookies, Java applets, Java scripts or ActiveX objects that may contain malicious program of users' information. So, we wish to prohibit the user (PC1\_1) from downloading the forbidden components.

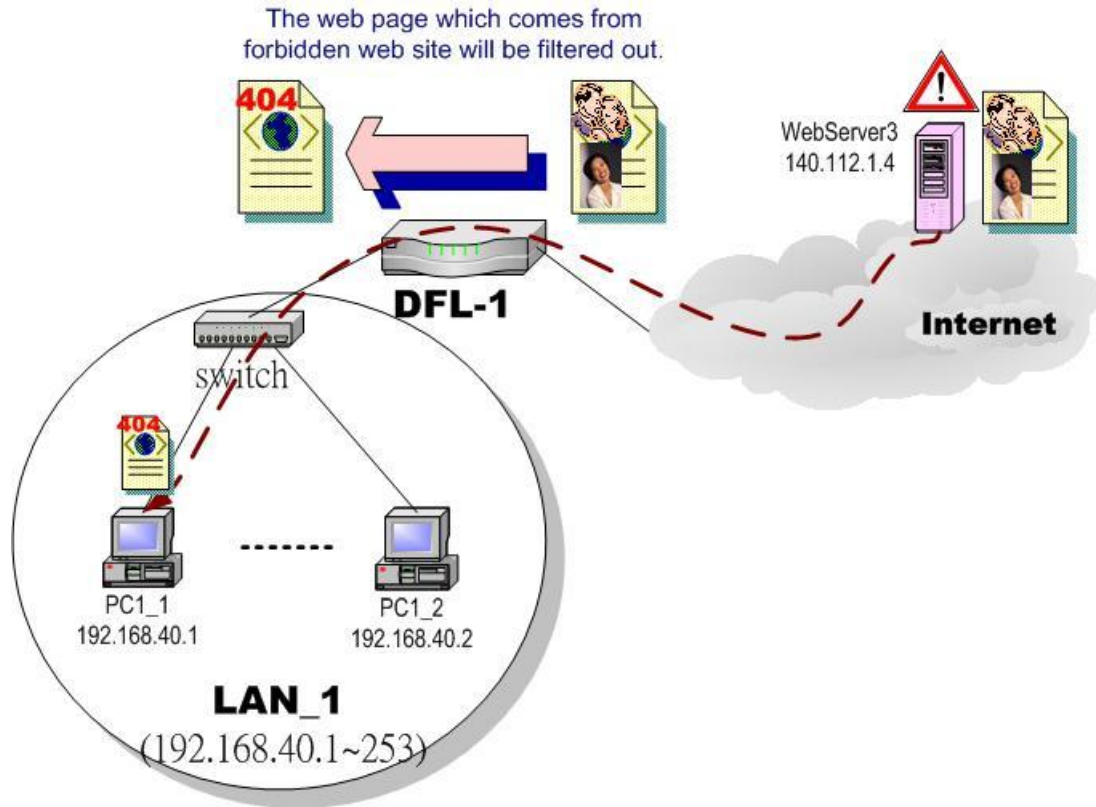

Figure 15-2 Use web filter functionality to avoid users view the forbidden web site

2. As the above Figure 15-2 illustrates, someone (PC1\_1) is browsing forbidden web pages on office hours. The contents of the web pages may include stock markets, violence, or sex that will waste the bandwidth of the Internet access link while degrading the efficiency of normal working hours. So, we wish to prohibit the user (PC1\_1) from viewing the page on the forbidden web site.

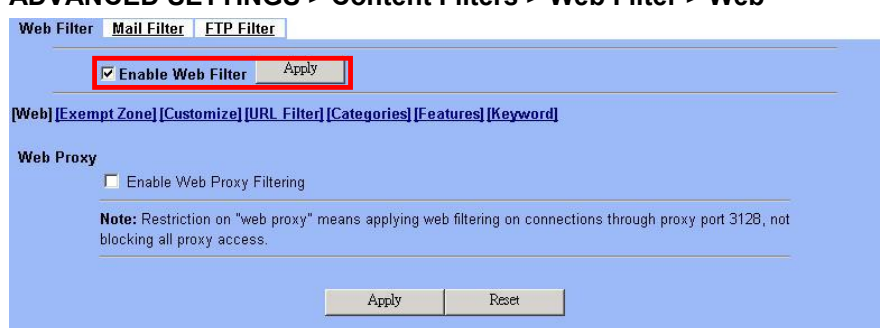

## 15.2 Objectives

1. Remove the cookies, Java applet, Java scripts, ActiveX objects from the web pages.
2. Prevent users from connecting to the forbidden sites.

## 15.3 Methods

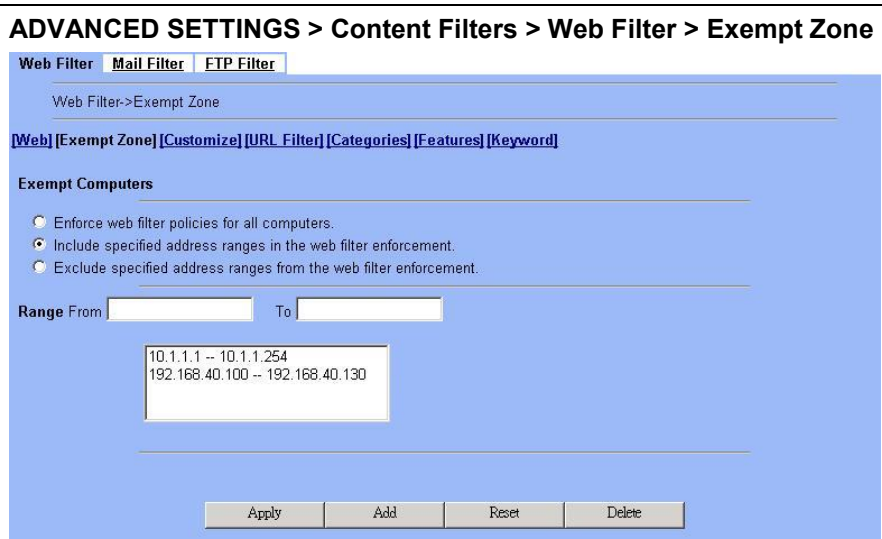

1. Setup content filtering for web objects such as cookies and Java applets.
2. Setup content filtering for URL requests. For each URL, check the pre-defined upgradeable URL database, self-entered forbidden domains, and self-entered keywords to check if the URL is allowed.

## 15.4 Steps

<p><b>Step 1. Enable Web Filter</b></p> <p>Check the <b>Enable Web Filter</b> checkbox and click the <b>Apply</b> right on the right side.</p>	<p><b>ADVANCED SETTINGS &gt; Content Filters &gt; Web Filter &gt; Web</b></p> 
--	--

FIELD	DESCRIPTION	EXAMPLE
Enable Web Filter	Enable Web Filter feature of DFL-900	Enabled
Enable Web Proxy Filtering	If enabling this feature, all the web pages pass through proxy ( <b>Only</b> port 3128) will also be verified by DFL-900. If disabling the “Web Proxy”, all the web pages through will bypass the verification.	Disabled
BUTTON	DESCRIPTION	
Apply	Apply the settings which have been configured.	
Reset	Clean the filled data and restore the original.	

Table 15-1 Enable Web Filter

<p><b>Step 2. Warning of Firewall</b></p> <p>This is a warning saying that if you block any web traffic from LAN-to-WAN in Firewall, the access control is shift to the Web Filter. Namely, if you block someone to access the web at the WAN side, after enabling the web filter, he can resume accessing the web until you set a content filter rule to block it.</p>	<p><b>ADVANCED SETTINGS &gt; Content Filters &gt; Web Filter &gt; Web</b></p> 
<p><b>Step 3. Further Customize the local zones</b></p> <p>You can configure to what range the filters will apply to the local zones. By default, the web filters apply to all computers so the “Enforce web filter policies for all computers” is selected, and the range is 0.0.0.0 – 255.255.255.255. Delete the default range by clicking the range item and the <b>Delete</b> button. Enter the IP range in the <b>Range</b> fields followed by a click of the <b>Add</b> button to add one address range to the web filter. Click “<b>Include.....</b>” and <b>Apply</b> if you want web filters to only apply to the specified ranges. Click “<b>Exclude.....</b>” and <b>Apply</b> if you want web filters to apply to all computers except those specified ranges.</p>	<p><b>ADVANCED SETTINGS &gt; Content Filters &gt; Web Filter &gt; Exempt Zone</b></p> 

## Part V Content Filters

FIELD	DESCRIPTION	EXAMPLE
Exempt Computers	Determine which IP range will exempt the verification by the web filter	
Enforce web filter policies for all computers	Web filter activates at all the computers, not limit range of the IP addresses	disabled
Include specified address ranges in the web filter enforcement	Web filter will only active at below specified computers.	Enabled
Exclude specified address ranges from the web filter enforcement	Except below specified IP address ranges. All the other IP address range, Web filter will active totally.	disabled
Range From	Here we can setup the IP address range, for the above Exempt Computers to use.	10.1.1.1 – 10.1.1.254 192.168.40.100 – 192.168.40.130
BUTTON	DESCRIPTION	
Apply	Apply the above selected “Exempt Computers” radius button.	
Add	Add the specified IP range which filled in the above “Range From” field.	
Reset	Clean the filled data and restore the original one.	
Delete	Delete the specified IP range which filled in the above “Range From” field.	

Table 15-2 Web Filter Exempt Zone setting page

<p><b>Step 4. Customize the specified sites</b></p> <p>Check the <b>Enable Filter List Customization</b> to allow all accesses to the <b>Trusted Domains</b> while disallowing all accesses to the <b>Forbidden Domains</b>. Check the <b>Disable all web traffic except for trusted domains</b> if you want to only allow the access to the <b>Trusted Domains</b>. However, if the web objects are set to be blocked by the DFL-900 in step 3, these allowed accesses will never be able to retrieve these objects. Check the “Don’t block ...” to allow the objects for these trusted domains. The domains are maintained by enter the address in the <b>Domain</b> field with a click of the <b>Add</b> button. To delete a domain, click the domain with a click of the <b>Delete</b> button.</p>	<p><b>ADVANCED SETTINGS &gt; Content Filters &gt; Web Filter &gt; Customize</b></p> <p>Web Filter   Mail Filter   FTP Filter</p> <p>Web Filter-&gt;Customize</p> <p><a href="#">Web</a>   <a href="#">Exempt Zone</a>   <a href="#">Customize</a>   <a href="#">URL Filter</a>   <a href="#">Categories</a>   <a href="#">Features</a>   <a href="#">Keyword</a></p> <p><input checked="" type="checkbox"/> <b>Enable Filter List Customization</b></p> <p><input checked="" type="checkbox"/> Disable all web traffic except for trusted domains.  <input checked="" type="checkbox"/> Don't block Java/JavaScript/ActiveX/Cookies to trusted domain sites.</p> <p><b>Trusted Domains</b></p> <p>Domain <input type="text"/></p> <p>www.dlink.com.tw www.dlink.com</p> <p><input type="button" value="Add"/> <input type="button" value="Delete"/></p> <hr/> <p><b>Forbidden Domains</b></p> <p>Domain <input type="text"/></p> <p>www.sex.com www.stockmarket.com</p> <p><input type="button" value="Add"/> <input type="button" value="Delete"/></p> <p><input type="button" value="Apply"/> <input type="button" value="Reset"/></p>
--	--

FIELD	DESCRIPTION	EXAMPLE
Enable Filter List Customization	Enable the Filter List Customization feature of web filter. If you only enable it, all the domains in the <code>Trusted Domains</code> will be allowed to pass through DFL-900. Contrarily, all the domains in the <code>Forbidden Domain</code> will be blocked by the DFL-900.	Enabled
Disable all web traffic except for trusted domains	Except the following specified domain range specified by the trusted domain. All the other URL domain IP addresses are all blocked access.	Enabled
Don't block Java/Java Script/ActiveX/Cookies to trusted domain sites	In the following domain range of the trusted domains. If there are include Java/ Java Script/ActiveX/Cookies components in the web page, the action is setting not to block.	Enabled
Trusted Domains Domain	Here we can specify the Trusted Domains for the above item using. You can enter either domain name or IP address. Note: if the domain name can not be resolved by the DNS server, the domain name entry will be ignored. Another issue is that if there are a lot of domain names in Customize area, name resolving will take longer time on Web Filter starting up.	www.dlink.com.tw www.dlink.com
Forbidden Domains Domain	Here we can specify the Forbidden Domains for the above item using. You can enter either domain name or IP address. Note: if the domain name can not be resolved by the DNS server, the domain name entry will be ignored. Another issue is that if there are a lot of domain names in Customize area, name resolving will take longer time on Web Filter starting up.	www.sex.com www.stockmarket.com
BUTTON	DESCRIPTION	
Add	Add the Trusted/Forbidden Domains IP range to the list.	
Delete	Delete the Trusted/Forbidden Domains IP range from the list.	
Apply	Apply the setting which configured on the checkbox.	
Reset	Clean the filled data and restore the original one.	

Table 15-3 Web Filter Customize setting page

<p><b>Step 5. Setup URL keyword blocking</b></p> <p>Check the <code>Enable Keyword Blocking</code> to block any URLs that contains the entered keywords. Add a key word by entering a word in the <code>keyword</code> field followed by a click of <code>Add</code>.</p>	<p><b>ADVANCED SETTINGS &gt; Content Filters &gt; Web Filter &gt; URL Filter</b></p>
---	--

## Part V Content Filters

FIELD	DESCRIPTION	EXAMPLE
Enable URL Keyword blocking	Enable URL keyword blocking feature of web filter	Enabled
Keyword	If the Keyword appears in the URL when connect to the Internet using browser. The contents about the URL will be block.	sex
BUTTON	DESCRIPTION	
Apply	Apply the setting which configured on the checkbox.	
Add	Add the Keyword to the list.	
Reset	Clean the filled data and restore the original one.	
Delete	Delete the selected keyword from the list.	

Table 15-4 Web Filter Domain Name setting page

**Step 6. Customize Categories**

With the built-in URL database, DFL-900 can block web sessions towards several pre-defined Categories of URLs. Check the items that you want to block or log. Simply click the Block all categories will apply all categories. Click Log & Block Access if you want to block and log any matched traffic. You can customize the Time of Day to allow such traffic after the office hours, such as 9:30 to 17:30.

**ADVANCED SETTINGS > Content Filters > Web Filter > Categories**

Web Filter | Mail Filter | FTP Filter

Web Filter->Categories

[\[Web\]](#) [\[Exempt Zone\]](#) [\[Customize\]](#) [\[URL Filter\]](#) [\[Categories\]](#) [\[Features\]](#) [\[Keyword\]](#)

**Use URL Database**

The database has not been updated

Log & Block Access
  Log Only
  Block Only
  Block all categories

<input checked="" type="checkbox"/> Violence/Profanity	<input type="checkbox"/> Partial Nudity	<input checked="" type="checkbox"/> Full Nudity	<input checked="" type="checkbox"/> Sexual Acts
<input checked="" type="checkbox"/> Gross Depictions	<input checked="" type="checkbox"/> Racist/Ethnic Imp.	<input type="checkbox"/> Statnic/Cult	<input checked="" type="checkbox"/> Drug Culture
<input type="checkbox"/> Militant/Extremist	<input checked="" type="checkbox"/> Sex Education	<input type="checkbox"/> Gambling/Questionable/Illegal	
<input checked="" type="checkbox"/> Alcohol, Beer, Wine, Tobacco		<input checked="" type="checkbox"/> Sports/Entertainment	

**Time of Day**

Always block  
 Block from 9 : 30 to 17 : 30 (24-hour format)

FIELD	DESCRIPTION	EXAMPLE
Use URL Database	Determine how to deal with the URL types in this page (Log & Block Access, Log Only, Block Only)	Log & Block Access
Block all categories	Make all categories below enabled	disabled
Violence/Profanity, Gross Depictions, Militant/Extremist ,etc. items	Check the categories you would like to enable	Enable the checked ones
Time of Day	The time which was set for Web Filter.	9:30 ~ 17:30
BUTTON	DESCRIPTION	
Apply	Apply the settings which have been configured.	
Reset	Clean the filled data and restore the original.	

Table 15-5 Web Filter Categories setting page

<p><b>Step 7. Customize Objects</b></p> <p>Check the objects of <b>Restricted Features</b> to block the objects. Click the <b>Apply</b> button at the bottom of this page. After finish settings, you can use PC1_1 to browse the web page to see if the objects are blocked. If the objects still exist, the objects may be cached by the browser. Please clear the cache in the web browser, close the browser, reopen the browser, and connect to the web page again.</p>	<p><b>ADVANCED SETTINGS &gt; Content Filters &gt; Web Filter &gt; Features</b></p>
--	--

FIELD	DESCRIPTION	EXAMPLE
Restricted Features	Select the below items that will verified by Web Filter of DFL-900.	
ActiveX	filter the web page that includes ActiveX	Enabled
Java	filter the web page that includes Java applet	Enabled
Java Script	filter the web page that includes Java Script	Enabled
Cookies	filter the web page that includes Cookies	Enabled
MSN over HTTP	filter MSN application which is through http proxy	Disabled
BUTTON	DESCRIPTION	
Apply	Apply the settings which have been configured.	
Reset	Clean the filled data and restore the original.	

Table 15-6 Web Filter setting page

<p><b>Step 8. Setup contents keyword blocking</b></p> <p>Check the <b>Enable Keyword Blocking</b> to block any Web pages that contain the entered keywords. Add a key word by entering a word in the <b>Keyword</b> field and then click <b>Add</b> to proceed.</p> <p>Note that you can add the keywords as many as you like.</p>	<p><b>ADVANCED SETTINGS &gt; Content Filters &gt; Web Filter &gt; Keyword</b></p>
--	---

FIELD	DESCRIPTION	EXAMPLE
Enable keyword blocking, limit at __ matches	Check <b>Enable keyword blocking</b> , and then the web pages will be blocked if the keywords below you have added are appeared in the pages. "Limit at 3 matches" means that the webpages will be blocked as long as any of the added keywords appear equal or more than three times.	Enabled 3 matches

Keyword	Specify the keyword that you want to block.	sex violence blood
BUTTON	DESCRIPTION	
Apply	Apply the settings which have been configured.	
Add	Add the Keyword to the list.	
Reset	Clean the filled data and restore the original one.	
Delete	Delete the Keyword from the list.	

Table 15-7 Web Filter Content Keywords setting page

## 15.5 Setting priorities

The function priority of web filter is shown as the following Figure 15-3 illustrated. From the left feature (Exempt Zone) to the right feature (Keyword). Their priority is high to low.

Notice: The Restricted features of /Web Filter/Web page is lowest priority, but it is located at the most left side.

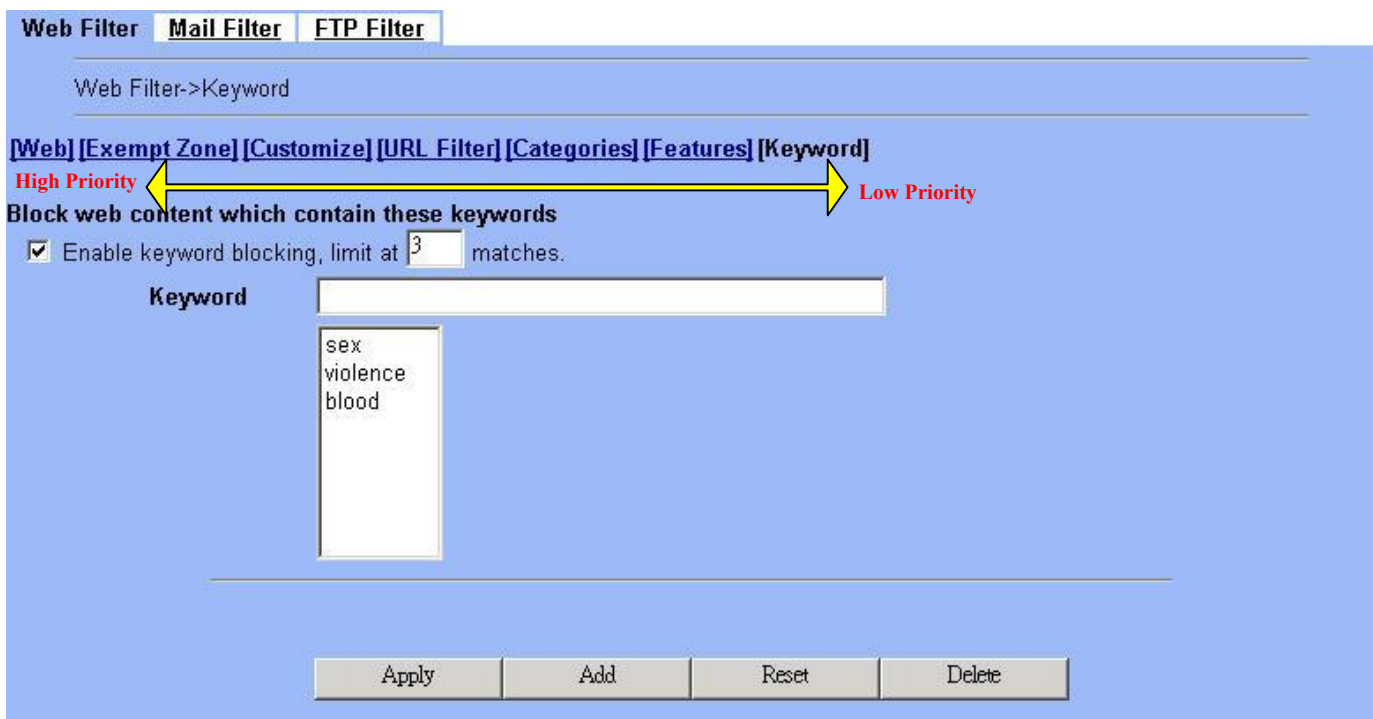

Figure 15-3 web filter features priority (from High to Low)

According to the priorities of web filter, we have the guiding principle to setup the web filter now. As we know, there are many choices according to your requirement in the web filter settings. Here we list the setting priorities for your reference. As the following Table 15-8 indicates, the smaller priority sequence would be executed first when running web filter.

Priority sequence	Selected item	Description	Restricted Region
1.	Web Filter > Exempt zone	Select which LAN region will apply the web filter settings. There are three items to choose (enforce all computers, include specified computers, and exclude specified computers)	LAN
2.	Web Filter > Customize	We can use the Customize domain to indicate the Trusted/Forbidden destination. There are two items for your choice. We can specify which URL domain names are trusted, and which ones are forbidden separately. Warning: Customize will not work on the proxy connections.	Internet web server
3.	Web Filter > URL_Filter	When an URL contains any keywords listed in the domain name, it will be blocked.	Internet web server
4.	Web Filter > Categories	We can use Database Update to update the latest URL database and then the Categories will be updated at the same time. The URL which user request will be blocked if it matches the categories in the URL Database.	Internet web server
5.	Web Filter > Features Web Filter > Keyword	If the web page contains the components includedactivex/java/javascript/cookie which indicated in “Web Filter > Features”, or the keywords indicated in “Web Filter > Keyword”. The forbidden components will be taken off from the web page by web filter.	Web page contents

Table 15-8 web filter features priority

# Chapter 16

## Content Filtering – Mail Filters

*This chapter introduces SMTP proxies and explains how to implement it.*

### 16.1 Demands

Sometimes there are malicious scripts like \*.vbs that may be attached in the email. If the users accidentally open such files, their computers may be infectious with virus.

### 16.2 Objectives

Modify the filename extension of the suspicious email attachments so that email receivers may notice that the file cannot be directly opened by the operating system because of the unrecognized filename extension.

### 16.3 Methods

1. Setup SMTP filters for outgoing emails from PC\_1 (in LAN1) towards the mail server (in DMZ1 or in WAN1) to append a “.bin” to all vbs attachments. Use PC1\_1 to send an email with vbs attachments to test the configuration.
2. Setup POP3 filters for incoming emails from a mail server (in WAN1 or in DMZ1) to PC\_1 (in LAN1) to append a “.bin” to all vbs attachments. Use PC1\_1 to retrieve an email with vbs attachments to test the configuration.

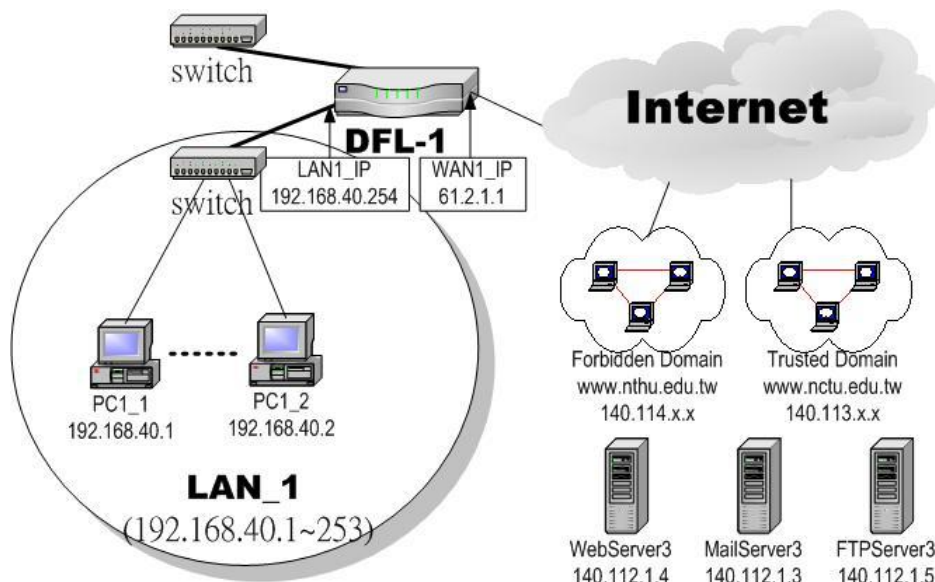

Figure 16-1 Use SMTP / POP3 filter functionality to avoid some sensitive e-mail directly opened

## 16.4 Steps for SMTP Filters

### Step 1 – Enable SMTP Filters

Check the `Enable SMTP Proxy` checkbox and click `Apply`.

### ADVANCED SETTINGS > Content Filters > Mail Filters > SMTP

The screenshot shows the configuration page for SMTP filters. At the top, there are tabs for 'Web Filter', 'Mail Filter', and 'FTP Filter'. Below the tabs, the 'Enable SMTP Proxy' checkbox is checked and highlighted with a red box, with an 'Apply' button next to it. Below this, there are links for '[SMTP]', '[SMTP Exempt Zone]', '[POP3]', and '[POP3 Exempt Zone]'. A section titled 'Append ".bin" to E-mail attachments whose' has a dropdown menu set to 'filename extension' and an empty text input field. Below this is a 'Blocking list' table with columns '#', 'Original Name', 'Type', and 'Mapped Name'. The table contains one row with '--' in the first column and 'No mapping defined' in the others. At the bottom, there are 'Add' and 'Delete' buttons.

FIELD	DESCRIPTION	EXAMPLE
Enable SMTP Proxy	Enable SMTP Proxy feature of DFL-900	Enabled
Append ".bin" to E-mail attachments whose	<ul style="list-style-type: none"> <li>➤ Filename extension When the filename extension of attachment file matches "Filename extension", add the ".bin" extension to the attachment file.</li> <li>➤ Exact filename When the whole filename of attachment file matches "Exact filename", add the ".bin" extension to the attachment file.</li> </ul>	Filename extension

Table 16-1 Mail Filter SMTP setting page

### Step 2 – Add a SMTP Filter

Select `filename extension`, enter `vbs`, and click `Add` to add a rule. This rule will apply to all LAN-to-DMZ/WAN SMTP connections. All such SMTP traffic will be examined to change the filename extension from `vbs` to `vbs.bin`.

Note that the filename to block cannot contain the marks such as `/, \, *, ?, ", <, >, |`.

### ADVANCED SETTINGS > Content Filters > Mail Filters > SMTP

The screenshot shows the same configuration page as in Step 1, but now a rule has been added to the 'Blocking list' table. The rule is highlighted with a red box and has the following details: # 1, Original Name vbs, Type EXT, and Mapped Name vbs.bin. The 'Enable SMTP Proxy' checkbox is still checked. The 'Append ".bin" to E-mail attachments whose' section is the same as in Step 1. The 'Add' and 'Delete' buttons are at the bottom.

<p><b>Step 3 – Customize the local zones</b></p> <p>You can configure to what range the filters will apply to the local zones. By default, the web filters apply to all computers so the “Enforce SMTP filter policies for all computers” is selected, and the range is 0.0.0.0 – 255.255.255.255. Delete the default range by clicking the range item and the Delete button. Enter the IP range in the Range fields followed by a click of the Add button to add one address range to the web filter. Click “Include.....” and Apply if you want web filters to only apply to the specified ranges. Click “Exclude.....” and Apply if you want web filters to apply to all computers except those specified ranges.</p>	<p><b>ADVANCED SETTINGS &gt; Content Filters &gt; Mail Filters &gt; SMTP Exempt Zone</b></p>
--	--

## 16.5 Steps for POP3 Filters

<p><b>Step 1 – Enable POP3 Filters</b></p> <p>Check the Enable POP3 Proxy checkbox and click Apply.</p>	<p><b>ADVANCED SETTINGS &gt; Content Filters &gt; Mail Filters &gt; POP3</b></p>
---	--

FIELD	DESCRIPTION	EXAMPLE
Enable POP3 Proxy	Enable POP3 Proxy feature of DFL-900	Enabled
Append ".bin" to E-mail attachments whose	<ul style="list-style-type: none"> <li>➤ Filename extension When the filename extension of attachment file matches “Filename extension”, add the “.bin” extension to the attachment file.</li> <li>➤ Exact filename When the whole filename of attachment file matches “Exact filename”, add the “.bin” extension to the attachment file.</li> </ul>	Filename extension

Table 16-2 Mail Filter SMTP setting page

## Part V Content Filters

### Step 2 – Add a POP3 Filter

Select filename extension, enter vbs, and click Add to add a rule. This rule will apply to all DMZ/WAN-to-LAN POP3 connections. All such POP3 traffic will be examined to change the filename extension from vbs to vbs.bin.

Note that the filename to block cannot contain the marks such as “/, \, \*, ?, “, <, >, |”.

### ADVANCED SETTINGS > Content Filters > Mail Filters > POP3

Web Filter Mail Filter FTP Filter

Enable POP3 Proxy

[SMTP] [SMTP Exempt Zone] [POP3] [POP3 Exempt Zone]

Append ".bin" to E-mail attachments whose filename extension is

Blocking list

#	Original Name	Type	Mapped Name
1	vbs	EXT	vbs.bin

### Step 3 – Customize the local zones

You can configure to what range the filters will apply to the local zones. By default, the web filters apply to all computers so the “Enforce POP3 filter policies for all computers” is selected, and the range is 0.0.0.0 – 255.255.255.255. Delete the default range by clicking the range item and the Delete button. Enter the IP range in the Range fields followed by a click of the Add button to add one address range to the web filter. Click “Include.....” and Apply if you want web filters to only apply to the specified ranges. Click “Exclude.....” and Apply if you want web filters to apply to all computers except those specified ranges.

### ADVANCED SETTINGS > Content Filters > Mail Filters > POP3 Exempt Zone

Web Filter Mail Filter FTP Filter

Mail Filter->POP3 Proxy Exempt Zone

[SMTP] [SMTP Exempt Zone] [POP3] [POP3 Exempt Zone]

POP3 Exempt Computers

Enforce POP3 filter policies for all computers.  
 Include specified address ranges in the POP3 filter enforcement.  
 Exclude specified address ranges from the POP3 filter enforcement.

Range From  To

192.168.40.100 -- 192.168.40.130  
 10.1.1.1 -- 10.1.1.254

## Chapter 17

# Content Filtering – FTP Filtering

*This chapter introduces FTP proxies and explains how to implement it.*

### 17.1 Demands

1. Some users in LAN1 use FTP to download big MP3 files and cause waste of bandwidth.

### 17.2 Objectives

1. Forbid PC1\_1 from downloading MP3 files with FTP.

### 17.3 Methods

1. Setup the filename extension of the forbidden types of file that are not allowed to be transmitted using standard FTP port.
2. Let PC1\_1 download a MP3 file from the FTPServer3 to see if the session is blocked.

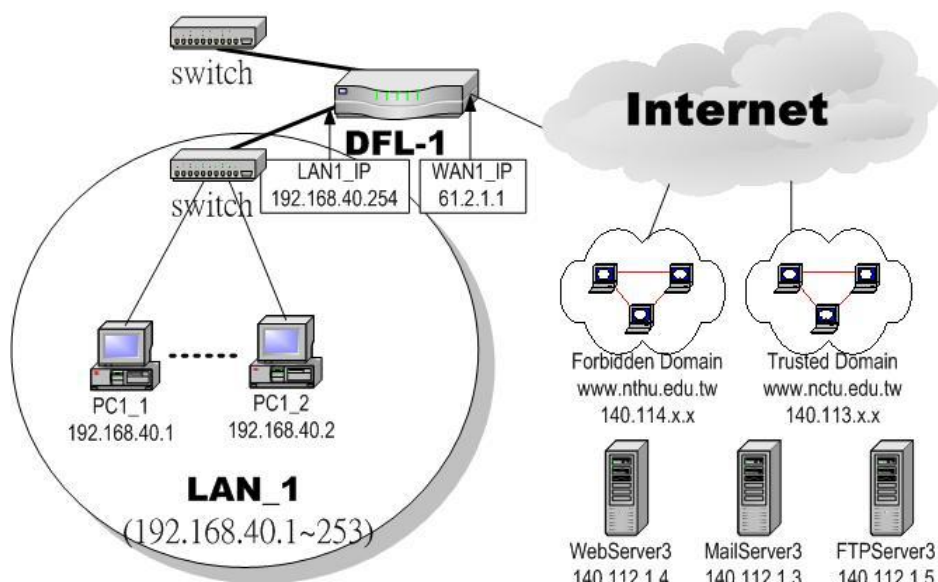

Figure 17-1 Use FTP filter functionality to avoid user download forbidden file type

## 17.4 Steps

<p><b>Step 1. Enable FTP Filter</b></p> <p>Check the <code>Enable FTP Filter</code> checkbox and click the nearby <code>Apply</code> button to enable this feature. Click the <code>Add</code> button to add a new FTP filter.</p>	<p><b>ADVANCED SETTINGS &gt; Content Filters &gt; FTP Filter &gt; FTP</b></p>
--	---

FIELD	DESCRIPTION	EXAMPLE
Enable FTP Filter	Enable FTP Filter feature of DFL-900	Enabled

Table 17-1 FTP Filter FTP setting page

<p><b>Step 2. Add an FTP Filter</b></p> <p>Enter <code>mp3</code> in the <code>Name</code> field and select <code>Extension Name</code> in the <code>Blocked Type</code> field. Click the <code>Add</code> button to apply the change. Now users in LANs can never download any mp3 files.</p> <p>Note that the filename to block cannot contain the marks such as “ /, \, *, ?, “, &lt;, &gt;,   ”.</p>	<p><b>ADVANCED SETTINGS &gt; Content Filters &gt; FTP Filter &gt; FTP &gt; Add</b></p>
--	--

FIELD	DESCRIPTION	EXAMPLE
Name	Fill in the file extension or exact filename.	mp3
Blocked Type	<ul style="list-style-type: none"> <li>➤ Extension Name When the extension filename of download file is matching, the action is blocked download from FTP server.</li> <li>➤ Full Name When the exact filename of download file is matching, the action is blocked download from FTP server.</li> </ul>	Extension Name

Table 17-2 FTP Filter FTP adding filter entry

**Step 3. View the result**

We can see the specified record in this page.

**ADVANCED SETTINGS > Content Filters > FTP Filter > FTP**

Web Filter | Mail Filter | FTP Filter

Enable FTP Filter

[FTP] [FTP Exempt Zone]

	#	Type	Blocked Name
<input checked="" type="radio"/>	1	Extension	mp3
<input type="radio"/>	2	...	...
<input type="radio"/>	3	...	...

<input type="radio"/>	5	...	...
<input type="radio"/>	6	...	...
<input type="radio"/>	7	...	...
<input type="radio"/>	8	...	...

**Step 4. Add an Exempt Zone**

Add a new Exempt Zone record. It's IP address range is between 192.168.40.10 to 192.168.40.30.

**ADVANCED SETTINGS > Content Filters > FTP Filter > FTP Exempt Zone > Add**

Web Filter | Mail Filter | FTP Filter

FTP Filter->FTP Exempt Zone

[FTP] [FTP Exempt Zone]

Add Address Range

From Address:

To Address:

FIELD	DESCRIPTION	EXAMPLE
From Address	Exempt zone record IP address from	192.168.40.10
To Address	Exempt zone record IP address to	192.168.40.30

Table 17-3 FTP Filter add an exempt zone entry

**Step 5. Show the Exempt Zones**

Here we can discover that new added Exempt Zone record is appeared.

**ADVANCED SETTINGS > Content Filters > FTP Filter > FTP Exempt Zone**

The screenshot shows a web interface for configuring FTP Exempt Zones. At the top, there are tabs for 'Web Filter', 'Mail Filter', and 'FTP Filter'. Below the tabs, the breadcrumb path 'FTP Filter->FTP Exempt Zone' is visible. The main heading is '[FTP] [FTP Exempt Zone]'. Underneath, there is a section titled 'FTP Exempt Computers' with three radio button options: 'Enforce FTP filter policies for all computers.', 'Include specified address ranges in the FTP filter enforcement.', and 'Exclude specified address ranges from the FTP filter enforcement.'. Below these options is a table with three columns: '#', 'From Address', and 'To Address'. The table contains five rows, with the first row selected. At the bottom of the page, there are navigation buttons: 'Prev. Page', 'Next Page', 'Apply', 'Add', and 'Delete'.

#	From Address	To Address
<input checked="" type="radio"/> 1	192.168.40.10	192.168.40.30
<input type="radio"/> 2	...	...
<input type="radio"/> 3	...	...
<input type="radio"/> 4	...	...
<input type="radio"/> 5	...	...

# Part VI

## Intrusion Detection System

# Chapter 18

## Intrusion Detection Systems

*This chapter introduces Intrusion Detection System (IDS) and explains how to implement it.*

### 18.1 Demands

Although Firewall settings are correct, there may still be some crackers intrude our system. Crackers hack into our system through Firewall-allowed channels with sophisticated skills. Most often, they attack specific application servers such as SNMP, Web, and FTP services in your DMZ.

### 18.2 Objectives

1. Detect any attacks towards our DMZ servers.
2. Instantly notify our network administrators what attacks have been detected.

Figure 18-1 Some cracker in the Internet would try to hack our company

### 18.3 Methods

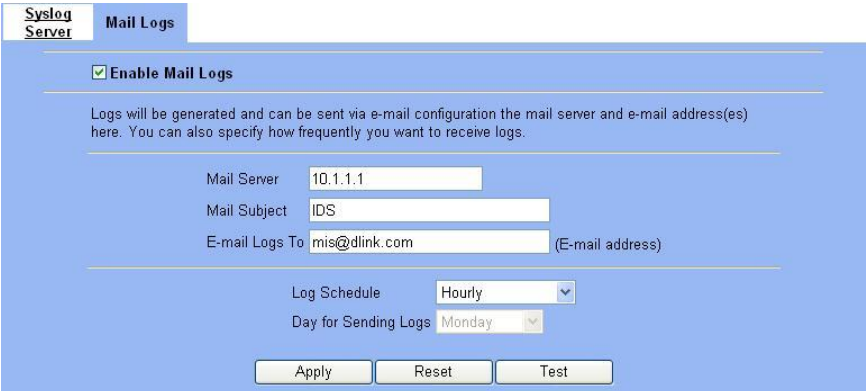

1. Specify where our Web server is located to let the IDS on the DFL-900 focus more on the attacks.
2. Setup logs to email to the specified email address when the log is full. You can also set daily/weekly emails to periodically monitor the IDS logs.

## 18.4 Steps

<p><b>Step 1 – Enable IDS</b></p> <p>Check the <code>Enable IDS</code> checkbox, and click the <code>Apply</code> button.</p>	<p><b>ADVANCED SETTINGS &gt; IDS &gt; IDS Status</b></p> 
---	---

FIELD	DESCRIPTION	EXAMPLE
Enable IDS	Enable IDS feature of DFL-900. When enabled, the built-in IDS detect more than 2000 application-level attacks from the default WAN link. The attack signatures can be periodically updated.	Enabled

Table 18-1 IDS option list explanation

<p><b>Step 2 – Setup Logs</b></p> <p>Enter the Mail Server IP Address, Mail Subject, and the email address that you want to receive from. Select the Log Schedule of emailing the logs to your email server.</p>	<p><b>DEVICE STATUS &gt; Log Config &gt; Mail Logs</b></p> 
--	--

<p><b>Step 3 – View logs</b></p> <p>If there are attacks towards the WAN port from the public Internet, there will be logs describing the details.</p>	<p><b>DEVICE STATUS &gt; IDS Logs</b></p> 
--	--

<p><b>Step 4 – Update Attack Patterns</b></p> <p>IDS attack patterns require frequent updates because there are many new attacks every week. Please go to <b>SYSTEM TOOLS &gt; Database Update &gt; Update</b> to update IDS attack patterns. The DFL-900 will connect to <code>fwupdate.dlinktw.com.tw</code> to fetch any new signatures.</p>	<p><b>SYSTEM TOOLS &gt; Database Update &gt; Update</b></p>

# Part VII

## Bandwidth Management

# Chapter 19

## Bandwidth Management

This chapter introduces bandwidth management and explains how to implement it.

### 19.1 Demands

Figure 19-1 Use bandwidth management mechanism to shape the data flow on the downlink direction

- As the above Figure 19-1 illustrated, we hope LAN\_1 users can watch the Video Stream Server smoothly. Besides, we hope LAN\_1 users can access the web server located at DMZ region more faster

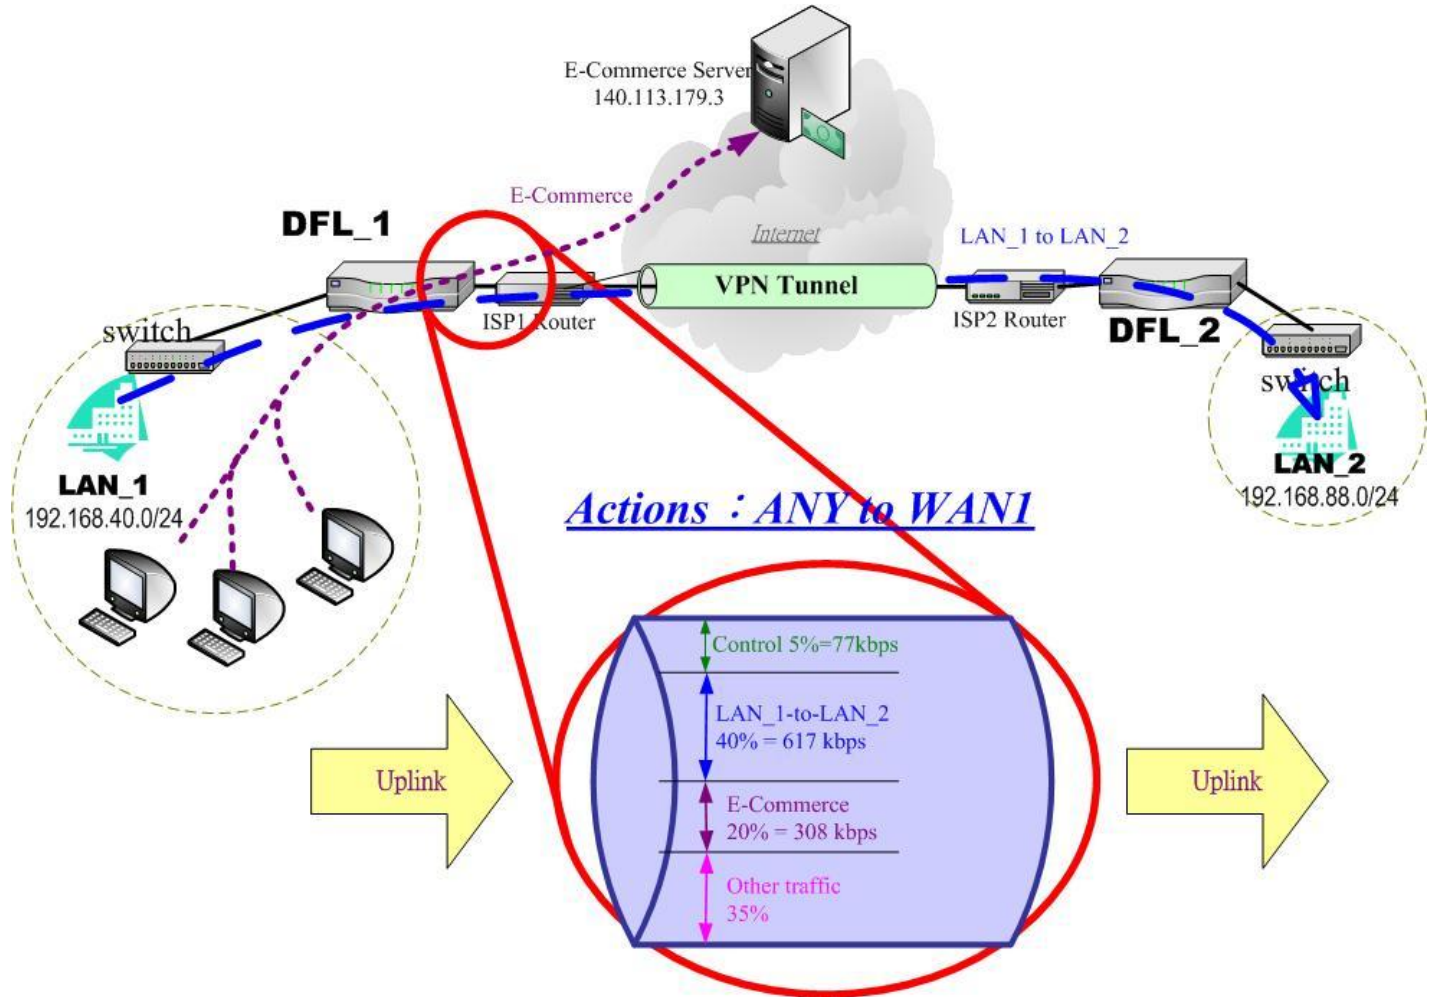

Figure 19-2 Use bandwidth management mechanism to shape the data flow on the uplink direction

- As the above Figure 19-2 illustrated, LAN\_1 PCs are using the E-Commerce service from the E-Commerce Server (140.113.179.3), causing the blocking of the VPN transfer from LAN\_1 to LAN\_2. So we want to make sure that the VPN tunnel links is reserved at least 600 kbps speed rate. And the free bandwidth will raise the transmission bandwidth of LAN\_1 PCs access the E-Commerce service.

## 19.2 Objectives

- As the above diagram Figure 19-1 illustrates, LAN\_1 PCs are browsing the web pages from the Web Server of Internet. This occupies the bandwidth of PCs who are watching the video provided by the Video Stream Server (140.113.179.4), causing the video to be blocked and to have poor quality. So we hope to guarantee the video quality of the LAN\_1 PCs which are accessing Video Stream Server.

The total bandwidth of ANY to LAN1 direction is 100 Mbps (The bandwidth of LAN1 interface is 100 Mbps). Here we will make sure that PCs of LAN\_1 have the smooth stream quality that must have at least 1% of LAN1 total bandwidth (1000 kbps) speed rate.

Besides, we have another web server located at DMZ region. Because the web server is located at local area, so we can assign larger bandwidth for this direction (web traffic from DMZ → LAN).

The remaining bandwidths are named Other traffic. They are reserved for other ANY to LAN1 data transmission which don't list in the above Figure 19-1 diagram.

- Reserve at least 600kbps for the LAN\_1 to LAN\_2 transfer. The LAN\_1 PCs can share about 20% (308kbps) for using E-Commerce Services. However, when the LAN\_1 to LAN\_2 traffic less than 40% (617kbps), the E-Commerce service can occupy the free bandwidth from LAN\_1-to-LAN\_2 and the remaining bandwidth from default class.

### 19.3 Methods

- As the following Table 19-1 listed, partition the inbound bandwidth (total 100Mbps) into three classes, web\_from\_WAN, video\_from\_WAN and web\_from\_DMZ class. The remaining bandwidth is assigned to other services which are not listed here.

Service	Goal	Assigned bandwidth	Borrow bit status
Web from WAN	limited bandwidth (MAX. 300kbps)	0.3% = 300kbps	Disabled
Video from WAN	guaranteed bandwidth (At least 1000kbps)	1% = 1000kbps	Enabled
Web from DMZ	guaranteed bandwidth (At least 50Mbps)	50% = 50Mbps	Enabled

Table 19-1 Bandwidth management action assignment from ANY to LAN1

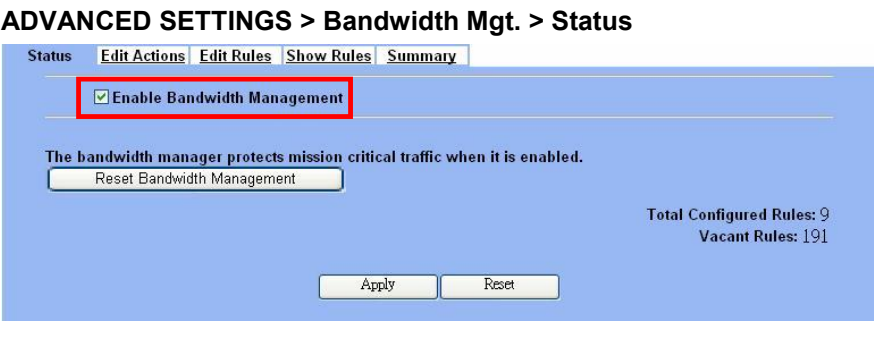

- As the following Table 19-2 listed. Partition the outbound bandwidth (total 1.544Mbps) into two classes, the LAN\_1-to-LAN\_2 (40% 617 kbps) and the E-commerce (20% 308kbps) classes. Besides, set the E-Commerce to be able to borrow from other bandwidth if any bandwidth is available.

Service	Goal	Assigned bandwidth	Borrow bit status
LAN_1 to LAN_2	limited bandwidth (MAX. 617kbps)	40% = 617kbps	Disabled
E-Commerce	guaranteed bandwidth (At least 308kbps)	20% = 308kbps	Enabled

Table 19-2 Bandwidth management action assignment from ANY to WAN1

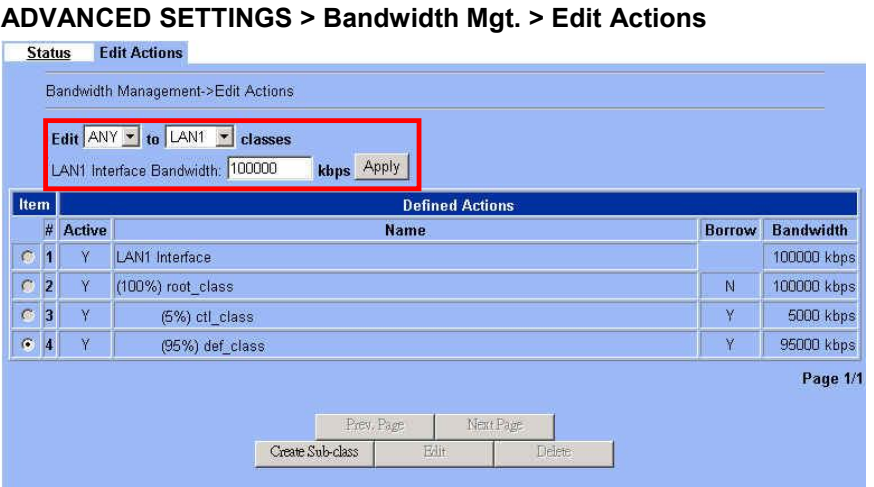

## 19.4 Steps

### 19.4.1 Inbound Traffic Management

<p><b>Step 1. Enable Bandwidth Management</b></p> <p>Check the <code>Enable Bandwidth Management</code> checkbox, click the <code>Apply</code>.</p>	<p><b>ADVANCED SETTINGS &gt; Bandwidth Mgt. &gt; Status</b></p> 
---	--

FIELD	DESCRIPTION	Range/Format	EXAMPLE
Enable Bandwidth Management	Enable Bandwidth Management feature of DFL-900	Enable/Disable	Enabled
BUTTON	DESCRIPTION		
Reset Bandwidth Management	Reset all the bandwidth management rules to default status.		
Apply	Apply the settings which have been configured.		
Reset	Clean the filled data and restore the original one.		

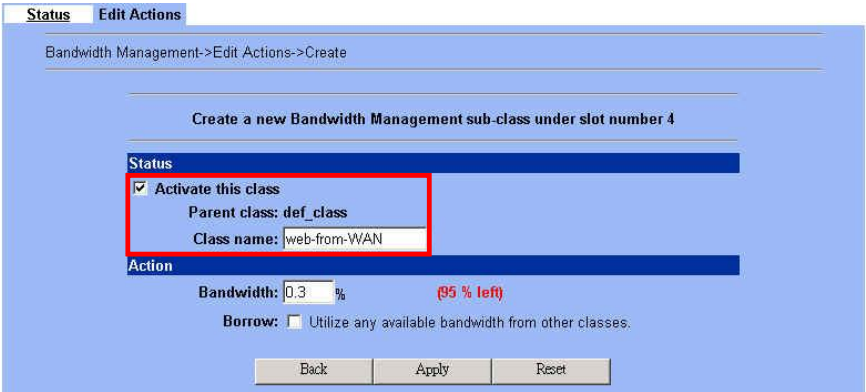

Table 19-3 Setup status page of Bandwidth Management

<p><b>Step 2. Setup the LAN1 Link</b></p> <p>Select <code>ANY</code> to <code>LAN1</code> to setup traffic that will be transmitted by the LAN1 interface. Enter the LAN1 interface bandwidth as <code>100000kbps</code> (100Mbps). Click the <code>Apply</code> button to enforce the LAN1 link bandwidth to be specified bandwidth. In the table, the <code>root</code> class represents the whole bandwidth of the link. By default the link is partitioned into two classes: control class (<code>ctl_class</code>) and default class (<code>def_class</code>). The control class reserves bandwidth for control protocols such as ICMP, TCP ACKs. The default class is the default action of non-matched packets. The default class can be recursively partitioned into more classes. The classes are organized as a tree. Click <code>Create Sub-Class</code> to partition the default class.</p>	<p><b>ADVANCED SETTINGS &gt; Bandwidth Mgt. &gt; Edit Actions</b></p> 
---	--

FIELD	DESCRIPTION	Range/Format	EXAMPLE
Edit __ to __ classes	Select the direction of action which you are going to configure one.	ANY to WAN/LAN/DMZ	Edit ANY to LAN1 classes

LAN1 Interface Bandwidth __ kbps	Fill the real bandwidth which is located in the upper direction.	10 to 100000 kbps	100000 kbps
BUTTON	DESCRIPTION		
Prev. Page	If there are more than one action pages, you can press Prev. Page to back to the previous page.		
Next Page	If there are more than one action pages, you can press Next Page to go to the next page.		
Create-Sub-class	Create a sub class from the indicated class.		
Edit	Edit the properties of the existent class.		
Delete	Delete the indicated class.		

Table 19-4 Setup edit actions page of Bandwidth Management

<p><b>Step 3. Add new classes</b></p> <p>Create a sub-class named <code>web-from-WAN</code> from the default class. Enter 0.3% in the bandwidth field. Make sure that <code>Borrow</code> button is unchecked and then <code>web-from-WAN</code> class will not enlarge the bandwidth from borrowing other unused bandwidth. Finally, click <code>Apply</code> button. See the steps in the right diagram.</p> <p>Subsequently, we will continue to setup another two classes, such as <code>video-from-WAN</code> class and <code>web-from-DMZ</code> class. Select the default class and click the <code>Create Sub-Class</code> to create these two classes. The setting procedure is the same as the <code>web-from-WAN</code> class described.</p>	<p><b>ADVANCED SETTINGS &gt; Bandwidth Mgt. &gt; Edit Actions &gt; Create Sub-class</b></p> 
---	---

FIELD	DESCRIPTION	Range/Format	EXAMPLE
Activate this class	Enable the bandwidth management class for later using	Enable/Disable	Enabled
Class name	Bandwidth management class name	text string	web-from-WAN
Bandwidth	How many percentage does this class occupy higher class?	0.1 ~ Max Value (as red text described)	0.3
Borrow	When the bandwidth of other class is idle, it will use the bandwidth of other class to increase bandwidth temporarily.	Enable/Disable	Disabled
BUTTON	DESCRIPTION		
Back	back to previous configuration page.		
Apply	Apply the settings which have been configured.		
Reset	Clean the filled data and restore the original one.		

Table 19-5 Add new class in the bandwidth management feature

**Step 4. Partition into Classes**

Now there are three actions under the default action.

**ADVANCED SETTINGS > Bandwidth Mgt. > Edit Actions > Create Sub-Class**

---

**Step 5. Setup WAN1-to-LAN1 Rules**

Select WAN1 to LAN1 to display the rules. There is a pre-defined rule that matches all traffic into the default class. Click Insert to insert a rule before the default rule.

**ADVANCED SETTINGS > Firewall > Edit Rules**

FIELD	DESCRIPTION	Range/Format	EXAMPLE
Edit __ to __ rules	Select the rule direction of rule which you are going to configure.	WAN/LAN/DMZ to WAN/LAN/DMZ	Edit WAN1 to LAN1 rules
BUTTON	DESCRIPTION		
Prev. Page	If there are more than one rule pages, you can press Prev. Page to back to the previous page.		
Next Page	If there are more than one action rules, you can press Next Page to go to the next page.		
Move Page __	Move to the indicated page.		
Insert	Insert a new rule.		
Edit	Edit the properties of the existent rule.		
Delete	Delete the indicated rule.		
Move Before __	Move the selected rule to the front of the indicated rule number.		

Table 19-6 Setup edit rules page of Bandwidth Management

**Step 6. Customize the Rule**

Enter a rule name such as `web-from-WAN`, enter the Source IP/Netmask as `0.0.0.0 / 0.0.0.0`. Enter the Dest. IP/Netmask as `0.0.0.0 / 0.0.0.0`. Besides, make sure the source port is TCP port 80 because of this is web service. Select the action to be `web-from-WAN`. In this way, All inbound web traffic from WAN1 will be put into the `web-from-WAN` queue and scheduled out at 300kbps bandwidth. Click `Apply` to store the changes.

Repeat the same procedure for the `video-from-WAN` class.

**ADVANCED SETTINGS > Firewall > Edit Rules > Insert**

The screenshot shows the 'Insert a new WAN1-to-LAN1 Firewall rule' configuration page. The 'Action' section is highlighted with a red box, showing the following settings:

- Forward  and  do not log  the matched session.
- Forward bandwidth class: `web-from-WAN` (highlighted with a red box)
- Reverse bandwidth class: `def_class`

	FIELD	DESCRIPTION	Range/Format	EXAMPLE
Status	Activate this rule	Enable this firewall rule	Enable/Disable	Enabled
	Rule name	The firewall rule name	text string	<code>web-from-WAN</code>
Condition	Source IP & Netmask	When source IP address of incoming packets conforms the “Source IP/Netmask” settings, do the “Action”.	IPv4 format	<code>0.0.0.0 / 0.0.0.0</code>
	Dest. IP & Netmask	When destination IP address of incoming packets conforms the “Dest IP/Netmask” settings, do the “Action”.	IPv4 format	<code>0.0.0.0 / 0.0.0.0</code>
	Service	Verify if the service of packet belongs to TCP, UDP, or ICMP type.	ANY/TCP/UDP/ICMP	TCP
	Configure src. port?	If the service is TCP or UDP, we can choose to configure or not to configure source port.	Enable/Disable	Enabled
	Type	If we decide to configure source port, we must choose the port to be single or range.	Single/Range	Single
	Src. Port	If we select single at above field, we just have to fill a port in the first blank space. If we select range at above field, we need to fill the range of the ports.	1 ~ 65534	80
	Configure dest. port?	If the service is TCP or UDP, we can choose to configure or not to configure destination port.	Enable/Disable	Disabled
	Type	If we decide to configure destination port, we must choose the port to be single or range.	Single/Range	N/A

## Part VII Bandwidth Management

	Dest. Port	If we select single at above field, we just have to fill a port in the first blank space. If we select range at above field, we need to fill the range of the ports.	1 ~ 65534	N/A
Action	Forward / Block the matched session	If packet is matched the rule condition, Forward or Block this matched packet?	Forward / Block	Forward
	Don't log / Log the matched session	If packet is matched the rule condition, Log or Don't log this matched packet?	log / do not log	do not log
	Forward bandwidth class	Forward bandwidth class if any.	def_class web-from-DMZ video-from-WAN web-from-WAN	Web-from-WAN
	Reverse bandwidth class	Reverse bandwidth class if any.	def_class E-Commerce LAN_1-to-LAN_2	def_class
BUTTON		DESCRIPTION		
Back		Back to previous configuration page.		
Apply		Apply the settings which have been configured.		
Reset		Clean the filled data and restore the original one.		

Table 19-7 Add a new Bandwidth Management rule

### Step 7. View the rules

Now we can see that there are existed two customized rules in the queue of WAN1 to LAN1 direction.

In the No. 1 rule. The DFL-900 is configured to direct video-from-WAN packets into the video-from-WAN queue (300kbps).

In the No. 2 rule. The DFL-900 will direct web-from-WAN packets into the web-from-WAN queue (1000kbps).

In the No. 3 rule. The other traffic will be put into the def\_class queue (any available bandwidth).

### ADVANCED SETTINGS > Firewall > Edit Rules

[Status](#) [Edit Rules](#) [Show Rules](#) [Attack Alert](#) [Summary](#)

Firewall->Edit Rules

Edit WAN1 to LAN1 rules

Default action for this packet direction: Block  Log  Apply

Packets are top-down matched by the rules.

Item	Status	Condition			Action			
#	Active	Name	Direction	Source IP Address	Dest. IP Address	Service	Action	Log
1	Y	video-from-WAN	WAN1 to LAN1	140.113.179.4/255.255.255.255	Any	Any	Forward	N
2	Y	web-from-WAN	WAN1 to LAN1	Any	Any	TCP:80	Forward	N
3	Y	Default	WAN1 to LAN1	Any	Any	Any	Block	Y

Page 1/1

**Step 8. Add DMZ to LAN1 rule**

Here we will add another rule (web from DMZ). Select DMZ1 to LAN1 direction.

**ADVANCED SETTINGS > Firewall > Edit Rules**

Firewall->Edit Rules

Default action for this packet direction: Block Log Apply

Packets are top-down matched by the rules.

Item	Status	Condition					Action	
#	Active	Name	Direction	Source IP Address	Dest. IP Address	Service	Action	Log
1	Y	Default	DMZ1 to LAN1	Any	Any	Any	Block	Y

Page 1/1

**Step 9. Customize the rule**

Setup the web-from-DMZ rule. Here we fill four 0.0.0.0 values in the Source IP / Netmask / Dest. IP / Netmask field. It means that if the packets come from DMZ and targeted LAN1 region, we do not need to care about its source / dest IP. If the packets request for web traffic (source port 80), it will be put into the web-from-DMZ queue by DFL-900 bandwidth management feature.

Not: In the Action region, the web-from-DMZ class was edited in the previous Step 4 before.

**ADVANCED SETTINGS > Firewall > Edit Rules > Insert**

Firewall->Edit Rules->Insert

Insert a new DMZ1-to-LAN1 Firewall rule

Status

Activate this rule

Rule name: web-from-DMZ

Condition

Source IP: 0.0.0.0 Netmask: 0.0.0.0

Dest. IP: 0.0.0.0 Netmask: 0.0.0.0

Service: TCP

Configure dest. port?

Type  Single  Range

Dest. Port: 80 to 0

Well known port FTP (21) Copy To Dest. Port

Action

Forward and do not log the matched session.

Forward bandwidth class: web-from-DMZ

Reverse bandwidth class: def\_class

Back Apply Reset

**Step 10. View the results**

We can see the result of our settings at the DMZ-to-LAN rule direction.

**ADVANCED SETTINGS > Firewall > Edit Rules**

Firewall->Edit Rules

Default action for this packet direction: Block Log Apply

Packets are top-down matched by the rules.

Item	Status	Condition					Action	
#	Active	Name	Direction	Source IP Address	Dest. IP Address	Service	Action	Log
1	Y	web-from-DMZ	DMZ1 to LAN1	Any	Any	TCP:80	Forward	N
2	Y	Default	DMZ1 to LAN1	Any	Any	Any	Block	Y

Page 1/1

### 19.4.2 Outbound Traffic Management

#### Step 1. Enable Bandwidth Management

Check the `Enable Bandwidth Management` checkbox, click the `Apply`.

#### ADVANCED SETTINGS > Bandwidth Mgt. > Status

#### Step 2. Setup the WAN1 Link

Select `ANY` to `WAN1` to setup traffic that will be transmitted by the `WAN1` interface. Enter the `WAN1` interface bandwidth as `1544kbps`. Click the `Apply` button to enforce the `WAN1` link bandwidth to be `1544kbps`. Then click `Create Sub-Class` to partition the default class.

#### ADVANCED SETTINGS > Bandwidth Mgt. > Edit Actions

Item	#	Active	Name	Borrow	Bandwidth
	1	Y	WAN1 Interface		1544 kbps
	2	Y	(100%) root_class	N	1544 kbps
	3	Y	(5%) cti_class	Y	77 kbps
	4	Y	(95%) def_class	Y	1466 kbps

#### Step 3. Partition into Classes

Create a sub-class named `LAN_1-to-LAN_2` from the default class. Enter `40%` in the bandwidth field, uncheck the `Borrow` button, and click `Apply`. Select the default class and click the `Create Sub-Class` to create another sub-class named `E-Commerce` from the default class. Enter `20%` in the bandwidth field, check the `Borrow` button and click `Apply`. Now there are two actions under the default action. They are separately `LAN_1-to-LAN_2` and `E-Commerce` class as the right diagram.

#### ADVANCED SETTINGS > Bandwidth Mgt. > Edit Actions > Create Sub-Class

Item	#	Active	Name	Borrow	Bandwidth
	1	Y	WAN1 Interface		1544 kbps
	2	Y	(100%) root_class	N	1544 kbps
	3	Y	(5%) cti_class	Y	77 kbps
	4	Y	(95%) def_class	Y	1466 kbps
	5	Y	(20%) E-Commerce	Y	308 kbps
	6	Y	(40%) LAN_1-to-LAN_2	N	617 kbps

**Step 4. Setup LAN1-to-WAN1 Rules**

Select LAN1 to WAN1 to display the rules. There is a pre-defined rule that matches all traffic into the default class. Click **Insert** to insert a rule before the default rule.

**ADVANCED SETTINGS > Firewall > Edit Rules**

Firewall->Edit Rules

Edit LAN1 to WAN1 rules

Default action for this packet direction: Forward  Log **Apply**

Packets are top-down matched by the rules.

Item	Status	Condition					Action	
#	Active	Name	Direction	Source IP Address	Dest. IP Address	Service	Action	Log
1	Y	Default	LAN1 to WAN1	Any	Any	Any	Forward	N

Page 1/1

Prev. Page Next Page Move Page 1

**Insert** Edit Delete Move Before 1

**Step 5. Customize the Rules**

Enter a rule name such as outVPN, enter the Source IP as 192.168.40.0 and the netmask as 255.255.255.0. Enter the Dest. IP as 192.168.88.0 and the netmask as 255.255.255.0. Select the action to be LAN\_1-to-LAN\_2. In this way, all outbound packets to the LAN\_2 area will be put into the LAN\_1-to-LAN\_2 queue and scheduled out at 617 kbps bandwidth. Click **Apply** to store the changes.

Repeat the same procedure for the outE-Commerce rule.

**ADVANCED SETTINGS > Firewall > Edit Rules > Insert**

Firewall->Edit Rules->Insert

Insert a new LAN1-to-WAN1 Firewall rule

**Status**

Activate this rule

Rule name: outVPN

**Condition**

Source IP: 192.168.40.0 Netmask: 255.255.255.0

Dest. IP: 192.168.88.0 Netmask: 255.255.255.0

Service: Any

Configure dest. port?

Type  Single  Range

Dest. Port: 0 to 0

Well known port: FTP (21) **Copy To Dest. Port**

**Action**

Forward and do not log the matched session.

Forward bandwidth class: LAN\_1-to-LAN\_2

Reverse bandwidth class: def\_class

Back Apply Reset

**Step 6. View the rules**

The DFL-900 is configured to direct outE-Commerce matched packets into the E-Commerce queue (308 kbps), outVPN matched packets into the LAN\_1-to-LAN\_2 queue (617 kbps). Here we reserve 40% WAN1 bandwidth for the LAN\_1 to LAN\_2 VPN data, to guarantee the data communication between VPN. The other traffic will be put into the def\_class queue (any available bandwidth).

**ADVANCED SETTINGS > Firewall > Edit Rules**

Firewall->Edit Rules

Edit LAN1 to WAN1 rules

Default action for this packet direction: Forward  Log **Apply**

Packets are top-down matched by the rules.

Item	Status	Condition					Action	
#	Active	Name	Direction	Source IP Address	Dest. IP Address	Service	Action	Log
1	Y	outE-Commerce	LAN1 to WAN1	Any	140.113.179.3/255.255.255.255	Any	Forward	N
2	Y	outVPN	LAN1 to WAN1	192.168.40.0/255.255.255.0	192.168.88.0/255.255.255.0	Any	Forward	N
3	Y	Default	LAN1 to WAN1	Any	Any	Any	Forward	N

# Part VIII

## System Maintenance

# Chapter 20

## System Status

### 20.1 Demands

1. Since we have finished the settings of DFL-900, we need to gather the device information quickly. Then we can have a overview of the system status.

### 20.2 Objectives

1. We can know the current situation easily through an integrated interface.

### 20.3 Methods

1. Through DEVICE STATUS > System Status path, we can get the needed information.

### 20.4 Steps

#### Step 1. System Status

Here we can see the system information (include system name, firmware version), and the full list of each port settings.

#### DEVICE STATUS > System Status > System Status

System Status	Network Status	CPU & Memory	DHCP Table	Routing Table	Active Sessions	Top20 Sessions	IPSec Sessions
System Name: <b>DFL-1.dlink.com</b> Firmware Version: <b>NetOS Ver1.531 (DLINK) #0: Wed May 26 14:10:36 CST 2004</b>							
Default gateway: <b>61.2.1.6</b> Primary DNS: <b>168.95.1.1</b> Secondary DNS:							
<b>Port1: WAN1 (Static IP)[Default]</b> IP Address: <b>61.2.1.1</b> Subnet Mask: <b>255.255.255.248</b>							
<b>Port2: LAN1</b> IP Address: <b>192.168.1.254</b> Subnet Mask: <b>255.255.255.0</b>							
<b>Port3: DMZ1</b> IP Address: <b>10.1.1.254</b> Subnet Mask: <b>255.255.255.0</b>							

#### Step 2. Network Status

We can know the port status here, whether the port is up or down, and view the amount of the transmitted packets or received packets in each port.

#### DEVICE STATUS > System Status > Network Status

System Status	Network Status	CPU & Memory	DHCP Table	Routing Table	Active Sessions	Top20 Sessions	IPSec Sessions
Port	TxPkts	RxPkts	Collisions	Tx B/s	Rx B/s		
1. <b>WAN1</b>	15	800	0	0	719		
2. <b>LAN1</b>	13483	14815	0	3332	1140		
3. <b>DMZ1</b>	0	0	0	0	0		

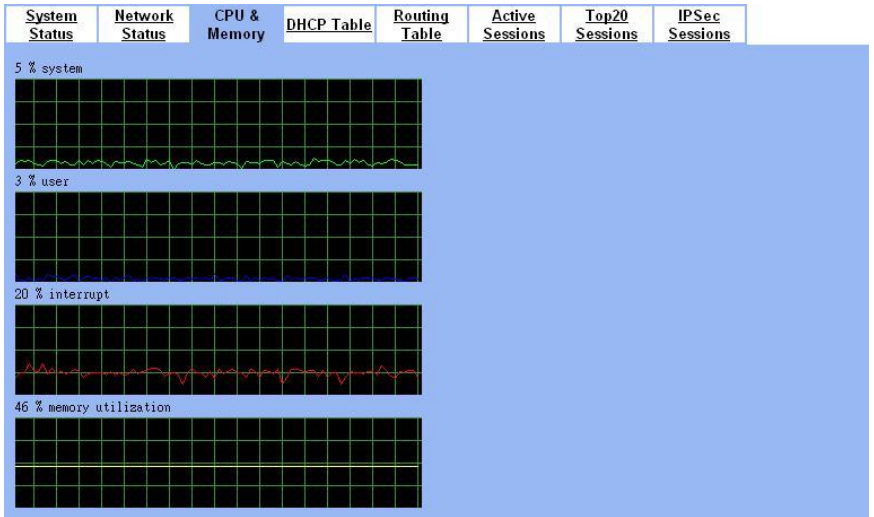

**Step 3. CPU & Memory**

We can know the device information (include system, user, interrupt and memory utilization) through the graphic interface.

Note: If you can not view the graphic correctly, the situation may result from that you don't install the java virtual machine (JVM) onto your browser. Simply go to the following link, <http://java.sun.com/j2se/1.4.2/download.html>.

And then, download the Java 2 Platform, Standard Edition (JRE) to your platform (ex. windows). After installing JRE properly, you will see the CPU & Memory graphic as right side.

**DEVICE STATUS > System Status > CPU & Memory**

**Step 4. DHCP Table**

Through the DHCP Table, we can recognize which IP has been allocated by the DHCP server. And know which pc (MAC address) has been leased this IP address.

**DEVICE STATUS > System Status > DHCP Table**

#	IP Address	Hostname	MAC Address	Leases Expires
1	192.168.1.20	pc101	00:40:F4:84:89:4D	2024-05-29 16:02:32

**Step 5. Routing Table**

Click the Routing Table to see the routing table information of DFL-900.

**DEVICE STATUS > System Status > Routing Table**

#	Type	Destination/Netmask	Gateway	Interface
1	Default/Static	0.0.0.0/0.0.0.0	61.2.1.6	WAN1
2	Net	10.1.1.0/255.255.255.0	10.1.1.254	DMZ1
3	Net	61.2.1.0/255.255.255.248	61.2.1.1	WAN1
4	Net	192.168.1.0/255.255.255.0	192.168.1.254	LAN1
5	Net/Static	192.168.50.0/255.255.255.0	192.168.40.253	WAN1
6	Net	210.2.1.0/255.255.255.248	210.2.1.1	WAN1

**Step 6. Active Sessions**

Click the **Active Sessions** to see all the current sessions of DFL-900. The **Active Sessions** include all the outbound and inbound sessions.

**DEVICE STATUS > System Status > Active Sessions**

System Status	Network Status	CPU & Memory	DHCP Table	Routing Table	Active Sessions	Top20 Sessions	IPSec Sessions
---------------	----------------	--------------	------------	---------------	-----------------	----------------	----------------

Refresh Clear

Current Sessions: 9 Page 1/1

Item	Local Client		Remote Server		Traffic Statistics
	#	IP Address	Port	IP Address	Port
1	192.168.17.188	6222	211.78.4.48	80	1116
2	192.168.17.188	6221	211.78.4.48	80	1106

# Chapter 21

## Log System

### 21.1 Demands

1. The System Administrator wants to know all the actions of administration in the past. So it can avoid illegal system administration.
2. The System Administrator needs to check the logs of VPN, IDS, Firewall, and Content Filter everyday. But he / she feels inconvenient to verify the DFL-900 logs. He / She hopes to decrease the checking procedure.

### 21.2 Objectives

1. The System Administrator wants to know all actions of administration in the past.
2. The System administrator would like to view the daily log report of DFL-900.

### 21.3 Methods

1. Through tracking the system logs, you can distinguish which administrated action is valid or not.
2. Use the syslog server to receive mail, or edit the “Mail Logs” page of DFL-900. Make the log mailed out automatically every periodic time.

### 21.4 Steps

#### 21.4.1 System Logs

<p><b>Step 1. View System Logs</b></p> <p>All the system administrated actions will be log in this page.</p> <p>For the detailed information of System Logs, please refer Appendix C.</p>	<p><b>DEVICE STATUS &gt; System Logs</b></p> <p><b>System Access Logs</b></p> <table border="1"> <thead> <tr> <th>No.</th> <th>Time</th> <th>Source-IP</th> <th>Access-Info</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>2004-07-28 09:57:40</td> <td>DFL-900</td> <td>SYSTEM: [S1] System Startup.</td> </tr> <tr> <td>2</td> <td>2004-07-28 09:57:40</td> <td>DFL-900</td> <td>Firewall: Reload all rules at startup.</td> </tr> <tr> <td>3</td> <td>2004-07-28 09:57:40</td> <td>DFL-900</td> <td>SYSTEM: [S43] NAT: rule for Basic-LAN1 added .</td> </tr> <tr> <td>4</td> <td>2004-07-28 09:57:40</td> <td>DFL-900</td> <td>SYSTEM: [S43] NAT: rule for Basic-DMZ1 added .</td> </tr> <tr> <td>5</td> <td>2004-07-28 09:57:43</td> <td>DFL-900</td> <td>SYSTEM: [S5] HTTP started.</td> </tr> <tr> <td>6</td> <td>2004-07-28 09:57:44</td> <td>DFL-900</td> <td>SYSTEM: [S6] HTTPS started.</td> </tr> <tr> <td>7</td> <td>2004-07-28 10:00:48</td> <td>192.168.17.141</td> <td>AUTH: [A1] admin login success.</td> </tr> <tr> <td>8</td> <td>2004-07-28 10:53:05</td> <td>DFL-900</td> <td>SYSTEM: [S8] WAN1: IP address = 61.2.1.1/255.255.255.248.</td> </tr> <tr> <td>9</td> <td>2004-07-28 10:53:05</td> <td>DFL-900</td> <td>SYSTEM: [S3] WAN1: Gateway IP = .</td> </tr> <tr> <td>10</td> <td>2004-07-28 10:53:05</td> <td>DFL-900</td> <td>SYSTEM: [S3] WAN1: IP Address Assignment = Fixed IP Address.</td> </tr> </tbody> </table> <p> <input type="button" value="Download To Local"/> <input type="button" value="Prev. # Chapter 22

## System Maintenance

*This chapter introduces how to do system maintenance.*

### 22.1 Demands

1. DFL-900 is designed to provide upgradeable firmware and database to meet the upcoming dynamics of the Internet. New features, new attack signatures, new forbidden URLs, and new virus definitions require timely updates to the DFL-900. This chapter introduces how to upgrade your system with TFTP and Web UI respectively.
2. Sometimes one may want to reset the firmware to factory default due to loss of password, firmware corrupted, configuration corrupted. Since DFL-900 does not have a reset button to prevent careless pressing of it, factory default has to be set with web GUI or console terminal. Of course, when you lose the password, you have to use CLI only because you can never enter the web GUI with the lost password.
3. Another issue is that after setup the DFL-900 properly, we might want to keep the current configuration to avoid the unknown accident. Then we can recover the original state from the previous reserved configuration.

### 22.2 Steps for TFTP Upgrade

Figure 22-1 Upgrade/Backup firmware from TFTP server

## Part VIII System Maintenance

<p><b>Step 1. Setup TFTP server</b></p> <p>Place the TFTP server <code>TftpServer</code> in the <code>c:\</code> directory and double click to run it. Place all <code>bin</code> files in the <code>c:\</code> as well. Set the PC to be 192.168.40.x to be in the same subnet with the DFL-900's LAN1. Login to DFL-900's console. Enter <code>en</code> to enter privileged mode. Configure the LAN1 address so that the DFL-900 can connect to the TFTP server. The CLI command to configure LAN1 interface is <code>ip ifconfig INTF1 192.168.40.254 255.255.255.0</code>.</p>	<pre>NetOS/i386 (DFL-900) (tty00)  login: admin Password: Welcome to DFL-900 VPN/Firewall Router!  DFL-900&gt; en DFL-900# ip ifconfig INTF1 192.168.40.254 255.255.255.0 DFL-900#</pre>
<p><b>Step 2. Upgrade firmware</b></p> <p>Enter <code>IP tftp upgrade image 192.168.40.x DFL-900-&lt;ver&gt;.bin</code>. After this procedure, DFL-900 device will reboot automatically.</p> <p>Notice: if you want to preserve the previous configuration, add the "preserve" keyword to the end.</p> <p>Refer Appendix A for the details.</p>	<pre>DFL-900# ip tftp upgrade image DFL-900-1.530p5-ALL.bin 192.168.40.170 preserve  Fetching from 192.168.40.170 for DFL-900-1.530p5-ALL.bin tftp&gt; tftp&gt; Verbose mode on. tftp&gt; getting from 192.168.40.170:DFL-900-1.530p5-ALL.bin to DFL-900-1.530p5-ALL.bin [octet]</pre>
<p><b>Step 3. Check if OK</b></p> <p>Check whether the system status is working properly or not.</p>	<pre>DFL-900&gt; sys st ===== System Name: DFL-900 Firmware Version: NetOS Ver1.600 (DFL-900) #1: Tue Jul 27 19:05:09 CST 2004 ===== Default Gateway: Primary DNS:      Secondary DNS: Default WAN Link (Gateway/DNS): WAN1 ===== Port Interface IP Address      Netmask      Type -----  1     WAN1    61.2.1.1     255.255.255.248 (Static IP)  2     LAN1    192.168.40.254 255.255.255.0  3     DMZ1    10.1.1.254    255.255.255.0 =====  10:55AM up 58 mins, 1 user, load averages: 0.17, 0.14, 0.09 DFL-900&gt;</pre>

### 22.3 Steps for Firmware upgrade from Web GUI

<p><b>Step 1. Download the newest firmware from web site</b></p> <p>If a new firmware issued, we can download it from the web site (<a href="http://fwupdate.dlinktw.com.tw">fwupdate.dlinktw.com.tw</a>) to the local computer.</p>	<p>Firmware upgrade site : <a href="http://fwupdate.dlinktw.com.tw/">http://fwupdate.dlinktw.com.tw/</a></p>
--	--

### Step 2. Upgrade firmware

In the System Tools / Firmware Upgrade page. Select the path of firmware through `Browse` button, and check the `Preserve Saved Configurations` to reserve original settings. Click the `Upload` button to upgrade firmware.

### SYSTEM TOOLS > Firmware Upgrade > Firmware Upgrade

**Firmware Upgrade**

**Caution!! Upgrading firmware with browser takes at least 2 minute and may fail occasionally due to users' interrupt. We suggest firmware upgrade with the CLI command 'ip tftp upgrade image FILENAME X.X.X.X' to a TFTP server.**

To upgrade the internal system firmware, browse to the location of the binary (.BIN) upgrade file and click `UPLOAD`. Download BIN files from `http://fwupdate.dlinktw.com.tw`. In some cases, you may need to reconfigure the system after upgrading.

File Path: `D:\Dlink Device\DFL-1E` `Browse...`

Preserve Saved Configurations

`Upload`

## 22.4 Steps for Database Update from Web GUI

### Step 3. Update database manually

If a new firmware issued, we can download it by clicking the `Update` button. Then we will see the database version shown on the left side.

**Update**

Status :

URL database : v1.40601 [ 2004/07/28 09:57 ] `Update`

IDS signatures: v1.40601 [ 2004/07/28 09:57 ] `Update`

Auto Update :

Update Center `fwupdate.dlinktw.com.tw`

Update Schedule On `Sunday` `3` `0`

Auto URL update

Auto IDS update

`Apply` `Reset`

### Step 4. Auto Update

We can also update database automatically. Fill the database server in the `Update Center` field. Choose what date/time we would like to update the database, and then check which databases we would like to update. Click `Apply` button to finish the settings.

### SYSTEM TOOLS > Firmware Upgrade > Firmware Upgrade

**Update**

Status :

URL database : v1.40601 [ 2004/07/28 09:57 ] `Update`

IDS signatures: v1.40601 [ 2004/07/28 09:57 ] `Update`

Auto Update :

Update Center `fwupdate.dlinktw.com.tw`

Update Schedule On `Sunday` `3` `0`

Auto URL update

Auto IDS update

`Apply` `Reset`

## 22.5 Steps for Factory Reset

### 22.5.1 Step for factory reset under web GUI

#### Step 1. Factory reset

In the Web GUI mode. Follow the path of right side. We can make DFL-900 configuration restored to the factory defaults with simply clicking the `Apply` button.

Warning: Be careful to use this function. It will make all your present configurations disappear. And the configuration will restore to the factory default.

#### SYSTEM TOOLS > System Utilities > Factory Reset

**Back to Factory Defaults**

Reset to clear all user-entered configuration information and return the system to its factory defaults. After resetting, the

- Password will be admin
- WAN1 will not be initialized
- DMZ1 IP will be 10.1.1.254
- LAN1 IP will be 192.168.1.254
- DHCP will be reset to server

To erase the router's configuration information and restore factory default settings, system will be rebooted automatically

### 22.5.2 Step for NORMAL factory reset

#### Step 1. Factory reset

In the CLI mode. Enter `sys resetconf` now to reset the firmware to factory default. Then the system will reboot automatically.

```
NetOS/i386 (DFL-900) (tty00)

login: admin
Password:
Welcome to DFL-900 VPN/Firewall Router

DFL-900> en
DFL-900# sys resetconf now
Resetting Configuration to default... DONE
System will reboot now
syncing disks... done
rebooting...
```

### 22.5.3 Steps for EMERGENT factory reset

#### Step 1. Enter the boot loader

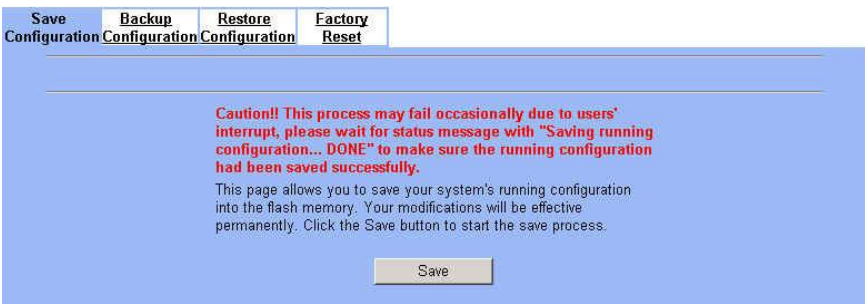

If the original firmware is damaged, you may need to recover the firmware with the factory default. Press `<tab>` or `<space>` during the 2-second countdown process.

```
>> NetOS Loader (i386), V1.5 (Fri Feb 20 10:25:11 CST 2004)
Press <TAB> to prompt - starting in 0
Type "boot rescue" to load safe-mode kernel to
(1) rescue corrupted firmware
(2) reset password for admin
type "?" or "help" for help.
>
```

<p><b>Step 2. Enter the Safe Mode</b></p> <p>Enter <code>boot rescue</code> to enter the emergency kernel. In this kernel, you can use <code>tftp</code> to fetch another firmware to install, or reset the configuration to default even though you lost the password.</p>	<pre>&gt; boot rescue 652762+7888436+358016=0x87dc4c NetOS Ver1.530 (RESCUE) #3: Sun Apr 25 03:07:34 CST 2004 cpu0: Intel Pentium III (Coppermine) Celeron (686-class), 852.00 MHz total memory = 255 MB avail memory = 228 MB Ethernet address 00:0d:88:17:0b:a7 Ethernet address 00:0d:88:17:0b:a6 Ethernet address 00:0d:88:17:0b:a5 wd0: drive supports PIO mode 4 Software Serial Number: [54623734431016644466]</pre> <p>Tips: Type "?" anytime when you need helps. Tips: To recover from corrupted firmware, setup IP address and use <code>tftp</code> to install the new firmware.</p> <p>DFL-900&gt;</p>
<p><b>Step 3. Factory reset</b></p> <p>Enter <code>sys resetconf now</code> to reset the firmware to factory default. Then system will reboot automatically.</p>	<pre>DFL-900&gt; en DFL-900# sys resetconf now System will reboot now syncing disks... done rebooting...</pre>

## 22.6 Save the current configuration

<p><b>Step 1. Backup the current configuration</b></p> <p>After finishing the settings of DFL-900, be sure to Press the <code>Save</code> button in this page to keep the running configuration.</p>	<p><b>SYSTEM TOOLS &gt; System Utilities &gt; Save Configuration</b></p> 
--	---

## 22.7 Steps for Backup / Restore Configurations

<p><b>Step 1. Backup the current configuration</b></p> <p>Before backup your current configuration, make sure you have saved your current configurations as described in Section 22.6. Then select page in the page of /System Tools /System Utilities /Backup Configurations, click <code>Backup</code> button to backup configuration file to local disk.</p>	<p><b>SYSTEM TOOLS &gt; System Utilities &gt; Backup Configuration</b></p> 
<p><b>Step 2. Restore the previous saving configuration</b></p> <p>In the page of System Tools / System Utilities / Restore Configuration, click the <code>Browse</code> button to select configuration file path first, and then click <code>Upload</code> button to restore configuration.</p>	<p><b>SYSTEM TOOLS &gt; System Utilities &gt; Restore Configuration</b></p> 

## 22.8 Steps for Reset password

<p><b>Step 1. Enter the boot loader</b></p> <p>If you forget the password, you can use the following way to reset the password. Press &lt;tab&gt; or &lt;space&gt; during the 2-second countdown process.</p>	<pre>&gt;&gt; NetOS Loader (i386), V1.5 (Fri Feb 20 10:25:11 CST 2004) Press &lt;TAB&gt; to prompt - starting in 0 Type "boot rescue" to load safe-mode kernel to (1) rescue corrupted firmware (2) reset password for admin type "?" or "help" for help. &gt;</pre>
<p><b>Step 2. Get the Initial Key</b></p> <p>Enter <code>boot -I</code> command as right side. When screen shows "Enter Initial Key", you can consult with your local technical supporter to get the Initial Key. You will need to tell the local technical supporter <b>all the MAC address</b> value. Then you will get the Initial Key. To reset admin password.</p>	<pre>&gt; boot -I 1002649+10753864+560236 [74+86272+648251]=0xbe50c8 NetOS Ver1.530 (DLINK) #0: Sun Apr 25 02:48:17 CST 2004 cpu0: Intel Pentium III (Coppermine) Celeron (686-class), 852.01 MHz total memory = 255 MB avail memory = 224 MB ASIC IPSec Enabled Ethernet address 00:0d:88:17:0b:a7 Ethernet address 00:0d:88:17:0b:a6 Ethernet address 00:0d:88:17:0b:a5 wd0: drive supports PIO mode 4 IPSec: Initialized Security Association Processing. Enter Initial Key:</pre>

# Appendix

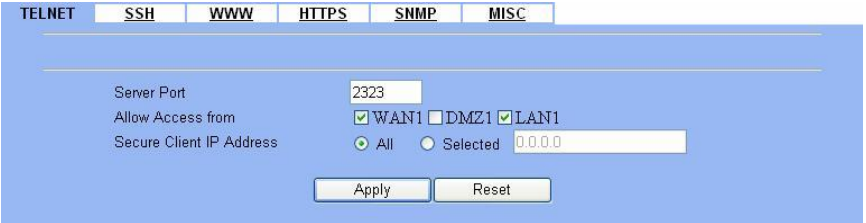

# Appendix A

## Command Line Interface (CLI)

You can configure the DFL-900 through the web interface (http/https) for the most time. Besides you can use another method, console/ssh/telnet method to configure the DFL-900 in the emergency. This is known as the Command Line Interface (CLI). By the way of CLI commands, you can effectively set the IP addresses, restore factory reset, reboot/shutdown system etc. Here we will give you a complete list to configure the DFL-900 using the CLI commands.

### A.1 Enable the port of DFL-900

If you prefer to use CLI commands, you can use it through console/ssh/telnet methods. For using ssh/telnet feature, you must enable the remote management first. Enable the specified port, so that you can login from the configured port.

<p><b>Step 1. Enable remote management / TELNET</b></p> <p>Check the selected port located in the telnet function. And customize the server port which is listened by telnet service.</p>	<p><b>SYSTEM Tools &gt; Remote Mgt. &gt; TELNET</b></p> 
<p><b>Step 2. Enable remote management / SSH</b></p> <p>Check the selected port located in the ssh function. And customize the server port which is listened by ssh service.</p>	<p><b>SYSTEM Tools &gt; Remote Mgt. &gt; SSH</b></p> 

### A.2 CLI commands list (Normal Mode)

Subsequently, we can use the console/ssh/telnet to connect the DFL-900. After logging the system successfully, we can use the CLI commands to configure DFL-900. The complete CLI commands are described as follows.

#### Non-privileged mode

Main commands	Sub commands	Example	Command description
?		?	Show the help menu
enable (en)		enable	Turn on privileged mode command
exit (ex)		exit	Exit command shell
ip			Configure IP related settings
	ping	ip ping 202.11.22.33	Send ICMP echo request messages
	tracert	ip tracert 202.11.22.33	Trace route to destination address or hostname
sys			Configure system parameters

	status (st)	sys status	Show system and network status
	version (ver)	sys version	Show DFL-900 firmware version

Table A-1 Non-privileged mode of normal mode

Note: If you don't know what parameter is followed by the commands, just type "?" following the command. Ex "ip?". It will show all the valid suffix parameters from "ip".

**Privileged mode**

Main commands	Sub commands	Example	Command description
?		?	Show the help menu
<b>disable (dis)</b>		disable	Turn off privileged mode command
<b>exit (ex)</b>		exit	Exit command shell
<b>ip</b>			Configure IP related settings
	arp	ip arp status	Show the ip/MAC mapping table
	dns	ip dns query www.yam.com.tw	Show the IP address of the www.yam.com.tw.
	ifconfig	ip ifconfig INTF1 192.168.1.100 255.255.255.0	Configure the ip address of each port
	ping	ip ping 202.11.22.33	Send ICMP echo request messages
	tftp upgrade/backup	ip tftp upgrade image <FILENAME> 192.168.1.170.	Upgrade/Backup firmware/configuration from/to tftp server. About the full description, please refer to Section A-3.
	traceroute	ip traceroute 202.11.22.33	Trace route to destination address or hostname.
<b>sys</b>			Configure system parameters
	halt	sys halt now	Shutdown system
	password	sys password	Change administrator password
	reboot	sys reboot now	Reboot system
	resetconf	sys resetconf now	Reset system configuration to default settings
	saveconf (sa)	sys saveconf	Save running configuration
	status (st)	sys status	Show system and network status
	tcpdump (tc)	sys tcpdump INTF0 host 10.1.1.1	Capture the information of specified packets which pass through the indicated interface.
	version (ver)	sys version	Show DFL-900 firmware version

Table A-2 Privileged mode of normal mode

The Full tftp commands are described in the following Table A-3.

Prefix command	2th command	3th command	Postfix command	Example	Command description
<b>ip tftp</b>	upgrade	config	FILENAME WORD	ip tftp upgrade config conf-0101 192.168.1.170	Upgrade configuration file image from tftp server.
		image	FILENAME WORD (preserve)	ip tftp upgrade image <FILENAME> 192.168.1.170 preserve	Upgrade system image from tftp server.
	backup	config	WORD	ip tftp backup config 192.168.1.170	Backup configuration file image to tftp server.
		image	WORD	ip tftp backup image 192.168.1.170	Backup system image to tftp server.

Table A-3 ip tftp commands description

In the Postfix command, the meanings of keywords are listed here.

**WORD:** tftp server IP address

**FILENAME:** Upgrade configuration file image name

**(preserve):** string “preserve”, this is optional

### A.3 CLI commands list (Rescue Mode)

If the original firmware was damaged by some accidents, you may need to recover it with the factory reset process in the rescue mode. Boot the DFL-900 and press <tab> or <space> during the 2-second countdown process. You may refer Section 22.5.3 for details.

#### Non-privileged mode

Main commands	Sub commands	Example	Command description
?		?	Show the help menu
<b>enable (en)</b>		enable	Turn on privileged mode command
<b>exit (ex)</b>		exit	Exit command shell
<b>ip</b>			Configure IP related settings
	ping	ip ping 202.11.22.33	Send ICMP messages
<b>sys</b>			Configure system parameters
	status (st)	sys status	Show the mode name and firmware version.
	version (ver)	sys version	Show the firmware version

Table A-4 Non-privileged mode of rescue mode

Note: If you don't know what parameter is followed by the commands, just type “?” following the command. Ex “ip?”. It will show all the valid suffix parameters from “ip”.

**Privileged mode**

Main commands	Sub commands	Example	Command description
<b>?</b>		?	Show the help menu
<b>disable (dis)</b>		disable	Turn off privileged mode command
<b>exit (ex)</b>		exit	Exit command shell
<b>ip</b>			Configure IP related settings
	arp	ip arp status	Show the ip/MAC mapping table
	dns	ip dns query www.yam.com.tw	Show the IP address of the www.yam.com.tw.
	ifconfig	ip ifconfig INTF1 192.168.1.100 255.255.255.0	Configure the ip address of each port
	ping	ip ping 202.11.22.33	Send ICMP echo request messages
	tftp	ip tftp upgrade image <FILENAME> 192.168.1.170.	Upgrade firmware from tftp server.
<b>sys</b>			Configure system parameters
	halt	sys halt now	Shutdown system
	reboot	sys reboot now	Reboot system
	resetconf	sys resetconf now	Reset system configuration to default settings
	status (st)	sys status	Show the mode name and firmware version.
	version (ver)	sys version	Show the firmware version

Table A-5 Privileged mode CLI commands

## Appendix B

# Trouble Shooting

1. If the power LED of DFL-900 is off when I turn on the power?

**Ans :** Check the connection between the power adapter and DFL-900 power cord. If this problem still exists, contact with your sales vendor.

2. How can I configure the DFL-900 if I forget the admin password of the DFL-900 ?

**Ans :** You can gather all the MAC addresses values of DFL-900, and contact the local technical supporter. Then we will give you an initial key. Please refer to the Section 22.8 described to reset the admin password.

3. I can't access DFL-900 via the console port ?

**Ans :** Check the console line and make sure it is connected between your computer serial port and DFL-900 Diagnostic RS-232 port. Notice whether the terminal software parameter setting as follows. No parity, 8 data bits, 1 stop bit, baud rate 9600 bps. The terminal type is VT100.

4. I can't ping DFL-900 WAN1 interface successfully ? Why ?

**Ans :** Follow below items to check if ready or not

- a. Check Basic Setup > WAN Settings > WAN1 status fields. Verify whether any data is correctly.
  - b. Check Device Status > System Status > Network Status WAN1 status is "UP". If the status is "DOWN", check if the network line is connectionless ?
  - c. Check System Tools > Remote Mgt. > MISC > WAN1. Verify if WAN1 port checkbox is enabled. The default enabled port is only LAN port.
  - d. Check whether virtual server rule (Dest. IP : WAN1 IP address, port : 1~65535) exists or not. If existing any virtual server rule like this type, it will make all the connections from WAN1 port outside relay to another server. Actually what you have pinged is another server, not DFL-900.
  - e. Check whether NAT One-to-One(bidirectional) rule (Translated Src IP : WAN1 IP address, port : 1~65535) exists or not. If existing any virtual server rule like this type, it will make all the connections from WAN1 port outside relay to another server. Actually what you have pinged is another server, not DFL-900.
  - f. If all the above items have checked, try to change a new network line. This is almost resulting from the network line problem. Please neglect the LED status, because it will confuse your judgment sometimes.
5. I have already set the WAN1 ip address of DFL-900 the same subnet with my pc, but I can't use https to login DFL-900 via WAN1 port from my pc all the time, why ?

**Ans :**

- a. Be sure that you can ping the WAN1 port, please check the procedure as question 4 description.
  - b. Make sure that the WAN1 IP address of DFL-900 is not duplicated with other existent IP address. You can take off the network line connected on the WAN1 port. Then try to ping the IP address which setup on the WAN1 port. If it is still successful, the IP address which setup on the WAN1 port is duplicated with the existent IP address.
  - c. Notice that you must check System Tools > Remote Mgt. > HTTPS > WAN1. The default enabled port is only LAN port.
6. I can't build the VPN – IPSec connection with another device at the another side all the time, why ?

Ans : Please make sure if you follow the setting method as follows.

- a. Check your IPSec Setting. Please refer to the settings in the Section 10.4- Step 3.
- b. Make sure if you have already added a WAN to LAN policy in the Advanced Settings/Firewall to let the IPSec packets pass through the DFL-900. (The default value from WAN to LAN is block.)

When you add a Firewall rule, the Source IP and Netmask are the IP address, PrefixLen/Subnet Mask in the pages of the Remote Address Type. And the Dest IP and Netmask are the IP Address, PrefixLen/Subnet Mask in the pages of the Local Address Type.

The following Figure B-1, Figure B-2 indicated the DFL\_A IPSec and Firewall setting. The Figure B-3, Figure B-4 indicated the opposite side DFL\_B IPSec and Firewall setting. When you configure an IPSec policy, please be sure to add a rule to let the packets of the IPSec pass from WAN to LAN. For the IP address of firewall rules, please refer to the Figure B-2, Figure B-4.

IPSec **PPTP** **L2TP** **Pass Through**

IPSec->IKE->Edit Rule

**Status**  
 Active  
 IKE Rule Name: IKERuleA

**Condition**  
 Local Address Type: Subnet Address  
 IP Address: 192.168.40.0  
 PrefixLen / Subnet Mask: 255.255.255.0  
 Remote Address Type: Subnet Address  
 IP Address: 192.168.88.0  
 PrefixLen / Subnet Mask: 255.255.255.0

The Local Address of DFL B

Status **Edit Rules** Show Rules Attack Alert Summary

Firewall->Edit Rules->Insert

Insert a new WAN1-to-LAN1 Firewall rule

**Status**  
 Activate this rule  
 Rule name: AllowIPSecPktA

**Condition**  
 Source IP: 192.168.88.0 Netmask: 255.255.255.0  
 Dest. IP: 192.168.40.0 Netmask: 255.255.255.0  
 Service: Any

Configure dest. port?   
 Type:  Single  Range  
 Dest. Port: 0 to 0  
 Well known port: FTP (21) Copy To Dest. Port

**Action**  
 Forward and do not log the matched session.  
 Forward bandwidth class: def\_class  
 Reverse bandwidth class: def\_class

Back Apply Reset

Figure B-2 DFL\_A - Insert a new firewall rule in WAN to LAN

Figure B-3 DFL\_B - Inset a new IPsec policy

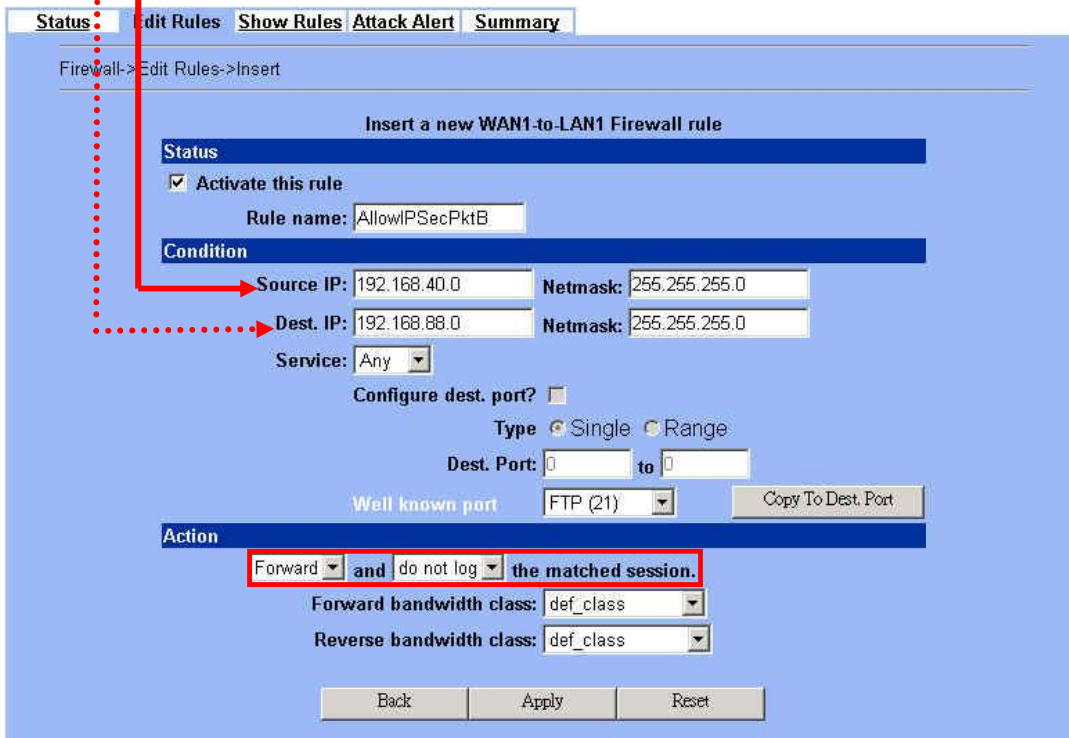

Figure B-4 DFL\_B - Insert a new firewall rule in WAN to LAN

7. Why does it always show the message as Figure B-5 indicated when I try to enable bandwidth management feature of DFL-900?

**Status: Bandwidth management will support PPPoE in the future release.**

Figure B-5 Bandwidth management feature can not cooperate with PPPoE feature

**Ans :** For the present design, you can not turn on bandwidth management in the PPPoE enabled condition. If you need to enable bandwidth management, please choose the WAN connection method (ex. DHCP, fixed IP).

8. Why the Source-IP field of System Logs is blank?

**Ans :** One reason is that you may enter Host Name and following by a space like “DFL-900 “. And enter the Domain Name string like “dlink.com” in the firmware version 1.391B. Then the System Name will present as “DFL-900 .dlink.com”. After upgrading firmware to upper version (ex. 1.50R). It will appear blank in the Source-IP field of System Logs.

9. When I ping the internet host from LAN/DMZ. I can't always finish the ping successfully. Sometimes it is work. But sometimes it fails to ping the outside host.

**Ans :** This may cause there are more than one host in the LAN/DMZ pinging the same host at the same time. If one host (Lan-A) is pinging internet host A(ex. 140.106.100.1), and at the same time, Lan-B is also pinging 140.106.100.1. Then the pinging action of the Lan-A and Lan-B may fail. But when each host (Lan-A or Lan-B) is finish pinging, the other host can continue the pinging action.

10. While I am upgrading firmware from local disk, the download is not complete but the network has been disconnected. What will it happen in such situation?

**Ans :** Under this circumstance, the DFL-900 will automatically reboot and all configurations will still remain as before.

11. While I am upgrading firmware from local disk, the download is complete. After md5 checks, the screen appears “Upgrading kernel image”. What will it happen if the power is off suddenly?

**Ans :** Almost all the cases will not cause firmware fail. The DFL-900 will automatically reboot and all configurations will still remain as before. But sometimes it will make firmware fail. If the firmware fails, DFL-900 will automatically enter rescue mode when it reboots. You may need to do the factory reset, and then restore your original configuration to DFL-900. Refer to the factory reset procedure of DFL-900 as Section 22.5. About restoring configuration procedure, please refer to Section 22.7.

12. While finishing the Content Filters > Web Filter settings, if I try to use browser to test, why does not the web page result match with the web filter configuration?

**Ans :** Be sure that you have cleaned all the file cache in the browser, and try to connect the internet web server. If the web page result still does not match with the web filter configuration, you may close your browser and reopen it.

13. While finishing the edition of DFL-900 settings and pressing apply button, the LAN/DMZ to WAN network connection (telnet, ssh, ftp, msn..) fails, why?

**Ans :** This is a normal situation. When you finish the following settings, all the active network connection will be disconnected. So, you must reconnect it again.

- a. SYSTEM TOOLS > Remote Mgt.
- b. ADVANCED SETTINGS > VPN Settings > IPSec
- c. ADVANCED SETTINGS > VPN Settings > PPTP > Client
- d. ADVANCED SETTINGS > VPN Settings > Pass Through
- e. ADVANCED SETTINGS > NAT

## Appendix C

# System Log Syntax

In the DFL-900, all the administration action will be logged by the system. You can refer all your management process through System log (DEVICE STATUS > System Logs > System Access Logs). Besides, all the system log descriptions are following the same syntax format.

In the below diagram, you can view the example of system log. The amplified system log example can be divided into 4 parts. The first part is **Component type**, second part is **Log ID**, third part is **log description** and final part is **Event ID**. When you applied each setting in the DFL-900, you had been issued an Event. So the same Event ID may have many different Log IDs because you may change different settings in the same apply action. The Event ID is a sequence number. It means that the same Log ID would not be assigned the same Event ID every time.

So if you apply any button while setting DFL-900 every time, an “Event” will occur immediately. And the “Event” will be displayed in the System log.

The screenshot shows the 'System Access Logs' interface. The log entries are as follows:

No.	Time	Source-IP	Access-Info
1	2004-05-14 11:08:39	192.168.17.170	LOG: [L07] logfile system_log.txt cleanup.
2	2004-05-14 11:08:45	192.168.17.170	SYSTEM: [S9] LAN1 IP Address Assignment: 192.168.1.254/255.255.255.0, ... MORE
3	2004-05-14 11:08:46	192.168.17.170	SYSTEM: [S4] Enable DHCP server on LAN1 by admin (192.168.17.179:443)... MORE
4	2004-05-14 11:08:46	192.168.17.170	SYSTEM: [S4] IP Pool Starting Address: 192.168.1.1, Pool Size: 20. Eve... MORE
5	2004-05-14 11:08:46	192.168.17.170	SYSTEM: [S43] NAT: rule for Basic-LAN1 added .
6	2004-05-14 11:08:46	192.168.17.170	SYSTEM: [S43] NAT: rule for Basic-LAN2 added .
7	2004-05-14 11:08:46	192.168.17.170	SYSTEM: [S43] NAT: rule for Basic-DMZ1 added .
8	2004-05-14 11:08:47	192.168.17.170	ROUTING: [R3] LAN1: Routing Protocol: None. EventID:247

The highlighted log entry is: **ROUTING : [R3] LAN1: Routing Protocol: None. EventID:247**

The syntax breakdown is: **ROUTING : [R3] LAN1: Routing Protocol: None. EventID:247**  
**Component type : Log ID : Log description : Event ID**

Figure D-1 All the system log descriptions are following the same format as above

In the following table, we list all the system logs for reference.

Component type	Log ID	Log description	Example
AUTH	A01	User Login	AUTH: [A01] admin login success (192.168.17.102:443).
			AUTH: [A01] admin login fail, miss password (192.168.17.102:443).
			AUTH: [A01] admin login fail, configuration is locked by administrator from Console (192.168.17.102:443).
			AUTH: [A01] admin login fail, configuration is locked by another user from 192.168.17.100 (192.168.17.102:443).
	A02	User Logout	AUTH: [A02] admin logout (192.168.17.102:443).

## Appendix C

	A03	Change Password	AUTH: [A03] admin change system password (192.168.17.100:443).
BANDWIDTH	B01	Enable/Disable Bandwidth Management	BANDWIDTH: [B01] Enable bandwidth management by admin (192.168.17.100:443).
			BANDWIDTH: [B01] Disable bandwidth management by admin (192.168.17.100:443).
			BANDWIDTH: [B01] WAN1 Disable bandwidth management with PPPoE connection.

S03	Interface Configuration	SYSTEM: [S03] WAN1: IP Address Assignment = Get IP Automatically by admin (192.168.17.102:443). SYSTEM: [S03] WAN1: IP Address Assignment = Fixed IP Address by admin (192.168.17.102:443). SYSTEM: [S03] WAN1: Got PPPoE IP Address F63/255.255.255.0.
S04	Startup/Shutdown DHCP Server	SYSTEM: [S04] Enable DHCP server on LAN1 by admin (192.168.17.102:443) SYSTEM: [S04] Disable DHCP server on LAN1.
S05	Startup/Shutdown HTTP Server	SYSTEM: [S05] HTTP started. SYSTEM: [S05] HTTP stopped.
S06	Startup/Shutdown HTTPS Server	SYSTEM: [S06] HTTPS started.
S07	Startup TELNET Server	
S08	Set Interface IP Address	SYSTEM: [S08] WAN1: IP Address: 192.168.17.102/255.255.255.0. (192.168.17.102:443).
S09	IP Alias	SYSTEM: [S09] LAN1: Add IP address alias 192.168.1.2/255.255.255.0 by admin (192.168.17.102:443). SYSTEM: [S09] LAN1: Delete IP address alias 192.168.1.2/255.255.255.0 by admin (192.168.17.102:443). SYSTEM: [S09] LAN1: Change IP address alias 192.168.1.2/255.255.255.0 to 192.168.1.3/255.255.255.0 by admin (192.168.17.102:443).
S10	Set Host Name	SYSTEM: [S10] HostName:DFL-900, set by admin (192.168.17.102:443).
S11	Set Domain Name	SYSTEM: [S11] Domain Name: dlink.com, set by admin (192.168.17.102:443).
S12	Enable/Disable DDNS	SYSTEM: [S12] Enable Dynamic DNS with hostname wall.adslDNS.org on WAN1 by admin (192.168.17.102:443). SYSTEM: [S12] Disable Dynamic DNS on WAN1 by admin (192.168.17.102:443).
S13	Enable/Disable DNS Proxy	SYSTEM: [S13] Enable DNS proxy by admin (192.168.17.102:443). SYSTEM: [S13] Disable DNS proxy by admin (192.168.17.102:443).
S14	Enable/Disable DHCP Relay	SYSTEM: [S14] Enable DHCP relay by admin (192.168.17.102:443). SYSTEM: [S14] Disable DHCP relay by admin (192.168.17.102:443).
S15	Set Date/Time	SYSTEM: [S15] System time update with NTP server tock.usno.navy.mil, set by admin (192.168.17.102:443). SYSTEM: [S15] System time update to 2003-10-10 13:33:25, set by admin (192.168.17.102:443).
S16	Set System Auto Timeout Lifetime	SYSTEM: [S16] System auto timeout changed to 45 minutes by admin (192.168.17.102:443).

	S17	Interface PORTS Configuration (WAN/LAN/DMZ)	
	S18	Backup Configuration	SYSTEM: [S18] Backup configuration file by admin (192.168.17.102:443).
	S19	Restore Configuration	SYSTEM: [S19] Restore configuration file by admin (192.168.17.102:443).
	S20	Factory Reset	SYSTEM: [S20] Factory Reset to default settings by admin (192.168.17.102:443)
	S21	Firmware Upgrade	SYSTEM: [S21] Firmware upgraded by admin (192.168.17.102:443)
	S22	Setup TELNET Server	
	S23	Setup SSH Server	
	S24	Setup WWW Server	
	S25	Setup HTTPS Server	
	S26	Setup SNMP Server	
	S27	MISC Setup	
	S28	Enable/Disable SNMP	SYSTEM: [S28] Enable SNMP by admin (192.168.17.104:443) SYSTEM: [S28] System Location: Building-A. SYSTEM: [S28] Contact Info: +886-2-28826262. SYSTEM: [S28] Disable SNMP.
	S29	Configure SNMP server	
	S30	File System Full	
	S31	Update remote management settings.	SYSTEM: [S31] Update remote management TELNET Server settings by admin (192.168.17.102:443).
	S32	Set Gateway	SYSTEM: [S32] WAN1: Gateway IP: 192.167.17.254 SYSTEM: [S32] WAN1: Got PPPoE Gateway IP 210.58.28.91.
	S33	Set DNS IP Address	SYSTEM: [S33] WAN1: Clear DNS IP Address. SYSTEM: [S33] WAN1: DNS IP Address: 168.95.1.1. SYSTEM: [S33] WAN1: Get DNS Automatically.
	S34	Syslog Reload	SYSTEM: [S34] Syslogd stop. SYSTEM: [S34] Syslogd start. SYSTEM: [S34] Syslogd restart.
	S35	Enable/Disable Ipmon	SYSTEM: [S35] Enable Ipmon. SYSTEM: [S35] Disable Ipmon.
	S36	System Checksum Update	
	S37	Disable Multicast Update Multicast	SYSTEM: [S37] Disable Multicast on interface WAN1
			SYSTEM: [S37] Update Multicast on interface WAN1 to xxx
			SYSTEM: [S37] Update Multicast on interface WAN1 to xxx
	S38	Update WAN NAT settings	SYSTEM: [S38] Update WAN NAT settings to FULL feature
		Update WAN NAT settings	SYSTEM: [S38] Update WAN NAT settings to Basic operation

		Disable WAN NAT feature	SYSTEM: [S38] Disable WAN NAT feature
VPN	V1	Update pass-through settings	VPN: [V1] Update pass-through settings
	V2	Deactivated IPSec	VPN: [V2] Deactivated IPSec
		Activated IPSec	

Table D-1 All the System Log descriptions

## Appendix D

# Glossary of Terms

### **CF (Content Filter) –**

A content filter is one or more pieces of software that work together to prevent users from viewing material found on the Internet. This process has two components.

### **DHCP (Dynamic Host Configuration Protocol) –**

Provides a framework for passing configuration information to hosts on a TCP/IP network. DHCP is based on BOOTP, adding the capability of automatic allocation of reusable network addresses and additional configuration options. DHCP captures the behavior of BOOTP relay agents, and DHCP participants can interoperate with BOOTP participants.

DHCP consists of two components: a protocol for delivering host-specific configuration parameters from a DHCP server to a host and a mechanism for allocation of network addresses to hosts.

### **DMZ (Demilitarized Zone) –**

From the military term for an area between two opponents where fighting is prevented. DMZ Ethernets connect networks and computers controlled by different bodies. They may be external or internal. External DMZ Ethernets link regional networks with routers.

### **Firewall –**

A device that protects and controls the connection of one network to another, for traffic both entering and leaving. Firewalls are used by companies that want to protect any network-connected server from damage (intentional or otherwise) by those who log in to it. This could be a dedicated computer equipped with security measures or it could be a software-based protection.

### **IPSec (IP Security) –**

IPSec provides security for transmission of sensitive information over unprotected networks such as the Internet. IPSec acts at the network layer, protecting and authenticating IP packets between participating IPSec devices ("peers").

### **L2TP (Layer 2 Tunneling Protocol) –**

Layer Two Tunneling Protocol (L2TP) is an extension of the Point-to-Point Tunneling Protocol (PPTP) used by an Internet Service Provider (ISP) to enable the operation of a Virtual Private Network (VPN) over the Internet. L2TP merges the best features of two other tunneling protocols: PPTP from Microsoft and L2F from Cisco Systems. The two main components that make up L2TP are the L2TP Access Concentrator (LAC), which is the device that physically terminates a call and the L2TP Network Server (LNS), which is the device that terminates and possibly authenticates the PPP stream.

### **NAT (Network Address Translation) –**

By the network address translation skill, we can transfer the internal network private address of DFL-900 to the public address for the Internet usage. By this method, we can use a large amount of private addresses in the enterprise.

### **POP3 (Post Office Protocol 3) –**

POP3 (Post Office Protocol 3) is the most recent version of a standard protocol for receiving e-mail. POP3 is a client/server protocol in which e-mail is received and held for you by your Internet server. Periodically, you (or your client e-mail receiver) check your mail-box on the server and download any mail.

### **PPTP (Point-to-Point Tunneling Protocol) –**

PPTP extends the Point to Point Protocol (PPP) standard for traditional dial-up networking. PPTP is best suited for the remote access applications of VPNs, but it also supports LAN internetworking. PPTP operates at Layer 2 of the OSI model.

### **OSPF (Open Shortest Path First) –**

Open Shortest Path First (OSPF), is a routing protocol used to determine the correct route for packets within IP networks. It was designed by the Internet Engineering Task Force to serve as an Interior Gateway Protocol replacing RIP.

### **SMTP (Simple Mail Transfer Protocol) –**

SMTP (Simple Mail Transfer Protocol) is a TCP/IP protocol used in sending and receiving e-mail. However, since it's limited in its ability to queue messages at the receiving end, it's usually used with one of two other protocols, POP3 or Internet Message Access Protocol, that let the user save messages in a server mailbox and download them periodically from the server.

### **VPN (Virtual Private Network) –**

The key feature of a VPN, however, is its ability to use public networks like the Internet rather than rely on private leased lines. VPN technologies implement restricted-access networks that utilize the same cabling and routers as a public network, and they do so without sacrificing features or basic security.
