

Slim & Heavy 3G/4G GPS Setup Guide

Getting Started

- 1) Purchase or use a SIM Card from an Australian Provider to use with your device (We recommend Telstra, Optus or Vodafone. Telstra has the best rural coverage).
- 2) Make sure the SIM Card you are going to use has Call, SMS and Data (This is integral to get the GPS setup and working!). To do this, you can top-up the SIMs plan at your local provider, through their website or via your mobile phone (If you do use your phone, keep the SIM outer-shell as you need the full-sizing for the GPS).
- 3) Charge the GPS for at least 10-12 hours prior to setup. If the device hasn't been charged, there can be a significant decrease in overall battery life and performance.
- 4) Download the WINNIES GPS app from the App Store or Google Play Store, which will be used to login and track your GPS.

Syncing your SIM and GPS

- 1) Insert the topped up, full-size SIM into the GPS Tracker until it clicks/locks into place (You may want to use a credit card or similar to click it into the device).
- 2) To turn the GPS on, flick the switch on the device towards the inserted the SIM. Place the tracker outside for the best signal to complete the following steps.
- 3) Text the mobile number of newly activated SIM that you inserted into the GPS with the following commands:
 - 1) **Begin123456**
You will get the "begin ok" reply from the GPS within 1-2 minutes, if not the SIM may not be correctly activated.
 - 2) The following command is provider-specific due to the fact that each Telco has their own specific APN (3G/4G Network). In our provided example we have used an Optus Sim Card.

Example Command: **Apn123456 connect**

Note: A space is required between Apn123456 and the providers APN

This command will return an “apn ok” response within a few minutes and connects the device with the providers network.

Here are the APNs of our recommended providers:

Provider	APN
Telstra	telstra.internet
Optus	connect (or: yesinternet)
Vodafone	live.vodafone.com

3) **Gprs123456**

This command engages the GPS positioning and connection and will return “gprs ok” when synched with your provider.

4) **Check123456**

This is used to confirm your commands have been inputted and “wake up” the GPS if needed. We often use this to troubleshoot.

That’s the most complicated part of the process done!

Getting into the App

Return to the WINNIES GPS app that you downloaded and use the following steps to login.

- 1) Before anything else, at the bottom of the app ensure you’ve selected the bottom left **IMEI/ID** login option.
- 2) In the top field, enter the server: **www.zg666gps.com**
- 3) In the second field, enter the IMEI/ID which is on the side/end of your GPS unit. This is most likely **4209** or **6209**.
- 4) In the third field the default password is **123456**, you can change this to a custom password after you’ve logged into the app.

Congratulations, you’re all setup!

Your GPS Trackers position will show it’s current location within 5-10 minutes of completing this setup guide. If you are not getting the current location, please contact the store via email **support@thespystore.com.au** or call us on **1300 681 609** (Business Hours: Mon-Fri, 9-5 AWST).
