

How to measure your space.

Width (In a tight space)

Width (In a tight space) Measure in 2 points between the bottom of your wall. Reduce the smallest dimension by a safe distance of 3cm.

This allows for any walls or crevices that are not straight along with providing enough distance for the desk to raise and lower safely.

Depth (In a tight space/nook)

If in a tight space measure from your wall to the desired area where you want the front of your desk. Tip: Use masking tape on the floor to help determine the best fit desk for your space.

Depth (In a room)

Depth (In a room) Ensure your desk is deep enough to meet your IT needs while ensuring it doesn't stick out into a busy area. If you are using a dual screen setup we recommend a depth of 730mm or deeper. If you have the space available in your space, deeper is generally recommended to provide additional working space and provide distance between you and your screens.

Height

Height Its important to check for obstructions such as wall mounted shelves or window sills that may obstruct the desk, or your computer screens as the desk raises. To be safe, we recommend allowing 170cm from floor to the bottom of any wall mounted shelf or obstruction.

- Use the advanced programming guide to program upper and lower limits in your desk to stop it hitting obstructions.
