Typical CHT Sensor

Engine Temperature Sensor: Description and Operation

CYLINDER HEAD TEMPERATURE (CHT) SENSOR

Typical CHT Sensor

The CHT sensor is a thermistor device in which resistance changes with the temperature. The electrical resistance of a thermistor decreases as temperature increases, and the resistance increases as the temperature decreases. The varying resistance affects the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

The CHT sensor is installed in the cylinder head and measures the metal temperature. The CHT sensor can provide complete engine temperature information and can be used to infer coolant temperature. If the CHT sensor conveys an overheating condition to the PCM, the PCM initiates a fail-safe cooling strategy based on information from the CHT sensor. A cooling system concern such as low coolant or coolant loss could cause an overheating condition. As a result, damage to major engine components could occur. Using both the CHT sensor and fail-safe cooling strategy, the PCM prevents damage by allowing air cooling of the engine and limp home capability.

Fuel Level Sensor: Description and Operation

FUEL LEVEL INPUT (FLI)

The FLI is a communications network message. Most vehicle applications use a potentiometer type FLI sensor connected to a float in the FP module to determine fuel level.

Part 2

Removal and Installation

WARNING:

- When working on or near the evaporative emission (EVAP) system, disconnect the battery ground cable from the battery. The EVAP system contains fuel vapor and condensed fuel vapor, so an

electrical spark may cause a fire or explosion. Failure to follow this instruction may result in serious personal injury.

- Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. Remove the fuel tank. 2. Disconnect the fuel tank pressure sensor electrical connector.

3. NOTE: The rear fuel tank vapor tube and fuel tank pressure sensor are an assembly and must be serviced as an assembly.

Disconnect the rear fuel tank vapor tube and fuel tank pressure sensor assembly-to-evaporative emissions (EVAP) canister quick connect coupling.

4. Disconnect the front fuel tank vapor tube-to-rear fuel tank vapor tube and fuel tank pressure sensor assembly quick connect coupling. 5. Remove the rear fuel tank vapor tube and fuel tank pressure sensor assembly. 6. To install, reverse the removal procedure.

- Carry out the leak test. See: Emission Control Systems/Evaporative Emissions System/Testing and Inspection

- Carry out the evaporative emission repair verification drive cycle.

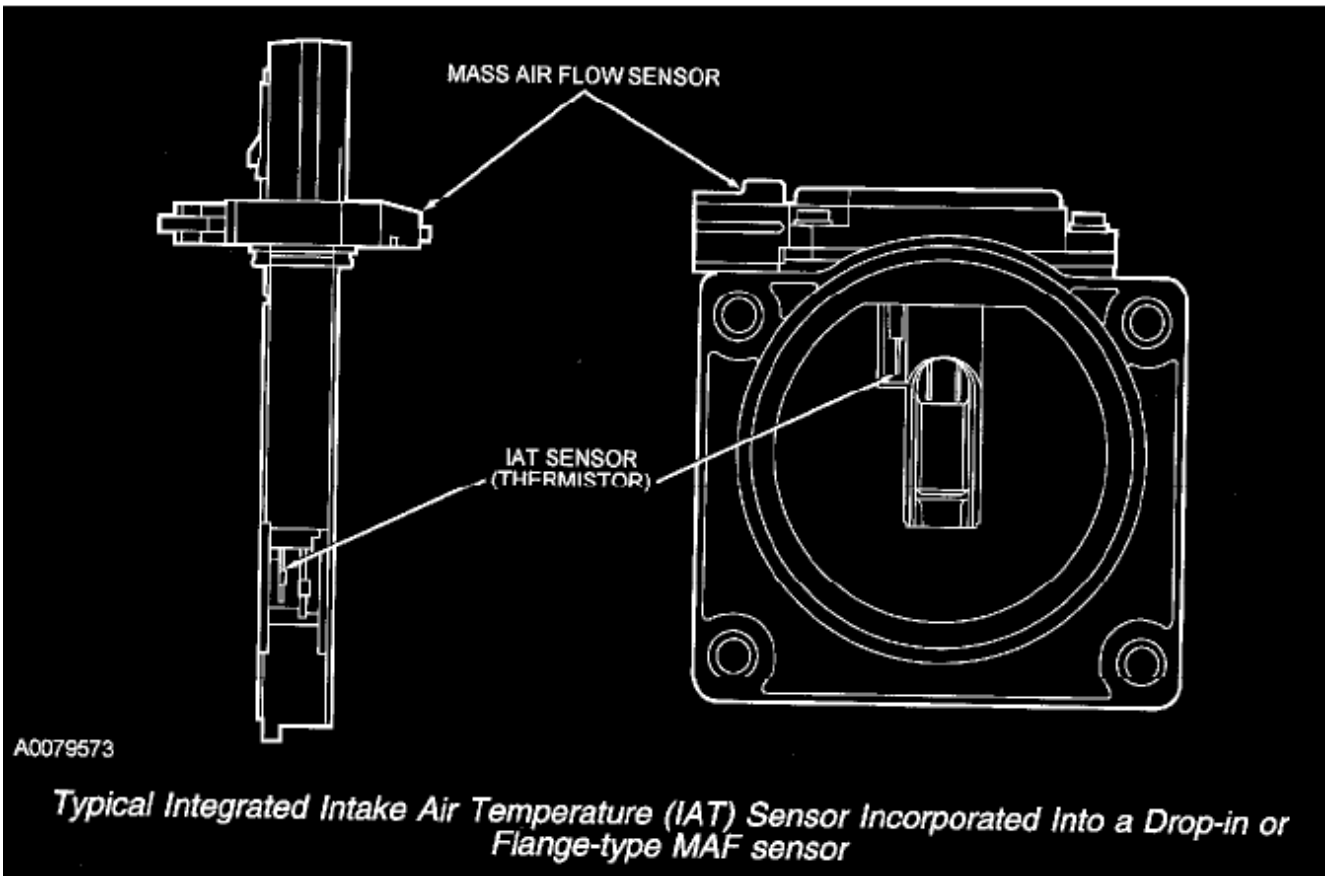
Typical Stand-Alone/Non-Integrated Intake Air Temperature (IAT) Sensors



Typical Integrated Intake Air Temperature (IAT) Sensor Incorporated Into a Drop-in or Flange-type MAF sensor

Intake Air Temperature Sensor: Description and Operation

Intake Air Temperature (IAT) Sensor

Typical Stand-Alone/Non-Integrated Intake Air Temperature (IAT) Sensors

Typical Integrated Intake Air Temperature (IAT) Sensor Incorporated Into A Drop-in Or Flange-type MAF Sensor

The IAT sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of a thermistor decreases as the temperature increases, and the resistance increases as the temperature decreases. The varying resistance affects the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Thermistor-type sensors are considered passive sensors. A passive sensor is connected to a voltage divider network so that varying the resistance of the passive sensor causes a variation in total current flow. Voltage that is dropped across a fixed resistor in a series with the sensor resistor determines the voltage signal at the PCM. This voltage signal is equal to the reference voltage minus the voltage drop across the fixed resistor.

The IAT provides air temperature information to the PCM. The PCM uses the air temperature information as a correction factor in the calculation of

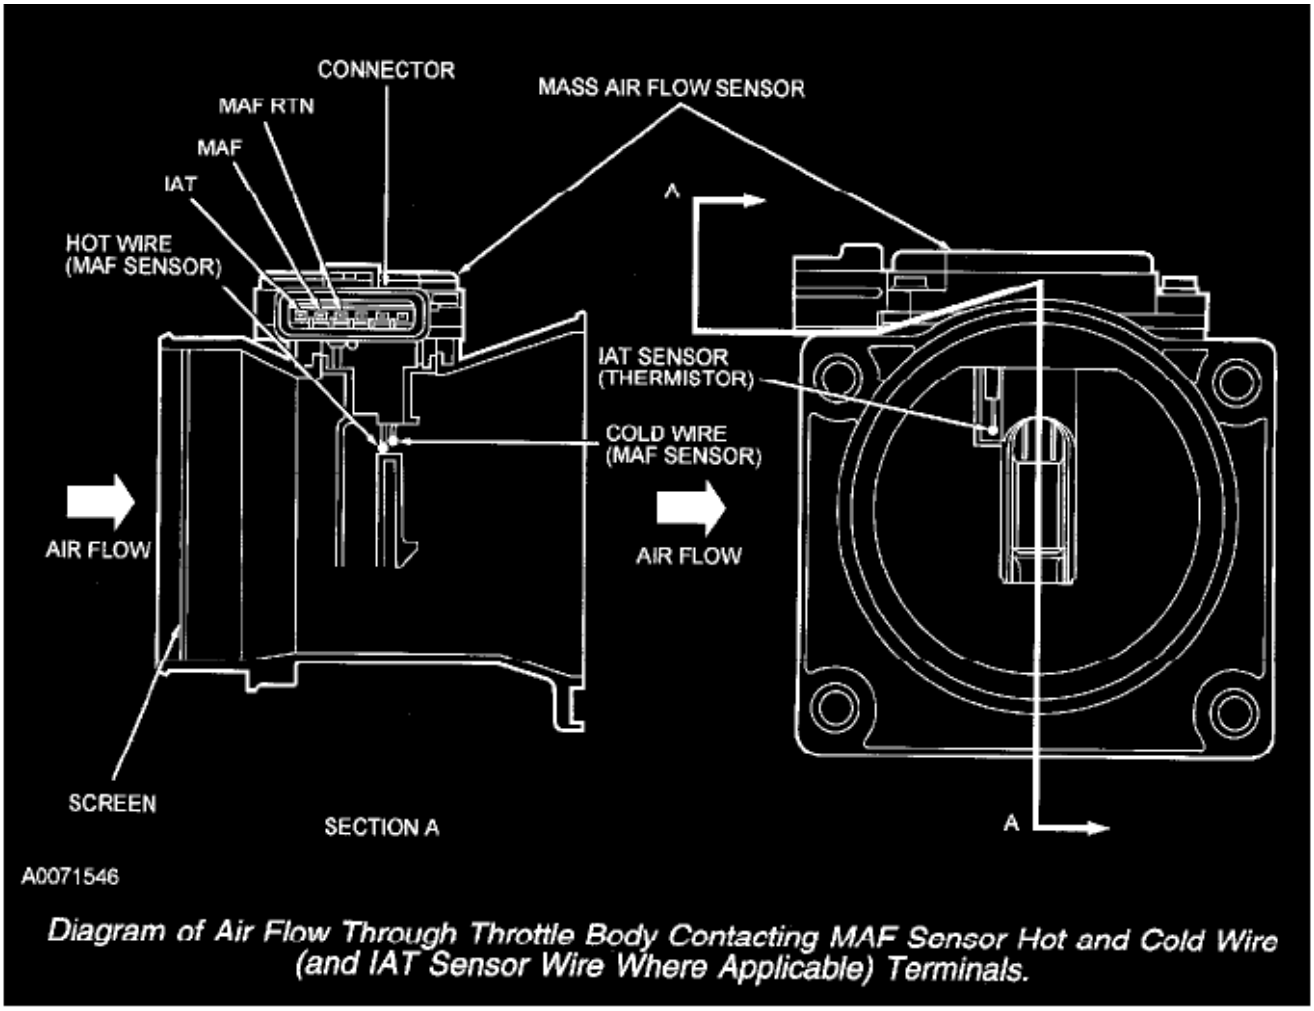


Diagram of Air Flow Through Throttle Body Contacting MAF Sensor Hot and Cold Wire (and IAT Sensor Wire Where Applicable) Terminals.

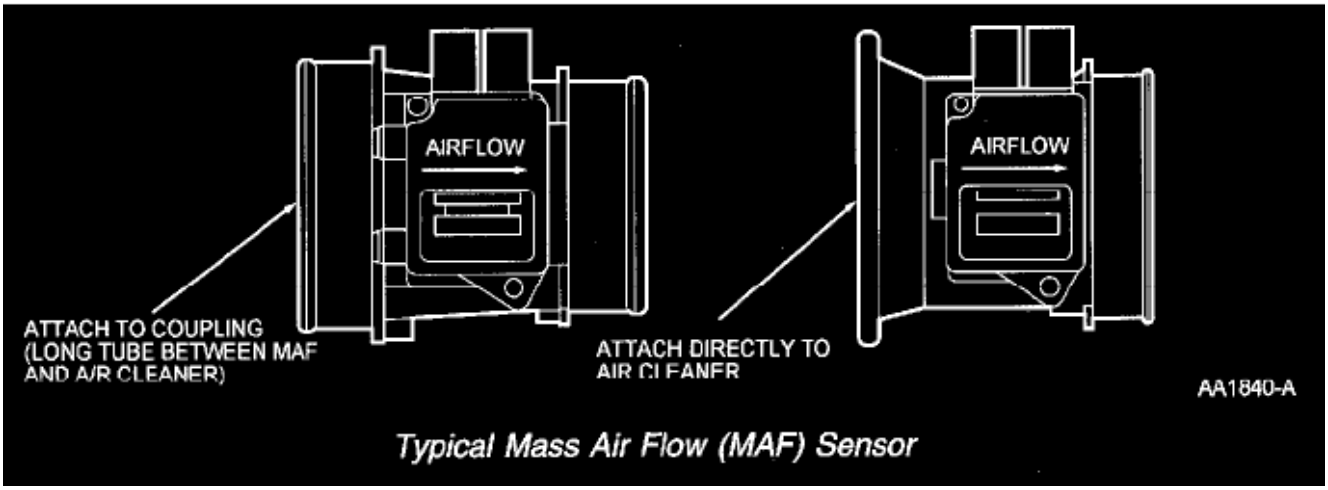


Typical Mass Air Flow (MAF) Sensor

fuel, spark, and air flow.

The IAT sensor provides a quicker temperature change response time than the ECT or CHT sensor.

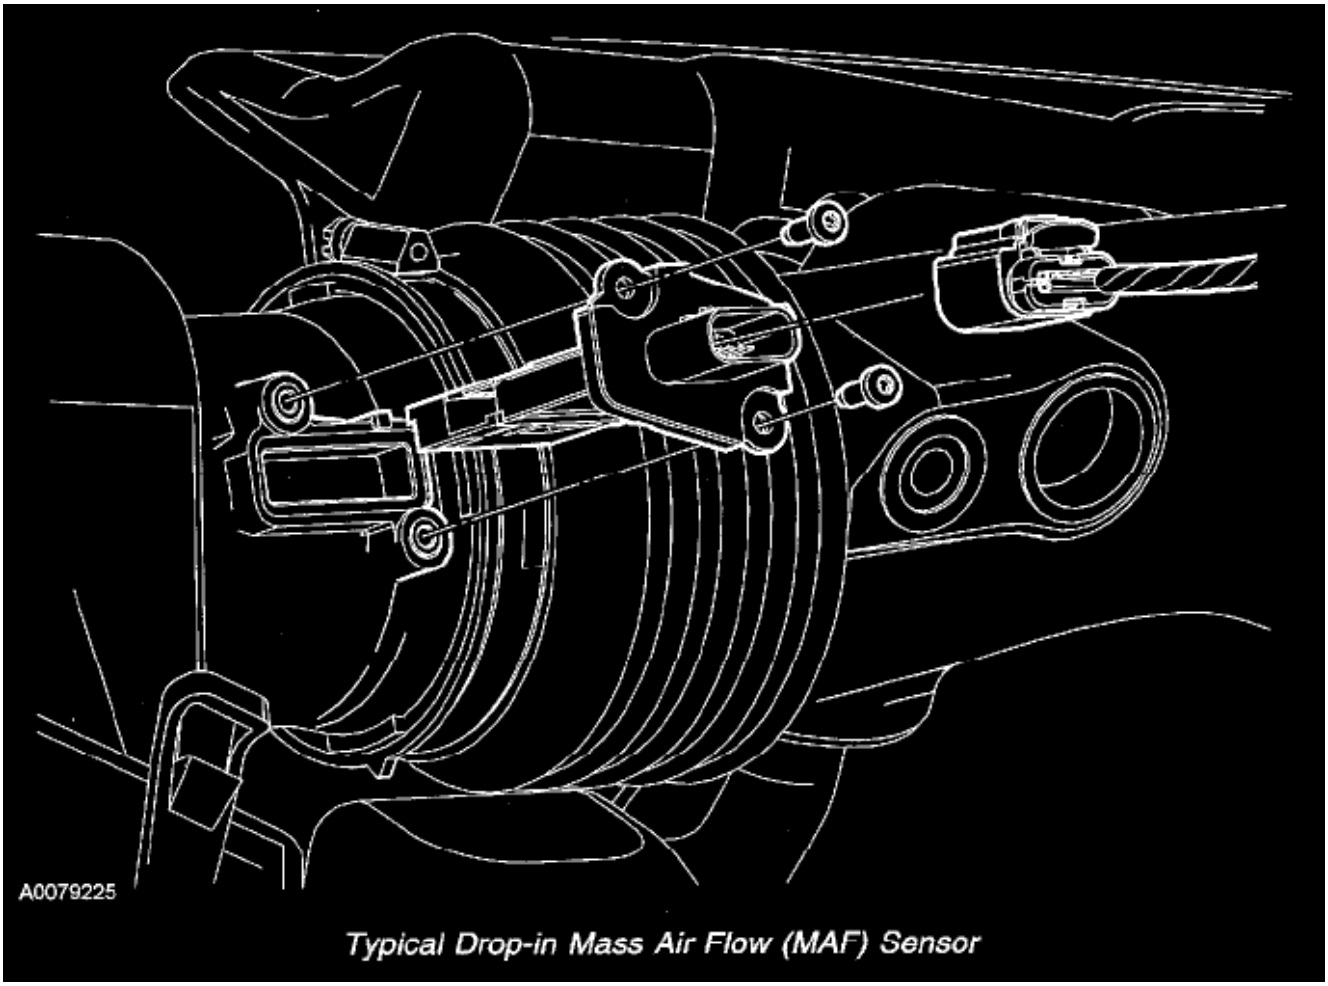
Currently there are 2 design types of IAT sensors used, a stand-alone/non-integrated type and a integrated type. Both types function the same, however the integrated type is incorporated into the mass air flow (MAF) sensor instead of being a stand alone sensor.

Supercharged vehicles use 2 IAT sensors. Both sensors are thermistor type devices and operate as described above. One is located before the supercharger at the air cleaner for standard OBD/cold weather input, while a second sensor (IAT2) is located after the supercharger in the intake manifold. The IAT2 sensor located after the supercharger provides air temperature information to the PCM to control spark and to help determine charge air cooler (CAC) efficiency.

Mass Air Flow (MAF) Sensor

Diagram Of Air Flow Through Throttle Body Contacting MAF Sensor Hot And Cold Wire (and IAT Sensor Wire Where Applicable) Terminals

Typical Mass Air Flow (MAF) Sensor



Typical Drop-in Mass Air Flow (MAF) Sensor

Typical Drop-in Mass Air Flow (MAF) Sensor

The MAF sensor uses a hot wire sensing element to measure the amount of air entering the engine. Air passing over the hot wire causes it to cool. This hot wire is maintained at 200°C (392°F) above the ambient temperature as measured by a constant cold wire. The current required to maintain the temperature of the hot wire is proportional to the mass air flow. The MAF sensor then outputs an analog voltage signal to the PCM proportional to the intake air mass. The PCM calculates the required fuel injector pulse width in order to provide the desired air/fuel ratio. This input is also used in determining transmission electronic pressure control (EPC), shift and torque converter clutch scheduling.

The MAF sensor is located between the air cleaner and the throttle body or inside the air cleaner assembly. Most MAF sensors have integrated bypass technology with an integrated intake air temperature (IAT) sensor. The hot wire electronic sensing element must be replaced as an assembly. Replacing only the element may change the air flow calibration.

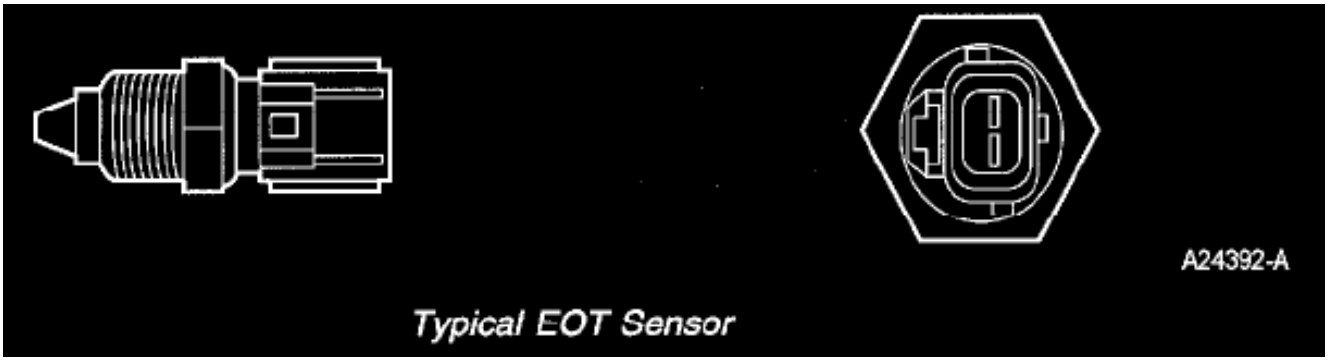
Manifold Pressure/Vacuum Sensor: Description and Operation

MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR

Typical Manifold Absolute Pressure (MAP) Sensor

The MAP sensor measures intake manifold absolute pressure. The PCM uses information from the MAP sensor to measure how much exhaust gas is introduced into the intake manifold.



Typical EOT Sensor

Oil Temperature Sensor For ECM: Description and Operation

ENGINE OIL TEMPERATURE (EOT) SENSOR

Typical EOT Sensor

The EOT sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of a thermistor decreases as the temperature increases and the resistance increases as the temperature decreases. The varying resistance changes the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Thermistor-type sensors are considered passive sensors. A passive sensor is connected to a voltage divider network so that varying the resistance of the passive sensor causes a variation in total current flow. Voltage that is dropped across a fixed resistor in a series with the sensor resistor determines the voltage signal at the PCM. This voltage signal is equal to the reference voltage minus the voltage drop across the fixed resistor.

The EOT sensor measures the temperature of the engine oil. The sensor is typically threaded into the engine oil lubrication system. The PCM can use the EOT sensor input to determine the following:

- On variable camshaft timing (VCT) applications the EOT input is used to adjust the VCT control gains and logic for camshaft timing.

- The PCM can use EOT sensor input in conjunction with other PCM inputs to determine oil degradation.

- The PCM can use EOT sensor input to initiate a soft engine shutdown. To prevent engine damage from occurring as a result of high oil temperatures, the PCM has the ability to initiate a soft engine shutdown. Whenever engine RPM exceeds a calibrated level for a certain period of time, the PCM begins reducing power by disabling engine cylinders.

Heated Oxygen Sensor (HO2S)

Oxygen Sensor: Description and Operation

Heated Oxygen Sensor (HO2S)

Heated Oxygen Sensor (HO2S)

The HO2S detects the presence of oxygen in the exhaust and produces a variable voltage according to the amount of oxygen detected. A high concentration of oxygen (lean air/fuel ratio) in the exhaust produces a voltage signal less than 0.4 volt. A low concentration of oxygen (rich air/fuel ratio) produces a voltage signal greater than 0.6 volt. The HO2S provides feedback to the PCM indicating air/fuel ratio in order to achieve a near stoichiometric air/fuel ratio of 14.7:1 during closed loop engine operation. The HO2S generates a voltage between 0.0 and 1.1 volts.

Embedded with the sensing element is the HO2S heater. The heating element heats the sensor to a temperature of 800°C (1,472°F). At approximately 300°C (572°F) the engine can enter closed loop operation. The VPWR circuit supplies voltage to the heater. The PCM turns the heater on by providing the ground when the correct conditions occur. The heater allows the engine to enter closed loop operation sooner. The use of this heater requires the HO2S heater control to be duty cycled, to prevent damage to the heater.

Universal HO2S

The universal HO2S, sometimes referred to as a wideband oxygen sensor, uses the typical HO2S combined with a current controller in the PCM to infer an air/fuel ratio relative to the stoichiometric air/fuel ratio. This is accomplished by balancing the amount of oxygen ions pumped in or out of a measurement chamber within the sensor. The typical HO2S within the universal HO2S is used to detect the oxygen content of the exhaust gas in the measurement chamber. The oxygen content inside the measurement chamber is maintained at the stoichiometric air/fuel ratio by pumping oxygen ions in and out of the measurement chamber. As the exhaust gasses get richer or leaner, the amount of oxygen that must be pumped in or out to maintain a stoichiometric air/fuel ratio in the measurement chamber varies in proportion to the air/fuel ratio. The amount of current required to

pump the oxygen ions in or out of the measurement chamber is used to measure the air/fuel ratio. The measured air/fuel ratio is actually the output from the current controller in the PCM and not a signal that comes directly from the sensor.

The universal HO2S also uses a self-contained reference chamber to make sure an oxygen differential is always present. The oxygen for the reference chamber is supplied by pumping small amounts of oxygen ions from the measurement chamber into the reference chamber. The universal HO2S does not need access to outside air.

Part to part variance is compensated for by placing a resistor in the connector. This resistor is used to trim the current measured by the current controller in the PCM.

Embedded with the sensing element is the universal H02S heater. The heater allows the engine to enter closed loop operation sooner. The heating element heats the sensor to a temperature of 780°C (1,436°F). The VPWR circuit supplies voltage to the heater. The PCM controls the heater on and off by providing the ground to maintain the sensor at the correct temperature for maximum accuracy.

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist.

2. NOTE: If necessary, lubricate the heated oxygen sensor (HO2S) with lock lubricant to assist in removal.

Using the special tool, remove the HO2S. -

To install, tighten to 48 Nm (35 lb-ft).

3. NOTE: Apply a light coat of anti-seize lubricant to the threads of the HO2S.

To install, reverse the removal procedure.

Power Steering Pressure Switch: Description and Operation

Power Steering Pressure (PSP) Sensor

Typical Power Steering Pressure (PSP) Sensor

The PSP sensor monitors the hydraulic pressure within the power steering system. The PSP sensor voltage input to the PCM changes as the hydraulic pressure changes. The PCM uses the input signal from the PSP sensor to compensate for additional loads on the engine by adjusting the

idle RPM and preventing engine stall during parking maneuvers. Also, the PSP sensor signals the PCM to adjust the transmission electronic pressure control (EPC) pressure during increased engine load, for example, during parking maneuvers.

Power Steering Pressure (PSP) Switch

Typical Power Steering Pressure (PSP) Switch

The PSP switch monitors the hydraulic pressure within the power steering system. The PSP switch is a normally closed switch that opens as the hydraulic pressure increases. The PCM provides a low current voltage on the PSP circuit. When the PSP switch is closed, this voltage is pulled low through the SIG RTN circuit. The PCM uses the input signal from the PSP switch to compensate for additional loads on the engine by adjusting the idle RPM and preventing engine stall during parking maneuvers. Also, the PSP switch signals the PCM to adjust the transmission electronic pressure control (EPC) pressure during increased engine load, for example during parking maneuvers.

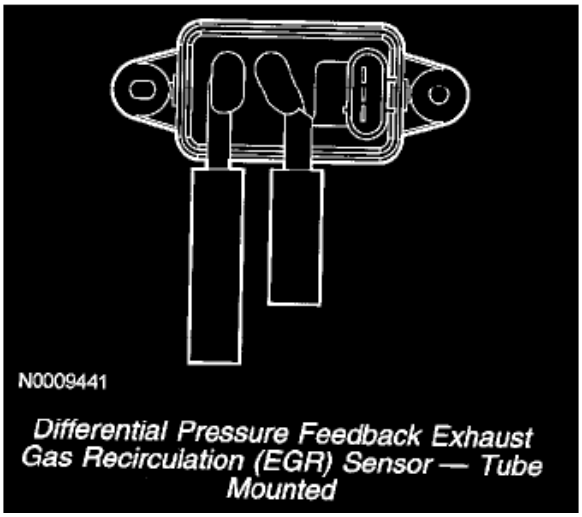
Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor



Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor — Tube Mounted

Pressure Feedback Exhaust Sensor: Description and Operation

Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor

Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor

The differential pressure feedback EGR sensor is a ceramic, capacitive-type pressure transducer that monitors the differential pressure across a metering orifice located in the orifice tube assembly. The differential pressure feedback EGR sensor receives this signal through 2 hoses referred to as the downstream pressure hose (REF SIGNAL) and upstream pressure hose (HI SIGNAL). The HI and REF hose connections are marked on the differential pressure feedback EGR sensor housing for identification (note that the HI signal uses a larger diameter hose). The differential pressure feedback EGR sensor outputs a voltage proportional to the pressure drop across the metering orifice and supplies it to the PCM as EGR flow rate feedback.

Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor - Tube Mounted

Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor - Tube Mounted

The tube mounted differential pressure feedback EGR sensor is identical in operation as the larger plastic differential pressure feedback EGR sensors and uses a 1.0 volt offset. The HI and REF

hose connections are marked on the side of the sensor.

Throttle Position Sensor: Description and Operation

Electronic Throttle Body (ETB) Throttle Position Sensor

The ETB throttle position sensor has 2 signal circuits in the sensor for redundancy. The redundant ETB throttle position signals are required for increased monitoring. The first ETB throttle position sensor signal (TP1) has a negative slope (increasing angle, decreasing voltage) and the second signal (TP2) has a positive slope (increasing angle, increasing voltage). The 2 ETB throttle position sensor signals make sure the PCM receives a correct input even if 1 signal has a concern. There is 1 reference voltage circuit and 1 signal return circuit for the sensor. The reference voltage circuit and the signal return circuit is shared with the reference voltage circuits and signal return circuits used by the APP sensor.

Throttle Position (TP) Sensor

Typical TP Sensor

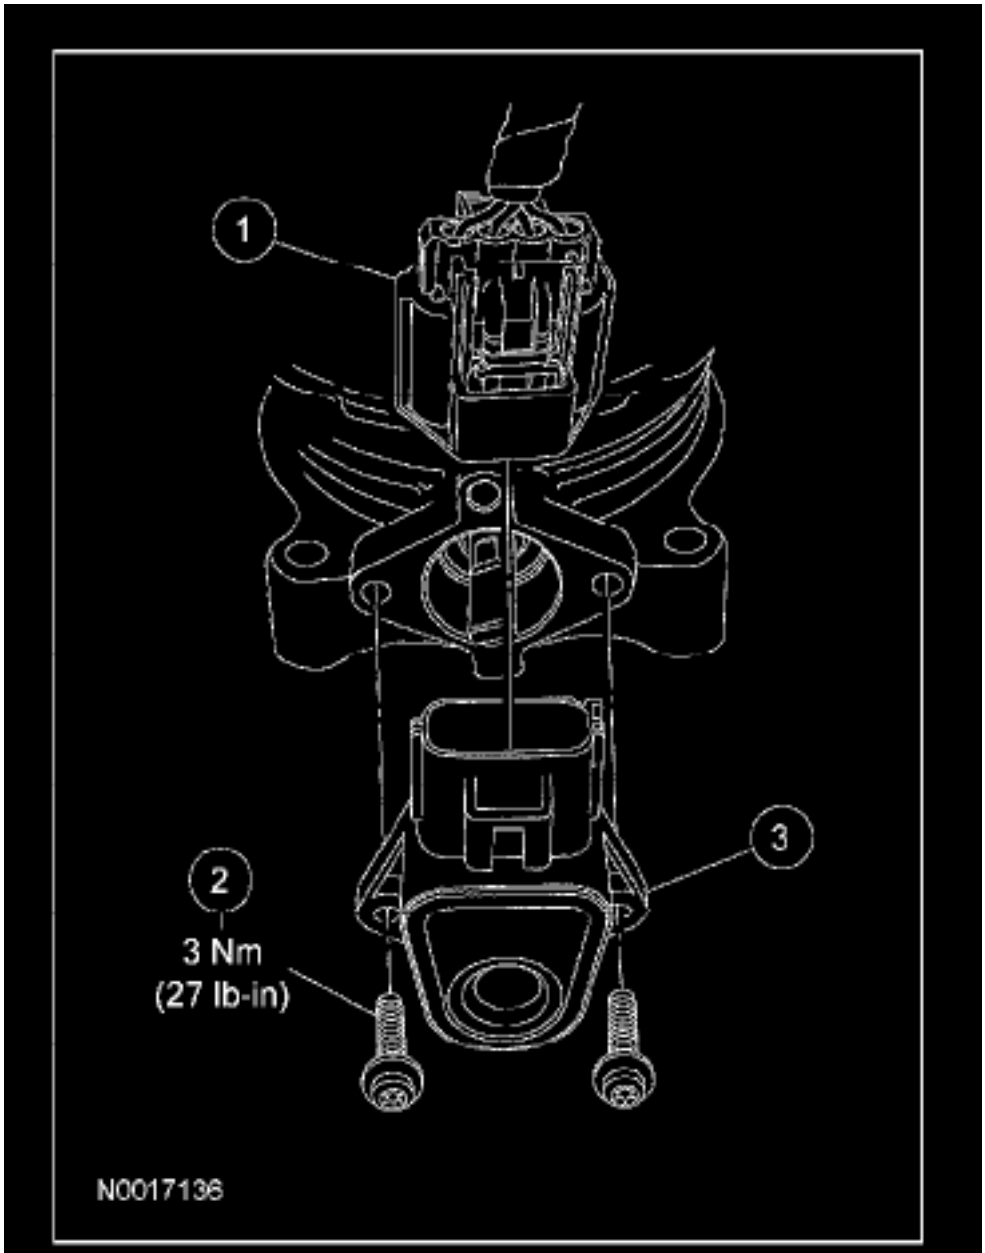
The TP sensor is a rotary potentiometer sensor that provides a signal to the PCM that is linearly proportional to the throttle plate/shaft position. The sensor housing has a 3-blade electrical connector that may be gold plated. The gold plating increases the corrosion resistance on the terminals and increases the connector durability. The TP sensor is mounted on the throttle body. As the TP sensor is rotated by the throttle shaft, 4 operating conditions are determined by the PCM from the TP. The operating conditions are: -

closed throttle (includes idle or deceleration)

- part throttle (includes cruise or moderate acceleration)

- wide open throttle (includes maximum acceleration or de-choke on crank)

- throttle angle rate



Item	Part Number	Description

2	W707535	TP sensor screw (2 required)
3	9E928	TP sensor

Throttle Position Sensor: Service and Repair

THROTTLE POSITION (TP) SENSOR

Removal and Installation

1. Disconnect the throttle position (TP) sensor electrical connector.

2. CAUTION: Failure to remove the throttle position (TP) sensor screws in the following manner will result in damage to the screws. First,

loosen the screws 1 to 2 full turns using a hand tool, and then use a suitable high-speed driver to complete the removal.

Remove and discard the 2 bolts and the TP sensor. -

To install, tighten to 3 Nm (27 lb-in).

3. CAUTION: Do not use a high-speed driver to install the new screws or damage to the throttle position (TP) sensor may occur.

NOTE: -

Do not reuse the TP sensor and screws. A new TP sensor and screws must be installed.

- Failure to install the TP sensor in this manner may result in excessive idle speeds. Slide the rotary tangs into position over the throttle shaft blade, then rotate the TP sensor.

To install, reverse the removal procedure. -

Install a new TP sensor and screws.

Digital Transmission Range (TR) Sensor

Digital Transmission Range (TR) Sensor

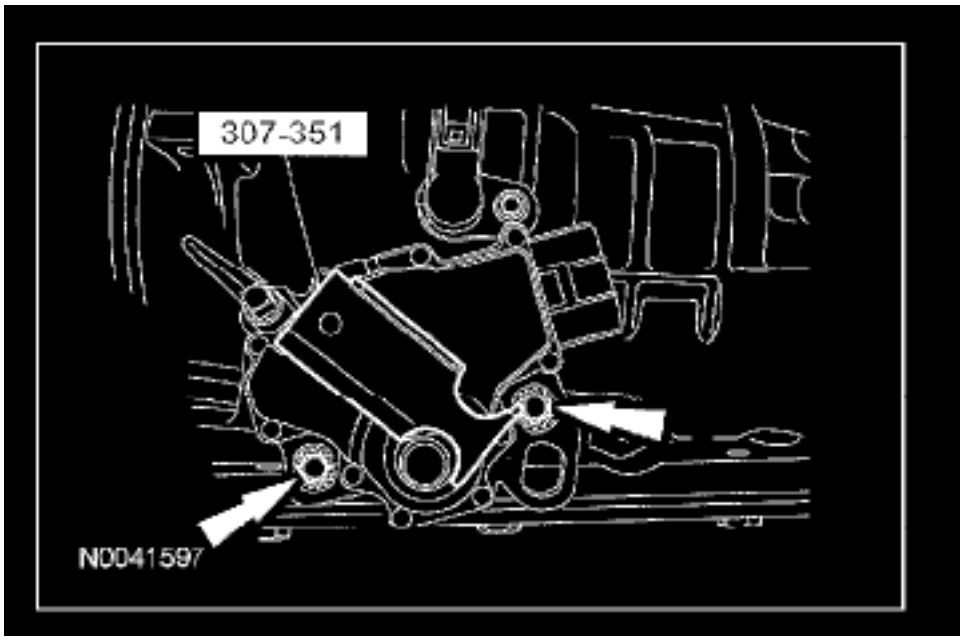
Removal

1. With the vehicle in NEUTRAL, position it on a hoist. 2. Disconnect the selector lever cable from the manual control lever. 3. Disconnect the digital transmission range (TR) sensor electrical connector. 4. Remove the manual control outer lever nut and manual control outer lever. 5. Remove the screws and the digital TR sensor.

Installation



1. CAUTION: The digital transmission range (TR) sensor must fit flush against the boss on the case to prevent damage to the sensor.

Install the digital TR sensor and loosely install the screws.

2. CAUTION: Tightening one screw before tightening the other may cause the sensor to bind or become damaged.

NOTE: The manual lever must be in the NEUTRAL position.

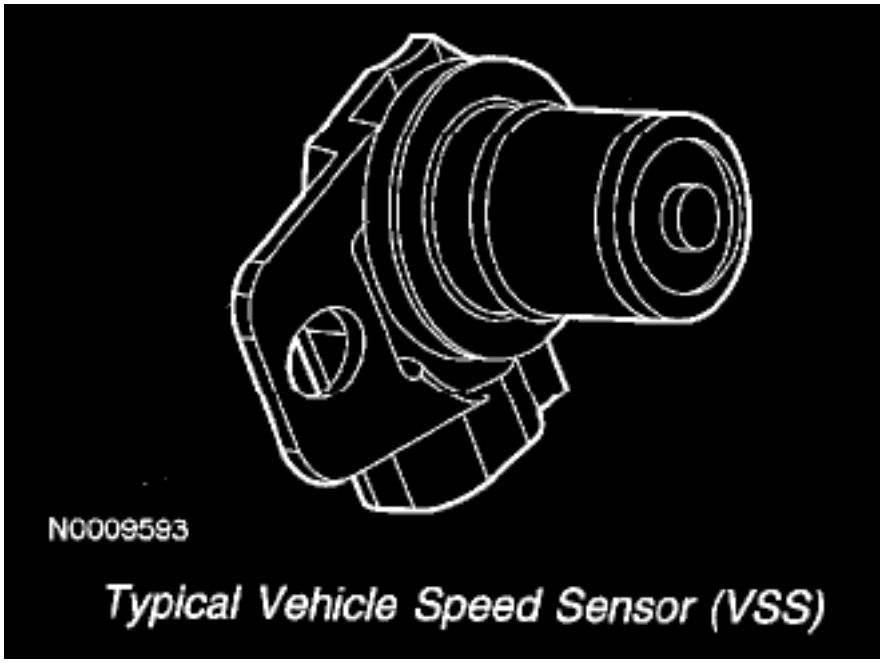
Using the special tool, align the digital TR sensor and tighten screws in an alternating sequence. ^

Tighten to 10 Nm (89 lb-inch).

3. Install the manual control outer lever and nut.

^ Tighten to 48 Nm (35 lb-ft).

4. Connect the digital TR sensor electrical connector. 5. Connect the selector lever cable to the manual control lever. 6. Verify that the selector lever cable is adjusted correctly.



Vehicle Speed Sensor: Description and Operation

Output Shaft Speed (OSS) Sensor

The OSS sensor provides the PCM with information about the rotational speed of an output shaft. The PCM uses the information to control and diagnose powertrain behavior. In some applications, the sensor is also used as the source of vehicle speed. The sensor may be physically located in different places on the vehicle, depending upon the specific application. The design of each speed sensor is unique and depends on which powertrain control feature uses the information that is generated.

Vehicle Speed Sensor (VSS)

Typical Vehicle Speed Sensor (VSS)

The VSS is a variable reluctance or Hall-effect sensor that generates a waveform with a frequency that is proportional to the speed of the vehicle. If the vehicle is moving at a relatively low velocity, the sensor produces a signal with a low frequency. As the vehicle velocity increases, the sensor generates a signal with a higher frequency. The PCM uses the frequency signal generated by the VSS (and other inputs) to control such parameters as fuel injection, ignition control, transmission/transaxle shift scheduling, and torque converter clutch scheduling.

2. CAUTION: Tightening one screw before tightening the other may cause the sensor to bind or become damaged.

NOTE: The manual lever must be in the NEUTRAL position.

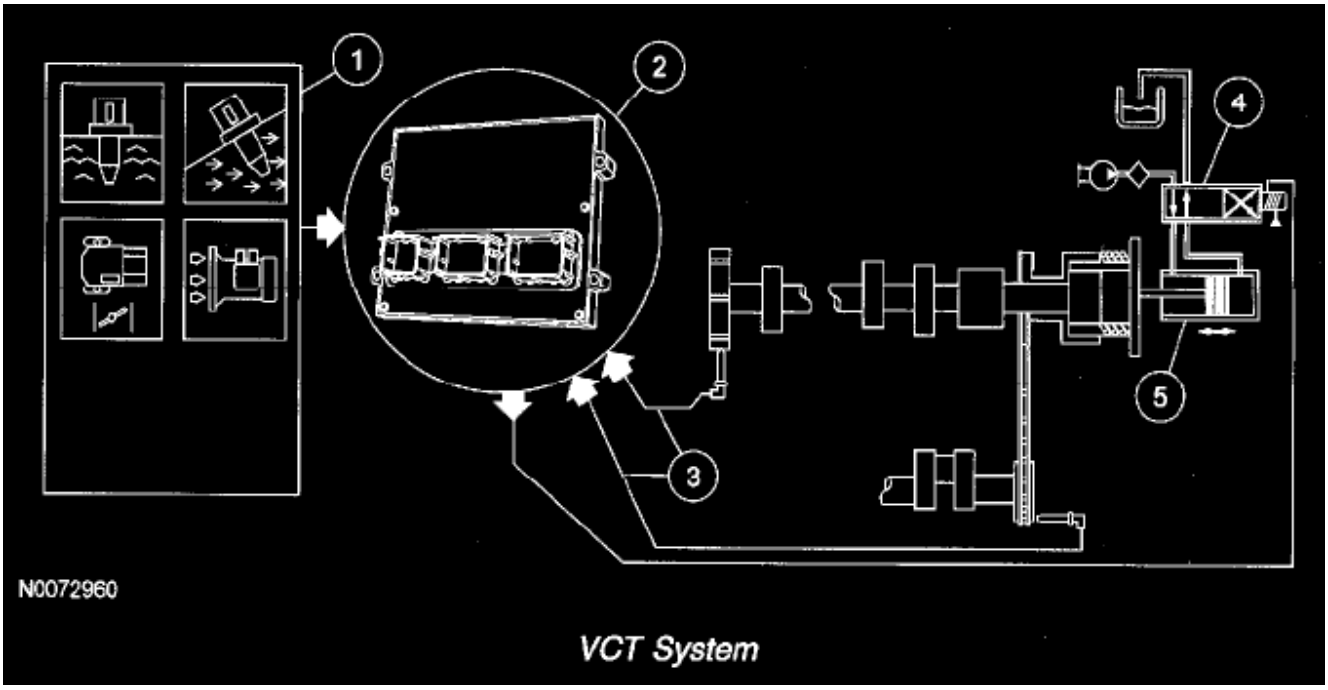
Using the special tool, align the digital TR sensor and tighten screws in an alternating sequence. ^

Tighten to 10 Nm (89 lb-inch).

3. Install the manual control outer lever and nut.

^ Tighten to 48 Nm (35 lb-ft).

4. Connect the digital TR sensor electrical connector. 5. Connect the selector lever cable to the manual control lever. 6. Verify that the selector lever cable is adjusted correctly.



VCT System

Variable Valve Timing Actuator: Description and Operation

VARIABLE CAMSHAFT TIMING (VCT) SYSTEM

Overview

The VCT enables rotation of the camshaft(s) relative to the crankshaft rotation as a function of engine operating conditions. There are 4 types of VCT systems.

- Exhaust phase shifting (EPS) system - the exhaust cam is the active cam being retarded.

- Intake phase shifting (IPS) system - the intake cam is the active cam being advanced.

- Dual equal phase shifting (DEPS) system - both intake and exhaust cams are phase shifted and equally advanced or retarded.

- Dual independent phase shifting (DIPS) system - where both the intake and exhaust cams are shifted independently.

All systems have 4 operational modes: idle, part throttle, wide open throttle (WOT), and default mode. At idle and low engine speeds with closed throttle, the powertrain control module (PCM) determines the phase angle based on air flow, engine oil temperature and engine coolant temperature. At part and wide open throttle the PCM determines the phase angle based on engine RPM, load, and throttle position. VCT systems provide reduced emissions and enhanced engine power, fuel economy and idle quality. IPS systems also have the added benefit of improved torque. In addition, some VCT system applications can eliminate the need for an external exhaust gas recirculation (EGR) system. The elimination of the EGR system is accomplished by controlling the overlap time between the intake valve opening and exhaust valve closing. Currently, both the IPS and DEPS systems are used.

Variable Camshaft Timing (VCT) System

VCT System

The VCT system consists of an electric hydraulic positioning control solenoid, a camshaft position (CMP) sensor, and a trigger wheel. The CMP trigger wheel has a number of equally spaced teeth equal to the number (n) of cylinders on a bank plus one extra tooth (n+1). Four cylinder and V8 engines use a CMP 4+1 tooth trigger wheel. V6 engines use a CMP 3+1 tooth trigger wheel. The extra tooth placed between the equally spaced teeth represents the CMP signal for that bank. A crankshaft position (CKP) sensor provides the PCM with crankshaft positioning information in 10 degree increments.

1. The PCM receives input signals from the intake air temperature (IAT) sensor, engine coolant temperature (ECT) sensor, engine oil temperature

(EOT) sensor, CMP, throttle position (TP) sensor, mass air flow (MAF) sensor, and CKP to determine the operating conditions of the engine. At idle and low engine speeds with closed throttle, the PCM controls the camshaft position based on ECT, EOT, IAT, and MAF. During part and wide open throttle, the camshaft position is determined by engine RPM, load and throttle position. The VCT system does not operate until the engine is at normal operating temperature.

2. The VCT system is enabled by the PCM when the correct conditions are met. 3. The CKP signal is used as a reference for CMP positioning. 4. The VCT solenoid valve is an integral part of the VCT system. The solenoid valve controls the flow of engine oil in the VCT actuator assembly.

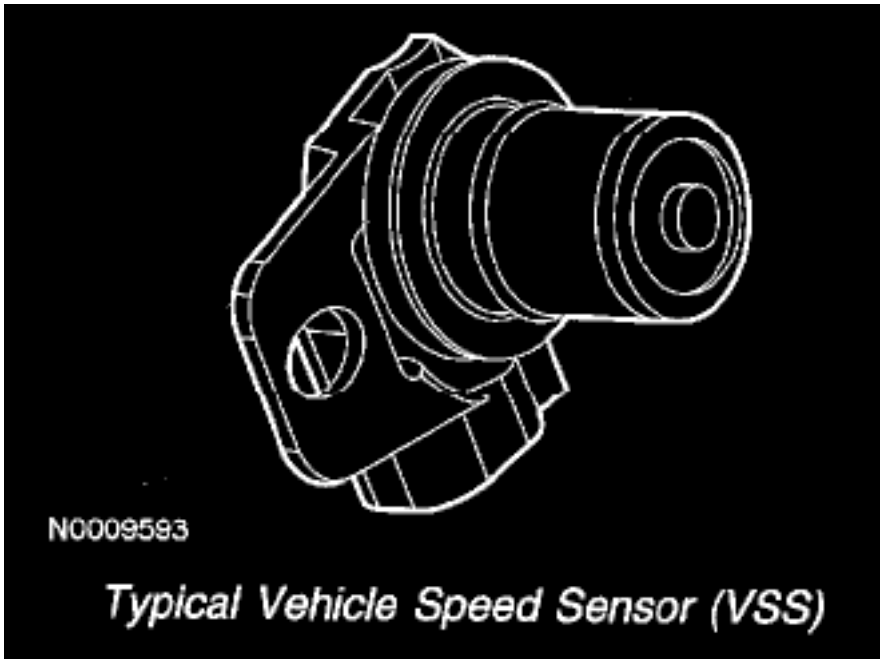
As the PCM controls the duty cycle of the solenoid valve, oil pressure/flow advances or retards the cam timing. Duty cycles near 0% or 100% represent rapid movement of the camshaft. Retaining a fixed camshaft position is accomplished by dithering (oscillating) the solenoid valve duty cycle.

The PCM calculates and determines the desired camshaft position. It continually updates the VCT solenoid duty cycle until the desired position is achieved. A difference between the desired and actual camshaft position represents a position error in the PCM VCT control loop. The PCM

disables the VCT and places the camshaft in a default position if a concern is detected. A related DTC is also set when the concern is detected.

5. When the VCT solenoid is energized, engine oil is allowed to flow to the VCT actuator assembly which advances or retards the camshaft timing.

One half of the VCT actuator is coupled to the camshaft and the other half is connected to the timing chain. Oil chambers between the 2 halves couple the camshaft to the timing chain. When the flow of oil is shifted from one side of the chamber to the other, the differential change in oil pressure forces the camshaft to rotate in either an advance or retard position depending on the oil flow.



Vehicle Speed Sensor: Description and Operation

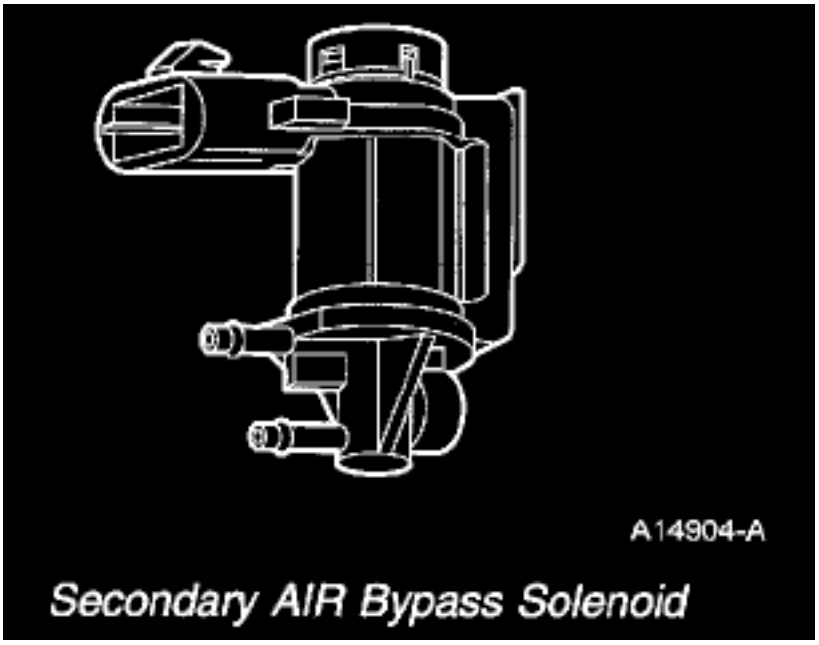
Output Shaft Speed (OSS) Sensor

The OSS sensor provides the PCM with information about the rotational speed of an output shaft. The PCM uses the information to control and diagnose powertrain behavior. In some applications, the sensor is also used as the source of vehicle speed. The sensor may be physically located in different places on the vehicle, depending upon the specific application. The design of each speed sensor is unique and depends on which powertrain control feature uses the information that is generated.

Vehicle Speed Sensor (VSS)

Typical Vehicle Speed Sensor (VSS)

The VSS is a variable reluctance or Hall-effect sensor that generates a waveform with a frequency that is proportional to the speed of the vehicle. If the vehicle is moving at a relatively low velocity, the sensor produces a signal with a low frequency. As the vehicle velocity increases, the sensor generates a signal with a higher frequency. The PCM uses the frequency signal generated by the VSS (and other inputs) to control such parameters as fuel injection, ignition control, transmission/transaxle shift scheduling, and torque converter clutch scheduling.

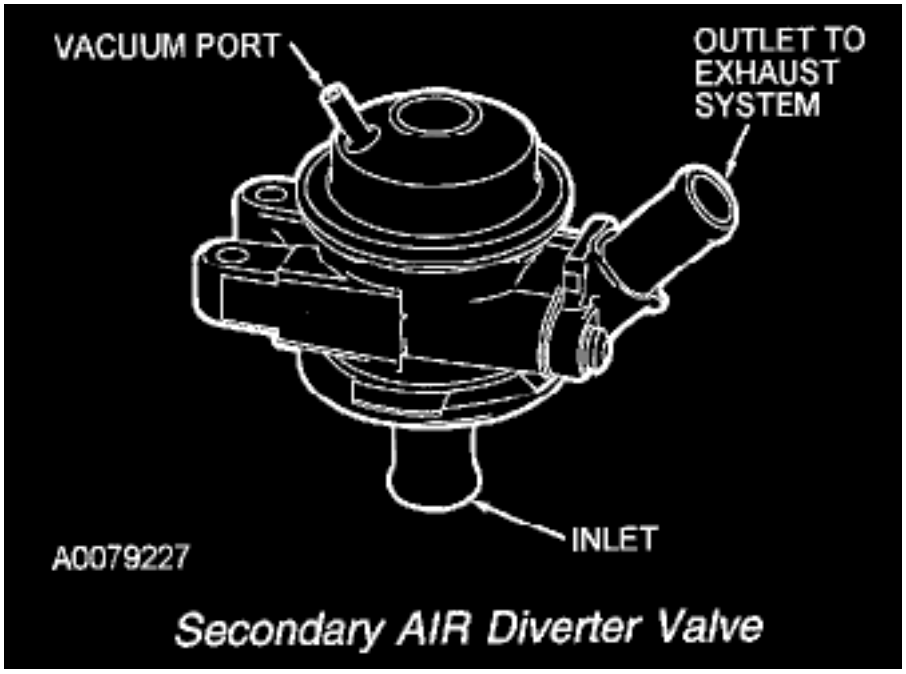


Air Diverter Solenoid: Description and Operation

SECONDARY AIR INJECTION (AIR) BYPASS SOLENOID

Secondary AIR Bypass Solenoid

The secondary AIR bypass solenoid is used by the PCM to control vacuum to the secondary air injection diverter (AIR diverter) valve. The secondary AIR bypass solenoid is a normally closed solenoid. The secondary AIR bypass solenoid also has a filtered vent feature to permit vacuum release.

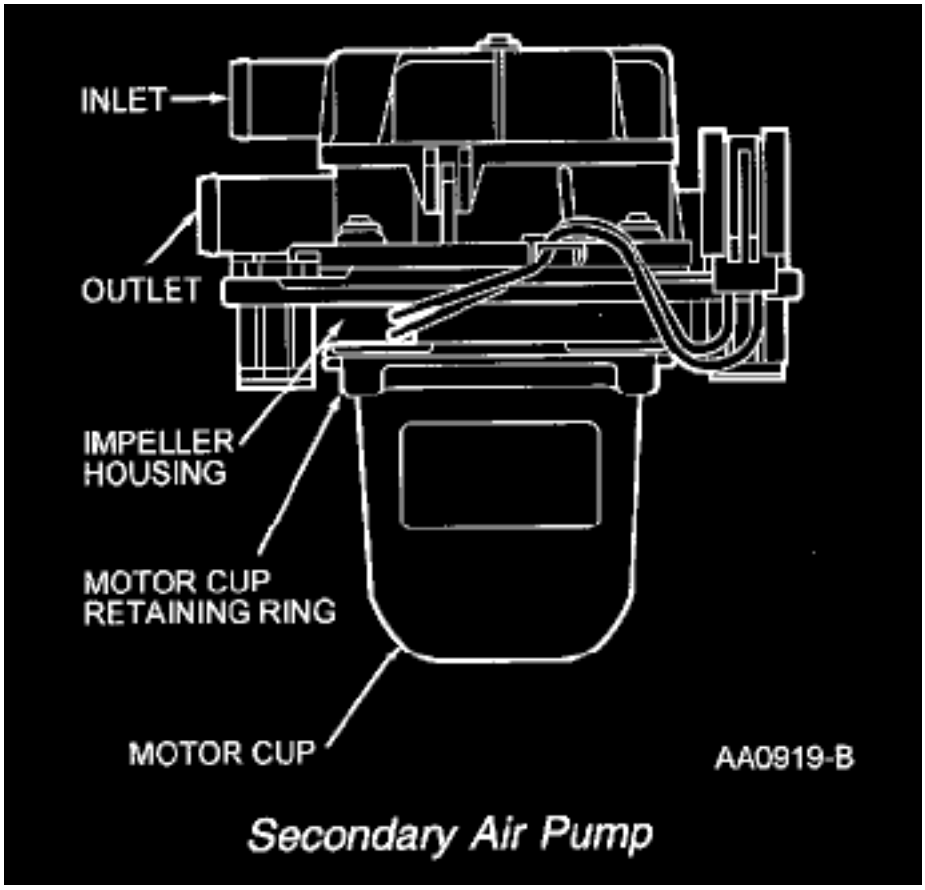


Air Diverter Valve: Description and Operation

SECONDARY AIR DIVERTER VALVE

Secondary AIR Diverter Valve

The secondary AIR diverter valve is used with the secondary AIR pump to provide on/off control of air to the exhaust manifold and catalytic converter. When the secondary AIR pump is on and vacuum is supplied to the AIR diverter valve, air passes the integral check valve disk. When the secondary AIR pump is off, and vacuum is removed from the AIR diverter valve, the integral check valve disk is held on the seat and stops air from being drawn into the exhaust system and prevents the back flow of the exhaust into the secondary AIR system.



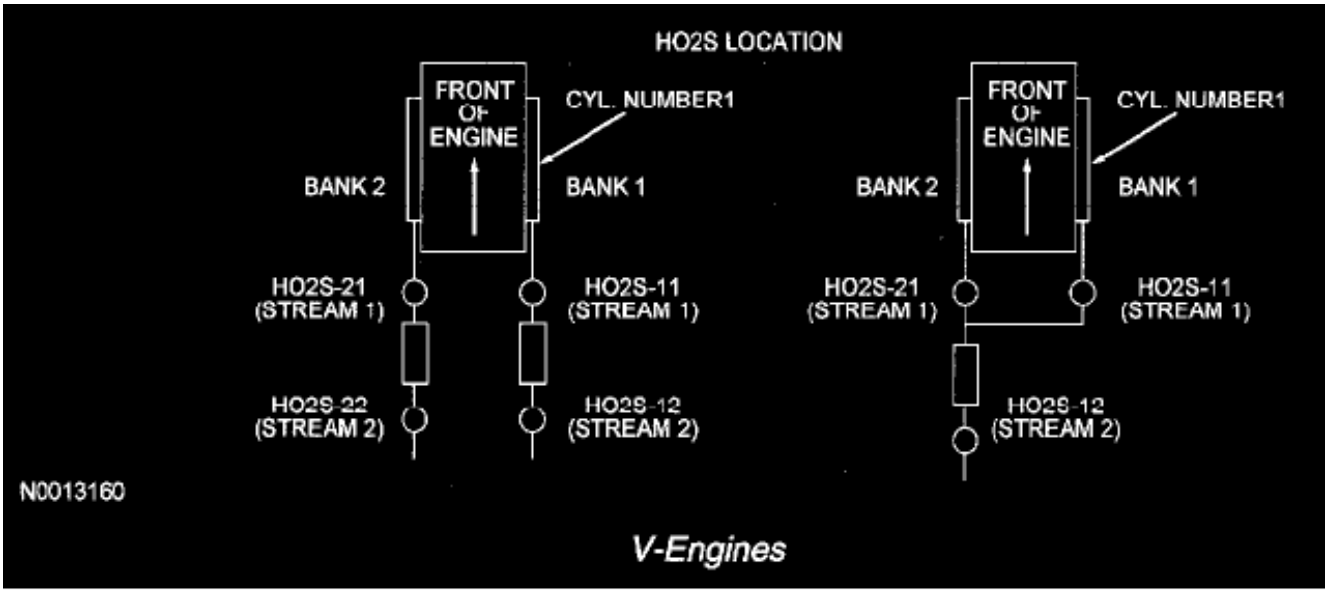
Secondary Air Pump

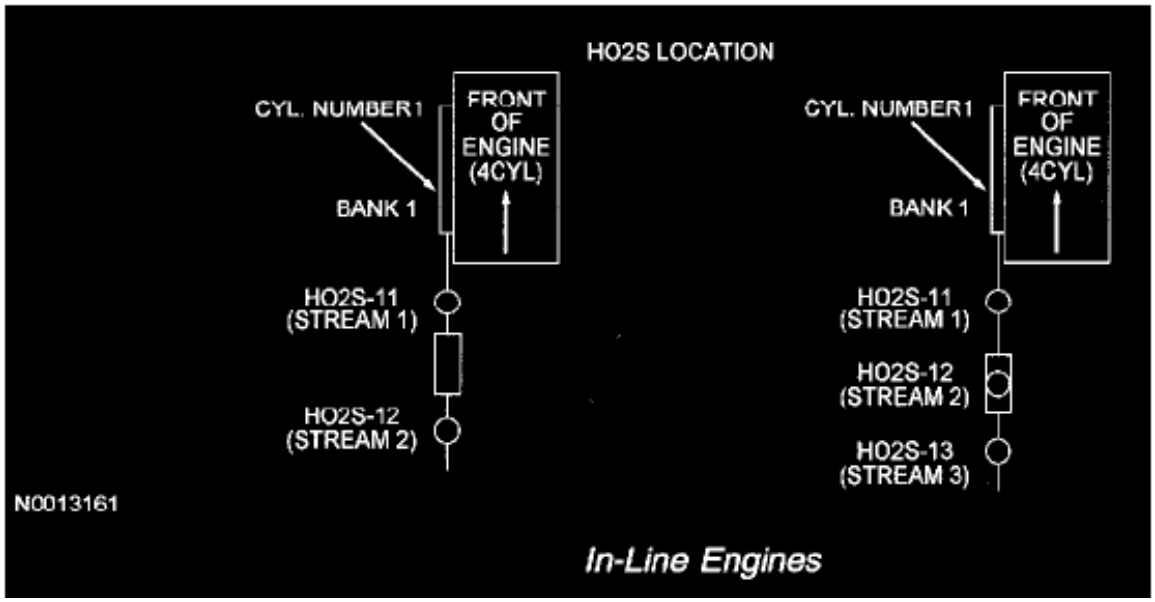
Air Injection Pump: Description and Operation

SECONDARY AIR PUMP

Secondary Air Pump

The secondary AIR pump provides pressurized air to the secondary AIR system. The secondary AIR pump functions independently of RPM and is controlled by the PCM. The secondary AIR pump is only used for short periods of time. Delivery of air is dependent on the amount of system backpressure and system voltage. The secondary AIR pump draws dry filtered air from the intake air system downstream of the MAF/IAT sensor.





Catalytic Converter: Description and Operation

CATALYST AND EXHAUST SYSTEMS

Overview

V-Engines

In-Line Engines

The catalytic converter and exhaust systems work together to control the release of harmful engine exhaust emissions into the atmosphere. The engine exhaust gas consists mainly of nitrogen (N),

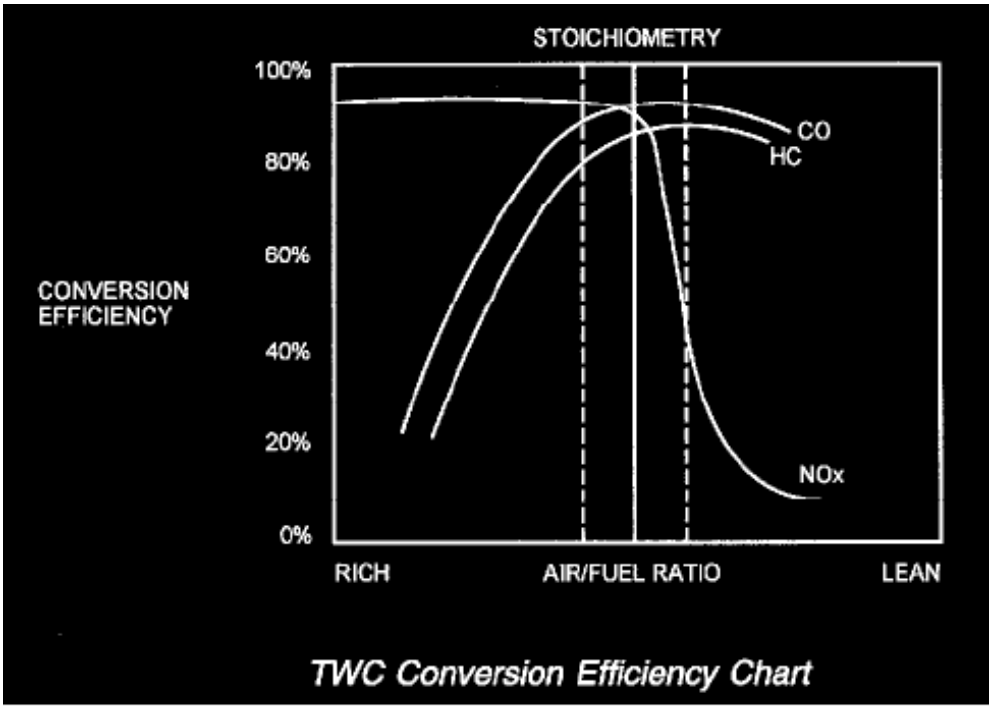
carbon dioxide (CO2) and water vapor (H2O). However, it also contains carbon monoxide (CO), oxides of nitrogen (NOx), hydrogen (H), and various unburned hydrocarbons (HCs). The major air pollutants of CO, NOx,and HCs, and their emission into the atmosphere must be controlled.

The exhaust system generally consists of an exhaust manifold, front exhaust pipe, front heated oxygen sensor (HO2S), rear exhaust pipe, catalyst HO2S, a muffler, and an exhaust tailpipe. The catalytic converter is typically installed between the front and rear exhaust pipes. On some vehicle applications, more than one catalyst is used between the front and rear exhaust pipes. Catalytic converter efficiency is monitored by the on board diagnostic (OBD) system strategy in the powertrain control module (PCM). For information on the OBD catalyst monitor, refer to the description for the Catalyst Efficiency Monitor. See: Computers and Control Systems/Testing and Inspection/Monitors, Trips, Drive Cycles and Readiness Codes/Catalyst Efficiency Monitor

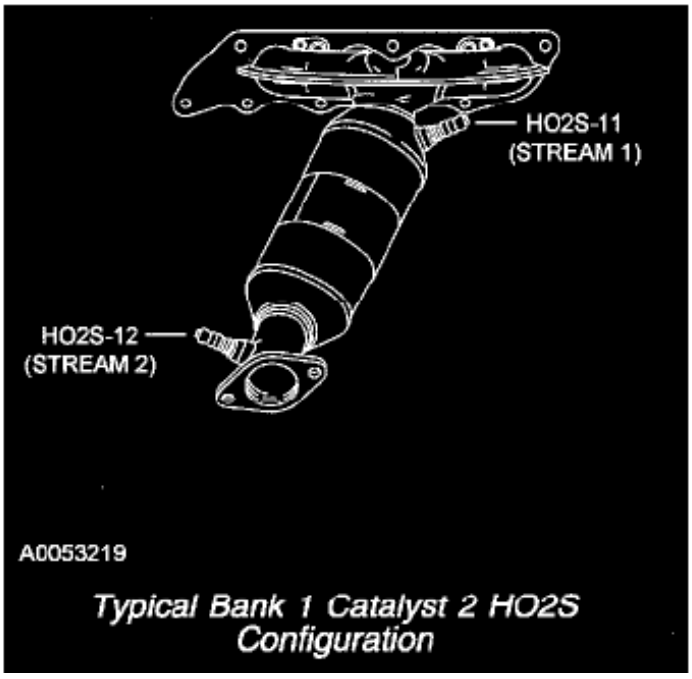
For most vehicles, only 2 HO2Ss are used in an exhaust stream. The front sensors (HO2S11/HO2S21) before the catalyst are used for primary fuel control while the ones after the catalyst (HO2S12/HO2S22) are used to monitor catalyst efficiency. However, some partial zero emission vehicles (PZEV) use 3 HO2Ss for each engine bank. The stream 1 sensors (HO2S11/HO2S21) located before the catalyst are used for primary fuel control, the stream 2 sensors (HO2S12/HO2S22) are used to monitor the light-off catalyst, and the stream 3 sensors (HO2S13/HO2S23) located after the catalyst are used for long term fuel trim control to optimize catalyst efficiency (fore aft oxygen sensor control).

Catalytic Converter

A catalyst is a material that remains unchanged when it initiates and increases the speed of a chemical reaction. A catalyst also enables a chemical reaction to occur at a lower temperature. The concentration of exhaust gas products released to the atmosphere must be controlled. The catalytic



TWC Conversion Efficiency Chart



Typical Bank 1 Catalyst 2 HO2S Configuration

converter assists in this task. It contains a catalyst in the form of a specially treated ceramic honeycomb structure saturated with catalytically active precious metals. As the exhaust gases come in contact with the catalyst, they are changed into mostly harmless products. The catalyst initiates and speeds up heat producing chemical reactions of the exhaust gas components so they are used up as much as possible.

Light Off Catalyst

As the catalyst heats up, converter efficiency rises rapidly. The point at which conversion efficiency exceeds 50% is called catalyst light off. For most catalysts this point occurs at 246°C to 302°C (475°F to 575°F). A fast light catalyst is a 3-way catalyst (TWC) that is located as close to the exhaust manifold as possible. Because the light off catalyst is located close to the exhaust manifold it lights off faster and reduces emissions more quickly than the catalyst located under the body. Once the catalyst lights off, the catalyst quickly reaches the maximum conversion efficiency for that catalyst.

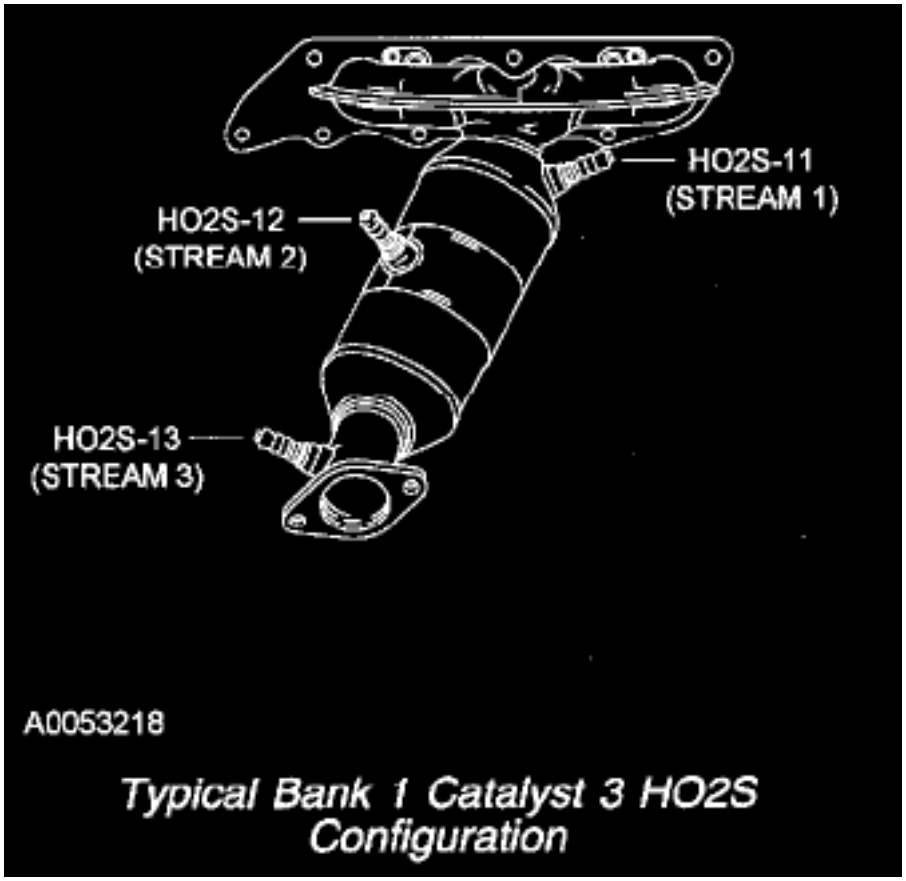
Three-Way Catalyst (TWC) Conversion Efficiency

TWC Conversion Efficiency Chart

A TWC requires a stoichiometric fuel ratio, 14.7 pounds of air to 1 pound of fuel (14.7:1), for high conversion efficiency. In order to achieve these high efficiencies, the air/fuel ratio must be tightly controlled with a narrow window of stoichiometry. Deviations outside of this window greatly decrease the conversion efficiency. For example a rich mixture decreases the HC and CO conversion efficiency while a lean mixture decreases the NOx conversion efficiency.

Exhaust System

Typical Bank 1 Catalyst 2 HO2S Configuration



Typical Bank 1 Catalyst 3 HO2S Configuration

Typical Bank 1 Catalyst 3 HO2S Configuration

The purpose of the exhaust system is to convey engine emissions from the exhaust manifold to the atmosphere. Engine exhaust emissions are directed from the engine exhaust manifold to the catalytic converter through the front exhaust pipe. A HO2S is mounted on the front exhaust pipe before the catalyst. The catalytic converter reduces the concentration of CO, unburned HCs, and NOx in the exhaust emissions to an acceptable level. The reduced exhaust emissions are directed from the catalytic converter past another HO2S mounted in the rear exhaust pipe and then on into the muffler. Finally, the exhaust emissions are directed to the atmosphere through an exhaust tailpipe.

On some PZEV, there is a total of 3 HO2S in the exhaust stream. One near the exhaust manifold (stream 1), one in the middle of the light-off catalyst (stream 2), and the third (stream 3) is mounted after the light-off catalyst.

Underbody Catalyst

The underbody catalyst is located after the light off catalyst. The underbody catalyst may be in line with the light off catalyst, or the underbody catalyst may be common to 2 light off catalysts, forming a Y pipe configuration. For an exact configuration of the catalyst and exhaust system for a specific vehicle, refer to Exhaust System for the exhaust system-exploded view.

Three-Way Catalytic (TWC) Converter

The TWC converter contains either platinum (Pt) and rhodium (Rh) or palladium (Pd) and rhodium (Rh). The TWC converter catalyzes the oxidation reactions of unburned HCs and CO and the reduction reaction of NOx. The 3-way conversion can be best accomplished by always operating the engine air fuel/ratio at or close to stoichiometry.

Exhaust Manifold Runners

The exhaust manifold runners collect exhaust gases from engine cylinders. The number of exhaust manifolds and exhaust manifold runners depends on the engine configuration and number of cylinders.

Exhaust Pipes

Exhaust pipes are usually treated during manufacturing with an anti-corrosive coating agent to increase the life of the product. The pipes serve as guides for the flow of exhaust gases from the engine exhaust manifold through the catalytic converter and the muffler.

Heated Oxygen Sensor (HO2S)

The HO2Ss provide the PCM with information related to the oxygen content of the exhaust gas.

Muffler

Mufflers are usually treated during manufacturing with an anti-corrosive coating agent to increase the life of the product. The muffler reduces the level of noise produced by the engine, and also reduces the noise produced by exhaust gases as they travel from the catalytic converter to the atmosphere.

Canister Purge Control Valve: Description and Operation

EVAPORATIVE EMISSION (EVAP) CANISTER PURGE VALVE

Typical EVAP Canister Purge Valve

NOTE: The EVAP canister purge valve may also be referred to as a vapor management valve (VMV).

The EVAP canister purge valve is part of the enhanced EVAP system that is controlled by the PCM. This valve controls the flow of vapors (purging) from the EVAP canister to the intake manifold during various engine operating modes. The EVAP canister purge valve is a normally closed valve. The EVAP canister purge valve controls the flow of vapors by way of a solenoid, eliminating the need for an electronic vacuum regulator and vacuum diaphragm. The PCM outputs a signal between 0 mA and 1,000 mA to control the EVAP canister purge valve.

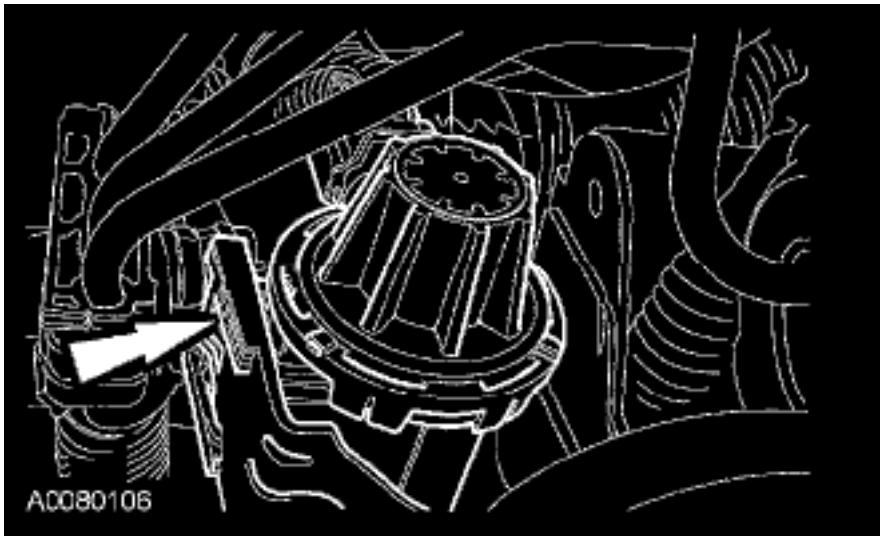
Removal and Installation

WARNING:

- When working on or near the evaporative emission (EVAP) system, disconnect the battery ground cable from the battery. The EVAP system contains fuel vapor and condensed fuel vapor, so an electrical spark may cause a fire or explosion. Failure to follow this instruction may result in serious personal injury.

- Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.



1. Disconnect the battery ground cable. 2. Slide the evaporative emission (EVAP) canister purge valve off the bracket.

3. Disconnect the intake manifold vapor tube-to-EVAP canister purge valve quick connect coupling, fuel tank vapor tube-to-EVAP canister purge

valve quick connect coupling and the EVAP canister purge valve electrical connector.

4. Remove the valve. 5. To install, reverse the removal procedure.

- Carry out the leak test. See: Testing and Inspection

- Carry out the evaporative emission repair verification drive cycle.

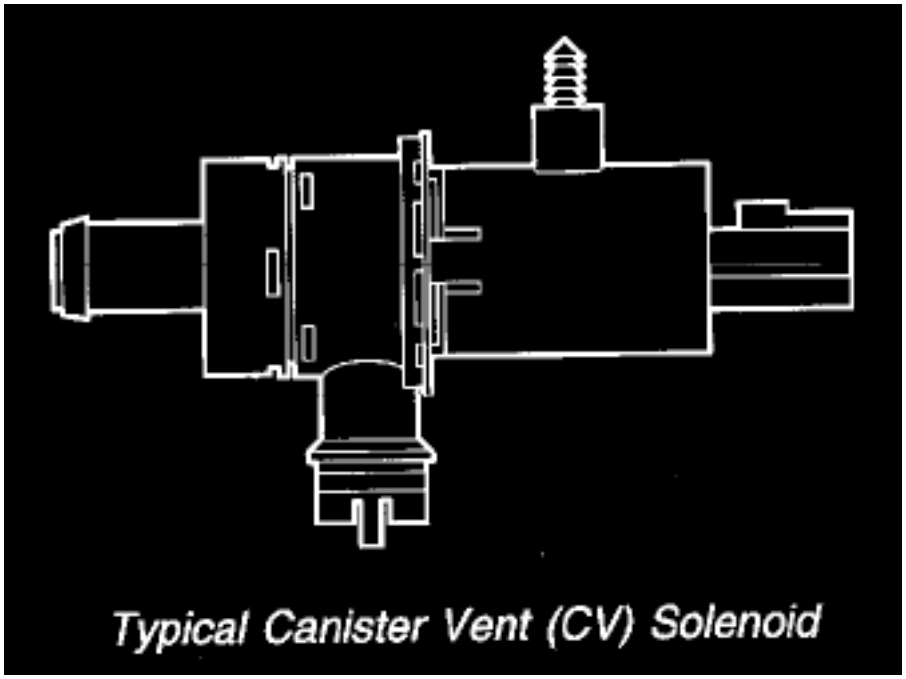
10. To install, reverse the removal procedure.

- Carry out the leak test. See: Testing and Inspection

- Carry out the evaporative emission repair verification drive cycle.



Leak Detection Solenoid: Description and Operation

CANISTER VENT (CV) SOLENOID

Typical Canister Vent (CV) Solenoid

During the evaporative emissions (EVAP) leak check monitor, the CV solenoid seals the EVAP canister from the atmospheric pressure. This allows the EVAP canister purge valve to obtain the target vacuum in the fuel tank during the EVAP leak check monitor.

EXHAUST GAS RECIRCULATION (EGR) VACUUM REGULATOR SOLENOID

EGR Vacuum Regulator Solenoid

Vacuum Output (IN-HG)

EGR Vacuum Regulator Solenoid Data

The EGR vacuum regulator solenoid is an electromagnetic device used to regulate the vacuum supply to the EGR valve. The solenoid contains a coil which magnetically controls the position of a disc to regulate the vacuum. As the duty cycle to the coil increases, the vacuum signal passed through the solenoid to the EGR valve also increases. Vacuum not directed to the EGR valve is vented through the solenoid vent to atmosphere. Note that at 0% duty cycle (no electrical signal applied), the EGR vacuum regulator solenoid allows some vacuum to pass, but not enough to open the EGR valve.

EGR Orifice Tube Assembly

EGR Tube: Description and Operation

EXHAUST GAS RECIRCULATION (EGR) ORIFICE TUBE ASSEMBLY

EGR Orifice Tube Assembly

The orifice tube assembly is a section of tubing connecting the exhaust system to the intake manifold. The assembly provides the flow path for the EGR to the intake manifold and also contains the metering orifice and 2 pressure pick-up tubes. The internal metering orifice creates a measurable pressure drop across it as the EGR valve opens and closes. This pressure differential across the orifice is picked up by the differential pressure feedback EGR sensor which provides feedback to the PCM.

EGR Valve: Description and Operation

Electric Exhaust Gas Recirculation (EEGR) Valve

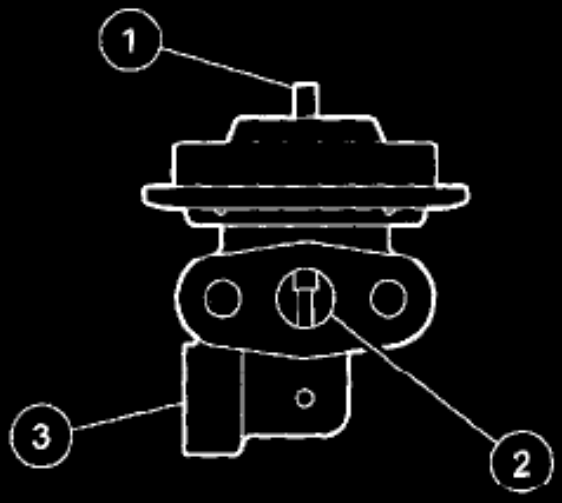
EEGR Motor/Valve Assembly

Depending on the application, the EEGR valve is a water cooled or an air cooled motor/valve assembly. The motor is commanded to move in 52 discrete steps as it acts directly on the EEGR valve. The position of the valve determines the rate of EGR. The built-in spring works to close the valve (against the motor opening force).

Exhaust Gas Recirculation (EGR) System Module (ESM)

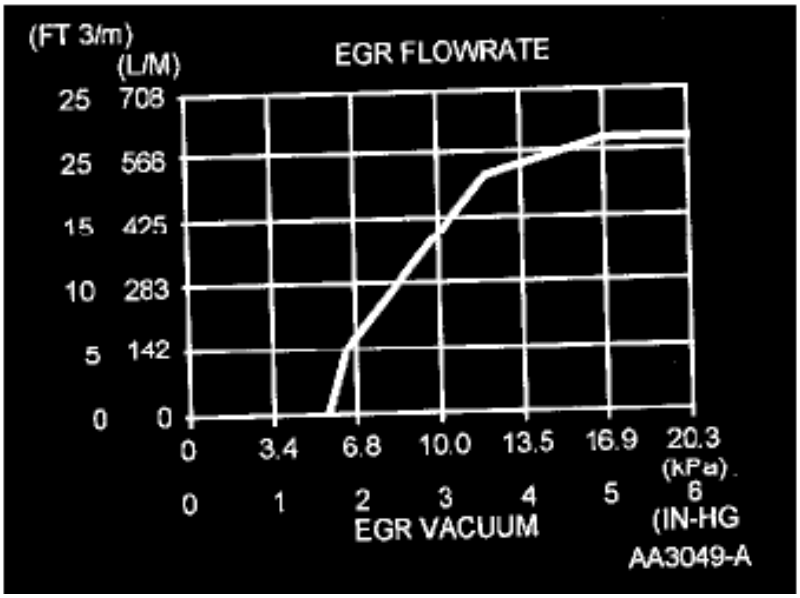
ESM

Typical EGR Valve



N0047972

Item	Part Number	Description
1	—	Vacuum Connection from EGR Vacuum Regulator Solenoid
2	—	Intake Manifold Connector
3	—	Orifice Tube Connection



The ESM is an integrated differential pressure feedback EGR system that functions in the same manner as a conventional differential pressure feedback EGR system. The various system components have been integrated into a single component called the ESM. The flange of the valve portion of the ESM bolts directly to the intake manifold with a metal gasket that forms the metering orifice. This arrangement increases system reliability, response time, and system precision. By relocating the EGR orifice from the exhaust to the intake side of the EGR valve, the downstream pressure signal measures manifold absolute pressure (MAP). This MAP signal is used for EGR correction and inferred barometric pressure (BARO) at key on. The system provides the powertrain control module (PCM) with a differential pressure feedback EGR signal, identical to a traditional differential pressure feedback EGR system.

Exhaust Gas Recirculation (EGR) Valve

Typical EGR Valve

EGR Flowrate

The EGR valve in the differential pressure feedback EGR system is a conventional, vacuum-actuated. The valve increases or decreases the flow of EGR. As vacuum applied to the EGR valve diaphragm overcomes the spring force, the valve begins to open. As the vacuum signal weakens, at 5.4 kPa (1.6 in-Hg) or less, the spring force closes the valve. The EGR valve is fully open at about 15 kPa (4.5 in-Hg).

Since EGR flow requirement varies greatly, providing repair specifications on flow rate is impractical. The on board diagnostic (OBD) system monitors the EGR valve function and triggers a diagnostic trouble code (DTC) if the test criteria is not met. The EGR valve flow rate is not measured directly as part of the diagnostic procedures.

Part 2

Removal and Installation

1. Detach the EGR valve vacuum connector. 2. Detach the exhaust manifold-to-EGR valve tube fitting.

- To install, tighten to 50 Nm (37 lb-ft).

3. Remove the bolts, the EGR valve and the gasket.

- Discard the gasket.

- To install, tighten to 25 Nm (18 lb-ft).

4. NOTE: The EGR valve sealing surfaces are soft metals.

To install, reverse the removal procedure. -

Carefully clean the EGR valve sealing surfaces.

- Install a new EGR valve gasket.

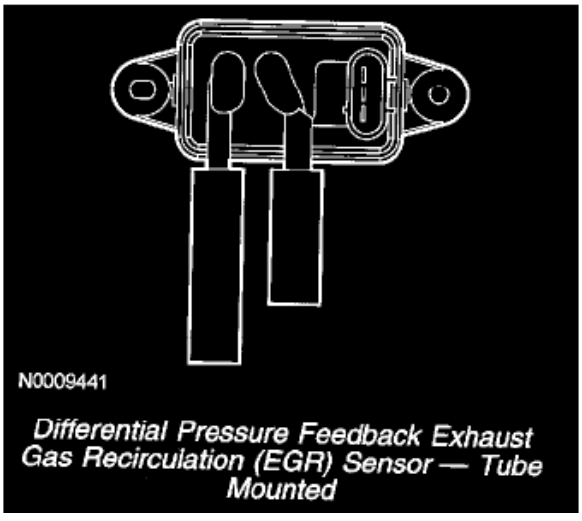
Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor



Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor — Tube Mounted

Pressure Feedback Exhaust Sensor: Description and Operation

Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor

Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor

The differential pressure feedback EGR sensor is a ceramic, capacitive-type pressure transducer that monitors the differential pressure across a metering orifice located in the orifice tube assembly. The differential pressure feedback EGR sensor receives this signal through 2 hoses referred to as the downstream pressure hose (REF SIGNAL) and upstream pressure hose (HI SIGNAL). The HI and REF hose connections are marked on the differential pressure feedback EGR sensor housing for identification (note that the HI signal uses a larger diameter hose). The differential pressure feedback EGR sensor outputs a voltage proportional to the pressure drop across the metering orifice and supplies it to the PCM as EGR flow rate feedback.

Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor - Tube Mounted

Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor - Tube Mounted

The tube mounted differential pressure feedback EGR sensor is identical in operation as the larger plastic differential pressure feedback EGR sensors and uses a 1.0 volt offset. The HI and REF hose connections are marked on the side of the sensor.

PCV Valve Hose: Customer Interest Engine - Blue Smoke On Start Up

TSB 07-22-10

11/12/07

3.0L 2V VULCAN ENGINE - BLUE SMOKE ON START Up

FORD: 2004-2008 Ranger

ISSUE Some 2004-2008 Ranger vehicles equipped with a 3.0L 2V Vulcan engine may exhibit blue smoke on start up after approximately a 4 hour cold soak. This may be due to small amounts of oil commonly found in the PCV system collecting in the upper intake manifold PCV channel. Under certain parking conditions, this oil can be drawn into the combustion chamber, creating momentary blue smoke that may be visible by the customer.

ACTION Follow the Service Procedure steps to reduce blue smoke on start up.

SERVICE PROCEDURE

1. Remove the clamp on the PCV tube assembly at the PCV valve.

2. Remove the upper intake manifold per the Workshop Manual (WSM), Section 303-01B. Leave the PCV tube assembly attached to the upper intake

manifold.

3. Remove the clamp on the PCV tube assembly at the upper intake manifold PCV port, and remove the PCV Tube Assembly from the upper intake

manifold PCV channel.

4. Drain the residual oil from the upper intake manifold PCV channel by holding the PCV channel vertical with the port facing down.

5. While holding the upper intake manifold in the vertical position, spray Brake Cleaner into the PCV channel. Use regulated compressed air to aid in

drying the PCV channel.

6. Lubricate the 0-Ring at the end of the new PCV Tube Assembly with water or diluted soapy water solution.

7. Install the new PCV Tube Assembly into the clean upper intake manifold PCV channel.

8. Install the upper intake manifold per WSM, Section 303-01B.

Special Tool(s)

WARNING:

- Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

- Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

- Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

- When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

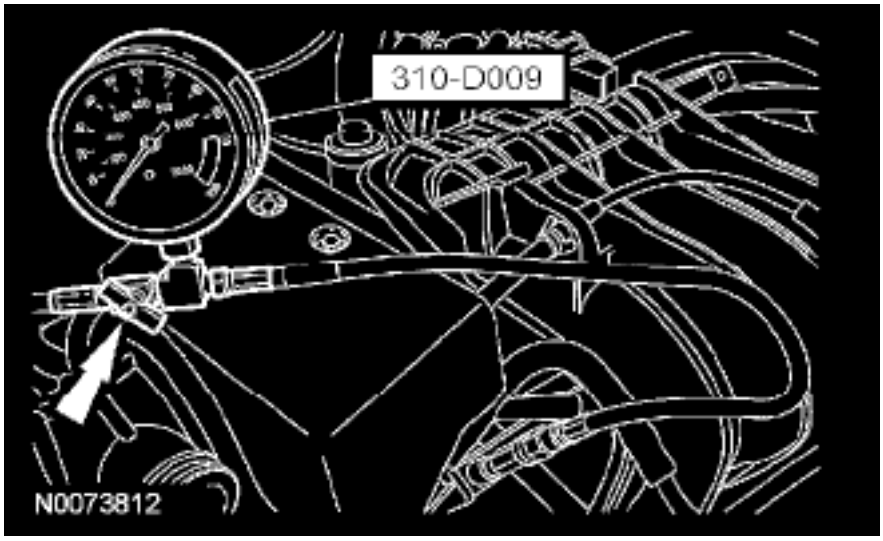
1. NOTE: 2.3L shown, 3.0L and 4.0L similar.

Remove the cap from the fuel pressure relief valve located on the fuel rail.

2. NOTE: 2.3L shown, 3.0L and 4.0L similar.

Install the special tool onto the fuel pressure relief valve.

3. Test the fuel system pressure to make sure it is within the specified range.



4. NOTE:

- 2.3L shown, 3.0L and 4.0L similar.

- Open the drain valve slowly to relieve the fuel system pressure. This may drain fuel from the system. Place fuel in a suitable container.

Upon completion of the fuel system pressure test, open the drain valve on the special tool and relieve the fuel system pressure.

5. NOTE: It may take more than one key cycle to pressurize the fuel system.

Cycle the ignition key and wait 3 seconds to pressurize the fuel system. Check for leaks before starting the engine.

Accelerator pedal pivot bolt	9	80

Torque Specifications

Accelerator Pedal: Initial Inspection and Diagnostic Overview

Principles of Operation

PRINCIPLES OF OPERATION

The acceleration control allows the operator to control the vehicle speed. The throttle is controlled by the accelerator cable which is attached to the accelerator pedal. As the operator presses on the accelerator pedal, the accelerator pedal pulls on the accelerator cable which opens the throttle.

Inspection and Verification

INSPECTION AND VERIFICATION

1. Verify the customer's concern by operating the acceleration control system to duplicate the condition. 2. Inspect to determine if any of the following mechanical concerns apply.

VISUAL INSPECTION CHART

Mechanical -

Damaged accelerator pedal and shaft

- Damaged linkage

- Damaged accelerator cable

- High engine idle speed

- Damaged throttle body (TB)

3. If the inspection reveals an obvious concern that can be readily identified, repair it as required. 4. If the concern remains after the inspection, determine the symptom(s) and go to the Symptom Chart. See: Symptom Related Diagnostic

Procedures

Symptom Chart

Condition	Possible Sources	Action
• Excessive effort is needed to depress the accelerator pedal and shaft	• Accelerator cable binding • Worn or damaged throttle body (TB)	• INSTALL a new accelerator cable. • INSTALL a new throttle body.
• The accelerator pedal and shaft feels rough or raspy	• Frayed or binding accelerator cable • Worn or damaged TB	• INSTALL a new accelerator cable. • INSTALL a new throttle body.
• The accelerator pedal and shaft binds or sticks	• Kinked accelerator cable • Foreign material caught in accelerator pedal linkage • Worn or damaged TB	• INSTALL a new accelerator cable. • CHECK the accelerator pedal linkage. • INSTALL a new TB.

Symptom Chart (Continued)

Condition	Possible Sources	Action
• The engine idle speed is high	• Kinked accelerator cable • Foreign material caught in accelerator pedal linkage • Accelerator pedal caught under mispositioned floor mat • Incorrect engine idle speed	• INSTALL a new accelerator cable. • CHECK the accelerator pedal linkage. • REFER to Computers and Control Systems for diagnosis and testing of the idle control system.

ACCELERATOR PEDAL

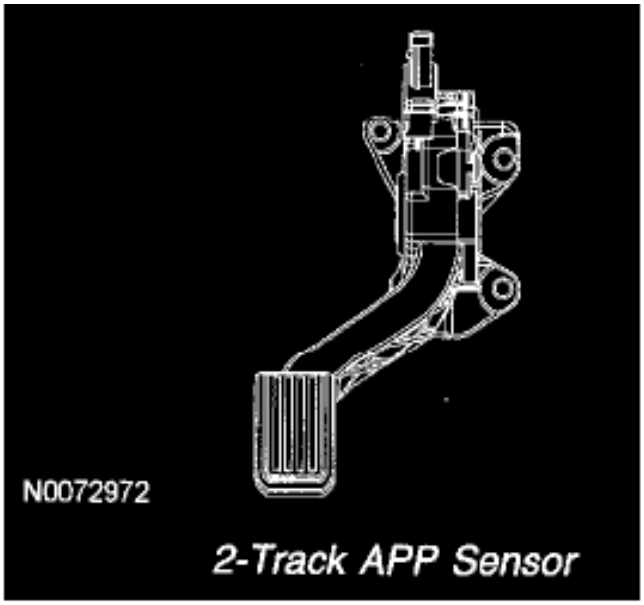
Removal and Installation

1. Disconnect the accelerator cable from the accelerator pedal.

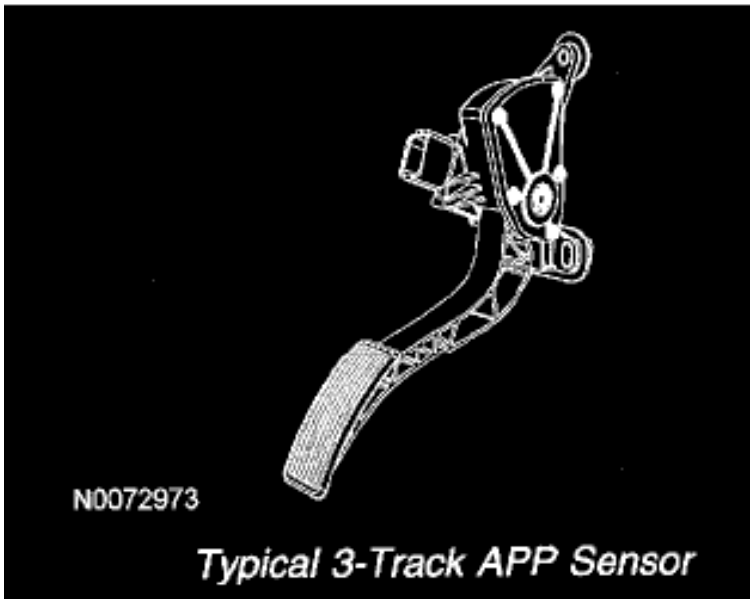
2. Remove the accelerator pedal pivot bolt and the accelerator pedal.

- To install, tighten to 9 Nm (80 lb-in).

3. To install, reverse the removal procedure.



N0072972
2-Track APP Sensor



N0072973
Typical 3-Track APP Sensor

Accelerator Pedal Position Sensor: Description and Operation

ACCELERATOR PEDAL POSITION (APP) SENSOR

The APP sensor is an input to the powertrain control module (PCM) and is used to determine the amount of torque requested by the operator. Depending on the application either a 2-track or 3-track APP sensor is used.

2-Track APP Sensor

2-Track APP Sensor

There are 2 pedal position signals in the sensor. Both signals, APP1 and APP2, have a positive slope (increasing angle, increasing voltage), but are offset and increase at different rates. The 2 pedal position signals make sure the PCM receives a correct input even if 1 signal has a concern. The PCM determines if a signal is incorrect by calculating where it should be, inferred from the other signals. If a concern is present with one of the circuits the other input is used. There are 2 reference voltage circuits, 2 signal return circuits, and 2 signal circuits (a total of 6 circuits and pins) between the PCM and the APP sensor assembly. The reference voltage circuits and the signal return circuits are shared with the reference voltage circuit and signal return circuit used by the electronic throttle body (ETB) throttle position sensor. The pedal position signal is converted to pedal travel degrees (rotary angle) by the PCM. The software then converts these degrees to counts, which is the input to the torque based strategy.

3-Track APP Sensor

Typical 3-Track APP Sensor

There are 3 pedal position signals in the sensor. Signal 1, APP1, has a negative slope (increasing angle, decreasing voltage) and signals 2 and 3, APP2 and APP3, both have a positive slope (increasing angle, increasing voltage). During normal operation APP1 is used as the indication of pedal position by the strategy. The 3 pedal position signals make sure the PCM receives a correct input even if 1 signal has a concern. The PCM determines if a signal is incorrect by calculating where it should be, inferred from the other signals. If a concern is present with one of the circuits the other inputs are used. The pedal position signal is converted to pedal travel degrees (rotary angle) by the PCM. The software then converts these degrees to counts, which is the input to the torque based strategy. There are 2 reference voltage circuits, 2 signal return circuits, and 3 signal circuits (a total of 7 circuits and pins) between the PCM and the APP sensor assembly. The reference voltage circuits and the signal return circuits are shared with the reference voltage circuit and signal return circuit used by the electronic throttle body (ETB) throttle position sensor.

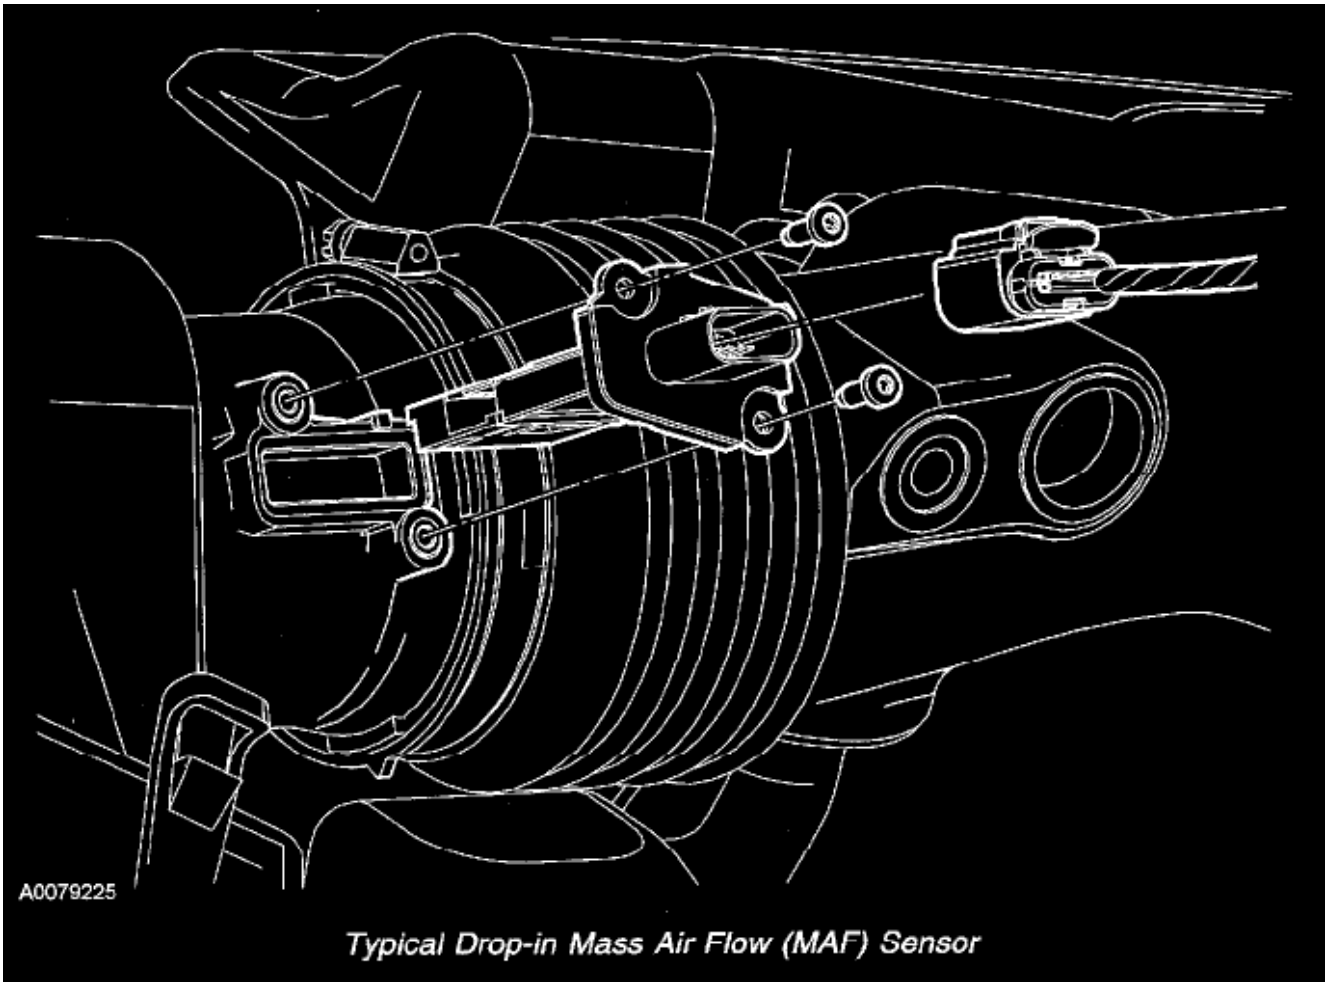
MASS AIR FLOW (MAF) SENSOR

Diagram Of Air Flow Through Throttle Body Contacting MAF Sensor Hot And Cold Wire (and IAT Sensor Wire Where Applicable) Terminals

Typical Mass Air Flow (MAF) Sensor

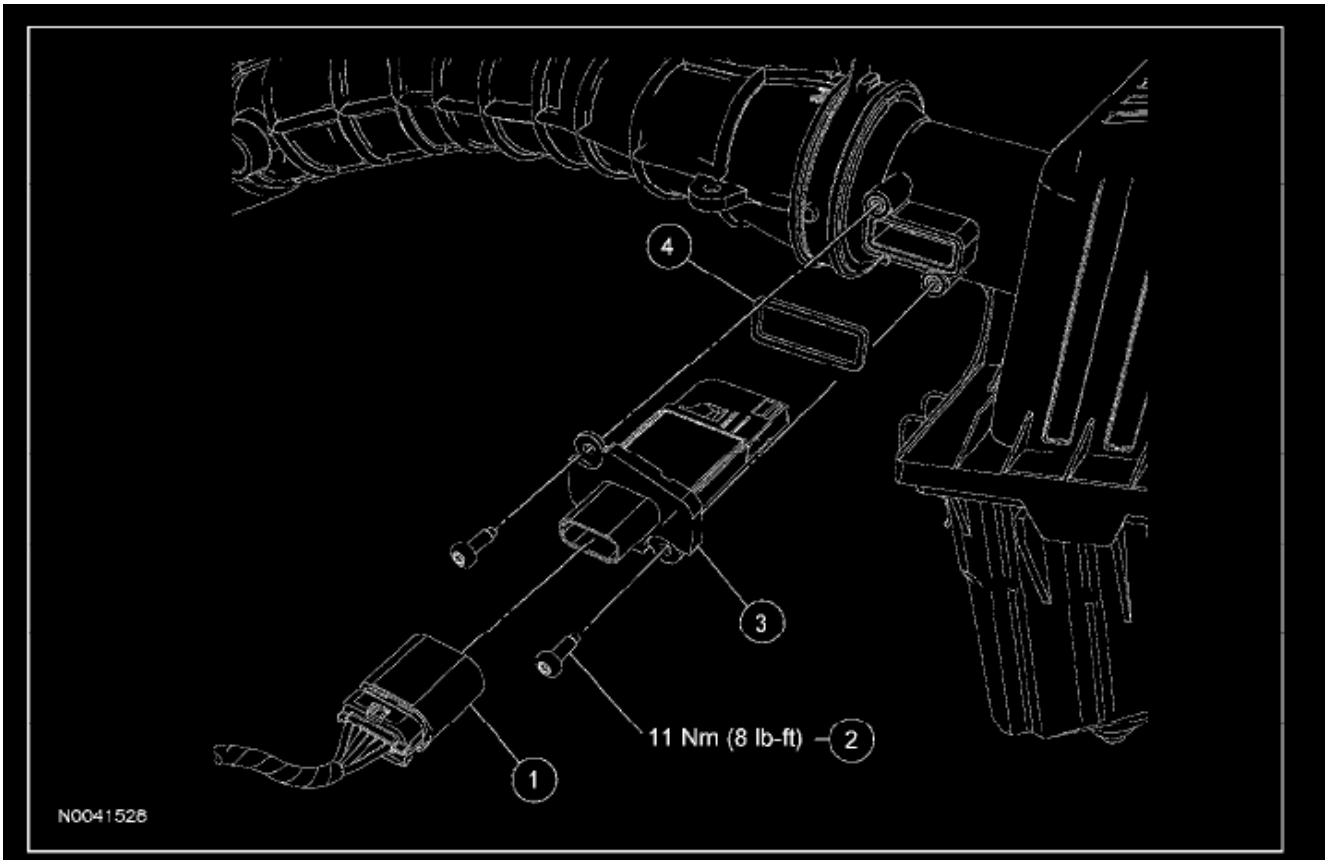


Typical Drop-in Mass Air Flow (MAF) Sensor

Typical Drop-in Mass Air Flow (MAF) Sensor

The MAF sensor uses a hot wire sensing element to measure the amount of air entering the engine. Air passing over the hot wire causes it to cool. This hot wire is maintained at 200°C (392°F) above the ambient temperature as measured by a constant cold wire. The current required to maintain the temperature of the hot wire is proportional to the mass air flow. The MAF sensor then outputs an analog voltage signal to the PCM proportional to the intake air mass. The PCM calculates the required fuel injector pulse width in order to provide the desired air/fuel ratio. This input is also used in determining transmission electronic pressure control (EPC), shift and torque converter clutch scheduling.

The MAF sensor is located between the air cleaner and the throttle body or inside the air cleaner assembly. Most MAF sensors have integrated bypass technology with an integrated intake air temperature (IAT) sensor. The hot wire electronic sensing element must be replaced as an assembly. Replacing only the element may change the air flow calibration.



Item	Part Number	Description
1	14A464	Mass air flow (MAF) sensor electrical connector (part of 12B637)
2	W709287	MAF sensor bolt (2 required)

4	—	MAF sensor gasket

Air Flow Meter/Sensor: Service and Repair

MASS AIR FLOW (MAF) SENSOR

Removal and Installation

1. Disconnect the mass air flow (MAF) sensor electrical connector. 2. Remove the 2 bolts, the MAF sensor and discard the gasket.

- To install, tighten to 11 Nm (8 lb-ft).

3. CAUTION: Do not tamper with the mass air flow (MAF) sensing elements located in the airflow bypass. Tampering may result in

failure.

NOTE: The MAF sensor module and body are calibrated and installed as a unit.

To install, reverse the removal procedure. -

Install a new gasket.

Fuel Filler Cap Warning Indicator: Description and Operation

CHECK FUEL CAP INDICATOR

The check fuel cap indicator is a communications network message sent by the PCM. The PCM sends the message to illuminate the lamp when the strategy determines there is a concern in the EVAP system due to the fuel filler cap or capless fuel tank filler pipe not being sealed correctly. This would be detected by the inability to pull vacuum in the fuel tank, after a fueling event.

Fuel Pressure Release: Service and Repair

FUEL SYSTEM PRESSURE RELEASE

Special Tool(s)

Special Tool(s)

WARNING:

- Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

- Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

- Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

- When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

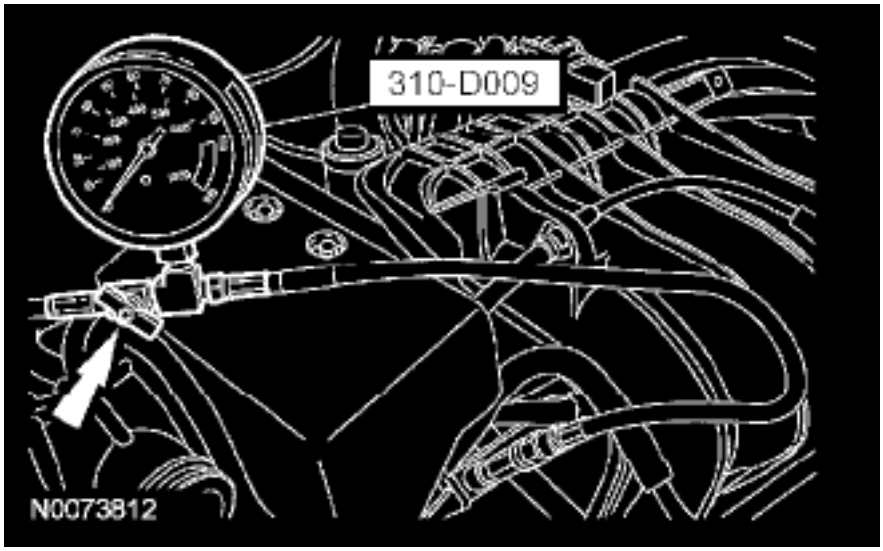
1. Disconnect the battery ground cable.

2. NOTE: 2.3L shown, 3.0L and 4.0L similar.

Remove the cap from the fuel pressure relief valve located on the fuel rail.

3. NOTE: 2.3L shown, 3.0L and 4.0L similar.

Install the special tool onto the fuel pressure relief valve.



4. NOTE:

- 2.3L shown, 3.0L and 4.0L similar.

- Open the drain valve slowly to relieve the system pressure. This may drain fuel from the system. Place fuel in a suitable container.

Open the drain valve on the special tool and relieve the fuel system pressure.

5. NOTE: It may take more than one key cycle to pressurize the fuel system.

Upon completion of the fuel system repairs, cycle the ignition key and wait 3 seconds to pressurize the fuel system. Check for leaks before starting the engine.

Fuel Injector: Description and Operation

FUEL INJECTORS

Typical Fuel Injector

CAUTION: Do not apply battery positive voltage (B+) directly to the fuel injector electrical connector terminals. The solenoids may be damaged internally in a matter of seconds.

The fuel injector is a solenoid-operated valve that meters fuel flow to the engine. The fuel injector is opened and closed a constant number of times per crankshaft revolution. The amount of fuel is controlled by the length of time the fuel injector is held open.

The fuel injector is normally closed, and is operated by a 12-volt source from either the electronic engine control (EEC) power relay or fuel pump relay. The ground signal is controlled by the PCM.

The injector is the deposit resistant injector (DRI) type and does not have to be cleaned. However, it can be flow checked and, if found outside of specification, a new fuel injector should be installed.

Removal

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. Disconnect the battery ground cable. 2. Release the fuel pressure. 3. Remove the upper intake manifold. 4. Disconnect the 6 fuel injector electrical connectors. 5. Disconnect the fuel supply tube spring lock coupling. 6. Remove the 4 fuel rail bolts and remove the fuel rail and the fuel injectors as an assembly. 7. Remove the 6 fuel injectors from the fuel rail.

- Remove and discard the fuel injector O-ring seals.

Installation

1. NOTE: Lubricate the new O-ring seals with clean engine oil prior to installation.

Install new O-ring seals on the fuel injectors and install the fuel injectors onto the fuel rail.

2. Install the fuel rail and fuel injectors as an assembly, and install the 4 bolts.

- Tighten to 10 Nm (89 lb-in).

3. Connect the fuel supply tube spring lock coupling. 4. Connect the 6 fuel injector electrical connectors. 5. Install the upper intake manifold. 6. Connect the battery ground cable.

Special Tool(s)

Disconnect - Type I

WARNING:

- Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

- Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

- Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

- When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

CAUTION:

- Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is essential that absolute cleanliness is observed when working with these components or component damage may occur. Always install blanking plugs to any open orifices or tubes.

- When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube or damage to the tube or connector retaining clip may occur. Apply clean engine oil to the end of the tube before inserting the tube into the connector.

1. Relieve the fuel pressure. 2. If equipped, remove the fuel tube safety clip.

3. Install the special tool.

1. Release the fuel system pressure. 2. If equipped, remove the fuel tube safety clip from the male hose.

3. Install the special tool and push into the spring lock coupling.

4. Separate the spring lock coupling.

Connect - Type II

1. Inspect and clean both spring lock coupling ends.

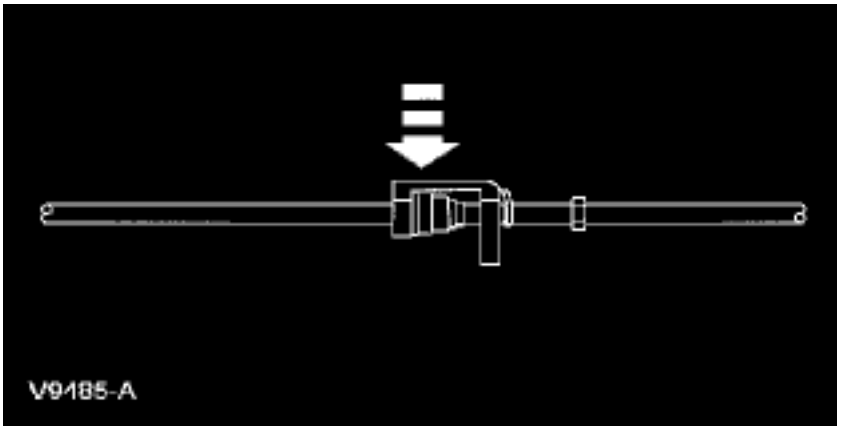
2. NOTE:

- Make sure the fuel tube clicks into place when installing the tube. To make sure that the fuel tube is fully seated, pull on the tube.

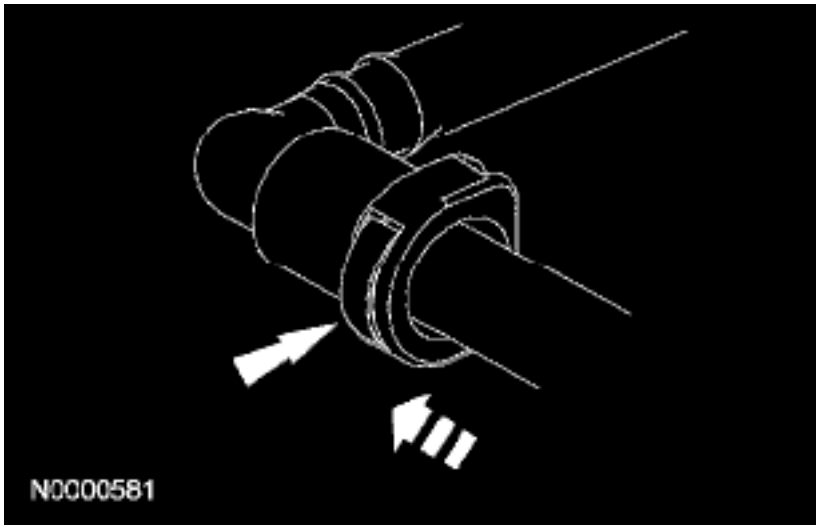
- Lubricate the tube end with clean engine oil to ease assembly.

Align and push the fuel tube spring lock coupling until a click is heard.

3. Pull on the spring lock coupling to make sure it is fully seated. If equipped, install the fuel tube safety clip on the male end.



V9185-A



Fuel Line Coupler: Service and Repair Quick Connect Coupling

QUICK CONNECT COUPLING

Disconnect - Type I

WARNING:

- When working on or near the evaporative emission (EVAP) system, disconnect the battery ground cable from the battery. The EVAP system contains fuel vapor and condensed fuel vapor, so an electrical spark may cause a fire or explosion. Failure to follow this instruction may result in serious personal injury.

- Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

- Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

- Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

- When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

CAUTION:

- Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is essential that absolute cleanliness is observed when working with these components or component damage may occur. Always install blanking plugs to any open orifices or tubes.

- When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube or damage to the tube or connector retaining clip may occur. Apply clean engine oil to the end of the tube before inserting the tube into the connector.

- Do not use any tools. The use of tools may cause a deformity in the clip components which may cause fuel leaks.

1. If servicing a liquid fuel tube, release the fuel system pressure. 2. Disconnect the fuel tube quick connect coupling.

- Press the fuel tube quick connect coupling button and pull the fuel tube to disconnect.

Connect - Type I

1. Inspect the quick connect coupling and the tube for damage. Remove any dirt or obstructions.

2. NOTE:

- Make sure the fuel tube clicks into place when installing the tube. To make sure that the fuel tube is fully seated, pull on the tube.

- Apply clean engine oil to O-ring seals.

Install the quick connect coupling onto the tube until it is fully seated.

Disconnect - Type II

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

CAUTION:

- Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is essential that absolute cleanliness is observed when working with these components or component damage may occur. Always install blanking plugs to any open orifices or tubes.

- When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube or damage to the tube or connector retaining clip may occur. Apply clean engine oil to the end of the tube before inserting the tube into the connector.

- Do not use any tools. The use of tools may cause a deformity in the clip components which may cause fuel leaks.

1. Release the locking tab on the quick connect coupling.

2. Separate the quick connect coupling from the fitting.

Connect - Type II

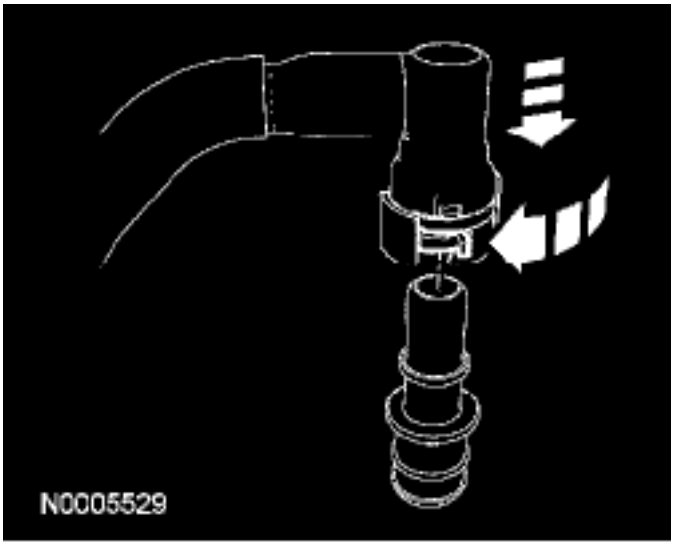
1. Inspect the quick connect coupling and the tube for damage. Remove any dirt or obstructions.

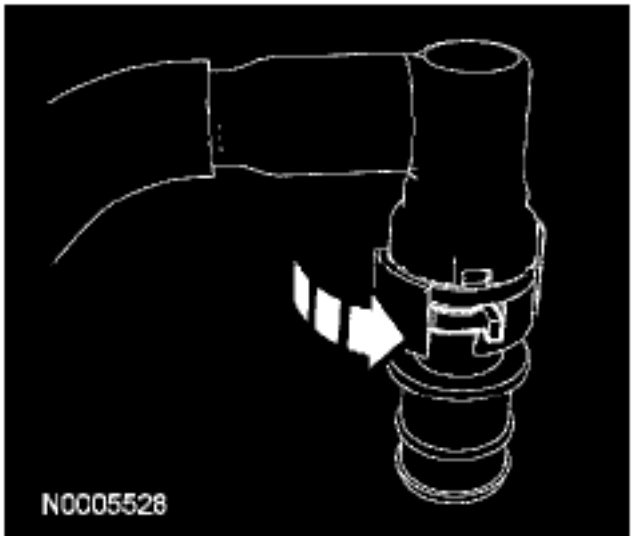
2. NOTE:

- Make sure the fuel tube clicks into place when installing the tube. To make sure that the fuel tube is fully seated, pull on the tube.

- Apply clean engine oil to O-ring seals.

Release the locking tab and install the quick connect coupling onto the fitting.





3. Position the locking tab into the latched position.

Disconnect - Type III

WARNING:

- When working on or near the evaporative emission (EVAP) system, disconnect the battery ground cable from the battery. The EVAP system contains fuel vapor and condensed fuel vapor, so an electrical spark may cause a fire or explosion. Failure to follow this instruction may result in serious personal injury.

- Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

- Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

- Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

- When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

CAUTION:

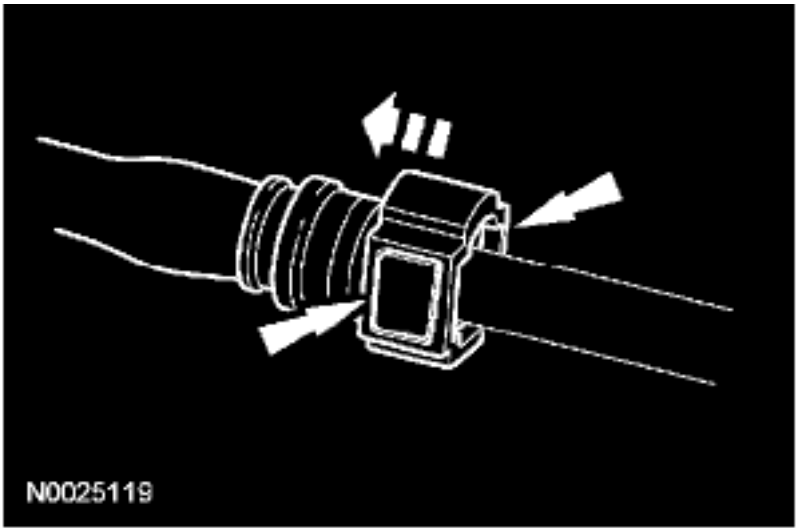
- When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube or damage to the tube or connector retaining clip may occur. Apply clean engine oil to the end of the tube before inserting the tube into the connector.

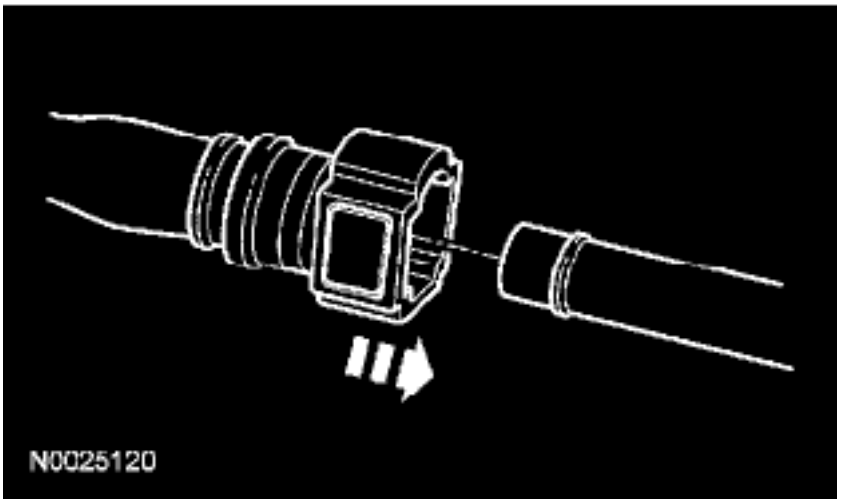
- Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is essential that absolute cleanliness is observed when working with these components or component damage may occur. Always install blanking plugs to any open orifices or tubes.

- Do not use any tools. The use of tools may cause a deformity in the clip components which may cause fuel leaks.

1. If servicing a liquid fuel tube, release the fuel system pressure. 2. Disconnect the battery ground cable. 3. Disconnect the fuel tube quick connect coupling.

- Press the 2 fuel tube quick connect coupling buttons and pull the fuel tube to disconnect.





Connect - Type IV

1. NOTE:

- Make sure the fuel tube clicks into place when installing the tube. To make sure that the fuel tube is fully seated, pull on the tube.

- Apply clean engine oil to O-ring seals.

Install the quick connect coupling onto the tube until it is fully seated.

Fuel Pressure Sensor/Switch: Description and Operation

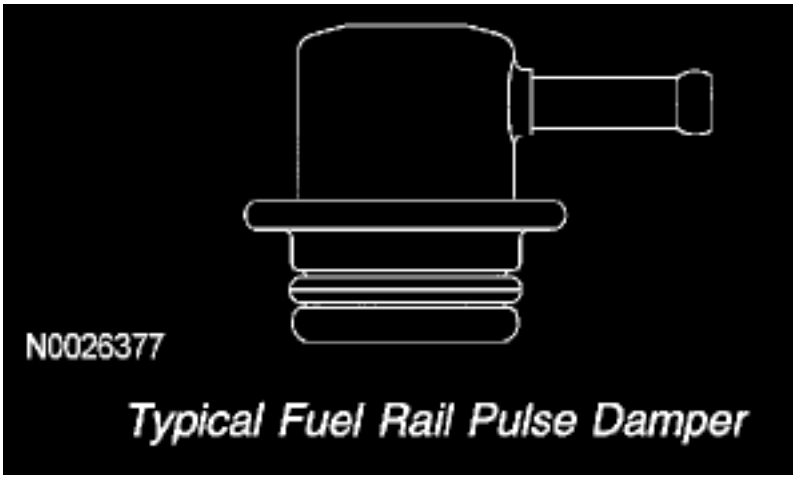
FUEL RAIL PRESSURE TEMPERATURE (FRPT) SENSOR

Typical Fuel Rail Pressure Temperature (FRPT) Sensor

The FRPT sensor measures the pressure and temperature of the fuel in the fuel rail and sends these signals to the PCM. The sensor uses the intake manifold vacuum as a reference to determine the pressure difference between the fuel rail and the intake manifold. The relationship between fuel pressure and fuel temperature is used to determine the possible presence of fuel vapor in the fuel rail.

The temperature sensing portion of the FRPT sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of the thermistor decreases as the temperature increases, and the resistance increases as the temperature decreases. The varying resistance changes the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Both the pressure and temperature signals are used to control the speed of the fuel pump. The speed of the fuel pump sustains fuel rail pressure which preserves fuel in its liquid state. The dynamic range of the fuel injectors increase because of the higher rail pressure, which allows the injector pulse width to decrease.



Fuel Pressure Pulsation Damper: Description and Operation

FUEL RAIL PULSE DAMPER

Typical Fuel Rail Pulse Damper

The fuel rail pulse damper is located on the fuel rail and reduces the fuel system noise caused by the pulsing of the fuel injectors. The vacuum port located on the damper is connected to manifold vacuum to avoid fuel spillage if the pulse damper diaphragm ruptures. The fuel rail pulse damper should not be confused with a fuel pressure regulator; it does not regulate the fuel rail pressure.

Fuel Pressure: Specifications

Item.....Specification

WARNING:

- Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

- Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

- Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

- When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

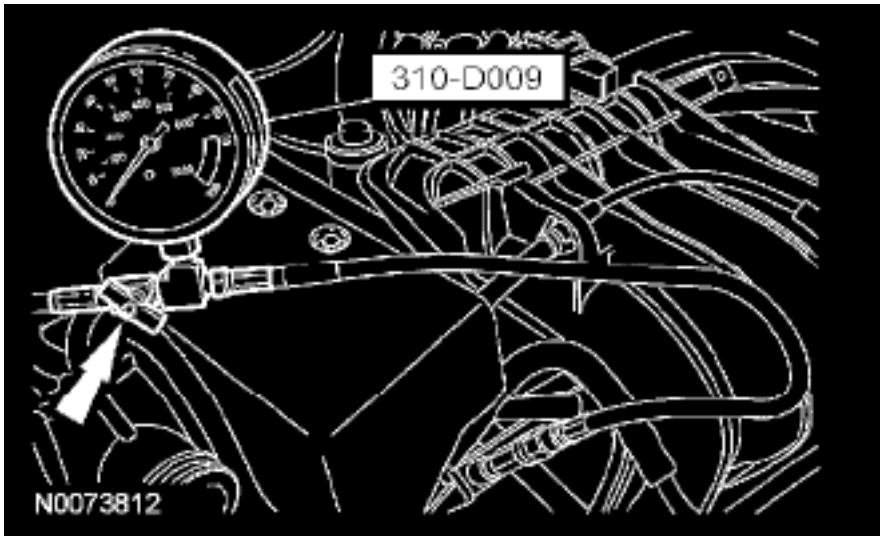
1. NOTE: 2.3L shown, 3.0L and 4.0L similar.

Remove the cap from the fuel pressure relief valve located on the fuel rail.

2. NOTE: 2.3L shown, 3.0L and 4.0L similar.

Install the special tool onto the fuel pressure relief valve.

3. Test the fuel system pressure to make sure it is within the specified range.



4. NOTE:

- 2.3L shown, 3.0L and 4.0L similar.

- Open the drain valve slowly to relieve the fuel system pressure. This may drain fuel from the system. Place fuel in a suitable container.

Upon completion of the fuel system pressure test, open the drain valve on the special tool and relieve the fuel system pressure.

5. NOTE: It may take more than one key cycle to pressurize the fuel system.

Cycle the ignition key and wait 3 seconds to pressurize the fuel system. Check for leaks before starting the engine.

Fuel Pump Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

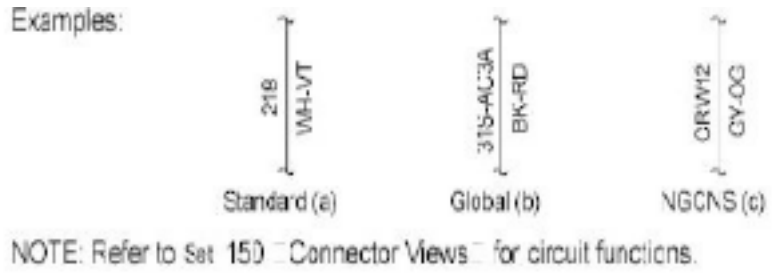
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

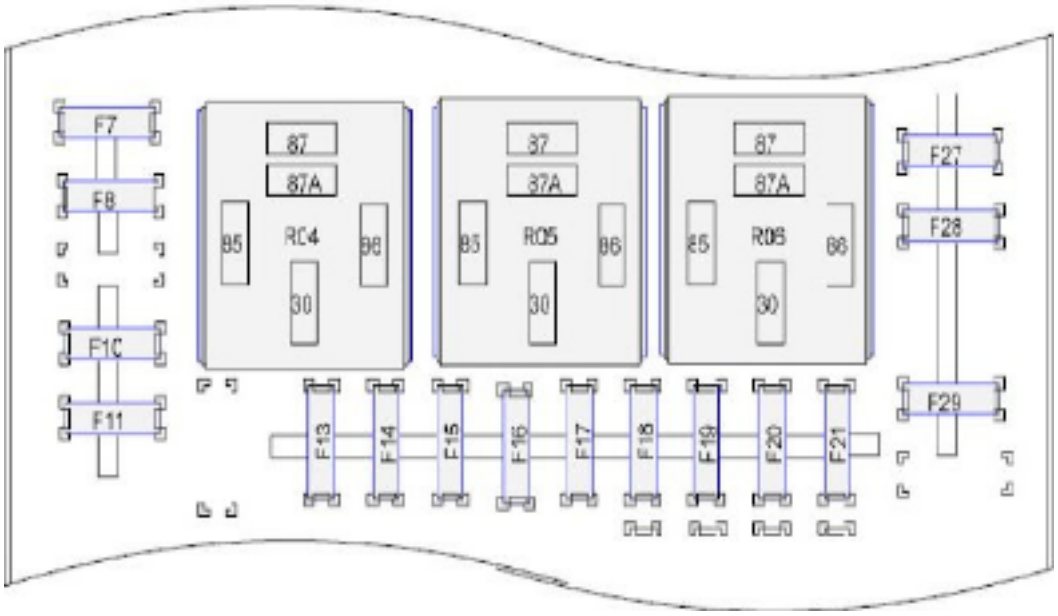
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

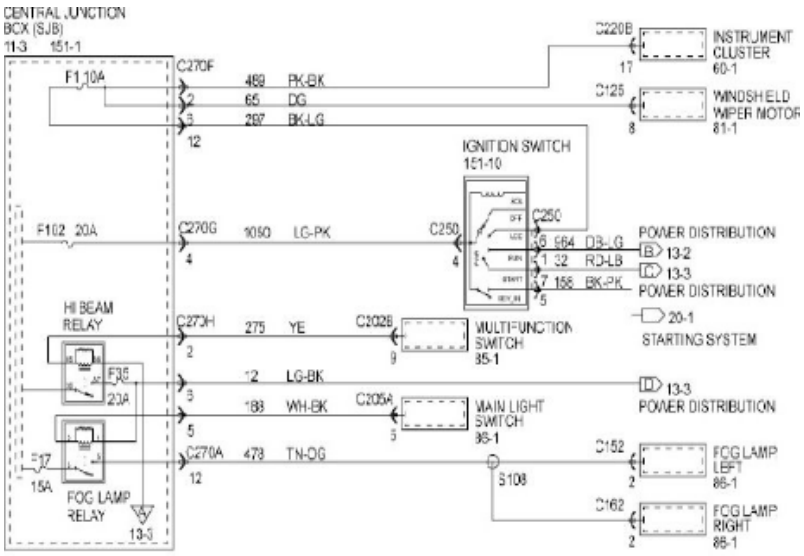
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

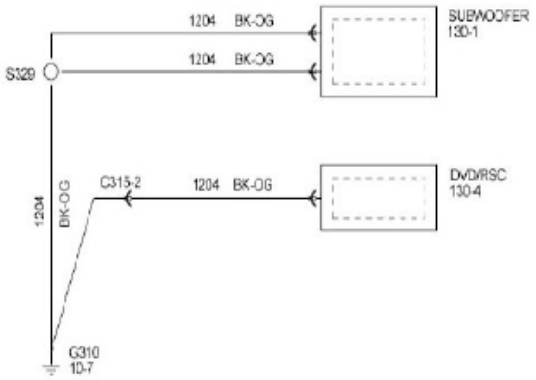
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

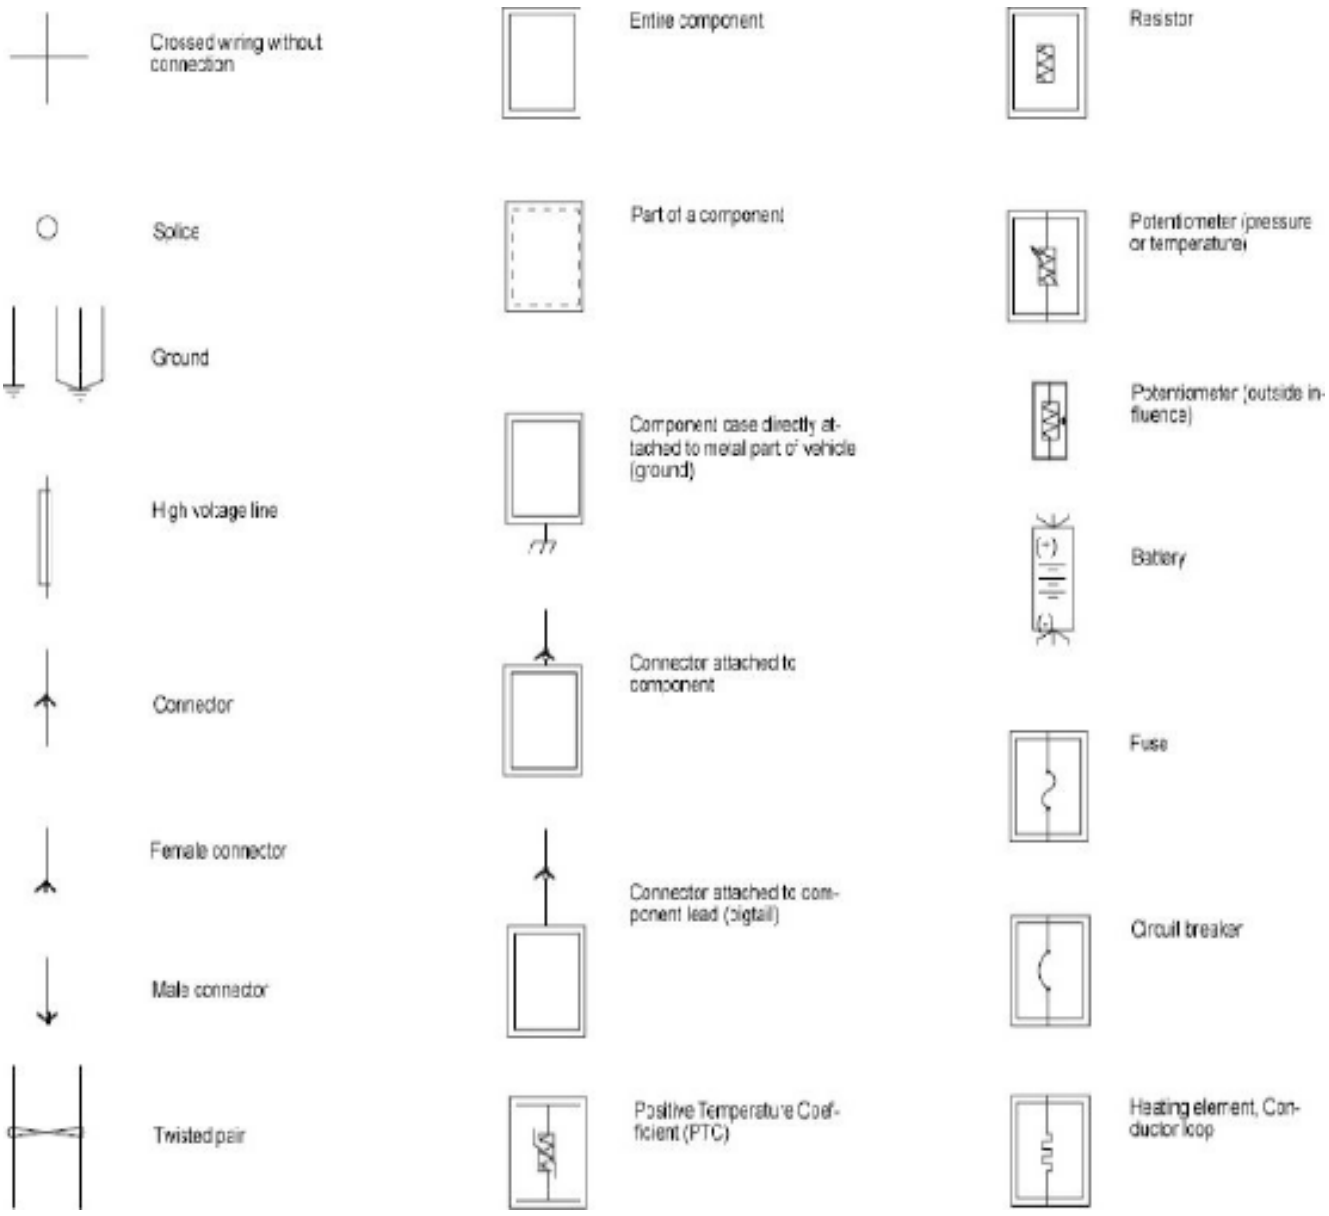
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

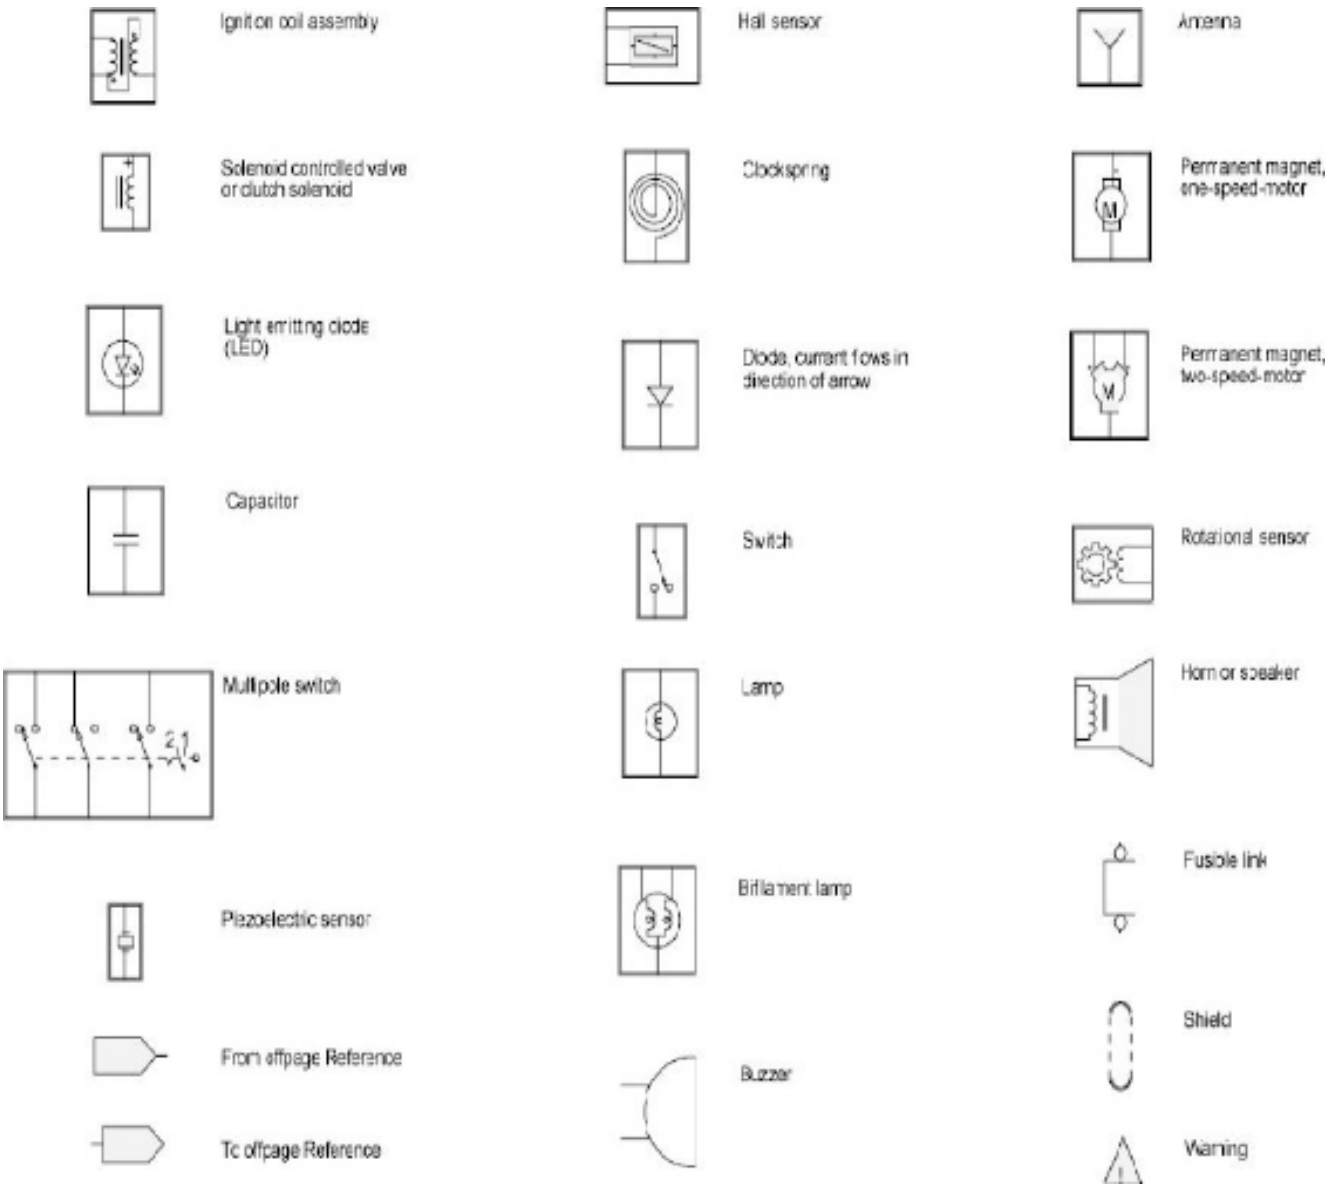
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

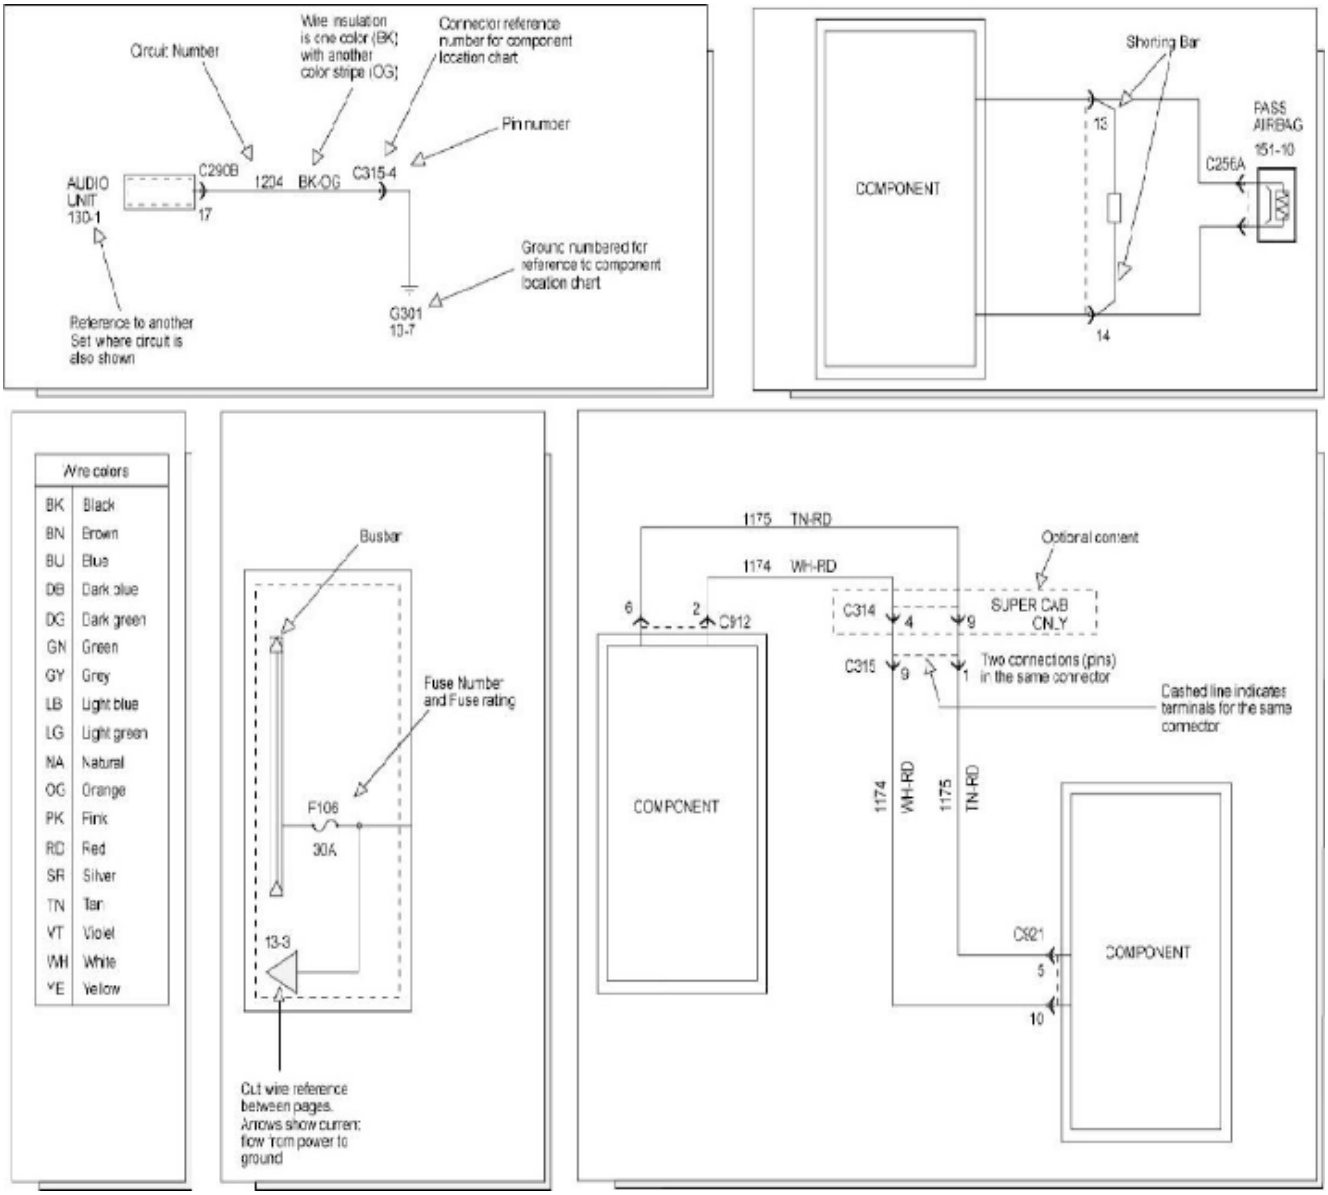
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

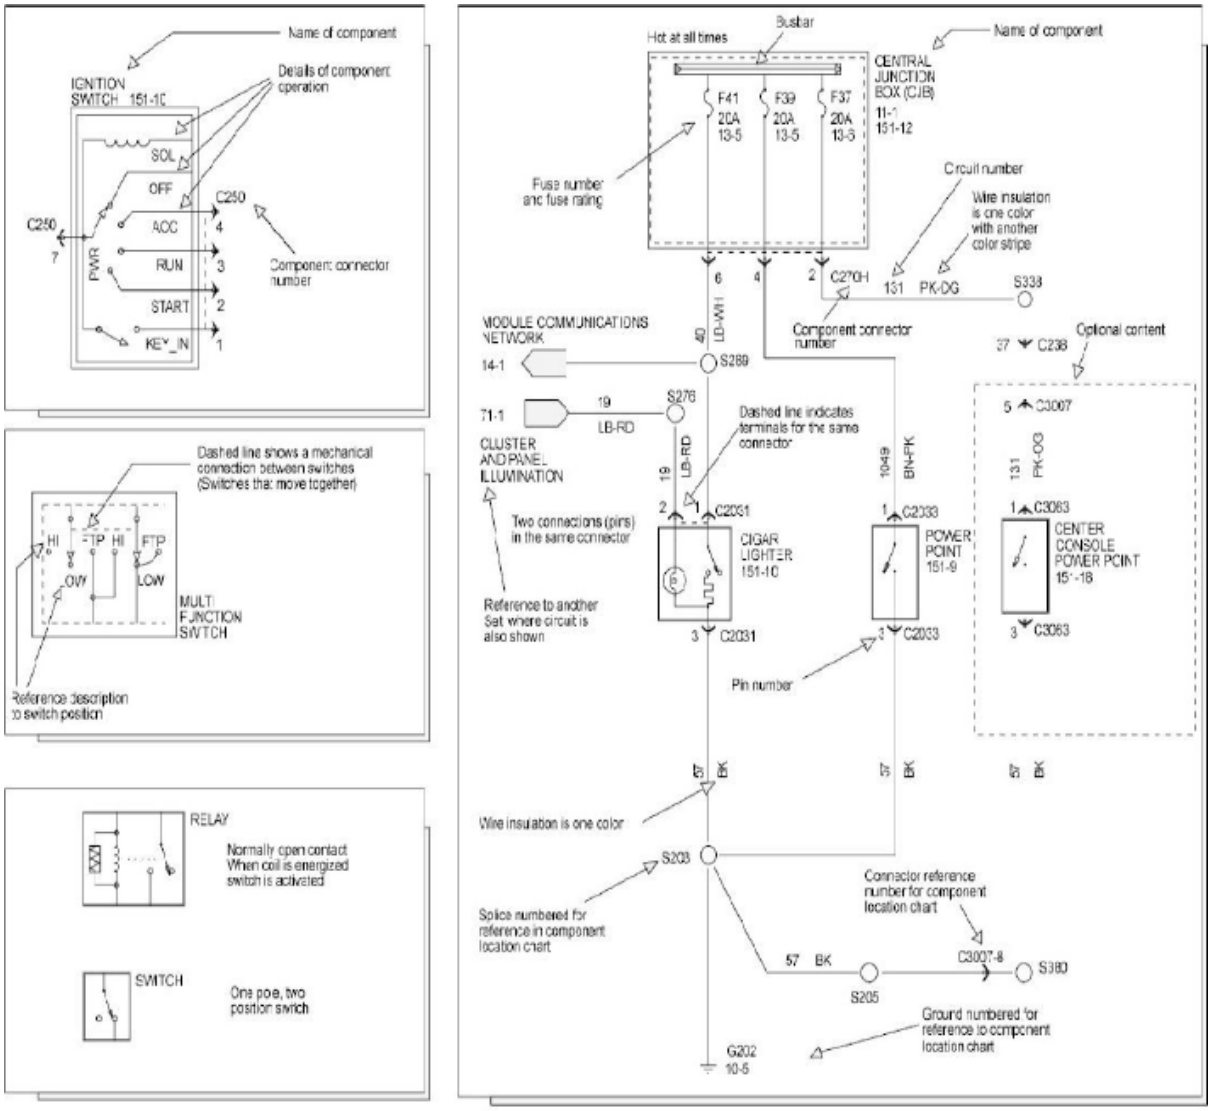
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Fuel Pump Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

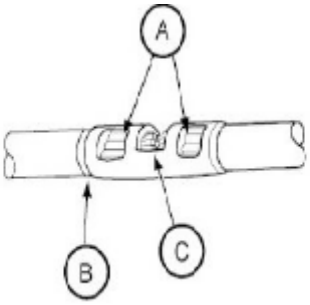
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

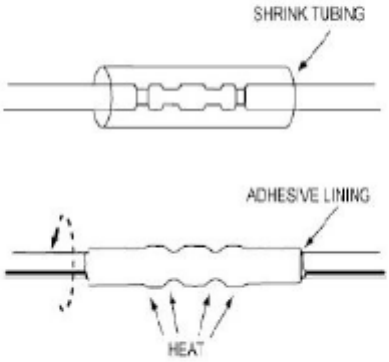
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4□ strip, cut 9 strands	* 1/4□ strip, cut 2 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip, fold 3x dia.
	16-14	* 1/4□ strip, cut 7 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip fold 2x dia	1□ strip, fold 3x dia.	1 1/4□ strip, fold 4x dia.	Not Recommended
	12-10	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip fold 3x cia.	1 1/4□ strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

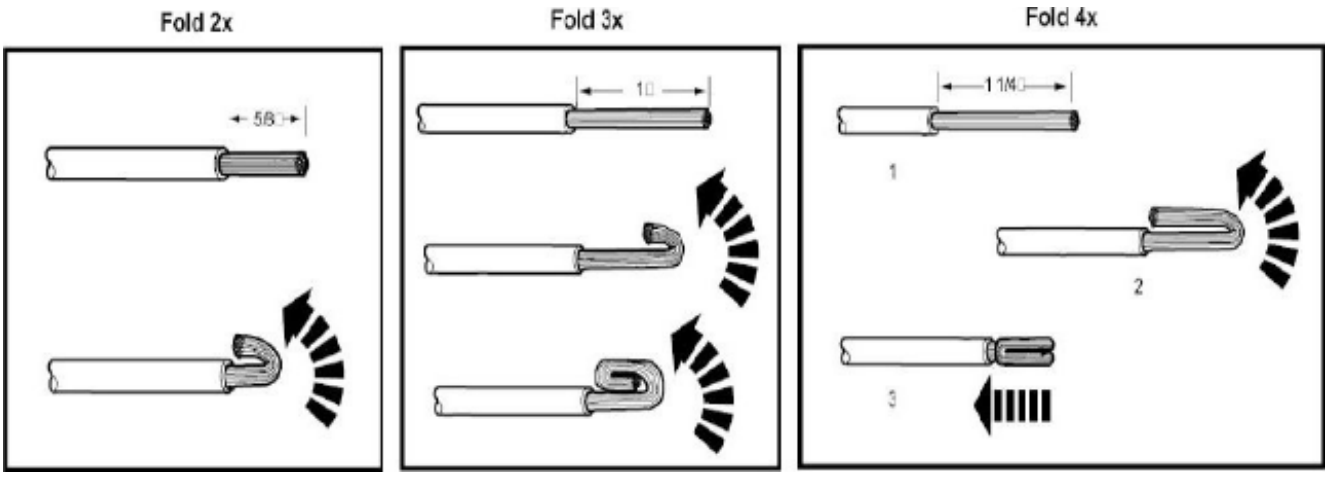
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



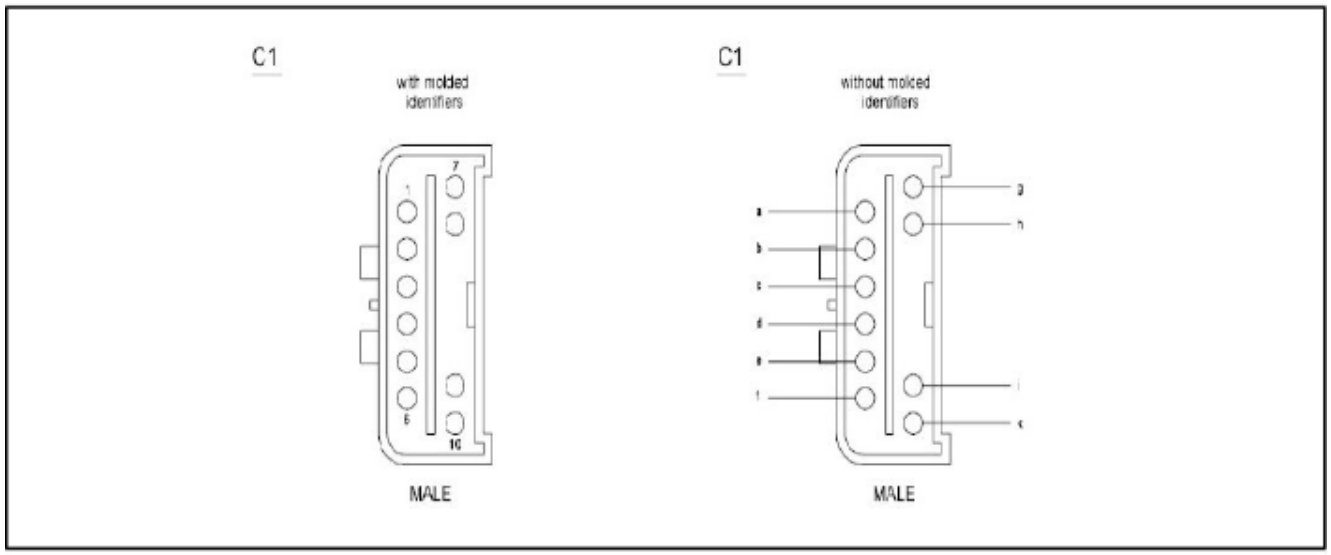
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



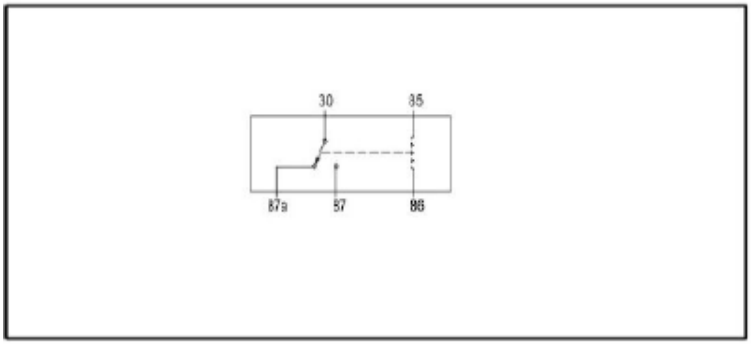
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

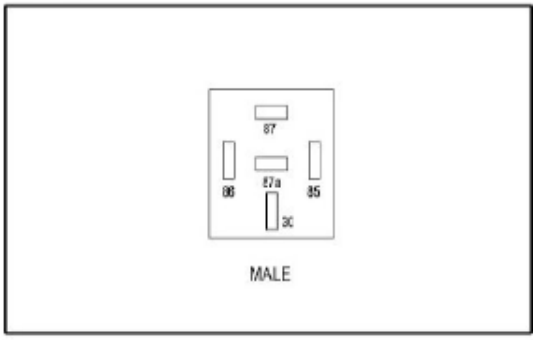
Fuel Pump Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Removal

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. Disconnect the battery ground cable. 2. Release the fuel pressure. 3. Remove the upper intake manifold. 4. Disconnect the 6 fuel injector electrical connectors. 5. Disconnect the fuel supply tube spring lock coupling. 6. Remove the 4 fuel rail bolts and remove the fuel rail and the fuel injectors as an assembly. 7. Remove the 6 fuel injectors from the fuel rail.

- Remove and discard the fuel injector O-ring seals.

Installation

1. NOTE: Lubricate the new O-ring seals with clean engine oil prior to installation.

Install new O-ring seals on the fuel injectors and install the fuel injectors onto the fuel rail.

2. Install the fuel rail and fuel injectors as an assembly, and install the 4 bolts.

- Tighten to 10 Nm (89 lb-in).

3. Connect the fuel supply tube spring lock coupling. 4. Connect the 6 fuel injector electrical connectors. 5. Install the upper intake manifold. 6. Connect the battery ground cable.

NOTE: 3.0L rear wheel drive (RWD) short wheelbase shown, others similar.

Part 2

Removal and Installation

All vehicles

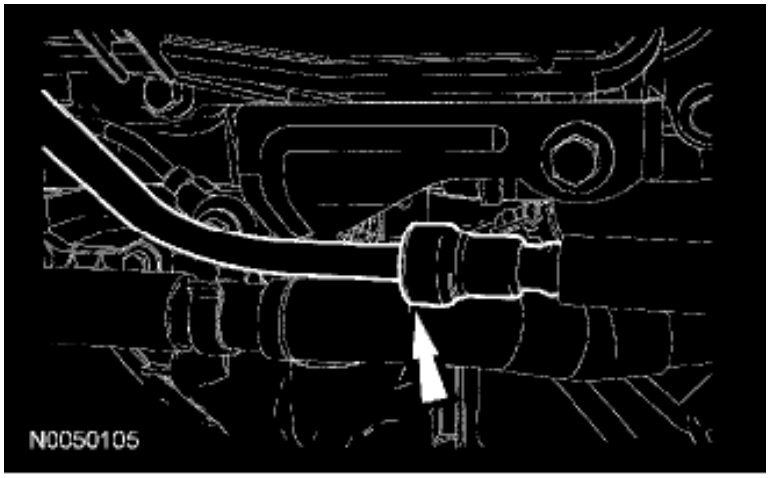
1. Remove the fuel tank.

Vehicles with 3.0L and 4.0L engine

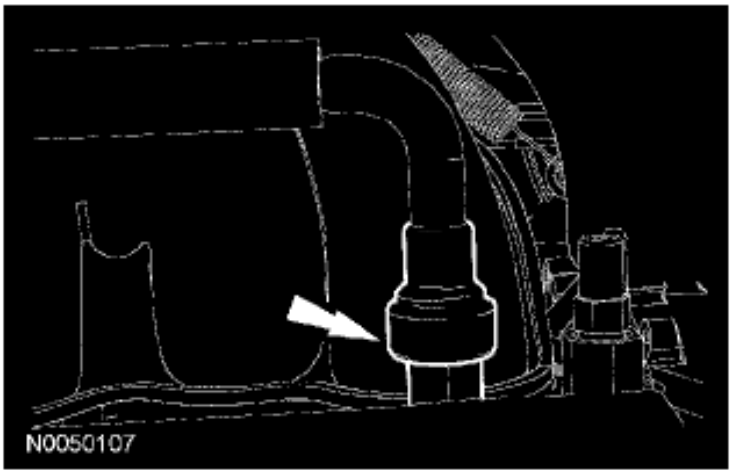
2. Remove the transmission.

Vehicles with 2.3L engine

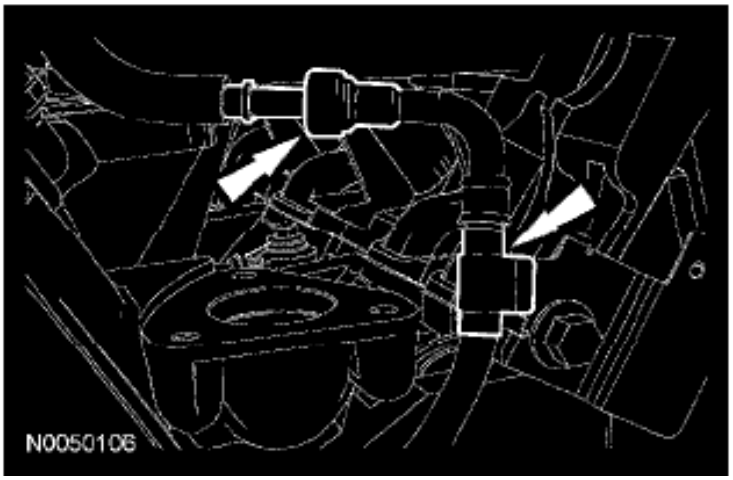
3. Disconnect the fuel supply tube-to-fuel rail supply tube spring lock coupling.



N0050105



N0050107



N0050106

Vehicles with 3.0L engine

4. Disconnect the fuel supply tube-to-fuel rail spring lock coupling.

Vehicles with 4.0L engine

5. Disconnect the fuel supply tube-to-fuel rail spring lock coupling and disconnect the fuel supply tube from the bracket.

All vehicles

6. Disconnect the front fuel tank vapor tube-to-evaporative emission (EVAP) canister purge valve quick connect coupling. 7. Disconnect the fuel tubes-to-fuel filter quick connect couplings. 8. Disconnect the front fuel tank vapor tube-to-rear fuel tank vapor tube and fuel tank pressure sensor assembly quick connect coupling.

Vehicles with 2.3L engine

9. Disconnect the wiring harness pin-type retainers from the fuel and vapor tube-to-rear transmission bracket, center of transmission housing, and fuel

and vapor tube-to-transmission bellhousing bracket.

10. Disconnect the fuel supply tube and front fuel tank vapor tube from the fuel and vapor tube-to-rear transmission bracket, and the fuel and vapor

tube-to-transmission bellhousing bracket.

All vehicles

11. Remove the fuel supply tube and the front fuel tank vapor tube from the vehicle. 12. Disconnect the rear fuel tank vapor tube and fuel tank pressure sensor assembly-to-EVAP canister quick connect coupling. 13. Disconnect the fuel tank pressure sensor electrical connector. 14. Disconnect the fuel supply tube, fuel return tube, and rear fuel tank vapor tube and fuel tank pressure sensor assembly from the frame clips and

remove from the vehicle.

15. To install, reverse the removal procedure.

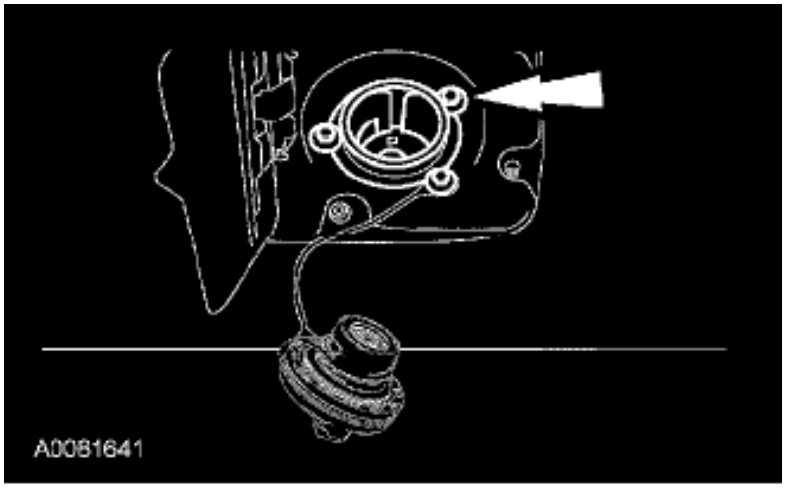
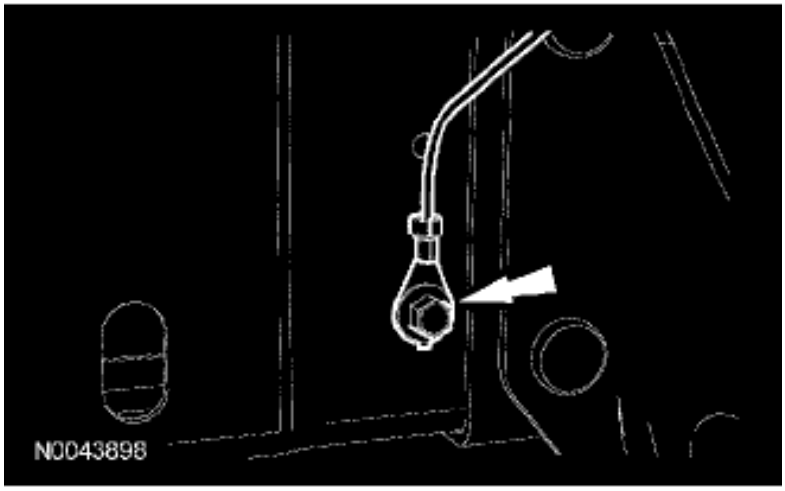
Removal and Installation

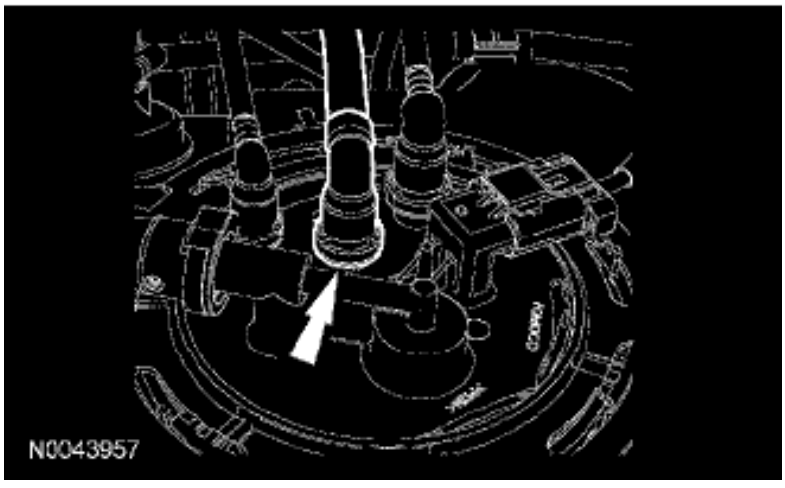
WARNING:



A0081641



N0043898



N0043957

- Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

- Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

- Remove the fuel filler cap slowly. The fuel system may be under pressure. If the fuel filler cap is venting vapor or if you hear a hissing sound, wait until it stops before completely removing the fuel filler cap. Otherwise, fuel may spray out. Failure to follow these instructions may result in serious personal injury.

1. With the vehicle in NEUTRAL, position it on a hoist 2. Disconnect the battery ground cable. 3. Remove the fuel tank filler pipe screws.

- To install, tighten to 2 Nm (18 lb-in).

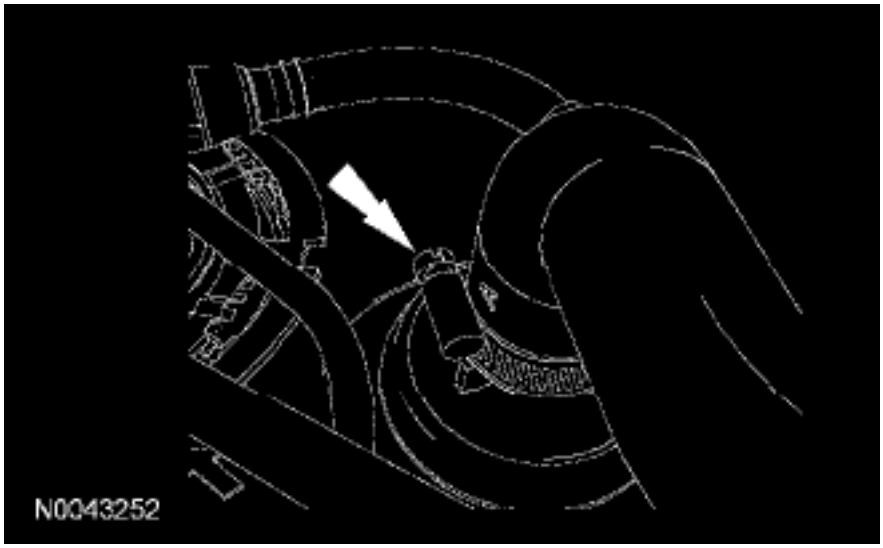
4. Remove the fuel tank filler pipe ground strap and bolt from the frame.

- To install, tighten to 15 Nm (11 lb-ft).

5. Disconnect the fuel tank filler pipe vent hose quick connect coupling at the fuel pump.

6. Loosen the fuel tank filler pipe hose clamp on the fuel tank. Remove the fuel tank filler pipe hose from the fuel tank.

- To install, tighten to 3 Nm (27 lb-in).



7. Remove the fuel tank filler pipe from the vehicle. 8. To install, reverse the removal procedure.

The reservoir prevents fuel flow interruptions during extreme vehicle maneuvers with low tank fill levels.

Fuel Temperature Sensor: Description and Operation

FUEL RAIL PRESSURE TEMPERATURE (FRPT) SENSOR

Typical Fuel Rail Pressure Temperature (FRPT) Sensor

The FRPT sensor measures the pressure and temperature of the fuel in the fuel rail and sends these signals to the PCM. The sensor uses the intake manifold vacuum as a reference to determine the pressure difference between the fuel rail and the intake manifold. The relationship between fuel pressure and fuel temperature is used to determine the possible presence of fuel vapor in the fuel rail.

The temperature sensing portion of the FRPT sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of the thermistor decreases as the temperature increases, and the resistance increases as the temperature decreases. The varying resistance changes the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Both the pressure and temperature signals are used to control the speed of the fuel pump. The speed of the fuel pump sustains fuel rail pressure which preserves fuel in its liquid state. The dynamic range of the fuel injectors increase because of the higher rail pressure, which allows the injector pulse width to decrease.

Idle Speed/Throttle Actuator - Electronic: Description and Operation

IDLE AIR CONTROL (IAC) VALVE

NOTE: The IAC valve assembly is not adjustable and cannot be cleaned, also some IAC valves are normally open and others are normally closed. Some IAC valves require engine vacuum to operate.

The IAC valve assembly controls the engine idle speed and provides a dashpot function. The IAC valve assembly meters intake air around the throttle plate through a bypass within the IAC valve assembly and throttle body. The PCM determines the desired idle speed or bypass air and signals the IAC valve assembly through a specified duty cycle. The IAC valve responds by positioning the IAC valve to control the amount of bypassed air. The PCM monitors engine RPM and increases or decreases the IAC duty cycle in order to achieve the desired RPM.

The PCM uses the IAC valve assembly to control:

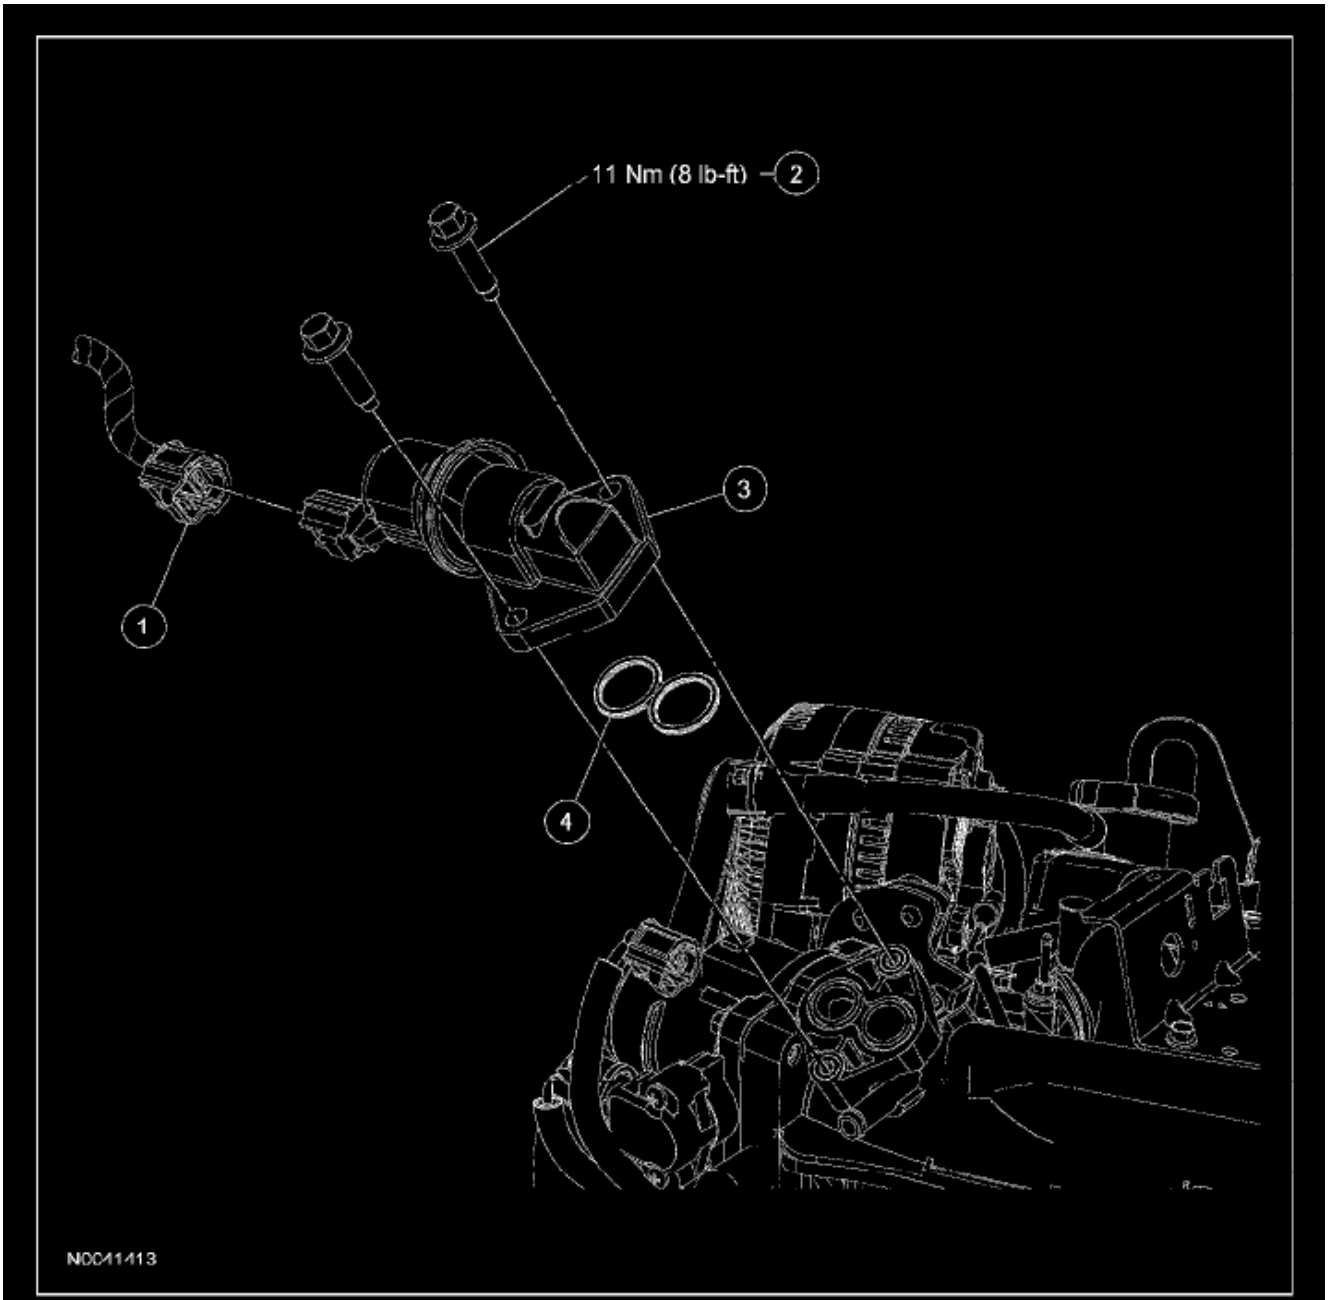
- no touch start

- cold engine fast idle for rapid warm-up

- idle (corrects for engine load)

- stumble or stalling on deceleration (provides a dashpot function)

- over-temperature idle boost



Item	Part Number	Description

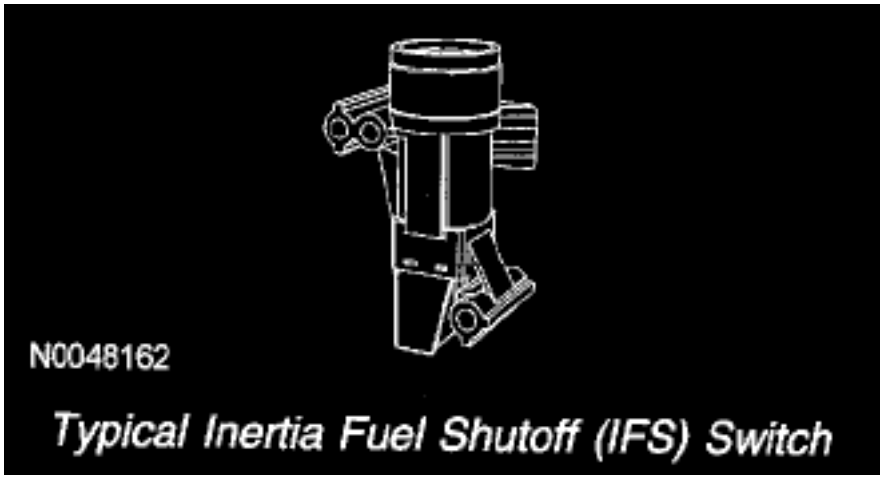
C282



Inertia Fuel Shutoff Switch: Description and Operation

INERTIA FUEL SHUTOFF (IFS) SWITCH

Typical Inertia Fuel Shutoff (IFS) Switch

The IFS switch is used in conjunction with the electric fuel pump. The purpose of the IFS switch is to shutoff the fuel pump if a collision occurs. It consists of a steel ball held in place by a magnet. When a sharp impact occurs, the ball breaks loose from the magnet, rolls up a conical ramp and strikes a target plate which opens the electrical contacts of the switch and shuts off the electric fuel pump. Once the switch is open, it must be manually reset before restarting the vehicle. Refer to the Owner's Literature, Roadside Emergencies for the location of the IFS switch.

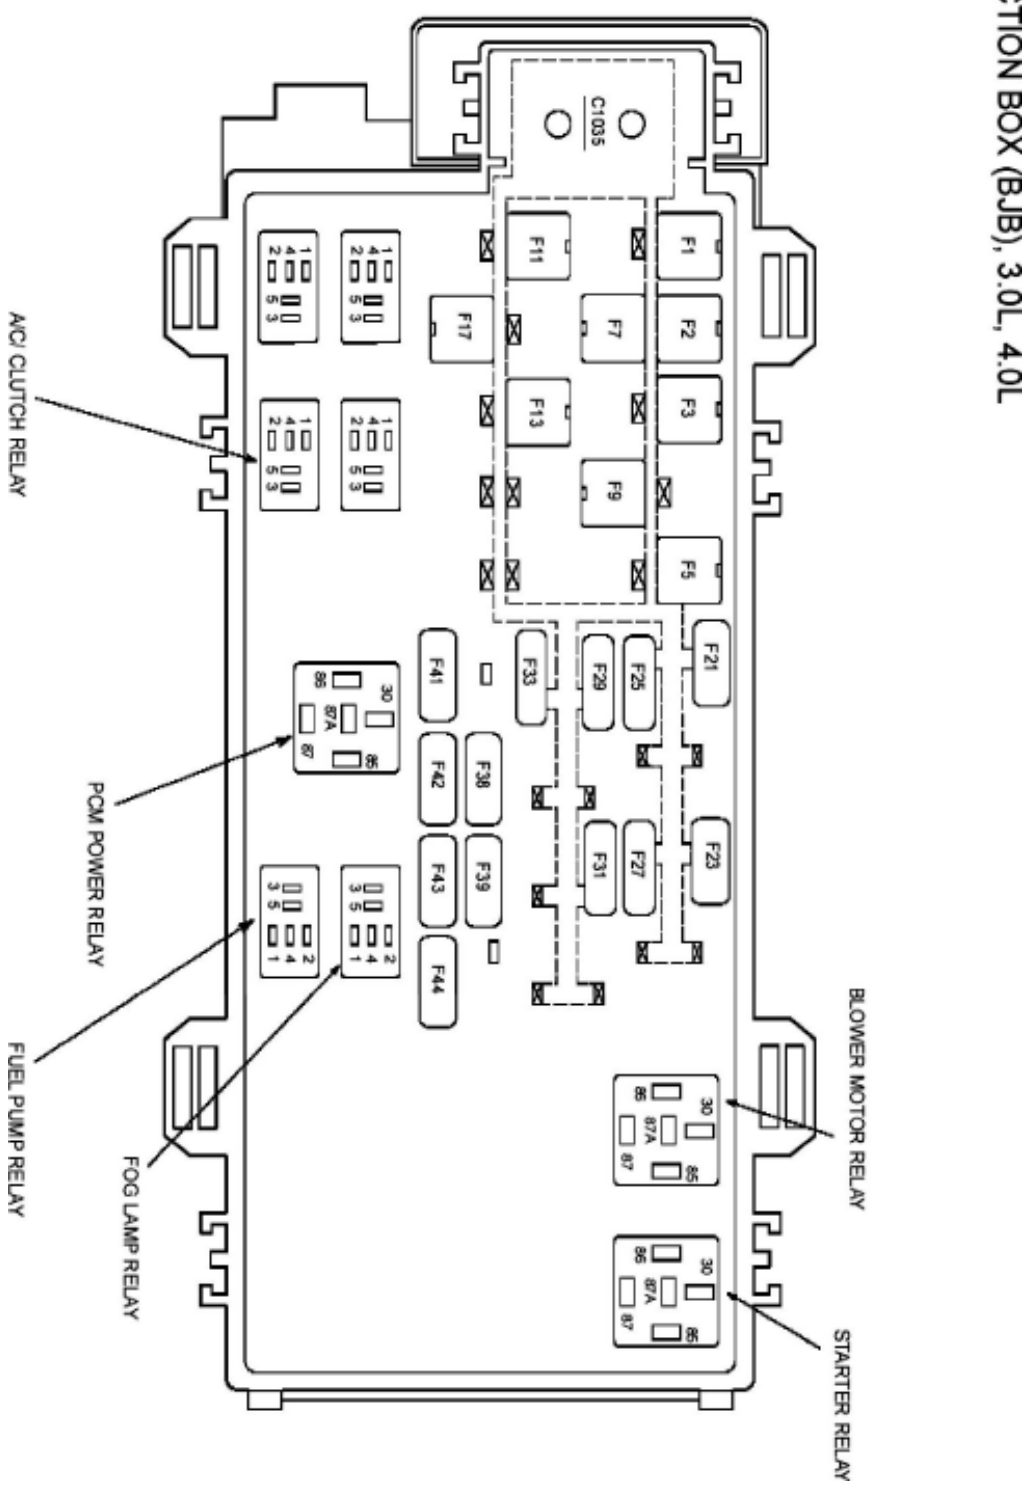
Removal and Installation

1. NOTE: The inertia fuel shutoff (IFS) switch is located behind the RH cowl panel.

Remove the RH scuff plate and cowl panel.

2. Remove the screws and the IFS switch. 3. Disconnect the IFS switch electrical connector. 4. To install, reverse the removal procedure.

BATTERY JUNCTION BOX (BJB), 3.0L, 4.0L

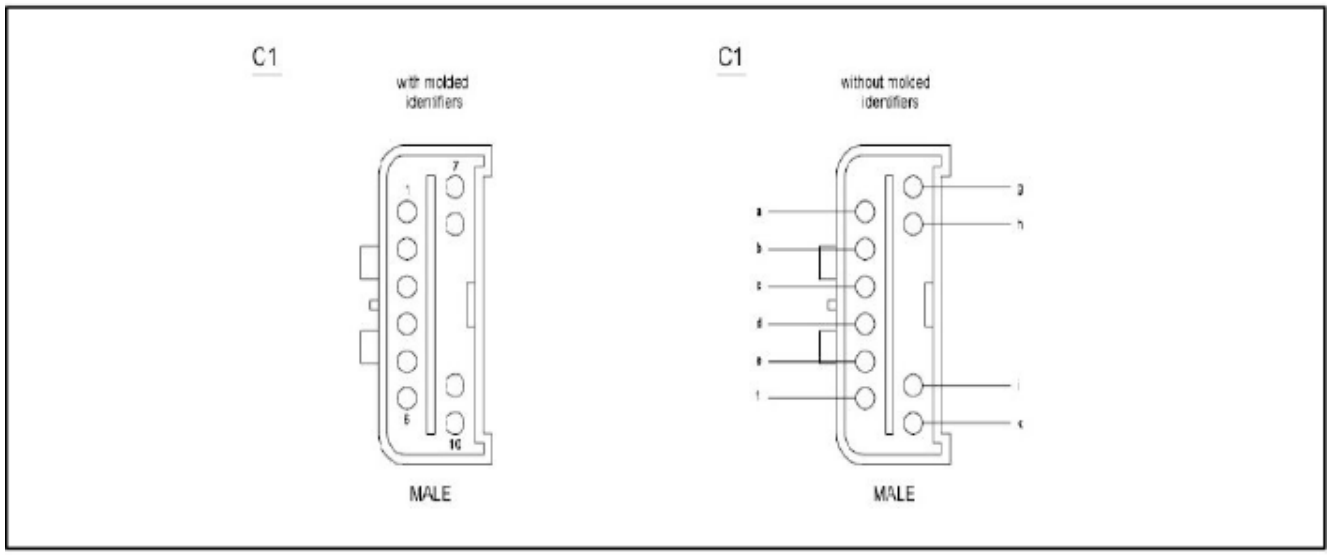


Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



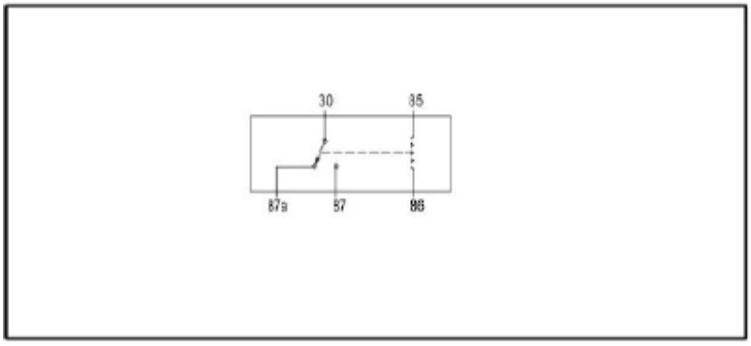
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

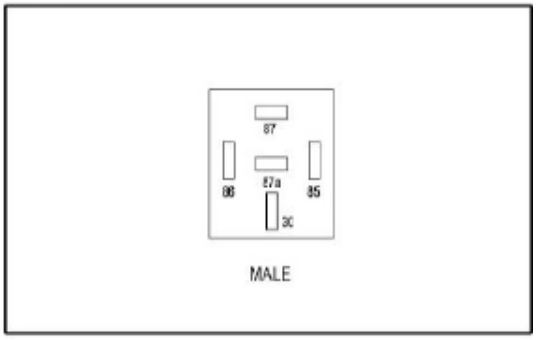
Main Relay (Computer/Fuel System): Testing and Inspection

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 35 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

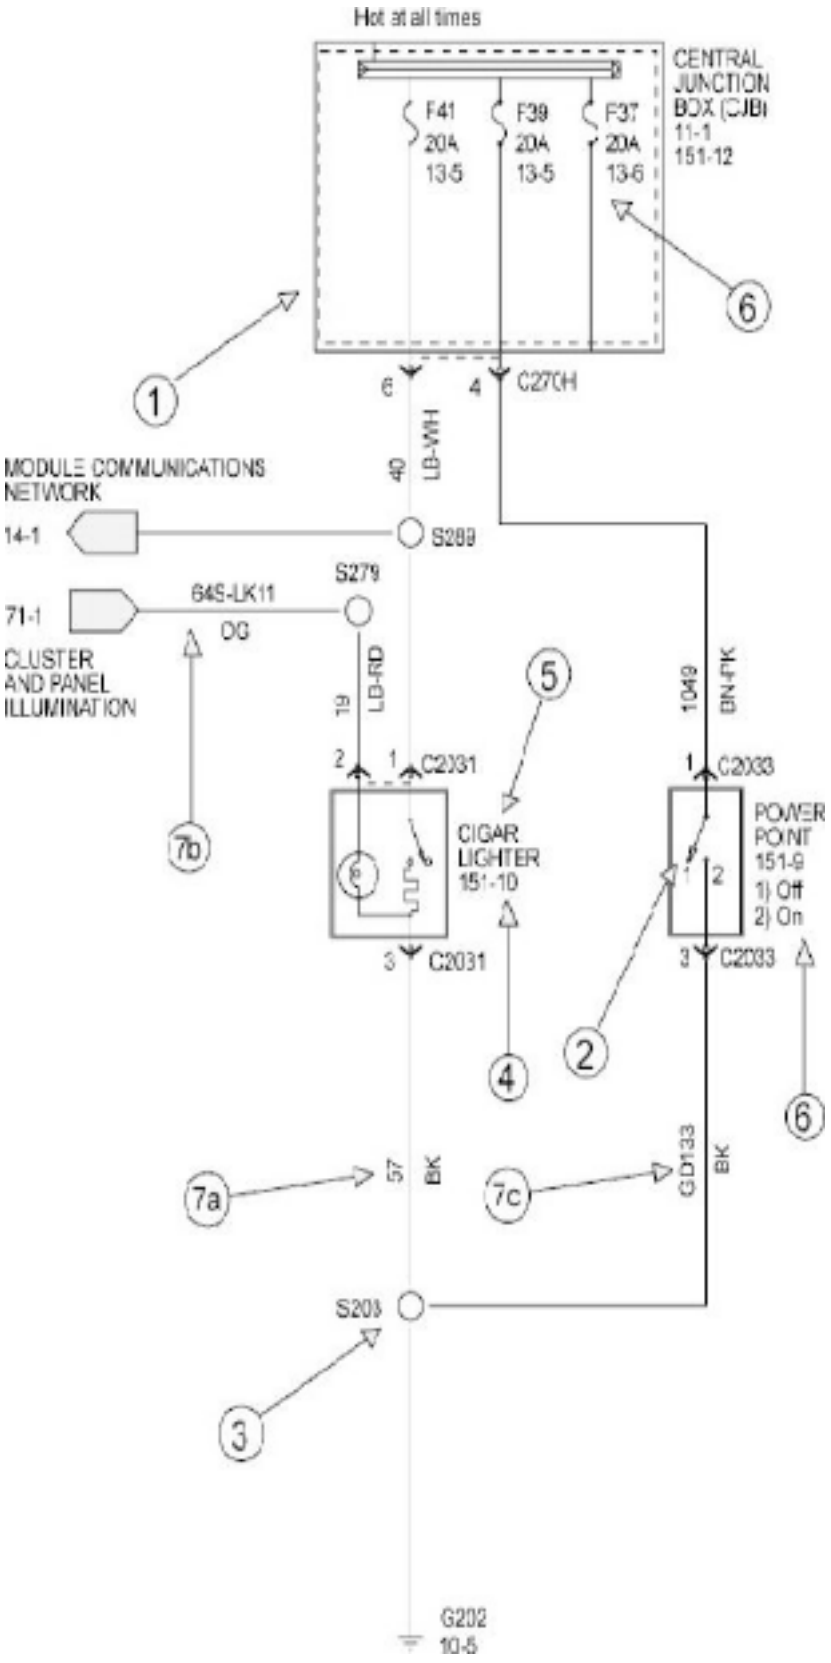
Ford Workshop Manuals > Powertrain Management > Fuel Delivery and Air Induction > Relays and Modules - Fuel Delivery and Air Induction > Fuel Pump Relay > Component Information > Diagrams > Diagram Information and Instructions



Fuel Pump Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

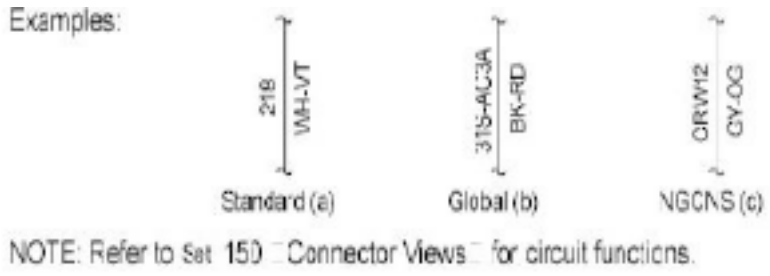
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

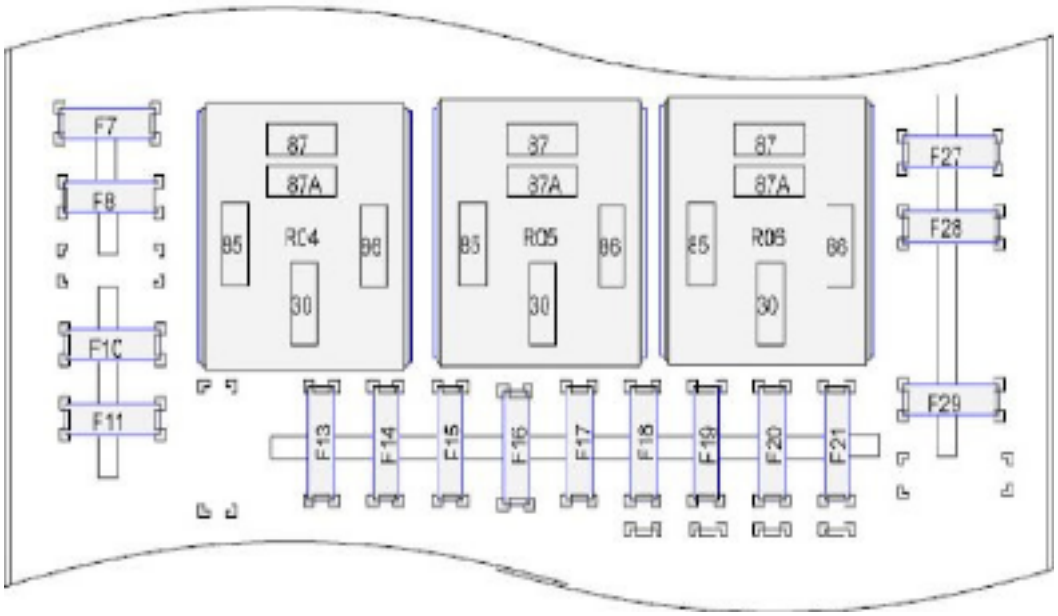
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

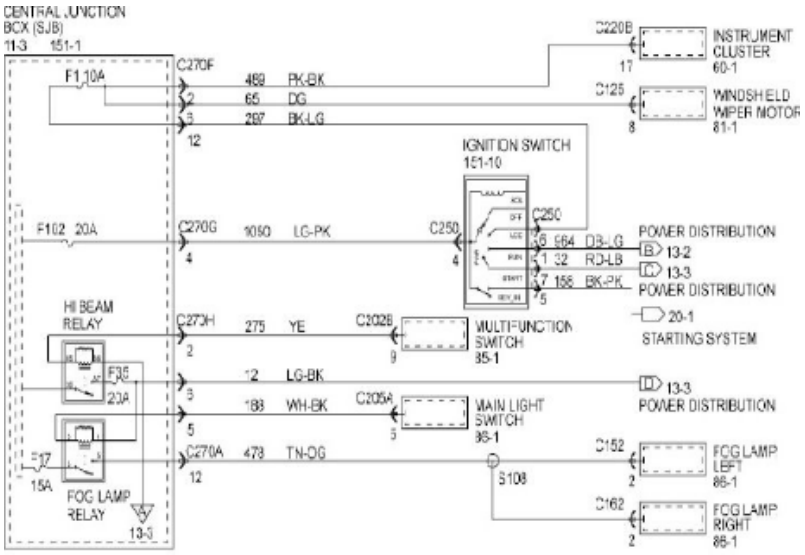
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

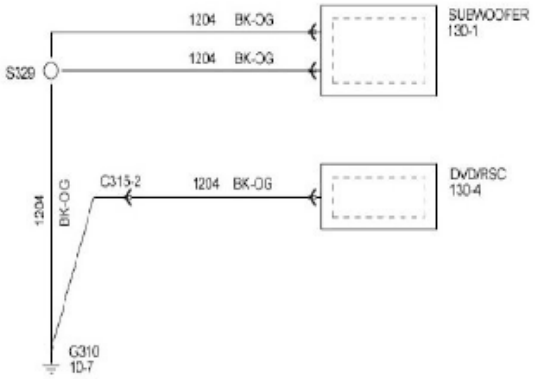
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by

each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

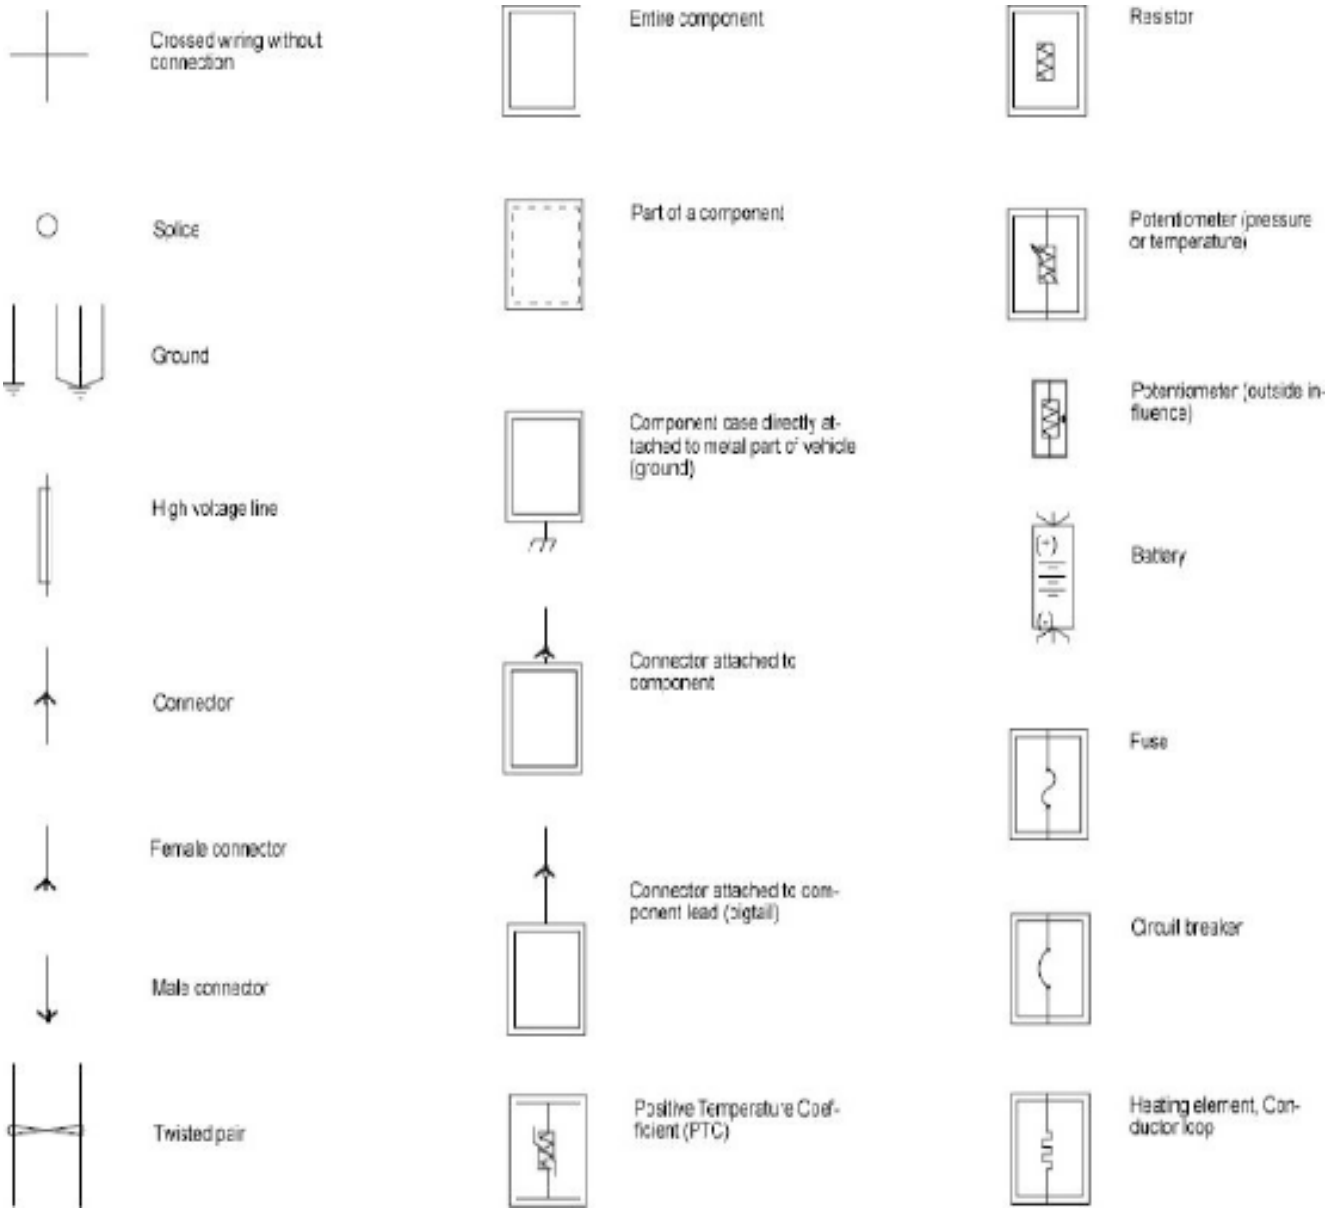
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

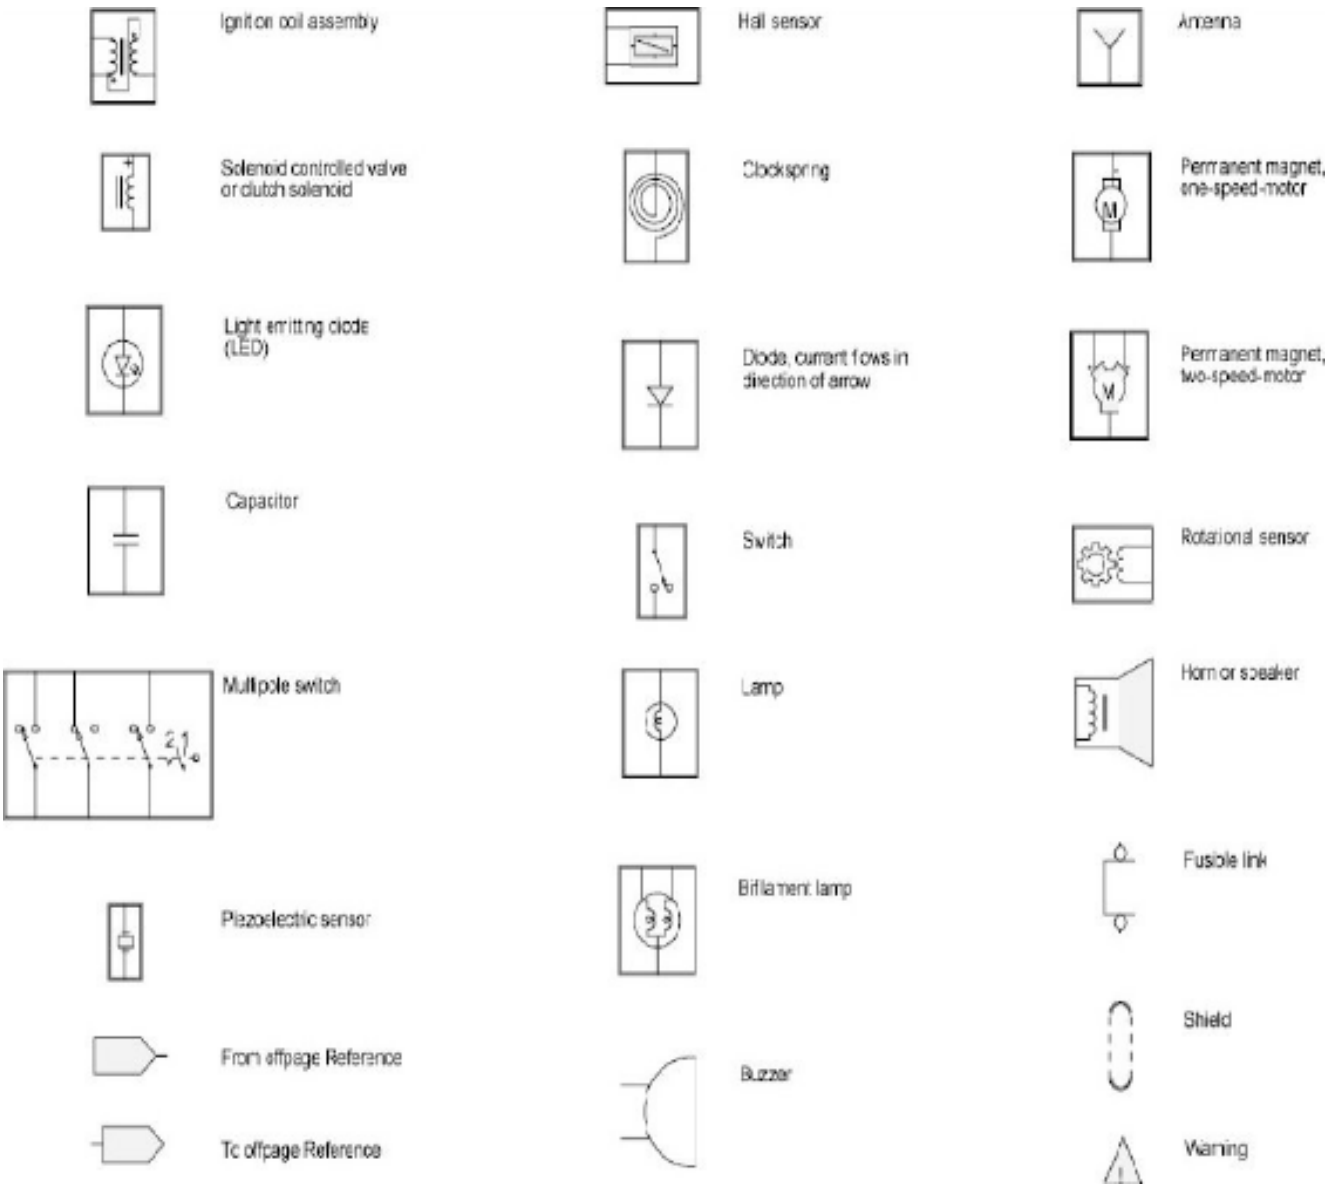
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

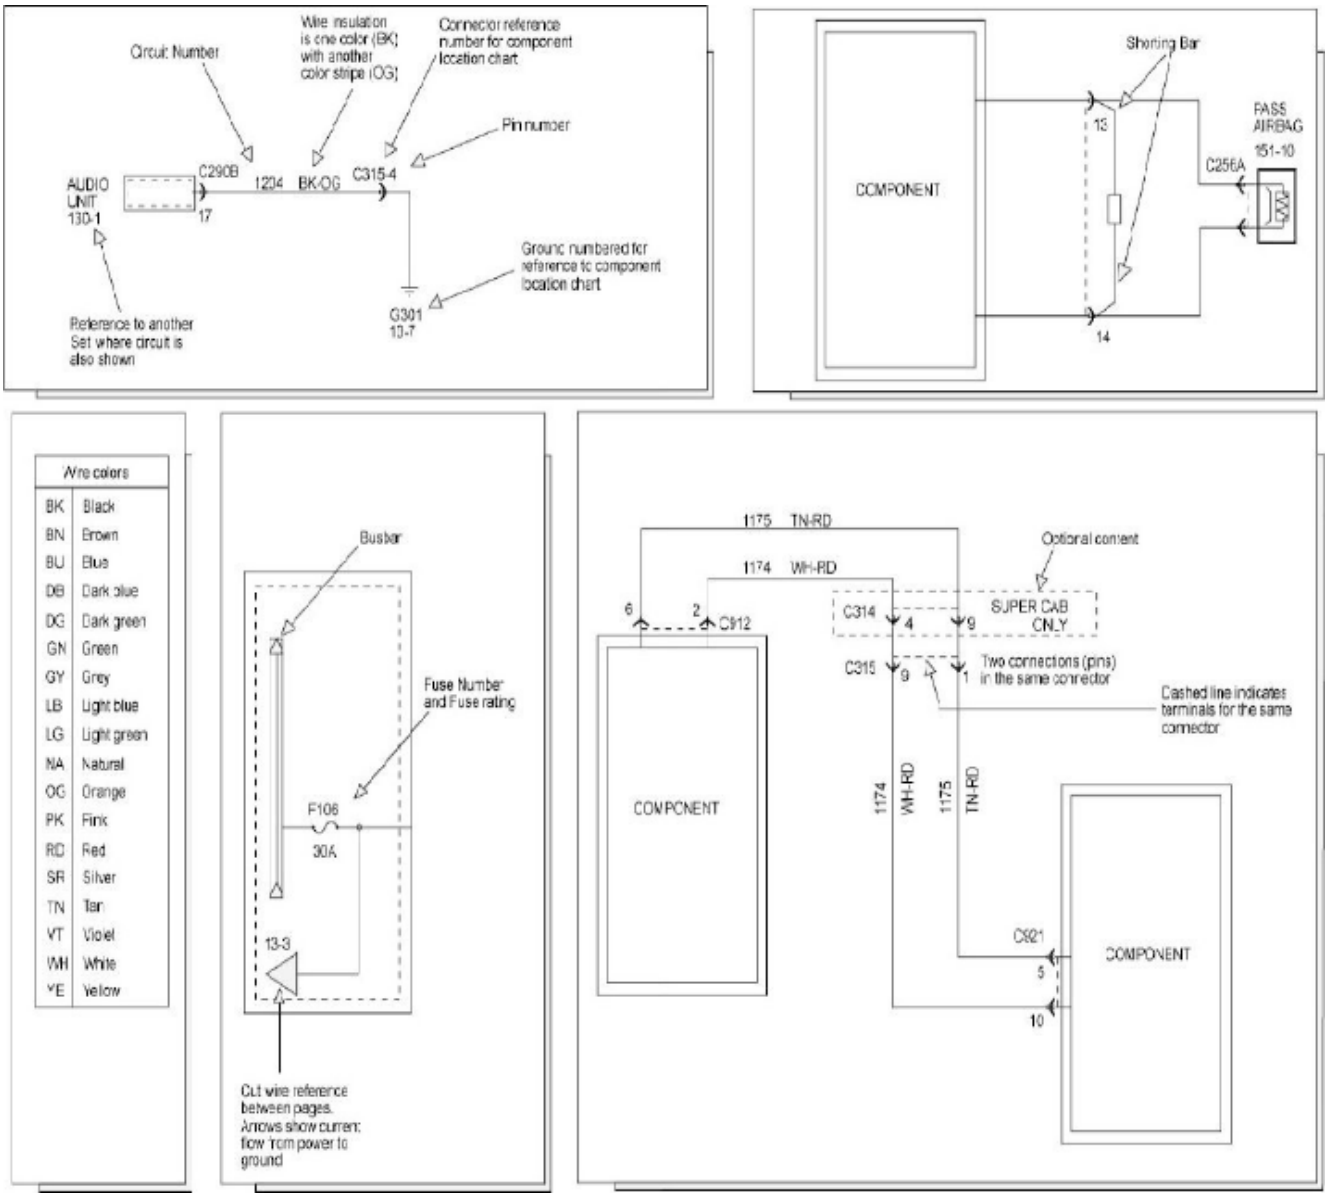
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

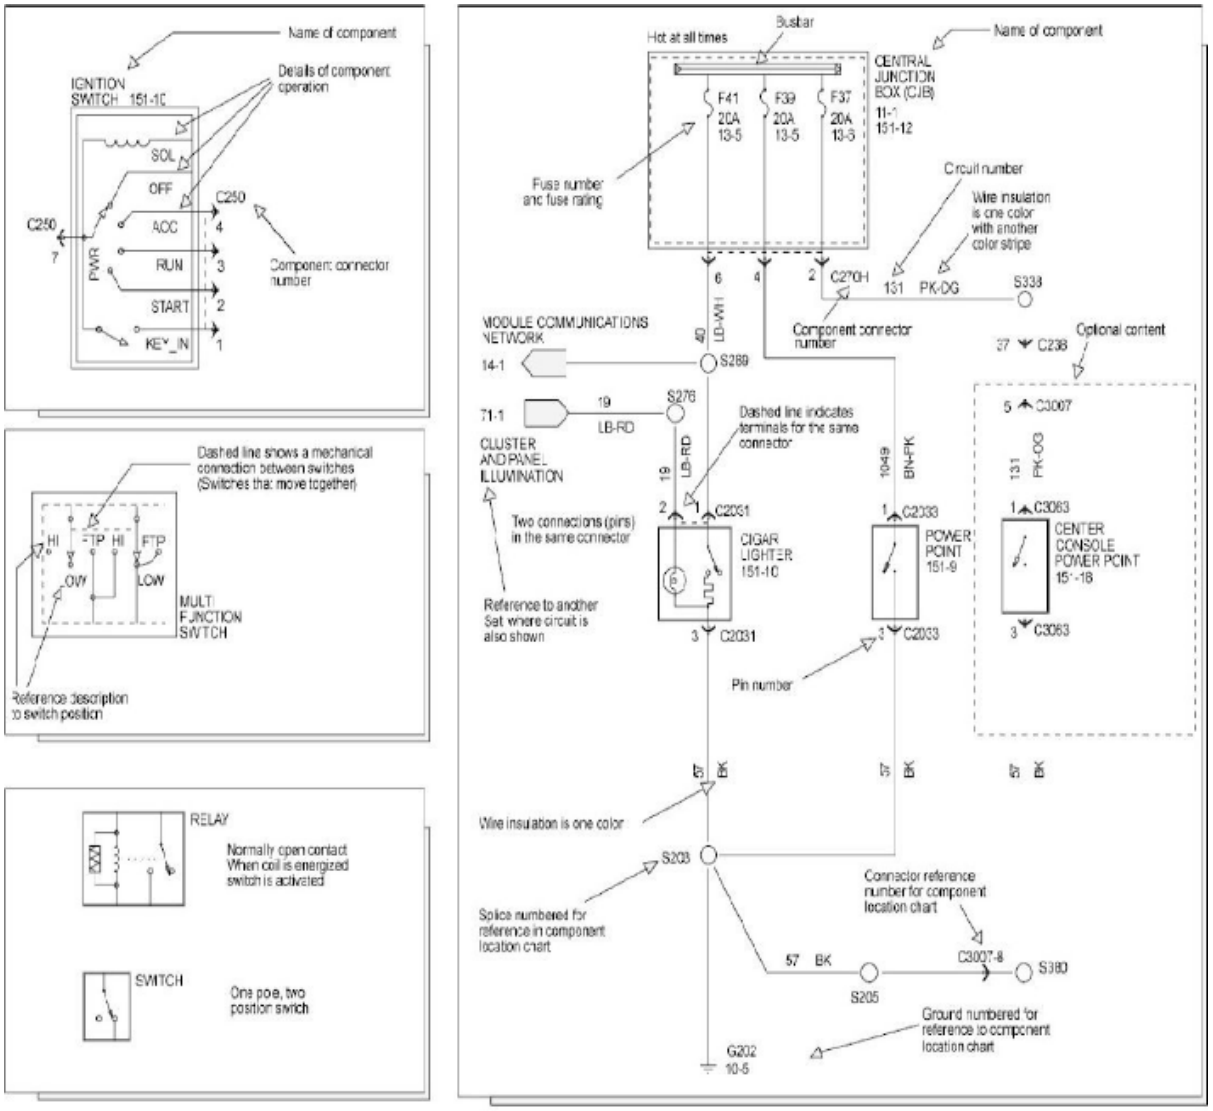
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed

Fuel Pump Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

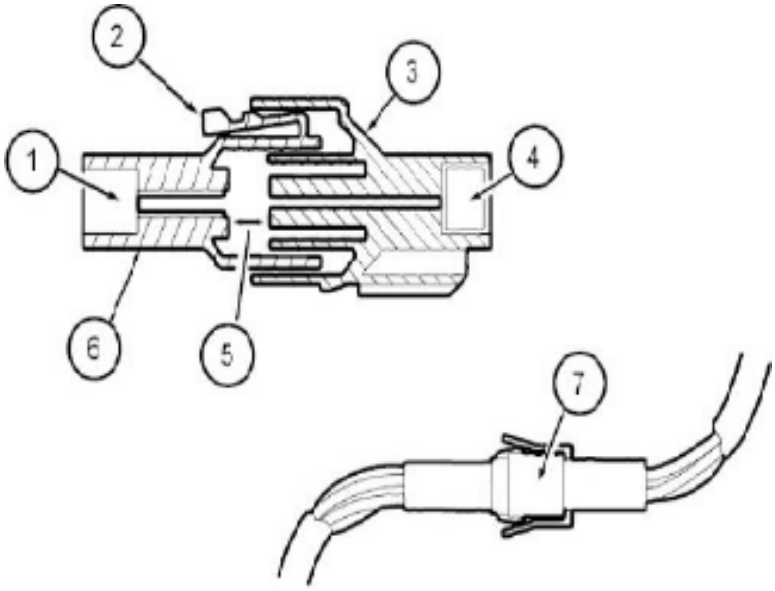
5 = Intermittent contact

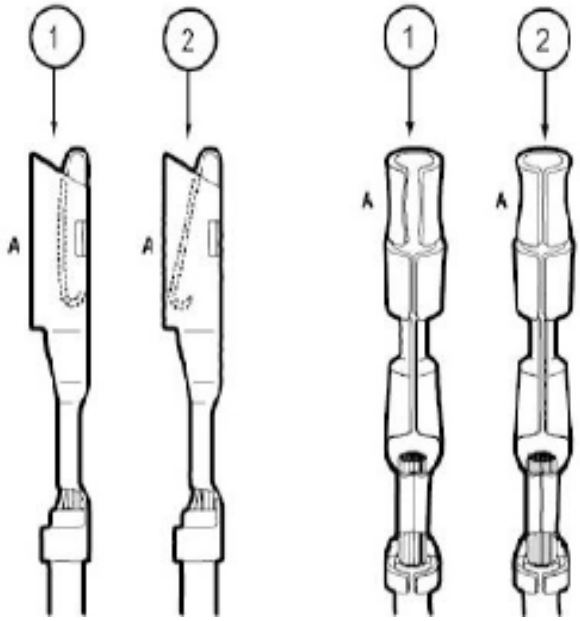
6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Defective insulation stripping





1 = Proper crimp

2 = Insulation not removed

3 = Wire strands missing

4 = Intermittent signals through pierced insulation

Partially mated connectors

1 = Seal

2 = Displaced tab

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Male half

7 = Intermittent contact

Lock may be displaced into an unlocked position; pull on the connector to verify the lock.

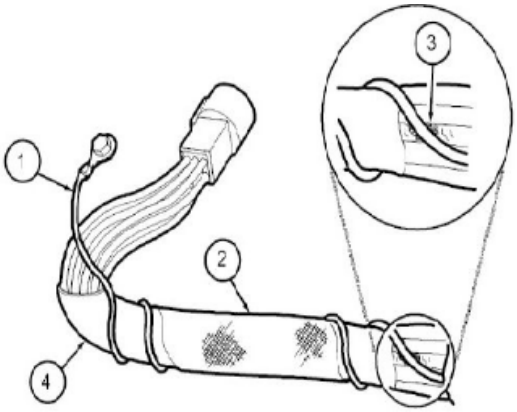
Deformed (enlarged) female terminals

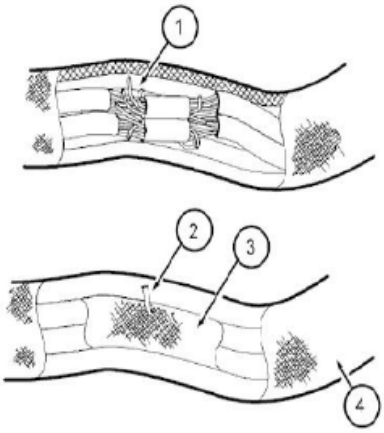
1 = Enlarged

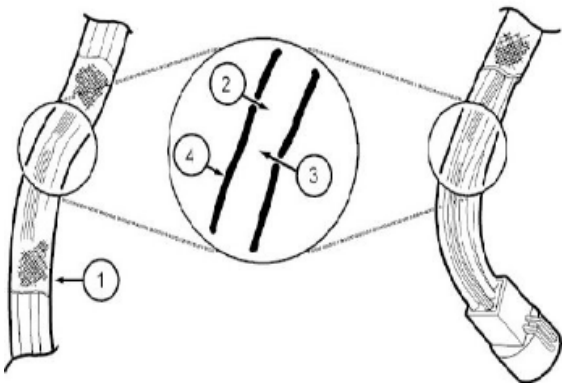
2 = Normal

Any probe entering the terminal may enlarge the contact spring opening creating an intermittent signal.

Insert the correct mating terminal (Location A) from the service kit and feel for a loose fit.







Electrical short inside the harness

1 = Solder coated wire to ground

2 = Harness protective tape

3 = Intermittent short

Solder coated wire pierced through the insulation of another circuit

4 = Grounding foil

Electrical short within the harness

Splice tape removed 1

= Intermittent short

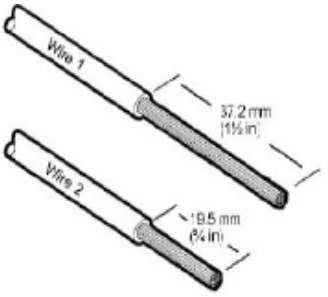
Splice covered 2

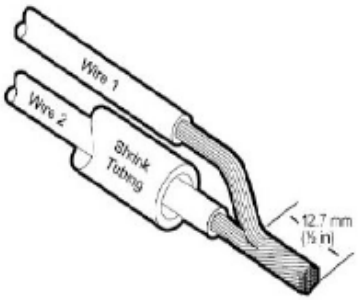
= Wire strand

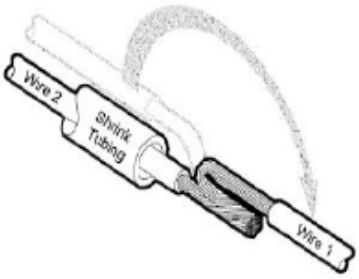
3 = Splice tape

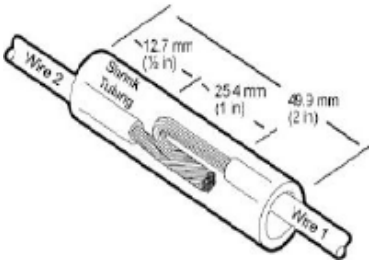
4 = Harness tape

Broken wire strands in harness









1 = Wiring harness tape

2 = Wiring strand

3 = Broken strands intermittent signal

4 = Circuit insulation

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. lnstall heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

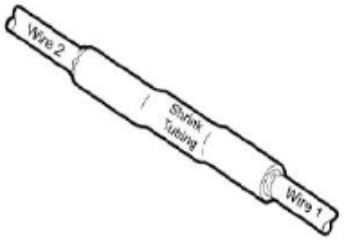
NOTE: -

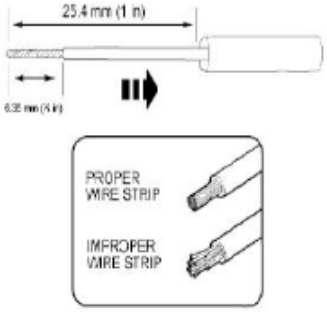
Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

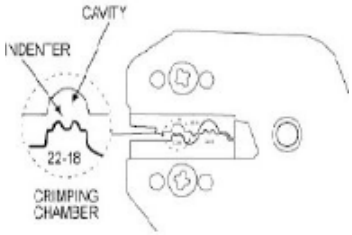
- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

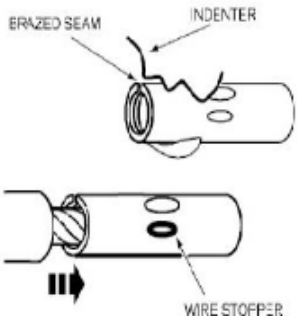
6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.









7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

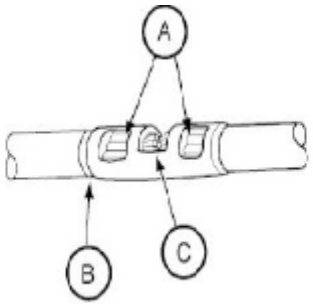
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

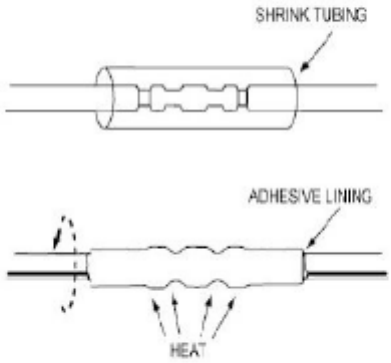
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x cia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

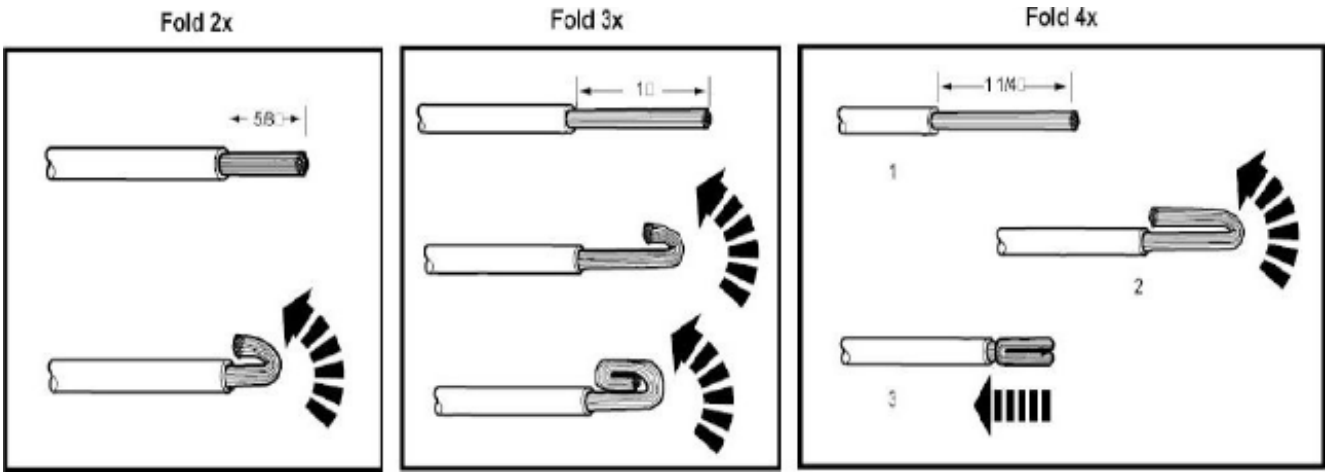
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



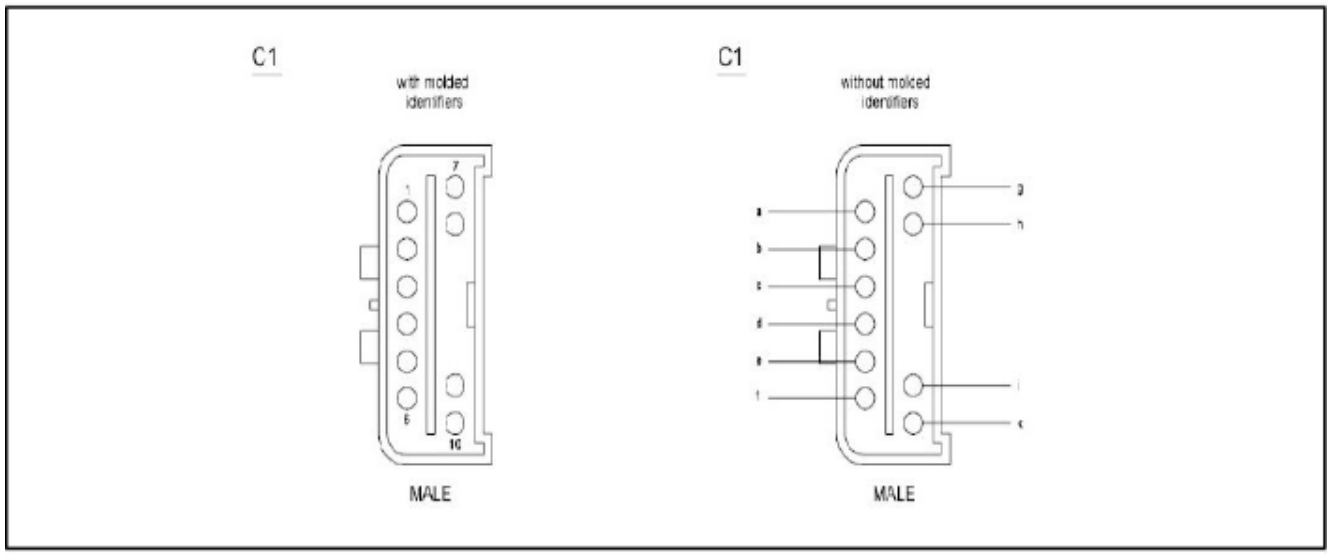
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



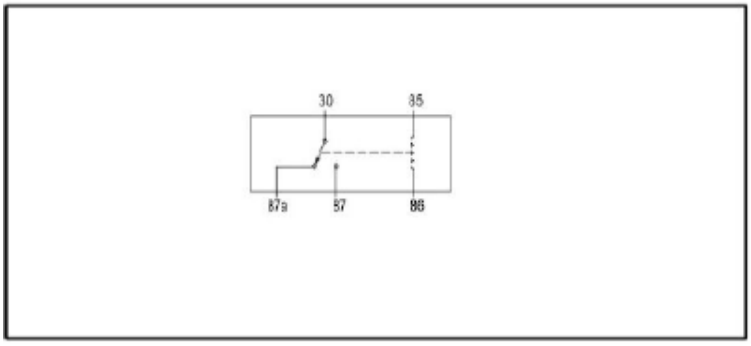
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

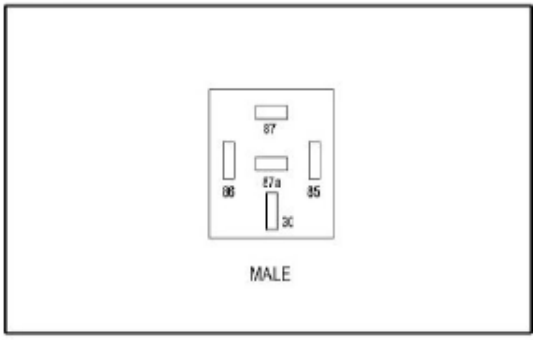
Fuel Pump Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

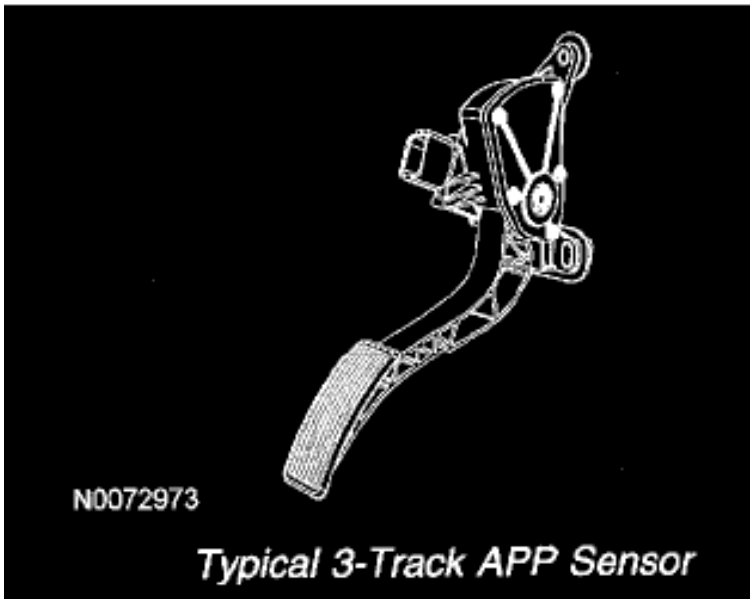
2-Track APP Sensor



N0072973
Typical 3-Track APP Sensor

Accelerator Pedal Position Sensor: Description and Operation

ACCELERATOR PEDAL POSITION (APP) SENSOR

The APP sensor is an input to the powertrain control module (PCM) and is used to determine the amount of torque requested by the operator. Depending on the application either a 2-track or 3-track APP sensor is used.

2-Track APP Sensor

2-Track APP Sensor

There are 2 pedal position signals in the sensor. Both signals, APP1 and APP2, have a positive slope (increasing angle, increasing voltage), but are offset and increase at different rates. The 2 pedal position signals make sure the PCM receives a correct input even if 1 signal has a concern. The PCM determines if a signal is incorrect by calculating where it should be, inferred from the other signals. If a concern is present with one of the circuits the other input is used. There are 2 reference voltage circuits, 2 signal return circuits, and 2 signal circuits (a total of 6 circuits and pins) between the PCM and the APP sensor assembly. The reference voltage circuits and the signal return circuits are shared with the reference voltage circuit and signal return circuit used by the electronic throttle body (ETB) throttle position sensor. The pedal position signal is converted to pedal travel degrees (rotary angle) by the PCM. The software then converts these degrees to counts, which is the input to the torque based strategy.

3-Track APP Sensor

Typical 3-Track APP Sensor

There are 3 pedal position signals in the sensor. Signal 1, APP1, has a negative slope (increasing angle, decreasing voltage) and signals 2 and 3, APP2 and APP3, both have a positive slope (increasing angle, increasing voltage). During normal operation APP1 is used as the indication of pedal position by the strategy. The 3 pedal position signals make sure the PCM receives a correct input even if 1 signal has a concern. The PCM determines if a signal is incorrect by calculating where it should be, inferred from the other signals. If a concern is present with one of the circuits the other inputs are used. The pedal position signal is converted to pedal travel degrees (rotary angle) by the PCM. The software then converts these degrees to counts, which is the input to the torque based strategy. There are 2 reference voltage circuits, 2 signal return circuits, and 3 signal circuits (a total of 7 circuits and pins) between the PCM and the APP sensor assembly. The reference voltage circuits and the signal return circuits are shared with the reference voltage circuit and signal return circuit used by the electronic throttle body (ETB) throttle position sensor.

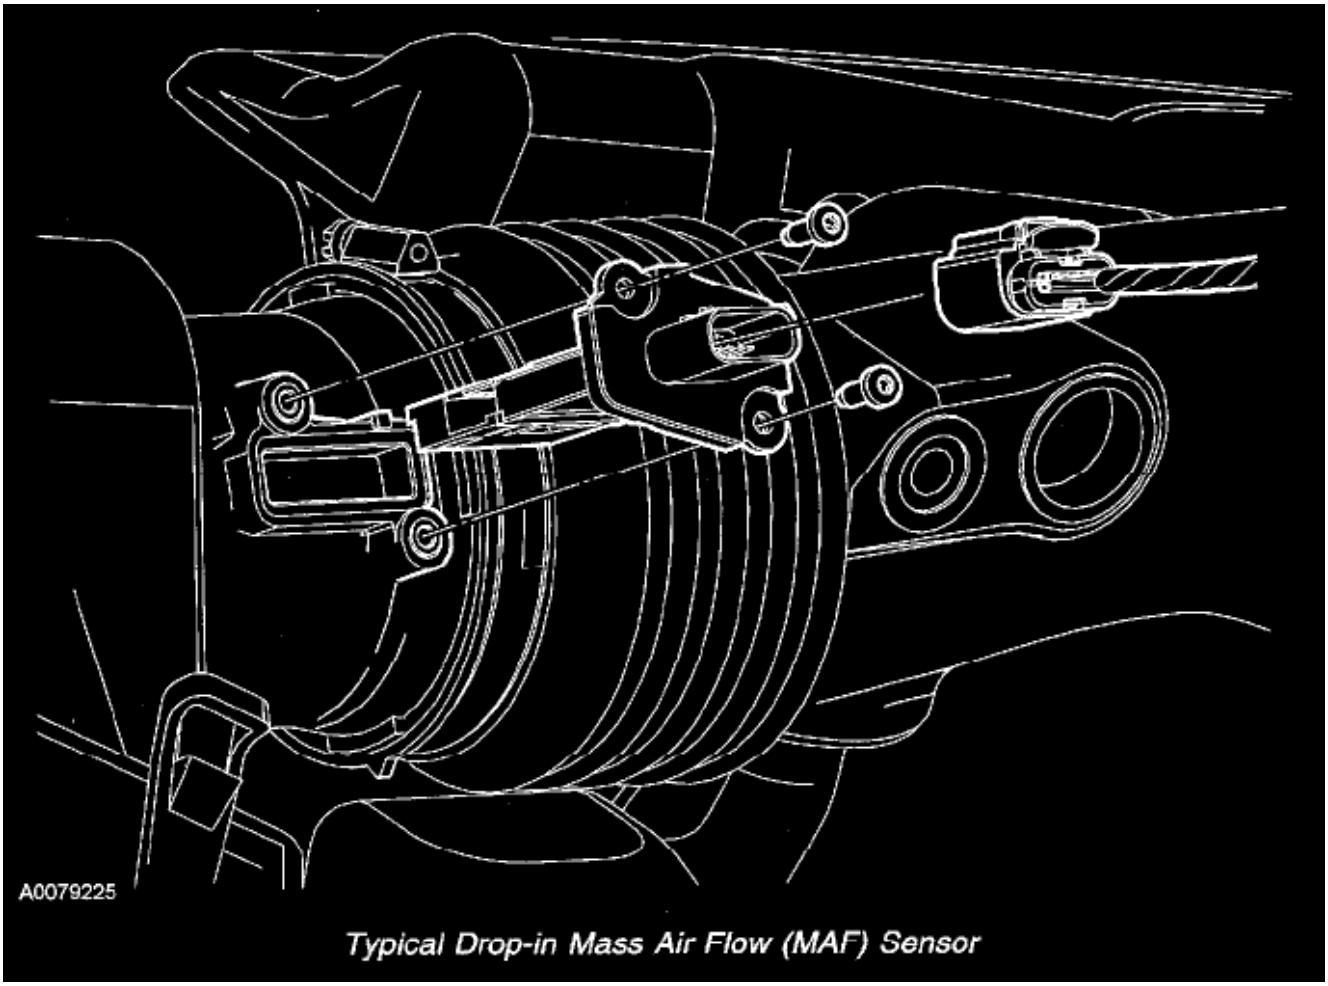
MASS AIR FLOW (MAF) SENSOR

Diagram Of Air Flow Through Throttle Body Contacting MAF Sensor Hot And Cold Wire (and IAT Sensor Wire Where Applicable) Terminals

Typical Mass Air Flow (MAF) Sensor

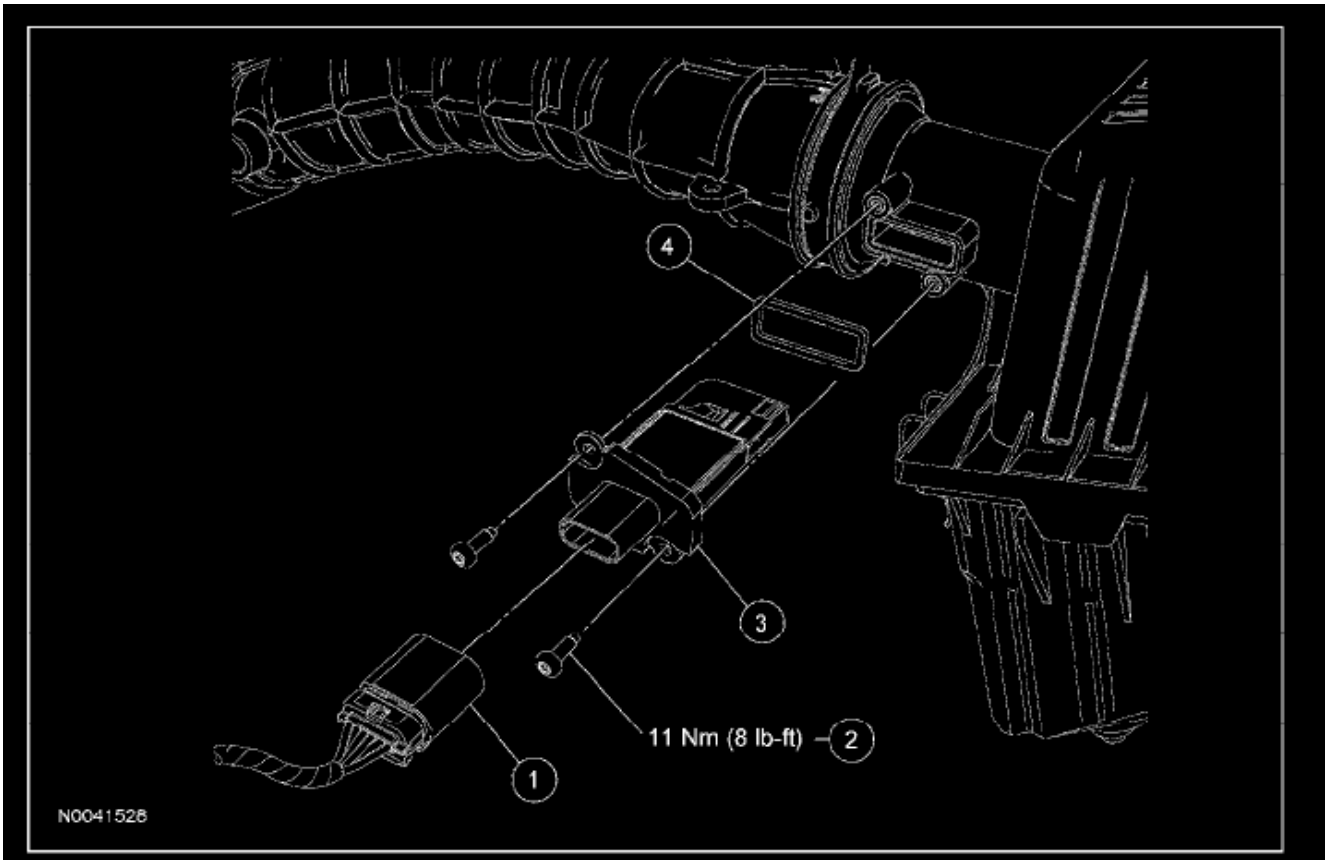


Typical Drop-in Mass Air Flow (MAF) Sensor

Typical Drop-in Mass Air Flow (MAF) Sensor

The MAF sensor uses a hot wire sensing element to measure the amount of air entering the engine. Air passing over the hot wire causes it to cool. This hot wire is maintained at 200°C (392°F) above the ambient temperature as measured by a constant cold wire. The current required to maintain the temperature of the hot wire is proportional to the mass air flow. The MAF sensor then outputs an analog voltage signal to the PCM proportional to the intake air mass. The PCM calculates the required fuel injector pulse width in order to provide the desired air/fuel ratio. This input is also used in determining transmission electronic pressure control (EPC), shift and torque converter clutch scheduling.

The MAF sensor is located between the air cleaner and the throttle body or inside the air cleaner assembly. Most MAF sensors have integrated bypass technology with an integrated intake air temperature (IAT) sensor. The hot wire electronic sensing element must be replaced as an assembly. Replacing only the element may change the air flow calibration.



Item	Part Number	Description

Air Flow Meter/Sensor: Service and Repair

MASS AIR FLOW (MAF) SENSOR

Removal and Installation

1. Disconnect the mass air flow (MAF) sensor electrical connector. 2. Remove the 2 bolts, the MAF sensor and discard the gasket.

- To install, tighten to 11 Nm (8 lb-ft).

3. CAUTION: Do not tamper with the mass air flow (MAF) sensing elements located in the airflow bypass. Tampering may result in

failure.

NOTE: The MAF sensor module and body are calibrated and installed as a unit.

To install, reverse the removal procedure. -

Install a new gasket.

Typical Fuel Rail Pressure Temperature (FRPT) Sensor

Fuel Pressure Sensor/Switch: Description and Operation

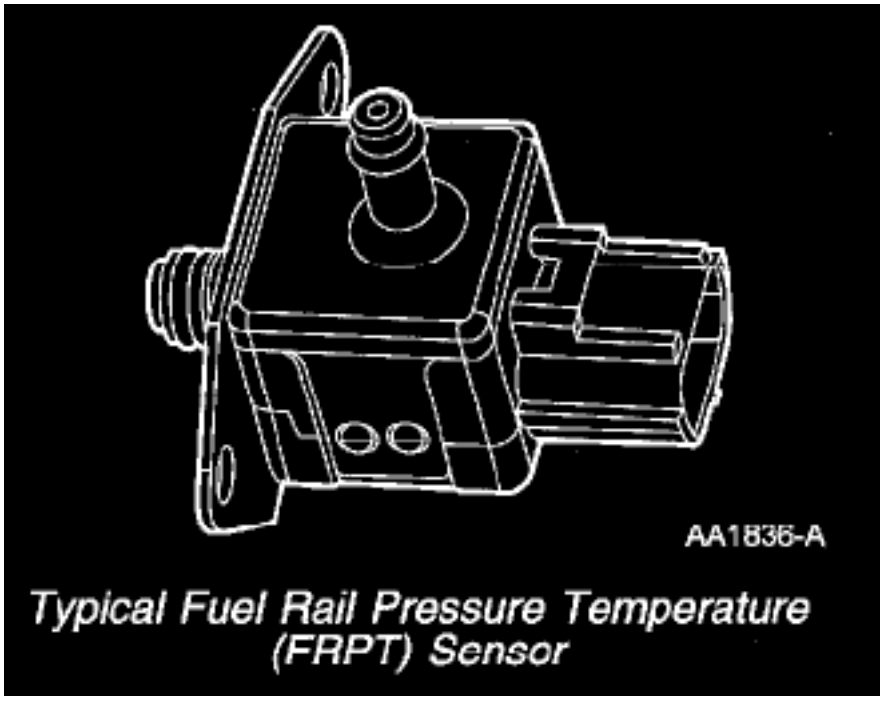
FUEL RAIL PRESSURE TEMPERATURE (FRPT) SENSOR

Typical Fuel Rail Pressure Temperature (FRPT) Sensor

The FRPT sensor measures the pressure and temperature of the fuel in the fuel rail and sends these signals to the PCM. The sensor uses the intake manifold vacuum as a reference to determine the pressure difference between the fuel rail and the intake manifold. The relationship between fuel pressure and fuel temperature is used to determine the possible presence of fuel vapor in the fuel rail.

The temperature sensing portion of the FRPT sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of the thermistor decreases as the temperature increases, and the resistance increases as the temperature decreases. The varying resistance changes the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Both the pressure and temperature signals are used to control the speed of the fuel pump. The speed of the fuel pump sustains fuel rail pressure which preserves fuel in its liquid state. The dynamic range of the fuel injectors increase because of the higher rail pressure, which allows the injector pulse width to decrease.



Fuel Temperature Sensor: Description and Operation

FUEL RAIL PRESSURE TEMPERATURE (FRPT) SENSOR

Typical Fuel Rail Pressure Temperature (FRPT) Sensor

The FRPT sensor measures the pressure and temperature of the fuel in the fuel rail and sends these signals to the PCM. The sensor uses the intake manifold vacuum as a reference to determine the pressure difference between the fuel rail and the intake manifold. The relationship between fuel pressure and fuel temperature is used to determine the possible presence of fuel vapor in the fuel rail.

The temperature sensing portion of the FRPT sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of the thermistor decreases as the temperature increases, and the resistance increases as the temperature decreases. The varying resistance changes the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Both the pressure and temperature signals are used to control the speed of the fuel pump. The speed of the fuel pump sustains fuel rail pressure which preserves fuel in its liquid state. The dynamic range of the fuel injectors increase because of the higher rail pressure, which allows the injector pulse width to decrease.

Inertia Fuel Shutoff Switch: Description and Operation

INERTIA FUEL SHUTOFF (IFS) SWITCH

Typical Inertia Fuel Shutoff (IFS) Switch

The IFS switch is used in conjunction with the electric fuel pump. The purpose of the IFS switch is to shutoff the fuel pump if a collision occurs. It consists of a steel ball held in place by a magnet. When a sharp impact occurs, the ball breaks loose from the magnet, rolls up a conical ramp and strikes a target plate which opens the electrical contacts of the switch and shuts off the electric fuel pump. Once the switch is open, it must be manually reset before restarting the vehicle. Refer to the Owner's Literature, Roadside Emergencies for the location of the IFS switch.

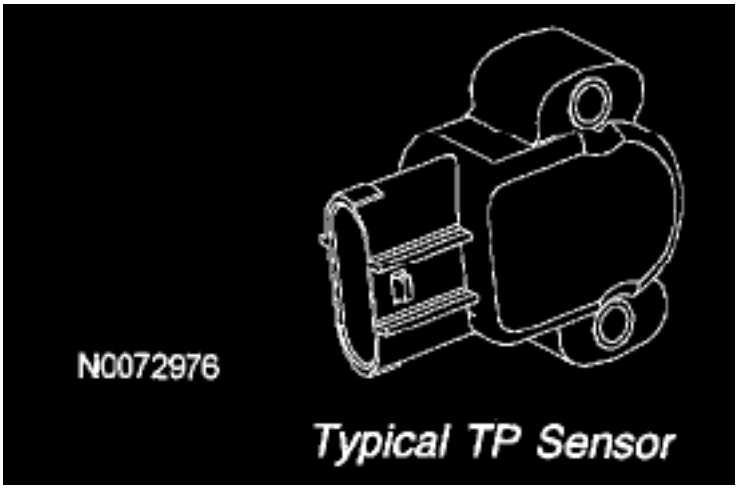
C1189



Throttle Position Sensor: Description and Operation

Electronic Throttle Body (ETB) Throttle Position Sensor

The ETB throttle position sensor has 2 signal circuits in the sensor for redundancy. The redundant ETB throttle position signals are required for increased monitoring. The first ETB throttle position sensor signal (TP1) has a negative slope (increasing angle, decreasing voltage) and the second signal (TP2) has a positive slope (increasing angle, increasing voltage). The 2 ETB throttle position sensor signals make sure the PCM receives a correct input even if 1 signal has a concern. There is 1 reference voltage circuit and 1 signal return circuit for the sensor. The reference voltage circuit and the signal return circuit is shared with the reference voltage circuits and signal return circuits used by the APP sensor.

Throttle Position (TP) Sensor

Typical TP Sensor

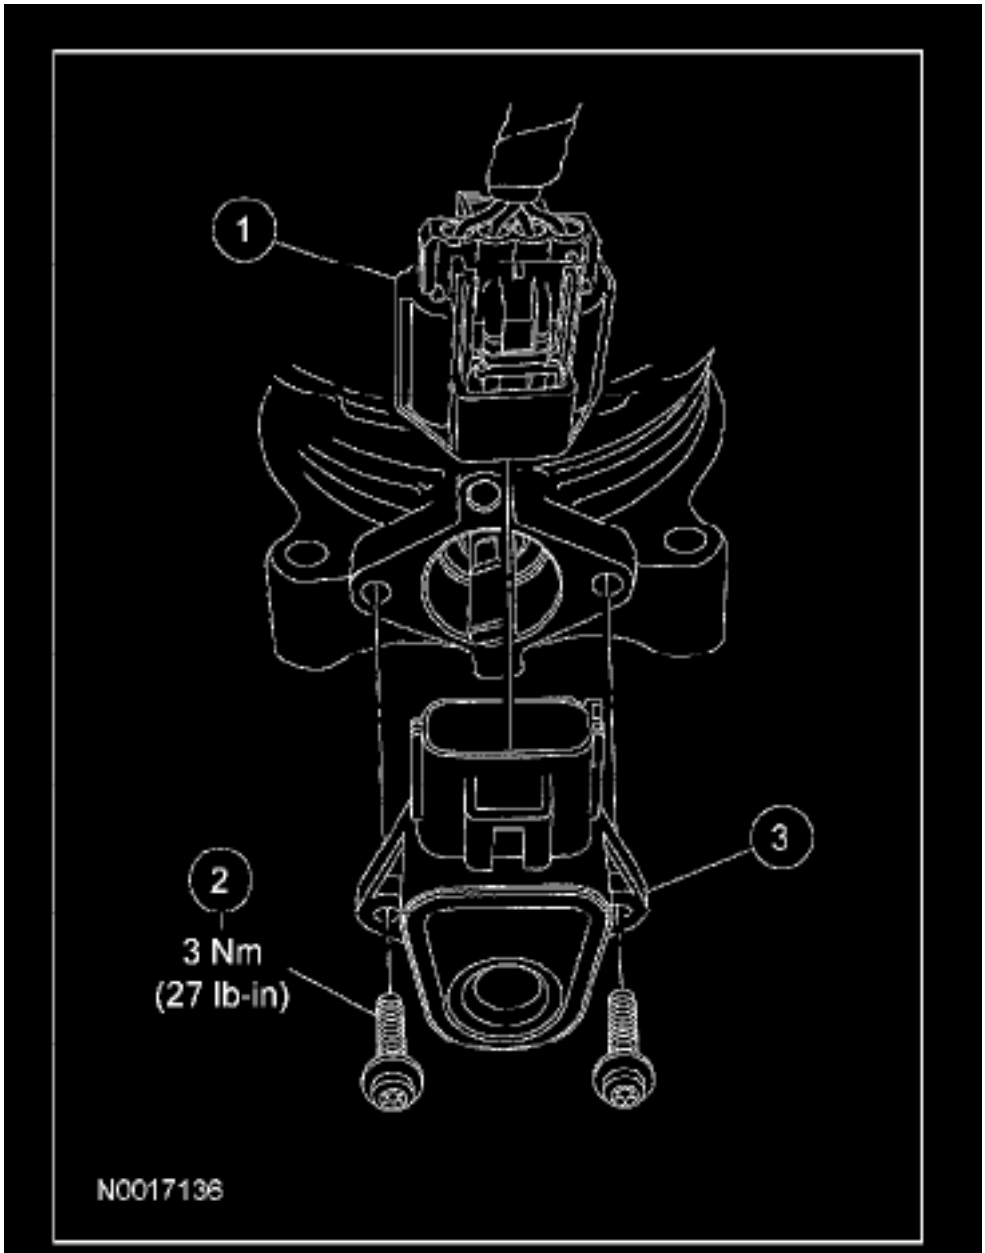
The TP sensor is a rotary potentiometer sensor that provides a signal to the PCM that is linearly proportional to the throttle plate/shaft position. The sensor housing has a 3-blade electrical connector that may be gold plated. The gold plating increases the corrosion resistance on the terminals and increases the connector durability. The TP sensor is mounted on the throttle body. As the TP sensor is rotated by the throttle shaft, 4 operating conditions are determined by the PCM from the TP. The operating conditions are: -

closed throttle (includes idle or deceleration)

- part throttle (includes cruise or moderate acceleration)

- wide open throttle (includes maximum acceleration or de-choke on crank)

- throttle angle rate



Item	Part Number	Description
1	14A464	Throttle position (TP) sensor electrical connector (part of 12B637)
2	W707535	TP sensor screw (2 required)
3	9E928	TP sensor

Throttle Position Sensor: Service and Repair

THROTTLE POSITION (TP) SENSOR

Removal and Installation

1. Disconnect the throttle position (TP) sensor electrical connector.

2. CAUTION: Failure to remove the throttle position (TP) sensor screws in the following manner will result in damage to the screws. First,

loosen the screws 1 to 2 full turns using a hand tool, and then use a suitable high-speed driver to complete the removal.

Remove and discard the 2 bolts and the TP sensor. -

To install, tighten to 3 Nm (27 lb-in).

3. CAUTION: Do not use a high-speed driver to install the new screws or damage to the throttle position (TP) sensor may occur.

NOTE: -

Do not reuse the TP sensor and screws. A new TP sensor and screws must be installed.

- Failure to install the TP sensor in this manner may result in excessive idle speeds. Slide the rotary tangs into position over the throttle shaft blade, then rotate the TP sensor.

To install, reverse the removal procedure. -

Install a new TP sensor and screws.

Throttle Body (TB) Cover

10	9E936	TB gasket

Throttle Body (TB)

Removal and Installation

1. Remove the air cleaner outlet pipe. 2. Remove the bolt and the throttle body (TB) cover. 3. Disconnect the throttle position (TP) sensor electrical connector. 4. Disconnect the accelerator cable, the speed control cable and the TB return spring. 5. Remove the 3 bolts, the stud bolt and the TB.

- Discard the TB gasket.

- To install, tighten to 10 Nm (89 lb-in).

6. If servicing the TB, remove the TP sensor.

7. NOTE: Clean all TB sealing surfaces and install a new TB gasket.

To install, reverse the removal procedure.

Throttle Cable/Linkage: Initial Inspection and Diagnostic Overview

Principles of Operation

PRINCIPLES OF OPERATION

The acceleration control allows the operator to control the vehicle speed. The throttle is controlled by the accelerator cable which is attached to the accelerator pedal. As the operator presses on the accelerator pedal, the accelerator pedal pulls on the accelerator cable which opens the throttle.

Inspection and Verification

INSPECTION AND VERIFICATION

1. Verify the customer's concern by operating the acceleration control system to duplicate the condition. 2. Inspect to determine if any of the following mechanical concerns apply.

VISUAL INSPECTION CHART

Mechanical -

Damaged accelerator pedal and shaft

- Damaged linkage

- Damaged accelerator cable

- High engine idle speed

- Damaged throttle body (TB)

3. If the inspection reveals an obvious concern that can be readily identified, repair it as required. 4. If the concern remains after the inspection, determine the symptom(s) and go to the Symptom Chart. See: Accelerator Pedal/Testing and

Inspection/Symptom Related Diagnostic Procedures

Symptom Chart

Condition	Possible Sources	Action
• Excessive effort is needed to depress the accelerator pedal and shaft	• Accelerator cable binding • Worn or damaged throttle body (TB)	• INSTALL a new accelerator cable. • INSTALL a new throttle body.
• The accelerator pedal and shaft feels rough or raspy	• Frayed or binding accelerator cable • Worn or damaged TB	• INSTALL a new accelerator cable. • INSTALL a new throttle body.
• The accelerator pedal and shaft binds or sticks	• Kinked accelerator cable • Foreign material caught in accelerator pedal linkage • Worn or damaged TB	• INSTALL a new accelerator cable. • CHECK the accelerator pedal linkage. • INSTALL a new TB.

Symptom Chart (Continued)

Condition	Possible Sources	Action
• The engine idle speed is high	• Kinked accelerator cable • Foreign material caught in accelerator pedal linkage • Accelerator pedal caught under mispositioned floor mat • Incorrect engine idle speed	• INSTALL a new accelerator cable. • CHECK the accelerator pedal linkage. • REFER to Computers and Control Systems for diagnosis and testing of the idle control system.

Throttle Position Sensor: Description and Operation

Electronic Throttle Body (ETB) Throttle Position Sensor

The ETB throttle position sensor has 2 signal circuits in the sensor for redundancy. The redundant ETB throttle position signals are required for increased monitoring. The first ETB throttle position sensor signal (TP1) has a negative slope (increasing angle, decreasing voltage) and the second signal (TP2) has a positive slope (increasing angle, increasing voltage). The 2 ETB throttle position sensor signals make sure the PCM receives a correct input even if 1 signal has a concern. There is 1 reference voltage circuit and 1 signal return circuit for the sensor. The reference voltage circuit and the signal return circuit is shared with the reference voltage circuits and signal return circuits used by the APP sensor.

Throttle Position (TP) Sensor

Typical TP Sensor

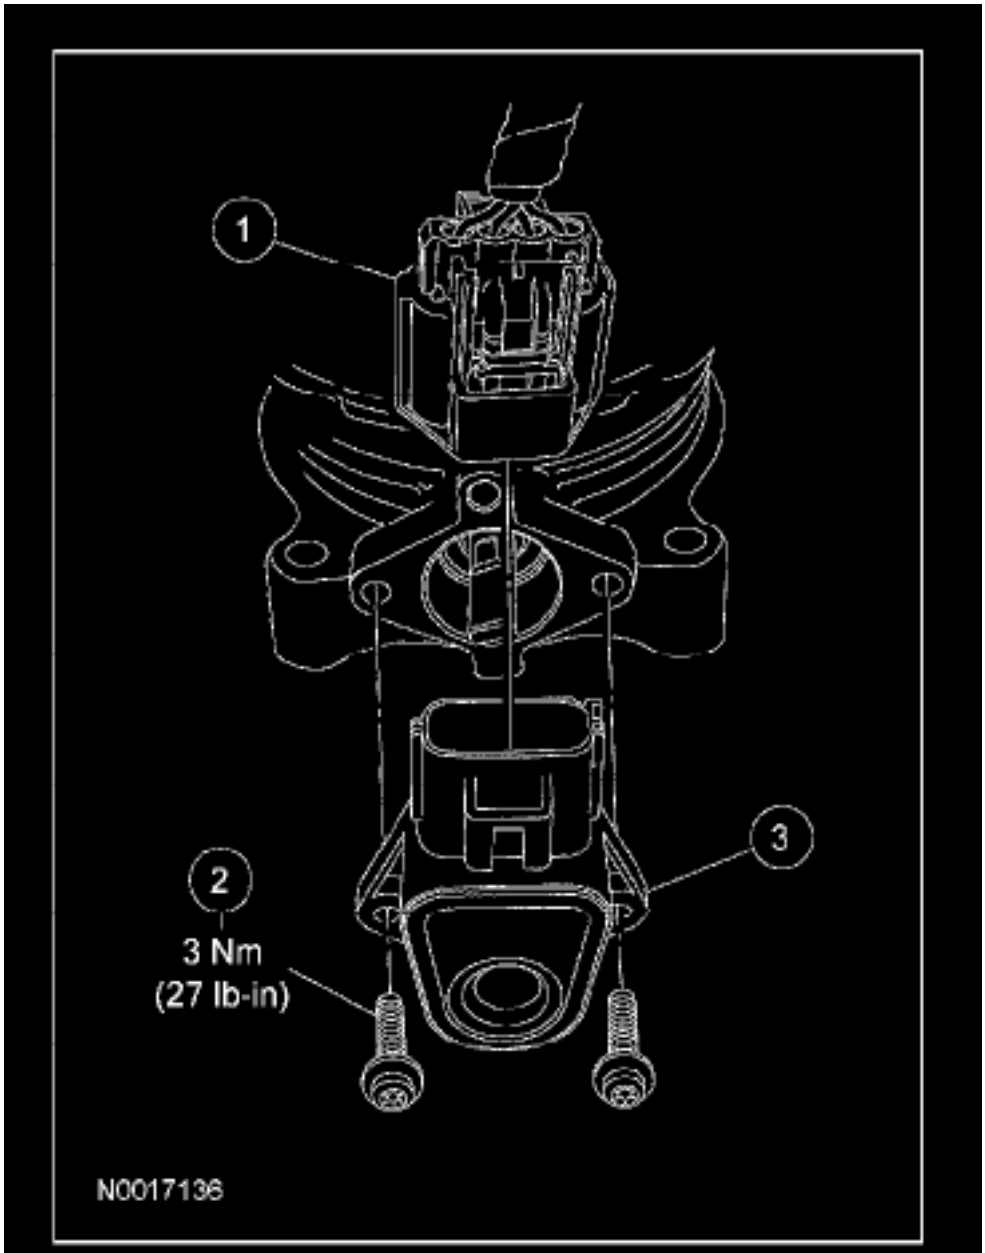
The TP sensor is a rotary potentiometer sensor that provides a signal to the PCM that is linearly proportional to the throttle plate/shaft position. The sensor housing has a 3-blade electrical connector that may be gold plated. The gold plating increases the corrosion resistance on the terminals and increases the connector durability. The TP sensor is mounted on the throttle body. As the TP sensor is rotated by the throttle shaft, 4 operating conditions are determined by the PCM from the TP. The operating conditions are: -

closed throttle (includes idle or deceleration)

- part throttle (includes cruise or moderate acceleration)

- wide open throttle (includes maximum acceleration or de-choke on crank)

- throttle angle rate



Item	Part Number	Description
1	14A464	Throttle position (TP) sensor electrical connector (part of 12B637)
2	W707535	TP sensor screw (2 required)
3	9E928	TP sensor

Throttle Position Sensor: Service and Repair

THROTTLE POSITION (TP) SENSOR

Removal and Installation

1. Disconnect the throttle position (TP) sensor electrical connector.

2. CAUTION: Failure to remove the throttle position (TP) sensor screws in the following manner will result in damage to the screws. First,

loosen the screws 1 to 2 full turns using a hand tool, and then use a suitable high-speed driver to complete the removal.

Remove and discard the 2 bolts and the TP sensor. -

To install, tighten to 3 Nm (27 lb-in).

3. CAUTION: Do not use a high-speed driver to install the new screws or damage to the throttle position (TP) sensor may occur.

NOTE: -

Do not reuse the TP sensor and screws. A new TP sensor and screws must be installed.

- Failure to install the TP sensor in this manner may result in excessive idle speeds. Slide the rotary tangs into position over the throttle shaft blade, then rotate the TP sensor.

To install, reverse the removal procedure. -

Install a new TP sensor and screws.

Variable Induction Control Actuator: Description and Operation

INTAKE MANIFOLD TUNING VALVE (IMTV)

WARNING: Substantial opening and closing torque is applied by this system. To prevent injury, be careful to keep fingers away from lever mechanisms when actuated.

The IMTV is a motorized actuated unit mounted directly to the intake manifold. The IMTV actuator controls a shutter device attached to the actuator shaft. There is no monitor input to the PCM with this system to indicate shutter position.

The motorized IMTV unit is not energized below approximately 2,600 RPM. The shutter is in the closed position not allowing airflow blend to occur in the intake manifold. The motorized unit is energized above approximately 2,600 RPM. The motorized unit is commanded on by the PCM initially at a 100 percent duty cycle to move the shutter to the open position, and then falling to approximately 50 percent to continue to hold the shutter open.

Typical Synchronizer Hall-Effect CMP Sensor

Typical Variable Reluctance CMP Sensor

Camshaft Position Sensor: Description and Operation

CAMSHAFT POSITION (CMP) SENSOR

Typical Synchronizer Hall-Effect CMP Sensor

Typical Variable Reluctance CMP Sensor

The CMP sensor detects the position of the camshaft. The CMP sensor identifies when piston number 1 is on its compression stroke. A signal is then sent to the PCM and used for synchronizing the sequential firing of the fuel injectors. Coil on plug (COP) ignition applications use the CMP signal to select the correct ignition coil to fire.

Vehicles with 2 CMP sensors are equipped with variable camshaft timing (VCT). They use the second sensor to identify the position of the camshaft on bank 2 as an input to the PCM.

There are 2 types of CMP sensors: the 3-pin connector Hall-effect type sensor and the 2-pin connector variable reluctance type sensor.

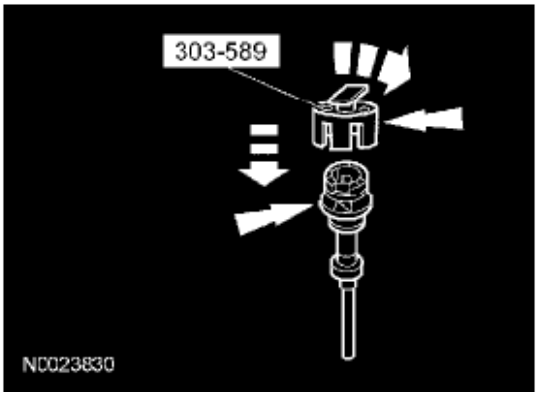
CAMSHAFT SYNCHRONIZER

Exploded View

Special Tool(s)

Special Tool(s)

ST2362-A	Synchronizer Alignment Gauge 303-589



Special Tool(s)

Removal

1. Disconnect the camshaft position (CMP) sensor electrical connector.

2. NOTE: Prior to the removal of the CMP sensor, note the position of the CMP sensor electrical connector. The installation procedure requires that

the electrical connector be located in the same position.

Remove the 2 bolts and the CMP sensor.

3. Remove the camshaft synchronizer bolt. 4. Remove the camshaft synchronizer. Inspect the O-ring seal and install a new O-ring seal if damaged.

Installation

1. CAUTION:

- After installation, do not loosen the synchronizer bolt and rotate the synchronizer assembly. The synchronizer assembly is not adjustable. Do not loosen the synchronizer bolt after the alignment tool has been removed in order to align the camshaft position (CMP) sensor electrical connector for any reason. If the electrical connector is not in the correct position, the synchronizer assembly must be removed. The alignment tool and the assembly must be reinstalled if the engine has not been rotated from top dead center (TDC) of the compression stroke on the No. 1 cylinder. Failure to follow this procedure will result in the fuel system being out of time with the engine, possibly causing engine damage.

- Do not turn the crankshaft or camshaft during the removal and installation procedure or the fuel system timing will be out of time with the engine, possibly causing engine damage.

- A special tool must be used during the installation of the new synchronizer assembly. Failure to follow this procedure will result in the fuel system being out of time with the engine, possibly causing engine damage.

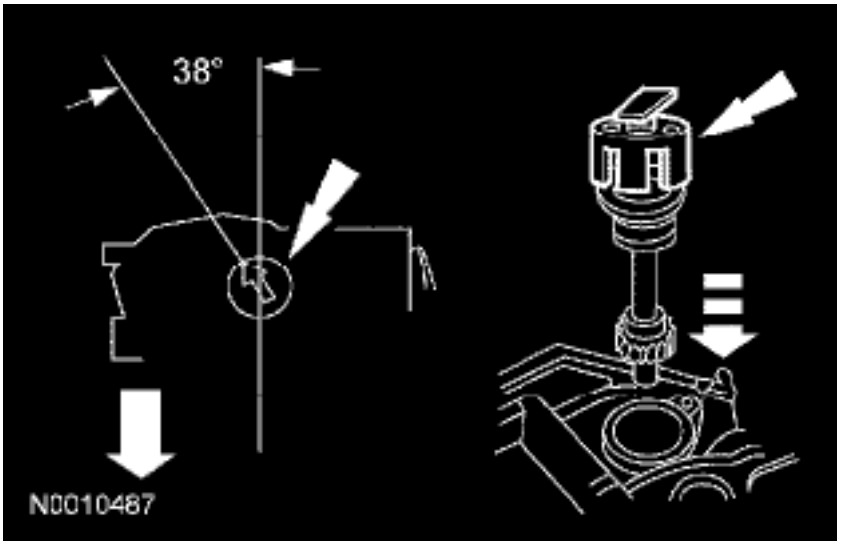
Install the special tool on the camshaft synchronizer by rotating the tool until it engages the notch in the camshaft synchronizer housing and the armature.

2. CAUTION: It is very important to coat the gear on the camshaft synchronizer with engine oil prior to installation. Failure to do so may

result in gear failure.

NOTE: During installation, the arrow on the special tool will rotate clockwise until the oil pump intermediate shaft and the camshaft gear engages.

Install the camshaft synchronizer housing assembly so the arrow on the special tool is 38 degrees from the centerline of the engine.



3. Install the camshaft synchronizer housing bolt.

- Tighten to 30 Nm (22 lb-ft).

4. Position the CMP sensor and install the 2 bolts.

- Tighten to 3 Nm (27 lb-in).

5. Connect the CMP sensor electrical connector.

Crankshaft Position Sensor: Description and Operation

CRANKSHAFT POSITION (CKP) SENSOR

Typical Crankshaft Position (CKP) Sensor

The CKP sensor is a magnetic transducer mounted on the engine block adjacent to a pulse wheel located on the crankshaft. By monitoring the crankshaft mounted pulse wheel, the CKP is the primary sensor for ignition information to the PCM. The pulse wheel has a total of 35 teeth spaced 10 degrees apart with one empty space for a missing tooth. The 6.8L 10-cylinder pulse wheel has 39 teeth spaced 9 degrees apart and one 9 degree empty space for a missing tooth. By monitoring the pulse wheel, the CKP sensor signal indicates crankshaft position and speed information to the PCM. By monitoring the missing tooth, the CKP sensor is also able to identify piston travel in order to synchronize the ignition system and provide a way of tracking the angular position of the crankshaft relative to a fixed reference for the CKP sensor configuration. The PCM also uses the CKP signal to determine if a misfire has occurred by measuring rapid decelerations between teeth.

Removal and Installation

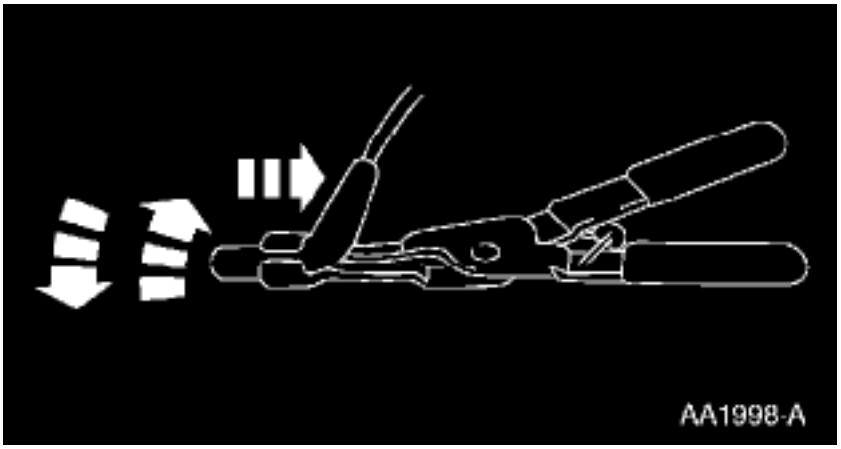
CAUTION: Spark plug wires must be connected correctly. Failure to follow this instruction may result in poor engine performance.

1. CAUTION: Do not pull on the spark plug wire as it may separate from the spark plug wire connector inside the spark plug wire boot.

Use the Spark Plug Wire Remover to grasp and twist the spark plug wire boot back and forth on the spark plug insulator to release the connectors.



2. Disconnect the spark plug wires from the ignition coil by twisting while pulling upward. 3. Open the spark plug wire separators and remove the spark plug wires.

4. CAUTION: Correct installation of the spark plug wires is critical to vehicle operation. If one spark plug wire is not correctly installed on

the spark plug or ignition coil, both spark plugs connected to that segment of the ignition coil may not fire under load.

To install, reverse the removal procedure. -

Use a small, clean tool to coat the entire interior surface of the boots with silicone brake caliper grease.

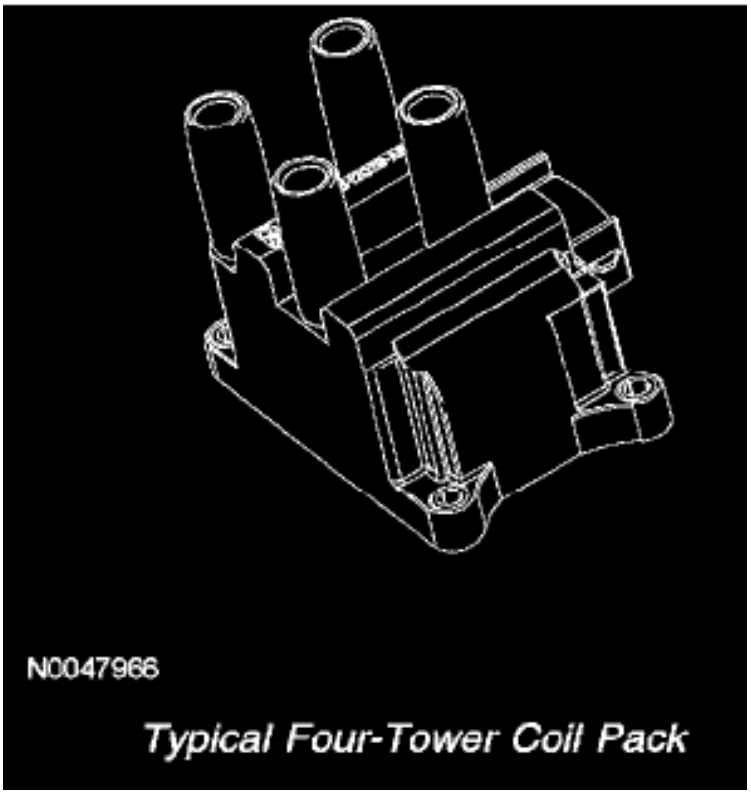
Typical Coil On Plug (COP)



Typical Four-Tower Coil Pack

Ignition Coil: Description and Operation

Coil On Plug (COP)

Typical Coil On Plug (COP)

The COP ignition operates similar to a standard coil pack ignition except each plug has one coil per plug. The COP has 3 different modes of operation: engine crank, engine running, and CMP failure mode effects management (FMEM).

Coil Pack

Typical Four-Tower Coil Pack

Typical Six-Tower Coil Pack

The PCM provides a grounding switch for the coil primary circuit. When the switch is closed, voltage is applied to the coil primary circuit. This creates a magnetic field around the primary coil. The PCM opens the switch, causing the magnetic field to collapse, inducing the high voltage in the secondary coil windings and firing the spark plug. The spark plugs are paired so that as one spark plug fires on the compression stroke, the other spark plug fires on the exhaust stroke. The next time the coil is fired the order is reversed. The next pair of spark plugs fire according to the engine firing order.

Coil packs come in 4-tower, 6-tower horizontal and series 5 6-tower models. Two adjacent coil towers share a common coil and are called a matched pair. For 6-tower coil pack (6 cylinder) applications, the matched pairs are 1 and 5, 2 and 6, and 3 and 4. For 4-tower coil pack (4 cylinder) applications, the matched pairs are 1 and 4, and 2 and 3.

When the coil is fired by the PCM, spark is delivered through the matched pair towers to their respective spark plugs. The spark plugs are fired simultaneously and are paired so that as one fires on the compression stroke, the other spark plug fires on the exhaust stroke. The next time the coil is fired, the situation is reversed. The next pair of spark plugs fire according to the engine firing order.

Typical Variable Reluctance CMP Sensor

Camshaft Position Sensor: Description and Operation

CAMSHAFT POSITION (CMP) SENSOR

Typical Synchronizer Hall-Effect CMP Sensor

Typical Variable Reluctance CMP Sensor

The CMP sensor detects the position of the camshaft. The CMP sensor identifies when piston number 1 is on its compression stroke. A signal is then sent to the PCM and used for synchronizing the sequential firing of the fuel injectors. Coil on plug (COP) ignition applications use the CMP signal to select the correct ignition coil to fire.

Vehicles with 2 CMP sensors are equipped with variable camshaft timing (VCT). They use the second sensor to identify the position of the camshaft on bank 2 as an input to the PCM.

There are 2 types of CMP sensors: the 3-pin connector Hall-effect type sensor and the 2-pin connector variable reluctance type sensor.

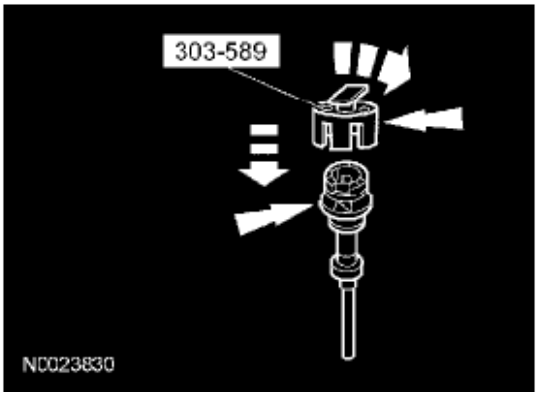
CAMSHAFT SYNCHRONIZER

Exploded View

Special Tool(s)

Special Tool(s)

ST2362-A	Synchronizer Alignment Gauge 303-589



Special Tool(s)

Removal

1. Disconnect the camshaft position (CMP) sensor electrical connector.

2. NOTE: Prior to the removal of the CMP sensor, note the position of the CMP sensor electrical connector. The installation procedure requires that

the electrical connector be located in the same position.

Remove the 2 bolts and the CMP sensor.

3. Remove the camshaft synchronizer bolt. 4. Remove the camshaft synchronizer. Inspect the O-ring seal and install a new O-ring seal if damaged.

Installation

1. CAUTION:

- After installation, do not loosen the synchronizer bolt and rotate the synchronizer assembly. The synchronizer assembly is not adjustable. Do not loosen the synchronizer bolt after the alignment tool has been removed in order to align the camshaft position (CMP) sensor electrical connector for any reason. If the electrical connector is not in the correct position, the synchronizer assembly must be removed. The alignment tool and the assembly must be reinstalled if the engine has not been rotated from top dead center (TDC) of the compression stroke on the No. 1 cylinder. Failure to follow this procedure will result in the fuel system being out of time with the engine, possibly causing engine damage.

- Do not turn the crankshaft or camshaft during the removal and installation procedure or the fuel system timing will be out of time with the engine, possibly causing engine damage.

- A special tool must be used during the installation of the new synchronizer assembly. Failure to follow this procedure will result in the fuel system being out of time with the engine, possibly causing engine damage.

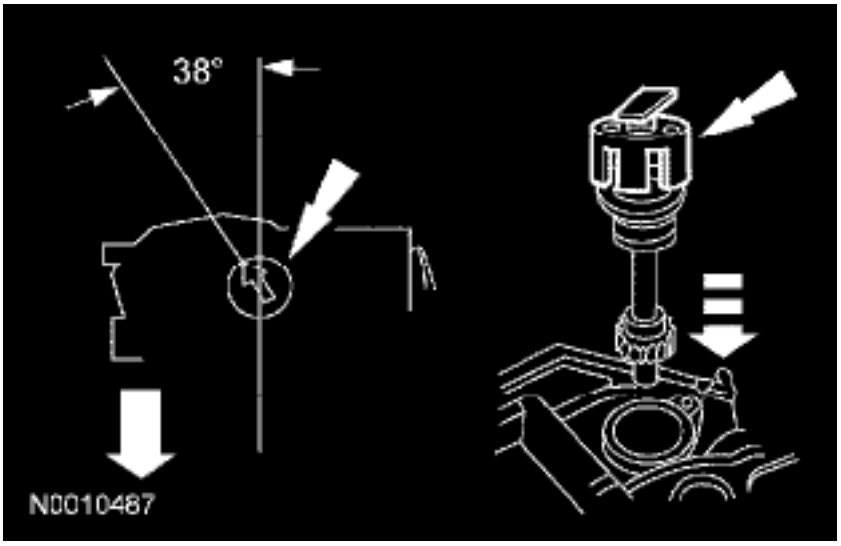
Install the special tool on the camshaft synchronizer by rotating the tool until it engages the notch in the camshaft synchronizer housing and the armature.

2. CAUTION: It is very important to coat the gear on the camshaft synchronizer with engine oil prior to installation. Failure to do so may

result in gear failure.

NOTE: During installation, the arrow on the special tool will rotate clockwise until the oil pump intermediate shaft and the camshaft gear engages.

Install the camshaft synchronizer housing assembly so the arrow on the special tool is 38 degrees from the centerline of the engine.



3. Install the camshaft synchronizer housing bolt.

- Tighten to 30 Nm (22 lb-ft).

4. Position the CMP sensor and install the 2 bolts.

- Tighten to 3 Nm (27 lb-in).

5. Connect the CMP sensor electrical connector.

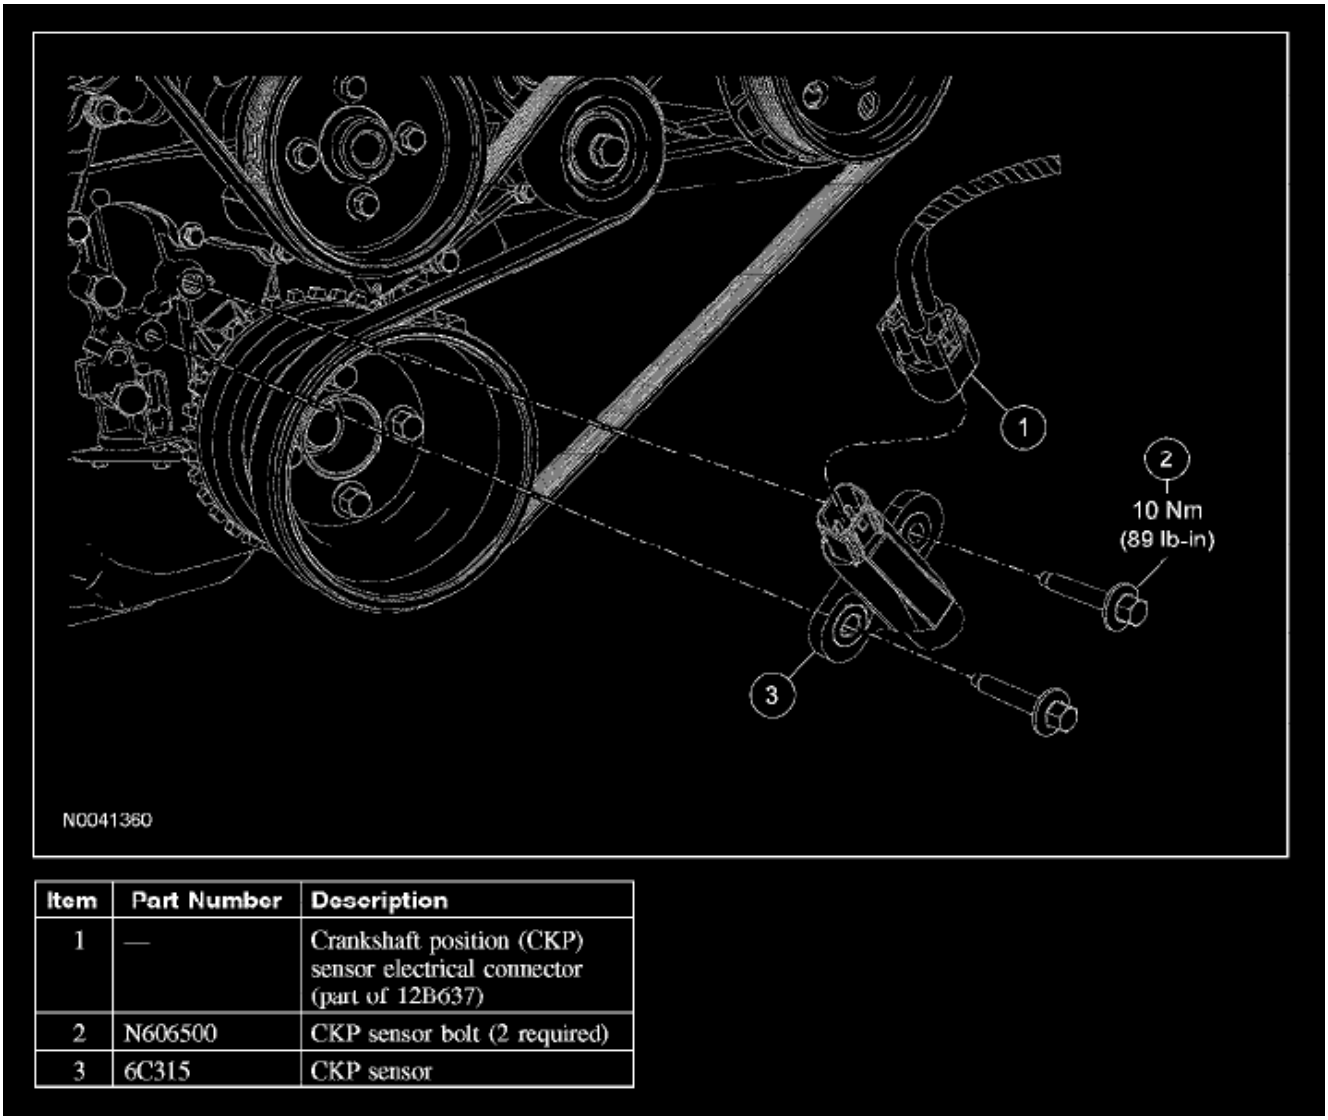
Crankshaft Position Sensor: Description and Operation

CRANKSHAFT POSITION (CKP) SENSOR

Typical Crankshaft Position (CKP) Sensor

The CKP sensor is a magnetic transducer mounted on the engine block adjacent to a pulse wheel located on the crankshaft. By monitoring the crankshaft mounted pulse wheel, the CKP is the primary sensor for ignition information to the PCM. The pulse wheel has a total of 35 teeth spaced 10 degrees apart with one empty space for a missing tooth. The 6.8L 10-cylinder pulse wheel has 39 teeth spaced 9 degrees apart and one 9 degree empty space for a missing tooth. By monitoring the pulse wheel, the CKP sensor signal indicates crankshaft position and speed information to the PCM. By monitoring the missing tooth, the CKP sensor is also able to identify piston travel in order to synchronize the ignition system and provide a way of tracking the angular position of the crankshaft relative to a fixed reference for the CKP sensor configuration. The PCM also uses the CKP signal to determine if a misfire has occurred by measuring rapid decelerations between teeth.



Item	Part Number	Description

Crankshaft Position Sensor: Service and Repair

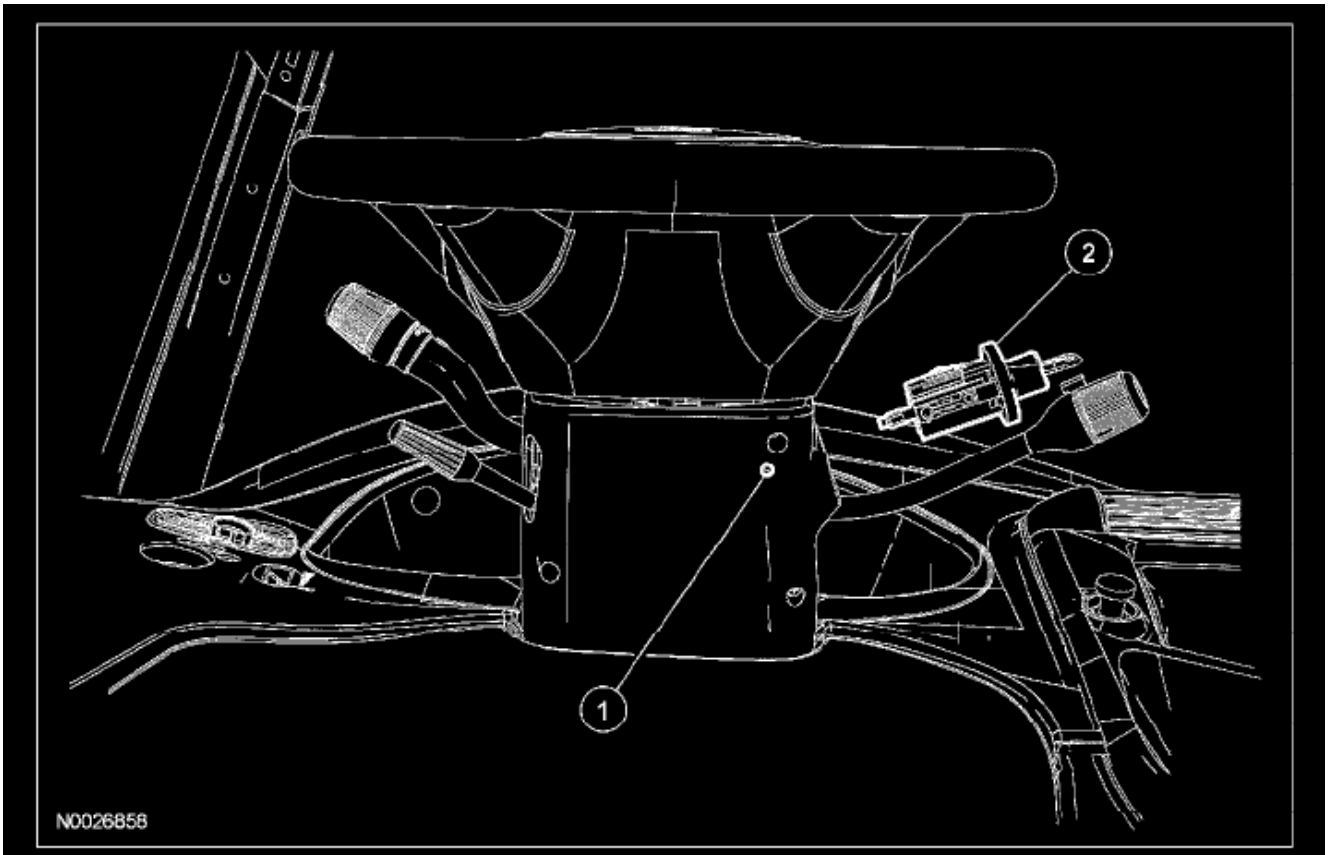
CRANKSHAFT POSITION (CKP) SENSOR

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. 2. Disconnect the crankshaft position (CKP) sensor electrical connector. 3. Remove the 2 bolts and the CKP sensor.

- To install, tighten to 10 Nm (89 lb-in).

4. To install, reverse the removal procedure.



Item	Part Number	Description
1	—	Ignition lock cylinder release hole (part of 3530)
2	11582	Ignition lock cylinder

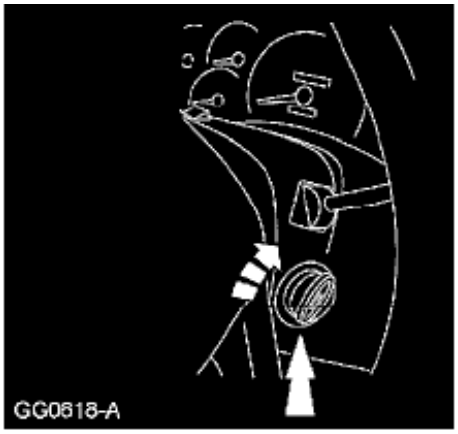
Ignition Switch Lock Cylinder: Service and Repair Ignition Lock Cylinder - Functional

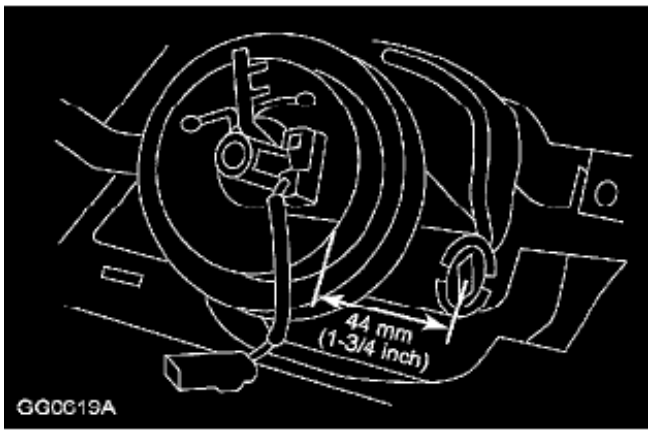
IGNITION LOCK CYLINDER - FUNCTIONAL

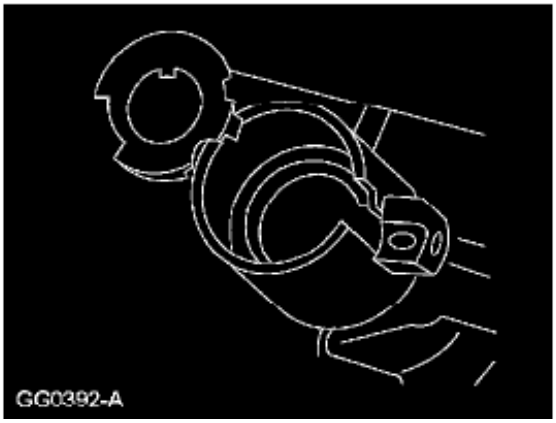
Removal and Installation

1. Disconnect the battery ground cable. 2. Insert the ignition key and turn to the RUN position. 3. Press the ignition lock cylinder release pin and remove the ignition lock cylinder. 4. To install, reverse the removal procedure.

- Verify ignition lock cylinder operation.







Ignition Switch Lock Cylinder: Service and Repair Ignition Lock Cylinder - Non Functional

IGNITION LOCK CYLINDER - NON FUNCTIONAL

Removal and Installation

1. NOTE: Make sure the front wheels are in the straight-ahead position.

Remove the steering wheel assembly.

2. Twist off the cap from the ignition lock cylinder.

3. NOTE: The lock cylinder is repaired by discarding the inoperative lock cylinder and building a new lock cylinder using the appropriate lock

repair package (F85Z-11582-AA). The lock repair package includes a detailed instruction sheet to build the new lock cylinder to the current key code of the vehicle.

Remove the ignition lock cylinder. -

Use a 1/8-inch diameter drill bit to drill out the lock cylinder retaining pin.

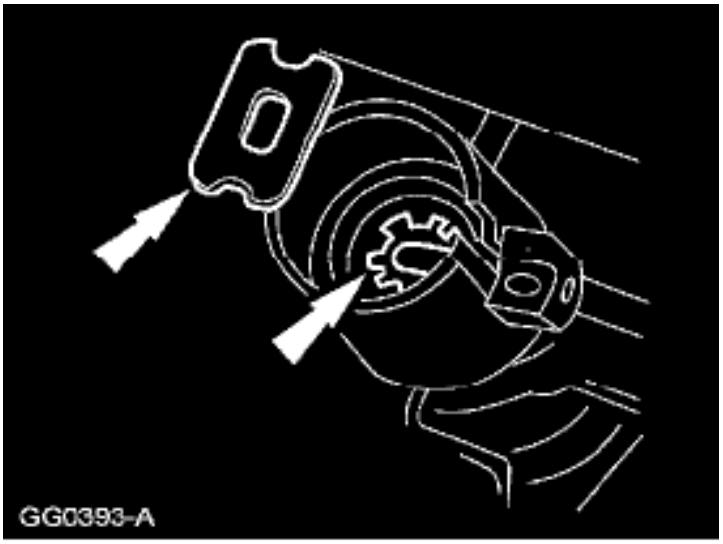
- Use a 3/8-inch drill bit to drill down the middle of the ignition lock key slot until the ignition lock cylinder breaks loose.

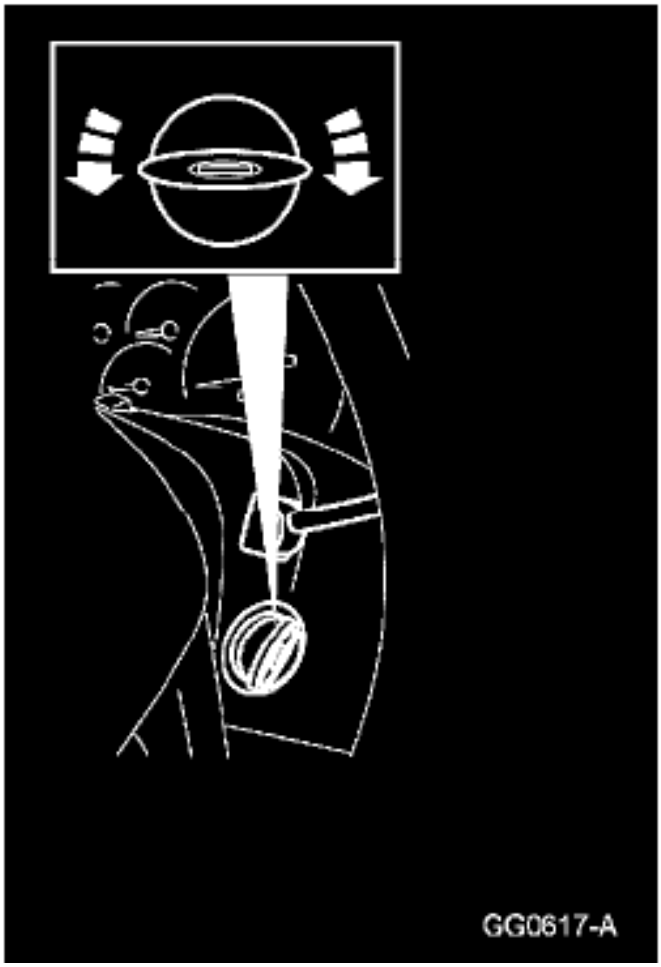
- Remove and discard the ignition lock cylinder and clean the drill shavings from the steering column.

4. Remove the bearing retainer.

5. Remove the bearing and gear.

- Thoroughly clean all drill shavings from the steering column and inspect it for damage.





6. To install, reverse the removal procedure.

- Install a new ignition lock cylinder.
- Verify ignition lock cylinder operation.

Spark Plug: Testing and Inspection

Spark Plug Inspection

1. Inspect the spark plug for a bridged gap.

^ Check for deposit build-up closing the gap between the electrodes. Deposits are caused by oil or carbon fouling.

^ Clean the spark plug.

2. Check for oil fouling.

^ Check for wet, black deposits on the insulator shell bore electrodes, caused by excessive oil entering the combustion chamber through worn rings and pistons, excessive valve-to-guide clearance or worn or loose bearings.

^ Correct the oil leak concern.

^ Install a new spark plug.

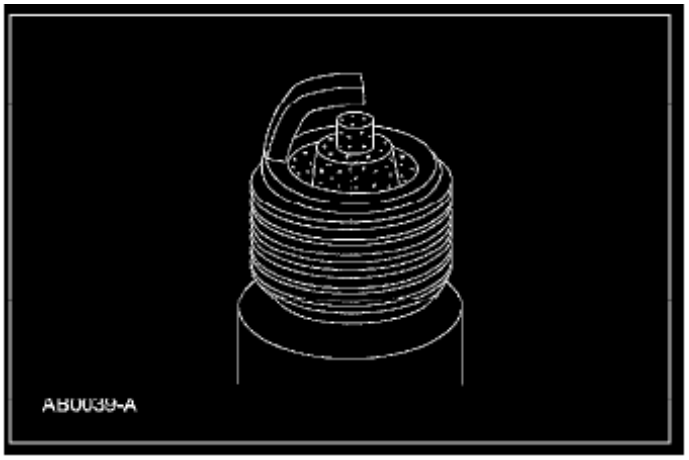
3. Inspect for carbon fouling. Look for black, dry, fluffy carbon deposits on the insulator tips, exposed shell surfaces and electrodes, caused by a

spark plug with an incorrect heat range, dirty air cleaner, too rich a fuel mixture or excessive idling.
^

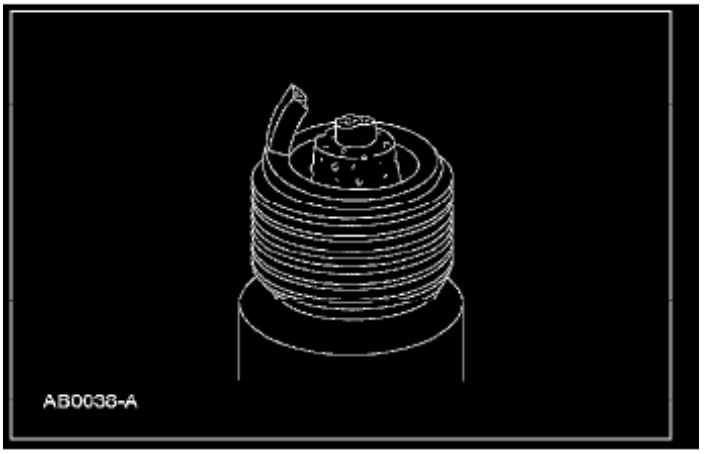
Install new spark plugs.

4. Inspect for normal burning.

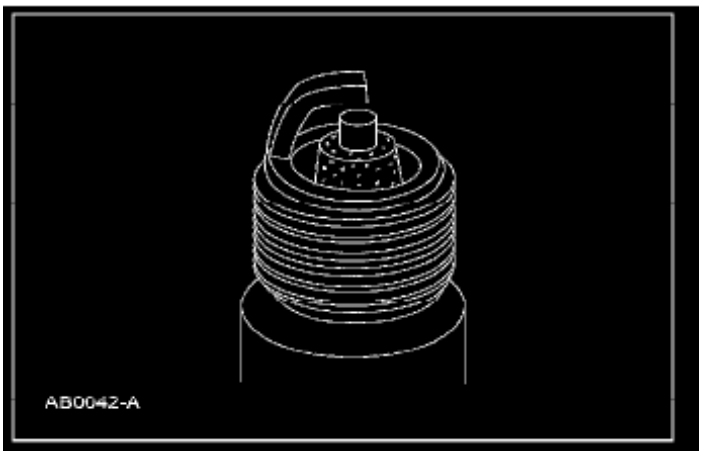
^ Check for light tan or gray deposits on the firing tip.



AB0039-A



AB0038-A



AB0042-A

5. Inspect for pre-ignition, identified by melted electrodes and a possibly damaged insulator. Metallic deposits on the insulator indicate engine

damage. This may be caused by incorrect ignition timing, wrong type of fuel or the unauthorized installation of a Heli-Coil(R) insert in place of the spark plug threads. ^

Install a new spark plug.

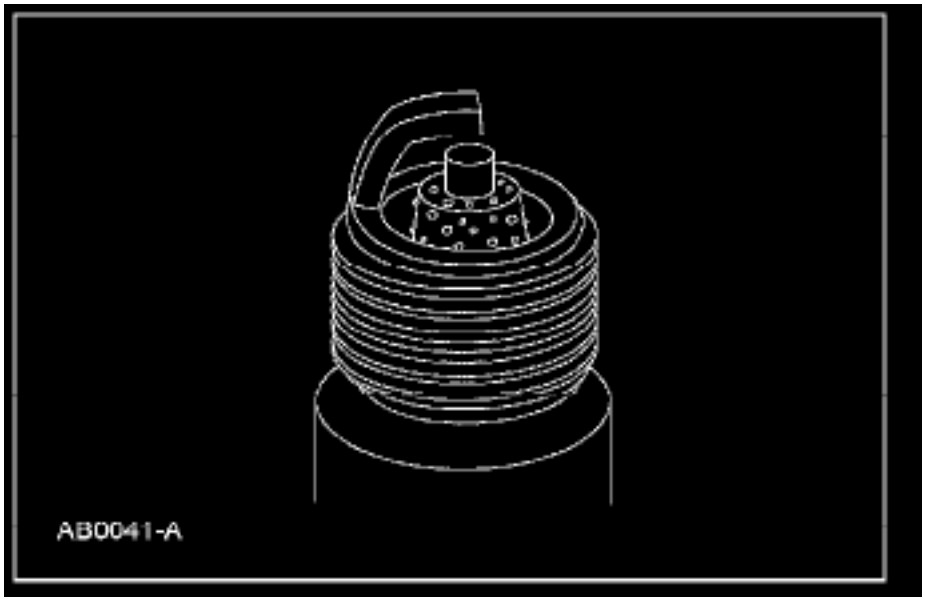
6. Inspect for overheating, identified by white or light gray spots and with a bluish-burnt appearance of electrodes. This is caused by engine

overheating, wrong type of fuel, loose spark plugs, spark plugs with an incorrect heat range, low fuel pump pressure or incorrect ignition timing. ^

Install a new spark plug.

7. Inspect for fused deposits, identified by melted or spotty deposits resembling bubbles or blisters. These are caused by sudden acceleration.

^ Install new spark plugs.



AB0041-A

Special Tool(s)

Special Tool(s)

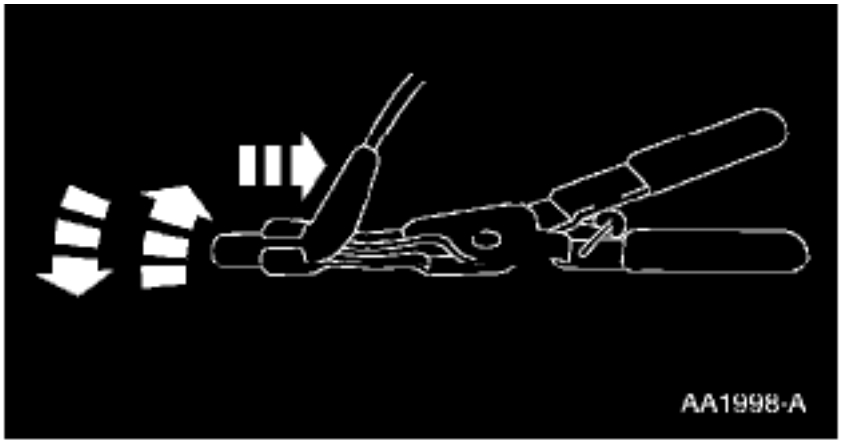
Removal and Installation

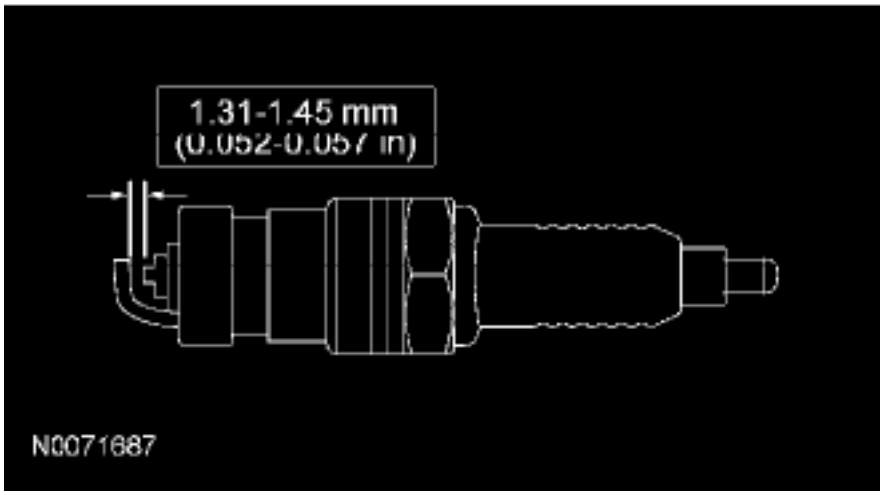
1. CAUTION:

- Spark plug wires must be connected correctly. Failure to follow this instruction may result in poor engine performance.

- Do not pull on the spark plug wire as it may separate from the spark plug wire connector inside the spark plug wire boot.

Use the Spark Plug Wire Remover to grasp and twist the spark plug wire boot back and forth on the spark plug insulator to release the connectors.





2. Loosen the spark plugs. 3. Remove any foreign material from the spark plug areas of the cylinder head with compressed air. 4. Remove the spark plugs.

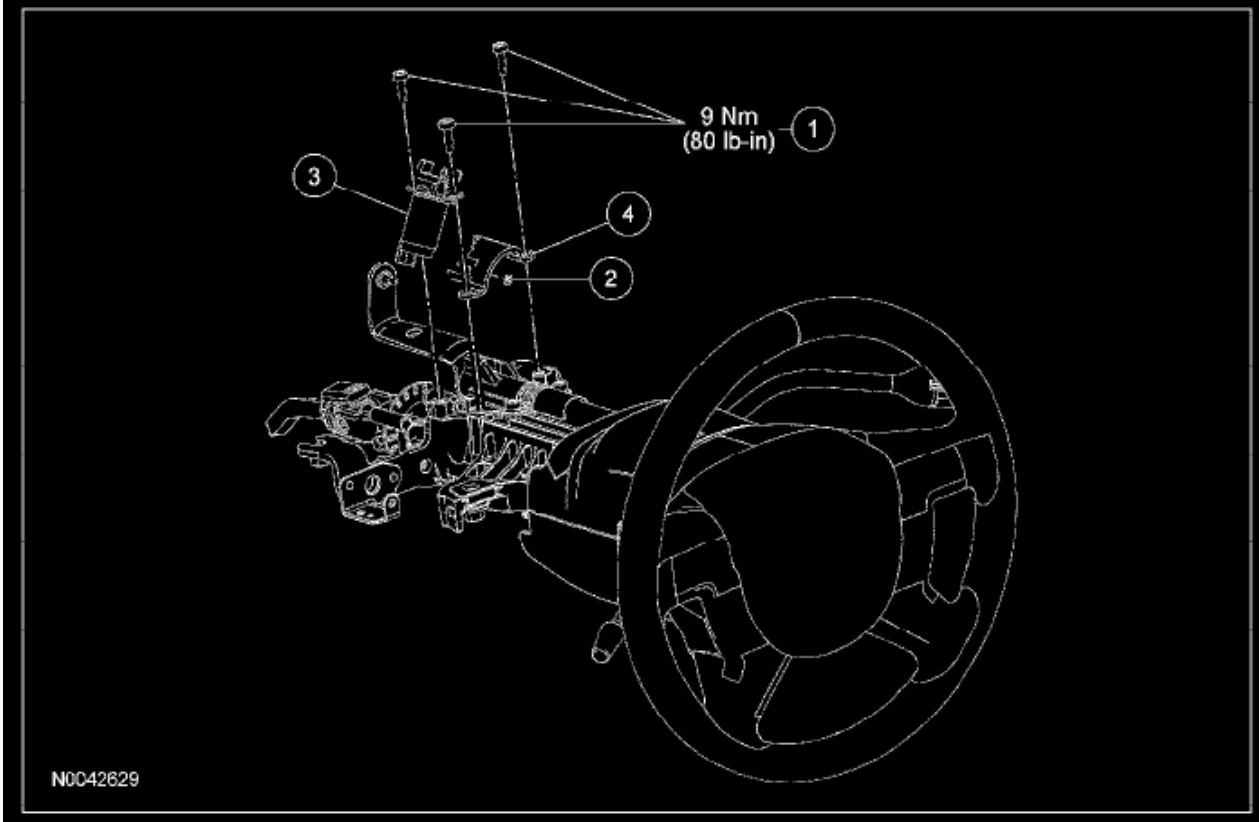
- To install, tighten to 15 Nm (11 lb-ft).

5. Inspect the spark plugs. 6. Adjust the spark plug gap as necessary.

7. To install, reverse the removal procedure.

- Use a small, clean tool to coat the entire interior surface of the boot with silicone brake caliper grease.

Brake Shift Interlock Actuator



Item	Part Number	Description
1	N806584-S	Brake shift interlock actuator bolts

Shift Solenoid: Service and Repair

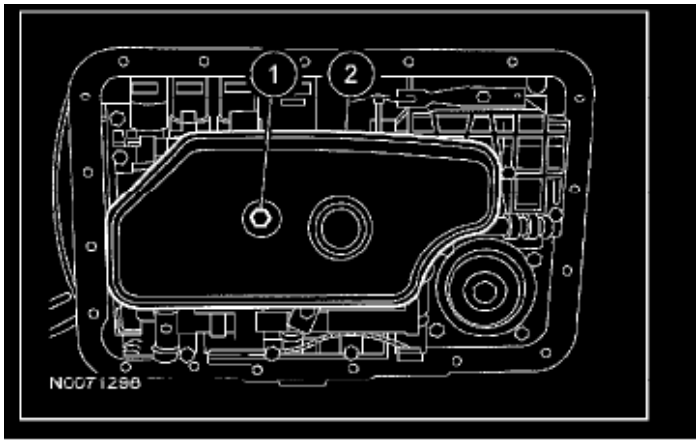
Solenoids - Shift, Torque Converter Clutch, Electronic Pressure Control

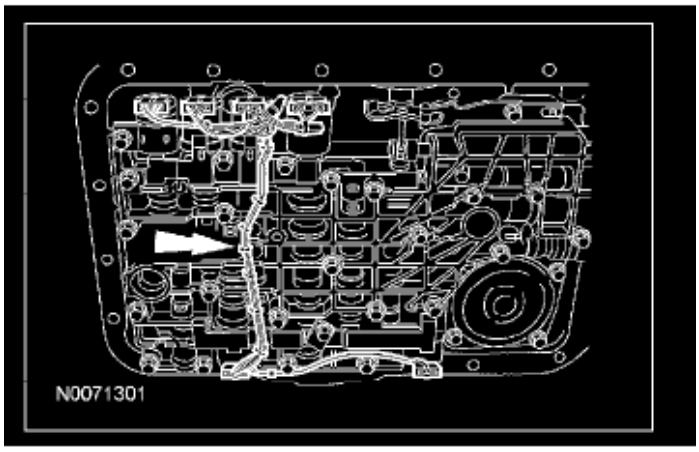
Removal

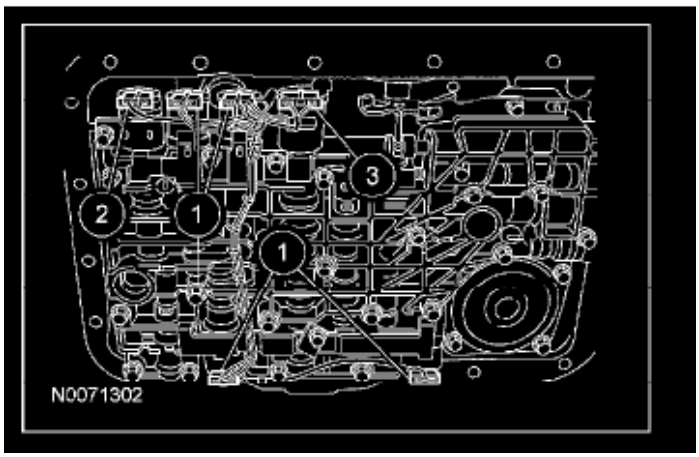
1. With the vehicle in NEUTRAL, position it on a hoist.

2. NOTE: If equipped, the transmission servo heat shield needs to be unclipped from the fluid pan rail and positioned aside for fluid pan removal.

If equipped, loosen the nut and position the heat shield aside.







3. Place a drain pan under the transmission fluid pan. 4. Drain the transmission fluid. 5. Remove the transmission fluid filter.

1 Remove the transmission fluid filter screw.

2 Remove the transmission fluid filter.

6. NOTE: Main control assembly does not need to be removed for solenoid service.

Remove wire loom guide and protector. ^

Carefully lift up on wire loom guide and protector and disengage the retaining pins from the solenoid clamps.

7. Disconnect the appropriate solenoid electrical connector.

1 Disconnect shift solenoids electrical connectors.

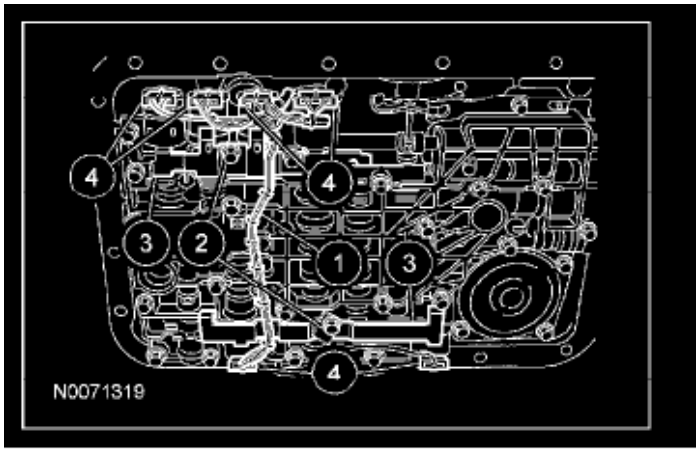
2 Disconnect the torque converter clutch (TCC) solenoid electrical connector.

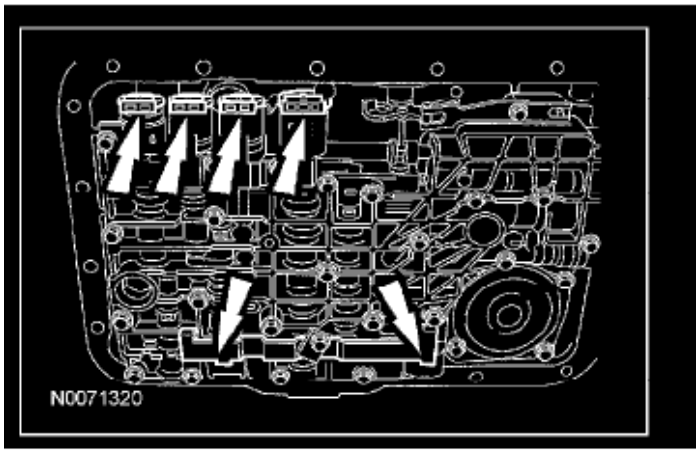
3 Disconnect the electronic pressure control (EPC) solenoid electrical connector.

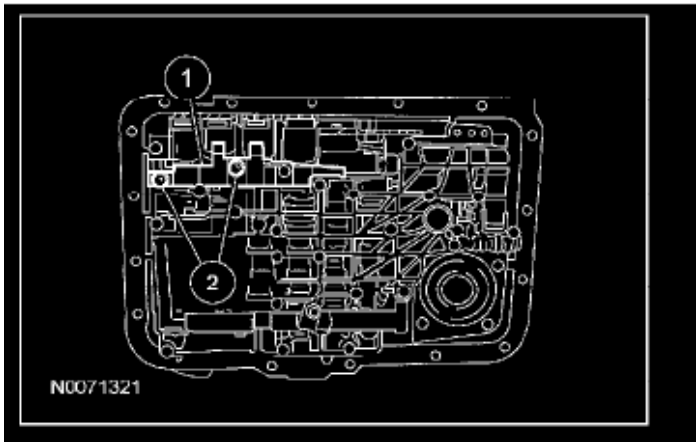
8. CAUTION: The torque converter clutch (TCC) solenoid and converter modulator valve may pop out of its bore. This may damage the

solenoid or converter modulator valve.

CAUTION: Shift solenoid (SSC) may pop out of its bore. This may damage the solenoid.







Remove the shift solenoids. 1

Remove the wire harness.

2 Remove the solenoid clamp screws.

3 Remove the solenoid clamp.

4 Remove the appropriate solenoid(s).

Installation

1. Install the new solenoid(s).

2. NOTE: The solenoid clamp must be installed in the torque converter clutch (TCC) and electronic pressure control (EPC) solenoid grooves, shift

solenoid pockets and the No. 204 plug.

Install the solenoid clamp. 1

Position the solenoid clamp on the main control valve body.

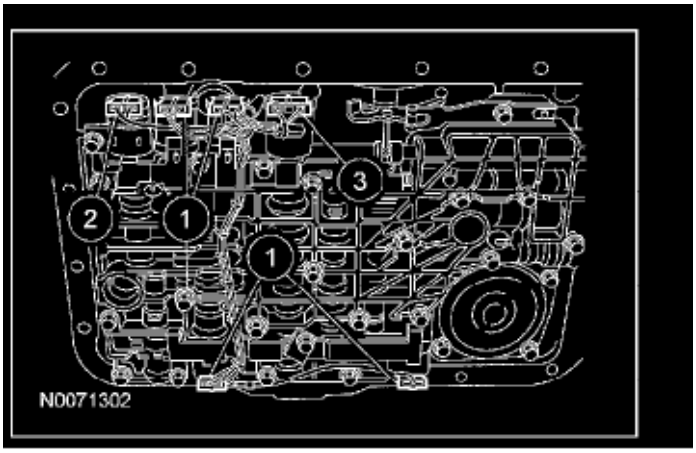
2 Install the solenoid clamp screws.

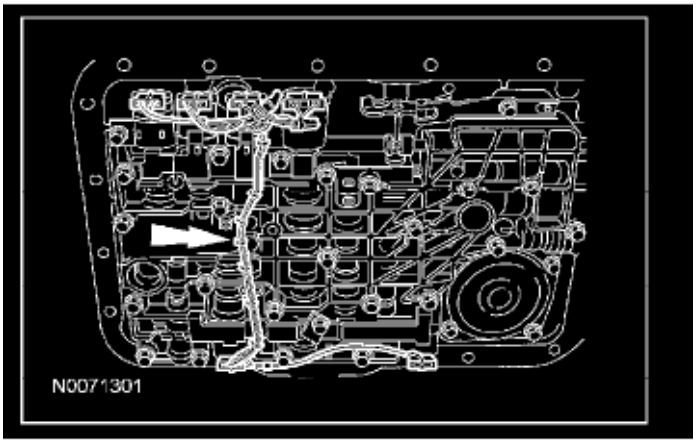
3. Connect the 6 solenoid electrical connectors.

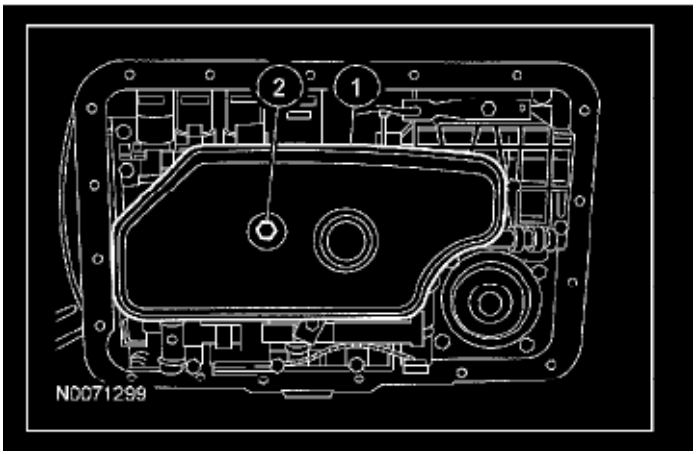
1 Connect shift solenoid SSA, SSB, SSC, SSD electrical connectors.

2 Connect the TCC solenoid electrical connector.

3 Connect the EPC solenoid electrical connector.







4. CAUTION: Excessive pressure may break the retaining pins.

Install the main control valve body wire loom. ^

Align the retaining pins to the holes in the solenoid clamps and gently press in the main control valve body wire loom guide and protector.

5. Install the transmission fluid filter.

1 Install the transmission fluid filter.

2 Install the transmission fluid filter screw. ^

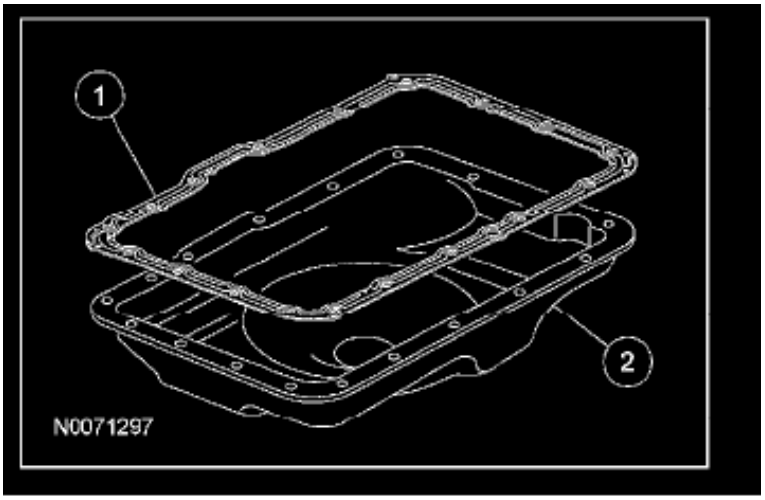
Tighten to 10 Nm (89 lb-inch).

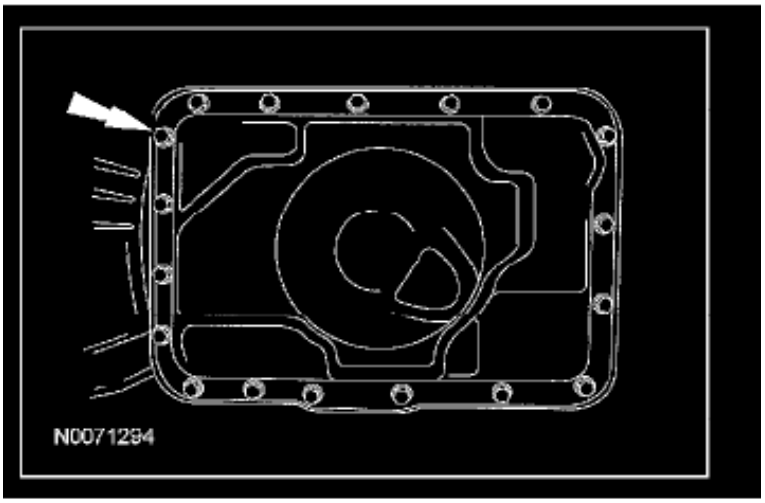
6. NOTE: The transmission fluid pan gasket is reusable. Clean and inspect for damage, if not damaged, the gasket should be reused.

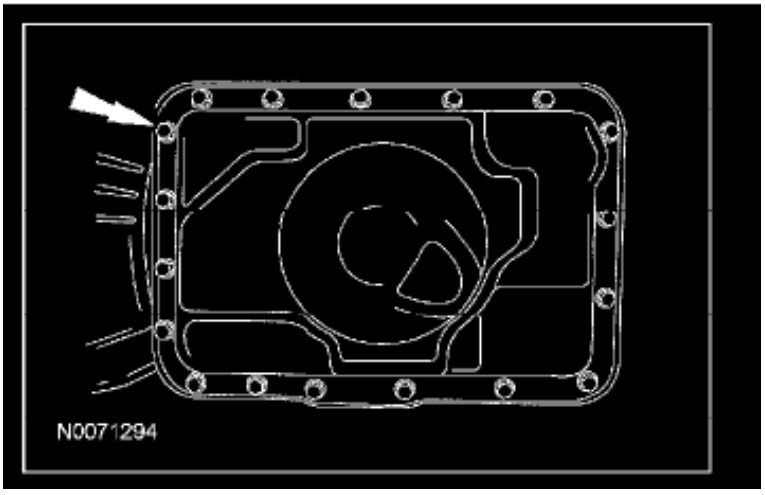
Install the transmission fluid pan. 1

Position the transmission fluid pan gasket on the transmission fluid pan.

2 Align and install the transmission fluid pan.







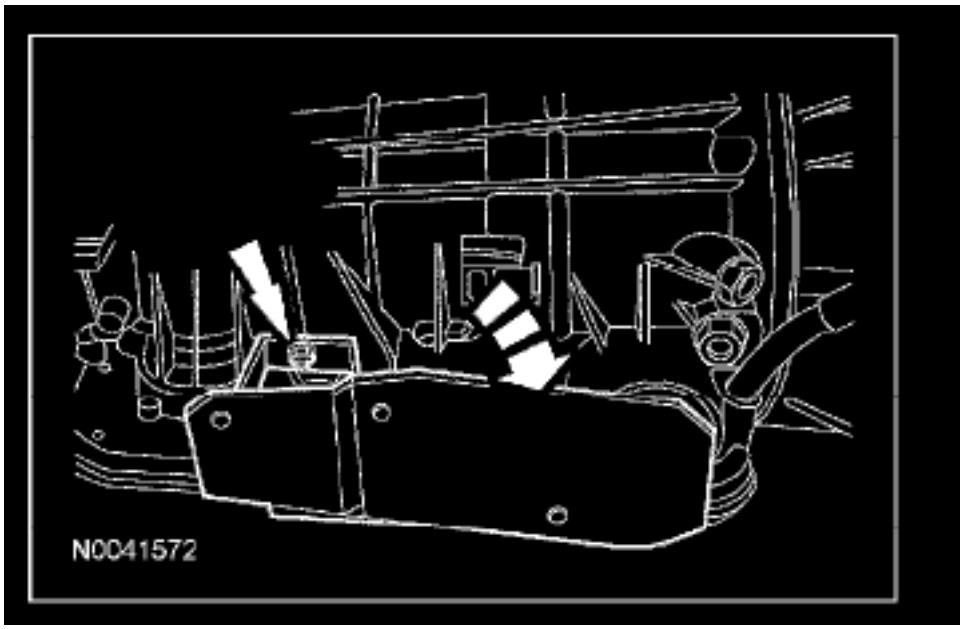
7. Loosely install the transmission fluid pan screws.

8. Tighten the transmission fluid pan screws in a crisscross pattern.

^ Tighten to 10 Nm (89 lb-inch).

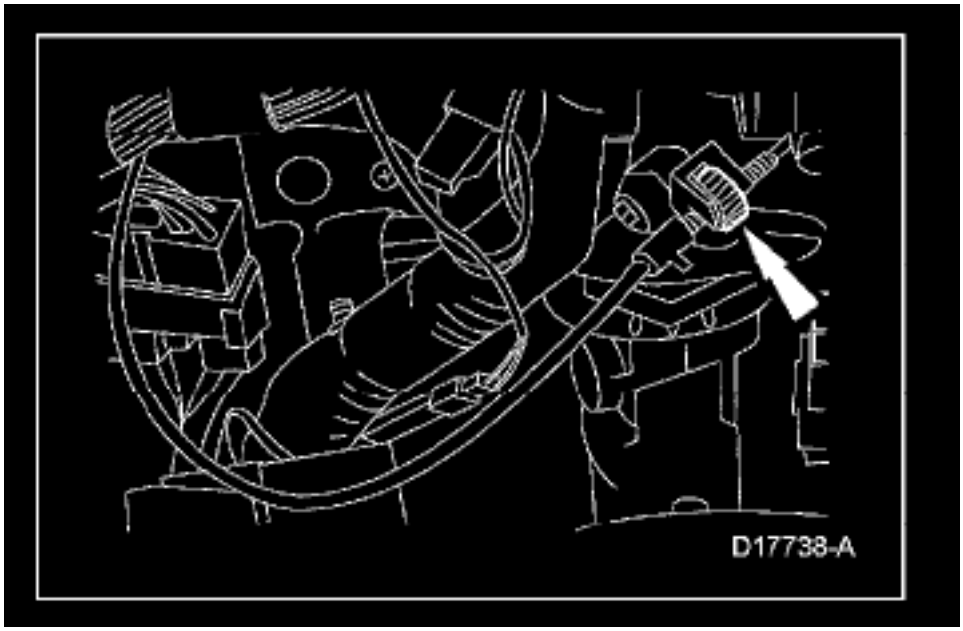
9. If equipped, position the servo heat shield over the servos and clip it to the pan rail.

^ Tighten to 10 Nm (89 lb-inch).



10. NOTE: Start with a minimum of 3.7L (4 qt) clean automatic transmission fluid.

Fill transmission with clean automatic transmission fluid to the correct fluid level.



Shift Indicator: Adjustments

Selector Lever Indicator Adjustment

1. Remove the upper instrument panel steering column cover. 2. Place the selector lever in the (D) position.

^ Rotate the selector lever clockwise until it bottoms out (1st gear), then rotate 2 detents counterclockwise ((D) position).

3. Hang the 1.4 kg (3 lb) weight on the gearshift lever. 4. Center the pointer in the middle of the (D) position.

^ Rotate the thumb-wheel located on the bottom of the steering column to adjust the pointer.

5. Remove the 1.4 kg (3 lb) weight. 6. Carefully move the selector lever into each detent and compare with the transmission settings.

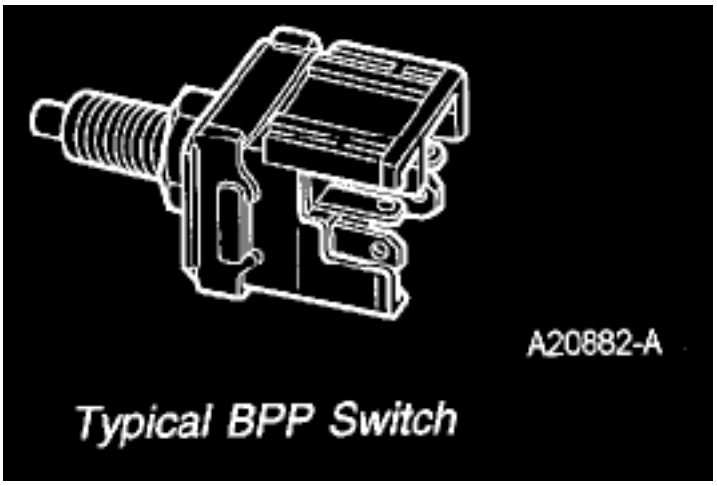
^ Readjust if necessary.

7. Install the upper instrument panel steering column cover.

Transmission Mode Indicator - A/T: Description and Operation

TRANSMISSION CONTROL INDICATOR LAMP (TCIL)

The TCIL is an output signal from the PCM that controls the lamp on/off function depending on the engagement or disengagement of overdrive.



Brake Switch - TCC: Description and Operation

BRAKE PEDAL POSITION (BPP) SWITCH

Typical BPP Switch

The BPP switch is sometimes referred to as the stoplamp switch. The BPP switch provides a signal to the PCM indicating that the brakes are applied. The BPP switch is normally open and is mounted on the brake pedal support. Depending on the vehicle application the BPP switch can be hardwired as follows:

- to the PCM supplying battery positive voltage (B+) when the vehicle brake pedal is applied.

- to the antilock brake system (ABS) module, or lighting control module (LCM), the BPP signal is then broadcast over the network to be received by the PCM.

- to the ABS traction control/stability assist module. The ABS module interprets the BPP switch input along with other ABS inputs and generates an output called the driver brake application (DBA) signal. The DBA signal is then sent to the PCM and to other BPP signal users.

Transmission Position Switch/Sensor: Service and Repair

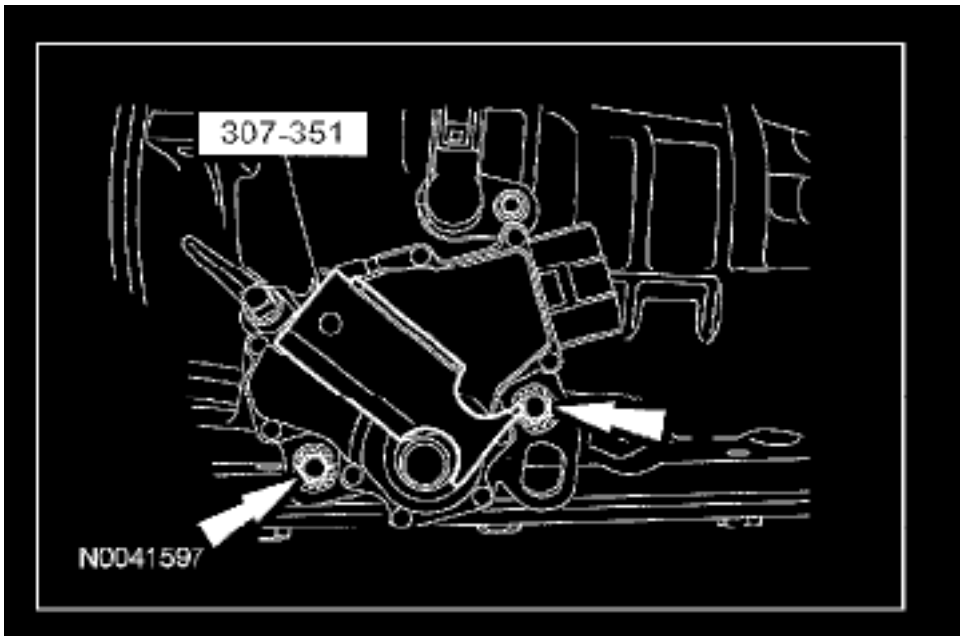
Digital Transmission Range (TR) Sensor

Digital Transmission Range (TR) Sensor

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. 2. Disconnect the selector lever cable from the manual control lever. 3. Disconnect the digital transmission range (TR) sensor electrical connector. 4. Remove the manual control outer lever nut and manual control outer lever. 5. Remove the screws and the digital TR sensor.

Installation



1. CAUTION: The digital transmission range (TR) sensor must fit flush against the boss on the case to prevent damage to the sensor.

Install the digital TR sensor and loosely install the screws.

2. CAUTION: Tightening one screw before tightening the other may cause the sensor to bind or become damaged.

NOTE: The manual lever must be in the NEUTRAL position.

Using the special tool, align the digital TR sensor and tighten screws in an alternating sequence. ^

Tighten to 10 Nm (89 lb-inch).

3. Install the manual control outer lever and nut.

^ Tighten to 48 Nm (35 lb-ft).

4. Connect the digital TR sensor electrical connector. 5. Connect the selector lever cable to the manual control lever. 6. Verify that the selector lever cable is adjusted correctly.

1. NOTE: Inspect the intermediate shaft speed sensor O-ring for damage. If damaged, install a new O-ring

Inspect and lubricate the O-ring with petroleum jelly.

Install the intermediate shaft speed sensor into the transmission.

2. Install the intermediate shaft speed sensor screw.

^ Tighten to 10 Nm (89 lb-inch).

3. Connect the intermediate shaft speed sensor electrical connector. 4. Lower the vehicle.

NOTE: The information in Technical Service Bulletins is intended for use by trained, professional technicians with the knowledge, tools, and equipment to do the job properly and safely. It informs these technicians of conditions that may occur on some vehicles, or provides information that could assist in proper vehicle service. The procedures should not be performed by "do-it-yourselfers". Do not assume that a condition described affects your car or truck. Contact a Ford, Lincoln, or Mercury dealership to determine whether the Bulletin applies to your vehicle.

PROM - Programmable Read Only Memory: Customer Interest Engine, A/T Controls - Delayed A/T Engagement

TSB 08-5-2

03/17/08

DELAYED AUTOMATIC TRANSMISSION ENGAGEMENT - BUILT ON OR BEFORE 02/14/2008

FORD: 2007-2008 Ranger

This article supersedes TSB 08-2-5 to add a production fix date.

ISSUE Some 2007-2008 Ranger vehicles equipped with an automatic transmission and built on or before 02/14/2008 may exhibit a delayed shift engagement into drive or reverse.

ACTION Reprogram the powertrain control module (PCM) to the latest calibration using IDS release 52.11 and higher or 53.1 and higher. This new calibration is not included in the VCM 2007.11 DVD. Calibration files may also be obtained at the website.

NOTE

TO MAXIMIZE THE BENEFIT OF THIS CALIBRATION, PCM KEEP ALIVE MEMORY (KAM) MUST BE RESET.

NOTE

AUTHORIZATION DECAL NOT REQUIRED.

WARRANTY STATUS: Eligible Under Provisions Of New Vehicle Limited Warranty Coverage IMPORTANT: Warranty coverage limits/policies are not altered by a TSB. Warranty coverage limits are determined by the identified causal part.

OPERATION DESCRIPTION TIME

080502A 2007-2008 Ranger With 0.7Hr.

Automatic Transmission: Check DTCs And Reprogram The PCM, Includes Time To Clear KAM and, Road Test Authorization Decal Not Required (Do Not Use With 12650D)

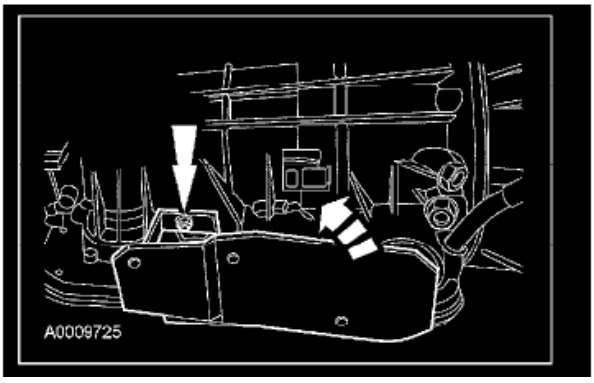
5	7G484	Shift solenoid (SSA)
6	7G484	Shift solenoid (SSC)



Shift Solenoid: Service and Repair

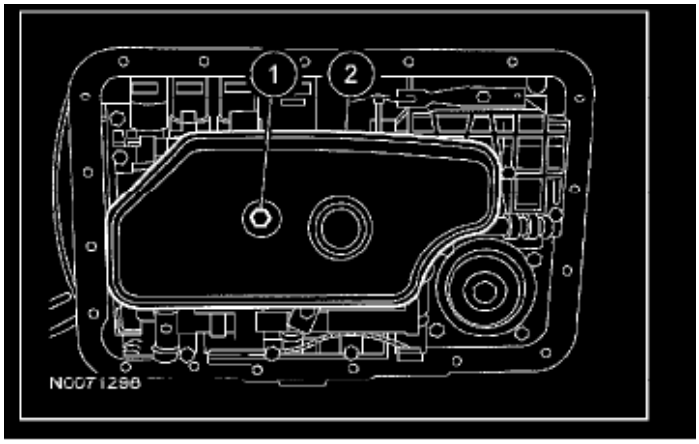
Solenoids - Shift, Torque Converter Clutch, Electronic Pressure Control

Removal

1. With the vehicle in NEUTRAL, position it on a hoist.

2. NOTE: If equipped, the transmission servo heat shield needs to be unclipped from the fluid pan rail and positioned aside for fluid pan removal.

If equipped, loosen the nut and position the heat shield aside.



1

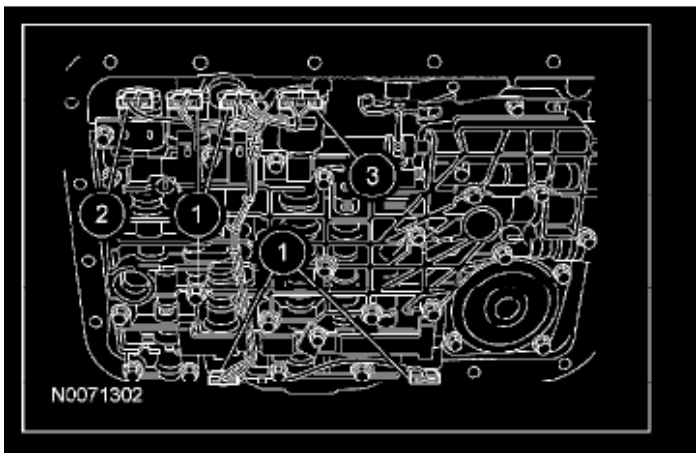
N0071301



3
2
1
1
N0071302

3. Place a drain pan under the transmission fluid pan. 4. Drain the transmission fluid. 5. Remove the transmission fluid filter.

1 Remove the transmission fluid filter screw.

2 Remove the transmission fluid filter.

6. NOTE: Main control assembly does not need to be removed for solenoid service.

Remove wire loom guide and protector. ^

Carefully lift up on wire loom guide and protector and disengage the retaining pins from the solenoid clamps.

7. Disconnect the appropriate solenoid electrical connector.

1 Disconnect shift solenoids electrical connectors.

2 Disconnect the torque converter clutch (TCC) solenoid electrical connector.

3 Disconnect the electronic pressure control (EPC) solenoid electrical connector.

8. CAUTION: The torque converter clutch (TCC) solenoid and converter modulator valve may pop out of its bore. This may damage the

solenoid or converter modulator valve.

CAUTION: Shift solenoid (SSC) may pop out of its bore. This may damage the solenoid.

Remove the shift solenoids. 1

Remove the wire harness.

2 Remove the solenoid clamp screws.

3 Remove the solenoid clamp.

4 Remove the appropriate solenoid(s).

Installation

1. Install the new solenoid(s).

2. NOTE: The solenoid clamp must be installed in the torque converter clutch (TCC) and electronic pressure control (EPC) solenoid grooves, shift

solenoid pockets and the No. 204 plug.

Install the solenoid clamp. 1

Position the solenoid clamp on the main control valve body.

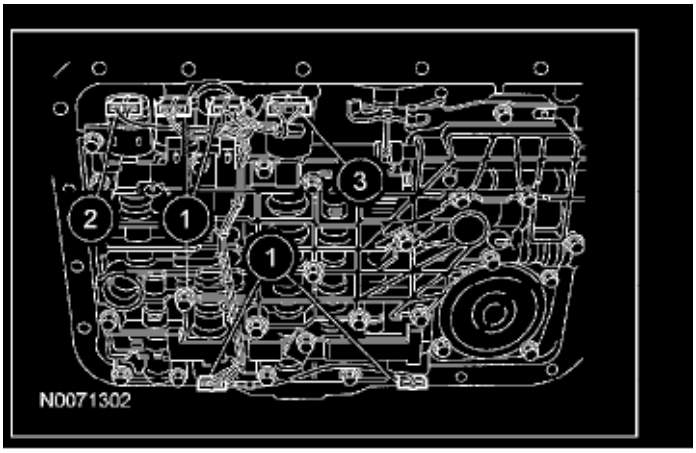
2 Install the solenoid clamp screws.

3. Connect the 6 solenoid electrical connectors.

1 Connect shift solenoid SSA, SSB, SSC, SSD electrical connectors.

2 Connect the TCC solenoid electrical connector.

3 Connect the EPC solenoid electrical connector.



3
2
1
1
N0071302

N0071299

4. CAUTION: Excessive pressure may break the retaining pins.

Install the main control valve body wire loom. ^

Align the retaining pins to the holes in the solenoid clamps and gently press in the main control valve body wire loom guide and protector.

5. Install the transmission fluid filter.

1 Install the transmission fluid filter.

2 Install the transmission fluid filter screw. ^

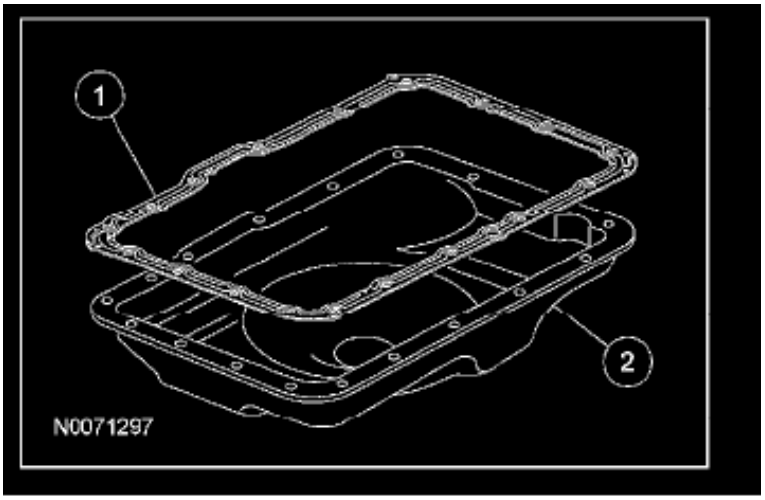
Tighten to 10 Nm (89 lb-inch).

6. NOTE: The transmission fluid pan gasket is reusable. Clean and inspect for damage, if not damaged, the gasket should be reused.

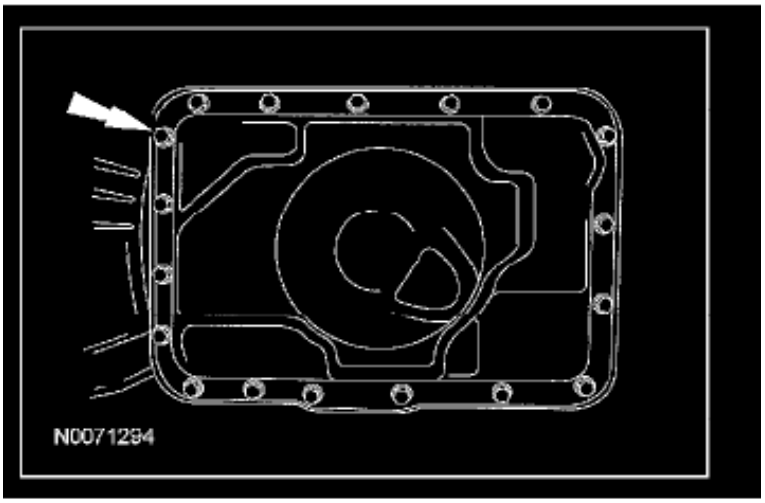
Install the transmission fluid pan. 1

Position the transmission fluid pan gasket on the transmission fluid pan.

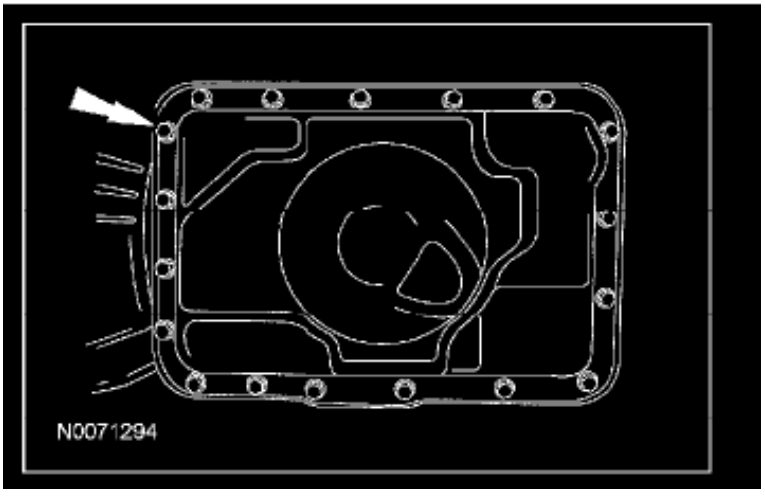
2 Align and install the transmission fluid pan.



1
2
N0071297



N0071294



N0071294

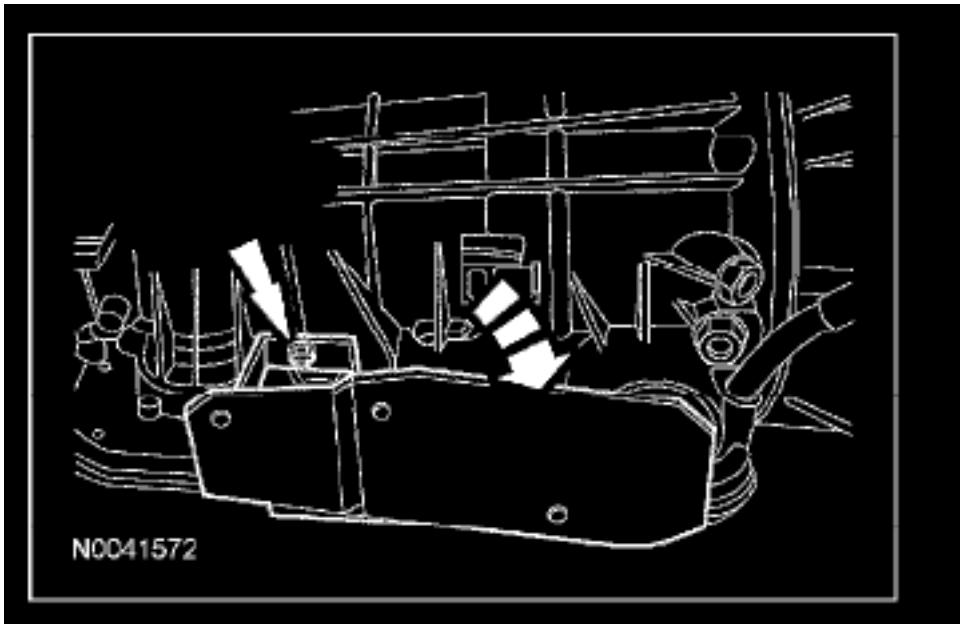
7. Loosely install the transmission fluid pan screws.

8. Tighten the transmission fluid pan screws in a crisscross pattern.

^ Tighten to 10 Nm (89 lb-inch).

9. If equipped, position the servo heat shield over the servos and clip it to the pan rail.

^ Tighten to 10 Nm (89 lb-inch).



10. NOTE: Start with a minimum of 3.7L (4 qt) clean automatic transmission fluid.

Fill transmission with clean automatic transmission fluid to the correct fluid level.

Shift Solenoid: Service and Repair

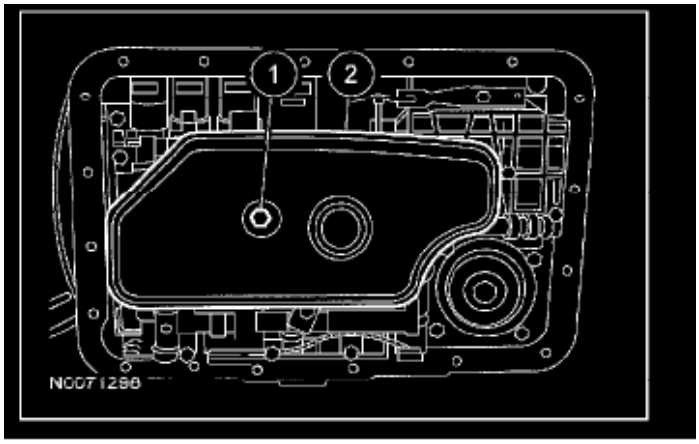
Solenoids - Shift, Torque Converter Clutch, Electronic Pressure Control

Removal

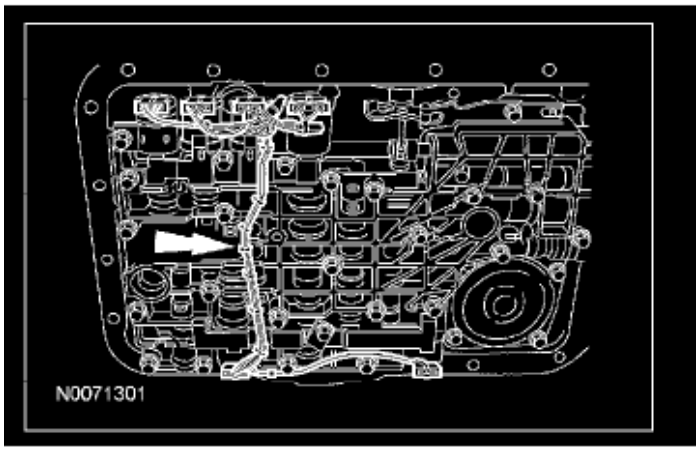
1. With the vehicle in NEUTRAL, position it on a hoist.

2. NOTE: If equipped, the transmission servo heat shield needs to be unclipped from the fluid pan rail and positioned aside for fluid pan removal.

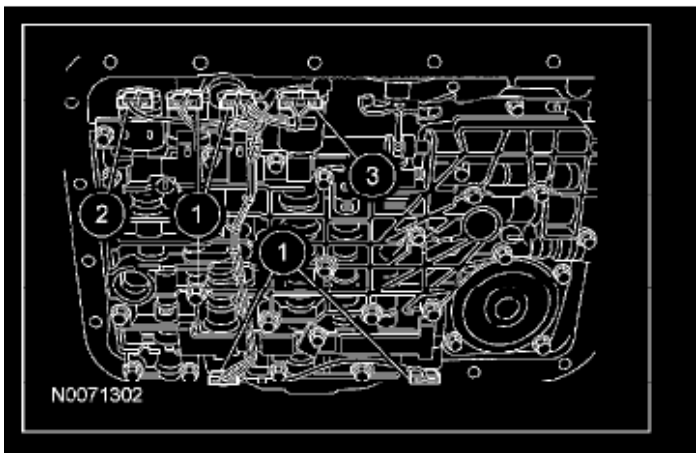
If equipped, loosen the nut and position the heat shield aside.



1
2
N0071298



N0071301



3
2
1
1
N0071302

3. Place a drain pan under the transmission fluid pan. 4. Drain the transmission fluid. 5. Remove the transmission fluid filter.

1 Remove the transmission fluid filter screw.

2 Remove the transmission fluid filter.

6. NOTE: Main control assembly does not need to be removed for solenoid service.

Remove wire loom guide and protector. ^

Carefully lift up on wire loom guide and protector and disengage the retaining pins from the solenoid clamps.

7. Disconnect the appropriate solenoid electrical connector.

1 Disconnect shift solenoids electrical connectors.

2 Disconnect the torque converter clutch (TCC) solenoid electrical connector.

3 Disconnect the electronic pressure control (EPC) solenoid electrical connector.

8. CAUTION: The torque converter clutch (TCC) solenoid and converter modulator valve may pop out of its bore. This may damage the

solenoid or converter modulator valve.

CAUTION: Shift solenoid (SSC) may pop out of its bore. This may damage the solenoid.

Remove the shift solenoids. 1

Remove the wire harness.

2 Remove the solenoid clamp screws.

3 Remove the solenoid clamp.

4 Remove the appropriate solenoid(s).

Installation

1. Install the new solenoid(s).

2. NOTE: The solenoid clamp must be installed in the torque converter clutch (TCC) and electronic pressure control (EPC) solenoid grooves, shift

solenoid pockets and the No. 204 plug.

Install the solenoid clamp. 1

Position the solenoid clamp on the main control valve body.

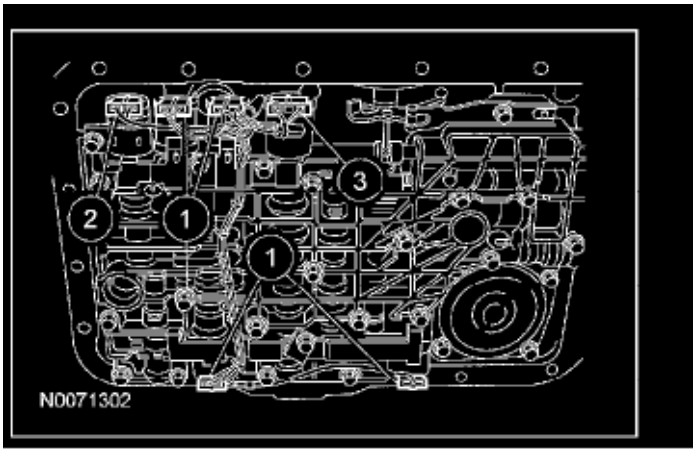
2 Install the solenoid clamp screws.

3. Connect the 6 solenoid electrical connectors.

1 Connect shift solenoid SSA, SSB, SSC, SSD electrical connectors.

2 Connect the TCC solenoid electrical connector.

3 Connect the EPC solenoid electrical connector.



3
2
1
1
N0071302

4. CAUTION: Excessive pressure may break the retaining pins.

Install the main control valve body wire loom. ^

Align the retaining pins to the holes in the solenoid clamps and gently press in the main control valve body wire loom guide and protector.

5. Install the transmission fluid filter.

1 Install the transmission fluid filter.

2 Install the transmission fluid filter screw. ^

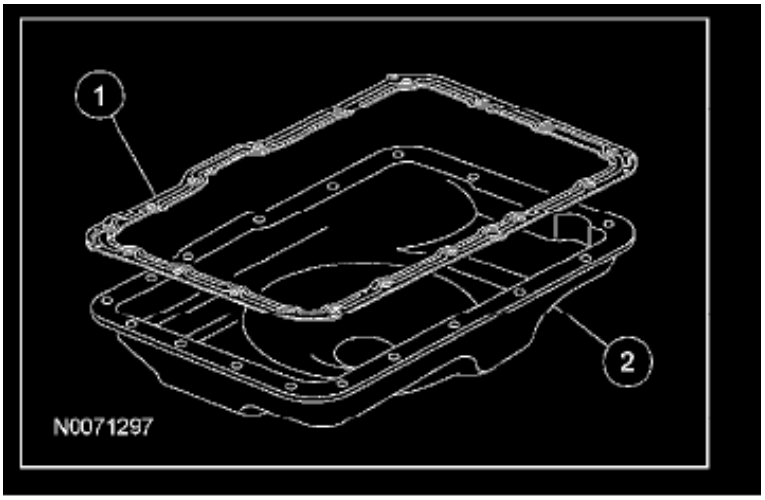
Tighten to 10 Nm (89 lb-inch).

6. NOTE: The transmission fluid pan gasket is reusable. Clean and inspect for damage, if not damaged, the gasket should be reused.

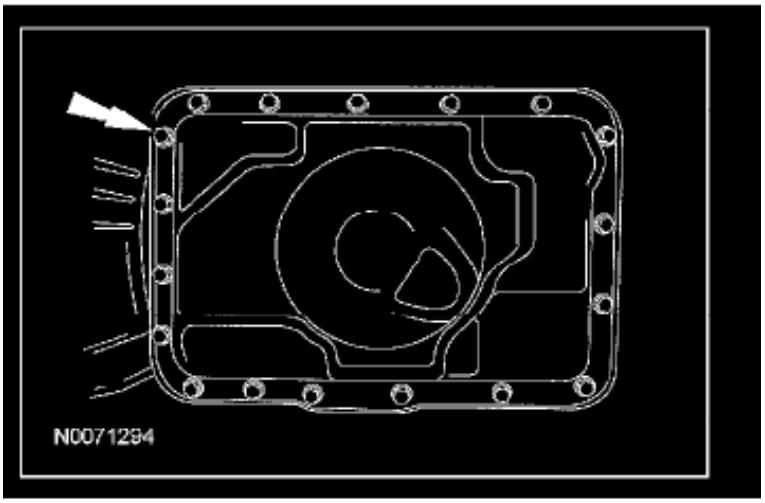
Install the transmission fluid pan. 1

Position the transmission fluid pan gasket on the transmission fluid pan.

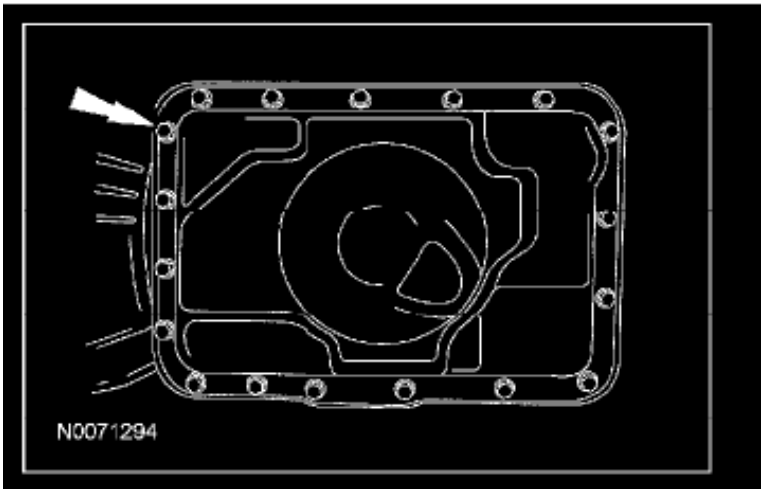
2 Align and install the transmission fluid pan.



1
2
N0071297



N0071294



N0071294

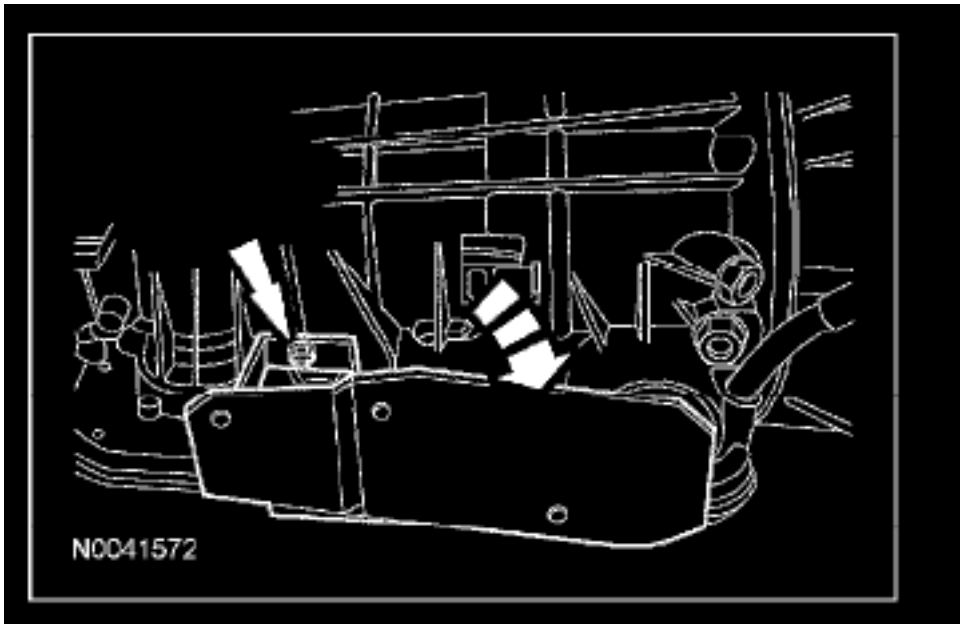
7. Loosely install the transmission fluid pan screws.

8. Tighten the transmission fluid pan screws in a crisscross pattern.

^ Tighten to 10 Nm (89 lb-inch).

9. If equipped, position the servo heat shield over the servos and clip it to the pan rail.

^ Tighten to 10 Nm (89 lb-inch).



10. NOTE: Start with a minimum of 3.7L (4 qt) clean automatic transmission fluid.

Fill transmission with clean automatic transmission fluid to the correct fluid level.

Brake Switch - TCC: Description and Operation

BRAKE PEDAL POSITION (BPP) SWITCH

Typical BPP Switch

The BPP switch is sometimes referred to as the stoplamp switch. The BPP switch provides a signal to the PCM indicating that the brakes are applied. The BPP switch is normally open and is mounted on the brake pedal support. Depending on the vehicle application the BPP switch can be hardwired as follows:

- to the PCM supplying battery positive voltage (B+) when the vehicle brake pedal is applied.

- to the antilock brake system (ABS) module, or lighting control module (LCM), the BPP signal is then broadcast over the network to be received by the PCM.

- to the ABS traction control/stability assist module. The ABS module interprets the BPP switch input along with other ABS inputs and generates an output called the driver brake application (DBA) signal. The DBA signal is then sent to the PCM and to other BPP signal users.

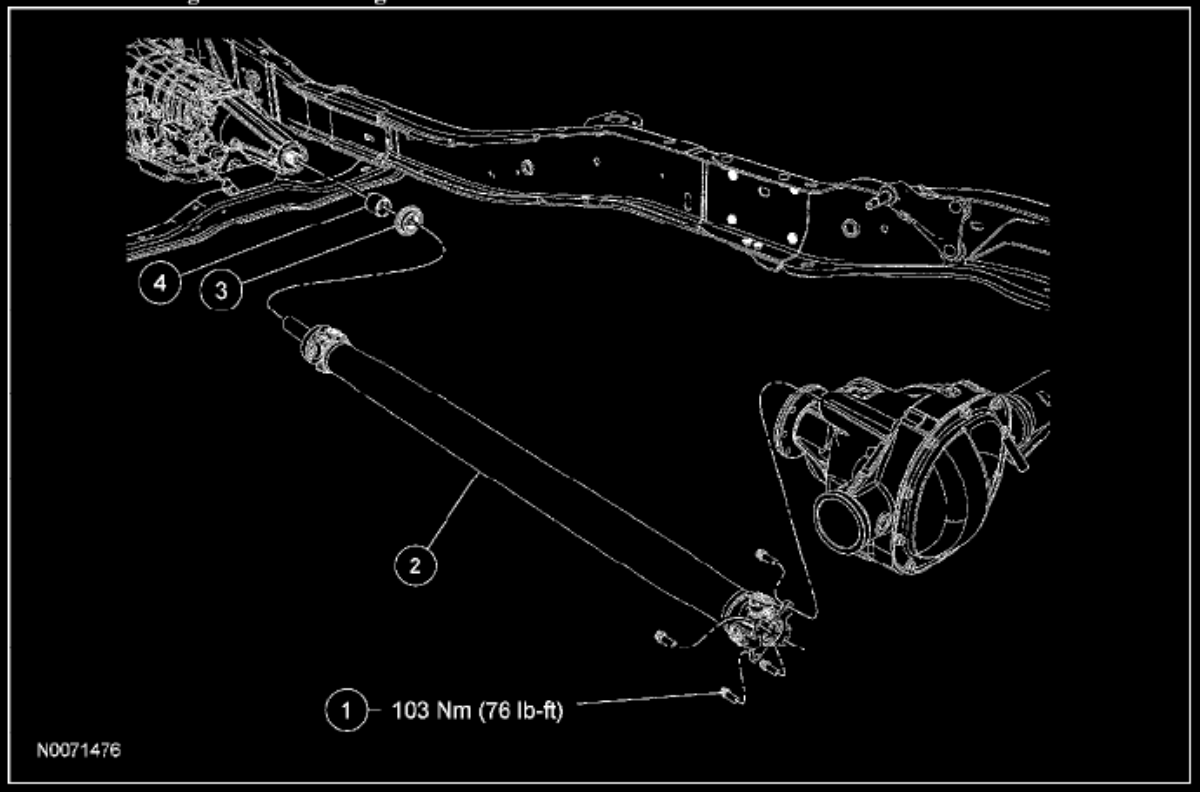
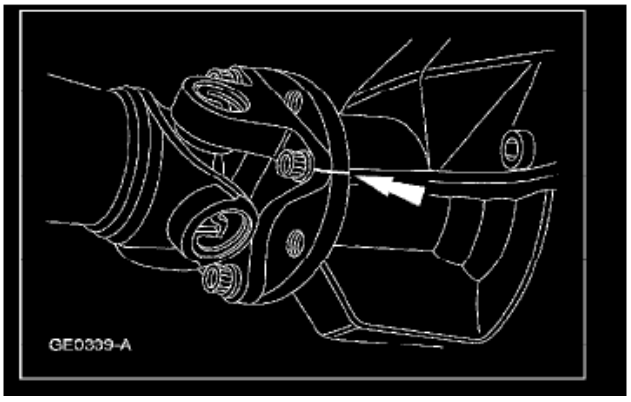
Extension Housing: Service and Repair

Extension Housing Seal and Bushing

Extension Housing Seal and Bushing



Item	Part Number	Description
1	N800594-S	Driveshaft bolt (4 required)
2	4602 H	Driveshaft
3	7052-A	Extension housing seal
4	7A034-A	Extension housing bushing



Extension Housing Seal and Bushing

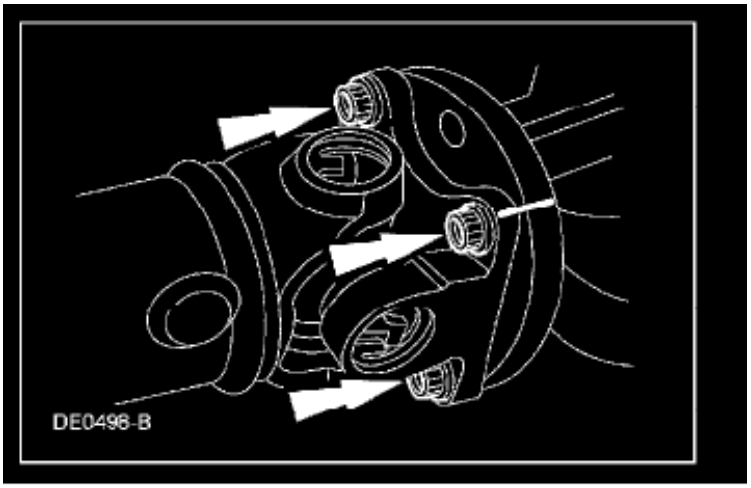
Removal

1. With the vehicle in NEUTRAL, position it on a hoist.

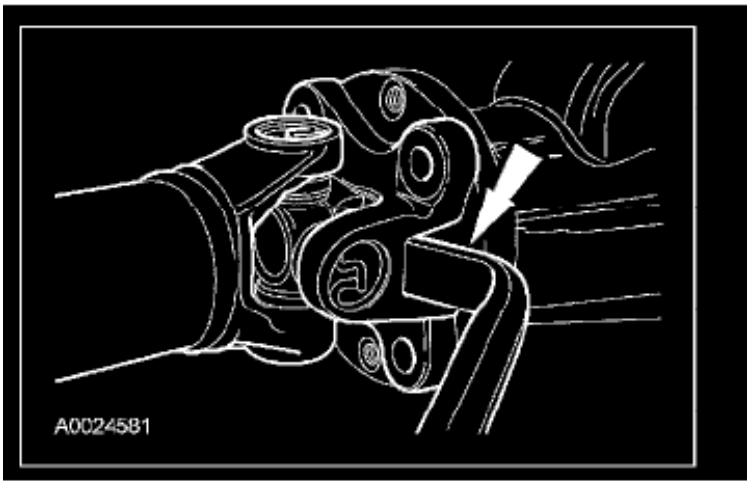
2. NOTE: To maintain initial driveshaft balance, mark the rear driveshaft yoke and axle flange so they can be installed in their original alignment.

Mark the rear driveshaft.

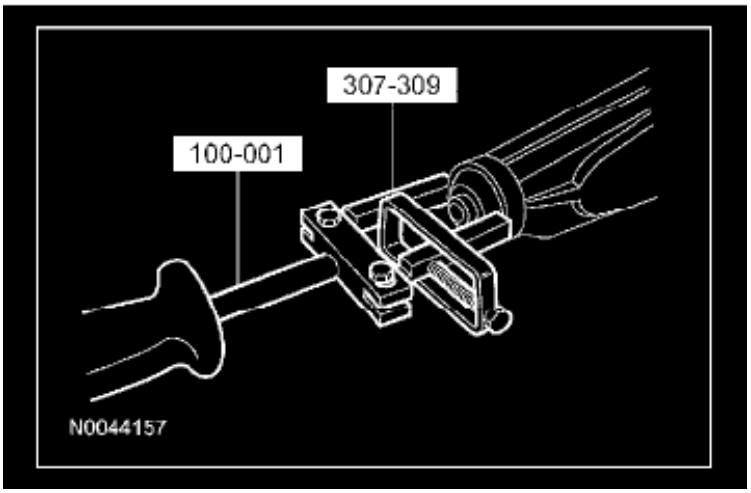
3. Remove the 4 rear driveshaft bolts.



DE0496-B



A0024581



307-309
100-001
N0044157

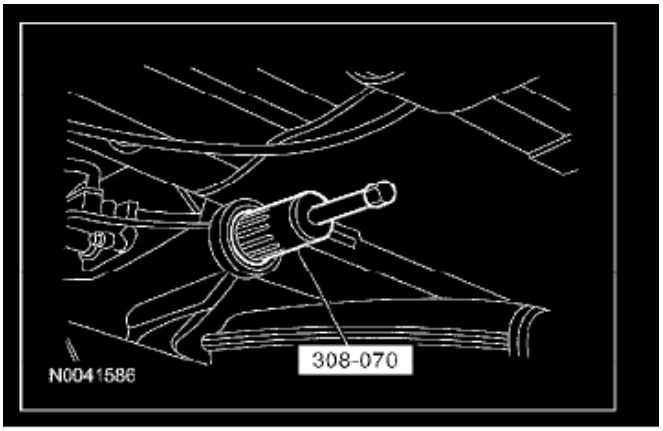
4. NOTE: Do not use a hammer.

Remove the rear driveshaft from the flange using a pry bar.

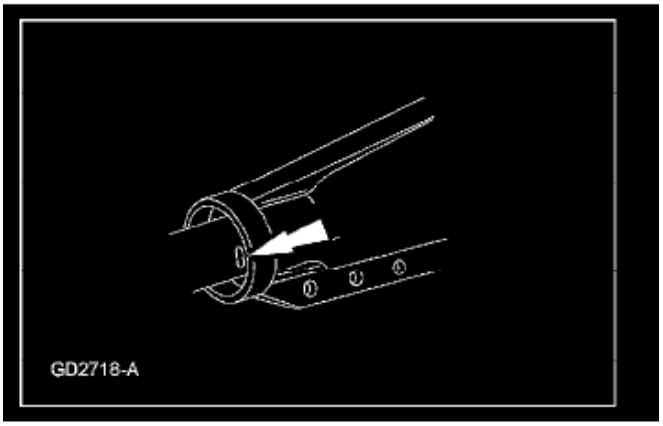
5. Using the special tools, remove the extension housing seal.

6. CAUTION: Use the extension housing bushing remover carefully so that the seal area is not damaged.

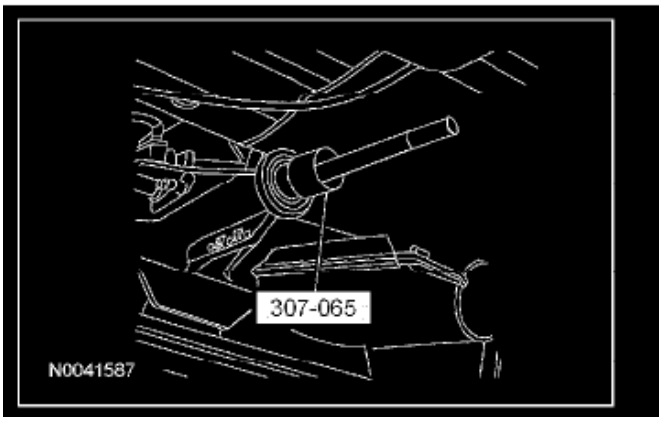
Using the special tool, remove the extension housing bushing.



308-070
N0041586



GD2718-A



307-065
N0041587

Installation

1. CAUTION: The lube hole in the extension housing bushing must be aligned with the lube groove in the extension housing. This groove is

located at the 3 o'clock position when viewed from the rear. Failure to align the bushing can result in bushing damage.

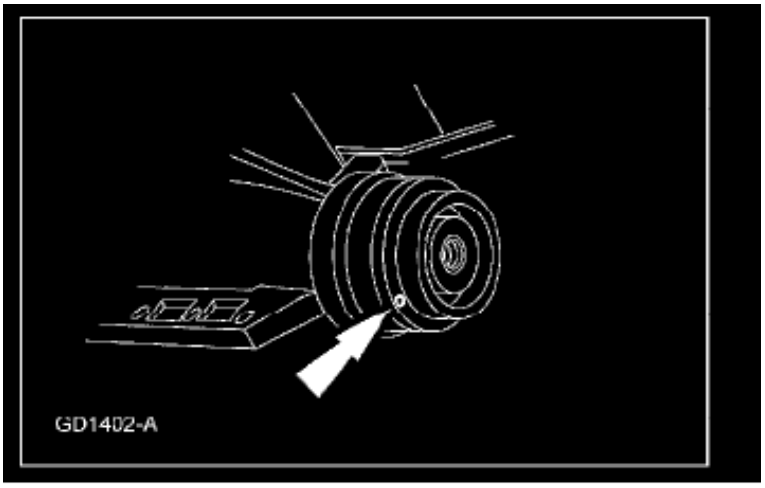
NOTE: Inspect the counterbore of the extension housing for burrs. Remove any burrs from the extension housing counterbore with an oil stone.

Position the extension housing bushing into the extension housing.

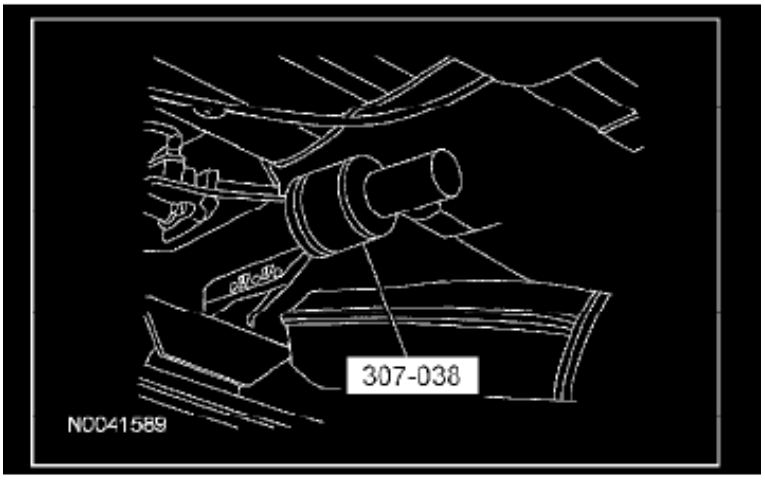
2. NOTE: The tool will bottom when bushing is in the correct position.

Using the special tool, install the extension housing bushing.

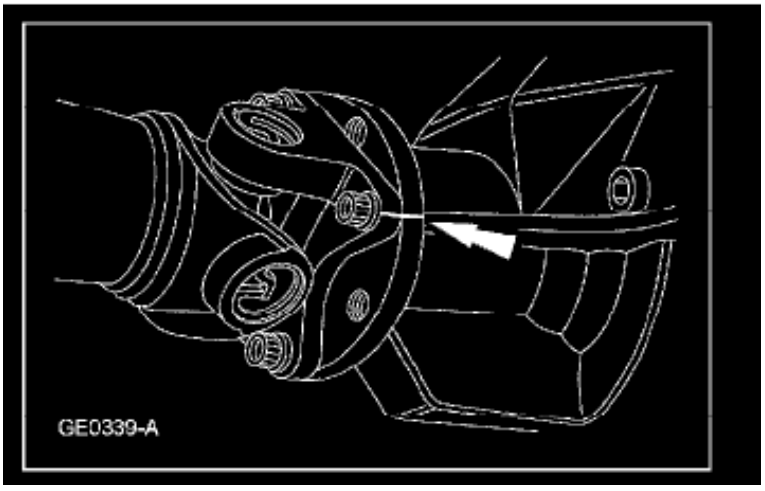
3. Position new extension housing seal with drain hole in the 6 o'clock position.



GD1402-A



307-038
N0041589



GE0339-A

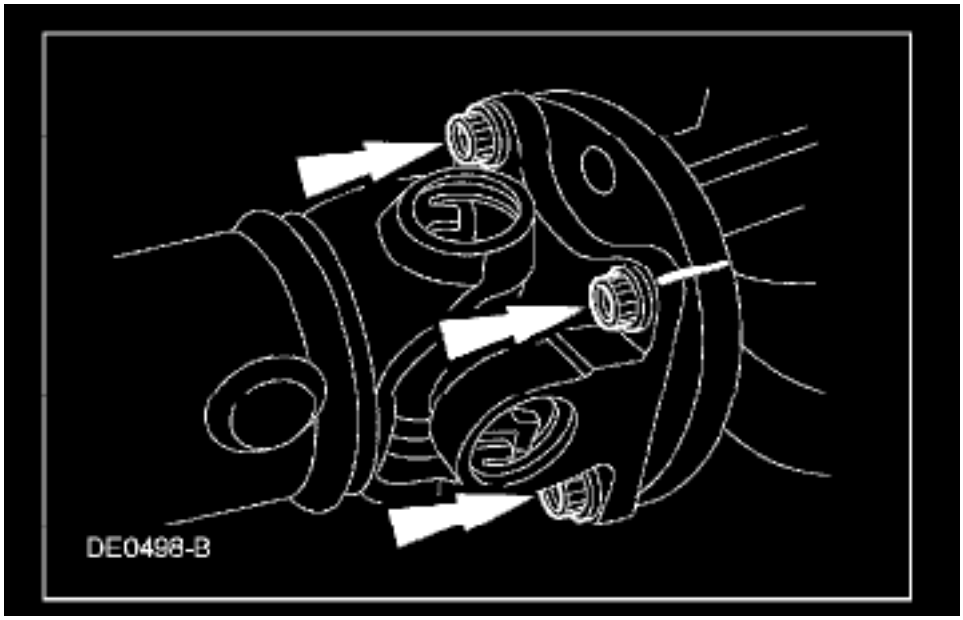
4. Using the special tool, install the extension housing seal.

5. NOTE: Inspect the driveshaft slip-yoke for wear and damage. Install a new component if required.

Align the driveshaft with the marks made during removal to make sure of correct balance.

6. With the marks aligned, install the rear driveshaft and bolts.

^ Tighten to 103 Nm (76 lb-ft).



7. Fill the transmission to the correct fluid level with clean automatic transmission fluid and check for correct transmission operation.

Fluid - A/T: Capacity Specifications

Transmission Fluid ..... 10.0 qts (9.5L)

Note: Indicates only approximate dry-fill capacity. Some applications may vary based on cooler size and if equipped with an in-tank cooler. The amount of transmission fluid and fluid level should be set by the indication on the dipstick's normal operating range.

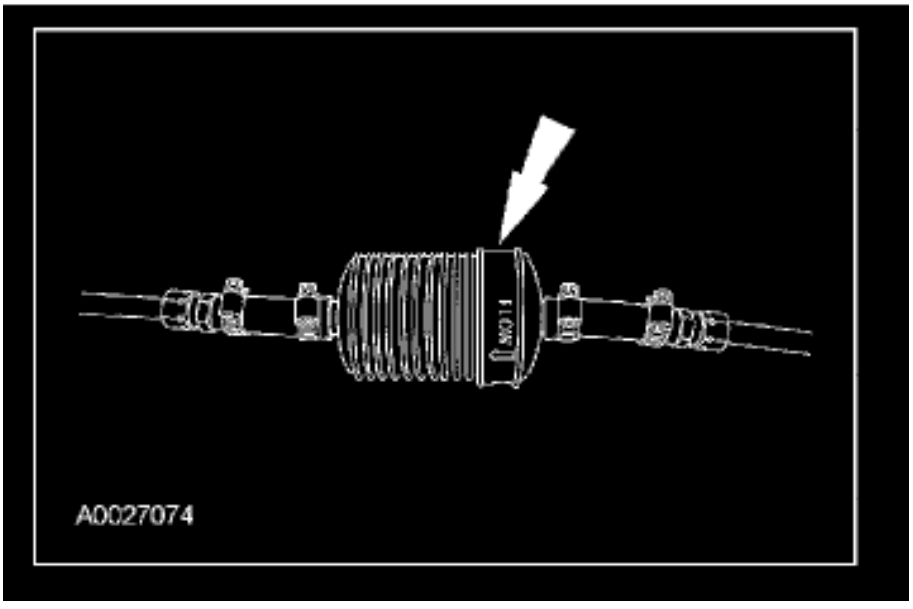
Fluid - A/T: Fluid Type Specifications

Transmission Fluid Type

Type ..... MERCON V

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V



Fluid - A/T: Service and Repair Transmission Fluid Cooler Backflushing and Cleaning

Transmission Fluid Cooler Backflushing and Cleaning

CAUTION: Whenever a transmission has been disassembled to install new parts or a new or remanufactured transmission has been installed, a new transmission fluid cooler, either in-tank, auxiliary or oil to air (OTA), if equipped will need to be installed. Using a suitable torque converter/fluid cooler cleaner, clean and backflush the transmission fluid cooler tubes.

When internal wear or damage has occurred in the transmission, metal particles, clutch plate material or band material may have been carried into the transmission fluid cooler. These contaminants are a major cause of recurring transmission concerns and must be removed from the system before the transmission is put back in use.

CAUTION: Use only clean automatic transmission fluid specified for this transmission. Do not use supplemental fluid additives, treatments or cleaning agent. The use of these materials may affect transmission operation and result in internal damage to the transmission.

NOTE: Do not use any solvents while carrying out this procedure. Only use clean automatic transmission fluid.

1. Conduct backflushing with a suitable torque converter/transmission fluid cooler cleaner. Test the equipment to make sure that a vigorous fluid

flow is present before proceeding. Install a new system filter if flow is weak or contaminated.

2. Remove and discard the in-line transmission fluid filter, if equipped.

3. To aid in attaching the cleaner to the transmission steel cooler lines, connect 2 additional rubber hoses to the transmission end of the steel

transmission cooler lines as described. ^

Connect the cleaner tank pressure line to the steel transmission cooler return line (longest line).

^ Connect a tank return hose to the steel transmission cooler pressure line (shorter line). Place the outlet end of this hose in the solvent tank reservoir.

4. Turn on the pump and allow the transmission fluid to circulate a minimum of 5 minutes (cycling switch on and off will help dislodge contaminants

in the cooler system).

5. Switch off the pump and disconnect the pressure hose from the transmission cooler return line.
6. Use compressed air to blow out the cooler(s) and lines (blow air into the transmission cooler return line) until all the fluid is removed. 7. Remove the rubber return hose from the remaining steel cooler line.

Special Tool(s)

Fluid - A/T: Service and Repair Transmission Fluid Drain and Refill - Automated Equipment

Transmission Fluid Drain and Refill - Automated Equipment

Drain

CAUTION: Use only clean automatic transmission fluid. Do not use any supplemental transmission fluid additives, treatments or cleaning agents. The use of these materials can affect the operation of the transmission, resulting in internal component failure.

NOTE: Always refer to the instructions supplied with the flush and fill machine.

NOTE: This is a new procedure for draining and adding transmission fluid using a suitable transmission flush and fill machine.

1. With the vehicle in PARK, position on a hoist. 2. Use a suitable flush and fill machine to change the fluid. 3. When connecting the flush and fill machine, connect the machine to the fluid cooler tube after the fluid cooler on the cooler return tube. This will

help remove any foreign material trapped in the fluid coolers.

4. Carry out the fluid exchange process.

Refill

1. Use only clean automatic transmission fluid. 2. Once the fluid exchange has been completed, disconnect the flush and fill machine. Reconnect any disconnected fluid cooler tubes. 3. Lower the vehicle. 4. With the engine running and the transmission at normal operating temperature 66-77° C (150-170° F), check and adjust the transmission fluid

level and check for any leaks. If fluid is needed, add fluid in increments of 0.24L (0.5 pt) until the correct level is achieved (fluid should be in the cross-hatched area of the fluid level indicator).

Fluid Filter - A/T: Service and Repair Transmission Filter - In Line

Transmission Filter - In Line

Transmission fluid in-line filter without oil-to-air (OTA) cooler

NOTE: Use the following guidelines for the in-line transmission fluid filter: ^

If the transmission was overhauled and the vehicle was equipped with an in-line fluid filter, install a new in-line fluid filter.

^ If the transmission was overhauled and the vehicle was not equipped with an in-line fluid filter, install a new in-line fluid filter kit.

^ If the transmission is being installed for a non-internal repair, do not install an in-line filter or filter kit.

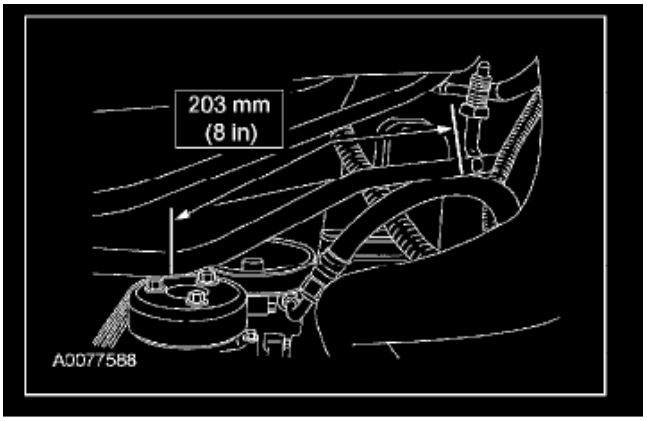
^ If installing a new or a Ford-authorized remanufactured transmission, install the in-line transmission fluid filter that is supplied.

1. With the vehicle in NEUTRAL, position it on a hoist. 2. Remove the retainer clips from the cooler lines.

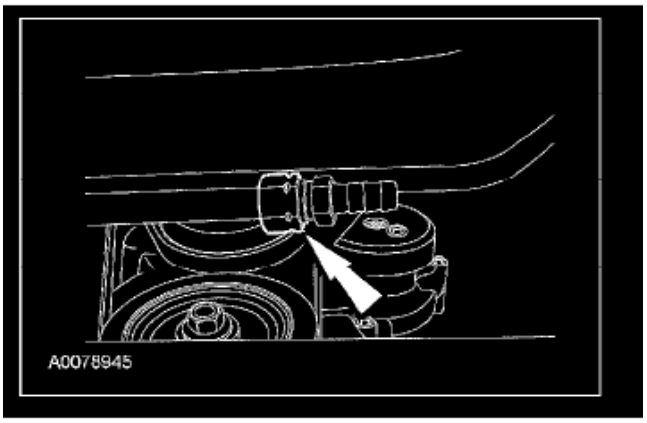
3. Disconnect the lower transmission cooler tube fitting.

4. Remove the section of the return line, as illustrated.

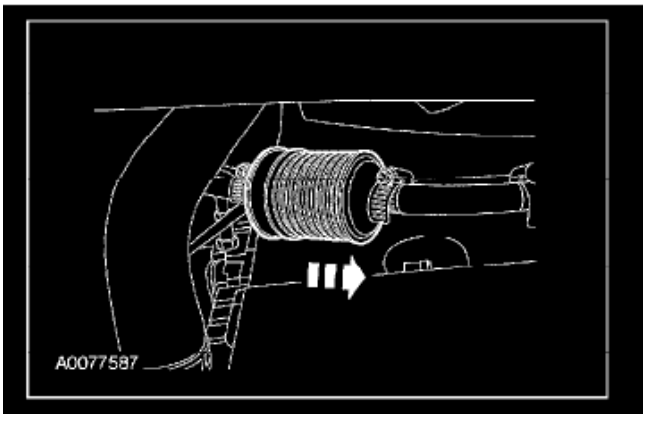
^ Clean and deburr the cut ends of the steel tubing.



203 mm
(8 in)
A0077588



A0078945



A0077587

5. NOTE: Be sure the cooler tube is fully seated in the body of the fitting before final tightening of the ferrule nut.

Install the 2 ferrule connectors finger tight onto each end of the tubing. Then tighten the nuts an additional 1-1/2 turns to seat the ferrules in the connectors.

6. CAUTION: The filter has a bypass valve in it. The red arrow on the filter indicates the direction of the fluid flow through the filter. The

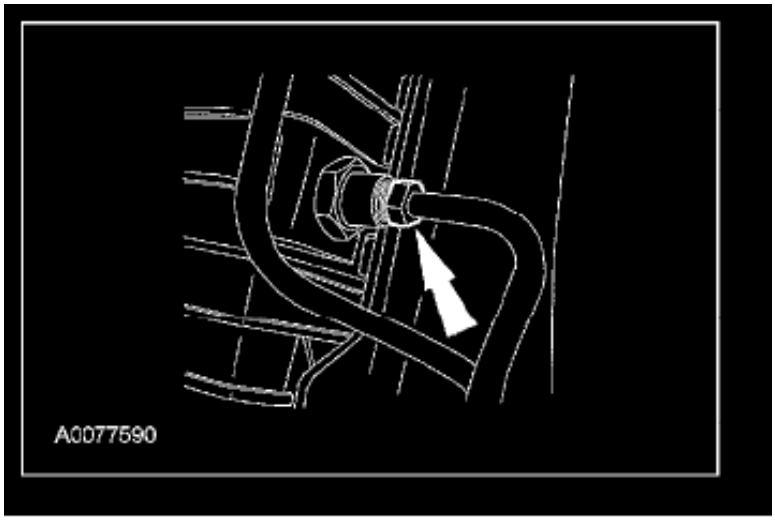
filter must be installed in the fluid cooler return line with the red arrow pointing away from the transmission fluid cooler and toward the transmission (the return line has fluid coming out of the cooler going to the transmission). If the fluid filter is not installed correctly, it will cause internal transmission damage.

NOTE: Do not install any rubber hoses or steel tubing with a bend entering the filter greater than 60 degrees.

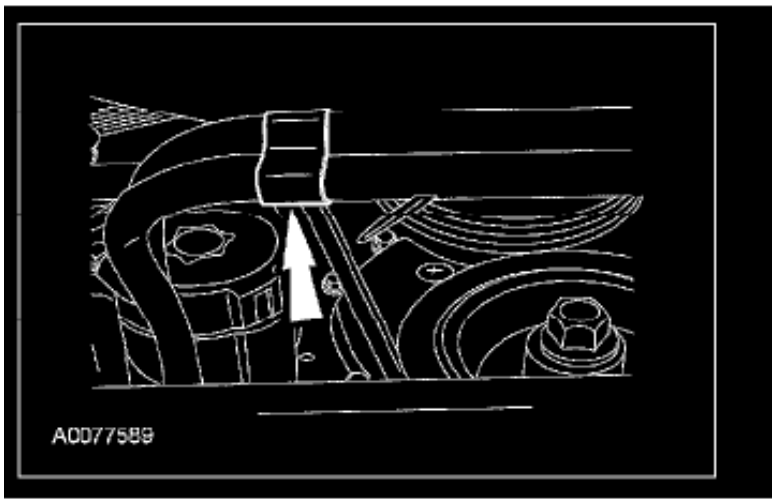
Using suitable length of hose(s), install the filter. Tighten the clamps.

7. Connect the lower transmission cooler tube fitting.

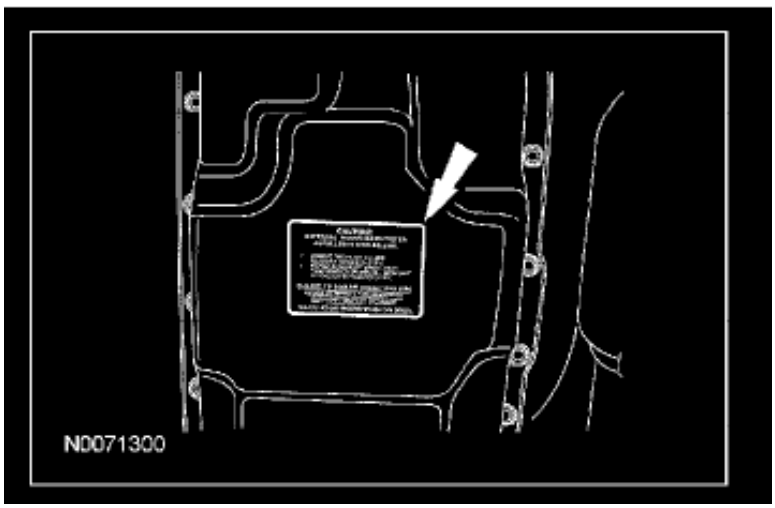
^ Tighten to 28 Nm (21 lb-ft).



A0077590



A0077589



N0071300

8. Install the retainer clips on the cooler lines.

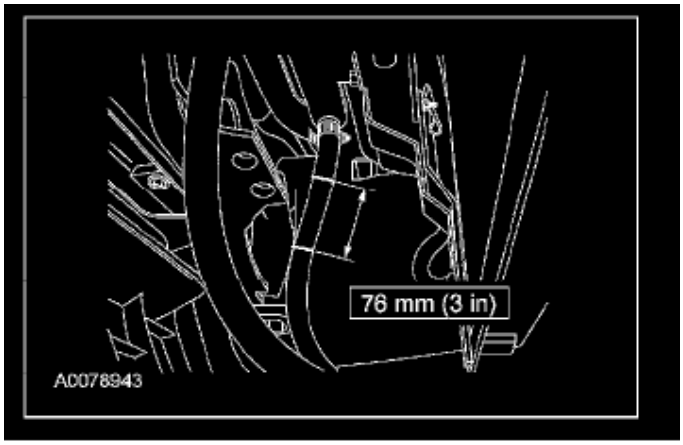
9. Clean a section of the transmission fluid pan and install the sticker.

10. Fill the transmission with clean automatic transmission fluid.

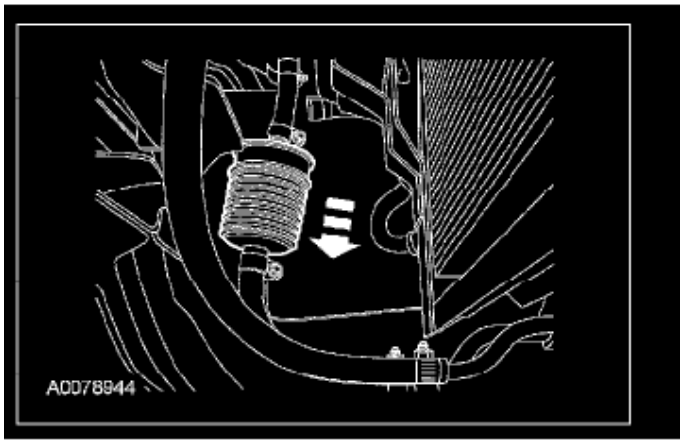
^ Verify for correct operation.

^ Check the filter for leaks.

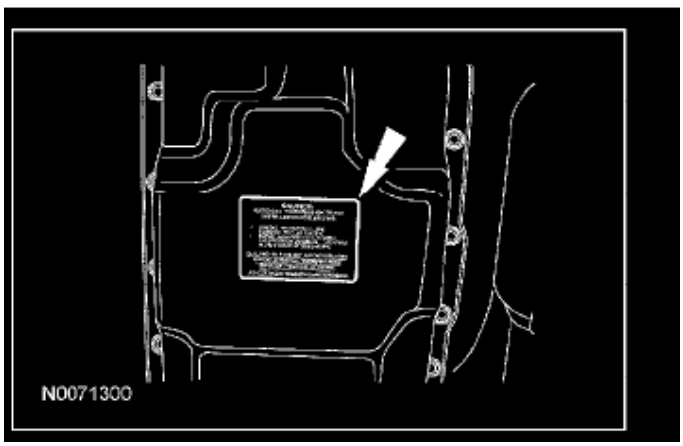
Transmission fluid in-line filter with OTA cooler 11. With the vehicle in NEUTRAL, position it on a hoist. 12. Remove the section of the return line, as illustrated.



76 mm (3 in)
A0078943



A0078944



N0071300

13. CAUTION: The filter has a bypass valve in it. The red arrow on the filter indicates the direction of the fluid flow through the filter. The

filter must be installed in the fluid cooler return line with the red arrow pointing away from the transmission fluid cooler and toward the transmission (the return line has fluid coming out of the cooler going to the transmission). If the fluid filter is not installed correctly, it will cause internal transmission damage.

NOTE: Do not install any rubber hoses or steel tubing with a bend entering the filter greater than 60 degrees.

Using 2 hose clamps, install the filter.

14. Clean a section of the transmission fluid pan and install the sticker.

15. Fill the transmission with clean automatic transmission fluid.

^ Verify for correct operation.

^ Check the filter for leaks.

9	7A469	Transmission fluid filter O-ring (2 required)

Fluid Pan, Gasket and Filter (Part 2)

Removal

1. With the vehicle in NEUTRAL, position it on a hoist.

2. NOTE: If equipped, the transmission servo heat shield must be unclipped from the fluid pan rail and positioned aside for fluid pan removal.

If equipped, loosen the nut and position the heat shield aside.

3. Drain transmission fluid.

^ Remove all the transmission fluid pan screws except for 2 in the front. Loosen the 2 front transmission fluid pan screws. Pry the rear of the transmission fluid pan down and allow fluid to drain. After fluid is drained, remove the front 2 transmission fluid pan screws.

4. NOTE: The transmission fluid gasket is reusable. Clean and inspect for damage, if not damaged, the gasket should be reused.

Remove the transmission fluid pan.

5. Remove the transmission fluid pan gasket. 6. Remove the transmission fluid filter screw. 7. Remove the transmission fluid filter. 8. Clean and inspect the transmission fluid pan and magnet. Clean all mating surfaces.

Installation

1. CAUTION: Lubricate fluid filter O-ring seals with clean automatic transmission fluid or they may be damaged.

Lubricate and install new O-ring seals onto the transmission fluid filter.

2. Position the transmission fluid filter on the main control valve body. 3. Install the transmission fluid filter screw.

^ Tighten to 10 Nm (89 lb-inch).

4. Position the fluid pan magnet in the transmission fluid pan.

5. NOTE: The transmission fluid pan gasket is reusable. Clean and inspect for damage, it not damaged, the gasket should be reused.

Position the transmission fluid pan gasket on the transmission fluid pan.

6. Install and align the transmission fluid pan. 7. Loosely install the transmission fluid pan screws. 8. Tighten the transmission fluid pan screws in a crisscross pattern.

^ Tighten to 10 Nm (89 lb-inch).

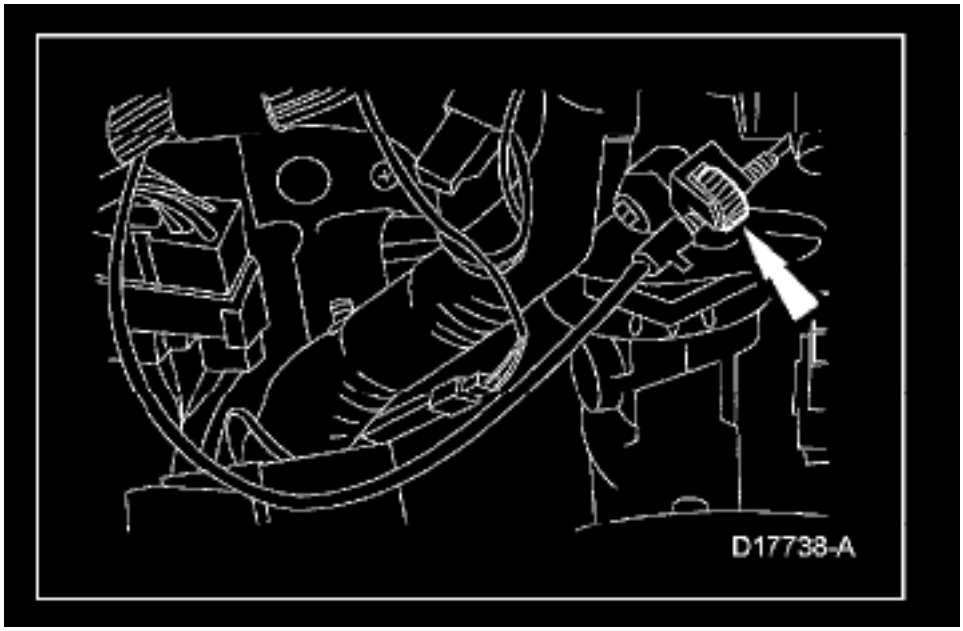
9. If equipped, position the servo heat shield over the servos and clip it to the pan rail.

^ Tighten to 10 Nm (89 lb-inch).

10. NOTE: Start with a minimum of 3.7L (4 qt) clean automatic transmission fluid.

Fill transmission with clean automatic transmission fluid to the correct fluid level.

11. Apply the park brake and start the engine. 12. Move the range selector lever through all the gears. 13. Check the transmission fluid level.



Shift Indicator: Adjustments

Selector Lever Indicator Adjustment

1. Remove the upper instrument panel steering column cover. 2. Place the selector lever in the (D) position.

^ Rotate the selector lever clockwise until it bottoms out (1st gear), then rotate 2 detents counterclockwise ((D) position).

3. Hang the 1.4 kg (3 lb) weight on the gearshift lever. 4. Center the pointer in the middle of the (D) position.

^ Rotate the thumb-wheel located on the bottom of the steering column to adjust the pointer.

5. Remove the 1.4 kg (3 lb) weight. 6. Carefully move the selector lever into each detent and compare with the transmission settings.

^ Readjust if necessary.

7. Install the upper instrument panel steering column cover.

Transmission Mode Indicator - A/T: Description and Operation

TRANSMISSION CONTROL INDICATOR LAMP (TCIL)

The TCIL is an output signal from the PCM that controls the lamp on/off function depending on the engagement or disengagement of overdrive.

307-065
N0041587

Installation

1. CAUTION: The lube hole in the extension housing bushing must be aligned with the lube groove in the extension housing. This groove is

located at the 3 o'clock position when viewed from the rear. Failure to align the bushing can result in bushing damage.

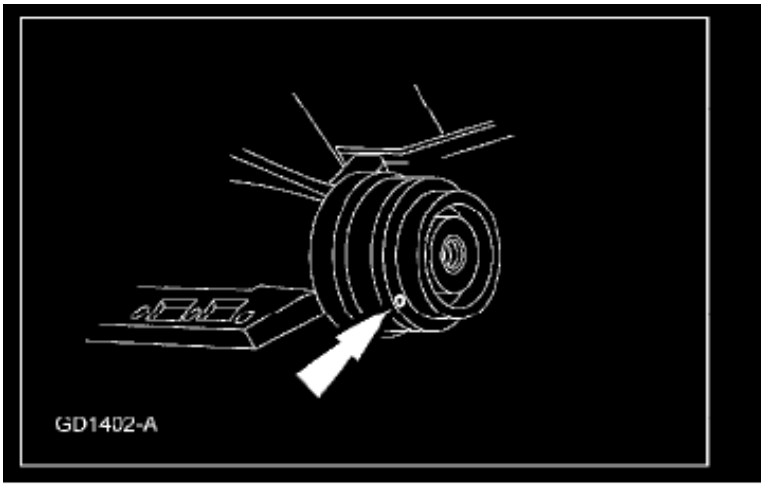
NOTE: Inspect the counterbore of the extension housing for burrs. Remove any burrs from the extension housing counterbore with an oil stone.

Position the extension housing bushing into the extension housing.

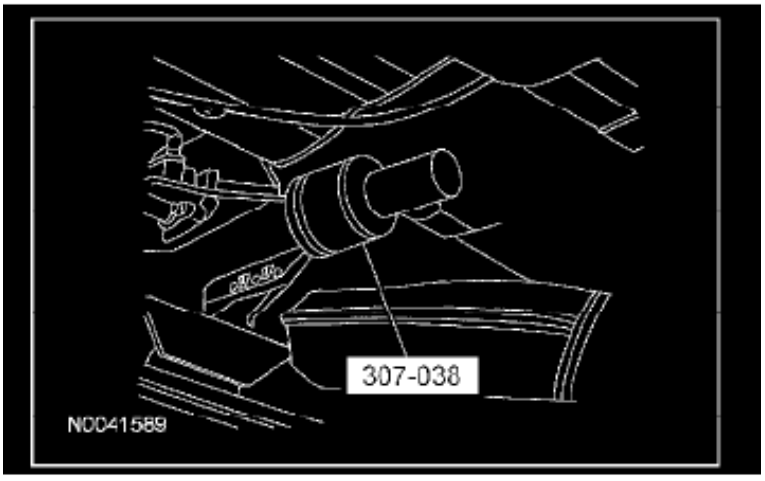
2. NOTE: The tool will bottom when bushing is in the correct position.

Using the special tool, install the extension housing bushing.

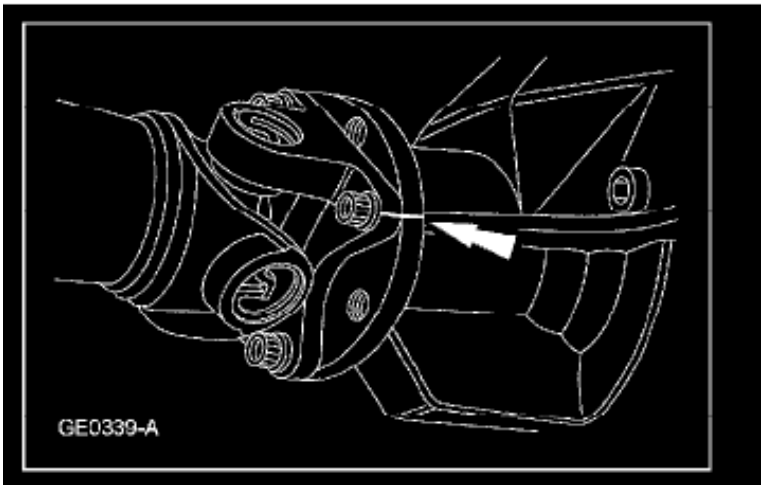
3. Position new extension housing seal with drain hole in the 6 o'clock position.



GD1402-A



307-038
N0041589



GE0339-A

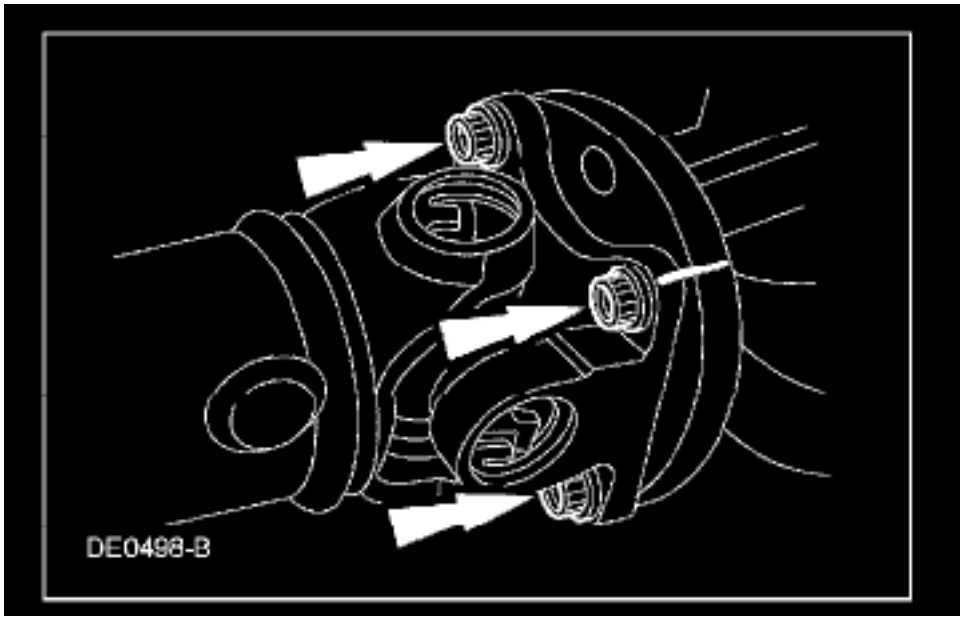
4. Using the special tool, install the extension housing seal.

5. NOTE: Inspect the driveshaft slip-yoke for wear and damage. Install a new component if required.

Align the driveshaft with the marks made during removal to make sure of correct balance.

6. With the marks aligned, install the rear driveshaft and bolts.

^ Tighten to 103 Nm (76 lb-ft).



7. Fill the transmission to the correct fluid level with clean automatic transmission fluid and check for correct transmission operation.

15. Connect the digital TR sensor electrical connector.

16. Connect the selector lever cable to the manual control lever.

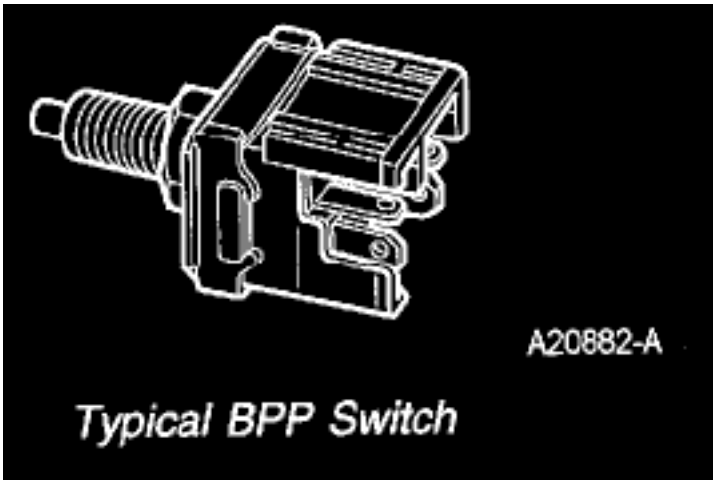
17. If equipped, position the servo heat shield over the servos and clip it to the pan rail.

^ Tighten to 10 Nm (89 lb-inch).

18. NOTE: Start with a minimum of 3.7L (4 qt) clean automatic transmission fluid.

Fill transmission with clean automatic transmission fluid to the correct fluid level.

19. Apply the park brake and start the engine. 20. Move the range selector lever through all the gears. 21. Check the transmission fluid level.



Brake Switch - TCC: Description and Operation

BRAKE PEDAL POSITION (BPP) SWITCH

Typical BPP Switch

The BPP switch is sometimes referred to as the stoplamp switch. The BPP switch provides a signal to the PCM indicating that the brakes are applied. The BPP switch is normally open and is mounted on the brake pedal support. Depending on the vehicle application the BPP switch can be hardwired as follows:

- to the PCM supplying battery positive voltage (B+) when the vehicle brake pedal is applied.

- to the antilock brake system (ABS) module, or lighting control module (LCM), the BPP signal is then broadcast over the network to be received by the PCM.

- to the ABS traction control/stability assist module. The ABS module interprets the BPP switch input along with other ABS inputs and generates an output called the driver brake application (DBA) signal. The DBA signal is then sent to the PCM and to other BPP signal users.

Shift Solenoid: Service and Repair

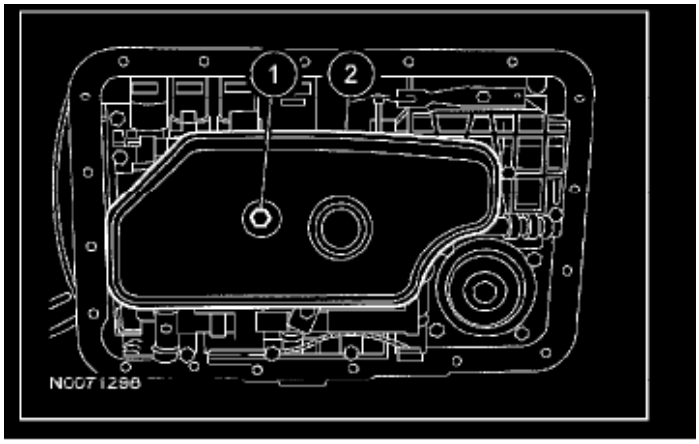
Solenoids - Shift, Torque Converter Clutch, Electronic Pressure Control

Removal

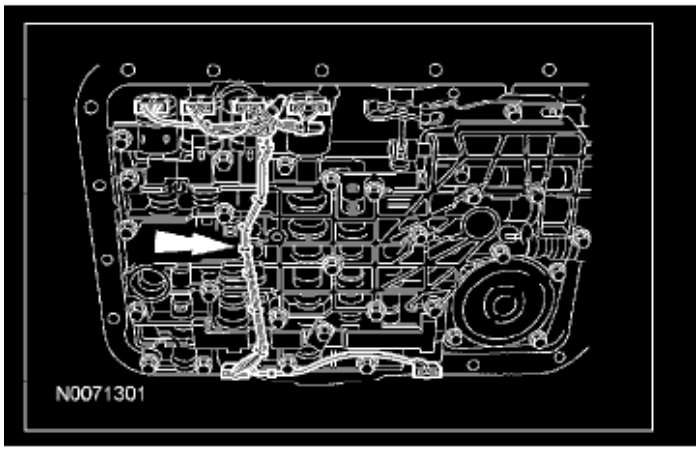
1. With the vehicle in NEUTRAL, position it on a hoist.

2. NOTE: If equipped, the transmission servo heat shield needs to be unclipped from the fluid pan rail and positioned aside for fluid pan removal.

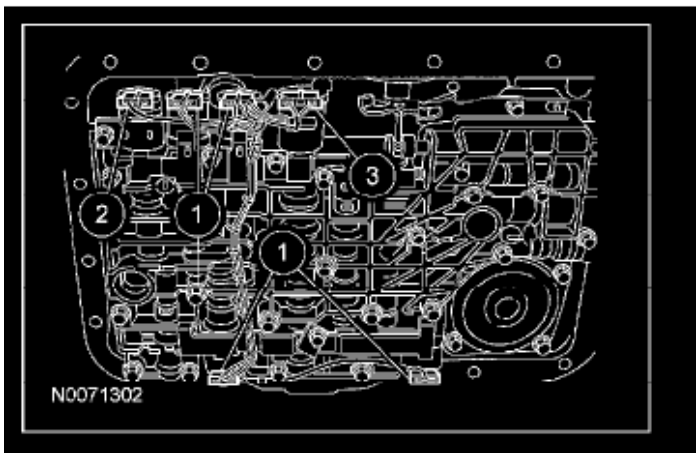
If equipped, loosen the nut and position the heat shield aside.



1
2
N0071298



N0071301



3
2
1
1
N0071302

3. Place a drain pan under the transmission fluid pan. 4. Drain the transmission fluid. 5. Remove the transmission fluid filter.

1 Remove the transmission fluid filter screw.

2 Remove the transmission fluid filter.

6. NOTE: Main control assembly does not need to be removed for solenoid service.

Remove wire loom guide and protector. ^

Carefully lift up on wire loom guide and protector and disengage the retaining pins from the solenoid clamps.

7. Disconnect the appropriate solenoid electrical connector.

1 Disconnect shift solenoids electrical connectors.

2 Disconnect the torque converter clutch (TCC) solenoid electrical connector.

3 Disconnect the electronic pressure control (EPC) solenoid electrical connector.

8. CAUTION: The torque converter clutch (TCC) solenoid and converter modulator valve may pop out of its bore. This may damage the

solenoid or converter modulator valve.

CAUTION: Shift solenoid (SSC) may pop out of its bore. This may damage the solenoid.

Remove the shift solenoids. 1

Remove the wire harness.

2 Remove the solenoid clamp screws.

3 Remove the solenoid clamp.

4 Remove the appropriate solenoid(s).

Installation

1. Install the new solenoid(s).

2. NOTE: The solenoid clamp must be installed in the torque converter clutch (TCC) and electronic pressure control (EPC) solenoid grooves, shift

solenoid pockets and the No. 204 plug.

Install the solenoid clamp. 1

Position the solenoid clamp on the main control valve body.

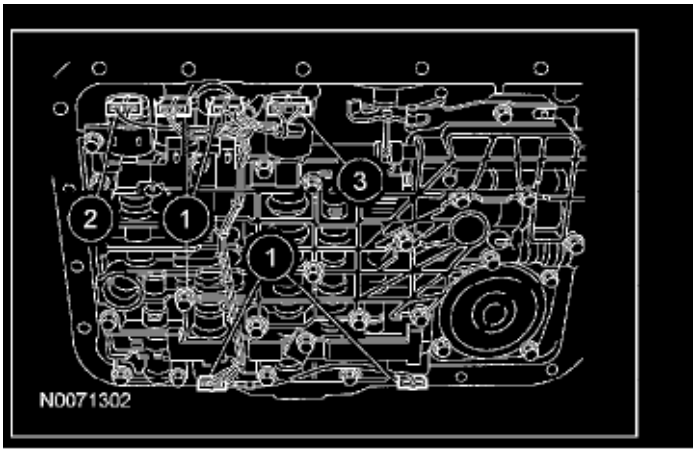
2 Install the solenoid clamp screws.

3. Connect the 6 solenoid electrical connectors.

1 Connect shift solenoid SSA, SSB, SSC, SSD electrical connectors.

2 Connect the TCC solenoid electrical connector.

3 Connect the EPC solenoid electrical connector.



3
2
1
1
N0071302

4. CAUTION: Excessive pressure may break the retaining pins.

Install the main control valve body wire loom. ^

Align the retaining pins to the holes in the solenoid clamps and gently press in the main control valve body wire loom guide and protector.

5. Install the transmission fluid filter.

1 Install the transmission fluid filter.

2 Install the transmission fluid filter screw. ^

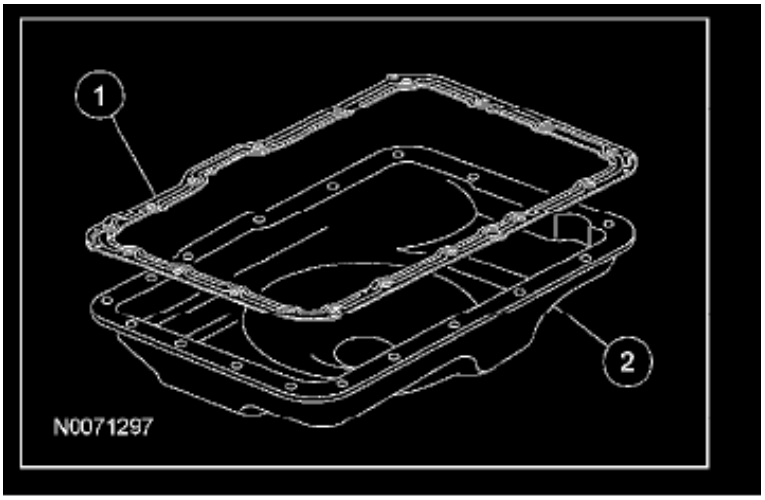
Tighten to 10 Nm (89 lb-inch).

6. NOTE: The transmission fluid pan gasket is reusable. Clean and inspect for damage, if not damaged, the gasket should be reused.

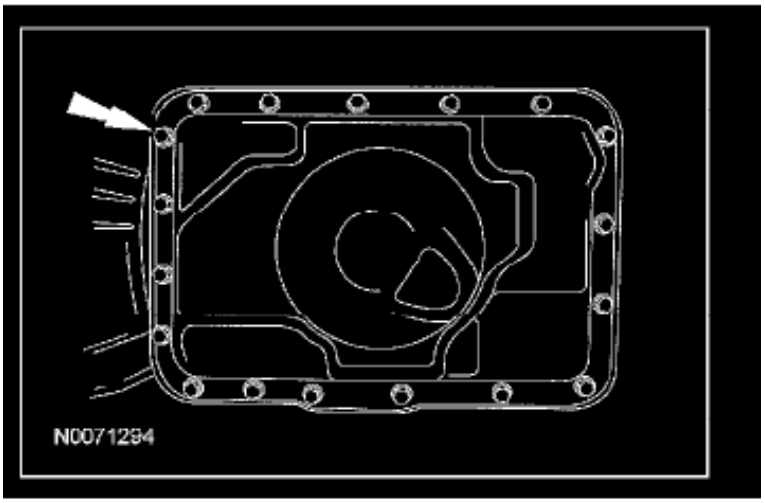
Install the transmission fluid pan. 1

Position the transmission fluid pan gasket on the transmission fluid pan.

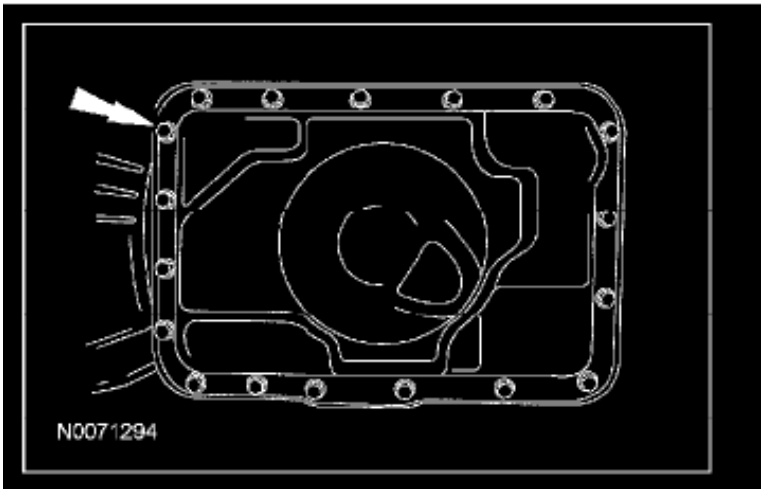
2 Align and install the transmission fluid pan.



1
2
N0071297



N0071294



N0071294

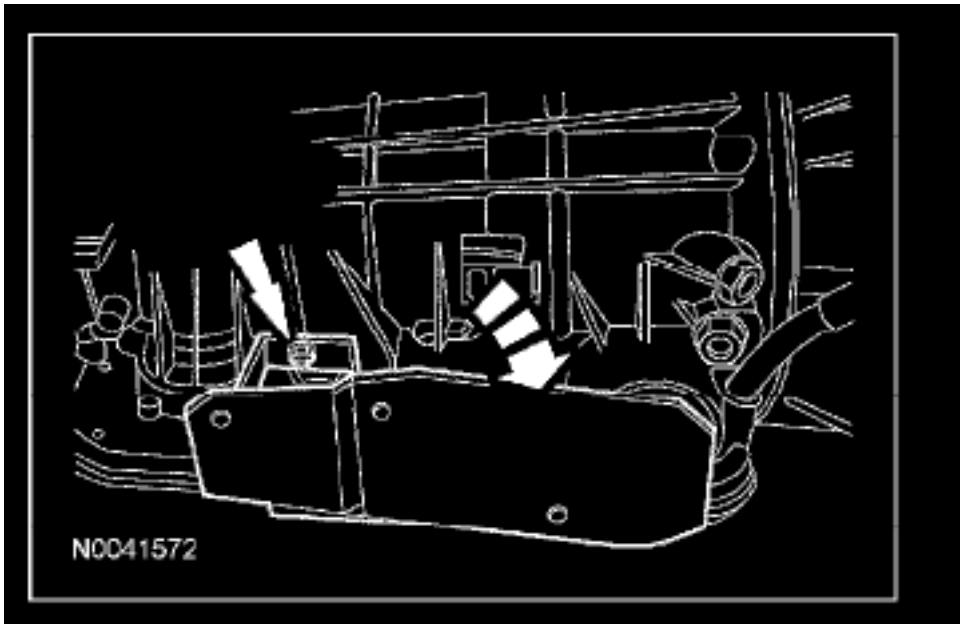
7. Loosely install the transmission fluid pan screws.

8. Tighten the transmission fluid pan screws in a crisscross pattern.

^ Tighten to 10 Nm (89 lb-inch).

9. If equipped, position the servo heat shield over the servos and clip it to the pan rail.

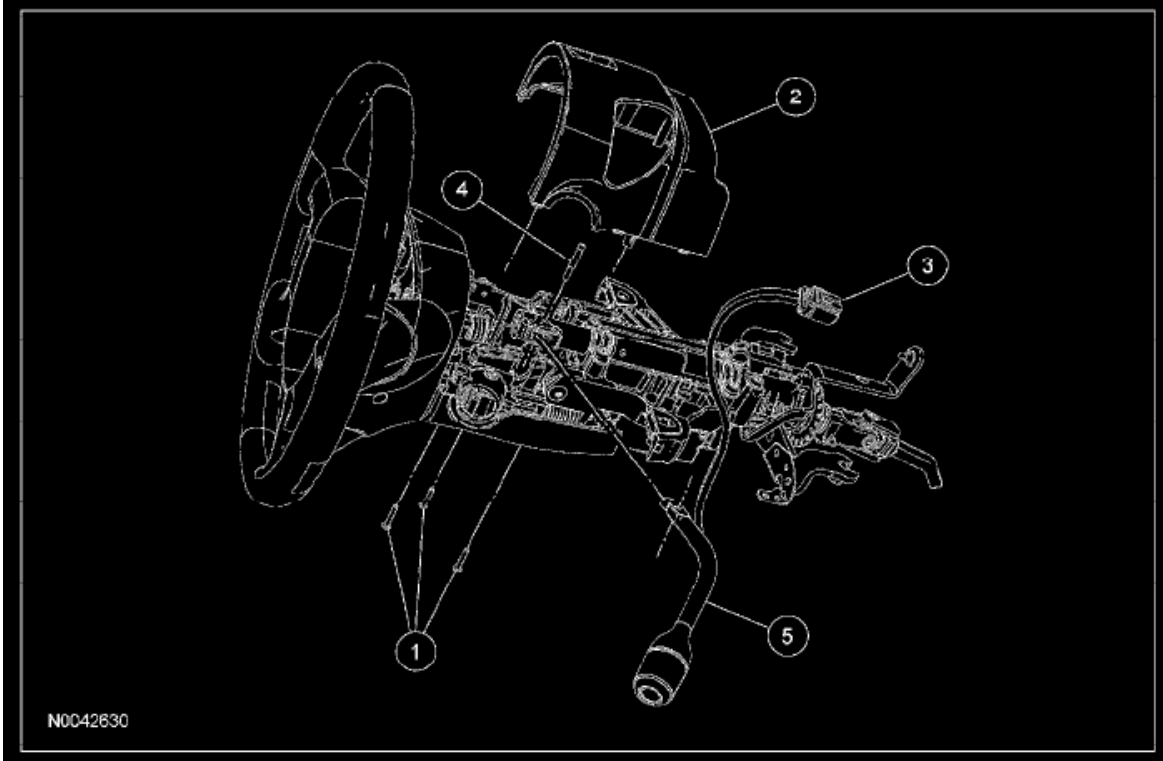
^ Tighten to 10 Nm (89 lb-inch).



10. NOTE: Start with a minimum of 3.7L (4 qt) clean automatic transmission fluid.

Fill transmission with clean automatic transmission fluid to the correct fluid level.

Transmission Selector Lever



Item	Part Number	Description
1	391727_S	Steering column shroud screws
2	3530-A	Steering column upper shroud
3	—	Transmission control switch electrical connector
4	7W441-B	Transmission selector lever pin

Shift Cable: Adjustments

Selector Lever Cable Adjustment

1. With the vehicle in NEUTRAL, position it on a hoist. 2. Place the gearshift lever in the (D) position and hang a 1.4 kg (3 lb) weight on the shift control selector lever.

^ Move the gearshift lever to the first gear position, then move back 2 detents to the (D) position.

^ Hang the 1.4 kg (3 lb) weight on the gearshift lever.

3. Verify the position of the selector lever indicator. If the selector lever indicator does not match the selector lever position the selector lever

indicator will need to be adjusted.

4. Disconnect the transmission selector lever cable from the manual control lever.

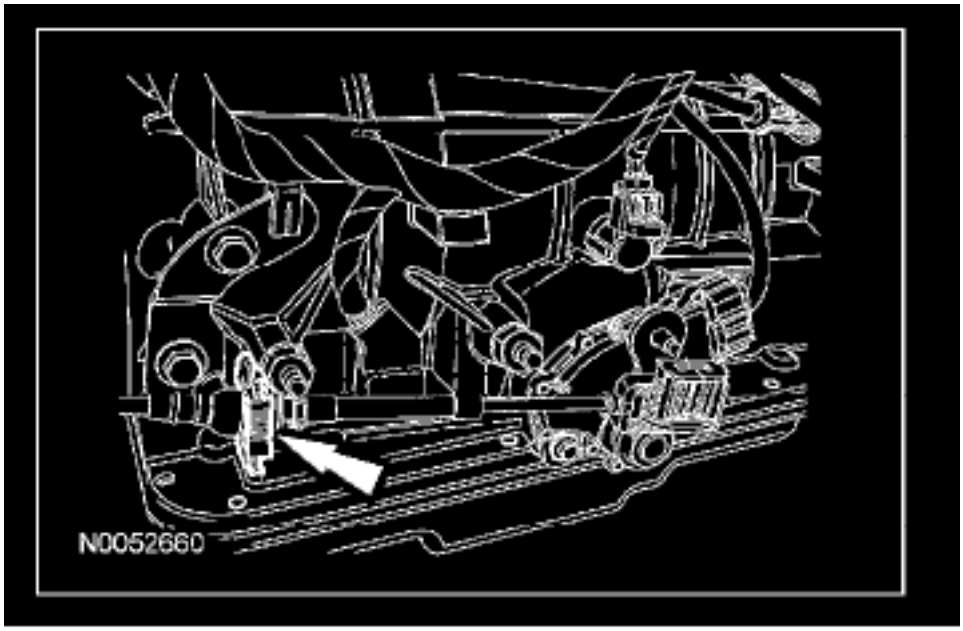
5. Remove the selector lever cable clip and remove the cable from the bracket.

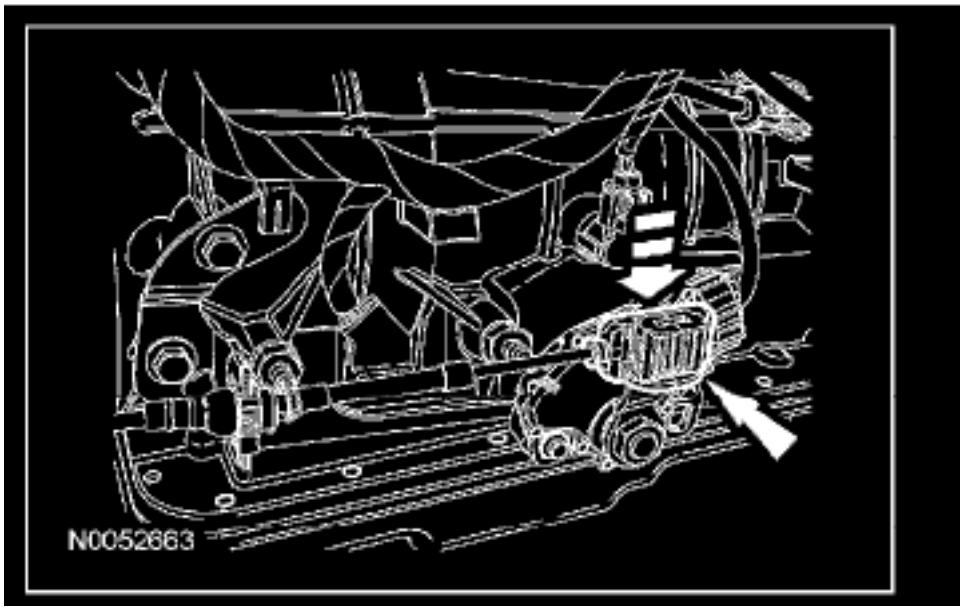
6. Place the manual control lever in the (D) position.

1 Rotate the manual control lever fully counterclockwise.

2 Rotate the manual control lever clockwise to the (D) position (2 detents).

7. Install the selector lever cable into the bracket and install the clip.





8. Connect the transmission selector lever cable to the manual control lever.

9. Remove the 1.4 kg (3 lb) weight.

10. CAUTION: To prevent damage, do not adjust the transmission selector lever cable in any position other than (D).

Verify that the vehicle will start only in PARK or NEUTRAL and that backup lamps illuminate in REVERSE. If not, repeat Steps 1 through 7 and carry out a digital transmission range (TR) sensor alignment.

Selector Lever Cable And Bracket (Part 2)

Removal and Installation

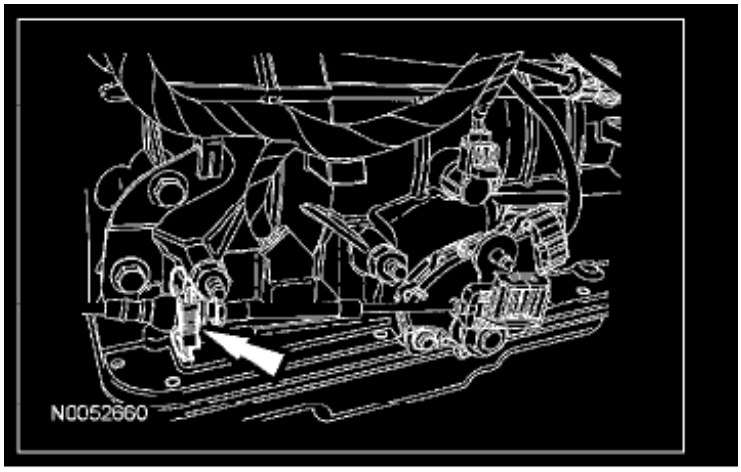
1. Disconnect the transmission selector lever cable from the steering column.

1 Disconnect the selector lever cable from the transmission column shift selector tube.

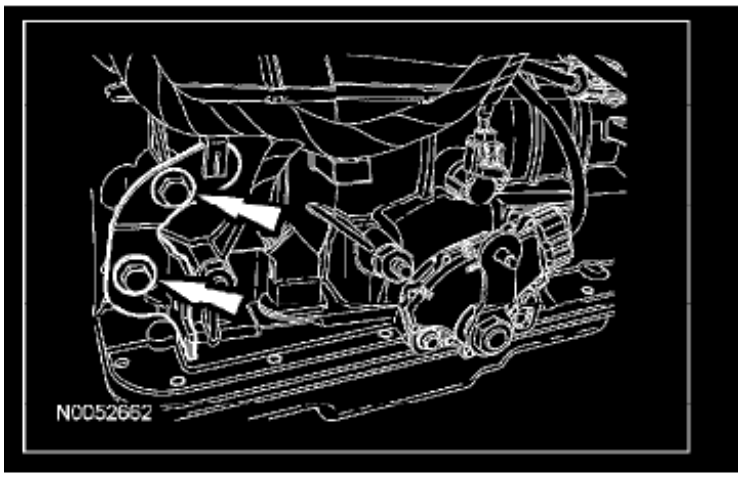
2 Disconnect the selector lever cable from the steering column bracket.

2. Push the rubber grommet and selector lever cable through the bulkhead. 3. With the vehicle in NEUTRAL, position it on a hoist. 4. Disconnect the selector lever cable from the locking clip. 5. Remove the transmission selector lever cable from the manual lever.

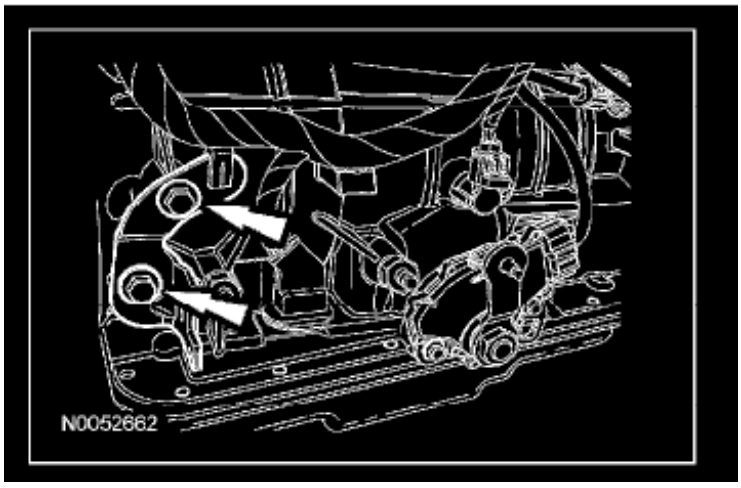
6. Remove the selector lever cable clip and remove the cable from the bracket.



N0052660



N0052662



N0052662

7. Remove the transmission selector lever cable bracket from the automatic transmission.

8. To install, reverse the removal procedure.

^ Tighten to 40 Nm (30 lb-ft).

^ Move manual lever into the (D) position.

^ Adjust the transmission selector lever cable.

Torque Converter: Description and Operation

Torque Converter

The torque converter transmits and multiplies torque. The torque converter is a 4-element device: ^

Impeller assembly

^ Turbine assembly

^ Reactor assembly

^ Clutch and damper assembly

The standard torque converter components operate as follows:

Rotation of the converter housing and impeller set the fluid in motion.

The turbine reacts to the fluid motion from the impeller, transferring rotation to the geartrain through the input shaft.

The reactor redirects fluid going back into the impeller, allowing for torque multiplication.

The clutch and damper assembly dampens powertrain torsional vibration and provides a direct mechanical connection for improved efficiency.

Power is transmitted from the torque converter to the planetary gearsets and other components through the input shaft.

Stall Speed Chart

Engine	Transmission	RPM
2.3L	5R44E	2,660-3,129

Torque Converter: Testing and Inspection Stall Speed Chart

Stall Speed Chart

Stall Speed Chart

Torque Converter: Testing and Inspection Torque Converter Diagnosis

Torque Converter Diagnosis

Prior to installing new or remanufactured torque converters, all diagnostic procedures must be followed. This is to prevent the unnecessary installation of new or remanufactured torque converters. Only after a complete diagnostic evaluation can the decision be made to install a new or remanufactured torque converter.

Begin with the normal diagnostic procedures as follows: 1. Preliminary Inspection. See: Transmission Control Systems/Testing and Inspection/Initial Inspection and Diagnostic Overview/Preliminary

Inspection

2. Know and Understand the Customer's Concern. 3. Verify the Concern. Refer to the Torque Converter Operation Test. See: Transmission Control Systems/Testing and Inspection/Component Tests

and General Diagnostics/Torque Converter Operation Test

4. Carry out Diagnostic Procedures. See: Transmission Control Systems/Testing and Inspection/Initial Inspection and Diagnostic

Overview/Diagnostics ^

Run on-board diagnostics. Refer to the On-Board Diagnostics With Scan Tool. -

Repair all non-transmission related DTCs first.

- Repair all transmission DTCs.

- Rerun on-board diagnostics to verify repair.

^ Carry out Line Pressure Test. Refer to the Special Testing Procedures. See: Transmission Control Systems/Testing and Inspection/Component Tests and General Diagnostics/Special Testing Procedures

^ Carry out Stall Speed Test. Refer to the Special Testing Procedures. See: Transmission Control Systems/Testing and Inspection/Component Tests and General Diagnostics/Special Testing Procedures

^ Carry out Diagnosis by Symptom Index. Refer to Diagnosis By Symptom. See: Transmission Control Systems/Testing and Inspection/Symptom Related Diagnostic Procedures/Diagnosis By Symptom -

Use the index to locate the appropriate routine that best describes the symptom(s). The routine will list all possible components that may cause or contribute to the symptom. Check each component listed; diagnose and service as required before servicing the torque converter.

Torque Converter: Testing and Inspection Torque Converter Operation Test

Torque Converter Operation Test

This test verifies that the torque converter clutch control system and the torque converter are operating correctly.

1. Carry out Quick Test. Refer to the On-Board Diagnostics With Scan Tool. Check for DTCs. Refer to the DTC Chart. See: Transmission Control

Systems/Testing and Inspection/Initial Inspection and Diagnostic Overview/Diagnostics See: Transmission Control Systems/Testing and Inspection/Diagnostic Trouble Code Descriptions

2. Connect a tachometer to the engine. 3. Bring the engine to normal operating temperature by driving the vehicle at highway speeds for approximately 15 minutes in (D) position. 4. After normal operating temperature is reached, maintain a constant vehicle speed of about 80 km/h (50 mph) and tap brake pedal with the left foot. 5. Engine rpm should increase when brake pedal is tapped, and decrease about 5 seconds after pedal is released. If this does not occur, refer to the

Torque Converter Operation Concerns in Diagnosis By Symptom. See: Transmission Control Systems/Testing and Inspection/Symptom Related Diagnostic Procedures/Diagnosis By Symptom

6. If the vehicle stalls in (D) or manual 2 at idle with vehicle at a stop, move the transmission range selector lever to manual 1 position. If the vehicle

stalls, refer to the Torque Converter Operation Concerns in Diagnosis By Symptom. Repair as required. If the vehicle does not stall in (D), refer to Diagnosis By Symptom. See: Transmission Control Systems/Testing and Inspection/Symptom Related Diagnostic Procedures/Diagnosis By Symptom

Torque Converter: Testing and Inspection Torque Converter

Torque Converter

1. A new or remanufactured torque converter must be installed if one or more of the following statements is true:

^ A torque converter malfunction has been determined based on complete diagnostic procedures.

^ Converter stud or studs, impeller hub or bushing are damaged.

^ Discoloration (due to overheating).

^ Evidence of transmission assembly or fluid contamination due to the following transmission or converter failure modes: -

Major metallic failure.

- Multiple clutches or clutch plate failures.

- Sufficient component wear which results in metallic contamination.

- Internal torque converter contamination present. For additional information refer to Torque Converter Contamination Inspection. See: Testing and Inspection/Component Tests and General Diagnostics/Torque Converter Contamination Inspection

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

Torque Converter: Testing and Inspection Torque Converter Contamination Inspection

Torque Converter Contamination Inspection

CAUTION: Do not use water-based cleaners or mineral spirits to clean or flush the torque converter or transmission damage will occur. Use only clean automatic transmission fluid designated for the transmission and converter being serviced.

NOTE: The torque converter drain plug and seal are not reusable. If equipped, discard the drain plug and seal, then install a new drain plug assembly.

1. If a new or remanufactured torque converter is not being installed, the following steps must be completed. 2. With the torque converter on a bench, pour a small amount of transmission fluid from the torque converter onto an absorbent white tissue or

through a paper filter and examine the fluid.

3. Observe the color and odor of the fluid. The fluid should be red, not brown or black. Odor may indicate an overheating condition such as clutch

disc or band failure.

4. Examine the stain on the tissue for evidence of particles (spec of any kind). Examine the fluid level indicator for signs of antifreeze (gum or

varnish). If particles are present in the fluid or there is evidence of engine coolant or water, a new torque converter must be installed.

5. If there are no particles or contamination present, drain the remainder of the transmission fluid from the torque converter. 6. Add 1.9L (2 qt) of clean automatic transmission fluid into the converter and agitate by hand. 7. Thoroughly drain the fluid.

Transmission Cooler: Initial Inspection and Diagnostic Overview

Inspection and Verification

CAUTION: Do not repair the radiator. Aluminum tabs securing radiator outlet tank are permanently damaged during disassembly.

When fluid leakage is found at any of the transmission fluid cooling components, a new component must be installed.

Symptom Chart — Transmission Cooling

Condition	Possible Sources	Action
• Transmission overheating	• Clogged transmission fluid cooler or lines • System leaks • Engine overheating • Internal transmission concerns	• REPAIR as required. • INSPECT transmission fluid cooler and lines for leaks. REPAIR as required. • REFER to Cooling System. • REFER to A/T.
• Fluid leak at the transmission in-tank cooler	• Transmission fluid cooler-to-fluid cooler fitting	• REFER to the Component Test.

Symptom Chart — Noise, Vibration and Harshness (NVH)

NOTE: Noise, vibration and harshness (NVH) symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Vehicle/Testing. Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Vehicle/Testing for the next likely system and continue diagnosis.

Condition	Possible Sources	Action
• Vibration — a high frequency (20-80 Hz) that is felt through the seat or selector lever. Changes with engine speed	• Transmission cooler lines grounded out	• CHECK the transmission cooler lines. REPAIR as necessary.

Transmission Cooler: Component Tests and General Diagnostics

Transmission Fluid Cooler Leaks at Radiator

Transmission fluid may leak between the radiator transmission fluid cooler and the transmission fluid cooler fitting (not the cooler line into the fitting), which may result in a residue of transmission fluid on the radiator tank around the fluid cooler fitting. Insufficient thread sealer on the transmission fluid cooler fitting may be the cause.

1. Clean the area around the transmission fluid cooler fittings.

2. Verify that transmission fluid is leaking between the transmission fluid cooler and the transmission fluid cooler fitting (not the transmission fluid

cooler line fitting into the transmission fluid cooler fitting).

3. Remove the radiator from the vehicle and place it on a flat surface with the transmission fluid cooler fittings facing upward. Refer to Cooling

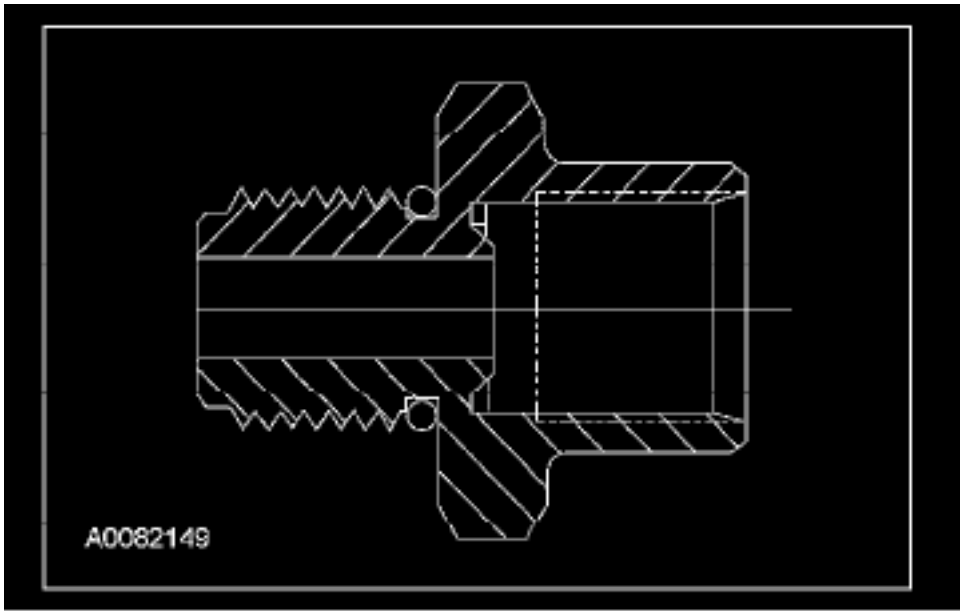
System.

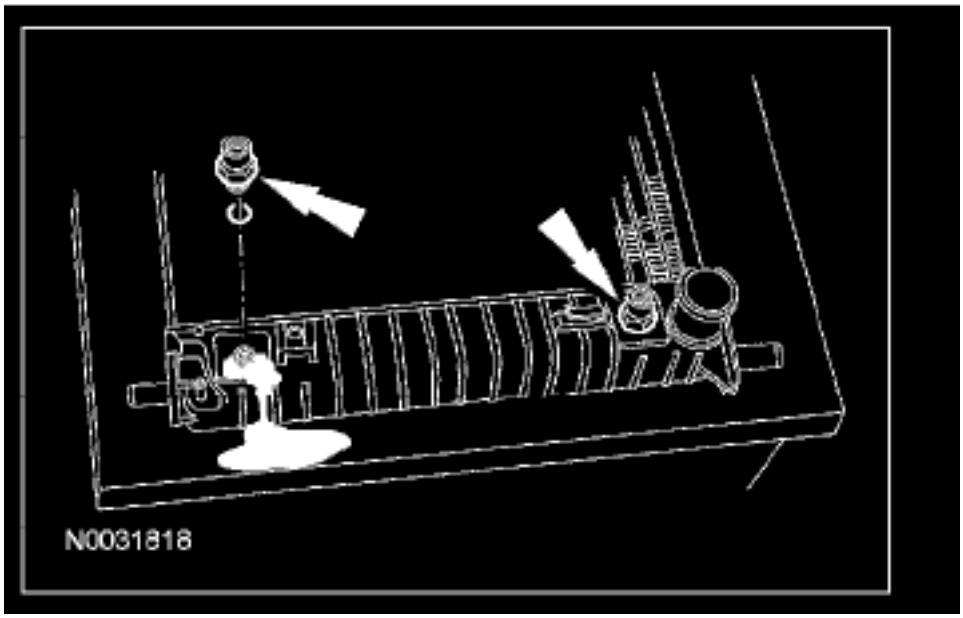
4. CAUTION: Oil-based solvents and cleaners should not be used when cleaning the radiator. Oil-based solvents and cleaners may damage

the radiator end tank seals and cause leaks.

Clean the area around the transmission fluid cooler fittings so that contaminants do not enter the transmission fluid cooler when the transmission fluid cooler fittings are removed.

5. NOTE: Remove only one transmission fluid cooler fitting at a time, otherwise the cooler may drop into the radiator.





Remove the upper transmission fluid cooler fitting.

6. Once the fitting is removed from the transmission fluid cooler, verify that there is a gasket between the transmission fluid cooler and the inside of

the radiator tank. ^

If there is no gasket, install a new radiator.

^ If there is a gasket, proceed to the next step.

7. Inspect the transmission fluid cooler fitting threads for damage.

^ If the threads are damaged, install a new radiator.

^ If the threads show no sign of damage, proceed to the next step.

8. CAUTION: Thread sealant or tape should never be used on the threads of the transmission fluid cooler fittings. The use of such

materials will create a leak path.

Install a new O-ring on the transmission fluid cooler fitting.

9. NOTE: Do not use air tools to tighten the transmission fluid cooler fitting. Use a hand-operated torque wrench only.

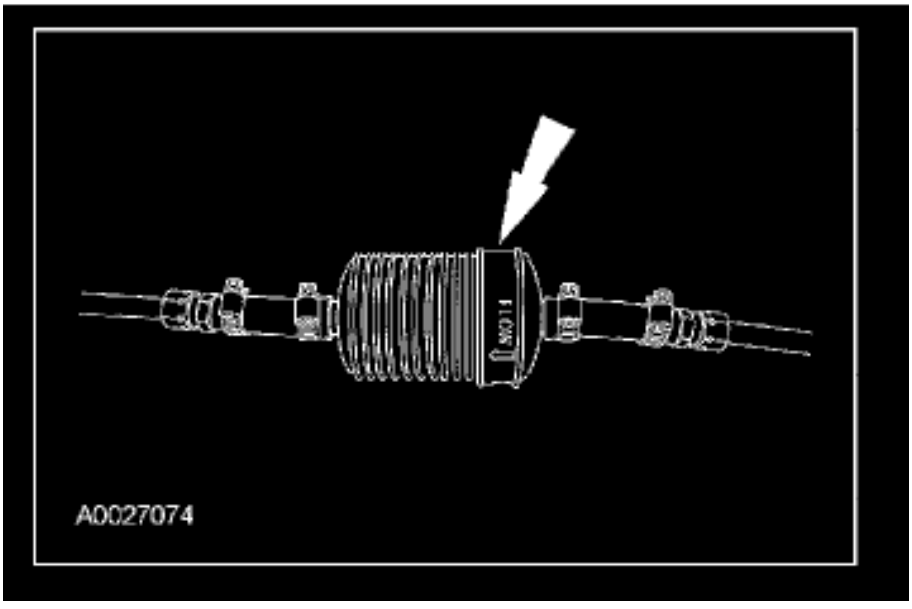
Making sure that the gasket between the transmission fluid cooler and the inside of the radiator tank is still in place, install the transmission fluid cooler fitting. ^

Tighten to 60 Nm (44 lb-ft).

10. Follow the procedure to install a new O-ring on the other transmission fluid cooler fitting. 11. Make sure that no radiator coolant has entered the transmission fluid cooler. Install the radiator in the vehicle. 12. Verify that both the transmission and the engine cooling system are at the correct fluid levels.

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V



Transmission Cooler: Procedures

Transmission Fluid Cooler Backflushing and Cleaning

CAUTION: Whenever a transmission has been disassembled to install new parts or a new or remanufactured transmission has been installed, a new transmission fluid cooler, either in-tank, auxiliary or oil to air (OTA), if equipped will need to be installed. Using a suitable torque converter/fluid cooler cleaner, clean and backflush the transmission fluid cooler tubes.

When internal wear or damage has occurred in the transmission, metal particles, clutch plate material or band material may have been carried into the transmission fluid cooler. These contaminants are a major cause of recurring transmission concerns and must be removed from the system before the transmission is put back in use.

CAUTION: Use only clean automatic transmission fluid specified for this transmission. Do not use supplemental fluid additives, treatments or cleaning agent. The use of these materials may affect transmission operation and result in internal damage to the transmission.

NOTE: Do not use any solvents while carrying out this procedure. Only use clean automatic transmission fluid.

1. Conduct backflushing with a suitable torque converter/transmission fluid cooler cleaner. Test the equipment to make sure that a vigorous fluid

flow is present before proceeding. Install a new system filter if flow is weak or contaminated.

2. Remove and discard the in-line transmission fluid filter, if equipped.

3. To aid in attaching the cleaner to the transmission steel cooler lines, connect 2 additional rubber hoses to the transmission end of the steel

transmission cooler lines as described. ^

Connect the cleaner tank pressure line to the steel transmission cooler return line (longest line).

^ Connect a tank return hose to the steel transmission cooler pressure line (shorter line). Place the outlet end of this hose in the solvent tank reservoir.

4. Turn on the pump and allow the transmission fluid to circulate a minimum of 5 minutes (cycling switch on and off will help dislodge contaminants

in the cooler system).

5. Switch off the pump and disconnect the pressure hose from the transmission cooler return line.
6. Use compressed air to blow out the cooler(s) and lines (blow air into the transmission cooler return line) until all the fluid is removed. 7. Remove the rubber return hose from the remaining steel cooler line.

Transmission Insulator and Retainer

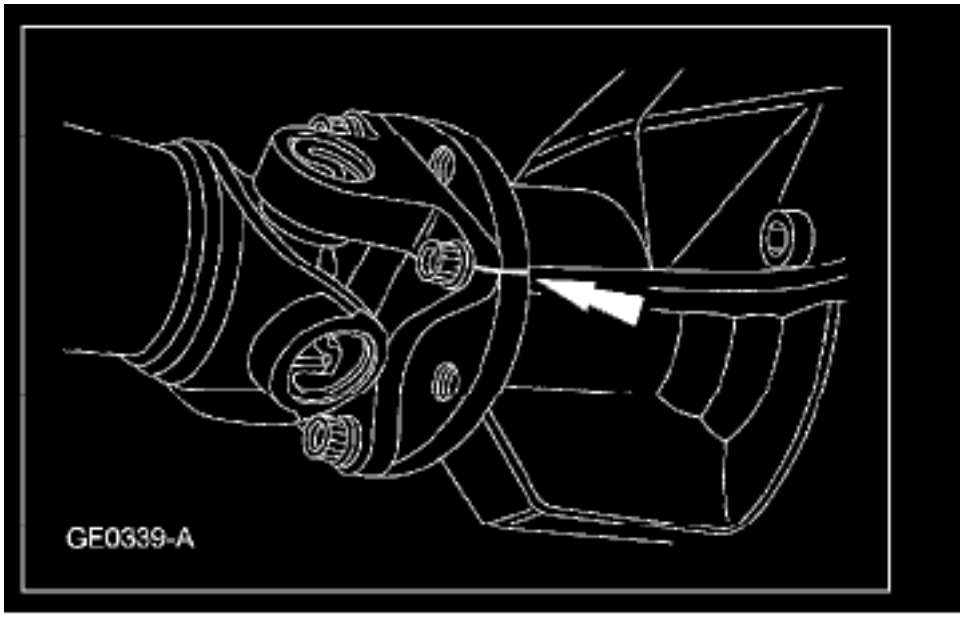
Removal

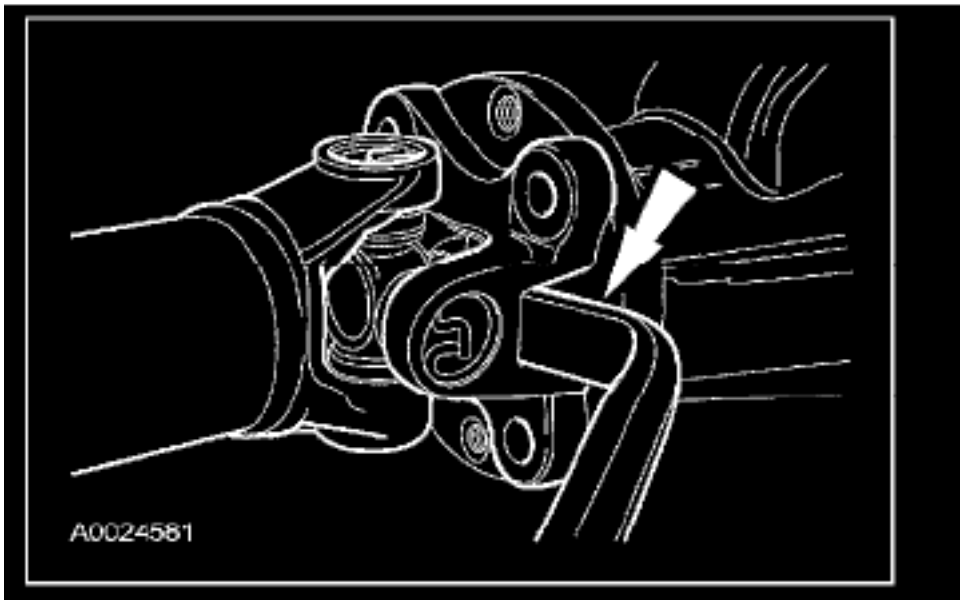
NOTE: Rear wheel drive (RWD) procedure shown, four wheel drive (4WD) similar. The front driveshaft must be removed.

1. With the vehicle in NEUTRAL, position it on a hoist.

2. NOTE: To maintain initial driveshaft balance, mark the rear driveshaft yoke and axle flange so they can be installed in their original alignment.

Mark the rear driveshaft.





3. Remove the 4 rear driveshaft bolts.

4. NOTE: Do not use a hammer.

Remove the rear driveshaft from the flange using a pry bar.

5. Remove the insulator nuts. 6. Raise and support the transmission. 7. Remove the insulator screws. 8. Remove the insulator.

Installation

1. Position the insulator on the extension housing. 2. Install the insulator-to-extension housing screws.

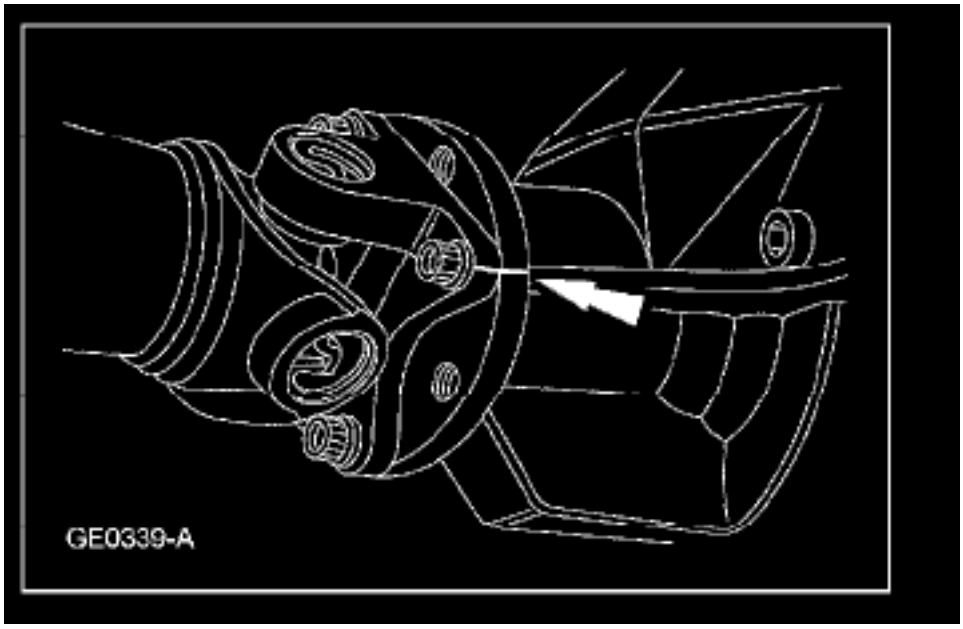
^ Tighten to 90 Nm (66 lb-ft).

3. Install the insulator into the crossmember and tighten the nuts.

^ Tighten to 90 Nm (66 lb-ft).

4. NOTE: Align the driveshaft with the marks made during removal to make sure of correct balance.

Align and install the rear driveshaft.



5. With the marks aligned, install the rear driveshaft and bolts.

^ Tighten to 103 Nm (76 lb-ft).

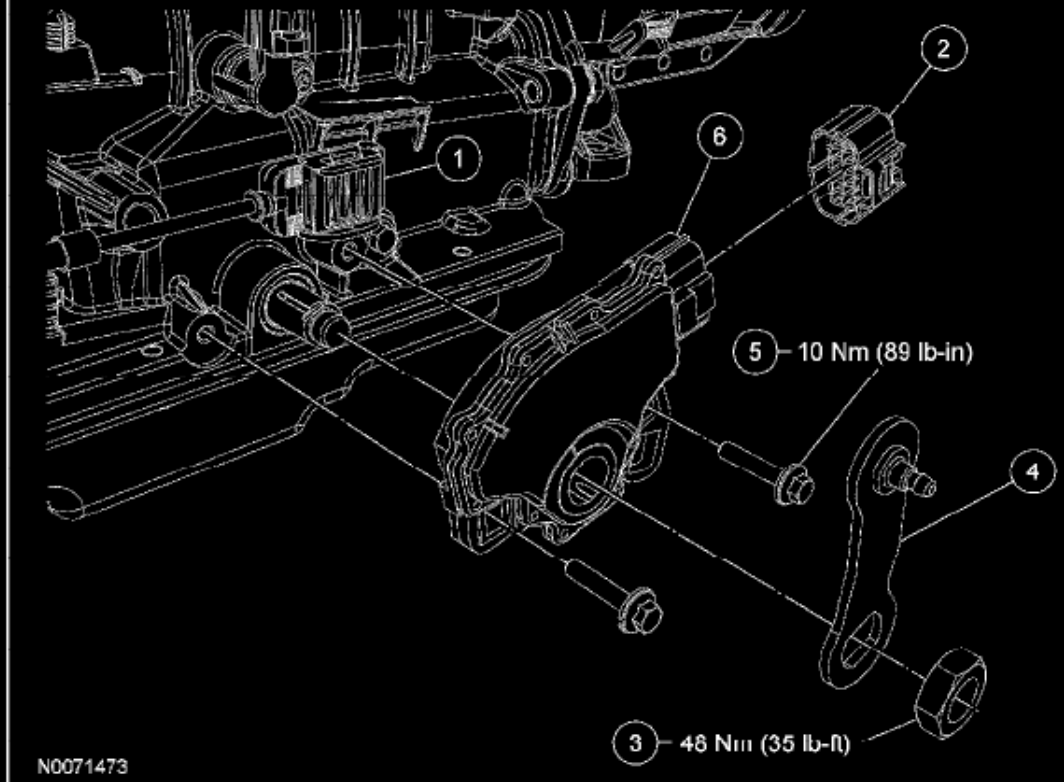
Special Tool(s)

ST1633-A	Alignment Gauge, TR Sensor 307-351 (T97L-70010-A)

Digital Transmission Range (TR) Sensor



Item	Part Number	Description
1	7E395-A	Selector lever cable
2	—	Digital transmission range (TR) sensor electrical connector
3	W701271-S	Manual control lever nut
4	7A256-A	Manual control lever
5	N806933-S	Digital TR sensor screw (2 required)
6	7F293-A	Digital TR sensor

Transmission Position Switch/Sensor: Service and Repair

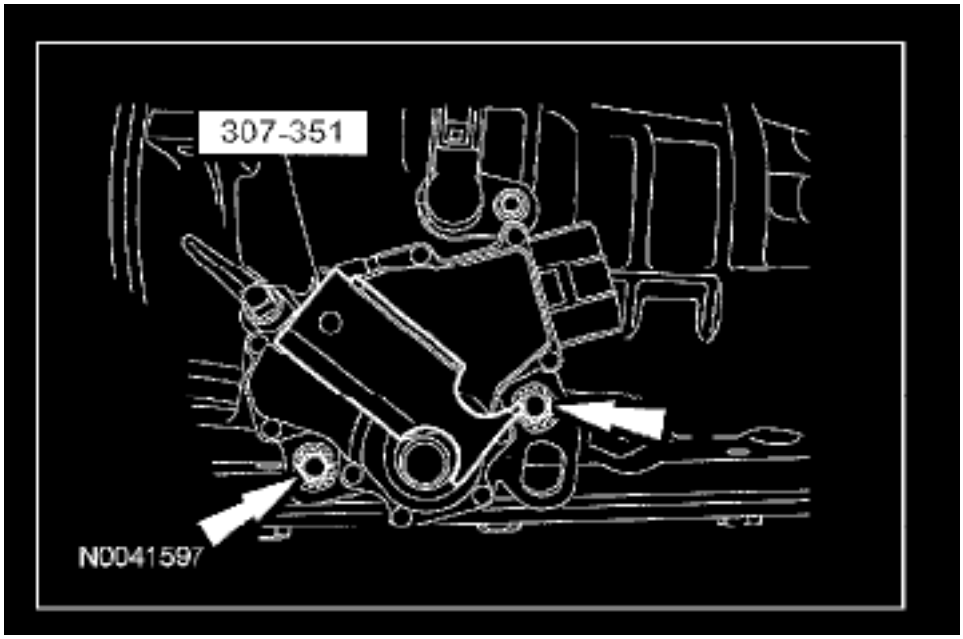
Digital Transmission Range (TR) Sensor

Digital Transmission Range (TR) Sensor

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. 2. Disconnect the selector lever cable from the manual control lever. 3. Disconnect the digital transmission range (TR) sensor electrical connector. 4. Remove the manual control outer lever nut and manual control outer lever. 5. Remove the screws and the digital TR sensor.

Installation



1. CAUTION: The digital transmission range (TR) sensor must fit flush against the boss on the case to prevent damage to the sensor.

Install the digital TR sensor and loosely install the screws.

2. CAUTION: Tightening one screw before tightening the other may cause the sensor to bind or become damaged.

NOTE: The manual lever must be in the NEUTRAL position.

Using the special tool, align the digital TR sensor and tighten screws in an alternating sequence. ^

Tighten to 10 Nm (89 lb-inch).

3. Install the manual control outer lever and nut.

^ Tighten to 48 Nm (35 lb-ft).

4. Connect the digital TR sensor electrical connector. 5. Connect the selector lever cable to the manual control lever. 6. Verify that the selector lever cable is adjusted correctly.

Output Shaft Speed (OSS) Sensor

Output Shaft Speed (OSS) Sensor

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. 2. Disconnect the output shaft speed (OSS) sensor electrical connector. 3. Remove the OSS sensor screw. 4. Remove the OSS sensor from the transmission.

Installation

1. NOTE: Inspect the OSS sensor O-ring for damage. If damaged, install a new O-ring Inspect and lubricate the O-ring with petroleum jelly.

Install the OSS sensor into the transmission.

2. Install the OSS sensor screw.

^ Tighten to 10 Nm (89 lb-inch).

3. Connect the OSS sensor electrical connector.

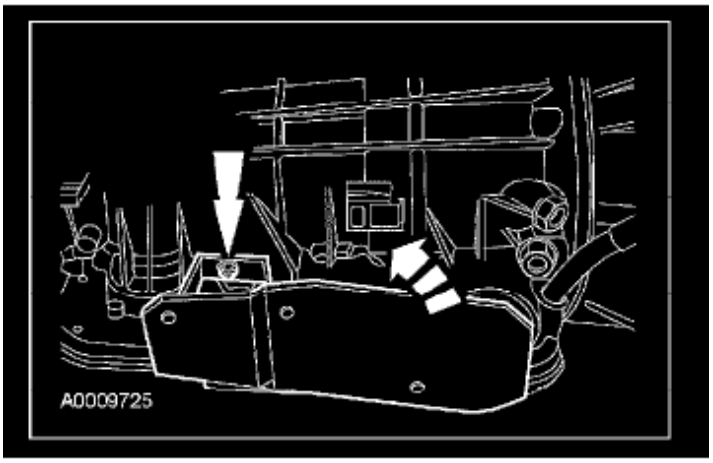
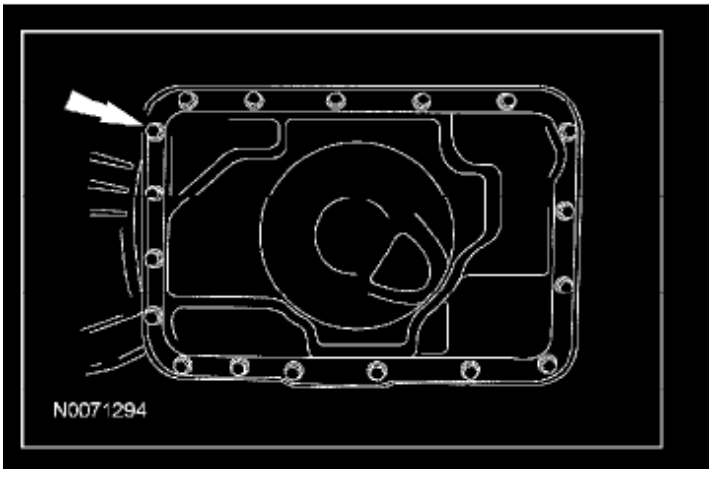
3	7G484	Shift solenoid (SSB)
4	7H144	Electronic pressure control (EPC)
5	7G484	Shift solenoid (SSA)
6	7G484	Shift solenoid (SSC)





Removal

1. With the vehicle in NEUTRAL, position it on a hoist.

2. NOTE: If equipped, the transmission servo heat shield needs to be unclipped from the fluid pan rail and positioned aside for fluid pan removal.

If equipped, loosen the nut and position the heat shield aside.

3. Drain transmission fluid.

^ Remove all the transmission fluid pan screws except for 2 in the front. Loosen the 2 front transmission fluid pan screws. Pry the rear of the transmission fluid pan down and allow fluid to drain. After fluid is drained, remove the front 2 transmission fluid pan screws.

4. NOTE: The transmission fluid pan gasket is reusable. Clean and inspect for damage, if not damaged, the gasket should be reused.

Remove the transmission fluid pan. 1

Remove the transmission fluid pan.

2 Remove the transmission fluid pan gasket.

8. Remove the manual control valve detent lever spring.

1 Remove the manual control valve detent lever spring screw.

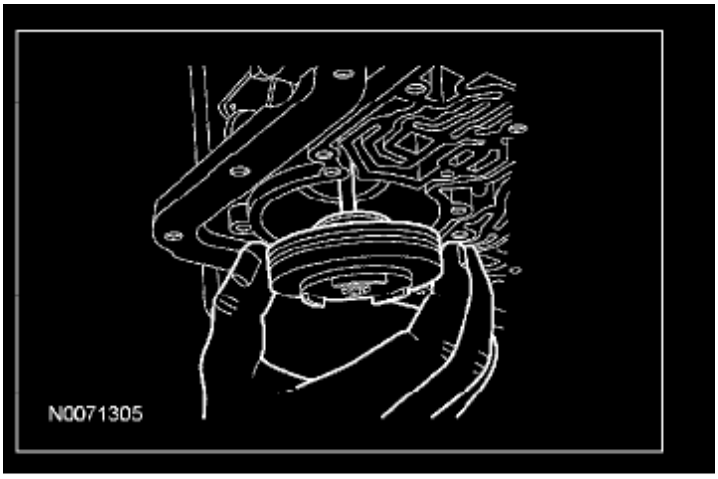
2 Remove the manual control valve detent lever spring.

9. Remove the low/reverse servo.

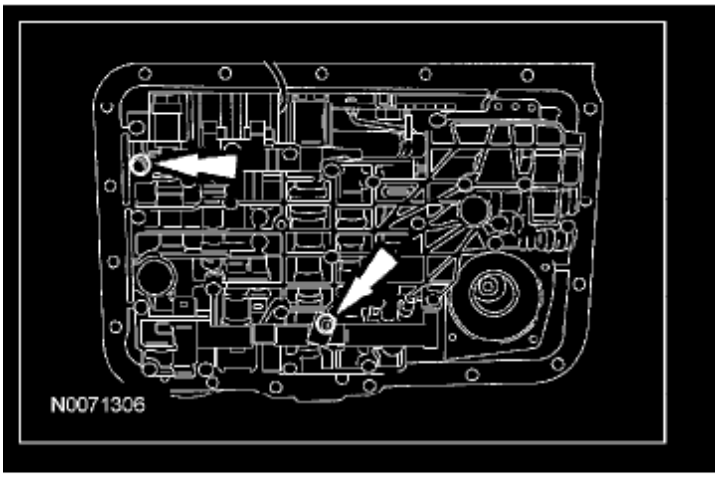
1 Remove the low/reverse servo cover screws.

2 Remove the low/reverse band servo cover and gasket. Discard the low/reverse servo separator plate cover gasket.

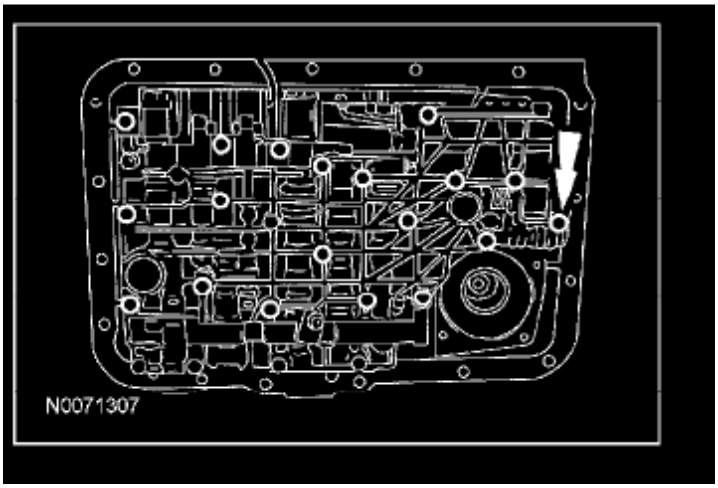
10. Remove the low/reverse band servo piston and rod.



N0071305



N0071306



N0071307

11. Do not remove the 2 (gold) screws specified.

12. CAUTION: Support the main control valve body until all of the screws are removed, otherwise damage to the main control valve body

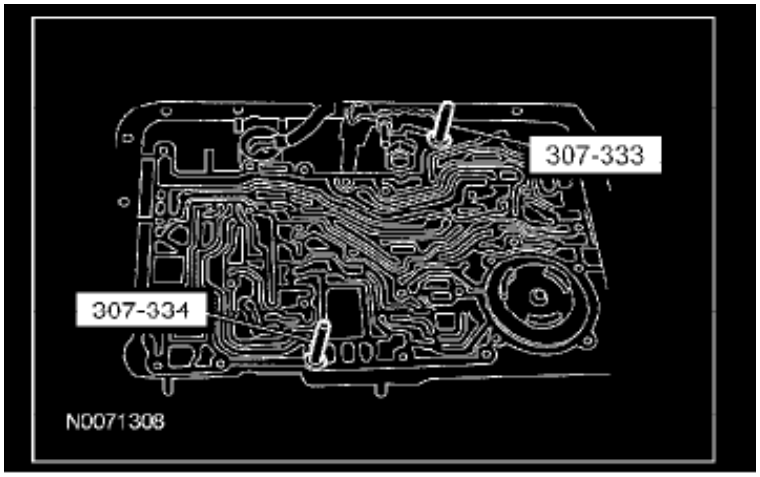
can occur.

Remove the screws.

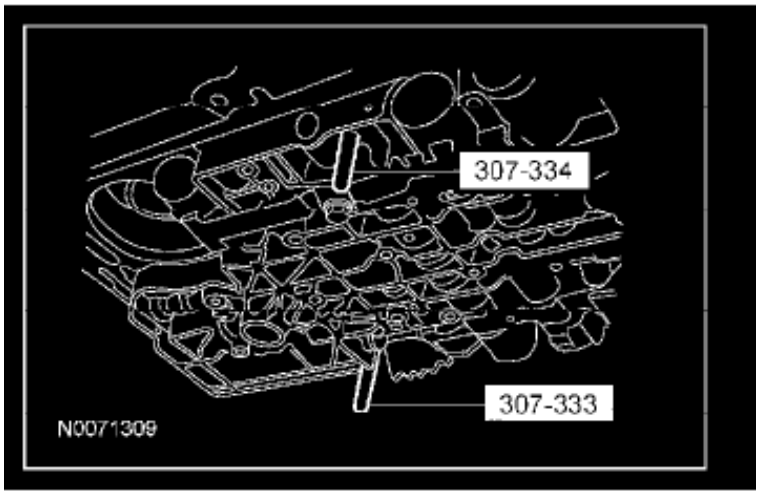
13. Remove the main control valve body.

Installation

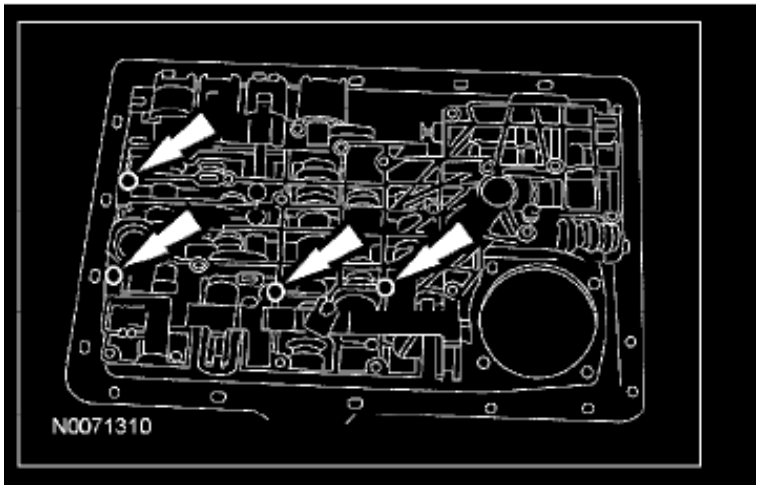
1. Install the special tools into the transmission case.



307-333
307-334
N0071308



307-334
307-333
N0071309



N0071310

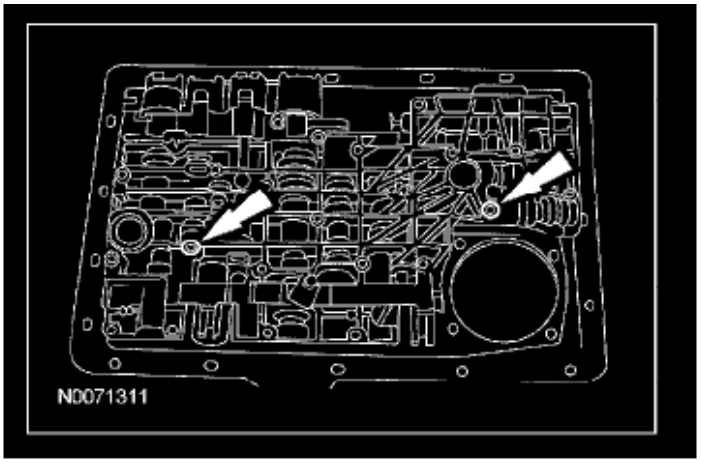
2. Position the main control valve body, using the 2 special tools as a guide.

3. NOTE: The main control valve body screws will be tightened in later steps.

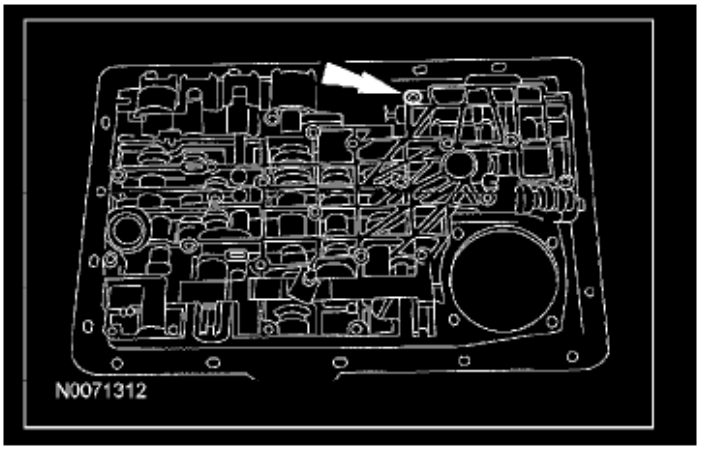
Loosely install 4 M6 x 45 mm (1.8 inch) screws.

4. NOTE: The main control valve body screws will be tightened in later steps.

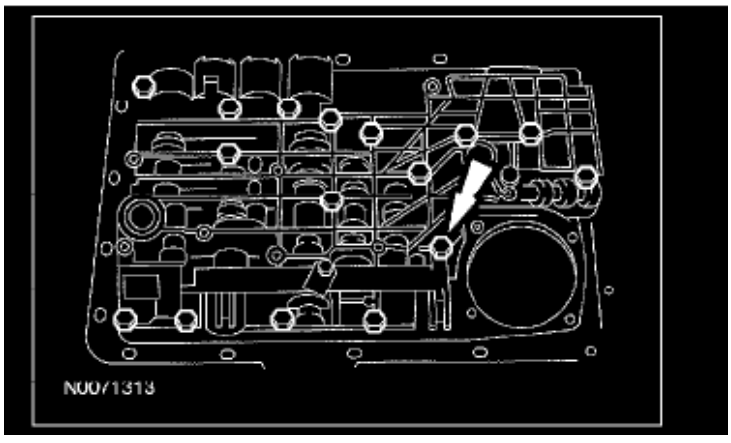
Loosely install 2 M6 x 35 mm (1.4 inch) screws.



N0071311



N0071312



N0071313

5. Remove the special tools.

6. NOTE: The main control valve body screws will be tightened in later steps.

Loosely install the M6 x 30 mm (1.2 inch) screw.

7. NOTE: The main control valve body screws will be tightened in later steps.

Loosely install the 16 M6 x 40 mm (1.6 inch) main control valve body screws.

8. Tighten the main control valve body screws in the sequence shown.

^ Tighten to 10 Nm (89 lb-inch).

Disassembly

1. CAUTION: The SSC solenoid may pop out of its bore. This may damage the solenoid.

Remove the SSA and the SSC clamp and SSA and SSC solenoid. 1

Remove the solenoid clamp screw.

2 Remove the solenoid clamp. 3 Remove the SSA and SSC solenoids.

2. CAUTION: The torque converter clutch (TCC) solenoid may pop out of its bore. This may damage the solenoid.

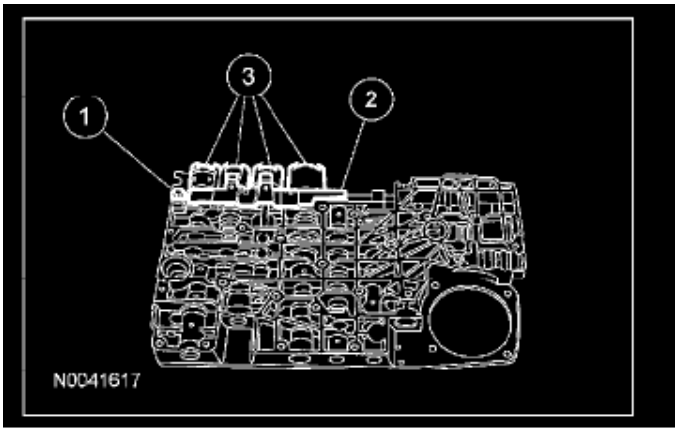
CAUTION: The converter modulator valve may come out after the torque converter clutch (TCC) solenoid. This may cause damage to the valve.

Remove the SSB, SSD, torque converter clutch (TCC) and the electronic pressure control (EPC) solenoid. 1

Remove the solenoid clamp screw.

2 Remove the solenoid clamp.

3 Remove the SSB, SSD, TCC and the EPC solenoids.



1

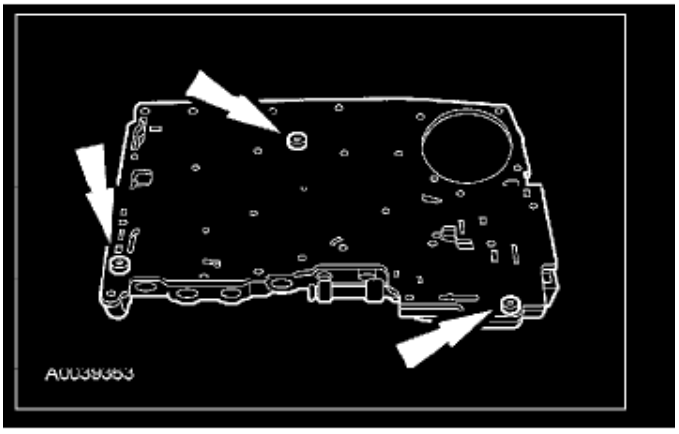
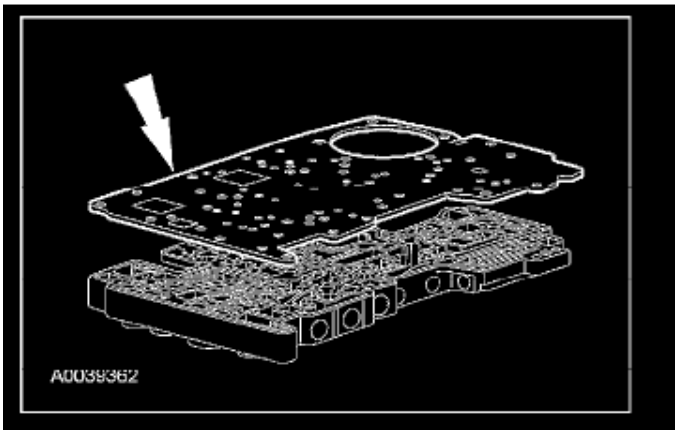
3
N0041617



A0039363



A0039362

3. Rotate the main control valve body so that the main control separating plate is facing up.

4. NOTE: Valves may come out when rotating the main control valve body.

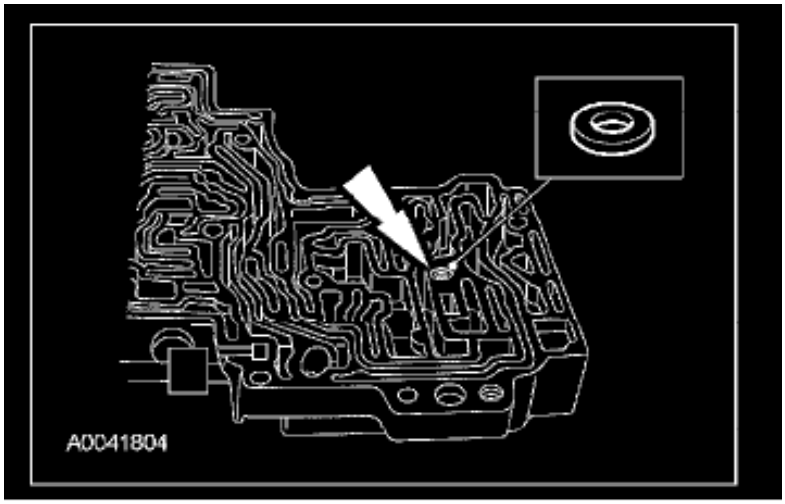
NOTE: The extension housing lube orifice and relief valves may stick to the separator plate.

NOTE: The main control separator plate has a bonded gasket.

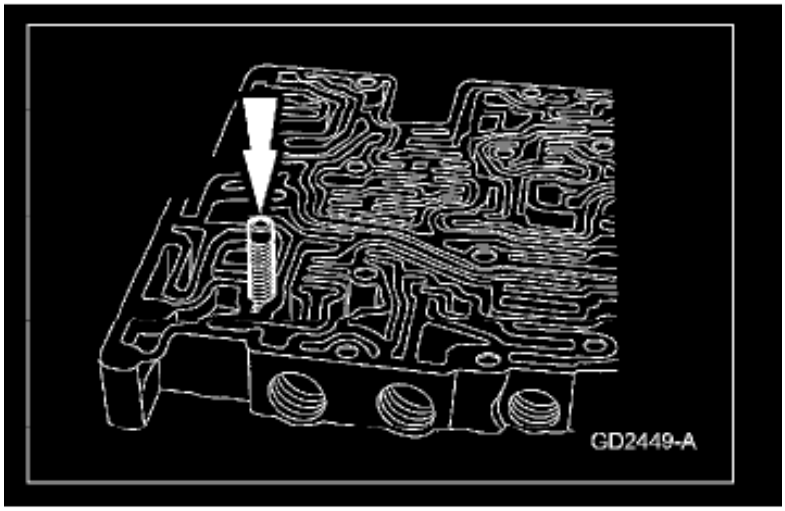
Remove the valve body separator plate screws.

5. Remove valve body separator plate.

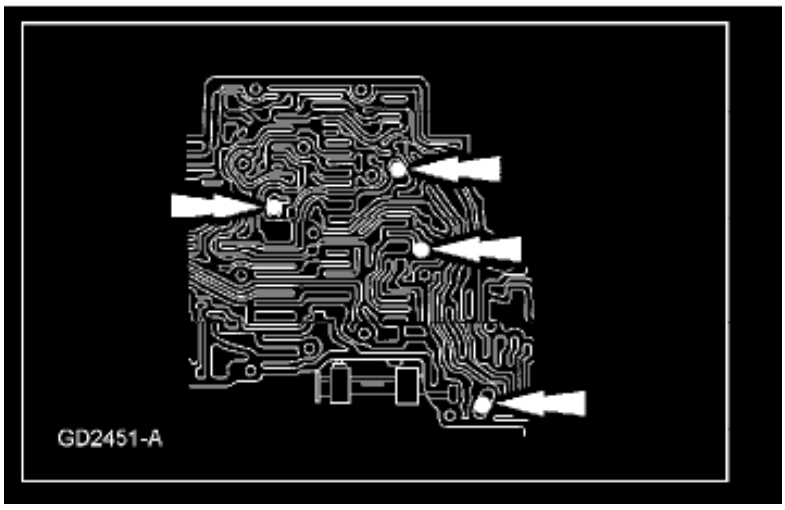
6. Remove the extension housing lube orifice.



A0041804



GD2449-A



GD2451-A

7. Remove the black plastic converter relief valve and spring.

8. Remove the 4 main control valve body check balls.

9. If the main control requires cleaning, completely disassemble the main control. Refer to the main control exploded view in this procedure.

Assembly

1. Thoroughly clean all parts in solvent and blow dry with moisture free compressed air.

2. CAUTION: Do not stone, file or sand the valves. This will remove the anodized finish and may result in further main control or

transmission damage.

After cleaning the main control valve body, carry out the following: ^

Inspect all valve and plug bores for scoring or burrs.

^ Check all fluid passages for obstructions.

^ Inspect all valves and plugs for burrs.

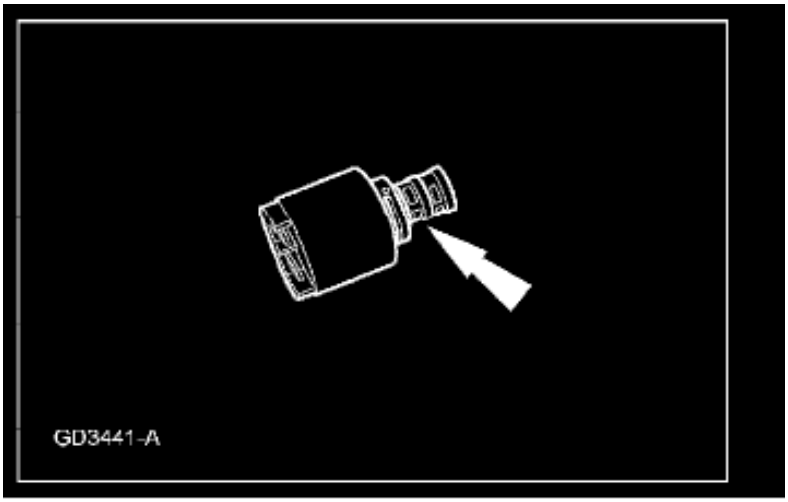
^ Inspect all mating surfaces for burrs or distortion.

^ Inspect all springs for distortion.

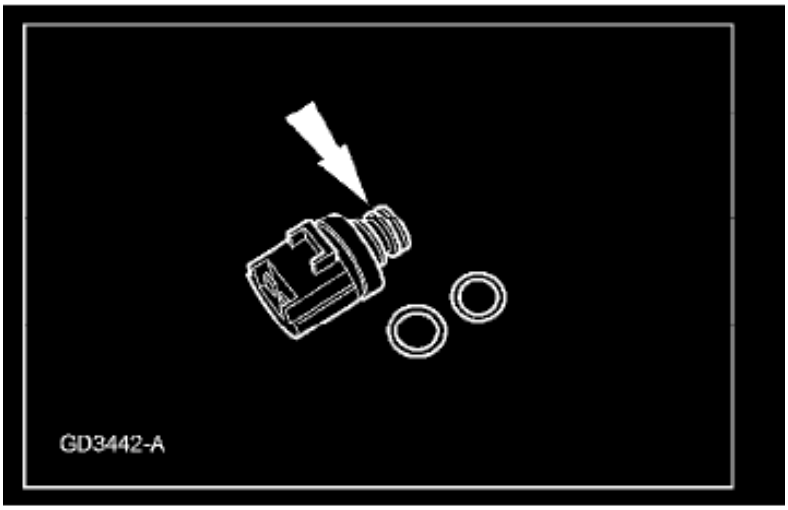
^ Check all valves and plugs for free movement in their respective bores. -

Valves and plugs, when dry, must fall from their own weight into their respective bores.

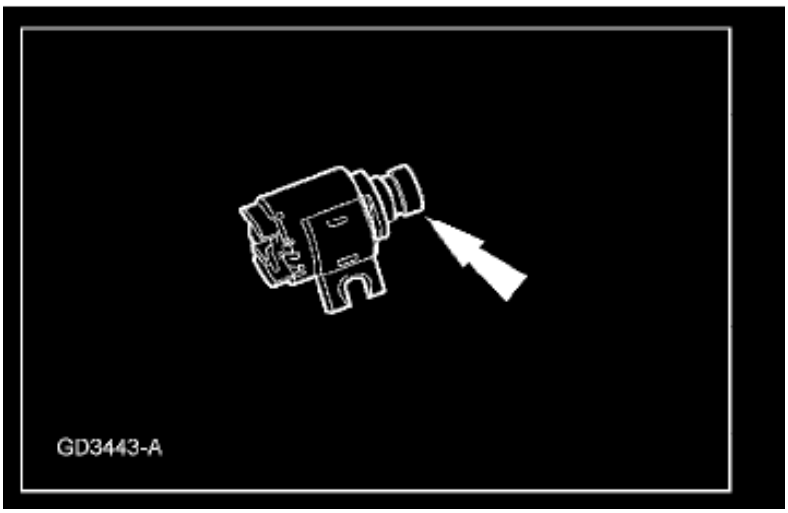
^ Roll the manual valve on a flat surface to check for a bent condition.



GD3441-A



GD3442-A



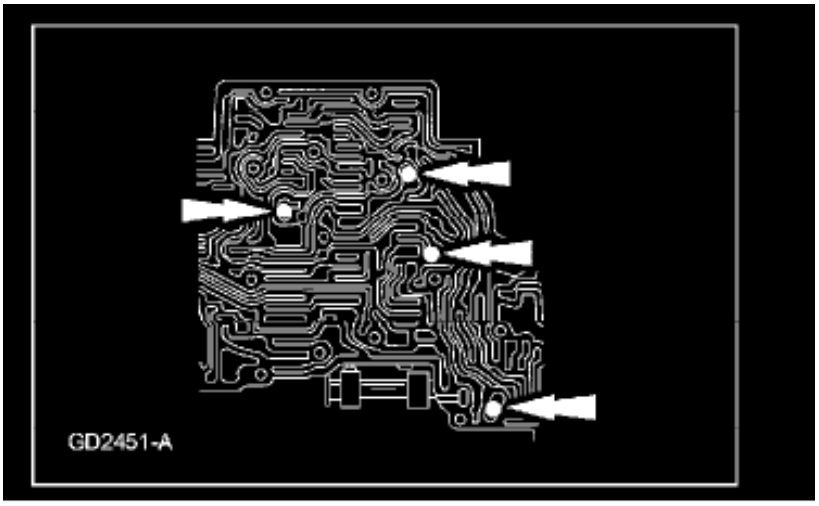
GD3443-A

3. Clean and inspect the EPC solenoid screens.

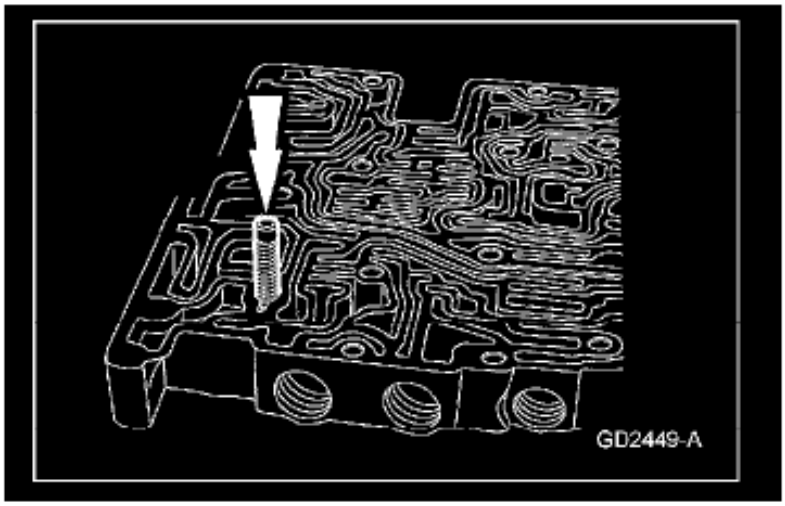
4. Remove and install new shift solenoid O-rings

5. Clean and inspect the TCC solenoid.

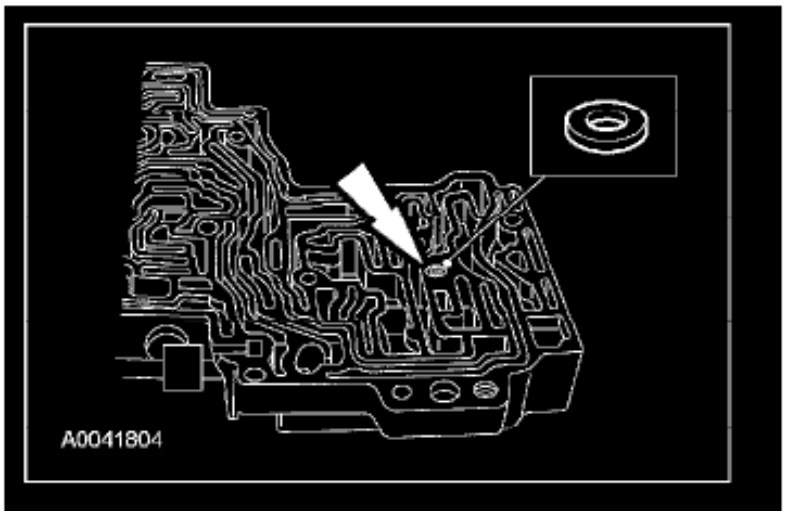
6. Install the 4 main control valve body check balls.



GD2451-A



GD2449-A



A0041804

7. Install the dark color plastic converter relief valve and spring.

8. Install the extension housing lube orifice.

9. NOTE: Apply petroleum jelly on the valve body separator plate to hold it in place on the main control valve body.

NOTE: Use a new bonded separator plate.

Install the main control valve body separator plate to the main control valve body.

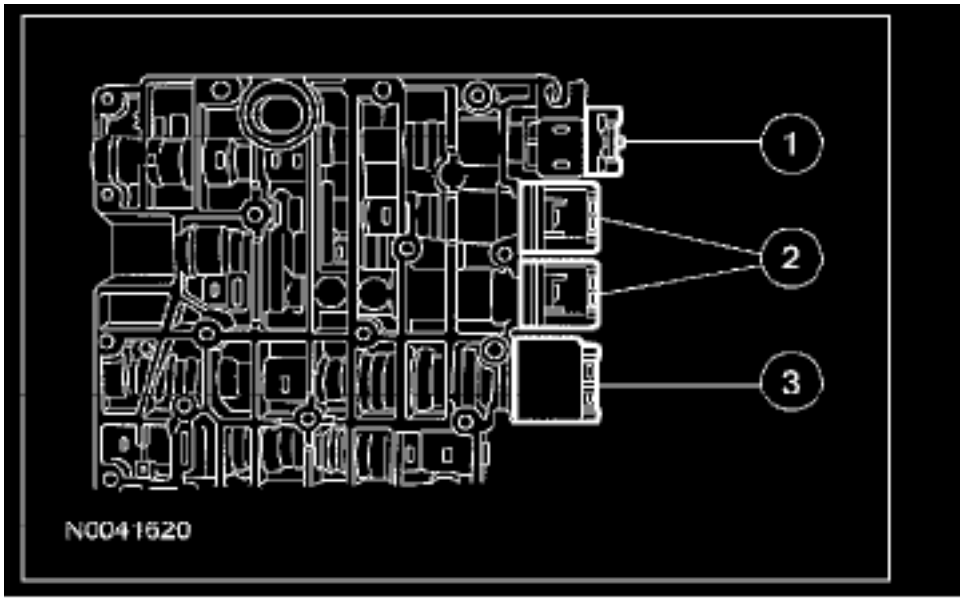
10. Install the special tools into the main control valve body.

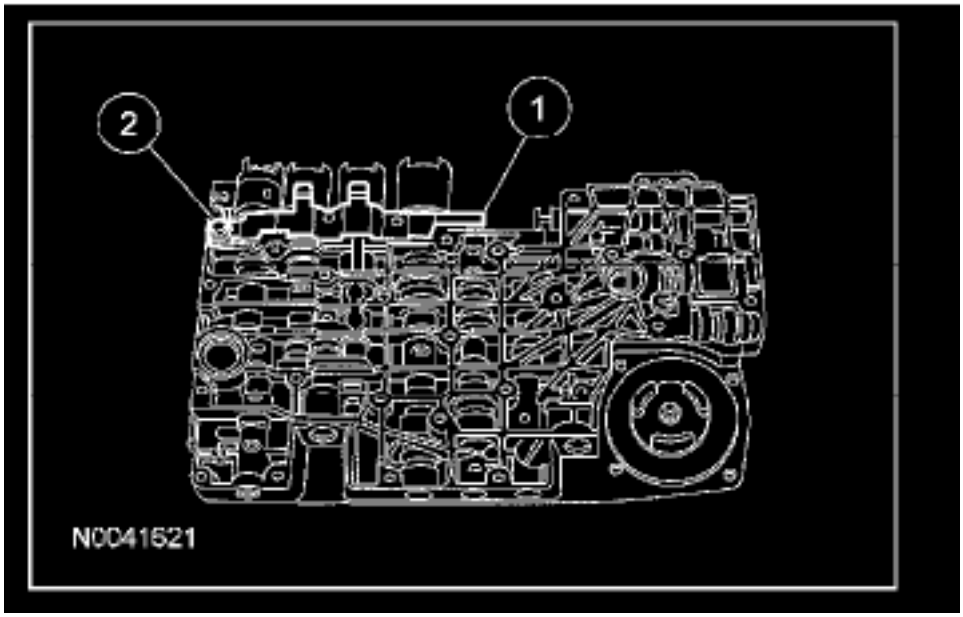
11. Install the valve body separator plate-to-main control valve body screws.

^ Tighten to 7 Nm (62 lb-inch).

12. Remove the special tools from the main control valve body.

13. Rotate the main control valve body so the valve body separator plate is facing down.





14. NOTE: All solenoid electrical connectors must face upward on installation.

NOTE: All shift solenoids are interchangeable.

NOTE: If the TCC valve came out during disassembly, use caution when installing the torque converter clutch solenoid.

Install the SSB, SSD, TCC and EPC solenoids. 1

Install the TCC solenoid.

2 Install the SSB and SSD solenoids.

3 Install the EPC solenoid.

15. NOTE: The solenoid clamp must be installed in the torque converter clutch (TCC) and electronic pressure control (EPC) solenoid grooves, shift

solenoid pockets and the No. 204 plug.

Install the solenoid clamp and the screw. 1

Position the solenoid clamp on the main control valve body.

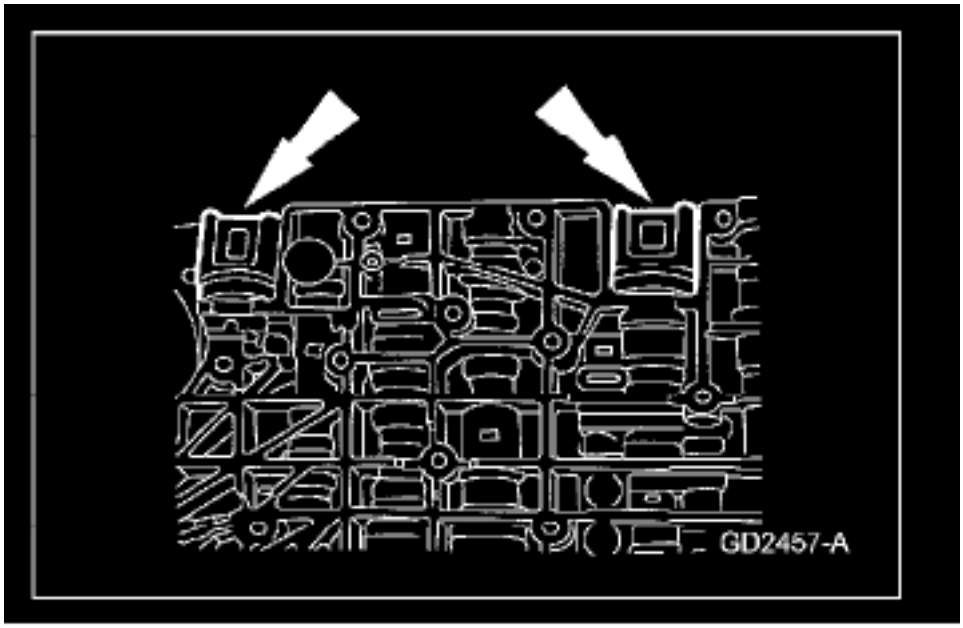
2 Install the screw. ^

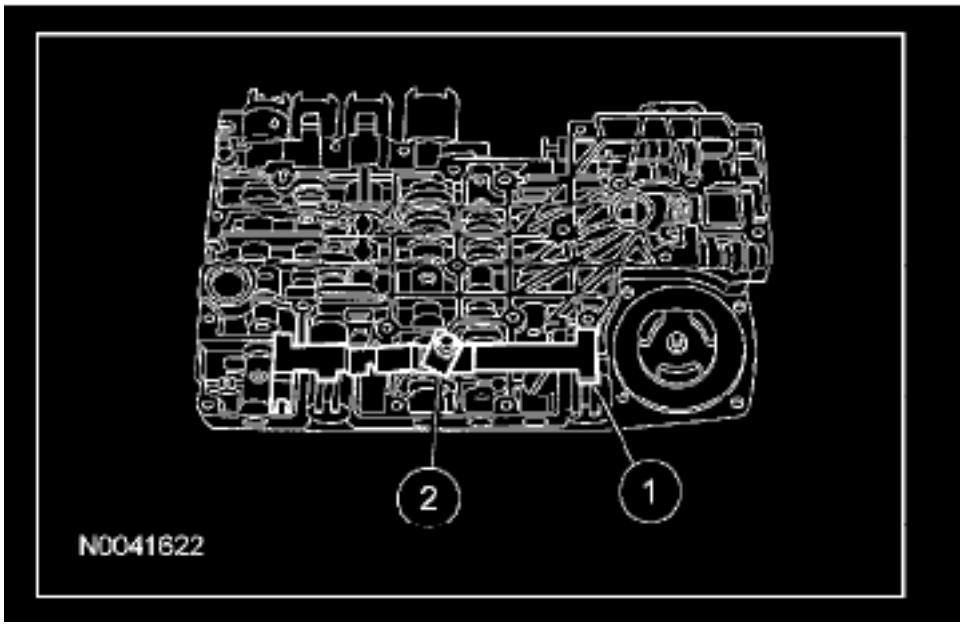
Tighten to 7 Nm (62 lb-inch).

16. NOTE: The shift solenoid electrical terminals must face up on installation.

NOTE: The shift solenoids are interchangeable.

Install the SSA and the SSC shift solenoids.





17. Install the solenoid clamp and the screw.

1 Position the solenoid clamp on the main control valve body.

2 Install the screw. ^

Tighten to 7 Nm (62 lb-inch).

10. Install the transmission fluid filter.

1 Position the transmission fluid filter on the main control valve body.

2 Install the transmission fluid filter screw. ^

Tighten to 10 Nm (89 lb-inch).

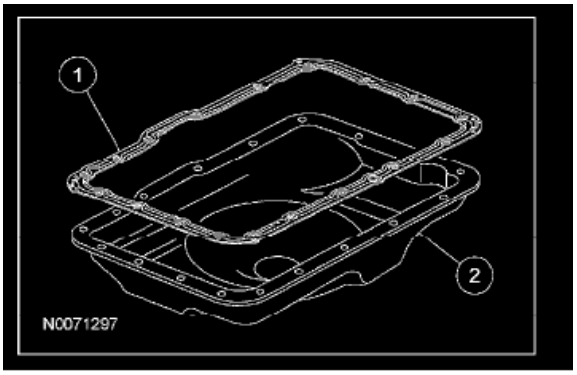
11. Position the oil pan magnet in the transmission fluid pan.

12. NOTE: The transmission fluid pan gasket is reusable. Clean and inspect for damage, if not damaged, the gasket should be reused.

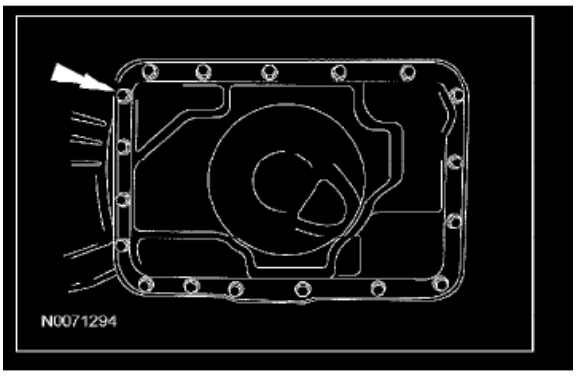
Install the transmission fluid pan. 1

Position the transmission fluid pan gasket on the transmission fluid pan.

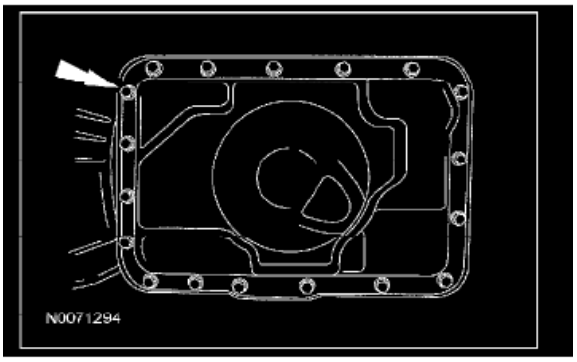
2 Install and align the transmission fluid pan.



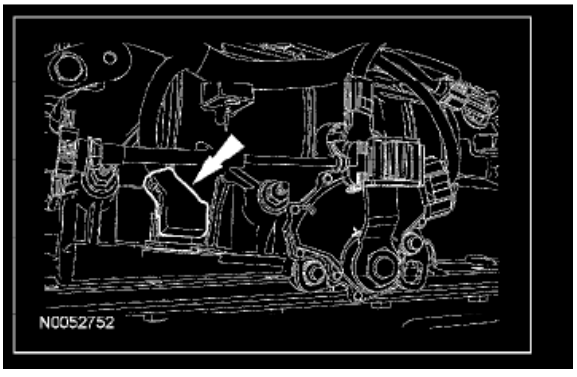
1
2
N0071297



N0071294



N0071294



N0052752

13. Loosely install the transmission fluid pan screws.

14. Tighten the transmission fluid pan screws in a crisscross pattern.

^ Tighten to 10 Nm (89 lb-inch).

15. Connect the vehicle harness to the transmission (16 pinch) connector. Make sure the lock is fully engaged.

16. NOTE: Start with a minimum of 3.7L (4 qt) clean automatic transmission fluid.

Fill the transmission with clean automatic transmission fluid to the correct fluid level.

Clutch Disc: Customer Interest M/T - Squeaking Noise During Clutch Pedal Operation

TSB 09-25-6

12/28/09

NOISE FROM CLUTCH SLAVE CYLINDER WHEN CLUTCH - ENGAGED/DISENGAGED

FORD: 2004-2009 Ranger

This article supersedes TSB 08-22-8 to update the vehicle model years covered.

ISSUE Some 2004-2009 Ranger vehicles equipped with a manual transmission may exhibit a squeaking noise when engaging or disengaging the clutch. This may be due to the inter[ace between the clutch slave cylinder and clutch fingers. The noise may be duplicated by cycling the clutch with the vehicle standing still and the engine off.

ACTION Follow the Service Procedure steps to correct the condition.

SERVICE PROCEDURE

1. Use a stethoscope to confirm the source of the noise is coming from the clutch slave cylinder located in the transmission bell housing.

a. If the noise is from the clutch slave cylinder, obtain the Dow Corning(R) Molykote(R) G-n Metal Assembly Paste and Clutch Kit and proceed to

Step 2.

b. If the noise is not from the clutch slave cylinder, do not continue with this procedure. Follow normal diagnostics per the Workshop Manual

(WSM).

NOTE

THE USE OF DOW CORNING(R) MOLYKOTE(R) G-N METAL ASSEMBLY PASTE IS A CRITICAL COMPONENT OF THIS PROCEDURE AND MUST BE APPLIED AS INDICATED.

2. A 2.8 oz. (79.3 g) tube of Dow Corning® Molykote(R) G-n Metal Assembly Paste may be obtained from a local source or one of the following

suppliers:

a. Dealers in the United States contact Motion Industries at 1-586-726-6262.

b. Dealers in Canada contact Paisley Products at 1-514-344-0218 extension 226.

3. Remove the transmission. Refer to the WSM, Section 308 for removal and installation procedures.

4. Replace the clutch disc and pressure plate.

5. Replace the clutch slave cylinder. Apply a thin film of Dow Corning® Molykote(R) G-n Metal Assembly Paste to the new clutch slave cylinder

bearing face as well as on each of the clutch fingers of the pressure plate.

NOTE

ONLY 1-2 OUNCES (28-57 g) OF GREASE IS REQUIRED PER VEHICLE.

6. Install the transmission.

NOTE

DOW CORNING® MOLYKOTE(R) G-N METAL ASSEMBLY PASTE MUST BE OBTAINED LOCALLY.

WARRANTY STATUS: Eligible Under Provisions Of New Vehicle Limited Warranty Coverage
IMPORTANT: Warranty coverage limits/policies are not altered by a TSB. Warranty coverage limits are determined by the identified causal part.

Clutch Disc: Testing and Inspection

Clutch Disc Check

1. NOTE: Install a new clutch disc if any of these conditions are present. Always install a new clutch pressure plate when installing a new clutch.

NOTE: For clutch discs that have oil or grease contamination, eliminate the source of the contamination.

NOTE: If the clutch disc springs are loose enough to rattle they will not cause noise when the vehicle is operating.

Inspect the clutch for the following: ^

Oil or grease contamination

^ Worn or loose facings

^ Distortion

^ Broken springs

^ Burrs or uneven wear on the splines

^ Wear or damage on the clutch disc surface

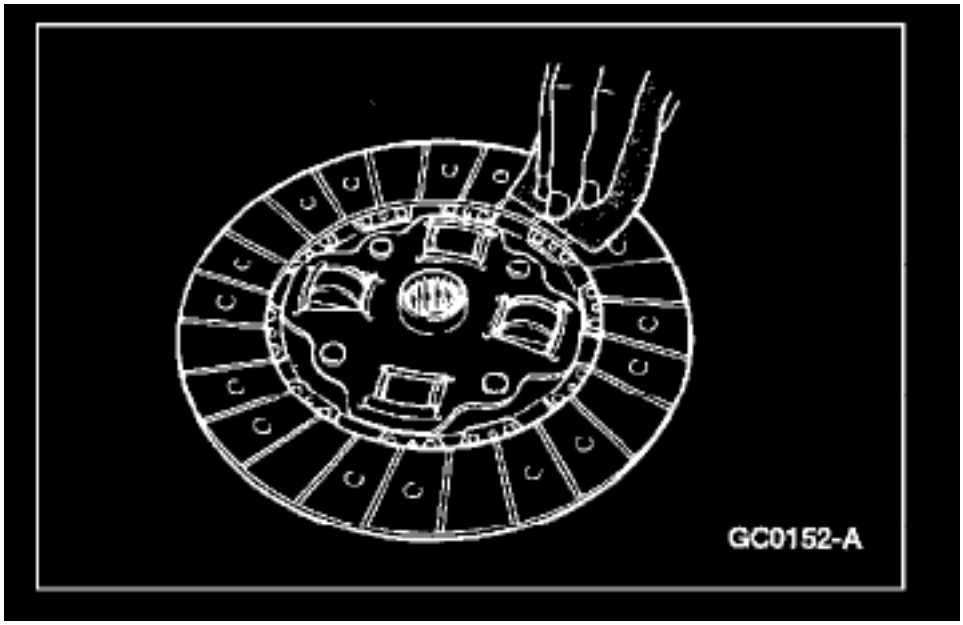
2. Check for a worn clutch disc lining. Measure the minimum allowable depth to the rivet heads with a slide caliper.

^ Check for loose clutch disc lining rivets.

3. Using a suitable dial indicator, check the maximum allowable runout of the clutch disc.

^ Install a new clutch disc if the runout is excessive.

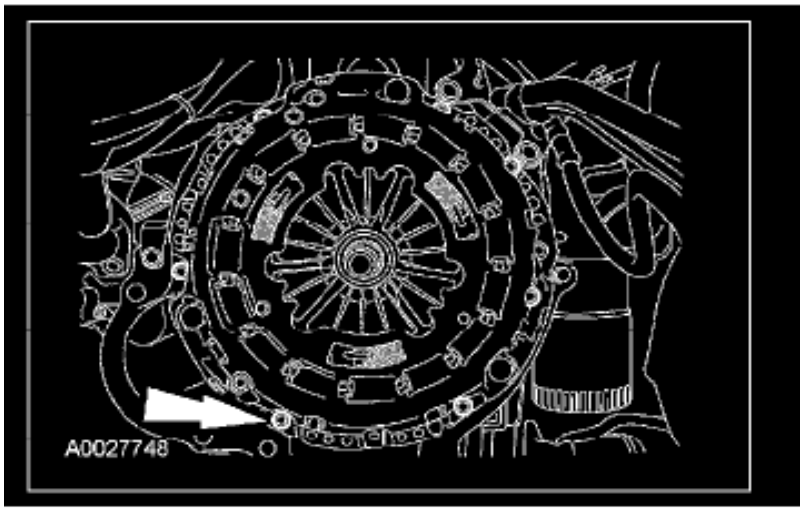
4. Use an emery cloth to remove minor imperfections in the clutch disc lining surface.

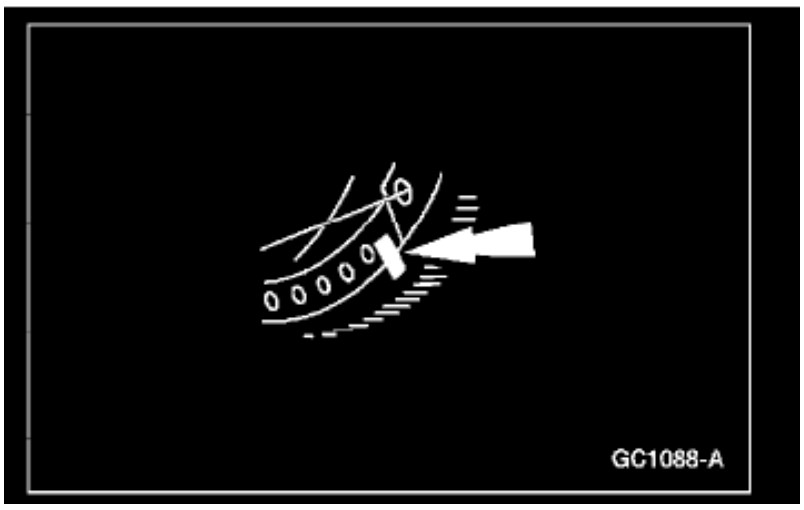


5. Check for wear or rust on the splines. If necessary, clean them with an emery cloth.

Material

Item	Specification
High Temperature 4x4 Front Axle and Wheel Bearing Grease E8TZ-19590-A	WSS-M1C267-A1





Clutch Disc: Service and Repair

Clutch Disc and Pressure Plate

Removal

1. Remove the transmission.

2. CAUTION: If the clutch disc and pressure plate are to be reinstalled, bolts must be removed evenly or permanent damage to the

diaphragm spring will occur, resulting in complete clutch release.

NOTE: If the parts are to be reused, index-mark the clutch pressure plate to the flywheel.

Remove the bolts, clutch pressure plate and the clutch disc.

3. Inspect the transmission input shaft pilot bearing:

^ for misalignment and looseness in the crankshaft (gasoline engine) or flywheel (diesel engine).

^ needle rollers for scoring, discoloration, wear and broken rollers.

^ seal for damage and lubricant leakage. -

Install a new transmission input shaft pilot bearing if any of these conditions are present.

4. NOTE: Use emery cloth to remove minor imperfections in the clutch disc friction surface.

Inspect the clutch disc for: ^

oil and grease saturation.

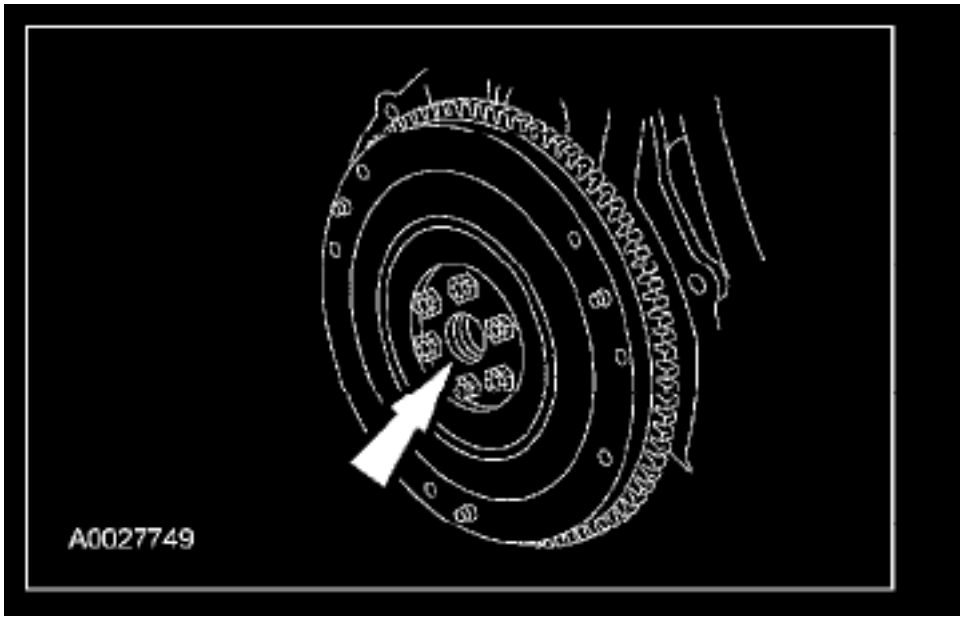
^ worn and loose rivets at the hub.

^ broken springs.

^ wear and rust on the splines. -

Install a new clutch disc if any of these conditions are present.

5. NOTE: If necessary, use a suitable cleaning solution to remove any oil film from the clutch pressure plate friction surface.



Inspect the clutch pressure plate levers for heavy wear associated with binding. Also, inspect for substantial difference in lever wear. Inspect the clutch pressure plate friction surface for scoring, burning, heat checking, distortion, warping and dishing. ^

Install a new clutch pressure plate if any of these conditions are present.

6. NOTE: If necessary, use a suitable cleaning solution to clean the flywheel clutch surface.

Inspect the flywheel for: ^

surface cracks.

^ heat check.

^ glazing.

^ scoring.

^ scratches or grooves. -

For minor damage, finish the flywheel surface with coarse emery cloth or with a fine grade (400 grit) sandpaper. To polish the surface, stroke parallel to the machine lines.

7. Inspect the flywheel or ring gear for worn, chopped or broken teeth.

Installation

1. Lubricate the transmission input shaft pilot bearing with grease.

2. Adjust the clutch pressure plate.

1 Using a suitable press, press downward on the fingers until the adjusting ring moves freely.

2 Rotate the adjusting ring counterclockwise to compress the tension springs. Hold the adjusting ring in this position.

3 Release the pressure on the fingers. The adjusting ring will stay in the reset position.

3

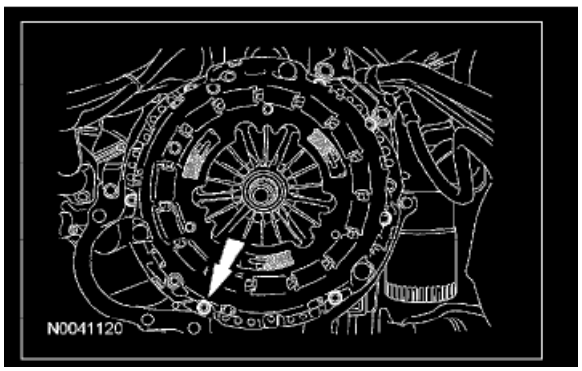
N0070190



N0041120

3. Using a suitable clutch aligner, position the clutch disc on the flywheel.

4. NOTE: If reusing the clutch pressure plate and flywheel, align the marks made during removal.

Using a suitable aligner, align the clutch disc and the clutch pressure plate. Install the bolts and tighten in a star-pattern sequence. ^

Tighten to 27 Nm (20 lb-ft).

5. NOTE: Before securing the transmission to the engine, connect the hydraulic line to the clutch slave cylinder.

Install the transmission.

Clutch Slave Cylinder: All Technical Service Bulletins M/T - Squeaking Noise During Clutch Pedal Operation

TSB 09-25-6

12/28/09

NOISE FROM CLUTCH SLAVE CYLINDER WHEN CLUTCH - ENGAGED/DISENGAGED

FORD: 2004-2009 Ranger

This article supersedes TSB 08-22-8 to update the vehicle model years covered.

ISSUE Some 2004-2009 Ranger vehicles equipped with a manual transmission may exhibit a squeaking noise when engaging or disengaging the clutch. This may be due to the inter[ace between the clutch slave cylinder and clutch fingers. The noise may be duplicated by cycling the clutch with the vehicle standing still and the engine off.

ACTION Follow the Service Procedure steps to correct the condition.

SERVICE PROCEDURE

1. Use a stethoscope to confirm the source of the noise is coming from the clutch slave cylinder located in the transmission bell housing.

a. If the noise is from the clutch slave cylinder, obtain the Dow Corning(R) Molykote(R) G-n Metal Assembly Paste and Clutch Kit and proceed to

Step 2.

b. If the noise is not from the clutch slave cylinder, do not continue with this procedure. Follow normal diagnostics per the Workshop Manual

(WSM).

NOTE

THE USE OF DOW CORNING(R) MOLYKOTE(R) G-N METAL ASSEMBLY PASTE IS A CRITICAL COMPONENT OF THIS PROCEDURE AND MUST BE APPLIED AS INDICATED.

2. A 2.8 oz. (79.3 g) tube of Dow Corning® Molykote(R) G-n Metal Assembly Paste may be obtained from a local source or one of the following

suppliers:

a. Dealers in the United States contact Motion Industries at 1-586-726-6262.

b. Dealers in Canada contact Paisley Products at 1-514-344-0218 extension 226.

3. Remove the transmission. Refer to the WSM, Section 308 for removal and installation procedures.

4. Replace the clutch disc and pressure plate.

5. Replace the clutch slave cylinder. Apply a thin film of Dow Corning® Molykote(R) G-n Metal Assembly Paste to the new clutch slave cylinder

bearing face as well as on each of the clutch fingers of the pressure plate.

NOTE

ONLY 1-2 OUNCES (28-57 g) OF GREASE IS REQUIRED PER VEHICLE.

6. Install the transmission.

NOTE

DOW CORNING® MOLYKOTE(R) G-N METAL ASSEMBLY PASTE MUST BE OBTAINED LOCALLY.

WARRANTY STATUS: Eligible Under Provisions Of New Vehicle Limited Warranty Coverage
IMPORTANT: Warranty coverage limits/policies are not altered by a TSB. Warranty coverage limits are determined by the identified causal part.

OPERATION DESCRIPTION TIME

092506A 2004-2009 Ranger 4X2 3.1 Hrs.

Clutch Slave Cylinder: Service and Repair

Clutch Slave Cylinder

Removal

1. Remove the transmission.

2. NOTE: Inspect the clutch housing for traces of fluid. If brake fluid is visible, install a new clutch slave cylinder.

Remove the clutch slave cylinder. 1

Remove the 2 clutch slave cylinder bolts.

2 Remove the clutch slave cylinder.

3. Inspect the clutch slave cylinder for the following:

^ Worn or damaged boot.

^ Leaking fluid.

^ Worn or damaged bearing.

4. Inspect the clutch release bearing as follows:

^ Rotate the outer race while applying pressure. If the bearing rotation is rough, install a new clutch slave cylinder.

^ Inspect for wear or damage.

Installation

1. Position the clutch slave cylinder to the transmission and install the 2 bolts.

^ Tighten to 20 Nm (15 lb-ft).

2. NOTE: Before securing the engine to the transmission, connect the hydraulic line to the clutch slave cylinder.

Install the transmission.

3. Depress and release the clutch pedal 5 full strokes.

Hydraulic Hose: Tools and Equipment

Clutch Line Fork

AST tool# 8008

Used for the R and R of the hydraulic clutch line from the internally mounted slave cylinder. This tool is applicable to the following Ford vehicles with manual transmissions: 1989 and later Ford Aerostar, Bronco II, Explorer, F150 and Ranger.

- For R and R of Hydraulic Clutch Lines

- Applicable to Ford Models with Manual Transmissions

- Steel Construction

- Black-Oxide Finish

Contact AST for pricing.

Pilot Bearing: Testing and Inspection

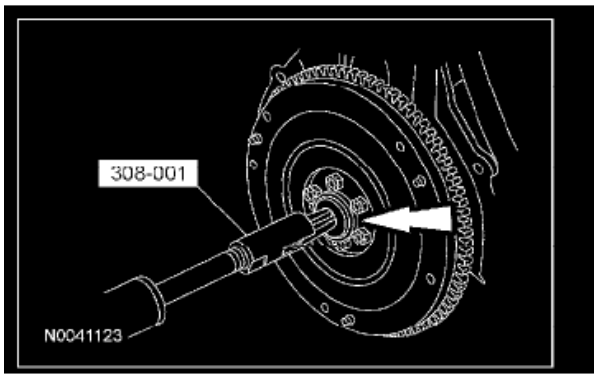
Pilot Bearing Check

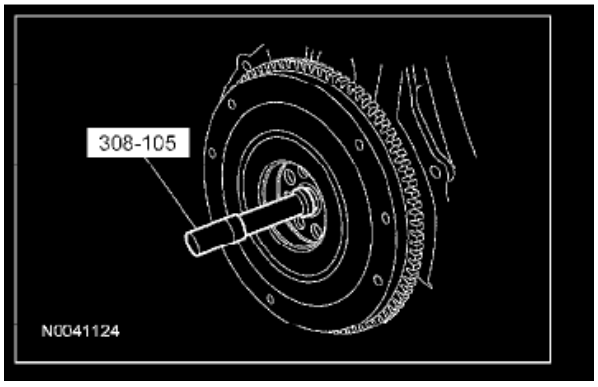
1. CAUTION: The pilot bearing is a sealed bearing and must not be immersed in any type of cleaning fluid.

Inspect the pilot bearing for excessive wear or scoring and install new if necessary.

Special Tool(s)

ST1470-A	Installer, Pilot Bearing 308-105 (T85T-7137-A)
ST1282-A	Remover, Pilot Bearing 308-001 (T58L-101-B)





Pilot Bearing: Service and Repair

Pilot Bearing

Removal

1. Using the special tool, remove the transmission input shaft pilot bearing.

2. Inspect the transmission input shaft pilot bearing for:

^ misalignment and looseness in the flywheel.

^ needle rollers for scoring, worn or broken needle rollers, inadequate grease or discoloration.

^ seal leakage.

Installation

1. NOTE: The transmission input shaft pilot bearing can only be installed with the seal facing the transmission. The transmission input shaft pilot

bearing is pregreased and does not require additional lubrication. A new transmission input shaft pilot bearing must be installed whenever it is removed.

Using a soft-face hammer and the special tool, install the transmission input shaft pilot bearing.

Pressure Plate: Testing and Inspection

Clutch Pressure Plate Check

1. Check the clutch pressure plate surface for scoring, cracks or discoloration. Minor scratches or discoloration should be removed with a fine emery

cloth.

2. Measure the flatness of the clutch pressure plate surface with a straightedge and a feeler gauge.

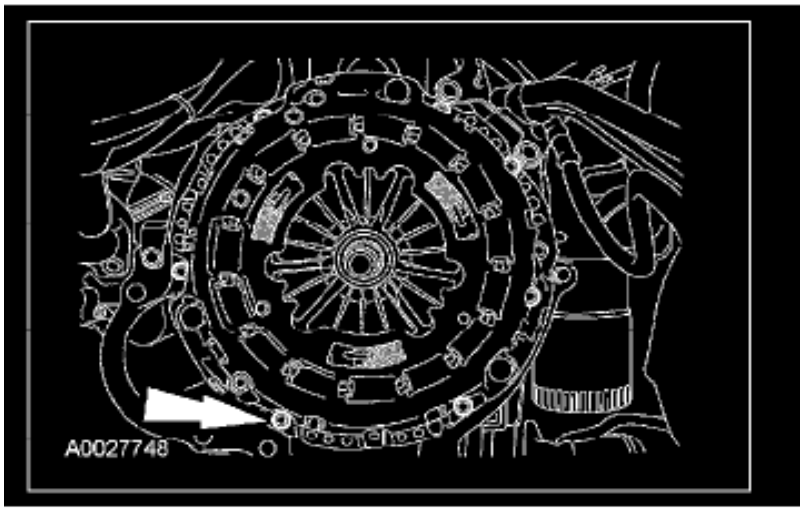
^ If the measurement exceeds the maximum allowance, install a new clutch pressure plate.

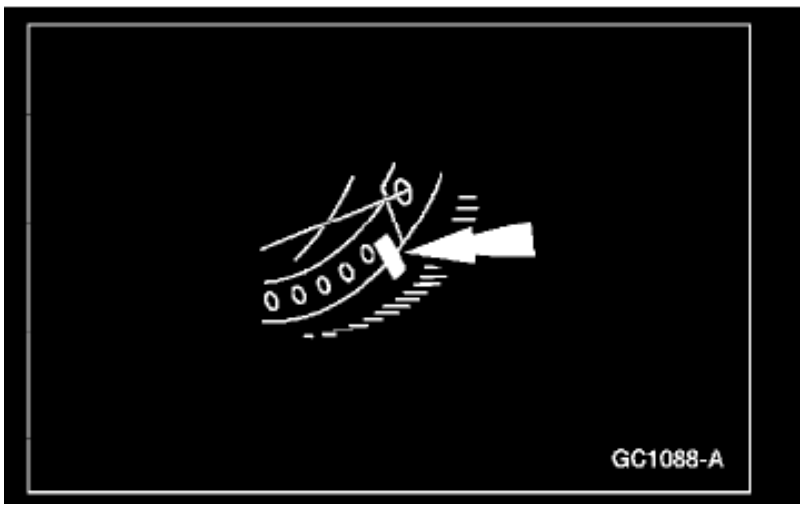
3. Check the diaphragm spring fingers for discoloration, scoring, bent or broken segments and spring ends that are higher or lower than the rest.

4. Measure the wear of the diaphragm spring fingers.

Material

Item	Specification
High Temperature 4x4 Front Axle and Wheel Bearing Grease E8TZ-19590-A	WSS-M1C267-A1





Pressure Plate: Service and Repair

Clutch Disc and Pressure Plate

Removal

1. Remove the transmission.

2. CAUTION: If the clutch disc and pressure plate are to be reinstalled, bolts must be removed evenly or permanent damage to the

diaphragm spring will occur, resulting in complete clutch release.

NOTE: If the parts are to be reused, index-mark the clutch pressure plate to the flywheel.

Remove the bolts, clutch pressure plate and the clutch disc.

3. Inspect the transmission input shaft pilot bearing:

^ for misalignment and looseness in the crankshaft (gasoline engine) or flywheel (diesel engine).

^ needle rollers for scoring, discoloration, wear and broken rollers.

^ seal for damage and lubricant leakage. -

Install a new transmission input shaft pilot bearing if any of these conditions are present.

4. NOTE: Use emery cloth to remove minor imperfections in the clutch disc friction surface.

Inspect the clutch disc for: ^

oil and grease saturation.

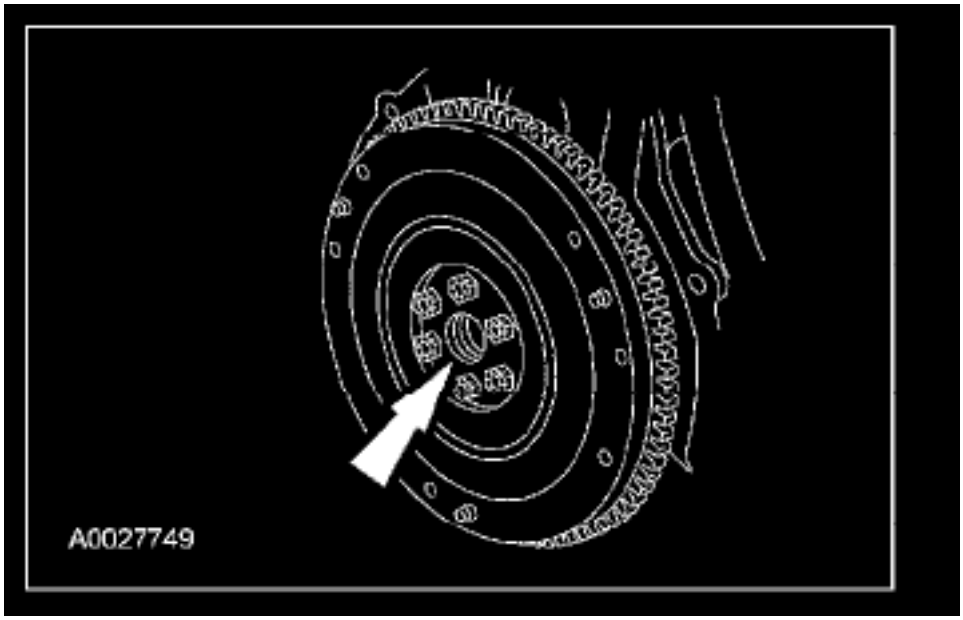
^ worn and loose rivets at the hub.

^ broken springs.

^ wear and rust on the splines. -

Install a new clutch disc if any of these conditions are present.

5. NOTE: If necessary, use a suitable cleaning solution to remove any oil film from the clutch pressure plate friction surface.



Inspect the clutch pressure plate levers for heavy wear associated with binding. Also, inspect for substantial difference in lever wear. Inspect the clutch pressure plate friction surface for scoring, burning, heat checking, distortion, warping and dishing. ^

Install a new clutch pressure plate if any of these conditions are present.

6. NOTE: If necessary, use a suitable cleaning solution to clean the flywheel clutch surface.

Inspect the flywheel for: ^

surface cracks.

^ heat check.

^ glazing.

^ scoring.

^ scratches or grooves. -

For minor damage, finish the flywheel surface with coarse emery cloth or with a fine grade (400 grit) sandpaper. To polish the surface, stroke parallel to the machine lines.

7. Inspect the flywheel or ring gear for worn, chopped or broken teeth.

Installation

1. Lubricate the transmission input shaft pilot bearing with grease.

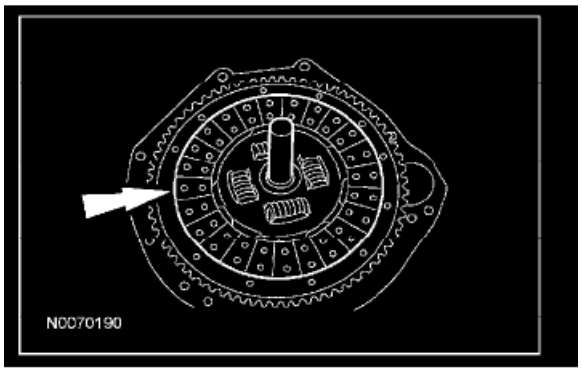
2. Adjust the clutch pressure plate.

1 Using a suitable press, press downward on the fingers until the adjusting ring moves freely.

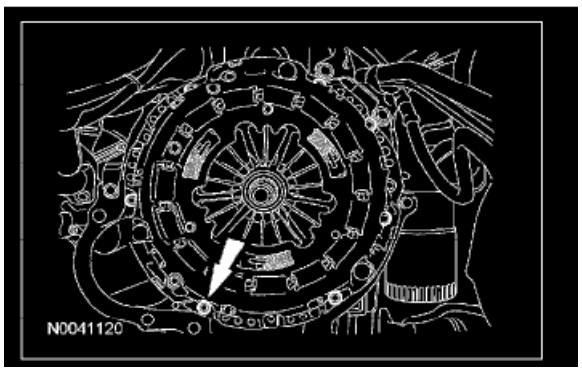
2 Rotate the adjusting ring counterclockwise to compress the tension springs. Hold the adjusting ring in this position.

3 Release the pressure on the fingers. The adjusting ring will stay in the reset position.

3
1
2
N0041116



N0070190



N0041120

3. Using a suitable clutch aligner, position the clutch disc on the flywheel.

4. NOTE: If reusing the clutch pressure plate and flywheel, align the marks made during removal.

Using a suitable aligner, align the clutch disc and the clutch pressure plate. Install the bolts and tighten in a star-pattern sequence. ^

Tighten to 27 Nm (20 lb-ft).

5. NOTE: Before securing the transmission to the engine, connect the hydraulic line to the clutch slave cylinder.

Install the transmission.

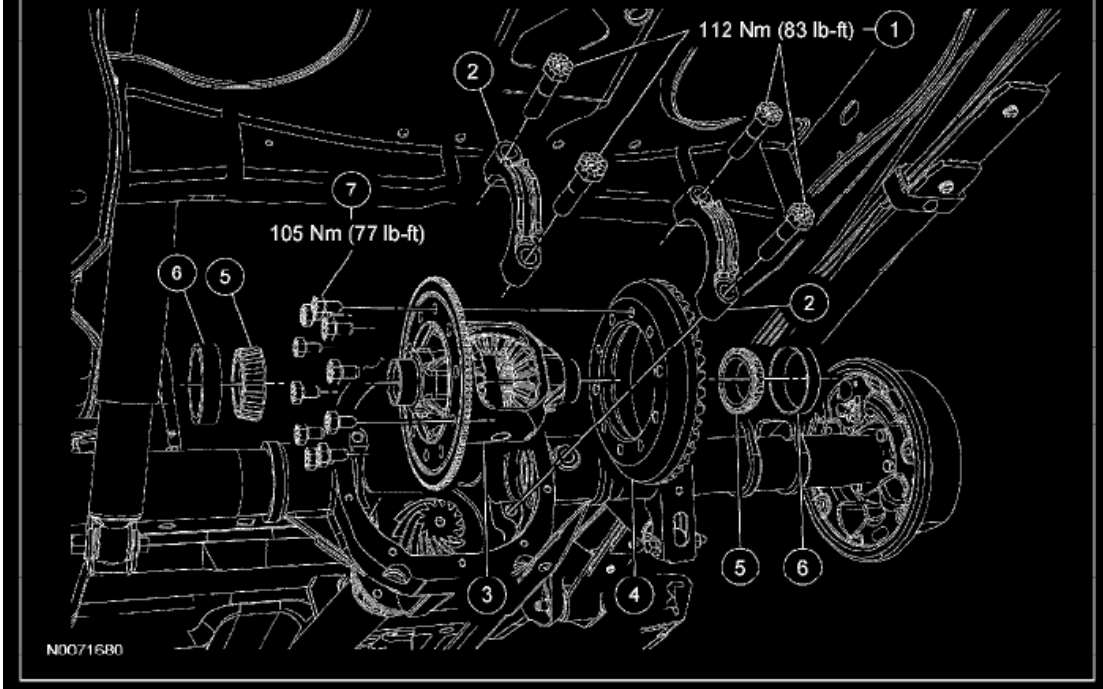
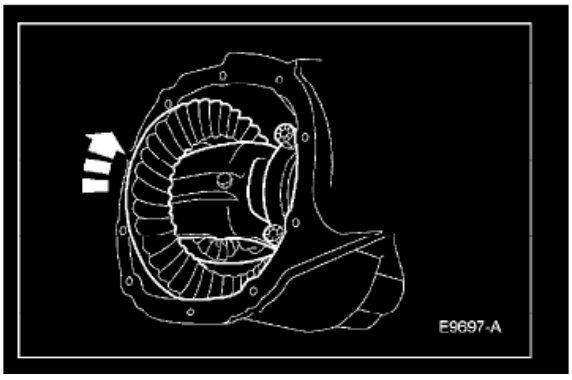
Differential Carrier: Service and Repair Differential Case

Ford 7.5-Inch Ring Gear - Rear Drive Axle/Differential

Differential Case



Item	Part Number	Description
1	—	Bearing cap bolts (part of 4010)
2	—	Bearing caps (part of 4010)
3	4204	Differential case
4	4209	Differential ring gear
5	4221	Differential bearings (2 required)
6	4222	Differential bearing cups (2 required)
7	4216	Differential ring gear bolt (10 required)



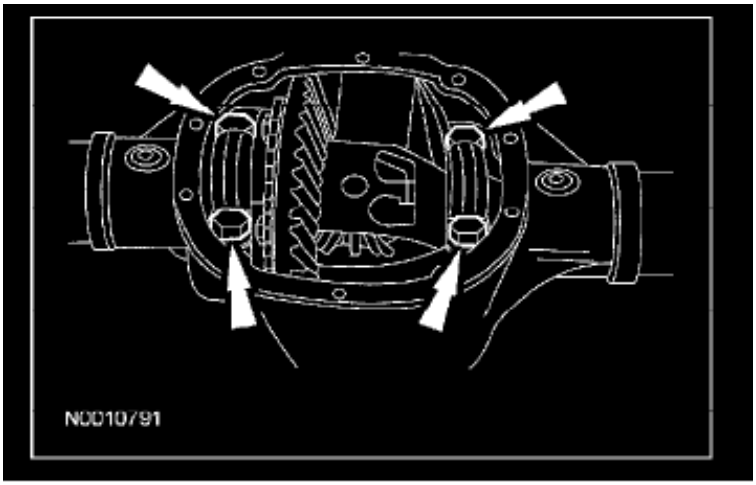
Removal

1. Remove the axle shafts.

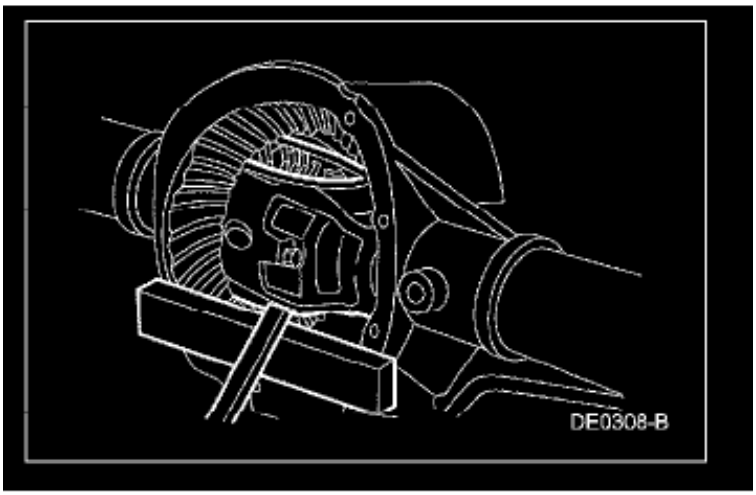
2. NOTE: Inspect the removed lubricant for metallic particles which indicate wear or damage.

Wipe the lubricant from the internal working parts and visually inspect the parts for wear or damage.

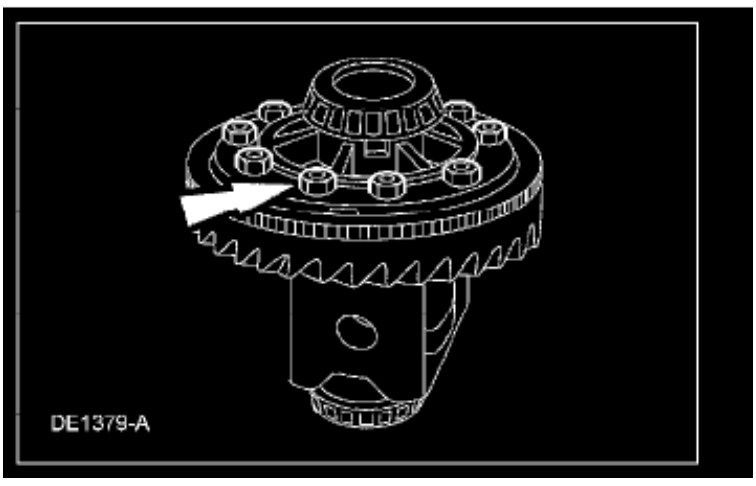
3. Rotate the differential case to see if there is any roughness which would indicate damaged bearings or gears.



N0010791



DE0308-B



DE1379-A

4. NOTE: Mark the position of the bearing caps, as arrows may not be visible. The bearing caps must be installed in their original locations and

positions.

Remove the 4 bolts and the 2 bearing caps.

5. CAUTION: Place a wood block between the pry bar and the rear axle housing to protect the machined surface from damage.

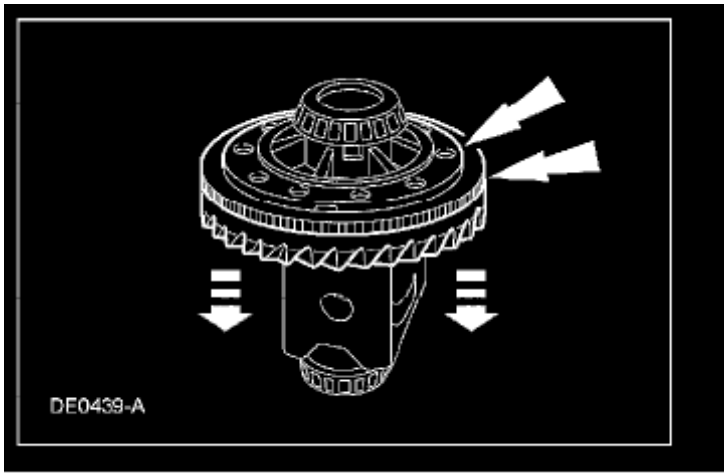
Using a pry bar and wood block, pry the differential case from the rear axle housing.

6. Remove and discard the 10 ring gear bolts.

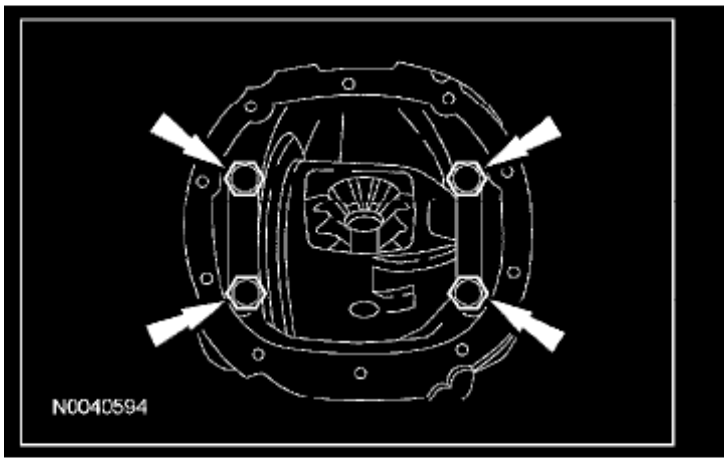
7. NOTE: Care should be taken not to damage the ring bolt hole threads.

NOTE: The anti-lock speed sensor ring cannot be reused once removed.

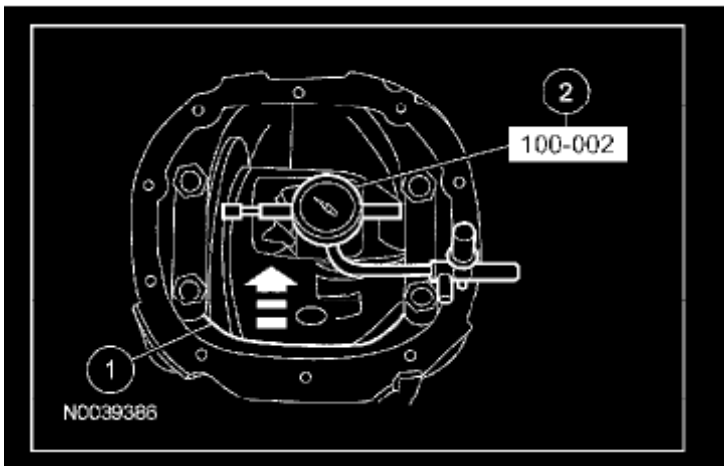
Insert a punch in the bolt holes and drive off the ring gear and, if necessary, the anti-lock speed sensor ring.



DE0439-A



N0040594



2
100-002
1
N0039386

8. Position the differential case assembly, including the bearing cups and shims, in the rear axle housing. Install the 2 differential bearing caps and

the 4 differential bearing cap bolts. ^

Tighten to 112 Nm (83 lb-ft).

9. Position the special tool.

1 Rotate the differential case to make sure the differential bearings are correctly seated.

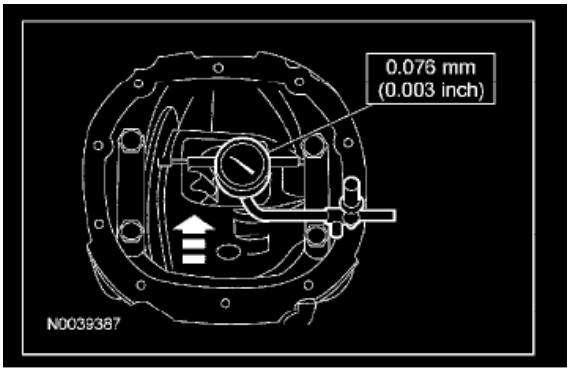
2 Position the special tool.

10. Rotate the differential case and measure the differential case runout without the ring gear.

^ If runout is less than the specification, install a new ring gear and pinion.

^ If runout exceeds specification, the ring gear is true and the concern is due to either a damaged differential case or differential bearings.

^ Inspect the differential bearings. If the differential bearings are not damaged, install new differential case and differential bearings.



0.076 mm
(0.003 inch)

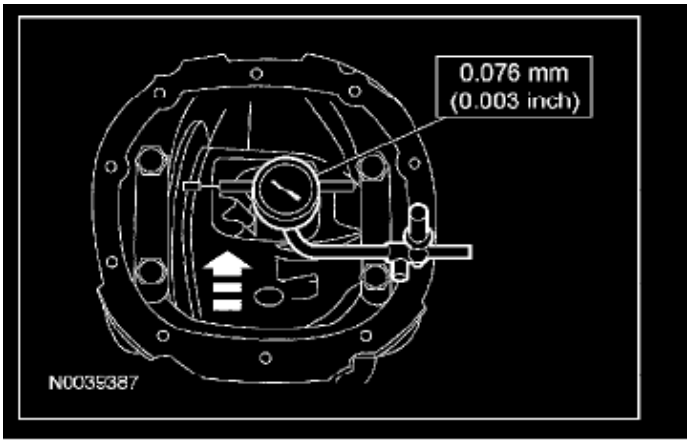
11. Remove the differential case from the rear axle housing. Using the special tools, remove the differential bearings.

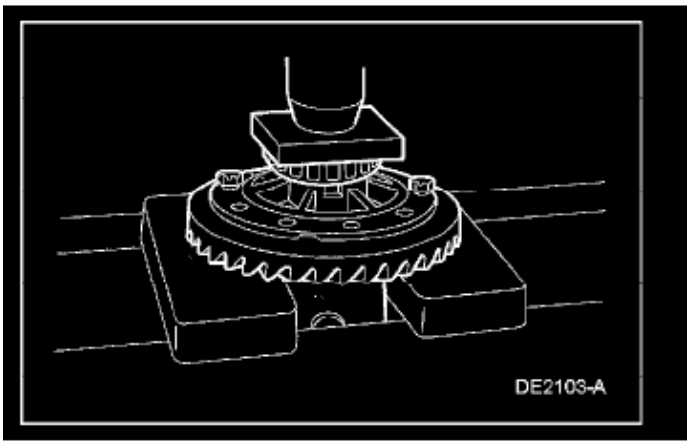
12. Using the special tool, install the new differential bearings on the differential case.

13. Position the differential case assembly, including the bearing cups and shims in the rear axle housing.

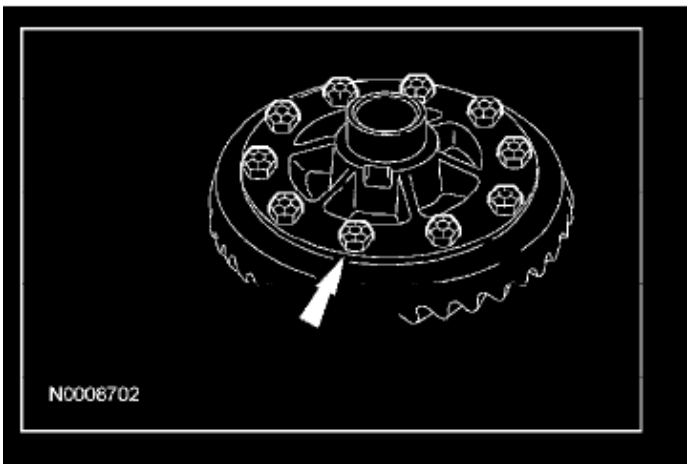
^ Tighten to 112 Nm (83 lb-ft).



0.076 mm
(0.003 inch)
N0035387



DE2103-A



N0008702

14. Measure the differential case runout without the ring gear. Check the case runout again with the new differential bearings.

^ If the runout is now within specification, use the new differential bearings for assembly.

^ If the runout exceeds the specification, install a new differential case.

15. Remove differential case from the rear axle housing.

Installation

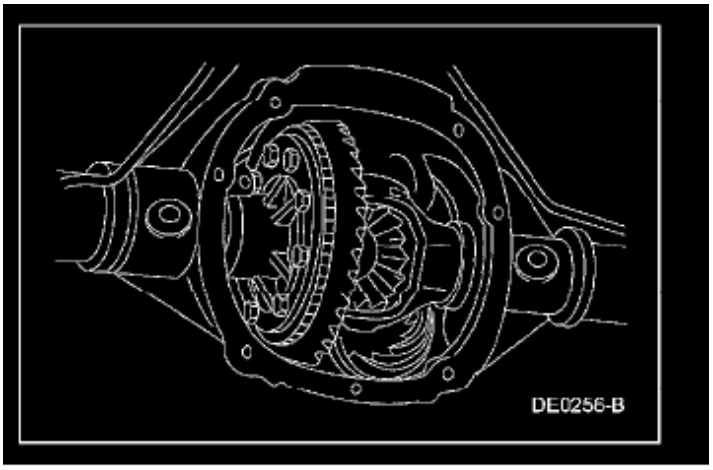
Assembly

1. Press a new anti-lock speed sensor ring, if removed, and the ring gear on the differential case.

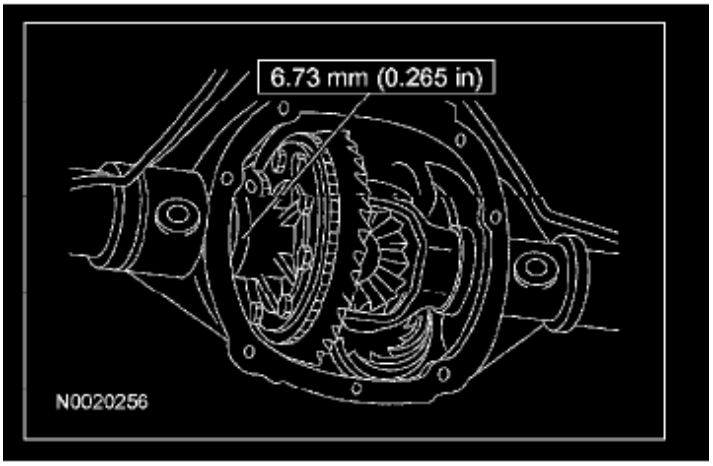
2. Install the 10 new ring gear bolts.

^ Tighten to 105 Nm (77 lb-ft).

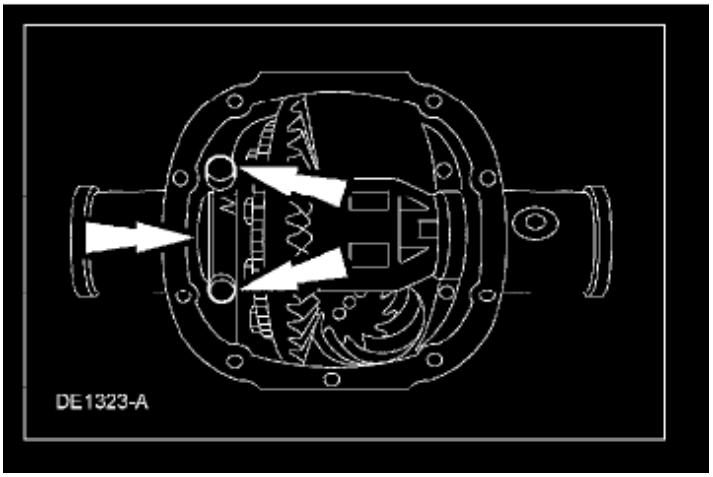
3. With pinion depth set and pinion installed, place the differential case in the rear axle housing.



DE0256-B



6.73 mm (0.265 in)
N0020256



DE1323-A

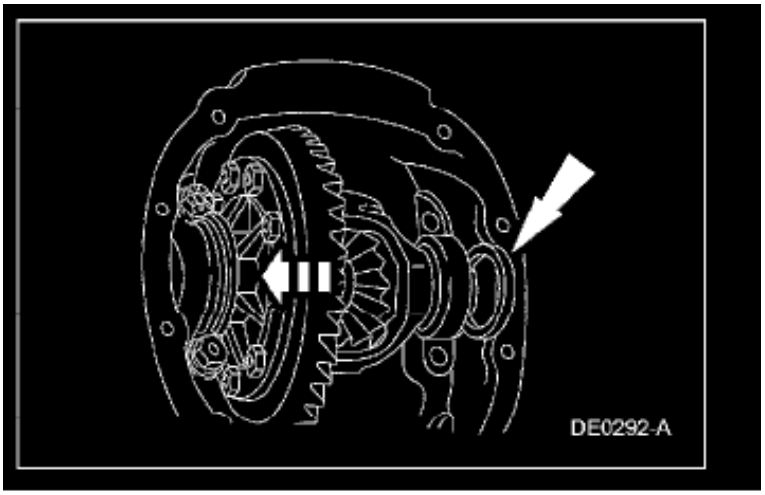
4. Install a nominal shim on the left side.

5. NOTE: Always install the bearing caps in their original locations and positions.

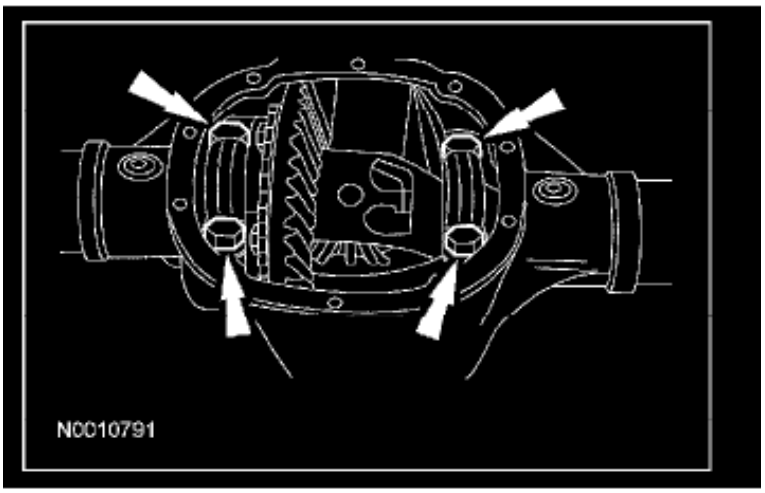
NOTE: Apply pressure toward the left side to make sure the left bearing cup is seated.

Install the left bearing cap and loosely install the 2 bearing cap bolts.

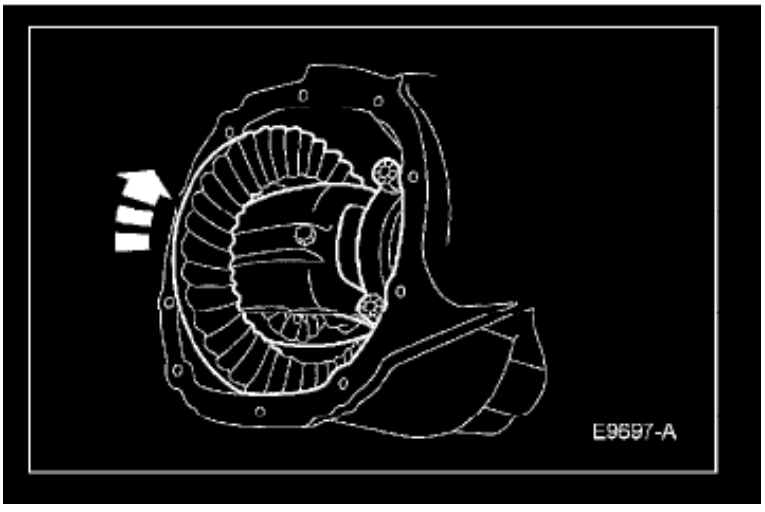
6. Install progressively larger shims on the right side until the largest shim selected can be assembled by hand.



DE0292-A



N0010791



E9697-A

7. Install the right side bearing cap and tighten the 2 left side and 2 right side bolts.

^ Tighten to 112 Nm (83 lb-ft).

8. Rotate the differential case to make sure it rotates freely.

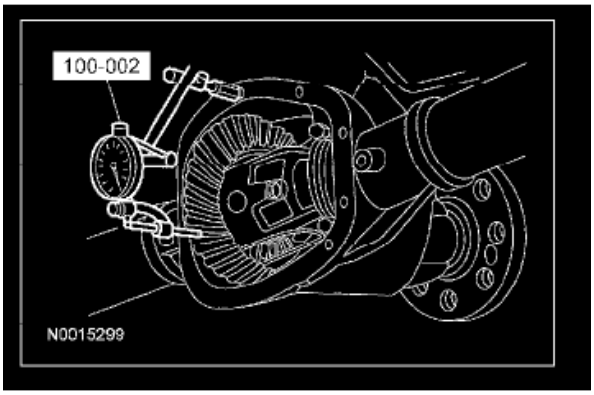
Measuring backlash 9. Using the special tools, measure the ring gear backlash.

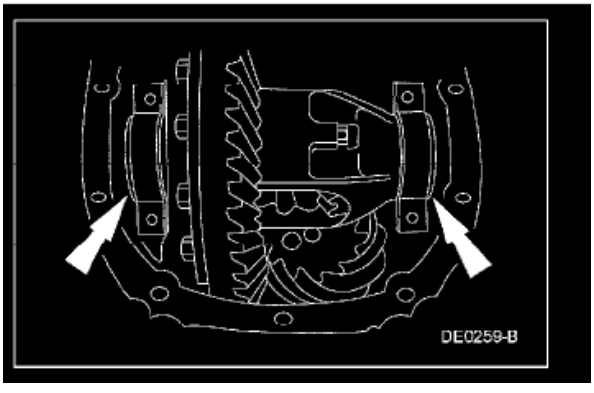
^ If the backlash is within specification, go to Backlash within specification.

^ If a zero backlash condition occurs, go to Zero backlash in this procedure.

^ If the backlash is not within specification, go to Backlash not within specification.

Backlash Change Required		Thickness Change Required	
mm	Inch	mm	Inch
0.025	0.001	0.050	0.002
0.050	0.002	0.050	0.002
0.076	0.003	0.101	0.004
0.101	0.004	0.152	0.006
0.127	0.005	0.152	0.006
0.152	0.006	0.203	0.008
0.177	0.007	0.254	0.010
0.203	0.008	0.254	0.010
0.228	0.009	0.304	0.012
0.254	0.010	0.355	0.014
0.279	0.011	0.355	0.014
0.304	0.012	0.406	0.016
0.330	0.013	0.457	0.018
0.335	0.014	0.457	0.018
0.381	0.015	0.508	0.020





Zero backlash 10. If a zero backlash condition occurs, add 0.51 mm (0.020 inch) to the RH side and subtract 0.51 mm (0.020 inch) from the LH side to allow

backlash indication. Check the backlash. Repeat Measuring backlash in this procedure.

Backlash not within specification 11. To increase or decrease the backlash, remove the bearing caps and install a thicker shim or a thinner shim as shown.

^ If the backlash is not within specification, correct by increasing the thickness of one differential bearing shim and decreasing the thickness of the other differential bearing shim by the same amount.

12. Rotate the differential several times to make sure the differential bearings are correctly seated.

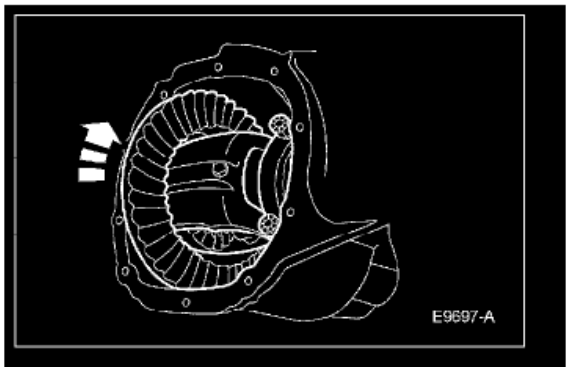
5	4221	Differential bearings (2 required)
6	4222	Differential bearing cups (2 required)
7	4216	Diffeerential ring gear bolt (10 required)



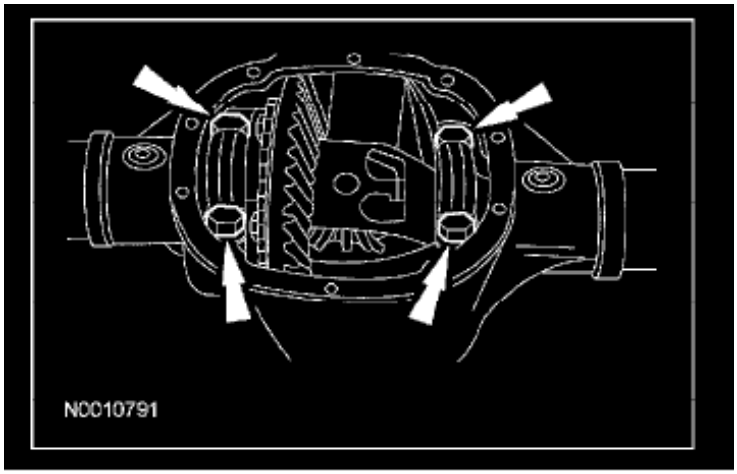
Removal

1. Remove the axle shafts.

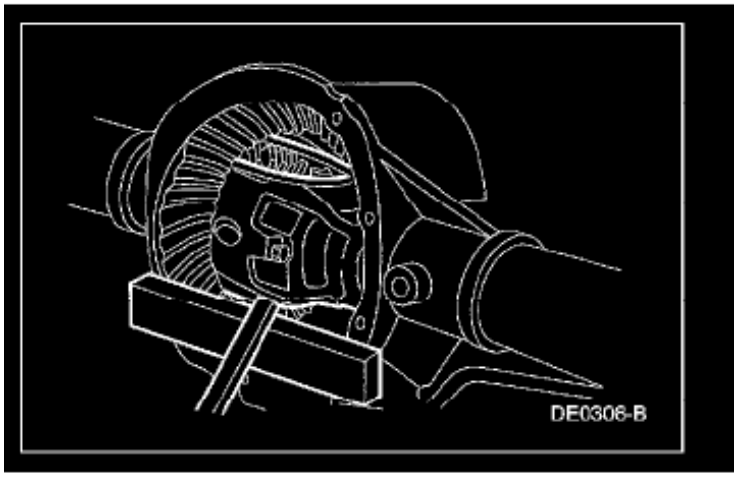
2. NOTE: Inspect the removed lubricant for metallic particles which indicate wear or damage.

Wipe the lubricant from the internal working parts and inspect the parts for wear and damage.

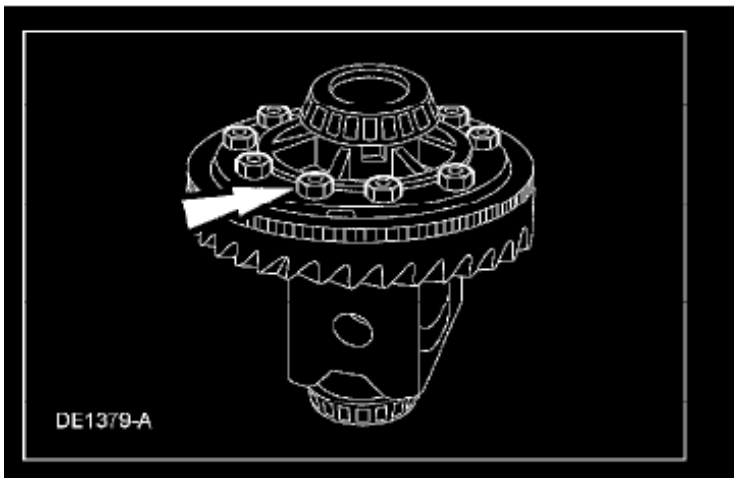
3. Rotate the differential assembly to check for roughness indicating bearing/gear damage.



N0010791



DE0306-B



DE1379-A

4. NOTE: Mark the position of the bearing caps, as the arrows may not be visible. Always install the bearing caps in their original locations and

positions.

Remove the 4 bolts and the 2 bearing caps.

5. CAUTION: Place a wood block between the pry bar and the differential housing to protect the machined surface or damage to the

component may occur.

Using a pry bar and a wood block, remove the differential assembly from the differential housing.

6. Remove and discard the 10 ring gear bolts.

7. NOTE: Do not damage the differential ring gear bolt hole threads.

NOTE: If removing the anti-lock speed sensor ring, discard it, and install a new anti-lock speed sensor ring during installation.

Insert a punch in the bolt holes and drive off the differential ring gear and, if necessary, the anti-lock speed sensor ring.

8. Position the differential assembly, including the differential bearing cups and differential bearing shims, in the differential housing. Install the 2

bearing caps and the 4 bolts. ^

Tighten to 112 Nm (83 lb-ft).

9. Position the special tool.

1 Rotate the differential case to verify that the differential bearings have seated correctly.

2 Position the special tool.

10. Measure and note the differential case runout.

^ If the runout does not exceed the specification, install a new differential ring gear and pinion.

^ If the runout exceeds the specification, the differential ring gear is true and the concern is due to either differential case/differential bearing damage. Proceed as follows.

11. Remove the 4 bearing cap bolts, the 2 bearing caps and the differential assembly from the axle housing. 12. Using the special tools, remove the differential bearings.

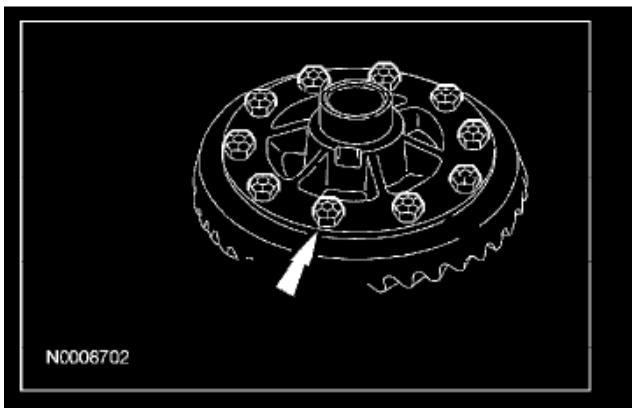
(0.003 inch)
N0039387



N0006702

16. Measure the differential case runout.

^ If the runout does not exceed the specification, use the new differential bearings for assembly.

^ If the runout exceeds the specification, install a new differential case.

17. Remove the 4 bearing cap bolts, the 2 bearing caps and the differential assembly from the axle housing.

Installation

Assembly

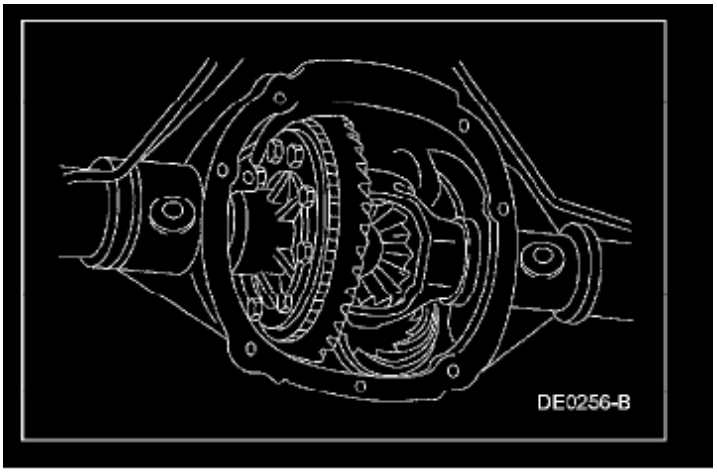
1. Position the differential ring gear, the anti-lock speed sensor ring and the differential case. Align the bolt holes by starting 2 bolts through the holes

in the differential case and the differential ring gear. Press the new anti-lock speed sensor ring, if removed, and the differential ring gear on the differential case.

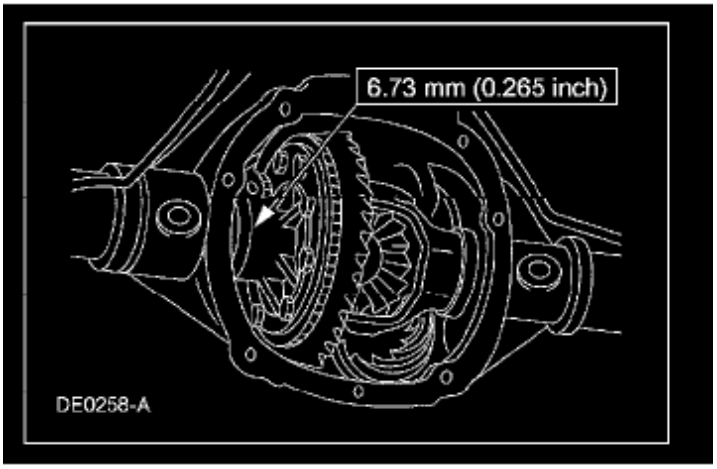
2. Install the 10 new differential ring gear bolts.

^ Tighten to 105 Nm (77 lb-ft).

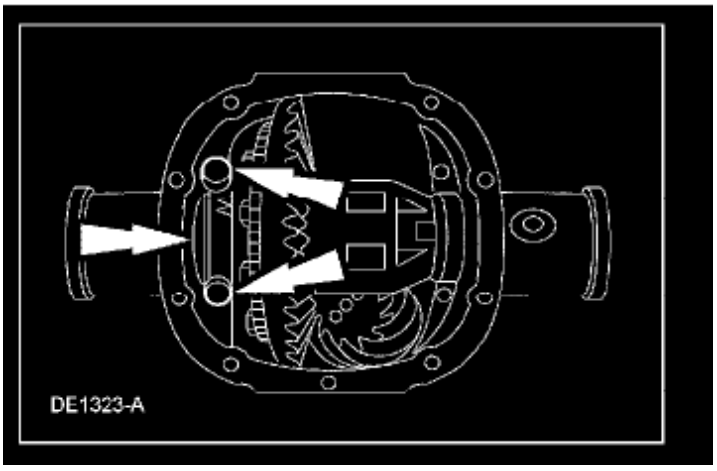
3. With the pinion depth set and pinion installed, place the differential assembly in the differential housing.



DE0256-B



6.73 mm (0.265 inch)
DE0258-A



DE1323-A

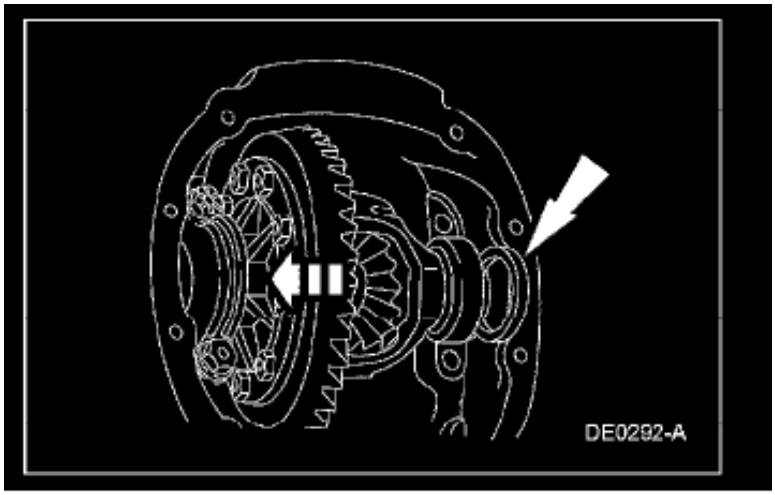
4. Install a differential bearing shim on the left side.

5. NOTE: Always install the bearing caps in their original locations and positions.

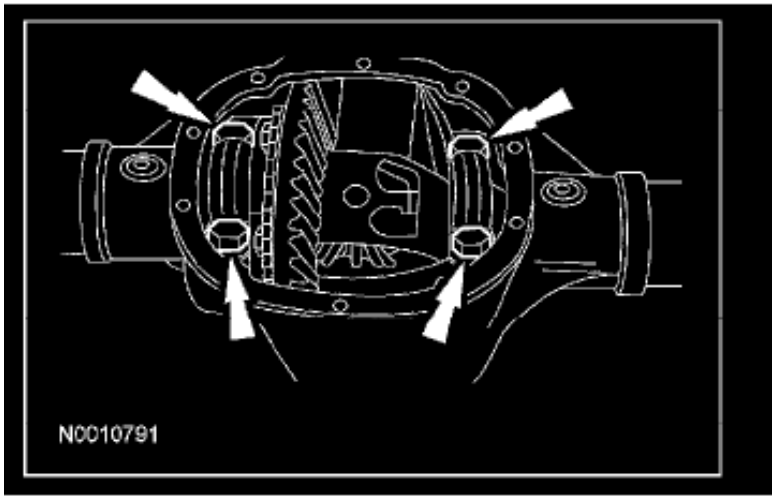
NOTE: Apply pressure toward the left side to make sure the left differential bearing cup seats correctly.

Install the left bearing cap and loosely install the 2 bolts.

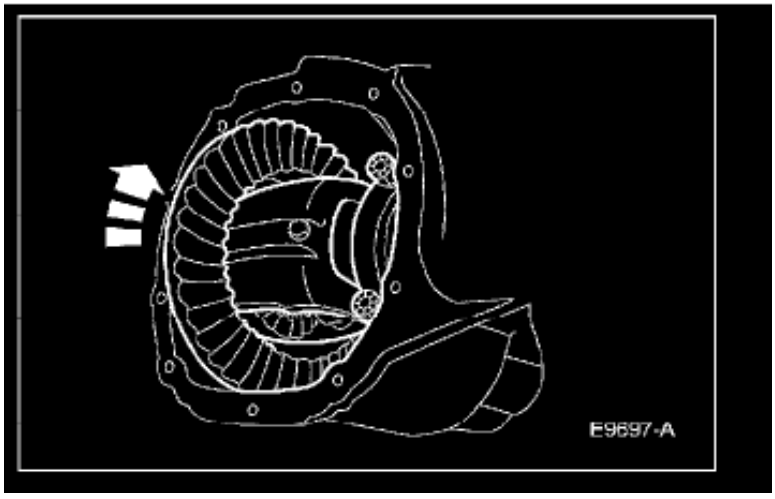
6. Install progressively larger differential bearing shims, on the right side until the largest shim selected is installed by hand.



DE0292-A



N0010791



E9697-A

7. Install the right side bearing cap and tighten the 2 left side and 2 right side bolts.

^ Tighten to 112 Nm (83 lb-ft).

8. Rotate the differential case to make sure it turns freely.

Measuring backlash 9. Using the special tools, measure and note the differential ring gear backlash.

^ If backlash is within the specification, refer to Backlash within specification in this procedure.

^ If a zero backlash condition occurs, refer to Zero backlash in this procedure.

^ If backlash is not within the specification, refer to Backlash not within specification in this procedure.

Backlash Change Required		Thickness Change Required	
mm	Inch	mm	Inch
0.025	0.001	0.050	0.002
0.050	0.002	0.050	0.002
0.076	0.003	0.101	0.004
0.101	0.004	0.152	0.006

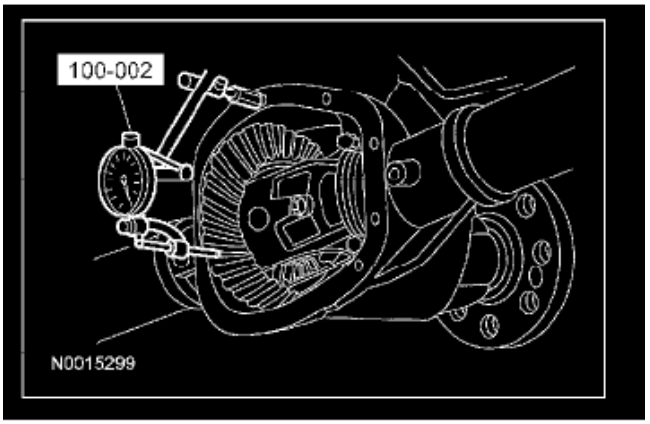
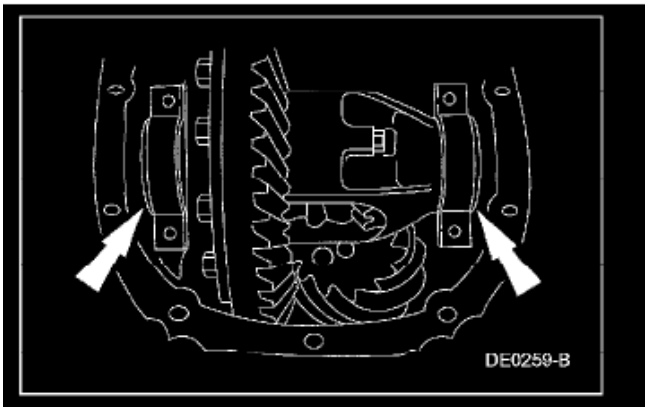
0.335	0.014	0.457	0.018
0.381	0.015	0.508	0.020



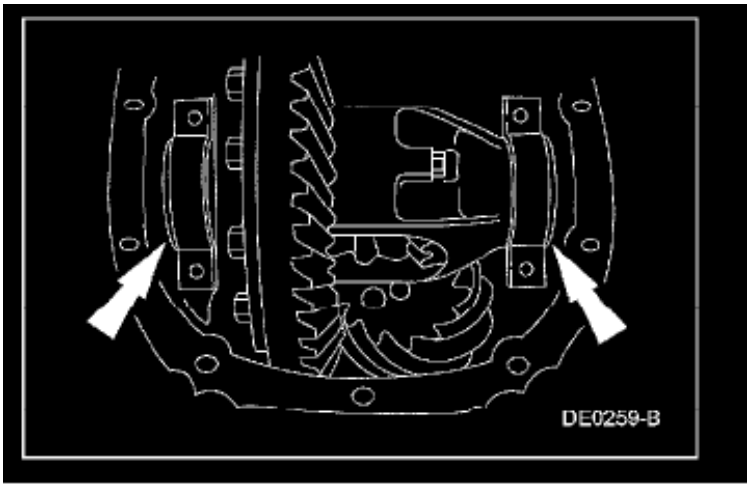


Zero backlash 10. If a zero backlash condition occurs, add 0.51 mm (0.020 inch) to the RH side and subtract 0.51 mm (0.020 inch) from the LH side to allow

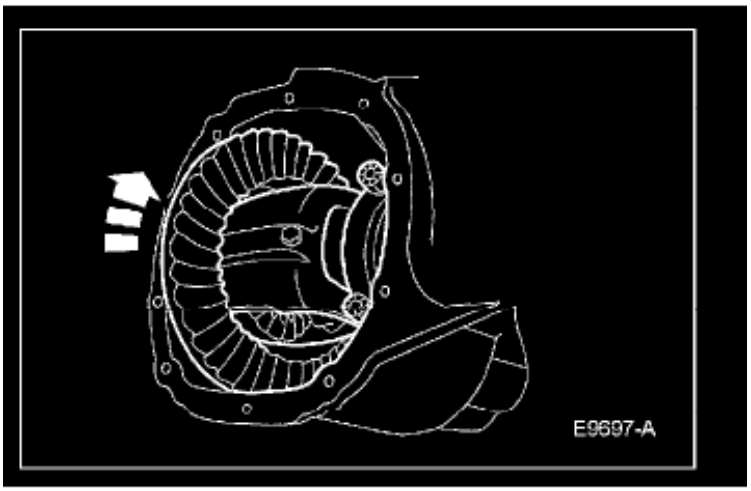
backlash indication. Measure the backlash. Refer to Measuring backlash in this procedure.

Backlash not within specification 11. To increase or decrease backlash, remove the bearing caps and install a thicker shim and a thinner shim accordingly.

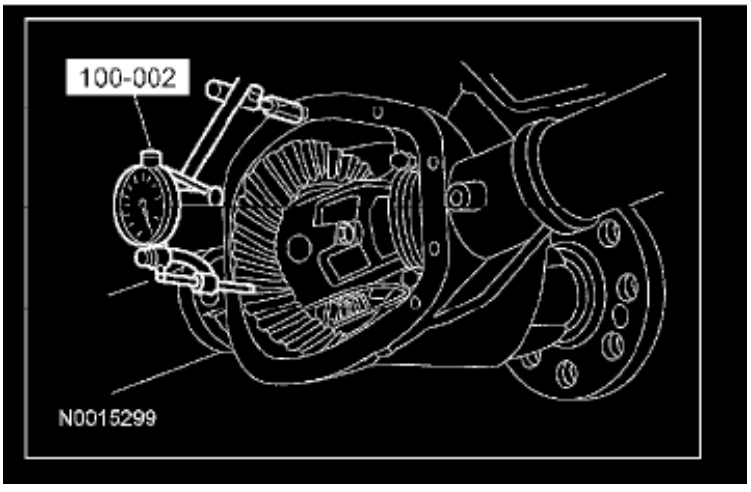
^ If backlash is not within the specification, increase the thickness of one differential bearing shim and decrease the thickness of the other differential bearing shim by the same amount.



DE0259-B



E9697-A



100-002
N0015299

12. Rotate the differential assembly several times to verify that the differential bearings seated correctly.

13. Using the special tools, recheck the backlash.

^ If backlash is within the specification, refer to Backlash within specification in this procedure. If backlash is not within the specification, repeat Backlash not within specification in this procedure.

Backlash within specification 14. Remove the 4 bolts and the 2 bearing caps. 15. To establish differential bearing preload, increase both left and right differential bearing shim sizes by the specification shown.

Removal

1. Remove the differential carrier. 2. Remove and discard the 10 differential ring gear bolts.

3. NOTE: Do not damage the differential ring gear bolt hole threads.

Insert a punch in the differential ring gear bolt holes and drive the differential ring gear off.

4. NOTE: The speed sensor ring cannot be reused once removed. Remove the speed sensor ring only if damaged.

If necessary, remove the speed sensor ring.

5. Using the special tools, remove the differential bearings.

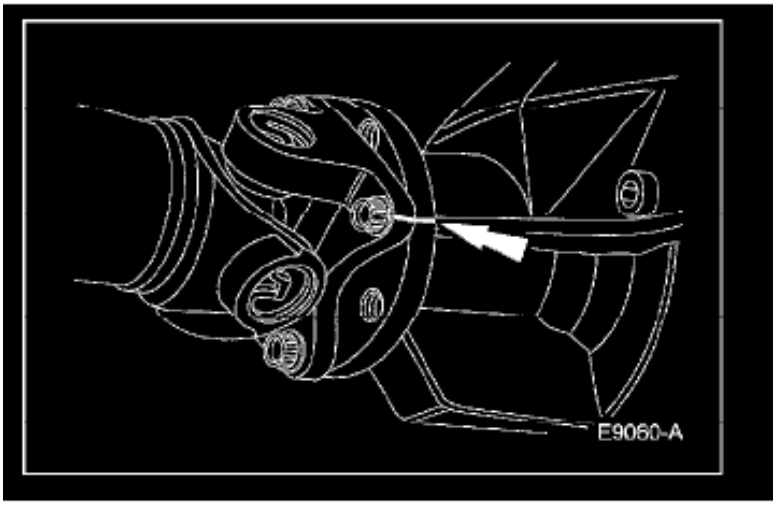
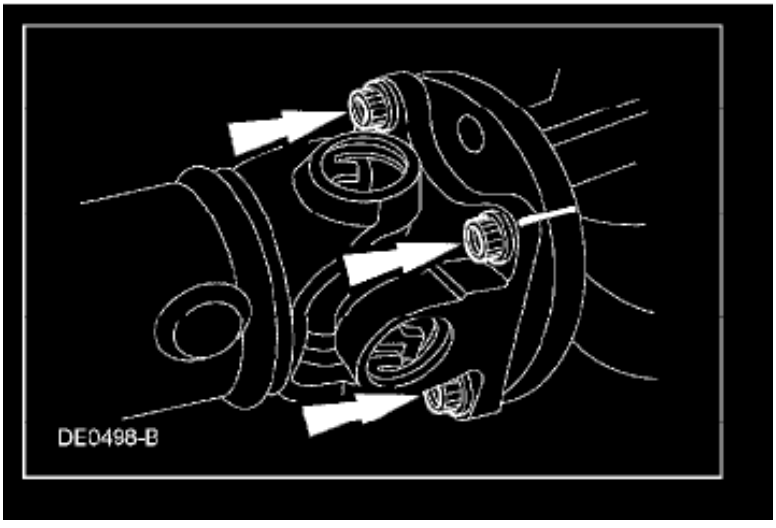
205-D016
N0015311



E9060-A



DE0498-B

6. Index-mark the driveshaft flange and pinion flange for correct alignment during installation.

7. Remove the 4 driveshaft flange bolts.

8. CAUTION: The driveshaft centering socket yoke fits tightly on the pinion flange pilot. Never hammer on the driveshaft or any of its

components to disconnect the driveshaft centering socket yoke from the pinion flange or damage to the component may occur. Pry only in the area shown with a suitable tool to disconnect the driveshaft centering socket yoke from the pinion flange or damage to the component may occur.

Using a suitable tool as shown, disconnect the driveshaft centering socket yoke from the pinion flange. ^

Using mechanic's wire, position the driveshaft aside.

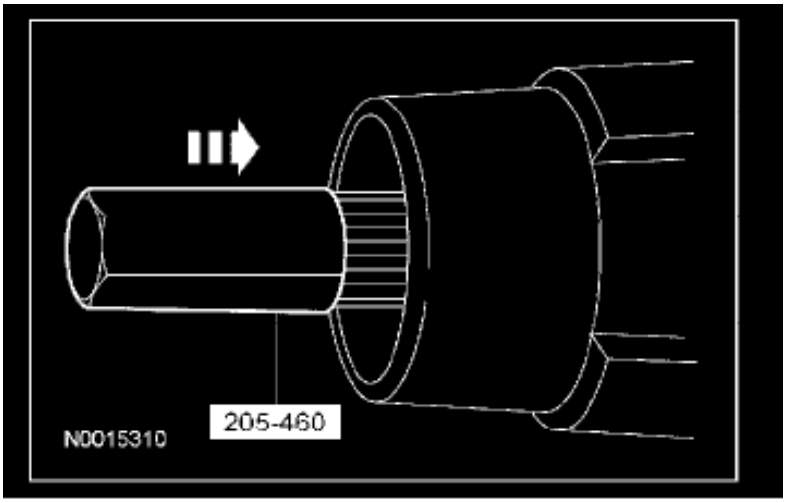
9. Using the special tool to hold the pinion flange, remove and discard the pinion nut.

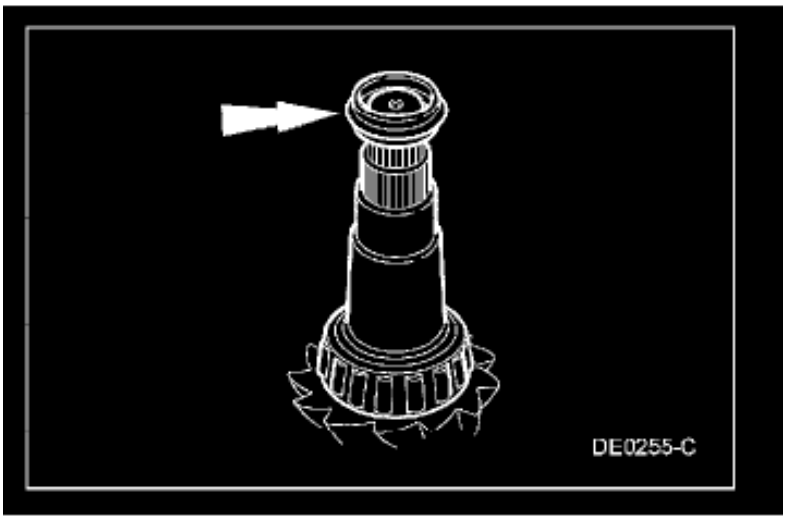
10. Using the special tool, remove the pinion flange.

11. Force up on the metal flange of the drive pinion seal. Install gripping pliers and strike with a hammer until the drive pinion seal is removed.

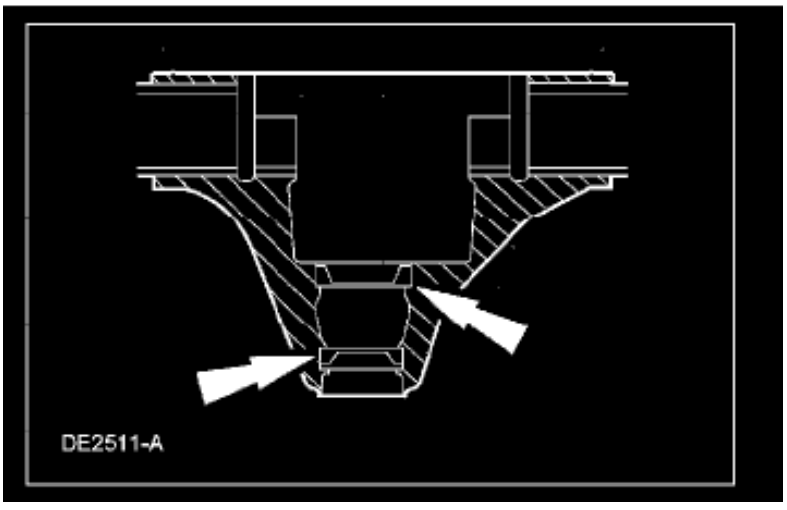
12. Remove the drive pinion shaft oil slinger and the outer drive pinion bearing.



205-460
N0015310



DE0255-C



DE2511-A

13. Install the special tool. Using a soft-faced hammer, drive the pinion assembly out of the axle housing.

14. Remove and discard the drive pinion collapsible spacer.

15. Using a brass drift, remove the drive pinion bearing cups by tapping alternately on opposite sides of the drive pinion bearing cups.

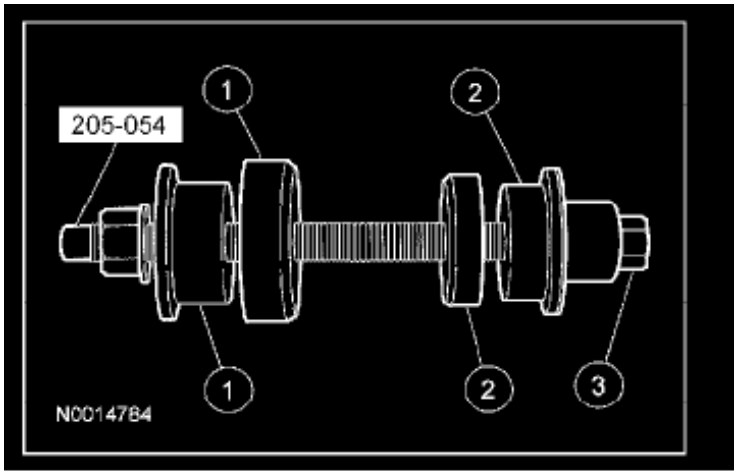
Installation

1. Position the special tool and the inner and outer drive pinion bearing cups in their respective bores.

1 After placing the inner and outer drive pinion bearing cups in their bores, place the special tool (inner) on the inner drive pinion bearing cup.

2 Place the special tool (outer) on the outer drive pinion bearing cup.

3 Install the special tool.



205-054

2. Tighten the special tool to seat the drive pinion bearing cups into their bores.

3. NOTE: If a feeler gauge can be inserted between a drive pinion bearing cup and the bottom of its bore at any point around the drive pinion

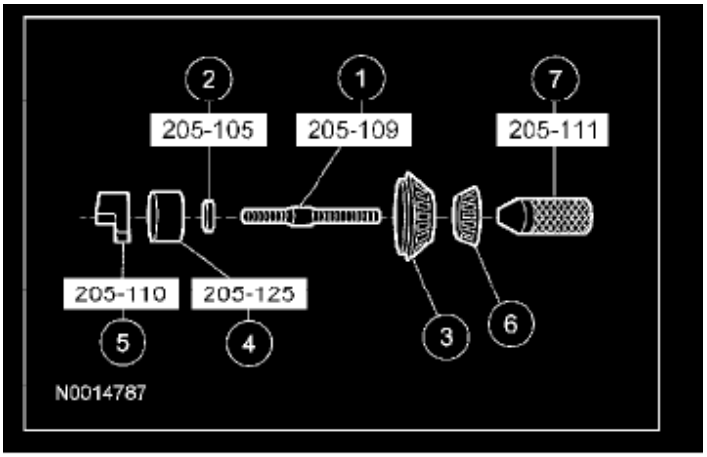
bearing cup, the drive pinion bearing cup is not correctly seated.

Make sure the drive pinion bearing cups are correctly seated in their bores.

4. NOTE: Install new drive pinion bearings without any additional lubricant since the anti-rust oil provides adequate lubricant without upsetting the

drive pinion bearing preload settings.

Assemble and position the special tools in the sequence shown.



2
3
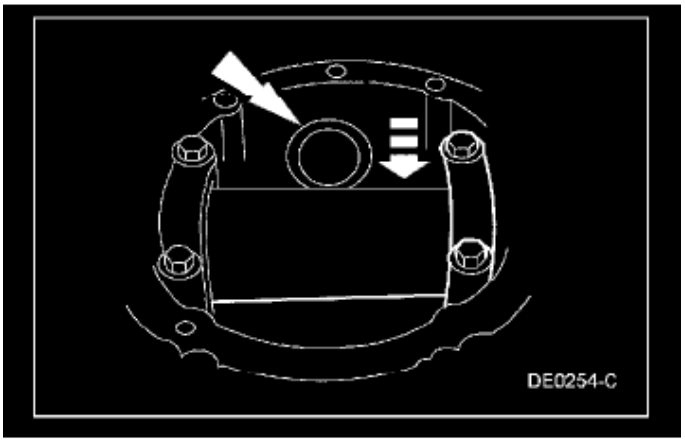
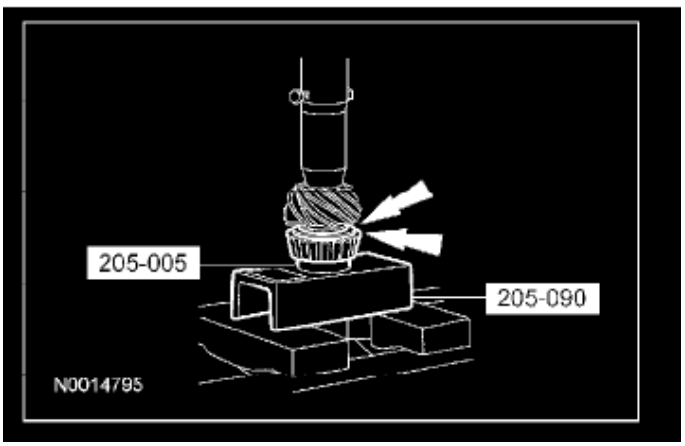
N0014790



DE0254-C



205-005
205-090
N0014795

8. NOTE: Drive pinion bearing adjustment shims must be flat and clean.

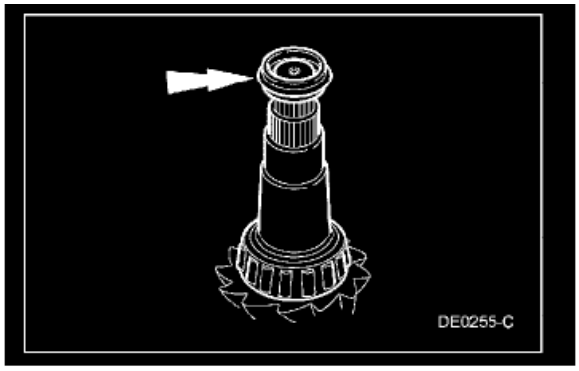
NOTE: A slight drag should be felt for correct drive pinion bearing adjustment shim selection. Do not attempt to force the drive pinion bearing adjustment shim between the gauge block and the gauge tube. This will minimize selection of a drive pinion bearing adjustment shim thicker than required, which results in a deep tooth contact in final assembly of integral axle assemblies.

Use a drive pinion bearing adjustment shim as a gauge for drive pinion bearing adjustment shim selection. ^

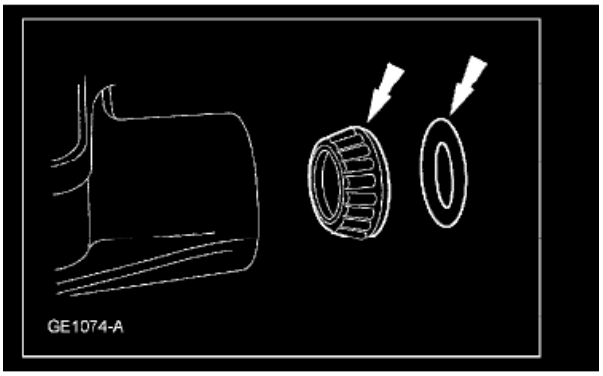
After the correct drive pinion bearing adjustment shim thickness has been determined, remove all of the special tools.

9. Using the special tool, press the inner drive pinion bearing and drive pinion bearing adjustment shim until it is firmly seated on the pinion shaft.

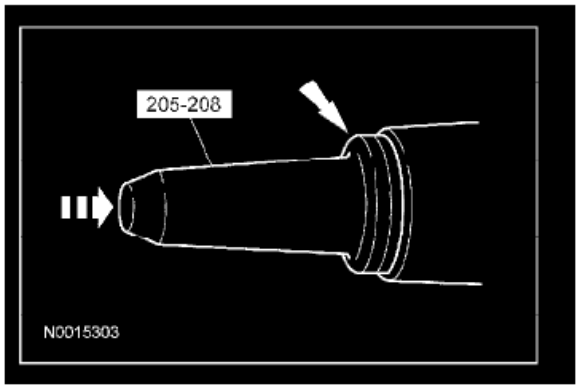
10. Install a new drive pinion collapsible spacer on the pinion shaft against the pinion shaft shoulder.



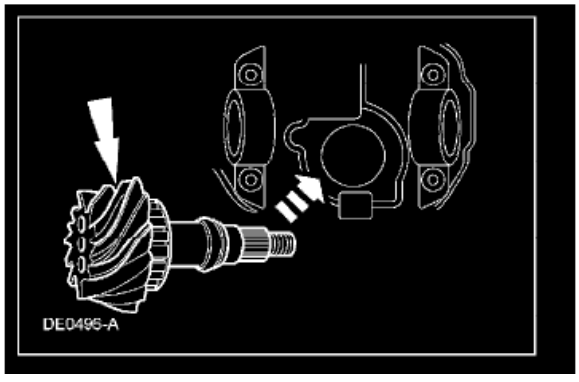
DE0255-C



GE1074-A

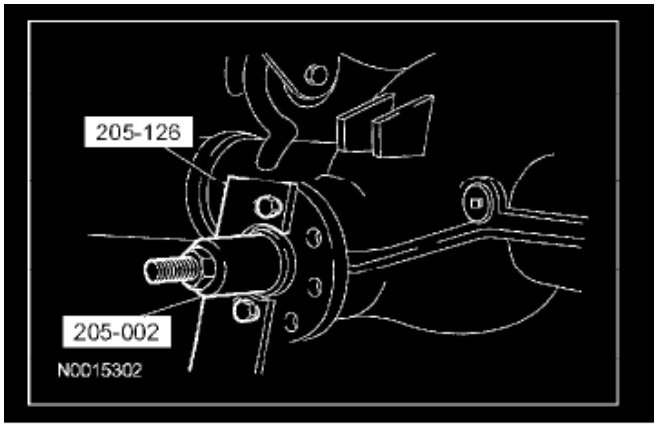


205-208
N0015303



DE0496-A

11. Install the outer drive pinion bearing and the drive pinion shaft oil slinger.
12. Using the special tools, install the drive pinion seal.
13. Position the drive pinion assembly into the axle housing.
14. Using the special tools, install the drive pinion flange.



205-126

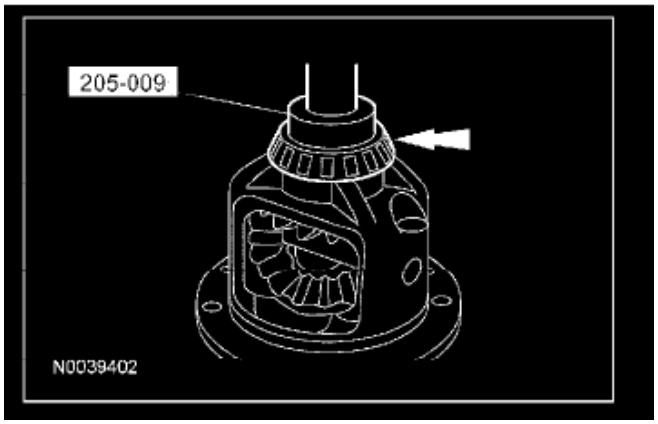
205-126
N0015301



205-009
N0039402

15. CAUTION: Do not, under any circumstance, loosen the drive pinion nut to reduce pinion bearing preload or damage to the component

may occur. If it is necessary to reduce the preload, install a new drive pinion collapsible spacer and drive pinion nut.

NOTE: Remove the special tool while taking rotational pinion bearing preload checks with the Nm (lb-inch) torque wrench.

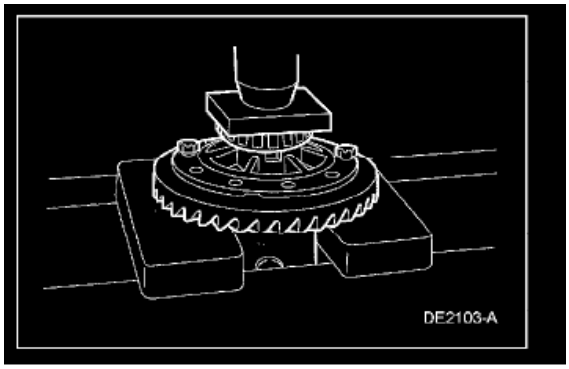
Use the special tool to hold the pinion flange while tightening the pinion nut. ^

Rotate the pinion occasionally to make sure the differential pinion bearings are seating correctly. Take frequent differential pinion bearing preload checks by rotating the differential pinion with a Nm (lb-inch) torque wrench. Tighten the pinion nut in small increments to avoid excessive pinion bearing preload. Tighten the pinion nut until the drive pinion bearing preload is in specification. -

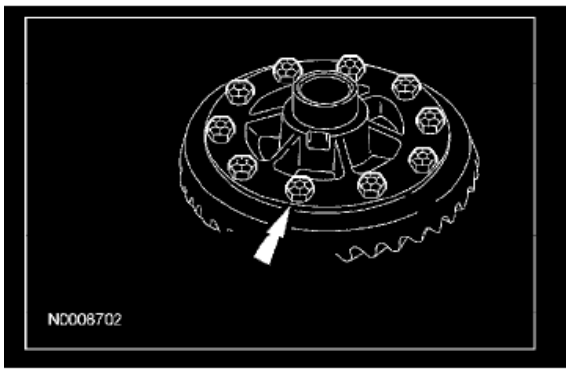
Tighten to a rotational torque of 1.8-3.3 Nm (16-29 lb-inch).

16. Using the special tool, install the 2 new differential bearings.

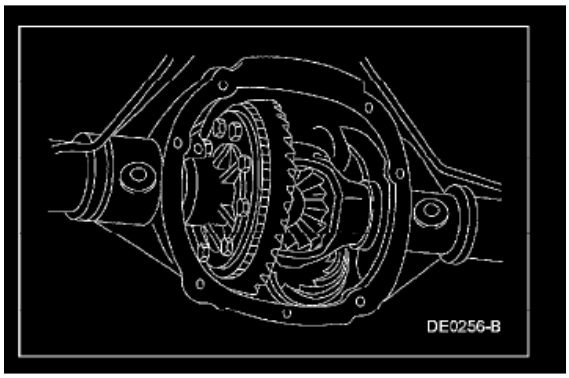
17. Press the differential ring gear on the differential assembly.



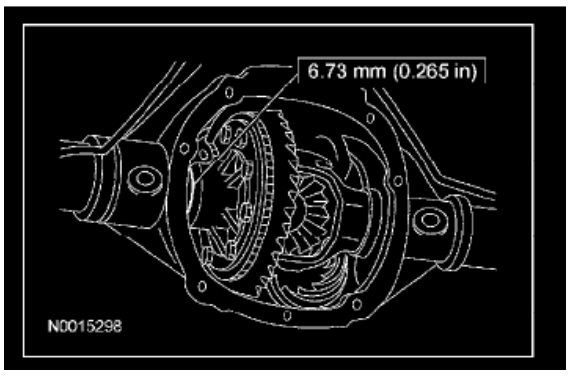
DE2103-A



N0008702



DE0256-B



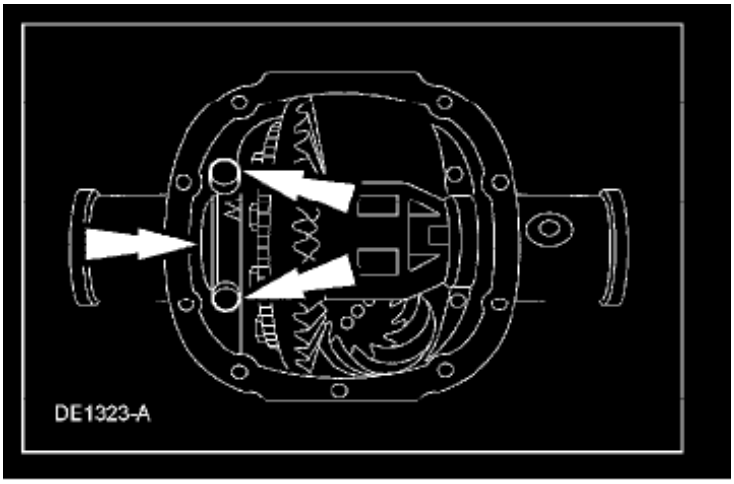
6.73 mm (0.265 in)
N0015298

18. Install the 10 new differential ring gear bolts.

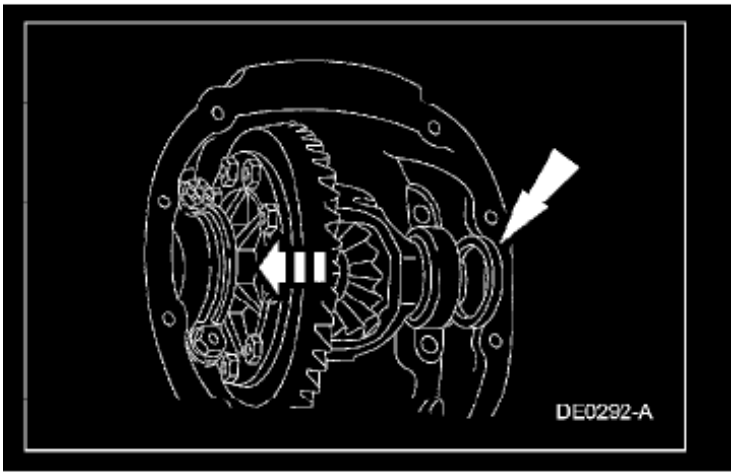
^ Tighten to 105 Nm (77 lb-ft).

19. Position the differential carrier assembly and the new differential bearing cups in the differential housing.

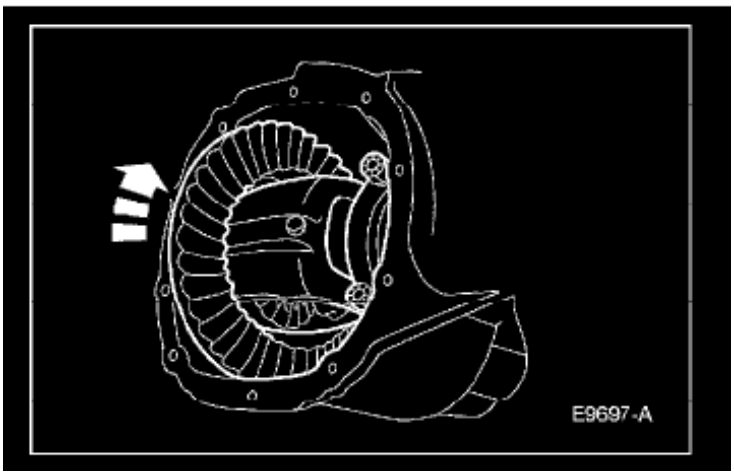
20. Install a differential bearing shim of the shown dimension on the LH side.



DE1323-A



DE0292-A



E9697-A

21. NOTE: Always install the bearing caps in their original locations and positions.

NOTE: Apply pressure toward the left side to make sure the LH differential bearing cup seats correctly.

Install the LH bearing cap and loosely install the 2 bolts.

22. Install progressively larger differential bearing shims on the RH side until the largest shim is installed by hand.

23. Install the right side bearing cap and 2 bolts. Tighten the 4 LH and RH bearing cap bolts.

^ Tighten to 112 Nm (83 lb-ft).

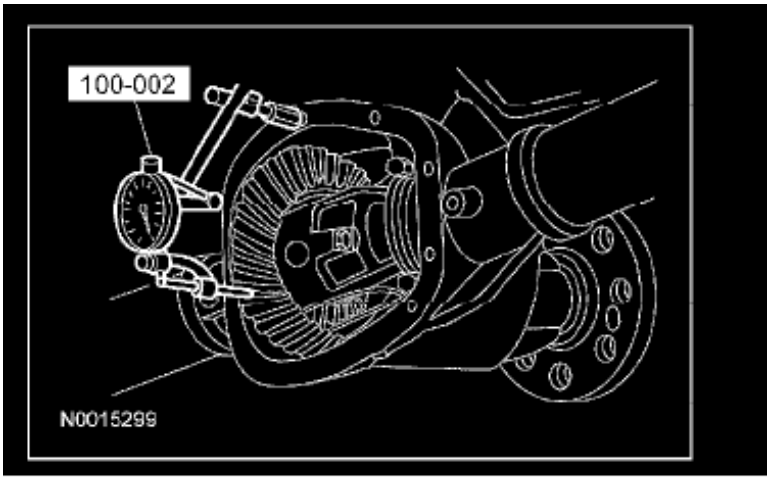
24. Rotate the differential carrier several times to verify the differential bearings have seated correctly.

25. Install the special tools and measure the ring gear backlash.

^ If the backlash is within specification, proceed to Step 28.

^ If a zero backlash condition occurs, proceed to Step 26.

^ If the backlash is not within specification, proceed to Step 27.



Backlash Change Required		Thickness Change Required	
mm	Inch	mm	Inch
0.025	0.001	0.050	0.002
0.050	0.002	0.050	0.002

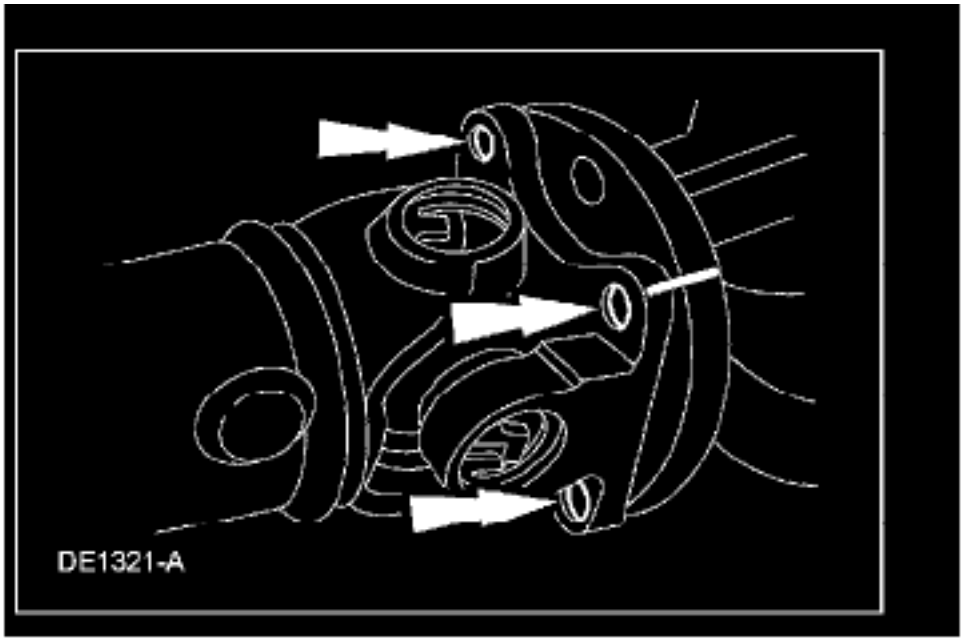
N0015299

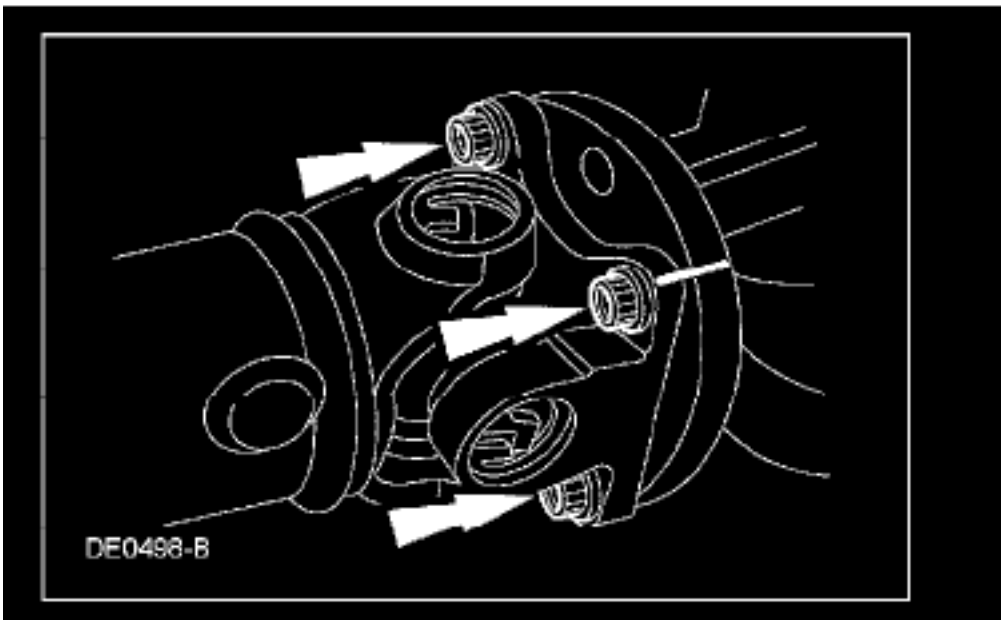
30. Using the special tool, fully seat the differential bearing shims. Make sure the assembly rotates freely.

31. Install the 2 bearing caps and 4 bolts.

^ Tighten to 112 Nm (83 lb-ft).

32. Using the special tools, recheck the ring gear backlash.





33. Apply marking compound and rotate the differential assembly 5 complete revolutions. 34. Verify an acceptable pattern check. 35. Install the axle shafts. 36. Position the driveshaft and align the index marks on the pinion flange.

37. NOTE: The driveshaft centering socket yoke fits tightly on the pinion flange pilot. To make sure that the driveshaft centering socket yoke seats

squarely on the pinion flange, tighten the driveshaft flange bolts evenly in a cross pattern.

Install the 4 driveshaft flange bolts. ^

Tighten to 112 Nm (83 lb-ft).

Removal

1. Remove the differential carrier assembly. 2. Remove and discard the 10 differential ring gear bolts.

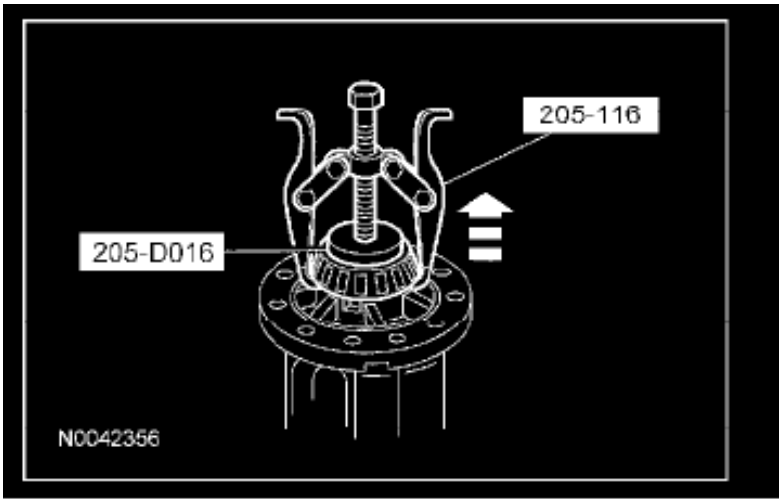
3. NOTE: Care should be taken not to damage the differential ring gear bolt hole threads.

Insert a punch in the differential ring gear bolt holes and drive the differential ring gear off.

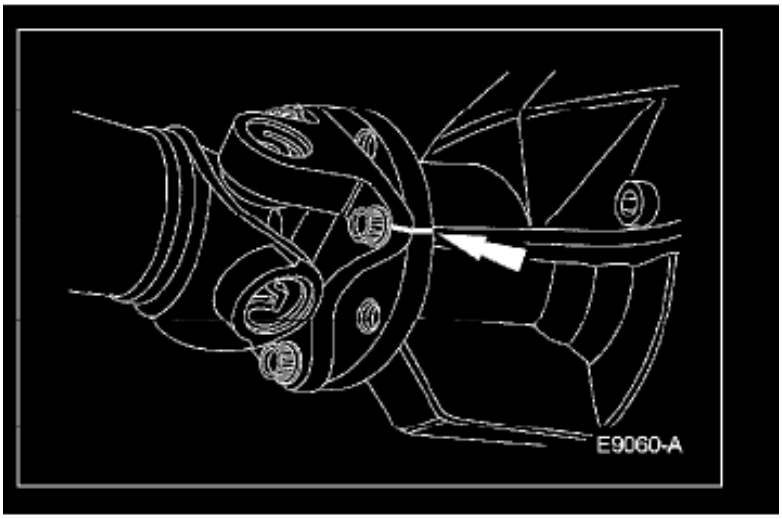
4. NOTE: The anti-lock ring cannot be reused once removed. Remove the anti-lock ring only if damaged.

If necessary, remove the anti-lock ring.

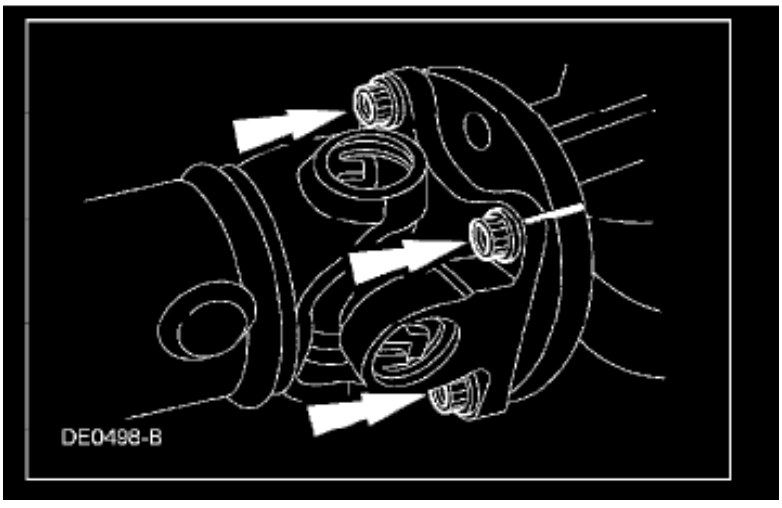
5. Using the special tools, remove the differential bearings.



205-116
205-D016
N0042356



E9060-A



DE0498-B

6. Index-mark the driveshaft flange and pinion flange for correct alignment during installation.

7. Remove the 4 driveshaft flange bolts.

8. CAUTION: The driveshaft centering socket yoke fits tightly on the pinion flange pilot. Never hammer on the driveshaft or any of its

components to disconnect the driveshaft centering socket yoke from the pinion flange. Pry only in the area shown with a suitable tool to disconnect the driveshaft centering socket yoke from the pinion flange or damage to the component may occur.

Using a suitable tool as shown, disconnect the driveshaft centering socket yoke from the pinion flange. ^

Using mechanic's wire, position the driveshaft aside.

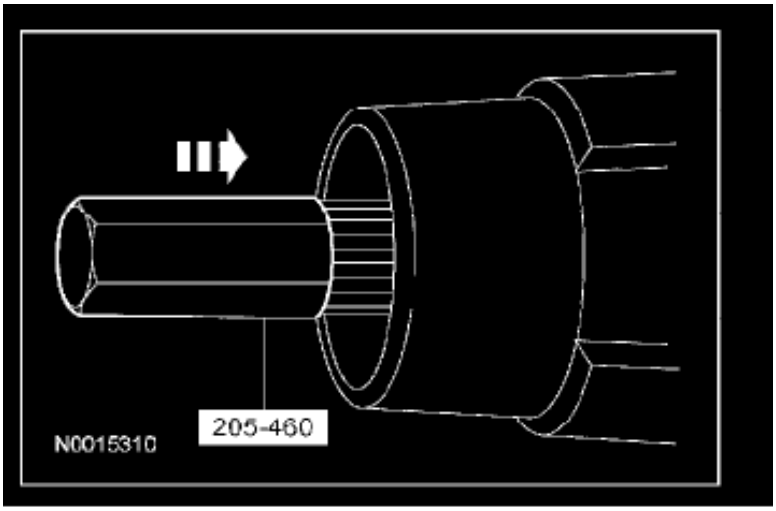
A0006803

9. Using the special tool to hold the pinion flange, remove and discard the pinion nut.

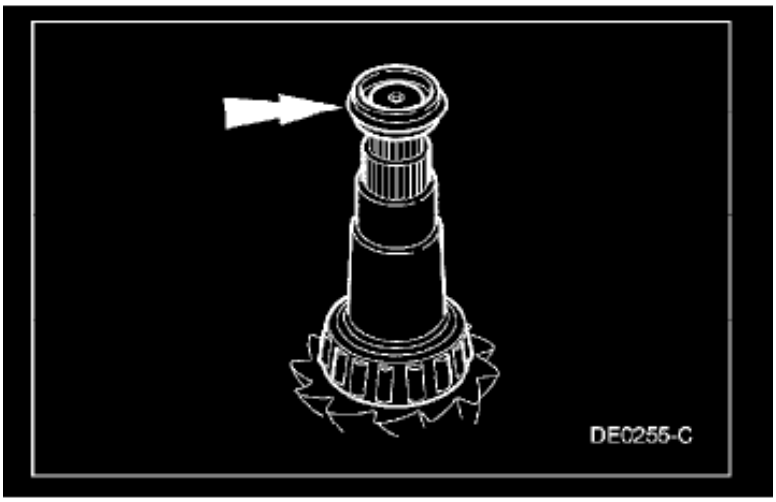
10. Using the special tool, remove the pinion flange.

11. Force up on the metal flange of the drive pinion seal. Install gripping pliers and strike with a hammer until the drive pinion seal is removed.

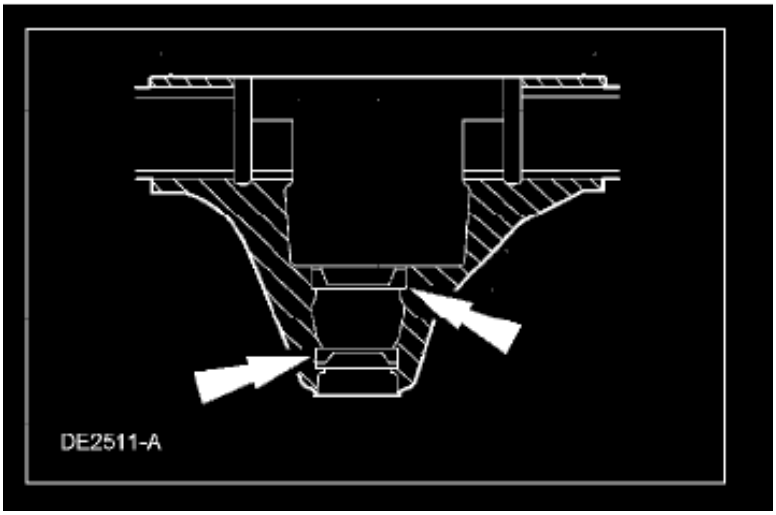
12. Remove the drive pinion shaft oil slinger and the outer drive pinion bearing.



205-460
N0015310



DE0255-C



DE2511-A

13. Install the special tool. Using a soft-faced hammer, drive the pinion assembly out of the axle housing.

14. Remove and discard the drive pinion collapsible spacer.

15. Using a brass drift, remove the drive pinion bearing cups by tapping alternately on opposite sides of the drive pinion bearing cups.

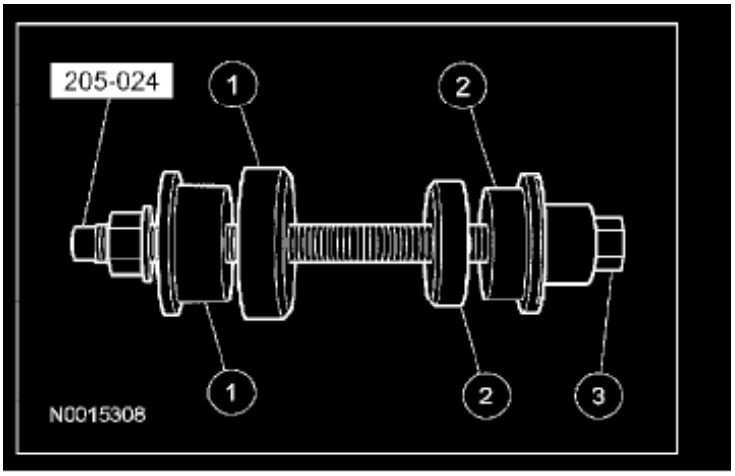
Installation

1. Position the special tool and the inner and outer drive pinion bearing cups in their respective bores.

1 After placing the inner and outer drive pinion bearing cups in their bores, place the special tool (inner) on the inner drive pinion bearing cup.

2 Place the special tool (outer) on the outer drive pinion bearing cup.

3 Install the special tool.



205-024

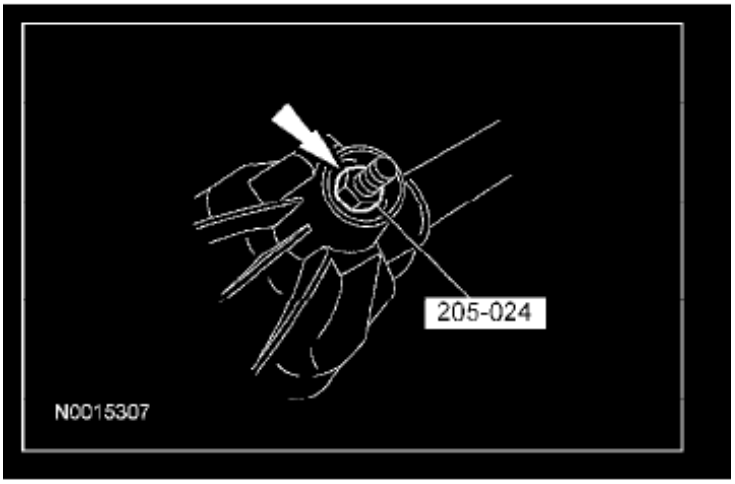
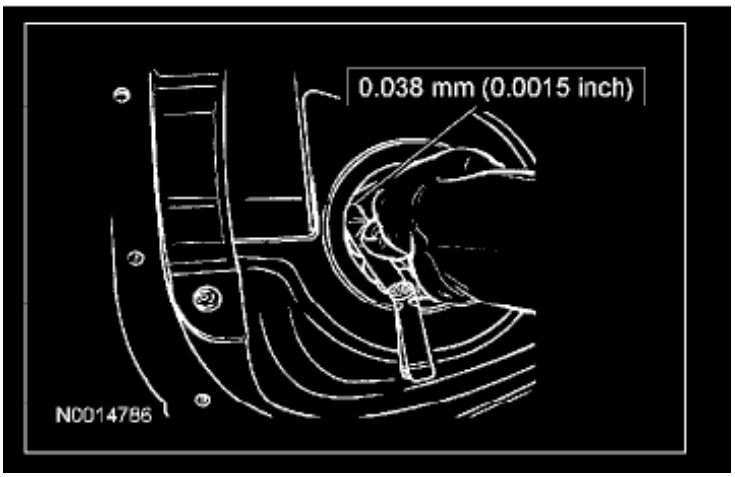
3
N0015308



205-024
N0015307



0.038 mm (0.0015 inch)
N0014786

2. Tighten the special tool to seat the drive pinion bearing cups into their bores.

3. NOTE: If a feeler gauge can be inserted between a drive pinion bearing cup and the bottom of its bore at any point around the drive pinion

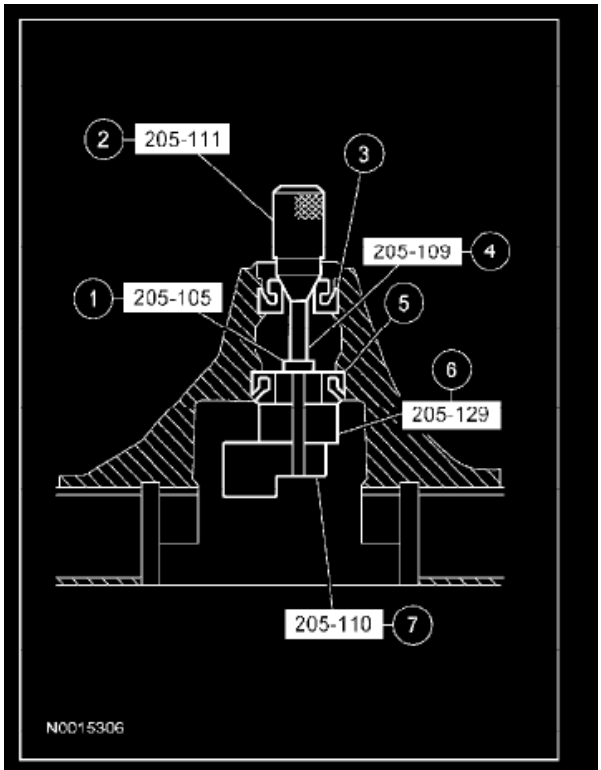
bearing cup, the drive pinion bearing cup is not correctly seated.

Make sure the drive pinion bearing cups are correctly seated in their bores.

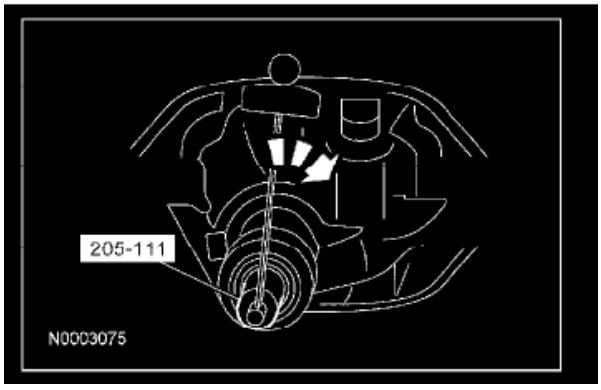
4. NOTE: Install new drive pinion bearings without any additional lubricant since the anti-rust oil provides adequate lubricant without upsetting the

drive pinion bearing preload settings.

Assemble and position the special tools.



Item	Part Number	Description
1	205-105	Adapter for 205-S127 (1.612 in O.D.) (T76P-4020-A3)
2	205-111	Adapter for 205-S127 (T76P-4020-A11)
3	4621	Drive pinion bearing (outer)
4	205-109	Adapter for 205-S127 (T76P-4020-A9)
5	4630	Drive pinion bearing (inner)
6	205-129	Adapter for 105-S127 (1.1884 in thick) (T79P-4020-A18)
7	205-110	Adapter for 205-S127 (1.7 in thick) (T76P-4020-A10)

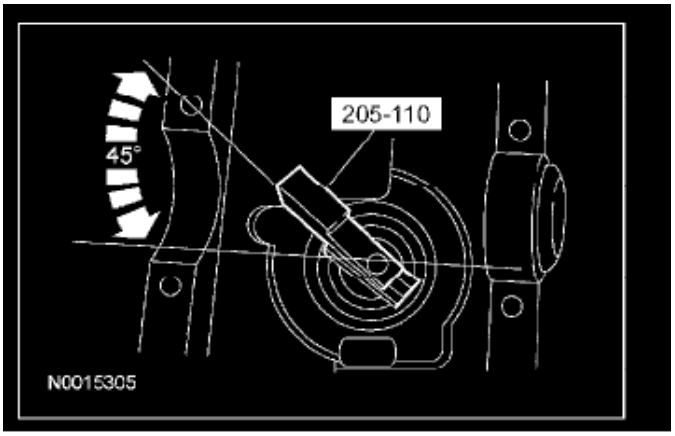


5. NOTE: This step duplicates final drive pinion bearing preload.

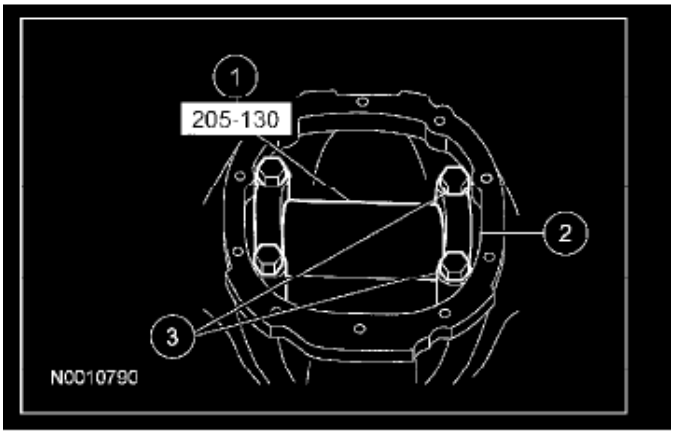
Tighten the special tool. Tighten to 2.2 Nm (20 lb-inch) rotational torque.

6. NOTE: The special tool must be offset to obtain an accurate reading.

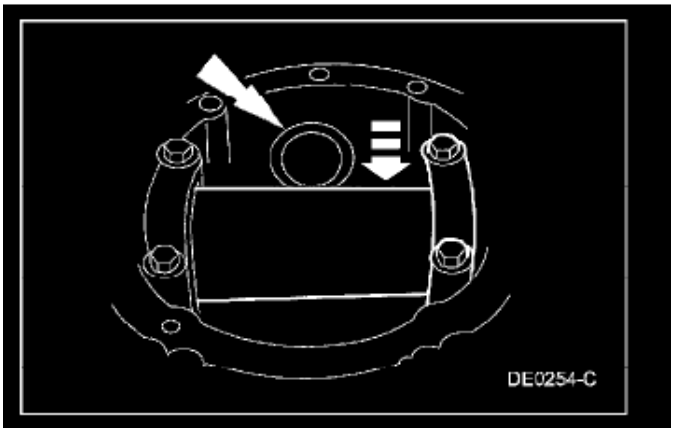
Rotate the special tool several half-turns to make sure of correct seating of the drive pinion bearings and position the special tool.



205-110
45°
N0015305



1
205-130
2
3
N0010790



DE0254-C

7. Install the special tool. 1 Position the special tool. 2 Install the 2 differential bearing caps. 3 Install the 4 differential bearing cap bolts. 1 Tighten to

112 Nm (83 lb-ft).

8. NOTE: Drive pinion bearing adjustment shims must be flat and clean.

NOTE: A slight drag should be felt for correct drive pinion bearing adjustment shim selection. Do not attempt to force the drive pinion bearing adjustment shim between the gauge block and the gauge tube. This will minimize selection of a drive pinion bearing adjustment shim thicker than required, which results in a deep tooth contact in final assembly of integral axle assemblies.

Use a drive pinion bearing adjustment shim as a gauge for drive pinion bearing adjustment shim selection. ^

After the correct drive pinion bearing adjustment shim thickness has been determined, remove all of the special tools.

9. Using the special tool and a shop press, drive the inner drive pinion bearing and the selected drive pinion bearing adjustment shim until they are

firmly seated on the pinion shaft.

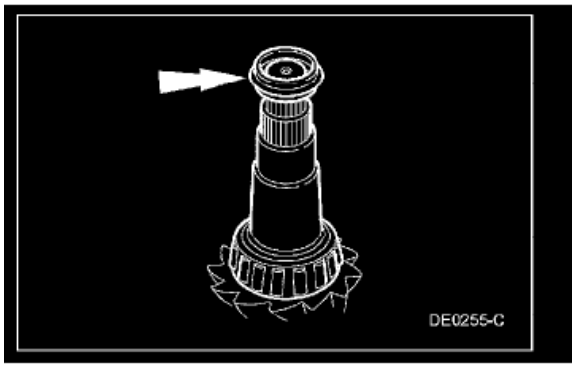
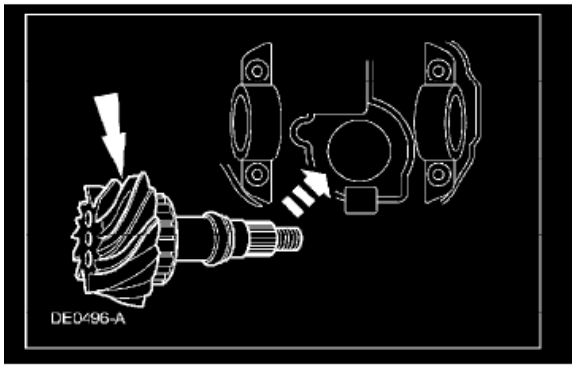
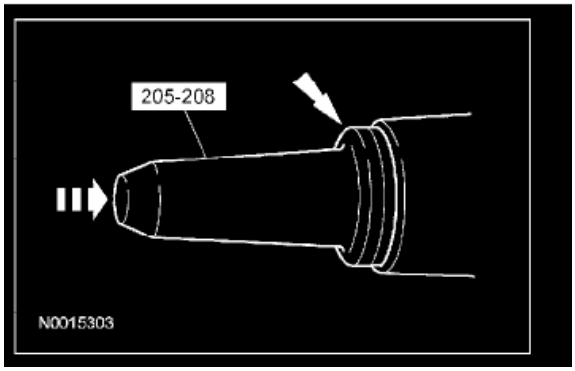
205-090
N0015304



DE0255-C



DE0496-A



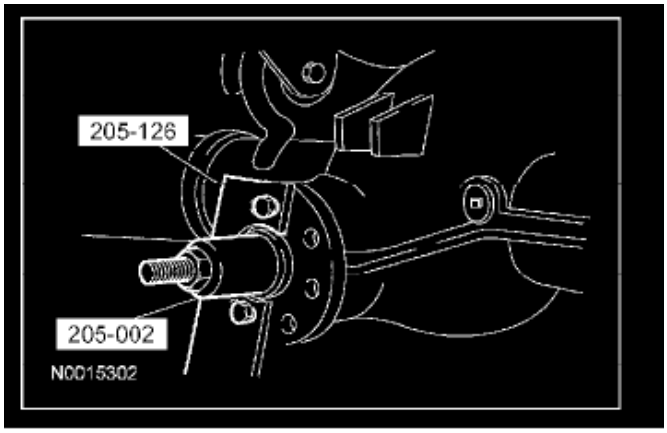
205-208
N0015303

10. Install a new drive pinion collapsible spacer on the pinion shaft against the pinion shaft shoulder.

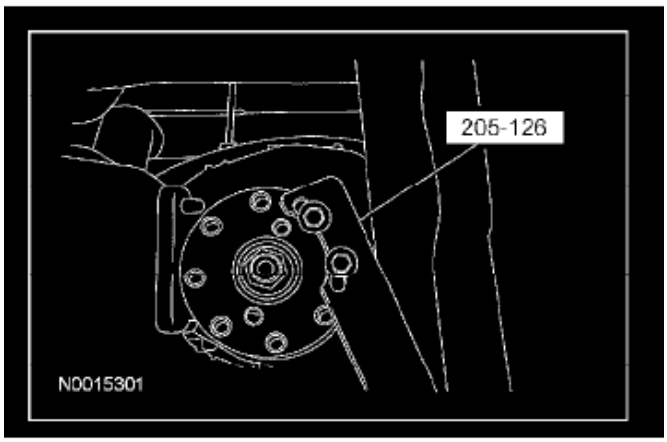
11. Install the drive pinion assembly into the axle housing.

12. Install the outer drive pinion bearing and the drive pinion shaft oil slinger. 13. Using the special tools, install the drive pinion seal.

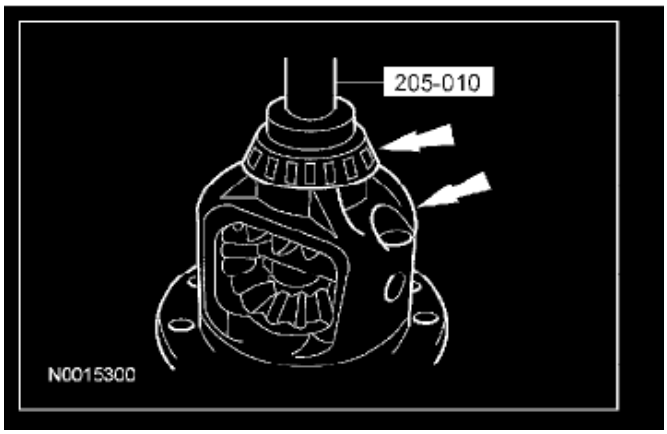
14. Using the special tools, install the drive pinion flange.



205-126
205-002
N0015302



205-126
N0015301



205-010
N0015300

15. CAUTION: Do not, under any circumstance, loosen the drive pinion nut to reduce pinion bearing preload or damage to the component

may occur. If it is necessary to reduce the preload, install a new drive pinion collapsible spacer and drive pinion nut.

NOTE: Remove the special tool while taking rotational pinion bearing preload checks with the Nm (lb-inch) torque wrench.

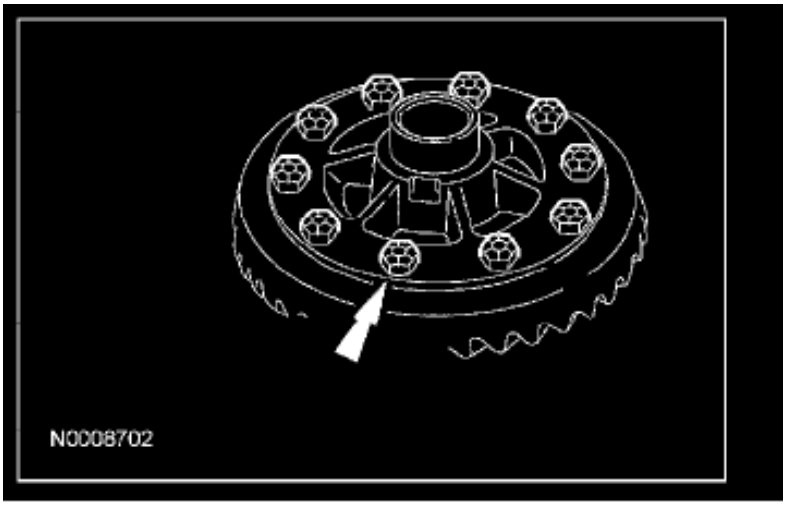
Use the special tool to hold the pinion flange while tightening the pinion nut. ^

Rotate the pinion occasionally to make sure the differential pinion bearings are seating correctly. Take frequent differential pinion bearing preload checks by rotating the differential pinion with a Nm (lb-inch) torque wrench. Tighten the pinion nut in small increments to avoid excessive pinion bearing preload. Tighten the pinion nut until the drive pinion bearing preload is in specification.

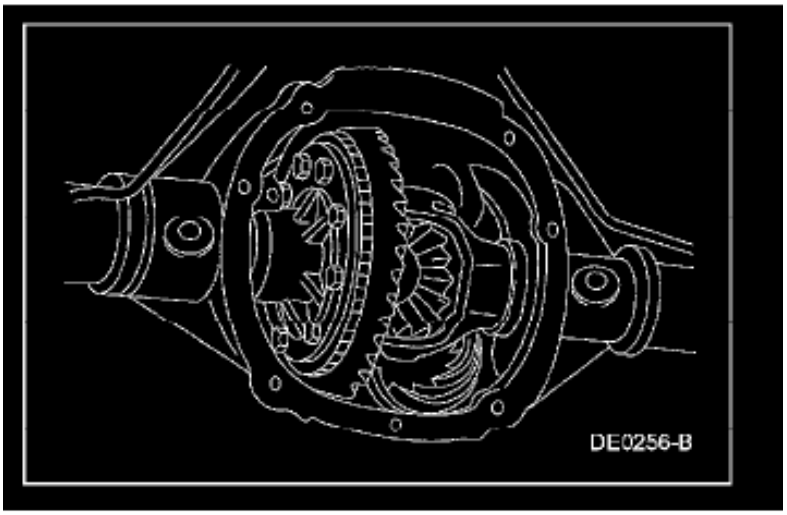
16. Using the special tool, install the 2 new differential bearings.

17. Install the 10 new differential ring gear bolts.

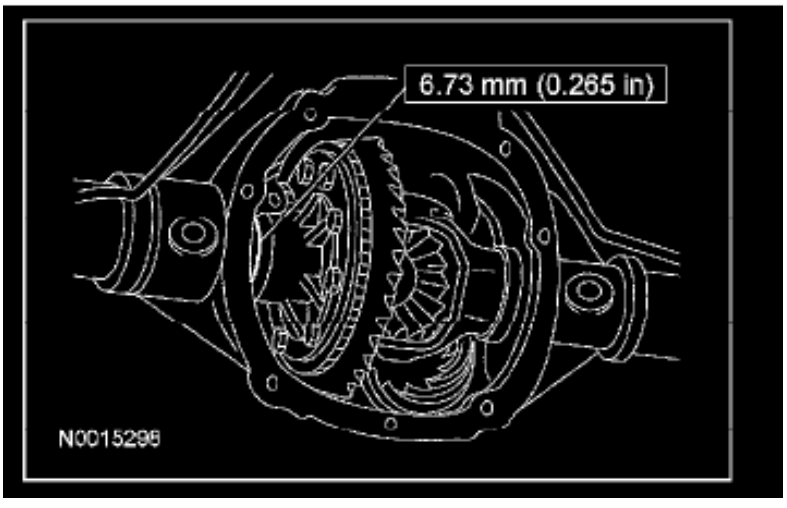
^ Tighten to 105 Nm (77 lb-ft).



N0008702



DE0256-B



6.73 mm (0.265 in)
N0015298

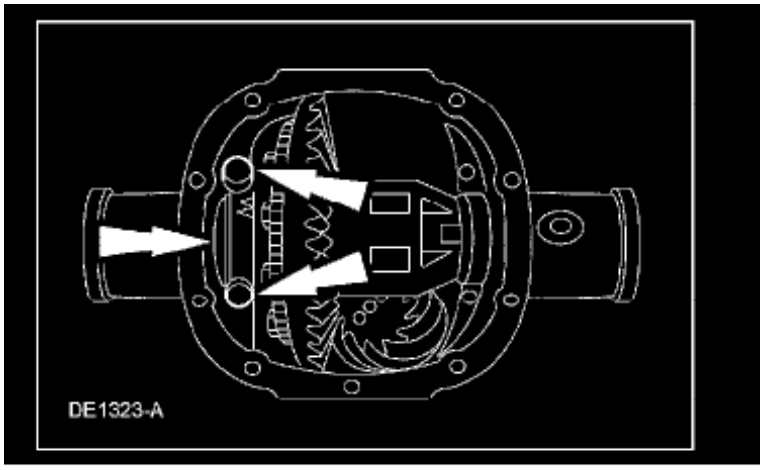
18. Position the differential carrier assembly and the new differential bearing cups in the differential housing.

19. Install a differential bearing shim of the shown dimension on the left side.

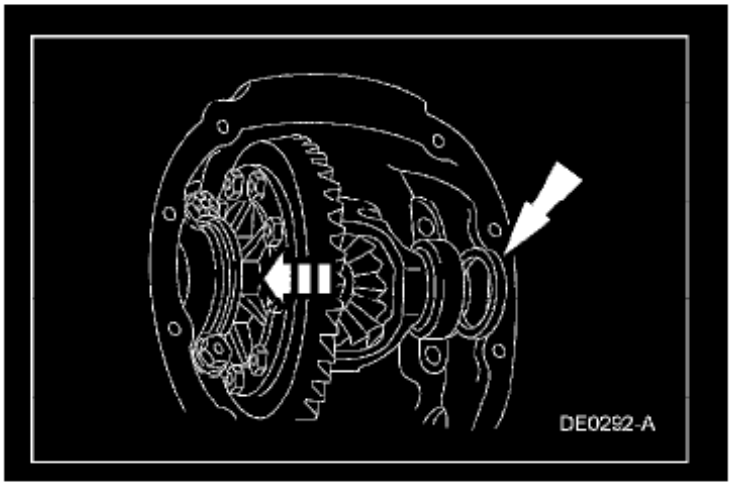
20. CAUTION: Always install the bearing caps in their original locations and positions or damage to the component may occur.

NOTE: Apply pressure toward the LH side to make sure the left differential bearing cup seats correctly.

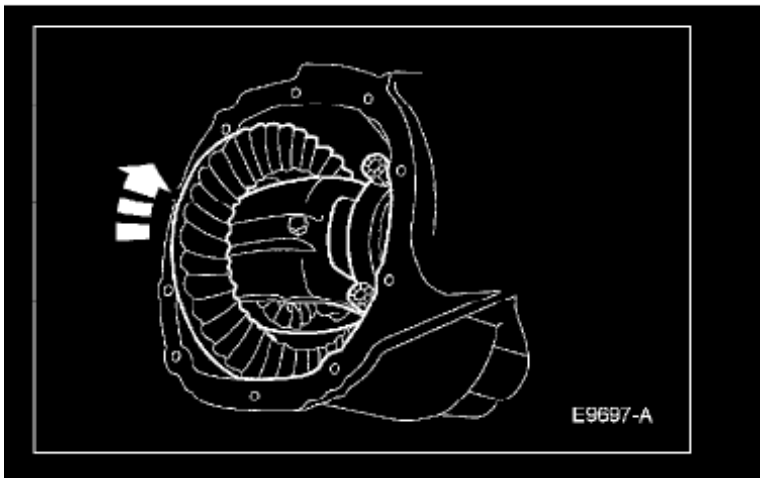
Install the LH bearing cap and loosely install the 2 bolts.



DE1323-A



DE0292-A



E9697-A

21. Install progressively larger differential bearing shims on the RH side until the largest shim is installed by hand.

22. Install the right side bearing cap and 2 bolts. Tighten the 4 LH and RH bearing cap bolts.

^ Tighten to 112 Nm (83 lb-ft).

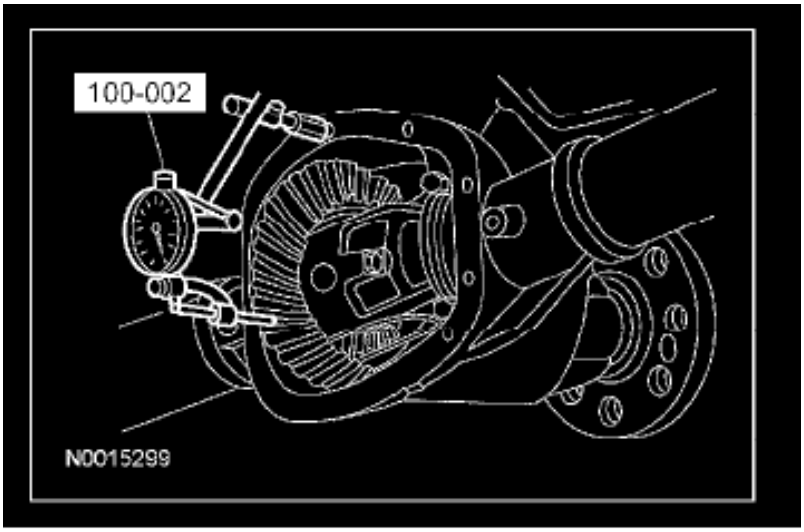
23. Rotate the differential carrier several times to verify the differential bearings have seated correctly.

24. Install the special tools and measure the ring gear backlash.

^ If the backlash is within specification, proceed to Step 27.

^ If a zero backlash condition occurs, proceed to Step 25.

^ If the backlash is not within specification, proceed to Step 26.



Backlash Change Required		Thickness Change Required	
mm	In	mm	In
0.025	0.001	0.050	0.002
0.050	0.002	0.050	0.002
0.076	0.003	0.101	0.004
0.101	0.004	0.152	0.006
0.127	0.005	0.152	0.006
0.152	0.006	0.203	0.008
0.177	0.007	0.254	0.010
0.203	0.008	0.254	0.010
0.228	0.009	0.304	0.012
0.254	0.010	0.355	0.014
0.279	0.011	0.355	0.014
0.304	0.012	0.406	0.016
0.330	0.013	0.457	0.018
0.335	0.014	0.457	0.018
0.381	0.015	0.508	0.020

25. If a zero backlash condition occurs, add 0.50 mm (0.020 inch) to the RH side shim and subtract 0.50 mm (0.020 inch) from the LH side shim to

allow a backlash indication. Go back to Step 24.

26. To correct for high or low backlash, increase the thickness of one differential bearing shim and decrease the thickness of the other differential

bearing shim by the same amount. Refer to the following tables when adjusting the backlash. When the backlash is within specification, proceed to Step 27.

DE0254-C

Rotate the special tool several half-turns to make sure of correct seating of the drive pinion bearings and position the special tool.

7. Install the special tool.

1 Position the special tool.

2 Install the 2 differential bearing caps.

3 Install the 4 differential bearing cap bolts. ^

Tighten to 112 Nm (83 lb-ft).

8. NOTE: Drive pinion bearing adjustment shims must be flat and clean.

NOTE: A slight drag should be felt for correct drive pinion bearing adjustment shim selection. Do not attempt to force the drive pinion bearing adjustment shim between the gauge block and the gauge tube. This will minimize selection of a drive pinion bearing adjustment shim thicker than required, which results in a deep tooth contact in final assembly of integral axle assemblies.

Use a drive pinion bearing adjustment shim as a gauge for drive pinion bearing adjustment shim selection. ^

After the correct drive pinion bearing adjustment shim thickness has been determined, remove all of the special tools.

9. Using the special tools and a shop press, drive the inner drive pinion bearing and the selected drive pinion bearing adjustment shim until they are

firmly seated on the pinion shaft.

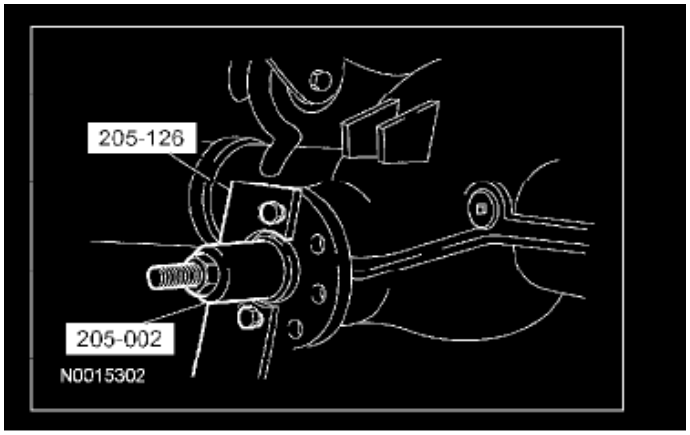
205-208
N0015303

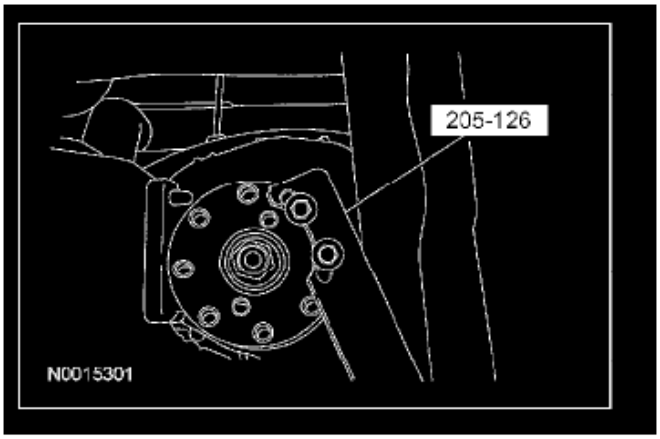
10. Install a new drive pinion collapsible spacer on the pinion shaft against the pinion shaft shoulder.

11. Install the drive pinion assembly into the axle housing.

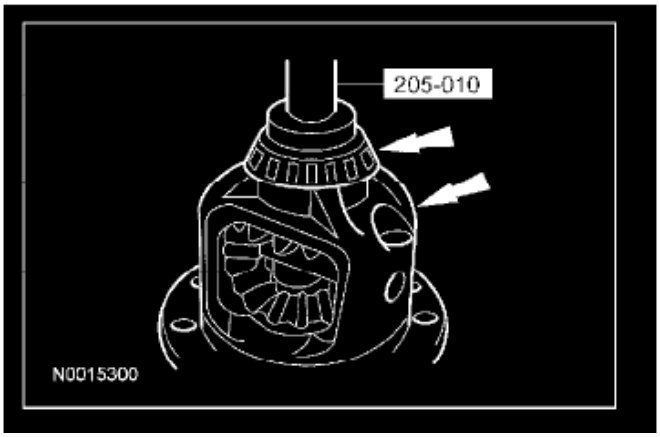
12. Install the outer drive pinion bearing and the drive pinion shaft oil slinger. 13. Using the special tool, install the drive pinion seal.



205-126
205-002
N0015302



205-126
N0015301



205-010
N0015300

14. Using the special tools, install the drive pinion flange.

15. CAUTION: Do not, under any circumstance, loosen the drive pinion nut to reduce pinion bearing preload. If it is necessary to reduce the

preload, install a new drive pinion collapsible spacer and drive pinion nut or damage to the component may occur.

NOTE: Remove the special tool while taking rotational pinion bearing preload checks with the Nm (lb-inch) torque wrench.

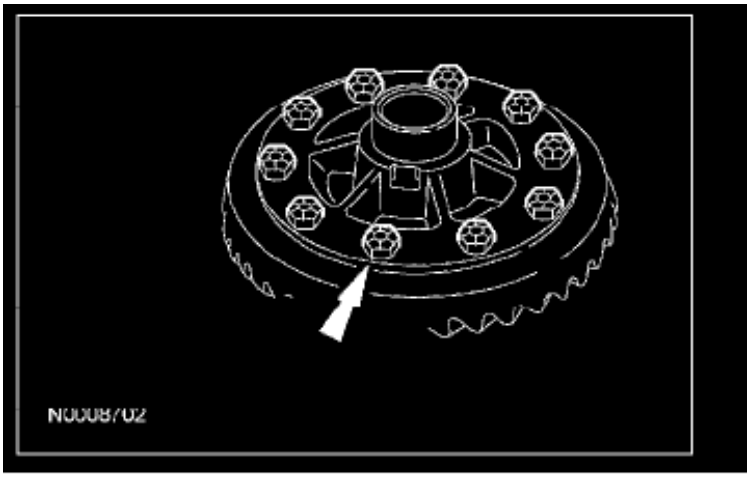
Use the special tool to hold the pinion flange while tightening the pinion nut. ^

Rotate the pinion occasionally to make sure the differential pinion bearings are seating correctly. Take frequent differential pinion bearing preload checks by rotating the differential pinion with a Nm (lb-inch) torque wrench. Tighten the pinion nut in small increments to avoid excessive pinion bearing preload. Tighten the pinion nut until the drive pinion bearing preload is in specification.

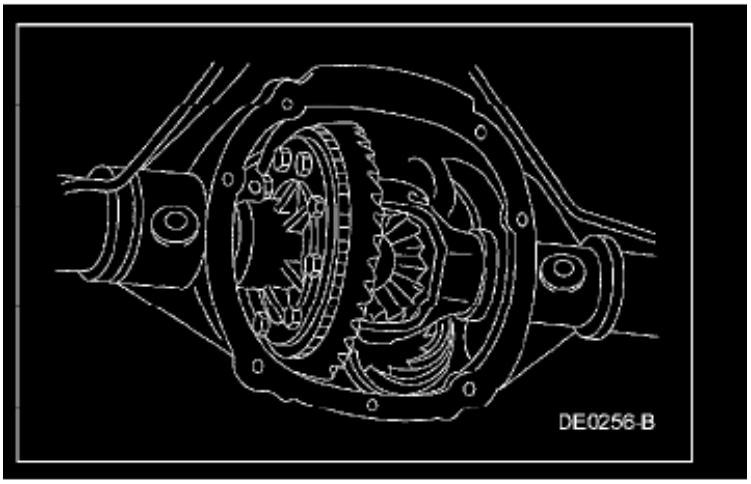
16. Using the special tool, install the 2 new differential bearings.

17. Install the 10 new differential ring gear bolts.

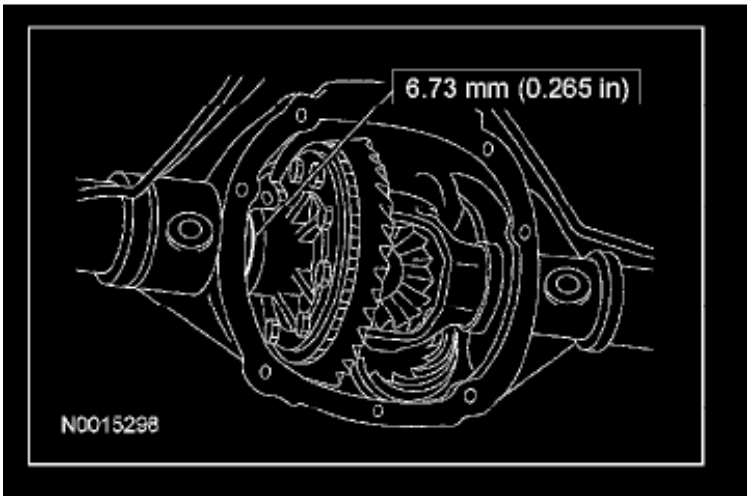
^ Tighten to 112 Nm (83 lb-ft).



N0008702



DE0256-B



6.73 mm (0.265 in)
N0015298

18. Position the differential carrier assembly and the new differential bearing cups in the differential housing.

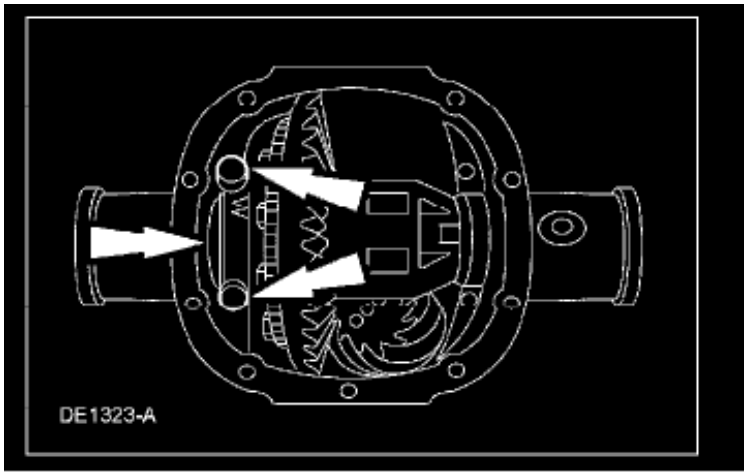
19. NOTE: Differential bearing shims are to be installed with the chamfer facing outboard.

Install a differential bearing shim of the shown dimension on the left side.

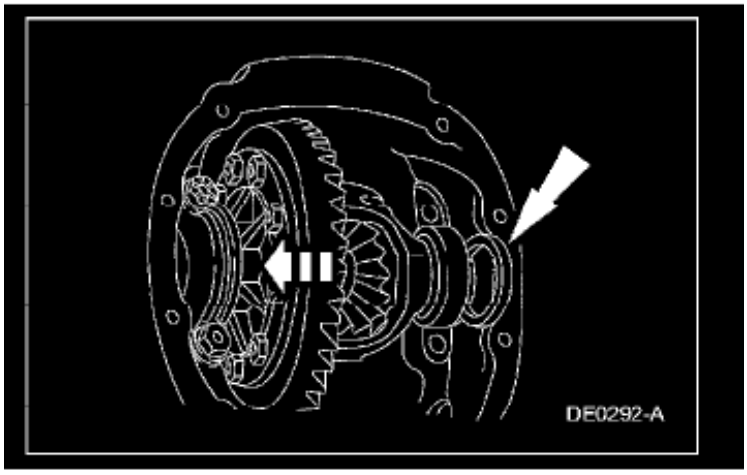
20. NOTE: Always install the bearing caps in their original locations and positions.

NOTE: Apply pressure toward the LH side to make sure the left differential bearing cup seats correctly.

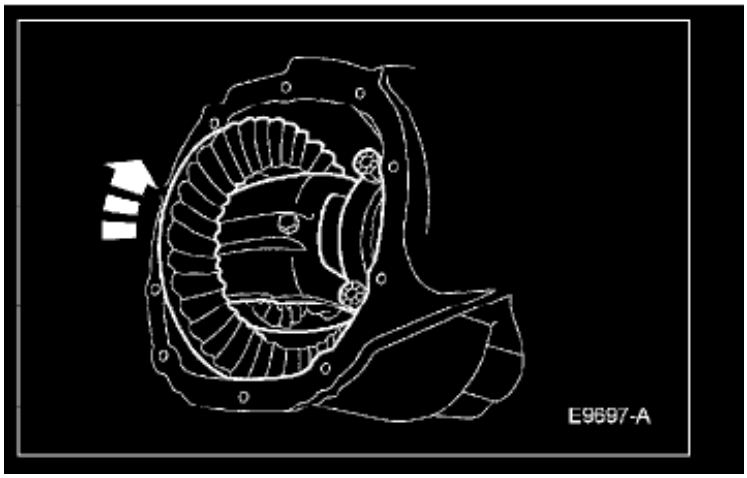
Install the LH bearing cap and loosely install the 2 bolts.



DE1323-A



DE0292-A



E9697-A

21. Install progressively larger differential bearing shims on the RH side until the largest shim is installed by hand.

22. Install the right side bearing cap and 2 bolts. Tighten the LH and RH bearing cap bolts.

^ Tighten to 112 Nm (83 lb-ft).

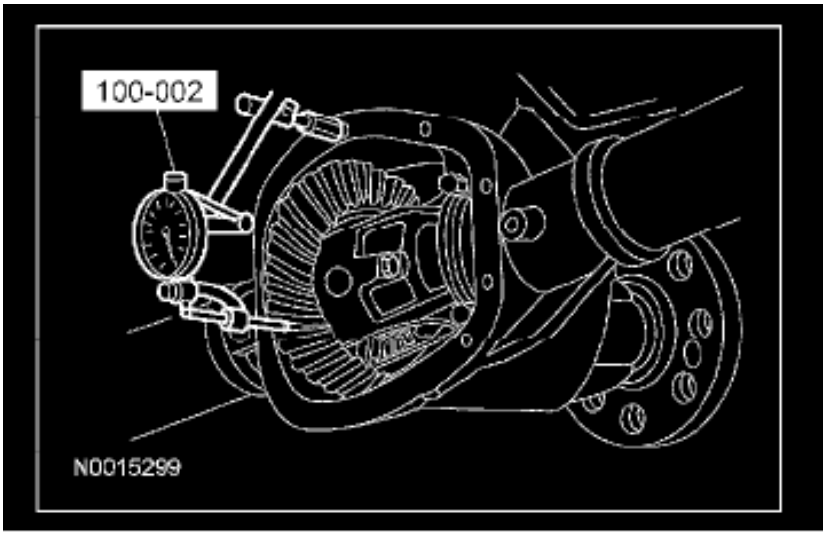
23. Rotate the differential carrier several times to verify the differential bearings have seated correctly.

24. Install the special tools and measure the ring gear backlash.

^ If the backlash is within specification, proceed to Step 27.

^ If a zero backlash condition occurs, proceed to Step 25.

^ If the backlash is not within specification, proceed to Step 26.



Backlash Change Required		Thickness Change Required	
mm	Inch	mm	Inch
0.025	0.001	0.050	0.002
0.050	0.002	0.050	0.002
0.076	0.003	0.101	0.004
0.101	0.004	0.152	0.006
0.127	0.005	0.152	0.006
0.152	0.006	0.203	0.008
0.177	0.007	0.254	0.010
0.203	0.008	0.254	0.010
0.228	0.009	0.304	0.012
0.254	0.010	0.355	0.014
0.279	0.011	0.355	0.014
0.304	0.012	0.406	0.016
0.330	0.013	0.457	0.018
0.335	0.014	0.457	0.018
0.381	0.015	0.508	0.020

25. If a zero backlash condition occurs, add 0.50 mm (0.020 inch) to the RH side shim and subtract 0.50 mm (0.020 inch) from the LH side shim to

allow a backlash indication. Go back to Step 24.

26. To correct for high or low backlash, increase the thickness of one differential bearing shim and decrease the thickness of the other differential

bearing shim by the same amount. Refer to the following tables when adjusting the backlash. When the backlash is within specification, proceed to Step 27.

Installation

1. CAUTION: Make sure the machined surfaces on the rear axle housing and the differential housing cover are clean and free of oil before

installing the new silicone sealant. The inside of the rear axle must be covered when cleaning the machined surface to prevent contamination or damage to the component may occur.

Clean the gasket mating surface of the rear axle and the differential housing cover.

2. Apply a new continuous bead of sealant of the specified thickness to the differential housing cover.

3. NOTE: The differential housing cover must be installed within 15 minutes of application of the silicone, or new sealant must be applied. If

possible, allow one hour before filling with lubricant to make sure the silicone sealant has correctly cured.

Install the differential housing cover and the 10 bolts. ^

Tighten to 45 Nm (33 lb-ft).

4. NOTE: For Traction-Lok(R) axles, before filling the rear axle with lubricant, first fill the rear axle with 118 ml (4 oz) of additive friction

modifier.

NOTE: Service refill capacities are determined by filling the rear axle with the specified lubricant to the level shown in the illustration.

Remove the filler plug and fill the rear axle with 2.4L (5 pt) with the specified lubricant and install the fill plug. ^

Tighten to 52 Nm (38 lb-ft).

Item	Part Number	Description
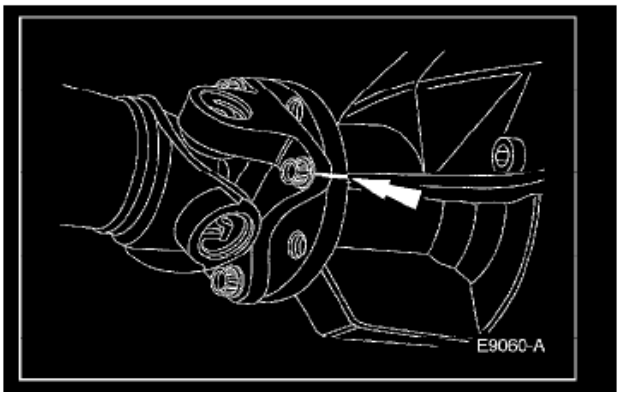
1	4010	Rear axle housing
2	4851	Pinion flange
3	3895546 S	Pinion nut



Removal

CAUTION: The color on the rear of the drive pinion nut is critical to this repair. Use the same color new drive pinion nut for installation. If a new collapsible spacer is installed, install the nut in the kit or damage to the component may occur.

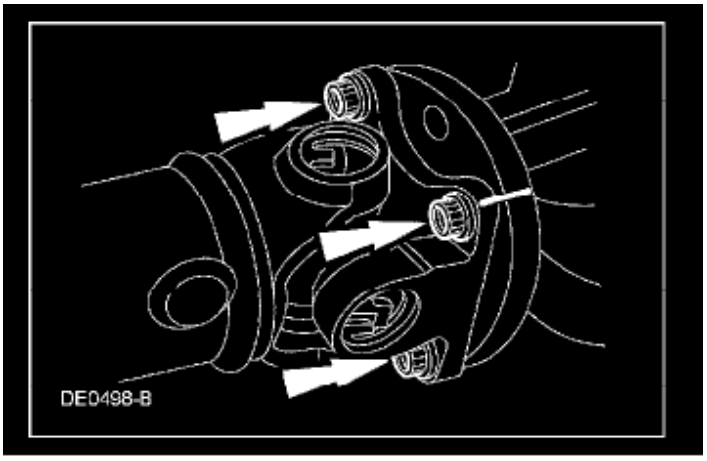
1. With the vehicle in NEUTRAL, position it on a hoist.

2. NOTE: The rear wheels and brake drums must be removed to prevent brake drag during drive pinion bearing preload adjustment.

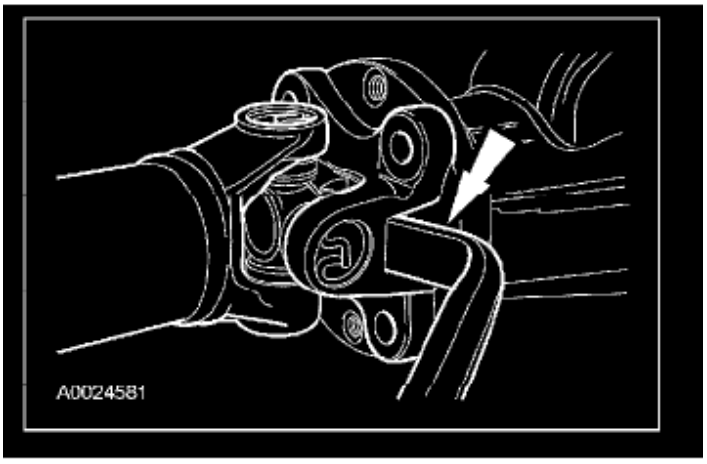
Remove the brake drums.

3. Mark the driveshaft flange and pinion flange for correct alignment during installation.

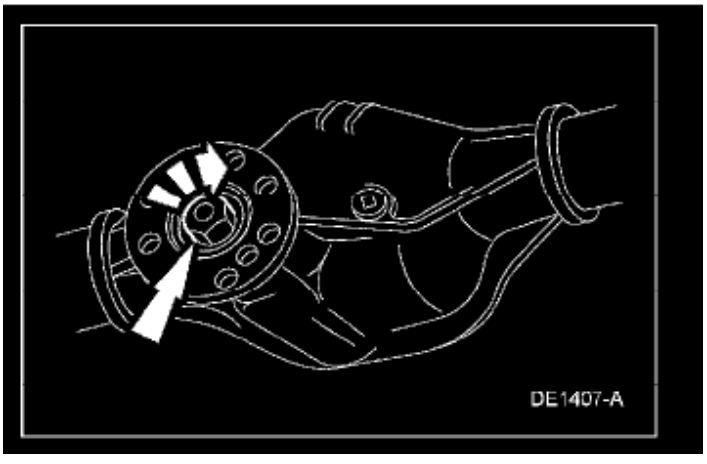
4. Remove the 4 driveshaft-to-pinion flange bolts.



DE0498-B



A0024581



DE1407-A

5. NOTE: The driveshaft centering socket yoke fits tightly on the rear axle pinion flange pilot. Never hammer on the driveshaft or any of its

components to disconnect the yoke from the flange. Pry only in the area shown with a suitable tool to disconnect the yoke from the flange.

Using a suitable tool as shown, disconnect the driveshaft centering socket yoke from the rear axle pinion flange. ^

Position the driveshaft aside.

6. Install a Nm (lb-inch) torque wrench on the pinion nut and record the torque required to maintain rotation of the pinion through several

revolutions.

7. Using the special tool, hold the pinion flange and remove and discard the nut.

205-D072
N0015316

8. Index-mark the pinion flange in relation to the pinion stem to make sure of correct alignment during installation.

9. Using the special tool, remove the pinion flange.

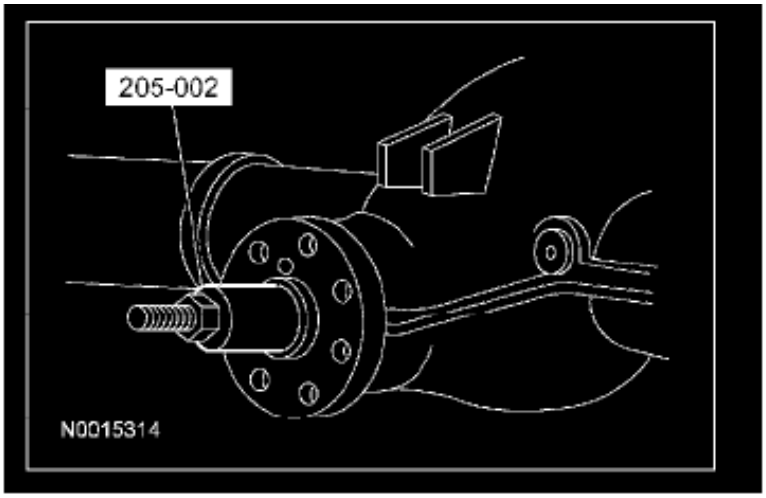
Installation

1. Lubricate the pinion flange splines with lubricant.

2. NOTE: Disregard the scribe marks if a new pinion flange is being installed.

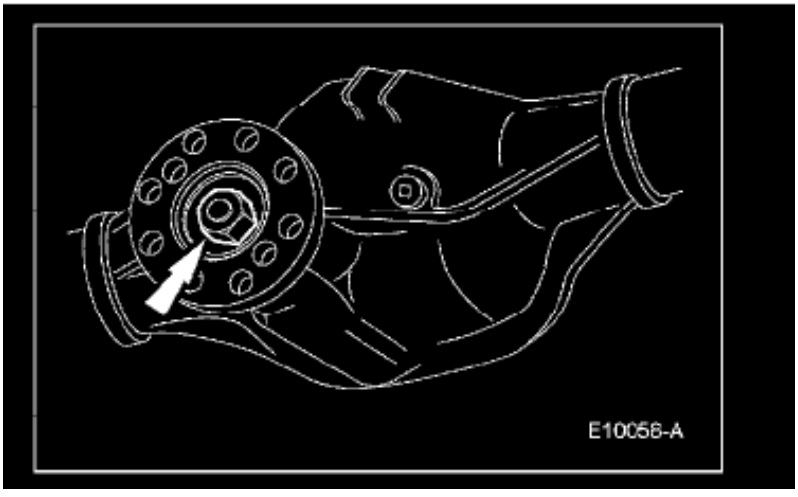
Align the pinion flange with the drive pinion shaft.

3. Install the pinion flange using the special tool.



7.5 In Drive Pinion Nut

Part Number	Color	Application
389546-S100	Orange	Axles built before 7/16/07
4320	Purple	Axles built after 7/16/07
4C121	Purple	Kit with spacer all 7.5



4. CAUTION: Use the same color new drive pinion nut for installation. If a new collapsible spacer must be installed for preload reduction,

install the nut supplied with the new spacer or damage to the component may occur.

Position the new pinion flange nut.

7.5 In Drive Pinion Nut

7.5 In Drive Pinion Nut

5. CAUTION: Under no circumstances is the pinion nut to be backed off to reduce preloads or component damage may occur. If reduced

preload is required, a new drive pinion collapsible spacer and pinion nut kit must be installed.

NOTE: Remove the special tool while taking preload readings with the Nm (lb-inch) torque wrench.

Using the special tool, hold the pinion flange and tighten the pinion nut. ^

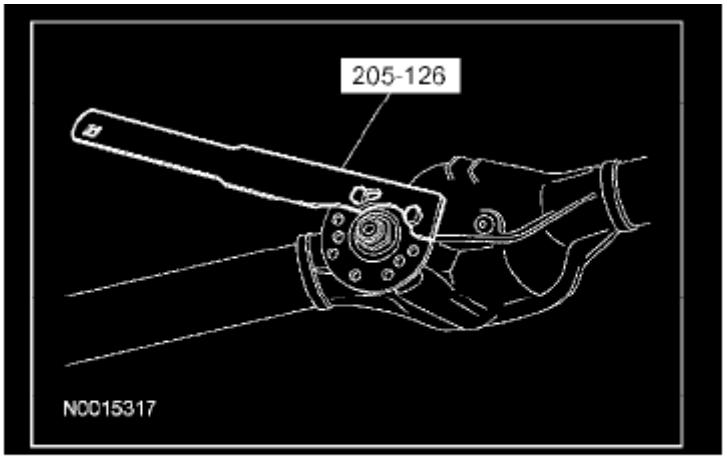
Rotate the pinion occasionally to make sure the cone and roller bearings are seating correctly.

^ Install a Nm (lb-inch) torque wrench on the pinion nut.

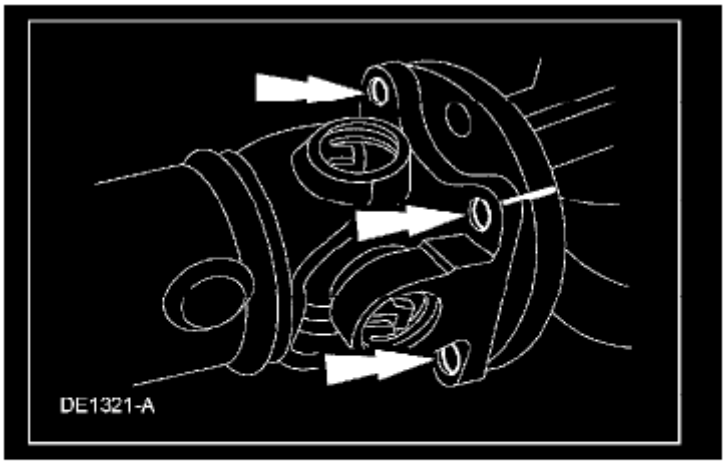
^ Rotating the pinion through several revolutions, take frequent cone and roller bearing torque preload readings until the original recorded preload reading is obtained.

^ If the original recorded preload is lower than specification, tighten to the appropriate specification. If the preload is higher than the specification, then tighten the nut to the original reading as recorded.

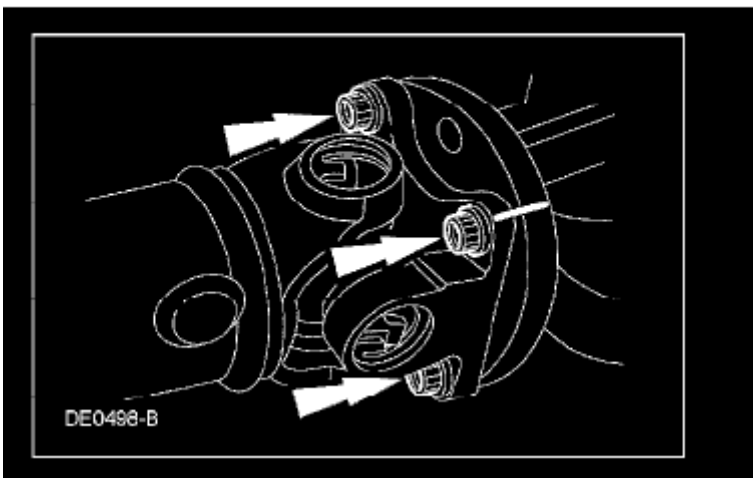
^ Refer to Torque Specification.



205-126
N0015317



DE1321-A



DE0498-B

6. Position the driveshaft and align the marks on the pinion flange.

7. NOTE: The driveshaft centering socket yoke fits tightly on the rear axle pinion flange pilot. To make sure that the yoke seats squarely on the

flange, tighten the bolts evenly in a cross pattern.

Install the 4 driveshaft bolts. ^

Tighten to 112 Nm (83 lb-ft).

8. Install the rear brake drums.

Premium Long-Life Grease XG-1-C or XG-1-K (US); CXG-1-C (Canada)	ESA-M1C75-B

Installation

1. Lubricate the lips of the new rear axle drive pinion seal with grease.

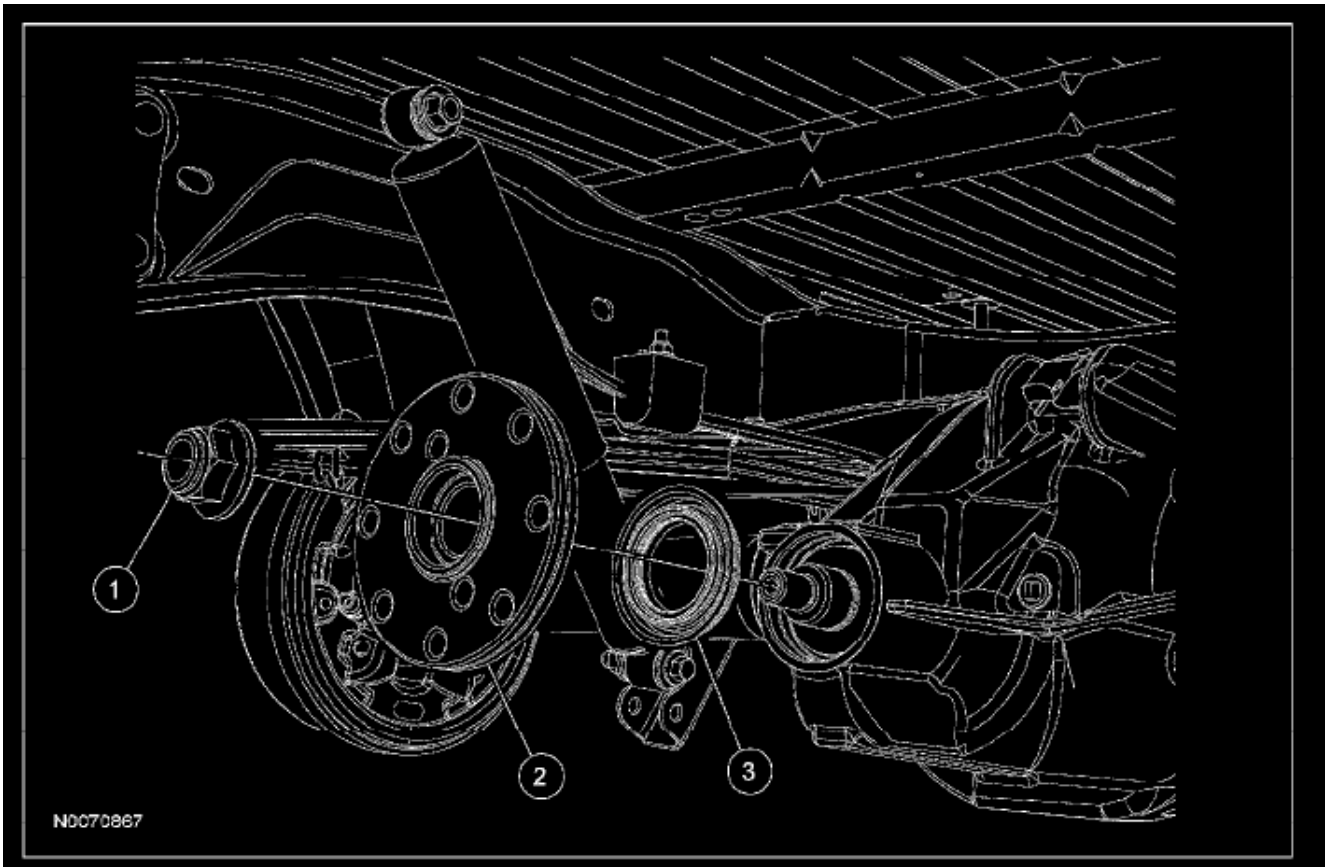
2. NOTE: If the rear axle drive pinion seal becomes misaligned during installation, remove the rear axle drive pinion seal and install a new seal.

Using the special tool, install the rear axle drive pinion seal.

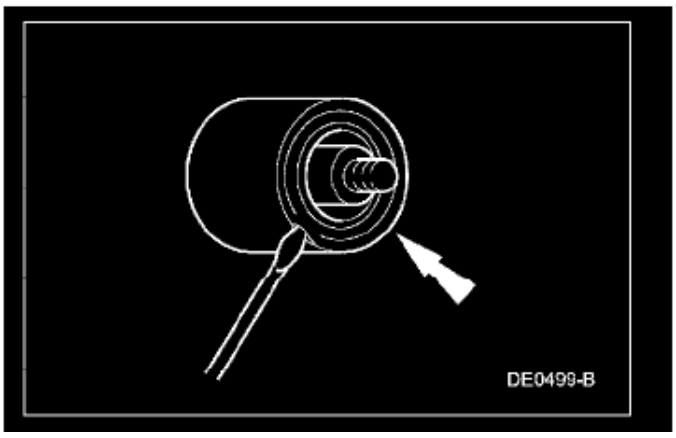
3. Install the pinion flange.

Ford 8.8-Inch Ring Gear - Rear Drive Axle/Differential

Drive Pinion Seal



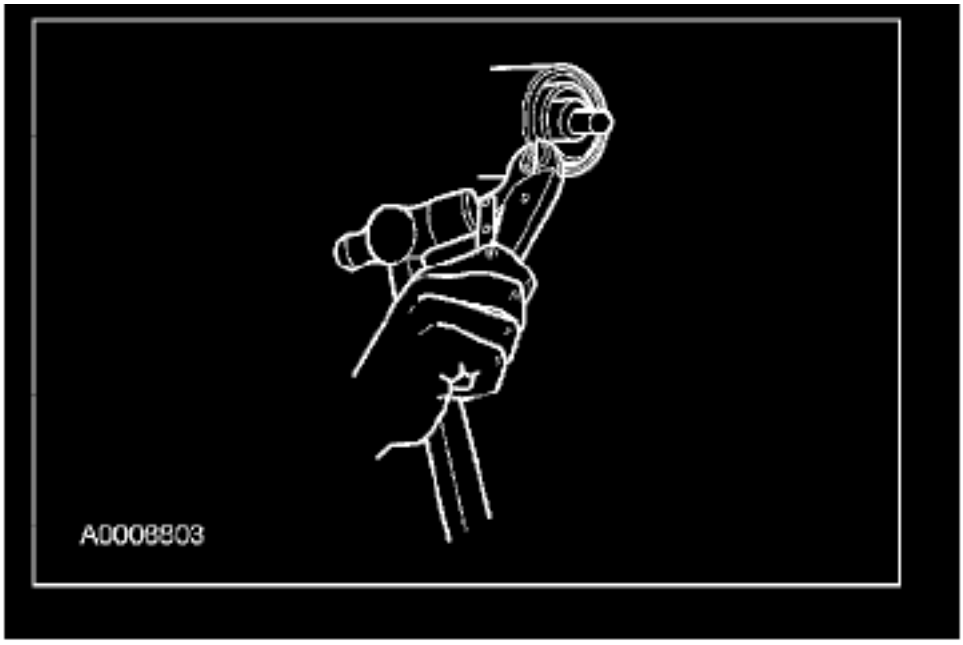
Item	Part Number	Description
1	389546-S100	Pinion nut
2	4851	Pinion flange
3	4676	Drive pinion seal

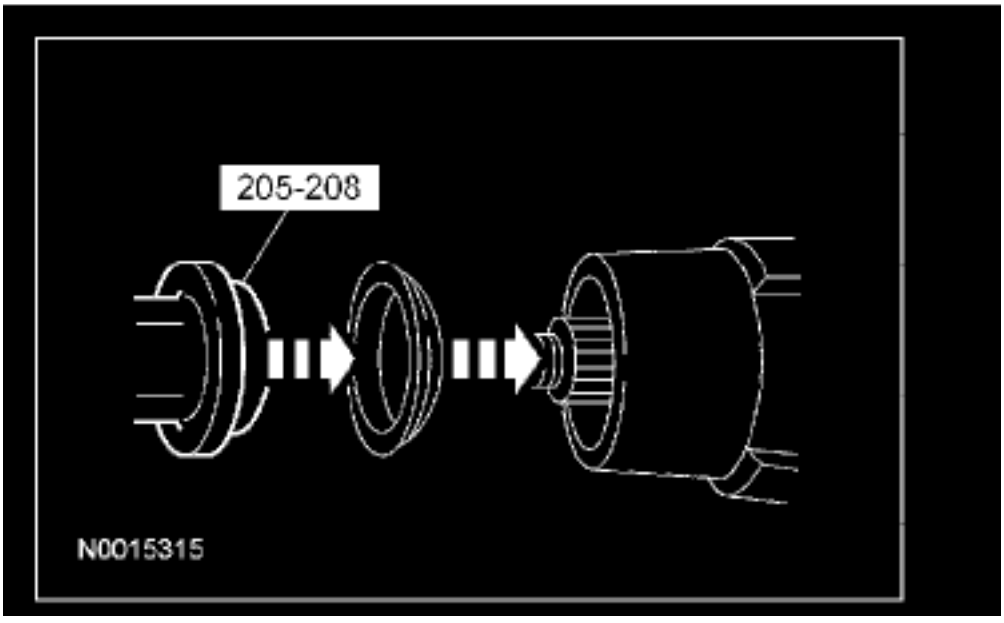


Removal

1. Remove the pinion flange. 2. Using a screwdriver, force the rear axle drive pinion seal metal flange up and strike it with a hammer.

3. Using gripping pliers and a hammer, remove the seal.





Installation

1. Coat the new rear axle drive pinion seal lips with grease.

2. NOTE: If the rear axle drive pinion seal becomes misaligned during installation, remove the seal and install a new seal.

Using the special tool, install the rear axle drive pinion seal.

3. Install the pinion flange.

Removal

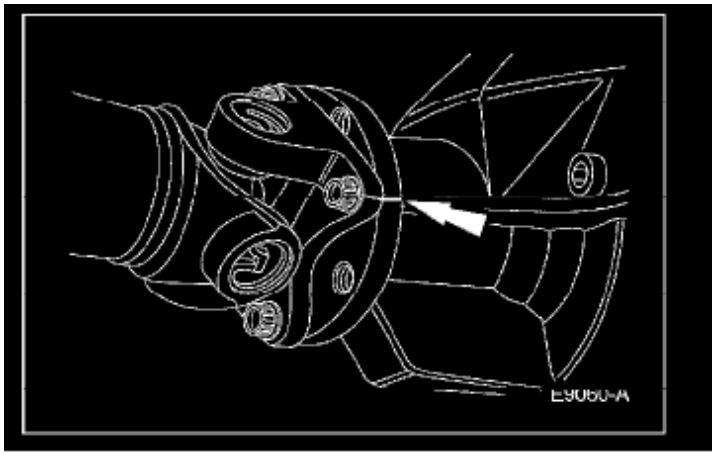
CAUTION: The color on the rear face of the drive pinion nut is critical to this repair. Use the same color new drive pinion nut for installation unless installing a new collapsible spacer or damage to the component may occur.

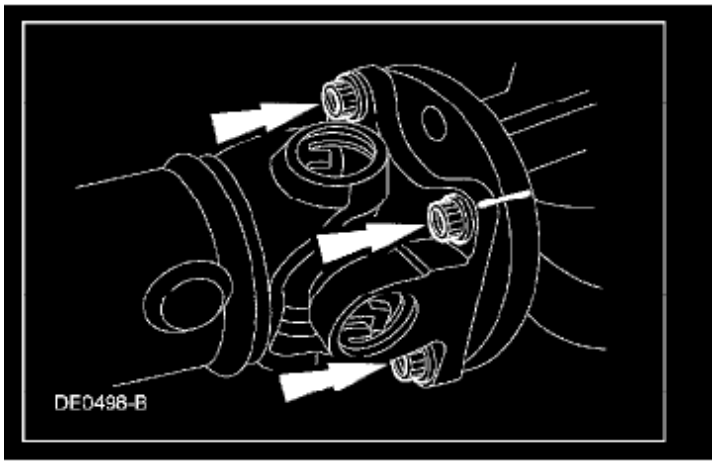
1. With the vehicle in NEUTRAL, position it on a hoist.

2. NOTE: The rear wheels and brake drums must be removed to prevent brake drag during drive pinion bearing preload adjustment.

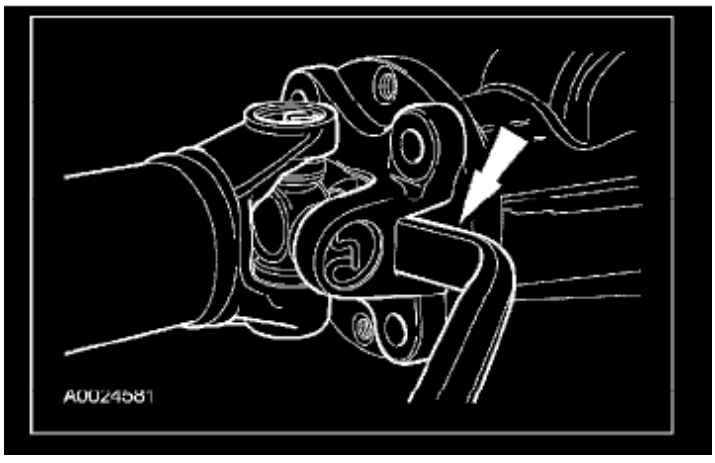
Remove the wheel and tire.

3. Remove the rear brake drums.





DE0498-B



A0024581

4. Mark the driveshaft flange and pinion flange for correct alignment during installation.

5. Remove the 4 driveshaft flange-to-pinion flange bolts.

6. CAUTION: The driveshaft centering socket yoke fits tightly on the rear axle pinion flange pilot. Never hammer on the driveshaft or any

of its components to disconnect the yoke from the flange. Pry only in the area shown with a suitable tool to disconnect the yoke from the flange or damage to the component may occur.

Using a suitable tool as shown, disconnect the driveshaft centering socket yoke from the rear axle pinion flange. ^

Position the driveshaft aside.

7. Install a Nm (lb-inch) torque wrench on the pinion nut and record the torque required to maintain rotation of the pinion through several

revolutions.

removed.

Installation

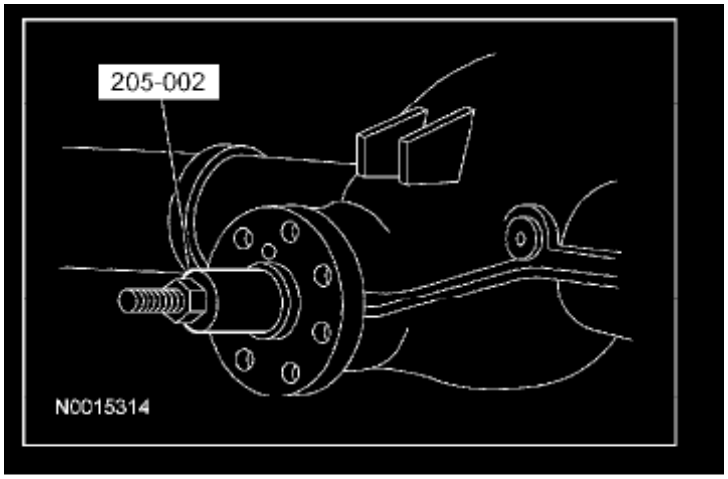
1. Lubricate the new rear axle drive pinion seal with lubricant. 2. Using the special tool, install the rear axle drive pinion seal.

3. Lubricate the pinion flange splines with lubricant.

4. NOTE: Disregard the scribe marks if a new pinion flange is being installed.

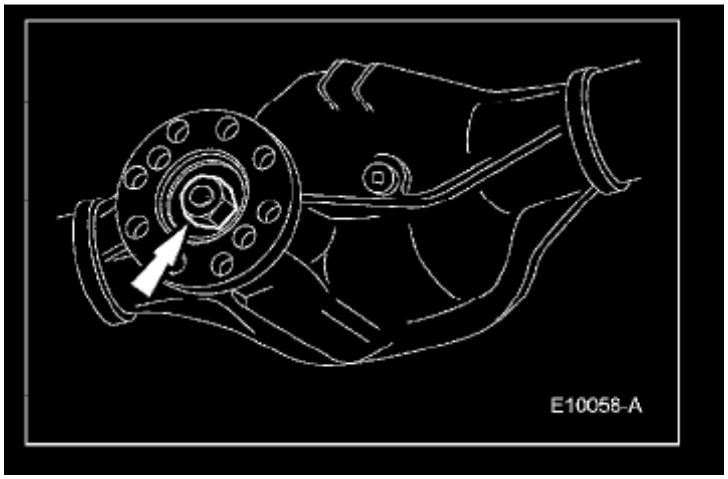
Align the pinion flange with the drive pinion shaft.

5. Install the pinion flange using the special tool.



Drive Pinion Nut

Part Number	Color Description	Application
389546-S100	Orange	Axles built before 7/16/07
4320	Purple	Axles built after 7/16/07
4C121	Purple	Kit with spacer for all 8.8 in axles



6. CAUTION: Install a new pinion nut with the same color as the original if not replacing the collapsible spacer. If a new collapsible spacer

is installed, install the nut in the kit or damage to the component may occur.

Position the new pinion nut.

Drive Pinion Nut

Drive Pinion Nut

7. CAUTION: Under no circumstances is the pinion nut to be backed off to reduce preload. If reduced preload is required, a new

collapsible spacer and pinion nut kit must be installed or damage to the component may occur.

NOTE: Remove the special tool while taking preload readings with the Nm (lb-inch) torque wrench.

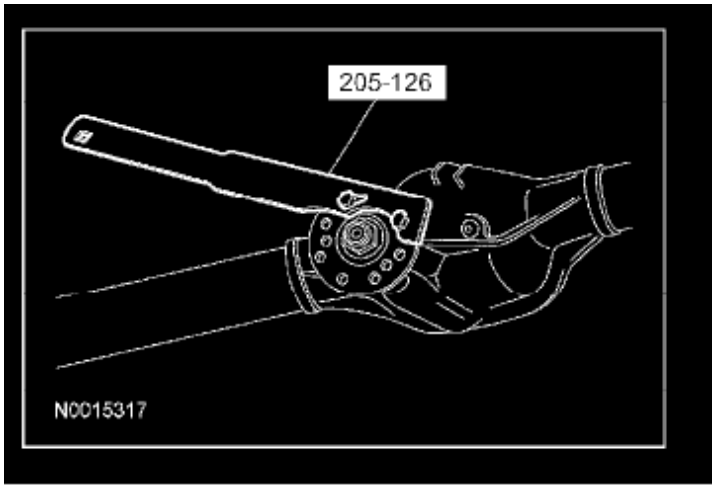
Using the special tool hold the pinion flange, tighten the pinion nut. ^

Rotate the pinion occasionally to make sure the cone and roller bearings are seating correctly.

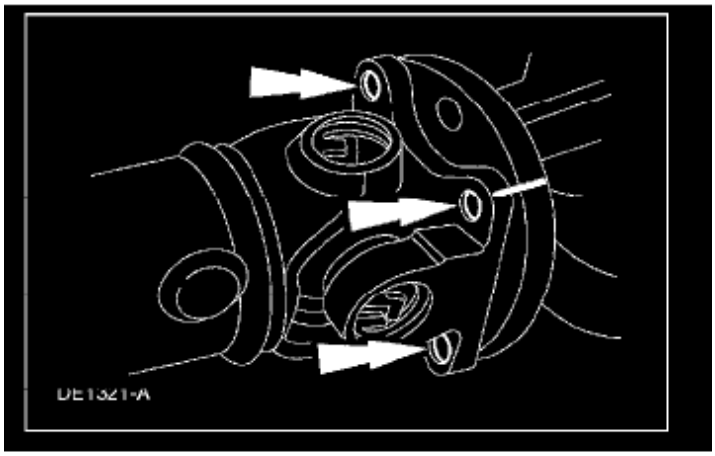
^ Install a Nm (lb-inch) torque wrench on the pinion nut.

^ Rotating the pinion through several revolutions, take frequent cone and roller bearing torque preload readings until the original recorded preload reading is obtained.

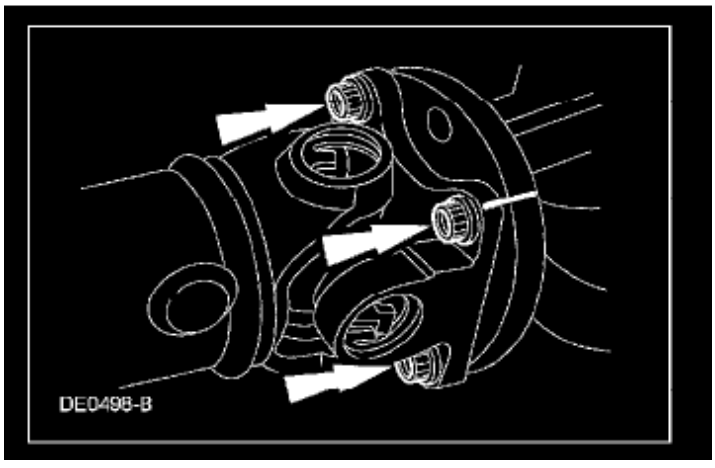
^ If the original recorded preload is lower than specifications, tighten to the appropriate specifications for used bearings. If the preload is higher than specification, tighten the nut to the original reading as recorded.



205-126
N0015317



DE1321-A



DE0498-B

8. Position the rear driveshaft and align the marks on the pinion flange.

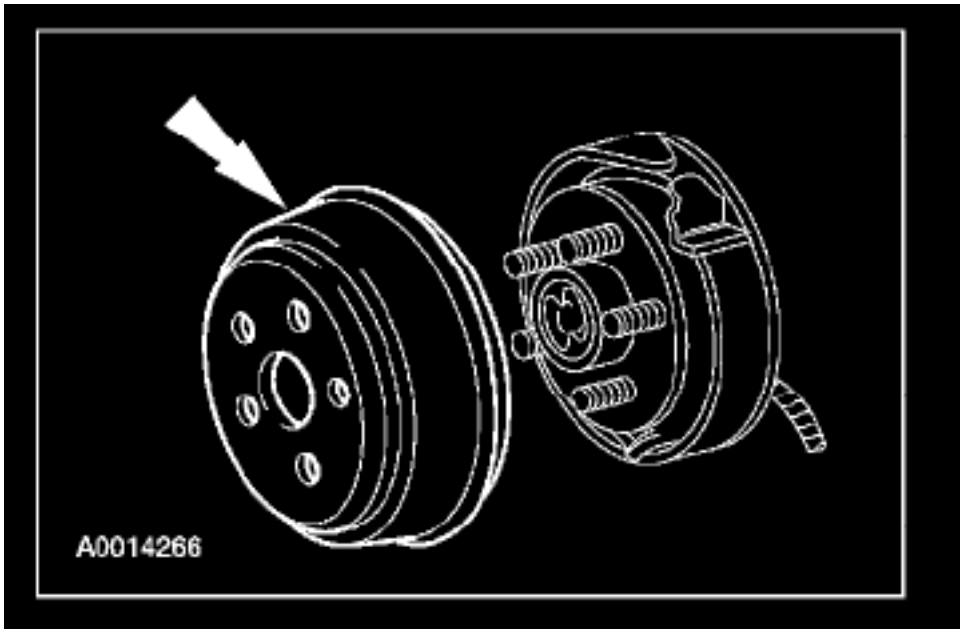
9. NOTE: The driveshaft centering socket yoke fits tightly on the rear axle pinion flange pilot. To make sure that the yoke seats squarely on the

flange, tighten the bolts evenly in a cross pattern.

Install the 4 bolts. ^

Tighten to 112 Nm (83 lb-ft).

10. Install the rear brake drums.



11. Install the wheel and tire.

4. NOTE: If a new bolt is unavailable, coat the bolt threads with Threadlock(R) prior to installation.

Install the differential pinion shaft.

^ Align the bolt hole in the differential pinion shaft with the bolt hole in the case.

^ Install the new pinion shaft lock bolt. 1 Tighten to 30 Nm (22 lb-ft).

5. Install the brake drum. 6. Install the differential housing cover and fill the differential housing with the specified lubricant. 7. Install the rear wheel and tire.

Material

Axle Shaft Assembly: Service and Repair Ford 8.8-Inch Ring Gear High Torque - Rear Drive Axle/Differential

Axle Shaft

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. 2. Remove the wheel and tire. 3. Remove the 10 differential housing cover bolts and drain the lubricant from the rear axle housing. 4. Remove the rear brake drums.

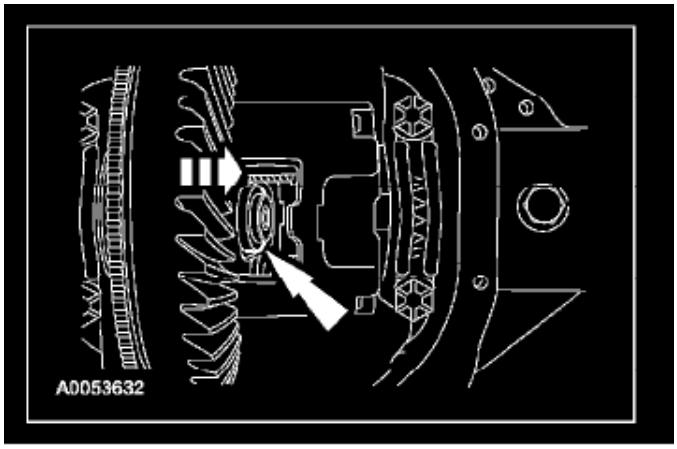
5. Remove the differential thrust plate.

1 Remove and discard the differential thrust plate lock bolt.

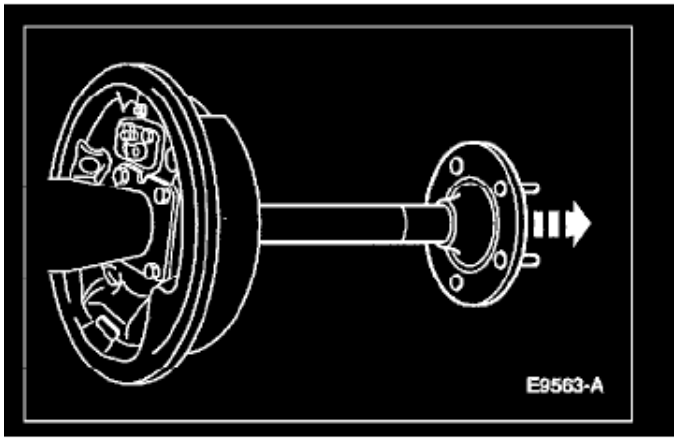
2 Remove the differential thrust plate.

6. NOTE: Do not damage the rubber O-rings in the axle shaft grooves.

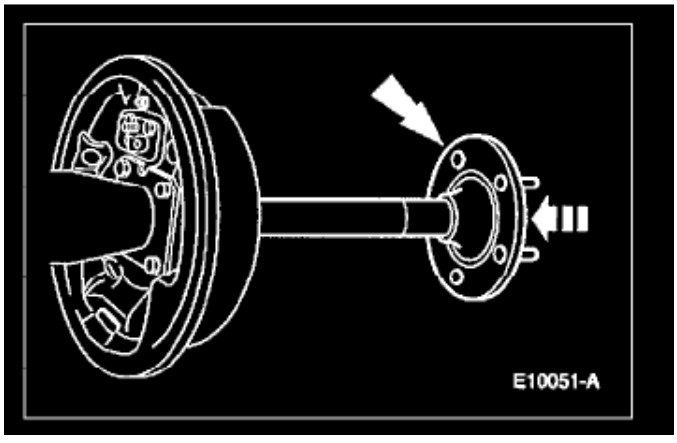
Push the axle shafts inboard and remove the U-washers.



A0053632



E9563-A



E10051-A

7. NOTE: Do not damage the wheel bearing oil seal.

Remove the 2 axle shafts.

Installation

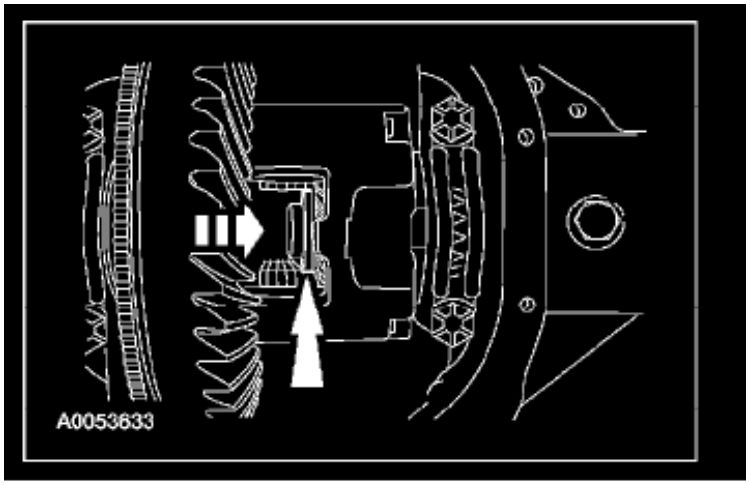
1. Lubricate the lip of the wheel bearing oil seal with grease.

2. NOTE: Do not damage the wheel bearing oil seal.

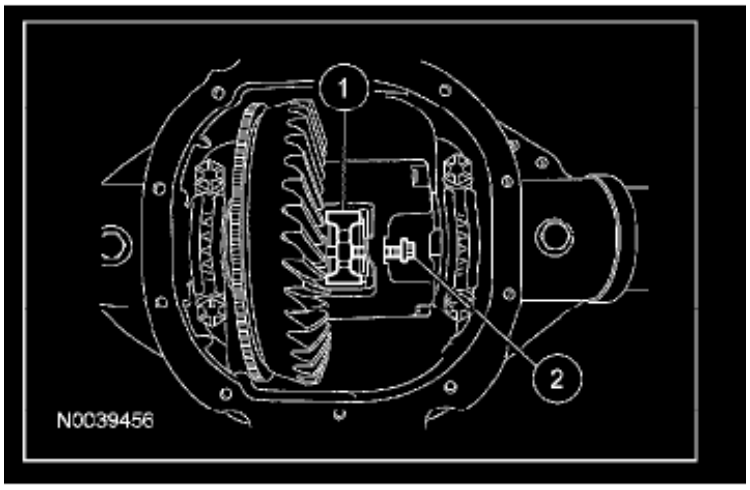
Install the 2 axle shafts.

3. NOTE: Do not damage the rubber O-rings in the U-washer grooves.

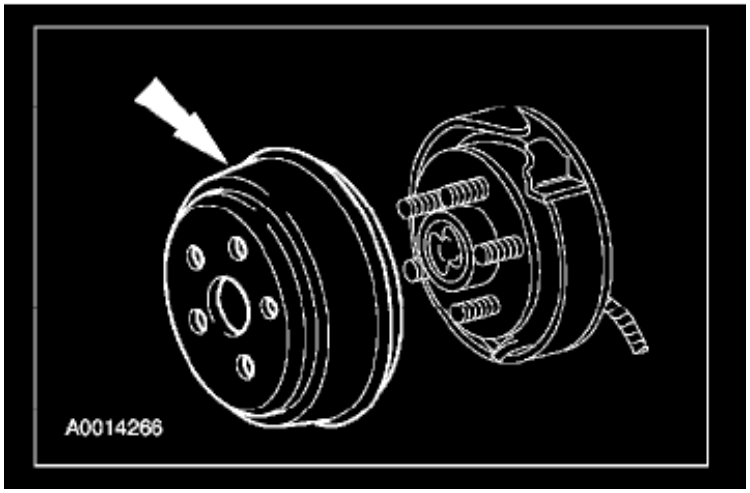
Position the 2 U-washers on the button end of the axle shafts and pull the axle shafts outward.



A0053633



1
2
N0039456



A0014266

4. Install the differential thrust plate.

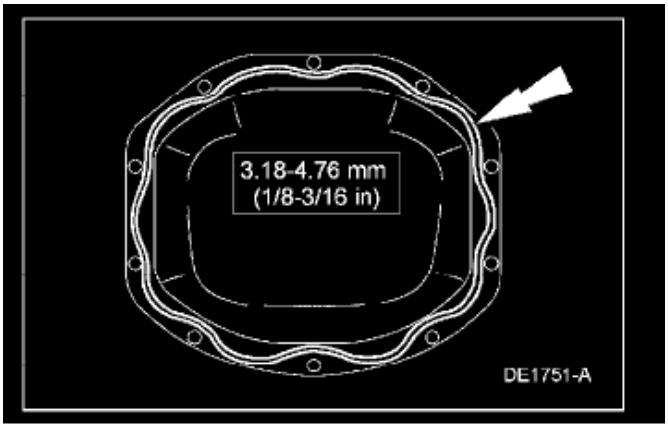
1 Align the hole in the thrust plate shaft with the case lock bolt hole.

2 Install a new differential pinion shaft lock bolt.

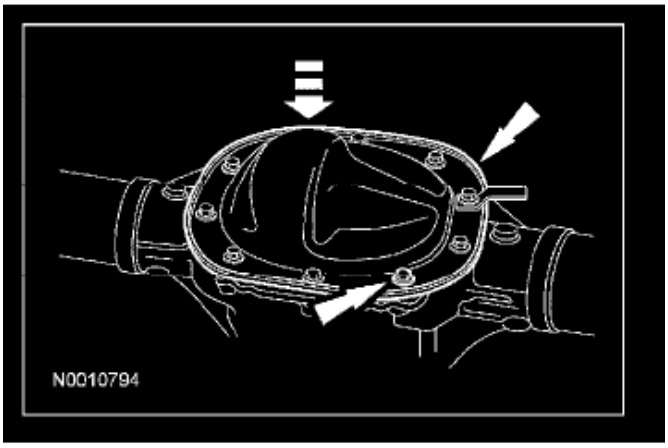
5. Install the rear brake drums.

6. NOTE: Clean the gasket mating surface of the rear axle and the differential housing cover.

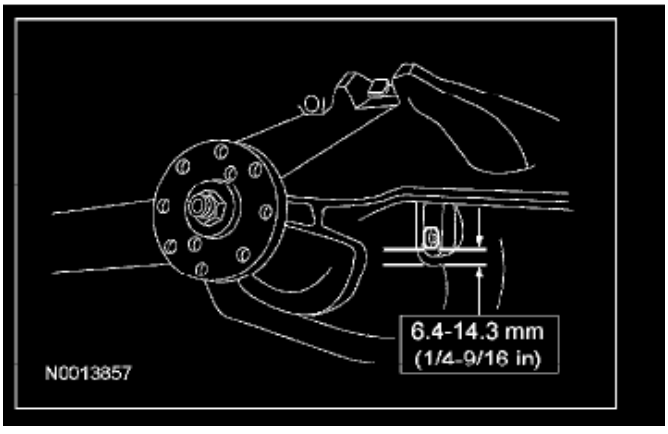
Apply a continuous bead of sealant to the differential housing cover.



3.18-4.76 mm
(1/8-3/16 in)
DE1751-A



N0010794



6.4-14.3 mm
(1/4-9/16 in)
N0013857

7. NOTE: The differential housing cover must be installed within 15 minutes of application of the silicone, or new sealant must be applied. If

possible, allow one hour before filling with lubricant to make sure the silicone sealant has correctly cured.

Install the differential housing cover and 10 bolts. ^

Tighten to 45 Nm (33 lb-ft).

8. NOTE: Service refill capacities are determined by filling the axle with the specified lubricant to the specified level below the bottom of the filler

hole.

Remove the plug and fill the axle to the level shown with axle lubricant and install the filler plug. ^

Tighten to 52 Nm (38 lb-ft).

9. Install the tire and wheel.

Drive/Propeller Shaft: Service and Repair

Driveshaft - Rear Wheel Drive (RWD)

Driveshaft - Rear Wheel Drive (RWD)

Removal and Installation

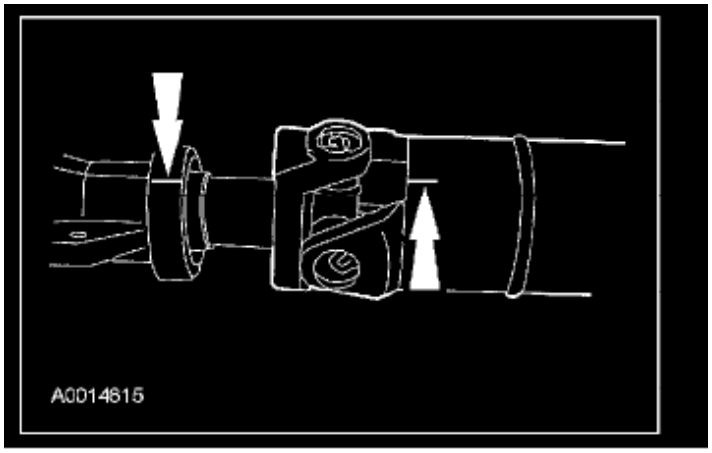
1. With the vehicle in NEUTRAL, position it on a hoist.

2. Index-mark the driveshaft flange to the rear axle pinion flange to maintain driveshaft balance.

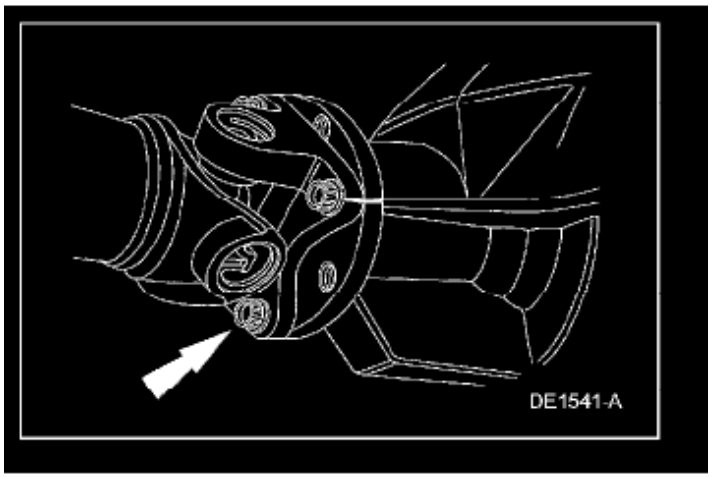
3. NOTE: Make sure the index marks on the extension housing and the driveshaft are aligned before separation.

NOTE: After removing the driveshaft, place an index mark on the transmission output shaft that matches the transmission extension housing mark.

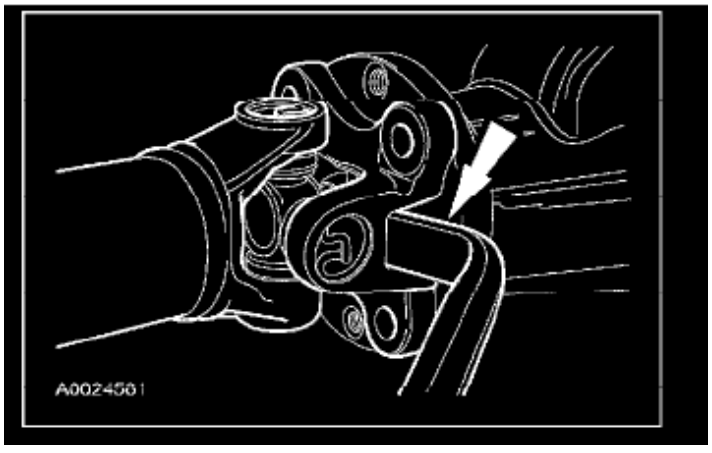
Index-mark the driveshaft and the extension housing.



A0014615



DE1541-A



A0024561

4. Remove and discard the 4 rear axle flange bolts.

^ Upon installation, install new bolts and tighten to 112 Nm (83 lb-ft).

5. NOTE: The driveshaft flange fits tightly on the rear axle pinion flange pilot. Never hammer on the driveshaft or any of its components to

disconnect the driveshaft flange from the pinion flange. Pry only in the area shown, with a suitable tool, to disconnect the driveshaft flange from the pinion flange.

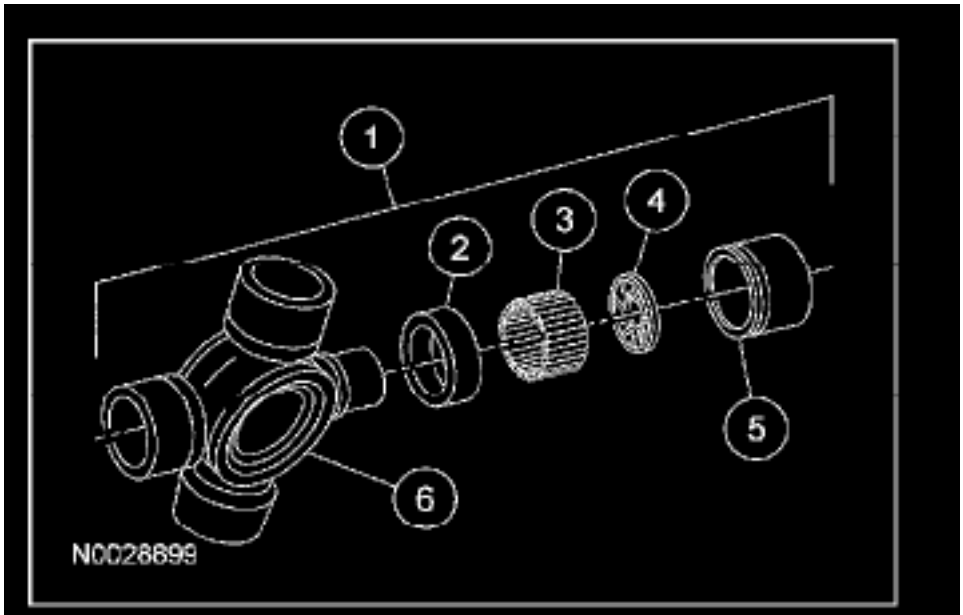
Using a suitable tool, pry only in the area shown. Separate the driveshaft flange from the rear axle pinion flange.

6. Lower the driveshaft and slide it off the output shaft. 7. Plug the extension housing to prevent fluid loss.

8. NOTE: The driveshaft flange fits tightly on the rear axle pinion flange pilot. To make sure that the driveshaft flange seats squarely on the pinion

flange, tighten the bolts evenly in a cross pattern as shown.

To install, reverse the removal procedure.



Item	Part Number	Description
1	4635	U-joint
2	—	Grease seal (part of 4635)
3	—	Needle roller (part of 4635)
4	—	Thrust washer (part of 4635)
5	—	Bearing cup (part of 4635)
6	—	Spider (part of 4635)

Universal Joint: Description and Operation

Universal Joints

The U-joints are: ^

lubed-for-life design and require no lubrication.

^ equipped with nylon thrust washers, located at each base of the bearing cup, which control end play, position the needle bearing and improve grease movement.

^ retained in the driveshaft yoke by snap rings.

The U-joints and constant velocity (CV) joints allow the driveshaft to rotate smoothly through the changing angles between the transmission output shaft and the driveshaft, plus the changes between the rear axle pinion angle and the driveshaft. The angles are constantly changing as the vehicle goes through jounce and rebound in the normal driving cycle.

Universal Joint: Service and Repair Driveshaft Universal Joint - Single Cardan, Slip Yoke

Driveshaft Universal Joint - Single Cardan, Slip Yoke

Universal Joint

Disassembly

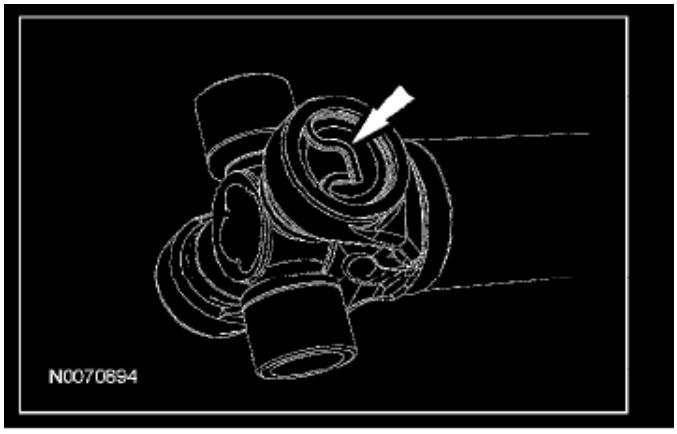
Initial Disassembly

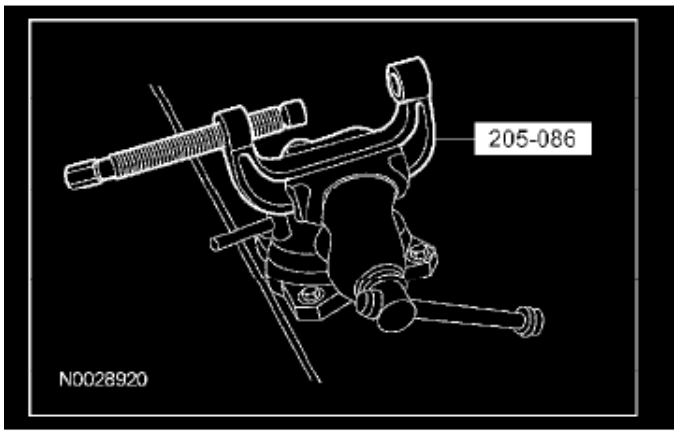
1. CAUTION: Do not, under any circumstance, clamp the shaft in the jaws of a vise or similar holding fixture. Denting or localizing

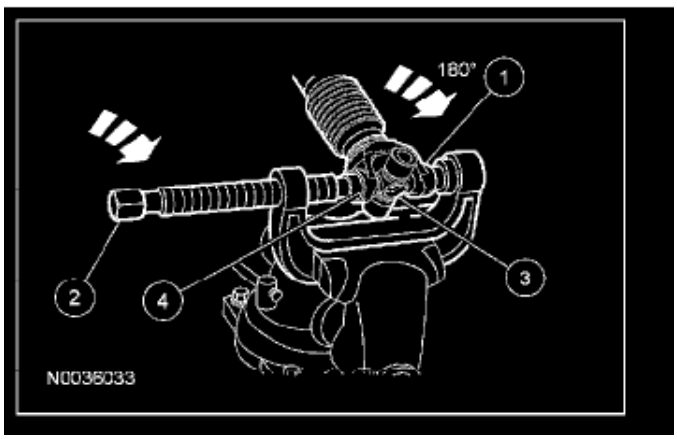
fracture may result, causing shaft failure during vehicle operation.

Place the shaft on a suitable workbench. Do not damage the tube.

2. Remove and discard the 2 snap rings.







3. Clamp the special tool in a vise.

Bearing cup removal

4. NOTE: If necessary, use a pair of pliers to remove a bearing cup that fails to press out all the way.

Remove the bearing cups and the slip-yoke. 1

Position the slip-yoke in the special tool.

2 Press out a bearing cup.

3 Rotate the driveshaft slip-yoke 180 degrees.

4 Press on the spider to remove the remaining bearing cup and the U-joint.

5. Clean the driveshaft slip-yoke.

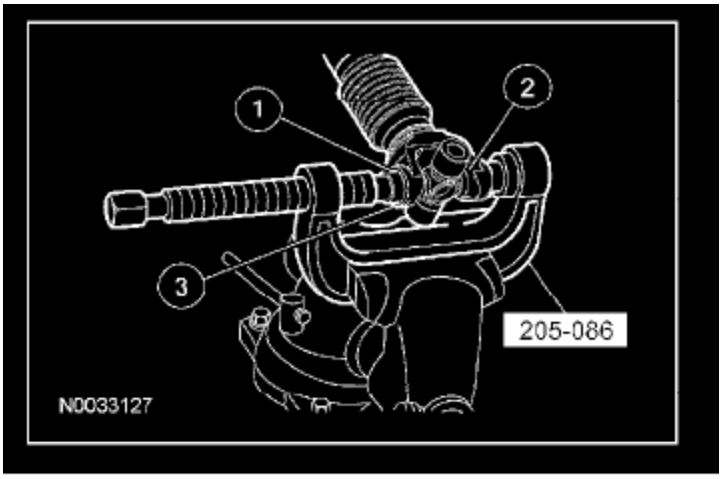
^ Inspect the driveshaft slip-yoke.

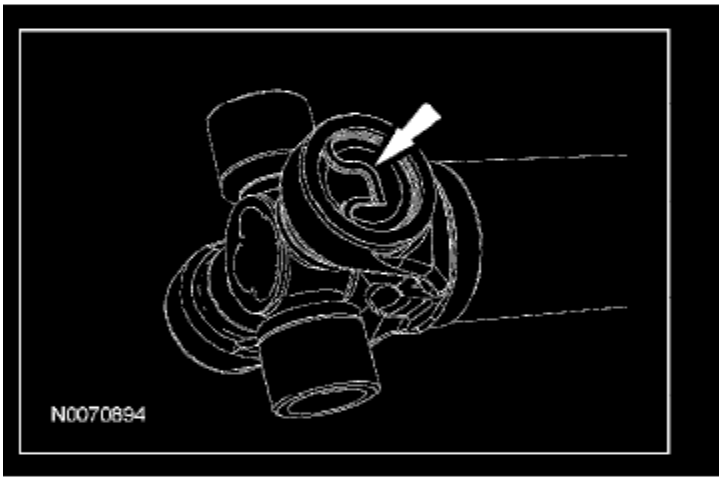
^ Install a new yoke as necessary.

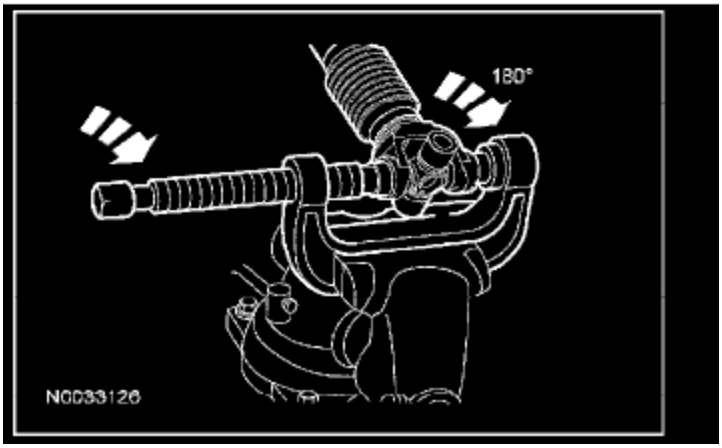
Assembly

Bearing cup installation

1. NOTE: Install the U-joint Kits as complete assemblies only. Do not mix components from other kits.







Install a new spider and bearing cup. 1

Start a new bearing cup in the shaft yoke. ^

Check the needle bearings for correct positioning.

2 Position the new spider in the shaft yoke.

3 Press the bearing cup to just below the snap ring groove.

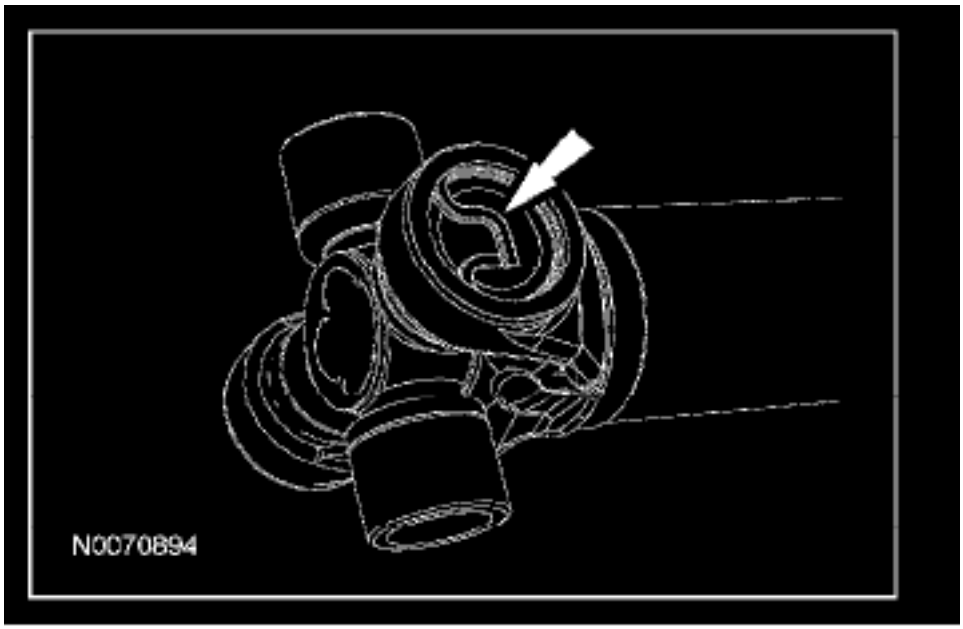
2. NOTE: Use the yellow snap rings supplied in the kit to assemble the U-joint. If difficulty is encountered with the yellow snap rings, install the

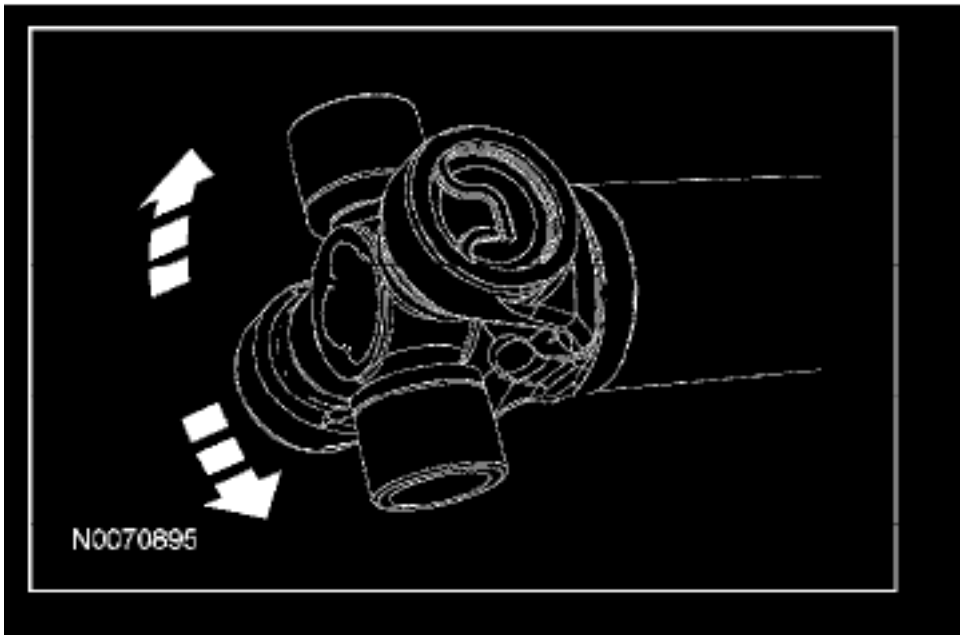
black snap rings.

Remove the shaft from the special tool and install the new snap ring.

Opposite bearing cup installation 3. Repeat bearing cup installation in this procedure to install the new bearing cup and snap ring on the opposite side of the shaft yoke.

4. Remove the shaft from the special tool and install the new snap ring.





5. CAUTION: Do not strike the bearings.

Check the U-joint for freedom of movement. ^

If binding, strike the yoke with a brass or plastic hammer.

Special Tool(s)

Universal Joint: Service and Repair Driveshaft Universal Joint - Single Cardan, Flange Yoke

Driveshaft Universal Joint - Single Cardan, Flange Yoke

Disassembly

Initial disassembly

1. CAUTION: Do not, under any circumstance, clamp the driveshaft in the jaws of a vise or similar holding fixture. Denting or localizing

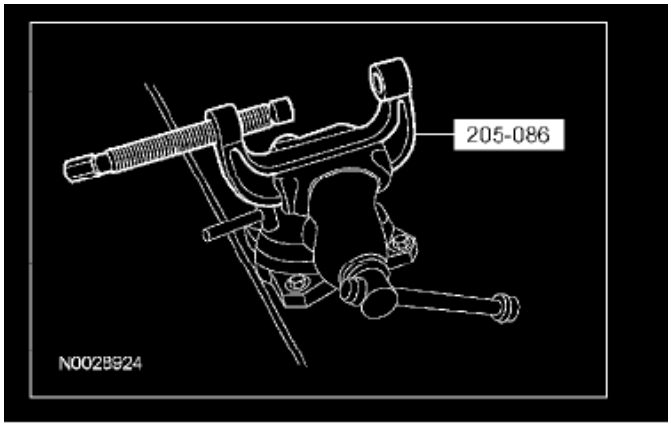
fracture may result, causing driveshaft failure during vehicle operation.

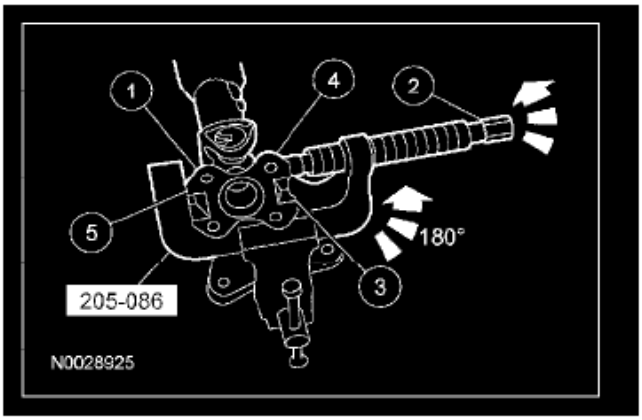
Place the driveshaft on a suitable workbench. Do not damage the tube.

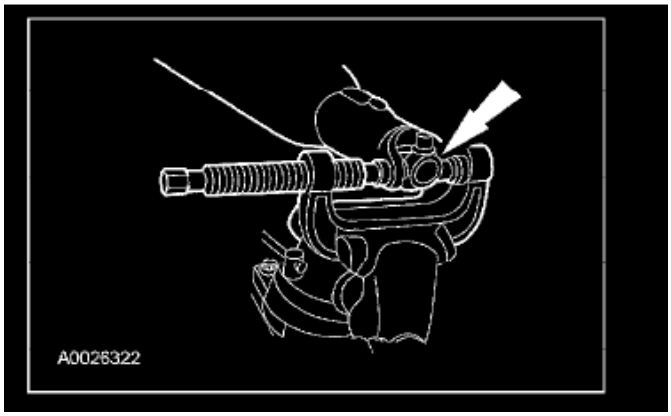
2. Index-mark the driveshaft components.

3. Remove and discard the 4 snap rings.

4. Clamp the special tool in a vise.







Bearing cup removal

5. NOTE: If necessary, use a pair of pliers to remove a bearing cup that fails to press out all the way.

Remove the bearing cups and the flange. 1

Position the flange in the special tool.

2 Press out a bearing cup.

3 Rotate the flange 180 degrees.

4 Press on the spider to remove the remaining bearing cup.

5 Remove the flange.

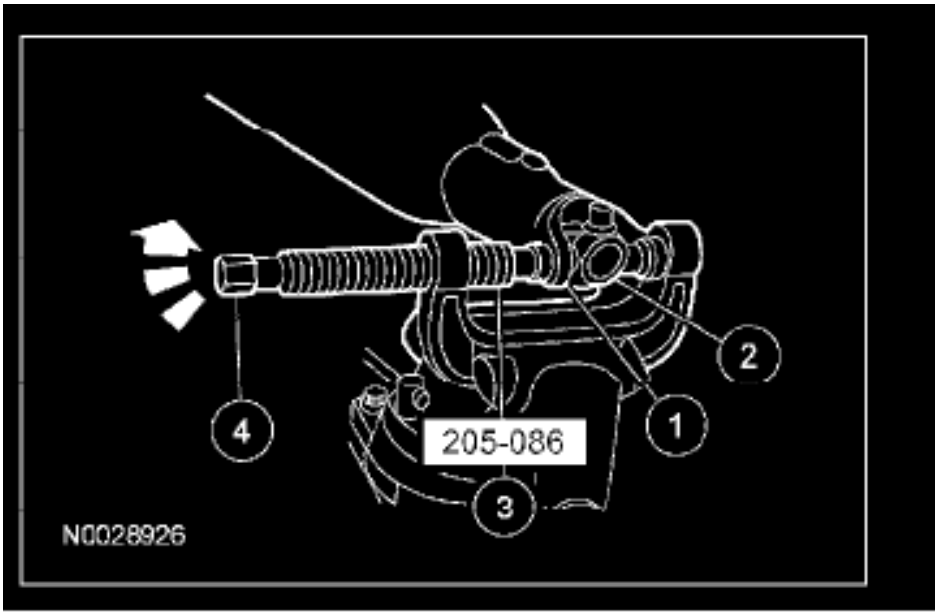
Final disassembly 6. Repeat bearing cup removal in this procedure to remove the remaining bearing cups and the spider from the driveshaft.

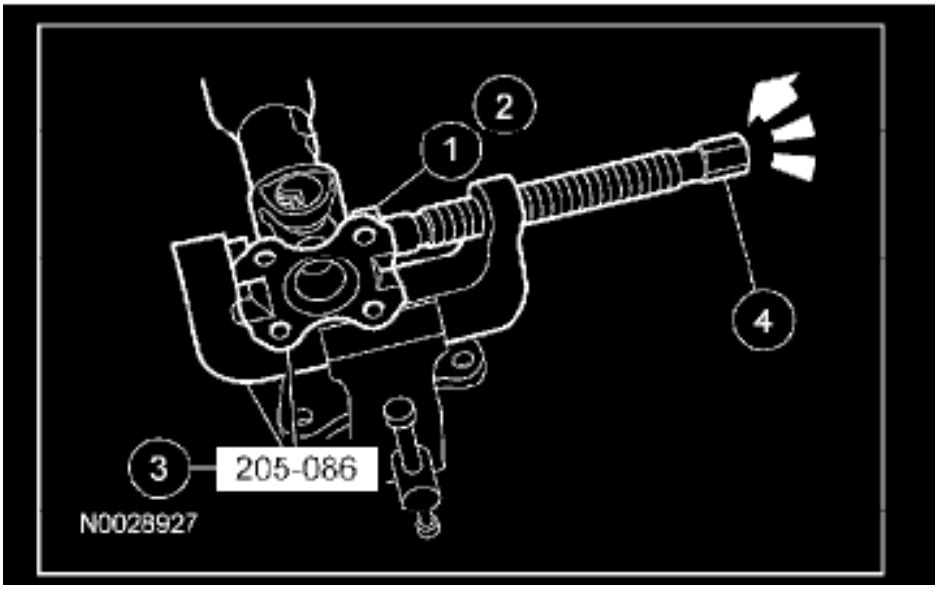
7. Clean the yoke area at the end of the driveshaft.

Assembly

Bearing cup installation

1. NOTE: Install the U-joint Kits as complete assemblies only. Do not mix components from other kits.





Install a new spider and bearing cups. 1

Start a new bearing cup in the driveshaft yoke. ^

Check the needle bearings for correct positioning.

2 Position the new spider in the driveshaft yoke.

3 Position the driveshaft yoke in the special tool.

4 Press the bearing cup to just below the snap ring groove. ^

Repeat to install the new bearing cup on the opposite side of the driveshaft yoke.

Flange installation 2. Inspect the flange. Install a new flange, if necessary. 3. Install the new bearing cups and the flange.

1 Start a new bearing cup in the flange. ^

Check the needle bearings for correct positioning.

2 Position the flange on the spider.

3 Position the assembly in the special tool.

4 Press the bearing cup to just below the snap ring groove. ^

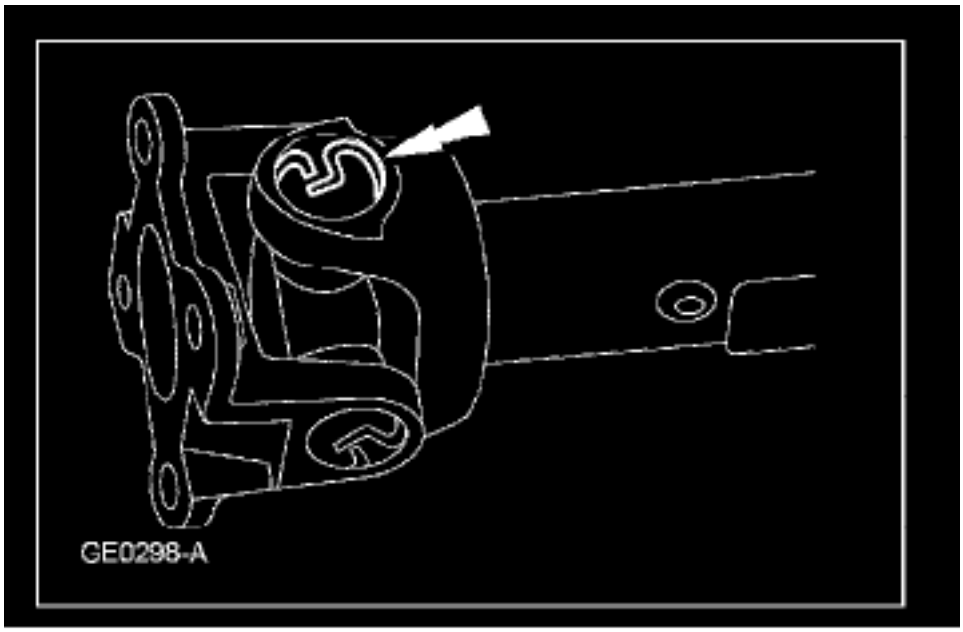
Repeat to install the new bearing cup on the opposite side of the flange.

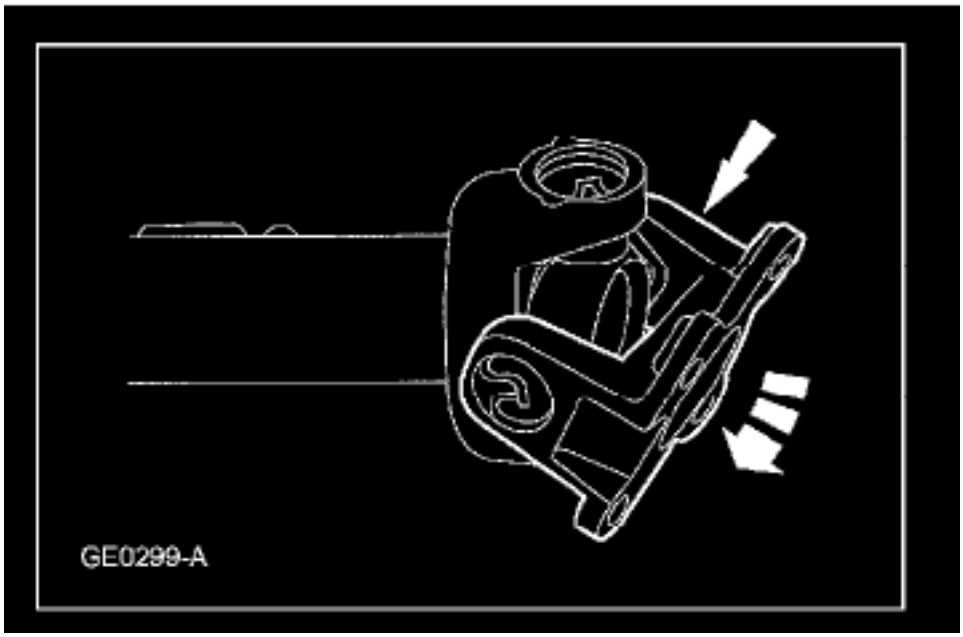
Final assembly

4. NOTE: Use the yellow snap rings supplied in the kit to assemble the U-joint. If difficulty is encountered with the yellow snap rings, install the

black snap rings.

Remove the driveshaft from the special tool, and install the 4 new snap rings.





5. CAUTION: Do not strike the bearings.

Check the U-joint for freedom of movement. ^

If binding, strike the yoke with a brass or plastic hammer.

Universal Joint: Service and Repair Driveshaft Slip Yoke

Driveshaft Slip Yoke

Disassembly

1. CAUTION: Do not, under any circumstance, clamp the driveshaft in the jaws of a vise or similar holding fixture. Denting or localizing

fracture can result, causing driveshaft failure during vehicle operation.

Place the driveshaft on a suitable workbench. Do not damage the tube.

2. Remove the driveshaft slip-yoke from the driveshaft.

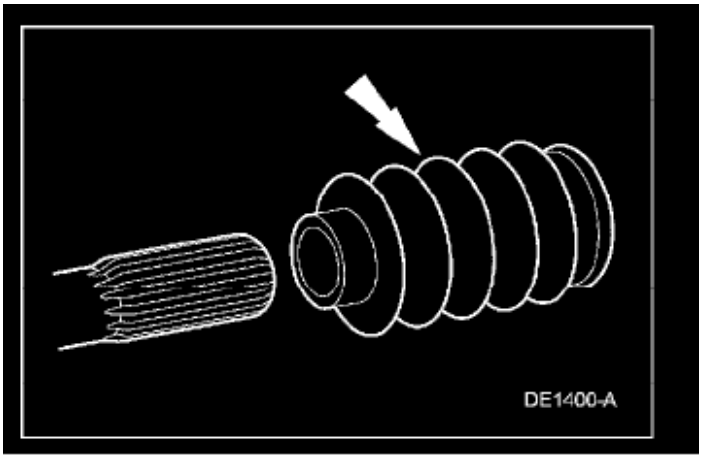
1 Index-mark the driveshaft and driveshaft slip-yoke.

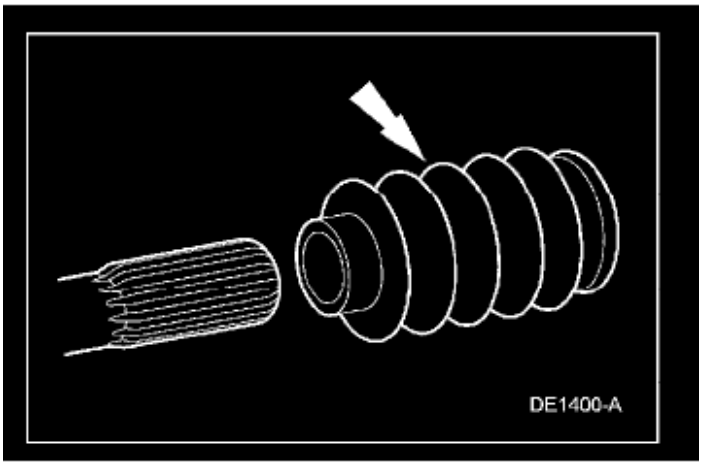
2 Cut and discard the driveshaft slip-yoke boot clamps.

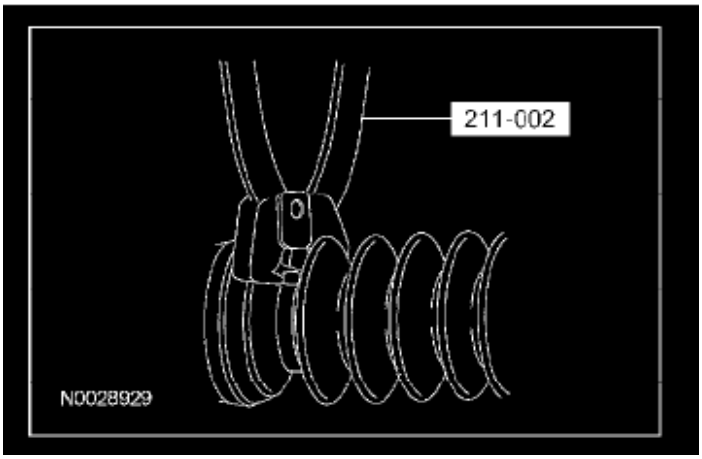
3 Remove the driveshaft slip-yoke from the driveshaft.

3. Remove the slip-yoke boot from the driveshaft.

^ Inspect the boot for damage. Discard the boot as necessary.







4. Inspect the lubricant on the driveshaft splines and in the driveshaft slip-yoke for contamination. If contaminated, inspect the driveshaft splines and

the driveshaft slip-yoke for wear. Install new components as necessary.

Assembly

1. Position the new small driveshaft slip-yoke boot clamp on the driveshaft stub shaft. 2. Slide the small opening end of the slip-yoke boot on the driveshaft stub shaft, as far as it will travel.

3. Using the special tool, crimp the driveshaft slip-yoke boot clamp.

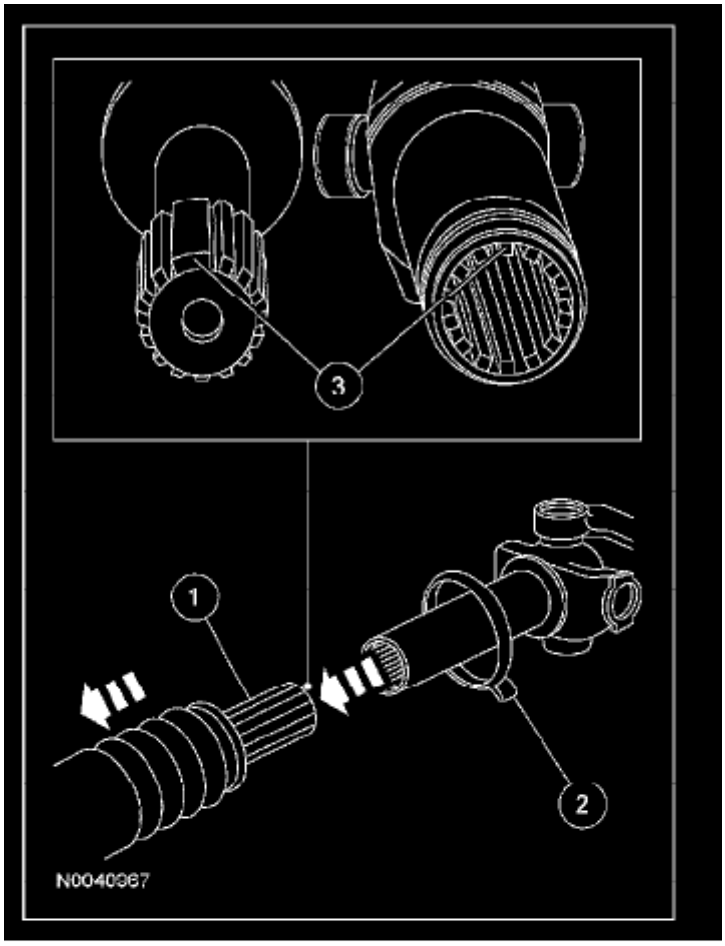
4. Install the driveshaft slip-yoke on the driveshaft.

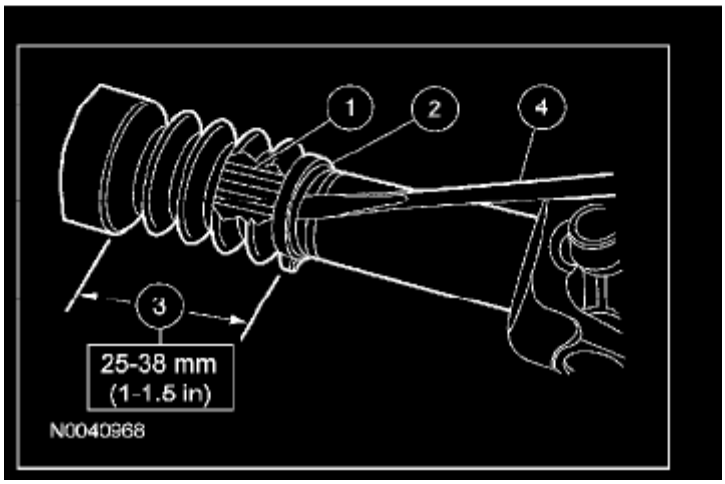
1 Pull the slip-yoke boot toward the driveshaft. Lubricate the driveshaft splines with approximately 10 gm (0.24 oz) of lubricant. ^

Use grease as the lubricant.

2 Position the new large slip-yoke boot clamp.

3 Align the index marks and install the driveshaft slip-yoke on the driveshaft.





5. Set the driveshaft assembled length to specification.

1 Remove any excess grease from the slip-yoke boot and driveshaft slip-yoke surfaces.

2 Position the slip-yoke boot in the slip-yoke boot groove.

3 Set the driveshaft assembled length to specification. ^

Measure from the stub shaft weld to the end of the driveshaft slip-yoke.

4 Bleed the air from the slip-yoke boot.

6. Using the special tool, crimp the large driveshaft slip-yoke boot clamp.

^ Inspect the flexplate for cracks or other damage. Install a new flexplate if necessary.

Installation

NOTE: Special bolts are used for the installation. Do not use standard bolts.

1. Position the flexplate on the crankshaft and install the bolts.

^ Tighten the bolts in a criss-cross pattern.

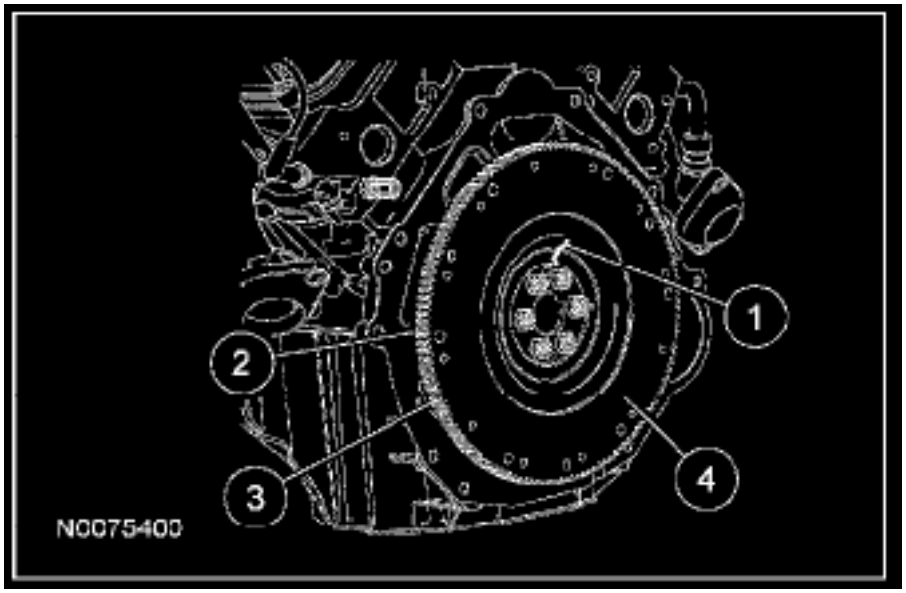
^ Tighten to 80 Nm (59 lb-ft).

2. Install the transmission.

Flywheel: Specifications

Flywheel bolts ..... 80 Nm (59 lb-ft)

Tighten the bolts in a criss-cross pattern



Flywheel: Testing and Inspection Flywheel Inspection

Flywheel Inspection

1. NOTE: The flywheel cannot be resurfaced, it must be replaced.

Inspect the flywheel for: 1

Any cracks.

2 Worn ring gear teeth.

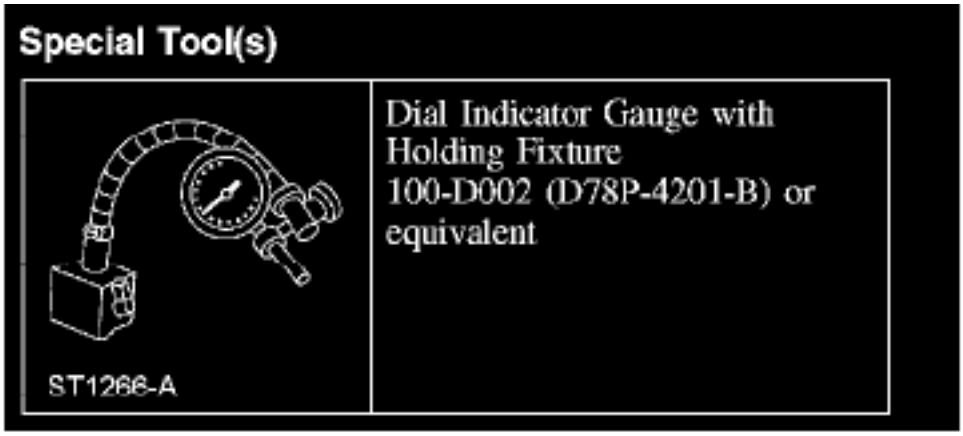
3 Chipped or cracked ring gear teeth.

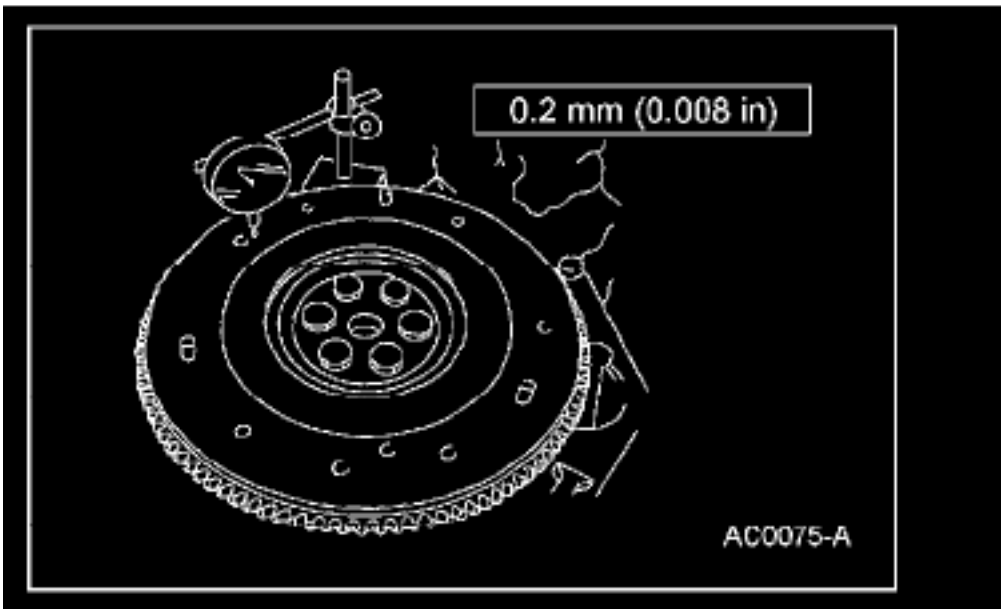
4 Scratches, nicks and discoloration.

Flywheel: Testing and Inspection Flywheel Housing Check

Flywheel Housing Check

1. Check the flywheel surface for scoring, cracks or discoloration. Minor scratches or discoloration should be removed with a fine emery cloth.



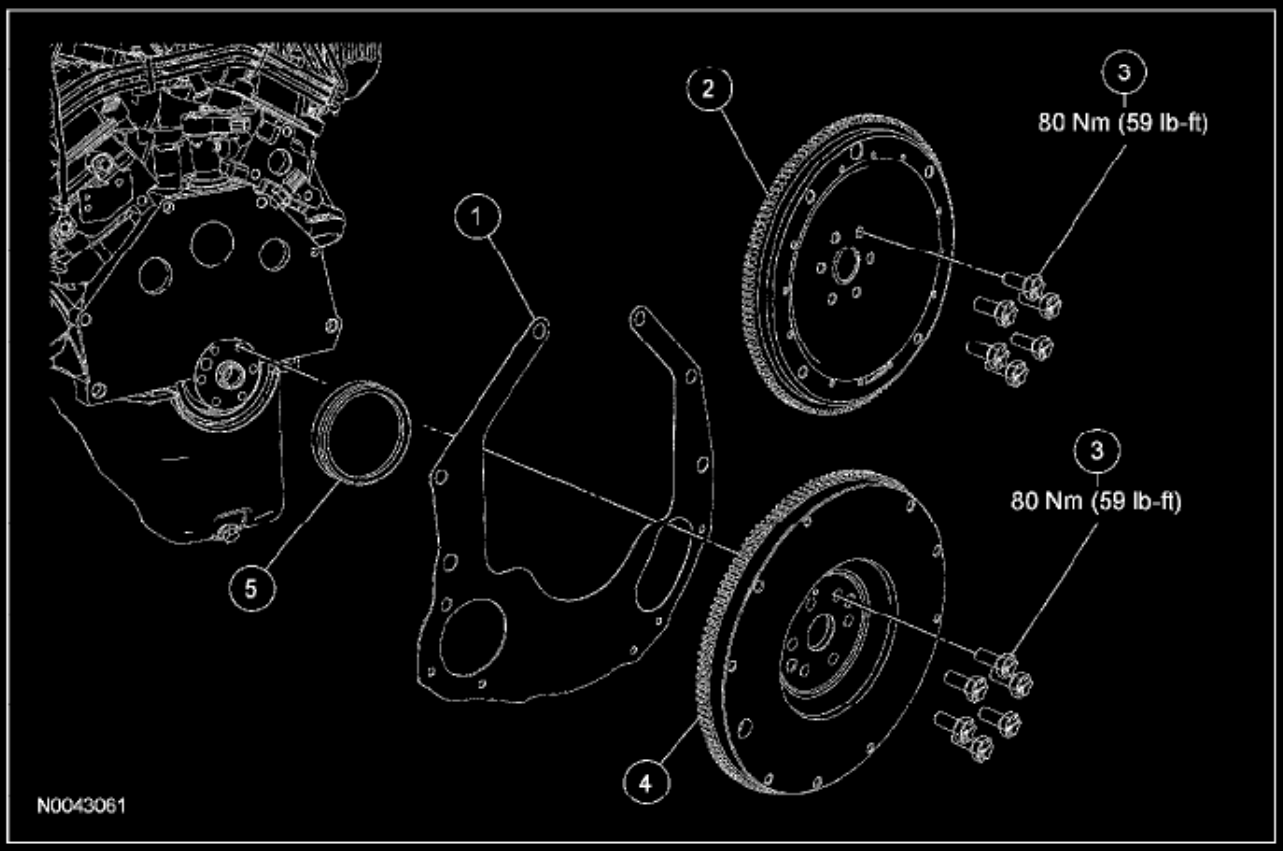


Flywheel: Testing and Inspection Flywheel Runout Check

Flywheel Runout Check

1. Mount the special tool so that the indicator contact point rides on the clutch disc contact surface.
2. Turn the flywheel. If the runout exceeds the maximum allowance, install a new flywheel.

Flexplate or Flywheel and Crankshaft Rear Seal — Exploded View



Item	Part Number	Description
1	6A372	Engine-to-transmission spacer plate
2	6375	Flexplate
3	N802012-S	Flexplate/flywheel bolt
4	6375	Flywheel
5	6701	Crankshaft rear seal

Flywheel: Service and Repair

Flywheel

Flexplate or Flywheel and Crankshaft Rear Seal - Exploded View

Flexplate or Flywheel and Crankshaft Rear Seal - Exploded View

Removal

1. Remove the clutch. 2. Remove the flywheel bolts. 3. Remove the flywheel.

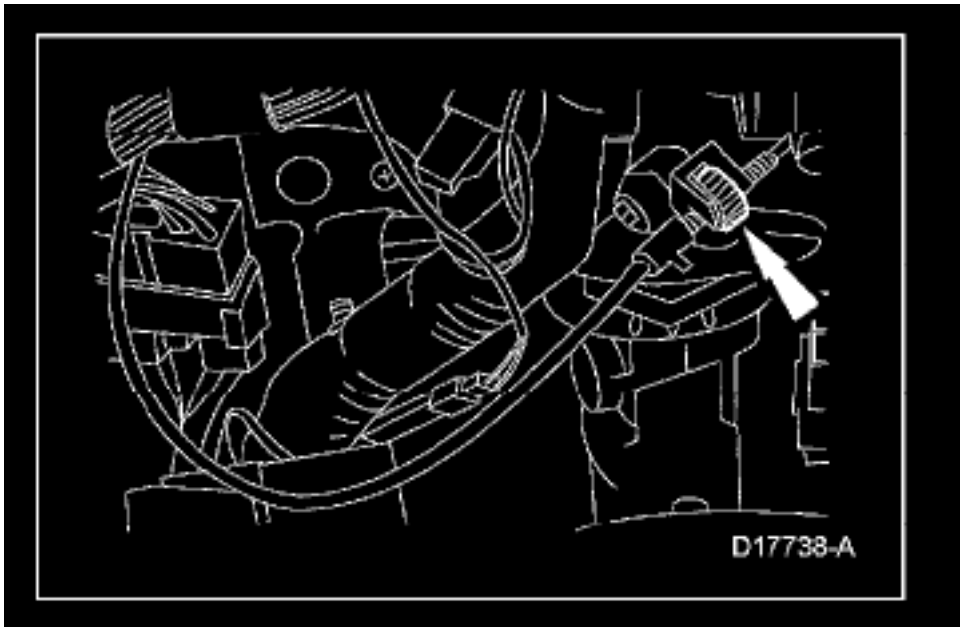
Installation

1. Install the flywheel.

^ Install the 6 bolts. Tighten the bolts in a criss-cross pattern.

^ Tighten to 80 Nm (59 lb-ft).

2. Install the clutch.



Shift Indicator: Adjustments

Selector Lever Indicator Adjustment

1. Remove the upper instrument panel steering column cover. 2. Place the selector lever in the (D) position.

^ Rotate the selector lever clockwise until it bottoms out (1st gear), then rotate 2 detents counterclockwise ((D) position).

3. Hang the 1.4 kg (3 lb) weight on the gearshift lever. 4. Center the pointer in the middle of the (D) position.

^ Rotate the thumb-wheel located on the bottom of the steering column to adjust the pointer.

5. Remove the 1.4 kg (3 lb) weight. 6. Carefully move the selector lever into each detent and compare with the transmission settings.

^ Readjust if necessary.

7. Install the upper instrument panel steering column cover.

Transmission Mode Indicator - A/T: Description and Operation

TRANSMISSION CONTROL INDICATOR LAMP (TCIL)

The TCIL is an output signal from the PCM that controls the lamp on/off function depending on the engagement or disengagement of overdrive.

Fluid - M/T: Capacity Specifications

Manual Transmission

Capacity ..... 2.8 Quarts

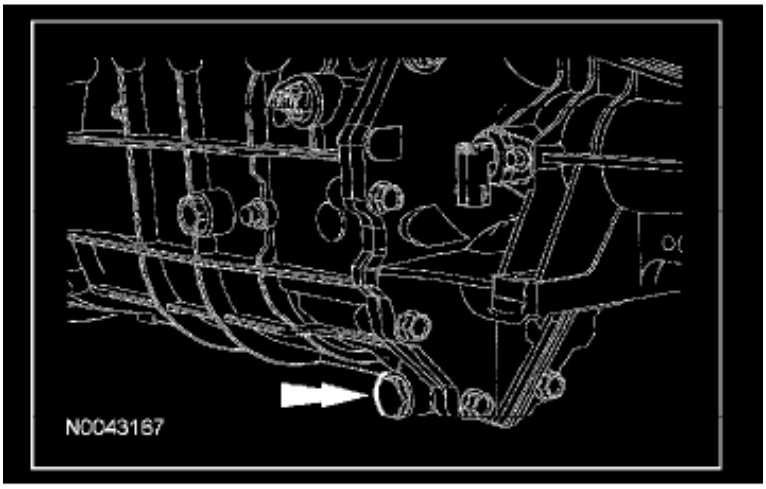
Note: Approximate refill. Service refill capacity is determined by filling the transmission to the bottom of the filler hole with the vehicle on a level surface.

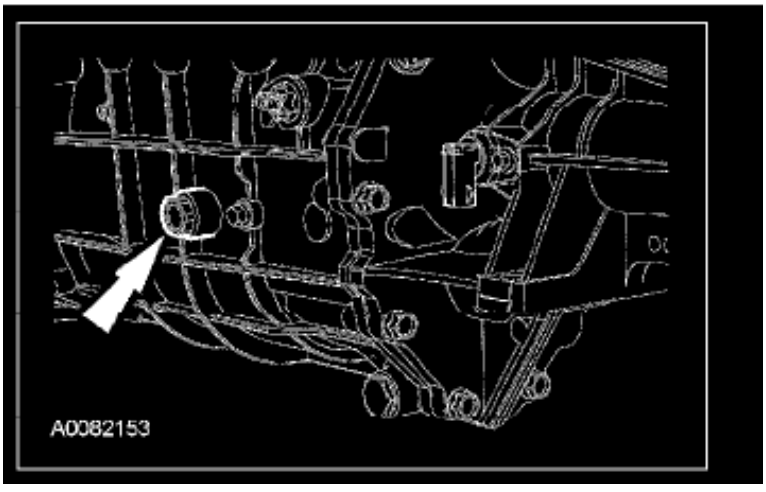
Fluid - M/T: Fluid Type Specifications

Manual Transmission Fluid ..... Mercon V ATF

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V





Fluid - M/T: Service and Repair

Transmission Draining and Filling

1. NOTE: Position a suitable drain pan under the transmission.

Remove the drain plug and drain the transmission.

2. Clean and install the drain plug.

^ Tighten to 48 Nm (35 lb-ft).

3. NOTE: Before removing, clean the area around the filler plug.

Remove the filler plug.

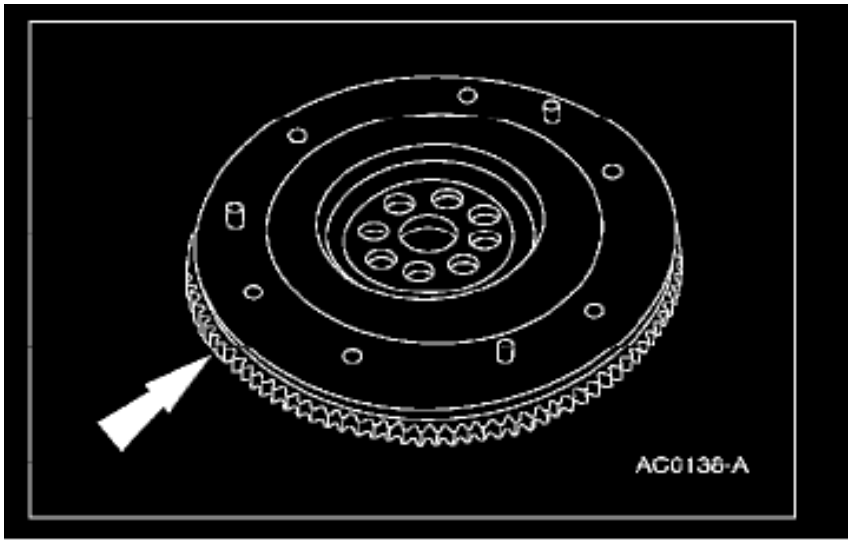
4. NOTE: Fill the transmission with the vehicle on a level surface.

Using a suitable oil suction gun, fill the transmission to the correct level with the specified fluid. The fluid must be just below the fill plug hole. ^

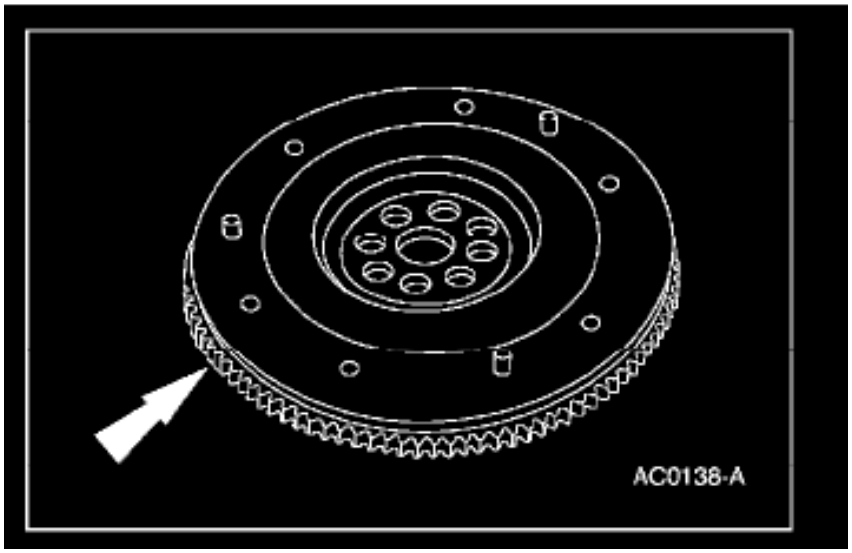
Transmission capacity is 2.6L (2.8 qt).

5. Install the fill plug.

^ Tighten to 48 Nm (35 lb-ft).



AC0138-A



AC0138-A

Flywheel Gear: Service and Repair

Flywheel Ring Gear

Removal

WARNING: This procedure should be carried out only by a correctly equipped and experienced acetylene torch operator. Use tongs or wear welding gloves and safety goggles when handling hot components. Failure to follow these instructions may result in serious personal injury.

1. Remove the flywheel.

2. CAUTION: Do not heat the flywheel ring gear beyond 278° C (500° F). Use heat indicating crayons to prevent over heating, over heating

will damage the flywheel.

NOTE: Tap the flywheel ring gear evenly to prevent binding.

Remove the flywheel ring gear from the flywheel. ^

Evenly heat the flywheel ring gear and use a brass drift to drive the flywheel ring gear off the flywheel.

Installation

WARNING: This procedure should be carried out only by a correctly equipped and experienced acetylene torch operator. Use tongs or wear welding gloves and safety goggles when handling hot components. Failure to follow these instructions may result in serious personal injury.

1. CAUTION: Do not heat the flywheel ring gear beyond 278° C (500° F). Use heat indicating crayons to prevent over heating, over heating

will damage the flywheel.

CAUTION: Keep the torch moving to prevent hot spots or damage to the components may occur.

Evenly heat the flywheel ring gear.

2. Install the flywheel ring gear.

^ The bevel on the flywheel ring gear must face the rear of the flywheel.

^ Use a brass drift.

3. Install the flywheel.

Gearshift Lever and Boot

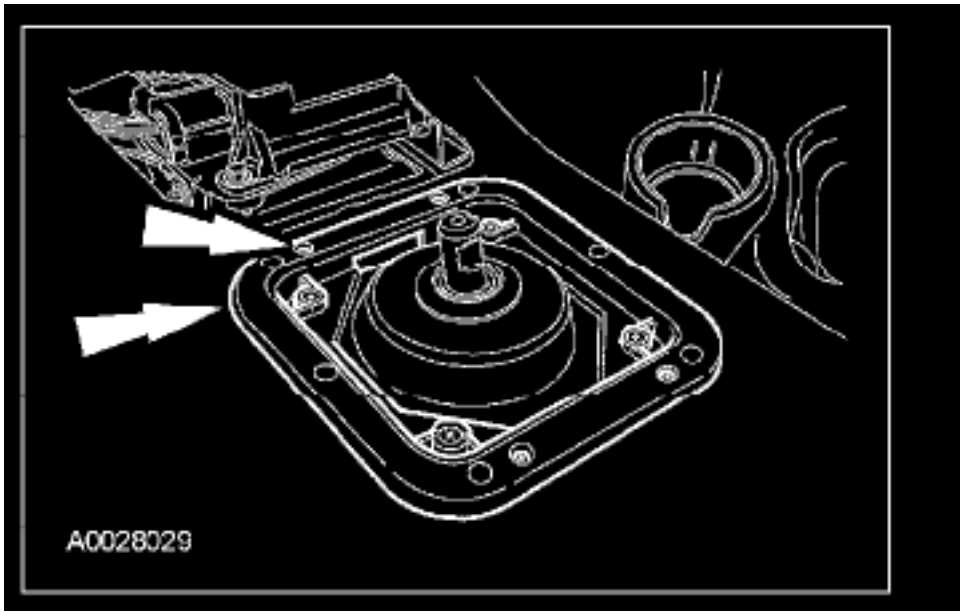
3. Install the nut on the LH side of the lever, then tighten the nut to remove the eccentric stud out of the gearshift lever.

4. Remove the upper gearshift lever and the outer gearshift lever boot and console assembly as an assembly.

5. NOTE: Note the position of the vehicle identification tags on the top of the inner gearshift lever boot for correct installation.

If necessary, remove the 4 screws and the inner gearshift lever boot.



6. To install, reverse the removal procedure.

Power Take-Off: Description and Operation

POWER TAKE-OFF (PTO) SWITCH AND CIRCUITS

The PTO circuit is used by the PCM to disable some of the on board diagnostics (OBD) monitors during PTO operation. The PTO switch is normally open. When the PTO unit is activated, the PTO switch is closed and battery voltage is supplied to the PTO input circuit. This indicates to the PCM that an additional load is being applied to the engine. The PTO indicator lamp illuminates when the PTO system is functioning correctly and flashes when the PTO system is damaged.

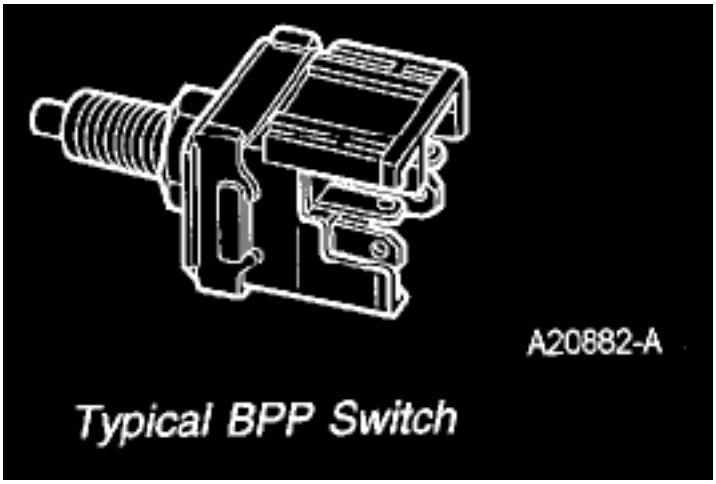
When the PTO unit is activated, the PCM disables some OBD monitors, which may not function reliably during PTO operation. Without the PTO circuit information to the PCM, false DTCs may be set during PTO operation. Prior to an Inspection/Maintenance test, operate the vehicle with the PTO disengaged long enough to successfully complete the OBD Monitors.

PTO Circuits Description

The 3 PTO input circuits are PTO mode, PTO engage, and PTO RPM.

The PTO engage circuit is used when the operator is requesting the PCM to check the needed inputs required to initiate the PTO engagement.

The PTO RPM circuit is used for the operator to request additional engine RPM for PTO operation.



Brake Switch - TCC: Description and Operation

BRAKE PEDAL POSITION (BPP) SWITCH

Typical BPP Switch

The BPP switch is sometimes referred to as the stoplamp switch. The BPP switch provides a signal to the PCM indicating that the brakes are applied. The BPP switch is normally open and is mounted on the brake pedal support. Depending on the vehicle application the BPP switch can be hardwired as follows:

- to the PCM supplying battery positive voltage (B+) when the vehicle brake pedal is applied.

- to the antilock brake system (ABS) module, or lighting control module (LCM), the BPP signal is then broadcast over the network to be received by the PCM.

- to the ABS traction control/stability assist module. The ABS module interprets the BPP switch input along with other ABS inputs and generates an output called the driver brake application (DBA) signal. The DBA signal is then sent to the PCM and to other BPP signal users.

Digital Transmission Range (TR) Sensor

Digital Transmission Range (TR) Sensor

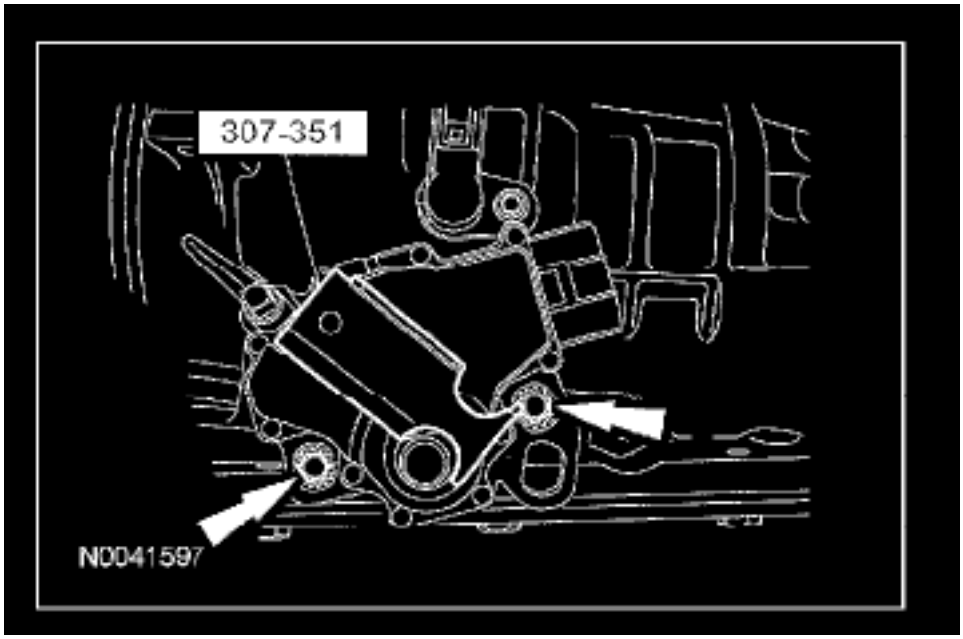
Removal

1. With the vehicle in NEUTRAL, position it on a hoist. 2. Disconnect the selector lever cable from the manual control lever. 3. Disconnect the digital transmission range (TR) sensor electrical connector. 4. Remove the manual control outer lever nut and manual control outer lever. 5. Remove the screws and the digital TR sensor.

Installation



1. CAUTION: The digital transmission range (TR) sensor must fit flush against the boss on the case to prevent damage to the sensor.

Install the digital TR sensor and loosely install the screws.

2. CAUTION: Tightening one screw before tightening the other may cause the sensor to bind or become damaged.

NOTE: The manual lever must be in the NEUTRAL position.

Using the special tool, align the digital TR sensor and tighten screws in an alternating sequence. ^

Tighten to 10 Nm (89 lb-inch).

3. Install the manual control outer lever and nut.

^ Tighten to 48 Nm (35 lb-ft).

4. Connect the digital TR sensor electrical connector. 5. Connect the selector lever cable to the manual control lever. 6. Verify that the selector lever cable is adjusted correctly.

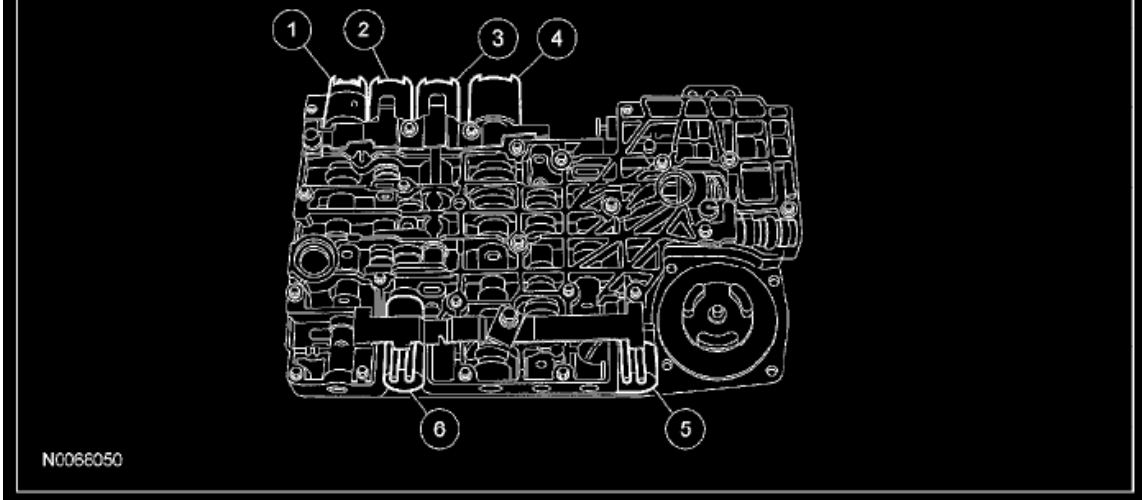
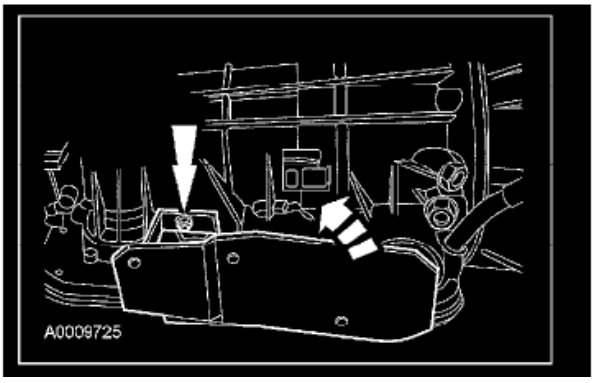
Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V



Item	Part Number	Description
1	7F037	Torque converter clutch (TCC)
2	7G484	Shift solenoid (SSD)
3	7G484	Shift solenoid (SSB)
4	7H144	Electronic pressure control (EPC)
5	7G484	Shift solenoid (SSA)
6	7G484	Shift solenoid (SSC)



Shift Solenoid: Service and Repair

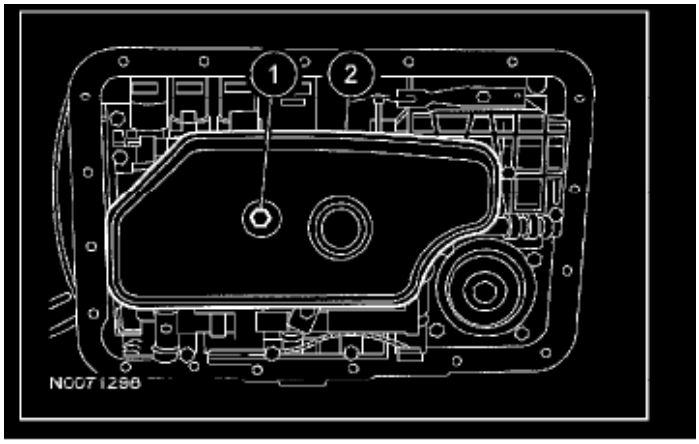
Solenoids - Shift, Torque Converter Clutch, Electronic Pressure Control

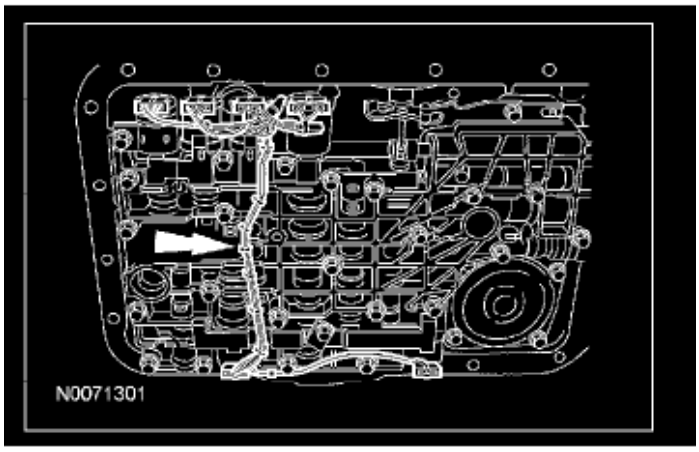
Removal

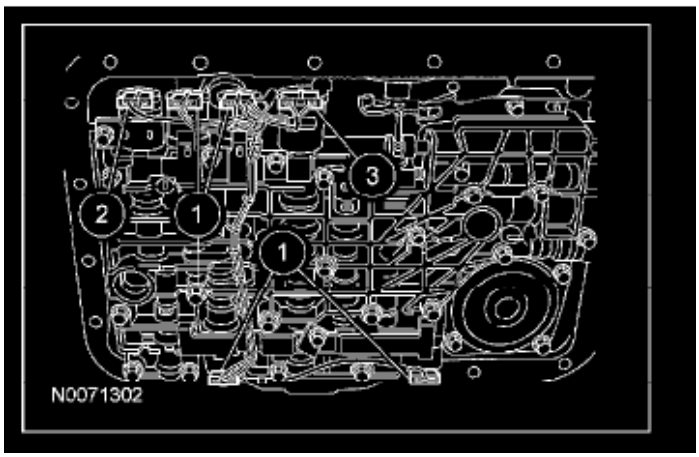
1. With the vehicle in NEUTRAL, position it on a hoist.

2. NOTE: If equipped, the transmission servo heat shield needs to be unclipped from the fluid pan rail and positioned aside for fluid pan removal.

If equipped, loosen the nut and position the heat shield aside.







3. Place a drain pan under the transmission fluid pan. 4. Drain the transmission fluid. 5. Remove the transmission fluid filter.

1 Remove the transmission fluid filter screw.

2 Remove the transmission fluid filter.

6. NOTE: Main control assembly does not need to be removed for solenoid service.

Remove wire loom guide and protector. ^

Carefully lift up on wire loom guide and protector and disengage the retaining pins from the solenoid clamps.

7. Disconnect the appropriate solenoid electrical connector.

1 Disconnect shift solenoids electrical connectors.

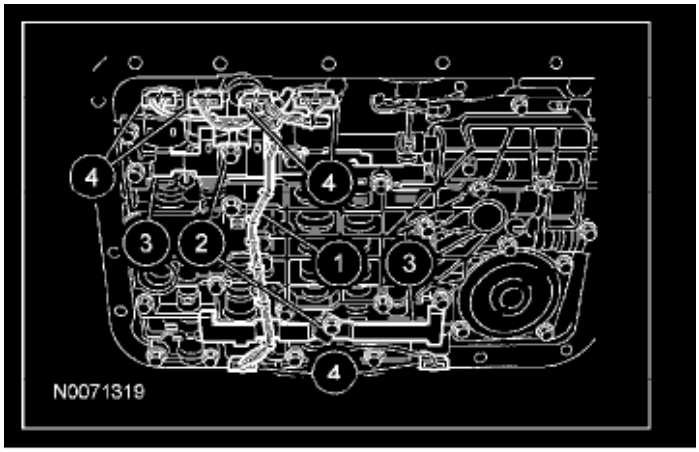
2 Disconnect the torque converter clutch (TCC) solenoid electrical connector.

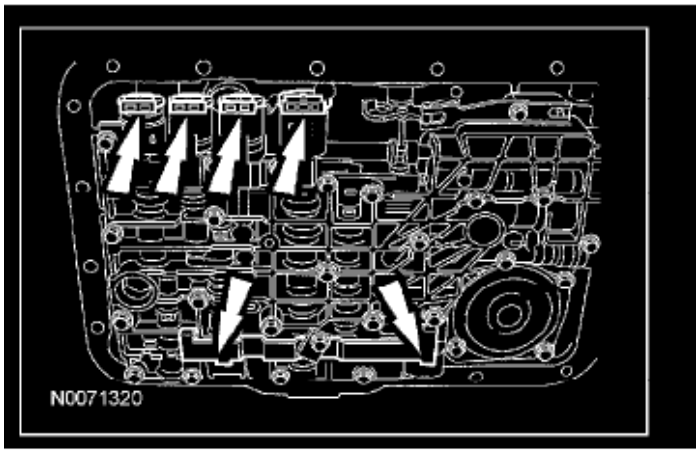
3 Disconnect the electronic pressure control (EPC) solenoid electrical connector.

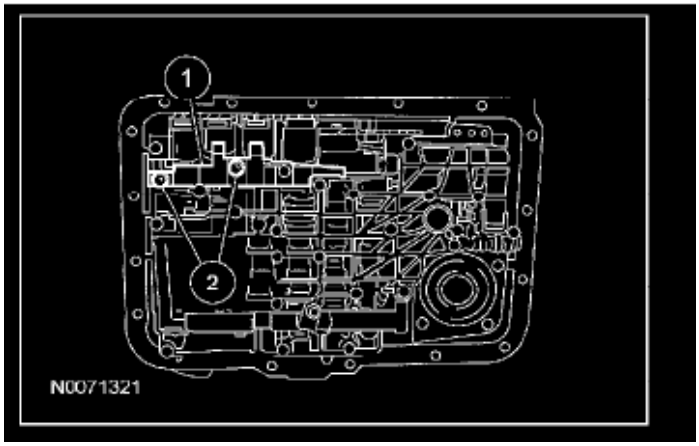
8. CAUTION: The torque converter clutch (TCC) solenoid and converter modulator valve may pop out of its bore. This may damage the

solenoid or converter modulator valve.

CAUTION: Shift solenoid (SSC) may pop out of its bore. This may damage the solenoid.







Remove the shift solenoids. 1

Remove the wire harness.

2 Remove the solenoid clamp screws.

3 Remove the solenoid clamp.

4 Remove the appropriate solenoid(s).

Installation

1. Install the new solenoid(s).

2. NOTE: The solenoid clamp must be installed in the torque converter clutch (TCC) and electronic pressure control (EPC) solenoid grooves, shift

solenoid pockets and the No. 204 plug.

Install the solenoid clamp. 1

Position the solenoid clamp on the main control valve body.

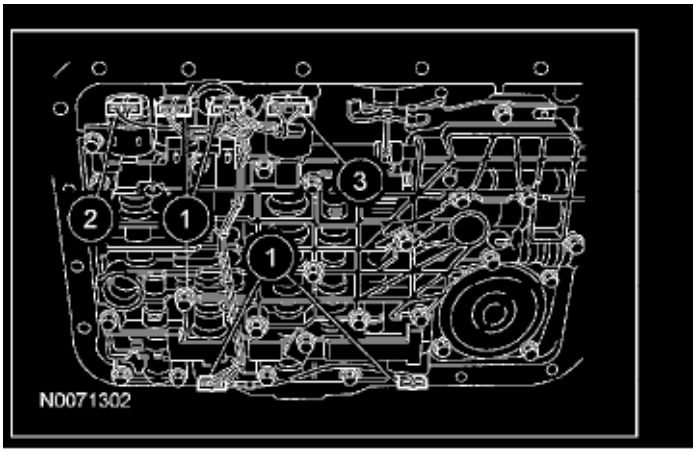
2 Install the solenoid clamp screws.

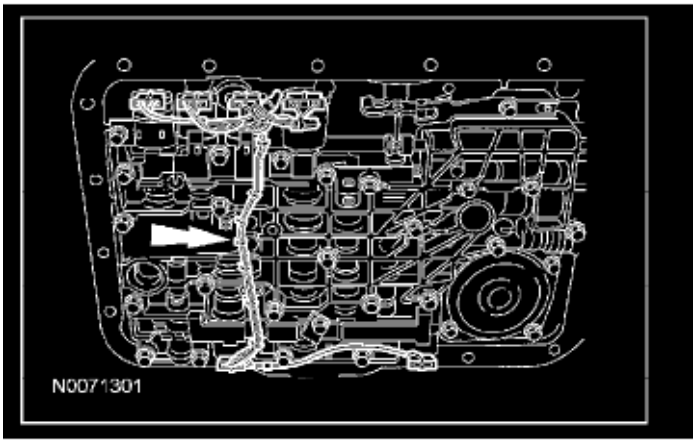
3. Connect the 6 solenoid electrical connectors.

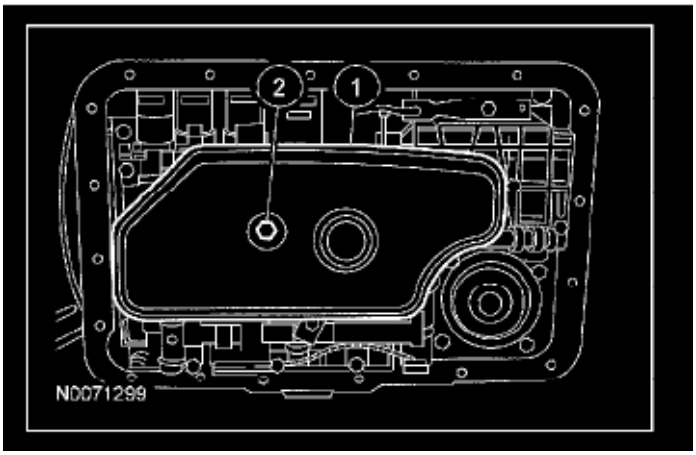
1 Connect shift solenoid SSA, SSB, SSC, SSD electrical connectors.

2 Connect the TCC solenoid electrical connector.

3 Connect the EPC solenoid electrical connector.







4. CAUTION: Excessive pressure may break the retaining pins.

Install the main control valve body wire loom. ^

Align the retaining pins to the holes in the solenoid clamps and gently press in the main control valve body wire loom guide and protector.

5. Install the transmission fluid filter.

1 Install the transmission fluid filter.

2 Install the transmission fluid filter screw. ^

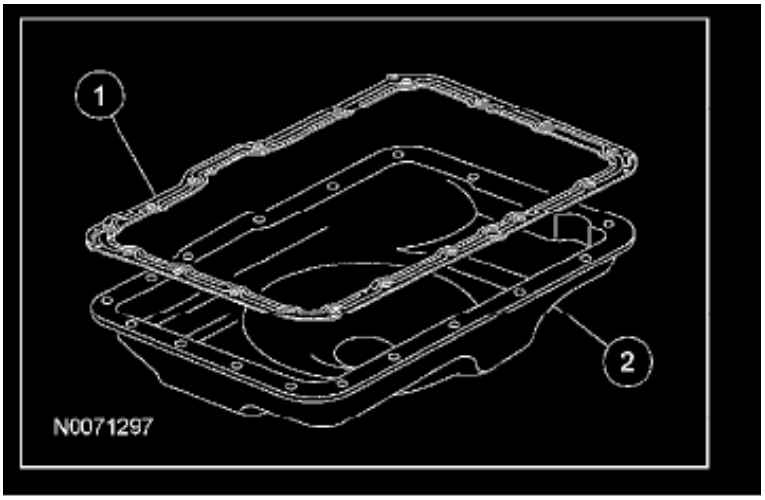
Tighten to 10 Nm (89 lb-inch).

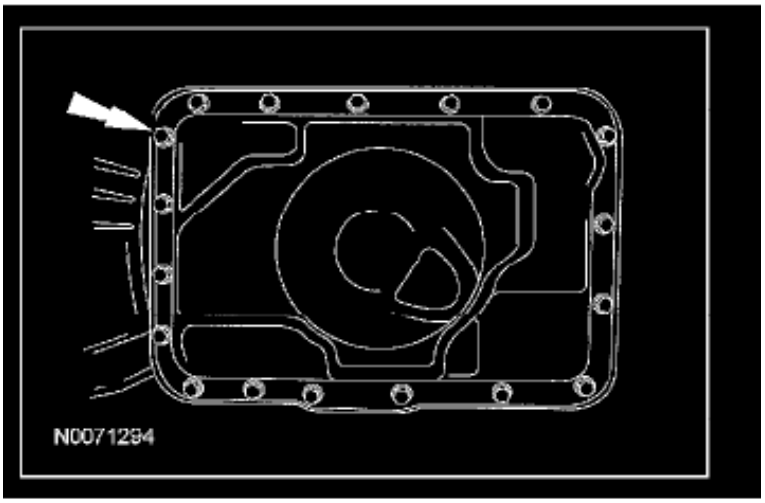
6. NOTE: The transmission fluid pan gasket is reusable. Clean and inspect for damage, if not damaged, the gasket should be reused.

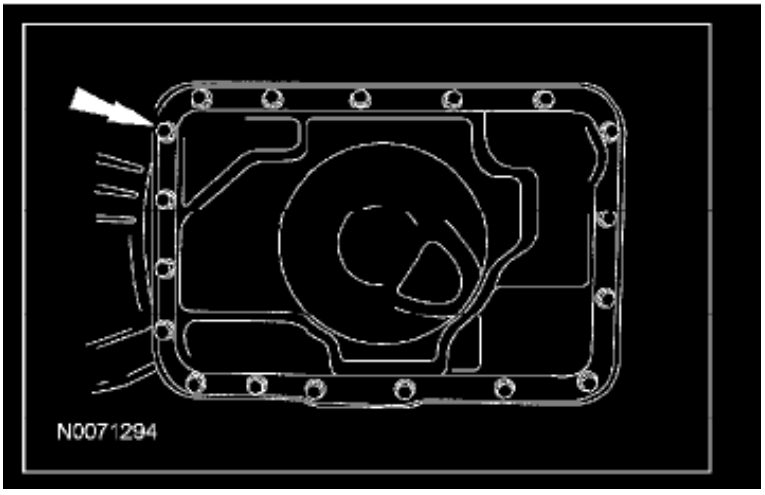
Install the transmission fluid pan. 1

Position the transmission fluid pan gasket on the transmission fluid pan.

2 Align and install the transmission fluid pan.







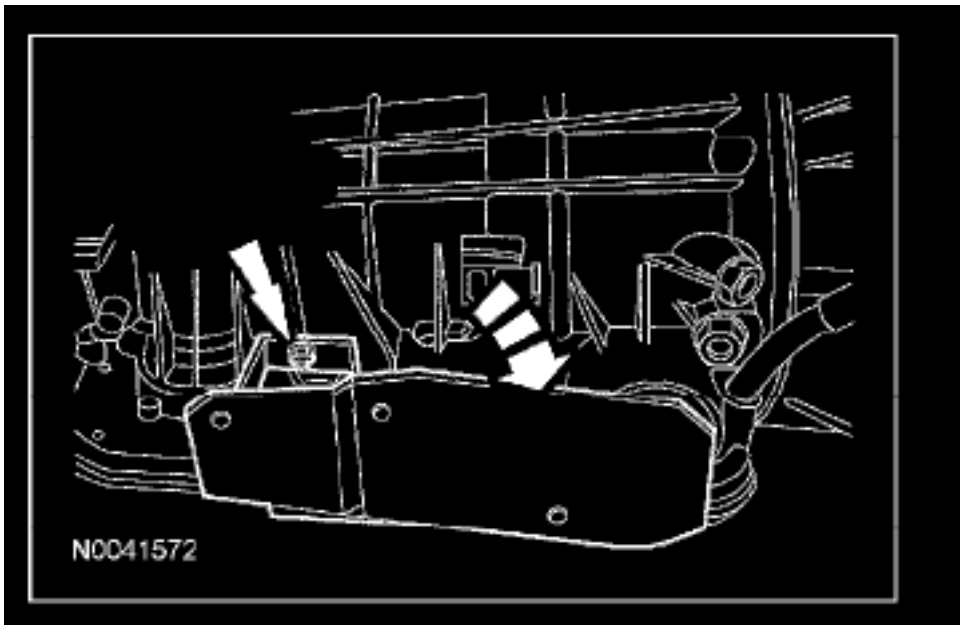
7. Loosely install the transmission fluid pan screws.

8. Tighten the transmission fluid pan screws in a crisscross pattern.

^ Tighten to 10 Nm (89 lb-inch).

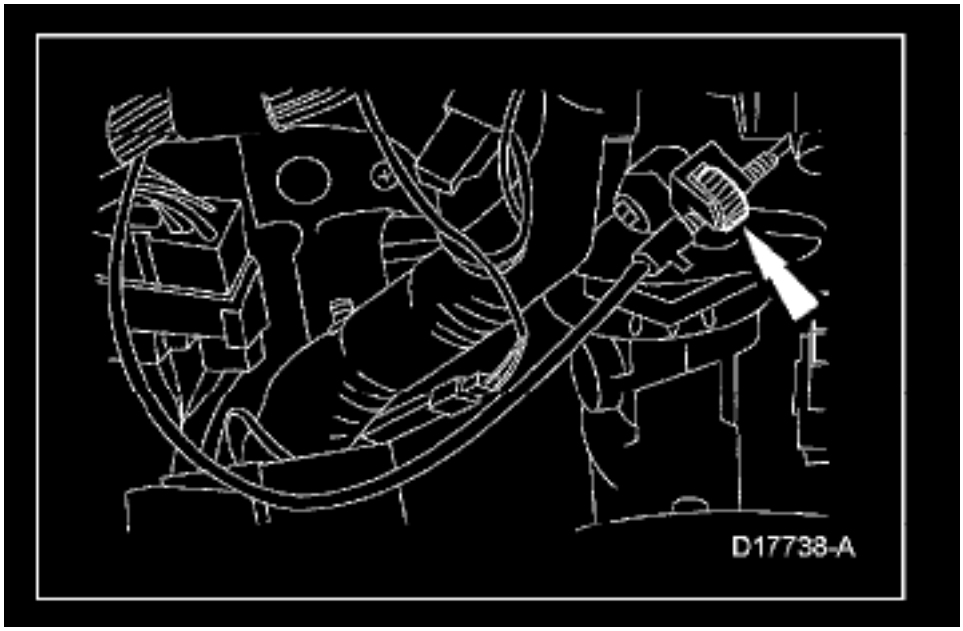
9. If equipped, position the servo heat shield over the servos and clip it to the pan rail.

^ Tighten to 10 Nm (89 lb-inch).



10. NOTE: Start with a minimum of 3.7L (4 qt) clean automatic transmission fluid.

Fill transmission with clean automatic transmission fluid to the correct fluid level.



Shift Indicator: Adjustments

Selector Lever Indicator Adjustment

1. Remove the upper instrument panel steering column cover. 2. Place the selector lever in the (D) position.

^ Rotate the selector lever clockwise until it bottoms out (1st gear), then rotate 2 detents counterclockwise ((D) position).

3. Hang the 1.4 kg (3 lb) weight on the gearshift lever. 4. Center the pointer in the middle of the (D) position.

^ Rotate the thumb-wheel located on the bottom of the steering column to adjust the pointer.

5. Remove the 1.4 kg (3 lb) weight. 6. Carefully move the selector lever into each detent and compare with the transmission settings.

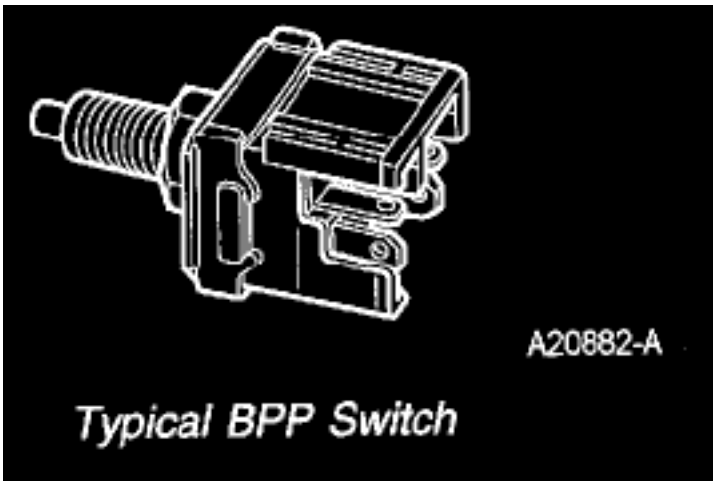
^ Readjust if necessary.

7. Install the upper instrument panel steering column cover.

Transmission Mode Indicator - A/T: Description and Operation

TRANSMISSION CONTROL INDICATOR LAMP (TCIL)

The TCIL is an output signal from the PCM that controls the lamp on/off function depending on the engagement or disengagement of overdrive.



Brake Switch - TCC: Description and Operation

BRAKE PEDAL POSITION (BPP) SWITCH

Typical BPP Switch

The BPP switch is sometimes referred to as the stoplamp switch. The BPP switch provides a signal to the PCM indicating that the brakes are applied. The BPP switch is normally open and is mounted on the brake pedal support. Depending on the vehicle application the BPP switch can be hardwired as follows:

- to the PCM supplying battery positive voltage (B+) when the vehicle brake pedal is applied.

- to the antilock brake system (ABS) module, or lighting control module (LCM), the BPP signal is then broadcast over the network to be received by the PCM.

- to the ABS traction control/stability assist module. The ABS module interprets the BPP switch input along with other ABS inputs and generates an output called the driver brake application (DBA) signal. The DBA signal is then sent to the PCM and to other BPP signal users.

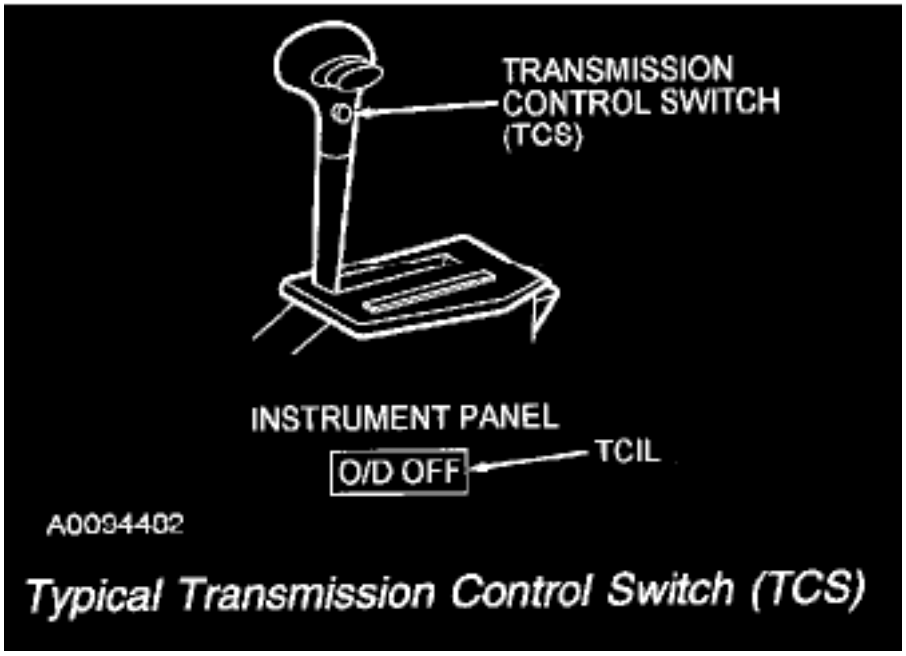
Typical Transmission Control Switch (TCS)



Typical Transmission Control Switch (TCS)

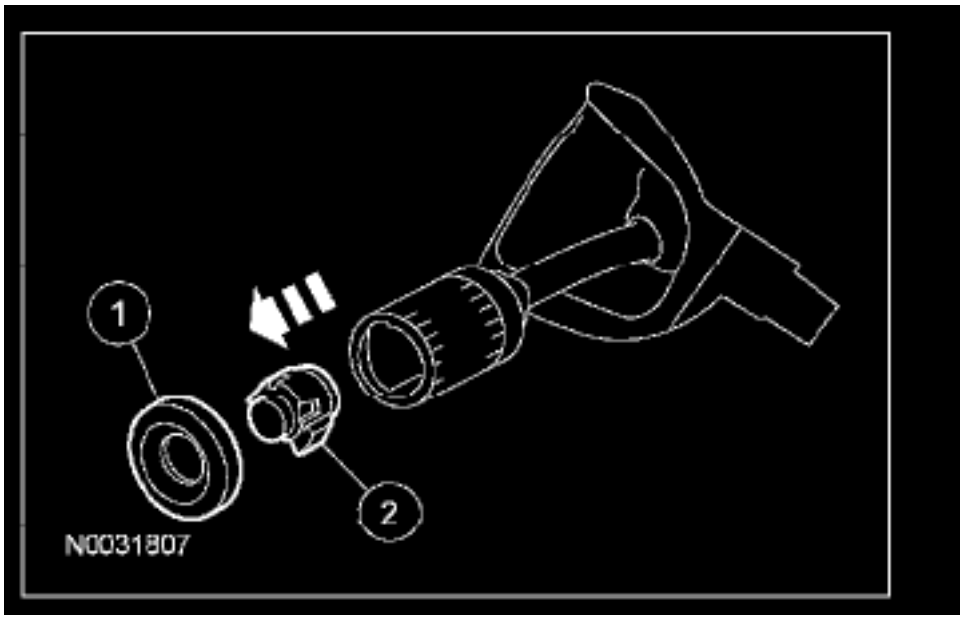
Transmission Mode Switch: Description and Operation

TRANSMISSION CONTROL SWITCH (TCS)

Typical Transmission Control Switch (TCS)

Typical Transmission Control Switch (TCS)

The TCS signals the PCM with VPWR whenever the TCS is pressed. On vehicles with this feature, the transmission control indicator lamp (TCIL) illuminates when the TCS is cycled to disengage overdrive.



Transmission Mode Switch: Service and Repair

Transmission Control (TC) Switch

Removal and Installation

1. Remove the transmission control (TC) switch.

1 Remove the TC switch cover.

2 Remove the TC switch.

2. To install, reverse the removal procedure.

2	—	Digital transmission range (TR) sensor electrical connector
3	W701211-S	Manual control lever nut
4	7A256-A	Manual control lever
5	N806933-S	Digital TR sensor screw (2 required)
6	7F293-A	Digital TR sensor

Transmission Position Switch/Sensor: Service and Repair

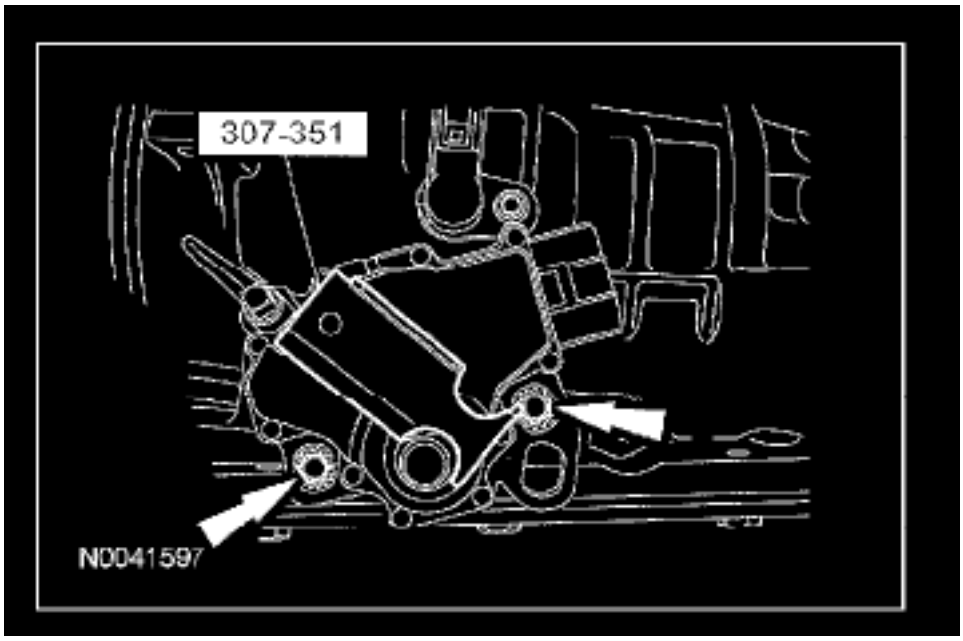
Digital Transmission Range (TR) Sensor

Digital Transmission Range (TR) Sensor

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. 2. Disconnect the selector lever cable from the manual control lever. 3. Disconnect the digital transmission range (TR) sensor electrical connector. 4. Remove the manual control outer lever nut and manual control outer lever. 5. Remove the screws and the digital TR sensor.

Installation



1. CAUTION: The digital transmission range (TR) sensor must fit flush against the boss on the case to prevent damage to the sensor.

Install the digital TR sensor and loosely install the screws.

2. CAUTION: Tightening one screw before tightening the other may cause the sensor to bind or become damaged.

NOTE: The manual lever must be in the NEUTRAL position.

Using the special tool, align the digital TR sensor and tighten screws in an alternating sequence. ^

Tighten to 10 Nm (89 lb-inch).

3. Install the manual control outer lever and nut.

^ Tighten to 48 Nm (35 lb-ft).

4. Connect the digital TR sensor electrical connector. 5. Connect the selector lever cable to the manual control lever. 6. Verify that the selector lever cable is adjusted correctly.

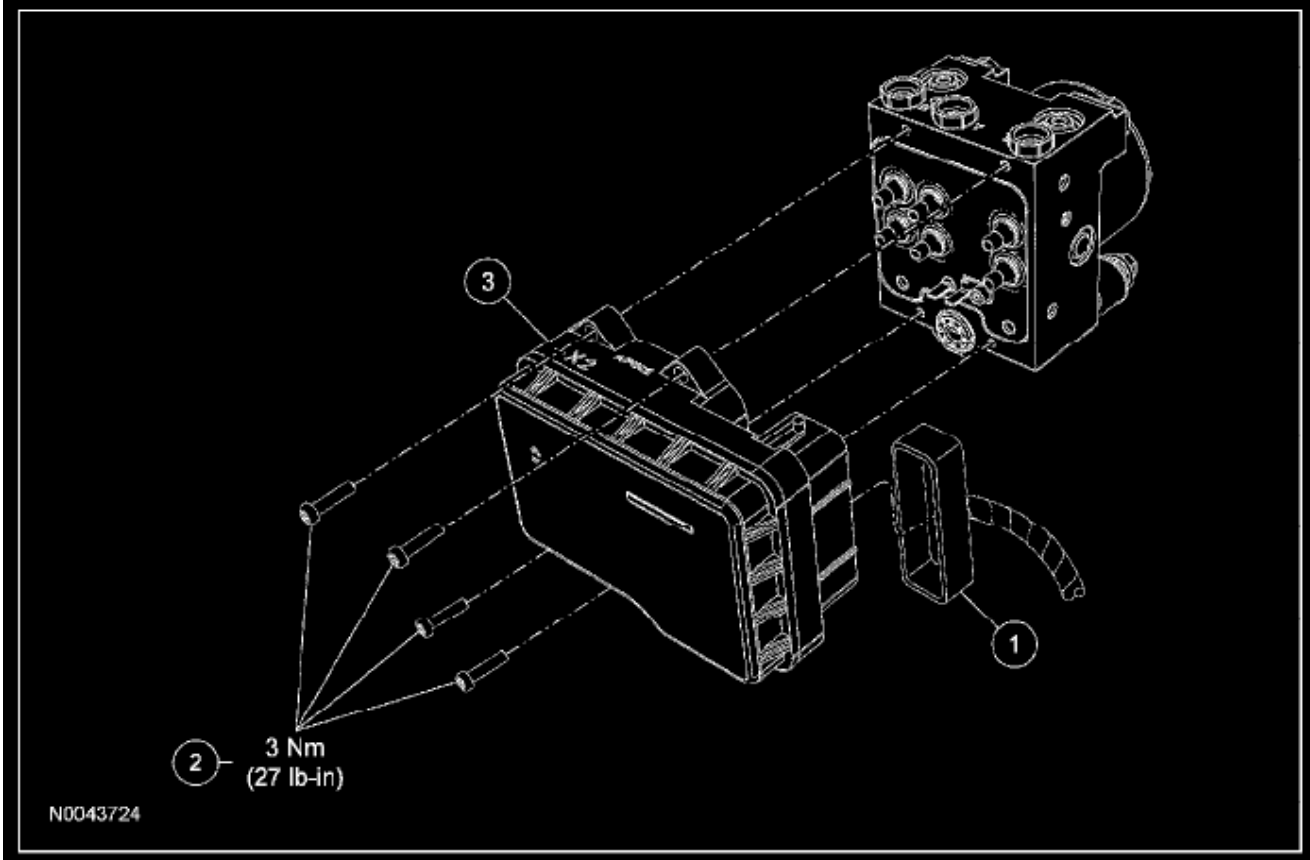
Anti-Lock Brake System (ABS) Module



Item	Part Number	Description
1	—	ABS module electrical connector (part of 14290)
2	—	ABS module bolts (4 required) (part of 2C065)
3	2C065	ABS module

Electronic Brake Control Module: Service and Repair

Anti-Lock Brake System (ABS) Module

Anti-Lock Brake System (ABS) Module

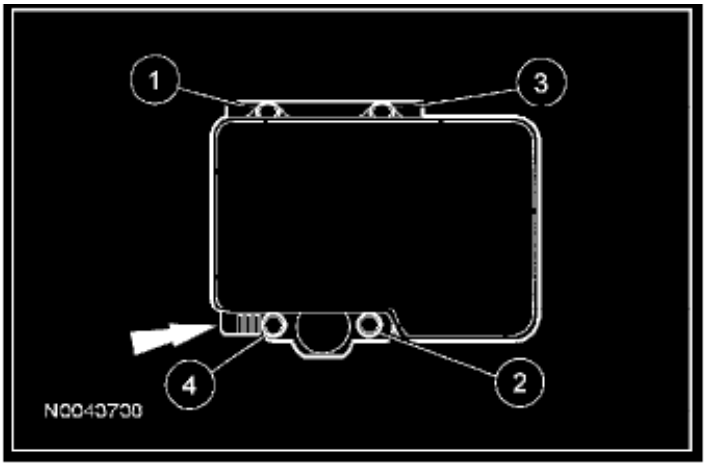
Removal and Installation

1. Remove the hydraulic control unit (HCU).

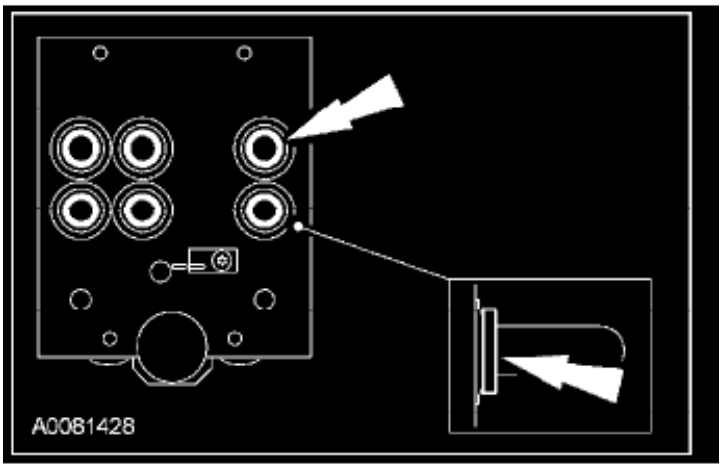
2. NOTE: The ABS module bolts must be removed and installed in the sequence shown.

Remove the 4 ABS module bolts in the sequence shown. ^

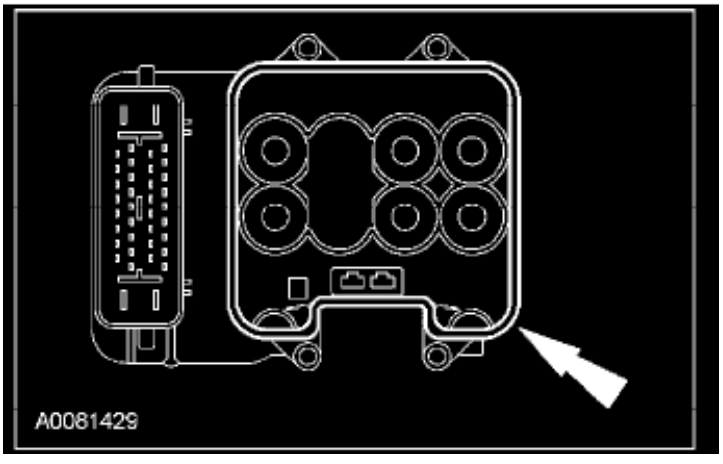
To install, tighten to 3 Nm (27 lb-inch).



1
3
4
2



A0081428



A0081429

3. CAUTION: When the anti-lock brake system (ABS) module is separated from the hydraulic control unit (HCU), the motor terminals and

the valve stems will be exposed. Protect the terminals and the valve stems from damage.

Remove the ABS module from the HCU.

4. Remove and discard the O-ring seals.

5. Remove and discard the ABS module seal.

6. CAUTION: All components must be free of dust, oil, fluid and foreign material prior to installation. A new seal kit must be used when

installing the anti-lock brake system (ABS) module. The old seals must be discarded as they may cause a leak between the ABS module and the hydraulic control unit (HCU).

NOTE: The O-ring seals must be installed to the valve flange. Make sure the O-ring seals are not deformed when installed.

NOTE: Clean the groove of the ABS module before installing a new seal.

To install, reverse the removal procedure.

Hydraulic Control Assembly - Antilock Brakes: Service and Repair

Hydraulic Control Unit (HCU)

Removal and Installation

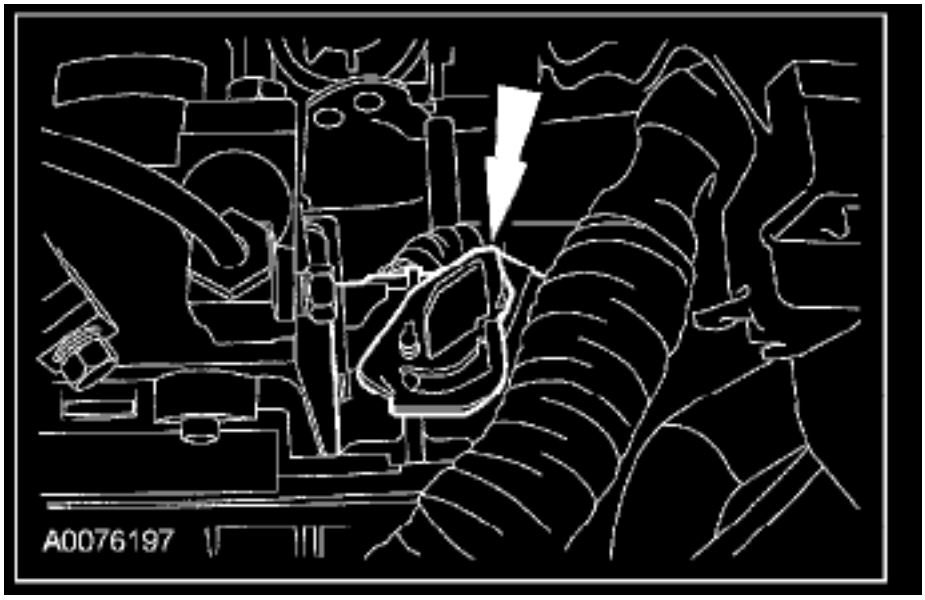
WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal

injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

1. Disconnect the battery ground cable. 2. Disconnect the ABS module electrical connector by rotating the release lever.



3. NOTE: After disconnecting the hydraulic control unit (HCU) brake tube fittings, cap the holes in the HCU to prevent contamination or foreign

material from entering the brake tube ports.

Disconnect the 5 HCU brake tube fittings from the HCU. ^

To install, tighten to 17 Nm (13 lb-ft).

4. Remove the 2 HCU-to-bracket nuts and the HCU assembly.

^ To install, tighten to 5 Nm (44 lb-inch).

5. If necessary, remove the 2 HCU bracket-to-frame nuts, the 2 HCU bracket-to-frame bolts and the HCU bracket.

^ To install, tighten to 12 Nm (9 lb-ft).

6. To install, reverse the removal procedure. 7. Bleed the brake system.

Brake Bleeding: Service and Repair Component Bleeding

Component Bleeding

Master Cylinder Priming

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

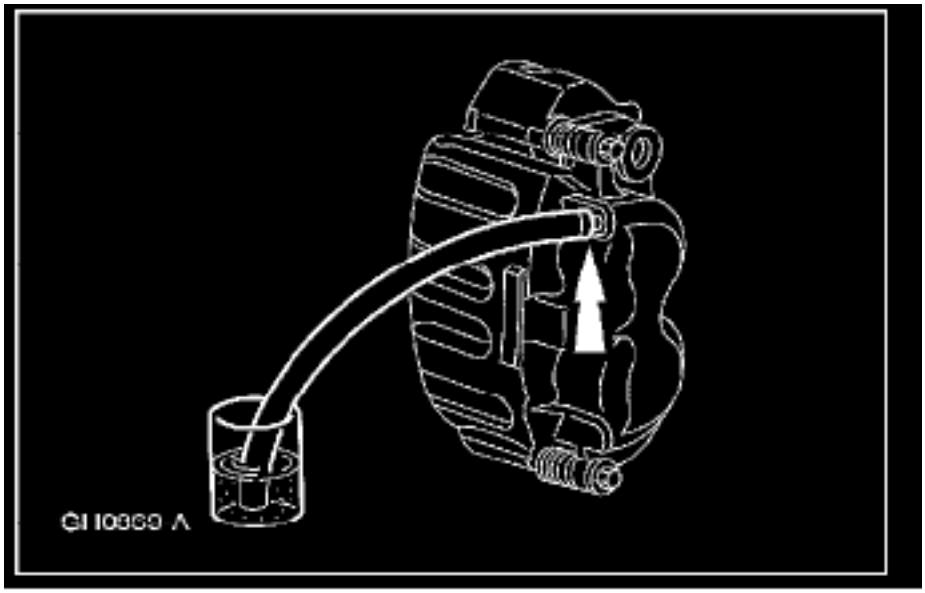
NOTE: When the brake master cylinder has been installed new or the system has been emptied or partially emptied, it must be primed to prevent air from entering the system.

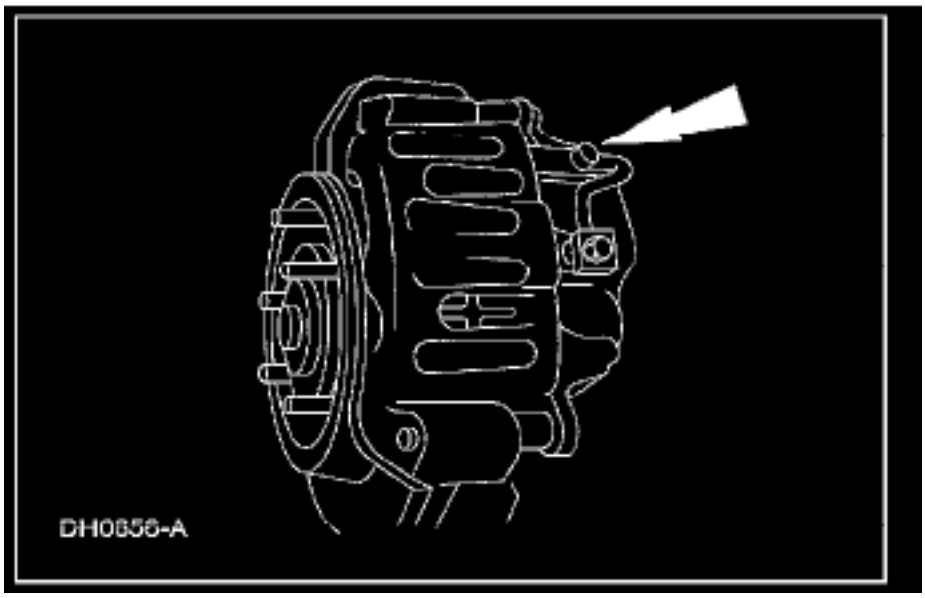
1. Disconnect the brake outlet tubes from the master cylinder.

2. Install short brake tubes with the ends submerged in the brake master cylinder reservoir and fill the brake master cylinder reservoir with clean,

specified brake fluid.

3. Have an assistant pump the brake pedal until clear fluid flows from both brake tubes, without air bubbles.





4. Remove the short brake tubes and install the brake outlet tubes. 5. Bleed each brake tube at the brake master cylinder as follows:

1 Have an assistant pump the brake pedal at least 2 times and then hold firm pressure on the brake pedal.

2 Loosen the rearmost brake tube fitting until a stream of brake fluid comes out. While the assistant maintains pressure on the brake pedal, tighten the brake tube fitting.

3 Repeat this operation until clear, bubble-free fluid comes out.

4 Refill the brake master cylinder reservoir as necessary. Repeat the bleeding operation at the front brake tube.

5 Tighten the master cylinder brake tube fittings to 18 Nm (13 lb-ft).

6. Bleed the brake system.

Brake caliper

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

NOTE: It is not necessary to do a complete brake system bleed if only the brake caliper was disconnected or installed new.

1. Remove the bleeder screw cap and place a box-end wrench on the disc brake caliper bleeder screw. Attach a rubber drain hose to the disc brake

caliper bleeder screw and submerge the free end of the hose in a container partially filled with clean, specified brake fluid.

2. Have an assistant pump the brake pedal at least 2 times and then hold firm pressure on the brake pedal. 3. Loosen the disc brake caliper bleeder screw until a stream of brake fluid comes out. While the assistant maintains pressure on the brake pedal,

tighten the disc brake caliper bleeder screw. ^

Repeat until clear, bubble-free fluid comes out.

^ Refill the brake master cylinder reservoir as necessary.

4. Tighten the brake caliper bleeder screw to 15 Nm (11 lb-ft), remove the rubber hose and install the bleeder screw cap.

5. Apply brakes several times to verify correct brake operation.

Wheel Cylinder

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

NOTE: It is not necessary to do a complete brake system bleed if only the wheel cylinder was disconnected or installed new.

1. Remove the bleeder screw cap and place a box-end wrench on the wheel cylinder bleeder screw. Attach a rubber drain hose to the disc brake

caliper bleeder screw and submerge the free end of the hose in a container partially filled with clean, specified brake fluid.

2. Have an assistant pump the brake pedal at least 2 times and then hold firm pressure on the brake pedal. 3. Loosen the wheel cylinder bleeder screw until a stream of brake fluid comes out. While the assistant maintains pressure on the brake pedal, tighten

the bleeder screw. ^

Repeat until clear, bubble-free fluid comes out.

^ Refill the brake master cylinder reservoir as necessary.

4. Tighten the wheel cylinder bleeder screw to 8 Nm (71 lb-inch), remove the rubber hose and install the bleeder screw cap. 5. Apply brakes several times to verify correct brake operation.

Brake Bleeding: Service and Repair Brake System Bleeding

Brake System Bleeding

ABS Hydraulic Control Unit (HCU) Bleeding

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

NOTE: When any part of the hydraulic system has been disconnected for repair or installation of new components, air can get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system, including the hydraulic control unit (HCU) after it has been correctly connected.

NOTE: If the HCU or any component upstream of the HCU is installed new, carry out the brake system bleed procedure first without the scan tool, followed by the brake system bleed procedure using the scan tool.

NOTE: This procedure is only required when a new HCU is installed.

1. Connect the scan tool and follow the ABS bleed instructions. 2. Follow the manual bleeding or pressure bleeding procedure steps to bleed the system.

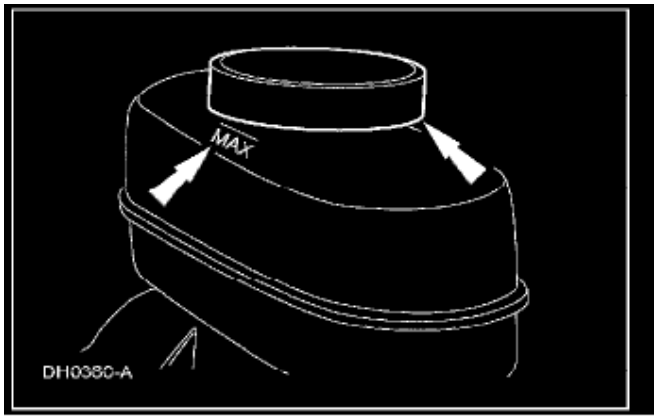
Manual Bleeding Method

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

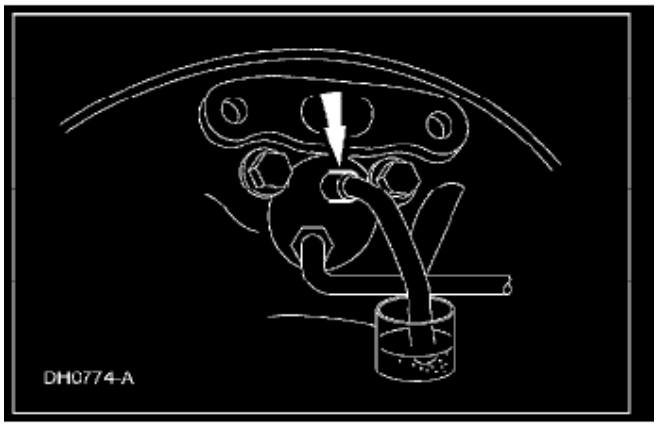
WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

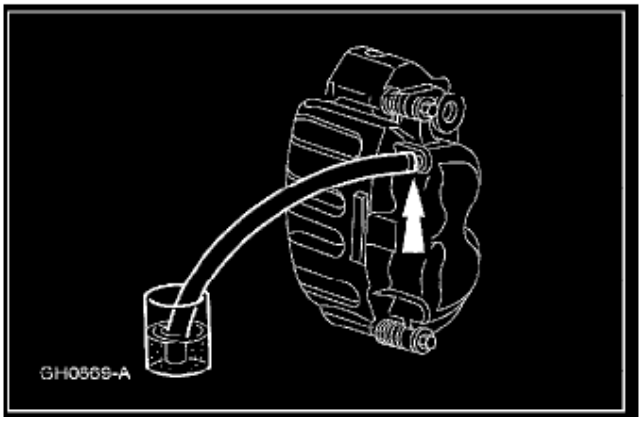
CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.



MAX
DH0380-A



DH0774-A



GH0569-A

NOTE: When any part of the hydraulic system has been disconnected for repair or installation of new components, air can get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system, including the HCU after it has been correctly connected.

1. Clean all the dirt from around the brake fluid reservoir cap and remove the cap. Fill the brake master cylinder reservoir with clean, specified brake

fluid.

2. Remove the RR wheel cylinder bleeder screw cap and place a box-end wrench on the bleeder screw. Attach a rubber drain hose to the RR wheel

cylinder bleeder screw and submerge the free end of the hose in a container partially filled with clean, specified brake fluid.

3. Have an assistant pump and then hold firm pressure on the brake pedal. 4. Loosen the RR wheel cylinder bleeder screw until a stream of brake fluid comes out. While an assistant maintains pressure on the brake pedal,

tighten the RR wheel cylinder bleeder screw. ^

Repeat until clear, bubble-free fluid comes out.

^ Refill the brake master cylinder reservoir as necessary.

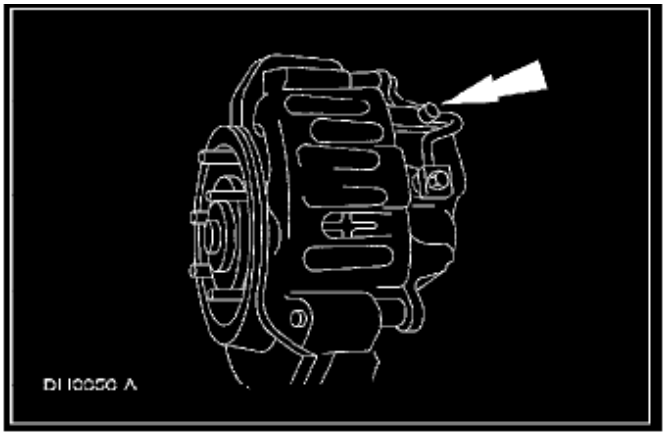
5. Tighten the RR wheel cylinder bleeder screw to 8 Nm (71 lb-inch), remove the rubber hose and install the bleeder screw cap. 6. Repeat Steps 2-5 for the LR wheel cylinder bleeder screw. 7. Remove the RF brake caliper bleeder cap and place a box-end wrench on the bleeder screw. Attach a rubber drain hose to the RF brake caliper

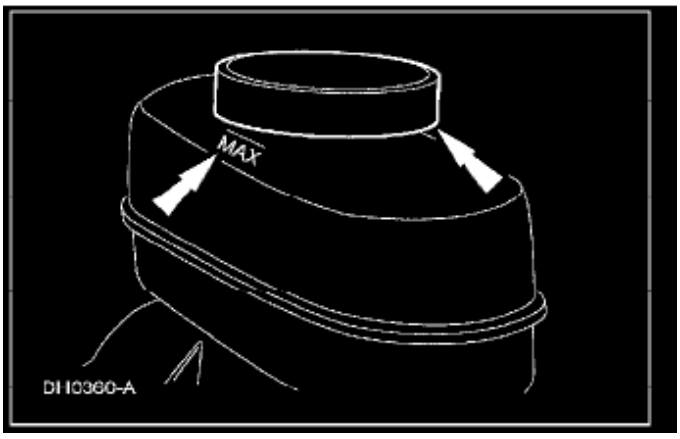
bleeder screw and submerge the free end of the hose in a container partially filled with clean, specified brake fluid.

8. Have an assistant pump and then hold firm pressure on the brake pedal. 9. Loosen the RF brake caliper bleeder screw until a stream of brake fluid comes out. While the assistant maintains pressure on the brake pedal,

tighten the RF brake caliper bleeder screw. ^

Repeat until clear, bubble-free fluid comes out.





MAX
DI10360-A

^ Refill the brake master cylinder reservoir as necessary.

10. Tighten the RF brake caliper bleeder screw to 15 Nm (11 lb-ft), remove the rubber hose and install the bleeder screw cap.

11. Repeat Steps 7 through 10 for the LF brake caliper bleeder screw. 12. Apply brakes several times to verify correct brake operation.

Pressure Bleeding Method

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

NOTE: When any part of the hydraulic system has been disconnected for repair or installation of new components, air can get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system, including the hydraulic control unit (HCU) after it has been correctly connected.

1. Clean all dirt from and remove the brake master cylinder filler cap and fill the brake master cylinder reservoir with clean, specified brake fluid.

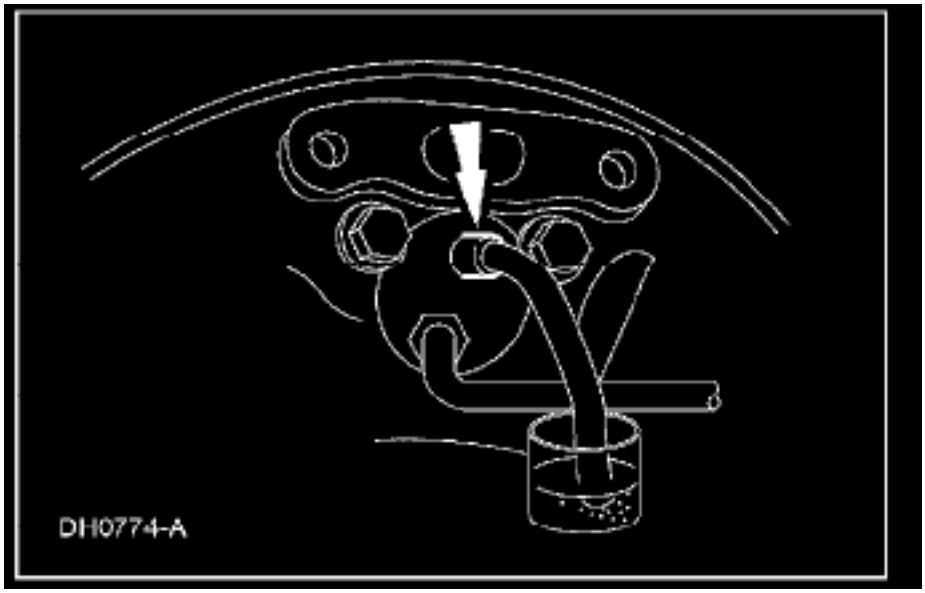
2. NOTE: Master cylinder pressure bleeder adapter tools are available from various manufacturers of pressure bleeding equipment. Follow the

instructions of the manufacturer when installing the adapter.

Install the bleeder adapter to the brake master cylinder reservoir, and attach the bleeder tank hose to the fitting on the adapter.

3. NOTE: Bleed the longest line first. Make sure the bleeder tank contains enough specified brake fluid to complete the bleeding operation.

Remove the RR wheel cylinder bleeder screw cap and place a box-end wrench on the bleeder screw. Attach a rubber drain hose to the RR wheel cylinder bleeder screw and submerge the free end of the hose in a container partially filled with clean, specified brake fluid.



4. Open the valve on the bleeder tank. 5. Loosen the RR wheel cylinder bleeder screw. Leave open until clear, bubble-free brake fluid flows, then tighten the RR wheel cylinder bleeder

screw to 8 Nm (71 lb-inch) and remove the rubber hose.

6. Continue bleeding the rest of the system, going in order from the LR wheel cylinder bleeder screw to the RF disc brake caliper bleeder screw,

ending with the LF disc brake caliper bleeder screw. ^

Tighten the brake caliper bleeder screws to 15 Nm (11 lb-ft).

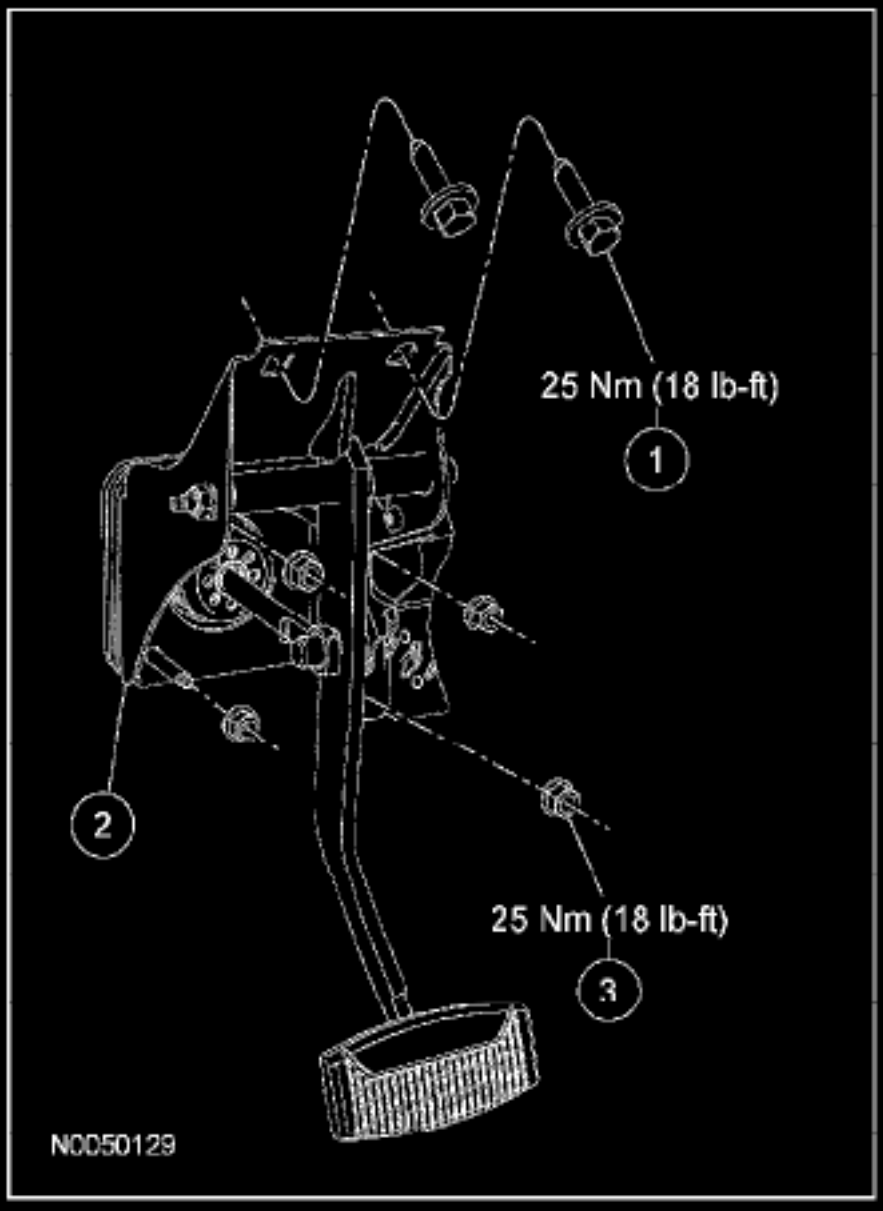
7. Close the bleeder tank valve. Remove the tank hose from the adapter and remove the adapter. Fill the reservoir with clean, specified brake fluid

and install the reservoir cap.

8. Apply brakes several times to verify correct brake operation.

Brake Pedal and Bracket

NOTE: Automatic transmission shown, manual transmission similar.



Item	Part Number	Description
1	N806738	Brake pedal bracket bolt (2 required)
2	2450	Brake pedal and bracket
3	N620481	Brake pedal bracket nut (4 required)

Brake Pedal Assy: Service and Repair

Brake Pedal and Bracket

NOTE: Automatic transmission shown, manual transmission similar.

Brake Pedal And Bracket

Removal and Installation

All vehicles

1. CAUTION: Do not service the brake pedal or brake booster without first removing the stoplamp switch and speed control deactivator

switch. These switches must be removed with the brake pedal in the at-rest position. Switch plungers must be compressed for the switch to rotate in the bracket. Attempting to remove the switch when the plunger is extended (during pedal apply) will result in damage to the switch.

Remove the stoplamp switch.

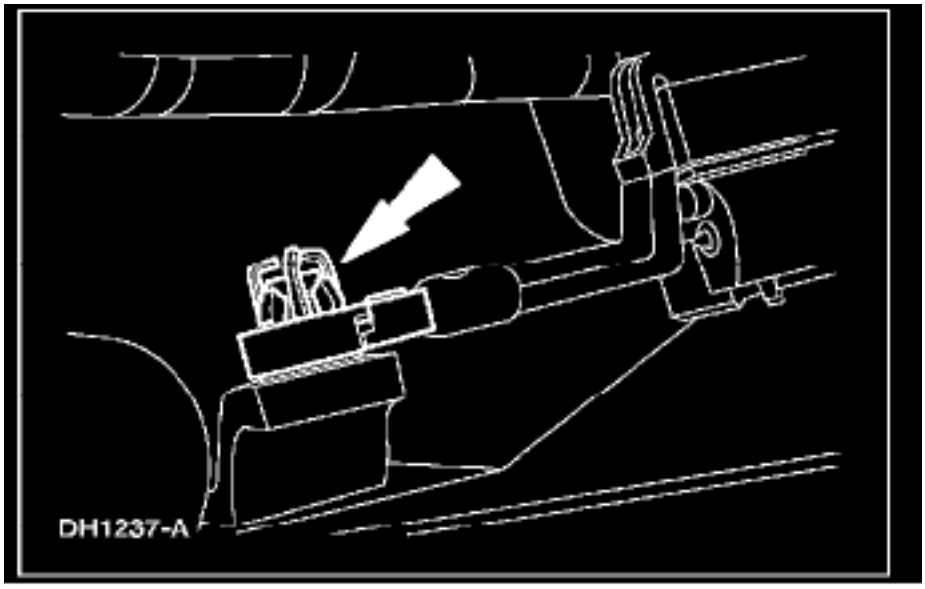
2. If equipped, remove the speed control deactivator switch.

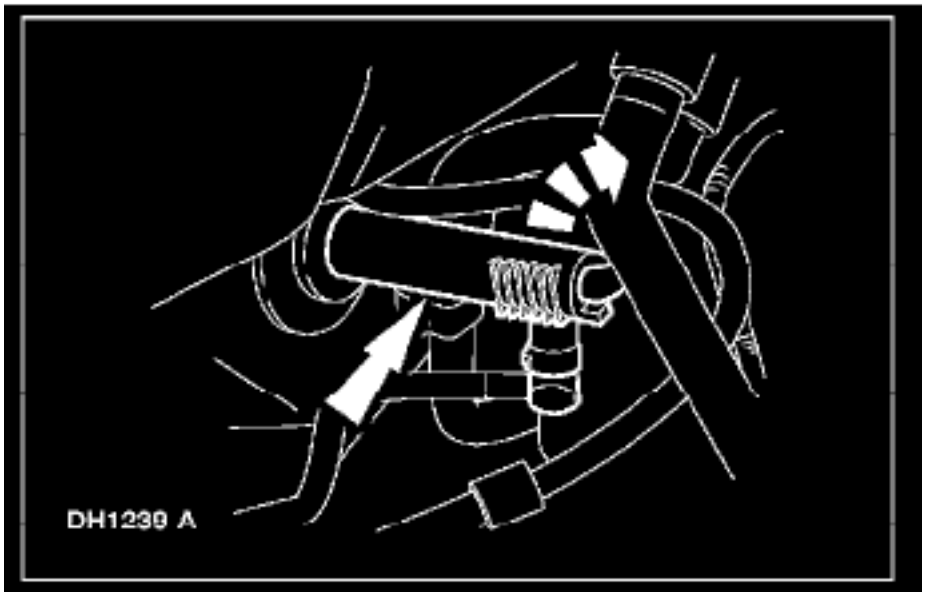
Manual transmission

3. Disconnect the clutch pedal position (CPP) switch.

4. NOTE: The clutch pedal master cylinder push rod retaining clip is not reusable.

Disconnect the clutch pedal master cylinder push rod.





5. Remove the clutch master cylinder from the brake and clutch pedal bracket by rotating it 45 degrees clockwise.

All vehicles

6. Remove the bulkhead sound insulator. 7. Remove the 2 brake pedal bracket bolts.

^ To install, tighten to 25 Nm (18 lb-ft).

8. CAUTION: Support the brake master cylinder and power brake booster in the engine compartment or damage to components may

occur.

Remove the 4 brake pedal bracket nuts and remove the brake pedal and bracket. ^

To install, tighten to 25 Nm (18 lb-ft).

9. CAUTION: Do not press, pull or otherwise move the brake pedal while installing the stoplamp switch or the speed control deactivator

switch. These switches must be installed with the booster push rod attached to the brake pedal and with the brake pedal in the at-rest position. Installing these switches with the brake pedal in any other position will result in incorrect adjustment and may damage the switches.

To install, reverse the removal procedure.

Brake Caliper: Service and Repair Caliper Removal and Installation, Front

Brake Caliper

Removal

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

1. Remove the wheel and tire. 2. Remove the brake caliper flow bolt and position the brake hose aside.

^ Discard the 2 copper washers.

^ Plug the brake hose.

3. CAUTION: Do not pry in the caliper sight hole to retract the pistons as this can damage the pistons and boots.

Remove the 2 brake caliper guide pin bolts and the brake caliper. ^

If leaks or damaged boots are found, install a new disc brake caliper.

Installation

1. CAUTION: Tighten the bottom caliper bolt before tightening the top caliper bolt or damage to guide pins may occur.

CAUTION: Make sure the caliper pin boots are correctly seated to prevent damage to the guide pins.

Position the brake caliper and install the 2 brake caliper guide pin bolts. ^

Tighten to 36 Nm (27 lb-ft).

2. Using 2 new copper washers, position the brake hose and install the brake caliper flow bolt.

^ Tighten to 34 Nm (25 lb-ft).

3. Bleed the brake caliper. 4. Install the wheel and tire. 5. Test the brake system for normal operation. 6. Apply the brakes several times to verify correct brake operation.

Brake Caliper Anchor Plate

NOTE: Rear wheel drive (RWD) shown, four wheel drive (4WD) similar.

Brake Pad: Service and Repair

Brake Pads

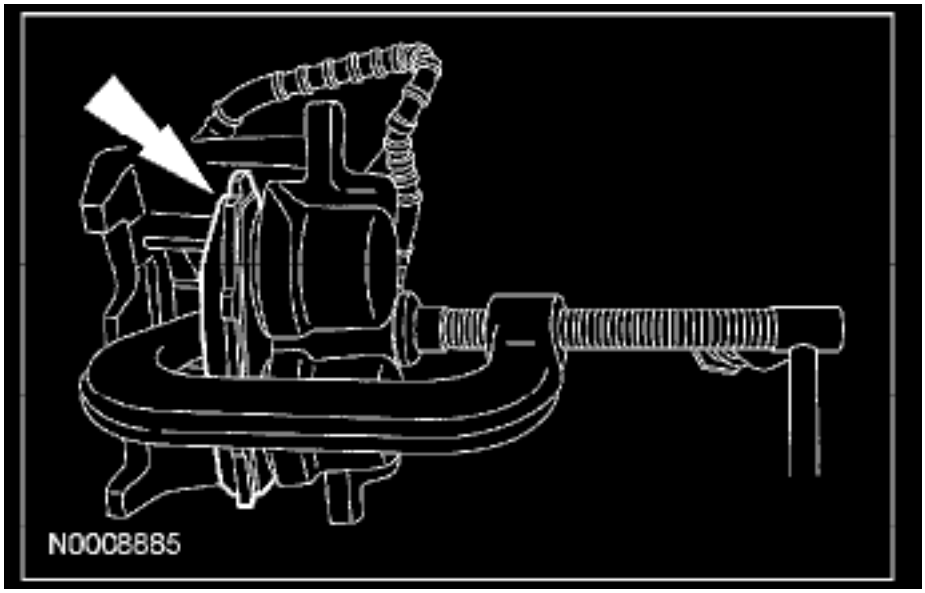
Removal

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

WARNING: Always install new brake shoes or pads at both ends of an axle to reduce the possibility of brakes pulling vehicle to one side. Failure to follow this instruction may result in uneven braking and serious personal injury.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.



1. Check the brake fluid level in the brake master cylinder reservoir.

^ If required, remove the fluid until the brake master cylinder reservoir is half full.

2. Remove the wheel and tire.

3. CAUTION: Do not pry in the caliper sight hole to retract the pistons, as this may damage the pistons and boots.

CAUTION: Do not allow the brake caliper to hang from the brake hose or damage to the hose may occur.

Remove the 2 brake caliper guide pin bolts and position the caliper aside. ^

Support the caliper using mechanic's wire.

4. NOTE: Do not remove the anchor pins unless installing new pins.

Inspect the anchor plate guide pins. They should slide in and out of the anchor plates with no binding. Check the boots for cracks or tears. If the pins do not slide easily or the boots are cracked or torn, install new boots and pins. Lubricate the pins using the specified silicone brake caliper grease.

5. Inspect the brake pads for wear and contamination. 6. Inspect the brake disc. Machine or install a new front brake disc as necessary.

Installation

1. CAUTION: Do not allow grease, oil brake fluid or other contaminants to contact the pad lining material, or damage to components may

occur. Do not install contaminated pads.

NOTE: If installing new brake pads, install all new hardware as supplied with the brake pad kit.

Install the 2 new brake pad clips and the 2 brake pads.

2. CAUTION: Protect the piston and boots when pushing the caliper piston into the caliper piston bores or damage to components may

occur.

If installing new brake pads, using a C-clamp and a worn brake pad, compress the disc brake caliper pistons into the caliper.

3. CAUTION: Tighten the bottom caliper bolt before tightening the top caliper bolt or damage to guide pins may occur.

CAUTION: Make sure the caliper pin boots are correctly seated to prevent damage to the guide pins.

Position the brake caliper and install the 2 caliper guide pin bolts. ^

Tighten to 36 Nm (27 lb-ft).

4. Install the wheel and tire. 5. Fill the brake master cylinder reservoir with clean, specified brake fluid. 6. Apply the brakes several times to verify correct brake operation.

Brake Rotor/Disc: Specifications

Minimum brake disc thickness ..... 24.50 mm (0.964 in) Minimum brake disc thickness to machine ..... 25.10 mm (0.988 in)

Material

Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2 (US); CXG-2-B (Canada)	ESE-M12A4-A
Metal Brake Parts Cleaner PM-4-A or PM-4-B (US); CPM-4 (Canada)	—

Brake Rotor/Disc: Procedures

Brake Disc Machining

NOTE: Do not use a bench lathe to machine the brake discs.

NOTE: Read the entire operating manual and/or view the video shipped with the lathe before installing, operating or repairing the lathe.

NOTE: If the thickness of the brake disc is less than the minimum thickness to machine specification, install a new brake disc. This will make sure that the brake disc will be above minimum thickness after machining.

NOTE: Do not machine new brake discs.

NOTE: Lateral runout and disc thickness variation measurements are not required because correct adjustment of the on-vehicle brake lathe will make sure that these dimensions are within specifications.

1. NOTE: It is not necessary to disconnect the brake tube from the brake caliper.

Position the brake caliper and brake caliper anchor bracket aside.

2. For vehicles with a 2-piece brake disc and hub assembly:

1 Mark the brake disc and the wheel stud for correct indexing during re-assembly.

2 Remove the brake disc from the hub.

3 CAUTION: Do not use an abrasive sanding disc since it will remove paint or other protective finishes from the wheel or metal from the mounting surfaces, adversely affecting corrosion protection and brake disc lateral runout.

Remove corrosion from the wheel mounting surface, both disc mounting surfaces and hub mounting surface.

4 Align the match marks and install the brake disc on the hub.

3. Machine the brake disc using an on-vehicle brake lathe.

1 Install the hub adapter and silencer belt if necessary.

2 Install the cutting lathe.

3 If the lathe is not self adjusting, adjust the lathe oscillation using a dial indicator. Total indicated reading (TIR) target is 0.000 mm (0.000 inch), maximum is 0.08 mm (0.003 inch).

4 Center the cutting head, adjust the cutting bits and install the chip deflector.

5 NOTE: The depth of cut should be between 0.10 and 0.20 mm (0.004 and 0.008 inch). Lighter cuts will cause the bit to heat up and wear faster. Heavier cuts will cause poor brake disc surface finish.

Machine the brake disc.

6 Remove the lathe and, if installed, the silencer belt.

7 Remove the hub adapter.

4. Remove the metal shavings. 5. For vehicles with a 2-piece brake disc and hub assembly:

1 Remove the brake disc from the hub.

2 Remove metal shavings from the hub, the brake disc mounting surfaces and from the ABS sensors.

3 Apply anti-seize lubricant to the hub mounting surface to prevent corrosion.

4 Align the match marks and install the brake disc on the hub.

6. NOTE: It is not required to install new brake pads if friction material properties are within guidelines.

Install the brake caliper and brake caliper anchor bracket.

GRABBING CONDITION FROM REAR DRUM BRAKES

FORD: 2002-2009 Ranger

This article supersedes TSB 8-6-7 to update the vehicle model years.

ISSUE Some 2002-2009 Ranger vehicles may exhibit a grabbing condition from the rear brakes during the first few brake applications. The condition only occurs after the vehicle has been parked for several hours.

ACTION Follow the Service Procedure steps to correct the condition.

SERVICE PROCEDURE

To service, reduce/minimize moisture intrusion into the rear drum brake assemblies by applying Motorcraft® Silicone Gasket and Sealant to the brake backing plate.

1. Place vehicle on hoist and remove the rear wheels.

2. Remove the rear brake drums and replace the rear linings. Refer to Workshop Manual (WSM), Section 206-02.

WARNING

Do not breathe dust or use compressed air to blow dust from storage containers or friction components. Remove dust using government-approved techniques. Friction component dust may

be a cancer and lung disease hazard. Exposure to potentially hazardous components may occur if dusts are created during repair of friction components, such as brake pads and clutch discs. Exposure may also cause irritation to skin, eyes and respiratory tract, and may cause allergic reactions and/or may lead to other chronic health effects. If irritation persists, seek medical attention or advice. Failure to follow these instructions may result in serious personal injury.

3. Inspect the rear brake assemblies for damaged, missing and/or improperly seated adjuster plug or parking brake cable.

4. Inspect and clean the lining contact area of the brake drum; machine if necessary.

5. Install the rear brake drums and adjust the lining to drum clearance per WSM, Section 206-02.

6. Thoroughly clean the backside of the rear drum brake backing plate to promote proper adhesion of sealant.

7. Apply Motorcraft(R) Silicone Gasket and Sealant to the backside of the rear drum brake backing plate at the following interface areas (Figure 1):

^ Axle Flange

^ Wheel Cylinder

PART NUMBER	PART NAME
3L5Z-2200-CA	Brake Shoes 9" (2003-2009)

2U2Z-2V200-MARM	Brake Shoes 9" (2002)
F77Z-2200-BA	Brake Shoes 10" (2002)
TA-30	Motorcraft® Silicone Gasket And Sealant

NOTE: The information in Technical Service Bulletins is intended for use by trained, professional technicians with the knowledge, tools, and equipment to do the job properly and safely. It informs these technicians of conditions that may occur on some vehicles, or provides information that could assist in proper vehicle service. The procedures should not be performed by "do-it-yourselfers". Do not assume that a condition described affects your car or truck. Contact a Ford, Lincoln, or Mercury dealership to determine whether the Bulletin applies to your vehicle.

^ Parking Brake Cable

^ Hold Down Pins

NOTE

AVOID GETTING SEALANT ON THE BRAKE BLEED SCREW AND BRAKE TUBE NUT.

8. Install the rear wheels and torque lug nuts per WSM, Section 204-04.

WARRANTY STATUS: Eligible Under Provisions Of New Vehicle Limited Warranty Coverage
IMPORTANT: Warranty coverage limits/policies are not altered by a TSB. Warranty coverage limits are determined by the identified causal part.

3. Inspect the rear brake assemblies for damaged, missing and/or improperly seated adjuster plug or parking brake cable.

4. Inspect and clean the lining contact area of the brake drum; machine if necessary.

5. Install the rear brake drums and adjust the lining to drum clearance per WSM, Section 206-02.

6. Thoroughly clean the backside of the rear drum brake backing plate to promote proper adhesion of sealant.

7. Apply Motorcraft(R) Silicone Gasket and Sealant to the backside of the rear drum brake backing plate at the following interface areas (Figure 1):

^ Axle Flange

^ Wheel Cylinder

Brake Drum: Service and Repair

Brake Drum

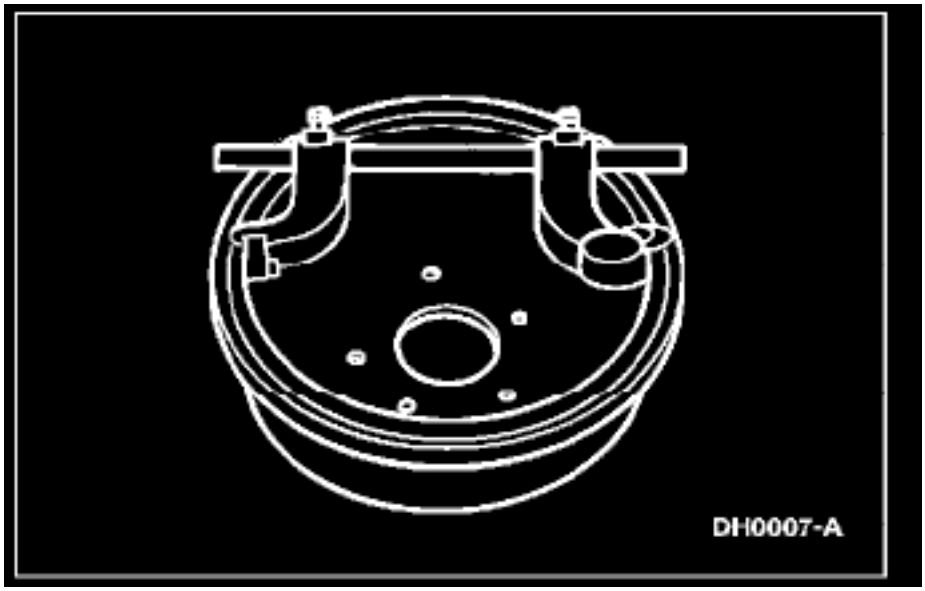
Removal and Installation

WARNING: Make sure the occupant classification sensor (OCS) shield(s) is present, not damaged and correctly installed. The OCS system shield(s) helps prevent damage to the OCS weight sensor bolt electrical connectors. Failure to follow these instructions may result in incorrect operation of the OCS system, which increases the risk of serious personal injury or death in a crash.

WARNING: Always install new brake shoes or pads at both ends of an axle to reduce the possibility of brakes pulling vehicle to one side. Failure to follow this instruction may result in uneven braking and serious personal injury.

NOTE: Make sure that the parking brake control is fully released.

1. Remove the wheel and tire.



2. CAUTION: Use of a brake drum puller or a torch is not recommended. Brake drum distortion may result.

NOTE: If the brake drum is rusted to the axle shaft pilot diameter, tap the center of the brake drum between the wheel studs.

Remove the brake drum.

3. Using the Brake Drum Micrometer, measure the brake drum inside diameter.

^ Install a new brake drum if the maximum inside diameter exceeds the specification molded on the brake drum.

4. To install, reverse the removal procedure.

^ Adjust the rear brakes.

GRABBING CONDITION FROM REAR DRUM BRAKES

FORD: 2002-2009 Ranger

This article supersedes TSB 8-6-7 to update the vehicle model years.

ISSUE Some 2002-2009 Ranger vehicles may exhibit a grabbing condition from the rear brakes during the first few brake applications. The condition only occurs after the vehicle has been parked for several hours.

ACTION Follow the Service Procedure steps to correct the condition.

SERVICE PROCEDURE

To service, reduce/minimize moisture intrusion into the rear drum brake assemblies by applying Motorcraft® Silicone Gasket and Sealant to the brake backing plate.

1. Place vehicle on hoist and remove the rear wheels.

2. Remove the rear brake drums and replace the rear linings. Refer to Workshop Manual (WSM), Section 206-02.

WARNING

Do not breathe dust or use compressed air to blow dust from storage containers or friction components. Remove dust using government-approved techniques. Friction component dust may

be a cancer and lung disease hazard. Exposure to potentially hazardous components may occur if dusts are created during repair of friction components, such as brake pads and clutch discs. Exposure may also cause irritation to skin, eyes and respiratory tract, and may cause allergic reactions and/or may lead to other chronic health effects. If irritation persists, seek medical attention or advice. Failure to follow these instructions may result in serious personal injury.

3. Inspect the rear brake assemblies for damaged, missing and/or improperly seated adjuster plug or parking brake cable.

4. Inspect and clean the lining contact area of the brake drum; machine if necessary.

5. Install the rear brake drums and adjust the lining to drum clearance per WSM, Section 206-02.

6. Thoroughly clean the backside of the rear drum brake backing plate to promote proper adhesion of sealant.

7. Apply Motorcraft(R) Silicone Gasket and Sealant to the backside of the rear drum brake backing plate at the following interface areas (Figure 1):

^ Axle Flange

Brake Shoe Adjustment

Brake Drums Removed

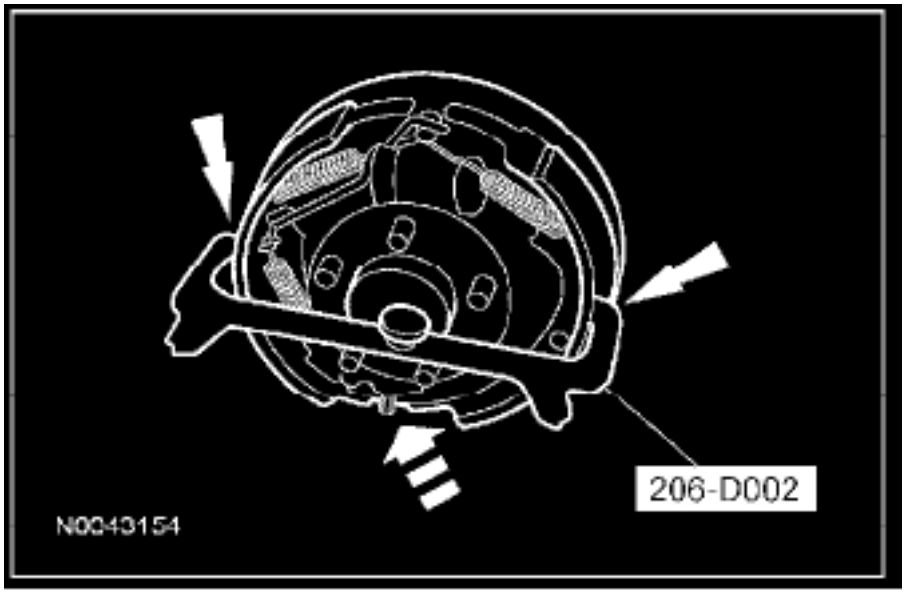
WARNING: Make sure the occupant classification sensor (OCS) shield(s) is present, not damaged and correctly installed. The OCS system shield(s) helps prevent damage to the OCS weight sensor bolt electrical connectors. Failure to follow these instructions may result in incorrect operation of the OCS system, which increases the risk of serious personal injury or death in a crash.

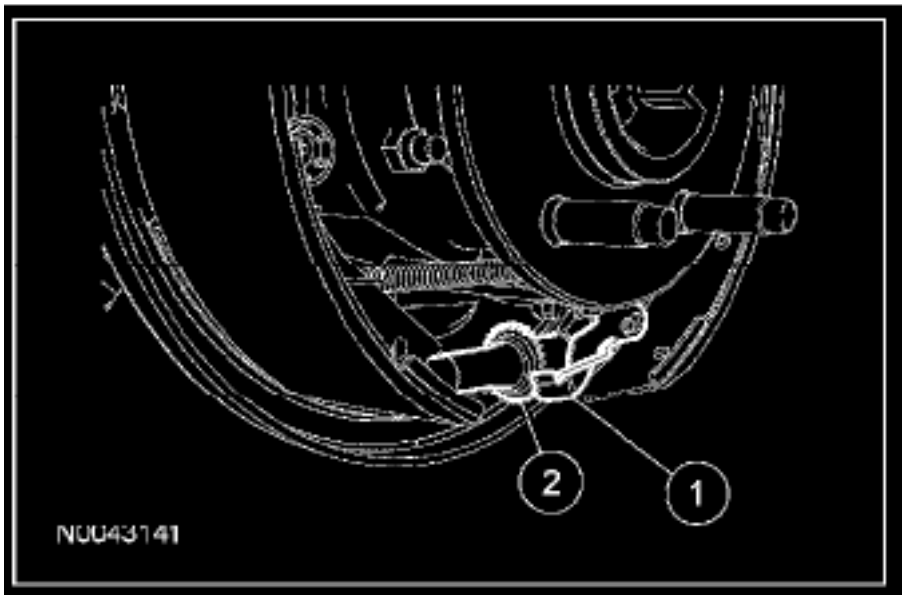
NOTE: After adjusting the rear brake shoes and linings, check the parking brake for correct operation. Make sure the parking brake cable equalizer operates freely.

1. Using the special tool or equivalent, measure the brake drum inside diameter.

2. Adjust the rear brake shoes and linings.

^ Rotate the brake adjusting screw until the brake shoes and linings touch the tool.





Brake Drums Installed

1. With the vehicle in NEUTRAL, position it on a hoist. 2. At the back of the brake backing plate, remove the brake adjusting hole cover. 3. Rotate the brake shoe adjusting screw.

1 Move the brake shoe adjusting lever off the brake shoe adjusting screw.

2 Using the special tool or equivalent, turn the adjusting screw until the brake drum begins to drag. Then loosen the brake adjusting screw until the brake drum rotates freely.

4. Install a new brake backing plate adjusting hole cover.

Removal

WARNING: DANGER, do not breathe dust or use compressed air to blow dust from storage containers or friction components. Use a low pressure/wet cleaning method, such as a solvent based brake and clutch cleaner to remove all adherent dust. Friction component dust may be a cancer and lung disease hazard. Exposure to potentially hazardous components may occur if dusts are created during repair of friction components, such as brake pads and clutch discs. Exposure may also cause irritation to skin, eyes and respiratory tract, and may cause allergic reactions and/or may lead to other chronic health effects. If irritation persists, seek medical attention or advice. Failure to follow these instructions may result in serious personal injury.

WARNING: Always install new brake shoes or pads at both ends of an axle to reduce the possibility of brakes pulling vehicle to one side. Failure to follow this instruction may result in uneven braking and serious personal injury.

NOTE: Make sure that the parking brake control is fully released.

1. Remove the brake drum. 2. Inspect the rear brake assembly.

^ Inspect the wheel cylinder for excessive leakage that can contaminate brake system parts and install a new wheel cylinder as necessary.

^ Inspect the brake shoes and linings for contamination and install new shoes and linings as necessary.

^ Inspect the brake shoes and linings for minimum thickness, above the backing plate or rivets and install new as necessary.

^ Inspect the springs for heat discoloration and install new as necessary.

^ Inspect the adjusting lever contact with the brake adjuster screw.

3. NOTE: To aid installation, note the locations of the short and long brake shoe retracting springs.

Remove the brake shoe retracting springs.

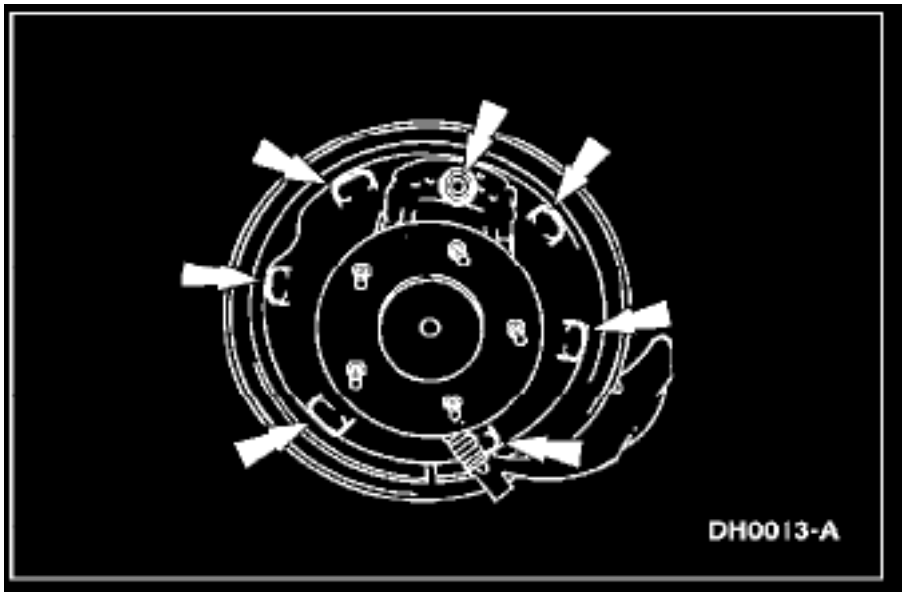
4. Remove the adjusting screw assembly in the following sequence.

1 Disconnect the brake shoe adjusting lever cable from the brake shoe adjusting lever.

2 Remove the brake shoe adjusting lever cable.

3 Remove the cable guide.

4 Remove the adjusting lever return spring and the brake shoe adjusting lever.



5 Remove the brake shoe adjusting screw spring.

6 Remove the brake adjuster screw assembly.

5. Remove the brake shoe anchor pin guide plate and the parking brake strut. 6. Remove the hold-down springs and the rear brake shoes and linings.

^ Remove the brake shoe hold-down spring pins.

7. Pull back the parking brake cable spring and disconnect the parking brake lever.

Installation

1. Compress the parking brake cable spring and attach the parking brake lever. 2. Clean and lubricate the brake backing plate using silicone brake caliper grease or an equivalent silicone.

3. Install the rear brake shoes and linings in the following sequence.

1 Position the rear brake shoes and linings.

2 Position the parking brake lever.

3 Install the brake shoe hold-down spring pins and the brake shoe hold-down springs.

4. Install the parking brake strut in the following sequence.

1 Install the parking brake link spring on the parking brake strut.

2 Install the parking brake strut.

3 Install the brake shoe anchor pin guide plate.

5. Install the short brake shoe retracting spring in the following sequence.

1 Place the brake shoe adjusting lever cable over the anchor pin, with crimped side in.

2 Install the short brake shoe retracting spring.

6. NOTE: Make sure the brake shoe adjusting lever cable is positioned in the cable guide groove.

Install the long brake shoe retracting spring in the following sequence. 1

Install the cable guide.

2 Position the brake shoe adjusting lever cable in the cable guide groove.

3 Install the long brake shoe retracting spring.

7. NOTE: To prevent incorrect installation, the socket end of each brake adjuster screw is stamped R or L.

Assemble the brake adjuster screw assembly in the following sequence. 1

Apply silicone brake caliper grease to the threads on the brake adjuster screw.

2 Install the brake adjuster screw into the brake shoe adjusting screw nut to the end of the threads, and then loosen one-half turn.

3 Install the brake shoe adjusting screw socket on the brake shoe adjusting screw nut.

8. Install the brake adjuster screw assembly in the following sequence.

1 Position the brake adjuster screw assembly.

2 Install the brake shoe adjusting screw spring.

3 Position the brake shoe adjusting lever cable.

4 Position the adjusting lever return spring and the brake shoe adjusting lever.

5 Hook the brake shoe adjusting lever cable to the brake shoe adjusting lever.

9. Test the operation of the automatic self-adjuster.

^ Pull the brake shoe adjusting lever cable and check that the brake shoe adjusting lever rotates the brake shoe adjuster assembly.

^ Release the brake shoe adjusting lever cable and check that the brake shoe adjusting lever advances to the next notch on the brake shoe adjusting screw nut.

10. Adjust the brakes. 11. Install the brake drum.

Wheel Cylinder

Removal and Installation

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal

injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

1. Remove the brake shoes and linings. 2. Disconnect the brake tube-to-wheel cylinder fitting.

^ To install, tighten to 18 Nm (13 lb-ft).

3. Remove the 2 wheel cylinder bolts and the wheel cylinder.

^ To install, tighten to 15 Nm (11 lb-ft).

4. To install, reverse the removal procedure.

^ Bleed the brake system.

High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A

Brake Bleeding: Service and Repair Component Bleeding

Component Bleeding

Master Cylinder Priming

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

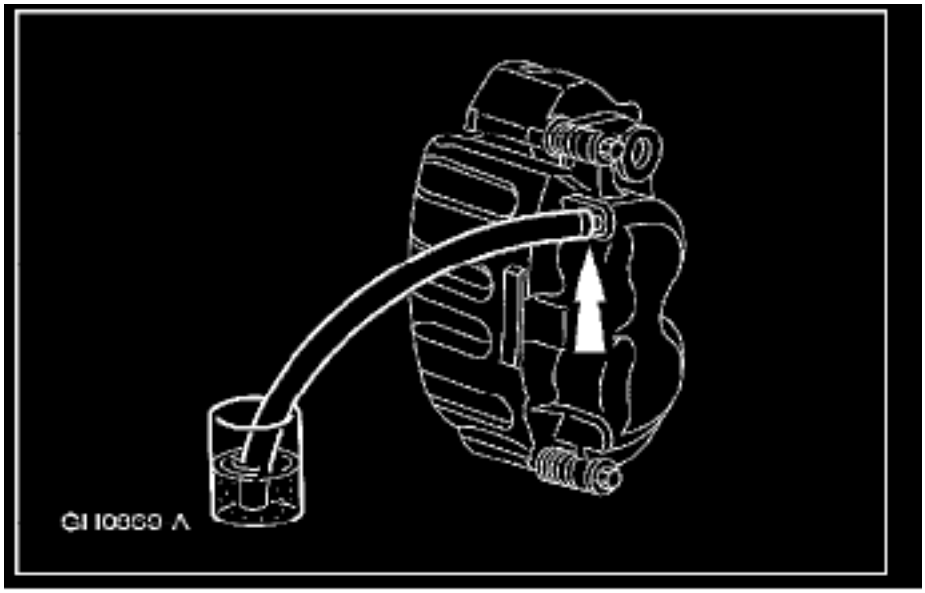
NOTE: When the brake master cylinder has been installed new or the system has been emptied or partially emptied, it must be primed to prevent air from entering the system.

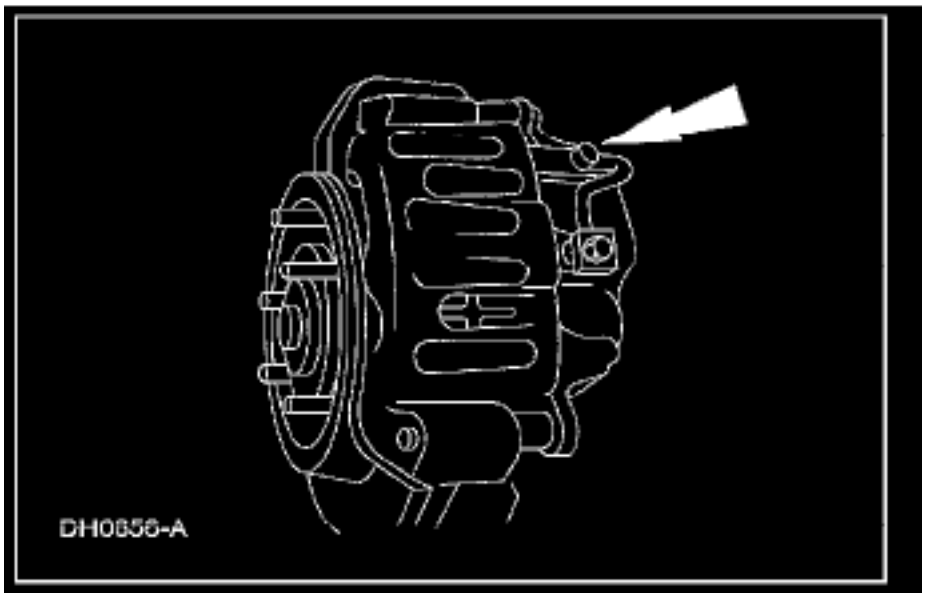
1. Disconnect the brake outlet tubes from the master cylinder.

2. Install short brake tubes with the ends submerged in the brake master cylinder reservoir and fill the brake master cylinder reservoir with clean,

specified brake fluid.

3. Have an assistant pump the brake pedal until clear fluid flows from both brake tubes, without air bubbles.





4. Remove the short brake tubes and install the brake outlet tubes. 5. Bleed each brake tube at the brake master cylinder as follows:

1 Have an assistant pump the brake pedal at least 2 times and then hold firm pressure on the brake pedal.

2 Loosen the rearmost brake tube fitting until a stream of brake fluid comes out. While the assistant maintains pressure on the brake pedal, tighten the brake tube fitting.

3 Repeat this operation until clear, bubble-free fluid comes out.

4 Refill the brake master cylinder reservoir as necessary. Repeat the bleeding operation at the front brake tube.

5 Tighten the master cylinder brake tube fittings to 18 Nm (13 lb-ft).

6. Bleed the brake system.

Brake caliper

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

NOTE: It is not necessary to do a complete brake system bleed if only the brake caliper was disconnected or installed new.

1. Remove the bleeder screw cap and place a box-end wrench on the disc brake caliper bleeder screw. Attach a rubber drain hose to the disc brake

caliper bleeder screw and submerge the free end of the hose in a container partially filled with clean, specified brake fluid.

2. Have an assistant pump the brake pedal at least 2 times and then hold firm pressure on the brake pedal. 3. Loosen the disc brake caliper bleeder screw until a stream of brake fluid comes out. While the assistant maintains pressure on the brake pedal,

tighten the disc brake caliper bleeder screw. ^

Repeat until clear, bubble-free fluid comes out.

^ Refill the brake master cylinder reservoir as necessary.

4. Tighten the brake caliper bleeder screw to 15 Nm (11 lb-ft), remove the rubber hose and install the bleeder screw cap.

5. Apply brakes several times to verify correct brake operation.

Wheel Cylinder

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

NOTE: It is not necessary to do a complete brake system bleed if only the wheel cylinder was disconnected or installed new.

1. Remove the bleeder screw cap and place a box-end wrench on the wheel cylinder bleeder screw. Attach a rubber drain hose to the disc brake

caliper bleeder screw and submerge the free end of the hose in a container partially filled with clean, specified brake fluid.

2. Have an assistant pump the brake pedal at least 2 times and then hold firm pressure on the brake pedal. 3. Loosen the wheel cylinder bleeder screw until a stream of brake fluid comes out. While the assistant maintains pressure on the brake pedal, tighten

the bleeder screw. ^

Repeat until clear, bubble-free fluid comes out.

^ Refill the brake master cylinder reservoir as necessary.

4. Tighten the wheel cylinder bleeder screw to 8 Nm (71 lb-inch), remove the rubber hose and install the bleeder screw cap. 5. Apply brakes several times to verify correct brake operation.

Special Tool(s)

High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A

Brake Bleeding: Service and Repair Brake System Bleeding

Brake System Bleeding

ABS Hydraulic Control Unit (HCU) Bleeding

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

NOTE: When any part of the hydraulic system has been disconnected for repair or installation of new components, air can get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system, including the hydraulic control unit (HCU) after it has been correctly connected.

NOTE: If the HCU or any component upstream of the HCU is installed new, carry out the brake system bleed procedure first without the scan tool, followed by the brake system bleed procedure using the scan tool.

NOTE: This procedure is only required when a new HCU is installed.

1. Connect the scan tool and follow the ABS bleed instructions. 2. Follow the manual bleeding or pressure bleeding procedure steps to bleed the system.

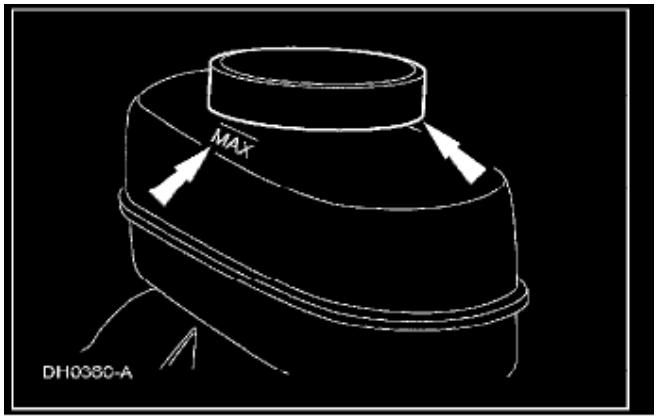
Manual Bleeding Method

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

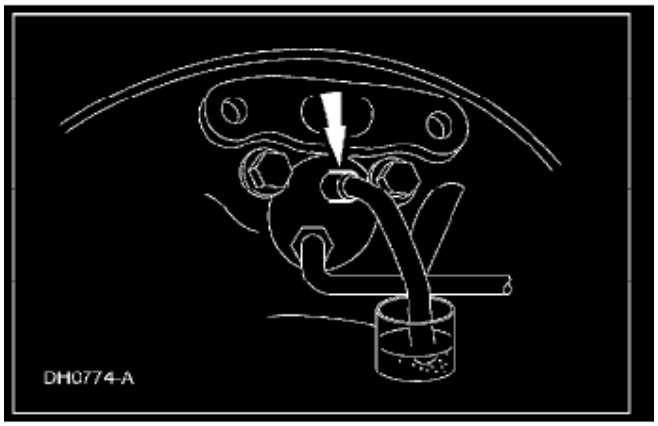
WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

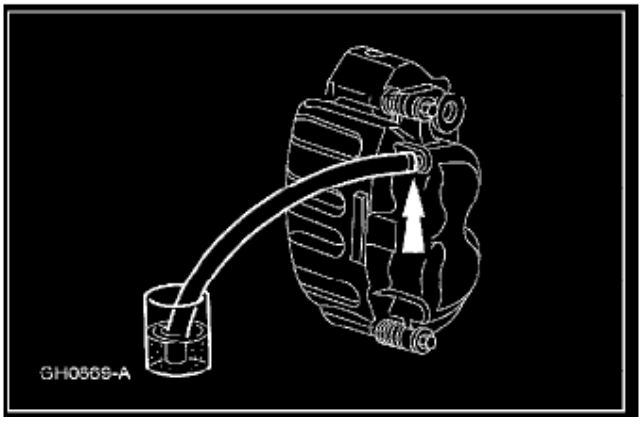
CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.



MAX
DH0380-A



DH0774-A



GH0565-A

NOTE: When any part of the hydraulic system has been disconnected for repair or installation of new components, air can get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system, including the HCU after it has been correctly connected.

1. Clean all the dirt from around the brake fluid reservoir cap and remove the cap. Fill the brake master cylinder reservoir with clean, specified brake

fluid.

2. Remove the RR wheel cylinder bleeder screw cap and place a box-end wrench on the bleeder screw. Attach a rubber drain hose to the RR wheel

cylinder bleeder screw and submerge the free end of the hose in a container partially filled with clean, specified brake fluid.

3. Have an assistant pump and then hold firm pressure on the brake pedal. 4. Loosen the RR wheel cylinder bleeder screw until a stream of brake fluid comes out. While an assistant maintains pressure on the brake pedal,

tighten the RR wheel cylinder bleeder screw. ^

Repeat until clear, bubble-free fluid comes out.

^ Refill the brake master cylinder reservoir as necessary.

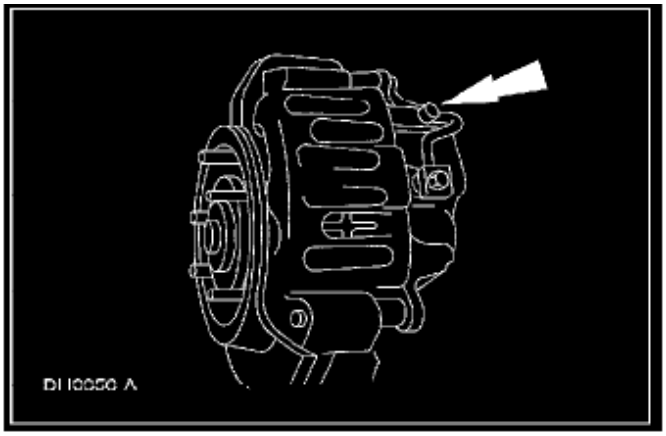
5. Tighten the RR wheel cylinder bleeder screw to 8 Nm (71 lb-inch), remove the rubber hose and install the bleeder screw cap. 6. Repeat Steps 2-5 for the LR wheel cylinder bleeder screw. 7. Remove the RF brake caliper bleeder cap and place a box-end wrench on the bleeder screw. Attach a rubber drain hose to the RF brake caliper

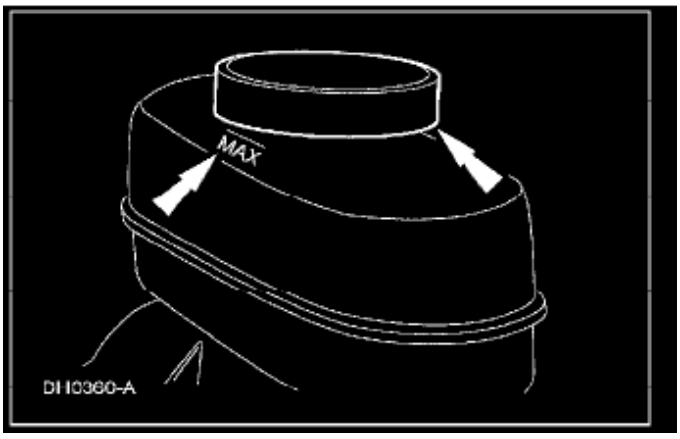
bleeder screw and submerge the free end of the hose in a container partially filled with clean, specified brake fluid.

8. Have an assistant pump and then hold firm pressure on the brake pedal. 9. Loosen the RF brake caliper bleeder screw until a stream of brake fluid comes out. While the assistant maintains pressure on the brake pedal,

tighten the RF brake caliper bleeder screw. ^

Repeat until clear, bubble-free fluid comes out.





MAX
DI10360-A

^ Refill the brake master cylinder reservoir as necessary.

10. Tighten the RF brake caliper bleeder screw to 15 Nm (11 lb-ft), remove the rubber hose and install the bleeder screw cap.

11. Repeat Steps 7 through 10 for the LF brake caliper bleeder screw. 12. Apply brakes several times to verify correct brake operation.

Pressure Bleeding Method

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

NOTE: When any part of the hydraulic system has been disconnected for repair or installation of new components, air can get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system, including the hydraulic control unit (HCU) after it has been correctly connected.

1. Clean all dirt from and remove the brake master cylinder filler cap and fill the brake master cylinder reservoir with clean, specified brake fluid.

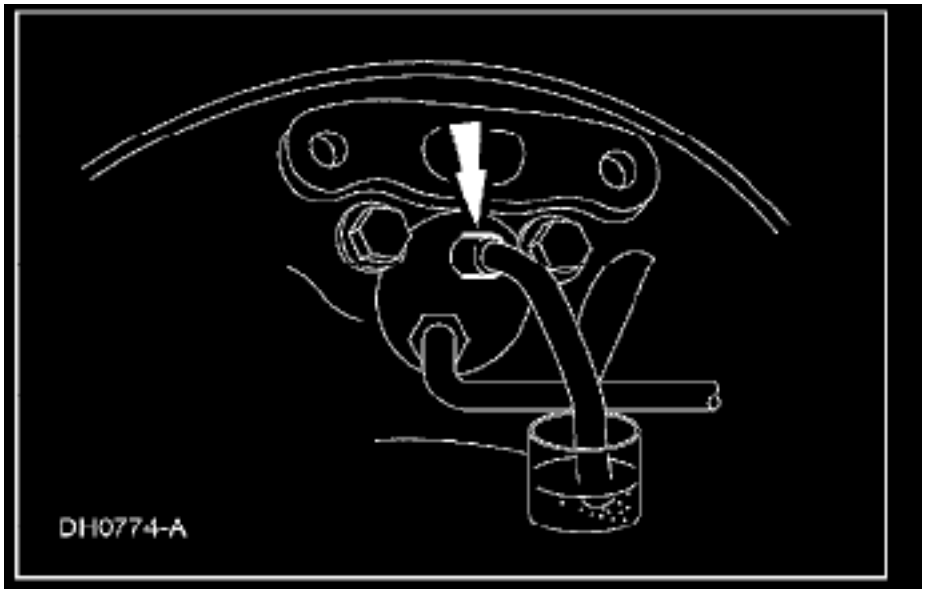
2. NOTE: Master cylinder pressure bleeder adapter tools are available from various manufacturers of pressure bleeding equipment. Follow the

instructions of the manufacturer when installing the adapter.

Install the bleeder adapter to the brake master cylinder reservoir, and attach the bleeder tank hose to the fitting on the adapter.

3. NOTE: Bleed the longest line first. Make sure the bleeder tank contains enough specified brake fluid to complete the bleeding operation.

Remove the RR wheel cylinder bleeder screw cap and place a box-end wrench on the bleeder screw. Attach a rubber drain hose to the RR wheel cylinder bleeder screw and submerge the free end of the hose in a container partially filled with clean, specified brake fluid.



4. Open the valve on the bleeder tank. 5. Loosen the RR wheel cylinder bleeder screw. Leave open until clear, bubble-free brake fluid flows, then tighten the RR wheel cylinder bleeder

screw to 8 Nm (71 lb-inch) and remove the rubber hose.

6. Continue bleeding the rest of the system, going in order from the LR wheel cylinder bleeder screw to the RF disc brake caliper bleeder screw,

ending with the LF disc brake caliper bleeder screw. ^

Tighten the brake caliper bleeder screws to 15 Nm (11 lb-ft).

7. Close the bleeder tank valve. Remove the tank hose from the adapter and remove the adapter. Fill the reservoir with clean, specified brake fluid

and install the reservoir cap.

8. Apply brakes several times to verify correct brake operation.

Brake Caliper

Removal

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

1. Remove the wheel and tire. 2. Remove the brake caliper flow bolt and position the brake hose aside.

^ Discard the 2 copper washers.

^ Plug the brake hose.

3. CAUTION: Do not pry in the caliper sight hole to retract the pistons as this can damage the pistons and boots.

Remove the 2 brake caliper guide pin bolts and the brake caliper. ^

If leaks or damaged boots are found, install a new disc brake caliper.

Installation

1. CAUTION: Tighten the bottom caliper bolt before tightening the top caliper bolt or damage to guide pins may occur.

CAUTION: Make sure the caliper pin boots are correctly seated to prevent damage to the guide pins.

Position the brake caliper and install the 2 brake caliper guide pin bolts. ^

Tighten to 36 Nm (27 lb-ft).

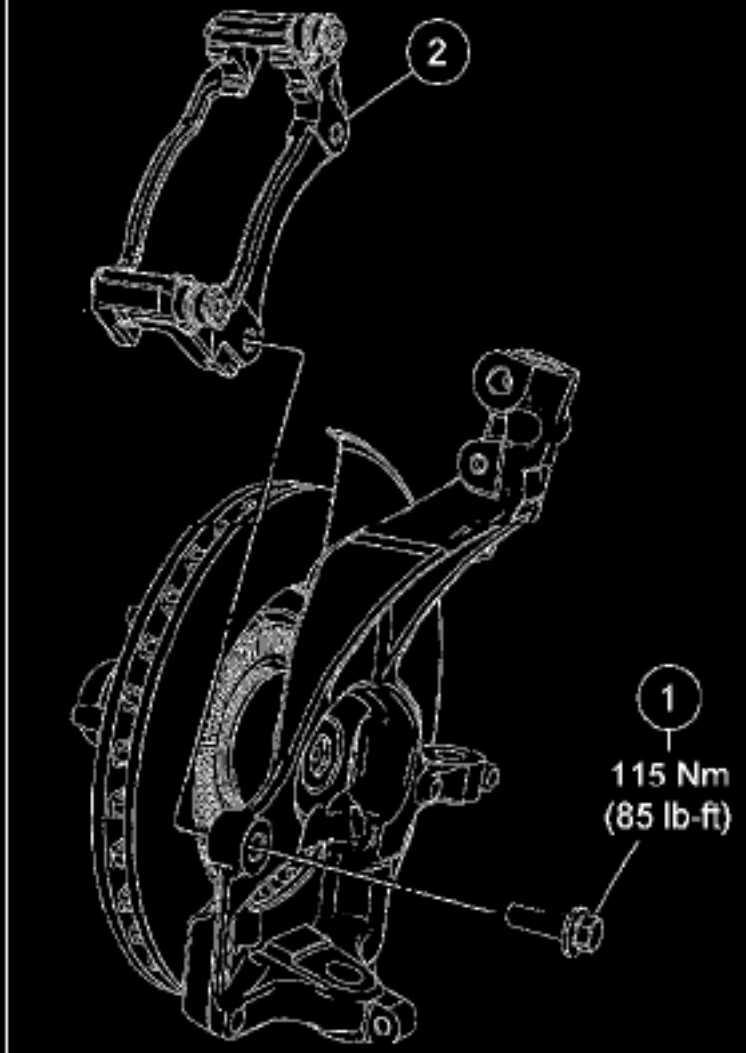
2. Using 2 new copper washers, position the brake hose and install the brake caliper flow bolt.

^ Tighten to 34 Nm (25 lb-ft).

3. Bleed the brake caliper. 4. Install the wheel and tire. 5. Test the brake system for normal operation. 6. Apply the brakes several times to verify correct brake operation.

Brake Caliper Anchor Plate

NOTE: Rear wheel drive (RWD) shown, four wheel drive (4WD) similar.



Item	Part Number	Description
1	W710701	Brake caliper anchor plate bolt (2 required)
2	2C396	Brake caliper anchor plate

Brake Caliper: Service and Repair Brake Caliper Anchor Plate, Front

Brake Caliper Anchor Plate

NOTE: Rear wheel drive (RWD) shown, four wheel drive (4WD) similar.

Removal and Installation

1. Remove the wheel and tire. 2. Remove the 2 brake caliper guide pin bolts and position the caliper aside.

^ To install, tighten to 36 Nm (27 lb-ft).

^ Support the caliper using mechanic's wire.

3. Remove the brake pads and the brake pad clips. 4. Remove the 2 brake caliper anchor plate bolts and the brake caliper anchor plate.

^ To install, tighten to 115 Nm (85 lb-ft).

5. To install, reverse the removal procedure.

Hydraulic Control Assembly - Antilock Brakes: Service and Repair

Hydraulic Control Unit (HCU)

Removal and Installation

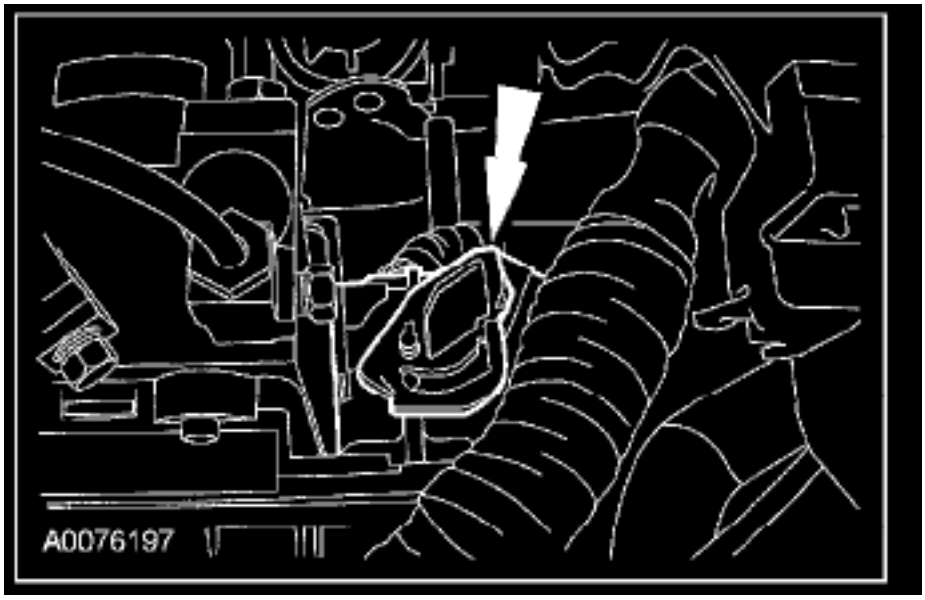
WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal

injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

1. Disconnect the battery ground cable. 2. Disconnect the ABS module electrical connector by rotating the release lever.



3. NOTE: After disconnecting the hydraulic control unit (HCU) brake tube fittings, cap the holes in the HCU to prevent contamination or foreign

material from entering the brake tube ports.

Disconnect the 5 HCU brake tube fittings from the HCU. ^

To install, tighten to 17 Nm (13 lb-ft).

4. Remove the 2 HCU-to-bracket nuts and the HCU assembly.

^ To install, tighten to 5 Nm (44 lb-inch).

5. If necessary, remove the 2 HCU bracket-to-frame nuts, the 2 HCU bracket-to-frame bolts and the HCU bracket.

^ To install, tighten to 12 Nm (9 lb-ft).

6. To install, reverse the removal procedure. 7. Bleed the brake system.

Brake Master Cylinder: Testing and Inspection Brake Master Cylinder - Bypass Condition

Brake Master Cylinder - Bypass Condition

1. Disconnect the brake tubes from the master cylinder. 2. Plug the outlet ports of the master cylinder. 3. Apply the brakes. If brake pedal height cannot be maintained, the brake master cylinder has an internal leak and a new brake master cylinder must

be installed.

Brake Master Cylinder: Testing and Inspection Brake Master Cylinder - Compensator Port

Brake Master Cylinder - Compensator Port

The purpose of the compensator ports in the brake master cylinder is to: ^

supply additional brake fluid from the brake master cylinder reservoir needed by the brake system due to brake lining wear.

^ allow brake fluid to return to the brake master cylinder reservoir when the brakes are released. The returning brake fluid creates a slight turbulence in the brake master cylinder reservoir. This is a normal condition and indicates that the compensator ports are not clogged.

Clogged compensator ports may cause the brakes to hang up or not fully release. If clogged compensator ports are suspected, proceed as follows: 1. With the vehicle in NEUTRAL, position it on a hoist. Refer to Maintenance/Service and Repair. 2. With the brakes released, attempt to rotate each wheel and check for any brake drag.

^ If an excessive amount of brake drag exists at all 4 wheels, continue with the test.

^ If an excessive amount of brake drag exists at only one wheel, it indicates a possible seized brake caliper, brake wheel cylinder or parking brake component. Repair or install new components as necessary.

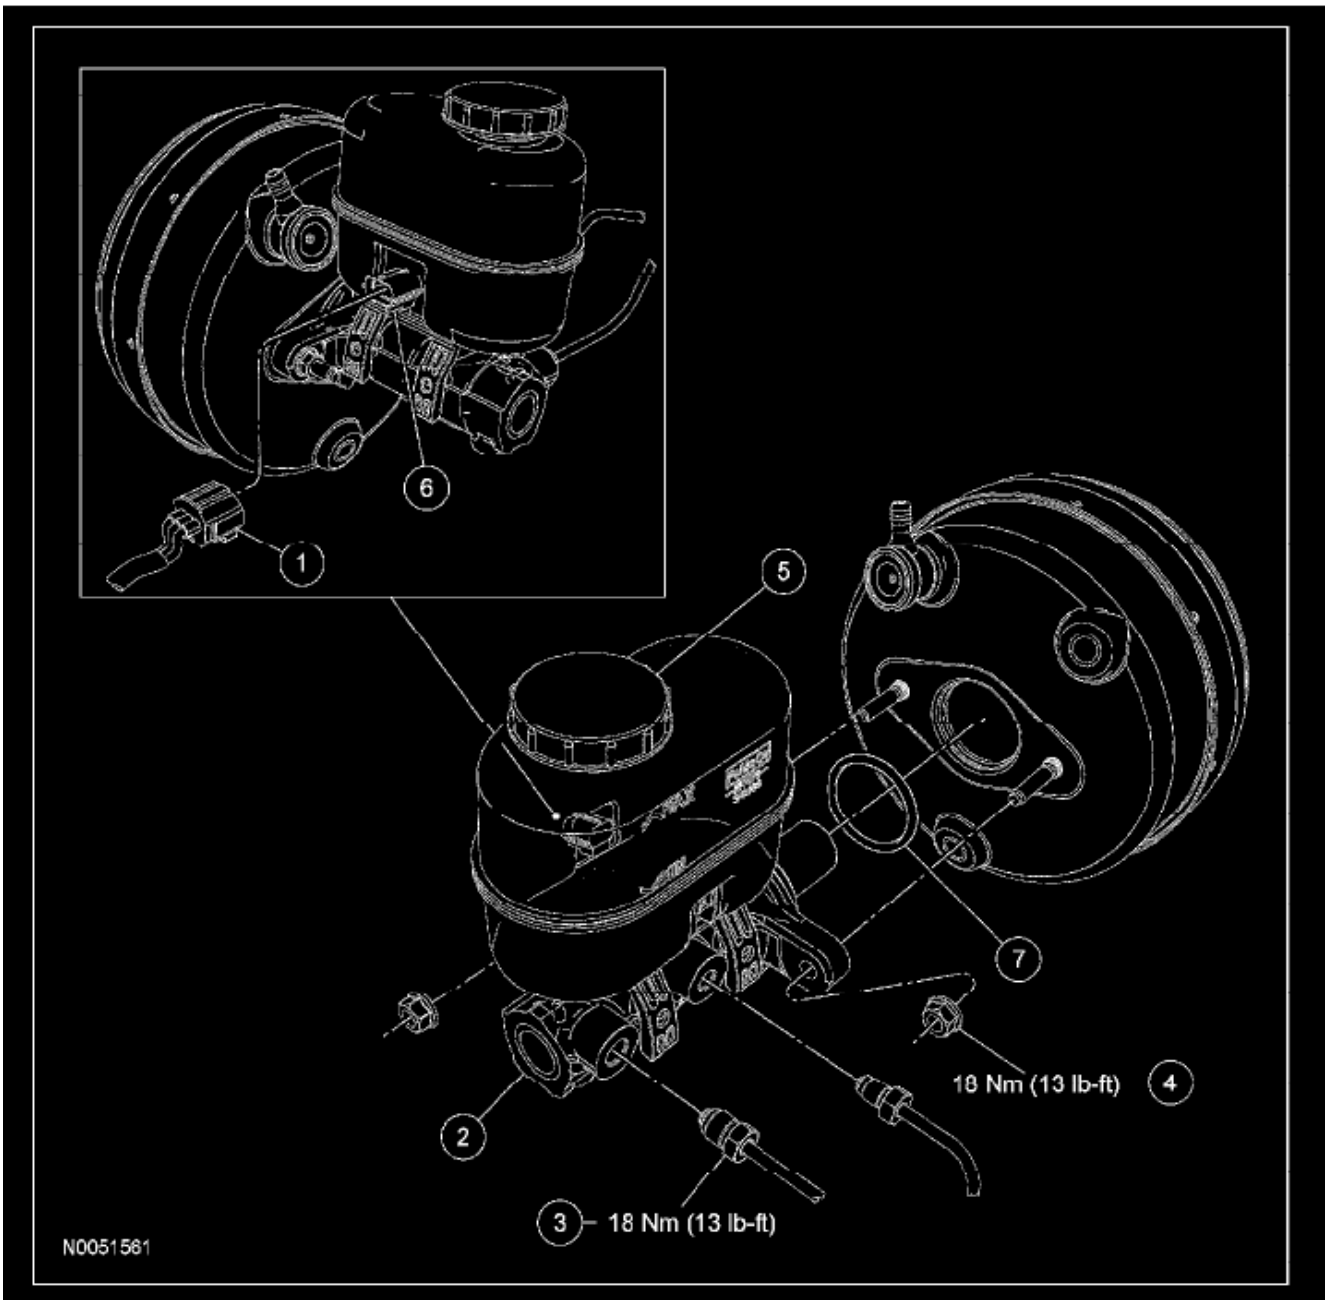
3. Check the brake stoplamp switch and the brake pedal free play to verify that the brake pedal is not partially applied. 4. Loosen the brake master cylinder nuts and position the brake master cylinder away from the brake booster. 5. With the brakes released, attempt to rotate each wheel and check for any brake drag.

^ If the brake drag is no longer present, install a new brake booster.

^ If the brake drag is still present, install a new master cylinder.

Material

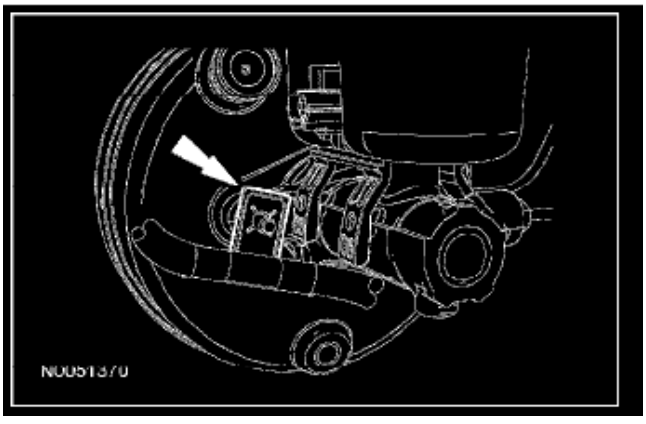
Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A



Brake Master Cylinder: Service and Repair

Brake Master Cylinder

Item	Part Number	Description
1	—	Brake master cylinder fluid level switch electrical connector (part of 14300)
2	2004	Brake master cylinder and reservoir assembly
3	—	Brake tube fitting (part of 2234)
4	W520112	Brake master cylinder nut (2 required)
5	2162	Brake master cylinder reservoir cap
6	2L414	Brake fluid level sensor
7	2152	Brake master cylinder-to-brake booster O-ring



Removal and Installation

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

1. Disconnect the brake fluid level warning switch electrical connector.

2. CAUTION: The vacuum must be relieved in the brake booster before the master cylinder is removed. Failure to relieve the vacuum will

result in the O-ring being drawn into the brake booster.

NOTE: If the O-ring is drawn into the brake booster and cannot be recovered, a new brake booster must be installed.

Remove the check valve from the brake booster to relieve the vacuum.

3. Disconnect the wiring retainer clip from the brake booster stud.

4. Disconnect the 2 brake tube fittings.

^ Plug the tubes and the brake master cylinder ports.

^ To install, tighten to 18 Nm (13 lb-ft).

5. Remove the 2 brake master cylinder nuts and the brake master cylinder.

^ To install, tighten to 18 Nm (13 lb-ft).

6. To install, reverse the removal procedure.

^ Bleed the master cylinder before installation.

Parking Brake Cable: Procedures

Parking Brake Cable Tension Release

1. Remove the LH cowl side trim panel. 2. With the help of an assistant, release the parking brake cable tension by pulling down on the intermediate cable at the cable-to-cable connector clip

until the parking brake control sector rotates to its stop and a 4 mm (0.15 inch) x 150 mm (5.9 inch) retainer pin can be inserted.

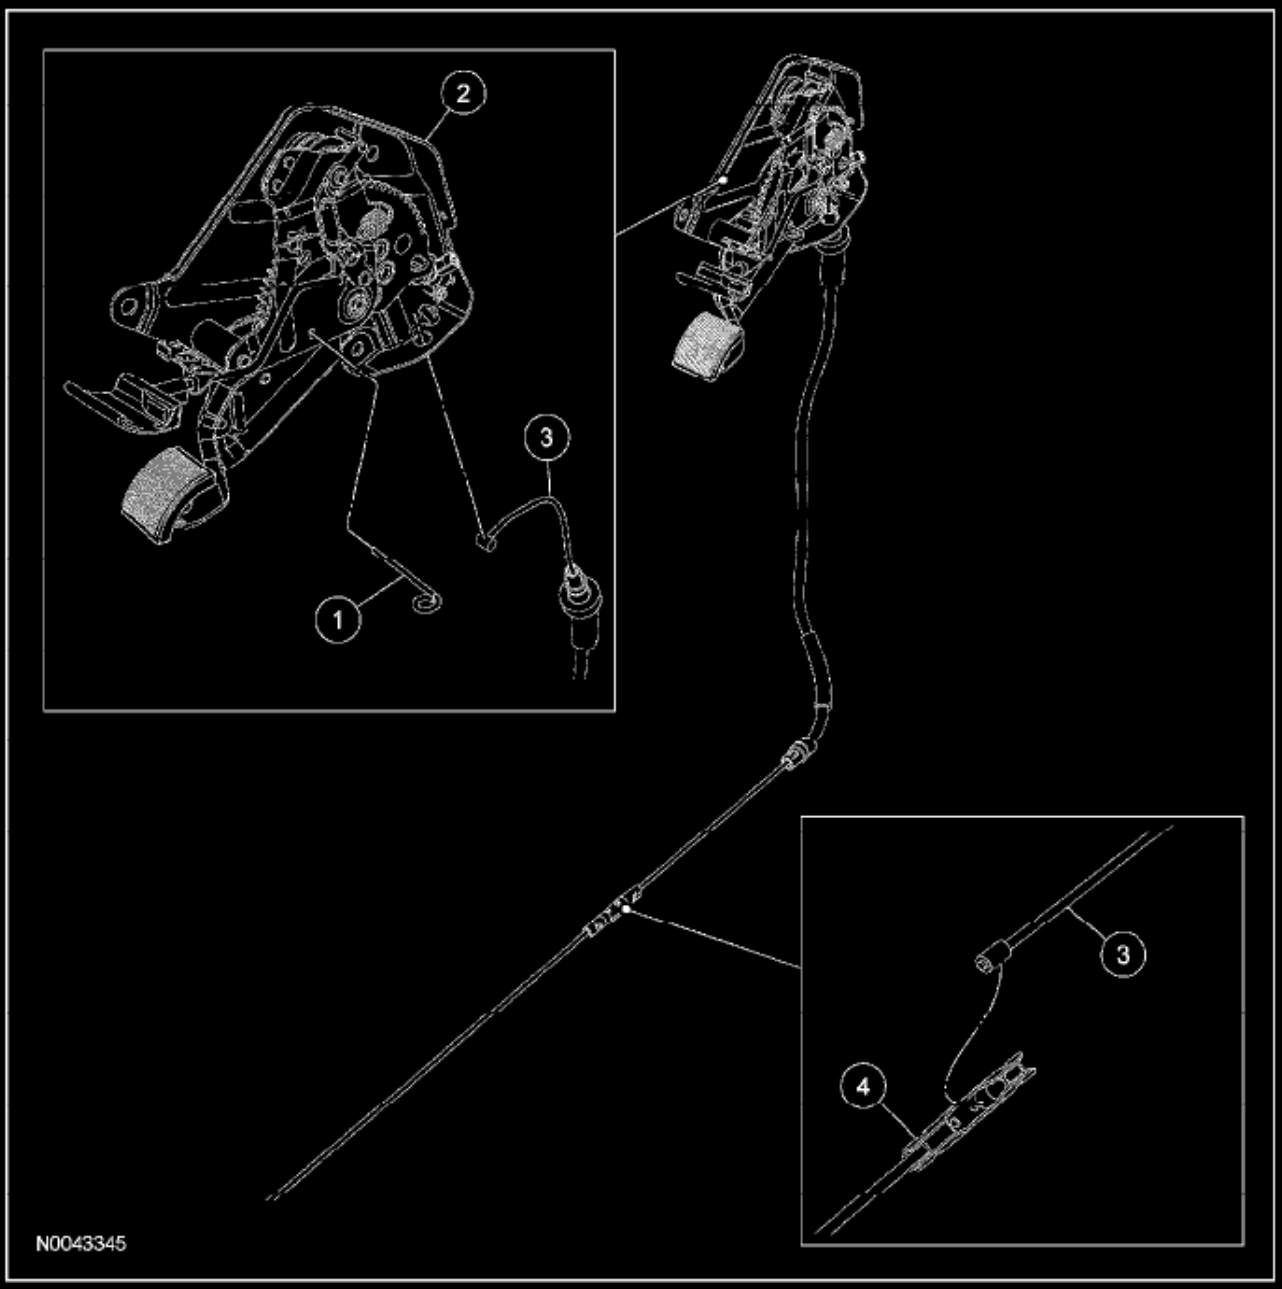
3. NOTE: Make sure the cable-to-cable connector clip is connected to the front and rear cable before removing the brake control retaining pin, and

the cable tension is reloaded slowly.

Disconnect the cable-to-cable connector clip.

4. To reload the tension on the parking brake cable, follow the release procedure in reverse.

Parking Brake Cable — Front



Item	Part Number	Description
1	—	Retaining pin (part of 2780)
2	2780	Parking brake control

2	2A635	LH rear parking brake cable
3	2A635	RH rear parking brake cable
4	2A793	Intermediate parking brake cable

Parking Brake Cable - Rear

Removal and Installation

1. NOTE: Make sure the parking brake control is fully released.

Release the parking brake cable tension.

2. Remove the brake shoes. 3. Disconnect the RH rear parking brake cable from the intermediate cable at the cable union. 4. Compress the retainer and separate the RH rear parking brake cable from the LH rear parking brake cable at the equalizer. 5. Remove the parking brake cable wireform bracket bolt.

^ To install, tighten to 17 Nm (13 lb-ft).

6. Separate the LH rear parking brake cable from the frame bracket.

^ Remove the equalizer.

^ Compress the parking brake cable clip.

^ Separate the LH rear parking brake cable from the frame bracket.

7. Separate the RH rear parking brake cable from the RH hydraulic brake tube clips. 8. Unclip the RH rear parking brake cable from the brake tube clip on top of the rear axle housing. 9. Disconnect the parking brake cables from the parking brake levers.

10. Compress the clips and disconnect the rear parking brake cables from the backing plates. 11. To install, reverse the removal procedure.

Torque Specifications

Description	Nm	lb-ft
Brake booster nuts	25	18

Vacuum Brake Booster: Specifications

Torque Specifications

Vacuum Brake Booster: Description and Operation

Brake Booster

The power brake actuation system consists of the following components: ^

Brake booster assembly

^ Brake booster vacuum fitting

Pedal pressure is amplified by the brake booster. The brake booster uses engine vacuum from the intake manifold. The low pressure in the intake manifold is applied to a rubber diaphragm on the vacuum side of the brake booster chamber, which then pulls the piston rod in when the brakes are applied to supply a power assist. The piston rod is connected to the brake pedal.

Vacuum Brake Booster: Testing and Inspection

Brake Booster

1. Disconnect the check valve from the brake booster. 2. Apply the parking brake, start the engine and place the transmission in NEUTRAL. 3. Verify that manifold vacuum is available at the check valve with the engine at idle speed and the transmission in NEUTRAL.

^ If manifold vacuum is available, stop the engine, connect the check valve and continue with Step 5.

^ If manifold vacuum is not available, continue with Step 4.

4. Disconnect the check valve from the vacuum hose and verify that manifold vacuum is available at the hose with the engine at idle speed and the

transmission in NEUTRAL. ^

If manifold vacuum is available, stop the engine, install a new check valve and continue with Step 5.

^ If manifold vacuum is not available, stop the engine, connect the vacuum hose to the check valve and refer to Engine to diagnose the no vacuum condition.

5. Apply the brake pedal several times to exhaust all vacuum from the system. 6. Apply the brake pedal and hold it in the applied position. Start the engine and verify that the brake pedal moves downward after the engine starts.

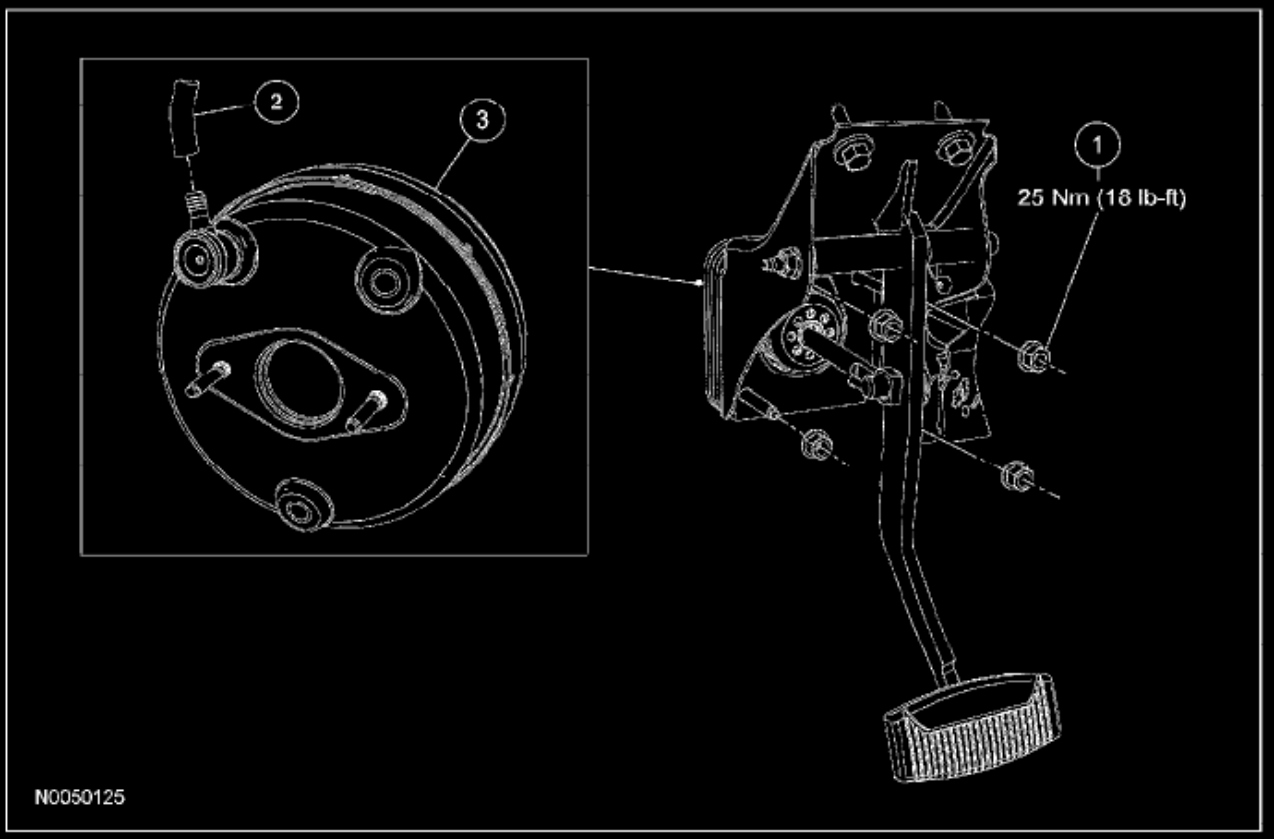
^ If the brake pedal moves, the brake booster is operating correctly

^ If the brake pedal does not move, install a new brake booster.

7. Operate the engine a minimum of 10 seconds at fast idle. Stop the engine, and let the vehicle stand for 10 minutes. Then apply the brake pedal with

approximately 89 N (20 lb) of force. The brake pedal feel should be the same as that noted with the engine operating. If the brake pedal feels hard (no power assist), install a new brake booster check valve and retest. If the brake pedal feels spongy, bleed the hydraulic system to remove air.

Brake Booster



Item	Part Number	Description
1	N620481	Brake booster nut (4 required)
2	9C482	Vacuum hose (4.0L)
2	9C490	Vacuum hose (2.3L and 3.0L)
3	2002	Brake booster kit

Vacuum Brake Booster: Service and Repair

Brake Booster

Brake Booster

Removal and Installation

1. Remove the brake master cylinder. 2. Disconnect the vacuum hose from the brake booster check valve.

3. CAUTION: Do not service the brake pedal or brake booster without first removing the stoplamp switch and speed control deactivator

switch. These switches must be removed with the brake pedal in the at-rest position. Switch plungers must be compressed for the switch to rotate in the bracket. Attempting to remove the switch when the plunger is extended (during pedal apply) will result in damage to the switch.

Remove the stoplamp switch.

4. Remove the speed control deactivator switch. 5. Disconnect the brake booster push rod from the brake pedal and bracket. 6. Remove the bulkhead sound insulator. 7. Remove the 4 brake booster nuts and the brake booster.

^ To install, tighten to 25 Nm (18 lb-ft).

8. CAUTION: Do not press, pull or otherwise move the brake pedal while installing the stoplamp switch or the speed control deactivator

switch. These switches must be installed with the booster push rod attached to the brake pedal and with the brake pedal in the at-rest position. Installing these switches with the brake pedal in any other position will result in incorrect adjustment and may damage the switches.

To install, reverse the removal procedure.

Vacuum Brake Booster Check Valve: Testing and Inspection

Brake Booster Check Valve

The function of the brake booster check valve is to allow manifold vacuum to enter the brake booster and prevent the escape of vacuum in case manifold vacuum is lost during sustained full throttle operation. 1. Disconnect the vacuum booster hose from the check valve. 2. Apply the parking brake, start the engine and place the transmission in NEUTRAL. 3. Verify that manifold vacuum is available at the check valve end of the vacuum hose with the engine at idle speed and the transmission in

NEUTRAL. ^

If manifold vacuum is available, stop the engine, connect the vacuum hose to the check valve and continue this test.

^ If manifold vacuum is not available, stop the engine, connect the vacuum hose to the check valve and refer to Engine to diagnose the no vacuum condition.

4. Connect the vacuum hose to the check valve and run the engine for at least 10 seconds. 5. Operate the brake pedal to check for power assist.

^ If power assist is present, continue with this test.

^ If power assist is not present, refer to Brake Booster Component Test.

6. NOTE: Do not remove the brake booster check valve from the brake booster in this step.

Stop the engine and disconnect the vacuum booster hose from the brake booster check valve.

7. Apply the brake and verify that there is enough vacuum retained in the brake booster for at least one power-assisted brake application.

^ If there is enough vacuum for at least one power-assisted brake application, the check valve is functioning correctly.

^ If there is not enough vacuum for at least on one power-assisted brake application, continue with this test.

8. Inspect the brake booster for any signs of damage that may cause a leak.

^ If any damage is found, install a new brake booster and repeat this test.

^ If no damage is found, install a new check valve.

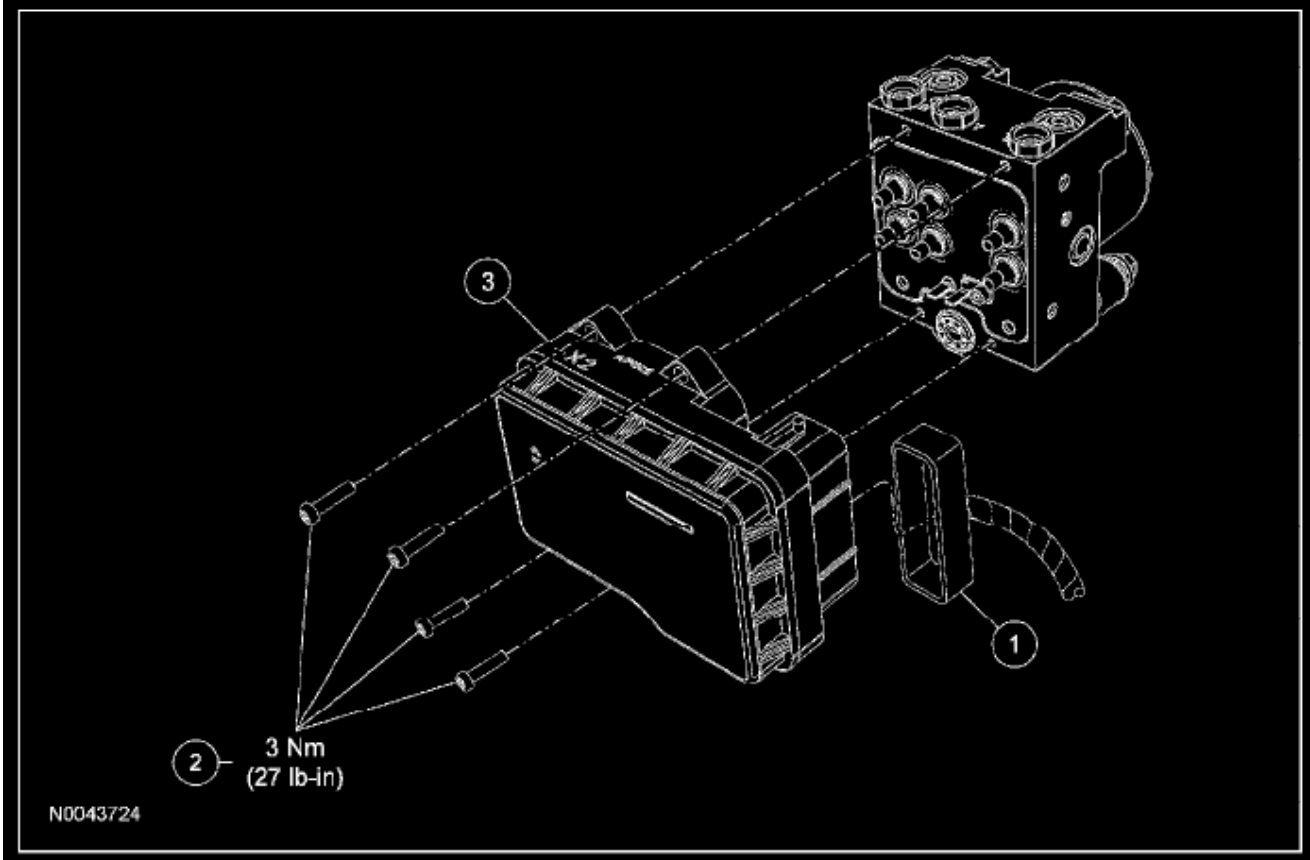
Anti-Lock Brake System (ABS) Module



Item	Part Number	Description
1	—	ABS module electrical connector (part of 14290)
2	—	ABS module bolts (4 required) (part of 2C065)
3	2C065	ABS module

Electronic Brake Control Module: Service and Repair

Anti-Lock Brake System (ABS) Module

Anti-Lock Brake System (ABS) Module

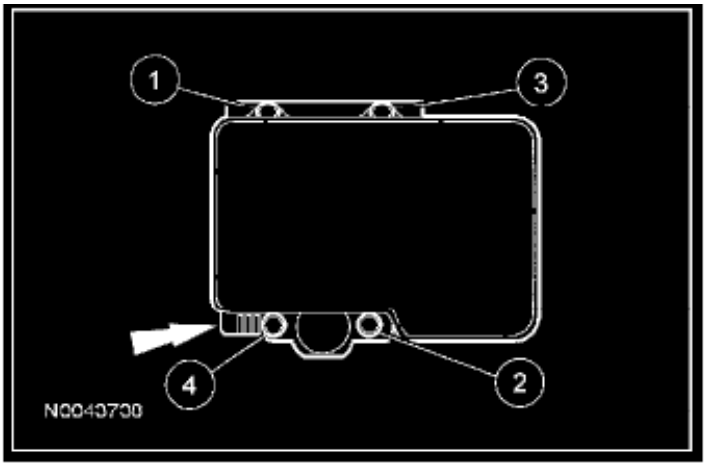
Removal and Installation

1. Remove the hydraulic control unit (HCU).

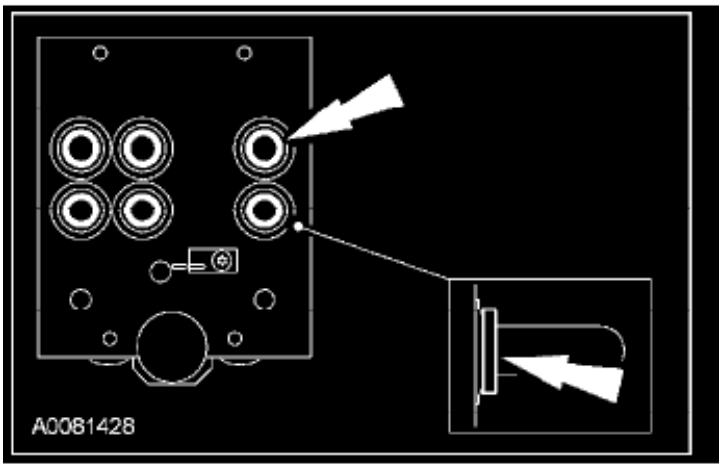
2. NOTE: The ABS module bolts must be removed and installed in the sequence shown.

Remove the 4 ABS module bolts in the sequence shown. ^

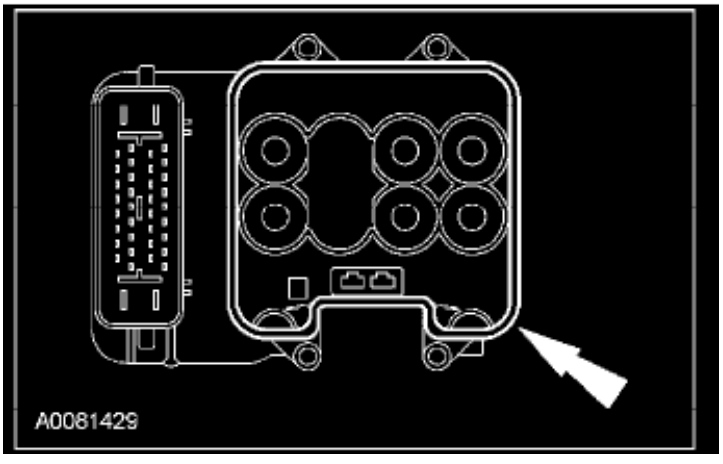
To install, tighten to 3 Nm (27 lb-inch).



1
3
4
2



A0081428



A0081429

3. CAUTION: When the anti-lock brake system (ABS) module is separated from the hydraulic control unit (HCU), the motor terminals and

the valve stems will be exposed. Protect the terminals and the valve stems from damage.

Remove the ABS module from the HCU.

4. Remove and discard the O-ring seals.

5. Remove and discard the ABS module seal.

6. CAUTION: All components must be free of dust, oil, fluid and foreign material prior to installation. A new seal kit must be used when

installing the anti-lock brake system (ABS) module. The old seals must be discarded as they may cause a leak between the ABS module and the hydraulic control unit (HCU).

NOTE: The O-ring seals must be installed to the valve flange. Make sure the O-ring seals are not deformed when installed.

NOTE: Clean the groove of the ABS module before installing a new seal.

To install, reverse the removal procedure.

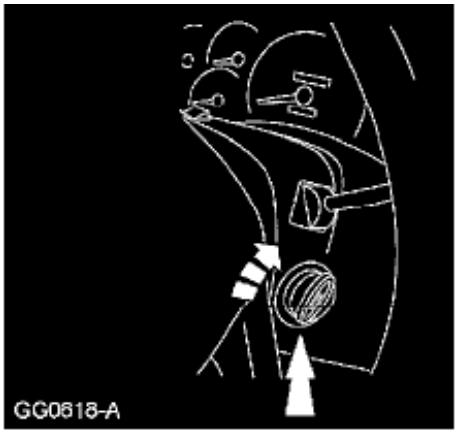
Ignition Switch Lock Cylinder: Service and Repair Ignition Lock Cylinder - Functional

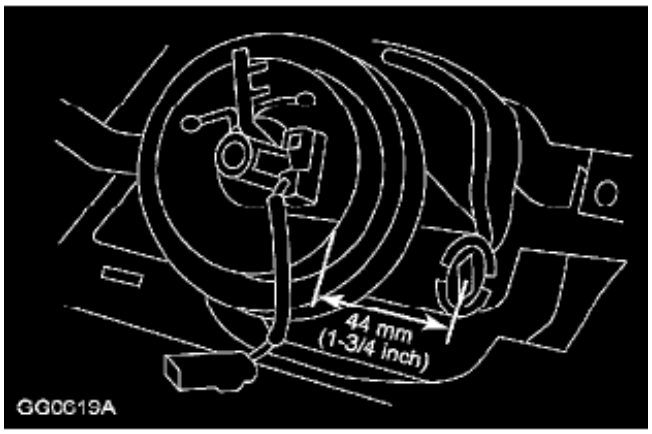
IGNITION LOCK CYLINDER - FUNCTIONAL

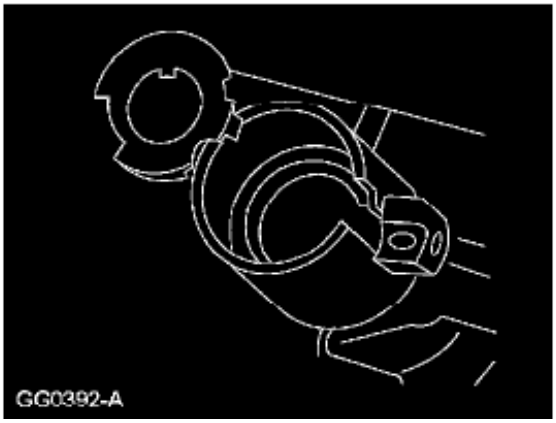
Removal and Installation

1. Disconnect the battery ground cable. 2. Insert the ignition key and turn to the RUN position. 3. Press the ignition lock cylinder release pin and remove the ignition lock cylinder. 4. To install, reverse the removal procedure.

- Verify ignition lock cylinder operation.







Ignition Switch Lock Cylinder: Service and Repair Ignition Lock Cylinder - Non Functional

IGNITION LOCK CYLINDER - NON FUNCTIONAL

Removal and Installation

1. NOTE: Make sure the front wheels are in the straight-ahead position.

Remove the steering wheel assembly.

2. Twist off the cap from the ignition lock cylinder.

3. NOTE: The lock cylinder is repaired by discarding the inoperative lock cylinder and building a new lock cylinder using the appropriate lock

repair package (F85Z-11582-AA). The lock repair package includes a detailed instruction sheet to build the new lock cylinder to the current key code of the vehicle.

Remove the ignition lock cylinder. -

Use a 1/8-inch diameter drill bit to drill out the lock cylinder retaining pin.

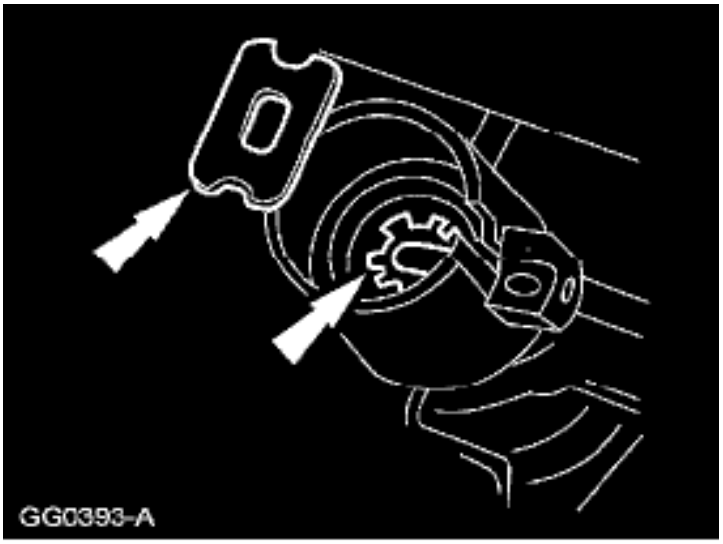
- Use a 3/8-inch drill bit to drill down the middle of the ignition lock key slot until the ignition lock cylinder breaks loose.

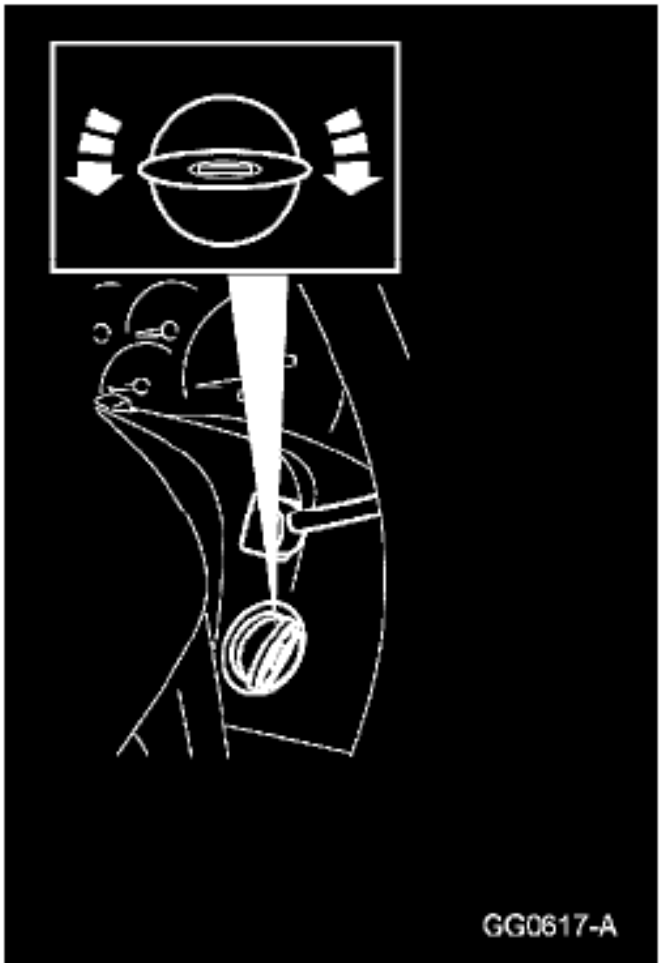
- Remove and discard the ignition lock cylinder and clean the drill shavings from the steering column.

4. Remove the bearing retainer.

5. Remove the bearing and gear.

- Thoroughly clean all drill shavings from the steering column and inspect it for damage.





6. To install, reverse the removal procedure.

- Install a new ignition lock cylinder.
- Verify ignition lock cylinder operation.

Starter Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

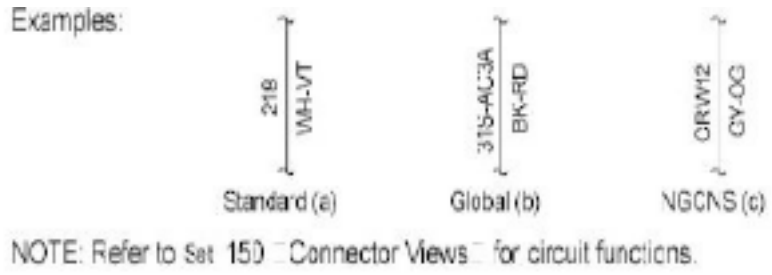
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

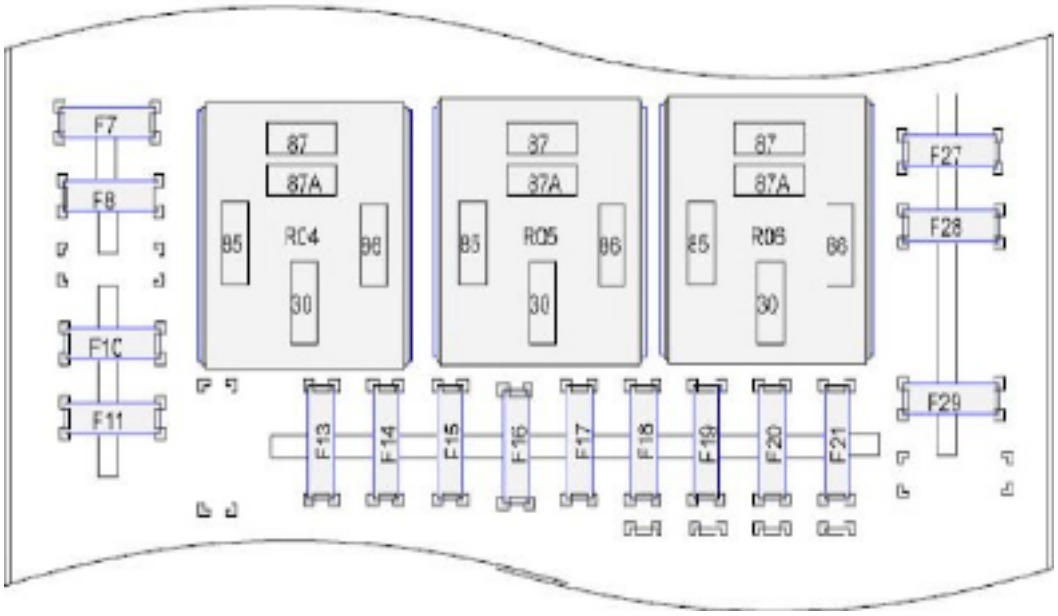
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

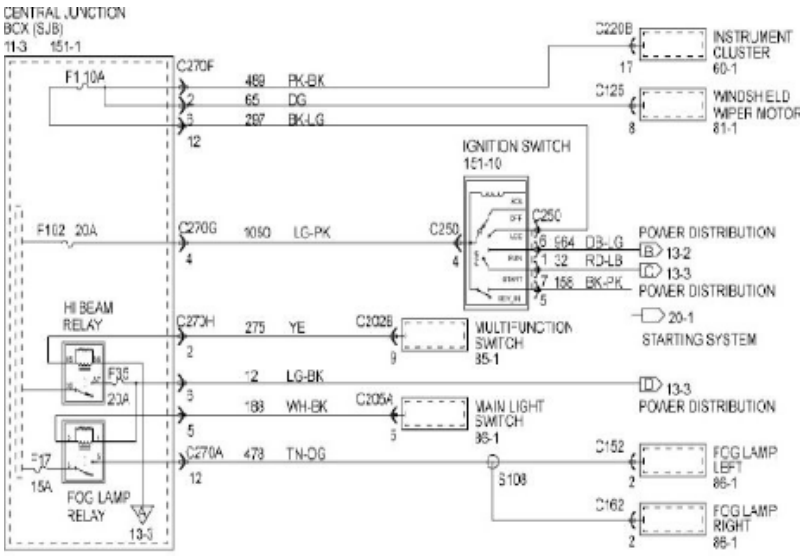
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

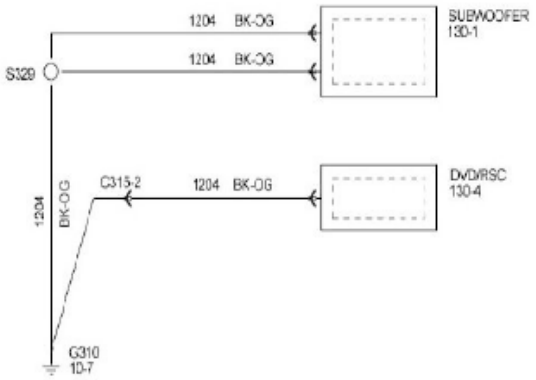
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

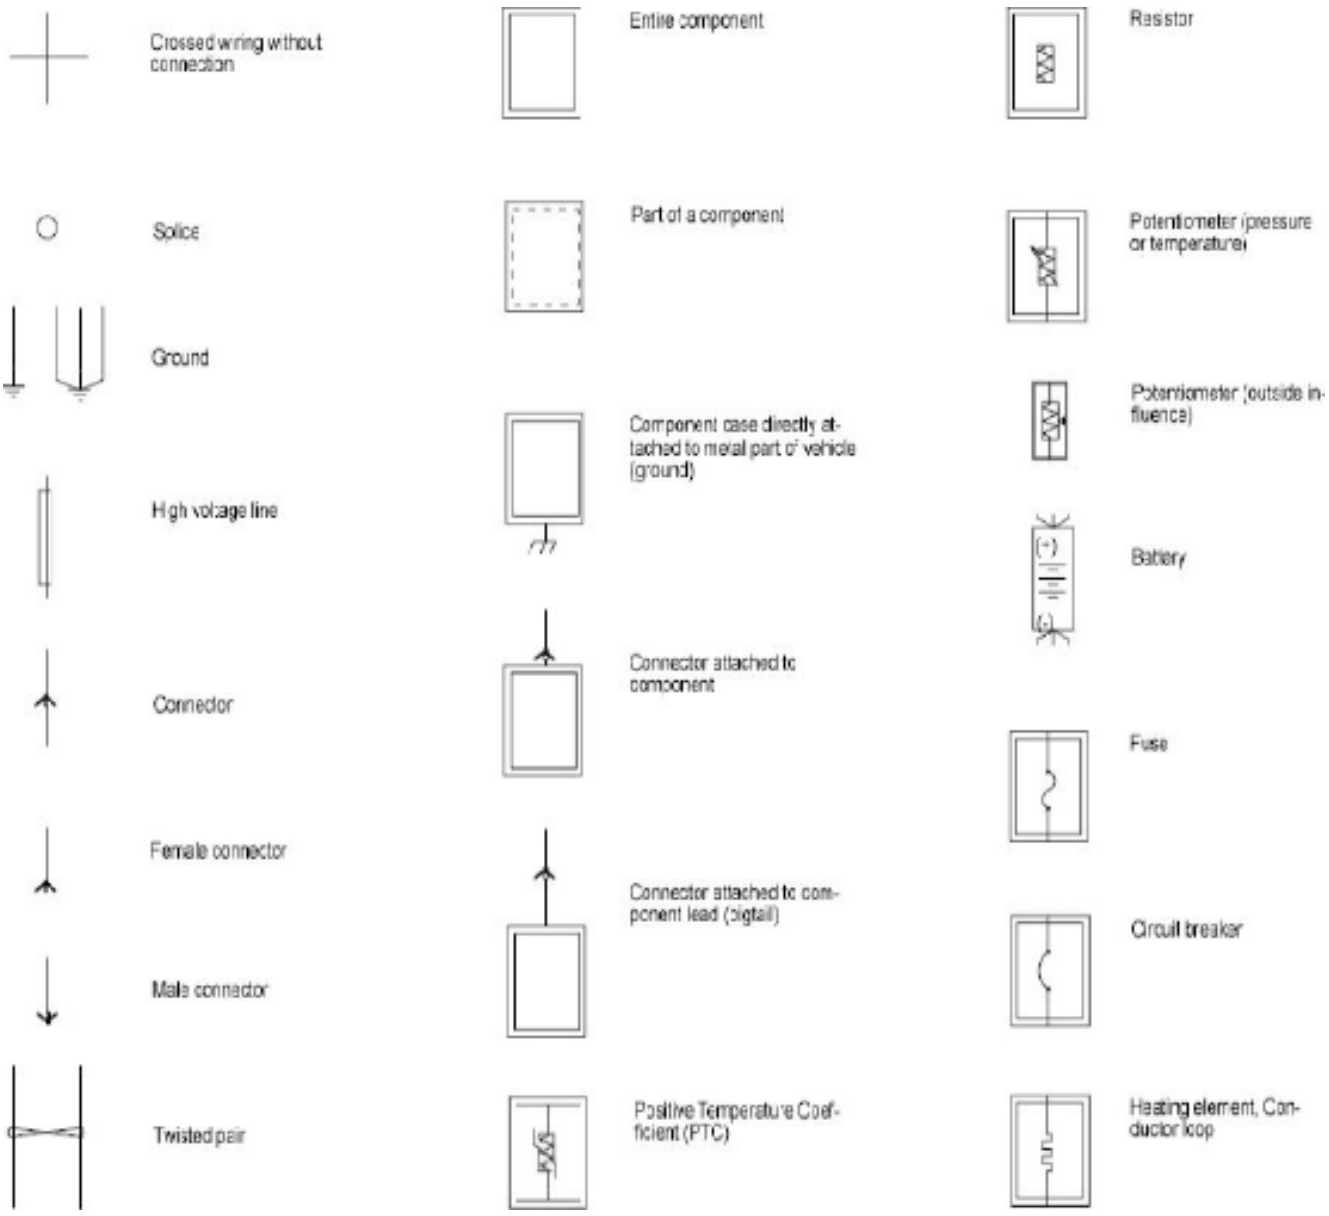
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

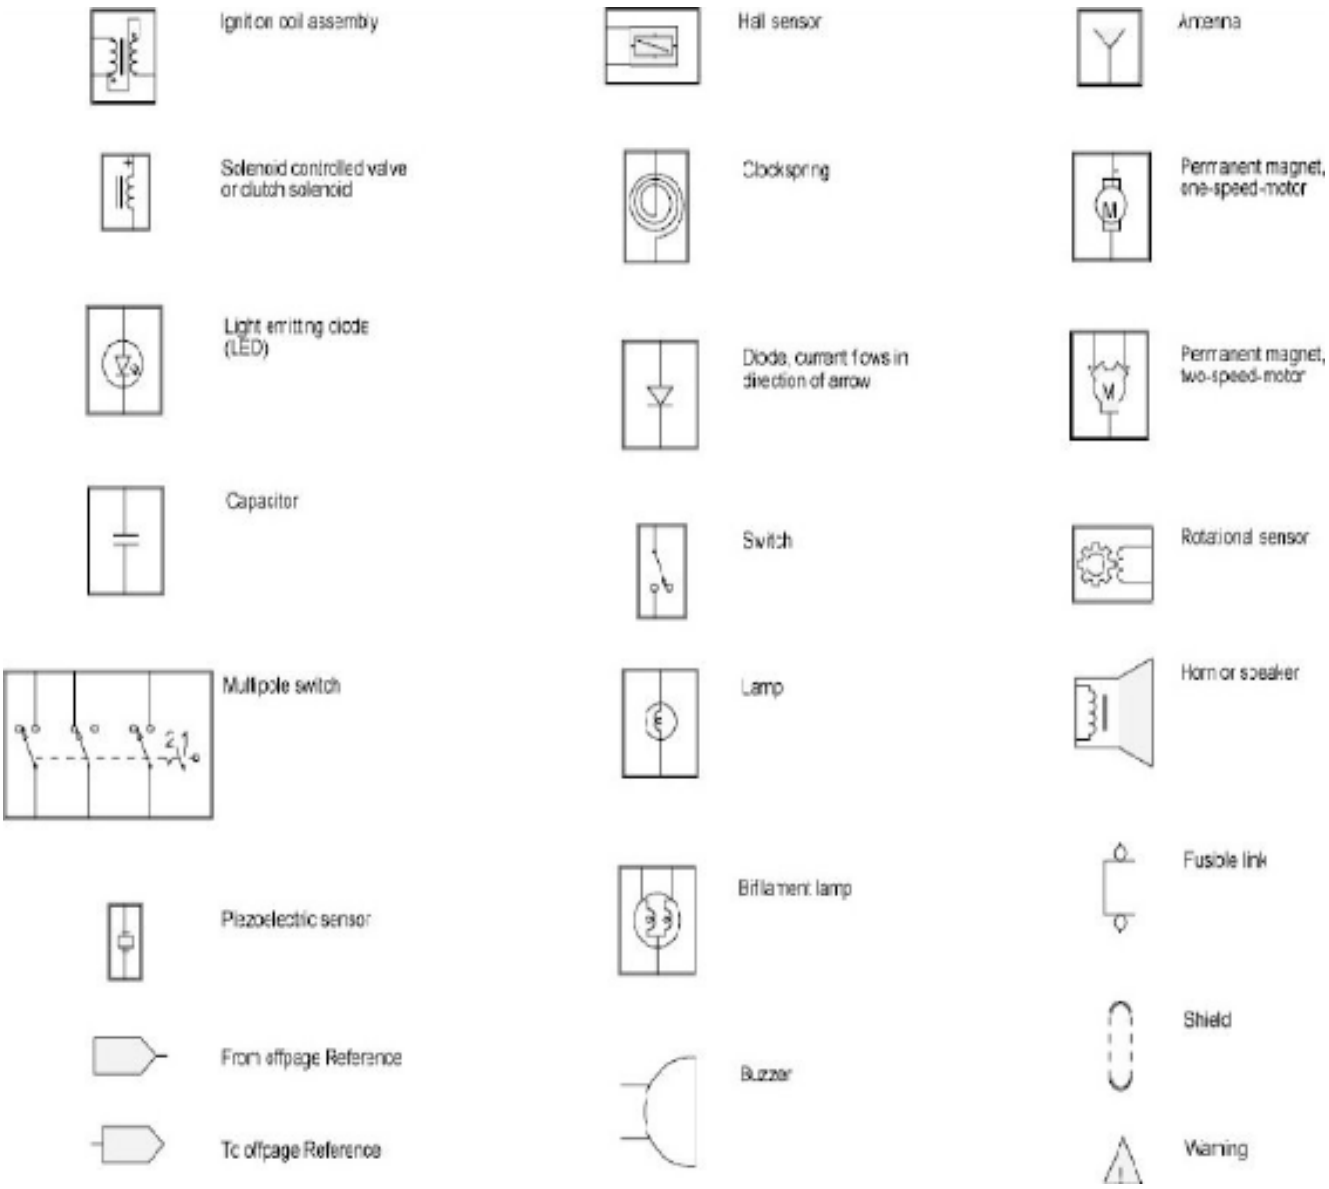
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

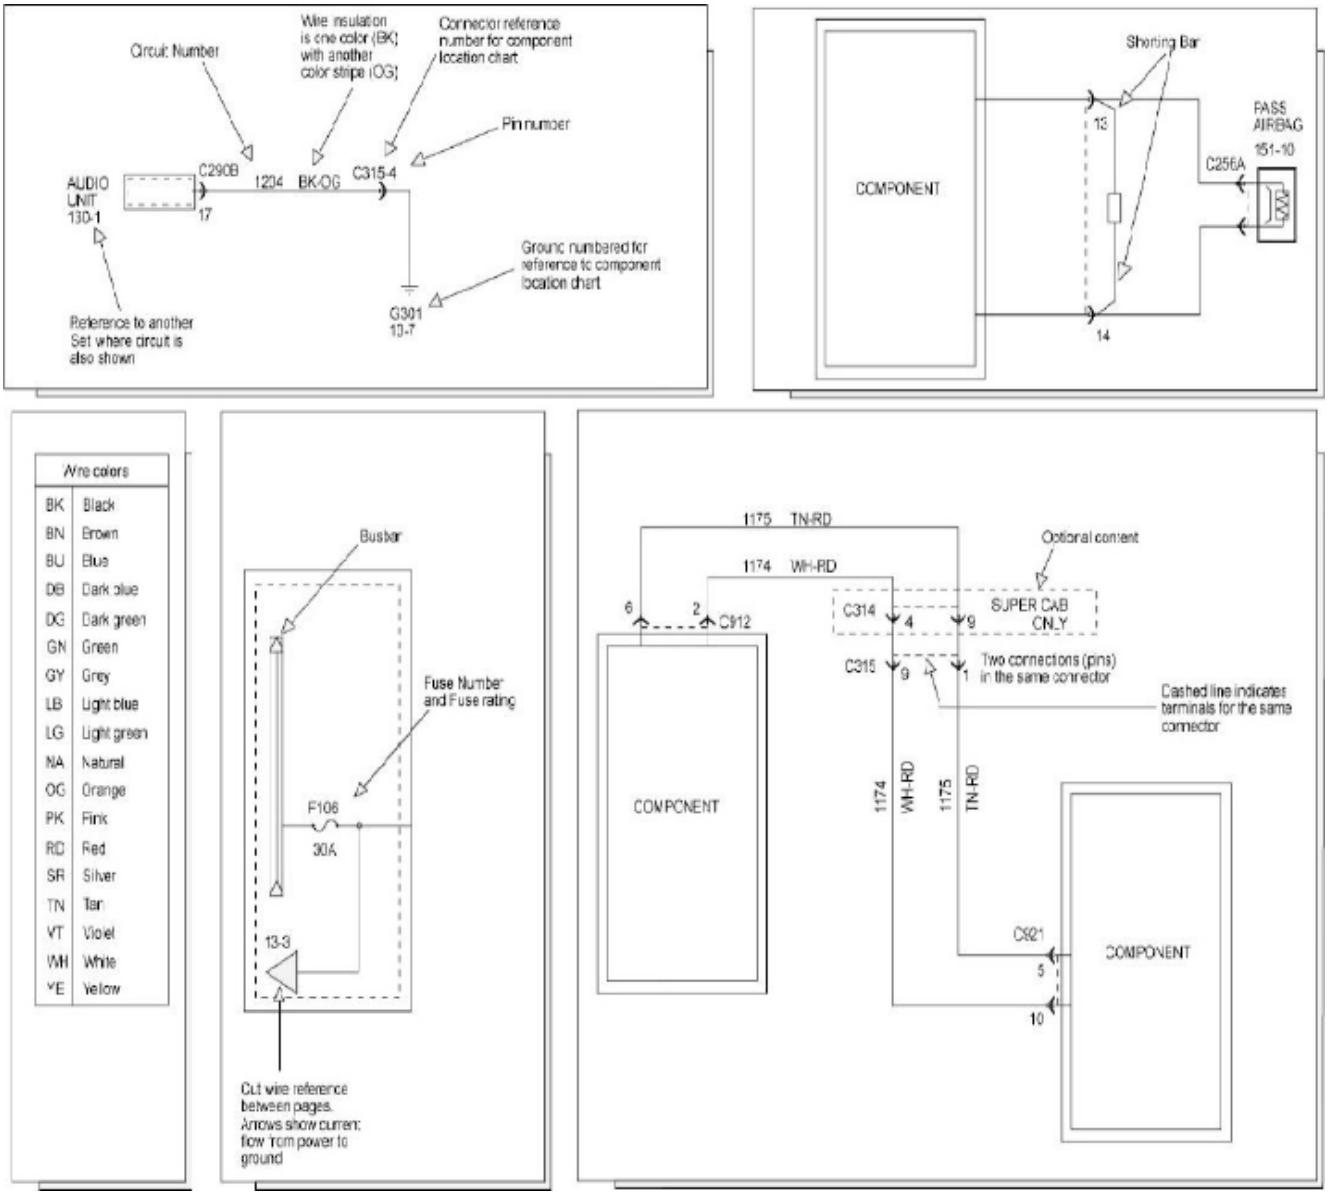
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

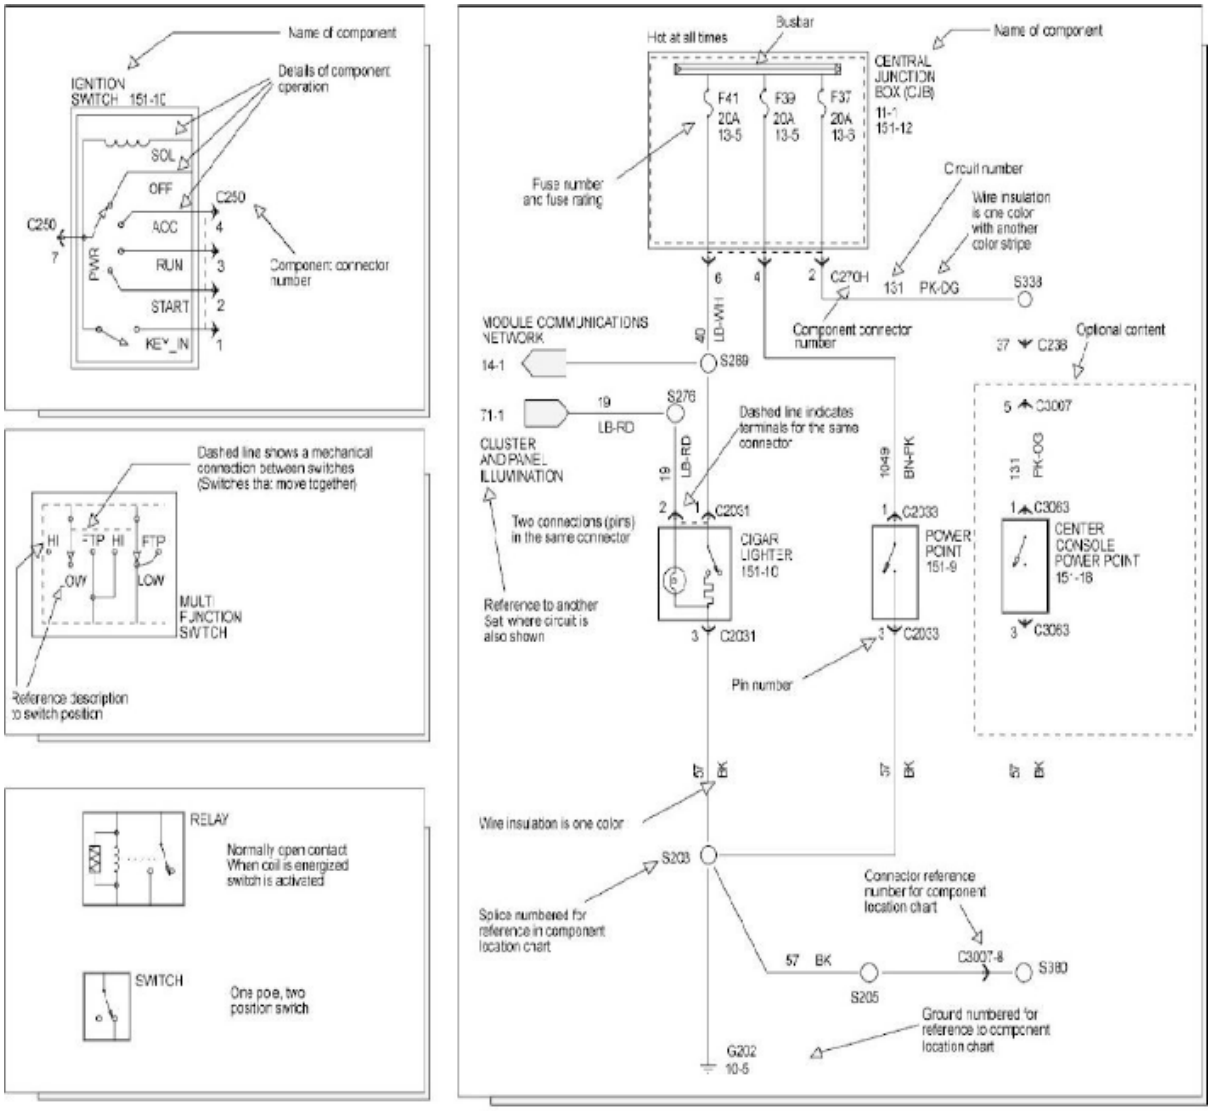
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right

Starter Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

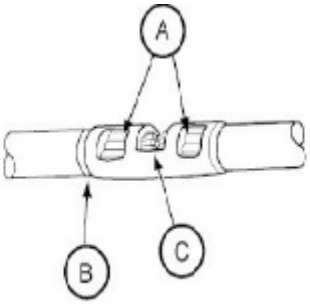
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

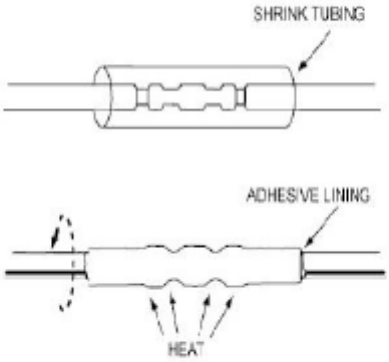
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x cia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Figtail only

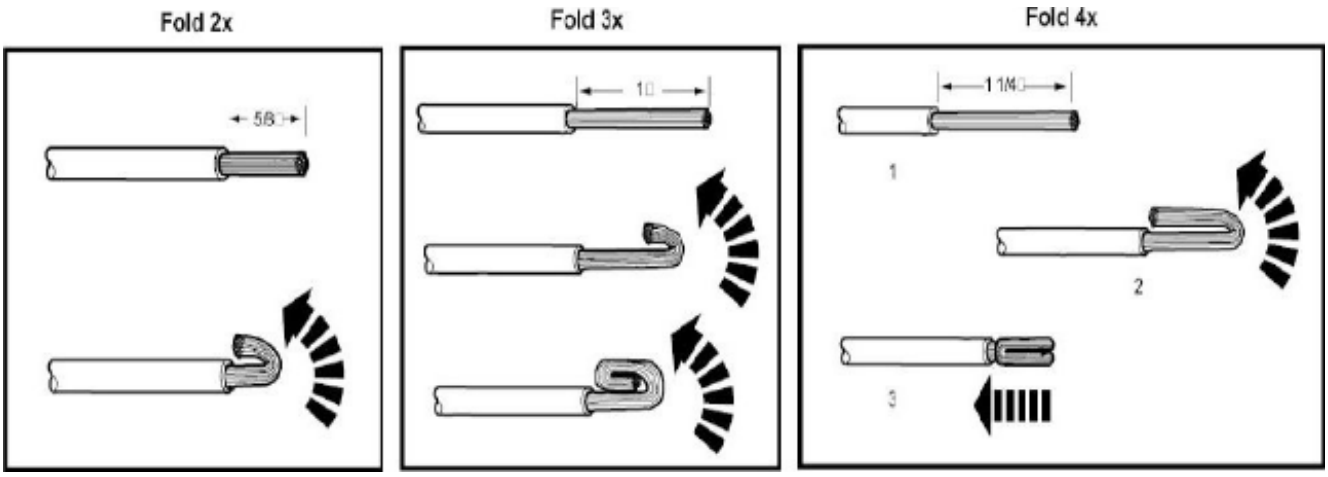
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Starter Relay: Description and Operation

The starter relay:

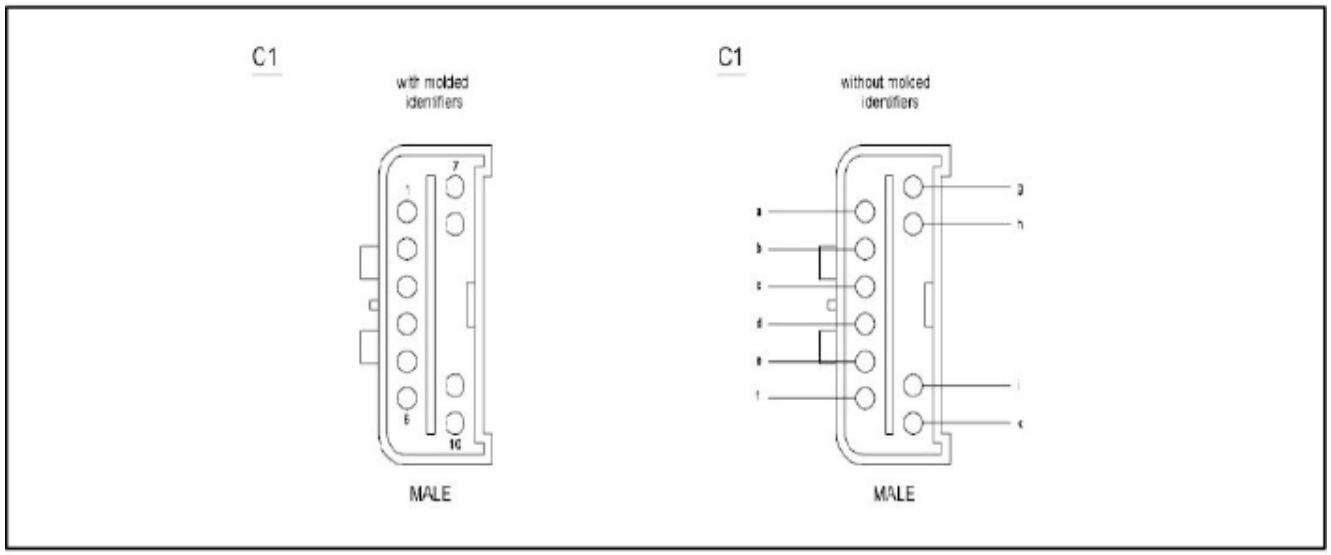
^ Is a mini ISO relay. A. switches power to the starter solenoid to engage the starter motor when it is provided a ground throigh the PCM.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



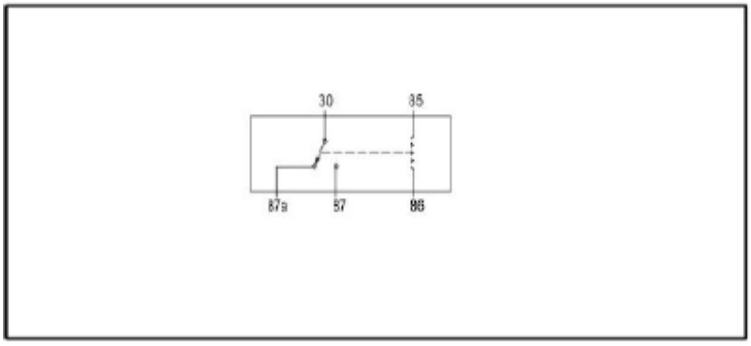
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

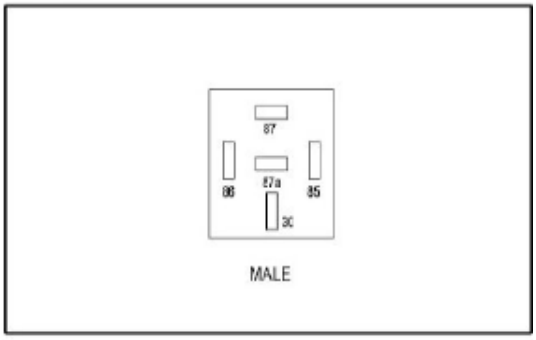
Starter Relay: Testing and Inspection

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	45 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Battery Cable Generator Connections

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. 2. Disconnect the battery. 3. Remove the bolt and position the battery cable body ground terminal aside.

- To install, tighten to 12 Nm (9 lb-ft).

4. If equipped, disconnect the A/C cut-off switch connector. 5. Release the 3 battery cable locators from the battery tray and fender. 6. Remove the battery junction box (BJB) cover, remove the 2 nuts and position the BJB terminal aside.

- To install, tighten to 12 Nm (9 lb-ft).

7. Disconnect the battery cable connector on the fender well. 8. If equipped, disconnect the A/C compressor electrical connector. 9. Remove the 2 battery cable locators from the A/C compressor.

10. Remove the nut and position the battery cable engine bracket aside.

- To install, tighten to 25 Nm (18 lb-ft).

11. Remove the nut and position the battery cable engine ground terminal aside

- To install, tighten to 27 Nm (20 lb-ft).

12. Remove the starter solenoid terminal cover. 13. Remove the nut and position the battery cable starter solenoid terminal aside.

- To install, tighten to 12 Nm (9 lb-ft).

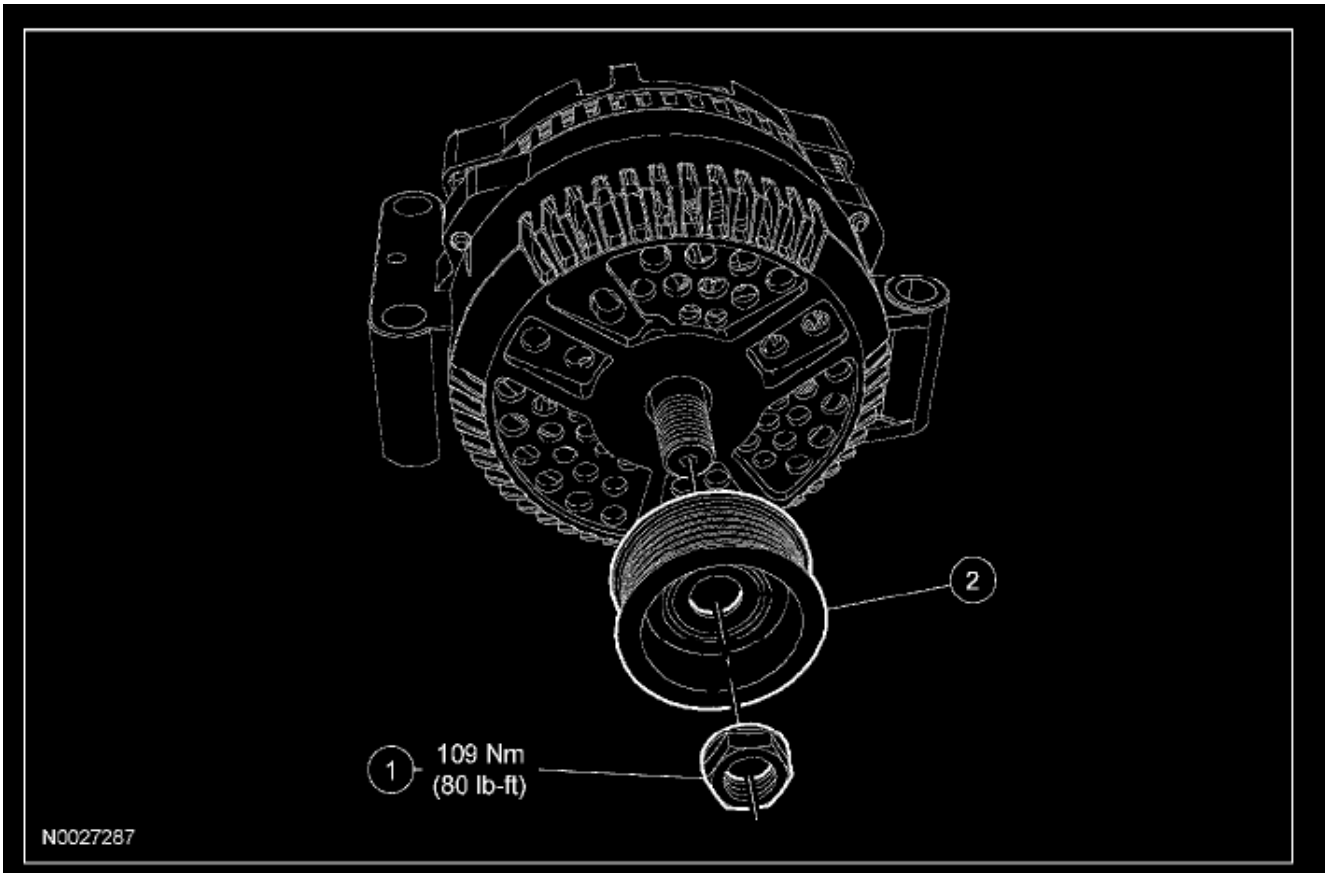
14. Remove the nut and position the battery cable starter solenoid wire terminal aside.

- To install, tighten to 5 Nm (44 lb-in).

15. Release the battery cable locator from the generator bracket. 16. Disconnect the 2 generator electrical connectors. 17. Position the generator B+ protective cover aside, remove the nut and position the battery cable generator B+ terminal aside.

- To install, tighten to 8 Nm (71 lb-in).

18. Remove the battery cable. 19. To install, reverse the removal procedure.



Item	Part Number	Description
1	—	Generator pulley nut (part of 10346)
2	10344	Generator pulley

Alternator Pulley: Service and Repair

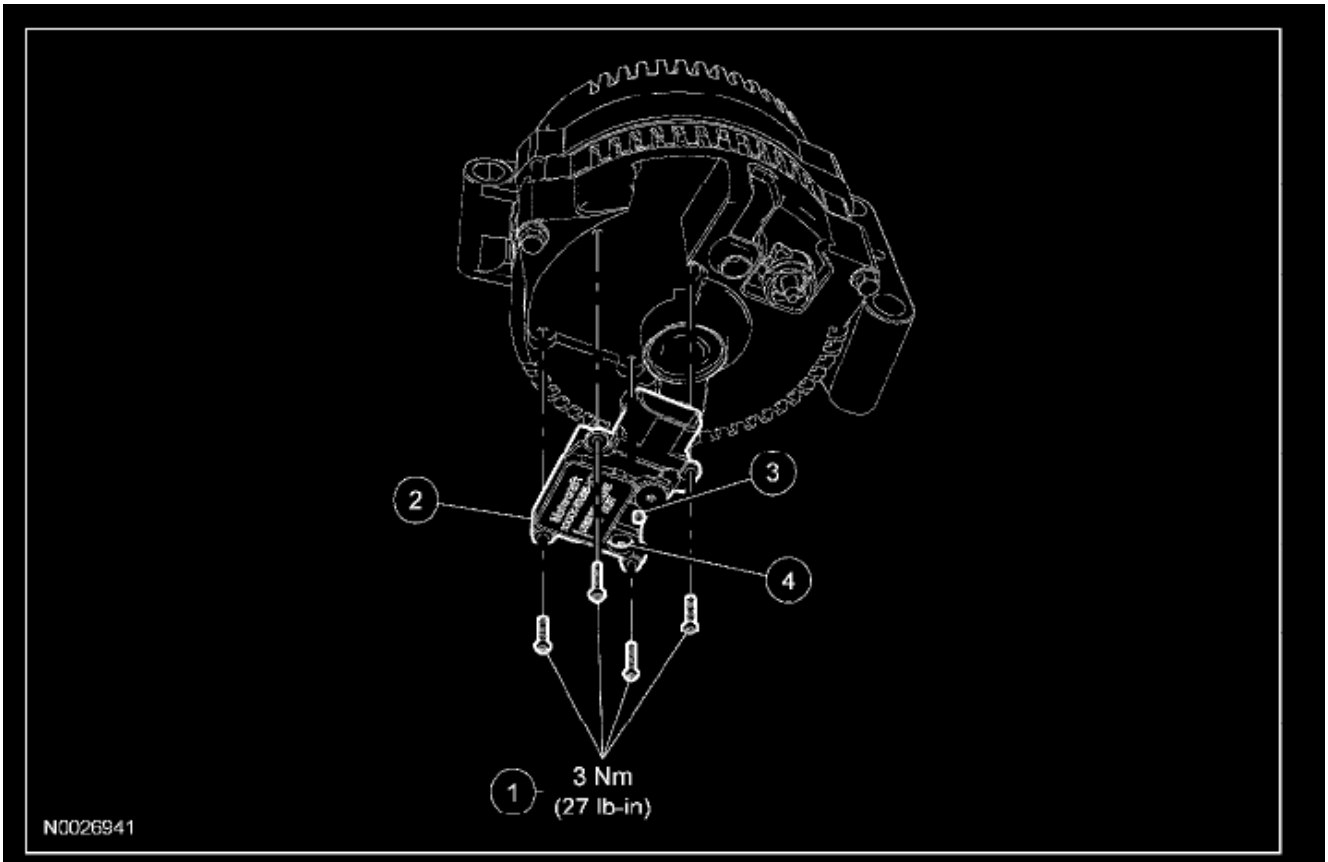
GENERATOR PULLEY

Removal and Installation

1. Remove the generator. 2. Remove the nut and the generator pulley.

- To install, tighten to 109 Nm (80 lb-ft).

3. To install, reverse the removal procedure.



Item	Part Number	Description
1	—	Generator voltage regulator screws (4 required) (includes the generator brush and terminal holder)
2	—	Generator voltage regulator (includes the generator brush and terminal holder)
3	—	Generator brush holding wire insertion hole
4	—	Generator test terminal

Voltage Regulator: Service and Repair

VOLTAGE REGULATOR

Removal and Installation

1. Remove the generator. 2. Remove the 4 screws and the generator voltage regulator (includes the generator brush and terminal holder).

- To install, tighten to 3 Nm (27 lb-in).

3. NOTE: When installing the voltage regulator (including the generator brush and terminal holder) assembly, it is necessary to insert a wire

(preferably plastic) into the generator brush holding wire insertion hole in order to hold the generator brushes while the voltage regulator assembly (including the generator brush and terminal holder) is being assembled to the generator. Make certain to remove the wire before the vehicle is started or the generator will not operate.

To install, reverse the removal procedure.

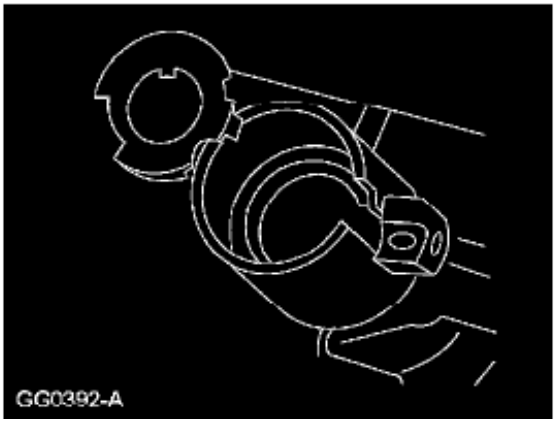
(1-3/4 inch)
GG0619A



GG0392-A

Ignition Switch Lock Cylinder: Service and Repair Ignition Lock Cylinder - Non Functional

IGNITION LOCK CYLINDER - NON FUNCTIONAL

Removal and Installation

1. NOTE: Make sure the front wheels are in the straight-ahead position.

Remove the steering wheel assembly.

2. Twist off the cap from the ignition lock cylinder.

3. NOTE: The lock cylinder is repaired by discarding the inoperative lock cylinder and building a new lock cylinder using the appropriate lock

repair package (F85Z-11582-AA). The lock repair package includes a detailed instruction sheet to build the new lock cylinder to the current key code of the vehicle.

Remove the ignition lock cylinder. -

Use a 1/8-inch diameter drill bit to drill out the lock cylinder retaining pin.

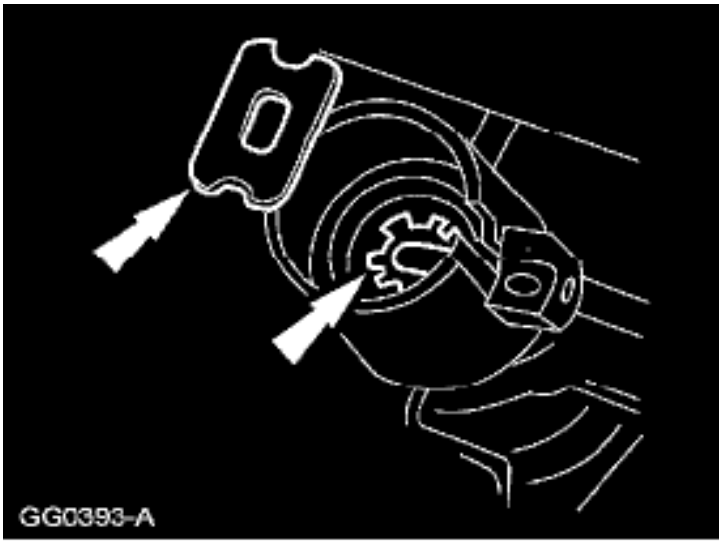
- Use a 3/8-inch drill bit to drill down the middle of the ignition lock key slot until the ignition lock cylinder breaks loose.

- Remove and discard the ignition lock cylinder and clean the drill shavings from the steering column.

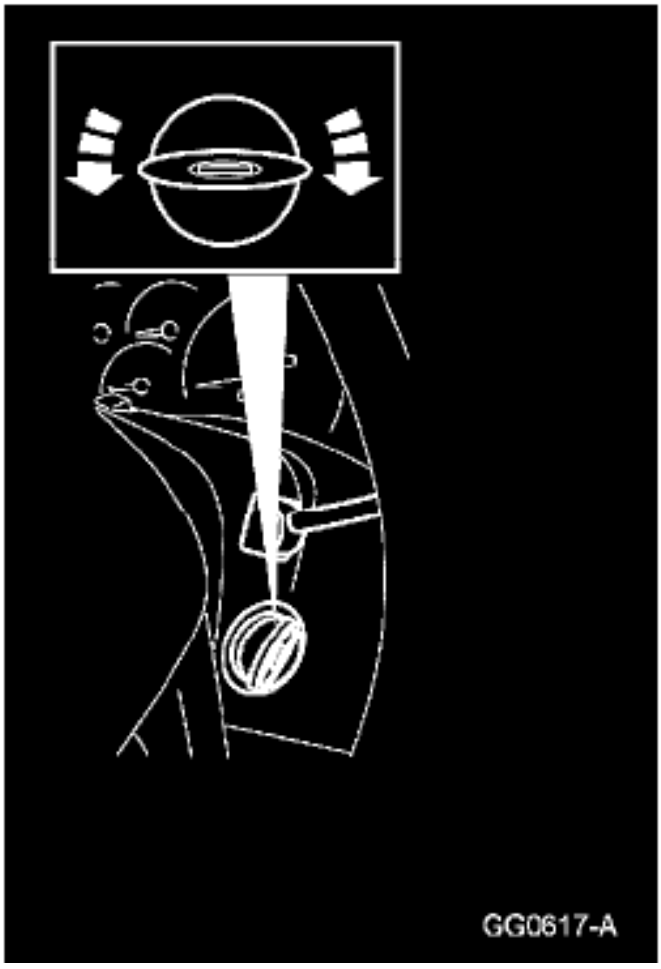
4. Remove the bearing retainer.

5. Remove the bearing and gear.

- Thoroughly clean all drill shavings from the steering column and inspect it for damage.



GG0393-A



GG0617-A

6. To install, reverse the removal procedure.

- Install a new ignition lock cylinder.
- Verify ignition lock cylinder operation.

Starter Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

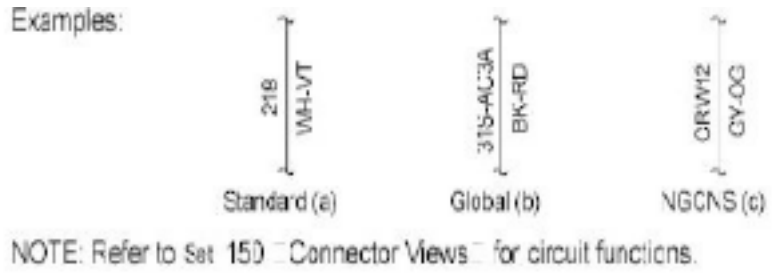
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

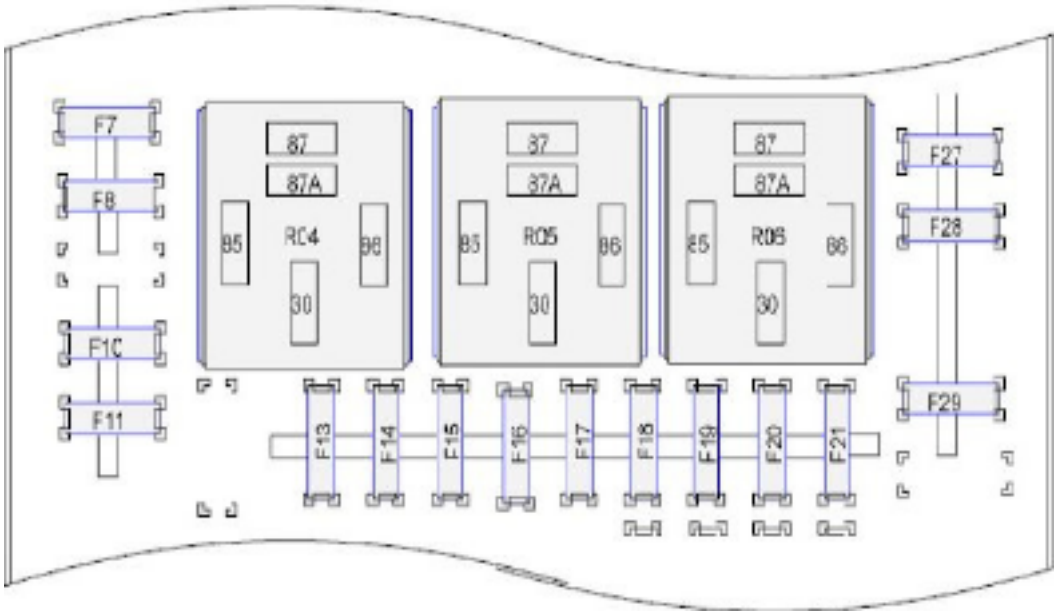
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

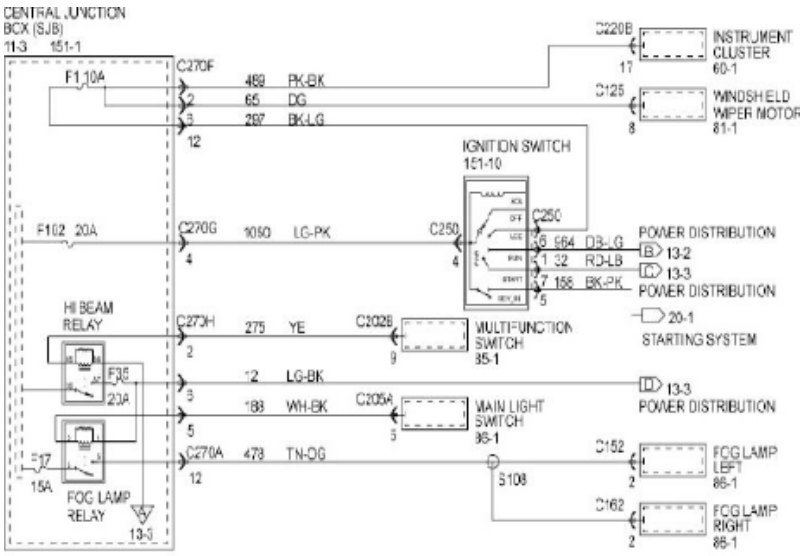
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

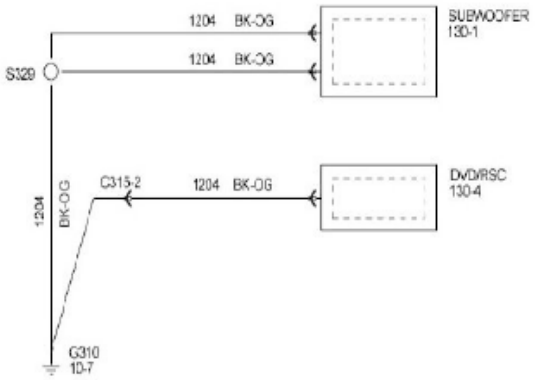
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

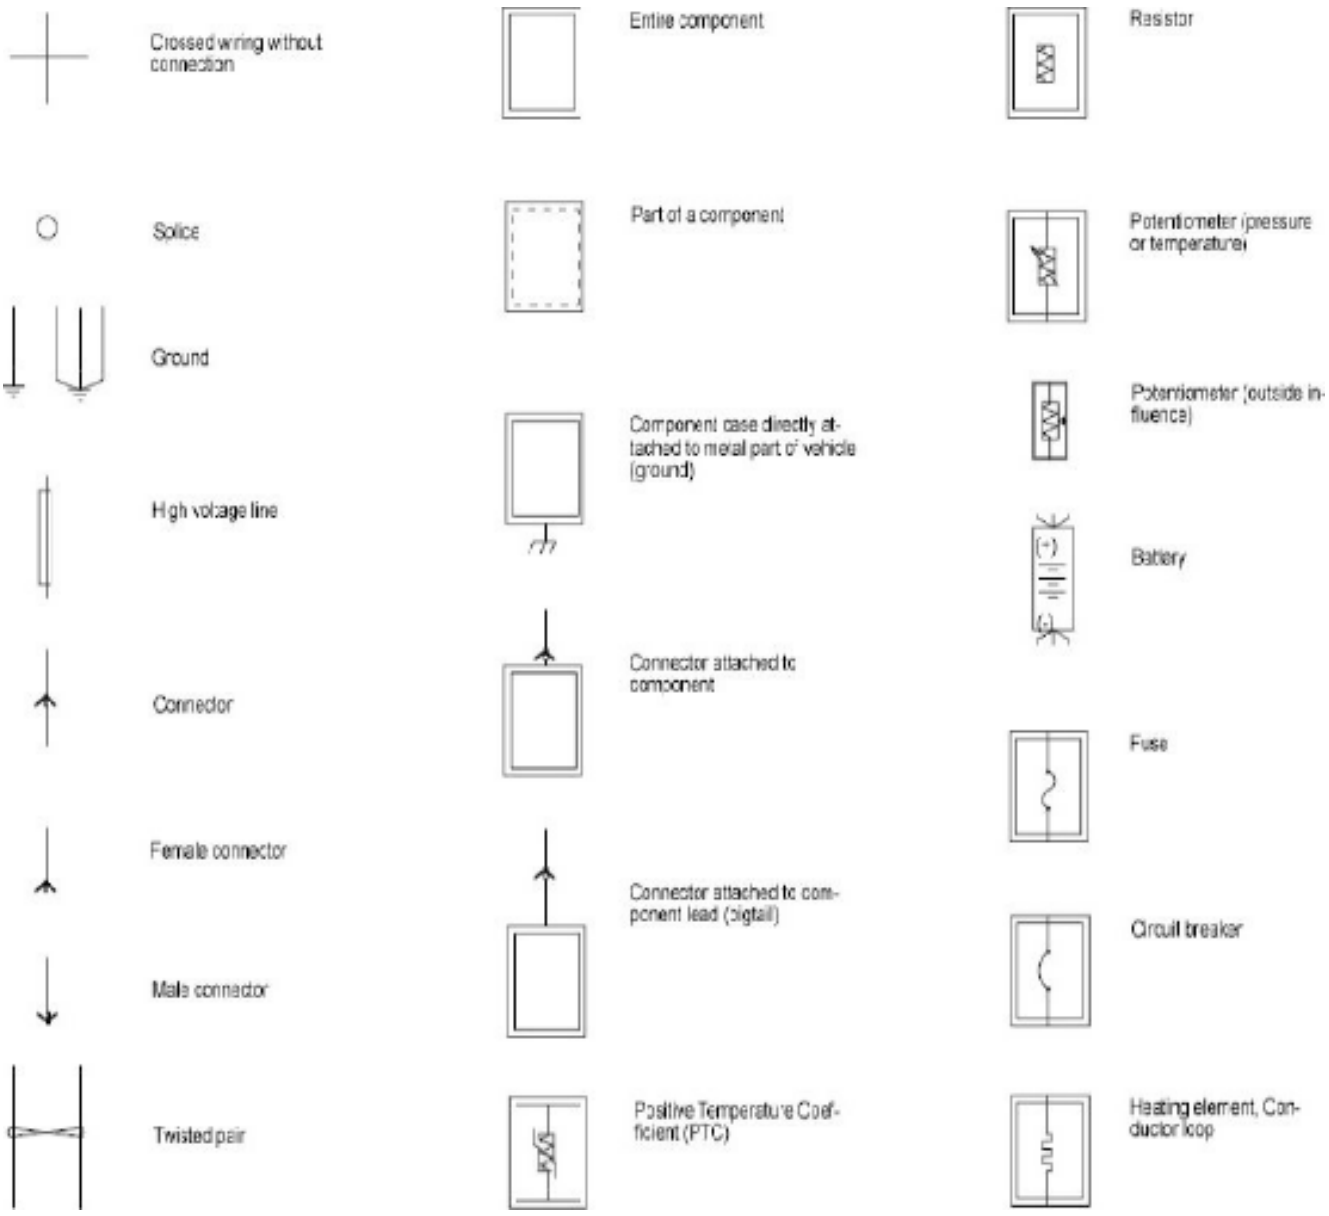
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

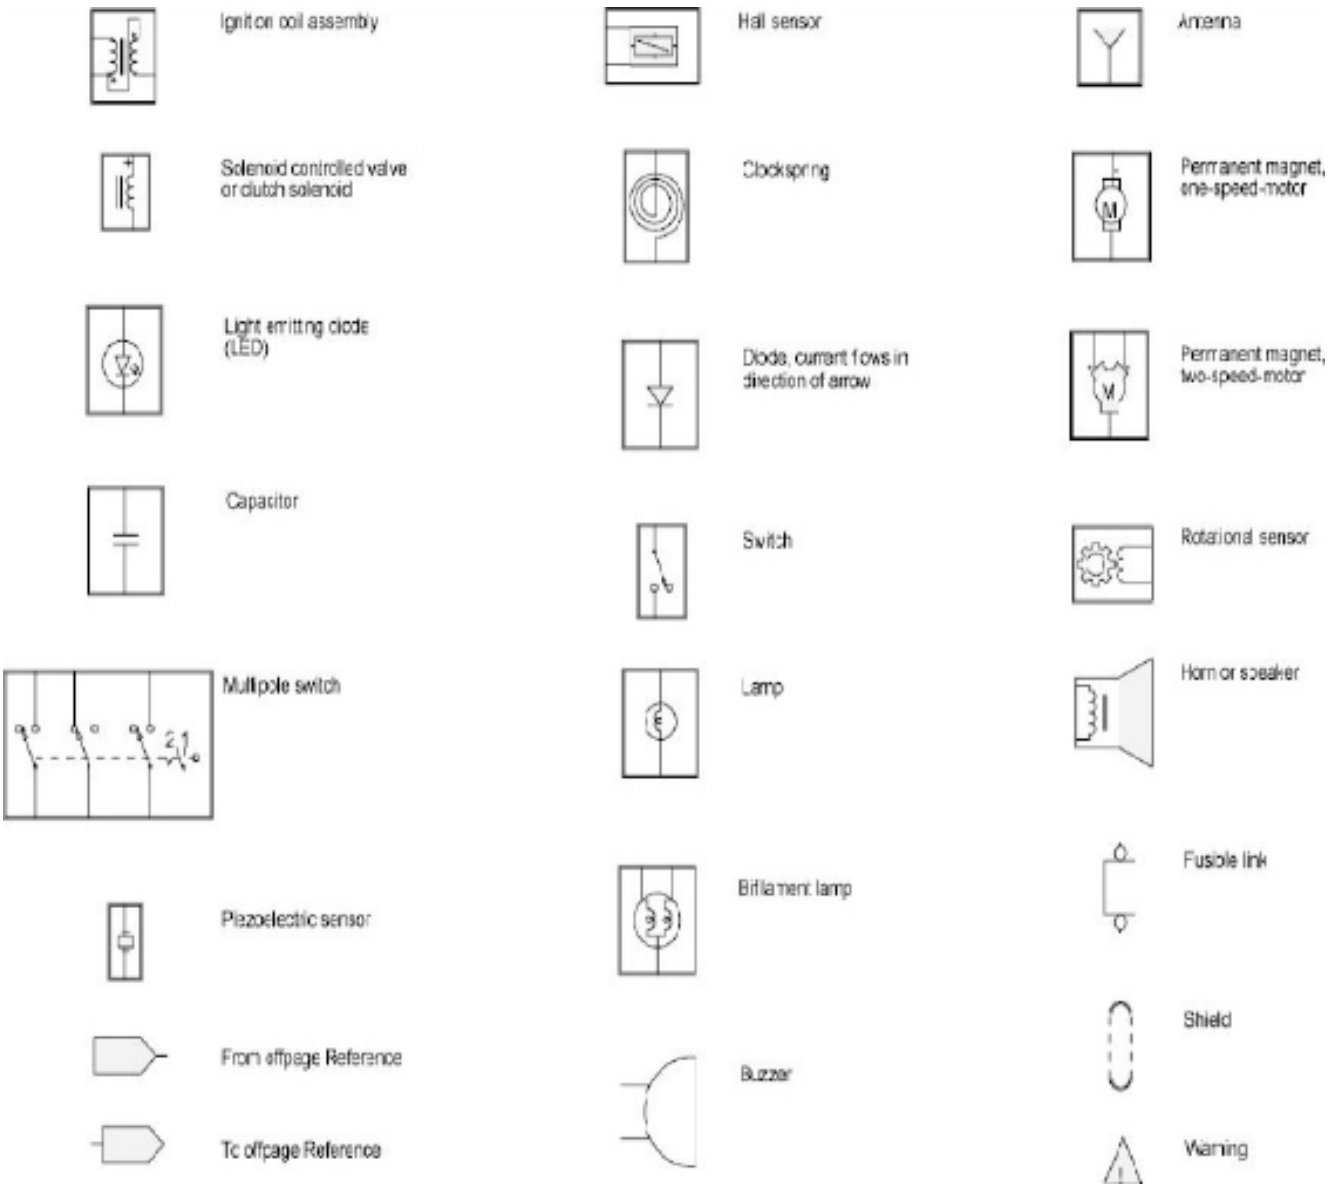
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

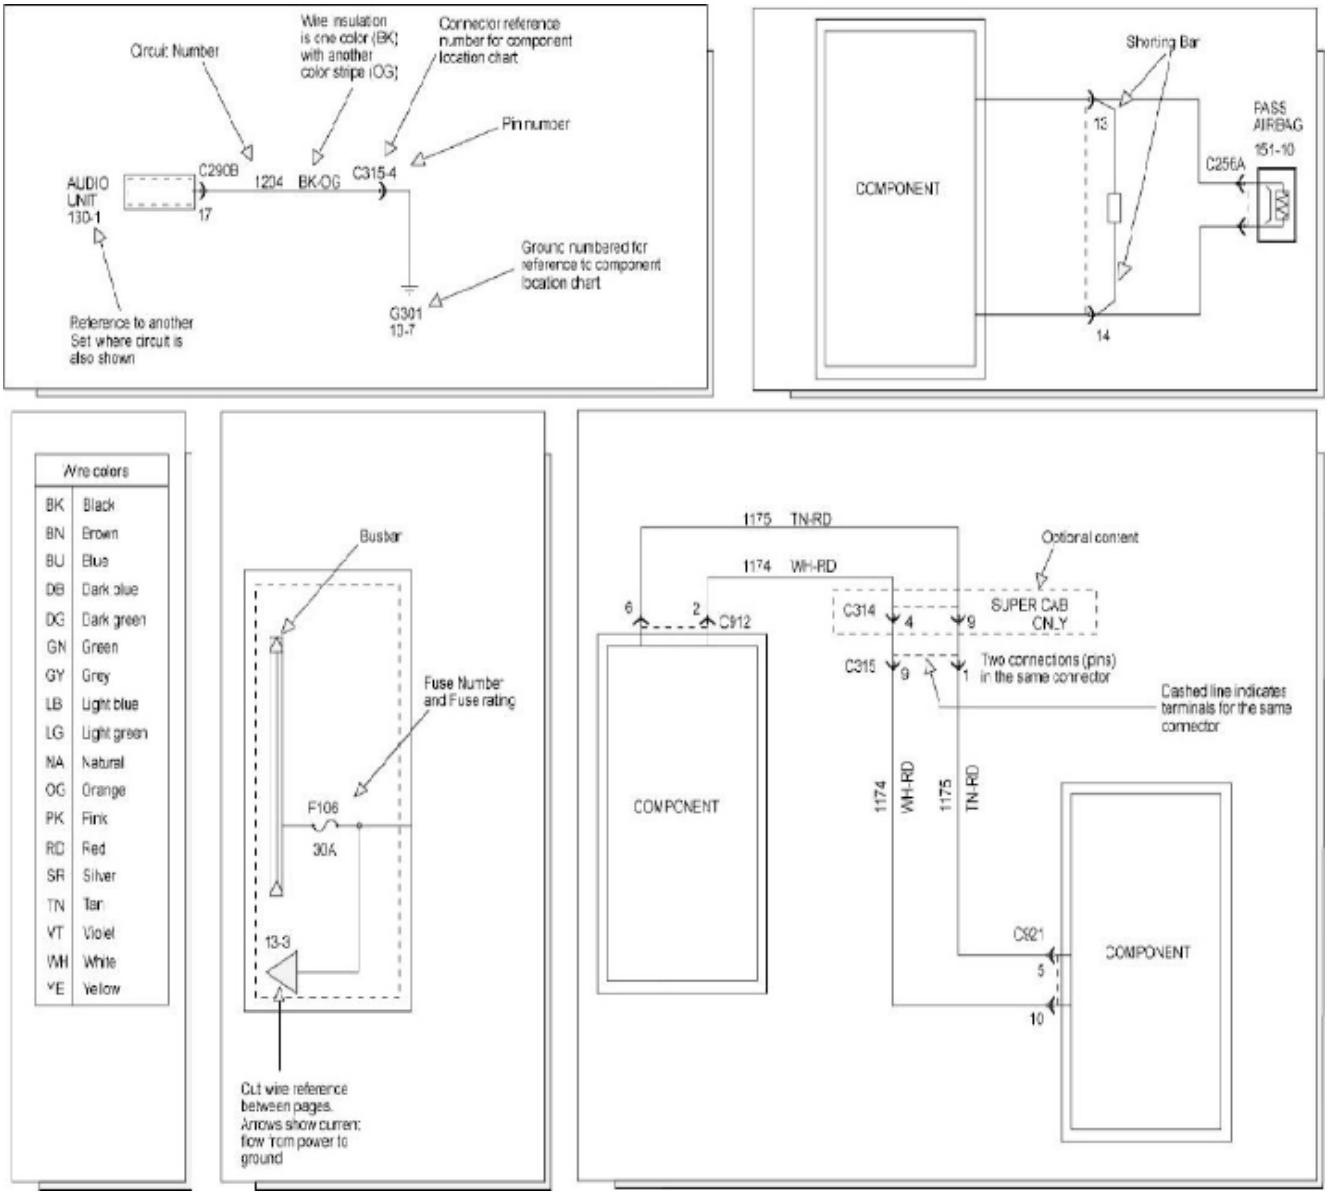
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

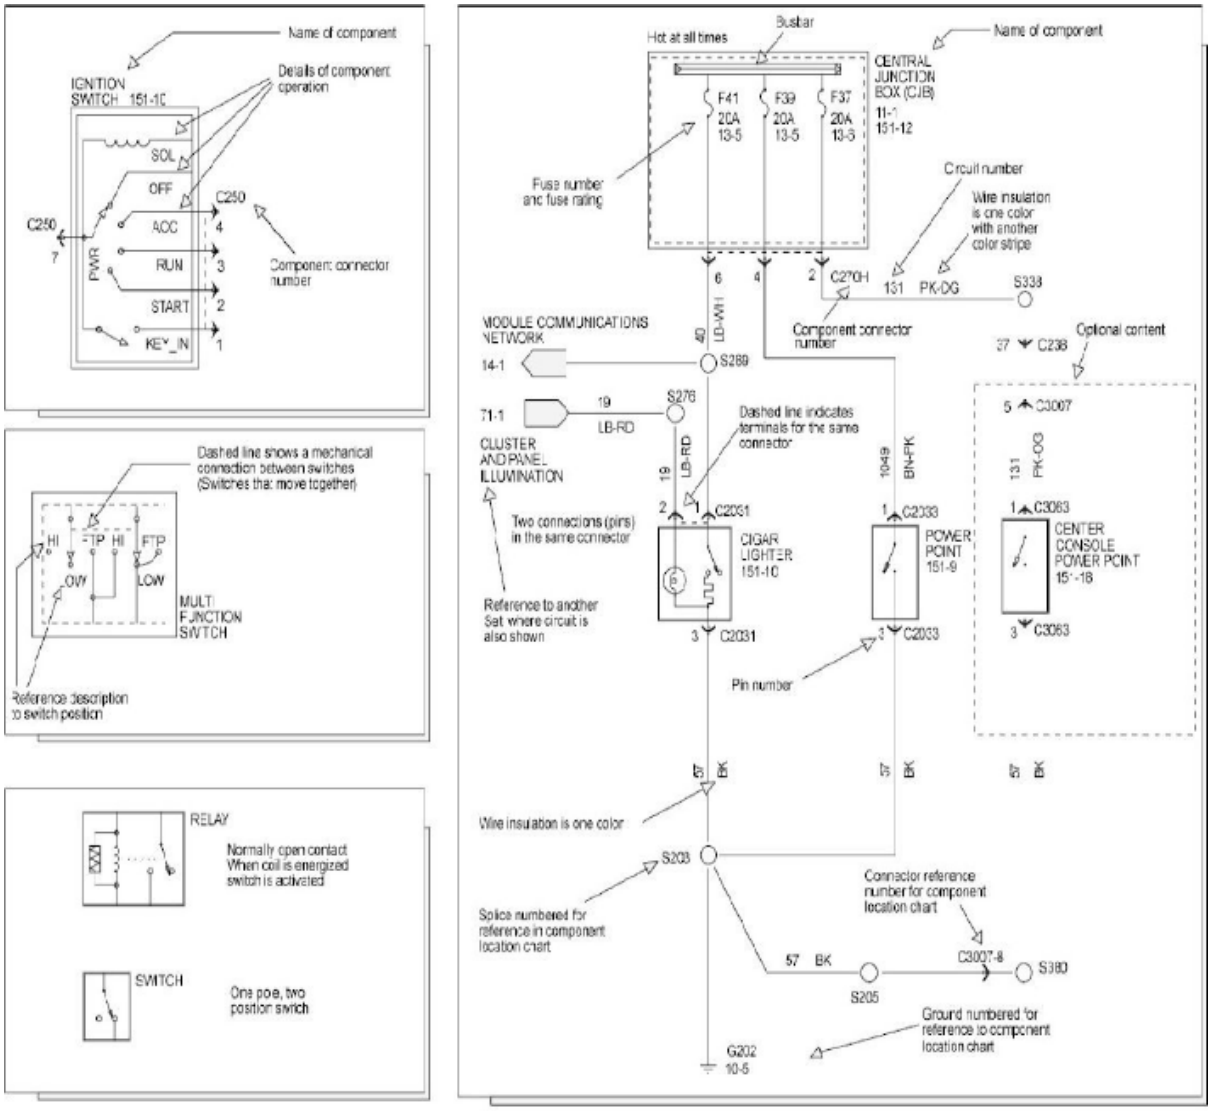
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door

Starter Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

3 = Broken strands intermittent signal

4 = Circuit insulation

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

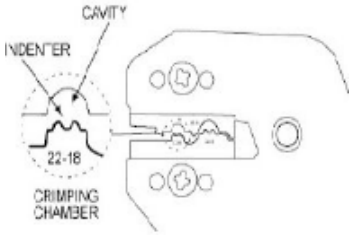
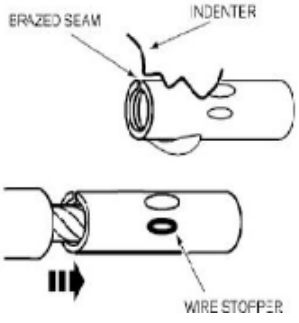
PROPER WIRE STRIP
IMPROPER WIRE STRIP



CAVITY
INDENTER
22-18
CRIMPING CHAMBER



BRAZED SEAM
INDENTER
WIRE STOPPER

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

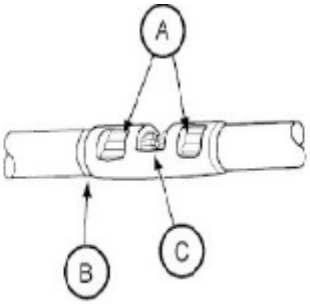
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

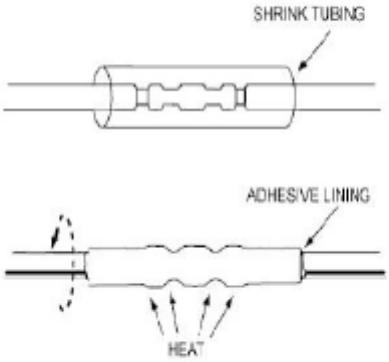
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x cia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Figtail only

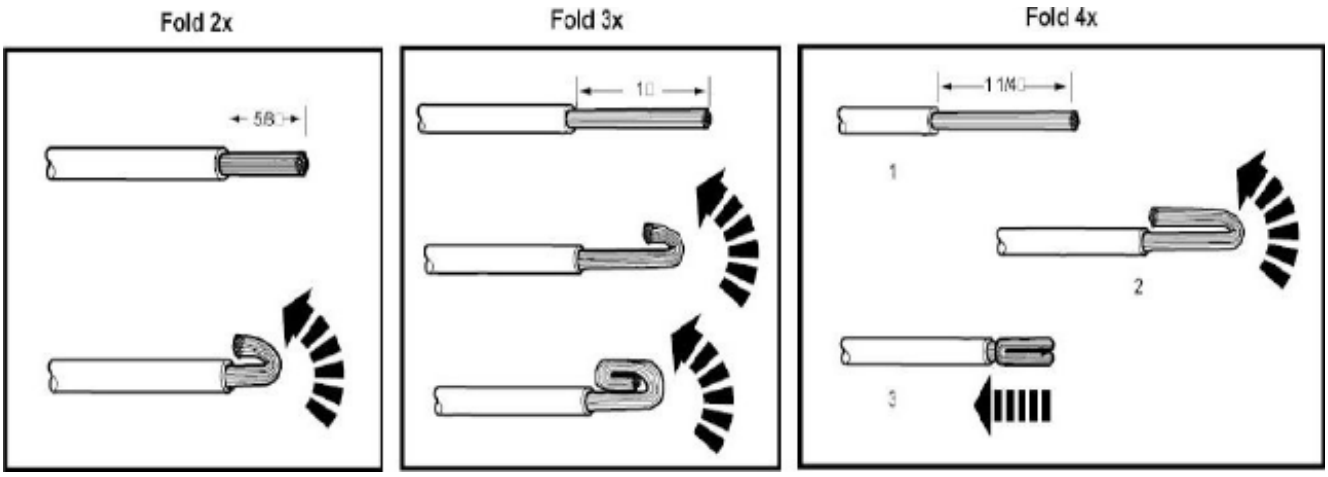
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Starter Relay: Description and Operation

The starter relay:

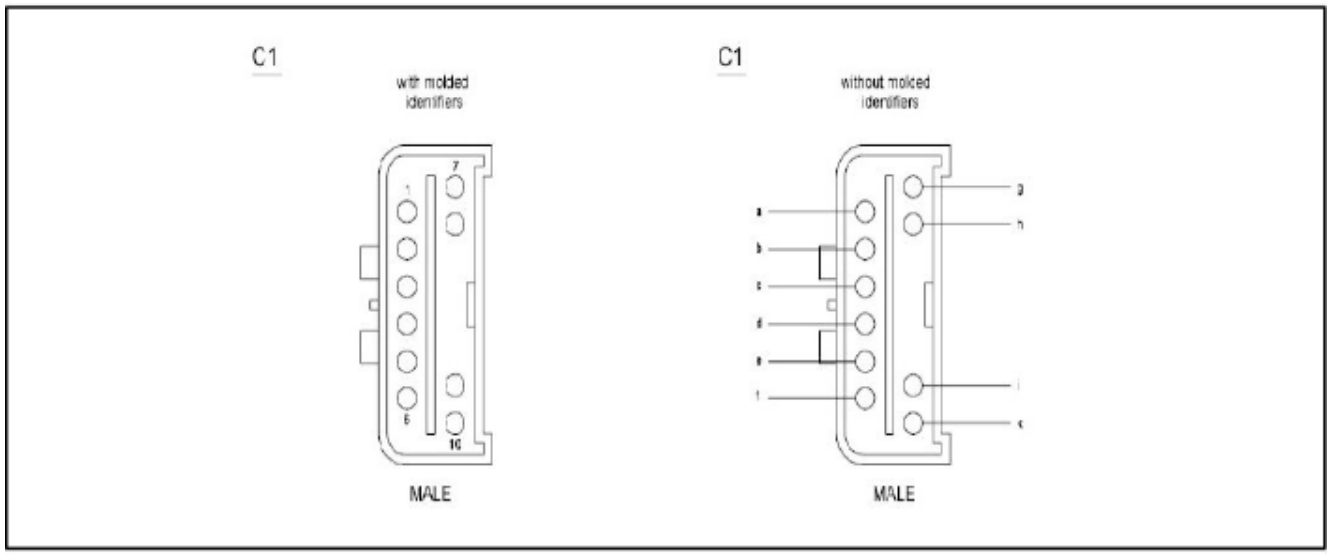
^ Is a mini ISO relay. A. switches power to the starter solenoid to engage the starter motor when it is provided a ground throigh the PCM.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



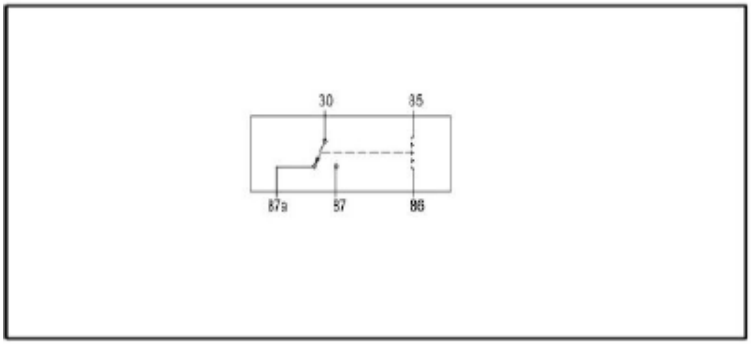
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

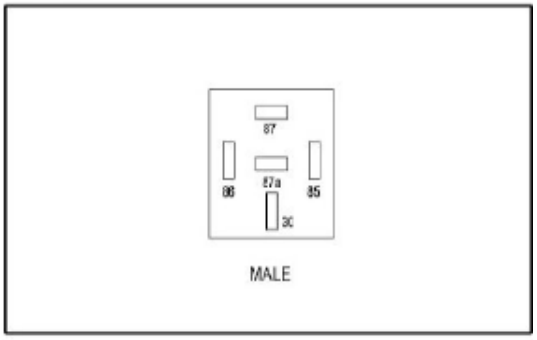
Starter Relay: Testing and Inspection

Relay □ Mini ISO

Schematic



Terminals

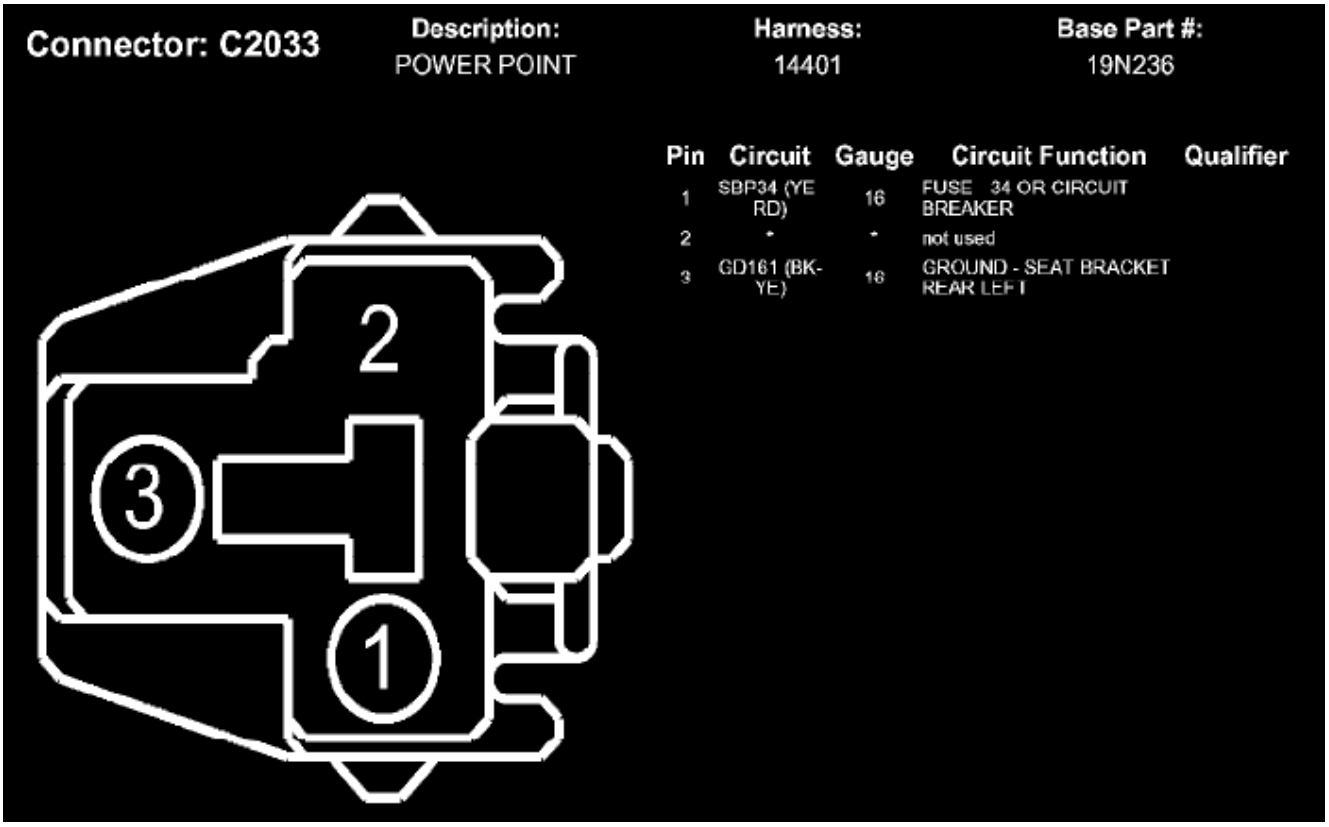


Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.



Pin	Circuit	Gauge	Circuit Function	Qualifier

Auxiliary Power Outlet: Service and Repair

POWER POINT

Special Tool(s)

Special Tool(s)

Removal

NOTE: Power point cover may differ depending on location.

1. Open the power point cover. 2. Install the special tool in one of the power point socket slots.

3. Position the special tool so that it engages in the adjacent slot.

4. Using the special tool, pull the power point socket out of the retainer.

5. Disconnect the electrical connector.

Installation

1. Connect the electrical connector. 2. Slide the power point socket into the retainer.

Fuse Block: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

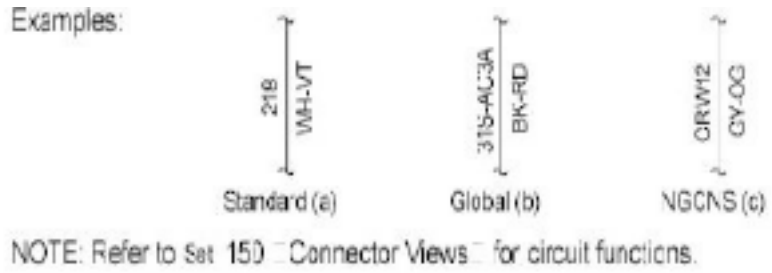
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

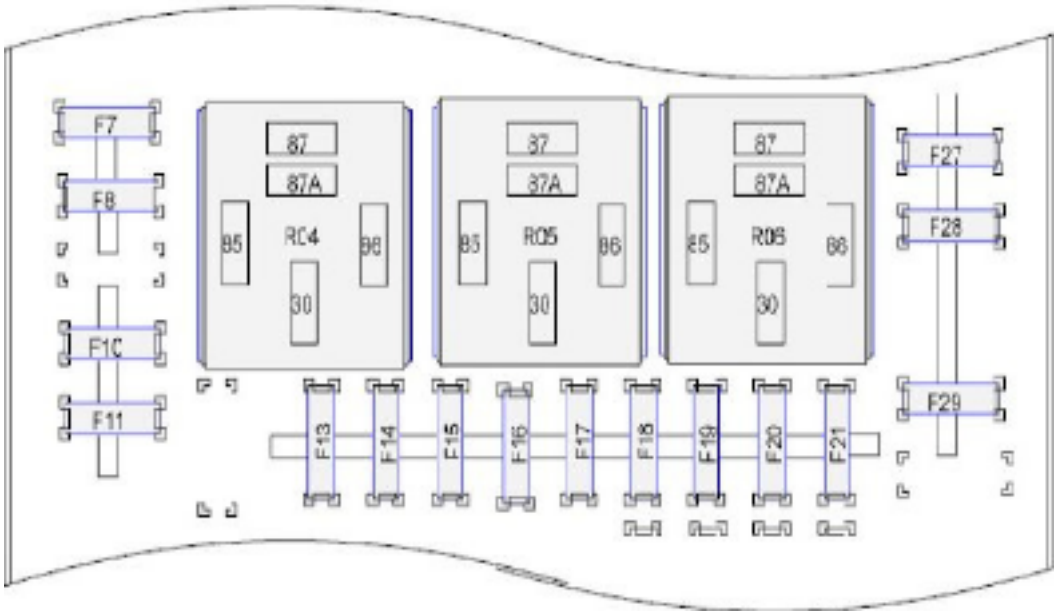
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

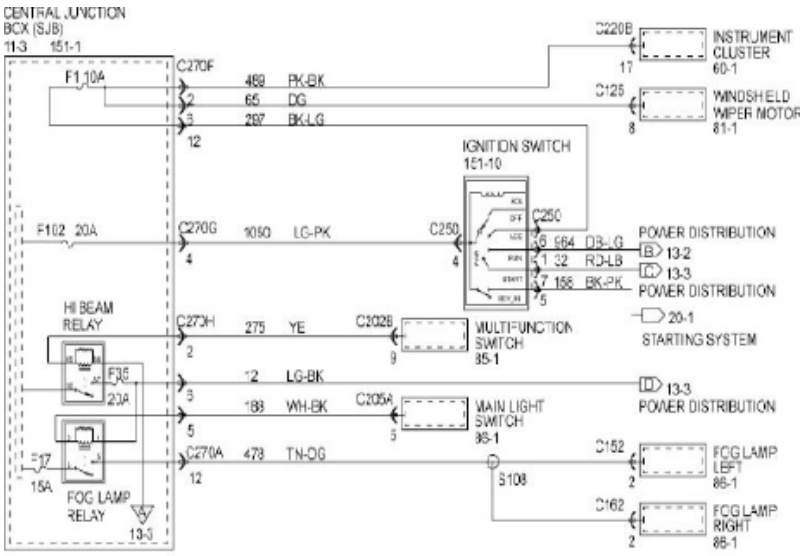
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

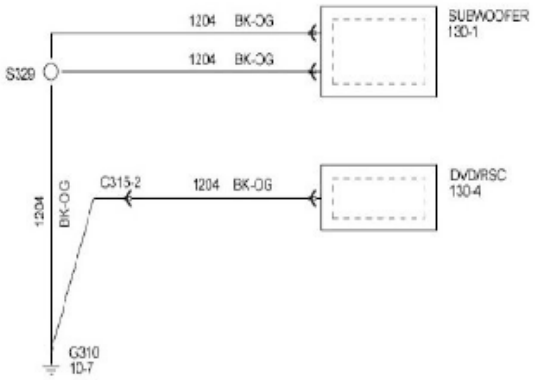
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

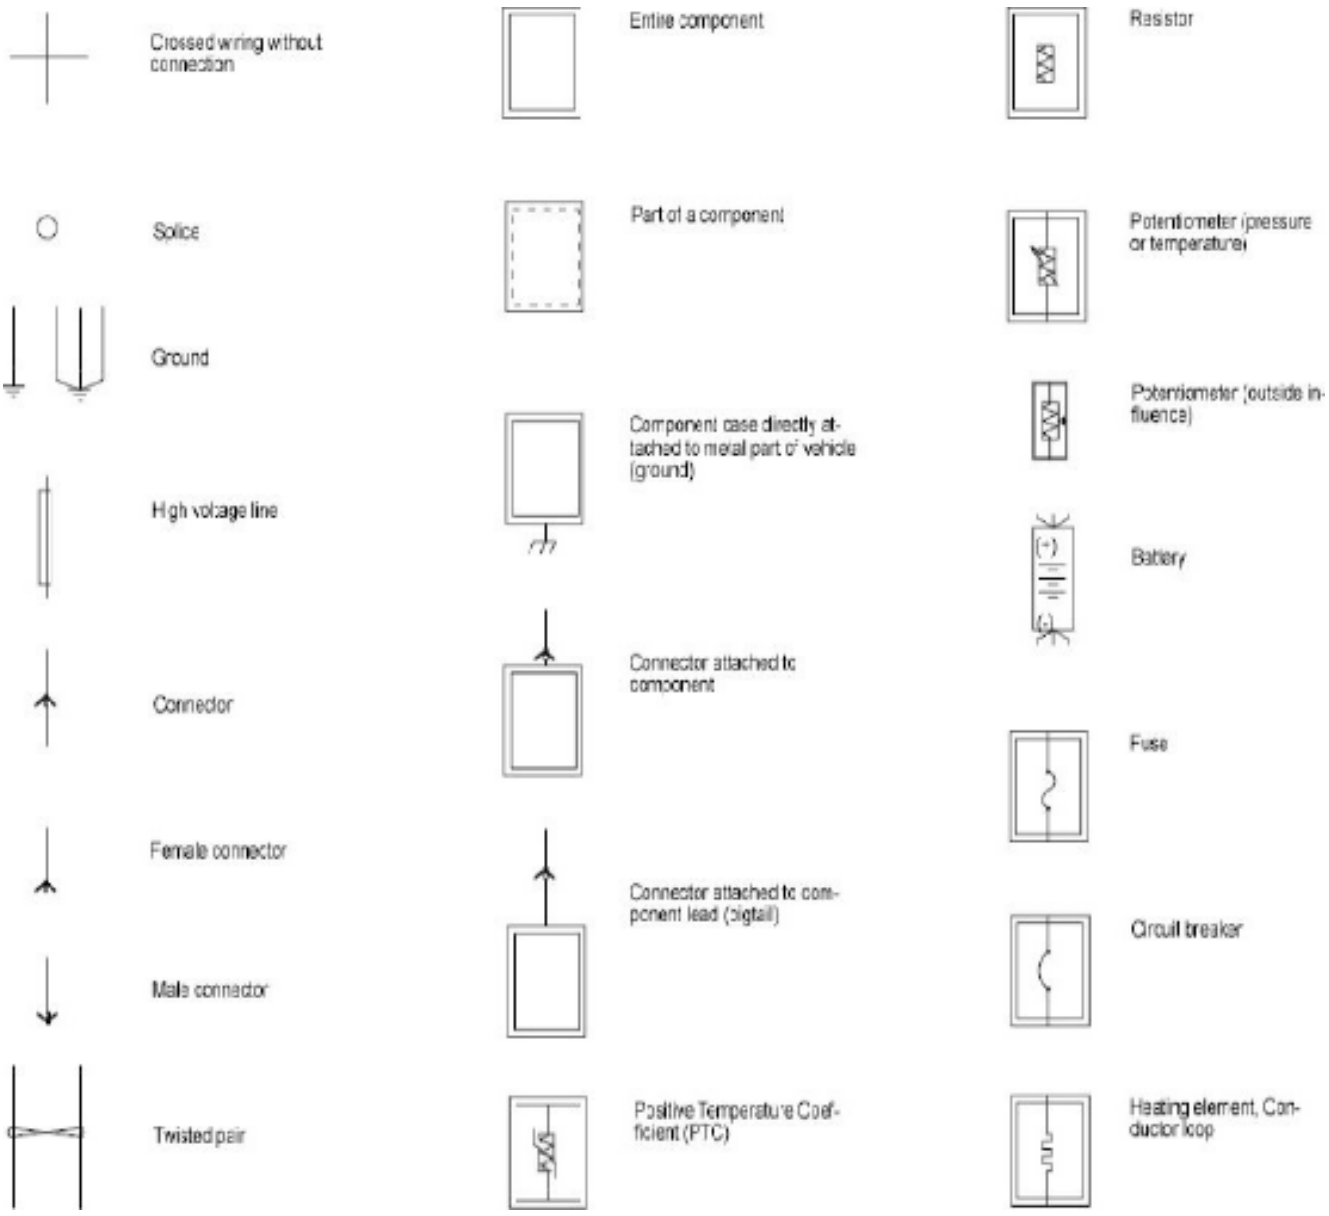
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

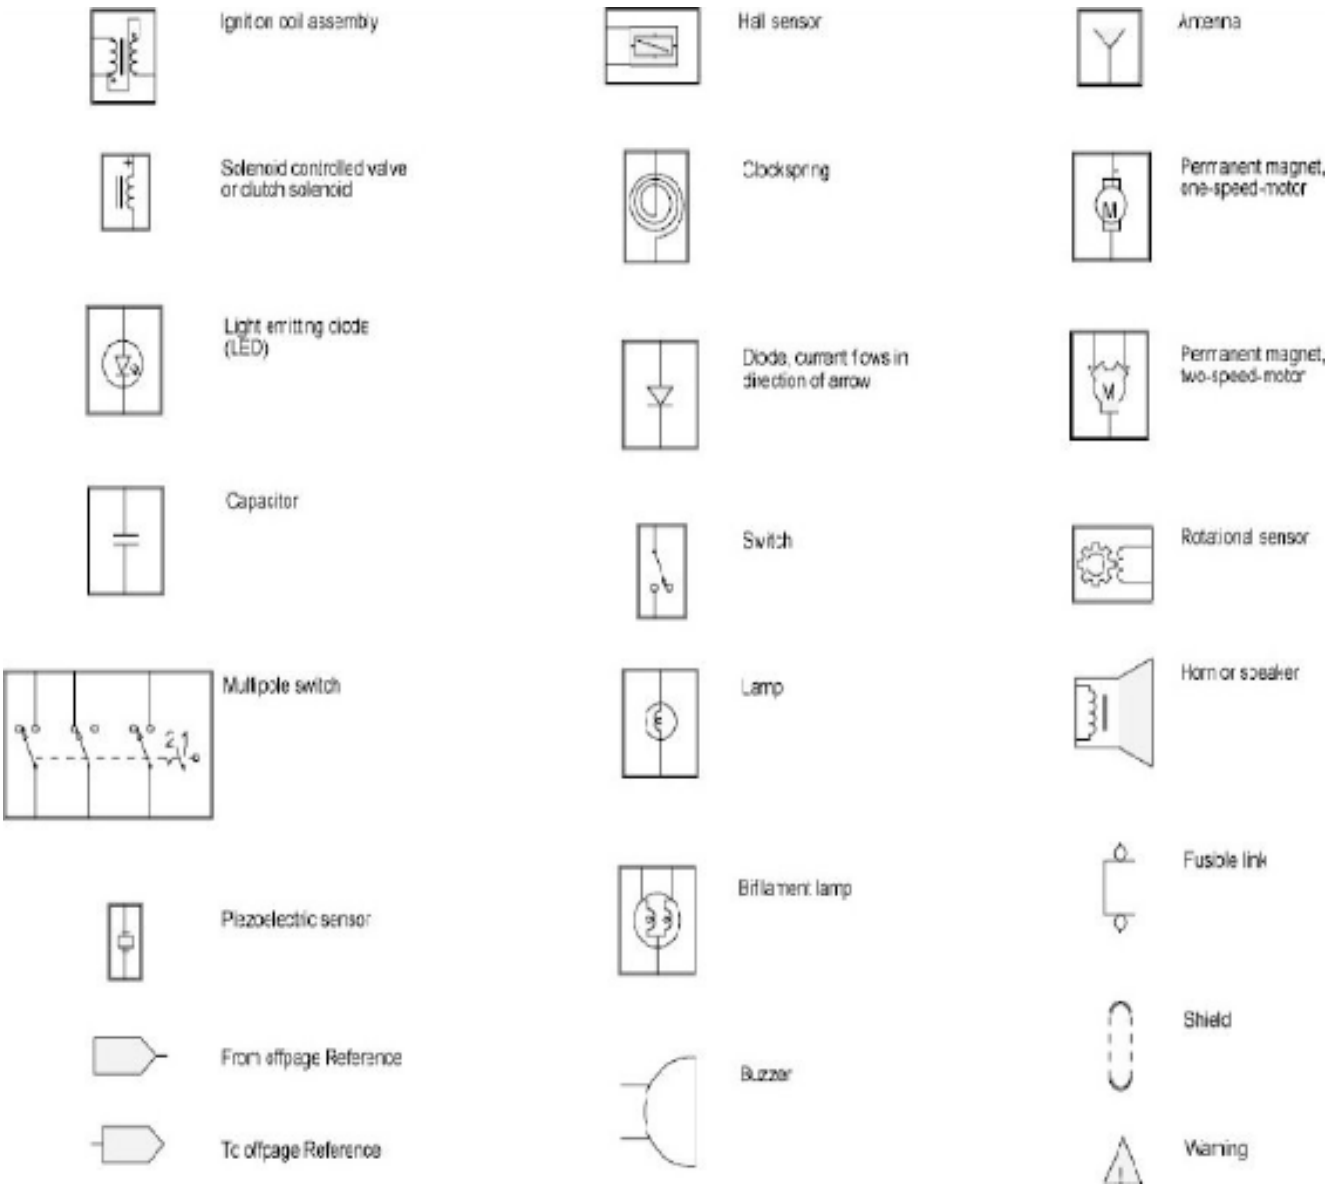
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

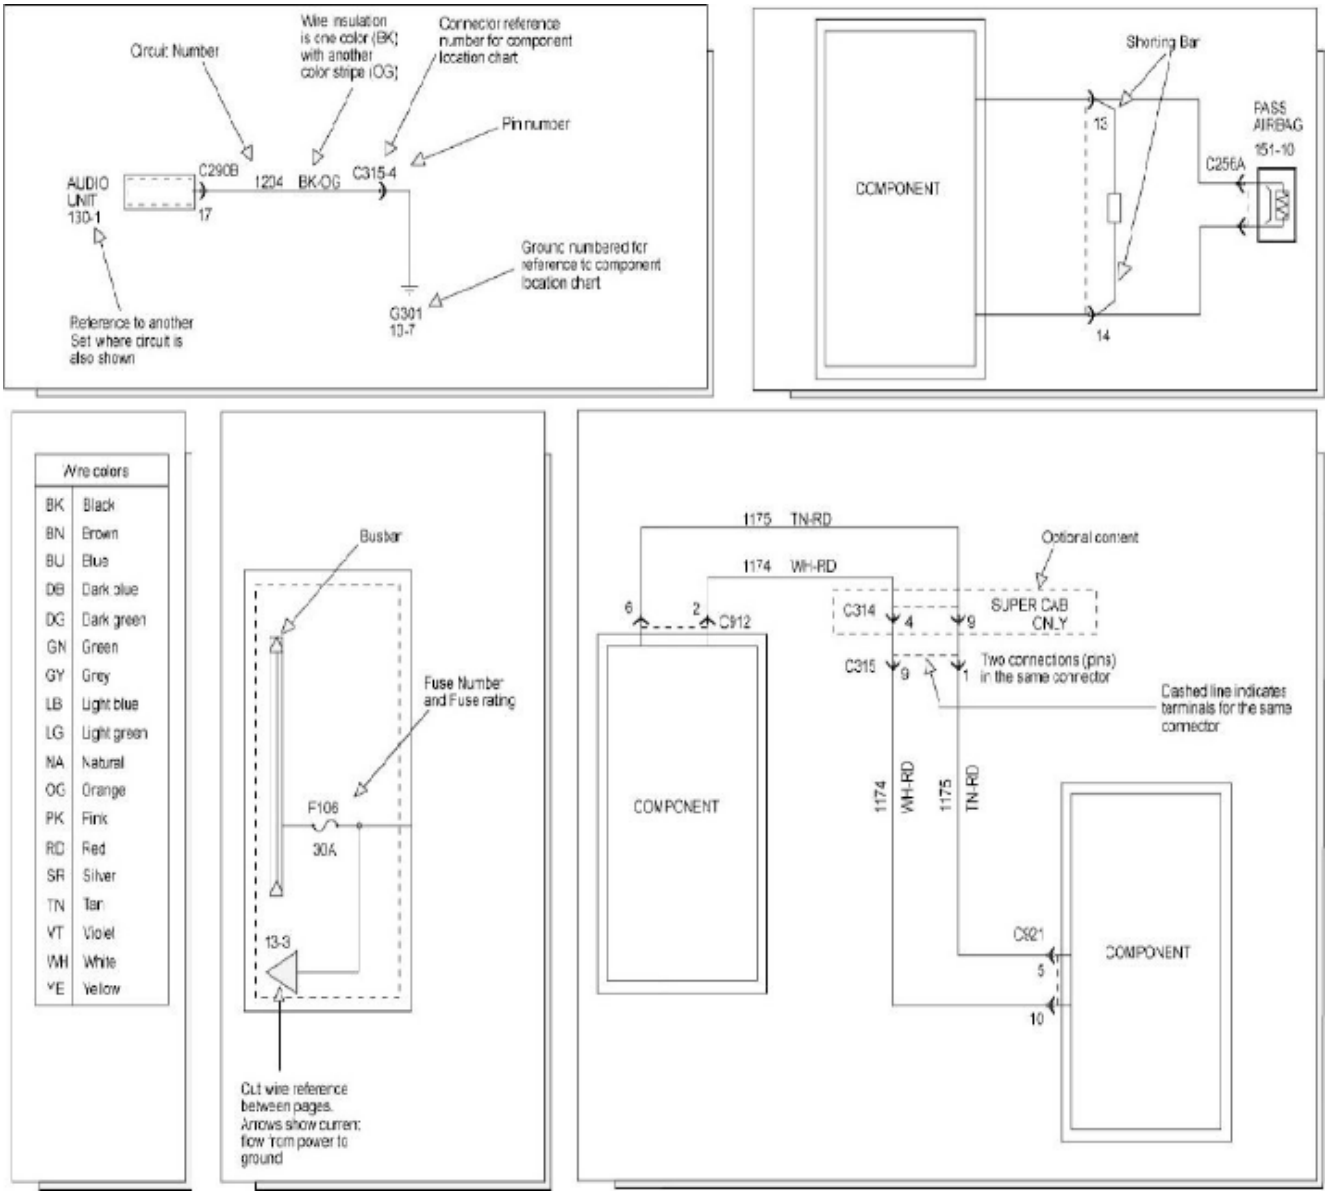
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

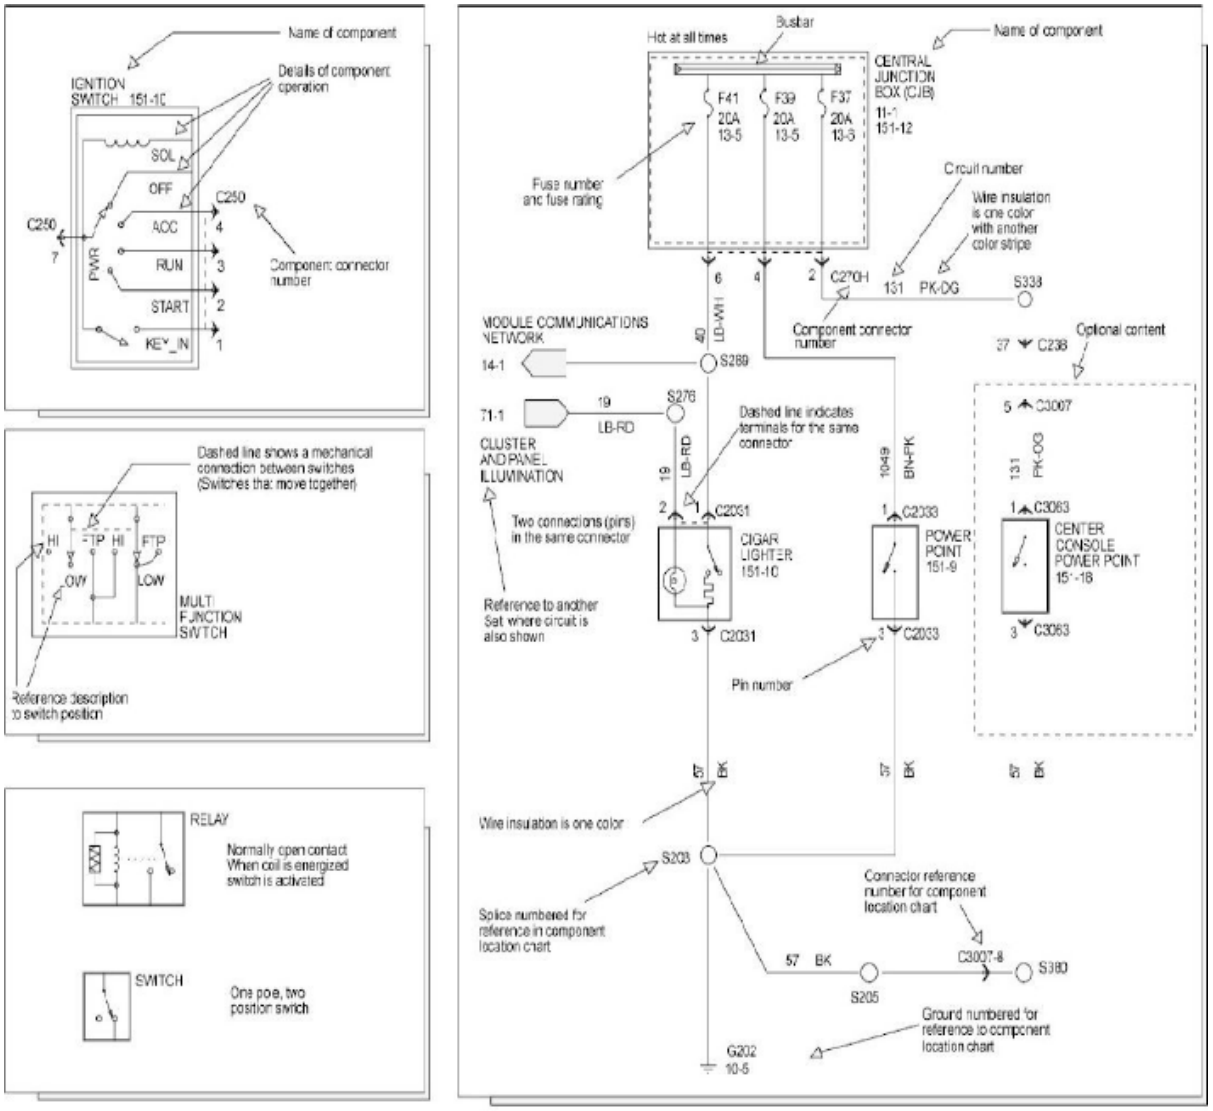
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Fuse Block: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Defective insulation stripping

1 = Proper crimp

2 = Insulation not removed

3 = Wire strands missing

4 = Intermittent signals through pierced insulation

Partially mated connectors

1 = Seal

2 = Displaced tab

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Male half

7 = Intermittent contact

Lock may be displaced into an unlocked position; pull on the connector to verify the lock.

Deformed (enlarged) female terminals

1 = Enlarged

2 = Normal

Any probe entering the terminal may enlarge the contact spring opening creating an intermittent signal.

Insert the correct mating terminal (Location A) from the service kit and feel for a loose fit.

3 = Broken strands intermittent signal

4 = Circuit insulation

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

WIRE STOPPER

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

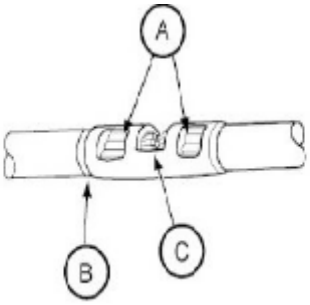
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

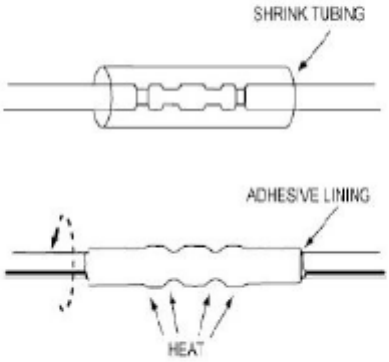
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4□ strip, cut 9 strands	* 1/4□ strip, cut 2 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip, fold 3x dia.
	16-14	* 1/4□ strip, cut 7 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip fold 2x dia	1□ strip, fold 3x dia.	1 1/4□ strip, fold 4x dia.	Not Recommended
	12-10	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip fold 3x cia.	1 1/4□ strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Figtail only

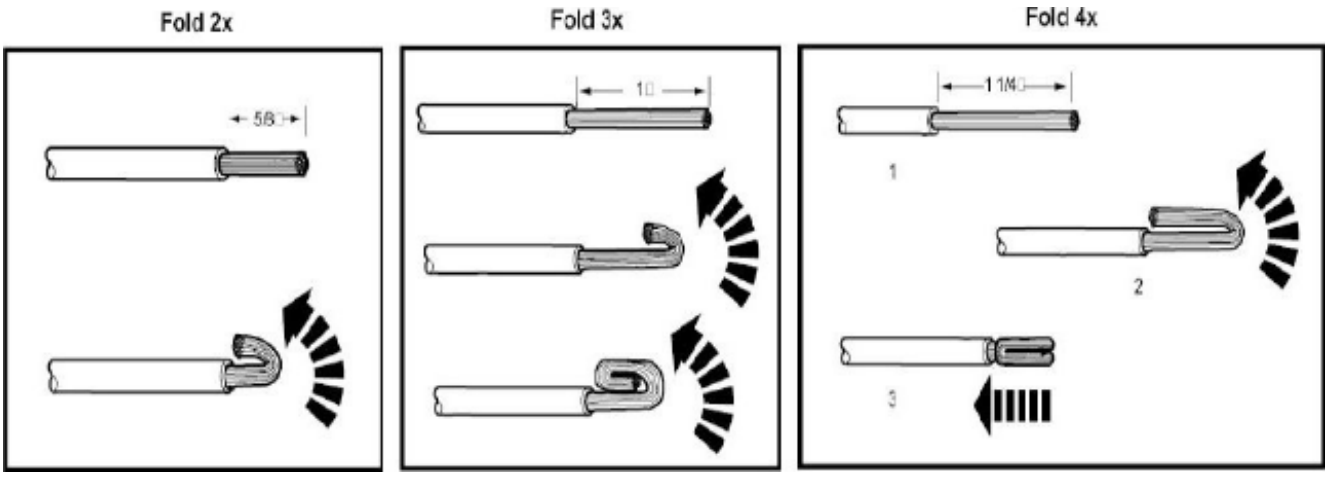
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

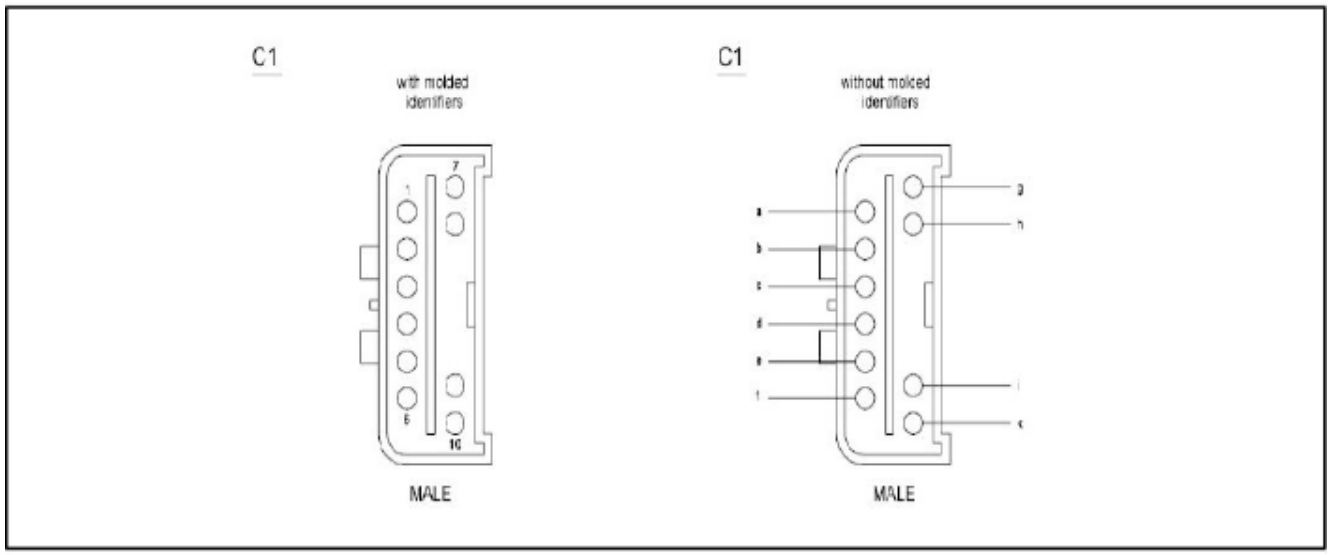
Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



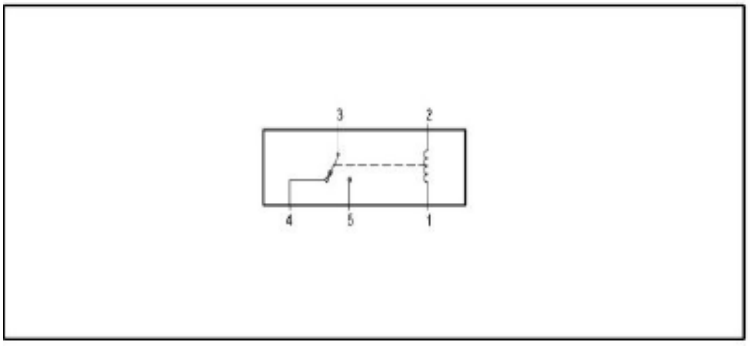
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

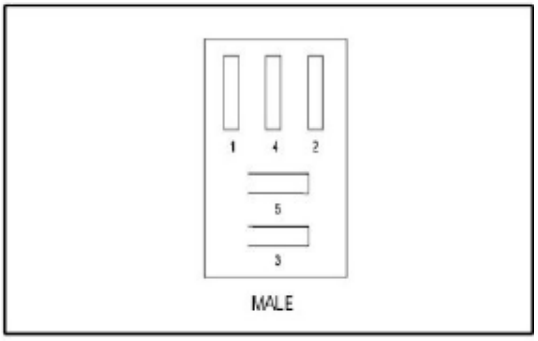
Micro ISO Relay: Testing and Inspection

Relay □ Micro ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	1 and 2	63□102 Ω
Contact	3 and 4	Closed circuit
	3 and 5	Open circuit
Coil □ Contact	1 and 3	Open circuit
	1 and 4	Open circuit
	1 and 5	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 2 and 3 to 12V DC power and pin 1 to ground. Measure voltage between pin 5 and pin 1. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 2 and measure voltage between pin 4 and pin 1. If the voltage is 12V, the relay is okay. If not, replace the relay.

Item	Part Number	Description
1	—	Smart junction box (SJB) electrical connectors (part of 14401)
2	—	SJB screws (3 required)
3	15604	SJB

Power Distribution Module: Service and Repair

SMART JUNCTION BOX (SJB)

Removal

CAUTION: Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.

NOTE: -

Prior to the replacement of the module, it is necessary to upload the module configuration information into the appropriate scan tool. This information must be downloaded into the new module after installation.

- The tire pressure monitoring system (TPMS) functionality is integral to the smart junction box (SJB).

- The steps included in the SJB removal and installation procedure are critical to restoring the vehicle security and tire pressure monitoring systems to normal operation. A new SJB is delivered in a manufacturing mode with 7 pre-set DTCs related to the TPMS. To clear the DTCs, successful configuration of the SJB must occur, followed by successful TPMS sensor training, and a successful self-test, including clearing of the DTCs. The DTCs are as follows:

- B106D (Tire Pressure Monitor System [TPMS] Initiators Not Configured)

- B2477 (Module Configuration Failure)

- B2868 (Left Front Tire Pressure Sensor Fault)

- B2869 (Right Front Tire Pressure Sensor Fault)

- 2870 (Right Rear Tire Pressure Sensor Fault)

- B2871 (Left Rear Tire Pressure Sensor Fault)

- C2780 (ECU in Manufacturer Sub-State)

1. NOTE: This step is necessary only if the SJB is being replaced.

Upload the module configuration information from the SJB.

2. Remove the RH lower cowl trim panel. 3. Disconnect the electrical connectors. 4. Remove the 3 screws and the SJB.

Installation

NOTE: When a new SJB is installed, all customer RKE transmitters may be required to be present in order to program the RKE transmitters to the new SJB.

1. Install the SJB.

- Install the 3 screws.

- Connect the electrical connectors.

2. NOTE: If the SJB was not replaced, this is the last step that is necessary.

Install the RH lower cowl trim panel.

3. NOTE:

- When successful, this step provides the calibration necessary for the SJB operation and clears DTCs B106D and B2477. The clearing of these DTCs indicates the calibration data has been successfully downloaded to the new SJB.

- When successful, this step also programs the remote transmitters into the new SJB. In the event the remote transmitters do not program to the new SJB, all of the remote transmitters will need to be present. Refer to Locks, Remote Keyless Entry Transmitter Programming. This action will program the remote transmitters into the new SJB. See: Accessories and Optional Equipment/Antitheft and Alarm Systems/Keyless Entry/Keyless Entry Transmitter/Testing and Inspection

Download the SJB configuration information from the scan tool into the new SJB.

4. NOTE: When successful, this step clears DTCs B2868, B2869, B2870 and B2871. The clearing of these DTCs indicates the SJB has recognized

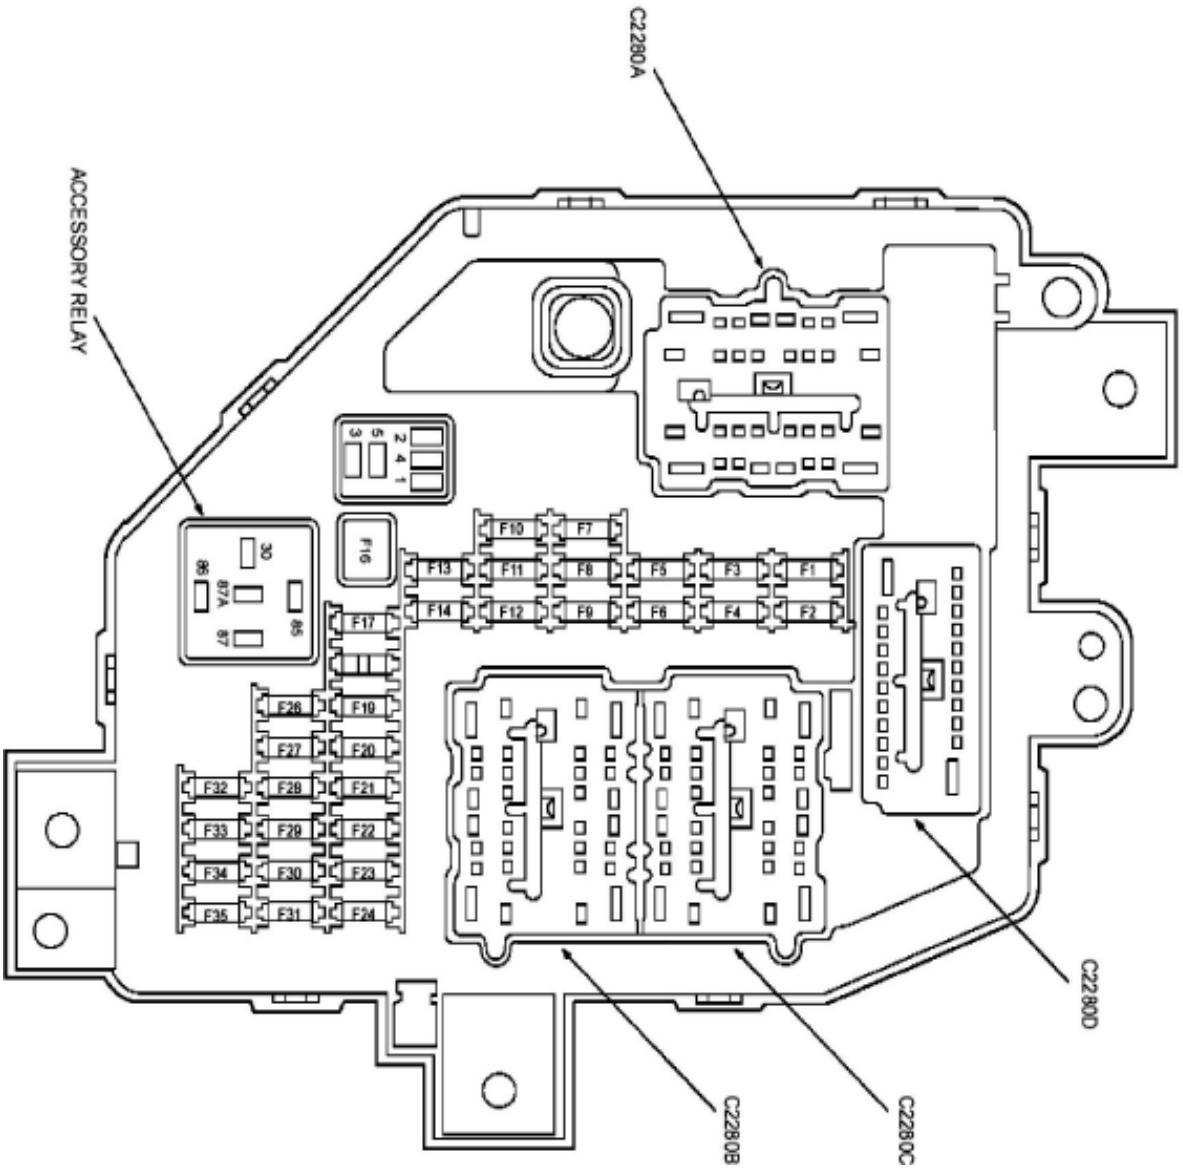
the tire pressure sensors during the training procedure.

Train the tire pressure sensors.

5. NOTE: DTC C2780 will not clear if any other DTCs are present in the SJB. When successful, this step will clear the DTC C2780.

Carry out the SJB on-demand self-test by clearing DTCs, and then retrieving DTCs to confirm all DTCs have been cleared.

SMART JUNCTION BOX (SJB)

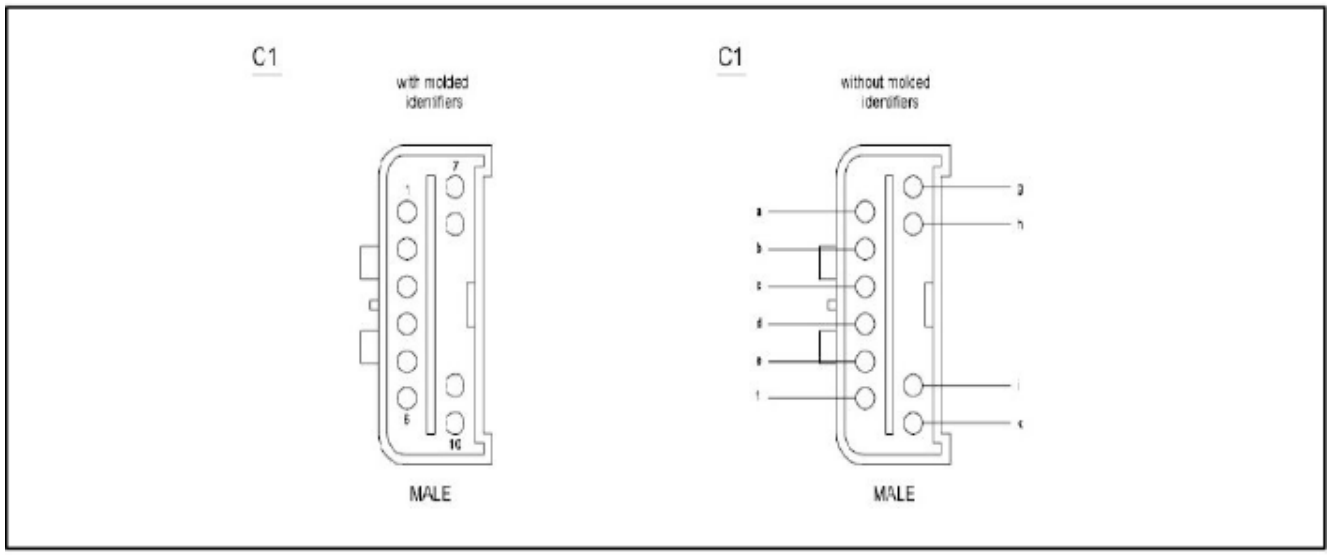


Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



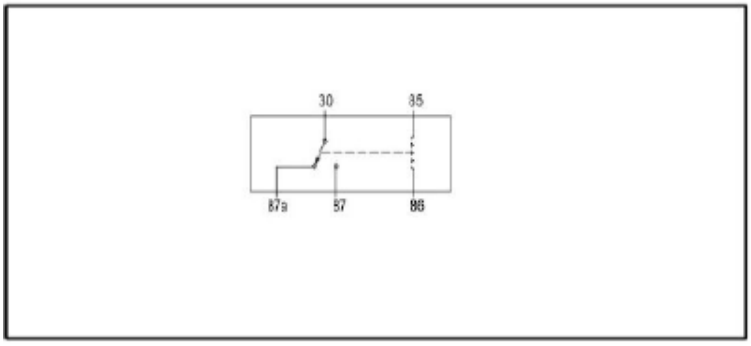
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

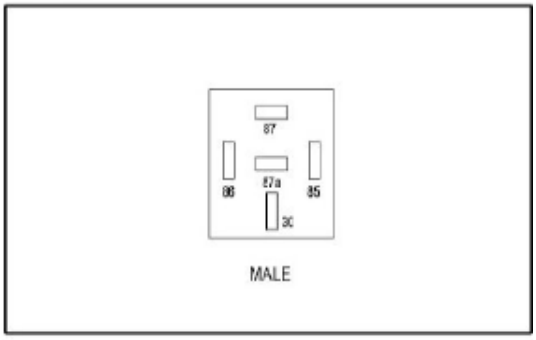
Power Distribution Relay: Testing and Inspection

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 □ 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

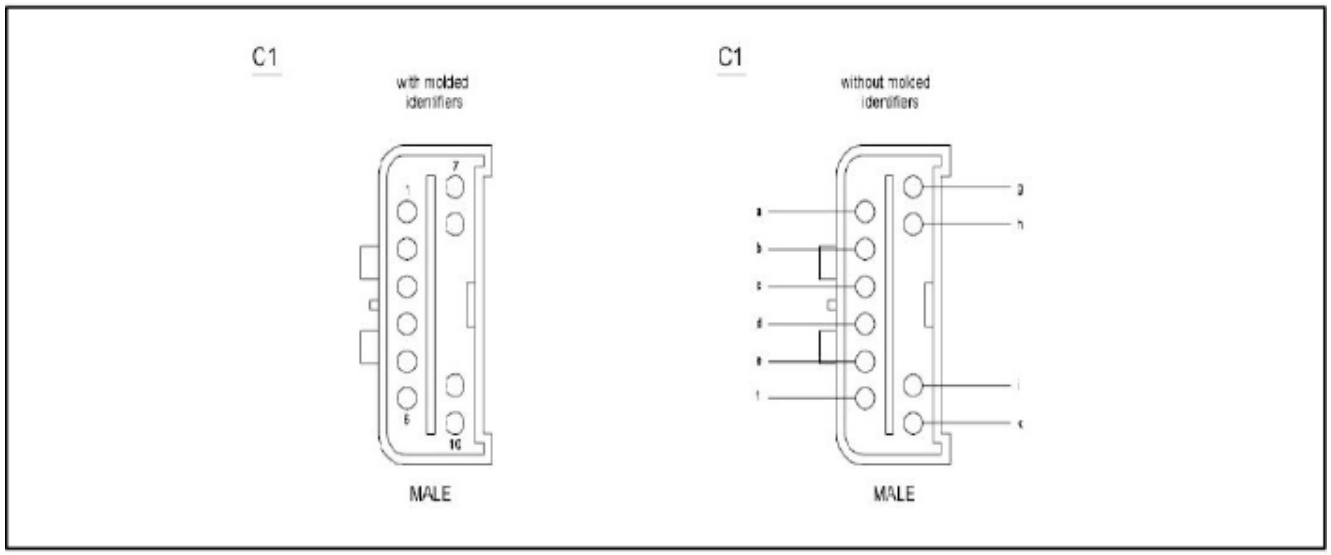
Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



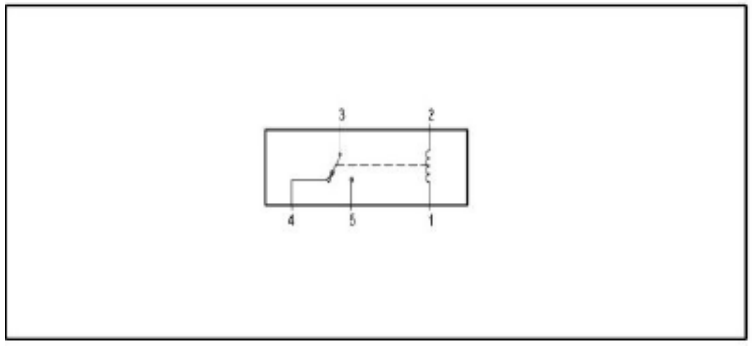
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

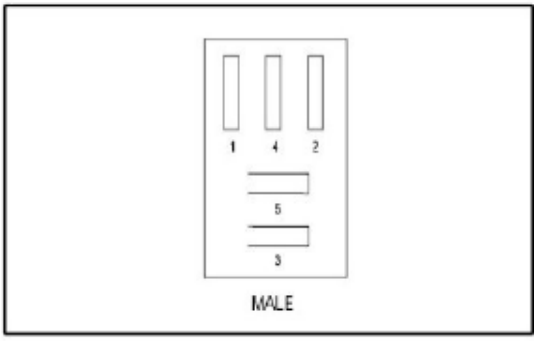
Micro ISO Relay: Testing and Inspection

Relay □ Micro ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	1 and 2	63□102 Ω
Contact	3 and 4	Closed circuit
	3 and 5	Open circuit
Coil □ Contact	1 and 3	Open circuit
	1 and 4	Open circuit
	1 and 5	Open circuit

Component testing procedure (voltage applied)

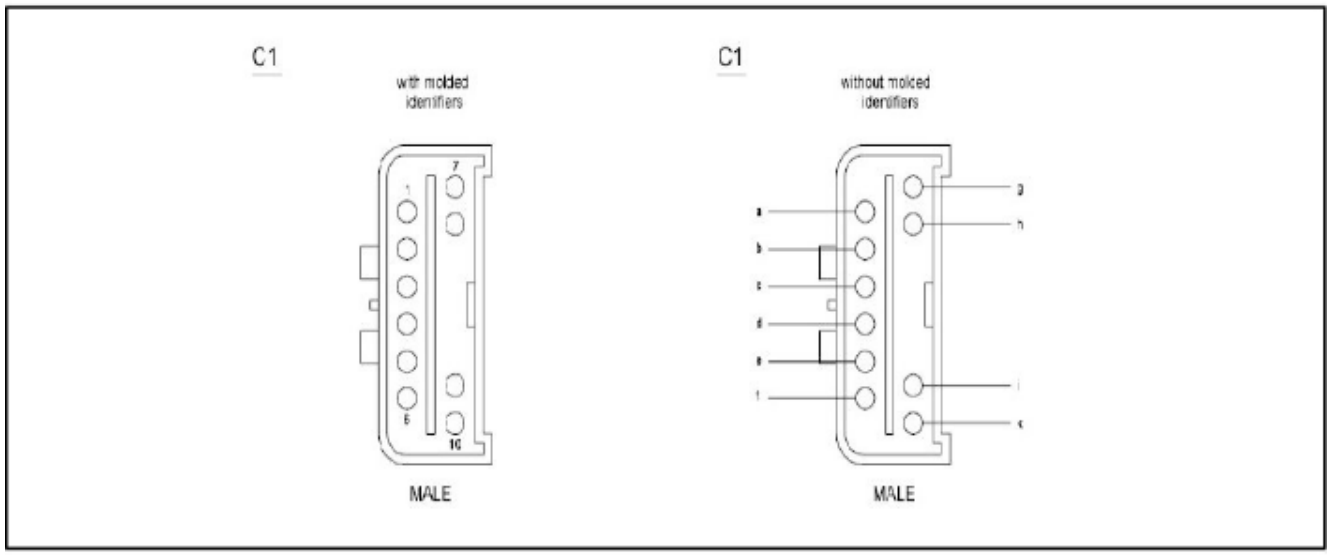
Disconnect the ohmmeter; connect pins 2 and 3 to 12V DC power and pin 1 to ground. Measure voltage between pin 5 and pin 1. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 2 and measure voltage between pin 4 and pin 1. If the voltage is 12V, the relay is okay. If not, replace the relay.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



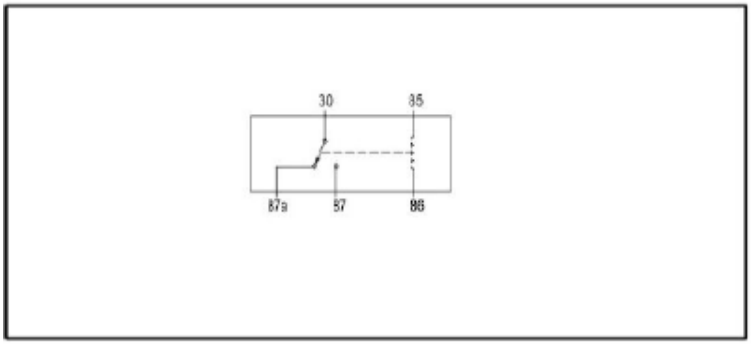
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

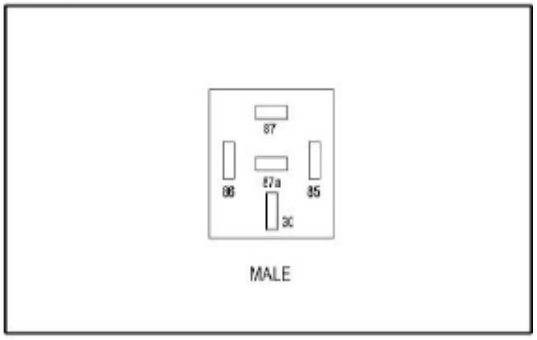
Mini ISO Relay: Testing and Inspection

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

POWER POINT

Special Tool(s)

Special Tool(s)

Removal

NOTE: Power point cover may differ depending on location.

1. Open the power point cover. 2. Install the special tool in one of the power point socket slots.

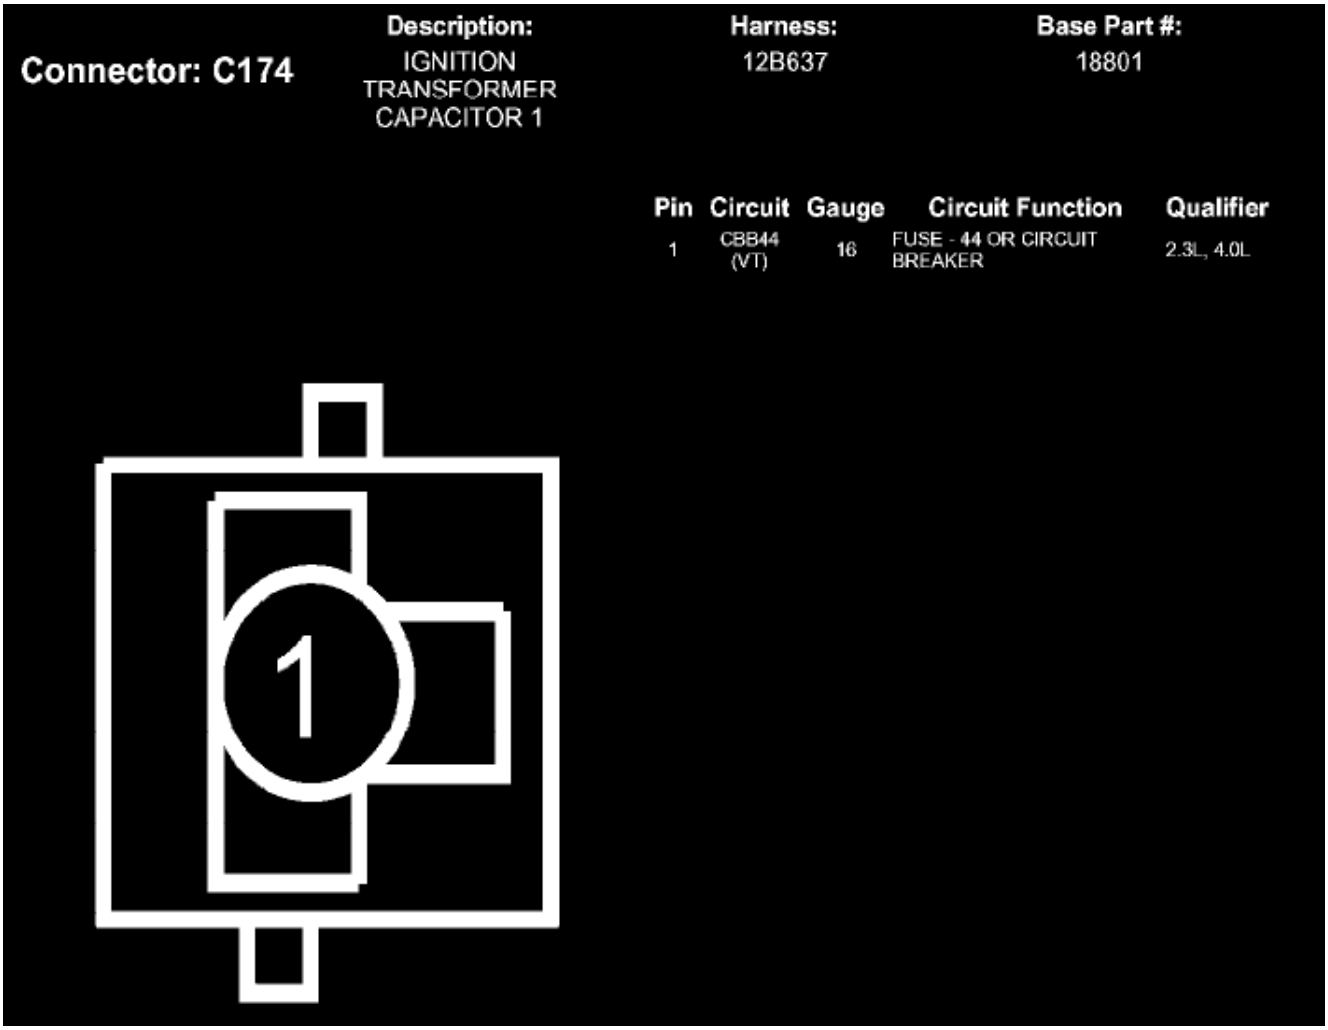
3. Position the special tool so that it engages in the adjacent slot.

4. Using the special tool, pull the power point socket out of the retainer.

5. Disconnect the electrical connector.

Installation

1. Connect the electrical connector. 2. Slide the power point socket into the retainer.



Connector: C174

Fuse Block: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

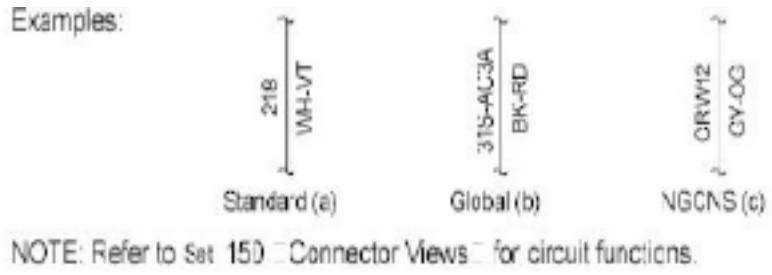
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

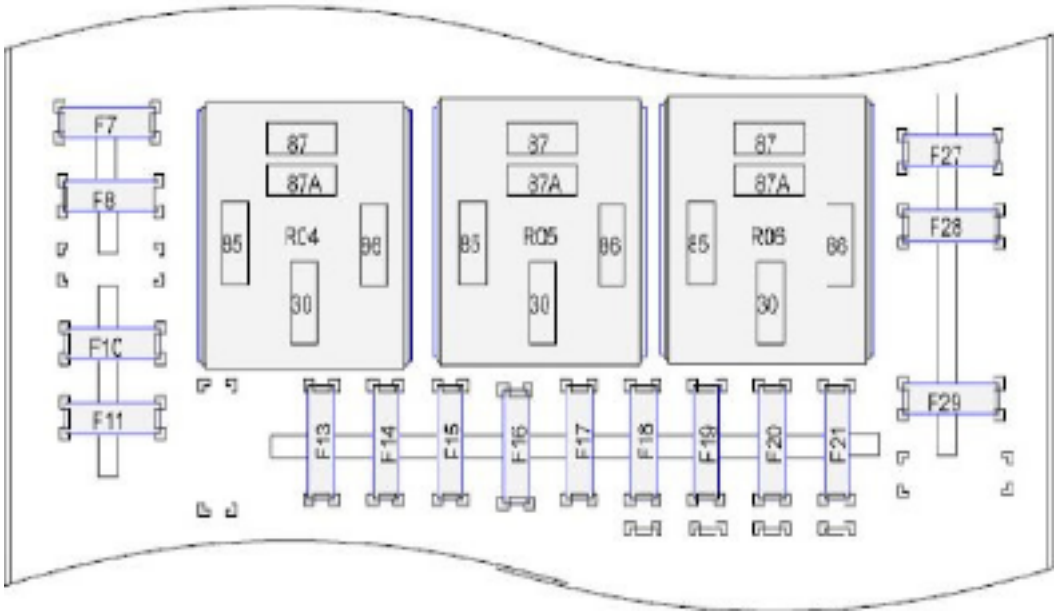
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

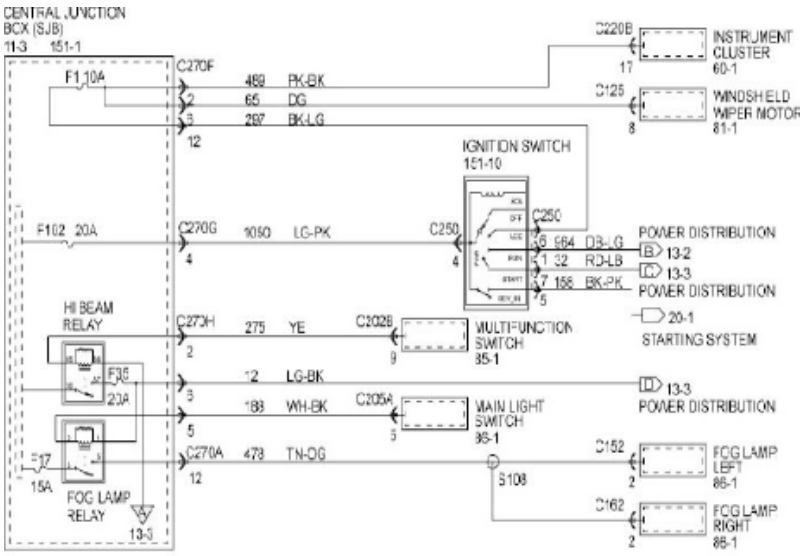
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

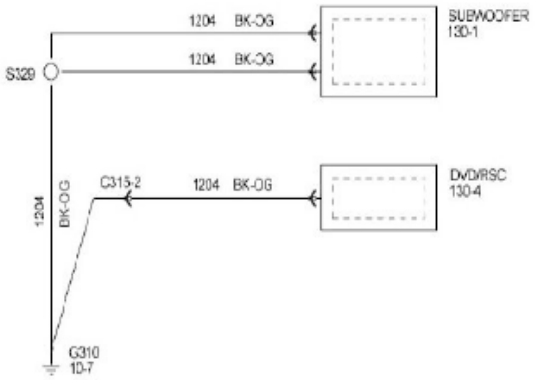
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

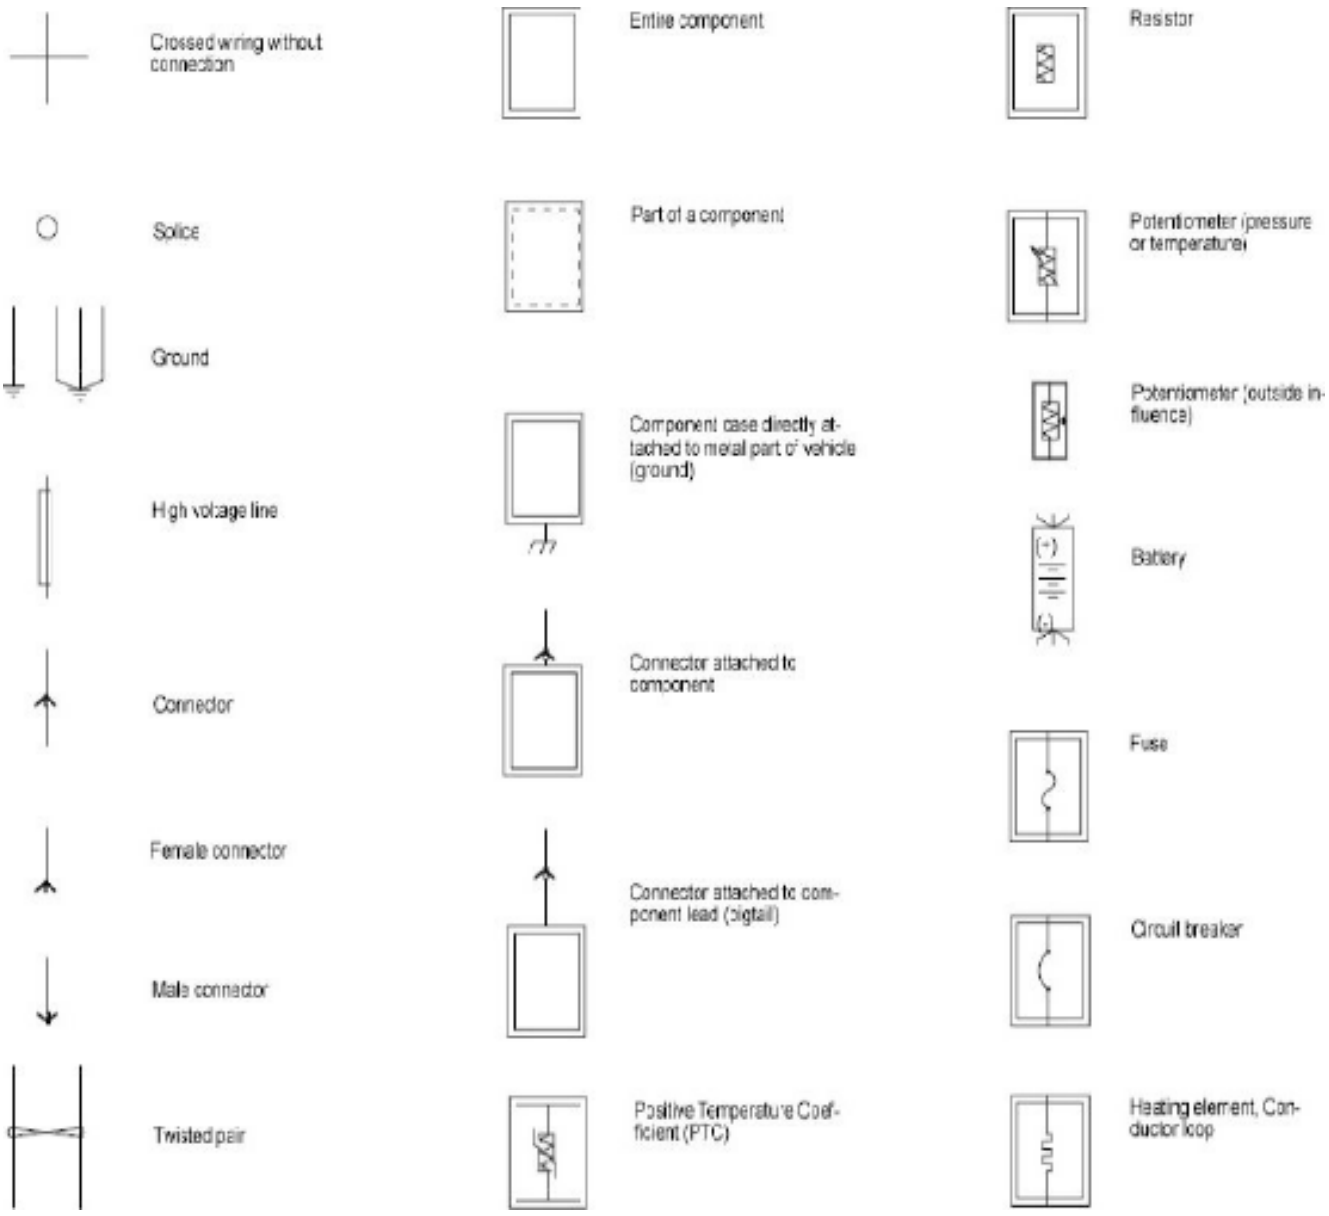
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

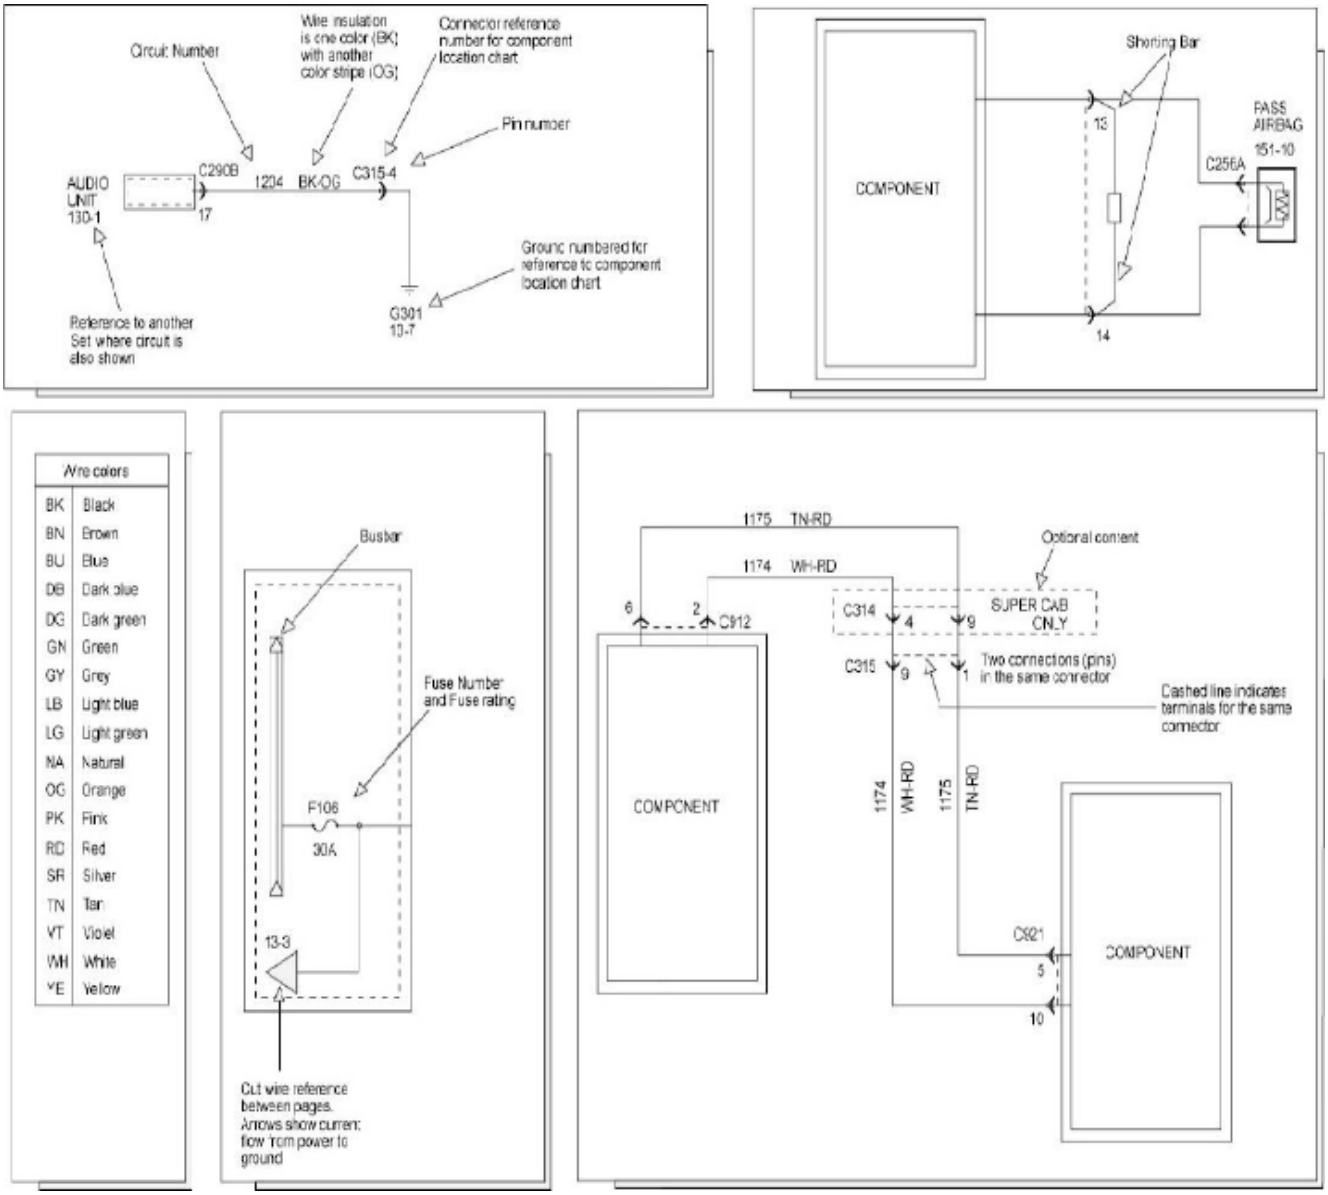
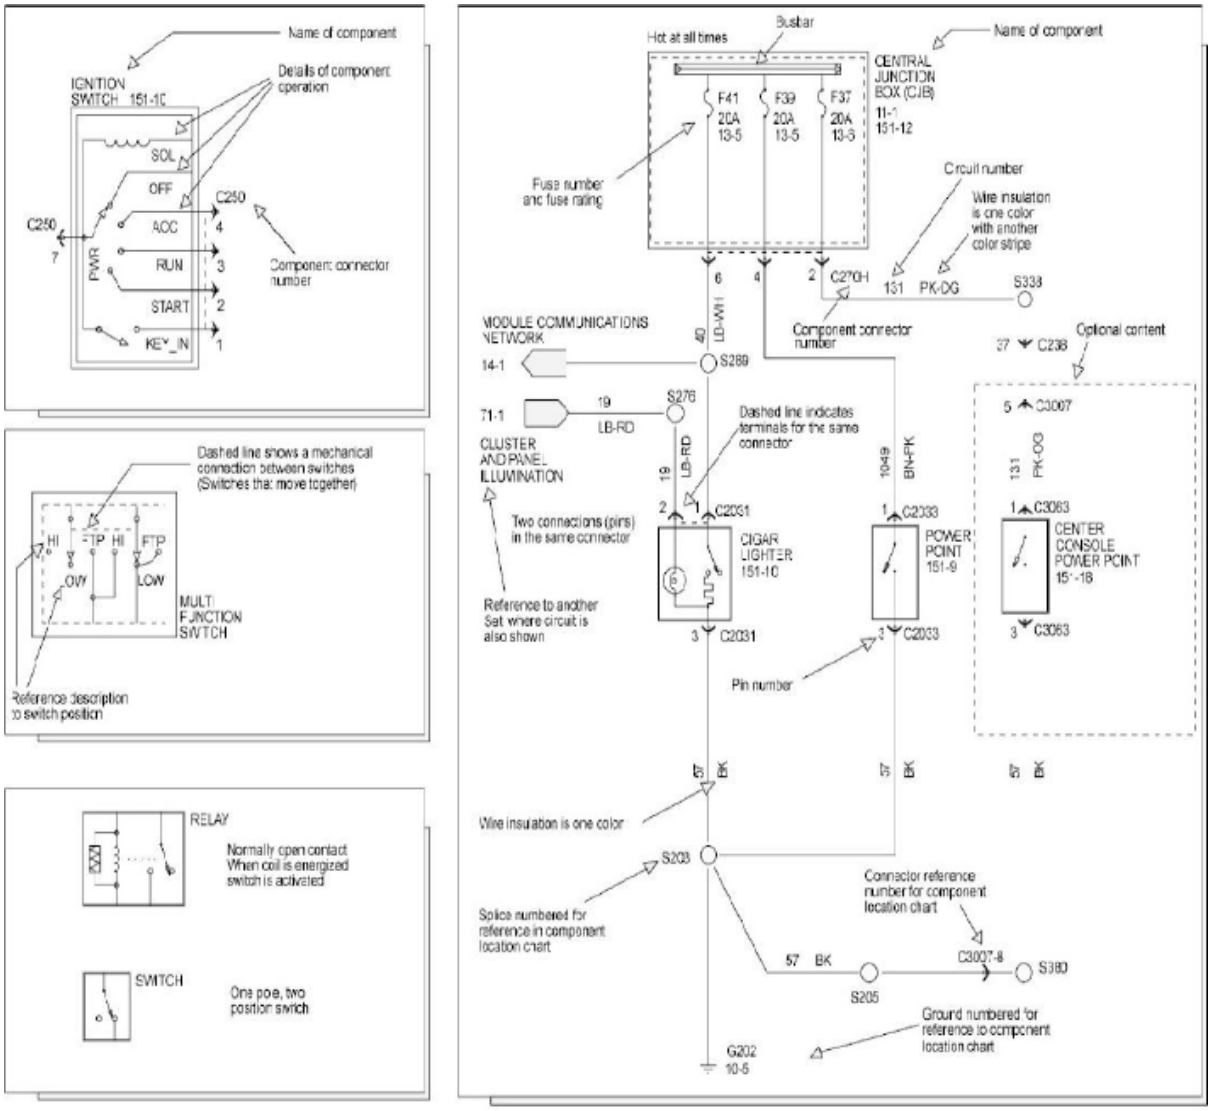
Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Fuse Block: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Defective insulation stripping

A
A

1 = Proper crimp

2 = Insulation not removed

3 = Wire strands missing

4 = Intermittent signals through pierced insulation

Partially mated connectors

1 = Seal

2 = Displaced tab

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Male half

7 = Intermittent contact

Lock may be displaced into an unlocked position; pull on the connector to verify the lock.

Deformed (enlarged) female terminals

1 = Enlarged

2 = Normal

Any probe entering the terminal may enlarge the contact spring opening creating an intermittent signal.

Insert the correct mating terminal (Location A) from the service kit and feel for a loose fit.

Wire 1

1 = Wiring harness tape

2 = Wiring strand

3 = Broken strands intermittent signal

4 = Circuit insulation

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

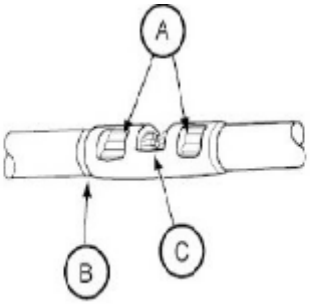
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

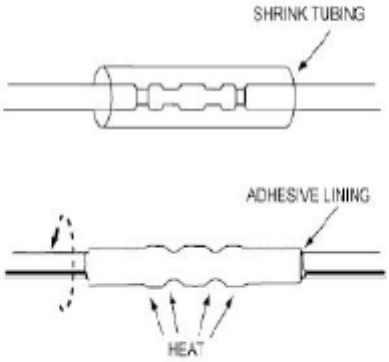
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4□ strip, cut 9 strands	* 1/4□ strip, cut 2 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip, fold 3x dia.
	16-14	* 1/4□ strip, cut 7 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip fold 2x dia	1□ strip, fold 3x dia.	1 1/4□ strip, fold 4x dia.	Not Recommended
	12-10	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip fold 3x cia.	1 1/4□ strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Figtail only

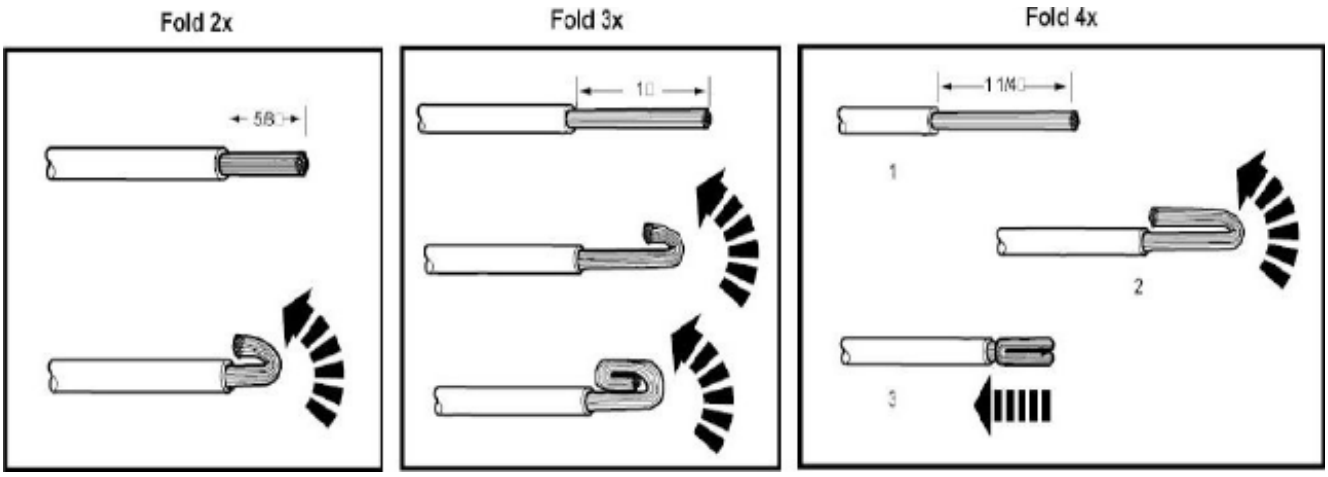
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

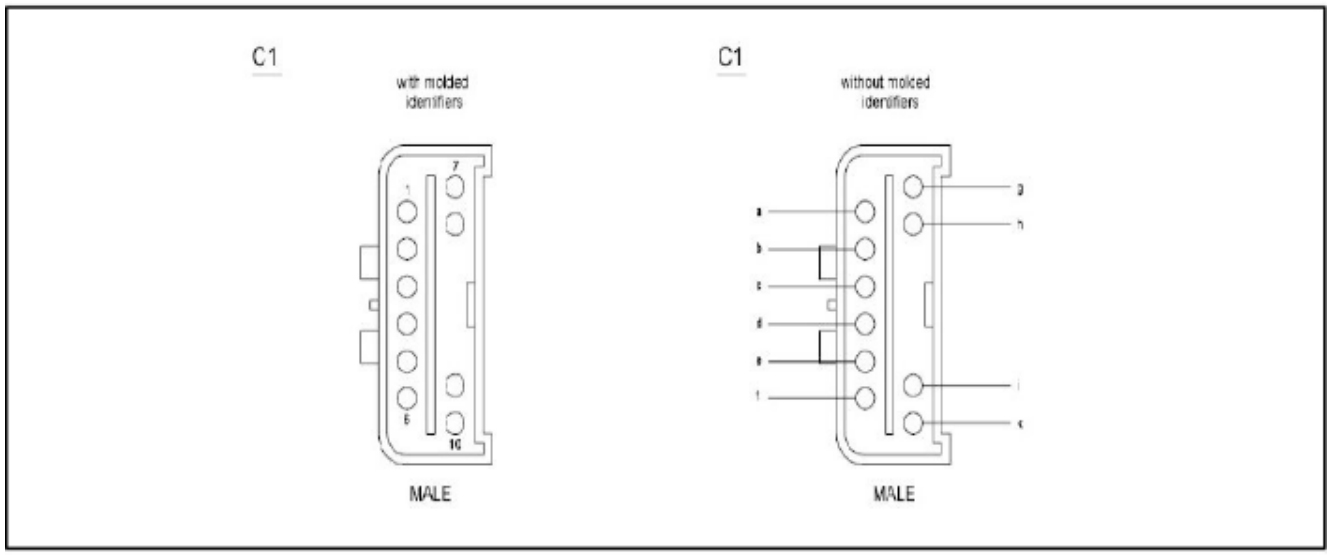
Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



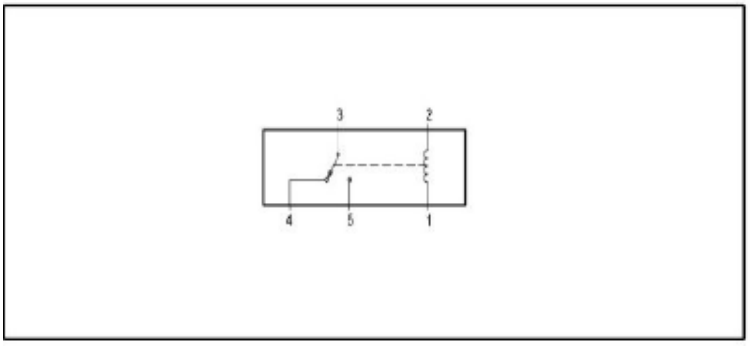
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

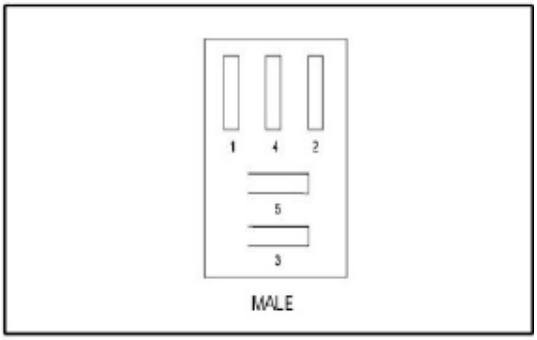
Micro ISO Relay: Testing and Inspection

Relay □ Micro ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	1 and 2	63□102 Ω
Contact	3 and 4	Closed circuit
	3 and 5	Open circuit
Coil □ Contact	1 and 3	Open circuit
	1 and 4	Open circuit
	1 and 5	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 2 and 3 to 12V DC power and pin 1 to ground. Measure voltage between pin 5 and pin 1. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 2 and measure voltage between pin 4 and pin 1. If the voltage is 12V, the relay is okay. If not, replace the relay.

Item	Part Number	Description
1	—	Smart junction box (SJB) electrical connectors (part of 14401)
2	—	SJB screws (3 required)
3	15604	SJB

Power Distribution Module: Service and Repair

SMART JUNCTION BOX (SJB)

Removal

CAUTION: Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.

NOTE: -

Prior to the replacement of the module, it is necessary to upload the module configuration information into the appropriate scan tool. This information must be downloaded into the new module after installation.

- The tire pressure monitoring system (TPMS) functionality is integral to the smart junction box (SJB).

- The steps included in the SJB removal and installation procedure are critical to restoring the vehicle security and tire pressure monitoring systems to normal operation. A new SJB is delivered in a manufacturing mode with 7 pre-set DTCs related to the TPMS. To clear the DTCs, successful configuration of the SJB must occur, followed by successful TPMS sensor training, and a successful self-test, including clearing of the DTCs. The DTCs are as follows:

- B106D (Tire Pressure Monitor System [TPMS] Initiators Not Configured)

- B2477 (Module Configuration Failure)

- B2868 (Left Front Tire Pressure Sensor Fault)

- B2869 (Right Front Tire Pressure Sensor Fault)

- 2870 (Right Rear Tire Pressure Sensor Fault)

- B2871 (Left Rear Tire Pressure Sensor Fault)

- C2780 (ECU in Manufacturer Sub-State)

1. NOTE: This step is necessary only if the SJB is being replaced.

Upload the module configuration information from the SJB.

2. Remove the RH lower cowl trim panel. 3. Disconnect the electrical connectors. 4. Remove the 3 screws and the SJB.

Installation

NOTE: When a new SJB is installed, all customer RKE transmitters may be required to be present in order to program the RKE transmitters to the new SJB.

1. Install the SJB.

- Install the 3 screws.

- Connect the electrical connectors.

2. NOTE: If the SJB was not replaced, this is the last step that is necessary.

Install the RH lower cowl trim panel.

3. NOTE:

- When successful, this step provides the calibration necessary for the SJB operation and clears DTCs B106D and B2477. The clearing of these DTCs indicates the calibration data has been successfully downloaded to the new SJB.

- When successful, this step also programs the remote transmitters into the new SJB. In the event the remote transmitters do not program to the new SJB, all of the remote transmitters will need to be present. Refer to Locks, Remote Keyless Entry Transmitter Programming. This action will program the remote transmitters into the new SJB. See: Accessories and Optional Equipment/Antitheft and Alarm Systems/Keyless Entry/Keyless Entry Transmitter/Testing and Inspection

Download the SJB configuration information from the scan tool into the new SJB.

4. NOTE: When successful, this step clears DTCs B2868, B2869, B2870 and B2871. The clearing of these DTCs indicates the SJB has recognized

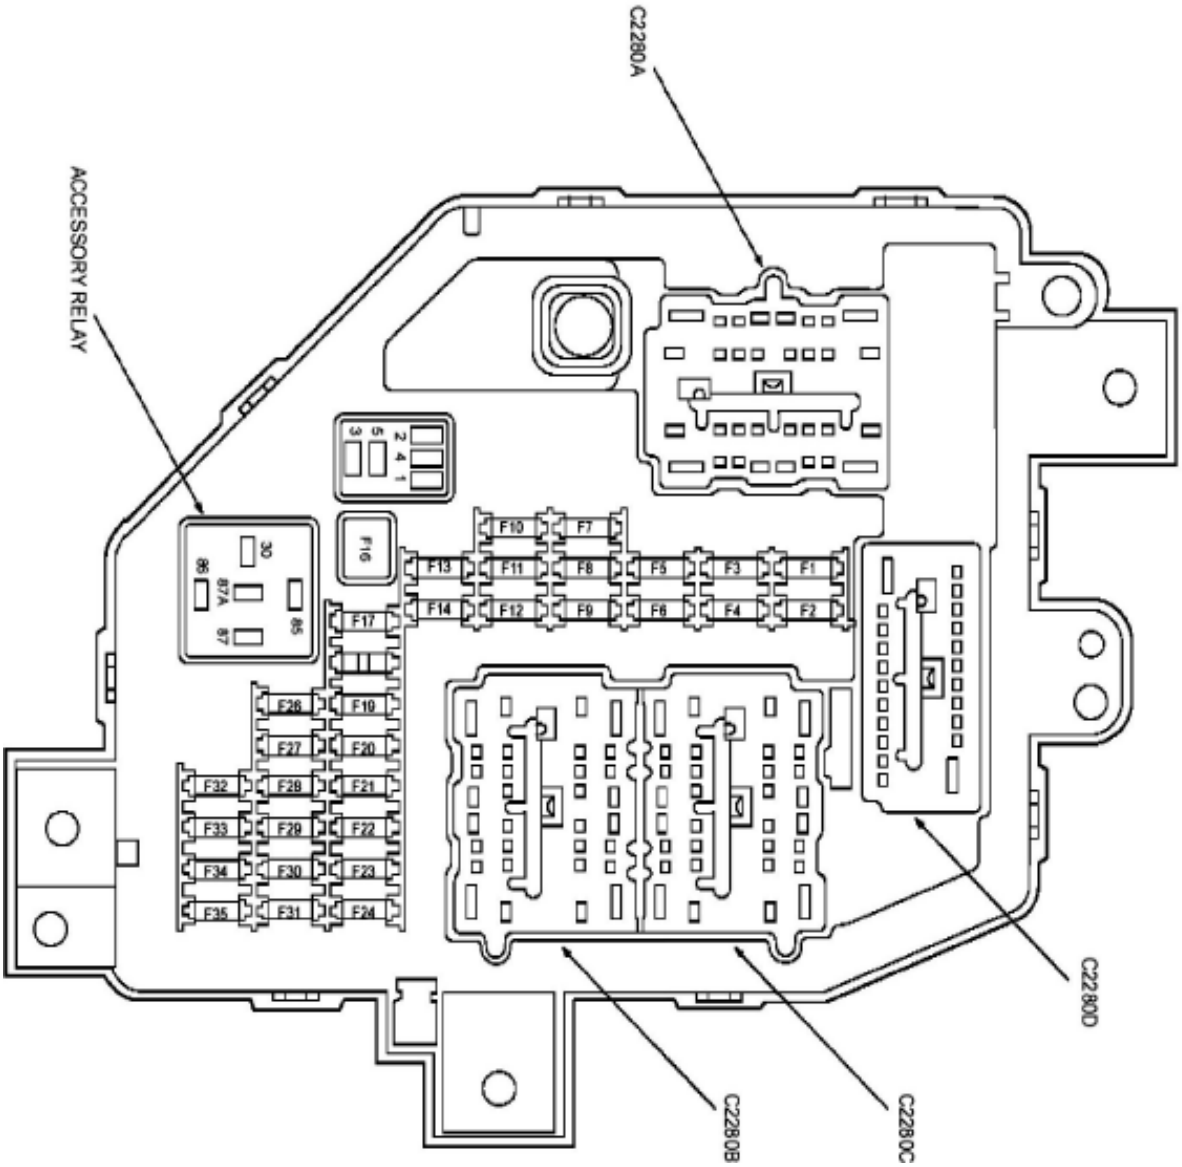
the tire pressure sensors during the training procedure.

Train the tire pressure sensors.

5. NOTE: DTC C2780 will not clear if any other DTCs are present in the SJB. When successful, this step will clear the DTC C2780.

Carry out the SJB on-demand self-test by clearing DTCs, and then retrieving DTCs to confirm all DTCs have been cleared.

SMART JUNCTION BOX (SJB)

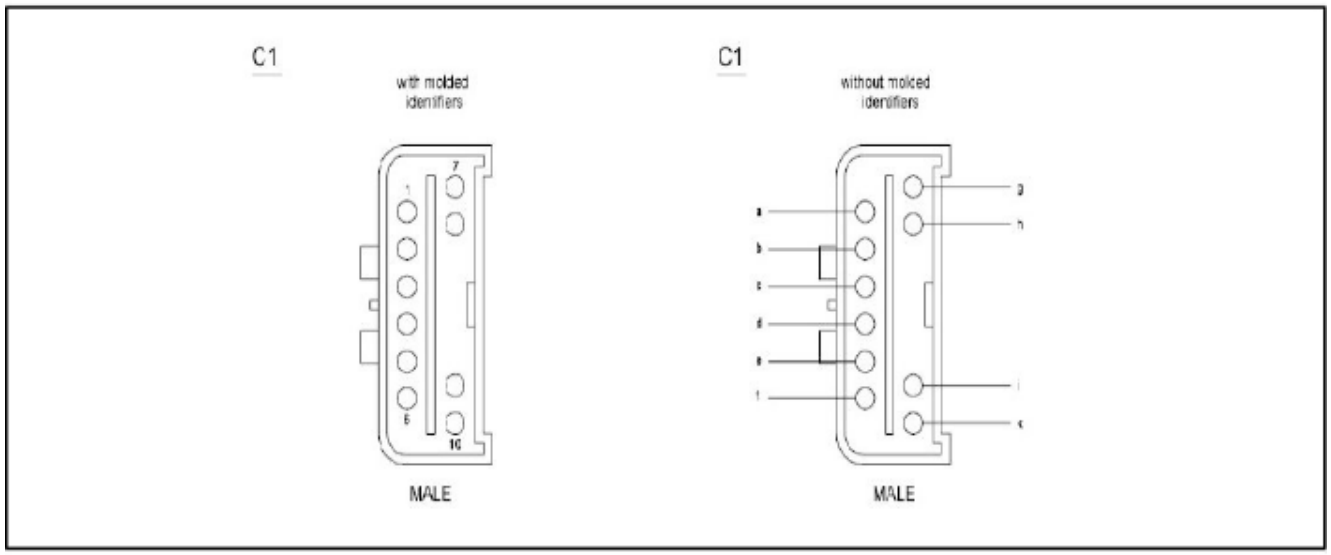


Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



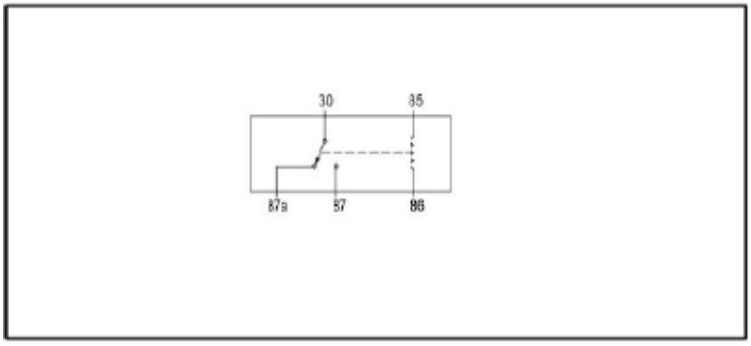
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

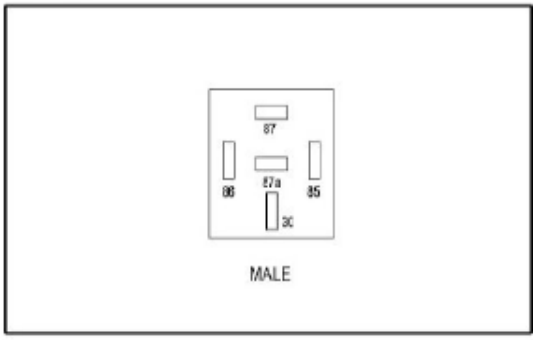
Power Distribution Relay: Testing and Inspection

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

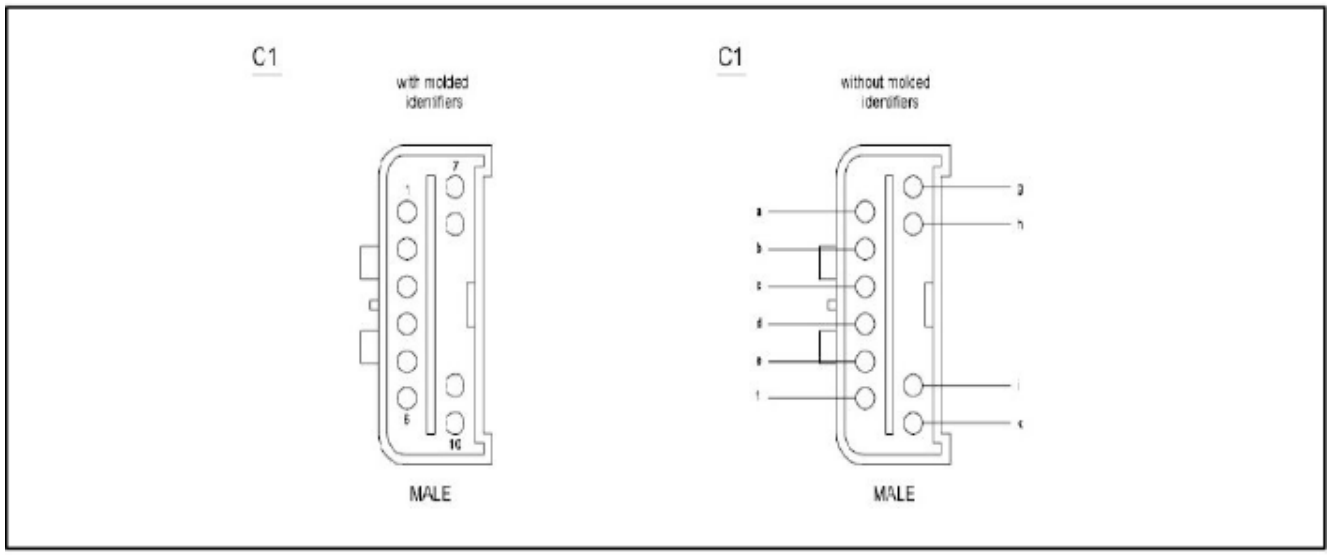
Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



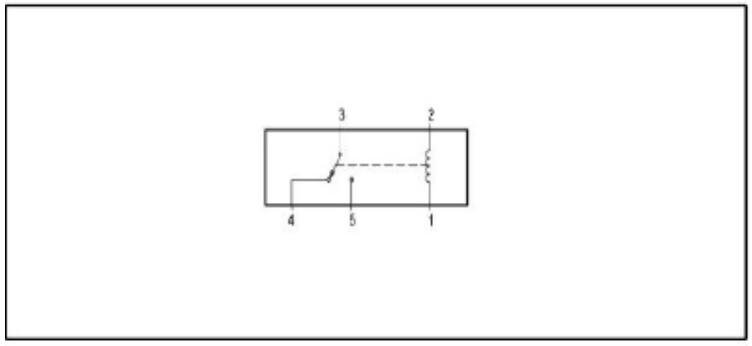
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

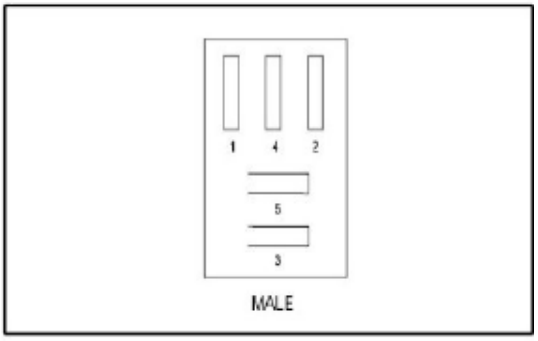
Micro ISO Relay: Testing and Inspection

Relay □ Micro ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	1 and 2	63□102 Ω
Contact	3 and 4	Closed circuit
	3 and 5	Open circuit
Coil □ Contact	1 and 3	Open circuit
	1 and 4	Open circuit
	1 and 5	Open circuit

Component testing procedure (voltage applied)

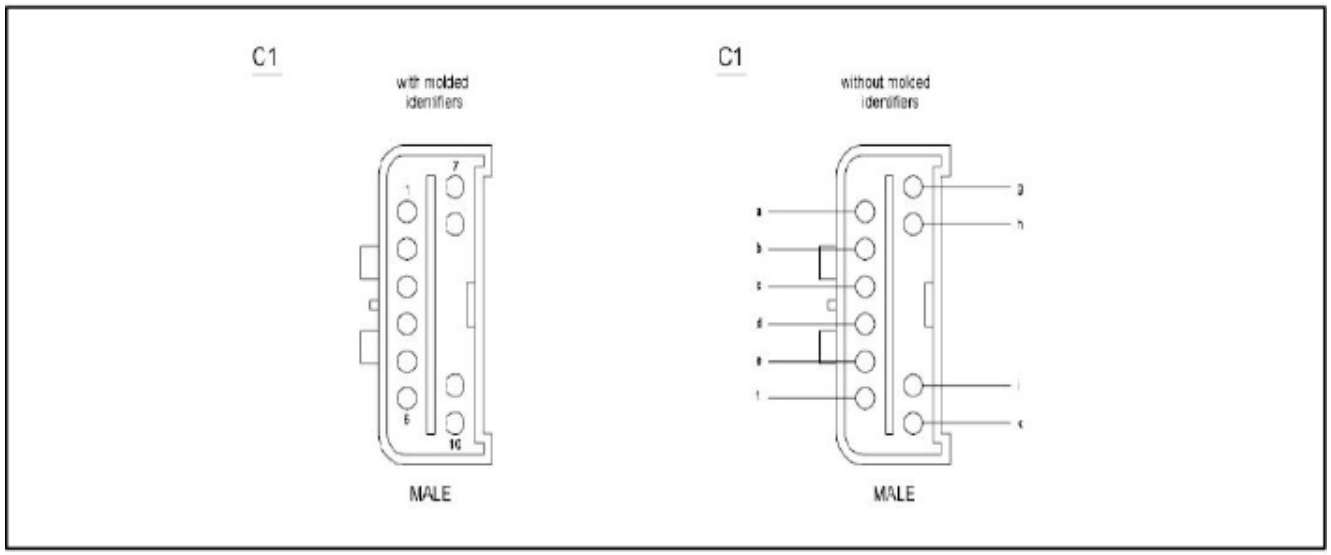
Disconnect the ohmmeter; connect pins 2 and 3 to 12V DC power and pin 1 to ground. Measure voltage between pin 5 and pin 1. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 2 and measure voltage between pin 4 and pin 1. If the voltage is 12V, the relay is okay. If not, replace the relay.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

Torque Specifications

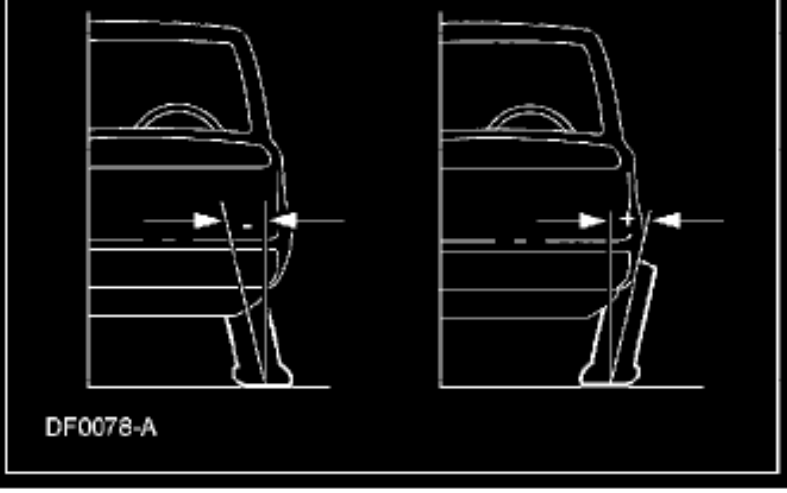
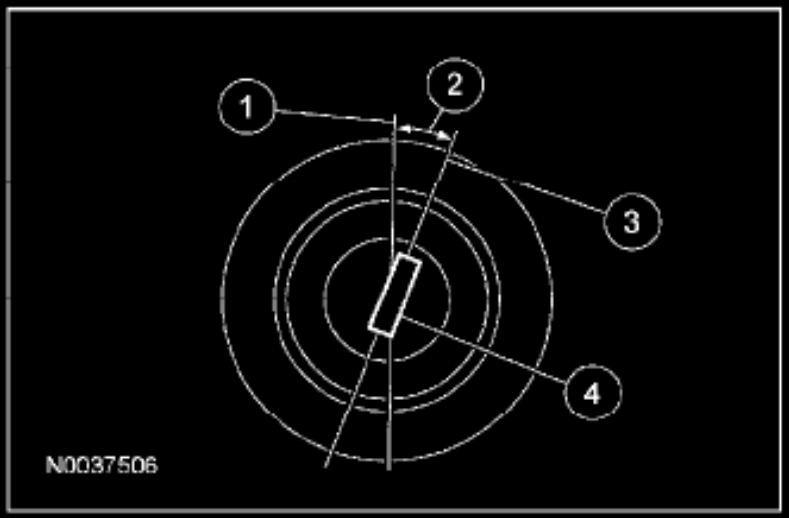
Negative and Positive Camber



Caster



Item	Part Number	Description
1	—	True vertical
2	—	Positive caster angle
3	—	Ball joint center line
4	—	Pivot center line

Alignment: Description and Operation

Wheel Alignment Angles

Front caster and camber are adjusted by replacing the upper arm alignment set shims with washers, this allows for adjustment of the arm in the frame slot. Front toe is adjusted by the use of the inner tie rods.

Camber

Negative and Positive Camber

Camber is the vertical tilt of the wheel when viewed from the front. Camber can be positive or negative and has a direct effect on tire wear.

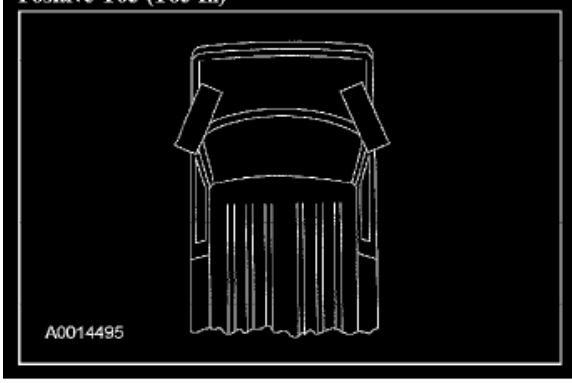
Caster

Caster

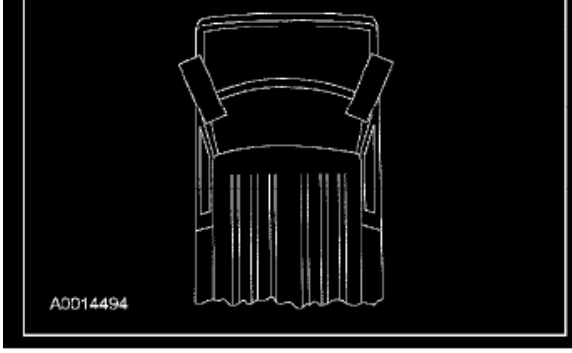
Caster is the deviation from vertical of an imaginary line drawn through the ball joints when viewed from the side. The caster specifications will give the vehicle the best directional stability characteristics when loaded and driven. The caster setting is not related to tire wear.

Toe

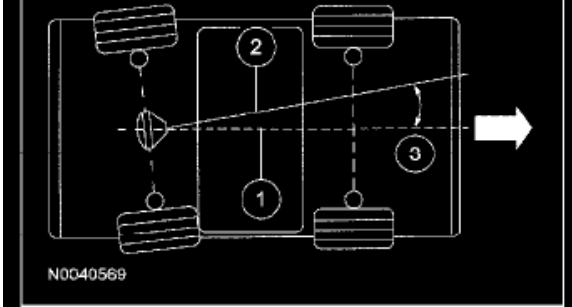
Positive Toe (Toe In)



Negative Toe (Toe Out)



Incorrect Thrust Angle (Dogtracking)



Item	Part Number	Description
1	—	Vertical centerline
2	—	Axle centerline
3	—	Thrust angle

Positive Toe (Toe In)

Negative Toe (Toe Out)

The vehicle toe setting: ^

affects tire wear and directional stability.

^ must be checked after adding aftermarket equipment, such as a snowplow.

Incorrect Thrust Angle (Dogtracking)

Incorrect Thrust Angle (Dogtracking)

Incorrect thrust angle (dogtracking) is the condition in which the rear axle is not square to the chassis. Heavily crowned roads can give the illusion of dogtracking.

Wander

Wander is the tendency of the vehicle to require frequent, random left and right steering wheel corrections to maintain a straight path down a level road.

Shimmy

Shimmy, as observed by the driver, is large, consistent, rotational oscillations of the steering wheel resulting from large, side-to-side (lateral) tire/wheel movements.

Shimmy is usually experienced near 64 km/h (40 mph), and can begin or be amplified when the tire contacts pot holes or irregularities in the road surface.

Nibble

Sometimes confused with shimmy, nibble is a condition resulting from tire interaction with various road surfaces and observed by the driver as small rotational oscillations of the steering wheel.

Poor Returnability/Sticky Steering

Poor returnability and sticky steering is used to described the poor return of the steering wheel to center after a turn or the steering correction is completed.

Drift/Pull

Pull is a tugging sensation, felt by the hands on the steering wheel, that must be overcome to keep the vehicle going straight.

Drift describes what a vehicle with this condition does with hands off the steering wheel. ^

A vehicle-related drift/pull, on a flat road, will cause a consistent deviation from the straight-ahead path and require constant steering input in the opposite direction to counteract the effect.

^ Drift/pull may be induced by conditions external to the vehicle (i.e., wind, road camber).

Poor Groove Feel

Poor groove feel is characterized by little or no buildup of turning effort felt in the steering wheel as the wheel is rocked slowly left and right within very small turns around center or straight-ahead (under 20 degrees of steering wheel turn). Efforts may be said to be "flat on center". ^

Under 20 degrees of turn, most of the turning effort that builds up comes from the mesh of gear teeth in the steering gear. In this range, the steering wheel is not yet turned enough to feel the effort from the self-aligning forces at the road wheel or tire patch.

^ In the diagnosis of a concern, it is important to understand the difference between wander and poor groove feel.

Adjustment	Front of Upper Arm	Rear of Upper Arm
Increase caster	Out	In
Decrease caster	In	Out
Increase camber	Out	Out
Decrease camber	In	In
Increase caster and camber simultaneously	Out	—
Decrease caster and camber simultaneously	In	—

Alignment: Service and Repair Camber and Caster Adjustment

Camber and Caster Adjustment

1. NOTE: The upper arm-to-frame mounting bolts have set shims that must be replaced with washers (W-705040S900) to allow for adjustment of

the arm in the frame slot.

Index-mark the upper arm-to-frame bolts, then remove and discard the upper arm-to-frame nuts and set shims.

2. Align the index marks and install the new washers and new nuts.

^ Tighten the nuts until snug.

3. Using alignment equipment and the manufacturer's instructions, measure the caster and camber.

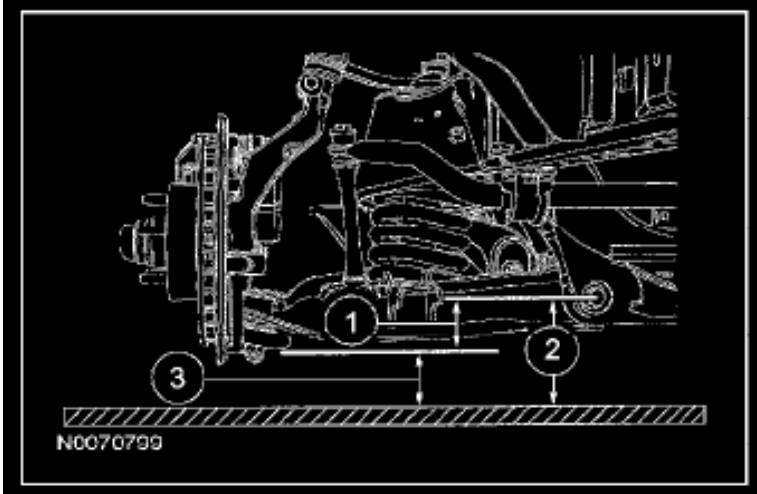
4. NOTE: The vehicle should be supported by the lower arms to ease movement of the upper arm in the slot.

To adjust the caster and camber refer to the following chart. ^

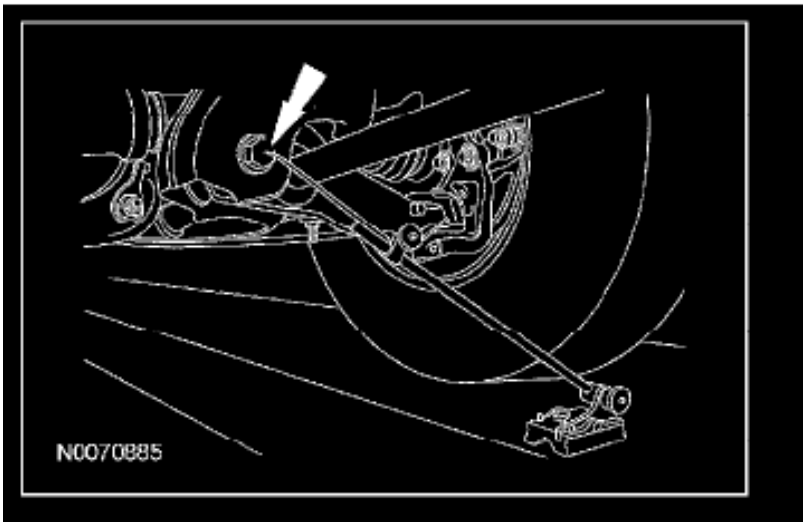
When making adjustments that require moving both the front and the rear of the upper arm, move both ends of the arm equally.

5. Tighten the upper arm-to-frame nuts to 133 Nm (98 lb-ft). 6. Recheck the caster and camber settings and adjust as necessary. 7. Check and, if necessary, adjust the front toe.

Front Ride Height Measurement



Item	Part Number	Description
1	—	Ride height = A - B
2	—	Measurement A
3	—	Measurement B



Alignment: Service and Repair Ride Height Measurement

Ride Height Measurement

Front Ride Height Measurement

Front Ride Height Measurement

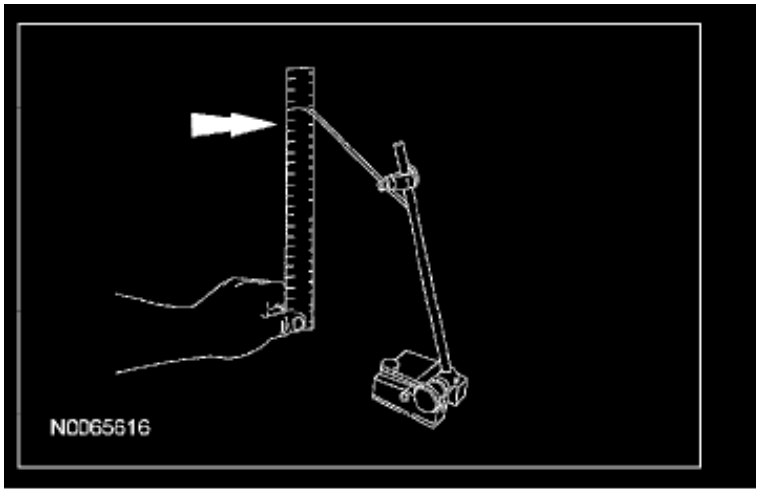
NOTE: Make sure that the vehicle is positioned on a flat, level surface and the tires are inflated to the correct pressure. Vehicle should have a full tank of fuel.

1. Position a suitable surface gauge (such as Starrett 57D Surface Gauge), on a flat, level surface and adjust the gauge's arm until the scriber point is

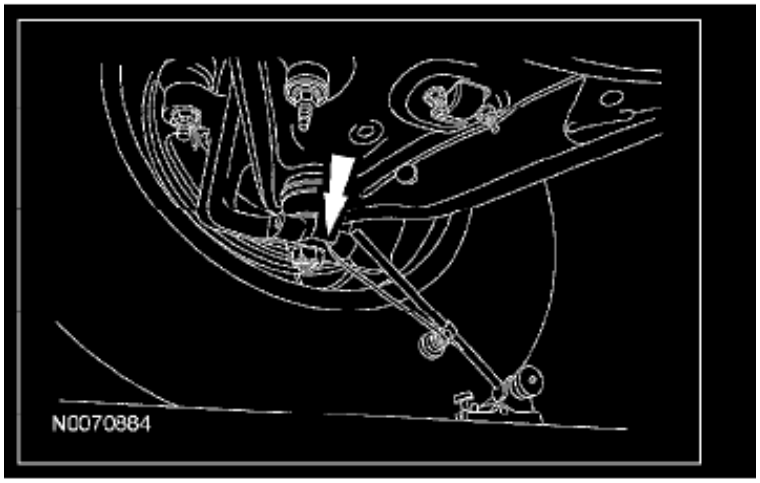
located in the center of the lower arm rearward bolt. ^

Lock the surface gauge in this position.

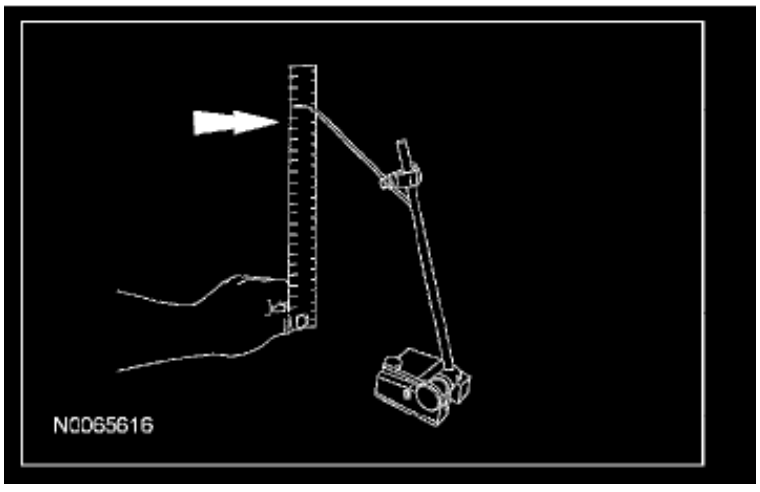
2. With the surface gauge positioned on a flat, level surface, record the measurement of the surface gauge position (measurement A).



N0065616



N0070884



N0065616

3. Position the surface gauge on the same flat, level surface as used in Step 1, adjust the gauge's arm until the scriber point is located on the wheel

knuckle lowest point, behind the lower ball joint nut. ^

Lock the surface gauge in this position.

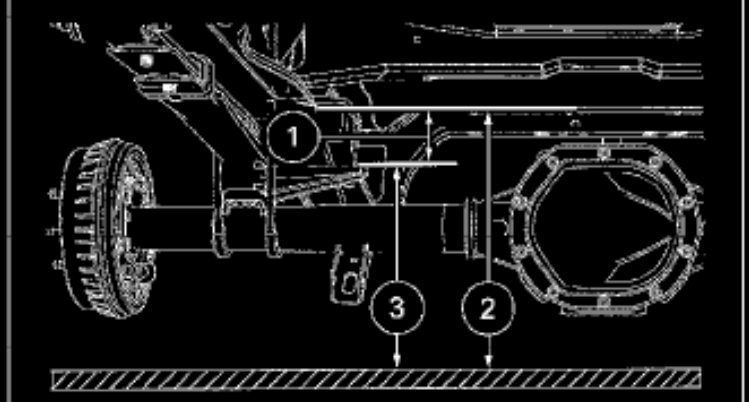
4. With the surface gauge positioned on a flat, level surface, record the measurement of the surface gauge position (measurement B).

5. Subtract measurement B from measurement A to obtain the front ride height.

^ Refer to Specifications.

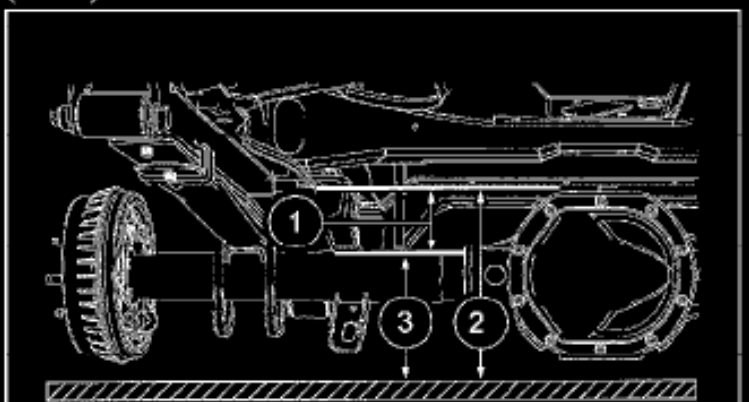
Rear Ride Height Measurement

Ride Height Measurement — Four Wheel Drive (4WD)



Item	Part Number	Description
1		Ride height = A - B
2	—	Measurement point A
3	—	Measurement point B

Ride Height Measurement — Rear Wheel Drive (RWD)



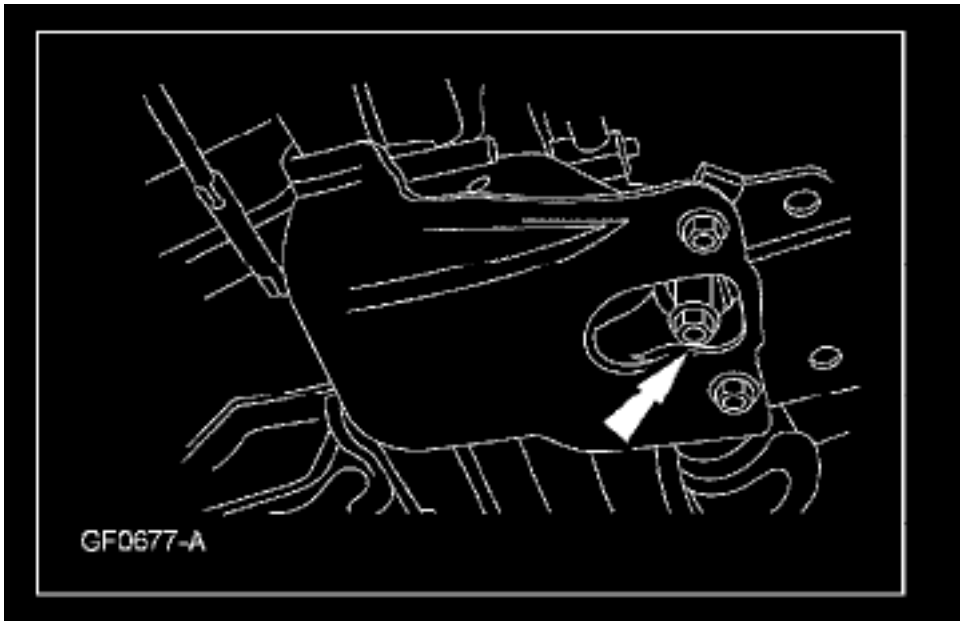
Item	Part Number	Description
1	—	Ride height = A - B
2	—	Measurement point A
3		Measurement point B

Ride Height Measurement - Four Wheel Drive (4WD)

Ride Height Measurement - Rear Wheel Drive (RWD)

NOTE: Make sure that the vehicle is positioned on a flat, level surface and the tires are inflated to the correct pressure. Vehicle should have a full tank of fuel.

1. To obtain rear ride height, measure the distance between points A and B. For additional information, refer to Specifications.



Alignment: Service and Repair Suspension Design Height Setting

Suspension Design Height Setting

NOTE: Make sure the vehicle is on a flat, level surface, such as a drive-on hoist.

1. Jounce the vehicle's front and rear suspension to normalize the vehicle static ride height. 2. Measure the ride height.

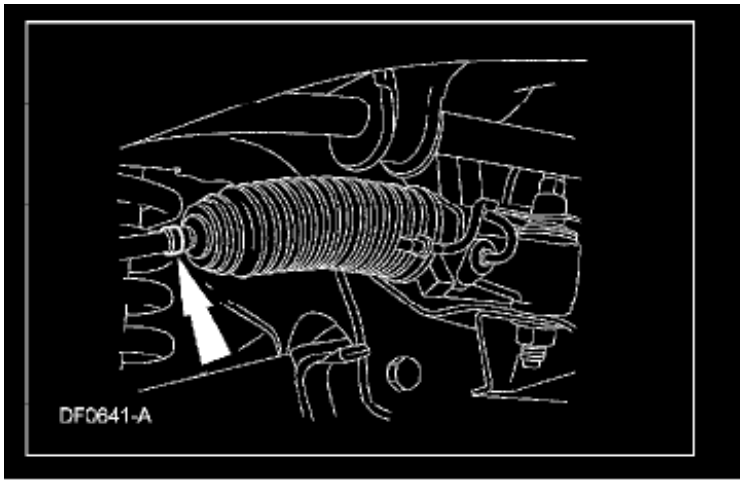
3. NOTE: The torsion bar adjusting bolt is coated with a thread locking compound that wears off after disassembly. If the torsion bar system is ever

disassembled or if the torsion bar adjusting bolt is ever removed, use a new torsion bar adjusting bolt when assembling.

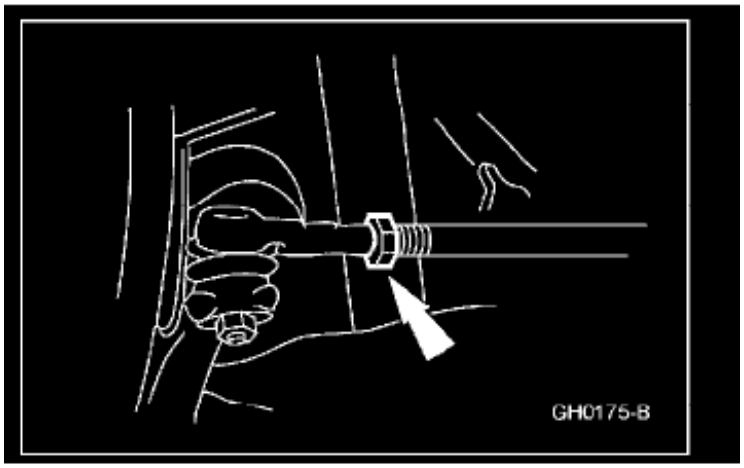
Adjust the ride height as follows: ^

To increase the ride height, tighten the torsion bar adjusting bolt.

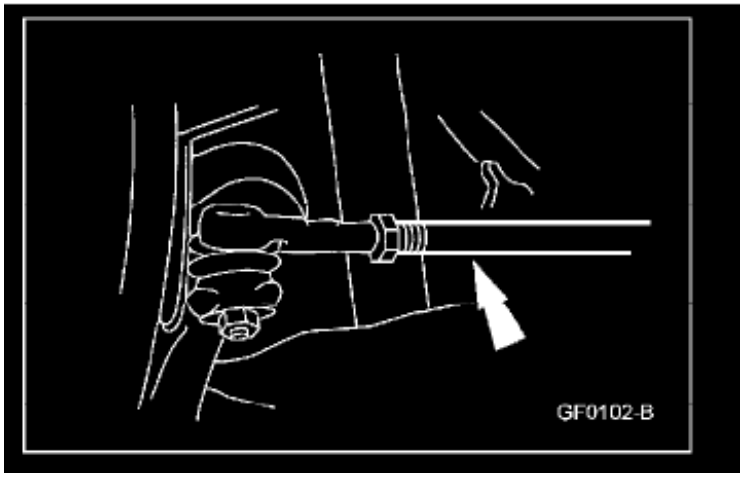
^ To decrease the ride height, loosen the torsion bar adjusting bolt.



DF0641-A



GH0175-B



GF0102-B

Alignment: Service and Repair Toe Adjustment

Toe Adjustment

1. Start the engine and center the steering wheel. 2. Turn the engine OFF and, using a suitable holding device, lock the steering wheel in the straight ahead position. 3. Using alignment equipment and the manufacturer's instructions, measure the toe. 4. Remove the steering gear bellows clamps.

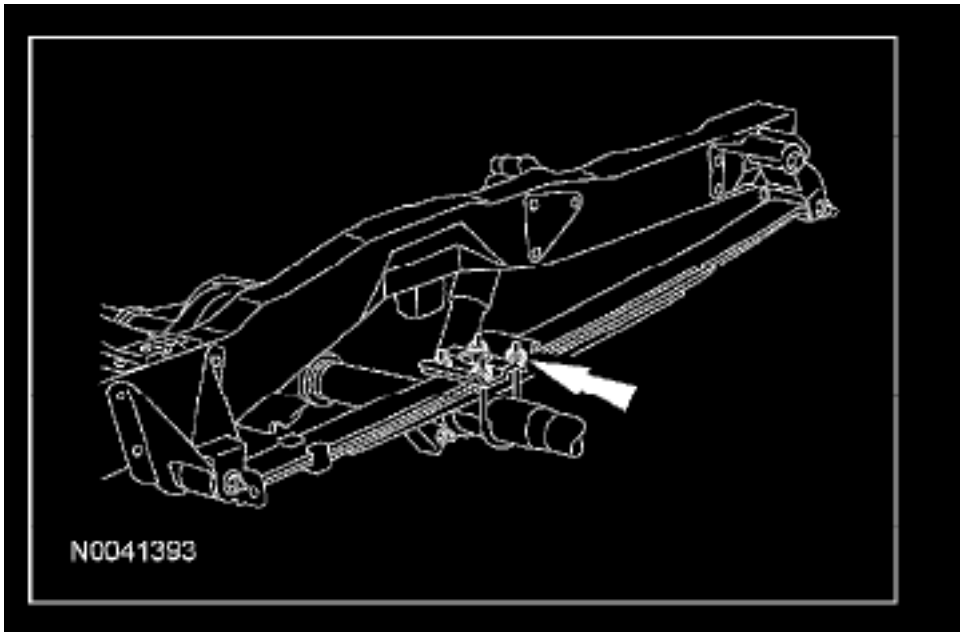
5. Loosen the tie-rod jam nuts.

6. CAUTION: Do not allow the steering gear bellows to twist when the front wheel spindle tie rod is rotated or damage to the bellows may

occur.

Rotate the inner tie rods until the toe setting is within specifications.

7. Tighten the tie-rod jam nuts to 80 Nm (59 lb-ft). 8. Install the steering gear bellows clamps. 9. Recheck the toe settings and adjust as necessary.



Alignment: Service and Repair Lean Correction - Rear

Lean Correction - Rear

NOTE: A side-to-side lean may be adjusted by 6 mm (0.25 inch). This is accomplished by placing a shim (D7TZ-5742-A) between the rear spring and the axle on the low side of the vehicle.

1. With the vehicle in NEUTRAL, position it on a hoist. 2. Using a suitable jack, support the rear axle. 3. Remove and discard the 4 U-bolt nuts and U-bolts.

^ Remove the spring plate.

^ To install, tighten to 115 Nm (85 lb-ft).

4. Using the jack, lower the rear axle approximately 13 mm (0.51 inch).

5. NOTE: Make sure that the spring locator bolt is centered in the spacer hole.

NOTE: On vehicles equipped with a spring spacer block, place the shim between the rear spring and the axle spacer.

Install the spacer (D7TZ-5742-A) between the spring and the axle.

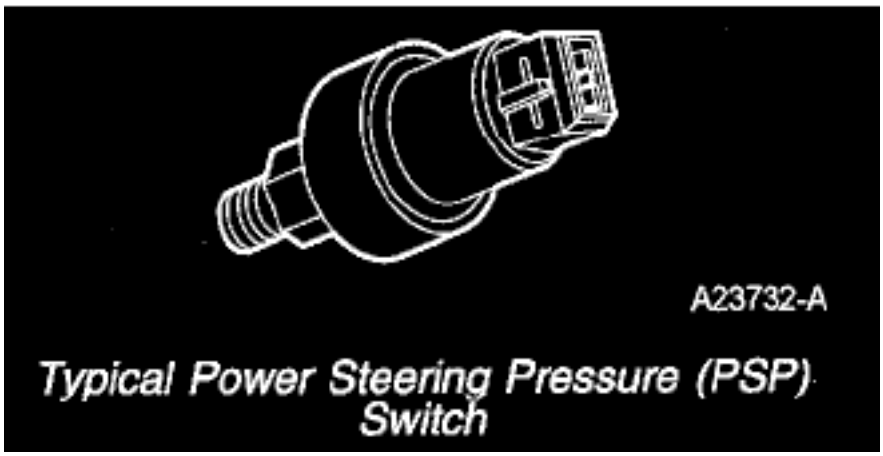
Typical Power Steering Pressure (PSP) Sensor



Typical Power Steering Pressure (PSP) Switch

Power Steering Pressure Switch: Description and Operation

Power Steering Pressure (PSP) Sensor

Typical Power Steering Pressure (PSP) Sensor

The PSP sensor monitors the hydraulic pressure within the power steering system. The PSP sensor voltage input to the PCM changes as the hydraulic pressure changes. The PCM uses the input signal from the PSP sensor to compensate for additional loads on the engine by adjusting the

idle RPM and preventing engine stall during parking maneuvers. Also, the PSP sensor signals the PCM to adjust the transmission electronic pressure control (EPC) pressure during increased engine load, for example, during parking maneuvers.

Power Steering Pressure (PSP) Switch

Typical Power Steering Pressure (PSP) Switch

The PSP switch monitors the hydraulic pressure within the power steering system. The PSP switch is a normally closed switch that opens as the hydraulic pressure increases. The PCM provides a low current voltage on the PSP circuit. When the PSP switch is closed, this voltage is pulled low through the SIG RTN circuit. The PCM uses the input signal from the PSP switch to compensate for additional loads on the engine by adjusting the idle RPM and preventing engine stall during parking maneuvers. Also, the PSP switch signals the PCM to adjust the transmission electronic pressure control (EPC) pressure during increased engine load, for example during parking maneuvers.

Special Tool(s)

ST2941-A	Activation Tool, Tire Pressure Monitor 204-363
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Tire Pressure Sensor: Testing and Inspection Tire Pressure Monitoring System (TPMS) Sensor Training

Tire Pressure Monitoring System (TPMS) Sensor Training

NOTE: If the vehicle has been stationary for more than 30 minutes, the sensors will go into a "sleep mode" to conserve battery power. It will be necessary to wake them up so they will transmit the latest tire pressure information to the smart junction box (SJB). For additional information, refer to Tire Pressure Monitoring System (TPMS) Sensor Activation.

NOTE: The tire pressure sensor training procedure must be done on a single vehicle, in an area without radio frequency noise and at least 1 m (3 ft) away from other vehicles equipped with tire pressure monitoring system (TPMS). Radio frequency noise is generated by electrical motors and appliance operation, cellular telephones, remote transmitters, power inverters and portable entertainment equipment.

NOTE: If a sensor does not respond to the activation tool, attempt to activate the same sensor with the activation tool. If the sensor still does not respond, move the vehicle to rotate the wheels at least 1/4 of a turn and attempt to activate the same sensor again.

NOTE: The SJB has a 2-minute time limit between sensor responses. If the SJB does not recognize any 1 of the 4 tire pressure sensors during this time limit, the horn will sound twice and the message center (if equipped) will display TIRE NOT TRAINED REPEAT and the entire procedure must be repeated.

1. NOTE: For vehicles with different front and rear tire pressures (such as the E-Series and certain F-Series), the tire pressure sensors must be

trained following a tire rotation. Failure to train the sensors will cause the TPMS indicator to illuminate. For vehicles with the same tire pressure for front and rear tires, tire rotation will not affect the system.

Turn the ignition switch to the OFF position, then press and release the brake pedal.

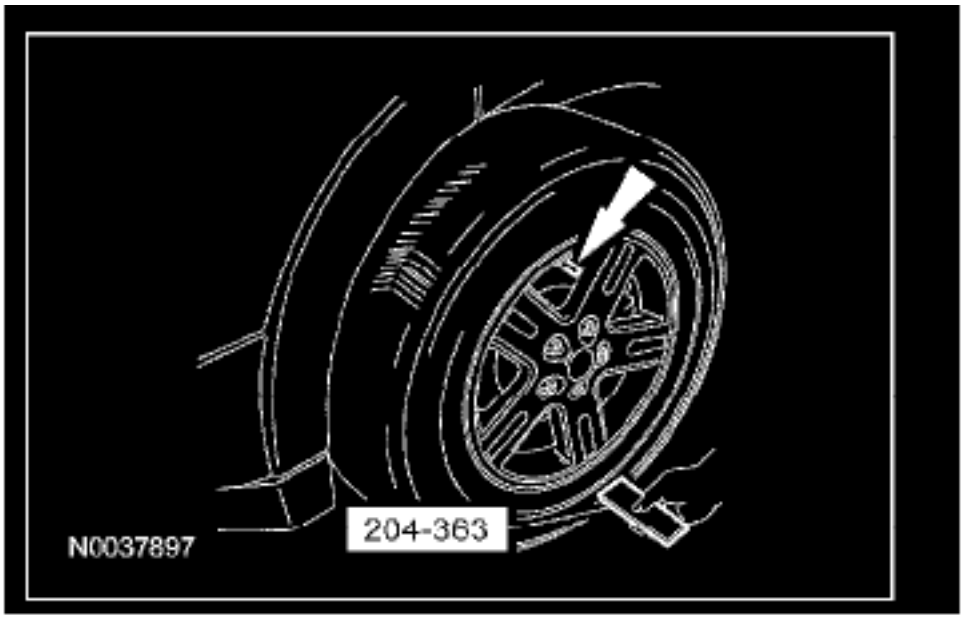
2. Cycle the ignition switch from the OFF position to the RUN position 3 times, ending in the RUN position. 3. Press and release the brake pedal. 4. Turn the ignition switch to the OFF position. 5. Turn the ignition switch from the OFF position to the RUN position 3 times, ending in the RUN position.

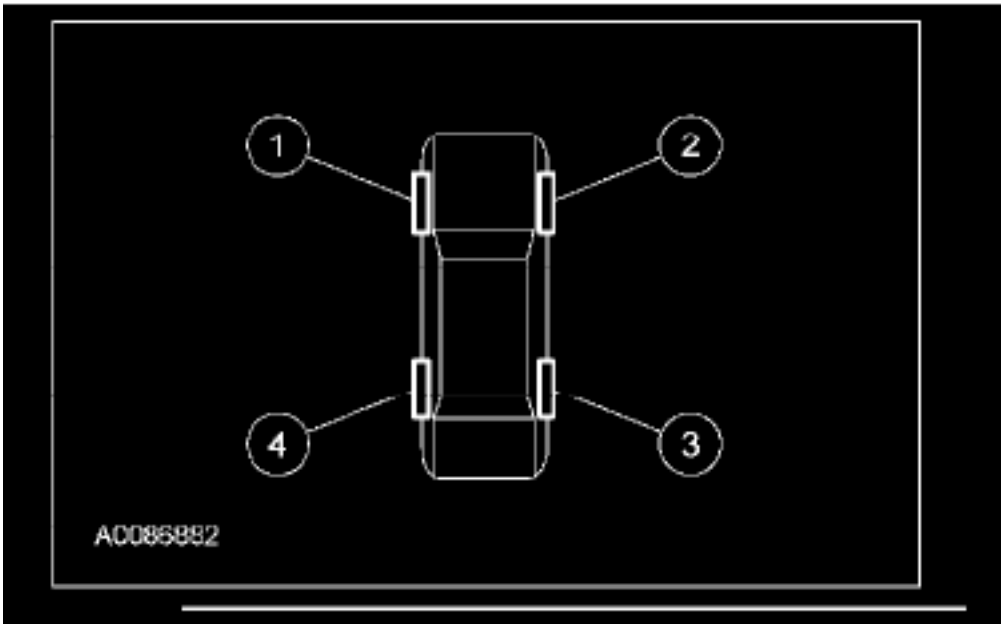
^ The horn will sound once and the TPMS indicator will flash if the training mode has been entered successfully. If equipped, the message center will display TRAIN LF TIRE.

6. NOTE: It may take up to 6 seconds to activate a tire pressure sensor. During this time, the activation tool must remain in place 180 degrees from

the valve stem.

Place the activation tool on the LF tire sidewall opposite (180 degrees) from the valve stem. Press and release the test button on the special tool. The horn will sound briefly to indicate that the tire pressure sensor has been recognized by the SJB.





7. Within 2 minutes of the horn sounding, place the activation tool on the RF tire sidewall opposite (180 degrees) from the valve stem and press and

release the test button to train the RF tire pressure sensor.

8. NOTE: Do not wait more than 2 minutes between training each sensor or the SJB will time out and the entire procedure must be repeated.

Repeat Step 7 for the RR and LR tires. ^

The procedure is completed after the last tire has been trained. When the training procedure is complete, the message center (if equipped) will display TIRE TRAINING COMPLETE.

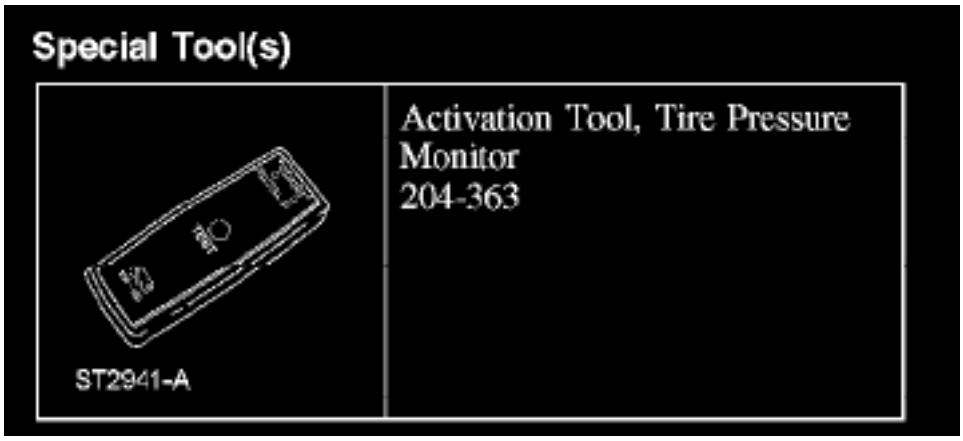
^ For vehicles not equipped with a message center, successful completion of the training procedure will be verified by turning the ignition switch to the OFF position without the horn sounding. If the horn sounds twice when the switch is turned to the OFF position, the training procedure was not successful.

9. Using the scan tool, locate the updated TPMS sensor IDs trained to the SJB and document them on the applicable warranty claim.

10. NOTE: This step is required to clear DTC C2780, cause the SJB to exit the manufacturing mode and to make sure there are no other concerns

with a newly programmed SJB.

If the sensors are being trained due to the installation of a new SJB, clear any DTCs and perform the SJB on-demand self test.



Tire Pressure Sensor: Testing and Inspection Tire Pressure Monitoring System (TPMS) Sensor Activation

Tire Pressure Monitoring System (TPMS) Sensor Activation

NOTE: The tire pressure sensors will go into a 14 sleep mode" after 30 minutes of inactivity to conserve battery power. The sensors do not transmit information while in sleep mode, it will be necessary to wake them up so they will transmit the latest tire pressure information.

1. Turn the ignition switch to the ON position. 2. Position the tire pressure monitor activation tool against the LF tire sidewall 180 degrees from the tire valve stem.

3. NOTE: The activation tool will provide feedback in the form of a flashing green light and a beep sound for each successful response from a tire

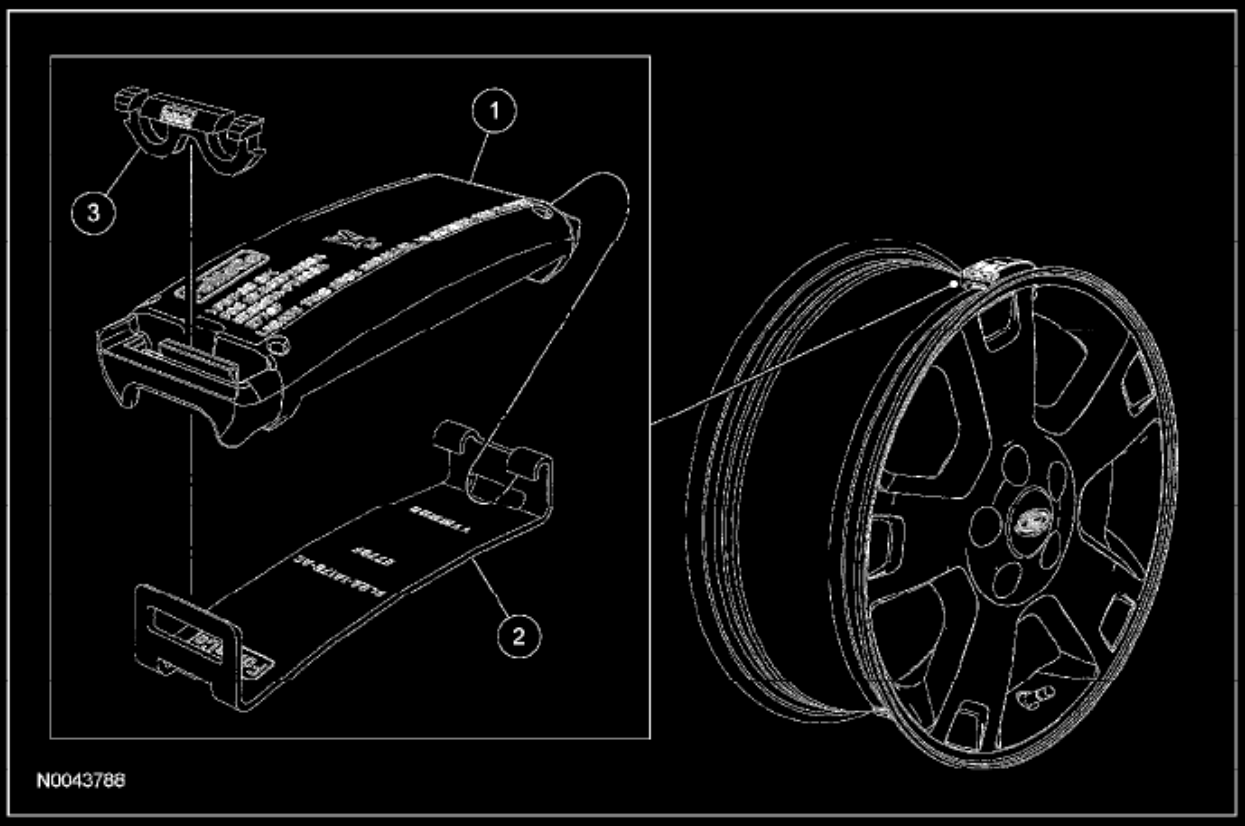
pressure sensor.

Press the test button on the activation tool to activate the sensor, activate the sensor at least 2 times.

4. Repeat Steps 2 and 3 for the remaining tires. 5. If the tire pressure monitoring system (TPMS) indicator remains illuminated after adjusting and activating each sensor, refer to the Symptom Chart

in Diagnosis and Testing.

Tire Pressure Monitoring System (TPMS) Sensor



Item	Part Number	Description
1	1A150/1A189	Tire pressure sensor/sensor kit

3	14C202	Locking clip (also part of 1A189)

Tire Pressure Sensor: Service and Repair Tire Pressure Monitoring System (TPMS) Sensor

Tire Pressure Monitoring System (TPMS) Sensor

Tire Pressure Monitoring System (TPMS) Sensor

Disassembly

WARNING: The tire pressure monitoring system (TPMS) sensor battery may release hazardous chemicals if exposed to extreme mechanical damage. If these chemicals contact the skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If any part of the battery is swallowed, contact a physician immediately. When disposing of TPMS sensors, follow the correct procedures for hazardous material disposal. Failure to follow these instructions may result in serious personal injury.

NOTE: Tire pressure sensors are equipped with Lithium-ion batteries and must be disposed of accordingly.

NOTE: Tire pressure sensors are manufactured in multiple colors based on their application. When installing a new sensor, make sure the color of the sensor being installed matches the color of the sensor that was removed. The different colored sensors are not interchangeable.

NOTE: The sensor can be removed and installed without removing the strap or the cradle.

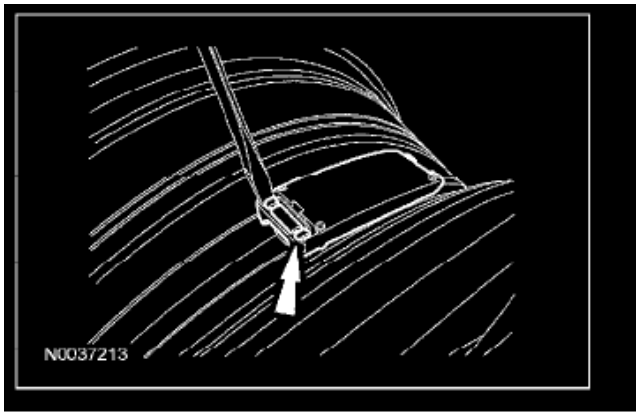
1. CAUTION: The sensor, cradle and strap may be damaged by incorrect tire mounting or dismounting. Dismount the tire only as

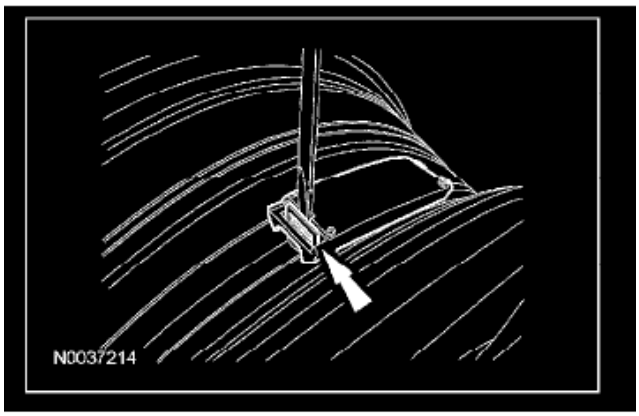
instructed.

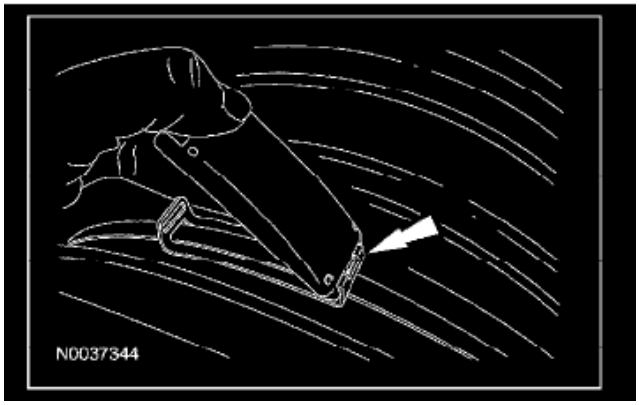
Remove the tire from the wheel.

2. CAUTION: Do not use a large screwdriver. Apply minimum force during removal or damage to the sensor locking clip may occur.

Using a pocket screwdriver or similar tool, remove the sensor locking clip.







3. CAUTION: Do not use a large screwdriver. Apply minimum force during removal or damage to the sensor may occur.

Using a pocket screwdriver or similar tool, detach the sensor from the cradle.

4. Remove the sensor.

Assembly

1. CAUTION: Damage to the sensor may occur if excessive force is applied during sensor installation.

NOTE: Make sure the sensor is fully seated into the cradle. The sensor will make a "click" noise when correctly seated.

Position the sensor into the cradle by inserting the hinge end of the sensor into the hook end of the cradle and pushing the opposite end of the sensor down onto the cradle.

2. NOTE: The locking clip can only be fully seated when installed in the correct orientation. If the sensor locking clip cannot be fully inserted, then

the sensor may not be fully seated on the cradle or the locking clip may be inserted backward.

Insert a new locking clip into the sensor.

3. CAUTION: The sensor, cradle and strap may be damaged by incorrect tire mounting or dismounting. Mount the tire only as instructed.

Install the tire onto the wheel.

4. NOTE: A new tire pressure sensor is shipped in an off mode (or battery saver mode) and must be turned on before it can be trained. To turn the

sensor on, install it on a wheel, mount the tire and inflate the tire to the recommended inflation pressure. Wait at least 2 minutes, then continue with the sensor training procedure.

Train the tire pressure sensor(s).

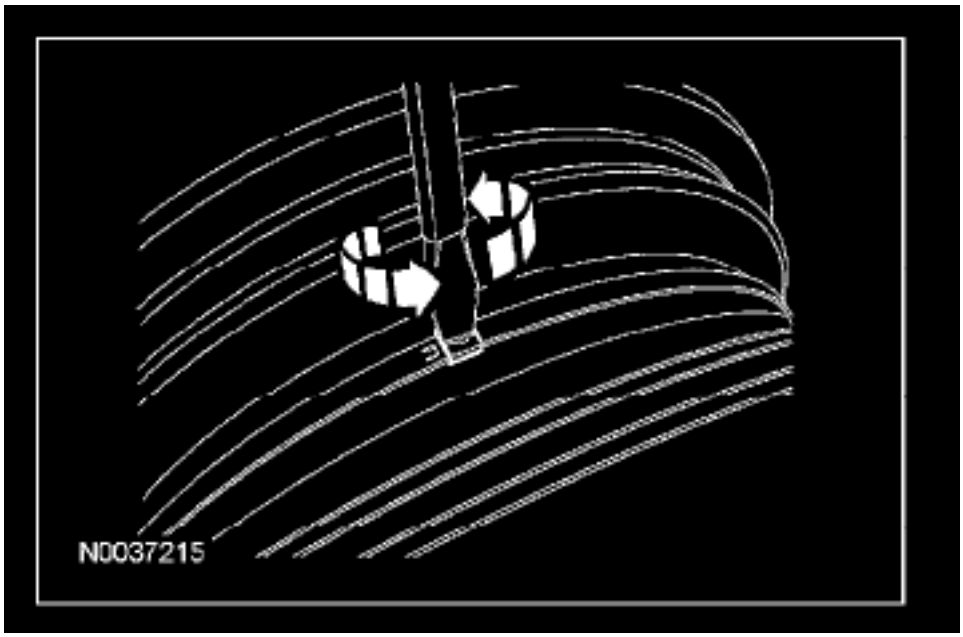
Tire Pressure Sensor: Service and Repair Tire Pressure Monitoring System (TPMS) Strap and Cradle

Tire Pressure Monitoring System (TPMS) Strap and Cradle

Disassembly



WARNING: The tire pressure monitoring system (TPMS) sensor battery may release hazardous chemicals if exposed to extreme mechanical damage. If these chemicals contact the skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If any part of the battery is swallowed, contact a physician immediately. When disposing of TPMS sensors, follow the correct procedures for hazardous material disposal. Failure to follow these instructions may result in serious personal injury.

NOTE: Tire pressure sensors are equipped with Lithium-ion batteries and must be disposed of accordingly.

NOTE: Tire pressure sensors are manufactured in multiple colors based on their application. When installing a new sensor, make sure the color of the sensor being installed matches the color of the sensor that was removed. The different colored sensors are not interchangeable.

NOTE: The sensor is available separately, the cradle and strap are available as a strap kit. There are several different strap kits available based on wheel diameter but all strap kits share the same base part number.

1. Remove the tire pressure monitoring system (TPMS) sensor.

2. WARNING: Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

WARNING: Wear protective gloves when handling components or parts that have pointed or sharp edges. Failure to follow this instruction may result in serious personal injury.

Remove a factory installed strap in the following sequence: 1

Locate the strap buckle and secure the strap to the wheel using duct tape or a similar item, on both sides of the buckle approximately 25 mm (0.98 inch) from the buckle.

2 Using a large screwdriver and a twisting motion, unbuckle the strap.

3 Discard the strap.

3. To remove a dealer installed strap, turn the worm gear screw until the strap is fully released from the worm gear.

^ Discard the strap.

4. NOTE: To aid assembly, mark the location of the cradle prior to disassembly.

Using a screwdriver, or similar tool, remove the cradle by inserting the screwdriver under the cradle and prying up.

Assembly

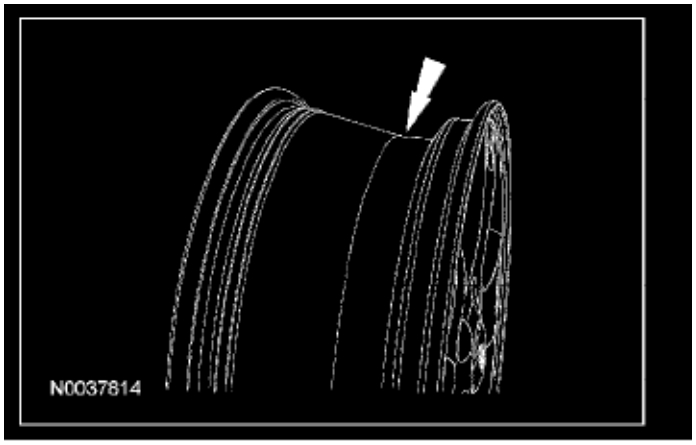
1. NOTE: Make sure the sensor is fully seated into the new cradle. The sensor will make a "click" noise when fully seated.

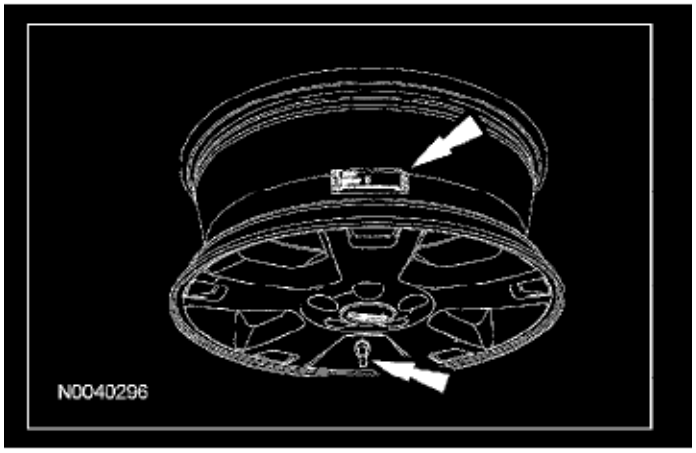
Position the sensor into the new cradle by inserting the hinge end of the sensor into the hook end of the cradle and pushing the opposite end of the sensor down onto the cradle.

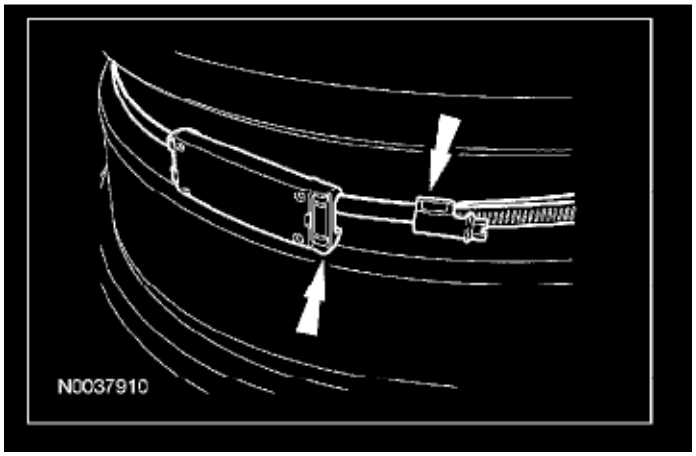
2. CAUTION: Metal scrapers may damage the wheel. Use only plastic or non-metallic scrapers to remove the cradle adhesive strip residue.

NOTE: The sensor and cradle must be installed in the drop well of the wheel, 180 degrees from the valve stem.

Clean the area where the sensor and cradle are to be installed.







3. NOTE: The sensor and cradle must be positioned with the hinge side of the sensor on the RH side when viewed from the curb side (beauty side)

of the wheel.

NOTE: The sensor has raised markings indicating how to position the sensor.

Remove the adhesive tape liner from the cradle and position the sensor and cradle into the wheel drop well 180 degrees from the valve stem.

4. Install the tapered end of the strap through the opening of the cradle on the hinge side of the sensor. This will position the worm gear on the

locking clip side of the sensor.

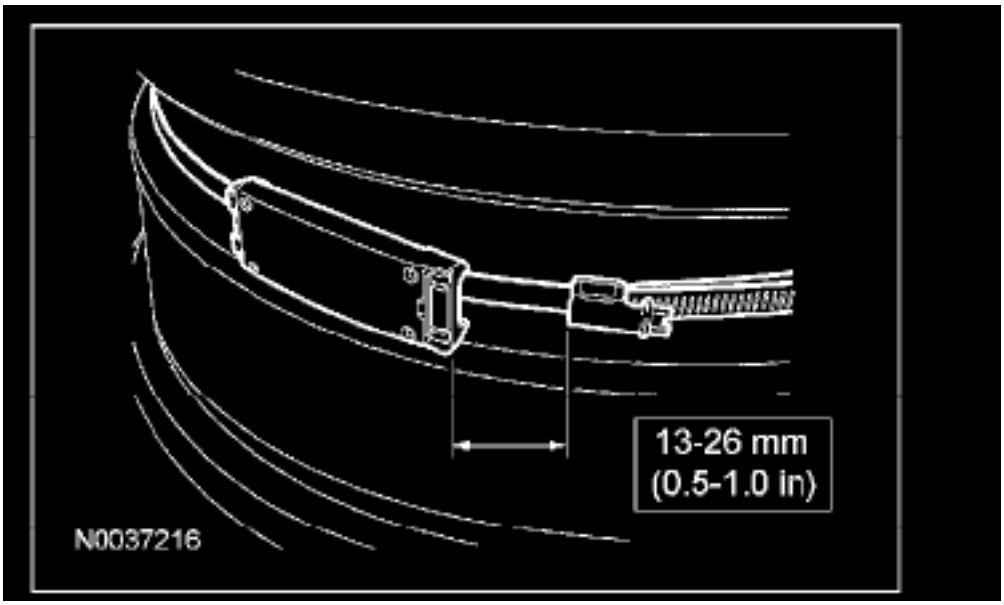
5. CAUTION: Steel wheels have a "high spot" along their circumference. Make sure the strap and sensor are mounted at the lowest spot

possible to avoid damaging the sensor during wheel and tire disassembly and assembly.

NOTE: Keep the strap parallel with the wheel flange while tightening the worm gear.

Position the worm gear 13-26 mm (0.5-1.0 inch) away from the sensor and tighten the worm gear.
^

Tighten to 3 Nm (27 lb-inch).



6. CAUTION: The sensor, cradle and strap may be damaged by incorrect tire mounting or dismounting. Mount the tire only as instructed.

Install the tire onto the wheel.

7. NOTE: A new tire pressure sensor is shipped in an off mode (or battery saver mode) and must be turned on before it can be trained. To turn the

sensor on, install it on a wheel, mount the tire and inflate the tire to the recommended inflation pressure. Wait at least 2 minutes, then continue with the sensor training procedure.

Train the tire pressure sensor(s).

Power Steering Bleeding: Service and Repair

Power Steering System Purging

CAUTION: If the air is not purged from the power steering system correctly, premature power steering pump failure may result. The condition may occur on pre-delivery vehicles with evidence of aerated fluid or on vehicles that have had steering component repairs.

1. NOTE: A whine heard from the power steering pump can be caused by air in the system. The power steering purge procedure must be carried out

prior to any component repair for which power steering noise complaints are accompanied by evidence of aerated fluid.

Remove the power steering pump reservoir cap. Check the fluid.

2. Raise the front wheels off the floor. 3. Tightly insert the stopper of the vacuum pump into the reservoir. 4. Start the engine. 5. Install the vacuum pump, apply vacuum and maintain the maximum vacuum of 68-85 kPa (20-25 in-Hg). 6. If equipped with Hydro-Boost(R), apply the brake pedal twice.

7. CAUTION: Do not hold the steering wheel against the stops for an extended amount of time. Damage to the power steering pump may

occur.

Cycle the steering wheel fully from stop-to-stop 10 times.

8. Stop the engine. 9. Release the vacuum and remove the vacuum pump.

10. NOTE: Do not overfill the reservoir.

Fill the reservoir. ^

Use approved transmission fluid.

11. Start the engine. 12. Install the vacuum pump. Apply and maintain the maximum vacuum of 68-85 kPa (20-25 in-Hg).

13. CAUTION: Do not hold the steering wheel against the stops for an extended amount of time. Damage to the power steering pump may

occur.

Cycle the steering wheel fully from stop-to-stop 10 times.

14. Stop the engine, release the vacuum and remove the vacuum pump.

15. NOTE: Do not overfill the reservoir.

Fill the reservoir as needed and install the reservoir cap.

16. Visually inspect the power steering system for leaks.

17. NOTE: Do not overfill the reservoir.

Fill the reservoir as needed and visually inspect the power steering system for leaks.

18. Install the reservoir cap.

Power Steering Fluid: Specifications

Transfer Case Fluid Type

Ford Part Number ..... Motorcraft MERCON V ATF Ford Part Number XT-5-QM
Ford Specification ..... MERCON V

Power Steering Fluid: Testing and Inspection

Power Steering Fluid Leak Test

NOTE: This test should only be carried out if a leak in the system has not been detected during a thorough visual inspection. Refer to Inspection and Verification.

1. Check the power steering fluid level. If necessary, add the specified power steering fluid. 2. Remove the power steering pump reservoir cap and tightly install the evacuation cap to the power steering pump reservoir. 3. Install the hose from the fill adapter manifold tee to the evacuation cap on the power steering pump reservoir. 4. Install the vacuum pump to the evacuation cap. 5. Using the vacuum pump, apply 68-85 kPa (20-25 in-Hg) of vacuum to the power steering system. 6. Observe the vacuum gauge for 30 seconds. If the vacuum gauge reading drops more than 3 kPa (0.88 in-Hg) a leak is present. 7. Remove the vacuum pump.

8. CAUTION: Do not hold the steering wheel at the stops for an extended amount of time. Damage to the power steering pump may occur.

Start the engine. With the engine at idle, raise the power steering fluid temperature to 74-80° C (165-176° F) by rotating the steering wheel fully to the left and right several times.

9. Visually inspect the system for leaks. If a leak is evident, repair as necessary. If a leak is not evident, add the specified UV fluorescent tracer dye

to the power steering fluid. Use 14.78 ml (1/2 oz) of dye solution for every 1.89L (2 qt) of power steering fluid.

10. CAUTION: Do not hold the steering wheel at the stops for an extended amount of time. Damage to the power steering pump may occur.

Start the engine. With the engine at idle, raise the power steering fluid temperature to 74-80° C (165-176° F) by rotating the steering wheel fully to the left and right several times.

11. Using the special tool (UV lamp), inspect the system for traces of UV dye. Repair as necessary.

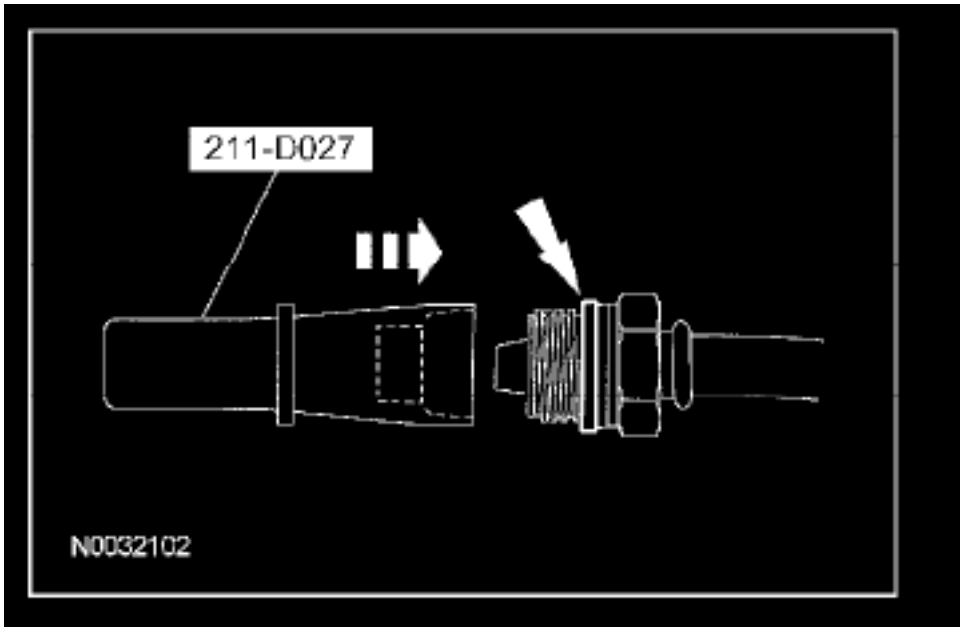
Power Steering Pump: Service and Repair Power Steering Pump

Power Steering Pump - 3.0L

Removal and Installation



CAUTION: While repairing the power steering system, care should be taken to prevent the entry of foreign material or failure of the power steering components may result.

1. CAUTION: Do not allow power steering fluid to contact the engine accessory drive belt or the belt may be damaged.

Using a suitable suction device, remove the power steering fluid from the reservoir.

2. Remove the power steering pump pulley. 3. Disconnect the pressure line-to-pump fitting.

^ Remove and discard the Teflon(R) seal.

^ To install, tighten to 65 Nm (48 lb-ft).

4. Compress the clamp and disconnect the power steering pump supply hose. 5. Remove the 3 bolts and the power steering pump.

^ To install, tighten to 25 Nm (18 lb-ft).

6. CAUTION: A new Teflon(R) seal must be installed any time the pressure line fitting is disconnected from the power steering pump or a

fluid leak may occur.

To install, reverse the removal procedure. ^

Using the special tool, install a new Teflon(R) seal on the pressure line-to-pump fitting.

^ Fill the power steering system.

Power Steering Pump Pulley — 3.0L, 4.0L

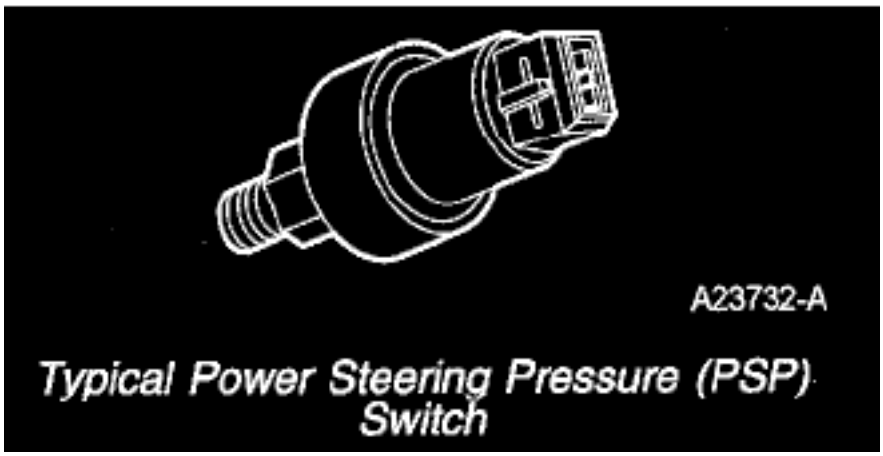
Typical Power Steering Pressure (PSP) Sensor



Typical Power Steering Pressure (PSP) Switch

Power Steering Pressure Switch: Description and Operation

Power Steering Pressure (PSP) Sensor

Typical Power Steering Pressure (PSP) Sensor

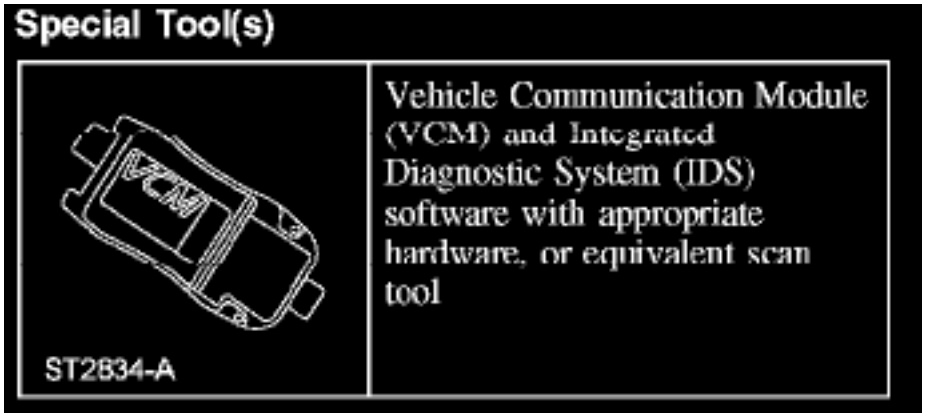
The PSP sensor monitors the hydraulic pressure within the power steering system. The PSP sensor voltage input to the PCM changes as the hydraulic pressure changes. The PCM uses the input signal from the PSP sensor to compensate for additional loads on the engine by adjusting the

idle RPM and preventing engine stall during parking maneuvers. Also, the PSP sensor signals the PCM to adjust the transmission electronic pressure control (EPC) pressure during increased engine load, for example, during parking maneuvers.

Power Steering Pressure (PSP) Switch

Typical Power Steering Pressure (PSP) Switch

The PSP switch monitors the hydraulic pressure within the power steering system. The PSP switch is a normally closed switch that opens as the hydraulic pressure increases. The PCM provides a low current voltage on the PSP circuit. When the PSP switch is closed, this voltage is pulled low through the SIG RTN circuit. The PCM uses the input signal from the PSP switch to compensate for additional loads on the engine by adjusting the idle RPM and preventing engine stall during parking maneuvers. Also, the PSP switch signals the PCM to adjust the transmission electronic pressure control (EPC) pressure during increased engine load, for example during parking maneuvers.



Air Bag(s) Arming and Disarming: Service and Repair Supplemental Restraint System (SRS) Depowering and Repowering

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) DEPOWERING AND REPOWERING

Special Tool(s)

Special Tool(s)

Depowering Procedure

WARNING:

- Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

- To reduce the risk of accidental deployment, do not use any memory saver devices. Failure to follow this instruction may result in serious personal injury or death.

NOTE:

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1. Turn all vehicle accessories OFF. 2. Turn the ignition switch to OFF. 3. At the smart junction box (SJB), located below the RH side of the instrument panel, remove the RH lower cowl trim panel and remove the

restraints control module (RCM) fuse 8 (10A) from the SJB.

4. Turn the ignition ON and visually monitor the air bag warning indicator for at least 30 seconds. The air bag warning indicator will remain lit

continuously (no flashing) if the correct RCM fuse has been removed. If the air bag warning indicator does not remain lit continuously, remove the correct RCM fuse before proceeding.

5. Turn the ignition OFF.

6. WARNING: Always deplete the backup power supply before repairing or installing any new front or side air bag supplemental restraint

system (SRS) component and before servicing, removing, installing, adjusting or striking components near the front or side impact sensors or the restraints control module (RCM). Nearby components include doors, instrument panel, console, door latches, strikers, seats and hood latches.

Refer to the Description and Operation portion of Air Bag Systems for location of the RCM and impact sensor(s).

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least 1 minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Failure to follow these instructions may result in serious personal injury or death in the event of an accidental deployment.

Disconnect the battery ground cable and wait at least one minute.

Repowering Procedure

1. Turn the ignition switch from OFF to ON. 2. Install the RCM fuse 8 (10A) to the SJB and install the RH lower cowl trim panel.

3. WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is

connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

Connect the battery ground cable.

4. Prove out the SRS as follows:

Turn the ignition key from ON to OFF. Wait 10 seconds, then turn the key back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning

indicator will light continuously for approximately 6 seconds and then turn off. If an air bag SRS fault is present, the air bag warning indicator will: -

fail to light.

- remain lit continuously.

- flash at a 5Hz rate (RCM not configured).

The air bag warning indicator may not illuminate until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.

Clear all continuous RCM and occupant classification system module (OCSM) DTCs using a scan tool.

Special Tool(s)

ST2621-A	Diagnostic Tool, Restraint System (2 required) 418-F395
ST2512-A	Diagnostic Tool, Restraint System 418-F403
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Air Bag(s) Arming and Disarming: Service and Repair Supplemental Restraint System (SRS) Deactivation and Reactivation

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) DEACTIVATION AND REACTIVATION

Special Tool(s)

Deactivation Procedure

WARNING:

- Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

- Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which

increases the risk of serious personal injury or death.

- To reduce the risk of accidental deployment, do not use any memory saver devices. Failure to follow this instruction may result in serious personal injury or death.

NOTE:

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

- No restraint system diagnostic tools are available for the safety belt buckle pretensioners. If the ignition switch is set to RUN or START with either the driver or passenger safety belt buckle pretensioner electrical connector disconnected, the DTCs for an open circuit fault will be active.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1. Turn all vehicle accessories OFF. 2. Turn the ignition switch to OFF. 3. At the smart junction box (SJB), located below the RH side of the instrument panel, remove the restraints control module (RCM) fuse 8 (10A)

from the SJB.

4. Turn the ignition ON and visually monitor the air bag warning indicator for at least 30 seconds. The air bag warning indicator will remain lit

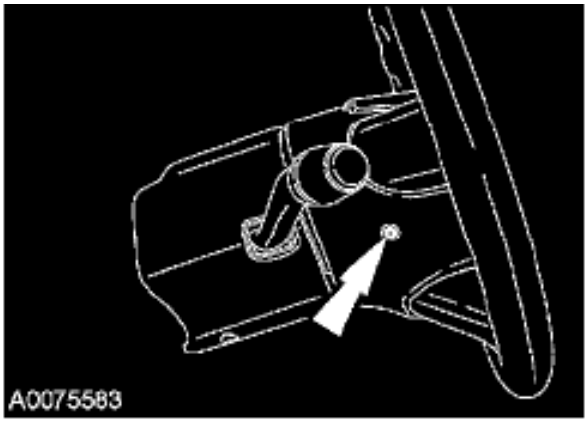
continuously (no flashing) if the correct RCM fuse has been removed. If the air bag warning indicator does not remain lit continuously, remove the correct RCM fuse before proceeding.

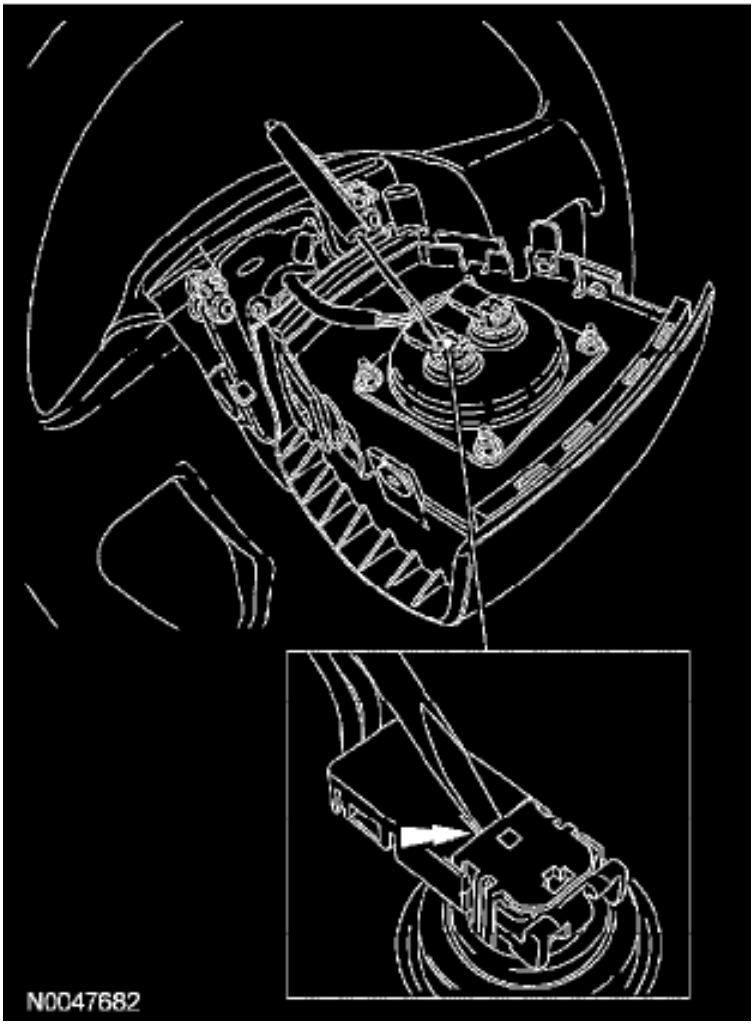
5. Turn the ignition OFF.

6. WARNING: Always deplete the backup power supply before repairing or installing any new front or side air bag supplemental restraint

system (SRS) component and before servicing, removing, installing, adjusting or striking components near the front or side impact sensors or the restraints control module (RCM). Nearby components include doors, instrument panel, console, door latches, strikers, seats and hood latches.

Refer to the Description and Operation portion of Air Bag Systems for location of the RCM and impact sensor(s).





To deplete the backup power supply energy, disconnect the battery ground cable and wait at least 1 minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Failure to follow these instructions may result in serious personal injury or death in the event of an accidental deployment.

Disconnect the battery ground cable and wait at least 1 minute.

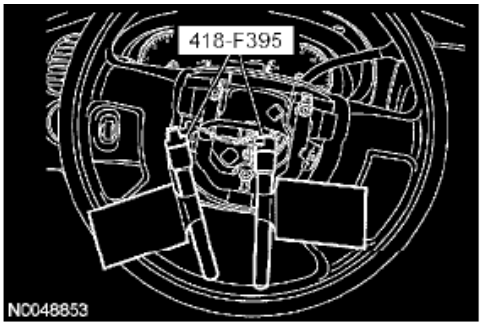
7. Remove the 2 driver air bag module bolts (1 shown).

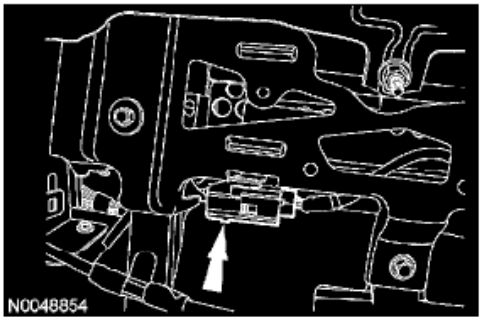
8. CAUTION: Do not pull the driver air bag module electrical connectors out by the locking buttons. Damage to the locking buttons may

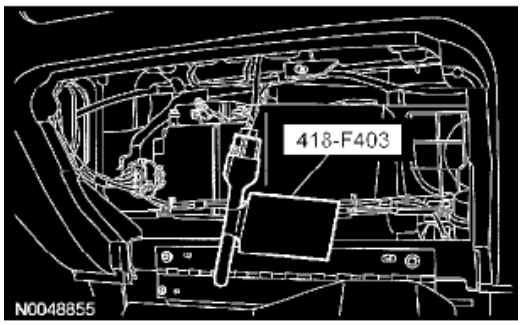
occur.

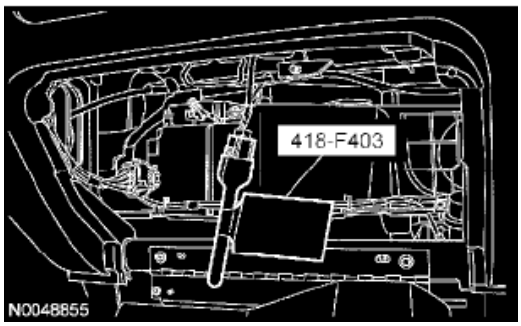
Using a small screwdriver as shown, lift up and release the locking buttons on the driver air bag module electrical connectors. With the locking buttons released, remove the electrical connectors and the driver air bag module.

9. Attach the restraint system diagnostic tools to the clockspring electrical connectors at the top of the steering column.









10. Open the glove compartment door fully to access the passenger air bag electrical connector.
11. Release the tab and disconnect the passenger air bag module electrical connector.

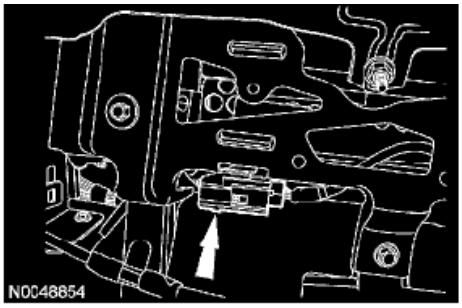
12. Attach the restraint system diagnostic tool to the vehicle harness side of the passenger air bag module electrical connector.

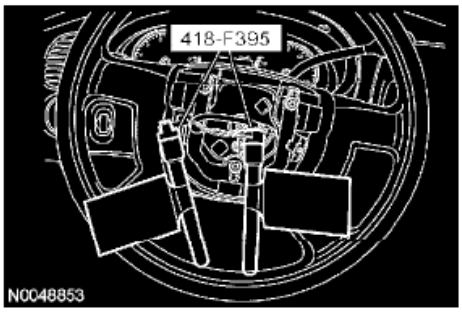
13. Install the RCM fuse 8 (10A) to the SJB. 14. Connect the battery ground cable.

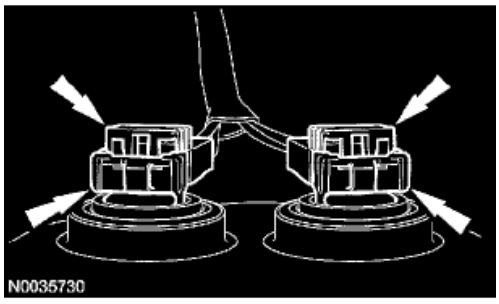
Reactivation Procedure

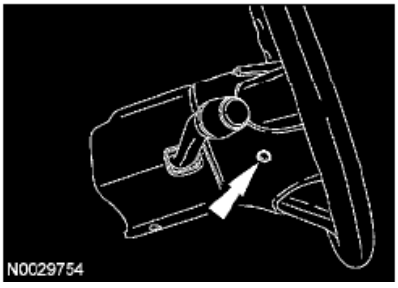
1. Remove the RCM fuse 8 (10A) from the SJB. 2. Disconnect the battery ground cable and wait at least one minute. 3. Remove the restraint system diagnostic tool from the vehicle harness side of the passenger air bag module electrical connector.

4. Connect the passenger air bag module electrical connector.









5. Close the glove compartment door. 6. Remove the restraint system diagnostic tools from the clockspring electrical connectors at the top of the steering column.

7. CAUTION:

- Do not install the driver air bag module electrical connectors by the locking buttons. Damage to the locking buttons may occur.

- The driver air bag module electrical connector locking buttons must be in the released position when the connector is being installed or connector damage may occur.

- The driver air bag module electrical connectors are unique and cannot be reversed when connected to the driver air bag module. Match the electrical connector key to the keyway in the driver air bag module. Do not force the electrical connectors into the driver air bag module. Damage to the connector or component may occur.

With the locking buttons released, install the driver air bag module electrical connectors fully into the driver air bag module and seat the locking buttons.

8. Install the 2 driver air bag module bolts (1 shown).

- Tighten to 6 Nm (53 lb-in).

9. WARNING: Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental

restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death

in a crash and possibly violate vehicle safety standards.

Make sure all restraint system diagnostic tool(s) that may have been installed during the repair have been removed from the vehicle and all SRS components are connected.

10. Turn the ignition from OFF to ON. 11. Install the restraint system control module fuse 8 (10A) to the SJB.

12. WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is

connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

Connect the battery ground cable.

13. Prove out the SRS as follows:

Turn the ignition key from ON to OFF. Wait 10 seconds, then turn the key back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an air bag SRS fault is present, the air bag warning indicator will: -

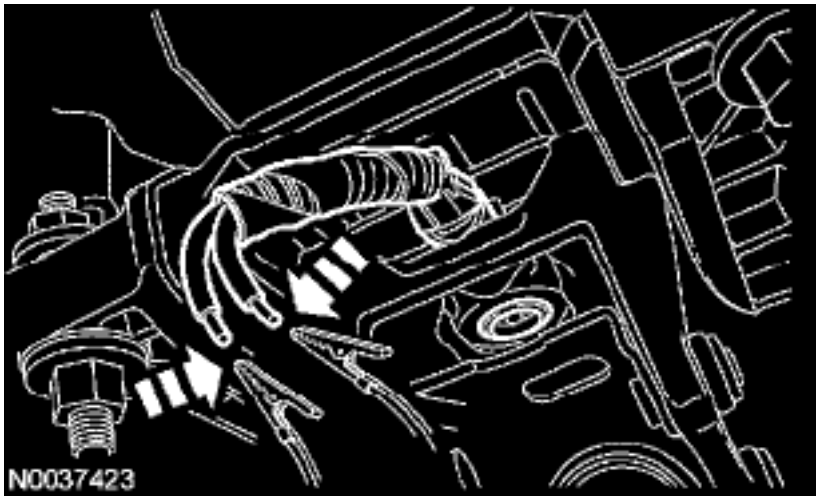
fail to light.

- remain lit continuously.

- flash at a 5Hz rate (RCM not configured).

The air bag warning indicator may not illuminate until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.

Clear all continuous RCM and occupant classification system module (OCSM) DTCs using a scan tool.



Adaptive Collapsible Steering Column: Service and Repair

DEPLOYABLE STEERING COLUMN - IN-VEHICLE DEPLOYMENT

WARNING: Deploy all supplemental restraint system (SRS) devices (air bags, pretensioners, load limiters, etc.) outdoors with all personnel at least 9.14 meters (30 feet) away to make sure of personal safety. Due to the loud report which occurs when an SRS device is deployed, hearing protection is required. Failure to follow these instructions may result in serious personal injury.

1. Depower the SRS.

2. NOTE: It may be necessary to lower or remove the deployable steering column from the instrument panel to access the deployable steering

column electrical connector.

Access the deployable steering column electrical connector.

3. NOTE: If the deployable steering column does not have a hard-wired pigtail, it will be necessary to cut the wires and connector(s) from the

vehicle wire harness and reconnect to the deployable steering column.

Cut each of the deployable steering column wires, leaving at least 4 inches to work with.

4. Remove any sheathing (if present) and strip the insulation from the ends of the cut wires. 5. Make a jumper harness to deploy the deployable steering column.

- Obtain 2 wires (20 gauge minimum) at least 9.14 m (30 ft) long and strip both ends of each wire.

- At one end of the jumper harness, connect the wires together.

6. Using the end of the jumper harness that the wires are not connected together, attach each wire of the jumper harness to each wire of the

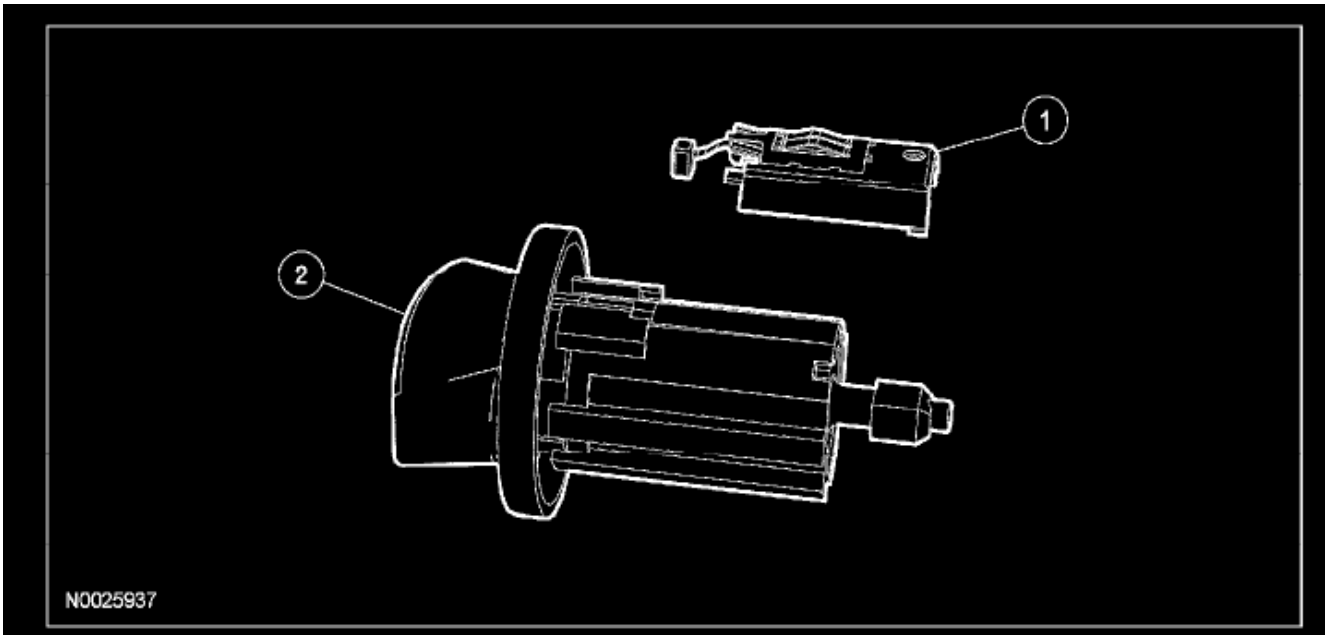
deployable steering column. Use tape or other insulating material to make sure that the leads do not make contact with each other.

7. Remain at least 9.14 m (30 ft) away from the deployable steering column. 8. From the end of the jumper harness that is not connected to the deployable steering column, disconnect the 2 wires of the jumper harness from

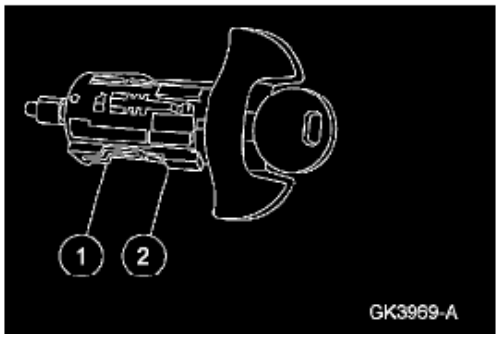
each other.

9. Deploy the deployable steering column by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.

10. To allow for cooling, wait at least 10 minutes before approaching the deployed steering column. 11. Dispose of the deployed steering column in the same manner as any other part to be scrapped.



Item	Part Number	Description
1	11A127	Key-in-ignition warning switch
2	11582	Ignition lock cylinder



Key Reminder Switch: Service and Repair

KEY-IN-IGNITION WARNING SWITCH

Removal and Installation

1. Remove the ignition lock cylinder. 2. Remove the key-in-ignition warning switch.

1 Pry the clip downward.

2 Release the key-in-ignition warning switch from the rear of the ignition lock cylinder.

3. To install, reverse the removal procedure.

Steering Gear: Testing and Inspection Steering Gear Valve Test

Steering Gear Valve Test

1. With the vehicle in motion, place the transmission in NEUTRAL and turn the engine OFF.

^ If the vehicle does not pull with the engine OFF, repair or install a new steering gear.

2. If the vehicle pulls with the engine OFF, switch the right side front wheel to the left side of the vehicle and the left side front wheel to the right side

of the vehicle.

3. If the vehicle pulls to the opposite side, switch the front wheels with the rear wheels keeping them on the same side of the vehicle. 4. If the vehicle pull direction does not change, check the front suspension components, wheel alignment and frame alignment.

Steering Gear: Testing and Inspection Steering Gear Grunt/Shudder Test

Steering Gear Grunt/Shudder Test

1. Start and run the vehicle to operating temperature. 2. Set engine idle speed to 1,200 rpm.

3. CAUTION: Do not hold the steering wheel against the stops for an extended amount of time. Damage to the power steering pump may

occur.

Rotate the steering wheel to the RH stop, then turn the steering wheel 90 degrees back from that position. Slowly turn the steering wheel back and forth approximately 1/12 of a full turn.

4. Turn the steering wheel another 90 degrees. Slowly turn the steering wheel back and forth approximately 1/12 of a full turn. 5. Repeat the test with the power steering fluid at different temperatures. 6. If a light grunt is heard or a low (50-200 Hz) shudder is present, this is a normal steering system condition. 7. If a loud grunt is heard, or a strong shudder is felt, purge the power steering system. If a loud grunt or strong shudder still exists, check the power

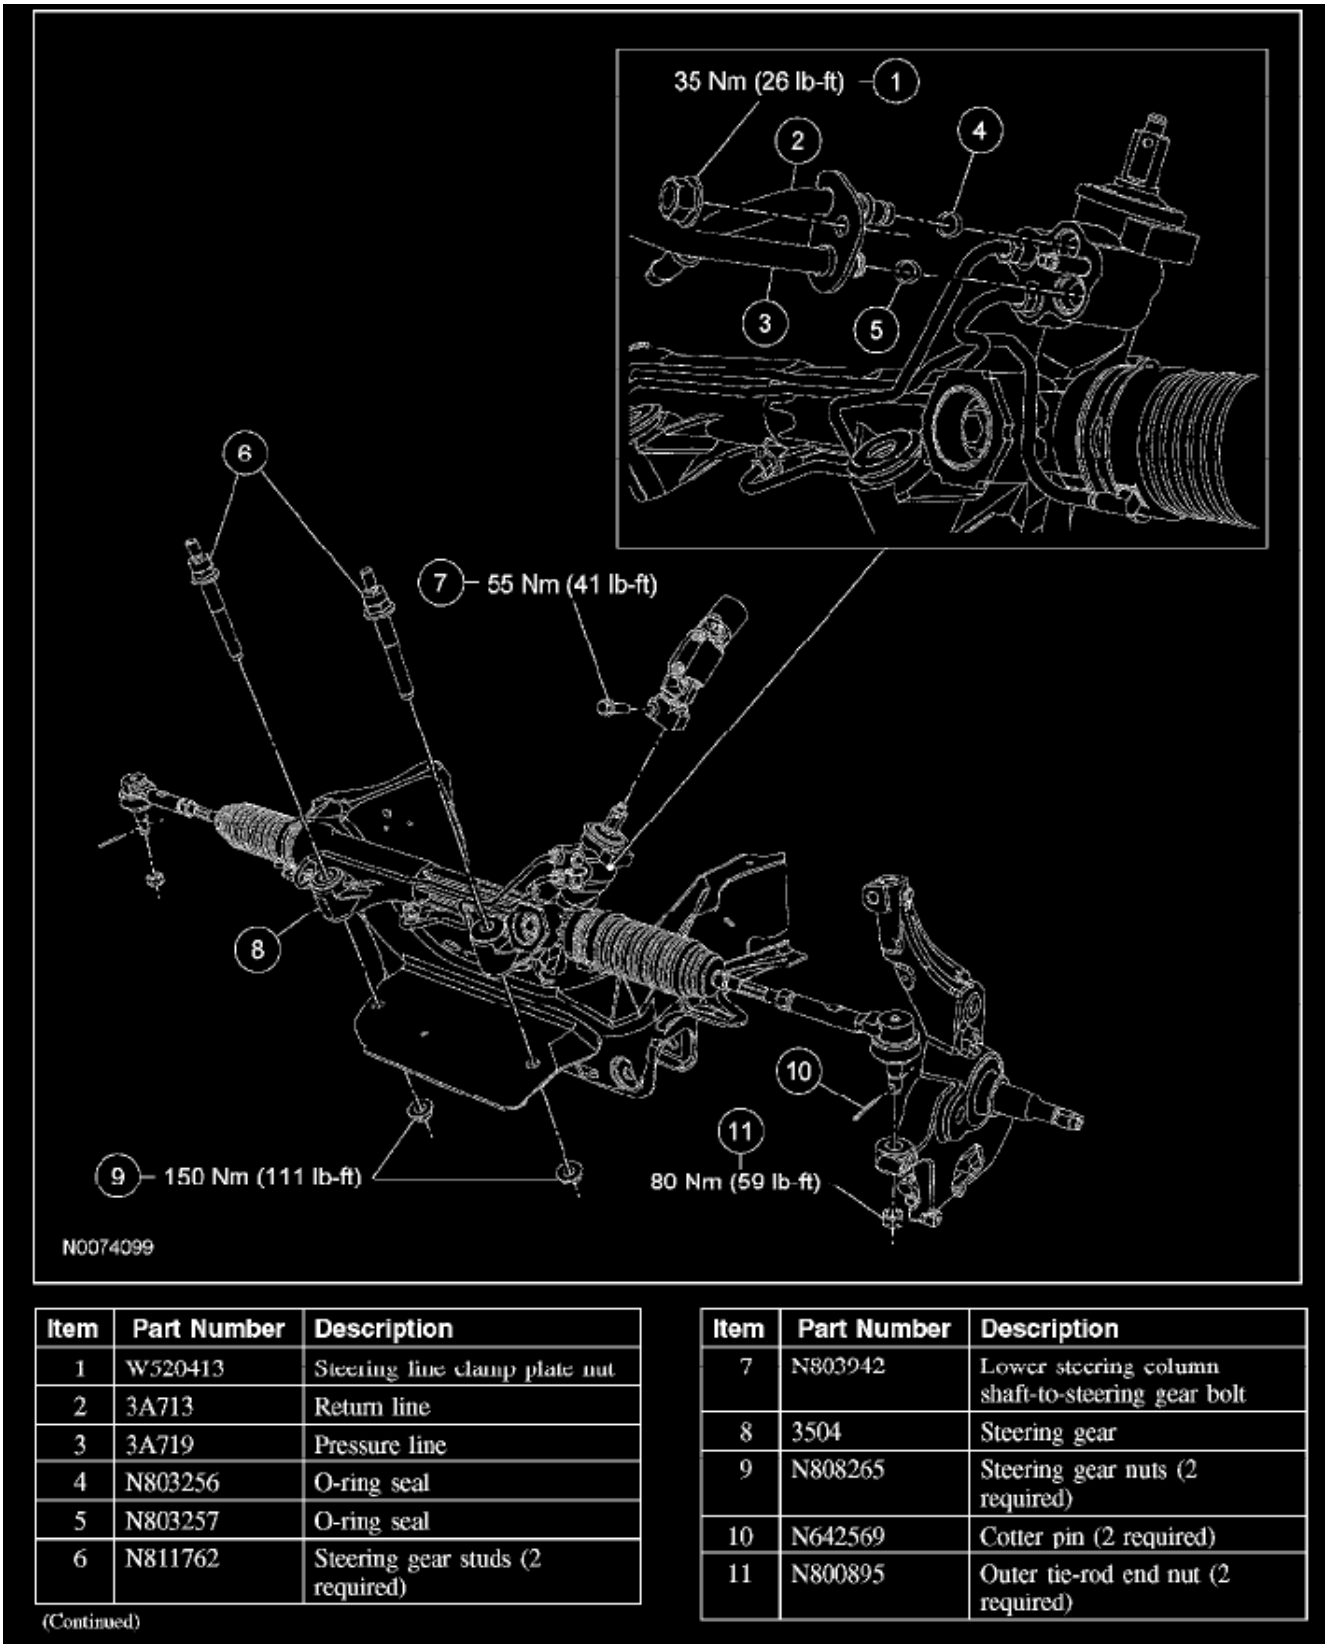
steering lines/hoses for restrictions or damage and repair as necessary. If the lines/hoses are OK, install a new steering gear.

Special Tool(s)

Remover, Tie-Rod End
211-001 (TOOL-3290-D) or equivalent

Steering Gear: Service and Repair

Steering Gear - Rear Wheel Drive (RWD)



Item	Part Number	Description

10	N642569	Cotter pin (2 required)
11	N800895	Outer tie-rod end nut (2 required)

Removal and Installation

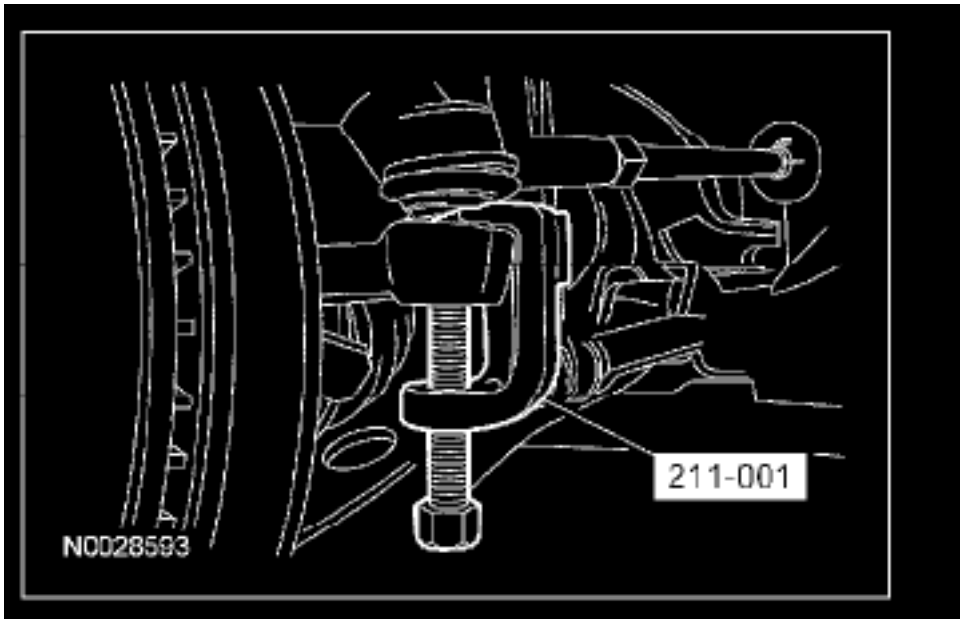
All vehicles

CAUTION: When repairing the power steering system, care should be taken to prevent the entry of foreign material or failure of the power steering components may result.

1. Remove the front wheels and tires. 2. Place the steering wheel in the straight-ahead position and remove the ignition key.

Rotate the steering wheel until the steering column locks into position.

(3.0L) and 4.0L) engines



3. Remove the power steering fluid cooler.

All vehicles

4. Remove the outer tie-rod end cotter pins and nuts.

^ Discard the cotter pins.

^ To install, tighten to 80 Nm (59 lb-ft).

5. CAUTION: Do not damage the tie-rod boot when installing the special tool.

NOTE: Remove the adapter from the ball end of the special tool. Apply a small amount of grease to the tie-rod end stud and the ball of the special tool.

Using special tool, separate the outer tie-rod ends from the wheel spindles.

6. CAUTION: Do not allow the steering column to rotate while the steering column shaft is disconnected from the steering gear or damage

to the clockspring may result. If there is evidence that the steering column has rotated, the clockspring must be removed and recentered.

Remove the lower steering column shaft-to- steering gear bolt and disconnect the lower steering column shaft from the gear. ^

Discard the bolt.

^ To install, tighten to 55 Nm (41 lb-ft).

7. Remove the steering line clamp plate nut and disconnect the pressure and return lines.

^ Discard the O-ring seals.

^ To install, tighten to 35 Nm (26 lb-ft).

8. Plug or cap the return line, pressure line and the steering gear ports to prevent the entry of dirt.

9. CAUTION: Hold the tops of the steering gear studs to avoid damaging the steering gear fluid transfer tubes.

Remove the 2 steering gear nuts and the 2 steering gear studs. ^

To install, tighten to 150 Nm (111 lb-ft).

10. Remove the steering gear. 11. If necessary, remove the outer tie-rod ends.

12. CAUTION: New O-ring seals must be installed any time the power steering lines are disconnected from the steering gear or a fluid leak

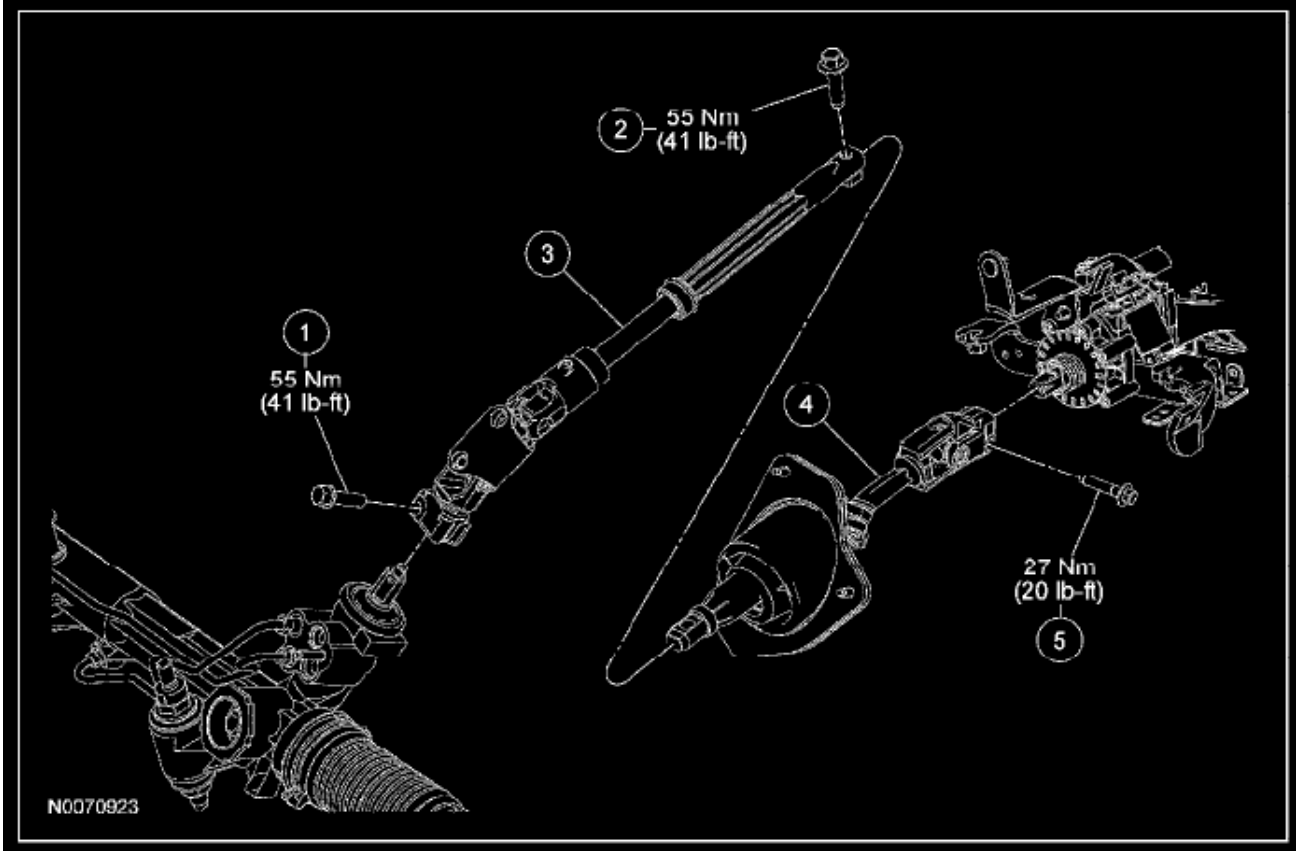
may occur.

To install, reverse the removal procedure. ^

Install new power steering line O-ring seals.

13. Fill the power steering system. 14. Check and, if necessary, adjust the front toe.

Steering Column Shaft



Item	Part Number	Description
1	N801614	Lower steering column shaft-to-steering gear bolt
2	N801614	Lower steering column shaft-to-upper steering column shaft bolt
3	3C662	Lower steering column shaft
4	3E751	Upper steering column shaft
5	N808684	Upper steering column shaft-to-steering column bolt

Steering Shaft: Service and Repair

Steering Column Shaft

Steering Column Shaft

Removal and Installation

Upper and lower shaft

1. With the vehicle in NEUTRAL, position it on a hoist.

2. CAUTION: Do not allow the steering column to rotate while the steering column shaft is disconnected or damage to the clockspring may

result. If there is evidence that the shaft has rotated, the clockspring must be removed and recentered.

Remove and discard the lower steering column shaft-to-upper steering column shaft bolt. ^

Collapse the lower steering column shaft.

^ To install, tighten to 55 Nm (41 lb-ft).

3. Remove the upper steering column shaft-to- steering column bolt and remove the upper steering column shaft.

^ Discard the bolt.

^ To install, tighten to 27 Nm (20 lb-ft).

Lower shaft 4. Remove the lower steering column shaft-to-steering gear bolt and remove the lower steering column shaft.

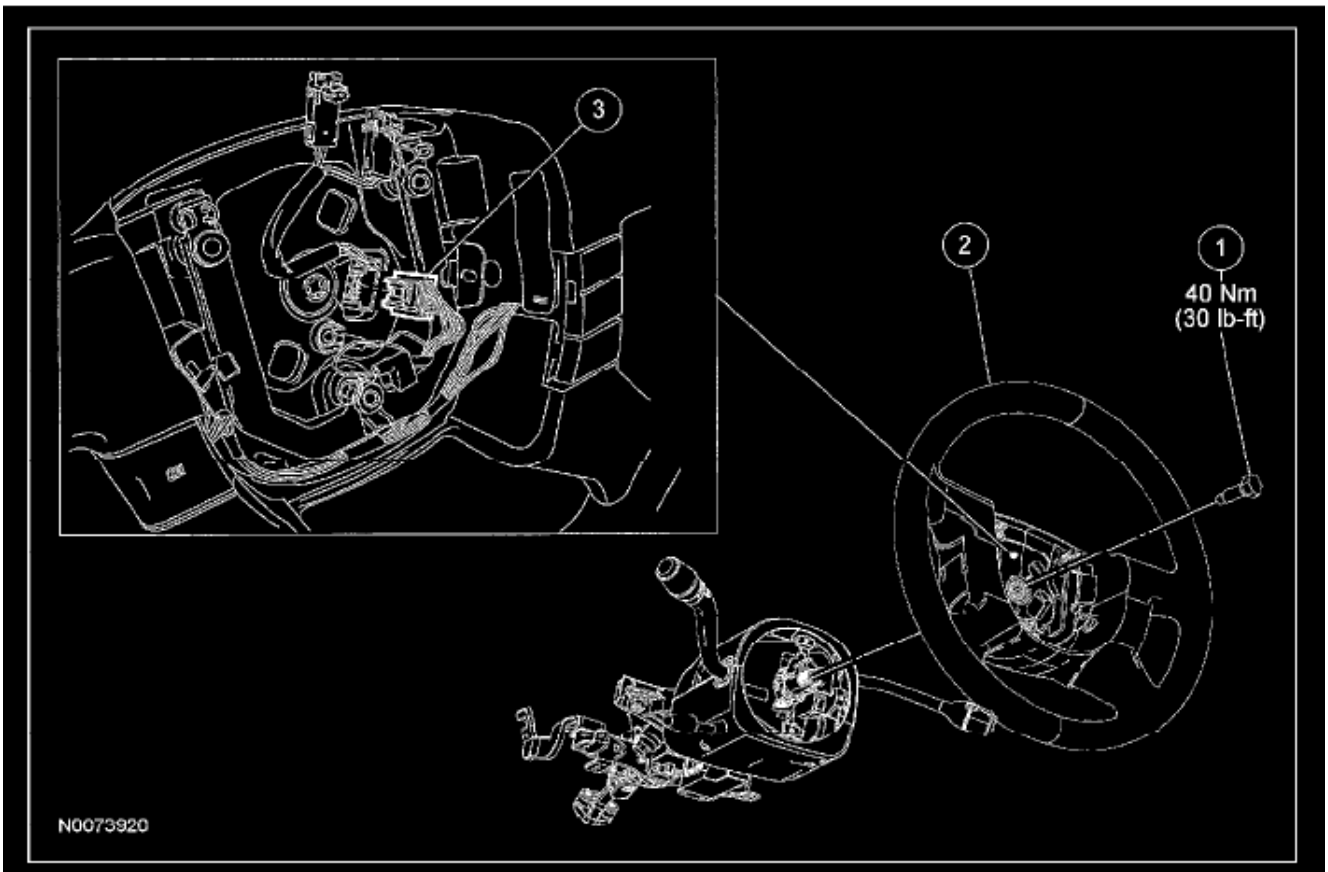
^ Discard the bolt.

^ To install, tighten to 55 Nm (41 lb-ft).

Upper and lower shaft 5. To install, reverse the removal procedure.

Special Tool(s)

 ST1321-A	Remover, Differential Bearing 205-116 (T77F-4220-B1)



Item	Part Number	Description
1	N807493	Steering wheel bolt
2	3600	Steering wheel
3	—	Steering wheel switches electrical connector (part of 3600)

Steering Wheel: Service and Repair

Steering Wheel

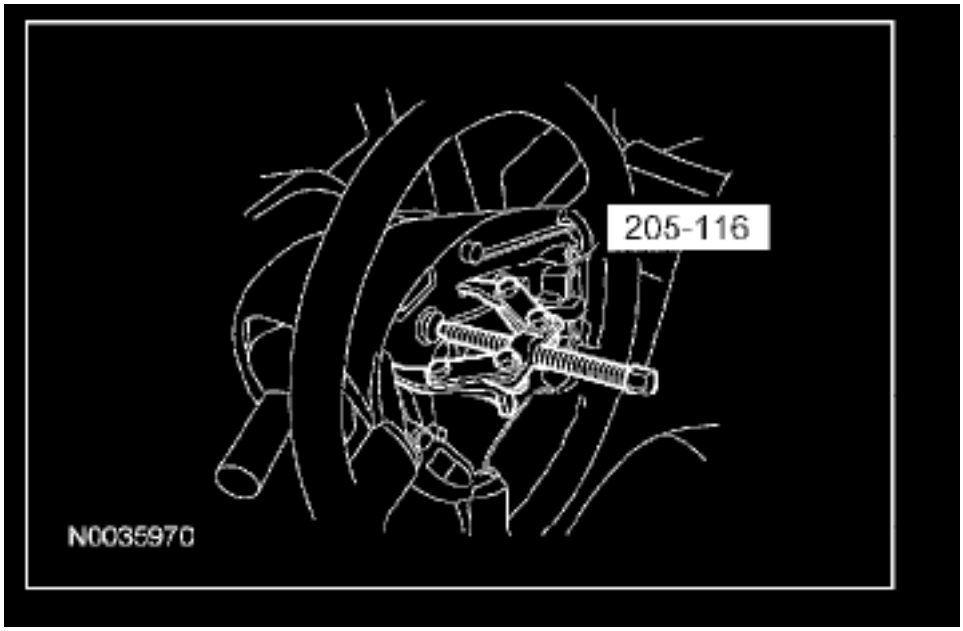
Removal and Installation

1. Turn the steering wheel to the straight-ahead position and turn the ignition switch to the OFF position. 2. Remove the driver air bag module. 3. Loosen the steering wheel bolt.

^ To install, tighten to 40 Nm (30 lb-ft).

4. CAUTION: Removing the steering wheel without using a puller may damage the column bearings.

Using the special tool, remove the steering wheel.



5. Remove and discard the steering wheel bolt. 6. Disconnect the steering wheel switches electrical connector from the clockspring. 7. Remove the steering wheel.

^ Route the wires from the clockspring through the steering wheel.

8. NOTE: A new steering wheel bolt must be installed.

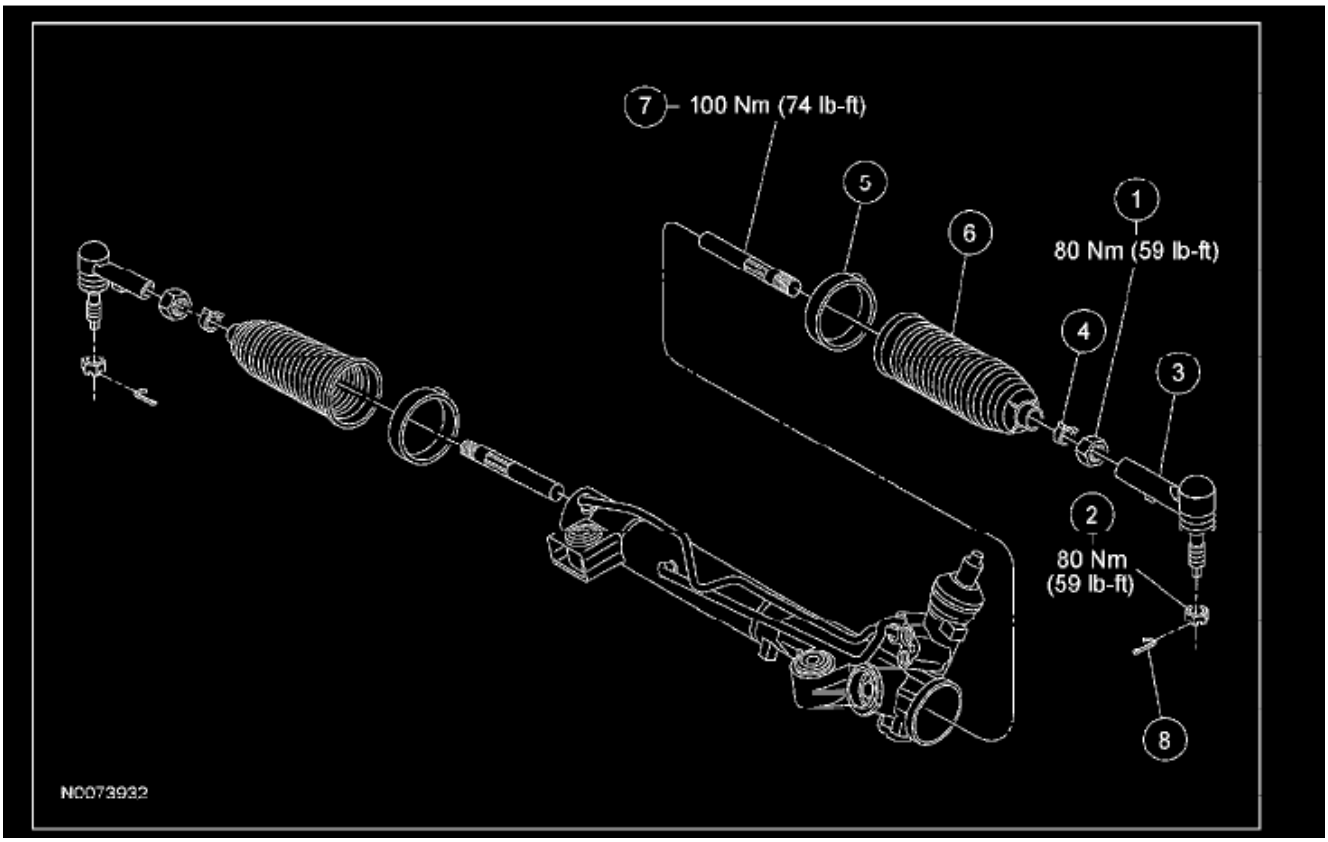
To install, reverse the removal procedure.

Special Tool(s)

ST1427-A	Inner Tie-Rod Socket Tool 211-D029 or equivalent
ST1408-A	Tie-Rod End Separator 211-105 (T85M-3395-A) or equivalent

Material

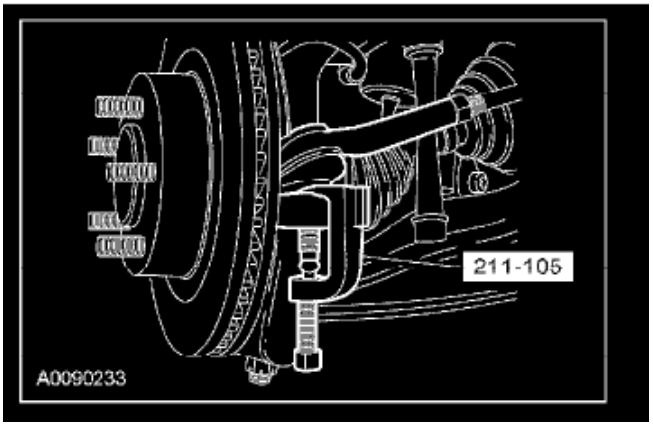
Item	Specification
Premium Long-Life Grease XG-1-C or XG-1-K (US); CXG-1-C (Canada)	ESA-M1C75-B



Tie Rod: Service and Repair

Inner Tie Rod

Item	Part Number	Description
1	N803637	Tie-rod jam nut (part of 3280) (2 required)
2	N800895	Outer tie-rod end nut (2 required)
3	3290	Outer tie-rod end (2 required)
4	3K745	Outer bellows boot clamp (2 required)
5	3C650A	Inner bellows boot clamp (2 required)
6	3K661	Steering gear bellows boot (2 required)
7	3280	Inner tie rod (2 required)
8	N642569	Cotter pin (2 required)



Removal and Installation

CAUTION: The boots and clamps are designed to provide an airtight seal and protect the internal components of the steering gear. If the seal is not airtight, the vacuum generated during turning may draw water and foreign material into the gear and damage internal components. Zip ties do not produce an airtight seal and must not be used.

CAUTION: The inner ball joint grease is not compatible with water. Water and foreign material trapped in the grease may damage the joint.

CAUTION: If present, the orientation of the vent tubes must be noted so the boots and vent tubes may be installed in their original locations. Incorrect venting may lead to internal component damage.

Coil spring suspension vehicles

1. Remove the wheel and tire. 2. Loosen the tie-rod jam nuts.

^ To install, tighten to 80 Nm (59 lb-ft).

3. Remove the outer tie-rod end cotter pin and nut.

^ Discard the cotter pin.

^ To install, tighten to 80 Nm (59 lb-ft).

4. CAUTION: Do not damage the tie-rod end boot when installing the special tool.

Using the special tool, disconnect the outer tie-rod end.

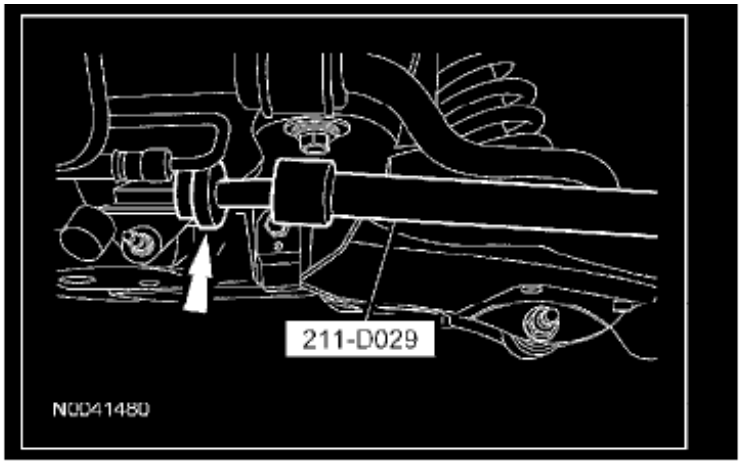
5. NOTE: Count and record the number of times the outer tie-rod end turns for assembly reference.

Remove the outer tie-rod end.

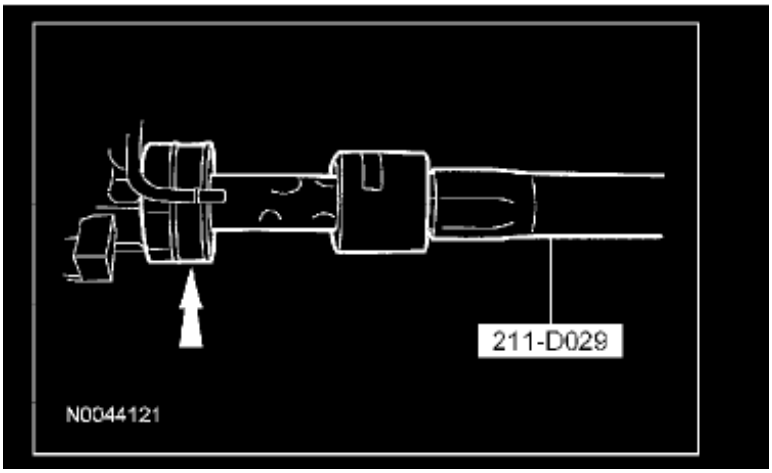
6. Remove the tie-rod jam nut.

7. NOTE: If repairing the RH side, it will be necessary to pull back the LH inner bellows boot to hold the steering gear.

Remove the inner and outer bellows boot clamps.



211-D029
N0041480



211-D029
N0044121

8. Remove the bellows boot.

9. CAUTION: Place the steering gear at the center position. Use a 21 mm (0.82 inch) crowfoot on the flat of the rack gear to resist rotation

and to prevent damage during removal and installation of the inner tie rod.

NOTE: The help of an assistant may be needed for removal of the RH inner tie rod.

Using the special tool, remove the inner tie rod. ^

To install, tighten to 100 Nm (74 lb-ft).

Torsion bar suspension vehicles 10. Loosen the tie-rod jam nut.

^ To install, tighten to 80 Nm (59 lb-ft).

11. Remove the steering gear.

12. NOTE: Count and record the number of times the outer tie-rod end turns for assembly reference.

Remove the outer tie-rod end and jam nut.

13. NOTE: If repairing the RH side, it will be necessary to pull back the LH inner bellows boot to hold the steering gear.

Remove the inner and outer bellows boot clamps.

14. CAUTION: Place the steering gear at the center position. Use a 21 mm (0.82 inch) crowfoot on the flat of the rack gear to resist rotation

and to prevent damage during removal and installation of the inner tie rod.

NOTE: The help of an assistant may be needed for removal of the RH inner tie rod.

Using the special tool, remove the inner tie rod. ^

To install, tighten to 100 Nm (74 lb-ft).

All vehicles

15. CAUTION: Thoroughly remove any dirt or foreign material that is present. This material is extremely harmful to the steering gear.

Thoroughly clean and inspect all the parts to be reused. Install new parts as necessary.

16. Check that the bellows boot seal is positioned correctly over the steering gear housing bead at the large inside diameter (ID) and is in the inner

tie-rod groove at the small ID. ^

Check that the bellows boot seal is not twisted and the breather tube is securely inserted into the breather nipple at both bellows boots.

17. NOTE: Lubricate the inner tie rod inside groove with steering gear grease where the bellows boot is clamped.

To install, reverse the removal procedure.

18. Check and if necessary adjust the front toe.

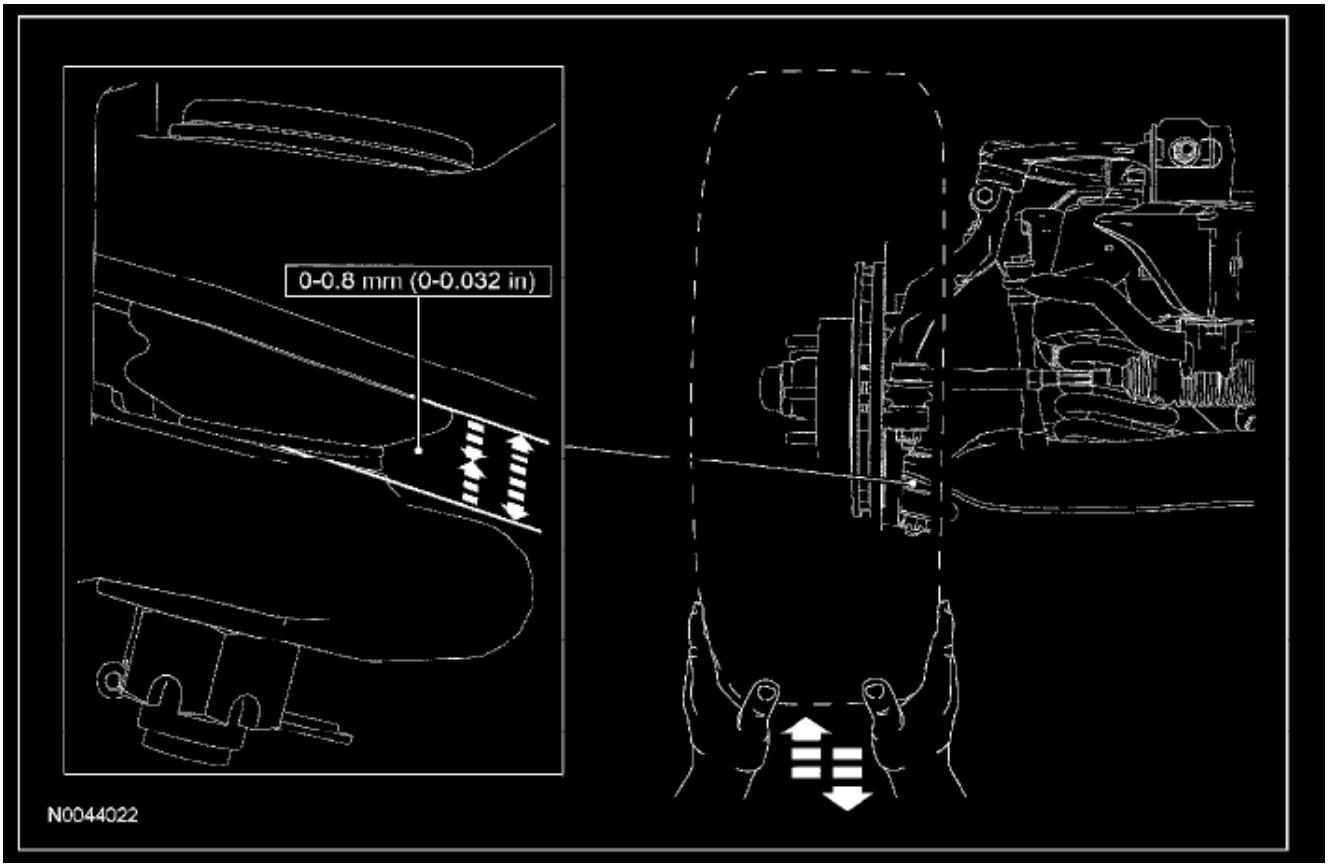
Ball Joint: Specifications

Ball Joint Wear Limits



Ball Joint: Testing and Inspection

Ball Joint Inspection

1. Prior to inspecting the ball joints for wear, inspect the wheel bearings. 2. Raise and support the vehicle by the frame or by the axle beams. 3. Inspect the ball joint and ball joint boot for damage.

^ If the ball joint or ball joint boot is damaged, install a new ball joint.

NOTE: Carry out Steps 4-6 to inspect the lower ball joint. Carry out Steps 7-9 to inspect the upper ball joint.

4. CAUTION: Do not use any tools or equipment to move the wheel and tire assembly or suspension components while checking for relative

movement. Suspension damage may occur. The use of tools or equipment will also create relative movement that may not exist when using hand force. Relative movement must be measured using hand force only.

Inspect the ball joint for relative movement by alternately pulling downward and pushing upward on the wheel and tire assembly by hand. Note any relative movement between the wheel knuckle and lower arm at the lower ball joint. ^

If relative movement is not felt or seen, the ball joint is OK. Do not install a new ball joint.

^ If relative movement is found, continue with Step 5.

5. NOTE: In order to obtain an accurate measurement, the dial indicator should be aligned as close as possible with the vertical axis (center line) of

the ball joint.

To measure ball joint deflection, attach a suitable dial indicator with a flexible arm between the lower arm and the wheel knuckle or ball joint stud.

6. Measure the ball joint deflection while an assistant pushes up and pulls down on the wheel and tire assembly by hand.

^ If the deflection exceeds the specification, a new lower ball joint must be installed.

^ If the deflection meets the specification, continue with the procedure.

7. CAUTION: Do not use any tools or equipment to move the wheel and tire or suspension components while checking for relative

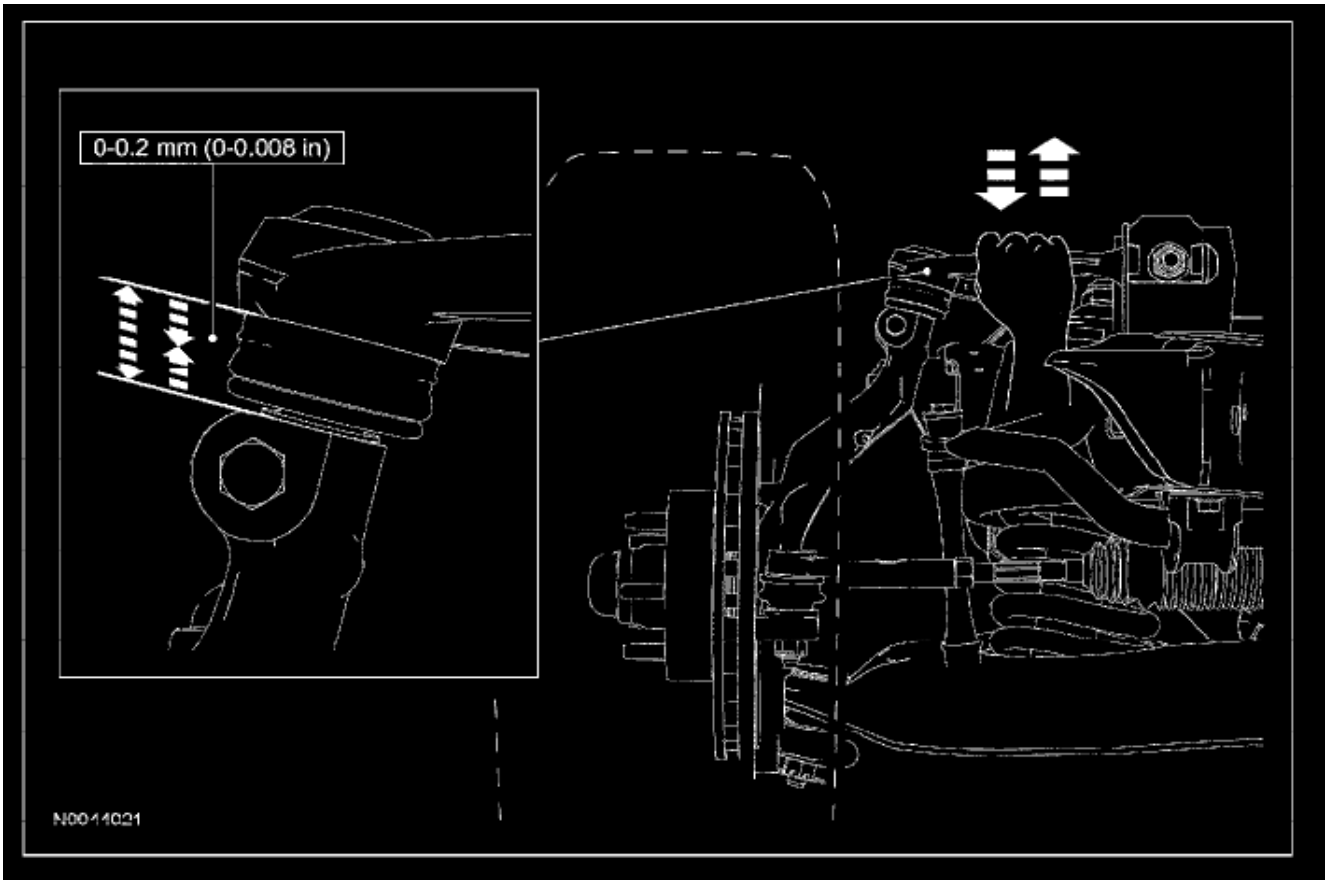
movement. Suspension damage may occur. The use of tools or equipment will also create relative movement that may not exist when using hand force. Relative movement must be measured using hand force only.

Inspect the ball joint for relative movement by alternately pulling downward and pushing upward on the upper arm by hand. Note any relative movement between the wheel knuckle and upper arm at the upper ball joint. ^

If relative movement is not felt or seen, the ball joint is OK. Do not install a new ball joint.

^ If relative movement is found, continue with Step 8.

8. NOTE: In order to obtain an accurate measurement, the dial indicator should be aligned as close as possible with the center line of the ball joint.



To measure ball joint deflection, attach a suitable dial indicator with a flexible arm between the upper arm and the wheel knuckle or ball joint stud.

9. Measure the ball joint deflection while an assistant pushes upward then pulls down on the upper arm by hand.

^ If the deflection exceeds the specification, a new upper ball joint must be installed.

^ If the deflection meets the specification, no further action is required.

3. Using the special tools, remove the lower ball joint.

Installation

1. CAUTION: Do not damage the lower ball joint boot when installing the special tool.

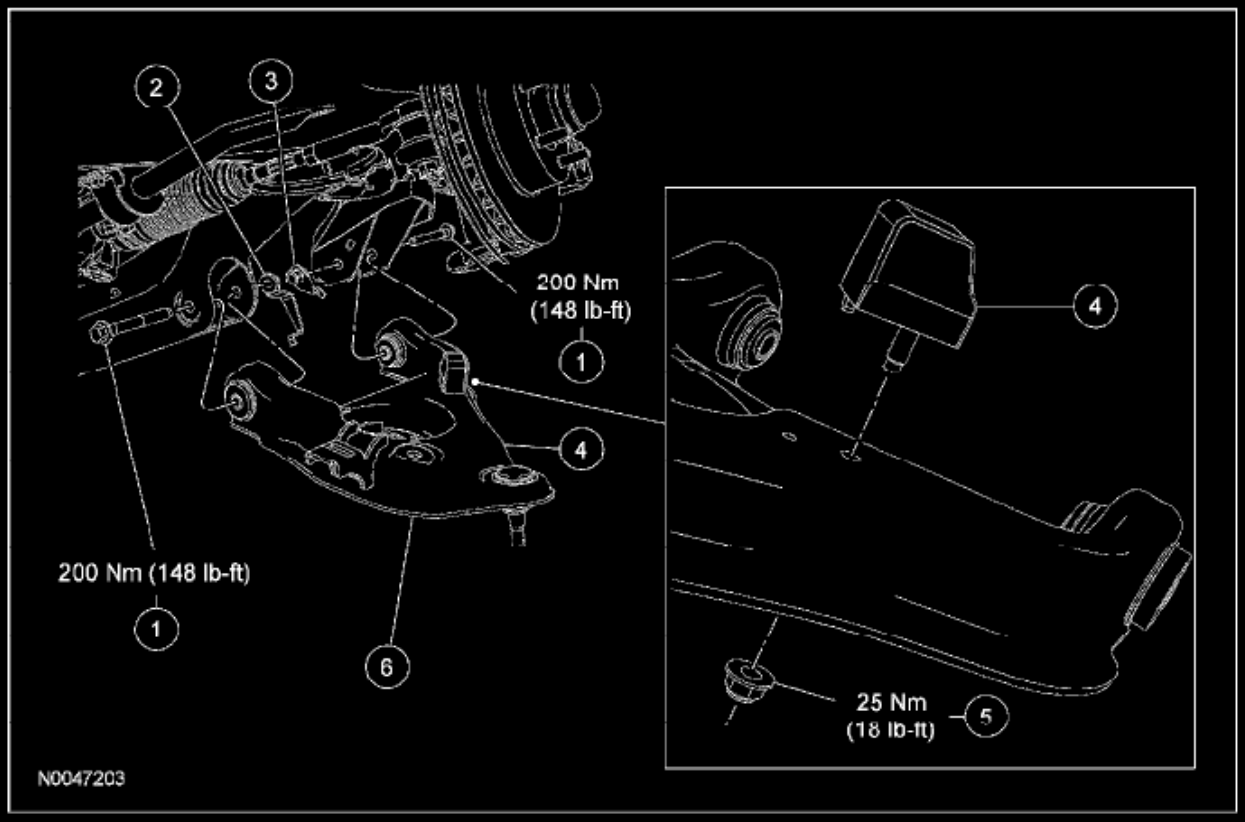
NOTE: Clean and inspect the lower arm ball joint bore for damage before installing a new ball joint.

NOTE: Make sure the new lower ball joint snap ring is fully seated.

Using the special tools, install the lower ball joint.

2. Install the wheel spindle.

Lower Arm — Coil Spring Suspension



Item	Part Number	Description
1	N808264	Lower arm bolt (2 required)
2	N811577	Lower arm forward flag nut
3	N808166	Lower arm rearward flag nut
4	3020	Jounce bumper
5	W520113	Jounce bumper nut
6	3042 RH/ 3051 LH	Lower arm

Control Arm: Service and Repair Lower Arm - Coil Spring Suspension

Lower Arm - Coil Spring Suspension

Lower Arm - Coil Spring Suspension

Removal and Installation

CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part number or an equivalent part if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Remove the spring. 2. Remove and discard the 2 lower arm bolts, flag nuts and the lower control arm.

^ To install, tighten to 200 Nm (148 lb-ft).

3. If necessary, replace the jounce bumper and jounce bumper nut.

^ To install, tighten to 25 Nm (18 lb-ft).

4. To install, reverse the removal procedure.

^ Check and, if necessary, align the front end.

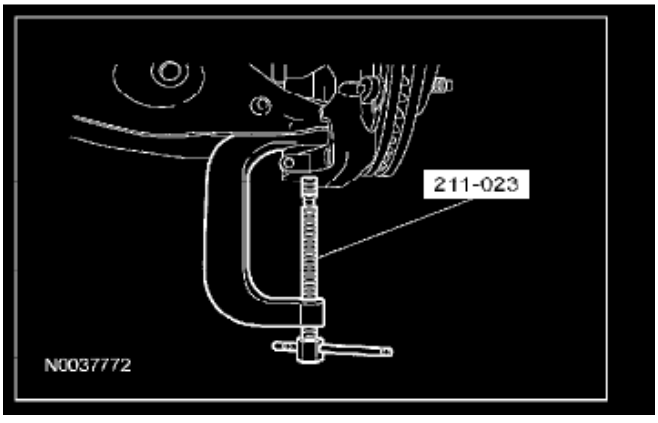
10	N808039	Lower ball joint nut
11	W525287	Lower ball joint cotter pin



Removal

CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part number or an equivalent part if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Remove the torsion bar. 2. Remove the wheel and tire. 3. Remove and discard the stabilizer bar link nut and grommet. 4. Remove the stabilizer link stud and grommet and the stabilizer link assembly. 5. Remove and discard the 2 lower shock nuts. 6. Remove and discard the lower ball joint cotter pin and nut.

7. CAUTION: Do not use a hammer to separate the ball joint from the wheel spindle/knuckle or damage to the wheel spindle/knuckle will

result.

CAUTION: Do not damage the ball joint boot while installing the special tool.

Using the special tool, separate the ball joint from the wheel spindle/knuckle.

8. Remove the lower arm bolts and nuts, and remove the front suspension lower arm.

^ Discard the 2 bolts and 2 nuts.

Installation

1. NOTE: Do not tighten the bolts at this time.

Position the lower arm and loosely install the 2 lower arm bolts and the 2 lower arm nuts.

2. Position the ball joint and install the ball joint nut.

^ Tighten to 133 Nm (98 lb-ft).

3. CAUTION: Install the new cotter pin into the lower ball joint from outboard to inboard with the fingers bent together at a right angle.

Failure to do so will result in damage to the wheel and tire assembly.

Install a new lower ball joint cotter pin.

4. Install the 2 shock absorber lower nuts.

^ Tighten to 25 Nm (18 lb-ft).

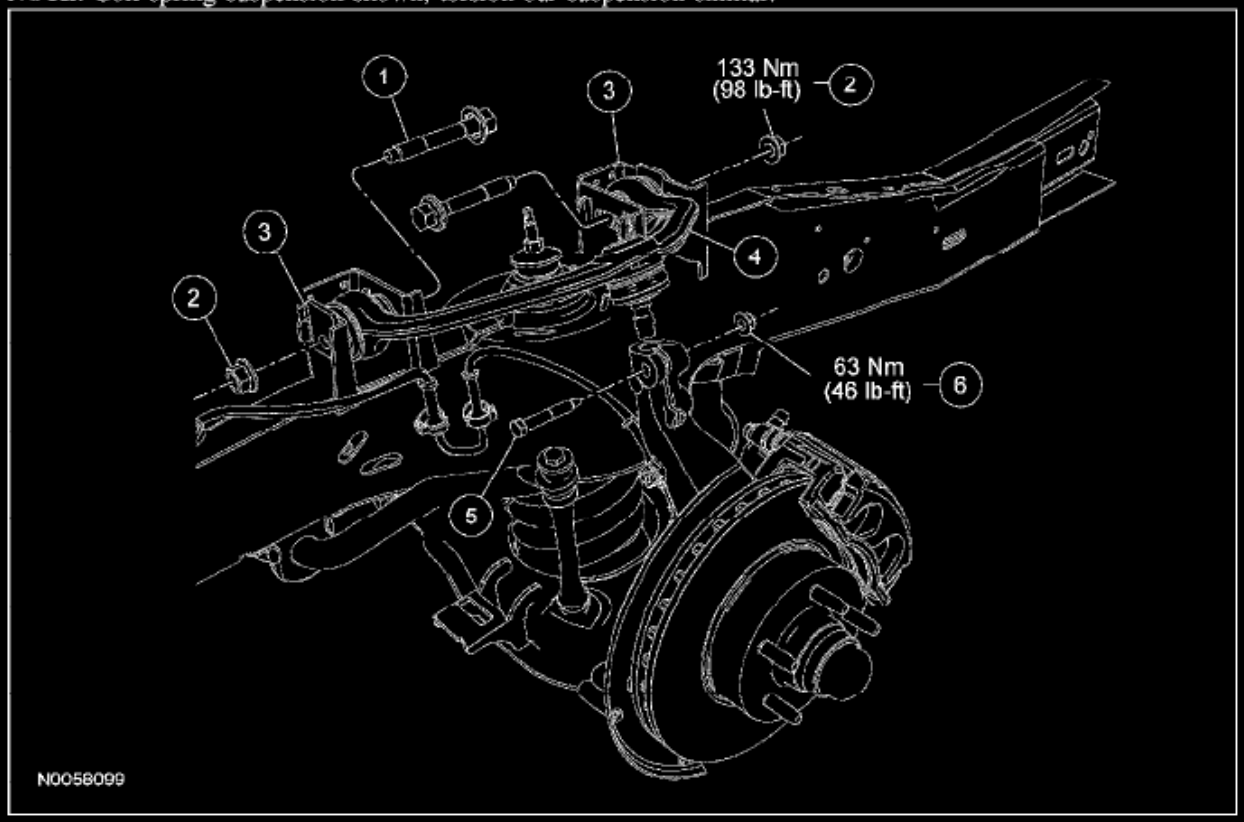
5. Install the stabilizer link stud and grommet and the stabilizer link assembly.

^ Tighten the stabilizer link nut to 35 Nm (26 lb-ft).

6. Install the wheel and tire. 7. With the weight of the vehicle on the wheel and tire, tighten the 2 lower arm nuts to 200 Nm (148 lb-ft).

Upper Arm

NOTE: Coil spring suspension shown, torsion bar suspension similar.



Item	Part Number	Description
1	W709831	Upper arm flag bolt (2 required)

Control Arm: Service and Repair Upper Arm

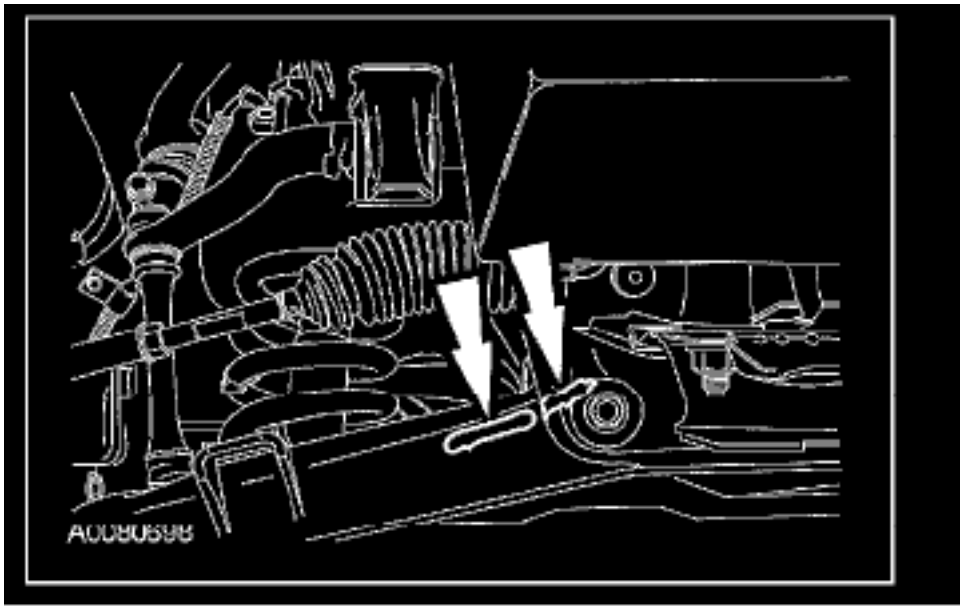
Upper Arm

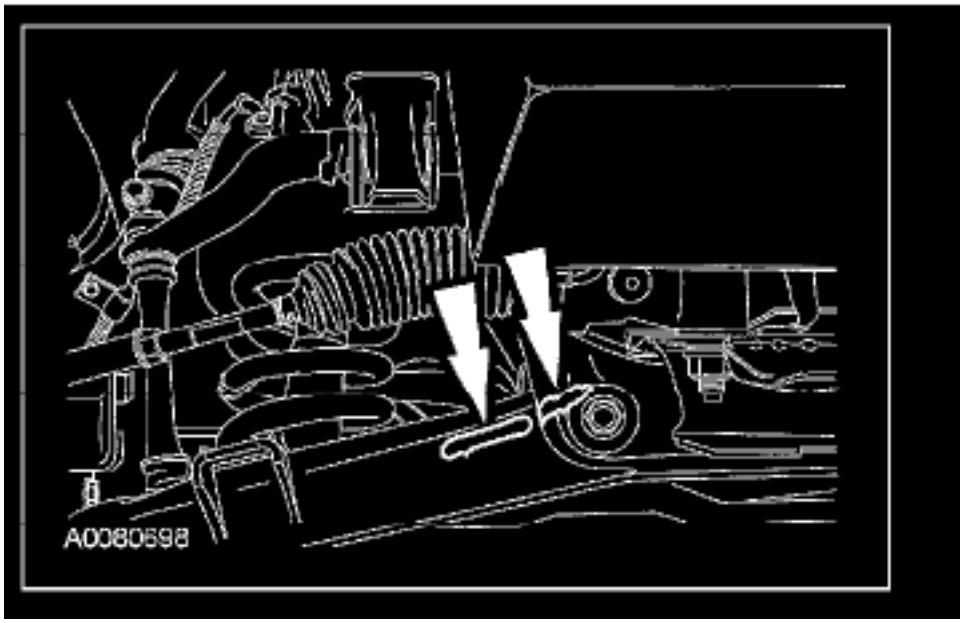
Upper Arm

Removal

CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part number or an equivalent part if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Index-mark the lower arm to the frame with the vehicle in a static ground position (curb height).





2. Remove the wheel and tire. 3. Use a suitable jack to support the lower arm.

4. CAUTION: To avoid possible damage to the wheel spindle/knuckle, secure the wheel spindle/knuckle to keep it from tilting before

removing the pinch bolt and nut.

Remove and discard the upper ball joint nut and pinch bolt, and separate the ball joint from the wheel spindle/knuckle.

5. Remove and discard the 2 upper arm nuts, flag bolts and set shims.

^ Remove the upper arm.

Installation

1. NOTE: Do not tighten the nuts at this time.

NOTE: Make sure that the set shims are installed in their original positions.

Position the upper arm and loosely install the 2 upper arm flag bolts, set shims and nuts.

2. Install the upper ball joint and ball joint nut.

^ Tighten to 63 Nm (46 lb-ft).

3. Position a suitable jack under the front suspension lower arm and raise the suspension until the index marks on the lower arm and the frame are

aligned (curb height).

4. CAUTION: Make sure the upper arm bolts are held in place when tightening the nuts. Failure to do so may result in incorrect torque.

Tighten the upper arm nuts to 133 Nm (98 lb-ft).

5. Install the wheel and tire. 6. Check and, if necessary, align the front end.

TRANSMISSION SUPPORT CROSSMEMBER

Transmission Support Crossmember

1. With the vehicle in NEUTRAL, position it on a hoist. 2. Remove the 2 transmission mount nuts from the transmission support crossmember. Discard the nuts.

- To install, tighten to 90 Nm (66 lb-ft).

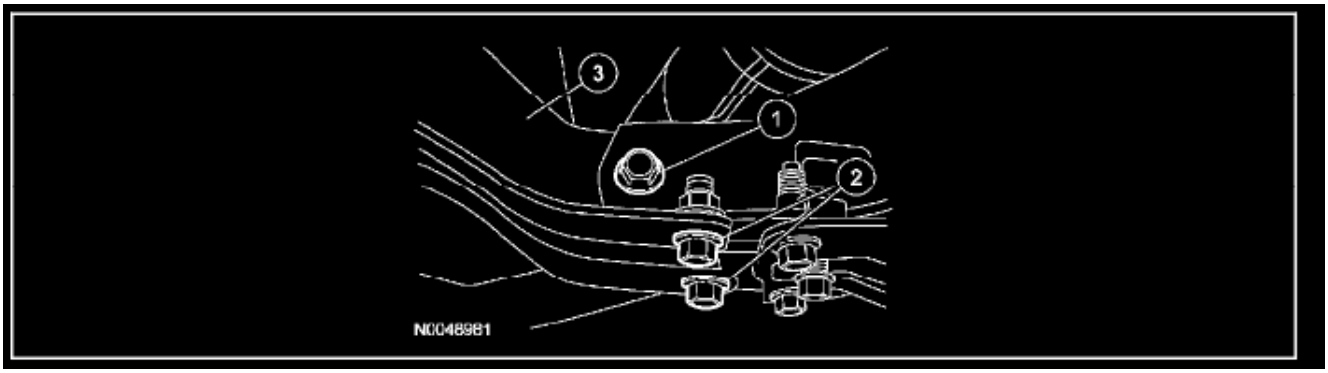
3. NOTE: Do not allow the transmission to hang freely.

Support the transmission with a suitable jack.

4. NOTE: Four-Wheel Drive (4WD) transmission support crossmember shown, Rear Wheel Drive (RWD) transmission support crossmember

similar.

Remove the transmission support crossmember. 1. Remove the 2 horizontal transmission support crossmember bolts and nuts (1 each side).



- To install, tighten to 127 Nm (94 lb-ft).

2. Remove the 4 vertical transmission support bolts and nuts (2 each side).

- To install, tighten to 99 Nm (73 lb-ft).

3. Remove the transmission support crossmember.

5. To install, reverse the removal procedure.

Spindle: Service and Repair

Wheel Spindle

Removal and Installation

CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part number or an equivalent part if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

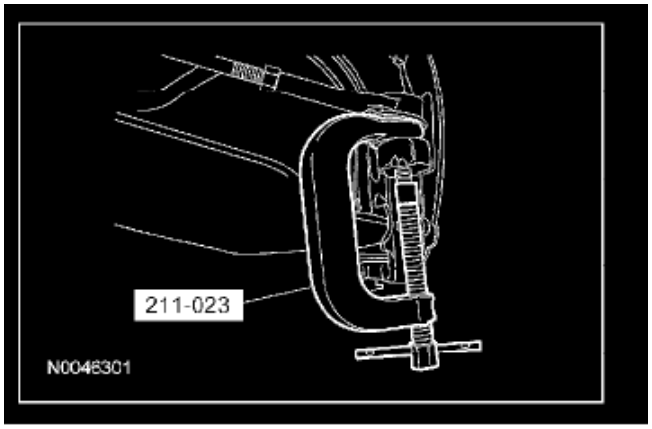
1. Remove the brake disc shield. 2. Remove and discard the wheel speed sensor harness bolt.

^ To install, tighten to 12 Nm (9 lb-ft).

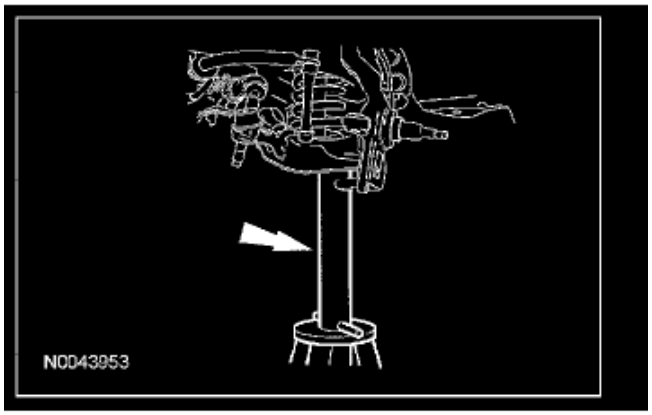
3. Remove and discard the wheel speed sensor bolt and disconnect the wheel speed sensor from the wheel spindle.

^ To install, tighten to 12 Nm (9 lb-ft).

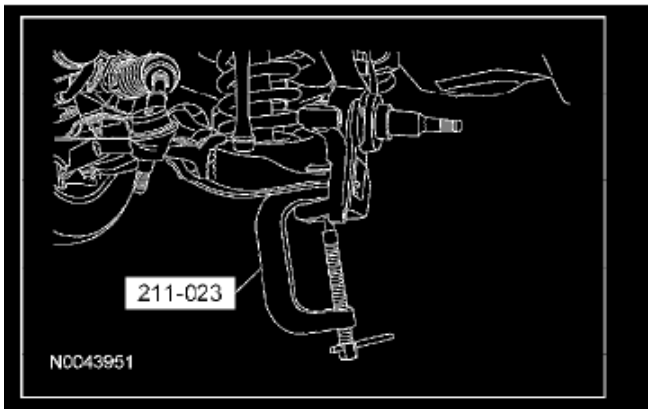
4. Remove and discard the outer tie-rod end nut.



211-023
N0046301



N0043953



211-023
N0043951

^ To install, tighten to 80 Nm (59 lb-ft).

5. CAUTION: Do not use a hammer to separate the tie-rod end from the wheel spindle or damage to the wheel spindle will result.

CAUTION: Do not damage the tie-rod end boot when installing the special tool.

Using the special tool, separate the outer tie-rod end from the wheel spindle.

6. Use a suitable jack to support the front suspension lower arm.

7. Remove and discard the upper ball joint nut and pinch bolt.

^ Disconnect the upper ball joint from the wheel spindle.

^ To install, tighten to 63 Nm (46 lb-ft).

8. Remove and discard the lower ball joint cotter pin and nut.

^ To install, tighten to 133 Nm (98 lb-ft).

9. CAUTION: Do not use a hammer to separate the ball joint from the wheel spindle or damage to the wheel spindle will result.

CAUTION: Do not damage the ball joint boot while installing the special tool.

Using the special tool, separate the lower ball joint from the wheel spindle and remove the front wheel spindle.

10. CAUTION: Always install the cotter pins into the nuts from the outboard to inboard, with the ringers bent together at a right angle.

Failure to do so will result in damage to the wheel and tire assembly.

To install, reverse the removal procedure.

Stabilizer Link: Service and Repair

Stabilizer Bar and Link

Stabilizer Bar and Link

Removal and Installation

CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part number or an equivalent part if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. With the vehicle in NEUTRAL, position it on a hoist. 2. Remove and discard the front stabilizer bar link nuts and grommets.

^ To install, tighten to 35 Nm (26 lb-ft).

3. Remove the front stabilizer bar link studs and the front stabilizer bar links. 4. Remove the 4 stabilizer bar bracket bolts, stabilizer bar, brackets and bushings.

^ Discard the stabilizer bar bracket bolts.

^ To install, tighten to 40 Nm (30 lb-ft).

5. NOTE: Inspect and clean the mating surfaces and the internal threads. Make sure all mating surfaces are free of foreign material and remove any

thread locking compound from the internal threads.

NOTE: In the event the stabilizer bar bracket bolts cannot be installed in the frame, remove the weld nut and replace with a flag nut (N807634-S441).

To install, reverse the removal procedure.

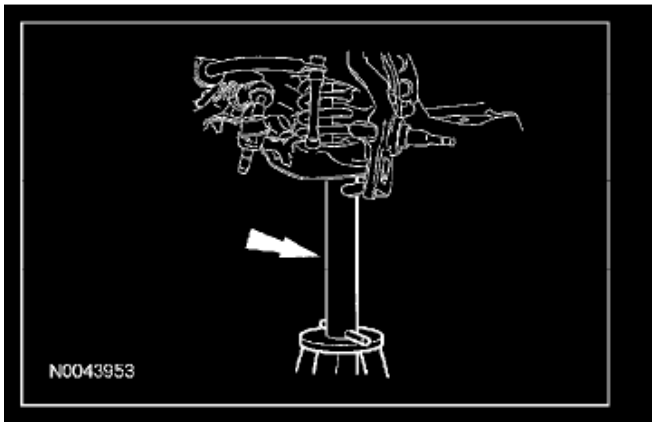
N0071226



N0043953

1. Index-mark the lower arm to the frame with the vehicle in a static ground position (curb height).

2. Remove the wheel and tire.

3. CAUTION: Do not allow the shaft to turn while removing the nut. Hold the flats on the shock rod using a suitable wrench or damage to

the shock can result.

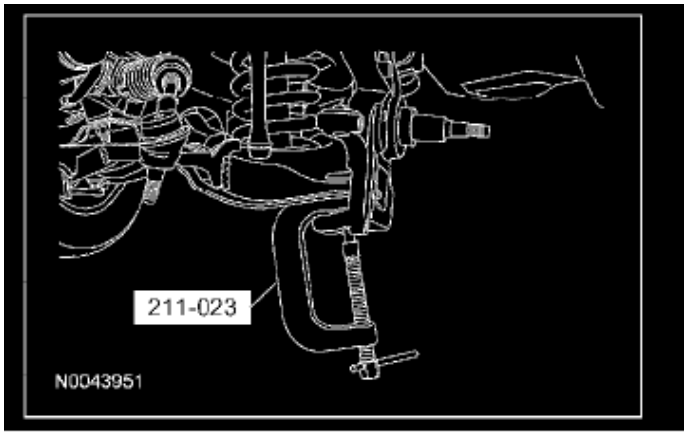
Remove and discard the shock absorber rod nut and washer assembly.

4. Remove and discard the 2 shock absorber lower nuts, and remove the shock absorber. 5. Remove the stabilizer bar link nut and grommet, then remove the link assembly. 6. Using the special tool, compress the coil spring.

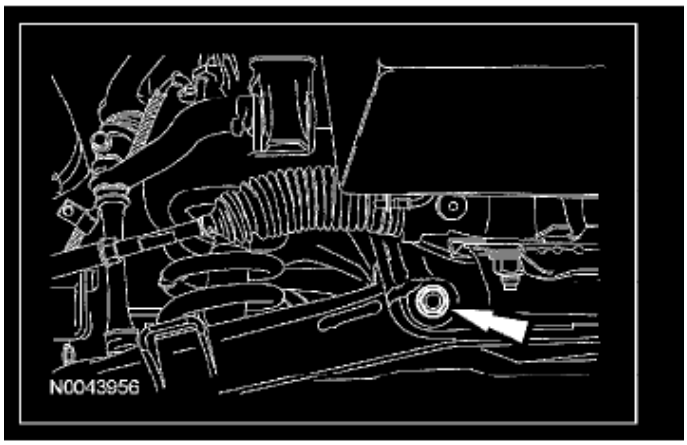
7. Remove and discard the lower ball joint nut. 8. Using a suitable jack, support the lower arm.

9. CAUTION: Do not damage the ball joint boot when installing the special tool.

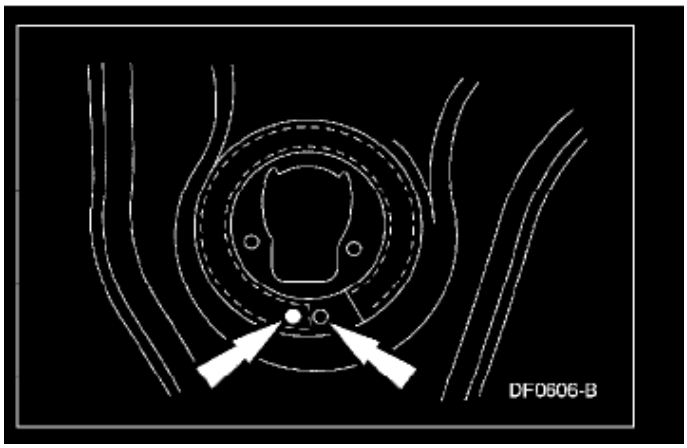
Using the special tool, separate the lower ball joint from the wheel spindle.



211-023
N0043951



N0043956



DF0606-B

10. Carefully remove the jack from under the lower arm. 11. Loosen the lower arm bolts and allow the lower arm to swing down.

12. Position the wheel spindle aside and remove the coil spring.

Installation

1. NOTE: The end of the coil spring must cover the first hole and should not be visible in the second hole of the lower arm.

Install the coil spring in the lower arm.

2. Using a suitable jack, support the lower arm.

3. CAUTION: Always install the cotter pin into the lower ball joint nut from outboard to inboard. Failure to do so will result in damage to

the wheel and tire assembly.

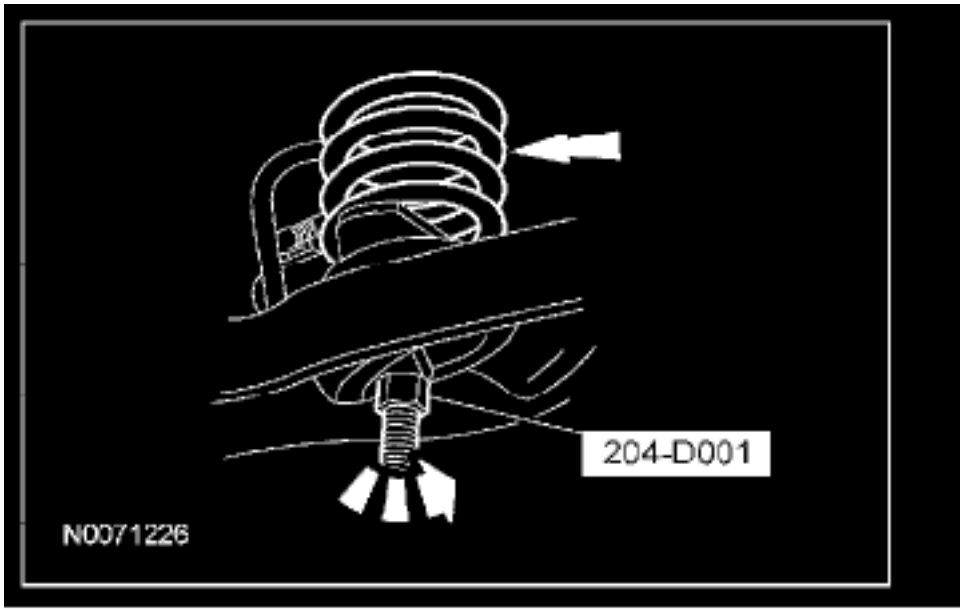
Position the lower ball joint and install a new nut. ^

Tighten to 133 Nm (98 lb-ft).

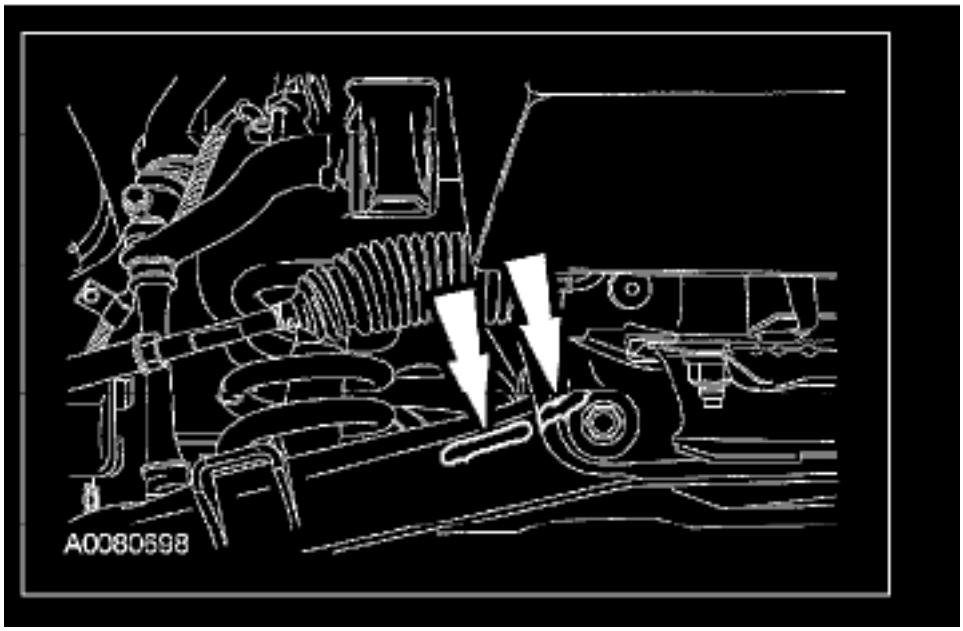
^ Install a new cotter pin.

4. Remove the jack from under the lower control arm. 5. Install the stabilizer bar link assembly in the following sequence.

1 Install the stabilizer bar link stud and grommet.



204-D001
N0071226



A0080698

2 Install a new stabilizer bar link nut and grommet. ^

Tighten to 35 Nm (26 lb-ft).

6. Remove the special tool.

7. Position the shock absorber and install 2 new shock absorber lower nuts.

^ Tighten to 25 Nm (18 lb-ft)

8. Install a new shock absorber rod nut and washer.

^ Tighten to 48 Nm (35 lb-ft).

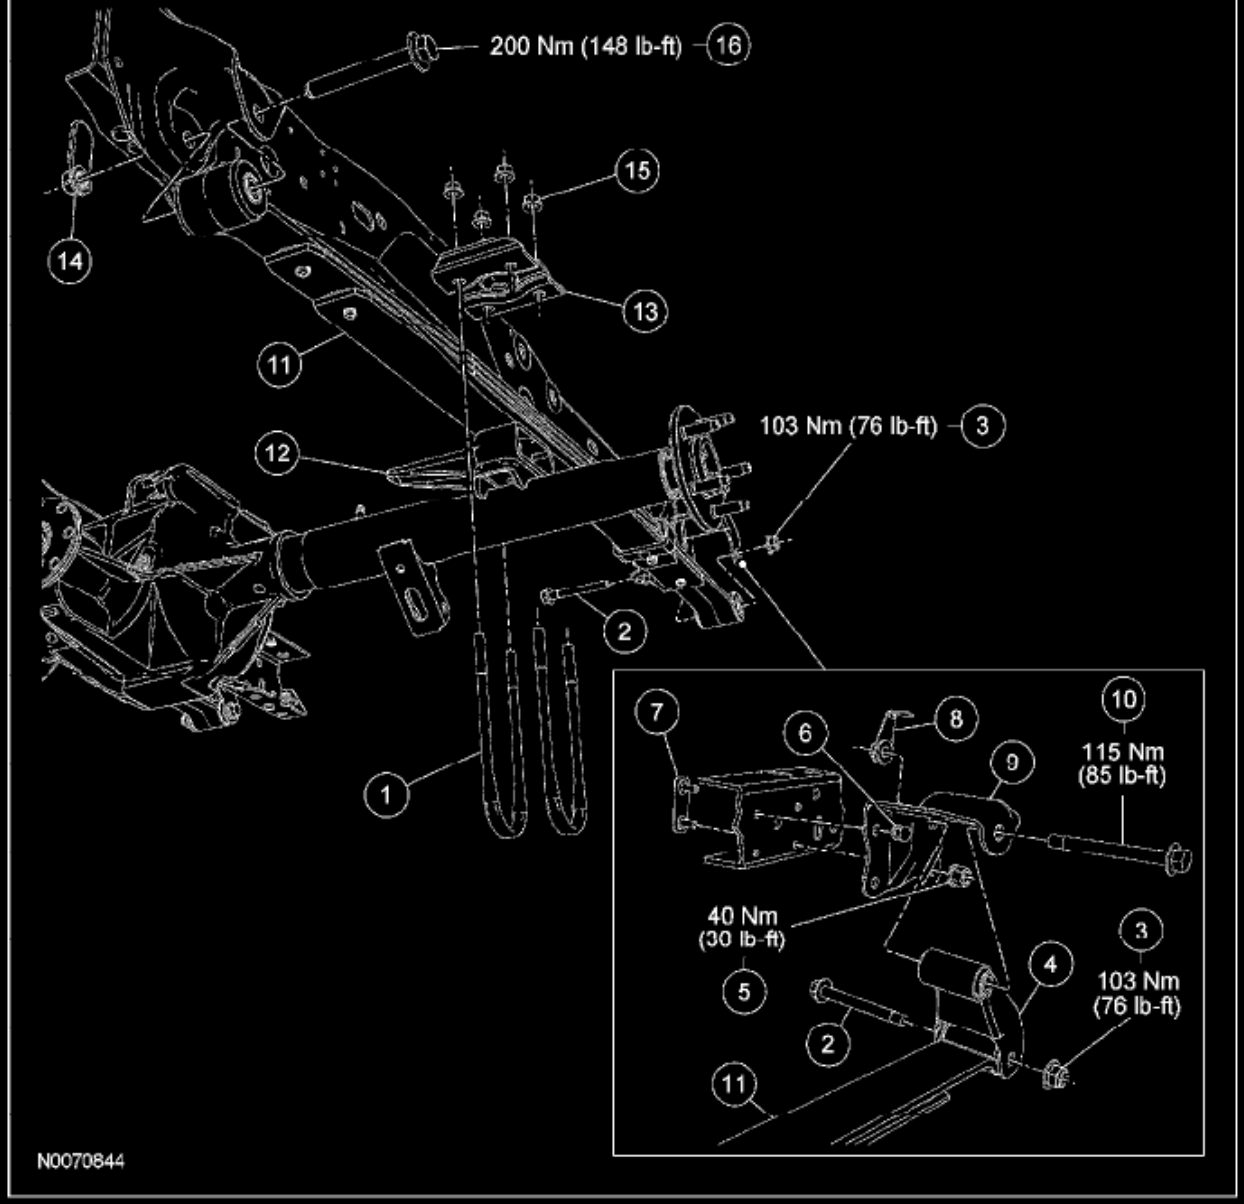
9. Position a suitable jack under the lower arm and raise the suspension until the index marks on the lower arm and the frame are aligned (curb

height). ^

Tighten to 200 Nm (148 lb-ft).

10. Remove the jack from under the lower control arm.

Spring



Item	Part Number	Description
1	W708550	U-bolt (2 required) (coil spring suspension)
1	5705	U-bolt (2 required) (Torsion® axle)

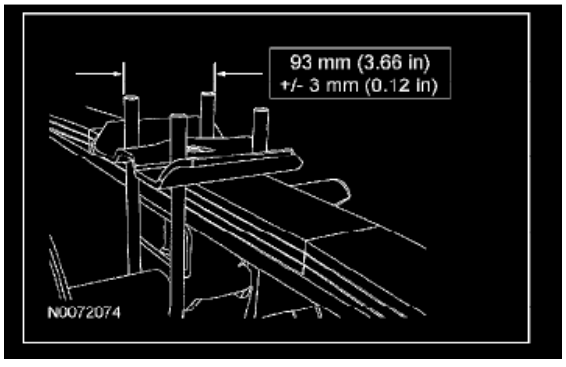
Suspension Spring (Coil / Leaf): Service and Repair Rear

Spring

Spring (Part 1)

Item	Part Number	Description
8	N806368	Spring shackle-to-frame bracket flag nut
9	5775	Frame bracket
10	N807280	Spring shackle-to-frame bracket bolt
11	5560	Leaf spring
12	5598	Rear spring spacer (torsion bar suspension only)
13	5798	Spring plate
14	W707573	Spring-to-frame bracket flag nut
15	N620483	U bolt nut (4 required) (standard axle)
15	W520115	U-bolt nut (Torsion® axle)
16	W707202	Spring-to-frame bracket bolt



Spring (Part 2)

Removal and Installation

CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent parts if replacement is necessary. Do not use replacement parts of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. With the vehicle in NEUTRAL, position it on a hoist. 2. Using a suitable jack, support the rear axle. 3. Remove and discard the lower shock absorber bolt and nut.

^ To install, tighten to 80 Nm (59 lb-ft).

4. NOTE: When installing new U-bolts, the distance between the U-bolts should be 93 mm (3.66 inch) ± 3 mm (0.12 inch). This is important for

providing the correct U-bolt clamp load and retention of parts.

Remove and discard the 4 rear U-bolt nuts. ^

Remove the U-bolts and the spring plate.

^ To install, tighten Torsion(R) axle U-bolt nuts in 4 stages. -

Stage 1: Tighten in a cross pattern to 25 Nm (18 lb-ft).

- Stage 2: Tighten in a cross pattern to 50 Nm (37 lb-ft).

- Stage 3: Tighten in a cross pattern to 75 Nm (55 lb-ft).

- Stage 4: Tighten in a cross pattern to 103 Nm (76 lb-ft).

^ To install, tighten standard axle U-bolt nuts in 4 stages. -

Stage 1: Tighten in a cross pattern to 30 Nm (22 lb-ft).

- Stage 2: Tighten in a cross pattern to 60 Nm (44 lb-ft).

- Stage 3: Tighten in a cross pattern to 90 Nm (66 lb-ft).

- Stage 4: Tighten in a cross pattern to 115 Nm (85 lb-ft).

5. If equipped carefully lower the rear axle and remove the rear spring spacer.

6. Remove and discard the spring-to-frame bracket bolt and flagnut.

^ To install, tighten to 200 Nm (148 lb-ft).

7. Remove and discard the spring shackle-to-spring bolt and nut and remove the spring.

^ To install, tighten to 103 Nm (76 lb-ft).

8. If necessary, remove the spring shackle.

^ Remove and discard the spring shackle-to-frame bracket bolt and flagnut.

^ Remove the shackle.

^ To install, tighten to 115 Nm (85 lb-ft).

9. To install, reverse the removal procedure.

Special Tool(s)

ST2036-A	Adapter for 204-185 (Spacer) 204-204

4	N811015	Torsion bar adjuster bolt

Item	Part Number	Description
5	N811848	Torsion bar cover plate bolts (4 required)
6	5D050 RH/ 5D051 LH	Torsion bar cover plate
7	5B335	Torsion bar insulator plate

(Continued)

Removal

CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be

installed with the same part number or an equivalent part if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

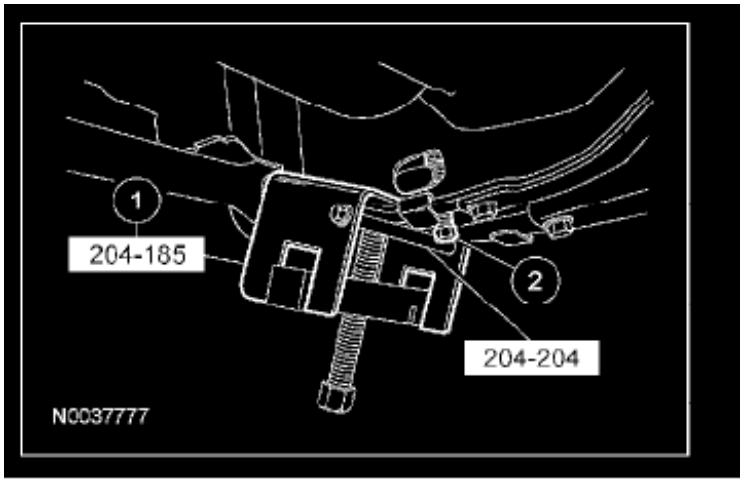
1. With the vehicle in NEUTRAL, position it on a hoist. 2. Remove the torsion bar cover plate bolts and the torsion bar cover plate.

^ To install, tighten to 55 Nm (41 lb-ft).

3. NOTE: Before relieving the torsion bar tension, measure and record the measurement of the torsion bar adjustment bolt. This measurement will

be used as the preset depth for the new torsion bar adjustment bolt during installation.

Make preliminary adjustment references.



1
204-185
2
204-204

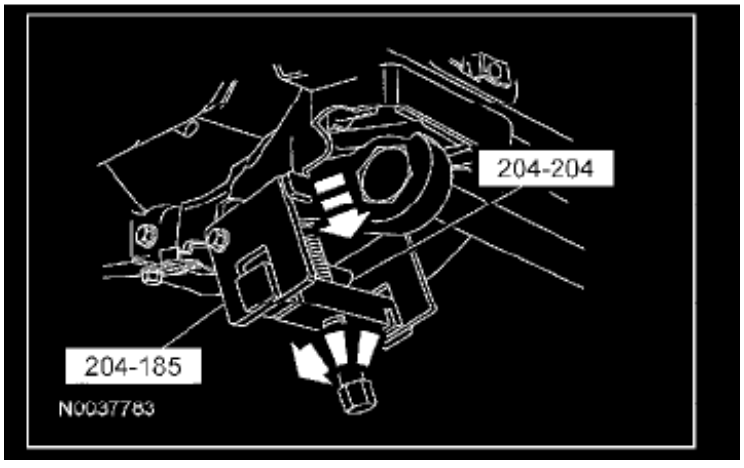
204-204
204-185
N0037769



204-204
204-185
N0037763

4. Relieve the torsion bar tension.

1 Position the special tool and adapters.

2 Tighten the special tool until the torsion bar adjuster lifts off the adjustment bolt.

5. CAUTION: The torsion bar adjustment bolt is coated with dry adhesive and must be replaced if it is backed off or removed. Failure to

do so may cause the adjustment bolt to loosen during operation and cause a loss of vehicle alignment.

Remove and discard the torsion bar adjustment bolt and support nut.

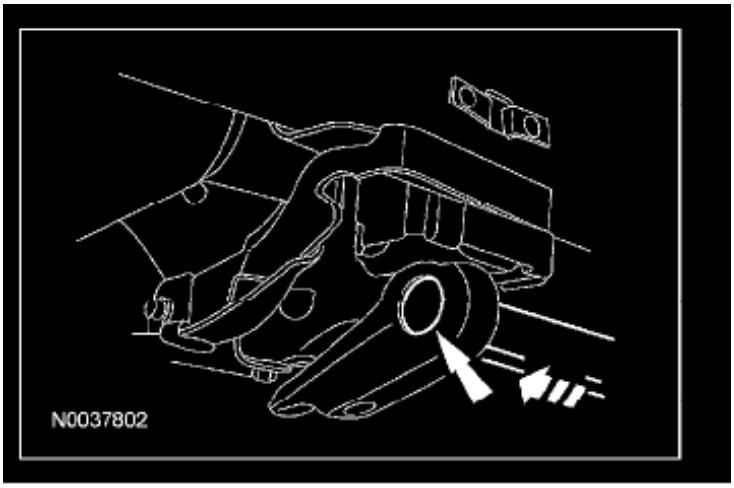
6. Loosen the special tool until the tension is removed from the torsion bar.

7. Remove the torsion bar in the following sequence.

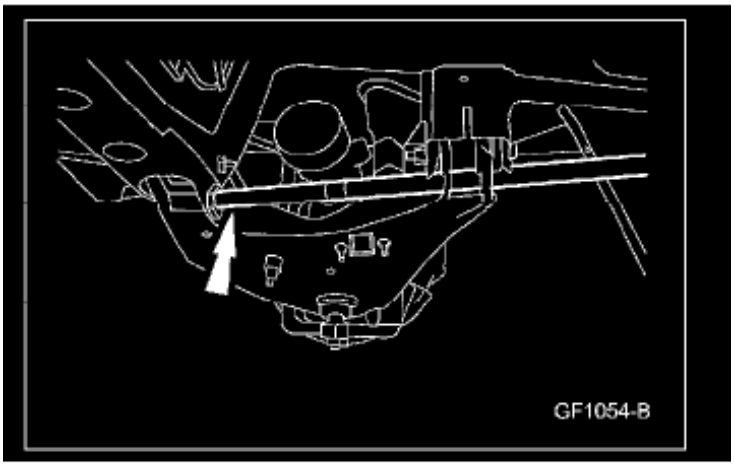
1 Mark the torsion bar and the adjuster for correct installation.

2 Remove the torsion bar insulator plate.

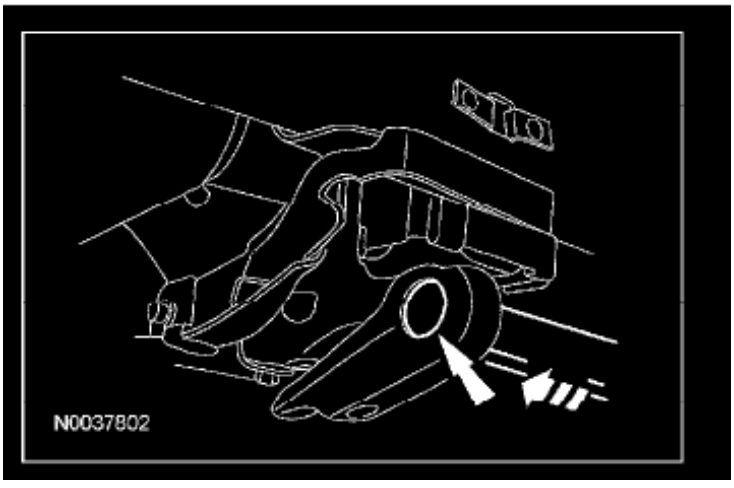
3 Grasp the torsion bar and pull it free from the lower arm.



N0037802



GF1054-B



N0037802

Installation

1. Position the torsion bar into lower arm.

2. Install the torsion bar adjuster in the following sequence.

1 Align the marks on the torsion bar and the torsion bar adjuster, then install the torsion bar adjuster.

2 Position the torsion bar insulator plate.

3. CAUTION: The torsion bar adjustment bolt is coated with dry adhesive and must be replaced if it is backed off or removed. Failure to

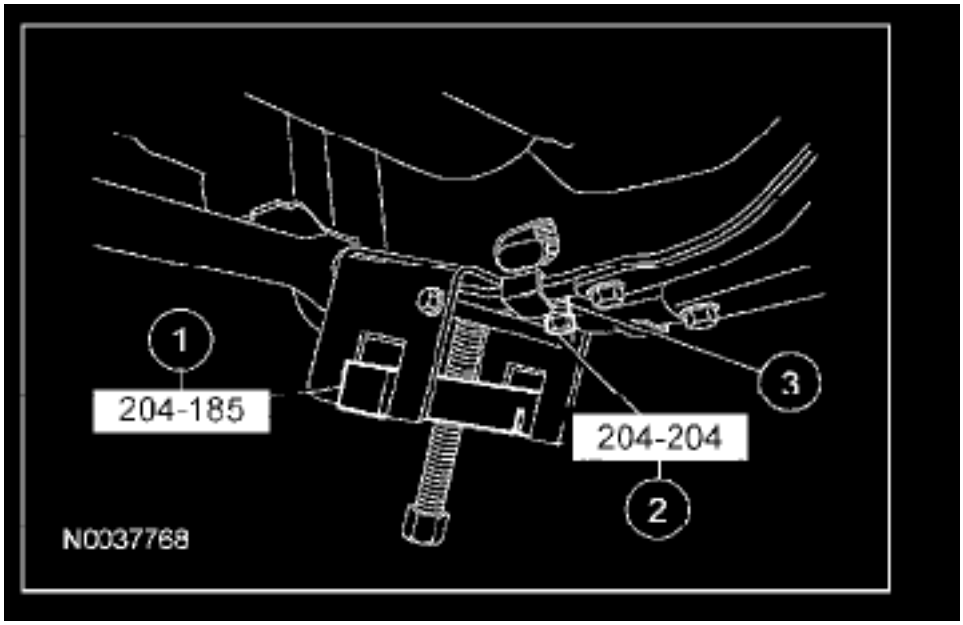
do so may cause the adjustment bolt to loosen during operation and cause a loss of vehicle alignment.

Preload the torsion bar in the following sequence. 1

Install the special tool and the adapters.

2 Tighten the special tool until the new adjustment bolt and nut can be installed.

3 Turn the adjustment bolt until the preliminary adjustment measurement (recorded length of the old adjustment bolt) is reached.



4. Remove the special tool. 5. Install the torsion bar cover plate and 4 retaining bolts.

^ Tighten to 55 Nm (41 lb-ft).

6. Adjust the ride height. 7. Check and if necessary, align the front end.

Special Tool(s)

ST1326-A	Adapter for 303-224 (Handle) 205-153 (T80T-4000-W)
ST1541A	Installer, Axle Shaft Bearing 205-124 (T78P-1225-A)

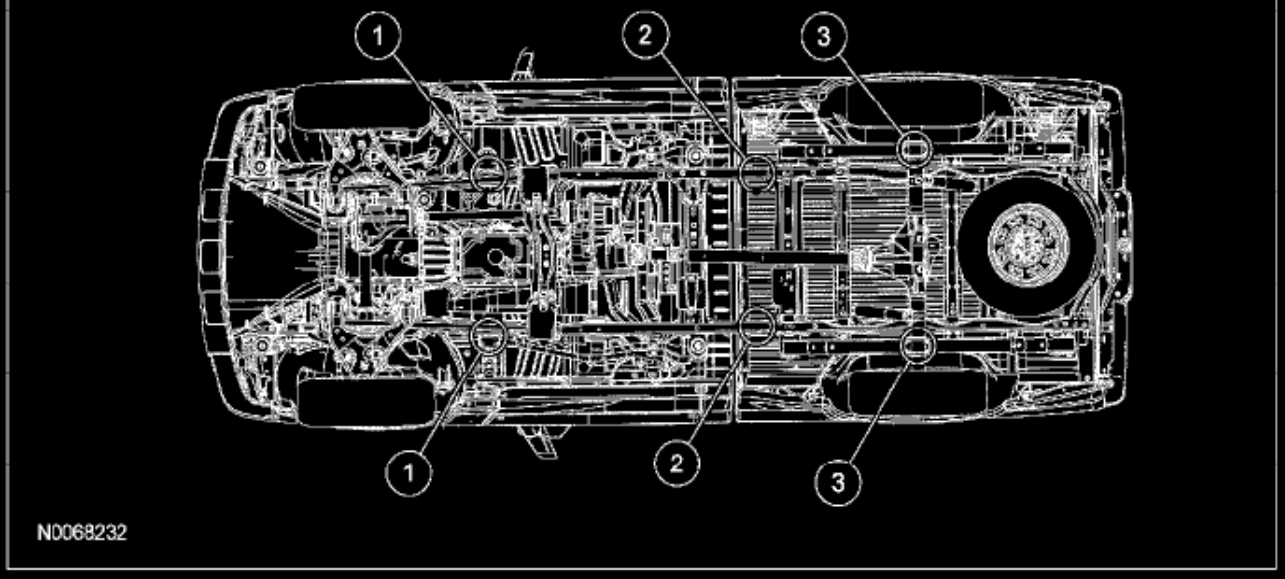
Jacking and Lifting Locations — Four Wheel Drive (4WD)



Item	Description
1	Front jacking and lifting locations
2	Rear lifting locations
3	Rear jacking locations

Vehicle Lifting: Description and Operation

JACKING AND LIFTING

WARNING:

- Block all wheels, set the parking brake and firmly apply the service brake to reduce the risk of vehicle movement during this procedure. Failure to follow these instructions may result in serious personal injury.

- Only raise the vehicle when positioned on a hard, level surface. Attempting to raise the vehicle on an uneven or soft surface may result in vehicle slipping or falling from the jack or jackstand. Failure to follow this instruction may result in serious personal injury.

- Never get underneath a vehicle that is supported only by a jack. The jack could unintentionally lower. Always support vehicle with floor stands. Failure to follow these instructions may result in serious personal injury.

CAUTION:

- The jack provided with the vehicle is intended to be used in an emergency for changing a deflated tire. To avoid damage to the vehicle, never use the jack to hoist the vehicle for any other purpose.

- Do not attempt to use jack pressure on either the front bumper or the rear bumper of any vehicle. Damage to bumper covers will occur.

- To prevent possible damage to the underbody, do not drive the vehicle onto the drive-on lift without first checking for possible interference.

- Make sure the jack has an adequate lifting capacity for the vehicle being lifted, or damage to the vehicle may occur.

- When raising a vehicle on a twin-post hoist, use care when positioning the vehicle so that the hoisting forks do not interfere with the suspension components, mounting brackets or stabilizer mounting brackets, if so equipped. In addition, use care in hoist positioning to avoid possible damage to the axle carrier or rear cover.

- Damage to the suspension, exhaust or steering linkage components may occur if care is not exercised when positioning the hoist adapters prior to lifting the vehicle.

Special Tool(s)

ST2941-A	Activation Tool, Tire Pressure Monitor 204-363
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Tire Pressure Sensor: Testing and Inspection Tire Pressure Monitoring System (TPMS) Sensor Training

Tire Pressure Monitoring System (TPMS) Sensor Training

NOTE: If the vehicle has been stationary for more than 30 minutes, the sensors will go into a "sleep mode" to conserve battery power. It will be necessary to wake them up so they will transmit the latest tire pressure information to the smart junction box (SJB). For additional information, refer to Tire Pressure Monitoring System (TPMS) Sensor Activation.

NOTE: The tire pressure sensor training procedure must be done on a single vehicle, in an area without radio frequency noise and at least 1 m (3 ft) away from other vehicles equipped with tire pressure monitoring system (TPMS). Radio frequency noise is generated by electrical motors and appliance operation, cellular telephones, remote transmitters, power inverters and portable entertainment equipment.

NOTE: If a sensor does not respond to the activation tool, attempt to activate the same sensor with the activation tool. If the sensor still does not respond, move the vehicle to rotate the wheels at least 1/4 of a turn and attempt to activate the same sensor again.

NOTE: The SJB has a 2-minute time limit between sensor responses. If the SJB does not recognize any 1 of the 4 tire pressure sensors during this time limit, the horn will sound twice and the message center (if equipped) will display TIRE NOT TRAINED REPEAT and the entire procedure must be repeated.

1. NOTE: For vehicles with different front and rear tire pressures (such as the E-Series and certain F-Series), the tire pressure sensors must be

trained following a tire rotation. Failure to train the sensors will cause the TPMS indicator to illuminate. For vehicles with the same tire pressure for front and rear tires, tire rotation will not affect the system.

Turn the ignition switch to the OFF position, then press and release the brake pedal.

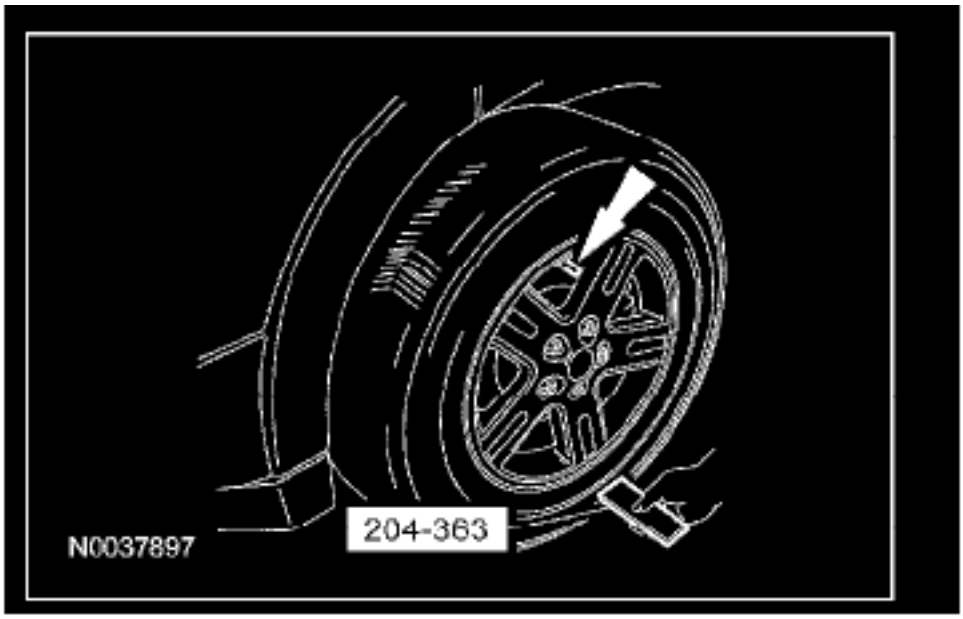
2. Cycle the ignition switch from the OFF position to the RUN position 3 times, ending in the RUN position. 3. Press and release the brake pedal. 4. Turn the ignition switch to the OFF position. 5. Turn the ignition switch from the OFF position to the RUN position 3 times, ending in the RUN position.

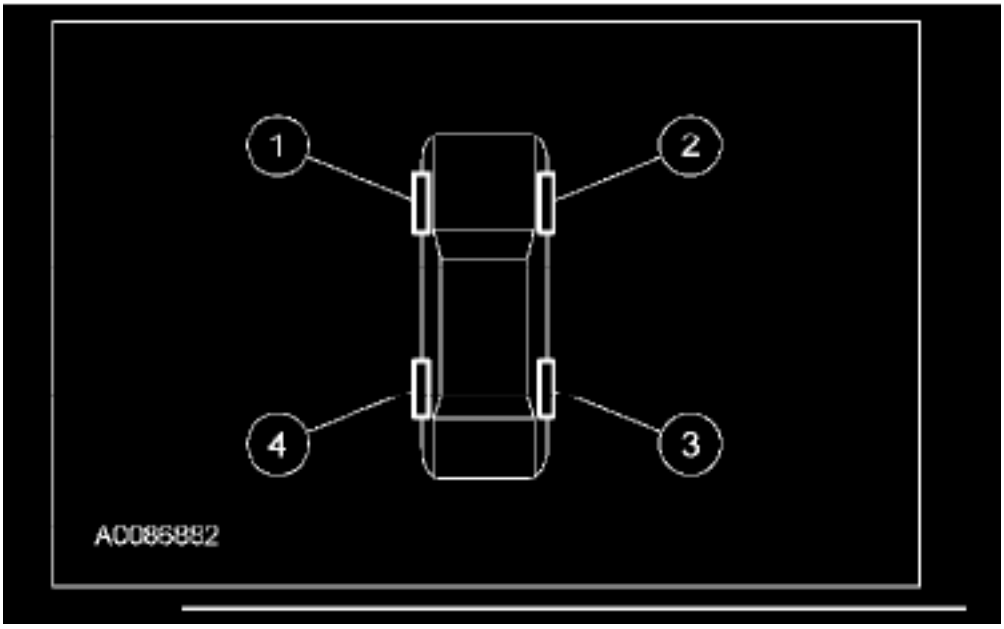
^ The horn will sound once and the TPMS indicator will flash if the training mode has been entered successfully. If equipped, the message center will display TRAIN LF TIRE.

6. NOTE: It may take up to 6 seconds to activate a tire pressure sensor. During this time, the activation tool must remain in place 180 degrees from

the valve stem.

Place the activation tool on the LF tire sidewall opposite (180 degrees) from the valve stem. Press and release the test button on the special tool. The horn will sound briefly to indicate that the tire pressure sensor has been recognized by the SJB.





7. Within 2 minutes of the horn sounding, place the activation tool on the RF tire sidewall opposite (180 degrees) from the valve stem and press and

release the test button to train the RF tire pressure sensor.

8. NOTE: Do not wait more than 2 minutes between training each sensor or the SJB will time out and the entire procedure must be repeated.

Repeat Step 7 for the RR and LR tires. ^

The procedure is completed after the last tire has been trained. When the training procedure is complete, the message center (if equipped) will display TIRE TRAINING COMPLETE.

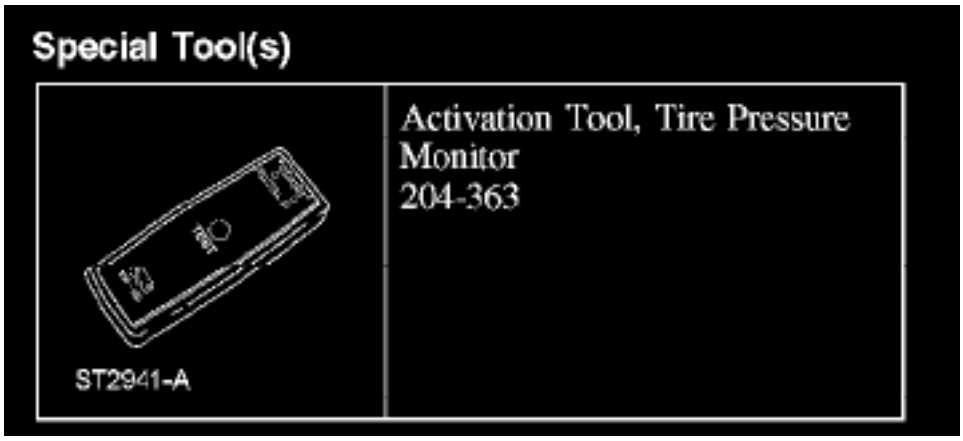
^ For vehicles not equipped with a message center, successful completion of the training procedure will be verified by turning the ignition switch to the OFF position without the horn sounding. If the horn sounds twice when the switch is turned to the OFF position, the training procedure was not successful.

9. Using the scan tool, locate the updated TPMS sensor IDs trained to the SJB and document them on the applicable warranty claim.

10. NOTE: This step is required to clear DTC C2780, cause the SJB to exit the manufacturing mode and to make sure there are no other concerns

with a newly programmed SJB.

If the sensors are being trained due to the installation of a new SJB, clear any DTCs and perform the SJB on-demand self test.



Tire Pressure Sensor: Testing and Inspection Tire Pressure Monitoring System (TPMS) Sensor Activation

Tire Pressure Monitoring System (TPMS) Sensor Activation

NOTE: The tire pressure sensors will go into a 14 sleep mode" after 30 minutes of inactivity to conserve battery power. The sensors do not transmit information while in sleep mode, it will be necessary to wake them up so they will transmit the latest tire pressure information.

1. Turn the ignition switch to the ON position. 2. Position the tire pressure monitor activation tool against the LF tire sidewall 180 degrees from the tire valve stem.

3. NOTE: The activation tool will provide feedback in the form of a flashing green light and a beep sound for each successful response from a tire

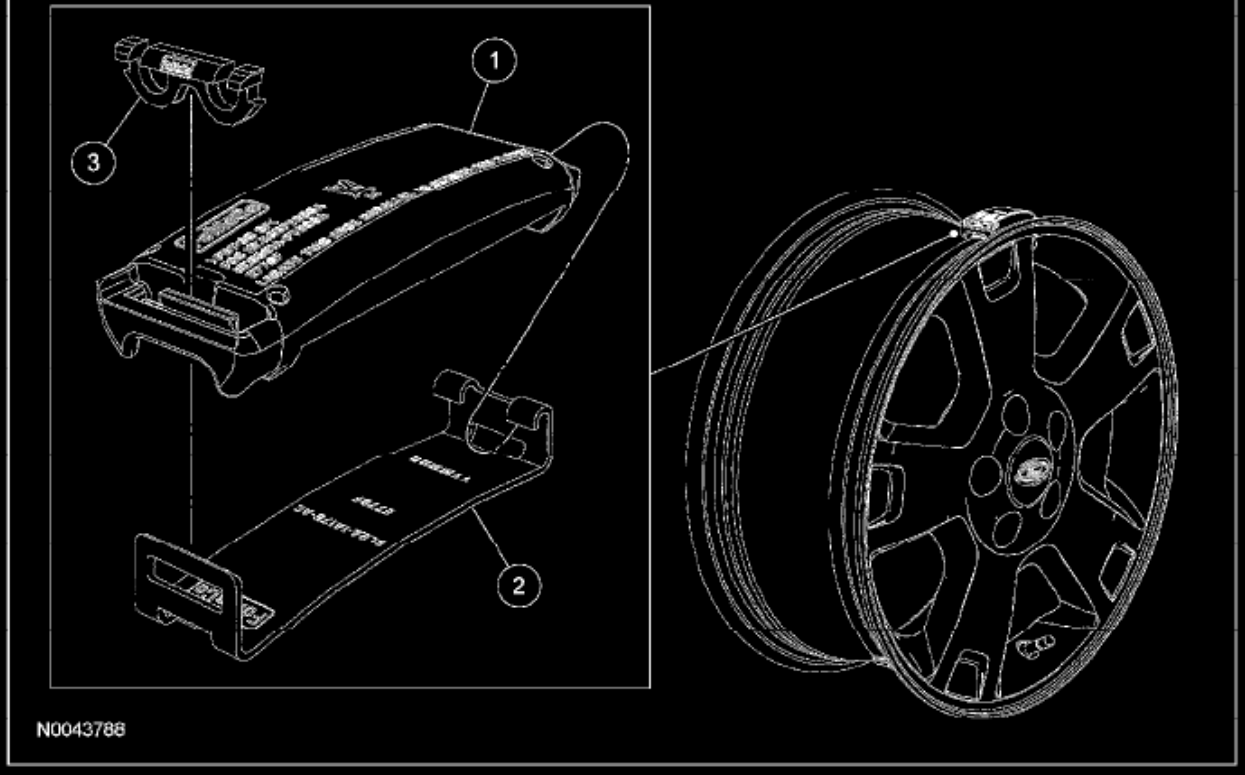
pressure sensor.

Press the test button on the activation tool to activate the sensor, activate the sensor at least 2 times.

4. Repeat Steps 2 and 3 for the remaining tires. 5. If the tire pressure monitoring system (TPMS) indicator remains illuminated after adjusting and activating each sensor, refer to the Symptom Chart

in Diagnosis and Testing.

Tire Pressure Monitoring System (TPMS) Sensor



Item	Part Number	Description
1	1A150/1A189	Tire pressure sensor/sensor kit
2	1A175	Sensor cradle

Item	Part Number	Description
3	14C202	Locking clip (also part of 1A189)

Tire Pressure Sensor: Service and Repair Tire Pressure Monitoring System (TPMS) Sensor

Tire Pressure Monitoring System (TPMS) Sensor

Tire Pressure Monitoring System (TPMS) Sensor

Disassembly

WARNING: The tire pressure monitoring system (TPMS) sensor battery may release hazardous chemicals if exposed to extreme mechanical damage. If these chemicals contact the skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If any part of the battery is swallowed, contact a physician immediately. When disposing of TPMS sensors, follow the correct procedures for hazardous material disposal. Failure to follow these instructions may result in serious personal injury.

NOTE: Tire pressure sensors are equipped with Lithium-ion batteries and must be disposed of accordingly.

NOTE: Tire pressure sensors are manufactured in multiple colors based on their application. When installing a new sensor, make sure the color of the sensor being installed matches the color of the sensor that was removed. The different colored sensors are not interchangeable.

NOTE: The sensor can be removed and installed without removing the strap or the cradle.

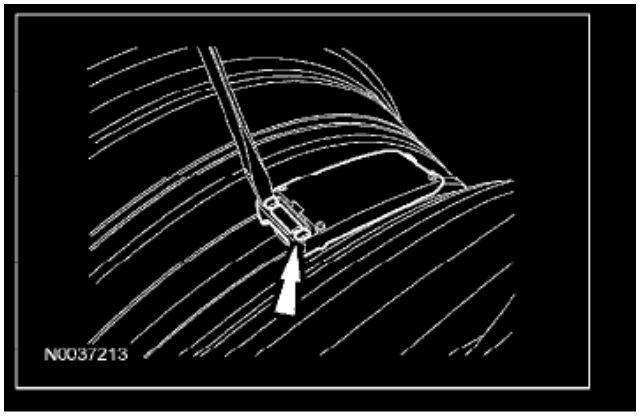
1. CAUTION: The sensor, cradle and strap may be damaged by incorrect tire mounting or dismounting. Dismount the tire only as

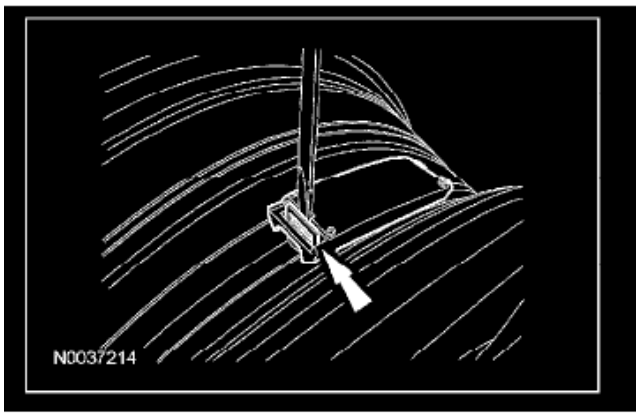
instructed.

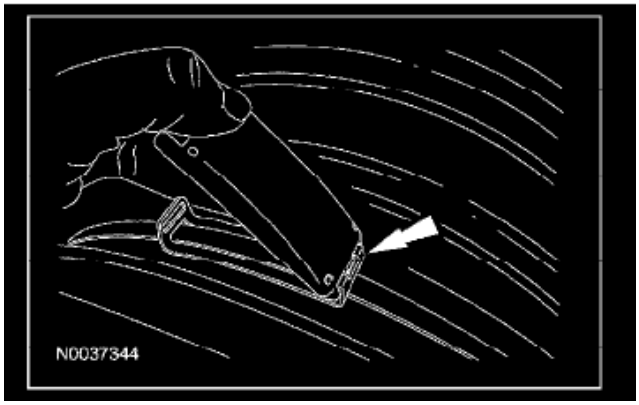
Remove the tire from the wheel.

2. CAUTION: Do not use a large screwdriver. Apply minimum force during removal or damage to the sensor locking clip may occur.

Using a pocket screwdriver or similar tool, remove the sensor locking clip.







3. CAUTION: Do not use a large screwdriver. Apply minimum force during removal or damage to the sensor may occur.

Using a pocket screwdriver or similar tool, detach the sensor from the cradle.

4. Remove the sensor.

Assembly

1. CAUTION: Damage to the sensor may occur if excessive force is applied during sensor installation.

NOTE: Make sure the sensor is fully seated into the cradle. The sensor will make a "click" noise when correctly seated.

Position the sensor into the cradle by inserting the hinge end of the sensor into the hook end of the cradle and pushing the opposite end of the sensor down onto the cradle.

2. NOTE: The locking clip can only be fully seated when installed in the correct orientation. If the sensor locking clip cannot be fully inserted, then

the sensor may not be fully seated on the cradle or the locking clip may be inserted backward.

Insert a new locking clip into the sensor.

3. CAUTION: The sensor, cradle and strap may be damaged by incorrect tire mounting or dismounting. Mount the tire only as instructed.

Install the tire onto the wheel.

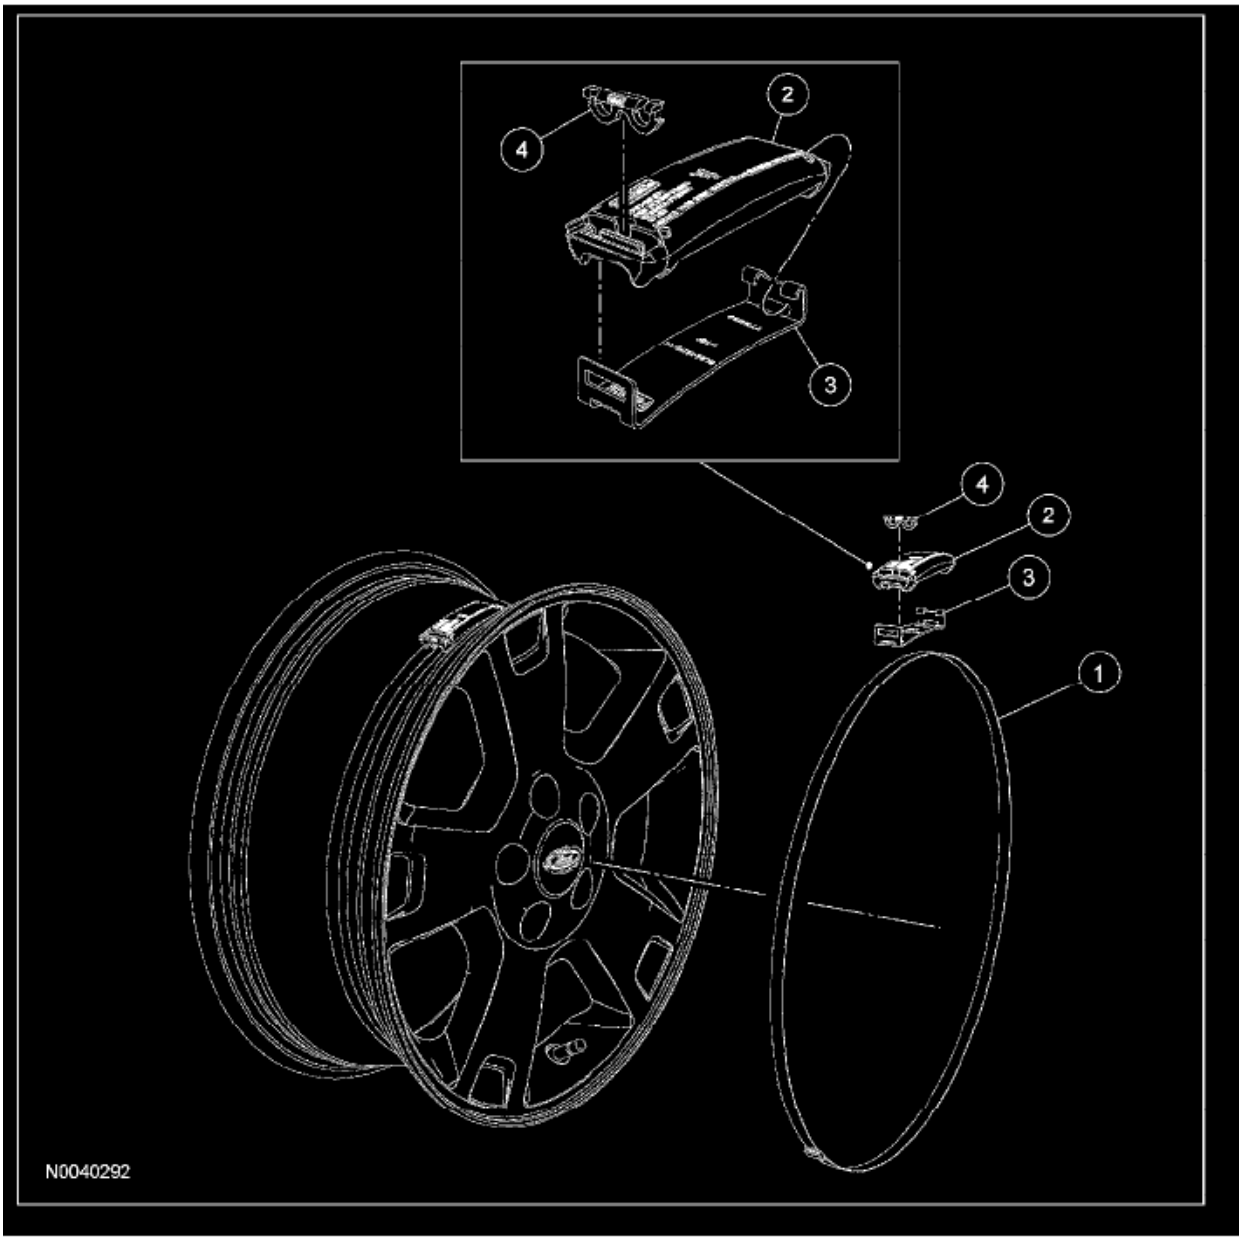
4. NOTE: A new tire pressure sensor is shipped in an off mode (or battery saver mode) and must be turned on before it can be trained. To turn the

sensor on, install it on a wheel, mount the tire and inflate the tire to the recommended inflation pressure. Wait at least 2 minutes, then continue with the sensor training procedure.

Train the tire pressure sensor(s).

Material

Item	Specification
Wheel and Tire Cleaner ZC-27-A or B	—

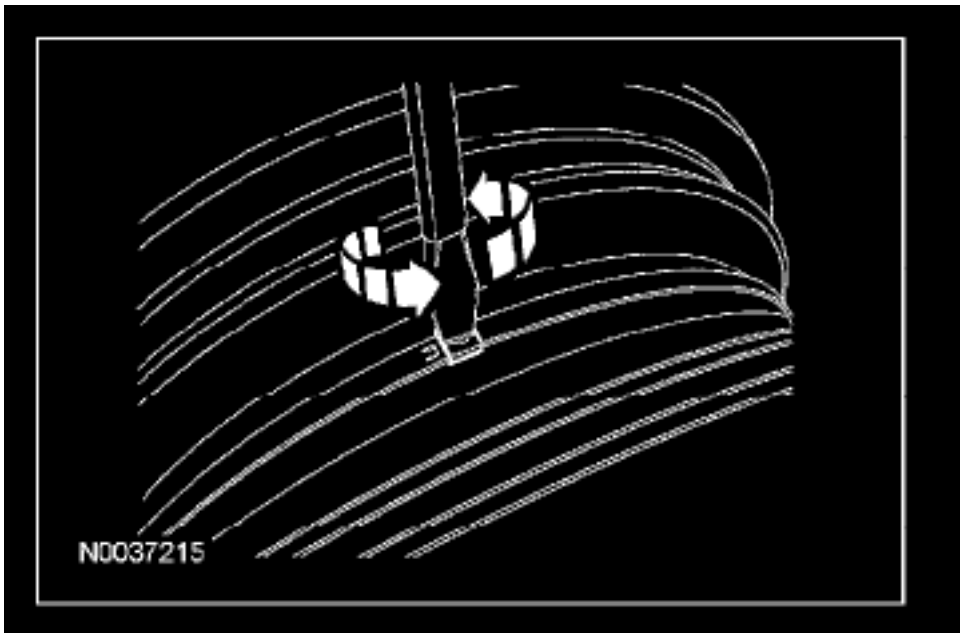


Item	Part Number	Description
1	1A177/1A193	Strap/strap kit
2	1A150/1A189	Tire pressure sensor/sensor kit
3	1A175	Sensor cradle (also part of 1A193)
4	14C202	Locking clip (also part of 1A189)

Tire Pressure Sensor: Service and Repair Tire Pressure Monitoring System (TPMS) Strap and Cradle

Tire Pressure Monitoring System (TPMS) Strap and Cradle

Disassembly



WARNING: The tire pressure monitoring system (TPMS) sensor battery may release hazardous chemicals if exposed to extreme mechanical damage. If these chemicals contact the skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If any part of the battery is swallowed, contact a physician immediately. When disposing of TPMS sensors, follow the correct procedures for hazardous material disposal. Failure to follow these instructions may result in serious personal injury.

NOTE: Tire pressure sensors are equipped with Lithium-ion batteries and must be disposed of accordingly.

NOTE: Tire pressure sensors are manufactured in multiple colors based on their application. When installing a new sensor, make sure the color of the sensor being installed matches the color of the sensor that was removed. The different colored sensors are not interchangeable.

NOTE: The sensor is available separately, the cradle and strap are available as a strap kit. There are several different strap kits available based on wheel diameter but all strap kits share the same base part number.

1. Remove the tire pressure monitoring system (TPMS) sensor.

2. WARNING: Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

WARNING: Wear protective gloves when handling components or parts that have pointed or sharp edges. Failure to follow this instruction may result in serious personal injury.

Remove a factory installed strap in the following sequence: 1

Locate the strap buckle and secure the strap to the wheel using duct tape or a similar item, on both sides of the buckle approximately 25 mm (0.98 inch) from the buckle.

2 Using a large screwdriver and a twisting motion, unbuckle the strap.

3 Discard the strap.

3. To remove a dealer installed strap, turn the worm gear screw until the strap is fully released from the worm gear.

^ Discard the strap.

4. NOTE: To aid assembly, mark the location of the cradle prior to disassembly.

Using a screwdriver, or similar tool, remove the cradle by inserting the screwdriver under the cradle and prying up.

Assembly

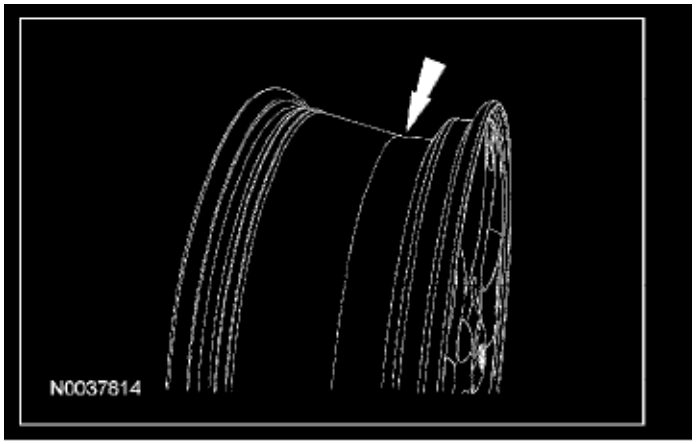
1. NOTE: Make sure the sensor is fully seated into the new cradle. The sensor will make a "click" noise when fully seated.

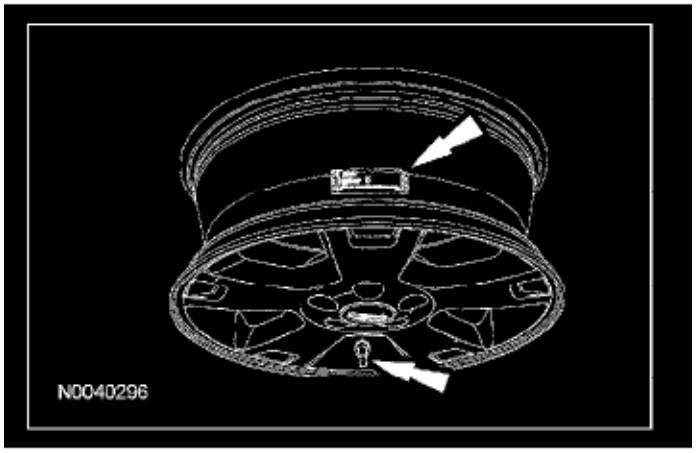
Position the sensor into the new cradle by inserting the hinge end of the sensor into the hook end of the cradle and pushing the opposite end of the sensor down onto the cradle.

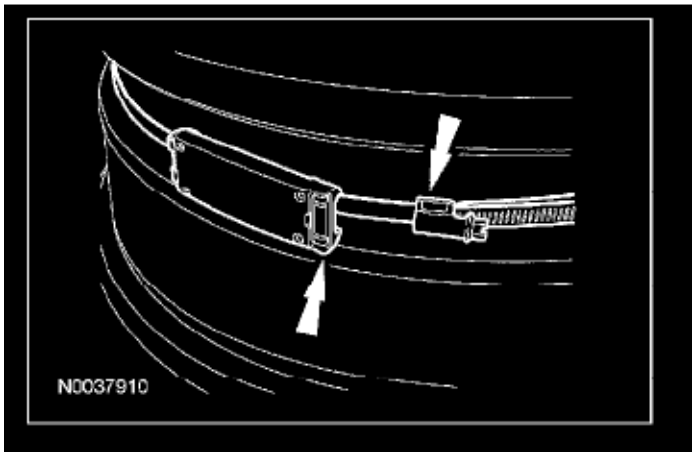
2. CAUTION: Metal scrapers may damage the wheel. Use only plastic or non-metallic scrapers to remove the cradle adhesive strip residue.

NOTE: The sensor and cradle must be installed in the drop well of the wheel, 180 degrees from the valve stem.

Clean the area where the sensor and cradle are to be installed.







3. NOTE: The sensor and cradle must be positioned with the hinge side of the sensor on the RH side when viewed from the curb side (beauty side)

of the wheel.

NOTE: The sensor has raised markings indicating how to position the sensor.

Remove the adhesive tape liner from the cradle and position the sensor and cradle into the wheel drop well 180 degrees from the valve stem.

4. Install the tapered end of the strap through the opening of the cradle on the hinge side of the sensor. This will position the worm gear on the

locking clip side of the sensor.

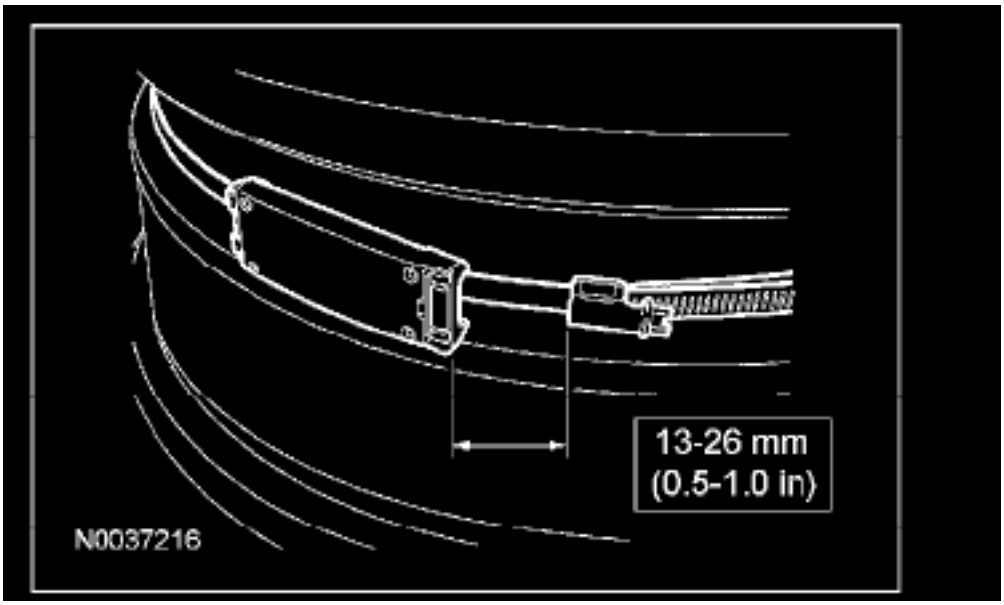
5. CAUTION: Steel wheels have a "high spot" along their circumference. Make sure the strap and sensor are mounted at the lowest spot

possible to avoid damaging the sensor during wheel and tire disassembly and assembly.

NOTE: Keep the strap parallel with the wheel flange while tightening the worm gear.

Position the worm gear 13-26 mm (0.5-1.0 inch) away from the sensor and tighten the worm gear.
^

Tighten to 3 Nm (27 lb-inch).



6. CAUTION: The sensor, cradle and strap may be damaged by incorrect tire mounting or dismounting. Mount the tire only as instructed.

Install the tire onto the wheel.

7. NOTE: A new tire pressure sensor is shipped in an off mode (or battery saver mode) and must be turned on before it can be trained. To turn the

sensor on, install it on a wheel, mount the tire and inflate the tire to the recommended inflation pressure. Wait at least 2 minutes, then continue with the sensor training procedure.

Train the tire pressure sensor(s).

Low Tire Pressure Indicator: Testing and Inspection

Tire Pressure Monitoring System (TPMS) Indicator and Message Center Messages

The TPMS indicator and vehicle message center (if equipped) sometimes displays faults that cannot be resolved by the customer. Treat these messages as TPMS faults that must be serviced.

Tire Pressure Monitoring System (TPMS) Indicator Illuminates Continuously

NOTE: If the spare tire is in use, the damaged road tire must be repaired and installed on the vehicle to restore complete TPMS functionality before carrying out any diagnosis.

NOTE: For vehicles with different front and rear tire pressures (such as E-Series and certain F-Series), the tire pressure sensors must be trained following a tire rotation. Failure to train the sensors will cause the TPMS indicator to illuminate.

For vehicles with the same tire pressures for front and rear tires, tire rotation will not affect the system.

1. The TPMS indicator remains on continuously for the following condition:

^ Low Tire Pressure - The TPMS indicator is illuminated solid and the message center displays LOW TIRE PRESSURE (if equipped). This is displayed when any of the tire pressures are low. When this condition exists, the tire pressure must be adjusted to the recommended cold pressure as indicated on the vehicle certification label.

2. NOTE: The TPMS sensors do not transmit when the vehicle is stationary. If the vehicle has been stationary for more than 30 minutes, it will be

necessary to wake up the sensors so they will transmit the latest tire pressure information to the SJB.

If the vehicle has been stationary for more than 30 minutes, refer to Tire Pressure Monitoring System (TPMS) Sensor Activation procedure.

Tire Pressure Monitoring System (TPMS) Indicator Flashes

The TPMS indicator flashes for 70 seconds and then remains ON solid when the ignition key is turned to the ON position for the following conditions: 1. Tire Pressure Sensor Fault - If equipped, the message center will display TIRE SENSOR FAULT when a tire pressure sensor is malfunctioning.

GO to Symptom Chart. See: Testing and Inspection/Symptom Related Diagnostic Procedures

2. No communication with the SJB (TPMS is integral to the SJB) - The TPMS indicator is illuminated when the instrument cluster has received no

signals from the SJB for more than 5 seconds. If equipped, the message center displays TIRE MONITOR FAULT. GO to Symptom Chart. See: Testing and Inspection/Symptom Related Diagnostic Procedures

3. Tire Pressure Monitor Fault - If equipped, the message center will display TIRE MONITOR FAULT when the tire pressure monitoring system is

malfunctioning or communication with the instrument cluster has been lost. GO to Symptom Chart. See: Testing and Inspection/Symptom Related Diagnostic Procedures

Special Tool(s)

ST2941-A	Activation Tool, Tire Pressure Monitor 204-363
ST2634-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Tire Pressure Sensor: Testing and Inspection Tire Pressure Monitoring System (TPMS) Sensor Training

Tire Pressure Monitoring System (TPMS) Sensor Training

NOTE: If the vehicle has been stationary for more than 30 minutes, the sensors will go into a "sleep mode" to conserve battery power. It will be necessary to wake them up so they will transmit the latest tire pressure information to the smart junction box (SJB). For additional information, refer to Tire Pressure Monitoring System (TPMS) Sensor Activation.

NOTE: The tire pressure sensor training procedure must be done on a single vehicle, in an area without radio frequency noise and at least 1 m (3 ft) away from other vehicles equipped with tire pressure monitoring system (TPMS). Radio frequency noise is generated by electrical motors and appliance operation, cellular telephones, remote transmitters, power inverters and portable entertainment equipment.

NOTE: If a sensor does not respond to the activation tool, attempt to activate the same sensor with the activation tool. If the sensor still does not respond, move the vehicle to rotate the wheels at least 1/4 of a turn and attempt to activate the same sensor again.

NOTE: The SJB has a 2-minute time limit between sensor responses. If the SJB does not recognize any 1 of the 4 tire pressure sensors during this time limit, the horn will sound twice and the message center (if equipped) will display TIRE NOT TRAINED REPEAT and the entire procedure must be repeated.

1. NOTE: For vehicles with different front and rear tire pressures (such as the E-Series and certain F-Series), the tire pressure sensors must be

trained following a tire rotation. Failure to train the sensors will cause the TPMS indicator to illuminate. For vehicles with the same tire pressure for front and rear tires, tire rotation will not affect the system.

Turn the ignition switch to the OFF position, then press and release the brake pedal.

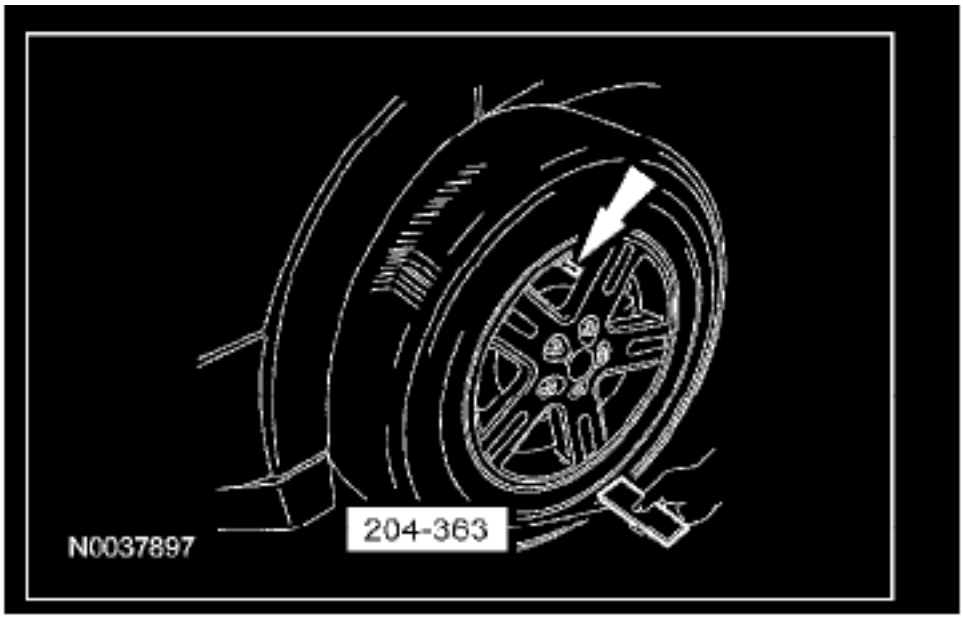
2. Cycle the ignition switch from the OFF position to the RUN position 3 times, ending in the RUN position. 3. Press and release the brake pedal. 4. Turn the ignition switch to the OFF position. 5. Turn the ignition switch from the OFF position to the RUN position 3 times, ending in the RUN position.

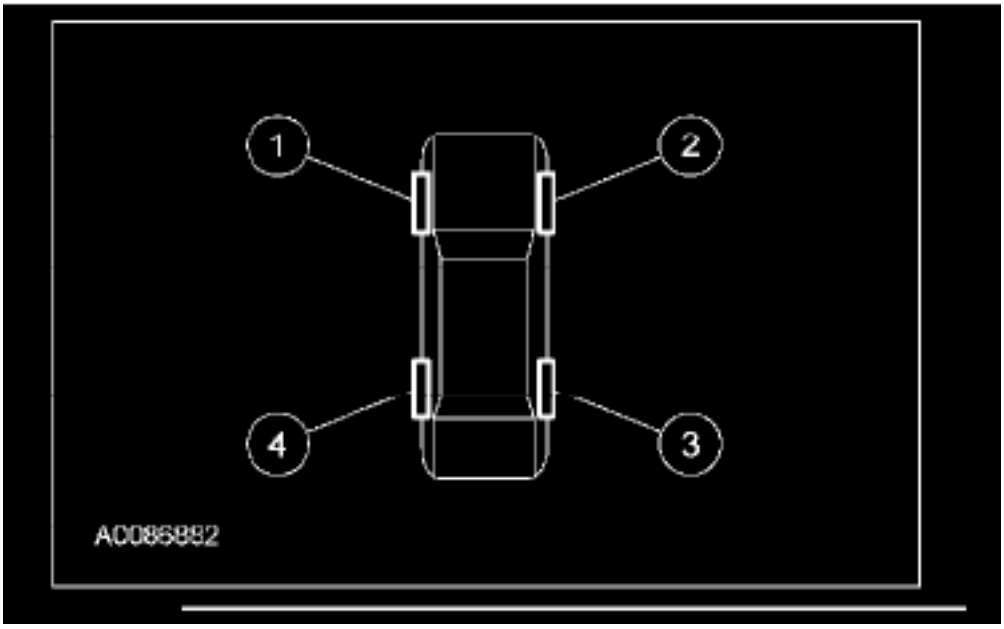
^ The horn will sound once and the TPMS indicator will flash if the training mode has been entered successfully. If equipped, the message center will display TRAIN LF TIRE.

6. NOTE: It may take up to 6 seconds to activate a tire pressure sensor. During this time, the activation tool must remain in place 180 degrees from

the valve stem.

Place the activation tool on the LF tire sidewall opposite (180 degrees) from the valve stem. Press and release the test button on the special tool. The horn will sound briefly to indicate that the tire pressure sensor has been recognized by the SJB.





7. Within 2 minutes of the horn sounding, place the activation tool on the RF tire sidewall opposite (180 degrees) from the valve stem and press and

release the test button to train the RF tire pressure sensor.

8. NOTE: Do not wait more than 2 minutes between training each sensor or the SJB will time out and the entire procedure must be repeated.

Repeat Step 7 for the RR and LR tires. ^

The procedure is completed after the last tire has been trained. When the training procedure is complete, the message center (if equipped) will display TIRE TRAINING COMPLETE.

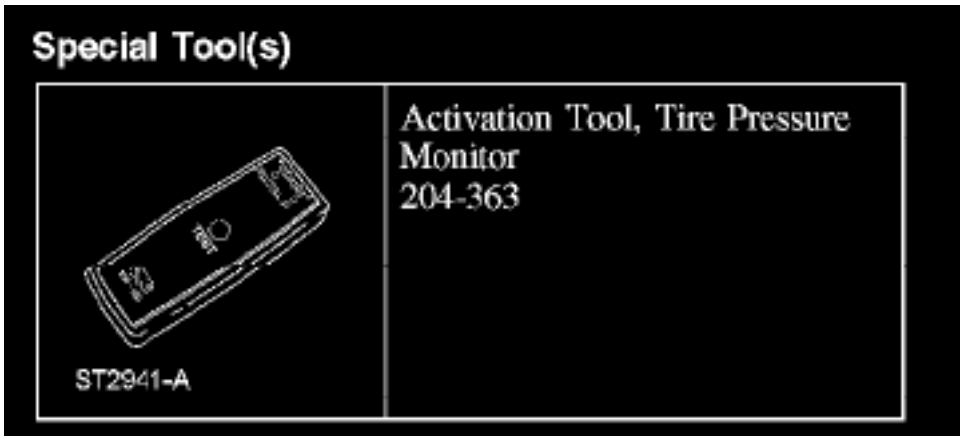
^ For vehicles not equipped with a message center, successful completion of the training procedure will be verified by turning the ignition switch to the OFF position without the horn sounding. If the horn sounds twice when the switch is turned to the OFF position, the training procedure was not successful.

9. Using the scan tool, locate the updated TPMS sensor IDs trained to the SJB and document them on the applicable warranty claim.

10. NOTE: This step is required to clear DTC C2780, cause the SJB to exit the manufacturing mode and to make sure there are no other concerns

with a newly programmed SJB.

If the sensors are being trained due to the installation of a new SJB, clear any DTCs and perform the SJB on-demand self test.



Tire Pressure Sensor: Testing and Inspection Tire Pressure Monitoring System (TPMS) Sensor Activation

Tire Pressure Monitoring System (TPMS) Sensor Activation

NOTE: The tire pressure sensors will go into a 14 sleep mode" after 30 minutes of inactivity to conserve battery power. The sensors do not transmit information while in sleep mode, it will be necessary to wake them up so they will transmit the latest tire pressure information.

1. Turn the ignition switch to the ON position. 2. Position the tire pressure monitor activation tool against the LF tire sidewall 180 degrees from the tire valve stem.

3. NOTE: The activation tool will provide feedback in the form of a flashing green light and a beep sound for each successful response from a tire

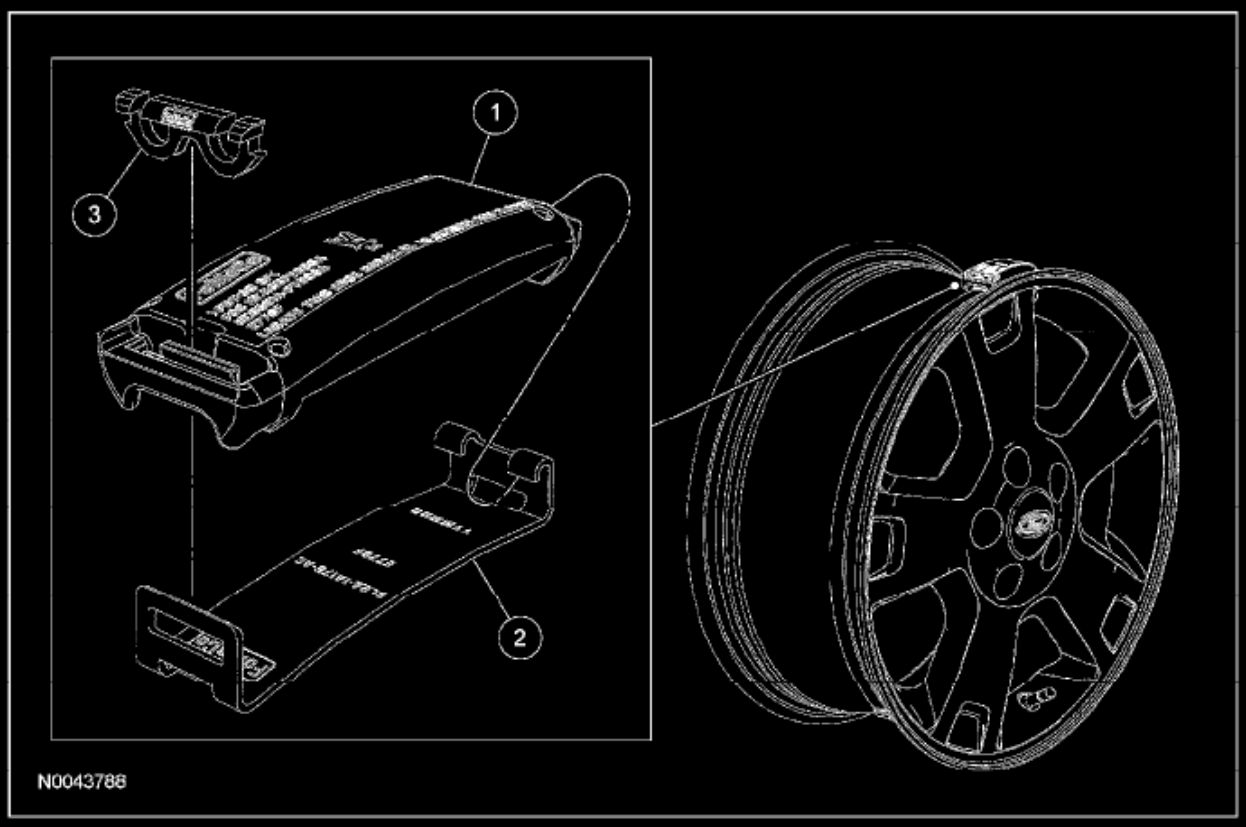
pressure sensor.

Press the test button on the activation tool to activate the sensor, activate the sensor at least 2 times.

4. Repeat Steps 2 and 3 for the remaining tires. 5. If the tire pressure monitoring system (TPMS) indicator remains illuminated after adjusting and activating each sensor, refer to the Symptom Chart

in Diagnosis and Testing.

Tire Pressure Monitoring System (TPMS) Sensor



Item	Part Number	Description
1	1A150/1A189	Tire pressure sensor/sensor kit
2	1A175	Sensor cradle

Item	Part Number	Description
3	14C202	Locking clip (also part of 1A189)

Tire Pressure Sensor: Service and Repair Tire Pressure Monitoring System (TPMS) Sensor

Tire Pressure Monitoring System (TPMS) Sensor

Tire Pressure Monitoring System (TPMS) Sensor

Disassembly

WARNING: The tire pressure monitoring system (TPMS) sensor battery may release hazardous chemicals if exposed to extreme mechanical damage. If these chemicals contact the skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If any part of the battery is swallowed, contact a physician immediately. When disposing of TPMS sensors, follow the correct procedures for hazardous material disposal. Failure to follow these instructions may result in serious personal injury.

NOTE: Tire pressure sensors are equipped with Lithium-ion batteries and must be disposed of accordingly.

NOTE: Tire pressure sensors are manufactured in multiple colors based on their application. When installing a new sensor, make sure the color of the sensor being installed matches the color of the sensor that was removed. The different colored sensors are not interchangeable.

NOTE: The sensor can be removed and installed without removing the strap or the cradle.

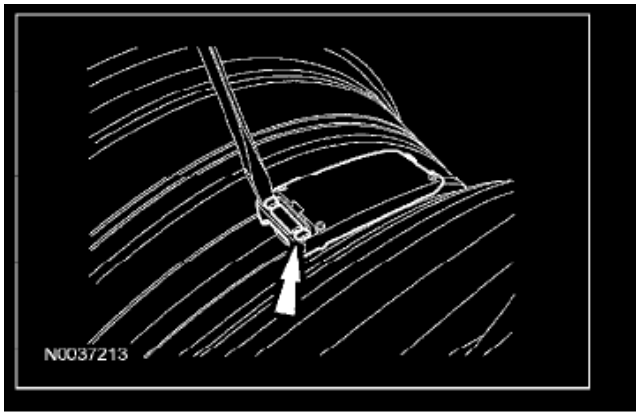
1. CAUTION: The sensor, cradle and strap may be damaged by incorrect tire mounting or dismounting. Dismount the tire only as

instructed.

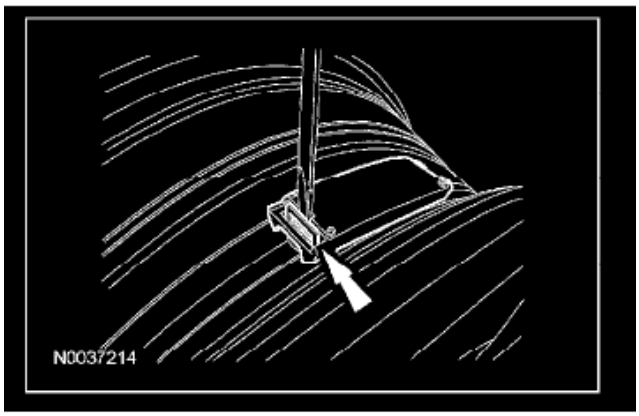
Remove the tire from the wheel.

2. CAUTION: Do not use a large screwdriver. Apply minimum force during removal or damage to the sensor locking clip may occur.

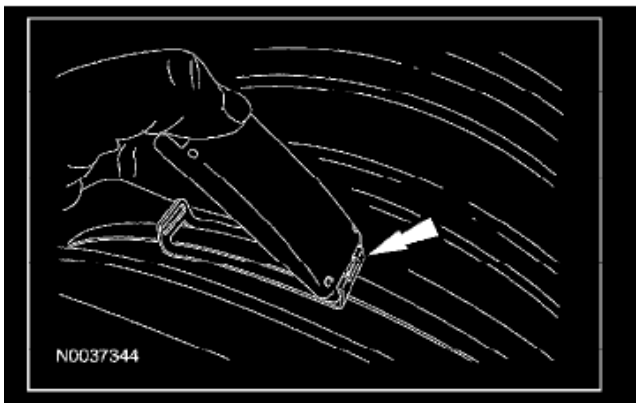
Using a pocket screwdriver or similar tool, remove the sensor locking clip.



N0037213



N0037214



N0037344

3. CAUTION: Do not use a large screwdriver. Apply minimum force during removal or damage to the sensor may occur.

Using a pocket screwdriver or similar tool, detach the sensor from the cradle.

4. Remove the sensor.

Assembly

1. CAUTION: Damage to the sensor may occur if excessive force is applied during sensor installation.

NOTE: Make sure the sensor is fully seated into the cradle. The sensor will make a "click" noise when correctly seated.

Position the sensor into the cradle by inserting the hinge end of the sensor into the hook end of the cradle and pushing the opposite end of the sensor down onto the cradle.

2. NOTE: The locking clip can only be fully seated when installed in the correct orientation. If the sensor locking clip cannot be fully inserted, then

the sensor may not be fully seated on the cradle or the locking clip may be inserted backward.

Insert a new locking clip into the sensor.

3. CAUTION: The sensor, cradle and strap may be damaged by incorrect tire mounting or dismounting. Mount the tire only as instructed.

Install the tire onto the wheel.

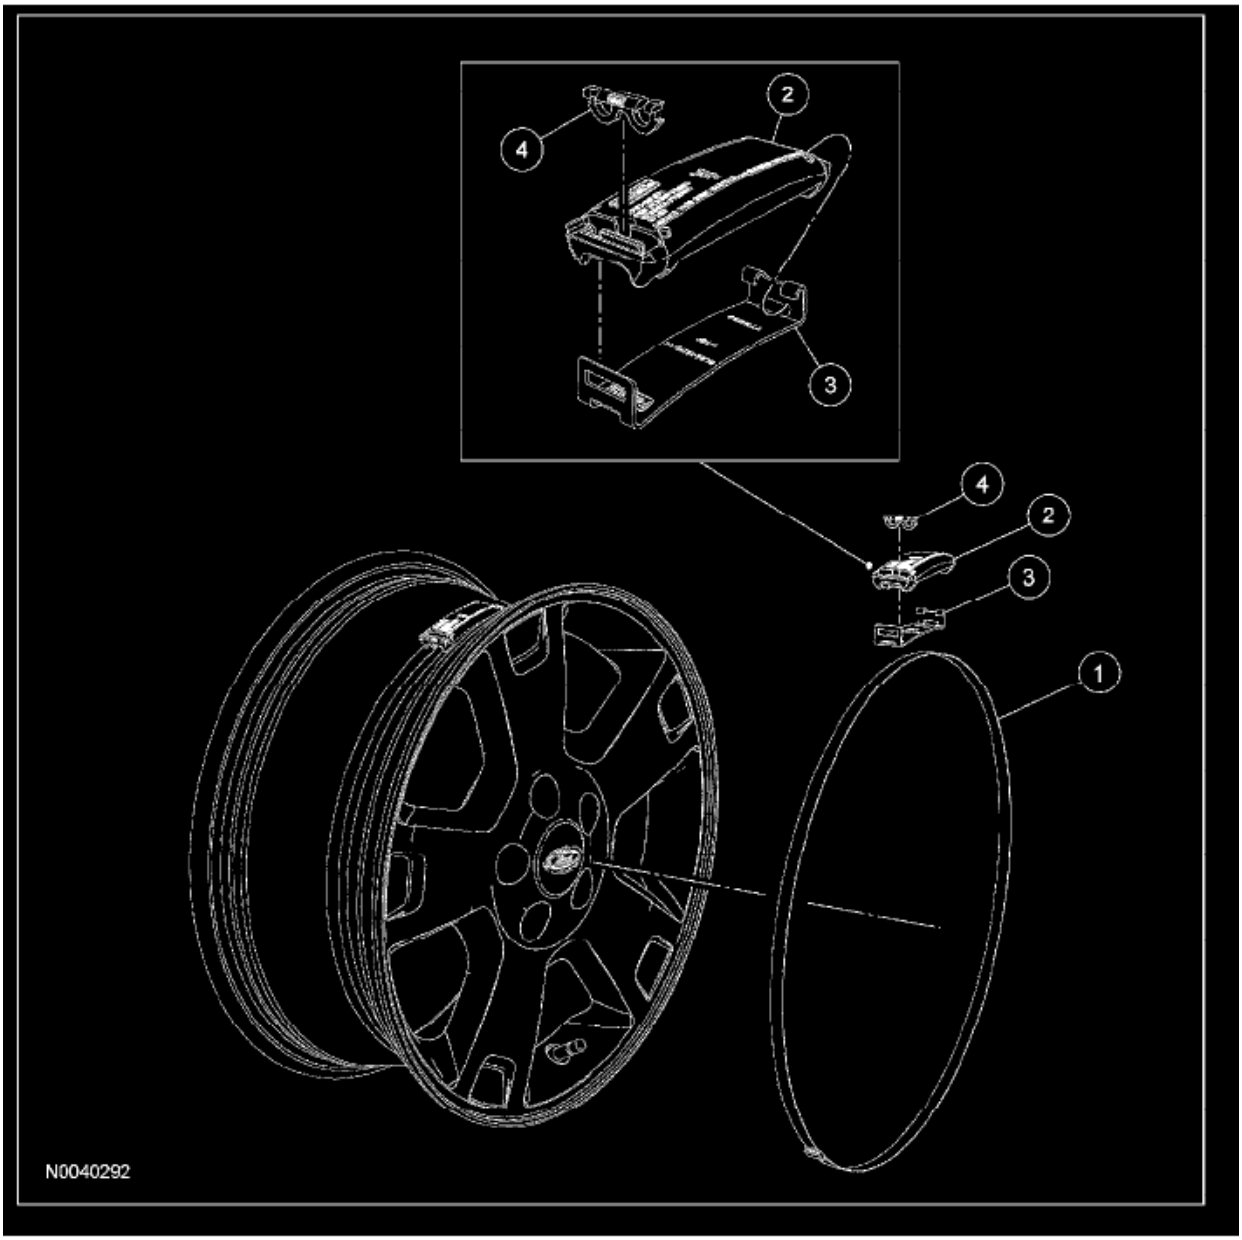
4. NOTE: A new tire pressure sensor is shipped in an off mode (or battery saver mode) and must be turned on before it can be trained. To turn the

sensor on, install it on a wheel, mount the tire and inflate the tire to the recommended inflation pressure. Wait at least 2 minutes, then continue with the sensor training procedure.

Train the tire pressure sensor(s).

Material

Item	Specification
Wheel and Tire Cleaner ZC-27-A or B	—

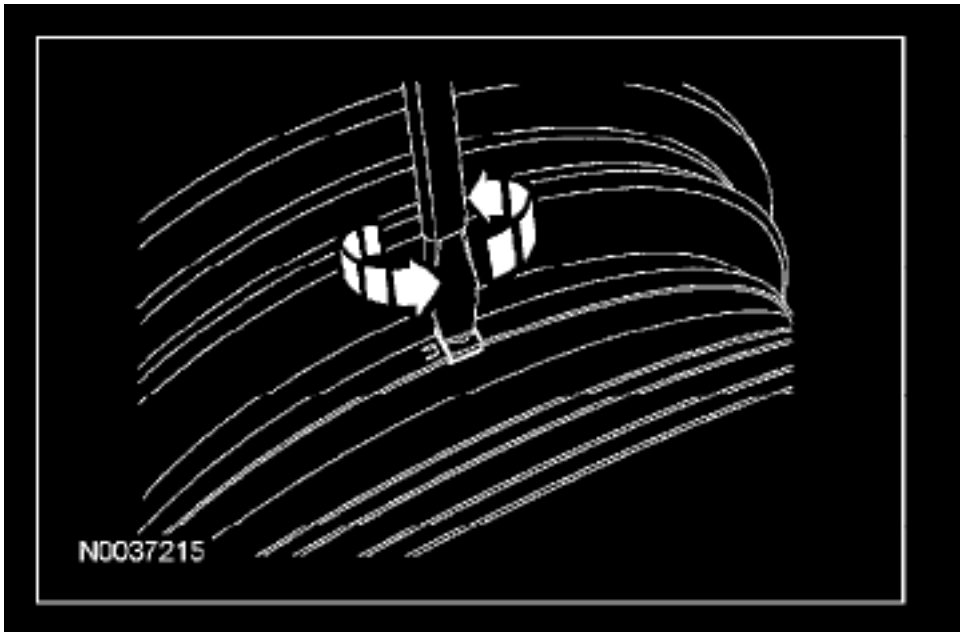


Item	Part Number	Description
1	1A177/1A193	Strap/strap kit
2	1A150/1A189	Tire pressure sensor/sensor kit
3	1A175	Sensor cradle (also part of 1A193)
4	14C202	Locking clip (also part of 1A189)

Tire Pressure Sensor: Service and Repair Tire Pressure Monitoring System (TPMS) Strap and Cradle

Tire Pressure Monitoring System (TPMS) Strap and Cradle

Disassembly



WARNING: The tire pressure monitoring system (TPMS) sensor battery may release hazardous chemicals if exposed to extreme mechanical damage. If these chemicals contact the skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If any part of the battery is swallowed, contact a physician immediately. When disposing of TPMS sensors, follow the correct procedures for hazardous material disposal. Failure to follow these instructions may result in serious personal injury.

NOTE: Tire pressure sensors are equipped with Lithium-ion batteries and must be disposed of accordingly.

NOTE: Tire pressure sensors are manufactured in multiple colors based on their application. When installing a new sensor, make sure the color of the sensor being installed matches the color of the sensor that was removed. The different colored sensors are not interchangeable.

NOTE: The sensor is available separately, the cradle and strap are available as a strap kit. There are several different strap kits available based on wheel diameter but all strap kits share the same base part number.

1. Remove the tire pressure monitoring system (TPMS) sensor.

2. WARNING: Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

WARNING: Wear protective gloves when handling components or parts that have pointed or sharp edges. Failure to follow this instruction may result in serious personal injury.

Remove a factory installed strap in the following sequence: 1

Locate the strap buckle and secure the strap to the wheel using duct tape or a similar item, on both sides of the buckle approximately 25 mm (0.98 inch) from the buckle.

2 Using a large screwdriver and a twisting motion, unbuckle the strap.

3 Discard the strap.

3. To remove a dealer installed strap, turn the worm gear screw until the strap is fully released from the worm gear.

^ Discard the strap.

4. NOTE: To aid assembly, mark the location of the cradle prior to disassembly.

Using a screwdriver, or similar tool, remove the cradle by inserting the screwdriver under the cradle and prying up.

Assembly

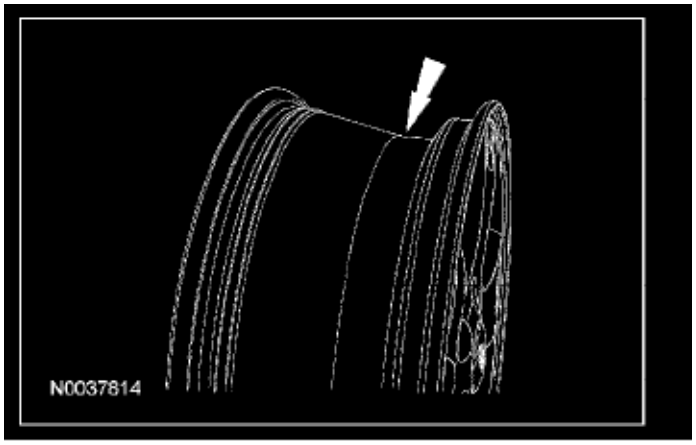
1. NOTE: Make sure the sensor is fully seated into the new cradle. The sensor will make a "click" noise when fully seated.

Position the sensor into the new cradle by inserting the hinge end of the sensor into the hook end of the cradle and pushing the opposite end of the sensor down onto the cradle.

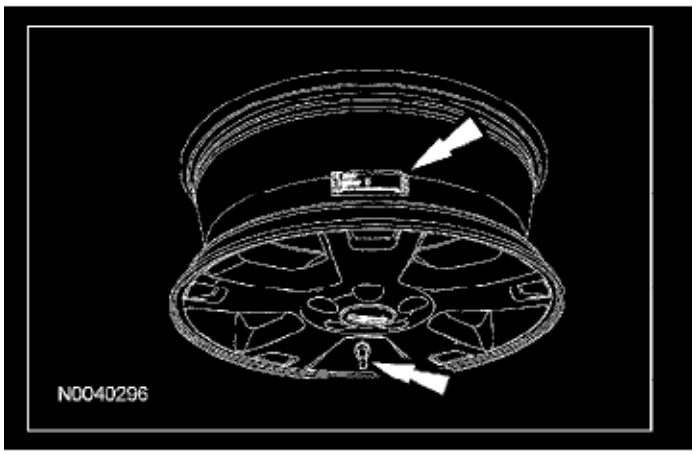
2. CAUTION: Metal scrapers may damage the wheel. Use only plastic or non-metallic scrapers to remove the cradle adhesive strip residue.

NOTE: The sensor and cradle must be installed in the drop well of the wheel, 180 degrees from the valve stem.

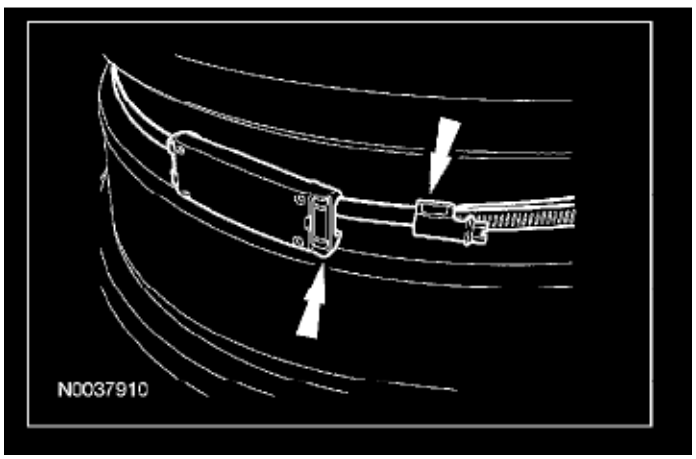
Clean the area where the sensor and cradle are to be installed.



N0037814



N0040296



N0037910

3. NOTE: The sensor and cradle must be positioned with the hinge side of the sensor on the RH side when viewed from the curb side (beauty side)

of the wheel.

NOTE: The sensor has raised markings indicating how to position the sensor.

Remove the adhesive tape liner from the cradle and position the sensor and cradle into the wheel drop well 180 degrees from the valve stem.

4. Install the tapered end of the strap through the opening of the cradle on the hinge side of the sensor. This will position the worm gear on the

locking clip side of the sensor.

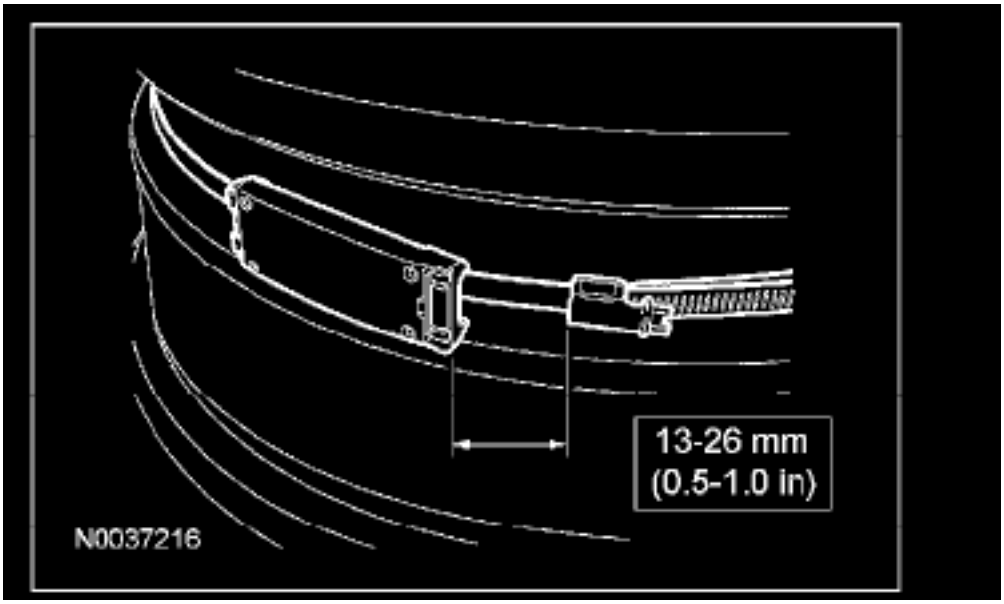
5. CAUTION: Steel wheels have a "high spot" along their circumference. Make sure the strap and sensor are mounted at the lowest spot

possible to avoid damaging the sensor during wheel and tire disassembly and assembly.

NOTE: Keep the strap parallel with the wheel flange while tightening the worm gear.

Position the worm gear 13-26 mm (0.5-1.0 inch) away from the sensor and tighten the worm gear.
^

Tighten to 3 Nm (27 lb-inch).



6. CAUTION: The sensor, cradle and strap may be damaged by incorrect tire mounting or dismounting. Mount the tire only as instructed.

Install the tire onto the wheel.

7. NOTE: A new tire pressure sensor is shipped in an off mode (or battery saver mode) and must be turned on before it can be trained. To turn the

sensor on, install it on a wheel, mount the tire and inflate the tire to the recommended inflation pressure. Wait at least 2 minutes, then continue with the sensor training procedure.

Train the tire pressure sensor(s).

Wheel Fastener: Service and Repair Rear

Wheel Studs

Removal

CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent parts if replacement is necessary. Do not use replacement parts of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

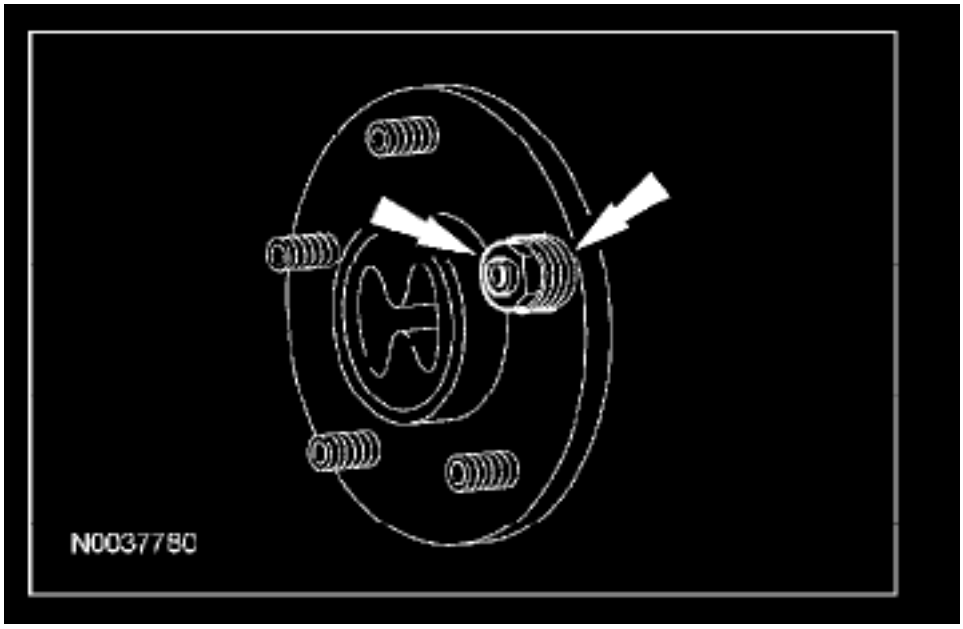
CAUTION: Never use a hammer to remove the wheel stud or damage to the axle flange, wheel bearing or hub may occur.

1. Remove the rear brake drum. 2. Using the special tool, press the wheel stud from its seat and discard.

Installation

CAUTION: Never use air tools to install wheel studs. The serrations may be stripped from the stud.

1. Insert a new wheel stud in the axle flange, making sure the serrations are aligned with those made by the original wheel stud.



2. Seat the new wheel stud in the axle flange.

^ Place 4 flat washers over the outside end of the wheel stud.

^ Thread a standard wheel nut with the flat side against the washers.

^ Tighten the wheel nut until the wheel stud head seats against the back side of the flange.

3. Remove the wheel nut and flat washers. 4. Install the rear brake drum.

Accumulator HVAC: Description and Operation

SUCTION ACCUMULATOR

NOTE: Installation of a new suction accumulator is not required when repairing the air conditioning system, except when there is physical evidence of contamination from a failed A/C compressor or damage to the suction accumulator.

After entering the inlet of the suction accumulator, heavier oil-laden refrigerant contacts an internally mounted dome (which serves as an umbrella) and drips down onto the bottom of the canister.

- A small diameter oil bleed hole, in the bottom of the vapor return tube, allows the accumulated heavier liquid refrigerant and oil mixture to re-enter the compressor suction line at a controlled rate.

- As the heavier mixture passes through the small diameter liquid bleed hole, it has a second chance to vaporize and recirculate through the A/C compressor without causing compressor damage due to slugging.

- A fine mesh screened filter fits tightly around the bottom of the vapor return tube to filter out refrigerant system contaminant particles.

- A desiccant bag is mounted inside the canister to absorb any moisture which may be in the refrigerant system.

- A fitting located on the side of the suction accumulator is used to mount a serviceable low-pressure A/C charge port valve.

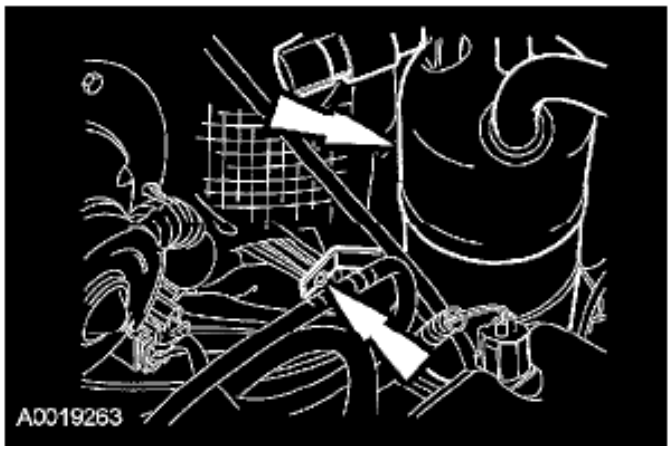
N0042407



A0019263

Accumulator HVAC: Service and Repair

SUCTION ACCUMULATOR

Removal and Installation

NOTE: Installation of a new suction accumulator is not required when repairing the air conditioning system, except when there is physical evidence of contamination from a failed A/C compressor or damage to the suction accumulator.

1. Recover the refrigerant. 2. Disconnect the A/C cycling switch electrical connector.

3. CAUTION: Use a back-up wrench to prevent damage to the tubes.

Disconnect the suction accumulator inlet and outlet fittings. -

Discard the O-ring seals.

- To install, tighten the inlet fitting to 39 Nm (29 lb-ft)

4. Remove the suction accumulator bracket screws and the suction accumulator.

5. To install, reverse the removal procedure.

- Install new O-ring seals.

- Lubricate the refrigerant system with the correct amount of clean PAG oil or equivalent.

6. Evacuate, leak test and charge the refrigerant system.

Blower Motor: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

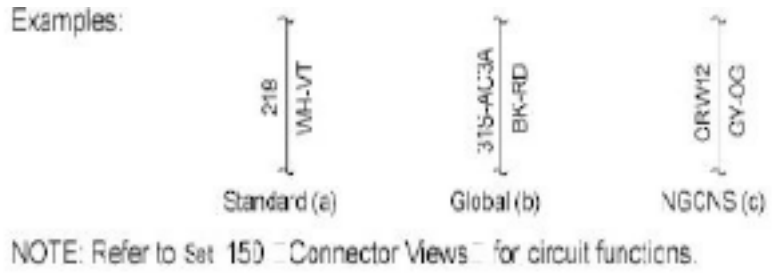
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

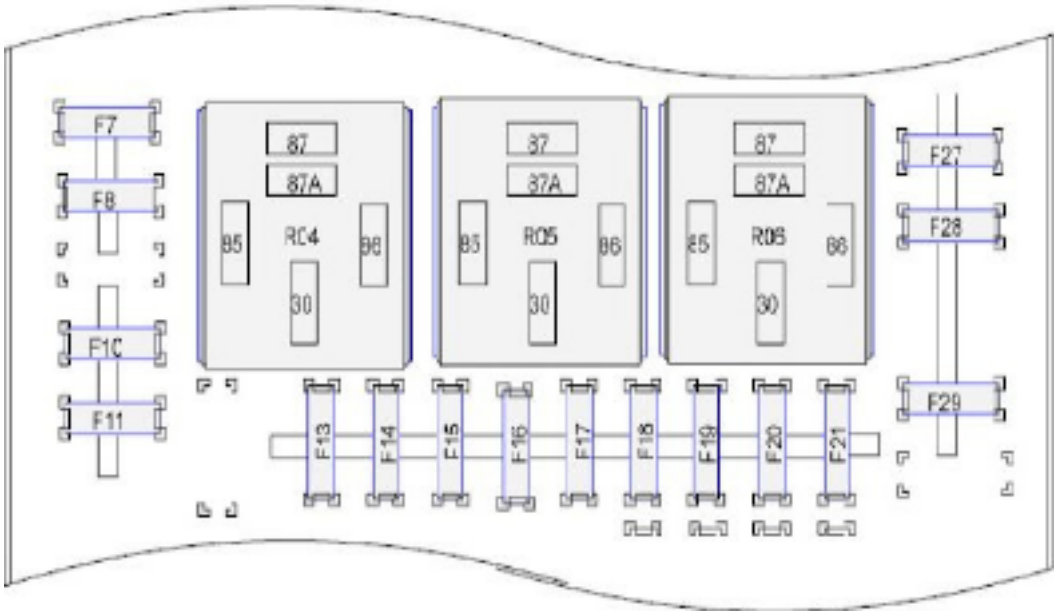
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

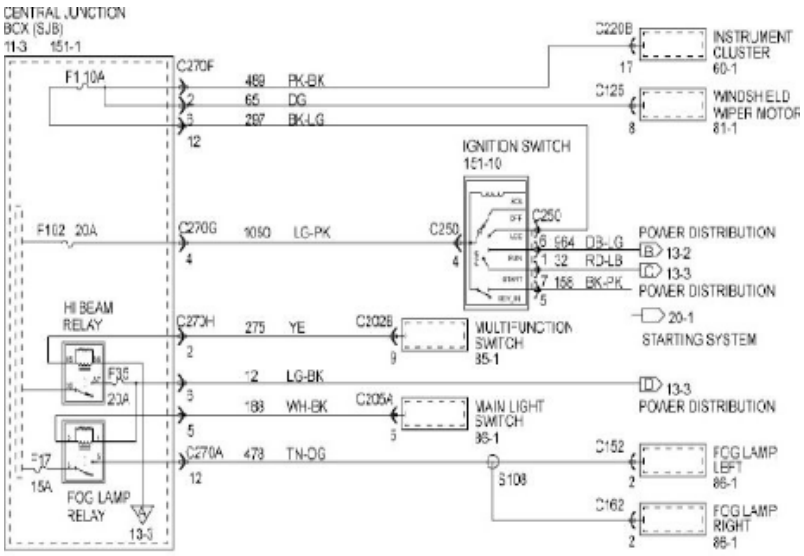
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

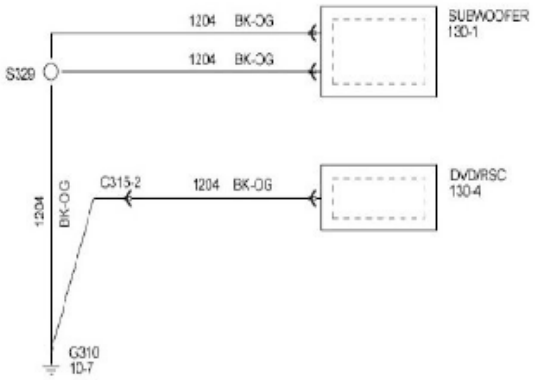
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

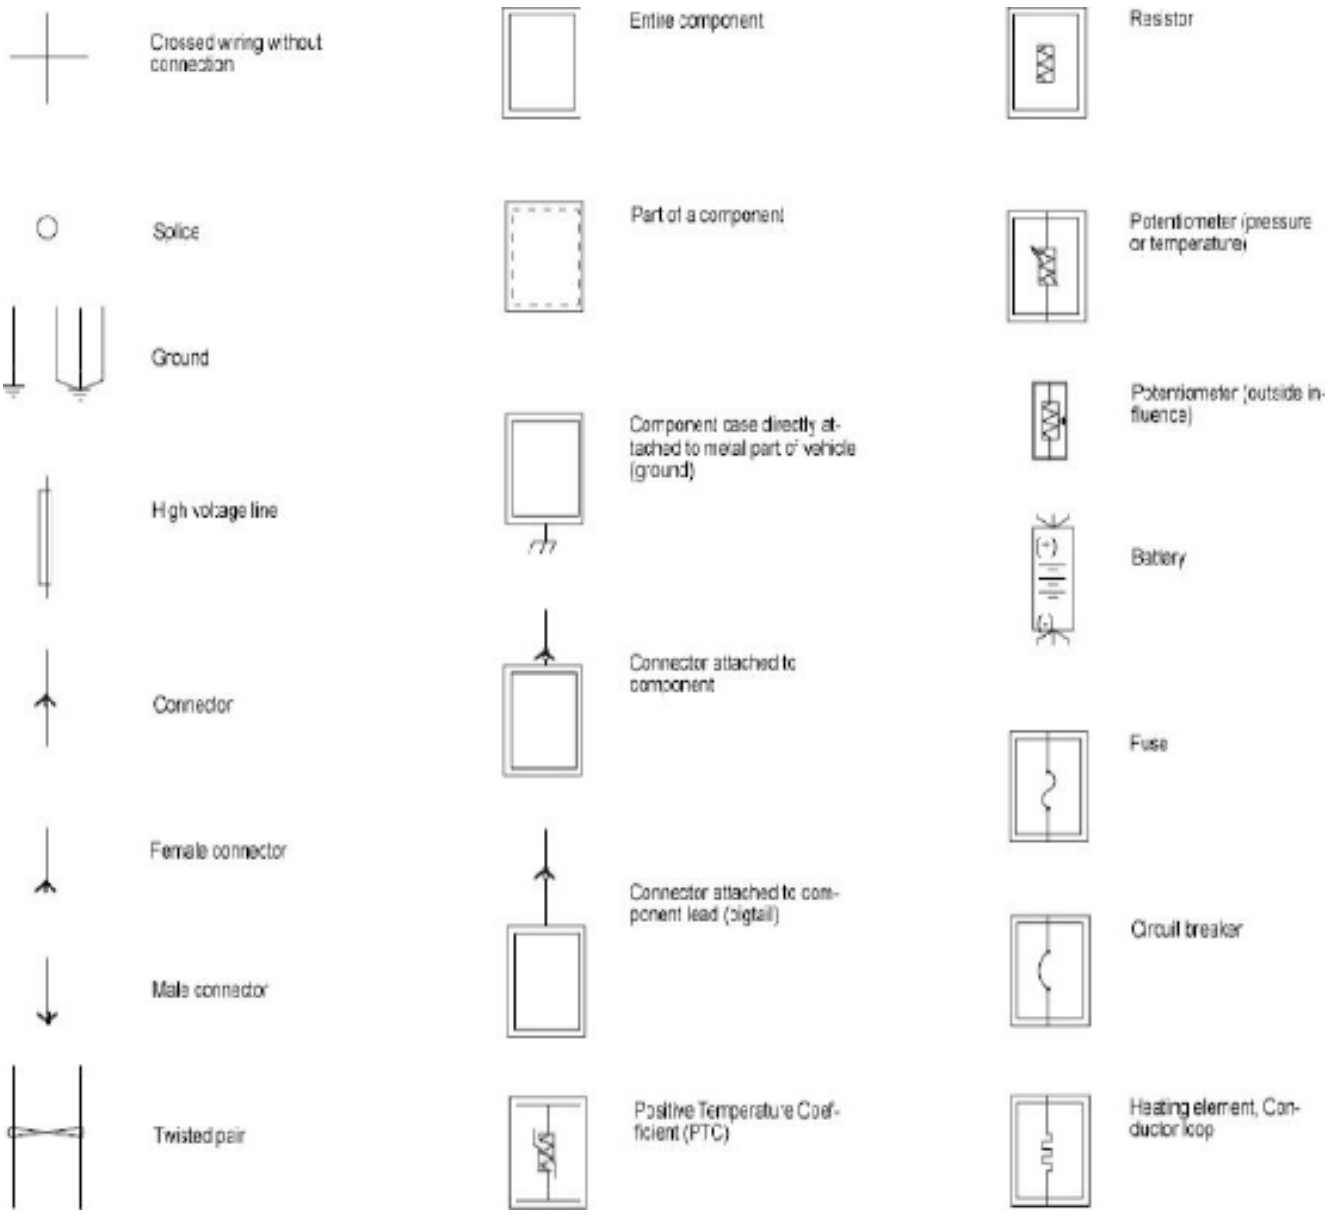
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Blower Motor: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

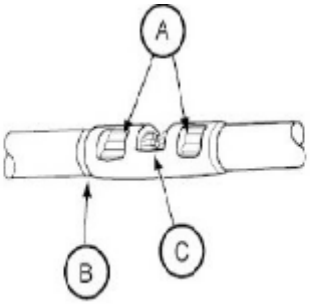
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

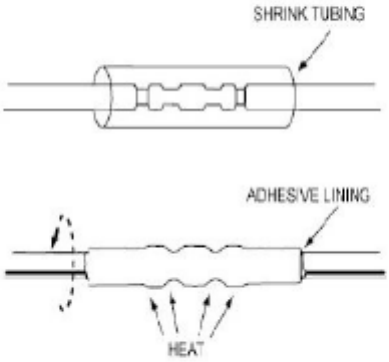
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24

The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

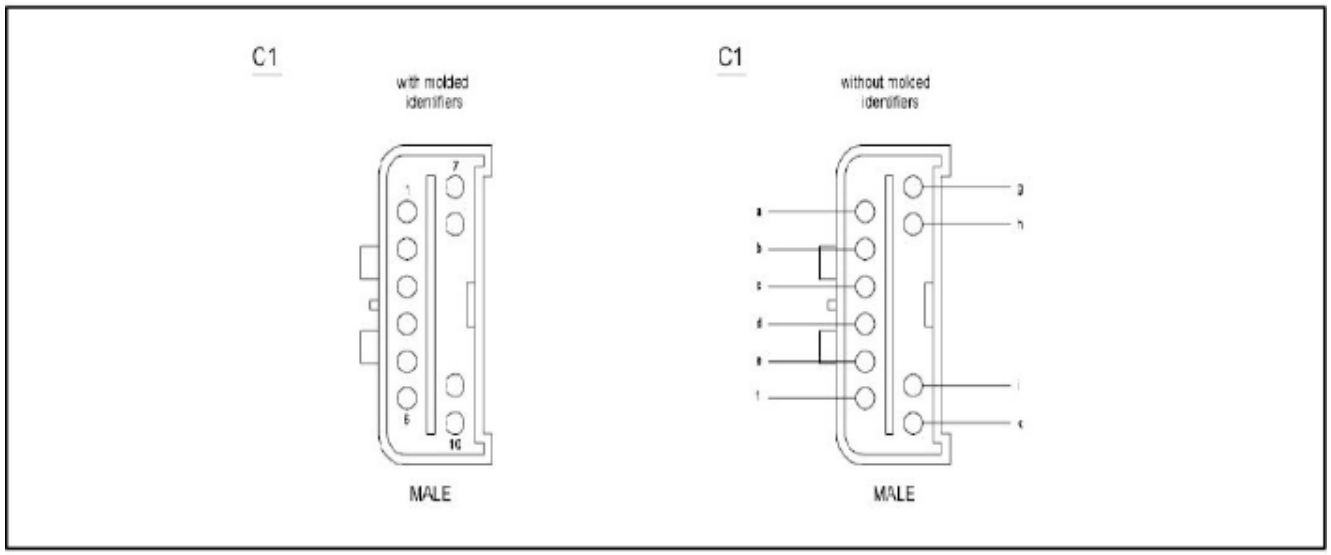
Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

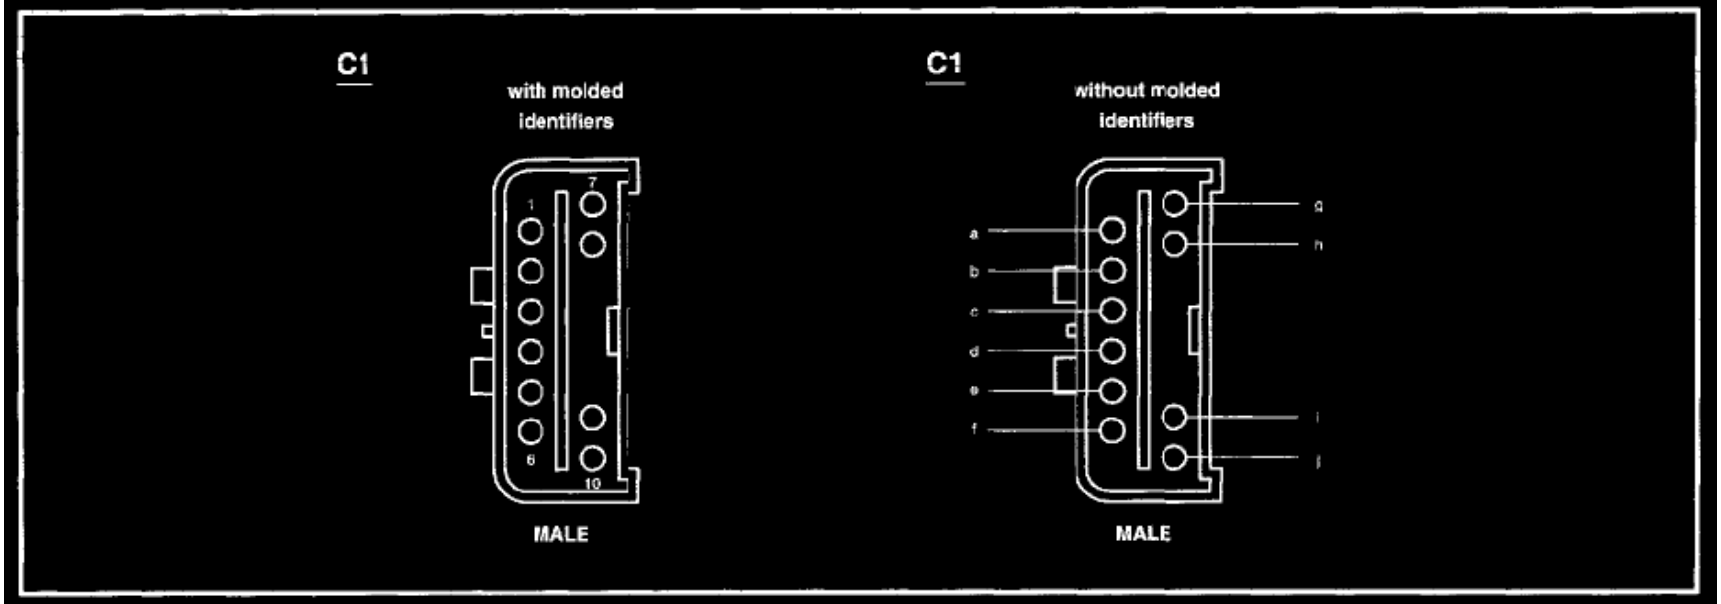
Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step–by–step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

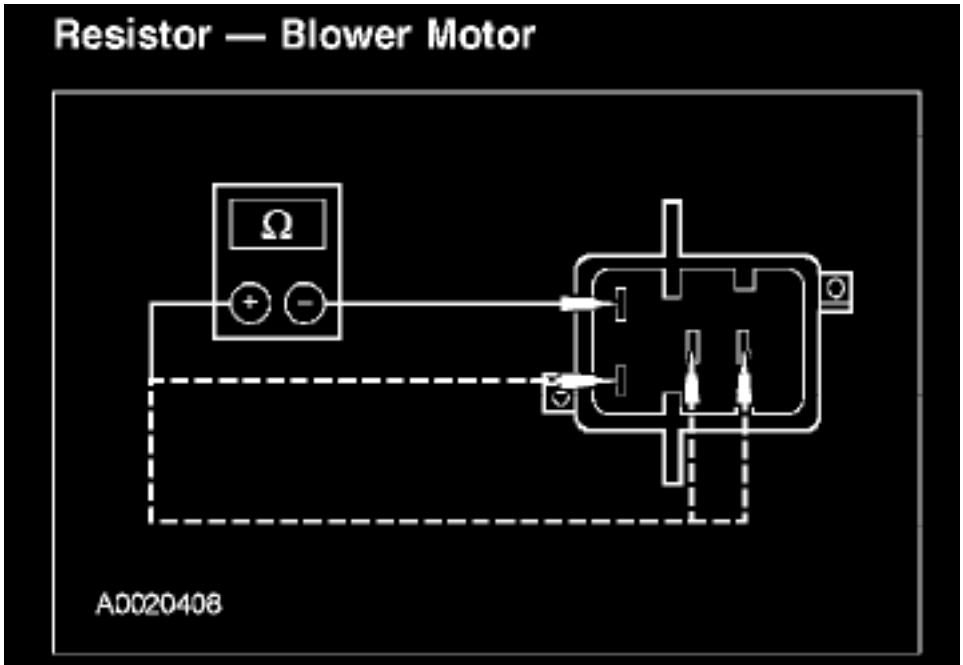
Blower Motor Resistor: Description and Operation

BLOWER MOTOR RESISTOR

The blower motor resistor has 3 resistor elements mounted on the resistor board to provide 4 blower motor speeds. Depending on the blower motor switch position, series resistance is added or bypassed in the blower motor circuit to decrease or increase blower motor speed. The blower motor resistor has an overheating device (thermal limiter) that opens the resistor coil when the temperature reaches approximately 184°C (363°F), interrupting the blower motor operation in all speeds except high. The thermal limiter cannot be reset and is not serviceable.



Blower Motor Resistor Pins	Resistance

Remove the A/C compressor clutch field coil. 1

Install the special tool on the nose opening of the A/C compressor.

2 Install the special tool.

3 Remove the A/C compressor clutch field coil.

Installation

All vehicles

1. NOTE: If installing a new A/C compressor, the A/C clutch components should be reused unless obvious signs of damage are found. If excessive

grooving is found, a new A/C clutch disc and hub and A/C compressor pulley must be installed together. Otherwise, each component can be installed individually where needed.

Visually inspect the A/C clutch disc and hub, A/C compressor pulley and A/C clutch field coil for damage. -

Inspect for physical damage, including cracked or melted components or discoloration due to excessive heat.

- Inspect for excessive wear, including grooving in the A/C clutch disc and hub or A/C compressor pulley that is more than fingernail depth.

- Inspect for roughness in the A/C compressor pulley bearing.

2. Clean the A/C compressor clutch field coil and bearing mounting surfaces.

3. CAUTION: Do not use air tools. The A/C compressor clutch field coil can be easily damaged.

Install the A/C compressor clutch field coil. 1

Place the A/C compressor clutch field coil on the A/C compressor with the A/C compressor clutch field coil electrical connector correctly positioned.

2 Place the special tool on the A/C clutch field coil.

3 Place the special tool on the special tool.

4 Use the special tool to install the A/C compressor clutch field coil until bottomed completely against the A/C compressor.

4. NOTE: The A/C clutch pulley is a tight fit on the A/C compressor head; it must be correctly aligned during installation.

Install the A/C clutch pulley.

Compressor Clutch Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

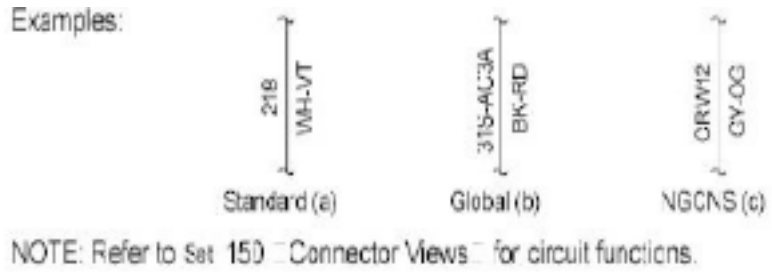
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

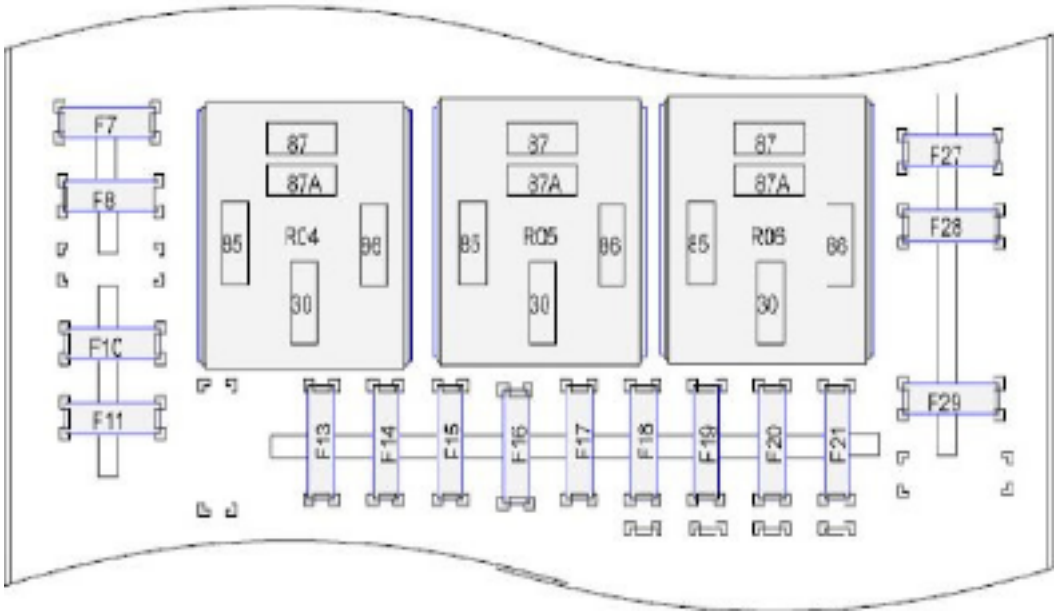
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

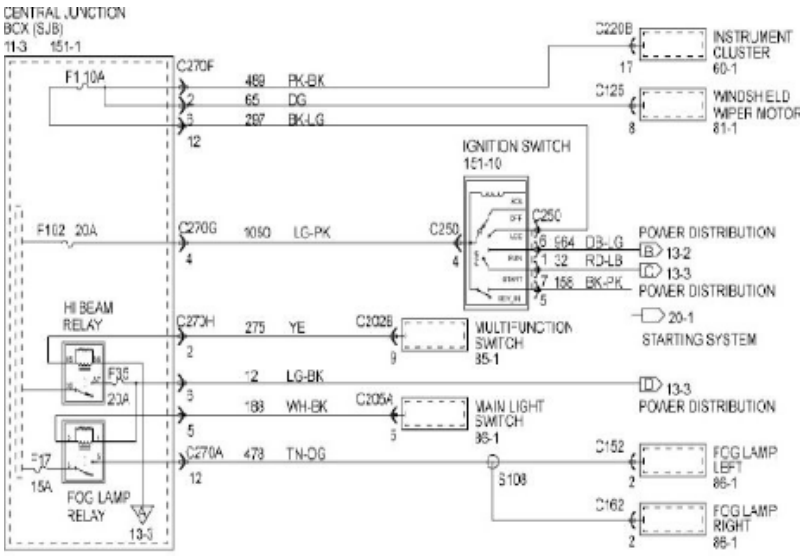
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

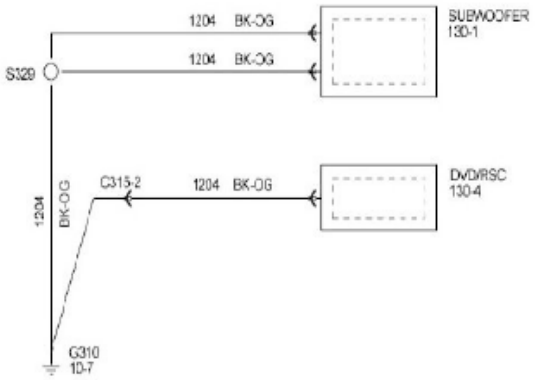
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

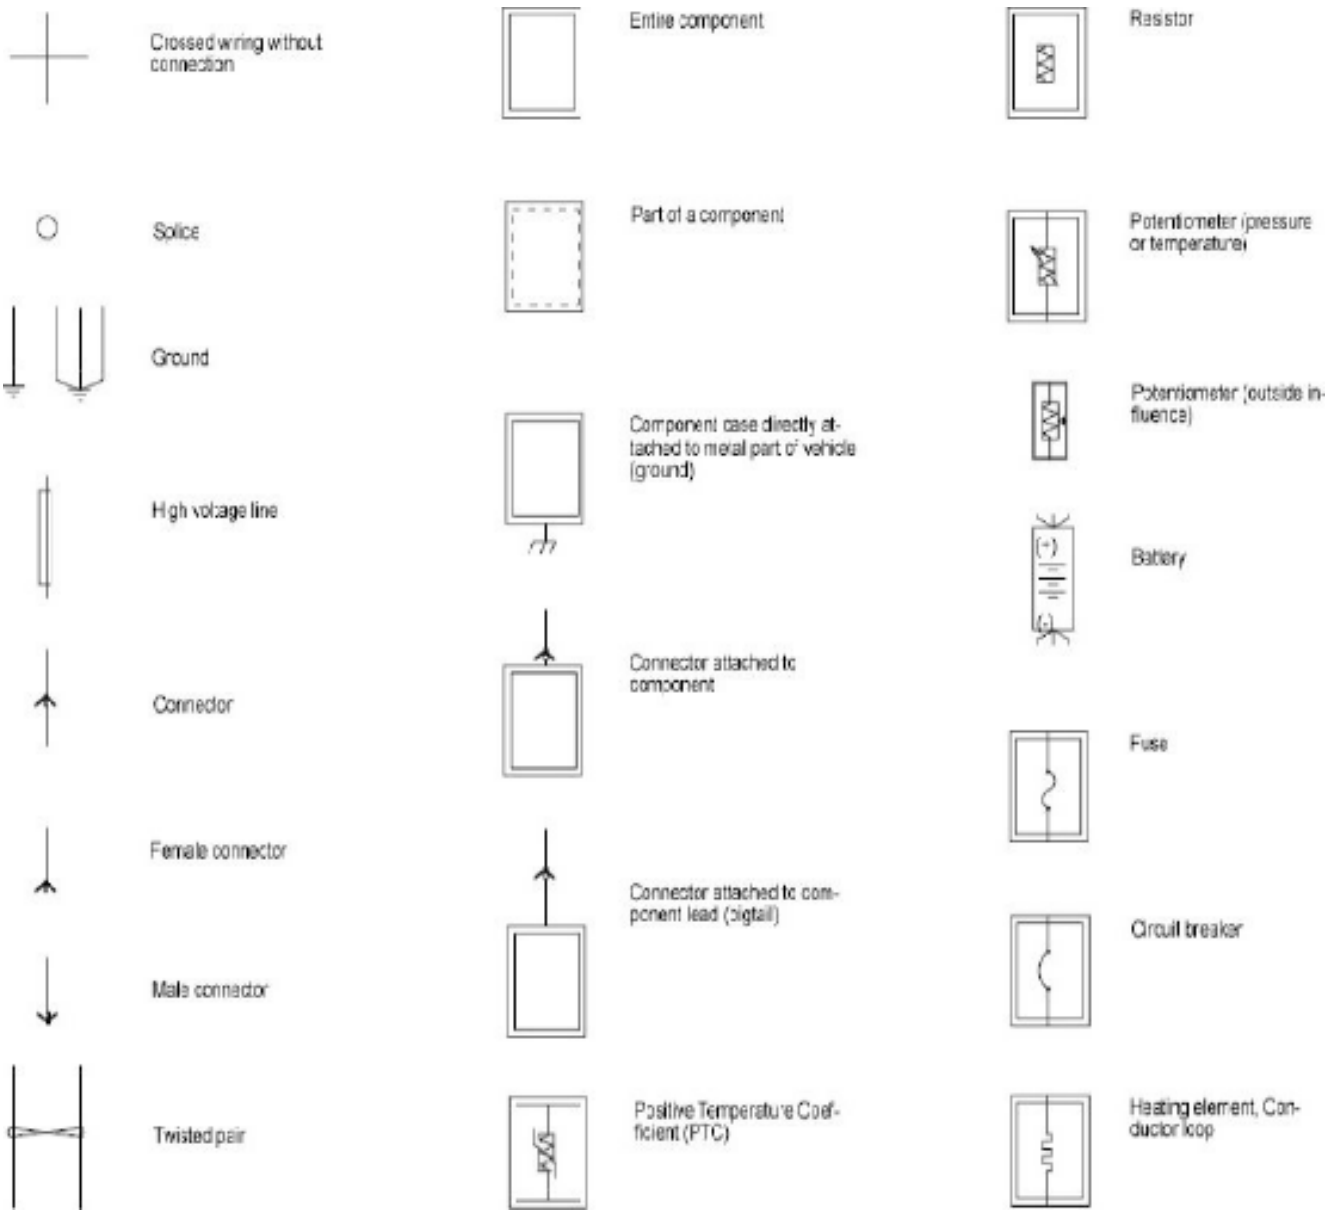
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

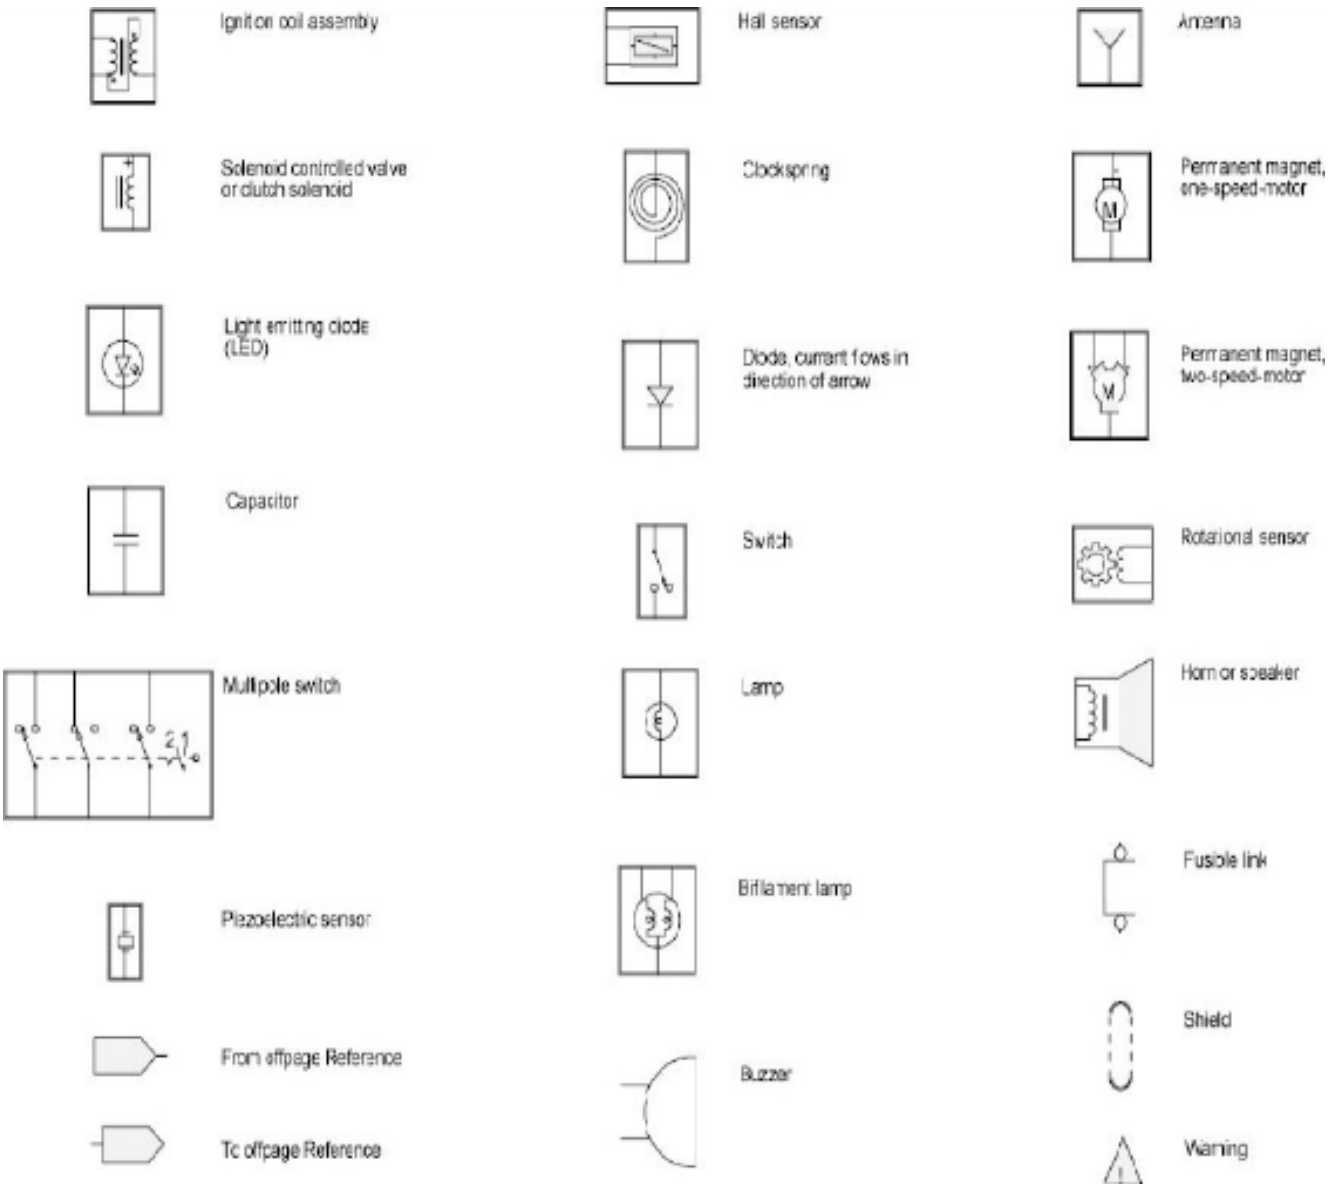
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

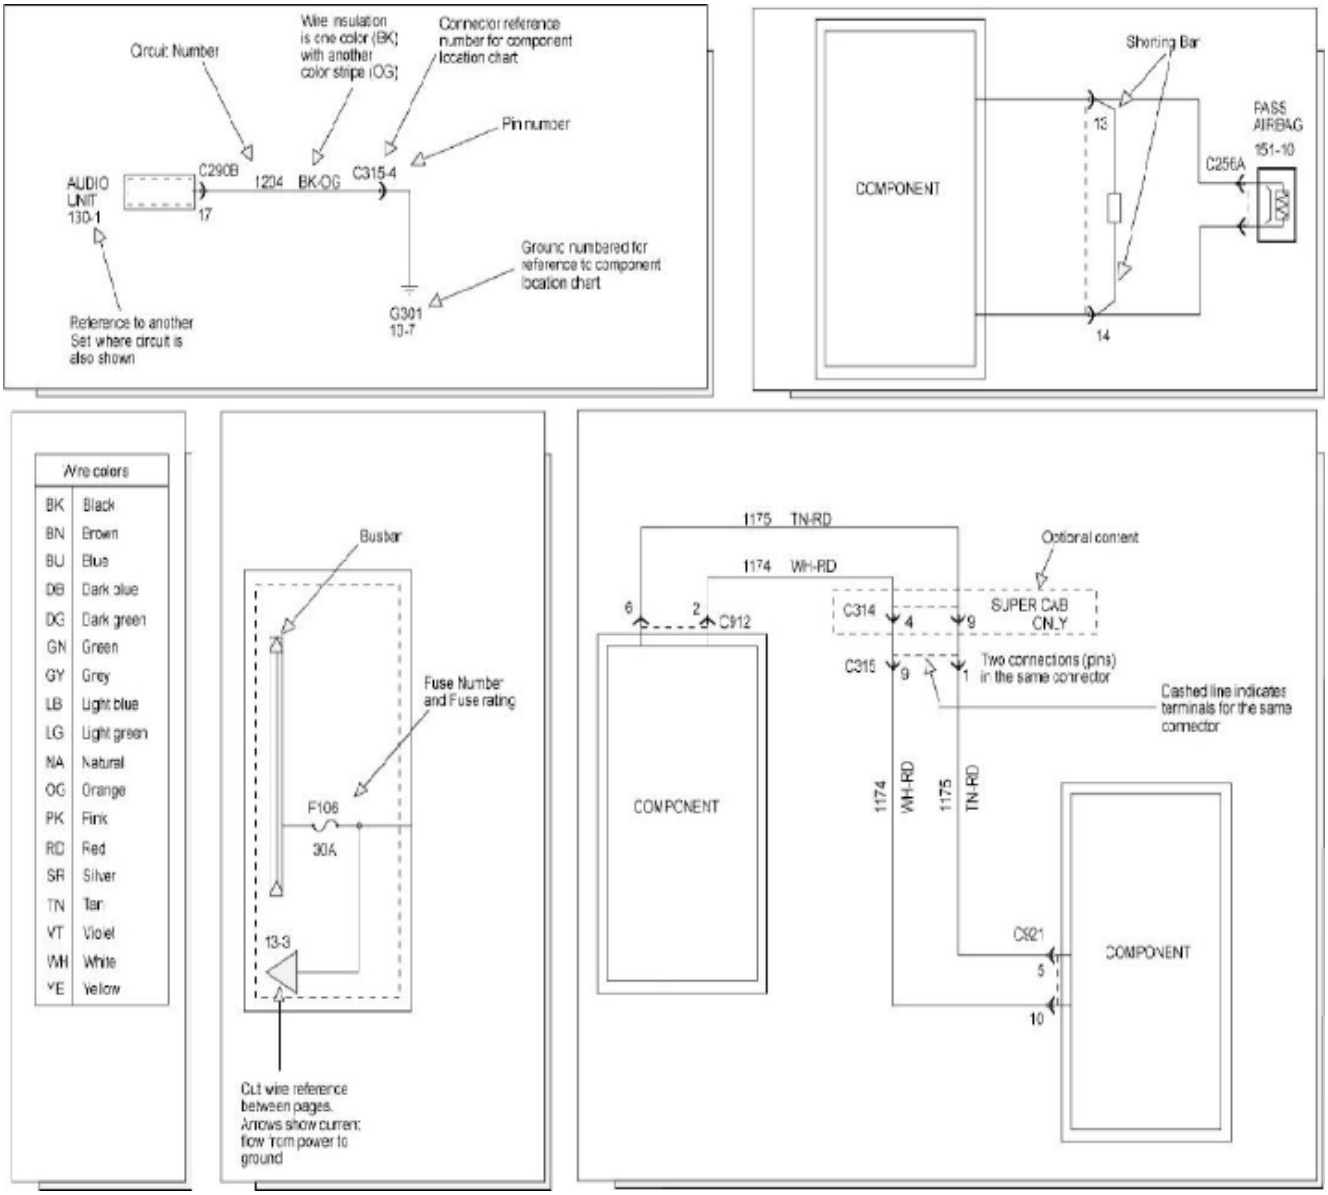
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

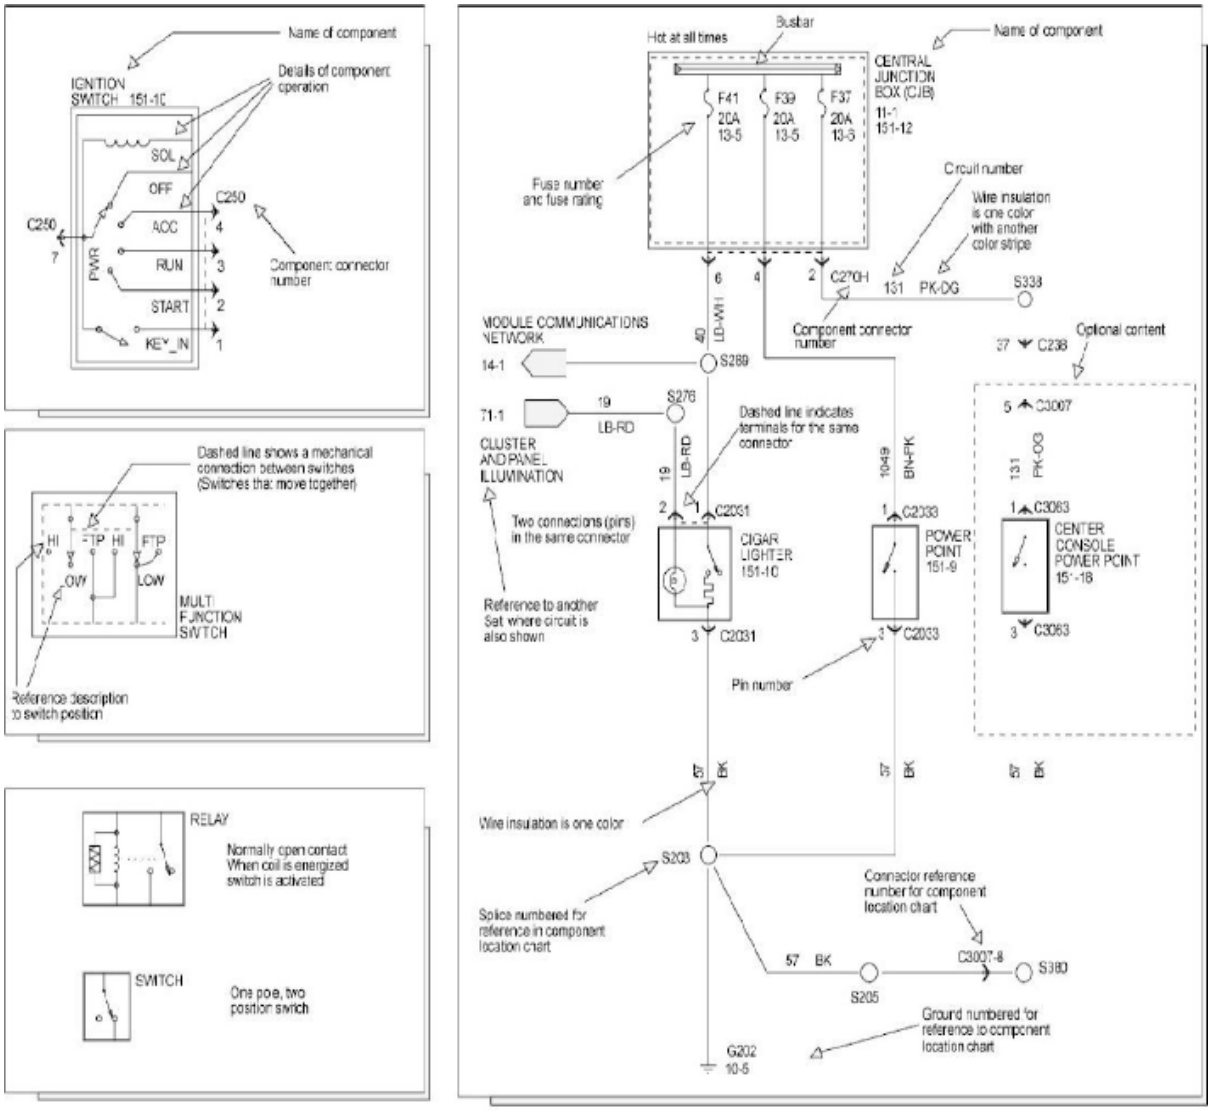
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

Compressor Clutch Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

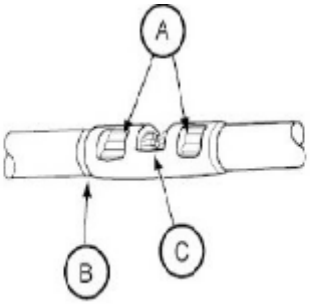
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

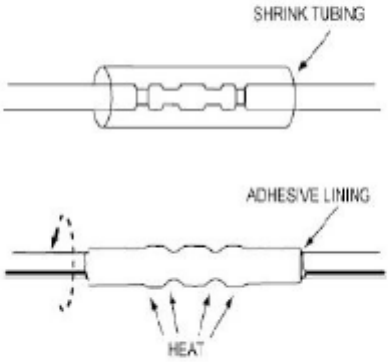
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.

	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x cia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Figtail only

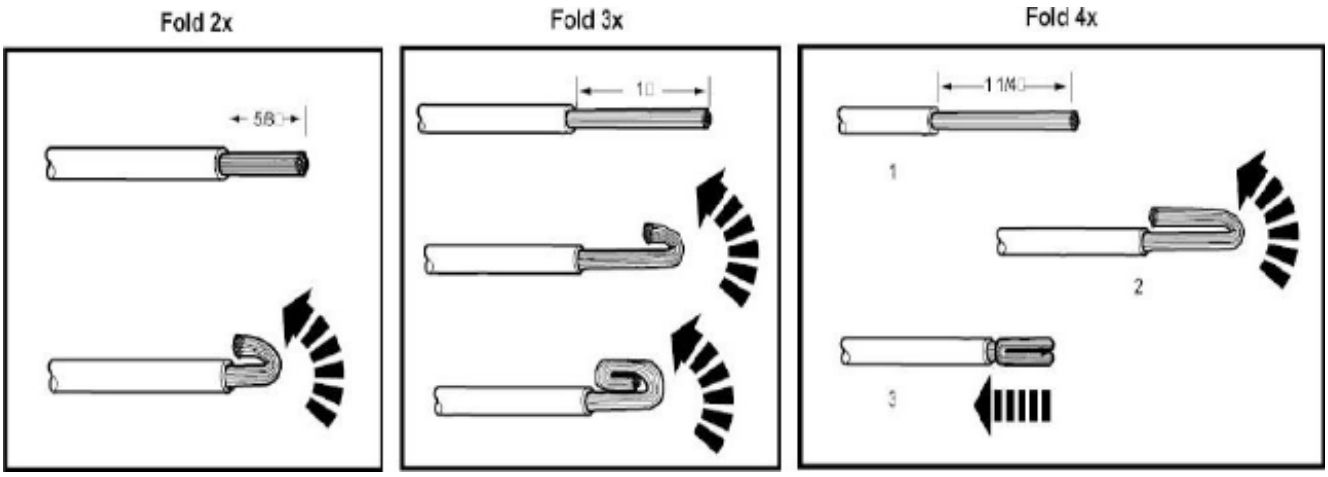
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Compressor Clutch Relay: Description and Operation

AIR CONDITIONING (A/C) CLUTCH RELAY (A/CCR)

NOTE: The PCM PIDs WAC and wide open throttle air conditioning cutoff fault (WACF) are used to monitor the A/CCR output.

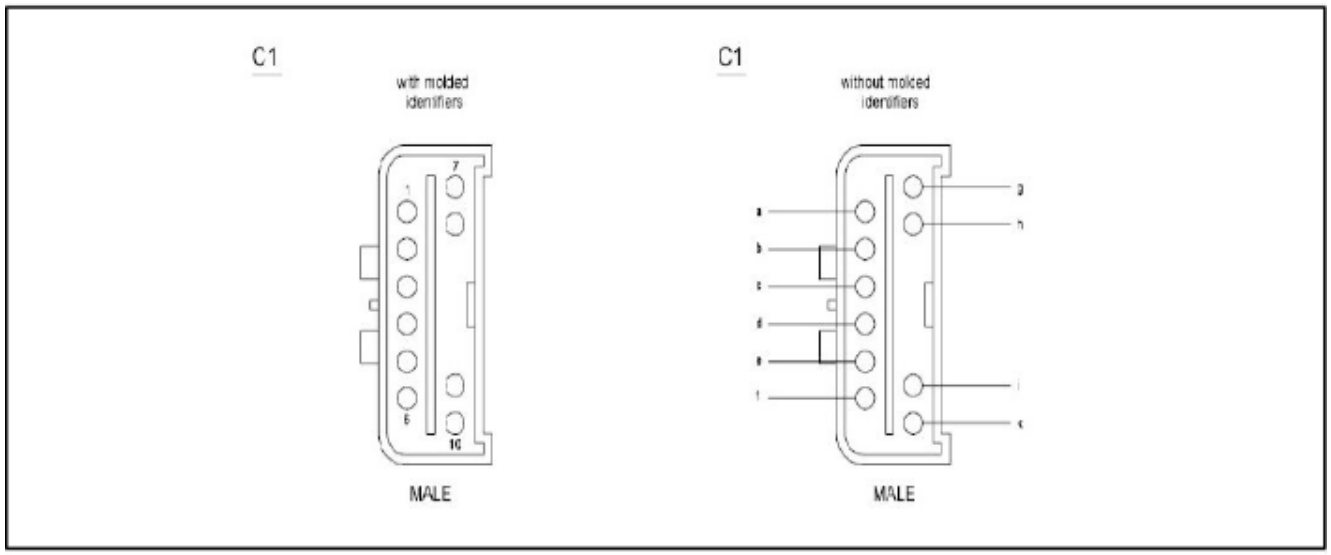
The A/CCR is wired normally open. There is no direct electrical connection between the A/C switch or electronic automatic temperature control (EATC) module and the A/C clutch. The PCM receives a signal indicating that A/C is requested. For some applications, this message is sent through the communications network. When A/C is requested, the PCM checks other A/C related inputs that are available, such as A/C pressure switch and A/C cycling switch. If these inputs indicate A/C operation is OK, and the engine conditions are OK (coolant temperature, engine RPM, throttle position), the PCM grounds the A/CCR output, closing the relay contacts and sending voltage to the A/CCR.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



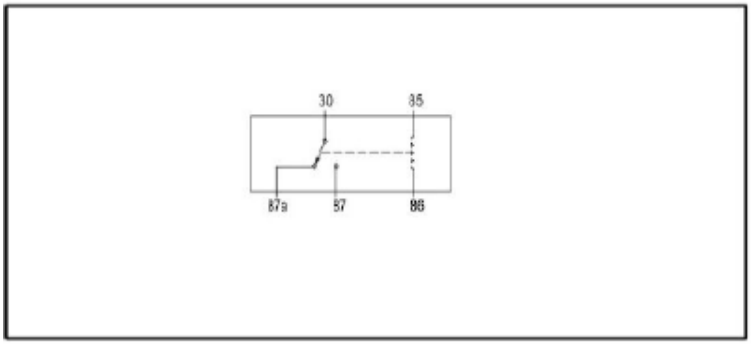
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

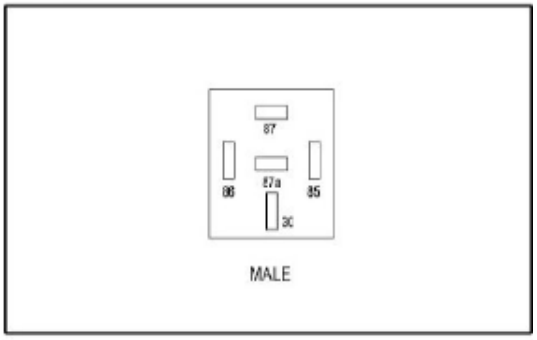
Compressor Clutch Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	45 □ 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Condenser HVAC: Description and Operation

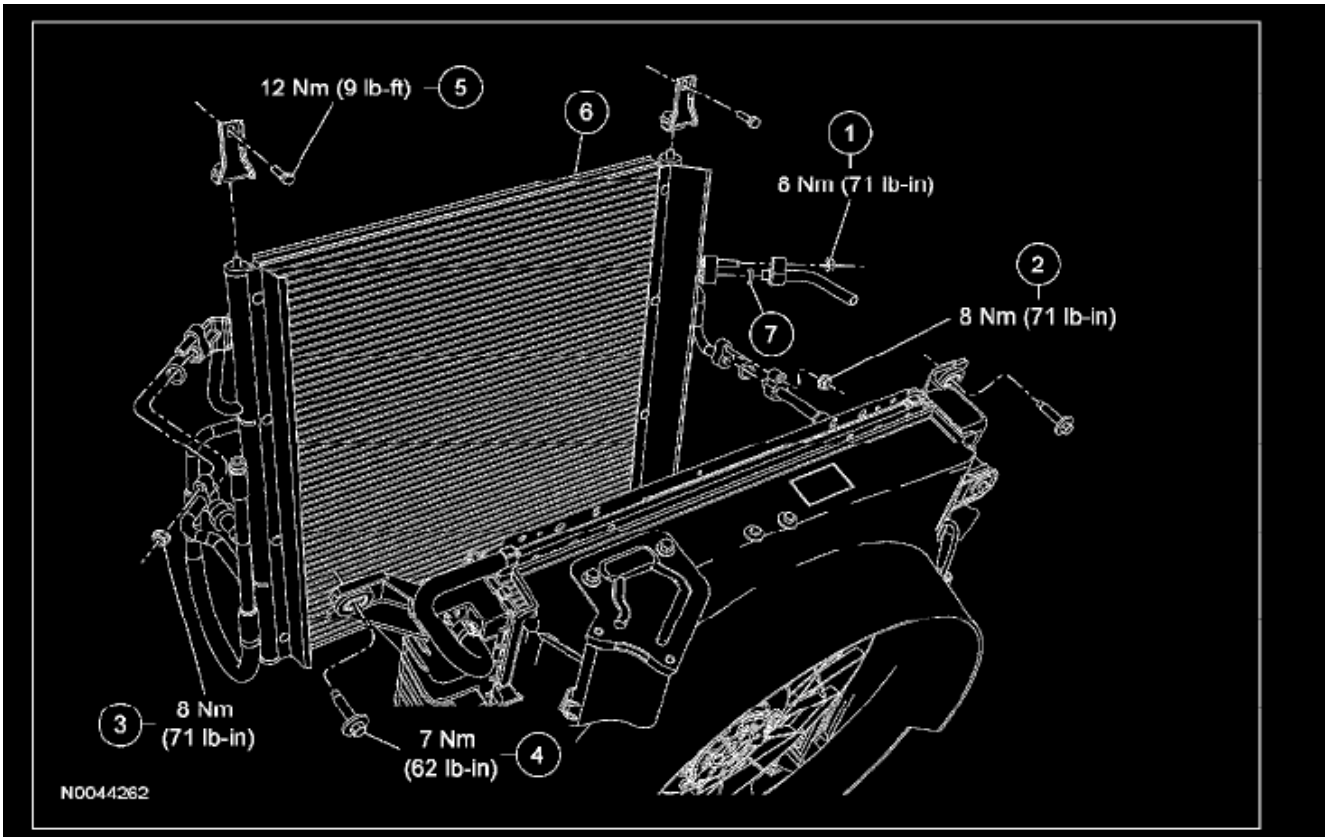
CONDENSER CORE

NOTE: Replacement of the suction accumulator is not required when repairing the air conditioning system except when there is physical evidence of system contamination from a failed A/C compressor or damage to the suction accumulator.

The condenser core has the following characteristics:

- It is an aluminum fin and tube design heat exchanger located in front of vehicle radiator.

- It cools compressed refrigerant gas by allowing air to pass over fins and tubes to extract heat and by condensing gas to liquid refrigerant as it is cooled.



Item	Part Number	Description
1	W520413	Condenser outlet fitting nut
2	W520413	Compressor-to-condenser line fitting nut
3	W520413	Condenser inlet fitting nut
4	N811605	Radiator bolt (2 required)

Item	Part Number	Description
5	19B594	Condenser bolt (2 required)
6	19712	Condenser core
7	19E889	O-ring seal (3 required, 2.3L) (2 required 3.0L or 4.0L)

(Continued)

Condenser HVAC: Service and Repair

CONDENSER CORE

Removal and Installation

NOTE:

- If a condenser core leak is suspected, the condenser core must be leak-tested before it is removed from the vehicle.

- Installation of a new suction accumulator is not required when repairing the air conditioning system, except when there is physical evidence of system contamination from a failed A/C compressor or damage to the suction accumulator.

All vehicles

1. Recover the refrigerant.

2.3L and 4.0L vehicles

2. Remove the air cleaner outlet tube.

2.3L vehicles

3. Remove the compressor-to-condenser line fitting nut and disconnect the fitting.

- Discard the O-ring seal.

- To install, tighten to 8 Nm (71 lb-in).

All vehicles

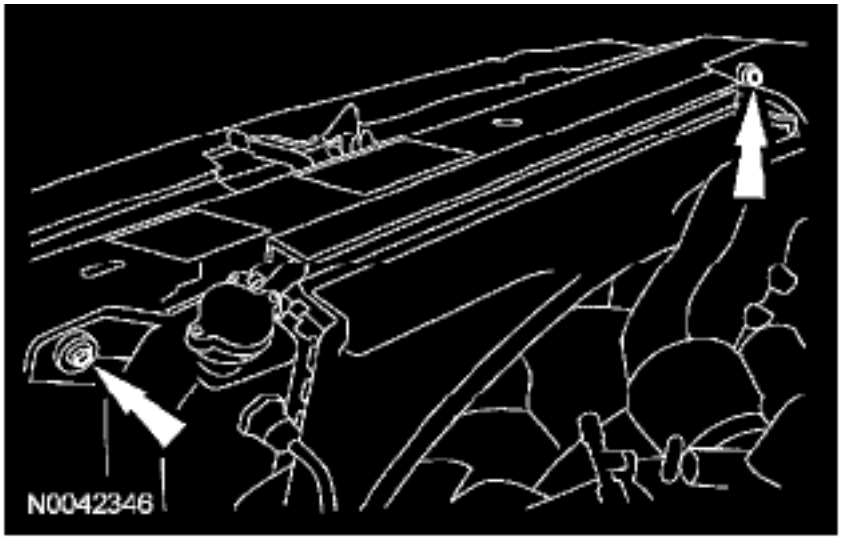
4. Remove the condenser outlet fitting nut and disconnect the fitting.

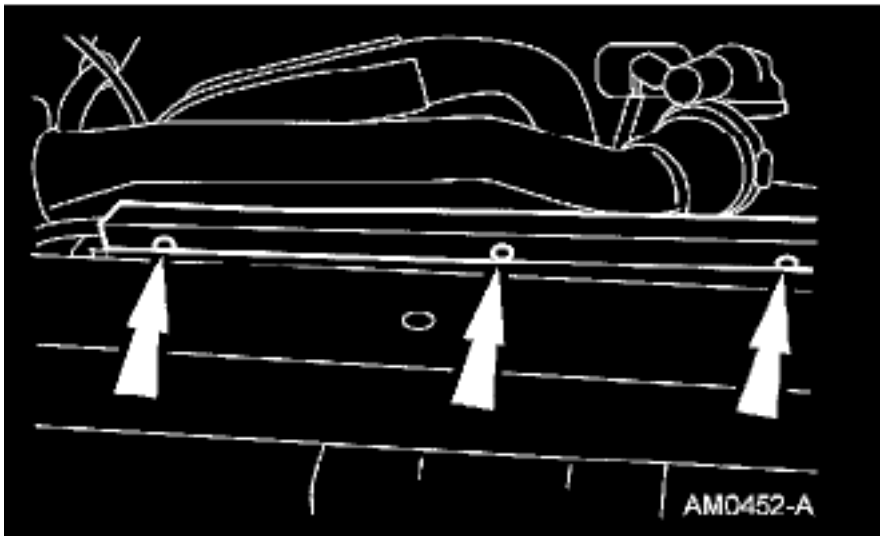
- Discard the O-ring seal.

- To install, tighten to 8 Nm (71 lb-in).

5. Remove the condenser inlet fitting nut and disconnect the fitting.

- Discard the O-ring seal.





- To install, tighten to 8 Nm (71 lb-in).

6. Remove the 2 radiator bolts and tilt the radiator rearward.

- To install, tighten to 7 Nm (62 lb-in).

7. Remove the pin-type retainers and remove the top seal.

8. NOTE: It may be necessary to remove the radiator from the mounting saddles to provide clearance for the condenser core removal.

Remove the 2 condenser core bolts and the condenser core. -

To install, tighten to 12 Nm (9 lb-ft).

9. To install, reverse the removal procedure.

- Install new O-ring seals.

- Lubricate the refrigerant system with the correct amount of clean PAG oil.

10. Evacuate, leak test and charge the refrigerant system.

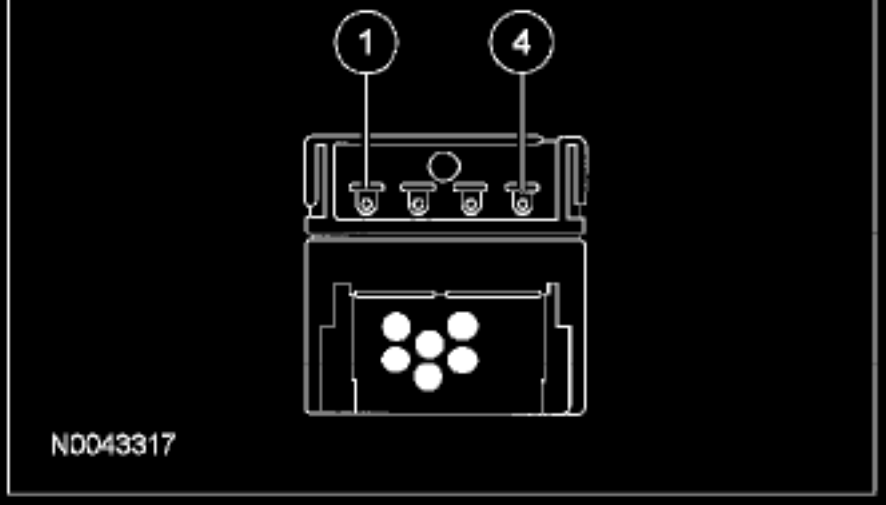
Control Assembly: Description and Operation

FUNCTION SELECTOR SWITCH

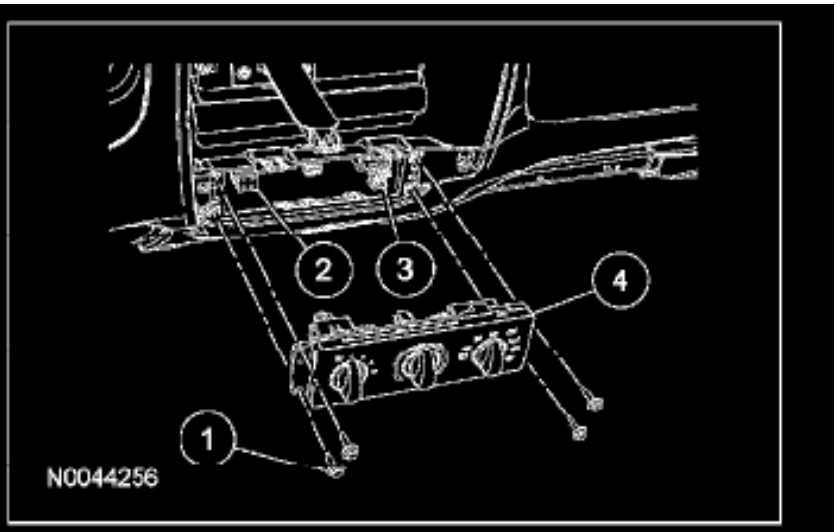
The function selector switch combines a vacuum selector valve with 2 electrical switches to supply battery voltage (B+) to the A/C clutch circuit and the blower motor speed control circuit.

Switch — Function Selector

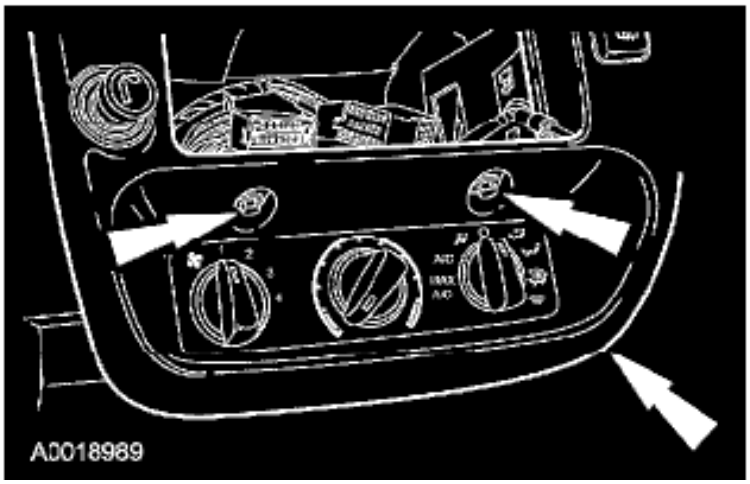


Switch Position	Continuity Between Pins
OFF	none
ANY EXCEPT OFF	3 and 4
A/C, MAX A/C, DEFROST and FLOOR/DEFROST	1 and 2

Switch - Function Selector



Item	Part Number	Description
1	—	Climate control assembly screw (4 required)
2	—	Climate control assembly electrical connector (part of 14401)
3	—	Climate control assembly vacuum connector (part of 19D699)
4	18549	Climate control assembly



Control Assembly: Service and Repair Climate Control Assembly

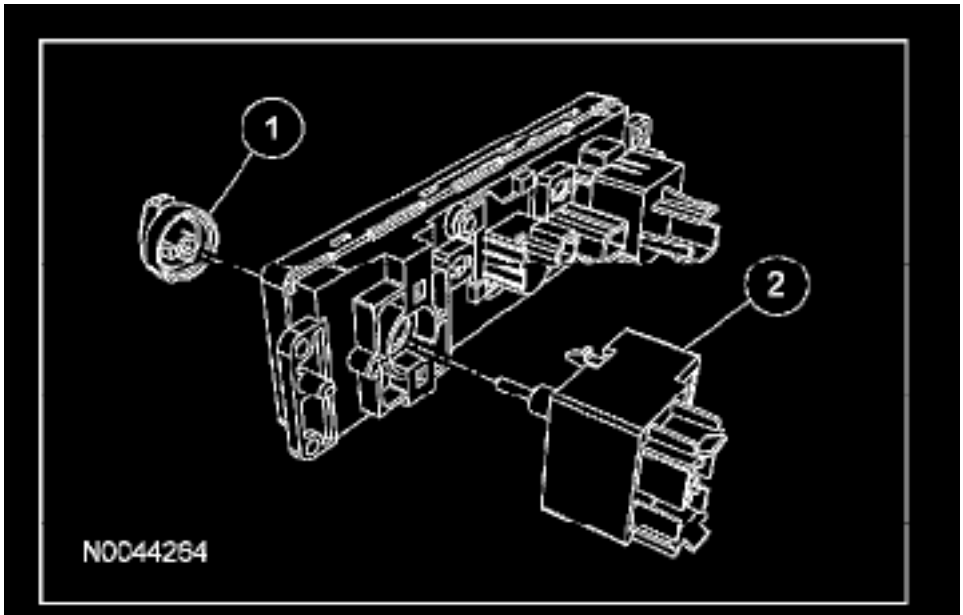
CLIMATE CONTROL ASSEMBLY

Removal and Installation

1. Remove the audio unit. 2. Remove the 2 screws and the instrument panel center finish panel.

- Disconnect the electrical connector.

3. Remove the 4 climate control assembly screws. 4. Disconnect the climate control assembly electrical connectors and vacuum connector. 5. Remove the climate control assembly. 6. To install, reverse the removal procedure.



Item	Part Number	Description
1	18519	Function selector switch knob

Control Assembly: Service and Repair Function Selector Switch

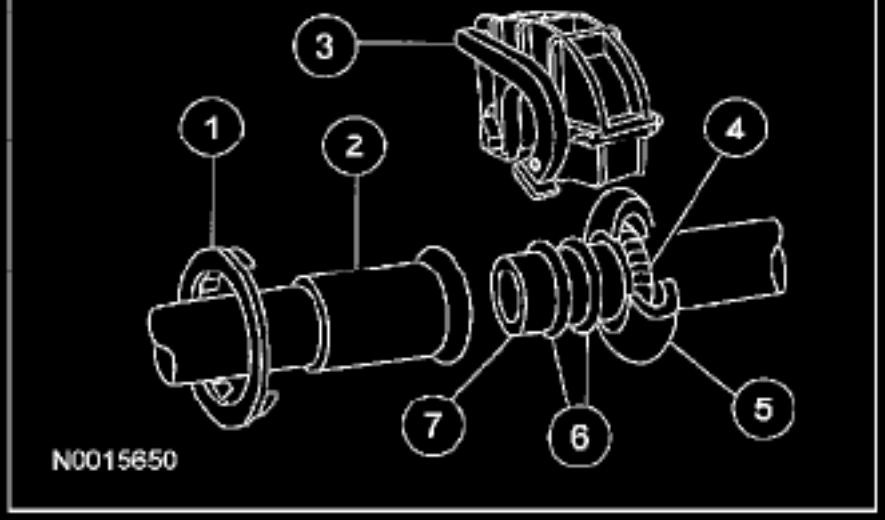
FUNCTION SELECTOR SWITCH

Removal and Installation

1. Remove the climate control assembly. 2. Gently pull and remove the function selector switch knob. 3. Release the clips and remove the function selector switch.

4. To install, reverse the removal procedure.

Spring Lock Coupling



Item	Part Number	Description
1	—	Plastic indicator ring
2	—	Female fitting
3	19E746	A/C tube lock coupling clip
4	19E576	A/C tube lock coupling spring
5	—	Cage
6	19E889	O-ring seals (3 required)
7	—	Male fitting

Coupler HVAC: Description and Operation

Spring Lock Coupling

Spring Lock Coupling

When disconnecting or connecting spring lock couplings, observe the following. -

When the coupling is connected together, the flared end of the female fitting slips behind the garter spring inside the cage of the male fitting.

- The garter spring and cage then prevent the flared end of the female fitting from pulling out of the cage.

- Three O-ring seals are used to seal between the 2 halves of the couplings.

- Use only the O-ring seals listed in the Ford Master Parts Catalog for the spring lock coupling.

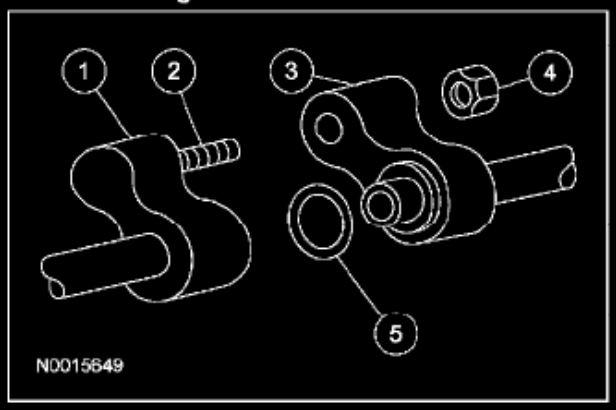
- A plastic indicator ring is used to indicate, during vehicle assembly, that the coupling is connected. Once the coupling is connected, the indicator ring is no longer necessary but will remain captive by the coupling near the cage opening.

- The indicator ring may also be used during service operations to indicate connection of the coupling.

- An A/C tube lock coupling clip is used to secure the coupling and is required.

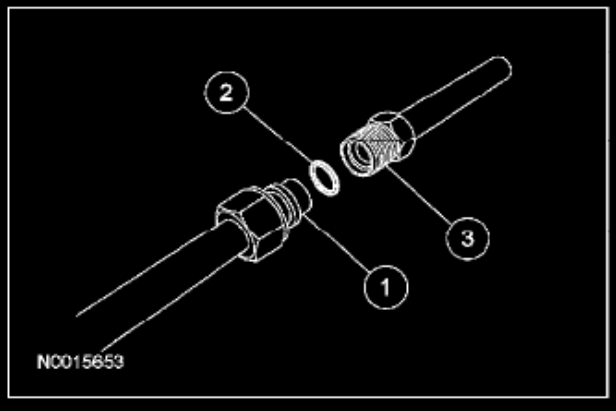
Peanut Fitting

Peanut Fitting



Item	Part Number	Description
1	—	Female block
2	W701890-S426	Stud (part of female block)
3	—	Male block
4	W520413-S301	Nut
5	19E889	O-ring seal

Tube-O Fitting



Item	Part Number	Description
1	—	Male fitting
2	19E889	O-ring seal
3	—	Female fitting

Peanut Fitting

When disconnecting or connecting peanut fittings, observe the following. -

The male and female blocks of the peanut fitting are retained with a nut.

- Support the female fitting with a wrench to prevent twisting of the tubes.

- An O-ring seal is installed around the tube on the male block.

- When correctly assembled, the male and female fittings should be flush.

- Use only the O-ring seal listed in the Ford Master Parts Catalog.

Tube-O Fitting

Tube-O Fitting

When disconnecting or connecting tube-O fittings, observe the following. -

The male and female portions of the fitting are retained with a nut.

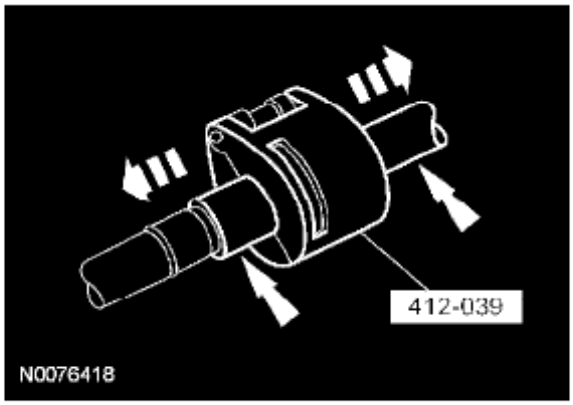
- Support the female fitting with a wrench to prevent twisting of the tubes when disconnecting.

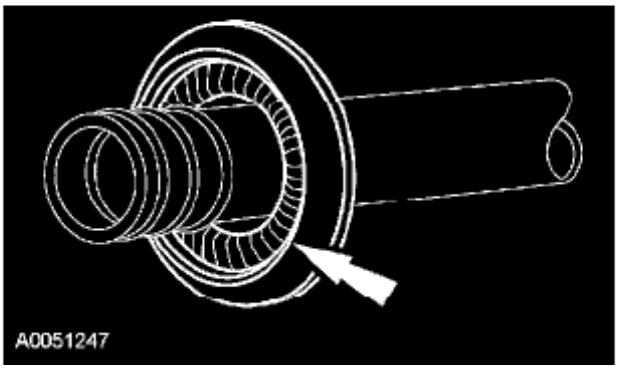
- An O-ring seal is installed around the tube on the male side of the fitting.

- Use only the O-ring seal listed in the Ford Master Parts Catalog.

Special Tool(s)

Remover, Refrigerant Coupling Spring
412-039 (T84L-19623-B)





Coupler HVAC: Service and Repair Spring Lock Coupling

SPRING LOCK COUPLING

Special Tool(s)

Special Tool(s)

Disconnect

1. Remove the spring lock coupling clip, if equipped.

2. CAUTION: Do not use metal tools to remove the O-ring seals. They may cause axial scratches across the O-ring seal grooves, resulting in

refrigerant leaks.

Push the Refrigerant Coupling Spring Remover into the cage opening to release the female fitting from the spring lock coupling spring and pull the fitting apart. -

Remove the O-ring seals using a non-metallic tool.

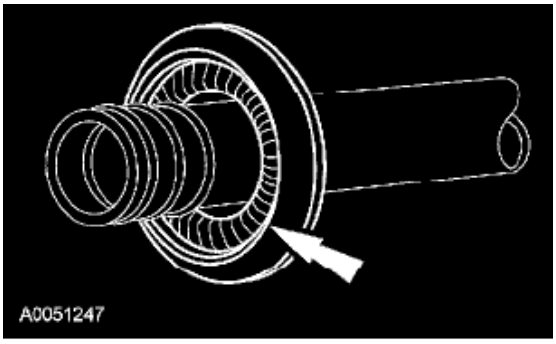
3. CAUTION: Do not use a screwdriver or similar tool to remove the air conditioning (A/C) tube lock coupling spring; this may cause axial

scratches across the O-ring seal grooves resulting in refrigerant leaks.

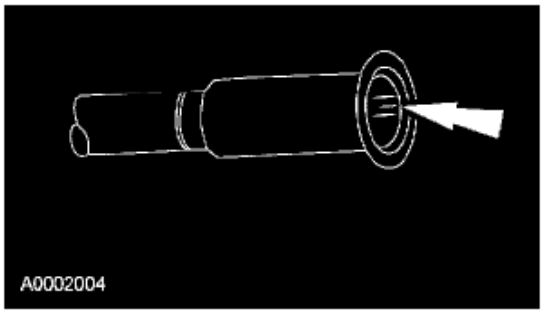
Remove the spring lock coupling spring with a small hooked wire.

Connect

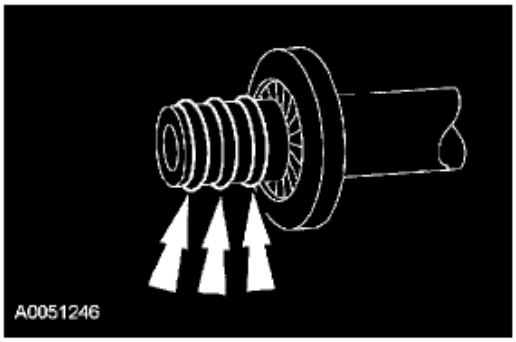
1. Install the spring lock coupling spring.



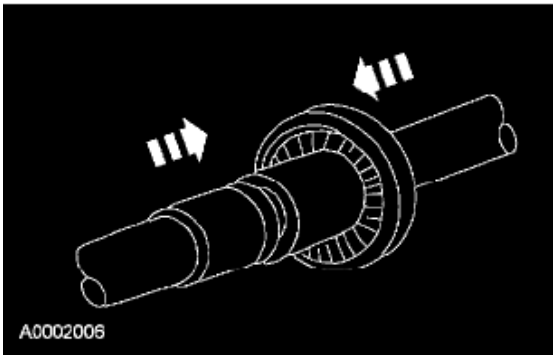
A0051247



A0002004



A0051246



A0002006

2. Lubricate the inside of the coupling with PAG oil.

3. CAUTION: Use only the new O-ring seals. The use of any O-ring seals other than those specified in the Ford Master Parts Catalog may

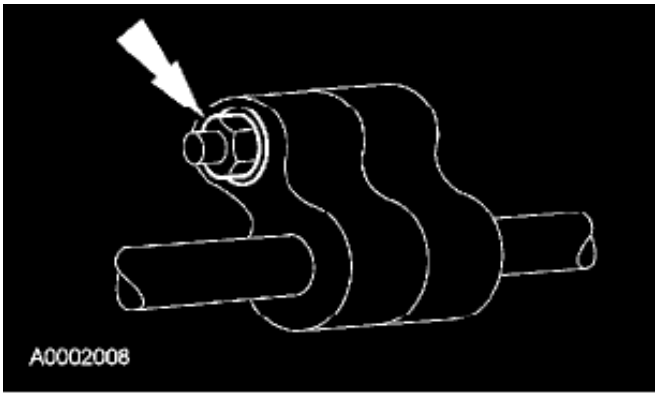
result in intermittent leakage during vehicle operation.

Install the O-ring seals.

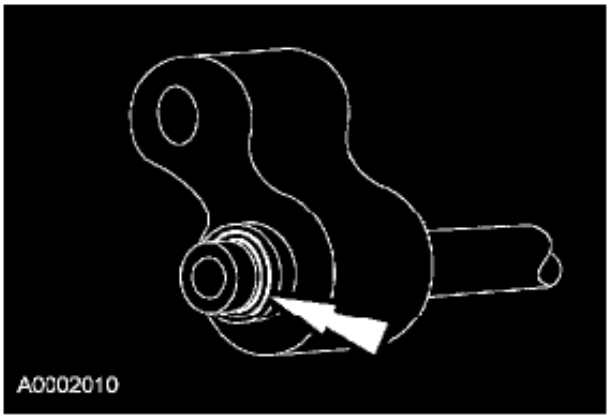
4. Connect the spring lock coupling fittings with a twisting motion until the spring lock coupling spring snaps over the flared end of the female

fitting.

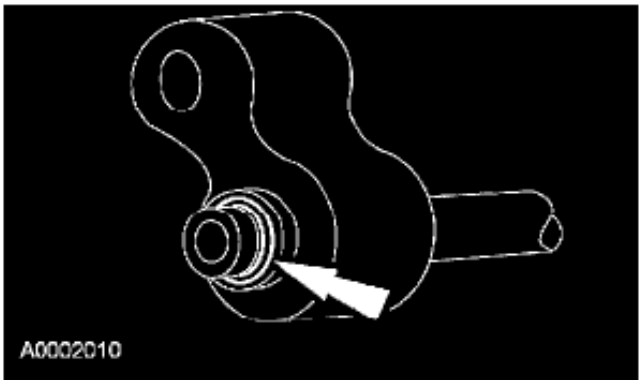
5. Install the spring lock coupling clip.



A0002008



A0002010



A0002010

Coupler HVAC: Service and Repair Air Conditioning Line (Peanut) Fitting

AIR CONDITIONING LINE (PEANUT) FITTING

Disconnect

1. CAUTION: Support the female fitting with a wrench to prevent the tubes from twisting.

Remove the nut and separate the 2 halves of the peanut fitting.

2. CAUTION: Do not use metal tools to remove the O-ring seal. They can cause axial scratches across the O-ring seal groove, resulting in

refrigerant leaks.

Remove the O-ring seal with a non-metallic tool.

Connect

1. Clean all dirt or foreign material from the fittings.

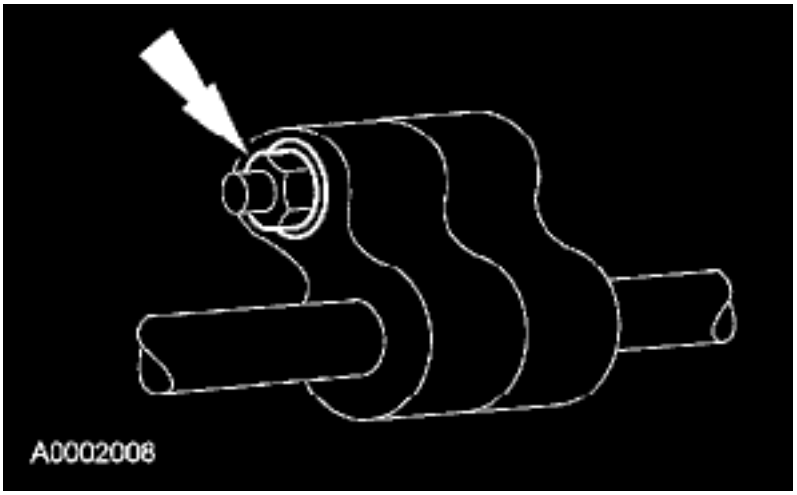
2. CAUTION: Use only the new O-ring seals. The use of any O-ring seals other than those specified in the Ford Master Parts Catalog may

result in intermittent leakage during vehicle operation.

Install the O-ring seal.

3. NOTE: When correctly assembled, the male and female fittings should be flush.

Assemble the male and female fittings together.



A0002008

Evaporator Core: Description and Operation

EVAPORATOR CORE

NOTE:

- The evaporator core is not separately serviceable. It is serviced only with the evaporator core housing assembly.

- Installation of a new suction accumulator is not required when repairing the air conditioning system except when there is physical evidence of system contamination from a failed A/C compressor or damage to the suction accumulator.

The evaporator core is the plate/fin type.

- A mixture of refrigerant and oil enters the bottom of the evaporator core through the evaporator core inlet tube and then moves out of the evaporator core through the evaporator core outlet tube.

- All airflow from the blower motor passes through the evaporator core and, during A/C operation, is cooled and dehumidified.

- The evaporator core is located in the evaporator core housing at the RH rear of the engine compartment.

Evaporator Core: Testing and Inspection

EVAPORATOR/CONDENSER CORE - ON-VEHICLE LEAK TEST

1. Discharge and recover the refrigerant. Refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging. 2. Disconnect the suspect evaporator core or condenser core from the A/C system. 3. Clean the manifold fittings. 4. Connect the appropriate test fittings from the A/C Fittings Set to the condenser or evaporator core tube connections.

5. NOTE: The automatic shut-off valves on some gauge set hoses do not open when connected to the test fittings. If available, use hoses without

shut-off valves. If hoses with shut-off valves are used, make sure the valve opens when attached to the test fittings or install an adapter that will activate the valve. The test is not valid if the shut-off valve does not open.

Connect the red and blue hoses from the R-134a Manifold Gauge Set to the test fittings on the evaporator core or condenser core. Connect the yellow hose to a known good vacuum pump.

6. Open both gauge set valves and start the vacuum pump. Allow the vacuum pump to operate for a minimum of 45 minutes after the gauge set

low-pressure gauge indicates 101 kPa (30 in-Hg). The 45-minute evacuation is necessary to remove any refrigerant from oil left in the evaporator core or condenser core. If the refrigerant is not completely removed from the oil, outgassing will degrade the vacuum and appear as a refrigerant leak.

7. If the low-pressure gauge reading will not drop to 101 kPa (30 in-Hg) when the valves on the gauge and manifold set are open and the vacuum

pump is operating, close the gauge set valves and observe the low pressure gauge. If the pressure rises rapidly to zero, a large leak is indicated. Recheck the test fitting connections and gauge set connections before installing a new evaporator core or condenser core.

8. After evacuating for 45 minutes, close the gauge set valves and stop the vacuum pump. Observe the low-pressure gauge; it should remain at the

101 kPa (30 in-Hg) mark. -

If the low-pressure gauge reading rises 34 or more kPa (10 or more in-Hg) of vacuum from the 101 kPa (30 in-Hg) position in 10 minutes, a leak is indicated.

- If a very small leak is suspected, wait 30 minutes and observe the vacuum gauge.

- If a small amount of vacuum is lost, operate the vacuum pump with gauge valves open for an additional 30 minutes to remove any remaining refrigerant from the oil in the evaporator core or condenser core. Then recheck for loss of vacuum.

- If a very small leak is suspected, allow the system to sit overnight with vacuum applied and check for vacuum loss.

9. If the evaporator core or condenser core does leak, as verified by the above procedure, install a new evaporator core or condenser core.

Evaporator Core: Service and Repair

EVAPORATOR CORE

Removal and Installation

NOTE:

- The evaporator core is not separately serviceable, it is serviced only with the evaporator core housing assembly.

- Replacement of the suction accumulator is not required when repairing the refrigerant system except when there is physical evidence of system contamination from a failed A/C compressor or damage to the suction accumulator.

- If an evaporator core leak is suspected, the evaporator core must be leak tested before it is removed from the vehicle.

1. Remove the evaporator core housing. 2. Transfer the components from the old evaporator core housing to the new evaporator core housing. 3. Install the evaporator core housing.

A/C EVAPORATOR TEMPERATURE (ACET) SENSOR VOLTAGE AND RESISTANCE

°C	°F	Volts	Resistance (K ohms)
100	212	0.47	2.08
90	194	0.61	2.80

30	86	2.74	24.25
20	68	3.26	37.34
10	50	3.73	58.99
0	32	4.14	95.85
-10	14	4.45	160.31
-20	-4	4.66	276.96

Evaporator Temperature Sensor / Switch: Description and Operation

AIR CONDITIONING EVAPORATOR TEMPERATURE (ACET) SENSOR

A/C Evaporator Temperature (ACET) Sensor Voltage And Resistance

The ACET sensor measures the evaporator air discharge temperature. The ACET sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of a thermistor decreases as the temperature increases, and the resistance increases as the temperature decreases. The PCM sources a low current 5 volts on the ACET circuit. With SIG RTN also connected to the ACET sensor, the varying resistance changes the voltage drop across the sensor terminals. As A/C evaporator air temperature changes, the varying resistance of the ACET sensor changes the voltage the PCM detects.

The ACET sensor is used to more accurately control A/C clutch cycling, improve defrost/demist performance, and reduce A/C clutch cycling.

NOTE: These values can vary 15% due to sensor and VREF variations. Voltage values were calculated for VREF equals 5.0 volts.

Expansion Block/Orifice Tube: Description and Operation

A/C EVAPORATOR CORE ORIFICE

NOTE: A new A/C evaporator core orifice should be installed whenever a new A/C compressor is installed.

The A/C evaporator core orifice has the following characteristics:

- It is located in the evaporator core inlet tube

- It has filter screens located on the inlet and outlet ends of the tube body

- The inlet filter screen acts as a strainer for the liquid refrigerant flowing through the A/C evaporator core orifice

- O-ring seals on the A/C evaporator core orifice prevent the high-pressure liquid refrigerant from bypassing the A/C evaporator core orifice

- The A/C evaporator core orifice assembly cannot be adjusted or serviced. It must be installed as a unit

Special Tool(s)

ST1223-A	Remover, Broken Orifice 412-035 (T83L-19990-B)
ST1224-A	Remover/Installer, Fixed Orifice 412-034 (T38L-19990-A)

NOTE: Installation of a new suction accumulator is not required when repairing the air conditioning system, except when there is physical evidence of contamination from a failed A/C compressor or damage to the suction accumulator.

Expansion Block/Orifice Tube: Service and Repair

EVAPORATOR CORE ORIFICE

Special Tool(s)

Special Tool(s)

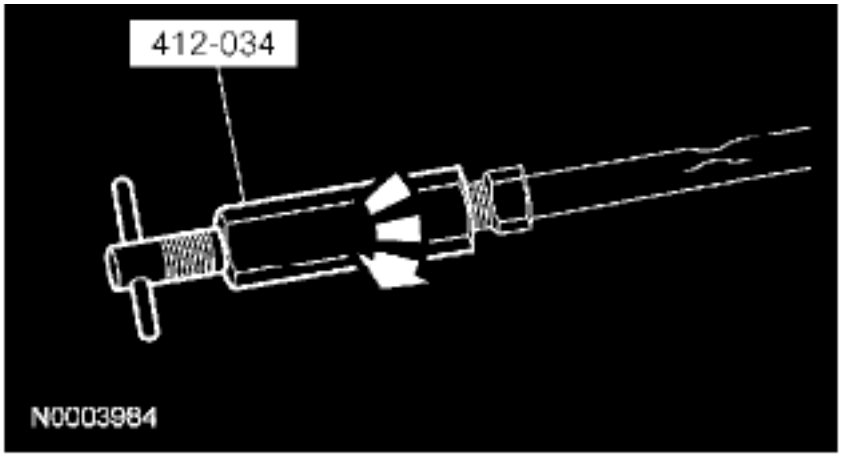
Removal

1. Recover the refrigerant. 2. Disconnect the evaporator inlet fitting.

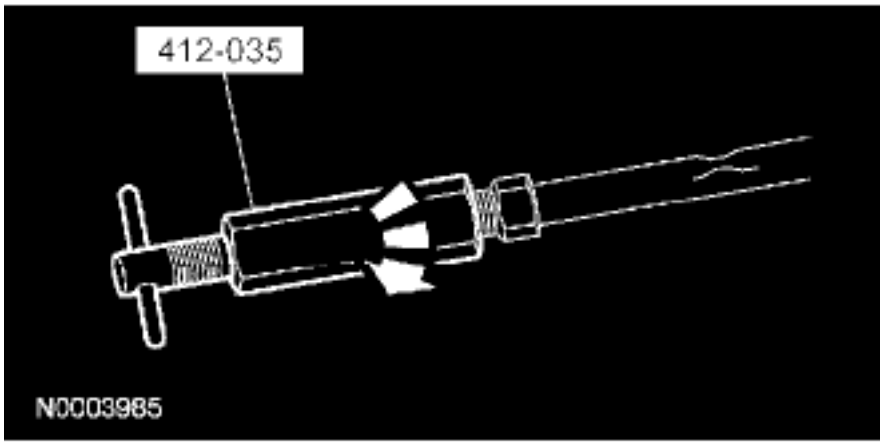
- Discard the O-ring seals.

3. Inspect the evaporator core orifice for damage before attempting to remove it from the evaporator core inlet line. 4. If the evaporator core orifice is intact, engage the special tool. Hold the T-handle stationary while rotating the tool body to remove the evaporator

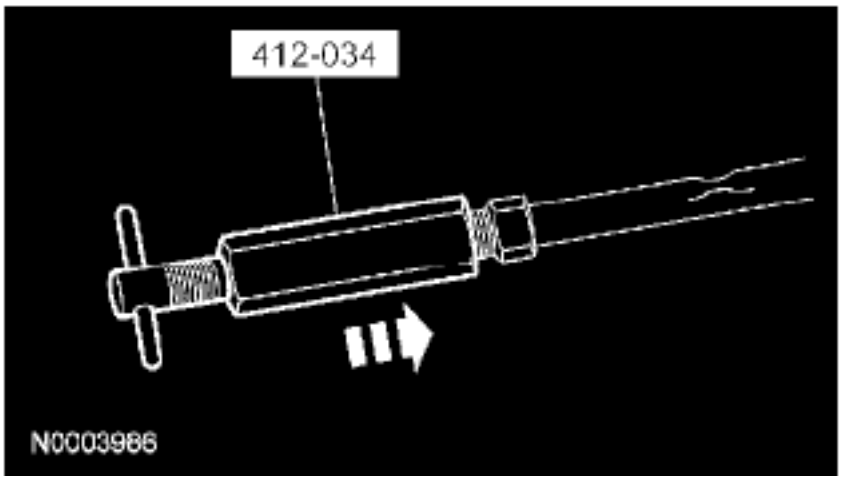
core orifice.



412-034
N0003984



412-035
N0003985



412-034
N0003986

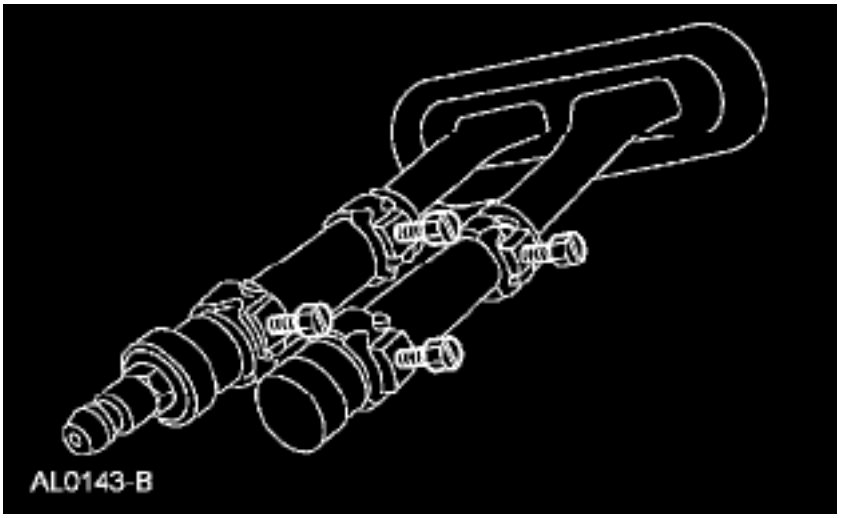
5. If the evaporator core orifice is broken, screw the end of the special tool into the broken orifice. Hold the T-handle stationary while rotating the

tool body to remove the evaporator core orifice.

Installation

1. Lubricate the evaporator core orifice O-ring seals with clean PAG oil and install the evaporator core orifice using the special tool.

2. Install new O-ring seals and connect the evaporator inlet fitting. 3. Evacuate, leak test and charge the refrigerant system.



Heater Core: Testing and Inspection

HEATER CORE

1. NOTE: Testing of returned heater cores reveals that a large percentage of heater cores are good and did not require the installation of a new

heater core. If a heater core leak is suspected, the heater core must be tested by following the plugged heater core component test before the heater core pressure test. Carry out a system inspection by checking the heater system thoroughly as follows:

Inspect for evidence of coolant leakage at the heater hose-to-heater core attachments. A coolant leak in the heater hose could follow the heater core tube to the heater core and appear as a leak in the heater core.

2. NOTE: Spring-type clamps are installed as original equipment. Installation and overtightening of non-specified clamps can cause leakage at the

heater hose connection and damage the heater core.

Check the integrity of the heater hose clamps.

Heater Core - Plugged

WARNING: Before disconnecting any heater water hoses, shut OFF the engine and wait until engine is fully cool. Failure to comply with this warning may result in serious injury or burns from hot liquid escaping from the engine cooling system.

1. Check to see that the engine coolant is at the correct level. 2. Start the engine and turn on the heater. 3. When the engine coolant reaches operating temperature, feel the heater core inlet and outlet hoses to see if they are hot. 4. If the outlet only is not hot:

- the heater core may have an air pocket.

- the heater core may be plugged.

5. If the inlet only is not hot, the thermostat may not be working correctly.

Heater Core - Pressure Test

Use the Pressure Test Kit to carry out the pressure test.

1. NOTE: Due to space limitations, a bench test may be necessary for pressure testing.

Drain the coolant from the cooling system.

2. Disconnect the heater hoses from the heater core. 3. Install a short piece of heater hose, approximately 101 mm (4 in) long on each heater core tube. 4. Fill the heater core and heater hoses with water and install plug BT-7422-B and adapter BT-7422-A from the Pressure Test Kit. Secure the heater

hoses, plug and adapter with hose clamps.

5. Attach the pump and gauge assembly from the Pressure Test Kit to the adapter. 6. Close the bleed valve at the base of the gauge. Pump 138 kPa (20 psi) of air pressure into the heater core. 7. Observe the pressure gauge for a minimum of 3 minutes. 8. If the pressure drops, check the heater hose connections to the core tubes for leaks. If the heater hoses do not leak, remove the heater core from the

vehicle and carry out the bench test.

Heater Core - Bench Test

1. Remove the heater core from the vehicle. 2. Drain all of the coolant from the heater core. 3. Connect the 101 mm (4 in) test heater hoses with plug and adapter to the core tubes. Then connect the Pressure Test Kit to the adapter. 4. Apply 138 kPa (20 psi) of air pressure to the heater core. Submerge the heater core in water. 5. If a leak is observed, install a new heater core.

Heater Core: Service and Repair

HEATER CORE

Removal and Installation

1. NOTE: If a heater core leak is suspected, the heater core must be leak tested before it is removed from the vehicle.

Remove the evaporator core housing.

2. Remove the instrument panel. 3. Remove the PCM. 4. Remove the PCM heat sink.

1 Remove the ground strap screw.

2 Remove the heat sink.

5. Remove the 4 nuts from the engine side of the dash panel. Position the plenum chamber on the vehicle floor.

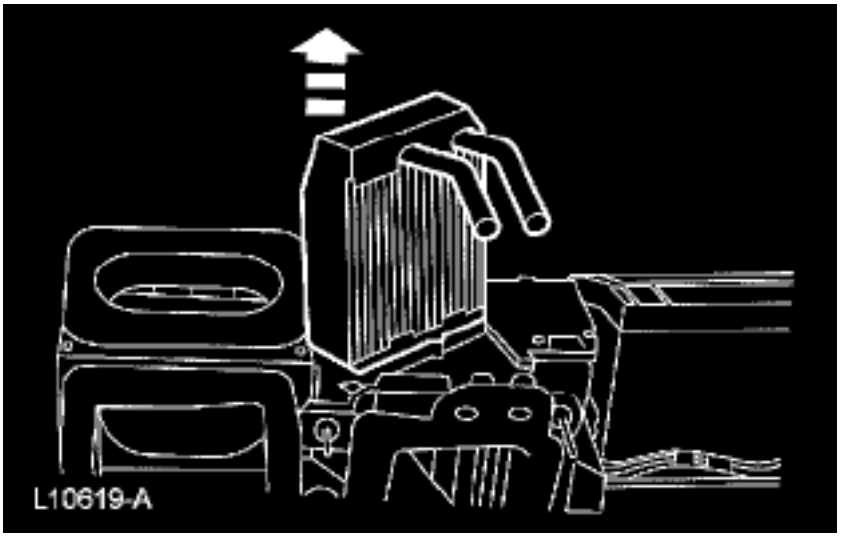
- To install, tighten to 4 Nm (35 lb-in).

6. Remove the heater core cover.

1 Remove the screws.

2 Remove the heater core cover.

7. Remove the heater core.



8. To install, reverse the removal procedure.

- During installation, be sure to install a new oval foam seal around the heater core inlet and outlet tubes.

High Pressure Safety Valve HVAC: Description and Operation

A/C PRESSURE RELIEF VALVE

NOTE: If the A/C compressor is operating within limits and the A/C pressure relief valve is venting, or if the A/C pressure relief valve is leaking around the threads, replace the A/C pressure relief valve and O-ring. If the A/C pressure relief valve still vents after it is replaced, diagnose the refrigerant system for a restriction.

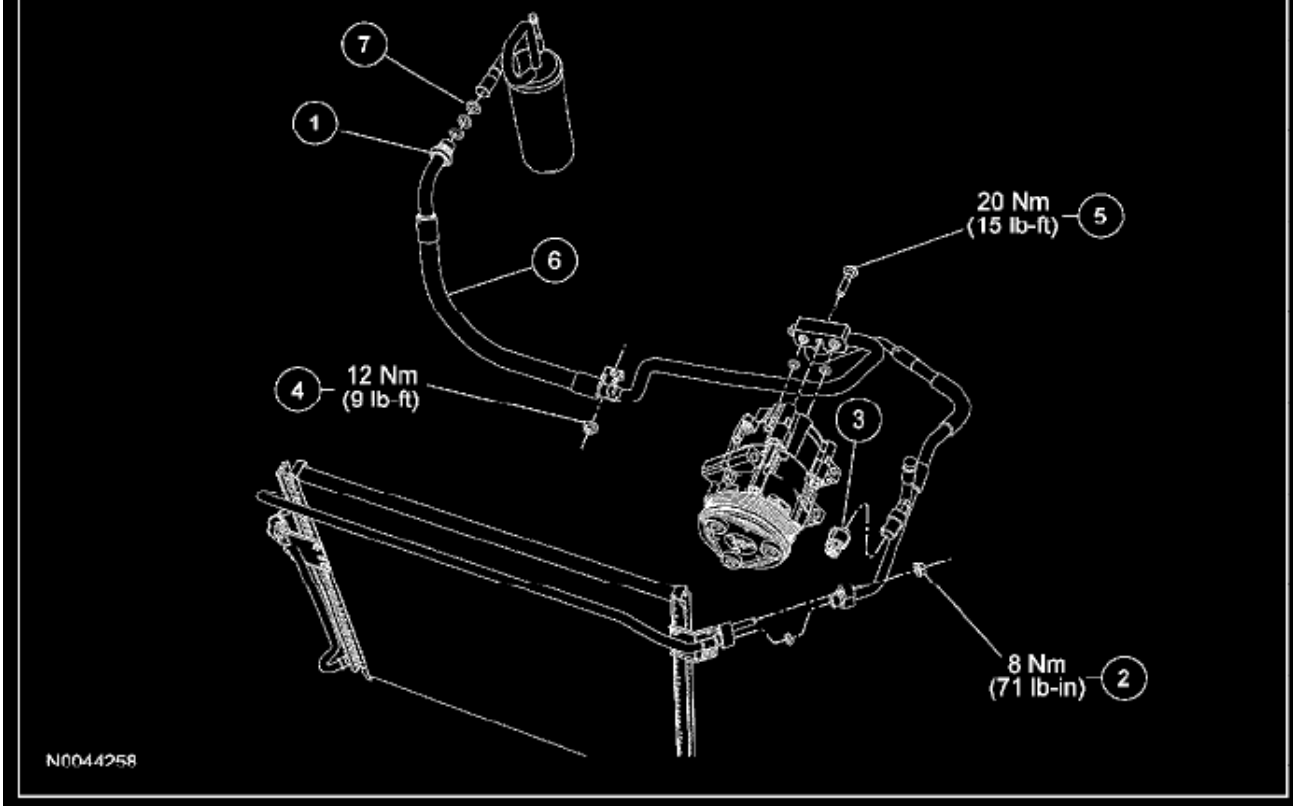
An A/C pressure relief valve is incorporated in the compressor manifold and tube assembly to:

- relieve unusually high refrigerant system discharge pressure buildups. For specifications regarding operating pressure(s), refer to Heating and Air Conditioning.

- prevent damage to the A/C compressor and other system components.

- avoid total refrigerant loss by closing after the excessive pressure has been relieved.

The A/C pressure relief valve is a separate component and can be replaced separately from the A/C compressor manifold and tube assembly. It is necessary to recover the refrigerant before removing the A/C pressure relief valve.



Item	Part Number	Description
1	—	Suction accumulator outlet fitting (part of 19D850)
2	W520413	Condenser inlet fitting nut
3	—	Pressure cutoff switch electrical connector (part of 14A280)
4	N621940	Compressor manifold and tube assembly bracket nut
5	W704692	A/C compressor manifold bolt
6	19D850	Compressor manifold and tube assembly
7	19E889	O-ring seal (6 required)

Hose/Line HVAC: Service and Repair Compressor Manifold and Tube Assembly

COMPRESSOR MANIFOLD AND TUBE ASSEMBLY

Removal and Installation

NOTE: Installation of a new suction accumulator is not required when repairing the air conditioning system, except when there is physical evidence of system contamination from a failed A/C compressor or damage to the suction accumulator.

1. Recover the refrigerant. 2. Disconnect the suction accumulator outlet fitting.

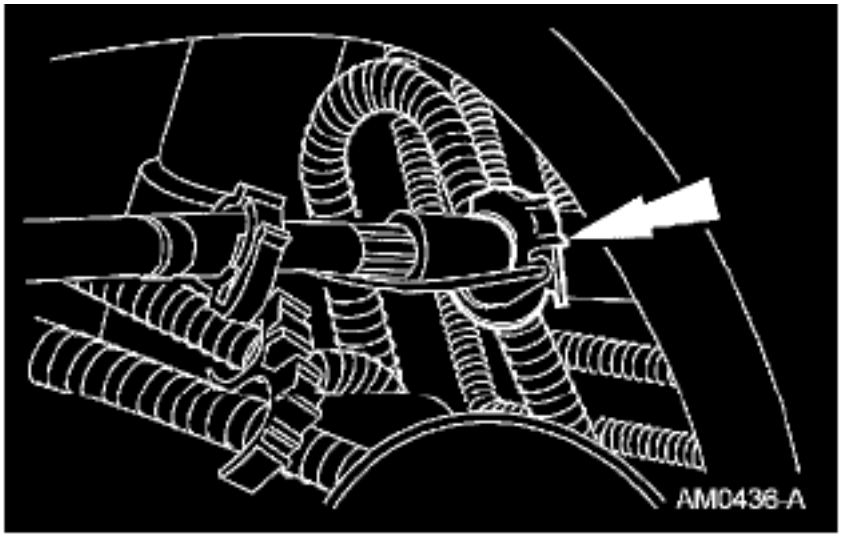
- Discard the O-ring seals.

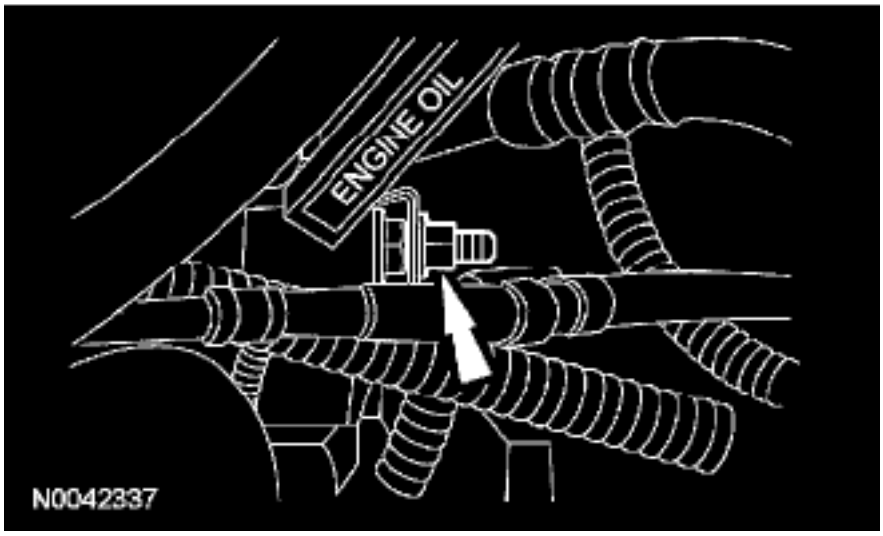
3. Remove the condenser inlet fitting nut and disconnect the fitting.

- Discard the O-ring seal.

- To install, tighten to 8 Nm (71 lb-in).

4. Disconnect the pressure cutoff switch electrical connector. 5. Disconnect the fuel line spring lock coupling.





6. Remove the nut and position the bracket aside.

- To install, tighten to 12 Nm (9 lb-ft).

7. Remove the compressor manifold and tube assembly bracket nut.

- To install, tighten to 12 Nm (9 lb-ft).

8. Loosen the A/C compressor manifold bolt and remove the compressor manifold and tube assembly.

- Discard the O-ring seals.

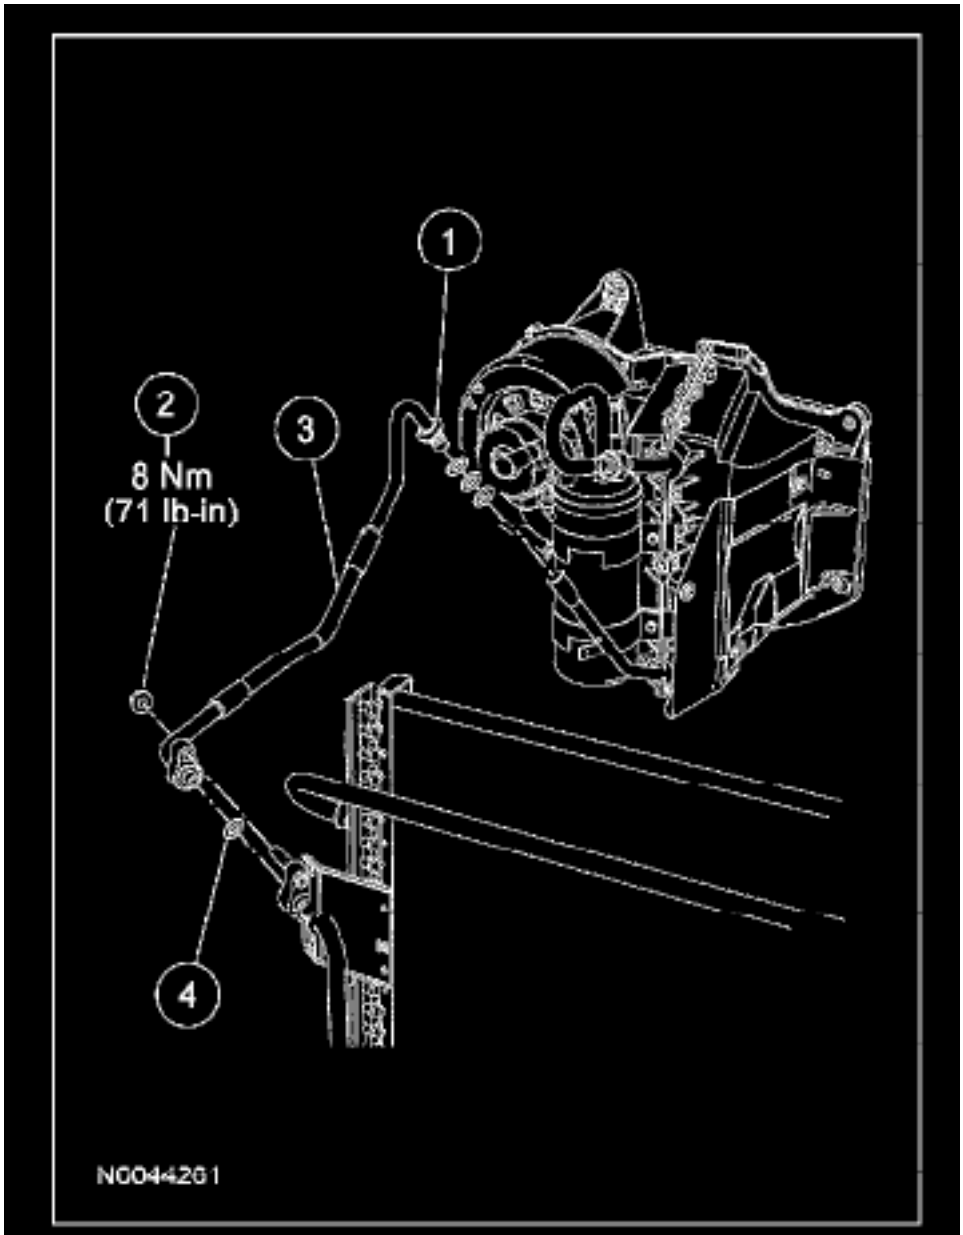
- To install, tighten to 20 Nm (15 lb-ft).

9. To install, reverse the removal procedure.

- Install new O-ring seals.

- Lubricate the refrigerant system with the correct amount of clean PAG oil.

10. Evacuate, leak test and charge the refrigerant system.



Item	Part Number	Description
1	—	Evaporator inlet fitting (part of 19835)
2	W520413	Condenser outlet fitting nut
3	19835	Condenser-to-evaporator line
4	19F889	O-ring seal (4 required)

Hose/Line HVAC: Service and Repair Condenser to Evaporator Line

CONDENSER TO EVAPORATOR LINE

Removal and Installation

NOTE: Installation of a new suction accumulator is not required when repairing the air conditioning system, except when there is physical evidence of system contamination from a failed A/C compressor or damage to the suction accumulator.

1. Recover the refrigerant. 2. Disconnect the evaporator inlet fitting.

- Discard the O-ring seals.

3. Remove the condenser outlet fitting nut and disconnect the fitting.

- Discard the O-ring seal.

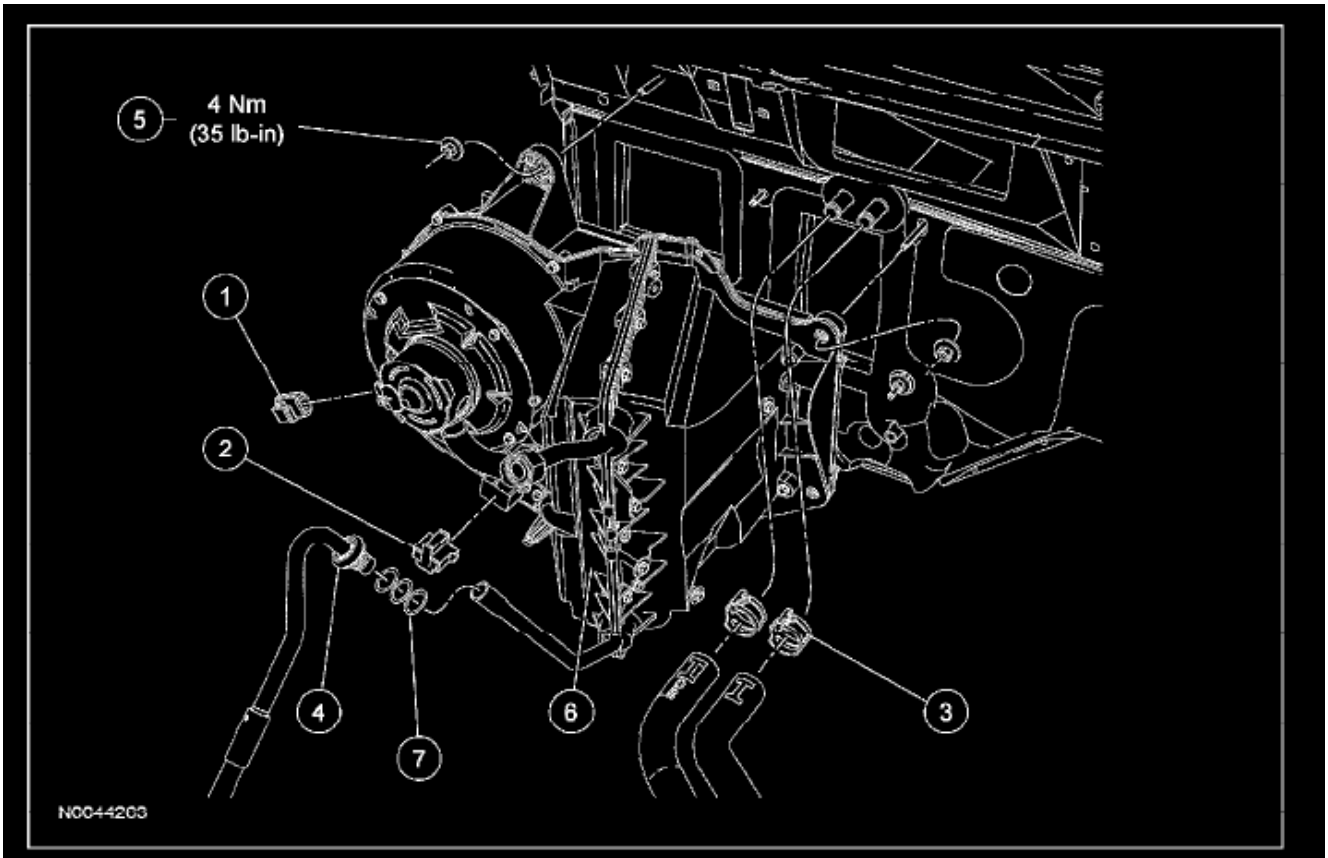
- To install, tighten to 8 Nm (71 lb-in).

4. To install, reverse the removal procedure.

- Install new O-ring seals.

- Lubricate the refrigerant system with the correct amount of clean PAG oil.

5. Evacuate, leak test and charge the refrigerant system.



Item	Part Number	Description
1	14290	Blower motor electrical connector
2	14290	Blower motor resistor electrical connector
3	8287	Heater hose clamp (2 required)

(Continued)

Item	Part Number	Description
4	—	Evaporator inlet line fitting (part of 19835)
5	N808823	Evaporator core housing nut (2 required)
6	19850	Evaporator core housing
7	19E889	O-ring seal (3 required)

Housing Assembly HVAC: Service and Repair Evaporator Core Housing

EVAPORATOR CORE HOUSING

Removal and Installation

NOTE:

- The evaporator core is not separately serviceable, it is serviced only with the evaporator core housing assembly.

- If an evaporator core leak is suspected, the evaporator core must be leak tested before it is removed from the vehicle.

- Installation of a new suction accumulator is not required when repairing the refrigerant system except when there is physical evidence of system contamination from a failed A/C compressor or damage to the suction accumulator.

All vehicles

1. Drain the cooling system. 2. Recover the refrigerant. 3. Remove the air cleaner outlet pipe. 4. Remove the suction accumulator.

Vehicles with 2.3L engine

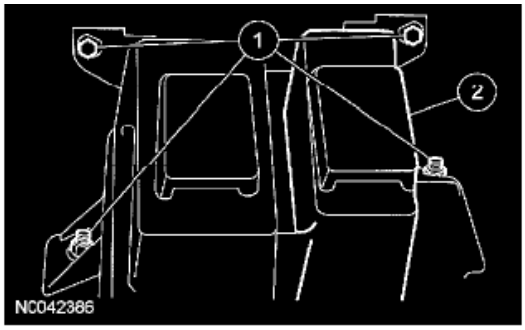
5. Remove the A/C compressor. 6. Remove the engine oil indicator and tube.

Vehicles with 3.0L and 4.0L engines

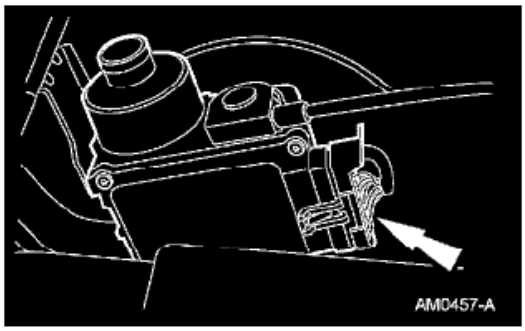
7. Position the coolant reservoir and windshield washer reservoir aside.

1 Remove the 2 screws and 2 nuts.

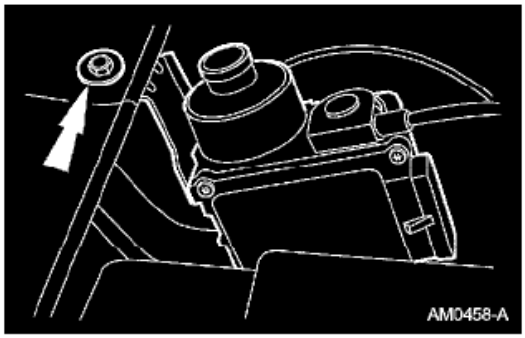
2 Position the reservoirs aside.



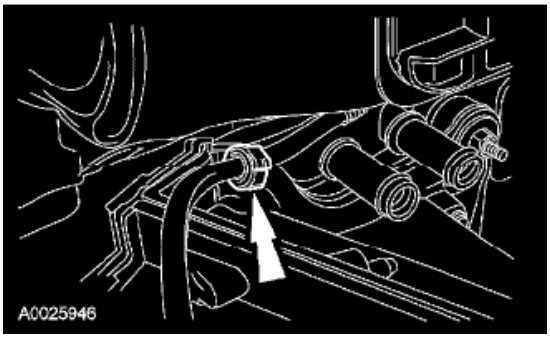
1
2
NC042386



AM0457-A



AM0458-A



A0025946

Vehicles with speed control

8. Disconnect the speed control actuator electrical connector.

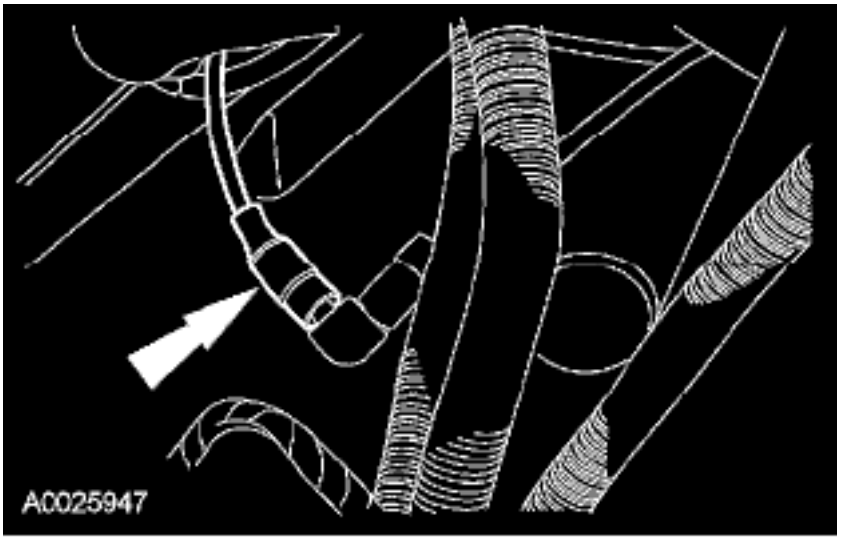
9. Remove the speed control actuator bolt and position the actuator aside.

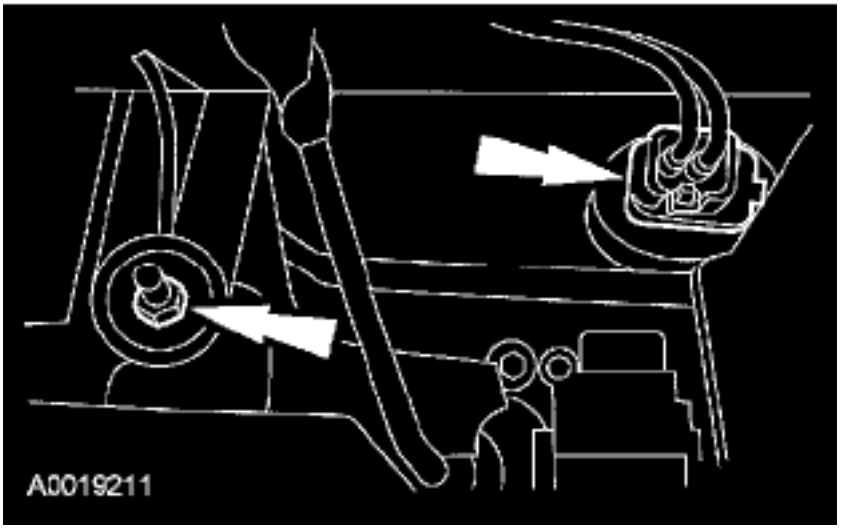
- Detach the speed control cable from the evaporator core housing.

All vehicles

10. Disconnect the blower motor electrical connector. 11. Disconnect the blower motor resistor electrical connector. 12. Release the 2 heater hose clamps and disconnect the heater hoses from the heater core. 13. Detach the pin-type retainer and position the windshield washer hose aside.

14. Disconnect and detach the heater control valve vacuum hose.





15. NOTE: 2.3L engine shown, others are similar.

Disconnect the vacuum supply hose near the evaporator core housing.

16. Disconnect the evaporator inlet fitting.

- Discard the O-ring seals.

17. NOTE: The following step is carried out at the lower passenger side dash panel, inside the passenger compartment.

Disconnect the vacuum hose connector and remove the nut.

Vehicles with 4.0L engine

18. If equipped, remove the wheel splash guard. 19. Remove the RH fender splash shield. 20. Remove the 2 evaporator core housing nuts.

- To install, tighten to 4 Nm (35 lb-in).

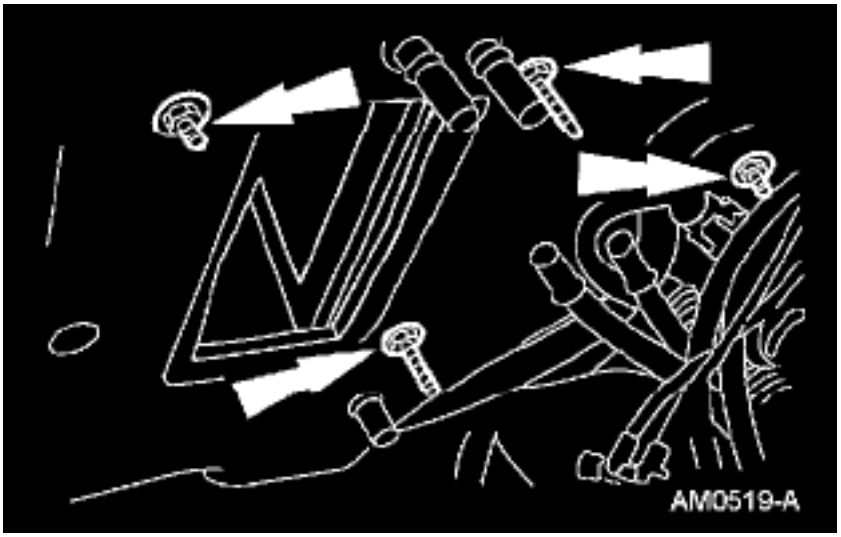
21. Remove the evaporator core housing. 22. To install, reverse the removal procedure.

- Lubricate the refrigerant system with the correct amount of clean PAG oil or equivalent.

- Install new O-ring seals.

- Lubricate the coolant hoses with plain water only, if needed.

23. Evacuate, leak test and charge the refrigerant system.



Housing Assembly HVAC: Service and Repair Plenum Chamber

PLENUM CHAMBER

Removal and Installation

1. Remove the instrument panel. 2. Remove the evaporator core housing. 3. Remove the 3 plenum chamber nuts and the plenum chamber.

- To install, tighten to 4 Nm (35 lb-in).

4. To install, reverse the removal procedure.

Blower Motor Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

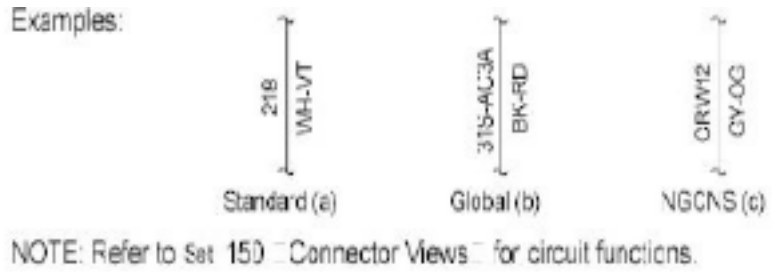
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

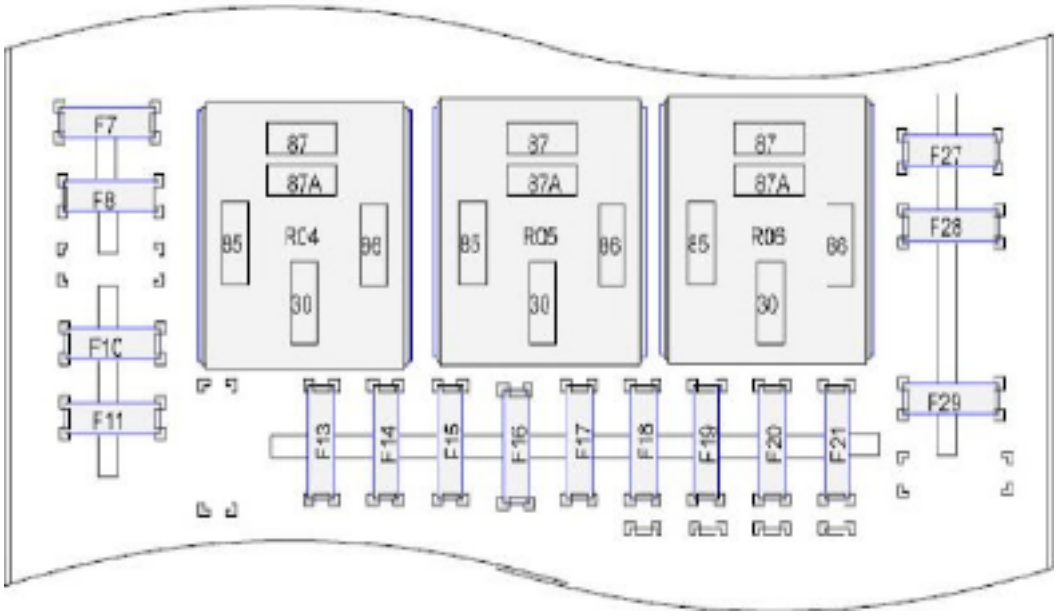
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

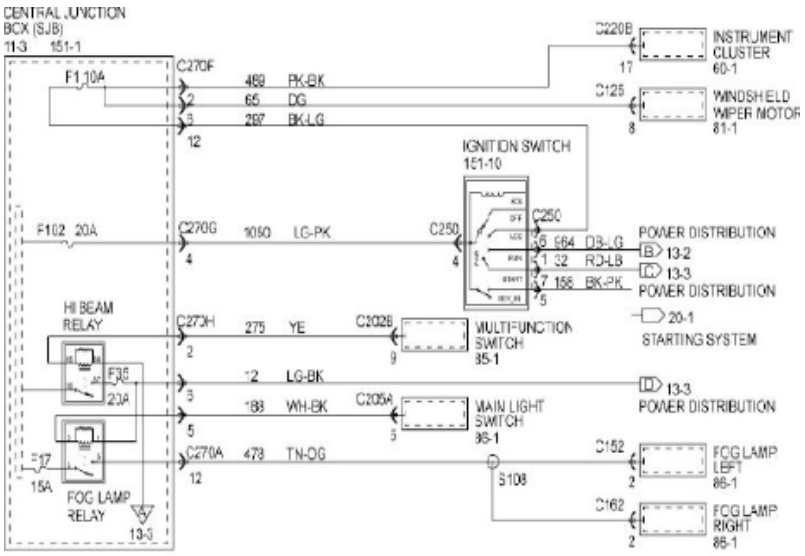
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

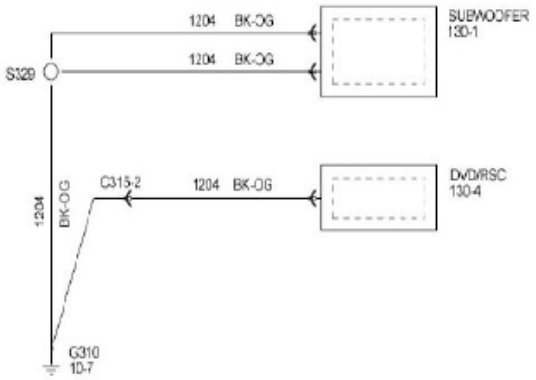
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

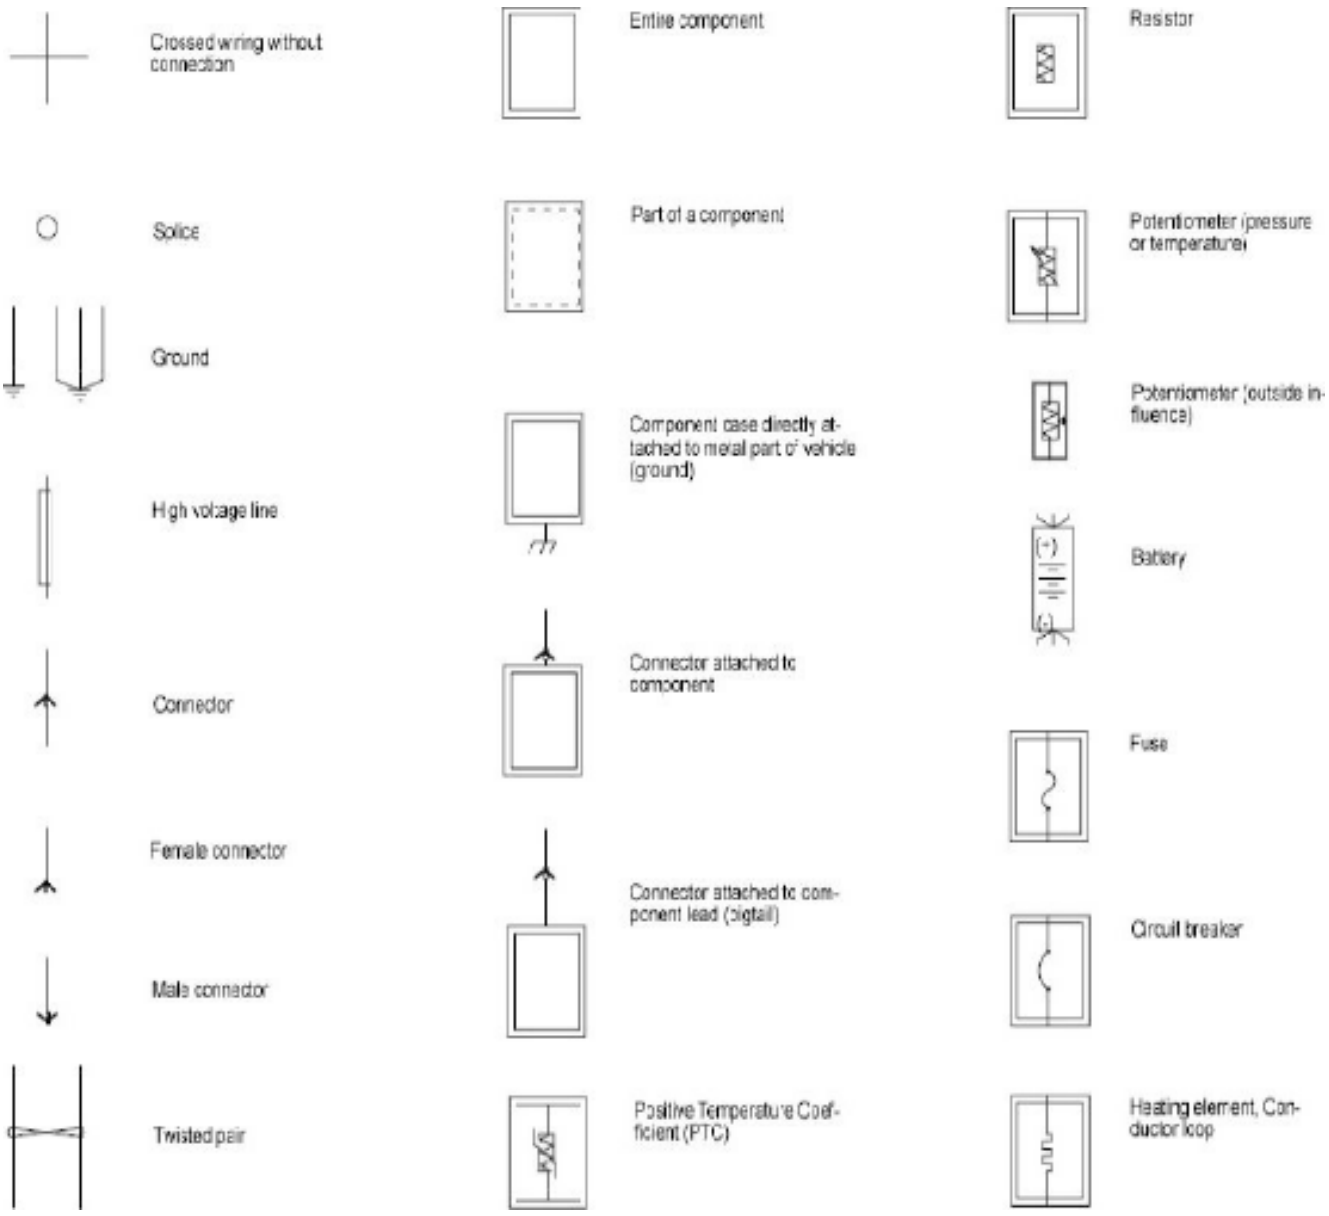
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

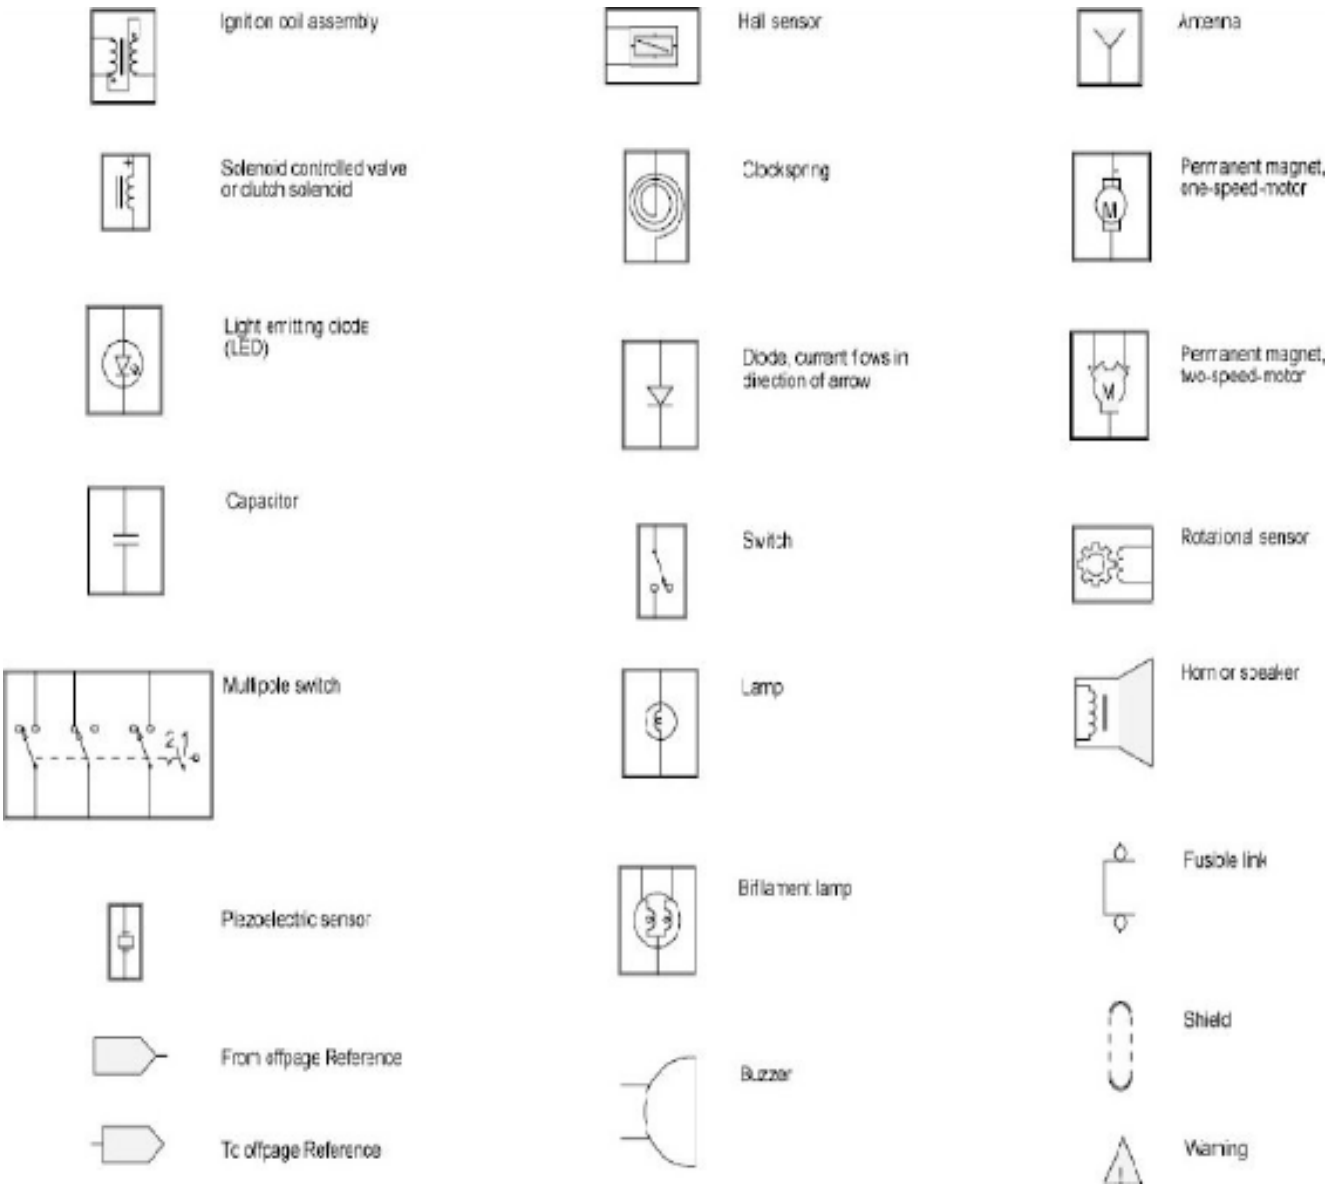
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

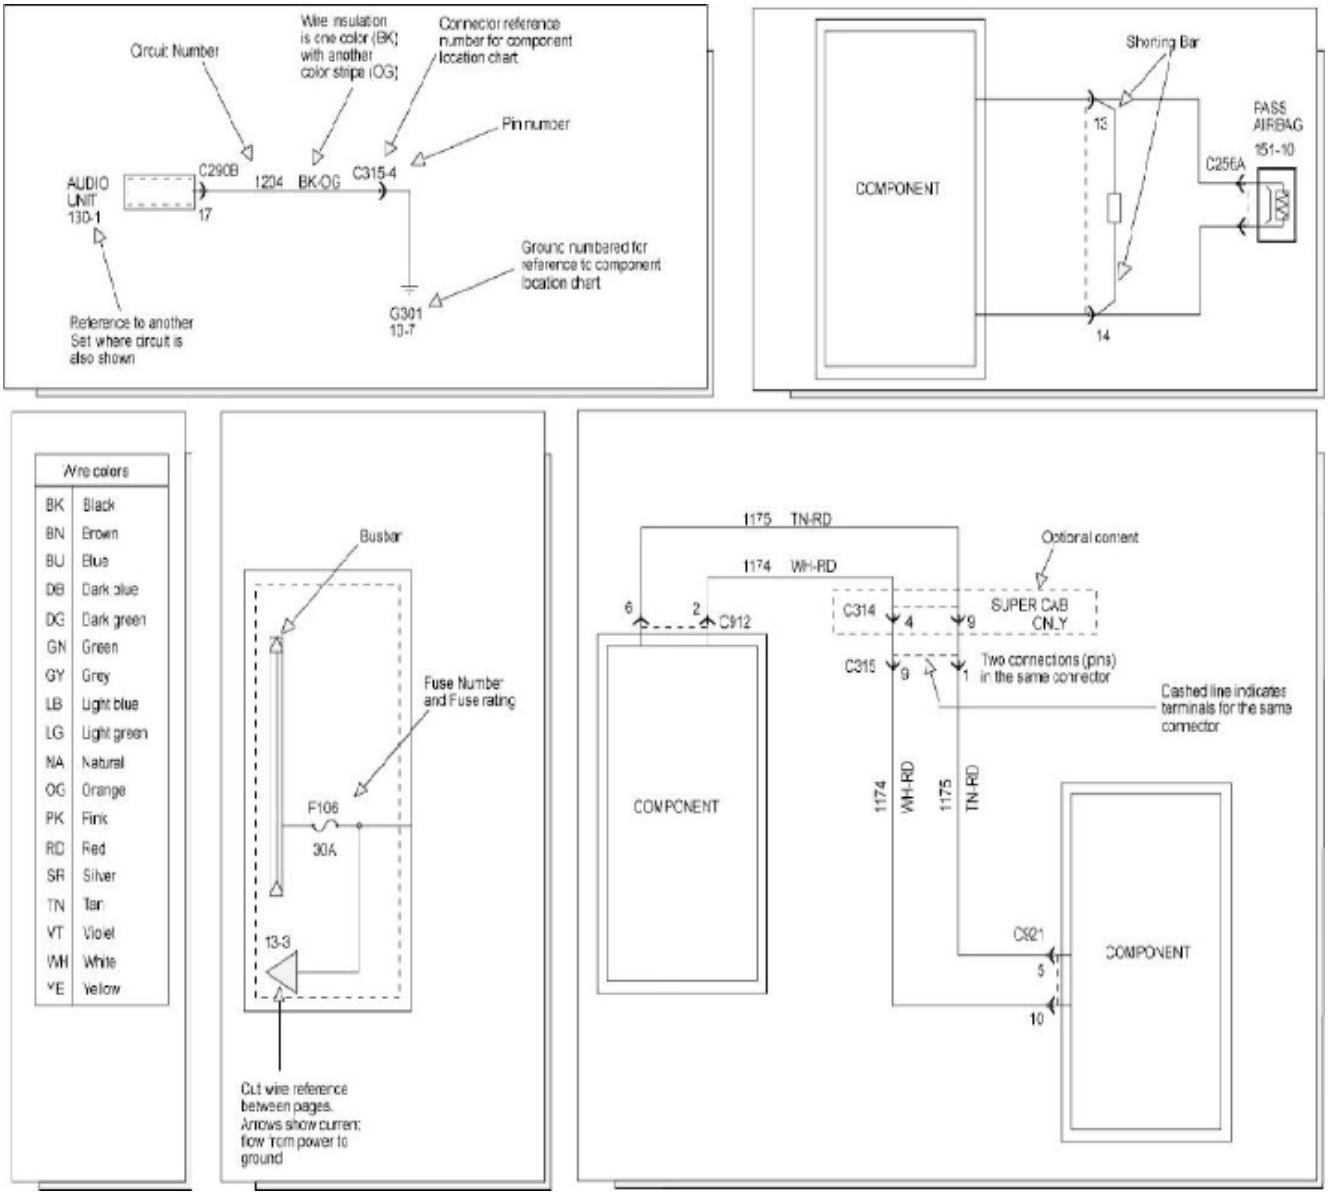
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

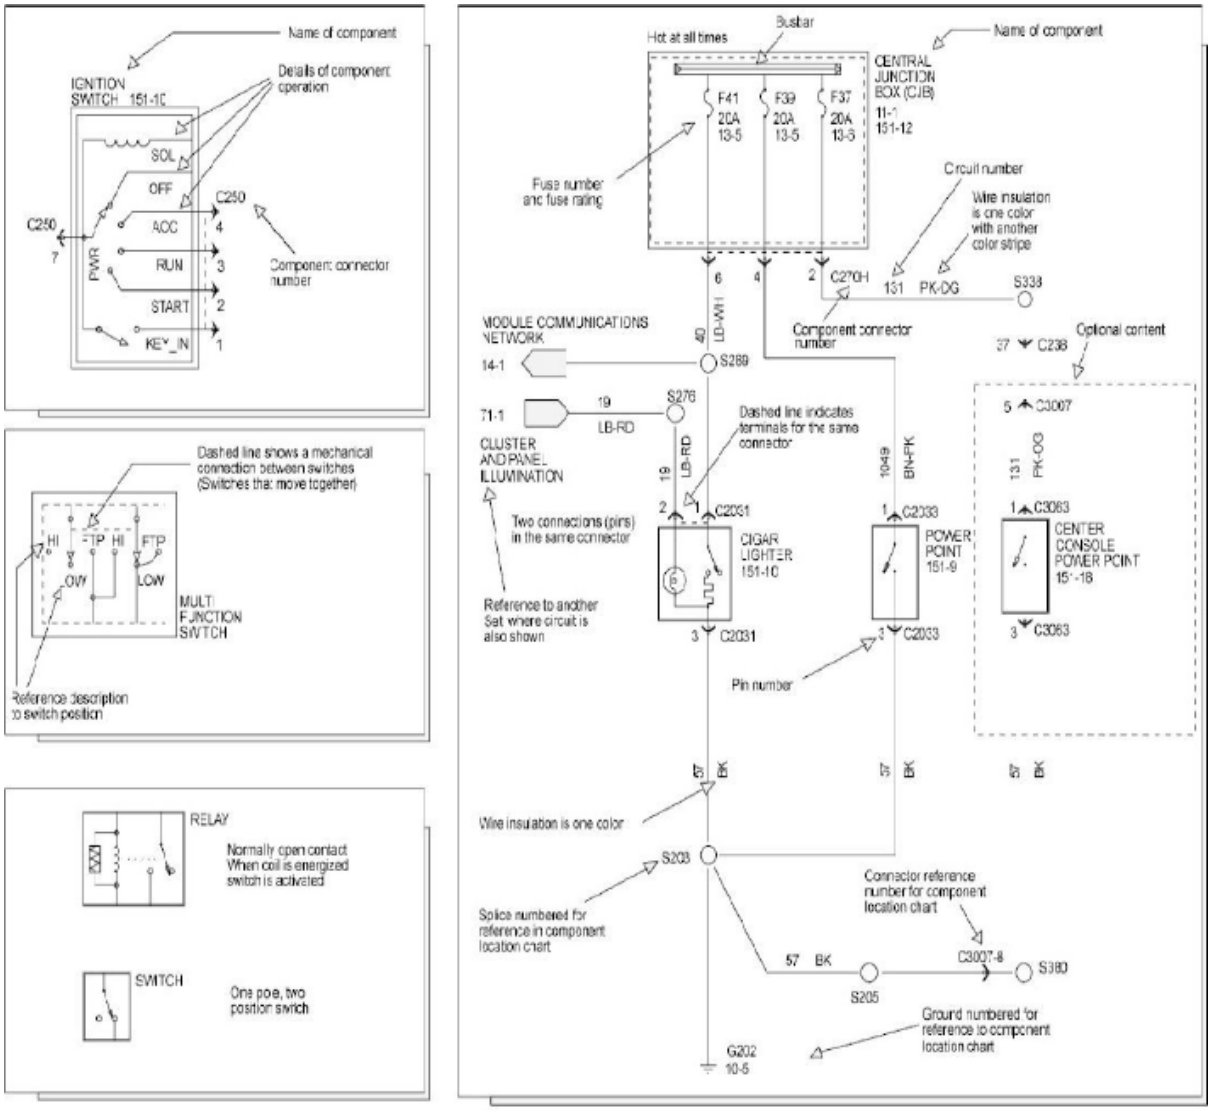
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right

Blower Motor Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

WIRE STOPPER

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

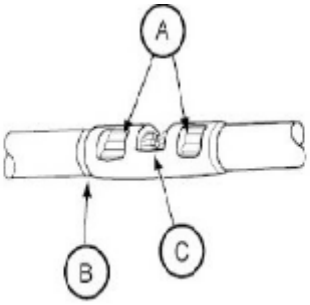
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

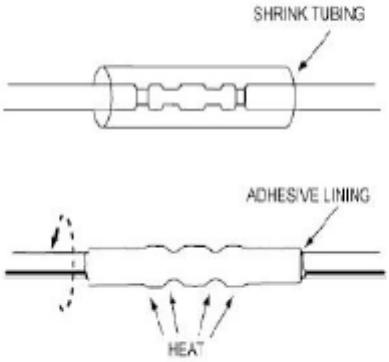
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x dia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

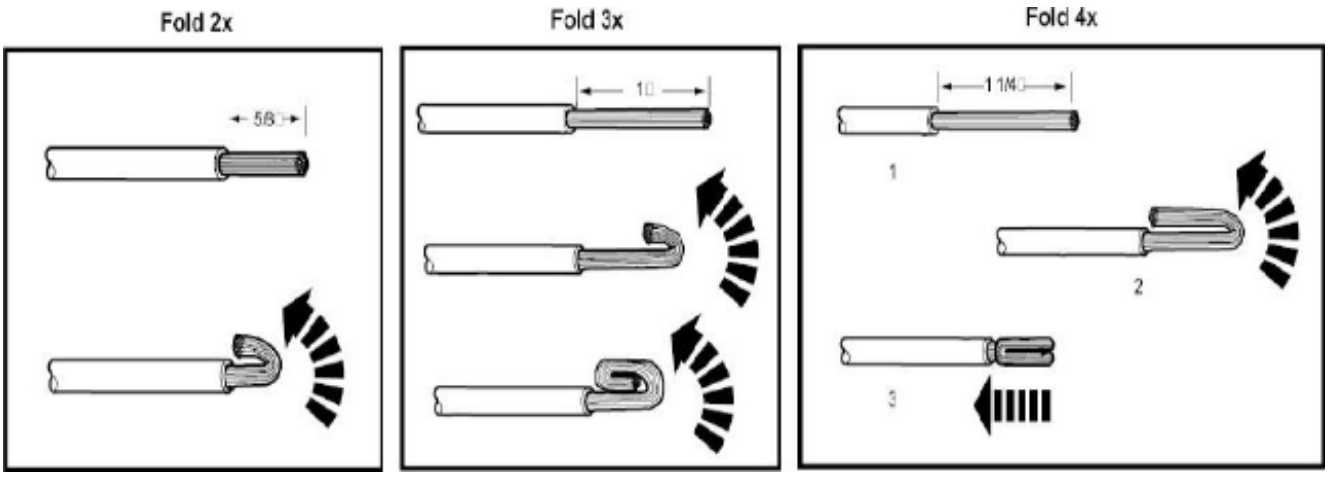
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



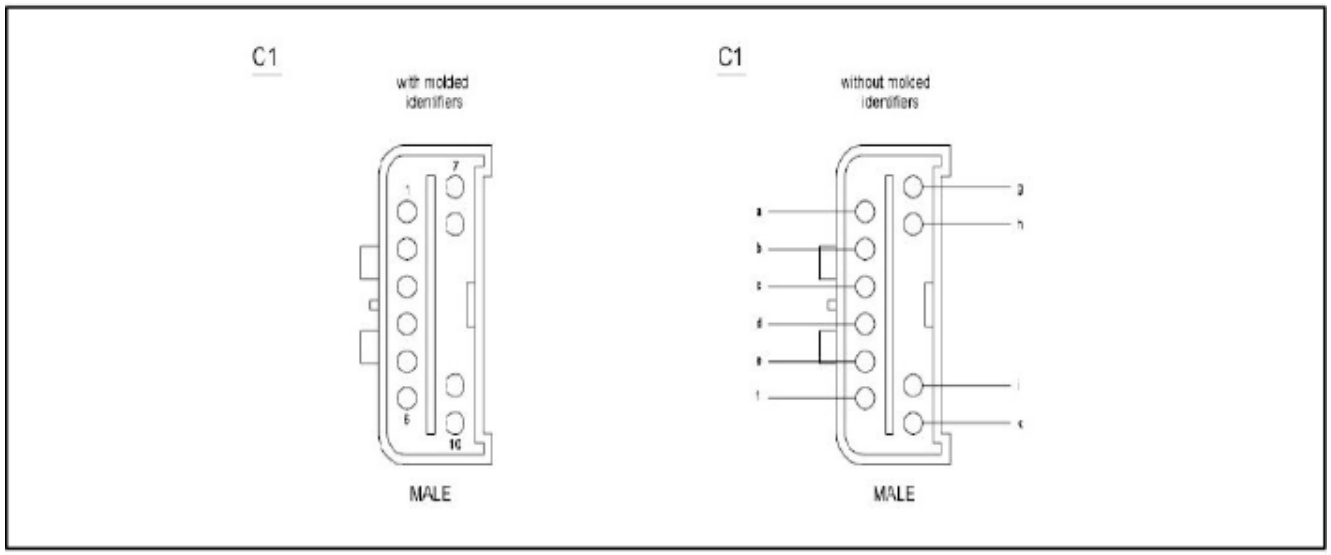
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step by step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



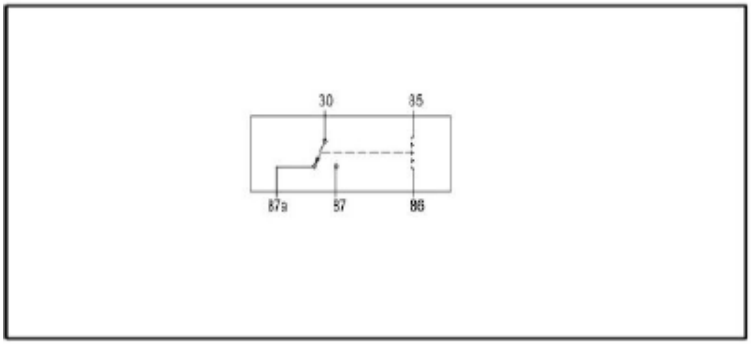
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

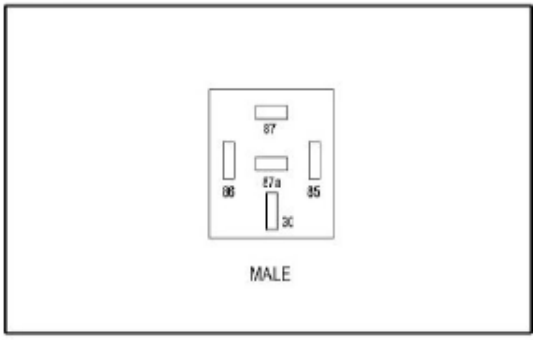
Blower Motor Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	45 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step–by–step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals

Compressor Clutch Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

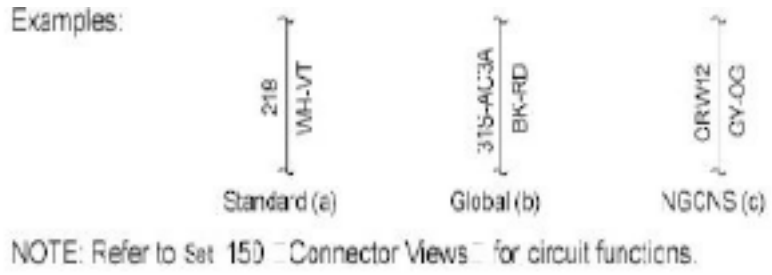
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

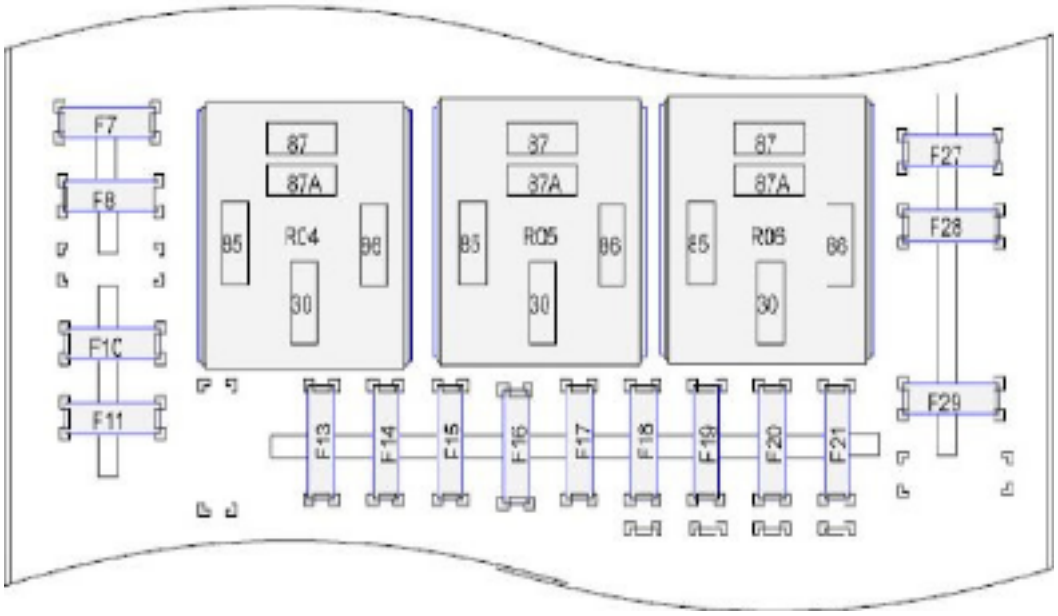
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

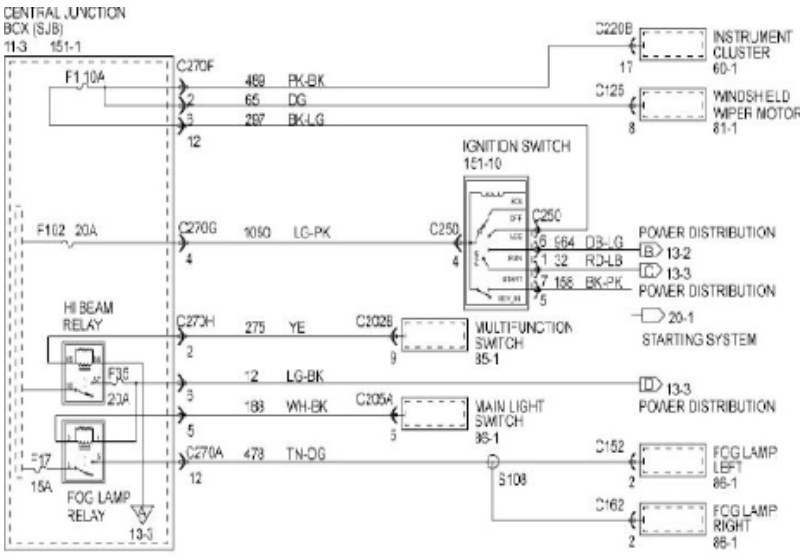
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

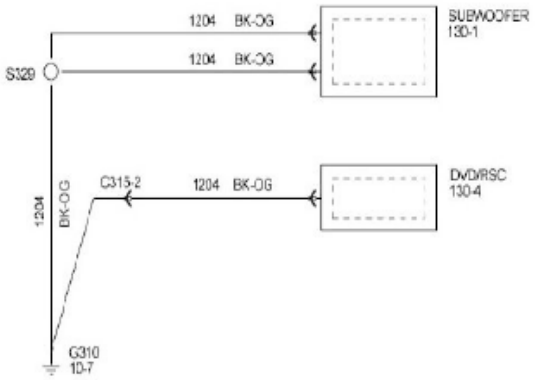
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

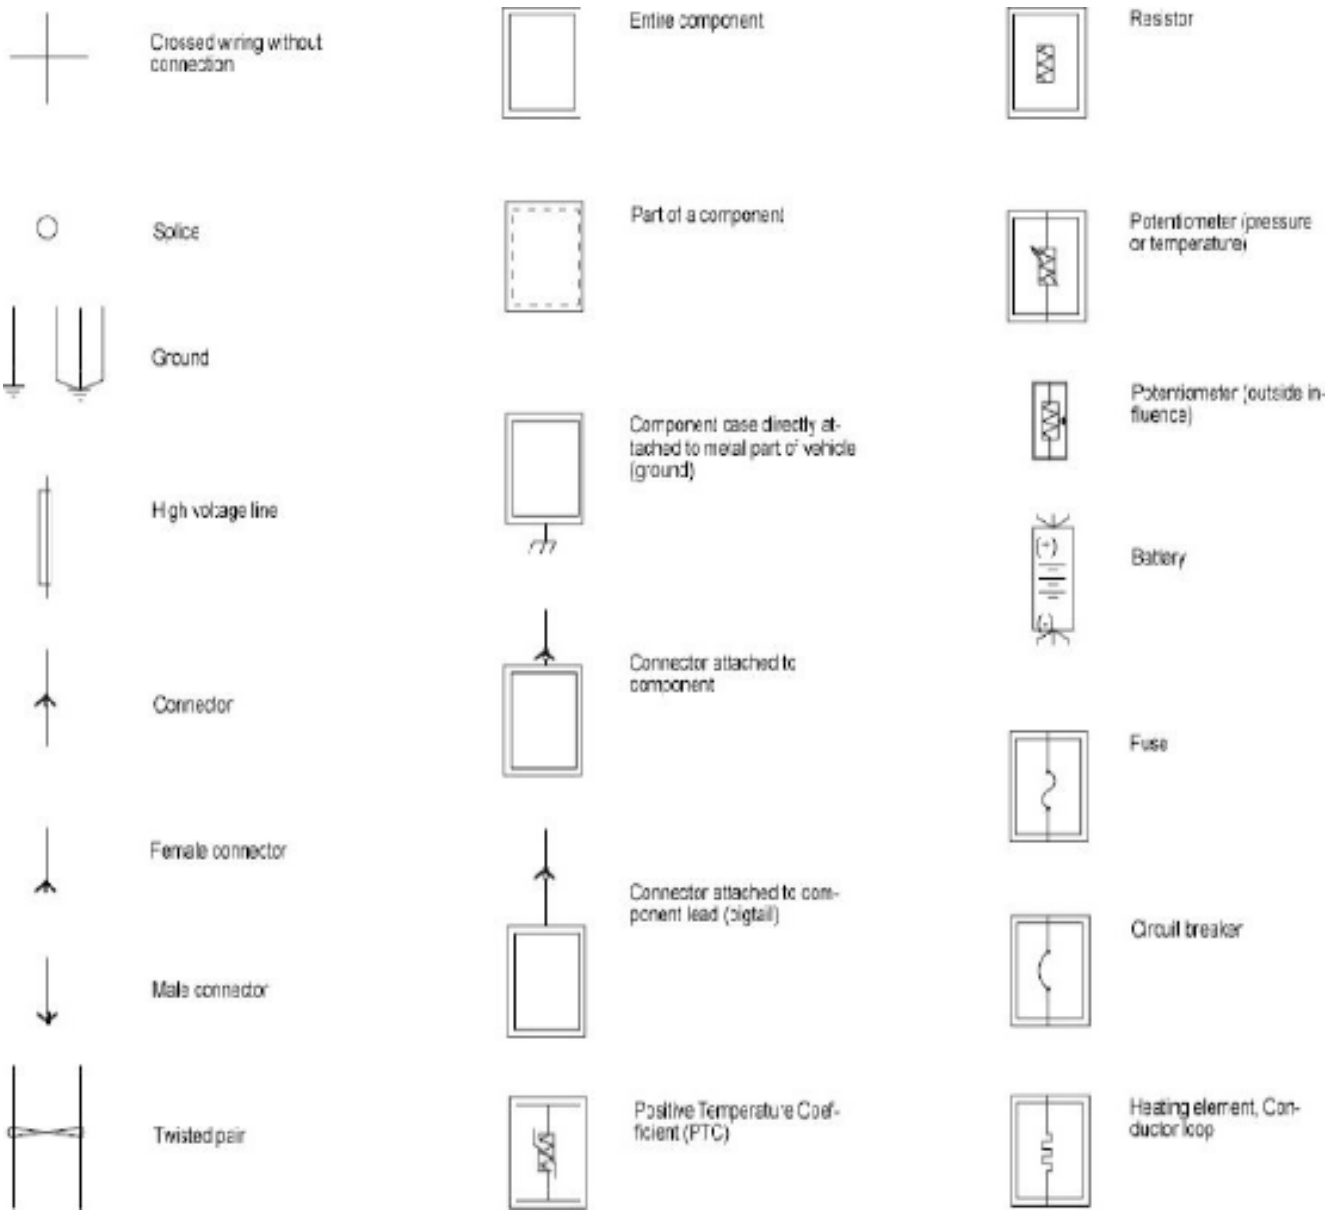
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

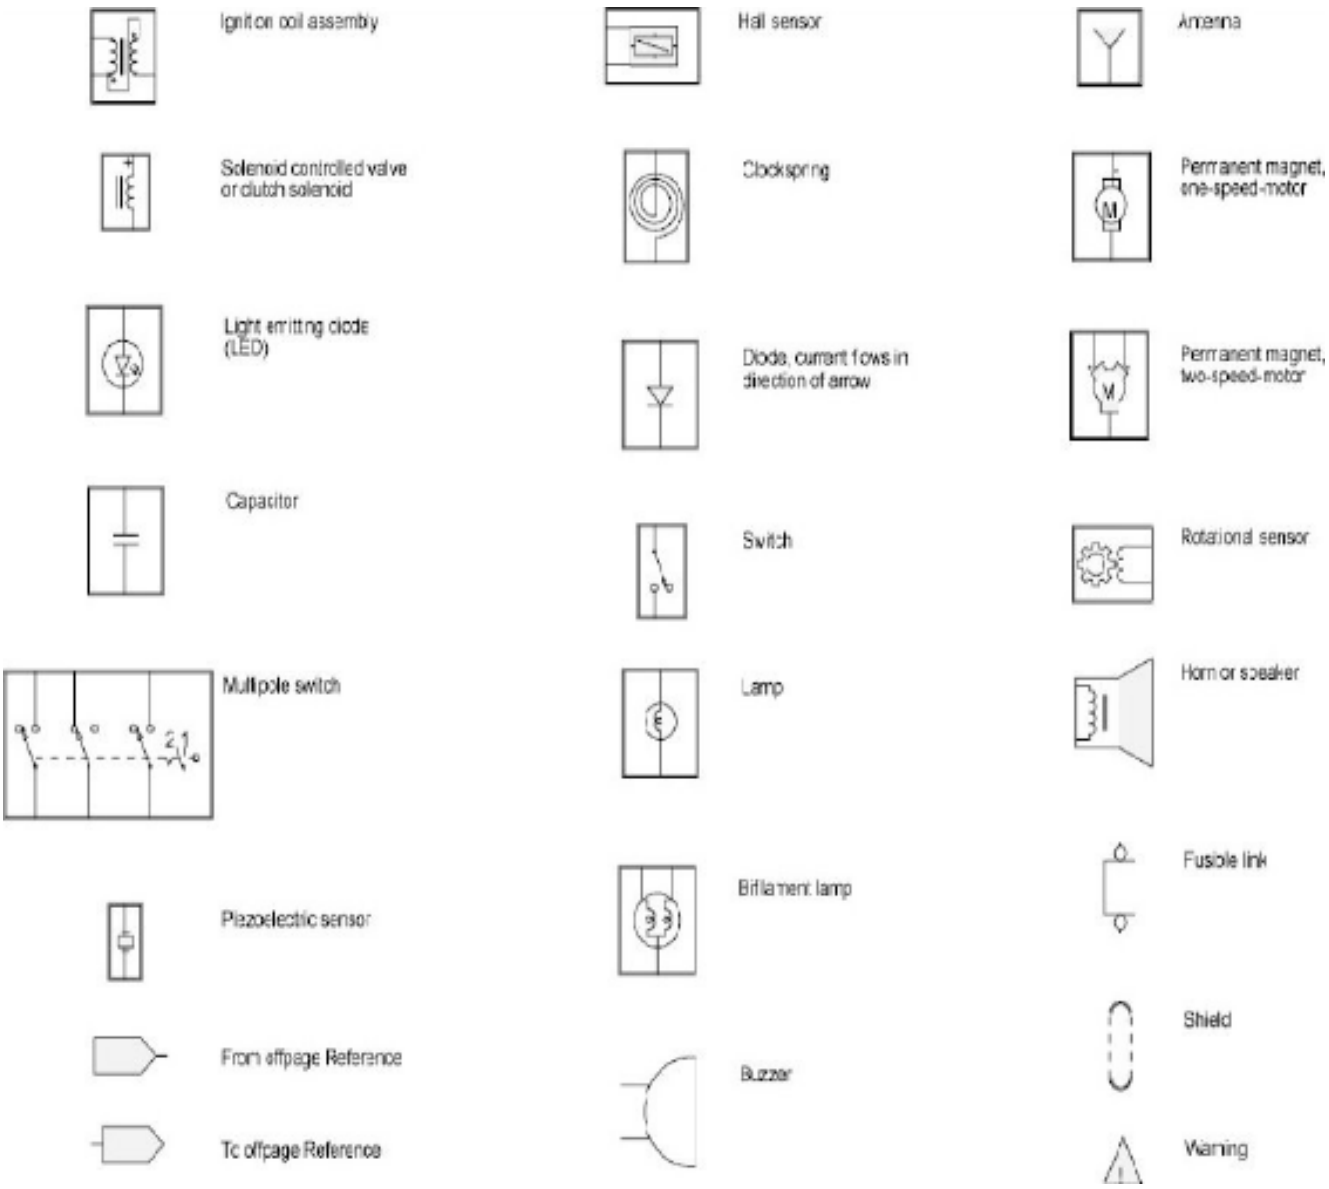
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

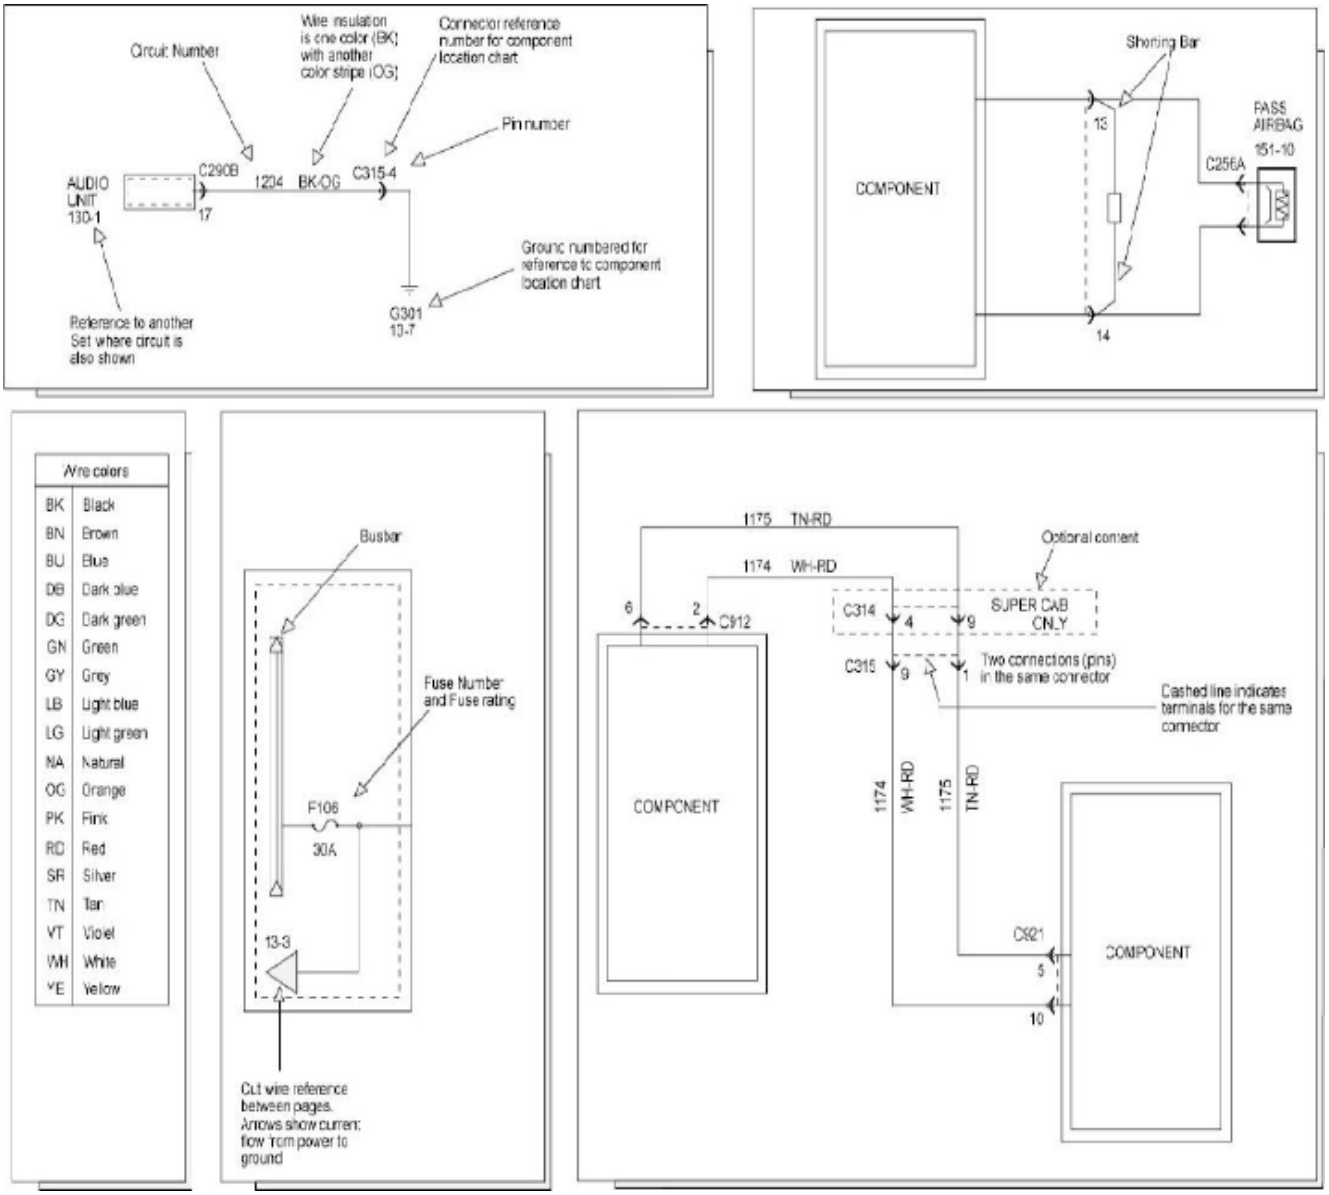
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

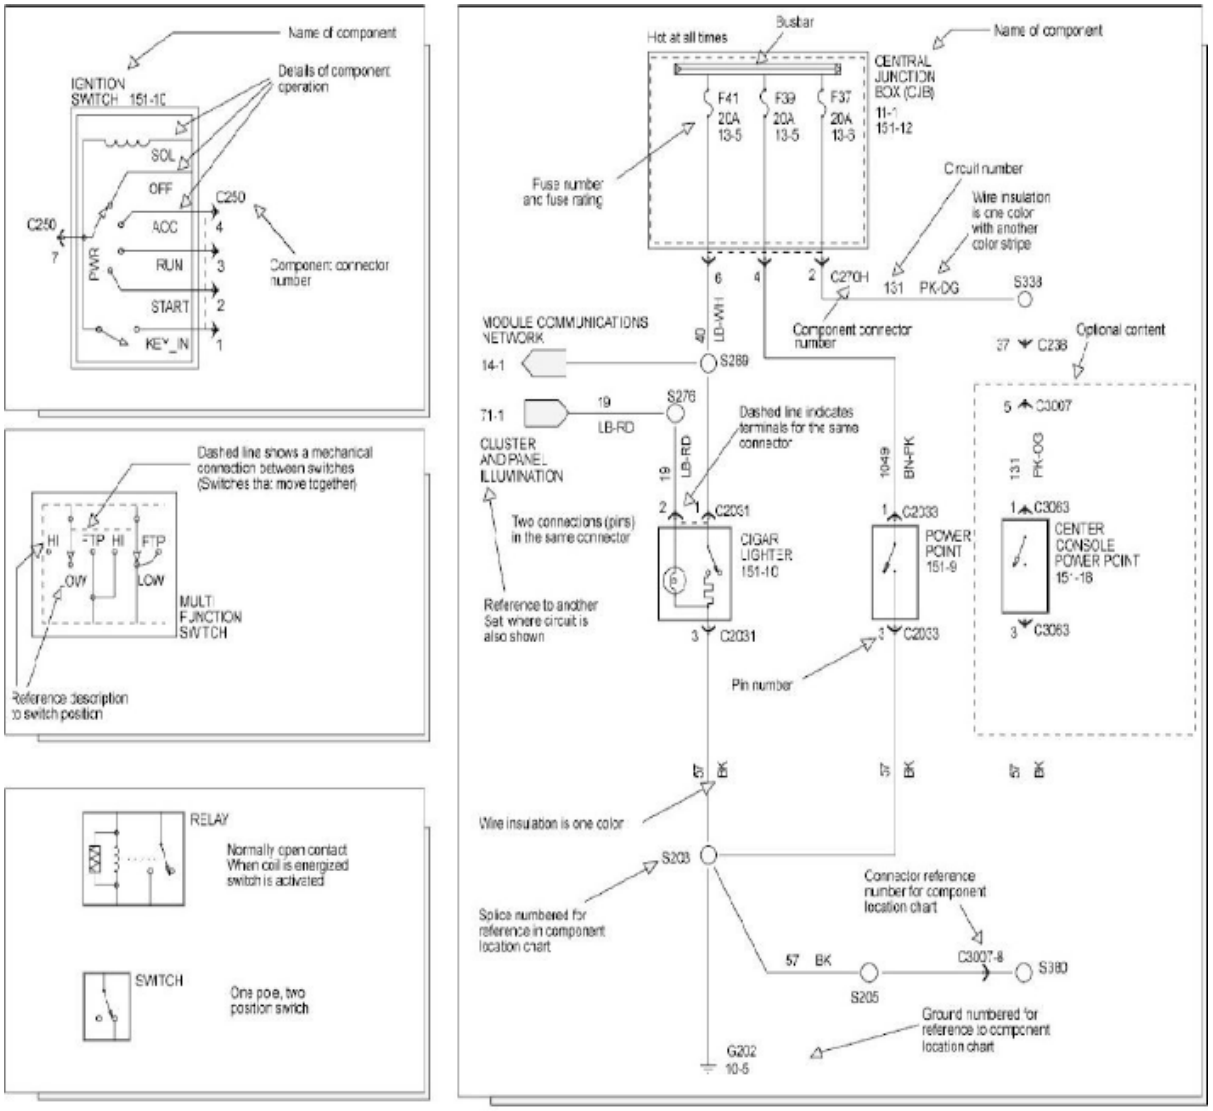
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Compressor Clutch Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

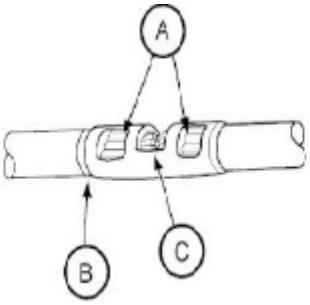
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

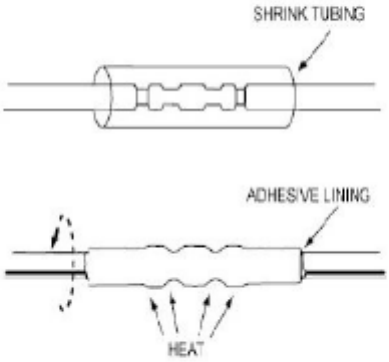
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x dia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

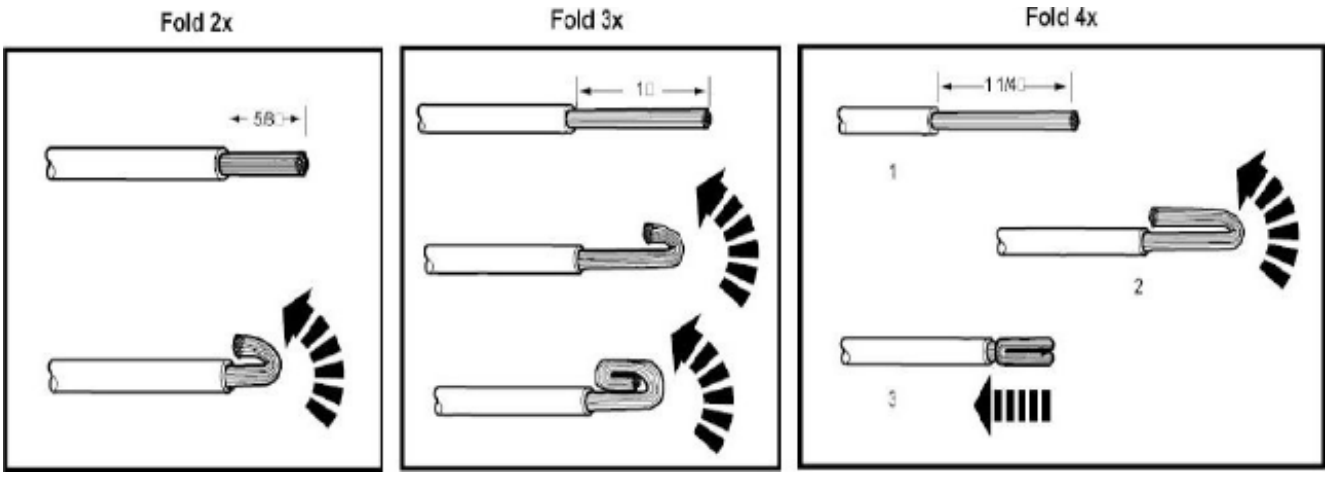
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Compressor Clutch Relay: Description and Operation

AIR CONDITIONING (A/C) CLUTCH RELAY (A/CCR)

NOTE: The PCM PIDs WAC and wide open throttle air conditioning cutoff fault (WACF) are used to monitor the A/CCR output.

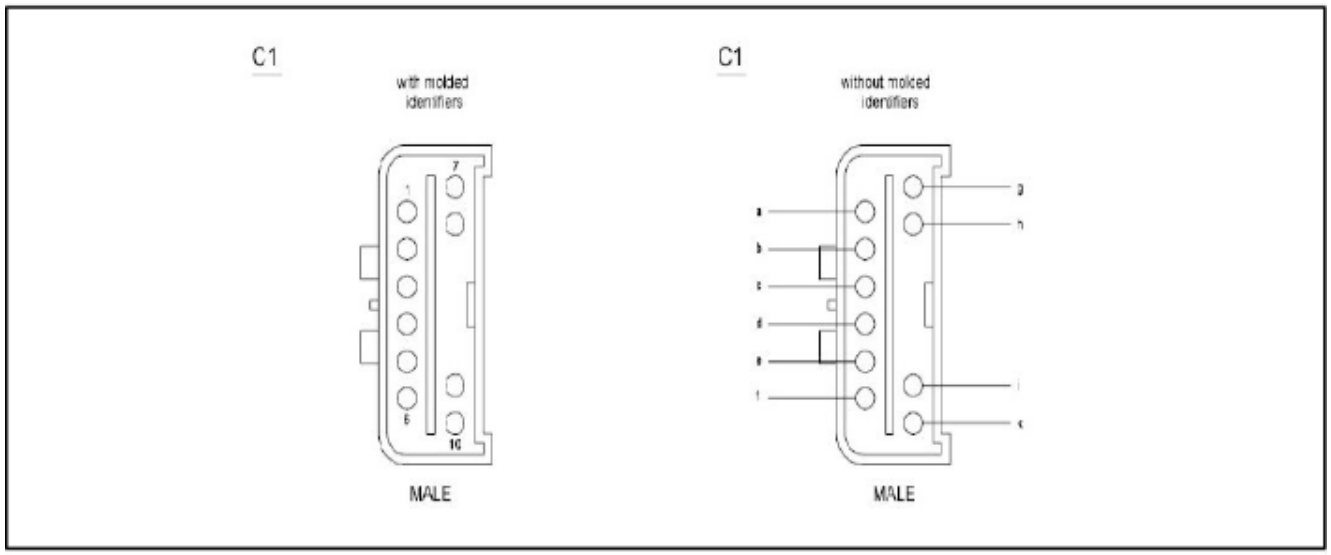
The A/CCR is wired normally open. There is no direct electrical connection between the A/C switch or electronic automatic temperature control (EATC) module and the A/C clutch. The PCM receives a signal indicating that A/C is requested. For some applications, this message is sent through the communications network. When A/C is requested, the PCM checks other A/C related inputs that are available, such as A/C pressure switch and A/C cycling switch. If these inputs indicate A/C operation is OK, and the engine conditions are OK (coolant temperature, engine RPM, throttle position), the PCM grounds the A/CCR output, closing the relay contacts and sending voltage to the A/CCR.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



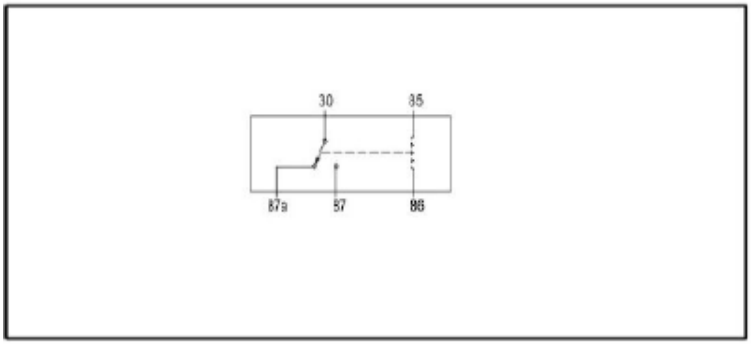
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

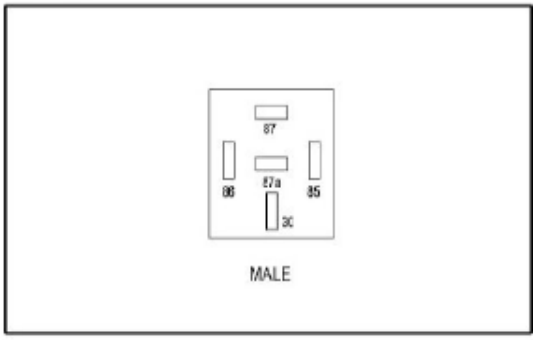
Compressor Clutch Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	45 □ 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

-20	-4	4.66	276.96

Evaporator Temperature Sensor / Switch: Description and Operation

AIR CONDITIONING EVAPORATOR TEMPERATURE (ACET) SENSOR

A/C Evaporator Temperature (ACET) Sensor Voltage And Resistance

The ACET sensor measures the evaporator air discharge temperature. The ACET sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of a thermistor decreases as the temperature increases, and the resistance increases as the temperature decreases. The PCM sources a low current 5 volts on the ACET circuit. With SIG RTN also connected to the ACET sensor, the varying resistance changes the voltage drop across the sensor terminals. As A/C evaporator air temperature changes, the varying resistance of the ACET sensor changes the voltage the PCM detects.

The ACET sensor is used to more accurately control A/C clutch cycling, improve defrost/demist performance, and reduce A/C clutch cycling.

NOTE: These values can vary 15% due to sensor and VREF variations. Voltage values were calculated for VREF equals 5.0 volts.

Service Port HVAC: Description and Operation

SERVICE GAUGE PORT VALVES

The high-pressure service gauge port valve is located on the compressor-to-condenser discharge line.

The low-pressure service gauge port valve is located on the suction accumulator.

The fitting is an integral part of the refrigeration line or component.

- Special couplings are required for both the high-side and low-side service gauge ports.

- A very small amount of leakage will always be detectable around the Schrader-type valve with the service gauge port valve cap removed, and is considered normal. A new Schrader-type valve core can be installed if the seal leaks excessively.

- The service gauge port valve caps are used as primary seals in the refrigerant system to prevent leakage through the Schrader-type valves from reaching the atmosphere. Always install and tighten the A/C service gauge port valve caps to the correct torque after they are removed.

Vacuum Harness HVAC: Service and Repair

VACUUM HOSE REPAIR - MINI-TUBE

Special Tool(s)

Special Tool(s)

1. Measure the length of the damaged area of the mini-tube vacuum hose. 2. Cut a piece of standard 1/8-inch inner diameter vacuum hose approximately 25 mm (1 in) longer than the damaged area of the mini-tube vacuum

hose.

3. Cut off the mini-tube vacuum hose on each side of the damaged area.

4. WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical

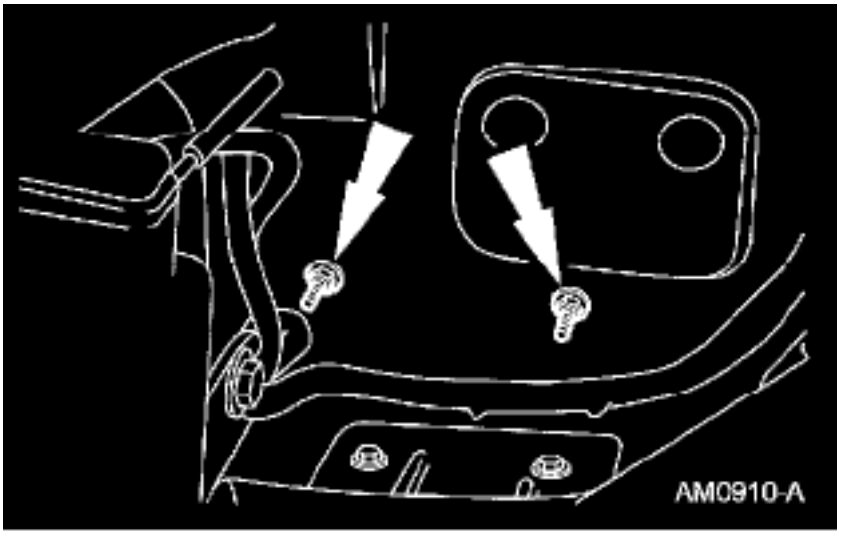
advice. Consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

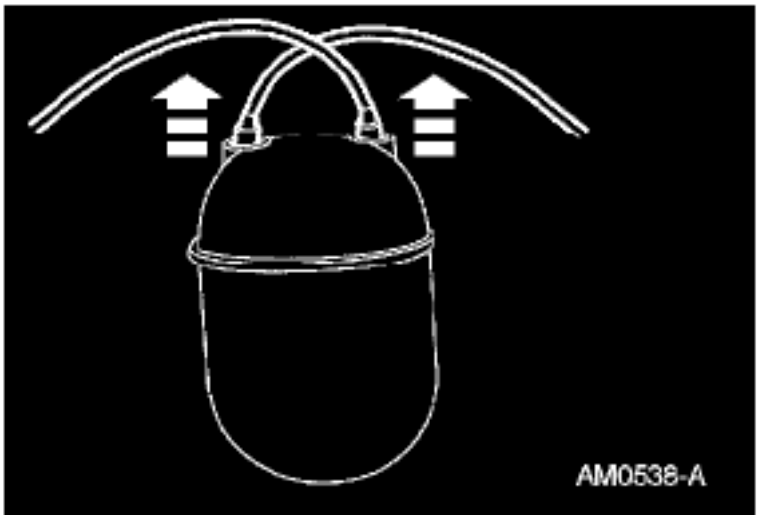
Dip the mini-tube hose ends in commercially available paint thinner containing methyl ethyl ketone (MEK). This solvent will seal the mini-tube in the vacuum hose.

5. Insert the ends of the mini-tube vacuum hose approximately 9 mm (3/8 in) into the ends of the standard 1/8-inch repair vacuum hose section.

6. Shake the repair joint after assembly to make sure the solvent is dispersed and the vacuum line is not plugged. 7. Test the system for a vacuum leak in the repair area.

- Use the vacuum pump or equivalent.





Vacuum Reservoir HVAC: Service and Repair

VACUUM RESERVOIR

Removal and Installation

1. Remove the engine air cleaner. 2. Remove the RH front fender splash shield. 3. Remove the nuts and the vacuum reservoir tank and bracket.

4. Disconnect the vacuum connectors.

5. To install, reverse the removal procedure.

Repairs and Inspections Required After a Collision: Service and Repair Inspection and Repair After A Supplemental Restraint System (SRS) Deployment

INSPECTION AND REPAIR AFTER A SUPPLEMENTAL RESTRAINT SYSTEM (SRS) DEPLOYMENT

WARNING: Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

NOTE:

- After diagnosing or repairing a supplemental restraint system (SRS), the restraint system diagnostic tools (if required) must be removed before operating the vehicle over the road.

- Deployable devices (such as air bag modules, pretensioners) may deploy alone or in various combinations depending on the impact event.

- Always refer to the appropriate Vehicle System procedures prior to carrying out vehicle repairs affecting the SRS and safety belt system.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

All vehicles

1. NOTE: Refer to the correct removal and installation procedure for all SRS components being installed.

When any deployable device or combination of devices are deployed and/or the restraints control module (RCM) has the DTC B1231 (Event Threshold Exceeded) in memory, the repair of the vehicle's SRS is to include the removal of all deployed devices and the installation of new deployable devices, the removal and installation of new impact sensors, and the removal and installation of a new RCM. DTCs must cleared from all required modules after repairs are carried out.

Vehicles with occupant classification sensor (OCS) system

2. NOTE: After installation of new occupant classification sensor (OCS) system components carry out the OCS System Reset procedure as

instructed in the Vehicle System. Refer to the appropriate Vehicle System for OCS system removal and installation procedure.

When a vehicle has been involved in a collision and the occupant classification system module (OCSM) has DTC B1231 stored in memory, the repair of the OCS system is to include the following procedures for the specified system: -

For rail type OCS system, inspect the passenger side floorpan for damage and repair as necessary. Install new OCS rails.

- For weight sensor bolt type OCS system, inspect the passenger side floorpan for damage and repair as necessary. Install a new seat track with OCS weight sensor bolts.

- NOTE: Most bladder type OCSM do not store a DTC B1231 in memory after deployment. The DTC B1231 is stored only by the RCM.

For bladder type OCS system, inspect for damage and repair as necessary. If installation of an OCS system component is required, an OCS system service kit must be installed.

All vehicles

3. When any damage to the impact sensor mounting points or mounting hardware has occurred, repair or install new mounting points and mounting

hardware as needed.

4. When the driver air bag module has deployed, a new clockspring must be installed. 5. New driver and/or front passenger safety belt systems (including retractors, buckles and height adjusters) must be installed if the vehicle is

involved in a collision that results in deployment of the driver and/or front passenger safety belt pretensioners.

6. Inspect the entire vehicle for damage, including the following components:

- Steering column (deployable column if equipped)

- Instrument panel knee bolsters and mounting points

- Instrument panel braces and brackets

- Instrument panel and mounting points

- Seats and seat mounting points

- Safety belts, safety belt buckles and safety belt retractors.

- SRS wiring, wiring harnesses and connectors

7. After carrying out the review and inspection of the entire vehicle for damage, repair or install new components as needed.

Repairs and Inspections Required After a Collision: Service and Repair Safety Belt Procedure After A Collision

SAFETY BELT PROCEDURE AFTER A COLLISION

WARNING: After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- Retractors

- Buckles

- Belt tension sensor (BTS) (if equipped)

- Front safety belt buckle support assemblies (slide bar) (if equipped)

- Safety belt shoulder belt height adjusters (if equipped)

- Child safety seat tether bracket assemblies

- Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

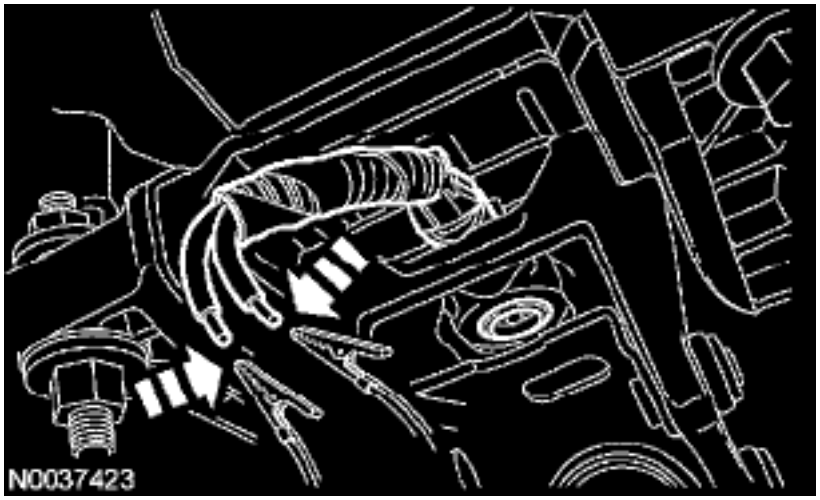
If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

1. Before installing a new safety belt assembly, the safety belt attaching areas must be inspected for damage and distortion. If the attaching points are

damaged and distorted, the sheet metal must be worked back to its original shape and structural integrity.

2. Install the new safety belt(s). Carry out Functional Test. See: Seat Belt Systems/Testing and Inspection/Component Tests and General Diagnostics



Adaptive Collapsible Steering Column: Service and Repair

DEPLOYABLE STEERING COLUMN - IN-VEHICLE DEPLOYMENT

WARNING: Deploy all supplemental restraint system (SRS) devices (air bags, pretensioners, load limiters, etc.) outdoors with all personnel at least 9.14 meters (30 feet) away to make sure of personal safety. Due to the loud report which occurs when an SRS device is deployed, hearing protection is required. Failure to follow these instructions may result in serious personal injury.

1. Depower the SRS.

2. NOTE: It may be necessary to lower or remove the deployable steering column from the instrument panel to access the deployable steering

column electrical connector.

Access the deployable steering column electrical connector.

3. NOTE: If the deployable steering column does not have a hard-wired pigtail, it will be necessary to cut the wires and connector(s) from the

vehicle wire harness and reconnect to the deployable steering column.

Cut each of the deployable steering column wires, leaving at least 4 inches to work with.

4. Remove any sheathing (if present) and strip the insulation from the ends of the cut wires. 5. Make a jumper harness to deploy the deployable steering column.

- Obtain 2 wires (20 gauge minimum) at least 9.14 m (30 ft) long and strip both ends of each wire.

- At one end of the jumper harness, connect the wires together.

6. Using the end of the jumper harness that the wires are not connected together, attach each wire of the jumper harness to each wire of the

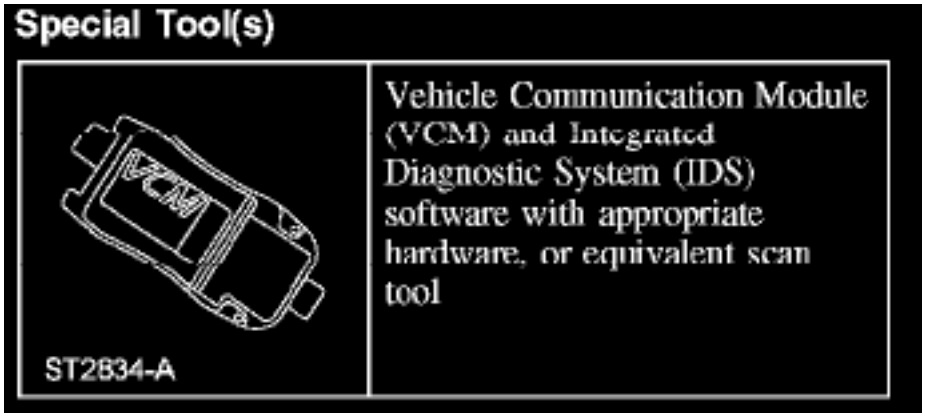
deployable steering column. Use tape or other insulating material to make sure that the leads do not make contact with each other.

7. Remain at least 9.14 m (30 ft) away from the deployable steering column. 8. From the end of the jumper harness that is not connected to the deployable steering column, disconnect the 2 wires of the jumper harness from

each other.

9. Deploy the deployable steering column by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.

10. To allow for cooling, wait at least 10 minutes before approaching the deployed steering column. 11. Dispose of the deployed steering column in the same manner as any other part to be scrapped.



Air Bag(s) Arming and Disarming: Service and Repair Supplemental Restraint System (SRS) Depowering and Repowering

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) DEPOWERING AND REPOWERING

Special Tool(s)

Special Tool(s)

Depowering Procedure

WARNING:

- Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

- To reduce the risk of accidental deployment, do not use any memory saver devices. Failure to follow this instruction may result in serious personal injury or death.

NOTE:

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1. Turn all vehicle accessories OFF. 2. Turn the ignition switch to OFF. 3. At the smart junction box (SJB), located below the RH side of the instrument panel, remove the RH lower cowl trim panel and remove the

restraints control module (RCM) fuse 8 (10A) from the SJB.

4. Turn the ignition ON and visually monitor the air bag warning indicator for at least 30 seconds. The air bag warning indicator will remain lit

continuously (no flashing) if the correct RCM fuse has been removed. If the air bag warning indicator does not remain lit continuously, remove the correct RCM fuse before proceeding.

5. Turn the ignition OFF.

6. WARNING: Always deplete the backup power supply before repairing or installing any new front or side air bag supplemental restraint

system (SRS) component and before servicing, removing, installing, adjusting or striking components near the front or side impact sensors or the restraints control module (RCM). Nearby components include doors, instrument panel, console, door latches, strikers, seats and hood latches.

Refer to the Description and Operation portion of Air Bag Systems for location of the RCM and impact sensor(s).

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least 1 minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Failure to follow these instructions may result in serious personal injury or death in the event of an accidental deployment.

Disconnect the battery ground cable and wait at least one minute.

Repowering Procedure

1. Turn the ignition switch from OFF to ON. 2. Install the RCM fuse 8 (10A) to the SJB and install the RH lower cowl trim panel.

3. WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is

connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

Connect the battery ground cable.

4. Prove out the SRS as follows:

Turn the ignition key from ON to OFF. Wait 10 seconds, then turn the key back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an air bag SRS fault is present, the air bag warning indicator will: -

fail to light.

- remain lit continuously.

- flash at a 5Hz rate (RCM not configured).

The air bag warning indicator may not illuminate until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.

Clear all continuous RCM and occupant classification system module (OCSM) DTCs using a scan tool.

Special Tool(s)

Air Bag(s) Arming and Disarming: Service and Repair Supplemental Restraint System (SRS) Deactivation and Reactivation

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) DEACTIVATION AND REACTIVATION

Special Tool(s)

Deactivation Procedure

WARNING:

- Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

- Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

- To reduce the risk of accidental deployment, do not use any memory saver devices. Failure to follow this instruction may result in serious personal injury or death.

NOTE:

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

- No restraint system diagnostic tools are available for the safety belt buckle pretensioners. If the ignition switch is set to RUN or START with either the driver or passenger safety belt buckle pretensioner electrical connector disconnected, the DTCs for an open circuit fault will be active.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1. Turn all vehicle accessories OFF. 2. Turn the ignition switch to OFF. 3. At the smart junction box (SJB), located below the RH side of the instrument panel, remove the restraints control module (RCM) fuse 8 (10A)

from the SJB.

4. Turn the ignition ON and visually monitor the air bag warning indicator for at least 30 seconds. The air bag warning indicator will remain lit

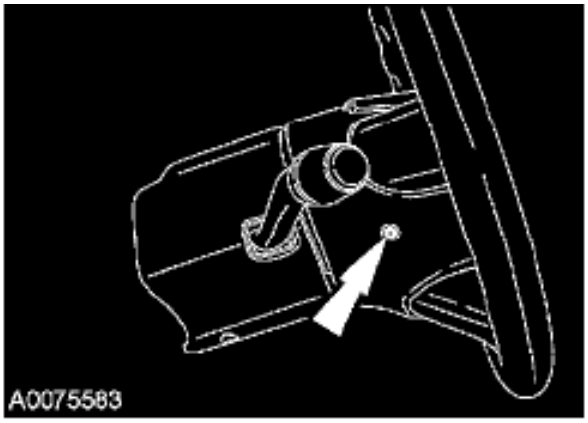
continuously (no flashing) if the correct RCM fuse has been removed. If the air bag warning indicator does not remain lit continuously, remove the correct RCM fuse before proceeding.

5. Turn the ignition OFF.

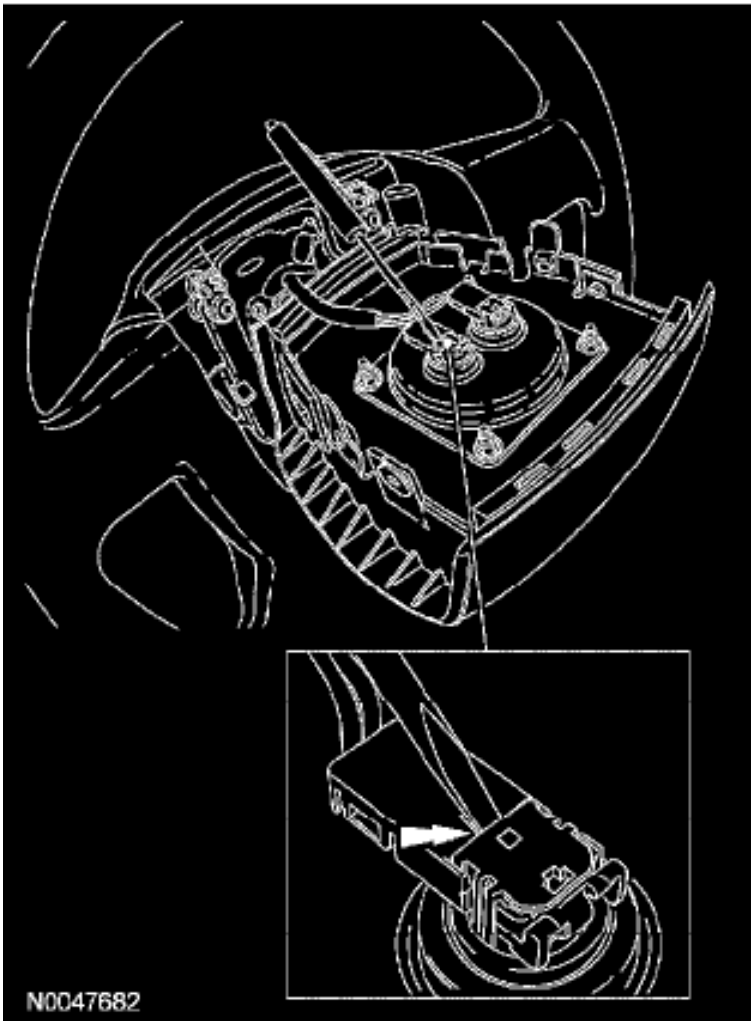
6. WARNING: Always deplete the backup power supply before repairing or installing any new front or side air bag supplemental restraint

system (SRS) component and before servicing, removing, installing, adjusting or striking components near the front or side impact sensors or the restraints control module (RCM). Nearby components include doors, instrument panel, console, door latches, strikers, seats and hood latches.

Refer to the Description and Operation portion of Air Bag Systems for location of the RCM and impact sensor(s).



A0075583



N0047682

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least 1 minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Failure to follow these instructions may result in serious personal injury or death in the event of an accidental deployment.

Disconnect the battery ground cable and wait at least 1 minute.

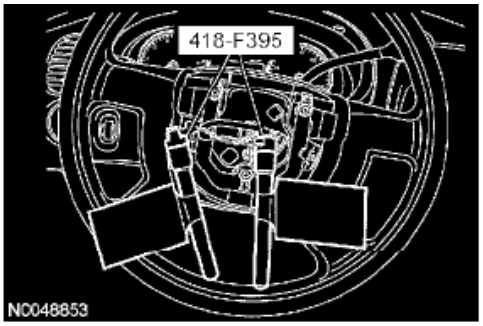
7. Remove the 2 driver air bag module bolts (1 shown).

8. CAUTION: Do not pull the driver air bag module electrical connectors out by the locking buttons. Damage to the locking buttons may

occur.

Using a small screwdriver as shown, lift up and release the locking buttons on the driver air bag module electrical connectors. With the locking buttons released, remove the electrical connectors and the driver air bag module.

9. Attach the restraint system diagnostic tools to the clockspring electrical connectors at the top of the steering column.



418-F395

10. Open the glove compartment door fully to access the passenger air bag electrical connector.
11. Release the tab and disconnect the passenger air bag module electrical connector.

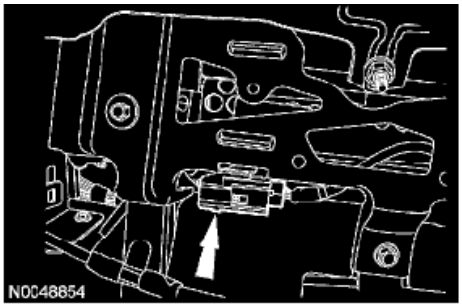
12. Attach the restraint system diagnostic tool to the vehicle harness side of the passenger air bag module electrical connector.

13. Install the RCM fuse 8 (10A) to the SJB. 14. Connect the battery ground cable.

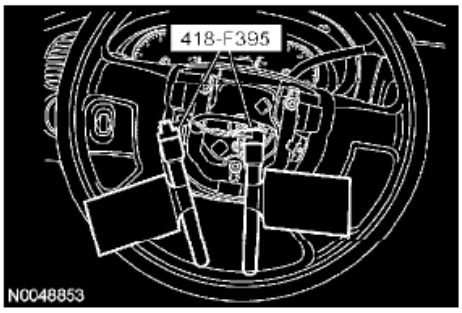
Reactivation Procedure

1. Remove the RCM fuse 8 (10A) from the SJB. 2. Disconnect the battery ground cable and wait at least one minute. 3. Remove the restraint system diagnostic tool from the vehicle harness side of the passenger air bag module electrical connector.

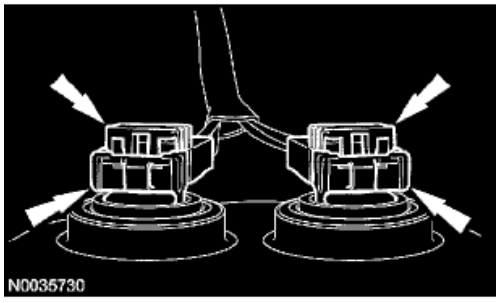
4. Connect the passenger air bag module electrical connector.



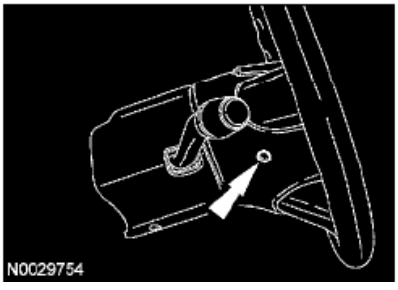
N0048854



418-F395
N0048853



N0035730



N0029754

5. Close the glove compartment door. 6. Remove the restraint system diagnostic tools from the clockspring electrical connectors at the top of the steering column.

7. CAUTION:

- Do not install the driver air bag module electrical connectors by the locking buttons. Damage to the locking buttons may occur.

- The driver air bag module electrical connector locking buttons must be in the released position when the connector is being installed or connector damage may occur.

- The driver air bag module electrical connectors are unique and cannot be reversed when connected to the driver air bag module. Match the electrical connector key to the keyway in the driver air bag module. Do not force the electrical connectors into the driver air bag module. Damage to the connector or component may occur.

With the locking buttons released, install the driver air bag module electrical connectors fully into the driver air bag module and seat the locking buttons.

8. Install the 2 driver air bag module bolts (1 shown).

- Tighten to 6 Nm (53 lb-in).

9. WARNING: Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental

restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death

in a crash and possibly violate vehicle safety standards.

Make sure all restraint system diagnostic tool(s) that may have been installed during the repair have been removed from the vehicle and all SRS components are connected.

10. Turn the ignition from OFF to ON. 11. Install the restraint system control module fuse 8 (10A) to the SJB.

12. WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is

connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

Connect the battery ground cable.

13. Prove out the SRS as follows:

Turn the ignition key from ON to OFF. Wait 10 seconds, then turn the key back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an air bag SRS fault is present, the air bag warning indicator will: -

fail to light.

- remain lit continuously.

- flash at a 5Hz rate (RCM not configured).

The air bag warning indicator may not illuminate until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.

Clear all continuous RCM and occupant classification system module (OCSM) DTCs using a scan tool.

Air Bag: Service and Repair Driver Air Bag Module

DRIVER AIR BAG MODULE

Removal

WARNING: -

Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

- Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

- Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which

increases the risk of serious personal injury or death.

NOTE: -

The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

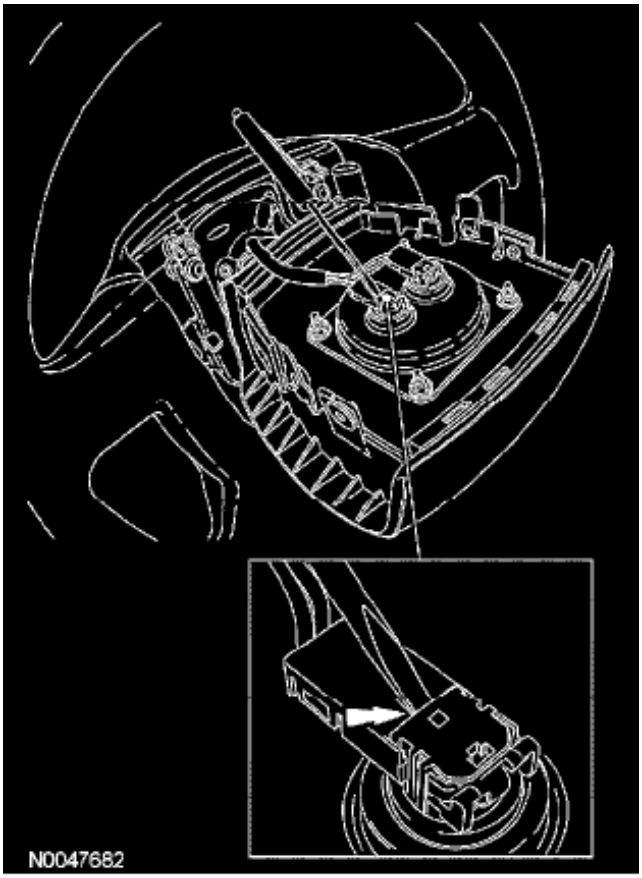
- Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

1. Depower the SRS. 2. Remove the 2 driver air bag module bolts.

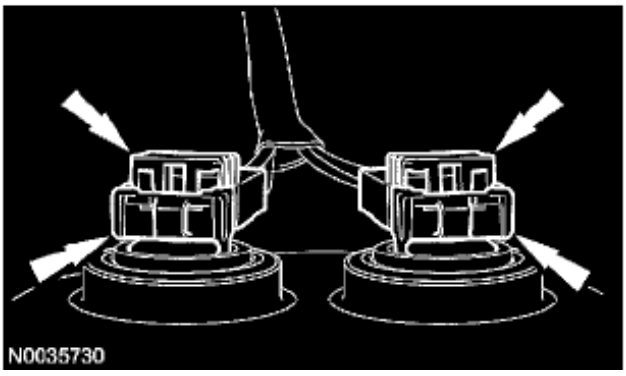
3. CAUTION: Do not pull the driver air bag module electrical connectors out by the locking buttons. Damage to the locking buttons may

occur.

Using a small screwdriver as shown, lift up and release the locking buttons on the driver air bag module electrical connectors. With the locking



N0047682



N0035730

buttons released, remove the electrical connectors and the driver air bag module.

Installation

1. CAUTION:

- Do not install the driver air bag module electrical connectors by the locking buttons. Damage to the locking buttons may occur.

- The driver air bag module electrical connector locking buttons must be in the released position when the connector is being installed or connector damage may occur.

- The driver air bag module electrical connectors are unique and cannot be reversed when connected to the driver air bag module. Match the electrical connector key to the keyway in the driver air bag module. Do not force the electrical connectors into the driver air bag module. Damage to the connector or component may occur.

With the locking buttons released, install the driver air bag module electrical connectors fully into the driver air bag module and seat the locking buttons.

2. Install the 2 driver air bag module bolts.

- Tighten to 6 Nm (53 lb-in).

3. Repower the SRS.

Air Bag: Service and Repair Passenger Air Bag Module

PASSENGER AIR BAG MODULE

Removal

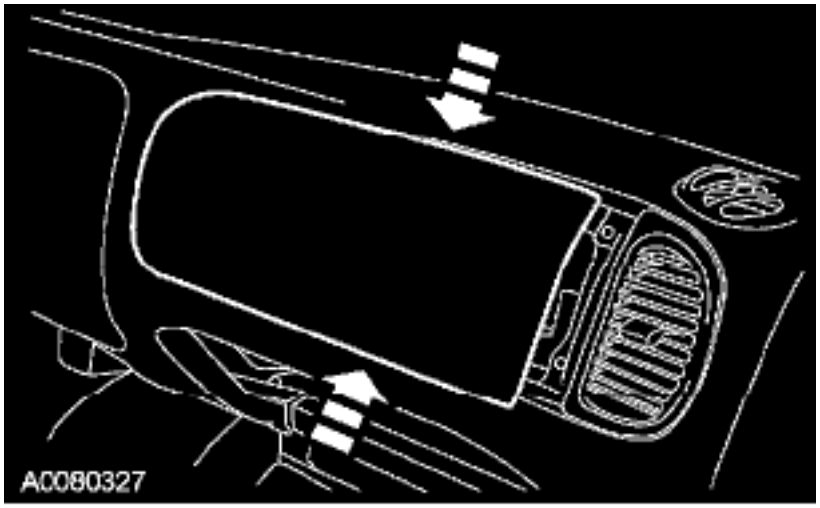
WARNING: -

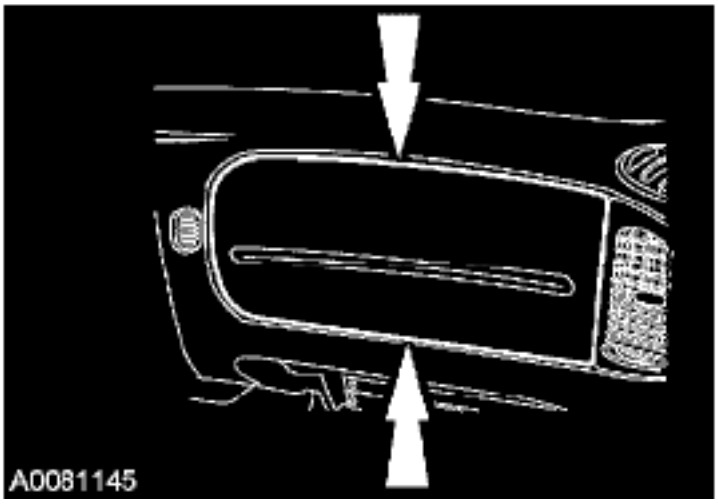
Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

- Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

- Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

- Do not repaint air bag modules with discolored or damaged trim covers or deployment doors; new air bag modules must be installed. Failure to follow this instruction may result in the air bag deploying incorrectly, which increases the risk of serious personal injury or





death in a crash.

NOTE: -

The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

- Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

1. Depower the SRS. 2. Open and lower the glove compartment door. 3. Disconnect the passenger air bag module electrical connector. 4. Remove the 2 passenger air bag module bolts.

5. CAUTION: Do not handle the passenger air bag module by grabbing the edges of the deployment doors. Damage to the air bag module

may occur.

Placing one hand in the glove compartment, push the passenger air bag module out and remove it. -

If necessary, push down on the top and up on the bottom of the deployment door while pushing out on the passenger air bag module, releasing the clips from the instrument panel and remove the passenger air bag module.

Installation

1. CAUTION: Do not handle the passenger air bag module by grabbing the edges of the deployment doors. Damage to the air bag module

may occur.

Position the passenger air bag module into the instrument panel. -

Angle the top of the passenger air bag module into the instrument panel first so that the deployment door upper clips engage to the instrument panel. Push up and in at the top and down and in at the bottom of the deployment door to seat all the clips to the instrument panel.

2. Align the passenger air bag module and install the 2 bolts.

- Tighten to 8 Nm (71 lb-in).

3. Connect the passenger air bag module electrical connector. 4. Close the glove compartment door. 5. Repower the SRS.

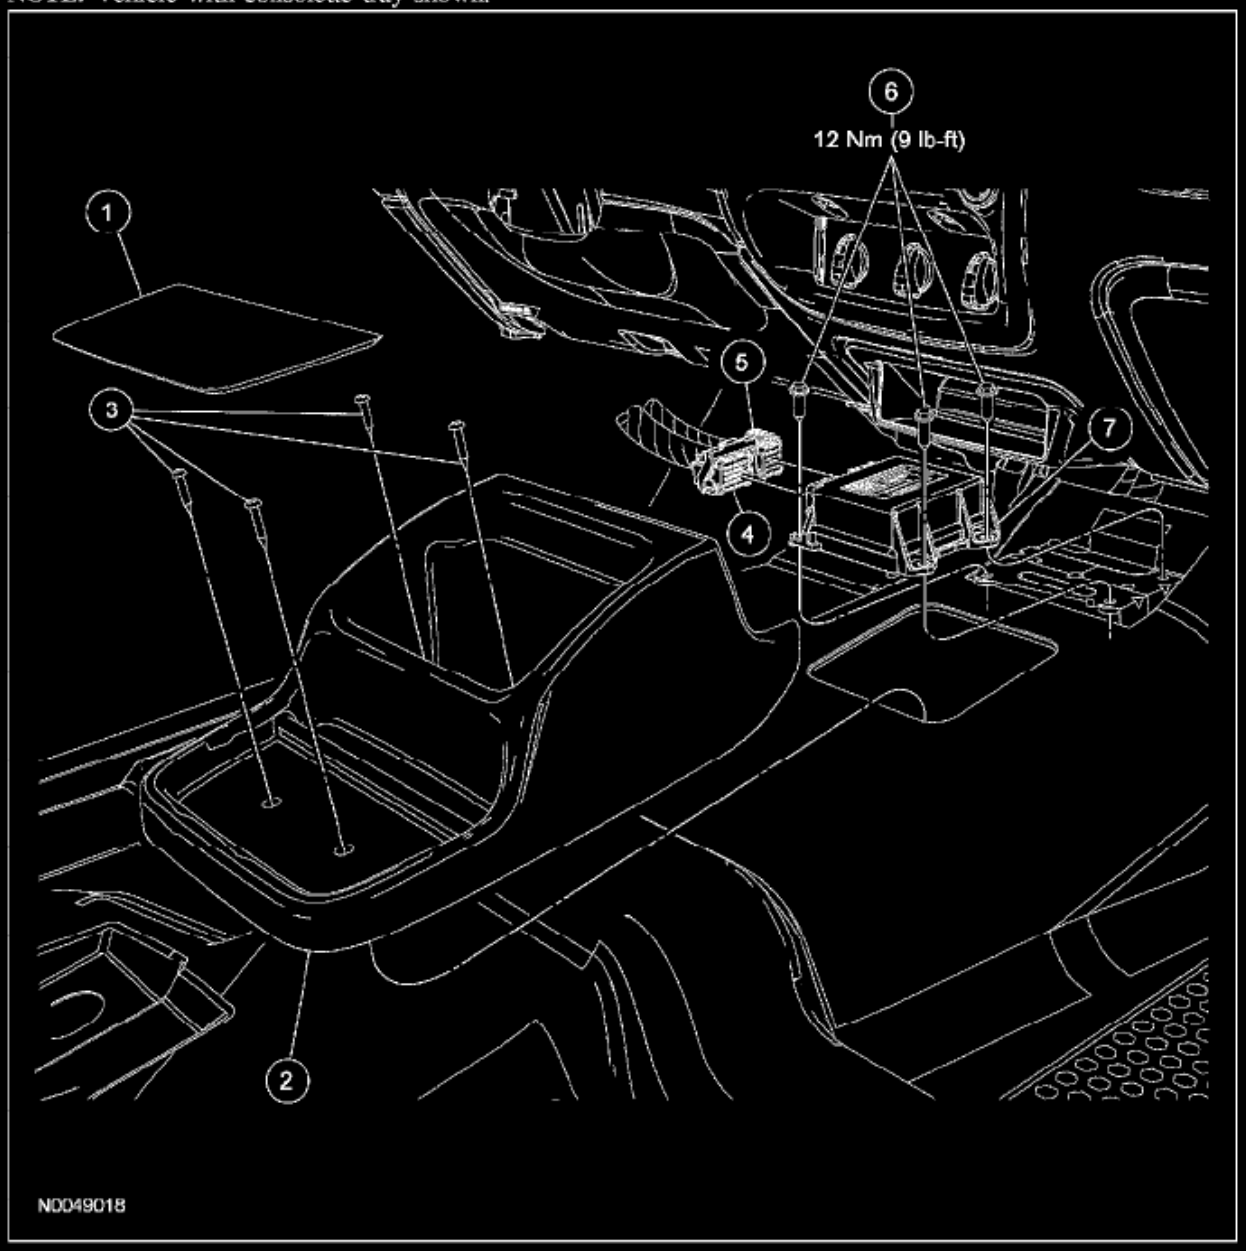
Air Bag Control Module: Service and Repair

RESTRAINTS CONTROL MODULE (RCM)

Special Tool(s)

Special Tool(s)

NOTE: Vehicle with consolette tray shown.



Item	Part Number	Description
1	—	Consolette tray mat (part of 045A36)
2	045A36	Consolette tray
3	—	Consolette tray screws (4 required) (part of 045A36)
4	—	Restraints control module (RCM) large electrical connector (part of 14401)

Item	Part Number	Description
5	—	RCM small electrical connector (part of 14401)
6	W701963	RCM bolts (3 required)
7	14B321	RCM

(Continued)

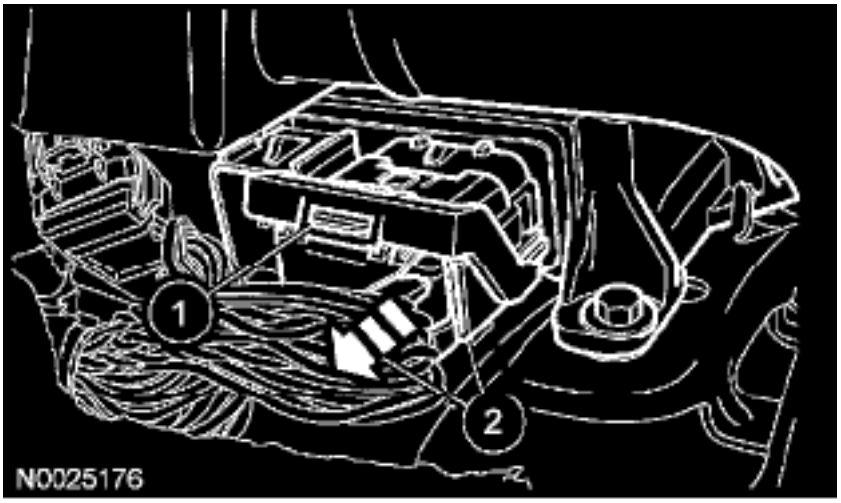
Removal

WARNING: If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the air bags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.

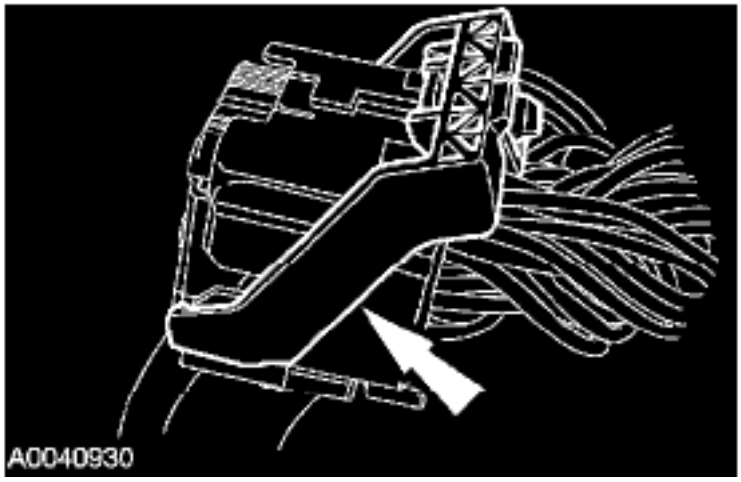
CAUTION: -

When installing a new restraints control module (RCM), it is necessary to carry out programmable module installation (PMI). System failure may occur if PMI is not carried out.

- Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.



1
2
N0025176



A0040930

NOTE: -

The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

- Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

All vehicles 1. Carry out the steps necessary to prepare for programmable module installation (PMI). 2. Depower the SRS.

Vehicles with high-series floor console 3. Remove the floor console.

Vehicles with a consolette 4. Remove the consolette tray mat. 5. Remove the 4 screws and remove the consolette tray.

All vehicles 6. Disconnect the small RCM electrical connector. 7. Disconnect the large RCM electrical connector.

1 Pinch the thumb tab and pivot the connector position assurance lever all the way back until it stops.

2 Pull out and disconnect the RCM electrical connector.

8. Remove the 3 bolts and the RCM.

Installation

All vehicles

1. WARNING: Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque.

Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.

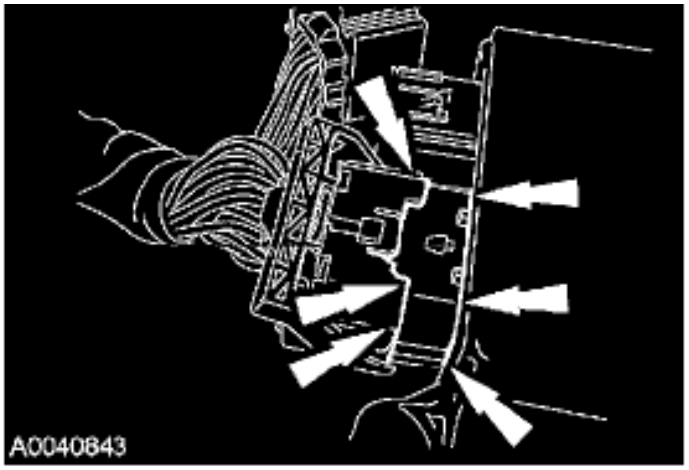
Install the RCM and the 3 bolts. -

To install, tighten to 12 Nm (9 lb-ft).

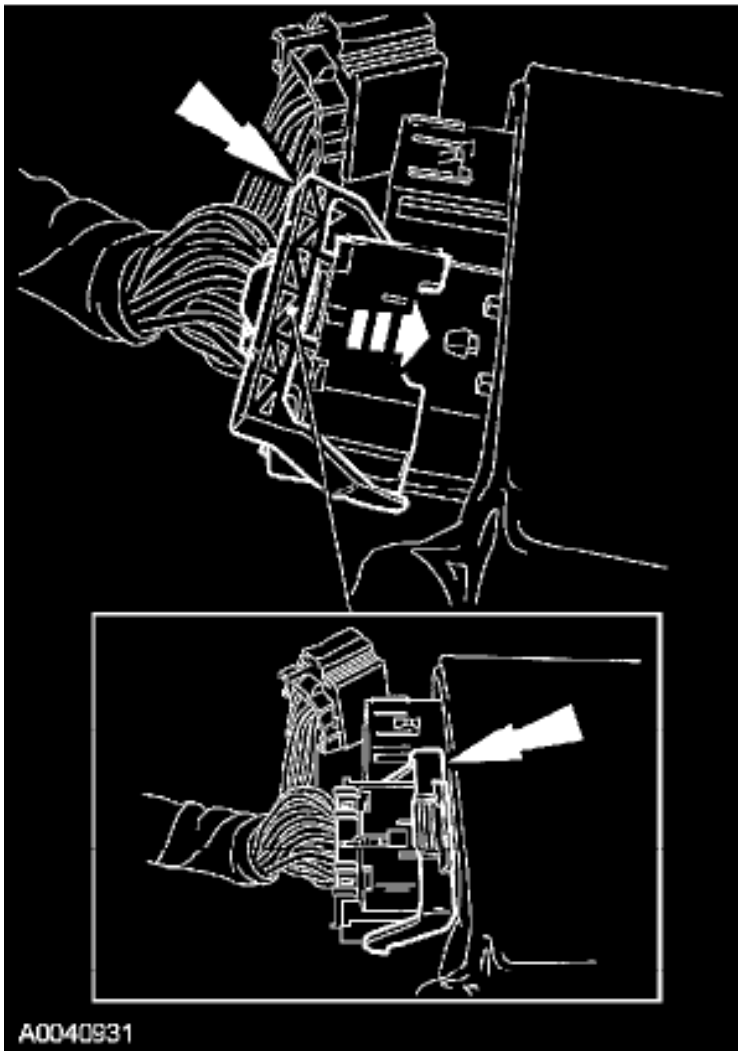
2. Make sure the large RCM connector position assurance lever is in the full release position before attempting to connect the connector.

3. CAUTION: Putting the large restraints control module (RCM) electrical wiring connector into the RCM on an angle can cause bad

electrical connections and damage components.



A0040843



A0040931

NOTE: The RCM has been removed for clarity.

Position the large RCM electrical connector into the RCM.

-

CAUTION: Do not push the connector to the point where the lever pivots and seats itself. Light pressure is needed to get the connector into position on the restraints control module (RCM), before using the lever to fully seat the connector. Damage to the connector or component may occur.

With the large RCM electrical connector uniformly aligned to the RCM, lightly push in until a subtle audible click is heard and slight resistance is felt.

4. Connect the large RCM electrical connector.

- Using the connector position assurance lever, pivot it toward the RCM, drawing the connector into the RCM. -

Make sure the thumb tab is engaged to the retainer on the RCM and locked in place.

5. Connect the small RCM electrical connector.

Vehicles with a consolette 6. Install the consolette tray and the 4 screws. 7. Install the consolette tray mat.

Vehicles with high-series floor console 8. Install the floor console.

All vehicles 9. Repower the SRS. Do not prove out the SRS at this time.

10. When installing a new RCM, carry out the steps necessary to complete PMI.

11. Prove out the supplemental restraint system (SRS) as follows:

Turn the ignition switch from ON to OFF. Wait 10 seconds, then turn the ignition switch back to ON and visually monitor the air bag indicator with the air bag modules installed. The air bag indicator will light continuously for approximately 6 seconds and then turn OFF. If an air bag SRS fault is present, the air bag indicator will: -

fail to light.

- remain lit continuously.

- flash at a 5 Hz rate (RCM not configured).

The air bag indicator might not light until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag indicator and any SRS fault discovered must be diagnosed and repaired.

Clear all continuous DTCs from the RCM and occupant classification system module (OCSM) using a scan tool.

Connector: C2286	Description:	Harness:	Base Part #:

Air Bag Deactivation Indicator: Service and Repair

PASSENGER AIR BAG DEACTIVATION (PAD) INDICATOR

Removal and Installation

NOTE:

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

- Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1. Depower the SRS. 2. Remove the 2 instrument panel (I/P) center finish panel screws. 3. Pull out to detach the 4 retaining clips and partially remove the I/P center trim panel. 4. Disconnect the passenger air bag deactivation (PAD) indicator electrical connector. 5. Remove the 2 screws from the PAD indicator and remove it from the I/P center finish panel. 6. To install, reverse the removal procedure. 7. Repower the SRS.

Removal

WARNING: -

Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

- Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

- Do not repaint air bag modules with discolored or damaged trim covers or deployment doors; new air bag modules must be installed. Failure to follow this instruction may result in the air bag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.

NOTE: -

The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a

supplemental restraint system (SRS) fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

- A repair is made by installing a new part only. If the new part does not correct the condition, install the original part and perform the diagnostic procedure again.

1. Remove the driver air bag module.

2. NOTE: Make sure the wheels are in the straight-ahead position.

Remove the steering wheel.

3. Remove the ignition lock cylinder. 4. Remove the 2 screws and position the hood release handle aside. 5. Remove the 2 screws from the lower steering column opening finish panel. Then pull out to release the retaining clips and remove the lower

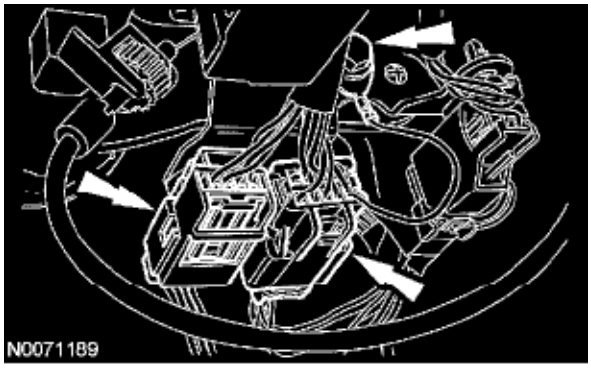
steering column opening finish panel.

6. Remove the 5 bolts and lower steering column opening finish panel reinforcement. 7. If equipped, remove the tilt wheel handle and shank. 8. Remove the 3 screws and lower steering column shroud. 9. Position the upper steering column shroud up enough to access the clockspring retaining clips.

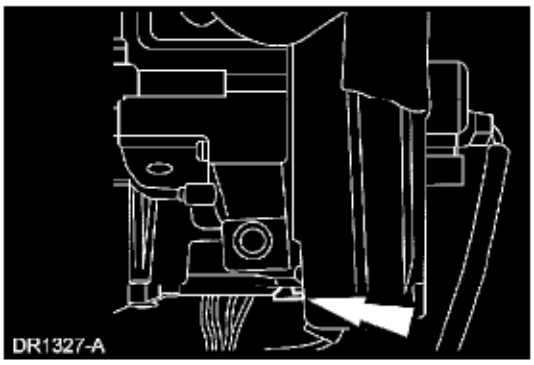
10. Detach the clockspring wire harness from the wiring retainer. 11. Disconnect the clockspring electrical connectors.

- Disconnect the harness ground wire.

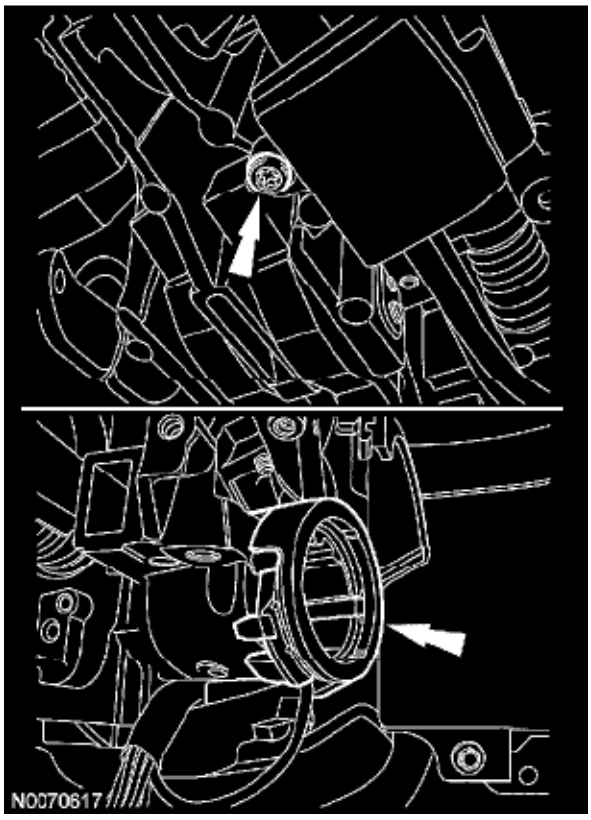
- Release the pin-type retainers and disconnect the clockspring electrical connectors.



N0071189



DR1327-A



N0070617

12. Release the lower clockspring retaining clip.

13. Remove the screw, the passive anti-theft system (PATS) antenna and the key-in-ignition warning indicator switch from the lock cylinder housing.

14. Release the remaining 2 clockspring retaining clips and remove the clockspring.

Installation

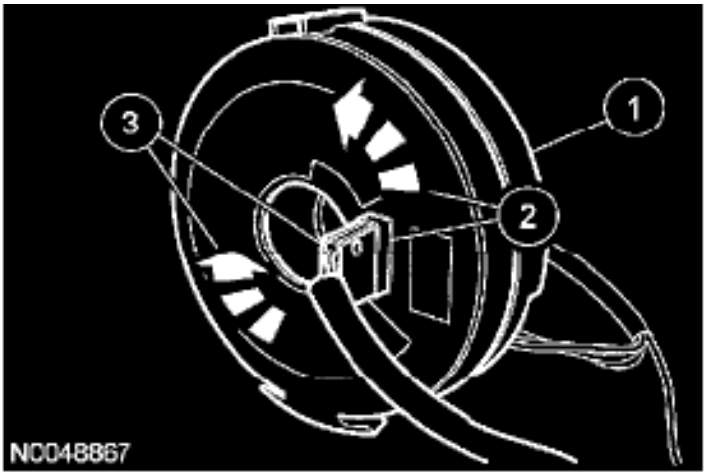
Vehicles receiving a new clockspring

1. NOTE: A new clockspring is packaged in a centralized position and fixed in position with a key.

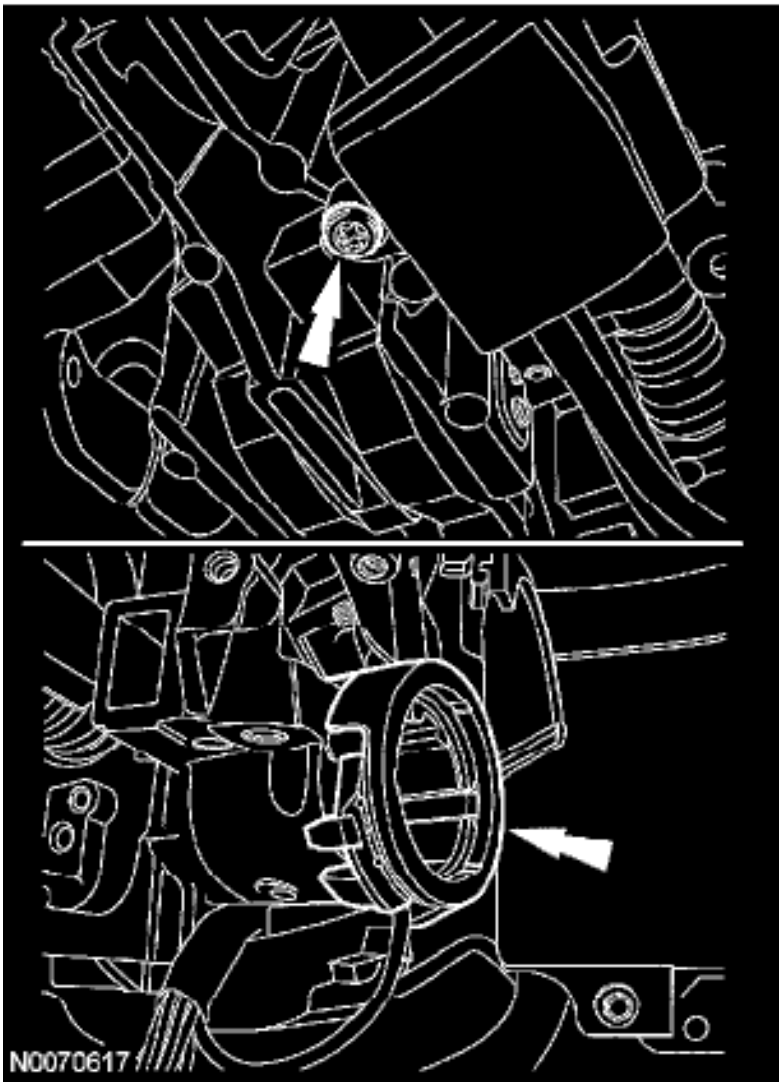
Remove the key from the clockspring, holding the rotor in its centralized position. -

Do not allow the clockspring rotor to turn.

Vehicles needing clockspring recentering



3
1
2
N0048867



N0070617

2. WARNING: If the clockspring is not correctly centralized, it may fail prematurely. If in doubt, repeat the centralizing procedure.

Failure to follow these instructions may increase the risk of serious personal injury or death in a crash.

NOTE: -

Make sure the wheels are in the straight-ahead position.

- If a clockspring has rotated out of center, follow through with this step.

- Similar clockspring shown.

Centralize the clockspring.

1 Hold the clockspring outer housing stationary.

2 CAUTION: Overturning will destroy the clockspring. The internal ribbon wire acts as the stop and can be broken from its internal connection.

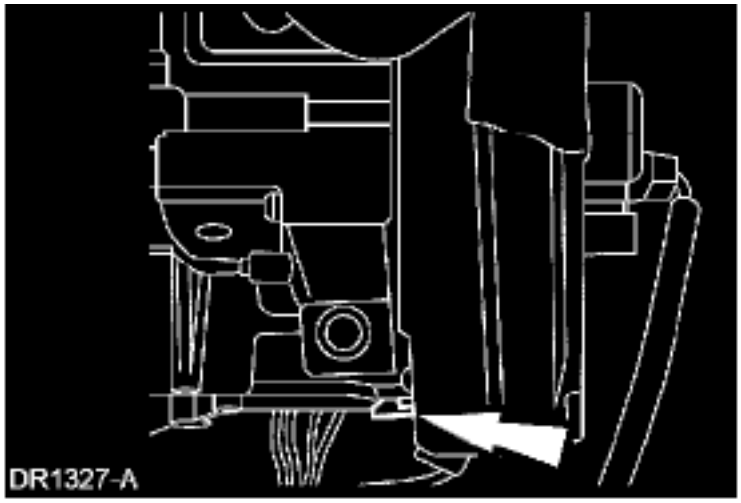
While holding the clockspring locking tab in the released position, turn the rotor counterclockwise, carefully feeling for the ribbon wire to run out of length and a slight resistance to be felt. Stop turning at this point.

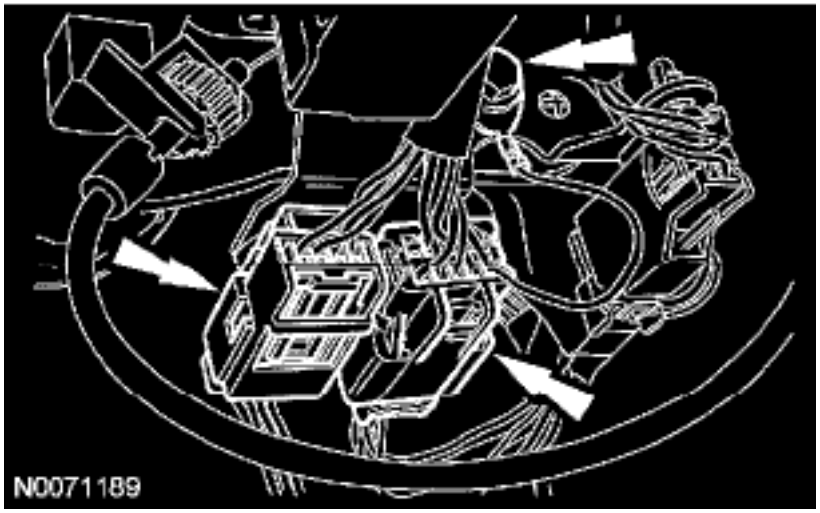
3 While holding the clockspring locking tab in the released position, turn the clockspring clockwise approximately 2.25 turns. This is the center point of the clockspring. -

Do not allow the rotor to turn from this position.

All vehicles 3. Install the PATS antenna and the key-in-ignition warning indicator switch to the lock cylinder housing.

4. NOTE: Slight clockspring rotor turning is allowed for steering column alignment.





Install the clockspring onto the steering column. -

With the flats of the clockspring aligned to the flats of the steering column, slide the clockspring onto the steering column.

- Engage the upper and side retaining tabs.

5. Engage the lower clockspring retaining clip.

6. Install the clockspring electrical connectors.

- Install the ground wire.

- Connect the electrical connectors. Install the pin-type retainers and electrical connectors to the bracket.

7. Attach the clockspring wire harness to the wiring retainer. 8. Reposition the upper steering column shroud. 9. Position the lower steering column shroud and install the 3 screws.

10. Install the tilt wheel handle and shank. 11. Position the steering column opening finish panel reinforcement and install the 4 bolts.

- Tighten to 12 Nm (9 lb-ft).

12. Align the lower steering column opening finish panel and push in, seating the retaining clips. Then install the 2 screws. 13. Position the hood release handle. Install the 2 screws. 14. Install the ignition lock cylinder.

15. NOTE: Make sure the wheels are in the straight-ahead position.

Install the steering wheel.

16. Install the driver air bag module.

Impact Sensor: Service and Repair

FRONT IMPACT SEVERITY SENSOR

Removal and Installation

WARNING:

- If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the air bags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.

- Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.

NOTE:

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

- Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

All vehicles

1. Depower the SRS.

Vehicles equipped with 2.3L and A/C

2. For the RH front impact severity sensor, remove the air cleaner and air cleaner outlet pipe.

All vehicles

3. NOTE:

- Make sure the radiator support and front impact severity sensor mating surfaces are clean and free of foreign material.

- Note position of locator tab on sensor bracket for installation.

Remove the front impact severity sensor bolt. -

To install, tighten to 12 Nm (9 lb-ft).

4. Disconnect the front impact severity sensor electrical connector and remove the sensor. 5. To install, reverse the removal procedure. 6. Repower the SRS.

5	—	Seat track-to-cushion frame bolts

Seat With A Service Kit Occupant Classification Sensor

Removal

WARNING: -

Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.

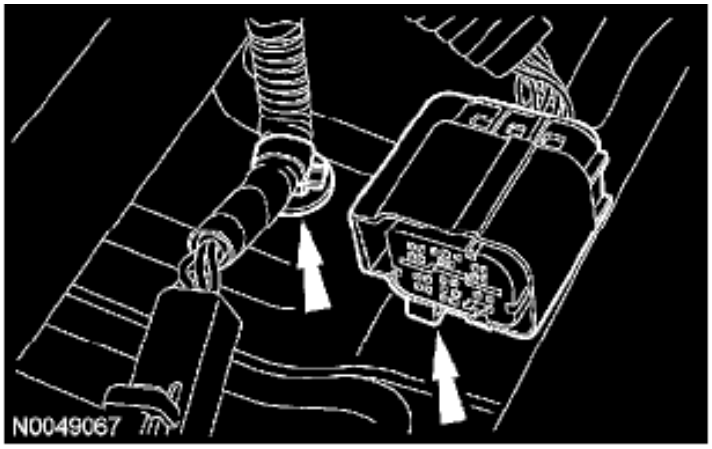
- Install a new occupant classification sensor (OCS) system service kit as a complete assembly. Never install only part of the kit components. Failure to follow this instruction may result in incorrect operation of the OCS system and increases the risk of serious personal injury or death in a crash.

- Make sure the front passenger seat repair is complete, the seat and all attached components (head restraint, seat side shield, etc.) are correctly assembled, and the seat is correctly installed to the vehicle before carrying out the System Reset. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increases the risk of serious personal injury or death in a crash.

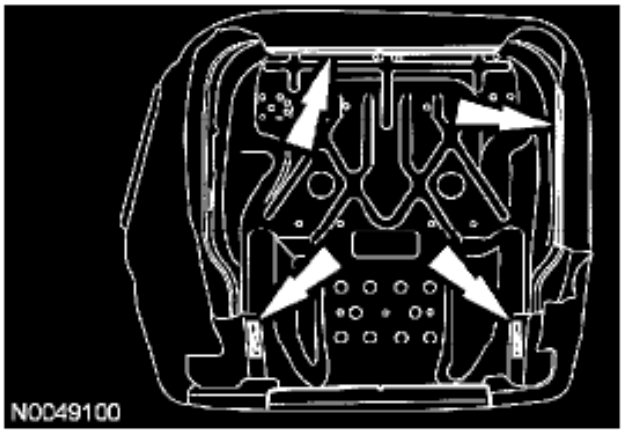
CAUTION: To prevent system failure, it is necessary to carry out the occupant classification sensor (OCS) system reset when a front passenger seat cushion is disassembled, a new trim cover installed or an OCS system service kit is installed. A scan tool is used to carry out the OCS system reset command.

NOTE: -

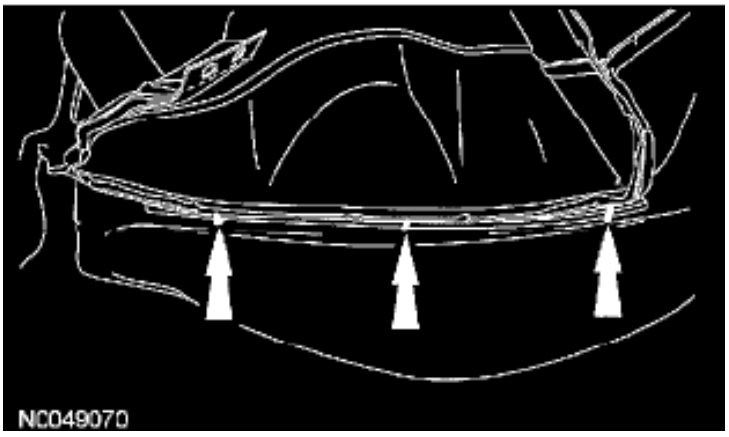
Occupant classification sensor (OCS) system components (seat cushion foam pad, bladder with pressure sensor and occupant classification system module [OCSM]) are calibrated to each other and are serviced as an assembly. The OCS system components are not to be installed separately. If a



N0049067



N0049100



N0049070

new OCS system, OCS system component or seat cushion foam pad are needed, a new OCS system service kit (seat cushion foam pad, bladder with pressure sensor, OCSM and seat wiring harness) must be installed as an assembly.

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

- Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and perform the diagnostic procedure again.

1. Remove the passenger seat. 2. Remove the seat backrest.

3. NOTE: Note position of wire routing for installation.

Release the seat wiring harness retainer clip and detach the seat wiring harness connector from the seat cushion frame.

4. Release the cushion trim cover rear J-clip. 5. Remove the 4 seat track-to-cushion frame bolts and the seat track assembly. 6. Release the remaining cushion trim cover J-clips.

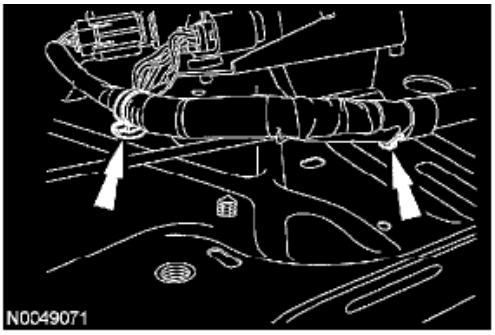
7. CAUTION: An occupant classification sensor (OCS) system service kit will have the OCS system bladder attached to the seat cushion

foam pad. Do not separate the OCS system bladder from the seat cushion foam pad. Failure to do so can result in component failure.

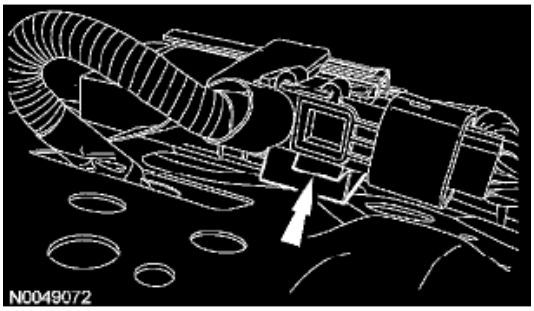
Remove the hog rings and the cushion trim cover from the seat cushion foam pad.

8. NOTE: Note position of wire routing for installation.

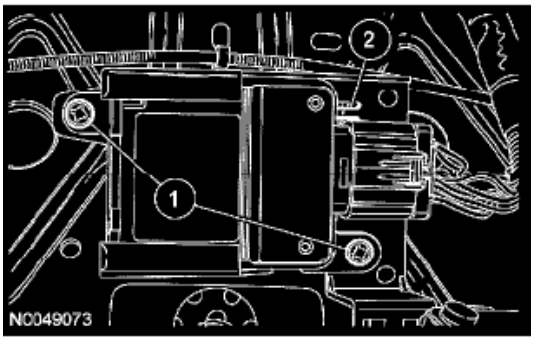
Release the 2 seat wiring harness routing clips from the cushion frame.



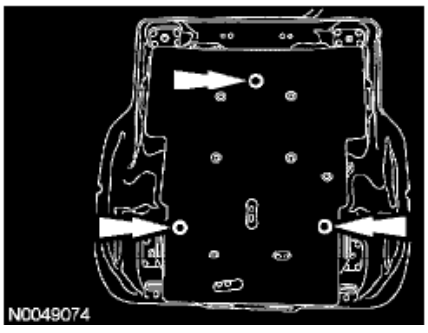
N0049071



N0049072



2
1
N0049073



N0049074

9. Release the pressure sensor bracket retainer and slide the pressure sensor off the bracket.

10. Remove the OCSM.

1 Remove the 2 screws from the OCSM.

2 Release the OCSM bracket retainer and slide the OCSM off the bracket.

11. CAUTION: A production occupant classification sensor (OCS) system bladder is shown. An OCS system service kit will have the OCS

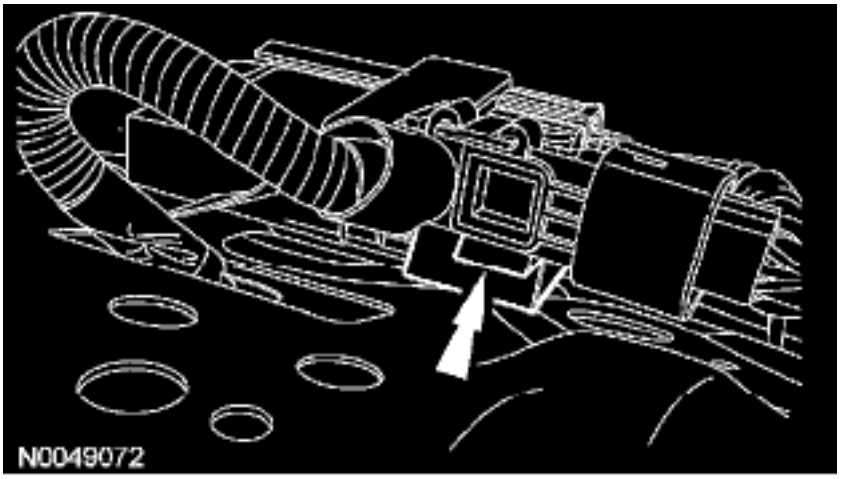
system bladder attached to the seat cushion foam pad. Do not separate the OCS system bladder from the seat cushion foam pad. Failure to do so can result in component failure.

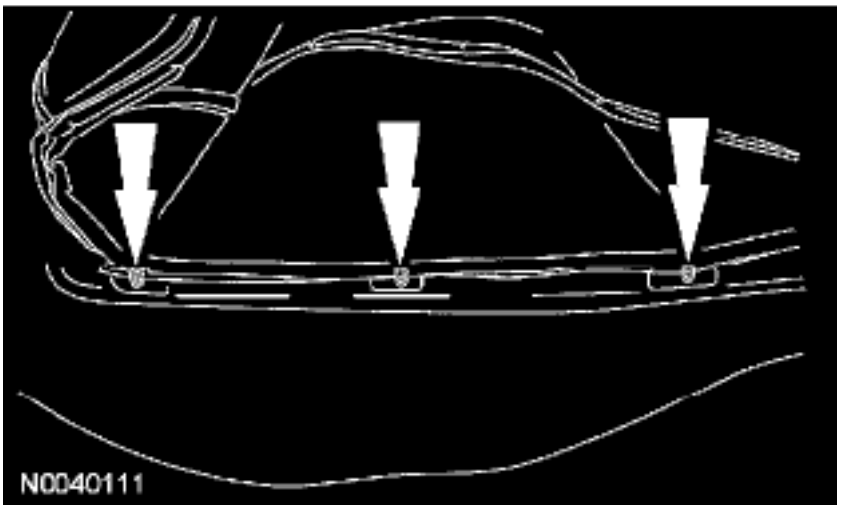
Release the 3 OCS system bladder pin-type retainers from the seat cushion frame.

12. NOTE: Note position of wire routing for installation.

Route the OCS system bladder hose and pressure sensor, OCSM and seat wiring harness out through the seat cushion pan opening.

Installation





1. WARNING: Install a new occupant classification sensor (OCS) system service kit as a complete assembly. Never install only part of the

kit components. Failure to follow this instruction may result in incorrect operation of the OCS system and increases the risk of serious personal injury or death in a crash.

CAUTION: -

Inspect the occupant classification sensor (OCS) system assembly, seat cushion frame and support assembly for any foreign objects before installing the OCS system assembly to the seat cushion frame. If any foreign objects are found, remove them. Failure to follow these instructions may result in incorrect OCS system operation or failure.

- Failure to route the seat occupant sensor components through the correct seat cushion support opening can cause component failure.

- While positioning the seat cushion pan and occupant classification sensor (OCS) assembly, be careful not to damage any of the components. Failure to do so may result in component failure.

NOTE: If the original equipment OCS system is not being installed, install a OCS system service kit using all parts in the kit.

Position the OCS system to the seat cushion frame. -

Route the OCS system bladder hose and pressure sensor, OCSM and seat wiring harness through the seat cushion pan opening.

2. CAUTION: An occupant classification sensor (OCS) system service kit will have the OCS bladder attached to the seat cushion foam pad.

Do not separate the OCS system bladder from the seat cushion foam pad. Failure to do so may result in component failure.

Install the 3 OCS system bladder pin-type retainers to the seat cushion frame.

3. Install the OCSM.

- Slide the OCSM back on the OCSM bracket until it is fully seated and locked in past the OCSM bracket retainer.

- Install the 2 screws in the OCSM.

4. Slide the pressure sensor on the bracket until it is fully seated and locked past the bracket retainer.

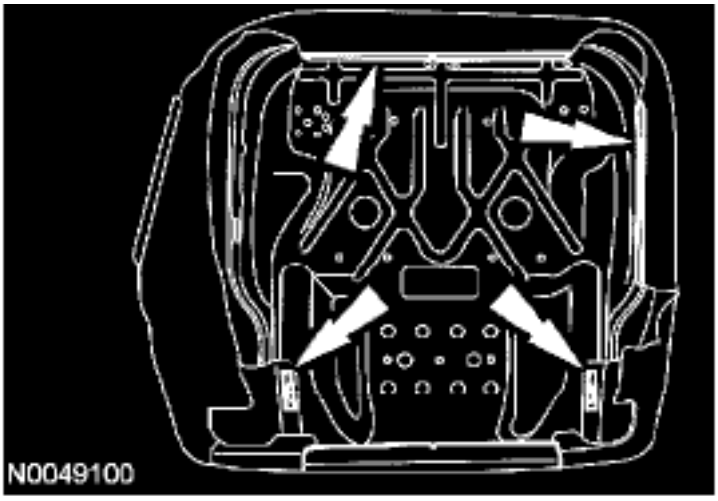
5. Install the 2 seat wiring harness routing clips to the seat cushion frame.

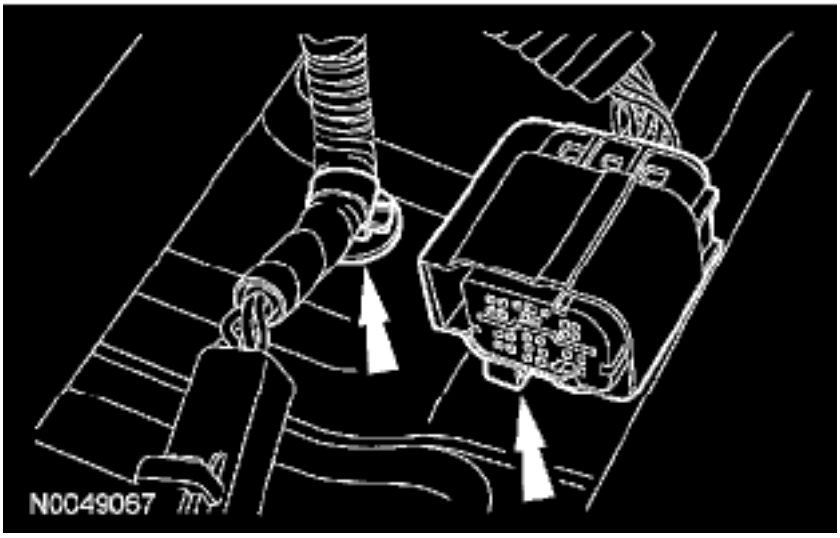
6. CAUTION: Inspect the seat cushion pad and seat cushion trim cover for any foreign objects, before installing the seat cushion trim cover

to the seat cushion pad. If any foreign objects are found, remove them. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and may cause system failure.

Position the cushion trim cover to the foam pad and install the hog rings.

7. Install the foam pad and cushion trim cover to the cushion frame and fasten the J-clips.





8. Install the seat track assembly and 4 bolts.

- Tighten to 6 Nm (53 lb-in).

9. Attach the seat cushion trim cover rear J-clip.

10. Install the seat wiring harness retainer clip and attach the seat wiring harness connector to the seat cushion frame.

11. Install the front seat backrest. 12. Install the passenger seat into the vehicle. 13. Repower the SRS. Do not prove out the SRS at this time.

14. WARNING:

- Install a new occupant classification sensor (OCS) system service kit as a complete assembly. Never install only part of the kit components. Failure to follow this instruction may result in incorrect operation of the OCS system and increases the risk of serious personal injury or death in a crash.

- Make sure the front passenger seat repair is complete, the seat and all attached components (head restraint, seat side shield, etc.) are correctly assembled, and the seat is correctly installed to the vehicle before carrying out the System Reset. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increases the risk of serious personal injury or death in a crash.

CAUTION: -

To prevent system failure, it is necessary to carry out the occupant classification sensor (OCS) system reset of the OCS system when a front passenger seat cushion is disassembled, a new trim cover installed or an OCS system service kit is installed. A scan tool is used to carry out the OCS system reset command.

- To prevent system failure, the following precautions must be taken before carrying out the occupant classification sensor (OCS) system reset: -

Make sure the voltage to the occupant classification system module (OCSM) is above 8.0 volts and less than 18.0 volts.

- Make sure the OCS system is not at a temperature below 6°C (42°F) or above 36°C (97°F) when initiating the OCS system reset process. If the vehicle has been exposed to extreme cold or hot temperatures, the vehicle must be exposed and kept at a temperature within the limits, 6°C to 36°C (42°F to 97°F) for a minimum of 30 minutes.

- Make sure nothing is present on the passenger seat before carrying out the OCS system reset and nothing is placed on the seat during the process.

- Make sure a minimum 8-second time period has passed after cycling the ignition switch ON before the carrying out the OCS system reset process.

NOTE: If the first attempt to carry out the OCS system reset is unsuccessful, a second attempt must be made. If the second attempt is unsuccessful, a new OCS system service kit must be installed.

Carry out the OCS system reset active command.

15. Cycle the ignition switch from ON to OFF.

16. NOTE: The ignition switch must be cycled after the OCS system reset.

Cycle the ignition switch from OFF to ON.

17. Prove out the SRS as follows:

Turn the ignition key from ON to OFF. Wait 10 seconds, then turn the key back to ON and visually monitor the air bag indicator with the air bag modules installed. The air bag indicator will light continuously for approximately 6 seconds and then turn off. If an air bag SRS fault is present, the air bag indicator will: -

fail to light.

- remain lit continuously.

- flash at a 5 Hz rate (RCM not configured).

The air bag warning indicator may not illuminate until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.

Clear all continuous RCM and OCSM DTCs using a scan tool.

18. NOTE: A prepaid return postcard is provided with a new OCS system service kit. The serial number for the new part and the vehicle

identification number (VIN) must be recorded and sent to Ford Motor Company.

If a new OCS system was installed, fill out the necessary information on the OCS system traceability card and return it along with the complete inoperative OCS system to Ford Motor Company. -

When returning the inoperative OCS system include: seat cushion foam pad, bladder, OCSM, pressure sensor (transducer), hose, electrical connectors and wire harness (service part OCS system only).

Seat Position Sensor: Service and Repair

SEAT POSITION SENSOR

Removal and Installation

WARNING: Always tighten the seat position sensor retaining bolt to specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.

NOTE:

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

- Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

1. Depower the SRS. 2. Remove the driver seat. 3. Remove the seat track.

4. NOTE: Note the position of the seat position sensor locator tab for installation.

Remove the 2 screws and the seat position sensor and bracket.

5. To install, reverse the removal procedure. 6. Repower the SRS.

Child Seat: Description and Operation

ATTACHING SAFETY SEATS WITH TETHER STRAPS

Some manufacturers make child safety seats that include a tether strap that goes over the back of the vehicle seat and attaches to an anchoring point. Other manufacturers offer the tether strap as an accessory. Contact the manufacturer of the child safety seat for information about ordering a tether strap.

(Continued)

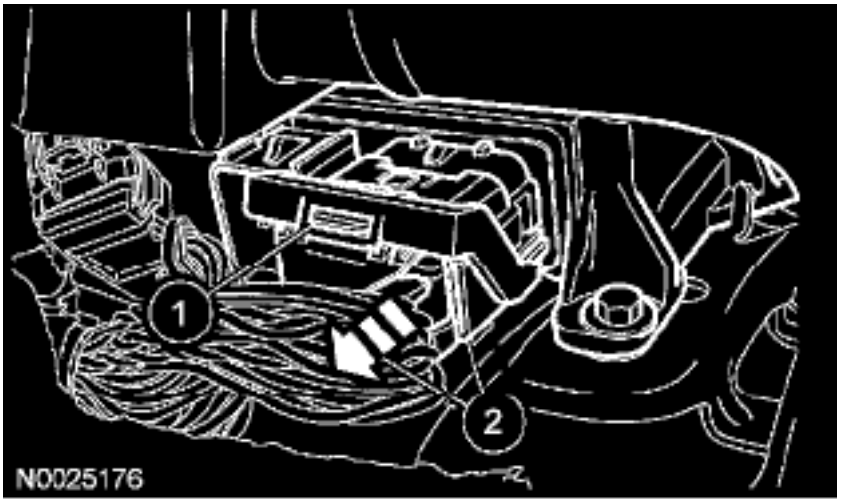
Removal

WARNING: If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the air bags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.

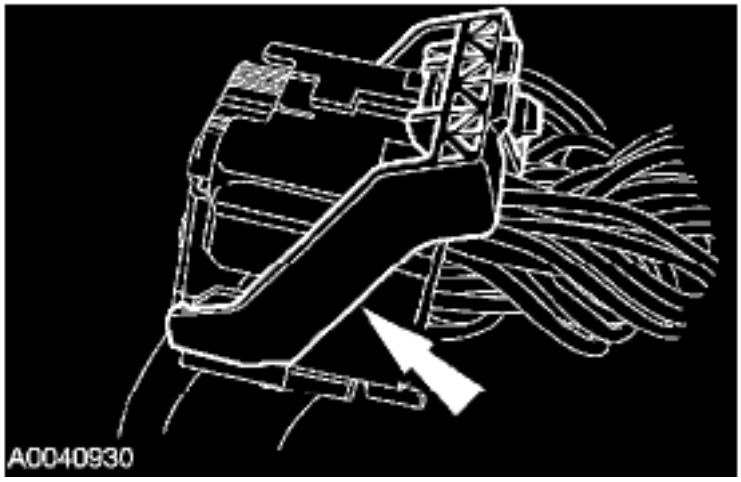
CAUTION: -

When installing a new restraints control module (RCM), it is necessary to carry out programmable module installation (PMI). System failure may occur if PMI is not carried out.

- Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.



1
2
N0025176



A0040930

NOTE: -

The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

- Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

All vehicles 1. Carry out the steps necessary to prepare for programmable module installation (PMI). 2. Depower the SRS.

Vehicles with high-series floor console 3. Remove the floor console.

Vehicles with a consolette 4. Remove the consolette tray mat. 5. Remove the 4 screws and remove the consolette tray.

All vehicles 6. Disconnect the small RCM electrical connector. 7. Disconnect the large RCM electrical connector.

1 Pinch the thumb tab and pivot the connector position assurance lever all the way back until it stops.

2 Pull out and disconnect the RCM electrical connector.

8. Remove the 3 bolts and the RCM.

Installation

All vehicles

1. WARNING: Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque.

Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.

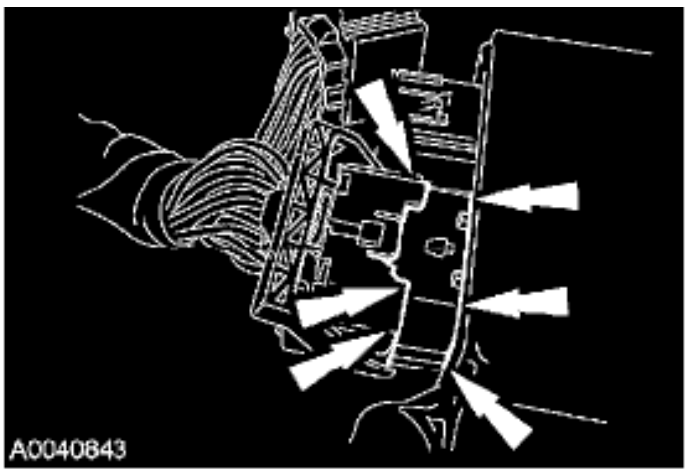
Install the RCM and the 3 bolts. -

To install, tighten to 12 Nm (9 lb-ft).

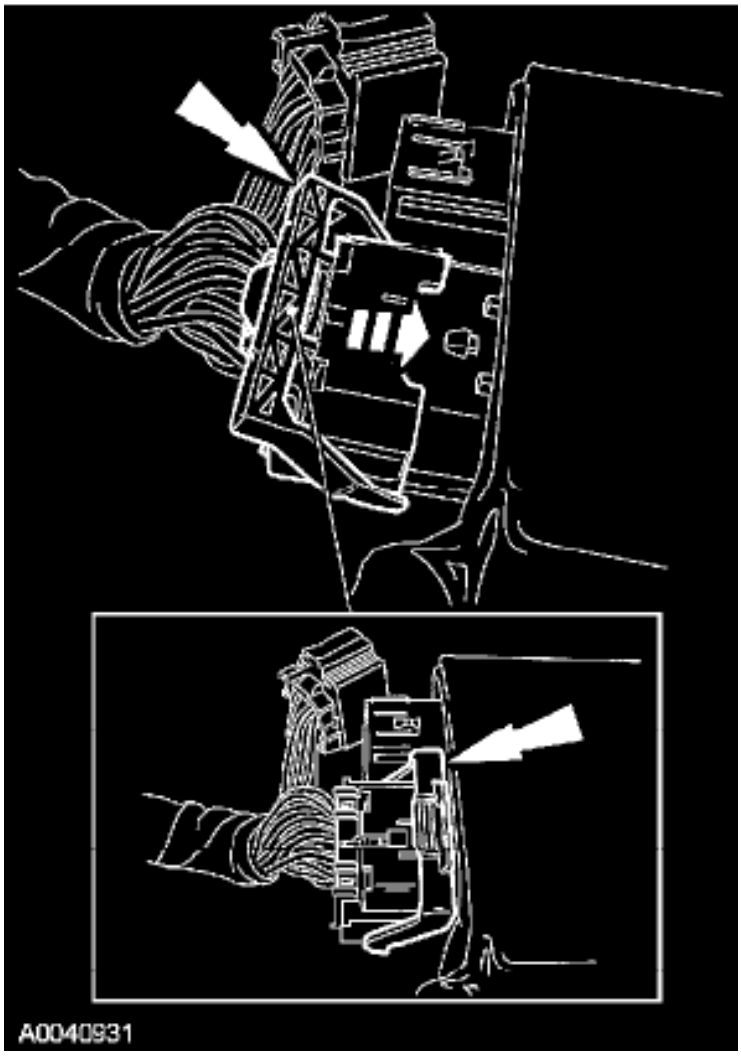
2. Make sure the large RCM connector position assurance lever is in the full release position before attempting to connect the connector.

3. CAUTION: Putting the large restraints control module (RCM) electrical wiring connector into the RCM on an angle can cause bad

electrical connections and damage components.



A0040843



A0040931

NOTE: The RCM has been removed for clarity.

Position the large RCM electrical connector into the RCM.

-

CAUTION: Do not push the connector to the point where the lever pivots and seats itself. Light pressure is needed to get the connector into position on the restraints control module (RCM), before using the lever to fully seat the connector. Damage to the connector or component may occur.

With the large RCM electrical connector uniformly aligned to the RCM, lightly push in until a subtle audible click is heard and slight resistance is felt.

4. Connect the large RCM electrical connector.

- Using the connector position assurance lever, pivot it toward the RCM, drawing the connector into the RCM. -

Make sure the thumb tab is engaged to the retainer on the RCM and locked in place.

5. Connect the small RCM electrical connector.

Vehicles with a consolette 6. Install the consolette tray and the 4 screws. 7. Install the consolette tray mat.

Vehicles with high-series floor console 8. Install the floor console.

All vehicles 9. Repower the SRS. Do not prove out the SRS at this time.

10. When installing a new RCM, carry out the steps necessary to complete PMI.

11. Prove out the supplemental restraint system (SRS) as follows:

Turn the ignition switch from ON to OFF. Wait 10 seconds, then turn the ignition switch back to ON and visually monitor the air bag indicator with the air bag modules installed. The air bag indicator will light continuously for approximately 6 seconds and then turn OFF. If an air bag SRS fault is present, the air bag indicator will: -

fail to light.

- remain lit continuously.

- flash at a 5 Hz rate (RCM not configured).

The air bag indicator might not light until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag indicator and any SRS fault discovered must be diagnosed and repaired.

Clear all continuous DTCs from the RCM and occupant classification system module (OCSM) using a scan tool.

Air Bag(s) Arming and Disarming: Service and Repair Supplemental Restraint System (SRS) Depowering and Repowering

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) DEPOWERING AND REPOWERING

Special Tool(s)

Special Tool(s)

Depowering Procedure

WARNING:

- Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

- To reduce the risk of accidental deployment, do not use any memory saver devices. Failure to follow this instruction may result in serious personal injury or death.

NOTE:

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1. Turn all vehicle accessories OFF. 2. Turn the ignition switch to OFF. 3. At the smart junction box (SJB), located below the RH side of the instrument panel, remove the RH lower cowl trim panel and remove the

restraints control module (RCM) fuse 8 (10A) from the SJB.

4. Turn the ignition ON and visually monitor the air bag warning indicator for at least 30 seconds. The air bag warning indicator will remain lit

continuously (no flashing) if the correct RCM fuse has been removed. If the air bag warning indicator does not remain lit continuously, remove the correct RCM fuse before proceeding.

5. Turn the ignition OFF.

6. WARNING: Always deplete the backup power supply before repairing or installing any new front or side air bag supplemental restraint

system (SRS) component and before servicing, removing, installing, adjusting or striking components near the front or side impact sensors or the restraints control module (RCM). Nearby components include doors, instrument panel, console, door latches, strikers, seats and hood latches.

Refer to the Description and Operation portion of Air Bag Systems for location of the RCM and impact sensor(s).

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least 1 minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Failure to follow these instructions may result in serious personal injury or death in the event of an accidental deployment.

Disconnect the battery ground cable and wait at least one minute.

Repowering Procedure

1. Turn the ignition switch from OFF to ON. 2. Install the RCM fuse 8 (10A) to the SJB and install the RH lower cowl trim panel.

3. WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is

connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

Connect the battery ground cable.

4. Prove out the SRS as follows:

Turn the ignition key from ON to OFF. Wait 10 seconds, then turn the key back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an air bag SRS fault is present, the air bag warning indicator will: -

fail to light.

- remain lit continuously.

- flash at a 5Hz rate (RCM not configured).

The air bag warning indicator may not illuminate until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.

Clear all continuous RCM and occupant classification system module (OCSM) DTCs using a scan tool.

Special Tool(s)

ST2512-A	Diagnostic Tool, Restraint System 418-F403
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Air Bag(s) Arming and Disarming: Service and Repair Supplemental Restraint System (SRS) Deactivation and Reactivation

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) DEACTIVATION AND REACTIVATION

Special Tool(s)

Deactivation Procedure

WARNING:

- Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

- Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

- To reduce the risk of accidental deployment, do not use any memory saver devices. Failure to follow this instruction may result in serious personal injury or death.

NOTE:

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

- No restraint system diagnostic tools are available for the safety belt buckle pretensioners. If the ignition switch is set to RUN or START with either the driver or passenger safety belt buckle pretensioner electrical connector disconnected, the DTCs for an open circuit fault will be active.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1. Turn all vehicle accessories OFF. 2. Turn the ignition switch to OFF. 3. At the smart junction box (SJB), located below the RH side of the instrument panel, remove the restraints control module (RCM) fuse 8 (10A)

from the SJB.

4. Turn the ignition ON and visually monitor the air bag warning indicator for at least 30 seconds. The air bag warning indicator will remain lit

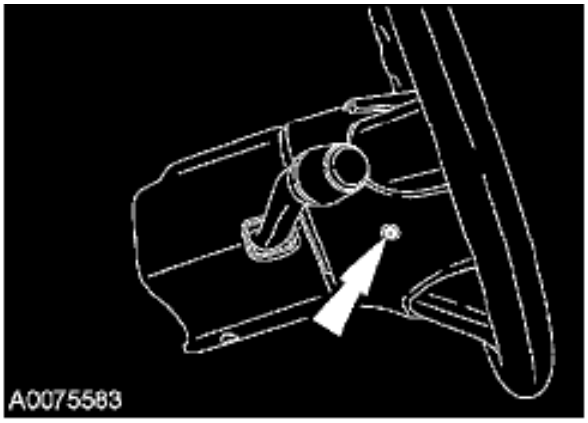
continuously (no flashing) if the correct RCM fuse has been removed. If the air bag warning indicator does not remain lit continuously, remove the correct RCM fuse before proceeding.

5. Turn the ignition OFF.

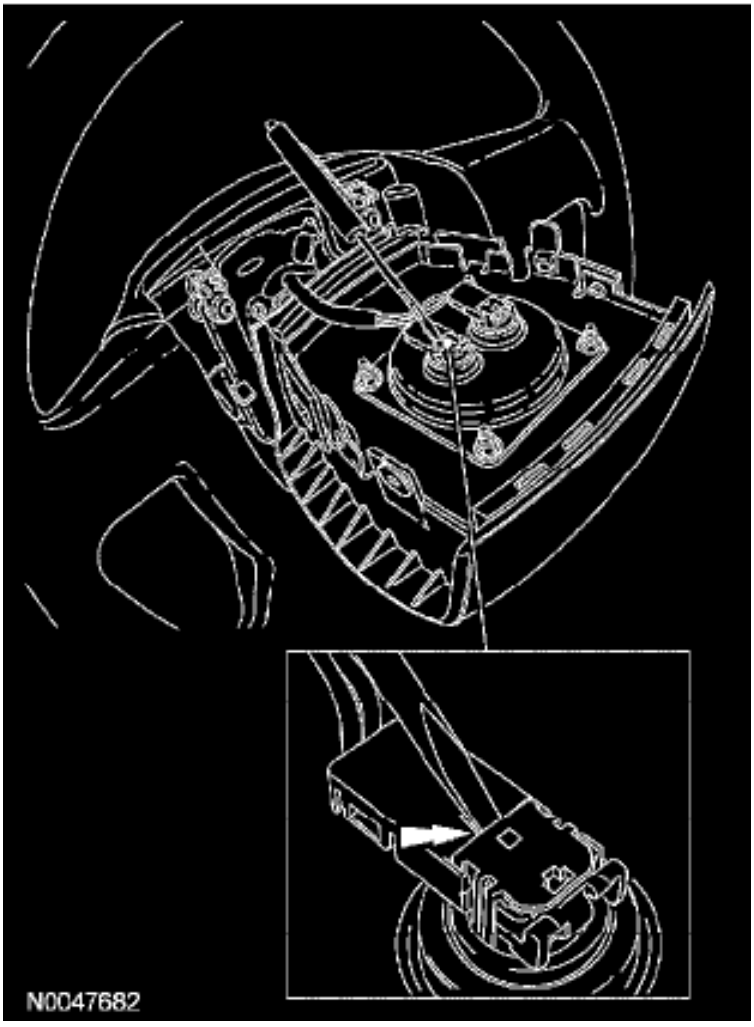
6. WARNING: Always deplete the backup power supply before repairing or installing any new front or side air bag supplemental restraint

system (SRS) component and before servicing, removing, installing, adjusting or striking components near the front or side impact sensors or the restraints control module (RCM). Nearby components include doors, instrument panel, console, door latches, strikers, seats and hood latches.

Refer to the Description and Operation portion of Air Bag Systems for location of the RCM and impact sensor(s).



A0075583



N0047682

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least 1 minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Failure to follow these instructions may result in serious personal injury or death in the event of an accidental deployment.

Disconnect the battery ground cable and wait at least 1 minute.

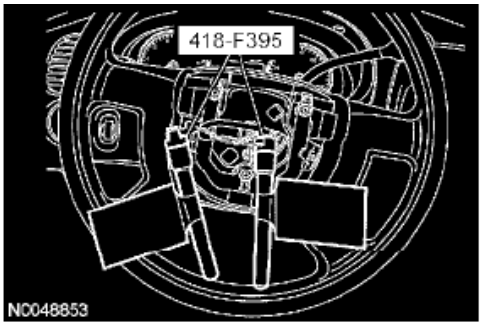
7. Remove the 2 driver air bag module bolts (1 shown).

8. CAUTION: Do not pull the driver air bag module electrical connectors out by the locking buttons. Damage to the locking buttons may

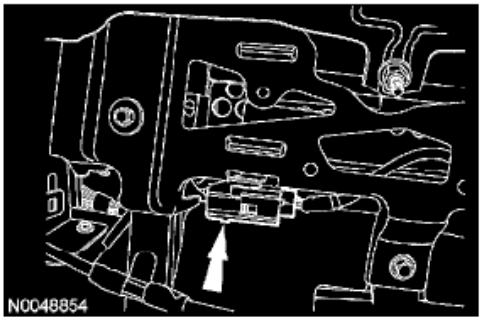
occur.

Using a small screwdriver as shown, lift up and release the locking buttons on the driver air bag module electrical connectors. With the locking buttons released, remove the electrical connectors and the driver air bag module.

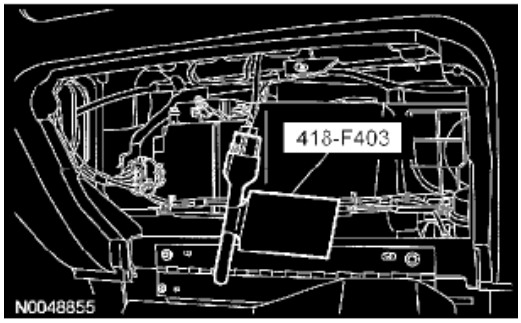
9. Attach the restraint system diagnostic tools to the clockspring electrical connectors at the top of the steering column.



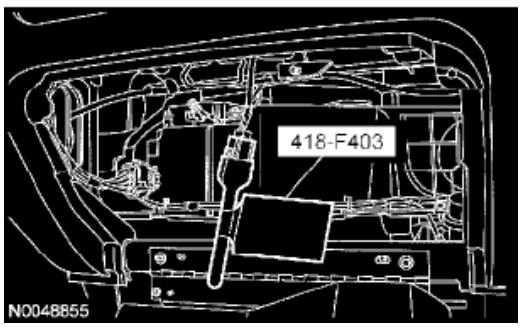
418-F395
N0048853



N0048854



418-F403
N0048855



418-F403

10. Open the glove compartment door fully to access the passenger air bag electrical connector.
11. Release the tab and disconnect the passenger air bag module electrical connector.

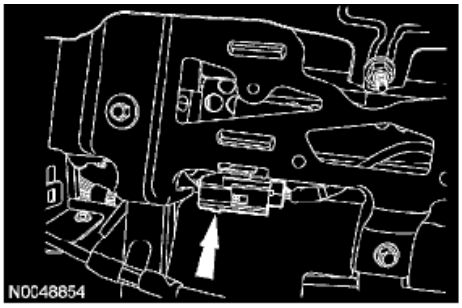
12. Attach the restraint system diagnostic tool to the vehicle harness side of the passenger air bag module electrical connector.

13. Install the RCM fuse 8 (10A) to the SJB. 14. Connect the battery ground cable.

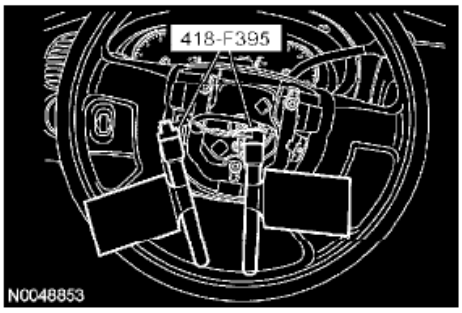
Reactivation Procedure

1. Remove the RCM fuse 8 (10A) from the SJB. 2. Disconnect the battery ground cable and wait at least one minute. 3. Remove the restraint system diagnostic tool from the vehicle harness side of the passenger air bag module electrical connector.

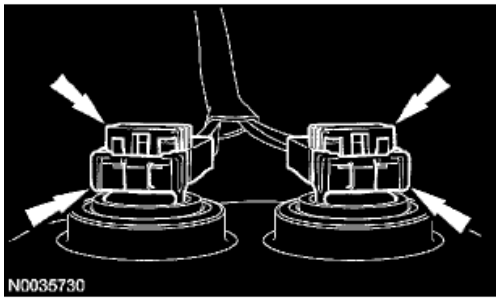
4. Connect the passenger air bag module electrical connector.



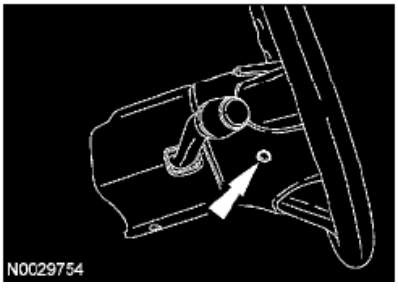
N0048854



418-F395
N0048853



N0035730



N0029754

5. Close the glove compartment door. 6. Remove the restraint system diagnostic tools from the clockspring electrical connectors at the top of the steering column.

7. CAUTION:

- Do not install the driver air bag module electrical connectors by the locking buttons. Damage to the locking buttons may occur.

- The driver air bag module electrical connector locking buttons must be in the released position when the connector is being installed or connector damage may occur.

- The driver air bag module electrical connectors are unique and cannot be reversed when connected to the driver air bag module. Match the electrical connector key to the keyway in the driver air bag module. Do not force the electrical connectors into the driver air bag module. Damage to the connector or component may occur.

With the locking buttons released, install the driver air bag module electrical connectors fully into the driver air bag module and seat the locking buttons.

8. Install the 2 driver air bag module bolts (1 shown).

- Tighten to 6 Nm (53 lb-in).

9. WARNING: Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental

restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death

in a crash and possibly violate vehicle safety standards.

Make sure all restraint system diagnostic tool(s) that may have been installed during the repair have been removed from the vehicle and all SRS components are connected.

10. Turn the ignition from OFF to ON. 11. Install the restraint system control module fuse 8 (10A) to the SJB.

12. WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is

connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

Connect the battery ground cable.

13. Prove out the SRS as follows:

Turn the ignition key from ON to OFF. Wait 10 seconds, then turn the key back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an air bag SRS fault is present, the air bag warning indicator will: -

fail to light.

- remain lit continuously.

- flash at a 5Hz rate (RCM not configured).

The air bag warning indicator may not illuminate until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.

Clear all continuous RCM and occupant classification system module (OCSM) DTCs using a scan tool.

Child Seat Tether Attachment: Description and Operation

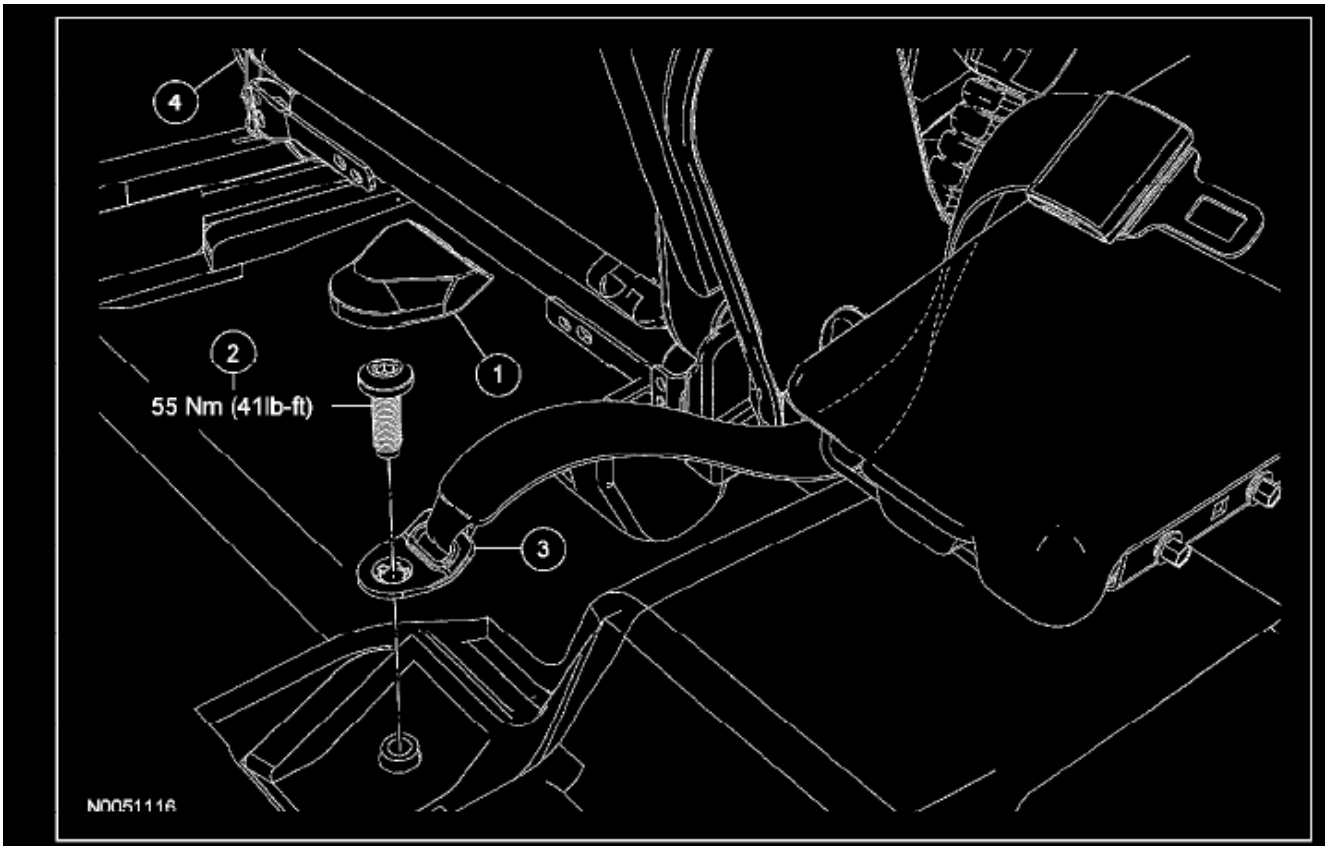
CHILD SAFETY SEAT TETHER ANCHOR

Child safety seat tether anchors have been provided in the vehicle at the passenger and center (60/40 bench only) positions. They are located directly beneath the seat back cushion attached to the frame. To use these anchors, refer to the Owner's Literature. Any child safety seat tether anchor in use during a collision must be inspected and a new seat frame installed if damaged.

Seat Belt: Description and Operation

SAFETY BELT, LAP/SHOULDER

While the vehicle is in motion, the combination lap and shoulder belt adjusts to the occupant's movement. However, if the vehicle brakes hard, corners hard or if the vehicle receives an impact of 8 km/h (5 mph) or more, the lap and shoulder belt locks and helps reduce the occupant's forward movement.



Item	Part Number	Description
1	611B32	Front center safety belt bolt cover (SuperCab only)
2	—	Front center safety belt bolt (part of 611B60)
3	611B60	Front center safety belt
4	—	Driver seat

Seat Belt: Service and Repair Safety Belt - Front, Center

SAFETY BELT - FRONT, CENTER

Removal and Replacement

WARNING: After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- Retractors

- Buckles

- Belt tension sensor (BTS) (if equipped)

- Front safety belt buckle support assemblies (slide bar) (if equipped)

- Safety belt shoulder belt height adjusters (if equipped)

- Child safety seat tether bracket assemblies

- Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

1. Position the front seats to allow access to the front center safety belt bolt. 2. For SuperCab, remove the front center safety belt bolt cover. 3. Remove the front center safety belt bolt.

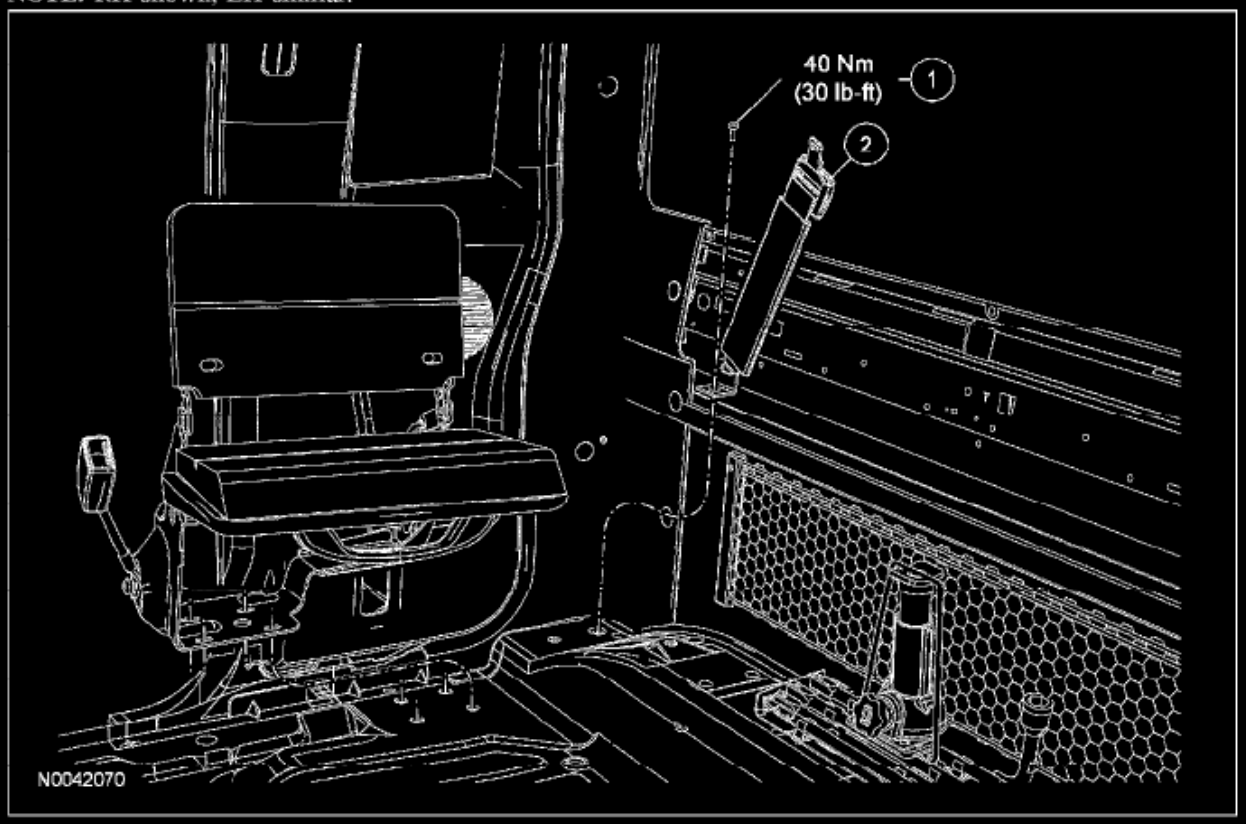
- To install, tighten to 55 Nm (41 lb-ft)

4. NOTE: The SuperCab and regular cab safety belts route differently. Note safety belt position for correct installation.

Route the front center safety belt through the seat cushion trim cover and remove.

5. To install, reverse the removal procedure. 6. Check the active restraint system for correct operation.

NOTE: RH shown, LH similar.



Item	Part Number	Description
1	—	Safety belt bolt (part of 613B84)
2	613B84	Safety belt

Seat Belt: Service and Repair Safety Belt - Rear, 2-Door, Supercab

SAFETY BELT - REAR, 2-DOOR, SUPERCAB

Removal and Installation

WARNING: After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- Retractors

- Buckles

- Belt tension sensor (BTS) (if equipped)

- Front safety belt buckle support assemblies (slide bar) (if equipped)

- Safety belt shoulder belt height adjusters (if equipped)

- Child safety seat tether bracket assemblies

- Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

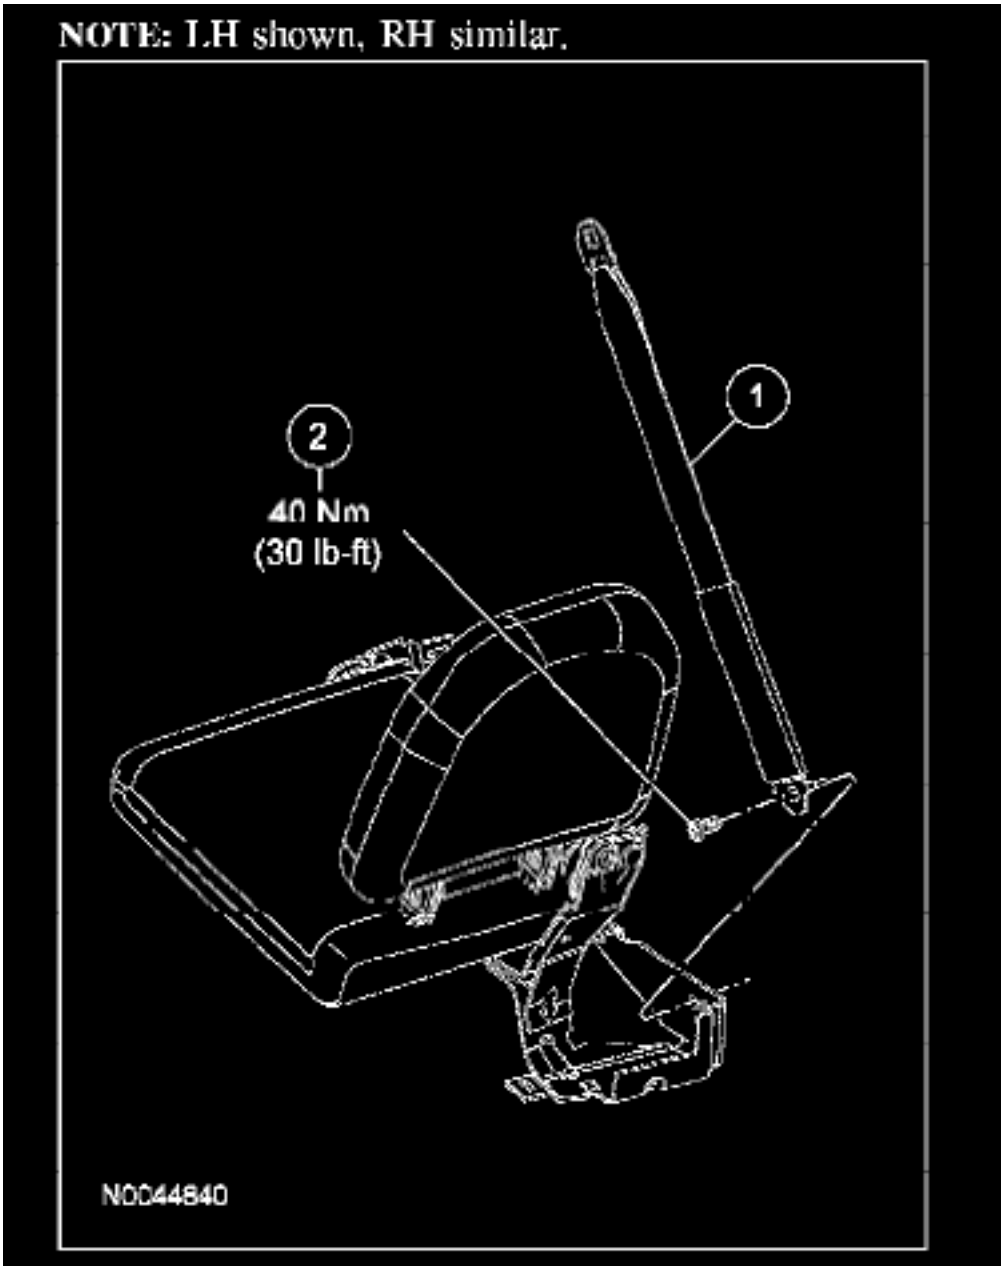
NOTE: Seat is removed for clarity.

1. Remove the bolt and safety belt.

- To install, tighten to 40 Nm (30 lb-ft).

2. To install, reverse the removal procedure.

3. Check the active restraint system for correct operation.



Item	Part Number	Description
1	611B68	Safety belt
2		Safety belt bolt

Seat Belt: Service and Repair Safety Belt - Rear, 4-Door, Supercab

SAFETY BELT - REAR, 4-DOOR, SUPERCAB

Removal and Installation

WARNING: After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- Retractors

- Buckles

- Belt tension sensor (BTS) (if equipped)

- Front safety belt buckle support assemblies (slide bar) (if equipped)

- Safety belt shoulder belt height adjusters (if equipped)

- Child safety seat tether bracket assemblies

- Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

1. Remove the affected rear seat. 2. Remove the bolt and safety belt.

- To install, tighten to 40 Nm (30 lb-ft).

3. To install, reverse the removal procedure. 4. Check the active restraint system for correct operation.

Seat Belt Buckle: Description and Operation

SAFETY BELT BUCKLE AND PRETENSIONER

The driver and front outboard passenger safety belt buckle and pretensioner are secured to the front seat assembly on the seat track. This allows the front safety belt buckle end to move with the front seat. The belt and buckle assembly pretensioner is a pyrotechnic device that removes excess webbing from the safety belt system.

The belt and buckle assembly pretensioner uses the same crash sensor system as the air bag supplemental restraint system (SRS). When the belt and buckle assembly pretensioner deploys, the buckle moves downward, pulling excess webbing from the lap and shoulder safety belts.

If the safety belt buckle and pretensioner assembly is deployed, a new assembly must be installed.

For safety belt buckle pretensioner diagnostic information, refer to Air Bag Systems.

For safety belt buckle pretensioner disposal information, refer to Air Bag Systems.

Seat Belt Buckle: Testing and Inspection

FUNCTIONAL TEST - BUCKLE AND TONGUE

The safety belt buckle and tongue assembly must operate freely during the latching and unlatching function. Fasten the safety belt by inserting the tongue (male portion) into the buckle (female portion).

1. Verify the following during the latching sequence:

- Tongue insertion is not hindered by excessive effort.

- A "click" is heard when the buckle latches the tongue.

2. Verify the system integrity by forcefully pulling on the belt webbing. 3. Unlatch the belt by fully depressing the buckle release button, and allowing the belt to release and retract. 4. Verify the following during the unlatching process:

- Push-button depression does not require excessive effort.

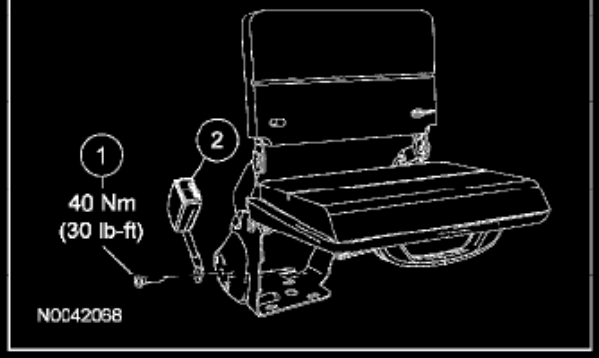
- Tongue can be removed easily from the buckle.

- Repeat the above steps 3 times.

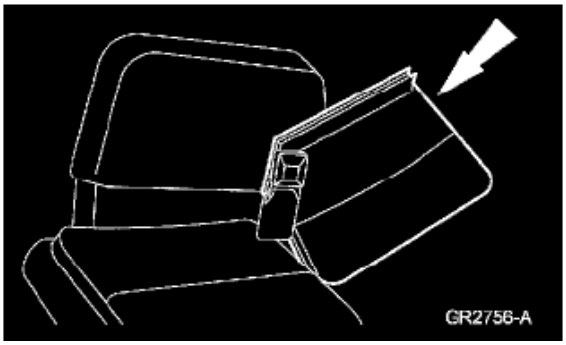
5. If the inspection reveals an obvious concern(s) that can be readily identified, service as required. Do not attempt to carry out any repair on the

buckle and tongue assembly. If a concern exists with either component, a new safety belt buckle and safety belt retractor assembly must be installed.

NOTE: RH shown, LH similar.



Item	Part Number	Description
1	—	Safety belt buckle bolt (part of 613B84)
2	613B84	Safety belt buckle



Seat Belt Buckle: Service and Repair Safety Belt Buckle - Rear, 2-Door, Supercab

5	—	Driver seat

Seat Belt Buckle: Service and Repair Safety Belt Buckle and Pretensioner - 60 Percent

SAFETY BELT BUCKLE AND PRETENSIONER - 60 PERCENT

Removal and Installation

WARNING:

- Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

- After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function: -

Retractors

- Buckles

- Belt tension sensor (BTS) (if equipped)

- Front safety belt buckle support assemblies (slide bar) (if equipped)

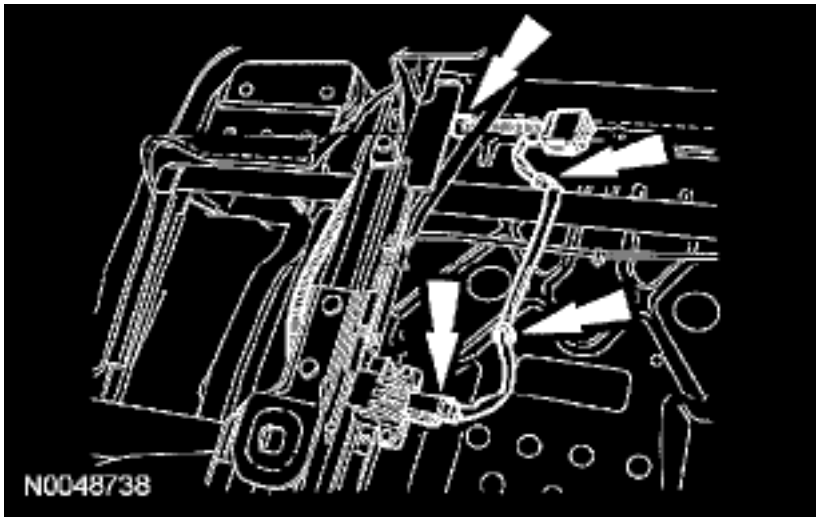
- Safety belt shoulder belt height adjusters (if equipped)

- Child safety seat tether bracket assemblies

- Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.



- Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.

CAUTION: It is necessary to carry out the occupant classification sensor (OCS) system reset when a front passenger seat cushion is disassembled, a new trim cover is installed or an OCS system service kit is installed. A scan tool is used to carry out the OCS system reset command. Failure to follow this instruction may result in system failure and the incorrect operation of the OCS system.

NOTE:

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

- Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

1. Depower the SRS. 2. Remove the 60 percent bench seat.

3. NOTE: Note the routing of the seat wiring harness for installation.

Detach the wiring harness from the cushion. -

Disconnect the SRS seat position sensor electrical connector.

- Detach the wiring harness and electrical connector pin-type retainers.

- Route out the wiring harness.

4. Remove the nut and safety belt buckle pretensioner.

- To install, tighten to 40 Nm (30 lb-ft).

5. To install, reverse the removal procedure. 6. Install the 60 percent bench seat.

- Make sure the safety belts and buckles are accessible to the occupants after installation.

7. Repower the SRS. 8. Check the active restraint system for correct operation.

5	—	Front passenger seat

Seat Belt Buckle: Service and Repair Safety Belt Buckle and Pretensioner - 40 Percent

SAFETY BELT BUCKLE AND PRETENSIONER - 40 PERCENT

Special Tool(s)

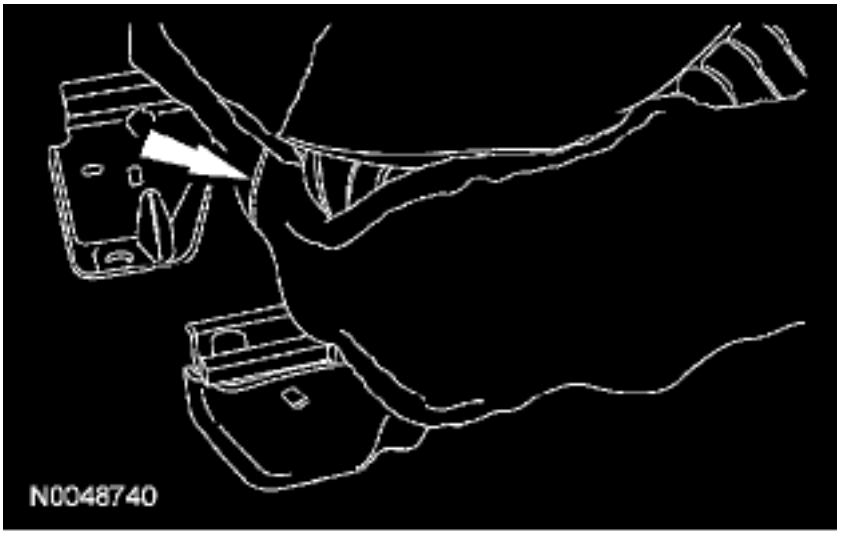
Special Tool(s)

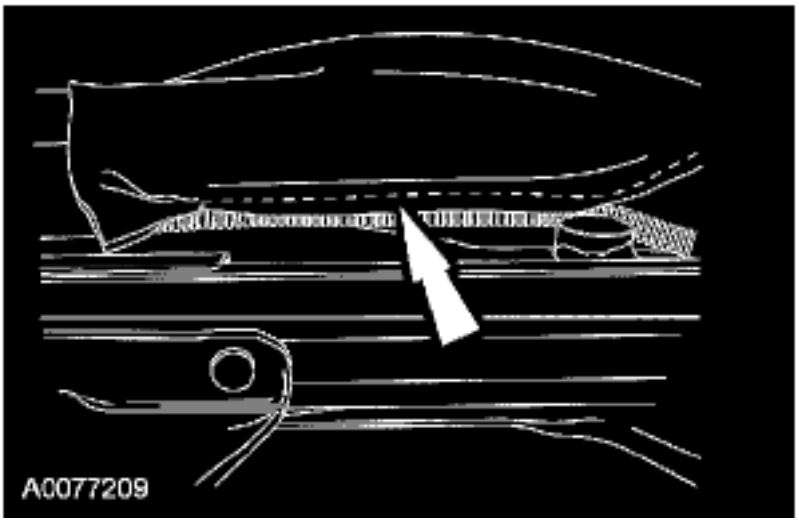
Removal and Installation

WARNING:

- Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

- After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify





correct function: -

Retractors

- Buckles

- Belt tension sensor (BTS) (if equipped)

- Front safety belt buckle support assemblies (slide bar) (if equipped)

- Safety belt shoulder belt height adjusters (if equipped)

- Child safety seat tether bracket assemblies

- Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

- Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.

CAUTION: It is necessary to carry out the occupant classification sensor (OCS) system reset of the OCS system when a front passenger seat cushion is disassembled, a new trim cover installed or an OCS system service kit is installed. A scan tool is used to trigger the command to carry out the OCS system reset.

NOTE:

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

All seats

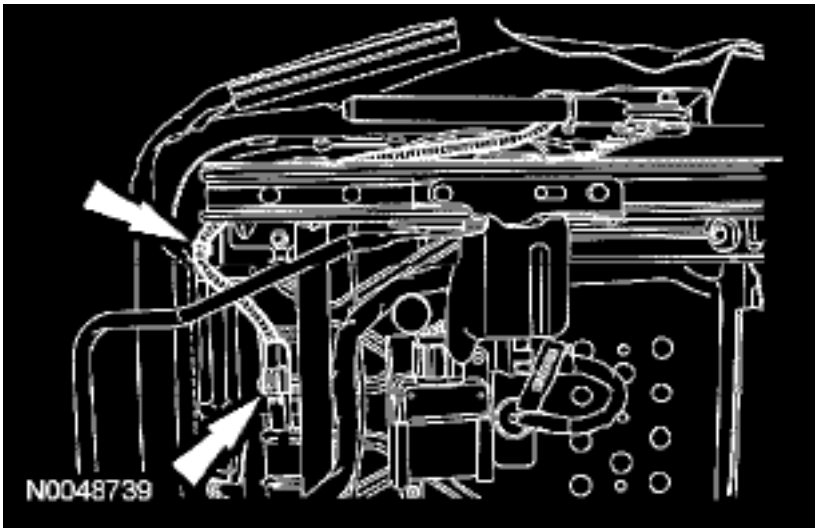
1. Remove the front seat. 2. Release the inboard side rear hook-and-loop strip.

3. Release the inboard side bottom J-clip for access to the safety belt buckle pretensioner.

4. NOTE: Note the routing of the wire harness through the seat for installation.

Detach the pin-type retainers and safety belt buckle pretensioner wire harness from the seat cushion pan. -

For driver seat, disconnect the seat position electrical connector.



- For passenger seat, disconnect the safety belt buckle pretensioner electrical connector.

5. Remove the nut, safety belt buckle pretensioner and wire harness.

- To install, tighten to 40 Nm (30 lb-ft).

6. To install, reverse the removal procedure.

- Make sure the safety belts and buckles are accessible to the occupants after installation.

7. Install the front seat and repower the SRS. If a passenger seat has been serviced, do not prove out the SRS at this time.

Passenger seat

8. WARNING: Make sure the front passenger seat repair is complete, the seat and all attached components (head restraint, seat side shield,

etc.) are correctly assembled, and the seat is correctly installed to the vehicle before carrying out the System Reset. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increases the risk of serious personal injury or death in a crash.

CAUTION: -

The following precautions must be taken before carrying out the occupant classification sensor (OCS) system reset: -

Make sure the OCS system components are connected and no faults are present.

- Make sure the voltage to the occupant classification system module (OCSM) is above 8.0 volt and less than 18.0 volts.

- Make sure the OCS system is not at a temperature below 6°C (42°F) or above 36°C (97°F) when initiating the OCS system reset process. If the vehicle has been exposed to extreme cold or hot temperatures, the vehicle must be exposed and kept at a temperature within the limits, 6°C to 36°C (42°C to 97°C) for a minimum of 30 minutes.

- Make sure nothing is present on the passenger seat before carrying out the OCS system reset and nothing is placed on the seat during the process.

- Make sure a minimum 4-second time period has passed after cycling the ignition switch ON before the carrying out the OCS system reset process.

NOTE: If the first attempt to carry out the occupant classification sensor (OCS) system reset is unsuccessful, a second attempt must be made. If the second attempt is unsuccessful, a new OCS system service kit must be installed.

Carry out the OCS system reset active command.

All seats

9. NOTE: The ignition switch must be cycled after the OCS system reset.

Prove out the SRS as follows: Turn the ignition key from ON to OFF. Wait 10 seconds, then turn the key back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn OFF. If an air bag SRS fault is present, the air bag warning indicator will: -

fail to light.

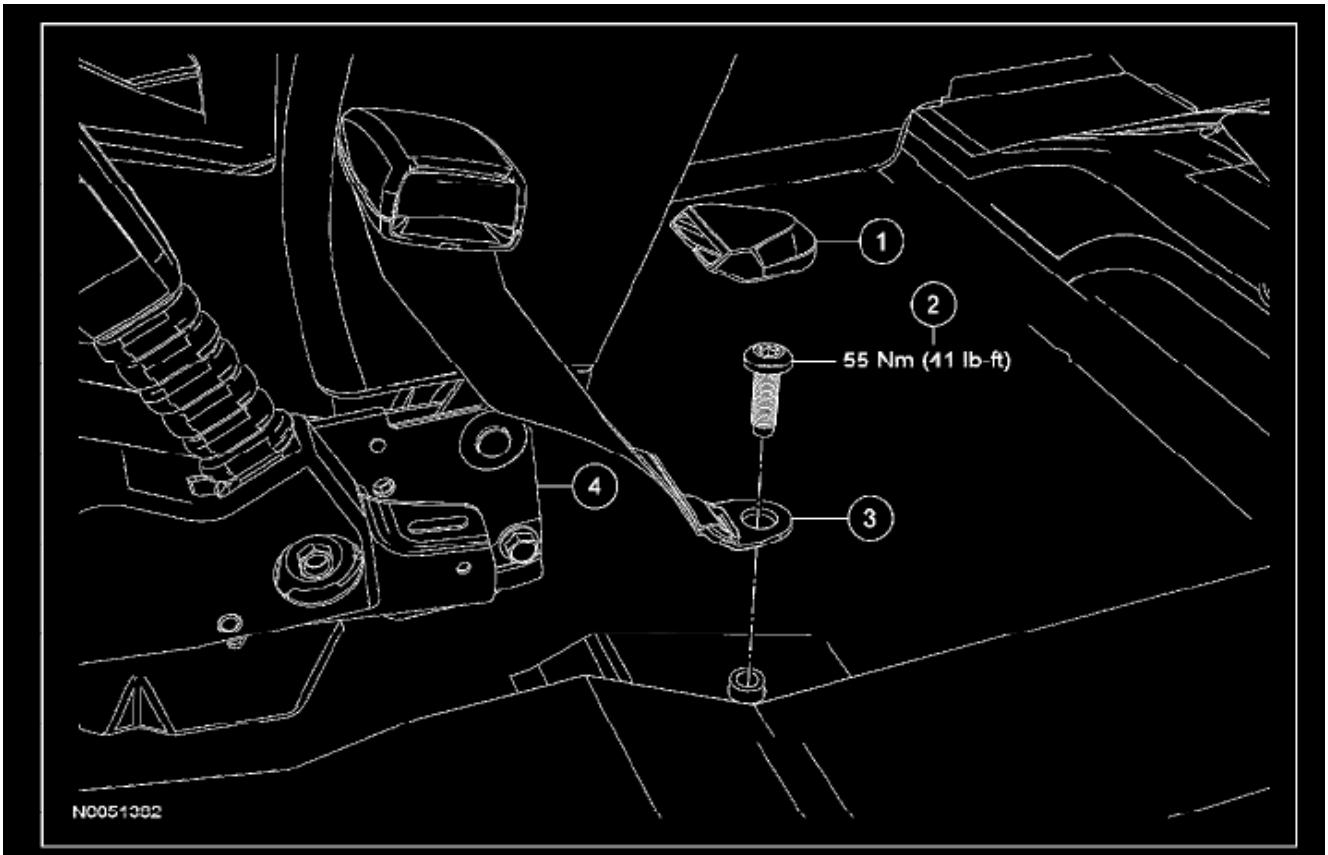
- remain lit continuously.

- flash at a 5 Hz rate (RCM not configured).

The air bag warning indicator might not light until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.

Clear all RCM and occupant classification system module (OCSM) DTCs using a scan tool.

10. Check the active restraint system for correct operation.



Item	Part Number	Description
1	611B32	Front center safety belt buckle bolt cover (SuperCab only)
2	—	Front center safety belt buckle bolt (part of 611B60)

Seat Belt Buckle: Service and Repair Safety Belt Buckle - Front, Center

SAFETY BELT BUCKLE - FRONT, CENTER

Removal and Replacement

WARNING: After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- Retractors

- Buckles

- Belt tension sensor (BTS) (if equipped)

- Front safety belt buckle support assemblies (slide bar) (if equipped)

- Safety belt shoulder belt height adjusters (if equipped)

- Child safety seat tether bracket assemblies

- Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

1. Position the front seats to allow access to the front center safety belt buckle bolt.

2. For SuperCab, remove the front center safety belt buckle bolt cover. 3. Remove the front center safety belt buckle bolt.

- To install, tighten to 55 Nm (41 lb-ft).

4. NOTE: The SuperCab and regular cab safety belts route differently. Note safety belt buckle position for correct installation.

Route the front center safety belt buckle through the locating strap on the side of the seat cushion and remove.

5. To install, reverse the removal procedure. 6. Check the active restraint system for correct operation.

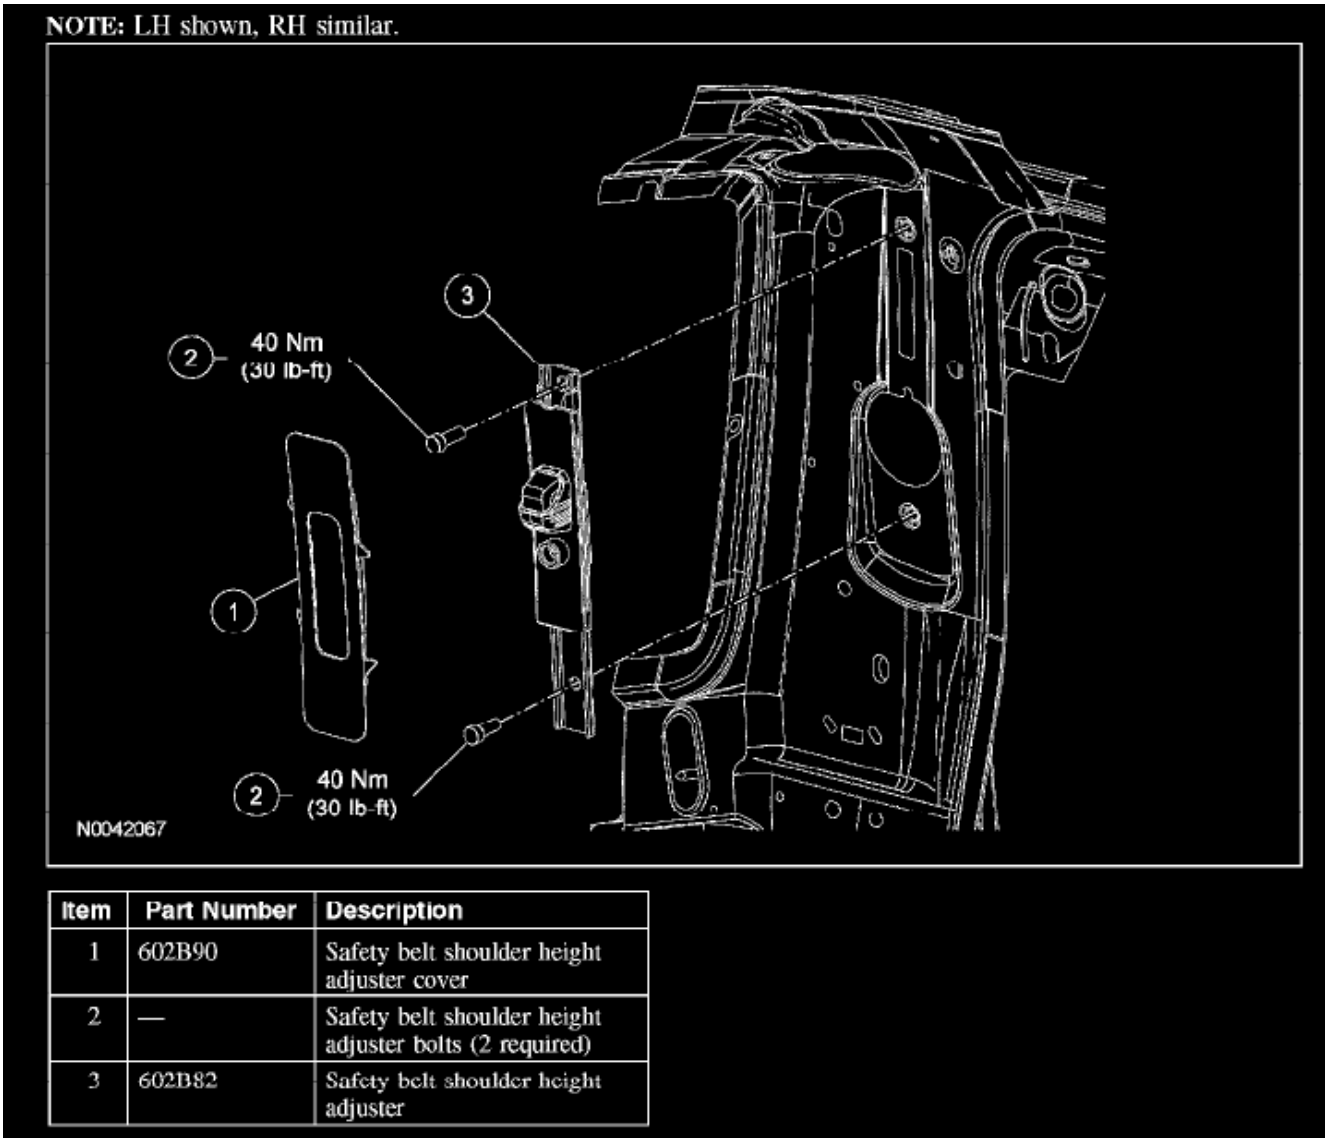
Seat Belt Extension: Description and Operation

SAFETY BELT EXTENSION ASSEMBLY

In certain cases, the safety belt may be too short even when it is fully extended. About 20 cm (8 in) can be added to the belt length by using a safety belt extension. Safety belt extensions are available at no cost from any Ford or Mercury dealership parts department. Safety belt extensions are only available with black webbing and the extender must be from the same manufacturer as the belt system to which it is attached.



Item	Part Number	Description
1	602B90	Safety belt shoulder height adjuster cover
2	—	Safety belt shoulder height adjuster bolts (2 required)

Removal and Installation

WARNING: After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- Retractors

- Buckles

- Belt tension sensor (BTS) (if equipped)

- Front safety belt buckle support assemblies (slide bar) (if equipped)

- Safety belt shoulder belt height adjusters (if equipped)

- Child safety seat tether bracket assemblies

- Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

1. Remove the rear door trim panel. 2. Remove the 2 bolts and safety belt shoulder height adjuster.

- To install, tighten to 40 Nm (30 lb-ft).

3. To install, reverse the removal procedure. 4. Check the active restraint system for correct operation.

If...	Then...
The driver's and front passenger's safety belts are buckled before the ignition switch is turned to the ON position or less than 1-2 minutes have elapsed since the ignition switch has been turned ON...	The Belt-Minder® feature will not activate.
The driver's or front passenger's safety belt is not buckled when the vehicle has reached at least 5 km/h (3 mph) and 1-2 minutes have elapsed since the ignition switch has been turned to ON...	The Belt-Minder® feature is activated — the safety belt warning indicator illuminates and the warning chime sounds for 6 seconds every 30 seconds, repeating for approximately 5 minutes or until the safety belts are buckled.
The driver's or front passenger's safety belt becomes unbuckled for approximately one minute while the vehicle is traveling at least 5 km/h (3 mph) and more than 1-2 minutes have elapsed since the ignition switch has been turned to ON...	The Belt-Minder® feature is activated — the safety belt warning indicator illuminates and the warning chime sounds for 6 seconds every 30 seconds, repeating for approximately 5 minutes or until the safety belts are buckled.

Seat Belt Reminder Buzzer: Description and Operation

Safety Belt Warning Indicator and Chime

The safety belt warning indicator and chime remind the driver to fasten their safety belt. The following conditions will take place: -

If the driver's safety belt is not buckled before the ignition is turned to the ON position, the chime will turn on for 4-8 seconds and the indicator will illuminate for 1-2 minutes.

- If the driver's safety belt is buckled while the indicator is on and the chime is sounding, both the indicator and chime will turn off.

- If the driver's safety belt is buckled before the ignition is turned to the ON position, neither the indicator nor the chime will be active.

Belt-Minder(R)

The Belt-Minder(R) feature is a supplemental warning to the safety belt warning function. The feature provides additional reminders by intermittently sounding a chime and illuminating the safety belt warning indicator in the instrument cluster when the driver's and front passenger's safety belt is unbuckled.

The Belt-Minder(R) feature uses information from the front passenger sensing system to determine if a front seat passenger is present and therefore potentially in need of a warning. To avoid activating the Belt-Minder(R) feature for objects placed in the front passenger seat, warnings will only be given to large front seat occupants as determined by the front passenger sensing system.

Both the driver's and passenger's safety belt usages are monitored and either may activate the Belt-Minder(R) feature. The warnings are the same for the driver and front passenger. If the Belt-Minder(R) warnings have expired (warnings for approximately 5 minutes) for one occupant (driver or front passenger), the other occupant can still activate the Belt-Minder(R) feature.

The Belt-Minder(R) feature uses information from the OCS system on the front passenger seat to determine if a front seat passenger is present and therefore potentially in need of a warning. The warning is activated if the OCS system senses weight exceeding a programmed set point.

The driver and front passenger Belt-Minder(R) feature is deactivated/activated independently. When deactivating/activating the Belt-Minder(R) for a seat, do not buckle the safety belts on the other seat, or the process will be terminated. To deactivate/activate the Belt-Minder(R) feature, refer to Instrument Panel, Gauges and Warning Indicators or the Owner's Literature.

If...	Then...
The driver's and front passenger's safety belts are buckled before the ignition switch is turned to the ON position or less than 1-2 minutes have elapsed since the ignition switch has been turned ON...	The Belt-Minder® feature will not activate.
The driver's or front passenger's safety belt is not buckled when the vehicle has reached at least 5 km/h (3 mph) and 1-2 minutes have elapsed since the ignition switch has been turned to ON...	The Belt-Minder® feature is activated — the safety belt warning indicator illuminates and the warning chime sounds for 6 seconds every 30 seconds, repeating for approximately 5 minutes or until the safety belts are buckled.
The driver's or front passenger's safety belt becomes unbuckled for approximately one minute while the vehicle is traveling at least 5 km/h (3 mph) and more than 1-2 minutes have elapsed since the ignition switch has been turned to ON...	The Belt-Minder® feature is activated — the safety belt warning indicator illuminates and the warning chime sounds for 6 seconds every 30 seconds, repeating for approximately 5 minutes or until the safety belts are buckled.

Seat Belt Reminder Lamp: Description and Operation

Safety Belt Warning Indicator and Chime

The safety belt warning indicator and chime remind the driver to fasten their safety belt. The following conditions will take place: -

If the driver's safety belt is not buckled before the ignition is turned to the ON position, the chime will turn on for 4-8 seconds and the indicator will illuminate for 1-2 minutes.

- If the driver's safety belt is buckled while the indicator is on and the chime is sounding, both the indicator and chime will turn off.

- If the driver's safety belt is buckled before the ignition is turned to the ON position, neither the indicator nor the chime will be active.

Belt-Minder(R)

The Belt-Minder(R) feature is a supplemental warning to the safety belt warning function. The feature provides additional reminders by intermittently sounding a chime and illuminating the safety belt warning indicator in the instrument cluster when the driver's and front passenger's safety belt is unbuckled.

The Belt-Minder(R) feature uses information from the front passenger sensing system to determine if a front seat passenger is present and therefore potentially in need of a warning. To avoid activating the Belt-Minder(R) feature for objects placed in the front passenger seat, warnings will only be given to large front seat occupants as determined by the front passenger sensing system.

Both the driver's and passenger's safety belt usages are monitored and either may activate the Belt-Minder(R) feature. The warnings are the same for the driver and front passenger. If the Belt-Minder(R) warnings have expired (warnings for approximately 5 minutes) for one occupant (driver or front passenger), the other occupant can still activate the Belt-Minder(R) feature.

The Belt-Minder(R) feature uses information from the OCS system on the front passenger seat to determine if a front seat passenger is present and therefore potentially in need of a warning. The warning is activated if the OCS system senses weight exceeding a programmed set point.

The driver and front passenger Belt-Minder(R) feature is deactivated/activated independently. When deactivating/activating the Belt-Minder(R) for a seat, do not buckle the safety belts on the other seat, or the process will be terminated. To deactivate/activate the Belt-Minder(R) feature, refer to Instrument Panel, Gauges and Warning Indicators or the Owner's Literature.

Seat Belt Retractor: Description and Operation

Dual Locking Mode Retractors

WARNING: After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function: -

Retractors

- Buckles

- Belt tension sensor (BTS) (if equipped)

- Front safety belt buckle support assemblies (slide bar) (if equipped)

- Safety belt shoulder belt height adjusters (if equipped)

- Child safety seat tether bracket assemblies

- Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

NOTE: When installing a new dual locking mode retractor, the retractor should be checked to make sure it is not in the automatic locking retractor (ALR) mode after installation in the STOWED position.

All outboard continuous-loop, 3-point retractor systems, except the driver position, are equipped with the dual locking mode system.

The emergency locking retractor (ELR) mode will allow the occupant freedom of movement, locking only on hard braking, hard cornering or an impact of approximately 8 km/h (5 mph). The ELR mode helps to reduce the forward movement of the driver and passengers. The ELR mode is continuously in operation at all seating positions.

The ALR portion of this system does not allow the occupant freedom of movement. The ALR mode is used when locking a child seat in an outboard seating position or when a tight belt fit is desired. The ALR mode is automatically engaged when the webbing is fully extracted from the retractor and then allowed to retract. As the webbing is retracted back onto the spool, an audible clicking sound is made indicating the retractor is in ALR mode and the webbing will not pull back out of the retractor. To disengage the ALR mode, let the webbing retract back onto the spool. The ALR mode is disengaged when the webbing is free to move out and back into the retractor.

The automatic locking mode must be used when installing a child safety seat in the front or rear passenger seating positions where dual locking mode retractors are provided.

Four-door, Supercab

The outboard safety belt for the front seat is a continuous-loop 3-point system. The combination lap and shoulder (continuous-loop) uses a common sliding tongue and retractor. The front seat safety

belt retractor and the front seat shoulder safety belt height adjuster are both located in the rear door.

The rear seat has a safety belt bolted to the rear seat frame. The rear safety belt buckle is located in the rear door.

The shoulder harness retractor is designed to let the webbing move freely in or out at all times, except during vehicle hard braking, hard cornering or an impact of 8 km/h (5 mph) or more, when it is automatically locked by a mechanically actuated inertia sensor.

The front safety belt retractors can also lock by jerking on the belt.

Energy Management Retractor

This vehicle has a safety belt system with an energy management feature at the front seating positions to help further reduce the risk of injury in the event of a head-on collision.

This safety belt system has a retractor assembly that is designed to pay out webbing in a controlled manner. This feature is designed to help reduce the belt force acting on an occupant's chest.

Seat Belt Retractor: Testing and Inspection

FUNCTIONAL TEST - RETRACTOR

The safety belt retractor assembly must be freely operational for extraction and retraction of the safety belt webbing between full extension and in-vehicle stowed positions.

1. Extract and retract the safety belt between the full extension and stowed positions. 2. Verify the retractor operates without excessive effort or binding. 3. Install a new safety belt retractor and buckle if no obvious concerns are noticed and the complaint has been verified.

Functional Test - Automatic Locking Retractor

WARNING: After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function: -

Retractors

- Buckles

- Belt tension sensor (BTS) (if equipped)

- Front safety belt buckle support assemblies (slide bar) (if equipped)

- Safety belt shoulder belt height adjusters (if equipped)

- Child safety seat tether bracket assembly

- Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

1. Position the seat back into the full up position. 2. Position the height adjuster (if equipped) in the full down or up position. 3. Latch the seat belt buckle and tongue assembly. 4. Pull the shoulder belt out until the automatic locking retractor (ALR) feature is activated. 5. Release the shoulder belt and allow it to retract until it stops. 6. Pull on the shoulder belt to check that the belt has remained in the ALR mode. If the belt is not locked, install a new safety belt assembly. 7. Unlatch the safety belt tongue from the buckle and allow the safety belt to retract to its stowed position. 8. Pull the shoulder belt to verify the retractor assembly has converted automatically out of the ALR mode. If the shoulder belt remains locked in the

stowed position, install a new safety belt retractor assembly.

NOTE: Passenger side shown, driver side similar.

NOTE: Interior trim panel removed for clarity.

Seat Belt Retractor: Service and Repair Safety Belt Retractor - Front

SAFETY BELT RETRACTOR - FRONT

Removal and Installation

WARNING: After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- Retractors

- Buckles

- Belt tension sensor (BTS) (if equipped)

- Front safety belt buckle support assemblies (slide bar) (if equipped)

- Safety belt shoulder belt height adjusters (if equipped)

- Child safety seat tether bracket assemblies

- Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

NOTE:

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

- Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

All safety belt retractors

1. NOTE: If the D-ring cover is damaged or does not remain attached, install a new D-ring cover.

Remove the D-ring cover.

2. Remove the nut and D-ring.

- To install, tighten to 40 Nm (30 lb-ft).

3. Remove the cover and bolt and position aside the safety belt anchor.

- To install, tighten to 40 Nm (30 lb-ft).

Passenger safety belt retractor

4. Depower the SRS.

5. NOTE: Note safety belt routing for installation.

Remove the quarter trim panel and disconnect the belt tension sensor electrical connector. -

Release the wiring harness pin-type retainers.

- Route out the safety belt webbing.

All safety belt retractors

6. Remove the quarter trim panel. 7. Remove the bolt and safety belt retractor.

- To install tighten to, 40 Nm (30 lb-ft).

8. To install, reverse the removal procedure.

Passenger safety belt retractor

9. Repower the SRS.

All safety belt retractors

10. Check the active restraint system for correct operation.

NOTE: Passenger side shown, driver side similar.

NOTE: Rear door interior trim panel removed for clarity.

All safety belt retractors

6. Remove the rear door trim panel. 7. Remove the bolt and safety belt retractor.

- To install, tighten to 40 Nm (30 lb-ft).

8. To install, reverse the removal procedure.

Passenger safety belt retractor

9. Repower the SRS.

All safety belt retractors

10. Check the active restraint system for correct operation.

Seat Belt Tension Sensor: Description and Operation

BELT TENSION SENSOR (BTS)

The safety belt tension sensor (BTS) is part of the passenger front safety belt and retractor assembly and is not serviced separately. The safety BTS is located at the safety belt anchor point and is used in conjunction with the occupant classification sensor (OCS) system. For information on diagnosing the BTS and OCS or servicing the OCS system, refer to the appropriate procedure in Air Bag Systems.

Seat Belt Tensioner: Description and Operation

SAFETY BELT BUCKLE AND PRETENSIONER

The driver and front outboard passenger safety belt buckle and pretensioner are secured to the front seat assembly on the seat track. This allows the front safety belt buckle end to move with the front seat. The belt and buckle assembly pretensioner is a pyrotechnic device that removes excess webbing from the safety belt system.

The belt and buckle assembly pretensioner uses the same crash sensor system as the air bag supplemental restraint system (SRS). When the belt and buckle assembly pretensioner deploys, the buckle moves downward, pulling excess webbing from the lap and shoulder safety belts.

If the safety belt buckle and pretensioner assembly is deployed, a new assembly must be installed.

For safety belt buckle pretensioner diagnostic information, refer to Air Bag Systems.

For safety belt buckle pretensioner disposal information, refer to Air Bag Systems.

Seat Belt Tensioner: Service and Repair Safety Belt Buckle and Pretensioner - 60 Percent

SAFETY BELT BUCKLE AND PRETENSIONER - 60 PERCENT

Removal and Installation

WARNING:

- Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

- After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function: -

Retractors

- Buckles

- Belt tension sensor (BTS) (if equipped)

- Front safety belt buckle support assemblies (slide bar) (if equipped)

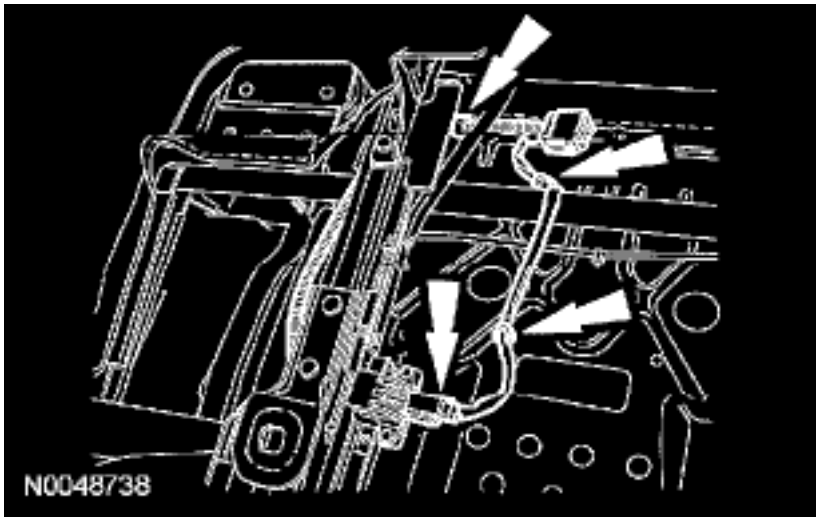
- Safety belt shoulder belt height adjusters (if equipped)

- Child safety seat tether bracket assemblies

- Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.



- Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.

CAUTION: It is necessary to carry out the occupant classification sensor (OCS) system reset when a front passenger seat cushion is disassembled, a new trim cover is installed or an OCS system service kit is installed. A scan tool is used to carry out the OCS system reset command. Failure to follow this instruction may result in system failure and the incorrect operation of the OCS system.

NOTE:

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

- Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

1. Depower the SRS. 2. Remove the 60 percent bench seat.

3. NOTE: Note the routing of the seat wiring harness for installation.

Detach the wiring harness from the cushion. -

Disconnect the SRS seat position sensor electrical connector.

- Detach the wiring harness and electrical connector pin-type retainers.

- Route out the wiring harness.

4. Remove the nut and safety belt buckle pretensioner.

- To install, tighten to 40 Nm (30 lb-ft).

5. To install, reverse the removal procedure. 6. Install the 60 percent bench seat.

- Make sure the safety belts and buckles are accessible to the occupants after installation.

7. Repower the SRS. 8. Check the active restraint system for correct operation.

Special Tool(s)

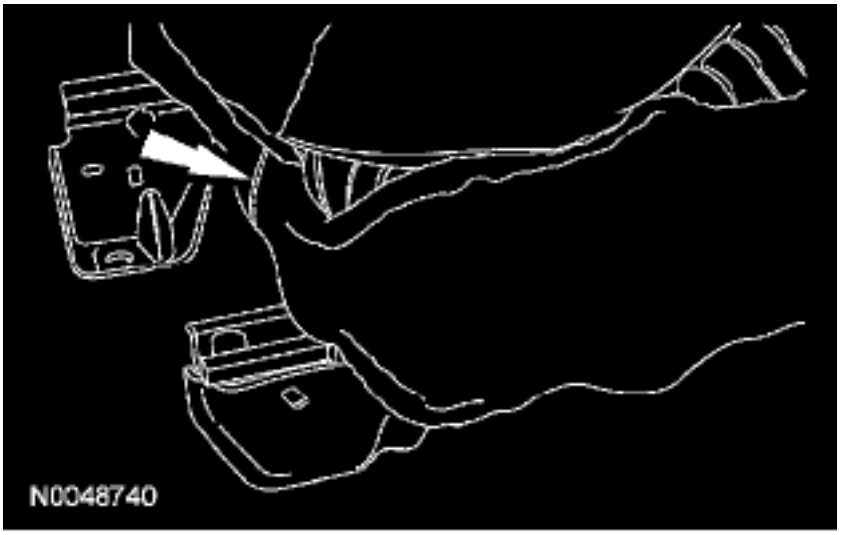
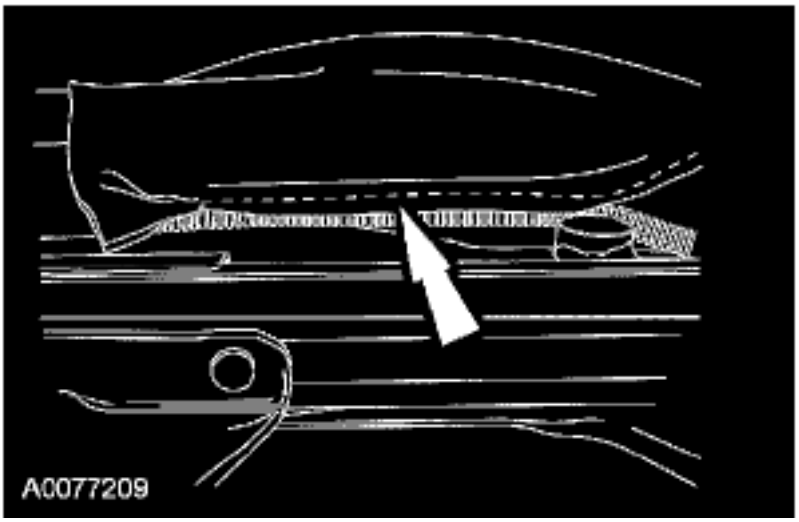
Removal and Installation

WARNING:

- Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

- After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify





correct function: -

Retractors

- Buckles

- Belt tension sensor (BTS) (if equipped)

- Front safety belt buckle support assemblies (slide bar) (if equipped)

- Safety belt shoulder belt height adjusters (if equipped)

- Child safety seat tether bracket assemblies

- Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

- Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.

CAUTION: It is necessary to carry out the occupant classification sensor (OCS) system reset of the OCS system when a front passenger seat cushion is disassembled, a new trim cover installed or an OCS system service kit is installed. A scan tool is used to trigger the command to carry out the OCS system reset.

NOTE:

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

All seats

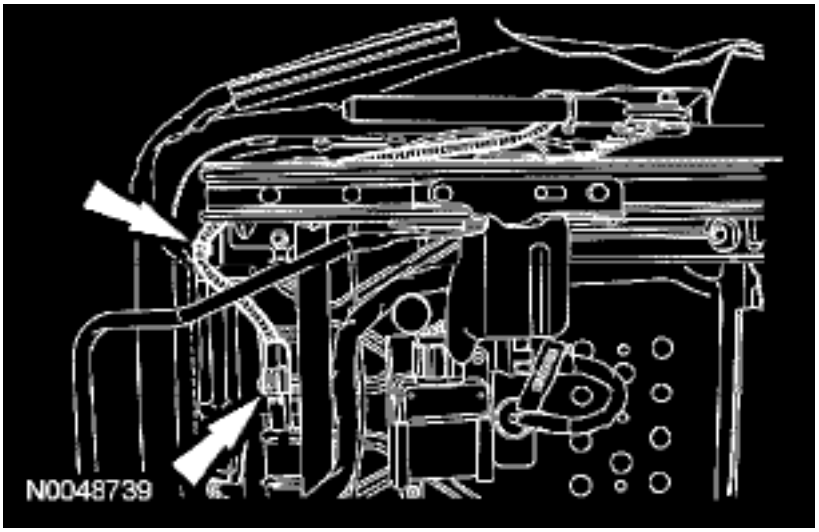
1. Remove the front seat. 2. Release the inboard side rear hook-and-loop strip.

3. Release the inboard side bottom J-clip for access to the safety belt buckle pretensioner.

4. NOTE: Note the routing of the wire harness through the seat for installation.

Detach the pin-type retainers and safety belt buckle pretensioner wire harness from the seat cushion pan. -

For driver seat, disconnect the seat position electrical connector.



- For passenger seat, disconnect the safety belt buckle pretensioner electrical connector.

5. Remove the nut, safety belt buckle pretensioner and wire harness.

- To install, tighten to 40 Nm (30 lb-ft).

6. To install, reverse the removal procedure.

- Make sure the safety belts and buckles are accessible to the occupants after installation.

7. Install the front seat and repower the SRS. If a passenger seat has been serviced, do not prove out the SRS at this time.

Passenger seat

8. WARNING: Make sure the front passenger seat repair is complete, the seat and all attached components (head restraint, seat side shield,

etc.) are correctly assembled, and the seat is correctly installed to the vehicle before carrying out the System Reset. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increases the risk of serious personal injury or death in a crash.

CAUTION: -

The following precautions must be taken before carrying out the occupant classification sensor (OCS) system reset: -

Make sure the OCS system components are connected and no faults are present.

- Make sure the voltage to the occupant classification system module (OCSM) is above 8.0 volt and less than 18.0 volts.

- Make sure the OCS system is not at a temperature below 6°C (42°F) or above 36°C (97°F) when initiating the OCS system reset process. If the vehicle has been exposed to extreme cold or hot temperatures, the vehicle must be exposed and kept at a temperature within the limits, 6°C to 36°C (42°C to 97°C) for a minimum of 30 minutes.

- Make sure nothing is present on the passenger seat before carrying out the OCS system reset and nothing is placed on the seat during the process.

- Make sure a minimum 4-second time period has passed after cycling the ignition switch ON before the carrying out the OCS system reset process.

NOTE: If the first attempt to carry out the occupant classification sensor (OCS) system reset is unsuccessful, a second attempt must be made. If the second attempt is unsuccessful, a new OCS system service kit must be installed.

Carry out the OCS system reset active command.

All seats

9. NOTE: The ignition switch must be cycled after the OCS system reset.

Prove out the SRS as follows: Turn the ignition key from ON to OFF. Wait 10 seconds, then turn the key back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn OFF. If an air bag SRS fault is present, the air bag warning indicator will: -

fail to light.

- remain lit continuously.
