Accessory Delay Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

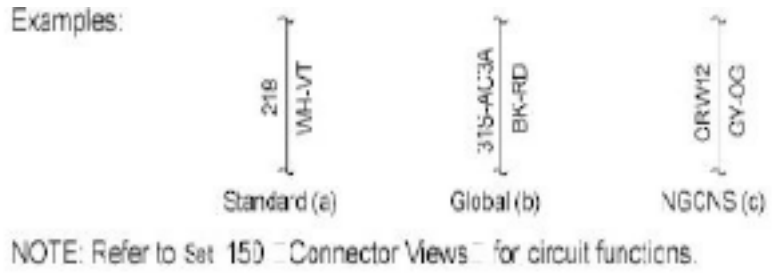
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

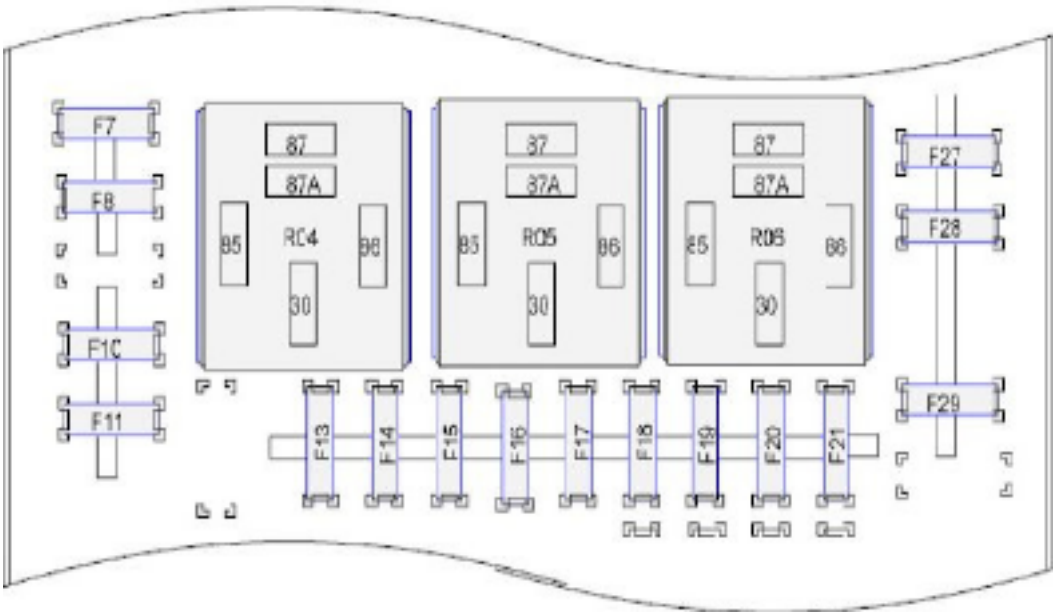
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

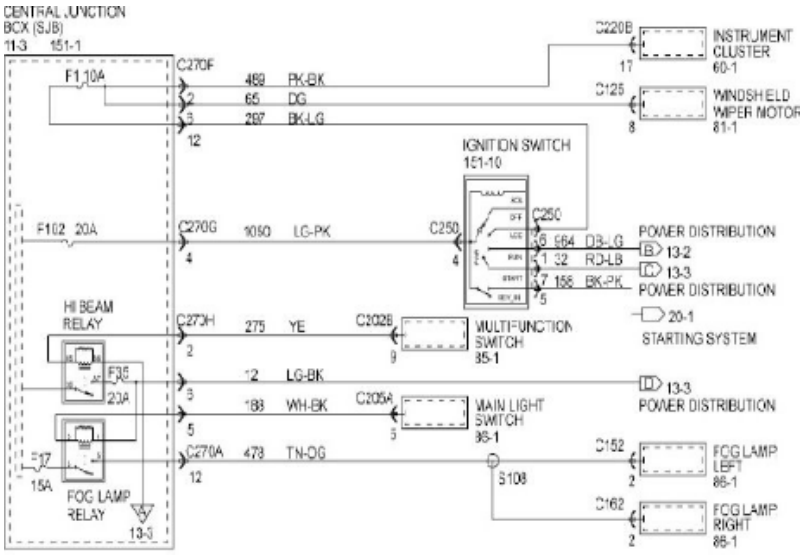
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

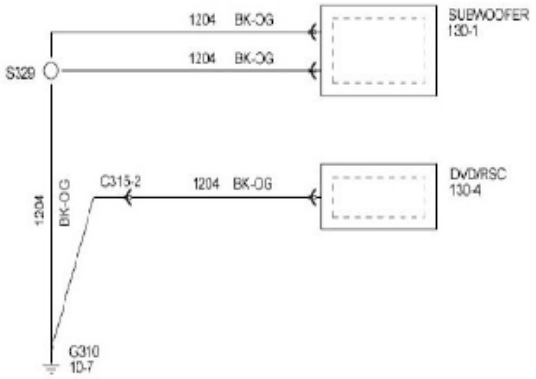
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by

each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

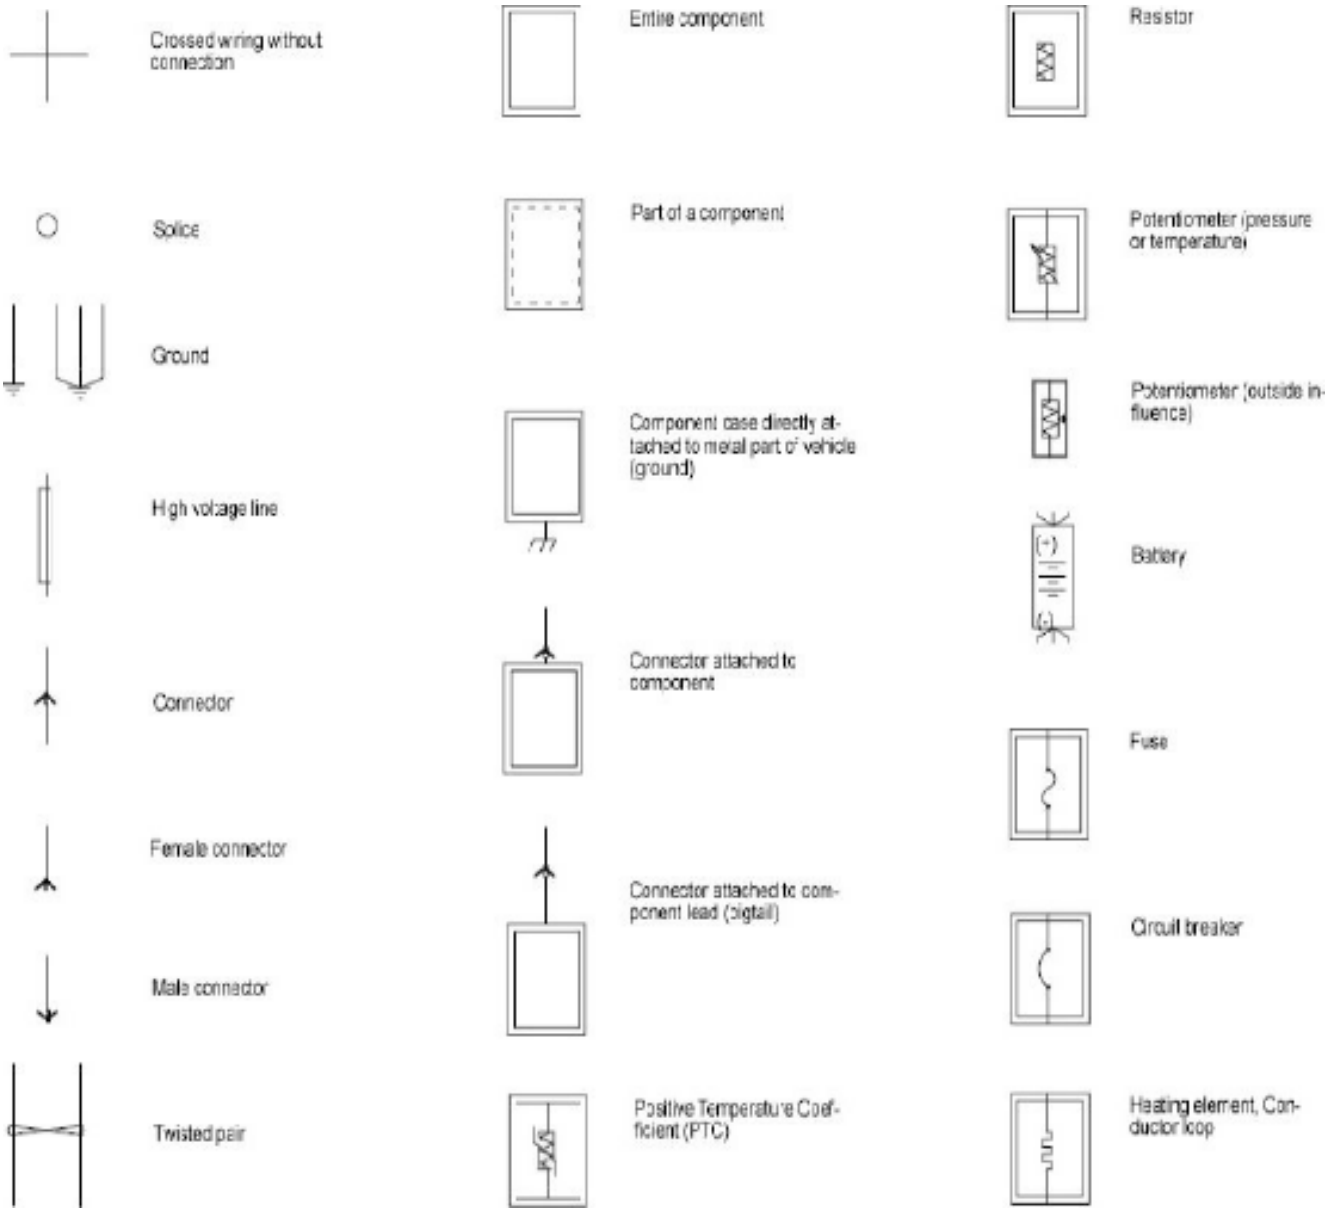
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

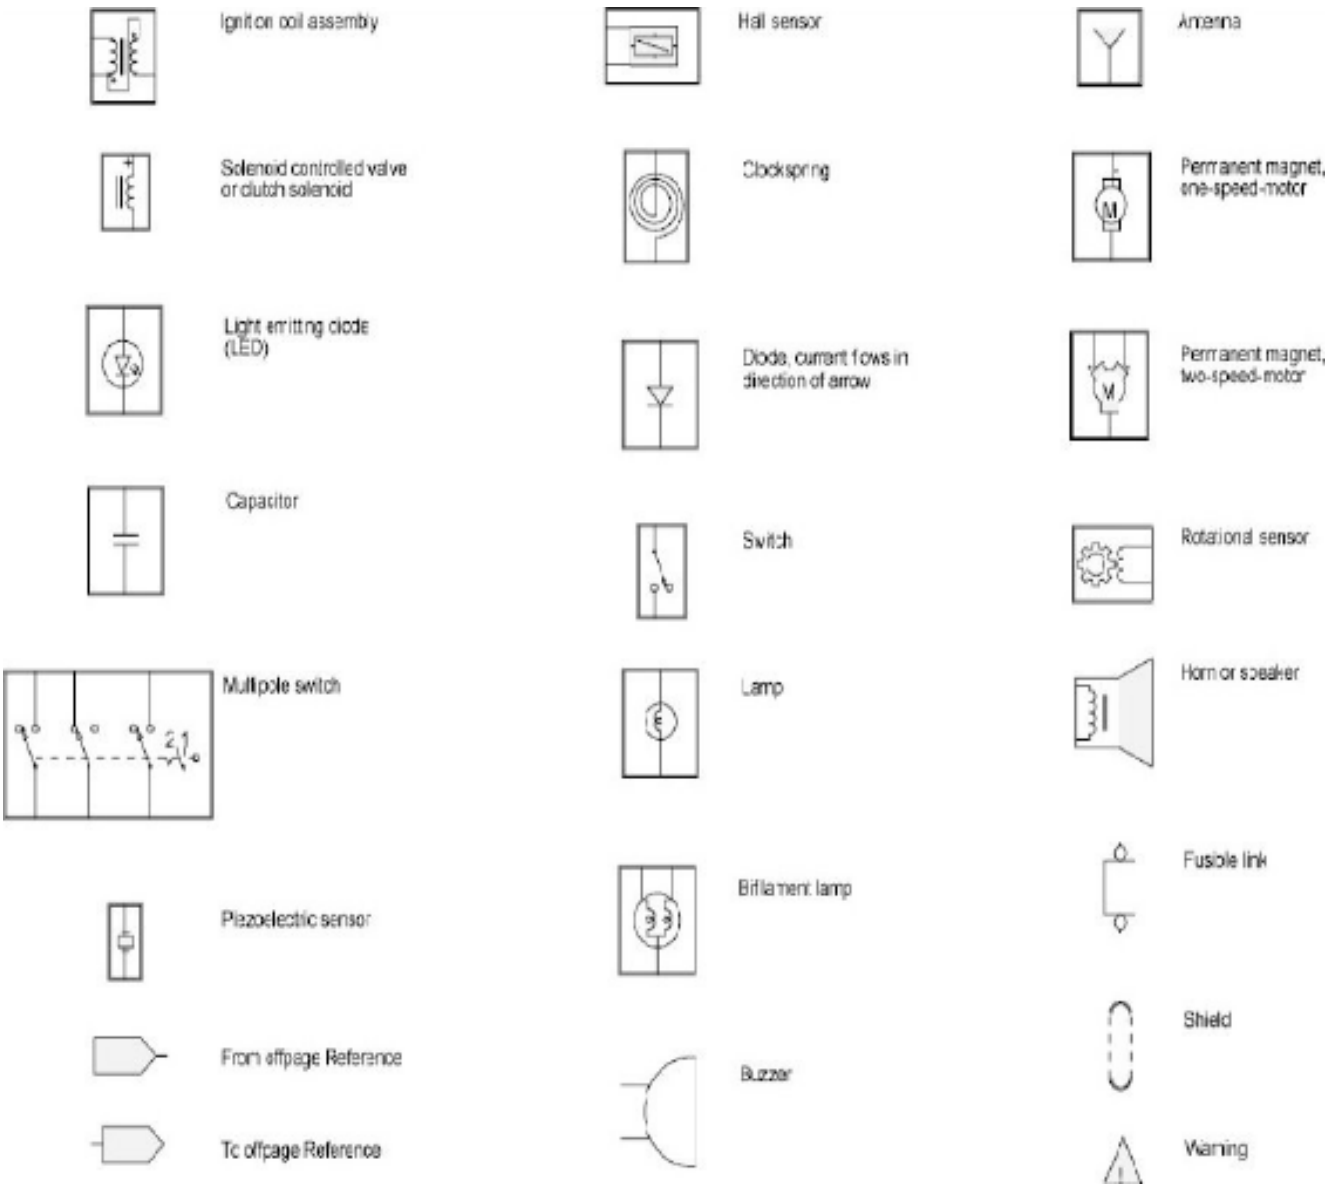
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

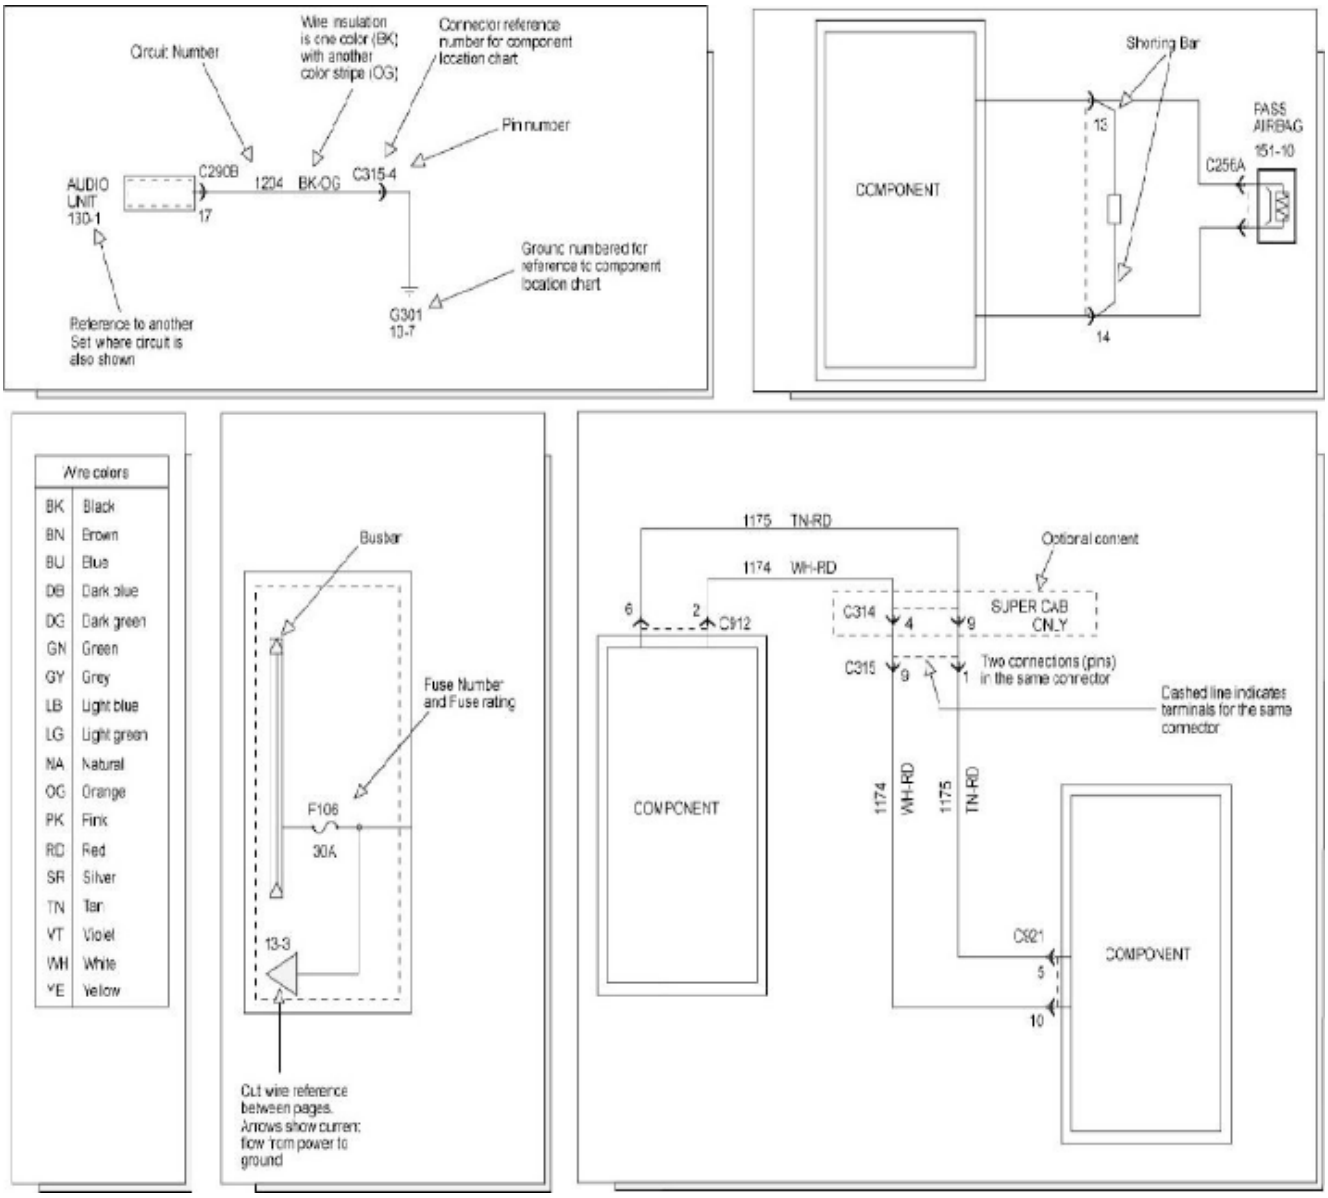
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

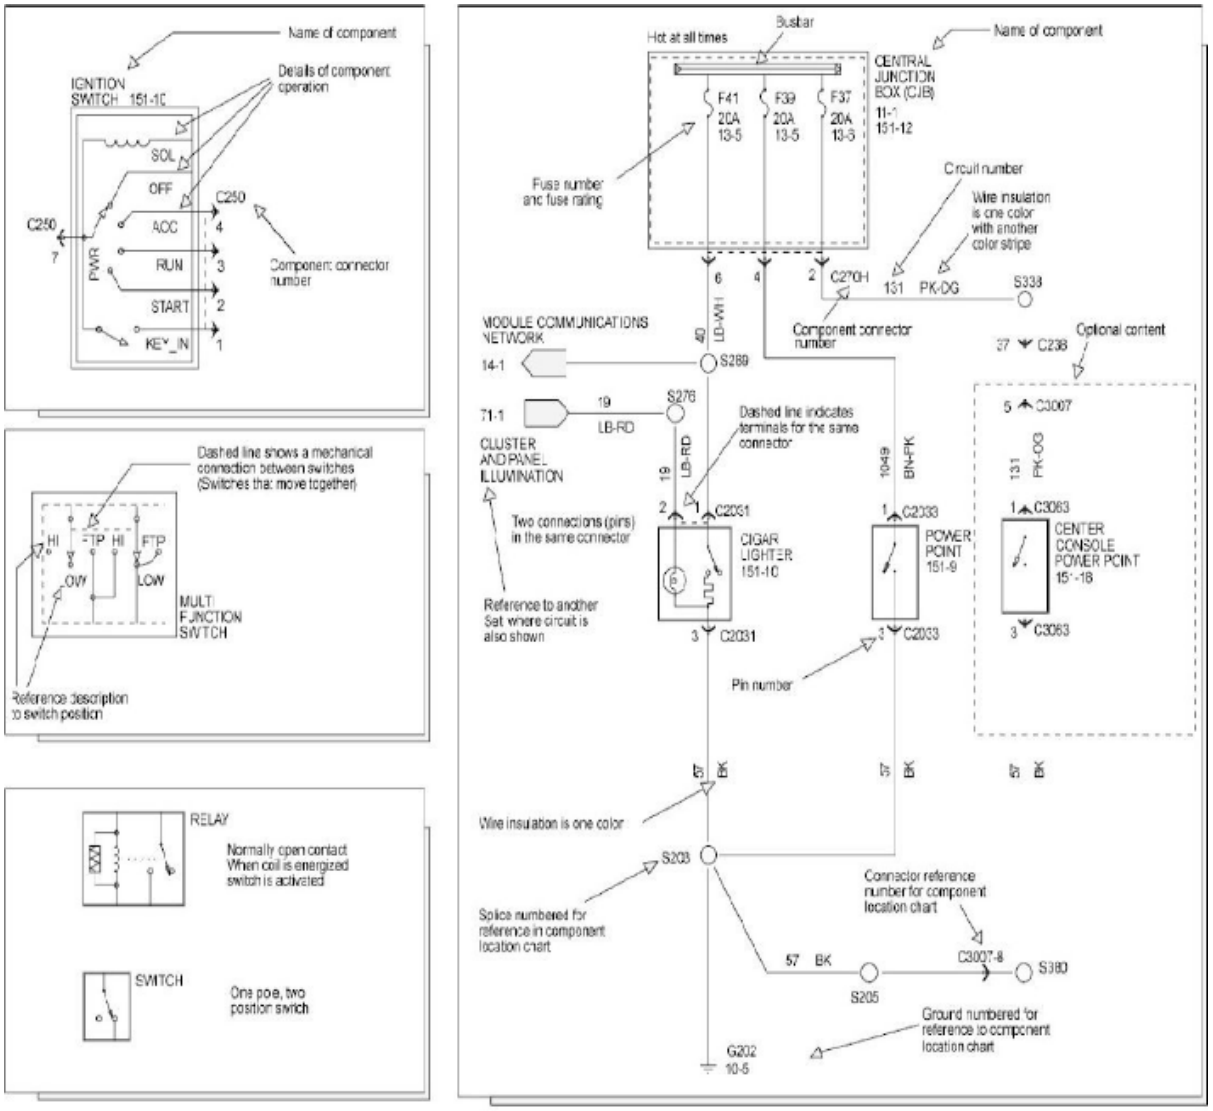
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Accessory Delay Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

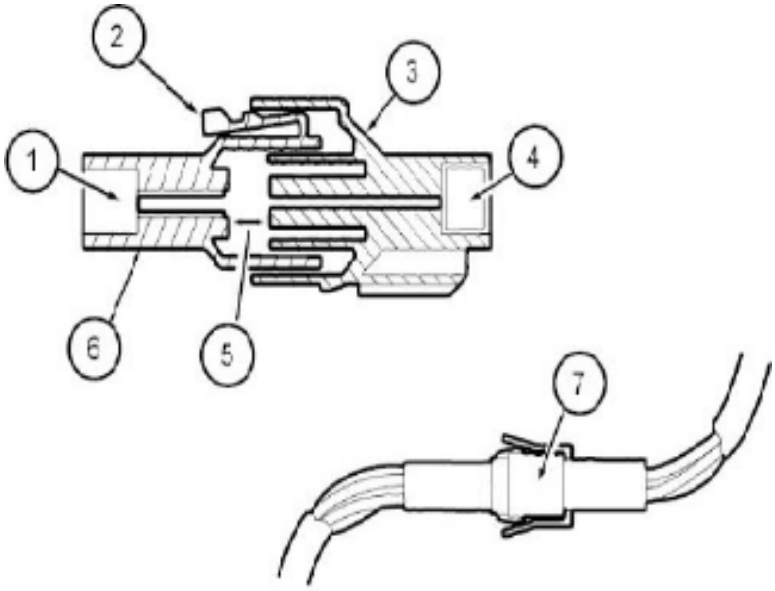
5 = Intermittent contact

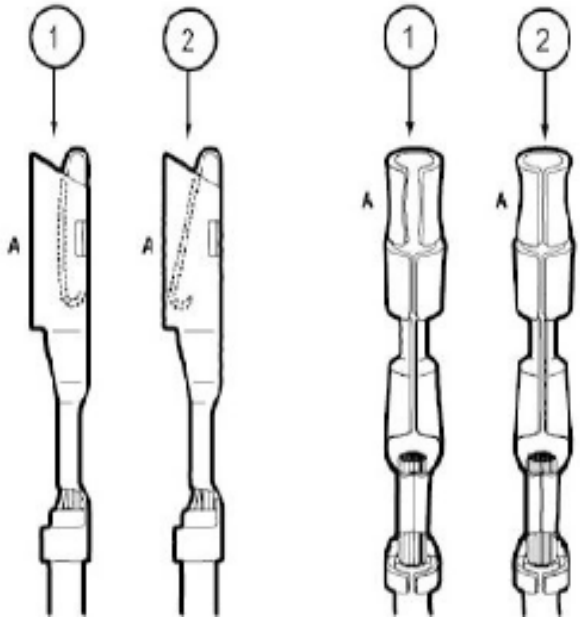
6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Defective insulation stripping





1 = Proper crimp

2 = Insulation not removed

3 = Wire strands missing

4 = Intermittent signals through pierced insulation

Partially mated connectors

1 = Seal

2 = Displaced tab

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Male half

7 = Intermittent contact

Lock may be displaced into an unlocked position; pull on the connector to verify the lock.

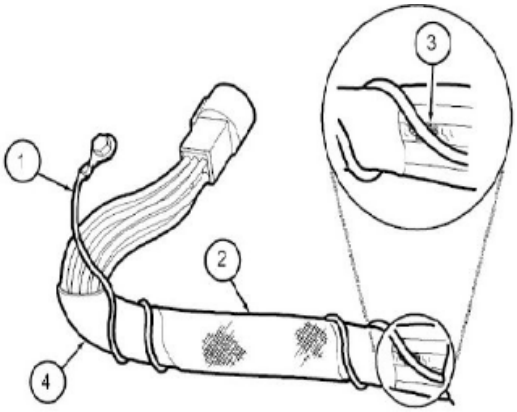
Deformed (enlarged) female terminals

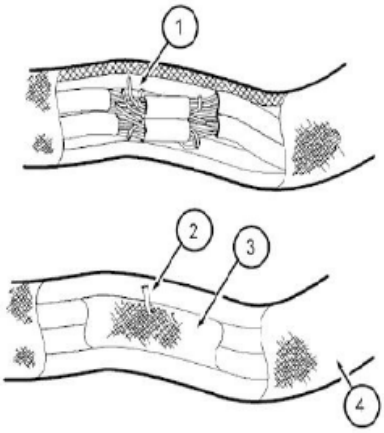
1 = Enlarged

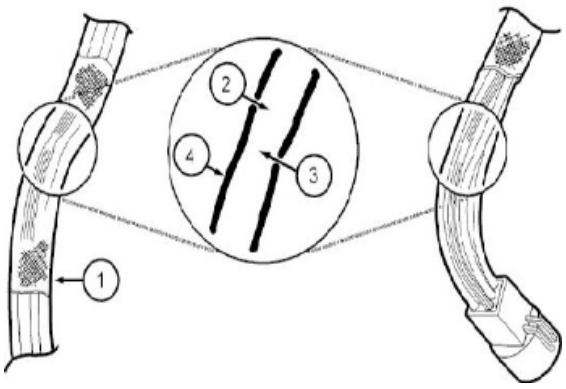
2 = Normal

Any probe entering the terminal may enlarge the contact spring opening creating an intermittent signal.

Insert the correct mating terminal (Location A) from the service kit and feel for a loose fit.







Electrical short inside the harness

1 = Solder coated wire to ground

2 = Harness protective tape

3 = Intermittent short

Solder coated wire pierced through the insulation of another circuit

4 = Grounding foil

Electrical short within the harness

Splice tape removed 1

= Intermittent short

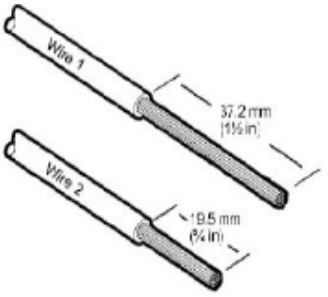
Splice covered 2

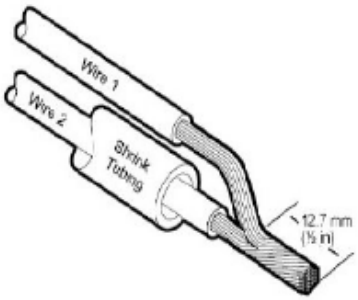
= Wire strand

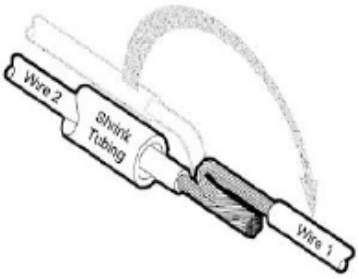
3 = Splice tape

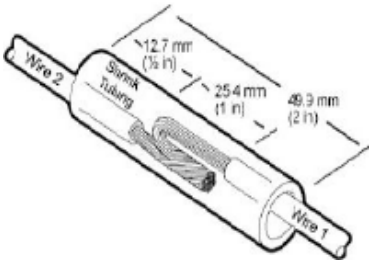
4 = Harness tape

Broken wire strands in harness









1 = Wiring harness tape

2 = Wiring strand

3 = Broken strands intermittent signal

4 = Circuit insulation

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. lnstall heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

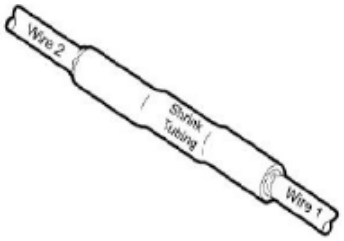
NOTE: -

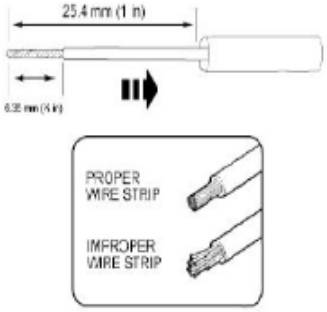
Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

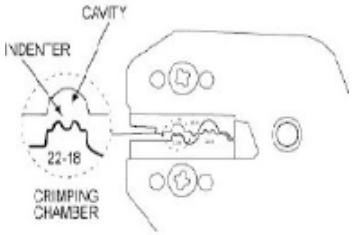
- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

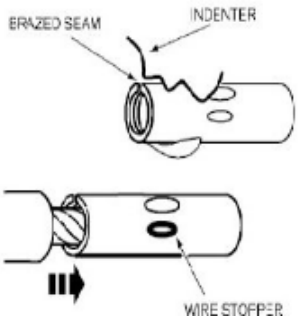
6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.









7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

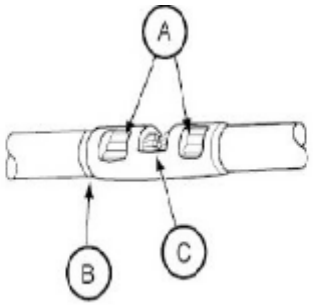
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

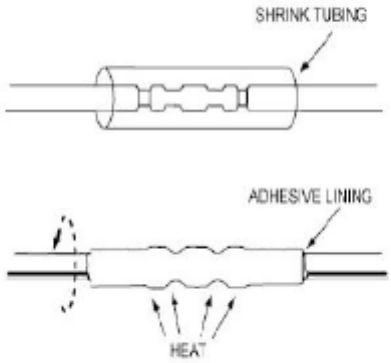
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x cia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

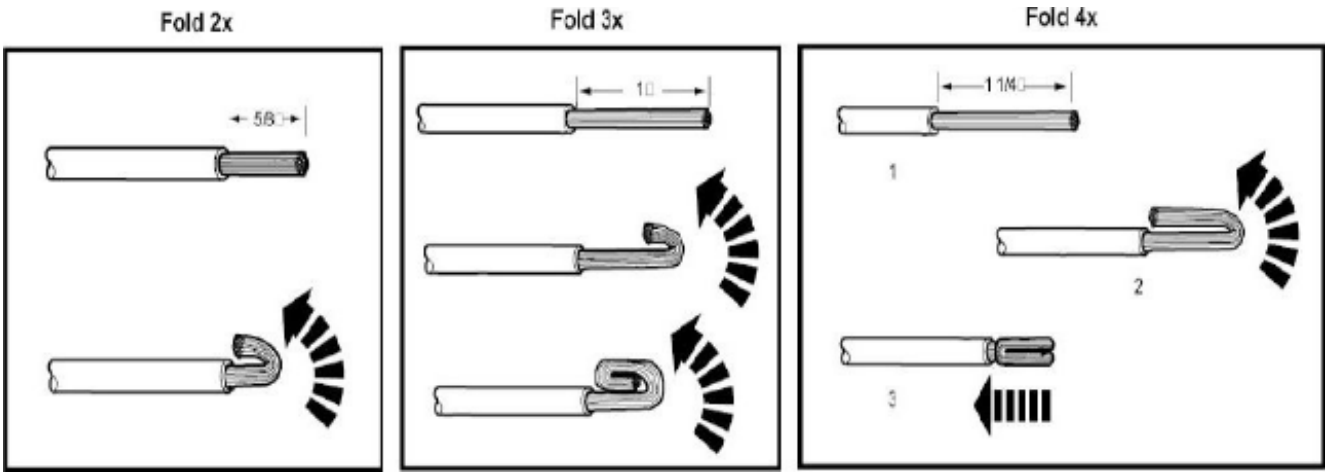
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



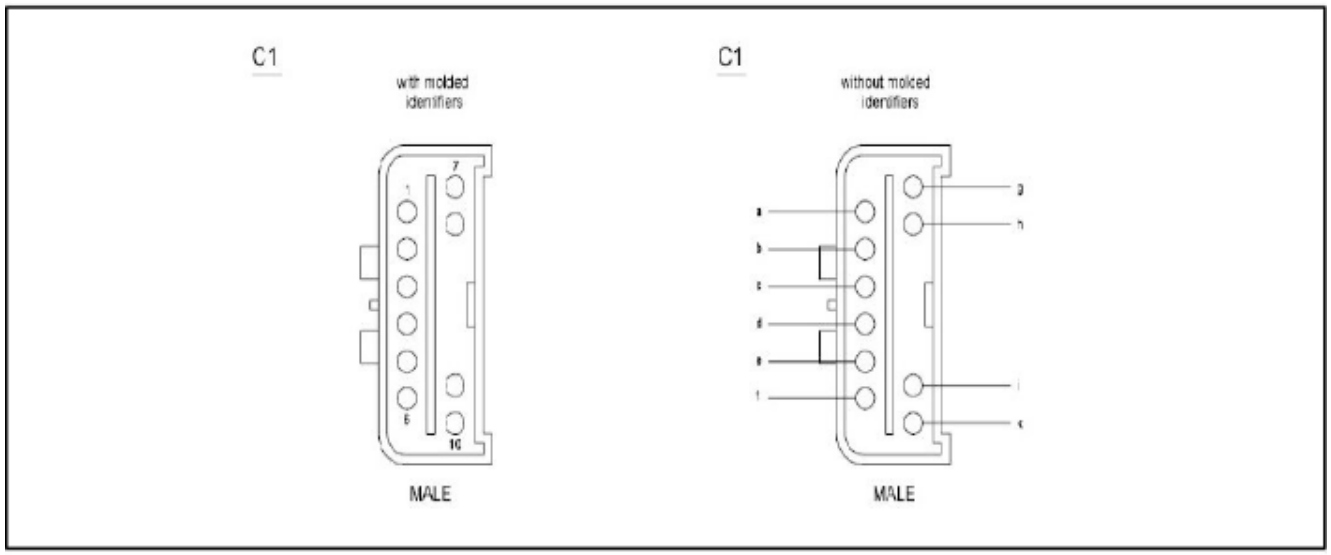
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



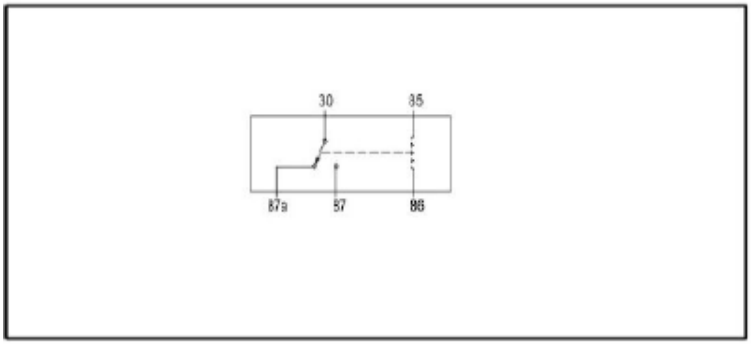
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

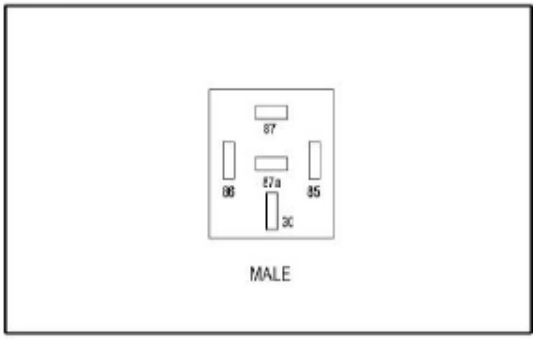
Accessory Delay Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step–by–step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals

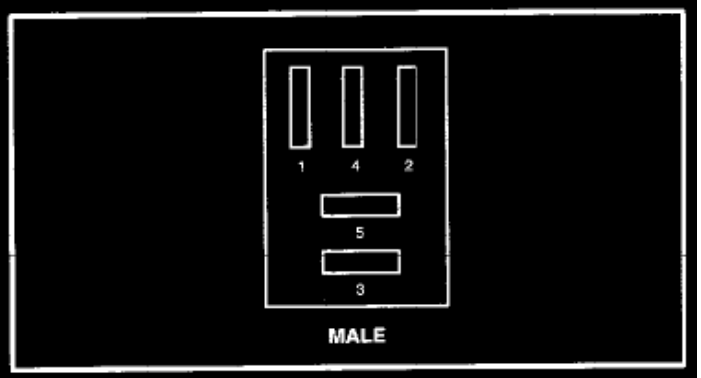
Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

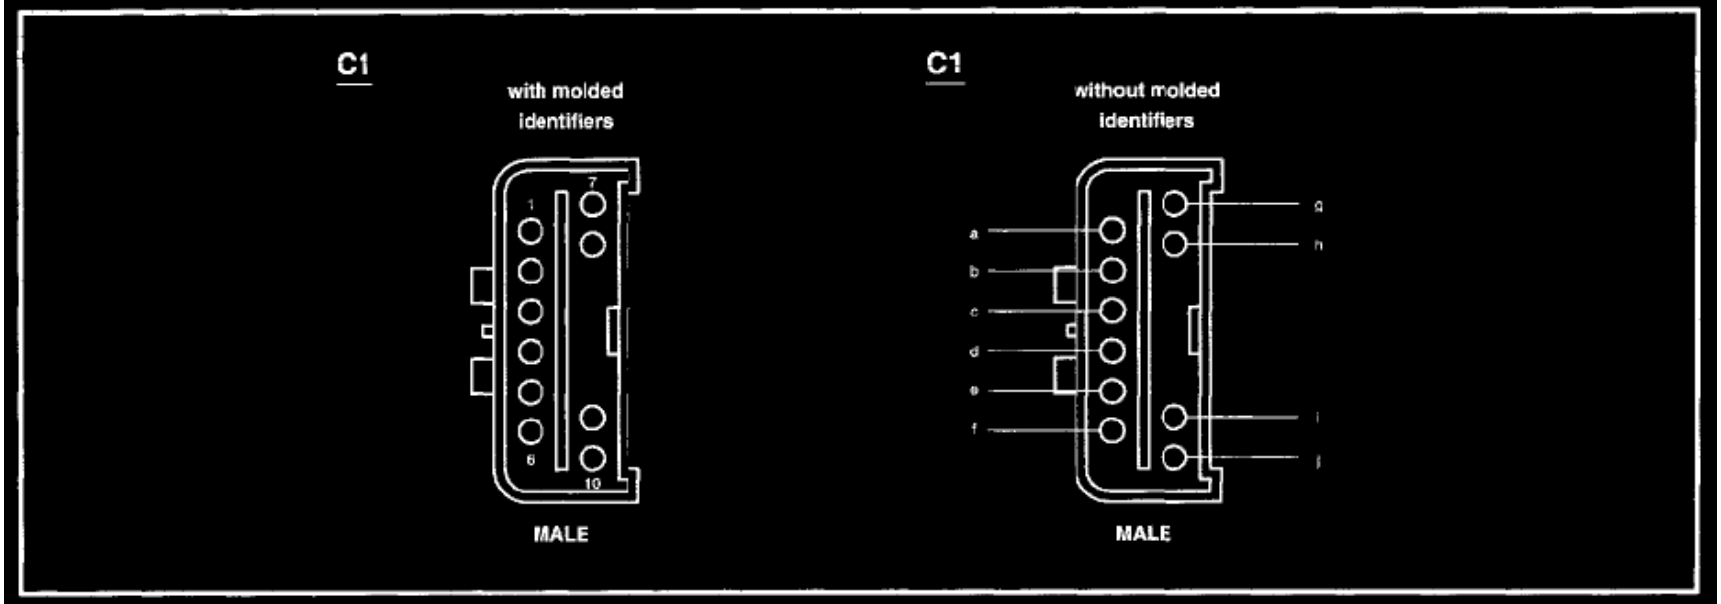
Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step–by–step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

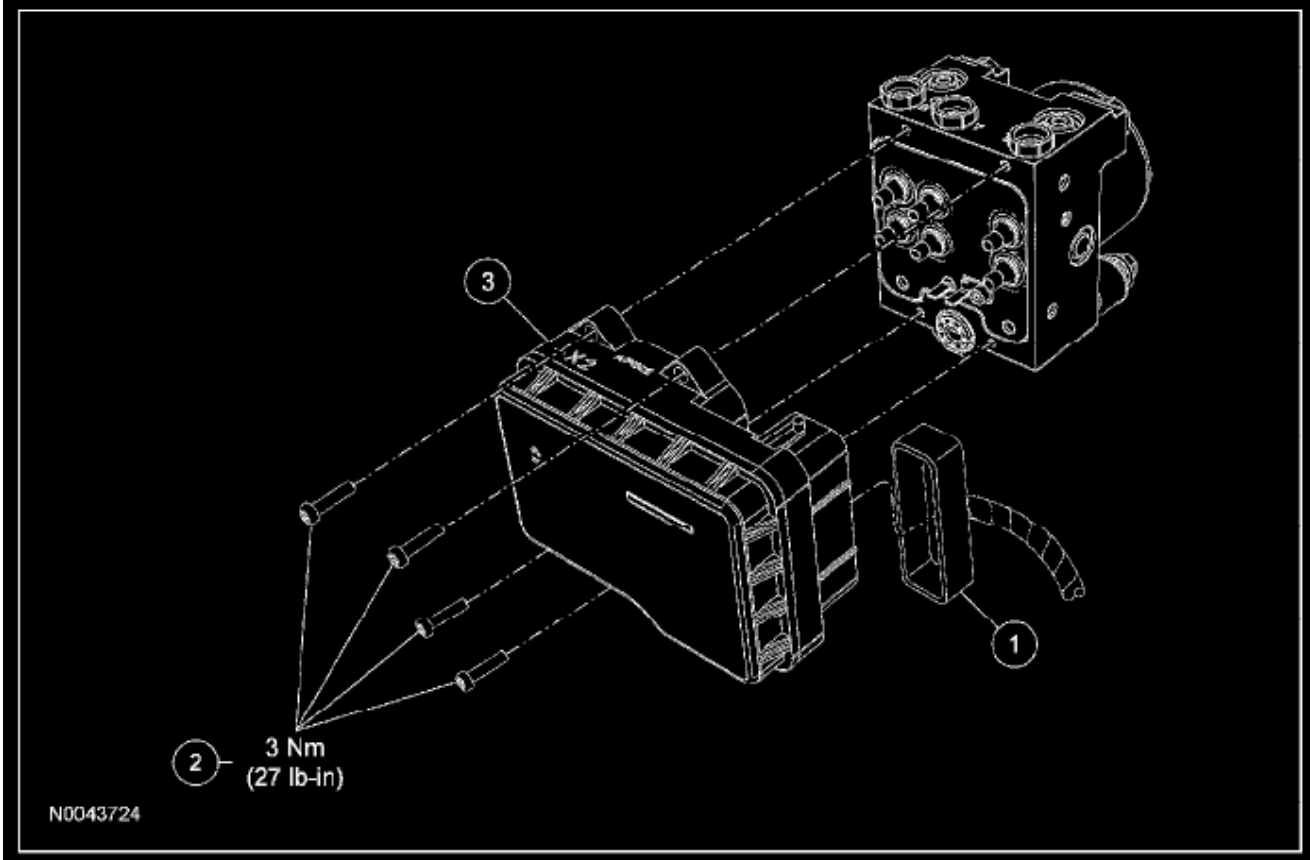
Anti-Lock Brake System (ABS) Module



Item	Part Number	Description
1	—	ABS module electrical connector (part of 14290)
2	—	ABS module bolts (4 required) (part of 2C065)
3	2C065	ABS module

Electronic Brake Control Module: Service and Repair

Anti-Lock Brake System (ABS) Module

Anti-Lock Brake System (ABS) Module

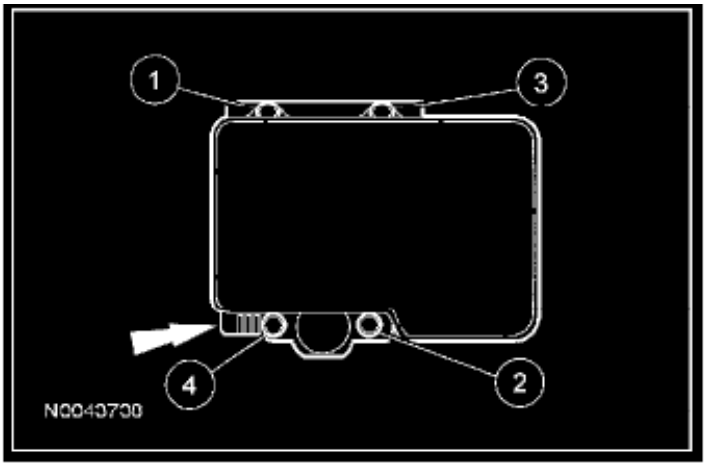
Removal and Installation

1. Remove the hydraulic control unit (HCU).

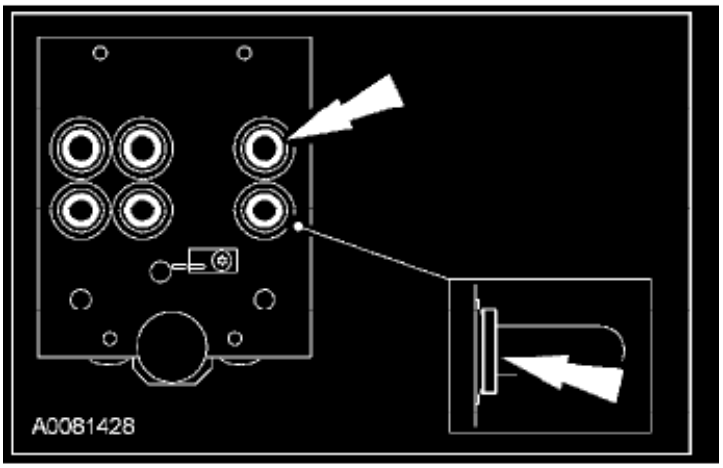
2. NOTE: The ABS module bolts must be removed and installed in the sequence shown.

Remove the 4 ABS module bolts in the sequence shown. ^

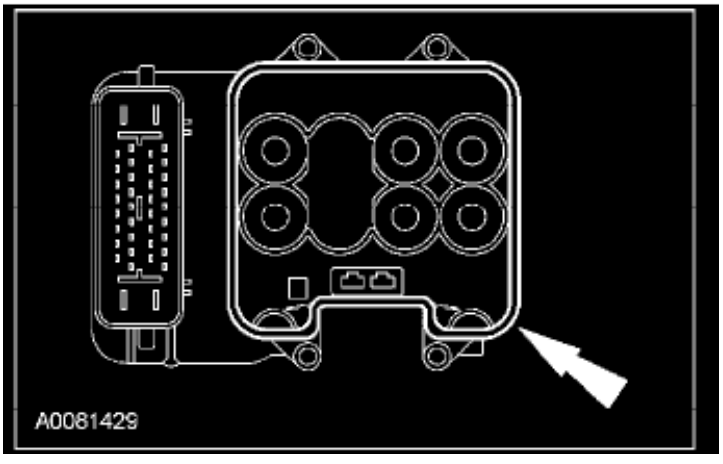
To install, tighten to 3 Nm (27 lb-inch).



1
3
4
2



A0081428



A0081429

3. CAUTION: When the anti-lock brake system (ABS) module is separated from the hydraulic control unit (HCU), the motor terminals and

the valve stems will be exposed. Protect the terminals and the valve stems from damage.

Remove the ABS module from the HCU.

4. Remove and discard the O-ring seals.

5. Remove and discard the ABS module seal.

6. CAUTION: All components must be free of dust, oil, fluid and foreign material prior to installation. A new seal kit must be used when

installing the anti-lock brake system (ABS) module. The old seals must be discarded as they may cause a leak between the ABS module and the hydraulic control unit (HCU).

NOTE: The O-ring seals must be installed to the valve flange. Make sure the O-ring seals are not deformed when installed.

NOTE: Clean the groove of the ABS module before installing a new seal.

To install, reverse the removal procedure.

Radiator Cooling Fan Motor Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

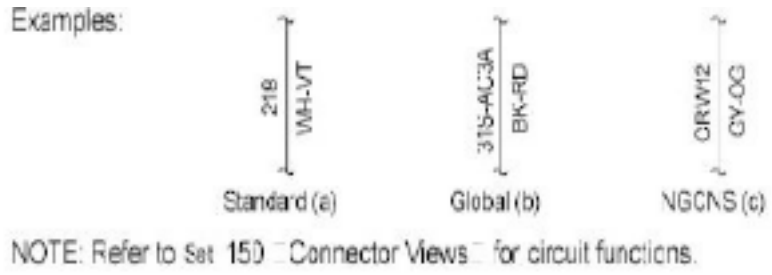
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

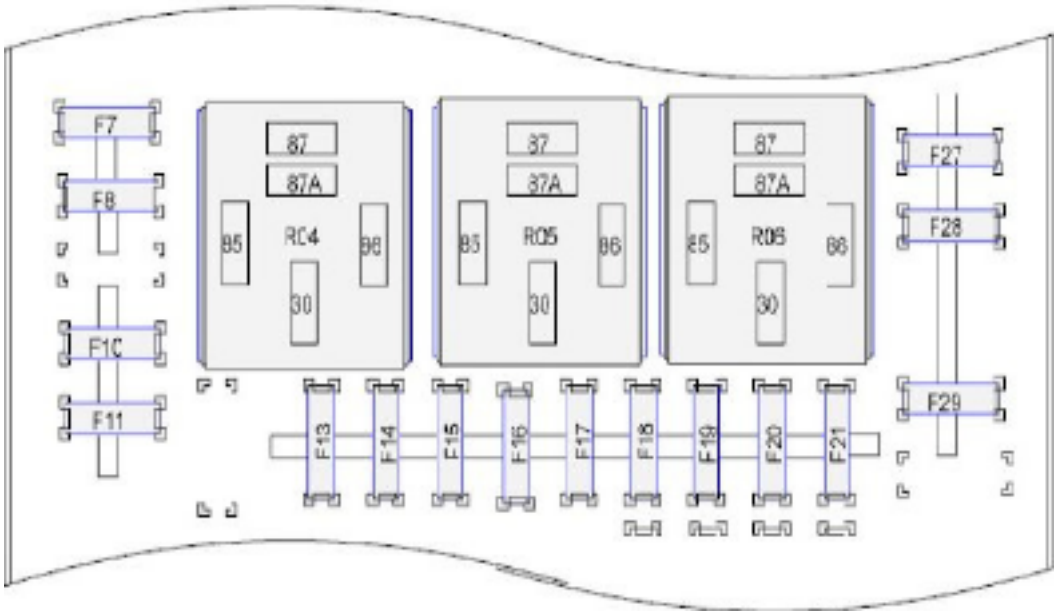
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

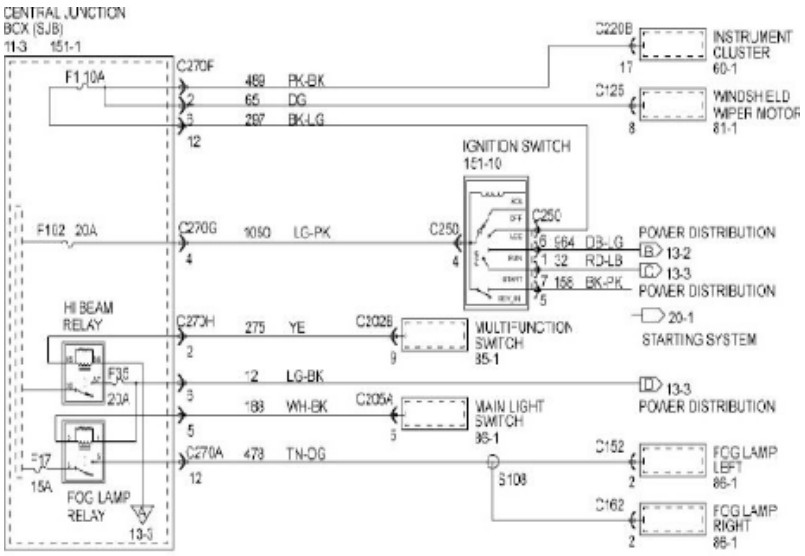
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

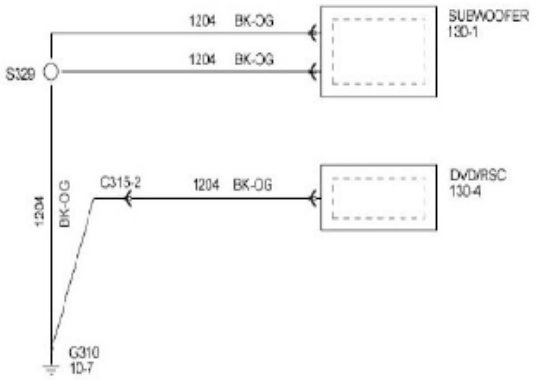
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

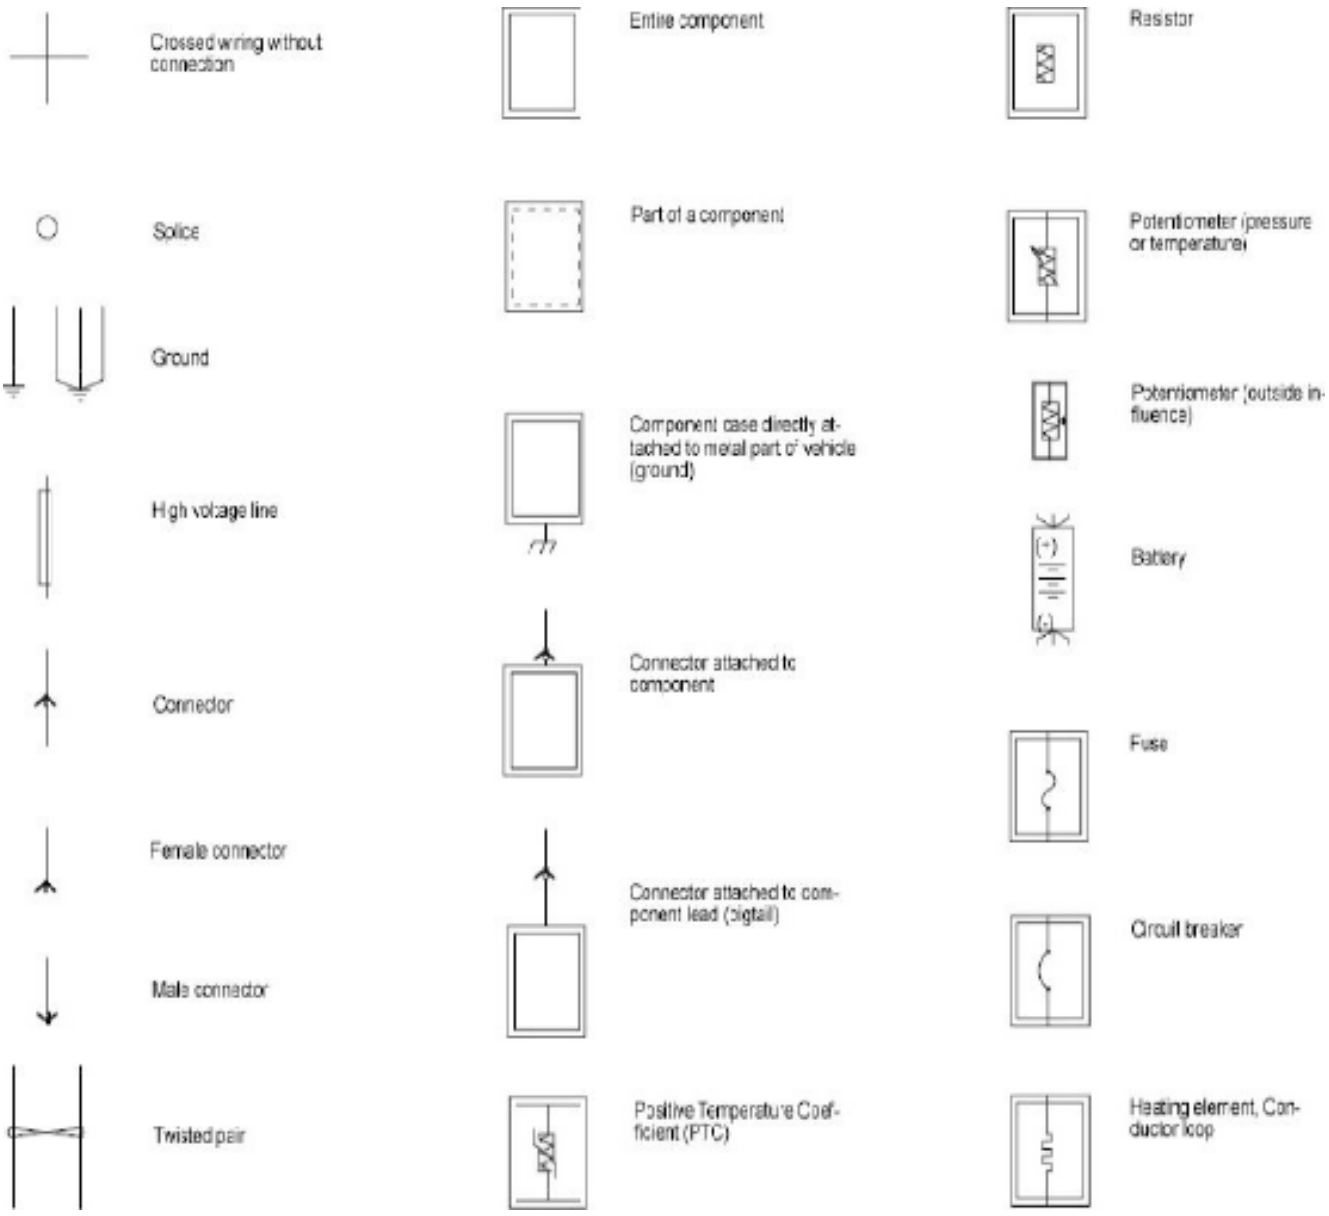
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

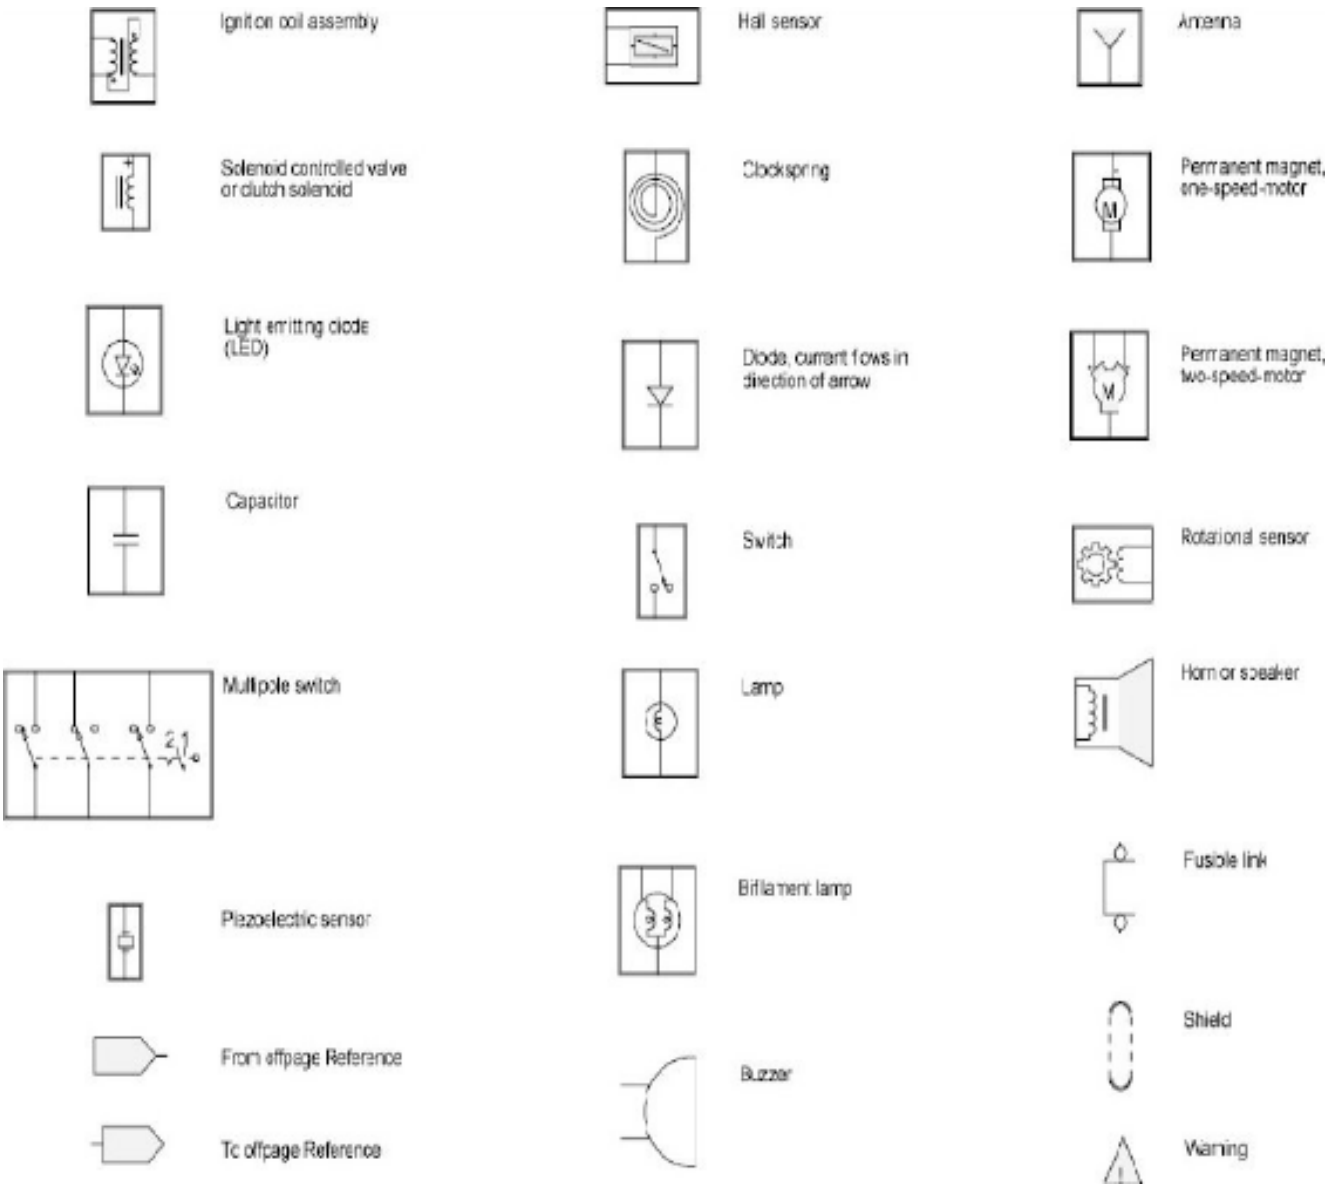
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

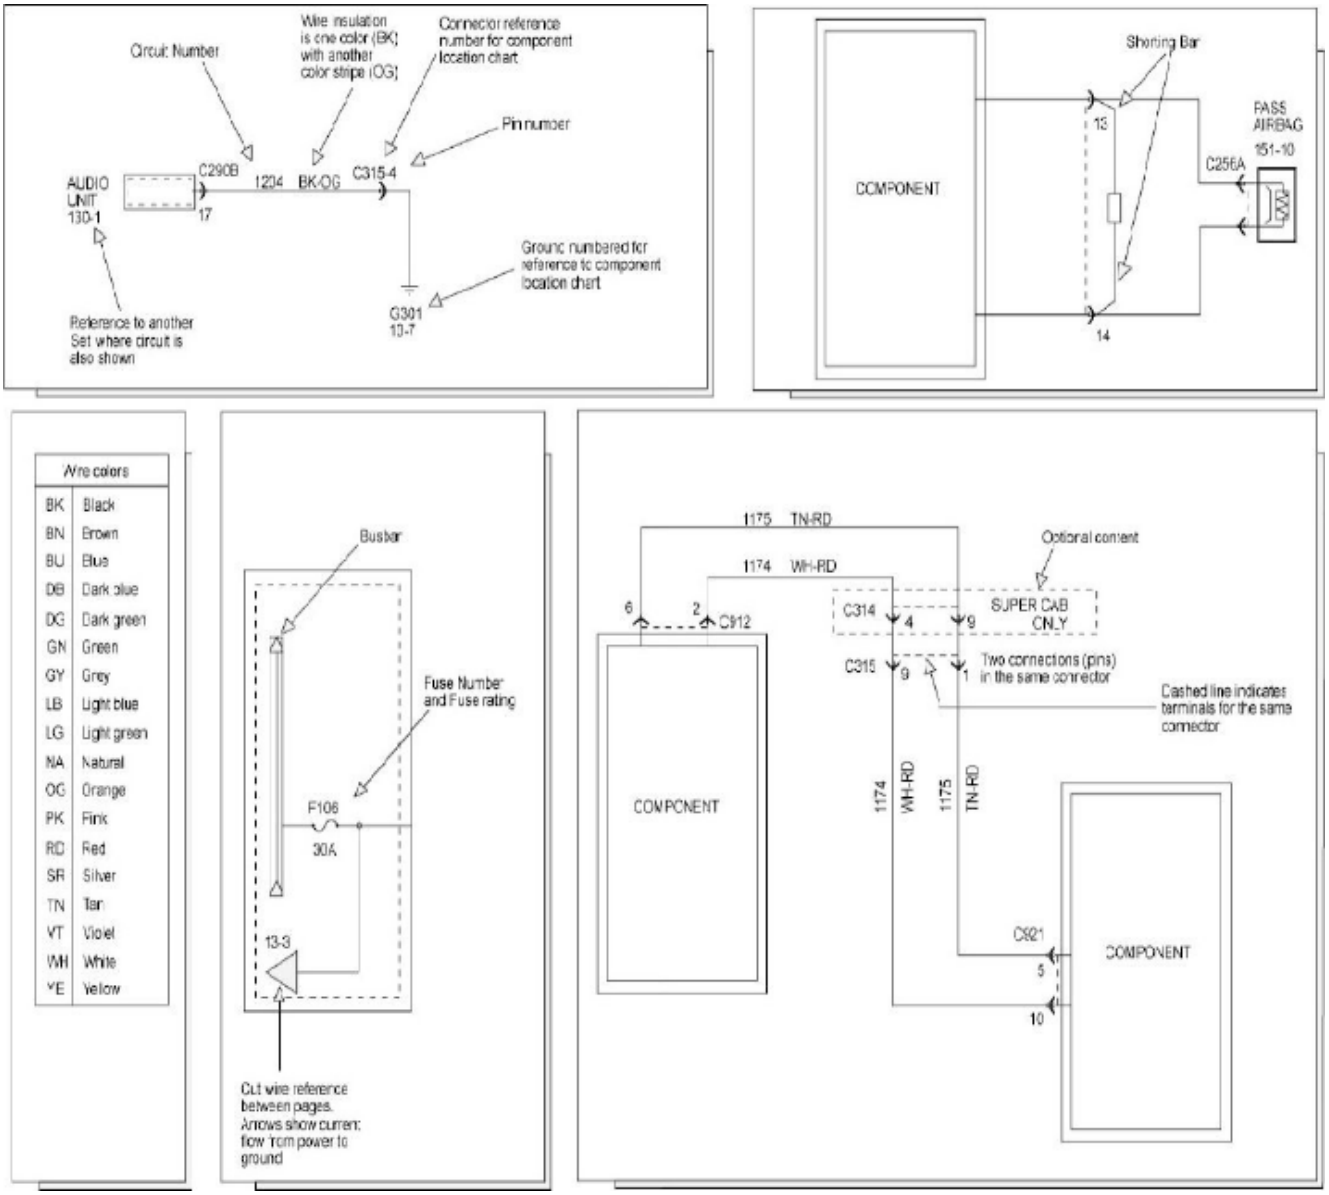
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

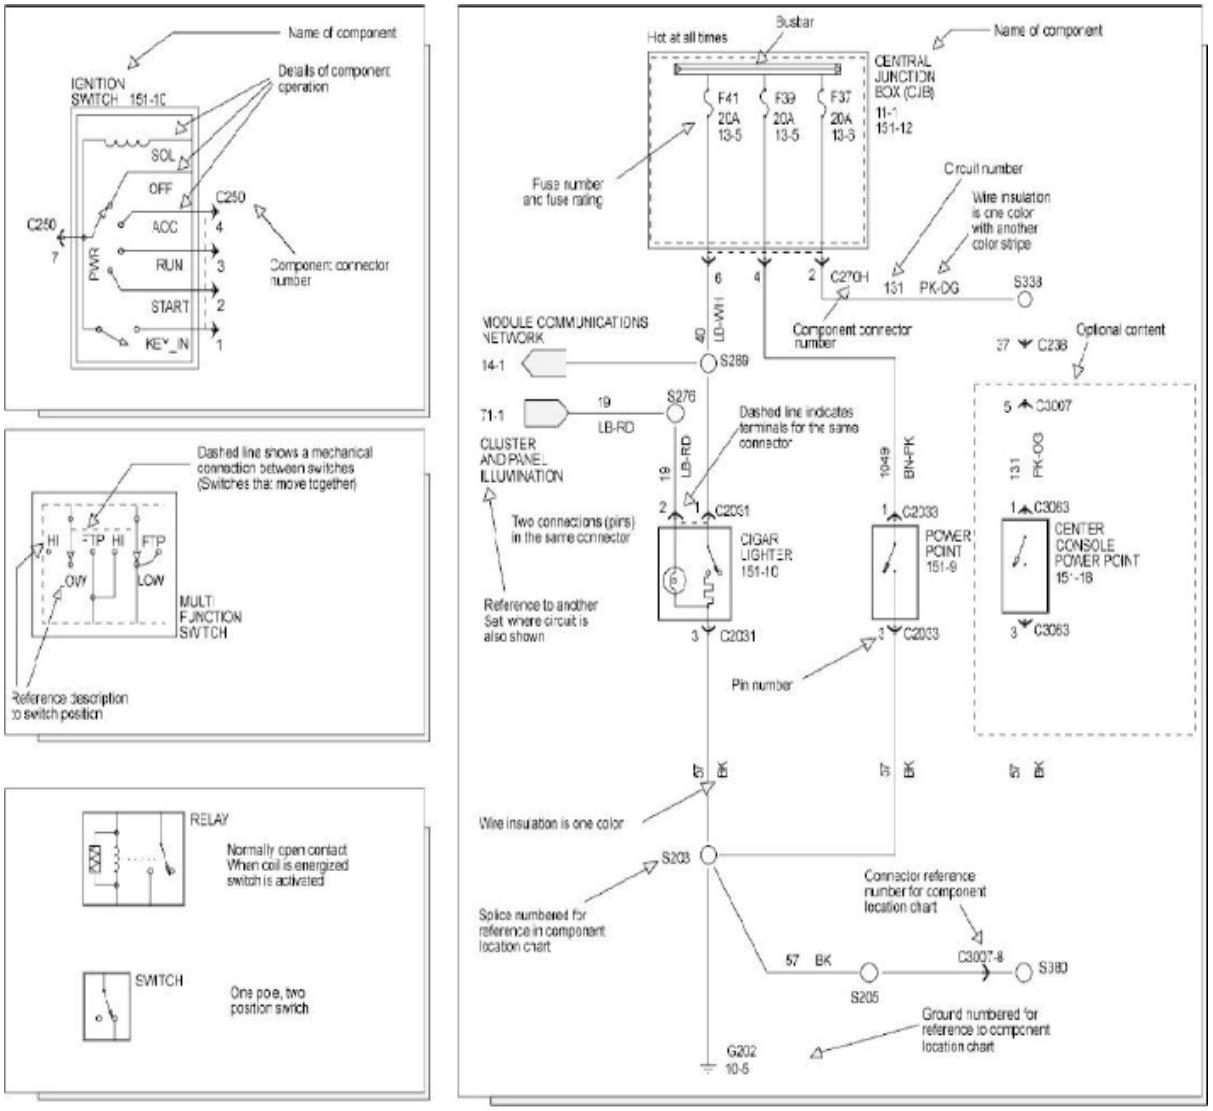
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Radiator Cooling Fan Motor Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

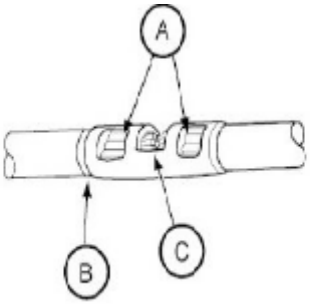
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

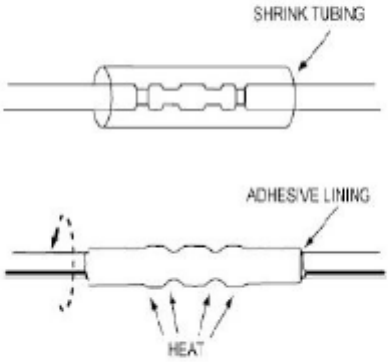
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4□ strip, cut 9 strands	* 1/4□ strip, cut 2 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip, fold 3x dia.
	16-14	* 1/4□ strip, cut 7 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip fold 2x dia	1□ strip, fold 3x dia.	1 1/4□ strip, fold 4x dia.	Not Recommended
	12-10	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip fold 3x cia.	1 1/4□ strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

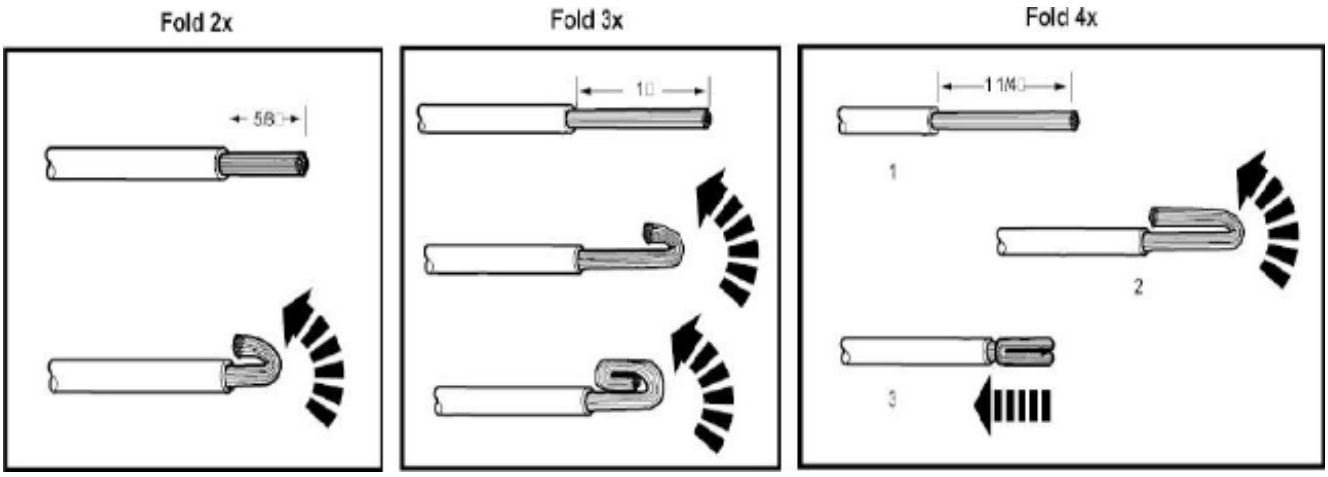
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



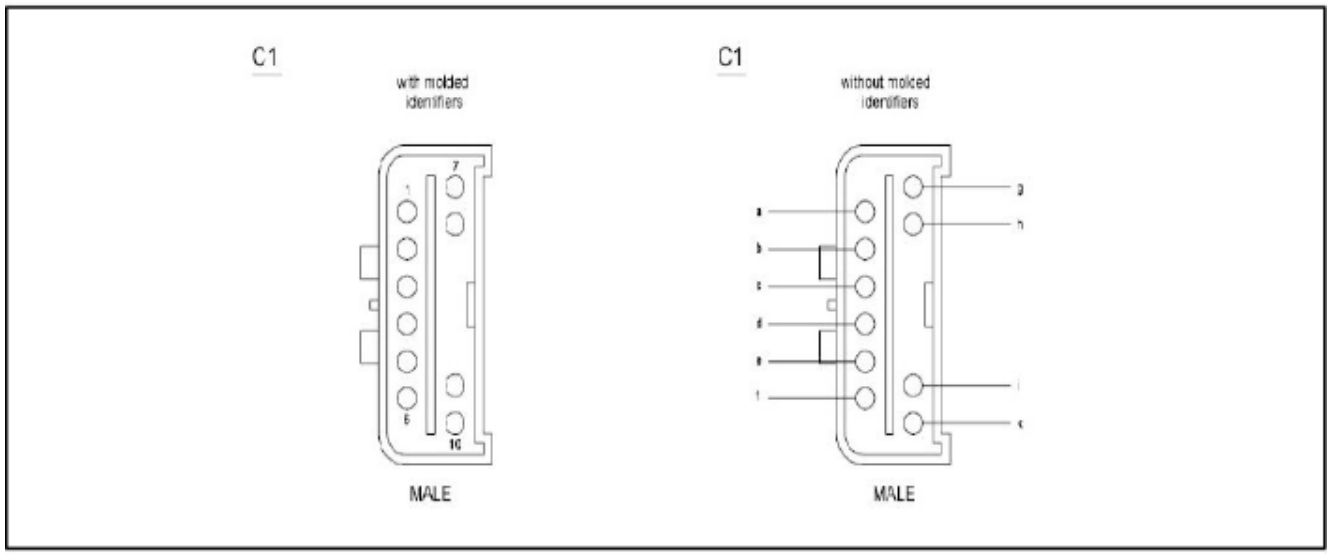
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

Blower Motor Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

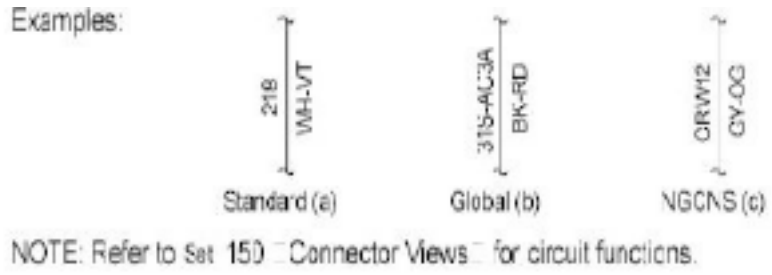
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

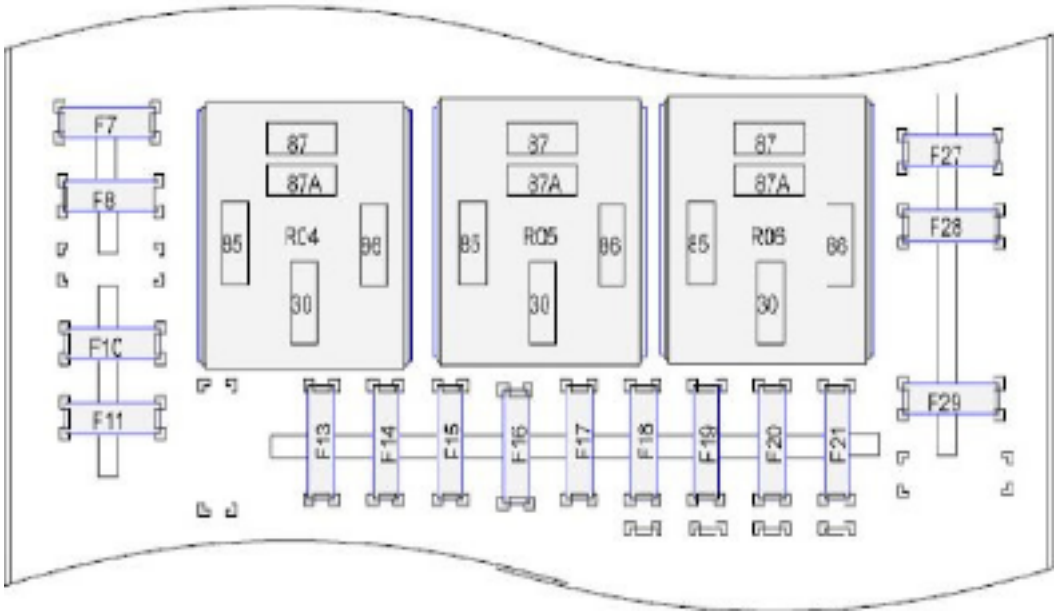
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

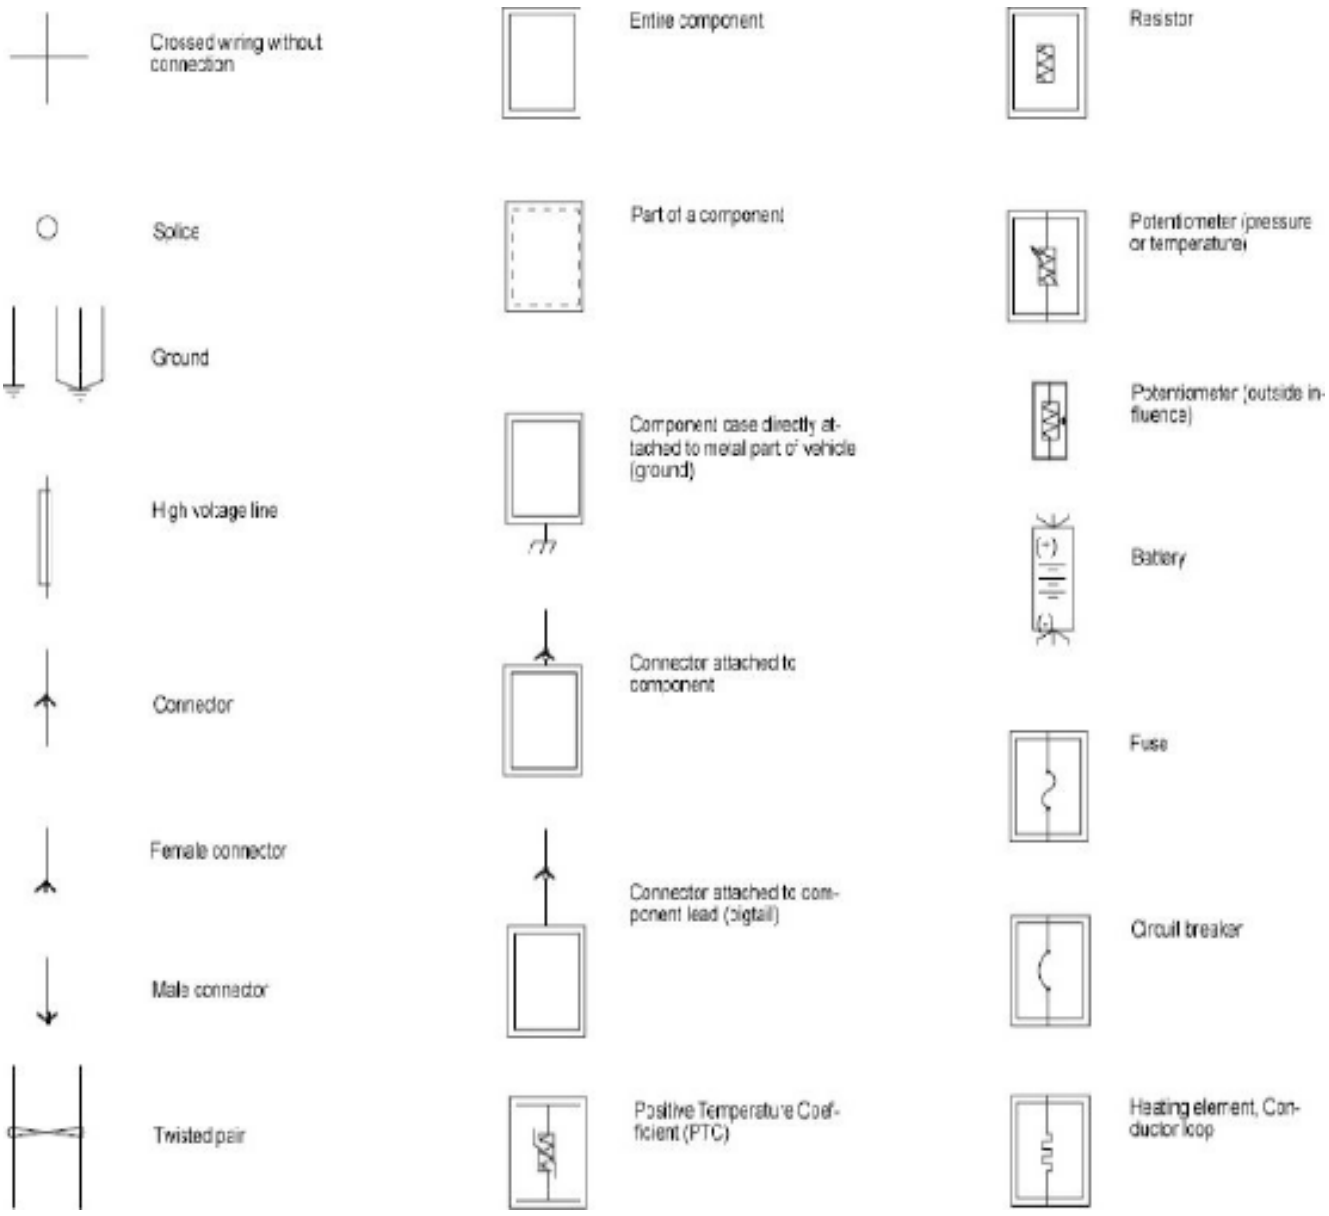
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

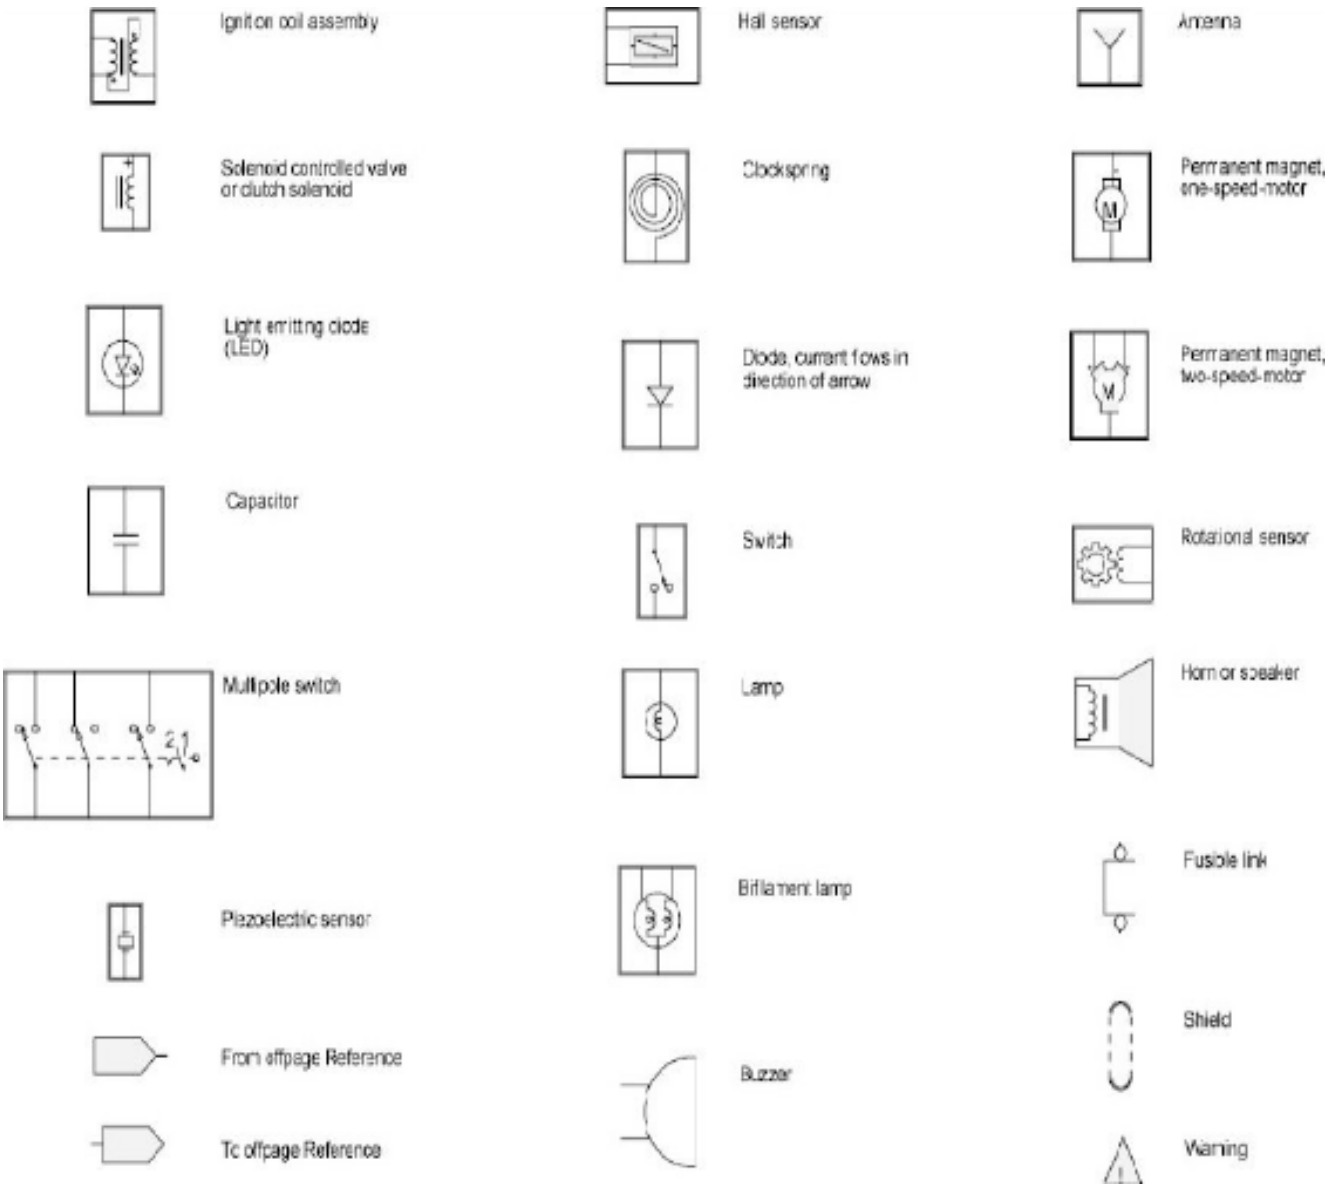
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

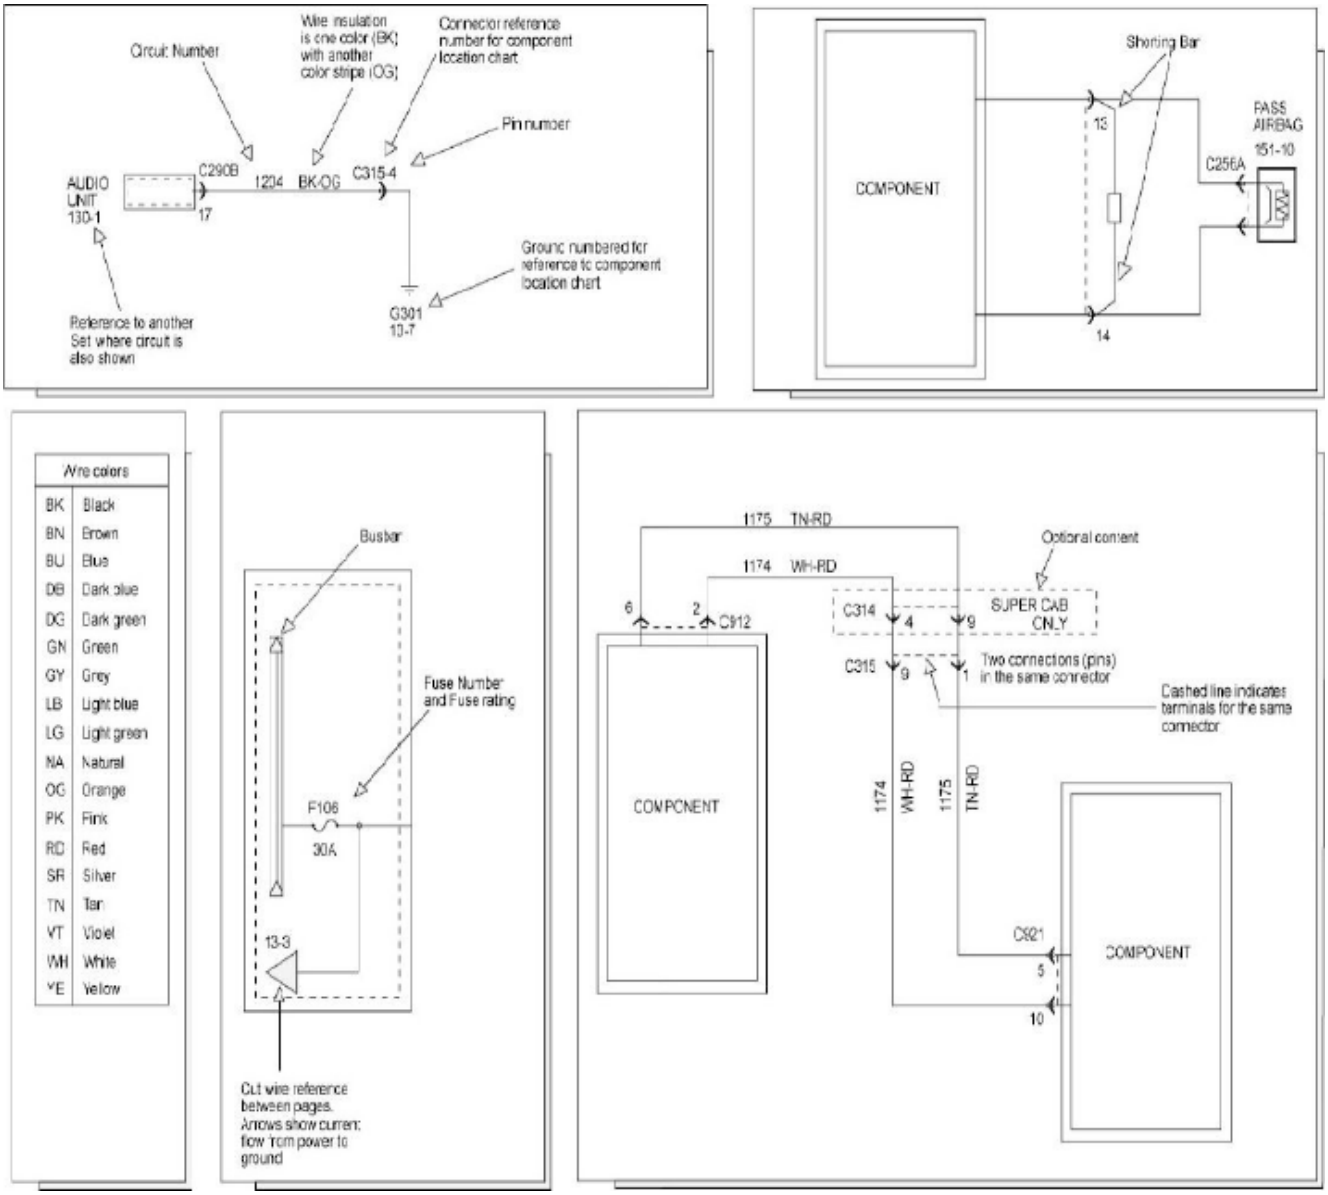
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

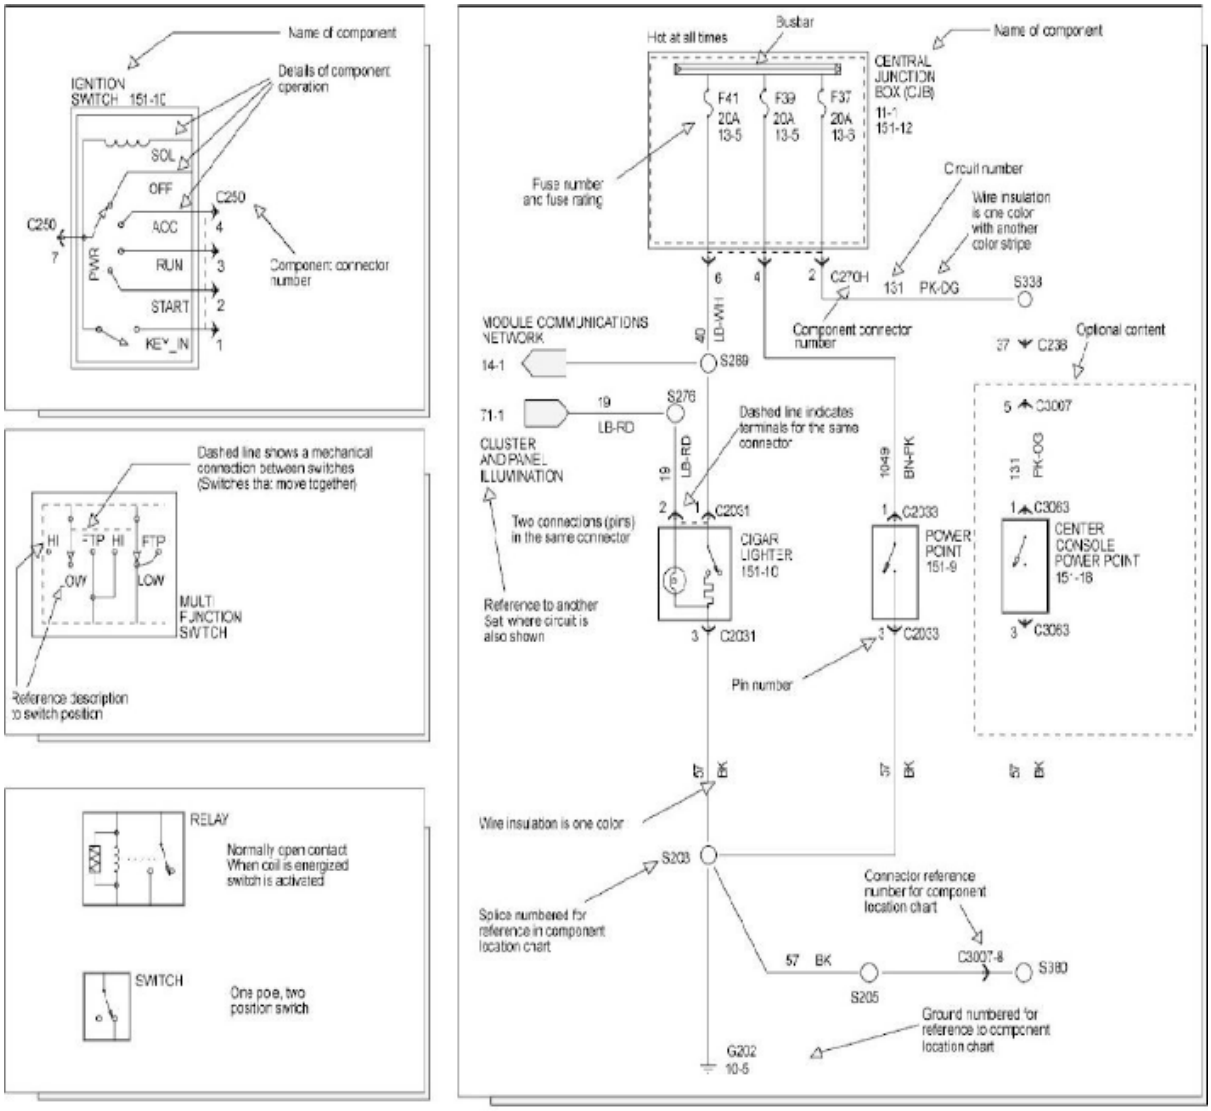
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Blower Motor Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

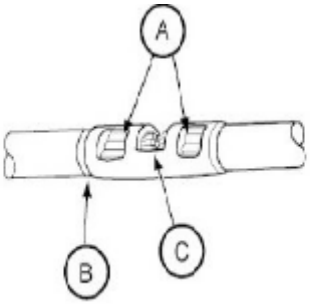
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

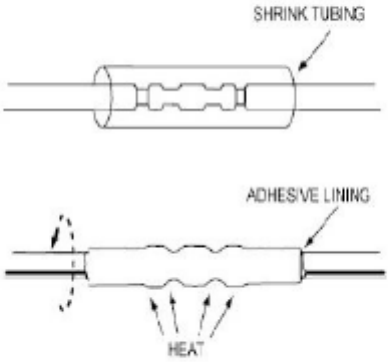
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4□ strip, cut 9 strands	* 1/4□ strip, cut 2 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip, fold 3x dia.
	16-14	* 1/4□ strip, cut 7 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip fold 2x dia	1□ strip, fold 3x dia.	1 1/4□ strip, fold 4x dia.	Not Recommended
	12-10	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip fold 3x dia.	1 1/4□ strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

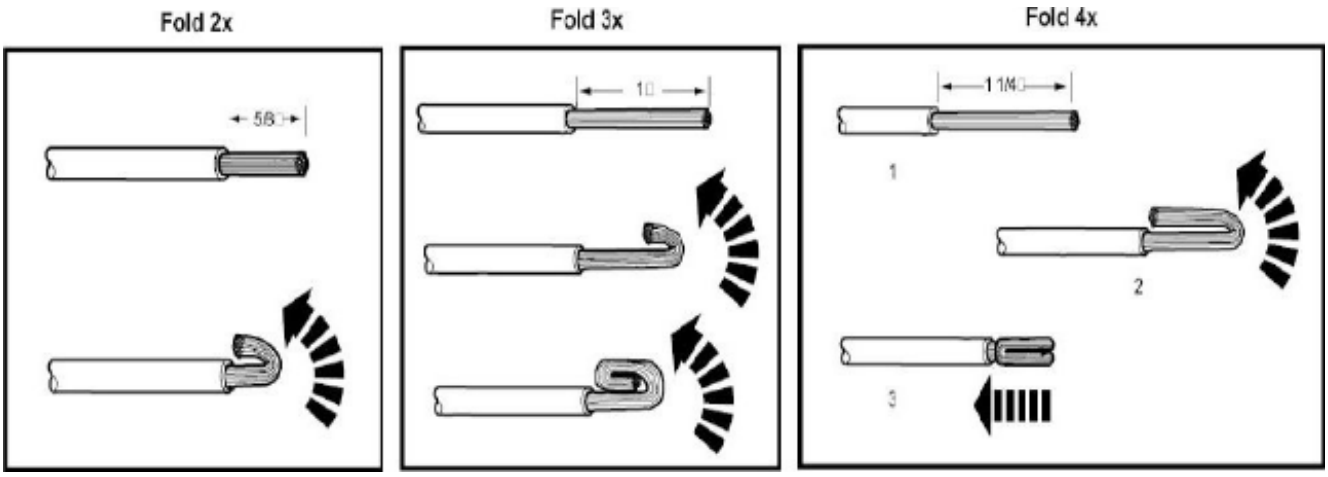
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



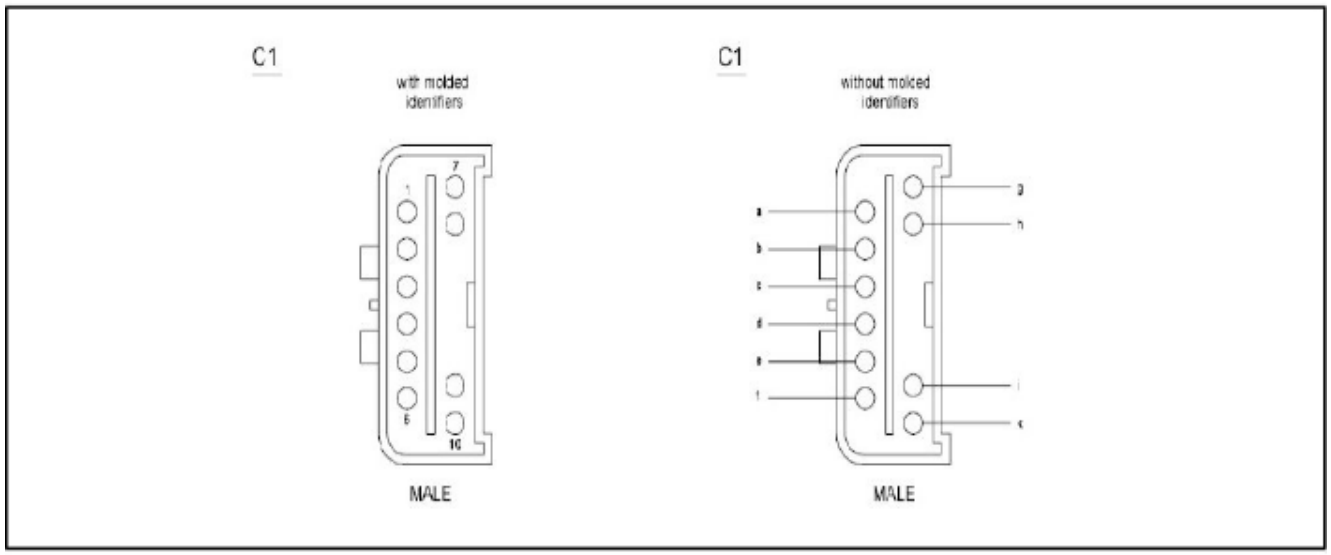
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



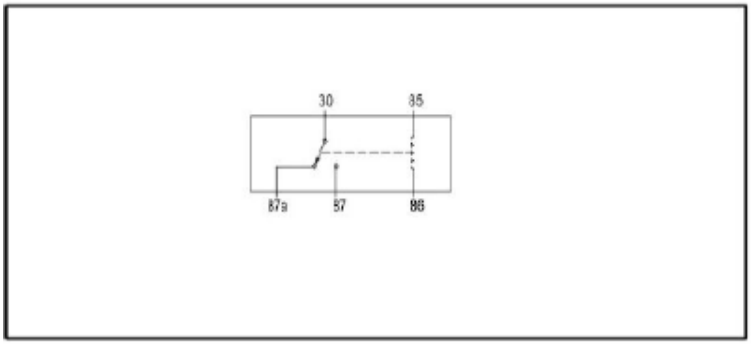
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

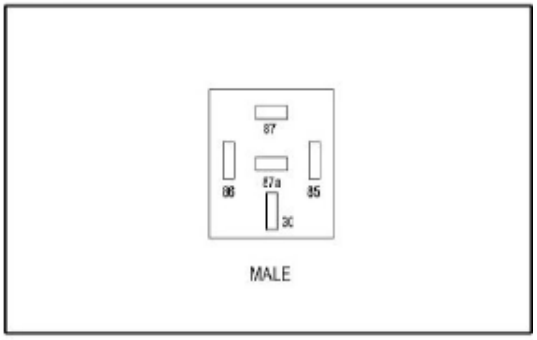
Blower Motor Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Compressor Clutch Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

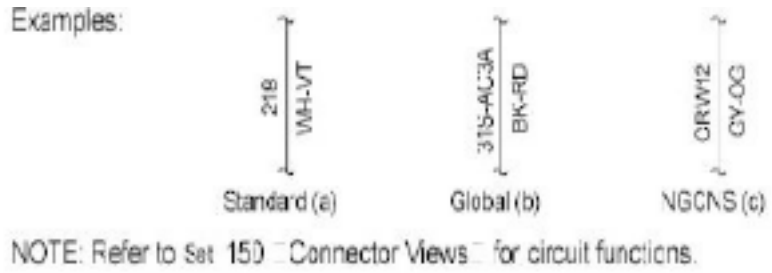
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

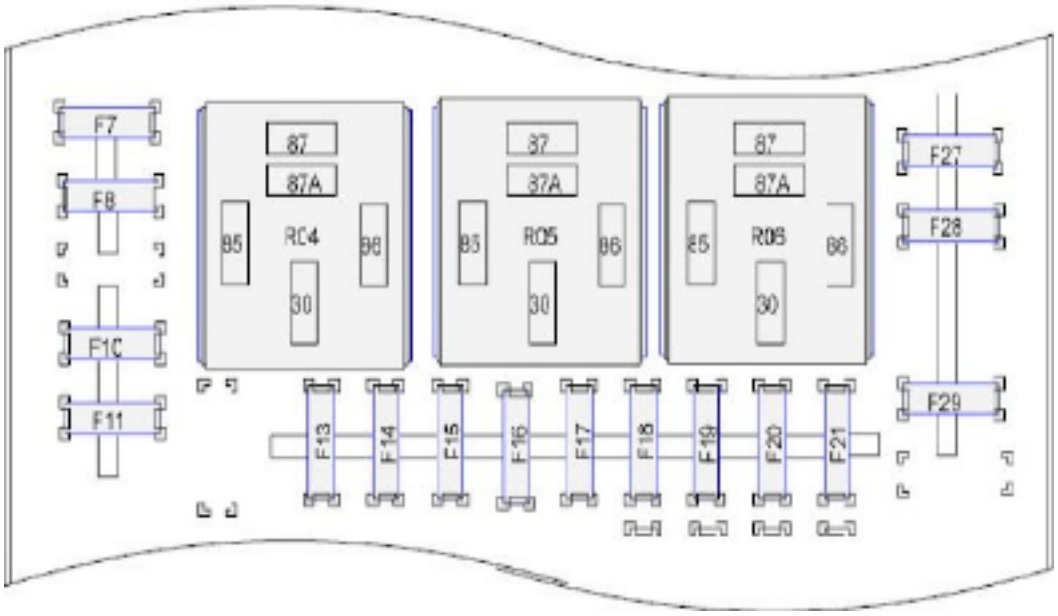
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

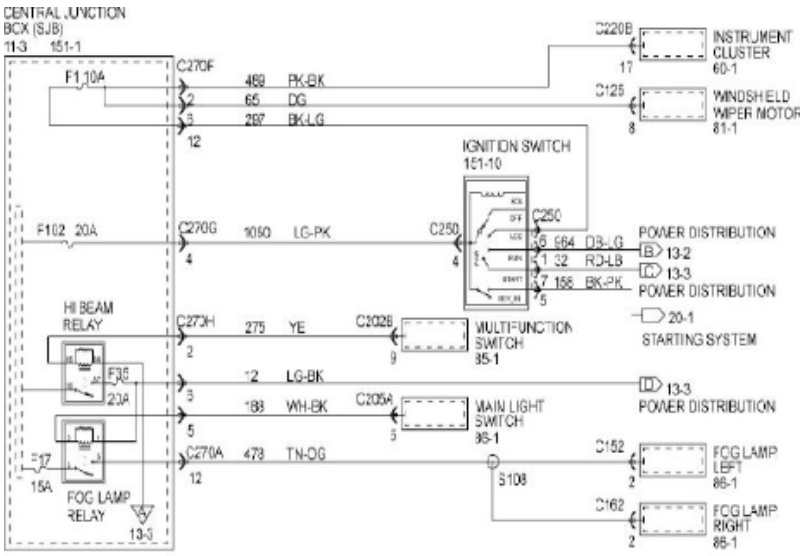
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

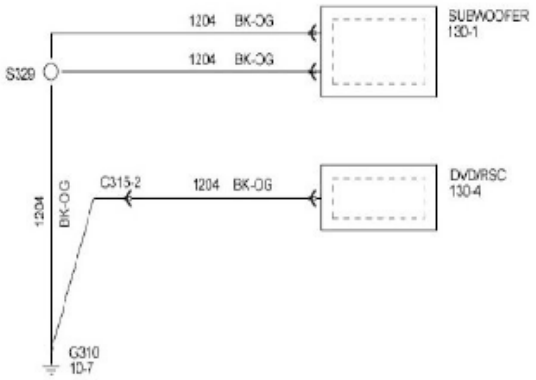
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

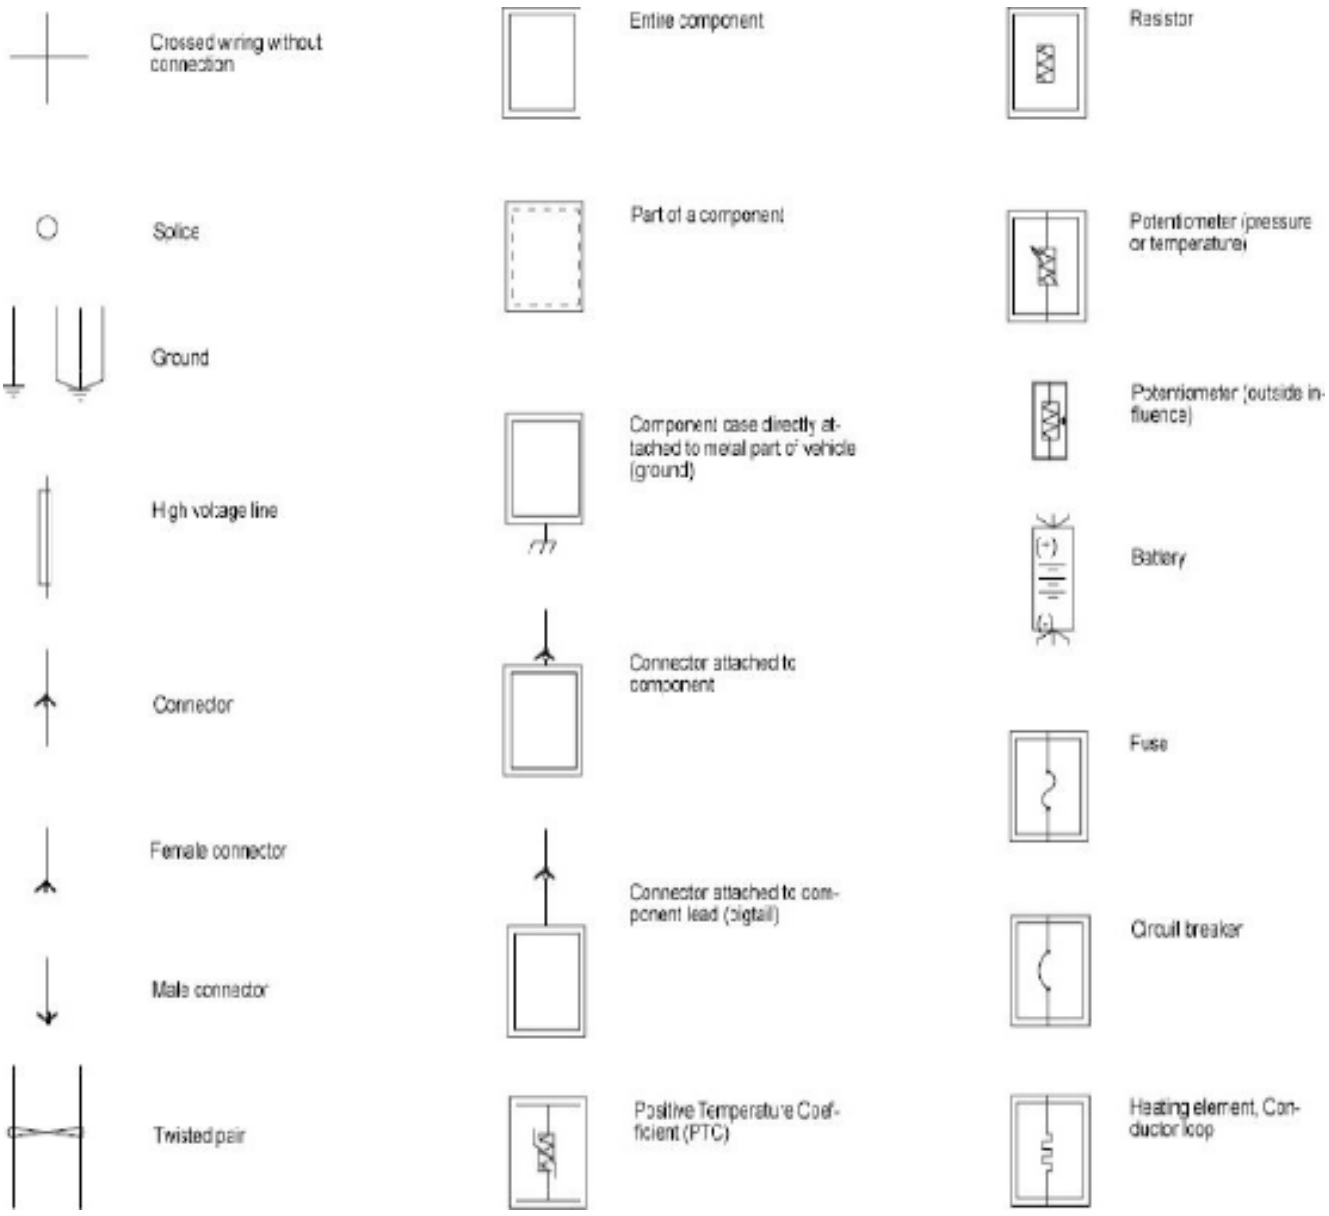
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

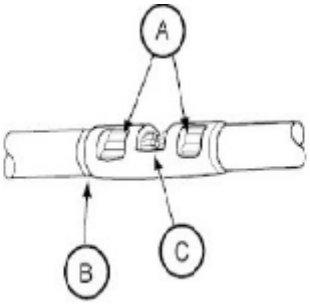
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

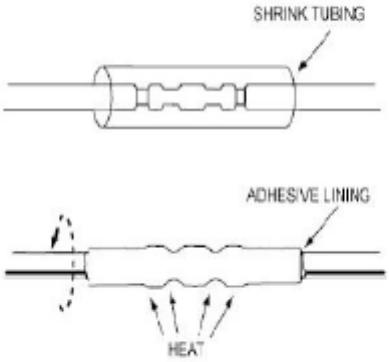
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24

	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x dia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

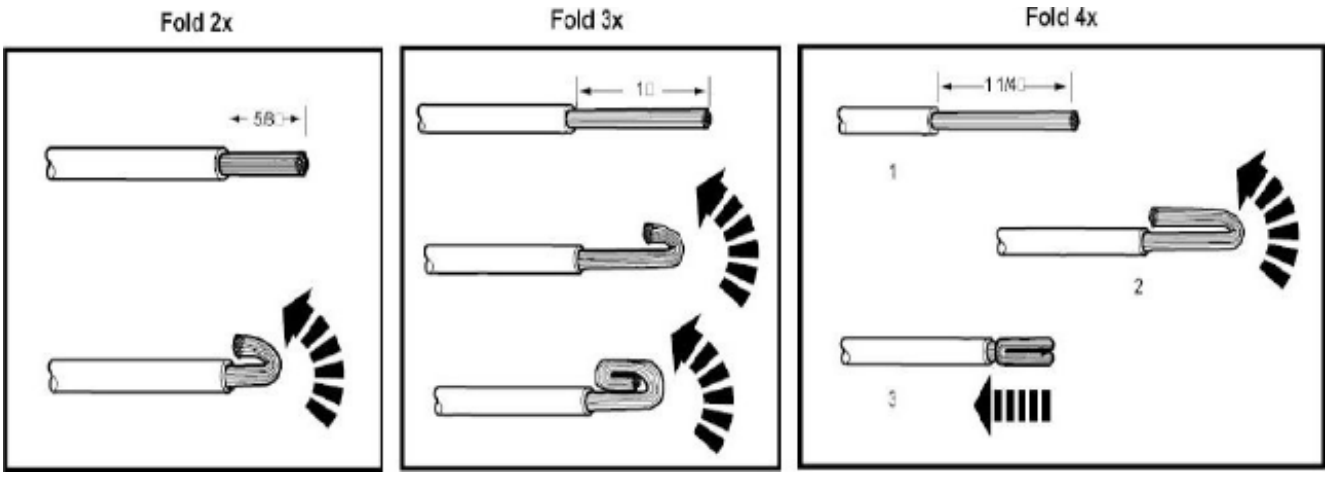
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Compressor Clutch Relay: Description and Operation

AIR CONDITIONING (A/C) CLUTCH RELAY (A/CCR)

NOTE: The PCM PIDs WAC and wide open throttle air conditioning cutoff fault (WACF) are used to monitor the A/CCR output.

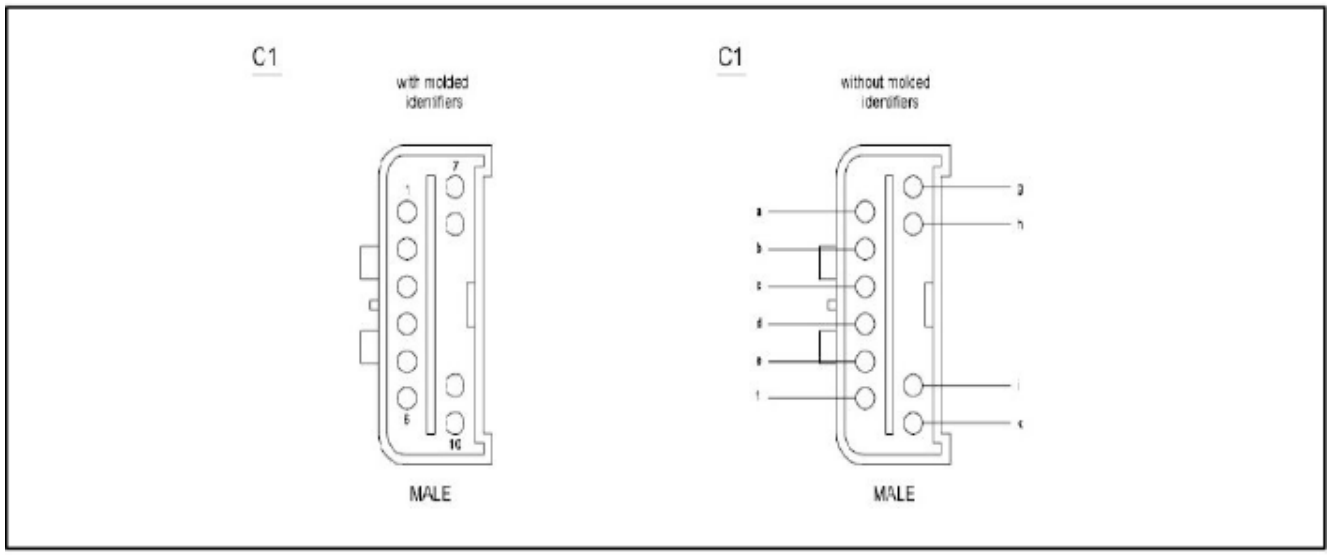
The A/CCR is wired normally open. There is no direct electrical connection between the A/C switch or electronic automatic temperature control (EATC) module and the A/C clutch. The PCM receives a signal indicating that A/C is requested. For some applications, this message is sent through the communications network. When A/C is requested, the PCM checks other A/C related inputs that are available, such as A/C pressure switch and A/C cycling switch. If these inputs indicate A/C operation is OK, and the engine conditions are OK (coolant temperature, engine RPM, throttle position), the PCM grounds the A/CCR output, closing the relay contacts and sending voltage to the A/CCR.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



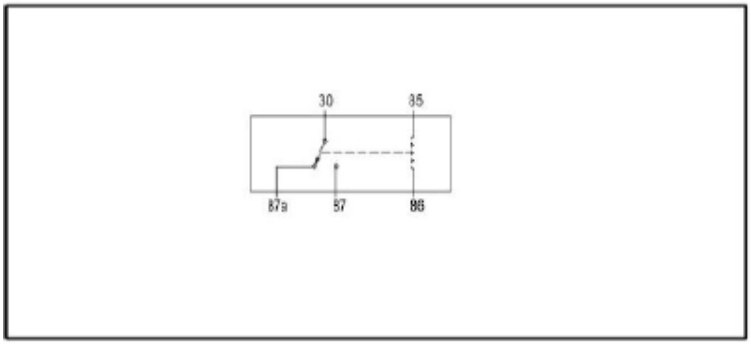
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

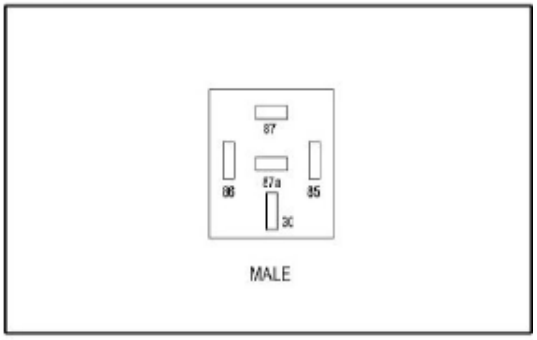
Compressor Clutch Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	45 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

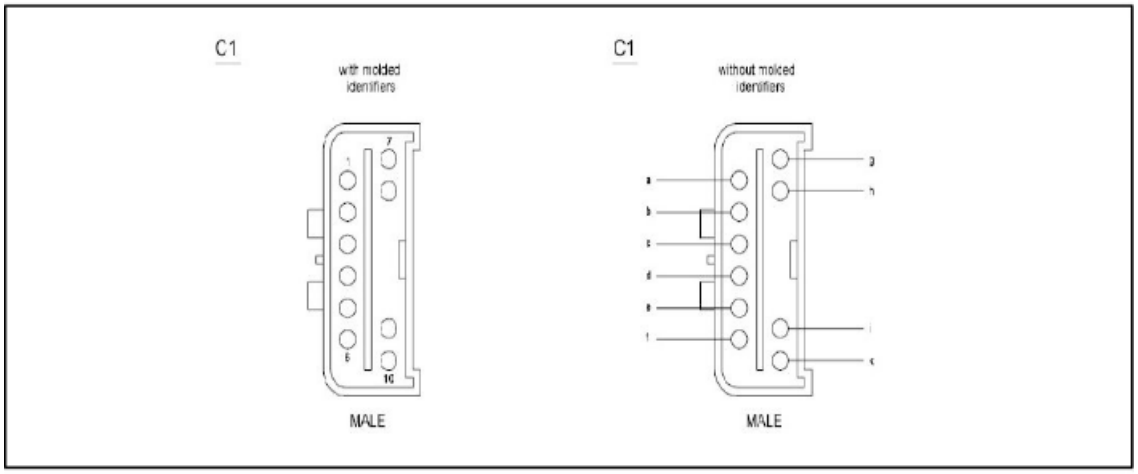
Testing information for each component includes a schematic, a view of the terminal locations and step□by□step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals

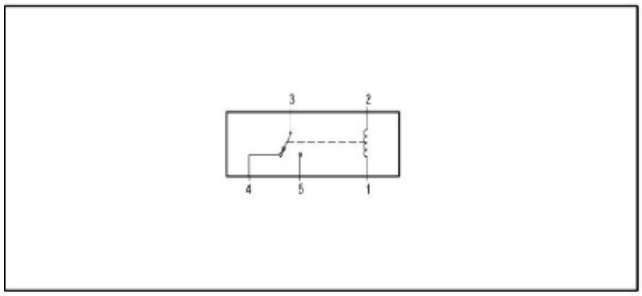


The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column □Circuit to test□. If you wish to test the complete component, perform all tests.

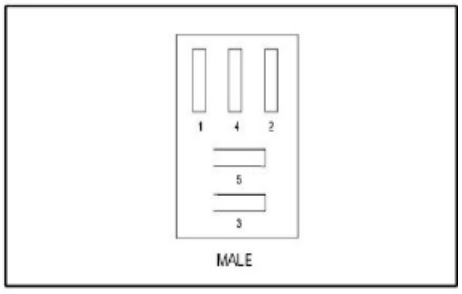
Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

Relay □ Micro ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	1 and 2	63□102 Ω
Contact	3 and 4	Closed circuit
	3 and 5	Open circuit
Coil □ Contact	1 and 3	Open circuit
	1 and 4	Open circuit
	1 and 5	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 2 and 3 to 12V DC power and pin 1 to ground. Measure voltage between pin 5 and pin 1. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 2 and measure voltage between pin 4 and pin 1. If the voltage is 12V, the relay is okay. If not, replace the relay.

Battery Discharge Protection Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

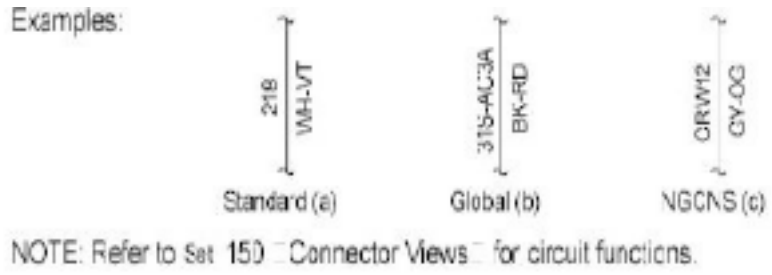
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

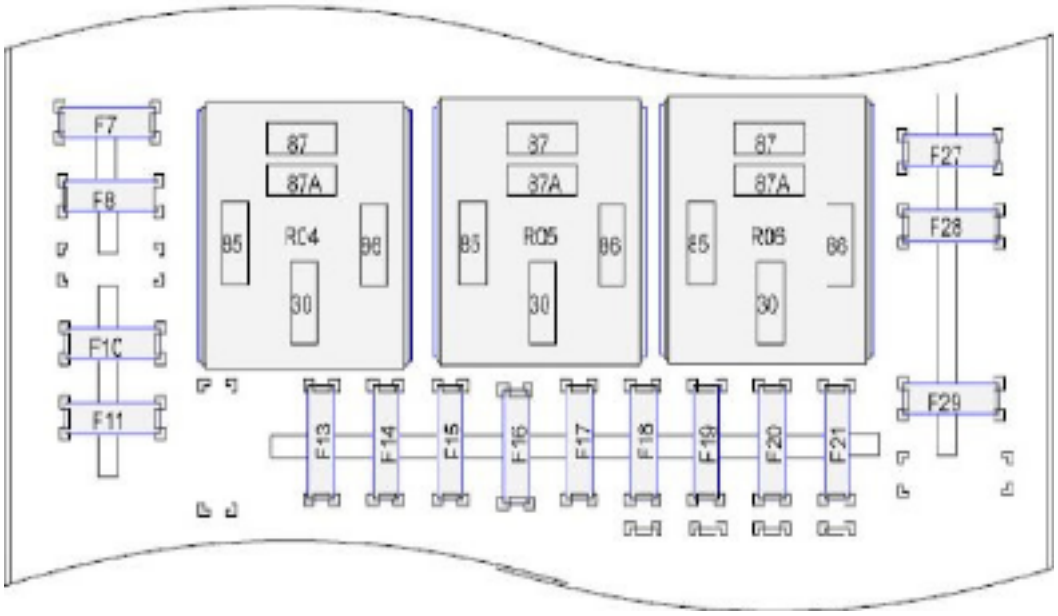
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

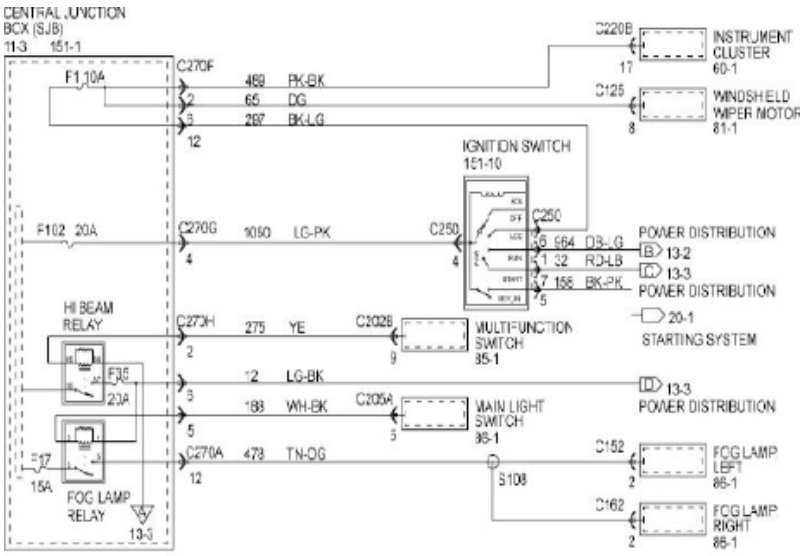
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

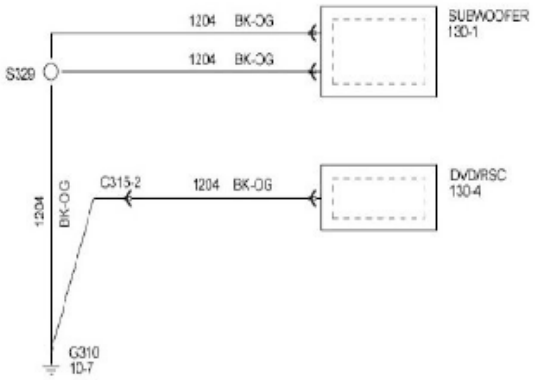
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

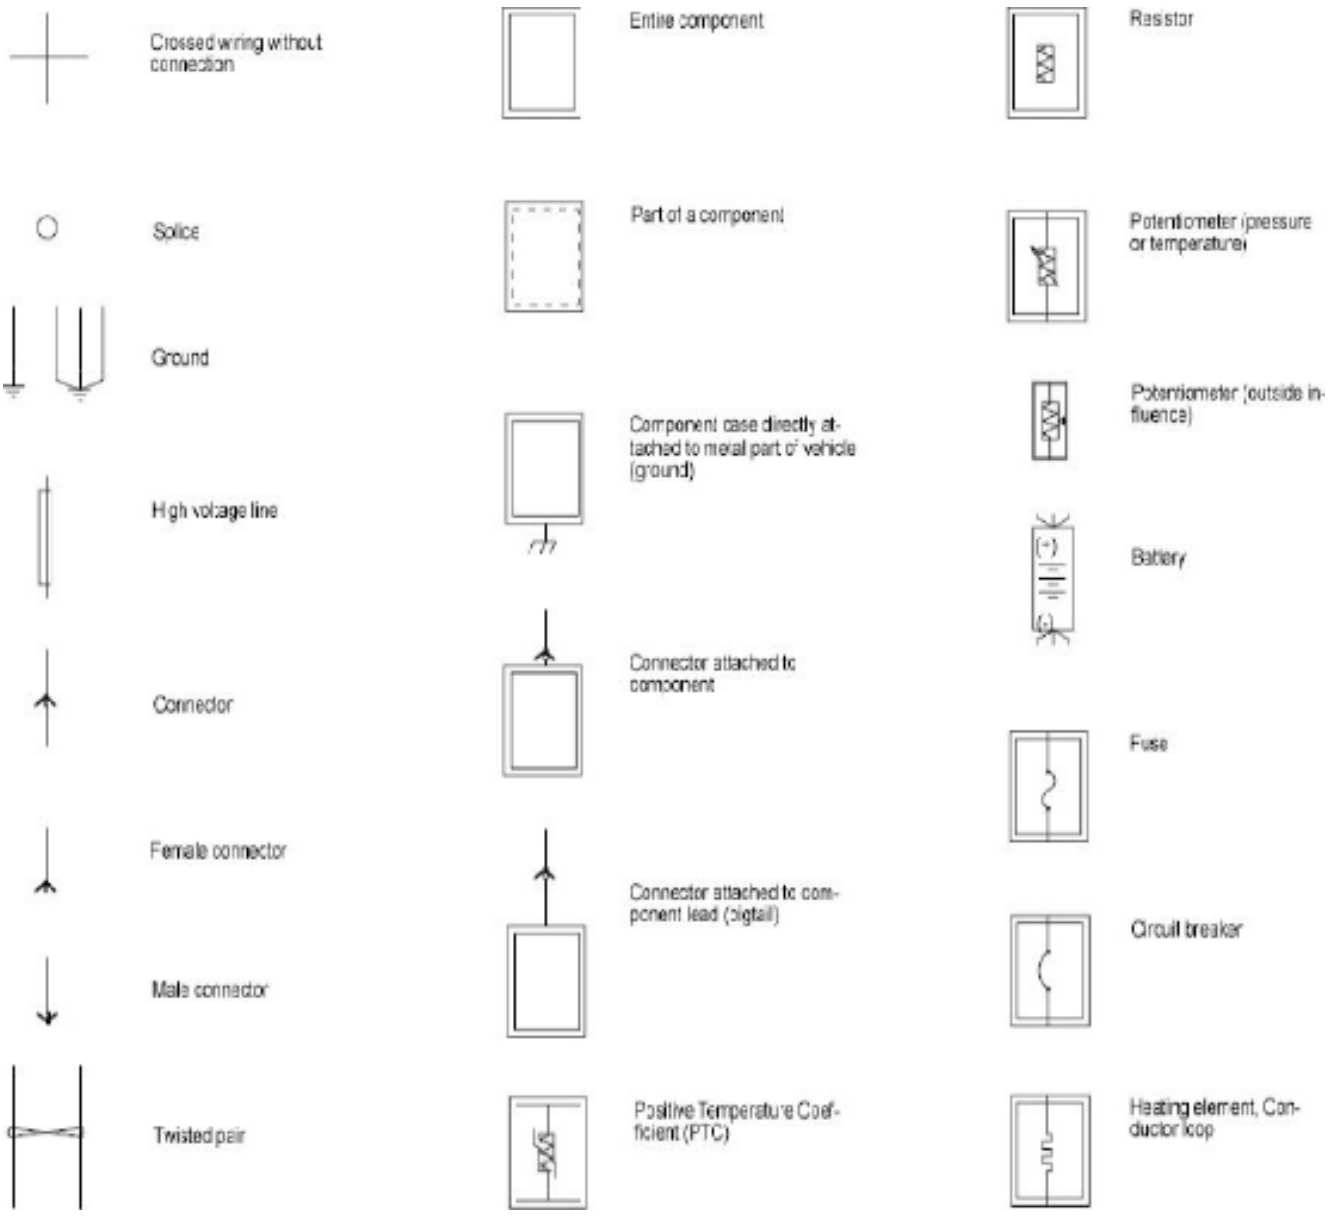
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

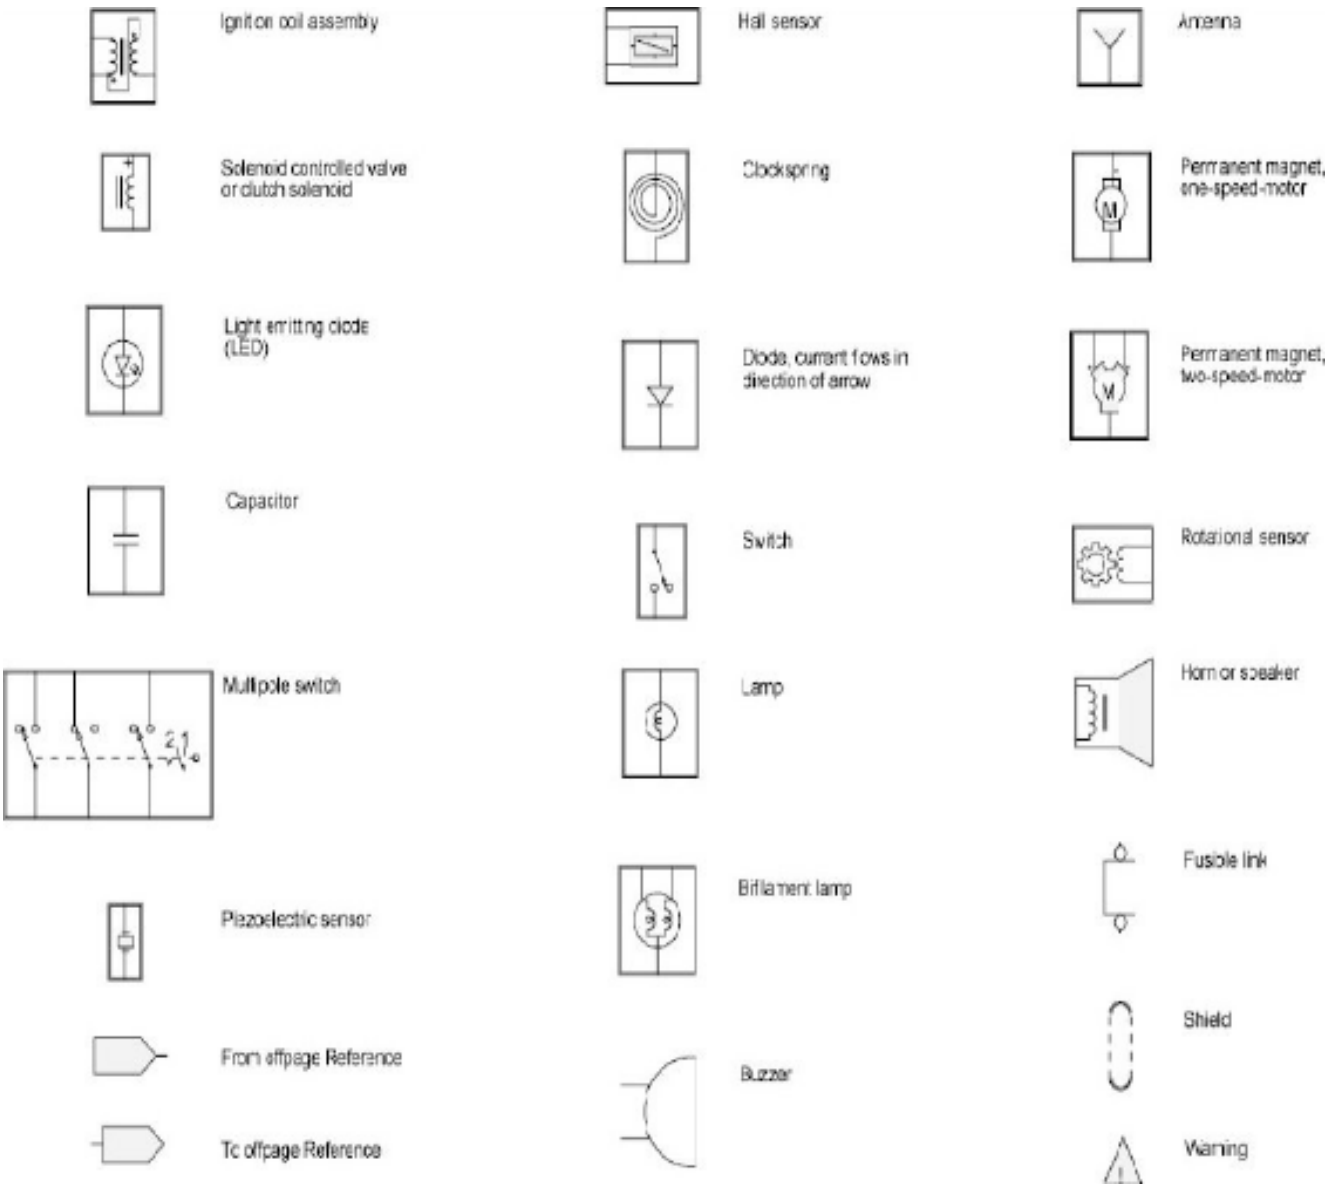
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

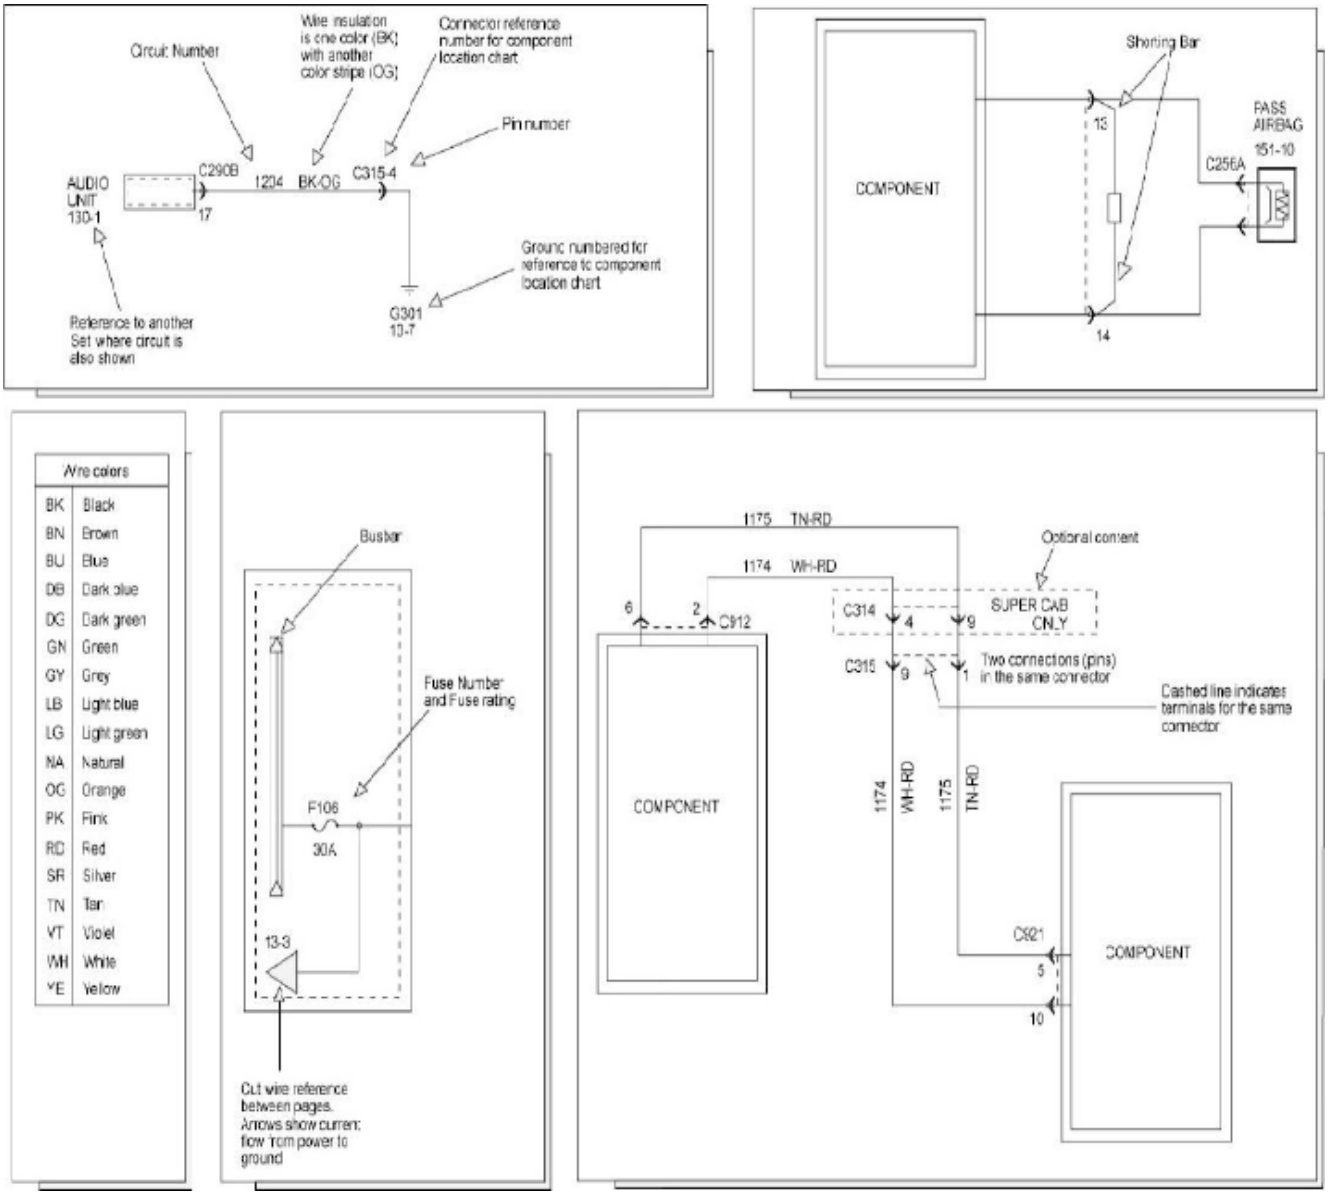
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

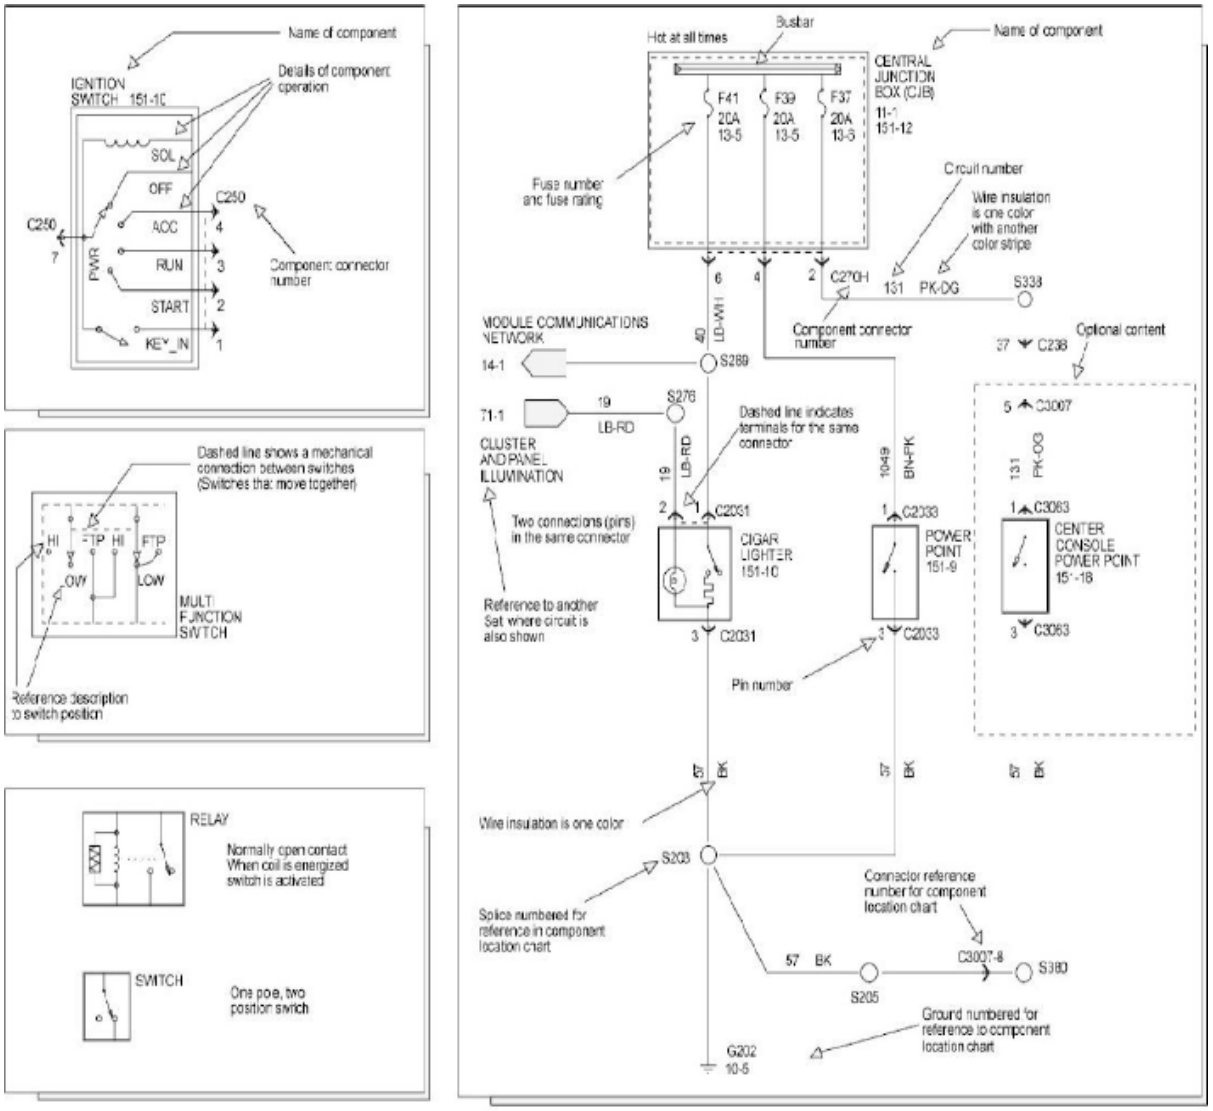
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Battery Discharge Protection Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

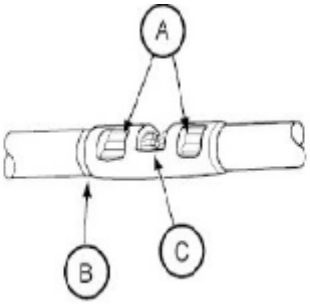
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

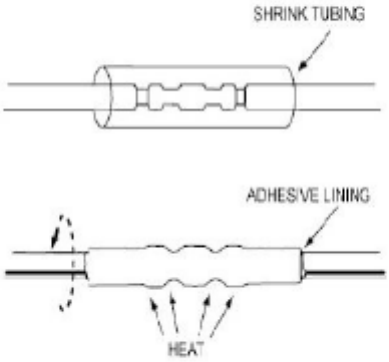
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x dia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

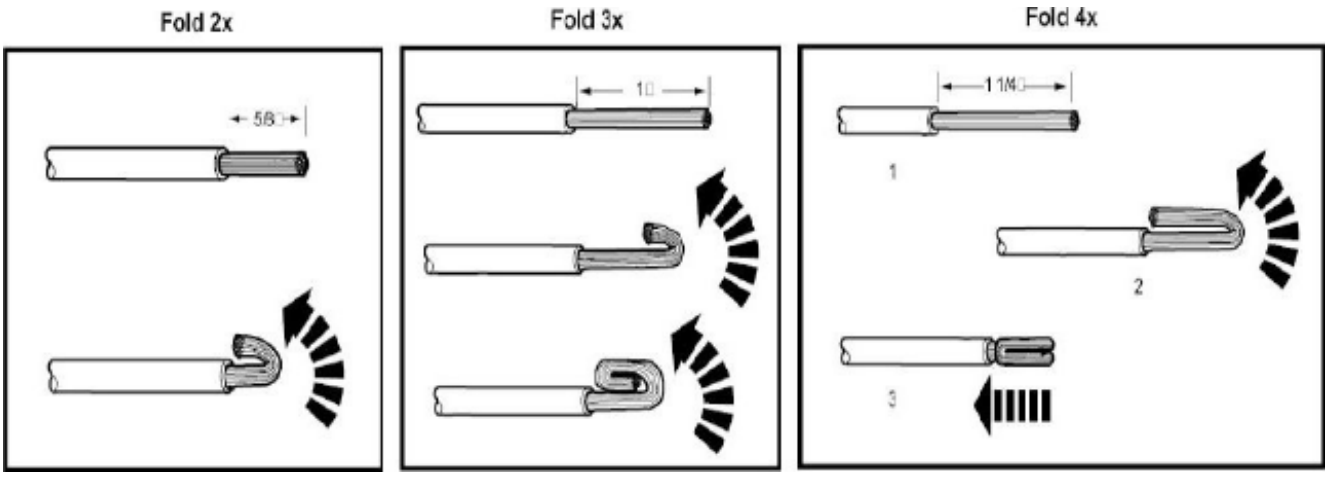
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



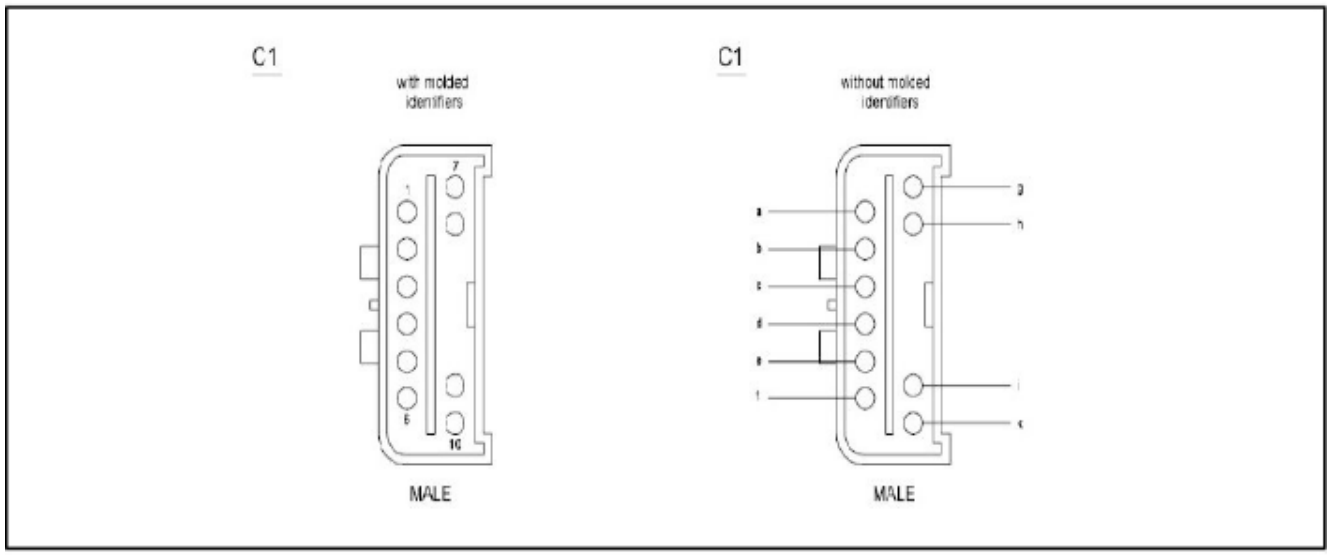
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



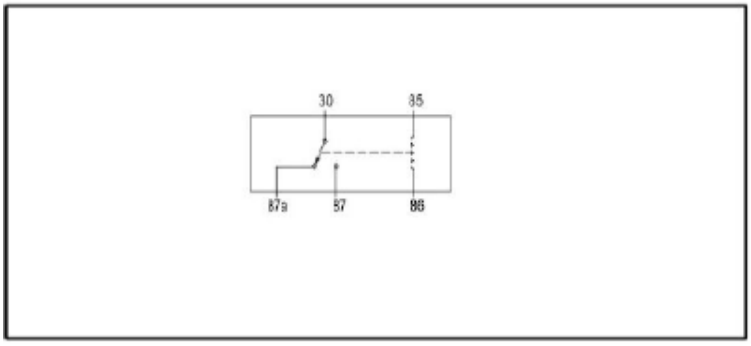
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

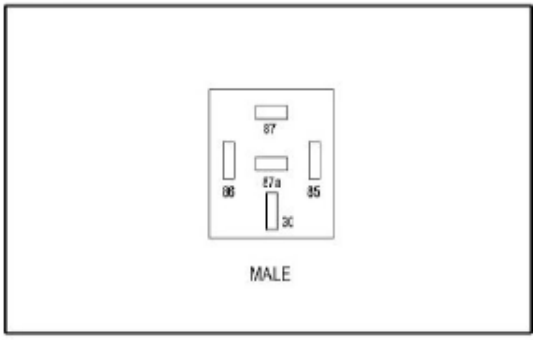
Battery Discharge Protection Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 - 90 Ω

Fog/Driving Lamp Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

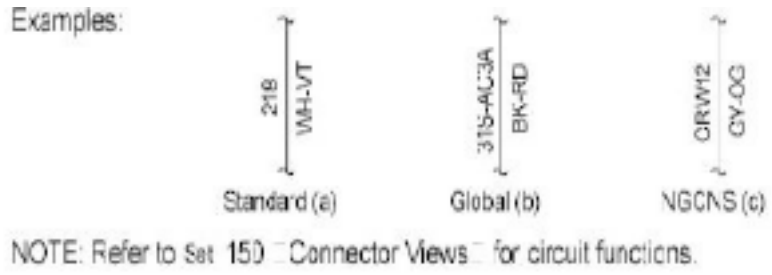
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

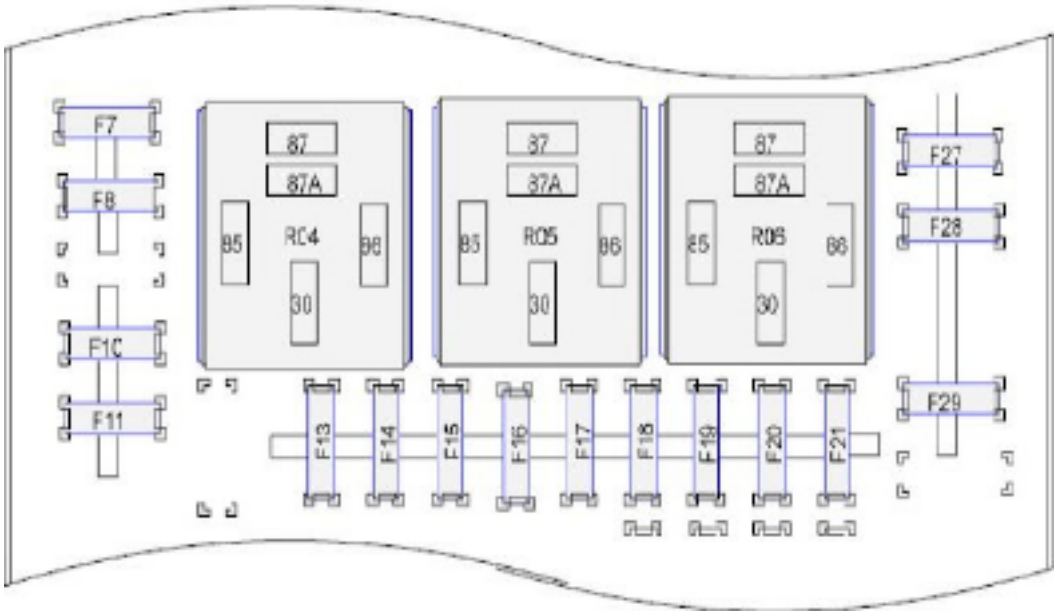
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

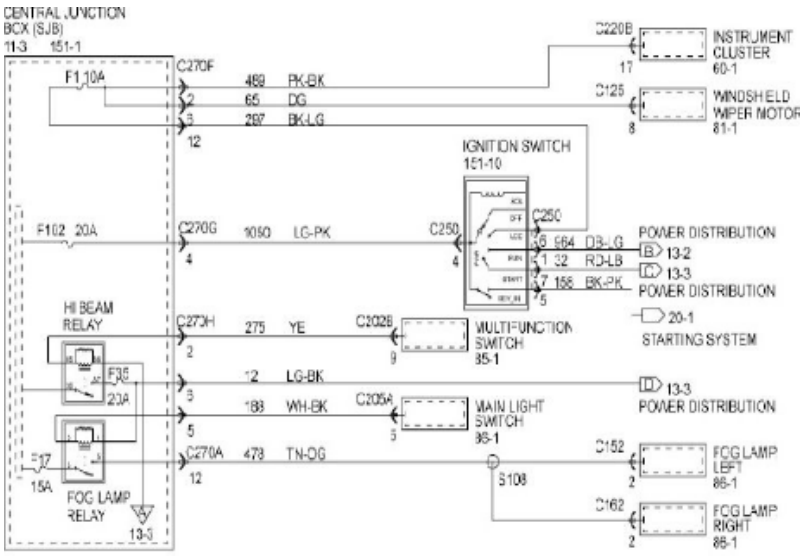
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

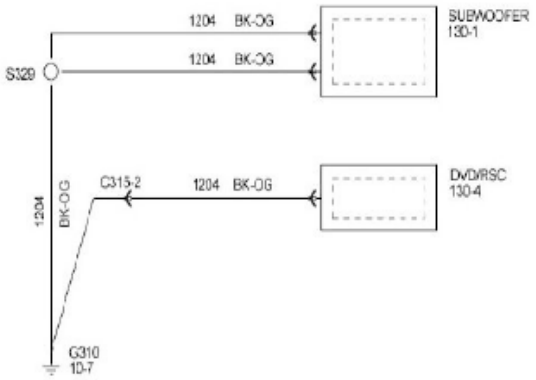
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

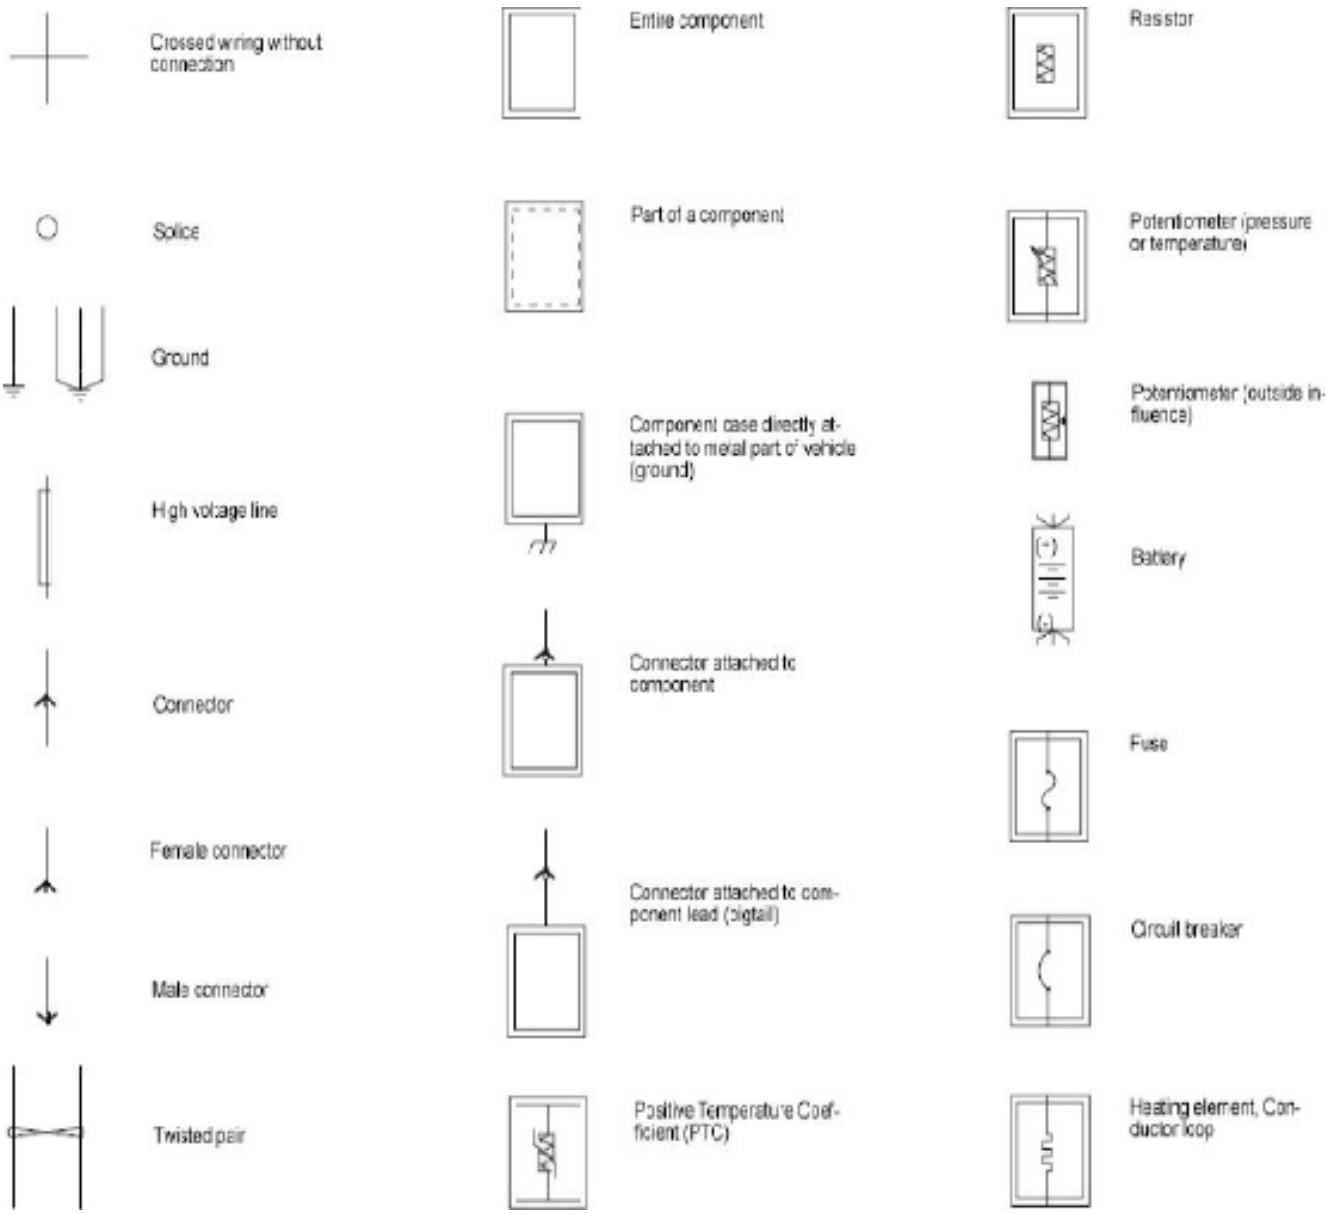
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

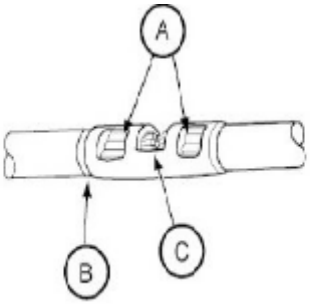
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

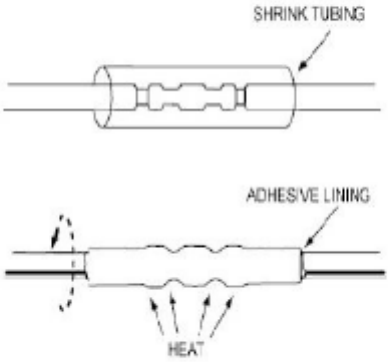
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4□ strip, cut 9 strands	* 1/4□ strip, cut 2 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip, fold 3x dia.
	16-14	* 1/4□ strip, cut 7 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip fold 2x dia	1□ strip, fold 3x dia.	1 1/4□ strip, fold 4x dia.	Not Recommended
	12-10	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip fold 3x cia.	1 1/4□ strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

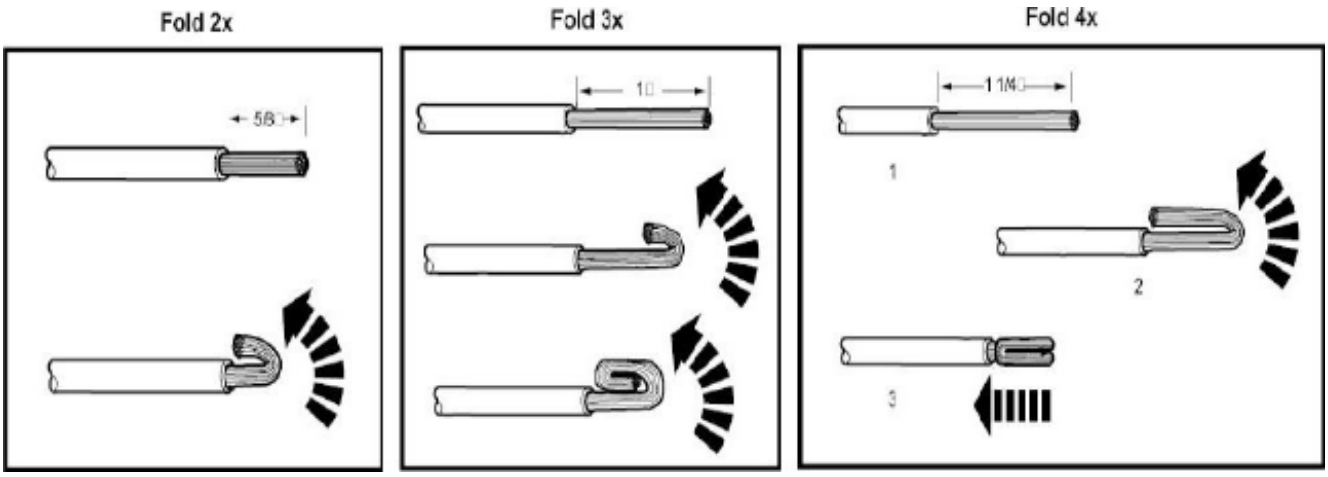
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



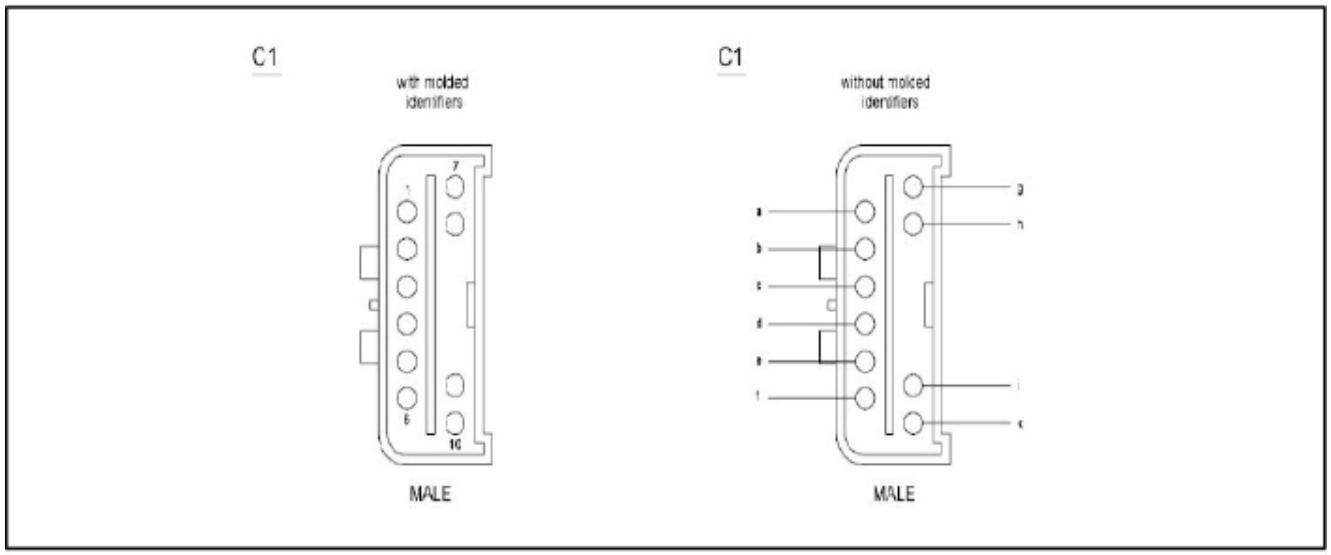
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



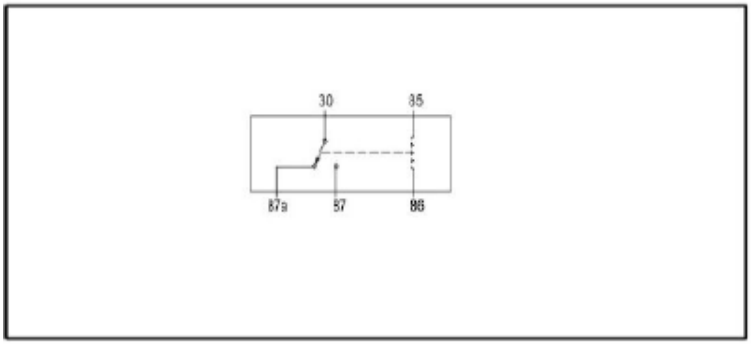
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

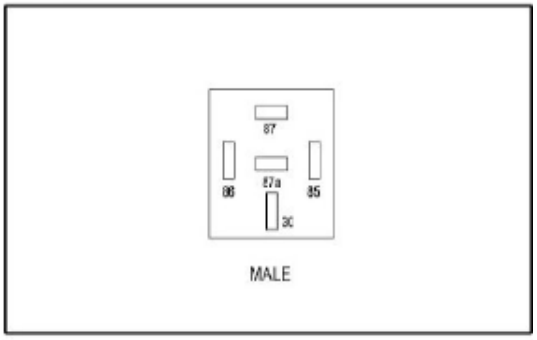
Fog/Driving Lamp Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step–by–step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Hazard Flasher Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

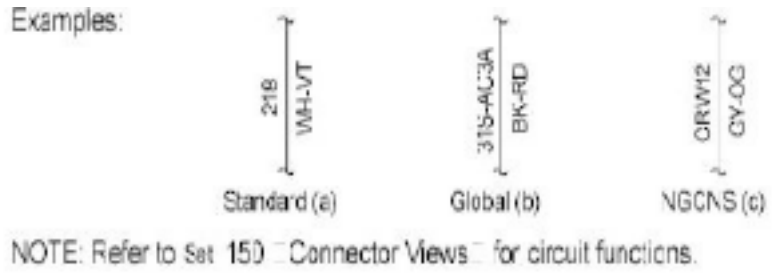
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

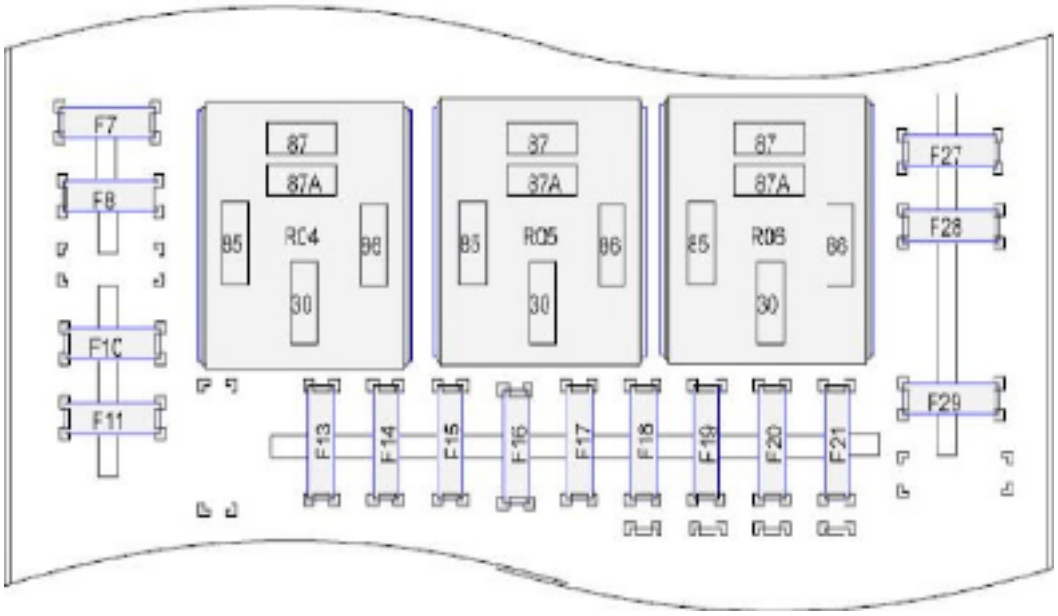
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

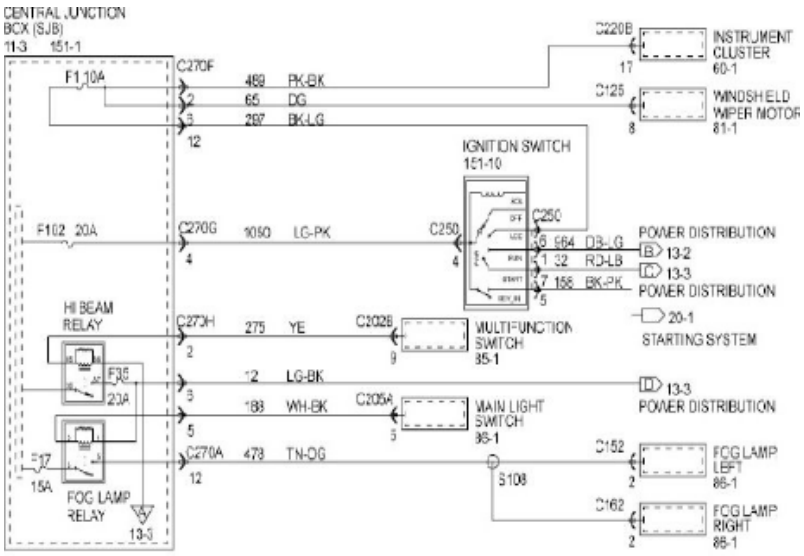
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

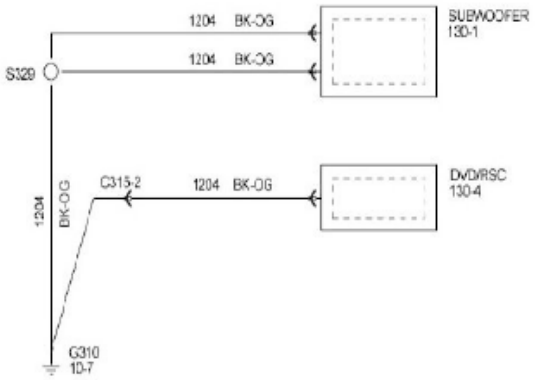
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

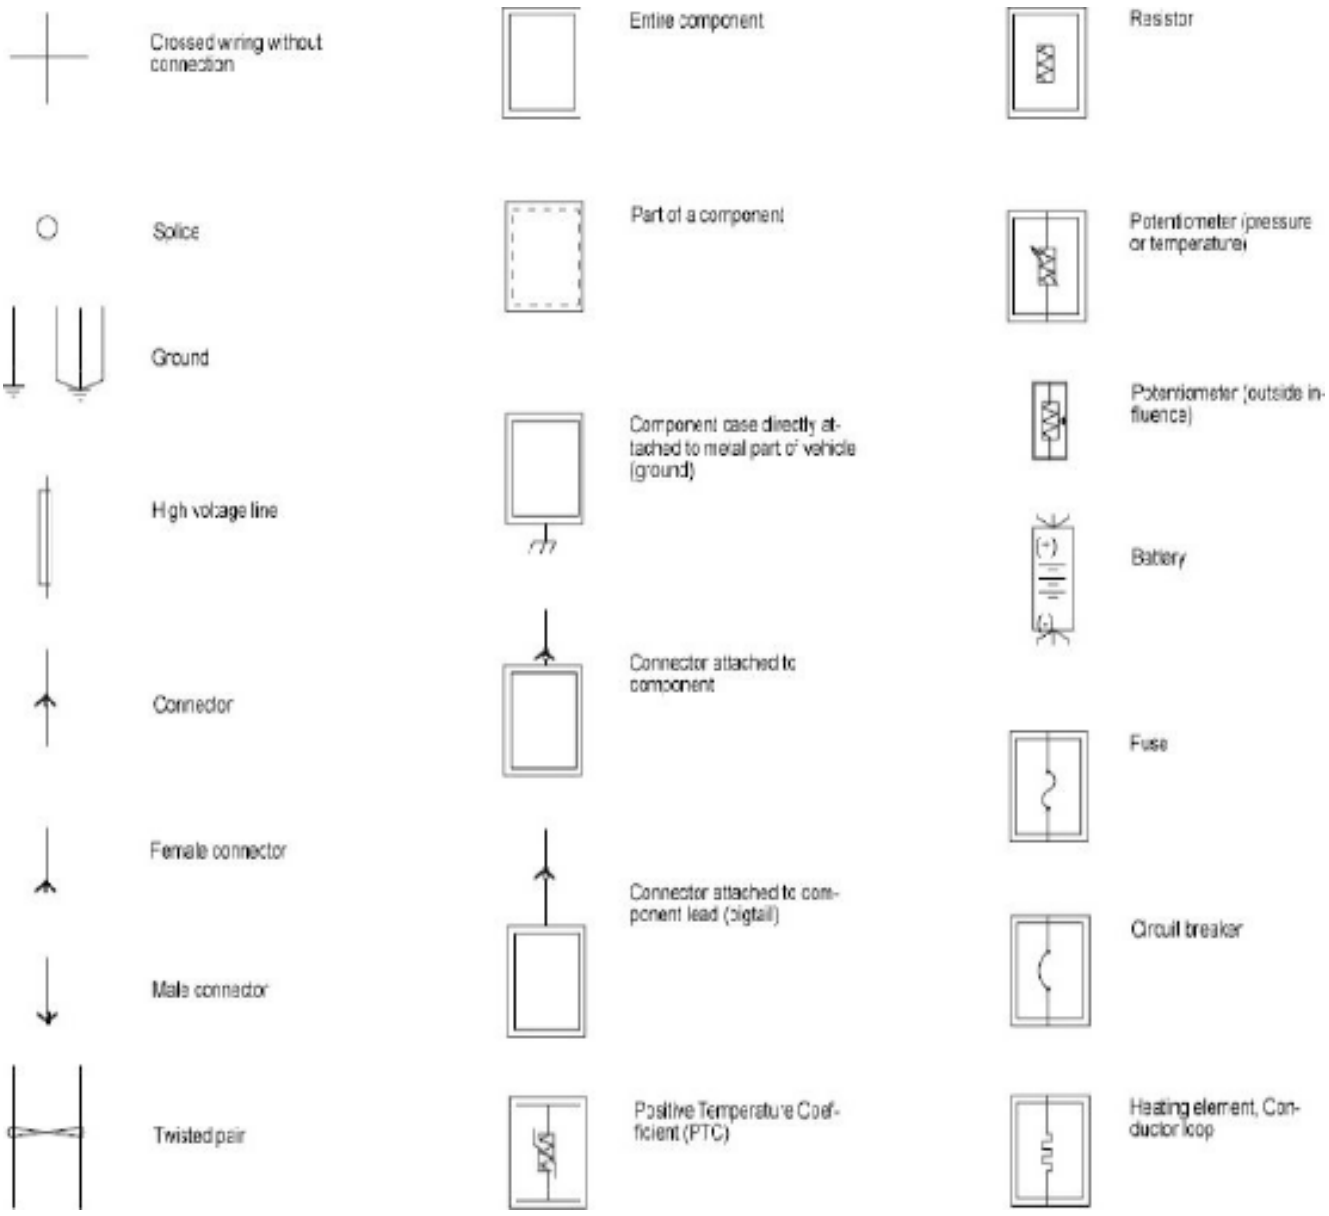
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

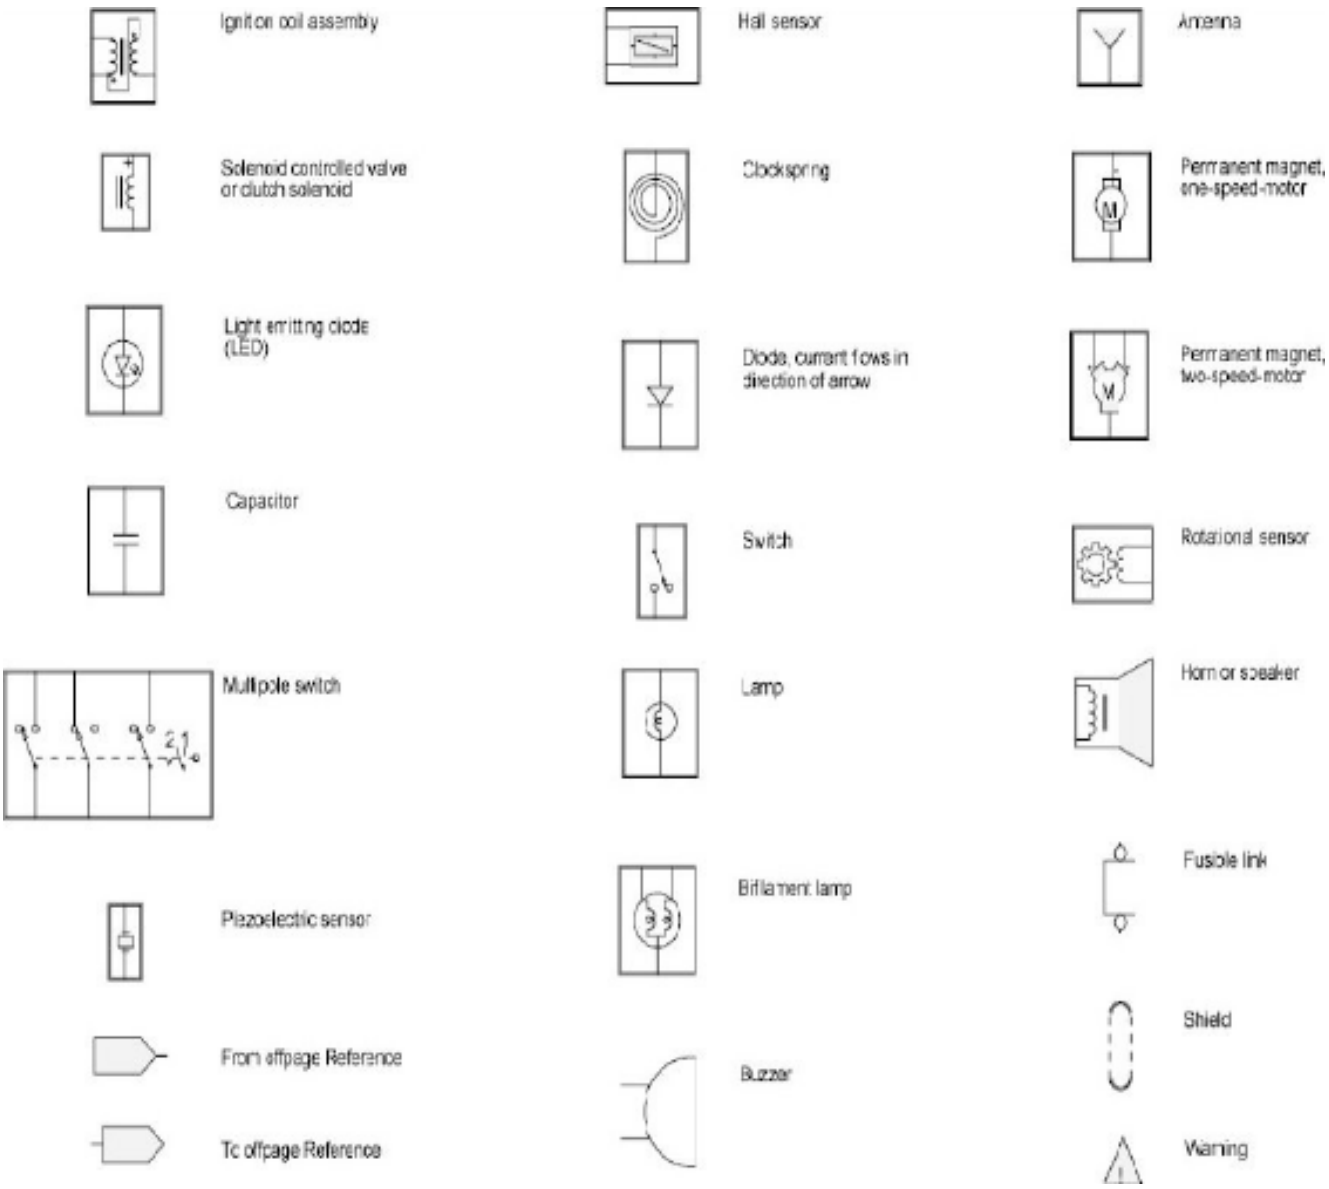
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

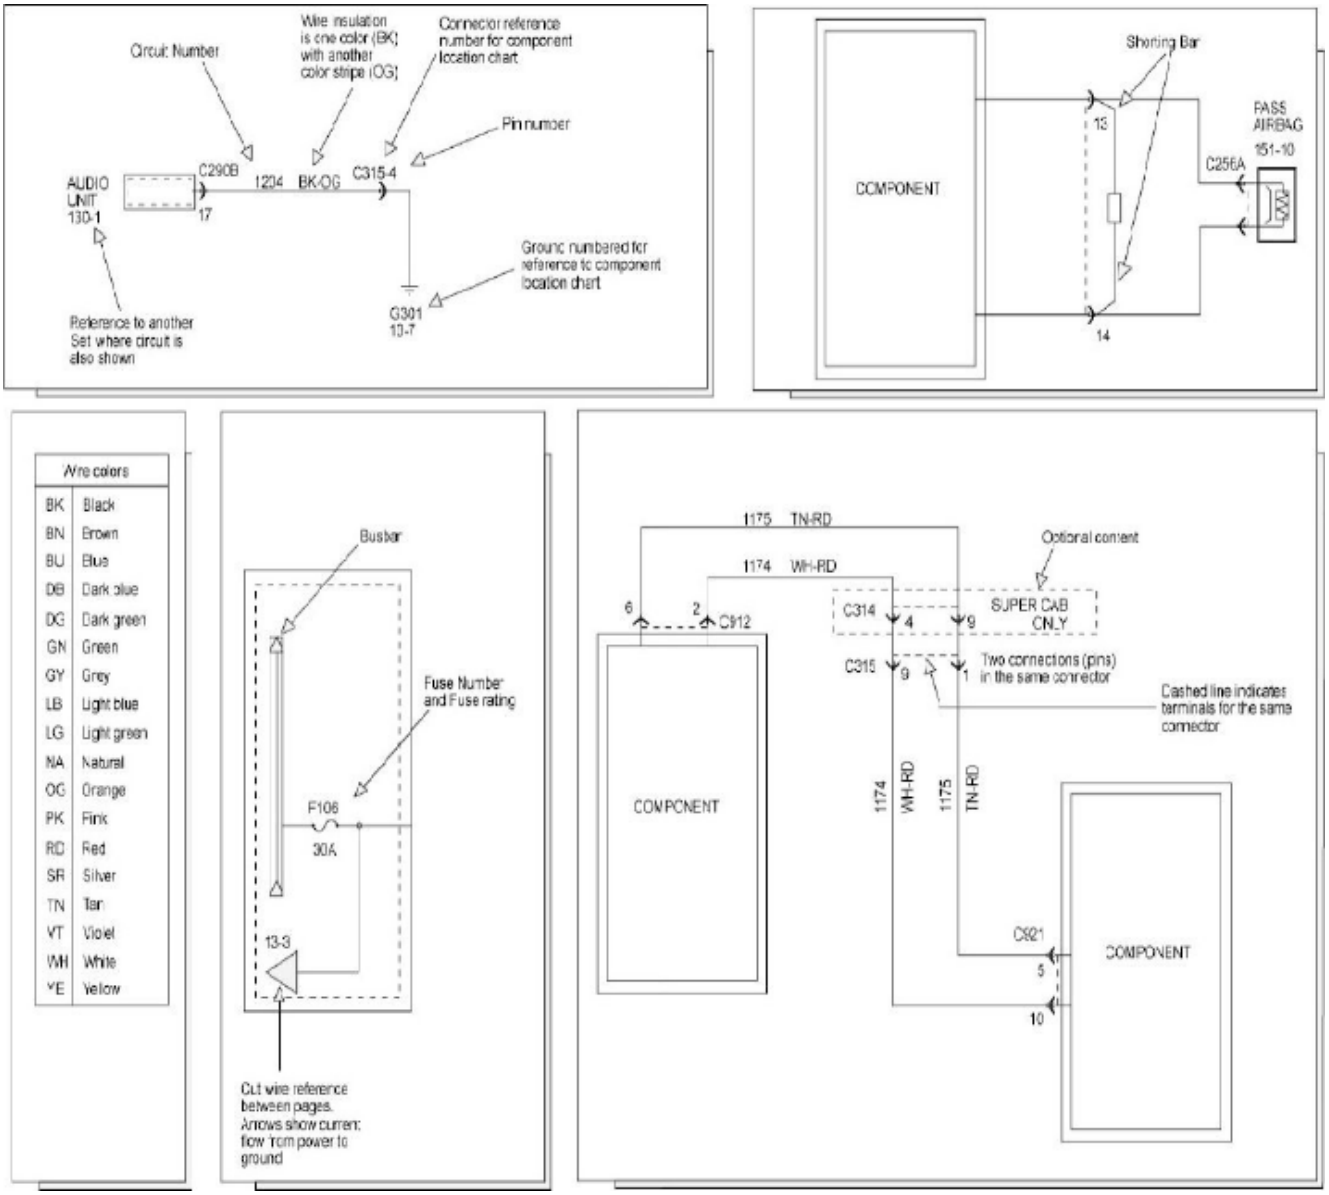
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

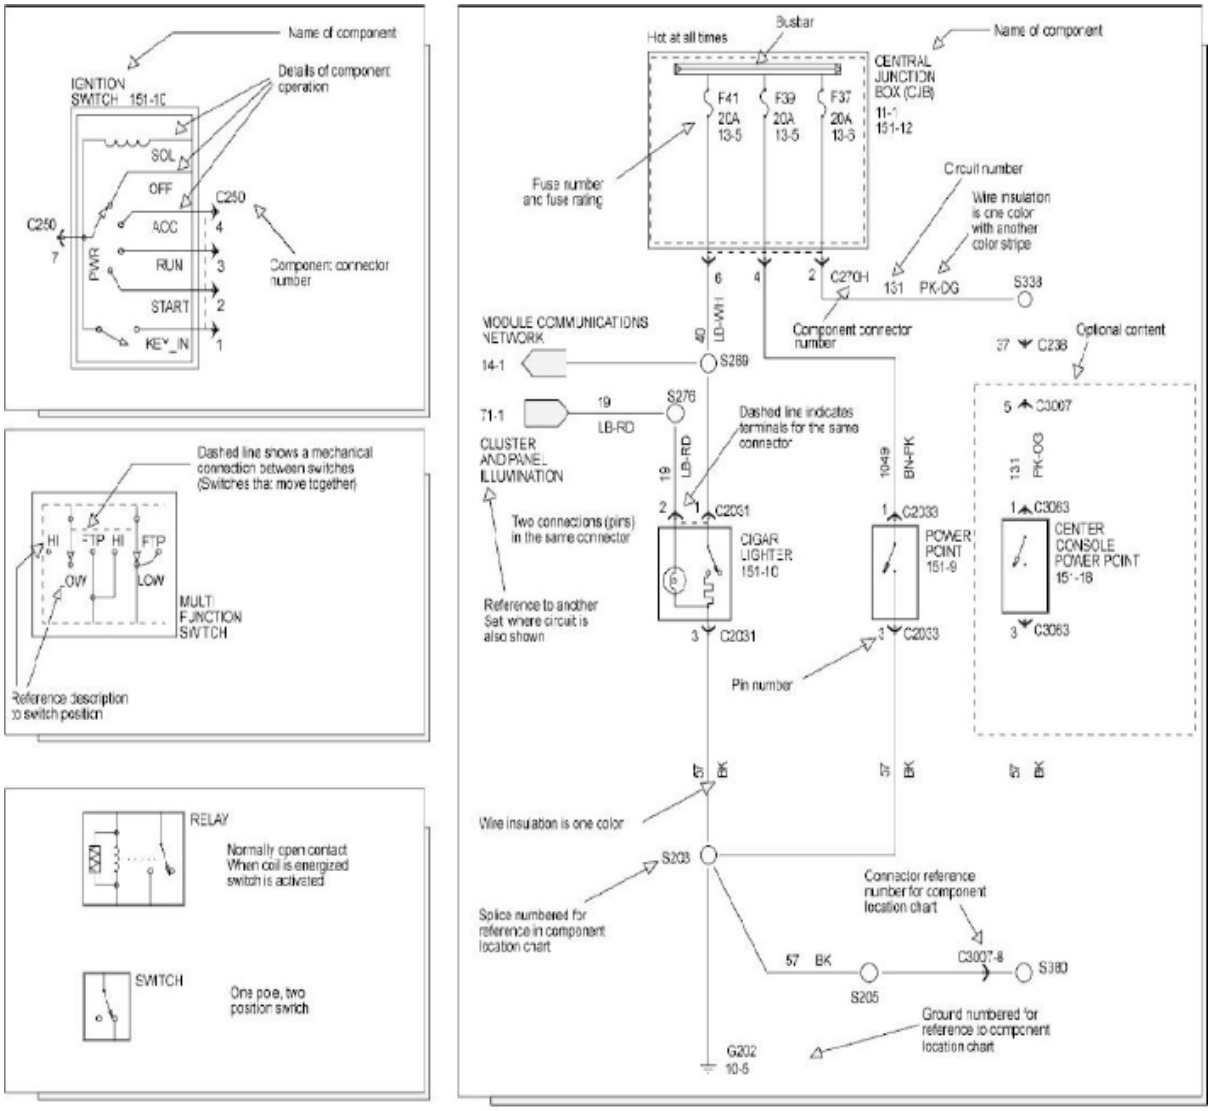
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Hazard Flasher Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

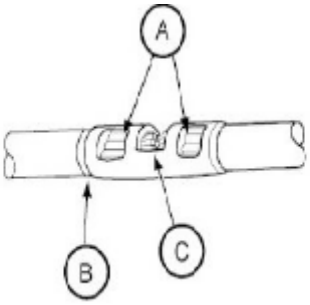
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

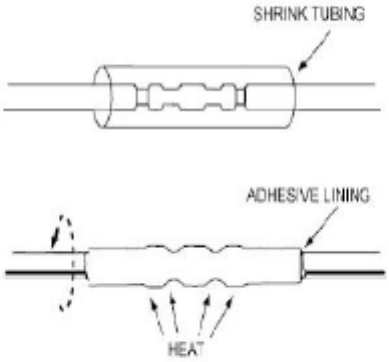
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4□ strip, cut 9 strands	* 1/4□ strip, cut 2 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip, fold 3x dia.
	16-14	* 1/4□ strip, cut 7 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip fold 2x dia	1□ strip, fold 3x dia.	1 1/4□ strip, fold 4x dia.	Not Recommended
	12-10	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip fold 3x cia.	1 1/4□ strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Figtail only

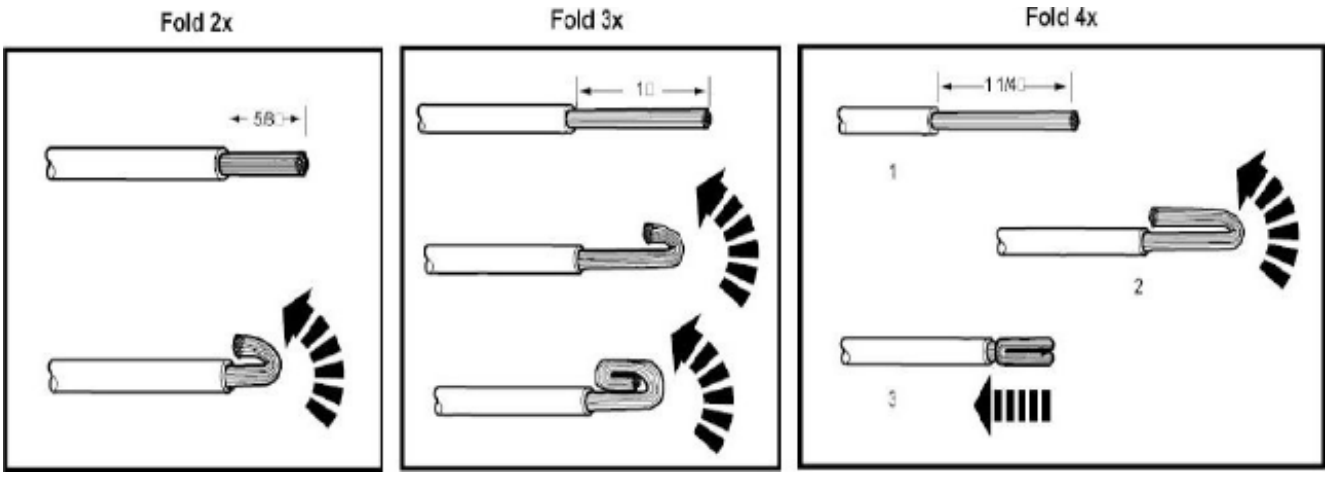
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

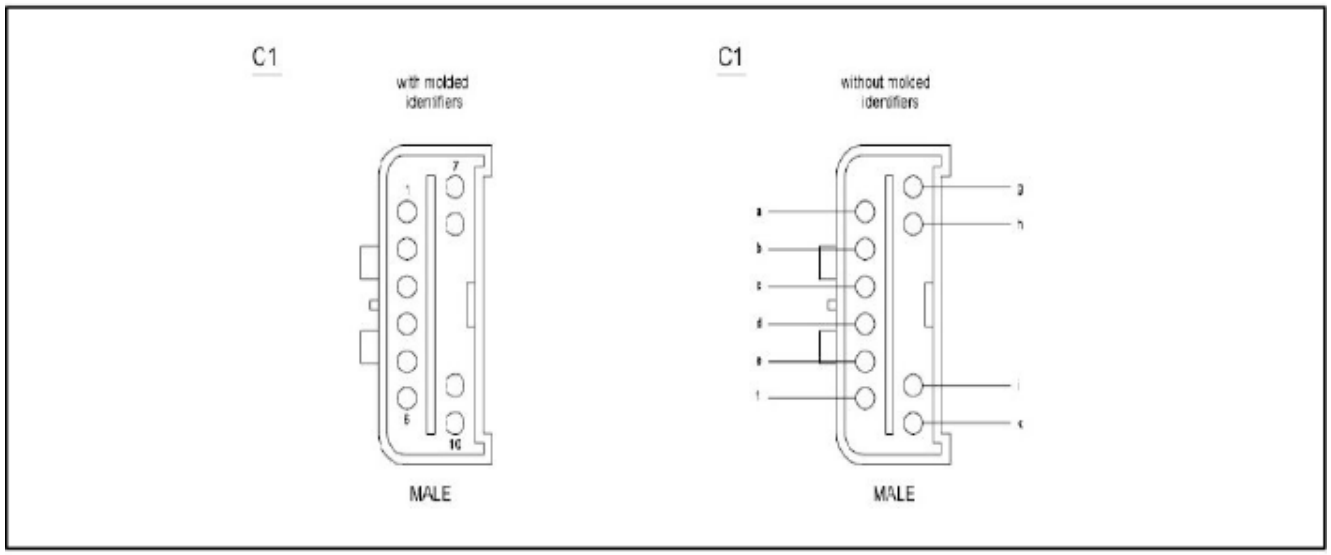
Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



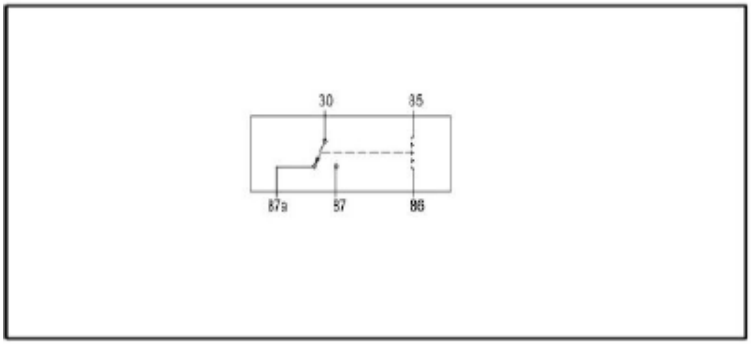
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

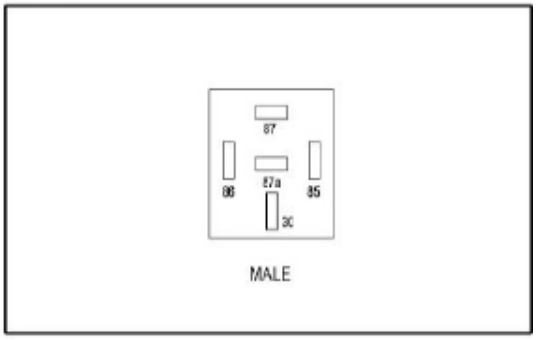
Hazard Flasher Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

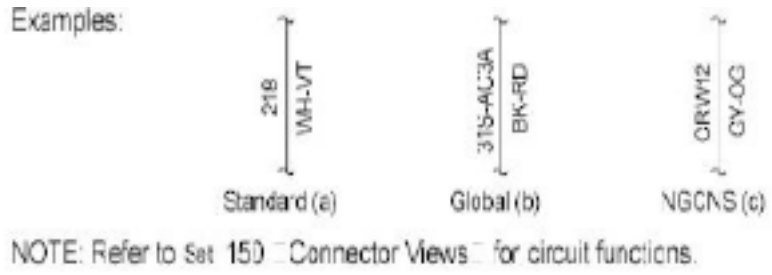
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

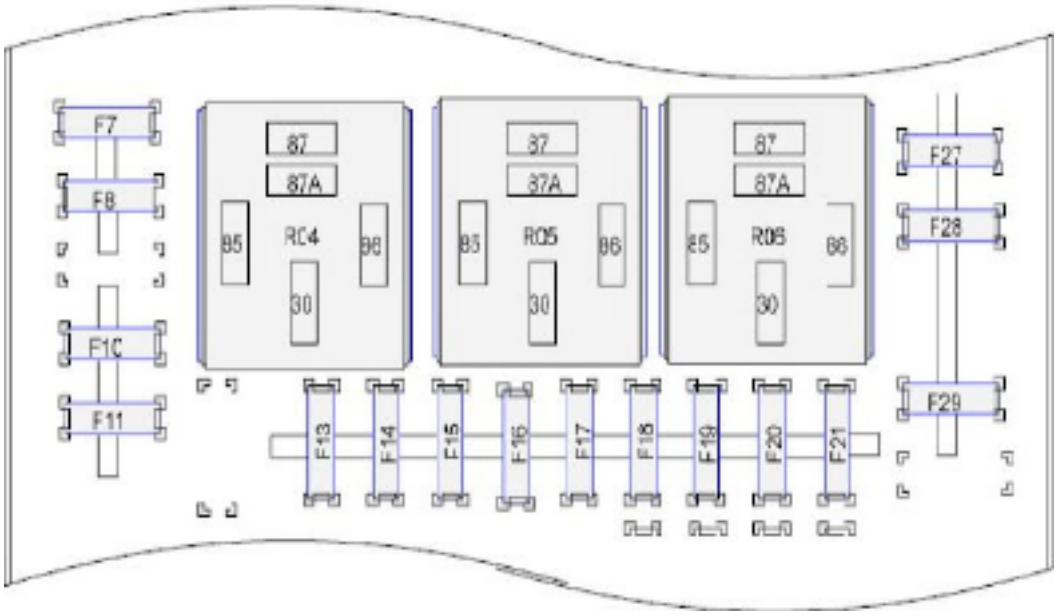
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

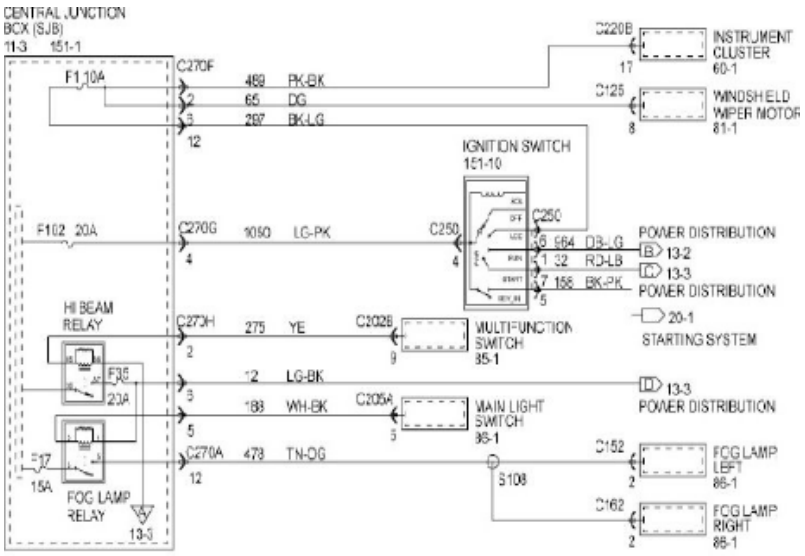
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

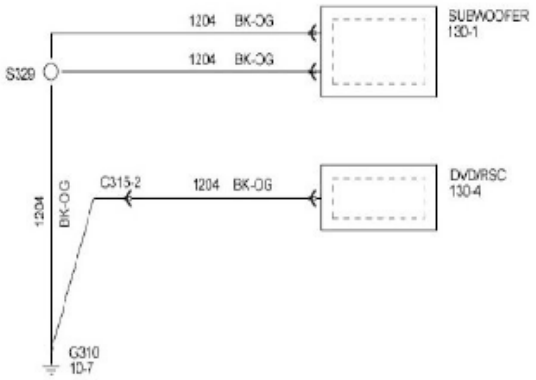
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

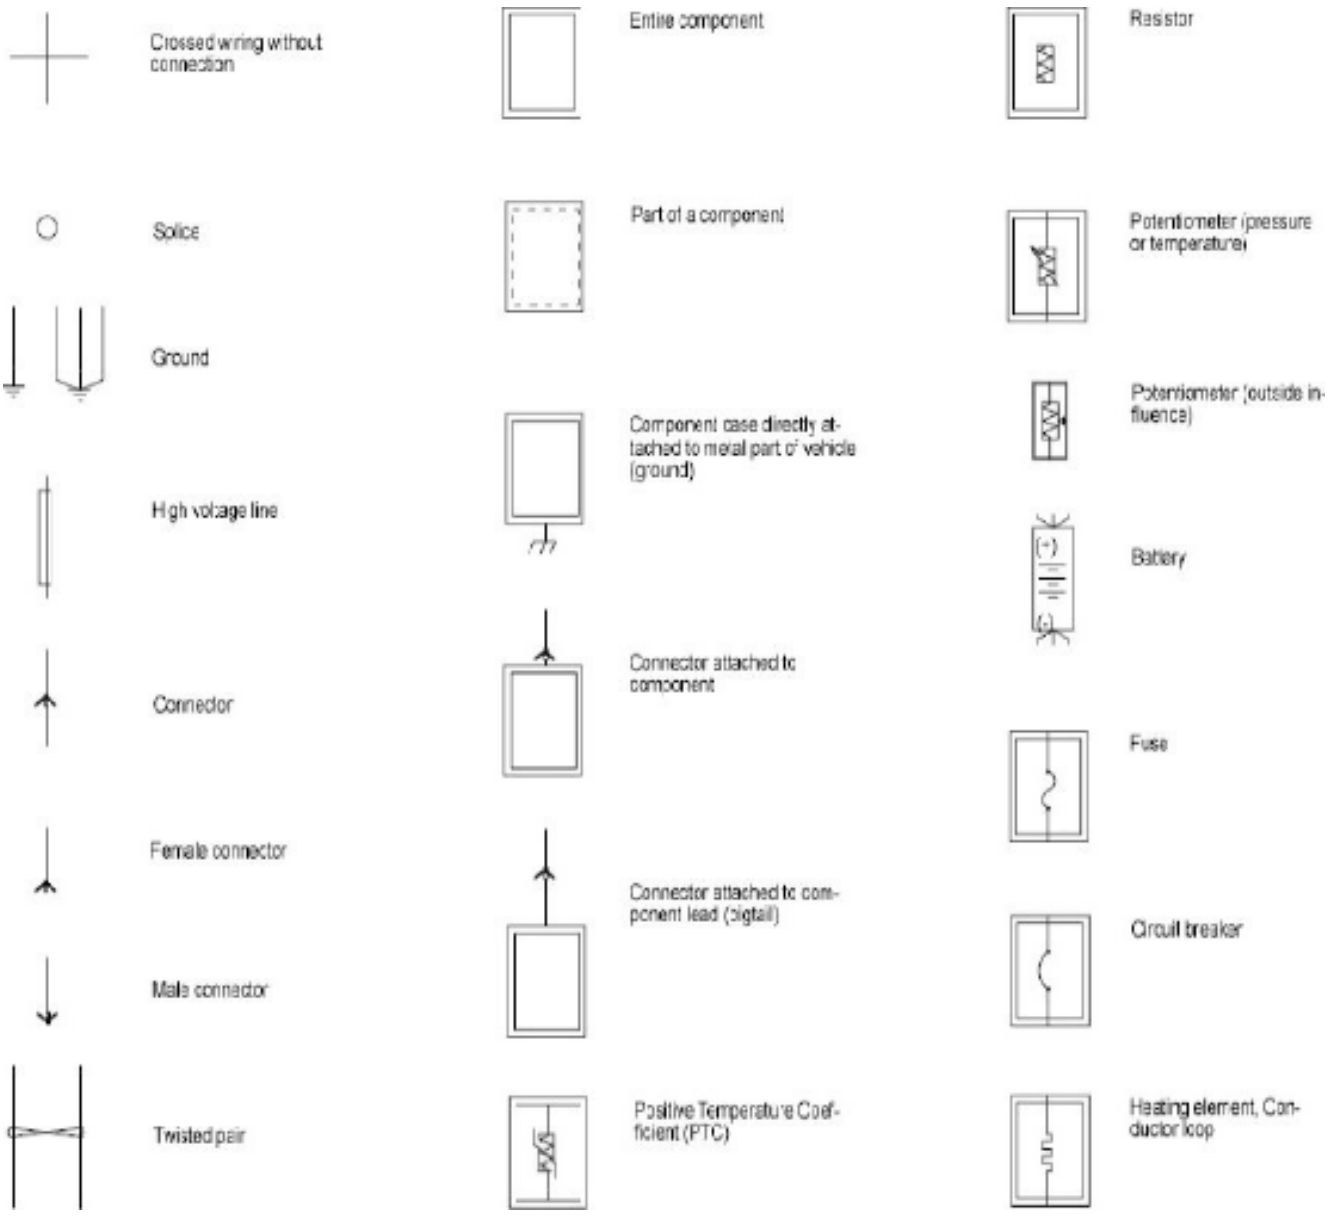
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

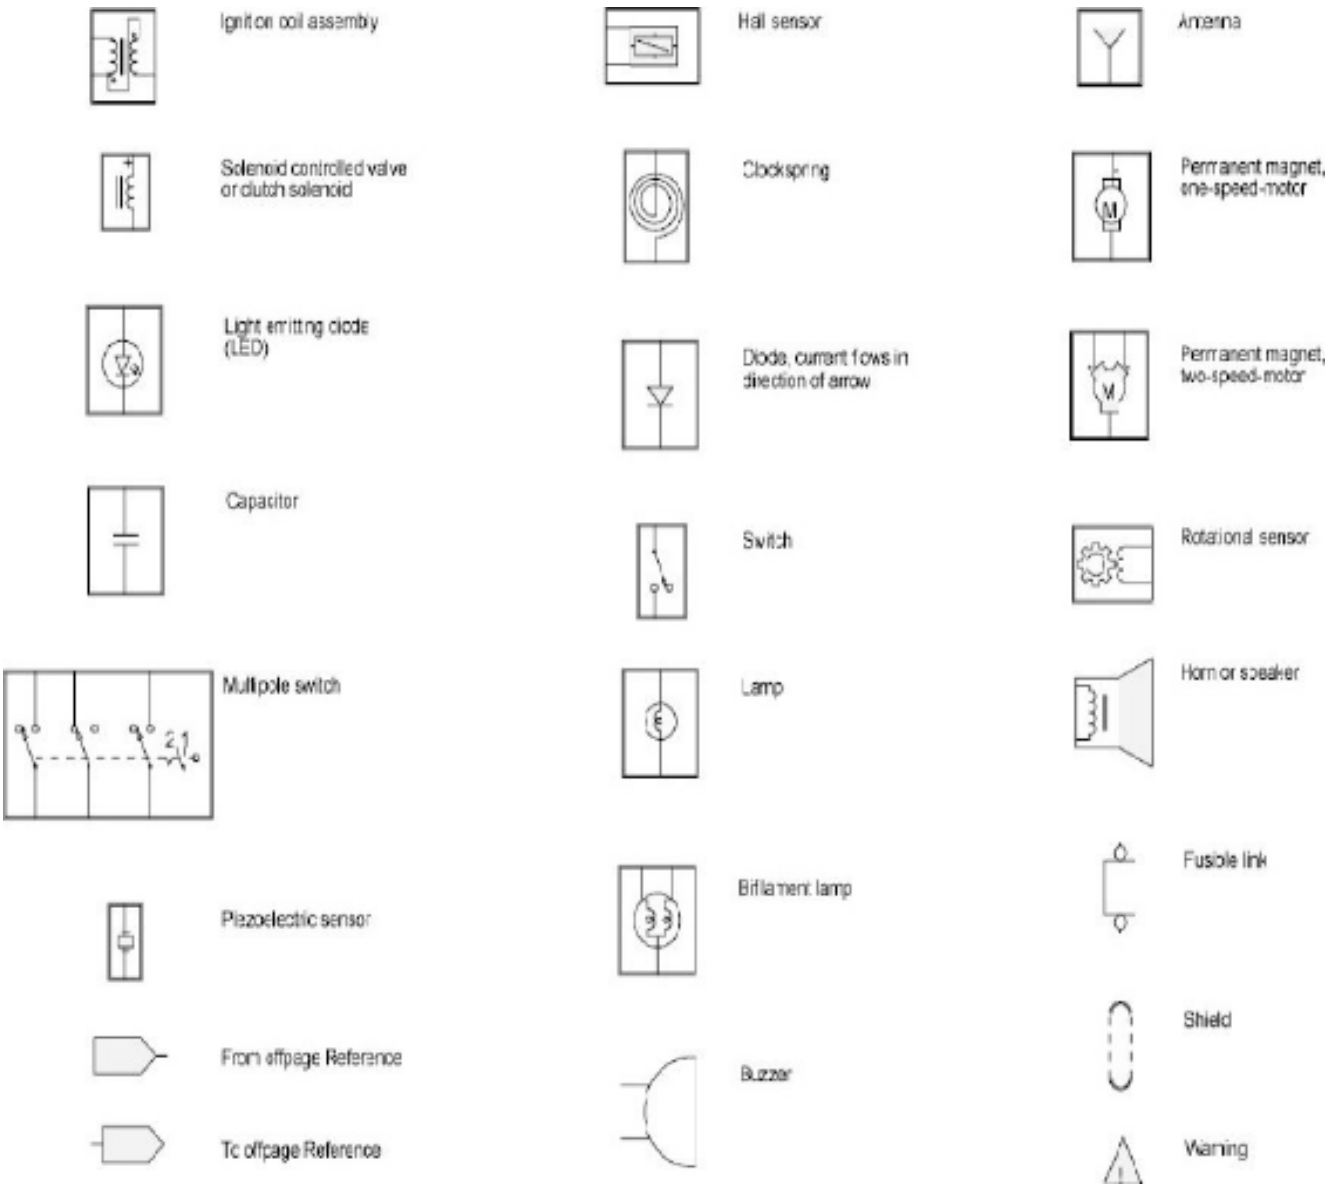
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

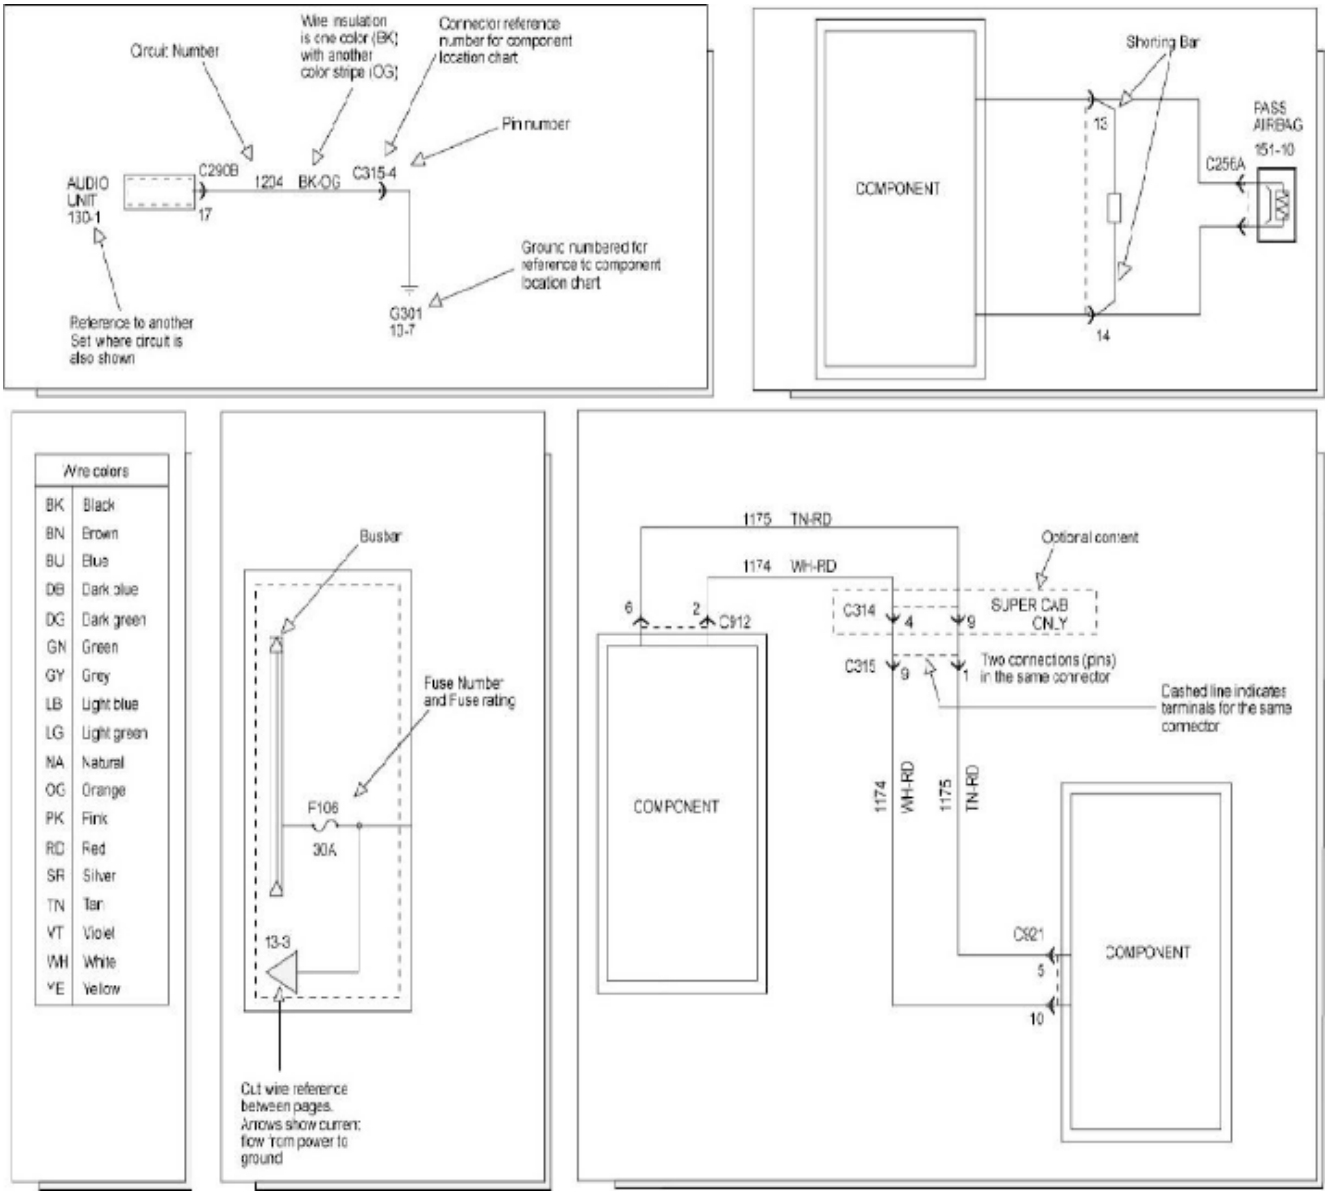
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

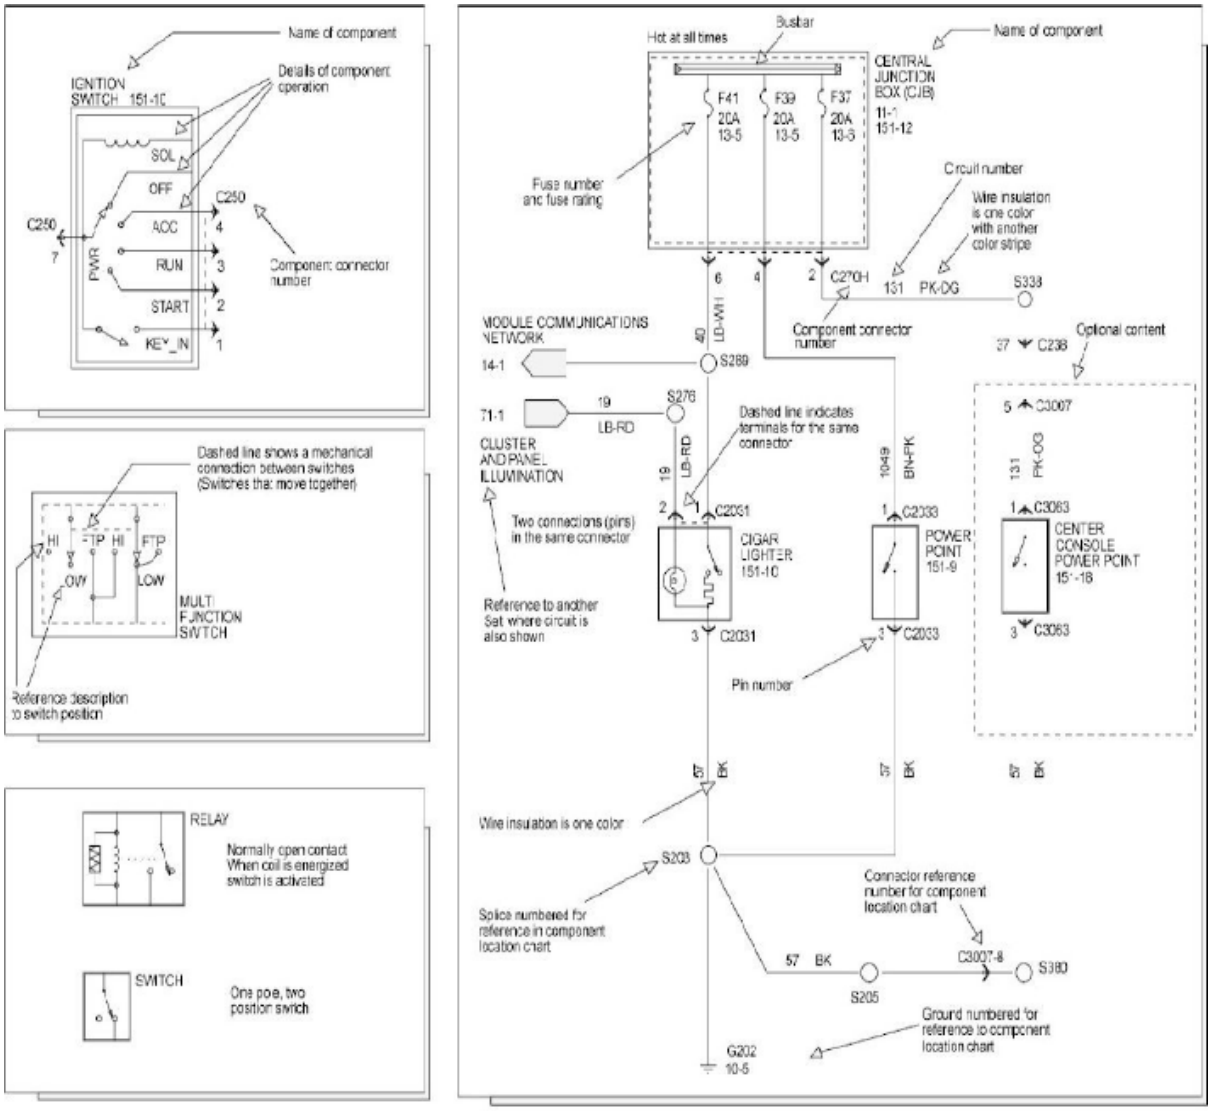
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION

Horn Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

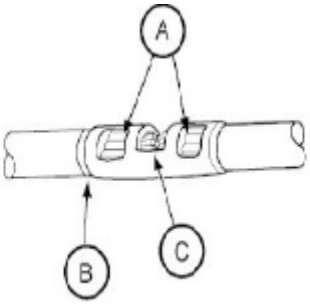
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

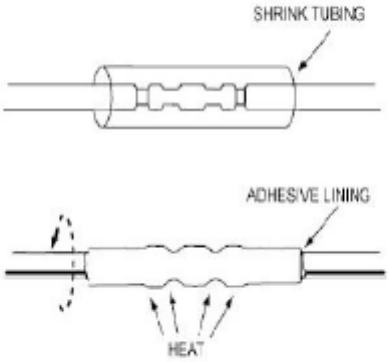
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x dia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

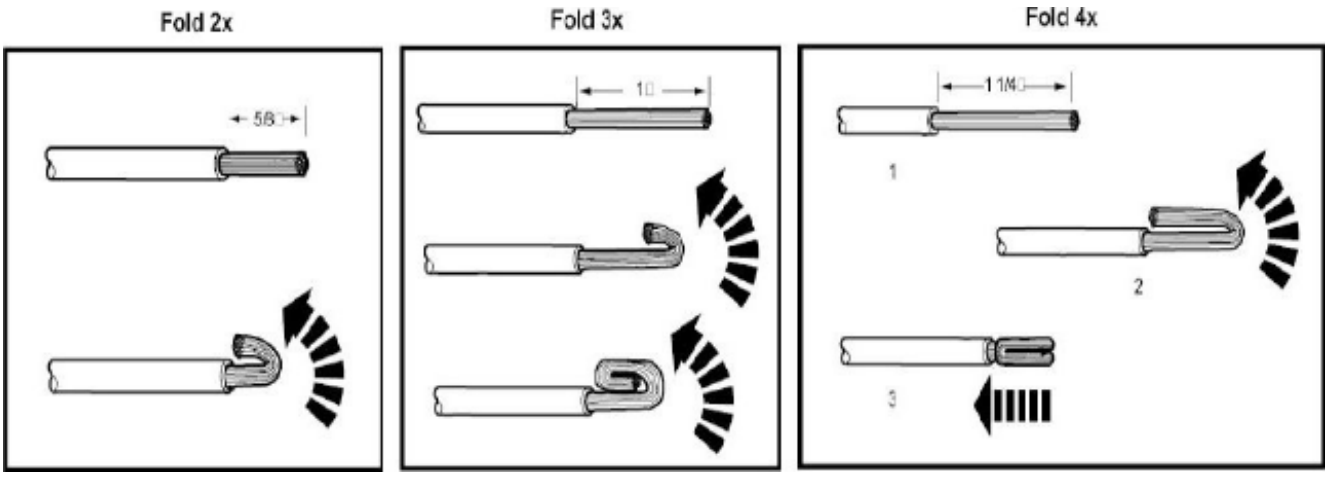
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



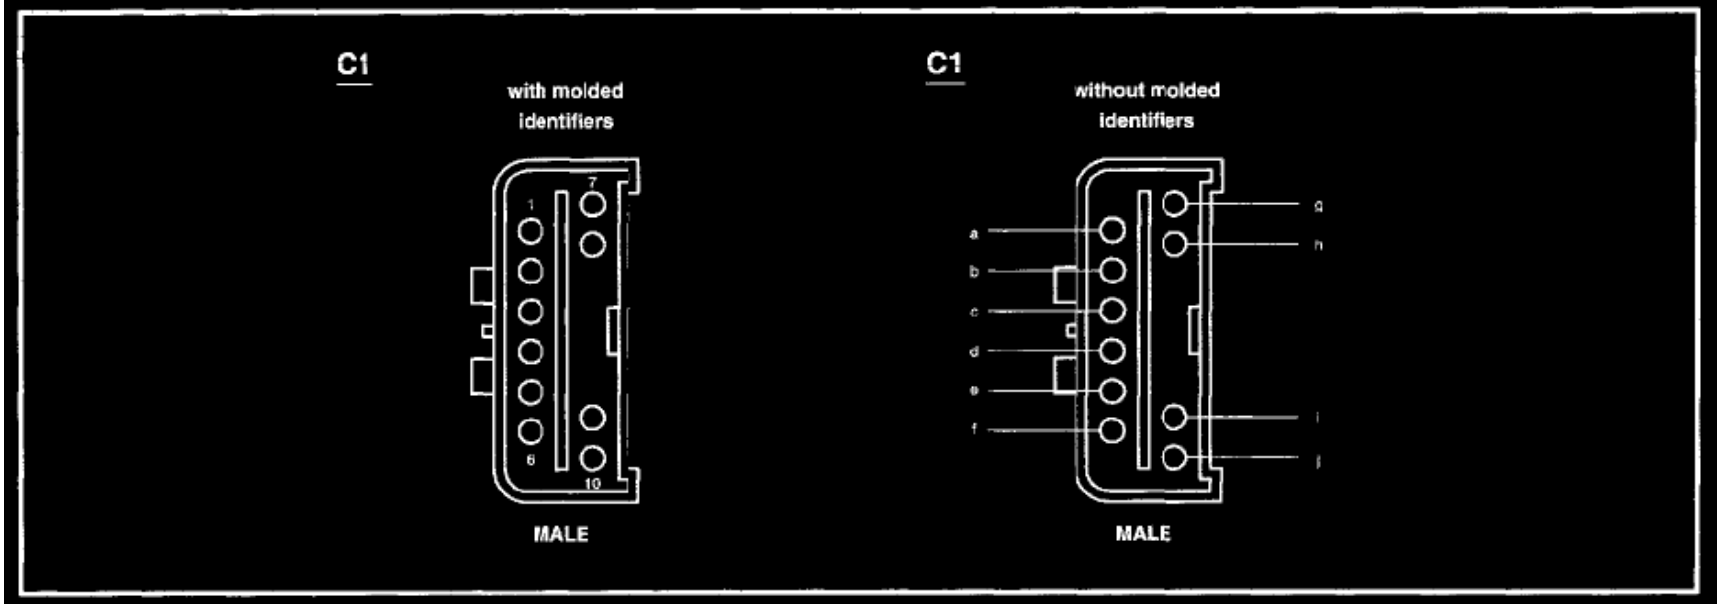
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step–by–step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



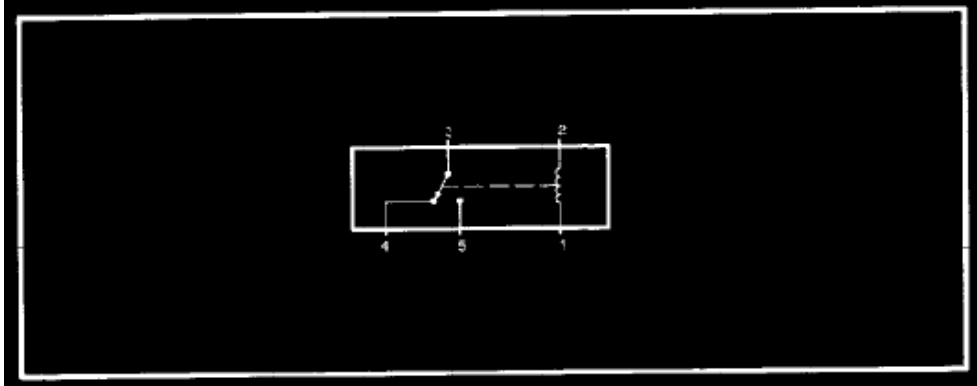
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

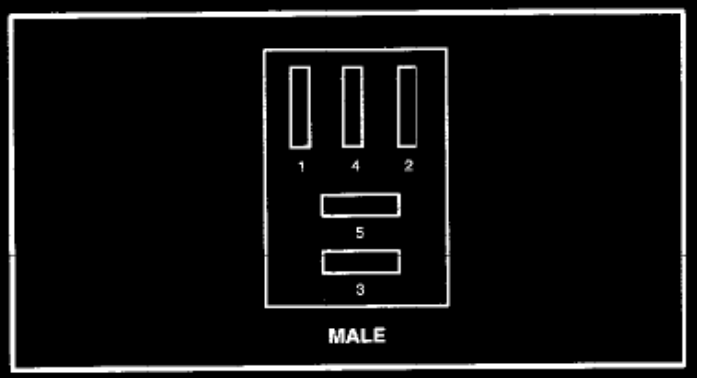
Horn Relay: Testing and Inspection Micro ISO Relay

Relay – Micro ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	1 and 2	63–102Ω
Contact	3 and 4	Closed circuit
	3 and 5	Open circuit
Coil – Contact	1 and 3	Open circuit
	1 and 4	Open circuit
	1 and 5	Open circuit

Component testing procedure (voltage applied)

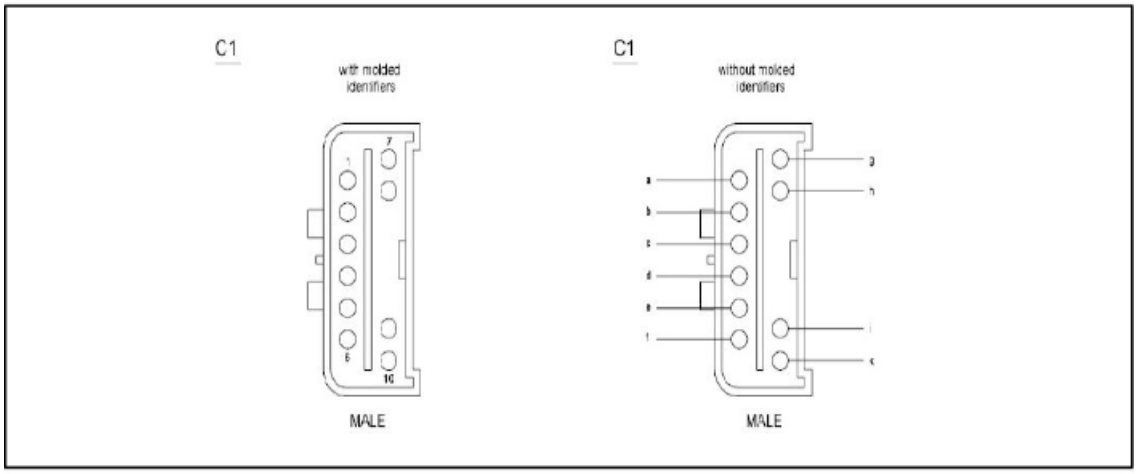
Disconnect the ohmmeter; connect pins 2 and 3 to 12V DC power and pin 1 to ground. Measure voltage between pin 5 and pin 1. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 2 and measure voltage between pin 4 and pin 1. If the voltage is 12V, the relay is okay. If not, replace the relay.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step□by□step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column □Circuit to test□. If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

Interior Lighting Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

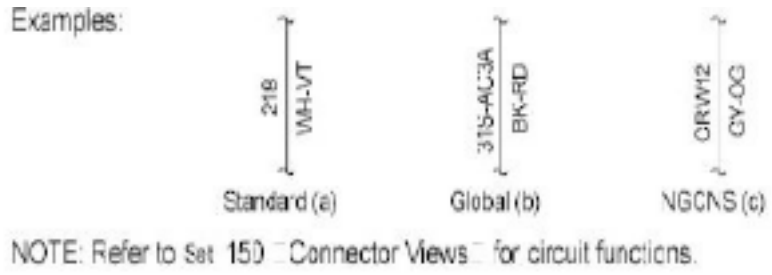
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

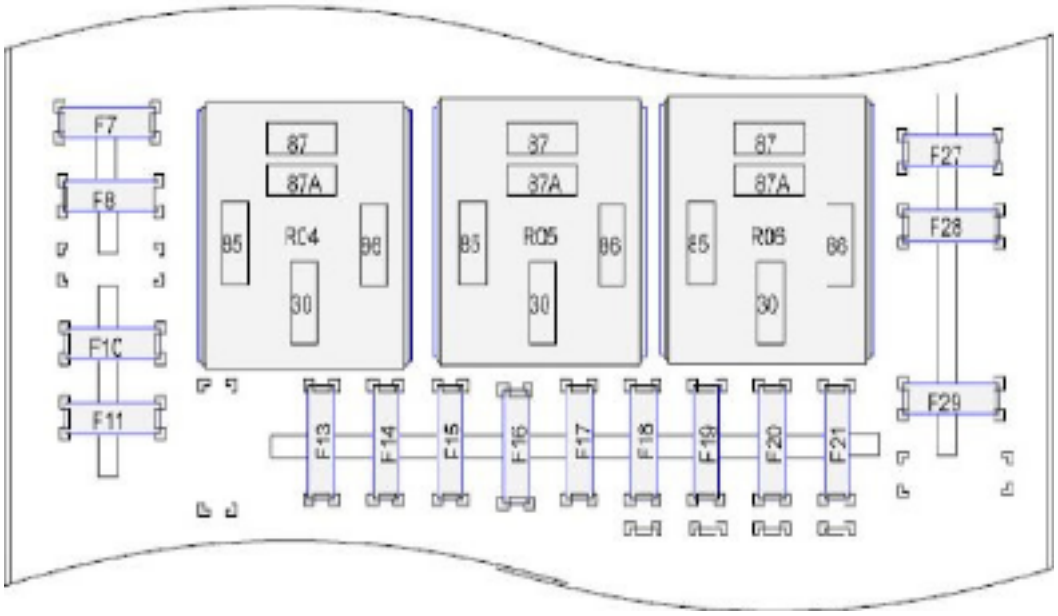
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

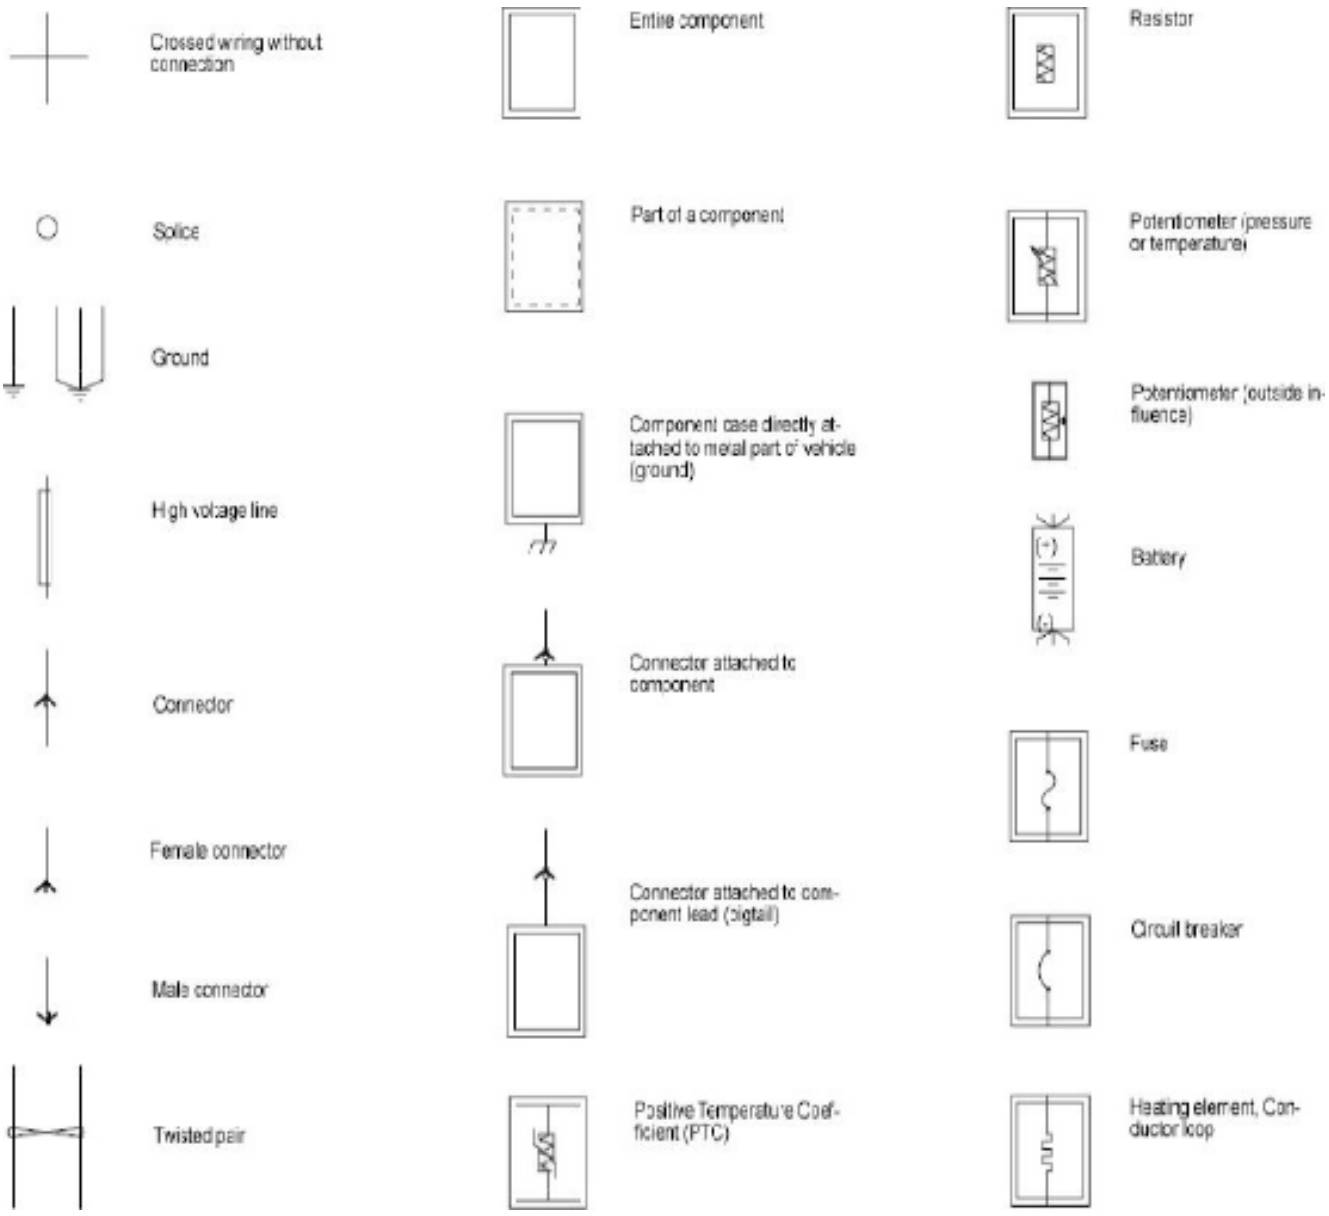
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

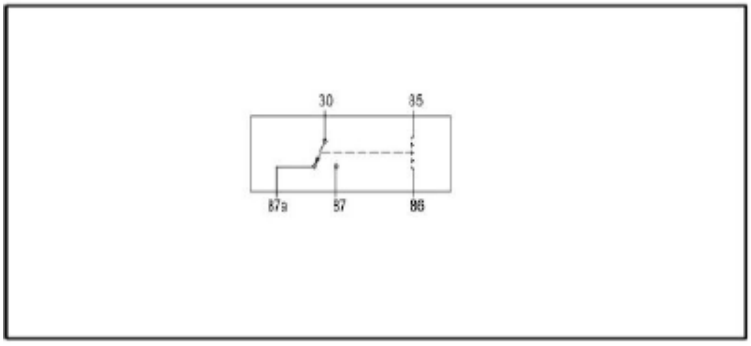
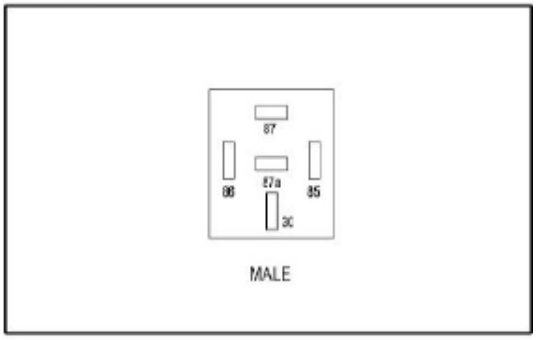
Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

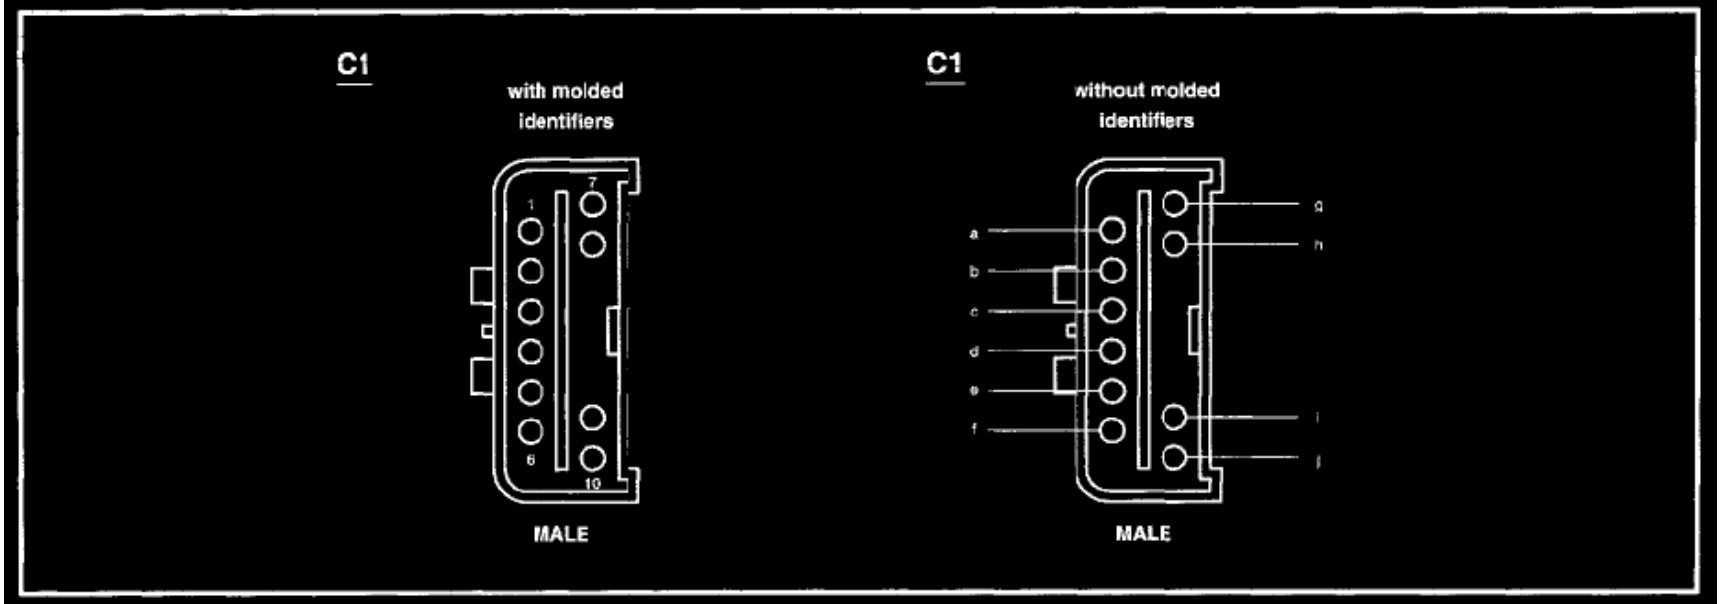
Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step–by–step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

Interior Lighting Relay: Testing and Inspection Micro ISO Relay

Trailer Lighting Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

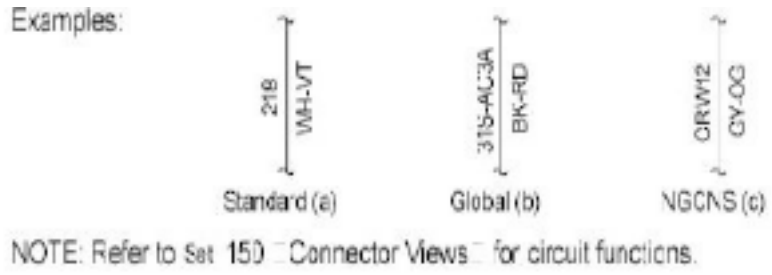
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

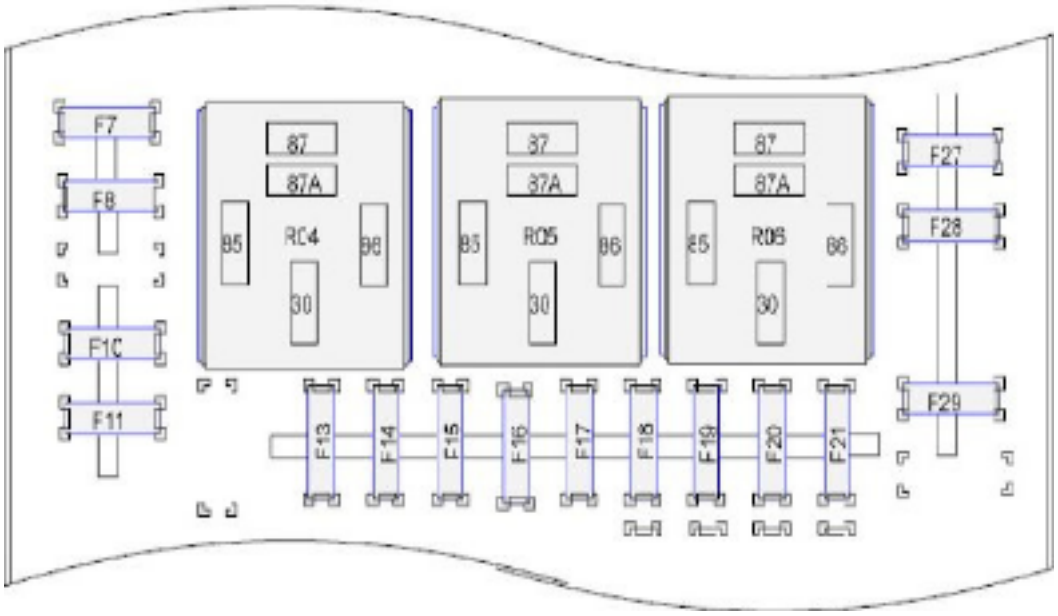
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

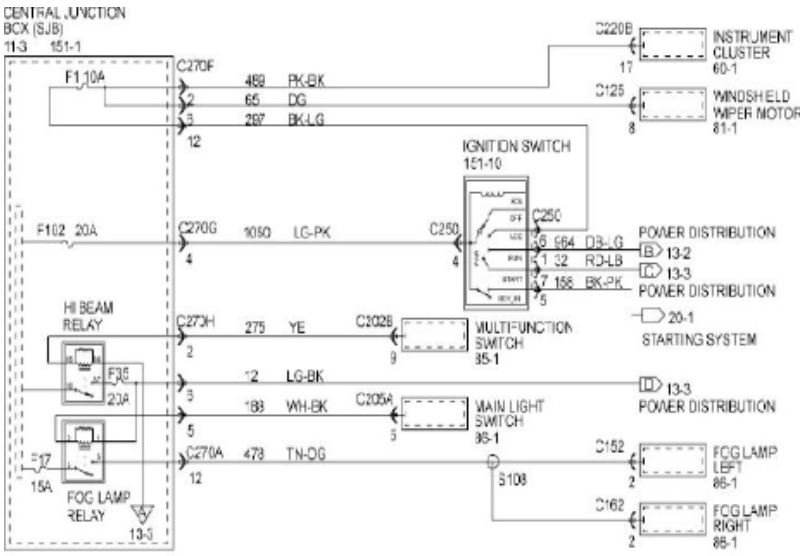
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

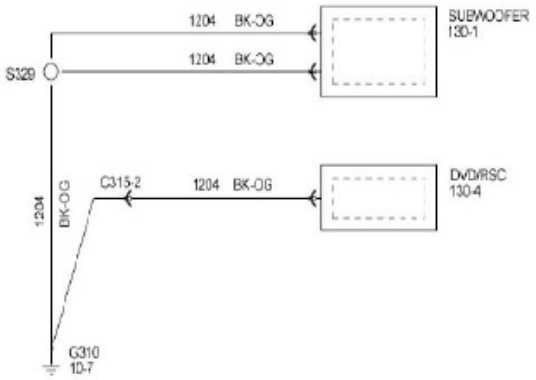
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

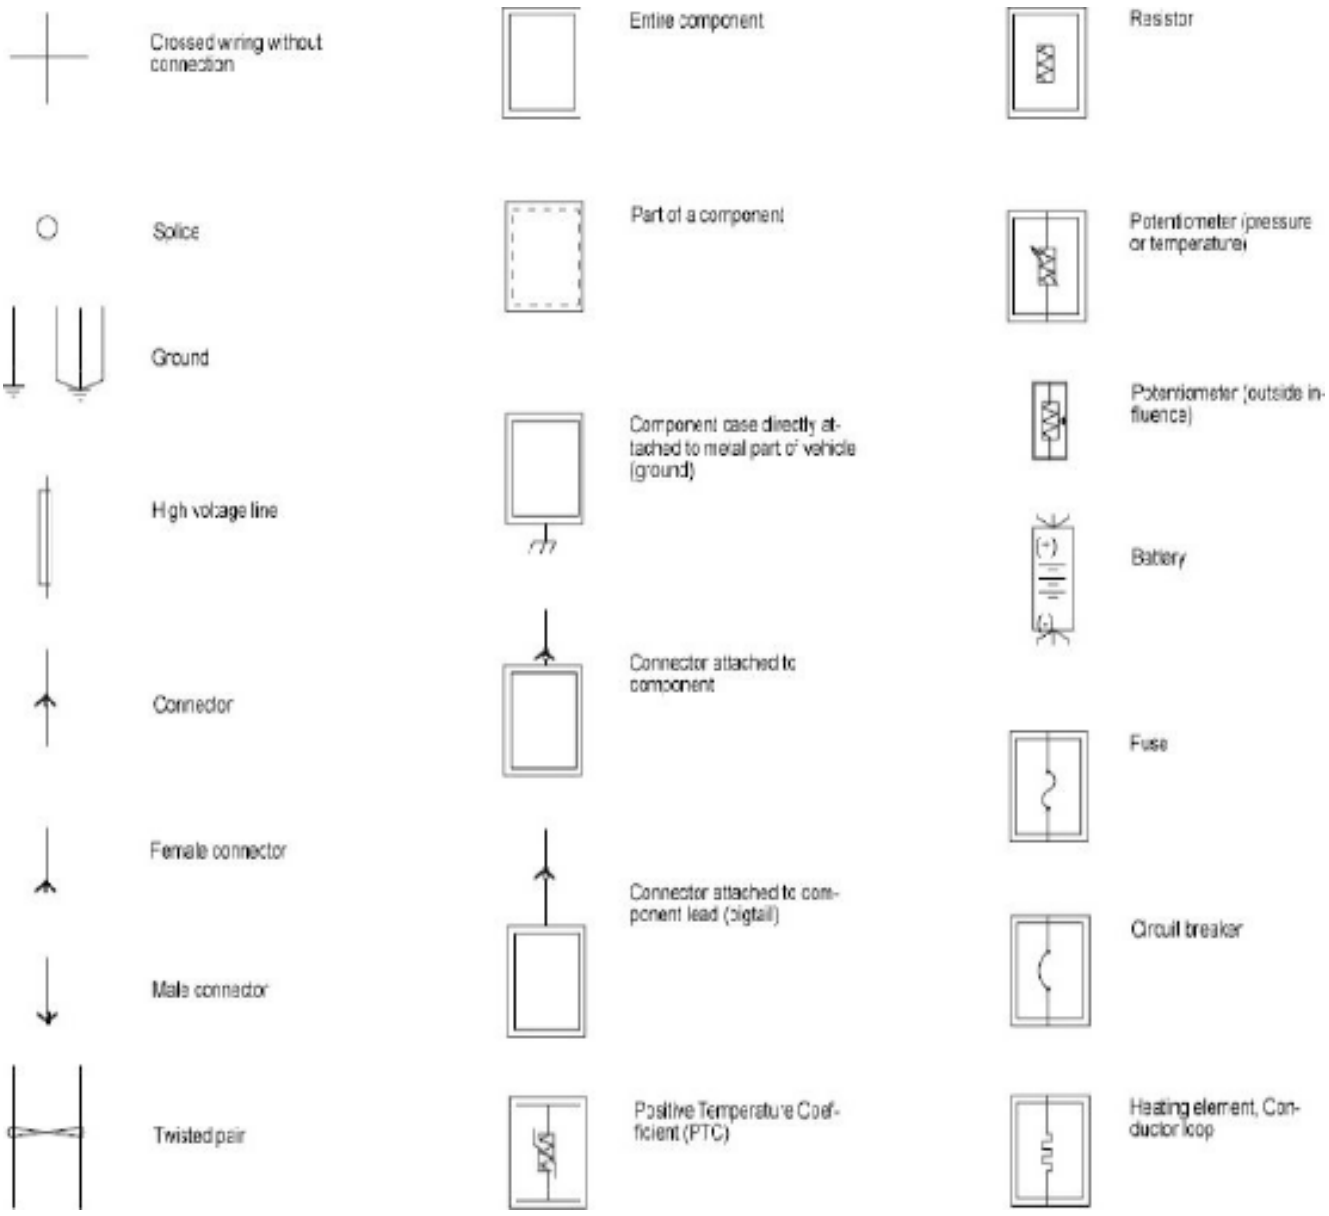
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

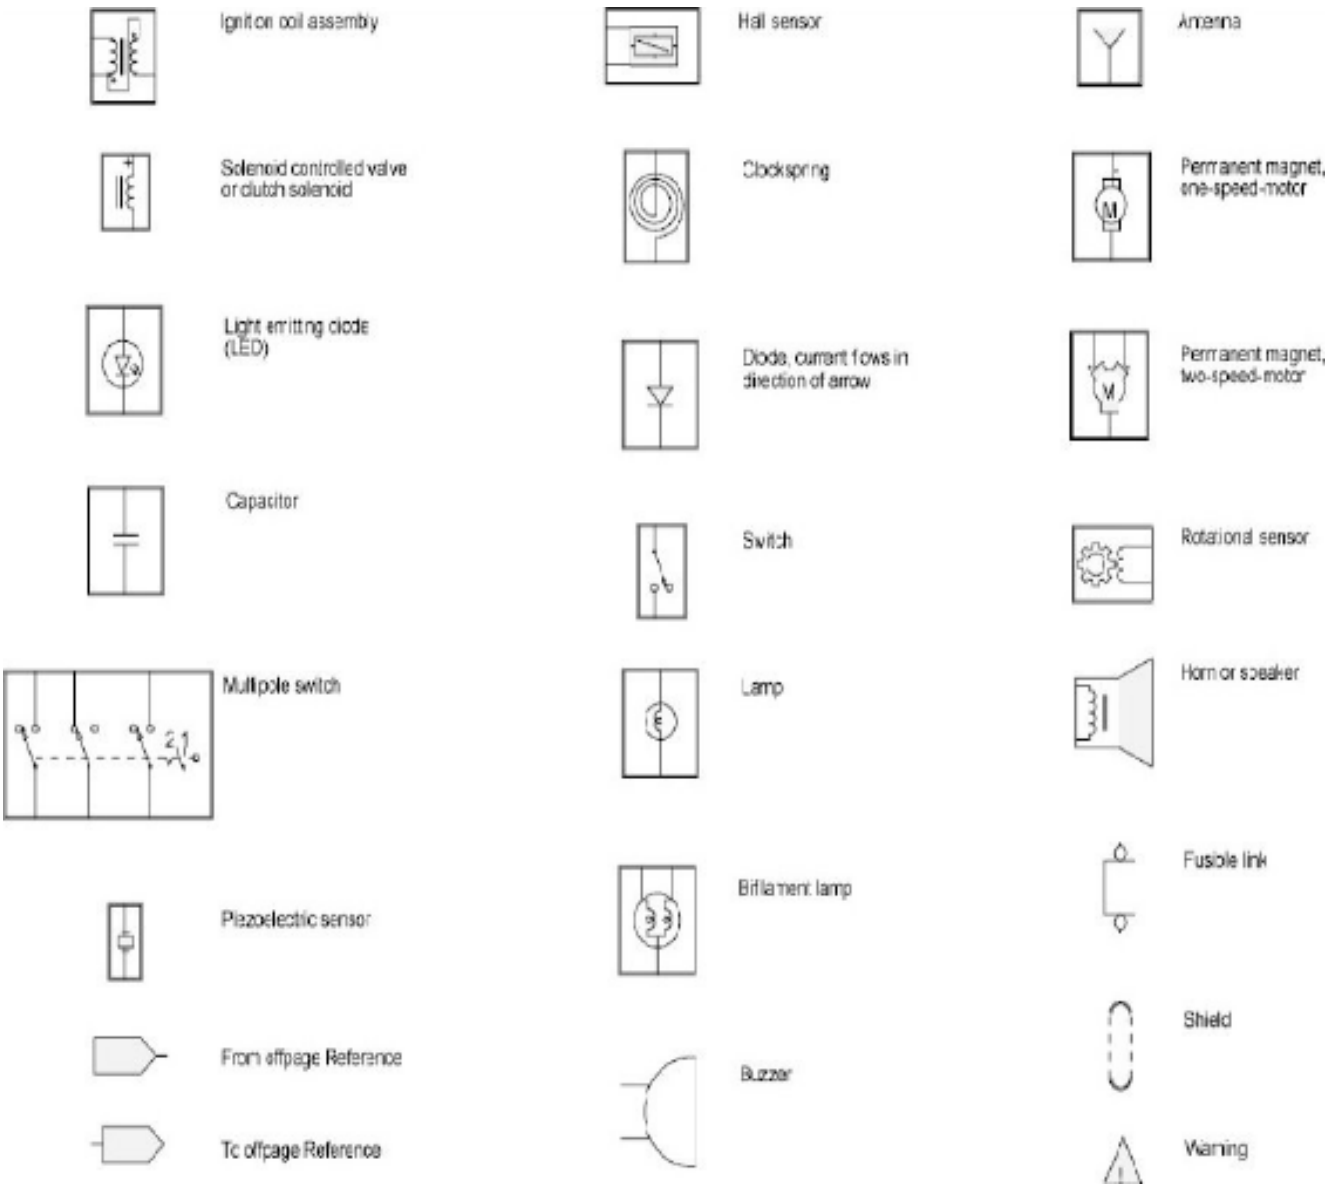
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

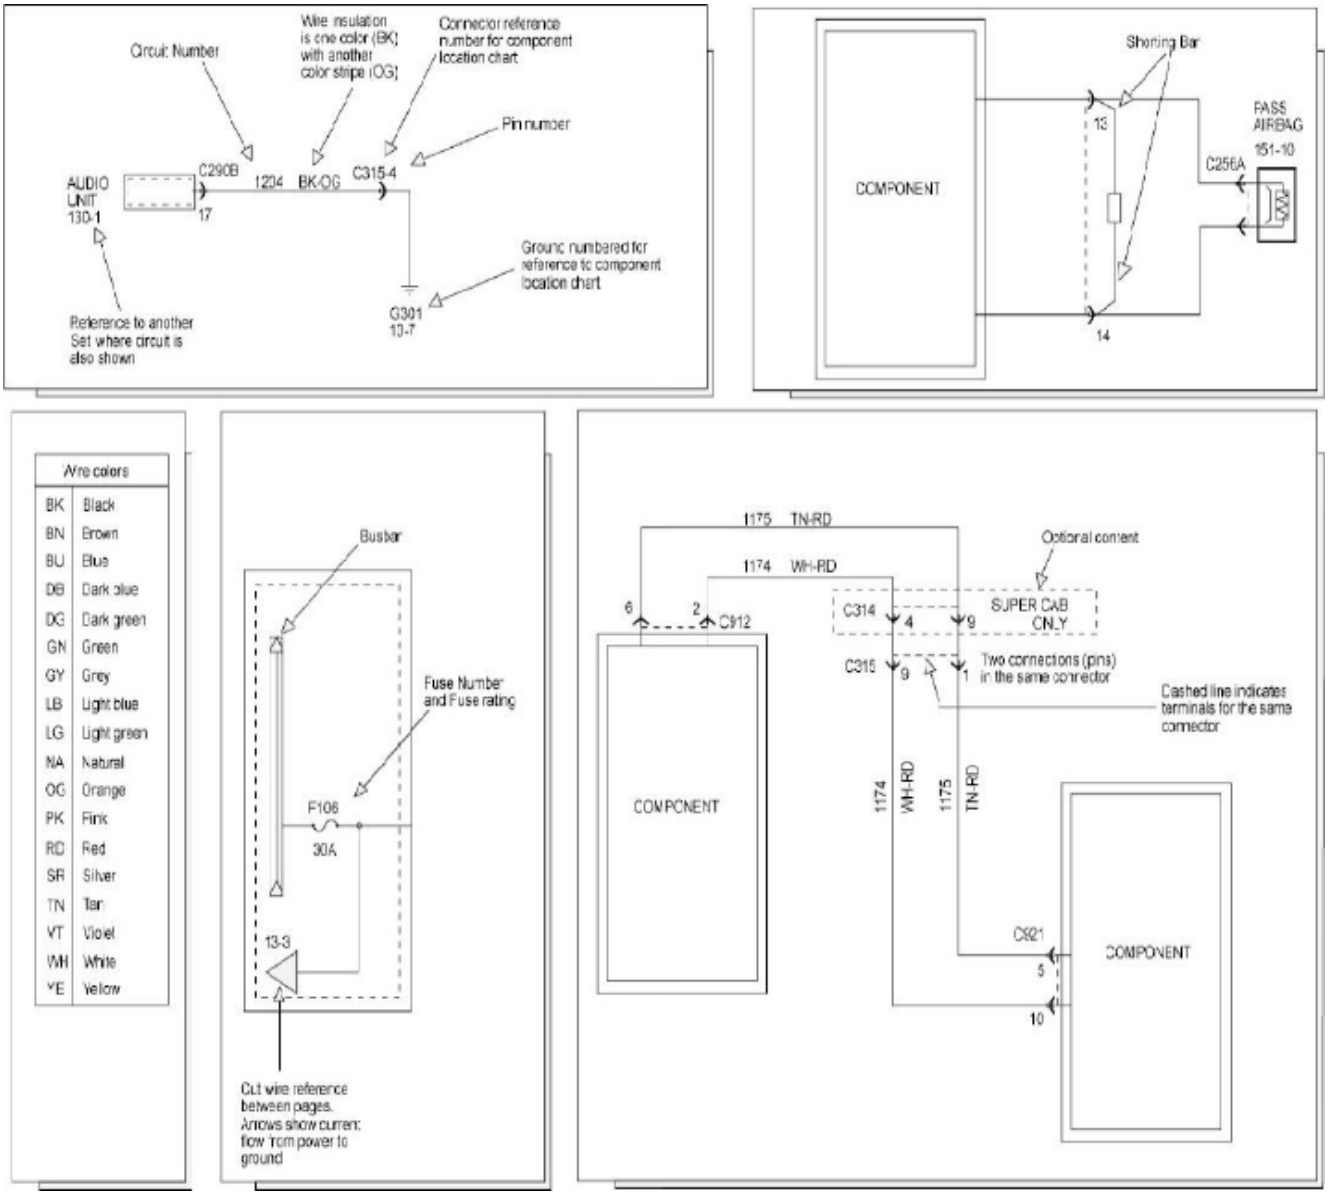
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

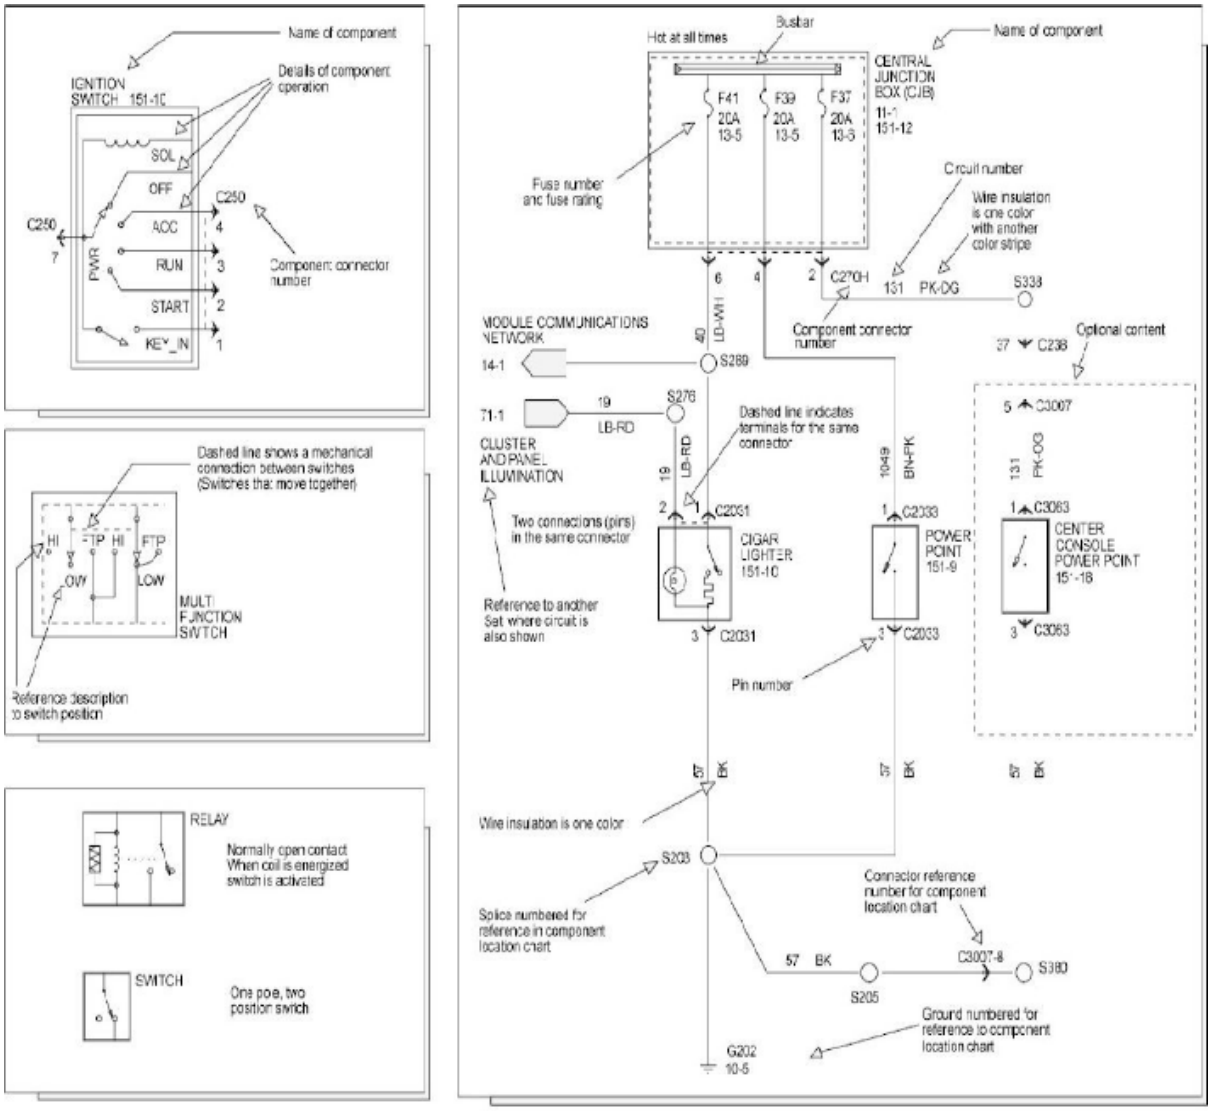
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Trailer Lighting Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

WIRE STOPPER

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

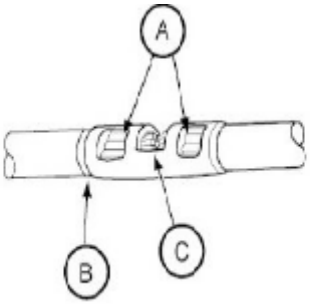
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

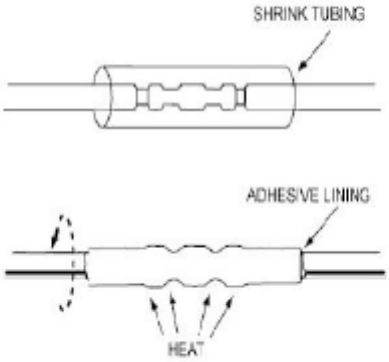
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x dia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

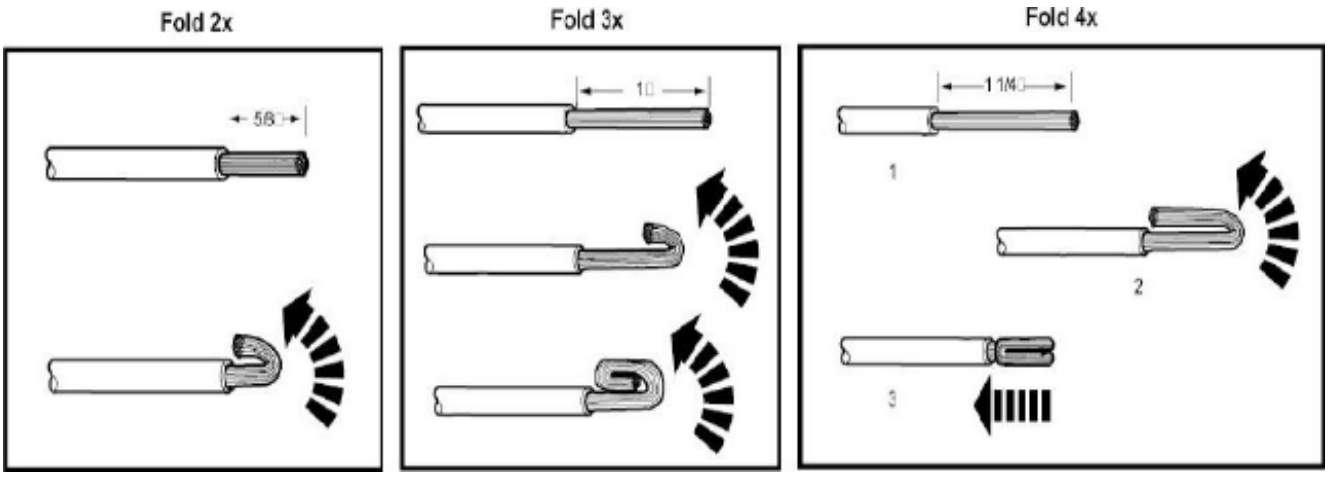
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



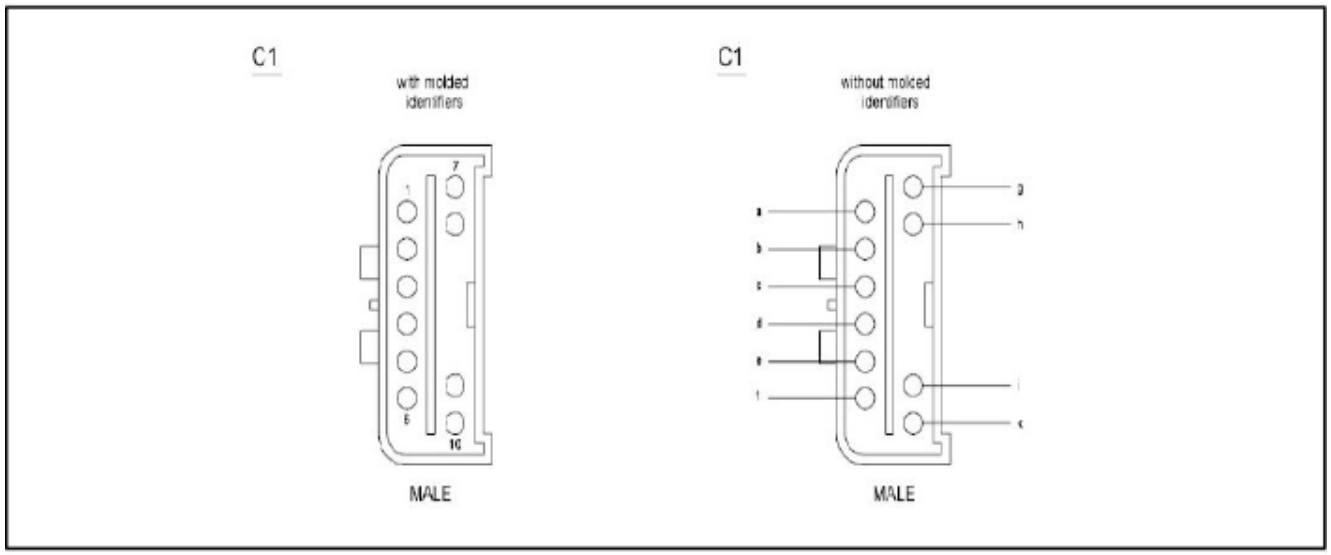
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

Turn Signal Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

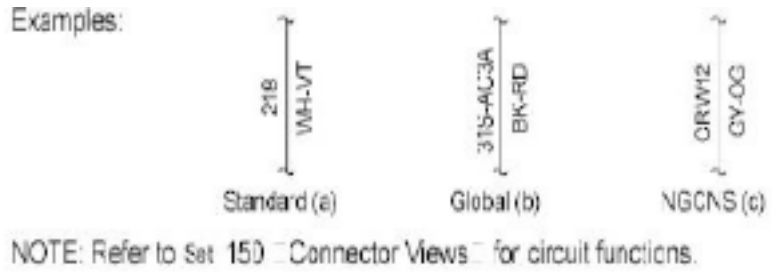
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

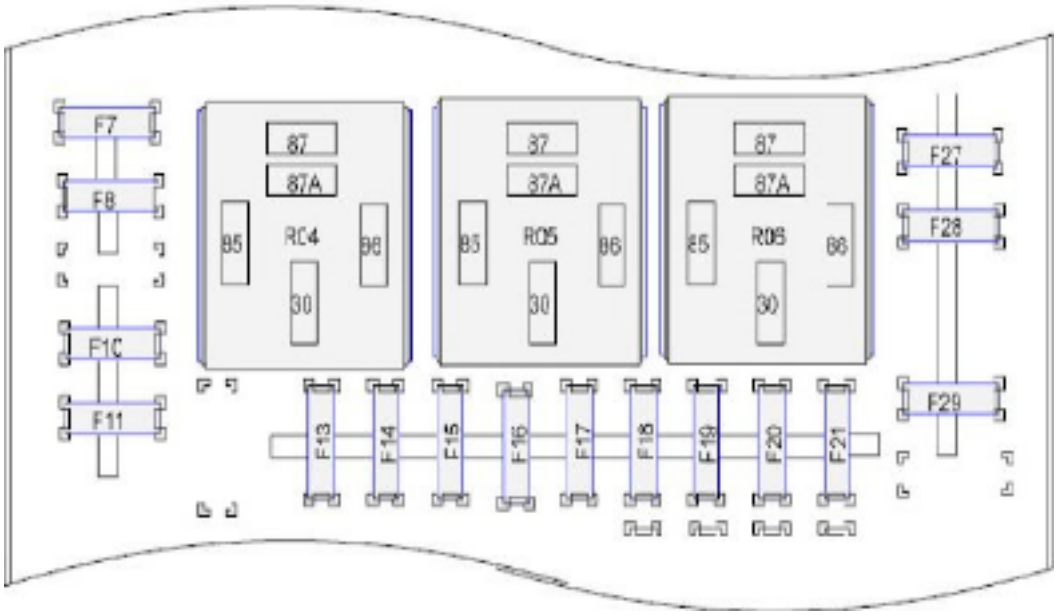
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

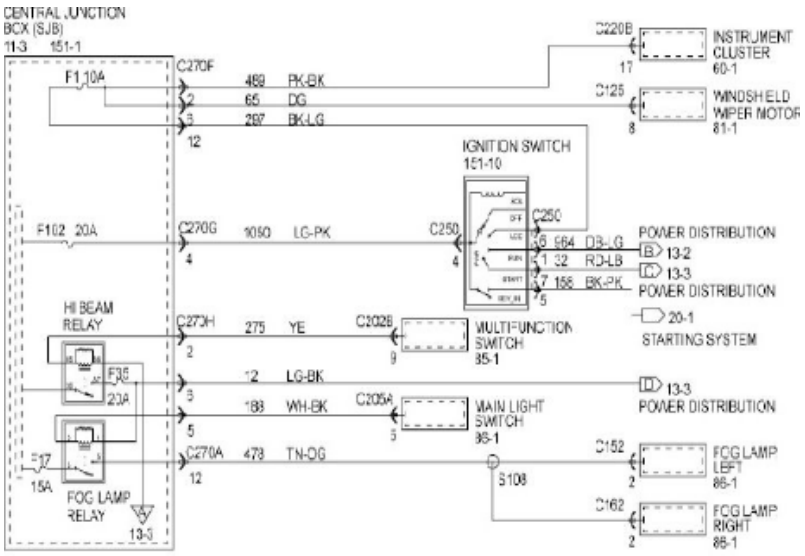
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

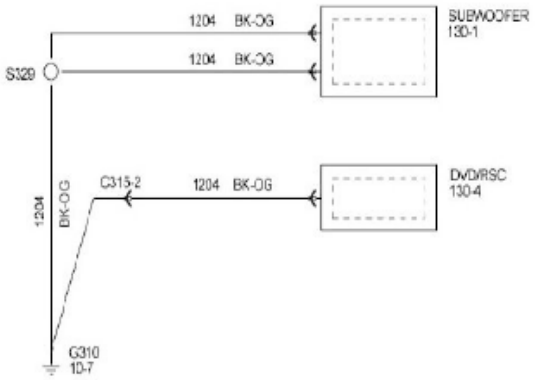
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

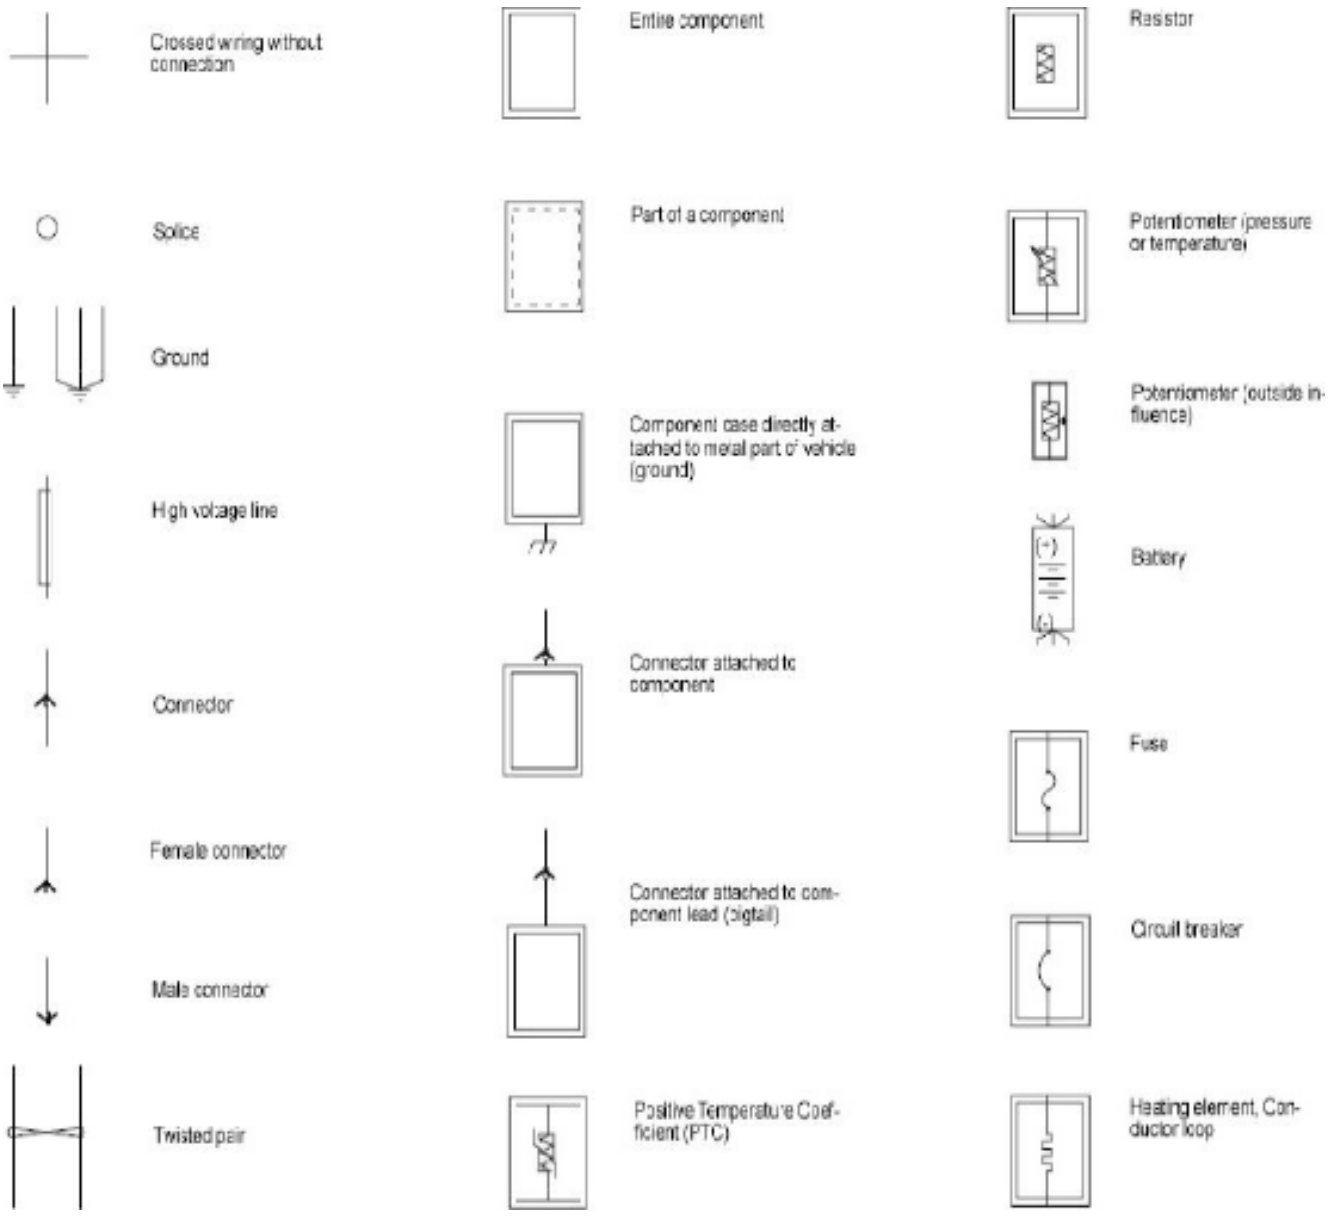
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

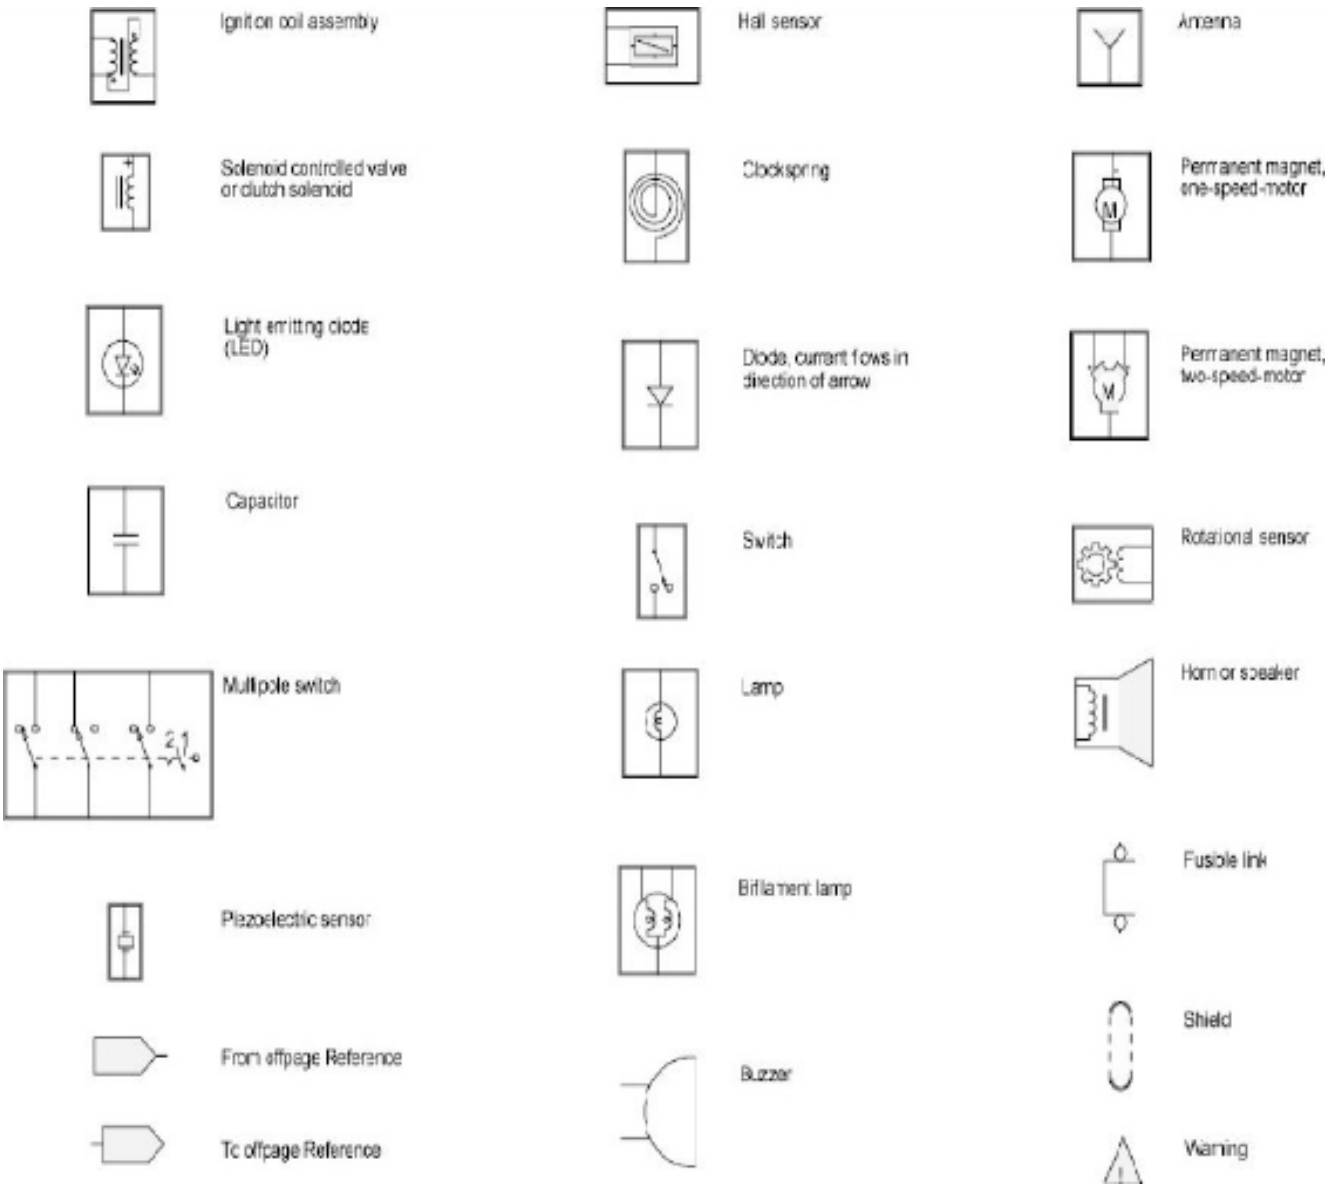
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

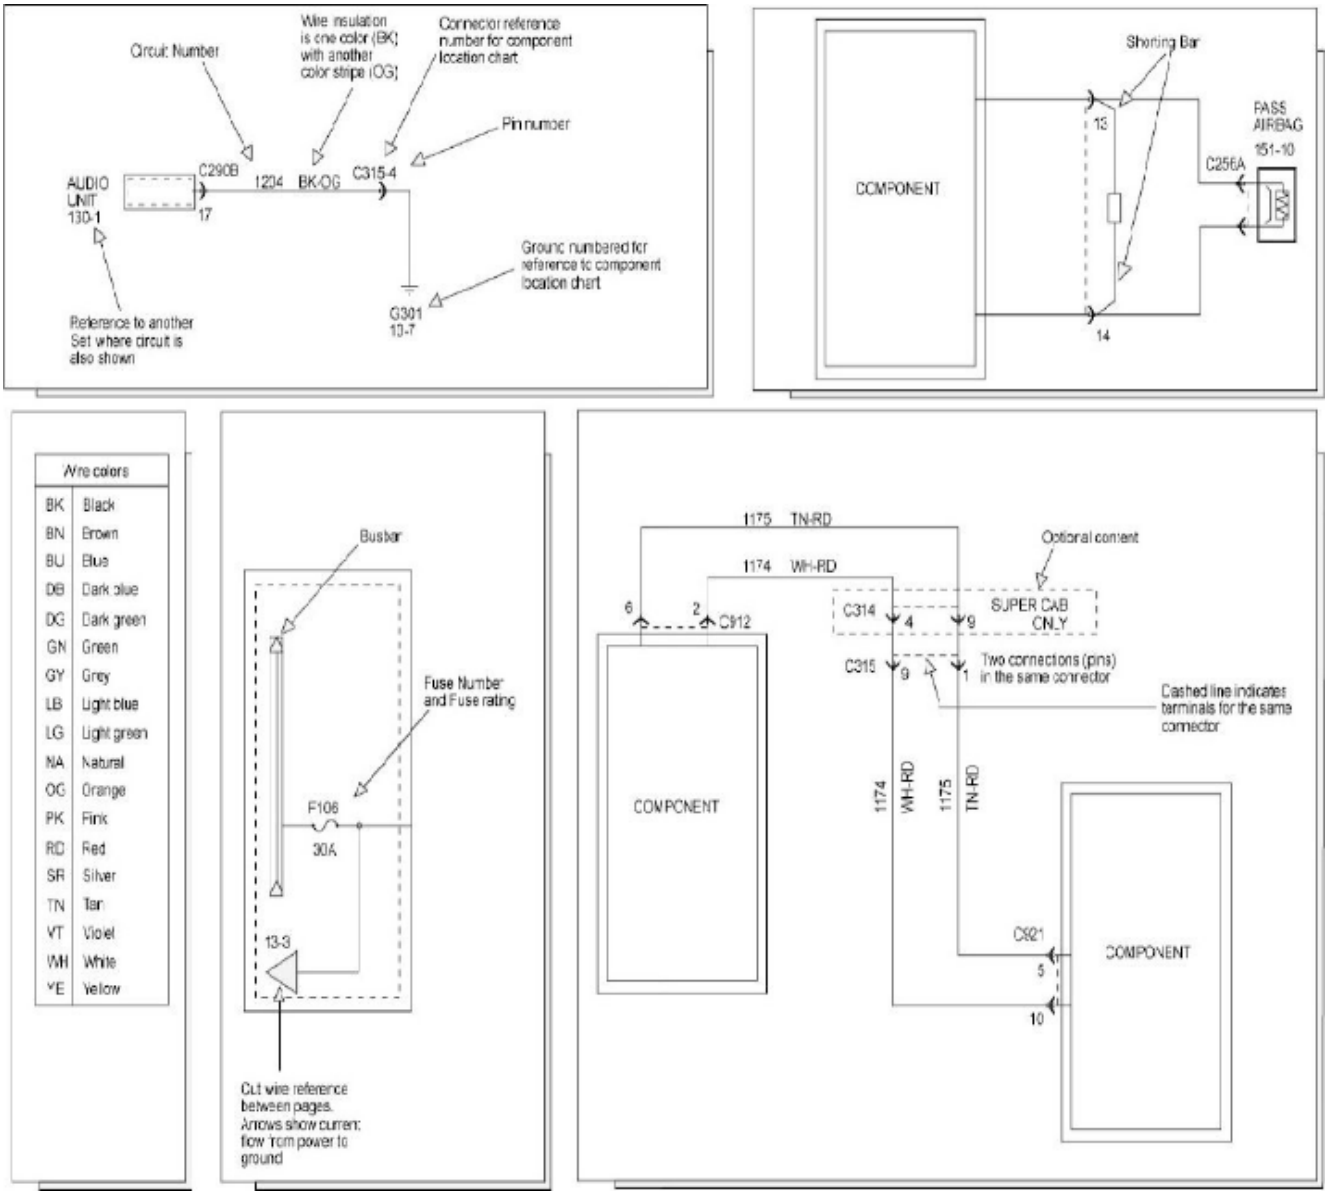
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

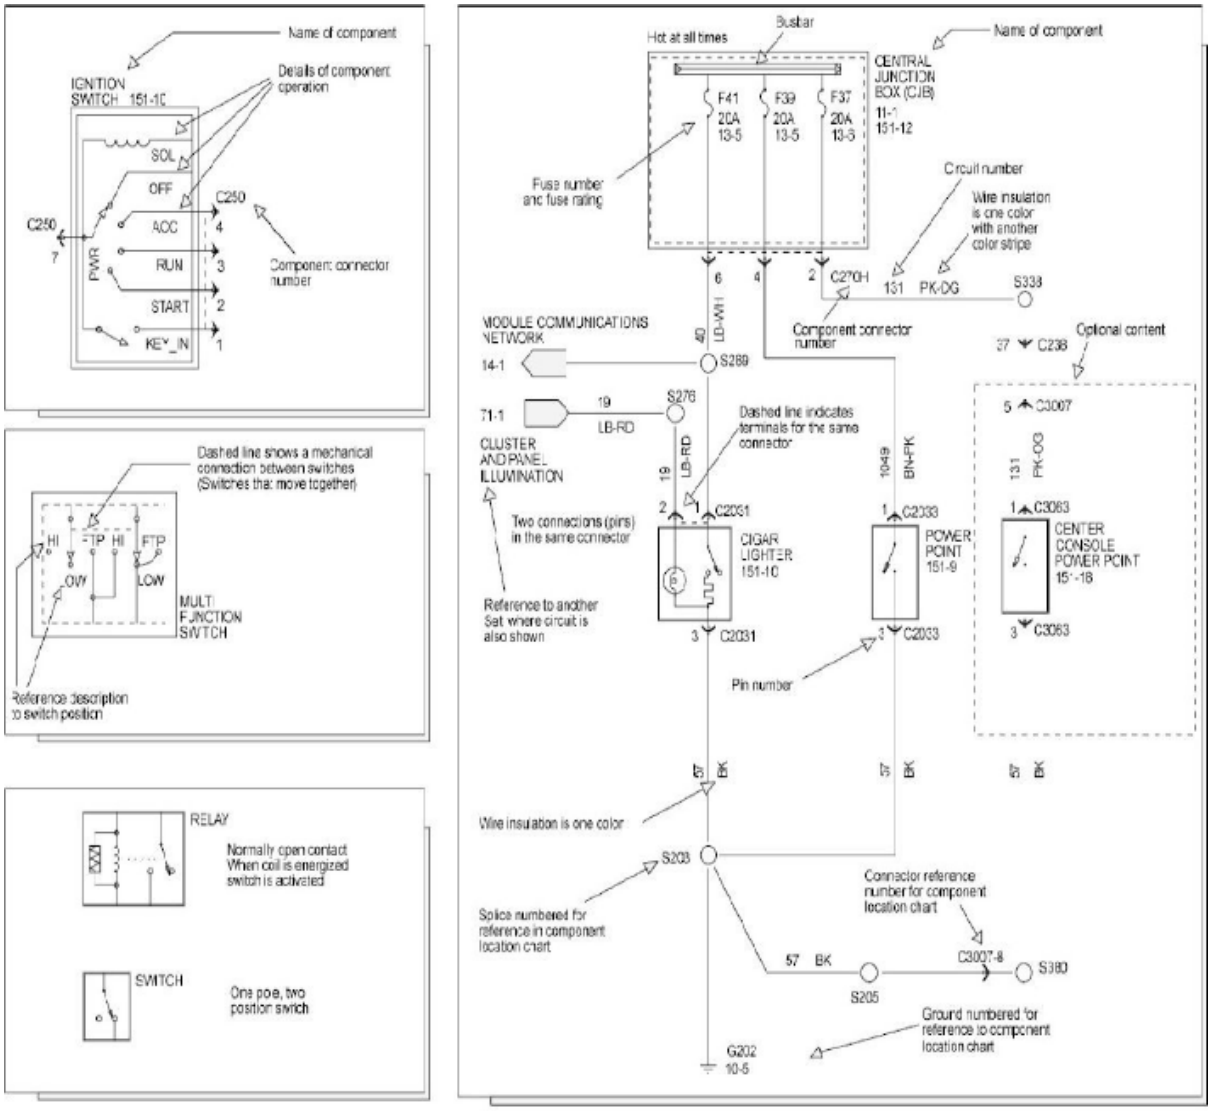
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Turn Signal Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Defective insulation stripping

2 = Insulation not removed

3 = Wire strands missing

4 = Intermittent signals through pierced insulation

Partially mated connectors

1 = Seal

2 = Displaced tab

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Male half

7 = Intermittent contact

Lock may be displaced into an unlocked position; pull on the connector to verify the lock.

Deformed (enlarged) female terminals

1 = Enlarged

2 = Normal

Any probe entering the terminal may enlarge the contact spring opening creating an intermittent signal.

Insert the correct mating terminal (Location A) from the service kit and feel for a loose fit.

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

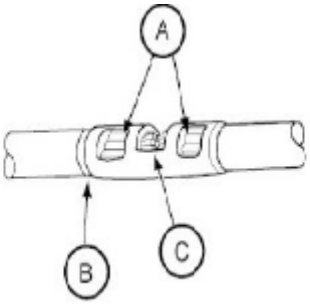
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

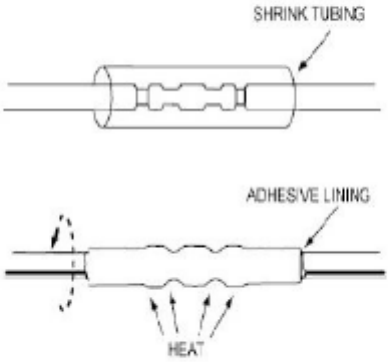
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x dia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

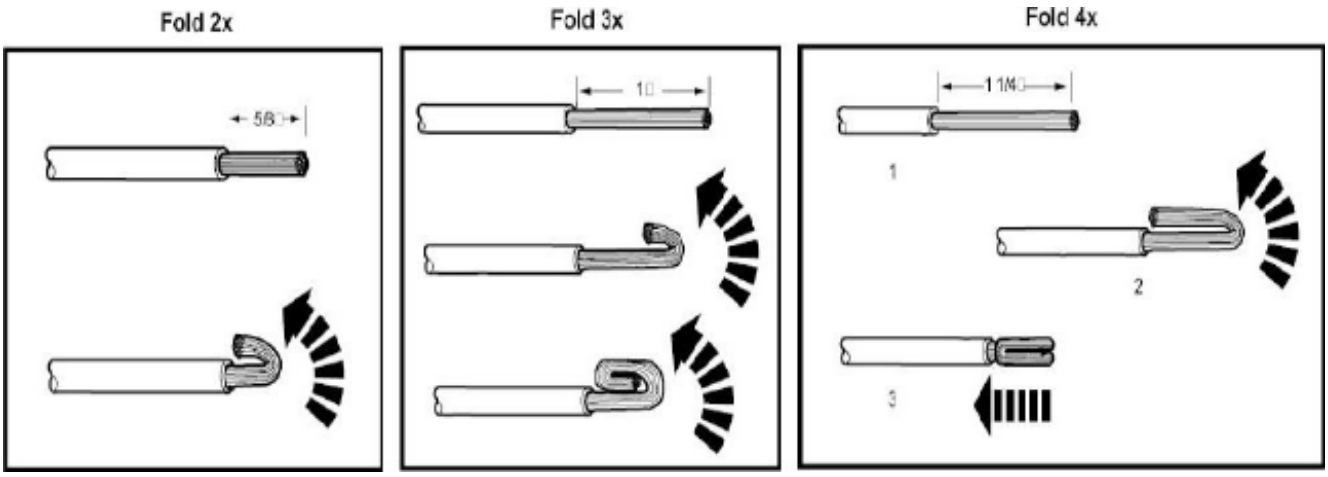
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Connector: C2047

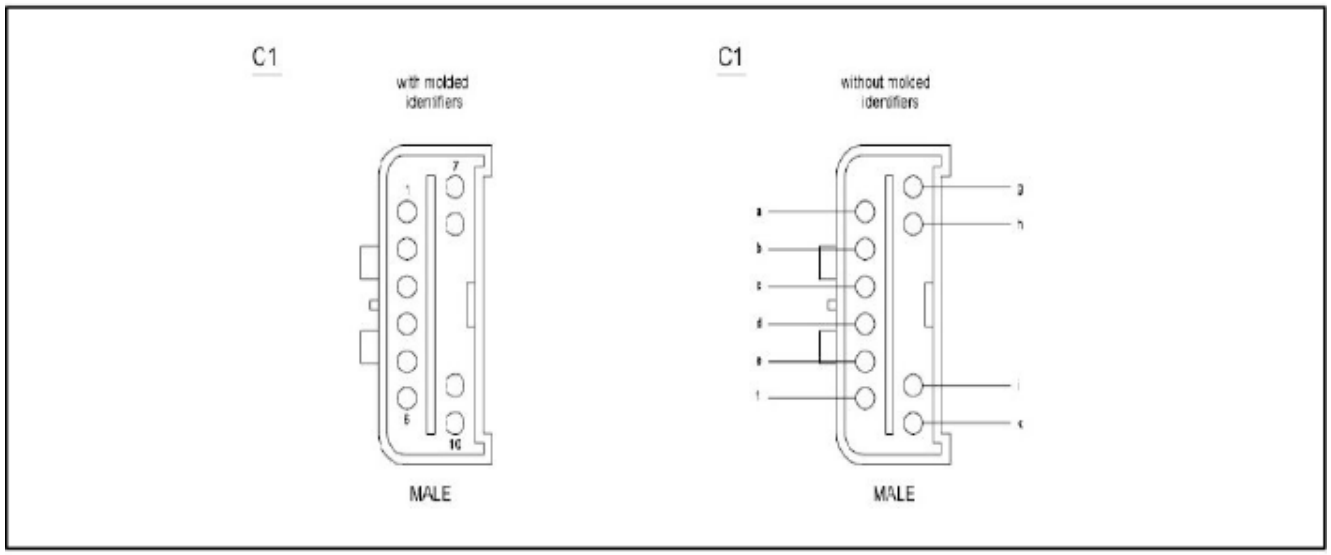
Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



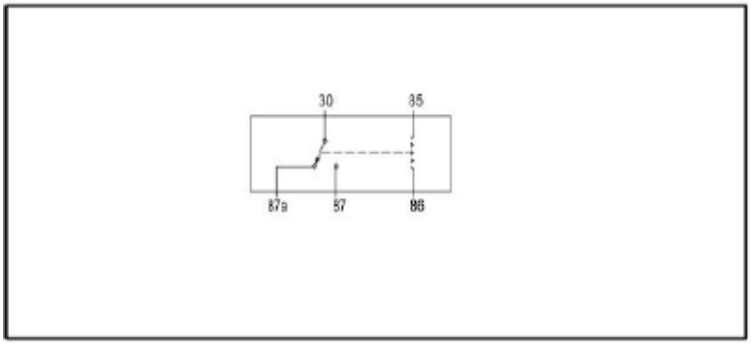
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

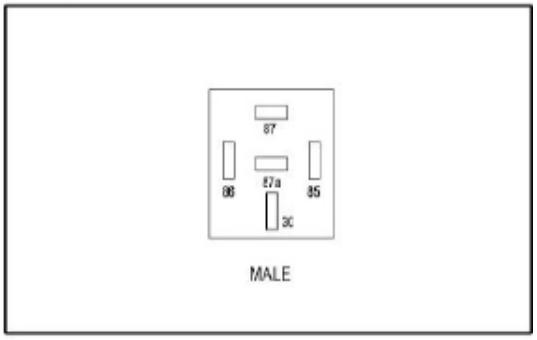
Turn Signal Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

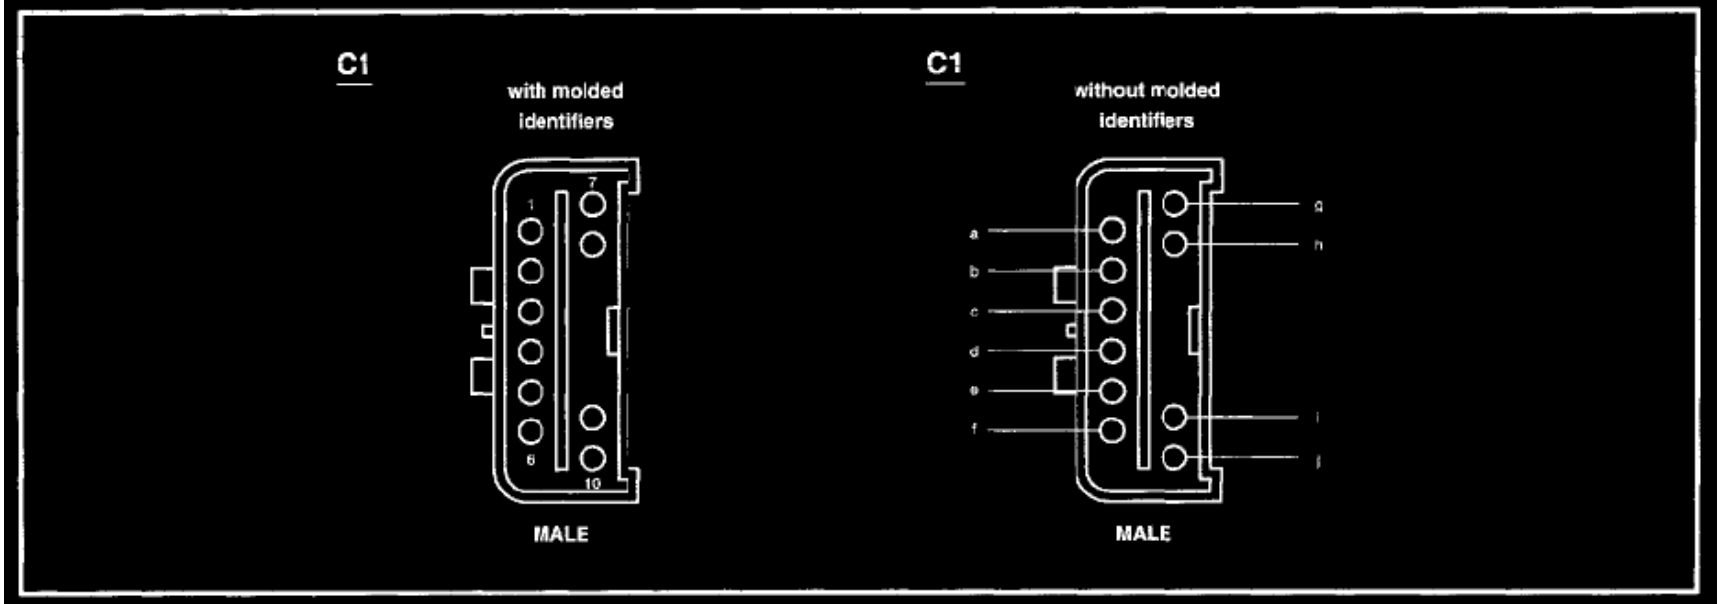
Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step–by–step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

Item	Part Number	Description
1	—	Smart junction box (SJB) electrical connectors (part of 14401)
2	—	SJB screws (3 required)
3	15604	SJB

Power Distribution Module: Service and Repair

SMART JUNCTION BOX (SJB)

Removal

CAUTION: Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.

NOTE: -

Prior to the replacement of the module, it is necessary to upload the module configuration information into the appropriate scan tool. This information must be downloaded into the new module after installation.

- The tire pressure monitoring system (TPMS) functionality is integral to the smart junction box (SJB).

- The steps included in the SJB removal and installation procedure are critical to restoring the vehicle security and tire pressure monitoring systems to normal operation. A new SJB is delivered in a manufacturing mode with 7 pre-set DTCs related to the TPMS. To clear the DTCs, successful configuration of the SJB must occur, followed by successful TPMS sensor training, and a successful self-test, including clearing of the DTCs. The DTCs are as follows:

- B106D (Tire Pressure Monitor System [TPMS] Initiators Not Configured)

- B2477 (Module Configuration Failure)

- B2868 (Left Front Tire Pressure Sensor Fault)

- B2869 (Right Front Tire Pressure Sensor Fault)

- 2870 (Right Rear Tire Pressure Sensor Fault)

- B2871 (Left Rear Tire Pressure Sensor Fault)

- C2780 (ECU in Manufacturer Sub-State)

1. NOTE: This step is necessary only if the SJB is being replaced.

Upload the module configuration information from the SJB.

2. Remove the RH lower cowl trim panel. 3. Disconnect the electrical connectors. 4. Remove the 3 screws and the SJB.

Installation

NOTE: When a new SJB is installed, all customer RKE transmitters may be required to be present in order to program the RKE transmitters to the new SJB.

1. Install the SJB.

- Install the 3 screws.

- Connect the electrical connectors.

2. NOTE: If the SJB was not replaced, this is the last step that is necessary.

Install the RH lower cowl trim panel.

3. NOTE:

- When successful, this step provides the calibration necessary for the SJB operation and clears DTCs B106D and B2477. The clearing of these DTCs indicates the calibration data has been successfully downloaded to the new SJB.

- When successful, this step also programs the remote transmitters into the new SJB. In the event the remote transmitters do not program to the new SJB, all of the remote transmitters will need to be present. Refer to Locks, Remote Keyless Entry Transmitter Programming. This action will program the remote transmitters into the new SJB. See: Accessories and Optional Equipment/Antitheft and Alarm Systems/Keyless Entry/Keyless Entry Transmitter/Testing and Inspection

Download the SJB configuration information from the scan tool into the new SJB.

4. NOTE: When successful, this step clears DTCs B2868, B2869, B2870 and B2871. The clearing of these DTCs indicates the SJB has recognized

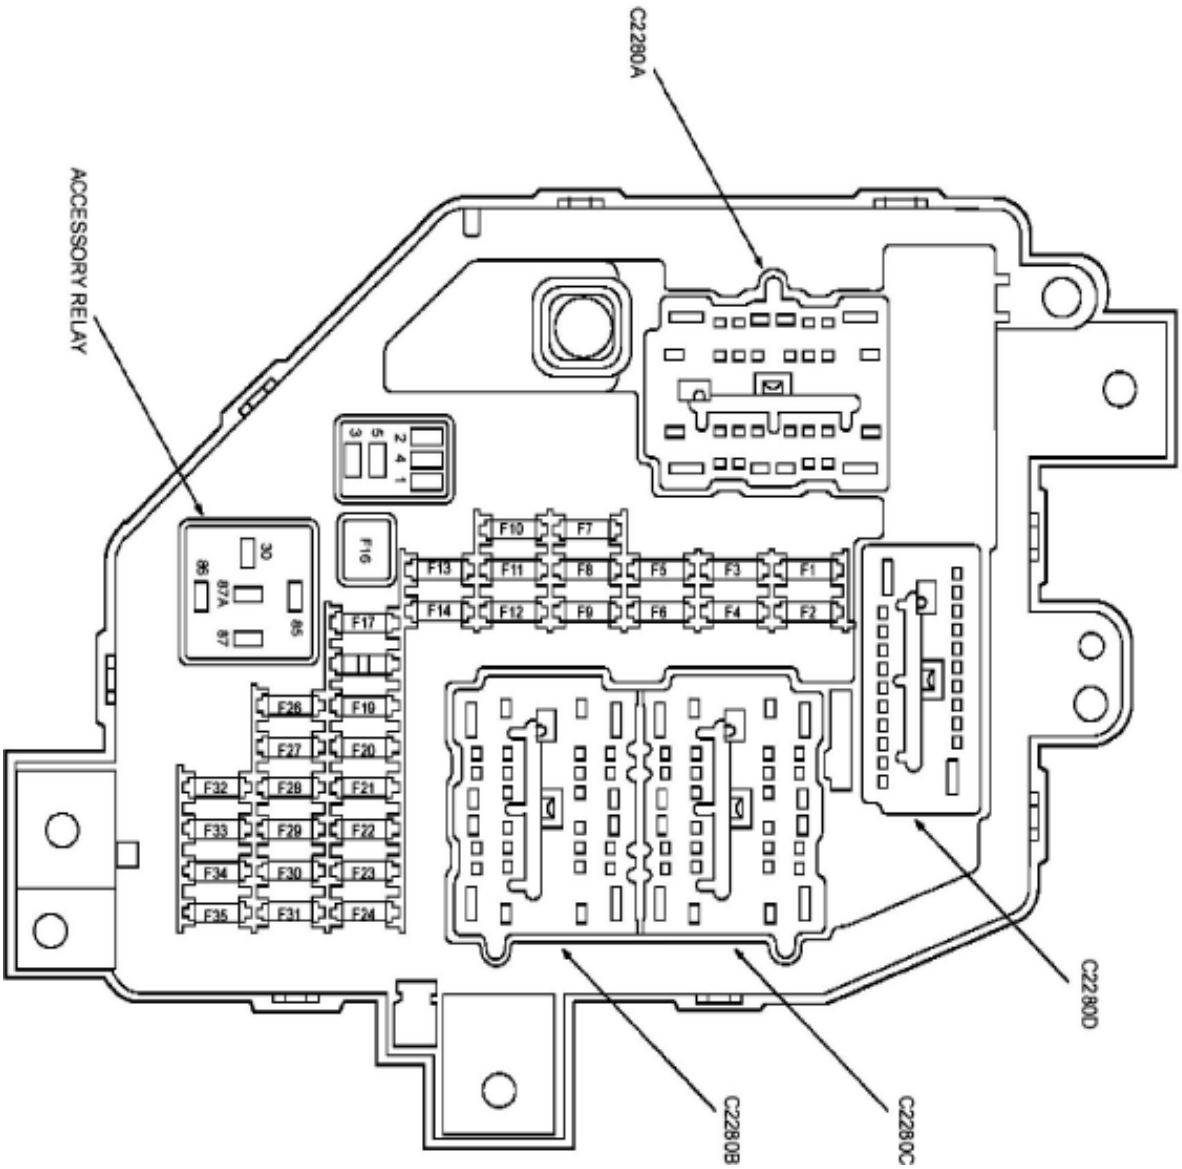
the tire pressure sensors during the training procedure.

Train the tire pressure sensors.

5. NOTE: DTC C2780 will not clear if any other DTCs are present in the SJB. When successful, this step will clear the DTC C2780.

Carry out the SJB on-demand self-test by clearing DTCs, and then retrieving DTCs to confirm all DTCs have been cleared.

SMART JUNCTION BOX (SJB)



Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

ETC System with a 3-Track APP Sensor Failure Mode and Effects Management:

Effect	Failure Mode ▪
No Effect on Driveability	A loss of redundancy or loss of a non-critical input could result in a concern that does not affect driveability. The powertrain malfunction indicator (wrench) illuminates, but the throttle control and torque control systems function normally. A DTC is set to indicate the component or circuit with the concern.
Disable Speed Control	If certain concerns are detected, speed control is disabled. Throttle control and torque control continue to function normally.

(Continued)

Electronic Throttle Control Module: Description and Operation

TORQUE BASED ELECTRONIC THROTTLE CONTROL (ETC)

Overview

The torque based ETC is a hardware and software strategy that delivers an engine output torque (via throttle angle) based on driver demand (pedal position). It uses an electronic throttle body, the powertrain control module (PCM), and an accelerator pedal assembly to control the throttle opening and engine torque.

Torque based ETC enables aggressive automatic transmission shift schedules (earlier upshifts and later downshifts). This is possible by adjusting the throttle angle to achieve the same wheel torque during shifts, and by calculating this desired torque, the system prevents engine lugging (low RPM and low manifold vacuum) while still delivering the performance and torque requested by the driver. It also enables many fuel economy/emission improvement technologies such as variable camshaft timing (VCT) (deliver same torque during transitions).

Torque based ETC also results in less intrusive vehicle and engine speed limiting, along with smoother traction control.

Other benefits of ETC are: -

eliminate cruise control actuators

- eliminate idle air control (IAC) valve

- better airflow range

- packaging (no cable)

- more responsive powertrain at altitude and improved shift quality

The ETC system illuminates a powertrain malfunction indicator (wrench) on the instrument cluster when a concern is present. Concerns are accompanied by diagnostic trouble codes (DTCs) and may also illuminate the malfunction indicator lamp (MIL).

Electronic Throttle Body (ETB)

The ETB has the following characteristics: -

The throttle actuator control (TAC) motor is a DC motor controlled by the PCM (requires 2-wires).

- There are 2 designs: parallel and in-line. The parallel design has the motor under the bore parallel to the plate shaft. The motor housing is integrated into the main housing. The in-line design has a separate motor housing.

- An internal spring is used in both designs to return the throttle plate to a default position. The default position is typically a throttle angle of 7 to 8 degrees from the hard stop angle.

- The closed throttle plate hard stop is used to prevent the throttle from binding in the bore (approximately 0.75 degree). This hard stop setting is not adjustable and is set to result in less airflow than the minimum engine airflow required at idle.

- The required idle airflow is provided by the plate angle in the throttle body assembly. This plate angle controls idle, idle quality, and eliminates the need for an IAC valve.

- There is 1 reference voltage and 1 signal return circuit between the PCM and the ETB. The reference voltage circuit and the signal return circuit is shared with the reference voltage circuits and signal return circuits used by the APP sensor. There are also 2 TP signal circuits for redundancy. The redundant TP signals are required for increased monitoring reasons. The first TP signal (TP1) has a negative slope (increasing angle, decreasing voltage) and the second signal (TP2) has a positive slope (increasing angle, increasing voltage). The TP2 signal reaches a limit of approximately 4.5 volts at approximately 45 degrees of throttle angle.

Accelerator Pedal Position (APP) Sensor

Depending on the application either a 2-track or 3-track APP sensor is used.

Electronic Throttle Control (ETC) System Strategy

ETC System With A 3-Track APP Sensor Failure Mode And Effects Management (Part 1)

ETC System with a 3-Track APP Sensor Failure Mode and Effects Management:

Effect	Failure Mode [a]
RPM Guard with Pedal Follower	In this mode, torque control is disabled due to the loss of a critical sensor or PCM concern. The throttle is controlled in pedal-follower mode as a function of the pedal position sensor input only. A maximum allowed RPM is determined based on the position of the accelerator pedal (RPM Guard). If the actual RPM exceeds this limit, spark and fuel are used to bring the RPM below the limit. The powertrain malfunction indicator (wrench) and the MIL illuminate in this mode and a DTC for an ETC-related component is set. EGR, VCT, and IMRC outputs are set to default values.
RPM Guard with Default Throttle	In this mode, the throttle plate control is disabled due to the loss of throttle position, the throttle plate position controller, or other major electronic throttle body concern. Depending on the concern detected, the throttle plate is either commanded to the default (limp home) position or the motor is disabled and the spring returns the throttle plate to the default (limp home) position. A maximum allowed RPM is determined based on the position of the accelerator pedal (RPM Guard). If the actual RPM exceeds this limit, spark and fuel are used to bring the RPM below the limit. The powertrain malfunction indicator (wrench) and the MIL illuminate in this mode and a DTC P2110 is set. EGR, VCT, and IMRC outputs are set to default values.
RPM Guard with High Forced Idle	This mode is caused by the loss of 2 or 3 pedal position sensor inputs due to sensor, wiring, or PCM concerns. The system is unable to determine driver demand, and the throttle is controlled to a fixed high idle airflow. There is no response to the driver input. The maximum allowed RPM is a fixed value (RPM Guard). If the actual RPM exceeds this limit, spark and fuel are used to bring the RPM below the limit. The powertrain malfunction indicator (wrench) and the MIL illuminate in this mode and a DTC P2104 is set. EGR, VCT, and IMRC outputs are set to default values.
Shutdown	If a significant processor concern is detected, the monitor forces vehicle shutdown by disabling all fuel injectors. The powertrain malfunction indicator (wrench) illuminates in this mode and a DTC P2105 is set.

a ETC illuminates or displays a message on the message center immediately; MIL illuminates after 2 driving cycles

ETC System With A 3-Track APP Sensor Failure Mode And Effects Management (Part 2)

ETC System with a 2-Track APP Sensor Failure Mode and Effects Management:

Effect	Failure Mode
No Effect on Driveability	A loss of redundancy or loss of a non-critical input could result in a concern that does not affect driveability. The powertrain malfunction indicator (wrench) and the MIL do not illuminate. However, speed control and power take off (PTO) may be disabled. A DTC is set to indicate the component or circuit with the concern.
Delayed APP Sensor Response with Brake Override	This mode is caused by the loss of 1 APP sensor input due to sensor, wiring, or PCM concerns. The system is unable to verify the APP sensor input and driver demand. The throttle plate response to the APP sensor input is delayed as the accelerator pedal is applied. The engine returns to idle RPM whenever the brake pedal is applied. The powertrain malfunction indicator (wrench) illuminates, but the MIL does not illuminate in this mode. An APP sensor related DTC is set.
Time-Based Driver Demand with Brake Override	This mode is caused by the loss of one brake pedal position (BPP) and one APP sensor input or both APP sensor inputs due to sensor, wiring, or PCM concerns. The system is unable to determine driver demand. There is no response when the accelerator pedal is applied. The engine returns to idle RPM whenever the brake pedal is applied. When the brake pedal is released, the PCM slowly increases the APP signal to a fixed value. The powertrain malfunction indicator (wrench) illuminates, but the MIL does not illuminate in this mode. An APP or BPP sensor related DTC is set.
RPM Guard with Pedal Follower	In this mode, torque control is disabled due to the loss of a critical sensor or PCM concern. The throttle is controlled in pedal-follower mode as a function of the APP sensor input only. A maximum allowed RPM is determined based on the position of the accelerator pedal (RPM Guard). If the actual RPM exceeds this limit, spark and fuel are used to bring the RPM below the limit. The powertrain malfunction indicator (wrench) and the MIL illuminate in this mode and a DTC for an ETC-related component is set. EGR, VCT, and IMRC outputs are set to default values and speed control is disabled.
RPM Guard with Default Throttle	In this mode, the throttle plate control is disabled due to the loss of both TP sensor inputs, loss of throttle plate control, stuck throttle plate, significant processor concerns, or other major electronic throttle body concern. The spring returns the throttle plate to the default (limp home) position. A maximum allowed RPM is determined based on the position of the accelerator pedal (RPM Guard). If the actual RPM exceeds this limit, spark and fuel are used to bring the RPM below the limit. The powertrain malfunction indicator (wrench) and the MIL illuminate in this mode and a DTC for an ETC-related component is set. EGR, VCT, and IMRC outputs are set to default values and speed control is disabled.

Electronic Throttle Monitor Operation:

DTCs [a]	
P060X, P061X	PCM processor concern (MIL, powertrain malfunction indicator [wrench])
P2104 (ETC system with a 3-track APP sensor)	ETC FMEM forced idle, 2 or 3 pedal sensor concerns (MIL, powertrain malfunction indicator [wrench])
P2105 (ETC system with a 3-track APP sensor)	ETC FMEM forced engine shutdown; PCM concern (MIL, powertrain malfunction indicator [wrench])
P2110 (ETC system with a 3-track APP sensor)	ETC FMEM forced limited RPM; Concern with both TP sensors; throttle plate position control concern (MIL, powertrain malfunction indicator [wrench])
U0300	ETC software version mismatch between processors internal to the PCM (non-MIL, powertrain malfunction indicator [wrench])

a Monitor execution is continuous. Monitor false detection duration is less than 1 second to register a concern.

ETC System With A 2-Track APP Sensor Failure Mode And Effects Management

Electronic Throttle Monitor Operation

Accelerator Pedal Position (APP) Sensor Check:

DTCs[a]	
P1575 (ETC system with a 2-track APP sensor)	APP sensor out of self-test range
P2122, P2123, P2127, P2128, P2132, P2133	APP sensor circuit continuity test (powertrain malfunction indicator [wrench], non-MIL)
P2121, P2126, P2131 (ETC system with a 3-track APP sensor)	APP range/performance (powertrain malfunction indicator [wrench], non-MIL)
P2138 (ETC system with a 2-track APP sensor)	APP to APP signal correlation (powertrain malfunction indicator [wrench], non-MIL)

a Correlation and range/performance - sensor disagreement between processors internal to the PCM. Monitor execution is continuous. Monitor false detection duration is less than 1 second to register a concern. Refer to Powertrain DTC Charts and Descriptions, Diagnostic Trouble Code (DTC) Charts and Descriptions for additional DTC information.

Throttle Position (TP) Sensor Check:

DTCs [a]	
P0122, P0123, P0222, P0223	TP circuit continuity test (MIL, powertrain malfunction indicator [wrench])
P0121, P0221 (ETC system with a 3-track APP sensor)	TP range/performance (non-MIL)
P1124 (ETC system with a 2-track APP sensor)	TP sensor out of self-test range
P2135	TP to TP sensor correlation test (powertrain malfunction indicator [wrench], non-MIL)

a Correlation and range/performance - sensor disagreement between processors internal to the PCM, TP inconsistent with requested throttle plate position. Monitor execution is continuous. Monitor false detection duration is less than 1 second to register a concern. Refer to Powertrain DTC Charts and Descriptions, Diagnostic Trouble Code (DTC) Charts and Descriptions for additional DTC information.

Electronic TAC Operation Check:

DTCs [a]	
P115E	Throttle actuator airflow trim at maximum limit (non-MIL)
P2072 (ETC system with a 3-track APP sensor)	Throttle body ice blockage (non-MIL)
P2100 (ETC system with a 3-track APP sensor)	Throttle actuator circuit open, short to power, short to ground (MIL)
P2101	Throttle actuator range/performance test (MIL)
P2107	Processor and TAC motor circuit test (MIL)
P2111	Throttle actuator system stuck open (MIL)
P2112	Throttle actuator system stuck closed (MIL)

a Note: For all DTCs, in addition to the MIL, the powertrain malfunction indicator (wrench) is on for the concern that caused the FMEM action. Monitor execution is continuous. Monitor false detection duration is less than 5 seconds to register a concern.

The torque based ETC strategy was developed to improve fuel economy and to accommodate variable camshaft timing (VCT). This is possible by not coupling the throttle angle to the driver

pedal position. Uncoupling the throttle angle (produce engine torque) from the pedal position (driver demand) allows the powertrain control strategy to optimize fuel control and transmission shift schedules while delivering the requested wheel torque.

The ETC monitor system is distributed across 2 processors within the PCM: the main powertrain control processor unit (CPU) and a separate monitoring processor. The primary monitoring function is carried out by the independent plausibility check (IPC) software, which resides on the main processor. It is responsible for determining the driver-demanded torque and comparing it to an estimate of the actual torque delivered. If the generated torque exceeds driver demand by a specified amount, appropriate corrective action is taken.

C175T (Part 2)

Engine Control Module: Procedures

FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)

Description

The EEPROM is contained in an integrated circuit internal to the powertrain control module (PCM). The EEPROM contains the vehicle strategy including calibration information specific to the vehicle, and is capable of being programmed or flashed repeatedly.

As part of the calibration there is an area referred to as the vehicle identification (VID) block. The VID block is programmed when installing a new PCM as described under Programming the VID Block for a Replacement PCM. Failure to carry out this procedure may generate DTCs PI635 or P1639. The VID block in an existing PCM can also be tailored to accommodate various hardware or parameter changes made to the vehicle since production. Failure to carry out this procedure properly may generate DTC P1635, Tire/Axle Ratio out of Acceptable Range. An incorrect tire/axle ratio is one of the main causes for DTC P1639. This is described under Making Changes to the VID Block and also under Making Changes to the PCM Calibration. The VID block contains many items used by the strategy for a variety of functions. Some of these items include the vehicle identification number (VIN), octane adjust, fuel octane, fuel type, vehicle speed limit, tire size, axle ratio, the presence of speed control, and 4-wheel drive electronic shift-on-the-fly (ESOF) versus manual shift-on-the-fly (MSOF). Only items applicable to the vehicle hardware and supported by the VID block is displayed on the scan tool.

When changing items in the VID block, the strategy places range limits on certain items such as tire and axle ratio. The number of times the VID block may be reconfigured is limited. When this limit is reached, the scan tool displays a message indicating the need to flash the PCM again to reset the VID block.

Programming can be carried out by a local Ford dealer or any non-Ford facility. Refer to the scan tool manufacturer's instruction manual for details.

Programming the VID Block for a Replacement PCM

A new PCM contains the latest strategy and calibration level for a particular vehicle. However, the VID block is blank and needs programming. There are 2 procedures available. The first is an automatic data transfer from the old PCM to the new PCM, and the second is manual data entry into the new PCM.

Automatic data transfer is carried out if the old PCM is capable of communicating. This is done by using a scan tool to retrieve data from the old PCM before removing it from the vehicle. The stored data can then be downloaded to the new PCM after it has been installed.

Carry out manual data entry if the old module is damaged or incapable of communicating. Remove and install a new PCM. Using a compatible scan tool, select and carry out the module/parameter programming, referring to the scan tool manufacturer's instruction manual. Make certain that all parameters are included. Failure to properly program tire size in revolutions per mile, (rev/mile equals 63,360 divided by the tire circumference in inches), axle ratio, 4x4/4x2, and/or MSOF/ESOF may result in DTCs P1635 and P1639. You may be instructed to contact the As-Built Data Center for the information needed to manually update the VID block with the scan tool. Contact the center only if the old PCM cannot be used or the data is corrupt. For Ford and Lincoln Mercury technicians, contact your National Hotline or the Professional Technician Society (PTS) website for As-Built data listed under the Service Publications Index. Non-Ford technicians use the Motorcraft(R) website at www.motorcraft.com. From the Motorcraft(R) homepage, use the search function to find the Module Programming or As-Built Data.

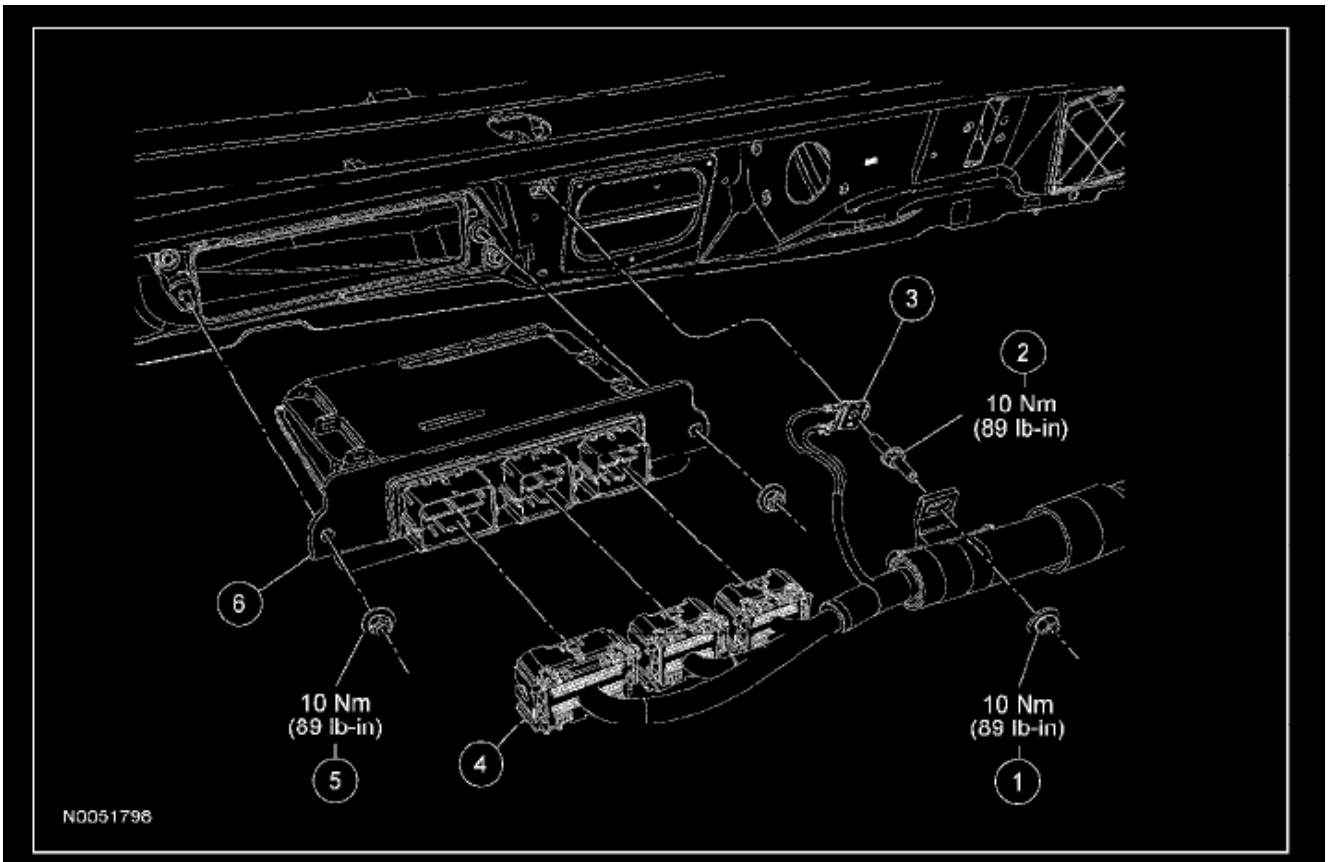
For Ford and Lincoln Mercury technicians, check the Programmable Module Installation link on the PTS website for quick Programmable Module data information by vehicle.

Making Changes to the VID Block

A PCM which is programmed may require changes to be made to certain VID information to accommodate the vehicle hardware. Refer to Module Reprogramming on the scan tool.

Making Changes to the PCM Calibration

At certain times, the entire EEPROM needs to be completely reprogrammed. This is due to changes made to the strategy or calibration after production, or the need to reset the VID block because it has reached its limit. Refer to Module Reprogramming on the scan tool.



Item	Part Number	Description
1	N621906	PCM wiring harness retainer nut
2	N806925	Ground wire stud bolt
3	—	Ground wire terminals (2 required) (part of 12B637)
4	14A464	PCM electrical connectors (3 required) (part of 12B637)
5	N621906	PCM nuts
6	12A651	PCM

Engine Control Module: Removal and Replacement

POWERTRAIN CONTROL MODULE (PCM)

Removal

1. Retrieve the module configuration. Carry out the module configuration retrieval steps of the Programmable Module Installation procedure. 2. Remove the PCM wiring harness retainer nut. 3. Remove the ground wire stud bolt. 4. Disconnect the 3 PCM electrical connectors. 5. Remove the 2 nuts and the PCM.

Installation

1. Install the PCM and the 2 nuts.

- Tighten to 10 Nm (89 lb-in).

2. Connect the 3 PCM electrical connectors. 3. Position the ground wire terminals and install the stud bolt.

- Tighten to 10 Nm (89 lb-in).

4. Install the PCM wiring harness retainer nut.

- Tighten to 10 Nm (89 lb-in).

5. NOTE: If a new PCM is installed, the parameters must be reset in both the PCM and the instrument cluster module or the vehicle will experience

a PATS no-start. This will occur even if the vehicle is not equipped with PATS. PATS vehicles and non-PATS vehicles have parameters in the instrument cluster module and the PCM and they both must be reset whenever a new PCM is installed.

Restore the module configurations for the instrument cluster module and the PCM. Carry out the module configuration restore steps of the Programmable Module Installation procedure.

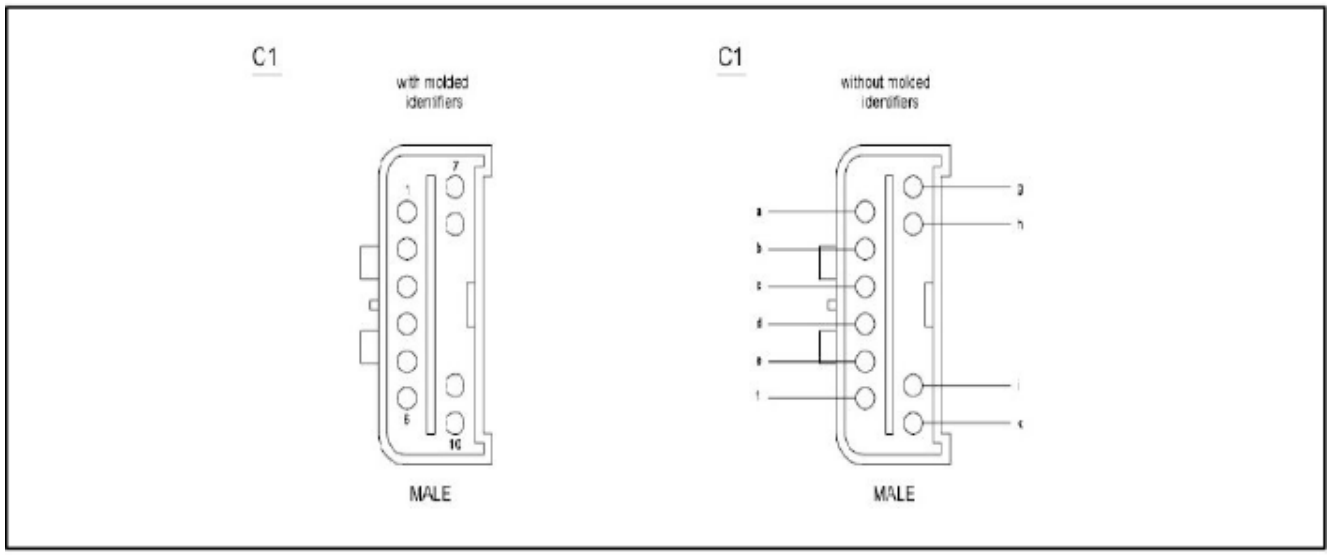
Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



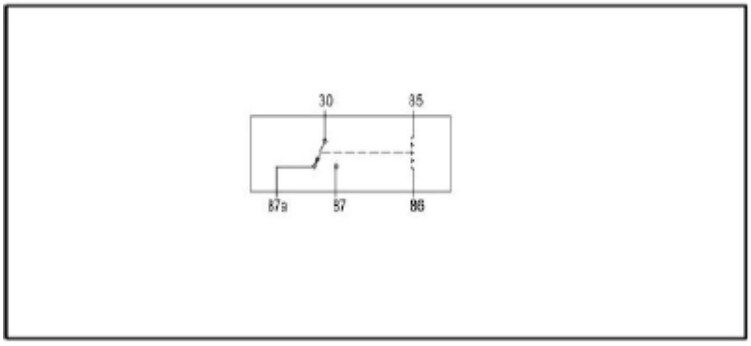
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

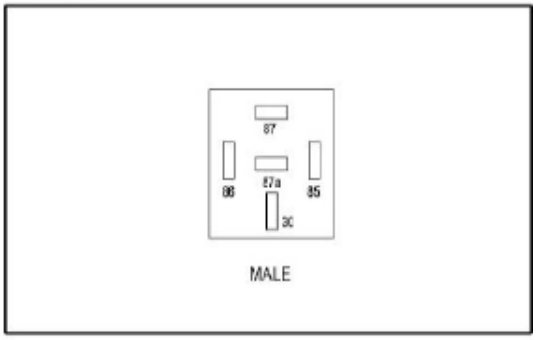
Main Relay (Computer/Fuel System): Testing and Inspection

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Fuel Pump Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

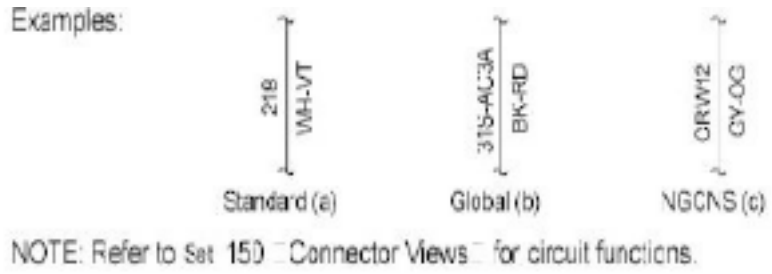
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

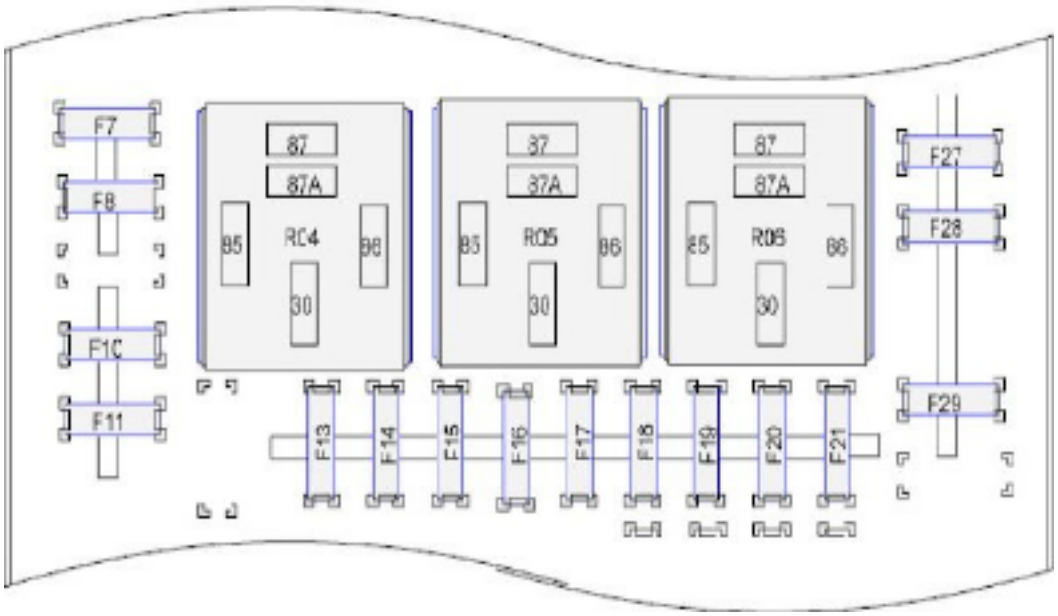
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

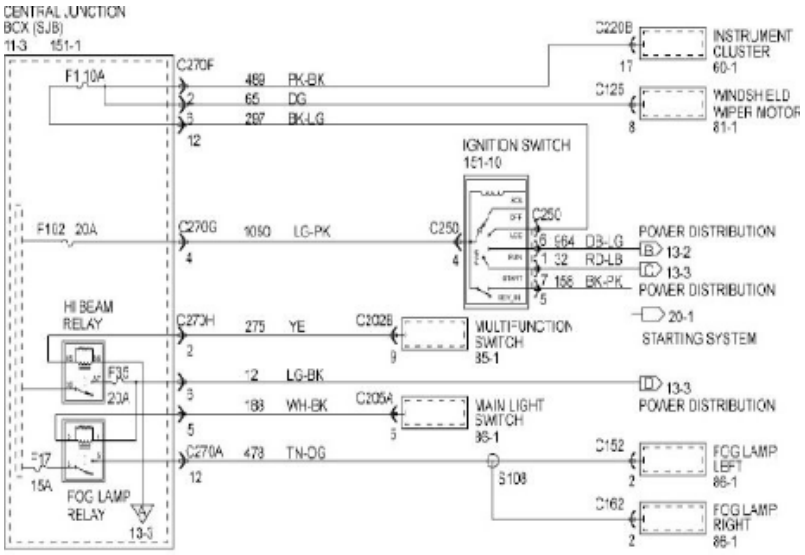
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

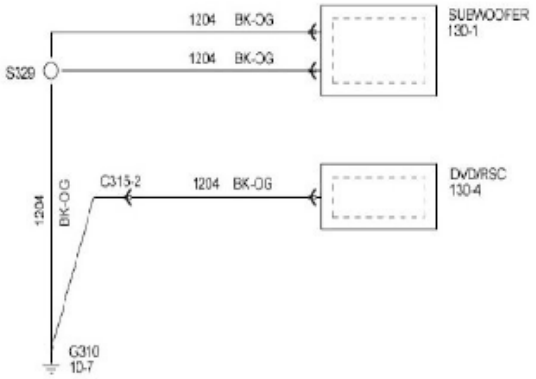
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by

each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

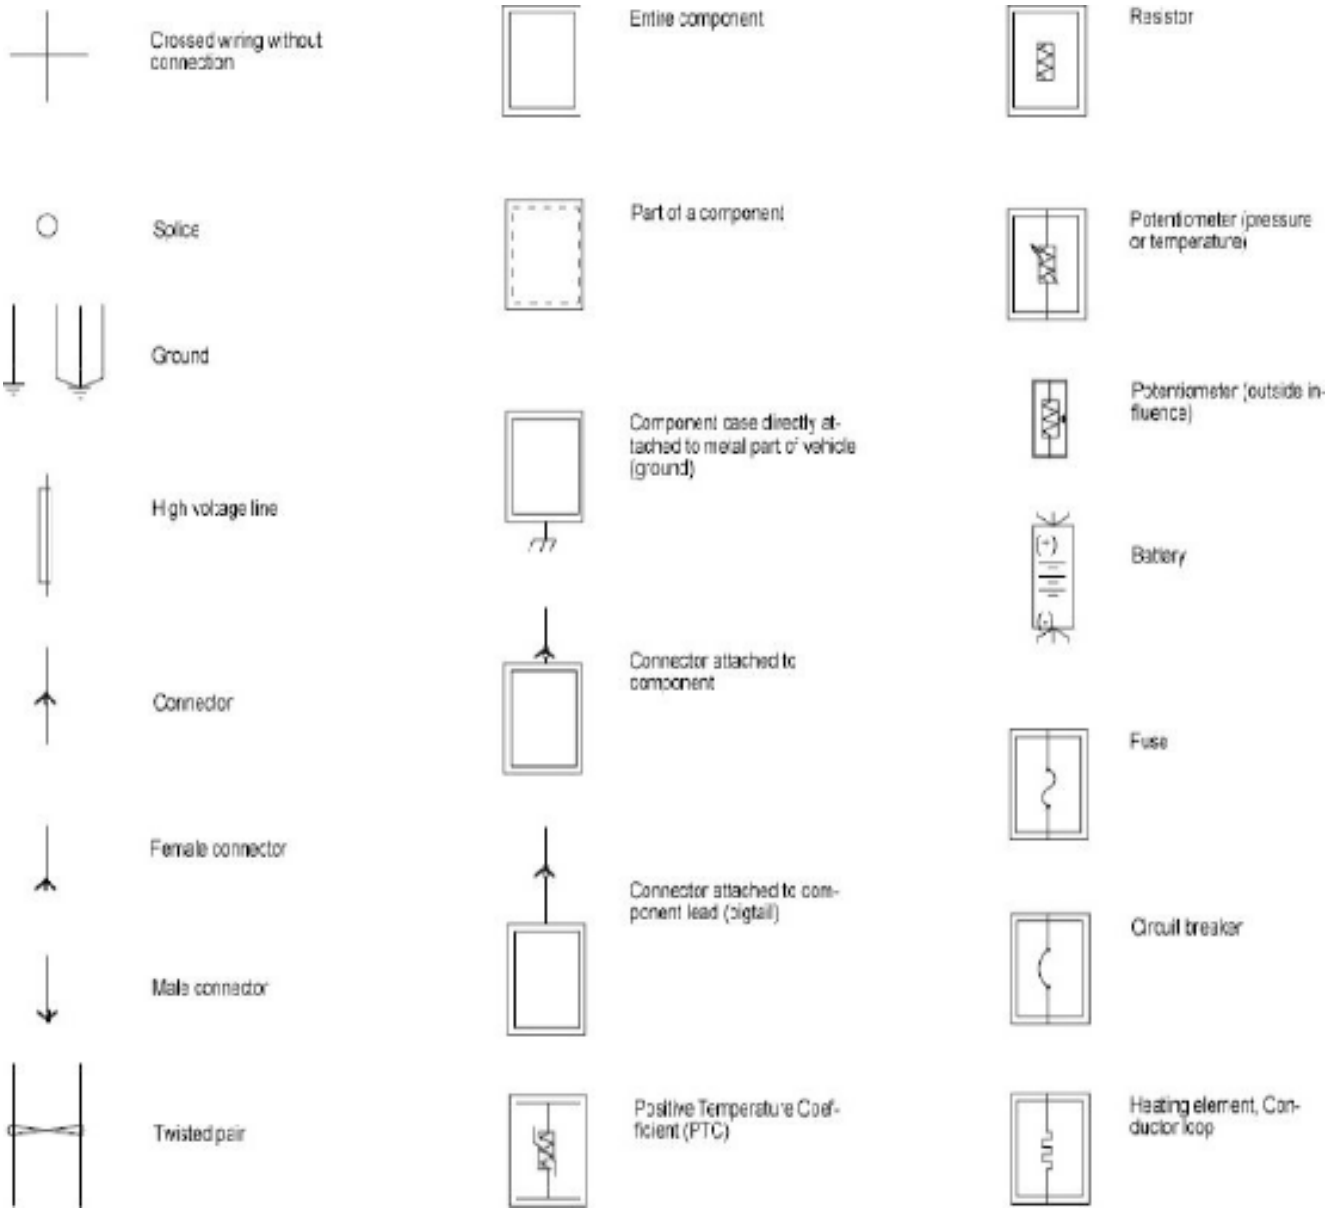
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

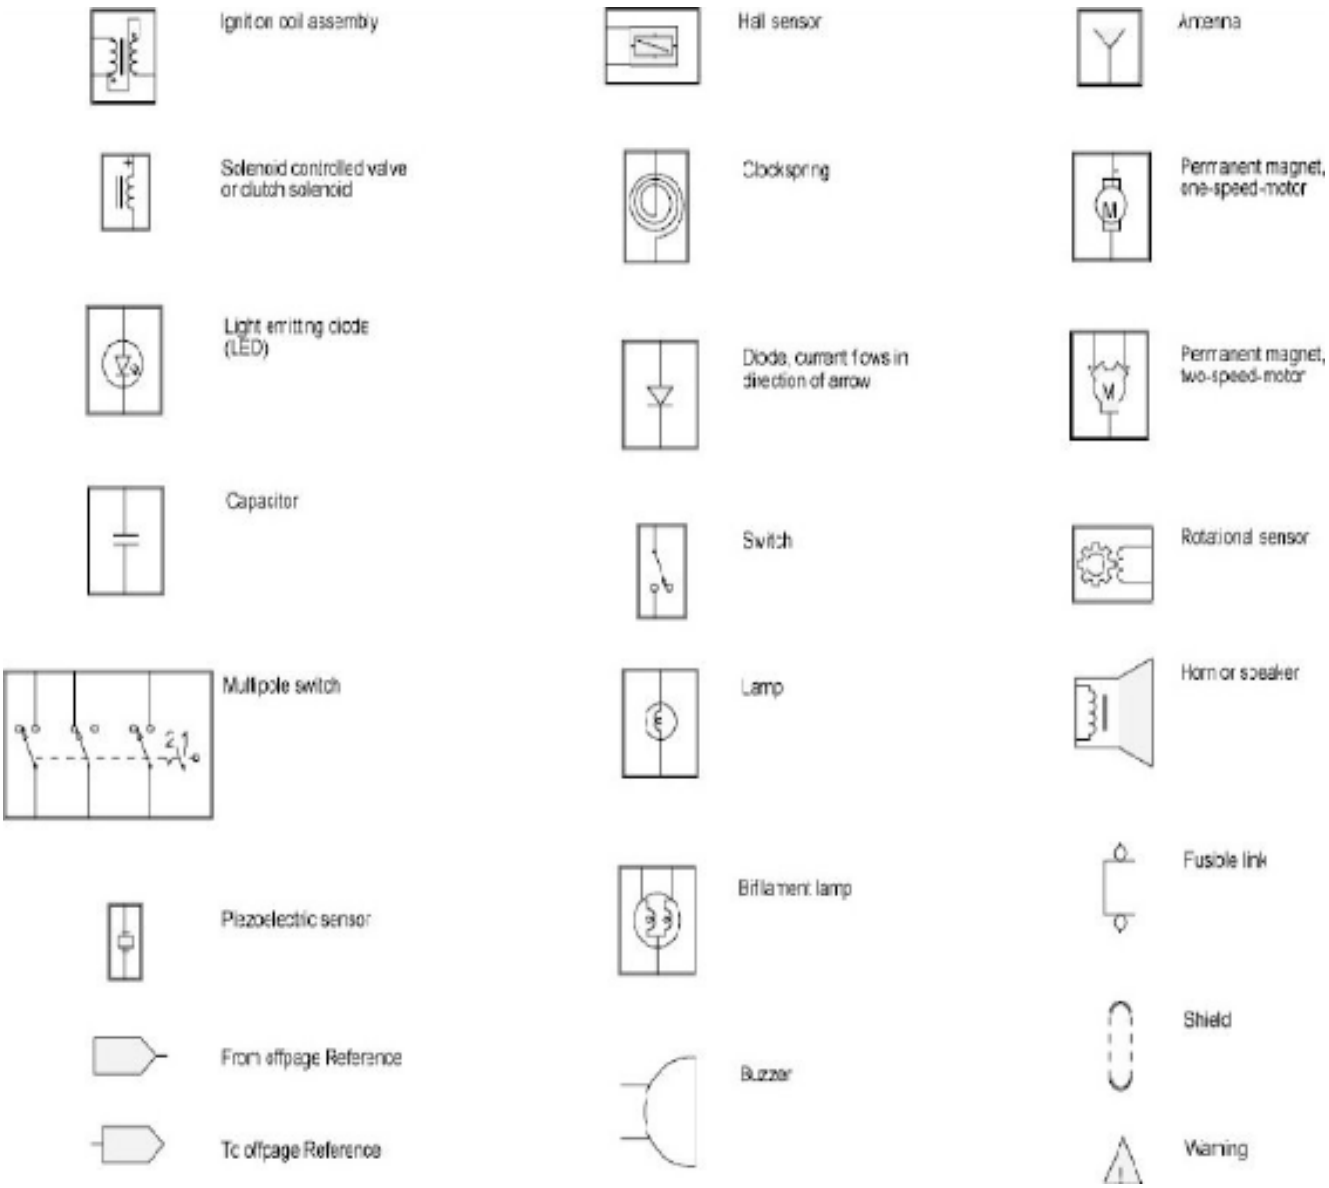
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

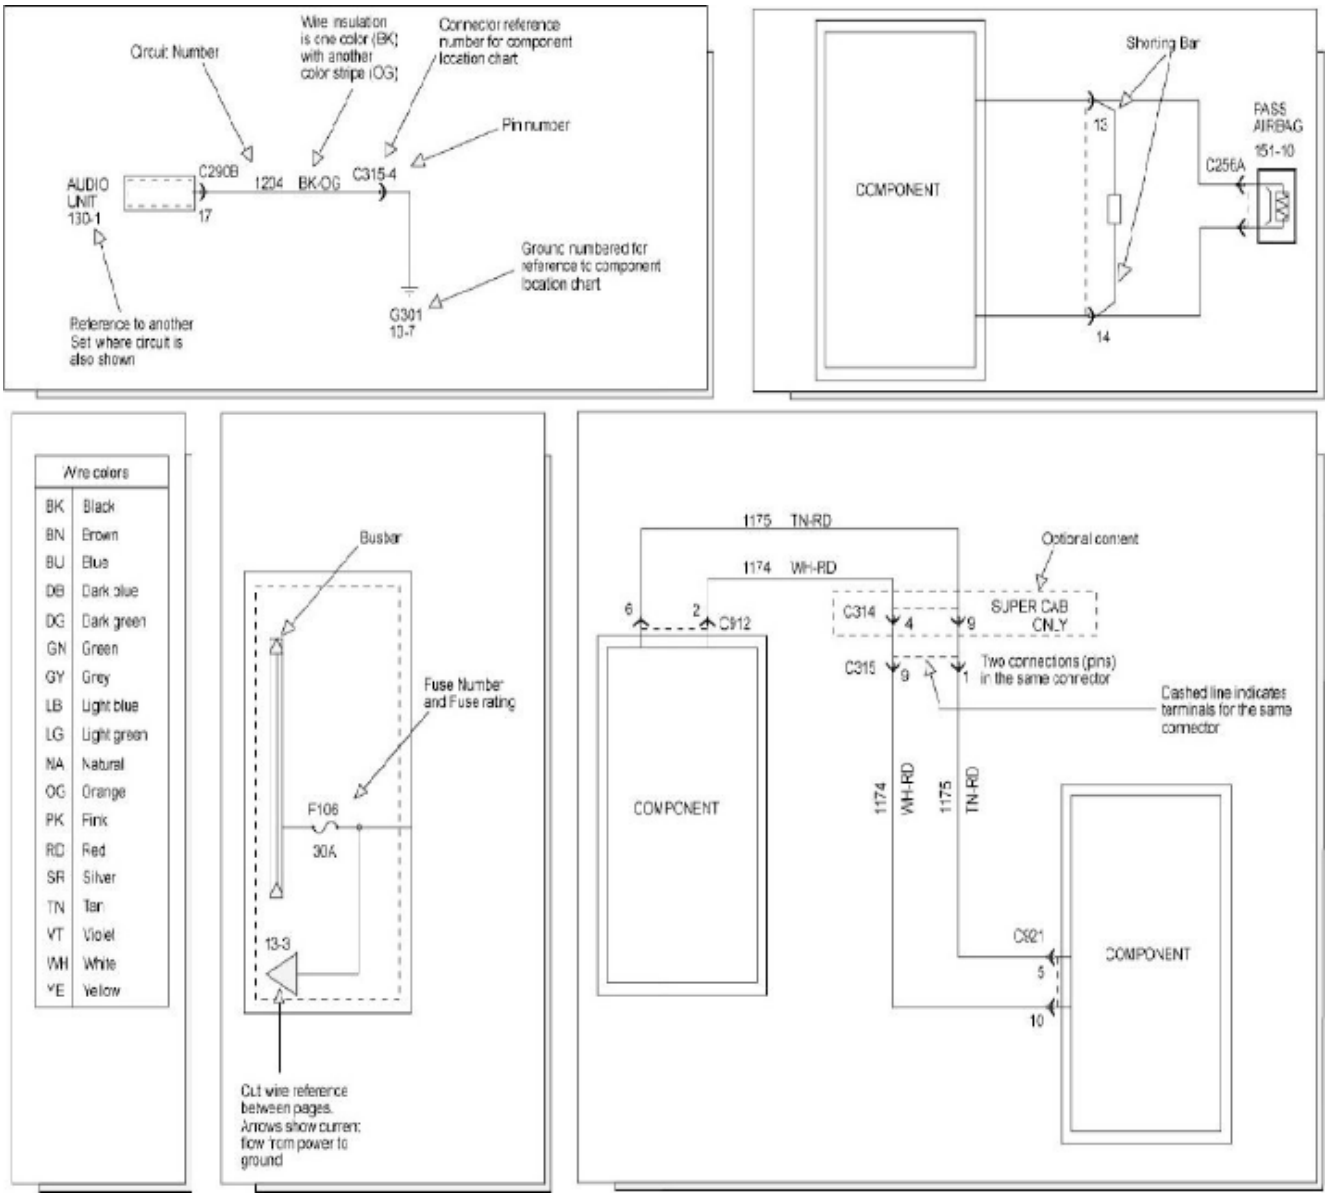
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

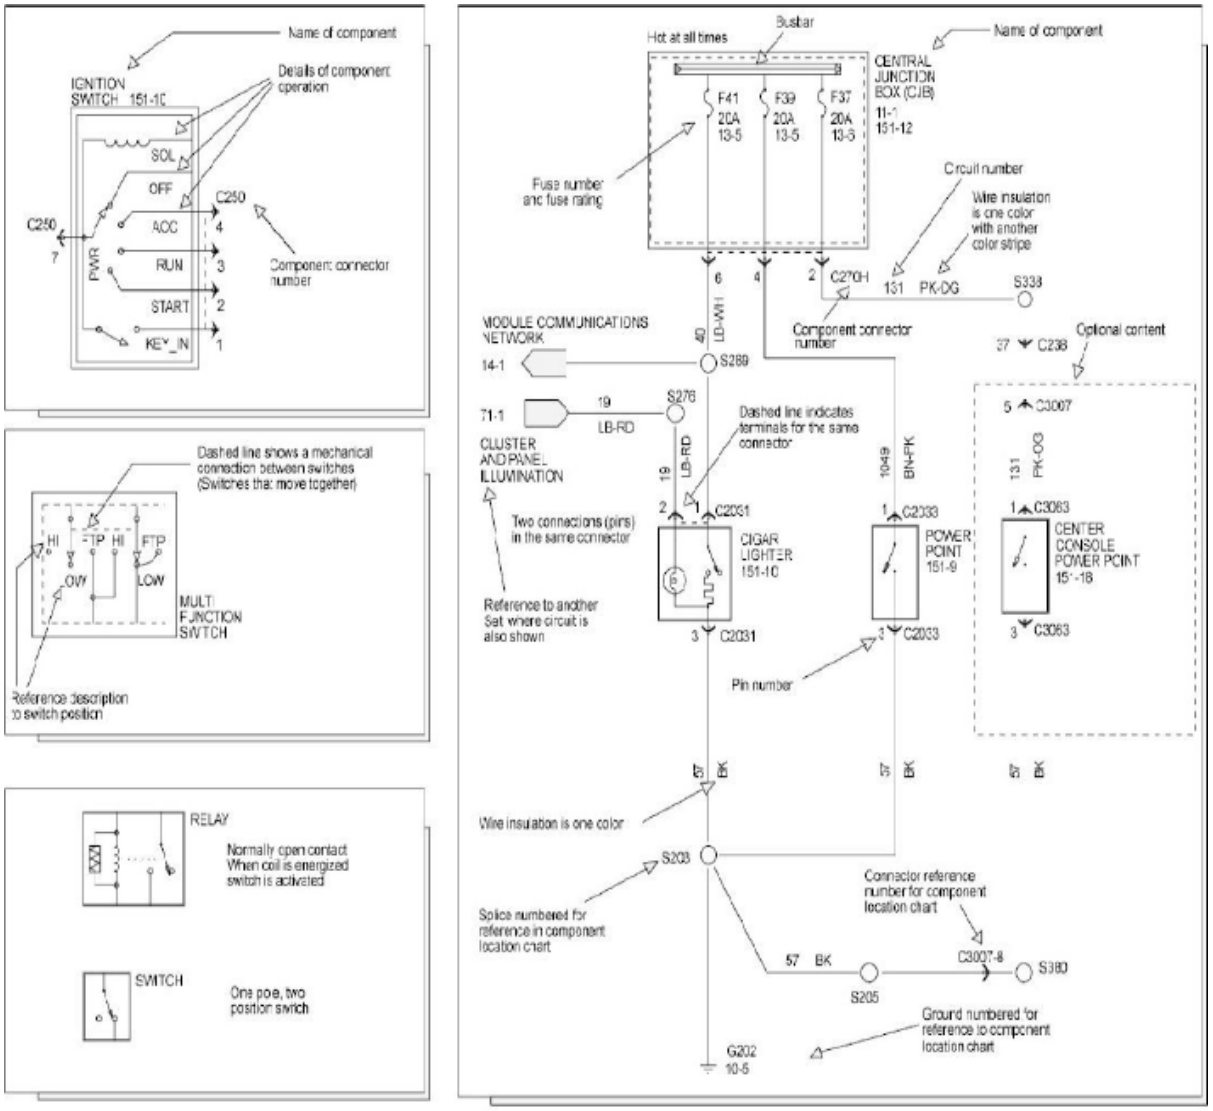
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left

Fuel Pump Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

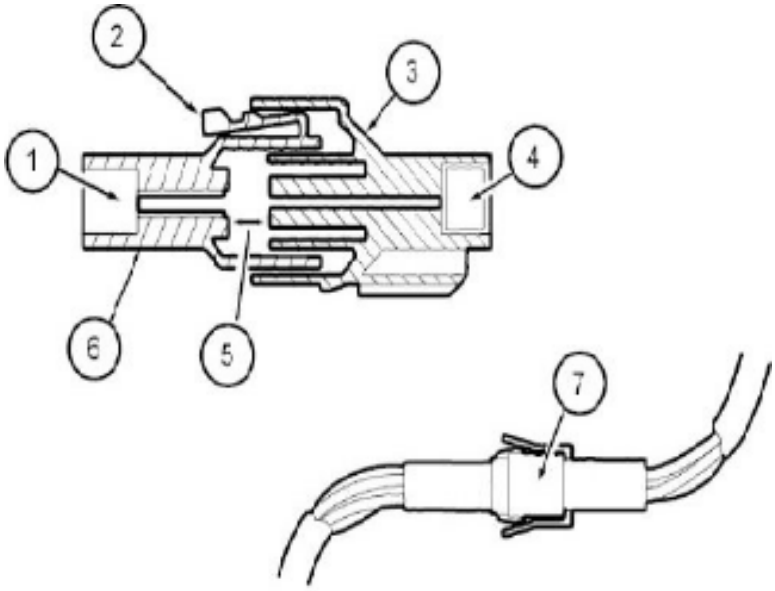
5 = Intermittent contact

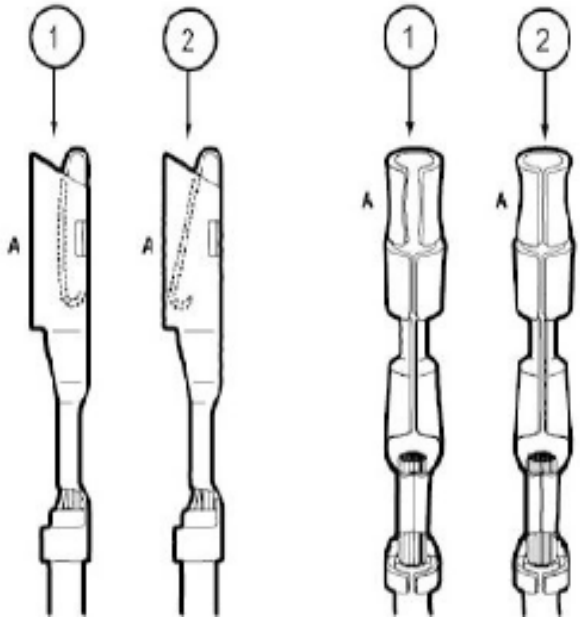
6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Defective insulation stripping





1 = Proper crimp

2 = Insulation not removed

3 = Wire strands missing

4 = Intermittent signals through pierced insulation

Partially mated connectors

1 = Seal

2 = Displaced tab

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Male half

7 = Intermittent contact

Lock may be displaced into an unlocked position; pull on the connector to verify the lock.

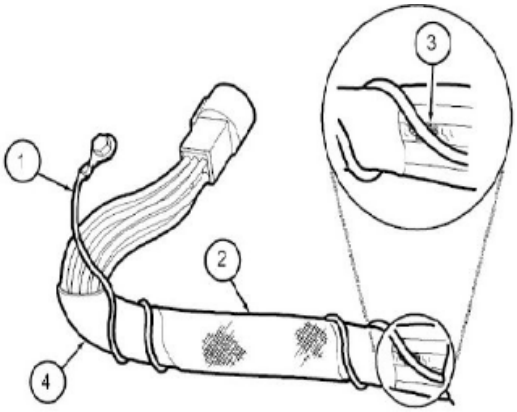
Deformed (enlarged) female terminals

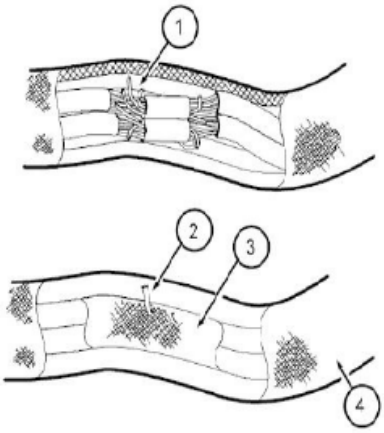
1 = Enlarged

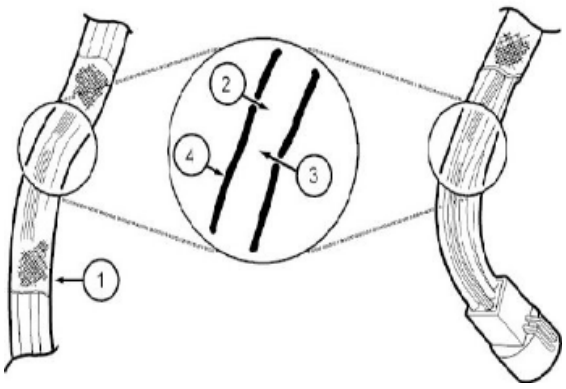
2 = Normal

Any probe entering the terminal may enlarge the contact spring opening creating an intermittent signal.

Insert the correct mating terminal (Location A) from the service kit and feel for a loose fit.







Electrical short inside the harness

1 = Solder coated wire to ground

2 = Harness protective tape

3 = Intermittent short

Solder coated wire pierced through the insulation of another circuit

4 = Grounding foil

Electrical short within the harness

Splice tape removed 1

= Intermittent short

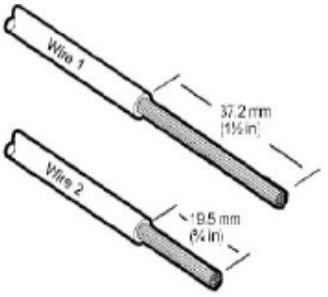
Splice covered 2

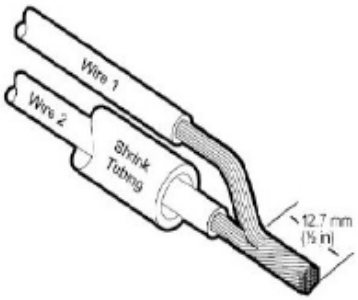
= Wire strand

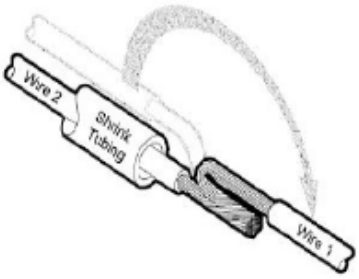
3 = Splice tape

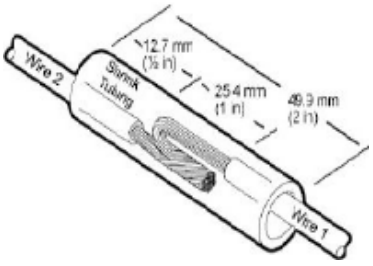
4 = Harness tape

Broken wire strands in harness









1 = Wiring harness tape

2 = Wiring strand

3 = Broken strands intermittent signal

4 = Circuit insulation

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. lnstall heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

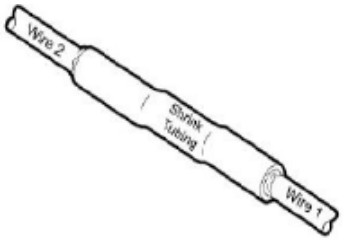
NOTE: -

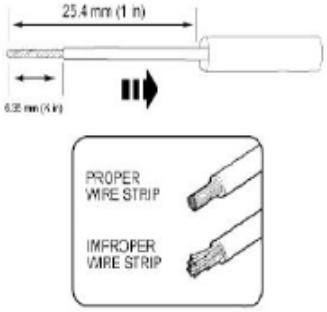
Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

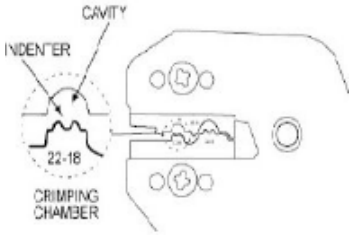
- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

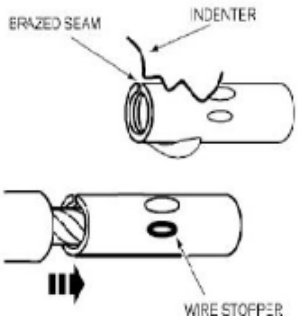
6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.









7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

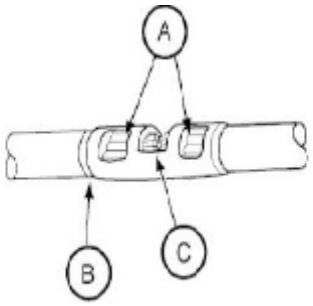
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

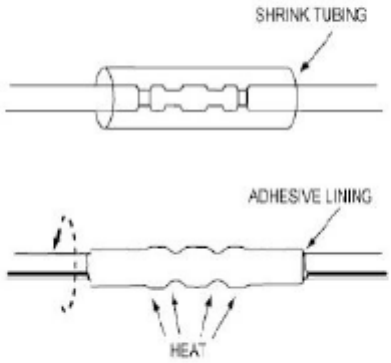
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x cia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

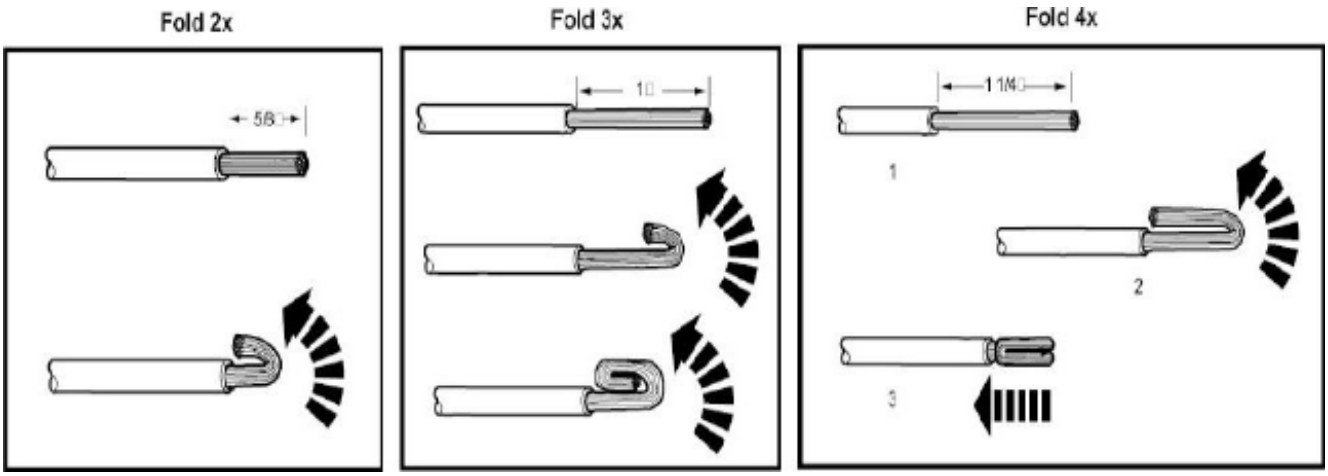
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



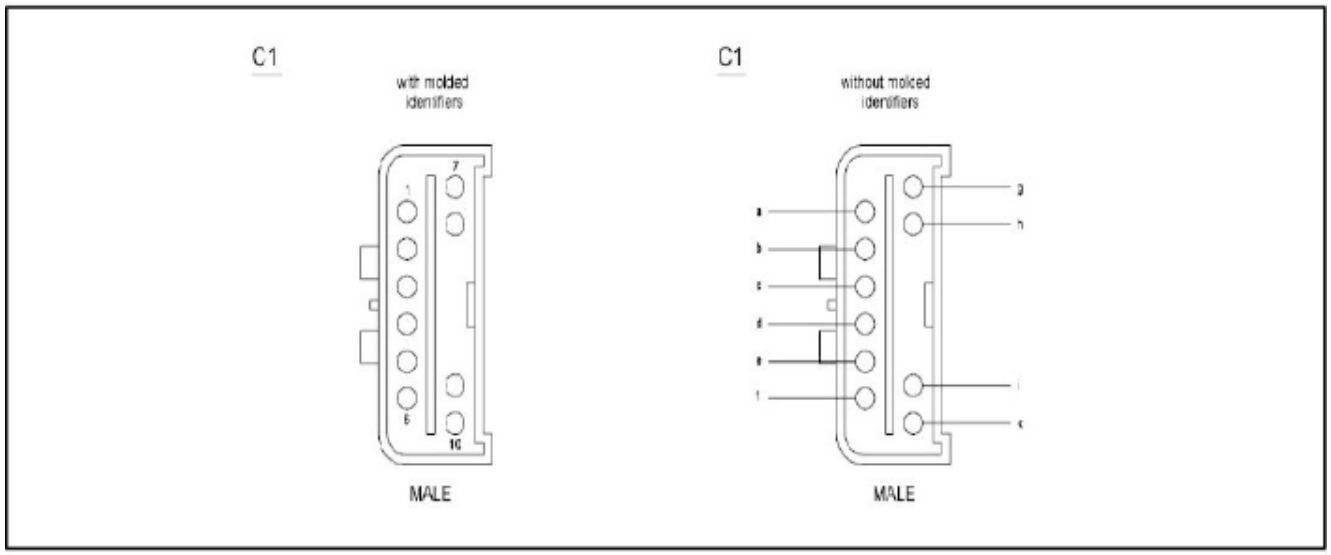
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



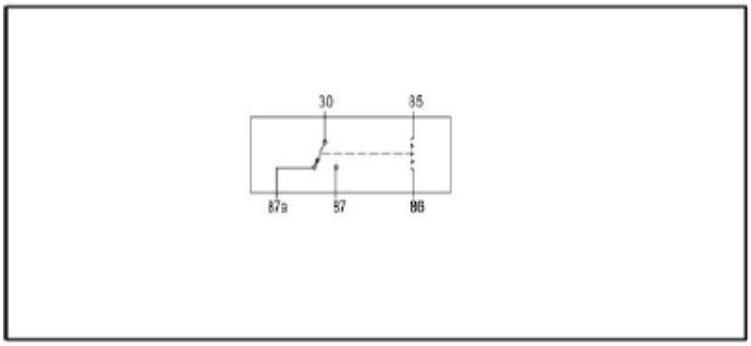
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

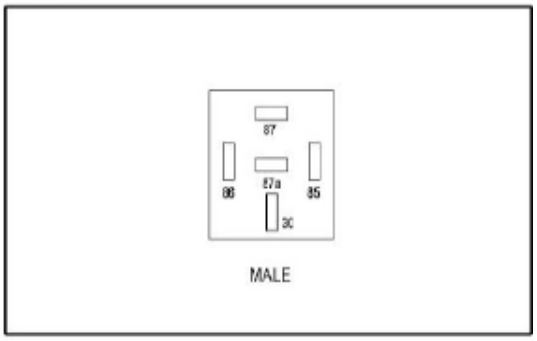
Fuel Pump Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	45 □ 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

7	14B321	RCM

(Continued)

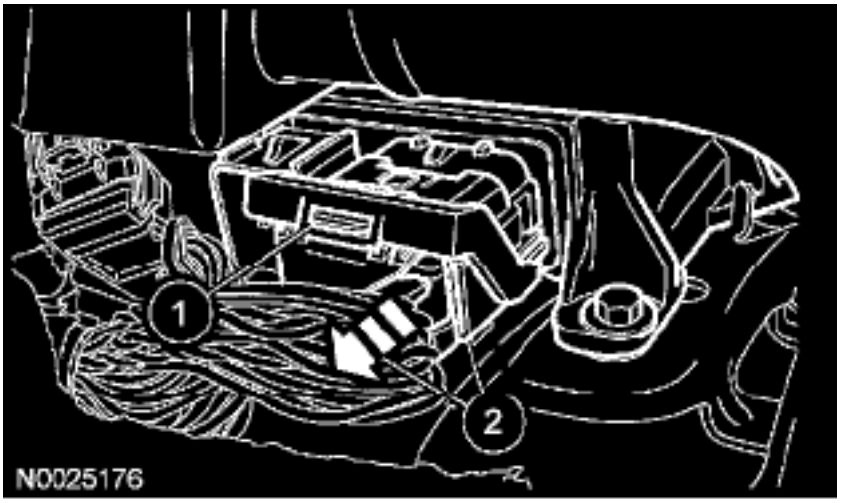
Removal

WARNING: If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the air bags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.

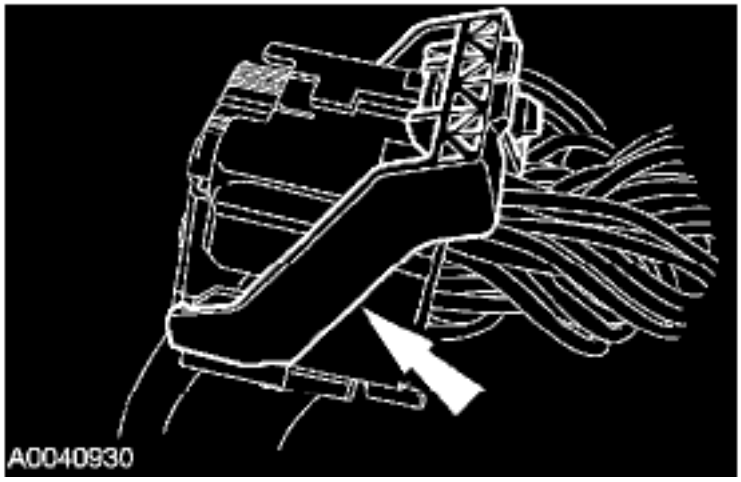
CAUTION: -

When installing a new restraints control module (RCM), it is necessary to carry out programmable module installation (PMI). System failure may occur if PMI is not carried out.

- Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.



1
2
N0025176



A0040930

NOTE: -

The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

- Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

All vehicles 1. Carry out the steps necessary to prepare for programmable module installation (PMI). 2. Depower the SRS.

Vehicles with high-series floor console 3. Remove the floor console.

Vehicles with a consolette 4. Remove the consolette tray mat. 5. Remove the 4 screws and remove the consolette tray.

All vehicles 6. Disconnect the small RCM electrical connector. 7. Disconnect the large RCM electrical connector.

1 Pinch the thumb tab and pivot the connector position assurance lever all the way back until it stops.

2 Pull out and disconnect the RCM electrical connector.

8. Remove the 3 bolts and the RCM.

Installation

All vehicles

1. WARNING: Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque.

Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.

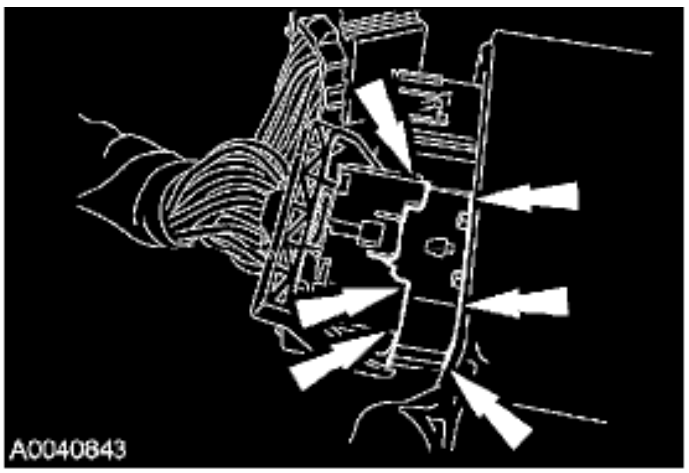
Install the RCM and the 3 bolts. -

To install, tighten to 12 Nm (9 lb-ft).

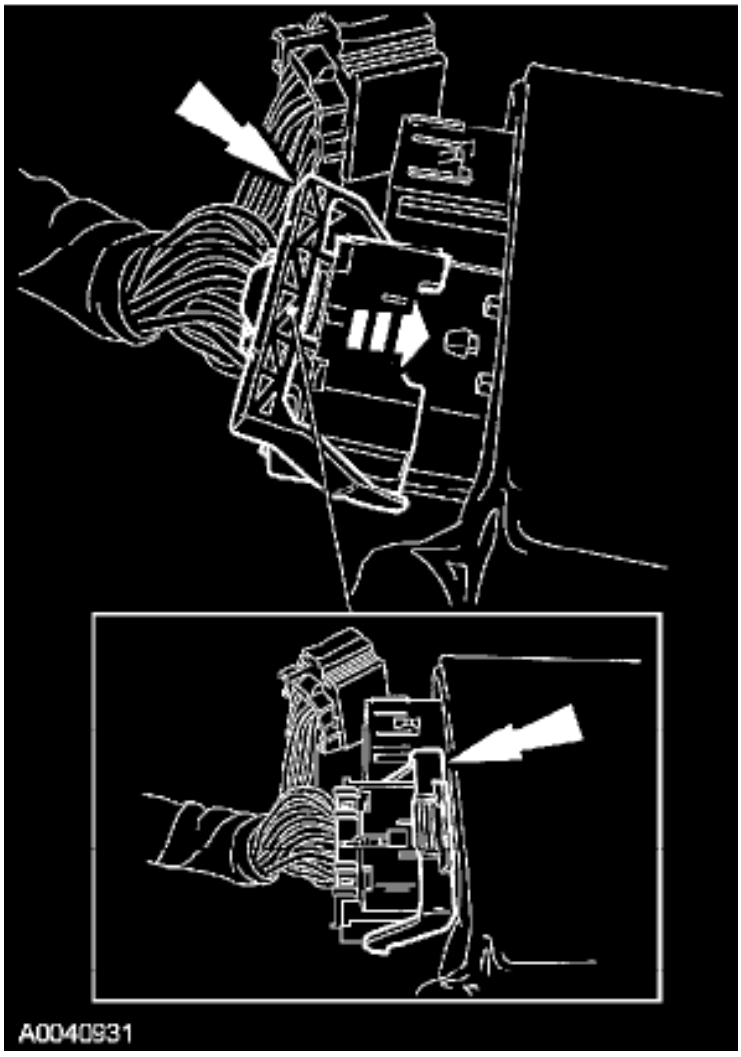
2. Make sure the large RCM connector position assurance lever is in the full release position before attempting to connect the connector.

3. CAUTION: Putting the large restraints control module (RCM) electrical wiring connector into the RCM on an angle can cause bad

electrical connections and damage components.



A0040843



A0040931

NOTE: The RCM has been removed for clarity.

Position the large RCM electrical connector into the RCM.

-

CAUTION: Do not push the connector to the point where the lever pivots and seats itself. Light pressure is needed to get the connector into position on the restraints control module (RCM), before using the lever to fully seat the connector. Damage to the connector or component may occur.

With the large RCM electrical connector uniformly aligned to the RCM, lightly push in until a subtle audible click is heard and slight resistance is felt.

4. Connect the large RCM electrical connector.

- Using the connector position assurance lever, pivot it toward the RCM, drawing the connector into the RCM. -

Make sure the thumb tab is engaged to the retainer on the RCM and locked in place.

5. Connect the small RCM electrical connector.

Vehicles with a consolette 6. Install the consolette tray and the 4 screws. 7. Install the consolette tray mat.

Vehicles with high-series floor console 8. Install the floor console.

All vehicles 9. Repower the SRS. Do not prove out the SRS at this time.

10. When installing a new RCM, carry out the steps necessary to complete PMI.

11. Prove out the supplemental restraint system (SRS) as follows:

Turn the ignition switch from ON to OFF. Wait 10 seconds, then turn the ignition switch back to ON and visually monitor the air bag indicator with the air bag modules installed. The air bag indicator will light continuously for approximately 6 seconds and then turn OFF. If an air bag SRS fault is present, the air bag indicator will: -

fail to light.

- remain lit continuously.

- flash at a 5 Hz rate (RCM not configured).

The air bag indicator might not light until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag indicator and any SRS fault discovered must be diagnosed and repaired.

Clear all continuous DTCs from the RCM and occupant classification system module (OCSM) using a scan tool.

Starter Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

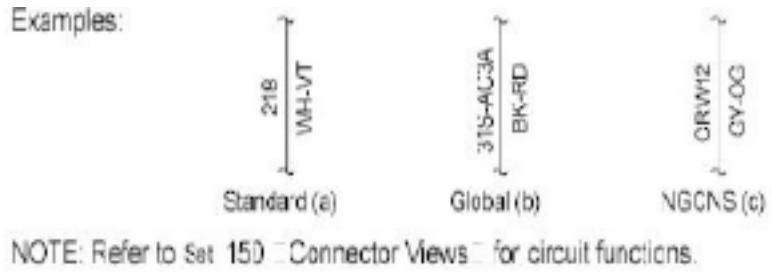
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

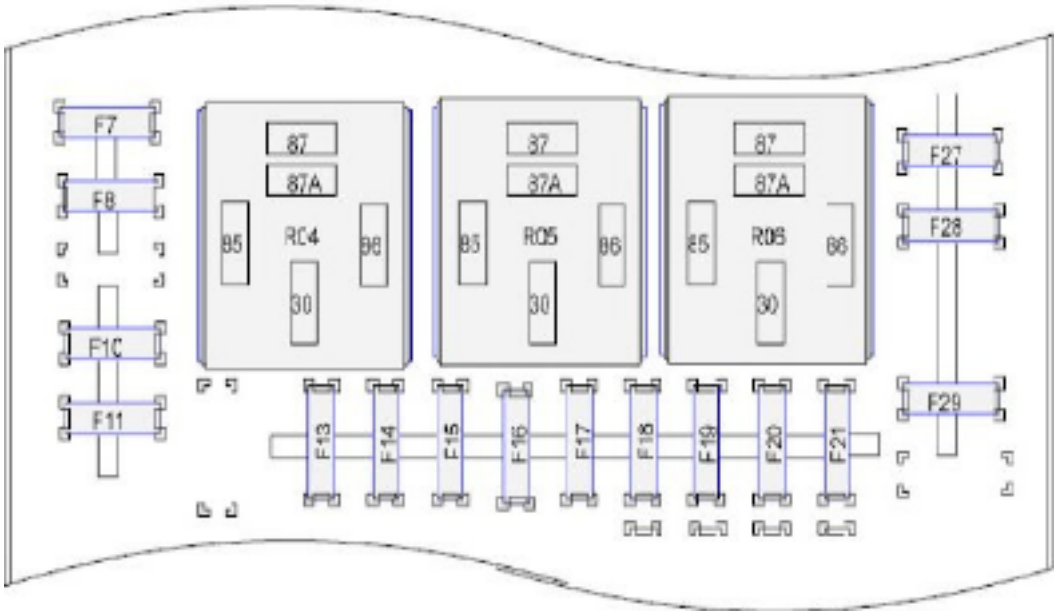
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

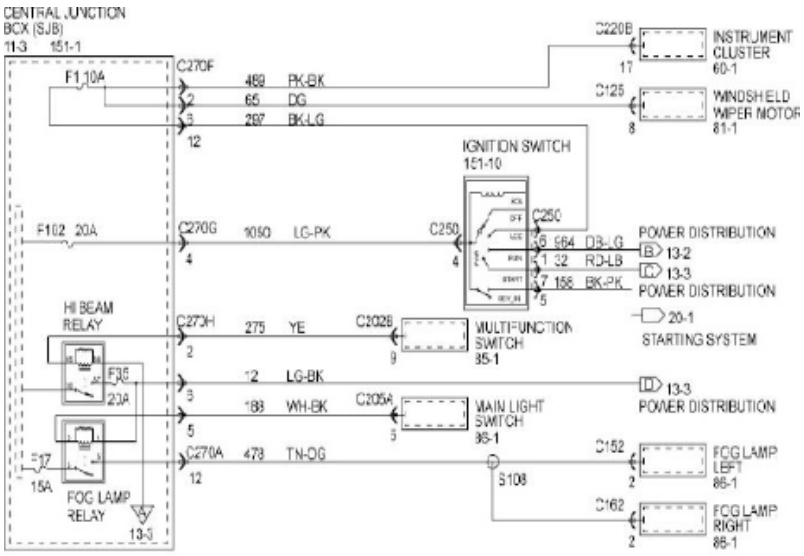
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

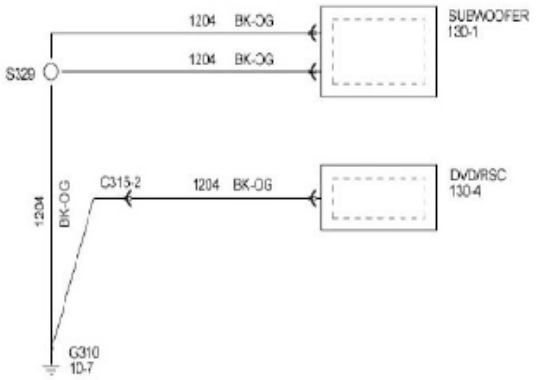
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

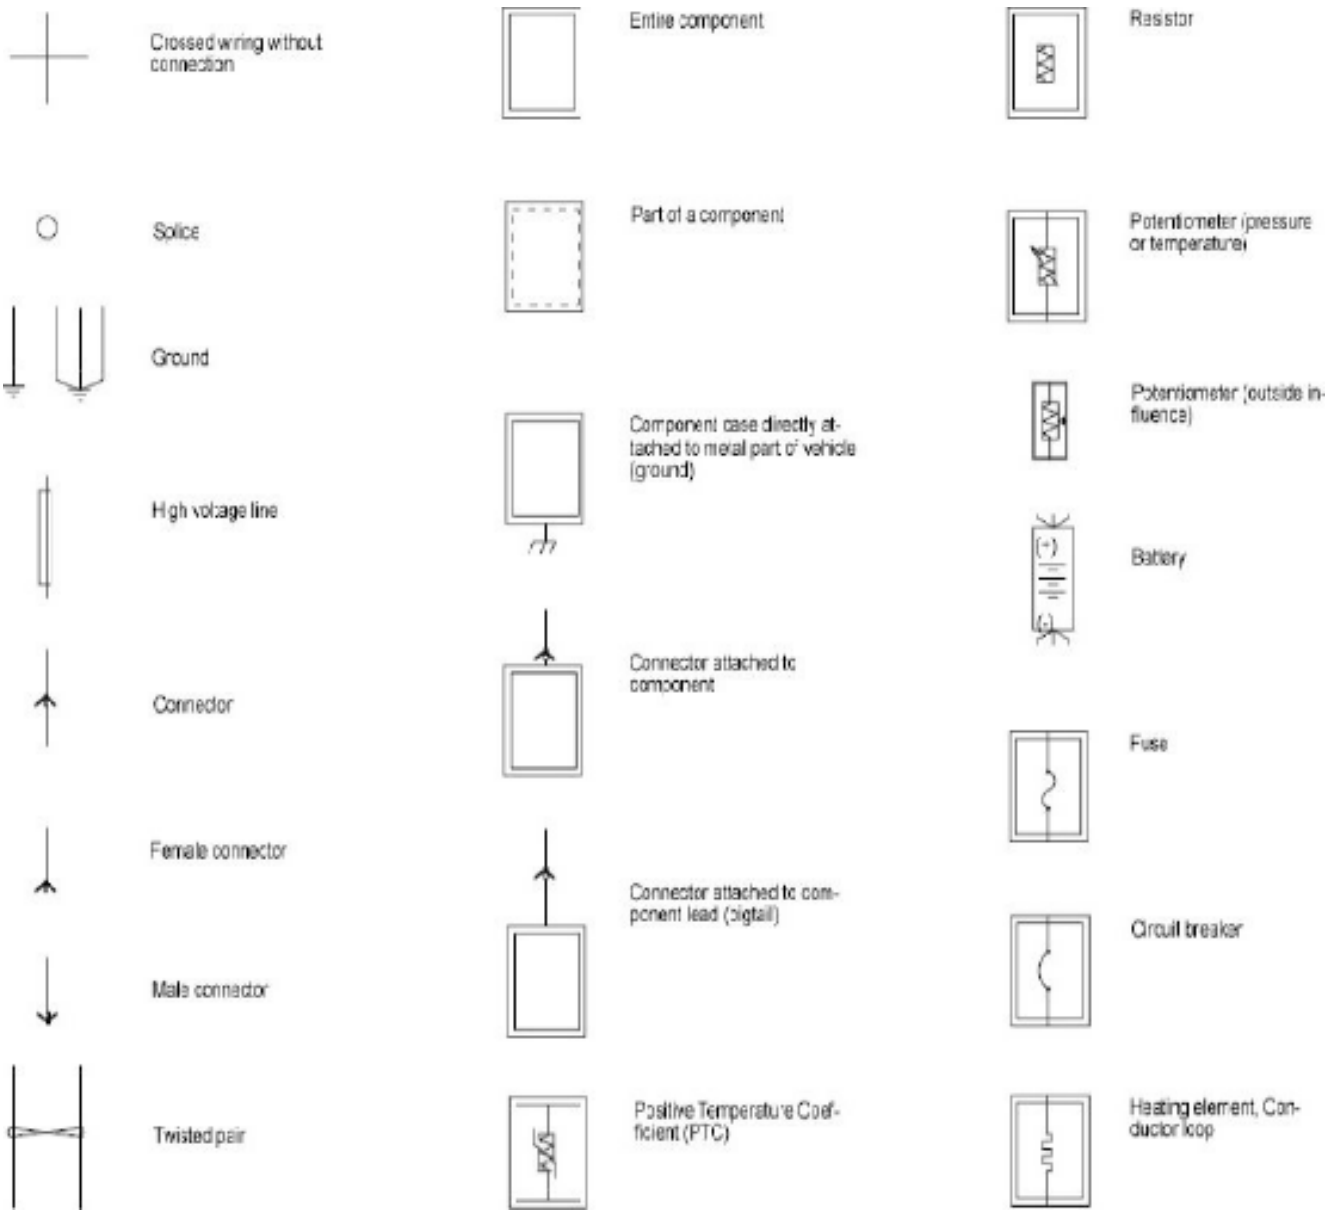
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Starter Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

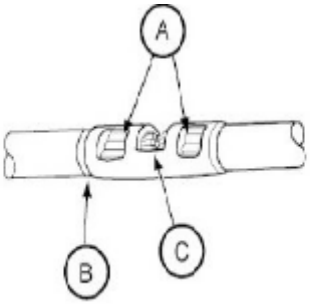
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

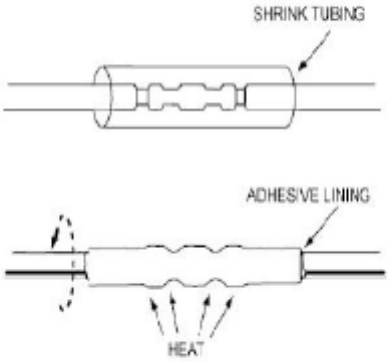
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24

* Figtail only

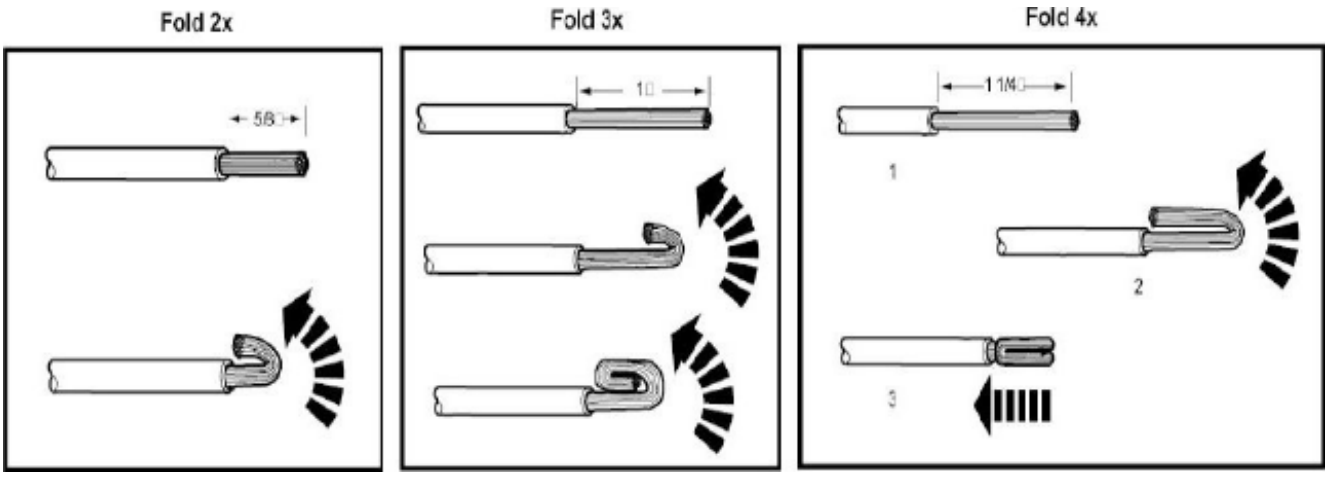
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Starter Relay: Description and Operation

The starter relay:

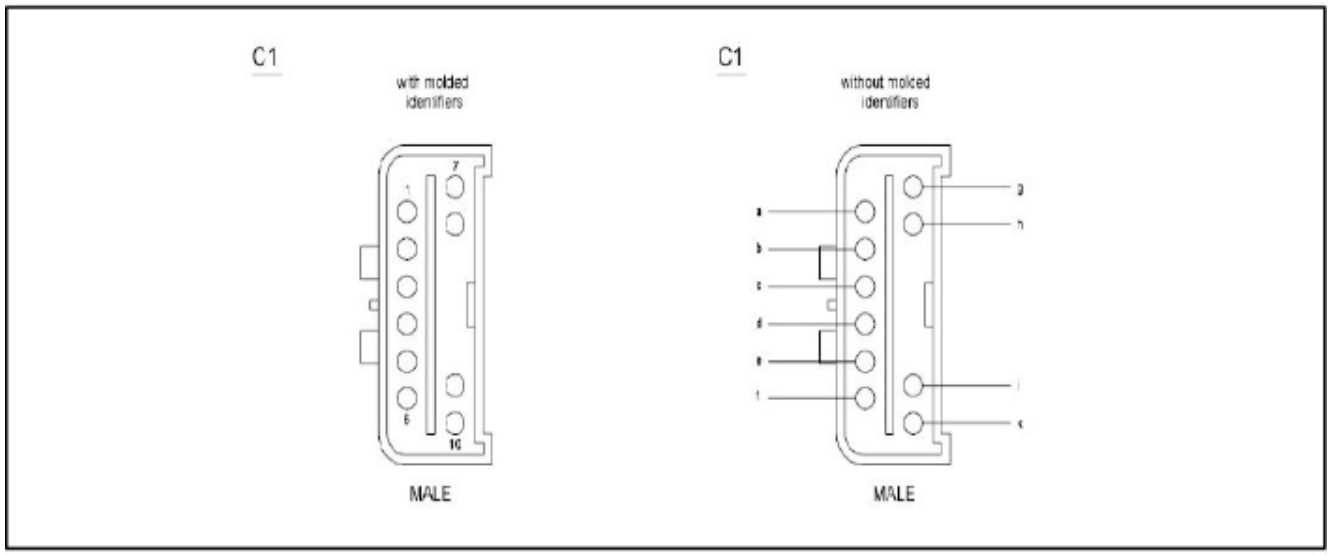
^ Is a mini ISO relay. A. switches power to the starter solenoid to engage the starter motor when it is provided a ground throigh the PCM.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



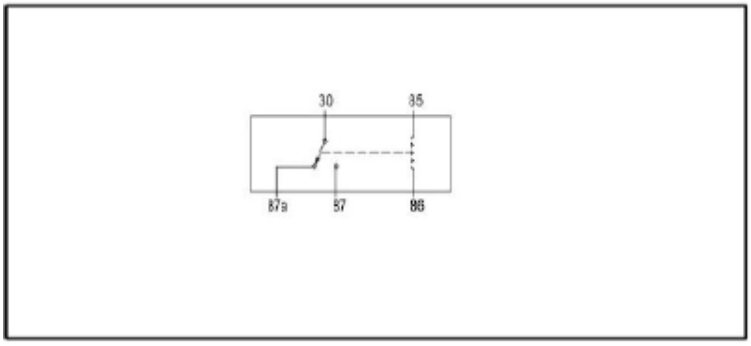
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

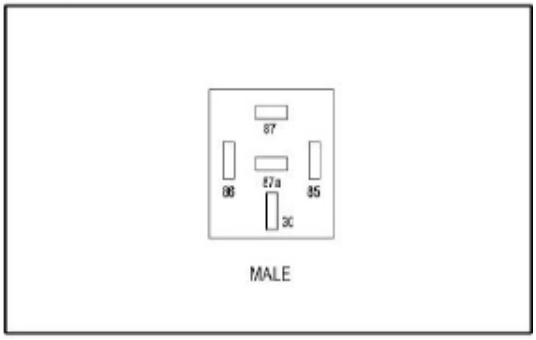
Starter Relay: Testing and Inspection

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Power Window Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

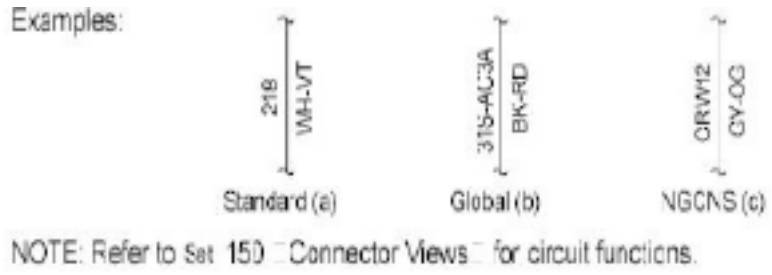
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

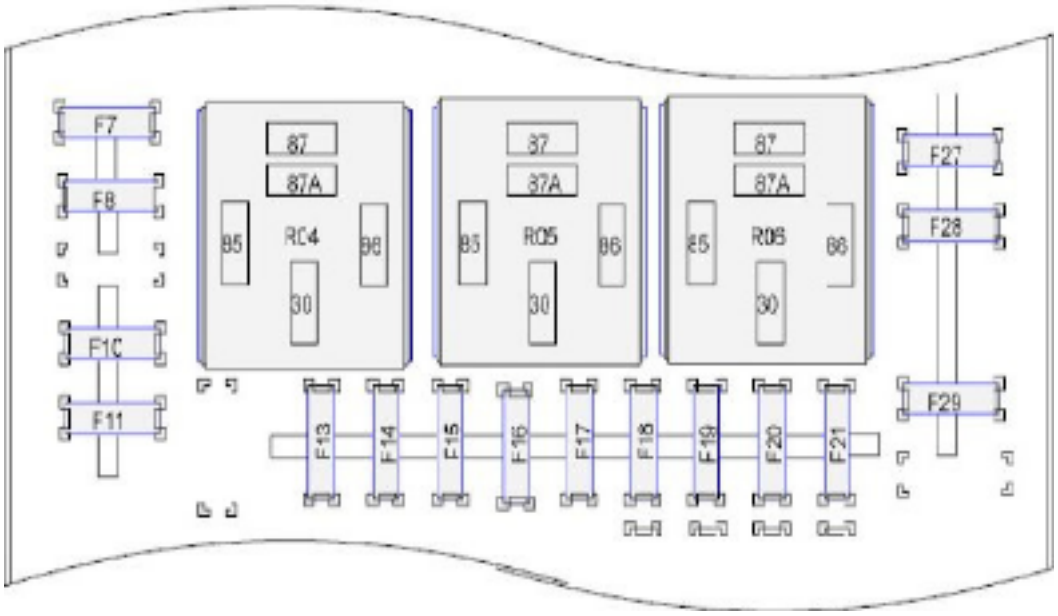
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

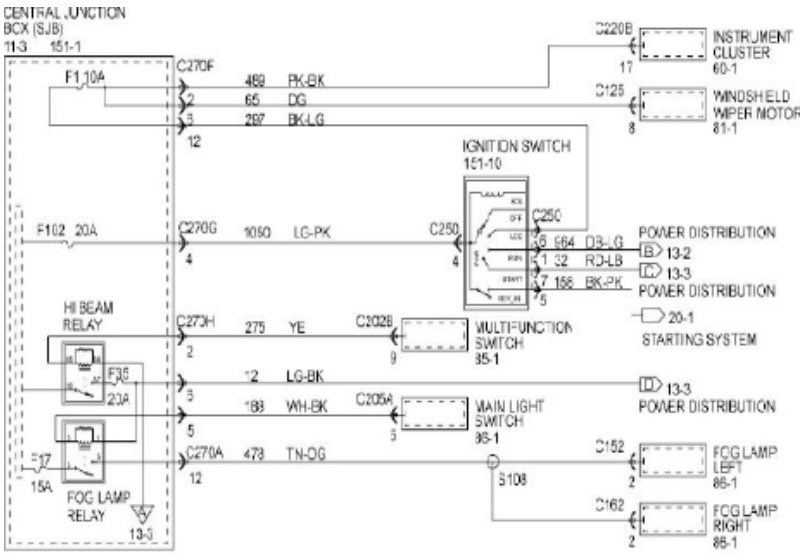
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

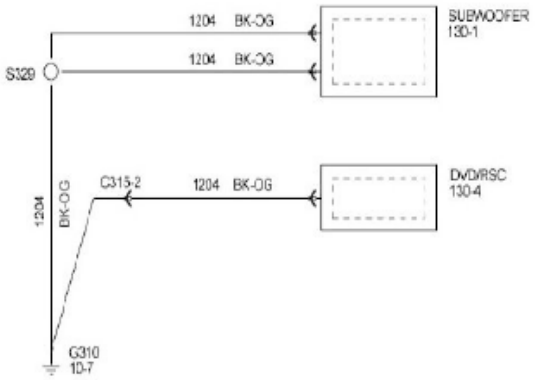
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

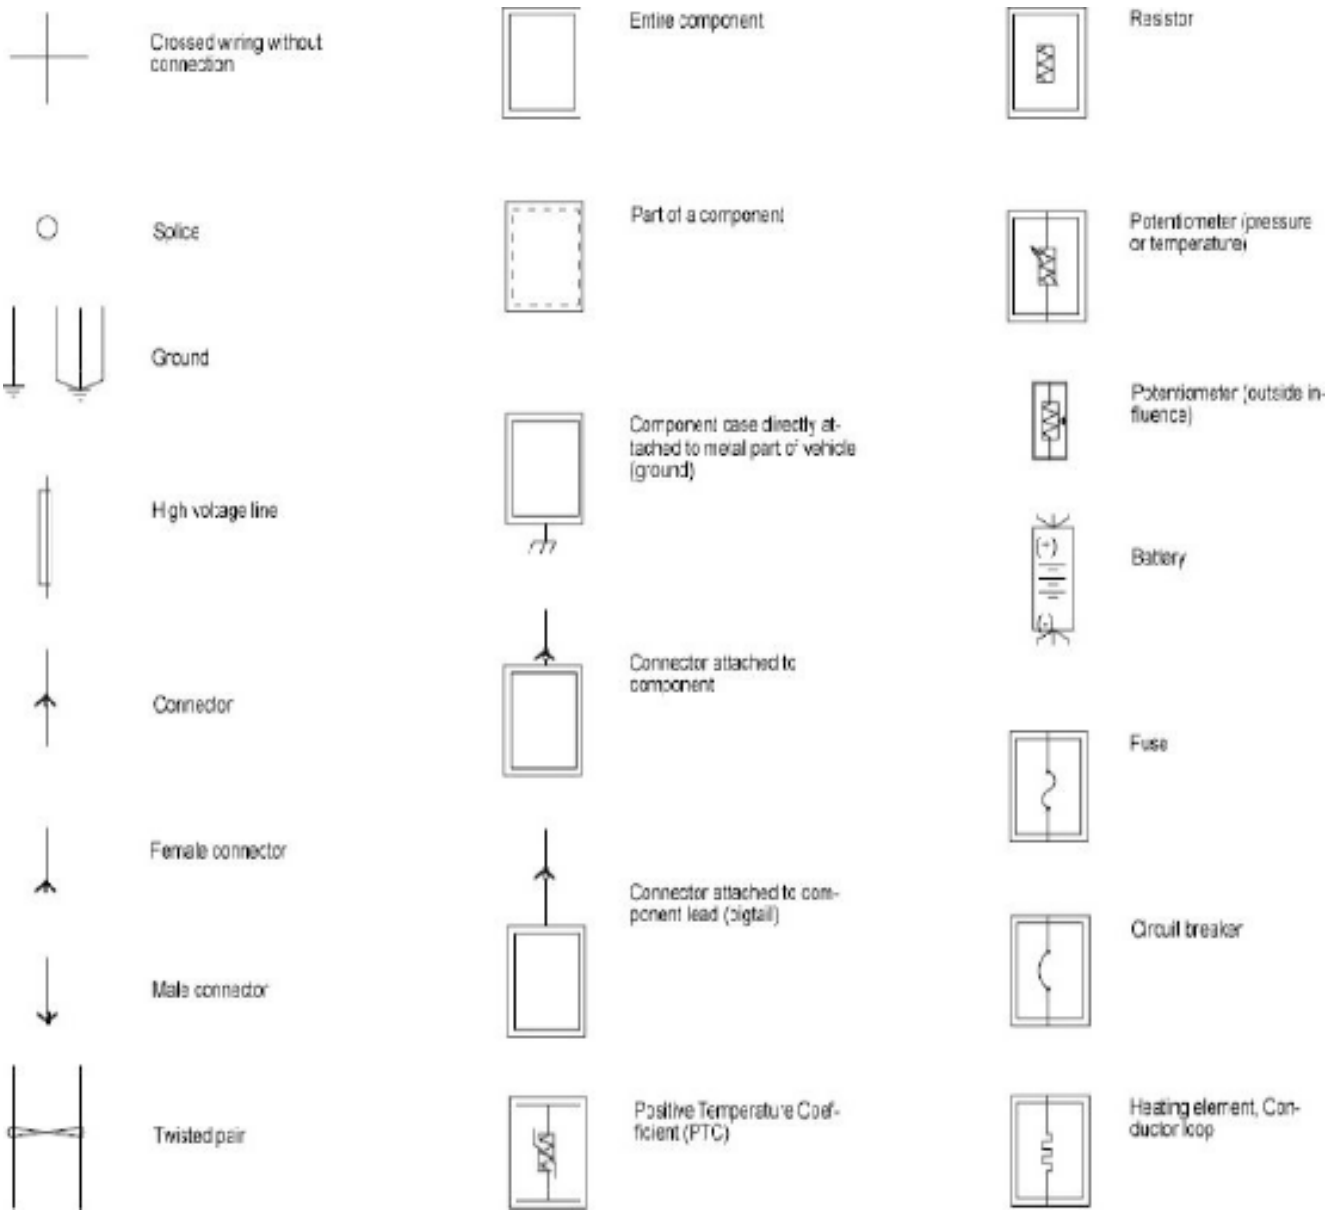
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Windshield Washer Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

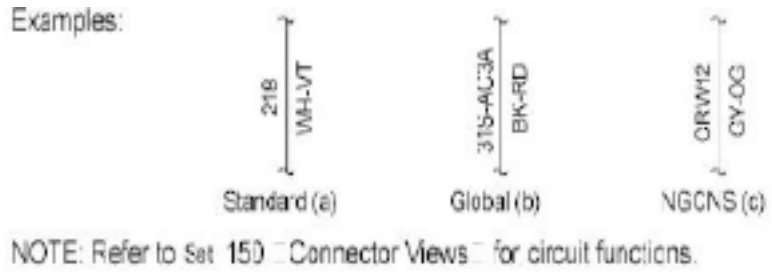
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

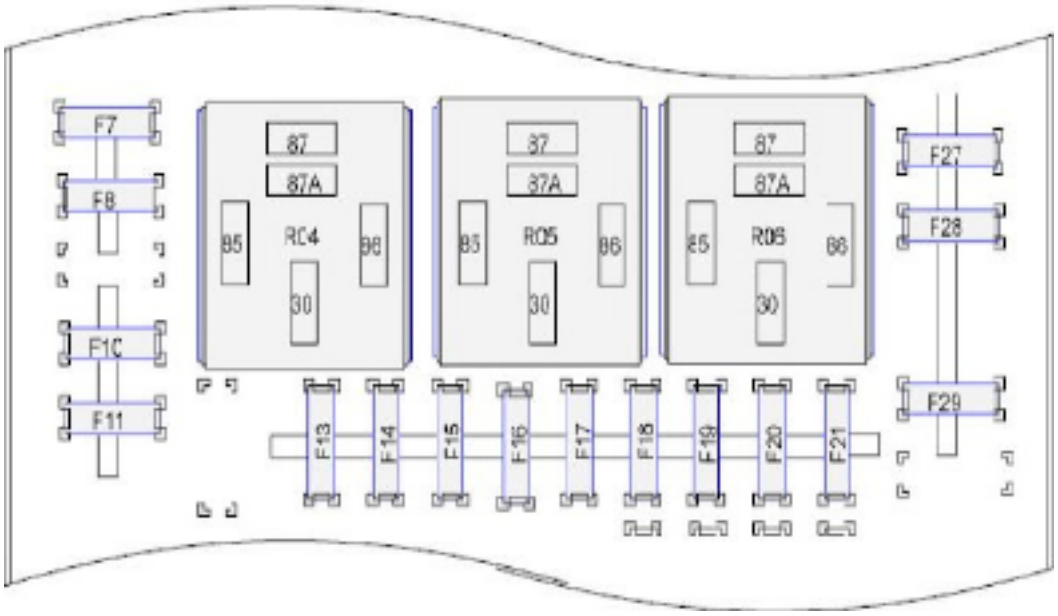
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

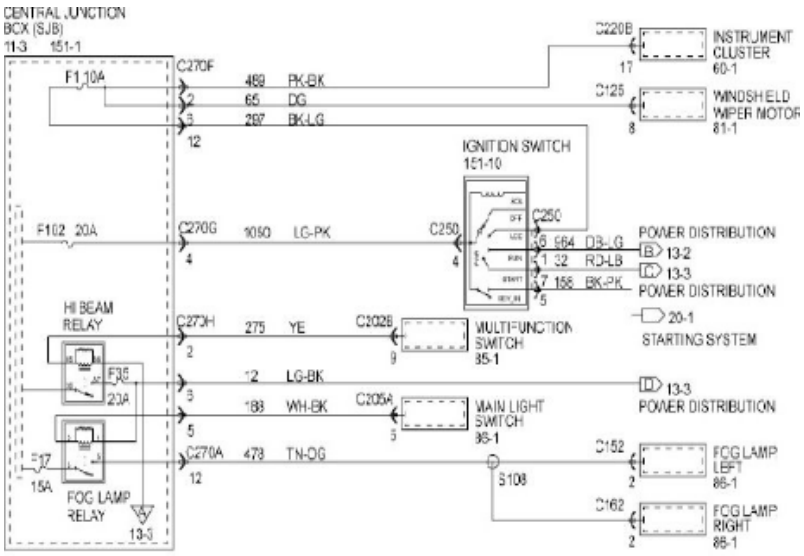
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

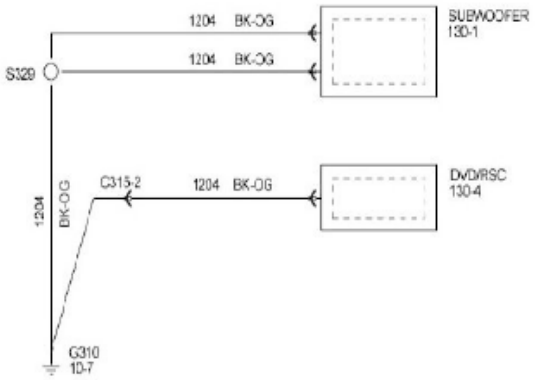
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

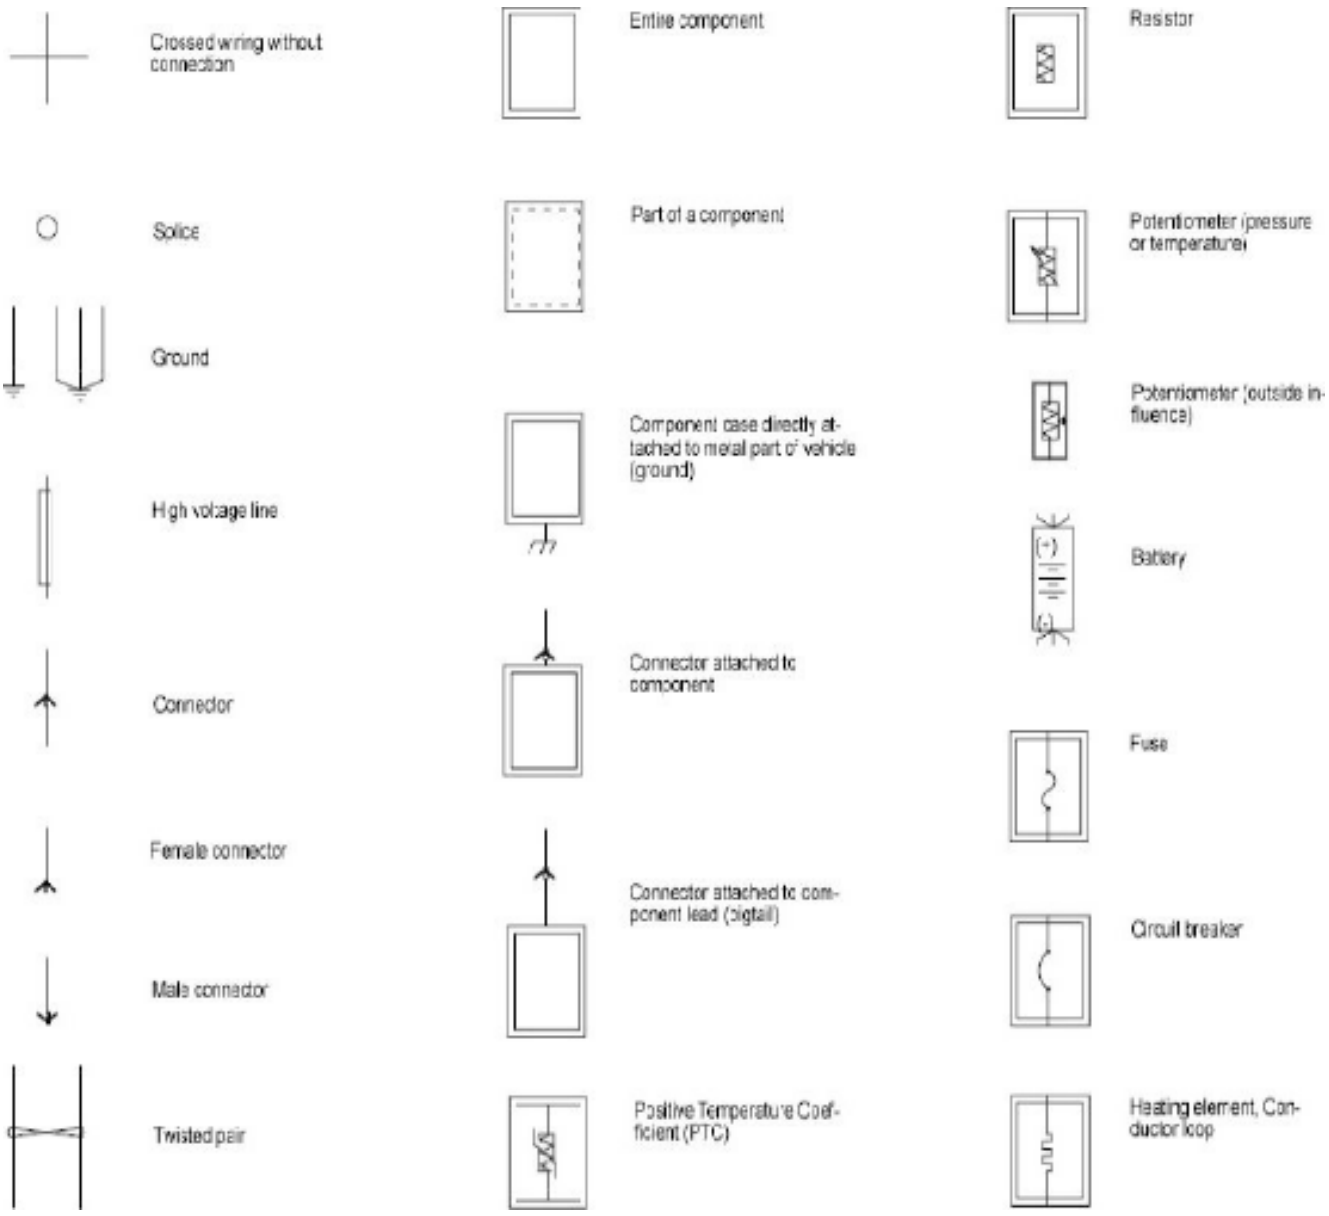
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Windshield Washer Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

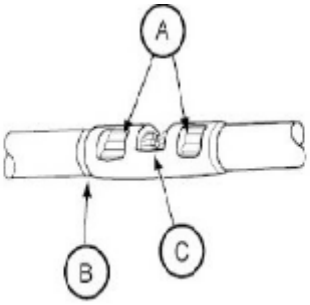
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

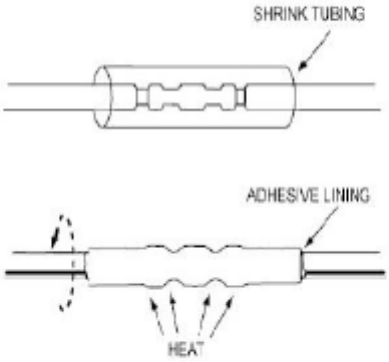
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4" strip, cut 9 strands	* 1/4" strip, cut 2 strands	1/4" strip, no fold	1/4" strip, no fold	1/4" strip, no fold	5/8" strip, fold 2x dia.	1" strip, fold 3x dia.
	16-14	* 1/4" strip, cut 7 strands	1/4" strip, no fold	1/4" strip, no fold	1/4" strip, no fold	5/8" strip fold 2x dia	1" strip, fold 3x dia.	1 1/4" strip, fold 4x dia.	Not Recommended
	12-10	1/4" strip, no fold	1/4" strip, no fold	5/8" strip, fold 2x dia.	1" strip fold 3x dia.	1 1/4" strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

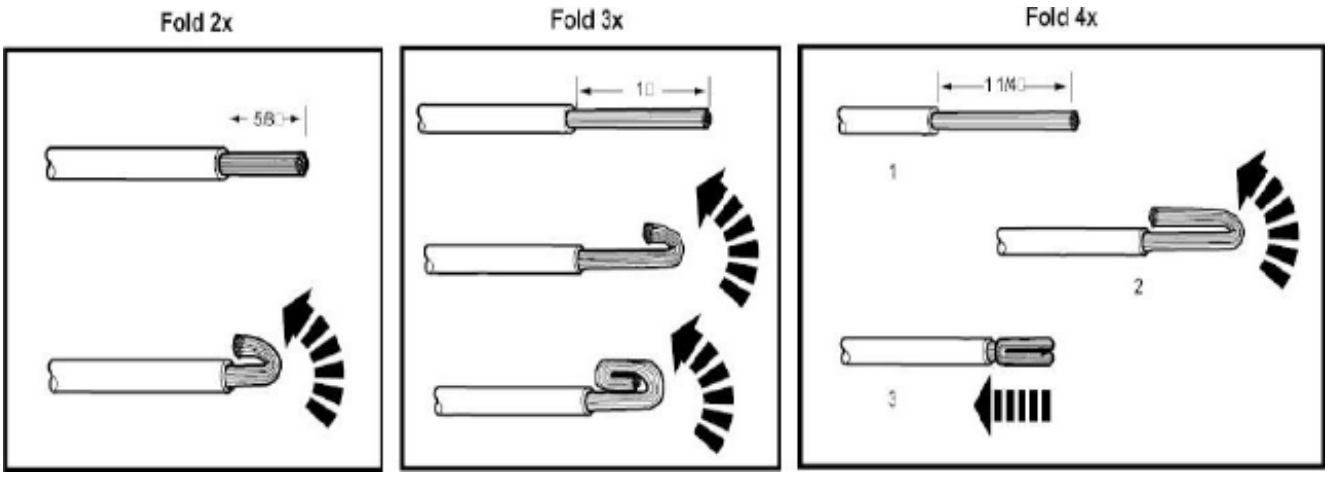
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



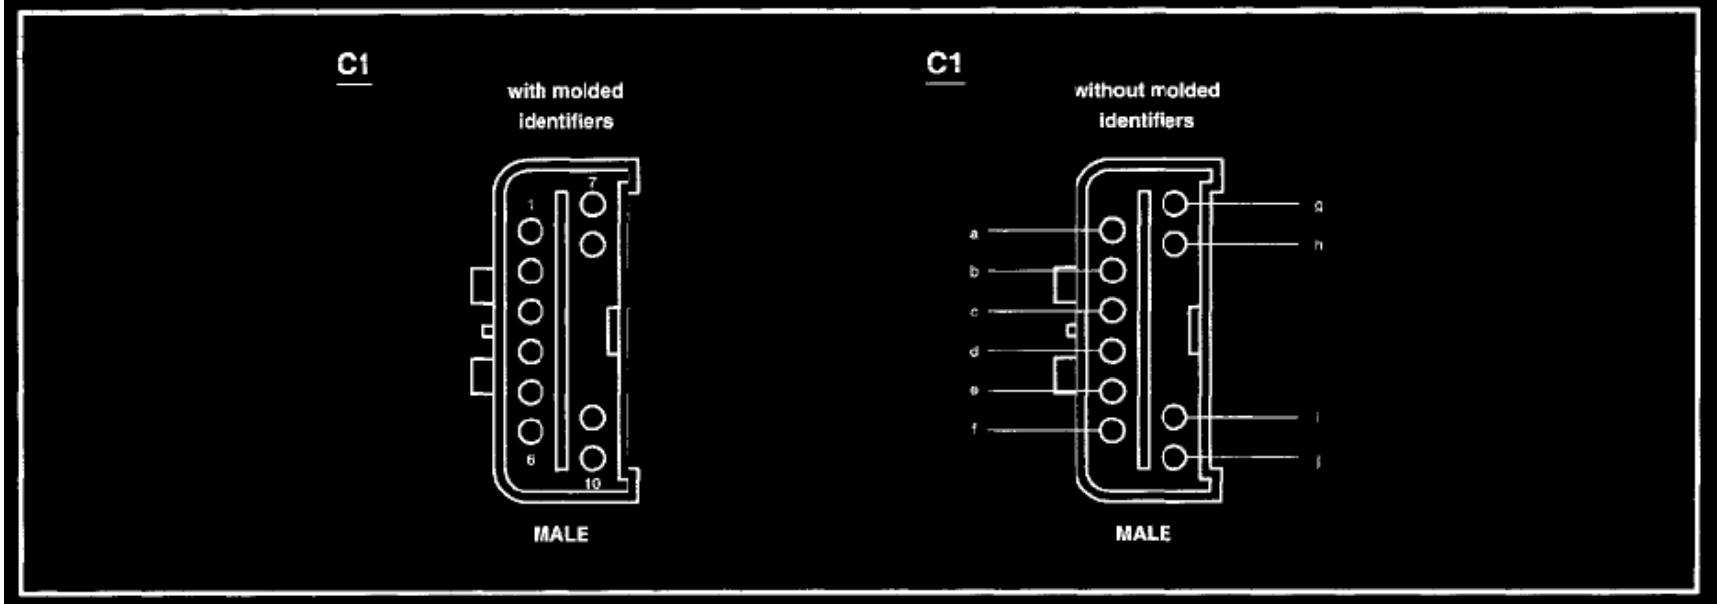
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step–by–step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



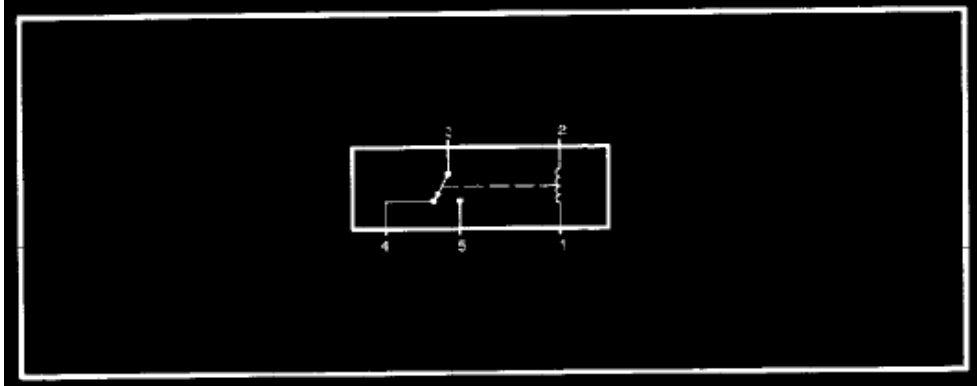
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

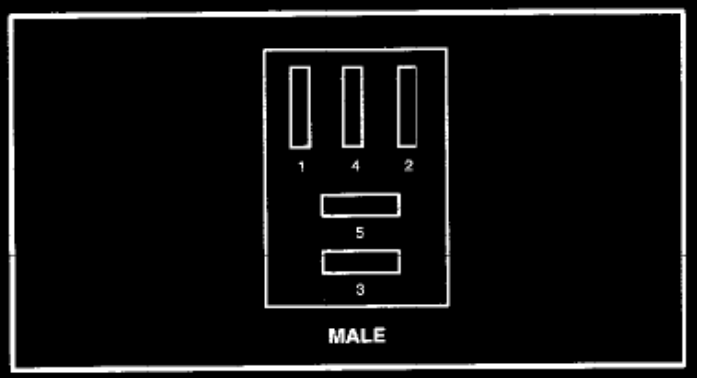
Windshield Washer Relay: Testing and Inspection Micro ISO Relay

Relay – Micro ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	1 and 2	63–102Ω
Contact	3 and 4	Closed circuit
	3 and 5	Open circuit
Coil – Contact	1 and 3	Open circuit
	1 and 4	Open circuit
	1 and 5	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 2 and 3 to 12V DC power and pin 1 to ground. Measure voltage between pin 5 and pin 1. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 2 and measure voltage between pin 4 and pin 1. If the voltage is 12V, the relay is okay. If not, replace the relay.

Introduction

Wiper Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

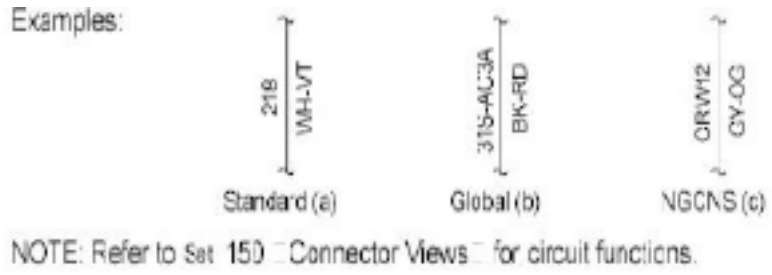
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

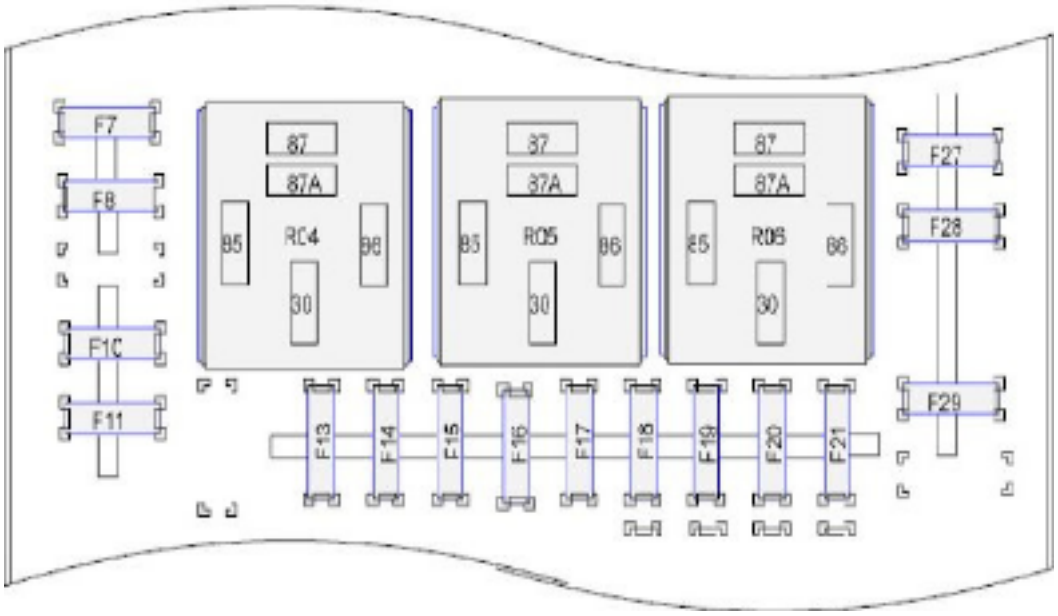
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

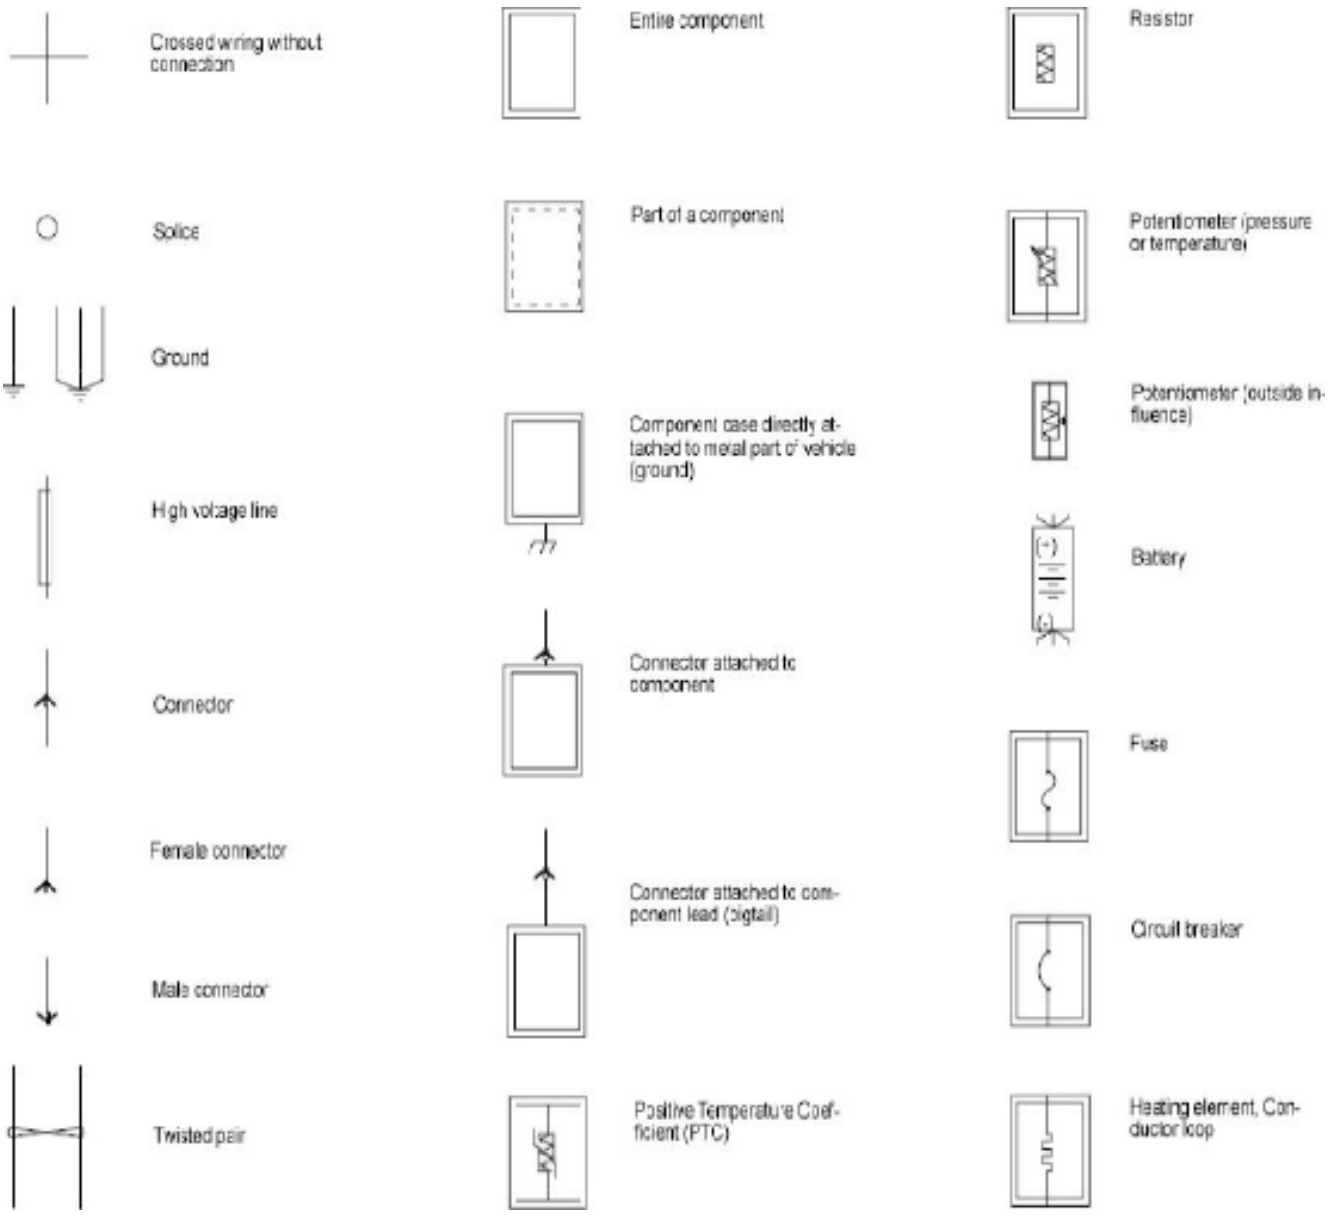
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

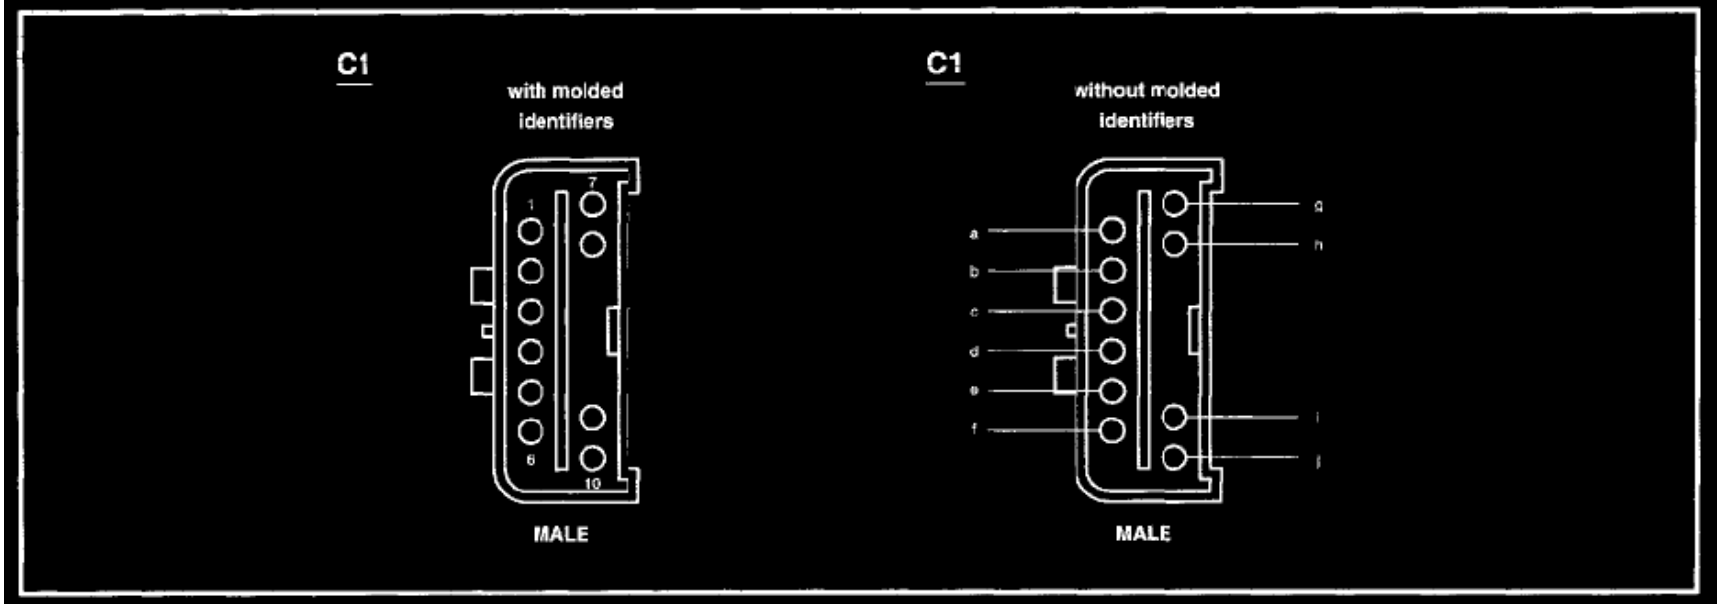
Testing information for each component includes a schematic, a view of the terminal locations and step–by–step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



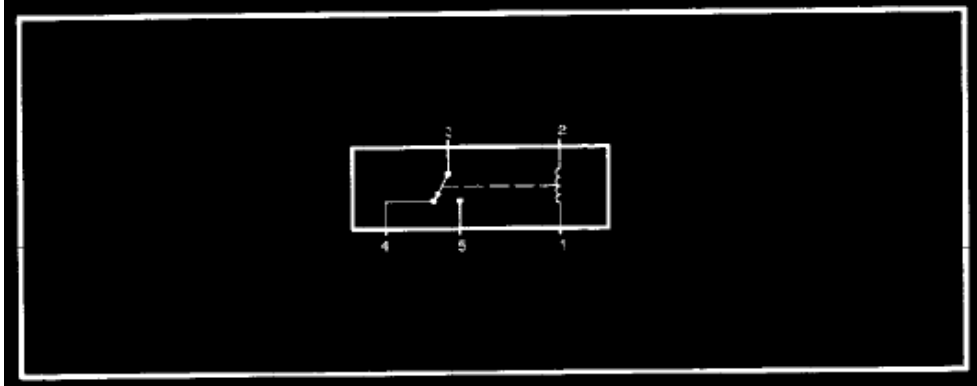
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

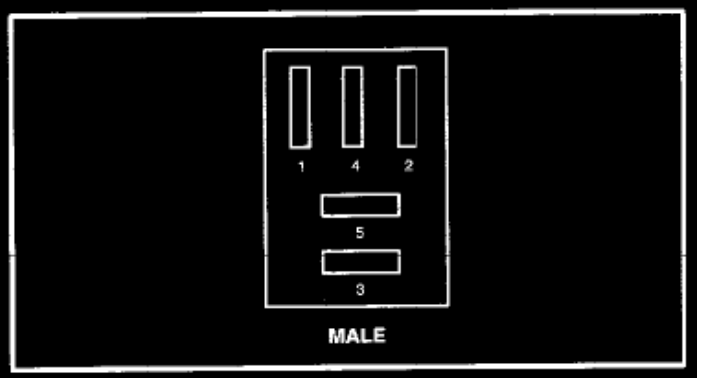
Wiper Relay: Testing and Inspection Micro ISO Relay

Relay – Micro ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	1 and 2	63–102Ω
Contact	3 and 4	Closed circuit
	3 and 5	Open circuit
Coil – Contact	1 and 3	Open circuit
	1 and 4	Open circuit
	1 and 5	Open circuit

Component testing procedure (voltage applied)

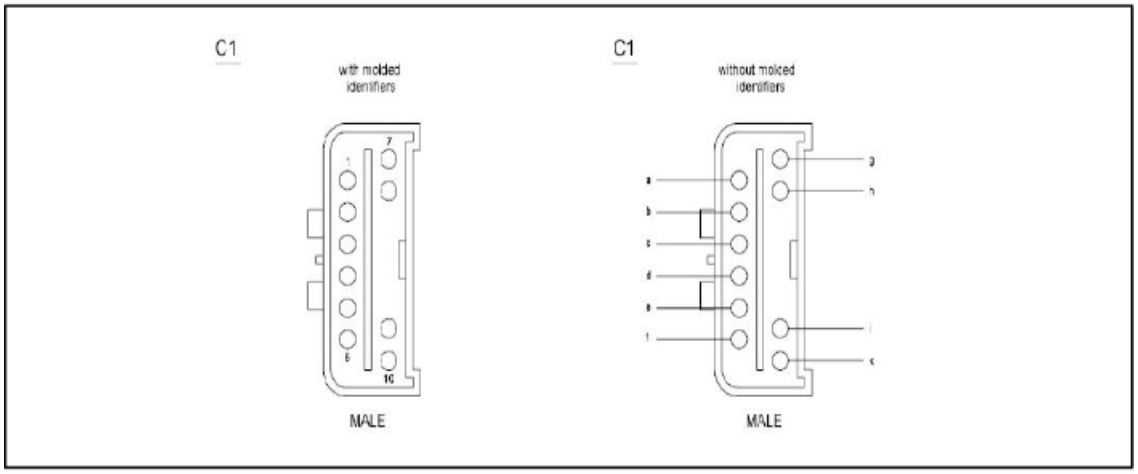
Disconnect the ohmmeter; connect pins 2 and 3 to 12V DC power and pin 1 to ground. Measure voltage between pin 5 and pin 1. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 2 and measure voltage between pin 4 and pin 1. If the voltage is 12V, the relay is okay. If not, replace the relay.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step□by□step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals

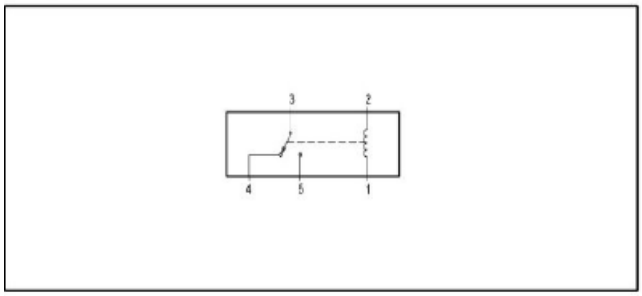


The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column □Circuit to test□. If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

Relay □ Micro ISO

Schematic



Terminals

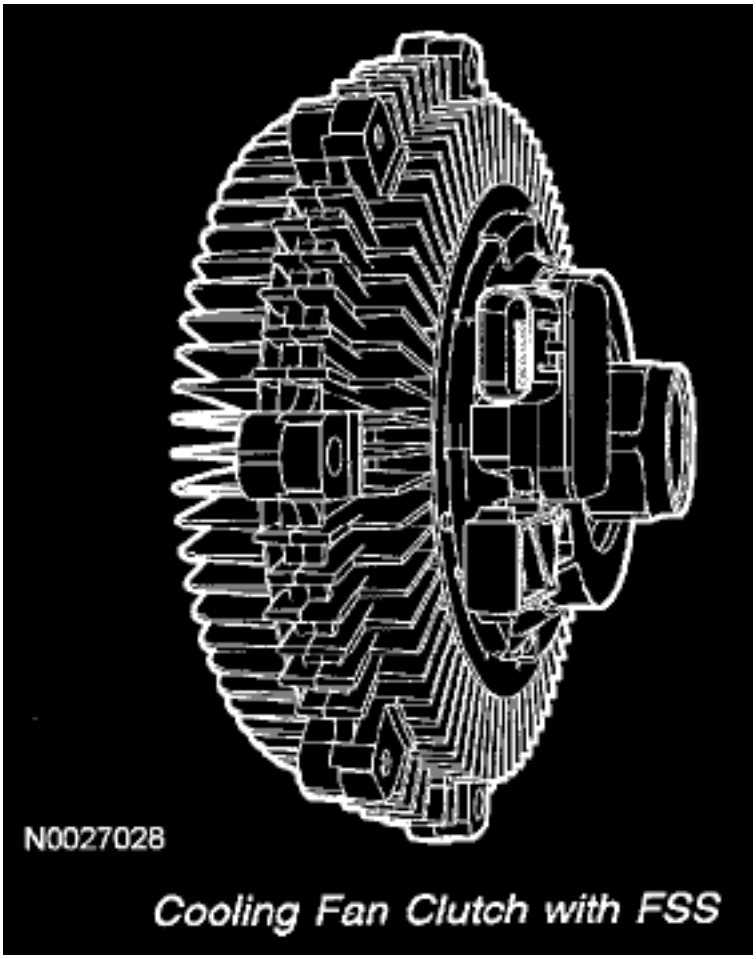
1. With the vehicle in NEUTRAL, position it on a hoist. 2. Disconnect the wheel speed sensor electrical connector. 3. Remove the wheel speed sensor bolt and the wheel speed sensor.

^ To install, tighten to 27 Nm (20 lb-ft).

4. NOTE: Plug the sensor cavity and thoroughly clean the sensor mounting surface.

NOTE: Inspect the anti-lock brake sensor O-ring seal for damage; lightly lubricate the O-ring seal with the specified lubricant.

To install, reverse the removal procedure.



Radiator Cooling Fan Speed Sensor: Description and Operation

FAN SPEED SENSOR (FSS)

Cooling Fan Clutch With FSS

The FSS is a Hall-effect sensor that measures the cooling fan clutch speed by generating a waveform with a frequency proportional to the fan speed. If the cooling fan clutch is moving at a relatively low speed, the sensor produces a signal with a low frequency. As the cooling fan clutch speed increases, the sensor generates a signal with a higher frequency. The PCM uses the frequency signal generated by the FSS as a feedback for closed loop control of the cooling fan clutch.

C1064

Coolant Temperature Sensor/Switch (For Computer): Description and Operation

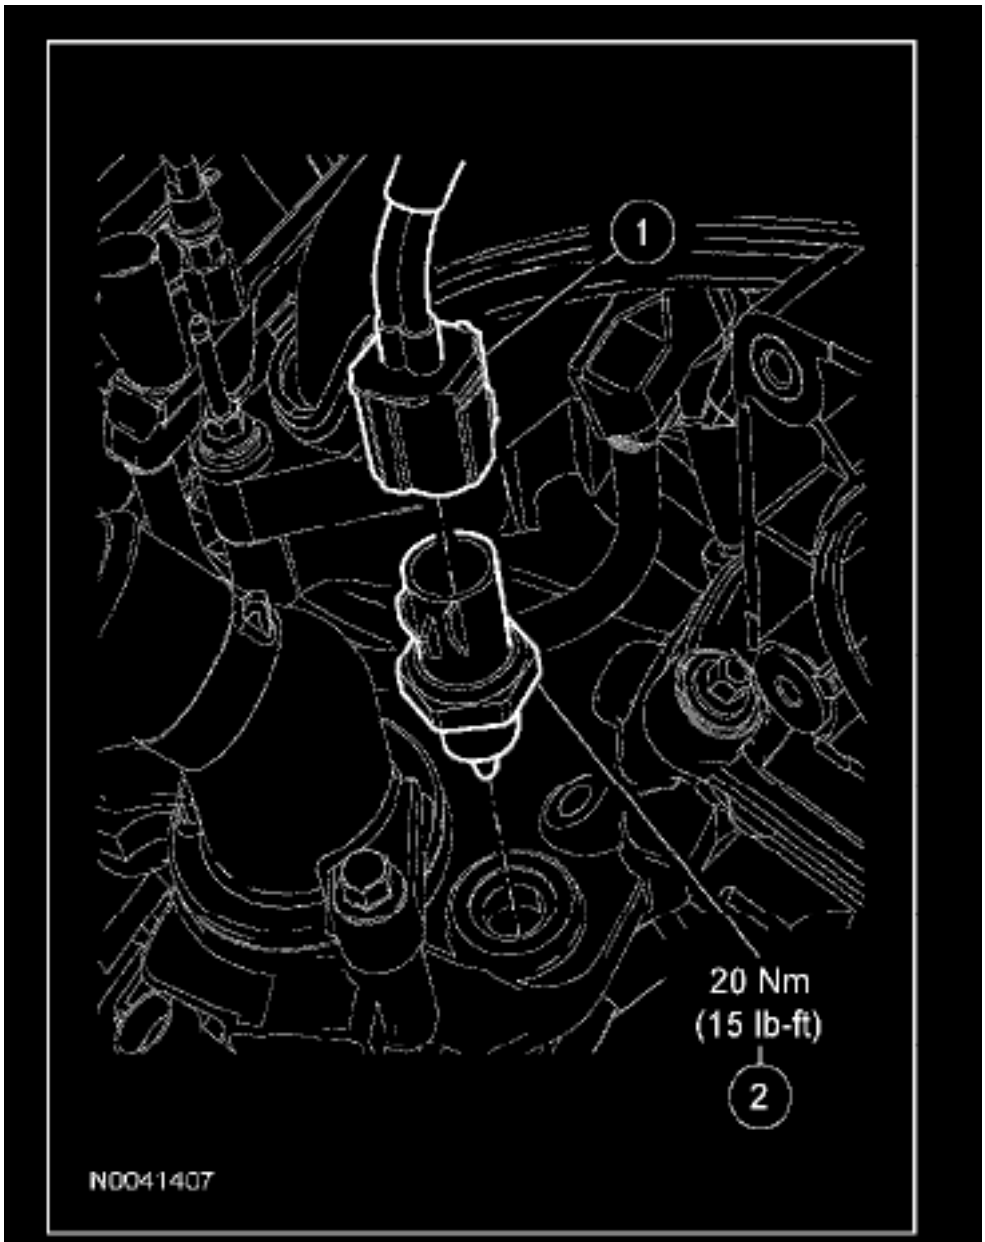
ENGINE COOLANT TEMPERATURE (ECT) SENSOR

Typical Thread Type ECT Sensor

The ECT sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of a thermistor decreases as the temperature increases, and the resistance increases as the temperature decreases. The varying resistance changes the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Thermistor-type sensors are considered passive sensors. A passive sensor is connected to a voltage divider network so that varying the resistance of the passive sensor causes a variation in total current flow. Voltage that is dropped across a fixed resistor in a series with the sensor resistor determines the voltage signal at the PCM. This voltage signal is equal to the reference voltage minus the voltage drop across the fixed resistor.

The ECT measures the temperature of the engine coolant. The PCM uses the ECT input for fuel control and for cooling fan control. There are 3 types of ECT sensors, threaded, push-in, and twist-lock. The ECT sensor is located in an engine coolant passage.



Item	Part Number	Description
1	14A464	Engine coolant temperature (ECT) sensor electrical connector (part of 12B637)
2	12A648	ECT sensor

Coolant Temperature Sensor/Switch (For Computer): Service and Repair

ENGINE COOLANT TEMPERATURE (ECT) SENSOR

Removal and Installation

1. Drain the cooling system. 2. Disconnect the engine coolant temperature (ECT) sensor electrical connector. 3. Remove the ECT sensor.

- To install, tighten to 20 Nm (15 lb-ft).

4. To install, reverse the removal procedure.

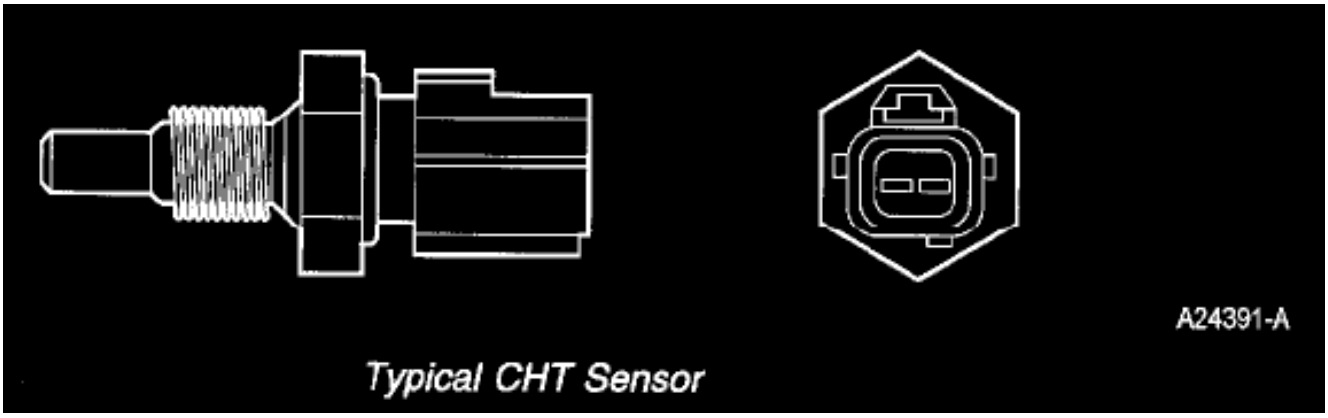
C107



Typical CHT Sensor

Engine Temperature Sensor: Description and Operation

CYLINDER HEAD TEMPERATURE (CHT) SENSOR

Typical CHT Sensor

The CHT sensor is a thermistor device in which resistance changes with the temperature. The electrical resistance of a thermistor decreases as temperature increases, and the resistance increases as the temperature decreases. The varying resistance affects the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

The CHT sensor is installed in the cylinder head and measures the metal temperature. The CHT sensor can provide complete engine temperature information and can be used to infer coolant temperature. If the CHT sensor conveys an overheating condition to the PCM, the PCM initiates a fail-safe cooling strategy based on information from the CHT sensor. A cooling system concern such as low coolant or coolant loss could cause an overheating condition. As a result, damage to major engine components could occur. Using both the CHT sensor and fail-safe cooling strategy, the PCM prevents damage by allowing air cooling of the engine and limp home capability.

C278

Brake Switch (Cruise Control): Description and Operation

Brake Pedal Position (BPP) Switch

Typical BPP Switch

The BPP switch is sometimes referred to as the stoplamp switch. The BPP switch provides a signal to the PCM indicating that the brakes are applied. The BPP switch is normally open and is mounted on the brake pedal support. Depending on the vehicle application the BPP switch can be hardwired as follows: -

to the PCM supplying battery positive voltage (B+) when the vehicle brake pedal is applied.

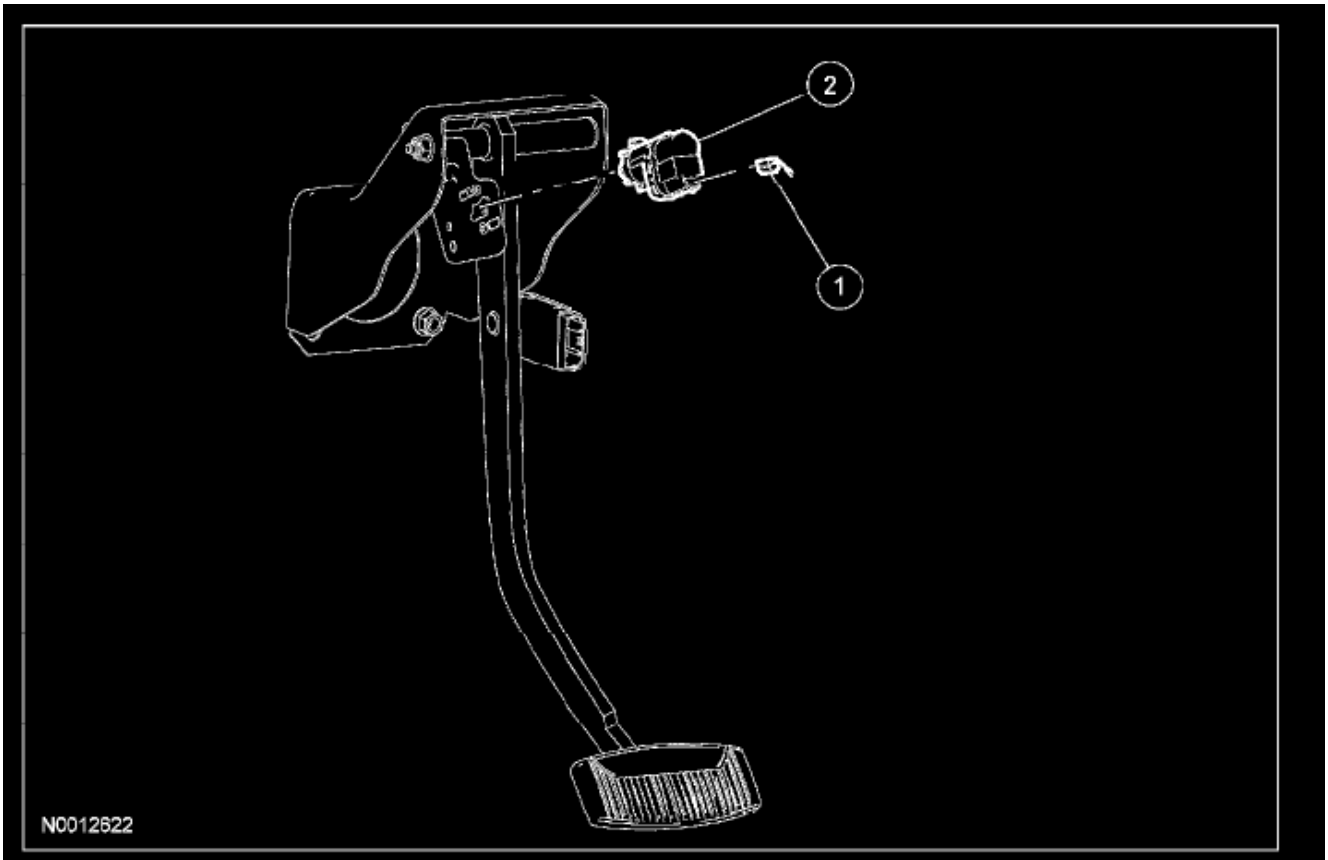
- to the antilock brake system (ABS) module, or lighting control module (LCM), the BPP signal is then broadcast over the network to be received by the PCM.

- to the ABS traction control/stability assist module. The ABS module interprets the BPP switch input along with other ABS inputs and generates an output called the driver brake application (DBA) signal. The DBA signal is then sent to the PCM and to other BPP signal users.

Brake Pedal Switch (BPS)/Brake Deactivator Switch

The BPS, also called the brake deactivator switch, is for vehicle speed control deactivation. A normally closed switch supplies battery positive voltage (B+) to the PCM when the brake pedal is not applied. When the brake pedal is applied, the normally closed switch opens and power is removed from the PCM.

On some applications the normally closed BPS, along with the normally open BPP switch, are used for a brake rationality test within the PCM. The PCM misfire monitor profile learn function may be disabled if a brake switch concern occurs. If one or both brake pedal inputs to the PCM is not changing states when they were expected to, a diagnostic trouble code (DTC) is set by the PCM strategy.



Item	Part Number	Description
1	—	Speed control deactivator switch electrical connector (part of 12A581)
2	9C872	Speed control deactivator switch

Brake Switch (Cruise Control): Service and Repair

SPEED CONTROL DEACTIVATOR SWITCH

Removal and Installation

1. CAUTION: Do not press the brake pedal when removing or installing the speed control deactivator switch or damage to the switch will

occur.

Disconnect the speed control deactivator switch electrical connector.

2. Rotate the speed control deactivator switch counterclockwise 45 degrees and remove it.

- Disconnect the electrical connector.

3. NOTE: The speed control deactivator switch is self-adjusting. Do not press the brake pedal during installation. Initial installation of the speed

control deactivator switch allows for one adjustment. If additional adjustments are necessary, install a new speed control deactivator switch.

To install, reverse the removal procedure.

Typical Clutch Pedal Position (CPP) Switch

Clutch Switch: Description and Operation

CLUTCH PEDAL POSITION (CPP) SWITCH

Typical Clutch Pedal Position (CPP) Switch

The CPP switch is an input to the PCM indicating the clutch pedal position. The PCM provides a low current voltage on the CPP circuit. When the CPP switch is closed, this voltage is pulled low through the SIG RTN circuit. The CPP input to the PCM is used to detect a reduction in engine load. The PCM uses the load information for mass air flow and fuel calculations.

Cruise Control Switch: Service and Repair

SPEED CONTROL SWITCH

Removal and Installation

1. Remove the steering wheel. 2. Remove the steering wheel rear cover.

1 Remove the 2 screws.

2 Remove the steering wheel rear cover.

3. Remove the ribbon harness from the clips.

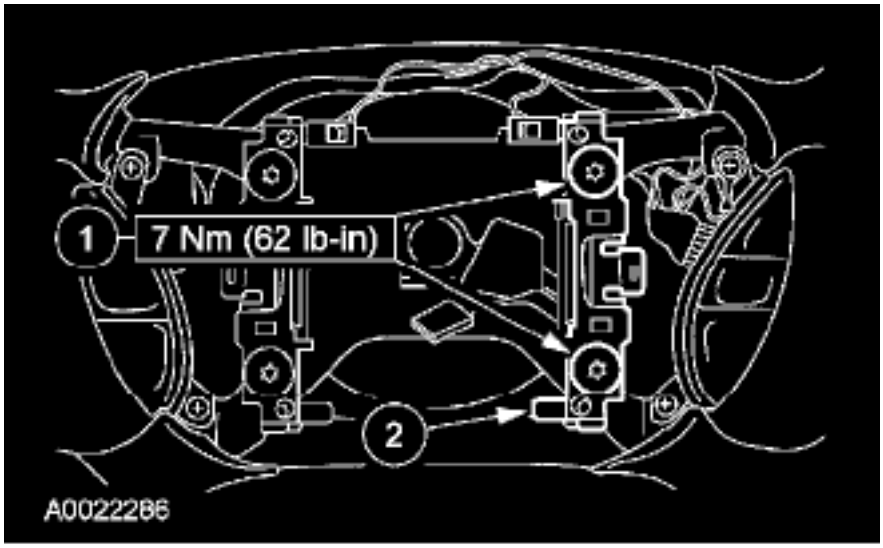
4. Disconnect the horn contact electrical connectors.

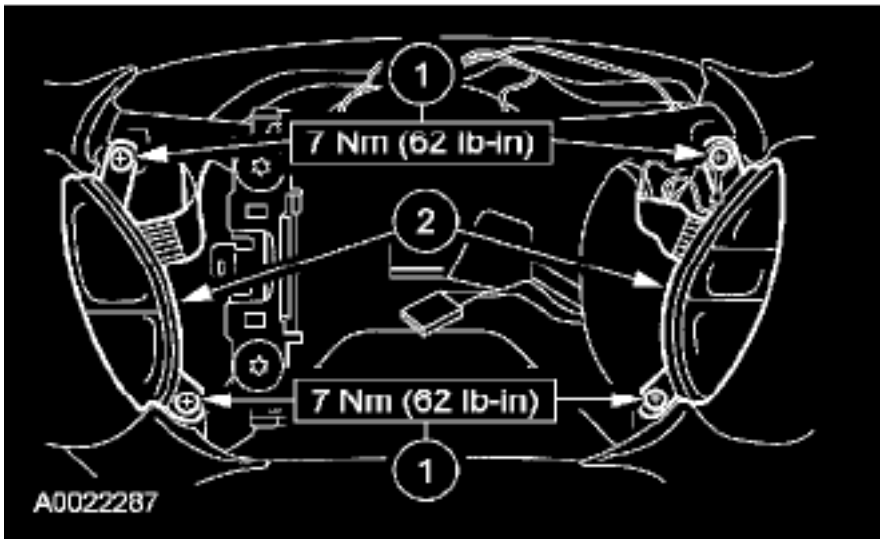
5. Remove the right side horn contact.

1 Remove the 2 screws. -

To install, tighten to 7 Nm (62 lb-in).

2 Remove the horn contact.





6. Remove the speed control switch assembly.

1 Remove the 4 screws. -

To install, tighten to 7 Nm (62 lb-in).

2 Remove the speed control switch assembly.

7. To install, reverse the removal procedure.

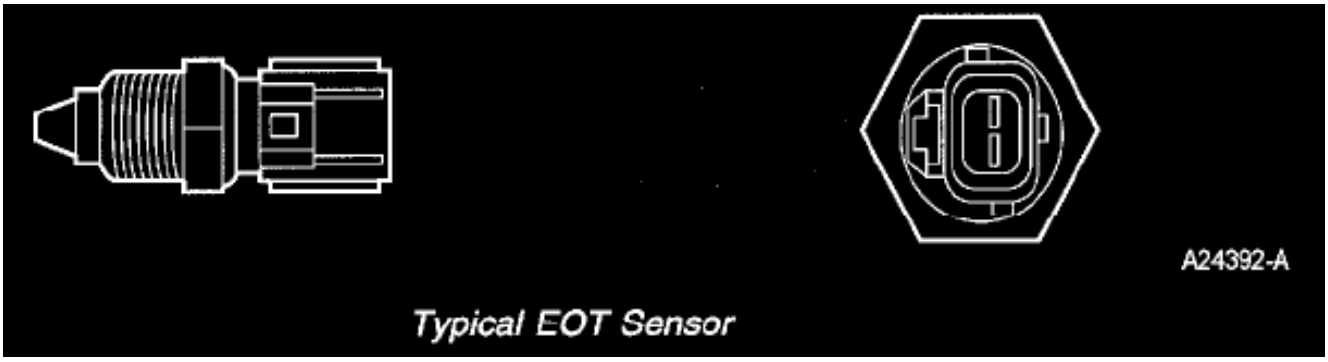
3. To install, reverse the removal procedure.



Typical EOT Sensor

Oil Temperature Sensor/Switch: Description and Operation

ENGINE OIL TEMPERATURE (EOT) SENSOR

Typical EOT Sensor

The EOT sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of a thermistor decreases as the temperature increases and the resistance increases as the temperature decreases. The varying resistance changes the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Thermistor-type sensors are considered passive sensors. A passive sensor is connected to a voltage divider network so that varying the resistance of the passive sensor causes a variation in total current flow. Voltage that is dropped across a fixed resistor in a series with the sensor resistor determines the voltage signal at the PCM. This voltage signal is equal to the reference voltage minus the voltage drop across the fixed resistor.

The EOT sensor measures the temperature of the engine oil. The sensor is typically threaded into the engine oil lubrication system. The PCM can use the EOT sensor input to determine the following:

- On variable camshaft timing (VCT) applications the EOT input is used to adjust the VCT control gains and logic for camshaft timing.

- The PCM can use EOT sensor input in conjunction with other PCM inputs to determine oil degradation.

- The PCM can use EOT sensor input to initiate a soft engine shutdown. To prevent engine damage from occurring as a result of high oil temperatures, the PCM has the ability to initiate a soft engine shutdown. Whenever engine RPM exceeds a calibrated level for a certain period of time, the PCM begins reducing power by disabling engine cylinders.

Blower Motor Switch: Description and Operation

BLOWER MOTOR SWITCH

The blower motor switch controls blower motor speed by adding or by passing resistors in the heater blower motor switch resistor.

Switch — Blower Motor

-20	-4	4.66	276.96

Evaporator Temperature Sensor / Switch: Description and Operation

AIR CONDITIONING EVAPORATOR TEMPERATURE (ACET) SENSOR

A/C Evaporator Temperature (ACET) Sensor Voltage And Resistance

The ACET sensor measures the evaporator air discharge temperature. The ACET sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of a thermistor decreases as the temperature increases, and the resistance increases as the temperature decreases. The PCM sources a low current 5 volts on the ACET circuit. With SIG RTN also connected to the ACET sensor, the varying resistance changes the voltage drop across the sensor terminals. As A/C evaporator air temperature changes, the varying resistance of the ACET sensor changes the voltage the PCM detects.

The ACET sensor is used to more accurately control A/C clutch cycling, improve defrost/demist performance, and reduce A/C clutch cycling.

NOTE: These values can vary 15% due to sensor and VREF variations. Voltage values were calculated for VREF equals 5.0 volts.

Dimmer Switch: Service and Repair

INSTRUMENT PANEL DIMMER SWITCH

Removal and Installation

1. Remove the radio. 2. Remove the center instrument panel finish panel.

- Remove the 2 screws.

- Disconnect the electrical connectors.

3. Remove the 2 bolts and position aside the hood latch release handle. 4. Remove the 2 screws and remove the instrument panel steering column cover. 5. Remove the 5 bolts and the lower instrument panel reinforcement.

- To install, tighten to 11 Nm (8 lb-ft).

6. If equipped, position the column-mounted transmission range selector lever to the lowest position. 7. Remove the instrument cluster finish panel.

- Remove the 5 screws.

- Disconnect the electrical connectors.

8. Remove the 2 screws and the instrument panel dimmer switch. 9. To install, reverse the removal procedure.

Fuel Gauge Sender: Description and Operation

Fuel Pump (FP) Module

Typical Electronic Returnless Fuel Pump (FP) Module

Typical Mechanical Returnless Fuel Pump (FP) Module

The FP module is a device that contains the fuel pump and sender assembly. The fuel pump is located inside the FP module reservoir and supplies fuel through the FP module manifold to the engine and FP module jet pump. The jet pump continuously refills the reservoir with fuel, and a check valve located in the manifold outlet maintains system pressure when the fuel pump is not energized. A flapper valve located in the bottom of the reservoir allows fuel to enter the reservoir and prime the fuel pump during the initial fill.

Fuel Pump (FP) Module and Reservoir

The FP module is mounted inside the fuel tank in a reservoir. The pump has a discharge check valve that maintains the system pressure after the key has been turned off to minimize starting concerns. The reservoir prevents fuel flow interruptions during extreme vehicle maneuvers with low tank fill levels.

Brake Light Switch: Description and Operation

BRAKE PEDAL POSITION (BPP) SWITCH

Typical BPP Switch

The BPP switch is sometimes referred to as the stoplamp switch. The BPP switch provides a signal to the PCM indicating that the brakes are applied. The BPP switch is normally open and is mounted on the brake pedal support. Depending on the vehicle application the BPP switch can be hardwired as follows:

- to the PCM supplying battery positive voltage (B+) when the vehicle brake pedal is applied.

- to the antilock brake system (ABS) module, or lighting control module (LCM), the BPP signal is then broadcast over the network to be received by the PCM.

- to the ABS traction control/stability assist module. The ABS module interprets the BPP switch input along with other ABS inputs and generates an output called the driver brake application (DBA) signal. The DBA signal is then sent to the PCM and to other BPP signal users.

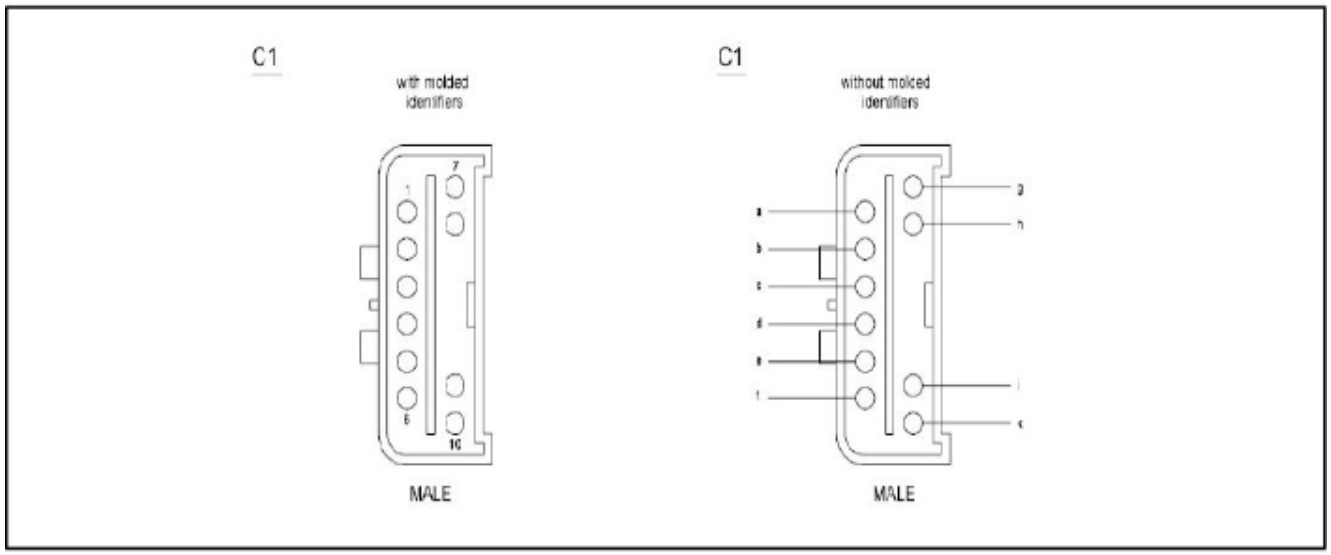
Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

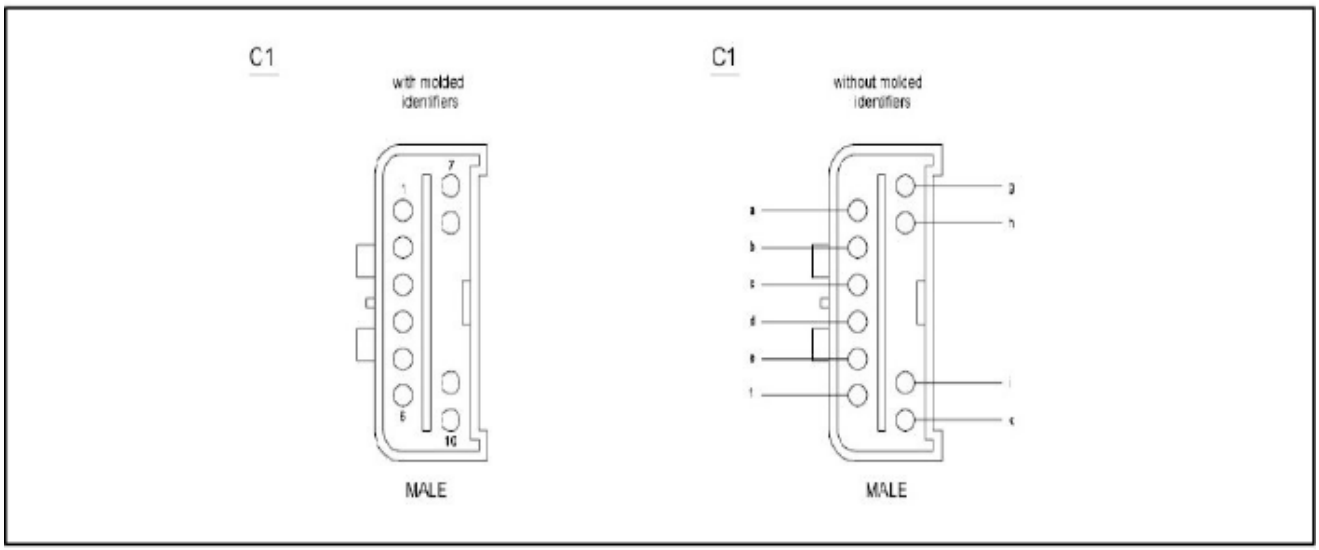
Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

Accelerator Pedal Position Sensor: Description and Operation

ACCELERATOR PEDAL POSITION (APP) SENSOR

The APP sensor is an input to the powertrain control module (PCM) and is used to determine the amount of torque requested by the operator. Depending on the application either a 2-track or 3-track APP sensor is used.

2-Track APP Sensor

2-Track APP Sensor

There are 2 pedal position signals in the sensor. Both signals, APP1 and APP2, have a positive slope (increasing angle, increasing voltage), but are offset and increase at different rates. The 2 pedal position signals make sure the PCM receives a correct input even if 1 signal has a concern. The PCM determines if a signal is incorrect by calculating where it should be, inferred from the other signals. If a concern is present with one of the circuits the other input is used. There are 2 reference voltage circuits, 2 signal return circuits, and 2 signal circuits (a total of 6 circuits and pins) between the PCM and the APP sensor assembly. The reference voltage circuits and the signal return circuits are shared with the reference voltage circuit and signal return circuit used by the electronic throttle body (ETB) throttle position sensor. The pedal position signal is converted to pedal travel degrees (rotary angle) by the PCM. The software then converts these degrees to counts, which is the input to the torque based strategy.

3-Track APP Sensor

Typical 3-Track APP Sensor

There are 3 pedal position signals in the sensor. Signal 1, APP1, has a negative slope (increasing angle, decreasing voltage) and signals 2 and 3, APP2 and APP3, both have a positive slope (increasing angle, increasing voltage). During normal operation APP1 is used as the indication of pedal position by the strategy. The 3 pedal position signals make sure the PCM receives a correct input even if 1 signal has a concern. The PCM determines if a signal is incorrect by calculating where it should be, inferred from the other signals. If a concern is present with one of the circuits the other inputs are used. The pedal position signal is converted to pedal travel degrees (rotary angle) by the PCM. The software then converts these degrees to counts, which is the input to the torque based strategy. There are 2 reference voltage circuits, 2 signal return circuits, and 3 signal circuits (a total of 7 circuits and pins) between the PCM and the APP sensor assembly. The reference voltage circuits and the signal return circuits are shared with the reference voltage circuit and signal return circuit used by the electronic throttle body (ETB) throttle position sensor.

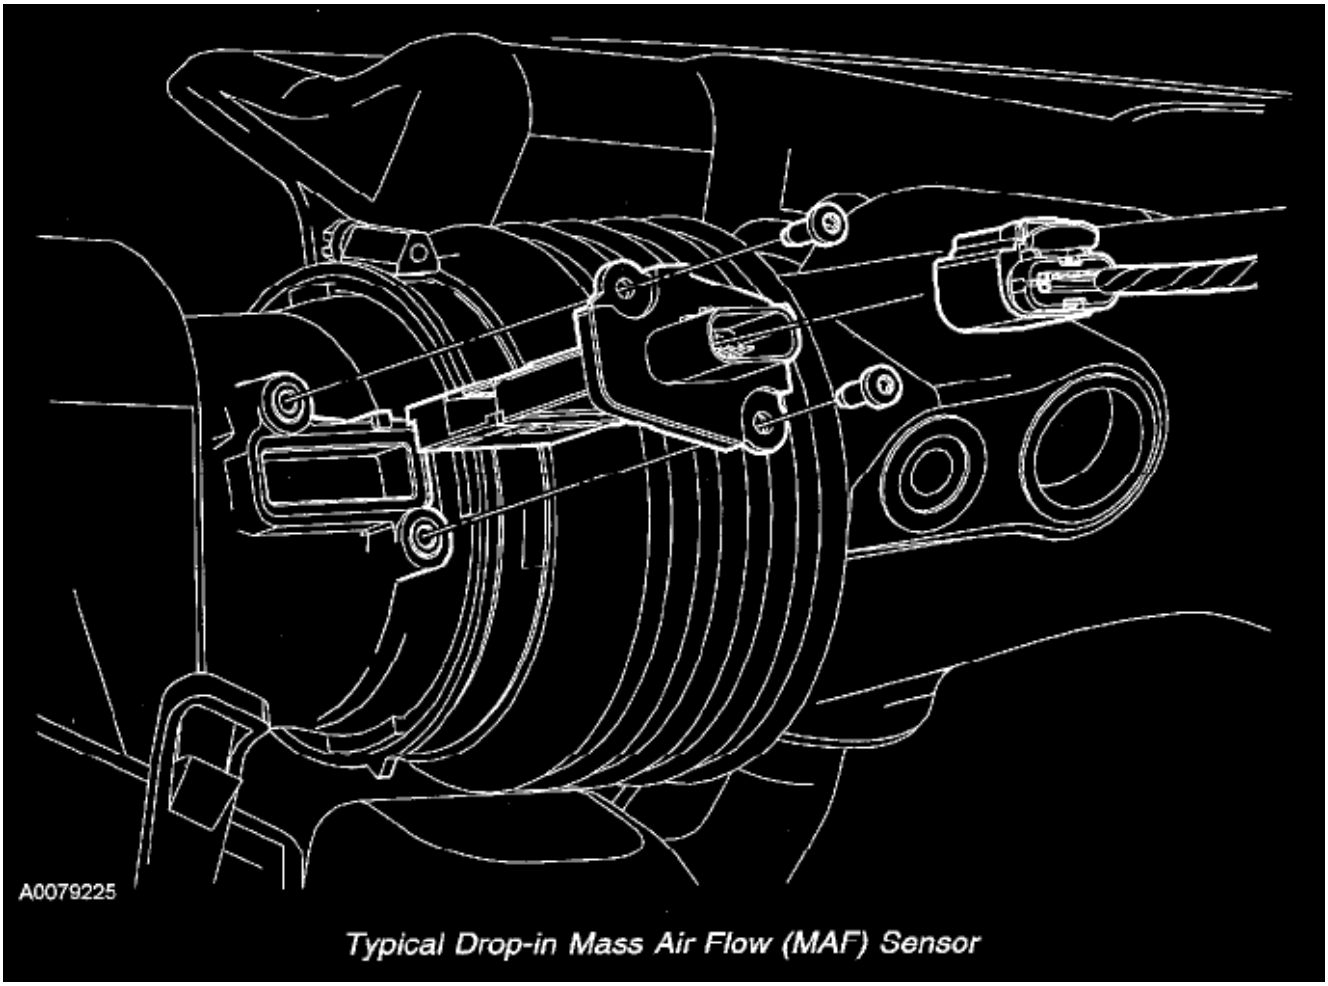
Air Flow Meter/Sensor: Description and Operation

MASS AIR FLOW (MAF) SENSOR

Diagram Of Air Flow Through Throttle Body Contacting MAF Sensor Hot And Cold Wire (and IAT Sensor Wire Where Applicable) Terminals

Typical Mass Air Flow (MAF) Sensor

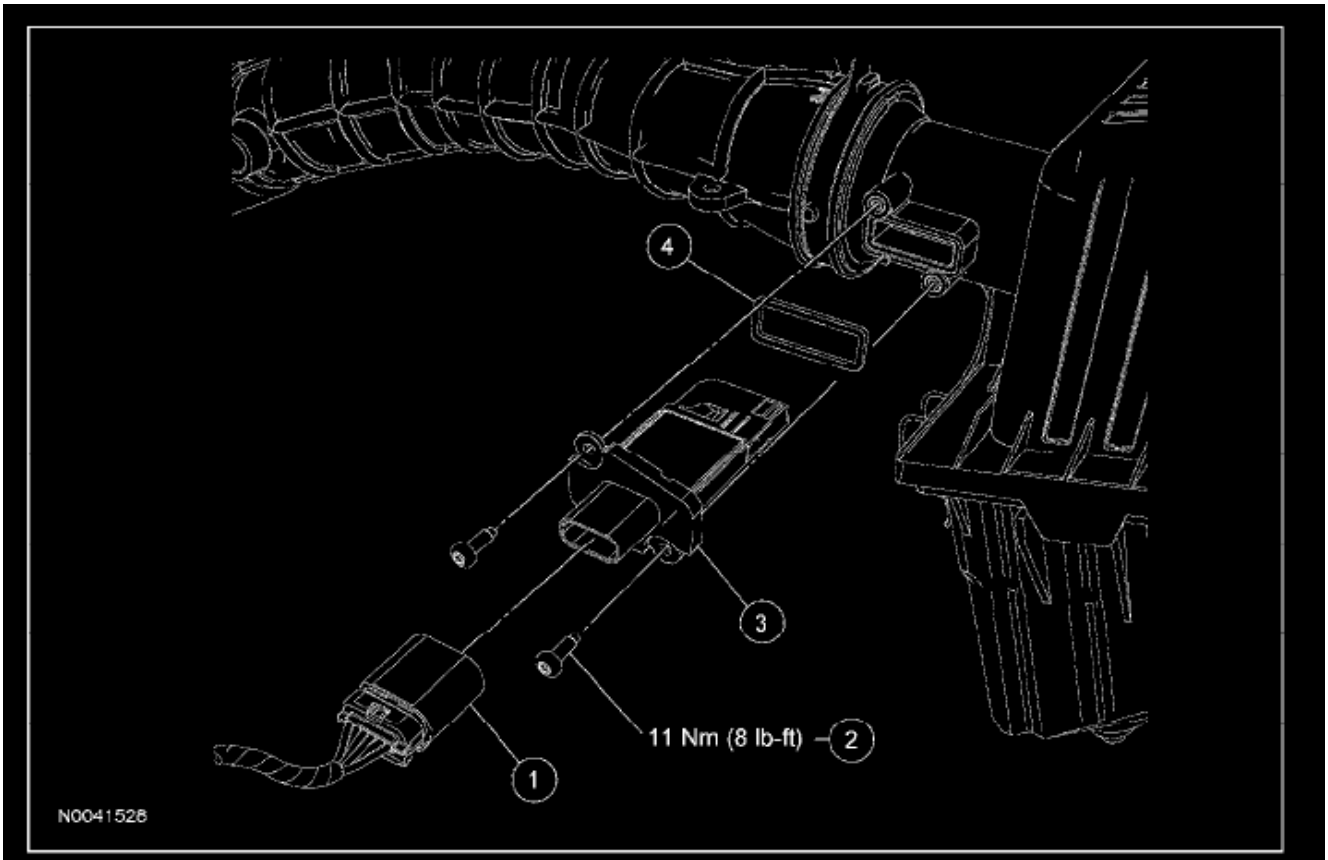


Typical Drop-in Mass Air Flow (MAF) Sensor

Typical Drop-in Mass Air Flow (MAF) Sensor

The MAF sensor uses a hot wire sensing element to measure the amount of air entering the engine. Air passing over the hot wire causes it to cool. This hot wire is maintained at 200°C (392°F) above the ambient temperature as measured by a constant cold wire. The current required to maintain the temperature of the hot wire is proportional to the mass air flow. The MAF sensor then outputs an analog voltage signal to the PCM proportional to the intake air mass. The PCM calculates the required fuel injector pulse width in order to provide the desired air/fuel ratio. This input is also used in determining transmission electronic pressure control (EPC), shift and torque converter clutch scheduling.

The MAF sensor is located between the air cleaner and the throttle body or inside the air cleaner assembly. Most MAF sensors have integrated bypass technology with an integrated intake air temperature (IAT) sensor. The hot wire electronic sensing element must be replaced as an assembly. Replacing only the element may change the air flow calibration.



Item	Part Number	Description
1	14A464	Mass air flow (MAF) sensor electrical connector (part of 12B637)

Air Flow Meter/Sensor: Service and Repair

MASS AIR FLOW (MAF) SENSOR

Removal and Installation

1. Disconnect the mass air flow (MAF) sensor electrical connector. 2. Remove the 2 bolts, the MAF sensor and discard the gasket.

- To install, tighten to 11 Nm (8 lb-ft).

3. CAUTION: Do not tamper with the mass air flow (MAF) sensing elements located in the airflow bypass. Tampering may result in

failure.

NOTE: The MAF sensor module and body are calibrated and installed as a unit.

To install, reverse the removal procedure. -

Install a new gasket.

Typical Synchronizer Hall-Effect CMP Sensor

Typical Variable Reluctance CMP Sensor

Camshaft Position Sensor: Description and Operation

CAMSHAFT POSITION (CMP) SENSOR

Typical Synchronizer Hall-Effect CMP Sensor

Typical Variable Reluctance CMP Sensor

The CMP sensor detects the position of the camshaft. The CMP sensor identifies when piston number 1 is on its compression stroke. A signal is then sent to the PCM and used for synchronizing the sequential firing of the fuel injectors. Coil on plug (COP) ignition applications use the CMP signal to select the correct ignition coil to fire.

Vehicles with 2 CMP sensors are equipped with variable camshaft timing (VCT). They use the second sensor to identify the position of the camshaft on bank 2 as an input to the PCM.

There are 2 types of CMP sensors: the 3-pin connector Hall-effect type sensor and the 2-pin connector variable reluctance type sensor.

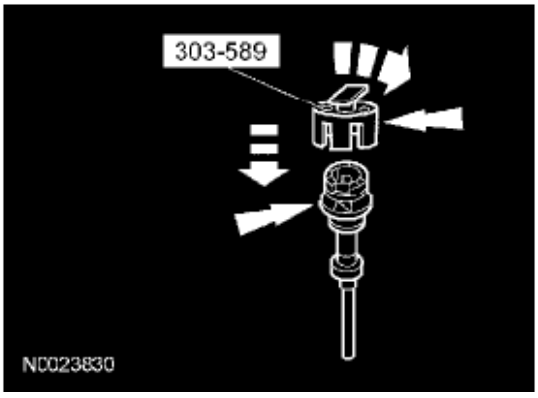
CAMSHAFT SYNCHRONIZER

Exploded View

Special Tool(s)

Special Tool(s)

ST2362-A	Synchronizer Alignment Gauge 303-589



Special Tool(s)

Removal

1. Disconnect the camshaft position (CMP) sensor electrical connector.

2. NOTE: Prior to the removal of the CMP sensor, note the position of the CMP sensor electrical connector. The installation procedure requires that

the electrical connector be located in the same position.

Remove the 2 bolts and the CMP sensor.

3. Remove the camshaft synchronizer bolt. 4. Remove the camshaft synchronizer. Inspect the O-ring seal and install a new O-ring seal if damaged.

Installation

1. CAUTION:

- After installation, do not loosen the synchronizer bolt and rotate the synchronizer assembly. The synchronizer assembly is not adjustable. Do not loosen the synchronizer bolt after the alignment tool has been removed in order to align the camshaft position (CMP) sensor electrical connector for any reason. If the electrical connector is not in the correct position, the synchronizer assembly must be removed. The alignment tool and the assembly must be reinstalled if the engine has not been rotated from top dead center (TDC) of the compression stroke on the No. 1 cylinder. Failure to follow this procedure will result in the fuel system being out of time with the engine, possibly causing engine damage.

- Do not turn the crankshaft or camshaft during the removal and installation procedure or the fuel system timing will be out of time with the engine, possibly causing engine damage.

- A special tool must be used during the installation of the new synchronizer assembly. Failure to follow this procedure will result in the fuel system being out of time with the engine, possibly causing engine damage.

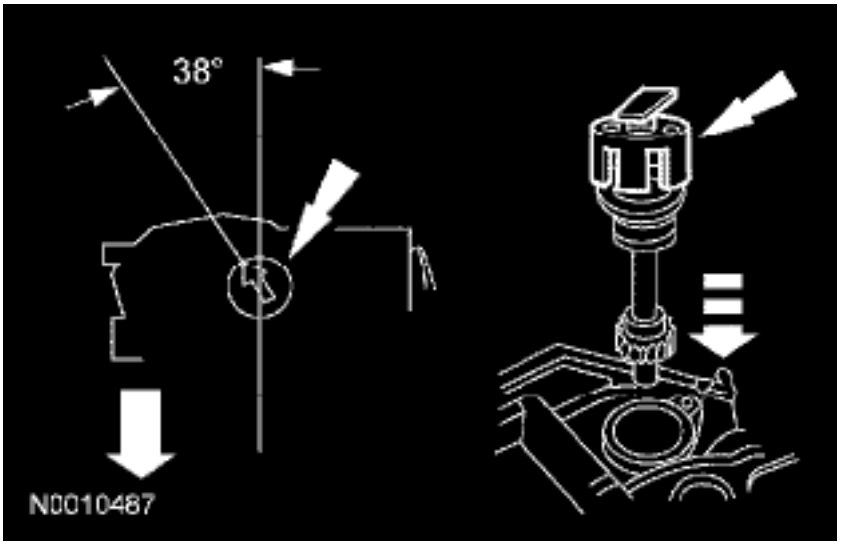
Install the special tool on the camshaft synchronizer by rotating the tool until it engages the notch in the camshaft synchronizer housing and the armature.

2. CAUTION: It is very important to coat the gear on the camshaft synchronizer with engine oil prior to installation. Failure to do so may

result in gear failure.

NOTE: During installation, the arrow on the special tool will rotate clockwise until the oil pump intermediate shaft and the camshaft gear engages.

Install the camshaft synchronizer housing assembly so the arrow on the special tool is 38 degrees from the centerline of the engine.



3. Install the camshaft synchronizer housing bolt.

- Tighten to 30 Nm (22 lb-ft).

4. Position the CMP sensor and install the 2 bolts.

- Tighten to 3 Nm (27 lb-in).

5. Connect the CMP sensor electrical connector.

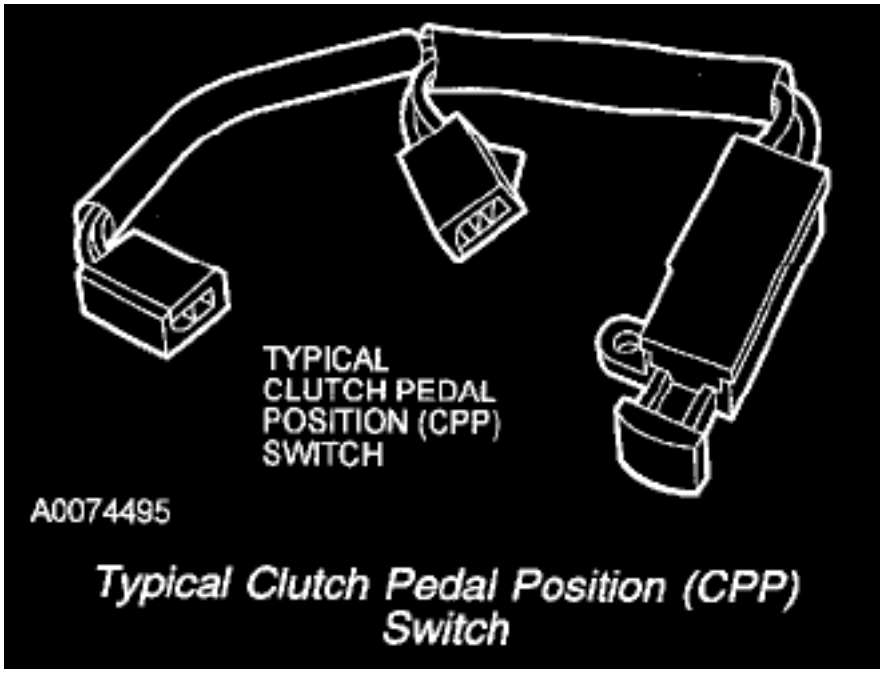
C257



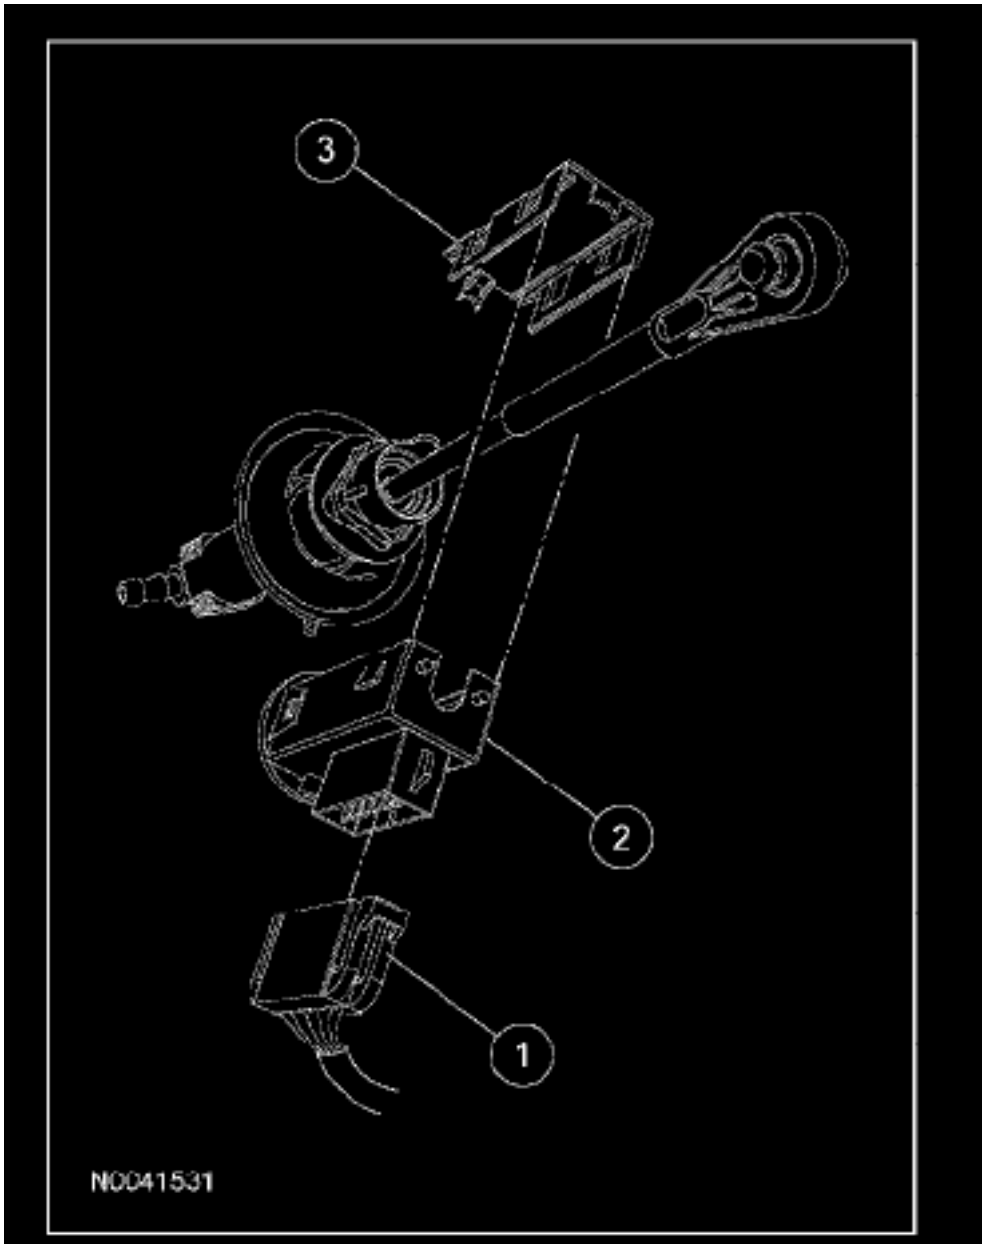
Typical Clutch Pedal Position (CPP) Switch

Clutch Switch: Description and Operation

CLUTCH PEDAL POSITION (CPP) SWITCH

Typical Clutch Pedal Position (CPP) Switch

The CPP switch is an input to the PCM indicating the clutch pedal position. The PCM provides a low current voltage on the CPP circuit. When the CPP switch is closed, this voltage is pulled low through the SIG RTN circuit. The CPP input to the PCM is used to detect a reduction in engine load. The PCM uses the load information for mass air flow and fuel calculations.



Item	Part Number	Description
1	—	Clutch pedal position (CPP) switch electrical connector
2	7C534	CPP switch
3	—	CPP switch cover (part of 7C534)

Clutch Switch: Service and Repair

CLUTCH PEDAL POSITION (CPP) SWITCH

Removal and Installation

1. Disconnect the clutch pedal position (CPP) switch electrical connector. 2. Spread the CPP switch apart. Remove from the pedal rod. 3. To install, reverse the removal procedure.

Coolant Temperature Sensor/Switch (For Computer): Description and Operation

ENGINE COOLANT TEMPERATURE (ECT) SENSOR

Typical Thread Type ECT Sensor

The ECT sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of a thermistor decreases as the temperature increases, and the resistance increases as the temperature decreases. The varying resistance changes the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Thermistor-type sensors are considered passive sensors. A passive sensor is connected to a voltage divider network so that varying the resistance of the passive sensor causes a variation in total current flow. Voltage that is dropped across a fixed resistor in a series with the sensor resistor determines the voltage signal at the PCM. This voltage signal is equal to the reference voltage minus the voltage drop across the fixed resistor.

The ECT measures the temperature of the engine coolant. The PCM uses the ECT input for fuel control and for cooling fan control. There are 3 types of ECT sensors, threaded, push-in, and twist-lock. The ECT sensor is located in an engine coolant passage.

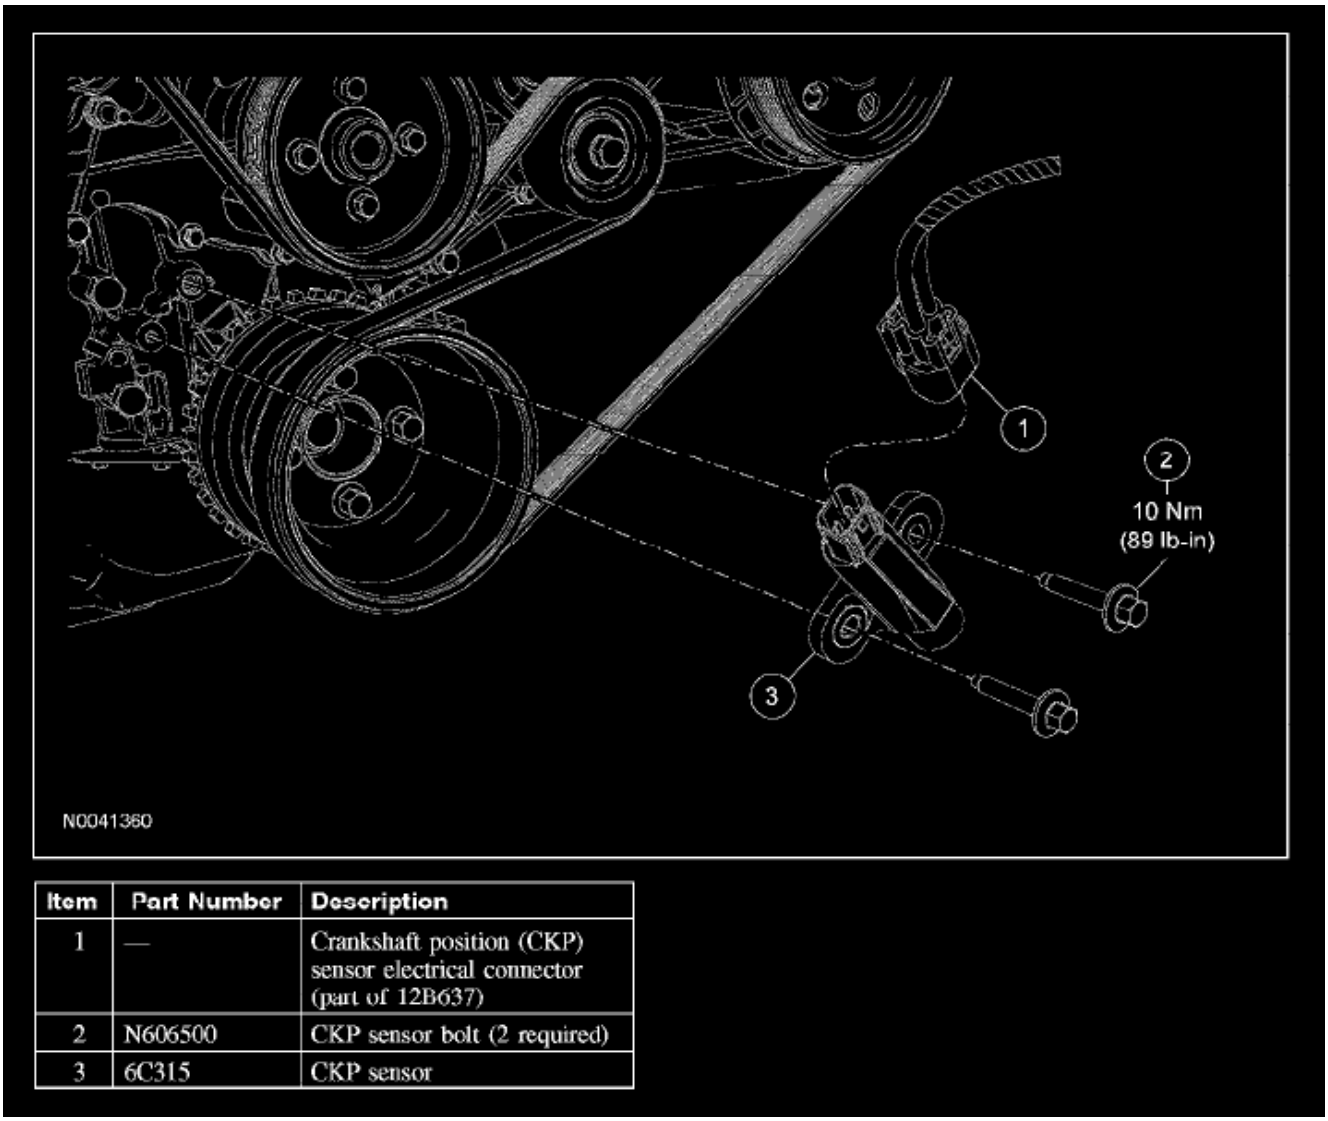
Crankshaft Position Sensor: Description and Operation

CRANKSHAFT POSITION (CKP) SENSOR

Typical Crankshaft Position (CKP) Sensor

The CKP sensor is a magnetic transducer mounted on the engine block adjacent to a pulse wheel located on the crankshaft. By monitoring the crankshaft mounted pulse wheel, the CKP is the primary sensor for ignition information to the PCM. The pulse wheel has a total of 35 teeth spaced 10 degrees apart with one empty space for a missing tooth. The 6.8L 10-cylinder pulse wheel has 39 teeth spaced 9 degrees apart and one 9 degree empty space for a missing tooth. By monitoring the pulse wheel, the CKP sensor signal indicates crankshaft position and speed information to the PCM. By monitoring the missing tooth, the CKP sensor is also able to identify piston travel in order to synchronize the ignition system and provide a way of tracking the angular position of the crankshaft relative to a fixed reference for the CKP sensor configuration. The PCM also uses the CKP signal to determine if a misfire has occurred by measuring rapid decelerations between teeth.



Item	Part Number	Description
1	—	Crankshaft position (CKP) sensor electrical connector (part of 12B637)

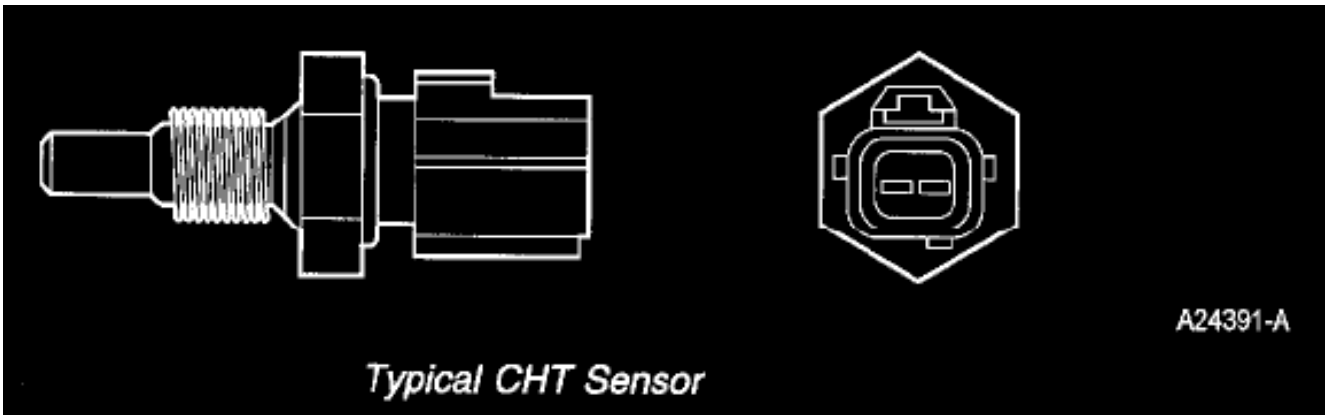
C107



Typical CHT Sensor

Engine Temperature Sensor: Description and Operation

CYLINDER HEAD TEMPERATURE (CHT) SENSOR

Typical CHT Sensor

The CHT sensor is a thermistor device in which resistance changes with the temperature. The electrical resistance of a thermistor decreases as temperature increases, and the resistance increases as the temperature decreases. The varying resistance affects the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

The CHT sensor is installed in the cylinder head and measures the metal temperature. The CHT sensor can provide complete engine temperature information and can be used to infer coolant temperature. If the CHT sensor conveys an overheating condition to the PCM, the PCM initiates a fail-safe cooling strategy based on information from the CHT sensor. A cooling system concern such as low coolant or coolant loss could cause an overheating condition. As a result, damage to major engine components could occur. Using both the CHT sensor and fail-safe cooling strategy, the PCM prevents damage by allowing air cooling of the engine and limp home capability.

Fuel Level Sensor: Description and Operation

FUEL LEVEL INPUT (FLI)

The FLI is a communications network message. Most vehicle applications use a potentiometer type FLI sensor connected to a float in the FP module to determine fuel level.

Part 2

Removal and Installation

WARNING:

- When working on or near the evaporative emission (EVAP) system, disconnect the battery ground cable from the battery. The EVAP system contains fuel vapor and condensed fuel vapor, so an

electrical spark may cause a fire or explosion. Failure to follow this instruction may result in serious personal injury.

- Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. Remove the fuel tank. 2. Disconnect the fuel tank pressure sensor electrical connector.

3. NOTE: The rear fuel tank vapor tube and fuel tank pressure sensor are an assembly and must be serviced as an assembly.

Disconnect the rear fuel tank vapor tube and fuel tank pressure sensor assembly-to-evaporative emissions (EVAP) canister quick connect coupling.

4. Disconnect the front fuel tank vapor tube-to-rear fuel tank vapor tube and fuel tank pressure sensor assembly quick connect coupling. 5. Remove the rear fuel tank vapor tube and fuel tank pressure sensor assembly. 6. To install, reverse the removal procedure.

- Carry out the leak test. See: Powertrain Management/Emission Control Systems/Evaporative Emissions System/Testing and Inspection

- Carry out the evaporative emission repair verification drive cycle.

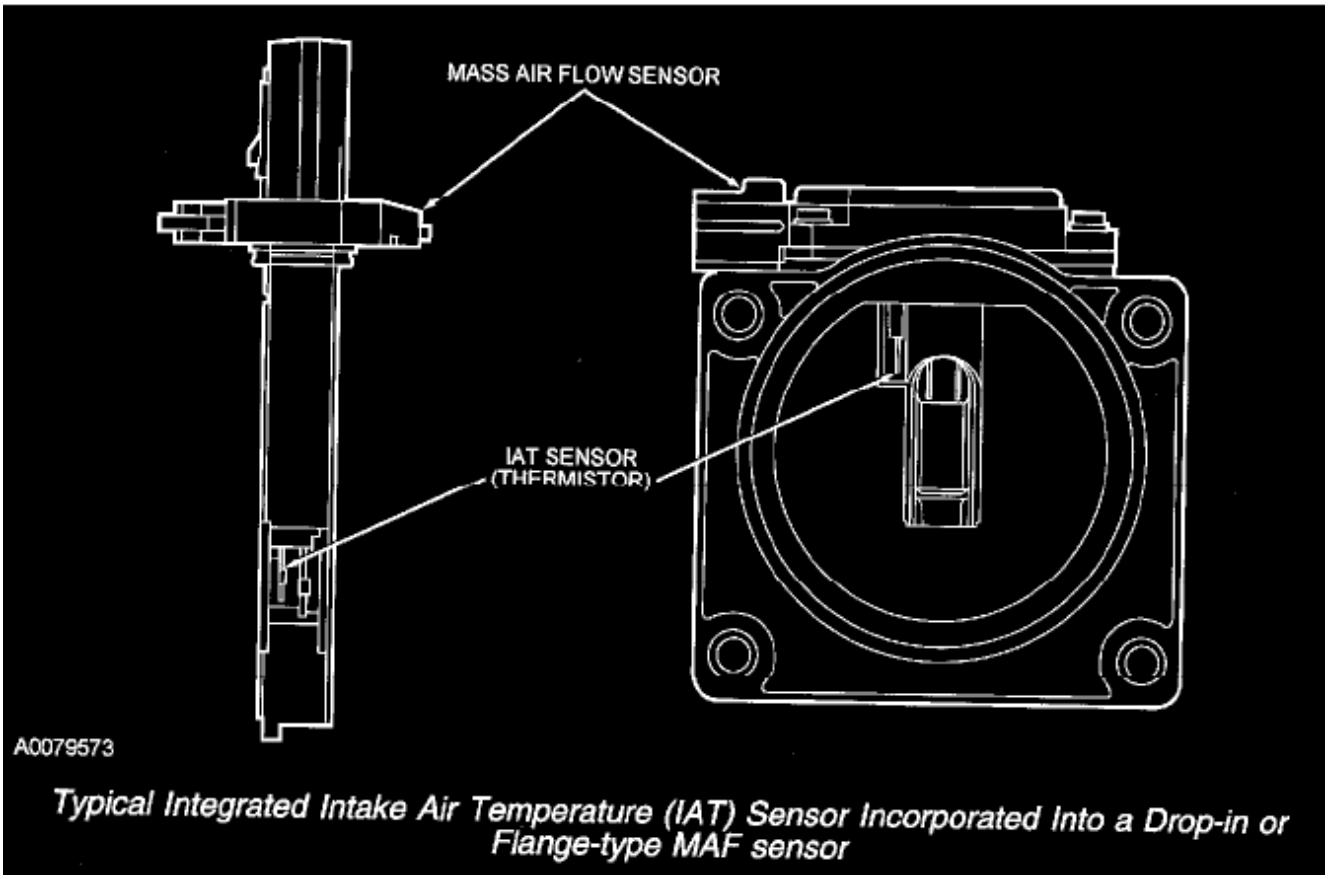
Typical Stand-Alone/Non-Integrated Intake Air Temperature (IAT) Sensors



Typical Integrated Intake Air Temperature (IAT) Sensor Incorporated Into a Drop-in or Flange-type MAF sensor

Intake Air Temperature Sensor: Description and Operation

Intake Air Temperature (IAT) Sensor

Typical Stand-Alone/Non-Integrated Intake Air Temperature (IAT) Sensors

Typical Integrated Intake Air Temperature (IAT) Sensor Incorporated Into A Drop-in Or Flange-type MAF Sensor

The IAT sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of a thermistor decreases as the temperature increases, and the resistance increases as the temperature decreases. The varying resistance affects the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Thermistor-type sensors are considered passive sensors. A passive sensor is connected to a voltage divider network so that varying the resistance of the passive sensor causes a variation in total current flow. Voltage that is dropped across a fixed resistor in a series with the sensor resistor determines the voltage signal at the PCM. This voltage signal is equal to the reference voltage minus the voltage drop across the fixed resistor.

The IAT provides air temperature information to the PCM. The PCM uses the air temperature information as a correction factor in the calculation of

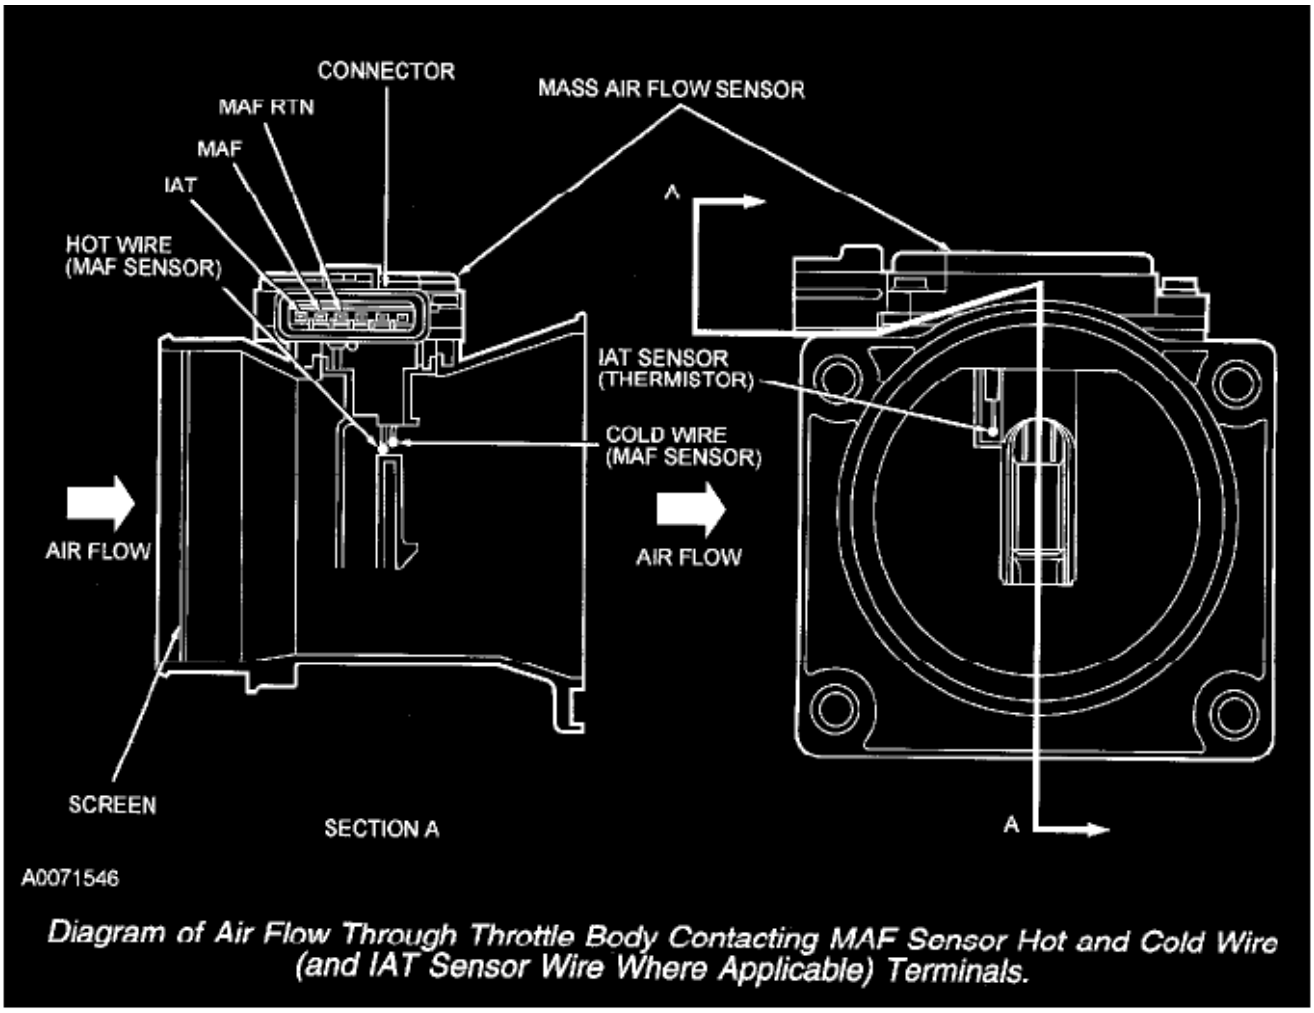


Diagram of Air Flow Through Throttle Body Contacting MAF Sensor Hot and Cold Wire (and IAT Sensor Wire Where Applicable) Terminals.

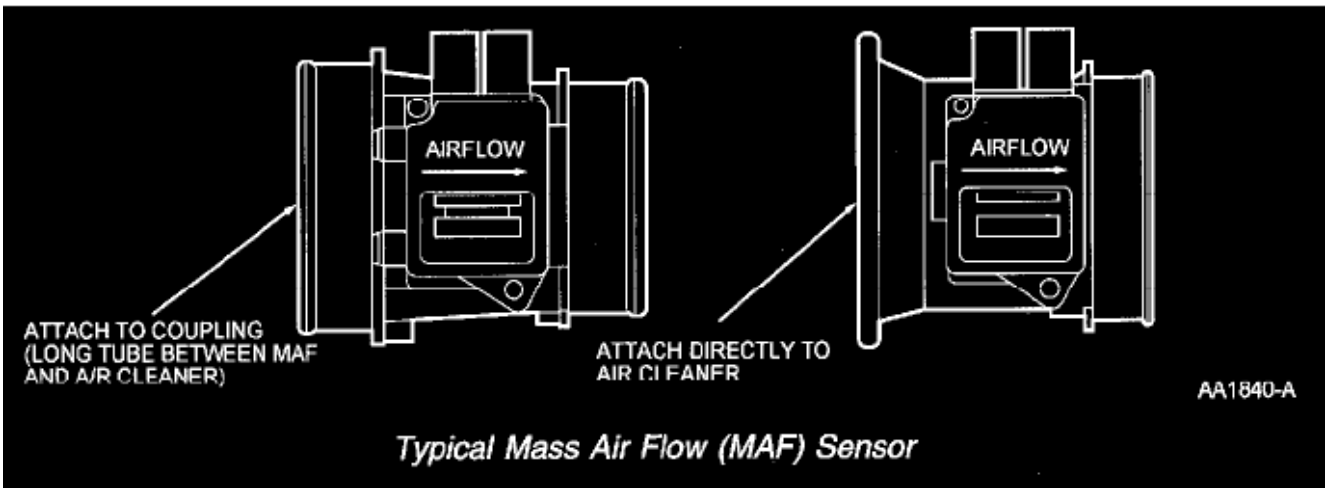


Typical Mass Air Flow (MAF) Sensor

fuel, spark, and air flow.

The IAT sensor provides a quicker temperature change response time than the ECT or CHT sensor.

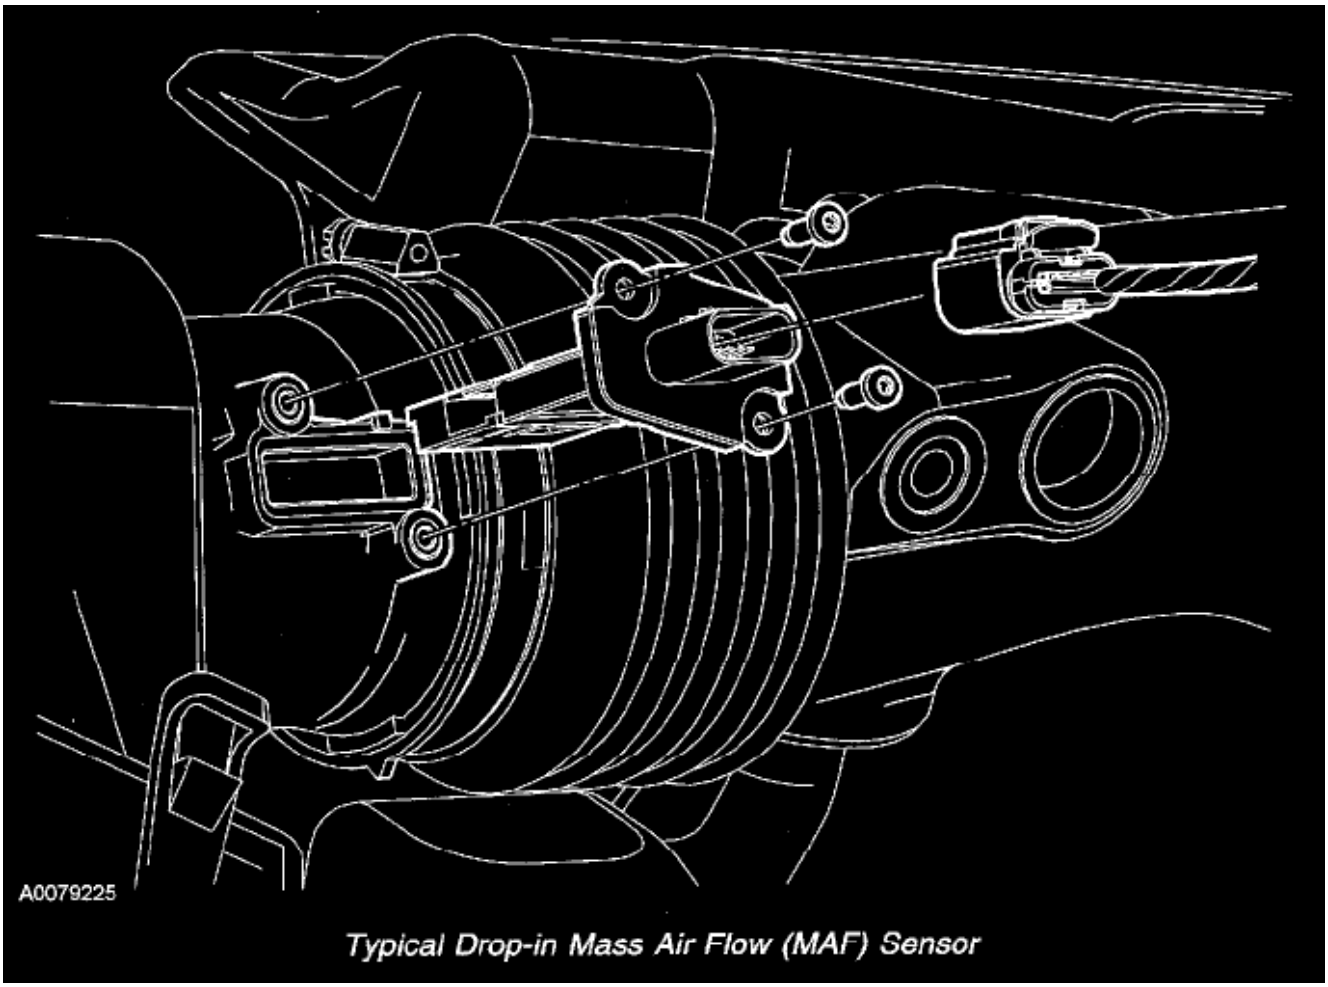
Currently there are 2 design types of IAT sensors used, a stand-alone/non-integrated type and a integrated type. Both types function the same, however the integrated type is incorporated into the mass air flow (MAF) sensor instead of being a stand alone sensor.

Supercharged vehicles use 2 IAT sensors. Both sensors are thermistor type devices and operate as described above. One is located before the supercharger at the air cleaner for standard OBD/cold weather input, while a second sensor (IAT2) is located after the supercharger in the intake manifold. The IAT2 sensor located after the supercharger provides air temperature information to the PCM to control spark and to help determine charge air cooler (CAC) efficiency.

Mass Air Flow (MAF) Sensor

Diagram Of Air Flow Through Throttle Body Contacting MAF Sensor Hot And Cold Wire (and IAT Sensor Wire Where Applicable) Terminals

Typical Mass Air Flow (MAF) Sensor



Typical Drop-in Mass Air Flow (MAF) Sensor

Typical Drop-in Mass Air Flow (MAF) Sensor

The MAF sensor uses a hot wire sensing element to measure the amount of air entering the engine. Air passing over the hot wire causes it to cool. This hot wire is maintained at 200°C (392°F) above the ambient temperature as measured by a constant cold wire. The current required to maintain the temperature of the hot wire is proportional to the mass air flow. The MAF sensor then outputs an analog voltage signal to the PCM proportional to the intake air mass. The PCM calculates the required fuel injector pulse width in order to provide the desired air/fuel ratio. This input is also used in determining transmission electronic pressure control (EPC), shift and torque converter clutch scheduling.

The MAF sensor is located between the air cleaner and the throttle body or inside the air cleaner assembly. Most MAF sensors have integrated bypass technology with an integrated intake air temperature (IAT) sensor. The hot wire electronic sensing element must be replaced as an assembly. Replacing only the element may change the air flow calibration.

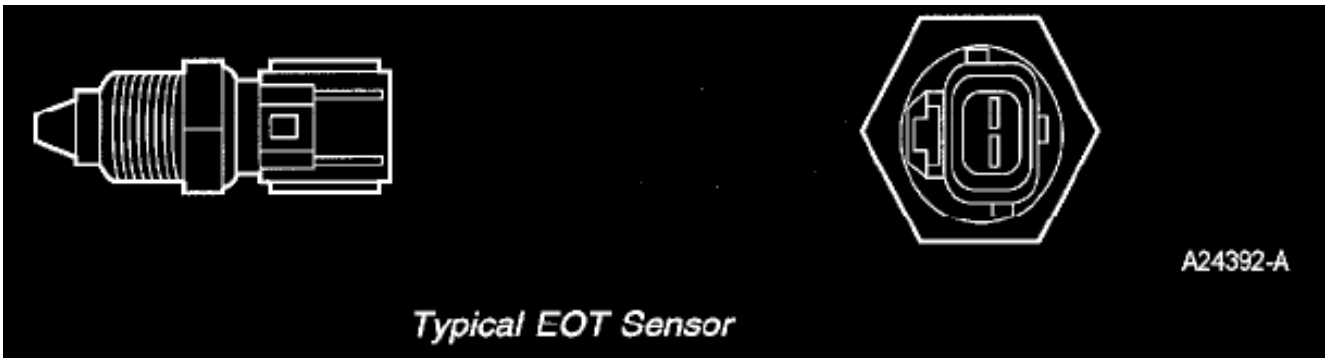
Manifold Pressure/Vacuum Sensor: Description and Operation

MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR

Typical Manifold Absolute Pressure (MAP) Sensor

The MAP sensor measures intake manifold absolute pressure. The PCM uses information from the MAP sensor to measure how much exhaust gas is introduced into the intake manifold.



Typical EOT Sensor

Oil Temperature Sensor For ECM: Description and Operation

ENGINE OIL TEMPERATURE (EOT) SENSOR

Typical EOT Sensor

The EOT sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of a thermistor decreases as the temperature increases and the resistance increases as the temperature decreases. The varying resistance changes the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Thermistor-type sensors are considered passive sensors. A passive sensor is connected to a voltage divider network so that varying the resistance of the passive sensor causes a variation in total current flow. Voltage that is dropped across a fixed resistor in a series with the sensor resistor determines the voltage signal at the PCM. This voltage signal is equal to the reference voltage minus the voltage drop across the fixed resistor.

The EOT sensor measures the temperature of the engine oil. The sensor is typically threaded into the engine oil lubrication system. The PCM can use the EOT sensor input to determine the following:

- On variable camshaft timing (VCT) applications the EOT input is used to adjust the VCT control gains and logic for camshaft timing.

- The PCM can use EOT sensor input in conjunction with other PCM inputs to determine oil degradation.

- The PCM can use EOT sensor input to initiate a soft engine shutdown. To prevent engine damage from occurring as a result of high oil temperatures, the PCM has the ability to initiate a soft engine shutdown. Whenever engine RPM exceeds a calibrated level for a certain period of time, the PCM begins reducing power by disabling engine cylinders.

Heated Oxygen Sensor (HO2S)

Oxygen Sensor: Description and Operation

Heated Oxygen Sensor (HO2S)

Heated Oxygen Sensor (HO2S)

The HO2S detects the presence of oxygen in the exhaust and produces a variable voltage according to the amount of oxygen detected. A high concentration of oxygen (lean air/fuel ratio) in the exhaust produces a voltage signal less than 0.4 volt. A low concentration of oxygen (rich air/fuel ratio) produces a voltage signal greater than 0.6 volt. The HO2S provides feedback to the PCM indicating air/fuel ratio in order to achieve a near stoichiometric air/fuel ratio of 14.7:1 during closed loop engine operation. The HO2S generates a voltage between 0.0 and 1.1 volts.

Embedded with the sensing element is the HO2S heater. The heating element heats the sensor to a temperature of 800°C (1,472°F). At approximately 300°C (572°F) the engine can enter closed loop operation. The VPWR circuit supplies voltage to the heater. The PCM turns the heater on by providing the ground when the correct conditions occur. The heater allows the engine to enter closed loop operation sooner. The use of this heater requires the HO2S heater control to be duty cycled, to prevent damage to the heater.

Universal HO2S

The universal HO2S, sometimes referred to as a wideband oxygen sensor, uses the typical HO2S combined with a current controller in the PCM to infer an air/fuel ratio relative to the stoichiometric air/fuel ratio. This is accomplished by balancing the amount of oxygen ions pumped in or out of a measurement chamber within the sensor. The typical HO2S within the universal HO2S is used to detect the oxygen content of the exhaust gas in the measurement chamber. The oxygen content inside the measurement chamber is maintained at the stoichiometric air/fuel ratio by pumping oxygen ions in and out of the measurement chamber. As the exhaust gasses get richer or leaner, the amount of oxygen that must be pumped in or out to maintain a stoichiometric air/fuel ratio in the measurement chamber varies in proportion to the air/fuel ratio. The amount of current required to

pump the oxygen ions in or out of the measurement chamber is used to measure the air/fuel ratio. The measured air/fuel ratio is actually the output from the current controller in the PCM and not a signal that comes directly from the sensor.

The universal HO2S also uses a self-contained reference chamber to make sure an oxygen differential is always present. The oxygen for the reference chamber is supplied by pumping small amounts of oxygen ions from the measurement chamber into the reference chamber. The universal HO2S does not need access to outside air.

Part to part variance is compensated for by placing a resistor in the connector. This resistor is used to trim the current measured by the current controller in the PCM.

Embedded with the sensing element is the universal H02S heater. The heater allows the engine to enter closed loop operation sooner. The heating element heats the sensor to a temperature of 780°C (1,436°F). The VPWR circuit supplies voltage to the heater. The PCM controls the heater on and off by providing the ground to maintain the sensor at the correct temperature for maximum accuracy.

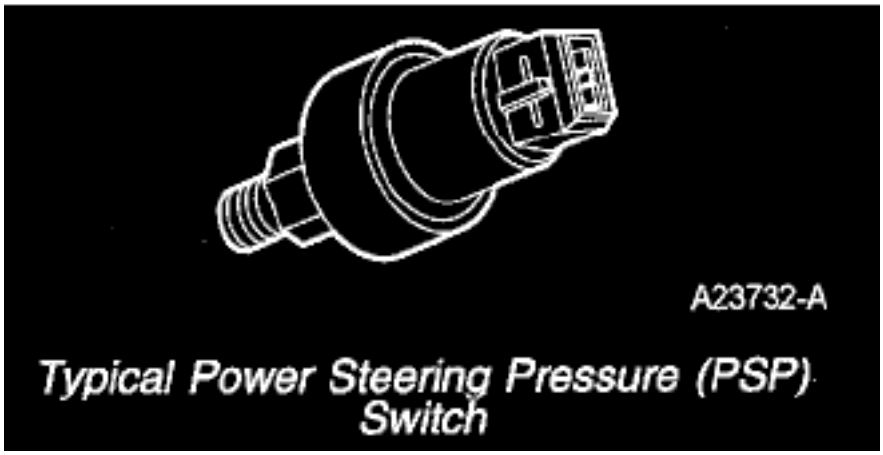
Typical Power Steering Pressure (PSP) Sensor



Typical Power Steering Pressure (PSP) Switch

Power Steering Pressure Switch: Description and Operation

Power Steering Pressure (PSP) Sensor

Typical Power Steering Pressure (PSP) Sensor

The PSP sensor monitors the hydraulic pressure within the power steering system. The PSP sensor voltage input to the PCM changes as the hydraulic pressure changes. The PCM uses the input signal from the PSP sensor to compensate for additional loads on the engine by adjusting the

idle RPM and preventing engine stall during parking maneuvers. Also, the PSP sensor signals the PCM to adjust the transmission electronic pressure control (EPC) pressure during increased engine load, for example, during parking maneuvers.

Power Steering Pressure (PSP) Switch

Typical Power Steering Pressure (PSP) Switch

The PSP switch monitors the hydraulic pressure within the power steering system. The PSP switch is a normally closed switch that opens as the hydraulic pressure increases. The PCM provides a low current voltage on the PSP circuit. When the PSP switch is closed, this voltage is pulled low through the SIG RTN circuit. The PCM uses the input signal from the PSP switch to compensate for additional loads on the engine by adjusting the idle RPM and preventing engine stall during parking maneuvers. Also, the PSP switch signals the PCM to adjust the transmission electronic pressure control (EPC) pressure during increased engine load, for example during parking maneuvers.

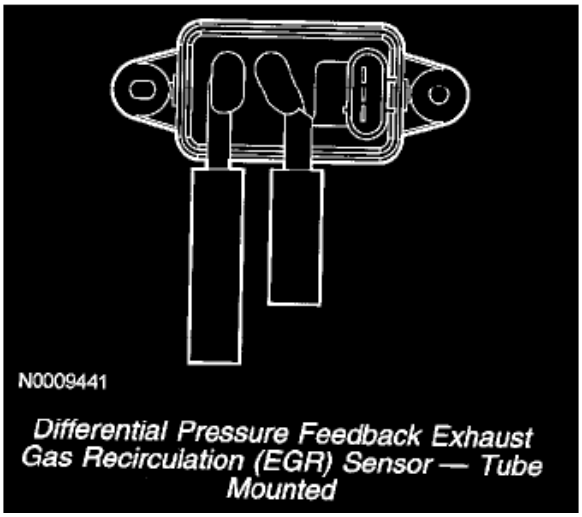
Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor



Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor — Tube Mounted

Pressure Feedback Exhaust Sensor: Description and Operation

Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor

Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor

The differential pressure feedback EGR sensor is a ceramic, capacitive-type pressure transducer that monitors the differential pressure across a metering orifice located in the orifice tube assembly. The differential pressure feedback EGR sensor receives this signal through 2 hoses referred to as the downstream pressure hose (REF SIGNAL) and upstream pressure hose (HI SIGNAL). The HI and REF hose connections are marked on the differential pressure feedback EGR sensor housing for identification (note that the HI signal uses a larger diameter hose). The differential pressure feedback EGR sensor outputs a voltage proportional to the pressure drop across the metering orifice and supplies it to the PCM as EGR flow rate feedback.

Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor - Tube Mounted

Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor - Tube Mounted

The tube mounted differential pressure feedback EGR sensor is identical in operation as the larger plastic differential pressure feedback EGR sensors and uses a 1.0 volt offset. The HI and REF

hose connections are marked on the side of the sensor.

Throttle Position Sensor: Description and Operation

Electronic Throttle Body (ETB) Throttle Position Sensor

The ETB throttle position sensor has 2 signal circuits in the sensor for redundancy. The redundant ETB throttle position signals are required for increased monitoring. The first ETB throttle position sensor signal (TP1) has a negative slope (increasing angle, decreasing voltage) and the second signal (TP2) has a positive slope (increasing angle, increasing voltage). The 2 ETB throttle position sensor signals make sure the PCM receives a correct input even if 1 signal has a concern. There is 1 reference voltage circuit and 1 signal return circuit for the sensor. The reference voltage circuit and the signal return circuit is shared with the reference voltage circuits and signal return circuits used by the APP sensor.

Throttle Position (TP) Sensor

Typical TP Sensor

The TP sensor is a rotary potentiometer sensor that provides a signal to the PCM that is linearly proportional to the throttle plate/shaft position. The sensor housing has a 3-blade electrical connector that may be gold plated. The gold plating increases the corrosion resistance on the terminals and increases the connector durability. The TP sensor is mounted on the throttle body. As the TP sensor is rotated by the throttle shaft, 4 operating conditions are determined by the PCM from the TP. The operating conditions are: -

closed throttle (includes idle or deceleration)

- part throttle (includes cruise or moderate acceleration)

- wide open throttle (includes maximum acceleration or de-choke on crank)

- throttle angle rate

Item	Part Number	Description
1	14A464	Throttle position (TP) sensor electrical connector (part of 12B637)
2	W707535	TP sensor screw (2 required)
3	9E928	TP sensor

Throttle Position Sensor: Service and Repair

THROTTLE POSITION (TP) SENSOR

Removal and Installation

1. Disconnect the throttle position (TP) sensor electrical connector.

2. CAUTION: Failure to remove the throttle position (TP) sensor screws in the following manner will result in damage to the screws. First,

loosen the screws 1 to 2 full turns using a hand tool, and then use a suitable high-speed driver to complete the removal.

Remove and discard the 2 bolts and the TP sensor. -

To install, tighten to 3 Nm (27 lb-in).

3. CAUTION: Do not use a high-speed driver to install the new screws or damage to the throttle position (TP) sensor may occur.

NOTE: -

Do not reuse the TP sensor and screws. A new TP sensor and screws must be installed.

- Failure to install the TP sensor in this manner may result in excessive idle speeds. Slide the rotary tangs into position over the throttle shaft blade, then rotate the TP sensor.

To install, reverse the removal procedure. -

Install a new TP sensor and screws.

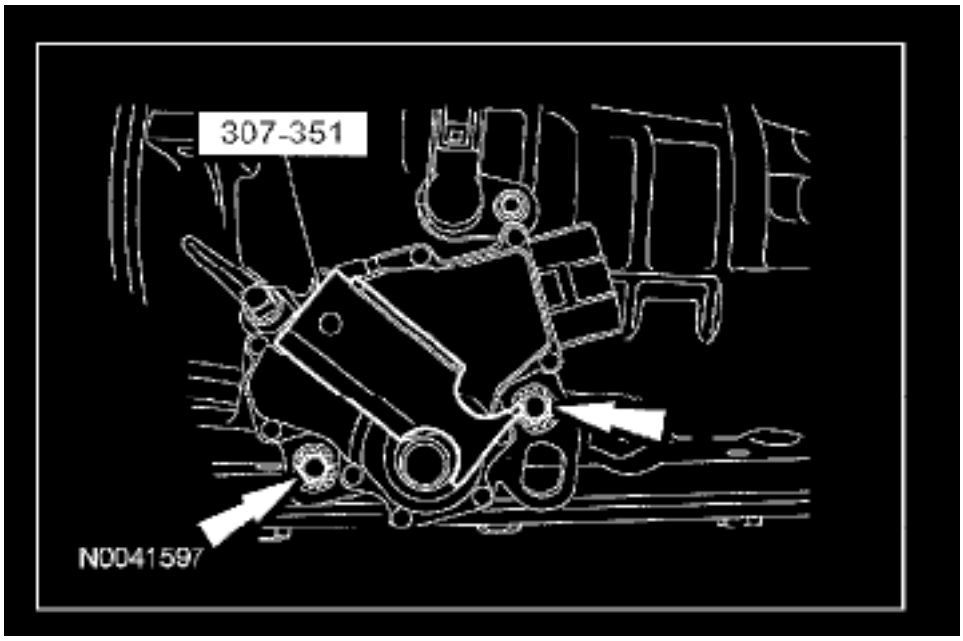
Remove the screws and the digital TR sensor.

Installation



1. CAUTION: The digital transmission range (TR) sensor must fit flush against the boss on the case to prevent damage to the sensor.

Install the digital TR sensor and loosely install the screws.

2. CAUTION: Tightening one screw before tightening the other may cause the sensor to bind or become damaged.

NOTE: The manual lever must be in the NEUTRAL position.

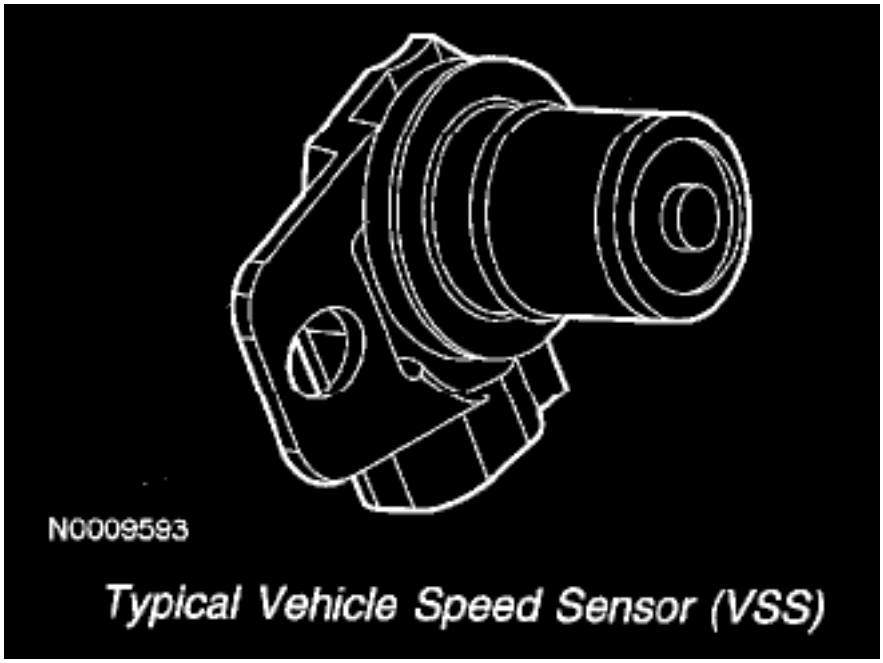
Using the special tool, align the digital TR sensor and tighten screws in an alternating sequence. ^

Tighten to 10 Nm (89 lb-inch).

3. Install the manual control outer lever and nut.

^ Tighten to 48 Nm (35 lb-ft).

4. Connect the digital TR sensor electrical connector. 5. Connect the selector lever cable to the manual control lever. 6. Verify that the selector lever cable is adjusted correctly.



Vehicle Speed Sensor: Description and Operation

Output Shaft Speed (OSS) Sensor

The OSS sensor provides the PCM with information about the rotational speed of an output shaft. The PCM uses the information to control and diagnose powertrain behavior. In some applications, the sensor is also used as the source of vehicle speed. The sensor may be physically located in different places on the vehicle, depending upon the specific application. The design of each speed sensor is unique and depends on which powertrain control feature uses the information that is generated.

Vehicle Speed Sensor (VSS)

Typical Vehicle Speed Sensor (VSS)

The VSS is a variable reluctance or Hall-effect sensor that generates a waveform with a frequency that is proportional to the speed of the vehicle. If the vehicle is moving at a relatively low velocity, the sensor produces a signal with a low frequency. As the vehicle velocity increases, the sensor generates a signal with a higher frequency. The PCM uses the frequency signal generated by the VSS (and other inputs) to control such parameters as fuel injection, ignition control, transmission/transaxle shift scheduling, and torque converter clutch scheduling.

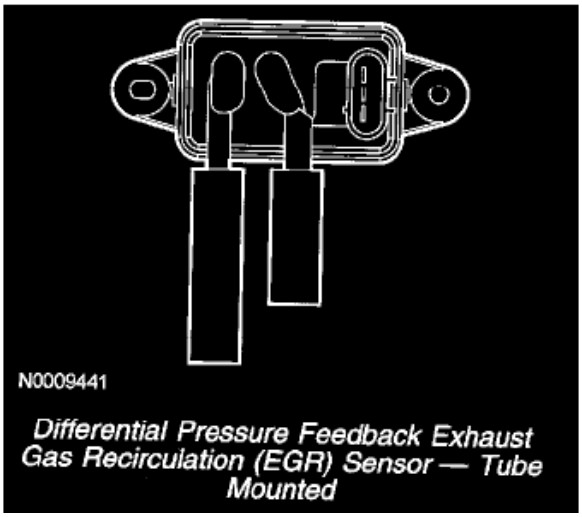
Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor



Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor — Tube Mounted

Pressure Feedback Exhaust Sensor: Description and Operation

Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor

Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor

The differential pressure feedback EGR sensor is a ceramic, capacitive-type pressure transducer that monitors the differential pressure across a metering orifice located in the orifice tube assembly. The differential pressure feedback EGR sensor receives this signal through 2 hoses referred to as the downstream pressure hose (REF SIGNAL) and upstream pressure hose (HI SIGNAL). The HI and REF hose connections are marked on the differential pressure feedback EGR sensor housing for identification (note that the HI signal uses a larger diameter hose). The differential pressure feedback EGR sensor outputs a voltage proportional to the pressure drop across the metering orifice and supplies it to the PCM as EGR flow rate feedback.

Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor - Tube Mounted

Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor - Tube Mounted

The tube mounted differential pressure feedback EGR sensor is identical in operation as the larger plastic differential pressure feedback EGR sensors and uses a 1.0 volt offset. The HI and REF

hose connections are marked on the side of the sensor.

Accelerator Pedal Position Sensor: Description and Operation

ACCELERATOR PEDAL POSITION (APP) SENSOR

The APP sensor is an input to the powertrain control module (PCM) and is used to determine the amount of torque requested by the operator. Depending on the application either a 2-track or 3-track APP sensor is used.

2-Track APP Sensor

2-Track APP Sensor

There are 2 pedal position signals in the sensor. Both signals, APP1 and APP2, have a positive slope (increasing angle, increasing voltage), but are offset and increase at different rates. The 2 pedal position signals make sure the PCM receives a correct input even if 1 signal has a concern. The PCM determines if a signal is incorrect by calculating where it should be, inferred from the other signals. If a concern is present with one of the circuits the other input is used. There are 2 reference voltage circuits, 2 signal return circuits, and 2 signal circuits (a total of 6 circuits and pins) between the PCM and the APP sensor assembly. The reference voltage circuits and the signal return circuits are shared with the reference voltage circuit and signal return circuit used by the electronic throttle body (ETB) throttle position sensor. The pedal position signal is converted to pedal travel degrees (rotary angle) by the PCM. The software then converts these degrees to counts, which is the input to the torque based strategy.

3-Track APP Sensor

Typical 3-Track APP Sensor

There are 3 pedal position signals in the sensor. Signal 1, APP1, has a negative slope (increasing angle, decreasing voltage) and signals 2 and 3, APP2 and APP3, both have a positive slope (increasing angle, increasing voltage). During normal operation APP1 is used as the indication of pedal position by the strategy. The 3 pedal position signals make sure the PCM receives a correct input even if 1 signal has a concern. The PCM determines if a signal is incorrect by calculating where it should be, inferred from the other signals. If a concern is present with one of the circuits the other inputs are used. The pedal position signal is converted to pedal travel degrees (rotary angle) by the PCM. The software then converts these degrees to counts, which is the input to the torque based strategy. There are 2 reference voltage circuits, 2 signal return circuits, and 3 signal circuits (a total of 7 circuits and pins) between the PCM and the APP sensor assembly. The reference voltage circuits and the signal return circuits are shared with the reference voltage circuit and signal return circuit used by the electronic throttle body (ETB) throttle position sensor.

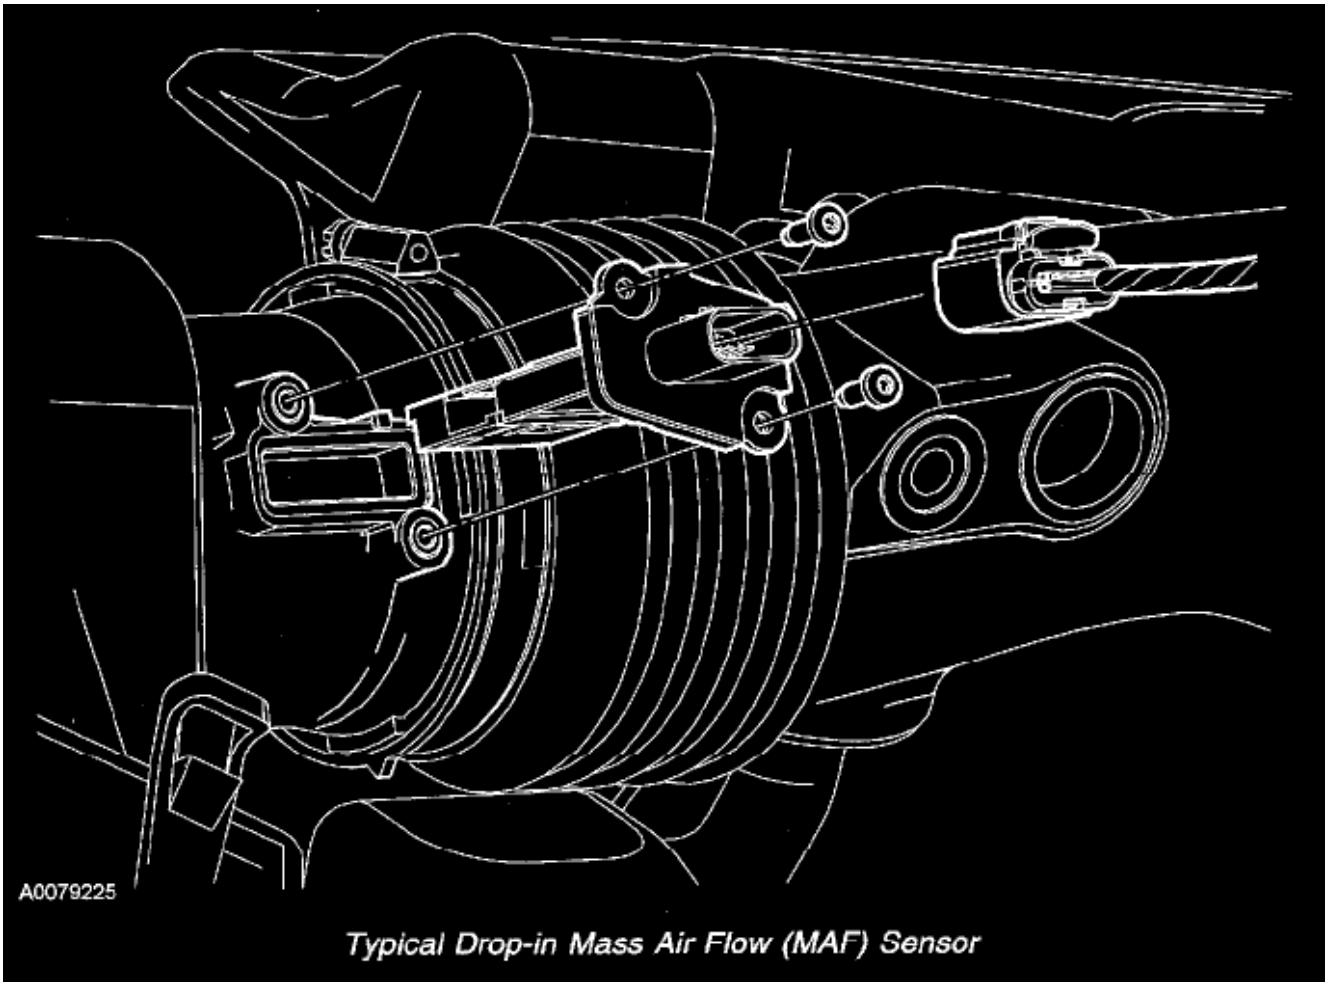
MASS AIR FLOW (MAF) SENSOR

Diagram Of Air Flow Through Throttle Body Contacting MAF Sensor Hot And Cold Wire (and IAT Sensor Wire Where Applicable) Terminals

Typical Mass Air Flow (MAF) Sensor



Typical Drop-in Mass Air Flow (MAF) Sensor

Typical Drop-in Mass Air Flow (MAF) Sensor

The MAF sensor uses a hot wire sensing element to measure the amount of air entering the engine. Air passing over the hot wire causes it to cool. This hot wire is maintained at 200°C (392°F) above the ambient temperature as measured by a constant cold wire. The current required to maintain the temperature of the hot wire is proportional to the mass air flow. The MAF sensor then outputs an analog voltage signal to the PCM proportional to the intake air mass. The PCM calculates the required fuel injector pulse width in order to provide the desired air/fuel ratio. This input is also used in determining transmission electronic pressure control (EPC), shift and torque converter clutch scheduling.

The MAF sensor is located between the air cleaner and the throttle body or inside the air cleaner assembly. Most MAF sensors have integrated bypass technology with an integrated intake air temperature (IAT) sensor. The hot wire electronic sensing element must be replaced as an assembly. Replacing only the element may change the air flow calibration.

Item	Part Number	Description

Typical Fuel Rail Pressure Temperature (FRPT) Sensor

Fuel Pressure Sensor/Switch: Description and Operation

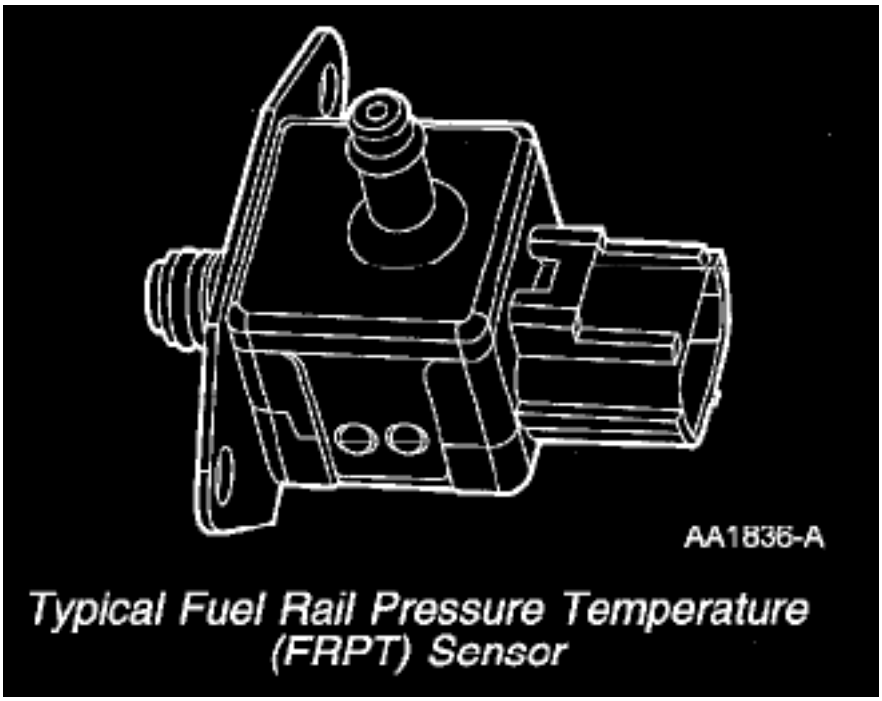
FUEL RAIL PRESSURE TEMPERATURE (FRPT) SENSOR

Typical Fuel Rail Pressure Temperature (FRPT) Sensor

The FRPT sensor measures the pressure and temperature of the fuel in the fuel rail and sends these signals to the PCM. The sensor uses the intake manifold vacuum as a reference to determine the pressure difference between the fuel rail and the intake manifold. The relationship between fuel pressure and fuel temperature is used to determine the possible presence of fuel vapor in the fuel rail.

The temperature sensing portion of the FRPT sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of the thermistor decreases as the temperature increases, and the resistance increases as the temperature decreases. The varying resistance changes the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Both the pressure and temperature signals are used to control the speed of the fuel pump. The speed of the fuel pump sustains fuel rail pressure which preserves fuel in its liquid state. The dynamic range of the fuel injectors increase because of the higher rail pressure, which allows the injector pulse width to decrease.



Typical Fuel Rail Pressure Temperature (FRPT) Sensor

Fuel Temperature Sensor: Description and Operation

FUEL RAIL PRESSURE TEMPERATURE (FRPT) SENSOR

Typical Fuel Rail Pressure Temperature (FRPT) Sensor

The FRPT sensor measures the pressure and temperature of the fuel in the fuel rail and sends these signals to the PCM. The sensor uses the intake manifold vacuum as a reference to determine the pressure difference between the fuel rail and the intake manifold. The relationship between fuel pressure and fuel temperature is used to determine the possible presence of fuel vapor in the fuel rail.

The temperature sensing portion of the FRPT sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of the thermistor decreases as the temperature increases, and the resistance increases as the temperature decreases. The varying resistance changes the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Both the pressure and temperature signals are used to control the speed of the fuel pump. The speed of the fuel pump sustains fuel rail pressure which preserves fuel in its liquid state. The dynamic range of the fuel injectors increase because of the higher rail pressure, which allows the injector pulse width to decrease.

Inertia Fuel Shutoff Switch: Description and Operation

INERTIA FUEL SHUTOFF (IFS) SWITCH

Typical Inertia Fuel Shutoff (IFS) Switch

The IFS switch is used in conjunction with the electric fuel pump. The purpose of the IFS switch is to shutoff the fuel pump if a collision occurs. It consists of a steel ball held in place by a magnet. When a sharp impact occurs, the ball breaks loose from the magnet, rolls up a conical ramp and strikes a target plate which opens the electrical contacts of the switch and shuts off the electric fuel pump. Once the switch is open, it must be manually reset before restarting the vehicle. Refer to the Owner's Literature, Roadside Emergencies for the location of the IFS switch.

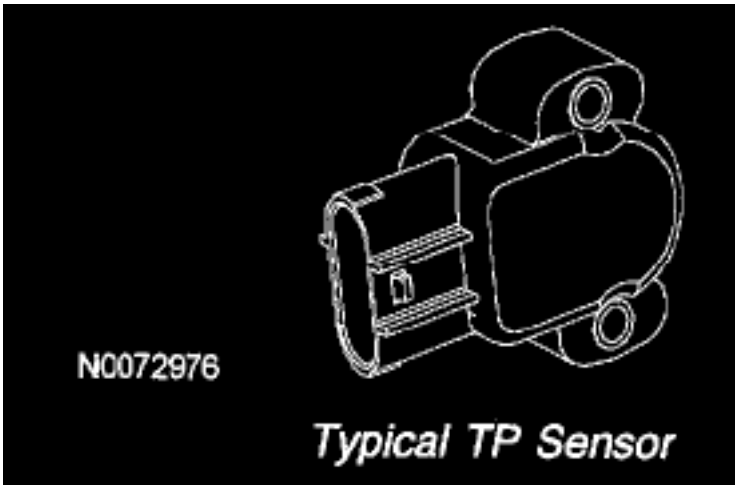
C1189



Throttle Position Sensor: Description and Operation

Electronic Throttle Body (ETB) Throttle Position Sensor

The ETB throttle position sensor has 2 signal circuits in the sensor for redundancy. The redundant ETB throttle position signals are required for increased monitoring. The first ETB throttle position sensor signal (TP1) has a negative slope (increasing angle, decreasing voltage) and the second signal (TP2) has a positive slope (increasing angle, increasing voltage). The 2 ETB throttle position sensor signals make sure the PCM receives a correct input even if 1 signal has a concern. There is 1 reference voltage circuit and 1 signal return circuit for the sensor. The reference voltage circuit and the signal return circuit is shared with the reference voltage circuits and signal return circuits used by the APP sensor.

Throttle Position (TP) Sensor

Typical TP Sensor

The TP sensor is a rotary potentiometer sensor that provides a signal to the PCM that is linearly proportional to the throttle plate/shaft position. The sensor housing has a 3-blade electrical connector that may be gold plated. The gold plating increases the corrosion resistance on the terminals and increases the connector durability. The TP sensor is mounted on the throttle body. As the TP sensor is rotated by the throttle shaft, 4 operating conditions are determined by the PCM from the TP. The operating conditions are: -

closed throttle (includes idle or deceleration)

- part throttle (includes cruise or moderate acceleration)

- wide open throttle (includes maximum acceleration or de-choke on crank)

- throttle angle rate

Item	Part Number	Description
1	14A464	Throttle position (TP) sensor electrical connector (part of 12B637)
2	W707535	TP sensor screw (2 required)
3	9E928	TP sensor

Throttle Position Sensor: Service and Repair

THROTTLE POSITION (TP) SENSOR

Removal and Installation

1. Disconnect the throttle position (TP) sensor electrical connector.

2. CAUTION: Failure to remove the throttle position (TP) sensor screws in the following manner will result in damage to the screws. First,

loosen the screws 1 to 2 full turns using a hand tool, and then use a suitable high-speed driver to complete the removal.

Remove and discard the 2 bolts and the TP sensor. -

To install, tighten to 3 Nm (27 lb-in).

3. CAUTION: Do not use a high-speed driver to install the new screws or damage to the throttle position (TP) sensor may occur.

NOTE: -

Do not reuse the TP sensor and screws. A new TP sensor and screws must be installed.

- Failure to install the TP sensor in this manner may result in excessive idle speeds. Slide the rotary tangs into position over the throttle shaft blade, then rotate the TP sensor.

To install, reverse the removal procedure. -

Install a new TP sensor and screws.

Typical Synchronizer Hall-Effect CMP Sensor

Typical Variable Reluctance CMP Sensor

Camshaft Position Sensor: Description and Operation

CAMSHAFT POSITION (CMP) SENSOR

Typical Synchronizer Hall-Effect CMP Sensor

Typical Variable Reluctance CMP Sensor

The CMP sensor detects the position of the camshaft. The CMP sensor identifies when piston number 1 is on its compression stroke. A signal is then sent to the PCM and used for synchronizing the sequential firing of the fuel injectors. Coil on plug (COP) ignition applications use the CMP signal to select the correct ignition coil to fire.

Vehicles with 2 CMP sensors are equipped with variable camshaft timing (VCT). They use the second sensor to identify the position of the camshaft on bank 2 as an input to the PCM.

There are 2 types of CMP sensors: the 3-pin connector Hall-effect type sensor and the 2-pin connector variable reluctance type sensor.

Removal

1. Disconnect the camshaft position (CMP) sensor electrical connector.

2. NOTE: Prior to the removal of the CMP sensor, note the position of the CMP sensor electrical connector. The installation procedure requires that

the electrical connector be located in the same position.

Remove the 2 bolts and the CMP sensor.

3. Remove the camshaft synchronizer bolt. 4. Remove the camshaft synchronizer. Inspect the O-ring seal and install a new O-ring seal if damaged.

Installation

1. CAUTION:

- After installation, do not loosen the synchronizer bolt and rotate the synchronizer assembly. The synchronizer assembly is not adjustable. Do not loosen the synchronizer bolt after the alignment tool has been removed in order to align the camshaft position (CMP) sensor electrical connector for any reason. If the electrical connector is not in the correct position, the synchronizer assembly must be removed. The alignment tool and the assembly must be reinstalled if the engine has not been rotated from top dead center (TDC) of the compression stroke on the No. 1 cylinder. Failure to follow this procedure will result in the fuel system being out of time with the engine, possibly causing engine damage.

- Do not turn the crankshaft or camshaft during the removal and installation procedure or the fuel system timing will be out of time with the engine, possibly causing engine damage.

- A special tool must be used during the installation of the new synchronizer assembly. Failure to follow this procedure will result in the fuel system being out of time with the engine, possibly causing engine damage.

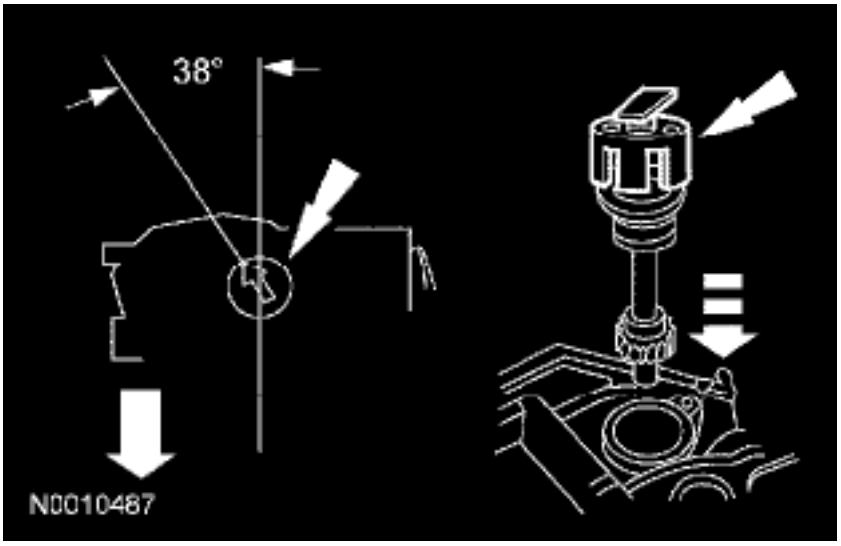
Install the special tool on the camshaft synchronizer by rotating the tool until it engages the notch in the camshaft synchronizer housing and the armature.

2. CAUTION: It is very important to coat the gear on the camshaft synchronizer with engine oil prior to installation. Failure to do so may

result in gear failure.

NOTE: During installation, the arrow on the special tool will rotate clockwise until the oil pump intermediate shaft and the camshaft gear engages.

Install the camshaft synchronizer housing assembly so the arrow on the special tool is 38 degrees from the centerline of the engine.



3. Install the camshaft synchronizer housing bolt.

- Tighten to 30 Nm (22 lb-ft).

4. Position the CMP sensor and install the 2 bolts.

- Tighten to 3 Nm (27 lb-in).

5. Connect the CMP sensor electrical connector.

Crankshaft Position Sensor: Description and Operation

CRANKSHAFT POSITION (CKP) SENSOR

Typical Crankshaft Position (CKP) Sensor

The CKP sensor is a magnetic transducer mounted on the engine block adjacent to a pulse wheel located on the crankshaft. By monitoring the crankshaft mounted pulse wheel, the CKP is the primary sensor for ignition information to the PCM. The pulse wheel has a total of 35 teeth spaced 10 degrees apart with one empty space for a missing tooth. The 6.8L 10-cylinder pulse wheel has 39 teeth spaced 9 degrees apart and one 9 degree empty space for a missing tooth. By monitoring the pulse wheel, the CKP sensor signal indicates crankshaft position and speed information to the PCM. By monitoring the missing tooth, the CKP sensor is also able to identify piston travel in order to synchronize the ignition system and provide a way of tracking the angular position of the crankshaft relative to a fixed reference for the CKP sensor configuration. The PCM also uses the CKP signal to determine if a misfire has occurred by measuring rapid decelerations between teeth.

Item	Part Number	Description

2	N606500	CKP sensor bolt (2 required)
3	6C315	CKP sensor

Crankshaft Position Sensor: Service and Repair

CRANKSHAFT POSITION (CKP) SENSOR

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. 2. Disconnect the crankshaft position (CKP) sensor electrical connector. 3. Remove the 2 bolts and the CKP sensor.

- To install, tighten to 10 Nm (89 lb-in).

4. To install, reverse the removal procedure.

Item	Part Number	Description
1	—	Ignition lock cylinder release hole (part of 3530)
2	11582	Ignition lock cylinder

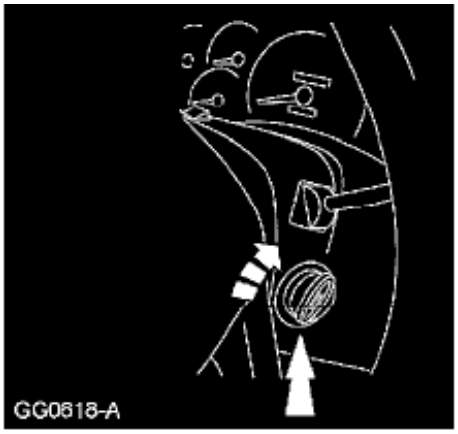
Ignition Switch Lock Cylinder: Service and Repair Ignition Lock Cylinder - Functional

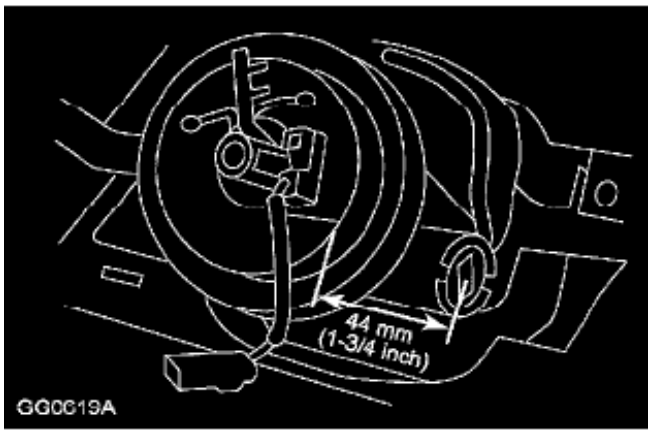
IGNITION LOCK CYLINDER - FUNCTIONAL

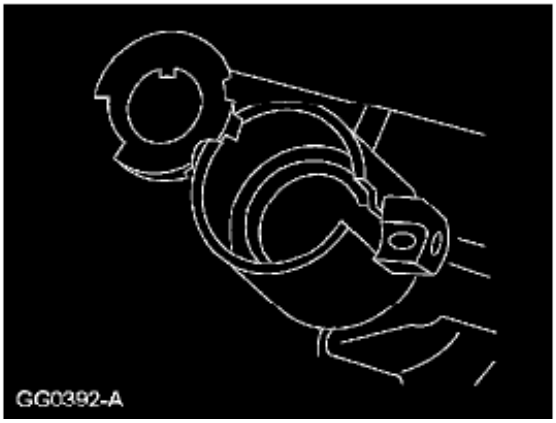
Removal and Installation

1. Disconnect the battery ground cable. 2. Insert the ignition key and turn to the RUN position. 3. Press the ignition lock cylinder release pin and remove the ignition lock cylinder. 4. To install, reverse the removal procedure.

- Verify ignition lock cylinder operation.







Ignition Switch Lock Cylinder: Service and Repair Ignition Lock Cylinder - Non Functional

IGNITION LOCK CYLINDER - NON FUNCTIONAL

Removal and Installation

1. NOTE: Make sure the front wheels are in the straight-ahead position.

Remove the steering wheel assembly.

2. Twist off the cap from the ignition lock cylinder.

3. NOTE: The lock cylinder is repaired by discarding the inoperative lock cylinder and building a new lock cylinder using the appropriate lock

repair package (F85Z-11582-AA). The lock repair package includes a detailed instruction sheet to build the new lock cylinder to the current key code of the vehicle.

Remove the ignition lock cylinder. -

Use a 1/8-inch diameter drill bit to drill out the lock cylinder retaining pin.

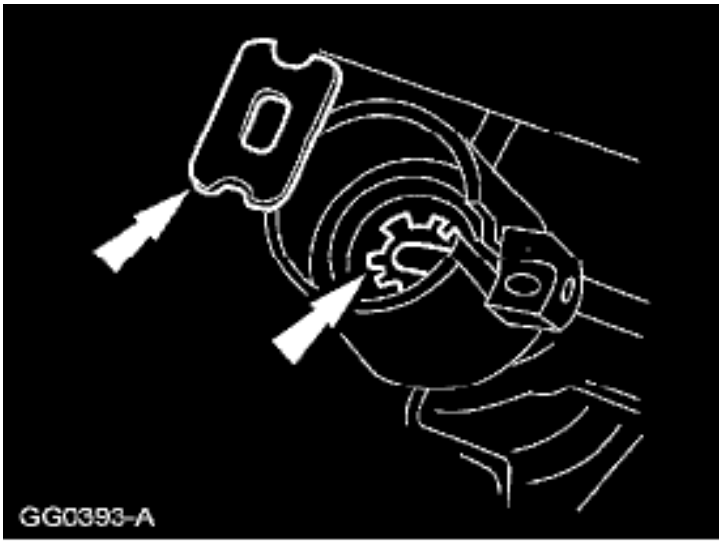
- Use a 3/8-inch drill bit to drill down the middle of the ignition lock key slot until the ignition lock cylinder breaks loose.

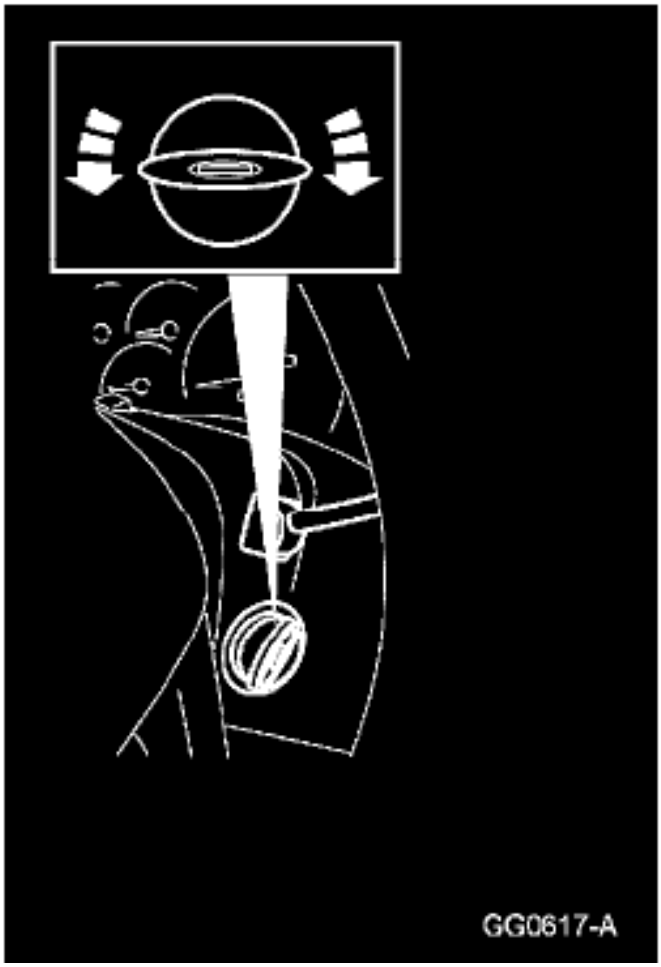
- Remove and discard the ignition lock cylinder and clean the drill shavings from the steering column.

4. Remove the bearing retainer.

5. Remove the bearing and gear.

- Thoroughly clean all drill shavings from the steering column and inspect it for damage.





6. To install, reverse the removal procedure.

- Install a new ignition lock cylinder.
- Verify ignition lock cylinder operation.

Impact Sensor: Service and Repair

FRONT IMPACT SEVERITY SENSOR

Removal and Installation

WARNING:

- If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the air bags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.

- Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.

NOTE:

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

- Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

All vehicles

1. Depower the SRS.

Vehicles equipped with 2.3L and A/C

2. For the RH front impact severity sensor, remove the air cleaner and air cleaner outlet pipe.

All vehicles

3. NOTE:

- Make sure the radiator support and front impact severity sensor mating surfaces are clean and free of foreign material.

- Note position of locator tab on sensor bracket for installation.

Remove the front impact severity sensor bolt. -

To install, tighten to 12 Nm (9 lb-ft).

4. Disconnect the front impact severity sensor electrical connector and remove the sensor. 5. To install, reverse the removal procedure. 6. Repower the SRS.

Seat Belt Tension Sensor: Description and Operation

BELT TENSION SENSOR (BTS)

The safety belt tension sensor (BTS) is part of the passenger front safety belt and retractor assembly and is not serviced separately. The safety BTS is located at the safety belt anchor point and is used in conjunction with the occupant classification sensor (OCS) system. For information on diagnosing the BTS and OCS or servicing the OCS system, refer to the appropriate procedure in Air Bag Systems.

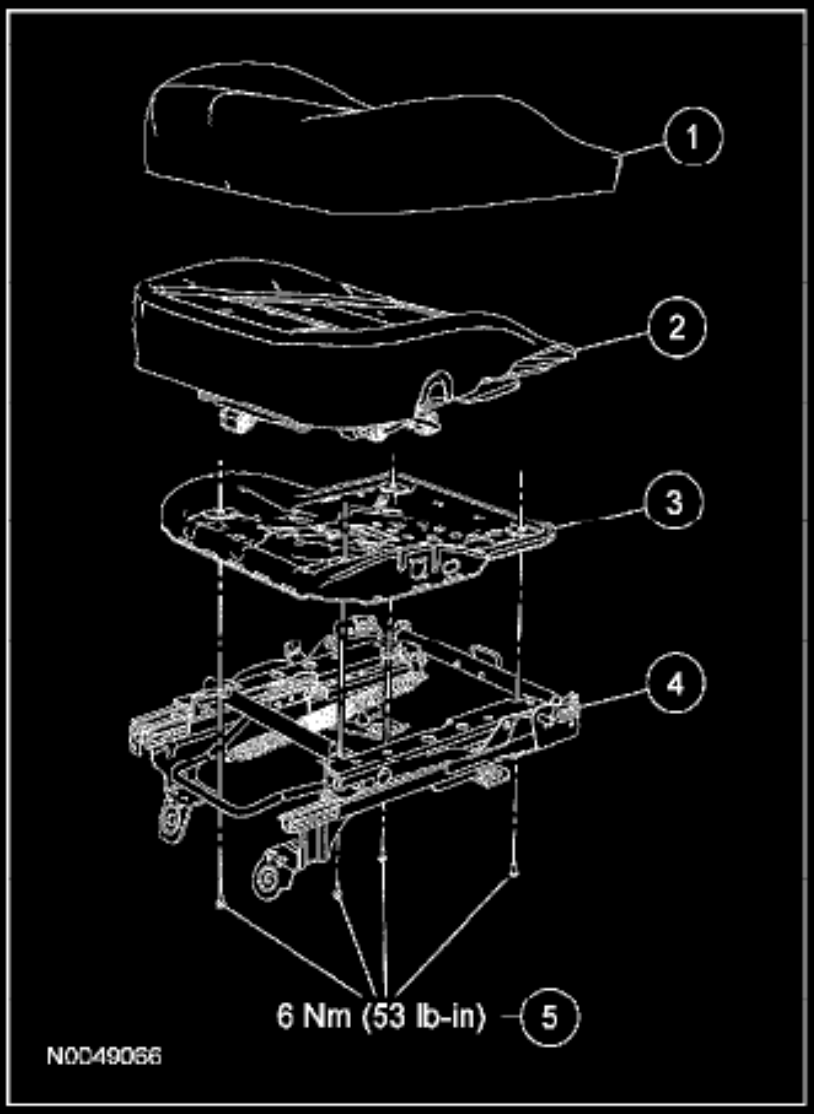
Seat with a Service Kit Occupant Classification Sensor



Item	Part Number	Description
1	62900	Seat cushion trim cover
2	603B02	Occupant classification sensor (OCS) system service kit (foam pad, bladder, hose with pressure sensor, OCSM and wiring harness)
3	63101	Seat cushion frame
4	—	Seat track assembly
5	—	Seat track-to-cushion frame bolts

Seat With A Service Kit Occupant Classification Sensor

Removal

WARNING: -

Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.

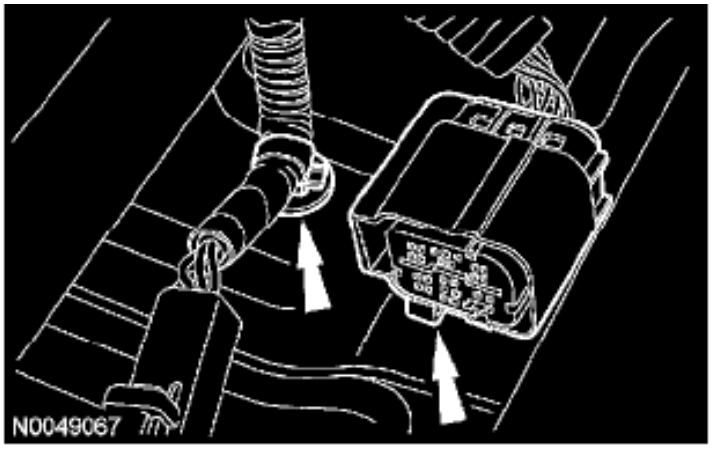
- Install a new occupant classification sensor (OCS) system service kit as a complete assembly. Never install only part of the kit components. Failure to follow this instruction may result in incorrect operation of the OCS system and increases the risk of serious personal injury or death in a crash.

- Make sure the front passenger seat repair is complete, the seat and all attached components (head restraint, seat side shield, etc.) are correctly assembled, and the seat is correctly installed to the vehicle before carrying out the System Reset. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increases the risk of serious personal injury or death in a crash.

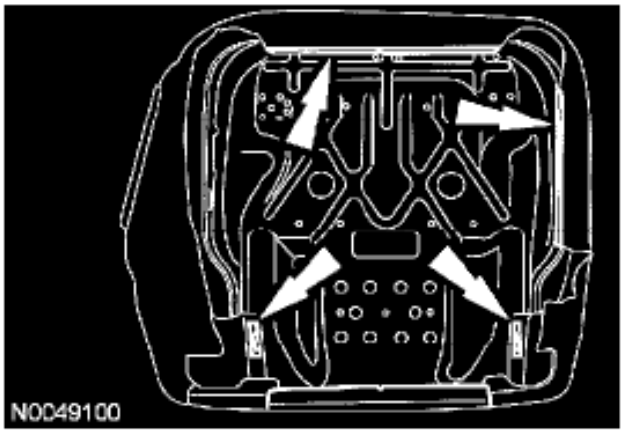
CAUTION: To prevent system failure, it is necessary to carry out the occupant classification sensor (OCS) system reset when a front passenger seat cushion is disassembled, a new trim cover installed or an OCS system service kit is installed. A scan tool is used to carry out the OCS system reset command.

NOTE: -

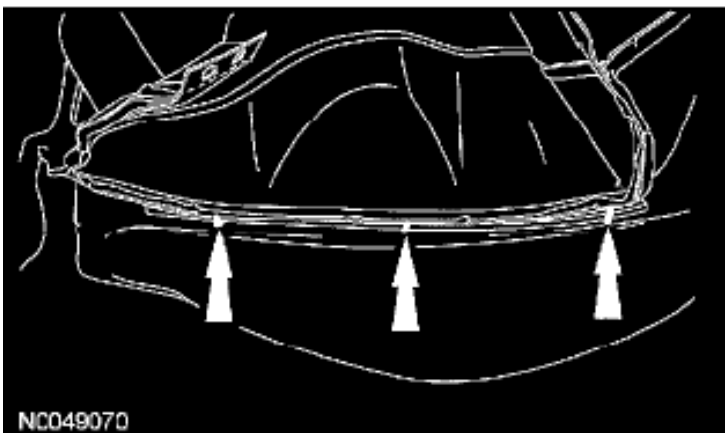
Occupant classification sensor (OCS) system components (seat cushion foam pad, bladder with pressure sensor and occupant classification system module [OCSM]) are calibrated to each other and are serviced as an assembly. The OCS system components are not to be installed separately. If a



N0049067



N0049100



N0049070

new OCS system, OCS system component or seat cushion foam pad are needed, a new OCS system service kit (seat cushion foam pad, bladder with pressure sensor, OCSM and seat wiring harness) must be installed as an assembly.

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

- Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and perform the diagnostic procedure again.

1. Remove the passenger seat. 2. Remove the seat backrest.

3. NOTE: Note position of wire routing for installation.

Release the seat wiring harness retainer clip and detach the seat wiring harness connector from the seat cushion frame.

4. Release the cushion trim cover rear J-clip. 5. Remove the 4 seat track-to-cushion frame bolts and the seat track assembly. 6. Release the remaining cushion trim cover J-clips.

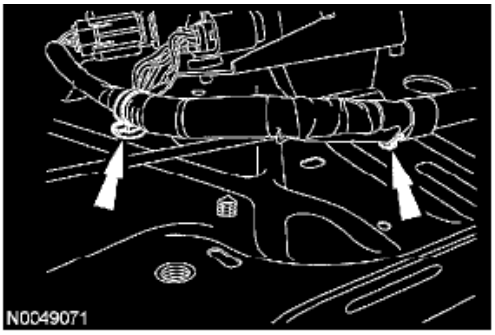
7. CAUTION: An occupant classification sensor (OCS) system service kit will have the OCS system bladder attached to the seat cushion

foam pad. Do not separate the OCS system bladder from the seat cushion foam pad. Failure to do so can result in component failure.

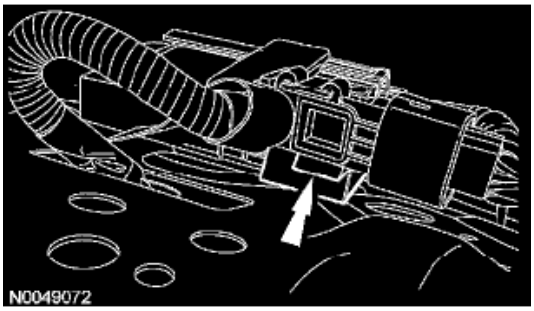
Remove the hog rings and the cushion trim cover from the seat cushion foam pad.

8. NOTE: Note position of wire routing for installation.

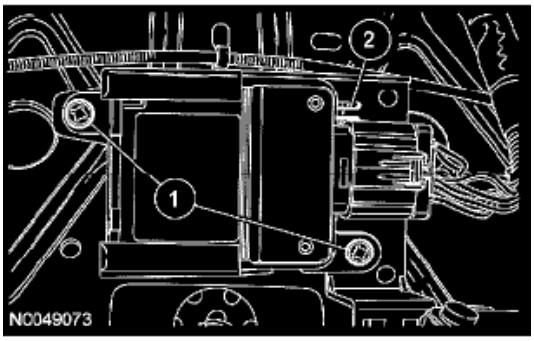
Release the 2 seat wiring harness routing clips from the cushion frame.



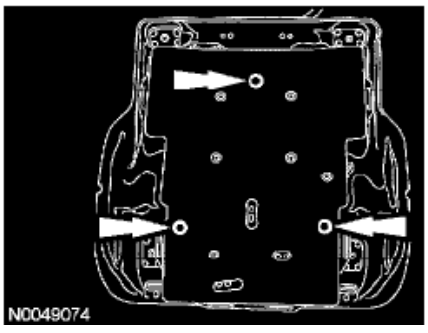
N0049071



N0049072



2
1
N0049073



N0049074

9. Release the pressure sensor bracket retainer and slide the pressure sensor off the bracket.

10. Remove the OCSM.

1 Remove the 2 screws from the OCSM.

2 Release the OCSM bracket retainer and slide the OCSM off the bracket.

11. CAUTION: A production occupant classification sensor (OCS) system bladder is shown. An OCS system service kit will have the OCS

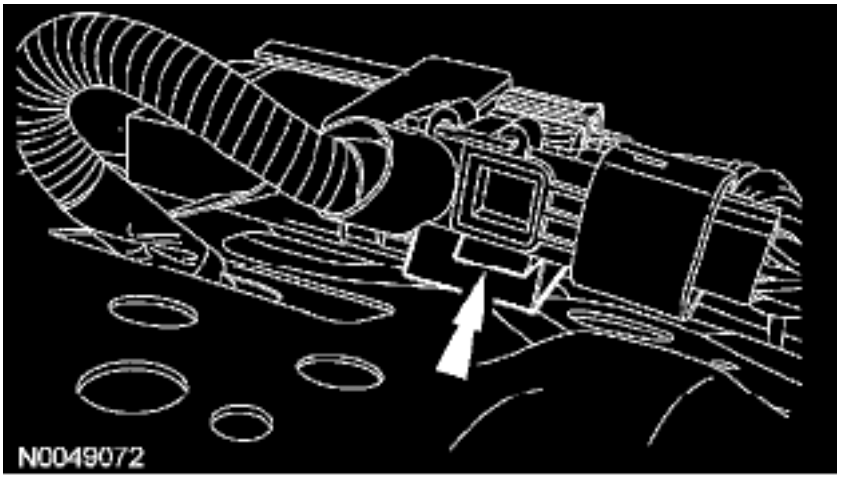
system bladder attached to the seat cushion foam pad. Do not separate the OCS system bladder from the seat cushion foam pad. Failure to do so can result in component failure.

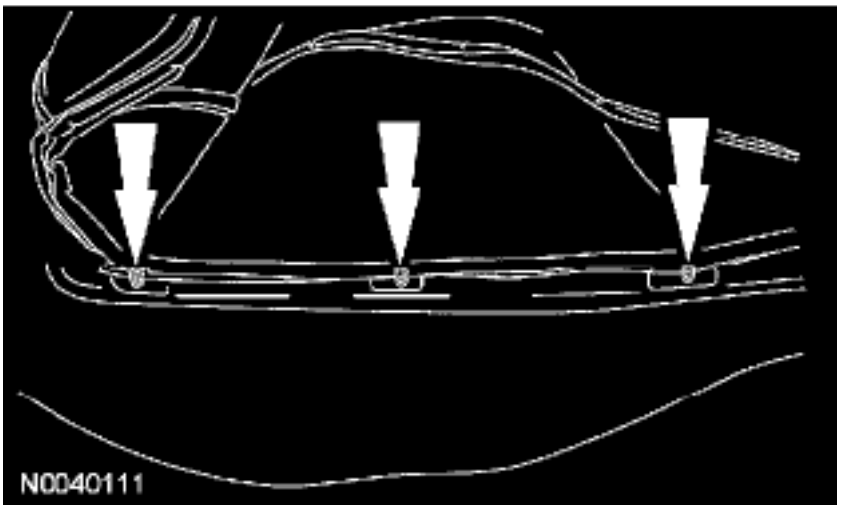
Release the 3 OCS system bladder pin-type retainers from the seat cushion frame.

12. NOTE: Note position of wire routing for installation.

Route the OCS system bladder hose and pressure sensor, OCSM and seat wiring harness out through the seat cushion pan opening.

Installation





1. WARNING: Install a new occupant classification sensor (OCS) system service kit as a complete assembly. Never install only part of the

kit components. Failure to follow this instruction may result in incorrect operation of the OCS system and increases the risk of serious personal injury or death in a crash.

CAUTION: -

Inspect the occupant classification sensor (OCS) system assembly, seat cushion frame and support assembly for any foreign objects before installing the OCS system assembly to the seat cushion frame. If any foreign objects are found, remove them. Failure to follow these instructions may result in incorrect OCS system operation or failure.

- Failure to route the seat occupant sensor components through the correct seat cushion support opening can cause component failure.

- While positioning the seat cushion pan and occupant classification sensor (OCS) assembly, be careful not to damage any of the components. Failure to do so may result in component failure.

NOTE: If the original equipment OCS system is not being installed, install a OCS system service kit using all parts in the kit.

Position the OCS system to the seat cushion frame. -

Route the OCS system bladder hose and pressure sensor, OCSM and seat wiring harness through the seat cushion pan opening.

2. CAUTION: An occupant classification sensor (OCS) system service kit will have the OCS bladder attached to the seat cushion foam pad.

Do not separate the OCS system bladder from the seat cushion foam pad. Failure to do so may result in component failure.

Install the 3 OCS system bladder pin-type retainers to the seat cushion frame.

3. Install the OCSM.

- Slide the OCSM back on the OCSM bracket until it is fully seated and locked in past the OCSM bracket retainer.

- Install the 2 screws in the OCSM.

4. Slide the pressure sensor on the bracket until it is fully seated and locked past the bracket retainer.

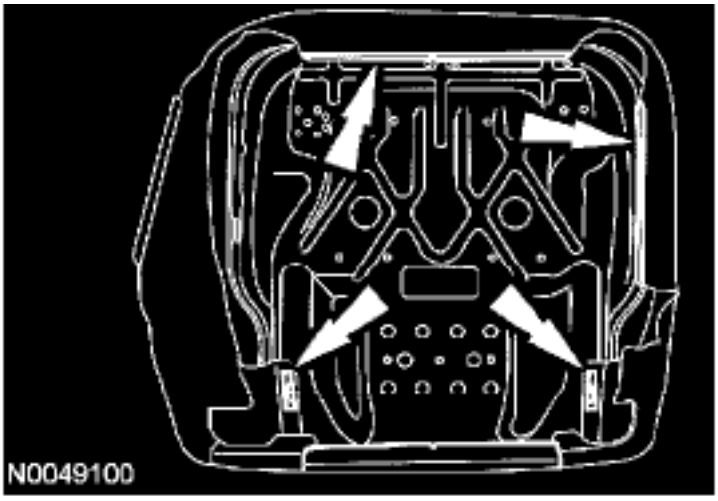
5. Install the 2 seat wiring harness routing clips to the seat cushion frame.

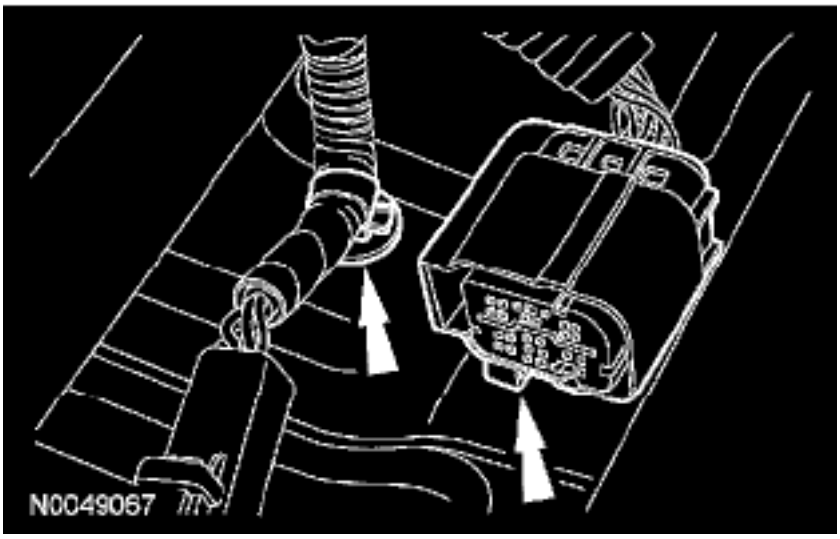
6. CAUTION: Inspect the seat cushion pad and seat cushion trim cover for any foreign objects, before installing the seat cushion trim cover

to the seat cushion pad. If any foreign objects are found, remove them. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and may cause system failure.

Position the cushion trim cover to the foam pad and install the hog rings.

7. Install the foam pad and cushion trim cover to the cushion frame and fasten the J-clips.





8. Install the seat track assembly and 4 bolts.

- Tighten to 6 Nm (53 lb-in).

9. Attach the seat cushion trim cover rear J-clip.

10. Install the seat wiring harness retainer clip and attach the seat wiring harness connector to the seat cushion frame.

11. Install the front seat backrest. 12. Install the passenger seat into the vehicle. 13. Repower the SRS. Do not prove out the SRS at this time.

14. WARNING:

- Install a new occupant classification sensor (OCS) system service kit as a complete assembly. Never install only part of the kit components. Failure to follow this instruction may result in incorrect operation of the OCS system and increases the risk of serious personal injury or death in a crash.

- Make sure the front passenger seat repair is complete, the seat and all attached components (head restraint, seat side shield, etc.) are correctly assembled, and the seat is correctly installed to the vehicle before carrying out the System Reset. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increases the risk of serious personal injury or death in a crash.

CAUTION: -

To prevent system failure, it is necessary to carry out the occupant classification sensor (OCS) system reset of the OCS system when a front passenger seat cushion is disassembled, a new trim cover installed or an OCS system service kit is installed. A scan tool is used to carry out the OCS system reset command.

- To prevent system failure, the following precautions must be taken before carrying out the occupant classification sensor (OCS) system reset: -

Make sure the voltage to the occupant classification system module (OCSM) is above 8.0 volts and less than 18.0 volts.

- Make sure the OCS system is not at a temperature below 6°C (42°F) or above 36°C (97°F) when initiating the OCS system reset process. If the vehicle has been exposed to extreme cold or hot temperatures, the vehicle must be exposed and kept at a temperature within the limits, 6°C to 36°C (42°F to 97°F) for a minimum of 30 minutes.

- Make sure nothing is present on the passenger seat before carrying out the OCS system reset and nothing is placed on the seat during the process.

- Make sure a minimum 8-second time period has passed after cycling the ignition switch ON before the carrying out the OCS system reset process.

NOTE: If the first attempt to carry out the OCS system reset is unsuccessful, a second attempt must be made. If the second attempt is unsuccessful, a new OCS system service kit must be installed.

Carry out the OCS system reset active command.

15. Cycle the ignition switch from ON to OFF.

16. NOTE: The ignition switch must be cycled after the OCS system reset.

Cycle the ignition switch from OFF to ON.

17. Prove out the SRS as follows:

Turn the ignition key from ON to OFF. Wait 10 seconds, then turn the key back to ON and visually monitor the air bag indicator with the air bag modules installed. The air bag indicator will light continuously for approximately 6 seconds and then turn off. If an air bag SRS fault is present, the air bag indicator will: -

fail to light.

- remain lit continuously.

- flash at a 5 Hz rate (RCM not configured).

The air bag warning indicator may not illuminate until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.

Clear all continuous RCM and OCSM DTCs using a scan tool.

18. NOTE: A prepaid return postcard is provided with a new OCS system service kit. The serial number for the new part and the vehicle

identification number (VIN) must be recorded and sent to Ford Motor Company.

If a new OCS system was installed, fill out the necessary information on the OCS system traceability card and return it along with the complete inoperative OCS system to Ford Motor Company. -

When returning the inoperative OCS system include: seat cushion foam pad, bladder, OCSM, pressure sensor (transducer), hose, electrical connectors and wire harness (service part OCS system only).

Seat Position Sensor: Service and Repair

SEAT POSITION SENSOR

Removal and Installation

WARNING: Always tighten the seat position sensor retaining bolt to specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.

NOTE:

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

- Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

1. Depower the SRS. 2. Remove the driver seat. 3. Remove the seat track.

4. NOTE: Note the position of the seat position sensor locator tab for installation.

Remove the 2 screws and the seat position sensor and bracket.

5. To install, reverse the removal procedure. 6. Repower the SRS.

1	—	Ignition lock cylinder release hole (part of 3530)
2	11582	Ignition lock cylinder

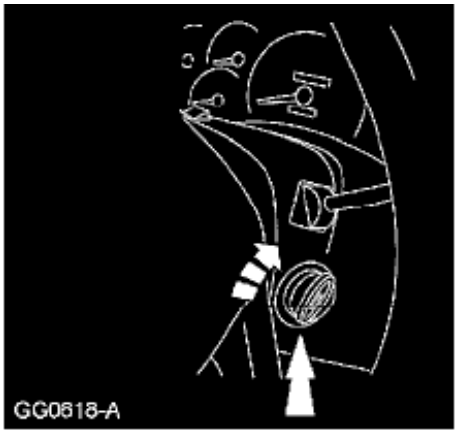
Ignition Switch Lock Cylinder: Service and Repair Ignition Lock Cylinder - Functional

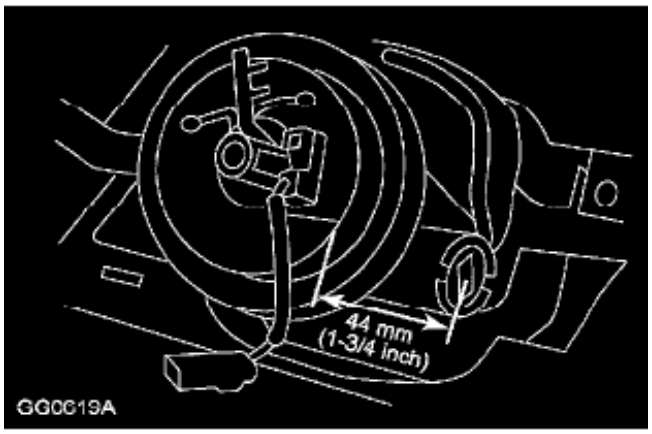
IGNITION LOCK CYLINDER - FUNCTIONAL

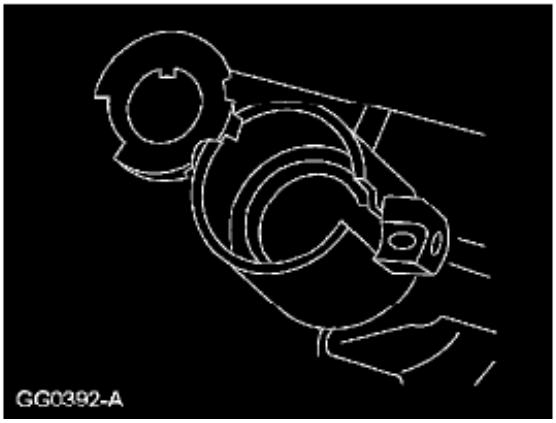
Removal and Installation

1. Disconnect the battery ground cable. 2. Insert the ignition key and turn to the RUN position. 3. Press the ignition lock cylinder release pin and remove the ignition lock cylinder. 4. To install, reverse the removal procedure.

- Verify ignition lock cylinder operation.







Ignition Switch Lock Cylinder: Service and Repair Ignition Lock Cylinder - Non Functional

IGNITION LOCK CYLINDER - NON FUNCTIONAL

Removal and Installation

1. NOTE: Make sure the front wheels are in the straight-ahead position.

Remove the steering wheel assembly.

2. Twist off the cap from the ignition lock cylinder.

3. NOTE: The lock cylinder is repaired by discarding the inoperative lock cylinder and building a new lock cylinder using the appropriate lock

repair package (F85Z-11582-AA). The lock repair package includes a detailed instruction sheet to build the new lock cylinder to the current key code of the vehicle.

Remove the ignition lock cylinder. -

Use a 1/8-inch diameter drill bit to drill out the lock cylinder retaining pin.

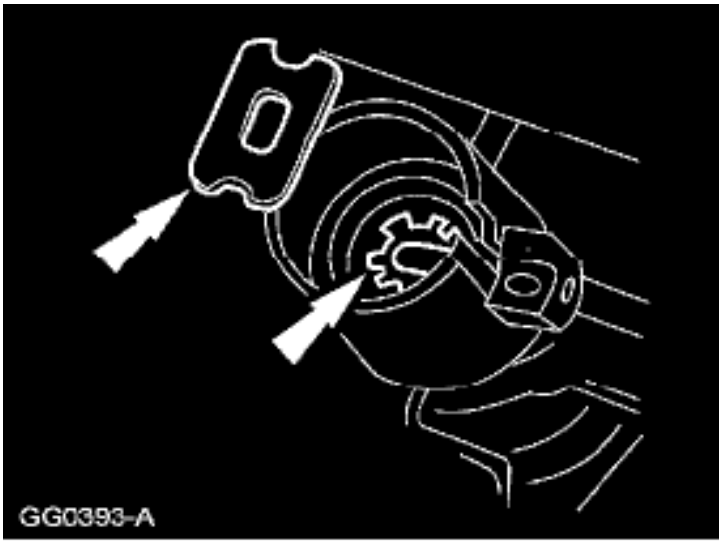
- Use a 3/8-inch drill bit to drill down the middle of the ignition lock key slot until the ignition lock cylinder breaks loose.

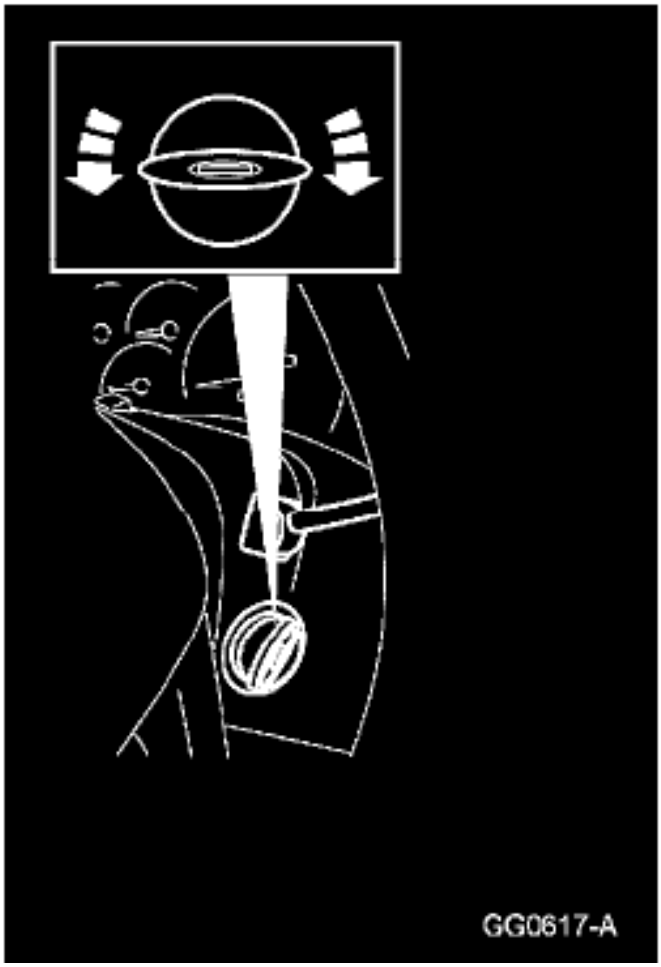
- Remove and discard the ignition lock cylinder and clean the drill shavings from the steering column.

4. Remove the bearing retainer.

5. Remove the bearing and gear.

- Thoroughly clean all drill shavings from the steering column and inspect it for damage.





6. To install, reverse the removal procedure.

- Install a new ignition lock cylinder.
- Verify ignition lock cylinder operation.

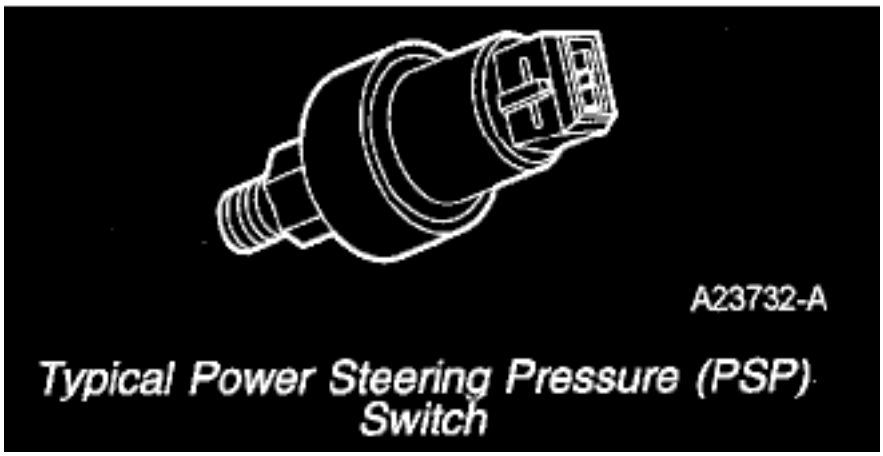
Typical Power Steering Pressure (PSP) Sensor



Typical Power Steering Pressure (PSP) Switch

Power Steering Pressure Switch: Description and Operation

Power Steering Pressure (PSP) Sensor

Typical Power Steering Pressure (PSP) Sensor

The PSP sensor monitors the hydraulic pressure within the power steering system. The PSP sensor voltage input to the PCM changes as the hydraulic pressure changes. The PCM uses the input signal from the PSP sensor to compensate for additional loads on the engine by adjusting the

idle RPM and preventing engine stall during parking maneuvers. Also, the PSP sensor signals the PCM to adjust the transmission electronic pressure control (EPC) pressure during increased engine load, for example, during parking maneuvers.

Power Steering Pressure (PSP) Switch

Typical Power Steering Pressure (PSP) Switch

The PSP switch monitors the hydraulic pressure within the power steering system. The PSP switch is a normally closed switch that opens as the hydraulic pressure increases. The PCM provides a low current voltage on the PSP circuit. When the PSP switch is closed, this voltage is pulled low through the SIG RTN circuit. The PCM uses the input signal from the PSP switch to compensate for additional loads on the engine by adjusting the idle RPM and preventing engine stall during parking maneuvers. Also, the PSP switch signals the PCM to adjust the transmission electronic pressure control (EPC) pressure during increased engine load, for example during parking maneuvers.

Special Tool(s)

ST2941-A	Activation Tool, Tire Pressure Monitor 204-363
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Tire Pressure Sensor: Testing and Inspection Tire Pressure Monitoring System (TPMS) Sensor Training

Tire Pressure Monitoring System (TPMS) Sensor Training

NOTE: If the vehicle has been stationary for more than 30 minutes, the sensors will go into a "sleep mode" to conserve battery power. It will be necessary to wake them up so they will transmit the latest tire pressure information to the smart junction box (SJB). For additional information, refer to Tire Pressure Monitoring System (TPMS) Sensor Activation.

NOTE: The tire pressure sensor training procedure must be done on a single vehicle, in an area without radio frequency noise and at least 1 m (3 ft) away from other vehicles equipped with tire pressure monitoring system (TPMS). Radio frequency noise is generated by electrical motors and appliance operation, cellular telephones, remote transmitters, power inverters and portable entertainment equipment.

NOTE: If a sensor does not respond to the activation tool, attempt to activate the same sensor with the activation tool. If the sensor still does not respond, move the vehicle to rotate the wheels at least 1/4 of a turn and attempt to activate the same sensor again.

NOTE: The SJB has a 2-minute time limit between sensor responses. If the SJB does not recognize any 1 of the 4 tire pressure sensors during this time limit, the horn will sound twice and the message center (if equipped) will display TIRE NOT TRAINED REPEAT and the entire procedure must be repeated.

1. NOTE: For vehicles with different front and rear tire pressures (such as the E-Series and certain F-Series), the tire pressure sensors must be

trained following a tire rotation. Failure to train the sensors will cause the TPMS indicator to illuminate. For vehicles with the same tire pressure for front and rear tires, tire rotation will not affect the system.

Turn the ignition switch to the OFF position, then press and release the brake pedal.

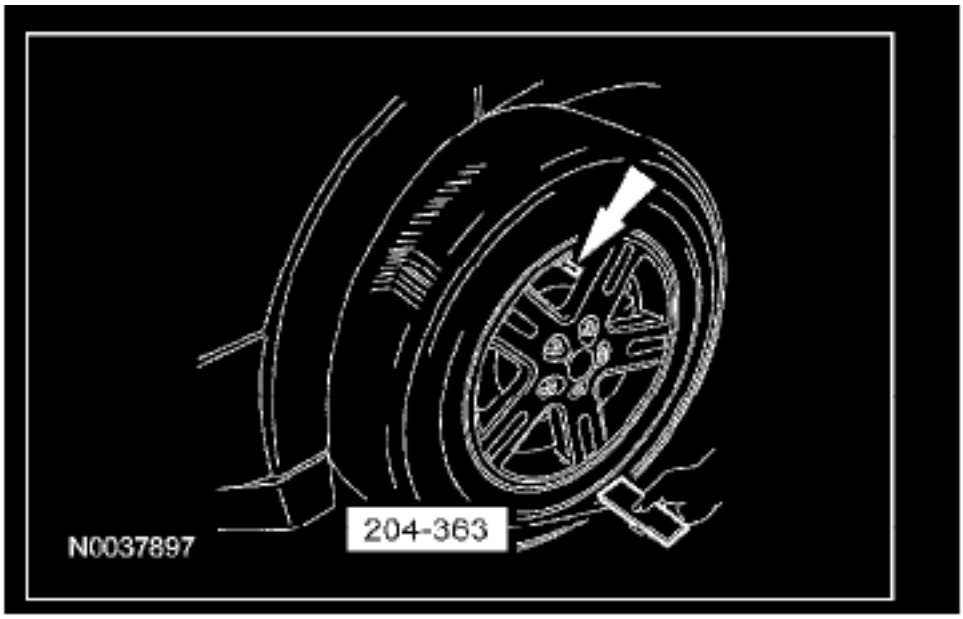
2. Cycle the ignition switch from the OFF position to the RUN position 3 times, ending in the RUN position. 3. Press and release the brake pedal. 4. Turn the ignition switch to the OFF position. 5. Turn the ignition switch from the OFF position to the RUN position 3 times, ending in the RUN position.

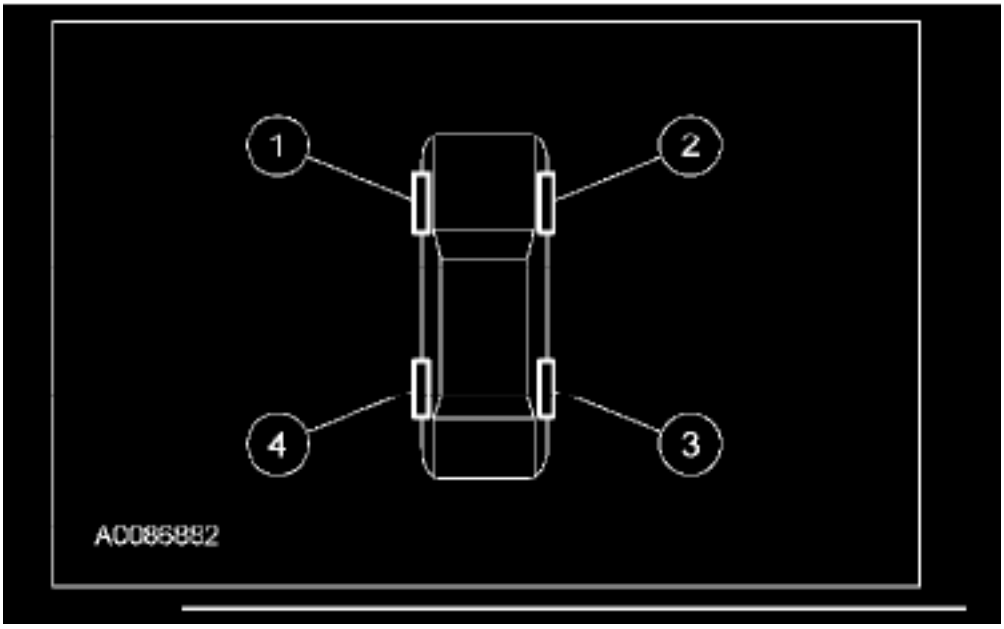
^ The horn will sound once and the TPMS indicator will flash if the training mode has been entered successfully. If equipped, the message center will display TRAIN LF TIRE.

6. NOTE: It may take up to 6 seconds to activate a tire pressure sensor. During this time, the activation tool must remain in place 180 degrees from

the valve stem.

Place the activation tool on the LF tire sidewall opposite (180 degrees) from the valve stem. Press and release the test button on the special tool. The horn will sound briefly to indicate that the tire pressure sensor has been recognized by the SJB.





7. Within 2 minutes of the horn sounding, place the activation tool on the RF tire sidewall opposite (180 degrees) from the valve stem and press and

release the test button to train the RF tire pressure sensor.

8. NOTE: Do not wait more than 2 minutes between training each sensor or the SJB will time out and the entire procedure must be repeated.

Repeat Step 7 for the RR and LR tires. ^

The procedure is completed after the last tire has been trained. When the training procedure is complete, the message center (if equipped) will display TIRE TRAINING COMPLETE.

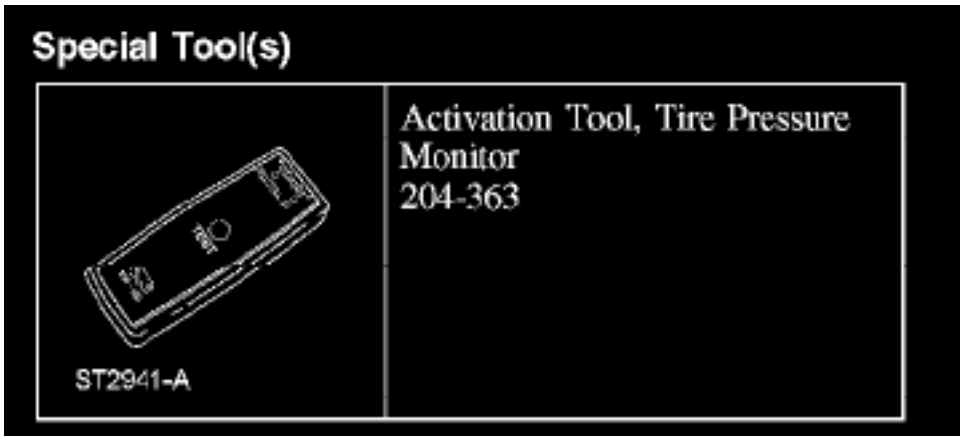
^ For vehicles not equipped with a message center, successful completion of the training procedure will be verified by turning the ignition switch to the OFF position without the horn sounding. If the horn sounds twice when the switch is turned to the OFF position, the training procedure was not successful.

9. Using the scan tool, locate the updated TPMS sensor IDs trained to the SJB and document them on the applicable warranty claim.

10. NOTE: This step is required to clear DTC C2780, cause the SJB to exit the manufacturing mode and to make sure there are no other concerns

with a newly programmed SJB.

If the sensors are being trained due to the installation of a new SJB, clear any DTCs and perform the SJB on-demand self test.



Tire Pressure Sensor: Testing and Inspection Tire Pressure Monitoring System (TPMS) Sensor Activation

Tire Pressure Monitoring System (TPMS) Sensor Activation

NOTE: The tire pressure sensors will go into a 14 sleep mode" after 30 minutes of inactivity to conserve battery power. The sensors do not transmit information while in sleep mode, it will be necessary to wake them up so they will transmit the latest tire pressure information.

1. Turn the ignition switch to the ON position. 2. Position the tire pressure monitor activation tool against the LF tire sidewall 180 degrees from the tire valve stem.

3. NOTE: The activation tool will provide feedback in the form of a flashing green light and a beep sound for each successful response from a tire

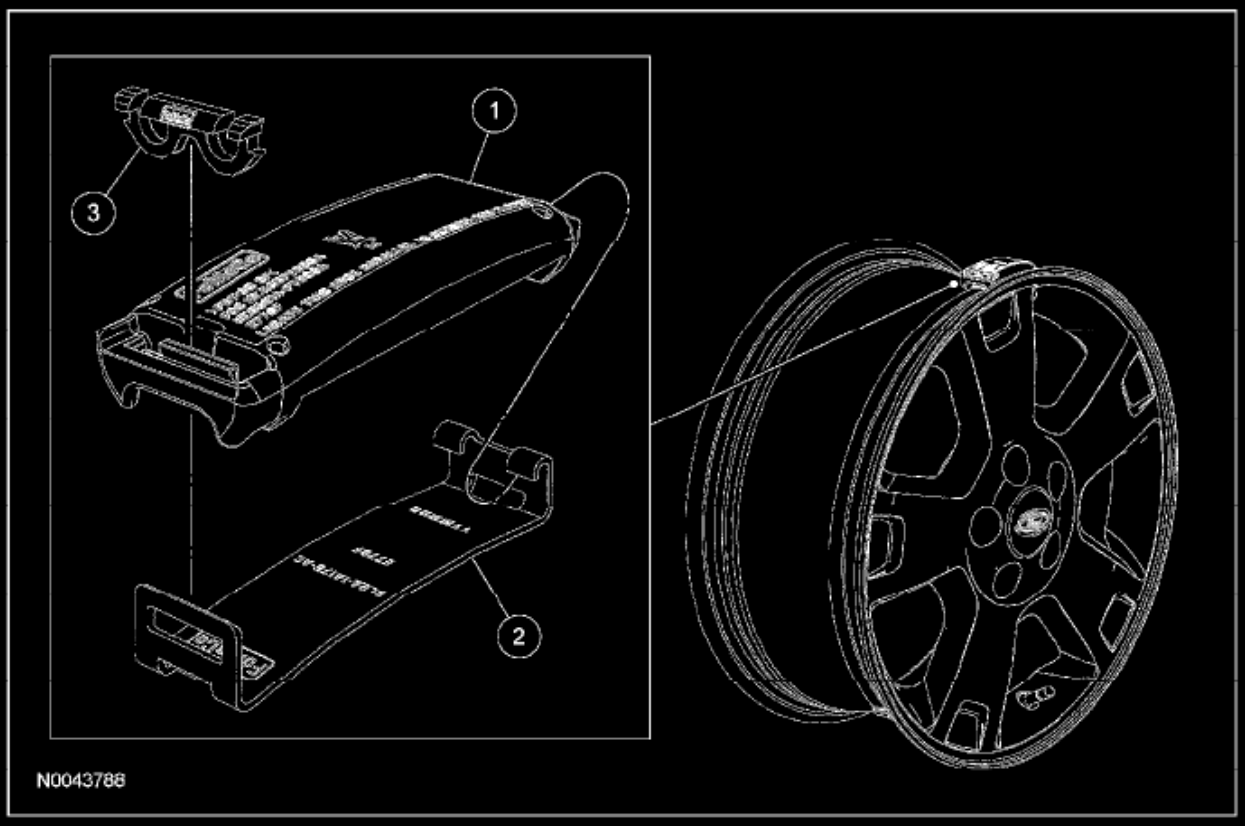
pressure sensor.

Press the test button on the activation tool to activate the sensor, activate the sensor at least 2 times.

4. Repeat Steps 2 and 3 for the remaining tires. 5. If the tire pressure monitoring system (TPMS) indicator remains illuminated after adjusting and activating each sensor, refer to the Symptom Chart

in Diagnosis and Testing.

Tire Pressure Monitoring System (TPMS) Sensor



Item	Part Number	Description
1	1A150/1A189	Tire pressure sensor/sensor kit
2	1A175	Sensor cradle

(Continued)

Item	Part Number	Description
3	14C202	Locking clip (also part of 1A189)

Tire Pressure Sensor: Service and Repair Tire Pressure Monitoring System (TPMS) Sensor

Tire Pressure Monitoring System (TPMS) Sensor

Tire Pressure Monitoring System (TPMS) Sensor

Disassembly

WARNING: The tire pressure monitoring system (TPMS) sensor battery may release hazardous chemicals if exposed to extreme mechanical damage. If these chemicals contact the skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If any part of the battery is swallowed, contact a physician immediately. When disposing of TPMS sensors, follow the correct procedures for hazardous material disposal. Failure to follow these instructions may result in serious personal injury.

NOTE: Tire pressure sensors are equipped with Lithium-ion batteries and must be disposed of accordingly.

NOTE: Tire pressure sensors are manufactured in multiple colors based on their application. When installing a new sensor, make sure the color of the sensor being installed matches the color of the sensor that was removed. The different colored sensors are not interchangeable.

NOTE: The sensor can be removed and installed without removing the strap or the cradle.

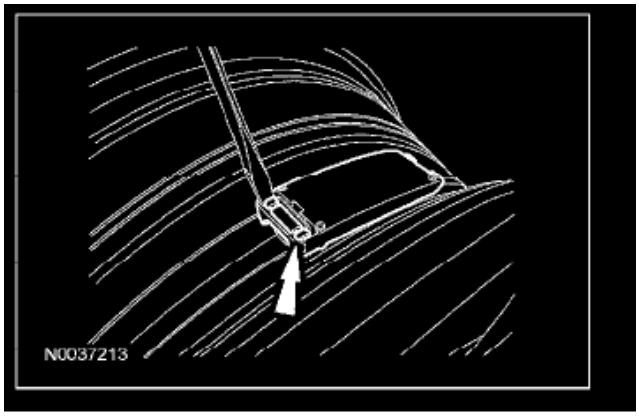
1. CAUTION: The sensor, cradle and strap may be damaged by incorrect tire mounting or dismounting. Dismount the tire only as

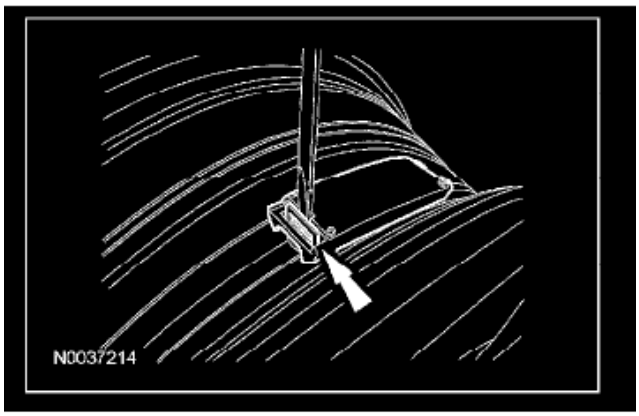
instructed.

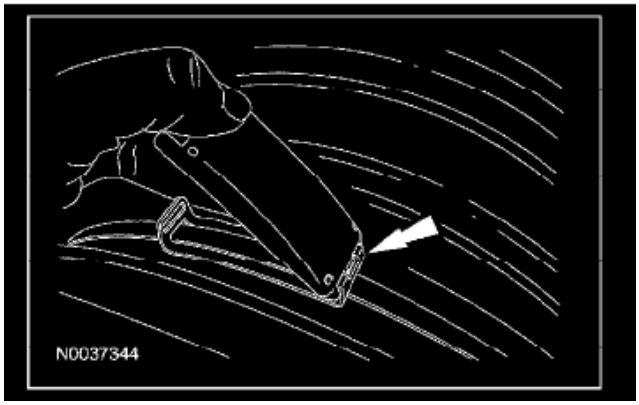
Remove the tire from the wheel.

2. CAUTION: Do not use a large screwdriver. Apply minimum force during removal or damage to the sensor locking clip may occur.

Using a pocket screwdriver or similar tool, remove the sensor locking clip.







3. CAUTION: Do not use a large screwdriver. Apply minimum force during removal or damage to the sensor may occur.

Using a pocket screwdriver or similar tool, detach the sensor from the cradle.

4. Remove the sensor.

Assembly

1. CAUTION: Damage to the sensor may occur if excessive force is applied during sensor installation.

NOTE: Make sure the sensor is fully seated into the cradle. The sensor will make a "click" noise when correctly seated.

Position the sensor into the cradle by inserting the hinge end of the sensor into the hook end of the cradle and pushing the opposite end of the sensor down onto the cradle.

2. NOTE: The locking clip can only be fully seated when installed in the correct orientation. If the sensor locking clip cannot be fully inserted, then

the sensor may not be fully seated on the cradle or the locking clip may be inserted backward.

Insert a new locking clip into the sensor.

3. CAUTION: The sensor, cradle and strap may be damaged by incorrect tire mounting or dismounting. Mount the tire only as instructed.

Install the tire onto the wheel.

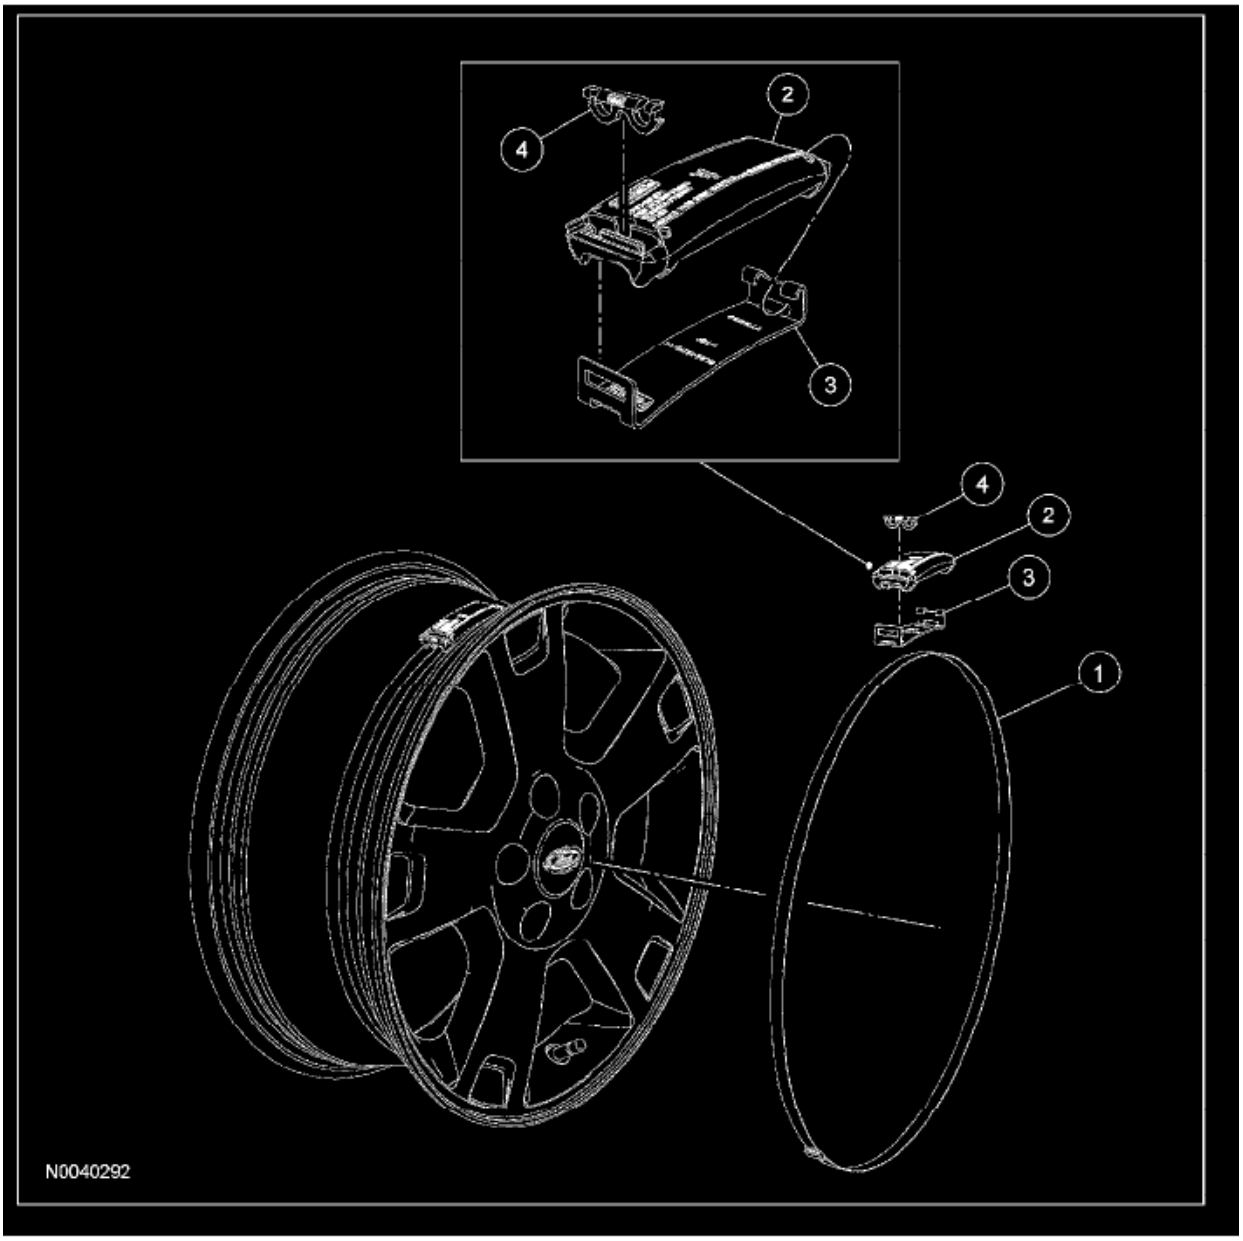
4. NOTE: A new tire pressure sensor is shipped in an off mode (or battery saver mode) and must be turned on before it can be trained. To turn the

sensor on, install it on a wheel, mount the tire and inflate the tire to the recommended inflation pressure. Wait at least 2 minutes, then continue with the sensor training procedure.

Train the tire pressure sensor(s).

Material

Item	Specification
Wheel and Tire Cleaner ZC-27-A or B	—



Item	Part Number	Description
1	1A177/1A193	Strap/strap kit
2	1A150/1A189	Tire pressure sensor/sensor kit

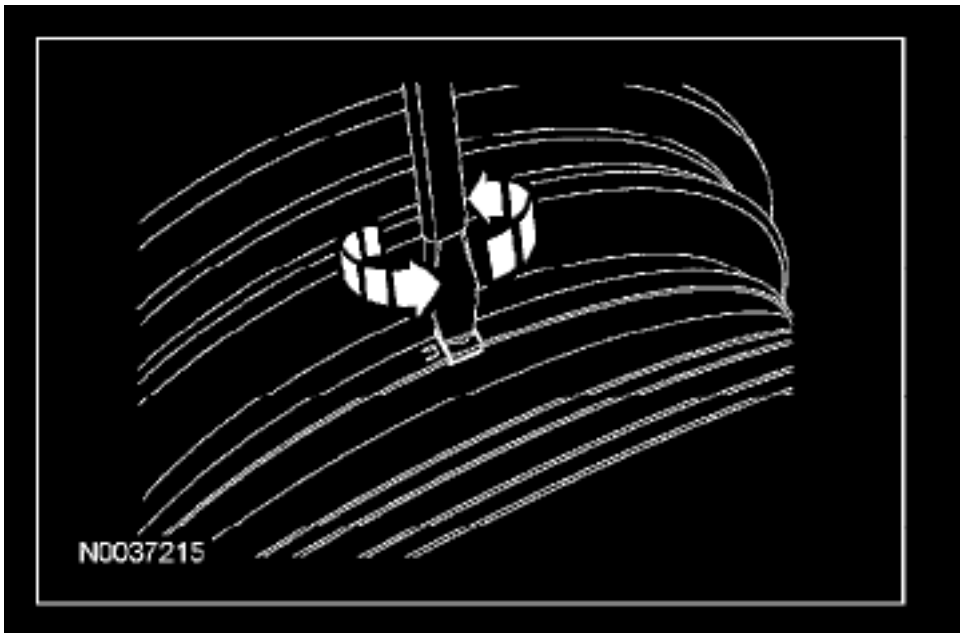
4	14C202	Locking clip (also part of 1A189)

Tire Pressure Sensor: Service and Repair Tire Pressure Monitoring System (TPMS) Strap and Cradle

Tire Pressure Monitoring System (TPMS) Strap and Cradle

Disassembly



WARNING: The tire pressure monitoring system (TPMS) sensor battery may release hazardous chemicals if exposed to extreme mechanical damage. If these chemicals contact the skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If any part of the battery is swallowed, contact a physician immediately. When disposing of TPMS sensors, follow the correct procedures for hazardous material disposal. Failure to follow these instructions may result in serious personal injury.

NOTE: Tire pressure sensors are equipped with Lithium-ion batteries and must be disposed of accordingly.

NOTE: Tire pressure sensors are manufactured in multiple colors based on their application. When installing a new sensor, make sure the color of the sensor being installed matches the color of the sensor that was removed. The different colored sensors are not interchangeable.

NOTE: The sensor is available separately, the cradle and strap are available as a strap kit. There are several different strap kits available based on wheel diameter but all strap kits share the same base part number.

1. Remove the tire pressure monitoring system (TPMS) sensor.

2. WARNING: Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

WARNING: Wear protective gloves when handling components or parts that have pointed or sharp edges. Failure to follow this instruction may result in serious personal injury.

Remove a factory installed strap in the following sequence: 1

Locate the strap buckle and secure the strap to the wheel using duct tape or a similar item, on both sides of the buckle approximately 25 mm (0.98 inch) from the buckle.

2 Using a large screwdriver and a twisting motion, unbuckle the strap.

3 Discard the strap.

3. To remove a dealer installed strap, turn the worm gear screw until the strap is fully released from the worm gear.

^ Discard the strap.

4. NOTE: To aid assembly, mark the location of the cradle prior to disassembly.

Using a screwdriver, or similar tool, remove the cradle by inserting the screwdriver under the cradle and prying up.

Assembly

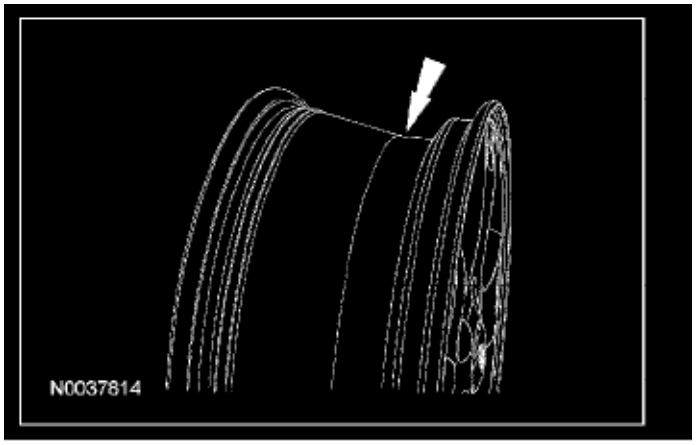
1. NOTE: Make sure the sensor is fully seated into the new cradle. The sensor will make a "click" noise when fully seated.

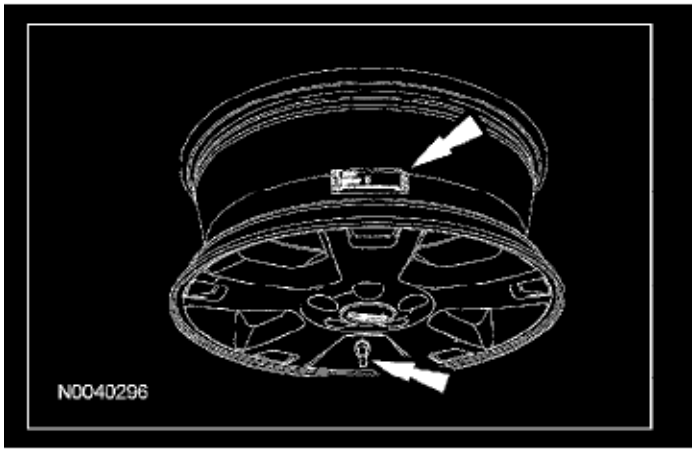
Position the sensor into the new cradle by inserting the hinge end of the sensor into the hook end of the cradle and pushing the opposite end of the sensor down onto the cradle.

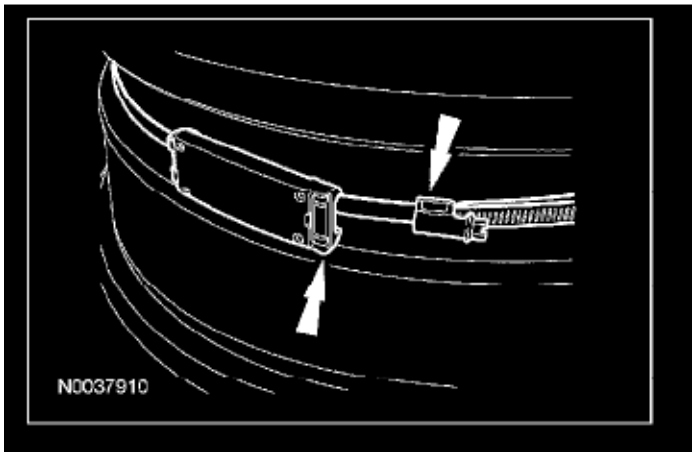
2. CAUTION: Metal scrapers may damage the wheel. Use only plastic or non-metallic scrapers to remove the cradle adhesive strip residue.

NOTE: The sensor and cradle must be installed in the drop well of the wheel, 180 degrees from the valve stem.

Clean the area where the sensor and cradle are to be installed.







3. NOTE: The sensor and cradle must be positioned with the hinge side of the sensor on the RH side when viewed from the curb side (beauty side)

of the wheel.

NOTE: The sensor has raised markings indicating how to position the sensor.

Remove the adhesive tape liner from the cradle and position the sensor and cradle into the wheel drop well 180 degrees from the valve stem.

4. Install the tapered end of the strap through the opening of the cradle on the hinge side of the sensor. This will position the worm gear on the

locking clip side of the sensor.

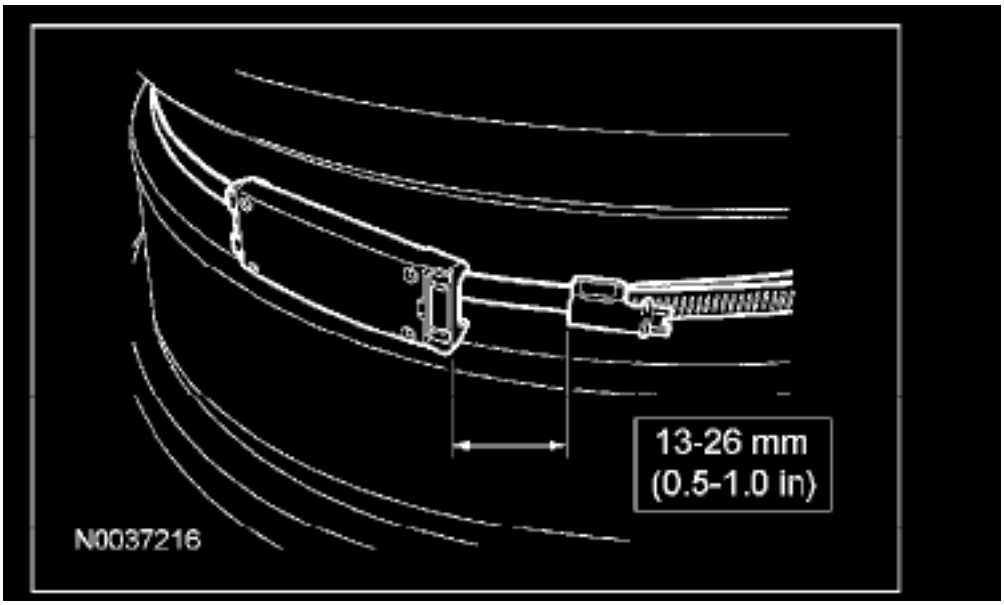
5. CAUTION: Steel wheels have a "high spot" along their circumference. Make sure the strap and sensor are mounted at the lowest spot

possible to avoid damaging the sensor during wheel and tire disassembly and assembly.

NOTE: Keep the strap parallel with the wheel flange while tightening the worm gear.

Position the worm gear 13-26 mm (0.5-1.0 inch) away from the sensor and tighten the worm gear.
^

Tighten to 3 Nm (27 lb-inch).



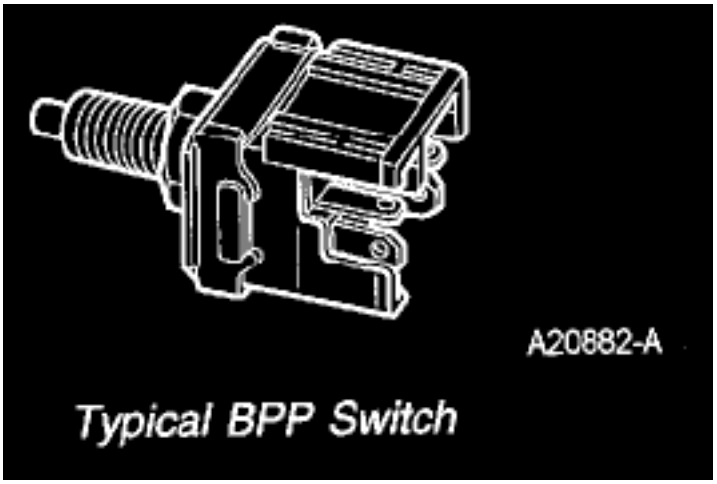
6. CAUTION: The sensor, cradle and strap may be damaged by incorrect tire mounting or dismounting. Mount the tire only as instructed.

Install the tire onto the wheel.

7. NOTE: A new tire pressure sensor is shipped in an off mode (or battery saver mode) and must be turned on before it can be trained. To turn the

sensor on, install it on a wheel, mount the tire and inflate the tire to the recommended inflation pressure. Wait at least 2 minutes, then continue with the sensor training procedure.

Train the tire pressure sensor(s).



Brake Switch - TCC: Description and Operation

BRAKE PEDAL POSITION (BPP) SWITCH

Typical BPP Switch

The BPP switch is sometimes referred to as the stoplamp switch. The BPP switch provides a signal to the PCM indicating that the brakes are applied. The BPP switch is normally open and is mounted on the brake pedal support. Depending on the vehicle application the BPP switch can be hardwired as follows:

- to the PCM supplying battery positive voltage (B+) when the vehicle brake pedal is applied.

- to the antilock brake system (ABS) module, or lighting control module (LCM), the BPP signal is then broadcast over the network to be received by the PCM.

- to the ABS traction control/stability assist module. The ABS module interprets the BPP switch input along with other ABS inputs and generates an output called the driver brake application (DBA) signal. The DBA signal is then sent to the PCM and to other BPP signal users.

Digital Transmission Range (TR) Sensor

Digital Transmission Range (TR) Sensor

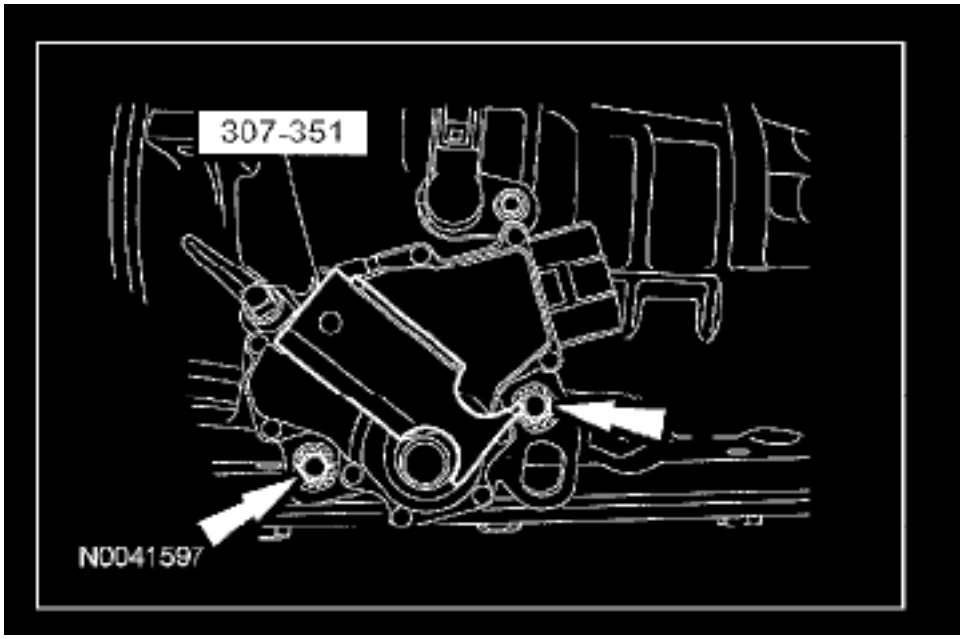
Removal

1. With the vehicle in NEUTRAL, position it on a hoist. 2. Disconnect the selector lever cable from the manual control lever. 3. Disconnect the digital transmission range (TR) sensor electrical connector. 4. Remove the manual control outer lever nut and manual control outer lever. 5. Remove the screws and the digital TR sensor.

Installation



1. CAUTION: The digital transmission range (TR) sensor must fit flush against the boss on the case to prevent damage to the sensor.

Install the digital TR sensor and loosely install the screws.

2. CAUTION: Tightening one screw before tightening the other may cause the sensor to bind or become damaged.

NOTE: The manual lever must be in the NEUTRAL position.

Using the special tool, align the digital TR sensor and tighten screws in an alternating sequence. ^

Tighten to 10 Nm (89 lb-inch).

3. Install the manual control outer lever and nut.

^ Tighten to 48 Nm (35 lb-ft).

4. Connect the digital TR sensor electrical connector. 5. Connect the selector lever cable to the manual control lever. 6. Verify that the selector lever cable is adjusted correctly.

Transmission Speed Sensor: Service and Repair Output Shaft Speed (OSS) Sensor

Output Shaft Speed (OSS) Sensor

Output Shaft Speed (OSS) Sensor

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. 2. Disconnect the output shaft speed (OSS) sensor electrical connector. 3. Remove the OSS sensor screw. 4. Remove the OSS sensor from the transmission.

Installation

1. NOTE: Inspect the OSS sensor O-ring for damage. If damaged, install a new O-ring Inspect and lubricate the O-ring with petroleum jelly.

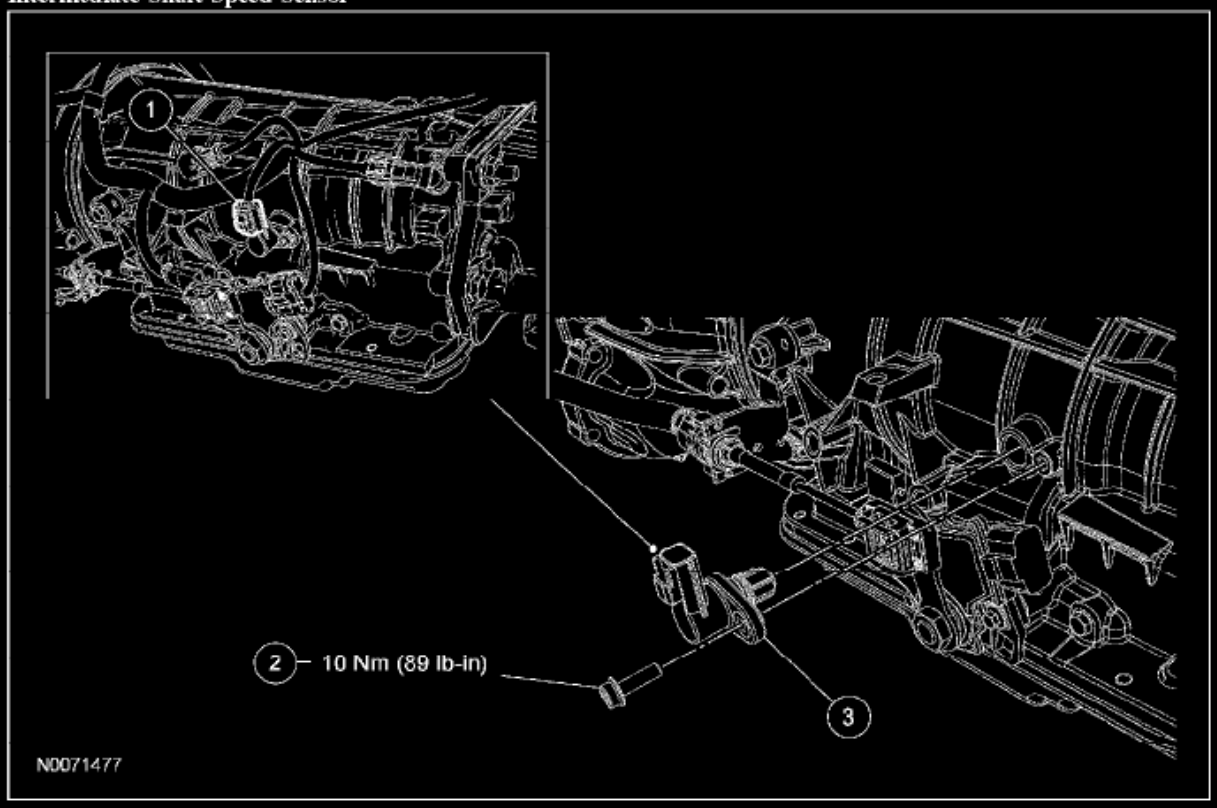
Install the OSS sensor into the transmission.

2. Install the OSS sensor screw.

^ Tighten to 10 Nm (89 lb-inch).

3. Connect the OSS sensor electrical connector.

Intermediate Shaft Speed Sensor



Item	Part Number	Description

Intermediate Shaft Speed Sensor

Intermediate Shaft Speed Sensor

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. 2. Disconnect the intermediate shaft speed sensor electrical connector. 3. Remove the intermediate shaft speed sensor screw. 4. Remove the intermediate shaft speed sensor from the transmission.

Installation

1. NOTE: Inspect the intermediate shaft speed sensor O-ring for damage. If damaged, install a new O-ring

Inspect and lubricate the O-ring with petroleum jelly.

Install the intermediate shaft speed sensor into the transmission.

2. Install the intermediate shaft speed sensor screw.

^ Tighten to 10 Nm (89 lb-inch).

3. Connect the intermediate shaft speed sensor electrical connector. 4. Lower the vehicle.

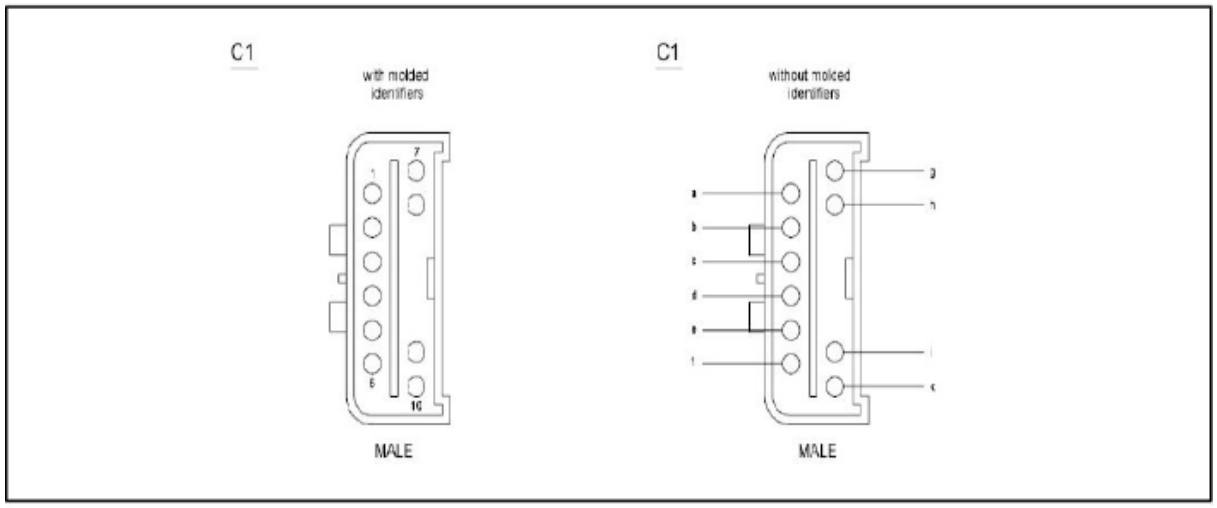
Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step by step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

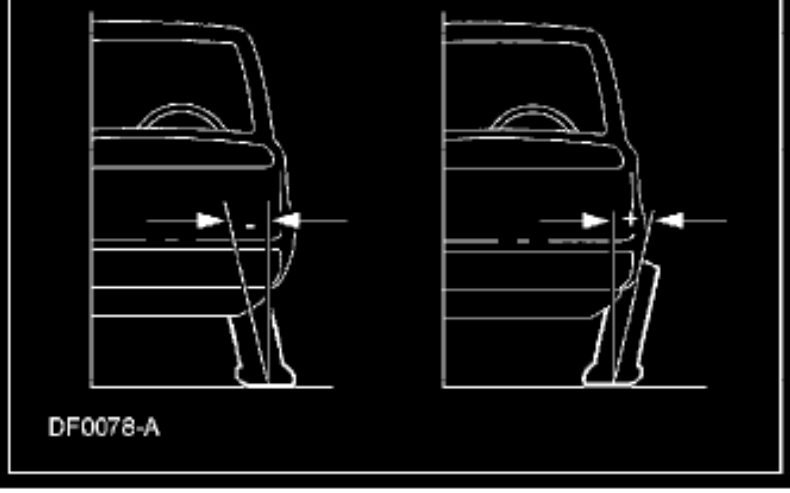
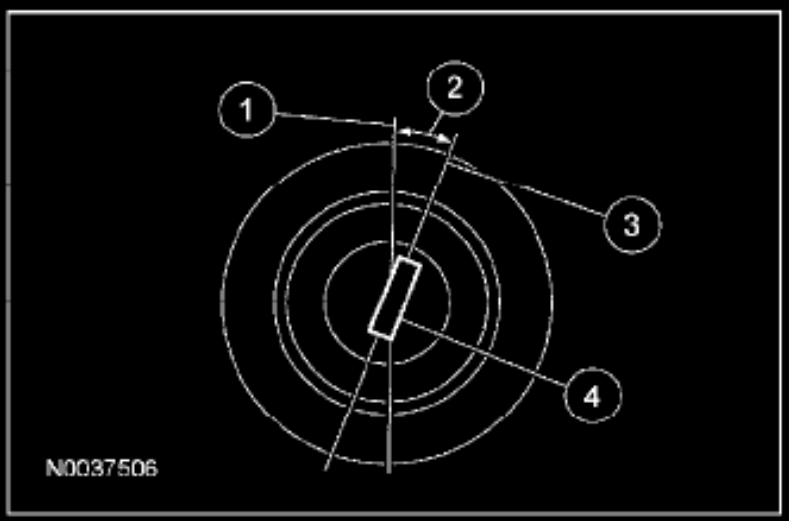
Alignment: Specifications Torque Specifications

Torque Specifications

Negative and Positive Camber



Caster



Item	Part Number	Description
1	—	True vertical
2	—	Positive caster angle
3	—	Ball joint center line
4	—	Pivot center line

Alignment: Description and Operation

Wheel Alignment Angles

Front caster and camber are adjusted by replacing the upper arm alignment set shims with washers, this allows for adjustment of the arm in the frame slot. Front toe is adjusted by the use of the inner tie rods.

Camber

Negative and Positive Camber

Camber is the vertical tilt of the wheel when viewed from the front. Camber can be positive or negative and has a direct effect on tire wear.

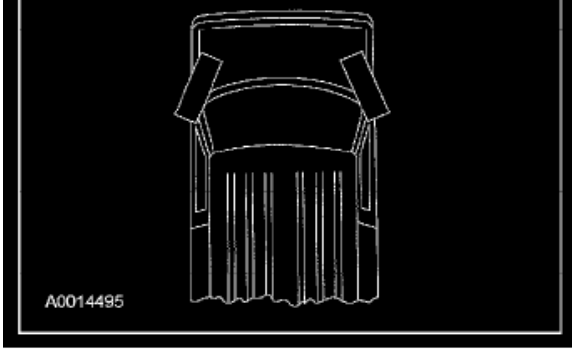
Caster

Caster

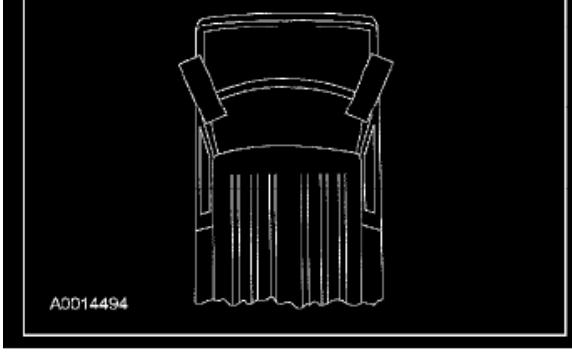
Caster is the deviation from vertical of an imaginary line drawn through the ball joints when viewed from the side. The caster specifications will give the vehicle the best directional stability characteristics when loaded and driven. The caster setting is not related to tire wear.

Toe

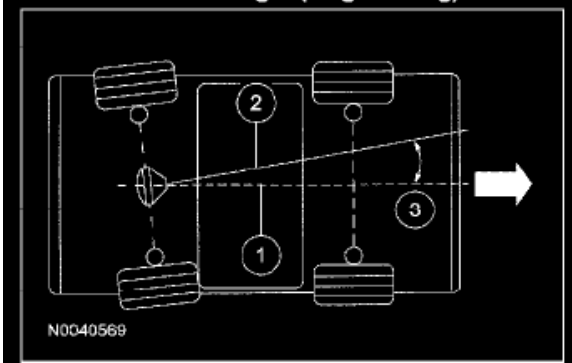
Positive Toe (Toe In)



Negative Toe (Toe Out)



Incorrect Thrust Angle (Dogtracking)



Item	Part Number	Description
1	—	Vertical centerline
2	—	Axle centerline
3	—	Thrust angle

Positive Toe (Toe In)

Negative Toe (Toe Out)

The vehicle toe setting: ^

affects tire wear and directional stability.

^ must be checked after adding aftermarket equipment, such as a snowplow.

Incorrect Thrust Angle (Dogtracking)

Incorrect Thrust Angle (Dogtracking)

Incorrect thrust angle (dogtracking) is the condition in which the rear axle is not square to the chassis. Heavily crowned roads can give the illusion of dogtracking.

Wander

Wander is the tendency of the vehicle to require frequent, random left and right steering wheel corrections to maintain a straight path down a level road.

Shimmy

Shimmy, as observed by the driver, is large, consistent, rotational oscillations of the steering wheel resulting from large, side-to-side (lateral) tire/wheel movements.

Shimmy is usually experienced near 64 km/h (40 mph), and can begin or be amplified when the tire contacts pot holes or irregularities in the road surface.

Nibble

Sometimes confused with shimmy, nibble is a condition resulting from tire interaction with various road surfaces and observed by the driver as small rotational oscillations of the steering wheel.

Poor Returnability/Sticky Steering

Poor returnability and sticky steering is used to described the poor return of the steering wheel to center after a turn or the steering correction is completed.

Drift/Pull

Pull is a tugging sensation, felt by the hands on the steering wheel, that must be overcome to keep the vehicle going straight.

Drift describes what a vehicle with this condition does with hands off the steering wheel. ^

A vehicle-related drift/pull, on a flat road, will cause a consistent deviation from the straight-ahead path and require constant steering input in the opposite direction to counteract the effect.

^ Drift/pull may be induced by conditions external to the vehicle (i.e., wind, road camber).

Poor Groove Feel

Poor groove feel is characterized by little or no buildup of turning effort felt in the steering wheel as the wheel is rocked slowly left and right within very small turns around center or straight-ahead (under 20 degrees of steering wheel turn). Efforts may be said to be "flat on center". ^

Under 20 degrees of turn, most of the turning effort that builds up comes from the mesh of gear teeth in the steering gear. In this range, the steering wheel is not yet turned enough to feel the effort from the self-aligning forces at the road wheel or tire patch.

^ In the diagnosis of a concern, it is important to understand the difference between wander and poor groove feel.

Adjustment	Front of Upper Arm	Rear of Upper Arm
Increase caster	Out	In
Decrease caster	In	Out
Increase camber	Out	Out
Decrease camber	In	In
Increase caster and camber simultaneously	Out	—
Decrease caster and camber simultaneously	In	—

Alignment: Service and Repair Camber and Caster Adjustment

Camber and Caster Adjustment

1. NOTE: The upper arm-to-frame mounting bolts have set shims that must be replaced with washers (W-705040S900) to allow for adjustment of

the arm in the frame slot.

Index-mark the upper arm-to-frame bolts, then remove and discard the upper arm-to-frame nuts and set shims.

2. Align the index marks and install the new washers and new nuts.

^ Tighten the nuts until snug.

3. Using alignment equipment and the manufacturer's instructions, measure the caster and camber.

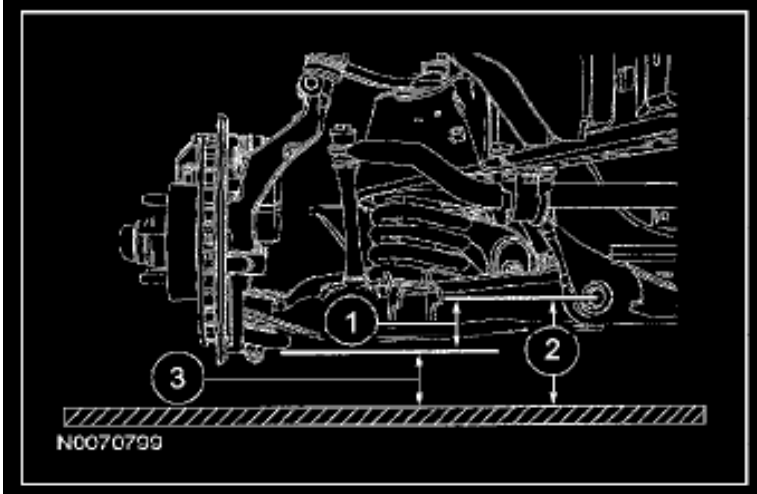
4. NOTE: The vehicle should be supported by the lower arms to ease movement of the upper arm in the slot.

To adjust the caster and camber refer to the following chart. ^

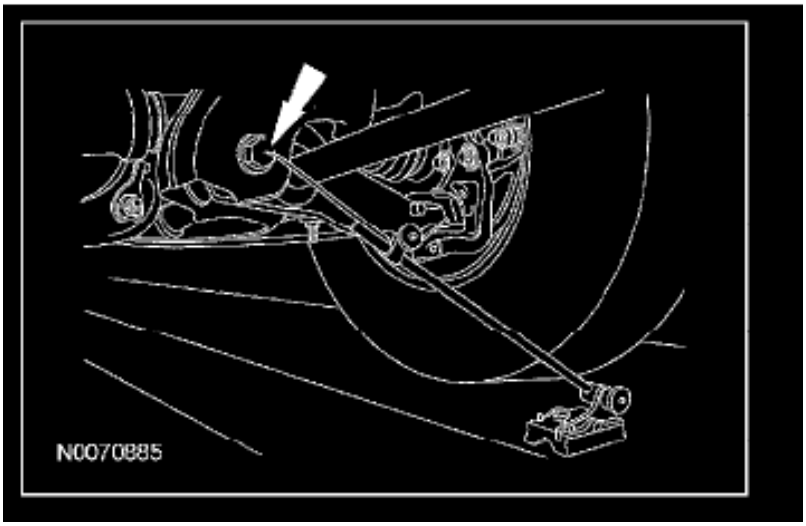
When making adjustments that require moving both the front and the rear of the upper arm, move both ends of the arm equally.

5. Tighten the upper arm-to-frame nuts to 133 Nm (98 lb-ft). 6. Recheck the caster and camber settings and adjust as necessary. 7. Check and, if necessary, adjust the front toe.

Front Ride Height Measurement



Item	Part Number	Description
1	—	Ride height = A - B
2	—	Measurement A
3	—	Measurement B



Alignment: Service and Repair Ride Height Measurement

Ride Height Measurement

Front Ride Height Measurement

Front Ride Height Measurement

NOTE: Make sure that the vehicle is positioned on a flat, level surface and the tires are inflated to the correct pressure. Vehicle should have a full tank of fuel.

1. Position a suitable surface gauge (such as Starrett 57D Surface Gauge), on a flat, level surface and adjust the gauge's arm until the scriber point is

located in the center of the lower arm rearward bolt. ^

Lock the surface gauge in this position.

2. With the surface gauge positioned on a flat, level surface, record the measurement of the surface gauge position (measurement A).

3. Position the surface gauge on the same flat, level surface as used in Step 1, adjust the gauge's arm until the scriber point is located on the wheel

knuckle lowest point, behind the lower ball joint nut. ^

Lock the surface gauge in this position.

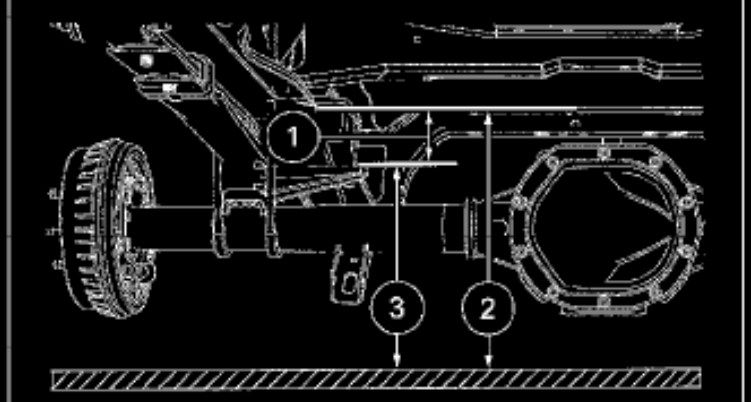
4. With the surface gauge positioned on a flat, level surface, record the measurement of the surface gauge position (measurement B).

5. Subtract measurement B from measurement A to obtain the front ride height.

^ Refer to Specifications.

Rear Ride Height Measurement

Ride Height Measurement — Four Wheel Drive (4WD)



Item	Part Number	Description
1		Ride height = A - B

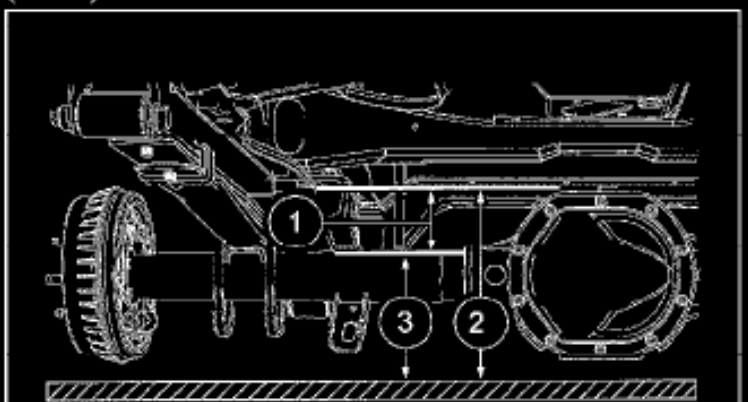
Ride Height Measurement — Rear Wheel Drive (RWD)



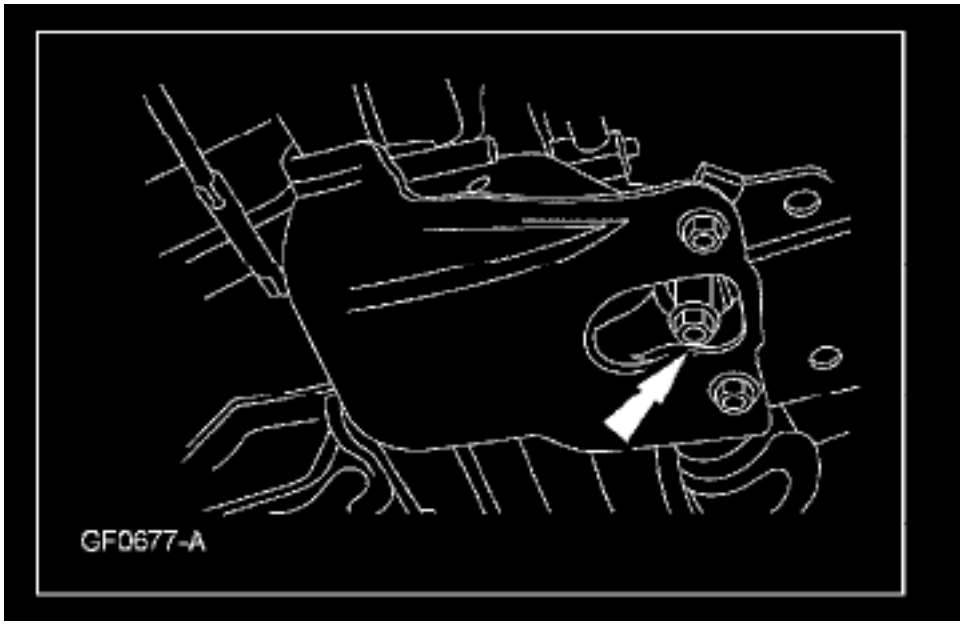
Item	Part Number	Description
1	—	Ride height = A - B
2	—	Measurement point A
3		Measurement point B

Ride Height Measurement - Four Wheel Drive (4WD)

Ride Height Measurement - Rear Wheel Drive (RWD)

NOTE: Make sure that the vehicle is positioned on a flat, level surface and the tires are inflated to the correct pressure. Vehicle should have a full tank of fuel.

1. To obtain rear ride height, measure the distance between points A and B. For additional information, refer to Specifications.



Alignment: Service and Repair Suspension Design Height Setting

Suspension Design Height Setting

NOTE: Make sure the vehicle is on a flat, level surface, such as a drive-on hoist.

1. Jounce the vehicle's front and rear suspension to normalize the vehicle static ride height. 2. Measure the ride height.

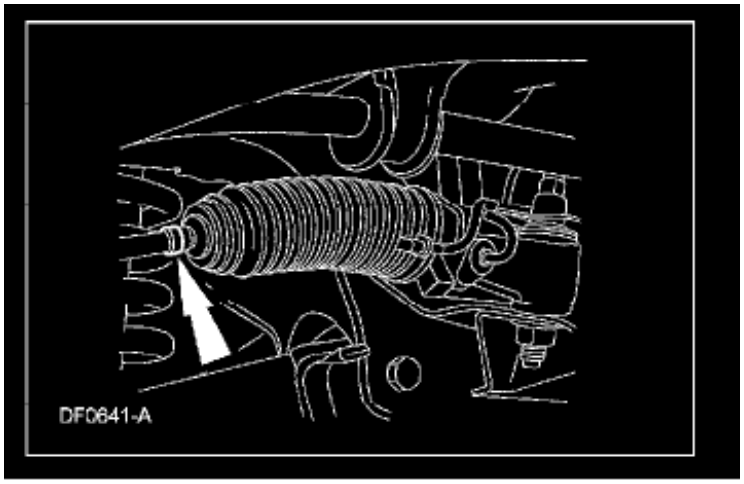
3. NOTE: The torsion bar adjusting bolt is coated with a thread locking compound that wears off after disassembly. If the torsion bar system is ever

disassembled or if the torsion bar adjusting bolt is ever removed, use a new torsion bar adjusting bolt when assembling.

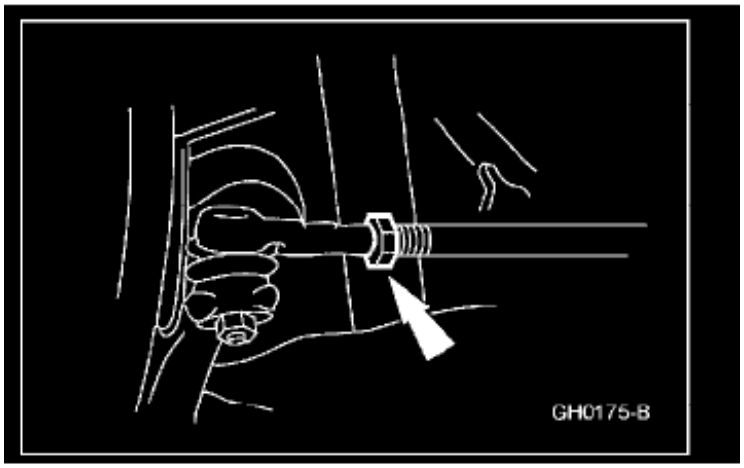
Adjust the ride height as follows: ^

To increase the ride height, tighten the torsion bar adjusting bolt.

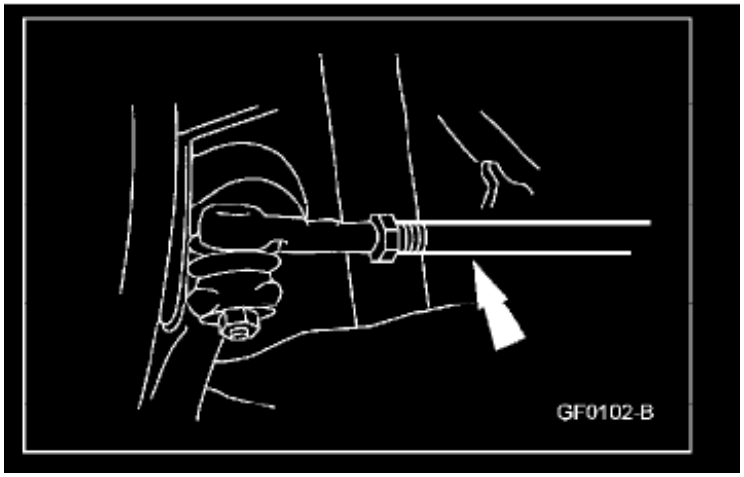
^ To decrease the ride height, loosen the torsion bar adjusting bolt.



DF0641-A



GH0175-B



GF0102-B

Alignment: Service and Repair Toe Adjustment

Toe Adjustment

1. Start the engine and center the steering wheel. 2. Turn the engine OFF and, using a suitable holding device, lock the steering wheel in the straight ahead position. 3. Using alignment equipment and the manufacturer's instructions, measure the toe. 4. Remove the steering gear bellows clamps.

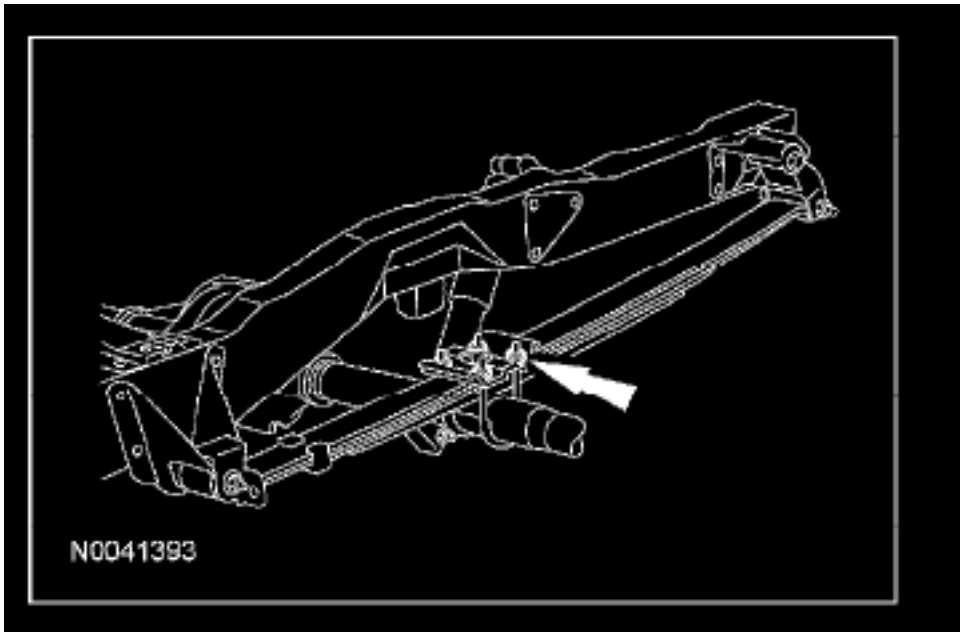
5. Loosen the tie-rod jam nuts.

6. CAUTION: Do not allow the steering gear bellows to twist when the front wheel spindle tie rod is rotated or damage to the bellows may

occur.

Rotate the inner tie rods until the toe setting is within specifications.

7. Tighten the tie-rod jam nuts to 80 Nm (59 lb-ft). 8. Install the steering gear bellows clamps. 9. Recheck the toe settings and adjust as necessary.



Alignment: Service and Repair Lean Correction - Rear

Lean Correction - Rear

NOTE: A side-to-side lean may be adjusted by 6 mm (0.25 inch). This is accomplished by placing a shim (D7TZ-5742-A) between the rear spring and the axle on the low side of the vehicle.

1. With the vehicle in NEUTRAL, position it on a hoist. 2. Using a suitable jack, support the rear axle. 3. Remove and discard the 4 U-bolt nuts and U-bolts.

^ Remove the spring plate.

^ To install, tighten to 115 Nm (85 lb-ft).

4. Using the jack, lower the rear axle approximately 13 mm (0.51 inch).

5. NOTE: Make sure that the spring locator bolt is centered in the spacer hole.

NOTE: On vehicles equipped with a spring spacer block, place the shim between the rear spring and the axle spacer.

Install the spacer (D7TZ-5742-A) between the spring and the axle.

Fuel Pressure: Specifications

Item.....Specification

Engine running.....414-448 kPa (60-65 psi) Key ON, engine OFF.....414-448 kPa (60-65 psi)

Fuel Pressure: Testing and Inspection

FUEL SYSTEM PRESSURE TEST

Special Tool(s)

Special Tool(s)

WARNING:

- Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

- Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

- Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

- When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

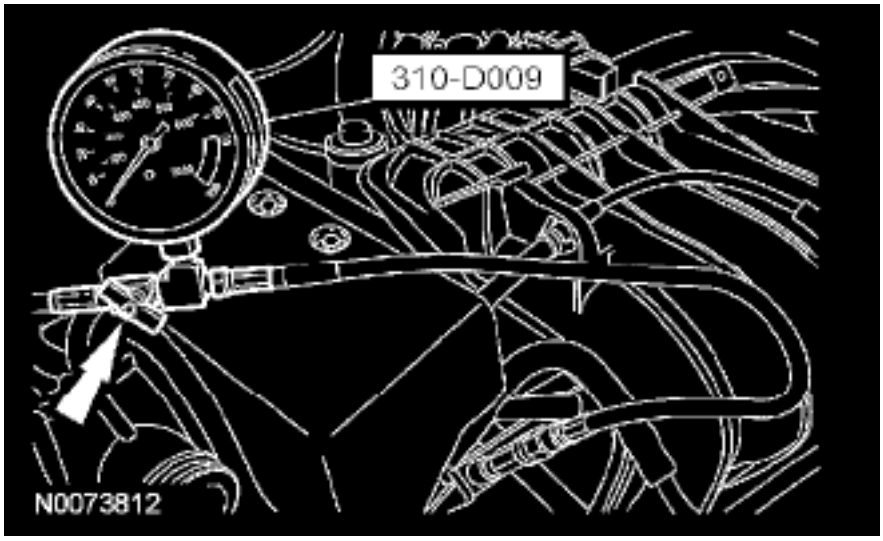
1. NOTE: 2.3L shown, 3.0L and 4.0L similar.

Remove the cap from the fuel pressure relief valve located on the fuel rail.

2. NOTE: 2.3L shown, 3.0L and 4.0L similar.

Install the special tool onto the fuel pressure relief valve.

3. Test the fuel system pressure to make sure it is within the specified range.



4. NOTE:

- 2.3L shown, 3.0L and 4.0L similar.

- Open the drain valve slowly to relieve the fuel system pressure. This may drain fuel from the system. Place fuel in a suitable container.

Upon completion of the fuel system pressure test, open the drain valve on the special tool and relieve the fuel system pressure.

5. NOTE: It may take more than one key cycle to pressurize the fuel system.

Cycle the ignition key and wait 3 seconds to pressurize the fuel system. Check for leaks before starting the engine.

Removal and Installation

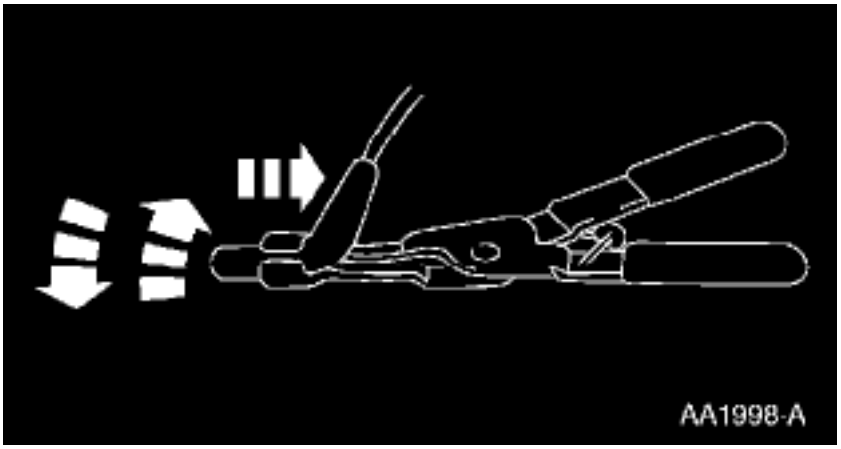
CAUTION: Spark plug wires must be connected correctly. Failure to follow this instruction may result in poor engine performance.

1. CAUTION: Do not pull on the spark plug wire as it may separate from the spark plug wire connector inside the spark plug wire boot.

Use the Spark Plug Wire Remover to grasp and twist the spark plug wire boot back and forth on the spark plug insulator to release the connectors.



2. Disconnect the spark plug wires from the ignition coil by twisting while pulling upward. 3. Open the spark plug wire separators and remove the spark plug wires.

4. CAUTION: Correct installation of the spark plug wires is critical to vehicle operation. If one spark plug wire is not correctly installed on

the spark plug or ignition coil, both spark plugs connected to that segment of the ignition coil may not fire under load.

To install, reverse the removal procedure. -

Use a small, clean tool to coat the entire interior surface of the boots with silicone brake caliper grease.

AB0040-A

Spark Plug: Testing and Inspection

Spark Plug Inspection

1. Inspect the spark plug for a bridged gap.

^ Check for deposit build-up closing the gap between the electrodes. Deposits are caused by oil or carbon fouling.

^ Clean the spark plug.

2. Check for oil fouling.

^ Check for wet, black deposits on the insulator shell bore electrodes, caused by excessive oil entering the combustion chamber through worn rings and pistons, excessive valve-to-guide clearance or worn or loose bearings.

^ Correct the oil leak concern.

^ Install a new spark plug.

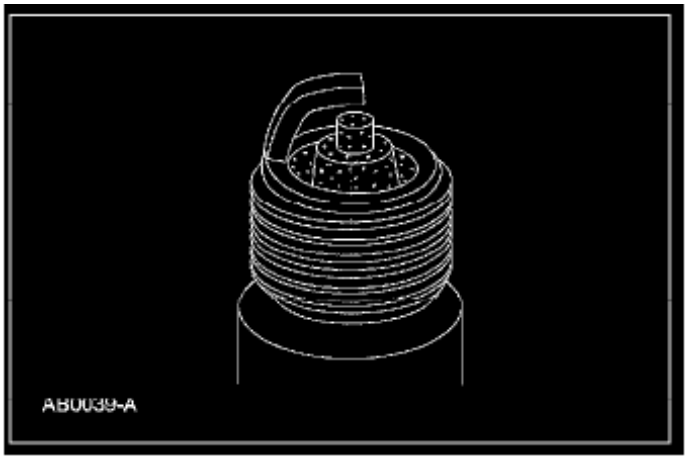
3. Inspect for carbon fouling. Look for black, dry, fluffy carbon deposits on the insulator tips, exposed shell surfaces and electrodes, caused by a

spark plug with an incorrect heat range, dirty air cleaner, too rich a fuel mixture or excessive idling.
^

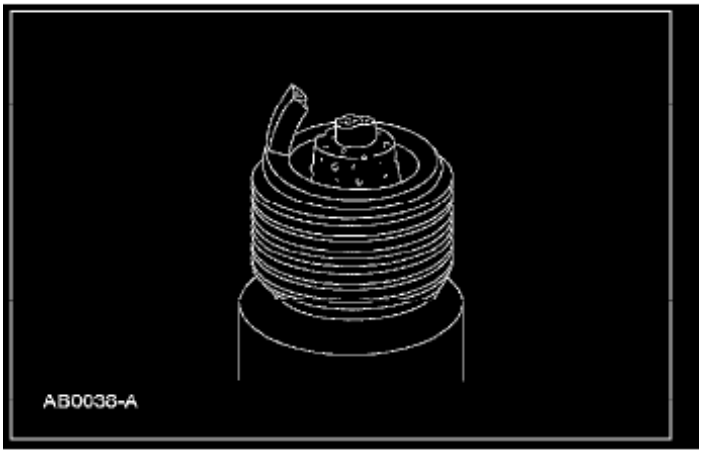
Install new spark plugs.

4. Inspect for normal burning.

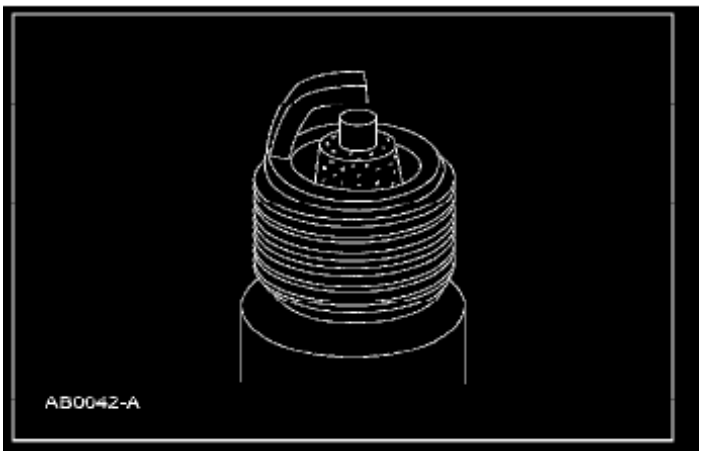
^ Check for light tan or gray deposits on the firing tip.



AB0039-A



AB0038-A



AB0042-A

5. Inspect for pre-ignition, identified by melted electrodes and a possibly damaged insulator. Metallic deposits on the insulator indicate engine

damage. This may be caused by incorrect ignition timing, wrong type of fuel or the unauthorized installation of a Heli-Coil(R) insert in place of the spark plug threads. ^

Install a new spark plug.

6. Inspect for overheating, identified by white or light gray spots and with a bluish-burnt appearance of electrodes. This is caused by engine

overheating, wrong type of fuel, loose spark plugs, spark plugs with an incorrect heat range, low fuel pump pressure or incorrect ignition timing. ^

Install a new spark plug.

7. Inspect for fused deposits, identified by melted or spotty deposits resembling bubbles or blisters. These are caused by sudden acceleration.

^ Install new spark plugs.

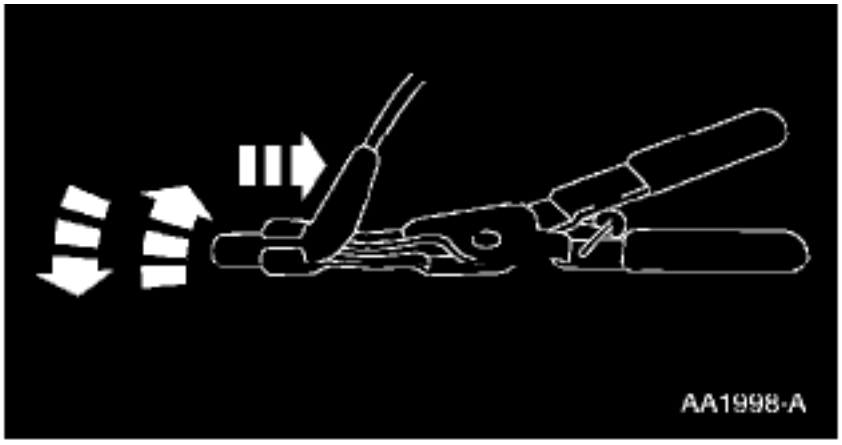
Removal and Installation

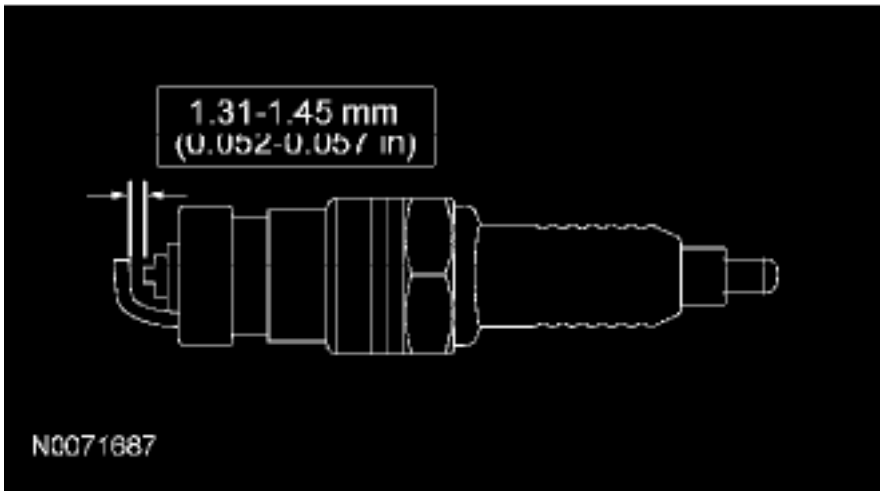
1. CAUTION:

- Spark plug wires must be connected correctly. Failure to follow this instruction may result in poor engine performance.

- Do not pull on the spark plug wire as it may separate from the spark plug wire connector inside the spark plug wire boot.

Use the Spark Plug Wire Remover to grasp and twist the spark plug wire boot back and forth on the spark plug insulator to release the connectors.





2. Loosen the spark plugs. 3. Remove any foreign material from the spark plug areas of the cylinder head with compressed air. 4. Remove the spark plugs.

- To install, tighten to 15 Nm (11 lb-ft).

5. Inspect the spark plugs. 6. Adjust the spark plug gap as necessary.

7. To install, reverse the removal procedure.

- Use a small, clean tool to coat the entire interior surface of the boot with silicone brake caliper grease.

Compression Check: Testing and Inspection

Compression Test - Compression Gauge Check

1. Make sure the oil in the crankcase is of the correct viscosity and at the correct level and that the battery is correctly charged. Operate the vehicle

until the engine is at normal operating temperature. Turn the ignition switch to the OFF position, then remove all the spark plugs.

2. Set the throttle plates in the wide-open position. 3. Install a compression gauge such as the Compression Tester in the No. 1 cylinder. 4. Install an auxiliary starter switch in the starting circuit. With the ignition switch in the OFF position, and using the auxiliary starter switch, crank

the engine a minimum of 5 compression strokes and record the highest reading. Note the approximate number of compression strokes required to obtain the highest reading.

5. Repeat the test on each cylinder, cranking the engine approximately the same number of compression strokes.

Compression Test - Test Results

The indicated compression pressures are considered within specification if the lowest reading cylinder is at least 75% of the highest reading. Refer to the Compression Pressure Limit Chart.

Compression Pressure Limit Chart

Compression Pressure Limit Chart (Part 1)

Compression Pressure Limit Chart (Part 2)

If one or more cylinders read low, squirt approximately one tablespoon of engine oil on top of the pistons in the low-reading cylinders. Repeat the

compression pressure check on these cylinders.

Compression Test - Interpreting Compression Readings

1. If compression improves considerably, piston rings are faulty. 2. If compression does not improve, valves are sticking or seating incorrectly. 3. If 2 adjacent cylinders indicate low compression pressures and squirting oil on each piston does not increase compression, the head gasket may be

leaking between cylinders. Engine oil or coolant in cylinders could result from this condition.

Use the Compression Pressure Limit Chart when checking cylinder compression so that the lowest reading is within 75% of the highest reading.

Valve Clearance: Specifications

Valve Clearance

This engine is equipped with hydraulic valve lifters. No adjustment is required.

Visual Inspection Chart

Mechanical
• Drive belt cracking/chunking/wear • Belt/pulley contamination • Incorrect accessory drive belt • Incorrectly routed accessory drive belt • Pulley misalignment or excessive pulley runout • Loose or mislocated hardware • Incorrectly routed power steering tubes (rubbing) • Loose accessory drive belt • Damaged pulleys • Tensioner arm misalignment

Drive Belt: Initial Inspection and Diagnostic Overview

Inspection and Verification

CAUTION: Under no circumstances should the accessory drive belt, tensioner or pulleys have any fluids or belt dressing applied to them as damage to the belt material and tensioner damping mechanism may occur.

1. Verify the customer concern by operating the system. 2. Visually inspect for obvious signs of mechanical damage.

Visual Inspection Chart

Visual Inspection Chart

Belt Tensioner With Belt Length Indicator

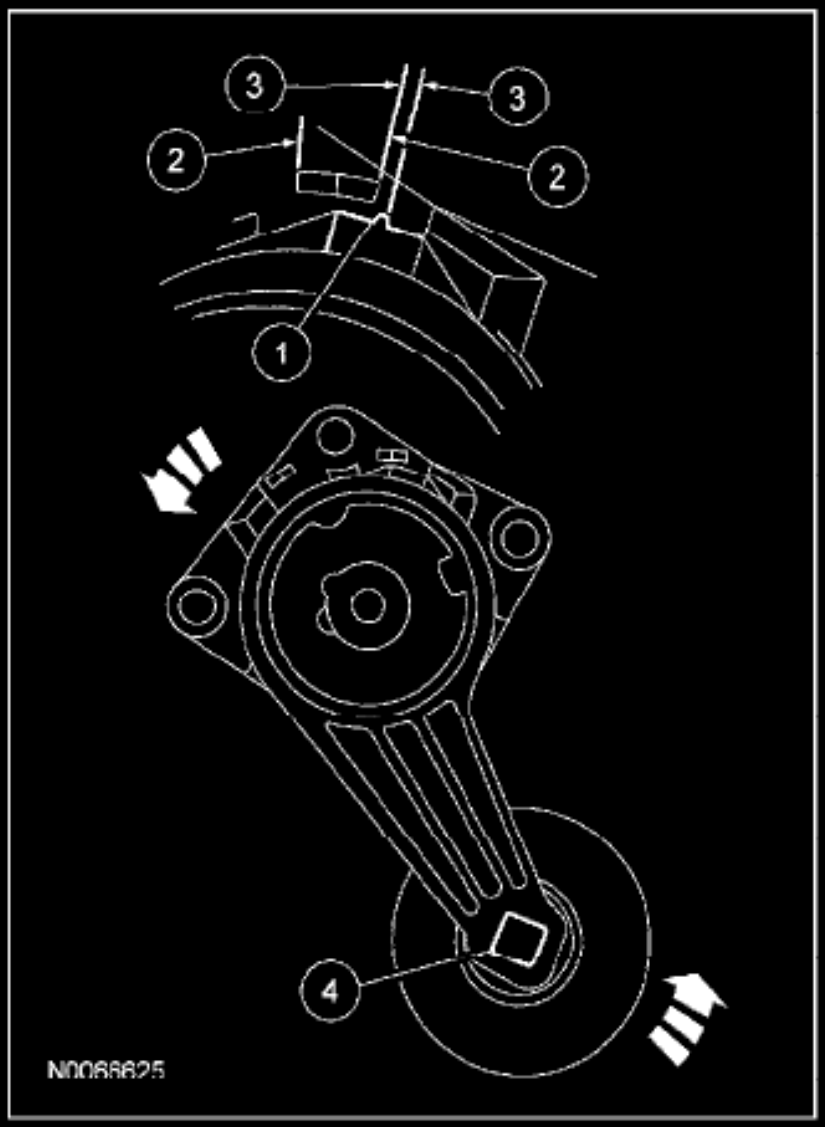
NOTE: Modular engine (without A/C) belt tensioner shown, others similar.

NOTE: Belt tensioner is shown in the free-state position against the arm travel stops.

Belt Tensioner With Belt Length Indicator

NOTE: Modular engine (without A/C) belt tensioner shown, others similar.

NOTE: Belt tensioner is shown in the free-state position against the arm travel stops



Item	Part Number	Description
1	—	Belt length indicator
2	—	Acceptable belt installation and wear range
3	—	Belt replacement range
4	—	Belt tension relief point

Belt Tensioner With Belt Length Indicator

3. Check that the belt length indicator, if equipped, on the belt tensioner is in the acceptable belt installation and wear range. If the indicator is in the

belt replacement range, either an incorrect belt is installed or the belt is worn beyond the service limit. Install a new belt as necessary.

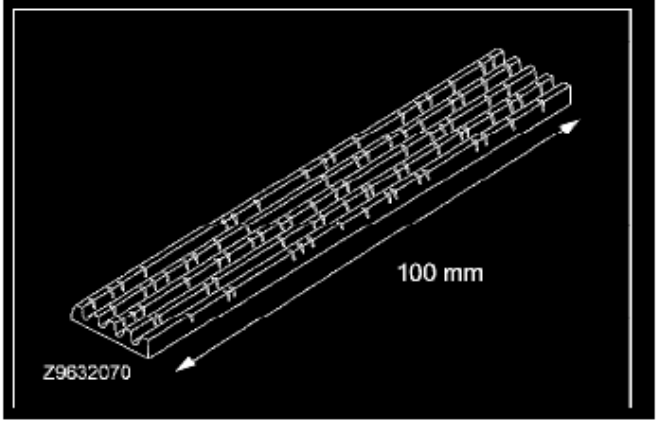
4. Eliminate all other non-belt related noises that could cause belt misdiagnosis, such as A/C compressor engagement chirp, A/C slugging noise,

power steering cavitations at low temperatures, variable camshaft timing (VCT) tick or generator whine.

5. If a concern is found, correct the condition before proceeding to the next step.

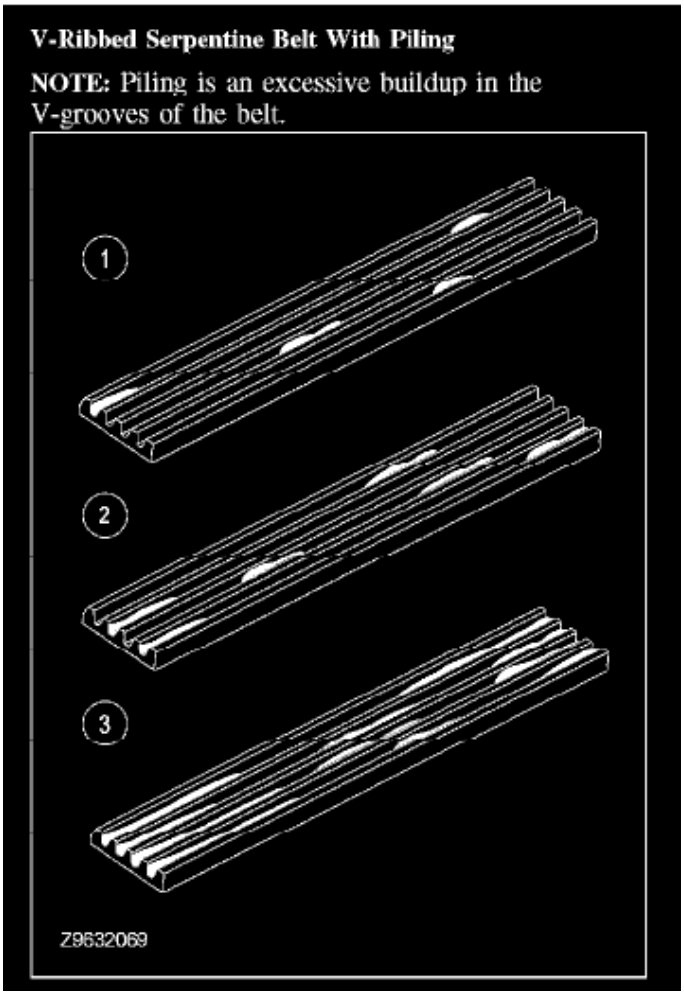
V-Ribbed Serpentine Drive Belt With Cracks Across Ribs

V-Ribbed Serpentine Drive Belt With Cracks Across Ribs



V-Ribbed Serpentine Belt With Piling

NOTE: Piling is an excessive buildup in the V-grooves of the belt.



V-Ribbed Serpentine Drive Belt With Cracks Across Ribs

6. Check the belt for cracks. Up to 15 cracks in a rib over a distance of 100 mm (4.0 inch) can be considered acceptable. If cracks exceed this

standard, install a new belt.

V-Ribbed Serpentine Belt With Piling

V-Ribbed Serpentine Belt With Piling

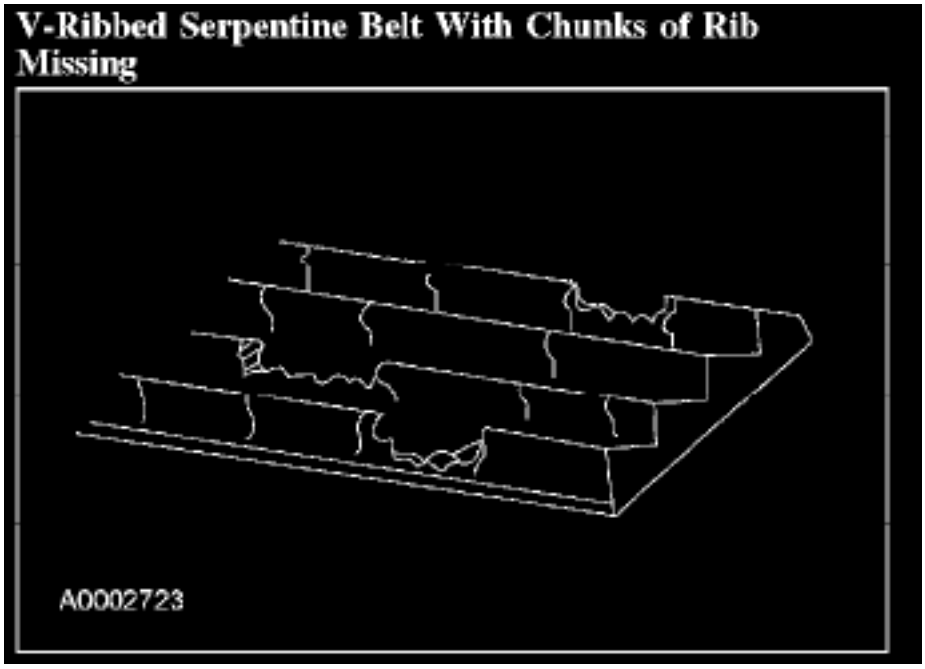
NOTE: Piling is an excessive buildup in the V-grooves of the belt.

7. The condition of the V-ribbed drive belt should be compared against the illustration and appropriate action taken.

1 Small scattered deposits of rubber material. This is not a concern, therefore, installation of a new belt is not required.

2 Longer deposit areas building up to 50% of the rib height. This is not considered a concern but it can result in excessive noise. If noise is apparent, install a new belt.

3 Heavy deposits building up along the grooves resulting in a possible noise and belt stability concern. If heavy deposits are apparent, install a new belt.



V-Ribbed Serpentine Belt With Chunks of Rib Missing

V-Ribbed Serpentine Belt With Chunks of Rib Missing

8. There should be no chunks missing from the belt ribs. If the belt shows any evidence of this, install a new accessory drive belt. 9. If the concern is not visually evident, verify the symptom and GO to Symptom Chart. See: Symptom Related Diagnostic Procedures

Symptom Chart

Condition	Possible Sources	Action
• Accessory drive belt cracking (over 15 cracks in a rib over a distance of 100 mm [4.0 in])	• Accessory drive belt	• INSPECT the accessory drive belt. REFER to Inspection and Verification, INSTALL a new accessory drive belt as necessary.
• Accessory drive belt chunking	• Accessory drive belt	• INSPECT the accessory drive belt. REFER to Inspection and Verification, INSTALL a new accessory drive belt as necessary.
	• Damaged pulley grooves	• INSPECT the accessory drive belt pulley grooves for damage. INSTALL a new pulley or component as necessary.

Drive Belt: Symptom Related Diagnostic Procedures

Symptom Chart

Symptom Chart (Part 1)

Symptom Chart (Continued)

Condition	Possible Sources	Action
• Accessory drive belt noise, squeal, chirping or flutter	• Defective/worn or incorrect accessory drive belt • Misaligned pulley(s) • Pulley runout • Damaged or worn accessory drive component or idler • Fluid contamination of accessory drive belt or pulleys	• REFER to Component Tests, Drive Belt, Noise/Flutter. REPAIR or INSTALL new parts as necessary.
	• Damaged or worn accessory drive belt tensioner	• REFER to Component Tests, Belt Tensioner — Mechanical and Belt Tensioner — Dynamics. INSTALL a new accessory drive belt tensioner as necessary.
	• Damaged pulley grooves	• INSPECT the accessory drive belt pulley grooves for damage. INSTALL a new pulley or component as necessary.
	• Accessory drive component failure	• CHECK the accessory drive components. INSTALL new components as necessary.
	• Accessory drive belt idler pulley bearing failure	• INSPECT the accessory drive belt idler pulley for freedom of rotation and damage. INSTALL a new accessory drive belt idler pulley as necessary.
• Premature accessory drive belt wear	• Defective or incorrect accessory drive belt • Misaligned pulley(s) • Pulley runout • Damaged accessories • Incorrectly installed drive belt • Fluid contamination	• REFER to Component Tests, Drive Belt Noise/Flutter and Incorrect Drive Belt Installation. REPAIR or INSTALL new parts as necessary.
	• Damaged pulley grooves	• INSPECT the accessory drive belt pulley grooves for damage. INSTALL a new pulley or component as necessary.

Symptom Chart (Part 2)

Drive Belt: Component Tests and General Diagnostics

Drive Belt - Noise/Flutter

Drive Belt - Noise/Flutter

CAUTION: Under no circumstances should the accessory drive belt, tensioner or pulleys have any fluids or belt dressing applied to them as damage to the belt material and tensioner damping mechanism may occur.

Drive belt chirp occurs due to pulley misalignment or excessive pulley runout. It can be the result of a damaged or incorrectly aligned grooved pulley.

To correct, determine the area where the noise comes from. Check each of the pulleys in that area with a straightedge to the crankshaft pulley. Look for accessory pulleys out of position in the fore/aft direction or at an angle to the straightedge.

Drive belt squeal may be an intermittent or constant noise that occurs when the drive belt slips on an accessory pulley under certain conditions.

A short intermittent squeal may occur during engine start-up and shut down or during very rapid engine acceleration and decelerations, such as: ^

wide open throttle (WOT) 1-2 and 2-3 shifts or 2-3 and 3-4 back out shifts on automatic transmissions.

^ WOT 1-2 and 2-3 shifts and any combination of rapid downshifting on manual transmissions.

These special short-term transient events are expected, and are due to the higher system inertia required to meet the electrical and cooling demands on today's vehicle systems. Constant or reoccurring drive belt squeal can occur: ^

if the A/C discharge pressure goes above specifications: -

the A/C system is overcharged.

- the A/C condenser core airflow is blocked.

^ if the A/C off equalized pressure (the common discharged and suction pressure that occurs after several minutes) exceeds specifications.

^ if any of the accessories or idler pulley(s) are damaged or have a worn or damaged bearing. All accessories should be rotatable by hand in the unloaded condition. If not, inspect the accessory.

^ if there is evidence of fluid contamination on the accessory drive belt. When the drive belt has been exposed to fluid contamination during vehicle operation, such as leaks from the power steering system, A/C system or cooling system, clean all pulleys with soap and water, rinse with clean water and install a new accessory drive belt. If the drive belt has been exposed to fluids in a localized area during routine vehicle service, such as replacement of hoses or fluids, the drive belt and pulleys should be washed with soap and water immediately (prior to starting the engine), and rinsed with clean water.

^ if the accessory drive belt is too long. A drive belt that is too long will allow the accessory drive belt tensioner arm to go all the way to the arm travel stop under certain load conditions, which will release tension to the drive belt. If the accessory drive belt tensioner indicator is outside the normal installation wear range window, install a new accessory drive belt.

^ NOTE: The accessory drive belt tensioner arm should rotate freely without binding.

Install a new accessory drive belt tensioner if the drive belt tensioner is worn or damaged.

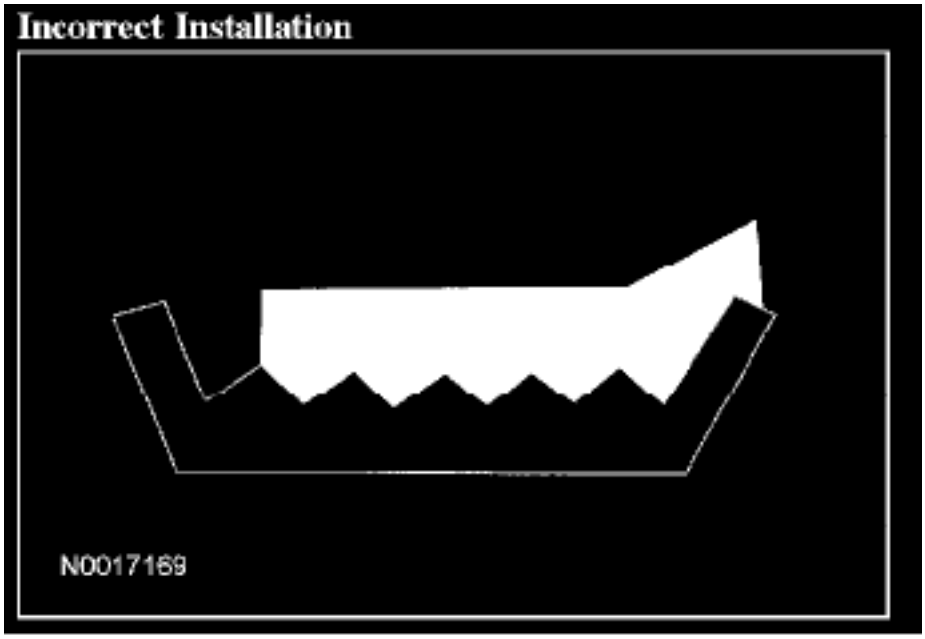
Drive Belt - Incorrect Installation

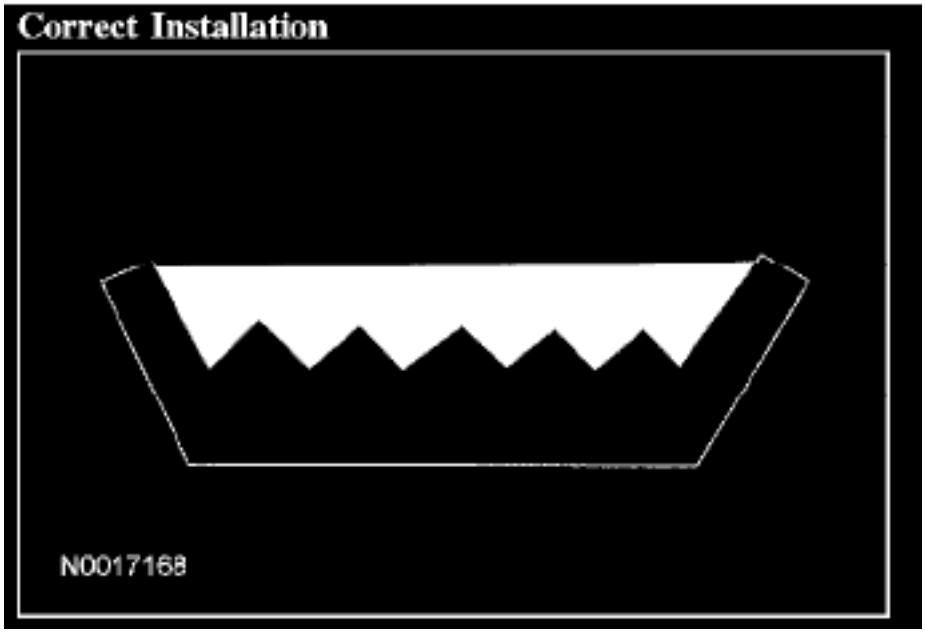
Drive Belt - Incorrect Installation

CAUTION: Incorrect accessory drive belt installation will cause excessive drive belt wear and may cause the drive belt to come off the pulleys.

Non-standard accessory drive belts can track differently or incorrectly. If an accessory drive belt tracks incorrectly, install a new accessory drive belt to avoid performance failure or loss of the drive belt.

Incorrect Installation





Incorrect Installation

Correct Installation

Correct Installation

With the engine running, check accessory drive belt tracking on all pulleys. If the edge of the accessory drive belt rides beyond the edge of the pulleys, noise and premature wear will occur. Make sure the accessory drive belt rides correctly on the pulley. If an accessory drive belt tracking condition exists, proceed with the following: ^

Visually check the accessory drive belt tensioner for damage and wear, especially the mounting pad surface and arm alignment. If the accessory drive belt tensioner is not installed correctly, the mounting surface pad will be out of position. If the tensioner arm is worn, the arm will be out of alignment. Either of these conditions will result in chirp and squeal noises.

^ With the engine running, visually observe the grooves in the pulleys (not the pulley flanges or the pulley forward faces) for excessive wobble. Install new components as necessary.

^ Check all accessories, mounting brackets and the accessory drive belt tensioner for any interference that would prevent the component from mounting correctly. Correct any interference condition and recheck the accessory drive belt tracking.

^ Tighten all accessories, mounting brackets and accessory drive belt tensioner retaining hardware to specification. Recheck the accessory drive belt tracking.

Belt Tensioner - Mechanical

Belt Tensioner - Mechanical

The only mechanical check that needs to be made is a check for tensioner stick, grab or bind. 1. With the engine off, check routing of the accessory drive belt. Refer to the illustrations under Description and Operation.

2. NOTE: The accessory drive belt tensioner spring is very strong and requires substantial force to release.

Using a suitable, commercially available serpentine belt tensioner release tool, release the tension on the belt and detach the accessory drive belt from the tensioner. Carry out the following tests: ^

Using the release tool, move the tensioner from its relaxed position, through its full stroke and back to the relaxed position to make sure there is no stick, grab or bind, and to make sure that there is tension on the tensioner spring.

^ Rotate the tensioner pulley by hand and check for a binding, contaminated or seized condition.

^ Inspect the area surrounding the accessory drive belt tensioner for oil leaks or contamination and repair any leaks.

3. If the accessory drive belt tensioner does not meet the criteria in the previous step, install a new tensioner. If the accessory drive belt tensioner

meets the criteria in the previous step, proceed to testing the tensioner dynamically.

Belt Tensioner - Dynamics

Belt Tensioner - Dynamics

The accessory drive belt tensioner can be checked dynamically as follows: 1. With the engine running, observe the accessory drive belt tensioner movement. The accessory drive tensioner should move (respond) when the

A/C clutch cycles (if equipped), or when the engine is accelerated rapidly. If the accessory drive belt tensioner movement is excessive without A/C clutch cycling or engine acceleration, check belt rideout. Excessive belt rideout (uneven depth of grooves in the belt) can cause excessive accessory drive belt tensioner movement. Check rideout condition by installing a new belt. If excessive accessory drive belt tensioner movement still exists, install a new accessory drive belt tensioner.

Removal and Installation

Exploded View

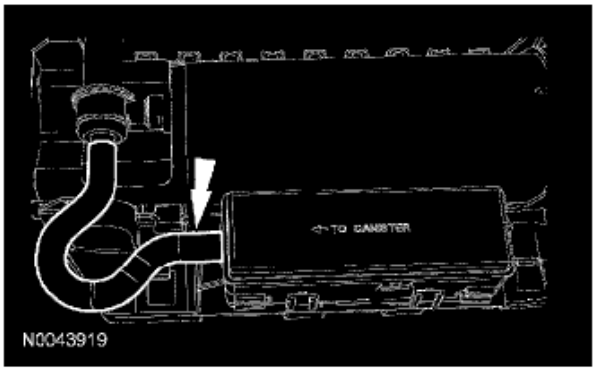
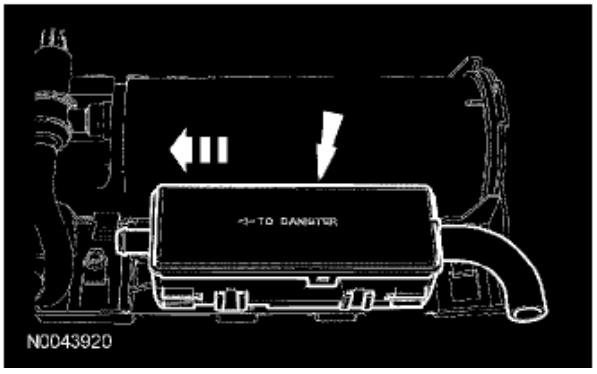
Part 1

Item	Part Number	Description
8	—	EVAP canister vent solenoid electrical connector (part of 14405)
9	—	Rear fuel tank vapor tube and fuel tank pressure sensor assembly-to-EVAP canister quick connect coupling (part of 9G291)





Part 2

WARNING:

- When working on or near the evaporative emission (EVAP) system, disconnect the battery ground cable from the battery. The EVAP system contains fuel vapor and condensed fuel vapor, so an electrical spark may cause a fire or explosion. Failure to follow this instruction may result in serious personal injury.

- Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. With the vehicle in NEUTRAL, position it on a hoist. 2. Disconnect the battery ground cable. 3. Disconnect the rear fuel tank vapor tube and fuel tank pressure sensor assembly-to-evaporative emissions (EVAP) canister quick connect coupling. 4. Disconnect the EVAP canister vent solenoid electrical connector. 5. Remove the EVAP canister and bracket assembly bolts.

- To install, tighten to 14 Nm (10 lb-ft).

6. Remove the EVAP canister and bracket assembly. 7. Disconnect the EVAP canister vent solenoid-to-dust separator hose from the dust separator.

8. Remove the dust separator from the bracket.

9. To install, reverse the removal procedure.

- Carry out the leak test. See: Powertrain Management/Emission Control Systems/Evaporative Emissions System/Testing and Inspection

- Carry out the evaporative emission repair verification drive cycle.

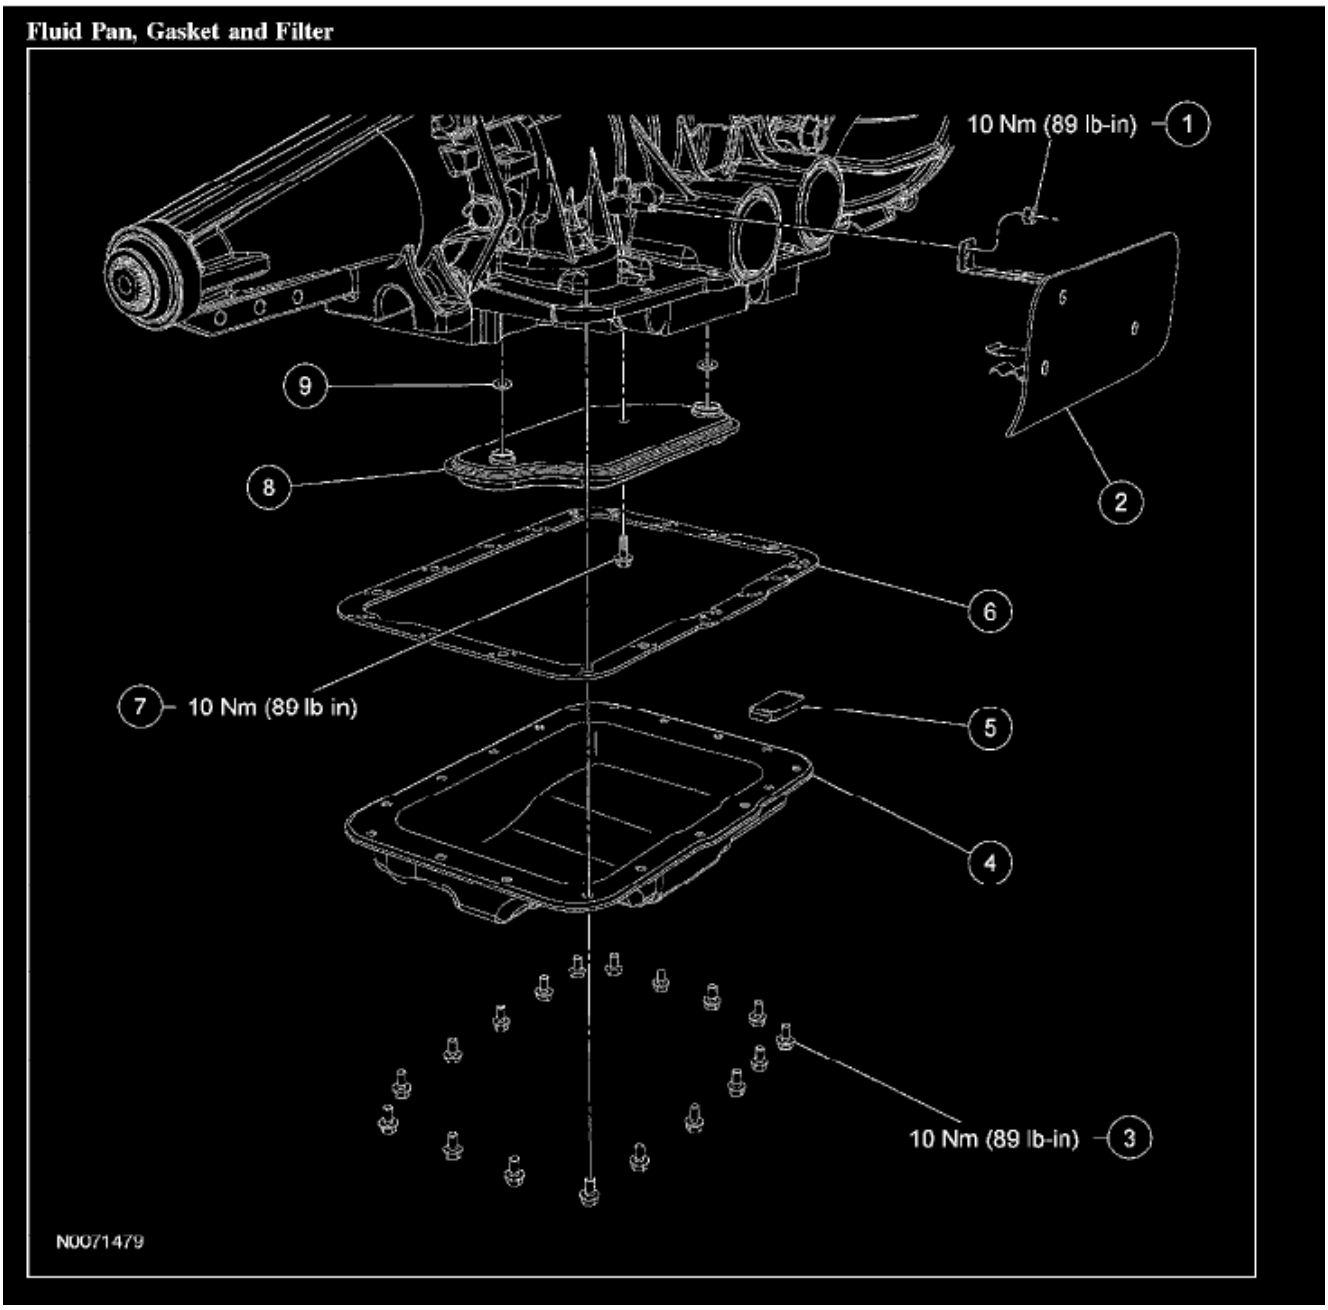
Fluid Pan, Gasket and Filter



Fluid Filter - A/T: Service and Repair Fluid Pan, Gasket and Filter

Fluid Pan, Gasket and Filter

Fluid Pan, Gasket and Filter (Part 1)

Item	Part Number	Description
1	N620040-S	Heat shield nut
2	7F013-B	Heat shield
3	W701203-S	Transmission fluid pan screw (18 required)
4	7A264-A	Transmission fluid pan
5	7L027	Magnet
6	7A191-A	Transmission fluid pan gasket
7	E800154	Transmission fluid filter screw
8	7A098-A	Transmission fluid filter
9	7A469	Transmission fluid filter O-ring (2 required)

Fluid Pan, Gasket and Filter (Part 2)

Removal

1. With the vehicle in NEUTRAL, position it on a hoist.

2. NOTE: If equipped, the transmission servo heat shield must be unclipped from the fluid pan rail and positioned aside for fluid pan removal.

If equipped, loosen the nut and position the heat shield aside.

3. Drain transmission fluid.

^ Remove all the transmission fluid pan screws except for 2 in the front. Loosen the 2 front transmission fluid pan screws. Pry the rear of the transmission fluid pan down and allow fluid to drain. After fluid is drained, remove the front 2 transmission fluid pan screws.

4. NOTE: The transmission fluid gasket is reusable. Clean and inspect for damage, if not damaged, the gasket should be reused.

Remove the transmission fluid pan.

5. Remove the transmission fluid pan gasket. 6. Remove the transmission fluid filter screw. 7. Remove the transmission fluid filter. 8. Clean and inspect the transmission fluid pan and magnet. Clean all mating surfaces.

Installation

1. CAUTION: Lubricate fluid filter O-ring seals with clean automatic transmission fluid or they may be damaged.

Lubricate and install new O-ring seals onto the transmission fluid filter.

2. Position the transmission fluid filter on the main control valve body. 3. Install the transmission fluid filter screw.

^ Tighten to 10 Nm (89 lb-inch).

4. Position the fluid pan magnet in the transmission fluid pan.

5. NOTE: The transmission fluid pan gasket is reusable. Clean and inspect for damage, it not damaged, the gasket should be reused.

Position the transmission fluid pan gasket on the transmission fluid pan.

6. Install and align the transmission fluid pan. 7. Loosely install the transmission fluid pan screws. 8. Tighten the transmission fluid pan screws in a crisscross pattern.

^ Tighten to 10 Nm (89 lb-inch).

9. If equipped, position the servo heat shield over the servos and clip it to the pan rail.

^ Tighten to 10 Nm (89 lb-inch).

10. NOTE: Start with a minimum of 3.7L (4 qt) clean automatic transmission fluid.

Fill transmission with clean automatic transmission fluid to the correct fluid level.

11. Apply the park brake and start the engine. 12. Move the range selector lever through all the gears. 13. Check the transmission fluid level.

Fluid Filter - A/T: Service and Repair Transmission Filter - In Line

Transmission Filter - In Line

Transmission fluid in-line filter without oil-to-air (OTA) cooler

NOTE: Use the following guidelines for the in-line transmission fluid filter: ^

If the transmission was overhauled and the vehicle was equipped with an in-line fluid filter, install a new in-line fluid filter.

^ If the transmission was overhauled and the vehicle was not equipped with an in-line fluid filter, install a new in-line fluid filter kit.

^ If the transmission is being installed for a non-internal repair, do not install an in-line filter or filter kit.

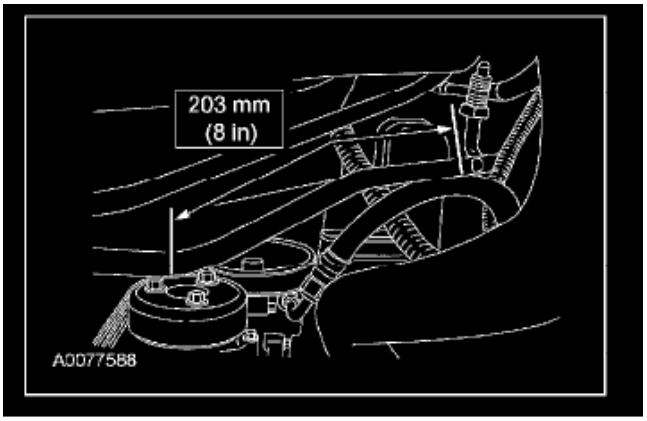
^ If installing a new or a Ford-authorized remanufactured transmission, install the in-line transmission fluid filter that is supplied.

1. With the vehicle in NEUTRAL, position it on a hoist. 2. Remove the retainer clips from the cooler lines.

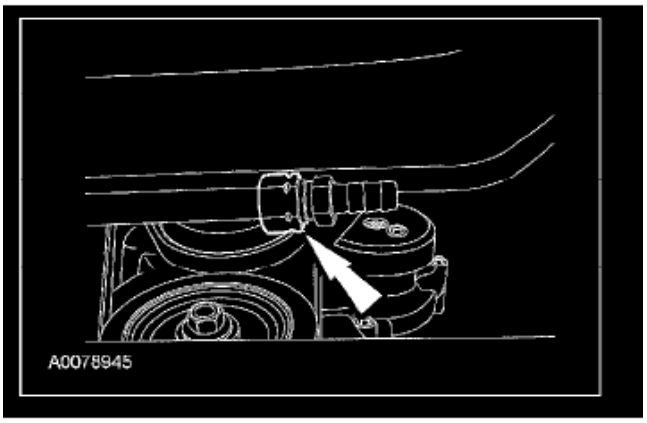
3. Disconnect the lower transmission cooler tube fitting.

4. Remove the section of the return line, as illustrated.

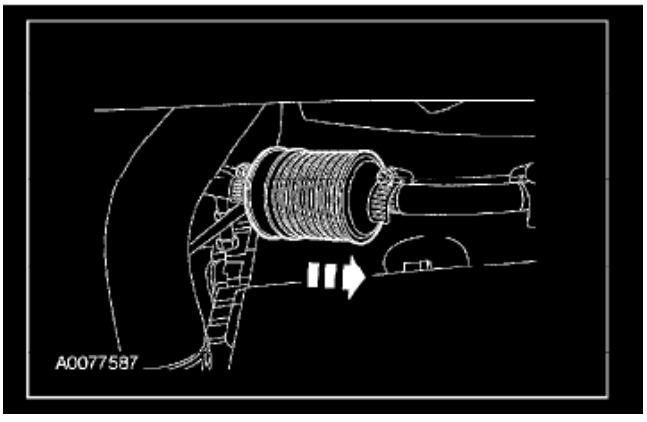
^ Clean and deburr the cut ends of the steel tubing.



203 mm
(8 in)
A0077588



A0078945



A0077587

5. NOTE: Be sure the cooler tube is fully seated in the body of the fitting before final tightening of the ferrule nut.

Install the 2 ferrule connectors finger tight onto each end of the tubing. Then tighten the nuts an additional 1-1/2 turns to seat the ferrules in the connectors.

6. CAUTION: The filter has a bypass valve in it. The red arrow on the filter indicates the direction of the fluid flow through the filter. The

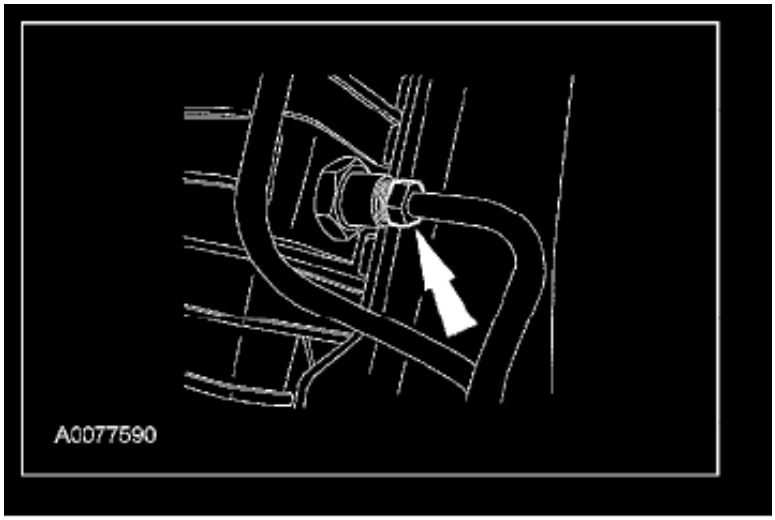
filter must be installed in the fluid cooler return line with the red arrow pointing away from the transmission fluid cooler and toward the transmission (the return line has fluid coming out of the cooler going to the transmission). If the fluid filter is not installed correctly, it will cause internal transmission damage.

NOTE: Do not install any rubber hoses or steel tubing with a bend entering the filter greater than 60 degrees.

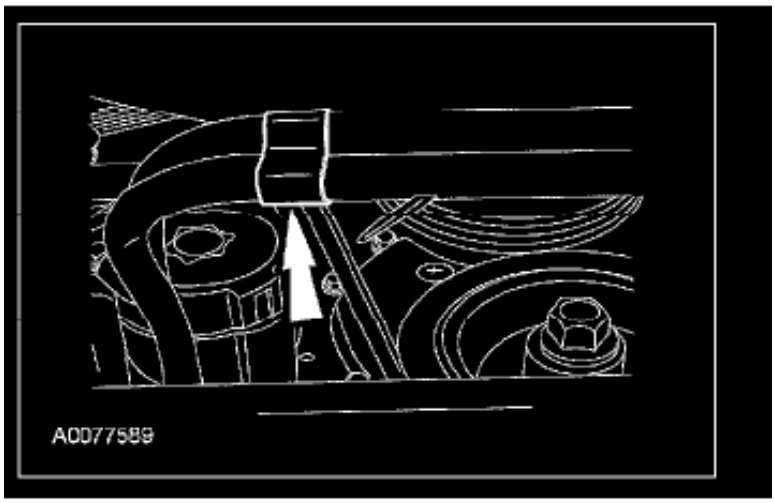
Using suitable length of hose(s), install the filter. Tighten the clamps.

7. Connect the lower transmission cooler tube fitting.

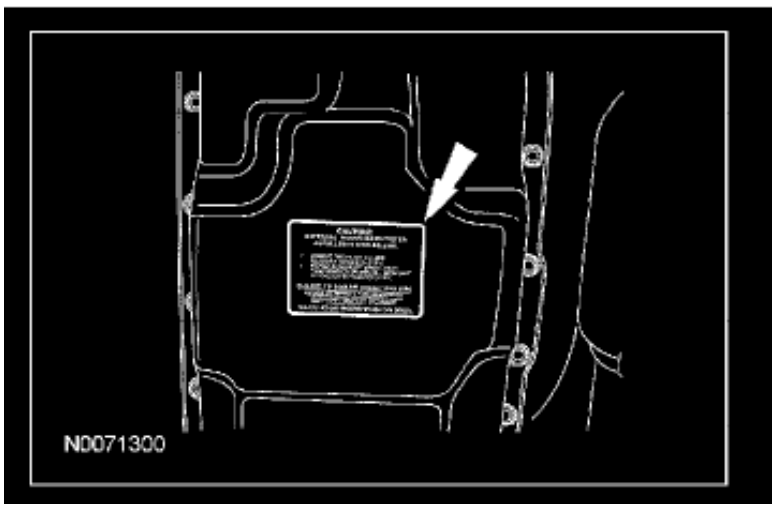
^ Tighten to 28 Nm (21 lb-ft).



A0077590



A0077589



N0071300

8. Install the retainer clips on the cooler lines.

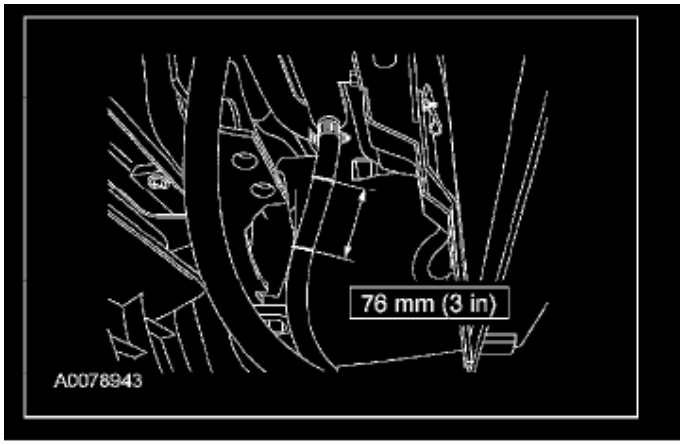
9. Clean a section of the transmission fluid pan and install the sticker.

10. Fill the transmission with clean automatic transmission fluid.

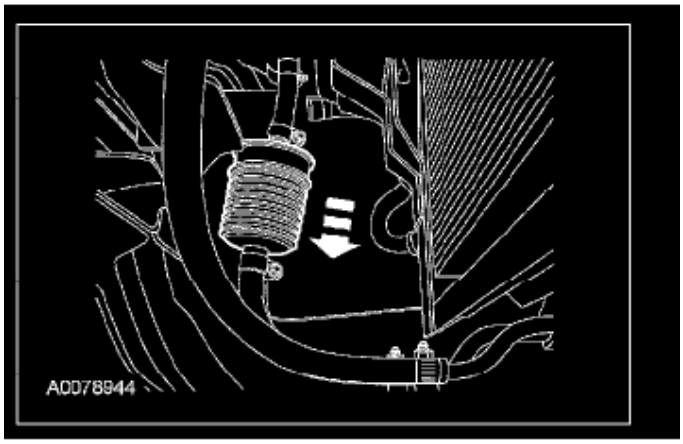
^ Verify for correct operation.

^ Check the filter for leaks.

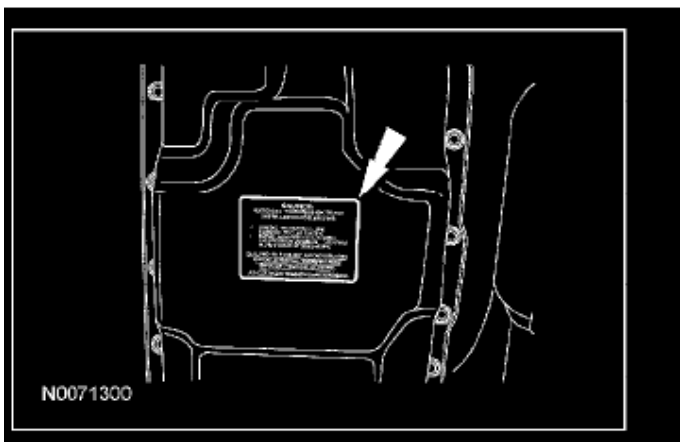
Transmission fluid in-line filter with OTA cooler 11. With the vehicle in NEUTRAL, position it on a hoist. 12. Remove the section of the return line, as illustrated.



76 mm (3 in)
A0078943



A0078944



N0071300

13. CAUTION: The filter has a bypass valve in it. The red arrow on the filter indicates the direction of the fluid flow through the filter. The

filter must be installed in the fluid cooler return line with the red arrow pointing away from the transmission fluid cooler and toward the transmission (the return line has fluid coming out of the cooler going to the transmission). If the fluid filter is not installed correctly, it will cause internal transmission damage.

NOTE: Do not install any rubber hoses or steel tubing with a bend entering the filter greater than 60 degrees.

Using 2 hose clamps, install the filter.

14. Clean a section of the transmission fluid pan and install the sticker.

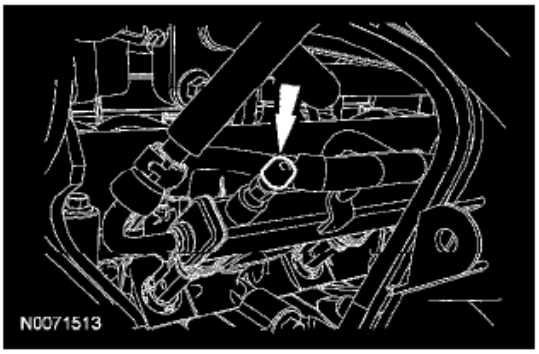
15. Fill the transmission with clean automatic transmission fluid.

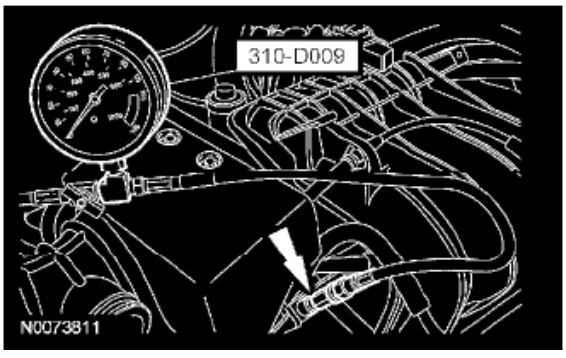
^ Verify for correct operation.

^ Check the filter for leaks.

Special Tool(s)

ST3038-A	Fuel Pressure Test Kit 310-D009 (D95L-7211A)





Fuel Pressure Release: Service and Repair

FUEL SYSTEM PRESSURE RELEASE

Special Tool(s)

Special Tool(s)

WARNING:

- Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

- Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

- Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

- When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

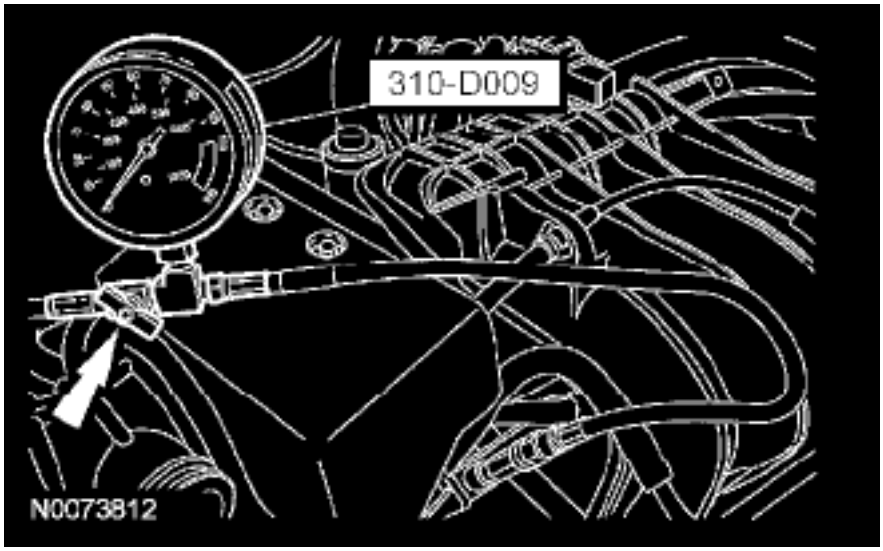
1. Disconnect the battery ground cable.

2. NOTE: 2.3L shown, 3.0L and 4.0L similar.

Remove the cap from the fuel pressure relief valve located on the fuel rail.

3. NOTE: 2.3L shown, 3.0L and 4.0L similar.

Install the special tool onto the fuel pressure relief valve.



4. NOTE:

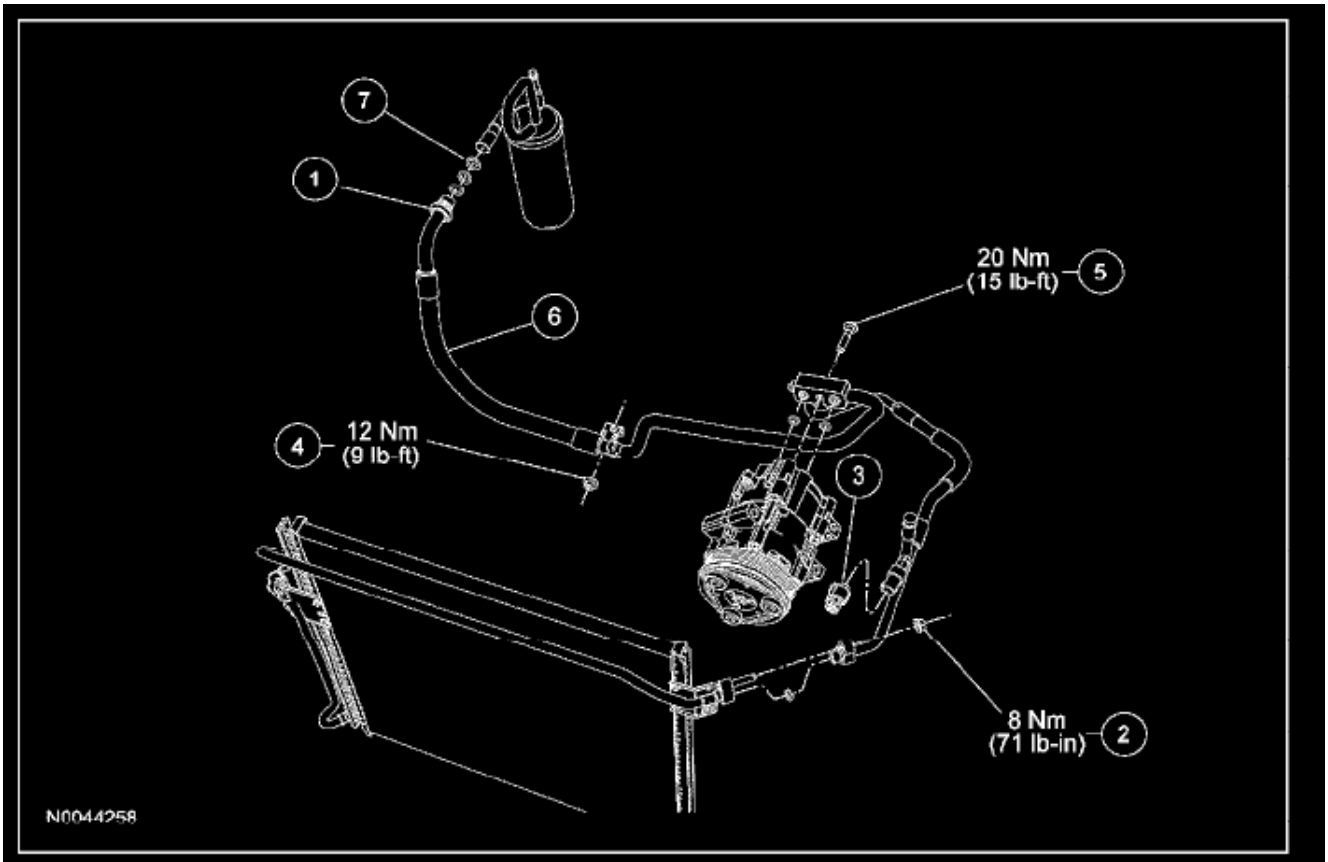
- 2.3L shown, 3.0L and 4.0L similar.

- Open the drain valve slowly to relieve the system pressure. This may drain fuel from the system. Place fuel in a suitable container.

Open the drain valve on the special tool and relieve the fuel system pressure.

5. NOTE: It may take more than one key cycle to pressurize the fuel system.

Upon completion of the fuel system repairs, cycle the ignition key and wait 3 seconds to pressurize the fuel system. Check for leaks before starting the engine.



Item	Part Number	Description
1	—	Suction accumulator outlet fitting (part of 19D850)
2	W520413	Condenser inlet fitting nut
3	—	Pressure cutoff switch electrical connector (part of 14A280)
4	N621940	Compressor manifold and tube assembly bracket nut
5	W704692	A/C compressor manifold bolt
6	19D850	Compressor manifold and tube assembly
7	19E889	O-ring seal (6 required)

Hose/Line HVAC: Service and Repair Compressor Manifold and Tube Assembly

COMPRESSOR MANIFOLD AND TUBE ASSEMBLY

Removal and Installation

NOTE: Installation of a new suction accumulator is not required when repairing the air conditioning system, except when there is physical evidence of system contamination from a failed A/C compressor or damage to the suction accumulator.

1. Recover the refrigerant. 2. Disconnect the suction accumulator outlet fitting.

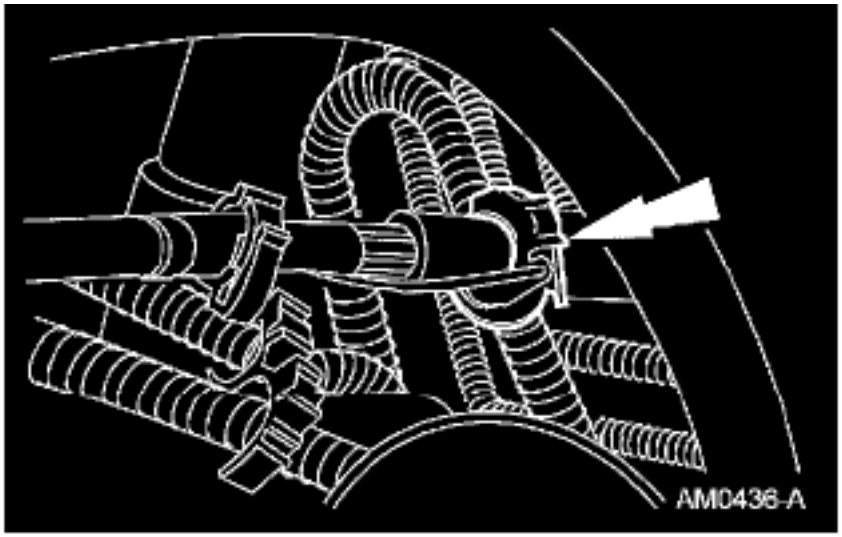
- Discard the O-ring seals.

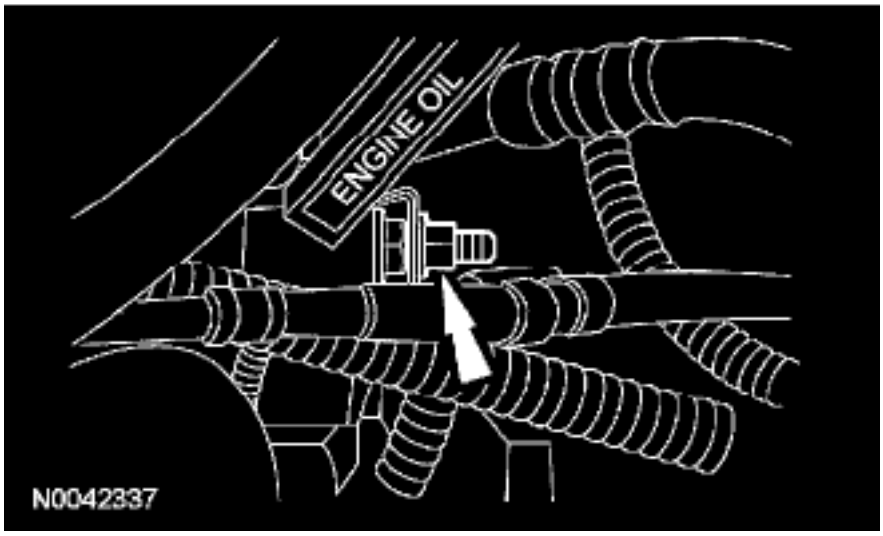
3. Remove the condenser inlet fitting nut and disconnect the fitting.

- Discard the O-ring seal.

- To install, tighten to 8 Nm (71 lb-in).

4. Disconnect the pressure cutoff switch electrical connector. 5. Disconnect the fuel line spring lock coupling.





6. Remove the nut and position the bracket aside.

- To install, tighten to 12 Nm (9 lb-ft).

7. Remove the compressor manifold and tube assembly bracket nut.

- To install, tighten to 12 Nm (9 lb-ft).

8. Loosen the A/C compressor manifold bolt and remove the compressor manifold and tube assembly.

- Discard the O-ring seals.

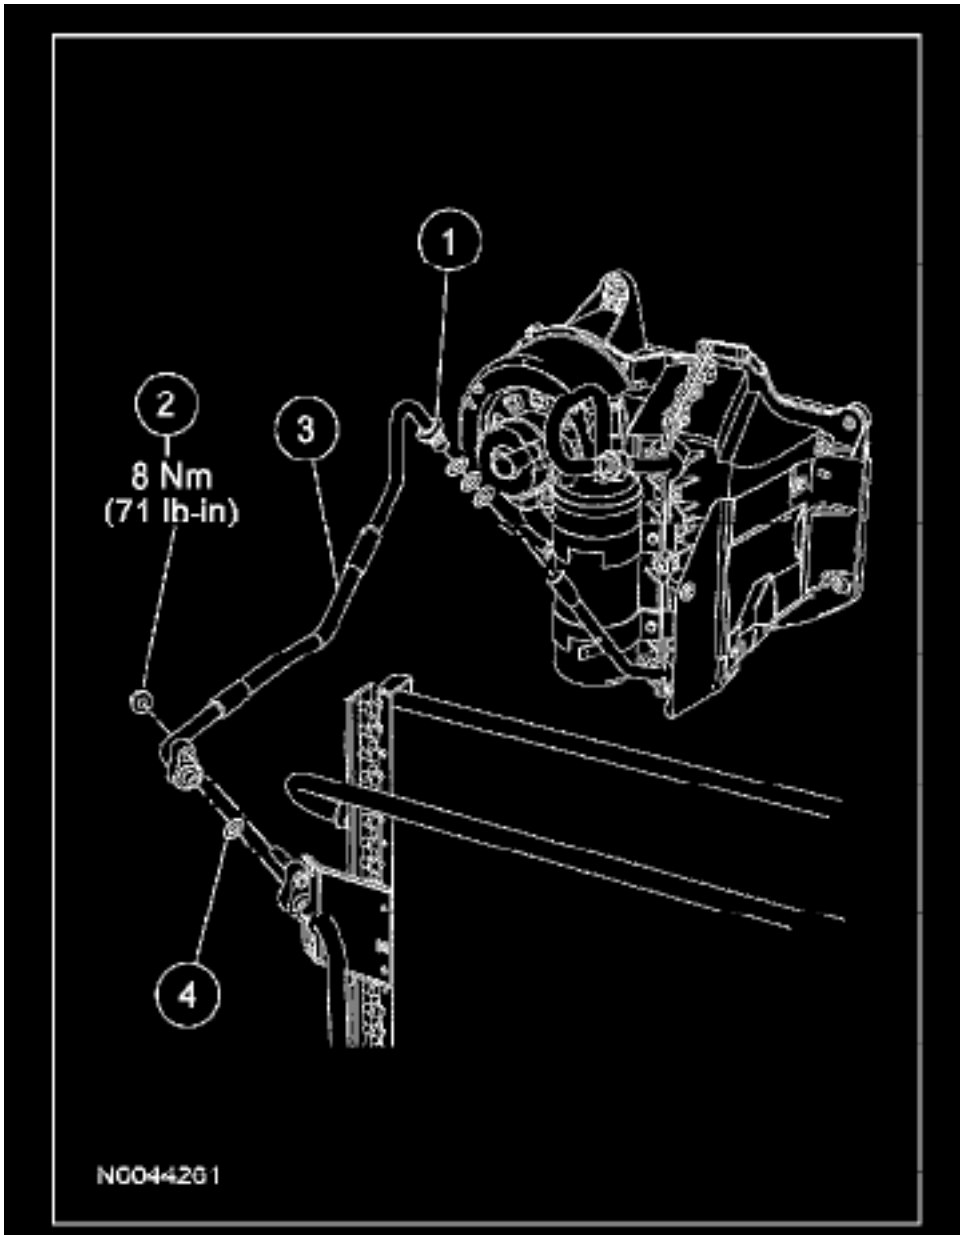
- To install, tighten to 20 Nm (15 lb-ft).

9. To install, reverse the removal procedure.

- Install new O-ring seals.

- Lubricate the refrigerant system with the correct amount of clean PAG oil.

10. Evacuate, leak test and charge the refrigerant system.



Item	Part Number	Description
1	—	Evaporator inlet fitting (part of 19835)
2	W520413	Condenser outlet fitting nut
3	19835	Condenser-to-evaporator line
4	19F889	O-ring seal (4 required)

Hose/Line HVAC: Service and Repair Condenser to Evaporator Line

CONDENSER TO EVAPORATOR LINE

Removal and Installation

NOTE: Installation of a new suction accumulator is not required when repairing the air conditioning system, except when there is physical evidence of system contamination from a failed A/C compressor or damage to the suction accumulator.

1. Recover the refrigerant. 2. Disconnect the evaporator inlet fitting.

- Discard the O-ring seals.

3. Remove the condenser outlet fitting nut and disconnect the fitting.

- Discard the O-ring seal.

- To install, tighten to 8 Nm (71 lb-in).

4. To install, reverse the removal procedure.

- Install new O-ring seals.

- Lubricate the refrigerant system with the correct amount of clean PAG oil.

5. Evacuate, leak test and charge the refrigerant system.

Brake Fluid: Specifications

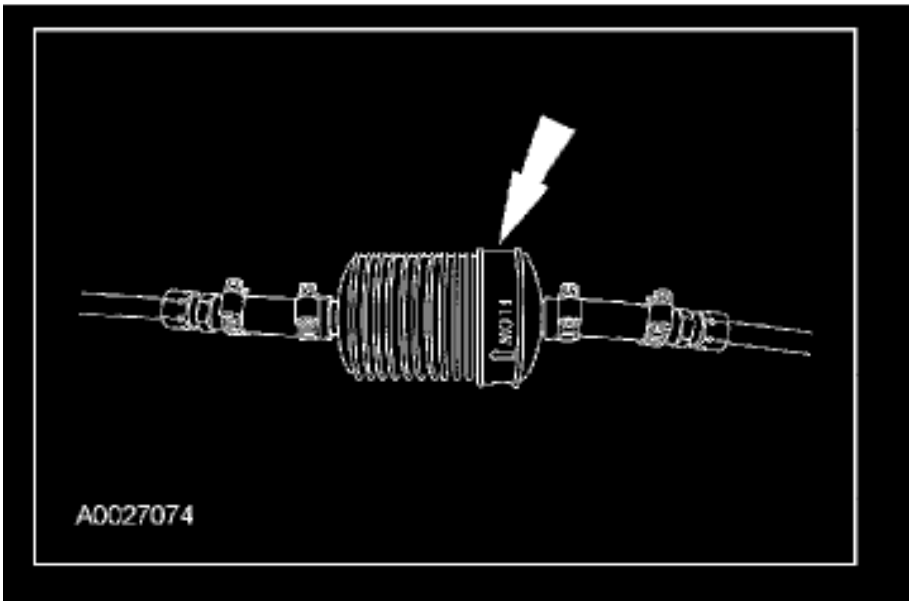
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V



Fluid - A/T: Service and Repair Transmission Fluid Cooler Backflushing and Cleaning

Transmission Fluid Cooler Backflushing and Cleaning

CAUTION: Whenever a transmission has been disassembled to install new parts or a new or remanufactured transmission has been installed, a new transmission fluid cooler, either in-tank, auxiliary or oil to air (OTA), if equipped will need to be installed. Using a suitable torque converter/fluid cooler cleaner, clean and backflush the transmission fluid cooler tubes.

When internal wear or damage has occurred in the transmission, metal particles, clutch plate material or band material may have been carried into the transmission fluid cooler. These contaminants are a major cause of recurring transmission concerns and must be removed from the system before the transmission is put back in use.

CAUTION: Use only clean automatic transmission fluid specified for this transmission. Do not use supplemental fluid additives, treatments or cleaning agent. The use of these materials may affect transmission operation and result in internal damage to the transmission.

NOTE: Do not use any solvents while carrying out this procedure. Only use clean automatic transmission fluid.

1. Conduct backflushing with a suitable torque converter/transmission fluid cooler cleaner. Test the equipment to make sure that a vigorous fluid

flow is present before proceeding. Install a new system filter if flow is weak or contaminated.

2. Remove and discard the in-line transmission fluid filter, if equipped.

3. To aid in attaching the cleaner to the transmission steel cooler lines, connect 2 additional rubber hoses to the transmission end of the steel

transmission cooler lines as described. ^

Connect the cleaner tank pressure line to the steel transmission cooler return line (longest line).

^ Connect a tank return hose to the steel transmission cooler pressure line (shorter line). Place the outlet end of this hose in the solvent tank reservoir.

4. Turn on the pump and allow the transmission fluid to circulate a minimum of 5 minutes (cycling switch on and off will help dislodge contaminants

in the cooler system).

5. Switch off the pump and disconnect the pressure hose from the transmission cooler return line.
6. Use compressed air to blow out the cooler(s) and lines (blow air into the transmission cooler return line) until all the fluid is removed. 7. Remove the rubber return hose from the remaining steel cooler line.

Fluid - A/T: Service and Repair Transmission Fluid Drain and Refill - Automated Equipment

Transmission Fluid Drain and Refill - Automated Equipment

Drain

CAUTION: Use only clean automatic transmission fluid. Do not use any supplemental transmission fluid additives, treatments or cleaning agents. The use of these materials can affect the operation of the transmission, resulting in internal component failure.

NOTE: Always refer to the instructions supplied with the flush and fill machine.

NOTE: This is a new procedure for draining and adding transmission fluid using a suitable transmission flush and fill machine.

1. With the vehicle in PARK, position on a hoist. 2. Use a suitable flush and fill machine to change the fluid. 3. When connecting the flush and fill machine, connect the machine to the fluid cooler tube after the fluid cooler on the cooler return tube. This will

help remove any foreign material trapped in the fluid coolers.

4. Carry out the fluid exchange process.

Refill

1. Use only clean automatic transmission fluid. 2. Once the fluid exchange has been completed, disconnect the flush and fill machine. Reconnect any disconnected fluid cooler tubes. 3. Lower the vehicle. 4. With the engine running and the transmission at normal operating temperature 66-77° C (150-170° F), check and adjust the transmission fluid

level and check for any leaks. If fluid is needed, add fluid in increments of 0.24L (0.5 pt) until the correct level is achieved (fluid should be in the cross-hatched area of the fluid level indicator).

Fluid - A/T: Service and Repair Transmission Fluid Drain and Refill - Vehicles Not Equipped With Torque Converter Drain Plug

Transmission Fluid Drain and Refill - Vehicles Not Equipped With Torque Converter Drain Plug

Drain

CAUTION: Use only clean automatic transmission fluid. Do not use any supplemental transmission fluid additives, treatments or cleaning agents. The use of these materials may affect the operation of the transmission, resulting in internal component failure.

1. With the vehicle in PARK, position it on a hoist.

2. NOTE: If equipped, the transmission servo heat shield must be unclipped from the fluid pan rail and positioned aside for fluid pan removal.

If equipped, loosen the nut and position the heat shield aside.

3. Place a drain pan under the transmission fluid pan. 4. Drain transmission fluid.

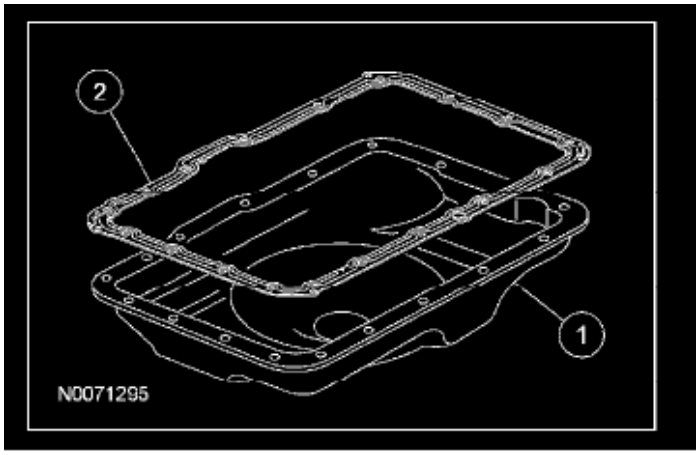
^ Remove all the transmission fluid pan screws except for 2 in the front. Loosen the 2 front transmission fluid pan screws. Pry the rear of the transmission fluid pan down and allow fluid to drain. After fluid is drained, remove the front 2 transmission fluid pan screws.

5. NOTE: The transmission fluid pan gasket is reusable. Clean and inspect for damage, if not damaged, the gasket should be reused.

Remove the transmission fluid pan. 1

Remove the transmission fluid pan.

2 Remove the transmission fluid pan gasket.



2
1
N0071295

6. Clean and inspect the transmission fluid pan and magnet. Clean all mating surfaces.

Refill

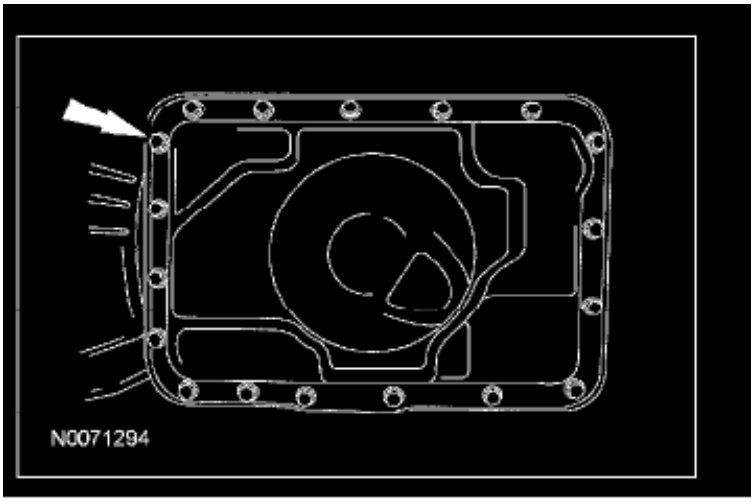
1. NOTE: The transmission fluid pan gasket is reusable. Clean and inspect for damage, if not damaged, the gasket should be reused.

Install the transmission fluid pan. 1

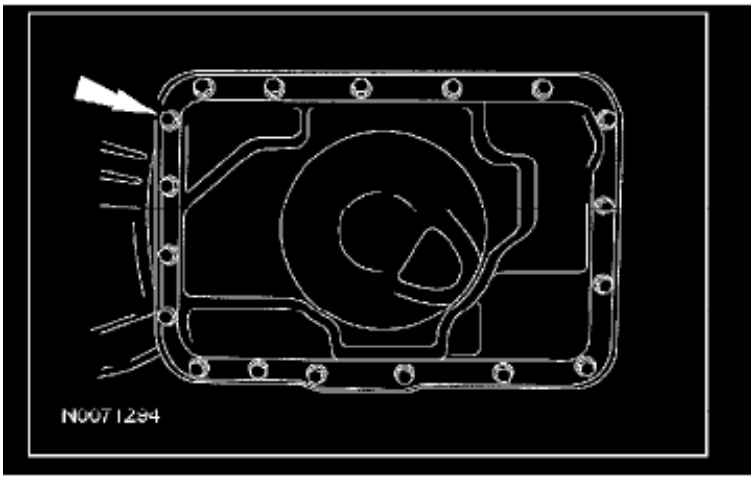
Position the transmission fluid pan gasket on the transmission fluid pan.

2 Install and align the transmission fluid pan.

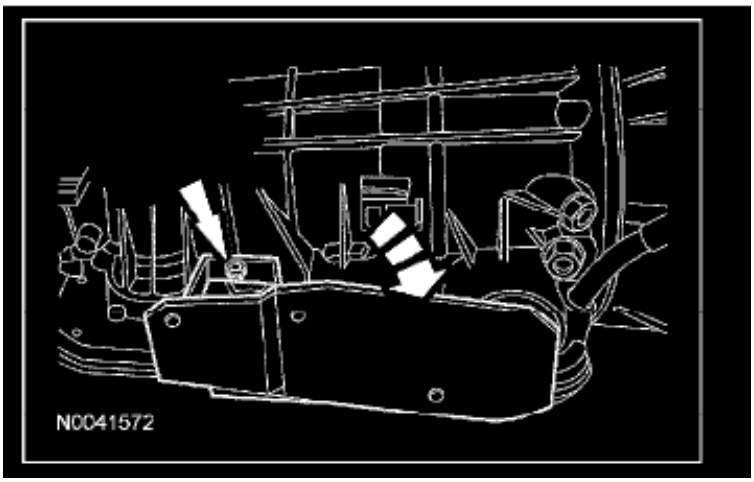
2. Loosely install the transmission fluid pan screws.



N0071294



N0071294



N0041572

3. Tighten the transmission fluid pan screws in a crisscross sequence.

^ Tighten to 10 Nm (89 lb-inch).

4. If equipped, position the servo heat shield over the servos and clip it to the pan rail.

^ Tighten to 10 Nm (89 lb-inch).

5. Lower the vehicle.

6. NOTE: When filling a dry transmission and converter, start with a minimum of 3.7L (4 qt).

With the engine running and the transmission at normal operating temperature 66-77° C (150-170° F), check and adjust the transmission fluid level and check for any leaks. If fluid is needed, add fluid in increments of 0.24L (0.5 pt) until the correct level is achieved (fluid should be in the crosshatched area of the fluid level indicator).

7. Apply the park brake and start the engine. 8. Move the range selector lever through all the gears. 9. Check the transmission fluid level.

Fluid - M/T: Capacity Specifications

Manual Transmission

Capacity ..... 2.8 Quarts

Note: Approximate refill. Service refill capacity is determined by filling the transmission to the bottom of the filler hole with the vehicle on a level surface.

Fluid - M/T: Fluid Type Specifications

Power Steering Fluid: Specifications

Transfer Case Fluid Type

Ford Part Number ..... Motorcraft MERCON V ATF Ford Part Number XT-5-QM
Ford Specification ..... MERCON V

Power Steering Fluid: Testing and Inspection

Power Steering Fluid Leak Test

NOTE: This test should only be carried out if a leak in the system has not been detected during a thorough visual inspection. Refer to Inspection and Verification.

1. Check the power steering fluid level. If necessary, add the specified power steering fluid. 2. Remove the power steering pump reservoir cap and tightly install the evacuation cap to the power steering pump reservoir. 3. Install the hose from the fill adapter manifold tee to the evacuation cap on the power steering pump reservoir. 4. Install the vacuum pump to the evacuation cap. 5. Using the vacuum pump, apply 68-85 kPa (20-25 in-Hg) of vacuum to the power steering system. 6. Observe the vacuum gauge for 30 seconds. If the vacuum gauge reading drops more than 3 kPa (0.88 in-Hg) a leak is present. 7. Remove the vacuum pump.

8. CAUTION: Do not hold the steering wheel at the stops for an extended amount of time. Damage to the power steering pump may occur.

Start the engine. With the engine at idle, raise the power steering fluid temperature to 74-80° C (165-176° F) by rotating the steering wheel fully to the left and right several times.

9. Visually inspect the system for leaks. If a leak is evident, repair as necessary. If a leak is not evident, add the specified UV fluorescent tracer dye

to the power steering fluid. Use 14.78 ml (1/2 oz) of dye solution for every 1.89L (2 qt) of power steering fluid.

10. CAUTION: Do not hold the steering wheel at the stops for an extended amount of time. Damage to the power steering pump may occur.

Start the engine. With the engine at idle, raise the power steering fluid temperature to 74-80° C (165-176° F) by rotating the steering wheel fully to the left and right several times.

11. Using the special tool (UV lamp), inspect the system for traces of UV dye. Repair as necessary.

Brake Bleeding: Service and Repair Component Bleeding

Component Bleeding

Master Cylinder Priming

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

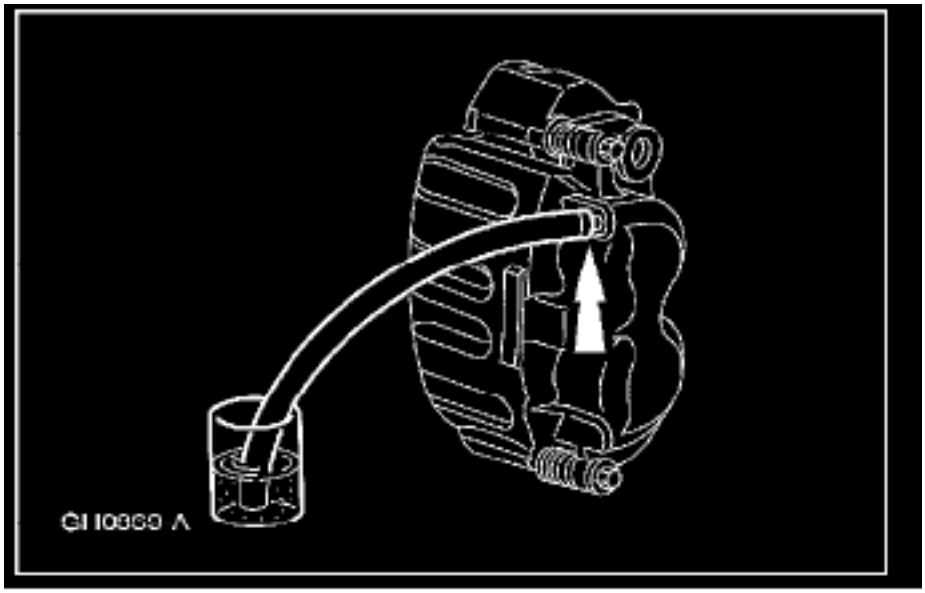
NOTE: When the brake master cylinder has been installed new or the system has been emptied or partially emptied, it must be primed to prevent air from entering the system.

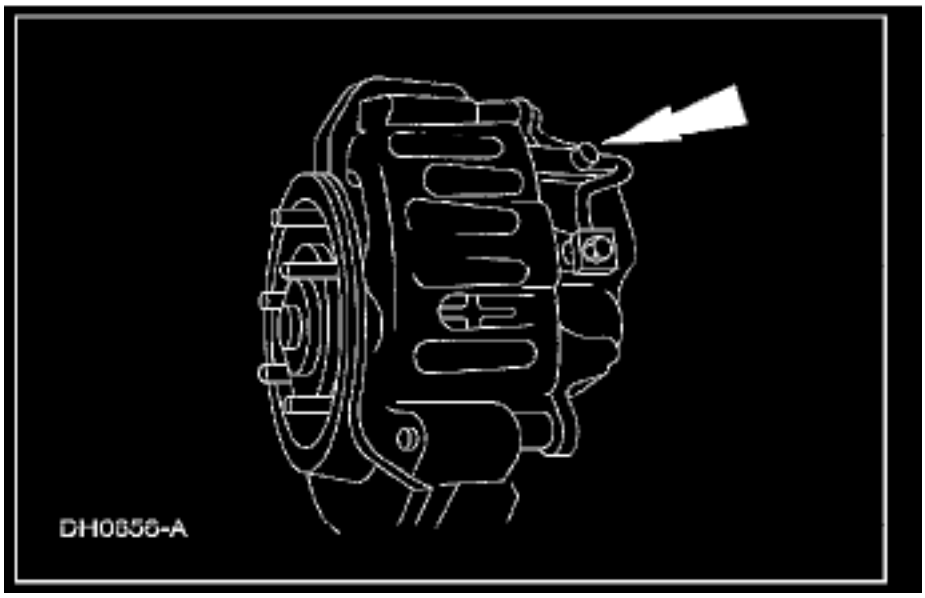
1. Disconnect the brake outlet tubes from the master cylinder.

2. Install short brake tubes with the ends submerged in the brake master cylinder reservoir and fill the brake master cylinder reservoir with clean,

specified brake fluid.

3. Have an assistant pump the brake pedal until clear fluid flows from both brake tubes, without air bubbles.





4. Remove the short brake tubes and install the brake outlet tubes. 5. Bleed each brake tube at the brake master cylinder as follows:

1 Have an assistant pump the brake pedal at least 2 times and then hold firm pressure on the brake pedal.

2 Loosen the rearmost brake tube fitting until a stream of brake fluid comes out. While the assistant maintains pressure on the brake pedal, tighten the brake tube fitting.

3 Repeat this operation until clear, bubble-free fluid comes out.

4 Refill the brake master cylinder reservoir as necessary. Repeat the bleeding operation at the front brake tube.

5 Tighten the master cylinder brake tube fittings to 18 Nm (13 lb-ft).

6. Bleed the brake system.

Brake caliper

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

NOTE: It is not necessary to do a complete brake system bleed if only the brake caliper was disconnected or installed new.

1. Remove the bleeder screw cap and place a box-end wrench on the disc brake caliper bleeder screw. Attach a rubber drain hose to the disc brake

caliper bleeder screw and submerge the free end of the hose in a container partially filled with clean, specified brake fluid.

2. Have an assistant pump the brake pedal at least 2 times and then hold firm pressure on the brake pedal. 3. Loosen the disc brake caliper bleeder screw until a stream of brake fluid comes out. While the assistant maintains pressure on the brake pedal,

tighten the disc brake caliper bleeder screw. ^

Repeat until clear, bubble-free fluid comes out.

^ Refill the brake master cylinder reservoir as necessary.

4. Tighten the brake caliper bleeder screw to 15 Nm (11 lb-ft), remove the rubber hose and install the bleeder screw cap.

5. Apply brakes several times to verify correct brake operation.

Wheel Cylinder

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

NOTE: It is not necessary to do a complete brake system bleed if only the wheel cylinder was disconnected or installed new.

1. Remove the bleeder screw cap and place a box-end wrench on the wheel cylinder bleeder screw. Attach a rubber drain hose to the disc brake

caliper bleeder screw and submerge the free end of the hose in a container partially filled with clean, specified brake fluid.

2. Have an assistant pump the brake pedal at least 2 times and then hold firm pressure on the brake pedal. 3. Loosen the wheel cylinder bleeder screw until a stream of brake fluid comes out. While the assistant maintains pressure on the brake pedal, tighten

the bleeder screw. ^

Repeat until clear, bubble-free fluid comes out.

^ Refill the brake master cylinder reservoir as necessary.

4. Tighten the wheel cylinder bleeder screw to 8 Nm (71 lb-inch), remove the rubber hose and install the bleeder screw cap. 5. Apply brakes several times to verify correct brake operation.

Brake Bleeding: Service and Repair Brake System Bleeding

Brake System Bleeding

ABS Hydraulic Control Unit (HCU) Bleeding

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

NOTE: When any part of the hydraulic system has been disconnected for repair or installation of new components, air can get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system, including the hydraulic control unit (HCU) after it has been correctly connected.

NOTE: If the HCU or any component upstream of the HCU is installed new, carry out the brake system bleed procedure first without the scan tool, followed by the brake system bleed procedure using the scan tool.

NOTE: This procedure is only required when a new HCU is installed.

1. Connect the scan tool and follow the ABS bleed instructions. 2. Follow the manual bleeding or pressure bleeding procedure steps to bleed the system.

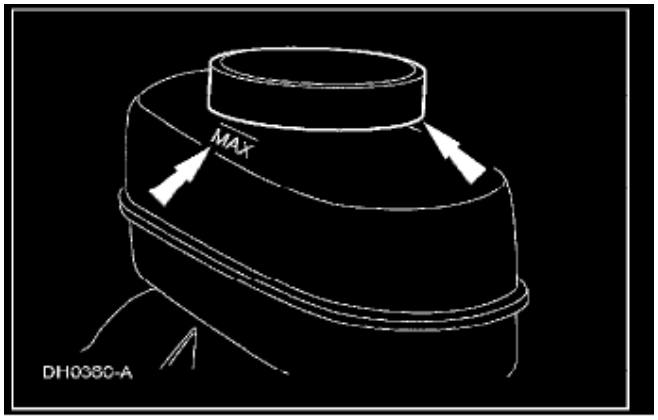
Manual Bleeding Method

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

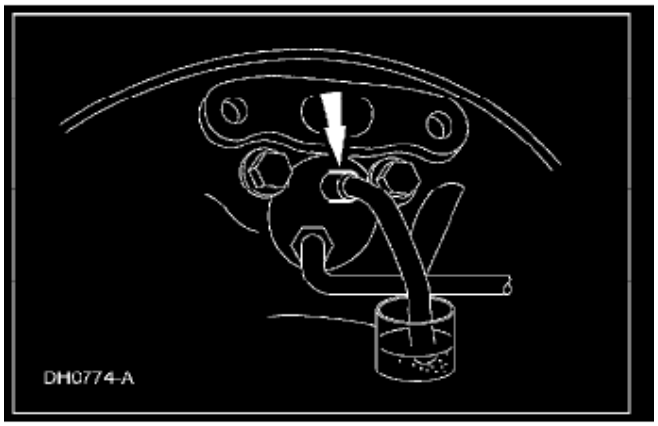
WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

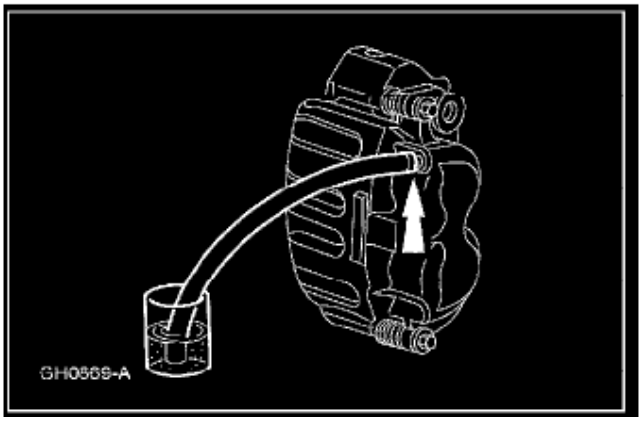
CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.



MAX
DH0380-A



DH0774-A



GH0565-A

NOTE: When any part of the hydraulic system has been disconnected for repair or installation of new components, air can get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system, including the HCU after it has been correctly connected.

1. Clean all the dirt from around the brake fluid reservoir cap and remove the cap. Fill the brake master cylinder reservoir with clean, specified brake

fluid.

2. Remove the RR wheel cylinder bleeder screw cap and place a box-end wrench on the bleeder screw. Attach a rubber drain hose to the RR wheel

cylinder bleeder screw and submerge the free end of the hose in a container partially filled with clean, specified brake fluid.

3. Have an assistant pump and then hold firm pressure on the brake pedal. 4. Loosen the RR wheel cylinder bleeder screw until a stream of brake fluid comes out. While an assistant maintains pressure on the brake pedal,

tighten the RR wheel cylinder bleeder screw. ^

Repeat until clear, bubble-free fluid comes out.

^ Refill the brake master cylinder reservoir as necessary.

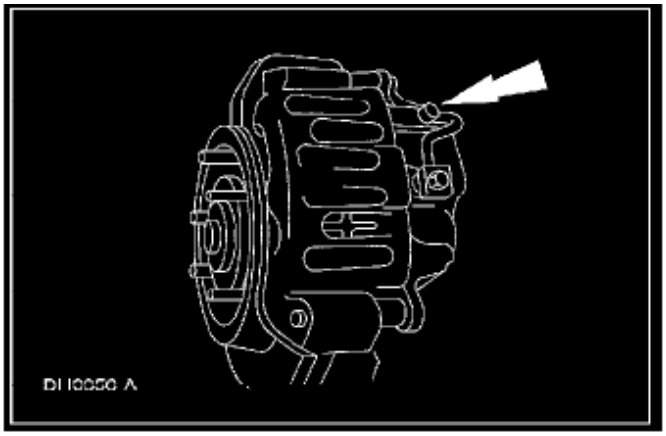
5. Tighten the RR wheel cylinder bleeder screw to 8 Nm (71 lb-inch), remove the rubber hose and install the bleeder screw cap. 6. Repeat Steps 2-5 for the LR wheel cylinder bleeder screw. 7. Remove the RF brake caliper bleeder cap and place a box-end wrench on the bleeder screw. Attach a rubber drain hose to the RF brake caliper

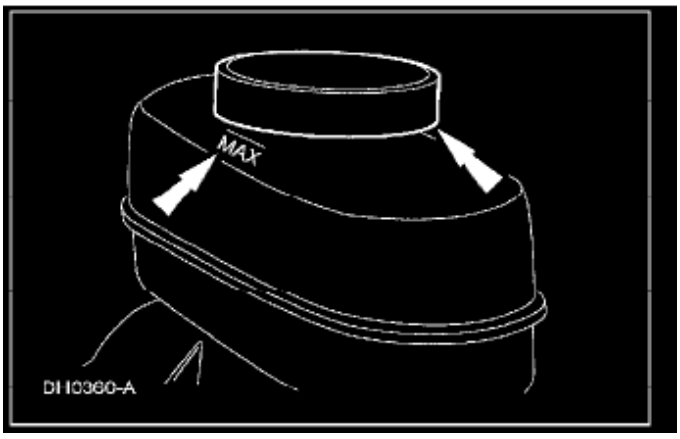
bleeder screw and submerge the free end of the hose in a container partially filled with clean, specified brake fluid.

8. Have an assistant pump and then hold firm pressure on the brake pedal. 9. Loosen the RF brake caliper bleeder screw until a stream of brake fluid comes out. While the assistant maintains pressure on the brake pedal,

tighten the RF brake caliper bleeder screw. ^

Repeat until clear, bubble-free fluid comes out.





MAX
DI10360-A

^ Refill the brake master cylinder reservoir as necessary.

10. Tighten the RF brake caliper bleeder screw to 15 Nm (11 lb-ft), remove the rubber hose and install the bleeder screw cap.

11. Repeat Steps 7 through 10 for the LF brake caliper bleeder screw. 12. Apply brakes several times to verify correct brake operation.

Pressure Bleeding Method

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

NOTE: When any part of the hydraulic system has been disconnected for repair or installation of new components, air can get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system, including the hydraulic control unit (HCU) after it has been correctly connected.

1. Clean all dirt from and remove the brake master cylinder filler cap and fill the brake master cylinder reservoir with clean, specified brake fluid.

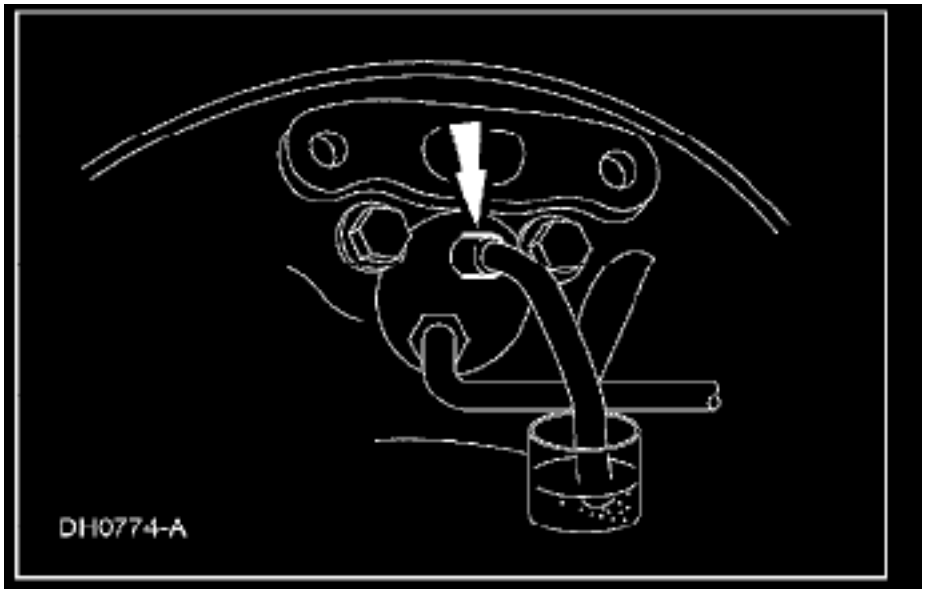
2. NOTE: Master cylinder pressure bleeder adapter tools are available from various manufacturers of pressure bleeding equipment. Follow the

instructions of the manufacturer when installing the adapter.

Install the bleeder adapter to the brake master cylinder reservoir, and attach the bleeder tank hose to the fitting on the adapter.

3. NOTE: Bleed the longest line first. Make sure the bleeder tank contains enough specified brake fluid to complete the bleeding operation.

Remove the RR wheel cylinder bleeder screw cap and place a box-end wrench on the bleeder screw. Attach a rubber drain hose to the RR wheel cylinder bleeder screw and submerge the free end of the hose in a container partially filled with clean, specified brake fluid.



4. Open the valve on the bleeder tank. 5. Loosen the RR wheel cylinder bleeder screw. Leave open until clear, bubble-free brake fluid flows, then tighten the RR wheel cylinder bleeder

screw to 8 Nm (71 lb-inch) and remove the rubber hose.

6. Continue bleeding the rest of the system, going in order from the LR wheel cylinder bleeder screw to the RF disc brake caliper bleeder screw,

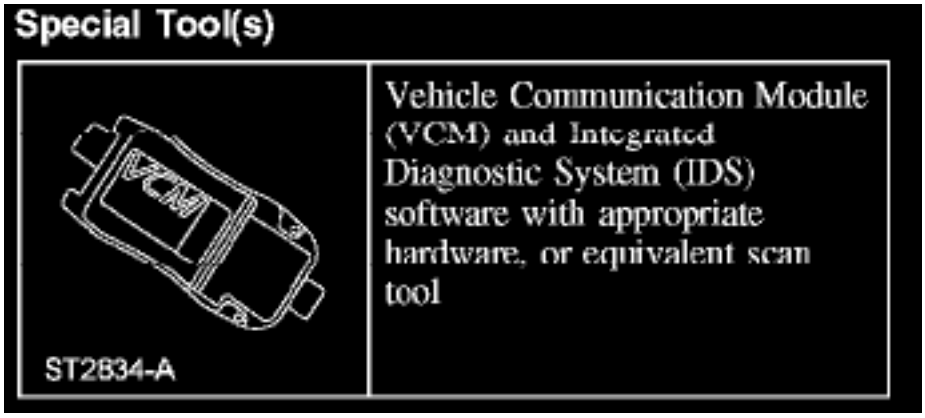
ending with the LF disc brake caliper bleeder screw. ^

Tighten the brake caliper bleeder screws to 15 Nm (11 lb-ft).

7. Close the bleeder tank valve. Remove the tank hose from the adapter and remove the adapter. Fill the reservoir with clean, specified brake fluid

and install the reservoir cap.

8. Apply brakes several times to verify correct brake operation.



Air Bag(s) Arming and Disarming: Service and Repair Supplemental Restraint System (SRS) Depowering and Repowering

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) DEPOWERING AND REPOWERING

Special Tool(s)

Special Tool(s)

Depowering Procedure

WARNING:

- Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

- To reduce the risk of accidental deployment, do not use any memory saver devices. Failure to follow this instruction may result in serious personal injury or death.

NOTE:

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1. Turn all vehicle accessories OFF. 2. Turn the ignition switch to OFF. 3. At the smart junction box (SJB), located below the RH side of the instrument panel, remove the RH lower cowl trim panel and remove the

restraints control module (RCM) fuse 8 (10A) from the SJB.

4. Turn the ignition ON and visually monitor the air bag warning indicator for at least 30 seconds. The air bag warning indicator will remain lit

continuously (no flashing) if the correct RCM fuse has been removed. If the air bag warning indicator does not remain lit continuously, remove the correct RCM fuse before proceeding.

5. Turn the ignition OFF.

6. WARNING: Always deplete the backup power supply before repairing or installing any new front or side air bag supplemental restraint

system (SRS) component and before servicing, removing, installing, adjusting or striking components near the front or side impact sensors or the restraints control module (RCM). Nearby components include doors, instrument panel, console, door latches, strikers, seats and hood latches.

Refer to the Description and Operation portion of Air Bag Systems for location of the RCM and impact sensor(s).

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least 1 minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Failure to follow these instructions may result in serious personal injury or death in the event of an accidental deployment.

Disconnect the battery ground cable and wait at least one minute.

Repowering Procedure

1. Turn the ignition switch from OFF to ON. 2. Install the RCM fuse 8 (10A) to the SJB and install the RH lower cowl trim panel.

3. WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is

connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

Connect the battery ground cable.

4. Prove out the SRS as follows:

Turn the ignition key from ON to OFF. Wait 10 seconds, then turn the key back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an air bag SRS fault is present, the air bag warning indicator will: -

fail to light.

- remain lit continuously.

- flash at a 5Hz rate (RCM not configured).

The air bag warning indicator may not illuminate until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.

Clear all continuous RCM and occupant classification system module (OCSM) DTCs using a scan tool.

Special Tool(s)

ST2621-A	Diagnostic Tool, Restraint System (2 required) 418-F395
ST2512-A	Diagnostic Tool, Restraint System 418-F403
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Air Bag(s) Arming and Disarming: Service and Repair Supplemental Restraint System (SRS) Deactivation and Reactivation

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) DEACTIVATION AND REACTIVATION

Special Tool(s)

Deactivation Procedure

WARNING:

- Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

- Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

- To reduce the risk of accidental deployment, do not use any memory saver devices. Failure to follow this instruction may result in serious personal injury or death.

NOTE:

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

- No restraint system diagnostic tools are available for the safety belt buckle pretensioners. If the ignition switch is set to RUN or START with either the driver or passenger safety belt buckle pretensioner electrical connector disconnected, the DTCs for an open circuit fault will be active.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1. Turn all vehicle accessories OFF. 2. Turn the ignition switch to OFF. 3. At the smart junction box (SJB), located below the RH side of the instrument panel, remove the restraints control module (RCM) fuse 8 (10A)

from the SJB.

4. Turn the ignition ON and visually monitor the air bag warning indicator for at least 30 seconds. The air bag warning indicator will remain lit

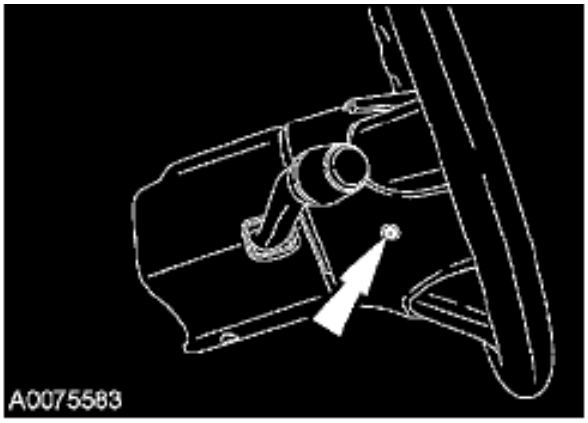
continuously (no flashing) if the correct RCM fuse has been removed. If the air bag warning indicator does not remain lit continuously, remove the correct RCM fuse before proceeding.

5. Turn the ignition OFF.

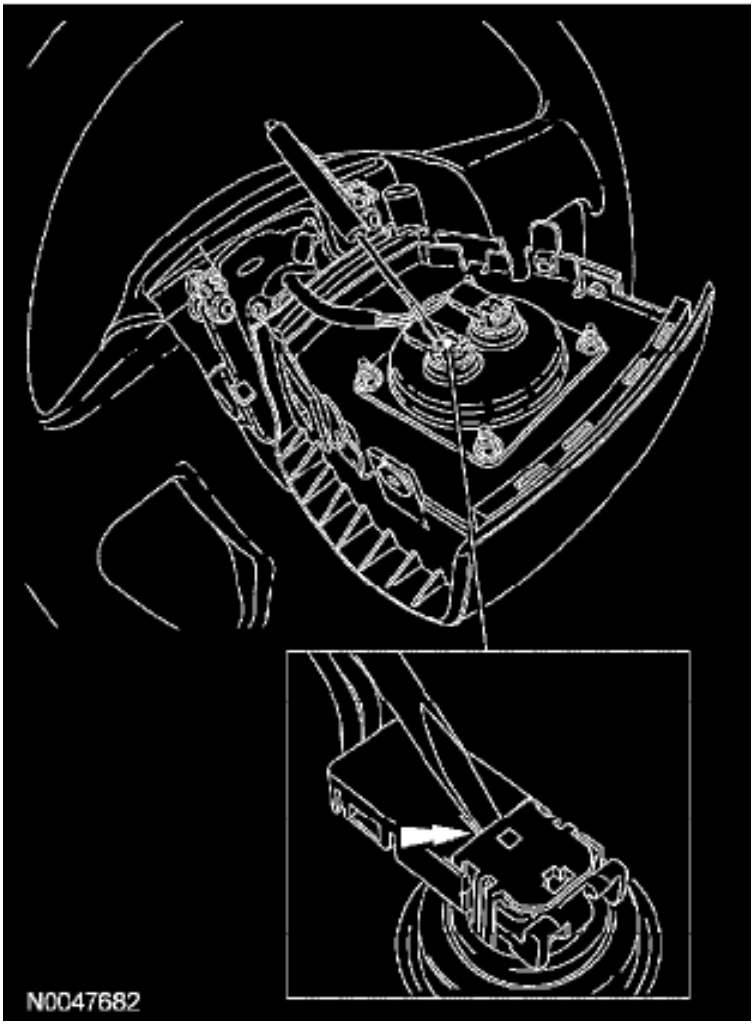
6. WARNING: Always deplete the backup power supply before repairing or installing any new front or side air bag supplemental restraint

system (SRS) component and before servicing, removing, installing, adjusting or striking components near the front or side impact sensors or the restraints control module (RCM). Nearby components include doors, instrument panel, console, door latches, strikers, seats and hood latches.

Refer to the Description and Operation portion of Air Bag Systems for location of the RCM and impact sensor(s).



A0075583



N0047682

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least 1 minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Failure to follow these instructions may result in serious personal injury or death in the event of an accidental deployment.

Disconnect the battery ground cable and wait at least 1 minute.

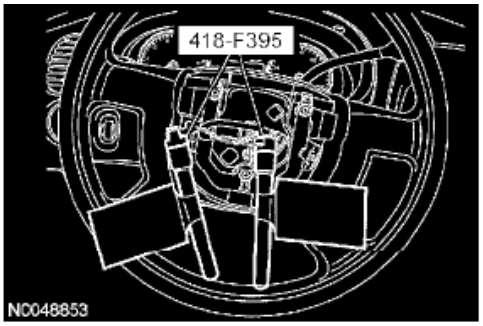
7. Remove the 2 driver air bag module bolts (1 shown).

8. CAUTION: Do not pull the driver air bag module electrical connectors out by the locking buttons. Damage to the locking buttons may

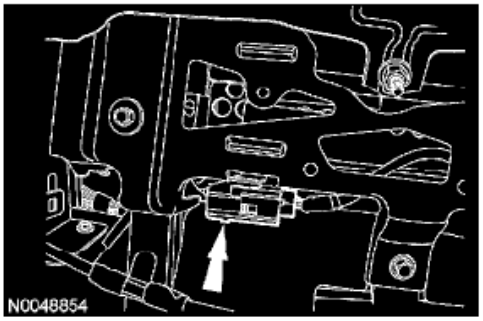
occur.

Using a small screwdriver as shown, lift up and release the locking buttons on the driver air bag module electrical connectors. With the locking buttons released, remove the electrical connectors and the driver air bag module.

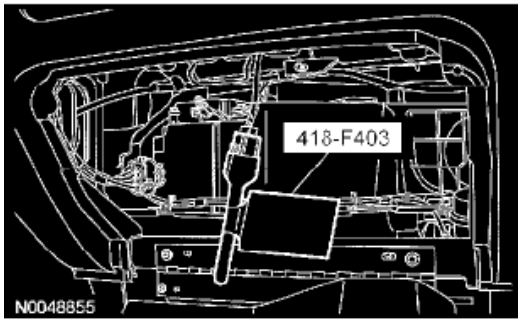
9. Attach the restraint system diagnostic tools to the clockspring electrical connectors at the top of the steering column.



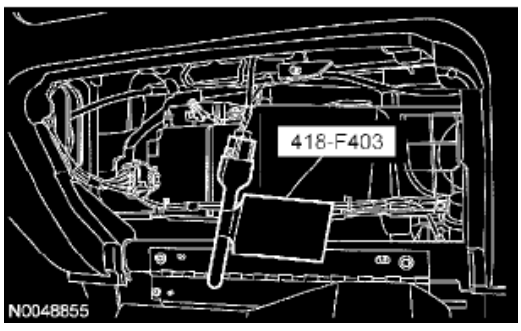
418-F395
N0048853



N0048854



418-F403
N0048855



418-F403
N0048855

10. Open the glove compartment door fully to access the passenger air bag electrical connector.
11. Release the tab and disconnect the passenger air bag module electrical connector.

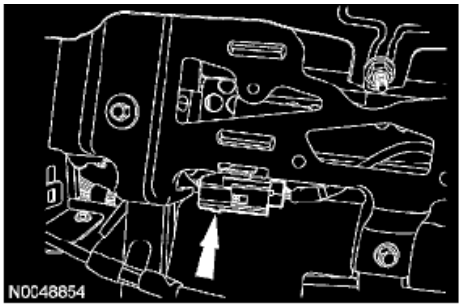
12. Attach the restraint system diagnostic tool to the vehicle harness side of the passenger air bag module electrical connector.

13. Install the RCM fuse 8 (10A) to the SJB. 14. Connect the battery ground cable.

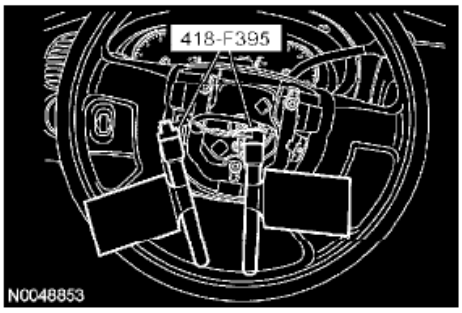
Reactivation Procedure

1. Remove the RCM fuse 8 (10A) from the SJB. 2. Disconnect the battery ground cable and wait at least one minute. 3. Remove the restraint system diagnostic tool from the vehicle harness side of the passenger air bag module electrical connector.

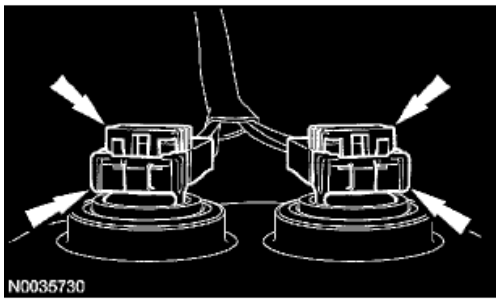
4. Connect the passenger air bag module electrical connector.



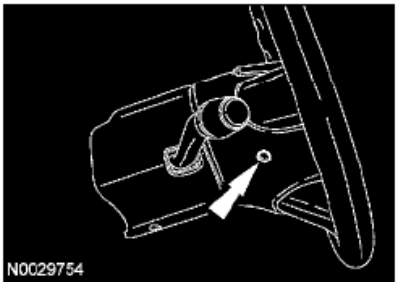
N0048854



418-F395
N0048853



N0035730



N0029754

5. Close the glove compartment door. 6. Remove the restraint system diagnostic tools from the clockspring electrical connectors at the top of the steering column.

7. CAUTION:

- Do not install the driver air bag module electrical connectors by the locking buttons. Damage to the locking buttons may occur.

- The driver air bag module electrical connector locking buttons must be in the released position when the connector is being installed or connector damage may occur.

- The driver air bag module electrical connectors are unique and cannot be reversed when connected to the driver air bag module. Match the electrical connector key to the keyway in the driver air bag module. Do not force the electrical connectors into the driver air bag module. Damage to the connector or component may occur.

With the locking buttons released, install the driver air bag module electrical connectors fully into the driver air bag module and seat the locking buttons.

8. Install the 2 driver air bag module bolts (1 shown).

- Tighten to 6 Nm (53 lb-in).

9. WARNING: Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental

restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death

in a crash and possibly violate vehicle safety standards.

Make sure all restraint system diagnostic tool(s) that may have been installed during the repair have been removed from the vehicle and all SRS components are connected.

10. Turn the ignition from OFF to ON. 11. Install the restraint system control module fuse 8 (10A) to the SJB.

12. WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is

connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

Connect the battery ground cable.

13. Prove out the SRS as follows:

Turn the ignition key from ON to OFF. Wait 10 seconds, then turn the key back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an air bag SRS fault is present, the air bag warning indicator will: -

fail to light.

- remain lit continuously.

- flash at a 5Hz rate (RCM not configured).

The air bag warning indicator may not illuminate until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.

Clear all continuous RCM and occupant classification system module (OCSM) DTCs using a scan tool.

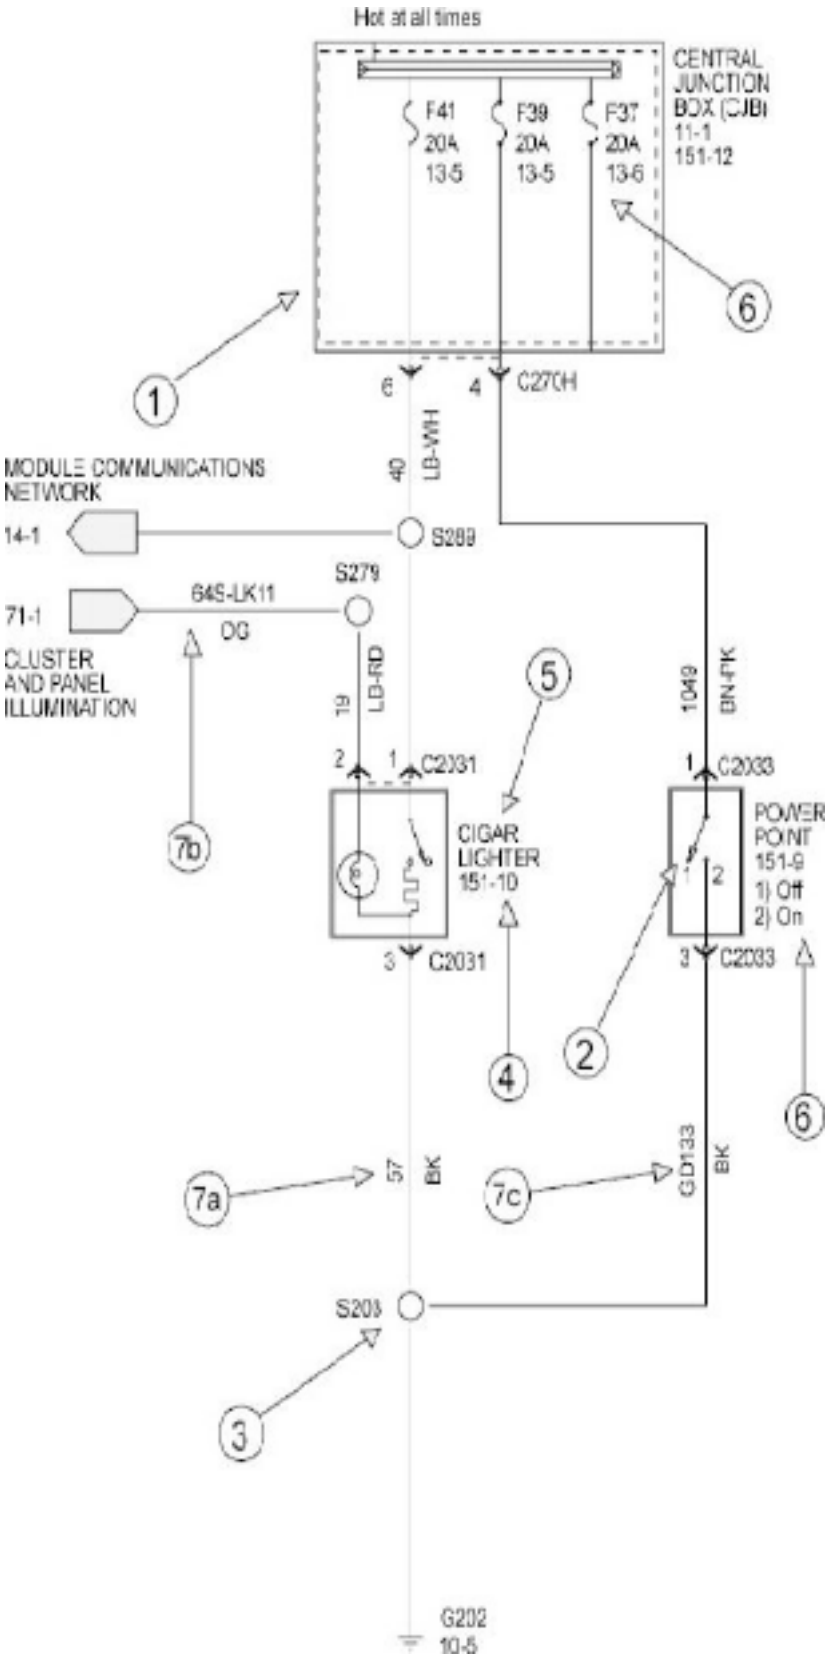
Ford Ranger 2wd Workshop Manual (V6-3.0L (2008))
Ford Workshop Manuals > Maintenance > Fuses and Circuit Breakers > Fuse Block > Component Information > Diagrams > Diagram Information and Instructions



Fuse Block: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

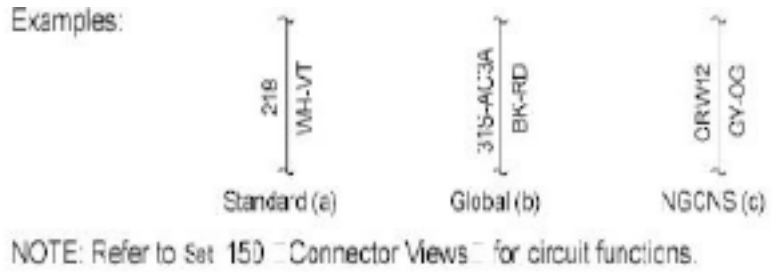
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

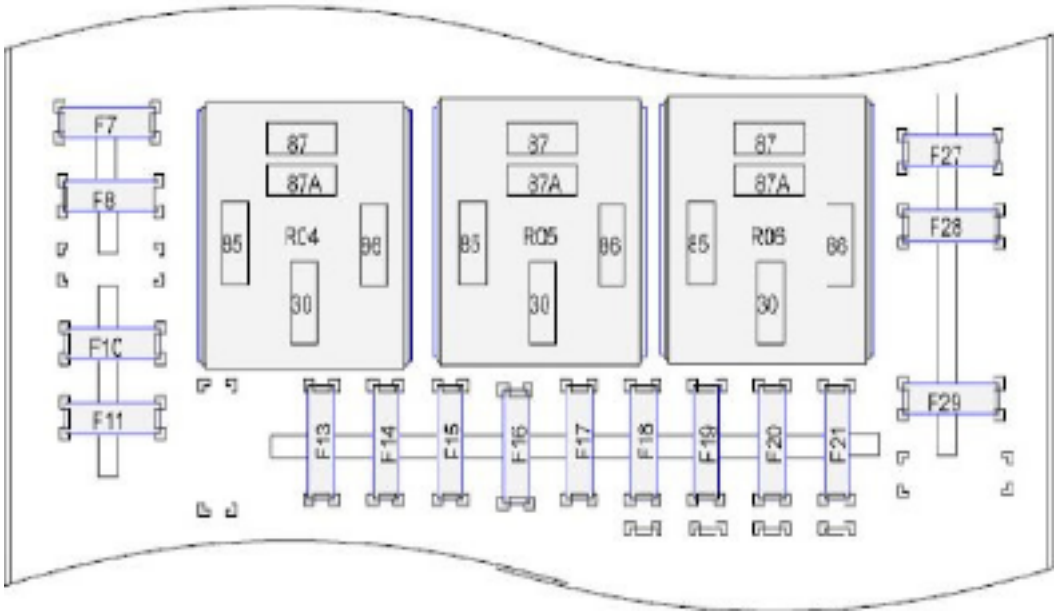
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

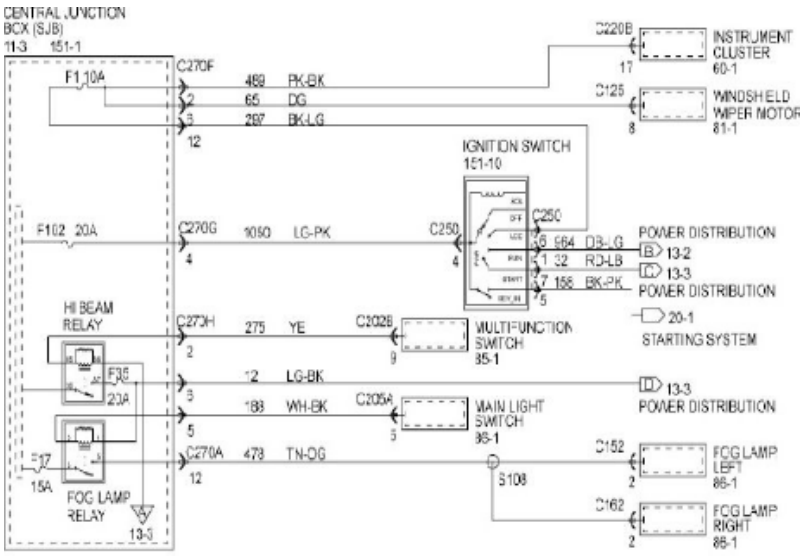
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

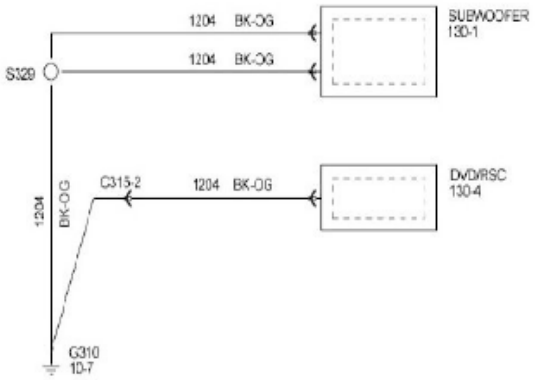
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

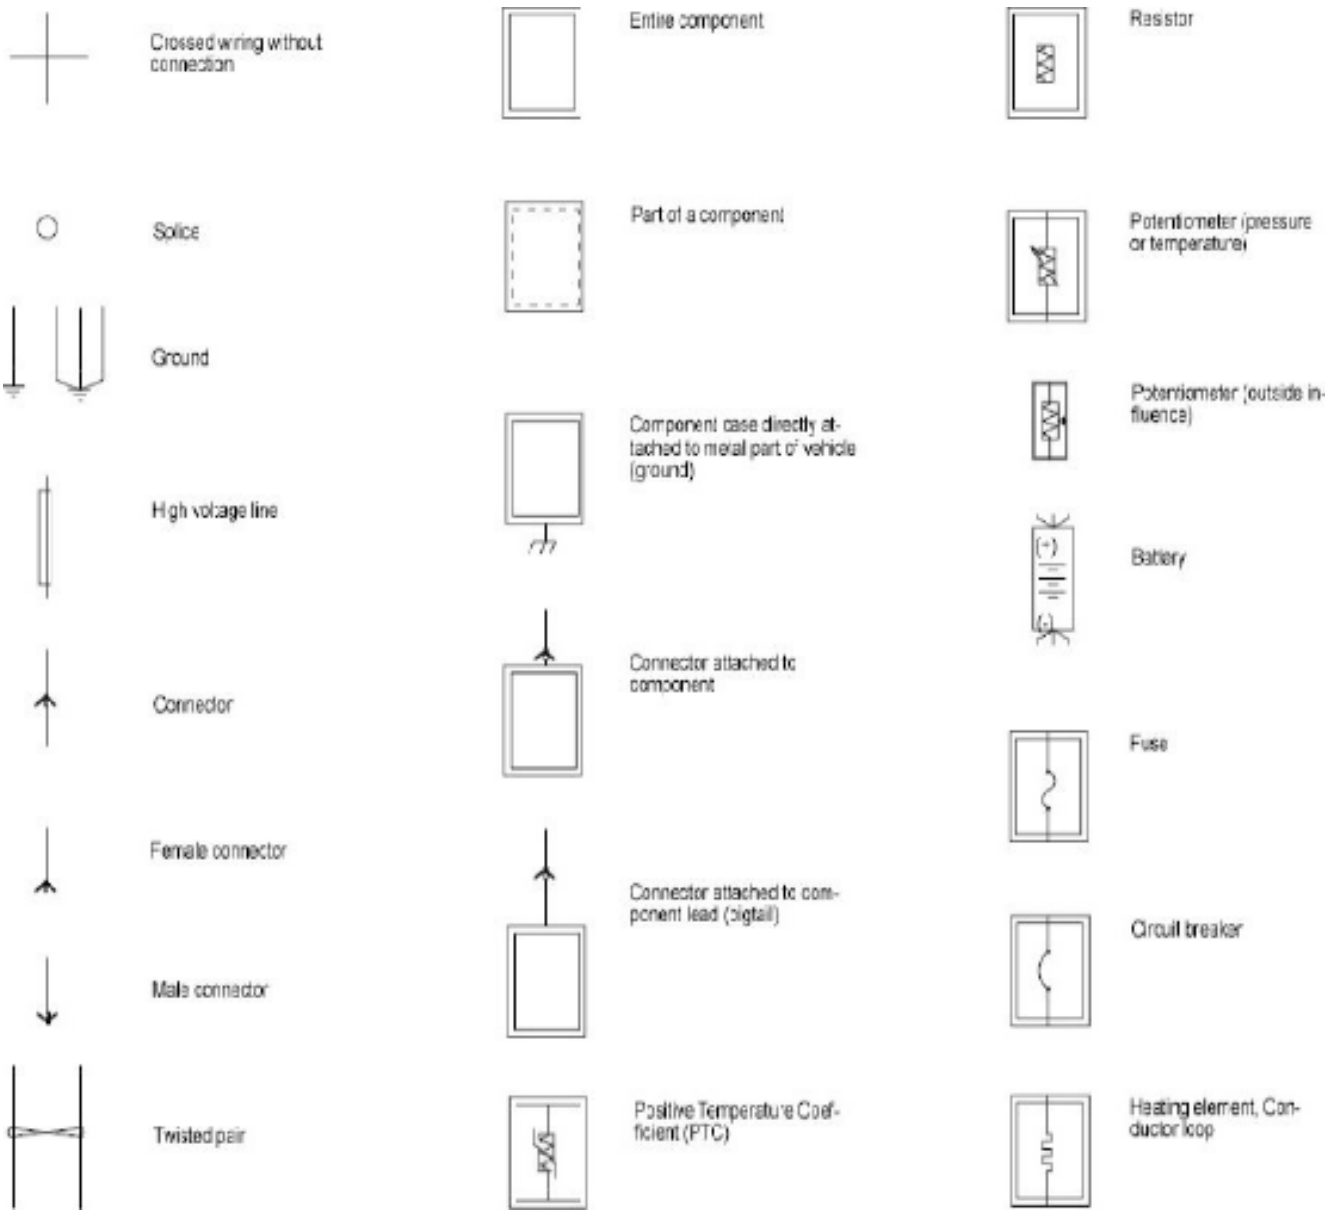
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

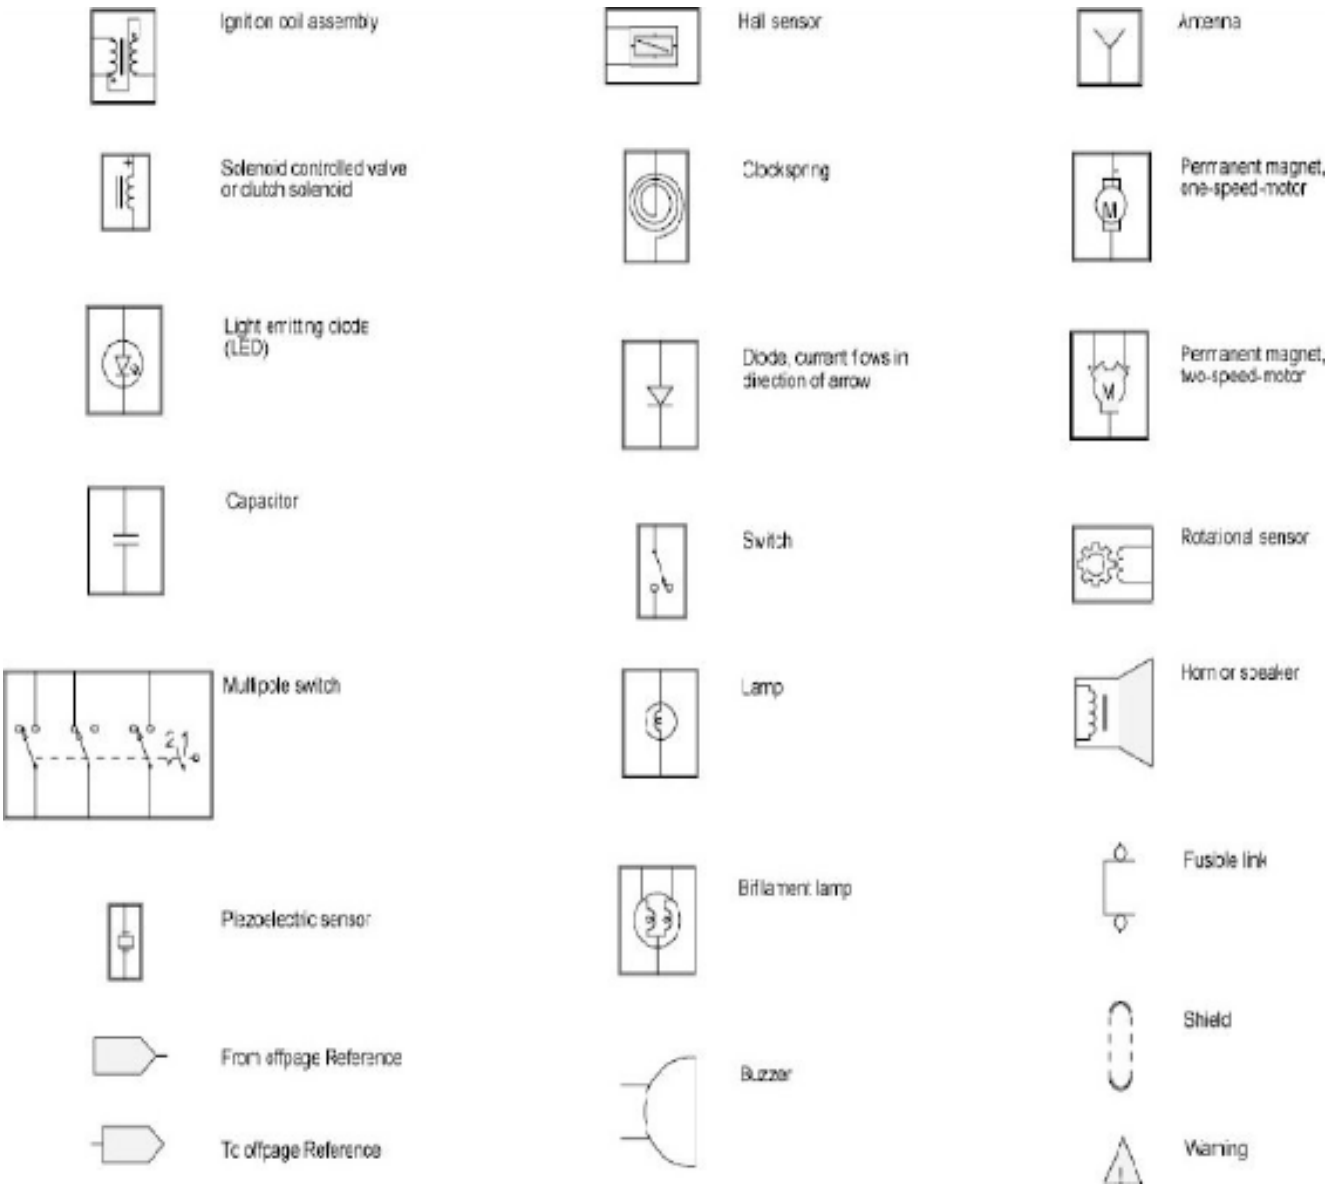
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

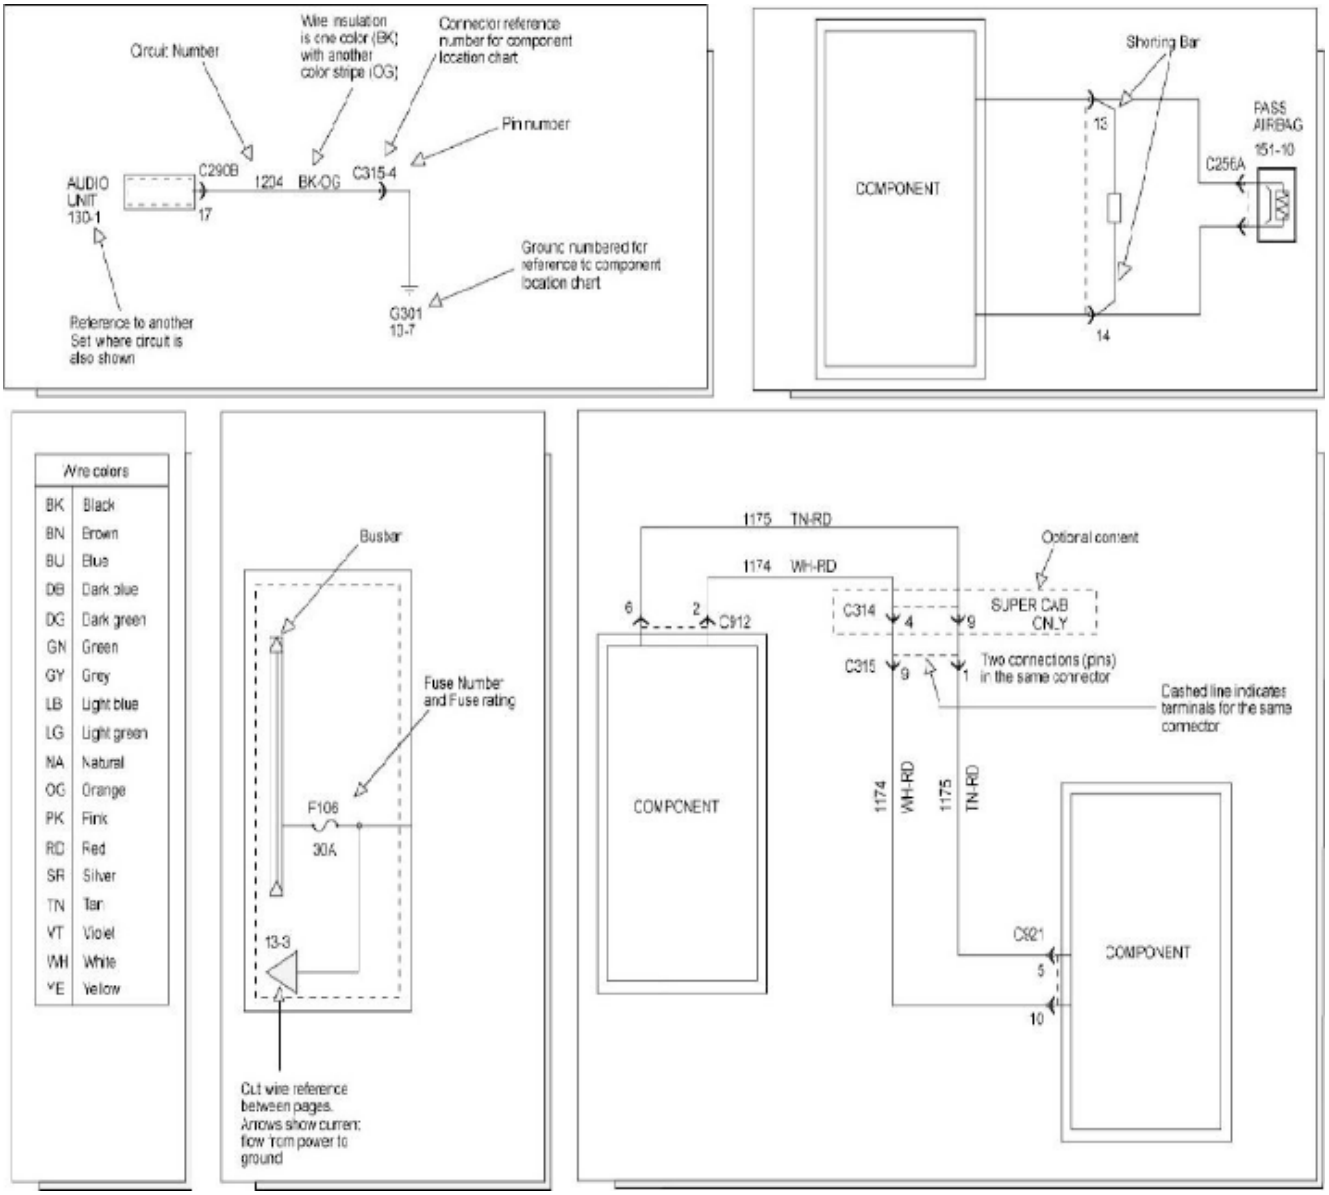
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

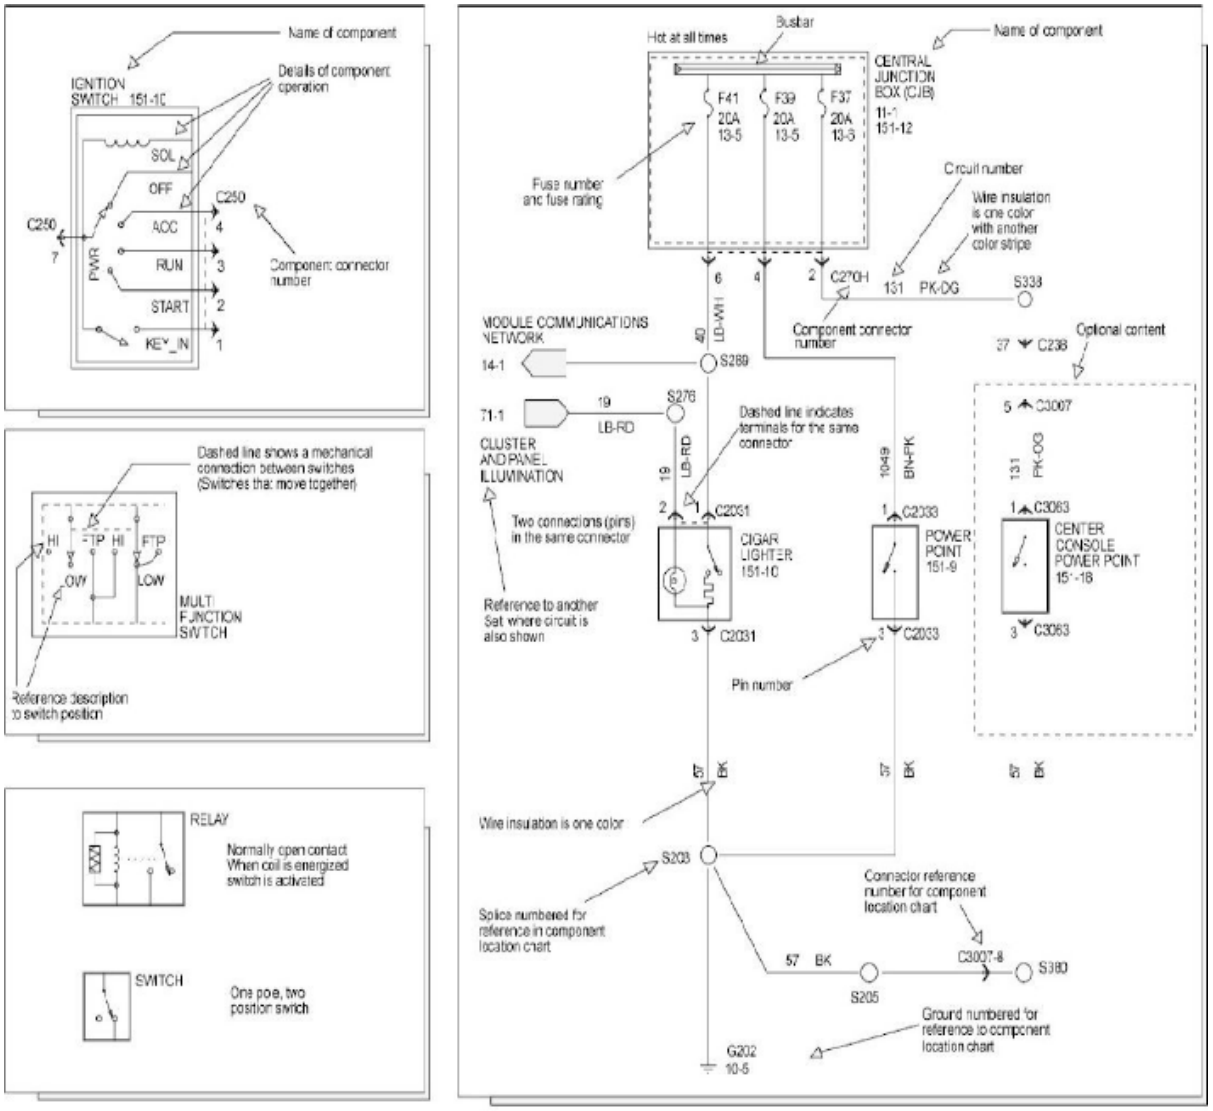
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Fuse Block: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Defective insulation stripping

A

1 = Proper crimp

2 = Insulation not removed

3 = Wire strands missing

4 = Intermittent signals through pierced insulation

Partially mated connectors

1 = Seal

2 = Displaced tab

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Male half

7 = Intermittent contact

Lock may be displaced into an unlocked position; pull on the connector to verify the lock.

Deformed (enlarged) female terminals

1 = Enlarged

2 = Normal

Any probe entering the terminal may enlarge the contact spring opening creating an intermittent signal.

Insert the correct mating terminal (Location A) from the service kit and feel for a loose fit.

1 = Wiring harness tape

2 = Wiring strand

3 = Broken strands intermittent signal

4 = Circuit insulation

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

WIRE STOPPER

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

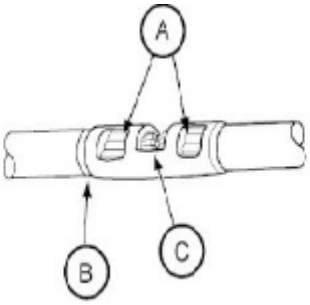
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

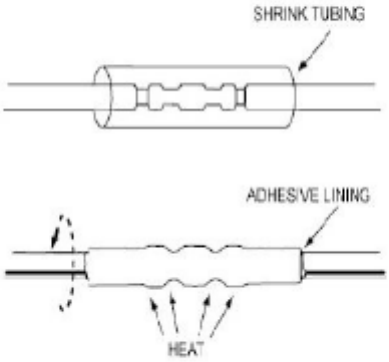
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4□ strip, cut 9 strands	* 1/4□ strip, cut 2 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip, fold 3x dia.
	16-14	* 1/4□ strip, cut 7 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip fold 2x dia	1□ strip, fold 3x dia.	1 1/4□ strip, fold 4x dia.	Not Recommended
	12-10	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip fold 3x dia.	1 1/4□ strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

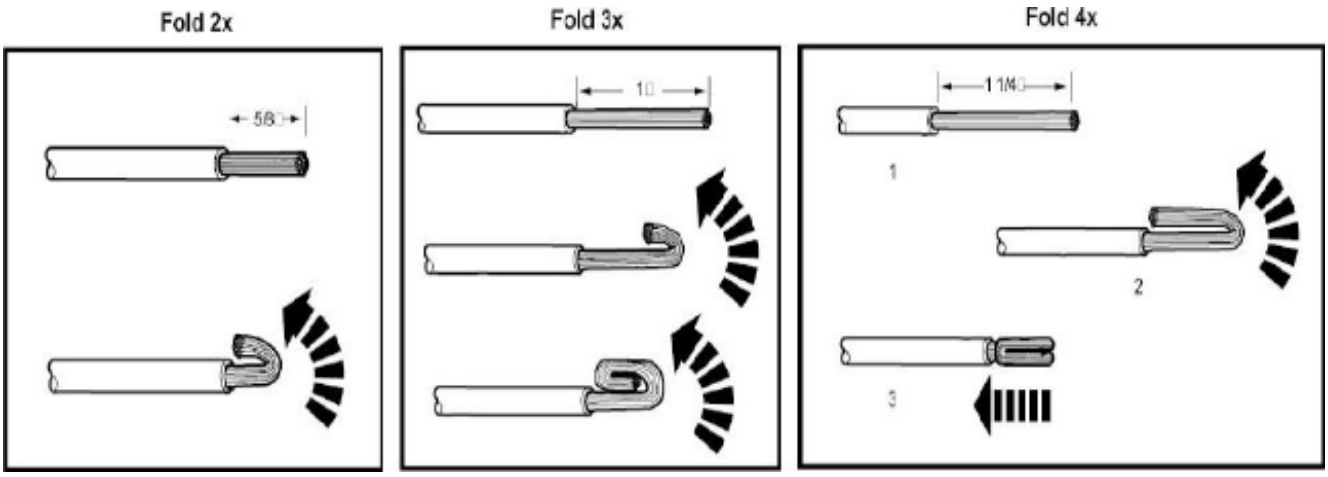
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Low Tire Pressure Indicator: Testing and Inspection

Tire Pressure Monitoring System (TPMS) Indicator and Message Center Messages

The TPMS indicator and vehicle message center (if equipped) sometimes displays faults that cannot be resolved by the customer. Treat these messages as TPMS faults that must be serviced.

Tire Pressure Monitoring System (TPMS) Indicator Illuminates Continuously

NOTE: If the spare tire is in use, the damaged road tire must be repaired and installed on the vehicle to restore complete TPMS functionality before carrying out any diagnosis.

NOTE: For vehicles with different front and rear tire pressures (such as E-Series and certain F-Series), the tire pressure sensors must be trained following a tire rotation. Failure to train the sensors will cause the TPMS indicator to illuminate.

For vehicles with the same tire pressures for front and rear tires, tire rotation will not affect the system.

1. The TPMS indicator remains on continuously for the following condition:

^ Low Tire Pressure - The TPMS indicator is illuminated solid and the message center displays LOW TIRE PRESSURE (if equipped). This is displayed when any of the tire pressures are low. When this condition exists, the tire pressure must be adjusted to the recommended cold pressure as indicated on the vehicle certification label.

2. NOTE: The TPMS sensors do not transmit when the vehicle is stationary. If the vehicle has been stationary for more than 30 minutes, it will be

necessary to wake up the sensors so they will transmit the latest tire pressure information to the SJB.

If the vehicle has been stationary for more than 30 minutes, refer to Tire Pressure Monitoring System (TPMS) Sensor Activation procedure.

Tire Pressure Monitoring System (TPMS) Indicator Flashes

The TPMS indicator flashes for 70 seconds and then remains ON solid when the ignition key is turned to the ON position for the following conditions: 1. Tire Pressure Sensor Fault - If equipped, the message center will display TIRE SENSOR FAULT when a tire pressure sensor is malfunctioning.

GO to Symptom Chart. See: Wheels and Tires/Tire Monitoring System/Testing and Inspection/Symptom Related Diagnostic Procedures

2. No communication with the SJB (TPMS is integral to the SJB) - The TPMS indicator is illuminated when the instrument cluster has received no

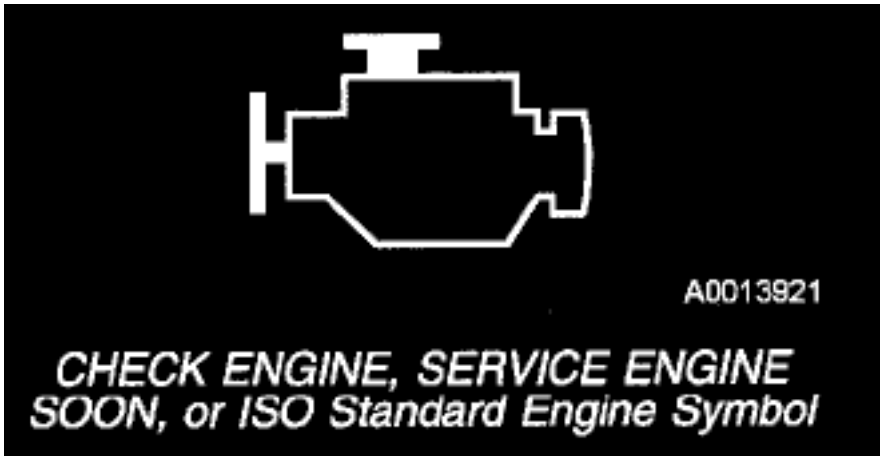
signals from the SJB for more than 5 seconds. If equipped, the message center displays TIRE MONITOR FAULT. GO to Symptom Chart. See: Wheels and Tires/Tire Monitoring System/Testing and Inspection/Symptom Related Diagnostic Procedures

3. Tire Pressure Monitor Fault - If equipped, the message center will display TIRE MONITOR FAULT when the tire pressure monitoring system is

malfunctioning or communication with the instrument cluster has been lost. GO to Symptom Chart. See: Wheels and Tires/Tire Monitoring System/Testing and Inspection/Symptom Related Diagnostic Procedures

Maintenance Required Lamp/Indicator: Service and Repair

This vehicle is not equipped with a Maintenance Required Lamp/Indicator.



Malfunction Indicator Lamp: Description and Operation

MALFUNCTION INDICATOR LAMP (MIL)

Check Engine, Service Engine Soon, Or ISO Standard Engine Symbol

The MIL notifies the driver that the powertrain control module (PCM) has detected an on board diagnostic (OBD) emission-related component or system concern. When this occurs, an OBD diagnostic trouble code (DTC) sets.

- The MIL is located in the instrument cluster and is labeled CHECK ENGINE, SERVICE ENGINE SOON or the international standards organization (ISO) standard engine symbol.

- The MIL is illuminated during the instrument cluster prove out for approximately 4 seconds.

- The MIL remains illuminated after instrument cluster prove out if: -

an emission-related concern and DTC exists.

- the PCM does not send a control message to the instrument cluster (applications with the MIL controlled through the communication link).

- the PCM is operating in the hardware limited operation strategy (HLOS).

- The MIL remains off during the instrument cluster prove out if an indicator or instrument cluster concern is present.

- To turn off the MIL after a repair, a reset command from the scan tool must be sent, or 3 consecutive drive cycles must be completed without a concern.

- For all MIL concerns, go to Symptom Charts. See: Powertrain Management/Computers and Control Systems/Testing and Inspection/Symptom Related Diagnostic Procedures

- If the MIL flashes at a steady rate, a severe misfire condition may exist.

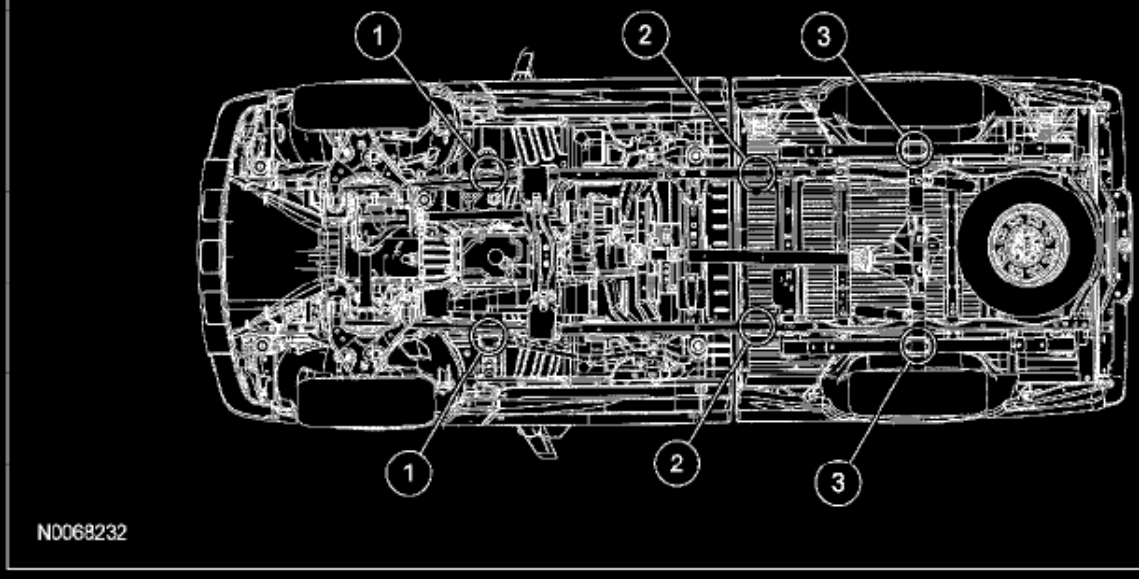
- If the MIL flashes erratically, the PCM can reset while cranking if the battery voltage is low.

- The MIL flashes after a period of time with the key in the RUN position (engine not running) if DTC P1000 is set.

Oil Change Reminder Lamp: Service and Repair

This vehicle is not equipped with an Oil Change Reminder Lamp.

Jacking and Lifting Locations — Four Wheel Drive (4WD)



Item	Description
1	Front jacking and lifting locations
2	Rear lifting locations
3	Rear jacking locations

Vehicle Lifting: Description and Operation

JACKING AND LIFTING

WARNING:

- Block all wheels, set the parking brake and firmly apply the service brake to reduce the risk of vehicle movement during this procedure. Failure to follow these instructions may result in serious personal injury.

- Only raise the vehicle when positioned on a hard, level surface. Attempting to raise the vehicle on an uneven or soft surface may result in vehicle slipping or falling from the jack or jackstand. Failure to follow this instruction may result in serious personal injury.

- Never get underneath a vehicle that is supported only by a jack. The jack could unintentionally lower. Always support vehicle with floor stands. Failure to follow these instructions may result in serious personal injury.

CAUTION:

- The jack provided with the vehicle is intended to be used in an emergency for changing a deflated tire. To avoid damage to the vehicle, never use the jack to hoist the vehicle for any other purpose.

- Do not attempt to use jack pressure on either the front bumper or the rear bumper of any vehicle. Damage to bumper covers will occur.

- To prevent possible damage to the underbody, do not drive the vehicle onto the drive-on lift without first checking for possible interference.

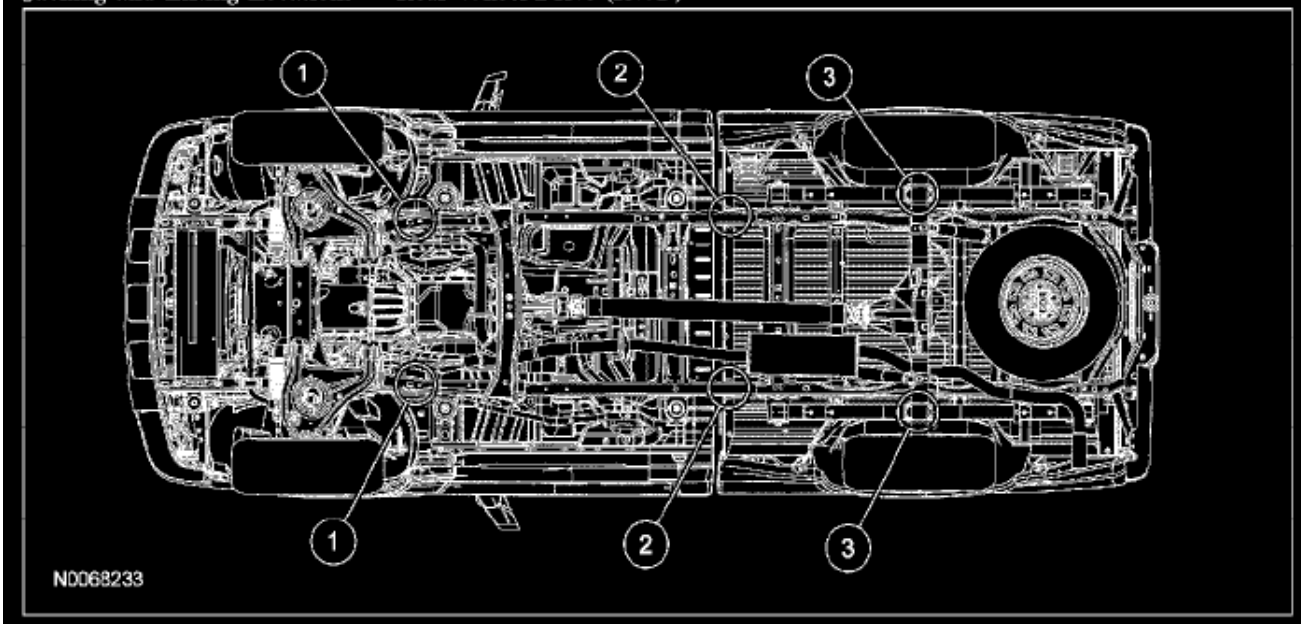
- Make sure the jack has an adequate lifting capacity for the vehicle being lifted, or damage to the vehicle may occur.

- When raising a vehicle on a twin-post hoist, use care when positioning the vehicle so that the hoisting forks do not interfere with the suspension components, mounting brackets or stabilizer mounting brackets, if so equipped. In addition, use care in hoist positioning to avoid possible damage to the axle carrier or rear cover.

- Damage to the suspension, exhaust or steering linkage components may occur if care is not exercised when positioning the hoist adapters prior to lifting the vehicle.

Jacking and Lifting Locations - Four Wheel Drive (4WD)

Jacking and Lifting Locations — Rear Wheel Drive (RWD)



Item	Description
1	Front jacking and lifting locations
2	Rear lifting locations
3	Rear jacking locations

Jacking and Lifting Locations - Rear Wheel Drive (RWD)

Special Tool(s)

ST2941-A	Activation Tool, Tire Pressure Monitor 204-363
ST2634-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Tire Pressure Sensor: Testing and Inspection Tire Pressure Monitoring System (TPMS) Sensor Training

Tire Pressure Monitoring System (TPMS) Sensor Training

NOTE: If the vehicle has been stationary for more than 30 minutes, the sensors will go into a "sleep mode" to conserve battery power. It will be necessary to wake them up so they will transmit the latest tire pressure information to the smart junction box (SJB). For additional information, refer to Tire Pressure Monitoring System (TPMS) Sensor Activation.

NOTE: The tire pressure sensor training procedure must be done on a single vehicle, in an area without radio frequency noise and at least 1 m (3 ft) away from other vehicles equipped with tire pressure monitoring system (TPMS). Radio frequency noise is generated by electrical motors and appliance operation, cellular telephones, remote transmitters, power inverters and portable entertainment equipment.

NOTE: If a sensor does not respond to the activation tool, attempt to activate the same sensor with the activation tool. If the sensor still does not respond, move the vehicle to rotate the wheels at least 1/4 of a turn and attempt to activate the same sensor again.

NOTE: The SJB has a 2-minute time limit between sensor responses. If the SJB does not recognize any 1 of the 4 tire pressure sensors during this time limit, the horn will sound twice and the message center (if equipped) will display TIRE NOT TRAINED REPEAT and the entire procedure must be repeated.

1. NOTE: For vehicles with different front and rear tire pressures (such as the E-Series and certain F-Series), the tire pressure sensors must be

trained following a tire rotation. Failure to train the sensors will cause the TPMS indicator to illuminate. For vehicles with the same tire pressure for front and rear tires, tire rotation will not affect the system.

Turn the ignition switch to the OFF position, then press and release the brake pedal.

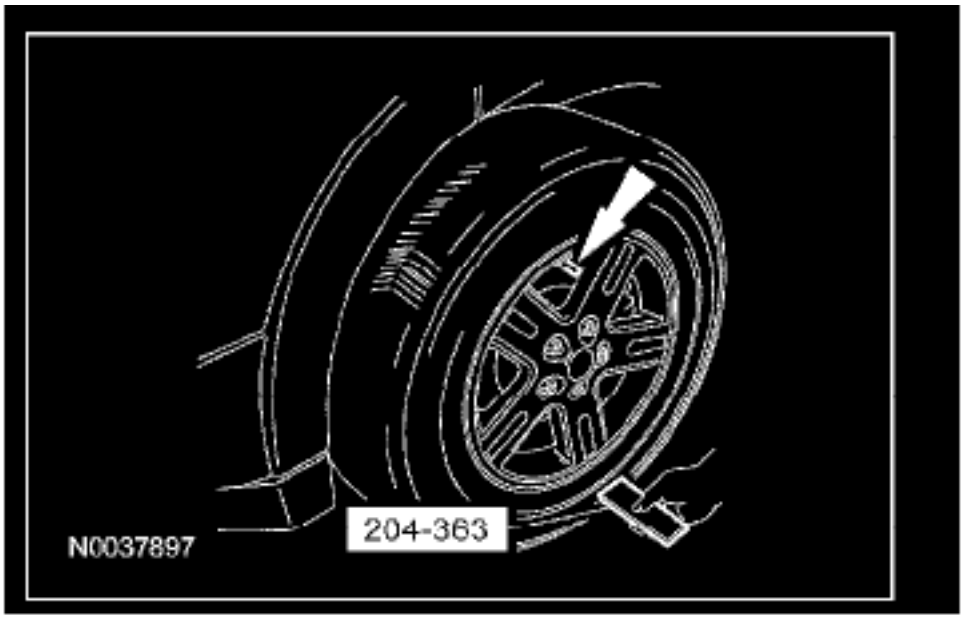
2. Cycle the ignition switch from the OFF position to the RUN position 3 times, ending in the RUN position. 3. Press and release the brake pedal. 4. Turn the ignition switch to the OFF position. 5. Turn the ignition switch from the OFF position to the RUN position 3 times, ending in the RUN position.

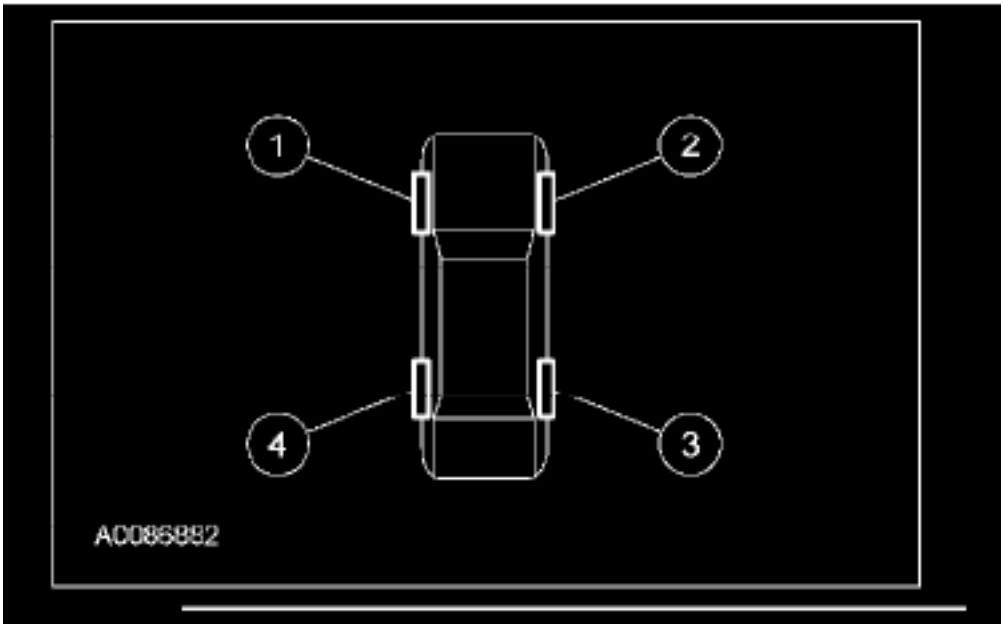
^ The horn will sound once and the TPMS indicator will flash if the training mode has been entered successfully. If equipped, the message center will display TRAIN LF TIRE.

6. NOTE: It may take up to 6 seconds to activate a tire pressure sensor. During this time, the activation tool must remain in place 180 degrees from

the valve stem.

Place the activation tool on the LF tire sidewall opposite (180 degrees) from the valve stem. Press and release the test button on the special tool. The horn will sound briefly to indicate that the tire pressure sensor has been recognized by the SJB.





7. Within 2 minutes of the horn sounding, place the activation tool on the RF tire sidewall opposite (180 degrees) from the valve stem and press and

release the test button to train the RF tire pressure sensor.

8. NOTE: Do not wait more than 2 minutes between training each sensor or the SJB will time out and the entire procedure must be repeated.

Repeat Step 7 for the RR and LR tires. ^

The procedure is completed after the last tire has been trained. When the training procedure is complete, the message center (if equipped) will display TIRE TRAINING COMPLETE.

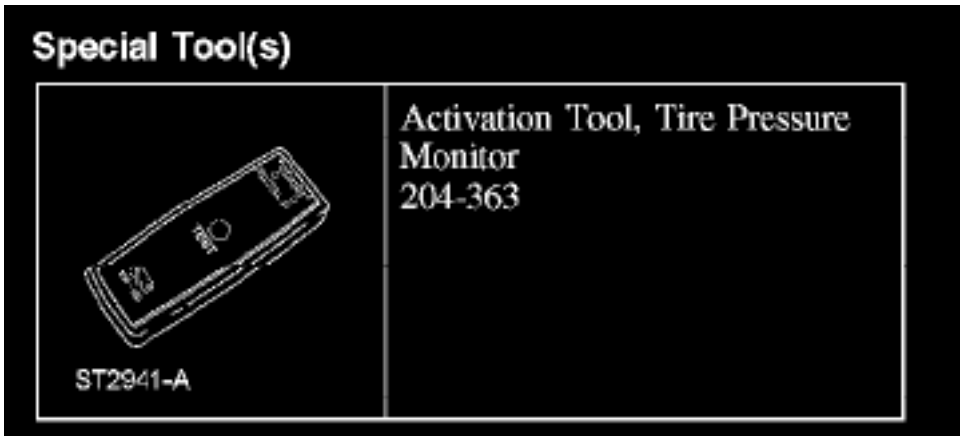
^ For vehicles not equipped with a message center, successful completion of the training procedure will be verified by turning the ignition switch to the OFF position without the horn sounding. If the horn sounds twice when the switch is turned to the OFF position, the training procedure was not successful.

9. Using the scan tool, locate the updated TPMS sensor IDs trained to the SJB and document them on the applicable warranty claim.

10. NOTE: This step is required to clear DTC C2780, cause the SJB to exit the manufacturing mode and to make sure there are no other concerns

with a newly programmed SJB.

If the sensors are being trained due to the installation of a new SJB, clear any DTCs and perform the SJB on-demand self test.



Tire Pressure Sensor: Testing and Inspection Tire Pressure Monitoring System (TPMS) Sensor Activation

Tire Pressure Monitoring System (TPMS) Sensor Activation

NOTE: The tire pressure sensors will go into a 14 sleep mode" after 30 minutes of inactivity to conserve battery power. The sensors do not transmit information while in sleep mode, it will be necessary to wake them up so they will transmit the latest tire pressure information.

1. Turn the ignition switch to the ON position. 2. Position the tire pressure monitor activation tool against the LF tire sidewall 180 degrees from the tire valve stem.

3. NOTE: The activation tool will provide feedback in the form of a flashing green light and a beep sound for each successful response from a tire

pressure sensor.

Press the test button on the activation tool to activate the sensor, activate the sensor at least 2 times.

4. Repeat Steps 2 and 3 for the remaining tires. 5. If the tire pressure monitoring system (TPMS) indicator remains illuminated after adjusting and activating each sensor, refer to the Symptom Chart

in Diagnosis and Testing.

Tire Pressure Monitoring System (TPMS) Sensor

Tire Pressure Sensor: Service and Repair Tire Pressure Monitoring System (TPMS) Sensor

Tire Pressure Monitoring System (TPMS) Sensor

Tire Pressure Monitoring System (TPMS) Sensor

Disassembly

WARNING: The tire pressure monitoring system (TPMS) sensor battery may release hazardous chemicals if exposed to extreme mechanical damage. If these chemicals contact the skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If any part of the battery is swallowed, contact a physician immediately. When disposing of TPMS sensors, follow the correct procedures for hazardous material disposal. Failure to follow these instructions may result in serious personal injury.

NOTE: Tire pressure sensors are equipped with Lithium-ion batteries and must be disposed of accordingly.

NOTE: Tire pressure sensors are manufactured in multiple colors based on their application. When installing a new sensor, make sure the color of the sensor being installed matches the color of the sensor that was removed. The different colored sensors are not interchangeable.

NOTE: The sensor can be removed and installed without removing the strap or the cradle.

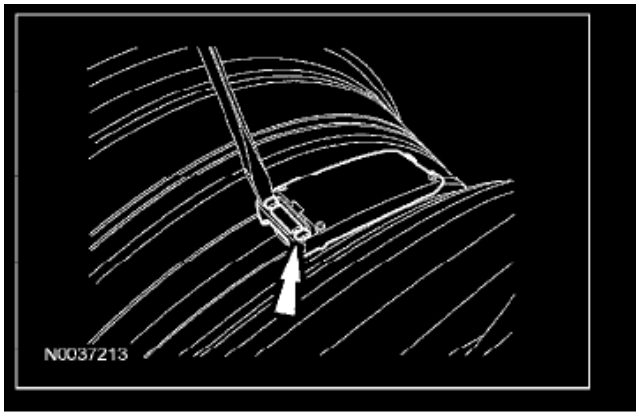
1. CAUTION: The sensor, cradle and strap may be damaged by incorrect tire mounting or dismounting. Dismount the tire only as

instructed.

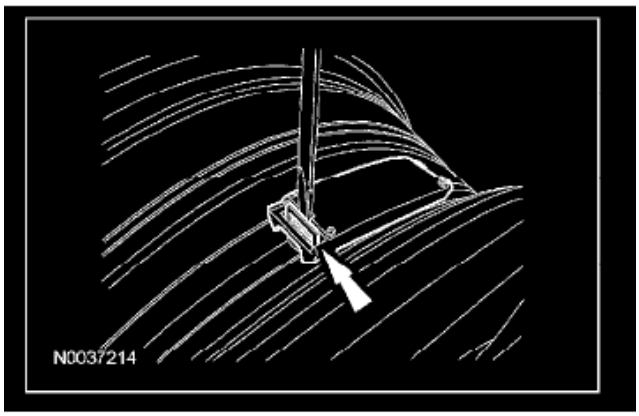
Remove the tire from the wheel.

2. CAUTION: Do not use a large screwdriver. Apply minimum force during removal or damage to the sensor locking clip may occur.

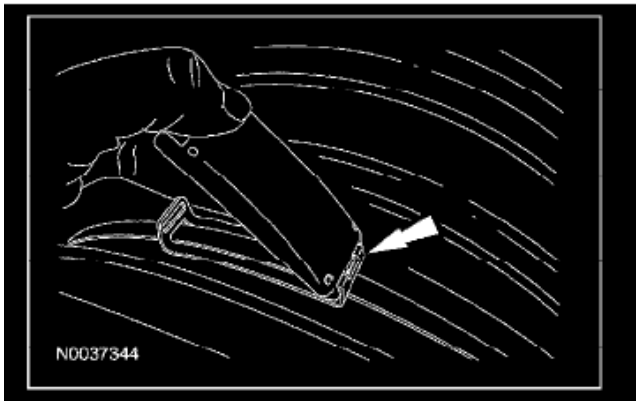
Using a pocket screwdriver or similar tool, remove the sensor locking clip.



N0037213



N0037214



N0037344

3. CAUTION: Do not use a large screwdriver. Apply minimum force during removal or damage to the sensor may occur.

Using a pocket screwdriver or similar tool, detach the sensor from the cradle.

4. Remove the sensor.

Assembly

1. CAUTION: Damage to the sensor may occur if excessive force is applied during sensor installation.

NOTE: Make sure the sensor is fully seated into the cradle. The sensor will make a "click" noise when correctly seated.

Position the sensor into the cradle by inserting the hinge end of the sensor into the hook end of the cradle and pushing the opposite end of the sensor down onto the cradle.

2. NOTE: The locking clip can only be fully seated when installed in the correct orientation. If the sensor locking clip cannot be fully inserted, then

the sensor may not be fully seated on the cradle or the locking clip may be inserted backward.

Insert a new locking clip into the sensor.

3. CAUTION: The sensor, cradle and strap may be damaged by incorrect tire mounting or dismounting. Mount the tire only as instructed.

Install the tire onto the wheel.

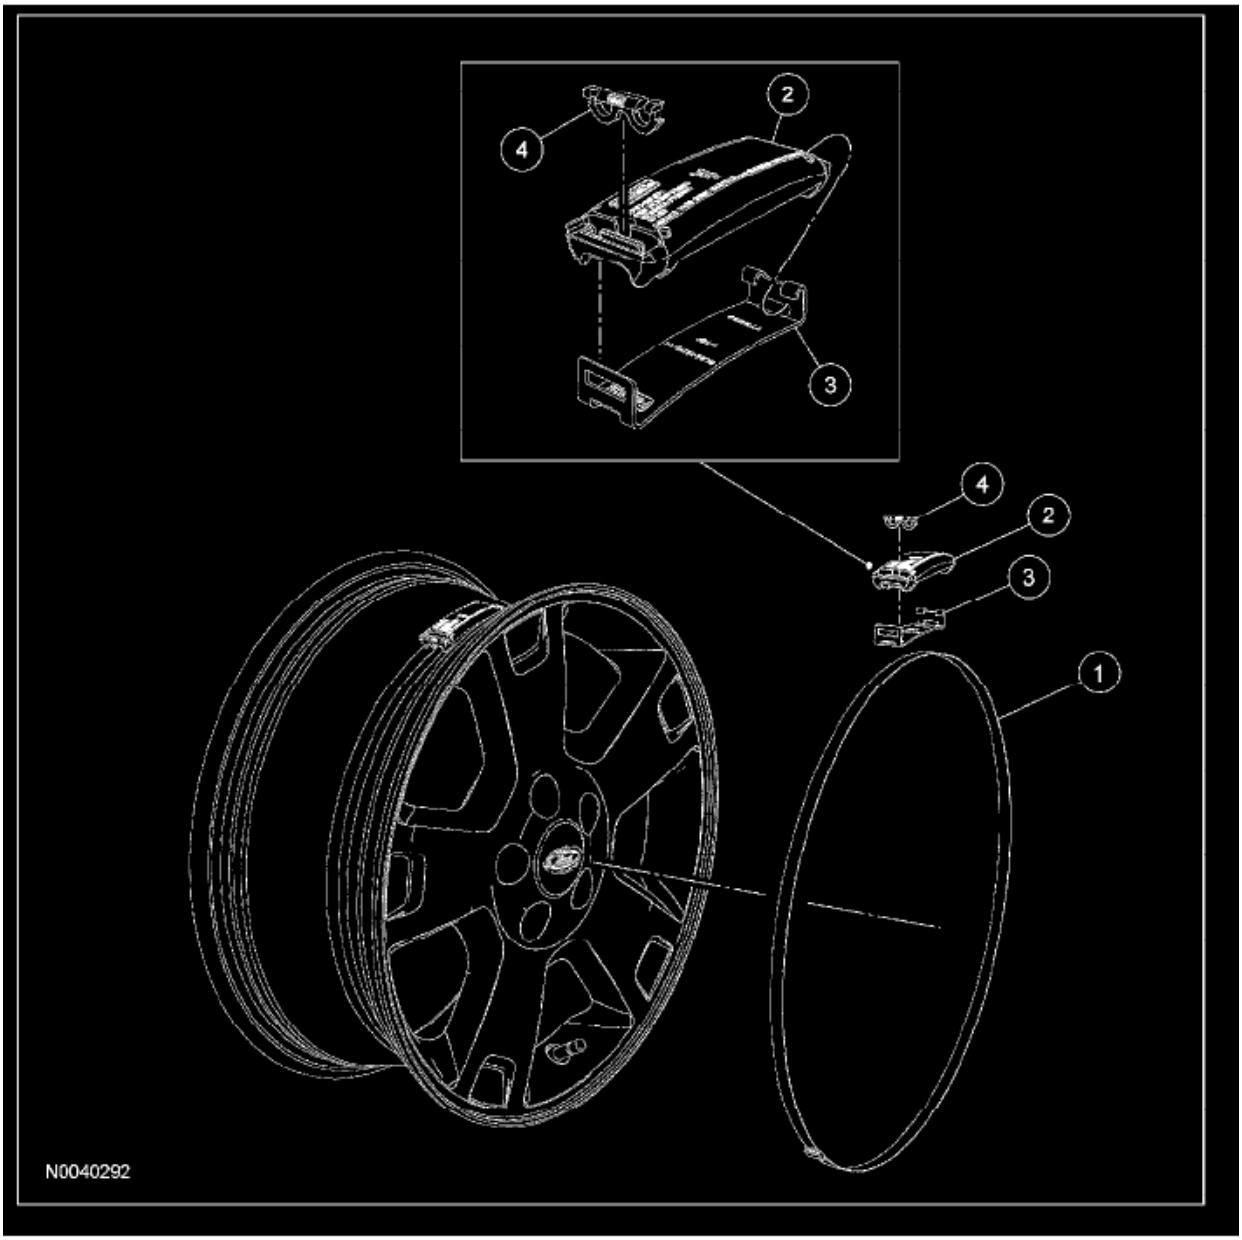
4. NOTE: A new tire pressure sensor is shipped in an off mode (or battery saver mode) and must be turned on before it can be trained. To turn the

sensor on, install it on a wheel, mount the tire and inflate the tire to the recommended inflation pressure. Wait at least 2 minutes, then continue with the sensor training procedure.

Train the tire pressure sensor(s).

Material

Item	Specification
Wheel and Tire Cleaner ZC-27-A or B	—

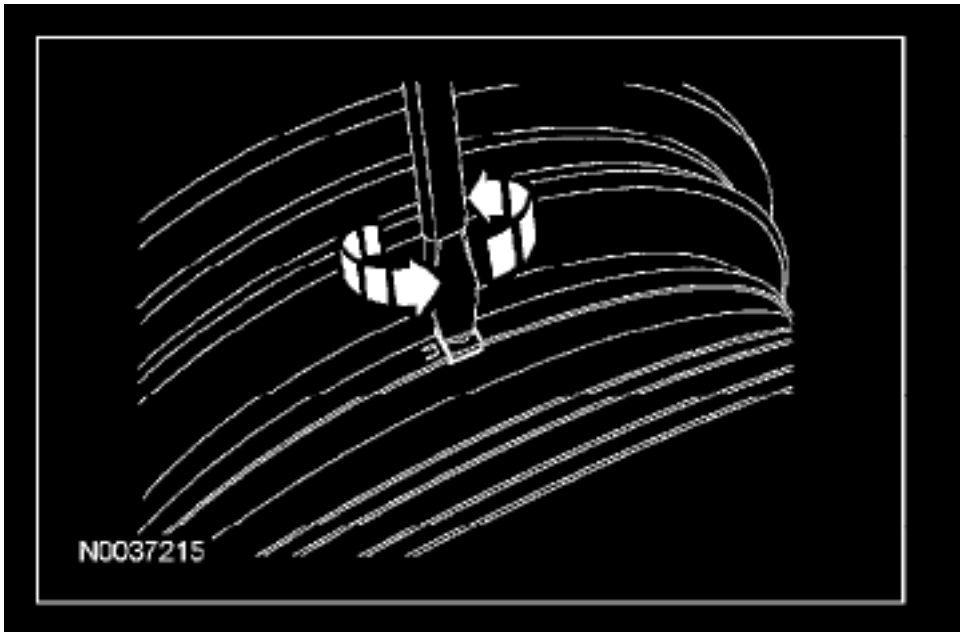


Item	Part Number	Description
1	1A177/1A193	Strap/strap kit
2	1A150/1A189	Tire pressure sensor/sensor kit
3	1A175	Sensor cradle (also part of 1A193)
4	14C202	Locking clip (also part of 1A189)

Tire Pressure Sensor: Service and Repair Tire Pressure Monitoring System (TPMS) Strap and Cradle

Tire Pressure Monitoring System (TPMS) Strap and Cradle

Disassembly



WARNING: The tire pressure monitoring system (TPMS) sensor battery may release hazardous chemicals if exposed to extreme mechanical damage. If these chemicals contact the skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If any part of the battery is swallowed, contact a physician immediately. When disposing of TPMS sensors, follow the correct procedures for hazardous material disposal. Failure to follow these instructions may result in serious personal injury.

NOTE: Tire pressure sensors are equipped with Lithium-ion batteries and must be disposed of accordingly.

NOTE: Tire pressure sensors are manufactured in multiple colors based on their application. When installing a new sensor, make sure the color of the sensor being installed matches the color of the sensor that was removed. The different colored sensors are not interchangeable.

NOTE: The sensor is available separately, the cradle and strap are available as a strap kit. There are several different strap kits available based on wheel diameter but all strap kits share the same base part number.

1. Remove the tire pressure monitoring system (TPMS) sensor.

2. WARNING: Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

WARNING: Wear protective gloves when handling components or parts that have pointed or sharp edges. Failure to follow this instruction may result in serious personal injury.

Remove a factory installed strap in the following sequence: 1

Locate the strap buckle and secure the strap to the wheel using duct tape or a similar item, on both sides of the buckle approximately 25 mm (0.98 inch) from the buckle.

2 Using a large screwdriver and a twisting motion, unbuckle the strap.

3 Discard the strap.

3. To remove a dealer installed strap, turn the worm gear screw until the strap is fully released from the worm gear.

^ Discard the strap.

4. NOTE: To aid assembly, mark the location of the cradle prior to disassembly.

Using a screwdriver, or similar tool, remove the cradle by inserting the screwdriver under the cradle and prying up.

Assembly

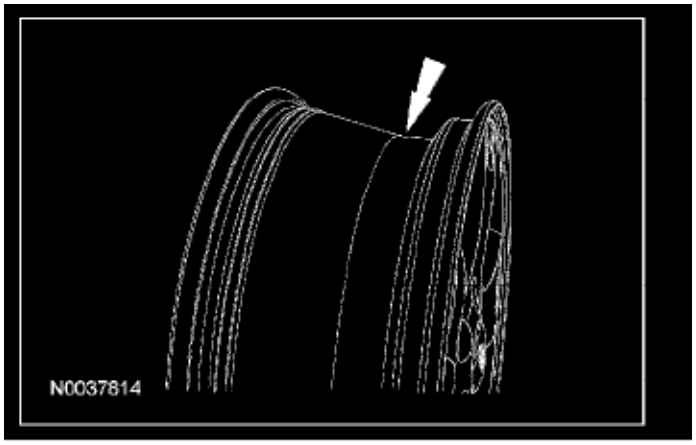
1. NOTE: Make sure the sensor is fully seated into the new cradle. The sensor will make a "click" noise when fully seated.

Position the sensor into the new cradle by inserting the hinge end of the sensor into the hook end of the cradle and pushing the opposite end of the sensor down onto the cradle.

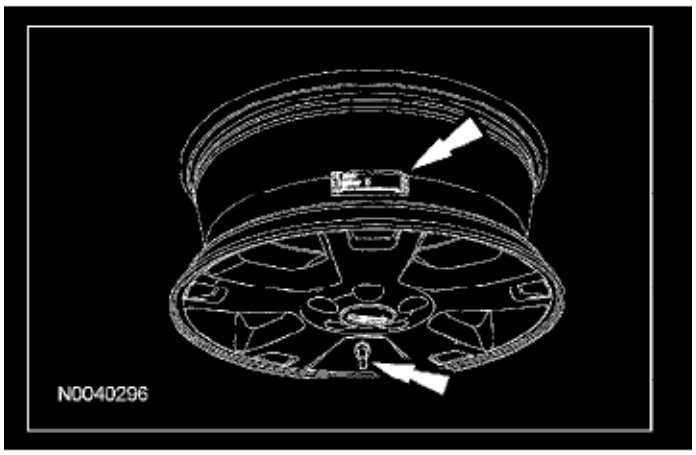
2. CAUTION: Metal scrapers may damage the wheel. Use only plastic or non-metallic scrapers to remove the cradle adhesive strip residue.

NOTE: The sensor and cradle must be installed in the drop well of the wheel, 180 degrees from the valve stem.

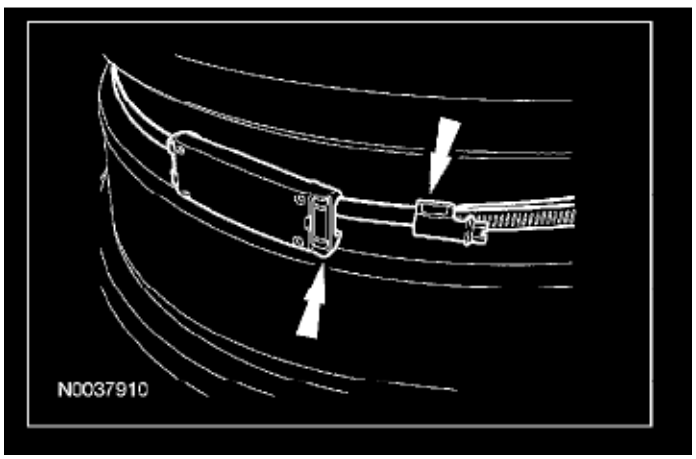
Clean the area where the sensor and cradle are to be installed.



N0037814



N0040296



N0037910

3. NOTE: The sensor and cradle must be positioned with the hinge side of the sensor on the RH side when viewed from the curb side (beauty side)

of the wheel.

NOTE: The sensor has raised markings indicating how to position the sensor.

Remove the adhesive tape liner from the cradle and position the sensor and cradle into the wheel drop well 180 degrees from the valve stem.

4. Install the tapered end of the strap through the opening of the cradle on the hinge side of the sensor. This will position the worm gear on the

locking clip side of the sensor.

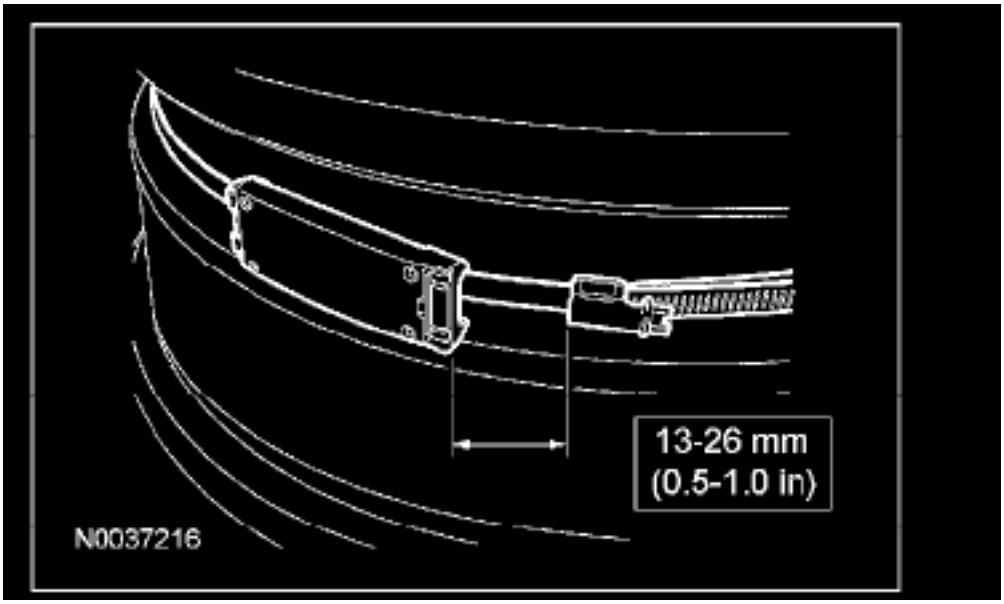
5. CAUTION: Steel wheels have a "high spot" along their circumference. Make sure the strap and sensor are mounted at the lowest spot

possible to avoid damaging the sensor during wheel and tire disassembly and assembly.

NOTE: Keep the strap parallel with the wheel flange while tightening the worm gear.

Position the worm gear 13-26 mm (0.5-1.0 inch) away from the sensor and tighten the worm gear.
^

Tighten to 3 Nm (27 lb-inch).



6. CAUTION: The sensor, cradle and strap may be damaged by incorrect tire mounting or dismounting. Mount the tire only as instructed.

Install the tire onto the wheel.

7. NOTE: A new tire pressure sensor is shipped in an off mode (or battery saver mode) and must be turned on before it can be trained. To turn the

sensor on, install it on a wheel, mount the tire and inflate the tire to the recommended inflation pressure. Wait at least 2 minutes, then continue with the sensor training procedure.

Train the tire pressure sensor(s).

Low Tire Pressure Indicator: Testing and Inspection

Tire Pressure Monitoring System (TPMS) Indicator and Message Center Messages

The TPMS indicator and vehicle message center (if equipped) sometimes displays faults that cannot be resolved by the customer. Treat these messages as TPMS faults that must be serviced.

Tire Pressure Monitoring System (TPMS) Indicator Illuminates Continuously

NOTE: If the spare tire is in use, the damaged road tire must be repaired and installed on the vehicle to restore complete TPMS functionality before carrying out any diagnosis.

NOTE: For vehicles with different front and rear tire pressures (such as E-Series and certain F-Series), the tire pressure sensors must be trained following a tire rotation. Failure to train the sensors will cause the TPMS indicator to illuminate.

For vehicles with the same tire pressures for front and rear tires, tire rotation will not affect the system.

1. The TPMS indicator remains on continuously for the following condition:

^ Low Tire Pressure - The TPMS indicator is illuminated solid and the message center displays LOW TIRE PRESSURE (if equipped). This is displayed when any of the tire pressures are low. When this condition exists, the tire pressure must be adjusted to the recommended cold pressure as indicated on the vehicle certification label.

2. NOTE: The TPMS sensors do not transmit when the vehicle is stationary. If the vehicle has been stationary for more than 30 minutes, it will be

necessary to wake up the sensors so they will transmit the latest tire pressure information to the SJB.

If the vehicle has been stationary for more than 30 minutes, refer to Tire Pressure Monitoring System (TPMS) Sensor Activation procedure.

Tire Pressure Monitoring System (TPMS) Indicator Flashes

The TPMS indicator flashes for 70 seconds and then remains ON solid when the ignition key is turned to the ON position for the following conditions: 1. Tire Pressure Sensor Fault - If equipped, the message center will display TIRE SENSOR FAULT when a tire pressure sensor is malfunctioning.

GO to Symptom Chart. See: Testing and Inspection/Symptom Related Diagnostic Procedures

2. No communication with the SJB (TPMS is integral to the SJB) - The TPMS indicator is illuminated when the instrument cluster has received no

signals from the SJB for more than 5 seconds. If equipped, the message center displays TIRE MONITOR FAULT. GO to Symptom Chart. See: Testing and Inspection/Symptom Related Diagnostic Procedures

3. Tire Pressure Monitor Fault - If equipped, the message center will display TIRE MONITOR FAULT when the tire pressure monitoring system is

malfunctioning or communication with the instrument cluster has been lost. GO to Symptom Chart. See: Testing and Inspection/Symptom Related Diagnostic Procedures

Special Tool(s)

ST2941-A	Activation Tool, Tire Pressure Monitor 204-363
ST2634-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Tire Pressure Sensor: Testing and Inspection Tire Pressure Monitoring System (TPMS) Sensor Training

Tire Pressure Monitoring System (TPMS) Sensor Training

NOTE: If the vehicle has been stationary for more than 30 minutes, the sensors will go into a "sleep mode" to conserve battery power. It will be necessary to wake them up so they will transmit the latest tire pressure information to the smart junction box (SJB). For additional information, refer to Tire Pressure Monitoring System (TPMS) Sensor Activation.

NOTE: The tire pressure sensor training procedure must be done on a single vehicle, in an area without radio frequency noise and at least 1 m (3 ft) away from other vehicles equipped with tire pressure monitoring system (TPMS). Radio frequency noise is generated by electrical motors and appliance operation, cellular telephones, remote transmitters, power inverters and portable entertainment equipment.

NOTE: If a sensor does not respond to the activation tool, attempt to activate the same sensor with the activation tool. If the sensor still does not respond, move the vehicle to rotate the wheels at least 1/4 of a turn and attempt to activate the same sensor again.

NOTE: The SJB has a 2-minute time limit between sensor responses. If the SJB does not recognize any 1 of the 4 tire pressure sensors during this time limit, the horn will sound twice and the message center (if equipped) will display TIRE NOT TRAINED REPEAT and the entire procedure must be repeated.

1. NOTE: For vehicles with different front and rear tire pressures (such as the E-Series and certain F-Series), the tire pressure sensors must be

trained following a tire rotation. Failure to train the sensors will cause the TPMS indicator to illuminate. For vehicles with the same tire pressure for front and rear tires, tire rotation will not affect the system.

Turn the ignition switch to the OFF position, then press and release the brake pedal.

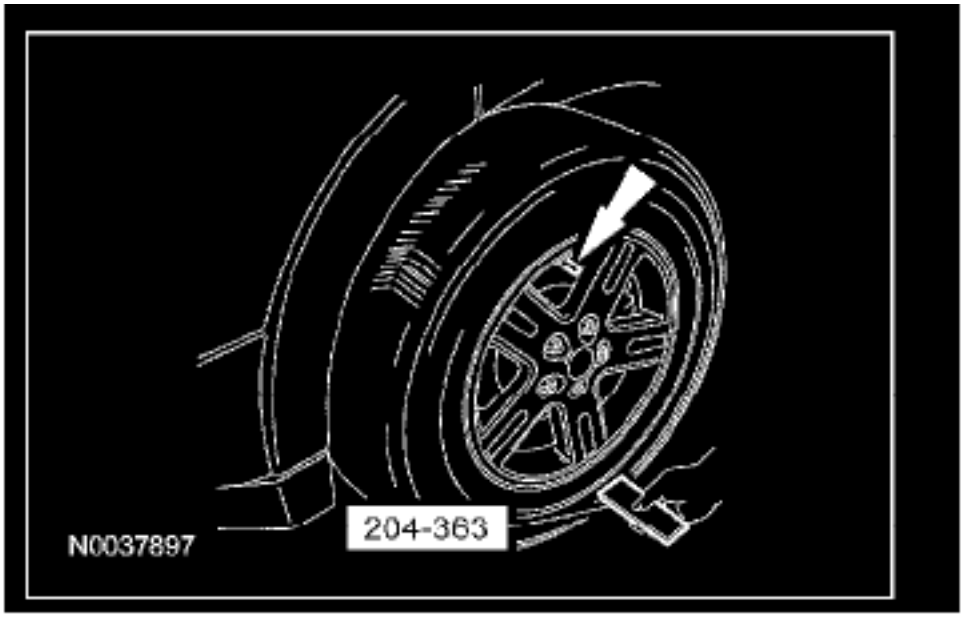
2. Cycle the ignition switch from the OFF position to the RUN position 3 times, ending in the RUN position. 3. Press and release the brake pedal. 4. Turn the ignition switch to the OFF position. 5. Turn the ignition switch from the OFF position to the RUN position 3 times, ending in the RUN position.

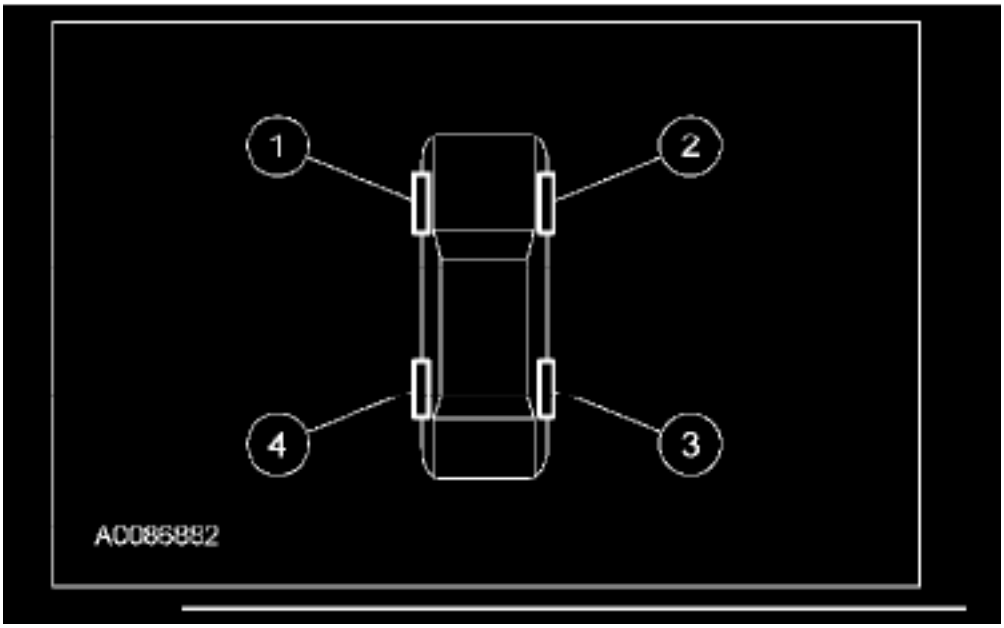
^ The horn will sound once and the TPMS indicator will flash if the training mode has been entered successfully. If equipped, the message center will display TRAIN LF TIRE.

6. NOTE: It may take up to 6 seconds to activate a tire pressure sensor. During this time, the activation tool must remain in place 180 degrees from

the valve stem.

Place the activation tool on the LF tire sidewall opposite (180 degrees) from the valve stem. Press and release the test button on the special tool. The horn will sound briefly to indicate that the tire pressure sensor has been recognized by the SJB.





7. Within 2 minutes of the horn sounding, place the activation tool on the RF tire sidewall opposite (180 degrees) from the valve stem and press and

release the test button to train the RF tire pressure sensor.

8. NOTE: Do not wait more than 2 minutes between training each sensor or the SJB will time out and the entire procedure must be repeated.

Repeat Step 7 for the RR and LR tires. ^

The procedure is completed after the last tire has been trained. When the training procedure is complete, the message center (if equipped) will display TIRE TRAINING COMPLETE.

^ For vehicles not equipped with a message center, successful completion of the training procedure will be verified by turning the ignition switch to the OFF position without the horn sounding. If the horn sounds twice when the switch is turned to the OFF position, the training procedure was not successful.

9. Using the scan tool, locate the updated TPMS sensor IDs trained to the SJB and document them on the applicable warranty claim.

10. NOTE: This step is required to clear DTC C2780, cause the SJB to exit the manufacturing mode and to make sure there are no other concerns

with a newly programmed SJB.

If the sensors are being trained due to the installation of a new SJB, clear any DTCs and perform the SJB on-demand self test.

Tire Pressure Sensor: Testing and Inspection Tire Pressure Monitoring System (TPMS) Sensor Activation

Tire Pressure Monitoring System (TPMS) Sensor Activation

NOTE: The tire pressure sensors will go into a 14 sleep mode" after 30 minutes of inactivity to conserve battery power. The sensors do not transmit information while in sleep mode, it will be necessary to wake them up so they will transmit the latest tire pressure information.

1. Turn the ignition switch to the ON position. 2. Position the tire pressure monitor activation tool against the LF tire sidewall 180 degrees from the tire valve stem.

3. NOTE: The activation tool will provide feedback in the form of a flashing green light and a beep sound for each successful response from a tire

pressure sensor.

Press the test button on the activation tool to activate the sensor, activate the sensor at least 2 times.

4. Repeat Steps 2 and 3 for the remaining tires. 5. If the tire pressure monitoring system (TPMS) indicator remains illuminated after adjusting and activating each sensor, refer to the Symptom Chart

in Diagnosis and Testing.

Wheel Fastener: Service and Repair Rear

Wheel Studs

Removal

CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent parts if replacement is necessary. Do not use replacement parts of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

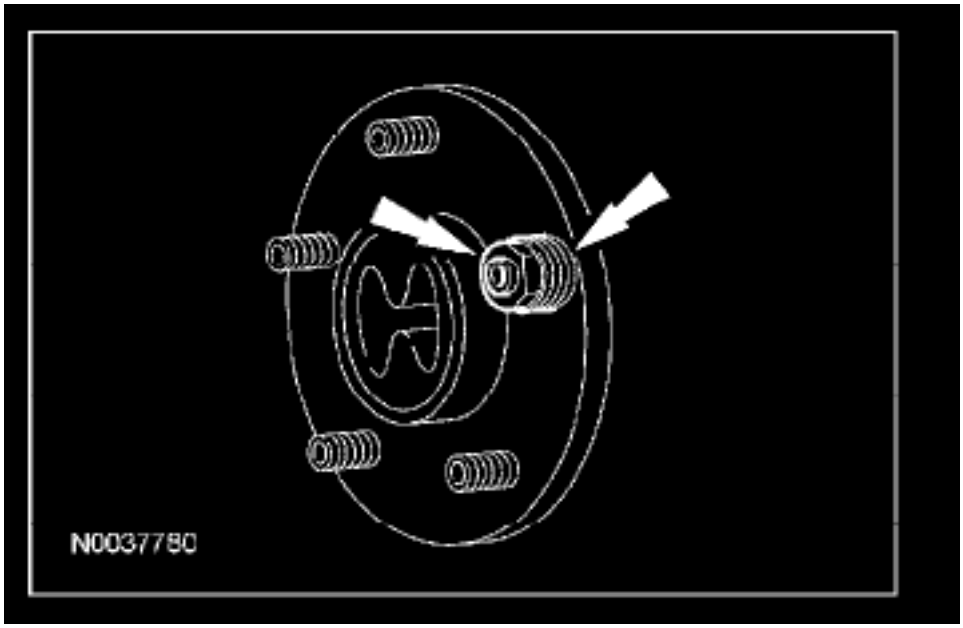
CAUTION: Never use a hammer to remove the wheel stud or damage to the axle flange, wheel bearing or hub may occur.

1. Remove the rear brake drum. 2. Using the special tool, press the wheel stud from its seat and discard.

Installation

CAUTION: Never use air tools to install wheel studs. The serrations may be stripped from the stud.

1. Insert a new wheel stud in the axle flange, making sure the serrations are aligned with those made by the original wheel stud.



2. Seat the new wheel stud in the axle flange.

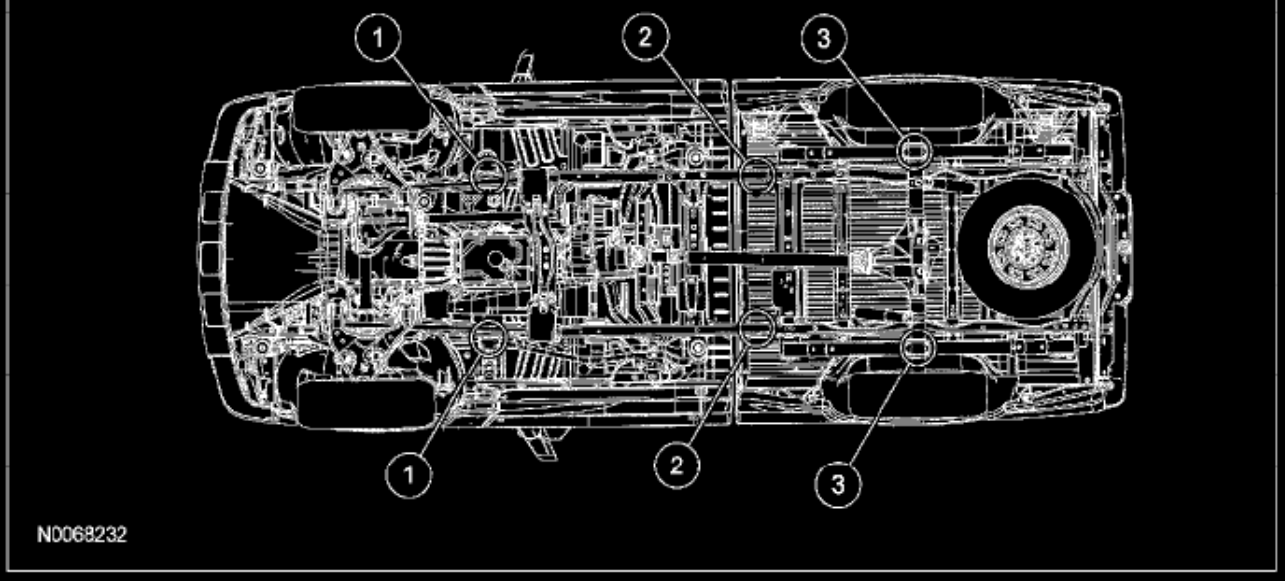
^ Place 4 flat washers over the outside end of the wheel stud.

^ Thread a standard wheel nut with the flat side against the washers.

^ Tighten the wheel nut until the wheel stud head seats against the back side of the flange.

3. Remove the wheel nut and flat washers. 4. Install the rear brake drum.

Jacking and Lifting Locations — Four Wheel Drive (4WD)



Item	Description
1	Front jacking and lifting locations
2	Rear lifting locations
3	Rear jacking locations

Vehicle Lifting: Description and Operation

JACKING AND LIFTING

WARNING:

- Block all wheels, set the parking brake and firmly apply the service brake to reduce the risk of vehicle movement during this procedure. Failure to follow these instructions may result in serious personal injury.

- Only raise the vehicle when positioned on a hard, level surface. Attempting to raise the vehicle on an uneven or soft surface may result in vehicle slipping or falling from the jack or jackstand. Failure to follow this instruction may result in serious personal injury.

- Never get underneath a vehicle that is supported only by a jack. The jack could unintentionally lower. Always support vehicle with floor stands. Failure to follow these instructions may result in serious personal injury.

CAUTION:

- The jack provided with the vehicle is intended to be used in an emergency for changing a deflated tire. To avoid damage to the vehicle, never use the jack to hoist the vehicle for any other purpose.

- Do not attempt to use jack pressure on either the front bumper or the rear bumper of any vehicle. Damage to bumper covers will occur.

- To prevent possible damage to the underbody, do not drive the vehicle onto the drive-on lift without first checking for possible interference.

- Make sure the jack has an adequate lifting capacity for the vehicle being lifted, or damage to the vehicle may occur.

- When raising a vehicle on a twin-post hoist, use care when positioning the vehicle so that the hoisting forks do not interfere with the suspension components, mounting brackets or stabilizer mounting brackets, if so equipped. In addition, use care in hoist positioning to avoid possible damage to the axle carrier or rear cover.

- Damage to the suspension, exhaust or steering linkage components may occur if care is not exercised when positioning the hoist adapters prior to lifting the vehicle.

Jacking and Lifting Locations - Four Wheel Drive (4WD)

Jacking and Lifting Locations — Rear Wheel Drive (RWD)

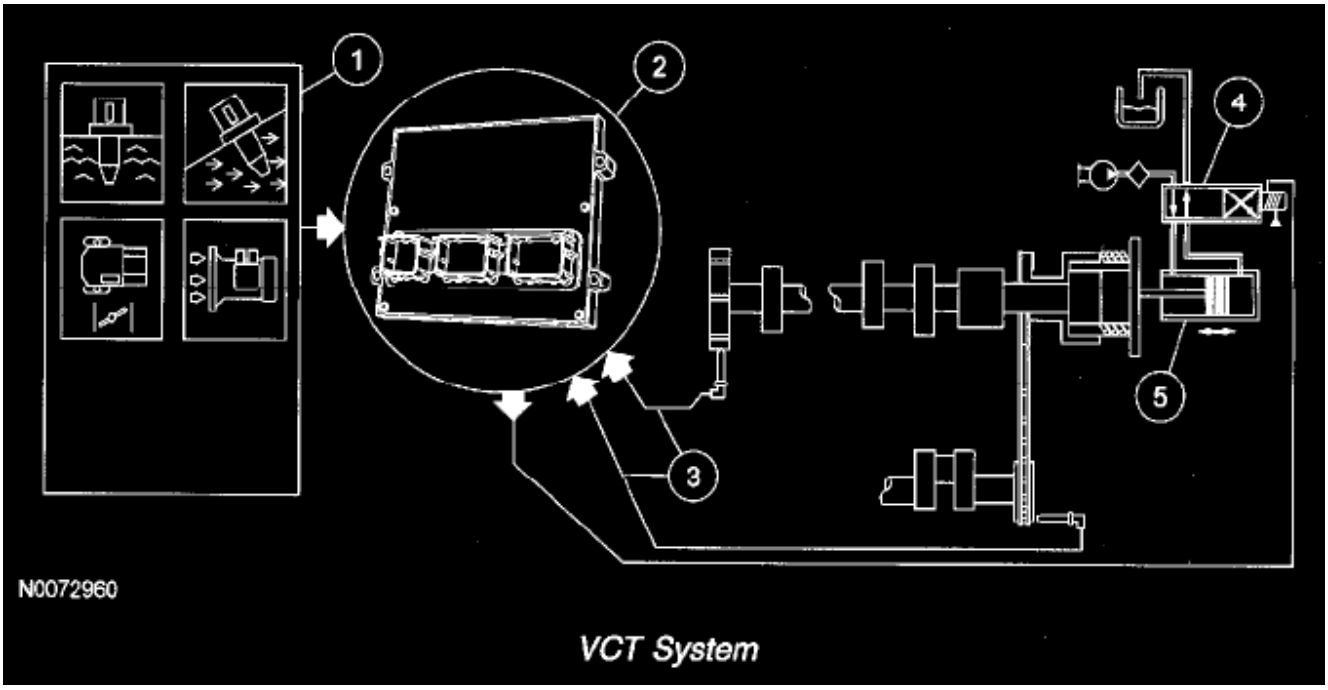
Jacking and Lifting Locations - Rear Wheel Drive (RWD)



VCT System

Variable Valve Timing Actuator: Description and Operation

VARIABLE CAMSHAFT TIMING (VCT) SYSTEM

Overview

The VCT enables rotation of the camshaft(s) relative to the crankshaft rotation as a function of engine operating conditions. There are 4 types of VCT systems.

- Exhaust phase shifting (EPS) system - the exhaust cam is the active cam being retarded.

- Intake phase shifting (IPS) system - the intake cam is the active cam being advanced.

- Dual equal phase shifting (DEPS) system - both intake and exhaust cams are phase shifted and equally advanced or retarded.

- Dual independent phase shifting (DIPS) system - where both the intake and exhaust cams are shifted independently.

All systems have 4 operational modes: idle, part throttle, wide open throttle (WOT), and default mode. At idle and low engine speeds with closed throttle, the powertrain control module (PCM) determines the phase angle based on air flow, engine oil temperature and engine coolant temperature. At part and wide open throttle the PCM determines the phase angle based on engine RPM, load, and throttle position. VCT systems provide reduced emissions and enhanced engine power, fuel economy and idle quality. IPS systems also have the added benefit of improved torque. In addition, some VCT system applications can eliminate the need for an external exhaust gas recirculation (EGR) system. The elimination of the EGR system is accomplished by controlling the overlap time between the intake valve opening and exhaust valve closing. Currently, both the IPS and DEPS systems are used.

Variable Camshaft Timing (VCT) System

VCT System

The VCT system consists of an electric hydraulic positioning control solenoid, a camshaft position (CMP) sensor, and a trigger wheel. The CMP trigger wheel has a number of equally spaced teeth equal to the number (n) of cylinders on a bank plus one extra tooth (n+1). Four cylinder and V8 engines use a CMP 4+1 tooth trigger wheel. V6 engines use a CMP 3+1 tooth trigger wheel. The extra tooth placed between the equally spaced teeth represents the CMP signal for that bank. A crankshaft position (CKP) sensor provides the PCM with crankshaft positioning information in 10 degree increments.

1. The PCM receives input signals from the intake air temperature (IAT) sensor, engine coolant temperature (ECT) sensor, engine oil temperature

(EOT) sensor, CMP, throttle position (TP) sensor, mass air flow (MAF) sensor, and CKP to determine the operating conditions of the engine. At idle and low engine speeds with closed throttle, the PCM controls the camshaft position based on ECT, EOT, IAT, and MAF. During part and wide open throttle, the camshaft position is determined by engine RPM, load and throttle position. The VCT system does not operate until the engine is at normal operating temperature.

2. The VCT system is enabled by the PCM when the correct conditions are met. 3. The CKP signal is used as a reference for CMP positioning. 4. The VCT solenoid valve is an integral part of the VCT system. The solenoid valve controls the flow of engine oil in the VCT actuator assembly.

As the PCM controls the duty cycle of the solenoid valve, oil pressure/flow advances or retards the cam timing. Duty cycles near 0% or 100% represent rapid movement of the camshaft. Retaining a fixed camshaft position is accomplished by dithering (oscillating) the solenoid valve duty cycle.

The PCM calculates and determines the desired camshaft position. It continually updates the VCT solenoid duty cycle until the desired position is achieved. A difference between the desired and actual camshaft position represents a position error in the PCM VCT control loop. The PCM

disables the VCT and places the camshaft in a default position if a concern is detected. A related DTC is also set when the concern is detected.

5. When the VCT solenoid is energized, engine oil is allowed to flow to the VCT actuator assembly which advances or retards the camshaft timing.

One half of the VCT actuator is coupled to the camshaft and the other half is connected to the timing chain. Oil chambers between the 2 halves couple the camshaft to the timing chain. When the flow of oil is shifted from one side of the chamber to the other, the differential change in oil pressure forces the camshaft to rotate in either an advance or retard position depending on the oil flow.

Compression Check: Testing and Inspection

Compression Test - Compression Gauge Check

1. Make sure the oil in the crankcase is of the correct viscosity and at the correct level and that the battery is correctly charged. Operate the vehicle

until the engine is at normal operating temperature. Turn the ignition switch to the OFF position, then remove all the spark plugs.

2. Set the throttle plates in the wide-open position. 3. Install a compression gauge such as the Compression Tester in the No. 1 cylinder. 4. Install an auxiliary starter switch in the starting circuit. With the ignition switch in the OFF position, and using the auxiliary starter switch, crank

the engine a minimum of 5 compression strokes and record the highest reading. Note the approximate number of compression strokes required to obtain the highest reading.

5. Repeat the test on each cylinder, cranking the engine approximately the same number of compression strokes.

Compression Test - Test Results

The indicated compression pressures are considered within specification if the lowest reading cylinder is at least 75% of the highest reading. Refer to the Compression Pressure Limit Chart.

Compression Pressure Limit Chart

Compression Pressure Limit Chart (Part 1)

Compression Pressure Limit Chart (Part 2)

If one or more cylinders read low, squirt approximately one tablespoon of engine oil on top of the pistons in the low-reading cylinders. Repeat the

compression pressure check on these cylinders.

Compression Test - Interpreting Compression Readings

1. If compression improves considerably, piston rings are faulty. 2. If compression does not improve, valves are sticking or seating incorrectly. 3. If 2 adjacent cylinders indicate low compression pressures and squirting oil on each piston does not increase compression, the head gasket may be

leaking between cylinders. Engine oil or coolant in cylinders could result from this condition.

Use the Compression Pressure Limit Chart when checking cylinder compression so that the lowest reading is within 75% of the highest reading.

Camshaft Gear/Sprocket: Specifications

Camshaft sprocket bolt ..... 63 Nm (46 lb-ft)

A0026934

Camshaft: Procedures

Camshaft Bearing Journal Diameter

NOTE: Refer to Specifications.

1. Measure each camshaft journal diameter in 2 directions.

Camshaft Journal to Bearing Clearance - Push Rod Engines

NOTE: Refer to Specifications.

1. NOTE: The camshaft journals must meet specifications before checking camshaft journal clearance.

Measure each camshaft bearing in 2 directions. ^

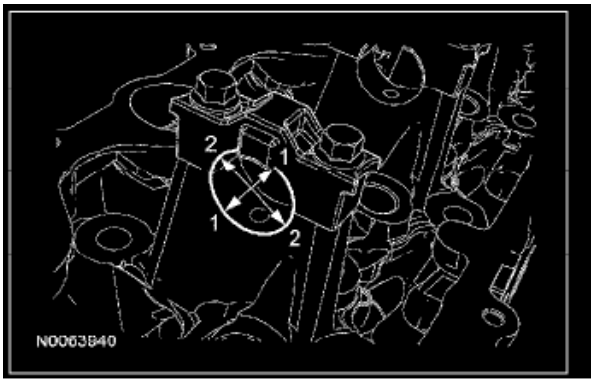
Subtract the camshaft journal diameter from the camshaft bearing diameter.

Camshaft Journal to Bearing Clearance - OHC Engines

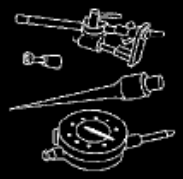
NOTE: Refer to Specifications.

1. NOTE: The camshaft journals must meet specifications before checking camshaft journal clearance.

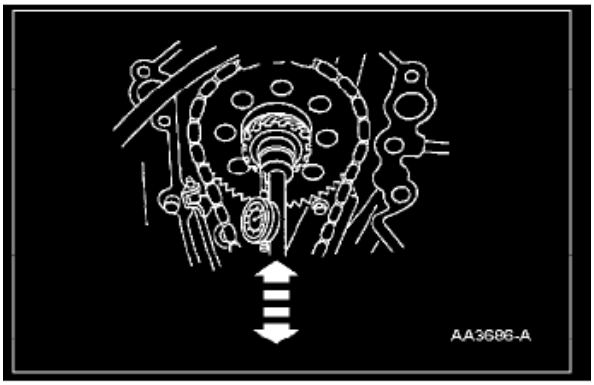
Measure each camshaft bearing in 2 directions.



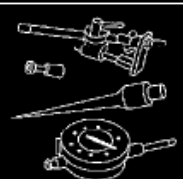
Special Tool(s)



Dial Indicator Gauge with Holding Fixture
100-002 (TOOL-4201-C) or equivalent



Special Tool(s)



Dial Indicator Gauge with Holding Fixture
100-002 (TOOL-4201-C) or equivalent

^ Subtract the camshaft journal diameter from the camshaft bearing diameter.

Camshaft End Play - Push Rod Engines

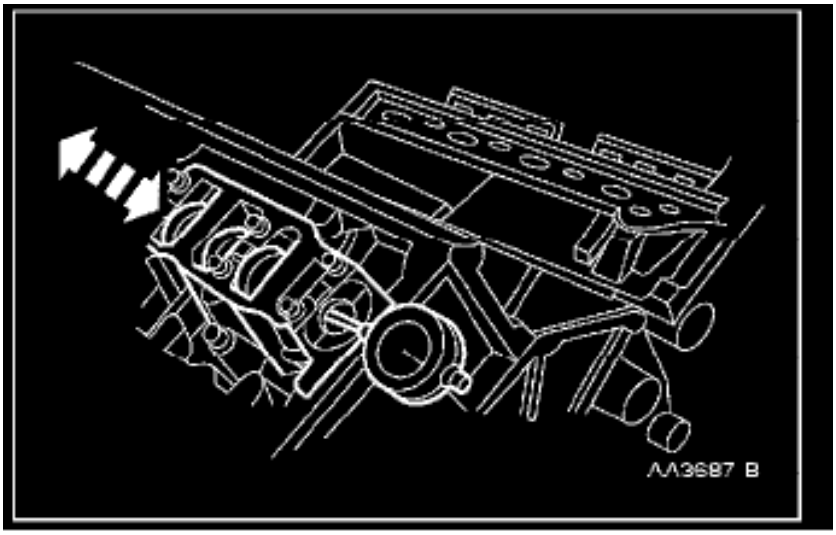
NOTE: Refer to Specifications.

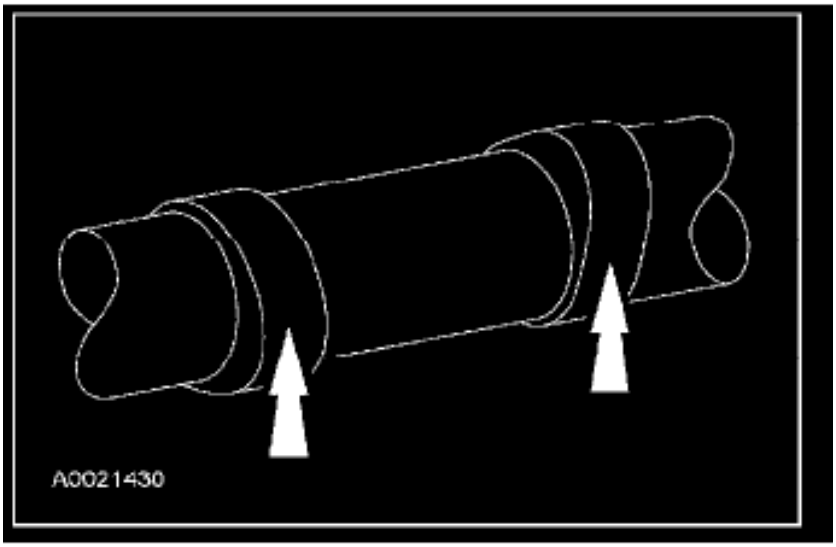
1. Remove the hydraulic lash adjusters. Refer to the appropriate procedure. 2. Use a Dial Indicator Gauge with Holding Fixture to measure camshaft end play. 3. Position the camshaft to the rear of the cylinder block. 4. Zero the indicator. 5. Move the camshaft to the front of the cylinder block. Note and record the camshaft end play.

Camshaft End Play - OHC Engines

NOTE: Refer to Specifications.

1. Using the special tool, measure the camshaft end play.





Special Tool(s)

ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent

2. Position the camshaft to the rear of the cylinder head. 3. Zero the indicator. 4. Move the camshaft to the front of the cylinder head. Note and record the camshaft end play.

^ If camshaft end play exceeds specifications, install a new camshaft and recheck end play.

^ If camshaft end play exceeds specification after camshaft installation, install a new cylinder head.

Camshaft Surface Inspection

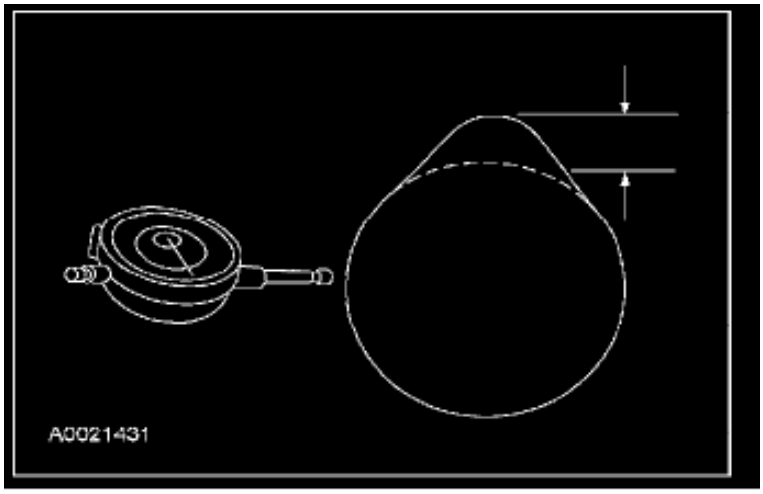
1. Inspect camshaft lobes for pitting or damage in the contact area. Minor pitting is acceptable outside the contact area.

Camshaft Lobe Lift

NOTE: Refer to Specifications.

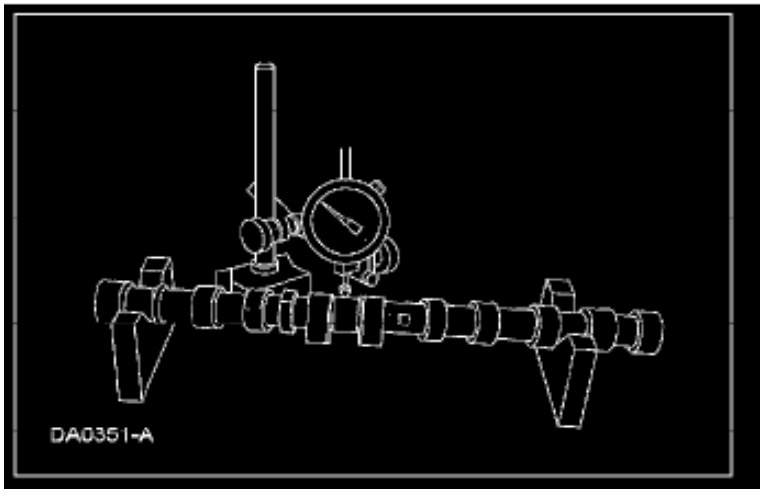
1. Use an indicator gauge to measure camshaft intake/exhaust lobe lift.

^ Rotate the camshaft and subtract the lowest indicator reading from the highest indicator reading to figure the camshaft lobe lift.



Special Tool(s)

ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent



Camshaft Runout

NOTE: Refer to Specifications.

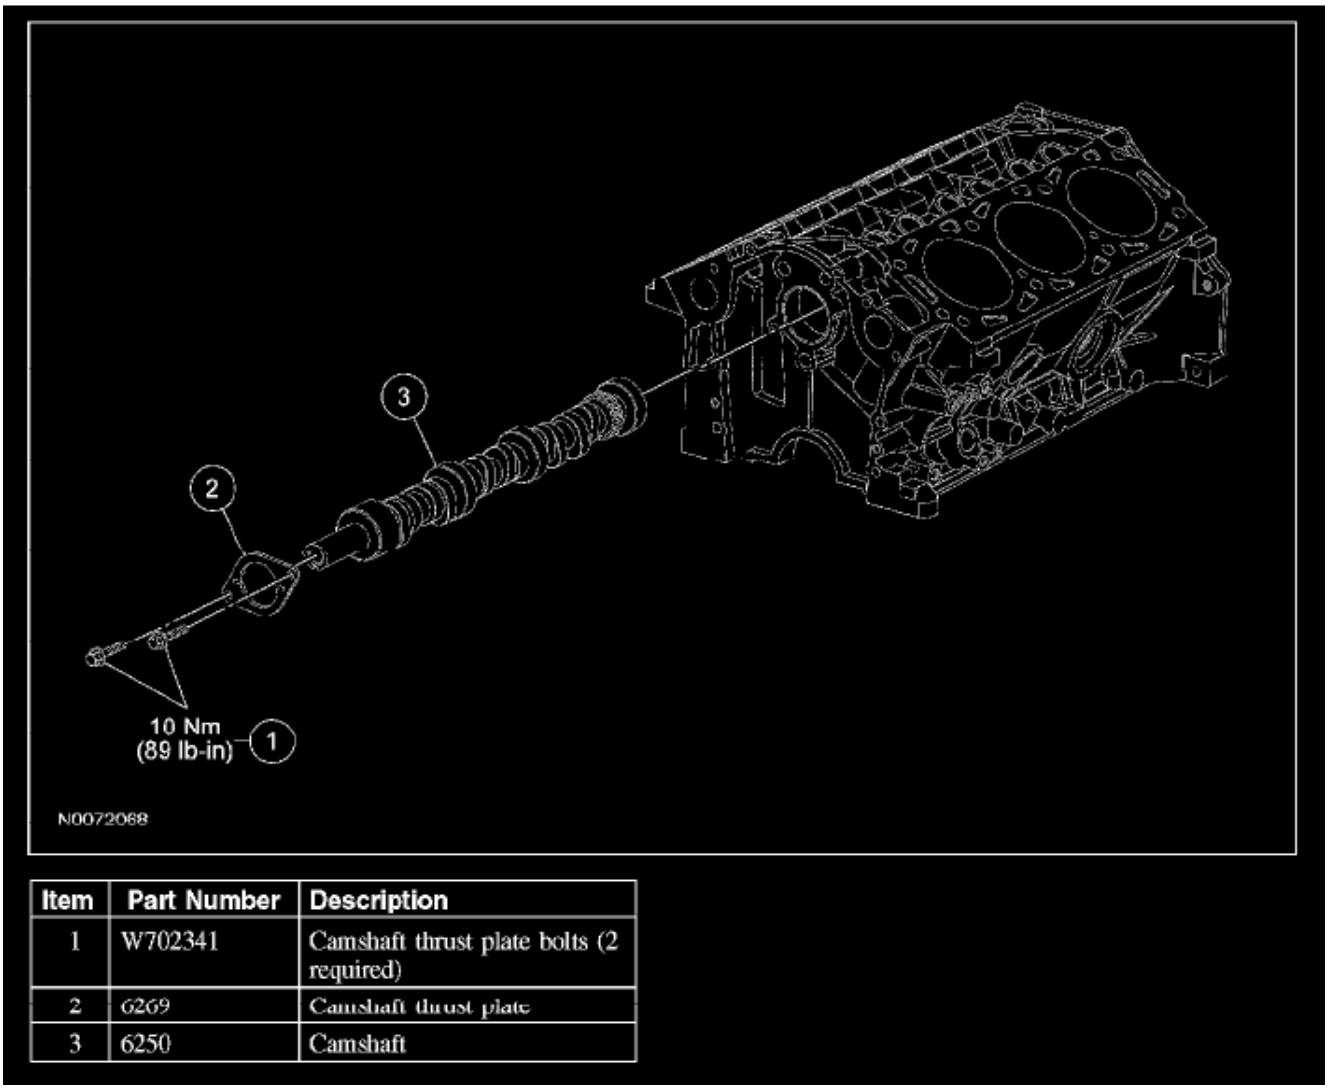
1. NOTE: Camshaft journals must be within specifications before checking runout.

Using the special tool, measure the camshaft runout. ^

Rotate the camshaft and subtract the lowest indicator reading from the highest indicator reading.

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A



Item	Part Number	Description
1	W702341	Camshaft thrust plate bolts (2 required)
2	6269	Camshaft thrust plate
3	6250	Camshaft

Camshaft: Removal and Replacement

Camshaft

Removal

1. Remove the radiator assembly. 2. Remove the hydraulic lash adjusters. 3. Remove the timing chain. 4. Remove the camshaft synchronizer assembly. 5. Remove the bolts and the camshaft thrust plate.

6. CAUTION: Damage to the camshaft or the camshaft bearings may occur if the camshaft is allowed to drop on the bearing surface or

cylinder block.

Remove the camshaft.

Installation

1. CAUTION: Damage to the camshaft or the camshaft bearings may occur if the camshaft is allowed to drop on the bearing surface or

cylinder block.

NOTE: Lubricate the camshaft, the camshaft bearings and the camshaft position sensor drive gear with clean engine oil prior to installation.

Install the camshaft.

2. NOTE: Lubricate the camshaft thrust plate with clean engine oil prior to installation.

Install the camshaft thrust plate and the bolts. ^

Tighten to 10 Nm (89 lb-inch).

3. Measure the camshaft end play. 4. Install the timing chain.

5. CAUTION: If a new camshaft is installed, always add the rest of the clean engine oil to the engine oil by pouring it through the

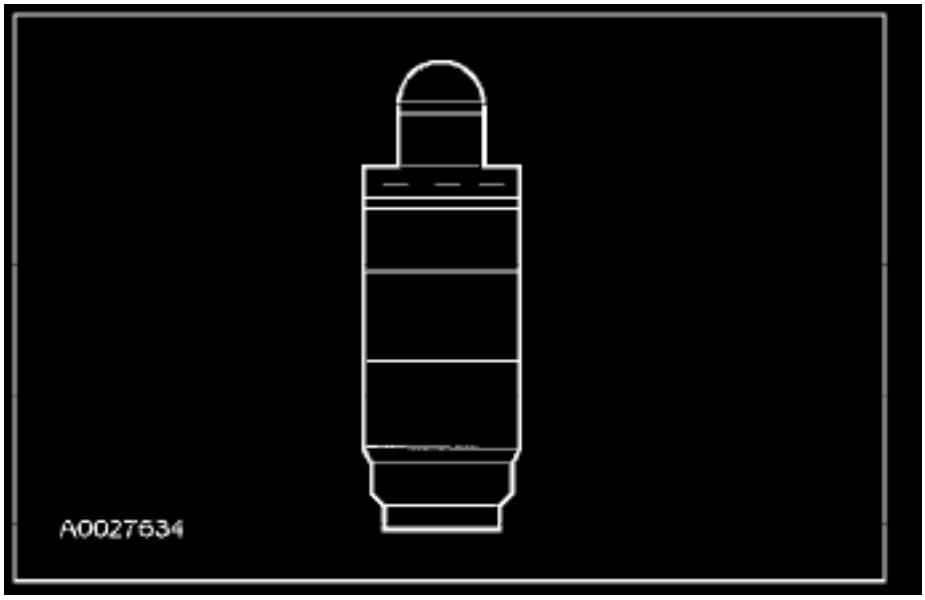
distributor hole onto the camshaft drive gear. Run engine at idle for 5 minutes before driving vehicle. Failure to follow these instructions may cause engine damage.

NOTE: Completely coat camshaft synchronizer gear teeth with clean engine oil.

Install the camshaft synchronizer assembly.

6. Install the hydraulic lash adjusters. 7. Install the radiator assembly. 8. Drain the engine oil. 9. Fill the engine with clean engine oil.

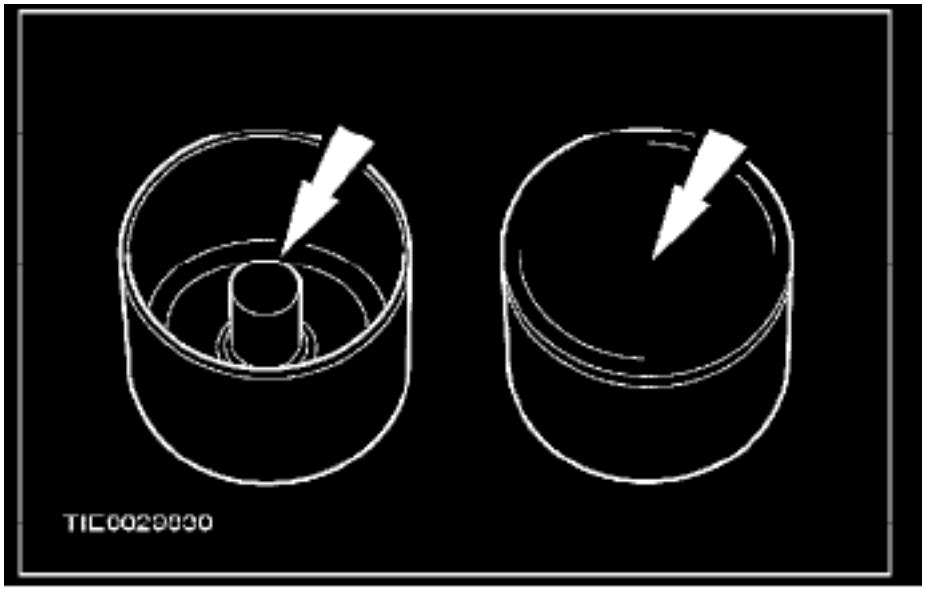
10. Fill and bleed the cooling system.

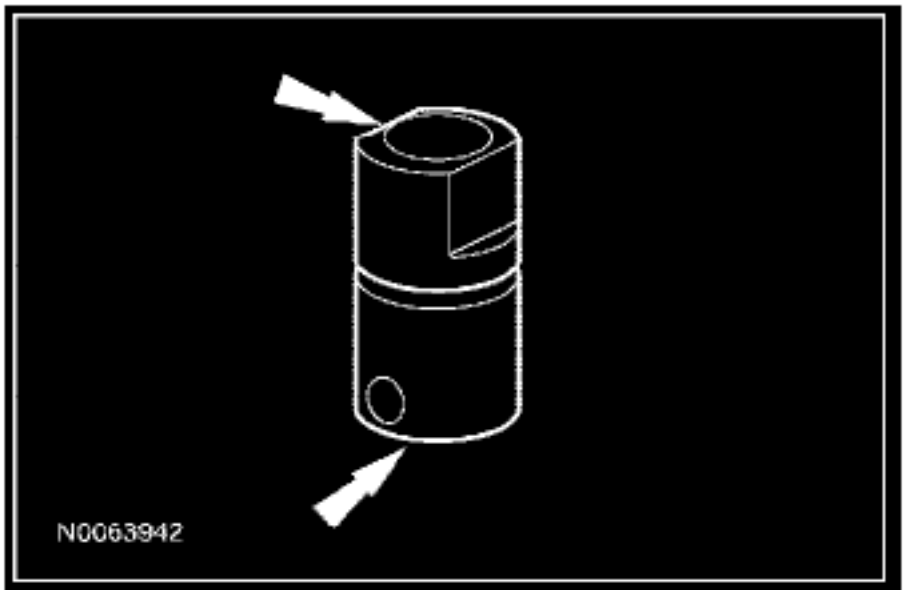


Lifter / Lash Adjuster: Testing and Inspection Hydraulic Lash Adjuster Inspection

Hydraulic Lash Adjuster Inspection

1. Inspect the hydraulic lash adjuster and roller follower for damage. If any damage is found, inspect the camshaft lobes and valves for damage.





Lifter / Lash Adjuster: Testing and Inspection Valve Tappet Inspection

Valve Tappet Inspection

OHC engines

1. Inspect the valve tappet for damage, especially in the indicated areas. If any damage is evident, inspect the camshaft lobes and valves for damage.

Replace components as necessary.

Push rod engines

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Lifter / Lash Adjuster: Service and Repair

Hydraulic Lash Adjuster

Removal

CAUTION: During engine repair procedures, cleanliness is extremely important. Any foreign material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.

NOTE: For a valve train noise concern, inspect the valve-to-rocker arm clearance, rocker arms and push rods for wear.

1. Remove the lower intake manifold. 2. Remove the 2 bolts and the hydraulic lash adjuster guide plate retainer. 3. Remove the hydraulic lash adjuster guide plates. 4. Remove the hydraulic lash adjusters.

Installation

1. NOTE: Lubricate the hydraulic lash adjusters and the hydraulic lash adjuster bores with clean engine oil prior to installation.

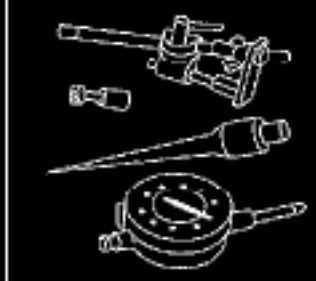
Install the hydraulic lash adjusters.

2. Install the hydraulic lash adjuster guide plates. 3. Install the hydraulic lash adjuster guide plate retainer and the 2 bolts.

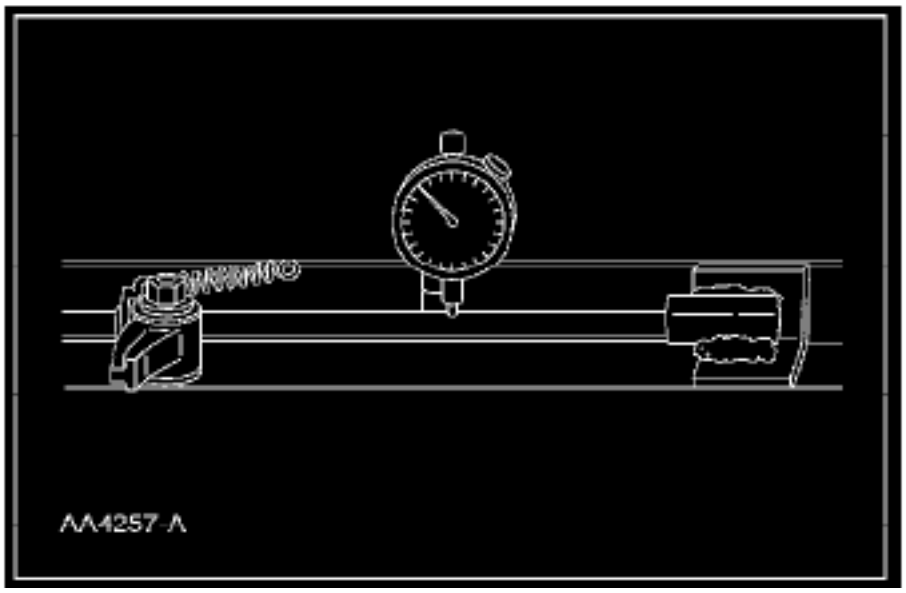
^ Tighten to 12 Nm (9 lb-ft).

4. Install the lower intake manifold.

Special Tool(s)



Dial Indicator Gauge with Holding Fixture
100-002 (TOOL-4201-C) or equivalent



Push Rod: Testing and Inspection

Push Rod Cleaning and Inspection

NOTE: Refer to Specifications.

1. Clean the push rods in a suitable solvent. Blow out the oil passage in the push rods with compressed air.

2. NOTE: Do not attempt to straighten the push rods.

Check the ends of the push rods for nicks, grooves, roughness or excessive wear. ^

The push rods can be checked for straightness while they are installed in the engine by rotating them with the valve closed.

^ They also can be checked using a Dial Indicator.

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Push Rod: Service and Repair

Push Rod

Removal and Installation

CAUTION: During engine repair procedures, cleanliness is extremely important. Any foreign material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.

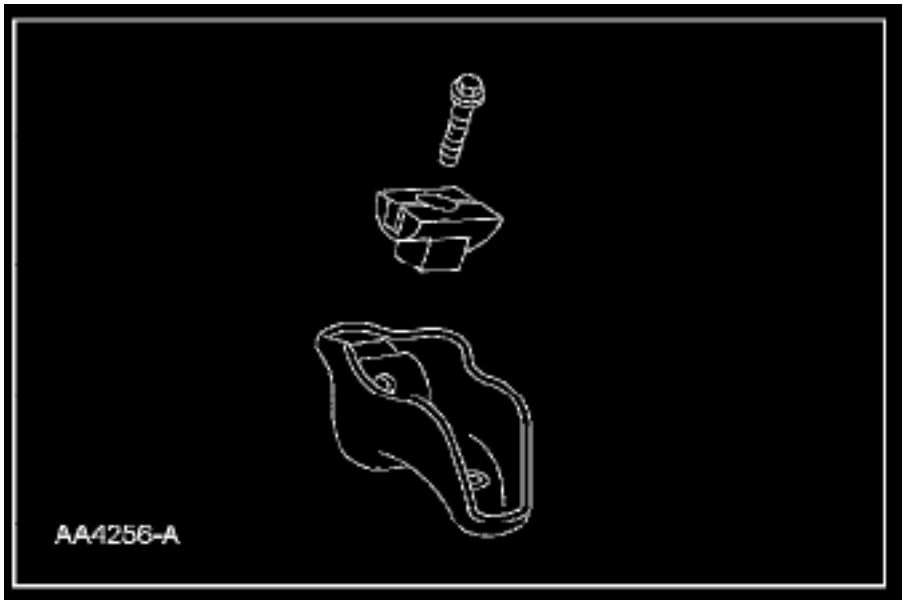
1. Remove the rocker arms.

2. NOTE: Identify and mark the location of each push rod. Each push rod must be installed in the original location.

Remove the push rods.

3. To install, reverse the removal procedure.

^ Lubricate the push rods with clean engine oil.



Rocker Arm Assembly: Testing and Inspection Rocker Arm Cleaning and Inspection

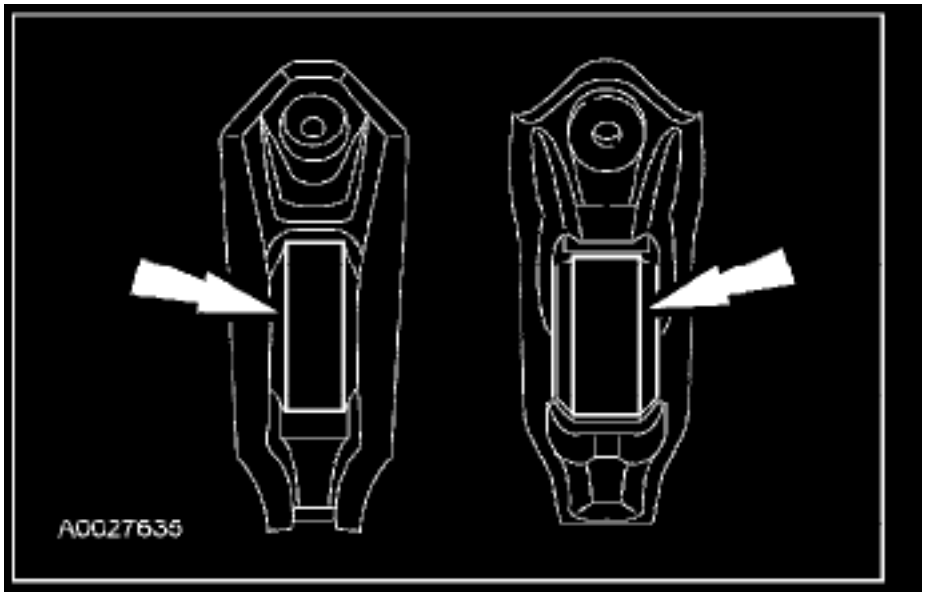
Rocker Arm Cleaning and Inspection

1. Clean all parts thoroughly. Make sure all oil passages are open. 2. Make sure the oil passage in the push rod/valve tappet end of the rocker arm is open.

CAUTION: Do not attempt to true surfaces by grinding. Check the rocker arm pad, side rails and seat for excessive wear, cracks, nicks or burrs. Check the rocker arm seat bolt for stripped or broken threads. Install new components as necessary or engine damage may occur.

3. Inspect the rocker arm push rod bore for nicks, scratches, scores or scuffs.

4. Inspect the pad at the valve end of the rocker arm for indications of grooving, scuffing or abnormal wear.



Rocker Arm Assembly: Testing and Inspection Roller Follower Inspection

Roller Follower Inspection

1. Inspect the roller follower for flat spots or scoring. If any damage is found, inspect the camshaft lobes and hydraulic lash adjuster for damage.

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Rocker Arm Assembly: Service and Repair

Rocker Arm

Removal and Installation

CAUTION: During engine repair procedures, cleanliness is extremely important. Any foreign material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.

1. Remove the valve cover.

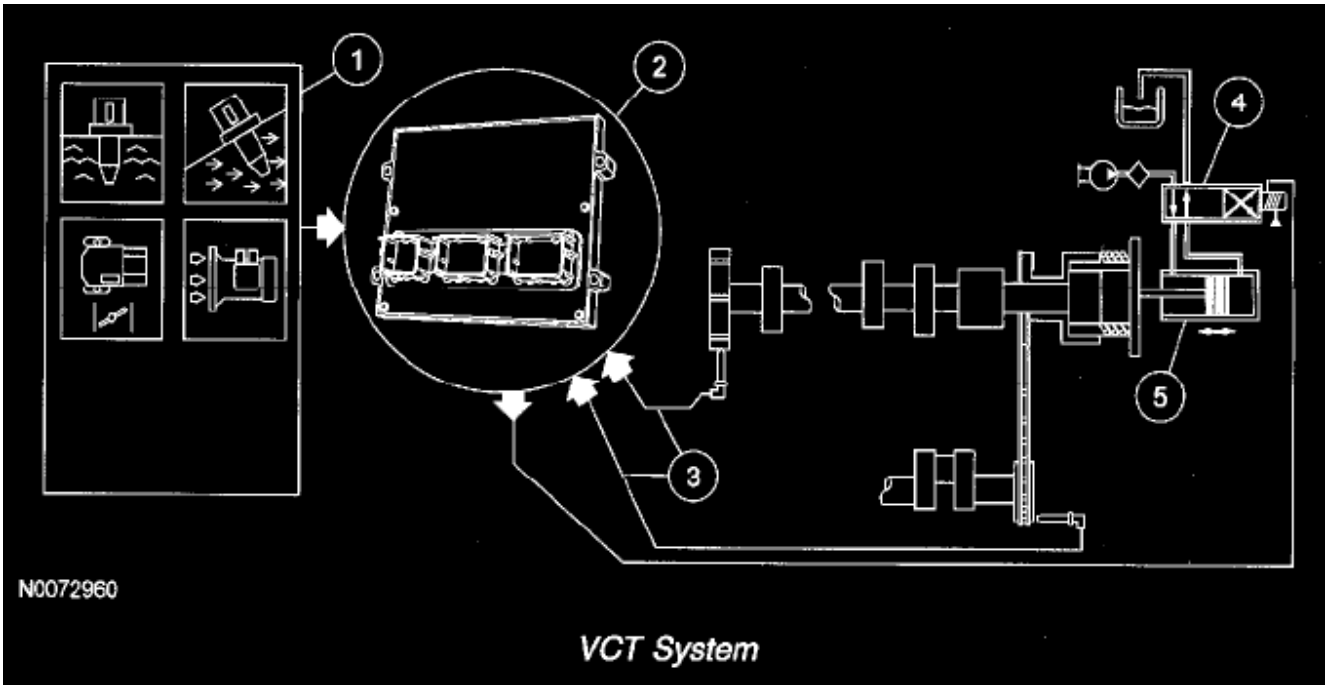
2. NOTE: Identify and mark the location of each rocker arm. Each rocker arm must be installed in the original location.

Remove the bolts and the rocker arms and fulcrums. ^

To install, tighten to 32 Nm (24 lb-ft).

3. To install, reverse the removal procedure.

^ Lubricate the rocker arms and fulcrums with clean engine oil.



VCT System

Variable Valve Timing Actuator: Description and Operation

VARIABLE CAMSHAFT TIMING (VCT) SYSTEM

Overview

The VCT enables rotation of the camshaft(s) relative to the crankshaft rotation as a function of engine operating conditions. There are 4 types of VCT systems.

- Exhaust phase shifting (EPS) system - the exhaust cam is the active cam being retarded.

- Intake phase shifting (IPS) system - the intake cam is the active cam being advanced.

- Dual equal phase shifting (DEPS) system - both intake and exhaust cams are phase shifted and equally advanced or retarded.

- Dual independent phase shifting (DIPS) system - where both the intake and exhaust cams are shifted independently.

All systems have 4 operational modes: idle, part throttle, wide open throttle (WOT), and default mode. At idle and low engine speeds with closed throttle, the powertrain control module (PCM) determines the phase angle based on air flow, engine oil temperature and engine coolant temperature. At part and wide open throttle the PCM determines the phase angle based on engine RPM, load, and throttle position. VCT systems provide reduced emissions and enhanced engine power, fuel economy and idle quality. IPS systems also have the added benefit of improved torque. In addition, some VCT system applications can eliminate the need for an external exhaust gas recirculation (EGR) system. The elimination of the EGR system is accomplished by controlling the overlap time between the intake valve opening and exhaust valve closing. Currently, both the IPS and DEPS systems are used.

Variable Camshaft Timing (VCT) System

VCT System

The VCT system consists of an electric hydraulic positioning control solenoid, a camshaft position (CMP) sensor, and a trigger wheel. The CMP trigger wheel has a number of equally spaced teeth equal to the number (n) of cylinders on a bank plus one extra tooth (n+1). Four cylinder and V8 engines use a CMP 4+1 tooth trigger wheel. V6 engines use a CMP 3+1 tooth trigger wheel. The extra tooth placed between the equally spaced teeth represents the CMP signal for that bank. A crankshaft position (CKP) sensor provides the PCM with crankshaft positioning information in 10 degree increments.

1. The PCM receives input signals from the intake air temperature (IAT) sensor, engine coolant temperature (ECT) sensor, engine oil temperature

(EOT) sensor, CMP, throttle position (TP) sensor, mass air flow (MAF) sensor, and CKP to determine the operating conditions of the engine. At idle and low engine speeds with closed throttle, the PCM controls the camshaft position based on ECT, EOT, IAT, and MAF. During part and wide open throttle, the camshaft position is determined by engine RPM, load and throttle position. The VCT system does not operate until the engine is at normal operating temperature.

2. The VCT system is enabled by the PCM when the correct conditions are met. 3. The CKP signal is used as a reference for CMP positioning. 4. The VCT solenoid valve is an integral part of the VCT system. The solenoid valve controls the flow of engine oil in the VCT actuator assembly.

As the PCM controls the duty cycle of the solenoid valve, oil pressure/flow advances or retards the cam timing. Duty cycles near 0% or 100% represent rapid movement of the camshaft. Retaining a fixed camshaft position is accomplished by dithering (oscillating) the solenoid valve duty cycle.

The PCM calculates and determines the desired camshaft position. It continually updates the VCT solenoid duty cycle until the desired position is achieved. A difference between the desired and actual camshaft position represents a position error in the PCM VCT control loop. The PCM

disables the VCT and places the camshaft in a default position if a concern is detected. A related DTC is also set when the concern is detected.

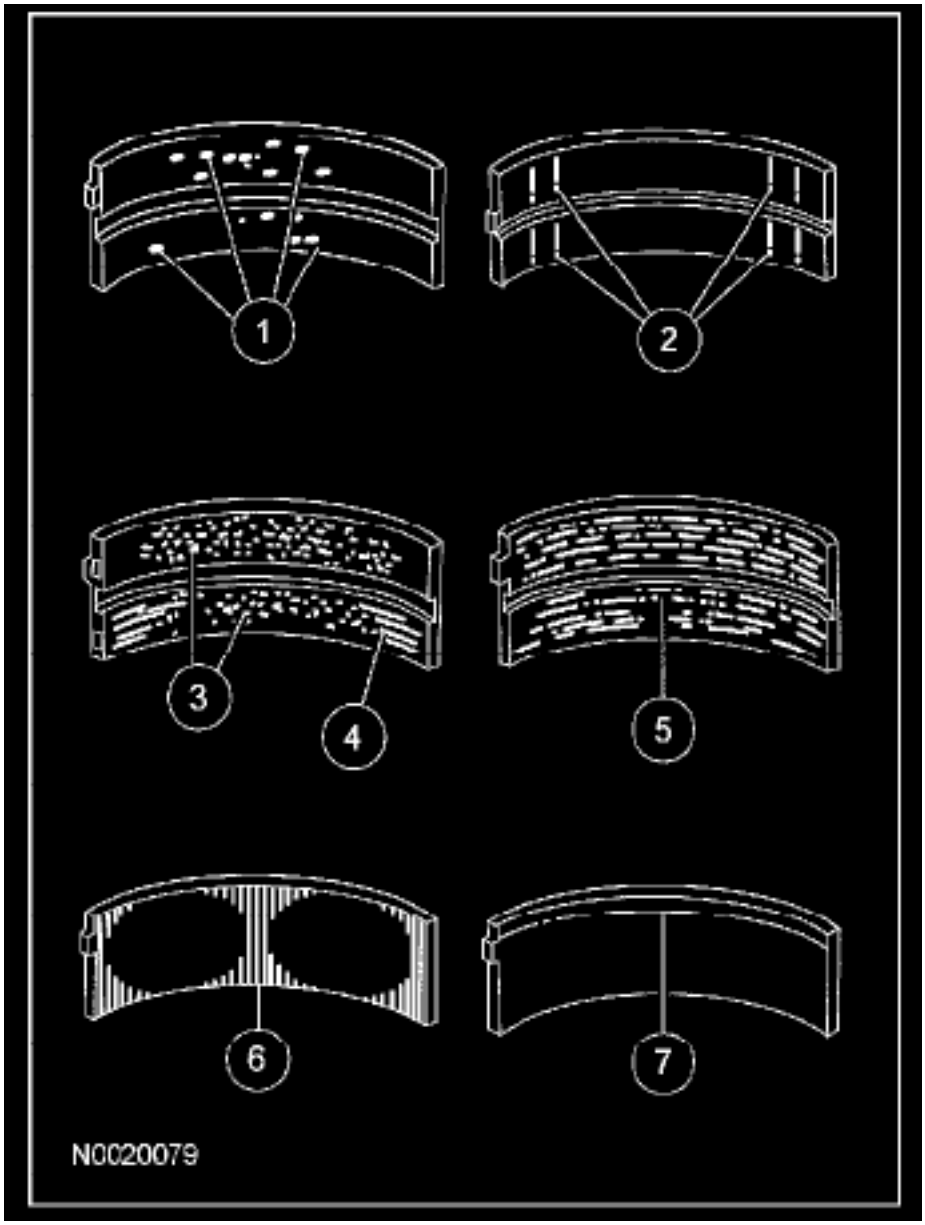
5. When the VCT solenoid is energized, engine oil is allowed to flow to the VCT actuator assembly which advances or retards the camshaft timing.

One half of the VCT actuator is coupled to the camshaft and the other half is connected to the timing chain. Oil chambers between the 2 halves couple the camshaft to the timing chain. When the flow of oil is shifted from one side of the chamber to the other, the differential change in oil pressure forces the camshaft to rotate in either an advance or retard position depending on the oil flow.

Connecting Rod Bearing: Specifications

Connecting Rod Bearings Clearance to crankshaft

Desired .... 0.025-0.035 mm (0.001-0.0014 in) Allowable .... 0.020-0.066 mm (0.00086-0.0027 in) Bearing wall thickness (Std) ..... 1.557-1.570 mm (0.0612-0.0618 in)



Connecting Rod Bearing: Testing and Inspection

Bearing Inspection

1. Inspect bearings for the following defects:

1 Cratering - fatigue failure

2 Spot polishing - incorrect seating

3 Imbedded dirty engine oil

4 Scratching - dirty engine oil

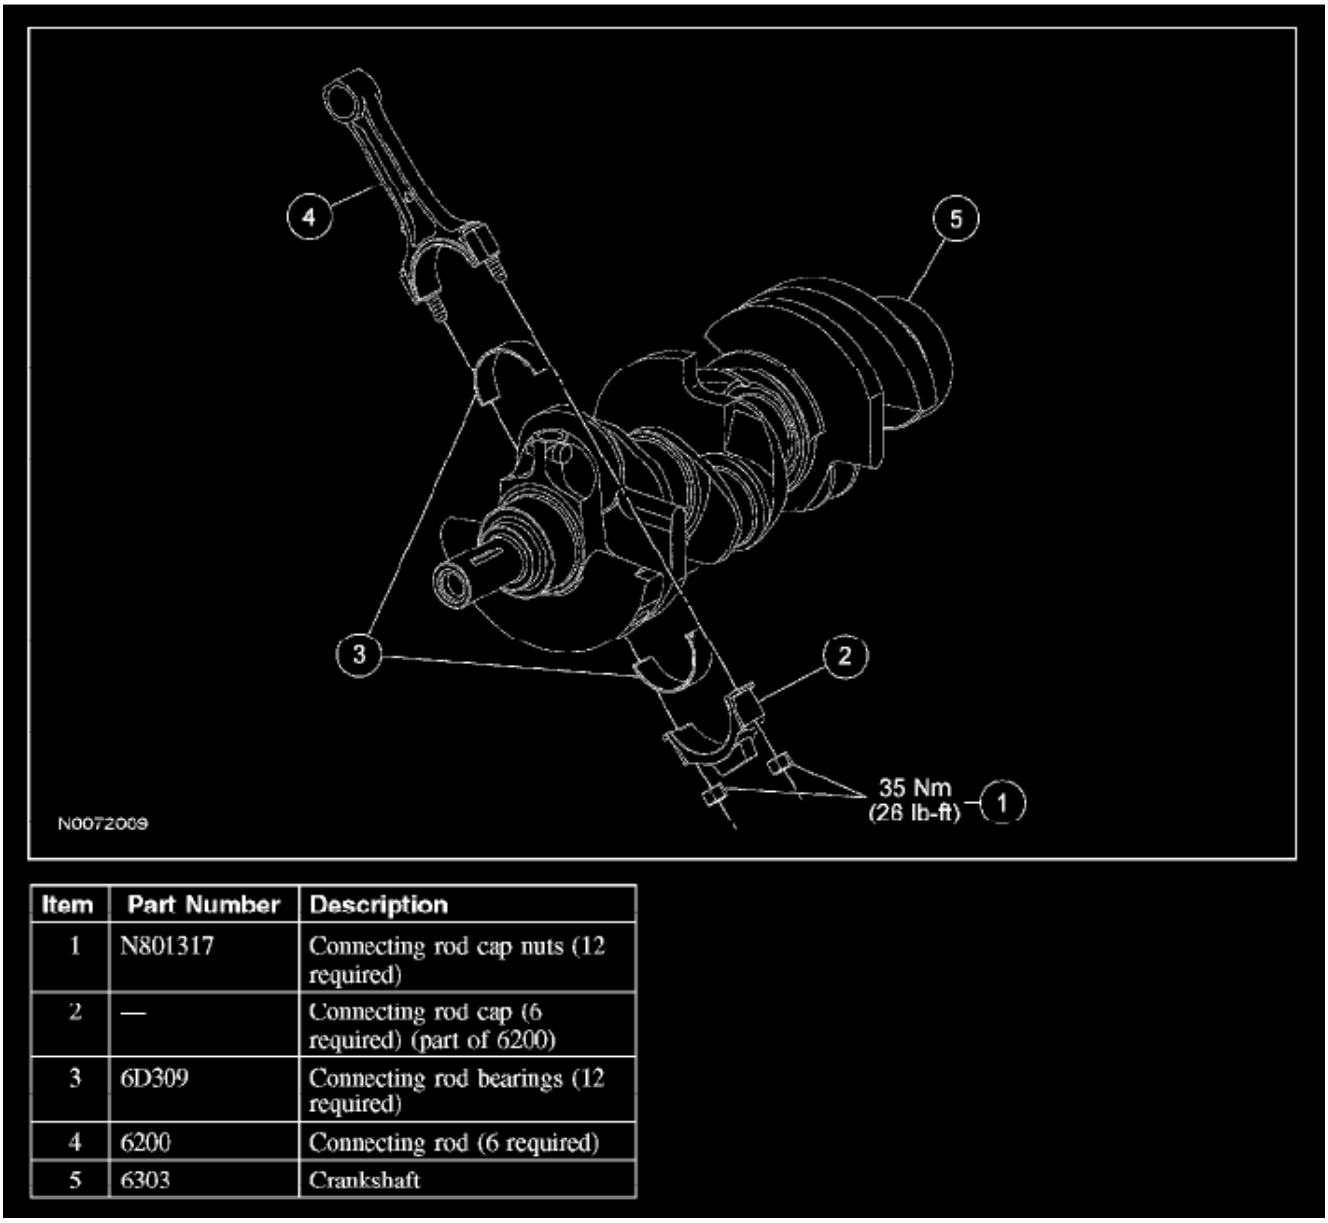
5 Base exposed - poor lubrication

6 Both edges worn - journal damaged

7 One edge worn - journal tapered or bearing not seated

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A



Item	Part Number	Description

4	6200	Connecting rod (6 required)
5	6303	Crankshaft

Connecting Rod Bearing: Service and Repair

Connecting Rod Bearings

Removal

1. Remove the oil pan. 2. Remove the 7 nuts and the oil pan baffle.

3. CAUTION: The connecting rod bearing caps and the connecting rods are a matched set. Installing the incorrect connecting rod bearing

cap on a connecting rod may result in engine damage.

Remove the 2 nuts and the connecting rod bearing cap.

4. Lift the piston slightly and remove the connecting rod bearings.

Installation

1. The connecting rod bearings are precision fit. Refer to Engine for checking clearances or bearing selection.

2. CAUTION: The connecting rod bearings must be lubricated with clean engine oil prior to installation or the connecting rod bearing may

be damaged.

Install the connecting rod bearings.

3. CAUTION: Bearing caps are directional and must be installed exactly as they were removed or the connecting rods, the connecting rod

bearings or the crankshaft may be damaged.

Install the connecting rod bearing cap and 2 nuts. ^

Tighten to 35 Nm (26 lb-ft).

4. Repeat the procedure until all the connecting rod bearings are installed. 5. Install the oil pan baffle and the 7 nuts.

^ Tighten to 32 Nm (24 lb-ft).

6. Install the oil pan.

Connecting Rod: Specifications

Connecting Rod: Service and Repair

Connecting Rod Cleaning

CAUTION: Do not use a caustic cleaning solution or damage to connecting rods can occur.

1. NOTE: The connecting rod large end is a matched set. The connecting rod cap must be installed on the original connecting rod in the original

position. Do not reverse the cap. Parts are not interchangeable.

Mark and separate the parts and clean with solvent. Clean the oil passages.

Connecting Rod Large End Bore

NOTE: Refer to Specifications.

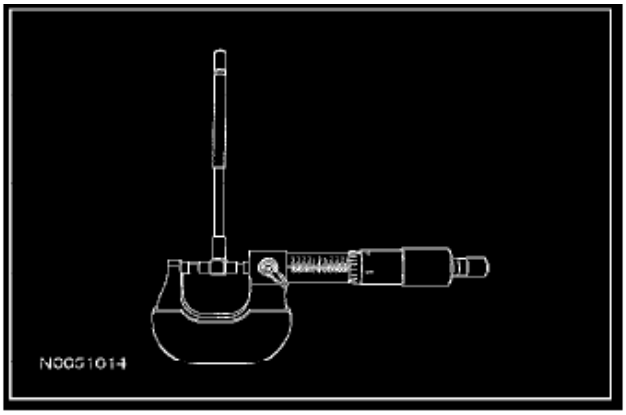
1. Tighten the bolts to specification, then measure the bore in 2 directions. The difference is the connecting rod bore out-of-round. Verify the

out-of-round is within specification.

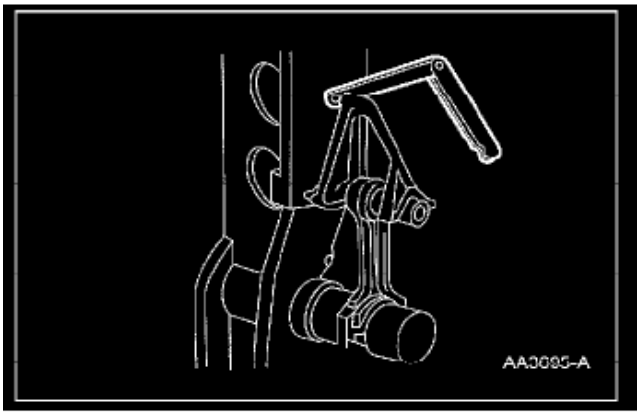
Connecting Rod Bushing Diameter

NOTE: Refer to Specifications.

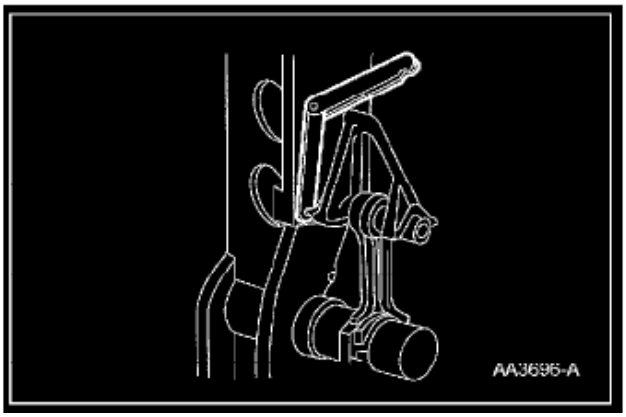
1. Use a telescoping gauge to determine the inner diameter of the connecting rod bushing, if equipped.



N0051614



AA3695-A



AA3696-A

2. Measure the telescoping gauge with a micrometer. Verify the diameter is within specification.

Connecting Rod Bend

NOTE: Refer to Specifications.

1. Measure the connecting rod bend on a suitable alignment fixture. Follow the instructions of the fixture manufacturer. Verify the bend measurement

is within specification.

Connecting Rod Twist

NOTE: Refer to Specifications.

1. Measure the connecting rod twist on a suitable alignment fixture. Follow the instructions of the fixture manufacturer. Verify the measurement is

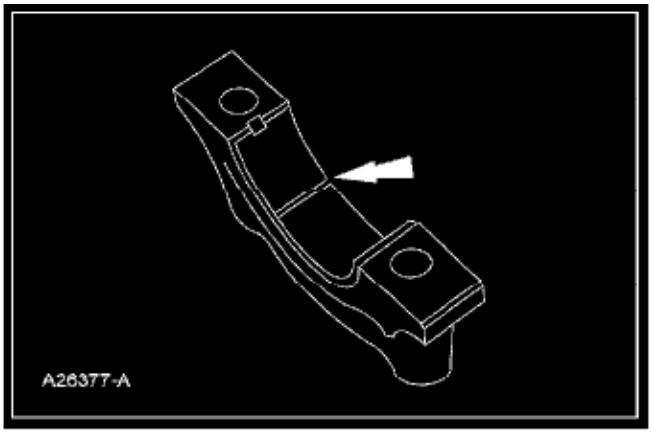
within specification.

Connecting Rod Bearing Journal-to-Bearing Clearance

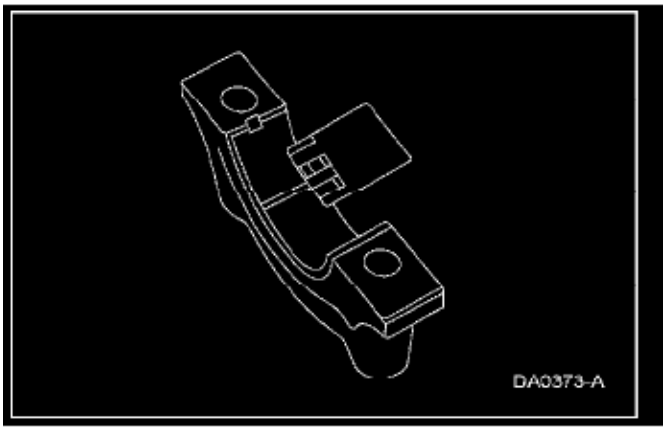
NOTE: Refer to Specifications.

NOTE: The crankshaft connecting rod journals must be within specifications to check the connecting rod bearing journal clearance.

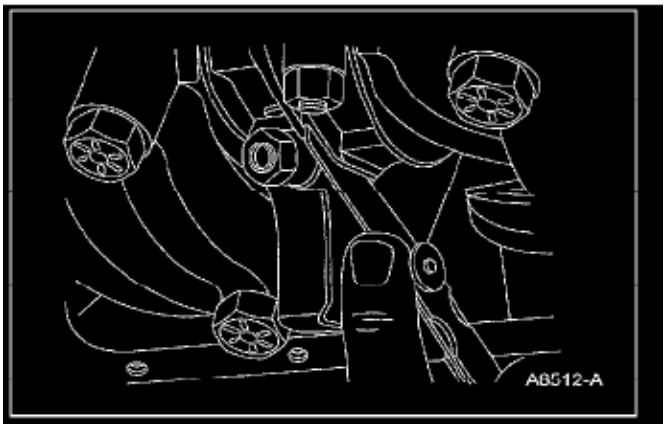
1. Remove the connecting rod bearing cap.



A26377-A



DA0373-A



AB512-A

2. Position a piece of Plastigage(R) across the bearing surface.

3. NOTE: Do not turn the crankshaft during this step.

Install and tighten to specifications, then remove the connecting rod bearing cap.

4. Measure the Plastigage(R) to get the connecting rod bearing journal clearance. The Plastigage(R) should be smooth and flat. A changing width

indicates a tapered or damaged connecting rod or connecting rod bearing.

Connecting Rod to Crankshaft Side Clearance

NOTE: Refer to Specifications.

1. Measure the clearance between the connecting rod and the crankshaft. Verify the measurement is within specification.

Connecting Rod-to-Piston Clearance

NOTE: Refer to Specifications.

1. Measure the clearance between the connecting rod and the piston. Verify the measurement is within specification.

Crankshaft: Service and Repair

Crankshaft Main Bearing Journal Diameter

NOTE: Refer to Specifications.

1. Measure each of the crankshaft main bearing journal diameters in at least 2 directions.

Crankshaft Main Bearing Journal Taper and Out-of-Round

NOTE: Refer to Specifications.

1. Measure each of the crankshaft main bearing journal diameters in at least 2 directions at each end of the main bearing journal.

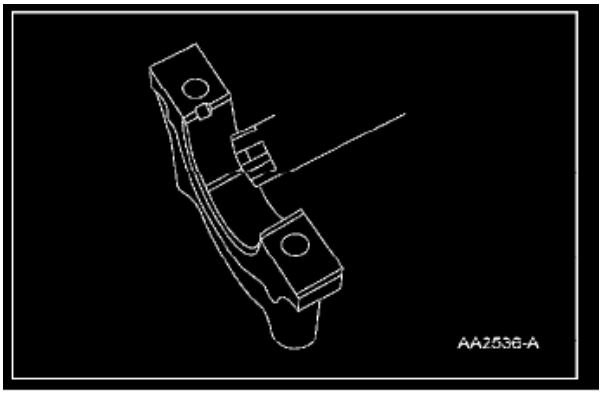
Crankshaft Main Bearing Journal-to-Bearing Clearance

NOTE: Refer to Specifications.

NOTE: Crankshaft main bearing journals must be within specifications before checking journal clearance.

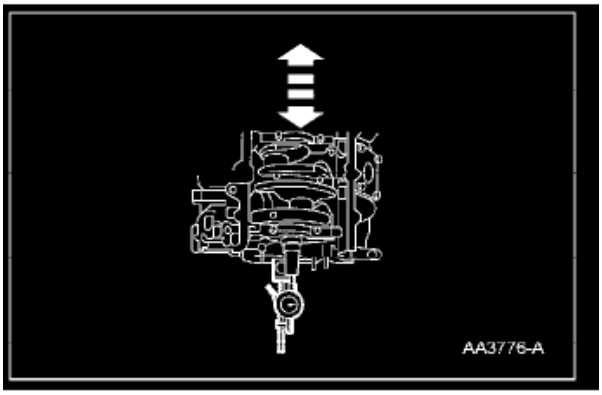
1. Remove the crankshaft main bearing caps and crankshaft main bearing. 2. Lay a piece of Plastigage(R) across the face of each crankshaft main bearing surface.

3. NOTE: Do not turn the crankshaft while carrying out this procedure.



Special Tool(s)

ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent



Special Tool(s)

ST1214-A	Dial Indicator with Bracketry 100-002 (TOOL-4201-C) or equivalent

Install and remove the crankshaft main bearing cap.

4. Verify the crankshaft journal clearance.

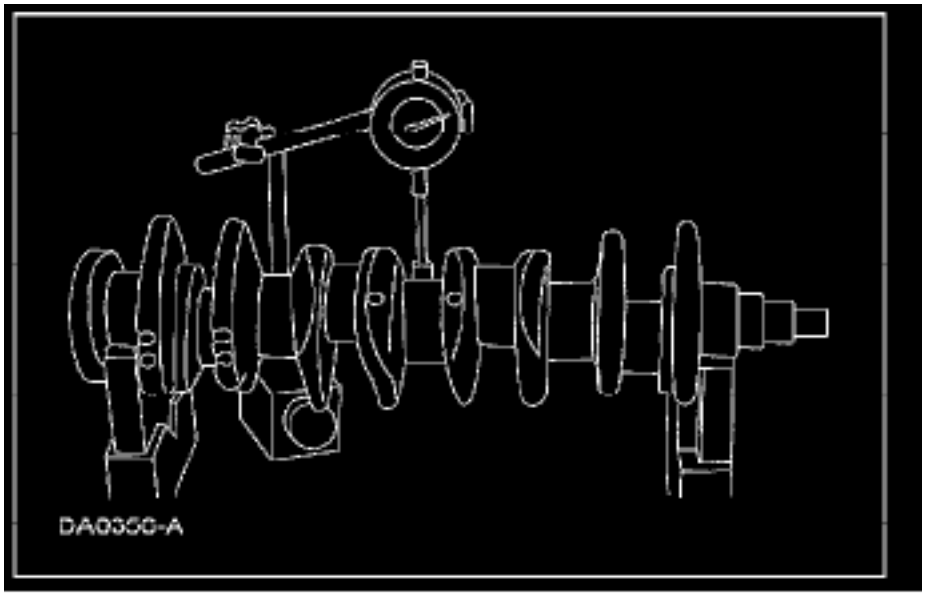
Crankshaft End Play

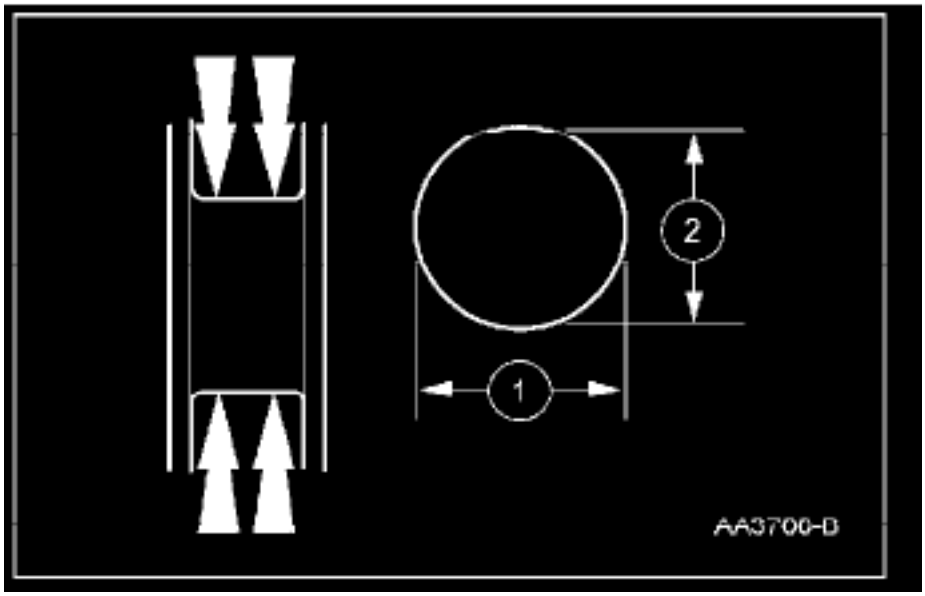
NOTE: Refer to Specifications.

1. Using the Dial Indicator Gauge, measure the crankshaft end play. 2. Position the crankshaft to the rear of the cylinder block. 3. Zero the indicator. 4. Move the crankshaft to the front of the cylinder block. Note and record the crankshaft end play.

Crankshaft Runout

NOTE: Refer to Specifications.





1. NOTE: Crankshaft main bearing journals must be within specifications before checking runout.

Use the Dial Indicator Gauge to measure the crankshaft runout. ^

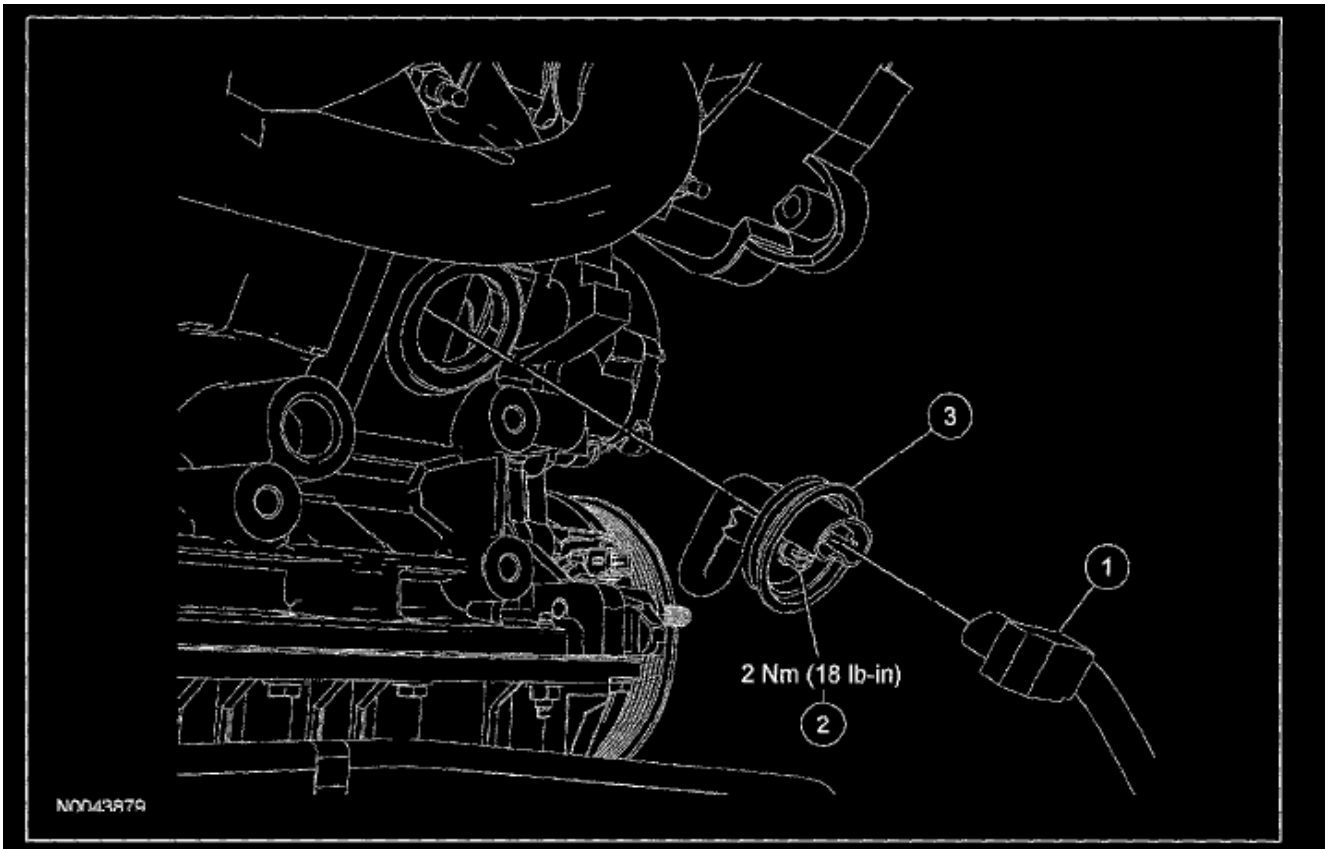
Rotate the crankshaft and subtract the lowest dial indicator reading from the highest dial indicator reading to figure the crankshaft runout.

Connecting Rod Bearing Journal Taper and Out-of-Round

NOTE: Refer to Specifications.

1. Measure the crankshaft connecting rod journal diameters in 2 directions perpendicular to one another at each end of the connecting rod journal.

The difference in the measurements from one end to the other is the taper. Verify measurement is within the wear limit.



Item	Part Number	Description
1	14A199	Block heater electrical connector (part of 6B018)
2	—	Block heater screw (part of 6A051)
3	6A051	Block heater

Engine Block Heater: Service and Repair

Block Heater

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. 2. Drain the cooling system. 3. Disconnect the block heater electrical connector.

4. NOTE: Do not loosen the screw more than necessary for removal.

Loosen the block heater screw and twist and slide the block heater to release the retainer clip. Discard the retainer clip and remove the block heater.

5. To install, reverse the removal procedure.

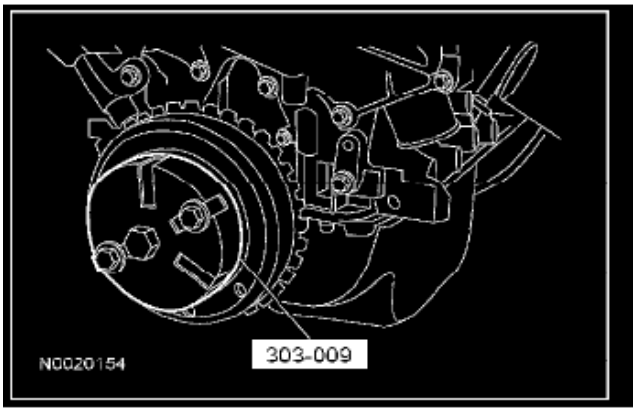
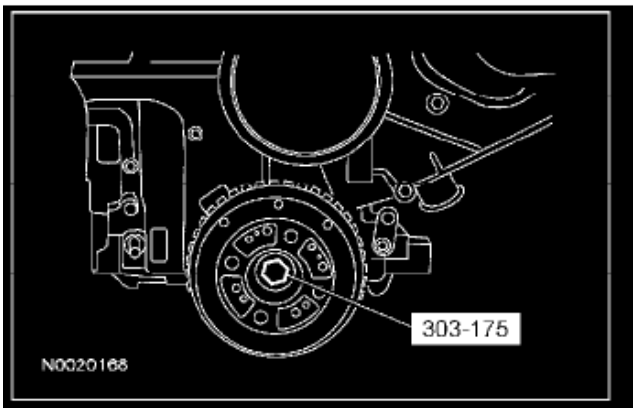
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4





Removal

1. Remove the air cleaner outlet tube. 2. Remove the fan blade and the fan shroud. 3. Remove the accessory drive belt. 4. Remove the 4 bolts and the crankshaft pulley. 5. Remove the crankshaft bolt and the washer. 6. Using the special tool, remove the crankshaft damper.

Installation

1. Using the special tool, install the crankshaft damper.

^ Coat the sealing surfaces of the crankshaft damper with clean engine oil.

^ Coat the crankshaft damper keyway with silicone gasket and sealant.

^ Install the crankshaft damper.

2. Install the crankshaft bolt and the washer.

^ Tighten to 145 Nm (107 lb-ft).

3. Install the crankshaft pulley and 4 bolts.

^ Tighten to 63 Nm (46 lb-ft).

4. Install the drive belt. 5. Install the fan blade and the fan shroud. 6. Install the air cleaner outlet tube.

Piston: Specifications

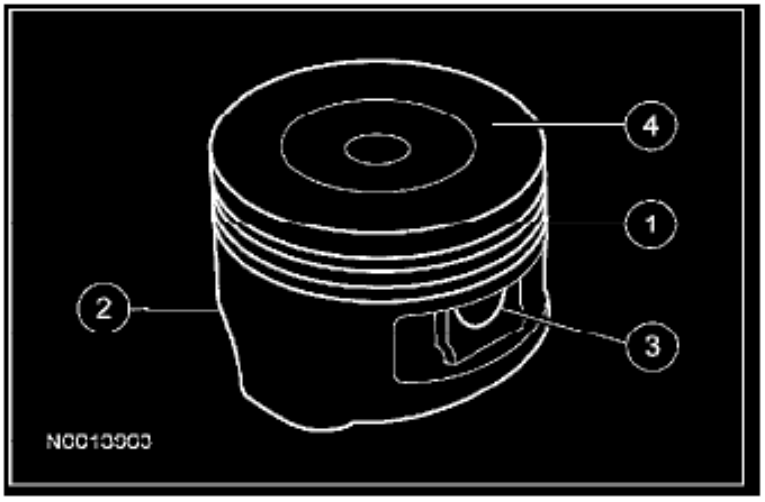
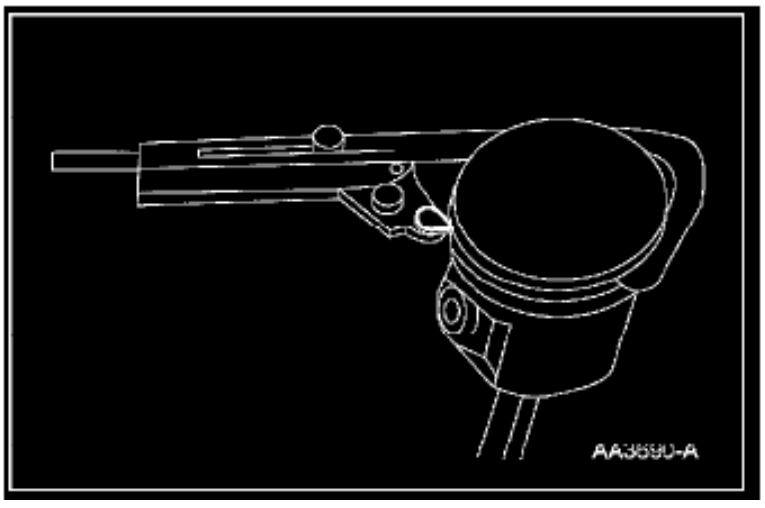
a When replacing pistons, measure the cylinder bore, and install the indicated service piston.

Special Tool(s)

ST1279-A	Scraper, Piston Ring Groove 303-D033 (D81L-6002-D) or equivalent





Piston: Procedures

Piston Inspection

CAUTION: Do not use a caustic cleaning solution or a wire brush to clean the pistons or damage can occur.

1. Clean and inspect the (1) ring lands, (2) skirts, (3) pin bosses and the (4) tops of the pistons. If wear marks, scores or glazing is found on the piston

skirt, check for a bent or twisted connecting rod.

2. Use the Piston Ring Groove Scraper to clean the piston ring grooves.

^ Make sure the oil ring holes are clean.

Piston Pin Bore Diameter

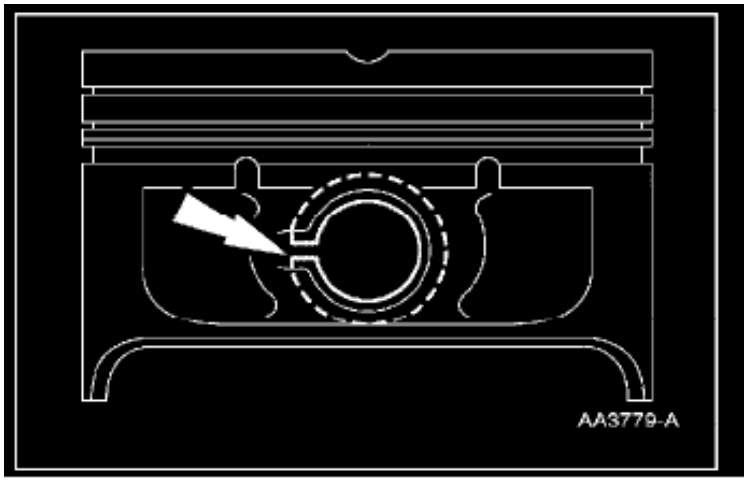
NOTE: Refer to Specifications.

1. WARNING: Since the retainer ring has a tendency to spring out, cover the end of the pin bore with a hand or shop rag when removing

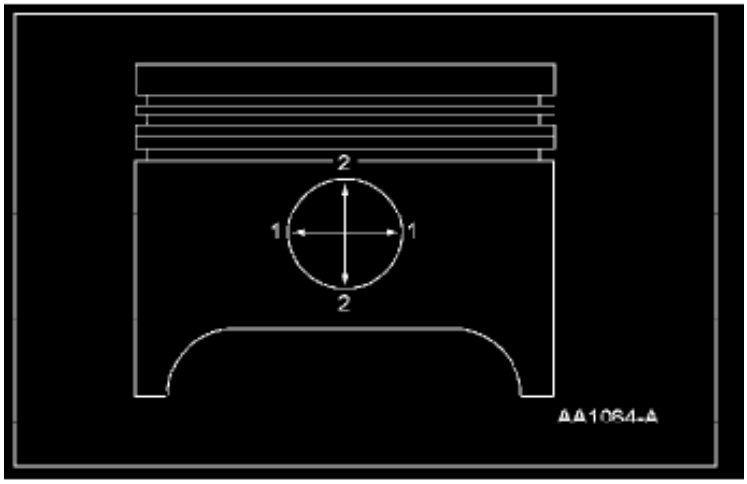
the ring. Wear eye protection. Failure to follow these instructions may result in serious personal injury.

NOTE: Piston and piston pins are a matched set and should not be interchanged.

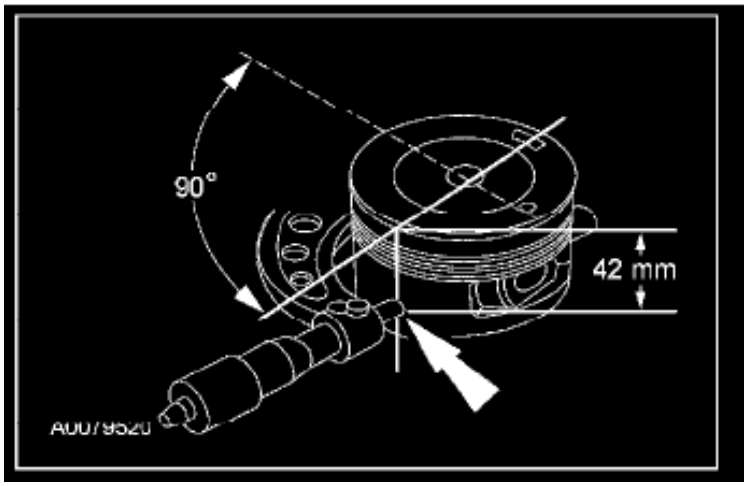
Measure the piston pin bore diameter in 2 directions on each side. Verify the diameter is within specification.



AA3779-A



2
1
1
2
AA1084-A



90°
42 mm
A00/9520

Piston Diameter

NOTE: Refer to Specifications.

1. Measure the piston diameter 90 degrees from the piston pin and 42 mm (1.65 inch) down from the top of the piston at the point indicated.

Piston To Cylinder Bore Clearance

NOTE: Refer to Specifications.

1. Subtract the piston diameter from the cylinder bore diameter to find the piston-to-cylinder bore clearance.

Piston Ring End Gap

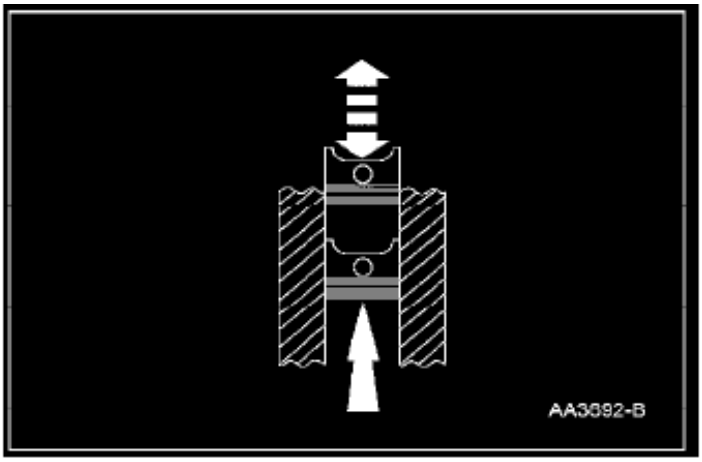
CAUTION: Use care when fitting piston rings to avoid possible damage to the piston ring or the cylinder bore.

NOTE: Piston rings should not be transferred from one piston to another.

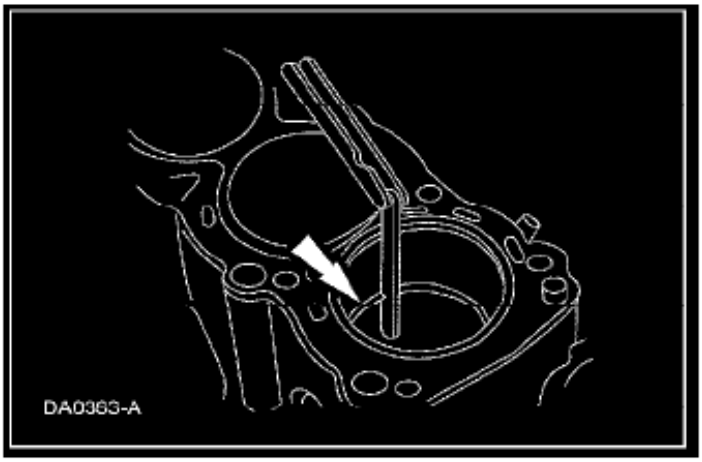
NOTE: Refer to Specifications.

NOTE: The cylinder bore must be within specification for taper and out-of-round.

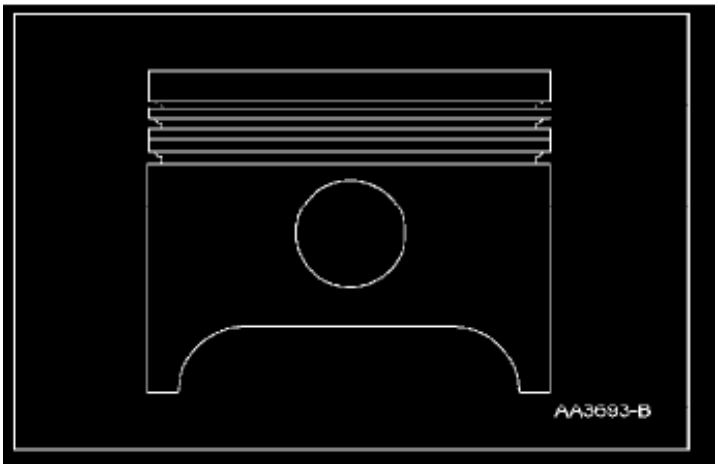
1. Use a piston without rings to push a piston ring in a cylinder to the bottom of ring travel.



AA3692-B



DA0363-A



AA3693-B

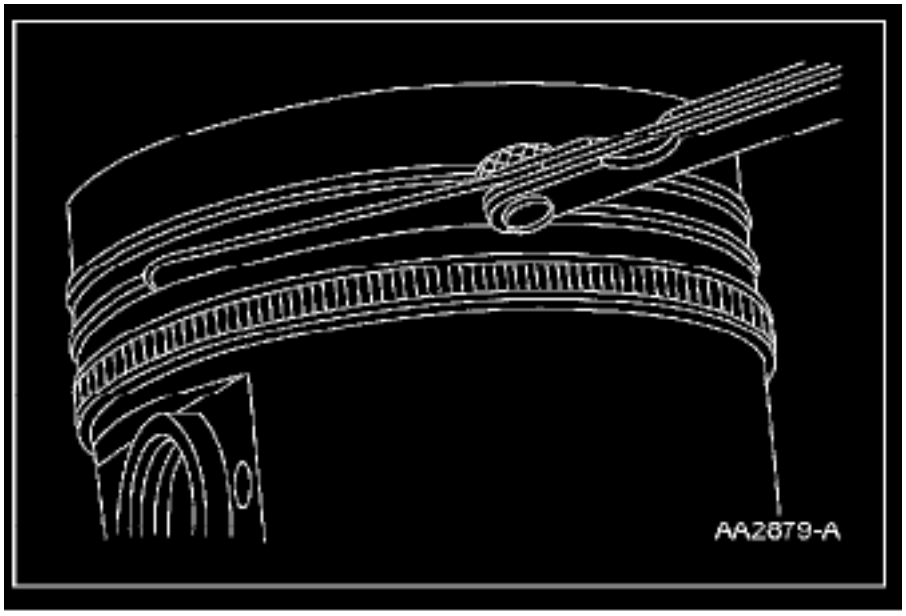
2. Use a feeler gauge to measure the top piston ring end gap and the second piston ring end gap.

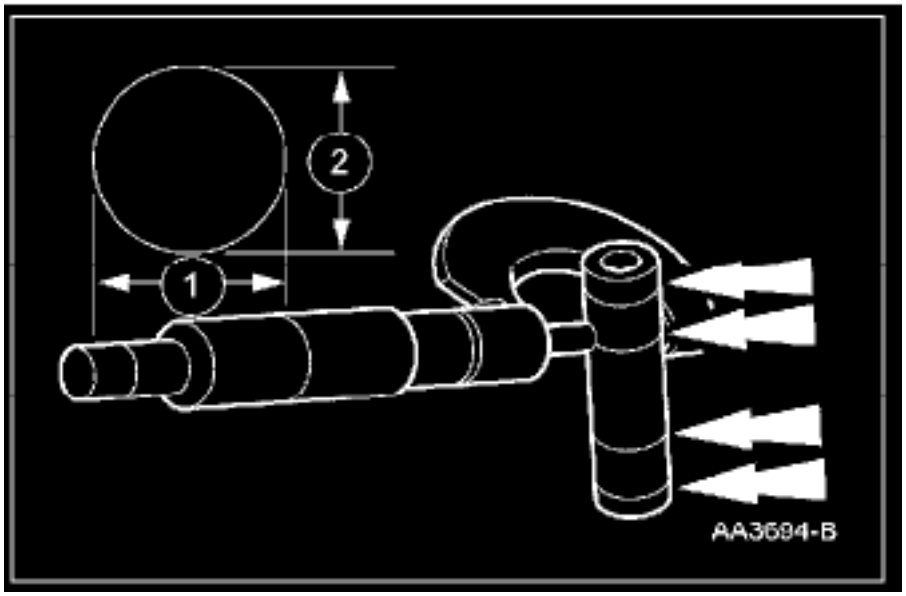
Piston Ring-to-Groove Clearance

NOTE: Refer to Specifications.

1. Inspect the piston for ring land damage or accelerated wear.

2. Measure the piston ring-to-groove clearance.





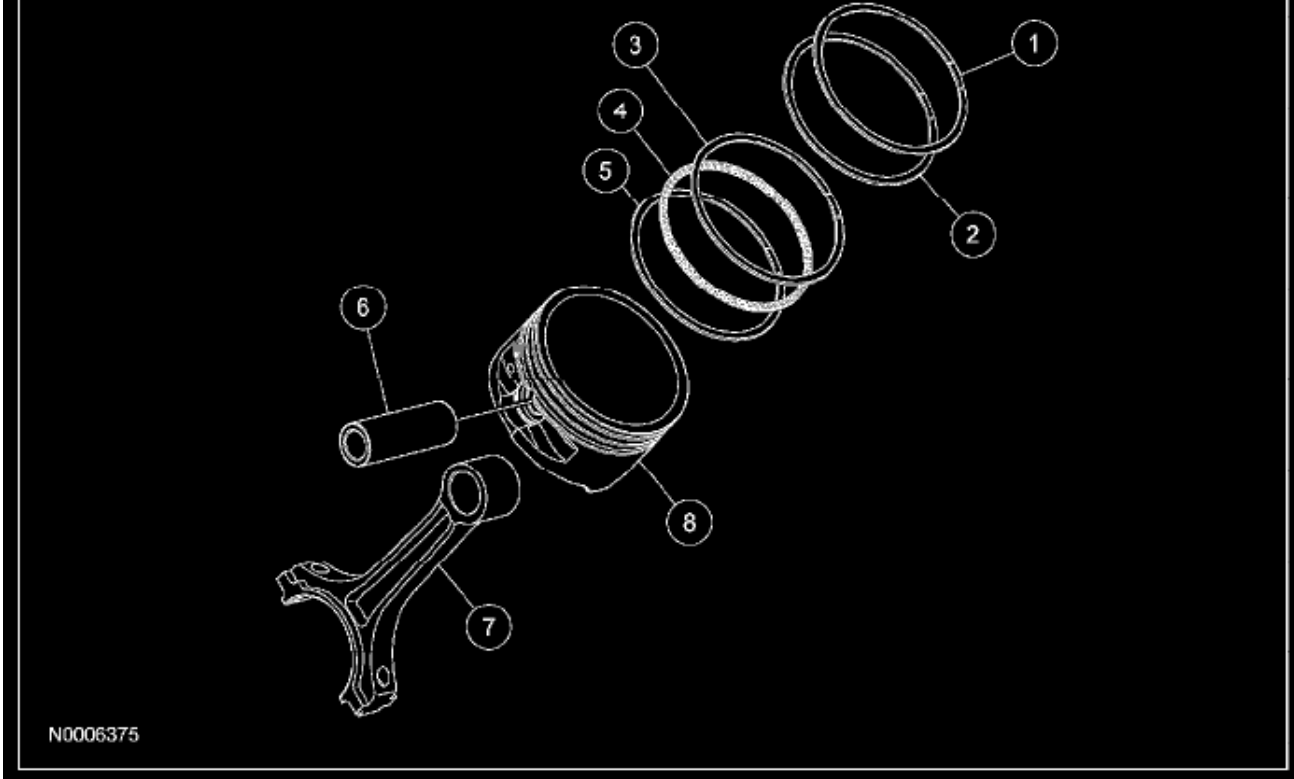
Piston Pin Diameter

NOTE: Refer to Specifications.

1. Measure the piston pin diameter in 2 directions at the points shown. Verify the diameter is within specification.

Special Tool(s)

ST1336-A	Service Set, Piston Pin 303-S024 (T68P-6135-A)



Item	Part Number	Description
1	6150	Piston compression upper ring

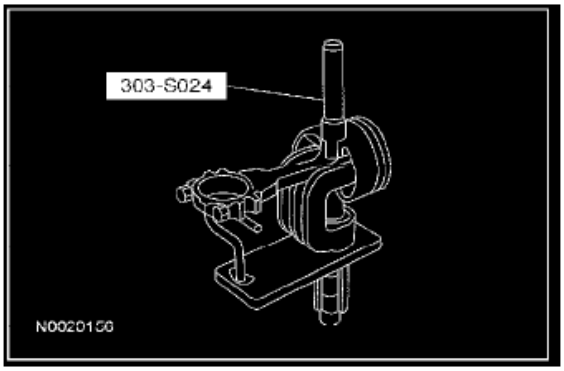
4	6161	Piston oil control spacer
5	6159	Piston control lower segment ring
6	6135	Piston pin
7	6200	Connecting rod
8	6110	Piston

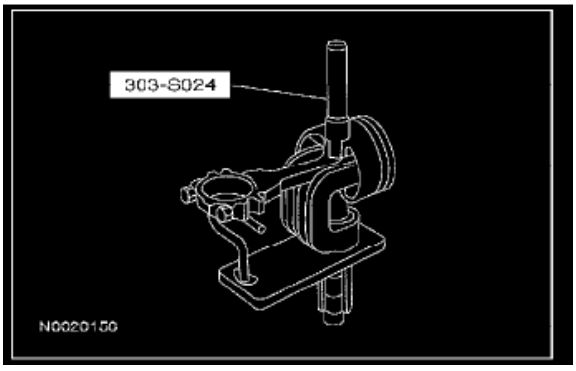
Piston: Overhaul

Piston

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A





Disassembly

1. CAUTION: Use a suitable ring expander to remove piston rings to prevent damage.

Remove the piston rings one at a time, starting with the top compression ring and finishing with the lower oil control ring. ^

Discard the piston rings.

2. NOTE: Take note of piston connecting rod assembly and index-mark the connecting rod and the piston to make sure of correct orientation during

reassembly.

Using the special tool, press the piston pin out of the piston connecting rod assembly.

3. Remove the connecting rod from the piston. 4. Clean and inspect the connecting rod and the piston.

Assembly

1. Lubricate the piston pin and piston pin bore.

^ Use clean engine oil.

2. NOTE: During assembly, the small end of the connecting rod must be heated to 232°-316° C (450°-600° F).

Using the special tool, press the piston pin into the piston and the connecting rod.

3. NOTE: Lubricate the piston and the piston rings with clean engine oil.

NOTE: Use a suitable ring expander to install the piston rings. Make sure ring end gaps are equally spaced around the circumference of the piston

for all piston rings.

Install the piston rings.

4. Check piston ring end gap and ring-to-groove side clearance.

Piston Ring: Specifications

Piston Ring gap Compression (top) (in gauge) ..... 0.25-0.50 mm (0.01-0.02 in) Compression (bottom) (in Gauge) ..... 0.25-0.50 mm (0.01-0.02 in) Oil ring (steel rail) (in Gauge) ..... 0.25-1.25 mm (0.010-0.049 in)

Side clearance 1st ring ..... 0.040-0.095 mm (0.0016-0.0037 in) 2nd ring ..... 0.040-0.095 mm (0.0016-0.0037 in)

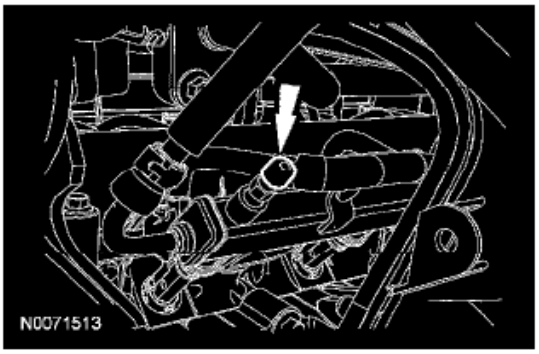
Valve Clearance: Specifications

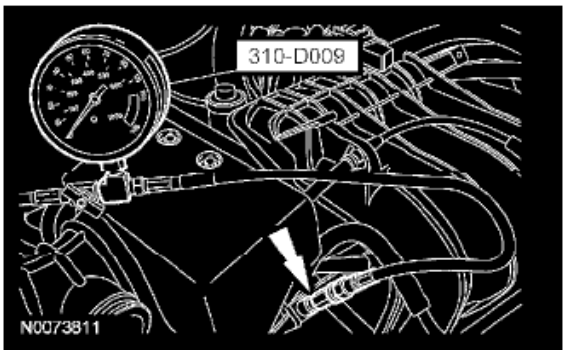
Valve Clearance

This engine is equipped with hydraulic valve lifters. No adjustment is required.

Special Tool(s)

ST3038-A	Fuel Pressure Test Kit 310-D009 (D95L-7211A)





Fuel Pressure Release: Service and Repair

FUEL SYSTEM PRESSURE RELEASE

Special Tool(s)

Special Tool(s)

WARNING:

- Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

- Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

- Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

- When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

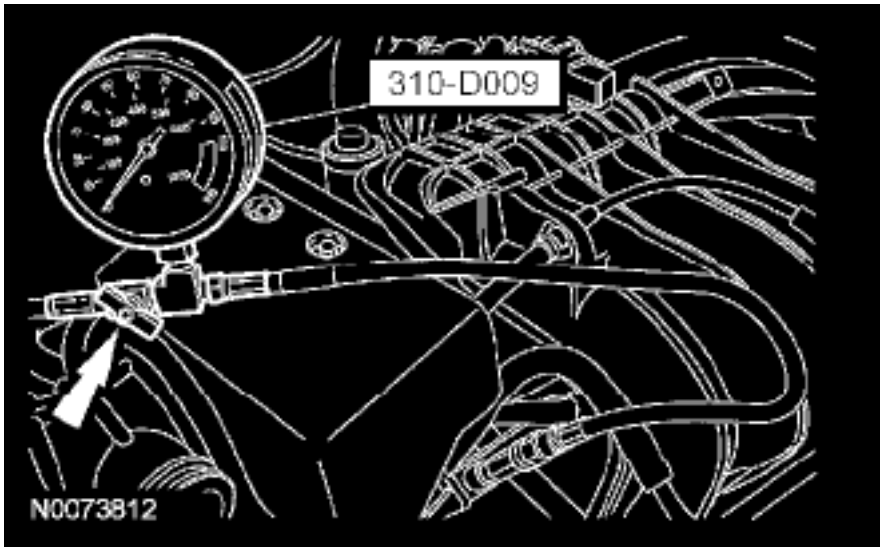
1. Disconnect the battery ground cable.

2. NOTE: 2.3L shown, 3.0L and 4.0L similar.

Remove the cap from the fuel pressure relief valve located on the fuel rail.

3. NOTE: 2.3L shown, 3.0L and 4.0L similar.

Install the special tool onto the fuel pressure relief valve.



4. NOTE:

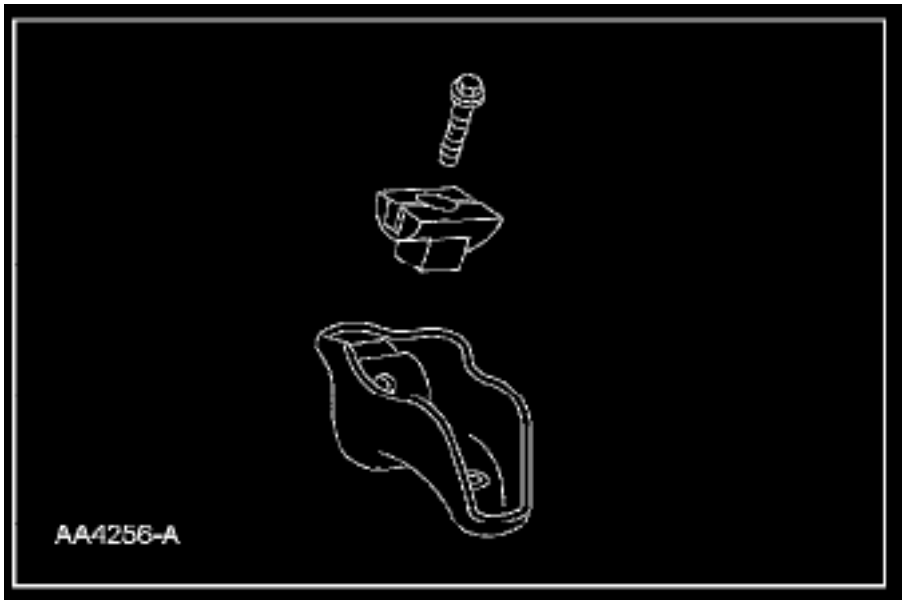
- 2.3L shown, 3.0L and 4.0L similar.

- Open the drain valve slowly to relieve the system pressure. This may drain fuel from the system. Place fuel in a suitable container.

Open the drain valve on the special tool and relieve the fuel system pressure.

5. NOTE: It may take more than one key cycle to pressurize the fuel system.

Upon completion of the fuel system repairs, cycle the ignition key and wait 3 seconds to pressurize the fuel system. Check for leaks before starting the engine.



Rocker Arm Assembly: Testing and Inspection Rocker Arm Cleaning and Inspection

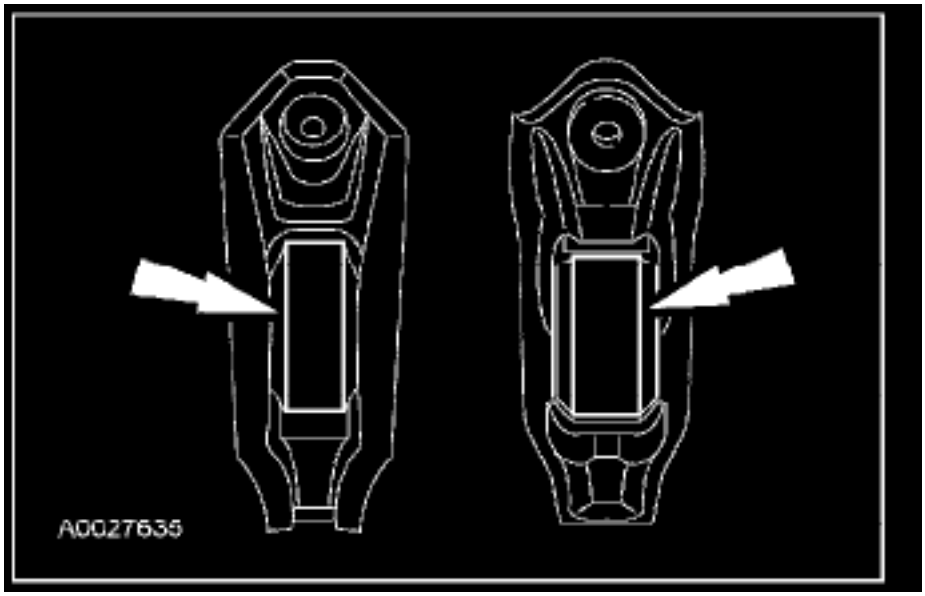
Rocker Arm Cleaning and Inspection

1. Clean all parts thoroughly. Make sure all oil passages are open. 2. Make sure the oil passage in the push rod/valve tappet end of the rocker arm is open.

CAUTION: Do not attempt to true surfaces by grinding. Check the rocker arm pad, side rails and seat for excessive wear, cracks, nicks or burrs. Check the rocker arm seat bolt for stripped or broken threads. Install new components as necessary or engine damage may occur.

3. Inspect the rocker arm push rod bore for nicks, scratches, scores or scuffs.

4. Inspect the pad at the valve end of the rocker arm for indications of grooving, scuffing or abnormal wear.



Rocker Arm Assembly: Testing and Inspection Roller Follower Inspection

Roller Follower Inspection

1. Inspect the roller follower for flat spots or scoring. If any damage is found, inspect the camshaft lobes and hydraulic lash adjuster for damage.

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Rocker Arm Assembly: Service and Repair

Rocker Arm

Removal and Installation

CAUTION: During engine repair procedures, cleanliness is extremely important. Any foreign material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.

1. Remove the valve cover.

2. NOTE: Identify and mark the location of each rocker arm. Each rocker arm must be installed in the original location.

Remove the bolts and the rocker arms and fulcrums. ^

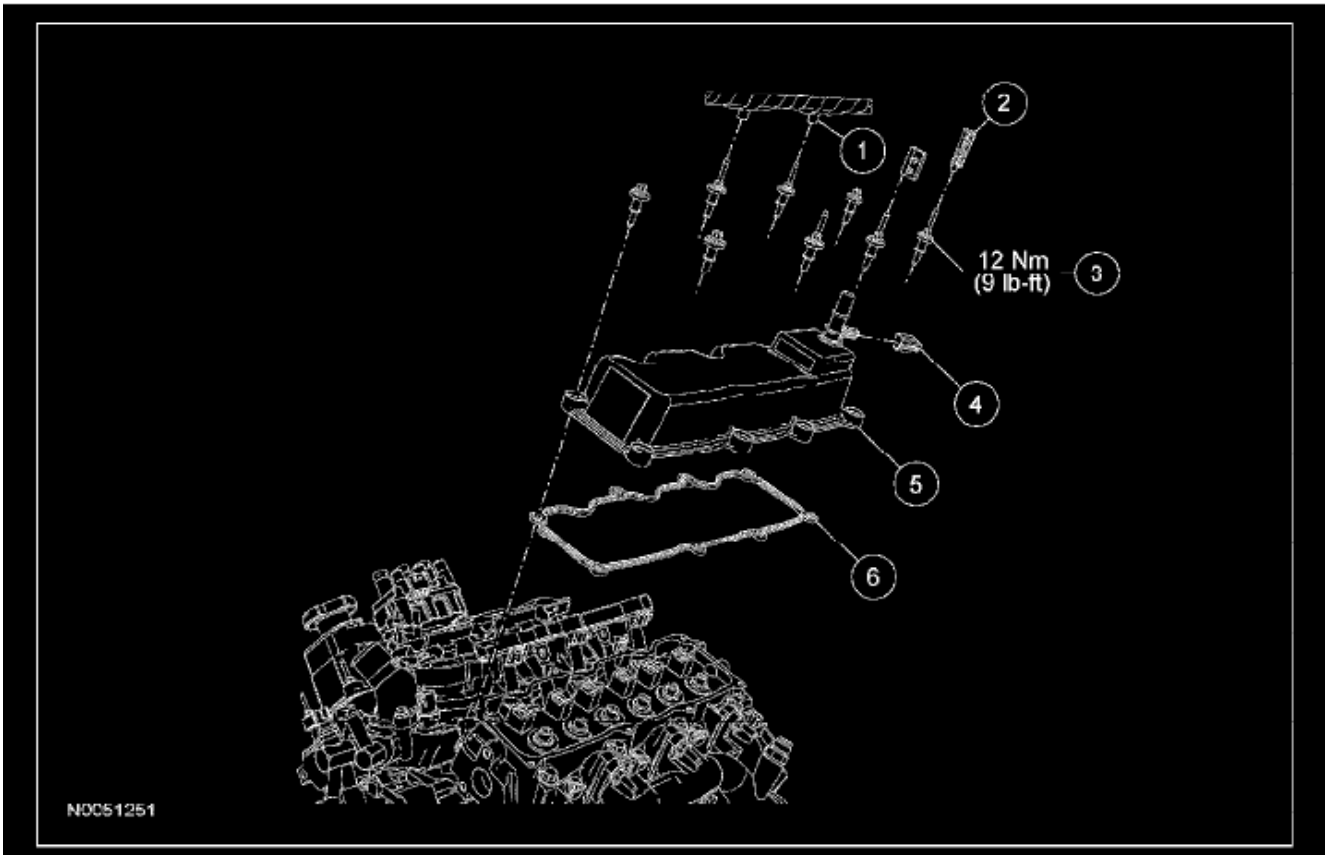
To install, tighten to 32 Nm (24 lb-ft).

3. To install, reverse the removal procedure.

^ Lubricate the rocker arms and fulcrums with clean engine oil.

Material

Item	Specification
Motorcraft Metal Surface Prep ZC-31	—
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4
Silicone Gasket Remover ZC-30	—



Item	Part Number	Description
1	13A506	Engine wiring harness retainer (part of 12B637)
2	12297	Spark plug wire holder
3	6C519	LH valve cover bolt (8 required)
4	14A464	PCV valve electrical connector (part of 12B637)
5	6A513	LH valve cover
6	6584	LH valve cover gasket

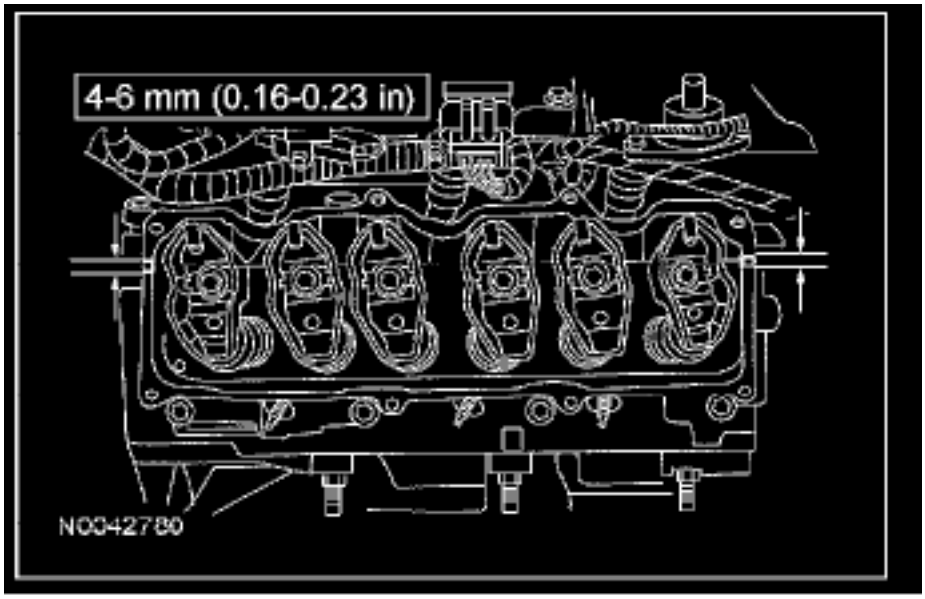
Valve Cover: Service and Repair Valve Cover - LH

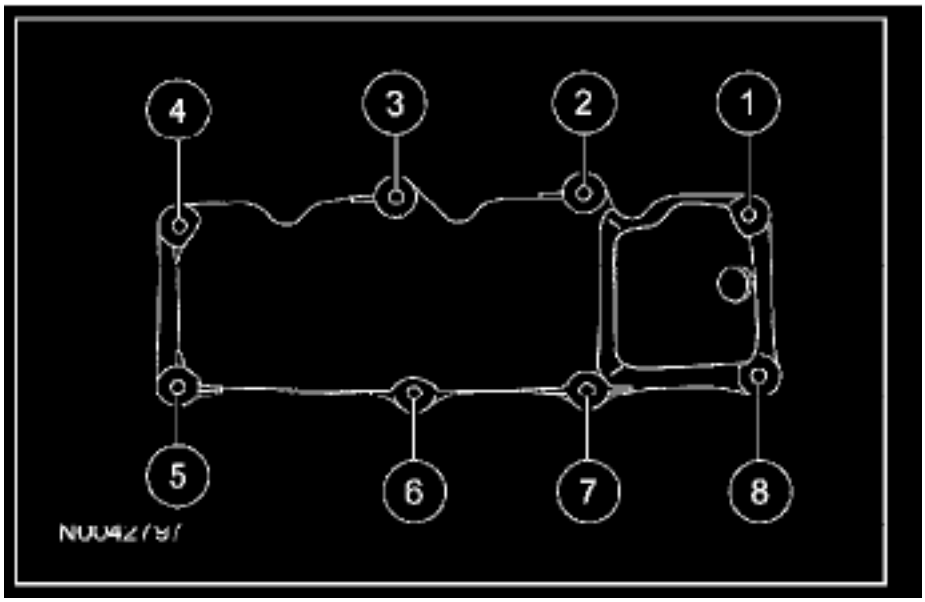
Valve Cover - LH

Removal

1. Remove the upper intake manifold. 2. Disconnect the LH spark plug wire holders. 3. Disconnect the engine wiring harness from the valve cover studs. 4. Disconnect the PCV valve electrical connector. 5. Remove the 3 bolts and the 5 stud bolts.

6. NOTE: To prevent stretching the valve cover gasket, loosen silicone gasket and sealant from the cylinder head by sliding a flat knife between the





valve cover gasket and cylinder head.

Remove the valve cover.

7. Remove and discard the valve cover gasket.

8. CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These

tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.

NOTE: To clean the sealing area, use silicone gasket remover and metal surface prep. Observe all warnings and cautions and follow all application directions contained on the packaging of the silicone gasket remover and metal surface prep.

Clean the LH valve cover gasket mating surfaces.

Installation

1. Install a new valve cover gasket.

2. CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These

tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.

NOTE: If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Observe all warnings and cautions and follow all application directions contained on the packaging of the silicone gasket remover and metal surface prep. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

Apply a drop of silicone gasket and sealant at the 4 cylinder block-to-cylinder head seams.

3. Install the valve cover.

^ Tighten the 3 bolts and the 5 stud bolts in the sequence shown.

^ Tighten to 12 Nm (9 lb-ft).

4. Connect the PCV valve electrical connector. 5. Connect the engine wiring harness to the valve cover studs. 6. Connect the LH spark plug wire holders. 7. Install the upper intake manifold.

Valve Cover

Removal

1. Disconnect the ignition coil electrical connector

2. CAUTION: Do not pull on the spark plug wire as it may separate from the spark plug wire connector inside the spark plug boot.

Disconnect the spark plug wires from the ignition coil by twisting while pulling upward.

3. Disconnect the heater hose support from the stud. 4. Disconnect the spark plug wire holders. 5. Disconnect the vacuum hose. 6. Disconnect the engine wiring harness from the valve cover studs. 7. Disconnect the crankcase ventilation tube.

8. NOTE: To prevent stretching the valve cover gasket, loosen silicone gasket and sealant from the cylinder head by sliding a flat knife between the

valve cover gasket and cylinder head.

Remove the 8 bolts and remove the valve cover.

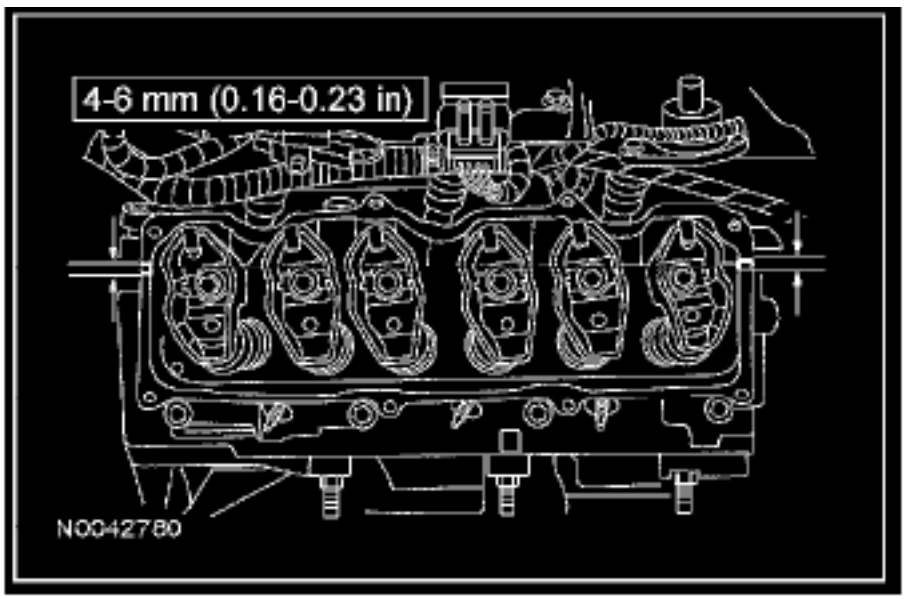
9. Remove and discard the valve cover gasket.

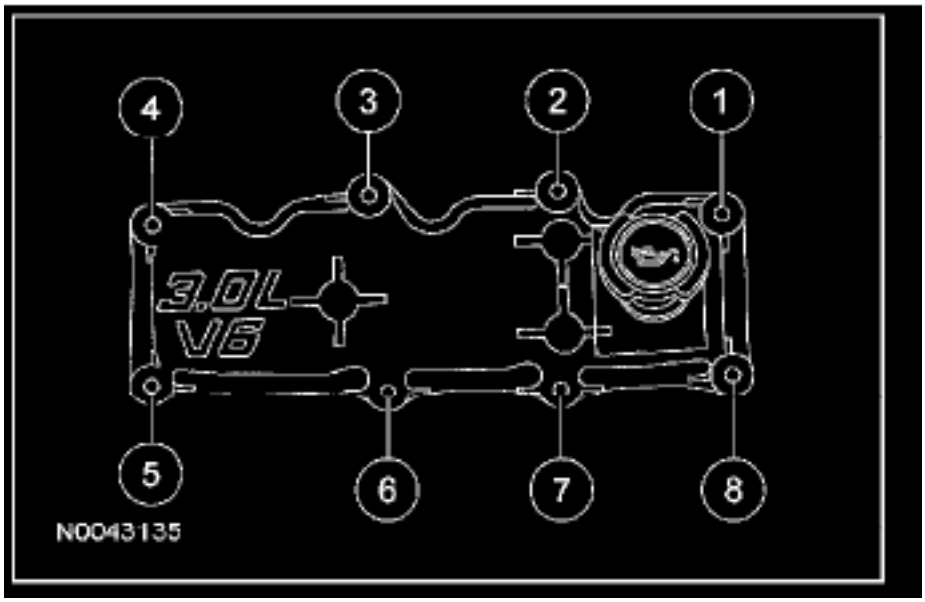
10. CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These

tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.

NOTE: To clean the sealing area, use silicone gasket remover and metal surface prep. Observe all warnings and cautions and follow all application directions contained on the packaging of the silicone gasket remover and metal surface prep.

Clean the RH valve cover gasket mating surfaces.





Installation

1. Install a new valve cover gasket.

2. CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These

tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.

NOTE: If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Observe all warnings and cautions and follow all application directions contained on the packaging of the silicone gasket remover and metal surface prep. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

Apply a drop of silicone gasket and sealant at the 4 cylinder block-to-cylinder head seams.

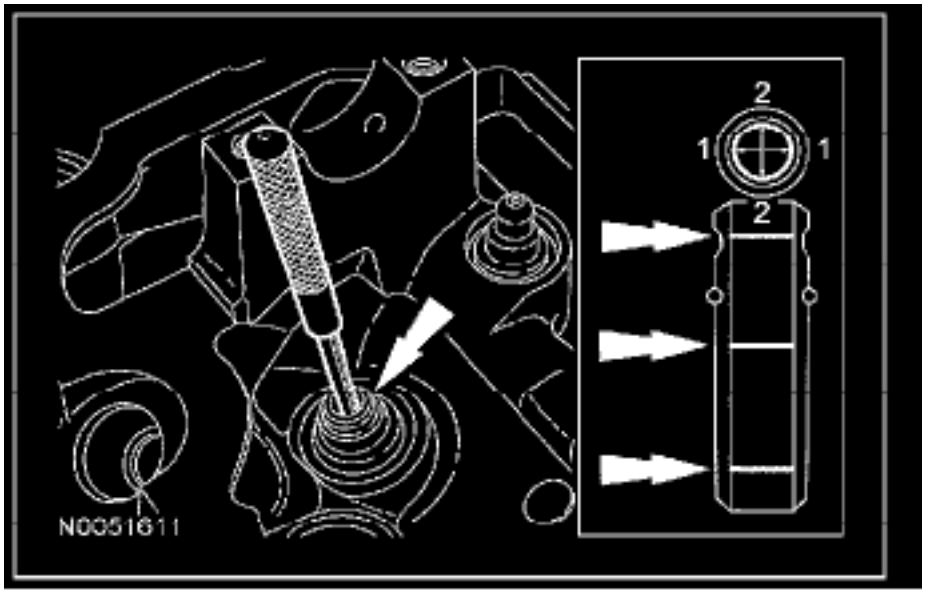
3. Install the valve cover.

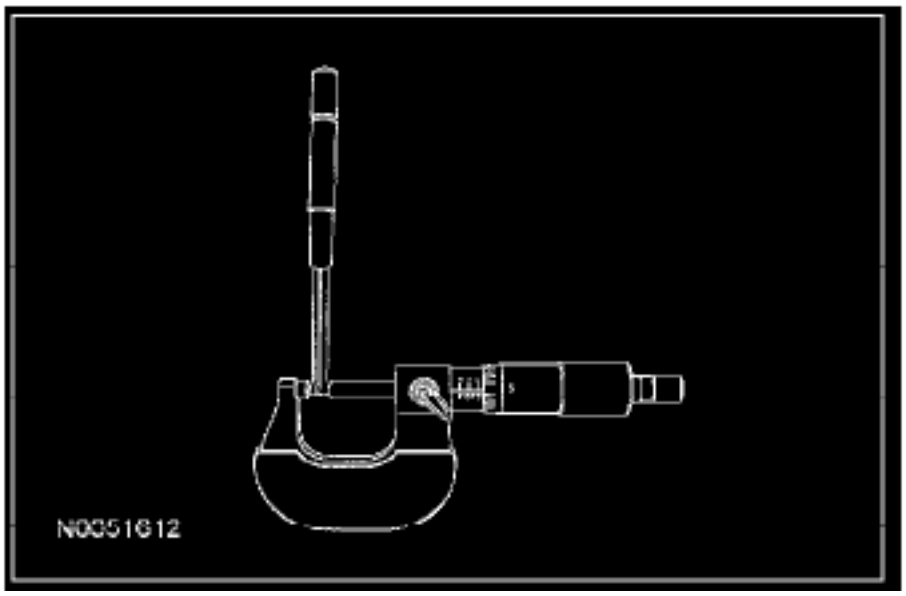
^ Tighten the 8 bolts in the sequence shown.

^ Tighten to 12 Nm (9 lb-ft).

4. Connect the crankcase ventilation tube. 5. Connect the engine wiring harness to the valve cover studs. 6. Connect the vacuum hose. 7. Connect the RH spark plug wire holders. 8. Connect the heater hose support. 9. Connect the spark plug wires to the ignition coil.

10. Connect the ignition coil electrical connector.





Valve Guide: Service and Repair

Valve Guide Inner Diameter

NOTE: Refer to Specifications.

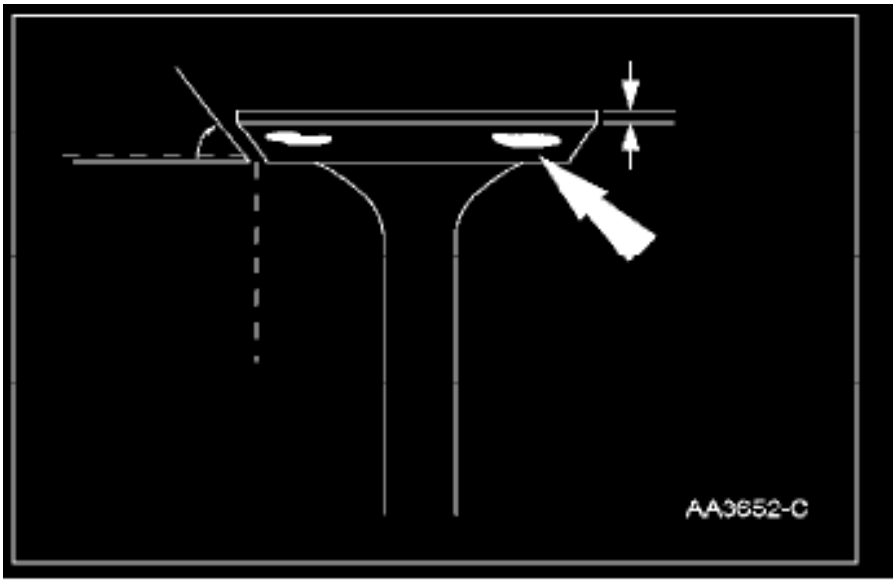
1. NOTE: Valve guides tend to wear in an hourglass pattern. The ball gauge can be inserted into the combustion chamber side of the valve guide if

necessary.

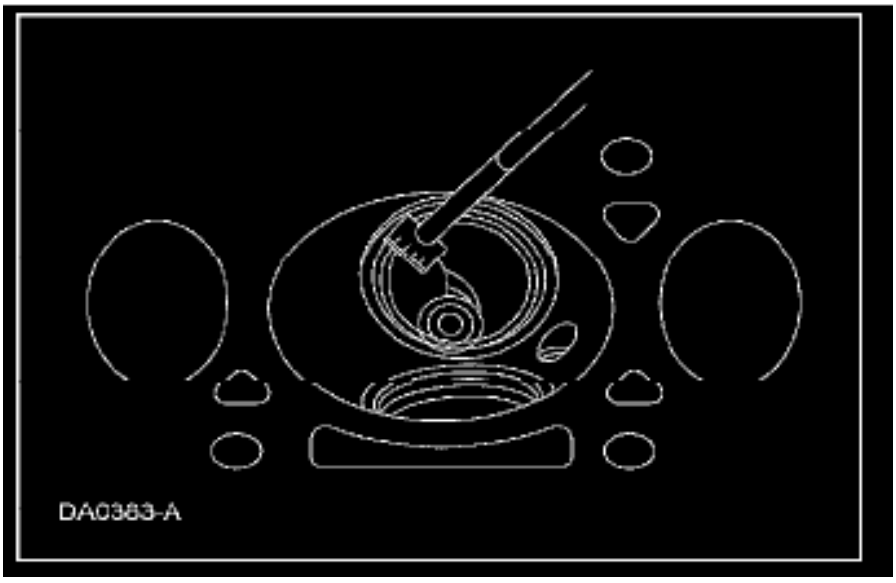
Use a ball gauge to determine the inner diameter of the valve guides in 2 directions at the top, middle and bottom of the valve guide.

2. Measure the ball gauge with a micrometer.

3. If the valve guide is not within specifications, install a new cylinder head assembly.



AA3652-C



DA0363-A

Valve Seat: Service and Repair

Valve Seat Inspection

Valve and Seat Refacing Measurements

NOTE: Refer to Specifications.

NOTE: After grinding valves or valve seats, check valve clearance.

1. Check the valve head and seat.

^ Check valve angles.

^ Check margin width.

^ Be sure margin width is within specification.

2. Inspect for abnormalities on the valve face and seat. Install a new cylinder head assembly if abnormalities are found.

Valve Seat Width

NOTE: Refer to Specifications.

1. Measure the valve seat width. If necessary, grind the valve seat to specification.

^ Measure the intake valve seat width.

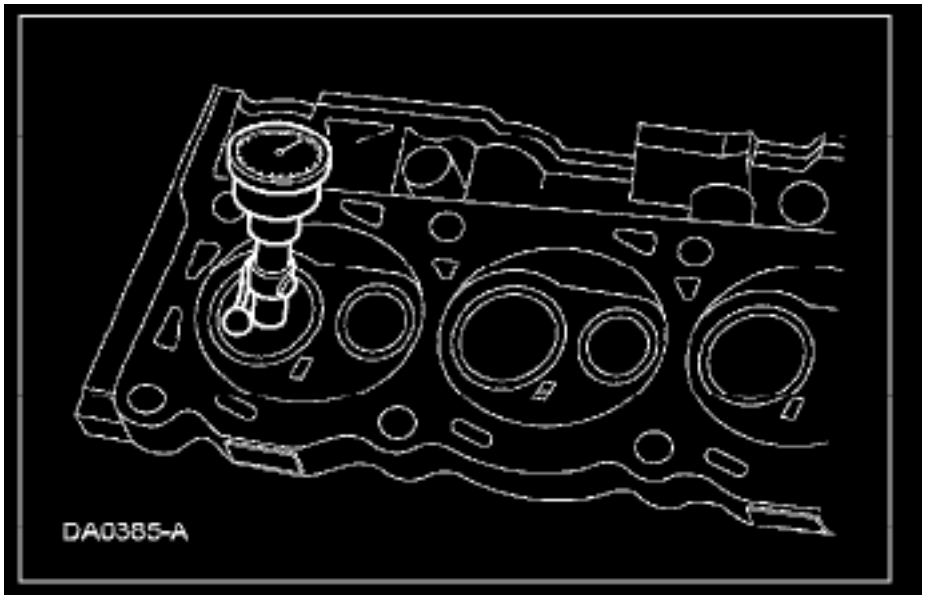
^ Measure the exhaust valve seat width.

^ Recheck the valve spring installed length after the seats have been ground, and shim the valve springs as necessary to achieve the correct installed spring length.

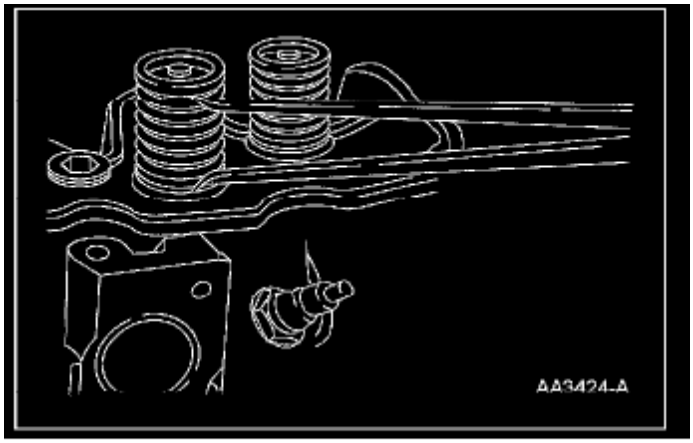
Valve Seat Runout

NOTE: Refer to Specifications.

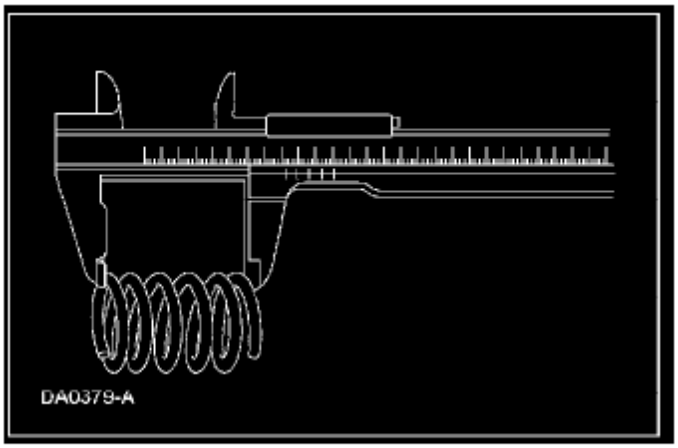
1. Use a valve seat runout gauge to check valve seat runout.



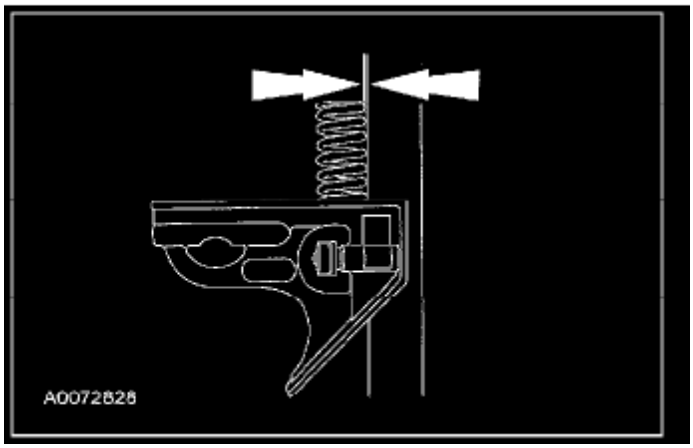
DA0385-A



AA3424-A



DA0379-A



A0072828

Valve Spring: Service and Repair

Valve Spring Installed Length

NOTE: Refer to Specifications.

1. Measure the installed length of each valve spring.

Valve Spring Free Length

NOTE: Refer to Specifications.

1. Measure the free length of each valve spring.

Valve Spring Squareness

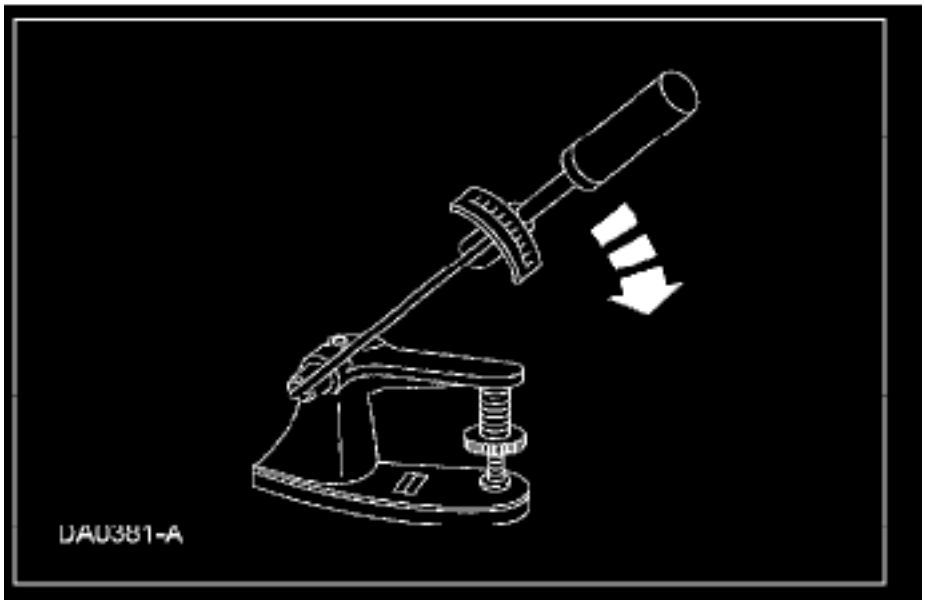
1. Measure the out-of-square on each valve spring.

^ Turn the valve spring and observe the space between the top of the valve spring and the square.

Valve Spring Strength

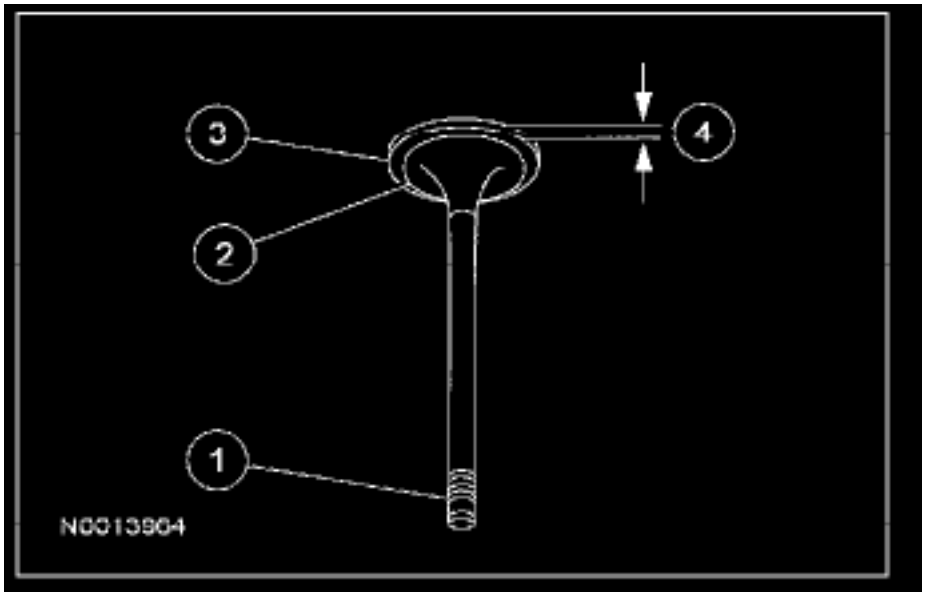
Special Tool(s)

ST1278-A	Pressure Gauge, Valve/Clutch Spring 303-006 (TOOL-6513-DD) or equivalent



NOTE: Refer to Specifications.

1. Use the special tool to check the valve spring for correct strength at the specified valve spring length.



Valve: Testing and Inspection

Valve Inspection

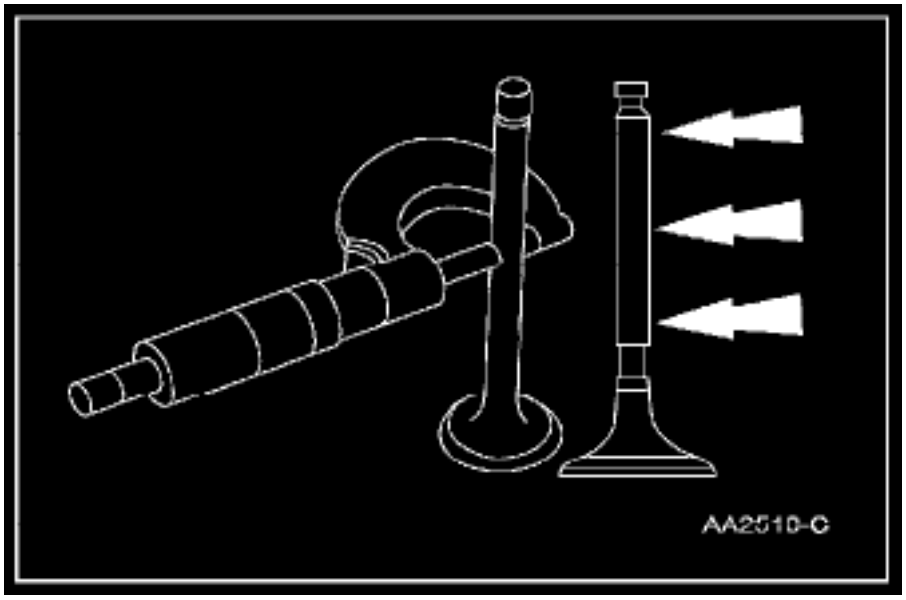
1. Inspect the following valve areas:

1 The end of the stem for grooves or scoring.

2 The valve face and the edge for pits, grooves or scores.

3 The valve head for signs of burning, erosion, warpage and cracking.

4 The valve margin for wear.



Valve: Service and Repair Valve Stem Diameter

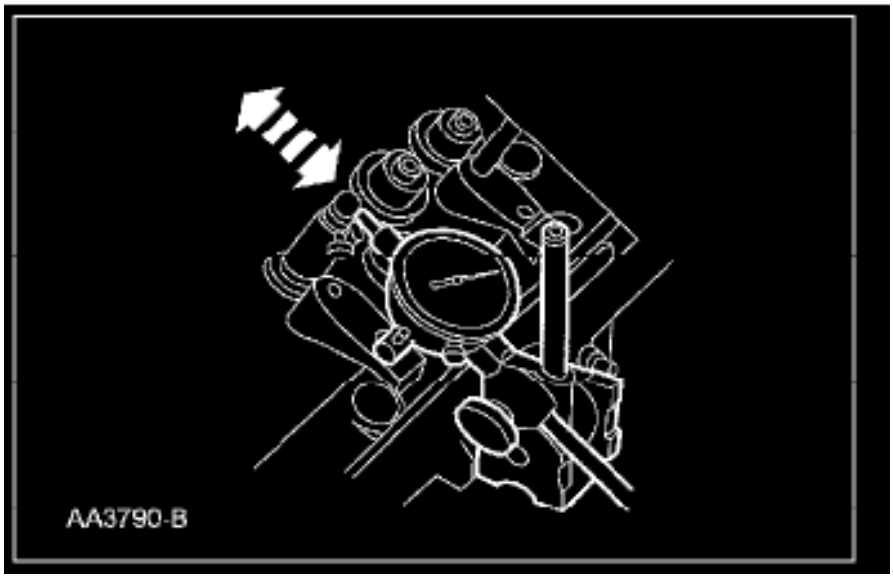
Valve Stem Diameter

NOTE: Refer to Specifications.

1. Measure the diameter of each intake and exhaust valve stem at the points shown. Verify the diameter is within specification.

Special Tool(s)

ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent
ST1251-A	Clearance Gauge, Valve Guide 303-004 (TOOL-6505-E) or equivalent



Valve: Service and Repair Valve Stem to Valve Guide Clearance

Valve Stem to Valve Guide Clearance

NOTE: Refer to Specifications.

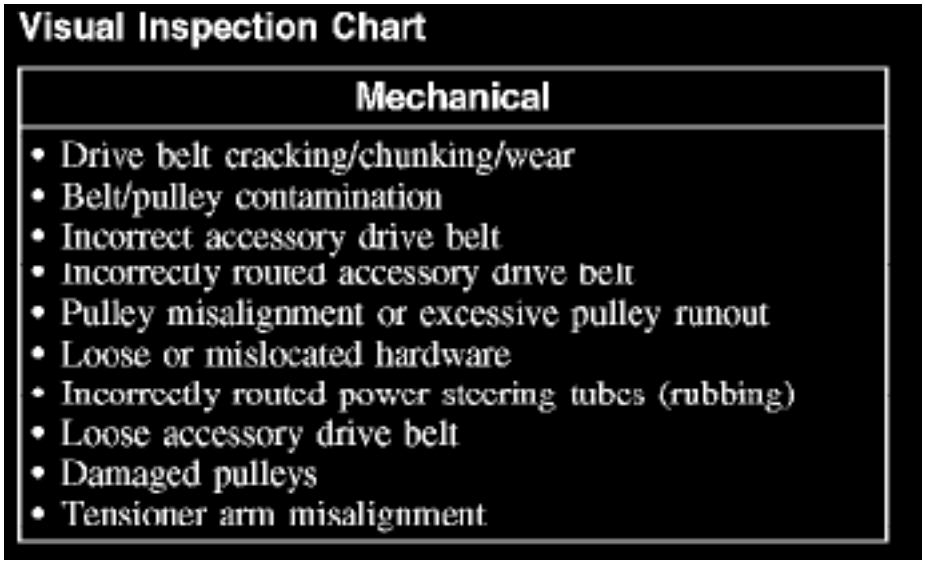
NOTE: The valve stem diameter must be within specifications before checking valve stem-to-valve guide clearance.

1. NOTE: If necessary, use a magnetic base.

Install a Valve Guide Clearance Gauge on the valve stem and install a Dial Indicator Gauge with Holding Fixture. Lower the valve until the clearance gauge contacts the upper surface of the valve guide.

2. Move the clearance gauge toward the indicator and zero the indicator. Move the clearance gauge away from the indicator and note the reading.

The reading will be DOUBLE the valve stem-to-valve guide clearance.



Drive Belt: Initial Inspection and Diagnostic Overview

Inspection and Verification

CAUTION: Under no circumstances should the accessory drive belt, tensioner or pulleys have any fluids or belt dressing applied to them as damage to the belt material and tensioner damping mechanism may occur.

1. Verify the customer concern by operating the system. 2. Visually inspect for obvious signs of mechanical damage.

Visual Inspection Chart

Visual Inspection Chart

Belt Tensioner With Belt Length Indicator

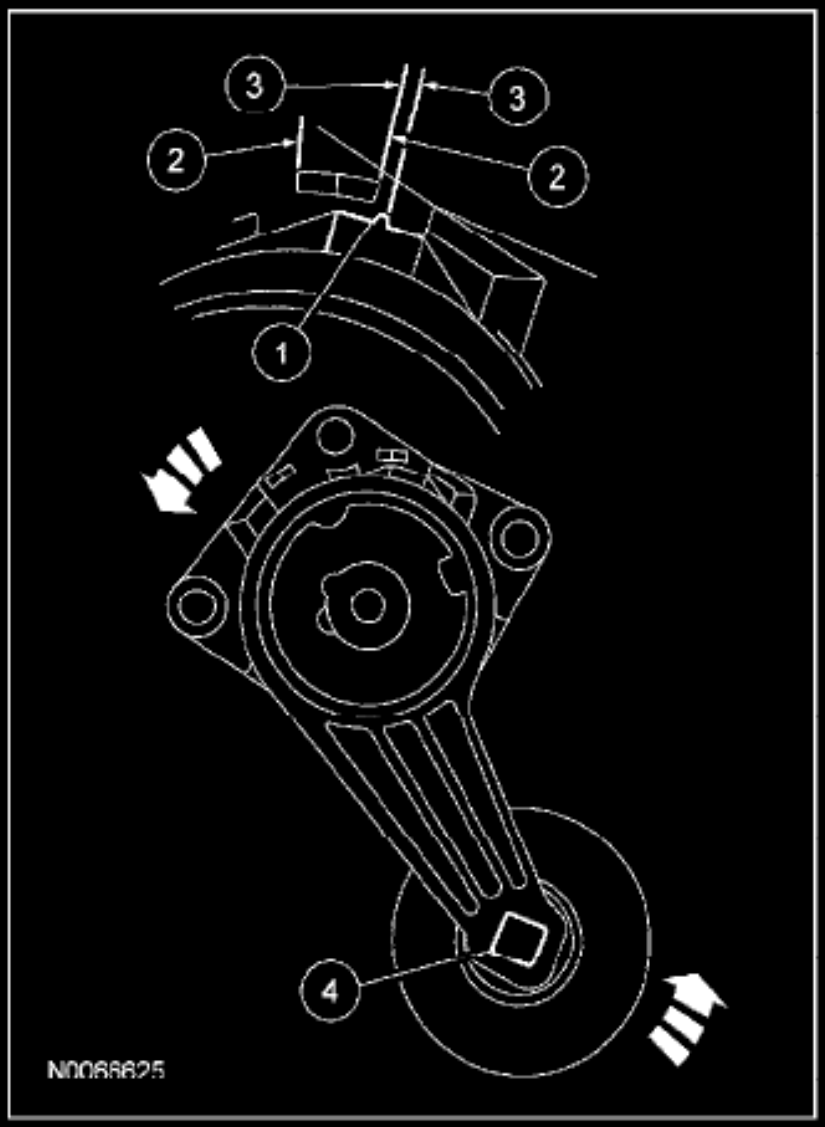
NOTE: Modular engine (without A/C) belt tensioner shown, others similar.

NOTE: Belt tensioner is shown in the free-state position against the arm travel stops.

Belt Tensioner With Belt Length Indicator

NOTE: Modular engine (without A/C) belt tensioner shown, others similar.

NOTE: Belt tensioner is shown in the free-state position against the arm travel stops



Item	Part Number	Description
1	—	Belt length indicator
2	—	Acceptable belt installation and wear range
3	—	Belt replacement range
4	—	Belt tension relief point

Belt Tensioner With Belt Length Indicator

3. Check that the belt length indicator, if equipped, on the belt tensioner is in the acceptable belt installation and wear range. If the indicator is in the

belt replacement range, either an incorrect belt is installed or the belt is worn beyond the service limit. Install a new belt as necessary.

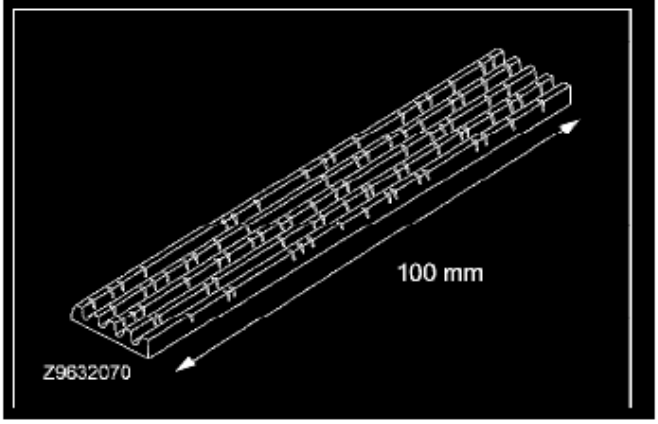
4. Eliminate all other non-belt related noises that could cause belt misdiagnosis, such as A/C compressor engagement chirp, A/C slugging noise,

power steering cavitations at low temperatures, variable camshaft timing (VCT) tick or generator whine.

5. If a concern is found, correct the condition before proceeding to the next step.

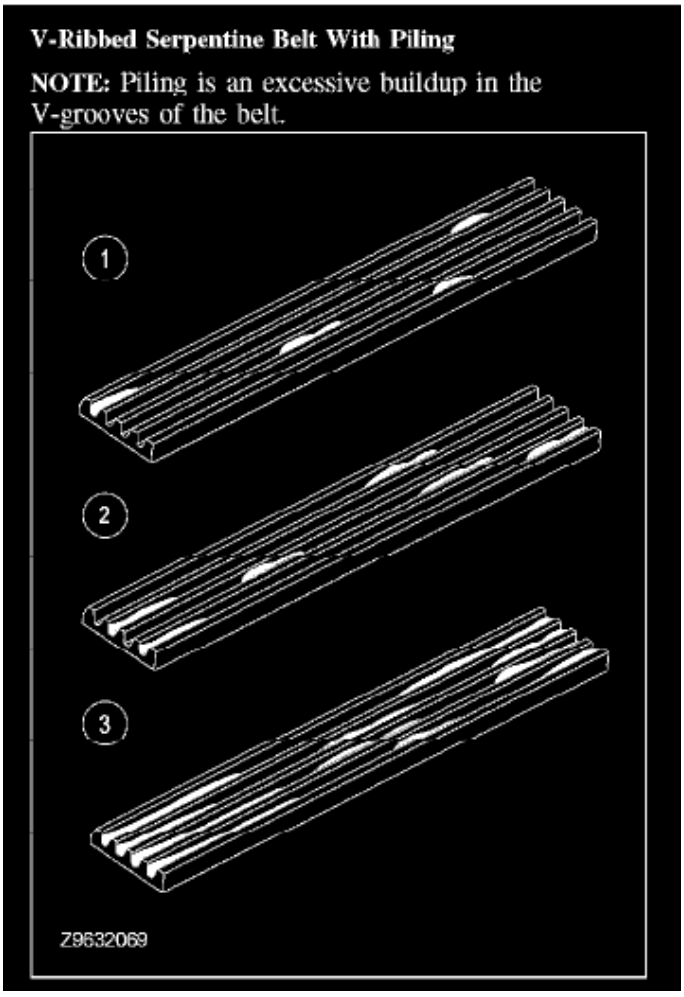
V-Ribbed Serpentine Drive Belt With Cracks Across Ribs

V-Ribbed Serpentine Drive Belt With Cracks Across Ribs



V-Ribbed Serpentine Belt With Piling

NOTE: Piling is an excessive buildup in the V-grooves of the belt.



V-Ribbed Serpentine Drive Belt With Cracks Across Ribs

6. Check the belt for cracks. Up to 15 cracks in a rib over a distance of 100 mm (4.0 inch) can be considered acceptable. If cracks exceed this

standard, install a new belt.

V-Ribbed Serpentine Belt With Piling

V-Ribbed Serpentine Belt With Piling

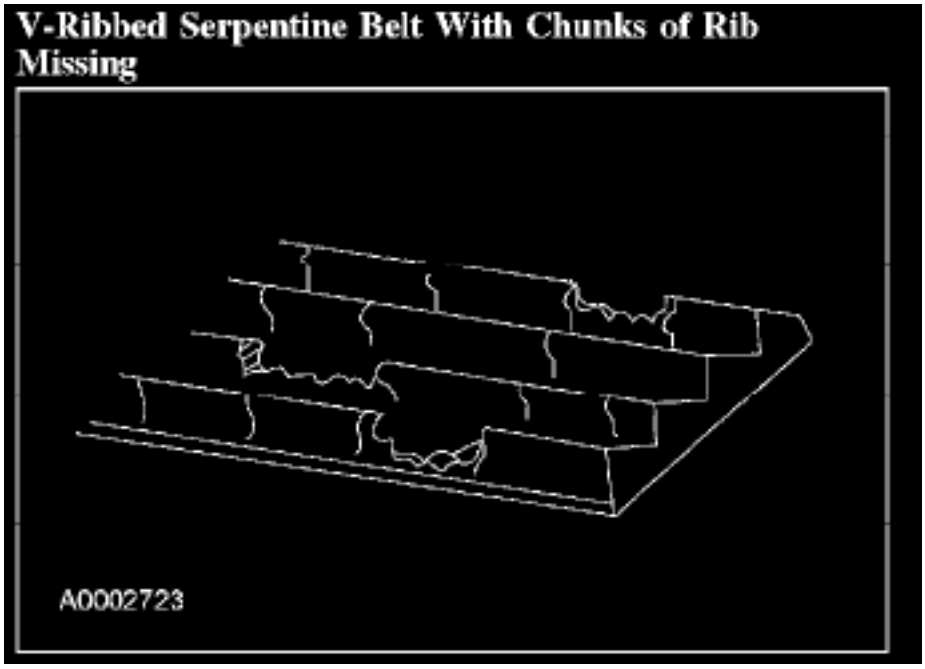
NOTE: Piling is an excessive buildup in the V-grooves of the belt.

7. The condition of the V-ribbed drive belt should be compared against the illustration and appropriate action taken.

1 Small scattered deposits of rubber material. This is not a concern, therefore, installation of a new belt is not required.

2 Longer deposit areas building up to 50% of the rib height. This is not considered a concern but it can result in excessive noise. If noise is apparent, install a new belt.

3 Heavy deposits building up along the grooves resulting in a possible noise and belt stability concern. If heavy deposits are apparent, install a new belt.



V-Ribbed Serpentine Belt With Chunks of Rib Missing

V-Ribbed Serpentine Belt With Chunks of Rib Missing

8. There should be no chunks missing from the belt ribs. If the belt shows any evidence of this, install a new accessory drive belt. 9. If the concern is not visually evident, verify the symptom and GO to Symptom Chart. See: Symptom Related Diagnostic Procedures

Symptom Chart

Condition	Possible Sources	Action
• Accessory drive belt cracking (over 15 cracks in a rib over a distance of 100 mm [4.0 in])	• Accessory drive belt	• INSPECT the accessory drive belt. REFER to Inspection and Verification, INSTALL a new accessory drive belt as necessary.
• Accessory drive belt chunking	• Accessory drive belt	• INSPECT the accessory drive belt. REFER to Inspection and Verification, INSTALL a new accessory drive belt as necessary.
	• Damaged pulley grooves	• INSPECT the accessory drive belt pulley grooves for damage. INSTALL a new pulley or component as necessary.

Drive Belt: Symptom Related Diagnostic Procedures

Symptom Chart

Symptom Chart (Part 1)

Symptom Chart (Continued)

Condition	Possible Sources	Action
• Accessory drive belt noise, squeal, chirping or flutter	• Defective/worn or incorrect accessory drive belt • Misaligned pulley(s) • Pulley runout • Damaged or worn accessory drive component or idler • Fluid contamination of accessory drive belt or pulleys	• REFER to Component Tests, Drive Belt, Noise/Flutter. REPAIR or INSTALL new parts as necessary.
	• Damaged or worn accessory drive belt tensioner	• REFER to Component Tests, Belt Tensioner — Mechanical and Belt Tensioner — Dynamics. INSTALL a new accessory drive belt tensioner as necessary.
	• Damaged pulley grooves	• INSPECT the accessory drive belt pulley grooves for damage. INSTALL a new pulley or component as necessary.
	• Accessory drive component failure	• CHECK the accessory drive components. INSTALL new components as necessary.
	• Accessory drive belt idler pulley bearing failure	• INSPECT the accessory drive belt idler pulley for freedom of rotation and damage. INSTALL a new accessory drive belt idler pulley as necessary.
• Premature accessory drive belt wear	• Defective or incorrect accessory drive belt • Misaligned pulley(s) • Pulley runout • Damaged accessories • Incorrectly installed drive belt • Fluid contamination	• REFER to Component Tests, Drive Belt Noise/Flutter and Incorrect Drive Belt Installation. REPAIR or INSTALL new parts as necessary.
	• Damaged pulley grooves	• INSPECT the accessory drive belt pulley grooves for damage. INSTALL a new pulley or component as necessary.

Symptom Chart (Part 2)

Drive Belt: Component Tests and General Diagnostics

Drive Belt - Noise/Flutter

Drive Belt - Noise/Flutter

CAUTION: Under no circumstances should the accessory drive belt, tensioner or pulleys have any fluids or belt dressing applied to them as damage to the belt material and tensioner damping mechanism may occur.

Drive belt chirp occurs due to pulley misalignment or excessive pulley runout. It can be the result of a damaged or incorrectly aligned grooved pulley.

To correct, determine the area where the noise comes from. Check each of the pulleys in that area with a straightedge to the crankshaft pulley. Look for accessory pulleys out of position in the fore/aft direction or at an angle to the straightedge.

Drive belt squeal may be an intermittent or constant noise that occurs when the drive belt slips on an accessory pulley under certain conditions.

A short intermittent squeal may occur during engine start-up and shut down or during very rapid engine acceleration and decelerations, such as: ^

wide open throttle (WOT) 1-2 and 2-3 shifts or 2-3 and 3-4 back out shifts on automatic transmissions.

^ WOT 1-2 and 2-3 shifts and any combination of rapid downshifting on manual transmissions.

These special short-term transient events are expected, and are due to the higher system inertia required to meet the electrical and cooling demands on today's vehicle systems. Constant or reoccurring drive belt squeal can occur: ^

if the A/C discharge pressure goes above specifications: -

the A/C system is overcharged.

- the A/C condenser core airflow is blocked.

^ if the A/C off equalized pressure (the common discharged and suction pressure that occurs after several minutes) exceeds specifications.

^ if any of the accessories or idler pulley(s) are damaged or have a worn or damaged bearing. All accessories should be rotatable by hand in the unloaded condition. If not, inspect the accessory.

^ if there is evidence of fluid contamination on the accessory drive belt. When the drive belt has been exposed to fluid contamination during vehicle operation, such as leaks from the power steering system, A/C system or cooling system, clean all pulleys with soap and water, rinse with clean water and install a new accessory drive belt. If the drive belt has been exposed to fluids in a localized area during routine vehicle service, such as replacement of hoses or fluids, the drive belt and pulleys should be washed with soap and water immediately (prior to starting the engine), and rinsed with clean water.

^ if the accessory drive belt is too long. A drive belt that is too long will allow the accessory drive belt tensioner arm to go all the way to the arm travel stop under certain load conditions, which will release tension to the drive belt. If the accessory drive belt tensioner indicator is outside the normal installation wear range window, install a new accessory drive belt.

^ NOTE: The accessory drive belt tensioner arm should rotate freely without binding.

Install a new accessory drive belt tensioner if the drive belt tensioner is worn or damaged.

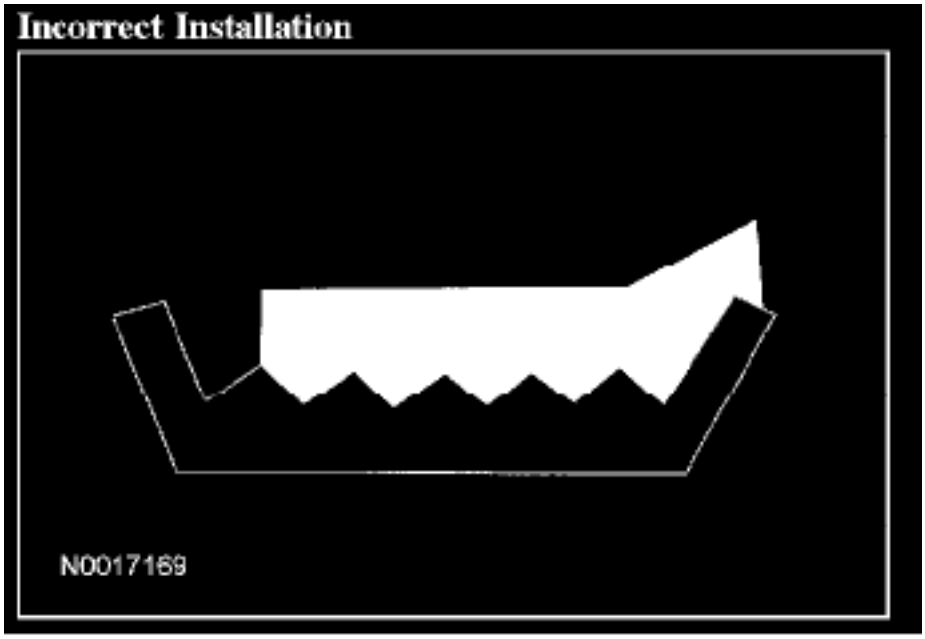
Drive Belt - Incorrect Installation

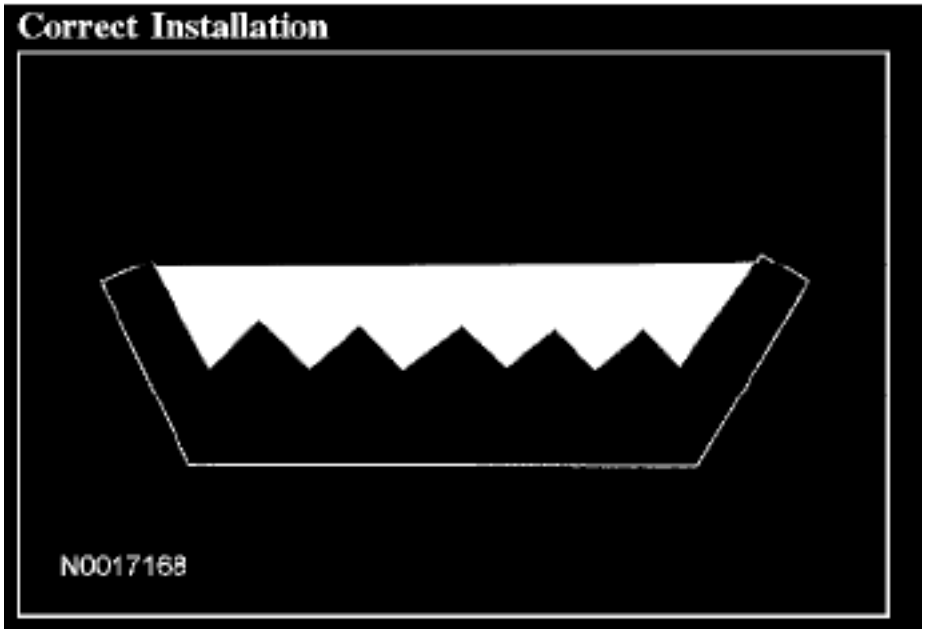
Drive Belt - Incorrect Installation

CAUTION: Incorrect accessory drive belt installation will cause excessive drive belt wear and may cause the drive belt to come off the pulleys.

Non-standard accessory drive belts can track differently or incorrectly. If an accessory drive belt tracks incorrectly, install a new accessory drive belt to avoid performance failure or loss of the drive belt.

Incorrect Installation





Incorrect Installation

Correct Installation

Correct Installation

With the engine running, check accessory drive belt tracking on all pulleys. If the edge of the accessory drive belt rides beyond the edge of the pulleys, noise and premature wear will occur. Make sure the accessory drive belt rides correctly on the pulley. If an accessory drive belt tracking condition exists, proceed with the following: ^

Visually check the accessory drive belt tensioner for damage and wear, especially the mounting pad surface and arm alignment. If the accessory drive belt tensioner is not installed correctly, the mounting surface pad will be out of position. If the tensioner arm is worn, the arm will be out of alignment. Either of these conditions will result in chirp and squeal noises.

^ With the engine running, visually observe the grooves in the pulleys (not the pulley flanges or the pulley forward faces) for excessive wobble. Install new components as necessary.

^ Check all accessories, mounting brackets and the accessory drive belt tensioner for any interference that would prevent the component from mounting correctly. Correct any interference condition and recheck the accessory drive belt tracking.

^ Tighten all accessories, mounting brackets and accessory drive belt tensioner retaining hardware to specification. Recheck the accessory drive belt tracking.

Belt Tensioner - Mechanical

Belt Tensioner - Mechanical

The only mechanical check that needs to be made is a check for tensioner stick, grab or bind. 1. With the engine off, check routing of the accessory drive belt. Refer to the illustrations under Description and Operation.

2. NOTE: The accessory drive belt tensioner spring is very strong and requires substantial force to release.

Using a suitable, commercially available serpentine belt tensioner release tool, release the tension on the belt and detach the accessory drive belt from the tensioner. Carry out the following tests: ^

Using the release tool, move the tensioner from its relaxed position, through its full stroke and back to the relaxed position to make sure there is no stick, grab or bind, and to make sure that there is tension on the tensioner spring.

^ Rotate the tensioner pulley by hand and check for a binding, contaminated or seized condition.

^ Inspect the area surrounding the accessory drive belt tensioner for oil leaks or contamination and repair any leaks.

3. If the accessory drive belt tensioner does not meet the criteria in the previous step, install a new tensioner. If the accessory drive belt tensioner

meets the criteria in the previous step, proceed to testing the tensioner dynamically.

Belt Tensioner - Dynamics

Belt Tensioner - Dynamics

The accessory drive belt tensioner can be checked dynamically as follows: 1. With the engine running, observe the accessory drive belt tensioner movement. The accessory drive tensioner should move (respond) when the

A/C clutch cycles (if equipped), or when the engine is accelerated rapidly. If the accessory drive belt tensioner movement is excessive without A/C clutch cycling or engine acceleration, check belt rideout. Excessive belt rideout (uneven depth of grooves in the belt) can cause excessive accessory drive belt tensioner movement. Check rideout condition by installing a new belt. If excessive accessory drive belt tensioner movement still exists, install a new accessory drive belt tensioner.

Drive Belt Tensioner: Service and Repair

Accessory Drive Belt Tensioner - 3.0L

Removal and Installation

1. Rotate the accessory drive belt tensioner clockwise and remove the accessory drive belt. 2. Remove the bolt and the belt tensioner.

^ To install, tighten to 27 Nm (20 lb-ft).

3. To install, reverse the removal procedure.

Engine Mount: Procedures

Powertrain/Drivetrain Mount Neutralizing

NOTE: Refer to the appropriate procedure for special instructions on loosening and tightening mount fasteners.

1. With the vehicle in NEUTRAL, position it on a hoist. 2. Loosen, but do not remove, the powertrain/drivetrain mount fasteners. 3. Lower the vehicle.

4. CAUTION: Do not twist or strain the powertrain/drivetrain mounts or damage to the mounts may occur.

Move the vehicle in forward and reverse 0.6-1.2 m (2-4 ft).

5. Raise and support the vehicle. 6. Tighten the powertrain/drivetrain mount fasteners. 7. Lower the vehicle. 8. Test the system for normal operation.

LH Engine Support Insulator

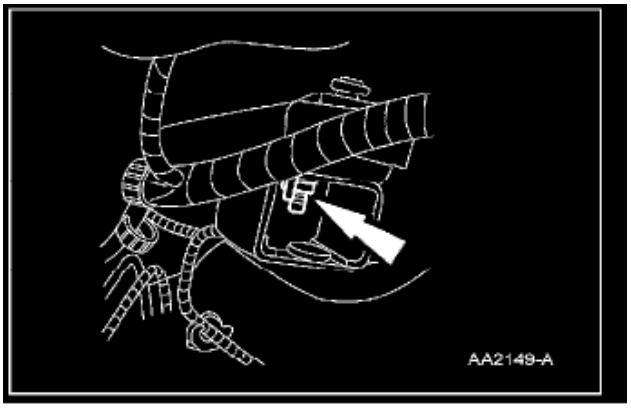
Removal

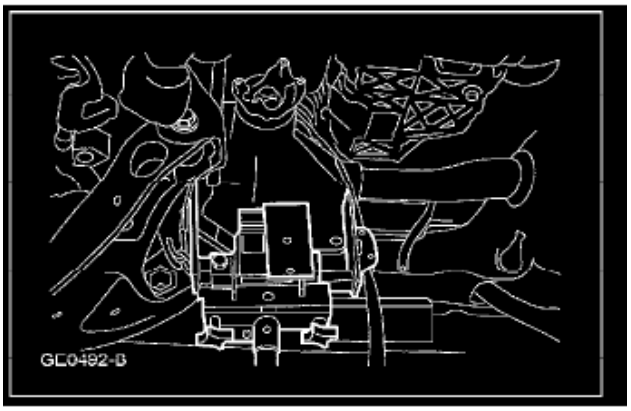
All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Maintenance/Service and Repair. 2. Disconnect the battery ground cable. 3. Remove the hood. 4. Remove the fan. 5. Attach the Lifting Eyes. 6. Remove the engine support insulator nuts. 7. Raise the engine and support it with a Three-Bar Engine Support.

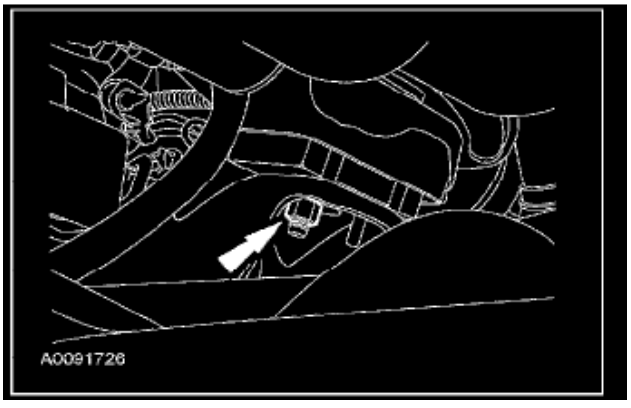
Rear wheel drive (RWD) vehicles



AA2149-A



GE0492-B



A0091726

8. Remove the engine support insulator nut.

Four wheel drive (4WD) vehicles

9. NOTE: Tape the U-joint bearing caps to prevent them from falling off the U-joints.

NOTE: Index-mark the front axle pinion flange to the front driveshaft.

Remove and discard the bolts and straps. Secure the driveshaft aside.

10. Secure the front axle housing to a suitable jack.

11. CAUTION: Any time bolts, washers, spacers or flagnuts are loosened in the front axle housing support for any reason, install new

components to prevent damage.

Remove the 3 axle housing mounting bolts and flagnuts, and lower the front axle housing support approximately 50 mm (2 inch).

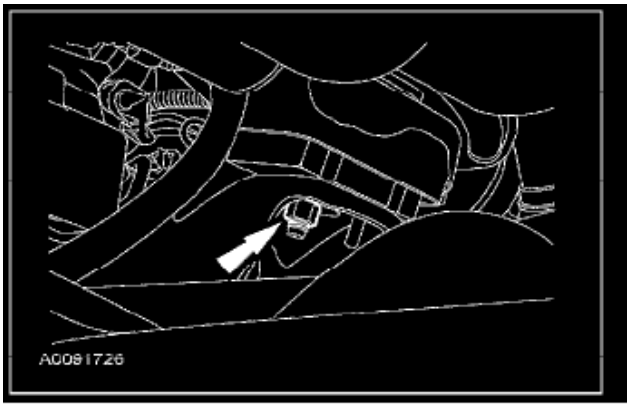
12. Remove the engine support insulator nut.

All vehicles

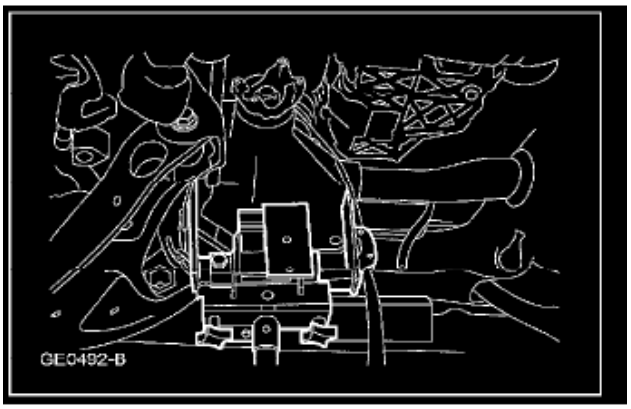
13. Remove the engine support insulator.

Installation

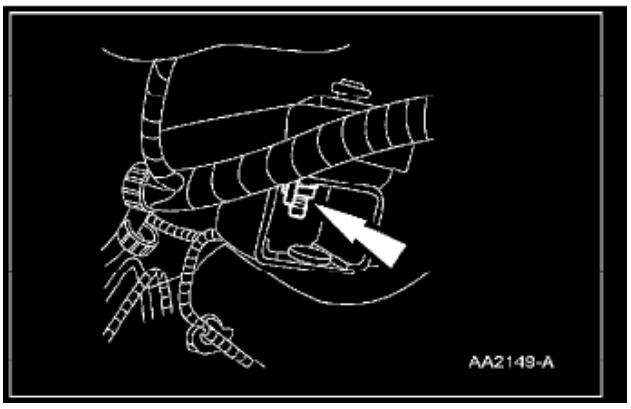
All vehicles



A0081726



GE0492-B



AA2149-A

1. Position the engine support insulator.

4WD vehicles

2. Install the engine support insulator nut.

^ Tighten to 103 Nm (76 lb-ft).

3. CAUTION: Any time bolts, washers, spacers or flagnuts are loosened in the front axle housing support for any reason, install new

components to prevent damage.

Raise the front axle housing into place and install the 3 bolts and flagnuts. ^

Tighten to 66 Nm (49 lb-ft).

4. Remove the jack.

5. Align the index marks and install new front driveshaft straps and the bolts.

^ Tighten to 19 Nm (14 lb-ft).

RWD vehicles

6. Install the engine support insulator nut.

^ Tighten to 103 Nm (76 lb-ft).

All vehicles

Idler Pulley: Service and Repair

Accessory Drive Belt Idler Pulley

Removal and Installation

Vehicles equipped with a 4.0L SOHC engine

1. Remove the air cleaner outlet pipe.

All vehicles

2. NOTE: The accessory drive belt tensioner on 2.3L and 4.0L SOHC engines is turned counterclockwise to remove the accessory drive belt. On

3.0L engines, it is turned clockwise.

Rotate the accessory drive belt tensioner and remove the accessory drive belt.

3. Remove the belt idler pulley assembly.

^ To install, tighten the 2.3L belt idler pulley assembly to 25 Nm (18 lb-ft).

^ To install, tighten the 3.0L and 4.0L belt idler pulley assembly to 47 Nm (35 lb-ft).

4. To install, reverse the removal procedure.

Engine Oil Pressure: Specifications

Oil pressure (hot 2,500 rpm) ..... 276-414 kPa (40-60 psi)

Engine Oil Pressure: Testing and Inspection

Oil Pressure Test

1. Disconnect and remove the oil pressure sensor from the engine. 2. Connect the Engine Oil Pressure Gauge to the oil pressure sender oil galley port. 3. Run the engine until normal operating temperature is reached. 4. Run the engine at the specified rpm and record the gauge reading. 5. The oil pressure should be within specifications; refer to the appropriate specification chart. 6. If the pressure is not within specification, check the following possible sources:

^ Insufficient oil

^ Oil leakage

^ Worn or damaged oil pump

^ Oil pump screen cover and tube

^ Excessive main bearing clearance

^ Excessive connecting rod bearing clearance

ST1831-A	Lifting Eyes 303-D030 (D81L-6001-D) or equivalent
ST1703-A	Three-Bar Engine Support Kit 303-D063 (D88L-6000-A) or equivalent

Material

Item	Specification
Motorcraft Metal Surface Prep ZC-31	—
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4
Silicone Gasket Remover ZC-30	—

Removal

All vehicles

1. Remove the flywheel or flexplate. 2. Drain the engine oil. Vehicles equipped with coil springs 3. Remove the air cleaner outlet tube. 4. Remove the engine support insulator nuts. 5. Install the Lifting Eyes, the Three-Bar Engine Support and raise the engine 43 mm (1.72 inch). 6. Install blocks between the engine mounts and the support brackets.

All vehicles

7. Remove the bolts and the oil pan.

^ Discard the oil pan gasket.

Installation

All vehicles

1. CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These

tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.

NOTE: If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Observe all warnings and cautions and follow all application directions contained on the packaging of the silicone gasket remover and metal surface prep. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

Thoroughly clean the oil pan and the old sealer from all gasket surfaces. Thoroughly clean all exposed areas with metal surface prep. Thoroughly clean the transmission bell housing area. Clean and inspect the oil inlet tube.

2. CAUTION: The thickness of the sealant must be between 4-6 mm (0.16-0.23 inch) or oil leaks may occur.

NOTE: If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned.

Apply a 4-6 mm (0.16-0.23 inch) bead of silicone gasket and sealant to the junction of the main bearing cap and the cylinder block and to the junction of the front cover assembly and the cylinder block.

3. Position the oil pan gasket to the oil pan by aligning the fastener holes and securing the gasket with the gasket clips.

4. NOTE: Make sure the fasteners are clean and dry prior to installation.

Install the oil pan and bolts. Tighten in the sequence shown. ^

Tighten to 12 Nm (9 lb-ft).

Vehicles equipped with coil springs

5. Remove the blocks from between the engine mounts and the support brackets. 6. Lower the engine and remove the Three-Bar Engine Support and the Lifting Eyes. 7. Install the engine support insulator nuts.

^ Tighten to 109 Nm (80 lb-ft).

8. Install the air cleaner outlet tube.

All vehicles

9. Install the flywheel or flexplate.

10. Fill the engine with clean engine oil. 11. Start the engine and check for leaks.

Engine Oil Pressure (EOP) Switch

Engine Oil Pressure (EOP) Switch

Removal and Installation

1. Disconnect the engine oil pressure switch electrical connector from the engine oil pressure switch. 2. Remove the engine oil pressure switch.

^ To install, tighten to 20 Nm (15 lb-ft).

3. To install, reverse the removal procedure.

Engine Oil Pressure: Specifications

Oil pressure (hot 2,500 rpm) ..... 276-414 kPa (40-60 psi)

Engine Oil Pressure: Testing and Inspection

Oil Pressure Test

1. Disconnect and remove the oil pressure sensor from the engine. 2. Connect the Engine Oil Pressure Gauge to the oil pressure sender oil galley port. 3. Run the engine until normal operating temperature is reached. 4. Run the engine at the specified rpm and record the gauge reading. 5. The oil pressure should be within specifications; refer to the appropriate specification chart. 6. If the pressure is not within specification, check the following possible sources:

^ Insufficient oil

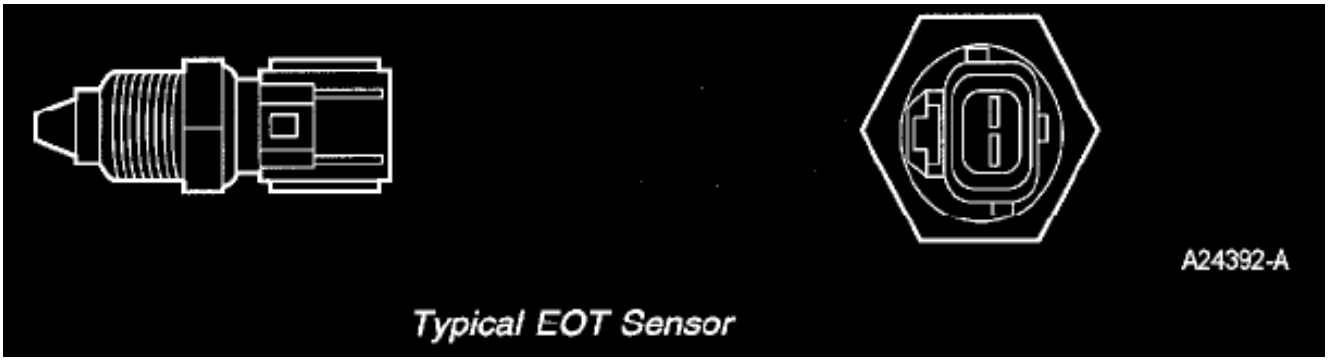
^ Oil leakage

^ Worn or damaged oil pump

^ Oil pump screen cover and tube

^ Excessive main bearing clearance

^ Excessive connecting rod bearing clearance



Typical EOT Sensor

Oil Temperature Sensor/Switch: Description and Operation

ENGINE OIL TEMPERATURE (EOT) SENSOR

Typical EOT Sensor

The EOT sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of a thermistor decreases as the temperature increases and the resistance increases as the temperature decreases. The varying resistance changes the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Thermistor-type sensors are considered passive sensors. A passive sensor is connected to a voltage divider network so that varying the resistance of the passive sensor causes a variation in total current flow. Voltage that is dropped across a fixed resistor in a series with the sensor resistor determines the voltage signal at the PCM. This voltage signal is equal to the reference voltage minus the voltage drop across the fixed resistor.

The EOT sensor measures the temperature of the engine oil. The sensor is typically threaded into the engine oil lubrication system. The PCM can use the EOT sensor input to determine the following:

- On variable camshaft timing (VCT) applications the EOT input is used to adjust the VCT control gains and logic for camshaft timing.

- The PCM can use EOT sensor input in conjunction with other PCM inputs to determine oil degradation.

- The PCM can use EOT sensor input to initiate a soft engine shutdown. To prevent engine damage from occurring as a result of high oil temperatures, the PCM has the ability to initiate a soft engine shutdown. Whenever engine RPM exceeds a calibrated level for a certain period of time, the PCM begins reducing power by disabling engine cylinders.

Intake Manifold: Customer Interest Engine - Blue Smoke On Start Up

TSB 07-22-10

11/12/07

3.0L 2V VULCAN ENGINE - BLUE SMOKE ON START Up

FORD: 2004-2008 Ranger

ISSUE Some 2004-2008 Ranger vehicles equipped with a 3.0L 2V Vulcan engine may exhibit blue smoke on start up after approximately a 4 hour cold soak. This may be due to small amounts of oil commonly found in the PCV system collecting in the upper intake manifold PCV channel. Under certain parking conditions, this oil can be drawn into the combustion chamber, creating momentary blue smoke that may be visible by the customer.

ACTION Follow the Service Procedure steps to reduce blue smoke on start up.

SERVICE PROCEDURE

1. Remove the clamp on the PCV tube assembly at the PCV valve.

2. Remove the upper intake manifold per the Workshop Manual (WSM), Section 303-01B. Leave the PCV tube assembly attached to the upper intake

manifold.

3. Remove the clamp on the PCV tube assembly at the upper intake manifold PCV port, and remove the PCV Tube Assembly from the upper intake

manifold PCV channel.

4. Drain the residual oil from the upper intake manifold PCV channel by holding the PCV channel vertical with the port facing down.

5. While holding the upper intake manifold in the vertical position, spray Brake Cleaner into the PCV channel. Use regulated compressed air to aid in

drying the PCV channel.

6. Lubricate the 0-Ring at the end of the new PCV Tube Assembly with water or diluted soapy water solution.

7. Install the new PCV Tube Assembly into the clean upper intake manifold PCV channel.

8. Install the upper intake manifold per WSM, Section 303-01B.

Parts Block

WARRANTY STATUS: Eligible Under Provisions Of New Vehicle Limited Warranty Coverage
IMPORTANT: Warranty coverage limits/policies are not altered by a TSB. Warranty coverage limits are determined by the identified causal part.

OPERATION DESCRIPTION TIME

072210A 2004-2008 Ranger 3.0L: 0.8 Hr.

Replace The PCV Tube, Includes Time To Remove Clean, Install Upper Intake Manifold (Do Not Use With 9424A, 6666A)

3	W707272-S	Upper intake manifold stud bolt
4	9424	Upper intake manifold
5	9H486	Upper intake manifold gasket (3 required)

Upper Intake Manifold

Removal

1. Disconnect the battery ground cable. 2. Remove the air cleaner outlet pipe. 3. Remove the bolt and the snow shield. 4. Disconnect the accelerator cable, speed control cable and the return spring. 5. Disconnect the accelerator cable and speed control cable from the accelerator bracket. 6. Disconnect the throttle position (TP) sensor and idle air control (IAC) valve electrical connectors. Disconnect the wire retainer. 7. Disconnect the engine vacuum harness-to-vacuum reservoir hose connection. 8. Disconnect the exhaust manifold-to-EGR valve tube from the EGR valve.

^ To install, tighten to 50 Nm (37 lb-ft).

9. Disconnect the fuel vapor hose from the intake manifold.

10. Disconnect the EGR vacuum regulator solenoid electrical connector. 11. Disconnect the brake booster vacuum hose and the PCV valve tube. 12. Remove the oil level indicator tube bracket nut and position the tube and bracket out of the way.

^ To install, tighten to 18 Nm (13 lb-ft).

13. Remove the nut and the upper intake manifold brace.

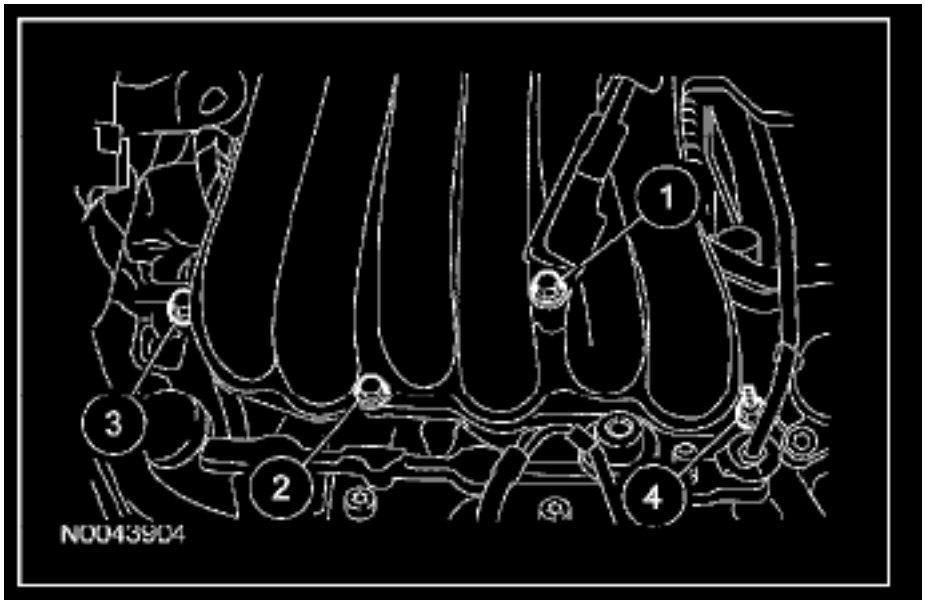
^ To install, tighten to 6 Nm (53 lb-inch).

14. Remove the bolts, the studbolt and the upper intake manifold.

^ Remove and discard the gaskets.

^ Clean and inspect all mating surfaces.

^ To install, tighten to 10 Nm (89 lb-inch) in the sequence shown.



15. NOTE: Install new gaskets.

To install, reverse the removal procedure.

Lower Intake Manifold

Removal

1. Drain the engine cooling system. 2. Remove both the valve covers. 3. Disconnect the upper radiator hose, heater hose and coolant bypass hose. 4. Disconnect the engine coolant temperature (ECT) sensor electrical connector. 5. Disconnect the crankshaft position (CKP) sensor electrical connector and detach the wiring retainer from the stud bolt. 6. Disconnect the fuel injector electrical connectors and position the engine wiring harness aside. 7. Release the fuel pressure and disconnect the fuel tube spring lock coupling. 8. Loosen the rocker arm bolts.

9. NOTE: Identify the location of each push rod. Each push rod is to be installed in the original location to prevent premature wear.

Remove all the push rods.

10. Remove the bolts from the lower intake manifold.

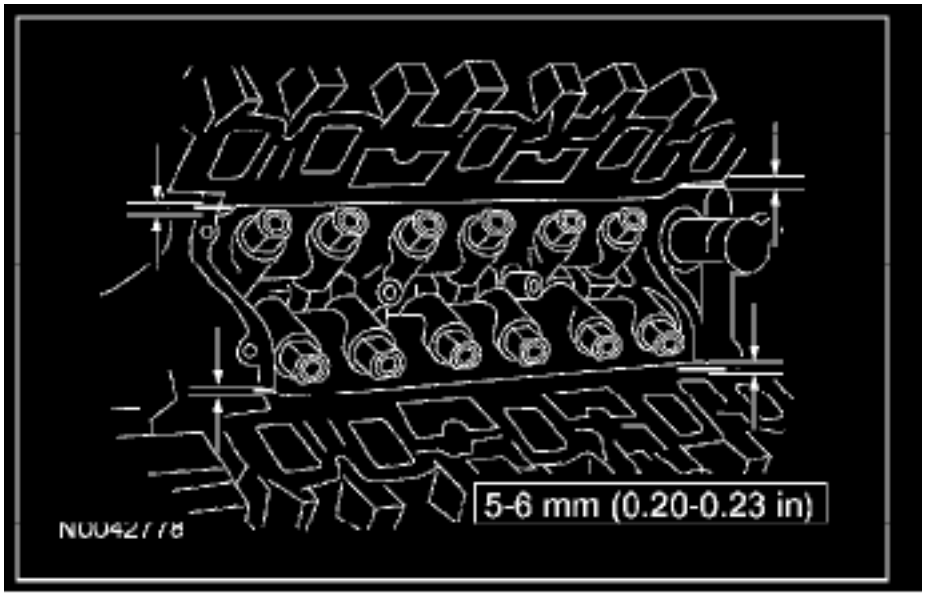
11. NOTE: Gently loosen the intake manifold to separate the silicone sealant from the cylinder block.

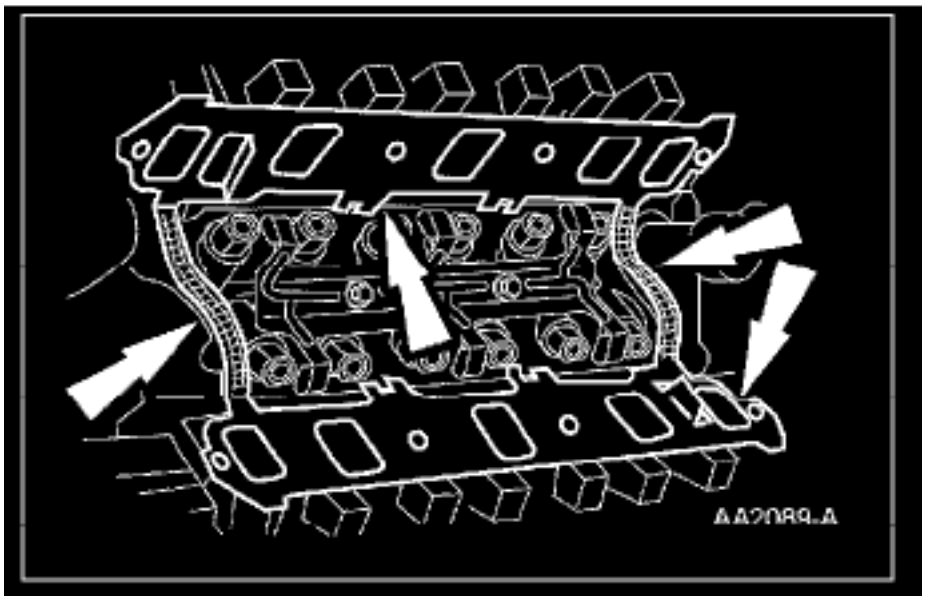
Remove the lower intake manifold.

12. Remove and discard the intake manifold gaskets and end seals.

13. CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These

tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.





NOTE: To clean the sealing area, use silicone gasket remover and metal surface prep. Observe all warnings and cautions and follow all application directions contained on the packaging of the silicone gasket remover and metal surface prep.

Clean the lower intake manifold gasket mating surfaces.

Installation

1. CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These

tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.

NOTE: If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Observe all warnings and cautions and follow all application directions contained on the packaging of the silicone gasket remover and metal surface prep. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

Apply a drop of silicone gasket and sealant at the 4 cylinder block-to-cylinder head seams.

2. Install the intake manifold gaskets and end seals.

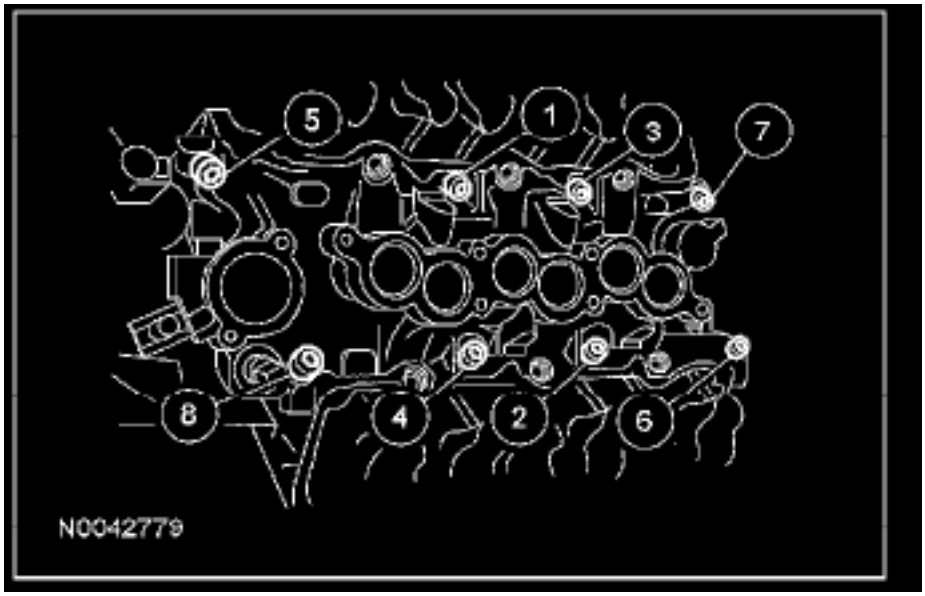
^ Position the intake manifold gaskets.

^ Position the end seals.

3. Position the lower intake manifold. 4. Install the bolts and tighten in 2 stages in the sequence shown.

^ Stage 1: Tighten to 15 Nm (11 lb-ft).

^ Stage 2: Tighten to 32 Nm (24 lb-ft).



5. Install the push rods. 6. Tighten the rocker arm bolts.

^ Tighten to 32 Nm (24 lb-ft).

7. Connect the fuel tube. 8. Connect the fuel injector electrical connectors. 9. Connect the CKP sensor electrical connector and attach the wiring retainer to the stud bolt.

10. Connect the ECT sensor electrical connector. 11. Connect the upper radiator hose, heater hose and coolant bypass hose. 12. Install both valve covers. 13. Fill and bleed the engine cooling system.

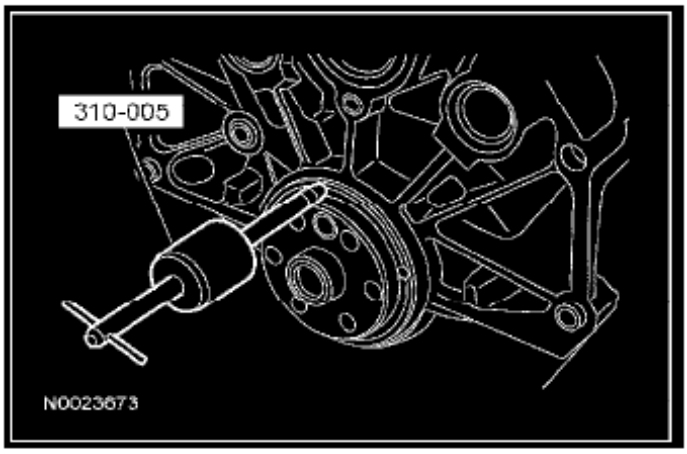
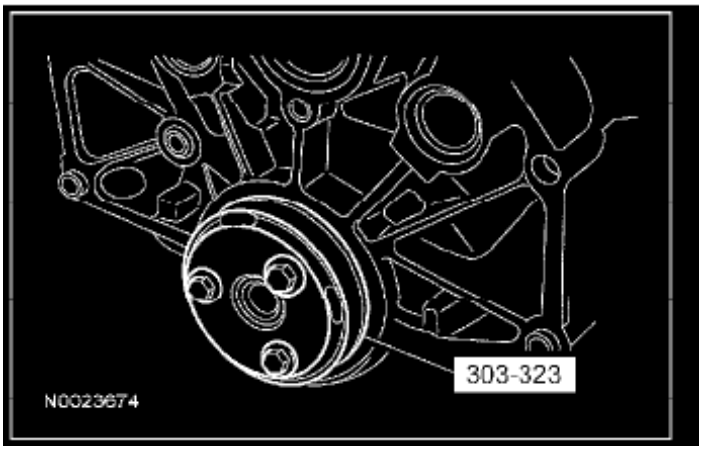
Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A





Removal

1. Remove the flywheel or flexplate.

2. CAUTION: Use care to avoid scratching or damaging the oil seal surface or leakage may occur.

Using a sharp awl, punch one hole into the crankshaft rear oil seal metal surface between the seal lip and the cylinder block.

3. Screw the threaded end of the special tool into the oil seal. Use the special tool to remove the crankshaft rear oil seal.

Installation

1. Lubricate the outer lips and the inner seal on the crankshaft rear oil seal with clean engine oil. 2. Using the special tool, install the crankshaft rear oil seal. Alternate bolt tightening to correctly seat the crankshaft rear oil seal.

3. Install the flywheel or flexplate.

Front Crankshaft Seal: Service and Repair

Crankshaft Front Seal

Removal

1. Remove the crankshaft vibration damper. 2. Remove the crankshaft front seal.

Installation

1. Install the crankshaft front seal.

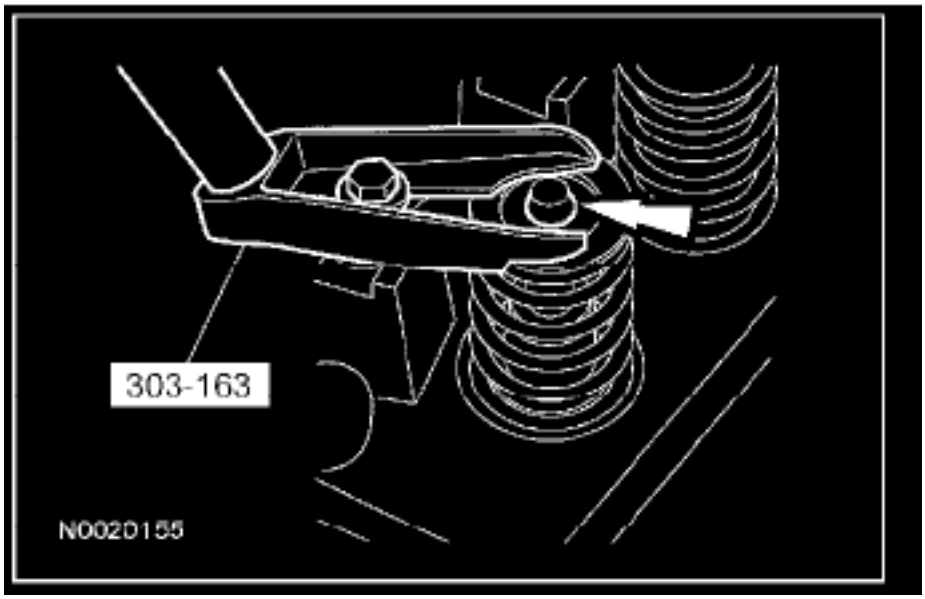
^ Lubricate the seal lip with clean engine oil.

^ Using the special tool, install the crankshaft front seal.

2. Install the crankshaft damper.

Special Tool(s)

Compressor, Valve Spring
303-163 (T81P-6513-A)



Valve Guide Seal: Service and Repair

Valve Seals

Removal and Installation

CAUTION: During engine repair procedures, cleanliness is extremely important. Any foreign material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.

1. Remove the rocker arms.

2. NOTE: Install an air line with an adapter in the spark plug hole and turn on the air supply. If the air pressure fails to hold the valve(s) closed while

carrying out the following steps, valve or valve seat damage is indicated and the cylinder head must be removed.

NOTE: Apply a minimum of 689 kPa (100 psi) of compressed air to the cylinder.

Using the special tool, remove the valve spring retainer keys.

3. Remove the valve spring retainer. 4. Remove the valve spring and inspect. Refer to Engine for component tests for the valve spring. 5. Remove the valve stem seal.

6. CAUTION: Do not release the compressed air from the cylinder until after the valve spring retainer keys are installed, or the valve will

fall into the cylinder.

To install, reverse the removal procedure.

Item	Part Number	Description
1	14A464	Engine oil pressure (EOP) switch electrical connector (part of 12B637)
2	9278	EOP switch

Oil Pressure Sender: Service and Repair

Engine Oil Pressure (EOP) Switch

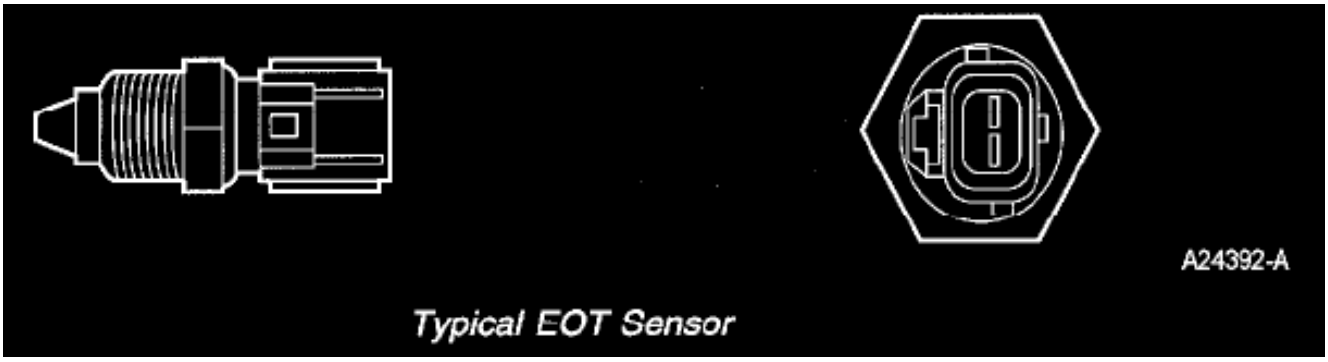
Engine Oil Pressure (EOP) Switch

Removal and Installation

1. Disconnect the engine oil pressure switch electrical connector from the engine oil pressure switch. 2. Remove the engine oil pressure switch.

^ To install, tighten to 20 Nm (15 lb-ft).

3. To install, reverse the removal procedure.



Typical EOT Sensor

Oil Temperature Sensor/Switch: Description and Operation

ENGINE OIL TEMPERATURE (EOT) SENSOR

Typical EOT Sensor

The EOT sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of a thermistor decreases as the temperature increases and the resistance increases as the temperature decreases. The varying resistance changes the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Thermistor-type sensors are considered passive sensors. A passive sensor is connected to a voltage divider network so that varying the resistance of the passive sensor causes a variation in total current flow. Voltage that is dropped across a fixed resistor in a series with the sensor resistor determines the voltage signal at the PCM. This voltage signal is equal to the reference voltage minus the voltage drop across the fixed resistor.

The EOT sensor measures the temperature of the engine oil. The sensor is typically threaded into the engine oil lubrication system. The PCM can use the EOT sensor input to determine the following:

- On variable camshaft timing (VCT) applications the EOT input is used to adjust the VCT control gains and logic for camshaft timing.

- The PCM can use EOT sensor input in conjunction with other PCM inputs to determine oil degradation.

- The PCM can use EOT sensor input to initiate a soft engine shutdown. To prevent engine damage from occurring as a result of high oil temperatures, the PCM has the ability to initiate a soft engine shutdown. Whenever engine RPM exceeds a calibrated level for a certain period of time, the PCM begins reducing power by disabling engine cylinders.

Engine Front Cover

Removal

1. Drain the engine coolant. 2. Remove the accessory drive belt. 3. Remove the fan and shroud assembly. 4. Remove the bolts and the coolant pump pulley. 5. Remove the nut and detach the wiring harness bracket. 6. Remove the nut and position the A/C hose and bracket assembly aside.

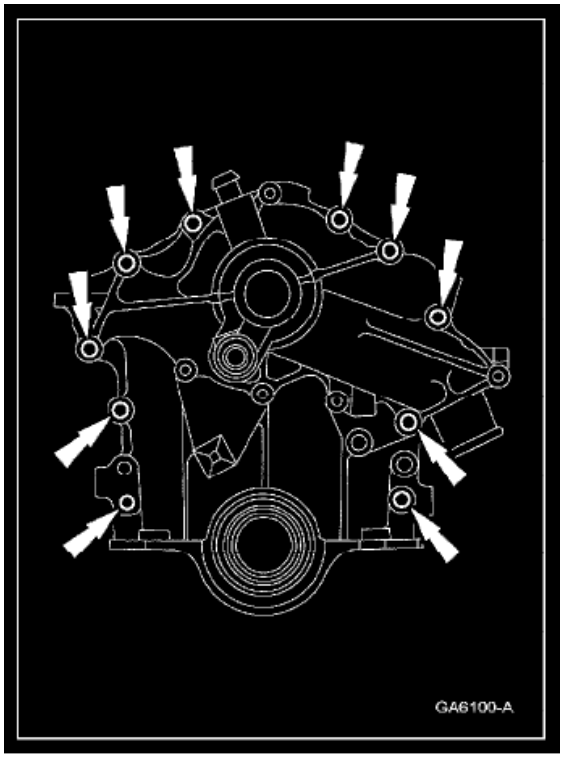
7. Remove the stud bolts from the A/C compressor mounting bracket. 8. Remove the bolt and the accessory drive belt tensioner. 9. Remove the bolts and position the power steering bracket and compressor aside.

10. Disconnect the heater hose at the coolant pump. 11. Disconnect the lower radiator hose assembly at the coolant pump outlet and lower intake manifold. 12. Remove the crankshaft front seal. 13. Remove the oil pan. 14. Remove the crankshaft position (CKP) sensor.

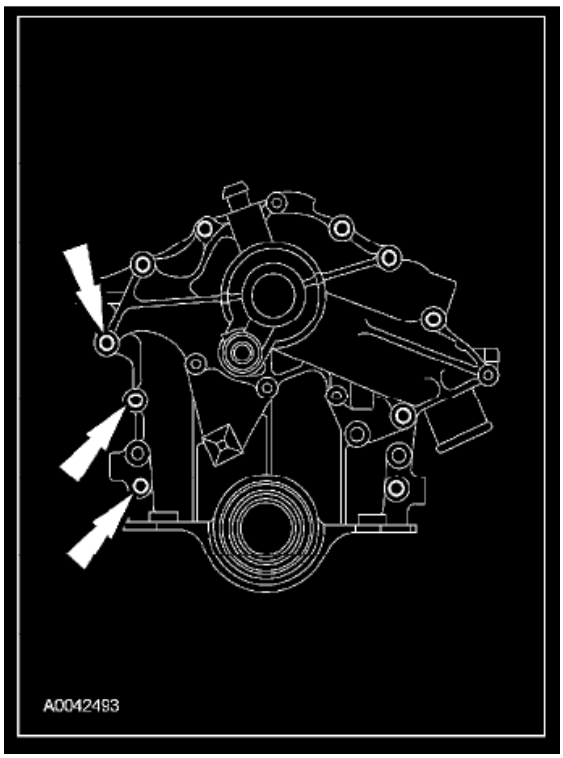
^ Disconnect the CKP sensor electrical connector.

^ Remove the 2 bolts and the CKP sensor.

15. Remove the bolts and the stud bolts, and remove the engine front cover and the coolant pump as an assembly.



GA6100-A



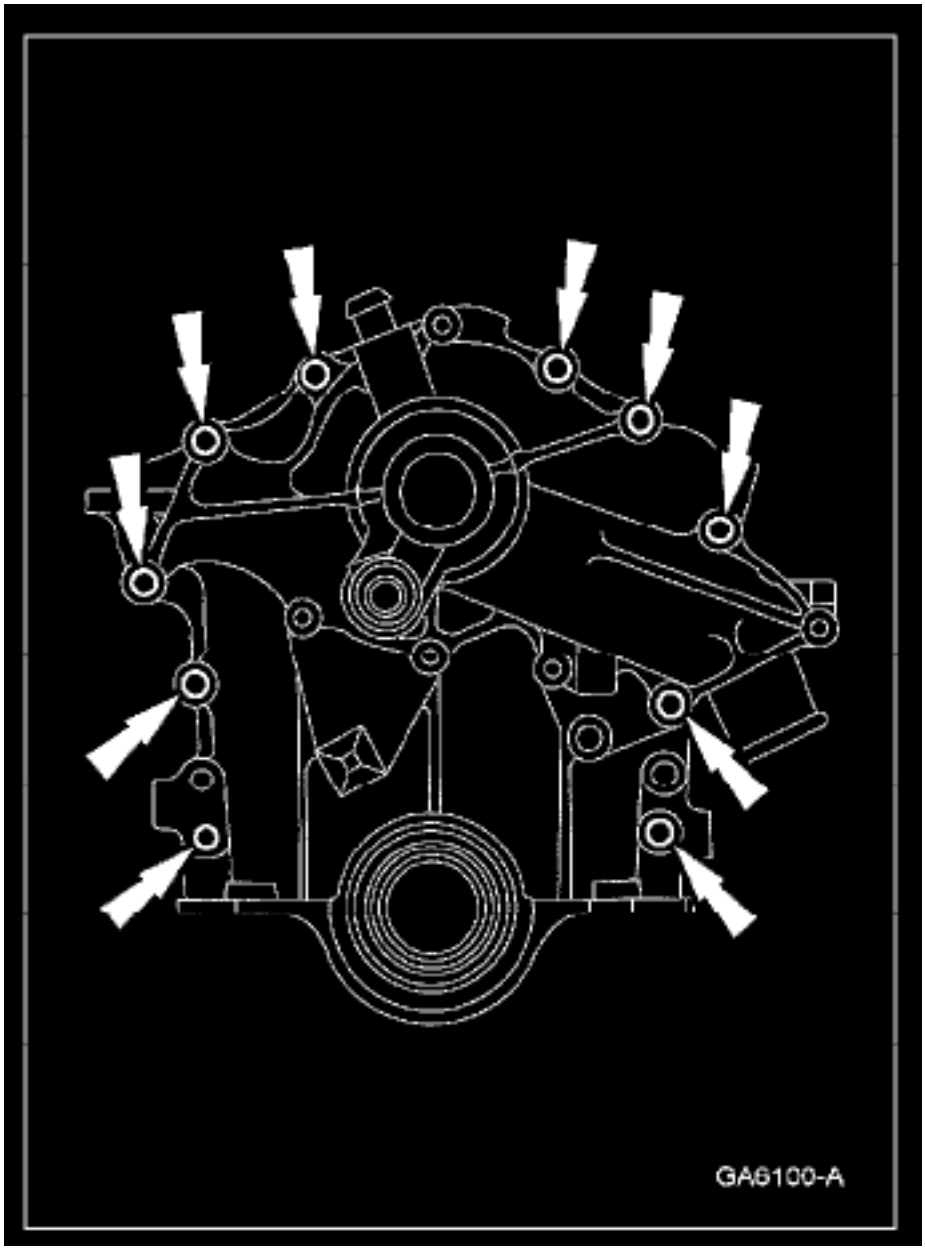
A0042483

16. Remove and discard the front cover gasket.

Installation

1. Clean all sealing surfaces and position a new front cover gasket. 2. Position the engine front cover. 3. Apply pipe sealant with PTFE to the bolts to be installed in the locations shown.

4. Install the engine front cover bolts.



^ Tighten to 25 Nm (18 lb-ft).

5. Position the CKP and install the 2 bolts.

^ Tighten to 10 Nm (89 lb-inch).

6. Connect the CKP sensor electrical connector. 7. Install the oil pan. 8. Install the crankshaft front seal. 9. Connect the lower radiator hose assembly at the coolant pump outlet and lower intake manifold.

10. Connect the heater hose at the coolant pump. 11. Position the A/C compressor and power steering bracket. Install the bolts.

^ Tighten to 47 Nm (35 lb-ft).

12. Install the accessory drive belt tensioner and install the bolt.

^ Tighten to 27 Nm (20 lb-ft).

13. Install the stud bolts to the A/C compressor mounting bracket.

^ Tighten to 47 Nm (35 lb-ft).

14. Position the A/C hose and bracket assembly and install the nut.

^ Tighten to 11 Nm (8 lb-ft).

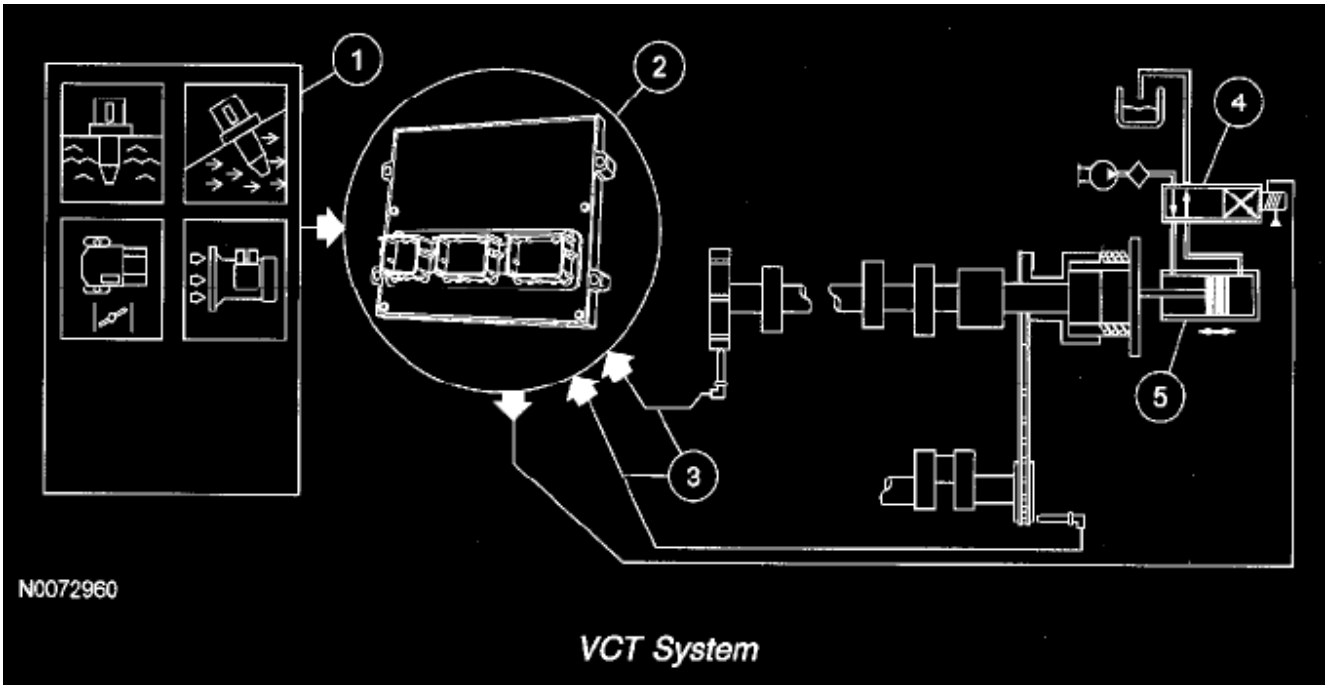
15. Position the wiring harness bracket and install the nut.

^ Tighten to 10 Nm (89 lb-inch).

16. Install the coolant pump pulley and the bolts.

^ Tighten to 25 Nm (18 lb-ft).

17. Install the fan and shroud assembly. 18. Install the accessory drive belt. 19. Fill and bleed the cooling system.



VCT System

Variable Valve Timing Actuator: Description and Operation

VARIABLE CAMSHAFT TIMING (VCT) SYSTEM

Overview

The VCT enables rotation of the camshaft(s) relative to the crankshaft rotation as a function of engine operating conditions. There are 4 types of VCT systems.

- Exhaust phase shifting (EPS) system - the exhaust cam is the active cam being retarded.

- Intake phase shifting (IPS) system - the intake cam is the active cam being advanced.

- Dual equal phase shifting (DEPS) system - both intake and exhaust cams are phase shifted and equally advanced or retarded.

- Dual independent phase shifting (DIPS) system - where both the intake and exhaust cams are shifted independently.

All systems have 4 operational modes: idle, part throttle, wide open throttle (WOT), and default mode. At idle and low engine speeds with closed throttle, the powertrain control module (PCM) determines the phase angle based on air flow, engine oil temperature and engine coolant temperature. At part and wide open throttle the PCM determines the phase angle based on engine RPM, load, and throttle position. VCT systems provide reduced emissions and enhanced engine power, fuel economy and idle quality. IPS systems also have the added benefit of improved torque. In addition, some VCT system applications can eliminate the need for an external exhaust gas recirculation (EGR) system. The elimination of the EGR system is accomplished by controlling the overlap time between the intake valve opening and exhaust valve closing. Currently, both the IPS and DEPS systems are used.

Variable Camshaft Timing (VCT) System

VCT System

The VCT system consists of an electric hydraulic positioning control solenoid, a camshaft position (CMP) sensor, and a trigger wheel. The CMP trigger wheel has a number of equally spaced teeth equal to the number (n) of cylinders on a bank plus one extra tooth (n+1). Four cylinder and V8 engines use a CMP 4+1 tooth trigger wheel. V6 engines use a CMP 3+1 tooth trigger wheel. The extra tooth placed between the equally spaced teeth represents the CMP signal for that bank. A crankshaft position (CKP) sensor provides the PCM with crankshaft positioning information in 10 degree increments.

1. The PCM receives input signals from the intake air temperature (IAT) sensor, engine coolant temperature (ECT) sensor, engine oil temperature

(EOT) sensor, CMP, throttle position (TP) sensor, mass air flow (MAF) sensor, and CKP to determine the operating conditions of the engine. At idle and low engine speeds with closed throttle, the PCM controls the camshaft position based on ECT, EOT, IAT, and MAF. During part and wide open throttle, the camshaft position is determined by engine RPM, load and throttle position. The VCT system does not operate until the engine is at normal operating temperature.

2. The VCT system is enabled by the PCM when the correct conditions are met. 3. The CKP signal is used as a reference for CMP positioning. 4. The VCT solenoid valve is an integral part of the VCT system. The solenoid valve controls the flow of engine oil in the VCT actuator assembly.

As the PCM controls the duty cycle of the solenoid valve, oil pressure/flow advances or retards the cam timing. Duty cycles near 0% or 100% represent rapid movement of the camshaft. Retaining a fixed camshaft position is accomplished by dithering (oscillating) the solenoid valve duty cycle.

The PCM calculates and determines the desired camshaft position. It continually updates the VCT solenoid duty cycle until the desired position is achieved. A difference between the desired and actual camshaft position represents a position error in the PCM VCT control loop. The PCM

disables the VCT and places the camshaft in a default position if a concern is detected. A related DTC is also set when the concern is detected.

5. When the VCT solenoid is energized, engine oil is allowed to flow to the VCT actuator assembly which advances or retards the camshaft timing.

One half of the VCT actuator is coupled to the camshaft and the other half is connected to the timing chain. Oil chambers between the 2 halves couple the camshaft to the timing chain. When the flow of oil is shifted from one side of the chamber to the other, the differential change in oil pressure forces the camshaft to rotate in either an advance or retard position depending on the oil flow.

Fuel Pressure: Specifications

Item.....Specification

Engine running.....414-448 kPa (60-65 psi) Key ON, engine OFF.....414-448 kPa (60-65 psi)

FUEL SYSTEM PRESSURE TEST

Special Tool(s)

Special Tool(s)

WARNING:

- Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

- Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

- Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

- When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

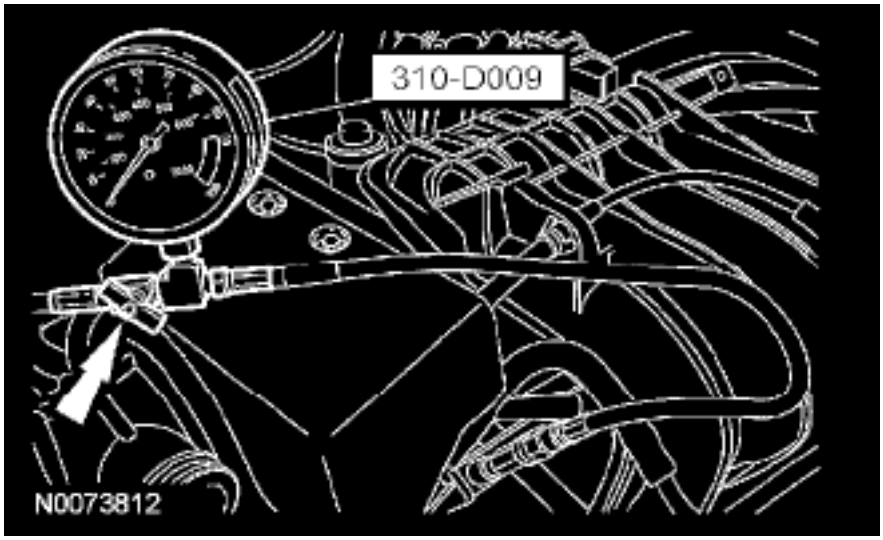
1. NOTE: 2.3L shown, 3.0L and 4.0L similar.

Remove the cap from the fuel pressure relief valve located on the fuel rail.

2. NOTE: 2.3L shown, 3.0L and 4.0L similar.

Install the special tool onto the fuel pressure relief valve.

3. Test the fuel system pressure to make sure it is within the specified range.



4. NOTE:

- 2.3L shown, 3.0L and 4.0L similar.

- Open the drain valve slowly to relieve the fuel system pressure. This may drain fuel from the system. Place fuel in a suitable container.

Upon completion of the fuel system pressure test, open the drain valve on the special tool and relieve the fuel system pressure.

5. NOTE: It may take more than one key cycle to pressurize the fuel system.

Cycle the ignition key and wait 3 seconds to pressurize the fuel system. Check for leaks before starting the engine.

Special Tool(s)

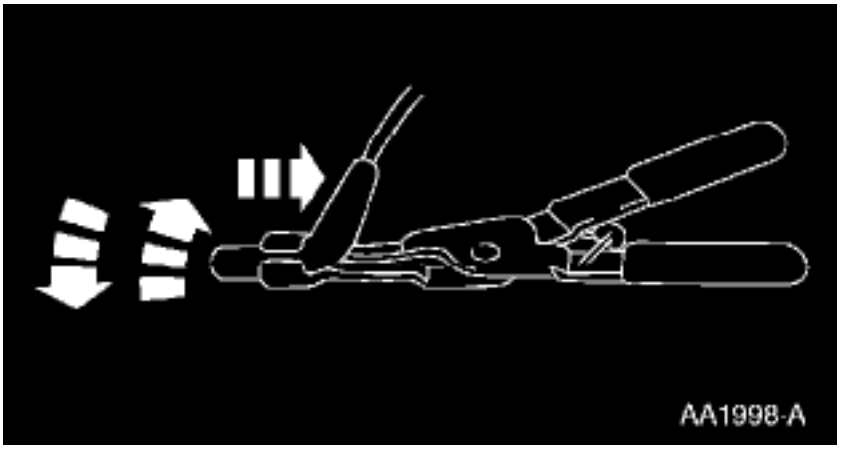
Removal and Installation

CAUTION: Spark plug wires must be connected correctly. Failure to follow this instruction may result in poor engine performance.

1. CAUTION: Do not pull on the spark plug wire as it may separate from the spark plug wire connector inside the spark plug wire boot.

Use the Spark Plug Wire Remover to grasp and twist the spark plug wire boot back and forth on the spark plug insulator to release the connectors.



2. Disconnect the spark plug wires from the ignition coil by twisting while pulling upward. 3. Open the spark plug wire separators and remove the spark plug wires.

4. CAUTION: Correct installation of the spark plug wires is critical to vehicle operation. If one spark plug wire is not correctly installed on

the spark plug or ignition coil, both spark plugs connected to that segment of the ignition coil may not fire under load.

To install, reverse the removal procedure. -

Use a small, clean tool to coat the entire interior surface of the boots with silicone brake caliper grease.

Spark Plug: Testing and Inspection

Spark Plug Inspection

1. Inspect the spark plug for a bridged gap.

^ Check for deposit build-up closing the gap between the electrodes. Deposits are caused by oil or carbon fouling.

^ Clean the spark plug.

2. Check for oil fouling.

^ Check for wet, black deposits on the insulator shell bore electrodes, caused by excessive oil entering the combustion chamber through worn rings and pistons, excessive valve-to-guide clearance or worn or loose bearings.

^ Correct the oil leak concern.

^ Install a new spark plug.

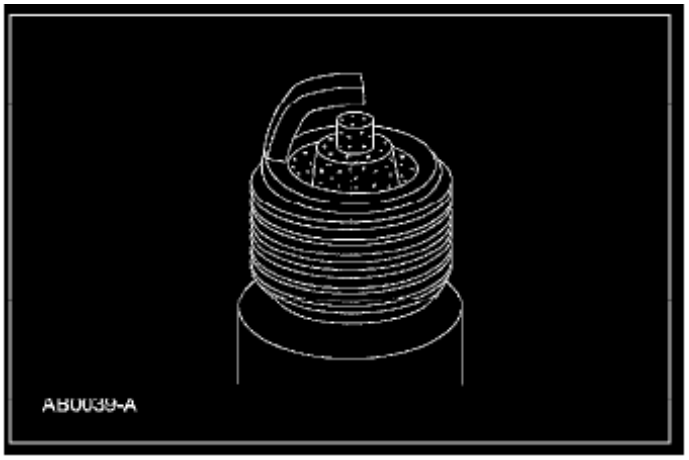
3. Inspect for carbon fouling. Look for black, dry, fluffy carbon deposits on the insulator tips, exposed shell surfaces and electrodes, caused by a

spark plug with an incorrect heat range, dirty air cleaner, too rich a fuel mixture or excessive idling.
^

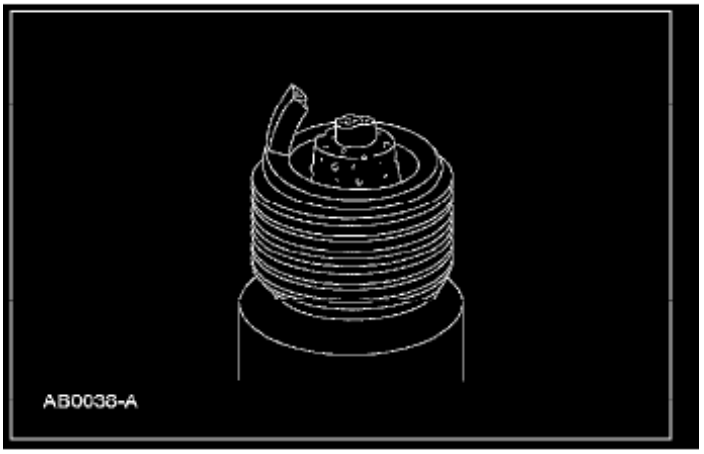
Install new spark plugs.

4. Inspect for normal burning.

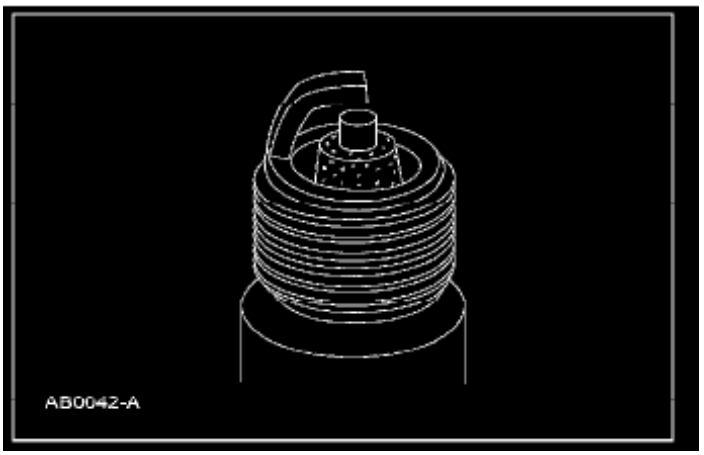
^ Check for light tan or gray deposits on the firing tip.



AB0039-A



AB0038-A



AB0042-A

5. Inspect for pre-ignition, identified by melted electrodes and a possibly damaged insulator. Metallic deposits on the insulator indicate engine

damage. This may be caused by incorrect ignition timing, wrong type of fuel or the unauthorized installation of a Heli-Coil(R) insert in place of the spark plug threads. ^

Install a new spark plug.

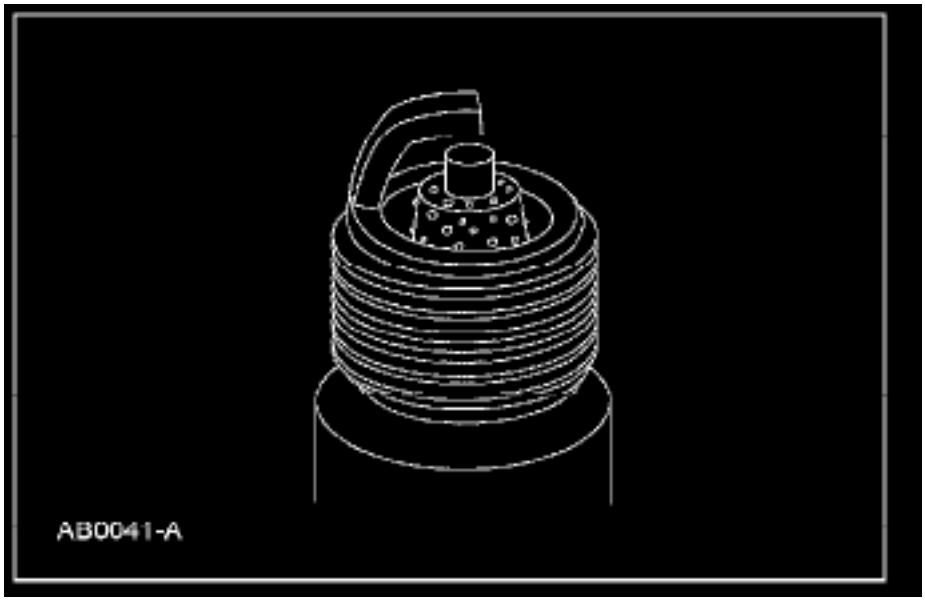
6. Inspect for overheating, identified by white or light gray spots and with a bluish-burnt appearance of electrodes. This is caused by engine

overheating, wrong type of fuel, loose spark plugs, spark plugs with an incorrect heat range, low fuel pump pressure or incorrect ignition timing. ^

Install a new spark plug.

7. Inspect for fused deposits, identified by melted or spotty deposits resembling bubbles or blisters. These are caused by sudden acceleration.

^ Install new spark plugs.



AB0041-A

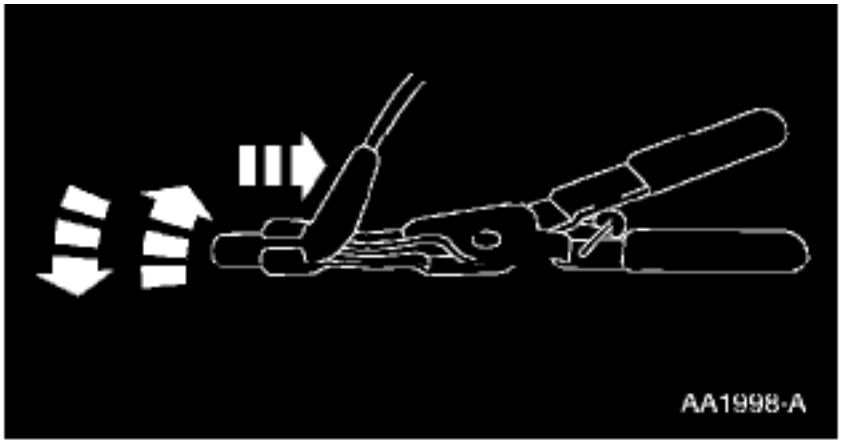
Removal and Installation

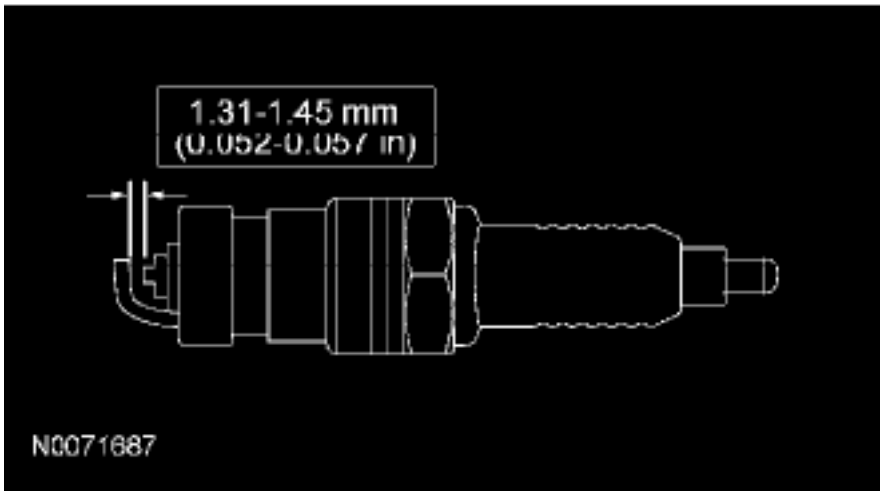
1. CAUTION:

- Spark plug wires must be connected correctly. Failure to follow this instruction may result in poor engine performance.

- Do not pull on the spark plug wire as it may separate from the spark plug wire connector inside the spark plug wire boot.

Use the Spark Plug Wire Remover to grasp and twist the spark plug wire boot back and forth on the spark plug insulator to release the connectors.





2. Loosen the spark plugs. 3. Remove any foreign material from the spark plug areas of the cylinder head with compressed air. 4. Remove the spark plugs.

- To install, tighten to 15 Nm (11 lb-ft).

5. Inspect the spark plugs. 6. Adjust the spark plug gap as necessary.

7. To install, reverse the removal procedure.

- Use a small, clean tool to coat the entire interior surface of the boot with silicone brake caliper grease.

Compression Check: Testing and Inspection

Compression Test - Compression Gauge Check

1. Make sure the oil in the crankcase is of the correct viscosity and at the correct level and that the battery is correctly charged. Operate the vehicle

until the engine is at normal operating temperature. Turn the ignition switch to the OFF position, then remove all the spark plugs.

2. Set the throttle plates in the wide-open position. 3. Install a compression gauge such as the Compression Tester in the No. 1 cylinder. 4. Install an auxiliary starter switch in the starting circuit. With the ignition switch in the OFF position, and using the auxiliary starter switch, crank

the engine a minimum of 5 compression strokes and record the highest reading. Note the approximate number of compression strokes required to obtain the highest reading.

5. Repeat the test on each cylinder, cranking the engine approximately the same number of compression strokes.

Compression Test - Test Results

The indicated compression pressures are considered within specification if the lowest reading cylinder is at least 75% of the highest reading. Refer to the Compression Pressure Limit Chart.

Compression Pressure Limit Chart

Compression Pressure Limit Chart (Part 1)

Compression Pressure Limit Chart (Part 2)

If one or more cylinders read low, squirt approximately one tablespoon of engine oil on top of the pistons in the low-reading cylinders. Repeat the

compression pressure check on these cylinders.

Compression Test - Interpreting Compression Readings

1. If compression improves considerably, piston rings are faulty. 2. If compression does not improve, valves are sticking or seating incorrectly. 3. If 2 adjacent cylinders indicate low compression pressures and squirting oil on each piston does not increase compression, the head gasket may be

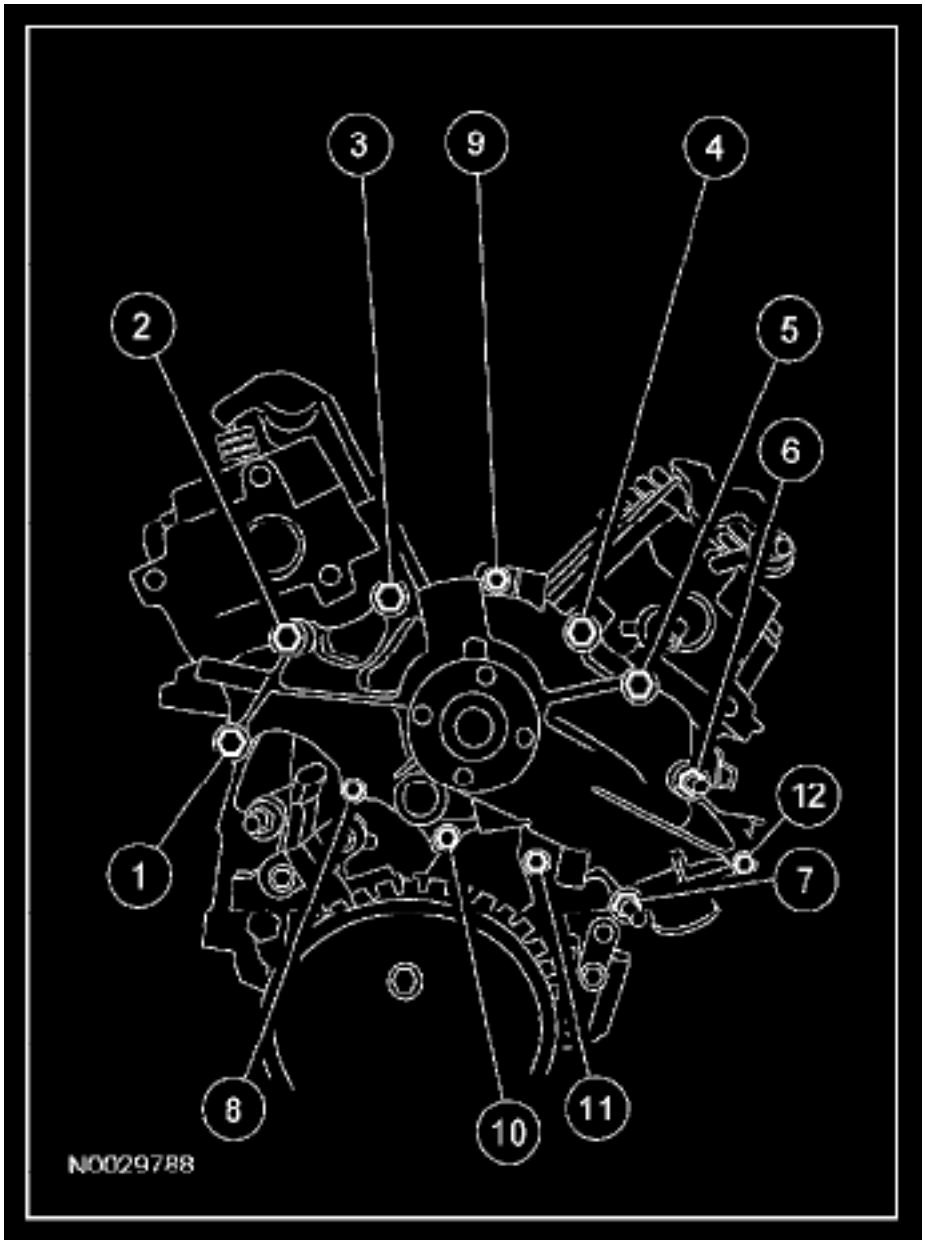
leaking between cylinders. Engine oil or coolant in cylinders could result from this condition.

Use the Compression Pressure Limit Chart when checking cylinder compression so that the lowest reading is within 75% of the highest reading.

Valve Clearance: Specifications

Valve Clearance

This engine is equipped with hydraulic valve lifters. No adjustment is required.



Water Pump: Specifications

Coolant pump 10 bolts and 2 stud bolts:

bolts 1-7 ..... 25 Nm (18 lb-ft) bolts 8-12 ..... 10 Nm (89 lb-inch)

LH Accessory Drive Bracket

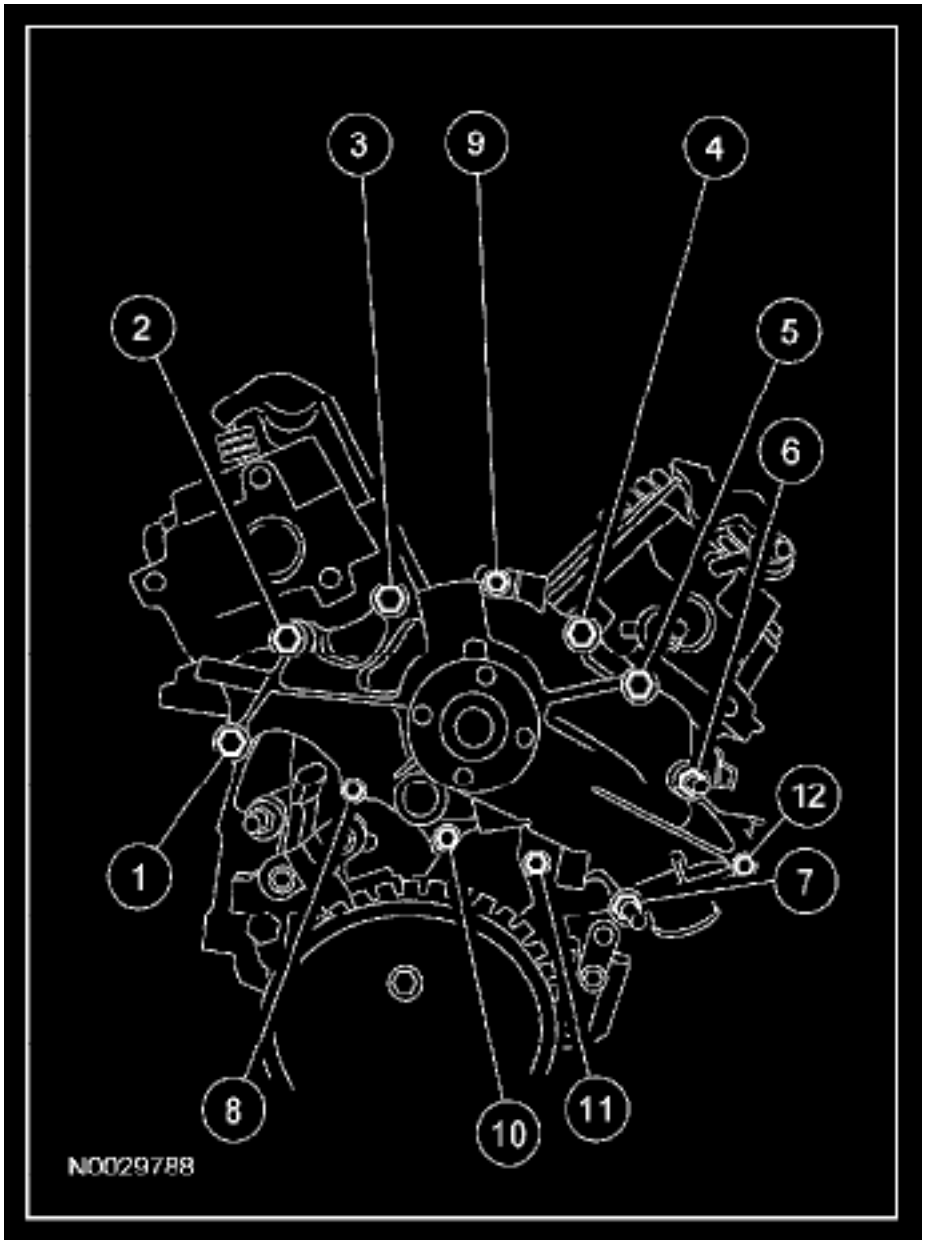
10	—	Bypass hose (part of 8B273)

Coolant Pump

Removal

1. Drain the cooling system. 2. Remove the air cleaner outlet tube. 3. Remove the accessory drive belt. 4. Remove the fan blade and the fan shroud. 5. Remove the bolts and the coolant pump pulley. 6. Disconnect the heater hose. 7. Disconnect the wiring harness retainer. 8. Remove the nut and detach the battery cable bracket. 9. Remove the side stud bolts from the A/C compressor mounting bracket.



10. Disconnect the bypass hose. 11. Remove the bolt and the accessory drive belt tensioner. 12. Remove the front bolts and position the A/C compressor mounting bracket aside. 13. Remove the bolts and the coolant pump. 14. Clean the sealing surfaces.

Installation

1. Position the coolant pump and loosely install the 10 bolts and 2 stud bolts.

^ Tighten bolts 1-7 in the sequence shown to 25 Nm (18 lb-ft).

^ Tighten bolts 8-12 in the sequence shown to 10 Nm (89 lb-inch).

2. Position the A/C compressor mounting bracket and install the front bolts.

^ Tighten to 51 Nm (38 lb-ft).

3. Position the accessory drive belt tensioner and install the bolt.

^ Tighten to 27 Nm (20 lb-ft).

4. Connect the bypass hose. 5. Install the A/C compressor mounting bracket side stud bolts.

^ Tighten to 47 Nm (35 lb-ft).

6. Position the battery cable bracket and install the nut.

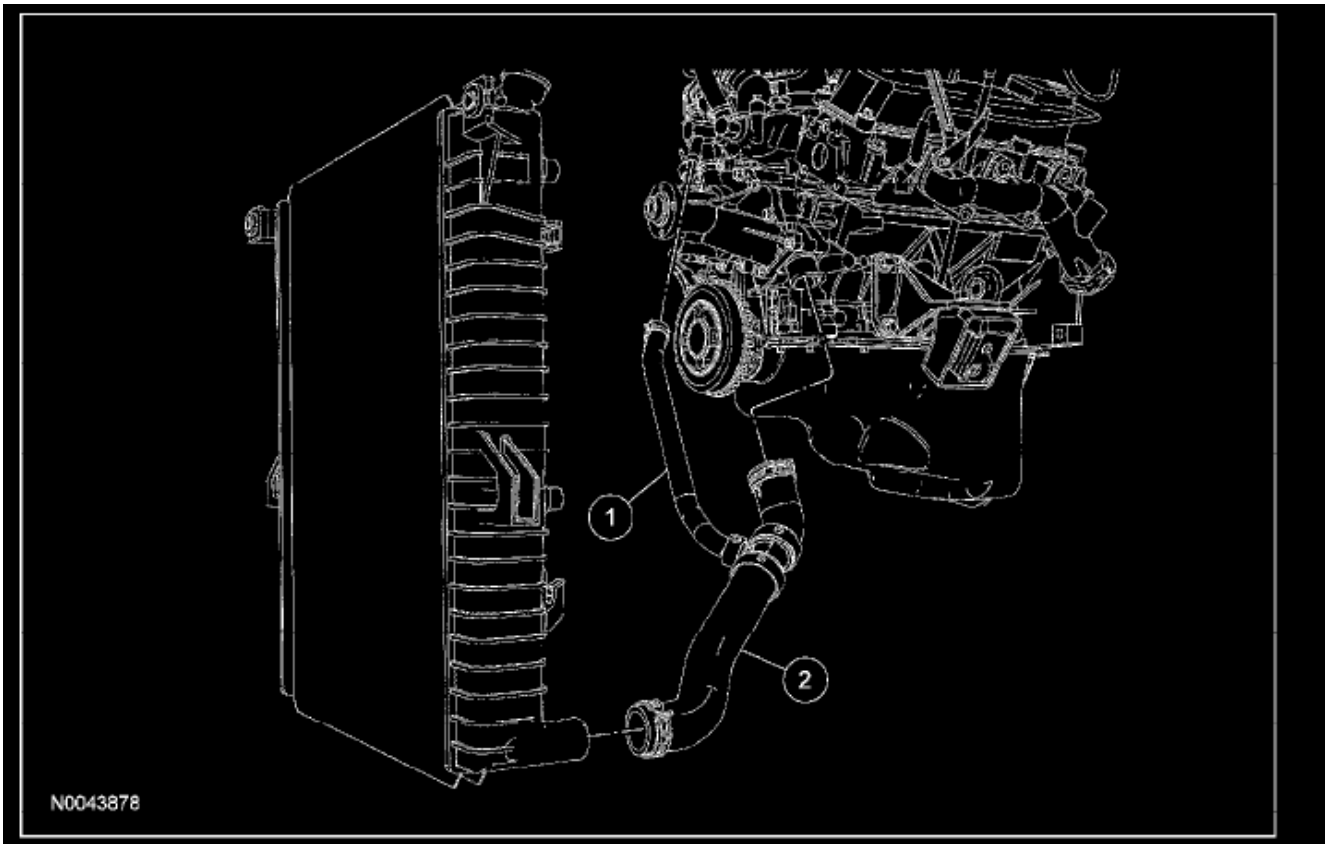
^ Tighten to 10 Nm (89 lb-inch).

7. Install the coolant pump pulley.

^ Tighten to 25 Nm (18 lb-ft).

8. Install the accessory drive belt. 9. Attach the wiring harness retainer.

10. Connect the heater hose. 11. Install the fan blade and fan shroud. 12. Install the air cleaner outlet tube. 13. Fill the cooling system.



Item	Part Number	Description
1	—	Bypass tube (part of 8286)
2	8286	Lower radiator hose

Thermostat Bypass Hose: Service and Repair

Bypass Tube - 3.0L

Removal and Installation

NOTE: The bypass tube and the lower radiator hose are a molded, one-piece assembly.

1. With the vehicle in NEUTRAL, position it on a hoist. 2. Drain the cooling system. 3. Disconnect the bypass tube from the water pump. 4. Disconnect the lower radiator hose from the engine. 5. Disconnect the lower radiator hose from the radiator and remove the lower radiator hose. 6. To install, reverse the removal procedure.

Coolant: Capacity Specifications

Coolant Capacity:

Manual Transmission ..... 15.1 qts (14.3L)

Automatic Transmission ..... 14.8 qts (14.0L)

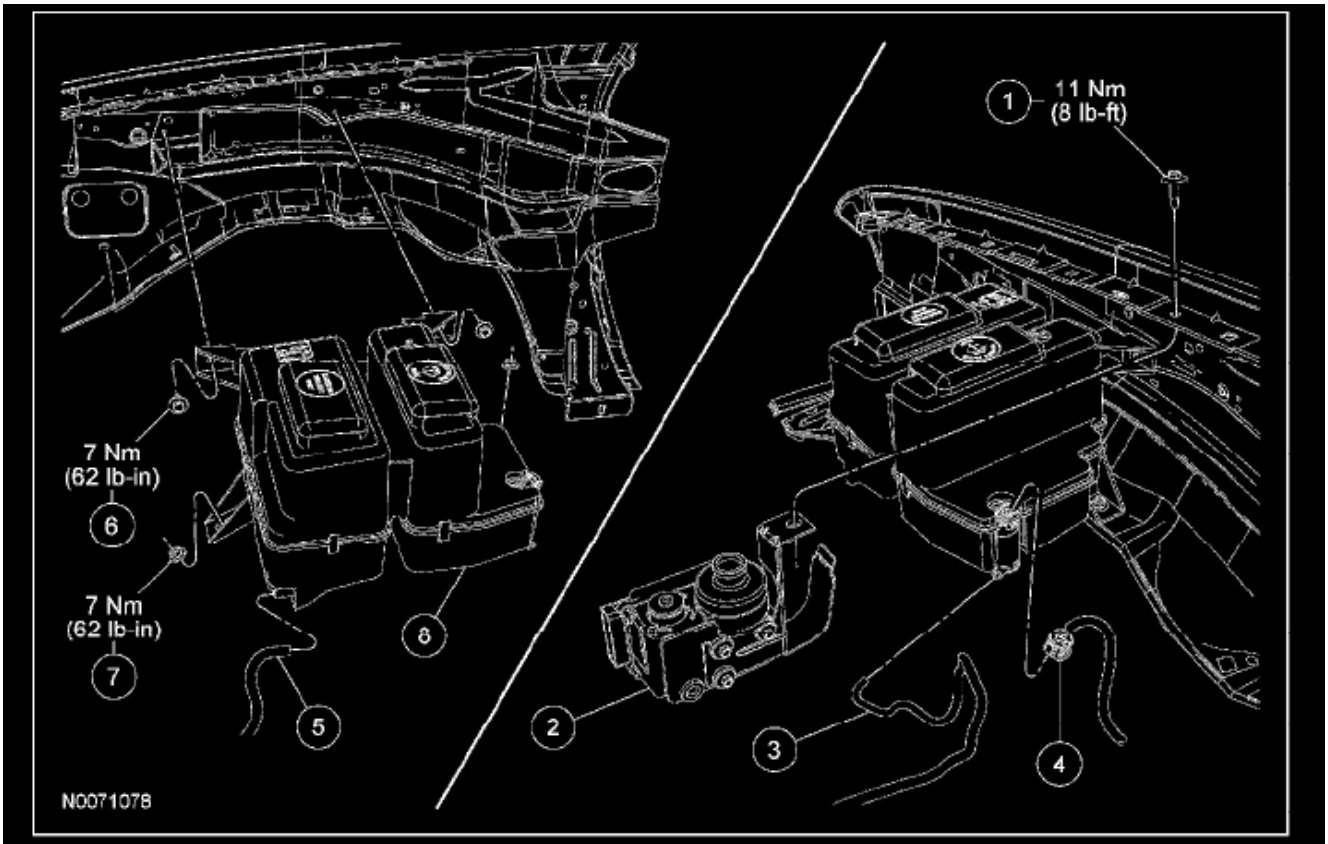
Coolant: Fluid Type Specifications

Engine Coolant

.....

Motorcraft Premium Gold Engine Coolant

Note: Add the coolant type originally equipped in your vehicle.



Item	Part Number	Description
1	N811664	Speed control servo bolt
2	9C734	Speed control servo
3	17K605	Windshield washer hose
4	14A464	Windshield washer motor electrical connector (part of 14290)
5	8W005	Radiator overflow hose
6	N611102	Coolant expansion tank bolt (2 required)
7	N621906	Coolant expnasion tank nut (2 required)
8	17B613	Coolant expansion tank

Coolant Reservoir: Service and Repair

Coolant Expansion Tank - 3.0L, 4.0L

Removal and Installation

1. Remove the air cleaner. 2. If equipped, remove the speed control servo bolt and position the servo aside.

^ To install, tighten to 11 Nm (8 lb-ft).

3. Disconnect the windshield washer hose. 4. Disconnect the windshield washer motor electrical connector. 5. Disconnect the overflow hose at the coolant expansion tank and drain the coolant into a suitable container. 6. Remove the 2 bolts, the 2 nuts and the coolant expansion tank.

^ To install, tighten to 7 Nm (62 lb-inch).

7. To install, reverse the removal procedure.

Radiator Cooling Fan Motor: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

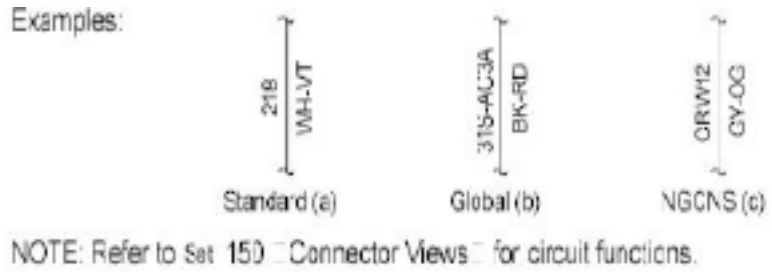
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

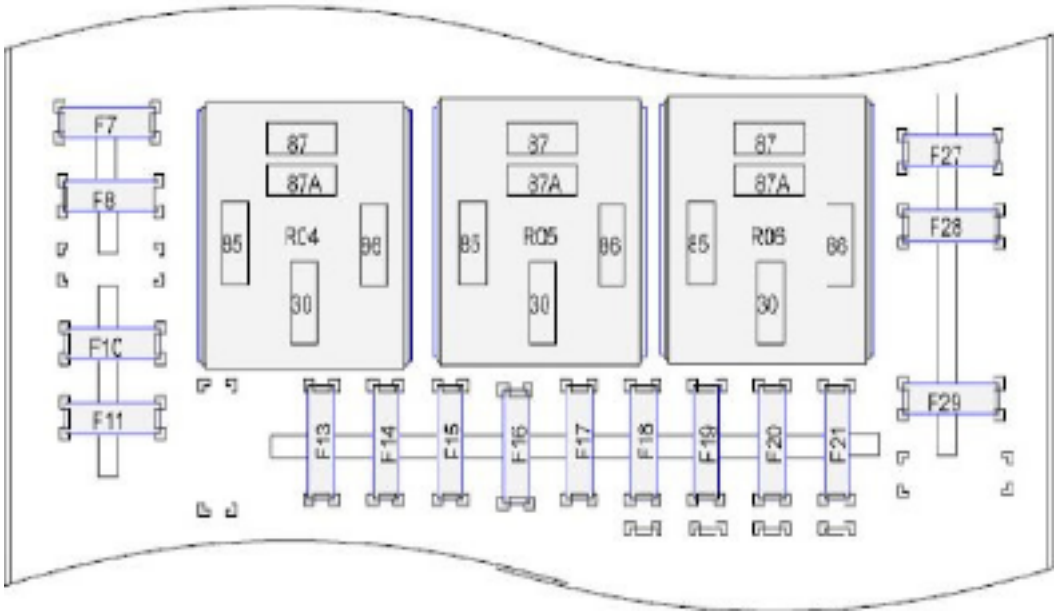
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

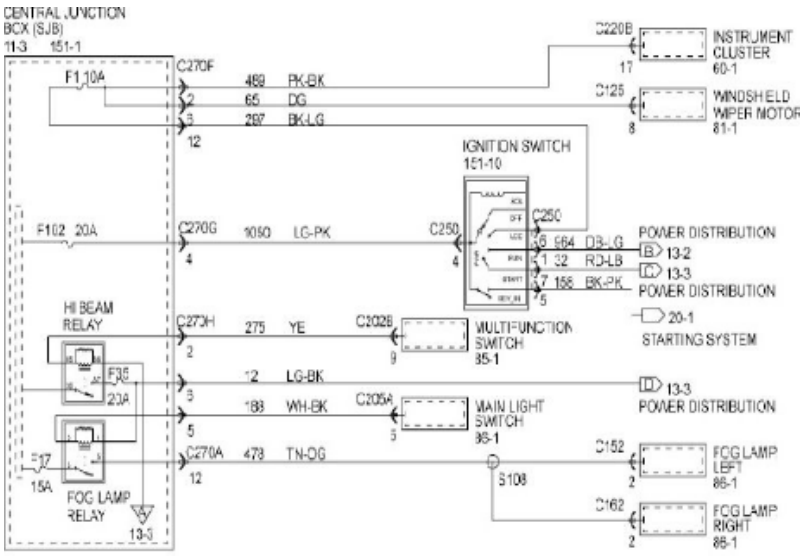
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

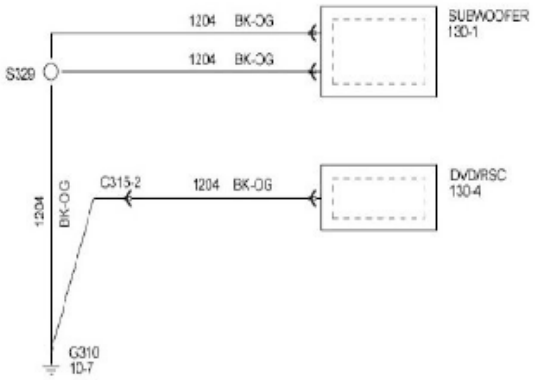
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

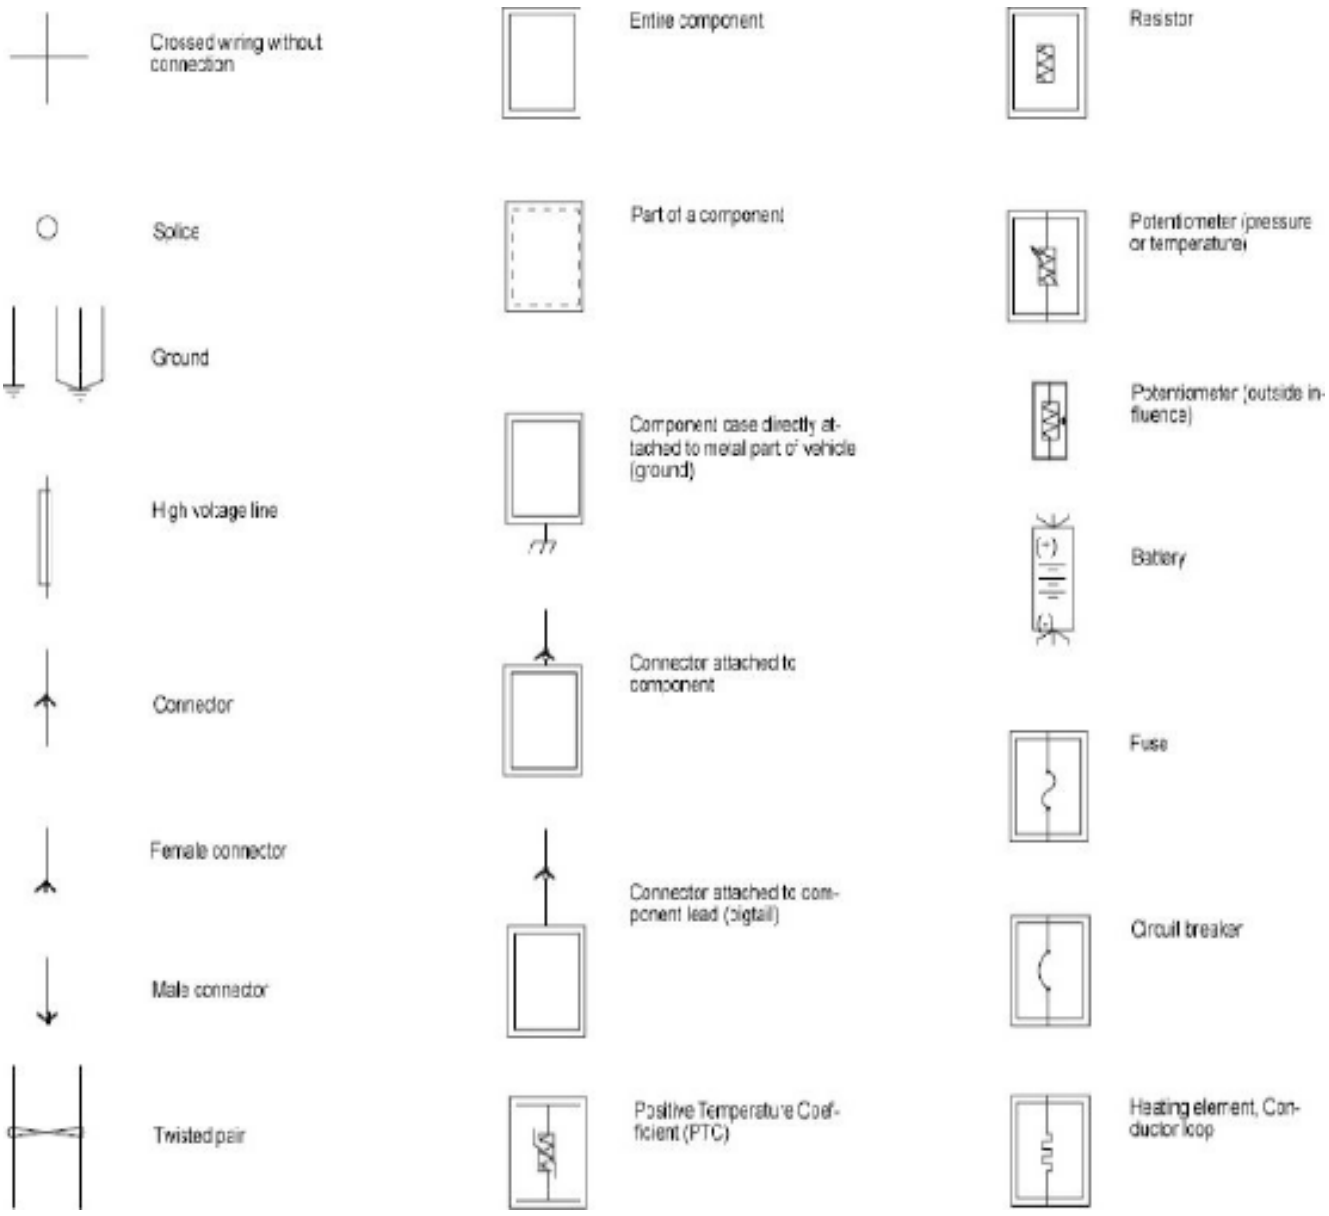
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

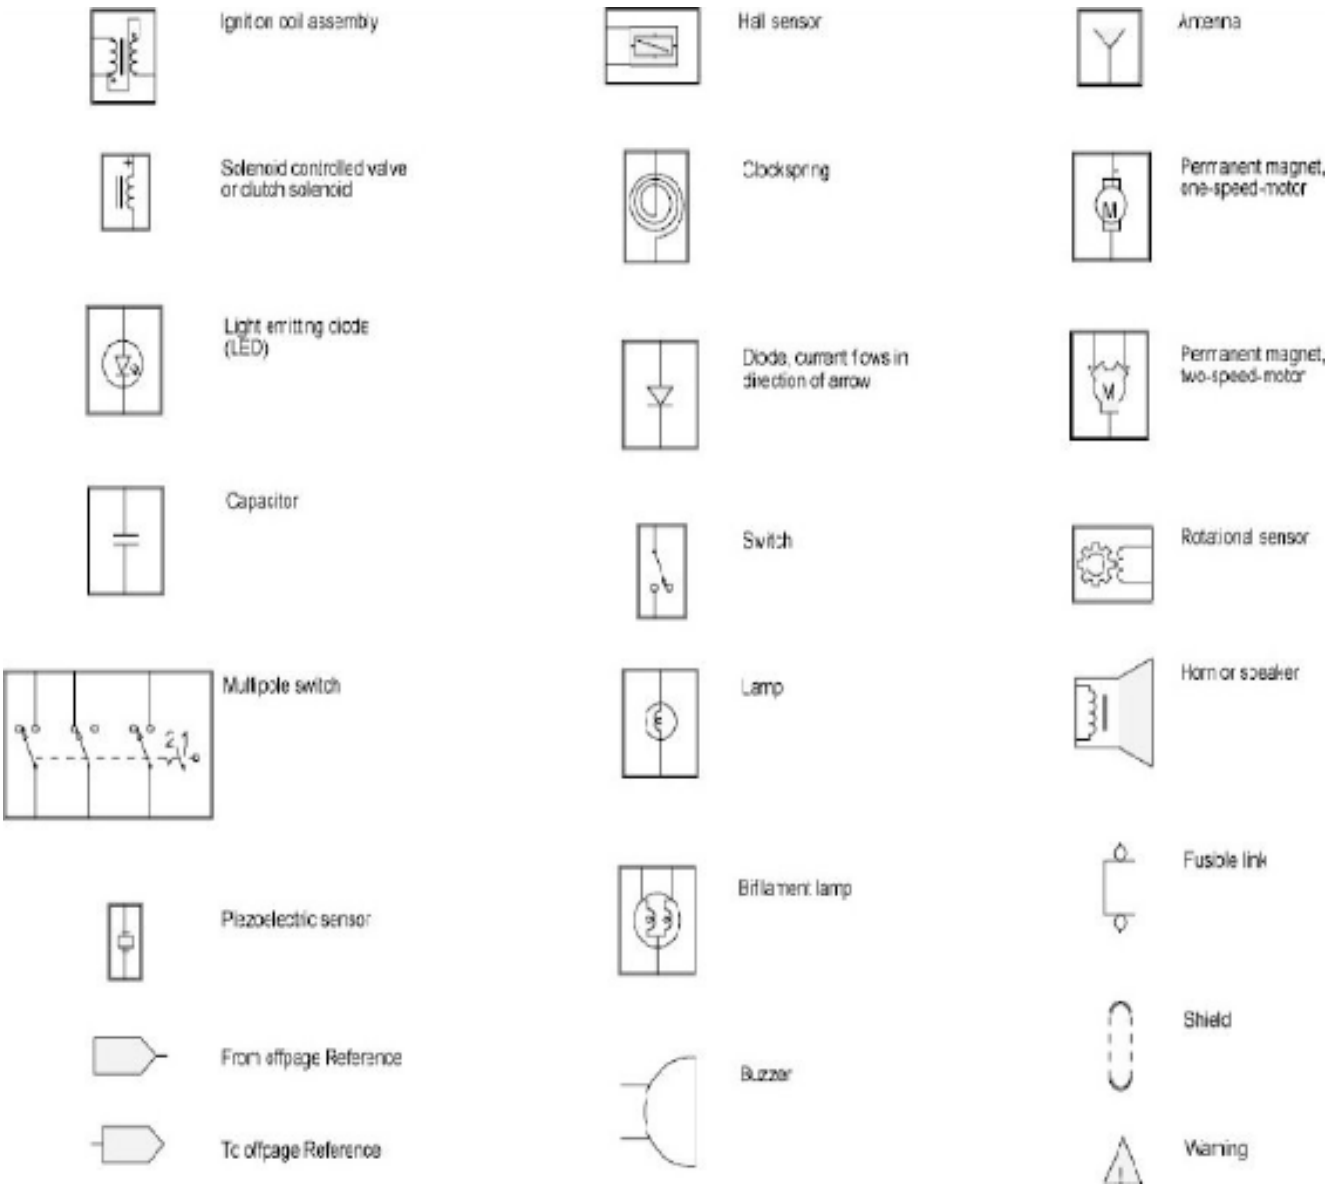
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

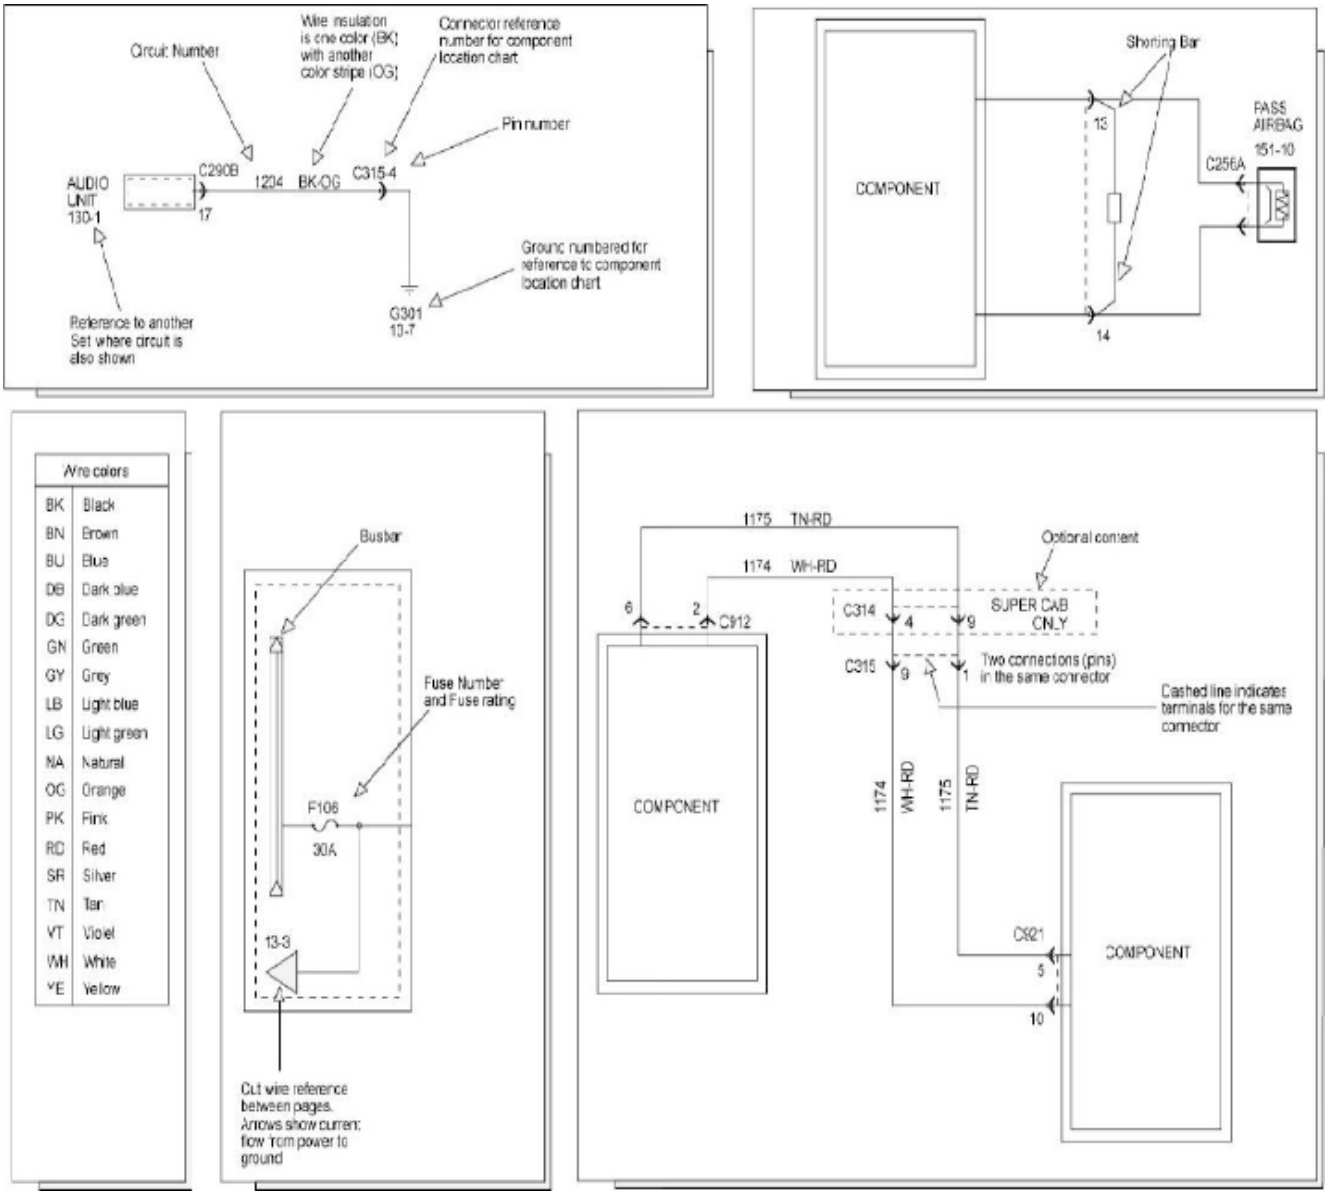
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

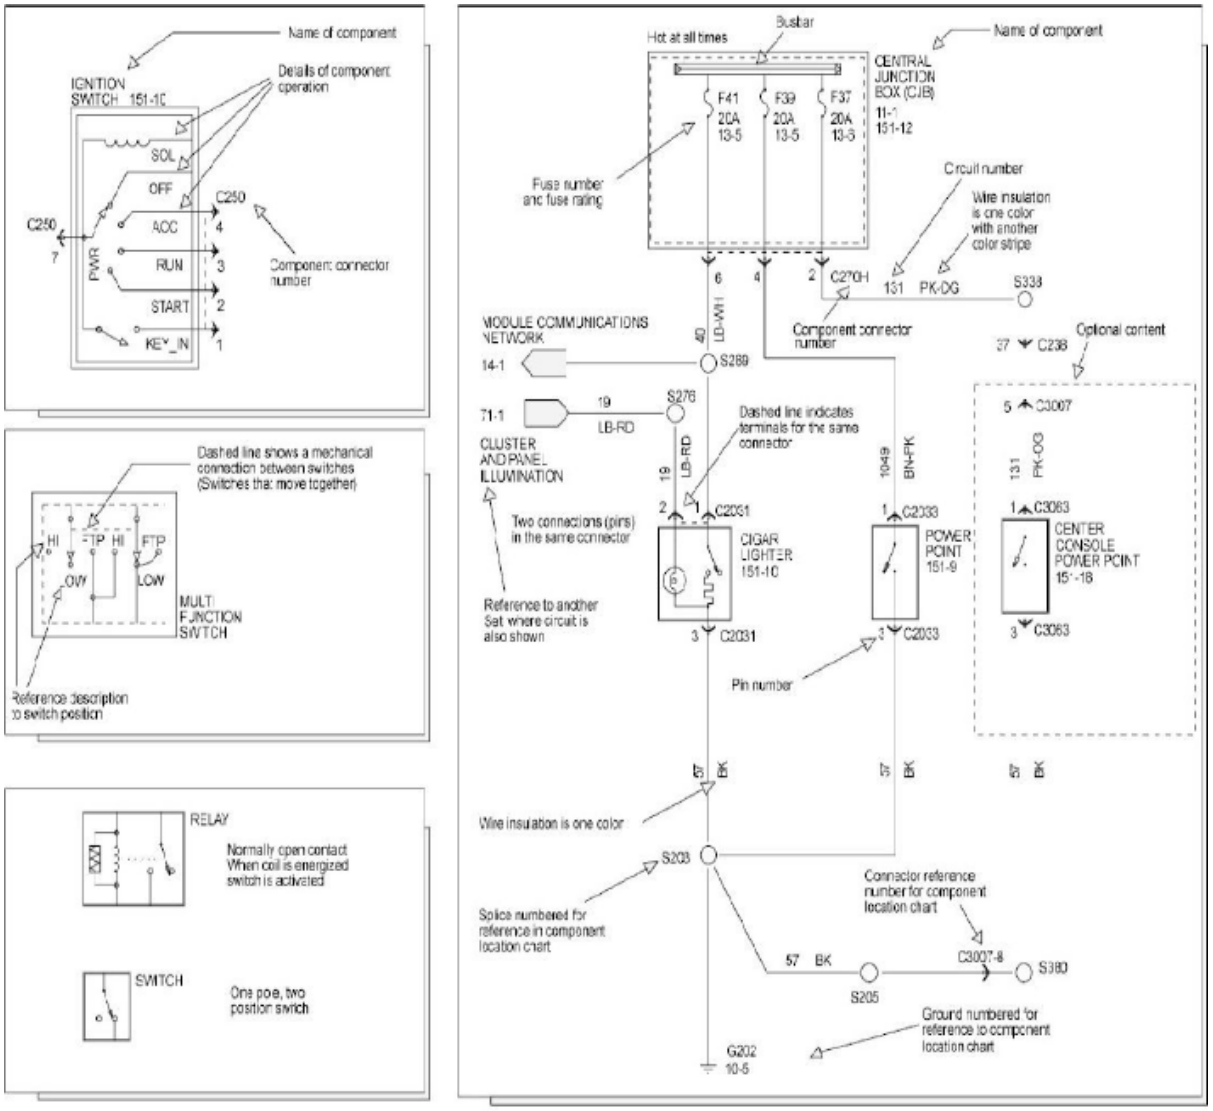
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Radiator Cooling Fan Motor: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

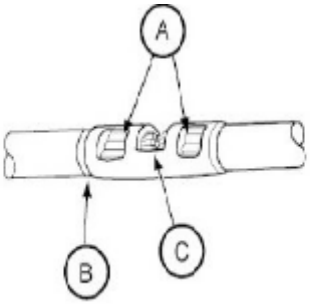
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

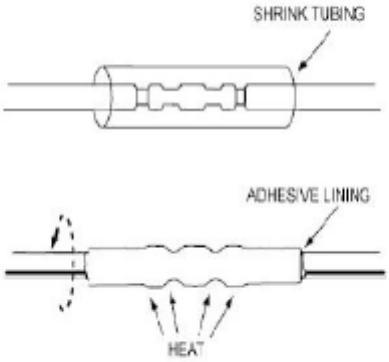
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x cia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Figtail only

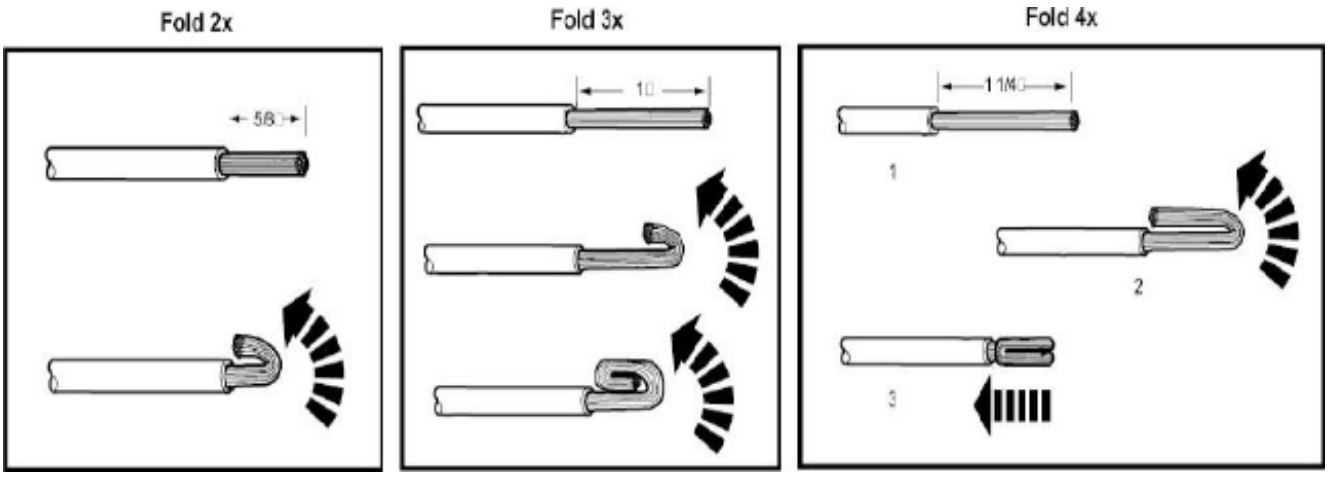
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Radiator Cooling Fan Motor: Electrical Diagrams

For information regarding diagrams for this component, please refer to Cooling System Diagrams.

EDGE/MKX, TAURUS/TAURUS X/SABLE, FUSION/MILAN/MKZ, CROWN VICTORIA/GRAND MARQUIS, TOWN CAR: FCV DUTY CYCLE OUTPUT FROM PCM (negative duty cycle)

FCV Duty Cycle Command (NEGATIVE (-) duty cycle)	Cooling Fan Response/Speed
Greater than 0 but less than 5%	Fan off, controller inactive
Greater than 5% but less than 10%	Fan off, controller is in active/ready state
Edge/MKX, Crown Victoria/Grand Marquis, Town Car: 10% - 90%	Edge/MKX, Crown Victoria/Grand Marquis, Town Car: Linear speed increase from 30% to 100%
Taurus/Taurus X/Sable, Fusion/Milan/MKZ: 30% - 90%	Taurus/Taurus X/Sable, Fusion/Milan/MKZ: Linear speed increase from 50% to 100%
Greater than 90% but less than 95%	100%
Greater than 95% but less than 100%	Fan off

2.0L FOCUS (with A/C): PCM FC OUTPUT STATE FOR COOLING FAN SPEEDS

PCM OUTPUT	LOW SPEED	MEDIUM SPEED	HIGH SPEED	FAN OFF
LFC (FC1)	ON	ON	ON	OFF
MFC (FC2)	ON	OFF	ON	OFF
HFC (FC3)	ON	OFF	OFF	OFF

2.3L ESCAPE: PCM FC OUTPUT STATE FOR COOLING FAN SPEEDS

PCM OUTPUT	LOW SPEED	MEDIUM SPEED	HIGH SPEED	FAN OFF
LFC (FC1)	ON	ON	ON	OFF
MFC (FC2)	OFF	ON	OFF (or ON)	OFF
HFC (FC3)	OFF	OFF	ON	OFF

Radiator Cooling Fan Motor: Description and Operation

FAN CONTROL

The PCM monitors certain parameters (such as engine coolant temperature, vehicle speed, A/C on/off status, A/C pressure) to determine engine cooling fan needs.

For variable speed electric fan(s):

Edge/MKX, Taurus/Taurus X/Sable, Fusion/Milan/MKZ, Crown Victoria/Grand Marquis, Town Car: FCV Duty Cycle Output From PCM (Negative Duty Cycle)

The PCM controls the fan speed and operation using a duty cycle output on the fan control variable (FCV) circuit. The fan controller (located at or integral to the engine cooling fan assembly) receives the FCV command and operates the cooling fan at the speed requested (by varying the power applied to the fan motor).

For relay controlled fans:

2.0L Focus (With A/C): PCM FC Output State For Cooling Fan Speeds

2.3L Escape: PCM FC Output State For Cooling Fan Speeds

The PCM controls the fan operation through the fan control (FC) (single speed fan applications), low fan control (LFC), medium fan control (MFC), and high fan control (HFC) outputs. Some applications will have the xFC circuit wired-to 2 separate-relays.

For 3-speed fans, although the PCM output circuits are called low, medium, and high fan control (FC), cooling fan speed is controlled by a combination of these outputs. Refer to the table.

Radiator Cooling Fan Motor Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

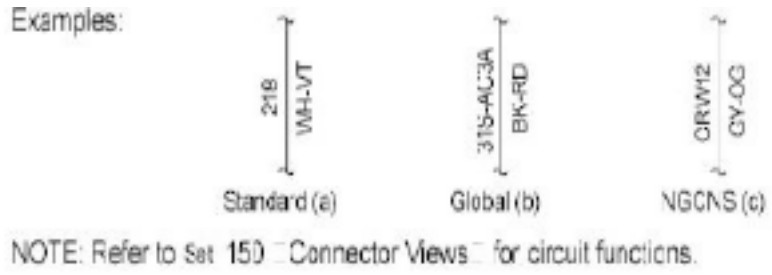
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

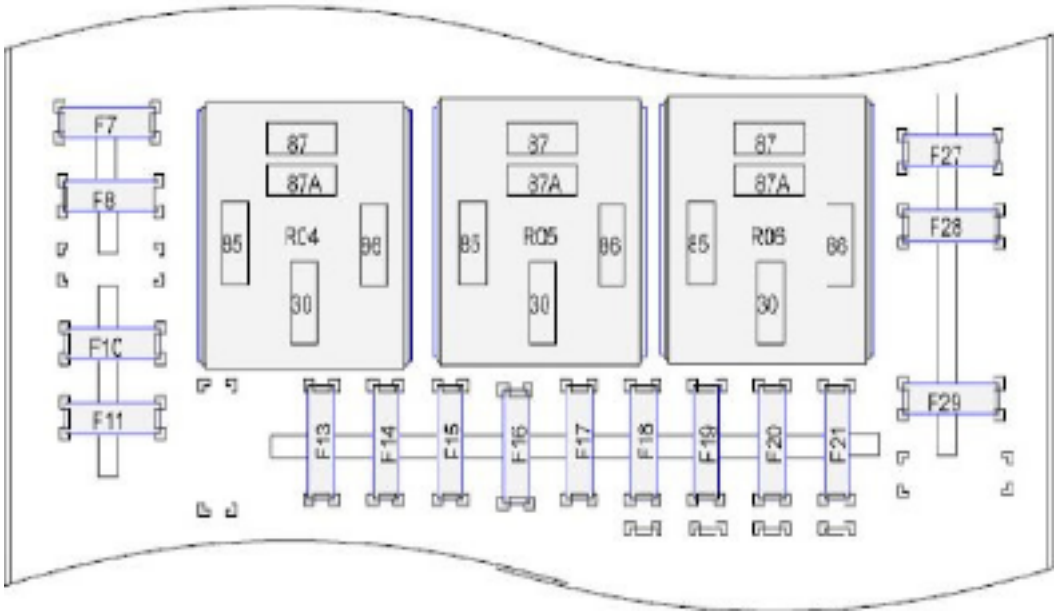
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

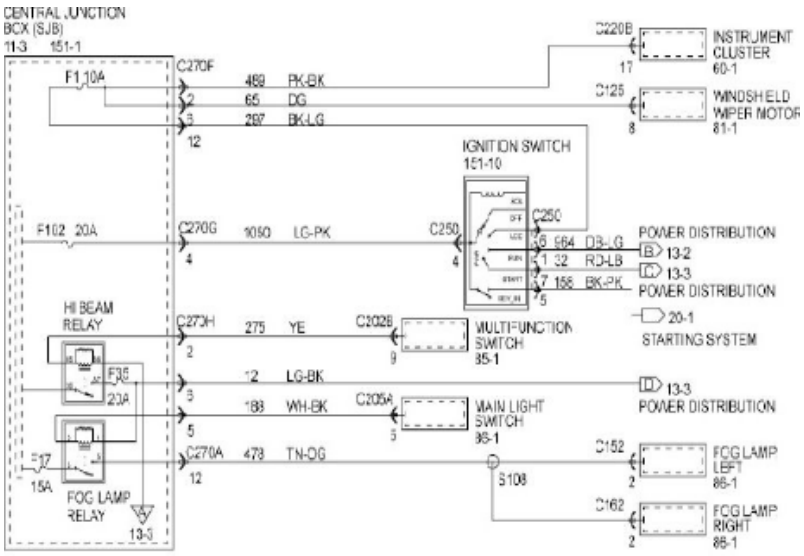
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

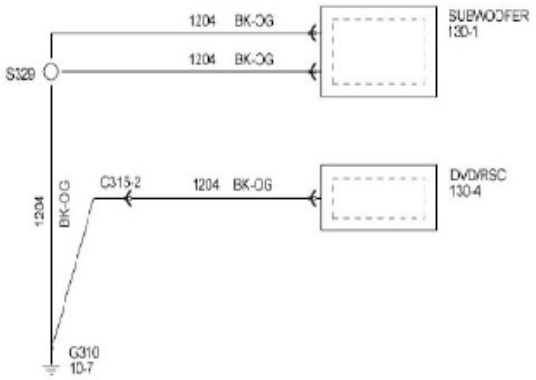
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

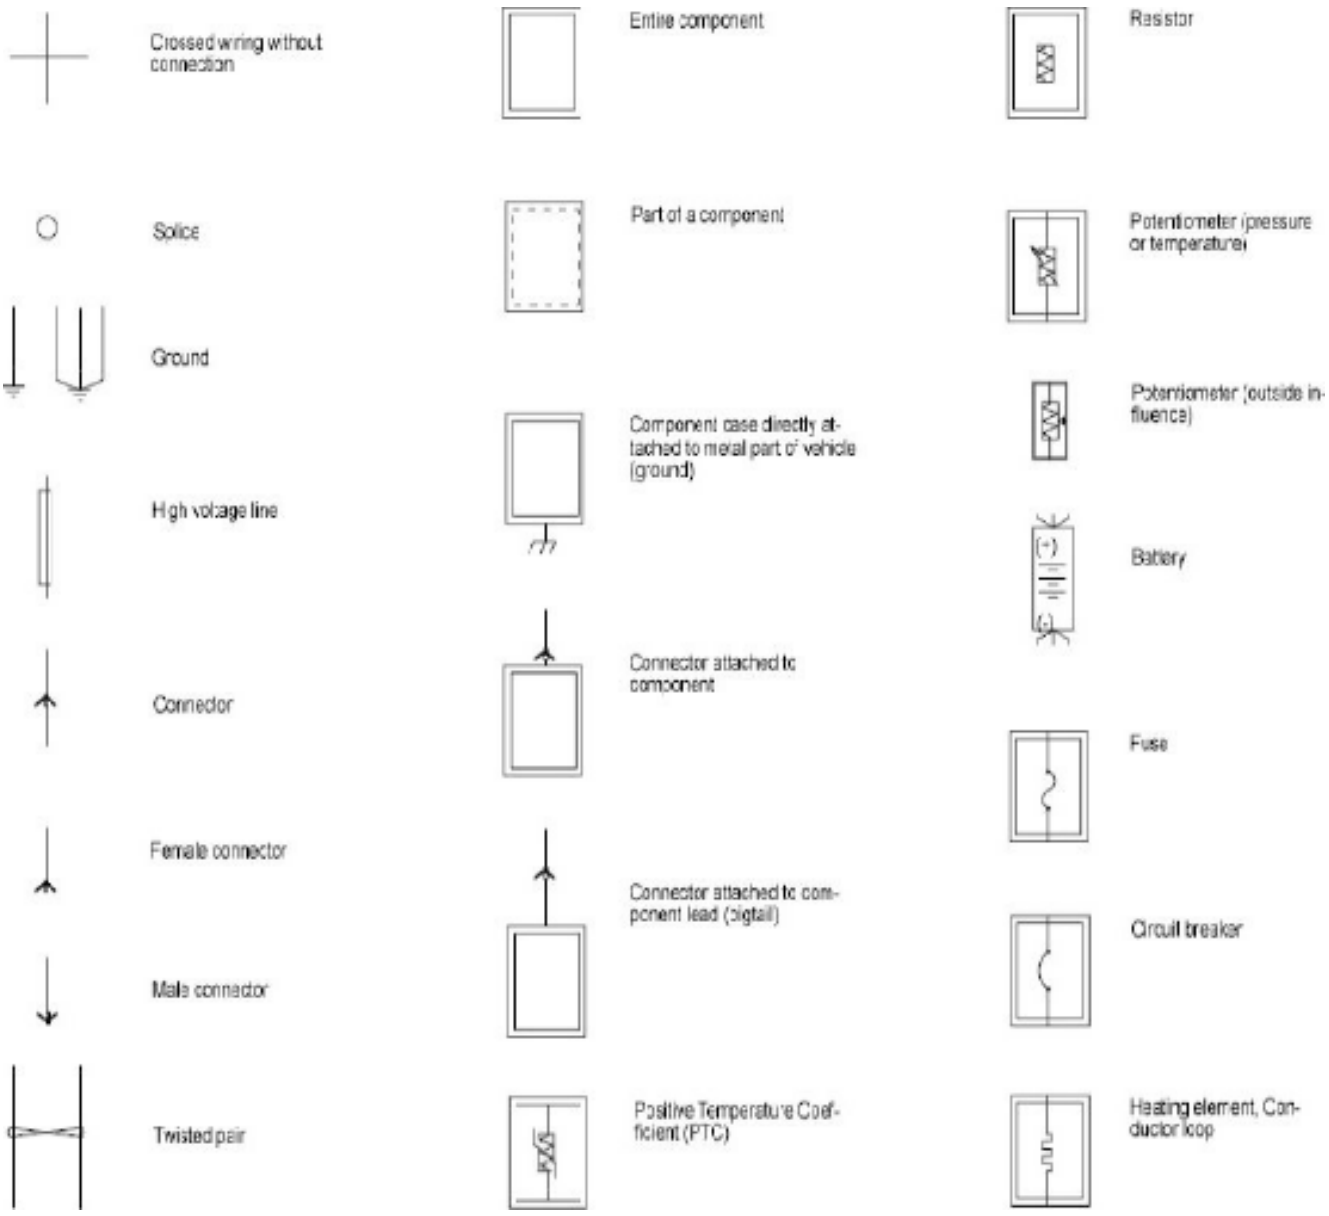
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

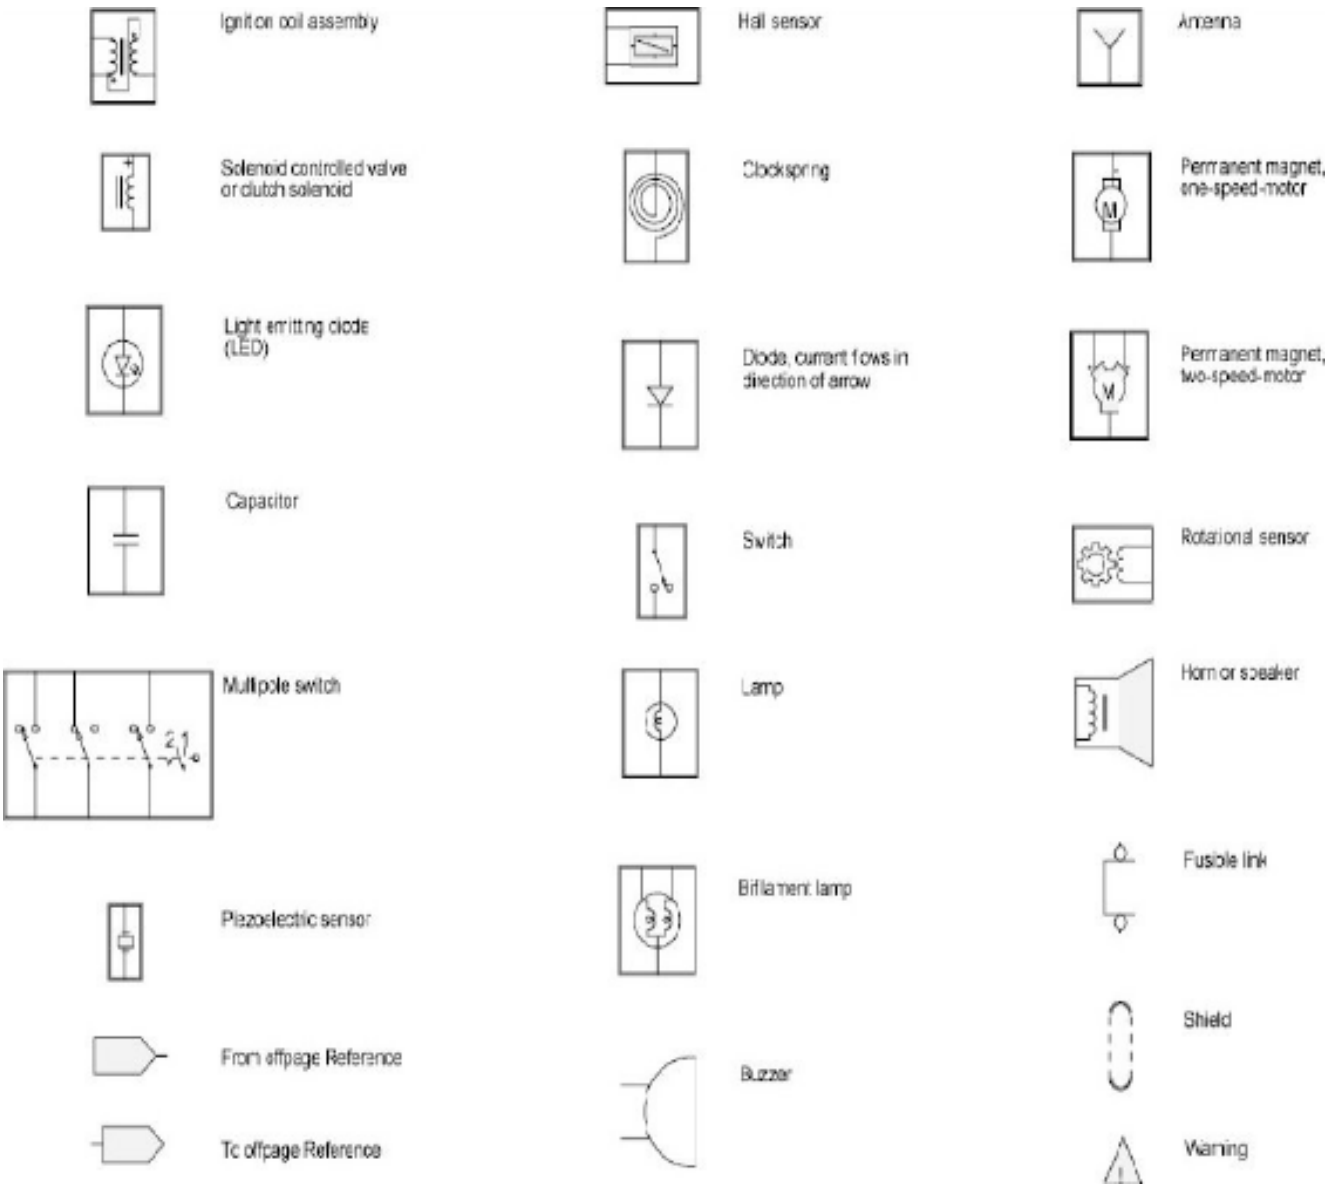
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

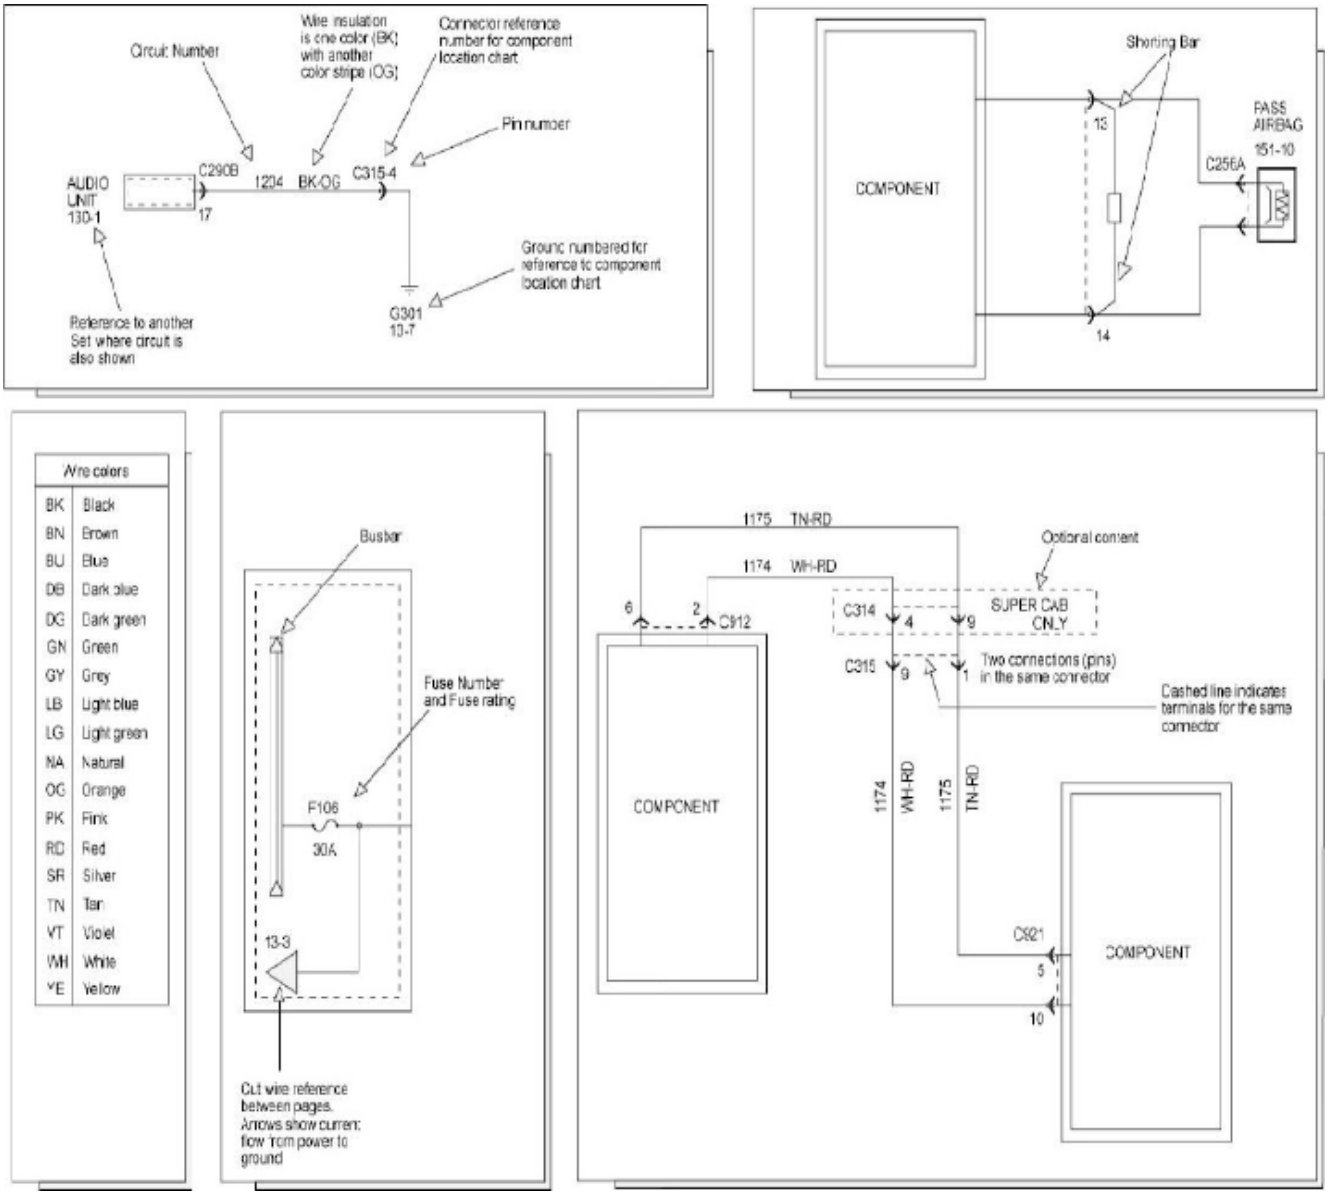
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

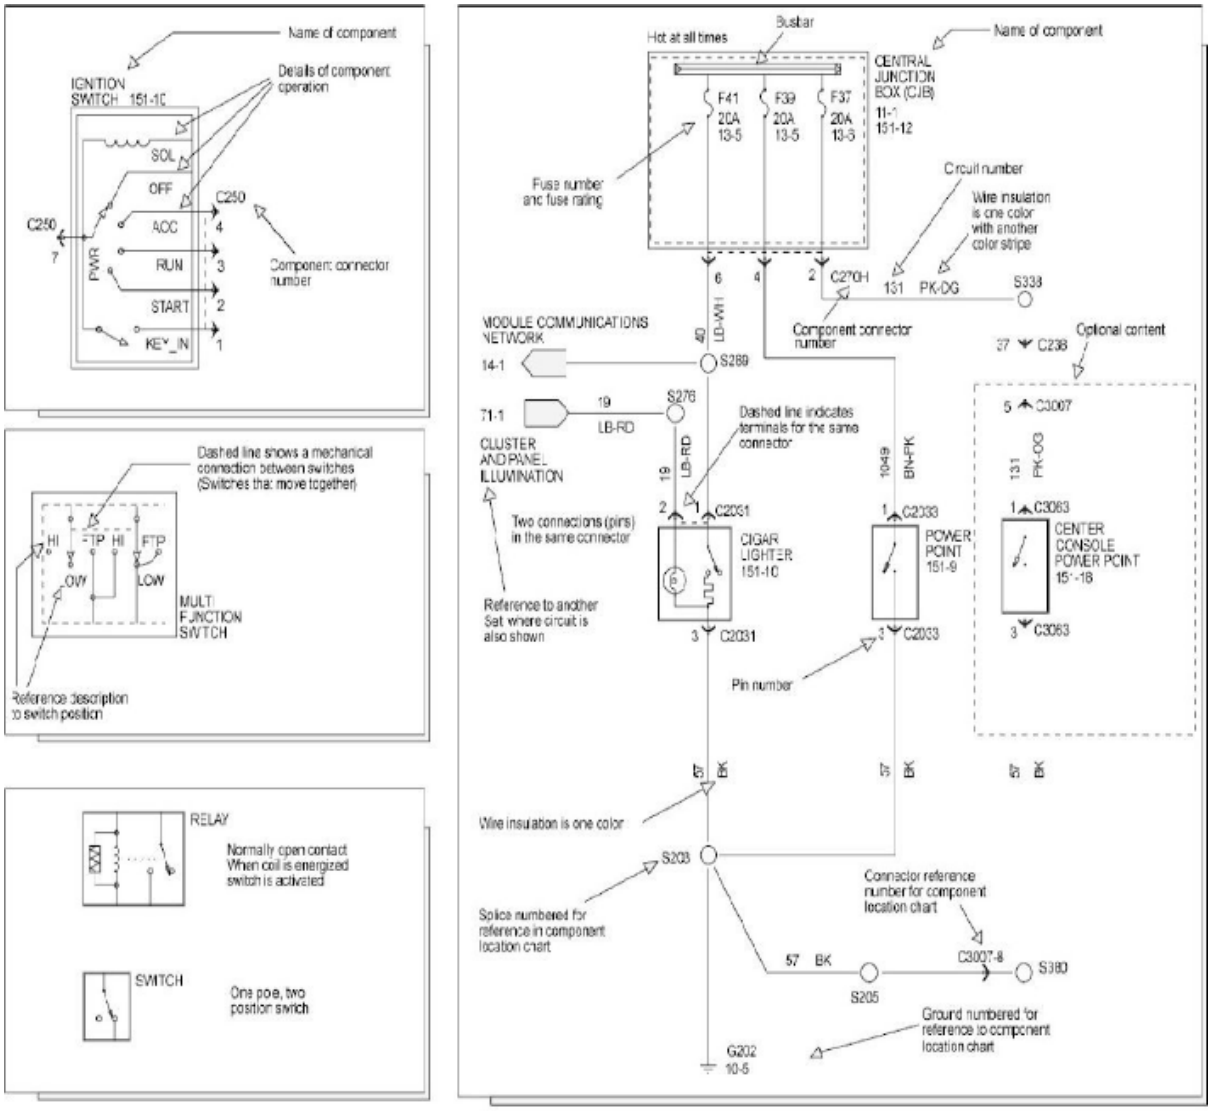
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Radiator Cooling Fan Motor Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

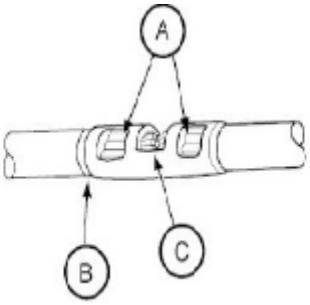
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

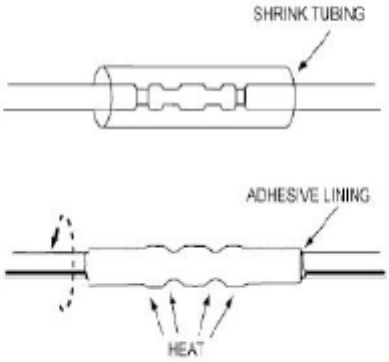
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4□ strip, cut 9 strands	* 1/4□ strip, cut 2 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip, fold 3x dia.
	16-14	* 1/4□ strip, cut 7 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip fold 2x dia	1□ strip, fold 3x dia.	1 1/4□ strip, fold 4x dia.	Not Recommended
	12-10	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip fold 3x dia.	1 1/4□ strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

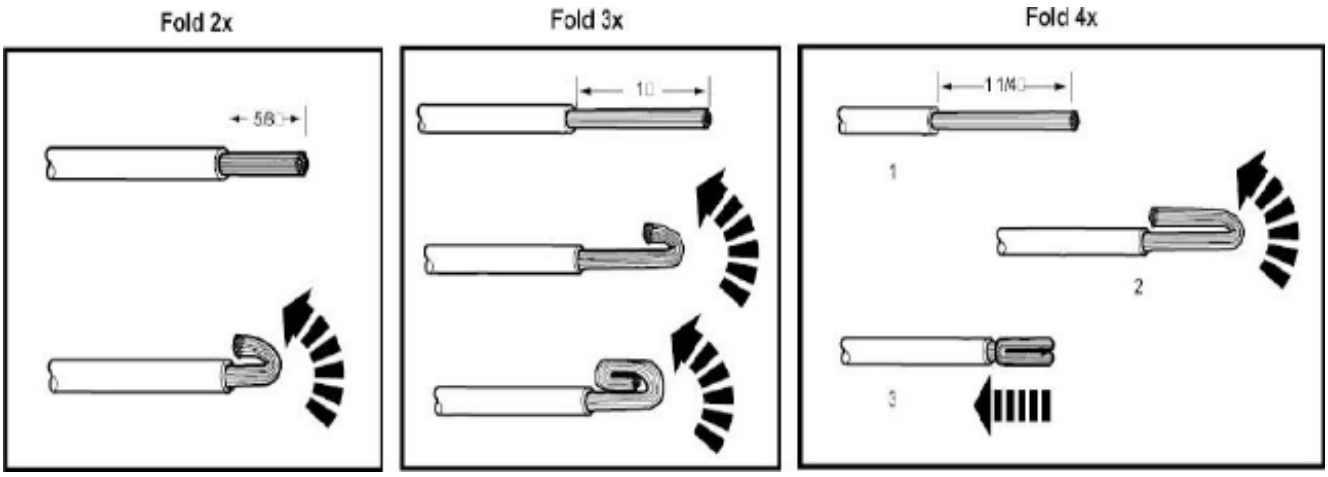
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



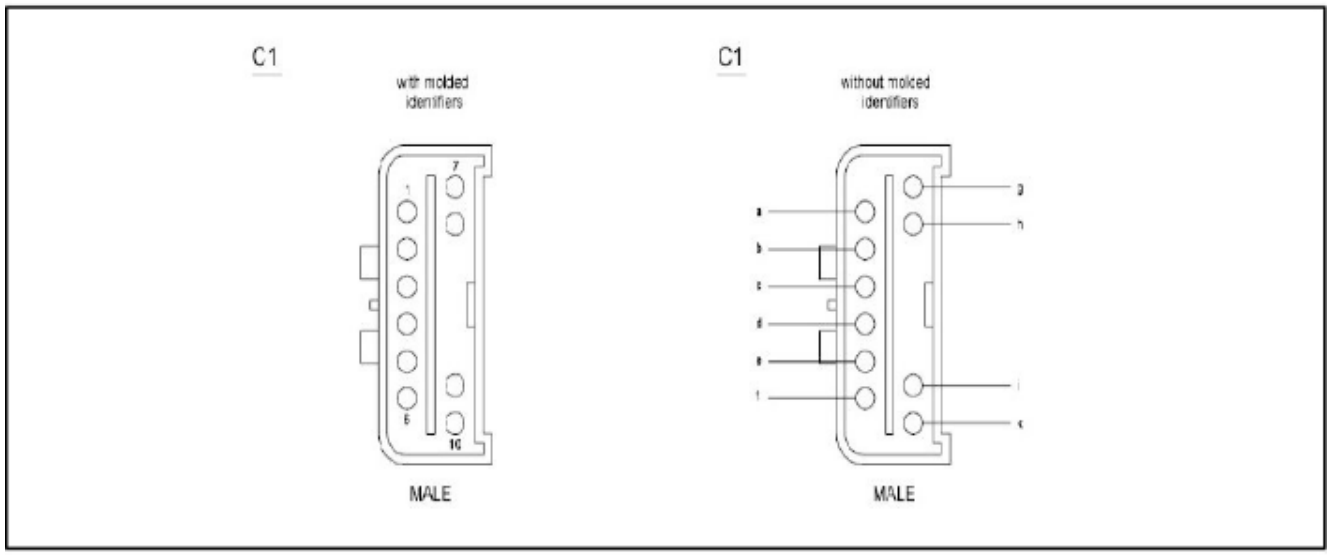
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



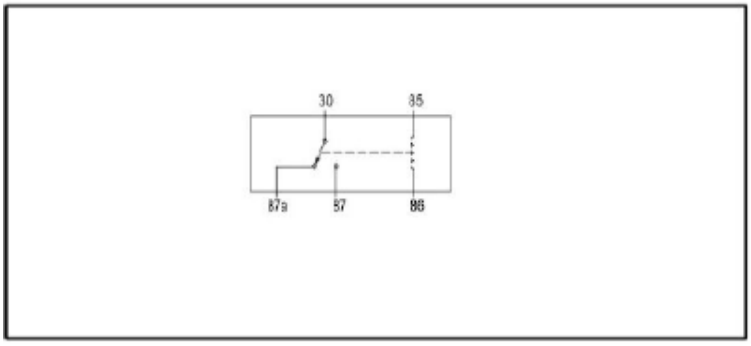
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

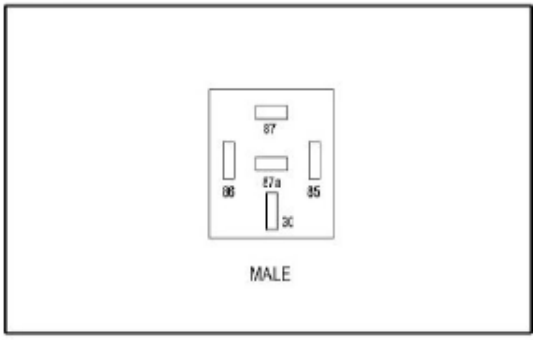
Radiator Cooling Fan Motor Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Radiator Cooling Fan Speed Sensor: Description and Operation

FAN SPEED SENSOR (FSS)

Cooling Fan Clutch With FSS

The FSS is a Hall-effect sensor that measures the cooling fan clutch speed by generating a waveform with a frequency proportional to the fan speed. If the cooling fan clutch is moving at a relatively low speed, the sensor produces a signal with a low frequency. As the cooling fan clutch speed increases, the sensor generates a signal with a higher frequency. The PCM uses the frequency signal generated by the FSS as a feedback for closed loop control of the cooling fan clutch.

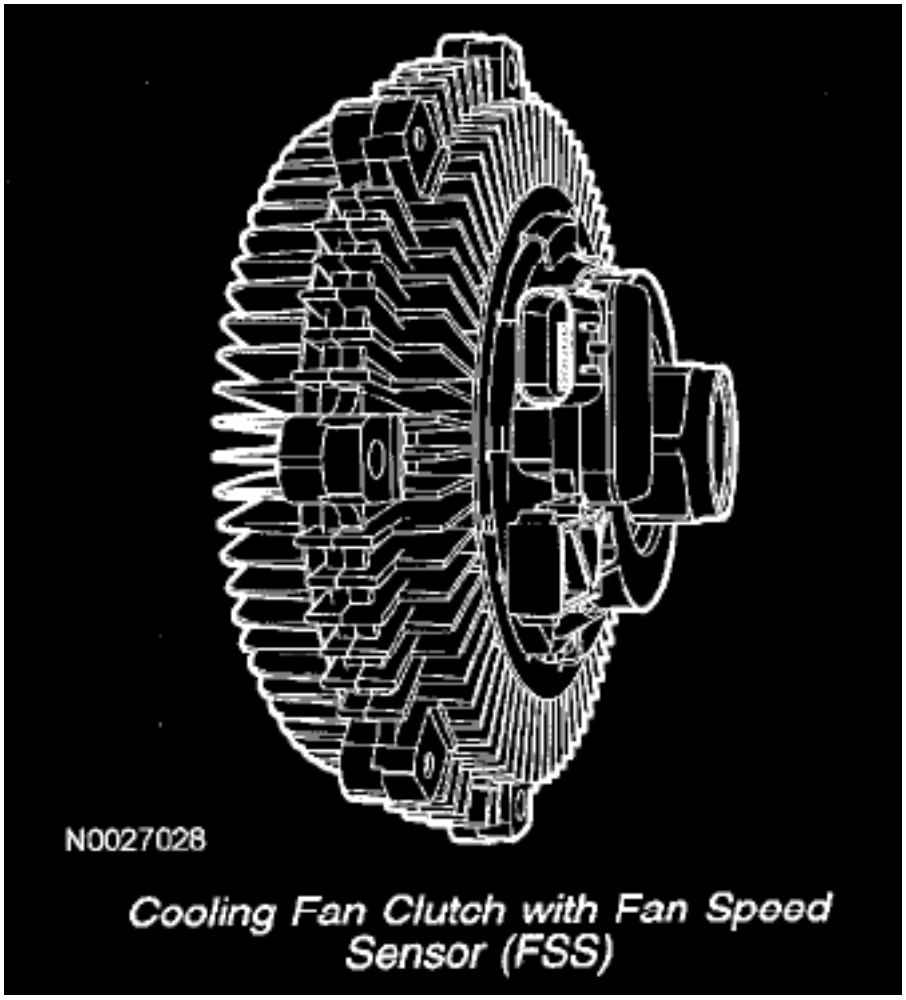
Removal and Installation

1. Remove fan shroud. 2. Remove the bolts and separate the fan from the fan clutch.

^ To install, tighten to 7 Nm (62 lb-inch).

3. To install, reverse the removal procedure.



Fan Clutch: Description and Operation

COOLING FAN CLUTCH

Cooling Fan Clutch With Fan Speed Sensor (FSS)

The cooling fan clutch is an electrically actuated viscous clutch that consists of 3 main elements:

- a working chamber

- a reservoir chamber

- a cooling fan clutch actuator valve and a fan speed sensor (FSS)

The cooling fan clutch actuator valve controls the fluid flow from the reservoir into the working chamber. Once viscous fluid is in the working chamber, shearing of the fluid results in fan rotation. The cooling fan clutch actuator valve is activated with a pulse width modulated (PWM) output signal from the PCM. By opening and closing the fluid port valve, the PCM can control the cooling fan clutch speed. The cooling fan clutch speed is measured by a Hall-effect sensor and is monitored by the PCM during closed loop operation.

The PCM optimizes fan speed based on engine coolant temperature (ECT), engine oil temperature (EOT), transmission fluid temperature (TFT), intake air temperature (IAT), or air conditioning requirements. When an increased demand for fan speed is requested for vehicle cooling, the PCM monitors the fan speed through the Hall-effect sensor. If a fan speed increase is required, the PCM outputs the PWM signal to the fluid port, providing the required fan speed increase.

C1064

Coolant Temperature Sensor/Switch (For Computer): Description and Operation

ENGINE COOLANT TEMPERATURE (ECT) SENSOR

Typical Thread Type ECT Sensor

The ECT sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of a thermistor decreases as the temperature increases, and the resistance increases as the temperature decreases. The varying resistance changes the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Thermistor-type sensors are considered passive sensors. A passive sensor is connected to a voltage divider network so that varying the resistance of the passive sensor causes a variation in total current flow. Voltage that is dropped across a fixed resistor in a series with the sensor resistor determines the voltage signal at the PCM. This voltage signal is equal to the reference voltage minus the voltage drop across the fixed resistor.

The ECT measures the temperature of the engine coolant. The PCM uses the ECT input for fuel control and for cooling fan control. There are 3 types of ECT sensors, threaded, push-in, and twist-lock. The ECT sensor is located in an engine coolant passage.

C107

Typical CHT Sensor

Engine Temperature Sensor: Description and Operation

CYLINDER HEAD TEMPERATURE (CHT) SENSOR

Typical CHT Sensor

The CHT sensor is a thermistor device in which resistance changes with the temperature. The electrical resistance of a thermistor decreases as temperature increases, and the resistance increases as the temperature decreases. The varying resistance affects the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

The CHT sensor is installed in the cylinder head and measures the metal temperature. The CHT sensor can provide complete engine temperature information and can be used to infer coolant temperature. If the CHT sensor conveys an overheating condition to the PCM, the PCM initiates a fail-safe cooling strategy based on information from the CHT sensor. A cooling system concern such as low coolant or coolant loss could cause an overheating condition. As a result, damage to major engine components could occur. Using both the CHT sensor and fail-safe cooling strategy, the PCM prevents damage by allowing air cooling of the engine and limp home capability.

Fan Shroud: Service and Repair

Cooling Fan Shroud - 3.0L, 4.0L

Removal and Installation

All vehicles

1. Remove the air cleaner outlet tube. 2. Remove the accessory drive belt.

3.0L vehicles

3. NOTE: The fan clutch has a left-hand thread and must be rotated clockwise for removal.

Using the special tool and a standard 7/8-in wrench, remove the fan and fan clutch assembly and position it into the shroud. ^

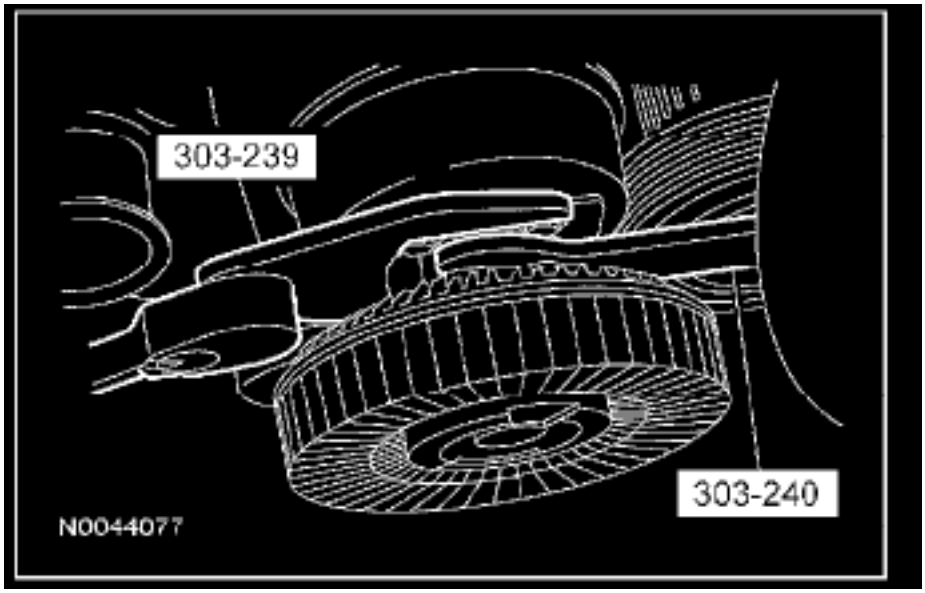
To install, tighten to 54 Nm (40 lb-ft).

4.0L SOHC vehicles

4. NOTE: The fan clutch has a left-hand thread and must be rotated clockwise for removal.

Using the special tools, remove the fan and fan clutch assembly and position it inside the shroud. ^

To install, tighten to 55 Nm (41 lb-ft).

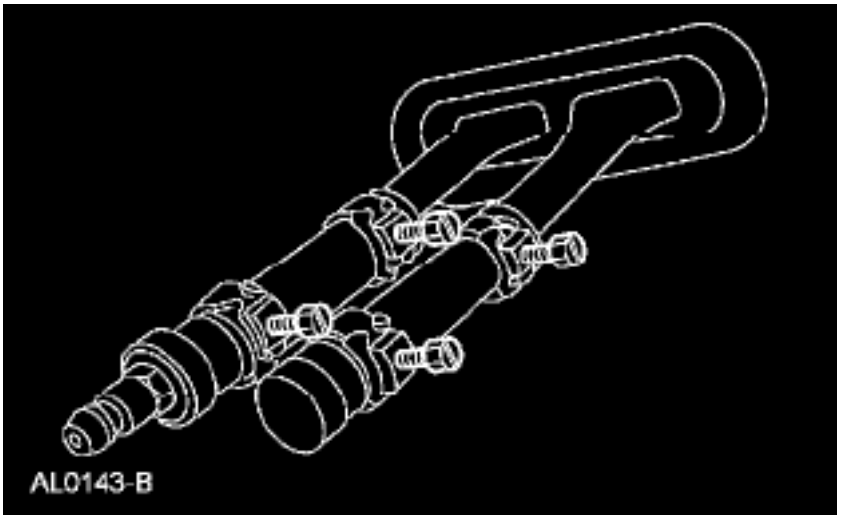


All vehicles

5. Remove the fan shroud bolts. Lift the fan and fan clutch assembly and the fan shroud together and remove from the vehicle.

^ To install, tighten to 6 Nm (53 lb-inch).

6. To install, reverse the removal procedure.



Heater Core: Testing and Inspection

HEATER CORE

1. NOTE: Testing of returned heater cores reveals that a large percentage of heater cores are good and did not require the installation of a new

heater core. If a heater core leak is suspected, the heater core must be tested by following the plugged heater core component test before the heater core pressure test. Carry out a system inspection by checking the heater system thoroughly as follows:

Inspect for evidence of coolant leakage at the heater hose-to-heater core attachments. A coolant leak in the heater hose could follow the heater core tube to the heater core and appear as a leak in the heater core.

2. NOTE: Spring-type clamps are installed as original equipment. Installation and overtightening of non-specified clamps can cause leakage at the

heater hose connection and damage the heater core.

Check the integrity of the heater hose clamps.

Heater Core - Plugged

WARNING: Before disconnecting any heater water hoses, shut OFF the engine and wait until engine is fully cool. Failure to comply with this warning may result in serious injury or burns from hot liquid escaping from the engine cooling system.

1. Check to see that the engine coolant is at the correct level. 2. Start the engine and turn on the heater. 3. When the engine coolant reaches operating temperature, feel the heater core inlet and outlet hoses to see if they are hot. 4. If the outlet only is not hot:

- the heater core may have an air pocket.

- the heater core may be plugged.

5. If the inlet only is not hot, the thermostat may not be working correctly.

Heater Core - Pressure Test

Use the Pressure Test Kit to carry out the pressure test.

1. NOTE: Due to space limitations, a bench test may be necessary for pressure testing.

Drain the coolant from the cooling system.

2. Disconnect the heater hoses from the heater core. 3. Install a short piece of heater hose, approximately 101 mm (4 in) long on each heater core tube. 4. Fill the heater core and heater hoses with water and install plug BT-7422-B and adapter BT-7422-A from the Pressure Test Kit. Secure the heater

hoses, plug and adapter with hose clamps.

5. Attach the pump and gauge assembly from the Pressure Test Kit to the adapter. 6. Close the bleed valve at the base of the gauge. Pump 138 kPa (20 psi) of air pressure into the heater core. 7. Observe the pressure gauge for a minimum of 3 minutes. 8. If the pressure drops, check the heater hose connections to the core tubes for leaks. If the heater hoses do not leak, remove the heater core from the

vehicle and carry out the bench test.

Heater Core - Bench Test

1. Remove the heater core from the vehicle. 2. Drain all of the coolant from the heater core. 3. Connect the 101 mm (4 in) test heater hoses with plug and adapter to the core tubes. Then connect the Pressure Test Kit to the adapter. 4. Apply 138 kPa (20 psi) of air pressure to the heater core. Submerge the heater core in water. 5. If a leak is observed, install a new heater core.

Heater Core: Service and Repair

HEATER CORE

Removal and Installation

1. NOTE: If a heater core leak is suspected, the heater core must be leak tested before it is removed from the vehicle.

Remove the evaporator core housing.

2. Remove the instrument panel. 3. Remove the PCM. 4. Remove the PCM heat sink.

1 Remove the ground strap screw.

2 Remove the heat sink.

5. Remove the 4 nuts from the engine side of the dash panel. Position the plenum chamber on the vehicle floor.

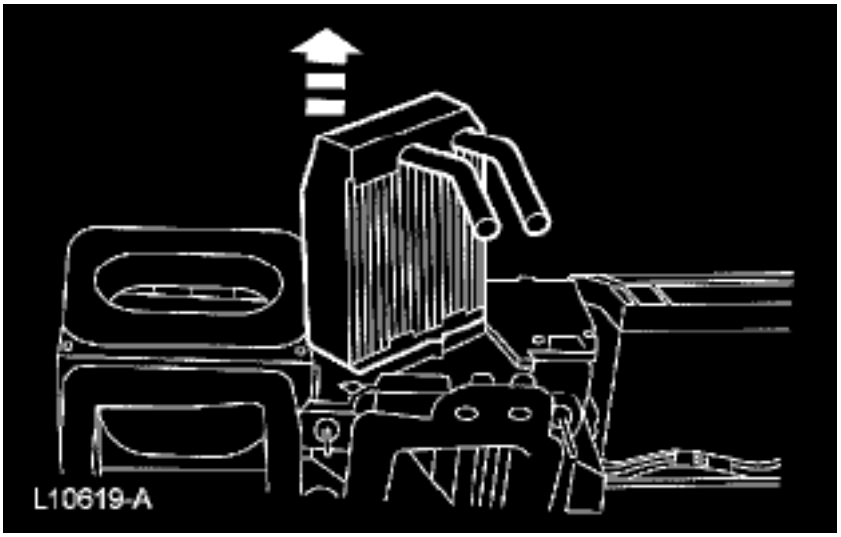
- To install, tighten to 4 Nm (35 lb-in).

6. Remove the heater core cover.

1 Remove the screws.

2 Remove the heater core cover.

7. Remove the heater core.



8. To install, reverse the removal procedure.

- During installation, be sure to install a new oval foam seal around the heater core inlet and outlet tubes.

Radiator and Hoses

Radiator: Service and Repair

Radiator - 3.0L, 4.0L

Removal

All vehicles

1. Drain the cooling system. 2. Disconnect the radiator overflow hose from the radiator. 3. Remove the cooling fan shroud. 4. Disconnect the upper radiator hose from the radiator. 5. Disconnect the lower radiator hose from the radiator.

Vehicles equipped with an automatic transmission

6. NOTE: To avoid disturbing the transmission oil cooler fittings, use a back-up wrench.

Disconnect the 2 transmission cooler tubes from the radiator.

All vehicles

7. Remove the 2 bolts and the radiator.

Installation

All vehicles

1. Position the radiator and install the 2 bolts.

^ Tighten to 7 Nm (62 lb-inch).

Vehicles equipped with an automatic transmission

2. NOTE: To avoid disturbing the transmission oil cooler fittings, use a back-up wrench.

Connect the transmission cooler tubes to the radiator. ^

Tighten to 25 Nm (18 lb-ft).

All vehicles

3. Connect the lower radiator hose to the radiator. 4. Connect the upper radiator hose to the radiator. 5. Install the cooling fan shroud. 6. Connect the radiator overflow hose to the radiator. 7. Fill and bleed the cooling system.

8. WARNING: Do not stand in line with or near the engine cooling fan blade when revving the engine. A damaged fan can separate during

operation. Failure to follow this instruction may result in serious personal injury.

Operate the engine for several minutes and check the hoses and connections for leaks.

Vehicles equipped with an automatic transmission

9. Check the transmission fluid level. Fill as needed.

Radiator Cooling Fan Motor Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

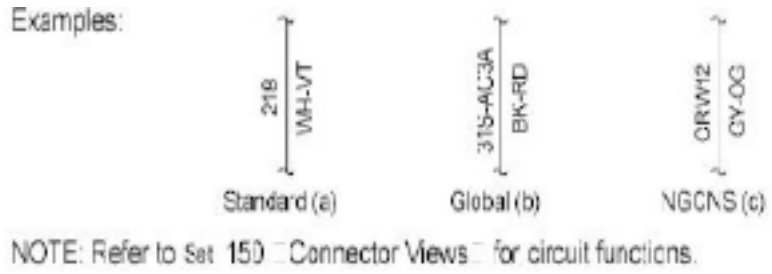
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

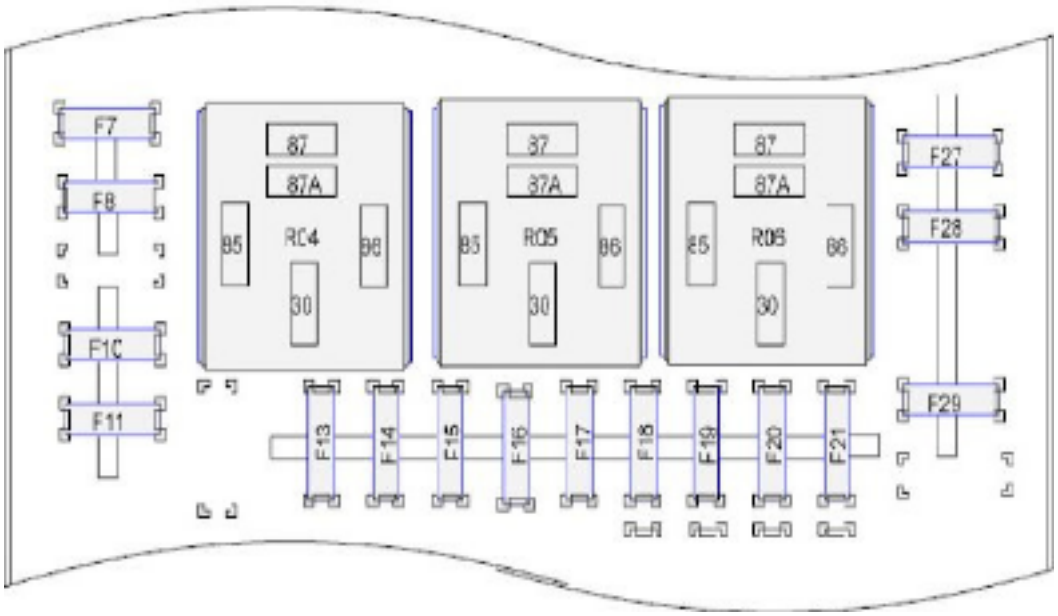
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

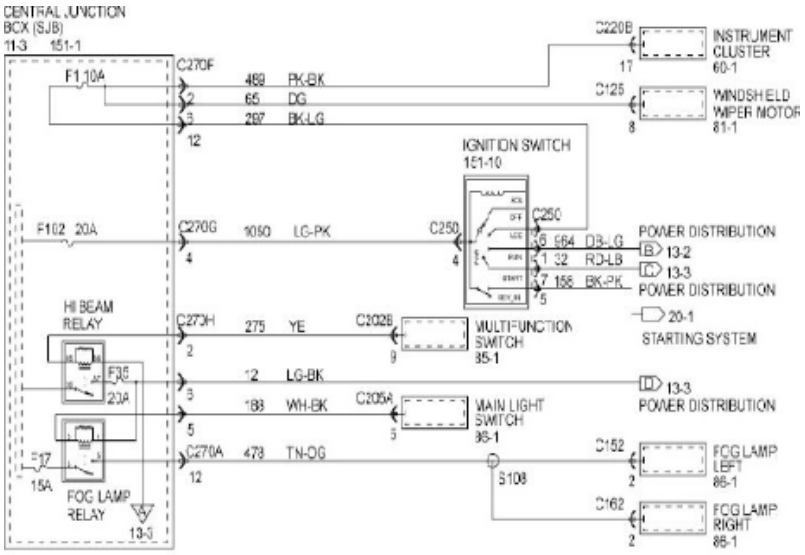
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

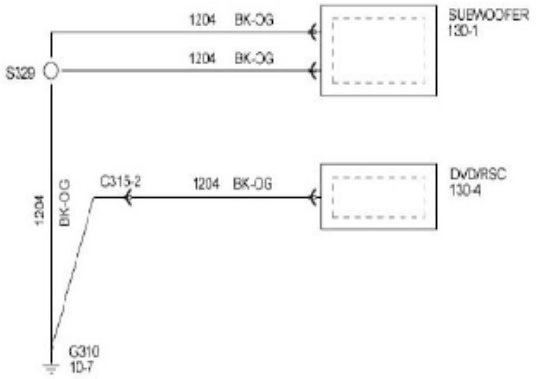
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by

each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

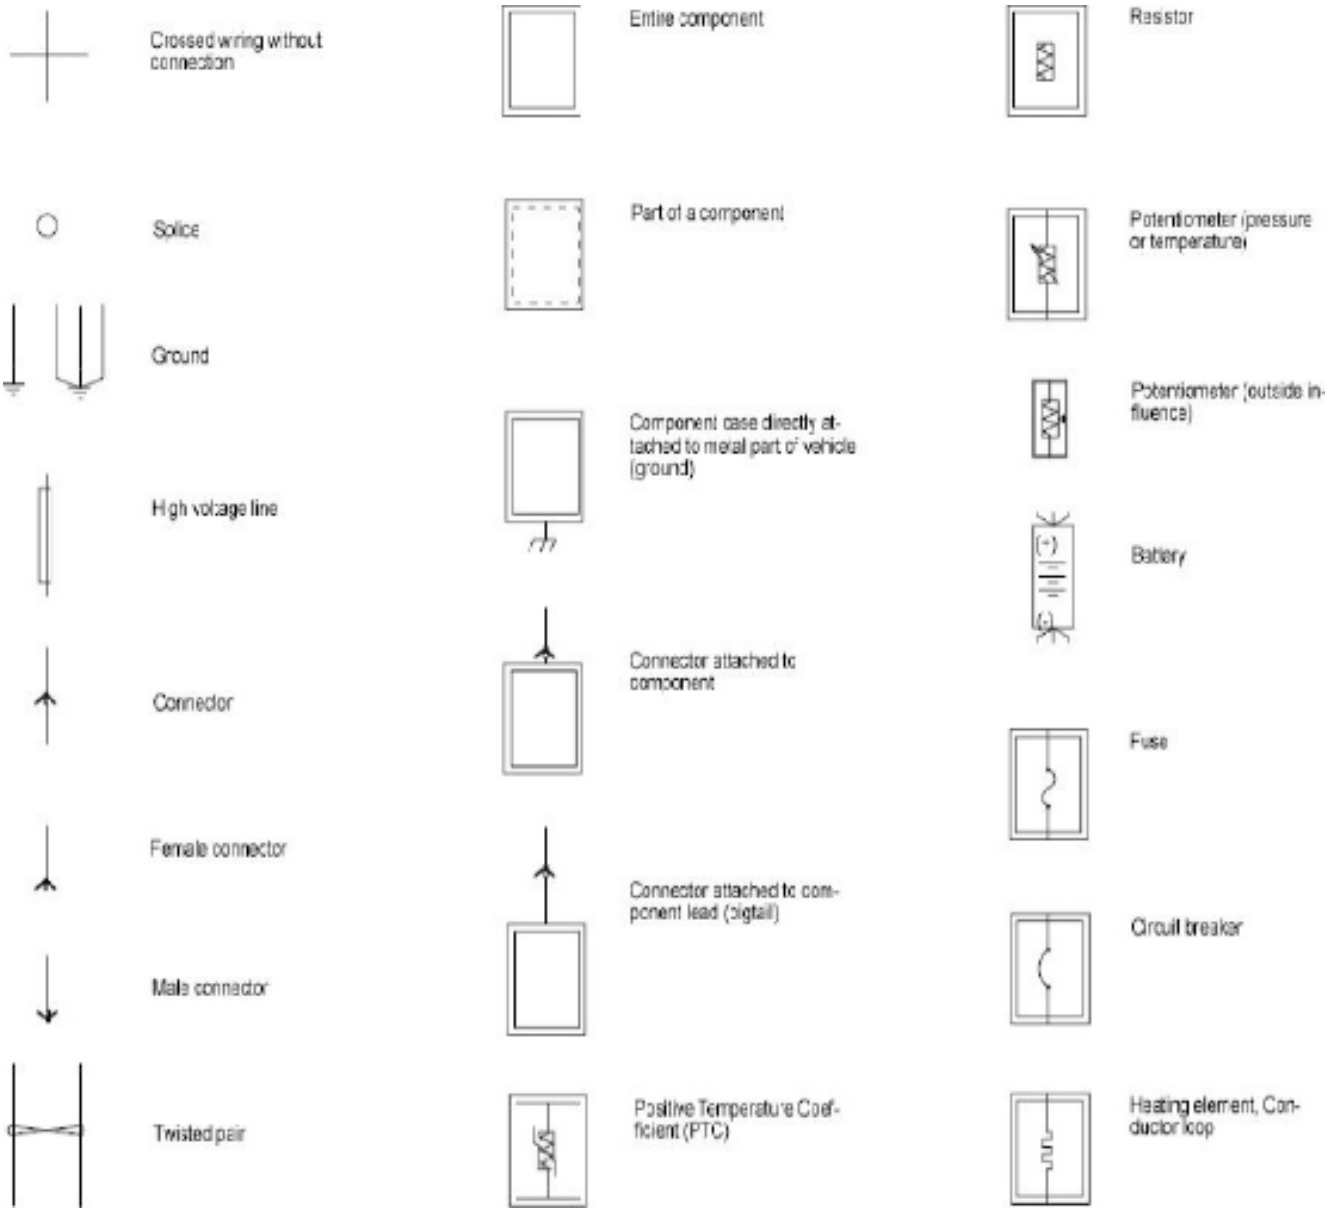
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

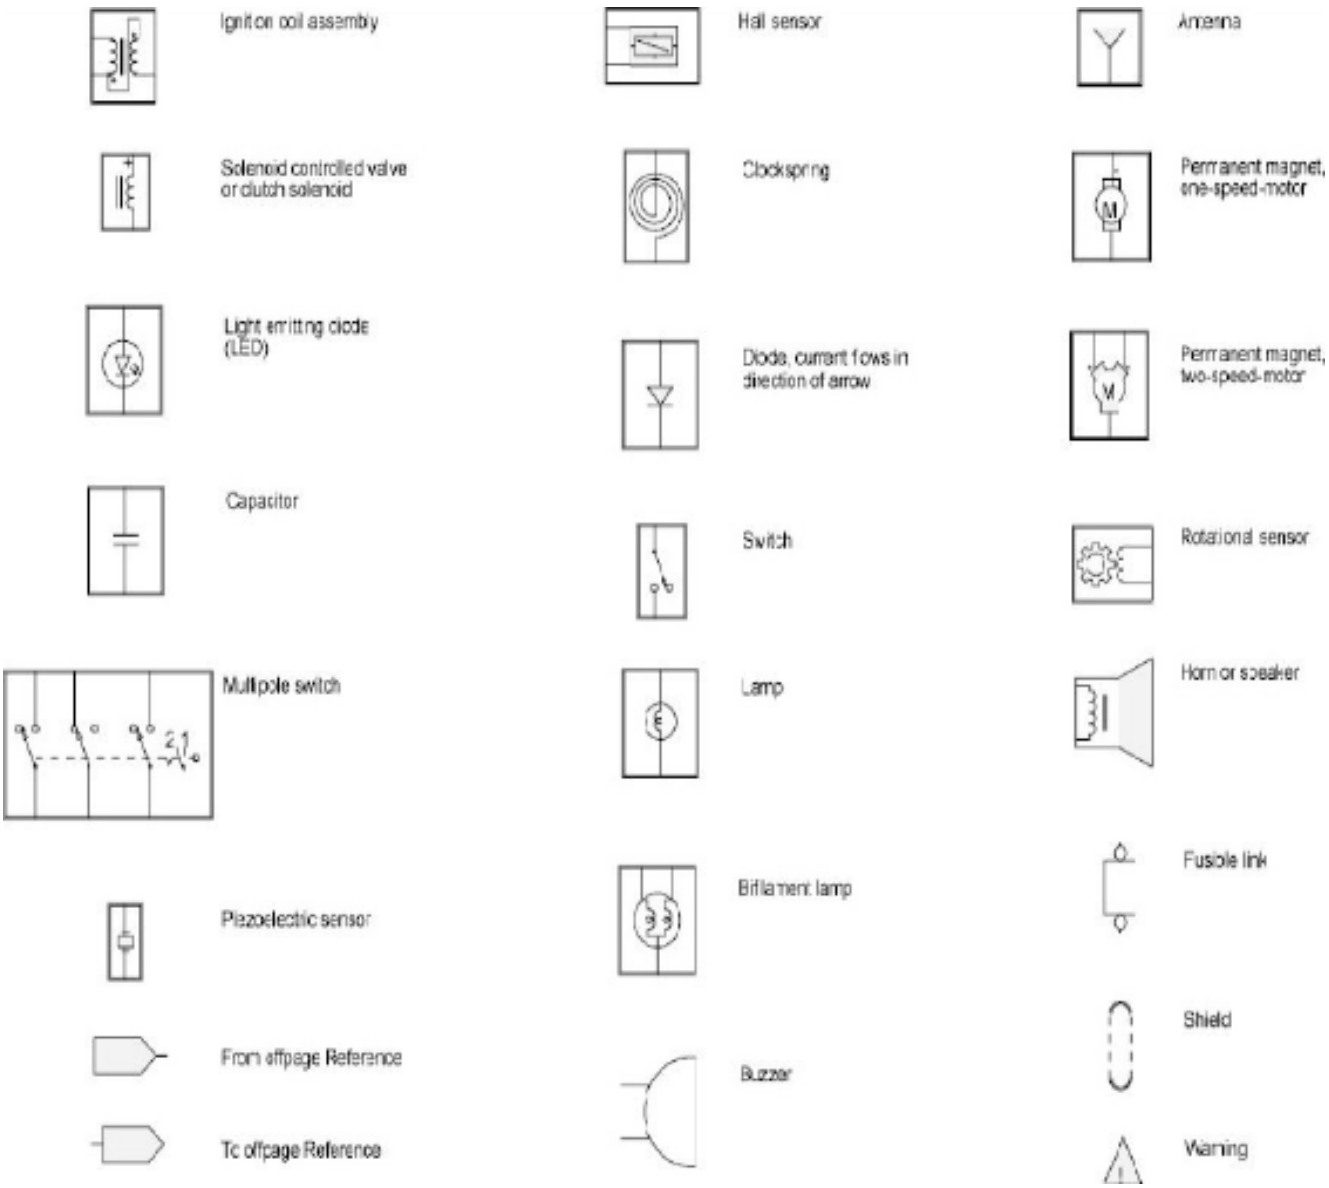
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

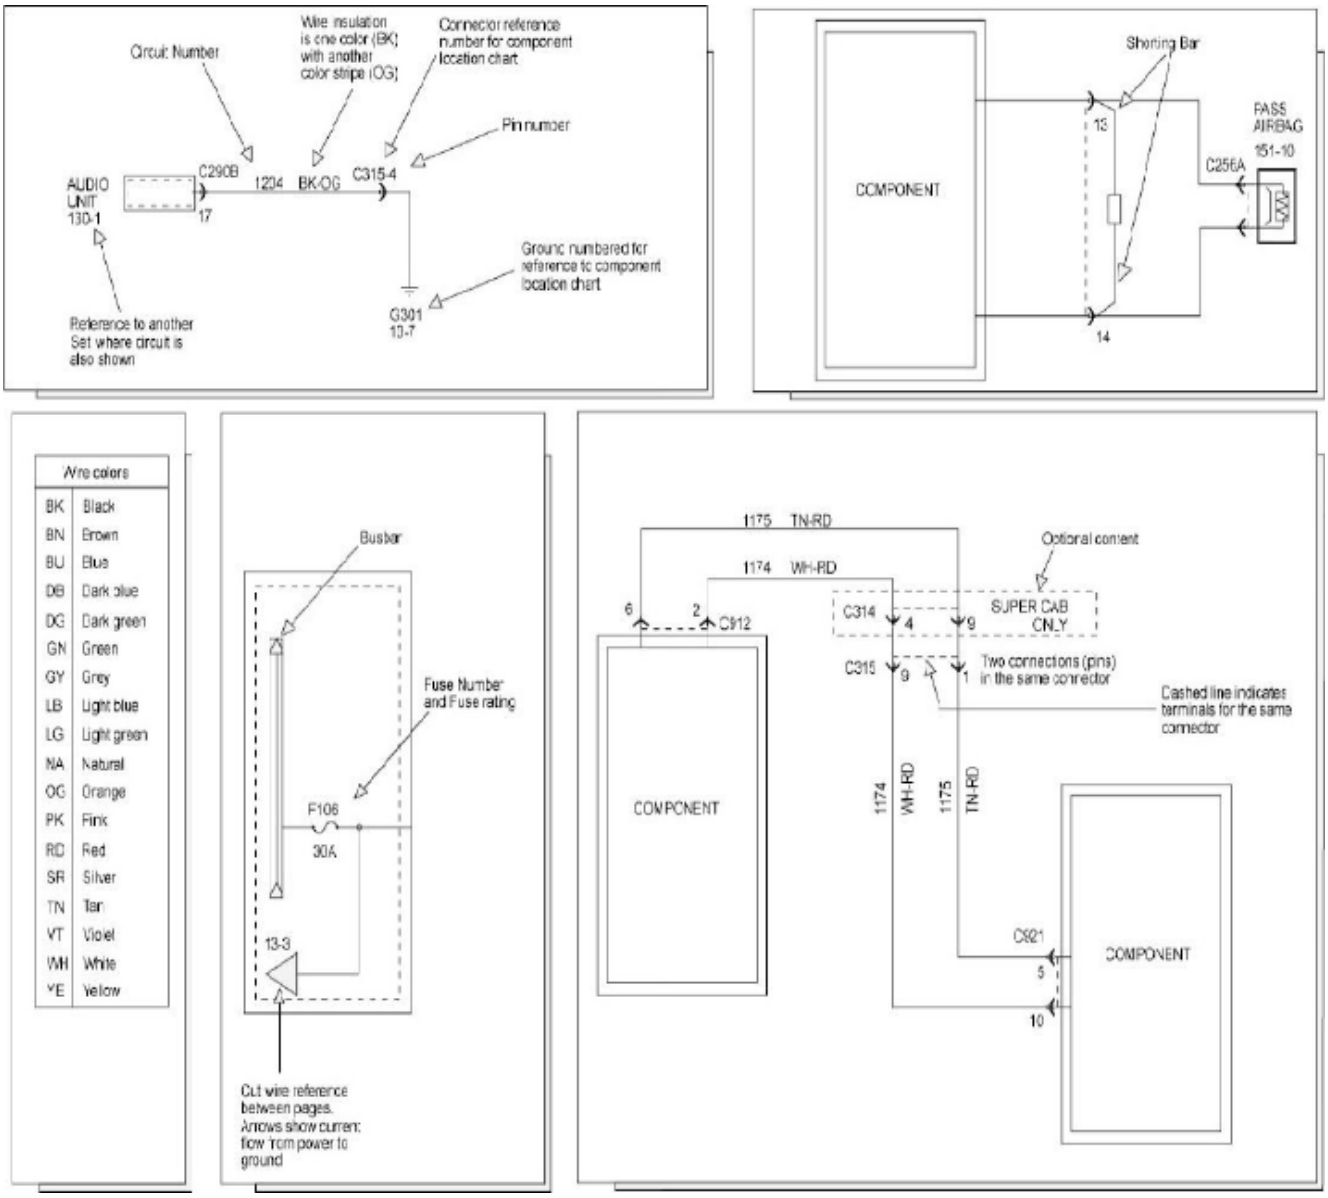
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

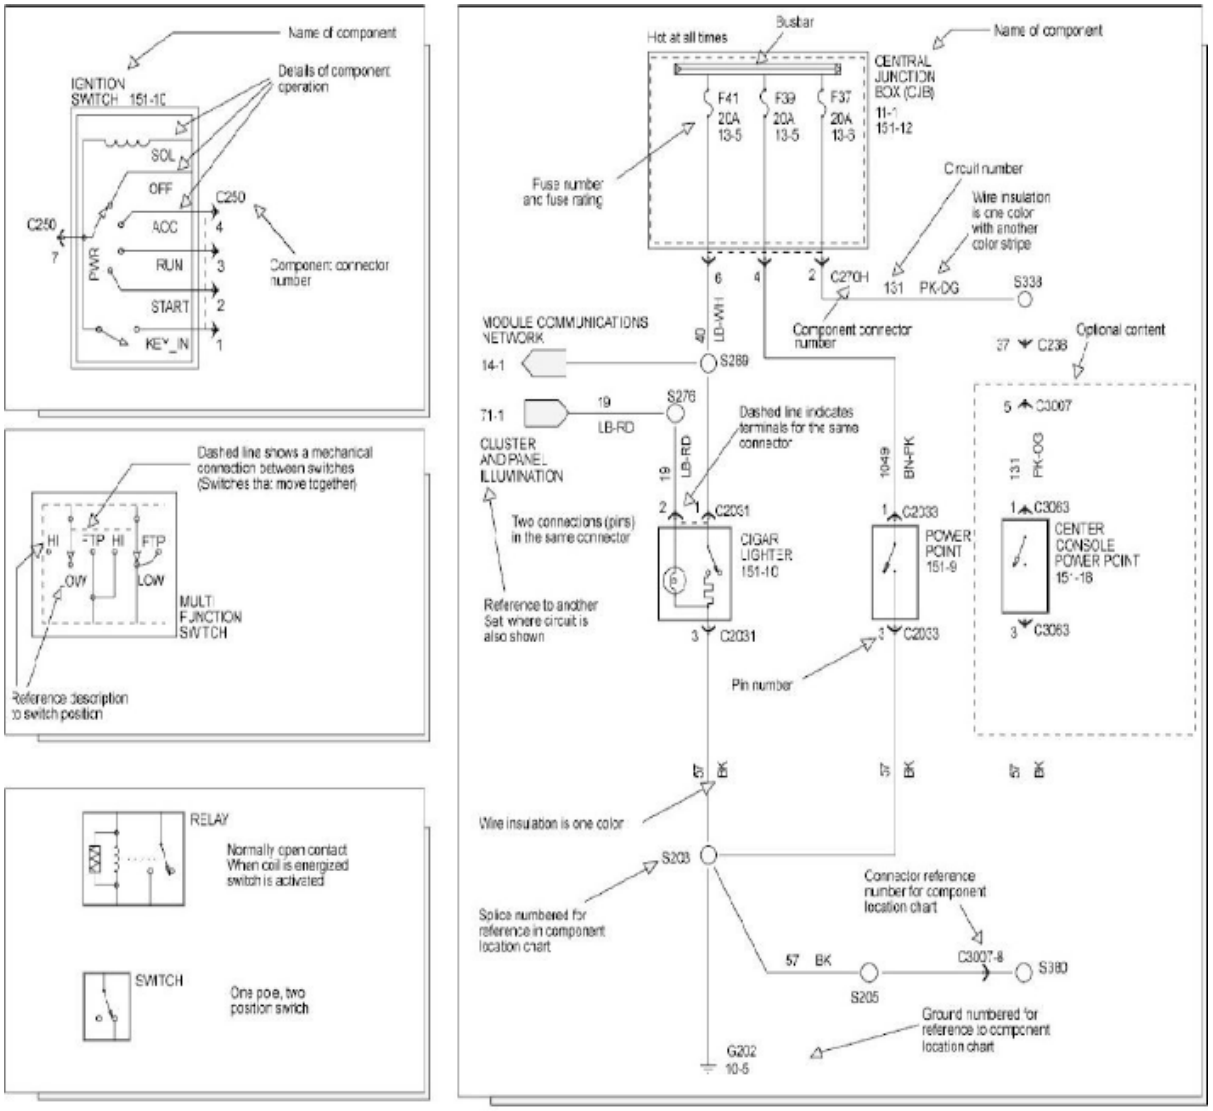
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left

Radiator Cooling Fan Motor Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

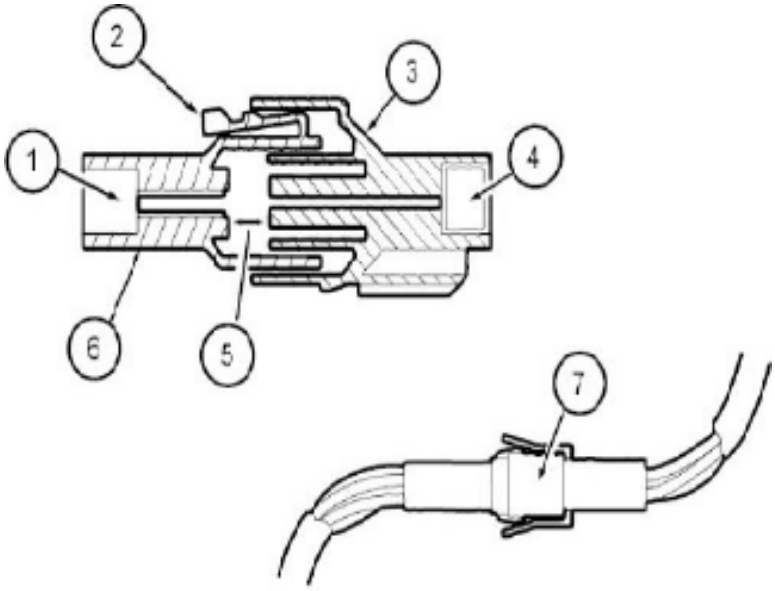
5 = Intermittent contact

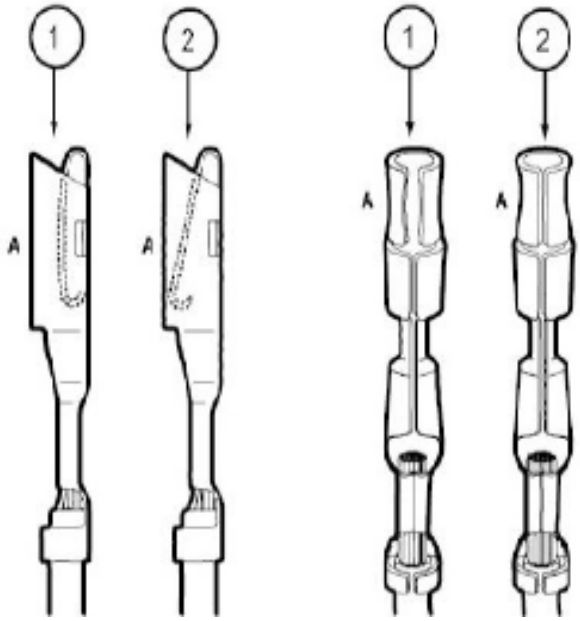
6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Defective insulation stripping





1 = Proper crimp

2 = Insulation not removed

3 = Wire strands missing

4 = Intermittent signals through pierced insulation

Partially mated connectors

1 = Seal

2 = Displaced tab

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Male half

7 = Intermittent contact

Lock may be displaced into an unlocked position; pull on the connector to verify the lock.

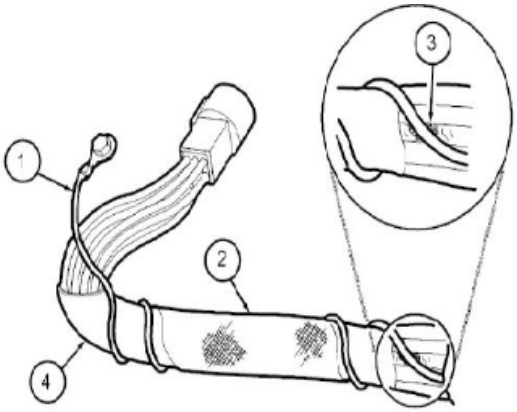
Deformed (enlarged) female terminals

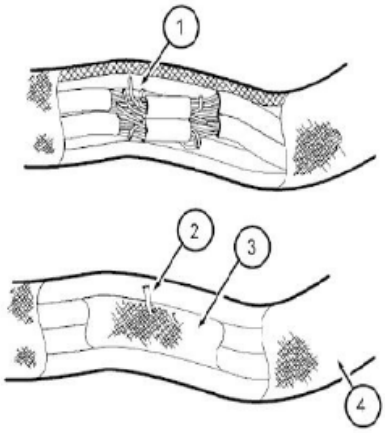
1 = Enlarged

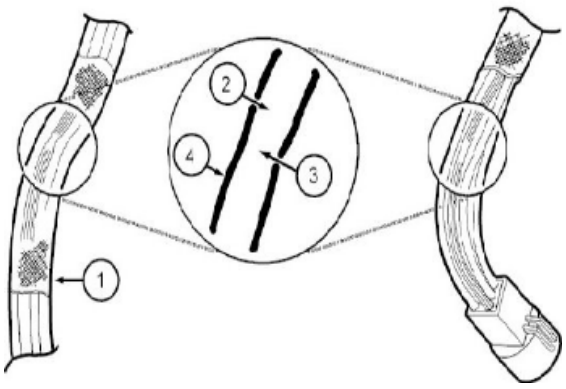
2 = Normal

Any probe entering the terminal may enlarge the contact spring opening creating an intermittent signal.

Insert the correct mating terminal (Location A) from the service kit and feel for a loose fit.







Electrical short inside the harness

1 = Solder coated wire to ground

2 = Harness protective tape

3 = Intermittent short

Solder coated wire pierced through the insulation of another circuit

4 = Grounding foil

Electrical short within the harness

Splice tape removed 1

= Intermittent short

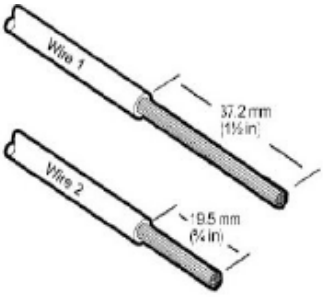
Splice covered 2

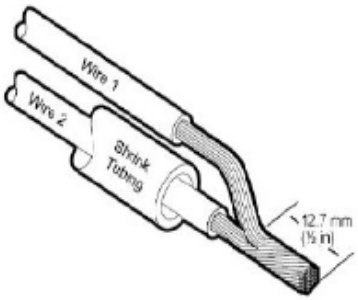
= Wire strand

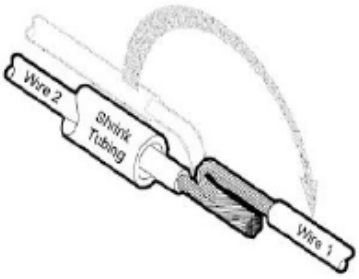
3 = Splice tape

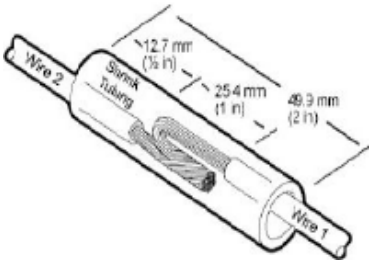
4 = Harness tape

Broken wire strands in harness









1 = Wiring harness tape

2 = Wiring strand

3 = Broken strands intermittent signal

4 = Circuit insulation

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. lnstall heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

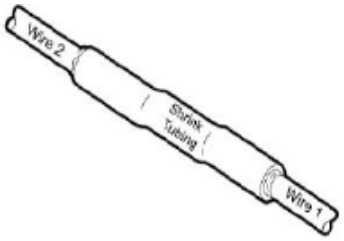
NOTE: -

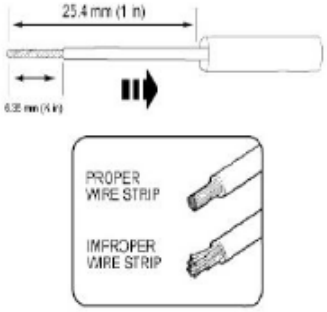
Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

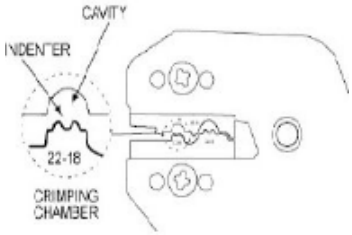
- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

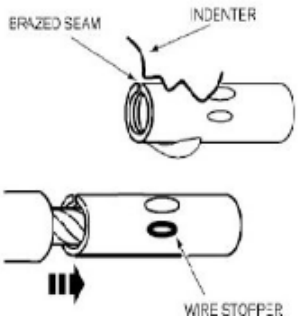
6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.









7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

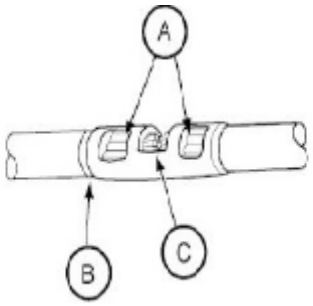
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

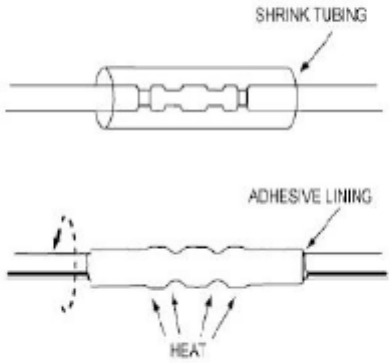
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x cia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

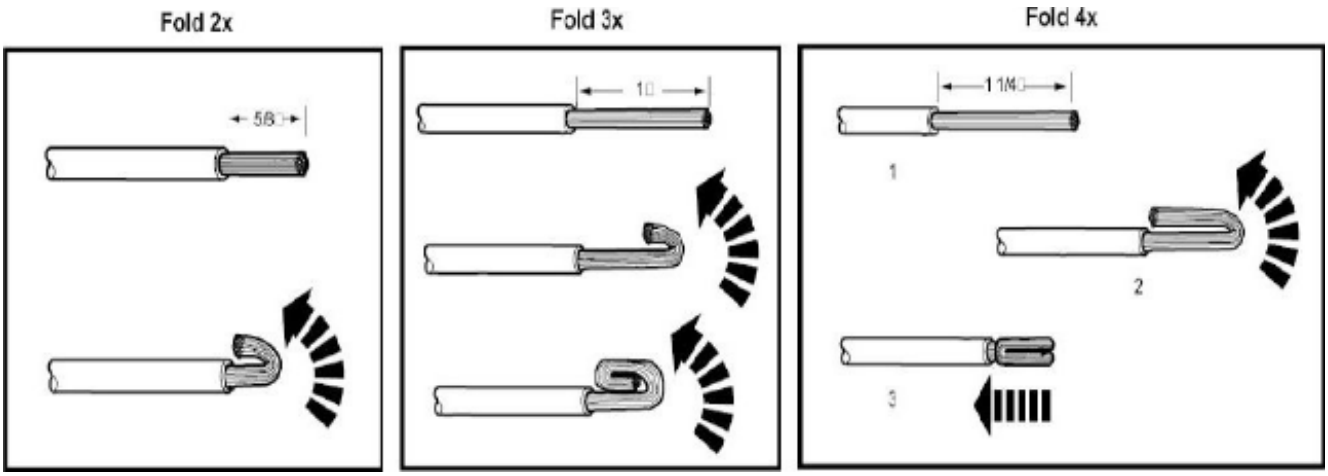
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



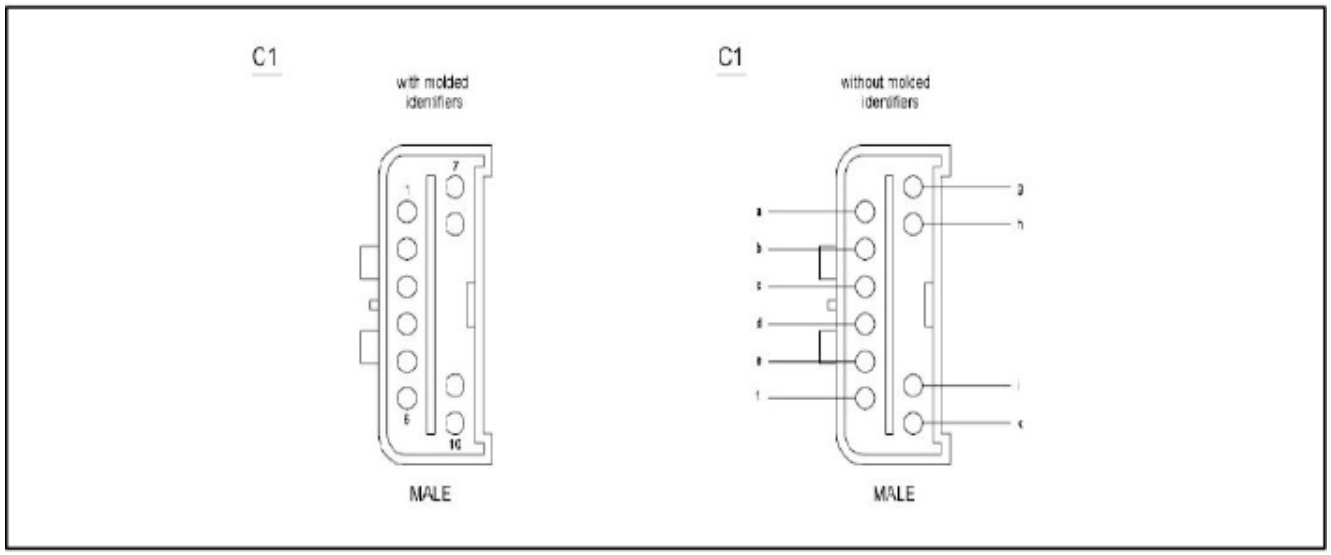
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



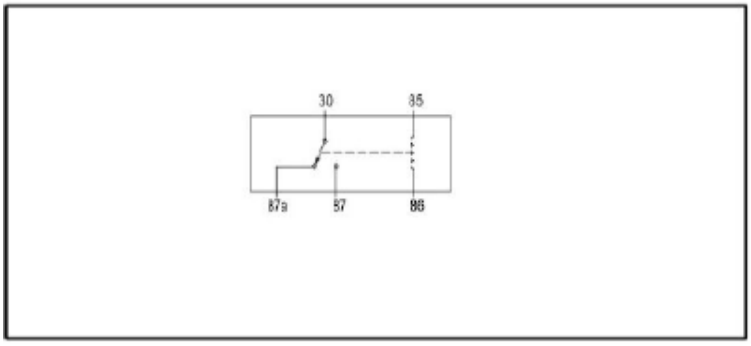
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

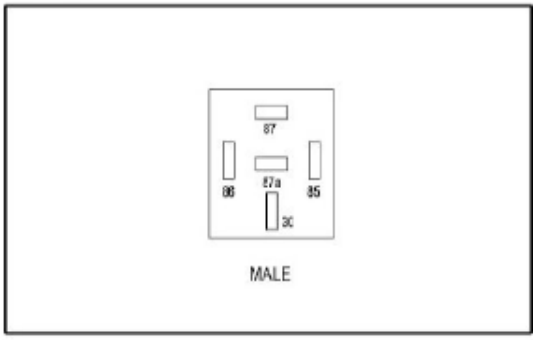
Radiator Cooling Fan Motor Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 - 90 Ω

Radiator Cooling Fan Speed Sensor: Description and Operation

FAN SPEED SENSOR (FSS)

Cooling Fan Clutch With FSS

The FSS is a Hall-effect sensor that measures the cooling fan clutch speed by generating a waveform with a frequency proportional to the fan speed. If the cooling fan clutch is moving at a relatively low speed, the sensor produces a signal with a low frequency. As the cooling fan clutch speed increases, the sensor generates a signal with a higher frequency. The PCM uses the frequency signal generated by the FSS as a feedback for closed loop control of the cooling fan clutch.

C1064

Coolant Temperature Sensor/Switch (For Computer): Description and Operation

ENGINE COOLANT TEMPERATURE (ECT) SENSOR

Typical Thread Type ECT Sensor

The ECT sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of a thermistor decreases as the temperature increases, and the resistance increases as the temperature decreases. The varying resistance changes the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Thermistor-type sensors are considered passive sensors. A passive sensor is connected to a voltage divider network so that varying the resistance of the passive sensor causes a variation in total current flow. Voltage that is dropped across a fixed resistor in a series with the sensor resistor determines the voltage signal at the PCM. This voltage signal is equal to the reference voltage minus the voltage drop across the fixed resistor.

The ECT measures the temperature of the engine coolant. The PCM uses the ECT input for fuel control and for cooling fan control. There are 3 types of ECT sensors, threaded, push-in, and twist-lock. The ECT sensor is located in an engine coolant passage.

C107

Engine Temperature Sensor: Description and Operation

CYLINDER HEAD TEMPERATURE (CHT) SENSOR

Typical CHT Sensor

The CHT sensor is a thermistor device in which resistance changes with the temperature. The electrical resistance of a thermistor decreases as temperature increases, and the resistance increases as the temperature decreases. The varying resistance affects the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

The CHT sensor is installed in the cylinder head and measures the metal temperature. The CHT sensor can provide complete engine temperature information and can be used to infer coolant temperature. If the CHT sensor conveys an overheating condition to the PCM, the PCM initiates a fail-safe cooling strategy based on information from the CHT sensor. A cooling system concern such as low coolant or coolant loss could cause an overheating condition. As a result, damage to major engine components could occur. Using both the CHT sensor and fail-safe cooling strategy, the PCM prevents damage by allowing air cooling of the engine and limp home capability.

2	9E766	TB cover

Thermostat: Service and Repair

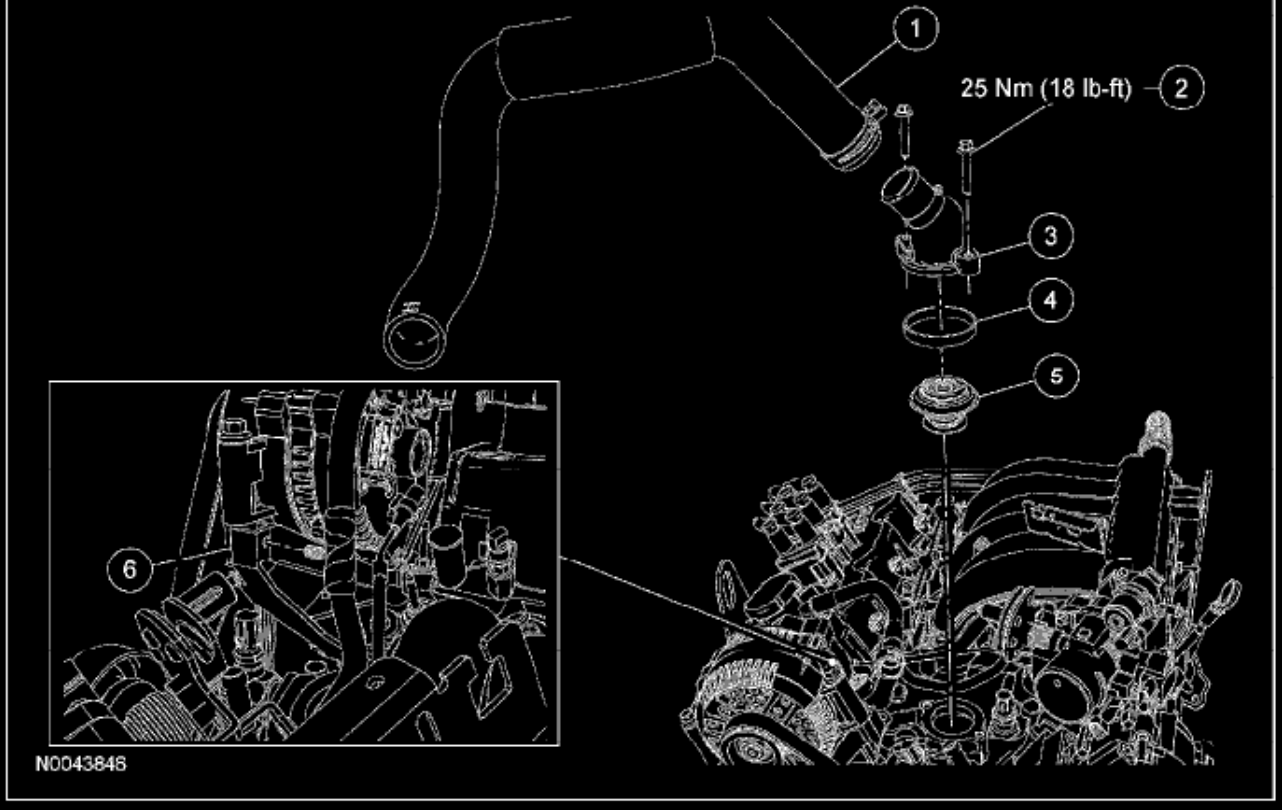
Thermostat - 3.0L (2V)

Throttle Body Cover

Throttle Body Cover

Thermostat

Thermostat



Item	Part Number	Description
1	8260	Upper radiator hose
2	N605909	Thermostat outlet housing bolt (2 required)
3	8592	Thermostat outlet housing
4	8255	Thermostat outlet housing gasket
5	8575	Thermostat
6	13A506	Alternator wiring pin-type retainer (part of 14A280)

Thermostat

Removal and Installation

1. Drain the cooling system. 2. Remove the air cleaner outlet tube. 3. Remove the bolt and the throttle body (TB) cover. 4. Remove the upper radiator hose from the thermostat outlet housing. 5. Detach the alternator wiring pin-type retainer. 6. Remove the bolts, the thermostat outlet housing and the thermostat.

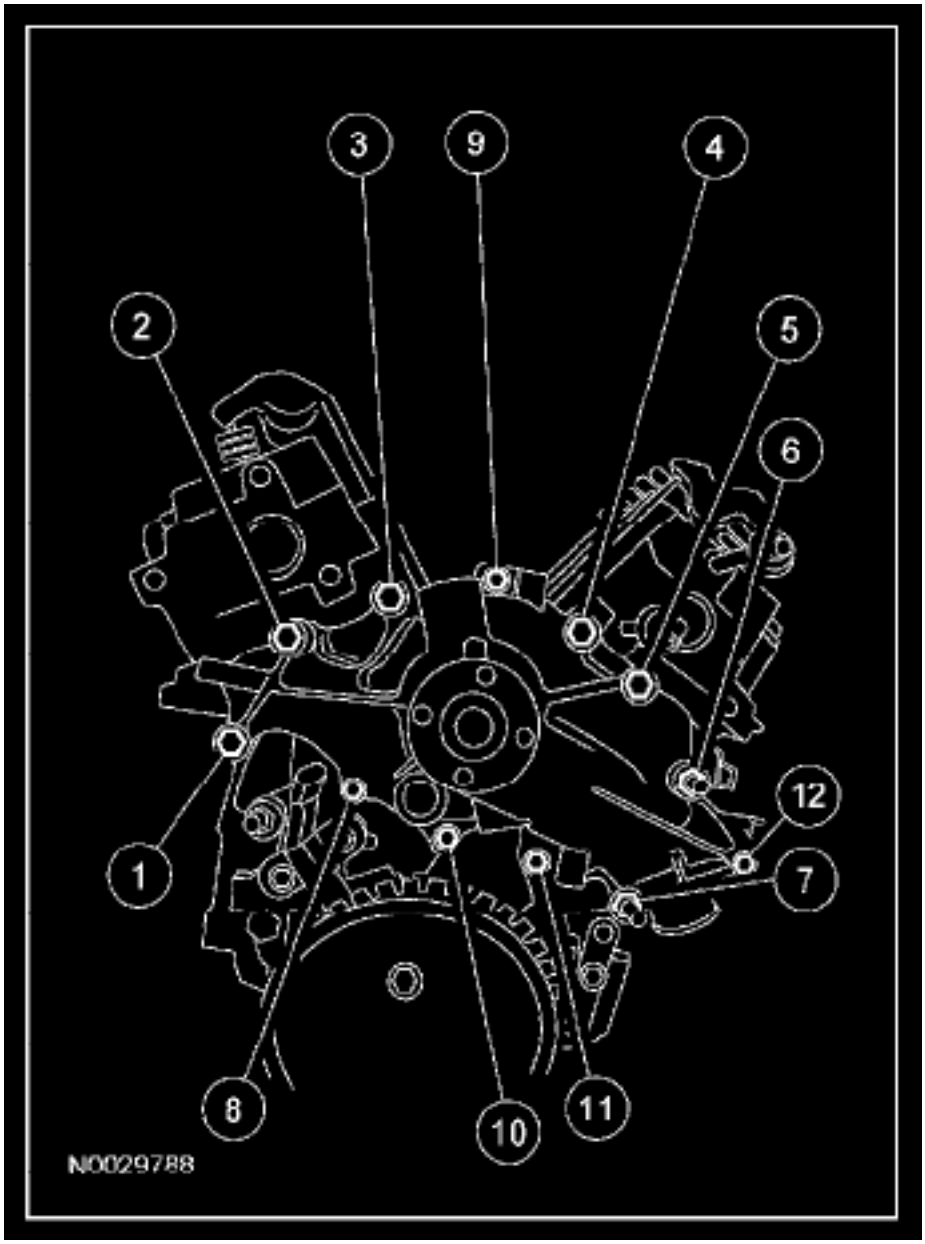
^ To install, tighten to 25 Nm (18 lb-ft).

7. CAUTION: Use care when scraping thermostat housing-to-gasket mating surfaces. Gouges in aluminum could form leak paths.

Discard the gasket and clean the sealing surfaces.

8. NOTE: Make sure the sealing surfaces are totally free of gasket material.

To install, reverse the removal procedure.

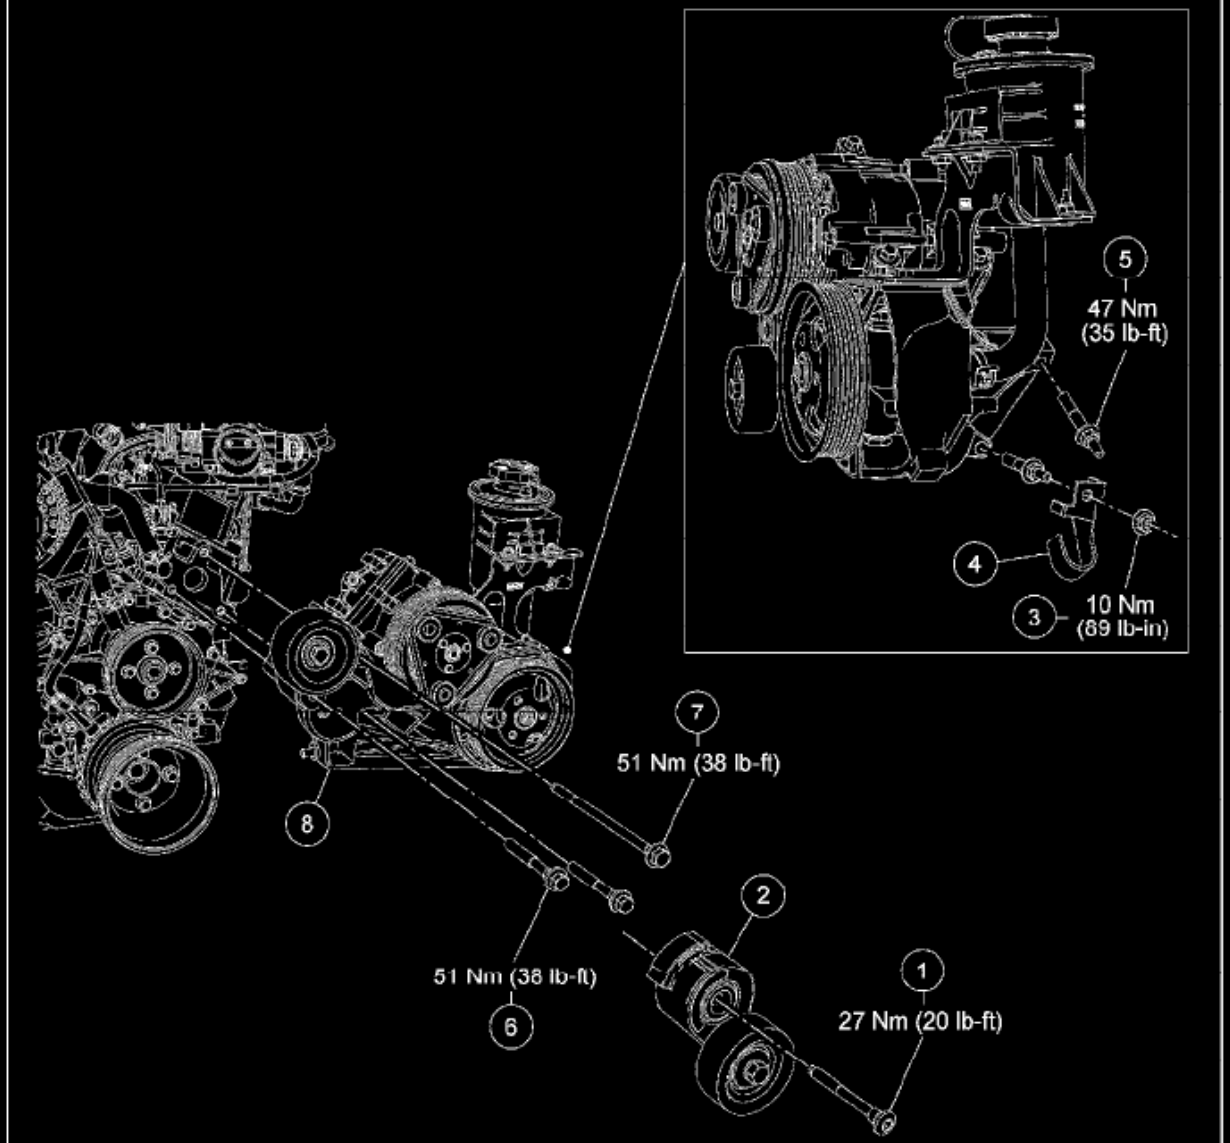


Water Pump: Specifications

Coolant pump 10 bolts and 2 stud bolts:

bolts 1-7 ..... 25 Nm (18 lb-ft) bolts 8-12 ..... 10 Nm (89 lb-inch)

LH Accessory Drive Bracket



Item	Part Number	Description

4	W807515	Coolant pump stud bolt
5	W708249	Coolant pump stud bolt

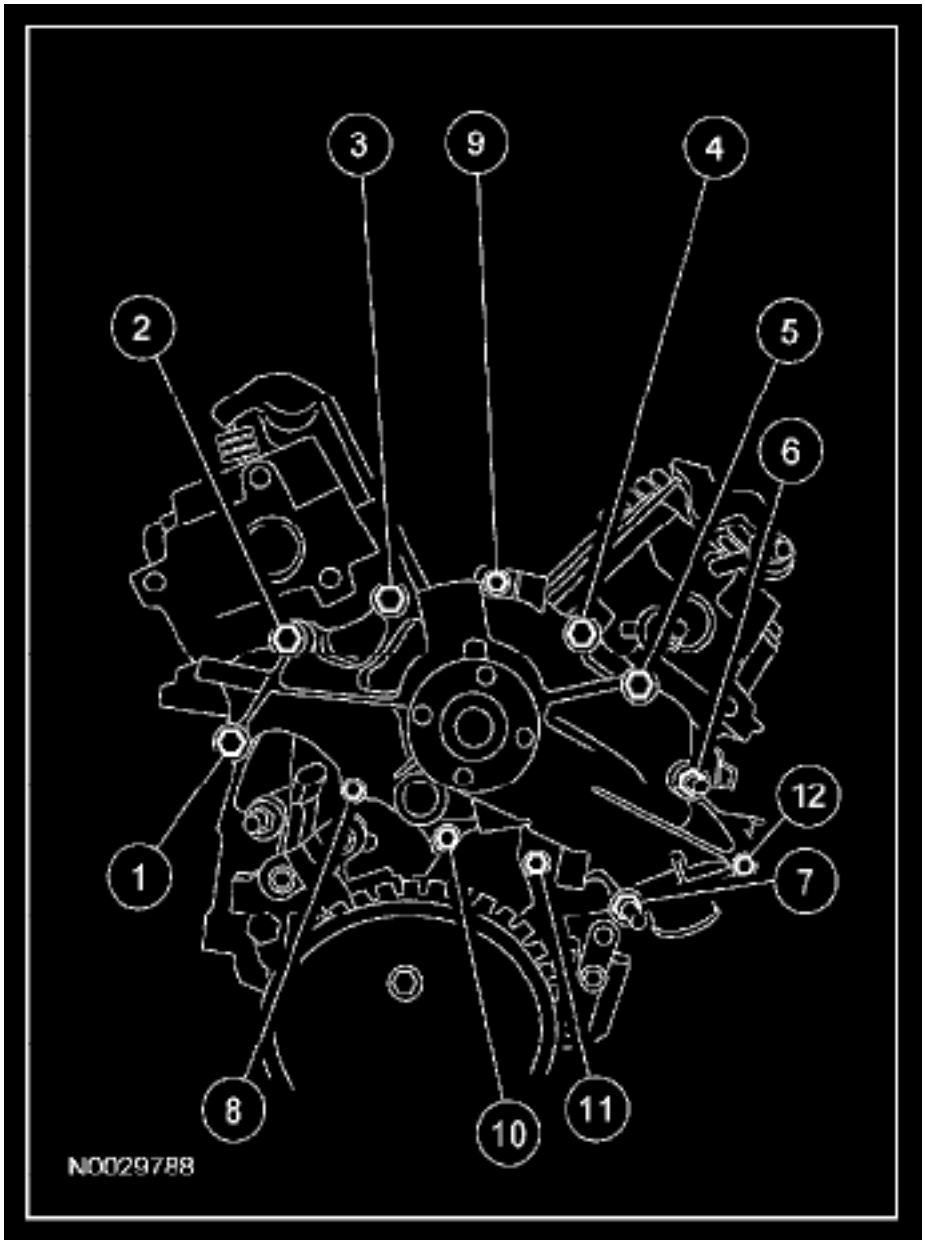
(Continued)

Item	Part Number	Description
6	N804576	Coolant pump bolt (5 required)
7	N811375	Coolant pump bolt (5 required)
8	8501	Coolant pump
9	18472	Heater hose
10	—	Bypass hose (part of 8B273)

Coolant Pump

Removal

1. Drain the cooling system. 2. Remove the air cleaner outlet tube. 3. Remove the accessory drive belt. 4. Remove the fan blade and the fan shroud. 5. Remove the bolts and the coolant pump pulley. 6. Disconnect the heater hose. 7. Disconnect the wiring harness retainer. 8. Remove the nut and detach the battery cable bracket. 9. Remove the side stud bolts from the A/C compressor mounting bracket.



10. Disconnect the bypass hose. 11. Remove the bolt and the accessory drive belt tensioner. 12. Remove the front bolts and position the A/C compressor mounting bracket aside. 13. Remove the bolts and the coolant pump. 14. Clean the sealing surfaces.

Installation

1. Position the coolant pump and loosely install the 10 bolts and 2 stud bolts.

^ Tighten bolts 1-7 in the sequence shown to 25 Nm (18 lb-ft).

^ Tighten bolts 8-12 in the sequence shown to 10 Nm (89 lb-inch).

2. Position the A/C compressor mounting bracket and install the front bolts.

^ Tighten to 51 Nm (38 lb-ft).

3. Position the accessory drive belt tensioner and install the bolt.

^ Tighten to 27 Nm (20 lb-ft).

4. Connect the bypass hose. 5. Install the A/C compressor mounting bracket side stud bolts.

^ Tighten to 47 Nm (35 lb-ft).

6. Position the battery cable bracket and install the nut.

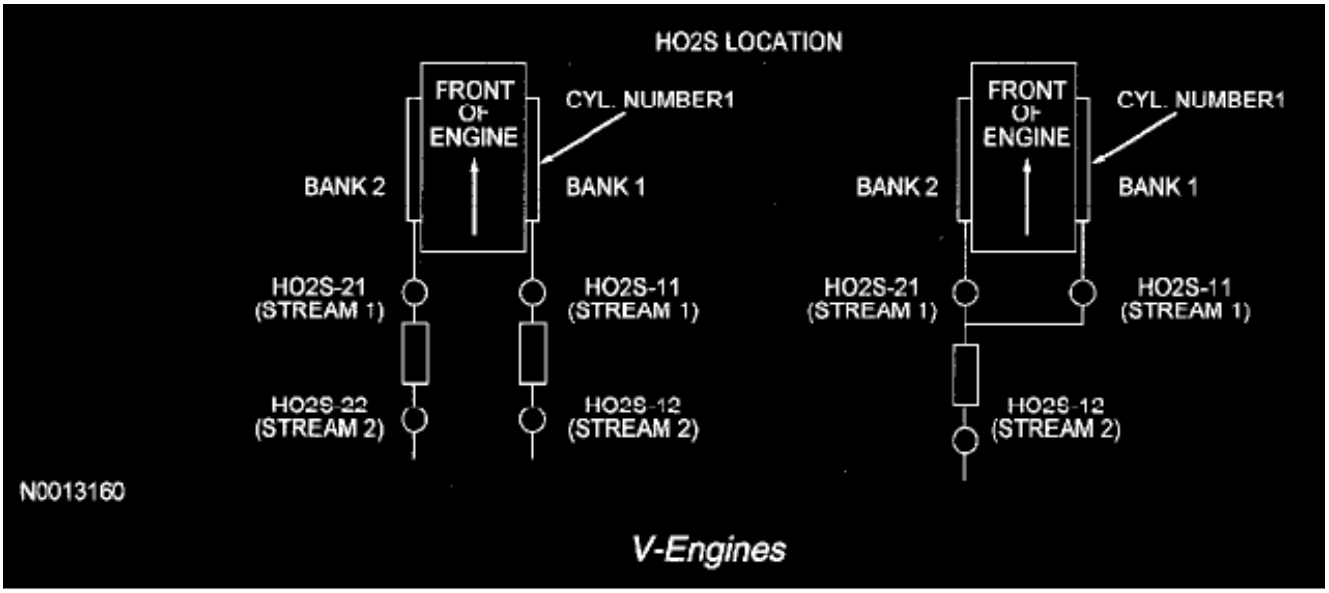
^ Tighten to 10 Nm (89 lb-inch).

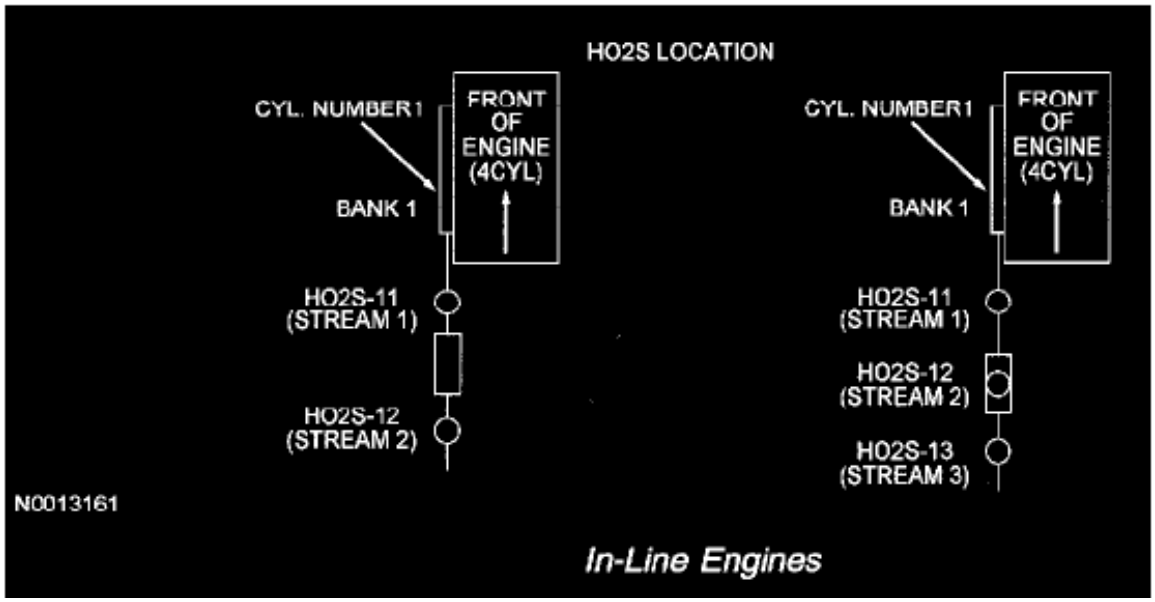
7. Install the coolant pump pulley.

^ Tighten to 25 Nm (18 lb-ft).

8. Install the accessory drive belt. 9. Attach the wiring harness retainer.

10. Connect the heater hose. 11. Install the fan blade and fan shroud. 12. Install the air cleaner outlet tube. 13. Fill the cooling system.





Catalytic Converter: Description and Operation

CATALYST AND EXHAUST SYSTEMS

Overview

V-Engines

In-Line Engines

The catalytic converter and exhaust systems work together to control the release of harmful engine exhaust emissions into the atmosphere. The engine exhaust gas consists mainly of nitrogen (N),

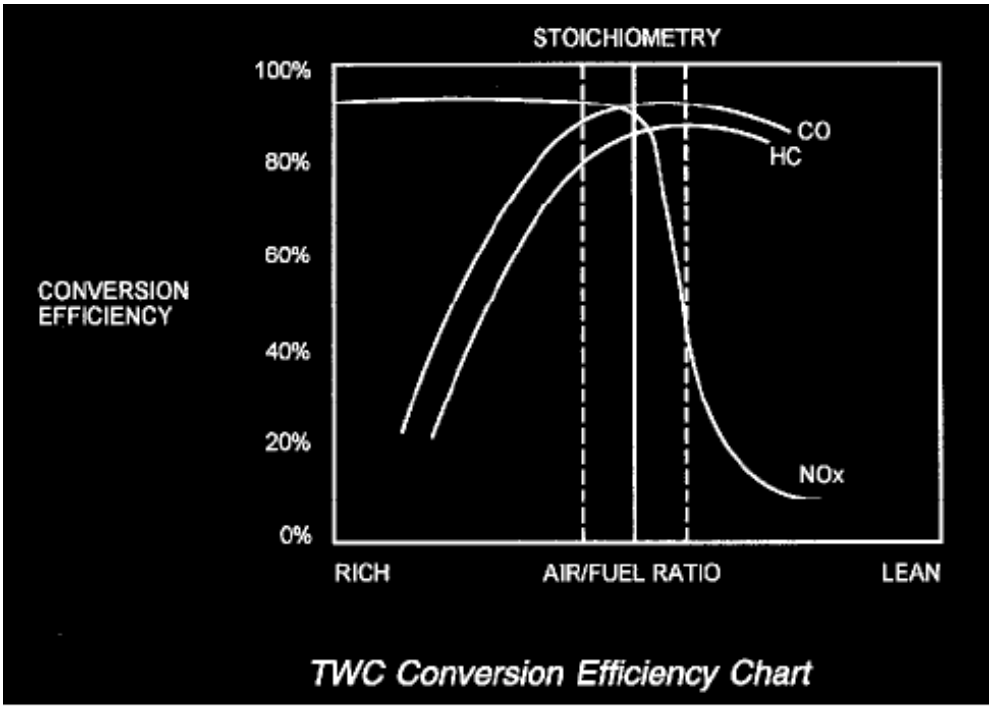
carbon dioxide (CO2) and water vapor (H2O). However, it also contains carbon monoxide (CO), oxides of nitrogen (NOx), hydrogen (H), and various unburned hydrocarbons (HCs). The major air pollutants of CO, NOx,and HCs, and their emission into the atmosphere must be controlled.

The exhaust system generally consists of an exhaust manifold, front exhaust pipe, front heated oxygen sensor (HO2S), rear exhaust pipe, catalyst HO2S, a muffler, and an exhaust tailpipe. The catalytic converter is typically installed between the front and rear exhaust pipes. On some vehicle applications, more than one catalyst is used between the front and rear exhaust pipes. Catalytic converter efficiency is monitored by the on board diagnostic (OBD) system strategy in the powertrain control module (PCM). For information on the OBD catalyst monitor, refer to the description for the Catalyst Efficiency Monitor. See: Powertrain Management/Computers and Control Systems/Testing and Inspection/Monitors, Trips, Drive Cycles and Readiness Codes/Catalyst Efficiency Monitor

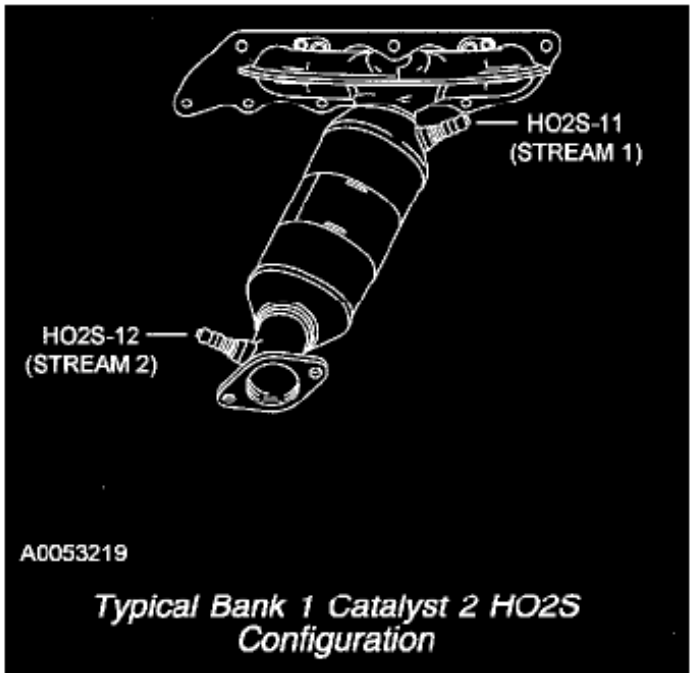
For most vehicles, only 2 HO2Ss are used in an exhaust stream. The front sensors (HO2S11/HO2S21) before the catalyst are used for primary fuel control while the ones after the catalyst (HO2S12/HO2S22) are used to monitor catalyst efficiency. However, some partial zero emission vehicles (PZEV) use 3 HO2Ss for each engine bank. The stream 1 sensors (HO2S11/HO2S21) located before the catalyst are used for primary fuel control, the stream 2 sensors (HO2S12/HO2S22) are used to monitor the light-off catalyst, and the stream 3 sensors (HO2S13/HO2S23) located after the catalyst are used for long term fuel trim control to optimize catalyst efficiency (fore aft oxygen sensor control).

Catalytic Converter

A catalyst is a material that remains unchanged when it initiates and increases the speed of a chemical reaction. A catalyst also enables a chemical reaction to occur at a lower temperature. The concentration of exhaust gas products released to the atmosphere must be controlled. The catalytic



TWC Conversion Efficiency Chart



Typical Bank 1 Catalyst 2 HO2S Configuration

converter assists in this task. It contains a catalyst in the form of a specially treated ceramic honeycomb structure saturated with catalytically active precious metals. As the exhaust gases come in contact with the catalyst, they are changed into mostly harmless products. The catalyst initiates and speeds up heat producing chemical reactions of the exhaust gas components so they are used up as much as possible.

Light Off Catalyst

As the catalyst heats up, converter efficiency rises rapidly. The point at which conversion efficiency exceeds 50% is called catalyst light off. For most catalysts this point occurs at 246°C to 302°C (475°F to 575°F). A fast light catalyst is a 3-way catalyst (TWC) that is located as close to the exhaust manifold as possible. Because the light off catalyst is located close to the exhaust manifold it lights off faster and reduces emissions more quickly than the catalyst located under the body. Once the catalyst lights off, the catalyst quickly reaches the maximum conversion efficiency for that catalyst.

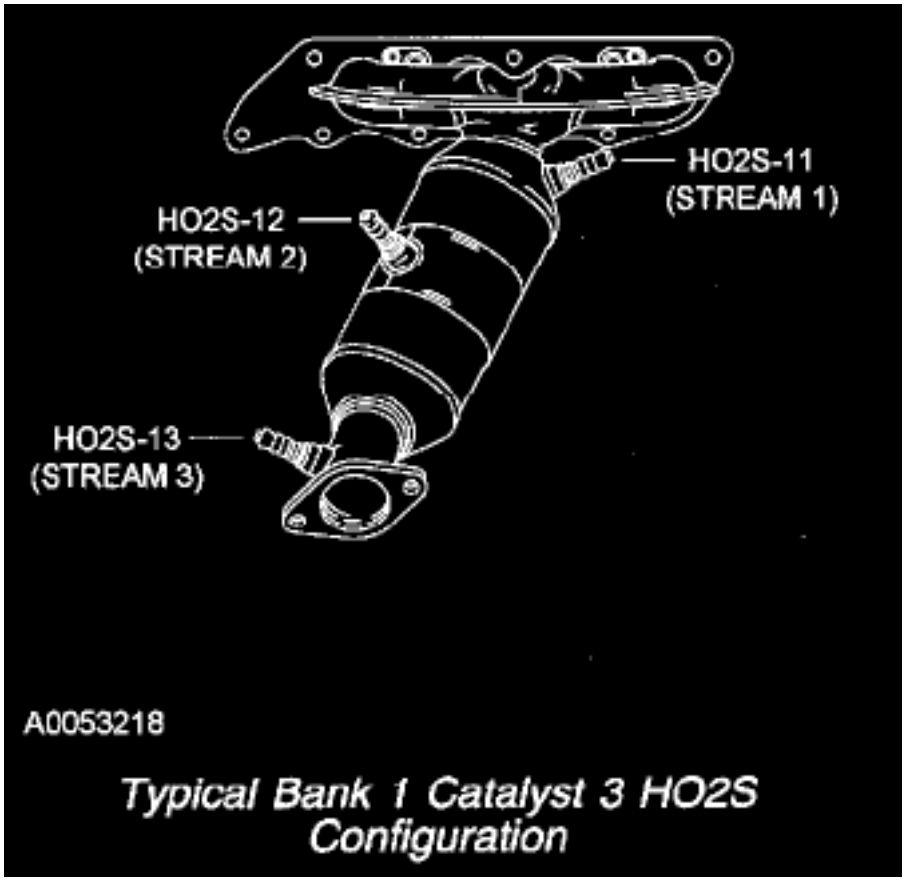
Three-Way Catalyst (TWC) Conversion Efficiency

TWC Conversion Efficiency Chart

A TWC requires a stoichiometric fuel ratio, 14.7 pounds of air to 1 pound of fuel (14.7:1), for high conversion efficiency. In order to achieve these high efficiencies, the air/fuel ratio must be tightly controlled with a narrow window of stoichiometry. Deviations outside of this window greatly decrease the conversion efficiency. For example a rich mixture decreases the HC and CO conversion efficiency while a lean mixture decreases the NOx conversion efficiency.

Exhaust System

Typical Bank 1 Catalyst 2 HO2S Configuration



Typical Bank 1 Catalyst 3 HO2S Configuration

Typical Bank 1 Catalyst 3 HO2S Configuration

The purpose of the exhaust system is to convey engine emissions from the exhaust manifold to the atmosphere. Engine exhaust emissions are directed from the engine exhaust manifold to the catalytic converter through the front exhaust pipe. A HO2S is mounted on the front exhaust pipe before the catalyst. The catalytic converter reduces the concentration of CO, unburned HCs, and NOx in the exhaust emissions to an acceptable level. The reduced exhaust emissions are directed from the catalytic converter past another HO2S mounted in the rear exhaust pipe and then on into the muffler. Finally, the exhaust emissions are directed to the atmosphere through an exhaust tailpipe.

On some PZEV, there is a total of 3 HO2S in the exhaust stream. One near the exhaust manifold (stream 1), one in the middle of the light-off catalyst (stream 2), and the third (stream 3) is mounted after the light-off catalyst.

Underbody Catalyst

The underbody catalyst is located after the light off catalyst. The underbody catalyst may be in line with the light off catalyst, or the underbody catalyst may be common to 2 light off catalysts, forming a Y pipe configuration. For an exact configuration of the catalyst and exhaust system for a specific vehicle, refer to Exhaust System for the exhaust system-exploded view.

Three-Way Catalytic (TWC) Converter

The TWC converter contains either platinum (Pt) and rhodium (Rh) or palladium (Pd) and rhodium (Rh). The TWC converter catalyzes the oxidation reactions of unburned HCs and CO and the reduction reaction of NOx. The 3-way conversion can be best accomplished by always operating the engine air fuel/ratio at or close to stoichiometry.

Exhaust Manifold Runners

The exhaust manifold runners collect exhaust gases from engine cylinders. The number of exhaust manifolds and exhaust manifold runners depends on the engine configuration and number of cylinders.

Exhaust Pipes

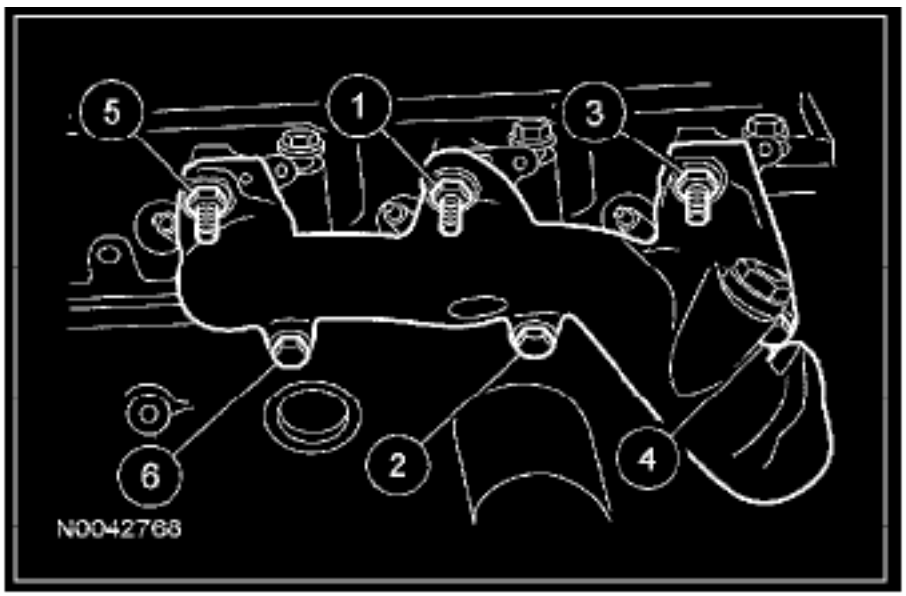
Exhaust pipes are usually treated during manufacturing with an anti-corrosive coating agent to increase the life of the product. The pipes serve as guides for the flow of exhaust gases from the engine exhaust manifold through the catalytic converter and the muffler.

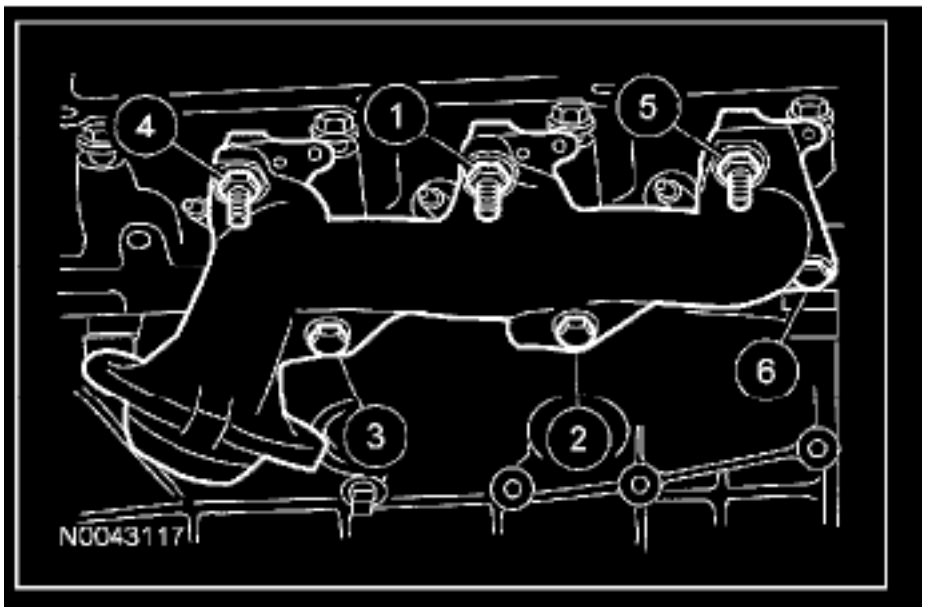
Heated Oxygen Sensor (HO2S)

The HO2Ss provide the PCM with information related to the oxygen content of the exhaust gas.

Muffler

Mufflers are usually treated during manufacturing with an anti-corrosive coating agent to increase the life of the product. The muffler reduces the level of noise produced by the engine, and also reduces the noise produced by exhaust gases as they travel from the catalytic converter to the atmosphere.





Exhaust Manifold: Specifications

LH exhaust manifold (New Studs and Bolts):

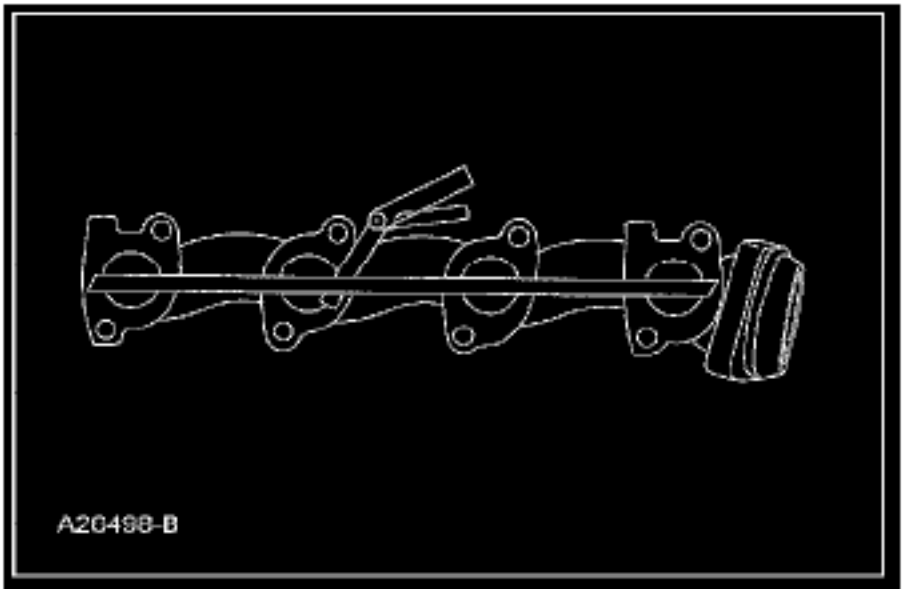
Stage 1 .... 10 Nm (89 lb-inch) Stage 2 .... 23 Nm (17 lb-ft)

RH exhaust manifold (New Studs and Bolts):

Stage 1 ..... 10 Nm (89 lb-inch) Stage 2 ..... 23 Nm (17 lb-ft)

Special Tool(s)

 ST1271-A	Feeler Gauge Set 303-D027 (D81L-4201-A) or equivalent



Exhaust Manifold: Testing and Inspection

Exhaust Manifold Cleaning and Inspection

1. Clean the exhaust manifold using a suitable solvent. Use a plastic scraping tool to clean the gasket sealing surfaces.

2. NOTE: New exhaust manifold gaskets, studs, nuts and/or bolts must be installed when an exhaust manifold is serviced.

NOTE: Use a straightedge that is calibrated by the manufacturer to be flat within 0.005 mm (0.0002 inch) per running foot of length, such as Snap-On(R) GA438A or equivalent. For example, if the straightedge is 61 cm (24 inch) long, the machined edge must be flat within 0.010 mm (0.0004 inch) from end to end.

Using the precision straight edge and a feeler gauge, check the exhaust manifold sealing surface for warpage. If the warpage is greater than 0.76 mm (0.0299 inch), install a new exhaust manifold.

N0050162

N0050162

10. Remove the LH side of the exhaust Y-pipe. 11. Remove the LH side of the exhaust Y-pipe-to-RH side of the exhaust Y-pipe gasket.

^ Discard the gasket.

12. NOTE: 3.0L shown, 4.0L similar.

Remove the RH side of the exhaust Y-pipe-to-exhaust manifold nuts and remove the RH side of the exhaust Y-pipe. ^

Discard the nuts.

Installation

CAUTION: Do not use oil or grease-based lubricants on the isolators. These lubricants may cause deterioration of the rubber. This can lead to separation of the isolator from the exhaust hanger bracket during vehicle operation.

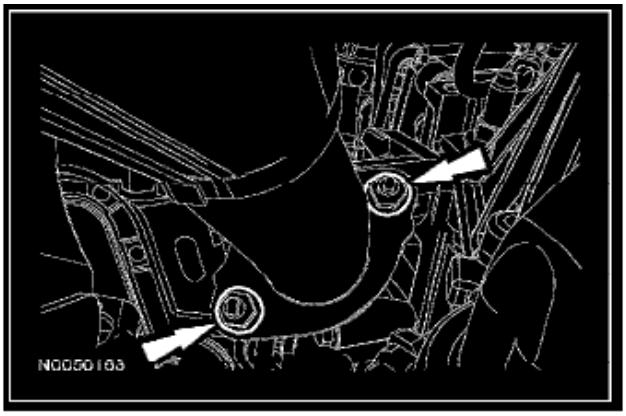
NOTE: Clean all the mating surface of the exhaust Y-pipe.

1. NOTE: 3.0L shown, 4.0L similar.

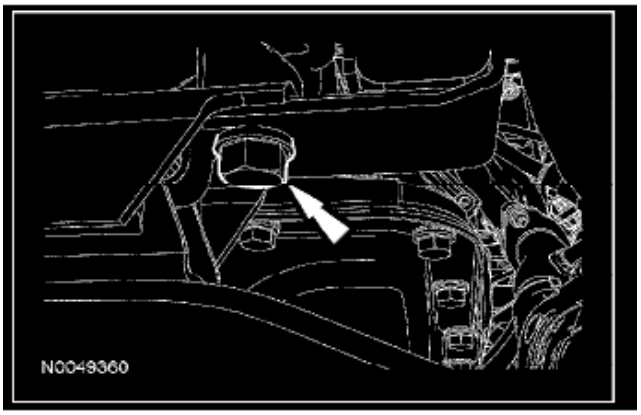
Position the RH side of the exhaust Y-pipe into the vehicle and loosely install the new RH side of the exhaust Y-pipe-to-exhaust manifold nuts.

2. Install a new LH side of the exhaust Y-pipe-to-RH side of the exhaust Y-pipe gasket.

3. NOTE: 3.0L shown, 4.0L similar.



N0050163



N0049360

N0050162

Position the LH side of the exhaust Y-pipe into the vehicle and loosely install the new LH side of the exhaust Y-pipe-to-exhaust manifold nuts.

4. Loosely install the new LH side of the exhaust Y-pipe-to-RH side of the exhaust Y-pipe nuts. 5. Install the transmission mount and isolator-to-transmission bolt.

^ Tighten to 90 Nm (66 lb-ft).

6. Install a new RH side of the exhaust Y-pipe-to-muffler and tailpipe assembly gasket. 7. Loosely install the RH side of the exhaust Y-pipe-to-muffler and tailpipe assembly bolts and new flagnuts.

8. NOTE: RH side shown, LH side similar.

NOTE: 3.0L shown, 4.0L similar.

Tighten the exhaust Y-pipe assembly-to-exhaust manifold nuts. ^

Tighten to 40 Nm (30 lb-ft).

9. Tighten the LH side of the exhaust Y-pipe-to-RH side of exhaust Y-pipe nuts.

^ Tighten to 40 Nm (30 lb-ft).

10. Tighten the RH side of the exhaust Y-pipe-to-muffler and tailpipe assembly bolts.

^ Tighten to 40 Nm (30 lb-ft).

11. Connect the HO2S and catalyst monitor sensors electrical connectors. 12. Check to see if the exhaust system isolators are at zero load. If the exhaust system isolators are not at zero load, carry out the exhaust system

alignment procedure.

Muffler: Service and Repair

Muffler and Tailpipe

Removal

CAUTION: Do not use oil or grease-based lubricants on the isolators. These lubricants may cause deterioration of the rubber. This can lead to separation of the isolator from the exhaust hanger bracket during vehicle operation.

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist.

Vehicles with 2.3L

2. Remove the exhaust downpipe-to-muffler and tailpipe assembly bolts, flagnuts and gasket.

^ Discard the flagnuts and gasket. Vehicles with 3.0L and 4.0L

3. Remove the RH side of the exhaust Y-pipe-to-muffler and tailpipe assembly bolts, flagnuts and gasket.

^ Discard the flagnuts and gasket. All vehicles

4. Disconnect the 3 rubber isolators and remove the muffler and tailpipe assembly.

Installation

CAUTION: Do not use oil or grease-based lubricants on the isolators. These lubricants may cause deterioration of the rubber. This can lead to separation of the isolator from the exhaust hanger bracket during vehicle operation.

NOTE: Clean all the mating surface of the muffler and tailpipe assembly.

All vehicles

1. Position the muffler and tailpipe assembly into the vehicle and connect the 3 rubber isolators.

Vehicles with 2.3L

2. Install a new exhaust downpipe-to-muffler and tailpipe assembly gasket. 3. Install the exhaust downpipe-to-muffler and tailpipe assembly bolts and new flagnuts.

^ Tighten to 40 Nm (30 lb-ft).

Vehicles with 3.0L and 4.0L

4. Install a new RH side of the exhaust Y-pipe-to-muffler and tailpipe assembly gasket. 5. Install the RH side of the exhaust Y-pipe-to-muffler and tailpipe assembly bolts and new flagnuts.

^ Tighten to 40 Nm (30 lb-ft).

All vehicles

6. Check to see if the exhaust system isolators are at zero load. If the exhaust system isolators are not at zero load, carry out the exhaust system

alignment procedure.

ETC System with a 3-Track APP Sensor Failure Mode and Effects Management:

Effect	Failure Mode ▪
No Effect on Driveability	A loss of redundancy or loss of a non-critical input could result in a concern that does not affect driveability. The powertrain malfunction indicator (wrench) illuminates, but the throttle control and torque control systems function normally. A DTC is set to indicate the component or circuit with the concern.
Disable Speed Control	If certain concerns are detected, speed control is disabled. Throttle control and torque control continue to function normally.

(Continued)

Electronic Throttle Control Module: Description and Operation

TORQUE BASED ELECTRONIC THROTTLE CONTROL (ETC)

Overview

The torque based ETC is a hardware and software strategy that delivers an engine output torque (via throttle angle) based on driver demand (pedal position). It uses an electronic throttle body, the powertrain control module (PCM), and an accelerator pedal assembly to control the throttle opening and engine torque.

Torque based ETC enables aggressive automatic transmission shift schedules (earlier upshifts and later downshifts). This is possible by adjusting the throttle angle to achieve the same wheel torque during shifts, and by calculating this desired torque, the system prevents engine lugging (low RPM and low manifold vacuum) while still delivering the performance and torque requested by the driver. It also enables many fuel economy/emission improvement technologies such as variable camshaft timing (VCT) (deliver same torque during transitions).

Torque based ETC also results in less intrusive vehicle and engine speed limiting, along with smoother traction control.

Other benefits of ETC are: -

eliminate cruise control actuators

- eliminate idle air control (IAC) valve

- better airflow range

- packaging (no cable)

- more responsive powertrain at altitude and improved shift quality

The ETC system illuminates a powertrain malfunction indicator (wrench) on the instrument cluster when a concern is present. Concerns are accompanied by diagnostic trouble codes (DTCs) and may also illuminate the malfunction indicator lamp (MIL).

Electronic Throttle Body (ETB)

The ETB has the following characteristics: -

The throttle actuator control (TAC) motor is a DC motor controlled by the PCM (requires 2-wires).

- There are 2 designs: parallel and in-line. The parallel design has the motor under the bore parallel to the plate shaft. The motor housing is integrated into the main housing. The in-line design has a separate motor housing.

- An internal spring is used in both designs to return the throttle plate to a default position. The default position is typically a throttle angle of 7 to 8 degrees from the hard stop angle.

- The closed throttle plate hard stop is used to prevent the throttle from binding in the bore (approximately 0.75 degree). This hard stop setting is not adjustable and is set to result in less airflow than the minimum engine airflow required at idle.

- The required idle airflow is provided by the plate angle in the throttle body assembly. This plate angle controls idle, idle quality, and eliminates the need for an IAC valve.

- There is 1 reference voltage and 1 signal return circuit between the PCM and the ETB. The reference voltage circuit and the signal return circuit is shared with the reference voltage circuits and signal return circuits used by the APP sensor. There are also 2 TP signal circuits for redundancy. The redundant TP signals are required for increased monitoring reasons. The first TP signal (TP1) has a negative slope (increasing angle, decreasing voltage) and the second signal (TP2) has a positive slope (increasing angle, increasing voltage). The TP2 signal reaches a limit of approximately 4.5 volts at approximately 45 degrees of throttle angle.

Accelerator Pedal Position (APP) Sensor

Depending on the application either a 2-track or 3-track APP sensor is used.

Electronic Throttle Control (ETC) System Strategy

ETC System With A 3-Track APP Sensor Failure Mode And Effects Management (Part 1)

ETC System with a 3-Track APP Sensor Failure Mode and Effects Management:

Effect	Failure Mode [a]
RPM Guard with Pedal Follower	In this mode, torque control is disabled due to the loss of a critical sensor or PCM concern. The throttle is controlled in pedal-follower mode as a function of the pedal position sensor input only. A maximum allowed RPM is determined based on the position of the accelerator pedal (RPM Guard). If the actual RPM exceeds this limit, spark and fuel are used to bring the RPM below the limit. The powertrain malfunction indicator (wrench) and the MIL illuminate in this mode and a DTC for an ETC-related component is set. EGR, VCT, and IMRC outputs are set to default values.
RPM Guard with Default Throttle	In this mode, the throttle plate control is disabled due to the loss of throttle position, the throttle plate position controller, or other major electronic throttle body concern. Depending on the concern detected, the throttle plate is either commanded to the default (limp home) position or the motor is disabled and the spring returns the throttle plate to the default (limp home) position. A maximum allowed RPM is determined based on the position of the accelerator pedal (RPM Guard). If the actual RPM exceeds this limit, spark and fuel are used to bring the RPM below the limit. The powertrain malfunction indicator (wrench) and the MIL illuminate in this mode and a DTC P2110 is set. EGR, VCT, and IMRC outputs are set to default values.
RPM Guard with High Forced Idle	This mode is caused by the loss of 2 or 3 pedal position sensor inputs due to sensor, wiring, or PCM concerns. The system is unable to determine driver demand, and the throttle is controlled to a fixed high idle airflow. There is no response to the driver input. The maximum allowed RPM is a fixed value (RPM Guard). If the actual RPM exceeds this limit, spark and fuel are used to bring the RPM below the limit. The powertrain malfunction indicator (wrench) and the MIL illuminate in this mode and a DTC P2104 is set. EGR, VCT, and IMRC outputs are set to default values.
Shutdown	If a significant processor concern is detected, the monitor forces vehicle shutdown by disabling all fuel injectors. The powertrain malfunction indicator (wrench) illuminates in this mode and a DTC P2105 is set.

a ETC illuminates or displays a message on the message center immediately; MIL illuminates after 2 driving cycles

ETC System With A 3-Track APP Sensor Failure Mode And Effects Management (Part 2)

ETC System with a 2-Track APP Sensor Failure Mode and Effects Management:

Effect	Failure Mode
No Effect on Driveability	A loss of redundancy or loss of a non-critical input could result in a concern that does not affect driveability. The powertrain malfunction indicator (wrench) and the MIL do not illuminate. However, speed control and power take off (PTO) may be disabled. A DTC is set to indicate the component or circuit with the concern.
Delayed APP Sensor Response with Brake Override	This mode is caused by the loss of 1 APP sensor input due to sensor, wiring, or PCM concerns. The system is unable to verify the APP sensor input and driver demand. The throttle plate response to the APP sensor input is delayed as the accelerator pedal is applied. The engine returns to idle RPM whenever the brake pedal is applied. The powertrain malfunction indicator (wrench) illuminates, but the MIL does not illuminate in this mode. An APP sensor related DTC is set.
Time-Based Driver Demand with Brake Override	This mode is caused by the loss of one brake pedal position (BPP) and one APP sensor input or both APP sensor inputs due to sensor, wiring, or PCM concerns. The system is unable to determine driver demand. There is no response when the accelerator pedal is applied. The engine returns to idle RPM whenever the brake pedal is applied. When the brake pedal is released, the PCM slowly increases the APP signal to a fixed value. The powertrain malfunction indicator (wrench) illuminates, but the MIL does not illuminate in this mode. An APP or BPP sensor related DTC is set.
RPM Guard with Pedal Follower	In this mode, torque control is disabled due to the loss of a critical sensor or PCM concern. The throttle is controlled in pedal-follower mode as a function of the APP sensor input only. A maximum allowed RPM is determined based on the position of the accelerator pedal (RPM Guard). If the actual RPM exceeds this limit, spark and fuel are used to bring the RPM below the limit. The powertrain malfunction indicator (wrench) and the MIL illuminate in this mode and a DTC for an ETC-related component is set. EGR, VCT, and IMRC outputs are set to default values and speed control is disabled.
RPM Guard with Default Throttle	In this mode, the throttle plate control is disabled due to the loss of both TP sensor inputs, loss of throttle plate control, stuck throttle plate, significant processor concerns, or other major electronic throttle body concern. The spring returns the throttle plate to the default (limp home) position. A maximum allowed RPM is determined based on the position of the accelerator pedal (RPM Guard). If the actual RPM exceeds this limit, spark and fuel are used to bring the RPM below the limit. The powertrain malfunction indicator (wrench) and the MIL illuminate in this mode and a DTC for an ETC-related component is set. EGR, VCT, and IMRC outputs are set to default values and speed control is disabled.

Electronic Throttle Monitor Operation:

DTCs [a]	
P060X, P061X	PCM processor concern (MIL, powertrain malfunction indicator [wrench])
P2104 (ETC system with a 3-track APP sensor)	ETC FMEM forced idle, 2 or 3 pedal sensor concerns (MIL, powertrain malfunction indicator [wrench])
P2105 (ETC system with a 3-track APP sensor)	ETC FMEM forced engine shutdown; PCM concern (MIL, powertrain malfunction indicator [wrench])
P2110 (ETC system with a 3-track APP sensor)	ETC FMEM forced limited RPM; Concern with both TP sensors; throttle plate position control concern (MIL, powertrain malfunction indicator [wrench])
U0300	ETC software version mismatch between processors internal to the PCM (non-MIL, powertrain malfunction indicator [wrench])

a Monitor execution is continuous. Monitor false detection duration is less than 1 second to register a concern.

ETC System With A 2-Track APP Sensor Failure Mode And Effects Management

Electronic Throttle Monitor Operation

Accelerator Pedal Position (APP) Sensor Check:

DTCs[a]	
P1575 (ETC system with a 2-track APP sensor)	APP sensor out of self-test range
P2122, P2123, P2127, P2128, P2132, P2133	APP sensor circuit continuity test (powertrain malfunction indicator [wrench], non-MIL)
P2121, P2126, P2131 (ETC system with a 3-track APP sensor)	APP range/performance (powertrain malfunction indicator [wrench], non-MIL)
P2138 (ETC system with a 2-track APP sensor)	APP to APP signal correlation (powertrain malfunction indicator [wrench], non-MIL)

a Correlation and range/performance - sensor disagreement between processors internal to the PCM. Monitor execution is continuous. Monitor false detection duration is less than 1 second to register a concern. Refer to Powertrain DTC Charts and Descriptions, Diagnostic Trouble Code (DTC) Charts and Descriptions for additional DTC information.

Throttle Position (TP) Sensor Check:

DTCs [a]	
P0122, P0123, P0222, P0223	TP circuit continuity test (MIL, powertrain malfunction indicator [wrench])
P0121, P0221 (ETC system with a 3-track APP sensor)	TP range/performance (non-MIL)
P1124 (ETC system with a 2-track APP sensor)	TP sensor out of self-test range
P2135	TP to TP sensor correlation test (powertrain malfunction indicator [wrench], non-MIL)

a Correlation and range/performance - sensor disagreement between processors internal to the PCM, TP inconsistent with requested throttle plate position. Monitor execution is continuous. Monitor false detection duration is less than 1 second to register a concern. Refer to Powertrain DTC Charts and Descriptions, Diagnostic Trouble Code (DTC) Charts and Descriptions for additional DTC information.

Electronic TAC Operation Check:

DTCs [a]	
P115E	Throttle actuator airflow trim at maximum limit (non-MIL)
P2072 (ETC system with a 3-track APP sensor)	Throttle body ice blockage (non-MIL)
P2100 (ETC system with a 3-track APP sensor)	Throttle actuator circuit open, short to power, short to ground (MIL)
P2101	Throttle actuator range/performance test (MIL)
P2107	Processor and TAC motor circuit test (MIL)
P2111	Throttle actuator system stuck open (MIL)
P2112	Throttle actuator system stuck closed (MIL)

a Note: For all DTCs, in addition to the MIL, the powertrain malfunction indicator (wrench) is on for the concern that caused the FMEM action. Monitor execution is continuous. Monitor false detection duration is less than 5 seconds to register a concern.

The torque based ETC strategy was developed to improve fuel economy and to accommodate variable camshaft timing (VCT). This is possible by not coupling the throttle angle to the driver

pedal position. Uncoupling the throttle angle (produce engine torque) from the pedal position (driver demand) allows the powertrain control strategy to optimize fuel control and transmission shift schedules while delivering the requested wheel torque.

The ETC monitor system is distributed across 2 processors within the PCM: the main powertrain control processor unit (CPU) and a separate monitoring processor. The primary monitoring function is carried out by the independent plausibility check (IPC) software, which resides on the main processor. It is responsible for determining the driver-demanded torque and comparing it to an estimate of the actual torque delivered. If the generated torque exceeds driver demand by a specified amount, appropriate corrective action is taken.

C175T (Part 2)

Engine Control Module: Procedures

FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)

Description

The EEPROM is contained in an integrated circuit internal to the powertrain control module (PCM). The EEPROM contains the vehicle strategy including calibration information specific to the vehicle, and is capable of being programmed or flashed repeatedly.

As part of the calibration there is an area referred to as the vehicle identification (VID) block. The VID block is programmed when installing a new PCM as described under Programming the VID Block for a Replacement PCM. Failure to carry out this procedure may generate DTCs PI635 or P1639. The VID block in an existing PCM can also be tailored to accommodate various hardware or parameter changes made to the vehicle since production. Failure to carry out this procedure properly may generate DTC P1635, Tire/Axle Ratio out of Acceptable Range. An incorrect tire/axle ratio is one of the main causes for DTC P1639. This is described under Making Changes to the VID Block and also under Making Changes to the PCM Calibration. The VID block contains many items used by the strategy for a variety of functions. Some of these items include the vehicle identification number (VIN), octane adjust, fuel octane, fuel type, vehicle speed limit, tire size, axle ratio, the presence of speed control, and 4-wheel drive electronic shift-on-the-fly (ESOF) versus manual shift-on-the-fly (MSOF). Only items applicable to the vehicle hardware and supported by the VID block is displayed on the scan tool.

When changing items in the VID block, the strategy places range limits on certain items such as tire and axle ratio. The number of times the VID block may be reconfigured is limited. When this limit is reached, the scan tool displays a message indicating the need to flash the PCM again to reset the VID block.

Programming can be carried out by a local Ford dealer or any non-Ford facility. Refer to the scan tool manufacturer's instruction manual for details.

Programming the VID Block for a Replacement PCM

A new PCM contains the latest strategy and calibration level for a particular vehicle. However, the VID block is blank and needs programming. There are 2 procedures available. The first is an automatic data transfer from the old PCM to the new PCM, and the second is manual data entry into the new PCM.

Automatic data transfer is carried out if the old PCM is capable of communicating. This is done by using a scan tool to retrieve data from the old PCM before removing it from the vehicle. The stored data can then be downloaded to the new PCM after it has been installed.

Carry out manual data entry if the old module is damaged or incapable of communicating. Remove and install a new PCM. Using a compatible scan tool, select and carry out the module/parameter programming, referring to the scan tool manufacturer's instruction manual. Make certain that all parameters are included. Failure to properly program tire size in revolutions per mile, (rev/mile equals 63,360 divided by the tire circumference in inches), axle ratio, 4x4/4x2, and/or MSOF/ESOF may result in DTCs P1635 and P1639. You may be instructed to contact the As-Built Data Center for the information needed to manually update the VID block with the scan tool. Contact the center only if the old PCM cannot be used or the data is corrupt. For Ford and Lincoln Mercury technicians, contact your National Hotline or the Professional Technician Society (PTS) website for As-Built data listed under the Service Publications Index. Non-Ford technicians use the Motorcraft(R) website at www.motorcraft.com. From the Motorcraft(R) homepage, use the search function to find the Module Programming or As-Built Data.

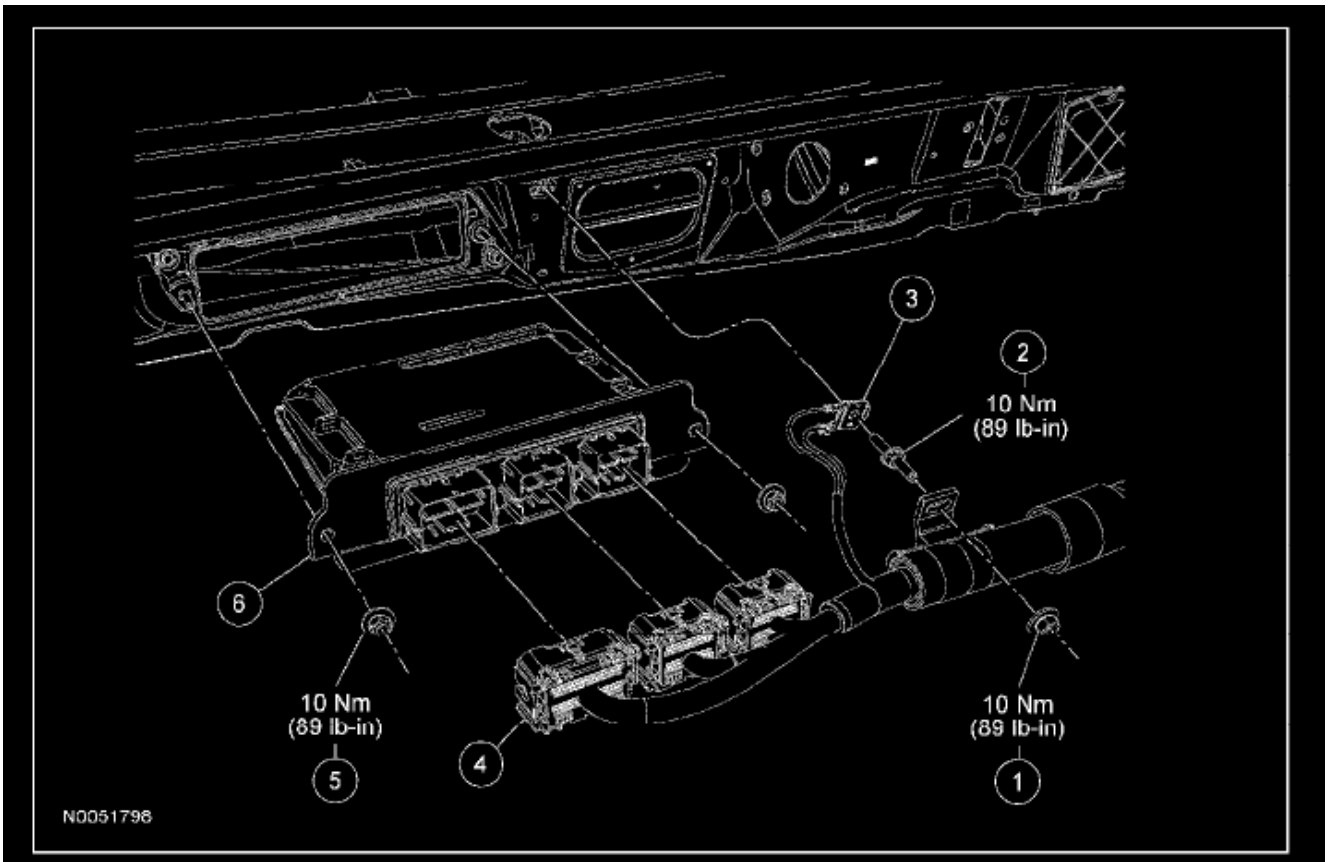
For Ford and Lincoln Mercury technicians, check the Programmable Module Installation link on the PTS website for quick Programmable Module data information by vehicle.

Making Changes to the VID Block

A PCM which is programmed may require changes to be made to certain VID information to accommodate the vehicle hardware. Refer to Module Reprogramming on the scan tool.

Making Changes to the PCM Calibration

At certain times, the entire EEPROM needs to be completely reprogrammed. This is due to changes made to the strategy or calibration after production, or the need to reset the VID block because it has reached its limit. Refer to Module Reprogramming on the scan tool.



Item	Part Number	Description
1	N621906	PCM wiring harness retainer nut
2	N806925	Ground wire stud bolt
3	—	Ground wire terminals (2 required) (part of 12B637)
4	14A464	PCM electrical connectors (3 required) (part of 12B637)
5	N621906	PCM nuts
6	12A651	PCM

Engine Control Module: Removal and Replacement

POWERTRAIN CONTROL MODULE (PCM)

Removal

1. Retrieve the module configuration. Carry out the module configuration retrieval steps of the Programmable Module Installation procedure. 2. Remove the PCM wiring harness retainer nut. 3. Remove the ground wire stud bolt. 4. Disconnect the 3 PCM electrical connectors. 5. Remove the 2 nuts and the PCM.

Installation

1. Install the PCM and the 2 nuts.

- Tighten to 10 Nm (89 lb-in).

2. Connect the 3 PCM electrical connectors. 3. Position the ground wire terminals and install the stud bolt.

- Tighten to 10 Nm (89 lb-in).

4. Install the PCM wiring harness retainer nut.

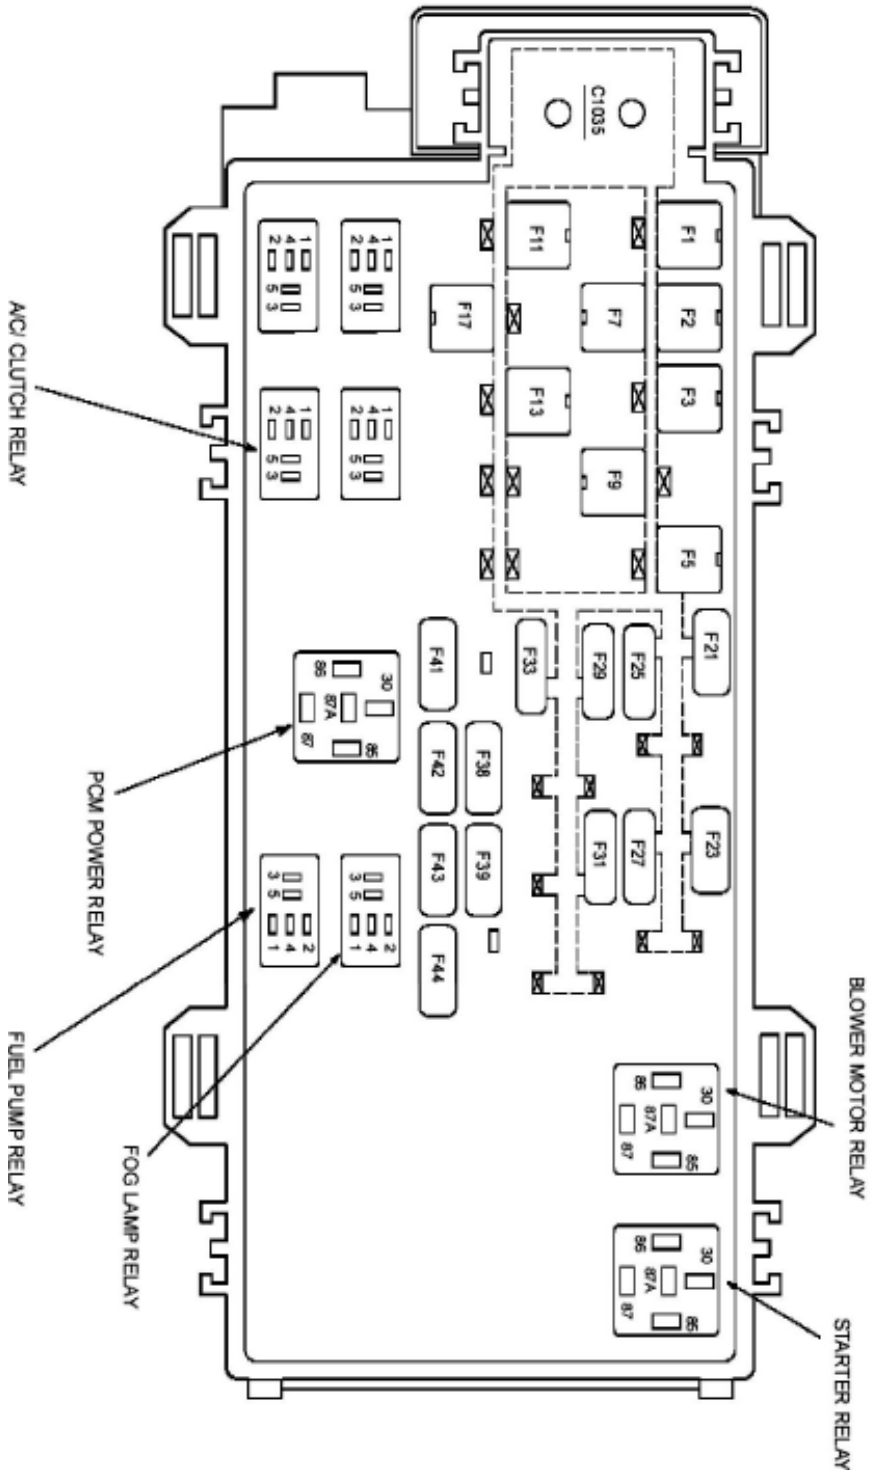
- Tighten to 10 Nm (89 lb-in).

5. NOTE: If a new PCM is installed, the parameters must be reset in both the PCM and the instrument cluster module or the vehicle will experience

a PATS no-start. This will occur even if the vehicle is not equipped with PATS. PATS vehicles and non-PATS vehicles have parameters in the instrument cluster module and the PCM and they both must be reset whenever a new PCM is installed.

Restore the module configurations for the instrument cluster module and the PCM. Carry out the module configuration restore steps of the Programmable Module Installation procedure.

BATTERY JUNCTION BOX (BJB), 3.0L, 4.0L

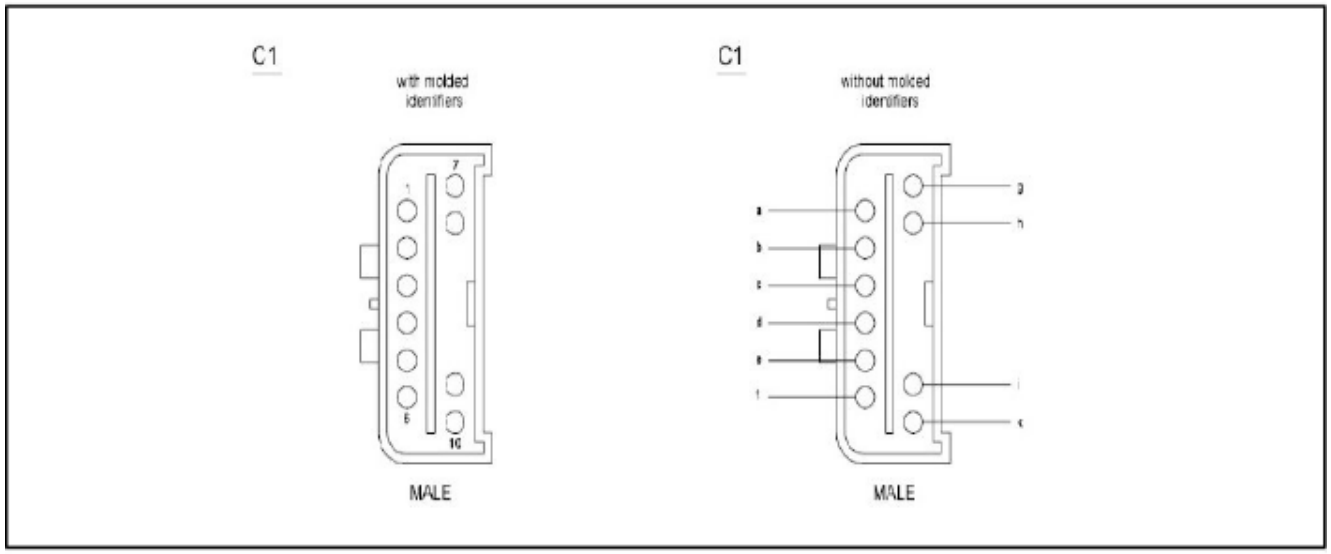


Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



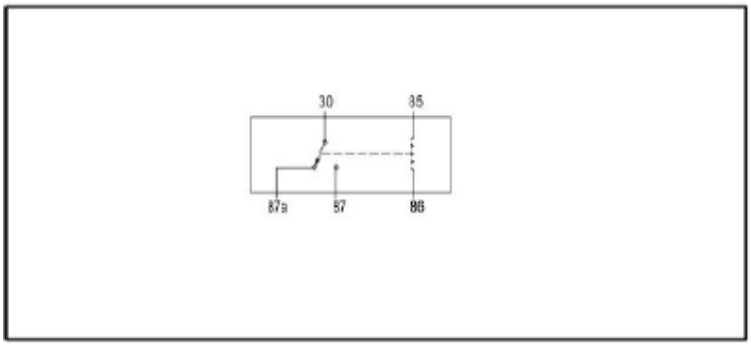
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

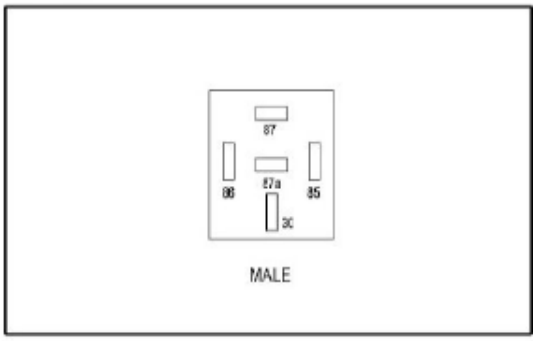
Main Relay (Computer/Fuel System): Testing and Inspection

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	45 □ 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Fuel Pump Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

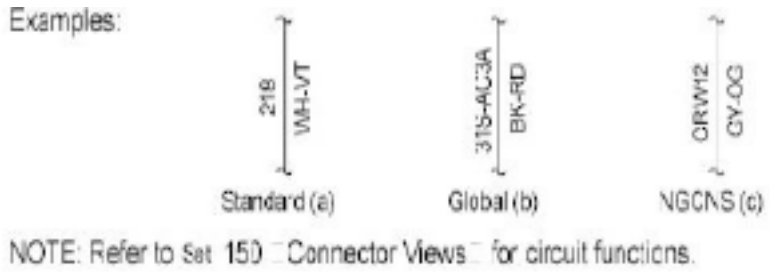
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

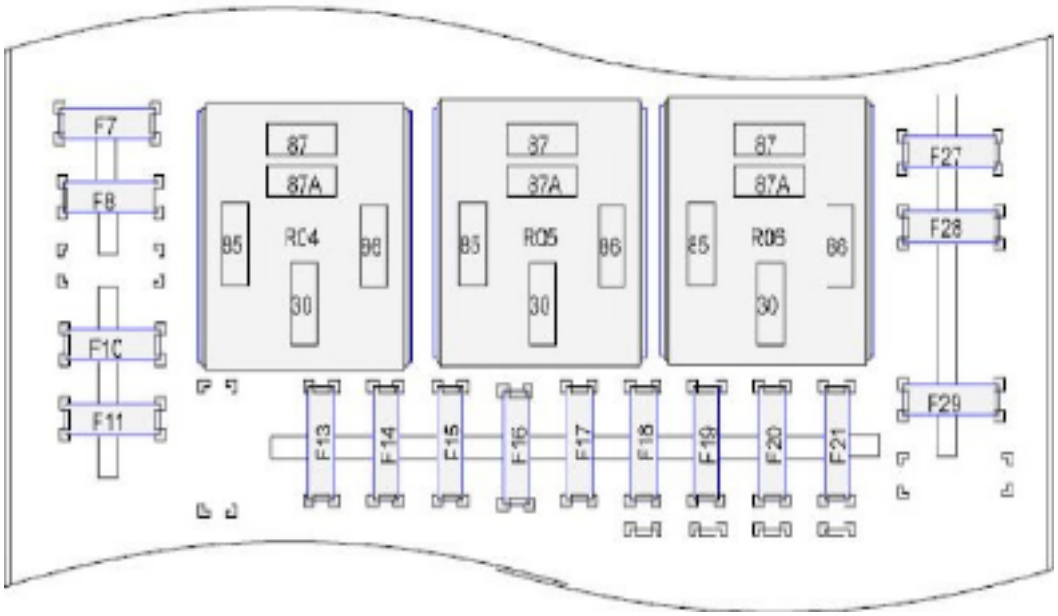
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

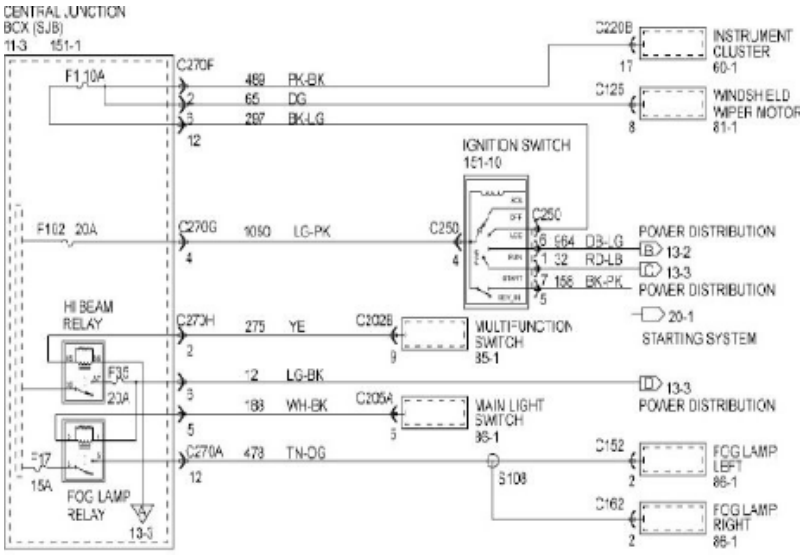
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

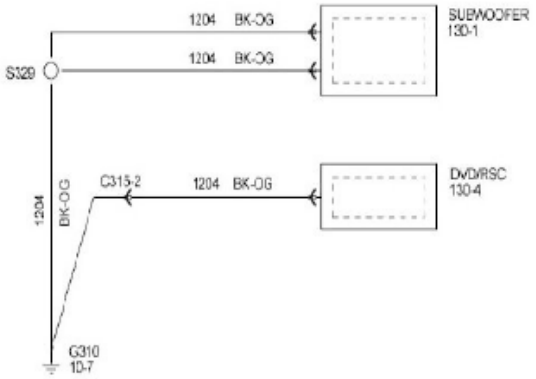
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by

each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

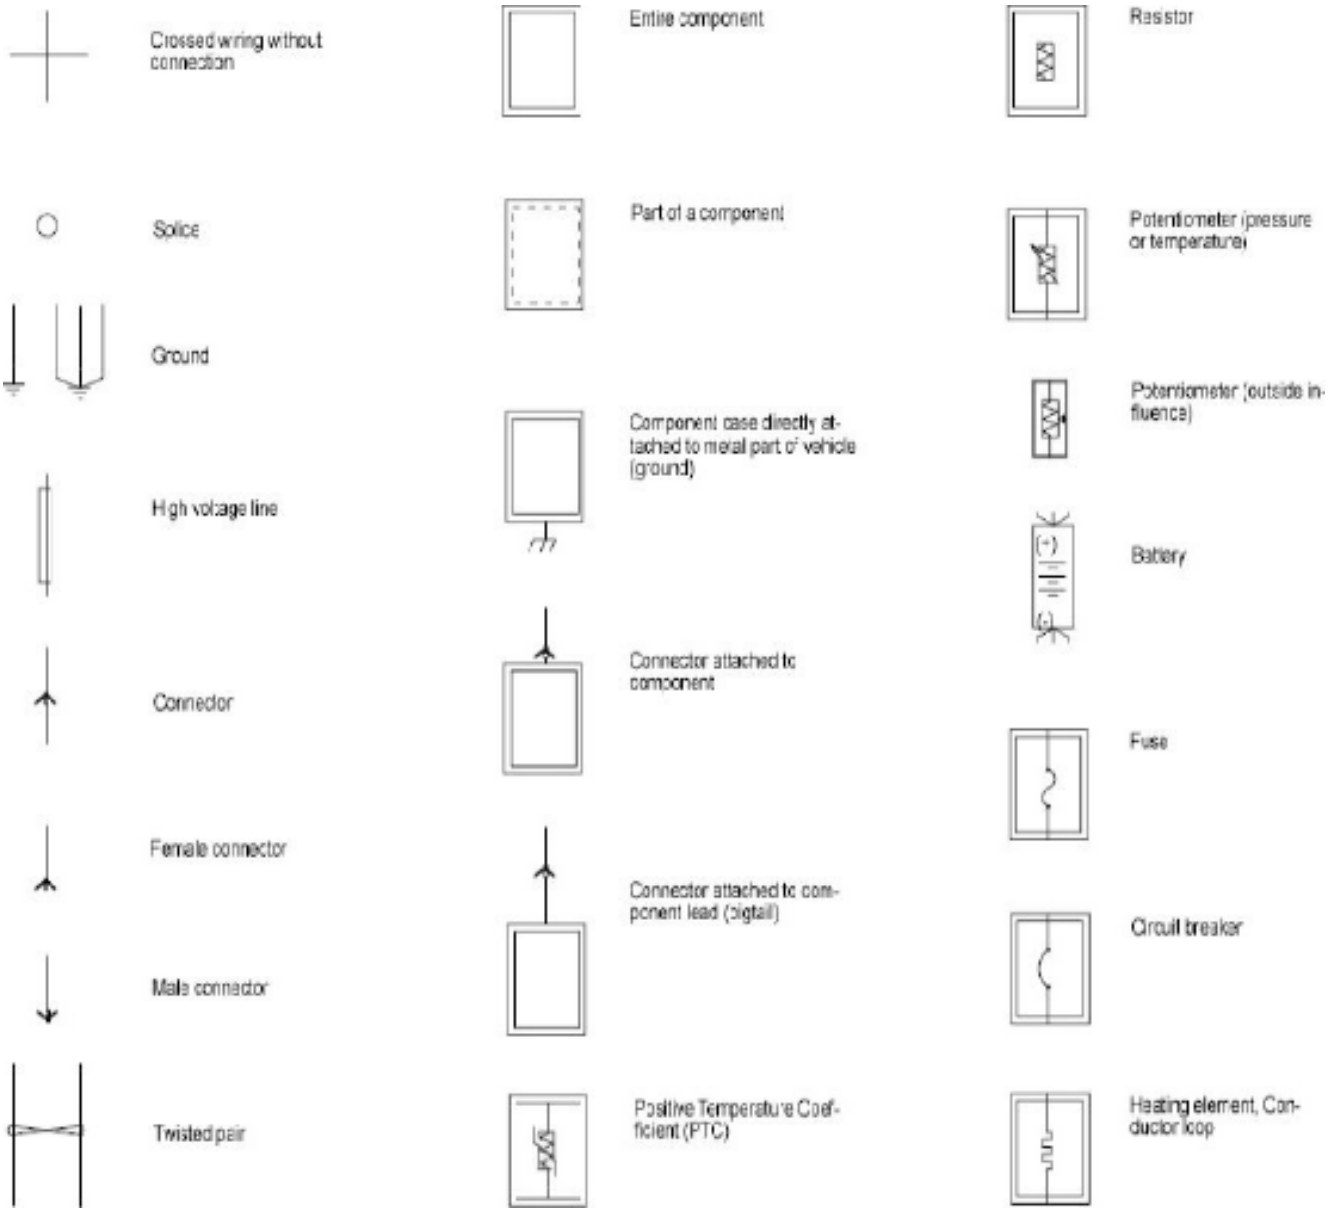
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

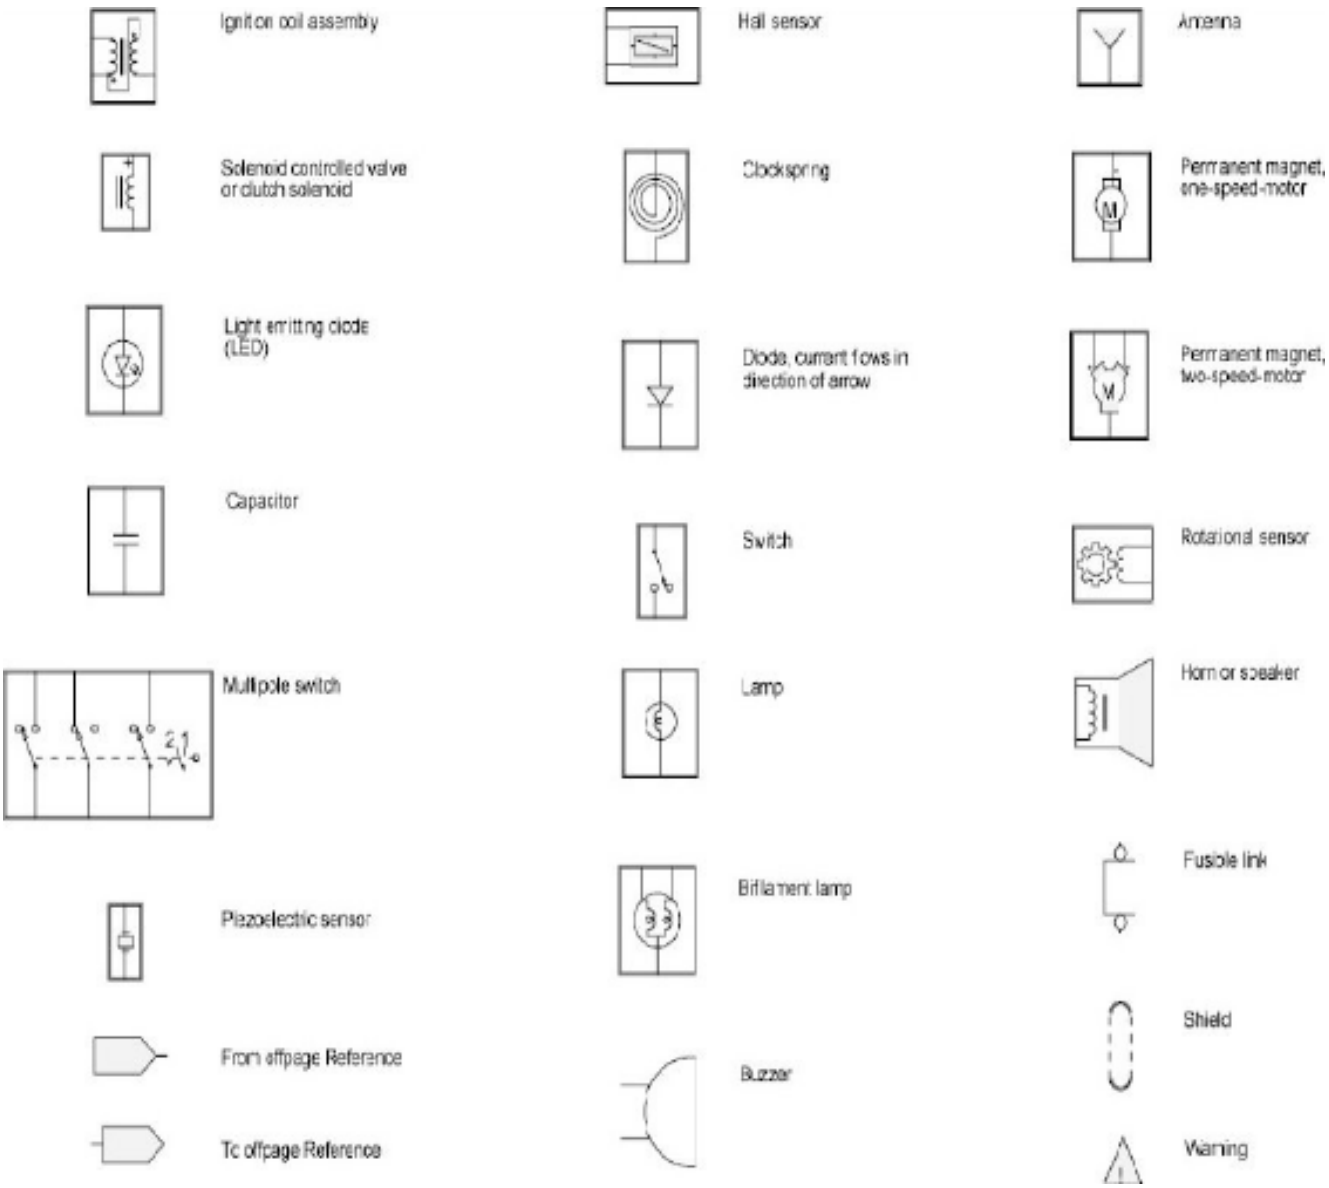
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

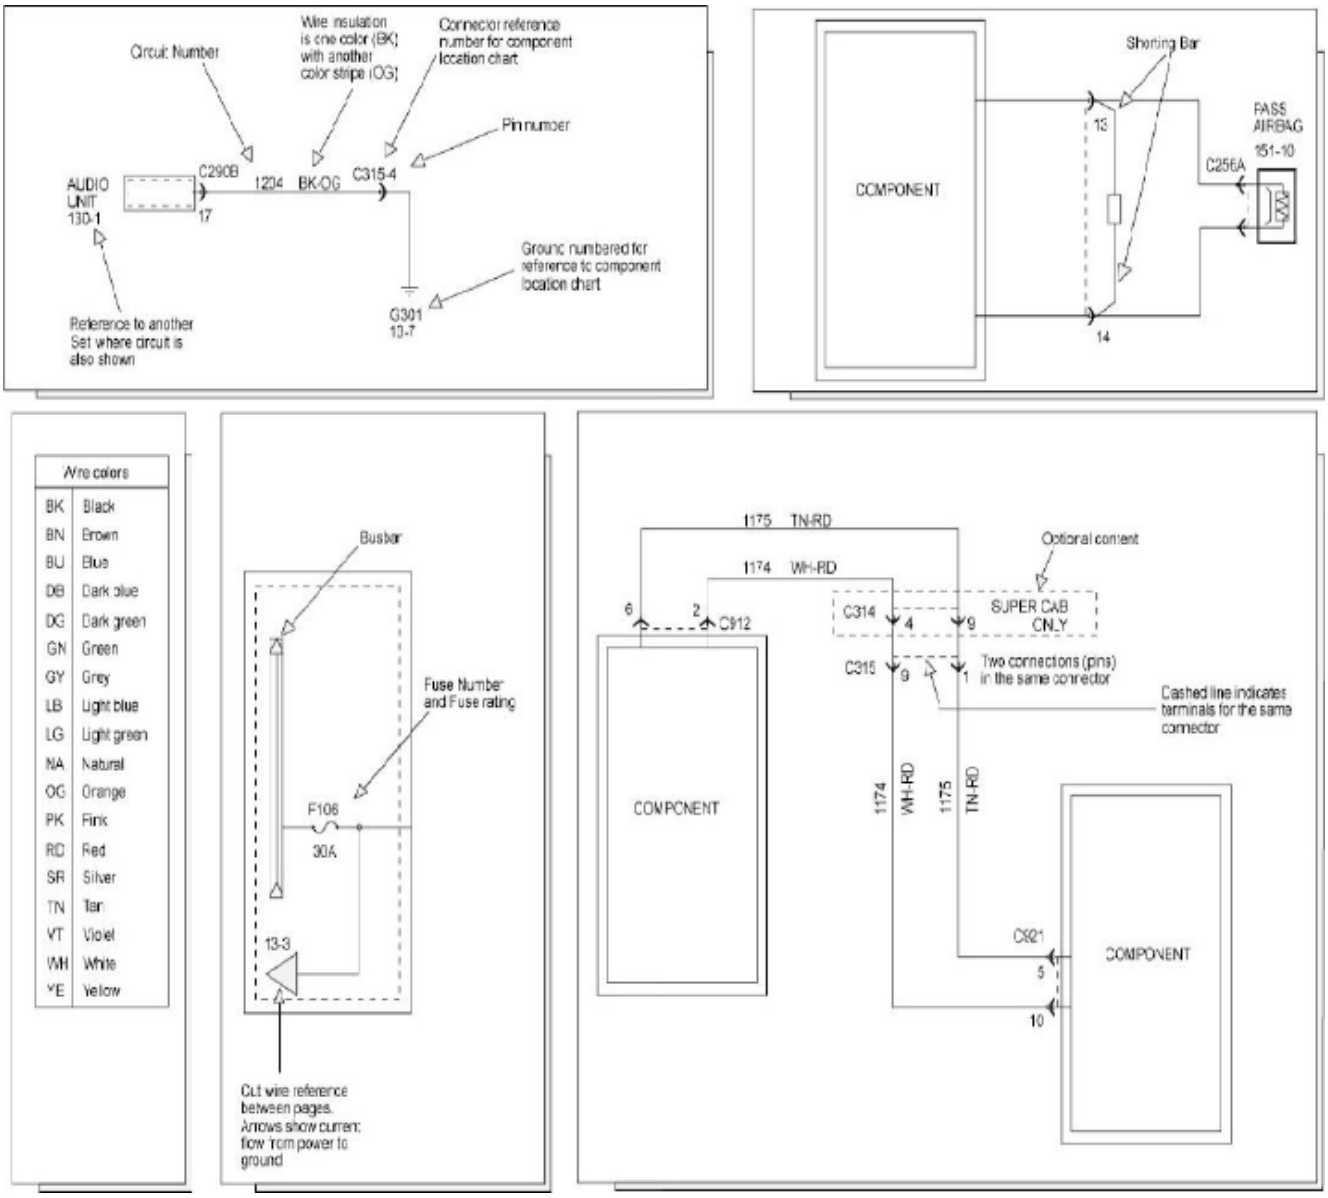
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

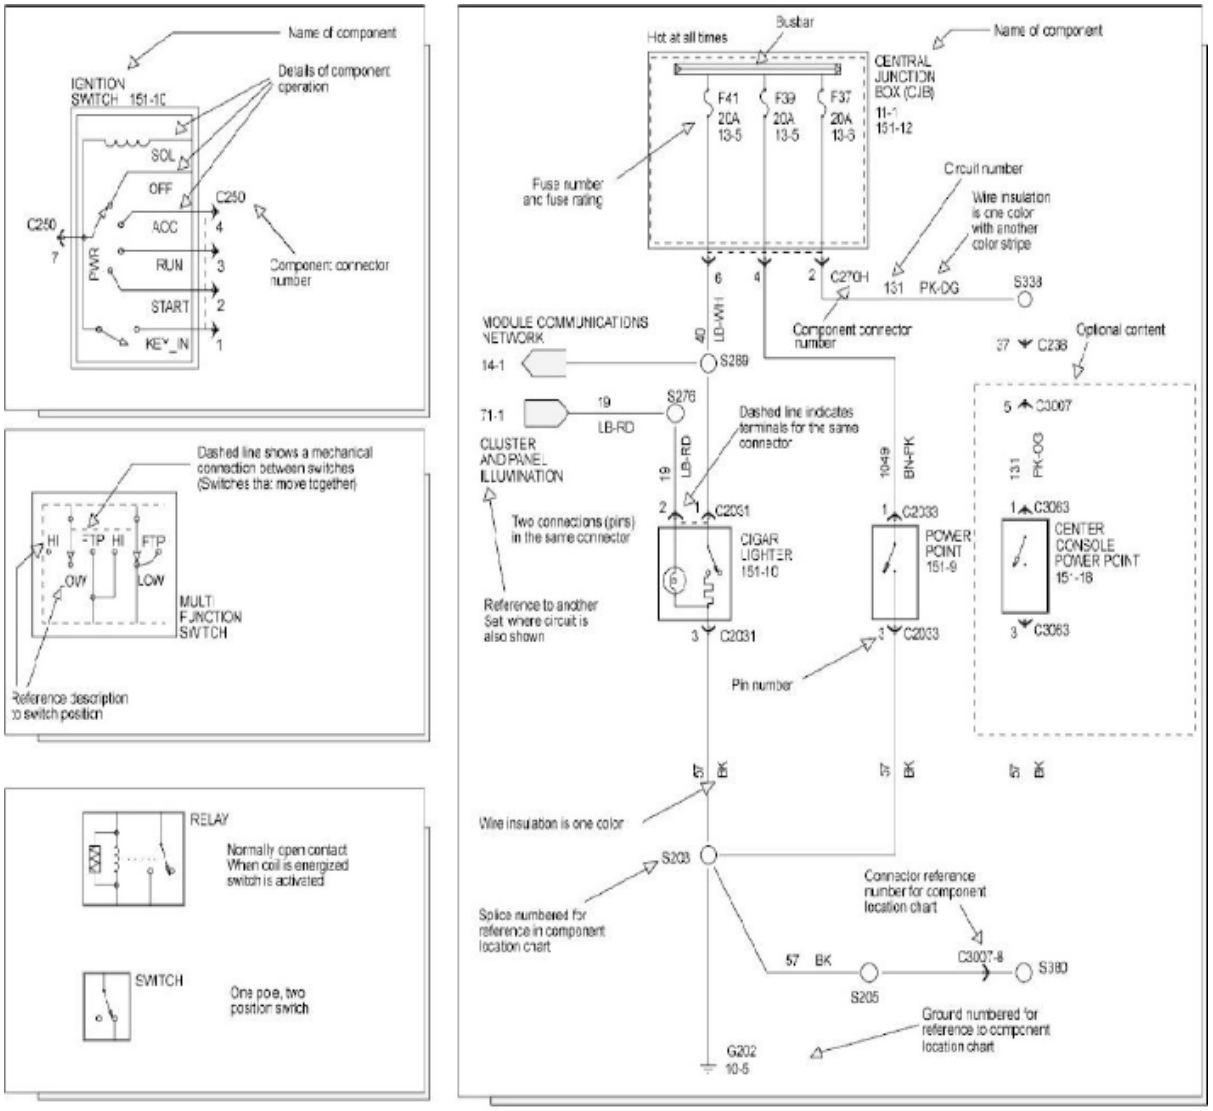
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)

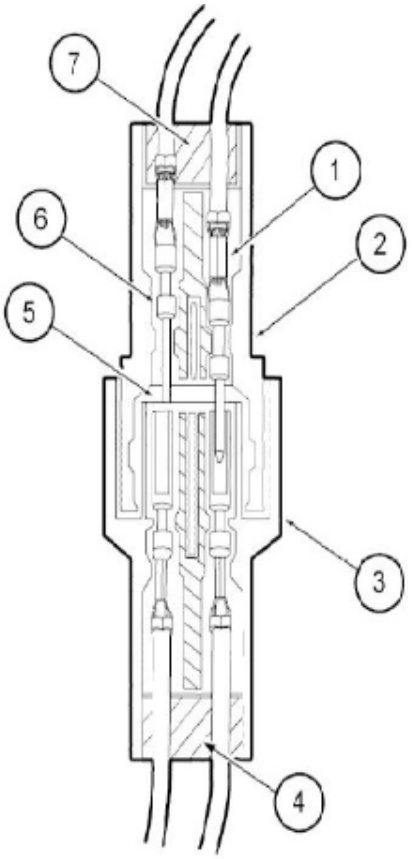


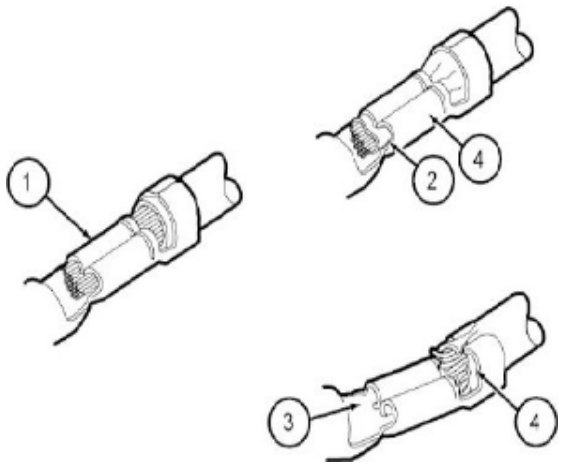
Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Symbols (Part 4)

Symbols (Part 5)





Fuel Pump Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

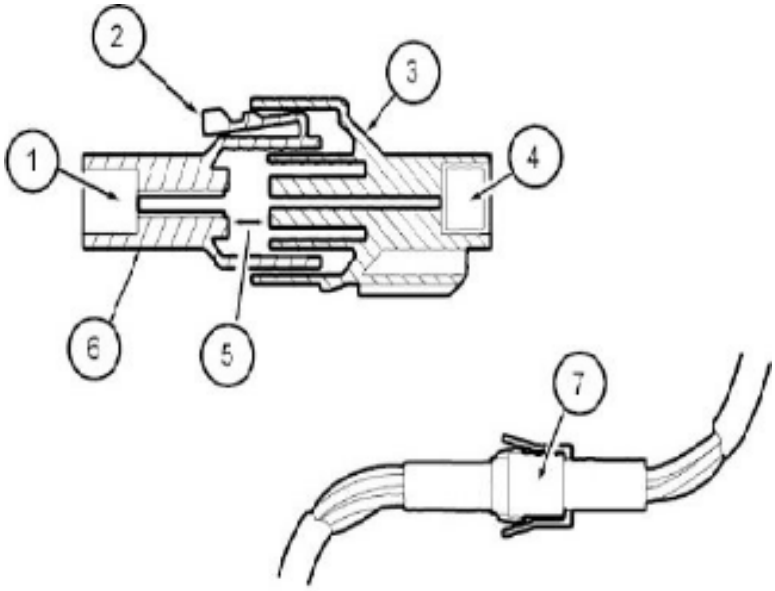
5 = Intermittent contact

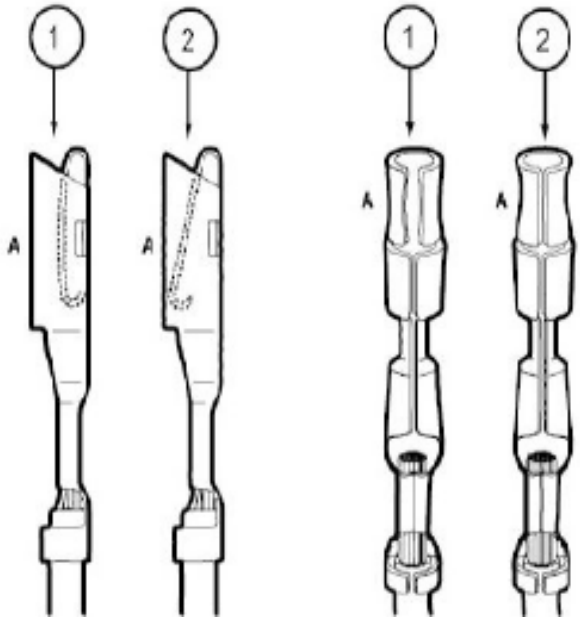
6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Defective insulation stripping





1 = Proper crimp

2 = Insulation not removed

3 = Wire strands missing

4 = Intermittent signals through pierced insulation

Partially mated connectors

1 = Seal

2 = Displaced tab

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Male half

7 = Intermittent contact

Lock may be displaced into an unlocked position; pull on the connector to verify the lock.

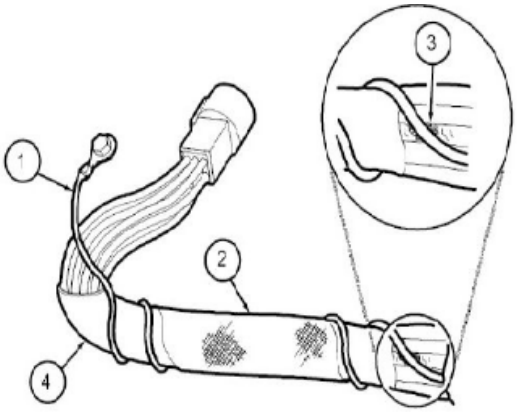
Deformed (enlarged) female terminals

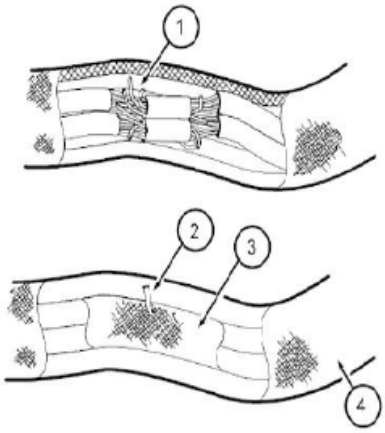
1 = Enlarged

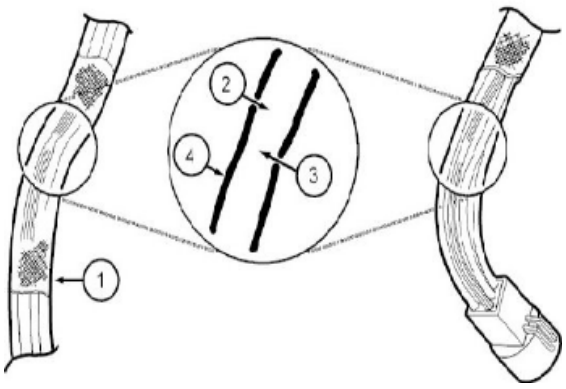
2 = Normal

Any probe entering the terminal may enlarge the contact spring opening creating an intermittent signal.

Insert the correct mating terminal (Location A) from the service kit and feel for a loose fit.







Electrical short inside the harness

1 = Solder coated wire to ground

2 = Harness protective tape

3 = Intermittent short

Solder coated wire pierced through the insulation of another circuit

4 = Grounding foil

Electrical short within the harness

Splice tape removed 1

= Intermittent short

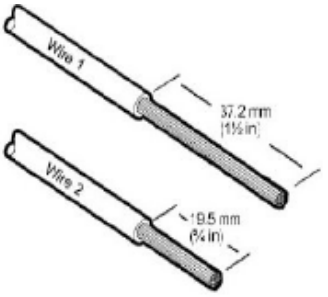
Splice covered 2

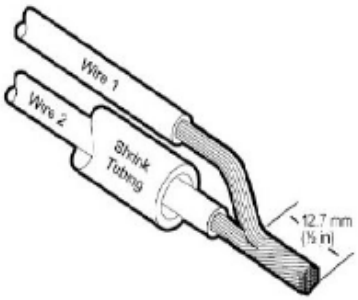
= Wire strand

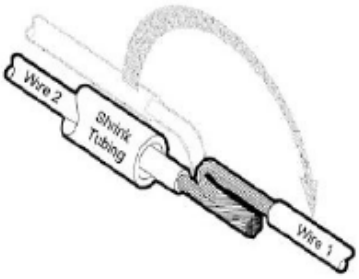
3 = Splice tape

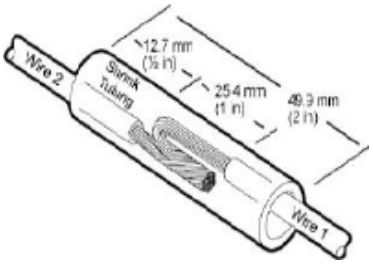
4 = Harness tape

Broken wire strands in harness









1 = Wiring harness tape

2 = Wiring strand

3 = Broken strands intermittent signal

4 = Circuit insulation

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. lnstall heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

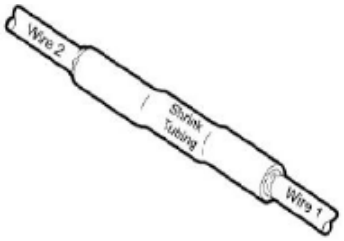
NOTE: -

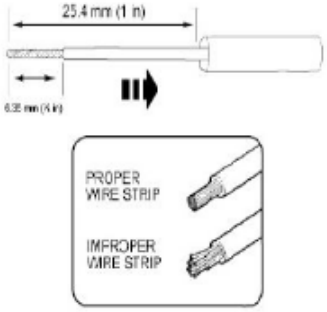
Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

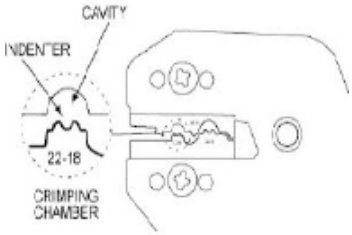
- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

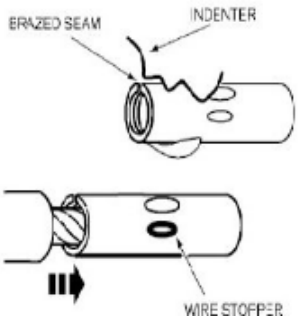
6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.









7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

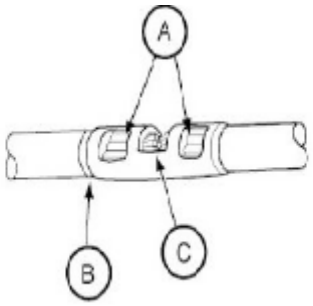
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

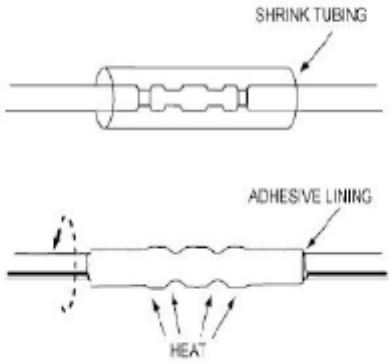
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4" strip, cut 9 strands	* 1/4" strip, cut 2 strands	1/4" strip, no fold	1/4" strip, no fold	1/4" strip, no fold	5/8" strip, fold 2x dia.	1" strip, fold 3x dia.
	16-14	* 1/4" strip, cut 7 strands	1/4" strip, no fold	1/4" strip, no fold	1/4" strip, no fold	5/8" strip fold 2x dia.	1" strip, fold 3x dia.	1 1/4" strip, fold 4x dia.	Not Recommended
	12-10	1/4" strip, no fold	1/4" strip, no fold	5/8" strip, fold 2x dia.	1" strip, fold 3x dia.	1 1/4" strip, fold 4x dia.	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

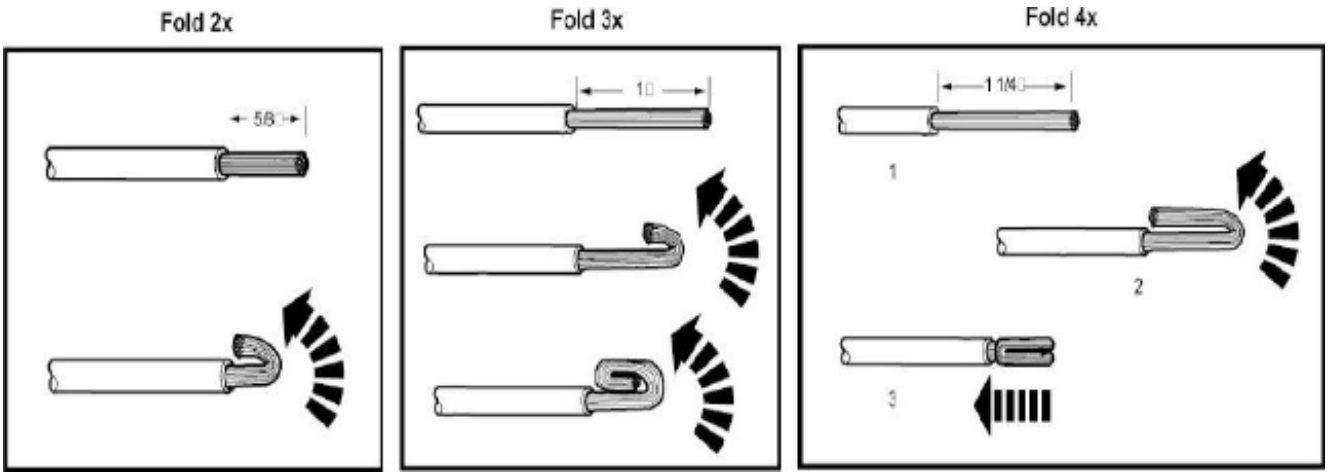
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



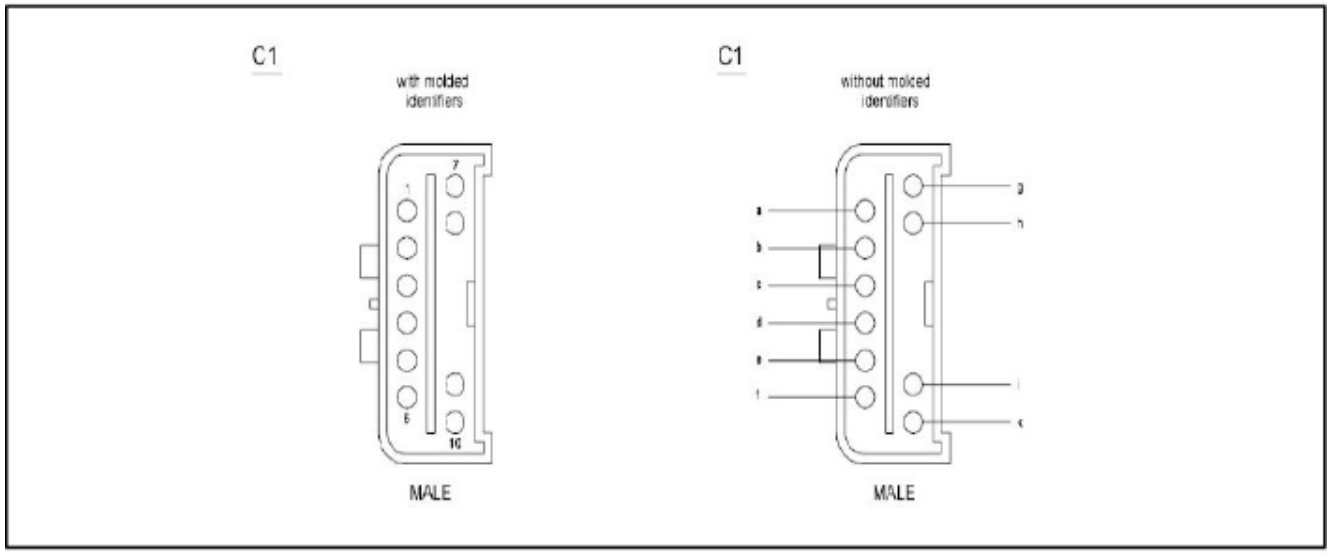
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



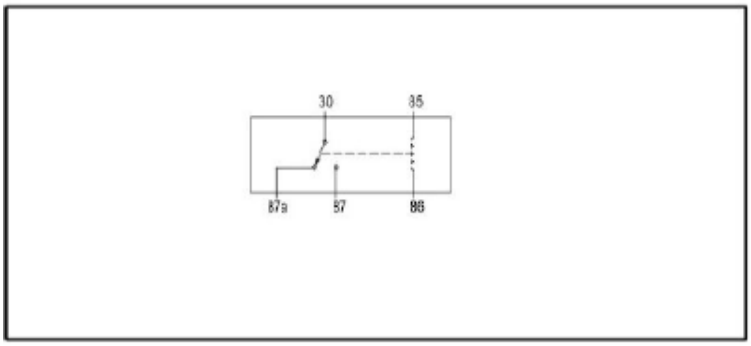
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

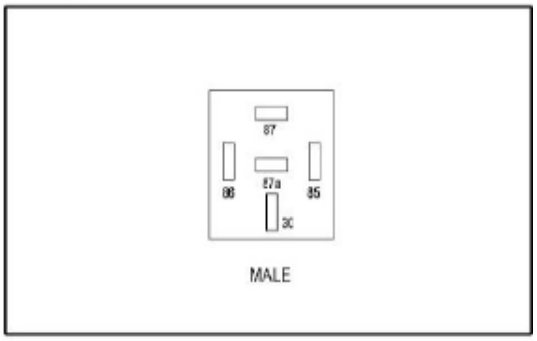
Fuel Pump Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	45 □ 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Accelerator Pedal Position Sensor: Description and Operation

ACCELERATOR PEDAL POSITION (APP) SENSOR

The APP sensor is an input to the powertrain control module (PCM) and is used to determine the amount of torque requested by the operator. Depending on the application either a 2-track or 3-track APP sensor is used.

2-Track APP Sensor

2-Track APP Sensor

There are 2 pedal position signals in the sensor. Both signals, APP1 and APP2, have a positive slope (increasing angle, increasing voltage), but are offset and increase at different rates. The 2 pedal position signals make sure the PCM receives a correct input even if 1 signal has a concern. The PCM determines if a signal is incorrect by calculating where it should be, inferred from the other signals. If a concern is present with one of the circuits the other input is used. There are 2 reference voltage circuits, 2 signal return circuits, and 2 signal circuits (a total of 6 circuits and pins) between the PCM and the APP sensor assembly. The reference voltage circuits and the signal return circuits are shared with the reference voltage circuit and signal return circuit used by the electronic throttle body (ETB) throttle position sensor. The pedal position signal is converted to pedal travel degrees (rotary angle) by the PCM. The software then converts these degrees to counts, which is the input to the torque based strategy.

3-Track APP Sensor

Typical 3-Track APP Sensor

There are 3 pedal position signals in the sensor. Signal 1, APP1, has a negative slope (increasing angle, decreasing voltage) and signals 2 and 3, APP2 and APP3, both have a positive slope (increasing angle, increasing voltage). During normal operation APP1 is used as the indication of pedal position by the strategy. The 3 pedal position signals make sure the PCM receives a correct input even if 1 signal has a concern. The PCM determines if a signal is incorrect by calculating where it should be, inferred from the other signals. If a concern is present with one of the circuits the other inputs are used. The pedal position signal is converted to pedal travel degrees (rotary angle) by the PCM. The software then converts these degrees to counts, which is the input to the torque based strategy. There are 2 reference voltage circuits, 2 signal return circuits, and 3 signal circuits (a total of 7 circuits and pins) between the PCM and the APP sensor assembly. The reference voltage circuits and the signal return circuits are shared with the reference voltage circuit and signal return circuit used by the electronic throttle body (ETB) throttle position sensor.

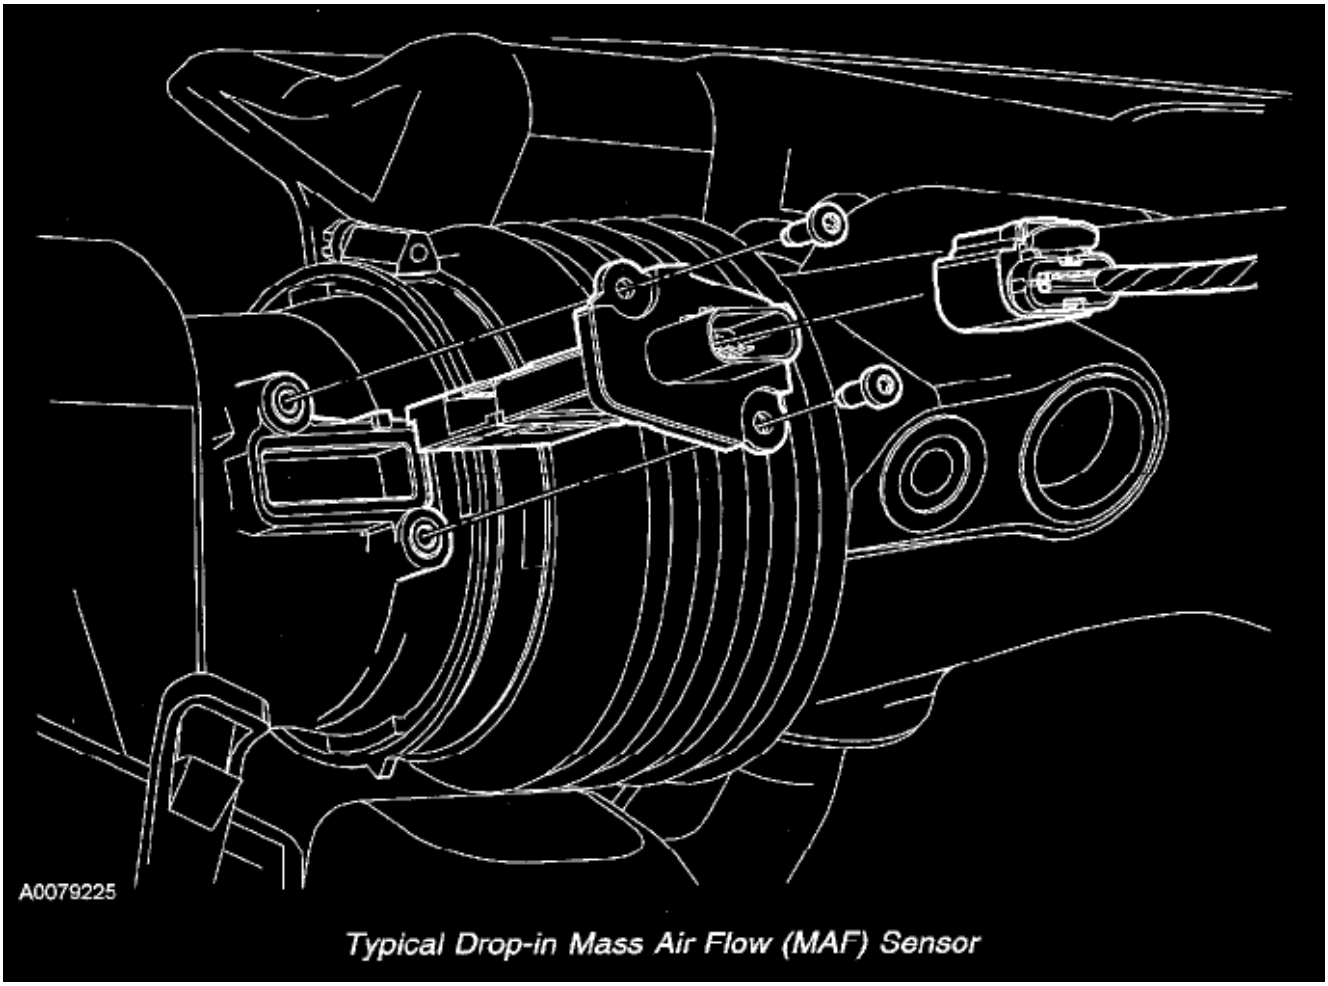
Diagram Of Air Flow Through Throttle Body Contacting MAF Sensor Hot And Cold Wire (and IAT Sensor Wire Where Applicable) Terminals

Typical Mass Air Flow (MAF) Sensor

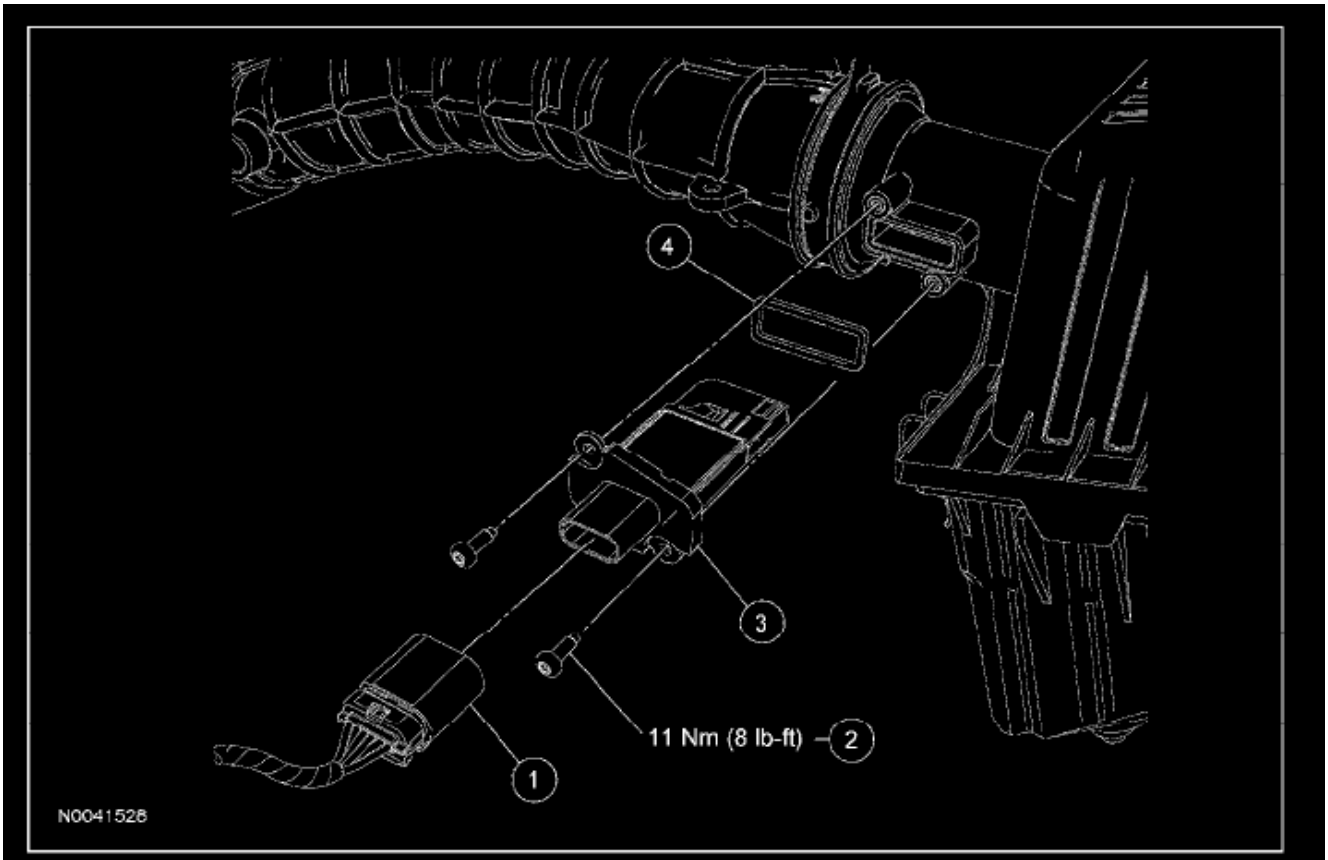


Typical Drop-in Mass Air Flow (MAF) Sensor

Typical Drop-in Mass Air Flow (MAF) Sensor

The MAF sensor uses a hot wire sensing element to measure the amount of air entering the engine. Air passing over the hot wire causes it to cool. This hot wire is maintained at 200°C (392°F) above the ambient temperature as measured by a constant cold wire. The current required to maintain the temperature of the hot wire is proportional to the mass air flow. The MAF sensor then outputs an analog voltage signal to the PCM proportional to the intake air mass. The PCM calculates the required fuel injector pulse width in order to provide the desired air/fuel ratio. This input is also used in determining transmission electronic pressure control (EPC), shift and torque converter clutch scheduling.

The MAF sensor is located between the air cleaner and the throttle body or inside the air cleaner assembly. Most MAF sensors have integrated bypass technology with an integrated intake air temperature (IAT) sensor. The hot wire electronic sensing element must be replaced as an assembly. Replacing only the element may change the air flow calibration.



Item	Part Number	Description

Air Flow Meter/Sensor: Service and Repair

MASS AIR FLOW (MAF) SENSOR

Removal and Installation

1. Disconnect the mass air flow (MAF) sensor electrical connector. 2. Remove the 2 bolts, the MAF sensor and discard the gasket.

- To install, tighten to 11 Nm (8 lb-ft).

3. CAUTION: Do not tamper with the mass air flow (MAF) sensing elements located in the airflow bypass. Tampering may result in

failure.

NOTE: The MAF sensor module and body are calibrated and installed as a unit.

To install, reverse the removal procedure. -

Install a new gasket.

Typical Synchronizer Hall-Effect CMP Sensor

Typical Variable Reluctance CMP Sensor

Camshaft Position Sensor: Description and Operation

CAMSHAFT POSITION (CMP) SENSOR

Typical Synchronizer Hall-Effect CMP Sensor

Typical Variable Reluctance CMP Sensor

The CMP sensor detects the position of the camshaft. The CMP sensor identifies when piston number 1 is on its compression stroke. A signal is then sent to the PCM and used for synchronizing the sequential firing of the fuel injectors. Coil on plug (COP) ignition applications use the CMP signal to select the correct ignition coil to fire.

Vehicles with 2 CMP sensors are equipped with variable camshaft timing (VCT). They use the second sensor to identify the position of the camshaft on bank 2 as an input to the PCM.

There are 2 types of CMP sensors: the 3-pin connector Hall-effect type sensor and the 2-pin connector variable reluctance type sensor.

1. Disconnect the camshaft position (CMP) sensor electrical connector.

2. NOTE: Prior to the removal of the CMP sensor, note the position of the CMP sensor electrical connector. The installation procedure requires that

the electrical connector be located in the same position.

Remove the 2 bolts and the CMP sensor.

3. Remove the camshaft synchronizer bolt. 4. Remove the camshaft synchronizer. Inspect the O-ring seal and install a new O-ring seal if damaged.

Installation

1. CAUTION:

- After installation, do not loosen the synchronizer bolt and rotate the synchronizer assembly. The synchronizer assembly is not adjustable. Do not loosen the synchronizer bolt after the alignment tool has been removed in order to align the camshaft position (CMP) sensor electrical connector for any reason. If the electrical connector is not in the correct position, the synchronizer assembly must be removed. The alignment tool and the assembly must be reinstalled if the engine has not been rotated from top dead center (TDC) of the compression stroke on the No. 1 cylinder. Failure to follow this procedure will result in the fuel system being out of time with the engine, possibly causing engine damage.

- Do not turn the crankshaft or camshaft during the removal and installation procedure or the fuel system timing will be out of time with the engine, possibly causing engine damage.

- A special tool must be used during the installation of the new synchronizer assembly. Failure to follow this procedure will result in the fuel system being out of time with the engine, possibly causing engine damage.

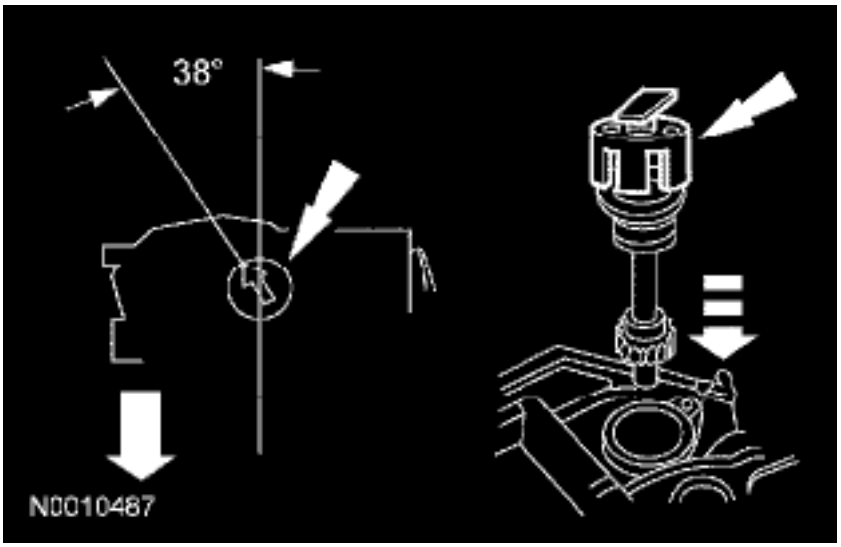
Install the special tool on the camshaft synchronizer by rotating the tool until it engages the notch in the camshaft synchronizer housing and the armature.

2. CAUTION: It is very important to coat the gear on the camshaft synchronizer with engine oil prior to installation. Failure to do so may

result in gear failure.

NOTE: During installation, the arrow on the special tool will rotate clockwise until the oil pump intermediate shaft and the camshaft gear engages.

Install the camshaft synchronizer housing assembly so the arrow on the special tool is 38 degrees from the centerline of the engine.



3. Install the camshaft synchronizer housing bolt.

- Tighten to 30 Nm (22 lb-ft).

4. Position the CMP sensor and install the 2 bolts.

- Tighten to 3 Nm (27 lb-in).

5. Connect the CMP sensor electrical connector.

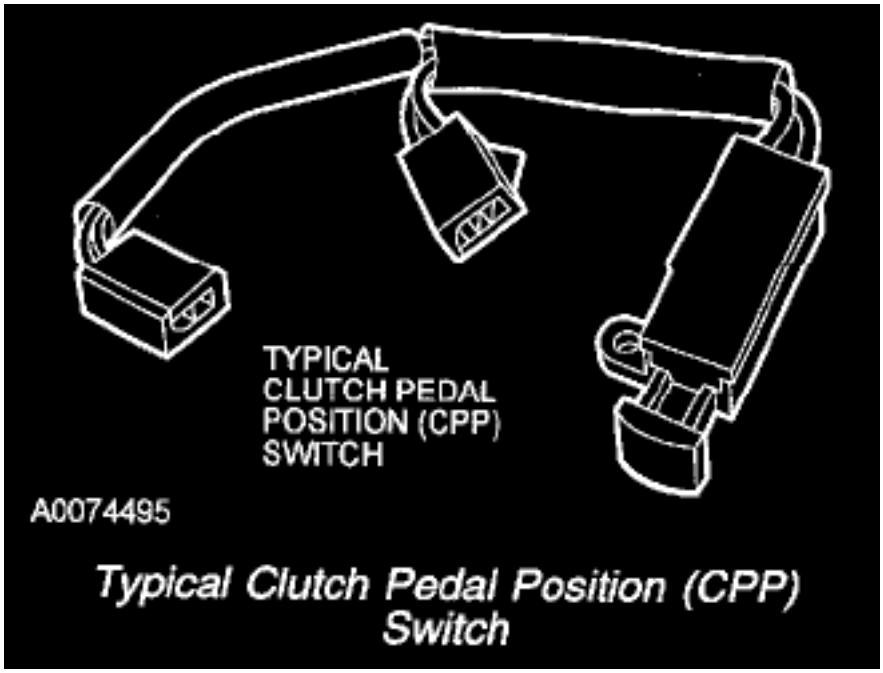
C257



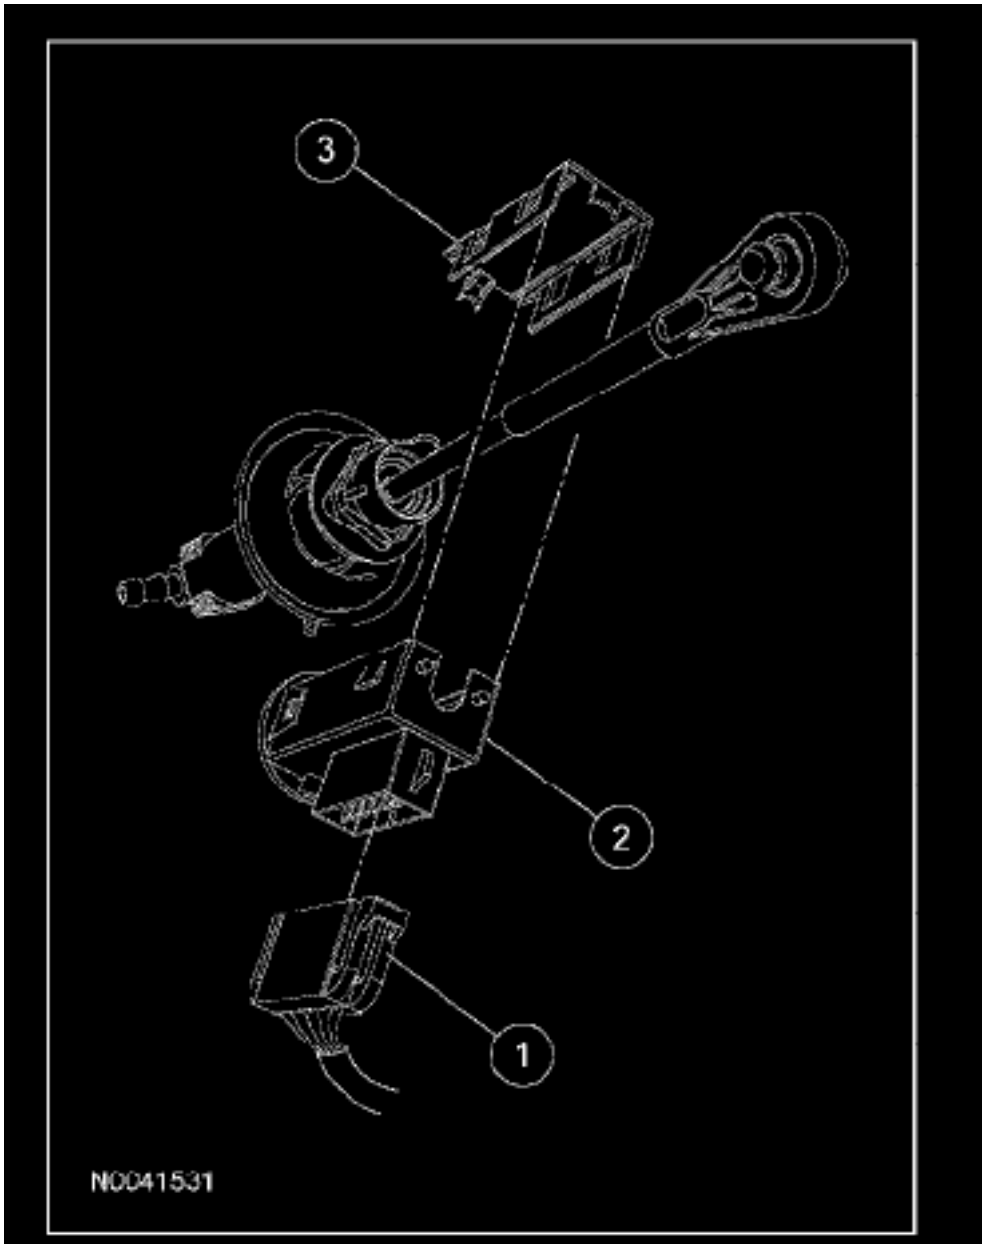
Typical Clutch Pedal Position (CPP) Switch

Clutch Switch: Description and Operation

CLUTCH PEDAL POSITION (CPP) SWITCH

Typical Clutch Pedal Position (CPP) Switch

The CPP switch is an input to the PCM indicating the clutch pedal position. The PCM provides a low current voltage on the CPP circuit. When the CPP switch is closed, this voltage is pulled low through the SIG RTN circuit. The CPP input to the PCM is used to detect a reduction in engine load. The PCM uses the load information for mass air flow and fuel calculations.



Item	Part Number	Description
1	—	Clutch pedal position (CPP) switch electrical connector
2	7C534	CPP switch
3	—	CPP switch cover (part of 7C534)

Clutch Switch: Service and Repair

CLUTCH PEDAL POSITION (CPP) SWITCH

Removal and Installation

1. Disconnect the clutch pedal position (CPP) switch electrical connector. 2. Spread the CPP switch apart. Remove from the pedal rod. 3. To install, reverse the removal procedure.

Typical Thread Type ECT Sensor

Coolant Temperature Sensor/Switch (For Computer): Description and Operation

ENGINE COOLANT TEMPERATURE (ECT) SENSOR

Typical Thread Type ECT Sensor

The ECT sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of a thermistor decreases as the temperature increases, and the resistance increases as the temperature decreases. The varying resistance changes the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Thermistor-type sensors are considered passive sensors. A passive sensor is connected to a voltage divider network so that varying the resistance of the passive sensor causes a variation in total current flow. Voltage that is dropped across a fixed resistor in a series with the sensor resistor determines the voltage signal at the PCM. This voltage signal is equal to the reference voltage minus the voltage drop across the fixed resistor.

The ECT measures the temperature of the engine coolant. The PCM uses the ECT input for fuel control and for cooling fan control. There are 3 types of ECT sensors, threaded, push-in, and twist-lock. The ECT sensor is located in an engine coolant passage.

Crankshaft Position Sensor: Description and Operation

CRANKSHAFT POSITION (CKP) SENSOR

Typical Crankshaft Position (CKP) Sensor

The CKP sensor is a magnetic transducer mounted on the engine block adjacent to a pulse wheel located on the crankshaft. By monitoring the crankshaft mounted pulse wheel, the CKP is the primary sensor for ignition information to the PCM. The pulse wheel has a total of 35 teeth spaced 10 degrees apart with one empty space for a missing tooth. The 6.8L 10-cylinder pulse wheel has 39 teeth spaced 9 degrees apart and one 9 degree empty space for a missing tooth. By monitoring the pulse wheel, the CKP sensor signal indicates crankshaft position and speed information to the PCM. By monitoring the missing tooth, the CKP sensor is also able to identify piston travel in order to synchronize the ignition system and provide a way of tracking the angular position of the crankshaft relative to a fixed reference for the CKP sensor configuration. The PCM also uses the CKP signal to determine if a misfire has occurred by measuring rapid decelerations between teeth.

C107

Engine Temperature Sensor: Description and Operation

CYLINDER HEAD TEMPERATURE (CHT) SENSOR

Typical CHT Sensor

The CHT sensor is a thermistor device in which resistance changes with the temperature. The electrical resistance of a thermistor decreases as temperature increases, and the resistance increases as the temperature decreases. The varying resistance affects the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

The CHT sensor is installed in the cylinder head and measures the metal temperature. The CHT sensor can provide complete engine temperature information and can be used to infer coolant temperature. If the CHT sensor conveys an overheating condition to the PCM, the PCM initiates a fail-safe cooling strategy based on information from the CHT sensor. A cooling system concern such as low coolant or coolant loss could cause an overheating condition. As a result, damage to major engine components could occur. Using both the CHT sensor and fail-safe cooling strategy, the PCM prevents damage by allowing air cooling of the engine and limp home capability.

Fuel Level Sensor: Description and Operation

FUEL LEVEL INPUT (FLI)

The FLI is a communications network message. Most vehicle applications use a potentiometer type FLI sensor connected to a float in the FP module to determine fuel level.

Part 2

Removal and Installation

WARNING:

- When working on or near the evaporative emission (EVAP) system, disconnect the battery ground cable from the battery. The EVAP system contains fuel vapor and condensed fuel vapor, so an

electrical spark may cause a fire or explosion. Failure to follow this instruction may result in serious personal injury.

- Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. Remove the fuel tank. 2. Disconnect the fuel tank pressure sensor electrical connector.

3. NOTE: The rear fuel tank vapor tube and fuel tank pressure sensor are an assembly and must be serviced as an assembly.

Disconnect the rear fuel tank vapor tube and fuel tank pressure sensor assembly-to-evaporative emissions (EVAP) canister quick connect coupling.

4. Disconnect the front fuel tank vapor tube-to-rear fuel tank vapor tube and fuel tank pressure sensor assembly quick connect coupling. 5. Remove the rear fuel tank vapor tube and fuel tank pressure sensor assembly. 6. To install, reverse the removal procedure.

- Carry out the leak test. See: Emission Control Systems/Evaporative Emissions System/Testing and Inspection

- Carry out the evaporative emission repair verification drive cycle.

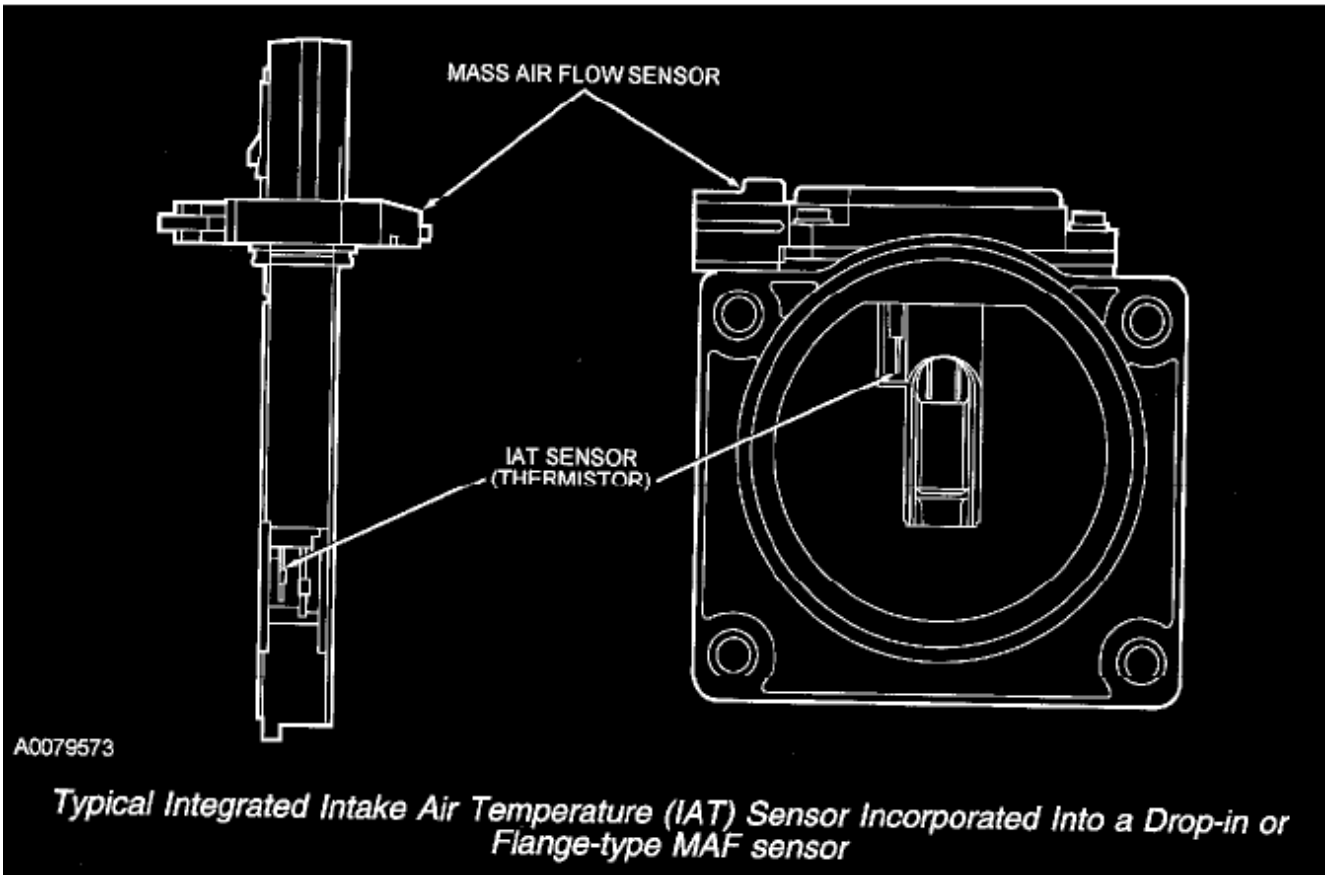
Typical Stand-Alone/Non-Integrated Intake Air Temperature (IAT) Sensors



Typical Integrated Intake Air Temperature (IAT) Sensor Incorporated Into a Drop-in or Flange-type MAF sensor

Intake Air Temperature Sensor: Description and Operation

Intake Air Temperature (IAT) Sensor

Typical Stand-Alone/Non-Integrated Intake Air Temperature (IAT) Sensors

Typical Integrated Intake Air Temperature (IAT) Sensor Incorporated Into A Drop-in Or Flange-type MAF Sensor

The IAT sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of a thermistor decreases as the temperature increases, and the resistance increases as the temperature decreases. The varying resistance affects the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Thermistor-type sensors are considered passive sensors. A passive sensor is connected to a voltage divider network so that varying the resistance of the passive sensor causes a variation in total current flow. Voltage that is dropped across a fixed resistor in a series with the sensor resistor determines the voltage signal at the PCM. This voltage signal is equal to the reference voltage minus the voltage drop across the fixed resistor.

The IAT provides air temperature information to the PCM. The PCM uses the air temperature information as a correction factor in the calculation of

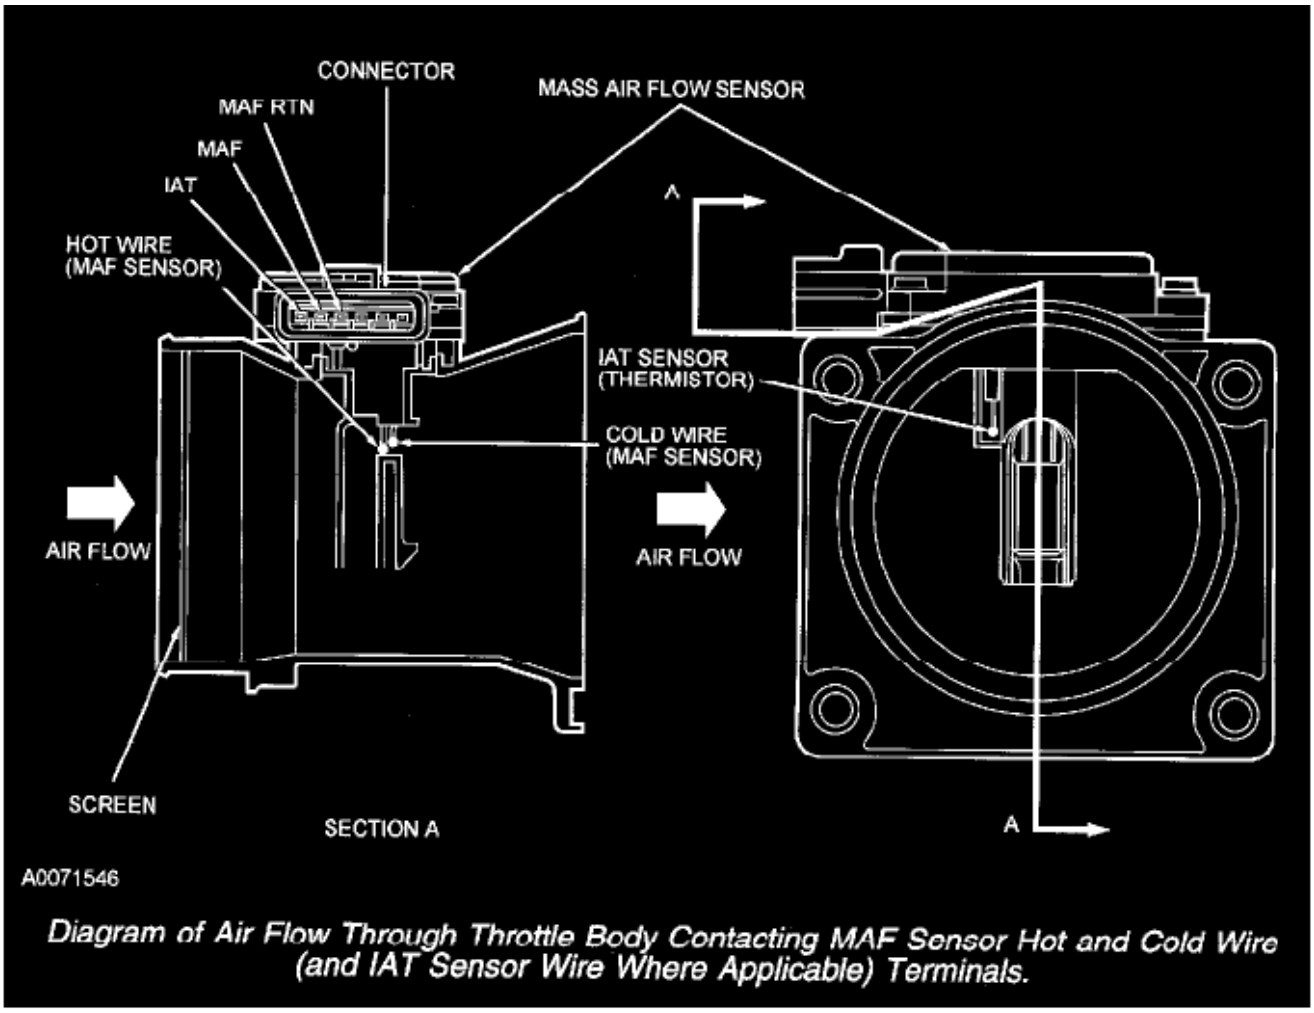


Diagram of Air Flow Through Throttle Body Contacting MAF Sensor Hot and Cold Wire (and IAT Sensor Wire Where Applicable) Terminals.

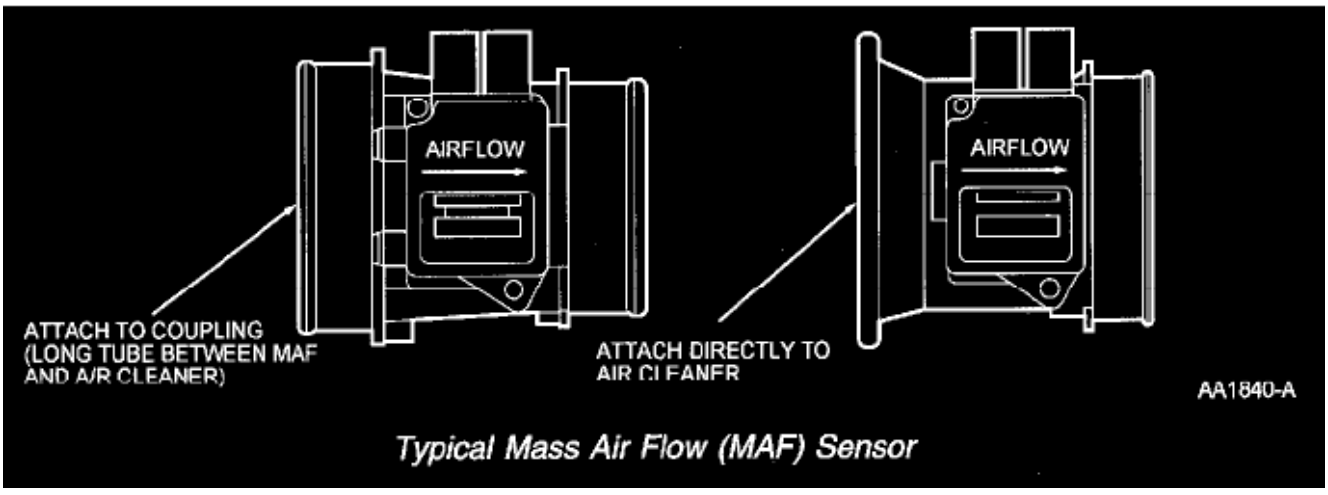


Typical Mass Air Flow (MAF) Sensor

fuel, spark, and air flow.

The IAT sensor provides a quicker temperature change response time than the ECT or CHT sensor.

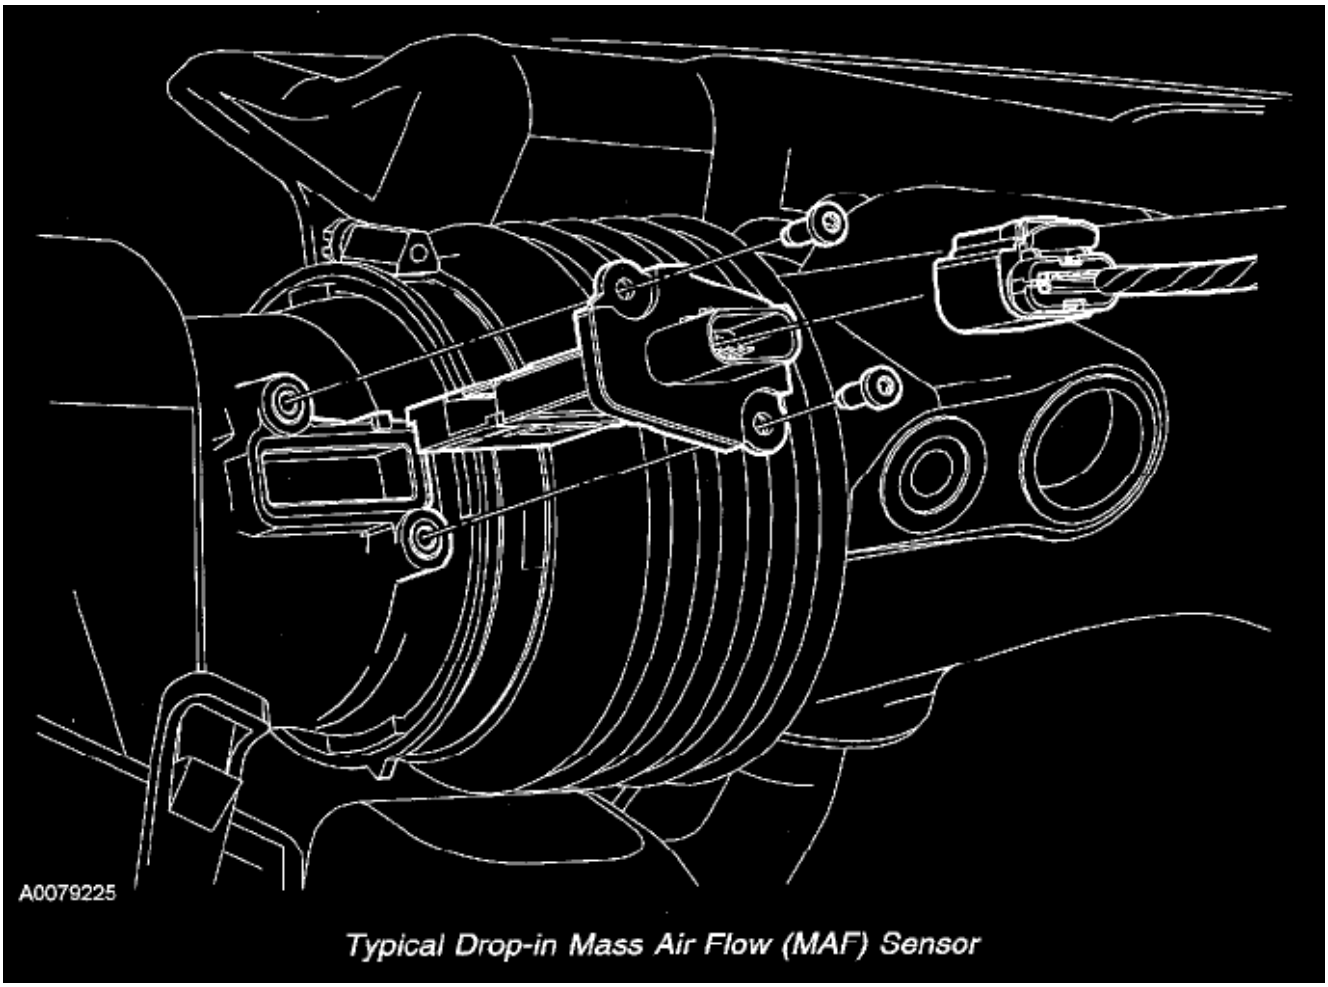
Currently there are 2 design types of IAT sensors used, a stand-alone/non-integrated type and a integrated type. Both types function the same, however the integrated type is incorporated into the mass air flow (MAF) sensor instead of being a stand alone sensor.

Supercharged vehicles use 2 IAT sensors. Both sensors are thermistor type devices and operate as described above. One is located before the supercharger at the air cleaner for standard OBD/cold weather input, while a second sensor (IAT2) is located after the supercharger in the intake manifold. The IAT2 sensor located after the supercharger provides air temperature information to the PCM to control spark and to help determine charge air cooler (CAC) efficiency.

Mass Air Flow (MAF) Sensor

Diagram Of Air Flow Through Throttle Body Contacting MAF Sensor Hot And Cold Wire (and IAT Sensor Wire Where Applicable) Terminals

Typical Mass Air Flow (MAF) Sensor



Typical Drop-in Mass Air Flow (MAF) Sensor

Typical Drop-in Mass Air Flow (MAF) Sensor

The MAF sensor uses a hot wire sensing element to measure the amount of air entering the engine. Air passing over the hot wire causes it to cool. This hot wire is maintained at 200°C (392°F) above the ambient temperature as measured by a constant cold wire. The current required to maintain the temperature of the hot wire is proportional to the mass air flow. The MAF sensor then outputs an analog voltage signal to the PCM proportional to the intake air mass. The PCM calculates the required fuel injector pulse width in order to provide the desired air/fuel ratio. This input is also used in determining transmission electronic pressure control (EPC), shift and torque converter clutch scheduling.

The MAF sensor is located between the air cleaner and the throttle body or inside the air cleaner assembly. Most MAF sensors have integrated bypass technology with an integrated intake air temperature (IAT) sensor. The hot wire electronic sensing element must be replaced as an assembly. Replacing only the element may change the air flow calibration.

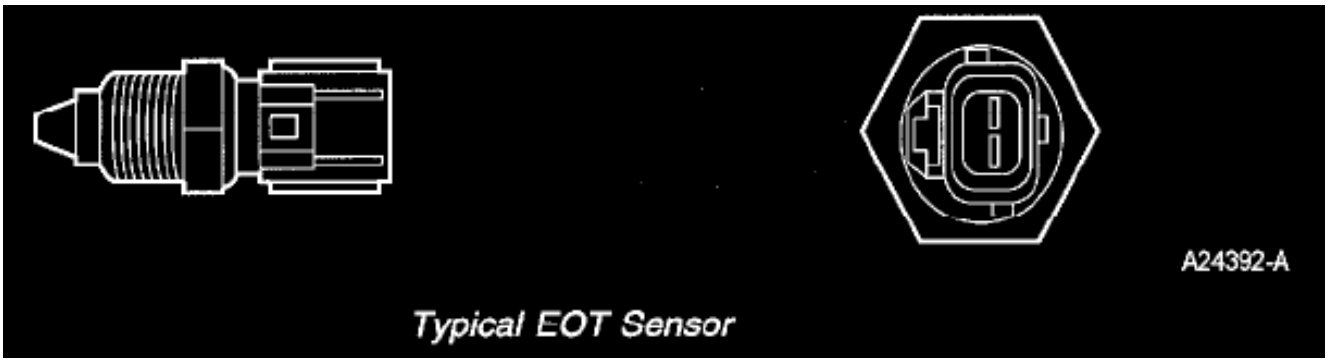
Manifold Pressure/Vacuum Sensor: Description and Operation

MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR

Typical Manifold Absolute Pressure (MAP) Sensor

The MAP sensor measures intake manifold absolute pressure. The PCM uses information from the MAP sensor to measure how much exhaust gas is introduced into the intake manifold.



Typical EOT Sensor

Oil Temperature Sensor For ECM: Description and Operation

ENGINE OIL TEMPERATURE (EOT) SENSOR

Typical EOT Sensor

The EOT sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of a thermistor decreases as the temperature increases and the resistance increases as the temperature decreases. The varying resistance changes the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Thermistor-type sensors are considered passive sensors. A passive sensor is connected to a voltage divider network so that varying the resistance of the passive sensor causes a variation in total current flow. Voltage that is dropped across a fixed resistor in a series with the sensor resistor determines the voltage signal at the PCM. This voltage signal is equal to the reference voltage minus the voltage drop across the fixed resistor.

The EOT sensor measures the temperature of the engine oil. The sensor is typically threaded into the engine oil lubrication system. The PCM can use the EOT sensor input to determine the following:

- On variable camshaft timing (VCT) applications the EOT input is used to adjust the VCT control gains and logic for camshaft timing.

- The PCM can use EOT sensor input in conjunction with other PCM inputs to determine oil degradation.

- The PCM can use EOT sensor input to initiate a soft engine shutdown. To prevent engine damage from occurring as a result of high oil temperatures, the PCM has the ability to initiate a soft engine shutdown. Whenever engine RPM exceeds a calibrated level for a certain period of time, the PCM begins reducing power by disabling engine cylinders.

Heated Oxygen Sensor (HO2S)

Oxygen Sensor: Description and Operation

Heated Oxygen Sensor (HO2S)

Heated Oxygen Sensor (HO2S)

The HO2S detects the presence of oxygen in the exhaust and produces a variable voltage according to the amount of oxygen detected. A high concentration of oxygen (lean air/fuel ratio) in the exhaust produces a voltage signal less than 0.4 volt. A low concentration of oxygen (rich air/fuel ratio) produces a voltage signal greater than 0.6 volt. The HO2S provides feedback to the PCM indicating air/fuel ratio in order to achieve a near stoichiometric air/fuel ratio of 14.7:1 during closed loop engine operation. The HO2S generates a voltage between 0.0 and 1.1 volts.

Embedded with the sensing element is the HO2S heater. The heating element heats the sensor to a temperature of 800°C (1,472°F). At approximately 300°C (572°F) the engine can enter closed loop operation. The VPWR circuit supplies voltage to the heater. The PCM turns the heater on by providing the ground when the correct conditions occur. The heater allows the engine to enter closed loop operation sooner. The use of this heater requires the HO2S heater control to be duty cycled, to prevent damage to the heater.

Universal HO2S

The universal HO2S, sometimes referred to as a wideband oxygen sensor, uses the typical HO2S combined with a current controller in the PCM to infer an air/fuel ratio relative to the stoichiometric air/fuel ratio. This is accomplished by balancing the amount of oxygen ions pumped in or out of a measurement chamber within the sensor. The typical HO2S within the universal HO2S is used to detect the oxygen content of the exhaust gas in the measurement chamber. The oxygen content inside the measurement chamber is maintained at the stoichiometric air/fuel ratio by pumping oxygen ions in and out of the measurement chamber. As the exhaust gasses get richer or leaner, the amount of oxygen that must be pumped in or out to maintain a stoichiometric air/fuel ratio in the measurement chamber varies in proportion to the air/fuel ratio. The amount of current required to

pump the oxygen ions in or out of the measurement chamber is used to measure the air/fuel ratio. The measured air/fuel ratio is actually the output from the current controller in the PCM and not a signal that comes directly from the sensor.

The universal HO2S also uses a self-contained reference chamber to make sure an oxygen differential is always present. The oxygen for the reference chamber is supplied by pumping small amounts of oxygen ions from the measurement chamber into the reference chamber. The universal HO2S does not need access to outside air.

Part to part variance is compensated for by placing a resistor in the connector. This resistor is used to trim the current measured by the current controller in the PCM.

Embedded with the sensing element is the universal H02S heater. The heater allows the engine to enter closed loop operation sooner. The heating element heats the sensor to a temperature of 780°C (1,436°F). The VPWR circuit supplies voltage to the heater. The PCM controls the heater on and off by providing the ground to maintain the sensor at the correct temperature for maximum accuracy.

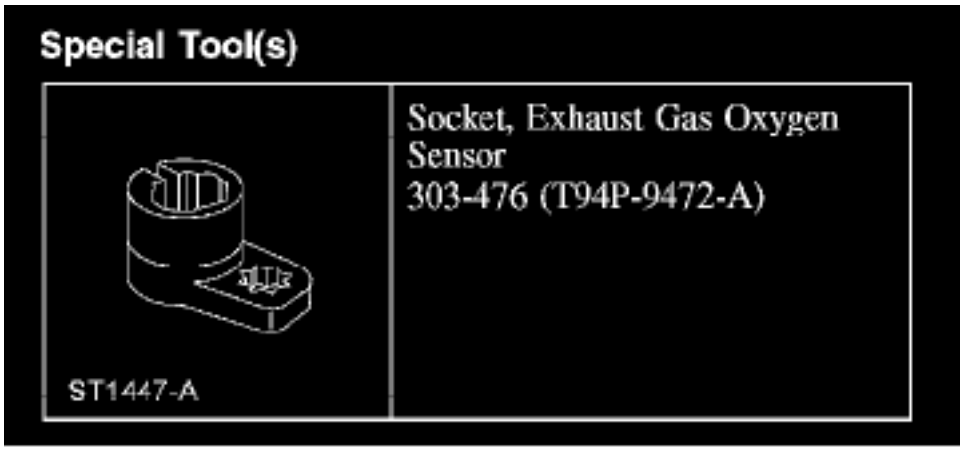
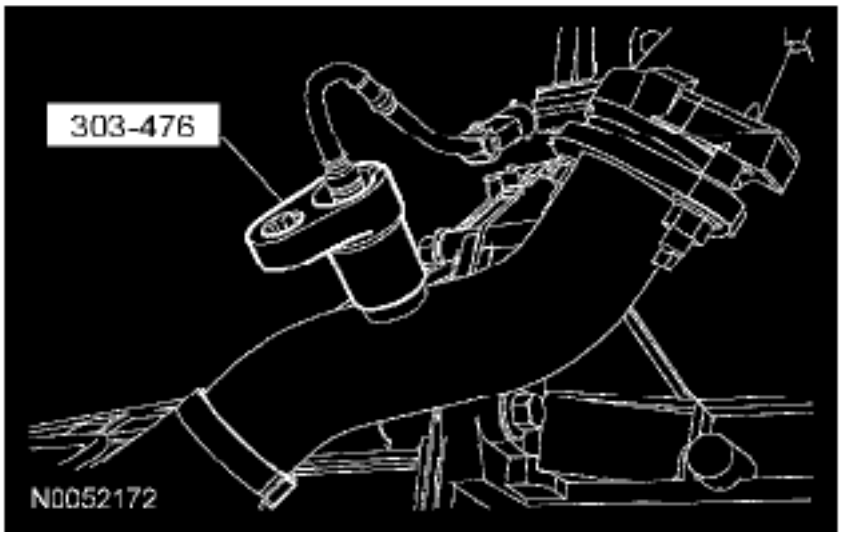
Special Tool(s)





Special Tool(s)

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist.

2. NOTE: If necessary, lubricate the heated oxygen sensor (HO2S) with lock lubricant to assist in removal.

Using the special tool, remove the HO2S. -

To install, tighten to 48 Nm (35 lb-ft).

3. NOTE: Apply a light coat of anti-seize lubricant to the threads of the HO2S.

To install, reverse the removal procedure.

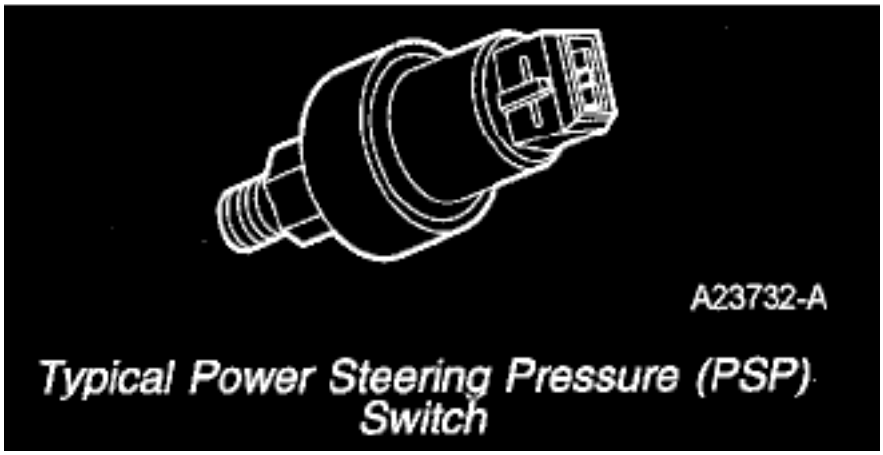
Typical Power Steering Pressure (PSP) Sensor



Typical Power Steering Pressure (PSP) Switch

Power Steering Pressure Switch: Description and Operation

Power Steering Pressure (PSP) Sensor

Typical Power Steering Pressure (PSP) Sensor

The PSP sensor monitors the hydraulic pressure within the power steering system. The PSP sensor voltage input to the PCM changes as the hydraulic pressure changes. The PCM uses the input signal from the PSP sensor to compensate for additional loads on the engine by adjusting the

idle RPM and preventing engine stall during parking maneuvers. Also, the PSP sensor signals the PCM to adjust the transmission electronic pressure control (EPC) pressure during increased engine load, for example, during parking maneuvers.

Power Steering Pressure (PSP) Switch

Typical Power Steering Pressure (PSP) Switch

The PSP switch monitors the hydraulic pressure within the power steering system. The PSP switch is a normally closed switch that opens as the hydraulic pressure increases. The PCM provides a low current voltage on the PSP circuit. When the PSP switch is closed, this voltage is pulled low through the SIG RTN circuit. The PCM uses the input signal from the PSP switch to compensate for additional loads on the engine by adjusting the idle RPM and preventing engine stall during parking maneuvers. Also, the PSP switch signals the PCM to adjust the transmission electronic pressure control (EPC) pressure during increased engine load, for example during parking maneuvers.

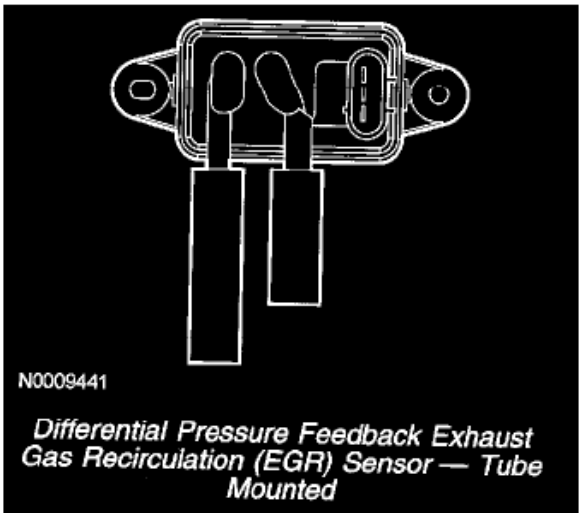
Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor



Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor — Tube Mounted

Pressure Feedback Exhaust Sensor: Description and Operation

Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor

Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor

The differential pressure feedback EGR sensor is a ceramic, capacitive-type pressure transducer that monitors the differential pressure across a metering orifice located in the orifice tube assembly. The differential pressure feedback EGR sensor receives this signal through 2 hoses referred to as the downstream pressure hose (REF SIGNAL) and upstream pressure hose (HI SIGNAL). The HI and REF hose connections are marked on the differential pressure feedback EGR sensor housing for identification (note that the HI signal uses a larger diameter hose). The differential pressure feedback EGR sensor outputs a voltage proportional to the pressure drop across the metering orifice and supplies it to the PCM as EGR flow rate feedback.

Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor - Tube Mounted

Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor - Tube Mounted

The tube mounted differential pressure feedback EGR sensor is identical in operation as the larger plastic differential pressure feedback EGR sensors and uses a 1.0 volt offset. The HI and REF

hose connections are marked on the side of the sensor.

Throttle Position Sensor: Description and Operation

Electronic Throttle Body (ETB) Throttle Position Sensor

The ETB throttle position sensor has 2 signal circuits in the sensor for redundancy. The redundant ETB throttle position signals are required for increased monitoring. The first ETB throttle position sensor signal (TP1) has a negative slope (increasing angle, decreasing voltage) and the second signal (TP2) has a positive slope (increasing angle, increasing voltage). The 2 ETB throttle position sensor signals make sure the PCM receives a correct input even if 1 signal has a concern. There is 1 reference voltage circuit and 1 signal return circuit for the sensor. The reference voltage circuit and the signal return circuit is shared with the reference voltage circuits and signal return circuits used by the APP sensor.

Throttle Position (TP) Sensor

Typical TP Sensor

The TP sensor is a rotary potentiometer sensor that provides a signal to the PCM that is linearly proportional to the throttle plate/shaft position. The sensor housing has a 3-blade electrical connector that may be gold plated. The gold plating increases the corrosion resistance on the terminals and increases the connector durability. The TP sensor is mounted on the throttle body. As the TP sensor is rotated by the throttle shaft, 4 operating conditions are determined by the PCM from the TP. The operating conditions are: -

closed throttle (includes idle or deceleration)

- part throttle (includes cruise or moderate acceleration)

- wide open throttle (includes maximum acceleration or de-choke on crank)

- throttle angle rate

Item	Part Number	Description
1	14A464	Throttle position (TP) sensor electrical connector (part of 12B637)
2	W707535	TP sensor screw (2 required)
3	9E928	TP sensor

Throttle Position Sensor: Service and Repair

THROTTLE POSITION (TP) SENSOR

Removal and Installation

1. Disconnect the throttle position (TP) sensor electrical connector.

2. CAUTION: Failure to remove the throttle position (TP) sensor screws in the following manner will result in damage to the screws. First,

loosen the screws 1 to 2 full turns using a hand tool, and then use a suitable high-speed driver to complete the removal.

Remove and discard the 2 bolts and the TP sensor. -

To install, tighten to 3 Nm (27 lb-in).

3. CAUTION: Do not use a high-speed driver to install the new screws or damage to the throttle position (TP) sensor may occur.

NOTE: -

Do not reuse the TP sensor and screws. A new TP sensor and screws must be installed.

- Failure to install the TP sensor in this manner may result in excessive idle speeds. Slide the rotary tangs into position over the throttle shaft blade, then rotate the TP sensor.

To install, reverse the removal procedure. -

Install a new TP sensor and screws.

4	7A256-A	Manual control lever
5	N806933-S	Digital TR sensor screw (2 required)
6	7F293-A	Digital TR sensor

Transmission Position Switch/Sensor: Service and Repair

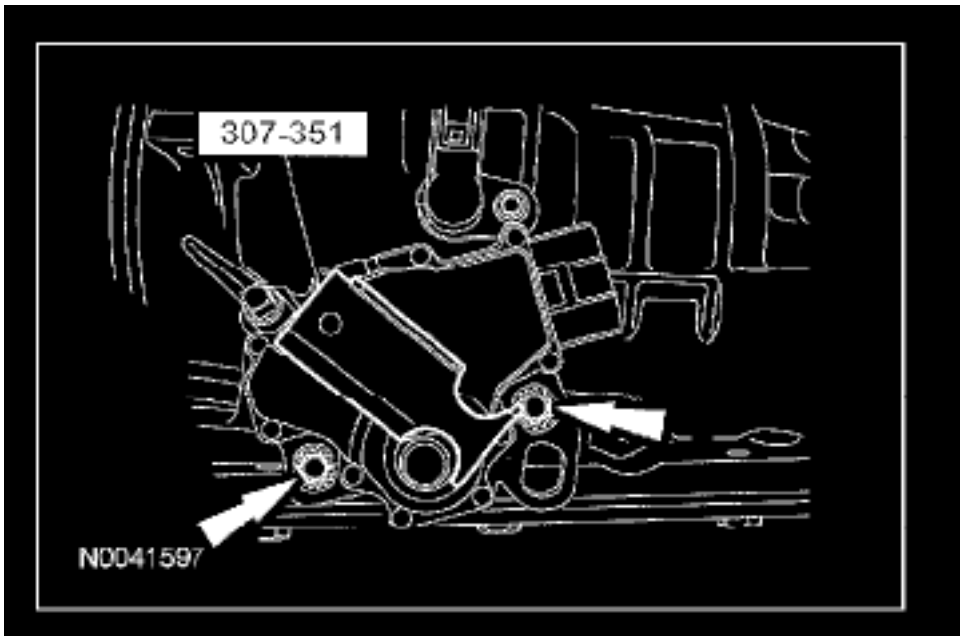
Digital Transmission Range (TR) Sensor

Digital Transmission Range (TR) Sensor

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. 2. Disconnect the selector lever cable from the manual control lever. 3. Disconnect the digital transmission range (TR) sensor electrical connector. 4. Remove the manual control outer lever nut and manual control outer lever. 5. Remove the screws and the digital TR sensor.

Installation



1. CAUTION: The digital transmission range (TR) sensor must fit flush against the boss on the case to prevent damage to the sensor.

Install the digital TR sensor and loosely install the screws.

2. CAUTION: Tightening one screw before tightening the other may cause the sensor to bind or become damaged.

NOTE: The manual lever must be in the NEUTRAL position.

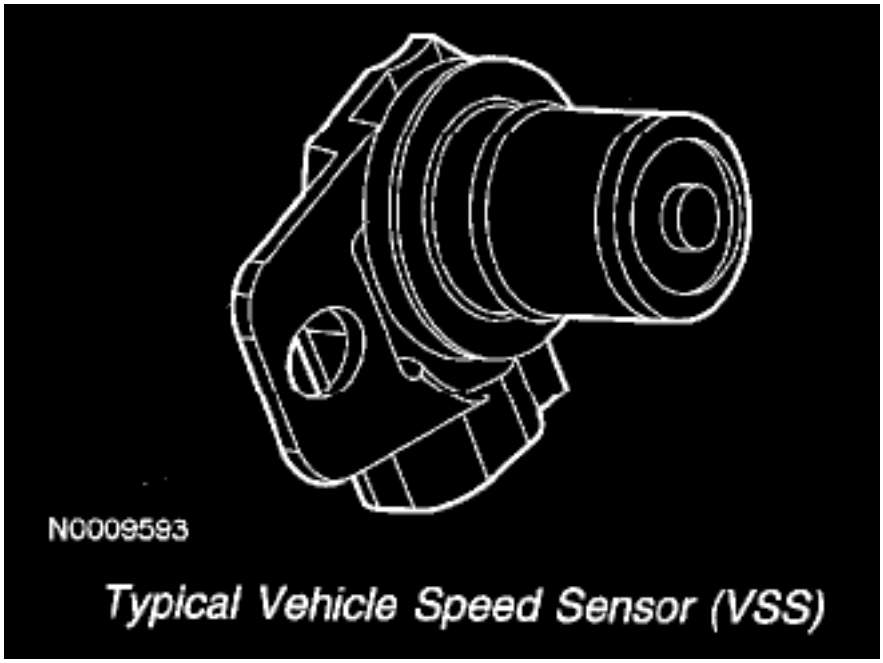
Using the special tool, align the digital TR sensor and tighten screws in an alternating sequence. ^

Tighten to 10 Nm (89 lb-inch).

3. Install the manual control outer lever and nut.

^ Tighten to 48 Nm (35 lb-ft).

4. Connect the digital TR sensor electrical connector. 5. Connect the selector lever cable to the manual control lever. 6. Verify that the selector lever cable is adjusted correctly.



Vehicle Speed Sensor: Description and Operation

Output Shaft Speed (OSS) Sensor

The OSS sensor provides the PCM with information about the rotational speed of an output shaft. The PCM uses the information to control and diagnose powertrain behavior. In some applications, the sensor is also used as the source of vehicle speed. The sensor may be physically located in different places on the vehicle, depending upon the specific application. The design of each speed sensor is unique and depends on which powertrain control feature uses the information that is generated.

Vehicle Speed Sensor (VSS)

Typical Vehicle Speed Sensor (VSS)

The VSS is a variable reluctance or Hall-effect sensor that generates a waveform with a frequency that is proportional to the speed of the vehicle. If the vehicle is moving at a relatively low velocity, the sensor produces a signal with a low frequency. As the vehicle velocity increases, the sensor generates a signal with a higher frequency. The PCM uses the frequency signal generated by the VSS (and other inputs) to control such parameters as fuel injection, ignition control, transmission/transaxle shift scheduling, and torque converter clutch scheduling.

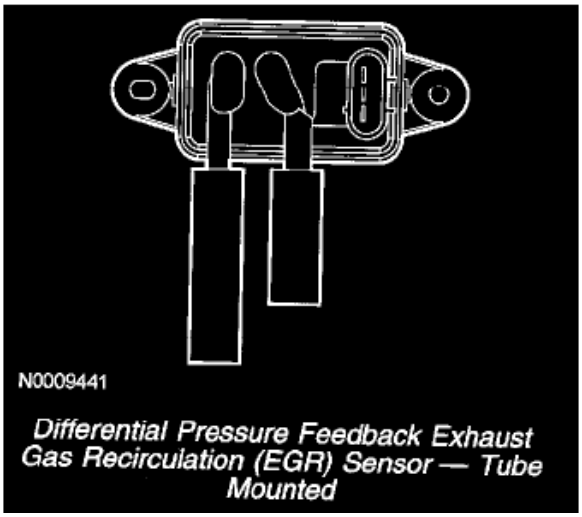
Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor



Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor — Tube Mounted

Pressure Feedback Exhaust Sensor: Description and Operation

Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor

Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor

The differential pressure feedback EGR sensor is a ceramic, capacitive-type pressure transducer that monitors the differential pressure across a metering orifice located in the orifice tube assembly. The differential pressure feedback EGR sensor receives this signal through 2 hoses referred to as the downstream pressure hose (REF SIGNAL) and upstream pressure hose (HI SIGNAL). The HI and REF hose connections are marked on the differential pressure feedback EGR sensor housing for identification (note that the HI signal uses a larger diameter hose). The differential pressure feedback EGR sensor outputs a voltage proportional to the pressure drop across the metering orifice and supplies it to the PCM as EGR flow rate feedback.

Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor - Tube Mounted

Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor - Tube Mounted

The tube mounted differential pressure feedback EGR sensor is identical in operation as the larger plastic differential pressure feedback EGR sensors and uses a 1.0 volt offset. The HI and REF

hose connections are marked on the side of the sensor.

Accelerator Pedal Position Sensor: Description and Operation

ACCELERATOR PEDAL POSITION (APP) SENSOR

The APP sensor is an input to the powertrain control module (PCM) and is used to determine the amount of torque requested by the operator. Depending on the application either a 2-track or 3-track APP sensor is used.

2-Track APP Sensor

2-Track APP Sensor

There are 2 pedal position signals in the sensor. Both signals, APP1 and APP2, have a positive slope (increasing angle, increasing voltage), but are offset and increase at different rates. The 2 pedal position signals make sure the PCM receives a correct input even if 1 signal has a concern. The PCM determines if a signal is incorrect by calculating where it should be, inferred from the other signals. If a concern is present with one of the circuits the other input is used. There are 2 reference voltage circuits, 2 signal return circuits, and 2 signal circuits (a total of 6 circuits and pins) between the PCM and the APP sensor assembly. The reference voltage circuits and the signal return circuits are shared with the reference voltage circuit and signal return circuit used by the electronic throttle body (ETB) throttle position sensor. The pedal position signal is converted to pedal travel degrees (rotary angle) by the PCM. The software then converts these degrees to counts, which is the input to the torque based strategy.

3-Track APP Sensor

Typical 3-Track APP Sensor

There are 3 pedal position signals in the sensor. Signal 1, APP1, has a negative slope (increasing angle, decreasing voltage) and signals 2 and 3, APP2 and APP3, both have a positive slope (increasing angle, increasing voltage). During normal operation APP1 is used as the indication of pedal position by the strategy. The 3 pedal position signals make sure the PCM receives a correct input even if 1 signal has a concern. The PCM determines if a signal is incorrect by calculating where it should be, inferred from the other signals. If a concern is present with one of the circuits the other inputs are used. The pedal position signal is converted to pedal travel degrees (rotary angle) by the PCM. The software then converts these degrees to counts, which is the input to the torque based strategy. There are 2 reference voltage circuits, 2 signal return circuits, and 3 signal circuits (a total of 7 circuits and pins) between the PCM and the APP sensor assembly. The reference voltage circuits and the signal return circuits are shared with the reference voltage circuit and signal return circuit used by the electronic throttle body (ETB) throttle position sensor.

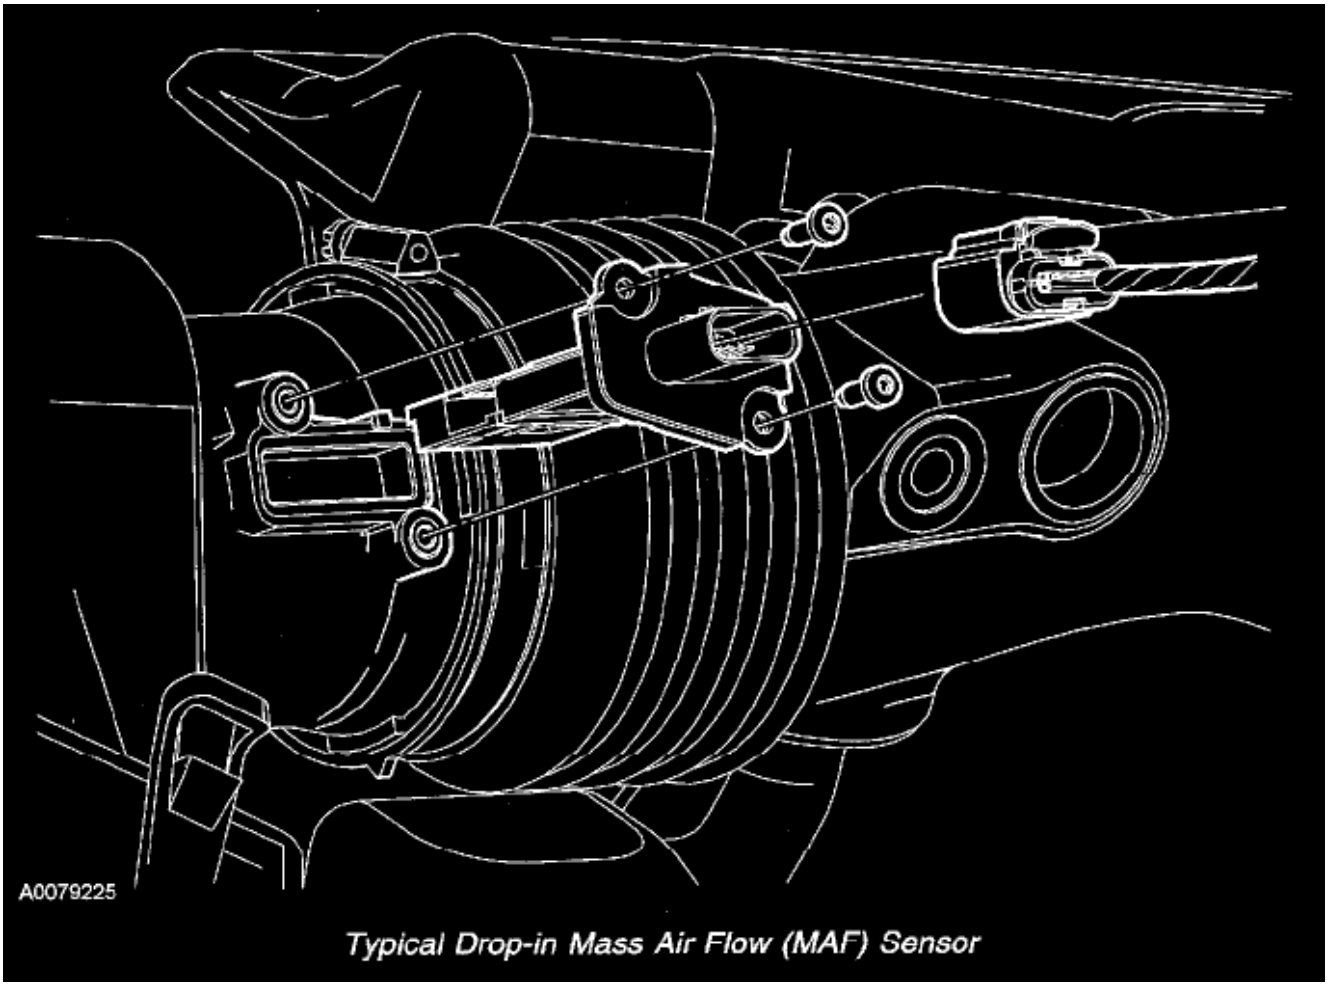
Air Flow Meter/Sensor: Description and Operation

MASS AIR FLOW (MAF) SENSOR

Diagram Of Air Flow Through Throttle Body Contacting MAF Sensor Hot And Cold Wire (and IAT Sensor Wire Where Applicable) Terminals

Typical Mass Air Flow (MAF) Sensor



Typical Drop-in Mass Air Flow (MAF) Sensor

Typical Drop-in Mass Air Flow (MAF) Sensor

The MAF sensor uses a hot wire sensing element to measure the amount of air entering the engine. Air passing over the hot wire causes it to cool. This hot wire is maintained at 200°C (392°F) above the ambient temperature as measured by a constant cold wire. The current required to maintain the temperature of the hot wire is proportional to the mass air flow. The MAF sensor then outputs an analog voltage signal to the PCM proportional to the intake air mass. The PCM calculates the required fuel injector pulse width in order to provide the desired air/fuel ratio. This input is also used in determining transmission electronic pressure control (EPC), shift and torque converter clutch scheduling.

The MAF sensor is located between the air cleaner and the throttle body or inside the air cleaner assembly. Most MAF sensors have integrated bypass technology with an integrated intake air temperature (IAT) sensor. The hot wire electronic sensing element must be replaced as an assembly. Replacing only the element may change the air flow calibration.

Item	Part Number	Description

Typical Fuel Rail Pressure Temperature (FRPT) Sensor

Fuel Pressure Sensor/Switch: Description and Operation

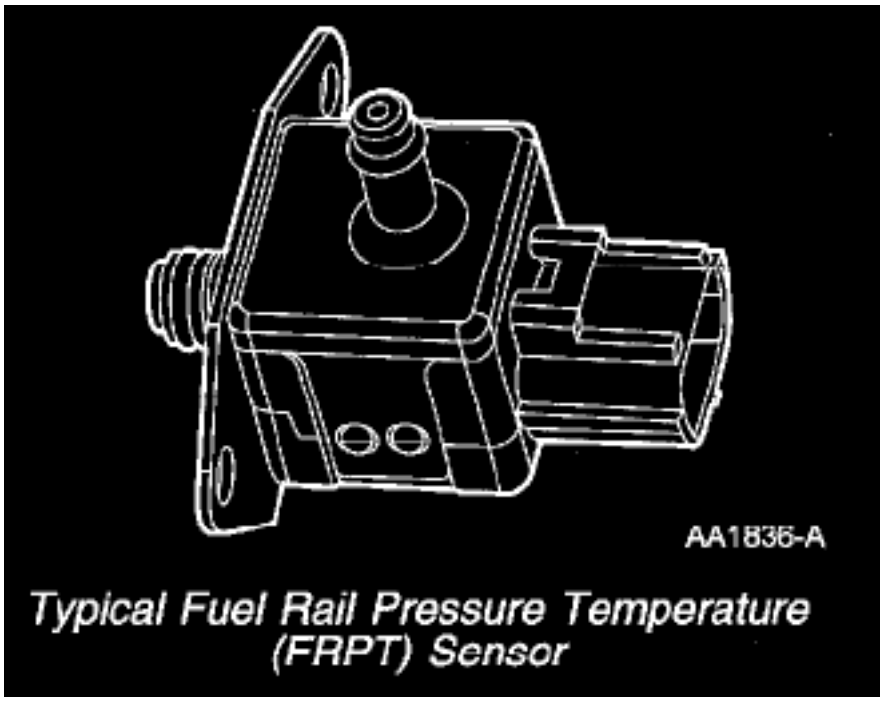
FUEL RAIL PRESSURE TEMPERATURE (FRPT) SENSOR

Typical Fuel Rail Pressure Temperature (FRPT) Sensor

The FRPT sensor measures the pressure and temperature of the fuel in the fuel rail and sends these signals to the PCM. The sensor uses the intake manifold vacuum as a reference to determine the pressure difference between the fuel rail and the intake manifold. The relationship between fuel pressure and fuel temperature is used to determine the possible presence of fuel vapor in the fuel rail.

The temperature sensing portion of the FRPT sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of the thermistor decreases as the temperature increases, and the resistance increases as the temperature decreases. The varying resistance changes the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Both the pressure and temperature signals are used to control the speed of the fuel pump. The speed of the fuel pump sustains fuel rail pressure which preserves fuel in its liquid state. The dynamic range of the fuel injectors increase because of the higher rail pressure, which allows the injector pulse width to decrease.



Typical Fuel Rail Pressure Temperature (FRPT) Sensor

Fuel Temperature Sensor: Description and Operation

FUEL RAIL PRESSURE TEMPERATURE (FRPT) SENSOR

Typical Fuel Rail Pressure Temperature (FRPT) Sensor

The FRPT sensor measures the pressure and temperature of the fuel in the fuel rail and sends these signals to the PCM. The sensor uses the intake manifold vacuum as a reference to determine the pressure difference between the fuel rail and the intake manifold. The relationship between fuel pressure and fuel temperature is used to determine the possible presence of fuel vapor in the fuel rail.

The temperature sensing portion of the FRPT sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of the thermistor decreases as the temperature increases, and the resistance increases as the temperature decreases. The varying resistance changes the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Both the pressure and temperature signals are used to control the speed of the fuel pump. The speed of the fuel pump sustains fuel rail pressure which preserves fuel in its liquid state. The dynamic range of the fuel injectors increase because of the higher rail pressure, which allows the injector pulse width to decrease.

Inertia Fuel Shutoff Switch: Description and Operation

INERTIA FUEL SHUTOFF (IFS) SWITCH

Typical Inertia Fuel Shutoff (IFS) Switch

The IFS switch is used in conjunction with the electric fuel pump. The purpose of the IFS switch is to shutoff the fuel pump if a collision occurs. It consists of a steel ball held in place by a magnet. When a sharp impact occurs, the ball breaks loose from the magnet, rolls up a conical ramp and strikes a target plate which opens the electrical contacts of the switch and shuts off the electric fuel pump. Once the switch is open, it must be manually reset before restarting the vehicle. Refer to the Owner's Literature, Roadside Emergencies for the location of the IFS switch.

Throttle Position Sensor: Description and Operation

Electronic Throttle Body (ETB) Throttle Position Sensor

The ETB throttle position sensor has 2 signal circuits in the sensor for redundancy. The redundant ETB throttle position signals are required for increased monitoring. The first ETB throttle position sensor signal (TP1) has a negative slope (increasing angle, decreasing voltage) and the second signal (TP2) has a positive slope (increasing angle, increasing voltage). The 2 ETB throttle position sensor signals make sure the PCM receives a correct input even if 1 signal has a concern. There is 1 reference voltage circuit and 1 signal return circuit for the sensor. The reference voltage circuit and the signal return circuit is shared with the reference voltage circuits and signal return circuits used by the APP sensor.

Throttle Position (TP) Sensor

Typical TP Sensor

The TP sensor is a rotary potentiometer sensor that provides a signal to the PCM that is linearly proportional to the throttle plate/shaft position. The sensor housing has a 3-blade electrical connector that may be gold plated. The gold plating increases the corrosion resistance on the terminals and increases the connector durability. The TP sensor is mounted on the throttle body. As the TP sensor is rotated by the throttle shaft, 4 operating conditions are determined by the PCM from the TP. The operating conditions are: -

closed throttle (includes idle or deceleration)

- part throttle (includes cruise or moderate acceleration)

- wide open throttle (includes maximum acceleration or de-choke on crank)

- throttle angle rate

Item	Part Number	Description
1	14A464	Throttle position (TP) sensor electrical connector (part of 12B637)
2	W707535	TP sensor screw (2 required)
3	9E928	TP sensor

Throttle Position Sensor: Service and Repair

THROTTLE POSITION (TP) SENSOR

Removal and Installation

1. Disconnect the throttle position (TP) sensor electrical connector.

2. CAUTION: Failure to remove the throttle position (TP) sensor screws in the following manner will result in damage to the screws. First,

loosen the screws 1 to 2 full turns using a hand tool, and then use a suitable high-speed driver to complete the removal.

Remove and discard the 2 bolts and the TP sensor. -

To install, tighten to 3 Nm (27 lb-in).

3. CAUTION: Do not use a high-speed driver to install the new screws or damage to the throttle position (TP) sensor may occur.

NOTE: -

Do not reuse the TP sensor and screws. A new TP sensor and screws must be installed.

- Failure to install the TP sensor in this manner may result in excessive idle speeds. Slide the rotary tangs into position over the throttle shaft blade, then rotate the TP sensor.

To install, reverse the removal procedure. -

Install a new TP sensor and screws.

Typical Variable Reluctance CMP Sensor

Camshaft Position Sensor: Description and Operation

CAMSHAFT POSITION (CMP) SENSOR

Typical Synchronizer Hall-Effect CMP Sensor

Typical Variable Reluctance CMP Sensor

The CMP sensor detects the position of the camshaft. The CMP sensor identifies when piston number 1 is on its compression stroke. A signal is then sent to the PCM and used for synchronizing the sequential firing of the fuel injectors. Coil on plug (COP) ignition applications use the CMP signal to select the correct ignition coil to fire.

Vehicles with 2 CMP sensors are equipped with variable camshaft timing (VCT). They use the second sensor to identify the position of the camshaft on bank 2 as an input to the PCM.

There are 2 types of CMP sensors: the 3-pin connector Hall-effect type sensor and the 2-pin connector variable reluctance type sensor.

Item	Part Number	Description

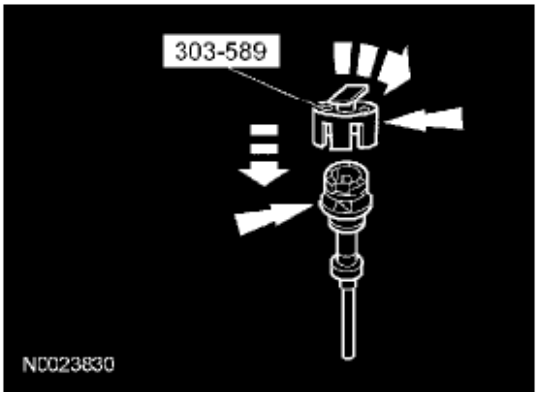
CAMSHAFT SYNCHRONIZER

Exploded View

Special Tool(s)

Special Tool(s)

ST2362-A	Synchronizer Alignment Gauge 303-589



Special Tool(s)

Removal

1. Disconnect the camshaft position (CMP) sensor electrical connector.

2. NOTE: Prior to the removal of the CMP sensor, note the position of the CMP sensor electrical connector. The installation procedure requires that

the electrical connector be located in the same position.

Remove the 2 bolts and the CMP sensor.

3. Remove the camshaft synchronizer bolt. 4. Remove the camshaft synchronizer. Inspect the O-ring seal and install a new O-ring seal if damaged.

Installation

1. CAUTION:

- After installation, do not loosen the synchronizer bolt and rotate the synchronizer assembly. The synchronizer assembly is not adjustable. Do not loosen the synchronizer bolt after the alignment tool has been removed in order to align the camshaft position (CMP) sensor electrical connector for any reason. If the electrical connector is not in the correct position, the synchronizer assembly must be removed. The alignment tool and the assembly must be reinstalled if the engine has not been rotated from top dead center (TDC) of the compression stroke on the No. 1 cylinder. Failure to follow this procedure will result in the fuel system being out of time with the engine, possibly causing engine damage.

- Do not turn the crankshaft or camshaft during the removal and installation procedure or the fuel system timing will be out of time with the engine, possibly causing engine damage.

- A special tool must be used during the installation of the new synchronizer assembly. Failure to follow this procedure will result in the fuel system being out of time with the engine, possibly causing engine damage.

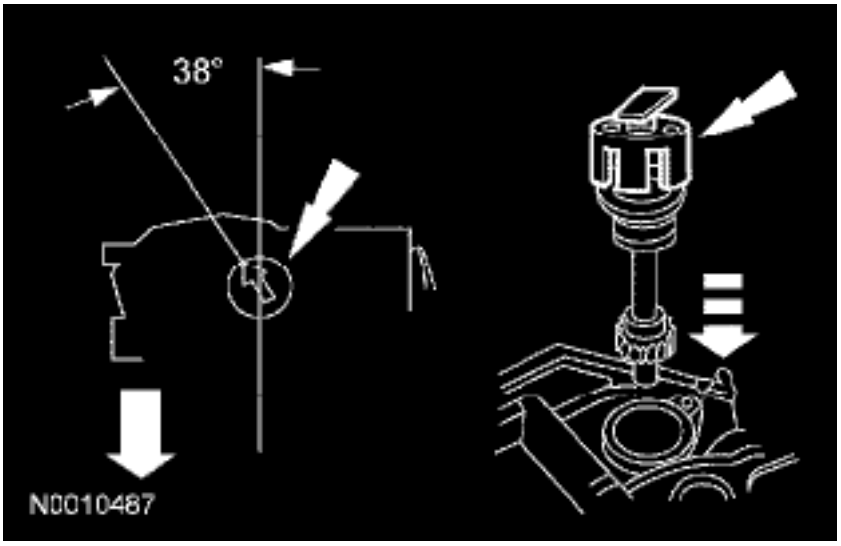
Install the special tool on the camshaft synchronizer by rotating the tool until it engages the notch in the camshaft synchronizer housing and the armature.

2. CAUTION: It is very important to coat the gear on the camshaft synchronizer with engine oil prior to installation. Failure to do so may

result in gear failure.

NOTE: During installation, the arrow on the special tool will rotate clockwise until the oil pump intermediate shaft and the camshaft gear engages.

Install the camshaft synchronizer housing assembly so the arrow on the special tool is 38 degrees from the centerline of the engine.



3. Install the camshaft synchronizer housing bolt.

- Tighten to 30 Nm (22 lb-ft).

4. Position the CMP sensor and install the 2 bolts.

- Tighten to 3 Nm (27 lb-in).

5. Connect the CMP sensor electrical connector.

Crankshaft Position Sensor: Description and Operation

CRANKSHAFT POSITION (CKP) SENSOR

Typical Crankshaft Position (CKP) Sensor

The CKP sensor is a magnetic transducer mounted on the engine block adjacent to a pulse wheel located on the crankshaft. By monitoring the crankshaft mounted pulse wheel, the CKP is the primary sensor for ignition information to the PCM. The pulse wheel has a total of 35 teeth spaced 10 degrees apart with one empty space for a missing tooth. The 6.8L 10-cylinder pulse wheel has 39 teeth spaced 9 degrees apart and one 9 degree empty space for a missing tooth. By monitoring the pulse wheel, the CKP sensor signal indicates crankshaft position and speed information to the PCM. By monitoring the missing tooth, the CKP sensor is also able to identify piston travel in order to synchronize the ignition system and provide a way of tracking the angular position of the crankshaft relative to a fixed reference for the CKP sensor configuration. The PCM also uses the CKP signal to determine if a misfire has occurred by measuring rapid decelerations between teeth.

Item	Part Number	Description
1	—	Crankshaft position (CKP) sensor electrical connector (part of 12B637)
2	N606500	CKP sensor bolt (2 required)
3	6C315	CKP sensor

Crankshaft Position Sensor: Service and Repair

CRANKSHAFT POSITION (CKP) SENSOR

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. 2. Disconnect the crankshaft position (CKP) sensor electrical connector. 3. Remove the 2 bolts and the CKP sensor.

- To install, tighten to 10 Nm (89 lb-in).

4. To install, reverse the removal procedure.

Item	Part Number	Description
1	—	Ignition lock cylinder release hole (part of 3530)
2	11582	Ignition lock cylinder

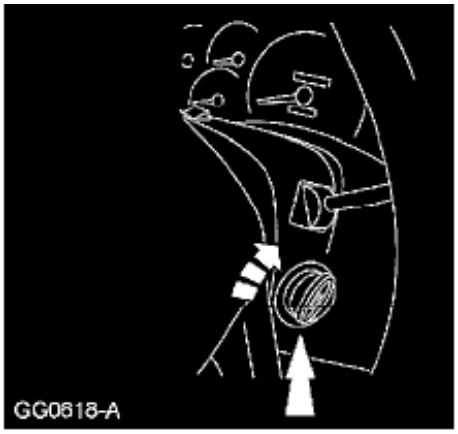
Ignition Switch Lock Cylinder: Service and Repair Ignition Lock Cylinder - Functional

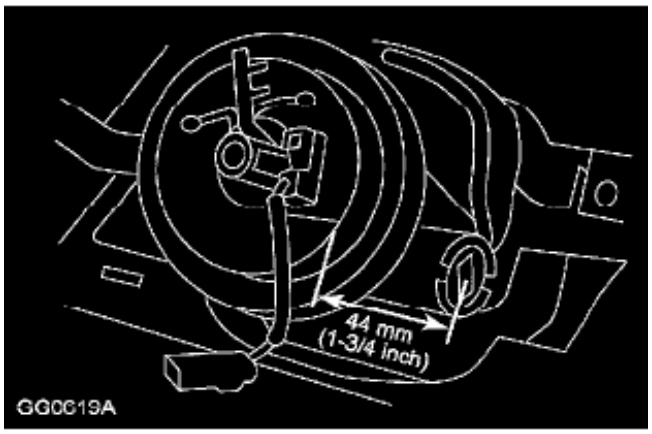
IGNITION LOCK CYLINDER - FUNCTIONAL

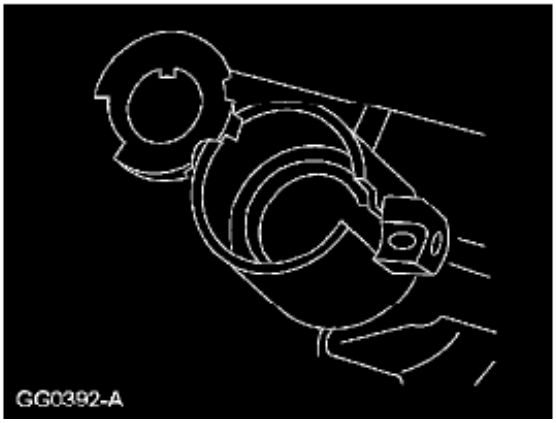
Removal and Installation

1. Disconnect the battery ground cable. 2. Insert the ignition key and turn to the RUN position. 3. Press the ignition lock cylinder release pin and remove the ignition lock cylinder. 4. To install, reverse the removal procedure.

- Verify ignition lock cylinder operation.







Ignition Switch Lock Cylinder: Service and Repair Ignition Lock Cylinder - Non Functional

IGNITION LOCK CYLINDER - NON FUNCTIONAL

Removal and Installation

1. NOTE: Make sure the front wheels are in the straight-ahead position.

Remove the steering wheel assembly.

2. Twist off the cap from the ignition lock cylinder.

3. NOTE: The lock cylinder is repaired by discarding the inoperative lock cylinder and building a new lock cylinder using the appropriate lock

repair package (F85Z-11582-AA). The lock repair package includes a detailed instruction sheet to build the new lock cylinder to the current key code of the vehicle.

Remove the ignition lock cylinder. -

Use a 1/8-inch diameter drill bit to drill out the lock cylinder retaining pin.

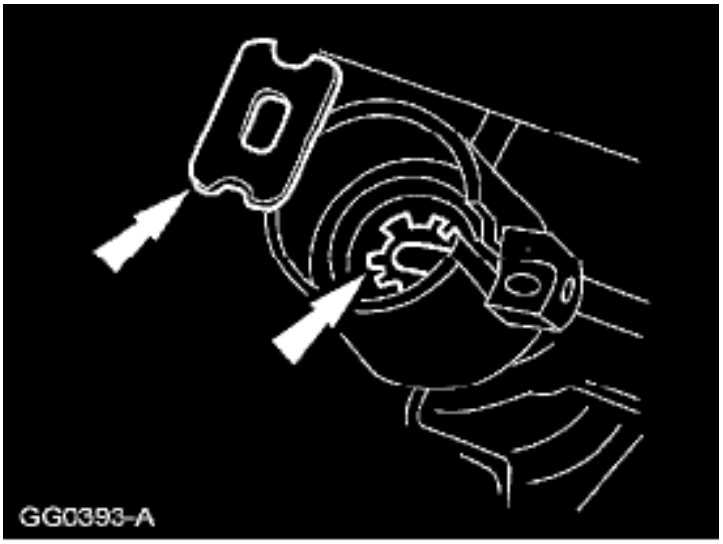
- Use a 3/8-inch drill bit to drill down the middle of the ignition lock key slot until the ignition lock cylinder breaks loose.

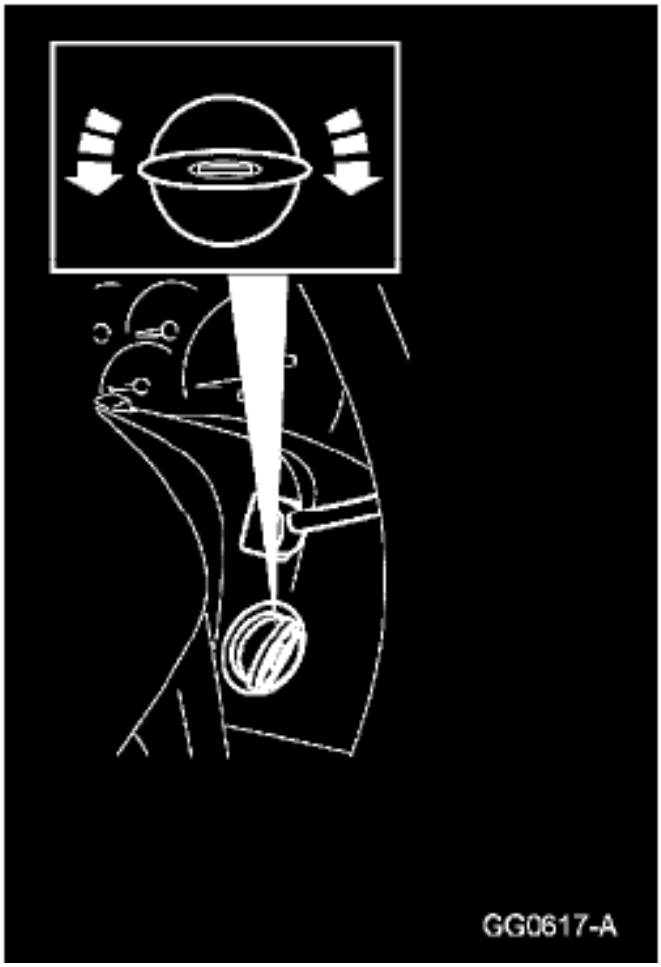
- Remove and discard the ignition lock cylinder and clean the drill shavings from the steering column.

4. Remove the bearing retainer.

5. Remove the bearing and gear.

- Thoroughly clean all drill shavings from the steering column and inspect it for damage.





6. To install, reverse the removal procedure.

- Install a new ignition lock cylinder.
- Verify ignition lock cylinder operation.

FUEL SYSTEM PRESSURE TEST

Special Tool(s)

Special Tool(s)

WARNING:

- Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

- Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

- Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

- When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

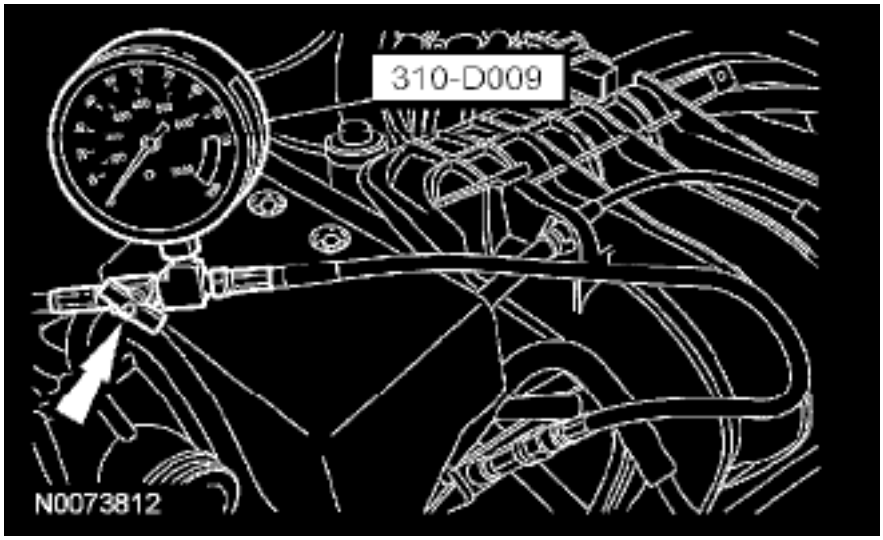
1. NOTE: 2.3L shown, 3.0L and 4.0L similar.

Remove the cap from the fuel pressure relief valve located on the fuel rail.

2. NOTE: 2.3L shown, 3.0L and 4.0L similar.

Install the special tool onto the fuel pressure relief valve.

3. Test the fuel system pressure to make sure it is within the specified range.



4. NOTE:

- 2.3L shown, 3.0L and 4.0L similar.

- Open the drain valve slowly to relieve the fuel system pressure. This may drain fuel from the system. Place fuel in a suitable container.

Upon completion of the fuel system pressure test, open the drain valve on the special tool and relieve the fuel system pressure.

5. NOTE: It may take more than one key cycle to pressurize the fuel system.

Cycle the ignition key and wait 3 seconds to pressurize the fuel system. Check for leaks before starting the engine.

Removal and Installation

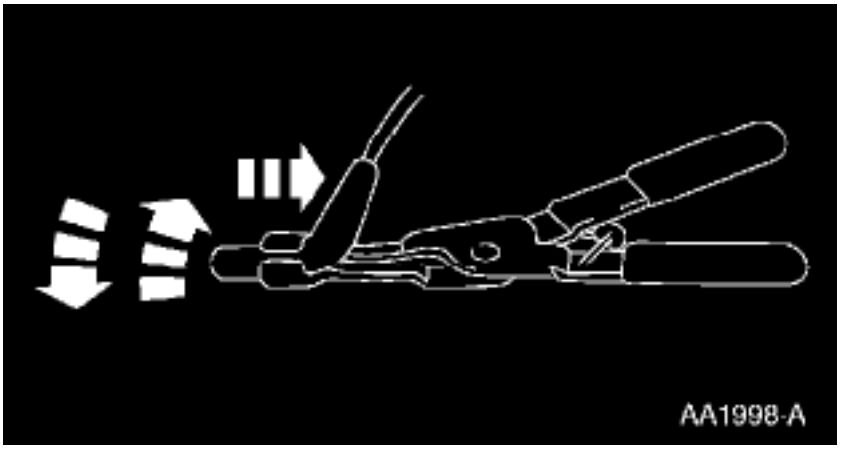
CAUTION: Spark plug wires must be connected correctly. Failure to follow this instruction may result in poor engine performance.

1. CAUTION: Do not pull on the spark plug wire as it may separate from the spark plug wire connector inside the spark plug wire boot.

Use the Spark Plug Wire Remover to grasp and twist the spark plug wire boot back and forth on the spark plug insulator to release the connectors.



2. Disconnect the spark plug wires from the ignition coil by twisting while pulling upward. 3. Open the spark plug wire separators and remove the spark plug wires.

4. CAUTION: Correct installation of the spark plug wires is critical to vehicle operation. If one spark plug wire is not correctly installed on

the spark plug or ignition coil, both spark plugs connected to that segment of the ignition coil may not fire under load.

To install, reverse the removal procedure. -

Use a small, clean tool to coat the entire interior surface of the boots with silicone brake caliper grease.

AB0040-A

Spark Plug: Testing and Inspection

Spark Plug Inspection

1. Inspect the spark plug for a bridged gap.

^ Check for deposit build-up closing the gap between the electrodes. Deposits are caused by oil or carbon fouling.

^ Clean the spark plug.

2. Check for oil fouling.

^ Check for wet, black deposits on the insulator shell bore electrodes, caused by excessive oil entering the combustion chamber through worn rings and pistons, excessive valve-to-guide clearance or worn or loose bearings.

^ Correct the oil leak concern.

^ Install a new spark plug.

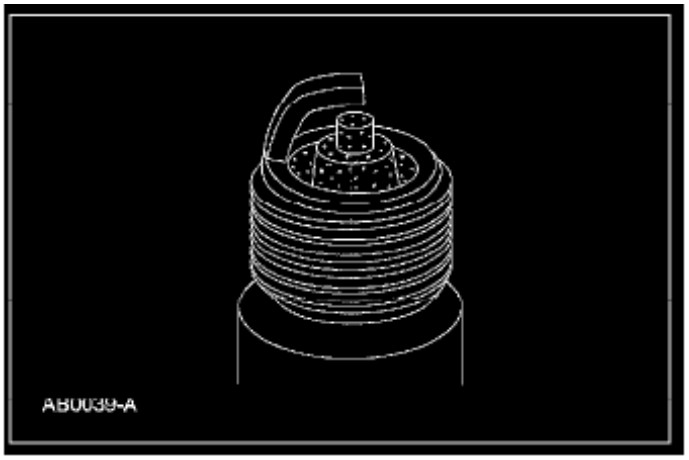
3. Inspect for carbon fouling. Look for black, dry, fluffy carbon deposits on the insulator tips, exposed shell surfaces and electrodes, caused by a

spark plug with an incorrect heat range, dirty air cleaner, too rich a fuel mixture or excessive idling.
^

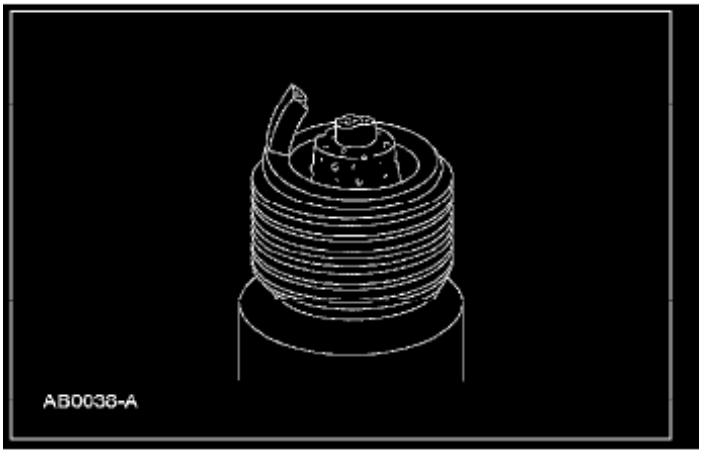
Install new spark plugs.

4. Inspect for normal burning.

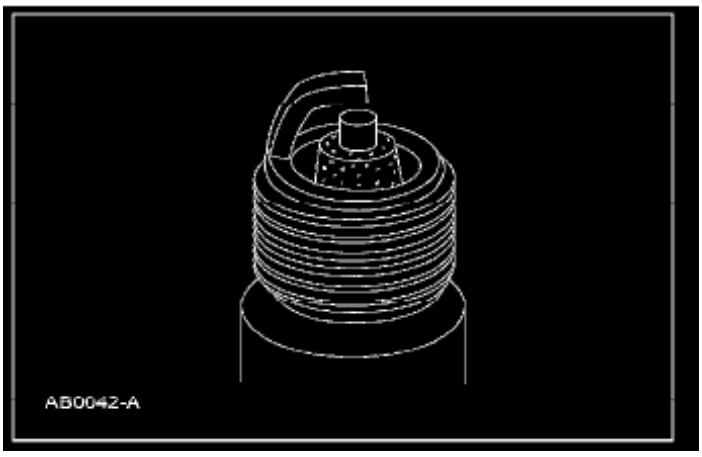
^ Check for light tan or gray deposits on the firing tip.



AB0039-A



AB0038-A



AB0042-A

5. Inspect for pre-ignition, identified by melted electrodes and a possibly damaged insulator. Metallic deposits on the insulator indicate engine

damage. This may be caused by incorrect ignition timing, wrong type of fuel or the unauthorized installation of a Heli-Coil(R) insert in place of the spark plug threads. ^

Install a new spark plug.

6. Inspect for overheating, identified by white or light gray spots and with a bluish-burnt appearance of electrodes. This is caused by engine

overheating, wrong type of fuel, loose spark plugs, spark plugs with an incorrect heat range, low fuel pump pressure or incorrect ignition timing. ^

Install a new spark plug.

7. Inspect for fused deposits, identified by melted or spotty deposits resembling bubbles or blisters. These are caused by sudden acceleration.

^ Install new spark plugs.

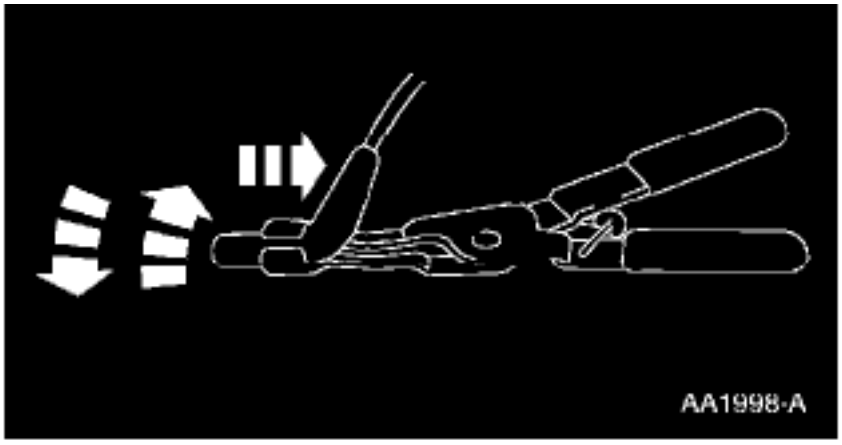
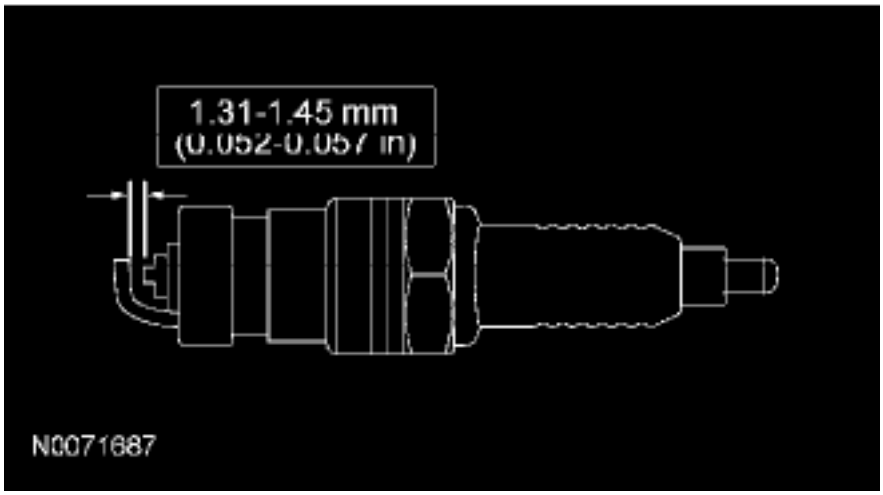
1. CAUTION:

- Spark plug wires must be connected correctly. Failure to follow this instruction may result in poor engine performance.

- Do not pull on the spark plug wire as it may separate from the spark plug wire connector inside the spark plug wire boot.

Use the Spark Plug Wire Remover to grasp and twist the spark plug wire boot back and forth on the spark plug insulator to release the connectors.





2. Loosen the spark plugs. 3. Remove any foreign material from the spark plug areas of the cylinder head with compressed air. 4. Remove the spark plugs.

- To install, tighten to 15 Nm (11 lb-ft).

5. Inspect the spark plugs. 6. Adjust the spark plug gap as necessary.

7. To install, reverse the removal procedure.

- Use a small, clean tool to coat the entire interior surface of the boot with silicone brake caliper grease.

Compression Check: Testing and Inspection

Compression Test - Compression Gauge Check

1. Make sure the oil in the crankcase is of the correct viscosity and at the correct level and that the battery is correctly charged. Operate the vehicle

until the engine is at normal operating temperature. Turn the ignition switch to the OFF position, then remove all the spark plugs.

2. Set the throttle plates in the wide-open position. 3. Install a compression gauge such as the Compression Tester in the No. 1 cylinder. 4. Install an auxiliary starter switch in the starting circuit. With the ignition switch in the OFF position, and using the auxiliary starter switch, crank

the engine a minimum of 5 compression strokes and record the highest reading. Note the approximate number of compression strokes required to obtain the highest reading.

5. Repeat the test on each cylinder, cranking the engine approximately the same number of compression strokes.

Compression Test - Test Results

The indicated compression pressures are considered within specification if the lowest reading cylinder is at least 75% of the highest reading. Refer to the Compression Pressure Limit Chart.

Compression Pressure Limit Chart

Compression Pressure Limit Chart (Part 1)

Compression Pressure Limit Chart (Part 2)

If one or more cylinders read low, squirt approximately one tablespoon of engine oil on top of the pistons in the low-reading cylinders. Repeat the

compression pressure check on these cylinders.

Compression Test - Interpreting Compression Readings

1. If compression improves considerably, piston rings are faulty. 2. If compression does not improve, valves are sticking or seating incorrectly. 3. If 2 adjacent cylinders indicate low compression pressures and squirting oil on each piston does not increase compression, the head gasket may be

leaking between cylinders. Engine oil or coolant in cylinders could result from this condition.

Use the Compression Pressure Limit Chart when checking cylinder compression so that the lowest reading is within 75% of the highest reading.

Valve Clearance: Specifications

Valve Clearance

This engine is equipped with hydraulic valve lifters. No adjustment is required.

Accelerator Pedal Position Sensor: Description and Operation

ACCELERATOR PEDAL POSITION (APP) SENSOR

The APP sensor is an input to the powertrain control module (PCM) and is used to determine the amount of torque requested by the operator. Depending on the application either a 2-track or 3-track APP sensor is used.

2-Track APP Sensor

2-Track APP Sensor

There are 2 pedal position signals in the sensor. Both signals, APP1 and APP2, have a positive slope (increasing angle, increasing voltage), but are offset and increase at different rates. The 2 pedal position signals make sure the PCM receives a correct input even if 1 signal has a concern. The PCM determines if a signal is incorrect by calculating where it should be, inferred from the other signals. If a concern is present with one of the circuits the other input is used. There are 2 reference voltage circuits, 2 signal return circuits, and 2 signal circuits (a total of 6 circuits and pins) between the PCM and the APP sensor assembly. The reference voltage circuits and the signal return circuits are shared with the reference voltage circuit and signal return circuit used by the electronic throttle body (ETB) throttle position sensor. The pedal position signal is converted to pedal travel degrees (rotary angle) by the PCM. The software then converts these degrees to counts, which is the input to the torque based strategy.

3-Track APP Sensor

Typical 3-Track APP Sensor

There are 3 pedal position signals in the sensor. Signal 1, APP1, has a negative slope (increasing angle, decreasing voltage) and signals 2 and 3, APP2 and APP3, both have a positive slope (increasing angle, increasing voltage). During normal operation APP1 is used as the indication of pedal position by the strategy. The 3 pedal position signals make sure the PCM receives a correct input even if 1 signal has a concern. The PCM determines if a signal is incorrect by calculating where it should be, inferred from the other signals. If a concern is present with one of the circuits the other inputs are used. The pedal position signal is converted to pedal travel degrees (rotary angle) by the PCM. The software then converts these degrees to counts, which is the input to the torque based strategy. There are 2 reference voltage circuits, 2 signal return circuits, and 3 signal circuits (a total of 7 circuits and pins) between the PCM and the APP sensor assembly. The reference voltage circuits and the signal return circuits are shared with the reference voltage circuit and signal return circuit used by the electronic throttle body (ETB) throttle position sensor.

Typical Mass Air Flow (MAF) Sensor

Typical Drop-in Mass Air Flow (MAF) Sensor

Typical Drop-in Mass Air Flow (MAF) Sensor

The MAF sensor uses a hot wire sensing element to measure the amount of air entering the engine. Air passing over the hot wire causes it to cool. This hot wire is maintained at 200°C (392°F) above the ambient temperature as measured by a constant cold wire. The current required to maintain the temperature of the hot wire is proportional to the mass air flow. The MAF sensor then outputs an analog voltage signal to the PCM proportional to the intake air mass. The PCM calculates the required fuel injector pulse width in order to provide the desired air/fuel ratio. This input is also used in determining transmission electronic pressure control (EPC), shift and torque converter clutch scheduling.

The MAF sensor is located between the air cleaner and the throttle body or inside the air cleaner assembly. Most MAF sensors have integrated bypass technology with an integrated intake air temperature (IAT) sensor. The hot wire electronic sensing element must be replaced as an assembly. Replacing only the element may change the air flow calibration.

Item	Part Number	Description
1	14A464	Mass air flow (MAF) sensor electrical connector (part of 12B637)
2	W709287	MAF sensor bolt (2 required)
3	12B605	MAF sensor
4	—	MAF sensor gasket

Air Flow Meter/Sensor: Service and Repair

MASS AIR FLOW (MAF) SENSOR

Removal and Installation

1. Disconnect the mass air flow (MAF) sensor electrical connector. 2. Remove the 2 bolts, the MAF sensor and discard the gasket.

- To install, tighten to 11 Nm (8 lb-ft).

3. CAUTION: Do not tamper with the mass air flow (MAF) sensing elements located in the airflow bypass. Tampering may result in

failure.

NOTE: The MAF sensor module and body are calibrated and installed as a unit.

To install, reverse the removal procedure. -

Install a new gasket.

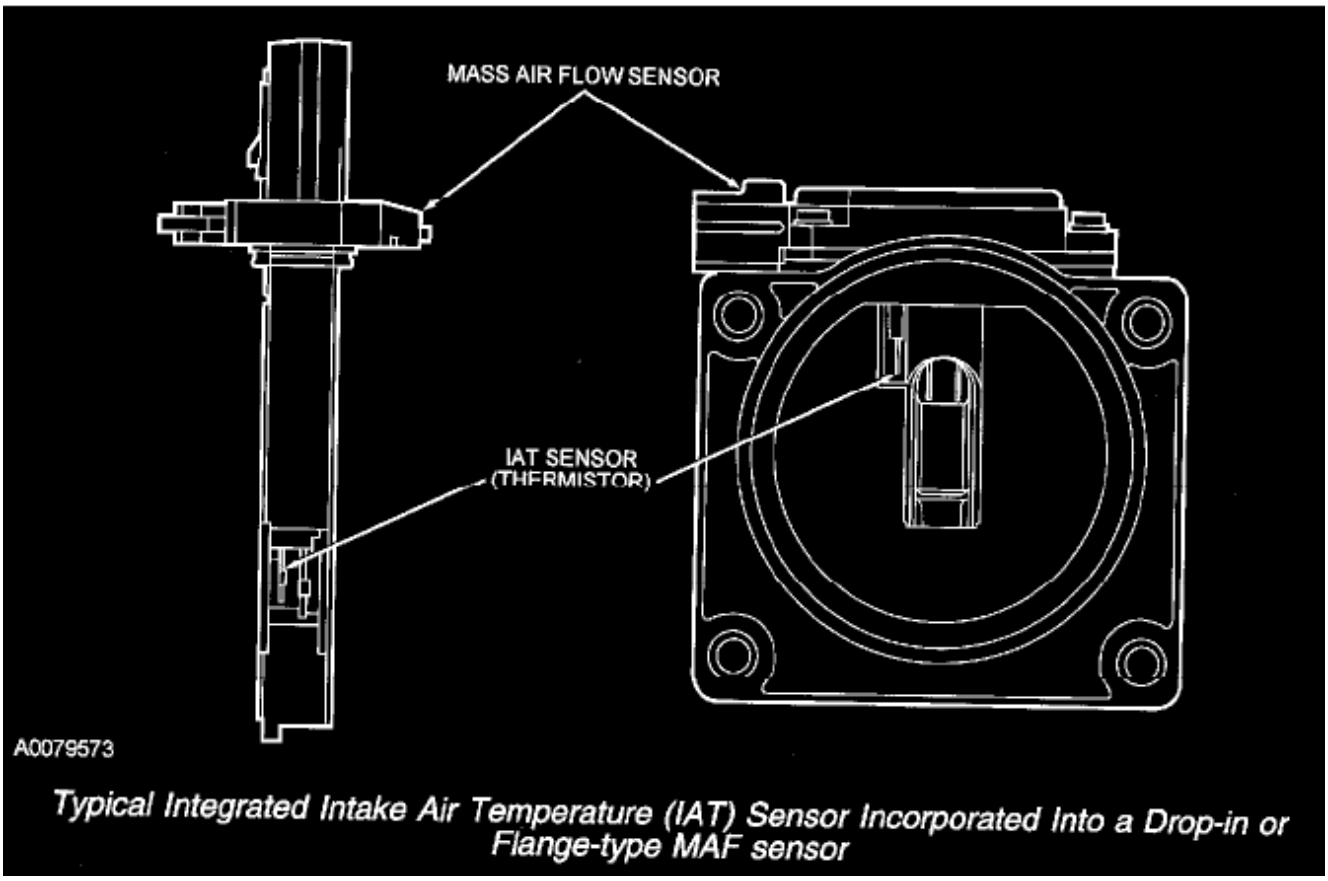
Typical Stand-Alone/Non-Integrated Intake Air Temperature (IAT) Sensors



Typical Integrated Intake Air Temperature (IAT) Sensor Incorporated Into a Drop-in or Flange-type MAF sensor

Intake Air Temperature Sensor: Description and Operation

Intake Air Temperature (IAT) Sensor

Typical Stand-Alone/Non-Integrated Intake Air Temperature (IAT) Sensors

Typical Integrated Intake Air Temperature (IAT) Sensor Incorporated Into A Drop-in Or Flange-type MAF Sensor

The IAT sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of a thermistor decreases as the temperature increases, and the resistance increases as the temperature decreases. The varying resistance affects the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Thermistor-type sensors are considered passive sensors. A passive sensor is connected to a voltage divider network so that varying the resistance of the passive sensor causes a variation in total current flow. Voltage that is dropped across a fixed resistor in a series with the sensor resistor determines the voltage signal at the PCM. This voltage signal is equal to the reference voltage minus the voltage drop across the fixed resistor.

The IAT provides air temperature information to the PCM. The PCM uses the air temperature information as a correction factor in the calculation of

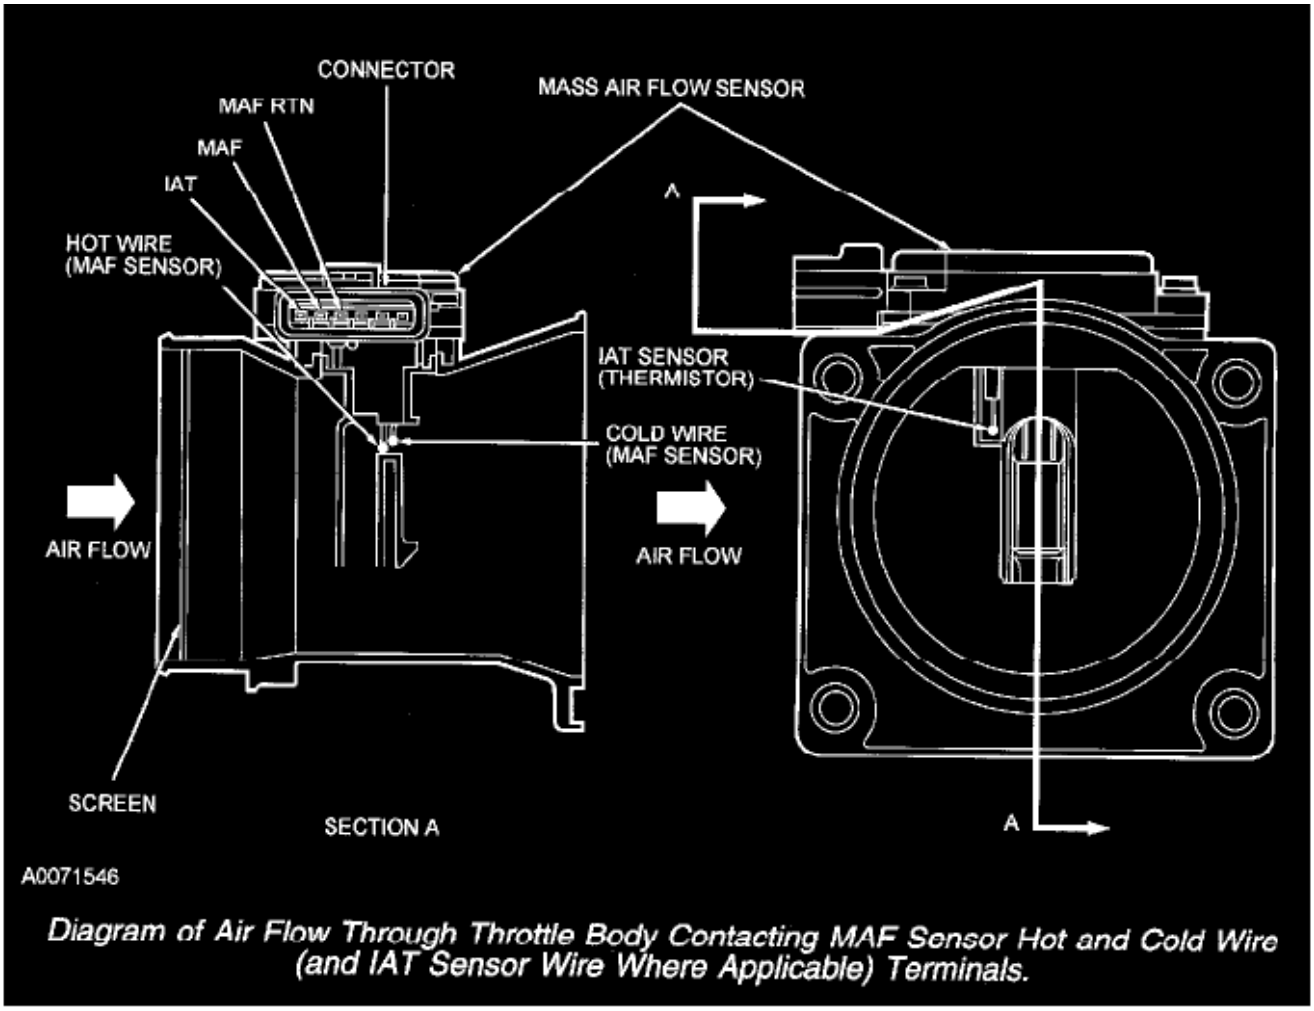


Diagram of Air Flow Through Throttle Body Contacting MAF Sensor Hot and Cold Wire (and IAT Sensor Wire Where Applicable) Terminals.

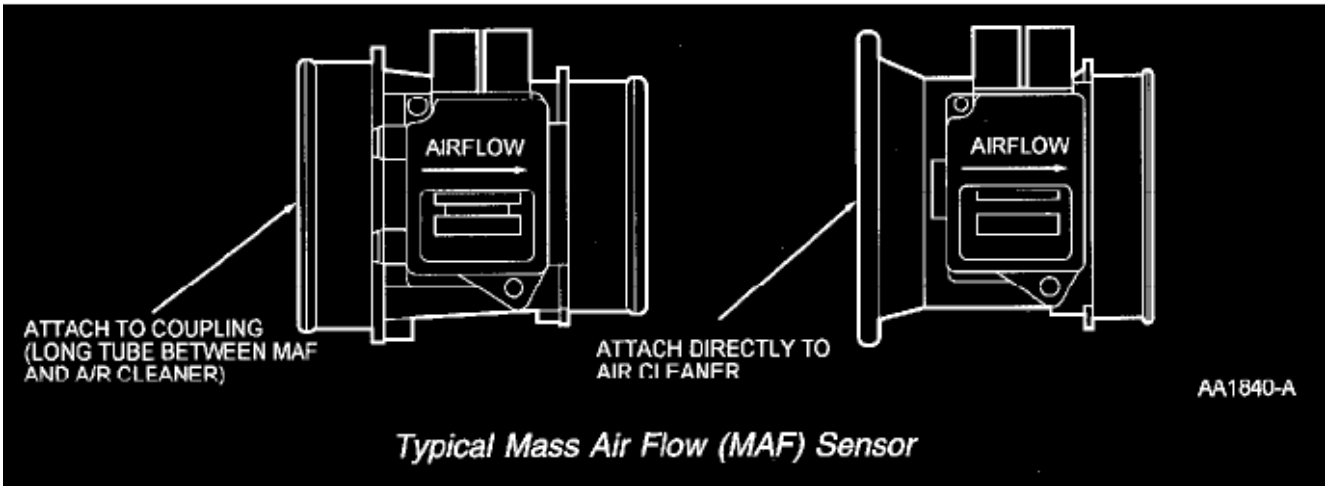

Typical Mass Air Flow (MAF) Sensor

fuel, spark, and air flow.

The IAT sensor provides a quicker temperature change response time than the ECT or CHT sensor.

Currently there are 2 design types of IAT sensors used, a stand-alone/non-integrated type and a integrated type. Both types function the same, however the integrated type is incorporated into the mass air flow (MAF) sensor instead of being a stand alone sensor.

Supercharged vehicles use 2 IAT sensors. Both sensors are thermistor type devices and operate as described above. One is located before the supercharger at the air cleaner for standard OBD/cold weather input, while a second sensor (IAT2) is located after the supercharger in the intake manifold. The IAT2 sensor located after the supercharger provides air temperature information to the PCM to control spark and to help determine charge air cooler (CAC) efficiency.

C278

Brake Signal: Description and Operation

Brake Pedal Position (BPP) Switch

Typical BPP Switch

The BPP switch is sometimes referred to as the stoplamp switch. The BPP switch provides a signal to the PCM indicating that the brakes are applied. The BPP switch is normally open and is mounted on the brake pedal support. Depending on the vehicle application the BPP switch can be hardwired as follows: -

to the PCM supplying battery positive voltage (B+) when the vehicle brake pedal is applied.

- to the antilock brake system (ABS) module, or lighting control module (LCM), the BPP signal is then broadcast over the network to be received by the PCM.

- to the ABS traction control/stability assist module. The ABS module interprets the BPP switch input along with other ABS inputs and generates an output called the driver brake application (DBA) signal. The DBA signal is then sent to the PCM and to other BPP signal users.

Brake Pedal Switch (BPS)/Brake Deactivator Switch

The BPS, also called the brake deactivator switch, is for vehicle speed control deactivation. A normally closed switch supplies battery positive voltage (B+) to the PCM when the brake pedal is not applied. When the brake pedal is applied, the normally closed switch opens and power is removed from the PCM.

On some applications the normally closed BPS, along with the normally open BPP switch, are used for a brake rationality test within the PCM. The PCM misfire monitor profile learn function may be disabled if a brake switch concern occurs. If one or both brake pedal inputs to the PCM is not changing states when they were expected to, a diagnostic trouble code (DTC) is set by the PCM strategy.

Camshaft Position Sensor: Description and Operation

CAMSHAFT POSITION (CMP) SENSOR

Typical Synchronizer Hall-Effect CMP Sensor

Typical Variable Reluctance CMP Sensor

The CMP sensor detects the position of the camshaft. The CMP sensor identifies when piston number 1 is on its compression stroke. A signal is then sent to the PCM and used for synchronizing the sequential firing of the fuel injectors. Coil on plug (COP) ignition applications use the CMP signal to select the correct ignition coil to fire.

Vehicles with 2 CMP sensors are equipped with variable camshaft timing (VCT). They use the second sensor to identify the position of the camshaft on bank 2 as an input to the PCM.

There are 2 types of CMP sensors: the 3-pin connector Hall-effect type sensor and the 2-pin connector variable reluctance type sensor.

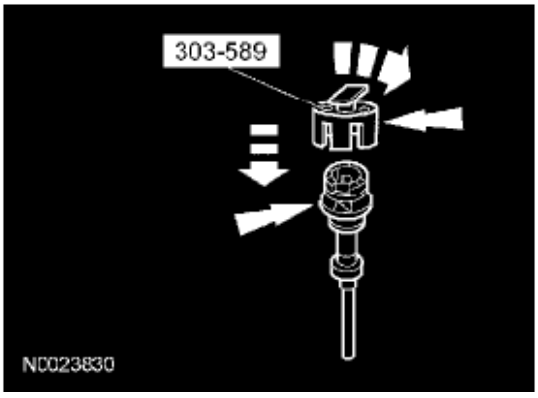
Special Tool(s)

Special Tool(s)

ST2362-A	Synchronizer Alignment Gauge 303-589



Special Tool(s)

Removal

1. Disconnect the camshaft position (CMP) sensor electrical connector.

2. NOTE: Prior to the removal of the CMP sensor, note the position of the CMP sensor electrical connector. The installation procedure requires that

the electrical connector be located in the same position.

Remove the 2 bolts and the CMP sensor.

3. Remove the camshaft synchronizer bolt. 4. Remove the camshaft synchronizer. Inspect the O-ring seal and install a new O-ring seal if damaged.

Installation

1. CAUTION:

- After installation, do not loosen the synchronizer bolt and rotate the synchronizer assembly. The synchronizer assembly is not adjustable. Do not loosen the synchronizer bolt after the alignment tool has been removed in order to align the camshaft position (CMP) sensor electrical connector for any reason. If the electrical connector is not in the correct position, the synchronizer assembly must be removed. The alignment tool and the assembly must be reinstalled if the engine has not been rotated from top dead center (TDC) of the compression stroke on the No. 1 cylinder. Failure to follow this procedure will result in the fuel system being out of time with the engine, possibly causing engine damage.

- Do not turn the crankshaft or camshaft during the removal and installation procedure or the fuel system timing will be out of time with the engine, possibly causing engine damage.

- A special tool must be used during the installation of the new synchronizer assembly. Failure to follow this procedure will result in the fuel system being out of time with the engine, possibly causing engine damage.

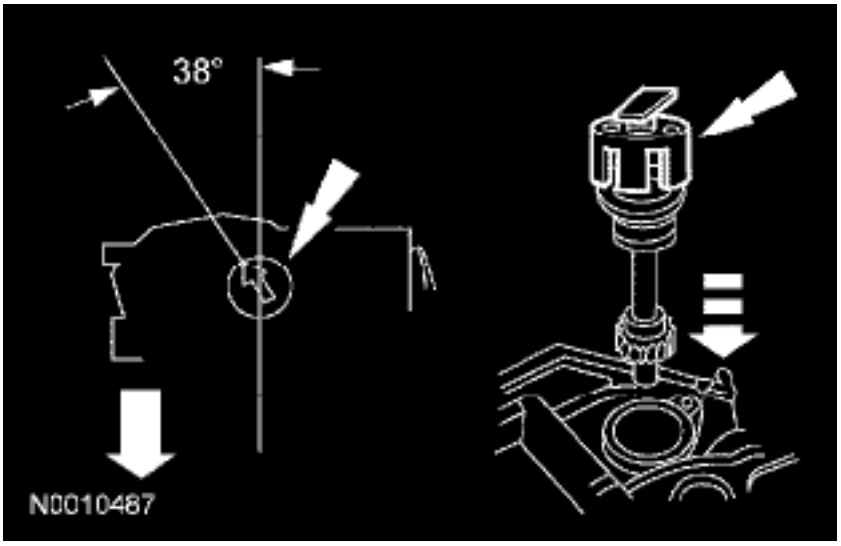
Install the special tool on the camshaft synchronizer by rotating the tool until it engages the notch in the camshaft synchronizer housing and the armature.

2. CAUTION: It is very important to coat the gear on the camshaft synchronizer with engine oil prior to installation. Failure to do so may

result in gear failure.

NOTE: During installation, the arrow on the special tool will rotate clockwise until the oil pump intermediate shaft and the camshaft gear engages.

Install the camshaft synchronizer housing assembly so the arrow on the special tool is 38 degrees from the centerline of the engine.



3. Install the camshaft synchronizer housing bolt.

- Tighten to 30 Nm (22 lb-ft).

4. Position the CMP sensor and install the 2 bolts.

- Tighten to 3 Nm (27 lb-in).

5. Connect the CMP sensor electrical connector.

Clutch Switch: Description and Operation

CLUTCH PEDAL POSITION (CPP) SWITCH

Typical Clutch Pedal Position (CPP) Switch

The CPP switch is an input to the PCM indicating the clutch pedal position. The PCM provides a low current voltage on the CPP circuit. When the CPP switch is closed, this voltage is pulled low through the SIG RTN circuit. The CPP input to the PCM is used to detect a reduction in engine load. The PCM uses the load information for mass air flow and fuel calculations.

C1064

Coolant Temperature Sensor/Switch (For Computer): Description and Operation

ENGINE COOLANT TEMPERATURE (ECT) SENSOR

Typical Thread Type ECT Sensor

The ECT sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of a thermistor decreases as the temperature increases, and the resistance increases as the temperature decreases. The varying resistance changes the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Thermistor-type sensors are considered passive sensors. A passive sensor is connected to a voltage divider network so that varying the resistance of the passive sensor causes a variation in total current flow. Voltage that is dropped across a fixed resistor in a series with the sensor resistor determines the voltage signal at the PCM. This voltage signal is equal to the reference voltage minus the voltage drop across the fixed resistor.

The ECT measures the temperature of the engine coolant. The PCM uses the ECT input for fuel control and for cooling fan control. There are 3 types of ECT sensors, threaded, push-in, and twist-lock. The ECT sensor is located in an engine coolant passage.

C1339

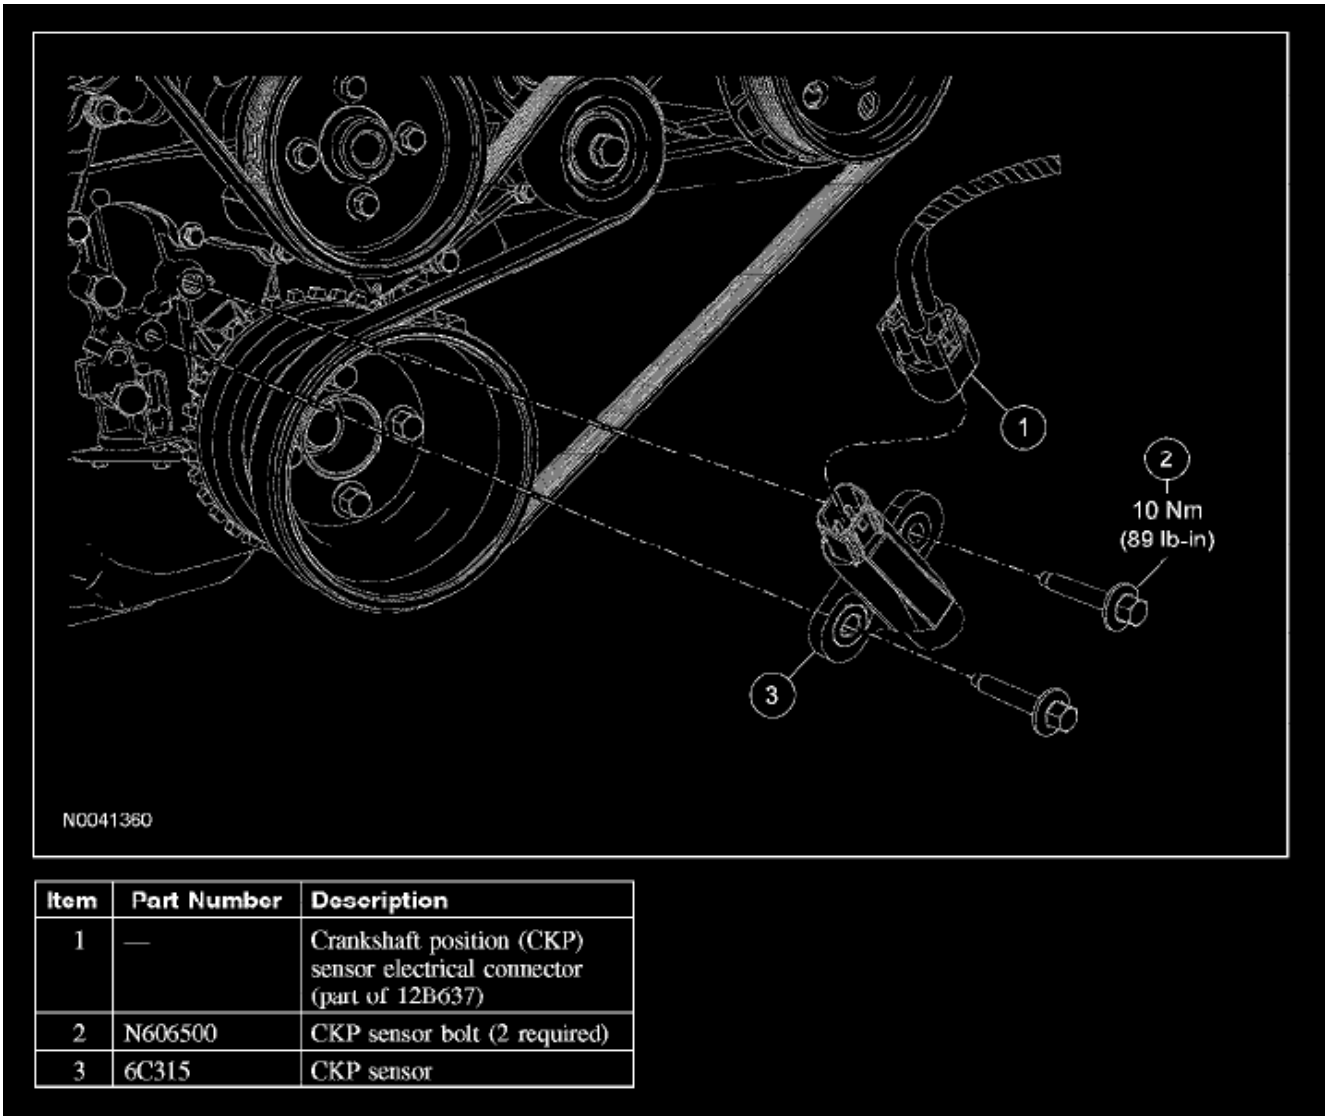
Crankshaft Position Sensor: Description and Operation

CRANKSHAFT POSITION (CKP) SENSOR

Typical Crankshaft Position (CKP) Sensor

The CKP sensor is a magnetic transducer mounted on the engine block adjacent to a pulse wheel located on the crankshaft. By monitoring the crankshaft mounted pulse wheel, the CKP is the primary sensor for ignition information to the PCM. The pulse wheel has a total of 35 teeth spaced 10 degrees apart with one empty space for a missing tooth. The 6.8L 10-cylinder pulse wheel has 39 teeth spaced 9 degrees apart and one 9 degree empty space for a missing tooth. By monitoring the pulse wheel, the CKP sensor signal indicates crankshaft position and speed information to the PCM. By monitoring the missing tooth, the CKP sensor is also able to identify piston travel in order to synchronize the ignition system and provide a way of tracking the angular position of the crankshaft relative to a fixed reference for the CKP sensor configuration. The PCM also uses the CKP signal to determine if a misfire has occurred by measuring rapid decelerations between teeth.



Item	Part Number	Description

Electronic Throttle Actuator: Description and Operation

ELECTRONIC THROTTLE ACTUATOR CONTROL (TAC)

Typical In-line TAC Design

Typical Parallel TAC Design

The electronic TAC is a DC motor controlled by the PCM (requires 2 wires). There are 2 designs for the TAC, parallel and in-line. The parallel design has the motor under the bore parallel to the plate shaft. The motor housing is integrated into the main housing. The in-line design has a separate motor housing. An internal spring is used in both designs to return the throttle plate to a default position. The default position is typically a throttle angle of 7 to 8 degrees from the hard stop angle. The closed throttle plate hard stop is used to prevent the throttle from binding in the bore (approximately 0.75 degree). This hard stop setting is not adjustable and is set to result in less airflow than the minimum engine airflow required at idle.

ETC System with a 3-Track APP Sensor Failure Mode and Effects Management:

Effect	Failure Mode ▪
No Effect on Driveability	A loss of redundancy or loss of a non-critical input could result in a concern that does not affect driveability. The powertrain malfunction indicator (wrench) illuminates, but the throttle control and torque control systems function normally. A DTC is set to indicate the component or circuit with the concern.
Disable Speed Control	If certain concerns are detected, speed control is disabled. Throttle control and torque control continue to function normally.

(Continued)

Electronic Throttle Control Module: Description and Operation

TORQUE BASED ELECTRONIC THROTTLE CONTROL (ETC)

Overview

The torque based ETC is a hardware and software strategy that delivers an engine output torque (via throttle angle) based on driver demand (pedal position). It uses an electronic throttle body, the powertrain control module (PCM), and an accelerator pedal assembly to control the throttle opening and engine torque.

Torque based ETC enables aggressive automatic transmission shift schedules (earlier upshifts and later downshifts). This is possible by adjusting the throttle angle to achieve the same wheel torque during shifts, and by calculating this desired torque, the system prevents engine lugging (low RPM and low manifold vacuum) while still delivering the performance and torque requested by the driver. It also enables many fuel economy/emission improvement technologies such as variable camshaft timing (VCT) (deliver same torque during transitions).

Torque based ETC also results in less intrusive vehicle and engine speed limiting, along with smoother traction control.

Other benefits of ETC are: -

eliminate cruise control actuators

- eliminate idle air control (IAC) valve

- better airflow range

- packaging (no cable)

- more responsive powertrain at altitude and improved shift quality

The ETC system illuminates a powertrain malfunction indicator (wrench) on the instrument cluster when a concern is present. Concerns are accompanied by diagnostic trouble codes (DTCs) and may also illuminate the malfunction indicator lamp (MIL).

Electronic Throttle Body (ETB)

The ETB has the following characteristics: -

The throttle actuator control (TAC) motor is a DC motor controlled by the PCM (requires 2-wires).

- There are 2 designs: parallel and in-line. The parallel design has the motor under the bore parallel to the plate shaft. The motor housing is integrated into the main housing. The in-line design has a separate motor housing.

- An internal spring is used in both designs to return the throttle plate to a default position. The default position is typically a throttle angle of 7 to 8 degrees from the hard stop angle.

- The closed throttle plate hard stop is used to prevent the throttle from binding in the bore (approximately 0.75 degree). This hard stop setting is not adjustable and is set to result in less airflow than the minimum engine airflow required at idle.

- The required idle airflow is provided by the plate angle in the throttle body assembly. This plate angle controls idle, idle quality, and eliminates the need for an IAC valve.

- There is 1 reference voltage and 1 signal return circuit between the PCM and the ETB. The reference voltage circuit and the signal return circuit is shared with the reference voltage circuits and signal return circuits used by the APP sensor. There are also 2 TP signal circuits for redundancy. The redundant TP signals are required for increased monitoring reasons. The first TP signal (TP1) has a negative slope (increasing angle, decreasing voltage) and the second signal (TP2) has a positive slope (increasing angle, increasing voltage). The TP2 signal reaches a limit of approximately 4.5 volts at approximately 45 degrees of throttle angle.

Accelerator Pedal Position (APP) Sensor

Depending on the application either a 2-track or 3-track APP sensor is used.

Electronic Throttle Control (ETC) System Strategy

ETC System With A 3-Track APP Sensor Failure Mode And Effects Management (Part 1)

ETC System with a 3-Track APP Sensor Failure Mode and Effects Management:

Effect	Failure Mode [a]
RPM Guard with Pedal Follower	In this mode, torque control is disabled due to the loss of a critical sensor or PCM concern. The throttle is controlled in pedal-follower mode as a function of the pedal position sensor input only. A maximum allowed RPM is determined based on the position of the accelerator pedal (RPM Guard). If the actual RPM exceeds this limit, spark and fuel are used to bring the RPM below the limit. The powertrain malfunction indicator (wrench) and the MIL illuminate in this mode and a DTC for an ETC-related component is set. EGR, VCT, and IMRC outputs are set to default values.
RPM Guard with Default Throttle	In this mode, the throttle plate control is disabled due to the loss of throttle position, the throttle plate position controller, or other major electronic throttle body concern. Depending on the concern detected, the throttle plate is either commanded to the default (limp home) position or the motor is disabled and the spring returns the throttle plate to the default (limp home) position. A maximum allowed RPM is determined based on the position of the accelerator pedal (RPM Guard). If the actual RPM exceeds this limit, spark and fuel are used to bring the RPM below the limit. The powertrain malfunction indicator (wrench) and the MIL illuminate in this mode and a DTC P2110 is set. EGR, VCT, and IMRC outputs are set to default values.
RPM Guard with High Forced Idle	This mode is caused by the loss of 2 or 3 pedal position sensor inputs due to sensor, wiring, or PCM concerns. The system is unable to determine driver demand, and the throttle is controlled to a fixed high idle airflow. There is no response to the driver input. The maximum allowed RPM is a fixed value (RPM Guard). If the actual RPM exceeds this limit, spark and fuel are used to bring the RPM below the limit. The powertrain malfunction indicator (wrench) and the MIL illuminate in this mode and a DTC P2104 is set. EGR, VCT, and IMRC outputs are set to default values.
Shutdown	If a significant processor concern is detected, the monitor forces vehicle shutdown by disabling all fuel injectors. The powertrain malfunction indicator (wrench) illuminates in this mode and a DTC P2105 is set.

a ETC illuminates or displays a message on the message center immediately; MIL illuminates after 2 driving cycles

ETC System With A 3-Track APP Sensor Failure Mode And Effects Management (Part 2)

ETC System with a 2-Track APP Sensor Failure Mode and Effects Management:

Effect	Failure Mode
No Effect on Driveability	A loss of redundancy or loss of a non-critical input could result in a concern that does not affect driveability. The powertrain malfunction indicator (wrench) and the MIL do not illuminate. However, speed control and power take off (PTO) may be disabled. A DTC is set to indicate the component or circuit with the concern.
Delayed APP Sensor Response with Brake Override	This mode is caused by the loss of 1 APP sensor input due to sensor, wiring, or PCM concerns. The system is unable to verify the APP sensor input and driver demand. The throttle plate response to the APP sensor input is delayed as the accelerator pedal is applied. The engine returns to idle RPM whenever the brake pedal is applied. The powertrain malfunction indicator (wrench) illuminates, but the MIL does not illuminate in this mode. An APP sensor related DTC is set.
Time-Based Driver Demand with Brake Override	This mode is caused by the loss of one brake pedal position (BPP) and one APP sensor input or both APP sensor inputs due to sensor, wiring, or PCM concerns. The system is unable to determine driver demand. There is no response when the accelerator pedal is applied. The engine returns to idle RPM whenever the brake pedal is applied. When the brake pedal is released, the PCM slowly increases the APP signal to a fixed value. The powertrain malfunction indicator (wrench) illuminates, but the MIL does not illuminate in this mode. An APP or BPP sensor related DTC is set.
RPM Guard with Pedal Follower	In this mode, torque control is disabled due to the loss of a critical sensor or PCM concern. The throttle is controlled in pedal-follower mode as a function of the APP sensor input only. A maximum allowed RPM is determined based on the position of the accelerator pedal (RPM Guard). If the actual RPM exceeds this limit, spark and fuel are used to bring the RPM below the limit. The powertrain malfunction indicator (wrench) and the MIL illuminate in this mode and a DTC for an ETC-related component is set. EGR, VCT, and IMRC outputs are set to default values and speed control is disabled.
RPM Guard with Default Throttle	In this mode, the throttle plate control is disabled due to the loss of both TP sensor inputs, loss of throttle plate control, stuck throttle plate, significant processor concerns, or other major electronic throttle body concern. The spring returns the throttle plate to the default (limp home) position. A maximum allowed RPM is determined based on the position of the accelerator pedal (RPM Guard). If the actual RPM exceeds this limit, spark and fuel are used to bring the RPM below the limit. The powertrain malfunction indicator (wrench) and the MIL illuminate in this mode and a DTC for an ETC-related component is set. EGR, VCT, and IMRC outputs are set to default values and speed control is disabled.

Electronic Throttle Monitor Operation:

DTCs [a]	
P060X, P061X	PCM processor concern (MIL, powertrain malfunction indicator [wrench])
P2104 (ETC system with a 3-track APP sensor)	ETC FMEM forced idle, 2 or 3 pedal sensor concerns (MIL, powertrain malfunction indicator [wrench])
P2105 (ETC system with a 3-track APP sensor)	ETC FMEM forced engine shutdown; PCM concern (MIL, powertrain malfunction indicator [wrench])
P2110 (ETC system with a 3-track APP sensor)	ETC FMEM forced limited RPM; Concern with both TP sensors; throttle plate position control concern (MIL, powertrain malfunction indicator [wrench])
U0300	ETC software version mismatch between processors internal to the PCM (non-MIL, powertrain malfunction indicator [wrench])

a Monitor execution is continuous. Monitor false detection duration is less than 1 second to register a concern.

ETC System With A 2-Track APP Sensor Failure Mode And Effects Management

Electronic Throttle Monitor Operation

Accelerator Pedal Position (APP) Sensor Check:

DTCs[a]	
P1575 (ETC system with a 2-track APP sensor)	APP sensor out of self-test range
P2122, P2123, P2127, P2128, P2132, P2133	APP sensor circuit continuity test (powertrain malfunction indicator [wrench], non-MIL)
P2121, P2126, P2131 (ETC system with a 3-track APP sensor)	APP range/performance (powertrain malfunction indicator [wrench], non-MIL)
P2138 (ETC system with a 2-track APP sensor)	APP to APP signal correlation (powertrain malfunction indicator [wrench], non-MIL)

a Correlation and range/performance - sensor disagreement between processors internal to the PCM. Monitor execution is continuous. Monitor false detection duration is less than 1 second to register a concern. Refer to Powertrain DTC Charts and Descriptions, Diagnostic Trouble Code (DTC) Charts and Descriptions for additional DTC information.

Throttle Position (TP) Sensor Check:

DTCs [a]	
P0122, P0123, P0222, P0223	TP circuit continuity test (MIL, powertrain malfunction indicator [wrench])
P0121, P0221 (ETC system with a 3-track APP sensor)	TP range/performance (non-MIL)
P1124 (ETC system with a 2-track APP sensor)	TP sensor out of self-test range
P2135	TP to TP sensor correlation test (powertrain malfunction indicator [wrench], non-MIL)

a Correlation and range/performance - sensor disagreement between processors internal to the PCM, TP inconsistent with requested throttle plate position. Monitor execution is continuous. Monitor false detection duration is less than 1 second to register a concern. Refer to Powertrain DTC Charts and Descriptions, Diagnostic Trouble Code (DTC) Charts and Descriptions for additional DTC information.

Electronic TAC Operation Check:

DTCs [a]	
P115E	Throttle actuator airflow trim at maximum limit (non-MIL)
P2072 (ETC system with a 3-track APP sensor)	Throttle body ice blockage (non-MIL)
P2100 (ETC system with a 3-track APP sensor)	Throttle actuator circuit open, short to power, short to ground (MIL)
P2101	Throttle actuator range/performance test (MIL)
P2107	Processor and TAC motor circuit test (MIL)
P2111	Throttle actuator system stuck open (MIL)
P2112	Throttle actuator system stuck closed (MIL)

a Note: For all DTCs, in addition to the MIL, the powertrain malfunction indicator (wrench) is on for the concern that caused the FMEM action. Monitor execution is continuous. Monitor false detection duration is less than 5 seconds to register a concern.

The torque based ETC strategy was developed to improve fuel economy and to accommodate variable camshaft timing (VCT). This is possible by not coupling the throttle angle to the driver pedal position. Uncoupling the throttle angle (produce engine torque) from the pedal position (driver

demand) allows the powertrain control strategy to optimize fuel control and transmission shift schedules while delivering the requested wheel torque.

The ETC monitor system is distributed across 2 processors within the PCM: the main powertrain control processor unit (CPU) and a separate monitoring processor. The primary monitoring function is carried out by the independent plausibility check (IPC) software, which resides on the main processor. It is responsible for determining the driver-demanded torque and comparing it to an estimate of the actual torque delivered. If the generated torque exceeds driver demand by a specified amount, appropriate corrective action is taken.

C175T (Part 2)

Engine Control Module: Procedures

FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)

Description

The EEPROM is contained in an integrated circuit internal to the powertrain control module (PCM). The EEPROM contains the vehicle strategy including calibration information specific to the vehicle, and is capable of being programmed or flashed repeatedly.

As part of the calibration there is an area referred to as the vehicle identification (VID) block. The VID block is programmed when installing a new PCM as described under Programming the VID Block for a Replacement PCM. Failure to carry out this procedure may generate DTCs PI635 or P1639. The VID block in an existing PCM can also be tailored to accommodate various hardware or parameter changes made to the vehicle since production. Failure to carry out this procedure properly may generate DTC P1635, Tire/Axle Ratio out of Acceptable Range. An incorrect tire/axle ratio is one of the main causes for DTC P1639. This is described under Making Changes to the VID Block and also under Making Changes to the PCM Calibration. The VID block contains many items used by the strategy for a variety of functions. Some of these items include the vehicle identification number (VIN), octane adjust, fuel octane, fuel type, vehicle speed limit, tire size, axle ratio, the presence of speed control, and 4-wheel drive electronic shift-on-the-fly (ESOF) versus manual shift-on-the-fly (MSOF). Only items applicable to the vehicle hardware and supported by the VID block is displayed on the scan tool.

When changing items in the VID block, the strategy places range limits on certain items such as tire and axle ratio. The number of times the VID block may be reconfigured is limited. When this limit is reached, the scan tool displays a message indicating the need to flash the PCM again to reset the VID block.

Programming can be carried out by a local Ford dealer or any non-Ford facility. Refer to the scan tool manufacturer's instruction manual for details.

Programming the VID Block for a Replacement PCM

A new PCM contains the latest strategy and calibration level for a particular vehicle. However, the VID block is blank and needs programming. There are 2 procedures available. The first is an automatic data transfer from the old PCM to the new PCM, and the second is manual data entry into the new PCM.

Automatic data transfer is carried out if the old PCM is capable of communicating. This is done by using a scan tool to retrieve data from the old PCM before removing it from the vehicle. The stored data can then be downloaded to the new PCM after it has been installed.

Carry out manual data entry if the old module is damaged or incapable of communicating. Remove and install a new PCM. Using a compatible scan tool, select and carry out the module/parameter programming, referring to the scan tool manufacturer's instruction manual. Make certain that all parameters are included. Failure to properly program tire size in revolutions per mile, (rev/mile equals 63,360 divided by the tire circumference in inches), axle ratio, 4x4/4x2, and/or MSOF/ESOF may result in DTCs P1635 and P1639. You may be instructed to contact the As-Built Data Center for the information needed to manually update the VID block with the scan tool. Contact the center only if the old PCM cannot be used or the data is corrupt. For Ford and Lincoln Mercury technicians, contact your National Hotline or the Professional Technician Society (PTS) website for As-Built data listed under the Service Publications Index. Non-Ford technicians use the Motorcraft(R) website at www.motorcraft.com. From the Motorcraft(R) homepage, use the search function to find the Module Programming or As-Built Data.

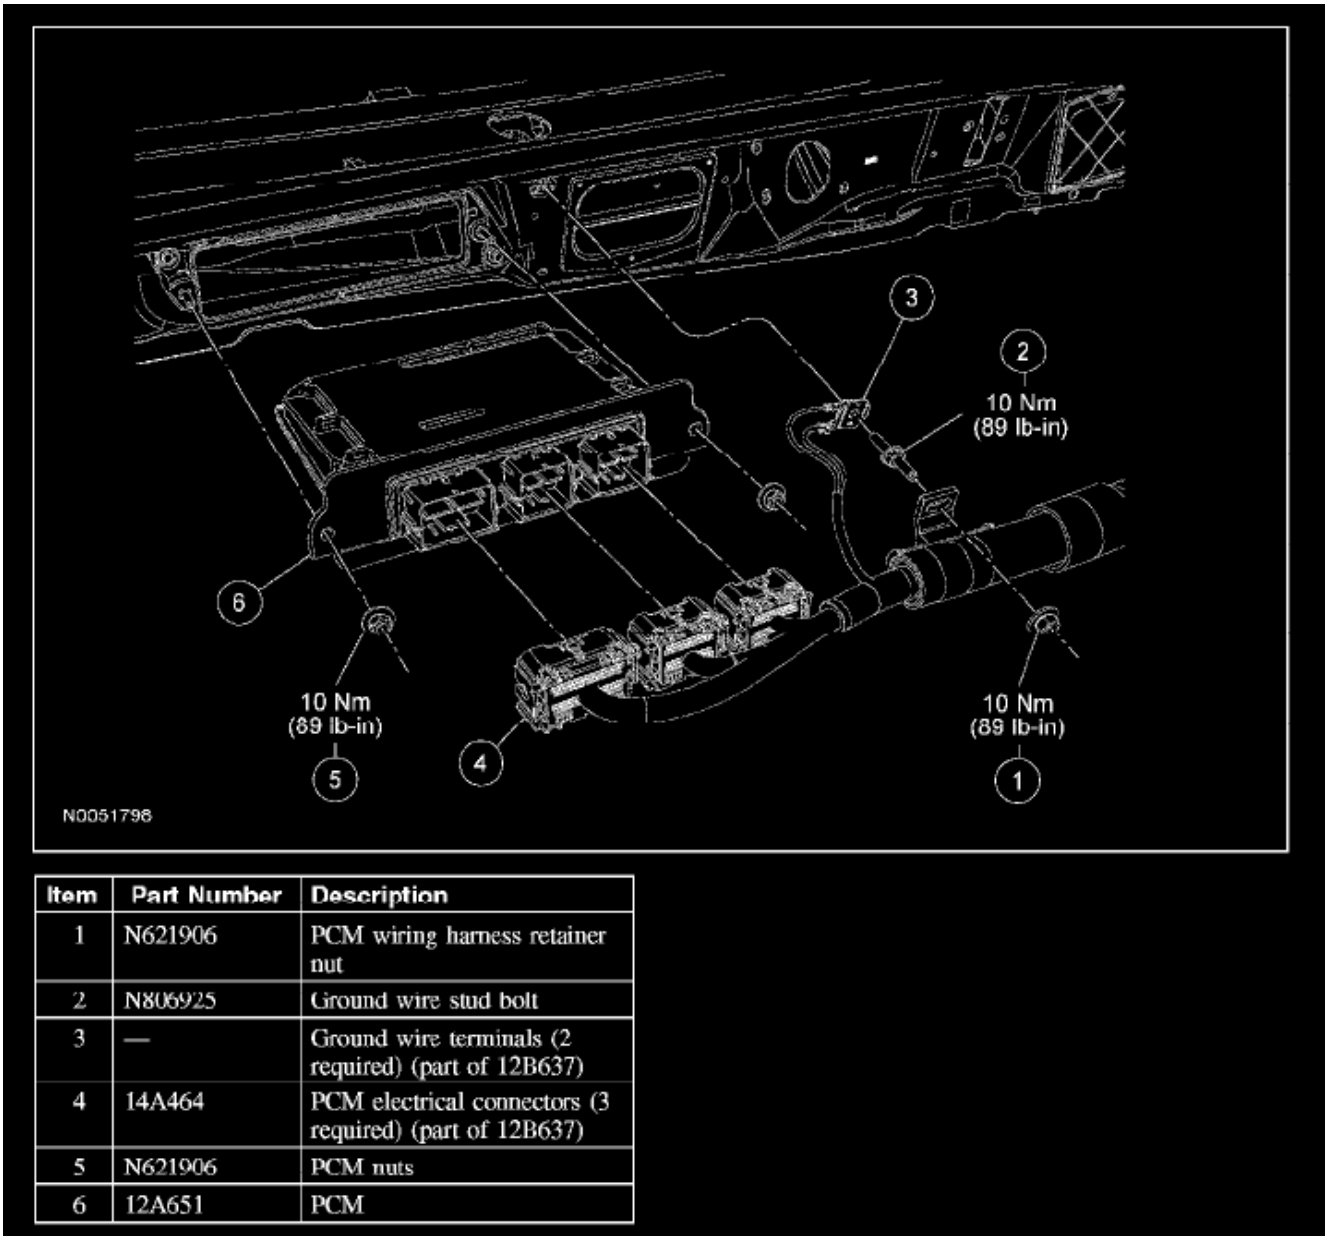
For Ford and Lincoln Mercury technicians, check the Programmable Module Installation link on the PTS website for quick Programmable Module data information by vehicle.

Making Changes to the VID Block

A PCM which is programmed may require changes to be made to certain VID information to accommodate the vehicle hardware. Refer to Module Reprogramming on the scan tool.

Making Changes to the PCM Calibration

At certain times, the entire EEPROM needs to be completely reprogrammed. This is due to changes made to the strategy or calibration after production, or the need to reset the VID block because it has reached its limit. Refer to Module Reprogramming on the scan tool.



Item	Part Number	Description
1	N621906	PCM wiring harness retainer nut
2	N806925	Ground wire stud bolt
3	—	Ground wire terminals (2 required) (part of 12B637)
4	14A464	PCM electrical connectors (3 required) (part of 12B637)
5	N621906	PCM nuts
6	12A651	PCM

Engine Control Module: Removal and Replacement

POWERTRAIN CONTROL MODULE (PCM)

Removal

1. Retrieve the module configuration. Carry out the module configuration retrieval steps of the Programmable Module Installation procedure. 2. Remove the PCM wiring harness retainer nut. 3. Remove the ground wire stud bolt. 4. Disconnect the 3 PCM electrical connectors. 5. Remove the 2 nuts and the PCM.

Installation

1. Install the PCM and the 2 nuts.

- Tighten to 10 Nm (89 lb-in).

2. Connect the 3 PCM electrical connectors. 3. Position the ground wire terminals and install the stud bolt.

- Tighten to 10 Nm (89 lb-in).

4. Install the PCM wiring harness retainer nut.

- Tighten to 10 Nm (89 lb-in).

5. NOTE: If a new PCM is installed, the parameters must be reset in both the PCM and the instrument cluster module or the vehicle will experience

a PATS no-start. This will occur even if the vehicle is not equipped with PATS. PATS vehicles and non-PATS vehicles have parameters in the instrument cluster module and the PCM and they both must be reset whenever a new PCM is installed.

Restore the module configurations for the instrument cluster module and the PCM. Carry out the module configuration restore steps of the Programmable Module Installation procedure.

C107

Typical CHT Sensor

Engine Temperature Sensor: Description and Operation

CYLINDER HEAD TEMPERATURE (CHT) SENSOR

Typical CHT Sensor

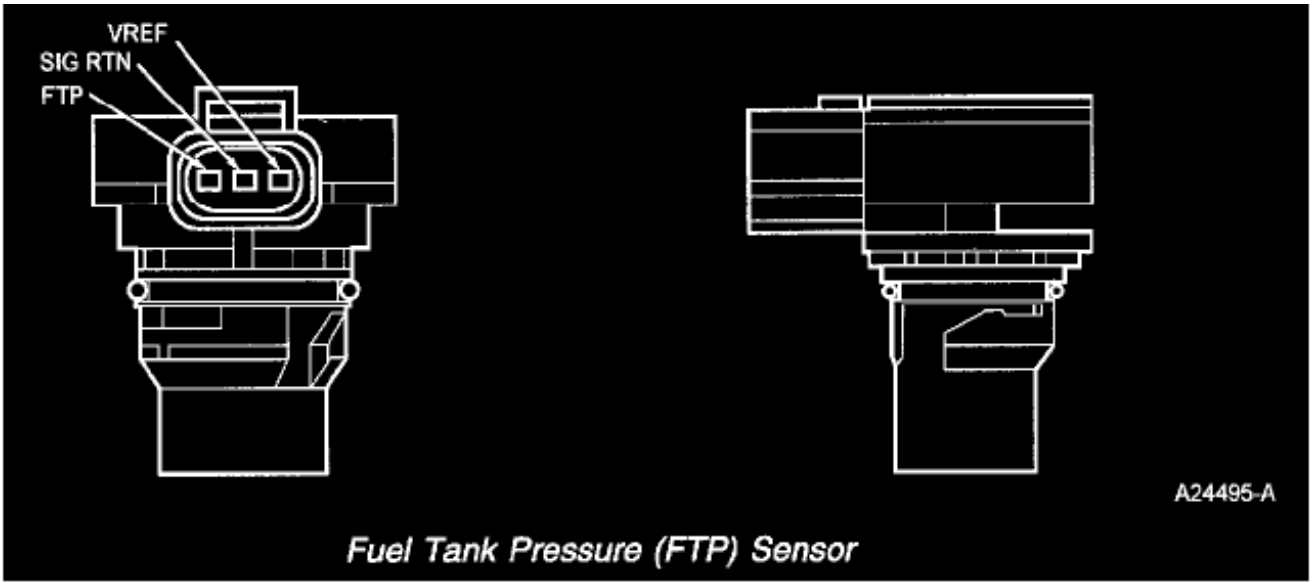
The CHT sensor is a thermistor device in which resistance changes with the temperature. The electrical resistance of a thermistor decreases as temperature increases, and the resistance increases as the temperature decreases. The varying resistance affects the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

The CHT sensor is installed in the cylinder head and measures the metal temperature. The CHT sensor can provide complete engine temperature information and can be used to infer coolant temperature. If the CHT sensor conveys an overheating condition to the PCM, the PCM initiates a fail-safe cooling strategy based on information from the CHT sensor. A cooling system concern such as low coolant or coolant loss could cause an overheating condition. As a result, damage to major engine components could occur. Using both the CHT sensor and fail-safe cooling strategy, the PCM prevents damage by allowing air cooling of the engine and limp home capability.

Fuel Level Sensor: Description and Operation

FUEL LEVEL INPUT (FLI)

The FLI is a communications network message. Most vehicle applications use a potentiometer type FLI sensor connected to a float in the FP module to determine fuel level.



Fuel Tank Pressure (FTP) Sensor

Part 2

Removal and Installation

WARNING:

- When working on or near the evaporative emission (EVAP) system, disconnect the battery ground cable from the battery. The EVAP system contains fuel vapor and condensed fuel vapor, so an electrical spark may cause a fire or explosion. Failure to follow this instruction may result in serious personal injury.

- Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. Remove the fuel tank. 2. Disconnect the fuel tank pressure sensor electrical connector.

3. NOTE: The rear fuel tank vapor tube and fuel tank pressure sensor are an assembly and must be serviced as an assembly.

Disconnect the rear fuel tank vapor tube and fuel tank pressure sensor assembly-to-evaporative emissions (EVAP) canister quick connect coupling.

4. Disconnect the front fuel tank vapor tube-to-rear fuel tank vapor tube and fuel tank pressure sensor assembly quick connect coupling. 5. Remove the rear fuel tank vapor tube and fuel tank pressure sensor assembly. 6. To install, reverse the removal procedure.

- Carry out the leak test. See: Emission Control Systems/Evaporative Emissions System/Testing and Inspection

- Carry out the evaporative emission repair verification drive cycle.

Idle Speed/Throttle Actuator - Electronic: Description and Operation

IDLE AIR CONTROL (IAC) VALVE

NOTE: The IAC valve assembly is not adjustable and cannot be cleaned, also some IAC valves are normally open and others are normally closed. Some IAC valves require engine vacuum to operate.

The IAC valve assembly controls the engine idle speed and provides a dashpot function. The IAC valve assembly meters intake air around the throttle plate through a bypass within the IAC valve assembly and throttle body. The PCM determines the desired idle speed or bypass air and signals the IAC valve assembly through a specified duty cycle. The IAC valve responds by positioning the IAC valve to control the amount of bypassed air. The PCM monitors engine RPM and increases or decreases the IAC duty cycle in order to achieve the desired RPM.

The PCM uses the IAC valve assembly to control:

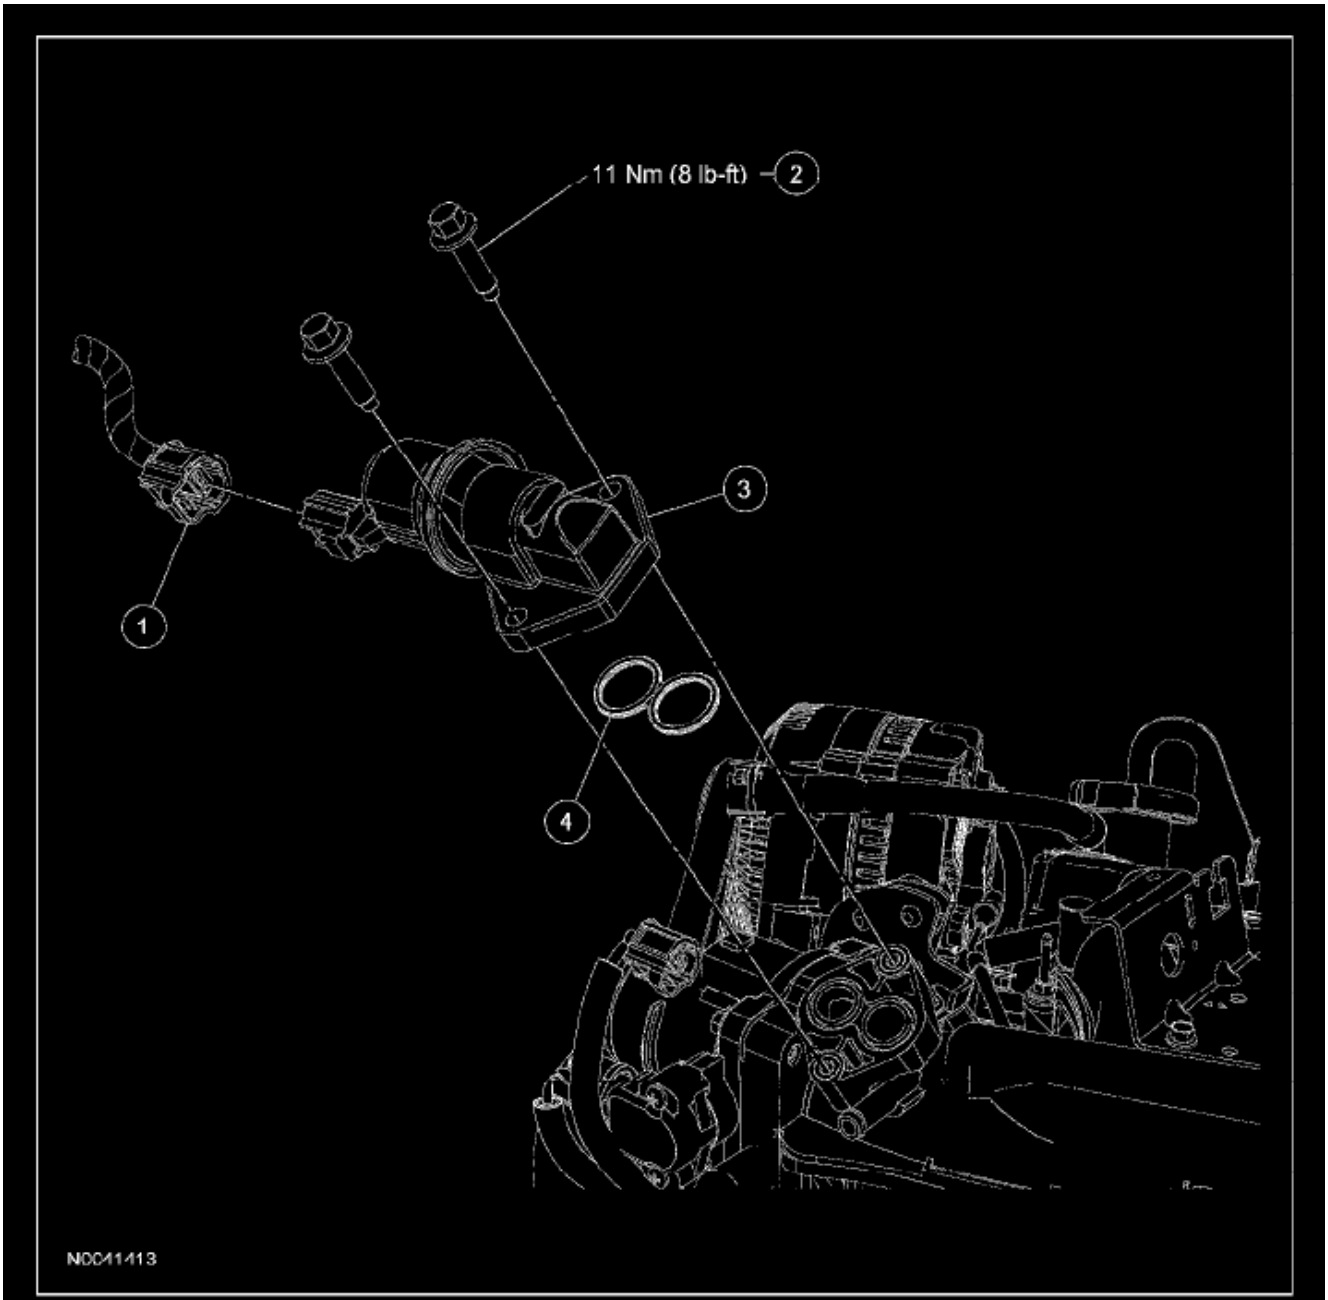
- no touch start

- cold engine fast idle for rapid warm-up

- idle (corrects for engine load)

- stumble or stalling on deceleration (provides a dashpot function)

- over-temperature idle boost



Item	Part Number	Description

Idle Speed/Throttle Actuator - Electronic: Service and Repair

IDLE AIR CONTROL (IAC) VALVE

Removal and Installation

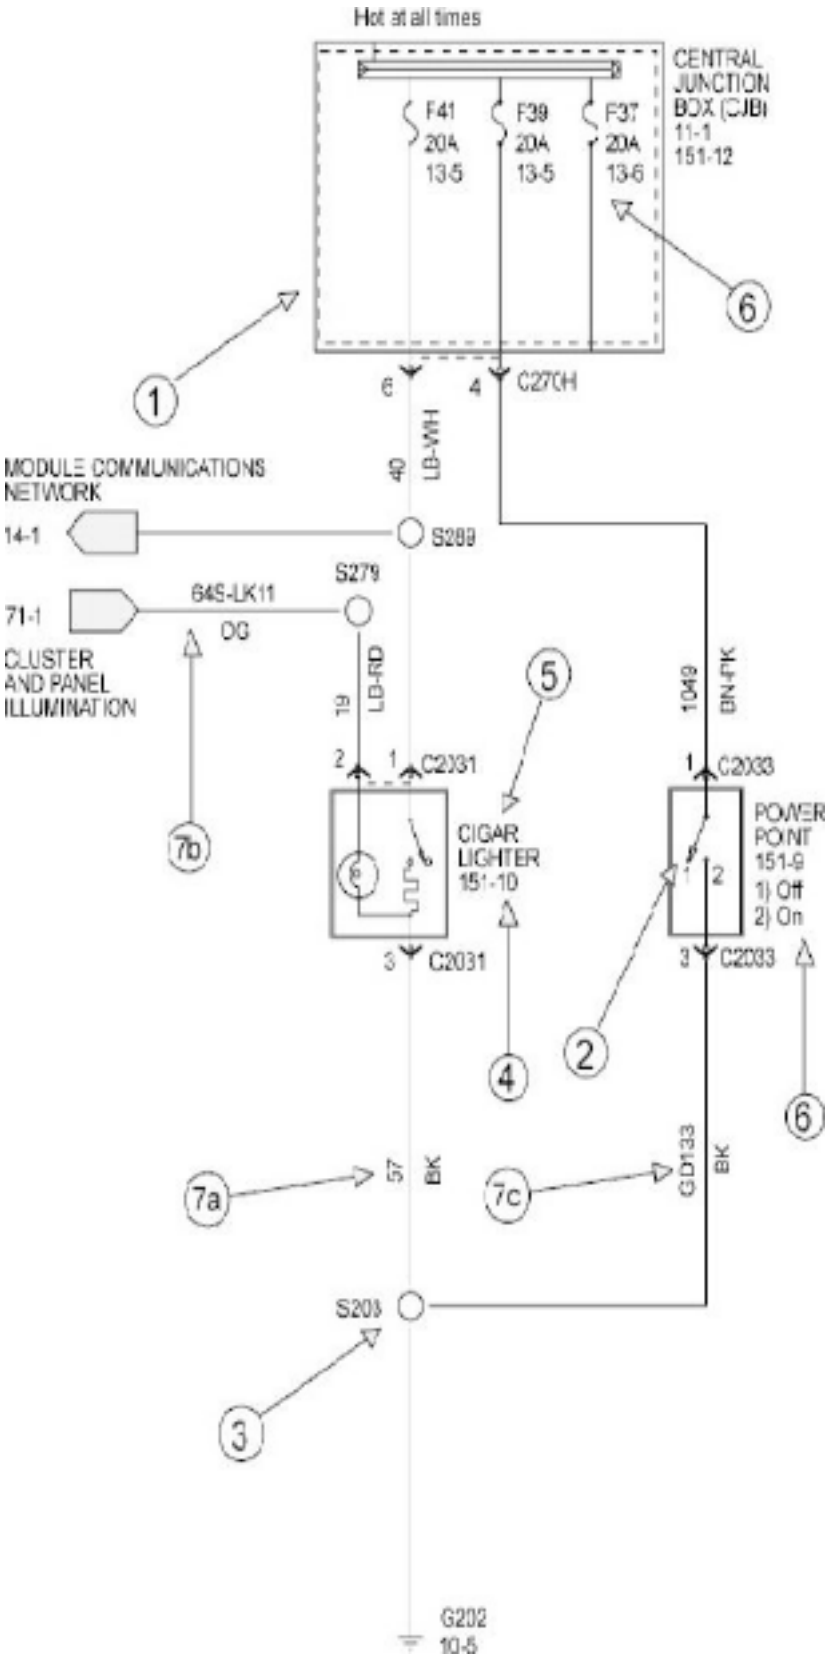
1. Disconnect the idle air control (IAC) valve electrical connector. 2. Remove the 2 bolts, the IAC valve and discard the gasket.

- To install, tighten to 11 Nm (8 lb-ft).

3. NOTE: Install a new IAC valve gasket.

To install, reverse the removal procedure.

Ford Ranger 2wd Workshop Manual (V6-3.0L (2008))
Ford Workshop Manuals > Powertrain Management > Computers and Control Systems > Information Bus > Component Information > Diagrams > Diagram Information and Instructions



Information Bus: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

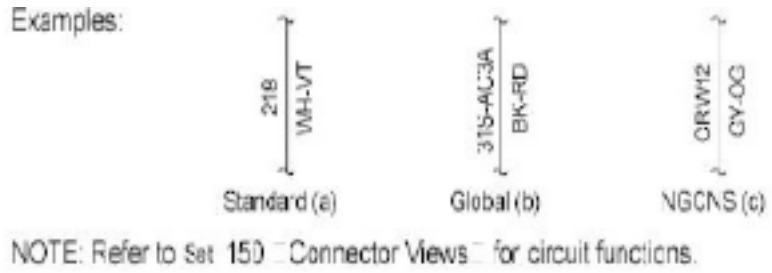
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

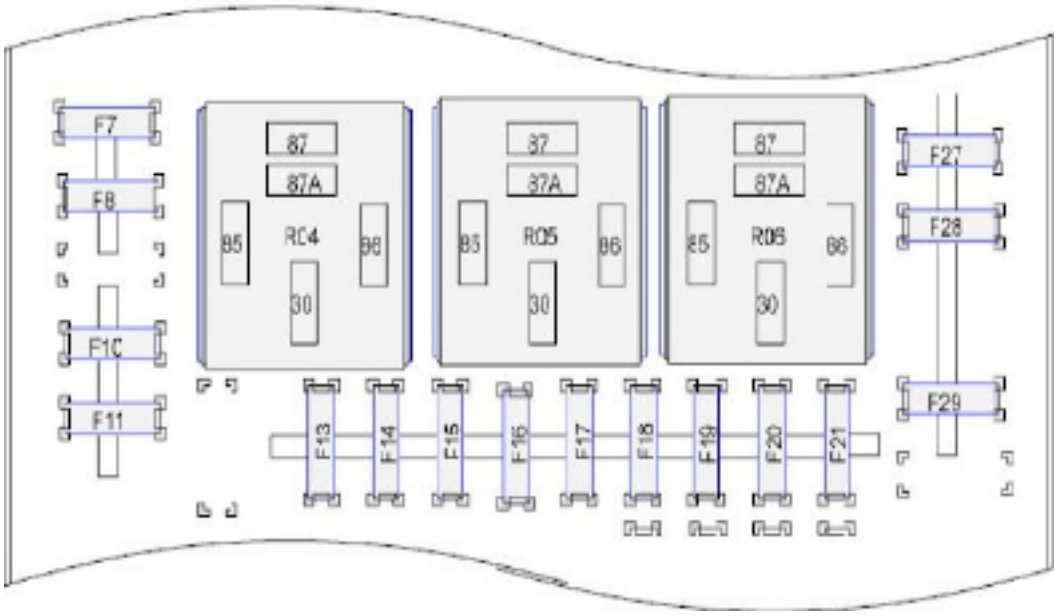
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

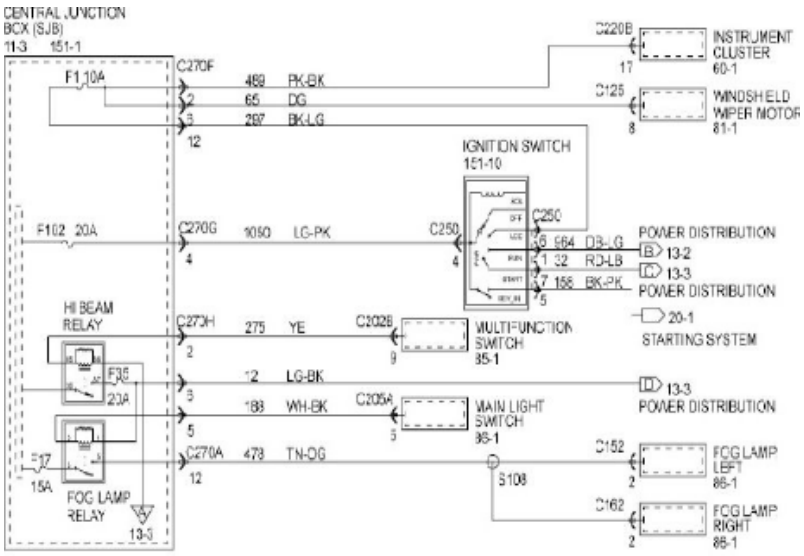
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

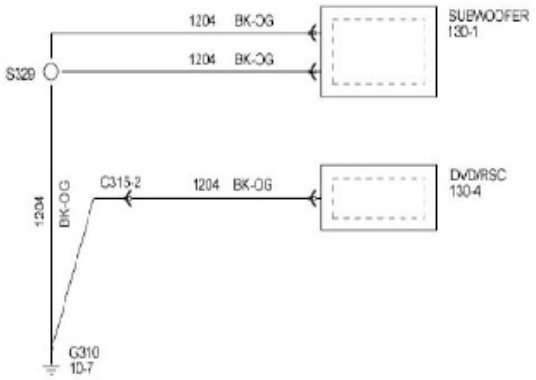
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

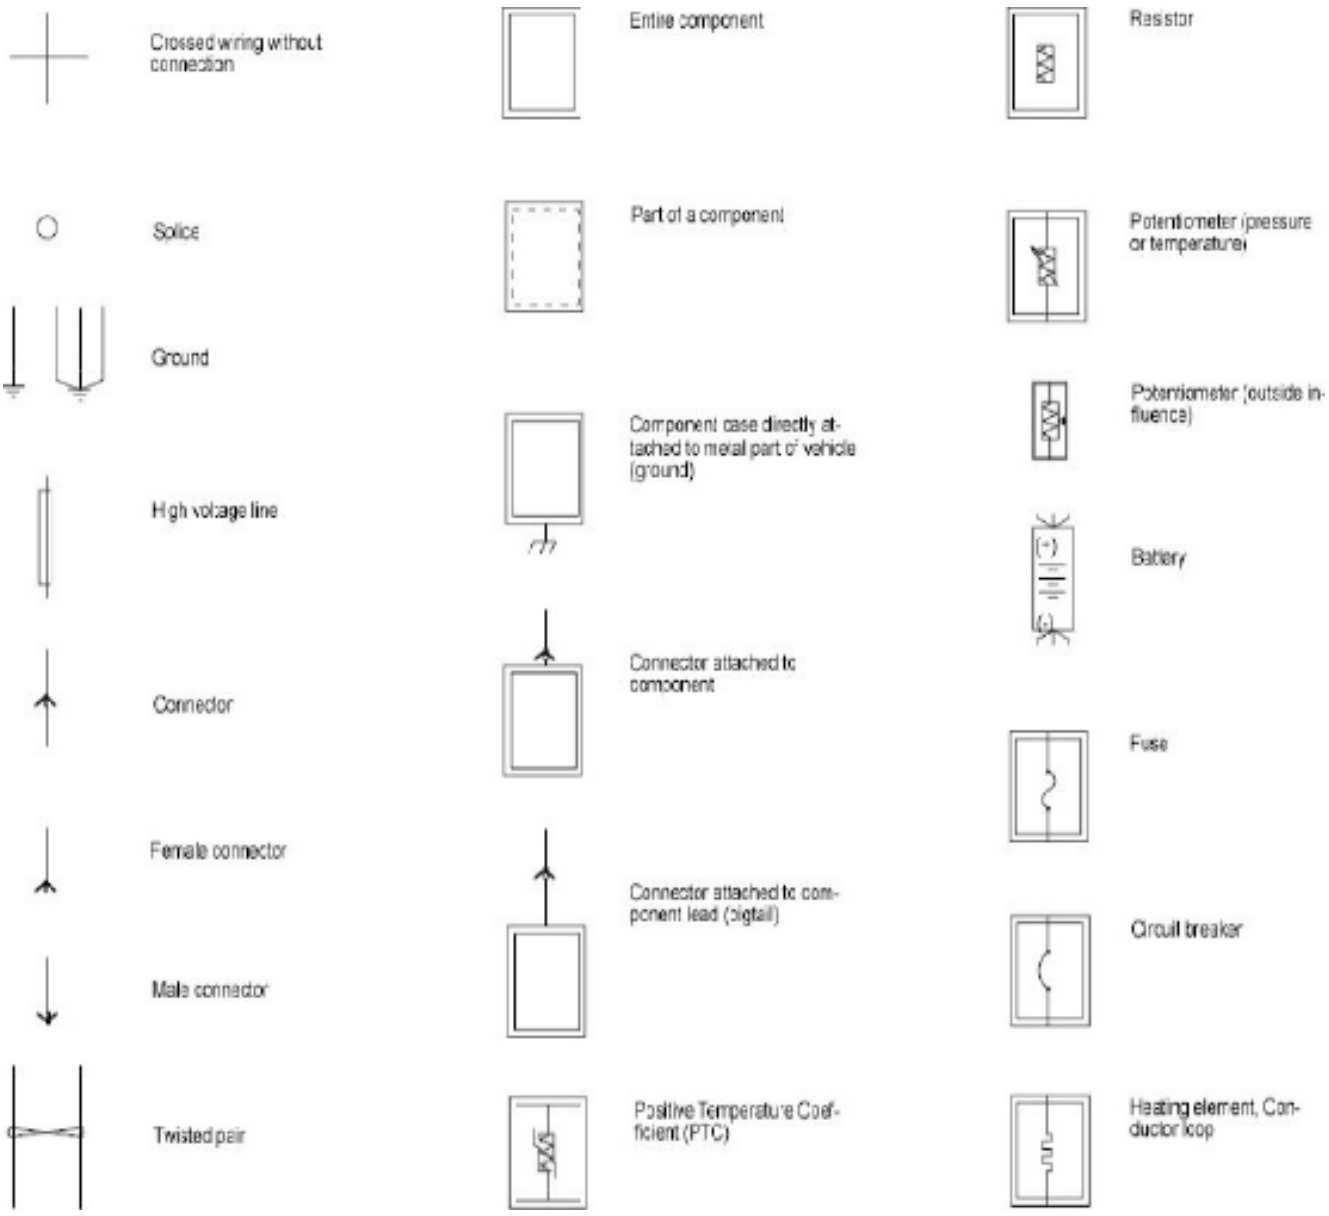
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

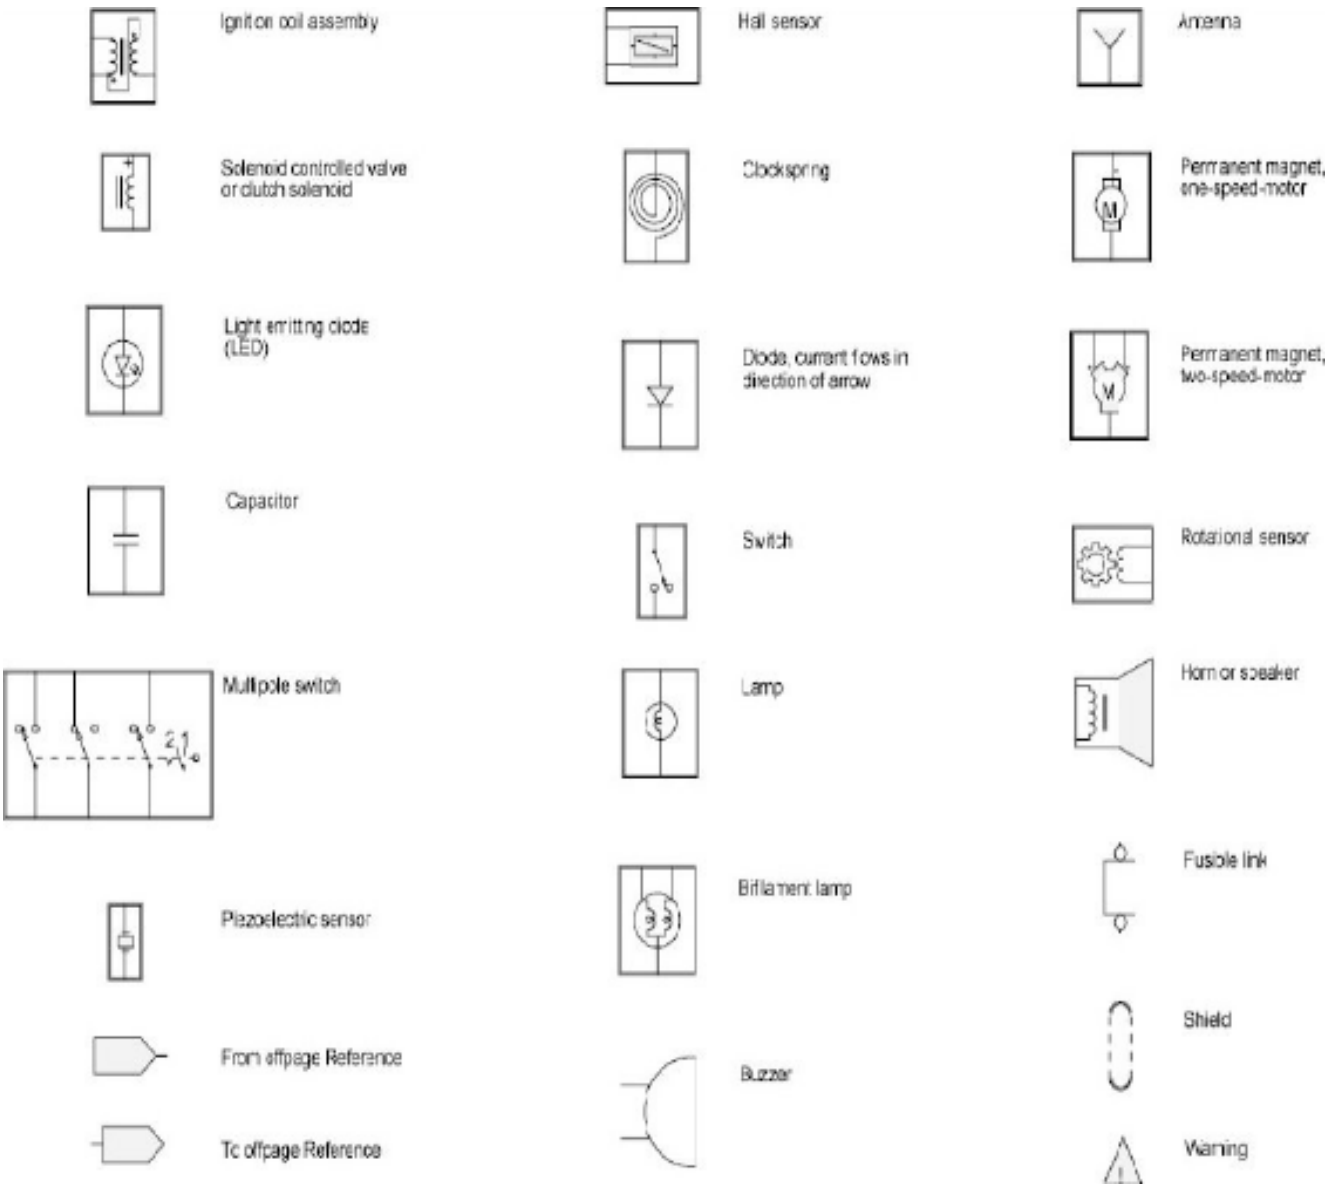
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

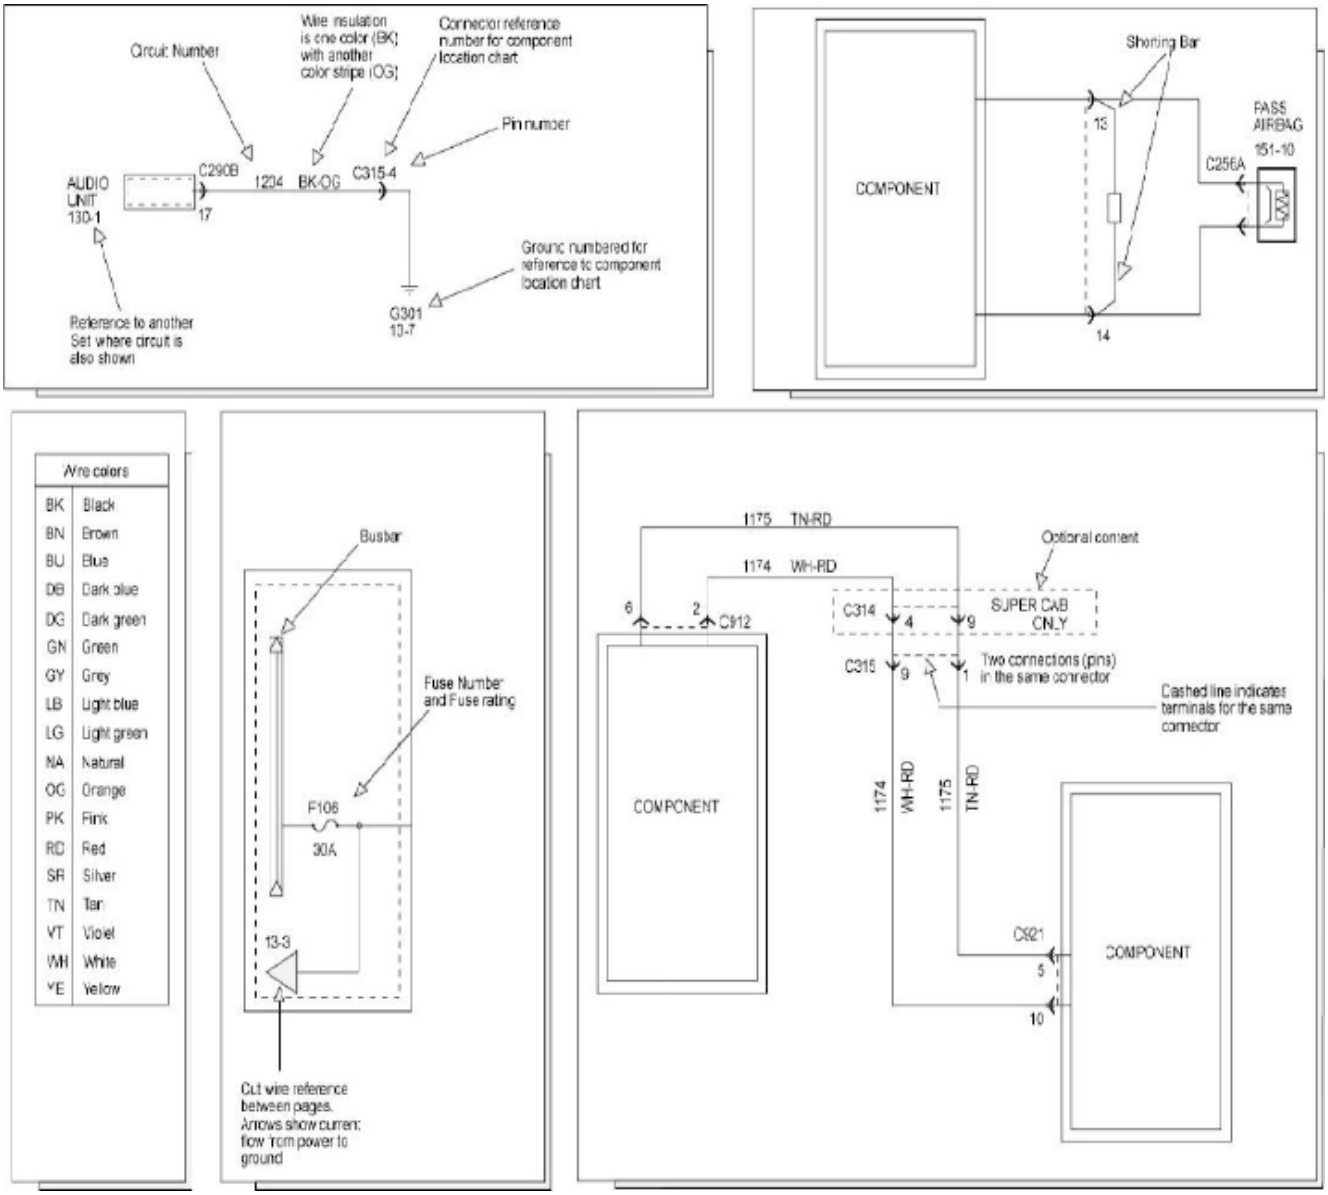
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

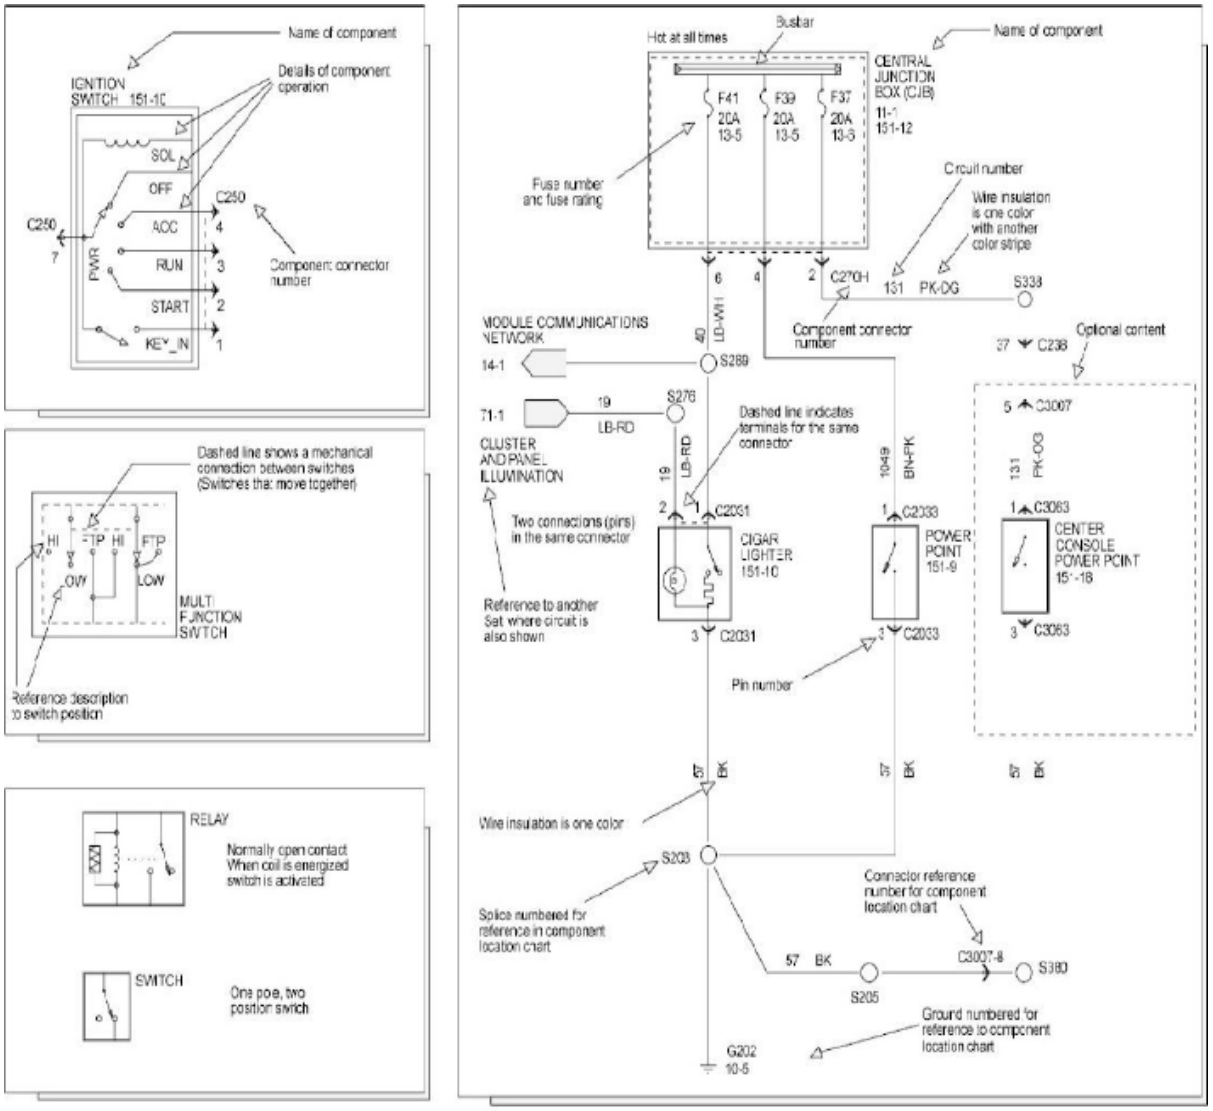
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left

Information Bus: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

WIRE STOPPER

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

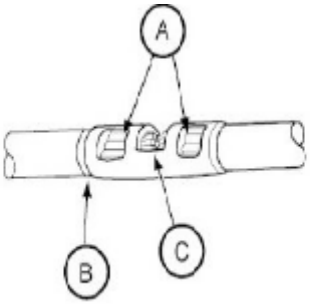
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

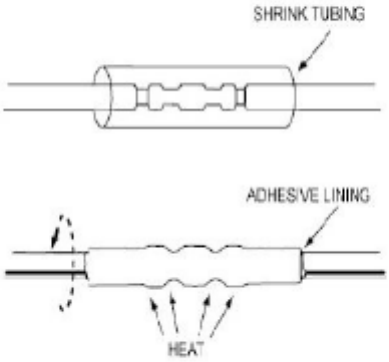
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4□ strip, cut 9 strands	* 1/4□ strip, cut 2 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip, fold 3x dia.
	16-14	* 1/4□ strip, cut 7 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip fold 2x dia	1□ strip, fold 3x dia.	1 1/4□ strip, fold 4x dia.	Not Recommended
	12-10	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip fold 3x dia.	1 1/4□ strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

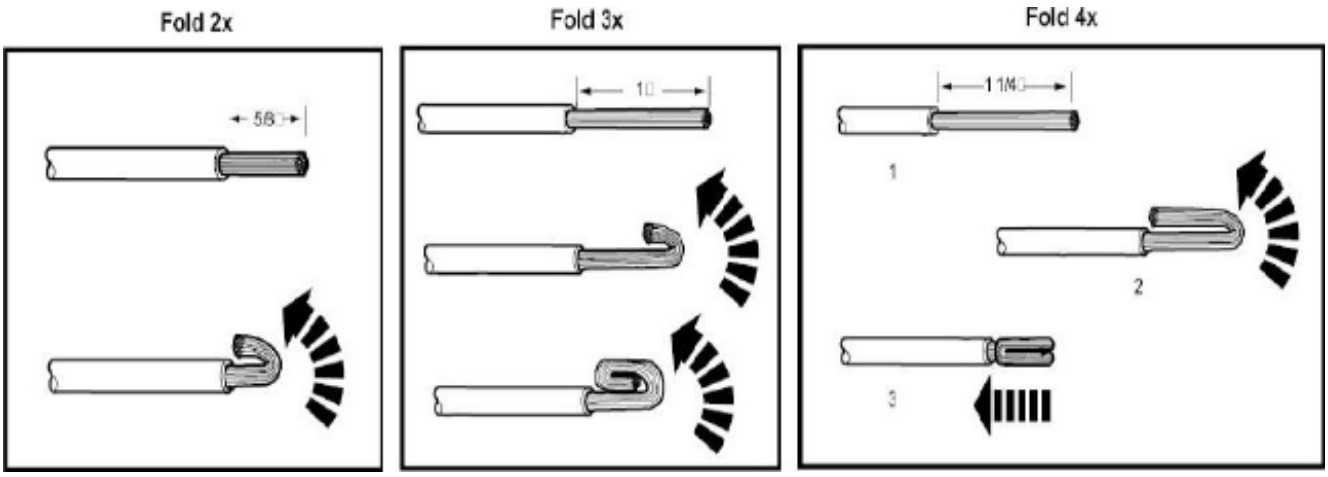
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

SJB	HS-CAN	No

Information Bus: Description and Operation

COMMUNICATIONS NETWORK

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

Vehicle communication utilizes both International Standards Organization (ISO) 9141 and controller area network (CAN) communications. ISO 9141 is used for diagnostic use only, and CAN is used for many modules to communicate with each other on a common network. CAN in-vehicle networking, is a method for transferring data among distributed electronic modules via a serial data bus. Without serial networking, intermodule communication requires dedicated, point to point wiring resulting in bulky, expensive, complex, and difficult to install wiring harnesses. Applying a serial

data network reduces the number of wires, combining the signals on a single network. Information is sent to individual control modules that control each function.

The vehicle has 2 module communication networks:

- ISO 9141

- High speed (HS) CAN

Both networks are connected to the data link connector (DLC). This makes diagnosis and testing of these systems easier by allowing one scan tool to be able to diagnose and control any module on both networks from one connector. The DLC can be found under the instrument panel.

Network Topology

ISO 9141 Network Operation

The ISO 9141 communications network is a single wire network. The ISO 9141 communication network is used only by the ABS module.

HS-CAN Network Operation

The HS-CAN network communicates using bussed messages. The HS-CAN network uses an unshielded twisted pair cable, data bus (+) and data bus (-) circuits. In addition to scan tool communication, this network allows sharing of information between all modules on the network.

The HS-CAN is a high speed communication network used for the following modules: -

PCM

- RCM

- SJB

- 4X4 control module (if equipped)

- Occupant classification system module (OCSM)

- Instrument cluster (IC)

Network Termination

The CAN network uses a network termination circuit to improve communication reliability. The network termination of the CAN bus takes place inside the termination modules by termination resistors. Termination modules are located at either end of the bus network. As network messages are broadcast, in the form of voltage signals, the network voltage signals are stabilized by the termination resistors. Each termination module has a 120 ohm resistor across the positive and negative bus connection in the termination module. With 2 termination modules on each network, and the 120 ohm resistors located in a parallel circuit configuration, the total network impedance, or total resistance is 60 ohms.

Network termination improves bus message reliability by: -

stabilizing bus voltage.

- eliminating electrical interference.

Information Bus: Initial Inspection and Diagnostic Overview

Inspection and Verification

INSPECTION AND VERIFICATION

1. Verify the customer concern. 2. Visually inspect for obvious signs of electrical damage.

VISUAL INSPECTION CHART

Electrical -

Battery junction box (BJB) fuse(s): -

9 (40A) (no communication with the smart junction box [SJB])

- 21 (10A) (no communication with the PCM)

- 39 (15A) (no communication with the PCM)

- SJB fuse(s): -

8 (10A) (no communication with the restraints control module [RCM], occupant classification system module [OCSM])

- 9 (5A) (no communication with the instrument cluster [IC])

- 10 (10A) (no communication with the IC, 4X4 control module)

- 11 (10A) (no communication with the SJB)

- 20 (10A) (no communication with the ABS module)

- 28 (15A) (no power to the 4X4 control module)

- 29 (20A) (no power to the scan tool)

- 33 (5A) (no communication with the IC)

- Data link connector (DLC)

- Wiring, terminals or connectors

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. NOTE: Make sure to use the latest scan tool software release.

If the cause is not visually evident, connect the scan tool to the DLC.

NOTE: The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

If the scan tool does not communicate with the VCM: -

Check the VCM connection to the vehicle.

- Check the scan tool connection to the VCM.

- GO to Pinpoint Test I, to diagnose No Power To The Scan Tool. See: Pinpoint Tests/Test I: No Power To The Scan Tool

5. NOTE: During the network test, the scan tool will first attempt to communicate with the PCM, after establishing communication with the PCM,

the scan tool will then attempt to communicate with all other modules on the vehicle.

Carry out the network test. -

If the network test passes, retrieve and record the continuous memory DTCs and proceed to Step 6.

- If the network test fails, GO to Symptom Chart to identify the module not communicating. See: Symptom Related Diagnostic Procedures

6. If the DTCs retrieved are related to the concern, go to DTC charts. For all other DTCs, refer to Body Control Systems (Multifunction Electronic

Control Module). See: Diagnostic Trouble Code Descriptions/Module Communications Network

7. If no DTCs related to the concern are retrieved, GO to Symptom Chart. See: Symptom Related Diagnostic Procedures

Principles of Operation

PRINCIPLES OF OPERATION

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

Vehicle communication utilizes both International Standards Organization (ISO) 9141 and controller area network (CAN) communications. ISO 9141 is used for diagnostic use only, and CAN is a method for transferring data among distributed electronic modules via a serial data bus.

The vehicle is equipped with 2 communication networks:

- ISO 9141

- High speed (HS) CAN

ISO 9141 Network Communication Fault Chart

Failure Description	Symptom
ISO circuit open	No communication
ISO circuit short to voltage	No communication
ISO circuit short to ground	No communication
Module loss of voltage or ground	No communication
Module internal failure	No communication

ISO 9141 Communications Network

The ISO 9141 communications network is a single wire network. The ISO 9141 communications network does not permit intermodule communication. When the scan tool communicates to modules on the ISO 9141 communication network, the scan tool must request all information; the modules cannot initiate communications.

The following fault chart describes the specific ISO 9141 network failures and their resulting symptom:

ISO 9141 Network Communication Fault Chart

HS-CAN

The HS-CAN network uses an unshielded twisted pair cable of data (+) and data (-) circuits. The data (+) and the data (-) circuits are each regulated to approximately 2.5 volts during neutral or rested network traffic. As bus messages are sent on the data (+) circuit, voltage is increased by approximately 1.0 volt. Inversely, the data (-) circuit is reduced by approximately 1.0 volt when a bus message is sent. Multiple bus messages can be sent over the network CAN circuits allowing multiple modules to communicate with each other.

The HS-CAN is a high speed communication network used for the instrument cluster (IC), PCM, the 4X4 control module, the restraints control module (RCM), the OCSM communications and the smart junction box (SJB), and designed for real time information transfer and control. The HS-CAN network will not communicate while certain faults are present, but will operate with diminished performance with other faults present. The HS-CAN bus may remain operational when 1 of the 2 termination resistors are not present.

In the event that one of the 2 network circuits (HS-CAN + or HS-CAN -) becomes open to a module on the network, unreliable network communication to all modules on the network may result. The module to which the network circuit is open may repeatedly send network messages indicating there has been partial data received. This type of message is referred to as a negative-acknowledge (NACK) message.

Repeated NACK messages may "load" the network with too much activity causing intermittent no communication to other network modules and/or the scan tool.

The following fault chart describes the specific HS-CAN network failures and their resulting symptom:

HS-CAN Network Communication Fault Chart

Failure Description	Symptom
HS-CAN (+) shorted to HS-CAN (-)	No communication
HS-CAN (+) short to voltage	No communication
HS-CAN (-) short to voltage	No communication
HS-CAN (+) short to ground	No communication
HS-CAN (-) short to ground	Unreliable communication possible to all modules on the network
HS-CAN (+) open	Unreliable communication possible to all modules on the network
HS-CAN (-) open	Unreliable communication possible to all modules on the network
Module loss of voltage or ground	No communication
Module internal failure	No communication

CAN Network Module Communication Message Chart (Part 2)

Inspection and Verification

INSPECTION AND VERIFICATION

This provides step-by-step module configuration procedures. Carry out the PMI procedures when another Vehicle System directs to carry out configuration or when DTCs from the given list are present. See: Programming and Relearning

Principles of Operation

PRINCIPLES OF OPERATION

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

Configurable modules accommodate a variety of vehicle options, eliminating the need for many unique modules for one vehicle line. These modules must be configured when replaced as part of a repair procedure.

Configurable modules should not be exchanged between vehicles since the settings are unique to each vehicle. Failure to configure a new module may result in improper operation and/or any of the following DTCs setting:

- B2477 and/or B2141 - sets when a body/chassis module is not configured or is configured incorrectly.

- B2900 - sets when there is a VIN mismatch between the module with the B2900 and the PCM. The stored VIN in either module may be incorrect.

- P0602, P0605 and/or P1639 - sets when the PCM vehicle identification (VID) block is not configured.

- U0300 and/or U0301 - sets when the configuration between 2 or more modules do not match.

- U2050 and/or U2051 - sets when a valid strategy/calibration is not present.

The following are the 3 different methods of configuration:

- Programmable module installation (PMI)

- Module reprogramming ("flashing")

- Programmable parameters

Some modules do not support all 3 methods.

Definition of Terms

The following are definitions of configuration terms:

Programmable Module Installation (PMI) PMI is a scan tool process which configures settings in a new module. Data used for the PMI process is automatically downloaded from the original module and stored when a scan tool session is started. If this data cannot be retrieved from the module being replaced, the scan tool may prompt for As-Built data entry or display a list of parameter values that need to be manually selected. Some modules are reprogrammed during PMI when a strategy/calibration update is available.

NOTE: It is important that the scan tool identifies the vehicle and obtains configuration data prior to removing any modules. The new module must be able to communicate with the scan tool in order to carry out PMI. See: Programming and Relearning

To carry out PMI, refer to Programmable Module Installation. See: Programming and Relearning

Module Reprogramming Module reprogramming (also referred to as "flashing") is a scan tool process which updates the strategy/calibration in a module. Module reprogramming is automatically carried out during PMI when a later strategy/calibration is available.

Reprogramming a module with the same level of software will not improve module operation or repair a hardware failure.

NOTE: -

Module reprogramming should be limited to circumstances where a published Technical Service Bulletin (TSB) procedure recommends doing so.

- A module cannot communicate with other modules on the communication network while being reprogrammed. Clear any network communication DTCs which may have been set in other modules during reprogramming.

Programmable Parameters Programmable parameters are customer preference items that may be modified by the dealer via scan tool or in some cases modified by the customer following a procedure listed in the vehicle Owner's Literature. While many configuration options are programmable parameters.

Adaptive Learning and Calibration

Some modules require a separate learning procedure be carried out if replaced as part of a repair procedure. For adaptive learning and calibration instructions, refer to the specific module removal and installation procedures.

Vehicle Identification (VID) Block

Some PCMs contain a memory area called a vehicle identification (VID) block. The PCM VID block commonly stores powertrain configuration items such as VIN, tire size, axle ratio, and whether or not the vehicle is equipped with speed control.

As-Built Data

As-Built data is a VIN specific module configuration record. During vehicle build, the configuration from all modules is downloaded and stored in the As-Built database. As-Built data will not reflect customer preference items that have been changed from the default state. These items will need to be changed using programmable parameters after the module is configured.

NOTE: It is not necessary to obtain As-Built data unless directed to do so by the scan tool. This data may be accessed from the technician service publication website.

The following chart lists module As-Built data addresses: may exist for a module, only a few of these options are programmable parameters.

Module Addresses for As-Built Data Entry

Module Name	Module Address
4X4 Control Module	761
Instrument Cluster (IC)	720
Restraints Control Module (RCM)	737
Smart Junction Box (SJB)	726

Module Configuration and Parameter Index

Module Name	Reprogram/ Flash Capable	Requires PMI	Requires Adaptive Learning	Requires Calibration	Available Programmable Parameters

Condition	Possible Sources	Action
• The PCM does not respond to the scan tool, or no high speed controller area network (HS-CAN) communication	• Fuse • Wiring, terminals or connectors • PCM • Restraints control module (RCM) • Occupant classification system module (OCSM) • 4X4 control module • Instrument cluster (IC) • SJB	• GO to Pinpoint Test A.
• The occupant classification system module (OCSM) does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • ABS module	• GO to Pinpoint Test B.
• The restraints control module (RCM) does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • RCM	• GO to Pinpoint Test C.

Information Bus: Symptom Related Diagnostic Procedures

Symptom Chart (Part 1)

Symptom Chart (Continued)

Condition	Possible Sources	Action
• The satellite radio receiver does not communicate with the scan tool	• Fuse • Wiring, terminals or connectors • Satellite radio receiver	• REFER to Radio, Stereo, and Compact Disc.
• The smart junction box (SJB) does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • SJB	• GO to Pinpoint Test D.
• The instrument cluster (IC) does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • IC	• GO to Pinpoint Test E.
• The four wheel drive (4X4) control module does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • 4X4 control module	• GO to Pinpoint Test F.
• The ABS module does not respond to the scan tool or no International Standards Organization (ISO) 9141 network communication	• Fuse • Wiring, terminals or connectors • ABS module	• GO to Pinpoint Test G.
• Intermittent no high speed controller area network (HS-CAN) communication, one or more modules are not responding during network test	• Wiring, terminals or connectors	• GO to Pinpoint Test H.
• No high speed controller area network (HS-CAN) communication, all modules are not responding	• Fuse • Wiring, terminals or connectors • PCM • RCM • OCSM • 4X4 control module • IC • SJB	• GO to Pinpoint Test A.
• No power to the scan tool	• Fuse • Wiring, terminals or connectors • Scan tool	• GO to Pinpoint Test I.

Symptom Chart (Part 2)

PINPOINT TEST A: THE PCM DOES NOT RESPOND TO THE SCAN TOOL OR NO HIGH SPEED CONTROLLER AREA NETWORK (HS-CAN) COMMUNICATION

⚠ **CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step		Result / Action to Take
A1	**CHECK THE DATA LINK CONNECTOR (DLC) PINS FOR DAMAGE** **NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test. • Key in OFF position. • Disconnect the scan tool cable from the DLC. • Inspect DLC pins 6 and 14 for damage.  A0093867 • **Are DLC pins 6 and 14 OK?**	**Yes** GO to **A2**. **No** REPAIR the DLC as necessary. CLEAR the DTCs. REPEAT the network test with the scan tool.
A2	**CHECK THE HS-CAN TERMINATION RESISTANCE** • Key in OFF position. • **NOTE:** Failure to disconnect the battery will result in false resistance readings. Disconnect the vehicle battery. • Disconnect the scan tool cable from the DLC.	

(Continued)

Information Bus: Pinpoint Tests

Test A: The PCM Does Not Respond To The Scan Tool Or No High Speed Controller Area Network (HS-CAN) Communication

PINPOINT TEST A: THE PCM DOES NOT RESPOND TO THE SCAN TOOL OR NO HIGH SPEED CONTROLLER AREA NETWORK (HS-CAN) COMMUNICATION

Normal Operation

The PCM communicates with the scan tool through the high speed controller area network (HS-CAN). Circuits VDB04 (WH/BU) (HS-CAN +) and VDB05 (WH) (HS-CAN -) provide the network connection to the PCM. The PCM shares the HS-CAN with the 4X4 control module, the restraints control module (RCM), the occupant classification system module (OCSM), the SJB, and the instrument cluster (IC). Circuits CBB39 (VT/WH) and SBB21 (GY/RD) provide voltage, and redundant circuit GD108 (BK/VT) provides ground.

This pinpoint test is intended to diagnose the following:

- Fuse

- Wiring, terminals or connectors

- PCM

- RCM

- Occupant classification system module (OCSM)

- 4X4 control module

- IC

- SJB

A1-A2

PINPOINT TEST A: THE PCM DOES NOT RESPOND TO THE SCAN TOOL OR NO HIGH SPEED CONTROLLER AREA NETWORK (HS-CAN) COMMUNICATION (Continued)

Test Step		Result / Action to Take
A2	CHECK THE HS-CAN TERMINATION RESISTANCE (Continued)	
	• Measure the resistance between the DLC C251-6, circuit VDB04 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance between 54 and 66 ohms?**	**Yes** GO to **A5**. **No** GO to **A3**.
A3	CHECK THE HS-CAN TERMINATION RESISTOR	
	• Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance between 108 and 132 ohms?**	**Yes** GO to **A9**. **No** GO to **A4**.
A4	CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER	
	• Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance less than 5 ohms?**	**Yes** GO to **A10**. **No** GO to **A9**.

(Continued)

A2-A4

PINPOINT TEST A: THE PCM DOES NOT RESPOND TO THE SCAN TOOL OR NO HIGH SPEED CONTROLLER AREA NETWORK (HS-CAN) COMMUNICATION (Continued)

Test Step		Result / Action to Take
A5	CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002963 • **Are the resistances greater than 10,000 ohms?**		**Yes** GO to **A6**. **No** GO to **A16**.
A6	CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO VOLTAGE	
• Connect the vehicle battery. • Key in ON position. • Measure the voltage between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002964 • **Is the voltage greater than 6 volts?**		**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** GO to **A7**.
A7	CHECK THE PCM VOLTAGE SUPPLY CIRCUITS FOR AN OPEN	
• Key in OFF position. • Disconnect: PCM C175b. • Key in ON position. • Measure the voltage between the PCM, harness side and ground as follows:		

PCM Connector-Pin	Circuit
C175b-35	CBB39 (VT/WH)
C175b-36	CBB39 (VT/WH)
C175b-45	SBB21 (GY/RD)

	• **Are the voltages greater than 10 volts?**	**Yes** GO to **A8**. **No** VERIFY the battery junction box (BJB) fuse 21 (10A) and fuse 39 (15A) is OK. If OK, REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.
A8	CHECK THE PCM GROUND CIRCUITS	
• Key in OFF position.		

(Continued)

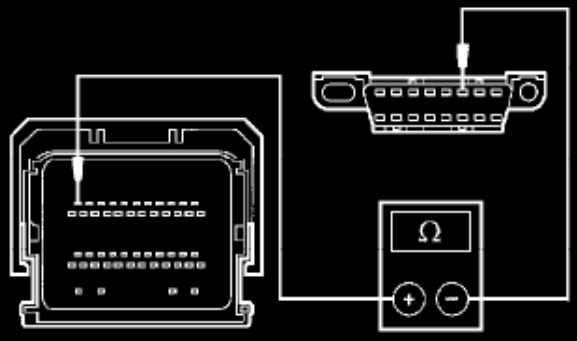
A5-A8

PINPOINT TEST A: THE PCM DOES NOT RESPOND TO THE SCAN TOOL OR NO HIGH SPEED CONTROLLER AREA NETWORK (HS-CAN) COMMUNICATION (Continued)

Test Step		Result / Action to Take
A8	CHECK THE PCM GROUND CIRCUITS (Continued)	
	• Measure the resistance between the PCM, harness side and ground as follows:	

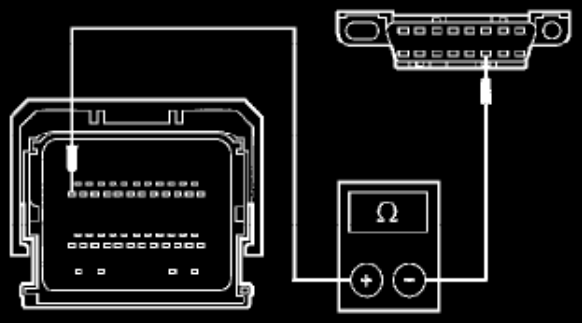
PCM Connector-Pin	Circuit
C175b-10	GD108 (BK/VT)
C175b-47	GD108 (BK/VT)
C175b-48	GD108 (BK/VT)
C175b-49	GD108 (BK/VT)
C175b-50	GD108 (BK/VT)

	• **Are the resistances less than 5 ohms?**	**Yes** GO to **A22**. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
A9	CHECK THE CAN CIRCUITS BETWEEN THE DLC AND THE PCM FOR AN OPEN	
	• Measure the resistance between the PCM C175b-11, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.	



N0002560

	• Measure the resistance between the PCM C175b-23, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.	



N0002561

	• **Are the resistances less than 5 ohms?**	**Yes** GO to **A18**. **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.
A10	CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE PCM DISCONNECTED	
	• Disconnect: PCM C175b.	

(Continucd)

A8-A10

PINPOINT TEST A: THE PCM DOES NOT RESPOND TO THE SCAN TOOL OR NO HIGH SPEED CONTROLLER AREA NETWORK (HS-CAN) COMMUNICATION (Continued)

Test Step		Result / Action to Take
A10	**CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE PCM DISCONNECTED (Continued)**	
	• Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance less than 5 ohms?**	**Yes** GO to **A11**. **No** GO to **A22**.
A11	**CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE 4X4 CONTROL MODULE DISCONNECTED**	
	• Disconnect: 4X4 Control Module C281a. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance less than 5 ohms?**	**Yes** GO to **A12**. **No** GO to **A23**.
A12	**CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE INSTRUMENT CLUSTER (IC) DISCONNECTED**	
	• Disconnect. IC C220b.	

(Continued)

A10-A12

PINPOINT TEST A: THE PCM DOES NOT RESPOND TO THE SCAN TOOL OR NO HIGH SPEED CONTROLLER AREA NETWORK (HS-CAN) COMMUNICATION (Continued)

	Test Step	Result / Action to Take
A12	**CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE INSTRUMENT CLUSTER (IC) DISCONNECTED (Continued)**	
	• Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance less than 5 ohms?**	**Yes** GO to **A13**. **No** GO to **A24**.
A13	**CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE SJB DISCONNECTED**	
	• Disconnect: SJB C2280d. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance less than 5 ohms?**	**Yes** GO to **A14**. **No** GO to **A25**.
A14	**CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE RCM DISCONNECTED**	
	• Depower the supplemental restraint system (SRS). Refer to Air Bag Systems. • Disconnect: RCM C2041a.

	• Disconnect: OCSM C3159. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to **A27**. **No** REPAIR the circuit. CONNECT all modules. REPOWER the SRS. REFER to Air Bag Systems. CLEAR the DTCs. REPEAT the network test with the scan tool.
A22	**CHECK FOR CORRECT PCM OPERATION**	
	• Disconnect all the PCM connectors. • Check for: — corrosion — damaged pins — pushed-out pins • Connect all the PCM module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

(Continued)

PINPOINT TEST A: THE PCM DOES NOT RESPOND TO THE SCAN TOOL OR NO HIGH SPEED CONTROLLER AREA NETWORK (HS-CAN) COMMUNICATION (Continued)

Test Step		Result / Action to Take
A23	CHECK FOR CORRECT 4X4 CONTROL MODULE OPERATION	
	• Disconnect all the 4X4 control module connectors. • Check for: — corrosion — damaged pins — pushed-out pins • Connect the 4X4 control module connectors and make sure they seat correctly. • Verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new 4X4 control module. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.
A24	CHECK FOR CORRECT IC OPERATION	
	• Disconnect the IC connector. • Check for: — corrosion — damaged pins — pushed-out pins • Connect the IC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IC. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.
A25	CHECK FOR CORRECT SJB OPERATION	
	• Disconnect all the SJB connectors. • Check for: — corrosion — damaged pins — pushed-out pins • Connect the SJB connectors and make sure they seat correctly. • Verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.
A26	CHECK FOR CORRECT RCM MODULE OPERATION	
	• Disconnect all the RCM module connectors. • Check for: — corrosion — damaged pins — pushed-out pins • Connect all the RCM module connectors and make sure they seat correctly. • Verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new RCM module. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. REPOWER the SRS. REFER to Air Bag Systems. CLEAR the DTCs. REPEAT the network test with the scan tool.
A27	CHECK FOR CORRECT OCSM OPERATION	
	• Disconnect the OCSM connector. • Check for: — corrosion — damaged pins — pushed-out pins • Connect the OCSM connector and make sure it seats correctly. • Verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new OCSM. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. REPOWER the SRS. REFER to Air Bag Systems. REPOWER the SRS. CLEAR the DTCs. REPEAT the network test with the scan tool.

A23-A27

Test B: The Occupant Classification System Module (OCSM) Does Not Communicate With the Scan Tool

PINPOINT TEST B: THE OCCUPANT CLASSIFICATION SYSTEM MODULE (OCSM) DOES NOT COMMUNICATE WITH THE SCAN TOOL

Normal Operation

The OCSM communicates with the scan tool through the high speed controller area network (HS-CAN). Circuits VDB04 (WH/BU) (HS-CAN +) and VDB05 (WH) (HS-CAN -) provide the network connection to the OCSM. The OCSM shares the HS-CAN with the PCM, the 4X4 control module, the restraints control module (RCM), the SJB, and the instrument cluster (IC). Voltage for the RCM is provided by circuit CBP08 (GY/YE) and circuit GD174 (BK/WH) provides ground.

PINPOINT TEST B: THE OCCUPANT CLASSIFICATION SYSTEM MODULE (OCSM) DOES NOT COMMUNICATE WITH THE SCAN TOOL

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step		Result / Action to Take
B1	CHECK THE OCSM VOLTAGE SUPPLY CIRCUITS FOR AN OPEN	
	• Key in OFF position. • Disconnect: OCSM C3159. • Key in ON position. • Measure the voltage between the OCSM C3159-1, circuit CBP08 (GY/YE), harness side and ground  • **Is the voltage greater than 10 volts?**	**Yes** GO to **B2**. **No** VERIFY the SJB fuse 46 (7.5A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
B2	CHECK THE GROUND CIRCUIT FOR AN OPEN	
	• Key in OFF position.	

(Continued)

This pinpoint test is intended to diagnose the following:

- Fuse

- Wiring, terminals or connectors

- OCSM

B1-B2

PINPOINT TEST B: THE OCCUPANT CLASSIFICATION SYSTEM MODULE (OCSM) DOES NOT COMMUNICATE WITH THE SCAN TOOL (Continued)

Test Step		Result / Action to Take
B2	CHECK THE GROUND CIRCUIT FOR AN OPEN (Continued)	
	• Measure the resistance between the OCSM C3159-14, circuit GD174 (BK/WH), harness side and ground.  N0058715 • **Is the resistance less than 5 ohms?**	**Yes** GO to **B3**. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
B3	CHECK THE HS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE OCSM FOR AN OPEN	
	• Measure the resistance between the OCSM C3159-18, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  N0026670 • Measure the resistance between the OCSM C3159-9, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026671 • **Are the resistances less than 5 ohms?**	**Yes** GO to **B4**. **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

(Continued)

B2-B3

PINPOINT TEST B: THE OCCUPANT CLASSIFICATION SYSTEM MODULE (OCSM) DOES NOT COMMUNICATE WITH THE SCAN TOOL (Continued)

Test Step		Result / Action to Take
B4	CHECK FOR CORRECT OCSM OPERATION	
	• Disconnect the OCSM connector. • Check for: — corrosion — damaged pins — pushed-out pins • Connect the OCSM connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new OCSM. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

B4

Test C: The Restraints Control Module (RCM) Does Not Respond to the Scan Tool

PINPOINT TEST C: THE RESTRAINTS CONTROL MODULE (RCM) DOES NOT RESPOND TO THE SCAN TOOL

Normal Operation

The RCM communicates with the scan tool through the high speed controller area network (HS-CAN). Circuits VDB04 (WH/BU) (HS-CAN +) and VDB05 (WH) (HS-CAN -) provide the network connection to the RCM. The RCM module shares the HS-CAN with the PCM, the 4X4 control module, the occupant classification system module (OCSM), the SJB, and the instrument cluster (IC). Voltage for the RCM is provided by circuit CBP08 (GY/YE), and the RCM is case grounded.

This pinpoint test is intended to diagnose the following:

- Fuse

- Wiring, terminals or connectors

- Case ground open

- RCM

PINPOINT TEST C: THE RESTRAINTS CONTROL MODULE (RCM) DOES NOT RESPOND TO THE SCAN TOOL

WARNING: Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

WARNING: Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

WARNING: Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step		Result / Action to Take
C1	CHECK THE RCM PINS FOR DAMAGE	
	• Key in OFF position. • Depower the SRS. Refer to Air Bag Systems. • Disconnect: RCM C2041a and C2041b. • Inspect the RCM C2041a, harness side and RCM C2041a, component side, pins 17 and 18 for damage. • **Are the RCM connector pins 17 and 18 OK?**	**Yes** GO to **C2**. **No** REPAIR the RCM connector pins as necessary. REPOWER the SRS. REFER to Air Bag Systems. CLEAR the DTCs. REPEAT the network test with the scan tool.
C2	CHECK THE RCM VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
	• Deactivate the SRS. Refer to Air Bag Systems. • Repower the SRS. Refer to Air Bag Systems. • Key in ON position. • Measure the voltage between the RCM C2041b-24, circuit CBP08 (GY/YE), harness side and ground.  A0093807 • **Is the voltage greater than 10 volts?**	**Yes** GO to **C3**. **No** VERIFY the SJB fuse 8 (10A) is OK. If OK, REPAIR the circuit. REACTIVATE the SRS. REFER to Air Bag Systems. CLEAR the DTCs. REPEAT the network test with the scan tool.
C3	CHECK THE RCM CASE GROUND	
	• Key in OFF position. • Measure the resistance between the RCM case and a good sheet metal ground near the RCM. • **Is the resistance less than 25 ohms?**	**Yes** GO to **C4**. **No** REPAIR the RCM case ground as necessary. REACTIVATE the SRS. REFER to Air Bag Systems. CLEAR the DTCs. REPEAT the network test with the scan tool.

(Continued)

PINPOINT TEST C: THE RESTRAINTS CONTROL MODULE (RCM) DOES NOT RESPOND TO THE SCAN TOOL (Continued)

Test Step		Result / Action to Take
C4	CHECK THE HS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE RCM FOR AN OPEN	
	• Measure the resistance between the RCM C2041a-18, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  N0026666 • Measure the resistance between the RCM C2041a-17, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026667 • **Are the resistances less than 5 ohms?**	**Yes** GO to **C5**. **No** REPAIR the circuit in question. REACTIVATE the SRS. REFER to Air Bag Systems. CLEAR the DTCs. REPEAT the network test with the scan tool.
C5	CHECK FOR CORRECT RCM OPERATION	
	• Disconnect all the RCM connectors. • Check for: — corrosion — damaged pins — pushed-out pins • Connect all the RCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new RCM. REACTIVATE the SRS. REFER to Air Bag Systems. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. REACTIVATE the SRS. REFER to Air Bag Systems. CLEAR the DTCs. REPEAT the network test with the scan tool.

C4-C5

Test D: The Smart Junction Box (SJB) Does Not Respond to the Scan Tool

PINPOINT TEST D: THE SMART JUNCTION BOX (SJB) DOES NOT RESPOND TO THE SCAN TOOL

Normal Operation

The SJB communicates with the scan tool through the high speed controller area network (HS-CAN). Circuits VDB04 (WH/BU) (HS-CAN +) and VDB05 (WH) (HS-CAN -) provide the network connection to the SJB. The SJB shares the HS-CAN with the PCM, the restraints control module (RCM), the occupant classification system module (OCSM), the 4X4 control module, and the instrument cluster (IC). Voltage is supplied through circuit SBB05 (GY/RD), and ground is provided through circuit GD174 (BK/WH).

This pinpoint test is intended to diagnose the following:

- Fuse

- Wiring, terminals or connectors

- SJB

PINPOINT TEST D: THE SMART JUNCTION BOX (SJB) DOES NOT RESPOND TO THE SCAN TOOL

⚠ **CAUTION: Use the correct probe adapter(s) when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step		Result / Action to Take
D1	CHECK THE SJB FUSE FOR AN OPEN	
	• Disconnect: SJB Fuse 11 (10A). • Inspect the fuse for an open. • **Is the fuse open?**	**Yes** GO to **D4**. **No** GO to **D2**.
D2	CHECK THE SJB GROUND CIRCUIT FOR AN OPEN	
	• Key in OFF position. • Disconnect: SJB C2280c. • Measure the resistance between the SJB C2280c-1, circuit GD174 (BK/WH), harness side and ground.  N0053249 • **Is the resistance less than 5 ohms?**	**Yes** GO to **D3**. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
D3	CHECK THE HS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE SJB FOR AN OPEN	
	• Disconnect: SJB C2280d.	

(Continued)

D1-D3

PINPOINT TEST D: THE SMART JUNCTION BOX (SJB) DOES NOT RESPOND TO THE SCAN TOOL (Continued)

Test Step	Result / Action to Take
D3 **CHECK THE HS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE SJB FOR AN OPEN (Continued)** • Measure the resistance between the SJB C2280d-20, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  N0053239 • Measure the resistance between the SJB C2280d-21, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0053240 • **Are the resistances less than 5 ohms?**	**Yes** GO to **D4**. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
D4 **CHECK FOR CORRECT SJB OPERATION** • Disconnect all the SJB connectors. • Check for: — corrosion — damaged pins — pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

D3-D4

Test E: The Instrument Cluster (IC) Does Not Respond to the Scan Tool

PINPOINT TEST E: THE INSTRUMENT CLUSTER (IC) DOES NOT RESPOND TO THE SCAN TOOL

Normal Operation

The instrument cluster (IC) communicates with the scan tool through the high speed controller area network (HS-CAN). Circuits VDB04 (WH/BU) (HS-CAN +) and VDB05 (WH) (HS-CAN -) provide the network connection to the IC. The IC shares the HS-CAN with the PCM, the restraints control module (RCM), the occupant classification system module (OCSM), the 4X4 control module, and the SJB. Voltage is supplied by circuits SBP33 (RD), CBP09 (VT/GY) and CBP10 (YE/OG). Ground is supplied by circuits GD161 (BK/YE) and GD174 (BK/WH).

This pinpoint test is intended to diagnose the following:

- Fuse

- Wiring, terminals or connectors

- IC

PINPOINT TEST E: THE INSTRUMENT CLUSTER (IC) DOES NOT RESPOND TO THE SCAN TOOL

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step		Result / Action to Take
E1	CHECK THE HS-CAN TERMINATION RESISTANCE	
	• Key in OFF position. • **NOTE:** Failure to disconnect the battery will result in false resistance readings. Disconnect the battery. • Disconnect the scan tool cable from the data link connector (DLC). • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance between 54 and 66 ohms?**	**Yes** GO to **E2**. **No** GO to **E4**.
E2	CHECK THE IC VOLTAGE SUPPLY CIRCUITS FOR AN OPEN	
	• Disconnect: IC C220b. • Connect the battery. • Key in ON position. • Measure the voltage between the IC, harness side and ground as follows: **Connector-Pin / Circuit** C220b-8 — CBP10 (YE/OG) C220b-10 — SBP33 (RD) C220b-12 — CBP09 (VT/GY) • **Are the voltages greater than 10 volts?**	**Yes** GO to **E3**. **No** VERIFY the SJB fuses 9 (5A), 10 (10A) and 33 (5A) are OK. If OK, REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

(Continued)

E1-E2

PINPOINT TEST E: THE INSTRUMENT CLUSTER (IC) DOES NOT RESPOND TO THE SCAN TOOL (Continued)

Test Step		Result / Action to Take
E3	**CHECK THE IC GROUND CIRCUITS FOR AN OPEN**	
	• Key in OFF position. • Disconnect: IC C220a. • Measure the resistance between the IC, harness side and ground as follows:	

Connector-Pin	Circuit
C220a-1	GD161 (BK/YE)
C220b-3	GD174 (BK/WH)

	• **Are the resistances less than 5 ohms?**	**Yes** GO to **E4**. **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.
E4	**CHECK THE HS-CAN CIRCUITS BETWEEN THE IC AND THE DLC FOR AN OPEN**	
	• Measure the resistance between the IC C220b-1, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.	
	 A0076180	
	• Measure the resistance between the IC C220b-2, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.	
	 A0076181	
	• **Are the resistances less than 5 ohms?**	**Yes** GO to **E5**. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
E5	**CHECK FOR CORRECT IC OPERATION**	
	• Disconnect the IC connector. • Check for: — corrosion — damaged pins — pushed-out pins • Connect the IC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IC. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

E3-E5

Test F: The Four Wheel Drive (4X4) Control Module Does Not Respond To The Scan Tool

PINPOINT TEST F: THE FOUR WHEEL DRIVE (4X4) CONTROL MODULE DOES NOT RESPOND TO THE SCAN TOOL

Normal Operation

The 4X4 control module communicates with the scan tool through the high speed controller area network (HS-CAN). Circuits VDB04 (WH/BU) (HS-CAN +) and VDB05 (WH) (HS-CAN -) provide the network connection to the 4X4 control module. The 4X4 control module shares the HS-CAN with the PCM, the restraints control module (RCM), the occupant classification system module (OCSM), the instrument cluster (IC), and the SJB.

PINPOINT TEST F: THE FOUR WHEEL DRIVE (4X4) CONTROL MODULE DOES NOT RESPOND TO THE SCAN TOOL

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step		Result / Action to Take
F1	**CHECK THE 4X4 CONTROL MODULE VOLTAGE SUPPLY CIRCUITS FOR AN OPEN** • Key in OFF position. • Disconnect: 4X4 Control Module C281a. • Disconnect: 4X4 Control Module C281b. • Key in ON position. • Measure the voltage between the 4X4 control module, harness side and ground as follows: **Connector-Pin** / **Circuit** C2281-8 — CBP10 (YE/OG) C2281-6 — SBB27 (BU/RD) C2281-7 — SBP28 (GN/RD) • **Are the voltages greater than 10 volts?**	**Yes** GO to **F2**. **No** VERIFY the battery junction box (BJB) fuse 27 (20A), and SJB fuses 10 (10A) and 28 (15A) are OK. If OK, REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.
F2	**CHECK THE 4X4 CONTROL MODULE GROUND CIRCUITS FOR AN OPEN** • Key in OFF position. • Disconnect: IC C220a. • Measure the resistance between the 4X4 control module, harness side and ground as follows: **Connector-Pin** / **Circuit** C2281-10 — GD161 (BK/YE) C2281-3 — GD174 (BK/WH) • **Are the resistances less than 5 ohms?**	**Yes** GO to **F3**. **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

(Continued)

Voltage is supplied by circuits SBB27 (BU/RD), SBP28 (GN/RD) and CBP10 (YE/OG). Ground is supplied by circuits GD161 (BK/YE) and GD174 (BK/WH).

This pinpoint test is intended to diagnose the following:

- Fuse

- Wiring, terminals or connectors

- 4X4 control module

F1-F2

PINPOINT TEST F: THE FOUR WHEEL DRIVE (4X4) CONTROL MODULE DOES NOT RESPOND TO THE SCAN TOOL (Continued)

Test Step		Result / Action to Take
F3	CHECK THE HIGH SPEED CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE 4X4 CONTROL MODULE FOR AN OPEN	
	• Measure the resistance between the 4X4 control module C281a-10, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  N0053241 • Measure the resistance between the 4X4 control module C281a-9, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0053242 • **Are the resistances less than 5 ohms?**	**Yes** GO to **F4**. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
F4	CHECK FOR CORRECT 4X4 CONTROL MODULE OPERATION	
	• Disconnect all the 4X4 control module connectors. • Check for: — corrosion — damaged pins — pushed-out pins • Connect all the 4X4 control module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a 4X4 control module. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

F3-F4

Test G: The ABS Module Does Not Respond To The Scan Tool Or No International Standards Organization (ISO) 9141 Network Communic

PINPOINT TEST G: THE ABS MODULE DOES NOT RESPOND TO THE SCAN TOOL OR NO INTERNATIONAL STANDARDS ORGANIZATION (ISO) 9141 NETWORK COMMUNICATION

Normal Operation

The scan tool communicates with the ISO 9141 network through the data link connector (DLC). The SJB communicates with the scan tool through the ISO 9141 communications network, circuit 70 (LB/WH).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors

- DLC

PINPOINT TEST G: PINPOINT TEST G: THE ABS MODULE DOES NOT RESPOND TO THE SCAN TOOL OR NO INTERNATIONAL STANDARDS ORGANIZATION (ISO) 9141 NETWORK COMMUNICATION

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step		Result / Action to Take
G1	**CHECK THE DLC PINS FOR DAMAGE** **NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test. • Key in OFF position. • Disconnect the scan tool cable from the DLC. • Inspect DLC pin 7 for damage.  N0053184 • **Is DLC pin 7 OK?**	**Yes** GO to **G2**. **No** REPAIR the DLC as necessary. CLEAR the DTCs. REPEAT the network test with the scan tool.
G2	**CHECK THE ISO 9141 CIRCUIT BETWEEN THE ABS MODULE AND THE DLC FOR AN OPEN** • Disconnect: ABS Module C135. • Measure the resistance between the ABS module C135-16, circuit VDB10 (GY), harness side and the DLC C251-7, circuit VDB10 (GY), harness side.  A0079897 • **Is the resistance less than 5 ohms?**	**Yes** GO to **G3**. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.

(Continued)

G1-G2

PINPOINT TEST G: PINPOINT TEST G: THE ABS MODULE DOES NOT RESPOND TO THE SCAN TOOL OR NO INTERNATIONAL STANDARDS ORGANIZATION (ISO) 9141 NETWORK COMMUNICATION (Continued)

Test Step	Result / Action to Take
G3 CHECK THE ISO 9141 NETWORK FOR A SHORT TO GROUND	
• Measure the resistance between the DLC C251-7, circuit VDB10 (GY), harness side and ground.  A0060879 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to **G4**. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
G4 CHECK THE ISO CIRCUIT FOR A SHORT TO VOLTAGE	
NOTE: The ABS module must be disconnected for this test step to be accurate. • Key in ON position. • Measure the voltage between the DLC C251-7, circuit VDB10 (GY), harness side and ground.  A0076176 • **Is any voltage indicated?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** GO to **G5**.
G5 CHECK THE ABS MODULE VOLTAGE SUPPLY	
• Measure the voltage between the ABS module, harness side and ground as follows: **ABS Module Connector-Pin / Circuit** C135-11 — SBB15 (WH/RD) C135-20 — CBP20 (YE/VT) C135-28 — SBB17 (RD) • **Are the voltages greater than 10 volts?**	**Yes** GO to **G6**. **No** VERIFY battery junction box (BJB) fuses 17 (40A) and 33 (30A) and SJB fuse 20 (10A) are OK. If OK, REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.
G6 CHECK THE ABS MODULE GROUND CIRCUITS	
• Key in OFF position. • Measure the resistance between the ABS module, harness side and ground as follows:	

(Continued)

G3-G6

PINPOINT TEST G: PINPOINT TEST G: THE ABS MODULE DOES NOT RESPOND TO THE SCAN TOOL OR NO INTERNATIONAL STANDARDS ORGANIZATION (ISO) 9141 NETWORK COMMUNICATION (Continued)

Test Step		Result / Action to Take
G6	CHECK THE ABS MODULE GROUND CIRCUITS (Continued)	
		Yes GO to **G7**. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.

ABS Module Connector-Pin	Circuit
C135-1	GD122 (BK)
C135-18	GD122 (BK)

- **Are the resistances less than 5 ohms?**

G7	CHECK FOR CORRECT ABS MODULE OPERATION	
	• Disconnect the ABS module connector. • Check for: — corrosion — damaged pins — pushed-out pins • Connect the ABS module connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ABS module. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

PINPOINT TEST H: INTERMITTENT NO HIGH SPEED CONTROLLER AREA NETWORK (HS-CAN) COMMUNICATION, ONE OR MORE MODULES ARE NOT RESPONDING DURING NETWORK TEST

NOTE: Various modules will set network DTCs during this test procedure. Clear DTCs from all modules after the diagnostic procedure is completed.

Test Step		Result / Action to Take
H1	CHECK THE DATA LINK CONNECTOR (DLC) PINS FOR DAMAGE	
	• Key in OFF position. • Disconnect the scan tool cable from the DLC.	

(Continued)

Test H: Intermittent No High Speed Controller Area Network (HS-CAN) Communication, One Or More Modules Are Not Responding Durin

PINPOINT TEST H: INTERMITTENT NO HIGH SPEED CONTROLLER AREA NETWORK (HS-CAN) COMMUNICATION, ONE OR MORE MODULES ARE NOT RESPONDING DURING NETWORK TEST

Normal Operation

The HS-CAN network is used for communication between the PCM, the power steering control module (PSCM), the ABS module, the restraints control module (RCM), the 4X4 control module (if equipped) and the instrument cluster (IC). An open circuit VDB04 (WH/BU) (HS-CAN +) or VDB05 (WH) (HS-CAN -) may cause intermittent or unreliable communication to all modules on the HS-CAN.

In the event that one of the 2 network circuits (HS-CAN + or HS-CAN -) becomes open to a module on the network, unreliable network communication to all modules on the network may result.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors

H1

PINPOINT TEST H: INTERMITTENT NO HIGH SPEED CONTROLLER AREA NETWORK (HS-CAN) COMMUNICATION, ONE OR MORE MODULES ARE NOT RESPONDING DURING NETWORK TEST (Continued)

Test Step		Result / Action to Take
H1	**CHECK THE DATA LINK CONNECTOR (DLC) PINS FOR DAMAGE (Continued)**	
	• Inspect DLC pins 6 and 14 for damage.  A0093867 • **Are DLC pins 6 and 14 OK?**	**Yes** GO to **H2**. **No** REPAIR the DLC as necessary. CLEAR the DTCs. REPEAT the network test with the scan tool.
H2	**CHECK THE HS-CAN TERMINATION RESISTANCE**	
	• Key in OFF position. • **NOTE:** Failure to disconnect the battery will result in false resistance readings. Disconnect the battery. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance between 54 and 66 ohms?**	**Yes** GO to **H3**. **No** GO to Pinpoint Test A.

(Continued)

H1-H2

PINPOINT TEST H: INTERMITTENT NO HIGH SPEED CONTROLLER AREA NETWORK (HS-CAN) COMMUNICATION, ONE OR MORE MODULES ARE NOT RESPONDING DURING NETWORK TEST (Continued)

Test Step		Result / Action to Take
H3	**CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND** • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002963 • **Are the resistances greater than 5,000 ohms?**	**Yes** GO to **H4**. **No** GO to Pinpoint Test A.
H4	**CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO VOLTAGE** • Connect the battery. • Key in ON position. • Measure the voltage between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002964 • **Is the voltage greater than 6 volts?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** GO to **H5**.

H3-H4

PINPOINT TEST H: INTERMITTENT NO HIGH SPEED CONTROLLER AREA NETWORK (HS-CAN) COMMUNICATION, ONE OR MORE MODULES ARE NOT RESPONDING DURING NETWORK TEST (Continued)

	Test Step	Result / Action to Take
H5	**CHECK FOR RESTORED COMMUNICATION WITH THE PCM DISABLED**	
	NOTE: An IDS session must be established prior to disabling the PCM in this test step. If the PCM has failed communication during multiple attempts to identify the vehicle, first identify the vehicle manually by entering a PCM part number, calibration number or tear tag when prompted by IDS. **NOTE:** When a vehicle is manually identified by a PCM part number, calibration number or tear tag, the IDS will not automatically run a network test. The network test must be manually selected and run. **NOTE:** When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results. • Disconnect: BJB Fuses 21 (10A) and 39 (15A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** INSTALL the removed fuses. GO to Pinpoint Test A. **No** INSTALL the removed fuses. GO to **H6**.
H6	**CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE SJB DISABLED**	
	NOTE: When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results. • Disconnect: SJB Fuse 11 (10A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** INSTALL the removed fuse. GO to Pinpoint Test D. **No** GO to **H7**.
H7	**CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE SJB DISCONNECTED**	
	• Disconnect: SJB C2280c. • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all modules pass the network test?**	**Yes** INSTALL the removed fuse. CONNECT the SJB. GO to Pinpoint Test D. **No** CONNECT the SJB. GO to **H8**.
H8	**CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE IC DISABLED**	
	NOTE: When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results. • Disconnect: SJB Fuse 9 (5A), 10 (10A) and 33 (5A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** INSTALL the removed fuses. If the vehicle is equipped with 4X4, GO to **H9**. If the vehicle is not equipped with 4X4, GO to Pinpoint Test E. **No** INSTALL the removed fuses. If the vehicle is equipped with 4X4, GO to **H10**. If the vehicle is not equipped with 4X4, GO to **H11**.
H9	**CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE IC DISCONNECTED**	
	NOTE: When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results. • Disconnect: IC C220b. • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** INSTALL the removed fuses. GO to Pinpoint Test E. **No** INSTALL the removed fuses. GO to **H10**.

(Continued)

H5-H9

PINPOINT TEST H: INTERMITTENT NO HIGH SPEED CONTROLLER AREA NETWORK (HS-CAN) COMMUNICATION, ONE OR MORE MODULES ARE NOT RESPONDING DURING NETWORK TEST (Continued)

	Test Step	Result / Action to Take
H10	**CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE 4X4 CONTROL MODULE DISABLED**	
	NOTE: When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results. • Disconnect: BJB Fuse 27 (20A) and SJB Fuses 10 (10A) and 28 (15A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** INSTALL the removed fuse. GO to Pinpoint Test F. **No** INSTALL the removed fuse. GO to **H11**.
H11	**CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE RESTRAINTS CONTROL MODULE (RCM) AND OCCUPANT CLASSIFICATION SYSTEM MODULE (OCSM) DISABLED**	
	NOTE: When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results. • Disconnect: SJB Fuse 8 (10A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** INSTALL the removed fuse. GO to **H12**. **No** INSTALL the removed fuse. An intermittent fault is not present. GO to Pinpoint Test A.
H12	**CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE OCCUPANT CLASSIFICATION SYSTEM MODULE (OCSM) DISCONNECTED**	
	NOTE: When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results. • Disconnect: OCSM C3159. • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** CONNECT the OCSM. GO to Pinpoint Test B. **No** CONNECT the OCSM. GO to **H13**.
H13	**CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE RESTRAINTS CONTROL MODULE (RCM) DISABLED**	
	NOTE: When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results. • Disconnect: RCM C2041a. • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** CONNECT the RCM. GO to Pinpoint Test C. **No** CONNECT the RCM. An intermittent fault is not present. GO to Pinpoint Test A.

H10-H13

Test I: No Power To The Scan Tool

PINPOINT TEST I: NO POWER TO THE SCAN TOOL

Normal Operation

The scan tool is connected to the data link connector (DLC) to communicate with the high speed controller area network (HS-CAN) and International Standards Organization (ISO) 9141 communications networks.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- DLC
- Scan tool

PINPOINT TEST I: NO POWER TO THE SCAN TOOL

Test Step		Result / Action to Take
I1	CHECK THE DLC PINS FOR DAMAGE	
	NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test. • Disconnect the scan tool cable from the DLC. • Inspect DLC pins 4, 5 and 16 for damage.  N0050767 • **Are DLC pins 4, 5 and 16 OK?**	**Yes** GO to I2. **No** REPAIR the DLC as necessary. CLEAR the DTCs. REPEAT the network test with the scan tool.
I2	CHECK THE DLC VOLTAGE SUPPLY CIRCUITS FOR AN OPEN	
	• Measure the voltage between the DLC C251-16, circuit SBP29 (GY/RD), harness side and ground.  A0057467 • **Is the voltage greater than 10 volts?**	**Yes** GO to I3. **No** VERIFY the SJB fuse 29 (20A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.

(Continued)

PINPOINT TEST I: NO POWER TO THE SCAN TOOL (Continued)

Test Step		Result / Action to Take
I3	CHECK THE DLC GROUND CIRCUITS	
	• Measure the resistance between the DLC C251-4, circuit GD161 (BK/YE), harness side and ground; and between the DLC C251-5, circuit GD174 (BK/WH), harness side and ground.  A0060571 • **Are the resistances less than 5 ohms?**	**Yes** REPAIR the scan tool. REPEAT the network test with the scan tool. **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

I1-I2

Information Bus: Programming and Relearning

PROGRAMMABLE MODULE INSTALLATION

Special Tool(s)

Special Tool(s)

Programmable Module Installation (PMI) Using The Integrated Diagnostic System (IDS) When The Original Module Is Available

NOTE: Following module installation, some modules require a separate learning procedure be carried out. For instructions, refer to the specific module removal and installation procedures.

1. Connect the IDS and identify the vehicle as normal. 2. From the Toolbox icon, select Module Programming and press the check mark. 3. Select Programmable Module Installation. 4. Select the module that is being replaced. 5. Follow the on-screen instructions, turn the ignition key to the OFF position, and press the check mark. 6. Install the new module and press the check mark. 7. Follow the on-screen instructions, turn the ignition key to the ON position, and press the check mark. 8. The IDS downloads the data into the new module and displays Module Configuration Complete. 9. Test module for correct operation.

Programmable Module Installation (PMI) Using The Integrated Diagnostic System (IDS) When The Original Module Is Not Available

NOTE: Following module installation, some modules require a separate learning procedure be carried out. For adaptive learning and calibration instructions, refer to the specific module removal and installation procedures.

1. Install the new module. 2. Connect the IDS and identify the vehicle as normal. 3. From the Toolbox icon, select Module Programming and press the check mark. 4. Select Programmable Module Installation. 5. Select the module that was replaced. 6. Follow the on-screen instructions, turn the ignition key to the OFF position, and press the check mark. 7. Follow the on-screen instructions, turn the ignition key to the ON position, and press the check mark. 8. If the data is not available, the IDS displays a screen stating to contact the As-Built Data Center. Retrieve the data from the technician service

publication website at this time and press the check mark.

9. Enter the module data and press the check mark.

10. The IDS downloads the data into the new module and displays Module Configuration Complete. 11. Test module for correct operation.

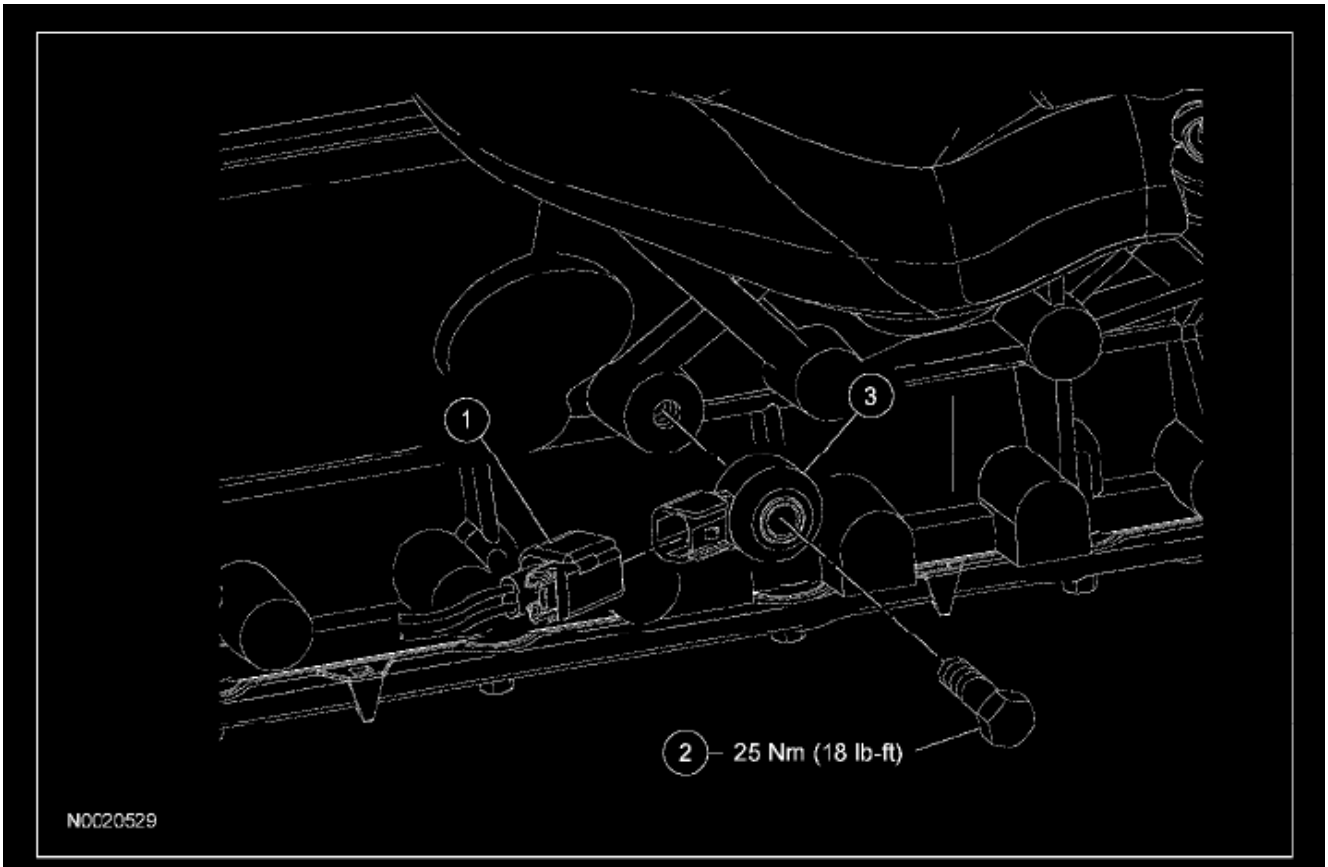
Two Types of Knock Sensor (KS)

Knock Sensor: Description and Operation

Knock Sensor (KS)

Two Types Of Knock Sensor (KS)

The KS is a tuned accelerometer on the engine which converts engine vibration to an electrical signal. The PCM uses this signal to determine the presence of engine knock and to retard spark timing.



Item	Part Number	Description
1	14A464	Knock sensor (KS) electrical connector (part of 12B637)
2	W5000225	KS bolt
3	12A699	KS

Knock Sensor: Service and Repair

KNOCK SENSOR (KS)

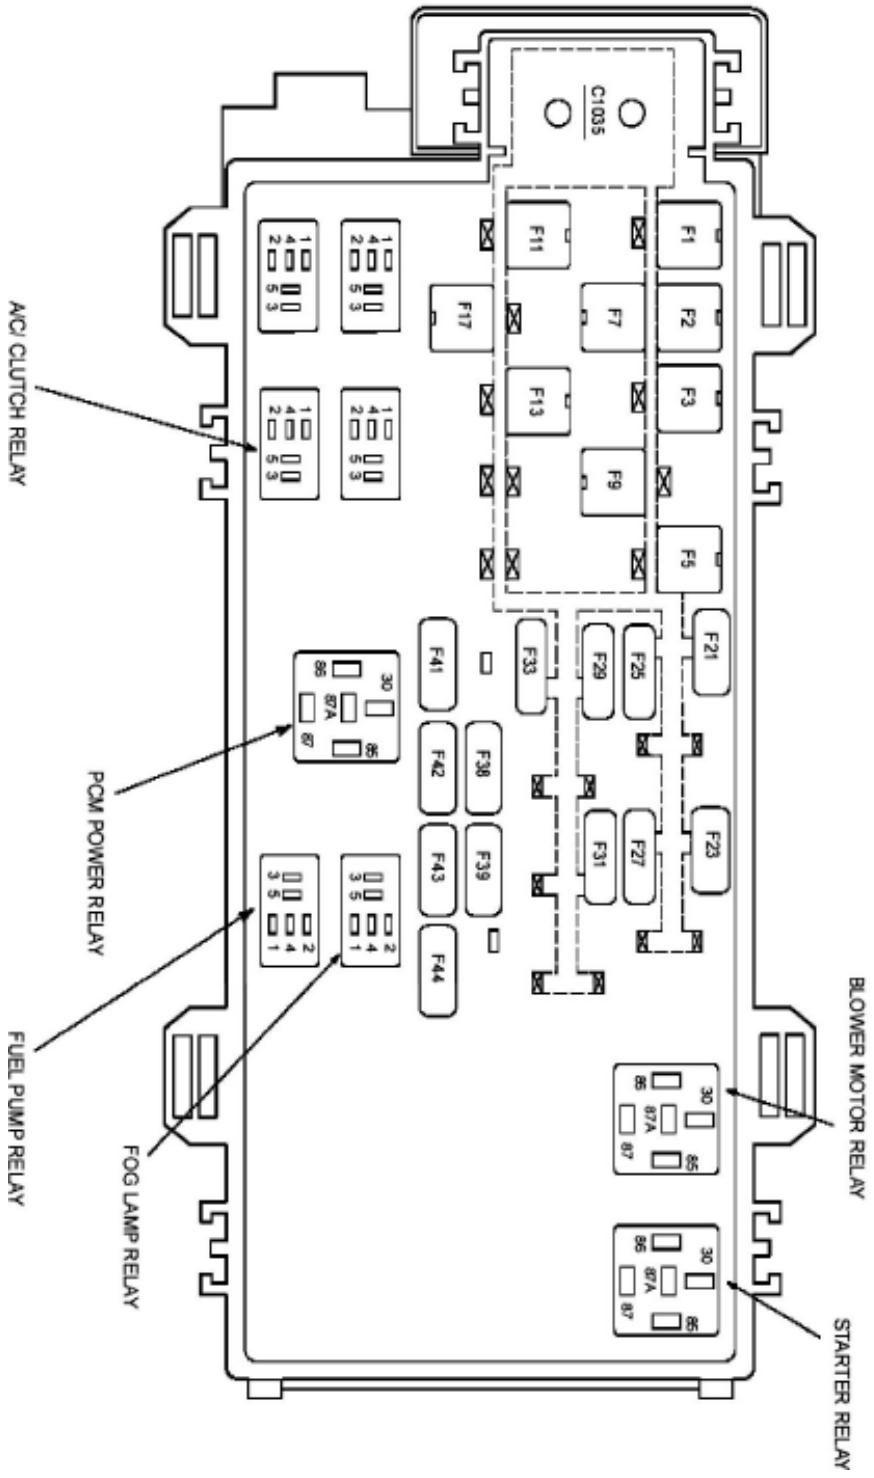
Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. 2. Disconnect the knock sensor (KS) electrical connector. 3. Remove the bolt and the KS.

- To install, tighten to 25 Nm (18 lb-ft).

4. To install, reverse the removal procedure.

BATTERY JUNCTION BOX (BJB), 3.0L, 4.0L

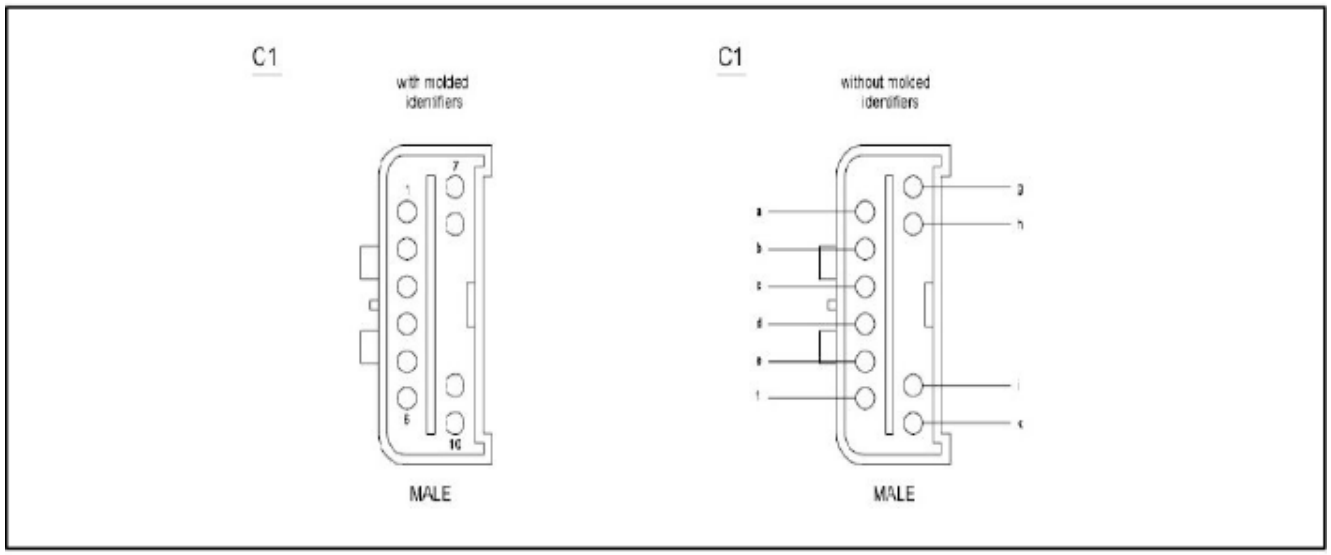


Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



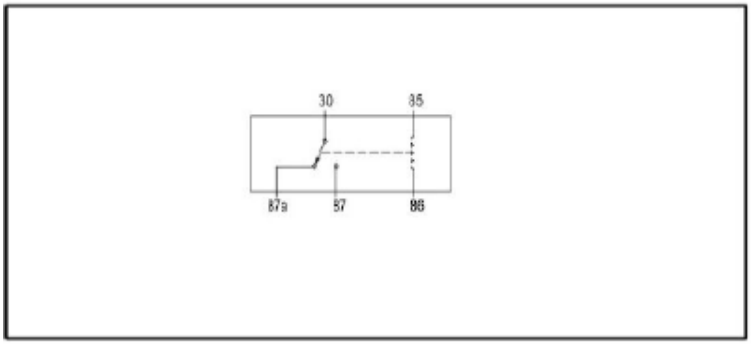
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

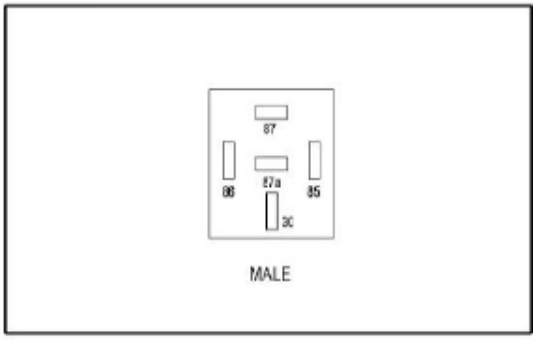
Main Relay (Computer/Fuel System): Testing and Inspection

Relay □ Mini ISO

Schematic



Terminals

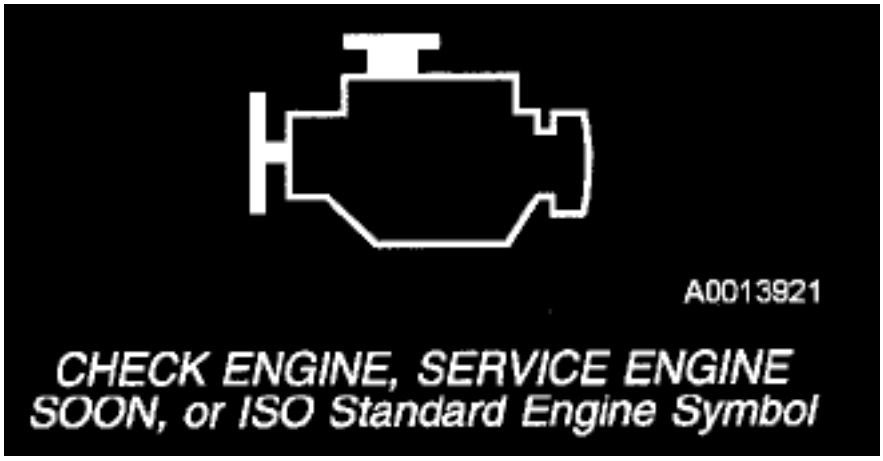


Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.



Malfunction Indicator Lamp: Description and Operation

MALFUNCTION INDICATOR LAMP (MIL)

Check Engine, Service Engine Soon, Or ISO Standard Engine Symbol

The MIL notifies the driver that the powertrain control module (PCM) has detected an on board diagnostic (OBD) emission-related component or system concern. When this occurs, an OBD diagnostic trouble code (DTC) sets.

- The MIL is located in the instrument cluster and is labeled CHECK ENGINE, SERVICE ENGINE SOON or the international standards organization (ISO) standard engine symbol.

- The MIL is illuminated during the instrument cluster prove out for approximately 4 seconds.

- The MIL remains illuminated after instrument cluster prove out if: -

an emission-related concern and DTC exists.

- the PCM does not send a control message to the instrument cluster (applications with the MIL controlled through the communication link).

- the PCM is operating in the hardware limited operation strategy (HLOS).

- The MIL remains off during the instrument cluster prove out if an indicator or instrument cluster concern is present.

- To turn off the MIL after a repair, a reset command from the scan tool must be sent, or 3 consecutive drive cycles must be completed without a concern.

- For all MIL concerns, go to Symptom Charts. See: Testing and Inspection/Symptom Related Diagnostic Procedures

- If the MIL flashes at a steady rate, a severe misfire condition may exist.

- If the MIL flashes erratically, the PCM can reset while cranking if the battery voltage is low.

- The MIL flashes after a period of time with the key in the RUN position (engine not running) if DTC P1000 is set.

C1087

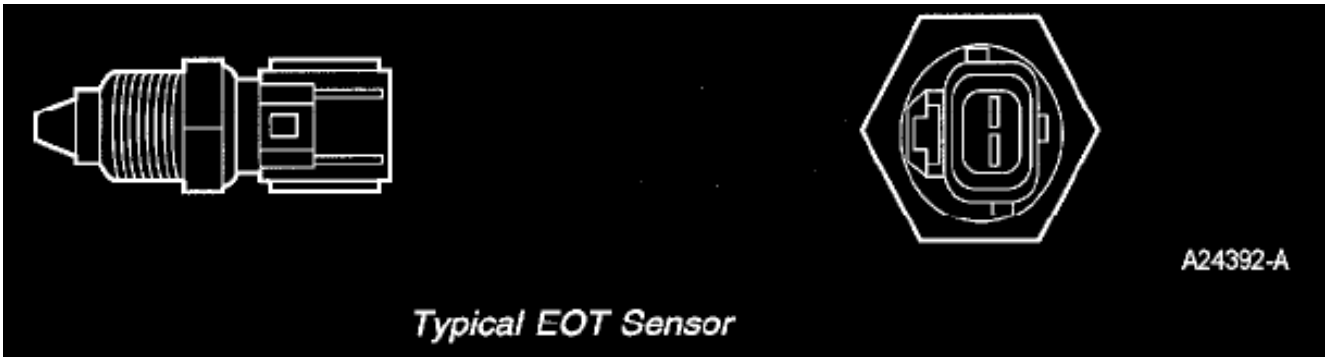
Manifold Pressure/Vacuum Sensor: Description and Operation

MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR

Typical Manifold Absolute Pressure (MAP) Sensor

The MAP sensor measures intake manifold absolute pressure. The PCM uses information from the MAP sensor to measure how much exhaust gas is introduced into the intake manifold.



Typical EOT Sensor

Oil Temperature Sensor For ECM: Description and Operation

ENGINE OIL TEMPERATURE (EOT) SENSOR

Typical EOT Sensor

The EOT sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of a thermistor decreases as the temperature increases and the resistance increases as the temperature decreases. The varying resistance changes the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Thermistor-type sensors are considered passive sensors. A passive sensor is connected to a voltage divider network so that varying the resistance of the passive sensor causes a variation in total current flow. Voltage that is dropped across a fixed resistor in a series with the sensor resistor determines the voltage signal at the PCM. This voltage signal is equal to the reference voltage minus the voltage drop across the fixed resistor.

The EOT sensor measures the temperature of the engine oil. The sensor is typically threaded into the engine oil lubrication system. The PCM can use the EOT sensor input to determine the following:

- On variable camshaft timing (VCT) applications the EOT input is used to adjust the VCT control gains and logic for camshaft timing.

- The PCM can use EOT sensor input in conjunction with other PCM inputs to determine oil degradation.

- The PCM can use EOT sensor input to initiate a soft engine shutdown. To prevent engine damage from occurring as a result of high oil temperatures, the PCM has the ability to initiate a soft engine shutdown. Whenever engine RPM exceeds a calibrated level for a certain period of time, the PCM begins reducing power by disabling engine cylinders.

Heated Oxygen Sensor (HO2S)

Oxygen Sensor: Description and Operation

Heated Oxygen Sensor (HO2S)

Heated Oxygen Sensor (HO2S)

The HO2S detects the presence of oxygen in the exhaust and produces a variable voltage according to the amount of oxygen detected. A high concentration of oxygen (lean air/fuel ratio) in the exhaust produces a voltage signal less than 0.4 volt. A low concentration of oxygen (rich air/fuel ratio) produces a voltage signal greater than 0.6 volt. The HO2S provides feedback to the PCM indicating air/fuel ratio in order to achieve a near stoichiometric air/fuel ratio of 14.7:1 during closed loop engine operation. The HO2S generates a voltage between 0.0 and 1.1 volts.

Embedded with the sensing element is the HO2S heater. The heating element heats the sensor to a temperature of 800°C (1,472°F). At approximately 300°C (572°F) the engine can enter closed loop operation. The VPWR circuit supplies voltage to the heater. The PCM turns the heater on by providing the ground when the correct conditions occur. The heater allows the engine to enter closed loop operation sooner. The use of this heater requires the HO2S heater control to be duty cycled, to prevent damage to the heater.

Universal HO2S

The universal HO2S, sometimes referred to as a wideband oxygen sensor, uses the typical HO2S combined with a current controller in the PCM to infer an air/fuel ratio relative to the stoichiometric air/fuel ratio. This is accomplished by balancing the amount of oxygen ions pumped in or out of a measurement chamber within the sensor. The typical HO2S within the universal HO2S is used to detect the oxygen content of the exhaust gas in the measurement chamber. The oxygen content inside the measurement chamber is maintained at the stoichiometric air/fuel ratio by pumping oxygen ions in and out of the measurement chamber. As the exhaust gasses get richer or leaner, the amount of oxygen that must be pumped in or out to maintain a stoichiometric air/fuel ratio in the measurement chamber varies in proportion to the air/fuel ratio. The amount of current required to

pump the oxygen ions in or out of the measurement chamber is used to measure the air/fuel ratio. The measured air/fuel ratio is actually the output from the current controller in the PCM and not a signal that comes directly from the sensor.

The universal HO2S also uses a self-contained reference chamber to make sure an oxygen differential is always present. The oxygen for the reference chamber is supplied by pumping small amounts of oxygen ions from the measurement chamber into the reference chamber. The universal HO2S does not need access to outside air.

Part to part variance is compensated for by placing a resistor in the connector. This resistor is used to trim the current measured by the current controller in the PCM.

Embedded with the sensing element is the universal H02S heater. The heater allows the engine to enter closed loop operation sooner. The heating element heats the sensor to a temperature of 780°C (1,436°F). The VPWR circuit supplies voltage to the heater. The PCM controls the heater on and off by providing the ground to maintain the sensor at the correct temperature for maximum accuracy.

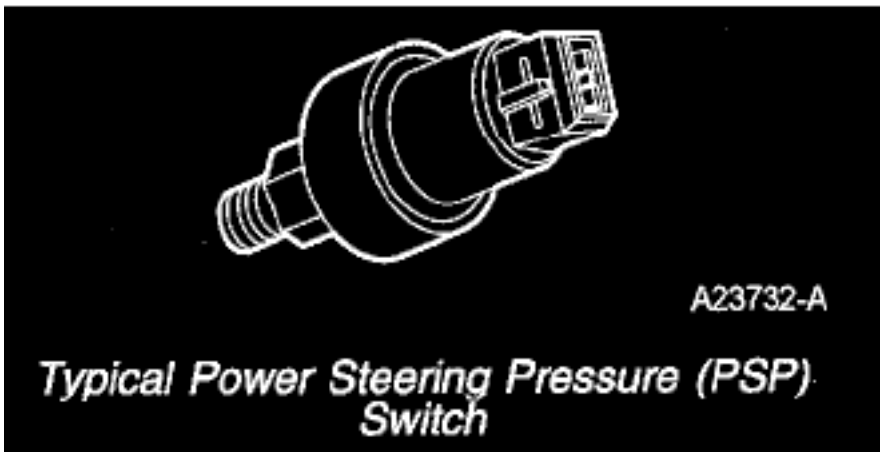
Typical Power Steering Pressure (PSP) Sensor



Typical Power Steering Pressure (PSP) Switch

Power Steering Pressure Switch: Description and Operation

Power Steering Pressure (PSP) Sensor

Typical Power Steering Pressure (PSP) Sensor

The PSP sensor monitors the hydraulic pressure within the power steering system. The PSP sensor voltage input to the PCM changes as the hydraulic pressure changes. The PCM uses the input signal from the PSP sensor to compensate for additional loads on the engine by adjusting the

idle RPM and preventing engine stall during parking maneuvers. Also, the PSP sensor signals the PCM to adjust the transmission electronic pressure control (EPC) pressure during increased engine load, for example, during parking maneuvers.

Power Steering Pressure (PSP) Switch

Typical Power Steering Pressure (PSP) Switch

The PSP switch monitors the hydraulic pressure within the power steering system. The PSP switch is a normally closed switch that opens as the hydraulic pressure increases. The PCM provides a low current voltage on the PSP circuit. When the PSP switch is closed, this voltage is pulled low through the SIG RTN circuit. The PCM uses the input signal from the PSP switch to compensate for additional loads on the engine by adjusting the idle RPM and preventing engine stall during parking maneuvers. Also, the PSP switch signals the PCM to adjust the transmission electronic pressure control (EPC) pressure during increased engine load, for example during parking maneuvers.

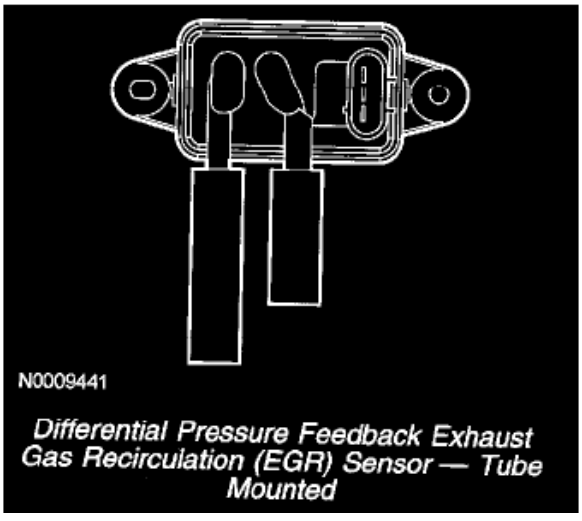
Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor



Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor — Tube Mounted

Pressure Feedback Exhaust Sensor: Description and Operation

Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor

Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor

The differential pressure feedback EGR sensor is a ceramic, capacitive-type pressure transducer that monitors the differential pressure across a metering orifice located in the orifice tube assembly. The differential pressure feedback EGR sensor receives this signal through 2 hoses referred to as the downstream pressure hose (REF SIGNAL) and upstream pressure hose (HI SIGNAL). The HI and REF hose connections are marked on the differential pressure feedback EGR sensor housing for identification (note that the HI signal uses a larger diameter hose). The differential pressure feedback EGR sensor outputs a voltage proportional to the pressure drop across the metering orifice and supplies it to the PCM as EGR flow rate feedback.

Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor - Tube Mounted

Differential Pressure Feedback Exhaust Gas Recirculation (EGR) Sensor - Tube Mounted

The tube mounted differential pressure feedback EGR sensor is identical in operation as the larger plastic differential pressure feedback EGR sensors and uses a 1.0 volt offset. The HI and REF hose connections are marked on the side of the sensor.

ETC System with a 3-Track APP Sensor Failure Mode and Effects Management:

Effect	Failure Mode ▪
No Effect on Driveability	A loss of redundancy or loss of a non-critical input could result in a concern that does not affect driveability. The powertrain malfunction indicator (wrench) illuminates, but the throttle control and torque control systems function normally. A DTC is set to indicate the component or circuit with the concern.
Disable Speed Control	If certain concerns are detected, speed control is disabled. Throttle control and torque control continue to function normally.

(Continued)

Electronic Throttle Control Module: Description and Operation

TORQUE BASED ELECTRONIC THROTTLE CONTROL (ETC)

Overview

The torque based ETC is a hardware and software strategy that delivers an engine output torque (via throttle angle) based on driver demand (pedal position). It uses an electronic throttle body, the powertrain control module (PCM), and an accelerator pedal assembly to control the throttle opening and engine torque.

Torque based ETC enables aggressive automatic transmission shift schedules (earlier upshifts and later downshifts). This is possible by adjusting the throttle angle to achieve the same wheel torque during shifts, and by calculating this desired torque, the system prevents engine lugging (low RPM and low manifold vacuum) while still delivering the performance and torque requested by the driver. It also enables many fuel economy/emission improvement technologies such as variable camshaft timing (VCT) (deliver same torque during transitions).

Torque based ETC also results in less intrusive vehicle and engine speed limiting, along with smoother traction control.

Other benefits of ETC are: -

eliminate cruise control actuators

- eliminate idle air control (IAC) valve

- better airflow range

- packaging (no cable)

- more responsive powertrain at altitude and improved shift quality

The ETC system illuminates a powertrain malfunction indicator (wrench) on the instrument cluster when a concern is present. Concerns are accompanied by diagnostic trouble codes (DTCs) and may also illuminate the malfunction indicator lamp (MIL).

Electronic Throttle Body (ETB)

The ETB has the following characteristics: -

The throttle actuator control (TAC) motor is a DC motor controlled by the PCM (requires 2-wires).

- There are 2 designs: parallel and in-line. The parallel design has the motor under the bore parallel to the plate shaft. The motor housing is integrated into the main housing. The in-line design has a separate motor housing.

- An internal spring is used in both designs to return the throttle plate to a default position. The default position is typically a throttle angle of 7 to 8 degrees from the hard stop angle.

- The closed throttle plate hard stop is used to prevent the throttle from binding in the bore (approximately 0.75 degree). This hard stop setting is not adjustable and is set to result in less airflow than the minimum engine airflow required at idle.

- The required idle airflow is provided by the plate angle in the throttle body assembly. This plate angle controls idle, idle quality, and eliminates the need for an IAC valve.

- There is 1 reference voltage and 1 signal return circuit between the PCM and the ETB. The reference voltage circuit and the signal return circuit is shared with the reference voltage circuits and signal return circuits used by the APP sensor. There are also 2 TP signal circuits for redundancy. The redundant TP signals are required for increased monitoring reasons. The first TP signal (TP1) has a negative slope (increasing angle, decreasing voltage) and the second signal (TP2) has a positive slope (increasing angle, increasing voltage). The TP2 signal reaches a limit of approximately 4.5 volts at approximately 45 degrees of throttle angle.

Accelerator Pedal Position (APP) Sensor

Depending on the application either a 2-track or 3-track APP sensor is used.

Electronic Throttle Control (ETC) System Strategy

ETC System With A 3-Track APP Sensor Failure Mode And Effects Management (Part 1)

ETC System with a 3-Track APP Sensor Failure Mode and Effects Management:

Effect	Failure Mode [a]
RPM Guard with Pedal Follower	In this mode, torque control is disabled due to the loss of a critical sensor or PCM concern. The throttle is controlled in pedal-follower mode as a function of the pedal position sensor input only. A maximum allowed RPM is determined based on the position of the accelerator pedal (RPM Guard). If the actual RPM exceeds this limit, spark and fuel are used to bring the RPM below the limit. The powertrain malfunction indicator (wrench) and the MIL illuminate in this mode and a DTC for an ETC-related component is set. EGR, VCT, and IMRC outputs are set to default values.
RPM Guard with Default Throttle	In this mode, the throttle plate control is disabled due to the loss of throttle position, the throttle plate position controller, or other major electronic throttle body concern. Depending on the concern detected, the throttle plate is either commanded to the default (limp home) position or the motor is disabled and the spring returns the throttle plate to the default (limp home) position. A maximum allowed RPM is determined based on the position of the accelerator pedal (RPM Guard). If the actual RPM exceeds this limit, spark and fuel are used to bring the RPM below the limit. The powertrain malfunction indicator (wrench) and the MIL illuminate in this mode and a DTC P2110 is set. EGR, VCT, and IMRC outputs are set to default values.
RPM Guard with High Forced Idle	This mode is caused by the loss of 2 or 3 pedal position sensor inputs due to sensor, wiring, or PCM concerns. The system is unable to determine driver demand, and the throttle is controlled to a fixed high idle airflow. There is no response to the driver input. The maximum allowed RPM is a fixed value (RPM Guard). If the actual RPM exceeds this limit, spark and fuel are used to bring the RPM below the limit. The powertrain malfunction indicator (wrench) and the MIL illuminate in this mode and a DTC P2104 is set. EGR, VCT, and IMRC outputs are set to default values.
Shutdown	If a significant processor concern is detected, the monitor forces vehicle shutdown by disabling all fuel injectors. The powertrain malfunction indicator (wrench) illuminates in this mode and a DTC P2105 is set.

a ETC illuminates or displays a message on the message center immediately; MIL illuminates after 2 driving cycles

ETC System With A 3-Track APP Sensor Failure Mode And Effects Management (Part 2)

ETC System with a 2-Track APP Sensor Failure Mode and Effects Management:

Effect	Failure Mode
No Effect on Driveability	A loss of redundancy or loss of a non-critical input could result in a concern that does not affect driveability. The powertrain malfunction indicator (wrench) and the MIL do not illuminate. However, speed control and power take off (PTO) may be disabled. A DTC is set to indicate the component or circuit with the concern.
Delayed APP Sensor Response with Brake Override	This mode is caused by the loss of 1 APP sensor input due to sensor, wiring, or PCM concerns. The system is unable to verify the APP sensor input and driver demand. The throttle plate response to the APP sensor input is delayed as the accelerator pedal is applied. The engine returns to idle RPM whenever the brake pedal is applied. The powertrain malfunction indicator (wrench) illuminates, but the MIL does not illuminate in this mode. An APP sensor related DTC is set.
Time-Based Driver Demand with Brake Override	This mode is caused by the loss of one brake pedal position (BPP) and one APP sensor input or both APP sensor inputs due to sensor, wiring, or PCM concerns. The system is unable to determine driver demand. There is no response when the accelerator pedal is applied. The engine returns to idle RPM whenever the brake pedal is applied. When the brake pedal is released, the PCM slowly increases the APP signal to a fixed value. The powertrain malfunction indicator (wrench) illuminates, but the MIL does not illuminate in this mode. An APP or BPP sensor related DTC is set.
RPM Guard with Pedal Follower	In this mode, torque control is disabled due to the loss of a critical sensor or PCM concern. The throttle is controlled in pedal-follower mode as a function of the APP sensor input only. A maximum allowed RPM is determined based on the position of the accelerator pedal (RPM Guard). If the actual RPM exceeds this limit, spark and fuel are used to bring the RPM below the limit. The powertrain malfunction indicator (wrench) and the MIL illuminate in this mode and a DTC for an ETC-related component is set. EGR, VCT, and IMRC outputs are set to default values and speed control is disabled.
RPM Guard with Default Throttle	In this mode, the throttle plate control is disabled due to the loss of both TP sensor inputs, loss of throttle plate control, stuck throttle plate, significant processor concerns, or other major electronic throttle body concern. The spring returns the throttle plate to the default (limp home) position. A maximum allowed RPM is determined based on the position of the accelerator pedal (RPM Guard). If the actual RPM exceeds this limit, spark and fuel are used to bring the RPM below the limit. The powertrain malfunction indicator (wrench) and the MIL illuminate in this mode and a DTC for an ETC-related component is set. EGR, VCT, and IMRC outputs are set to default values and speed control is disabled.

Electronic Throttle Monitor Operation:

DTCs [a]	
P060X, P061X	PCM processor concern (MIL, powertrain malfunction indicator [wrench])
P2104 (ETC system with a 3-track APP sensor)	ETC FMEM forced idle, 2 or 3 pedal sensor concerns (MIL, powertrain malfunction indicator [wrench])
P2105 (ETC system with a 3-track APP sensor)	ETC FMEM forced engine shutdown; PCM concern (MIL, powertrain malfunction indicator [wrench])
P2110 (ETC system with a 3-track APP sensor)	ETC FMEM forced limited RPM; Concern with both TP sensors; throttle plate position control concern (MIL, powertrain malfunction indicator [wrench])
U0300	ETC software version mismatch between processors internal to the PCM (non-MIL, powertrain malfunction indicator [wrench])

a Monitor execution is continuous. Monitor false detection duration is less than 1 second to register a concern.

ETC System With A 2-Track APP Sensor Failure Mode And Effects Management

Electronic Throttle Monitor Operation

Accelerator Pedal Position (APP) Sensor Check:

DTCs[a]	
P1575 (ETC system with a 2-track APP sensor)	APP sensor out of self-test range
P2122, P2123, P2127, P2128, P2132, P2133	APP sensor circuit continuity test (powertrain malfunction indicator [wrench], non-MIL)
P2121, P2126, P2131 (ETC system with a 3-track APP sensor)	APP range/performance (powertrain malfunction indicator [wrench], non-MIL)
P2138 (ETC system with a 2-track APP sensor)	APP to APP signal correlation (powertrain malfunction indicator [wrench], non-MIL)

a Correlation and range/performance - sensor disagreement between processors internal to the PCM. Monitor execution is continuous. Monitor false detection duration is less than 1 second to register a concern. Refer to Powertrain DTC Charts and Descriptions, Diagnostic Trouble Code (DTC) Charts and Descriptions for additional DTC information.

Throttle Position (TP) Sensor Check:

DTCs [a]	
P0122, P0123, P0222, P0223	TP circuit continuity test (MIL, powertrain malfunction indicator [wrench])
P0121, P0221 (ETC system with a 3-track APP sensor)	TP range/performance (non-MIL)
P1124 (ETC system with a 2-track APP sensor)	TP sensor out of self-test range
P2135	TP to TP sensor correlation test (powertrain malfunction indicator [wrench], non-MIL)

a Correlation and range/performance - sensor disagreement between processors internal to the PCM, TP inconsistent with requested throttle plate position. Monitor execution is continuous. Monitor false detection duration is less than 1 second to register a concern. Refer to Powertrain DTC Charts and Descriptions, Diagnostic Trouble Code (DTC) Charts and Descriptions for additional DTC information.

Electronic TAC Operation Check:

DTCs [a]	
P115E	Throttle actuator airflow trim at maximum limit (non-MIL)
P2072 (ETC system with a 3-track APP sensor)	Throttle body ice blockage (non-MIL)
P2100 (ETC system with a 3-track APP sensor)	Throttle actuator circuit open, short to power, short to ground (MIL)
P2101	Throttle actuator range/performance test (MIL)
P2107	Processor and TAC motor circuit test (MIL)
P2111	Throttle actuator system stuck open (MIL)
P2112	Throttle actuator system stuck closed (MIL)

a Note: For all DTCs, in addition to the MIL, the powertrain malfunction indicator (wrench) is on for the concern that caused the FMEM action. Monitor execution is continuous. Monitor false detection duration is less than 5 seconds to register a concern.

The torque based ETC strategy was developed to improve fuel economy and to accommodate variable camshaft timing (VCT). This is possible by not coupling the throttle angle to the driver

pedal position. Uncoupling the throttle angle (produce engine torque) from the pedal position (driver demand) allows the powertrain control strategy to optimize fuel control and transmission shift schedules while delivering the requested wheel torque.

The ETC monitor system is distributed across 2 processors within the PCM: the main powertrain control processor unit (CPU) and a separate monitoring processor. The primary monitoring function is carried out by the independent plausibility check (IPC) software, which resides on the main processor. It is responsible for determining the driver-demanded torque and comparing it to an estimate of the actual torque delivered. If the generated torque exceeds driver demand by a specified amount, appropriate corrective action is taken.

C175T (Part 2)

Engine Control Module: Procedures

FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM)

Description

The EEPROM is contained in an integrated circuit internal to the powertrain control module (PCM). The EEPROM contains the vehicle strategy including calibration information specific to the vehicle, and is capable of being programmed or flashed repeatedly.

As part of the calibration there is an area referred to as the vehicle identification (VID) block. The VID block is programmed when installing a new PCM as described under Programming the VID Block for a Replacement PCM. Failure to carry out this procedure may generate DTCs PI635 or P1639. The VID block in an existing PCM can also be tailored to accommodate various hardware or parameter changes made to the vehicle since production. Failure to carry out this procedure properly may generate DTC P1635, Tire/Axle Ratio out of Acceptable Range. An incorrect tire/axle ratio is one of the main causes for DTC P1639. This is described under Making Changes to the VID Block and also under Making Changes to the PCM Calibration. The VID block contains many items used by the strategy for a variety of functions. Some of these items include the vehicle identification number (VIN), octane adjust, fuel octane, fuel type, vehicle speed limit, tire size, axle ratio, the presence of speed control, and 4-wheel drive electronic shift-on-the-fly (ESOF) versus manual shift-on-the-fly (MSOF). Only items applicable to the vehicle hardware and supported by the VID block is displayed on the scan tool.

When changing items in the VID block, the strategy places range limits on certain items such as tire and axle ratio. The number of times the VID block may be reconfigured is limited. When this limit is reached, the scan tool displays a message indicating the need to flash the PCM again to reset the VID block.

Programming can be carried out by a local Ford dealer or any non-Ford facility. Refer to the scan tool manufacturer's instruction manual for details.

Programming the VID Block for a Replacement PCM

A new PCM contains the latest strategy and calibration level for a particular vehicle. However, the VID block is blank and needs programming. There are 2 procedures available. The first is an automatic data transfer from the old PCM to the new PCM, and the second is manual data entry into the new PCM.

Automatic data transfer is carried out if the old PCM is capable of communicating. This is done by using a scan tool to retrieve data from the old PCM before removing it from the vehicle. The stored data can then be downloaded to the new PCM after it has been installed.

Carry out manual data entry if the old module is damaged or incapable of communicating. Remove and install a new PCM. Using a compatible scan tool, select and carry out the module/parameter programming, referring to the scan tool manufacturer's instruction manual. Make certain that all parameters are included. Failure to properly program tire size in revolutions per mile, (rev/mile equals 63,360 divided by the tire circumference in inches), axle ratio, 4x4/4x2, and/or MSOF/ESOF may result in DTCs P1635 and P1639. You may be instructed to contact the As-Built Data Center for the information needed to manually update the VID block with the scan tool. Contact the center only if the old PCM cannot be used or the data is corrupt. For Ford and Lincoln Mercury technicians, contact your National Hotline or the Professional Technician Society (PTS) website for As-Built data listed under the Service Publications Index. Non-Ford technicians use the Motorcraft(R) website at www.motorcraft.com. From the Motorcraft(R) homepage, use the search function to find the Module Programming or As-Built Data.

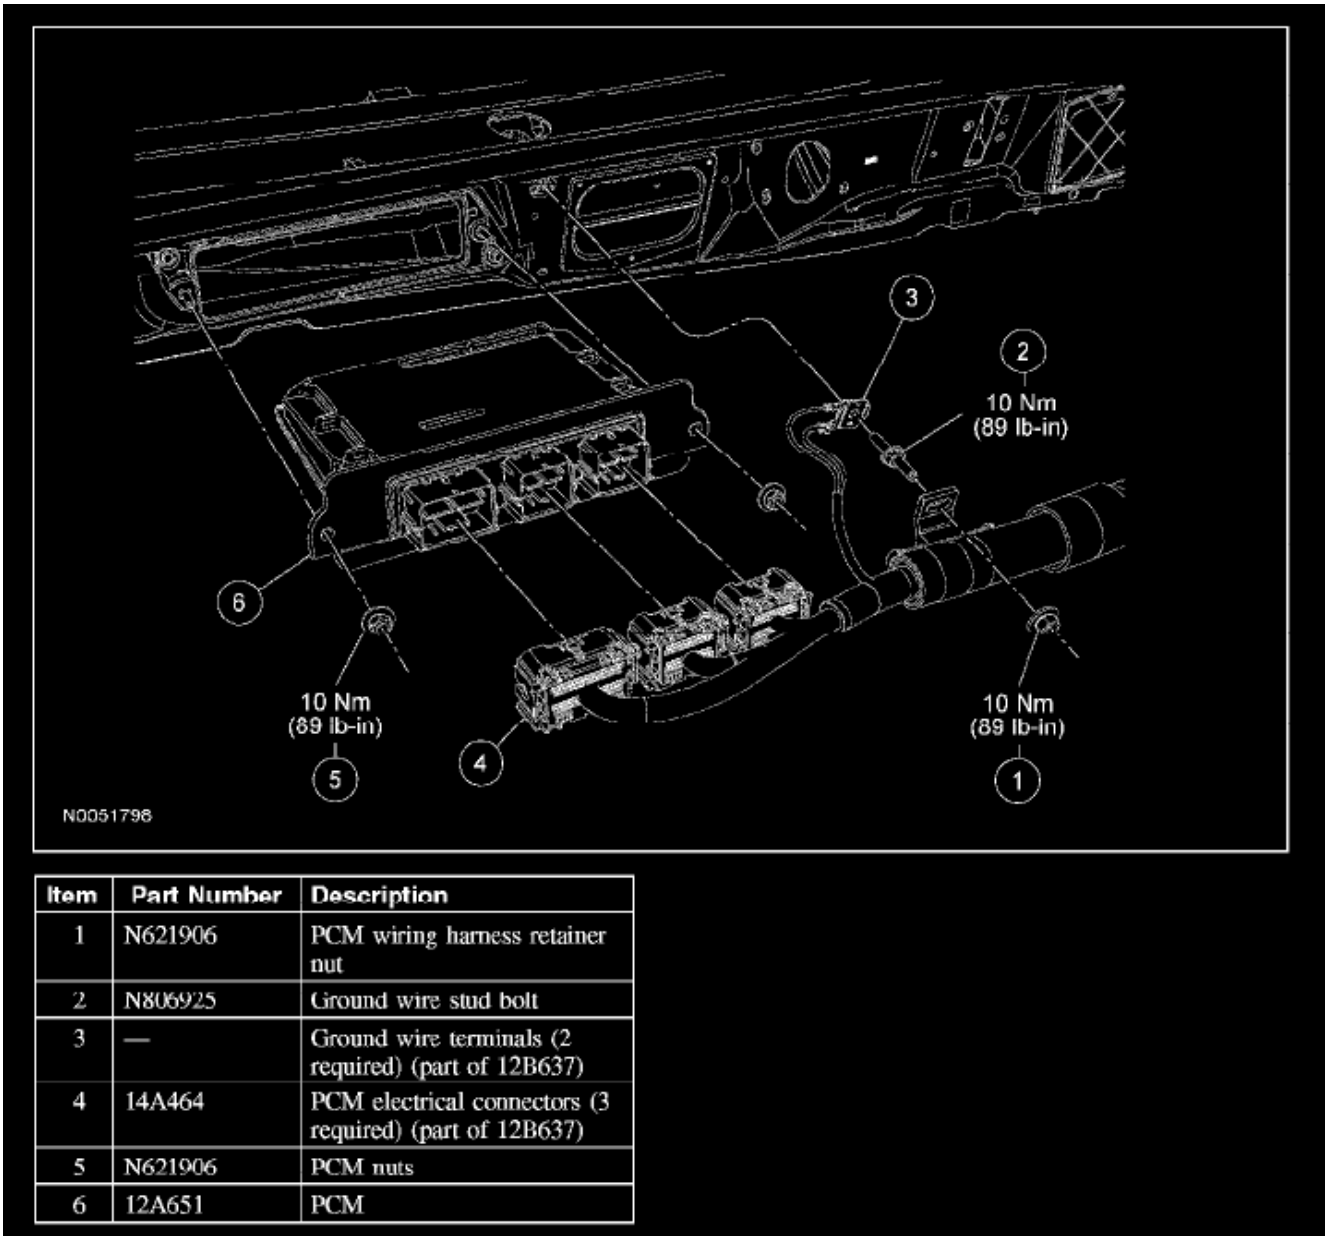
For Ford and Lincoln Mercury technicians, check the Programmable Module Installation link on the PTS website for quick Programmable Module data information by vehicle.

Making Changes to the VID Block

A PCM which is programmed may require changes to be made to certain VID information to accommodate the vehicle hardware. Refer to Module Reprogramming on the scan tool.

Making Changes to the PCM Calibration

At certain times, the entire EEPROM needs to be completely reprogrammed. This is due to changes made to the strategy or calibration after production, or the need to reset the VID block because it has reached its limit. Refer to Module Reprogramming on the scan tool.



Item	Part Number	Description
1	N621906	PCM wiring harness retainer nut
2	N806925	Ground wire stud bolt
3	—	Ground wire terminals (2 required) (part of 12B637)
4	14A464	PCM electrical connectors (3 required) (part of 12B637)
5	N621906	PCM nuts
6	12A651	PCM

Engine Control Module: Removal and Replacement

POWERTRAIN CONTROL MODULE (PCM)

Removal

1. Retrieve the module configuration. Carry out the module configuration retrieval steps of the Programmable Module Installation procedure. 2. Remove the PCM wiring harness retainer nut. 3. Remove the ground wire stud bolt. 4. Disconnect the 3 PCM electrical connectors. 5. Remove the 2 nuts and the PCM.

Installation

1. Install the PCM and the 2 nuts.

- Tighten to 10 Nm (89 lb-in).

2. Connect the 3 PCM electrical connectors. 3. Position the ground wire terminals and install the stud bolt.

- Tighten to 10 Nm (89 lb-in).

4. Install the PCM wiring harness retainer nut.

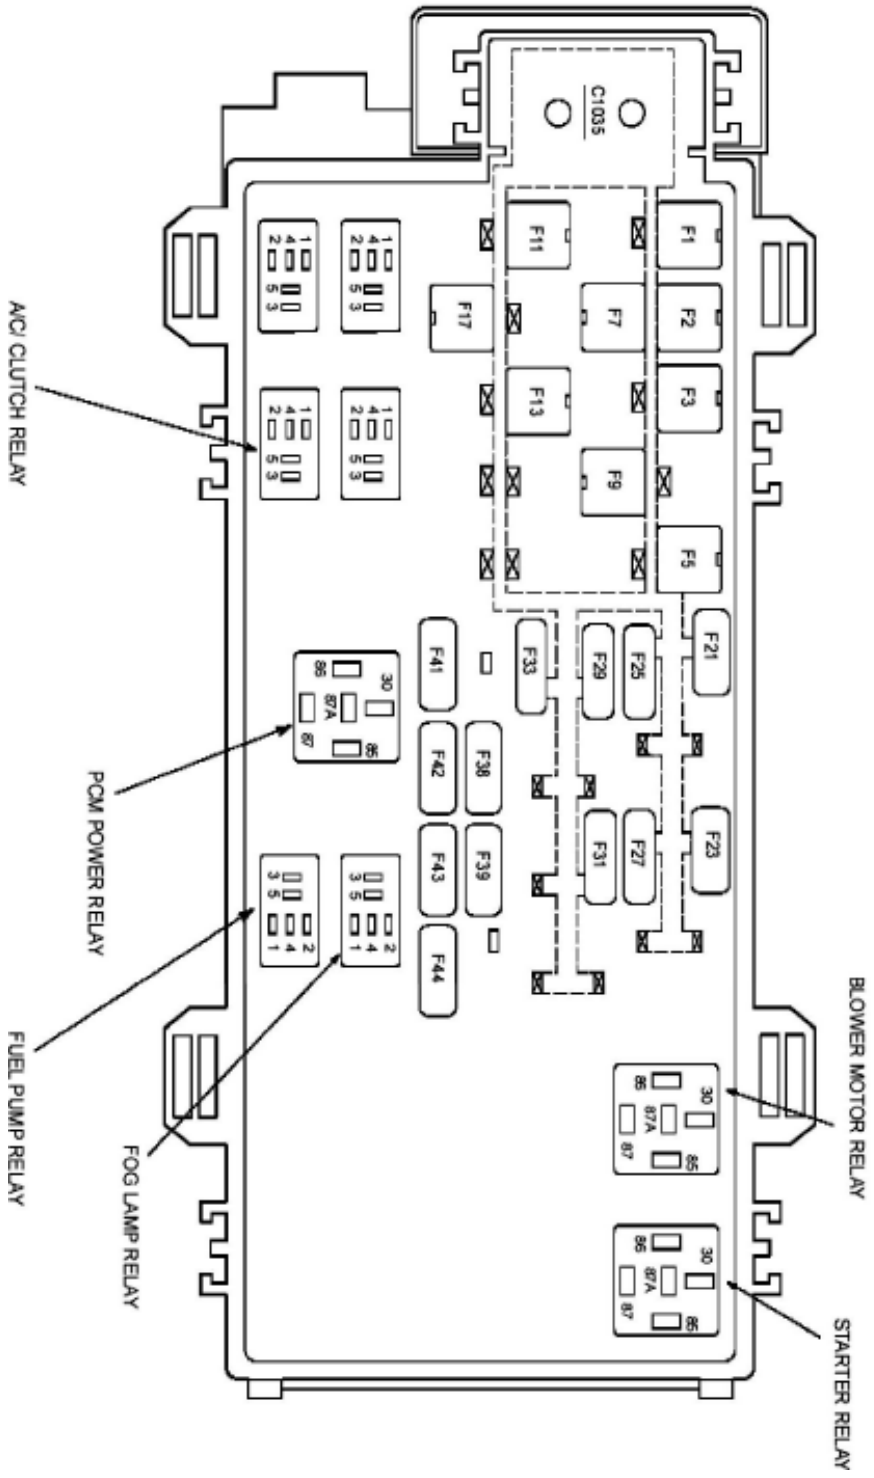
- Tighten to 10 Nm (89 lb-in).

5. NOTE: If a new PCM is installed, the parameters must be reset in both the PCM and the instrument cluster module or the vehicle will experience

a PATS no-start. This will occur even if the vehicle is not equipped with PATS. PATS vehicles and non-PATS vehicles have parameters in the instrument cluster module and the PCM and they both must be reset whenever a new PCM is installed.

Restore the module configurations for the instrument cluster module and the PCM. Carry out the module configuration restore steps of the Programmable Module Installation procedure.

BATTERY JUNCTION BOX (BJB), 3.0L, 4.0L

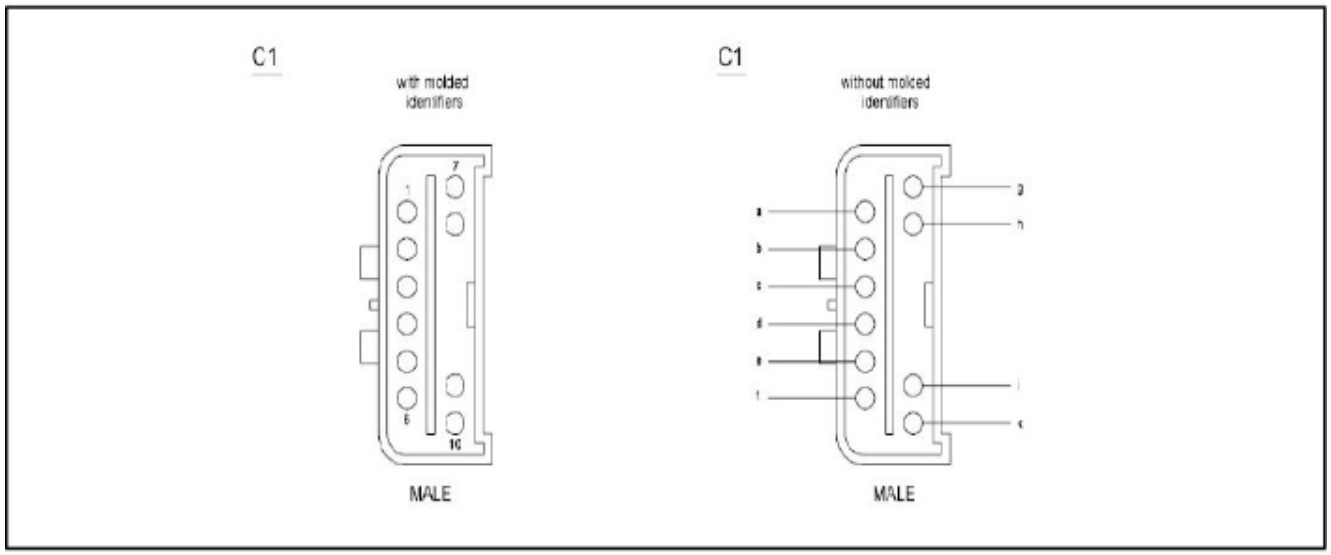


Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step by step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



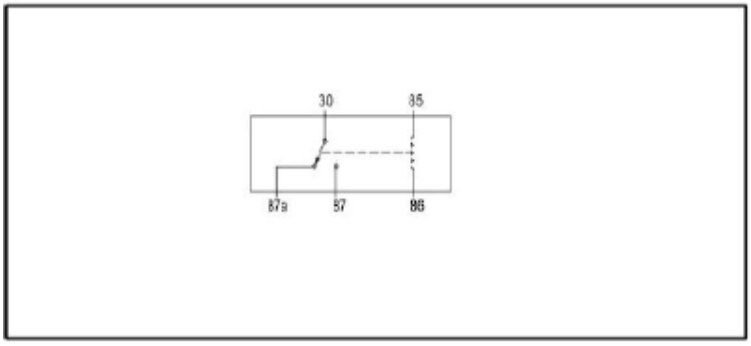
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

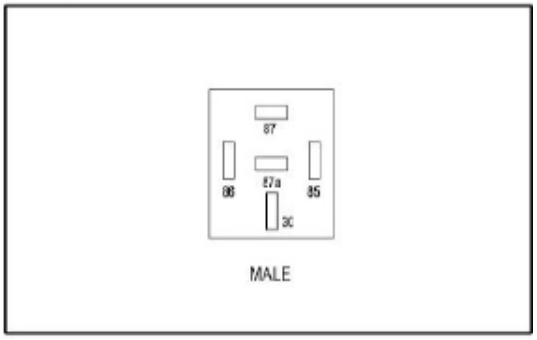
Main Relay (Computer/Fuel System): Testing and Inspection

Relay □ Mini ISO

Schematic



Terminals

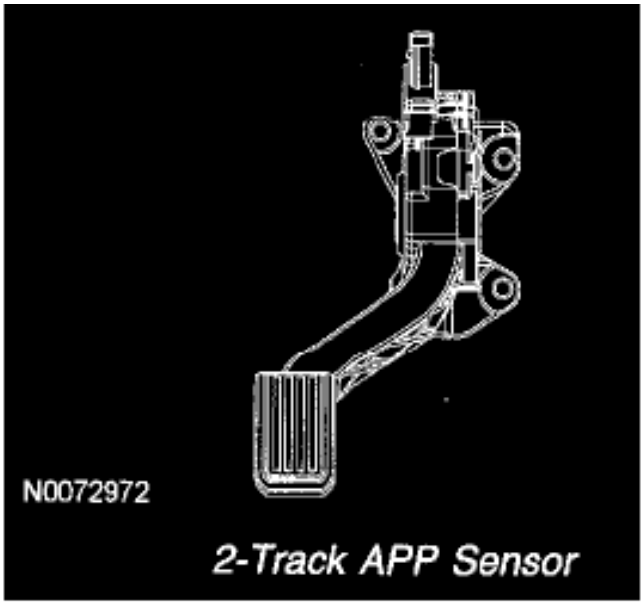


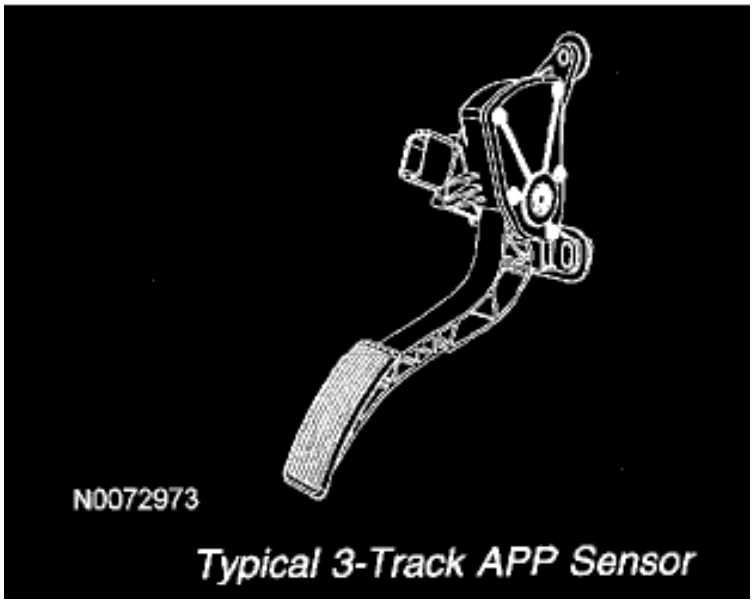
Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.





Accelerator Pedal Position Sensor: Description and Operation

ACCELERATOR PEDAL POSITION (APP) SENSOR

The APP sensor is an input to the powertrain control module (PCM) and is used to determine the amount of torque requested by the operator. Depending on the application either a 2-track or 3-track APP sensor is used.

2-Track APP Sensor

2-Track APP Sensor

There are 2 pedal position signals in the sensor. Both signals, APP1 and APP2, have a positive slope (increasing angle, increasing voltage), but are offset and increase at different rates. The 2 pedal position signals make sure the PCM receives a correct input even if 1 signal has a concern. The PCM determines if a signal is incorrect by calculating where it should be, inferred from the other signals. If a concern is present with one of the circuits the other input is used. There are 2 reference voltage circuits, 2 signal return circuits, and 2 signal circuits (a total of 6 circuits and pins) between the PCM and the APP sensor assembly. The reference voltage circuits and the signal return circuits are shared with the reference voltage circuit and signal return circuit used by the electronic throttle body (ETB) throttle position sensor. The pedal position signal is converted to pedal travel degrees (rotary angle) by the PCM. The software then converts these degrees to counts, which is the input to the torque based strategy.

3-Track APP Sensor

Typical 3-Track APP Sensor

There are 3 pedal position signals in the sensor. Signal 1, APP1, has a negative slope (increasing angle, decreasing voltage) and signals 2 and 3, APP2 and APP3, both have a positive slope (increasing angle, increasing voltage). During normal operation APP1 is used as the indication of pedal position by the strategy. The 3 pedal position signals make sure the PCM receives a correct input even if 1 signal has a concern. The PCM determines if a signal is incorrect by calculating where it should be, inferred from the other signals. If a concern is present with one of the circuits the other inputs are used. The pedal position signal is converted to pedal travel degrees (rotary angle) by the PCM. The software then converts these degrees to counts, which is the input to the torque based strategy. There are 2 reference voltage circuits, 2 signal return circuits, and 3 signal circuits (a total of 7 circuits and pins) between the PCM and the APP sensor assembly. The reference voltage circuits and the signal return circuits are shared with the reference voltage circuit and signal return circuit used by the electronic throttle body (ETB) throttle position sensor.

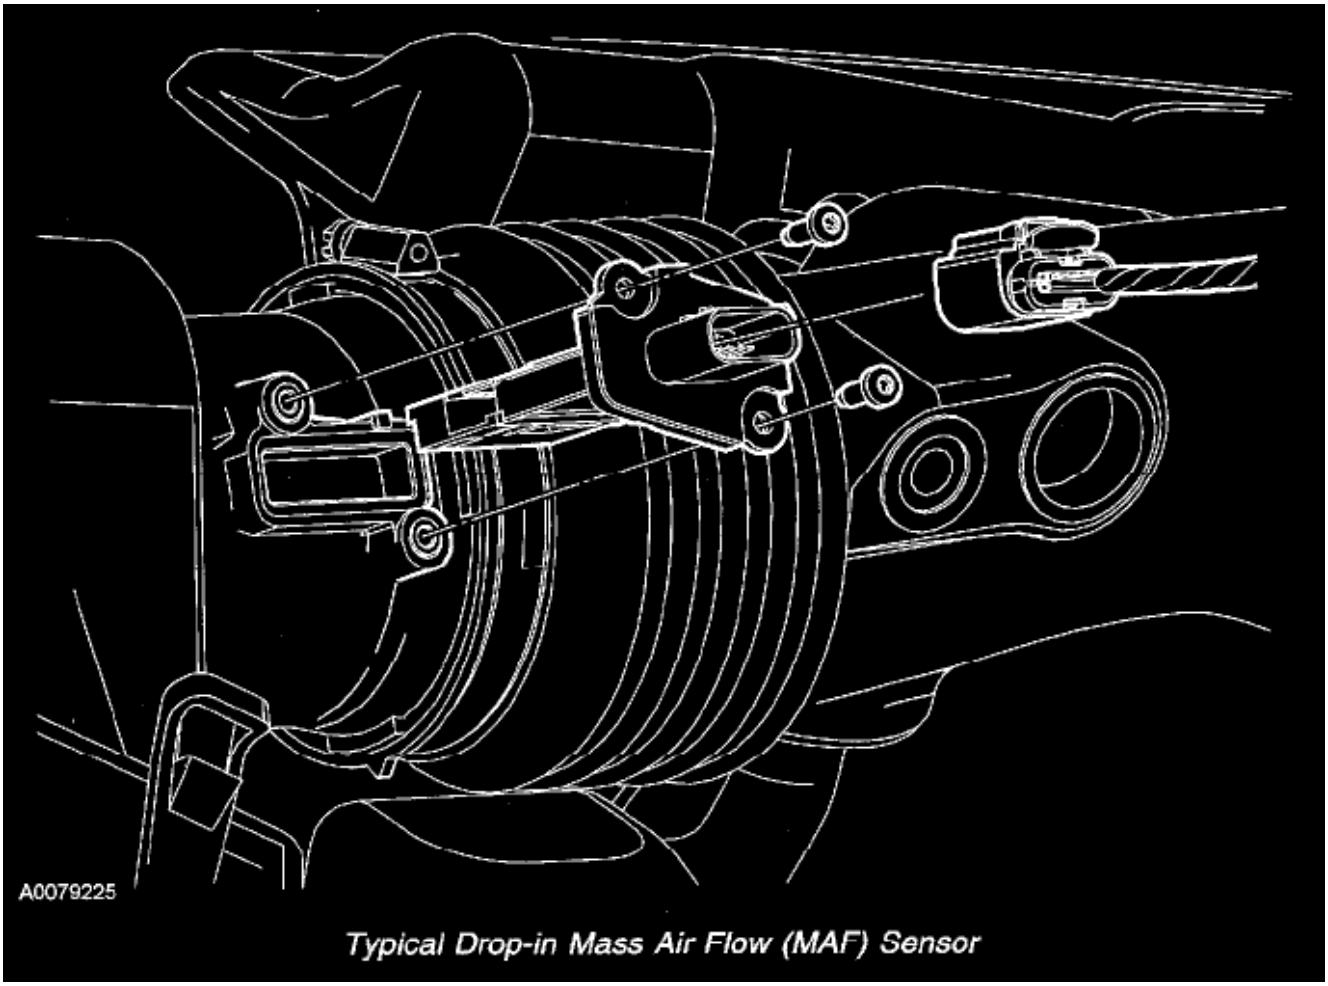
Air Flow Meter/Sensor: Description and Operation

MASS AIR FLOW (MAF) SENSOR

Diagram Of Air Flow Through Throttle Body Contacting MAF Sensor Hot And Cold Wire (and IAT Sensor Wire Where Applicable) Terminals

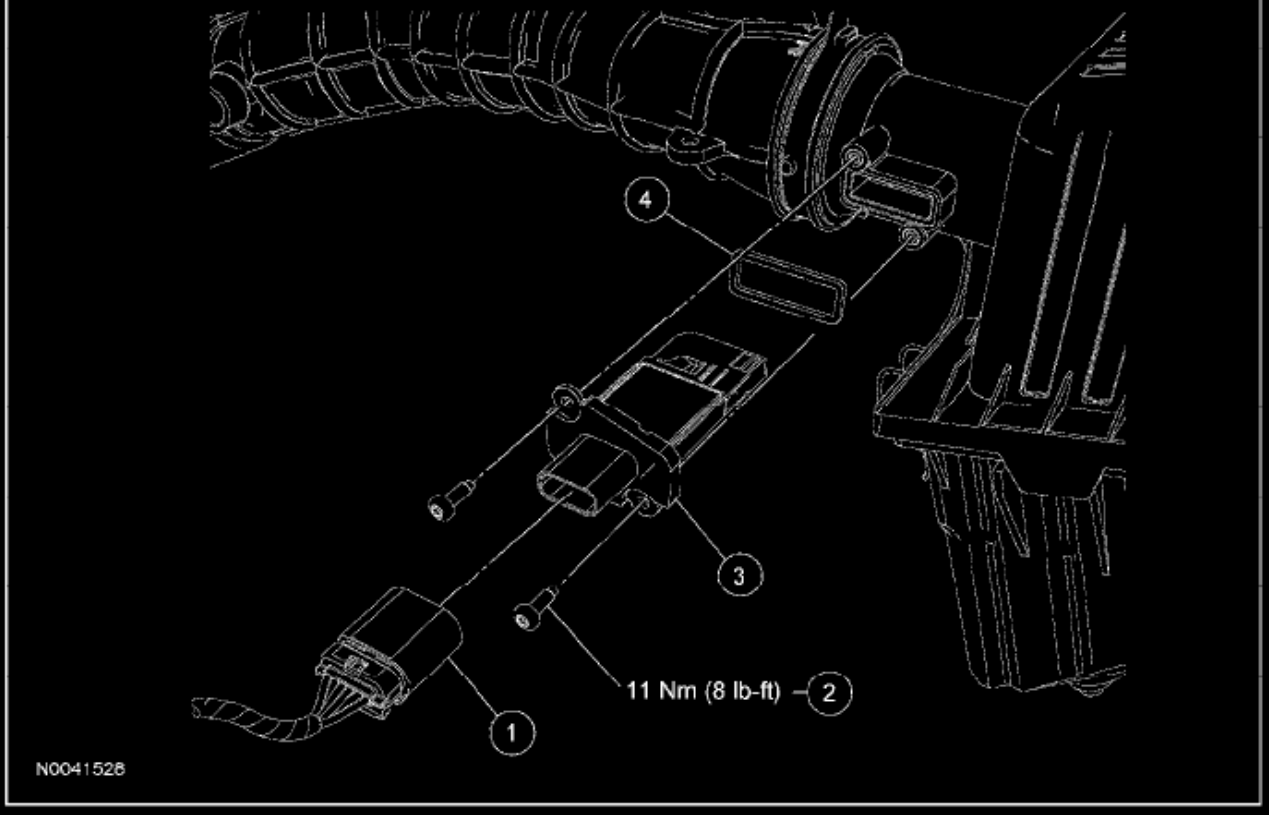
Typical Mass Air Flow (MAF) Sensor



Typical Drop-in Mass Air Flow (MAF) Sensor

The MAF sensor uses a hot wire sensing element to measure the amount of air entering the engine. Air passing over the hot wire causes it to cool. This hot wire is maintained at 200°C (392°F) above the ambient temperature as measured by a constant cold wire. The current required to maintain the temperature of the hot wire is proportional to the mass air flow. The MAF sensor then outputs an analog voltage signal to the PCM proportional to the intake air mass. The PCM calculates the required fuel injector pulse width in order to provide the desired air/fuel ratio. This input is also used in determining transmission electronic pressure control (EPC), shift and torque converter clutch scheduling.

The MAF sensor is located between the air cleaner and the throttle body or inside the air cleaner assembly. Most MAF sensors have integrated bypass technology with an integrated intake air temperature (IAT) sensor. The hot wire electronic sensing element must be replaced as an assembly. Replacing only the element may change the air flow calibration.



Item	Part Number	Description
1	14A464	Mass air flow (MAF) sensor electrical connector (part of 12B637)
2	W709287	MAF sensor bolt (2 required)
3	12B605	MAF sensor
4	—	MAF sensor gasket

Air Flow Meter/Sensor: Service and Repair

MASS AIR FLOW (MAF) SENSOR

Removal and Installation

1. Disconnect the mass air flow (MAF) sensor electrical connector. 2. Remove the 2 bolts, the MAF sensor and discard the gasket.

- To install, tighten to 11 Nm (8 lb-ft).

3. CAUTION: Do not tamper with the mass air flow (MAF) sensing elements located in the airflow bypass. Tampering may result in

failure.

NOTE: The MAF sensor module and body are calibrated and installed as a unit.

To install, reverse the removal procedure. -

Install a new gasket.

Camshaft Position Sensor: Description and Operation

CAMSHAFT POSITION (CMP) SENSOR

Typical Synchronizer Hall-Effect CMP Sensor

Typical Variable Reluctance CMP Sensor

The CMP sensor detects the position of the camshaft. The CMP sensor identifies when piston number 1 is on its compression stroke. A signal is then sent to the PCM and used for synchronizing the sequential firing of the fuel injectors. Coil on plug (COP) ignition applications use the CMP signal to select the correct ignition coil to fire.

Vehicles with 2 CMP sensors are equipped with variable camshaft timing (VCT). They use the second sensor to identify the position of the camshaft on bank 2 as an input to the PCM.

There are 2 types of CMP sensors: the 3-pin connector Hall-effect type sensor and the 2-pin connector variable reluctance type sensor.

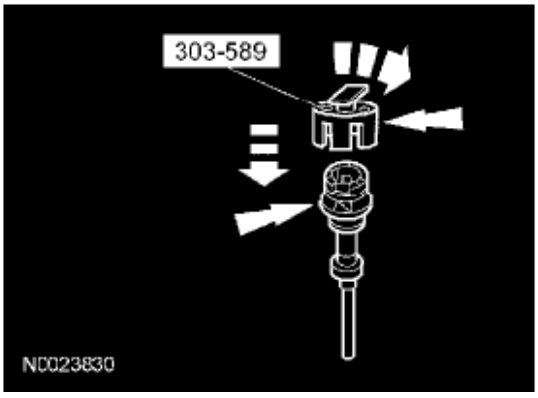
Special Tool(s)

Special Tool(s)

ST2362-A	Synchronizer Alignment Gauge 303-589



Special Tool(s)

Removal

1. Disconnect the camshaft position (CMP) sensor electrical connector.

2. NOTE: Prior to the removal of the CMP sensor, note the position of the CMP sensor electrical connector. The installation procedure requires that

the electrical connector be located in the same position.

Remove the 2 bolts and the CMP sensor.

3. Remove the camshaft synchronizer bolt. 4. Remove the camshaft synchronizer. Inspect the O-ring seal and install a new O-ring seal if damaged.

Installation

1. CAUTION:

- After installation, do not loosen the synchronizer bolt and rotate the synchronizer assembly. The synchronizer assembly is not adjustable. Do not loosen the synchronizer bolt after the alignment tool has been removed in order to align the camshaft position (CMP) sensor electrical connector for any reason. If the electrical connector is not in the correct position, the synchronizer assembly must be removed. The alignment tool and the assembly must be reinstalled if the engine has not been rotated from top dead center (TDC) of the compression stroke on the No. 1 cylinder. Failure to follow this procedure will result in the fuel system being out of time with the engine, possibly causing engine damage.

- Do not turn the crankshaft or camshaft during the removal and installation procedure or the fuel system timing will be out of time with the engine, possibly causing engine damage.

- A special tool must be used during the installation of the new synchronizer assembly. Failure to follow this procedure will result in the fuel system being out of time with the engine, possibly causing engine damage.

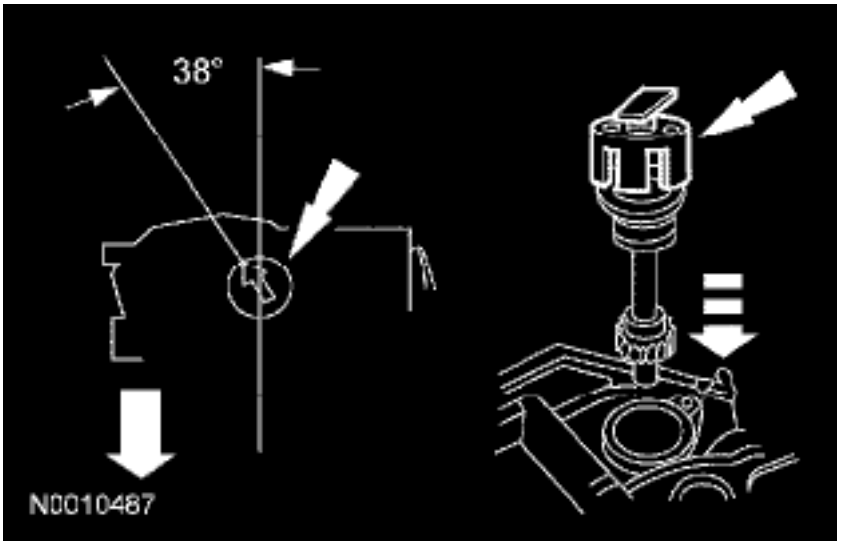
Install the special tool on the camshaft synchronizer by rotating the tool until it engages the notch in the camshaft synchronizer housing and the armature.

2. CAUTION: It is very important to coat the gear on the camshaft synchronizer with engine oil prior to installation. Failure to do so may

result in gear failure.

NOTE: During installation, the arrow on the special tool will rotate clockwise until the oil pump intermediate shaft and the camshaft gear engages.

Install the camshaft synchronizer housing assembly so the arrow on the special tool is 38 degrees from the centerline of the engine.



3. Install the camshaft synchronizer housing bolt.

- Tighten to 30 Nm (22 lb-ft).

4. Position the CMP sensor and install the 2 bolts.

- Tighten to 3 Nm (27 lb-in).

5. Connect the CMP sensor electrical connector.

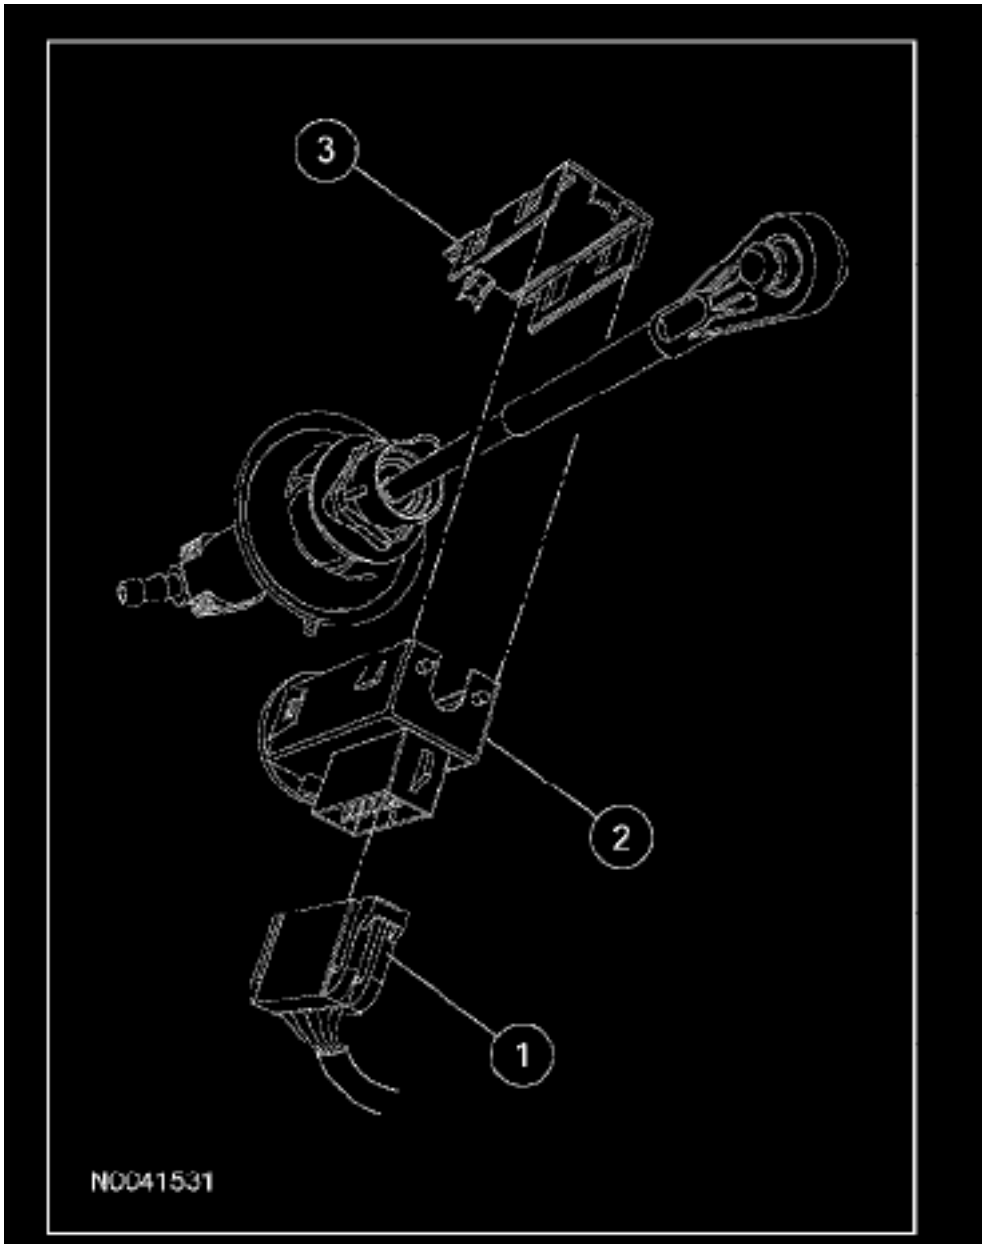
Typical Clutch Pedal Position (CPP) Switch

Clutch Switch: Description and Operation

CLUTCH PEDAL POSITION (CPP) SWITCH

Typical Clutch Pedal Position (CPP) Switch

The CPP switch is an input to the PCM indicating the clutch pedal position. The PCM provides a low current voltage on the CPP circuit. When the CPP switch is closed, this voltage is pulled low through the SIG RTN circuit. The CPP input to the PCM is used to detect a reduction in engine load. The PCM uses the load information for mass air flow and fuel calculations.



Item	Part Number	Description
1	—	Clutch pedal position (CPP) switch electrical connector
2	7C534	CPP switch
3	—	CPP switch cover (part of 7C534)

Clutch Switch: Service and Repair

CLUTCH PEDAL POSITION (CPP) SWITCH

Removal and Installation

1. Disconnect the clutch pedal position (CPP) switch electrical connector. 2. Spread the CPP switch apart. Remove from the pedal rod. 3. To install, reverse the removal procedure.

C1064

Coolant Temperature Sensor/Switch (For Computer): Description and Operation

ENGINE COOLANT TEMPERATURE (ECT) SENSOR

Typical Thread Type ECT Sensor

The ECT sensor is a thermistor device in which resistance changes with temperature. The electrical resistance of a thermistor decreases as the temperature increases, and the resistance increases as the temperature decreases. The varying resistance changes the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Thermistor-type sensors are considered passive sensors. A passive sensor is connected to a voltage divider network so that varying the resistance of the passive sensor causes a variation in total current flow. Voltage that is dropped across a fixed resistor in a series with the sensor resistor determines the voltage signal at the PCM. This voltage signal is equal to the reference voltage minus the voltage drop across the fixed resistor.

The ECT measures the temperature of the engine coolant. The PCM uses the ECT input for fuel control and for cooling fan control. There are 3 types of ECT sensors, threaded, push-in, and twist-lock. The ECT sensor is located in an engine coolant passage.

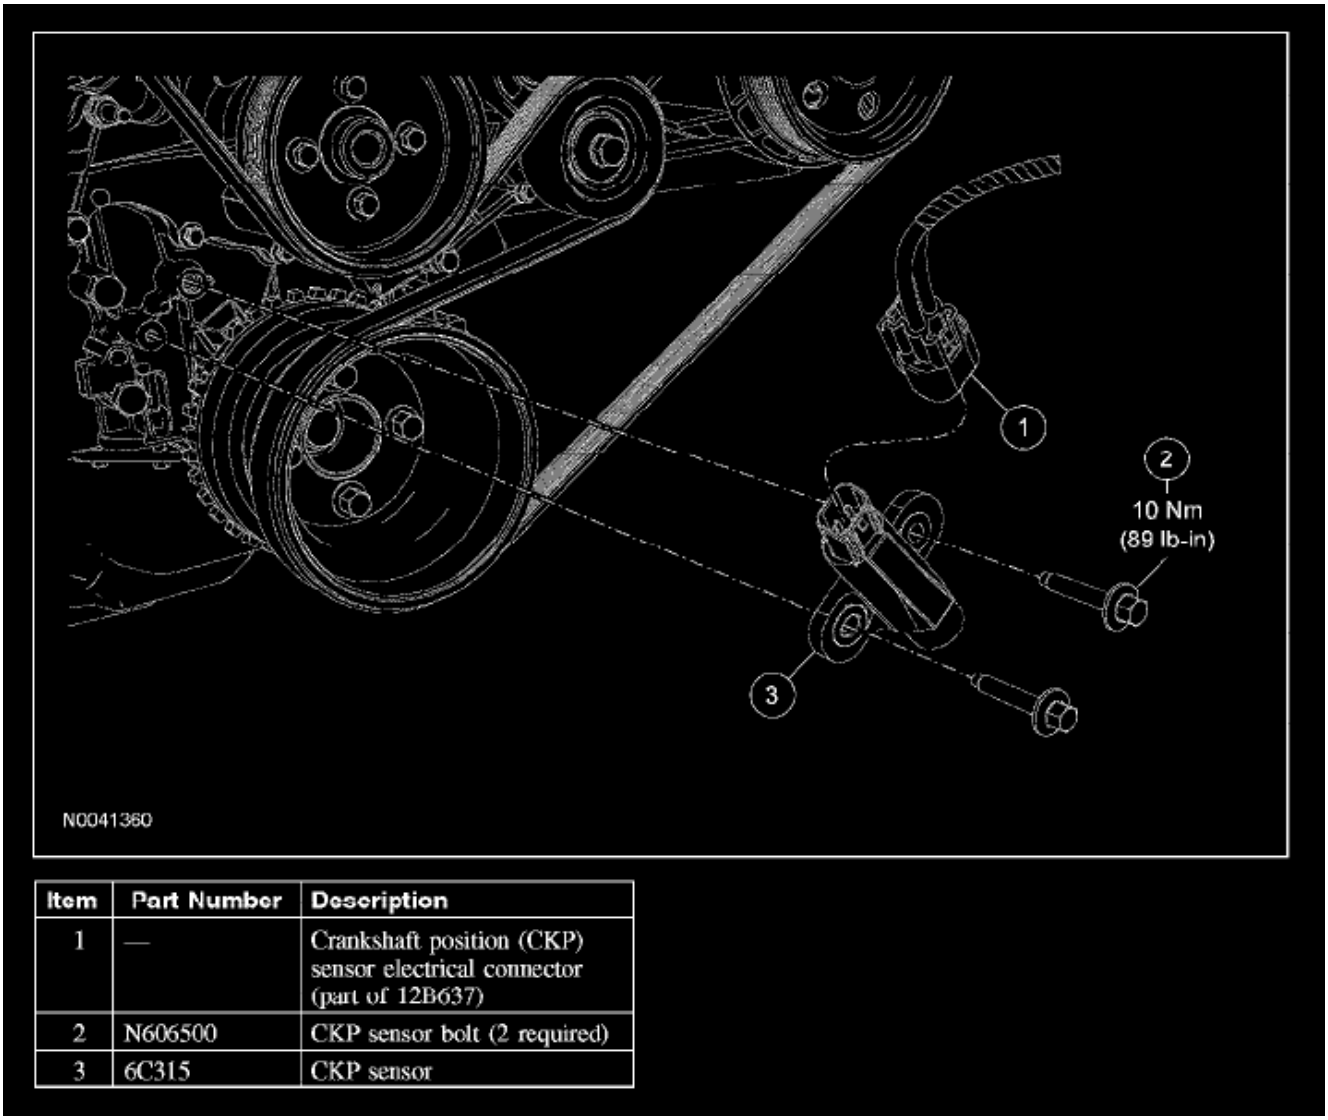
Crankshaft Position Sensor: Description and Operation

CRANKSHAFT POSITION (CKP) SENSOR

Typical Crankshaft Position (CKP) Sensor

The CKP sensor is a magnetic transducer mounted on the engine block adjacent to a pulse wheel located on the crankshaft. By monitoring the crankshaft mounted pulse wheel, the CKP is the primary sensor for ignition information to the PCM. The pulse wheel has a total of 35 teeth spaced 10 degrees apart with one empty space for a missing tooth. The 6.8L 10-cylinder pulse wheel has 39 teeth spaced 9 degrees apart and one 9 degree empty space for a missing tooth. By monitoring the pulse wheel, the CKP sensor signal indicates crankshaft position and speed information to the PCM. By monitoring the missing tooth, the CKP sensor is also able to identify piston travel in order to synchronize the ignition system and provide a way of tracking the angular position of the crankshaft relative to a fixed reference for the CKP sensor configuration. The PCM also uses the CKP signal to determine if a misfire has occurred by measuring rapid decelerations between teeth.



Item	Part Number	Description
1	—	Crankshaft position (CKP) sensor electrical connector (part of 12B637)
