- flash at a 5 Hz rate (RCM not configured).

The air bag warning indicator might not light until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.

Clear all RCM and occupant classification system module (OCSM) DTCs using a scan tool.

10. Check the active restraint system for correct operation.

Impact Sensor: Service and Repair

FRONT IMPACT SEVERITY SENSOR

Removal and Installation

WARNING:

- If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the air bags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.

- Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.

NOTE:

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

- Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

All vehicles

1. Depower the SRS.

Vehicles equipped with 2.3L and A/C

2. For the RH front impact severity sensor, remove the air cleaner and air cleaner outlet pipe.

All vehicles

3. NOTE:

- Make sure the radiator support and front impact severity sensor mating surfaces are clean and free of foreign material.

- Note position of locator tab on sensor bracket for installation.

Remove the front impact severity sensor bolt. -

To install, tighten to 12 Nm (9 lb-ft).

4. Disconnect the front impact severity sensor electrical connector and remove the sensor. 5. To install, reverse the removal procedure. 6. Repower the SRS.

Seat With A Service Kit Occupant Classification Sensor

Removal

WARNING: -

Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.

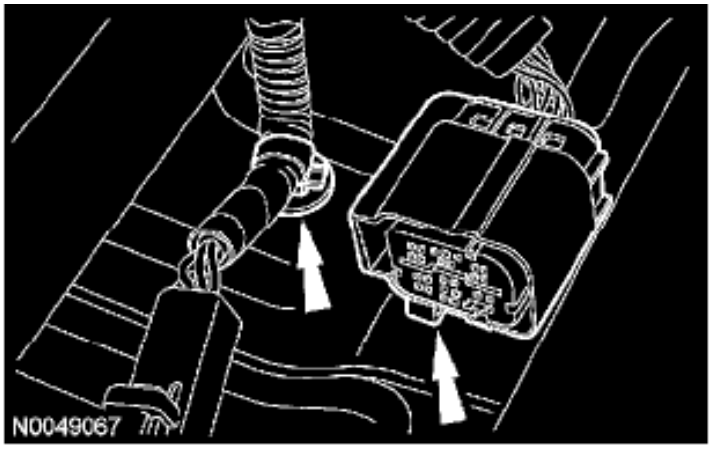
- Install a new occupant classification sensor (OCS) system service kit as a complete assembly. Never install only part of the kit components. Failure to follow this instruction may result in incorrect operation of the OCS system and increases the risk of serious personal injury or death in a crash.

- Make sure the front passenger seat repair is complete, the seat and all attached components (head restraint, seat side shield, etc.) are correctly assembled, and the seat is correctly installed to the vehicle before carrying out the System Reset. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increases the risk of serious personal injury or death in a crash.

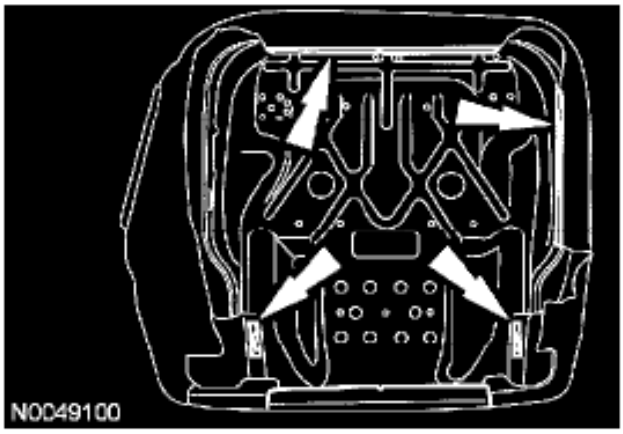
CAUTION: To prevent system failure, it is necessary to carry out the occupant classification sensor (OCS) system reset when a front passenger seat cushion is disassembled, a new trim cover installed or an OCS system service kit is installed. A scan tool is used to carry out the OCS system reset command.

NOTE: -

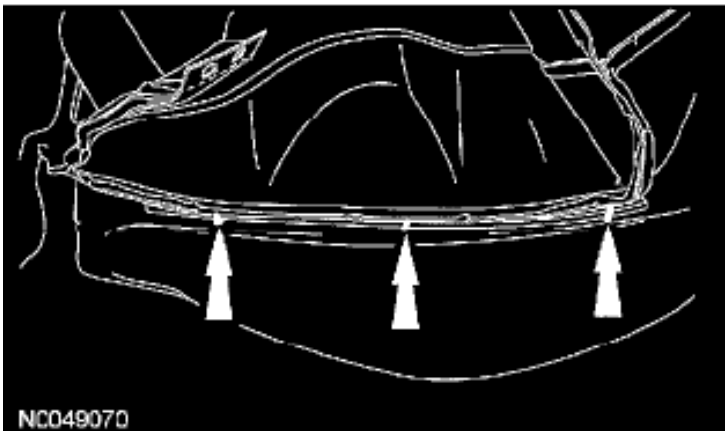
Occupant classification sensor (OCS) system components (seat cushion foam pad, bladder with pressure sensor and occupant classification system module [OCSM]) are calibrated to each other and are serviced as an assembly. The OCS system components are not to be installed separately. If a



N0049067



N0049100



N0049070

new OCS system, OCS system component or seat cushion foam pad are needed, a new OCS system service kit (seat cushion foam pad, bladder with pressure sensor, OCSM and seat wiring harness) must be installed as an assembly.

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

- Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and perform the diagnostic procedure again.

1. Remove the passenger seat. 2. Remove the seat backrest.

3. NOTE: Note position of wire routing for installation.

Release the seat wiring harness retainer clip and detach the seat wiring harness connector from the seat cushion frame.

4. Release the cushion trim cover rear J-clip. 5. Remove the 4 seat track-to-cushion frame bolts and the seat track assembly. 6. Release the remaining cushion trim cover J-clips.

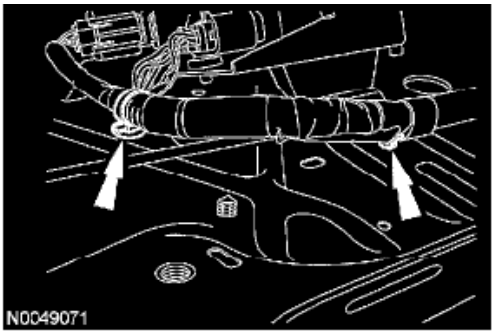
7. CAUTION: An occupant classification sensor (OCS) system service kit will have the OCS system bladder attached to the seat cushion

foam pad. Do not separate the OCS system bladder from the seat cushion foam pad. Failure to do so can result in component failure.

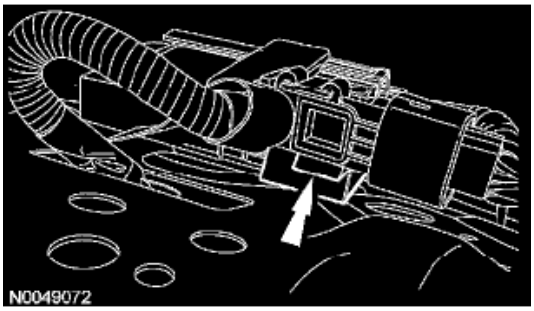
Remove the hog rings and the cushion trim cover from the seat cushion foam pad.

8. NOTE: Note position of wire routing for installation.

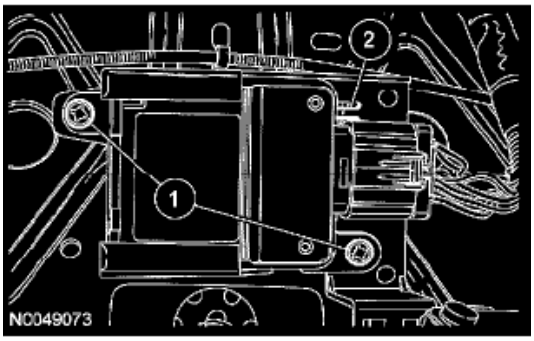
Release the 2 seat wiring harness routing clips from the cushion frame.



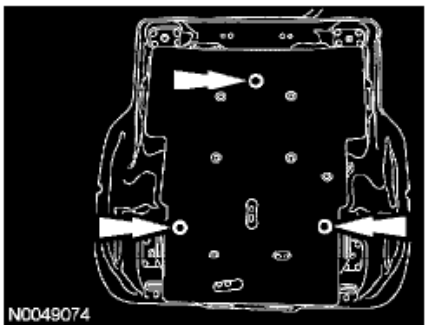
N0049071



N0049072



1
2
N0049073



N0049074

9. Release the pressure sensor bracket retainer and slide the pressure sensor off the bracket.

10. Remove the OCSM.

1 Remove the 2 screws from the OCSM.

2 Release the OCSM bracket retainer and slide the OCSM off the bracket.

11. CAUTION: A production occupant classification sensor (OCS) system bladder is shown. An OCS system service kit will have the OCS

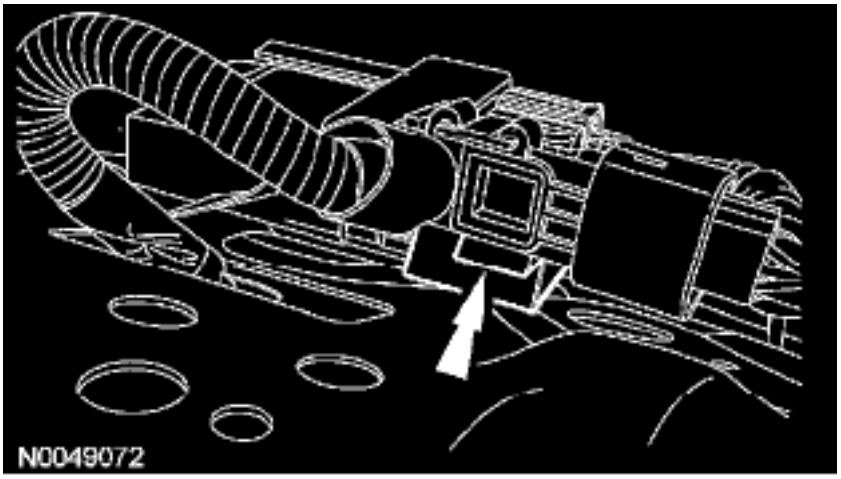
system bladder attached to the seat cushion foam pad. Do not separate the OCS system bladder from the seat cushion foam pad. Failure to do so can result in component failure.

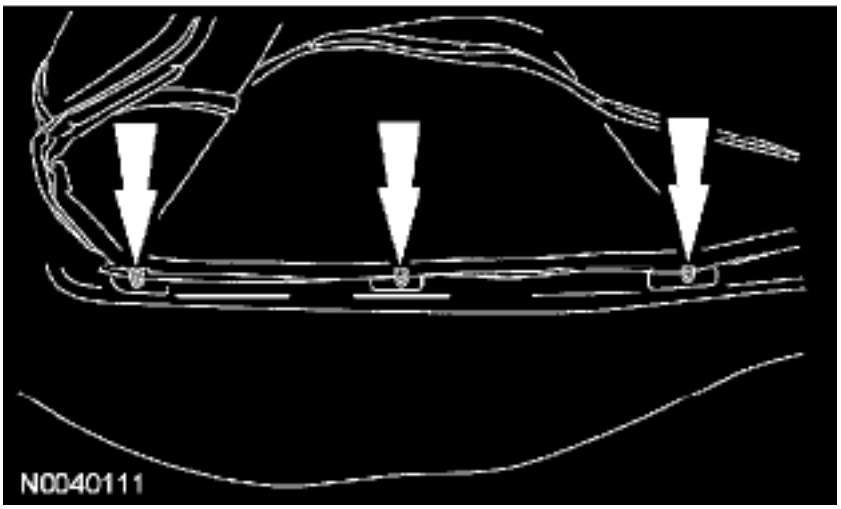
Release the 3 OCS system bladder pin-type retainers from the seat cushion frame.

12. NOTE: Note position of wire routing for installation.

Route the OCS system bladder hose and pressure sensor, OCSM and seat wiring harness out through the seat cushion pan opening.

Installation





1. WARNING: Install a new occupant classification sensor (OCS) system service kit as a complete assembly. Never install only part of the

kit components. Failure to follow this instruction may result in incorrect operation of the OCS system and increases the risk of serious personal injury or death in a crash.

CAUTION: -

Inspect the occupant classification sensor (OCS) system assembly, seat cushion frame and support assembly for any foreign objects before installing the OCS system assembly to the seat cushion frame. If any foreign objects are found, remove them. Failure to follow these instructions may result in incorrect OCS system operation or failure.

- Failure to route the seat occupant sensor components through the correct seat cushion support opening can cause component failure.

- While positioning the seat cushion pan and occupant classification sensor (OCS) assembly, be careful not to damage any of the components. Failure to do so may result in component failure.

NOTE: If the original equipment OCS system is not being installed, install a OCS system service kit using all parts in the kit.

Position the OCS system to the seat cushion frame. -

Route the OCS system bladder hose and pressure sensor, OCSM and seat wiring harness through the seat cushion pan opening.

2. CAUTION: An occupant classification sensor (OCS) system service kit will have the OCS bladder attached to the seat cushion foam pad.

Do not separate the OCS system bladder from the seat cushion foam pad. Failure to do so may result in component failure.

Install the 3 OCS system bladder pin-type retainers to the seat cushion frame.

3. Install the OCSM.

- Slide the OCSM back on the OCSM bracket until it is fully seated and locked in past the OCSM bracket retainer.

- Install the 2 screws in the OCSM.

4. Slide the pressure sensor on the bracket until it is fully seated and locked past the bracket retainer.

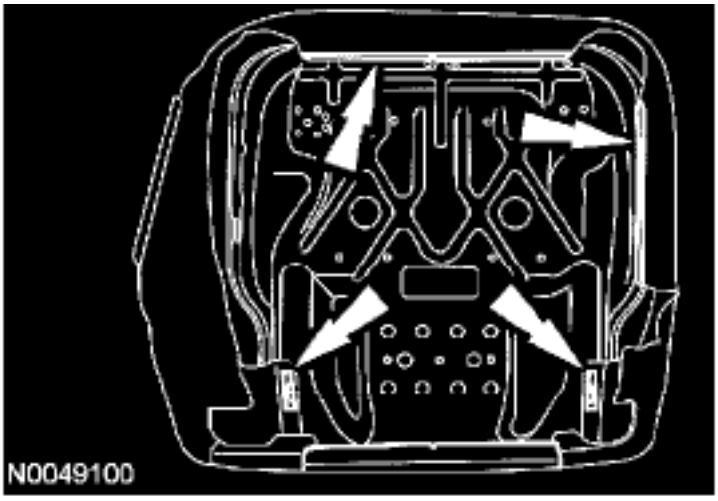
5. Install the 2 seat wiring harness routing clips to the seat cushion frame.

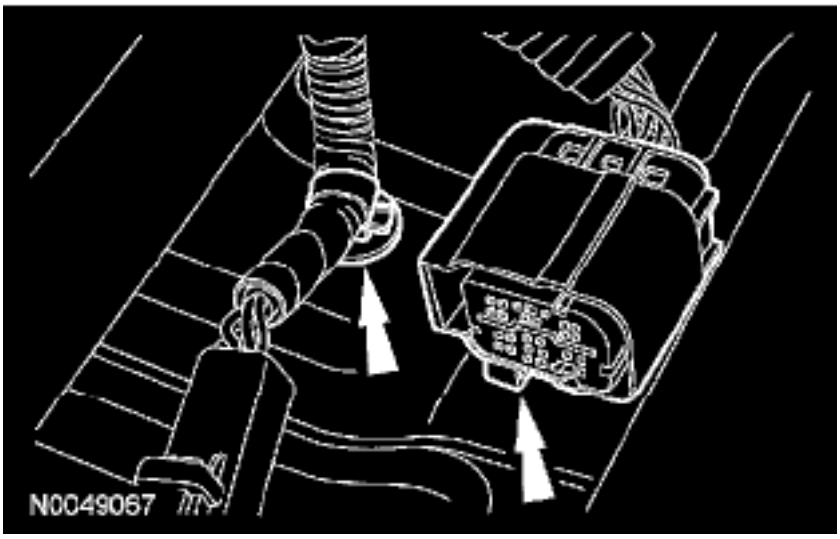
6. CAUTION: Inspect the seat cushion pad and seat cushion trim cover for any foreign objects, before installing the seat cushion trim cover

to the seat cushion pad. If any foreign objects are found, remove them. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and may cause system failure.

Position the cushion trim cover to the foam pad and install the hog rings.

7. Install the foam pad and cushion trim cover to the cushion frame and fasten the J-clips.





8. Install the seat track assembly and 4 bolts.

- Tighten to 6 Nm (53 lb-in).

9. Attach the seat cushion trim cover rear J-clip.

10. Install the seat wiring harness retainer clip and attach the seat wiring harness connector to the seat cushion frame.

11. Install the front seat backrest. 12. Install the passenger seat into the vehicle. 13. Repower the SRS. Do not prove out the SRS at this time.

14. WARNING:

- Install a new occupant classification sensor (OCS) system service kit as a complete assembly. Never install only part of the kit components. Failure to follow this instruction may result in incorrect operation of the OCS system and increases the risk of serious personal injury or death in a crash.

- Make sure the front passenger seat repair is complete, the seat and all attached components (head restraint, seat side shield, etc.) are correctly assembled, and the seat is correctly installed to the vehicle before carrying out the System Reset. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increases the risk of serious personal injury or death in a crash.

CAUTION: -

To prevent system failure, it is necessary to carry out the occupant classification sensor (OCS) system reset of the OCS system when a front passenger seat cushion is disassembled, a new trim cover installed or an OCS system service kit is installed. A scan tool is used to carry out the OCS system reset command.

- To prevent system failure, the following precautions must be taken before carrying out the occupant classification sensor (OCS) system reset: -

Make sure the voltage to the occupant classification system module (OCSM) is above 8.0 volts and less than 18.0 volts.

- Make sure the OCS system is not at a temperature below 6°C (42°F) or above 36°C (97°F) when initiating the OCS system reset process. If the vehicle has been exposed to extreme cold or hot temperatures, the vehicle must be exposed and kept at a temperature within the limits, 6°C to 36°C (42°F to 97°F) for a minimum of 30 minutes.

- Make sure nothing is present on the passenger seat before carrying out the OCS system reset and nothing is placed on the seat during the process.

- Make sure a minimum 8-second time period has passed after cycling the ignition switch ON before the carrying out the OCS system reset process.

NOTE: If the first attempt to carry out the OCS system reset is unsuccessful, a second attempt must be made. If the second attempt is unsuccessful, a new OCS system service kit must be installed.

Carry out the OCS system reset active command.

15. Cycle the ignition switch from ON to OFF.

16. NOTE: The ignition switch must be cycled after the OCS system reset.

Cycle the ignition switch from OFF to ON.

17. Prove out the SRS as follows:

Turn the ignition key from ON to OFF. Wait 10 seconds, then turn the key back to ON and visually monitor the air bag indicator with the air bag modules installed. The air bag indicator will light continuously for approximately 6 seconds and then turn off. If an air bag SRS fault is present, the air bag indicator will: -

fail to light.

- remain lit continuously.

- flash at a 5 Hz rate (RCM not configured).

The air bag warning indicator may not illuminate until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.

Clear all continuous RCM and OCSM DTCs using a scan tool.

18. NOTE: A prepaid return postcard is provided with a new OCS system service kit. The serial number for the new part and the vehicle

identification number (VIN) must be recorded and sent to Ford Motor Company.

If a new OCS system was installed, fill out the necessary information on the OCS system traceability card and return it along with the complete inoperative OCS system to Ford Motor Company. -

When returning the inoperative OCS system include: seat cushion foam pad, bladder, OCSM, pressure sensor (transducer), hose, electrical connectors and wire harness (service part OCS system only).

Seat Position Sensor: Service and Repair

SEAT POSITION SENSOR

Removal and Installation

WARNING: Always tighten the seat position sensor retaining bolt to specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.

NOTE:

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

- Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

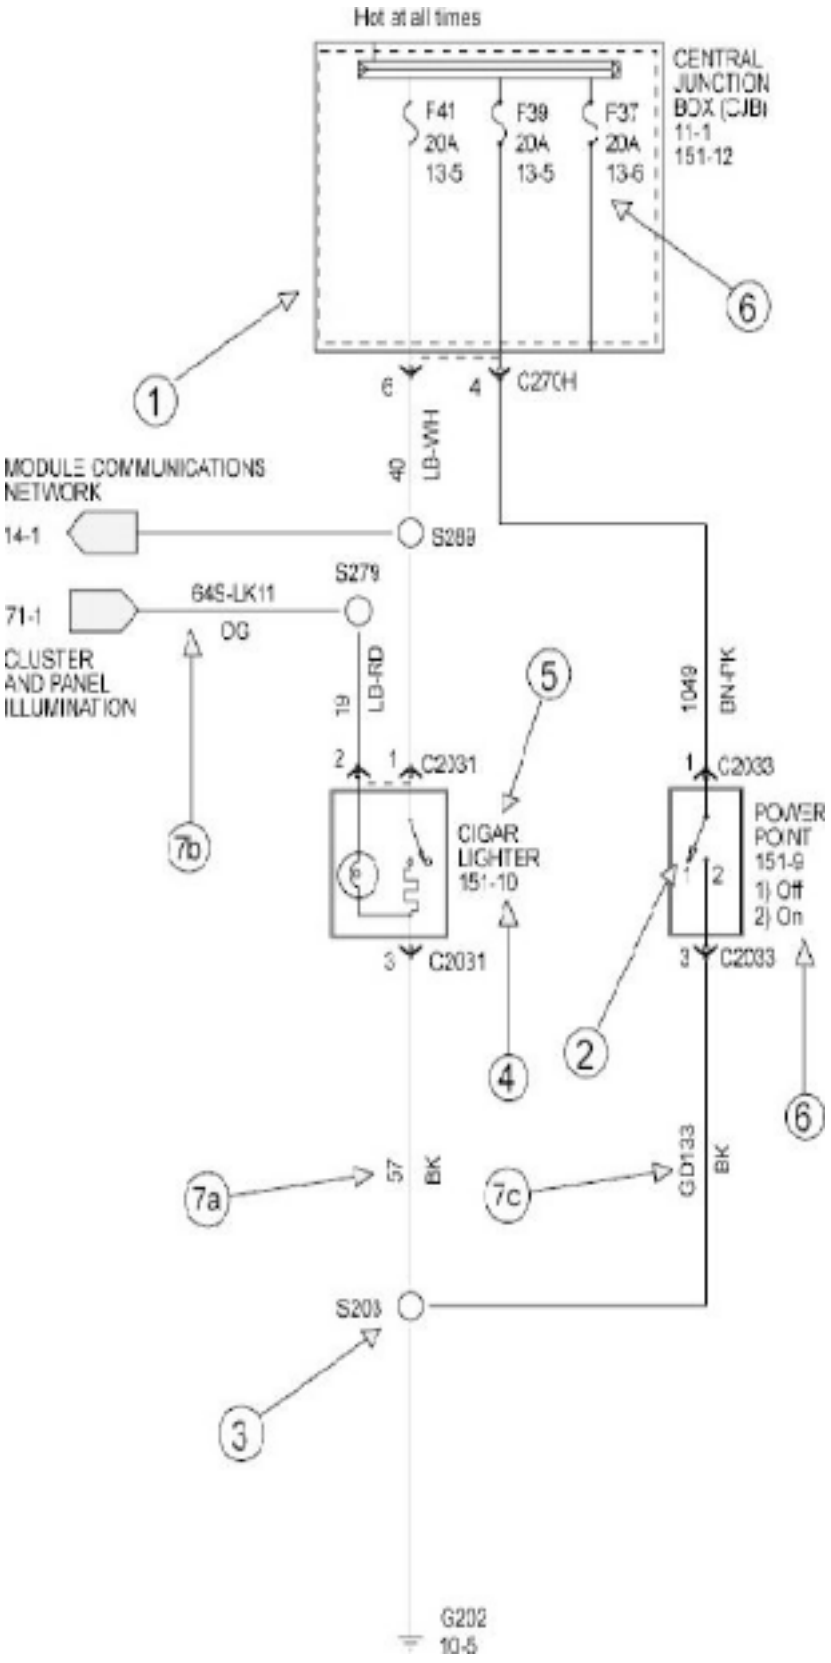
1. Depower the SRS. 2. Remove the driver seat. 3. Remove the seat track.

4. NOTE: Note the position of the seat position sensor locator tab for installation.

Remove the 2 screws and the seat position sensor and bracket.

5. To install, reverse the removal procedure. 6. Repower the SRS.

Ford Ranger 2wd Workshop Manual (V6-3.0L (2008))
Ford Workshop Manuals > Accessories and Optional Equipment > Accessory Delay Module > Accessory Delay Relay > Component Information > Diagrams > Diagram Information and Instructions



Accessory Delay Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

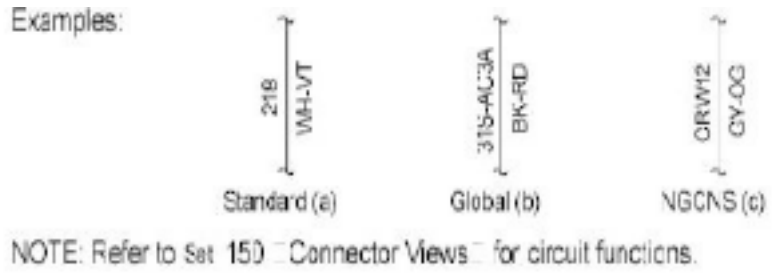
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

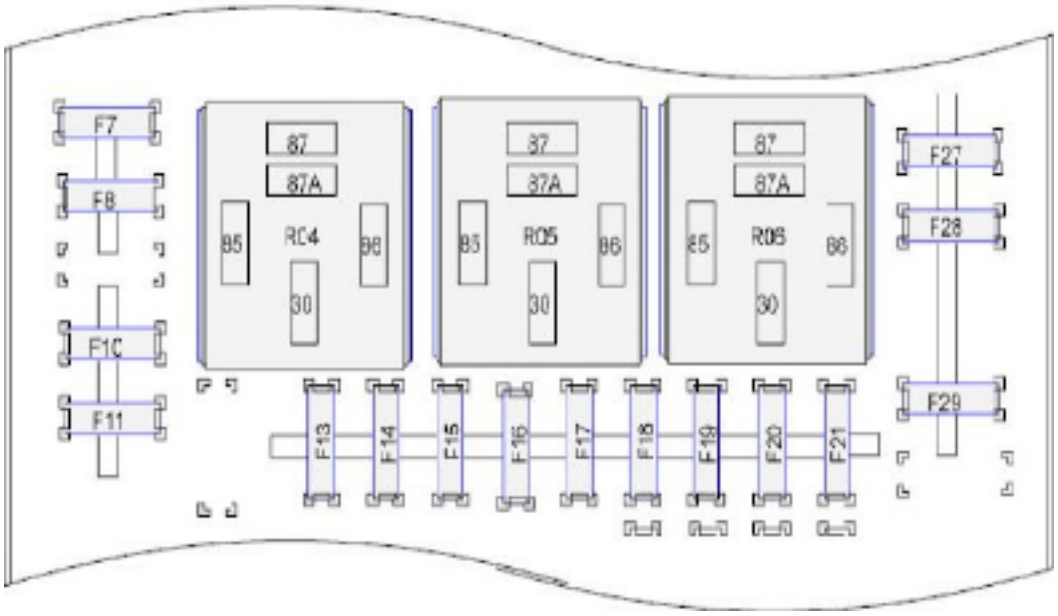
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

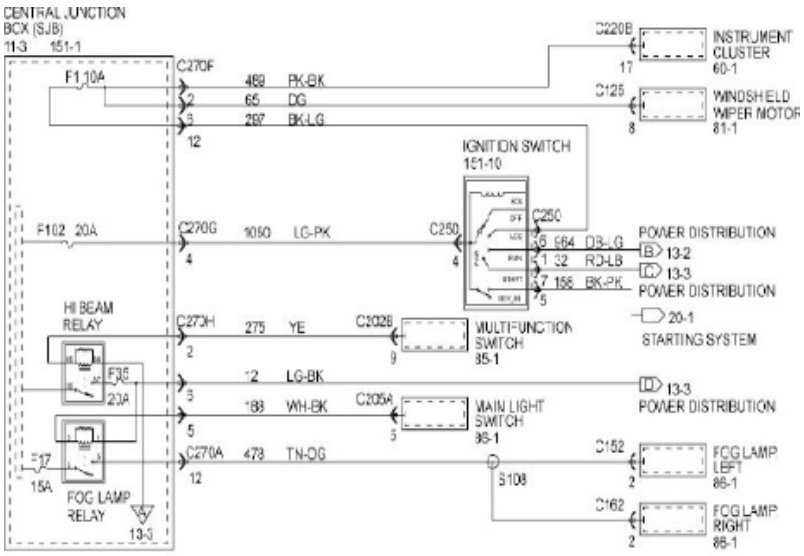
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

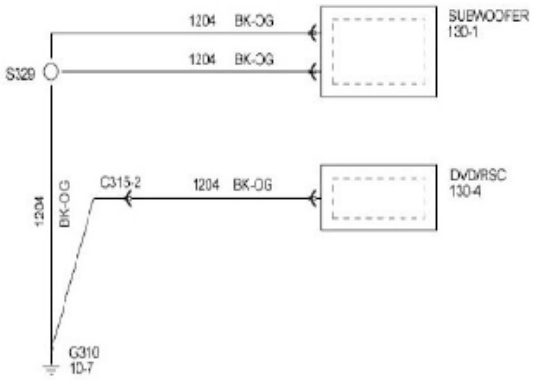
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

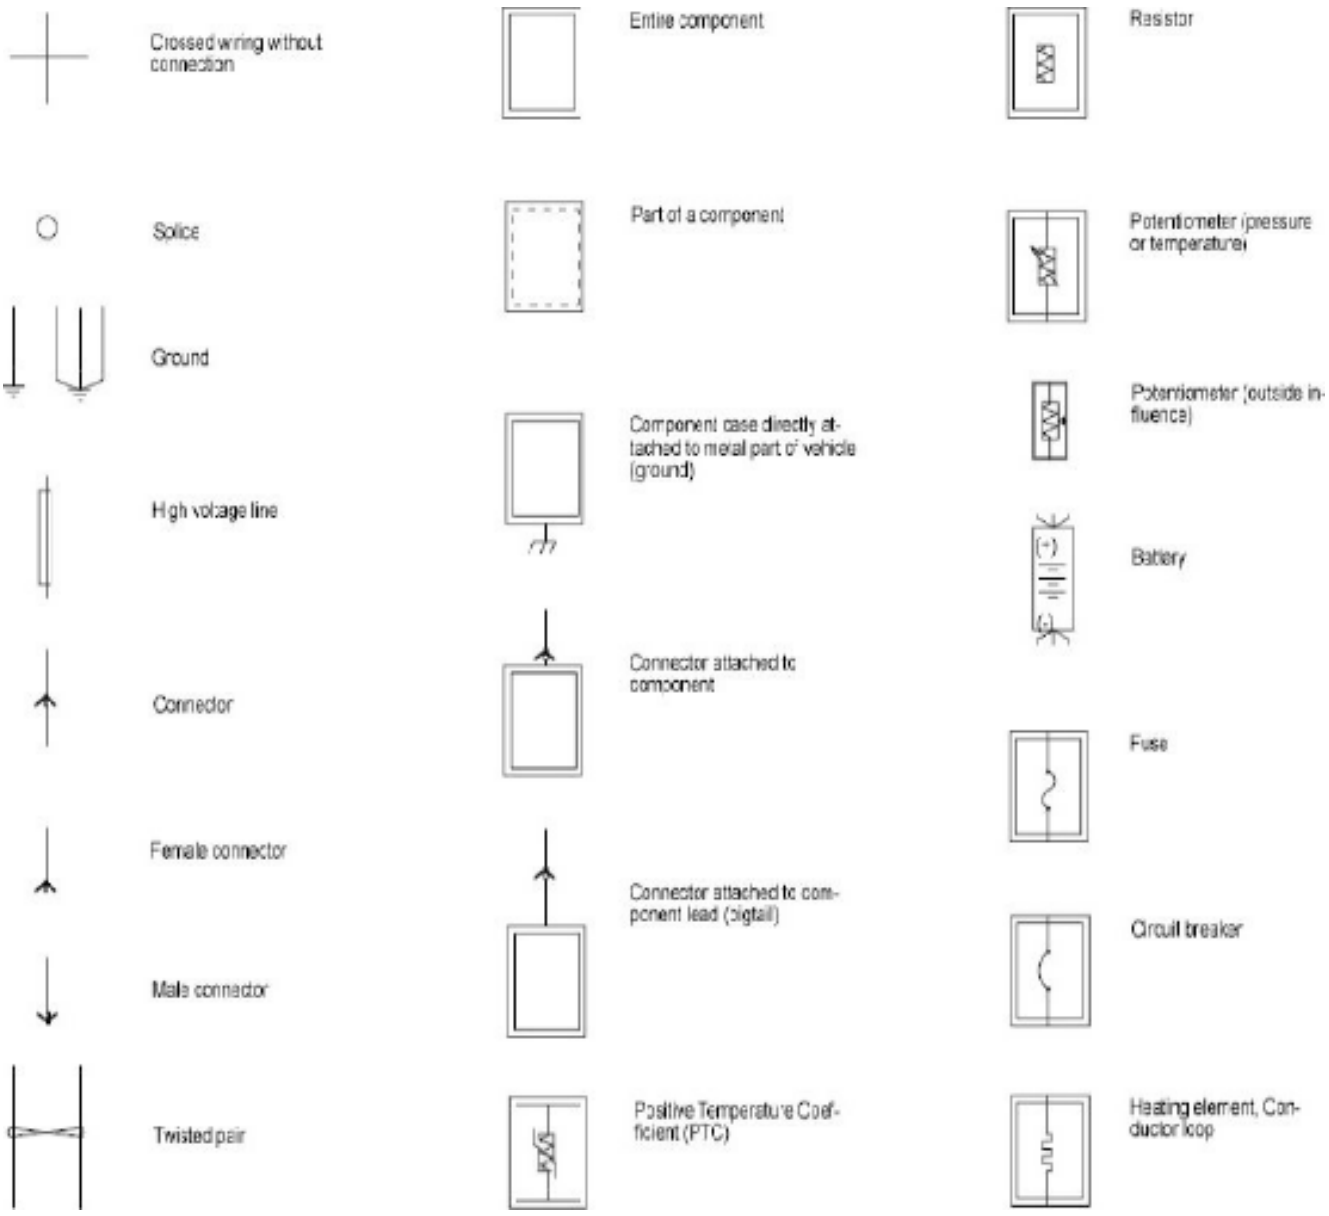
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

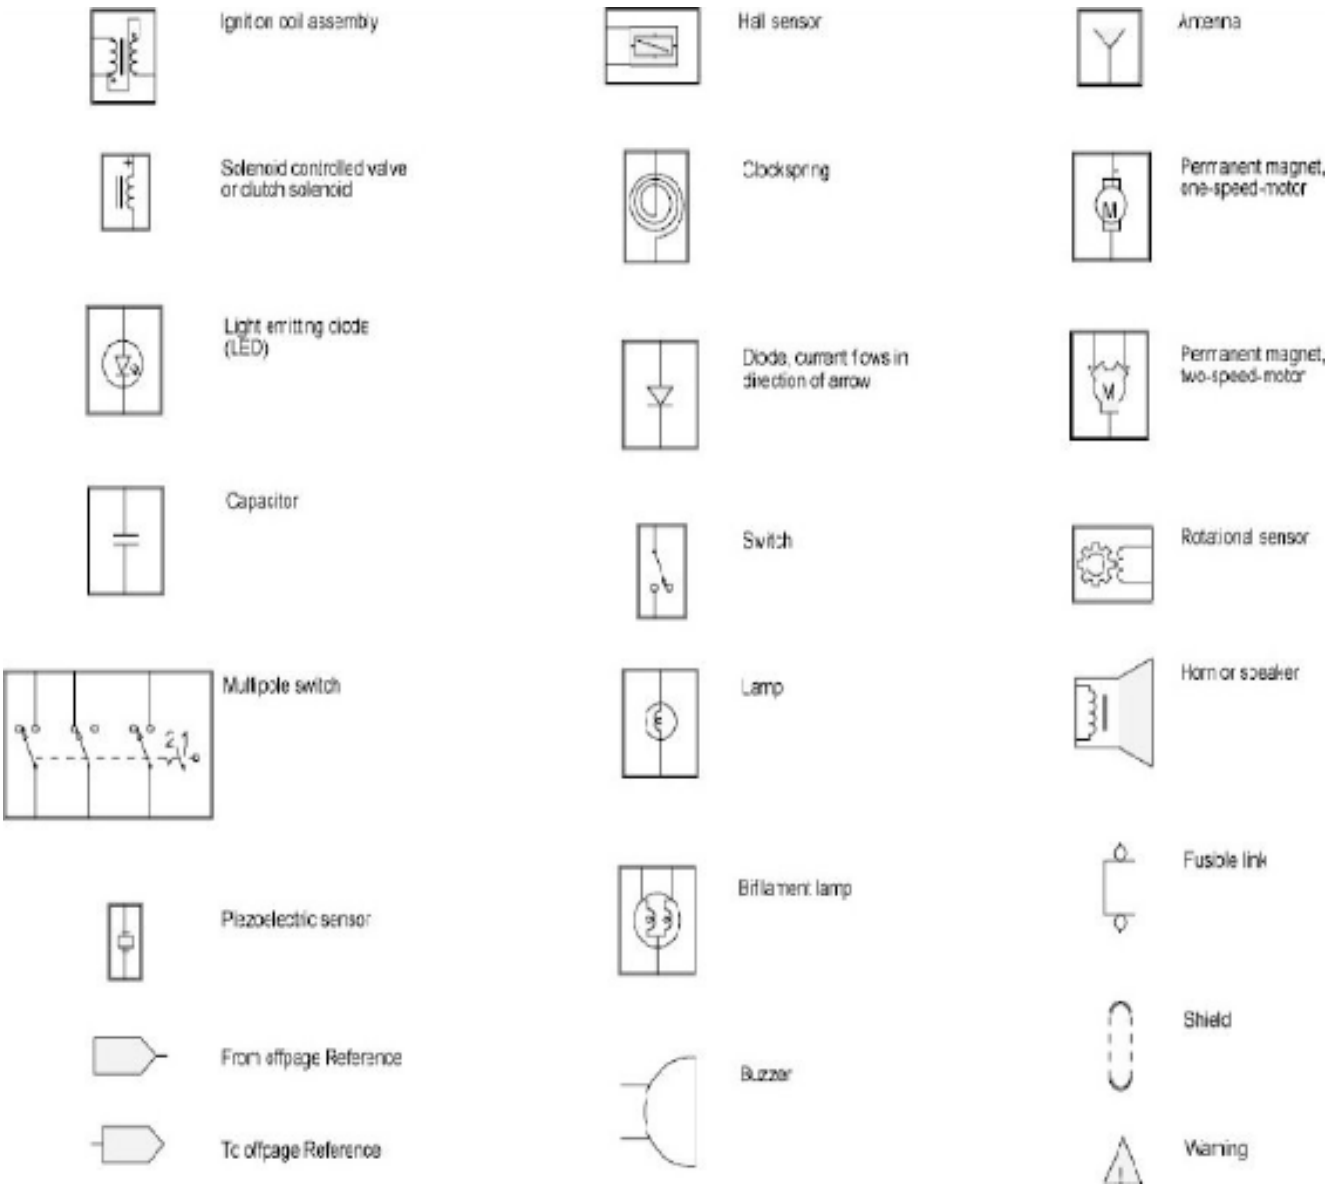
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

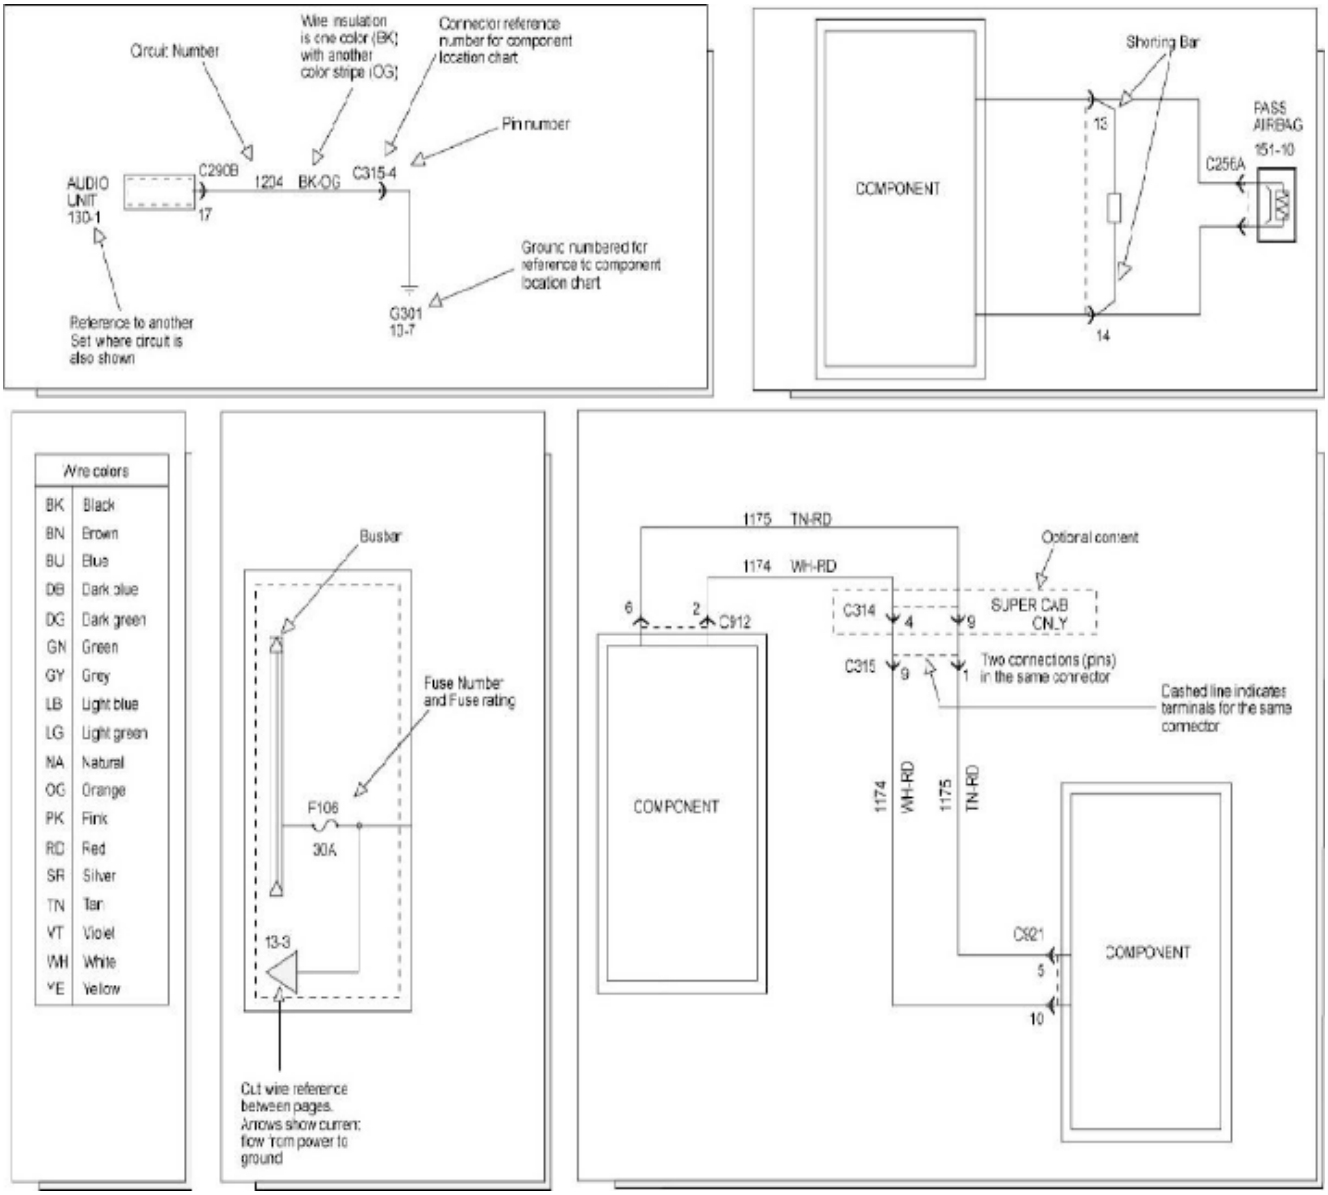
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

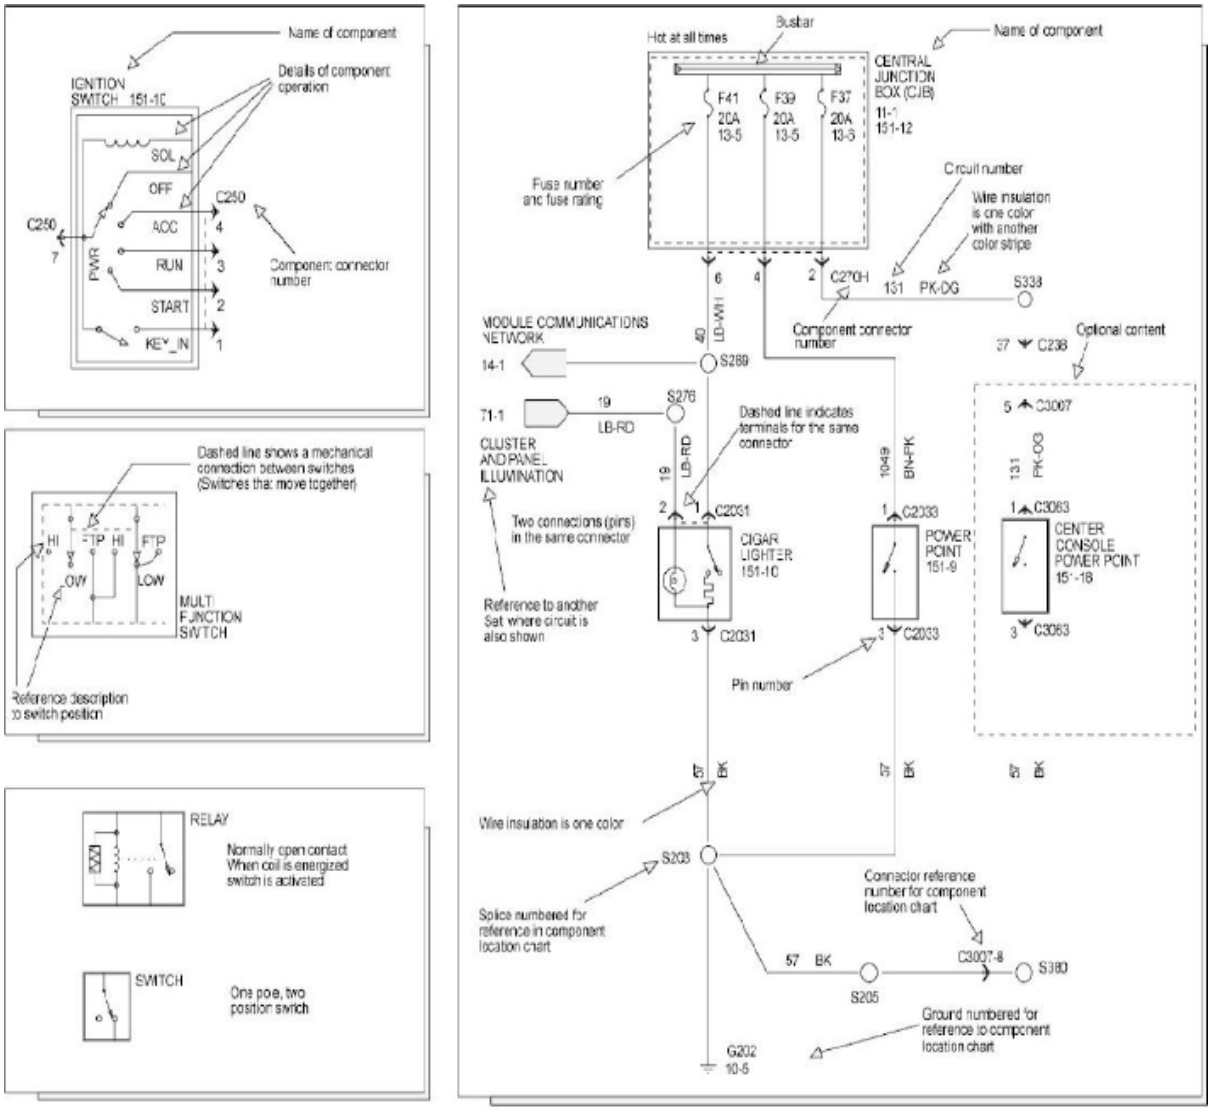
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

Accessory Delay Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

4 = Circuit insulation

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

BRAZED SEAM
INDENTER
WIRE STOPPER

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

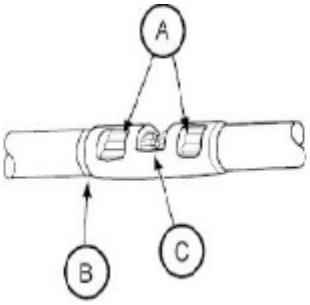
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

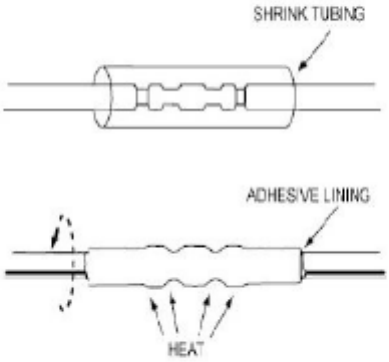
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4□ strip, cut 9 strands	* 1/4□ strip, cut 2 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip, fold 3x dia.
	16-14	* 1/4□ strip, cut 7 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip fold 2x dia	1□ strip, fold 3x dia.	1 1/4□ strip, fold 4x dia.	Not Recommended
	12-10	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip fold 3x dia.	1 1/4□ strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

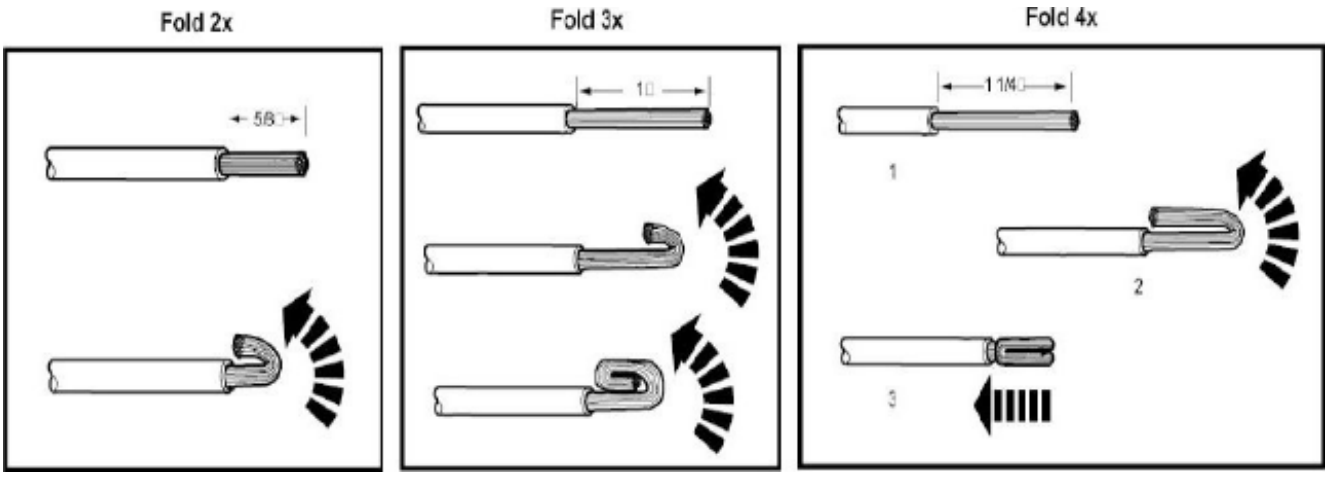
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



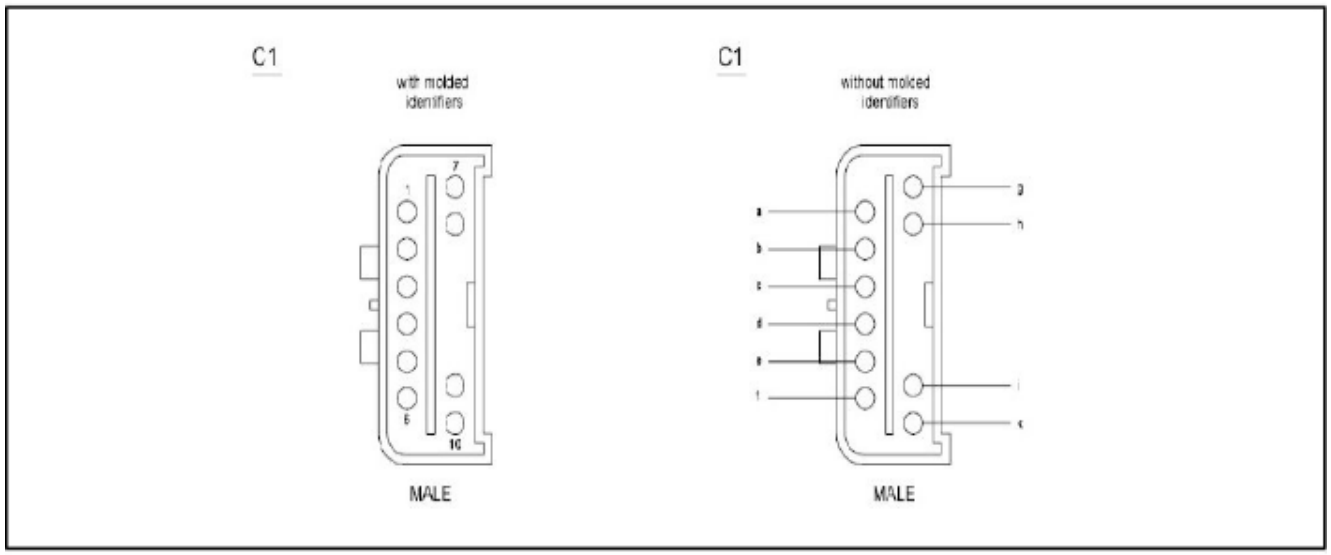
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step by step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



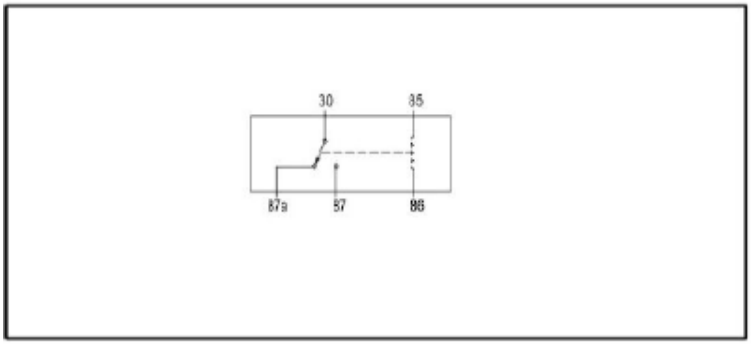
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

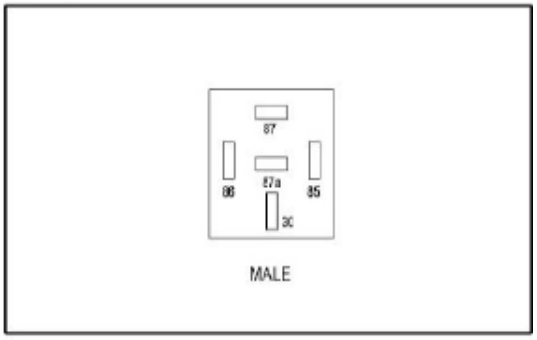
Accessory Delay Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 □ 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

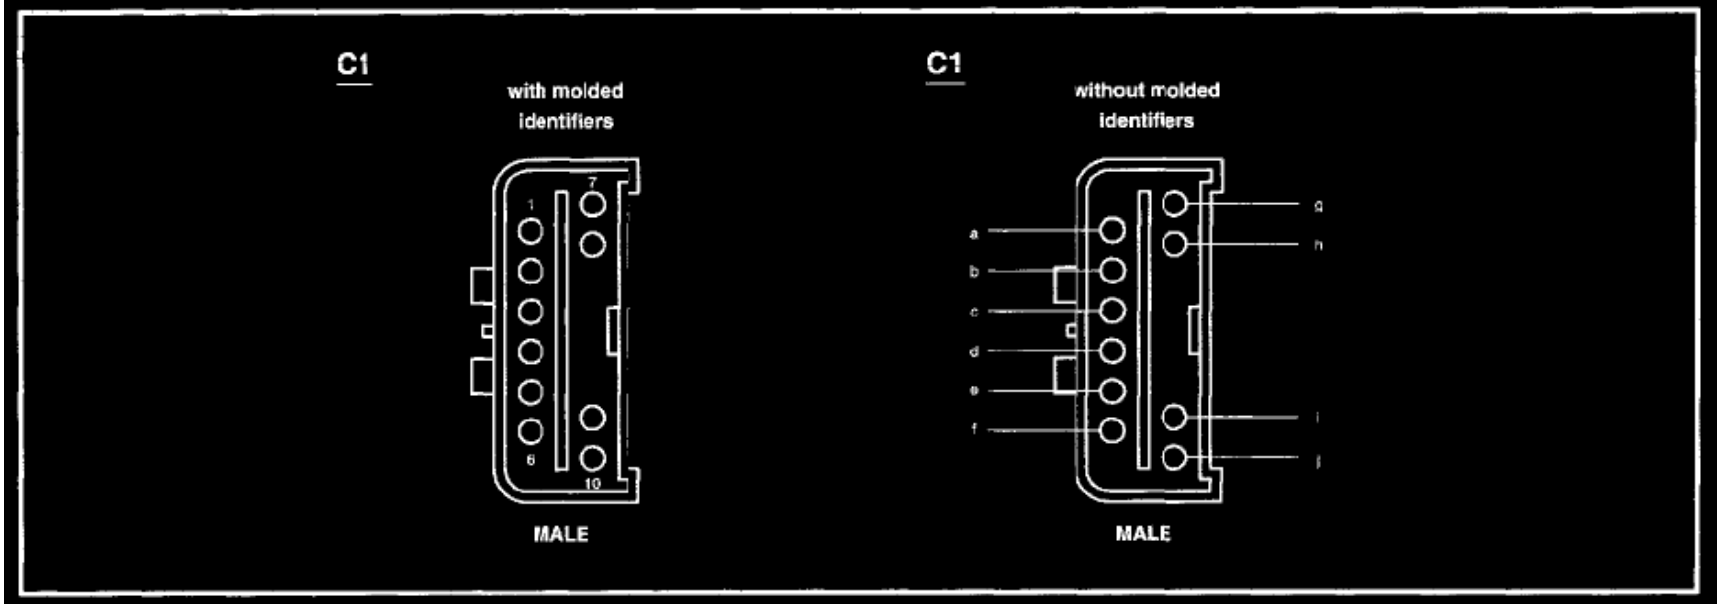
Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step–by–step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



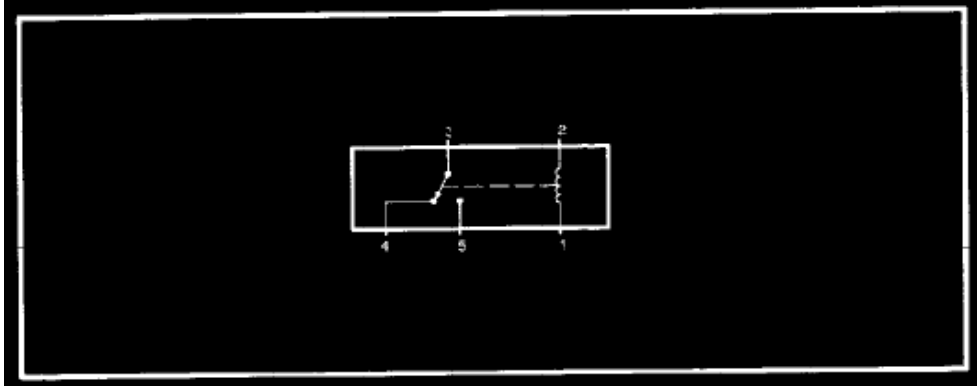
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

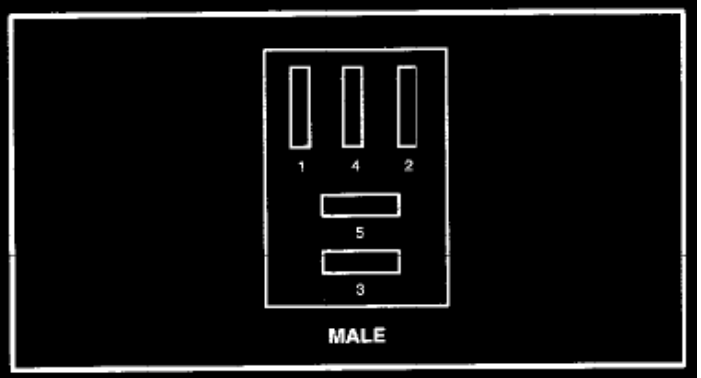
Accessory Delay Relay: Testing and Inspection Micro ISO Relay

Relay – Micro ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	1 and 2	63–102Ω
Contact	3 and 4	Closed circuit
	3 and 5	Open circuit
Coil – Contact	1 and 3	Open circuit
	1 and 4	Open circuit
	1 and 5	Open circuit

Component testing procedure (voltage applied)

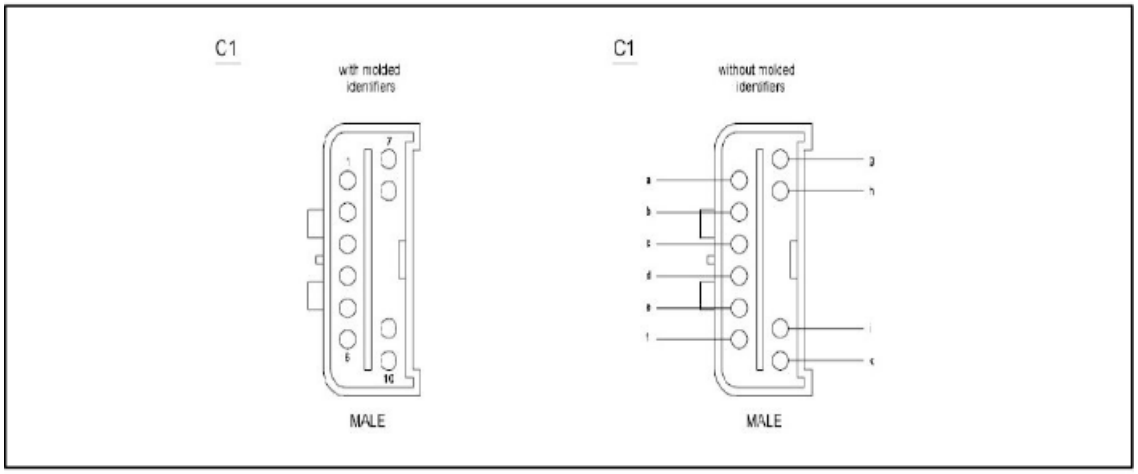
Disconnect the ohmmeter; connect pins 2 and 3 to 12V DC power and pin 1 to ground. Measure voltage between pin 5 and pin 1. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 2 and measure voltage between pin 4 and pin 1. If the voltage is 12V, the relay is okay. If not, replace the relay.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

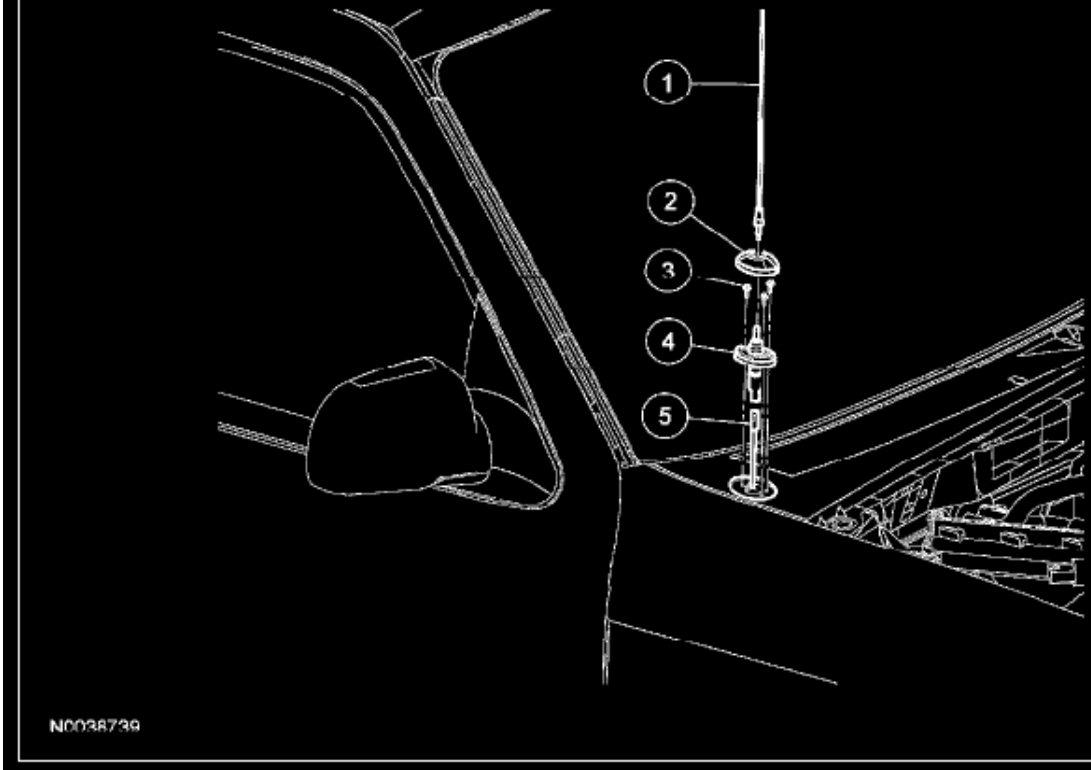
	1 and 5	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 2 and 3 to 12V DC power and pin 1 to ground. Measure voltage between pin 5 and pin 1. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 2 and measure voltage between pin 4 and pin 1. If the voltage is 12V, the relay is okay. If not, replace the relay.



Item	Part Number	Description
1	18813	Antenna mast
2	18A927	Antenna base cover
3	—	Antenna base screws (3 required)
4	19A182	Antenna base
5	—	Antenna cable connector (part of 18812)

Antenna: Service and Repair Antenna

ANTENNA

Removal and Installation

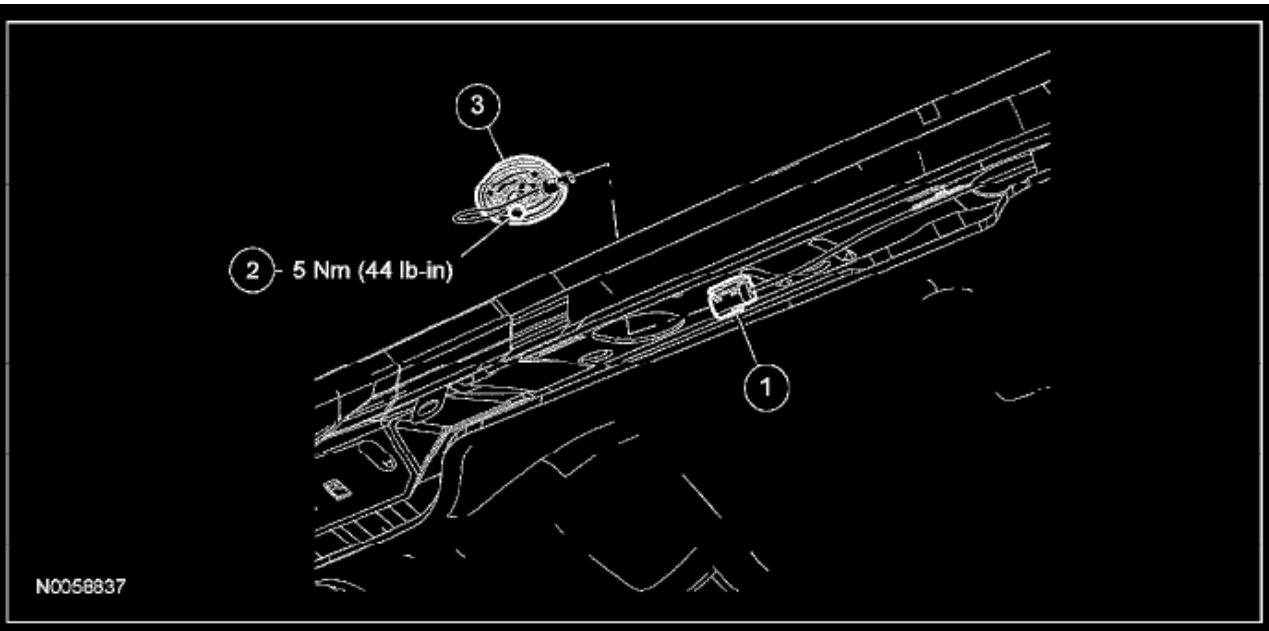
1. Remove the antenna mast. 2. Remove the antenna base cover by prying it from the base.

3. NOTE: Be careful not to allow the antenna cable to fall back into the fender.

Remove the 3 screws and the antenna base. -

Disconnect the antenna cable connector.

4. To install, reverse the removal procedure.



Item	Part Number	Description
1	—	Satellite radio antenna electrical connector (part of 19A397)
2	—	Satellite radio antenna bolt (part of 18C964)
3	18C964	Satellite radio antenna

Antenna: Service and Repair Antenna - Satellite Radio

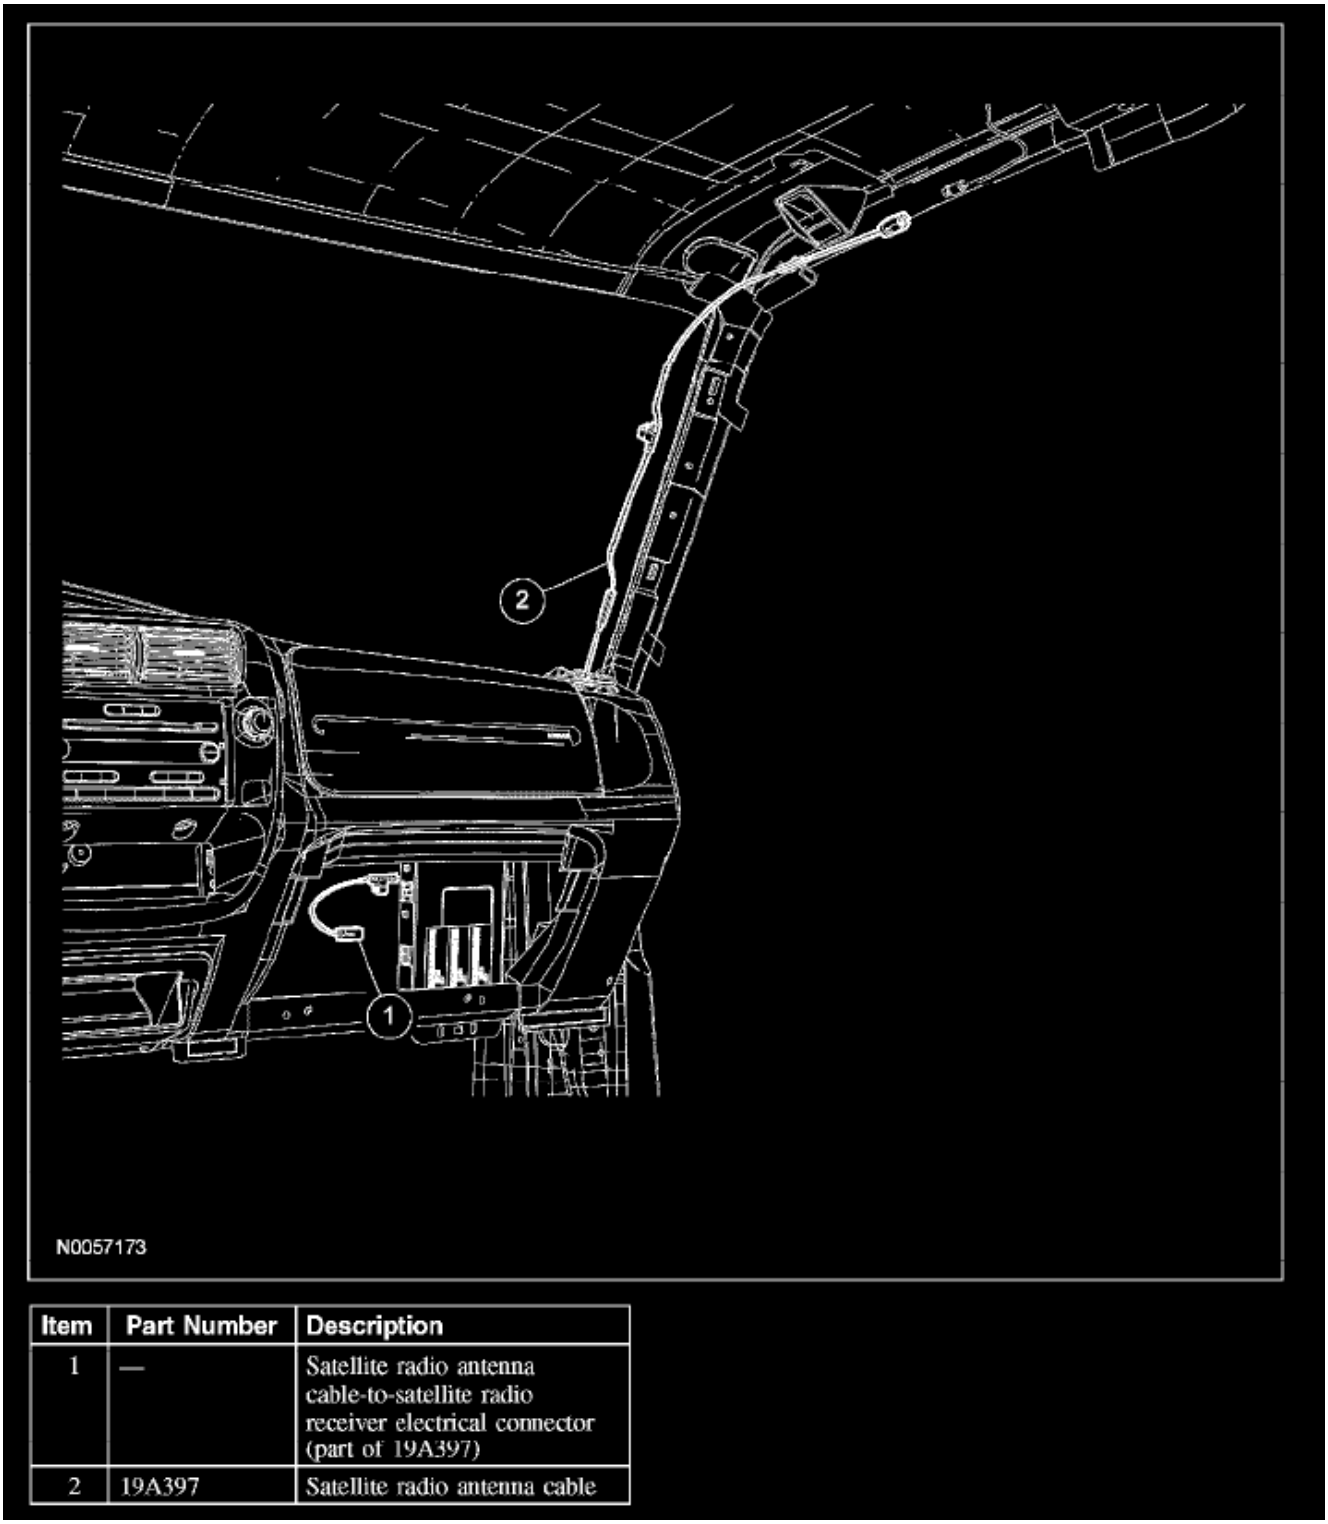
ANTENNA - SATELLITE RADIO

Removal and Installation

1. Remove the RH A-pillar trim panel. 2. Remove the RH visor. 3. Lower the headliner to access the satellite antenna. 4. Disconnect the satellite radio antenna electrical connector. 5. Loosen the bolt and remove the satellite radio antenna.

- To install, tighten to 5 Nm (44 lb-in).

6. To install, reverse the removal procedure.



Item	Part Number	Description
1	—	Satellite radio antenna cable-to-satellite radio receiver electrical connector (part of 19A397)
2	19A397	Satellite radio antenna cable

Antenna: Service and Repair Antenna Cable - Satellite Radio

ANTENNA CABLE - SATELLITE RADIO

Removal and Installation

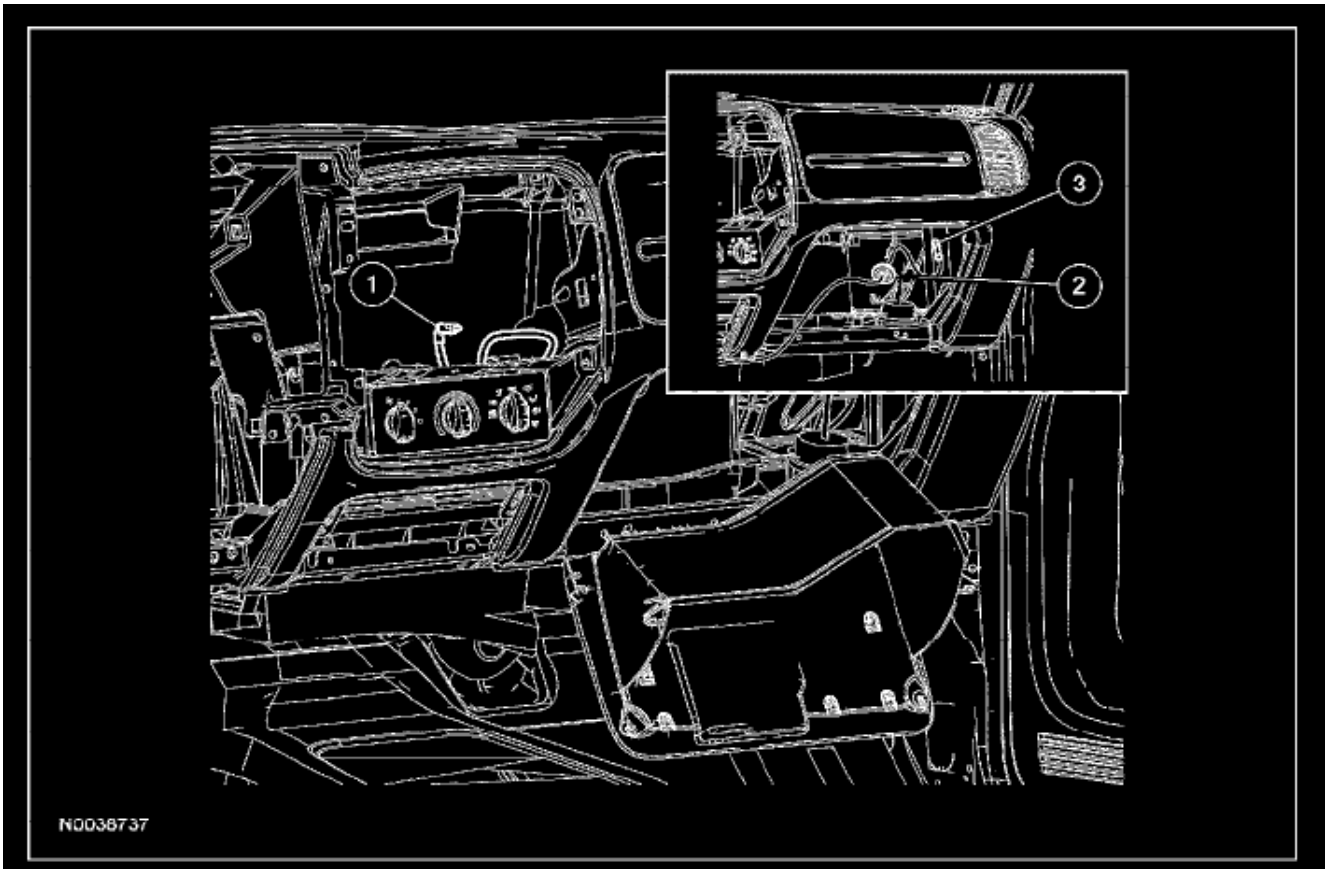
1. Remove the satellite radio antenna. 2. Press the tabs and lower the glove compartment completely. 3. Disconnect the satellite radio antenna cable-to-satellite radio receiver electrical connector.

4. NOTE: For ease of installation, the new satellite radio antenna should be tied to the existing cable and pulled through the side of the instrument

panel.

Remove the satellite radio antenna cable.

5. To install, reverse the removal procedure.



Item	Part Number	Description
1	18812	Antenna cable
2	—	Antenna cable grommet (part of 18812)
3	—	Antenna cable-to-antenna connector (part of 18812)

Antenna: Service and Repair Antenna Cable

ANTENNA CABLE

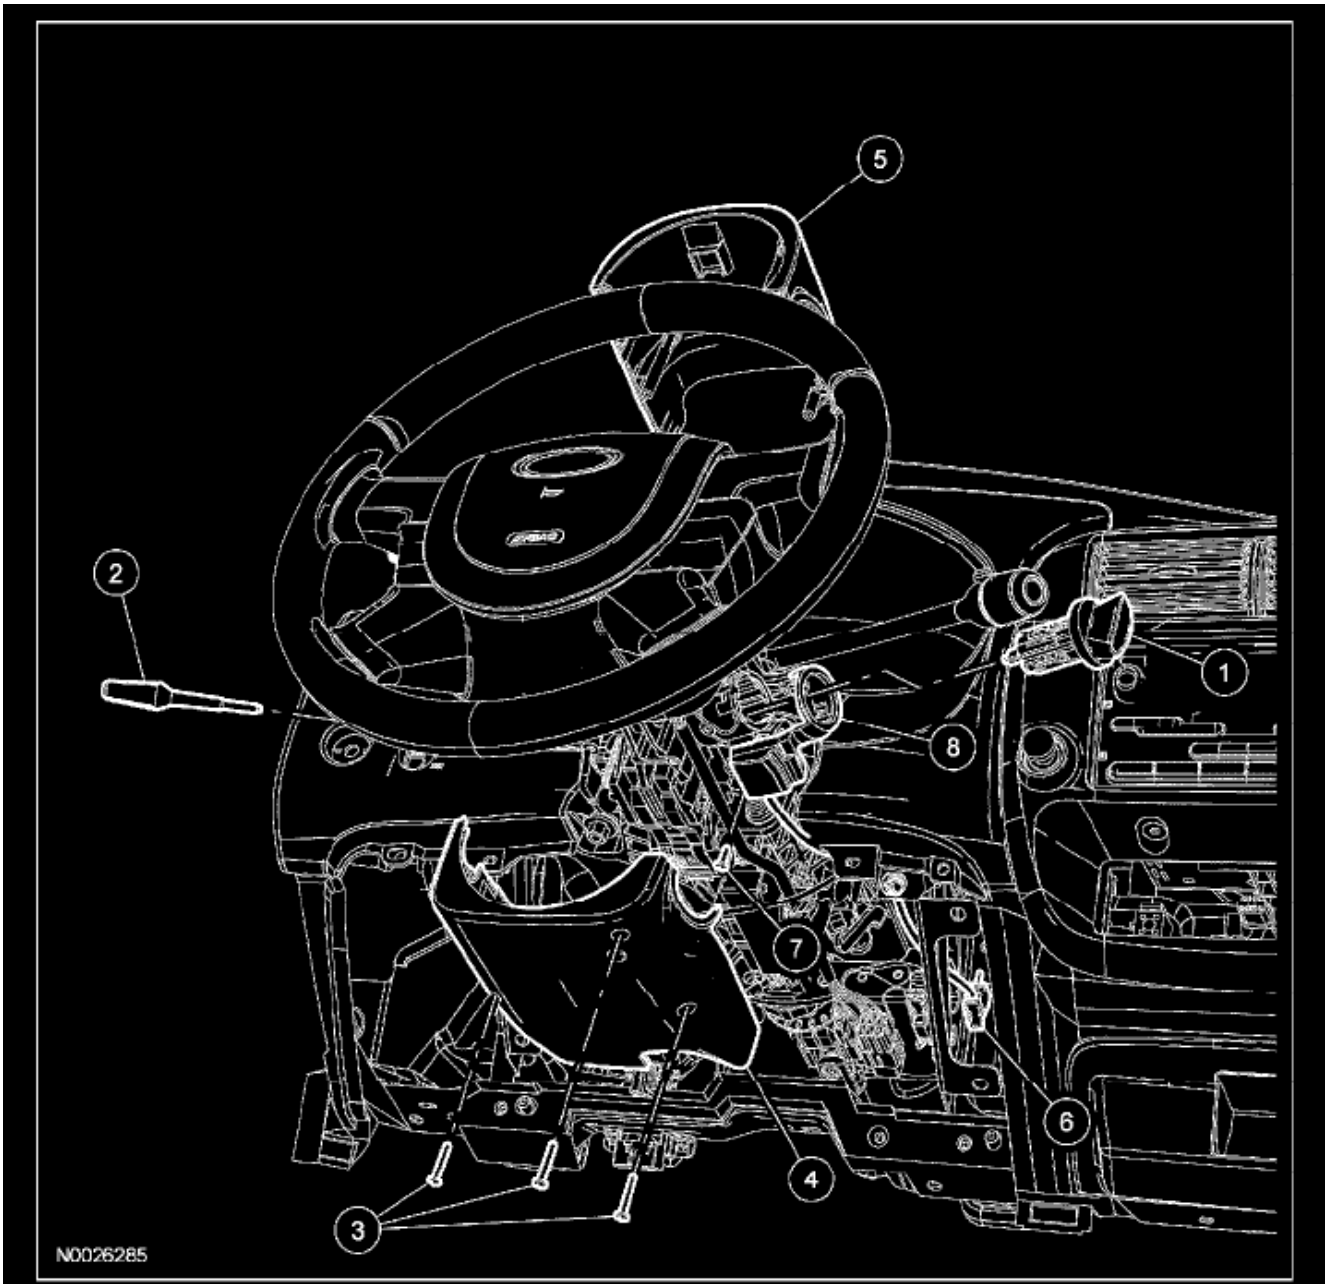
Removal and Installation

1. Remove the antenna. 2. Remove the audio unit. 3. Release the tabs and lower the glove compartment door to the full-open position. 4. Remove the antenna cable.

1 Pull the rubber grommet from the sheet metal.

2 Remove the antenna cable through the glove compartment door opening.

5. To install, reverse the removal procedure.



Item	Part Number	Description
1	11582	Ignition lock cylinder
2	—	Tilt column handle
3	391727-S424	Steering column shroud screws (3 required)
4	3K512	Lower steering column shroud

Item	Part Number	Description
5	3530	Upper steering column shroud
6	—	PATS transceiver electrical connector (part of 14401)
7	W710836-S424	PATS transceiver screw
8	15607	PATS transceiver

(Continued)

Alarm System Transmitter: Service and Repair

PASSIVE ANTI-THEFT SYSTEM (PATS) TRANSCEIVER

Removal and Installation

1. With the ignition lock cylinder in the ON position, press the ignition lock cylinder release button with a suitable tool and pull the ignition lock

cylinder out of the steering column.

2. Remove the steering column opening panel cover and reinforcement. 3. Remove the tilt column handle. 4. Remove the 3 screws and the upper and lower steering column shrouds. 5. Disconnect the electrical connector. 6. Open the 2 clockspring wiring harness guides. 7. Remove the screw and the PATS transceiver.

8. NOTE: Replacement of the PATS transceiver does not require the PATS keys to be programmed into the IC again.

To install, reverse the removal procedure.

Keyless Entry Transmitter: Customer Interest Keyless Entry - Transmitter May Not Operate

TSB 08-12-9

06/23/08

INOPERATIVE RKE TRANSMITTER (KEY FOB) - DISCHARGED KEY FOB BATTERY

FORD: 2008 Crown Victoria, Focus, Mustang 2007-2008 F-150 2008 E-Series, Expedition, Explorer Sport Trac, Explorer, F-Super Duty, Ranger

LINCOLN: 2007-2008 Mark LT

MERCURY: 2008 Grand Marquis, Mountaineer

ISSUE Some 2007-2008 vehicles equipped with a remote keyless entry (RKE) transmitter may exhibit an inoperative Key Fob due to a discharged Key Fob battery. This may be caused by an internal issue with the Key Fob software. This concern only applies to vehicles built within a specific date range with Key Fobs manufactured within a specific date range.

ACTION Follow the Service Procedure steps to correct the condition.

SERVICE PROCEDURE

NOTE

PERFORMING THIS PROCEDURE WILL HAVE NO EFFECT ON KEY FOB RANGE. REFER TO WORKSHOP MANUAL (WSM), SECTION 501-14 FOR KEY FOB RANGE DIAGNOSTICS.

1. Refer to vehicle list for build date range. (Figure 1)

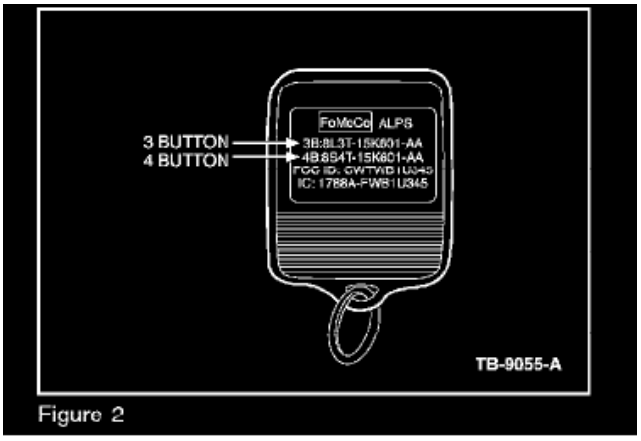

Figure 2

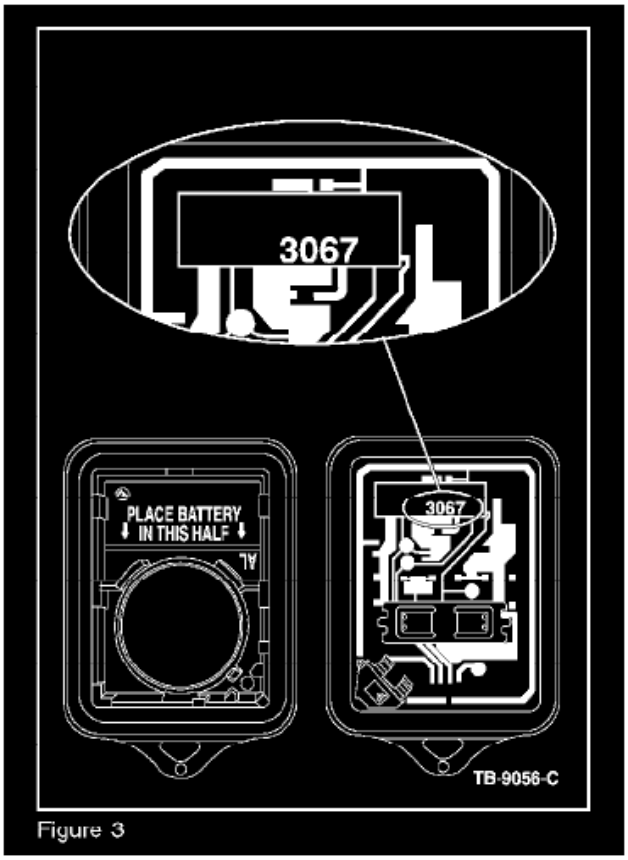

Figure 3

PART NUMBER	PART NAME
8L3Z-15K601-AA	3-Button Key Fob
8S4Z-15K601-A	4-Button Key Fob

a. If the vehicle was built within the date range, then continue with this procedure.

b. If not, then do not proceed. Continue with normal diagnostics per WSM, Section 501-14.

2. Is the vehicle Key Fob part number 8L3T-15K601-AA (3 button) or 8S4T-15K601-AA (4 button)? (Figure 2)

a. Yes - Go to Step 3.

b. No - Do not proceed. Continue with normal diagnostics per WSM, Section 501-14.

3. Using a thin coin, open the Key Fob and inspect manufacturer's date code sticker. The first three digits = day of year. The last digit = year. (Figure 3)

a. If the first 3 digits are equal to or between 005 and 306 (5th day through 306th day) and the last digit is 7 (year), then proceed to Step 4.

b. If the number is outside this specified range, then do not proceed. Continue with normal diagnostics per WSM, Section 501-14.

4. If the Key Fob is inoperative due to a discharged Key Fob battery, and the date code falls within the specified range, then replace Key Fob. Program the new Key Fob transmitter using the IDS RKE Transmitter Programming Procedure. Reassemble old Key Fob for warranty return analysis.

NOTE

KEY FOBS REPLACED UNDER WARRANTY WILL BE REQUESTED FOR ANALYSIS AND VERIFICATION OF THE DATE CODE.

a. IDS RKE Transmitter Programming Procedure

(1) Install known good battery into the suspect Key Fob so that IDS scan tool can identify it.

(2) Connect IDS to vehicle.

(3) From the Main Toolbox tab:

(a) Select - Body.

(b) Select - Security.

(c) Select - Remote Keyless Entry.

(4) Press the "Unlock" button on the suspect Key Fob to view the Transmitter Identification Code (TIC) in IDS.

5. Select "Erase One Key Fob" or the "Erase" button.

6. Select the suspect Key Fob TIC to erase from vehicle memory.

7. Remove battery from suspect Key Fob and reassemble for warranty return.

8. Select "Reprogram a New Keyfob" or the "Program" button.

9. Press the "Unlock" button on the NEW Key Fob.

10. Follow the instructions on the scan tool screen to complete the programming procedure.

WARRANTY STATUS: Eligible Under Provisions Of New Vehicle Limited Warranty Coverage
IMPORTANT: Warranty coverage limits/policies are not altered by a TSB. Warranty coverage limits are determined by the identified causal part.

OPERATION DESCRIPTION TIME

081209A 2008 Focus, Mustang, 0.3 Hr.

Explorer, Explorer Sport Trac, Mountaineer, E-Series, Expedition, Crown Victoria, Grand Marquis, Ranger, F-Super Duty: Replace Key Fob(s), Includes Time To Perform Key Fob Programming Procedure, And Verify Date Code Sticker (Do Not Use With 15601A)

081209A 2007-2008 F-150, Mark 0.3 Hr.

LT: Replace Key Fob(s), Includes Time To Perform Key Fob Programming Procedure, And Verify Date Code Sticker (Do Not Use With 15601A)

NOTE: The information in Technical Service Bulletins is intended for use by trained, professional technicians with the knowledge, tools, and equipment to do the job properly and safely. It informs these technicians of conditions that may occur on some vehicles, or provides information that could assist in proper vehicle service. The procedures should not be performed by "do-it-yourselfers". Do not assume that a condition described affects your car or truck. Contact a Ford, Lincoln, or Mercury dealership to determine whether the Bulletin applies to your vehicle.

Keyless Entry Transmitter: Testing and Inspection

REMOTE KEYLESS ENTRY TRANSMITTER PROGRAMMING

CAUTION: All remote keyless entry (RKE) transmitters must be programmed at the same time.

1. Before entering the program mode, the vehicle must be electronically unlocked with the RKE transmitter or the door lock control switch while the

driver door is open.

2. Turn the ignition switch from OFF to RUN 8 times within 10 seconds, with the eighth turn ending in RUN. If the module successfully enters

program mode, it locks and then unlocks all the doors.

3. Within 20 seconds, press any button on an RKE transmitter and the doors lock and then unlock to confirm that each RKE transmitter is

programmed. Repeat this step for each RKE transmitter.

4. If the door locks do not respond for any RKE transmitter, wait several seconds and press the button again. If the door locks still fail to respond,

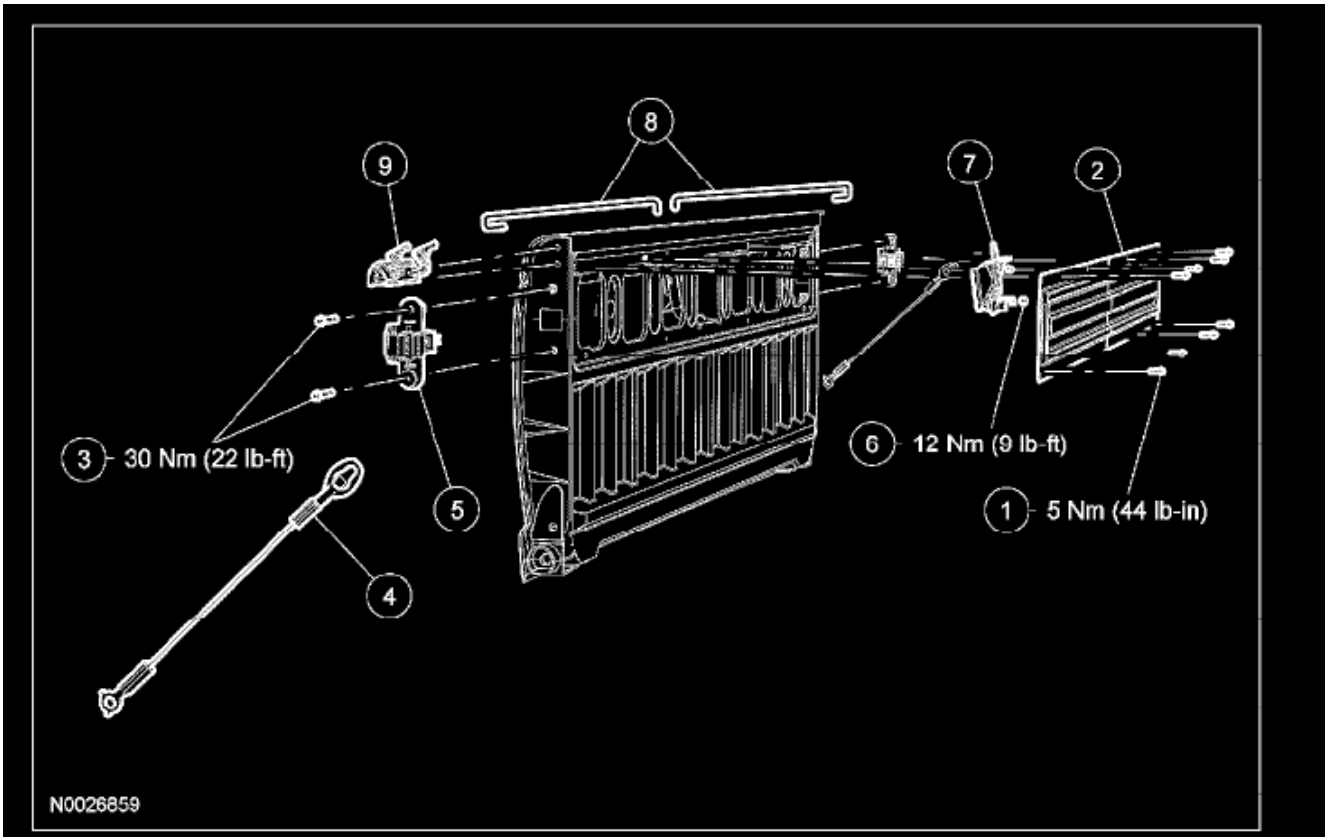
refer to Inspection and Verification. Make sure that no more than the maximum number of RKE transmitters is being programmed. See: Body and Frame/Locks/Power Locks/Testing and Inspection/Initial Inspection and Diagnostic Overview/Inspection and Verification

5. Exiting the programming mode is accomplished if 1 of the following occurs:

- The key transitions to the OFF position.

- 20 seconds have passed since entering programming mode or since the last RKE transmitter was programmed.

- The maximum number of RKE transmitters have been programmed.



Item	Part Number	Description

Keyless Entry Transmitter: Service and Repair

TAILGATE LATCH REMOTE CONTROL

Exploded View

Removal and Installation

1. Remove the 8 screws and the tailgate access cover.

- To install, tighten to 5 Nm (44 lb-in).

2. Open the tailgate latch actuating rod retainers and disconnect the tailgate latch actuating rods from the tailgate latch remote control. 3. Remove the 2 tailgate latch remote control nuts.

- To install, tighten to 12 Nm (9 lb-ft).

4. Remove the tailgate latch remote control.

5. NOTE: Prior to installation, remove the slack in the tailgate latch release links by pulling the tailgate latch release links to the center of the

tailgate. Close the plastic clip over the thread of the tailgate latch release links.

To install, reverse the removal procedure.

Navigation System: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

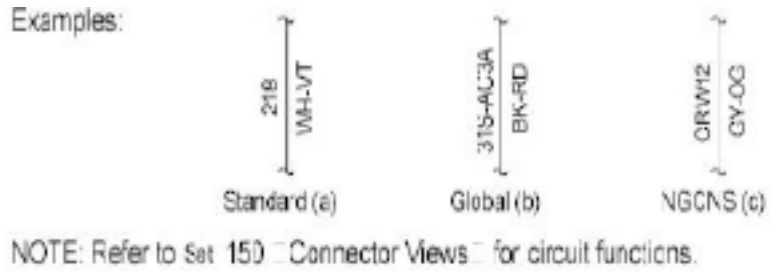
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

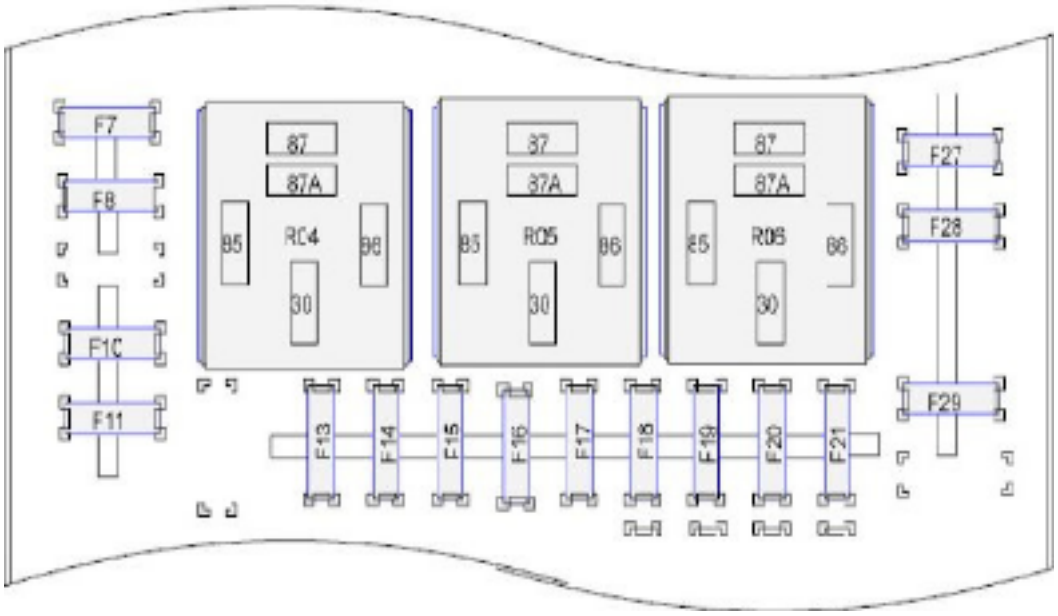
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

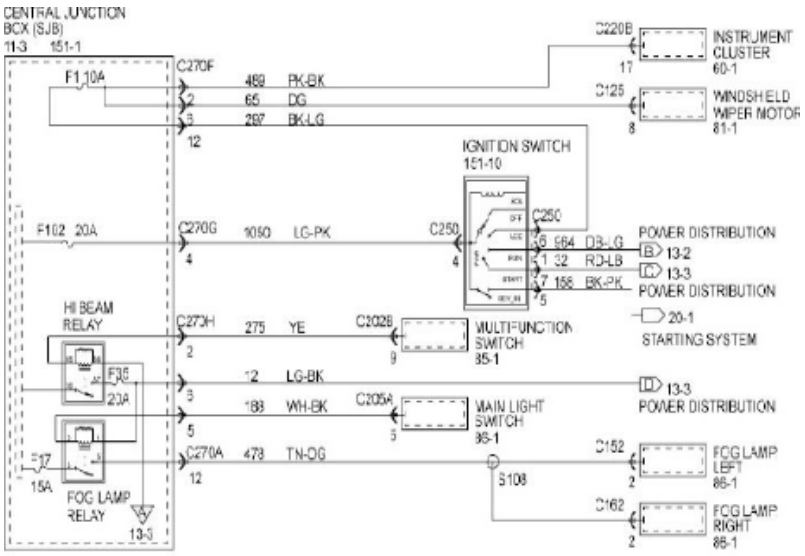
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

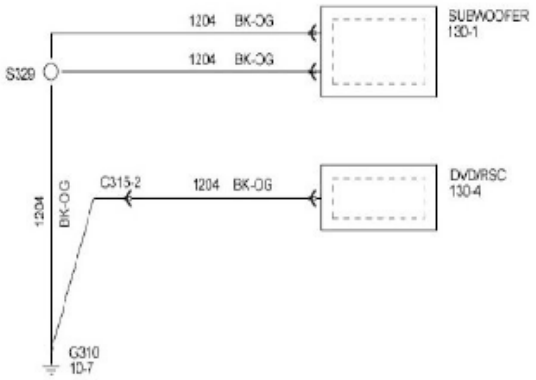
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

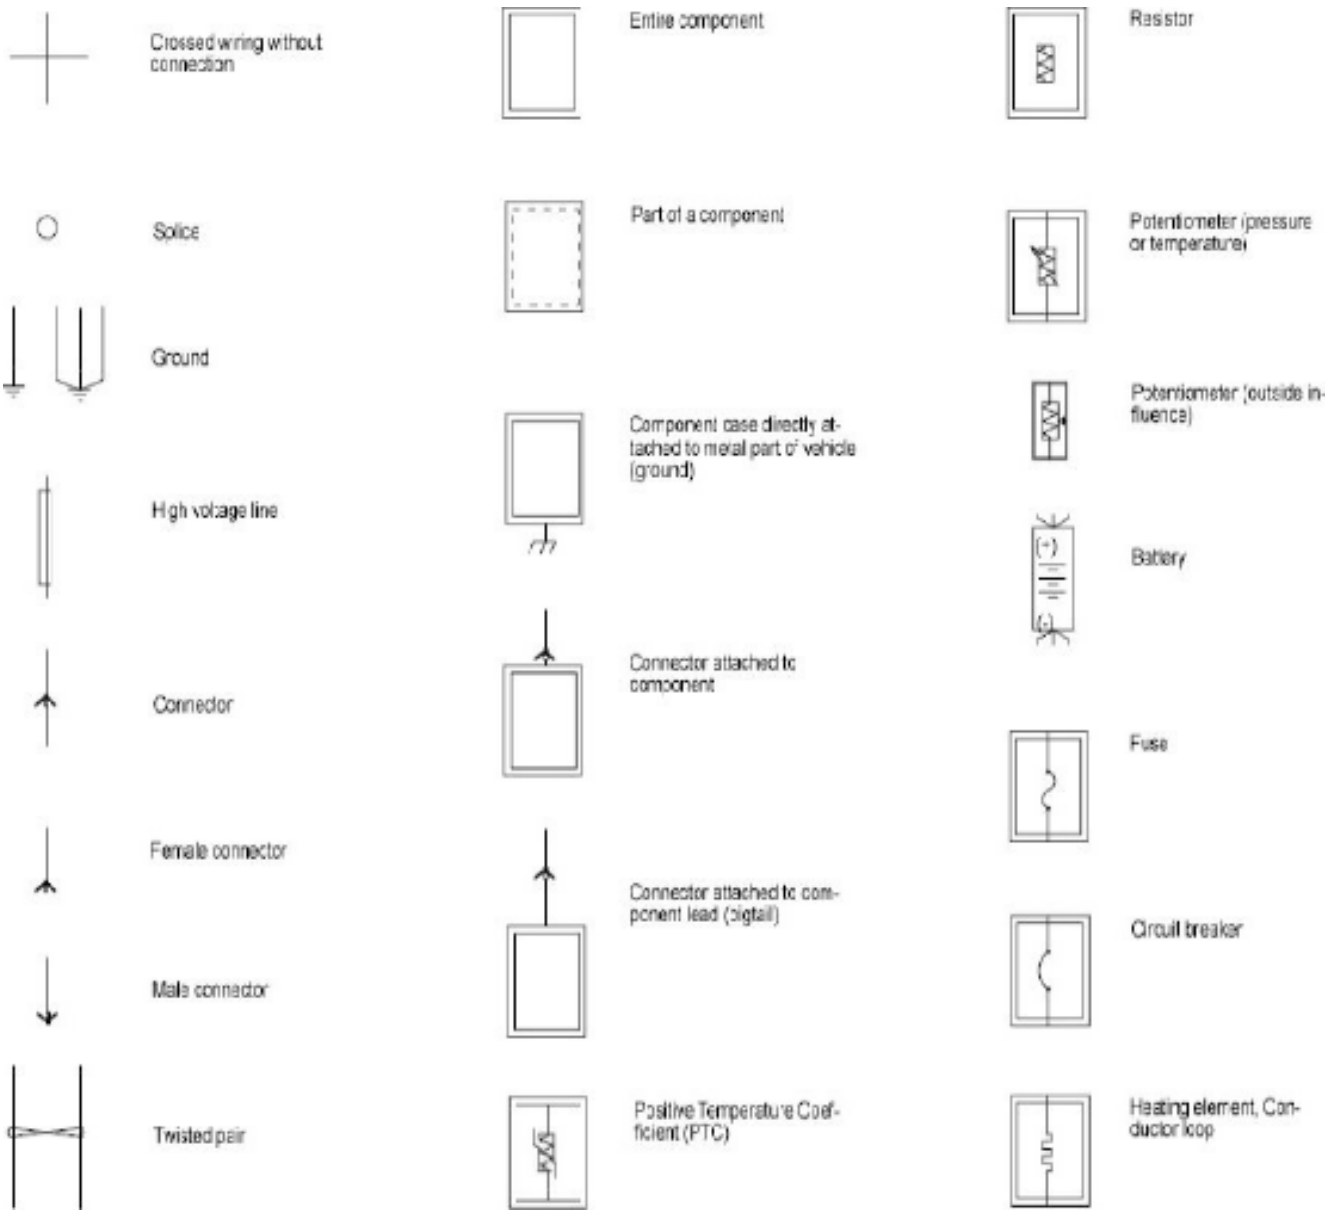
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

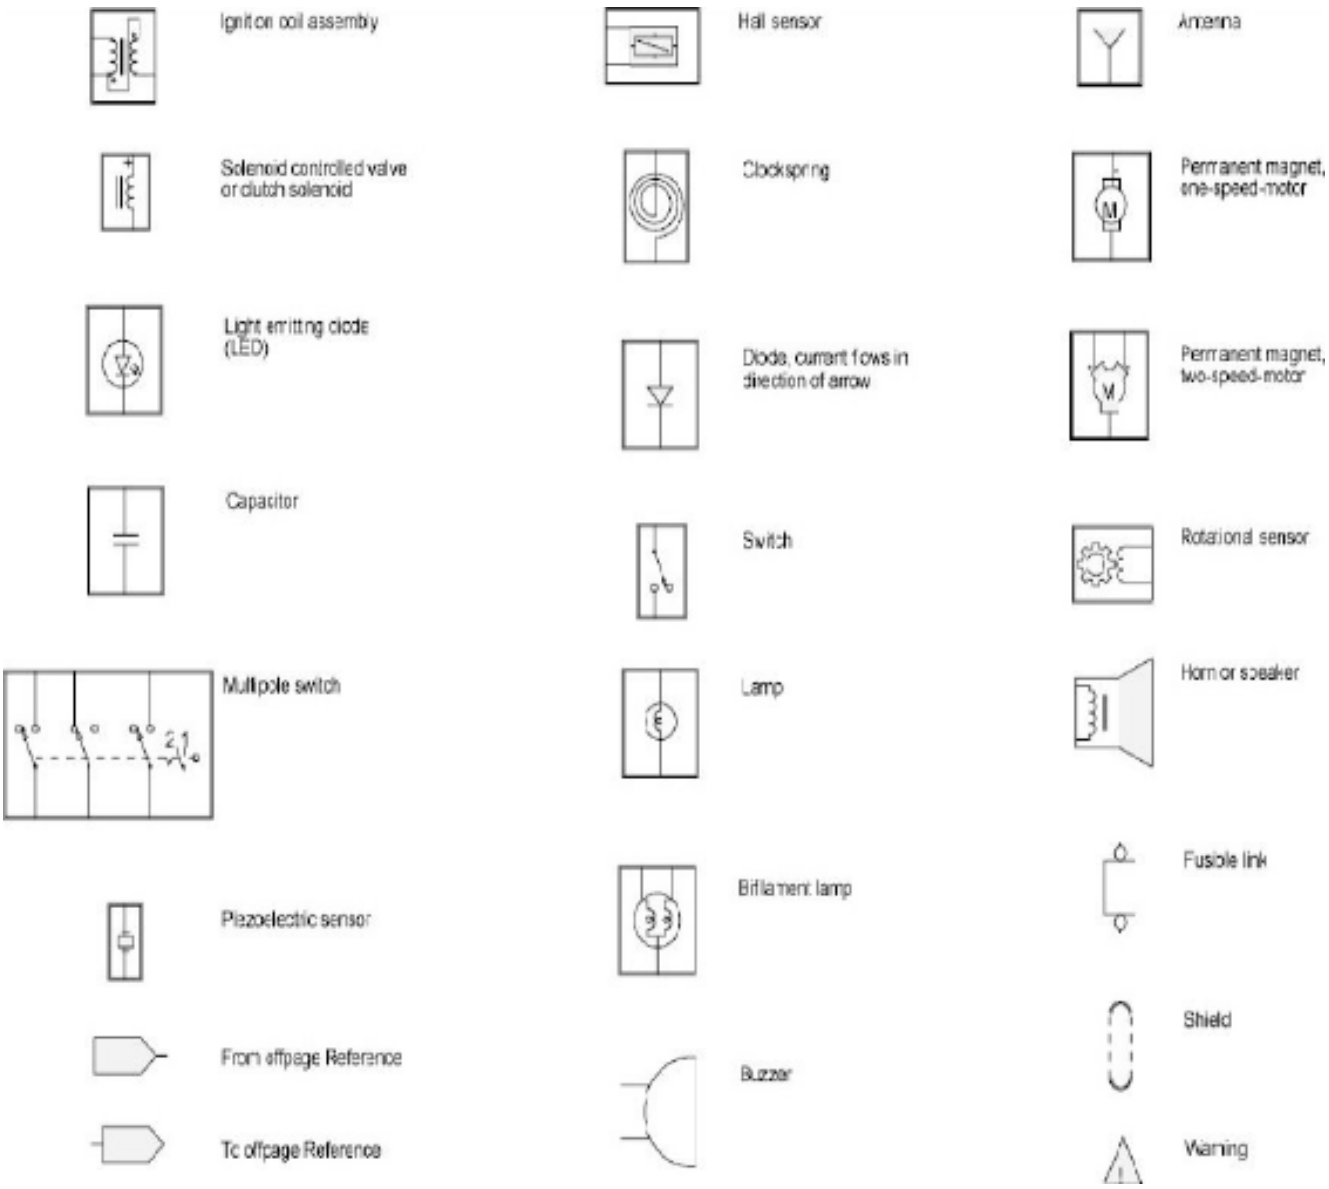
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

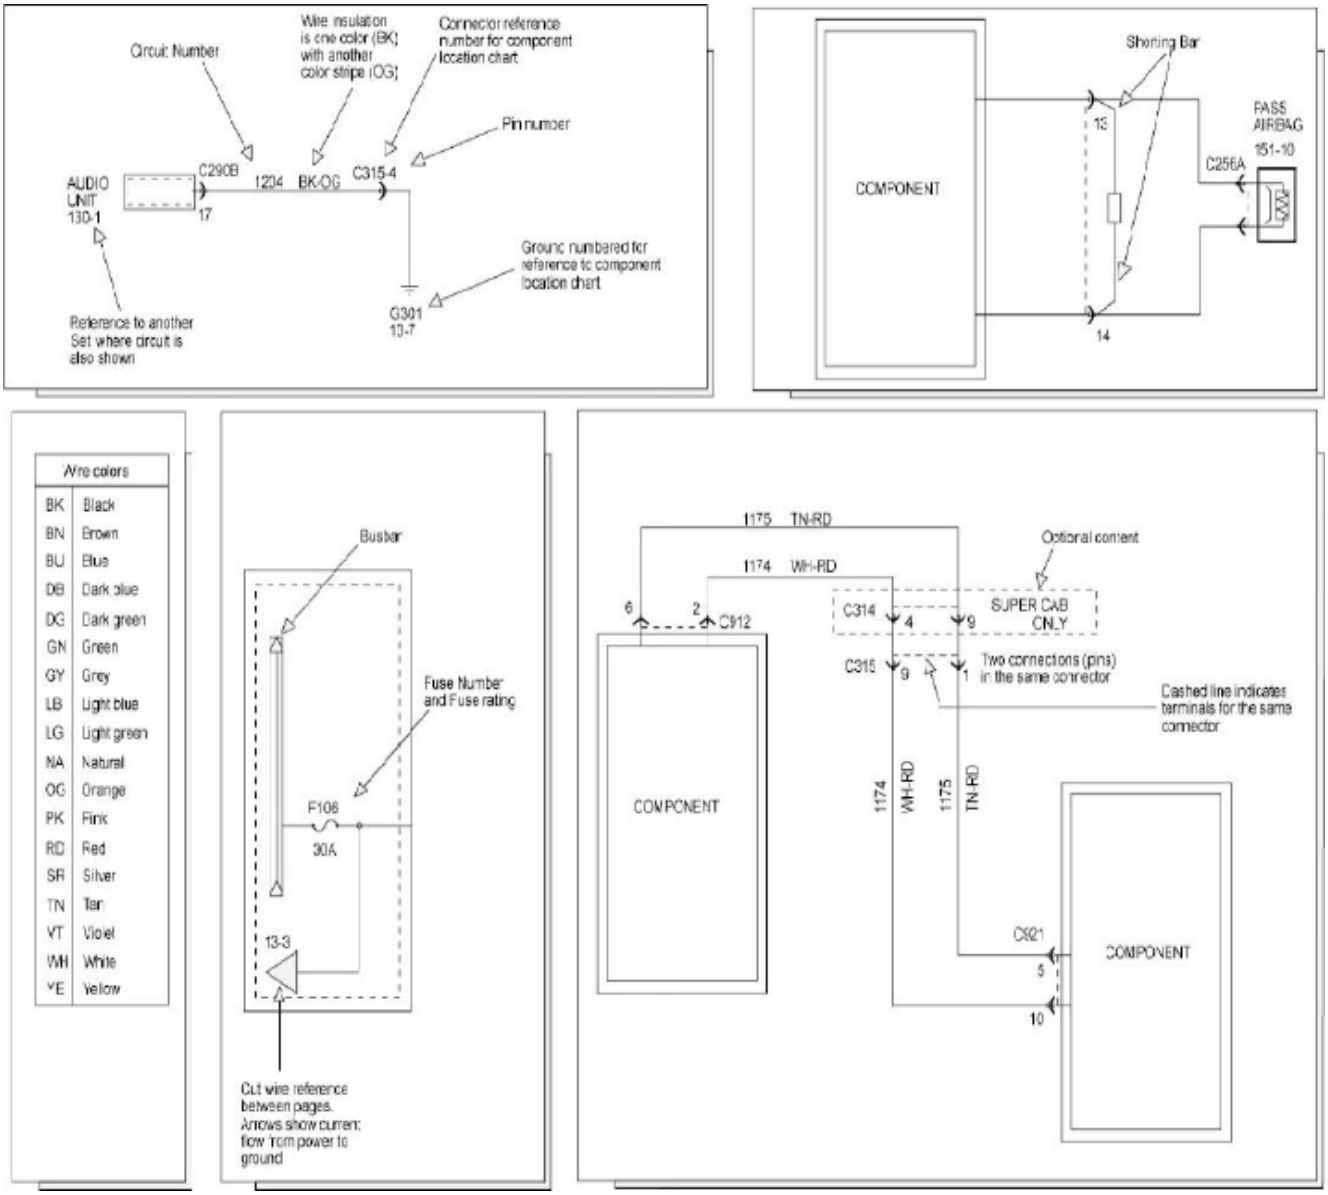
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

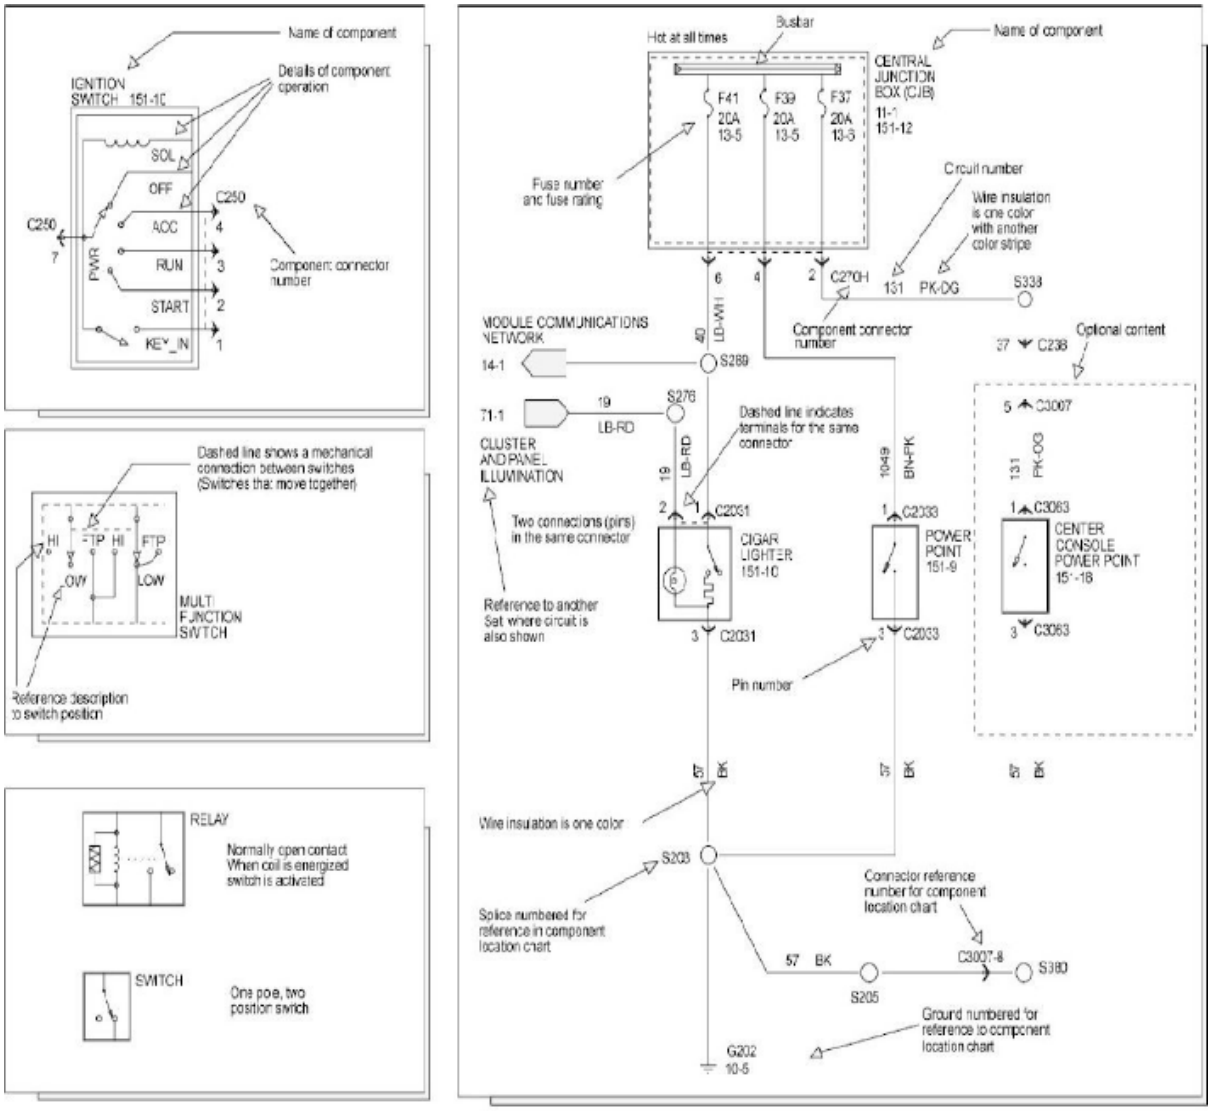
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Navigation System: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Defective insulation stripping

1 = Proper crimp

2 = Insulation not removed

3 = Wire strands missing

4 = Intermittent signals through pierced insulation

Partially mated connectors

1 = Seal

2 = Displaced tab

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Male half

7 = Intermittent contact

Lock may be displaced into an unlocked position; pull on the connector to verify the lock.

Deformed (enlarged) female terminals

1 = Enlarged

2 = Normal

Any probe entering the terminal may enlarge the contact spring opening creating an intermittent signal.

Insert the correct mating terminal (Location A) from the service kit and feel for a loose fit.

4 = Circuit insulation

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

WIRE STOPPER

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

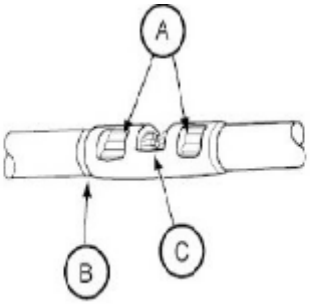
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

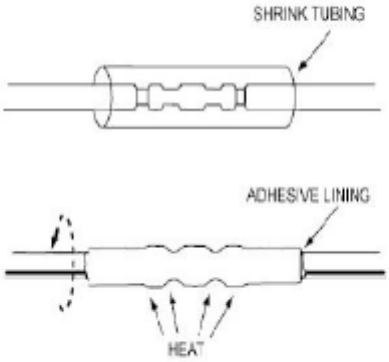
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4□ strip, cut 9 strands	* 1/4□ strip, cut 2 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip, fold 3x dia.
	16-14	* 1/4□ strip, cut 7 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip fold 2x dia	1□ strip, fold 3x dia.	1 1/4□ strip, fold 4x dia.	Not Recommended
	12-10	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip fold 3x cia.	1 1/4□ strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

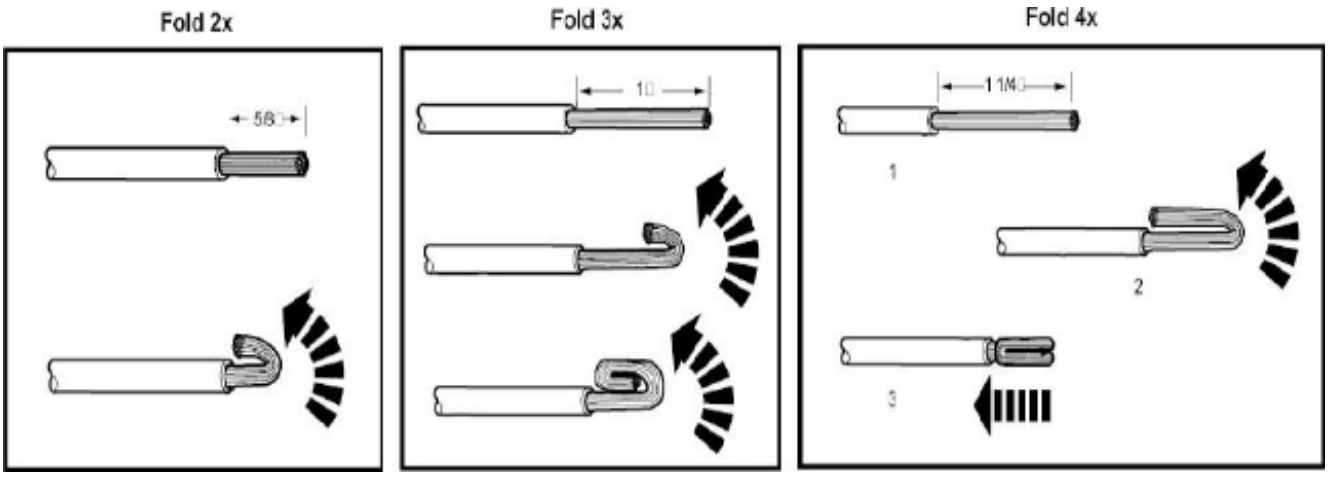
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Radio/Stereo: Procedures

Audio Unit Shipment Mode

AUDIO UNIT SHIPMENT MODE

Entering Shipment Mode

CAUTION: The CD6 audio unit must be placed in shipment mode anytime the audio unit is removed (including for diagnostic purposes). Failure to follow this instruction may result in damage to the audio unit.

NOTE: This procedure applies to the CD6 audio unit.

1. Turn the audio unit on and eject any CDs loaded in the audio unit. 2. Turn the key to OFF. 3. Press and hold presets 2 and 5, simultaneously. 4. While holding the presets, turn the key to ACC or RUN.

- The audio display will flash SHIPMENT.

- When the CD tray has parked, the audio unit will display SHIPMENT ON.

5. Turn the key to OFF. 6. Remove the audio unit.

Exiting Shipment Mode

NOTE: If the audio unit is removed, install the audio unit before beginning this procedure.

1. Turn the key to ACC or RUN. 2. Turn the audio unit on. 3. Press and hold the LOAD button for approximately 2 seconds.

- The audio unit will enter loading mode, at which time the shipment mode will be exited.

4. Turn the audio unit off.

Satellite Radio Receiver Electronic Serial Number (ESN) Retrieval

SATELLITE RADIO RECEIVER ELECTRONIC SERIAL NUMBER (ESN) RETRIEVAL

Audio Units Without Navigation

1. Operate the audio unit in satellite radio mode. 2. Press and hold the AUX button and preset button 1, simultaneously.

- The satellite radio receiver electronic serial number (ESN) will be displayed on the screen.

3. Record the satellite radio receiver ESN. 4. Turn the audio unit off.

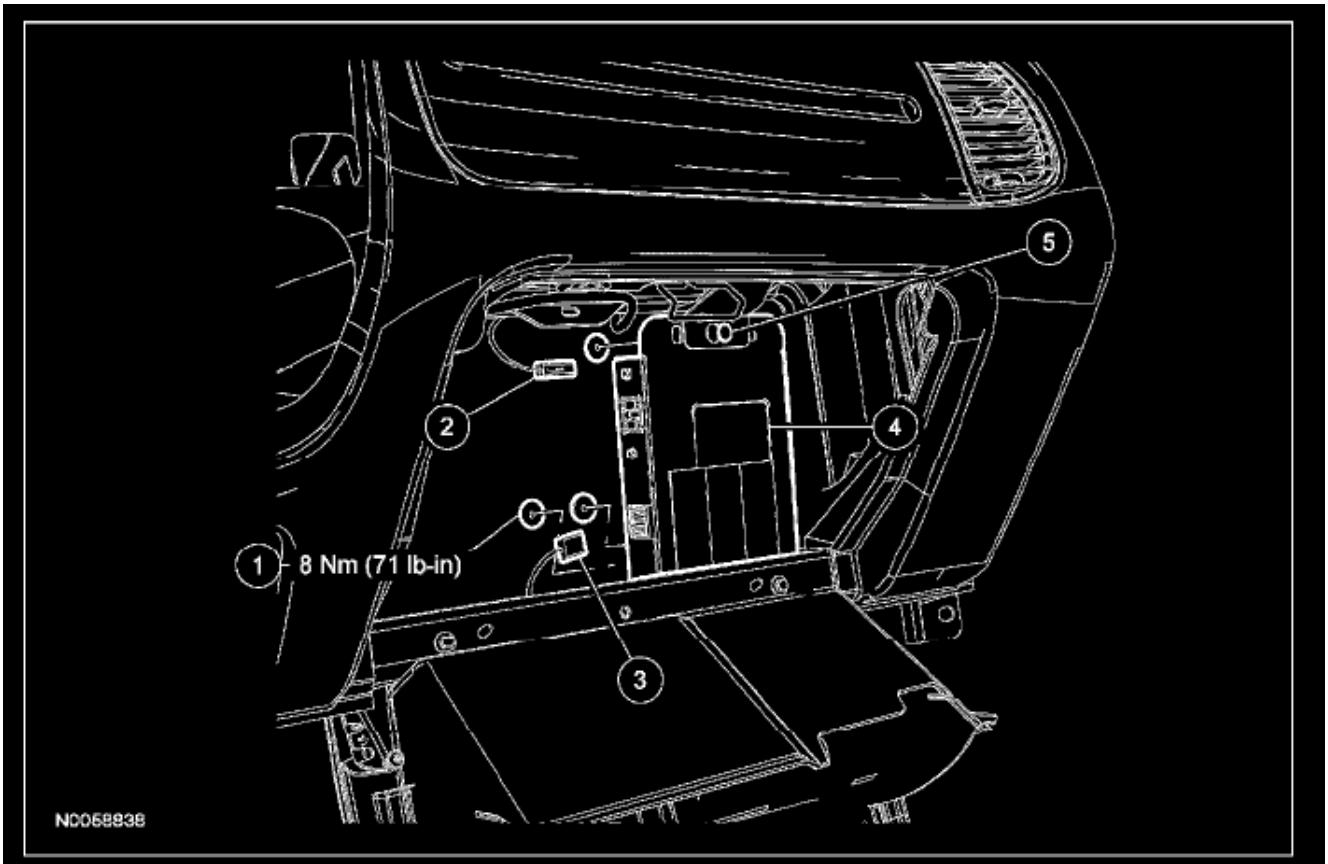
Audio Units With Navigation

1. Turn the audio unit on. 2. Press the MENU button. 3. Select the SYSTEM INFO tab.

4. NOTE: The satellite radio receiver ESN is shown on the lower left corner of the screen with the text "SR ESN:".

Record the satellite radio receiver ESN.

5. Turn the audio unit off.



Item	Part Number	Description
1	N811309	Satellite radio receiver nuts (3 required)
2	—	Satellite antenna cable (part of 19A397)
3	—	Satellite radio receiver electrical connector (part of 14401)
4	18C963	Satellite radio receiver
5	W707293	Satellite radio receiver J-stud (3 required)

Radio/Stereo: Removal and Replacement

SATELLITE RADIO RECEIVER

Removal and Installation

1. Lower the glove compartment completely. 2. Disconnect the satellite antenna cable and the satellite radio receiver electrical connector. 3. Remove the 3 nuts.

- To install, tighten to 8 Nm (71 lb-in).

4. Remove the 3 J-studs and the satellite radio receiver. 5. To install, reverse the removal procedure.

Speaker: Testing and Inspection

SPEAKER WALK-AROUND TEST - BASE AM/FM AUDIO UNIT

NOTE: The audio unit must be turned on to enter the speaker walk-around test.

1. To enter the test, press and hold preset buttons 3 and 6 simultaneously for approximately 3 seconds, then release. 2. The test applies sound to each speaker for 1-2 seconds. Speakers are tested in the following sequence: RH, LH. 3. To exit the test, turn the key to OFF or turn the audio unit off. 4. If the concern remains and the fault is not detected, GO to Symptom Chart. See: Testing and Inspection/Symptom Related Diagnostic Procedures

SPEAKER WALK-AROUND TEST - ALL EXCEPT BASE AM/FM AUDIO UNIT

NOTE: -

The audio unit must be turned on and in radio tuner mode to enter the speaker walk-around test or self-diagnostic mode.

- The self-diagnostic mode can only be entered while in the speaker walk-around test.

1. To enter the speaker walk-around test, press and hold preset buttons 3 and 6 simultaneously for approximately 3 seconds, then release. 2. The test applies sound to each speaker for 1-2 seconds. Speakers are tested and shown on the display in the following sequence: RF, LF, LR, RR,

SUBWOOFER.

3. To exit the test, turn the key to OFF, turn the audio unit off, or press preset button 1 for diagnostics.

NOTE: Always document, clear, and carry out the self-test again.

4. The self-diagnostic mode has 5 manual tests available:

- Preset button 1 = Enter diagnostics. This test enters diagnostics from the speaker walk-around test. The on-demand self-test of the audio subsystem is performed. This tests for concerns with random access memory (RAM), read only memory (ROM) or electronically etched programmable read only memory (EEPROM).

- Preset button 2 = Continuous DTCs. This test enters diagnostics from the speaker walk-around test. This test displays any DTCs currently set.

- Preset button 3 = Signal strength test. This test shows the average signal strength of the currently tuned frequency over a 5-second interval.

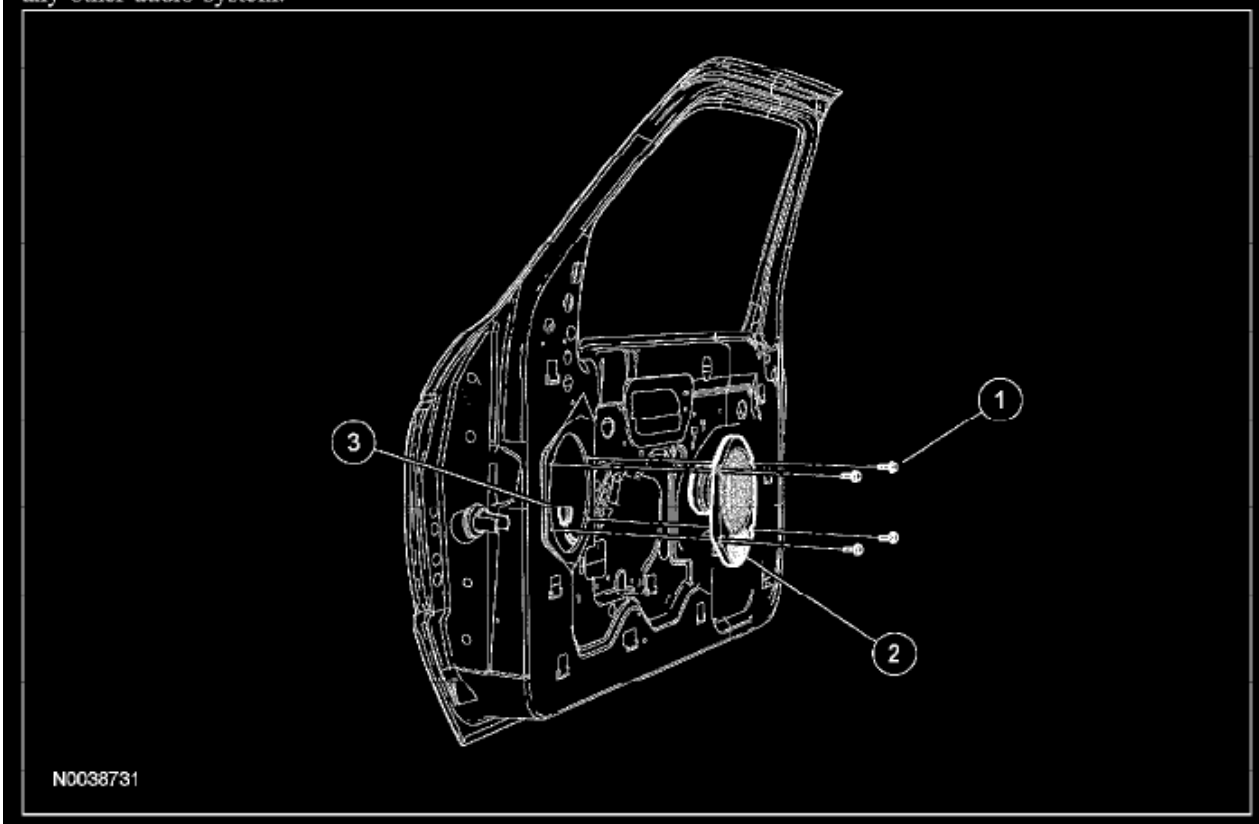
- Preset button 4 = Software configuration level. This test queries each audio unit system controller for its software configuration level.

- Preset button 5 = Display test. This test lights all the display segments for 5 seconds, then turns all segments off.

5. To exit the self-diagnostic mode, turn the key to OFF or turn the audio unit off. 6. If the DTCs retrieved are related to the concern, go to DTC Charts. See: Testing and Inspection/Diagnostic Trouble Code Descriptions 7. If the concern remains and the fault is not detected, GO to Symptom Chart. See: Testing and Inspection/Symptom Related Diagnostic Procedures

NOTE: RH front shown, others similar.

NOTE: The Audiophile system uses 2-voice (speaker with tweeter) speakers that are not interchangeable with any other audio system.



Item	Part Number	Description
1	—	Door speaker screws (4 (required)
2	18808	Door speaker

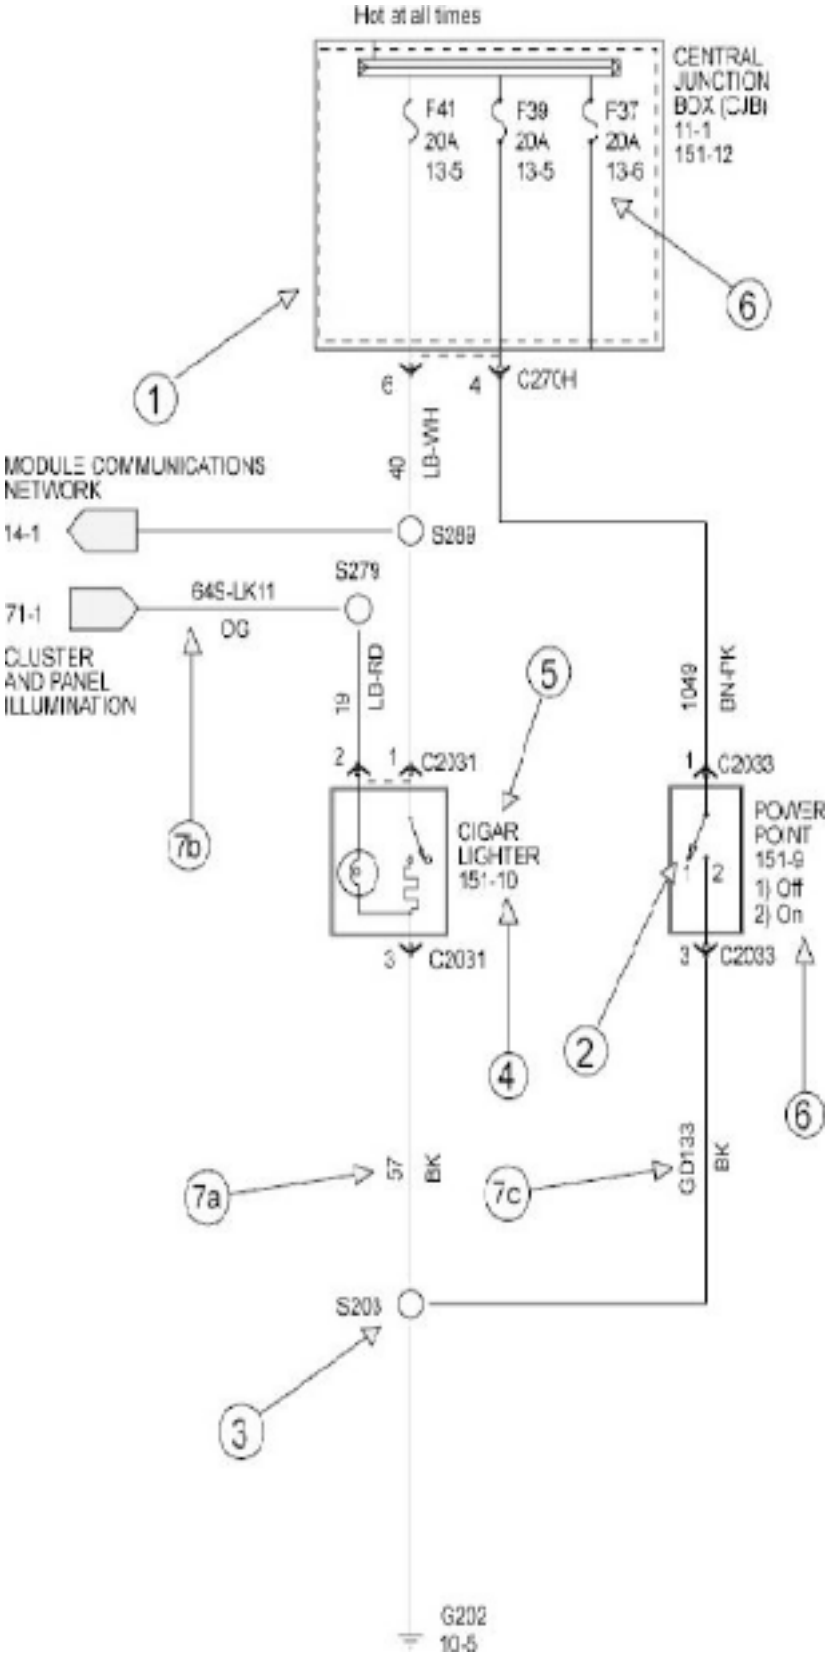
Ford Ranger 2wd Workshop Manual (V6-3.0L (2008))
Ford Workshop Manuals > Accessories and Optional Equipment > Relays and Modules - Accessories and Optional Equipment > Accessory Delay Module > Accessory Delay Relay > Component Information > Diagrams > Diagram Information and Instructions



Accessory Delay Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

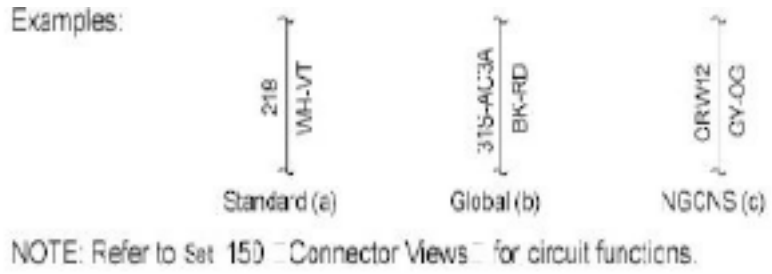
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

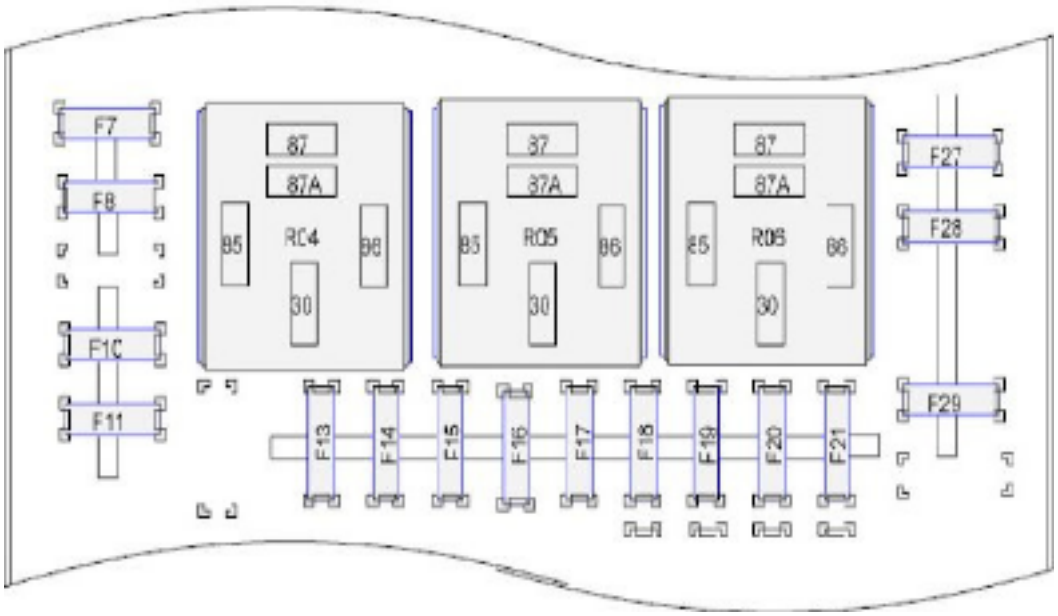
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by

each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

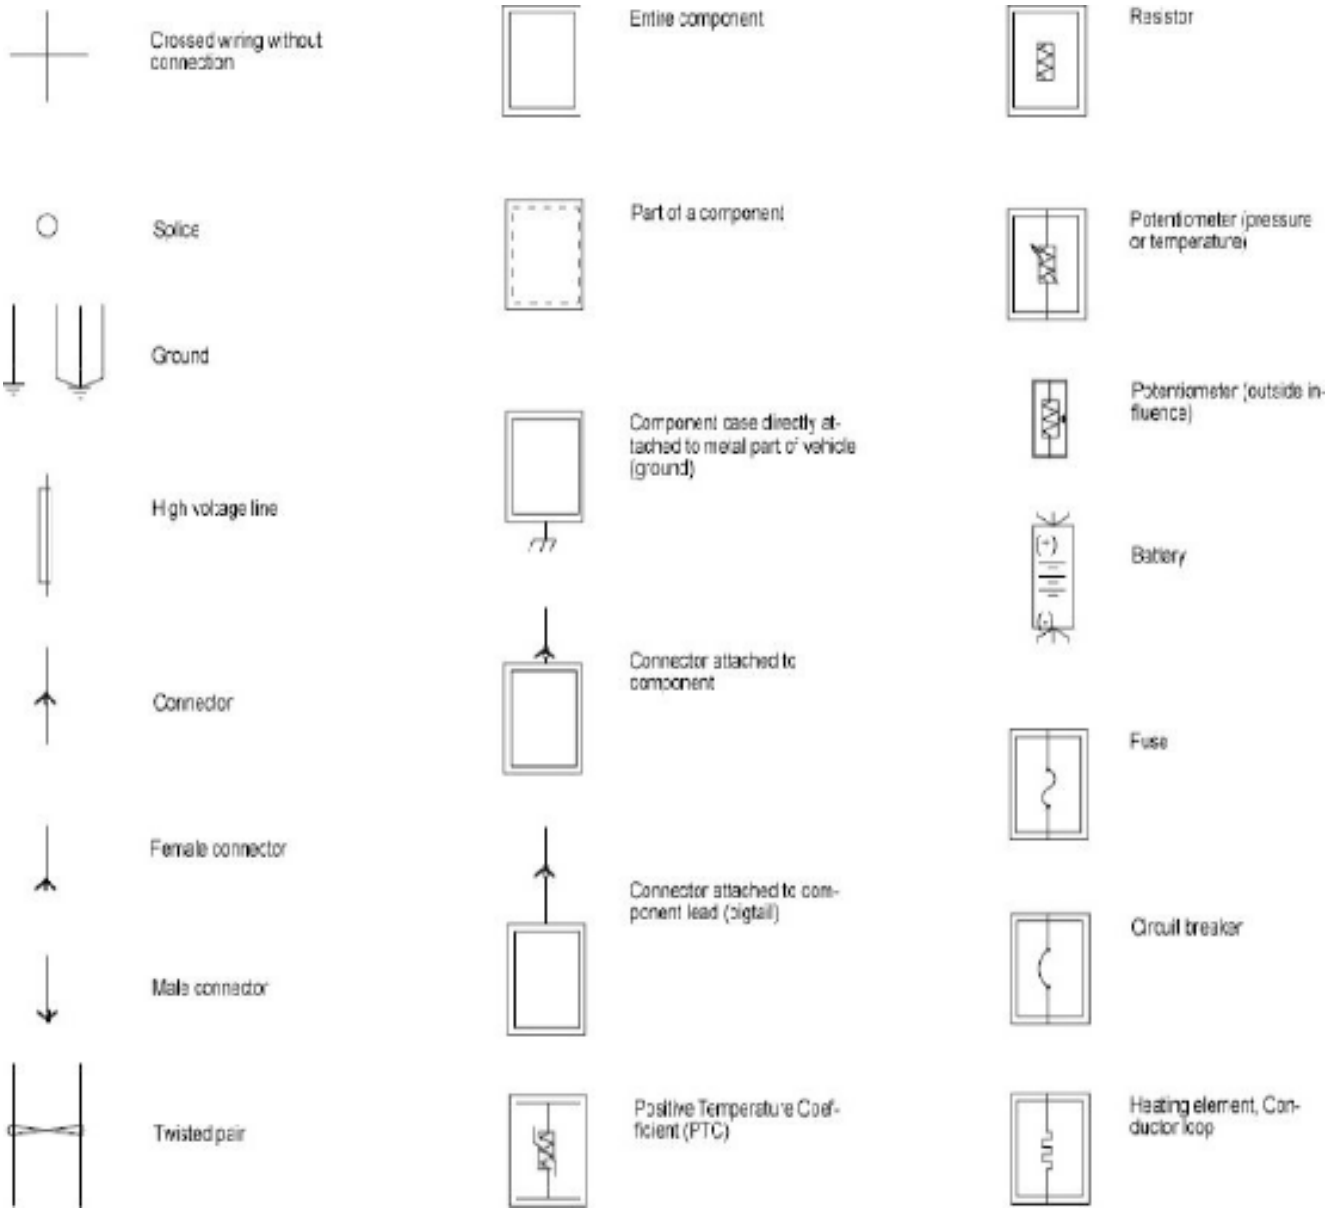
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

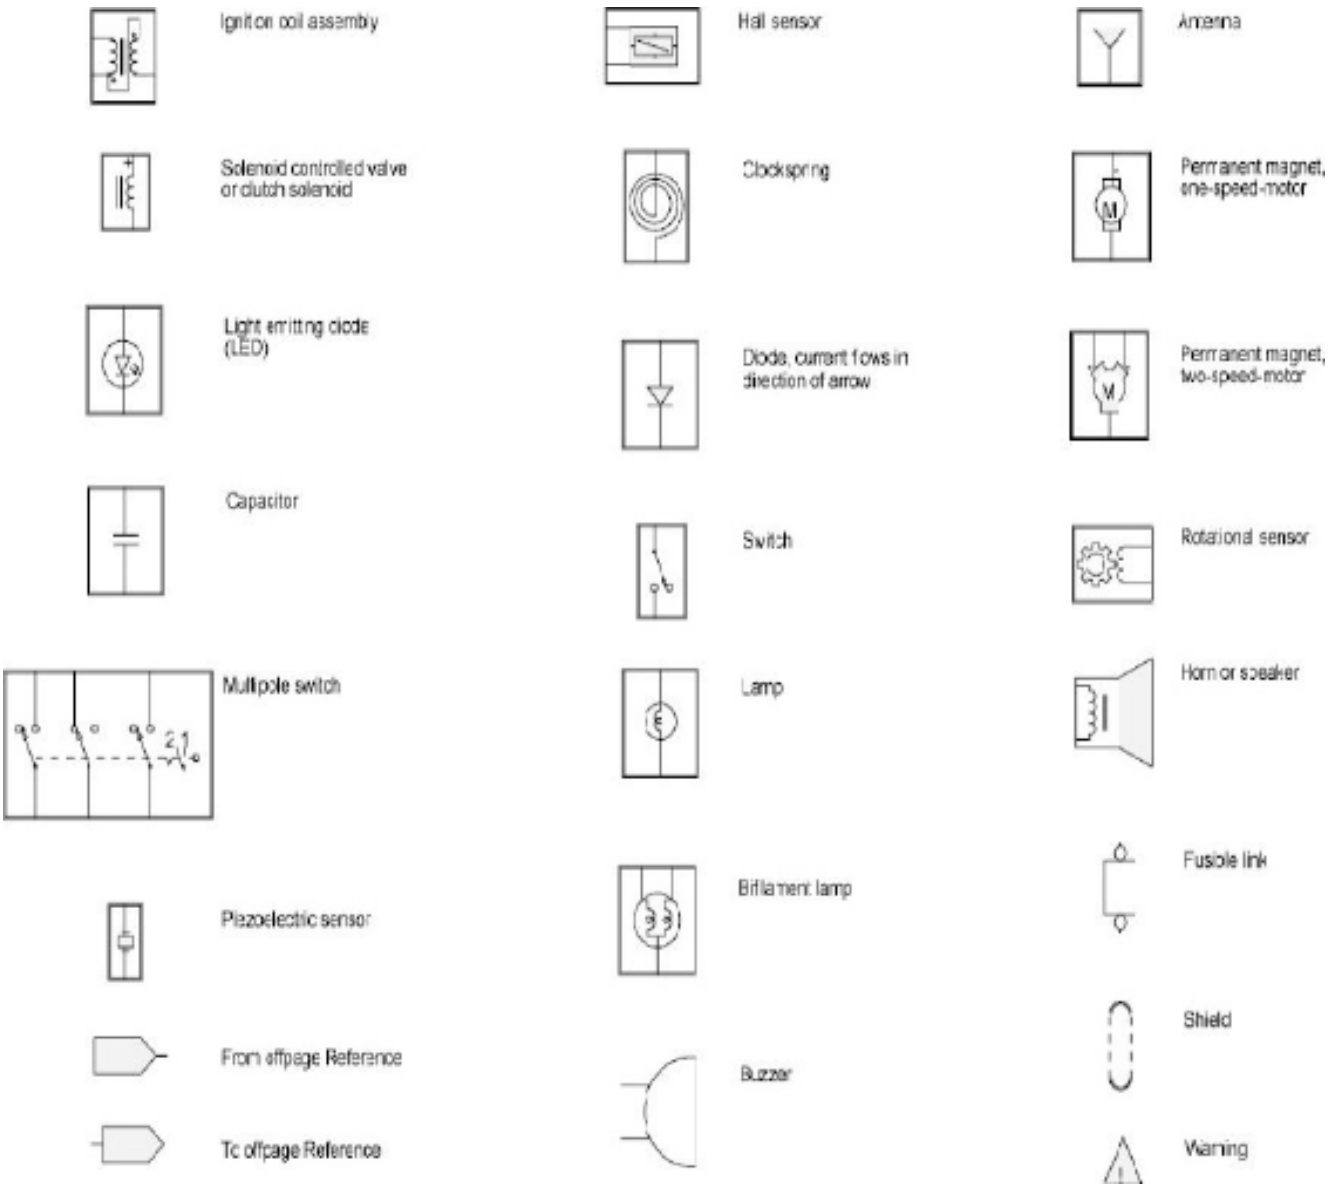
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

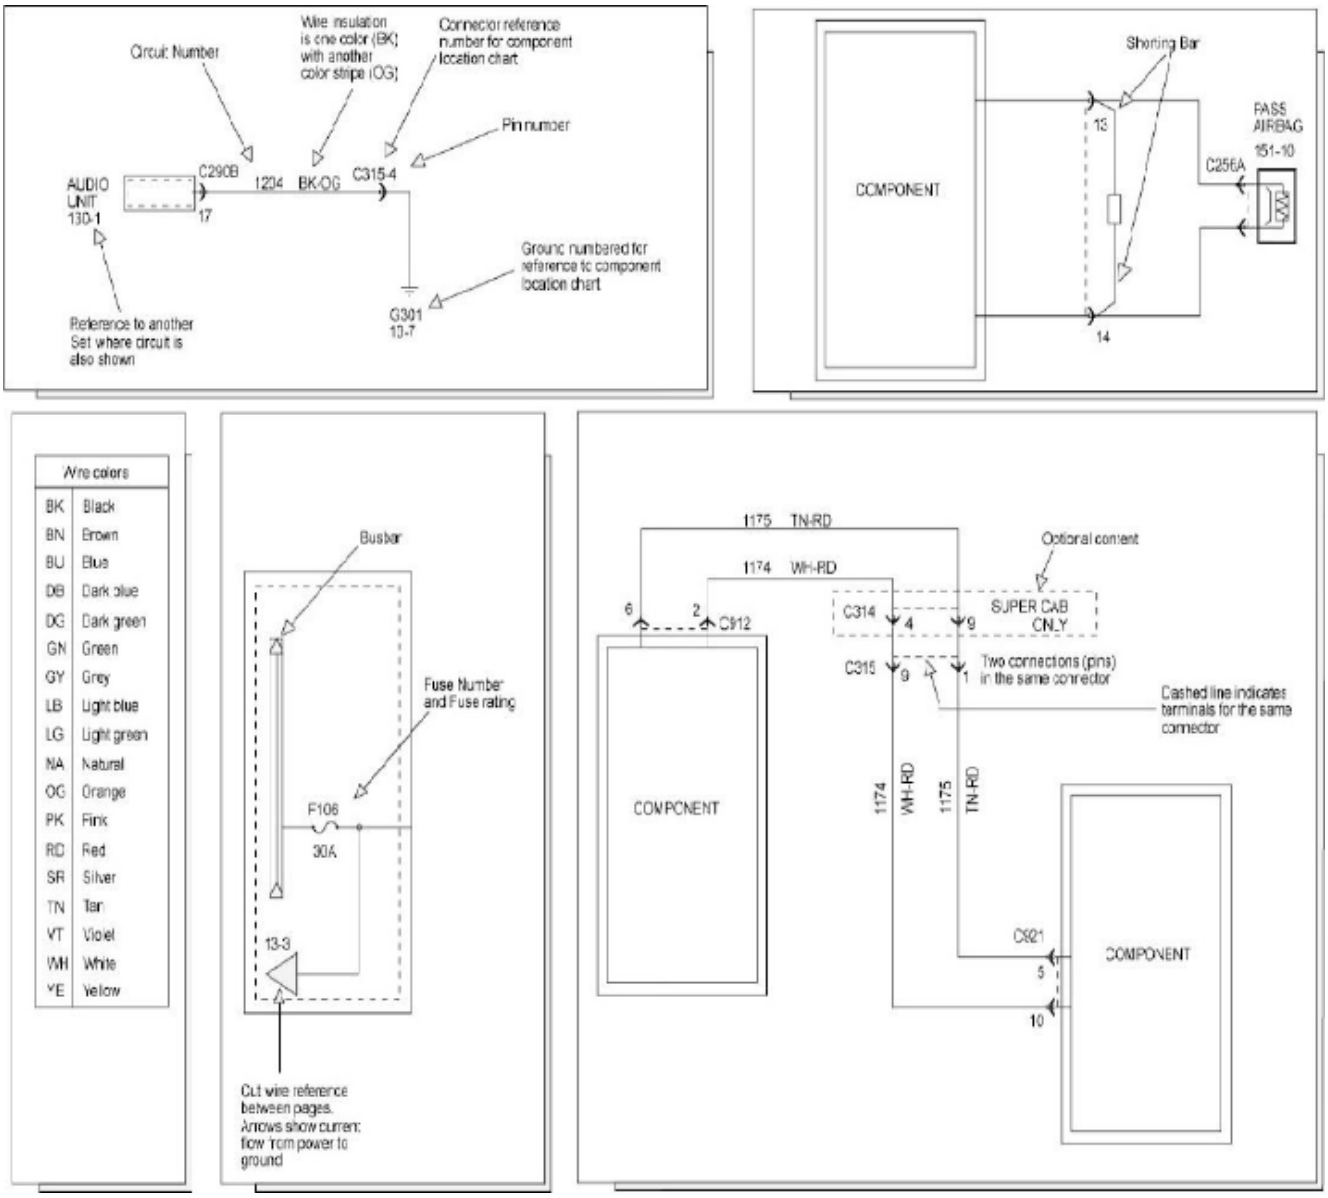
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

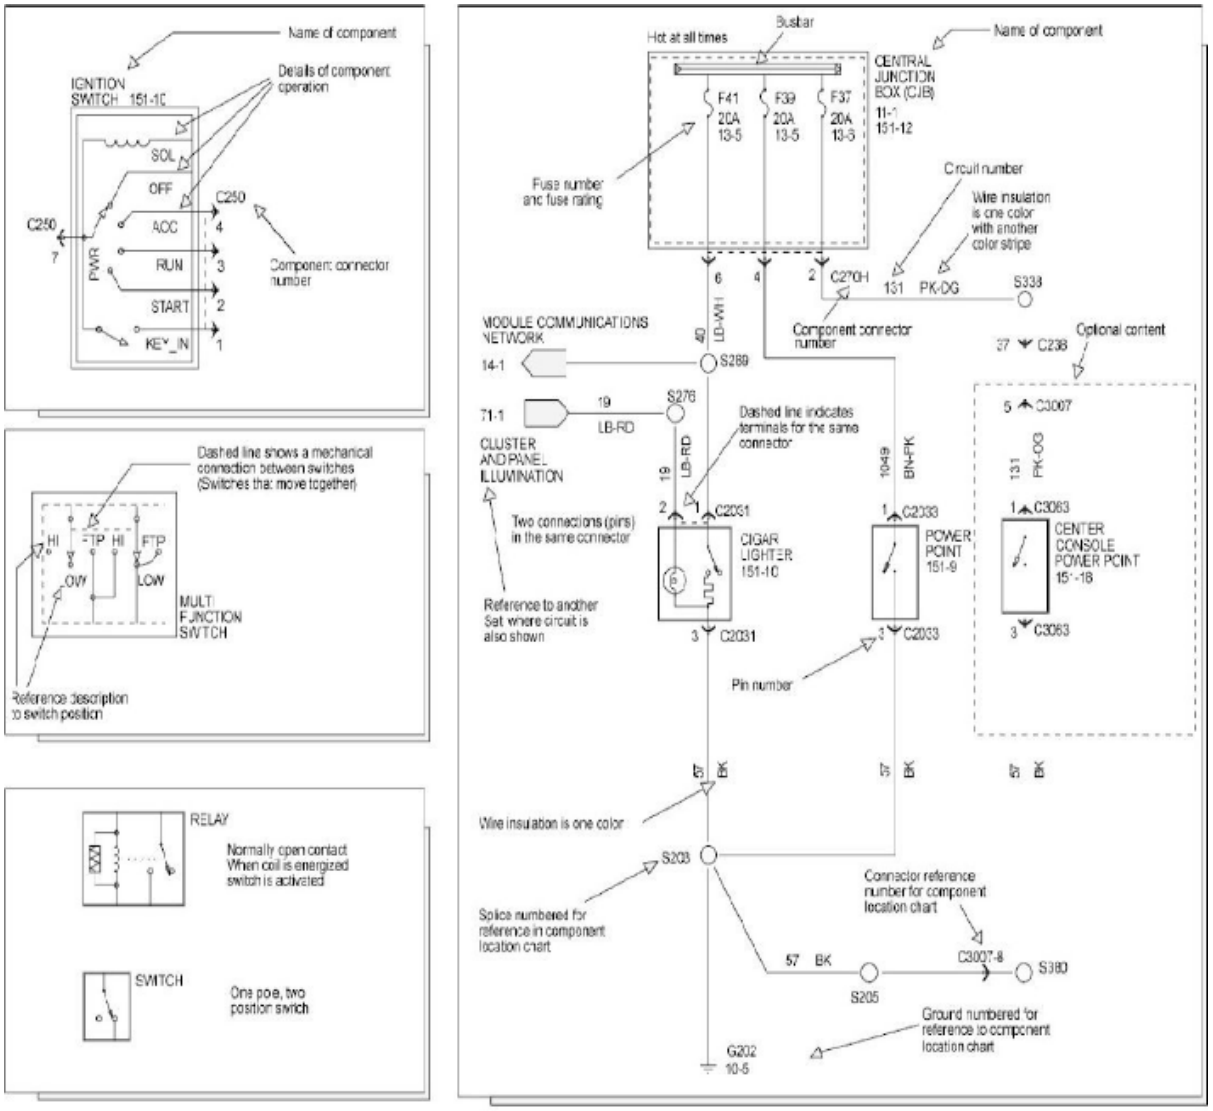
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

Accessory Delay Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

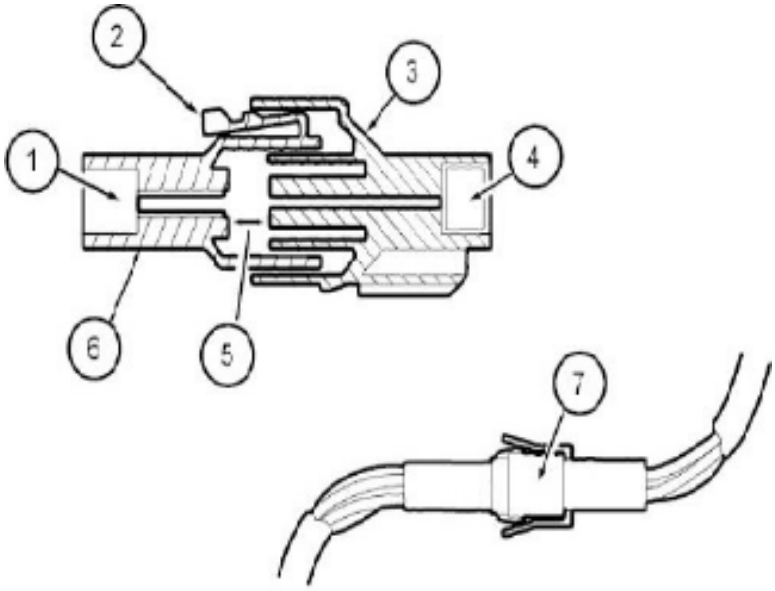
5 = Intermittent contact

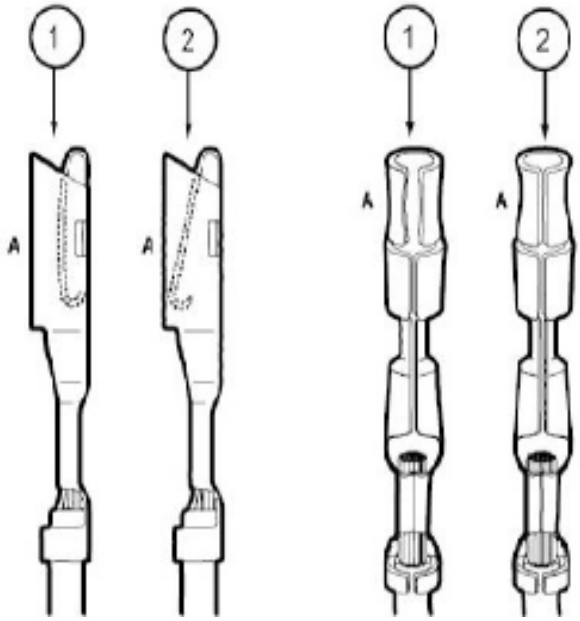
6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Defective insulation stripping





1 = Proper crimp

2 = Insulation not removed

3 = Wire strands missing

4 = Intermittent signals through pierced insulation

Partially mated connectors

1 = Seal

2 = Displaced tab

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Male half

7 = Intermittent contact

Lock may be displaced into an unlocked position; pull on the connector to verify the lock.

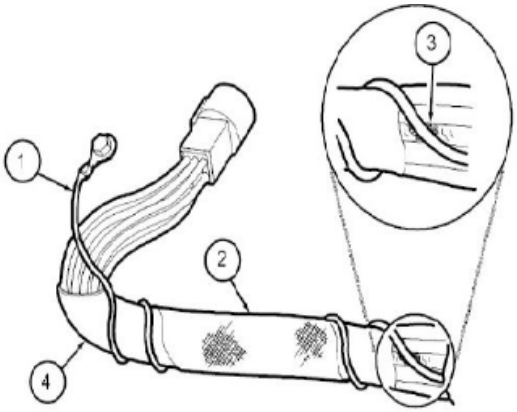
Deformed (enlarged) female terminals

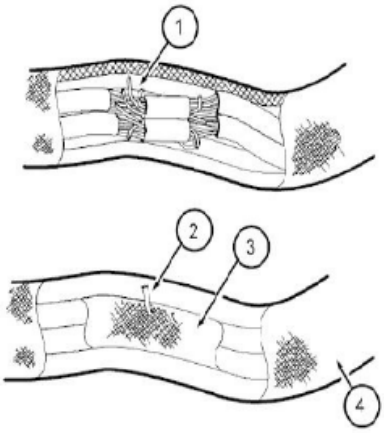
1 = Enlarged

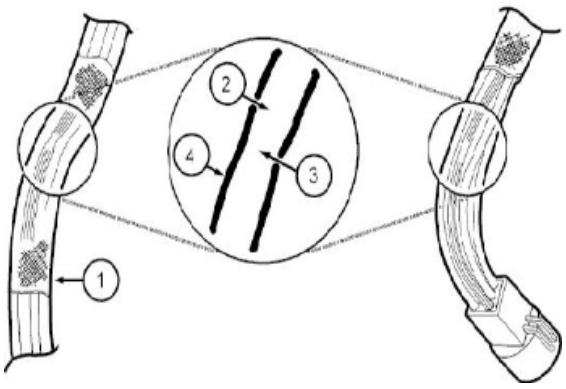
2 = Normal

Any probe entering the terminal may enlarge the contact spring opening creating an intermittent signal.

Insert the correct mating terminal (Location A) from the service kit and feel for a loose fit.







Electrical short inside the harness

1 = Solder coated wire to ground

2 = Harness protective tape

3 = Intermittent short

Solder coated wire pierced through the insulation of another circuit

4 = Grounding foil

Electrical short within the harness

Splice tape removed 1

= Intermittent short

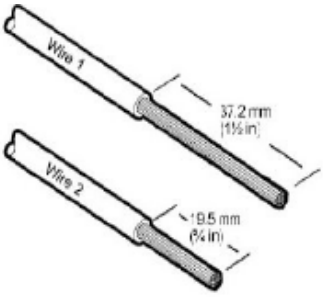
Splice covered 2

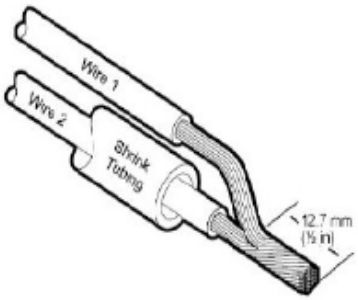
= Wire strand

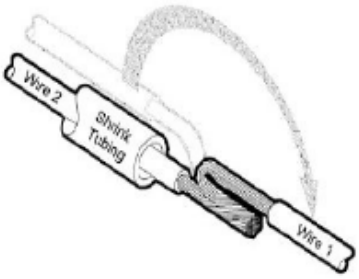
3 = Splice tape

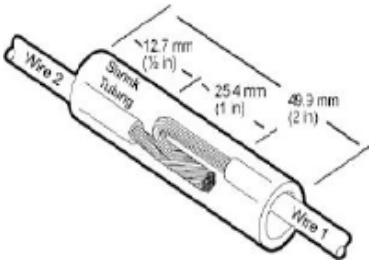
4 = Harness tape

Broken wire strands in harness









1 = Wiring harness tape

2 = Wiring strand

3 = Broken strands intermittent signal

4 = Circuit insulation

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. lnstall heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

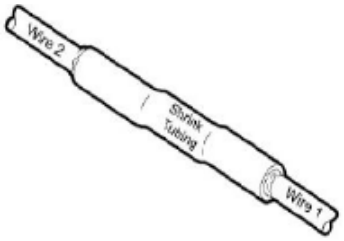
NOTE: -

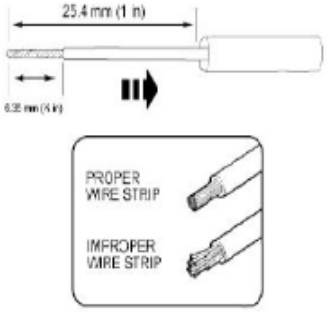
Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

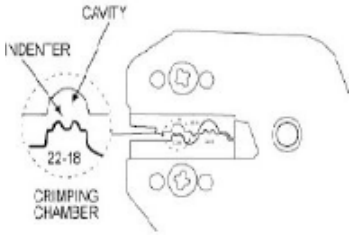
- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

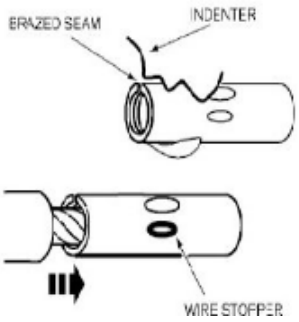
6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.









7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

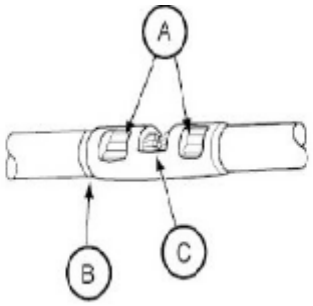
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

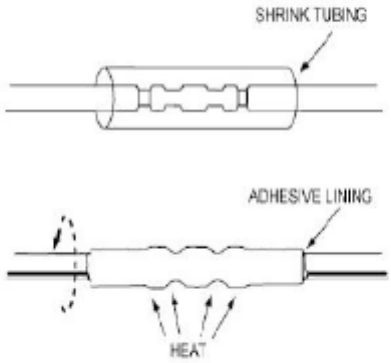
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x cia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

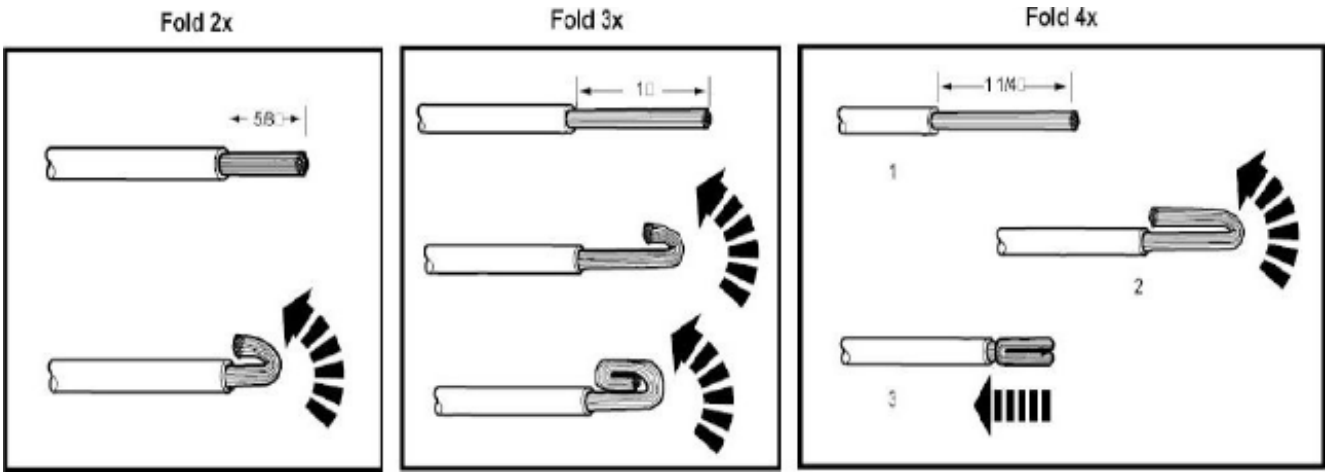
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



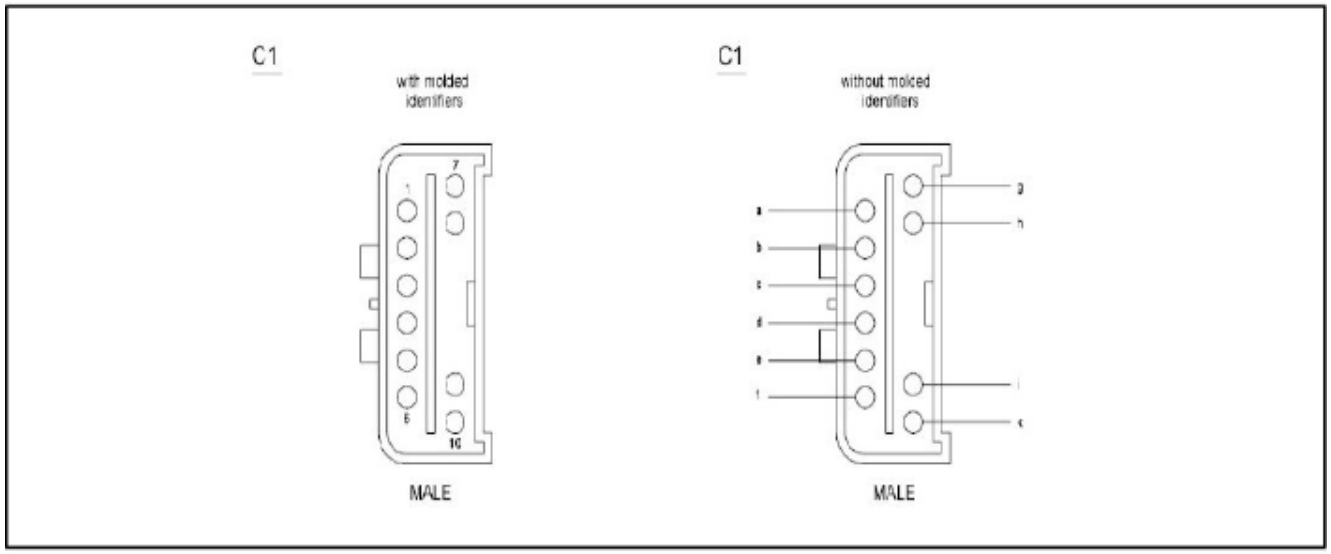
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



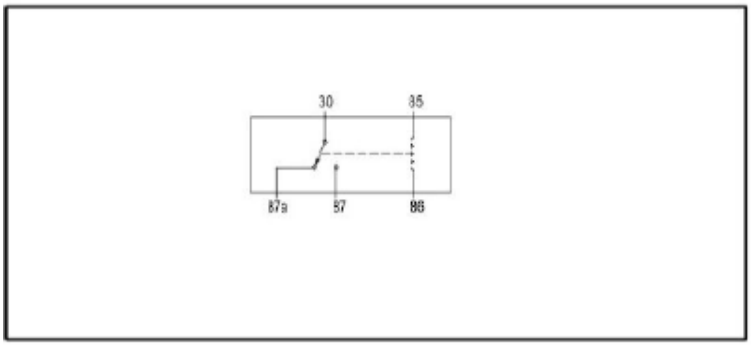
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

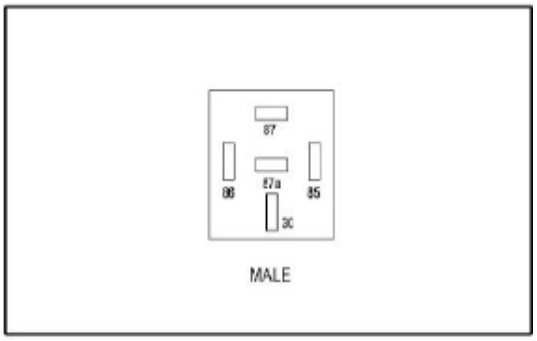
Accessory Delay Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	45 □ 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

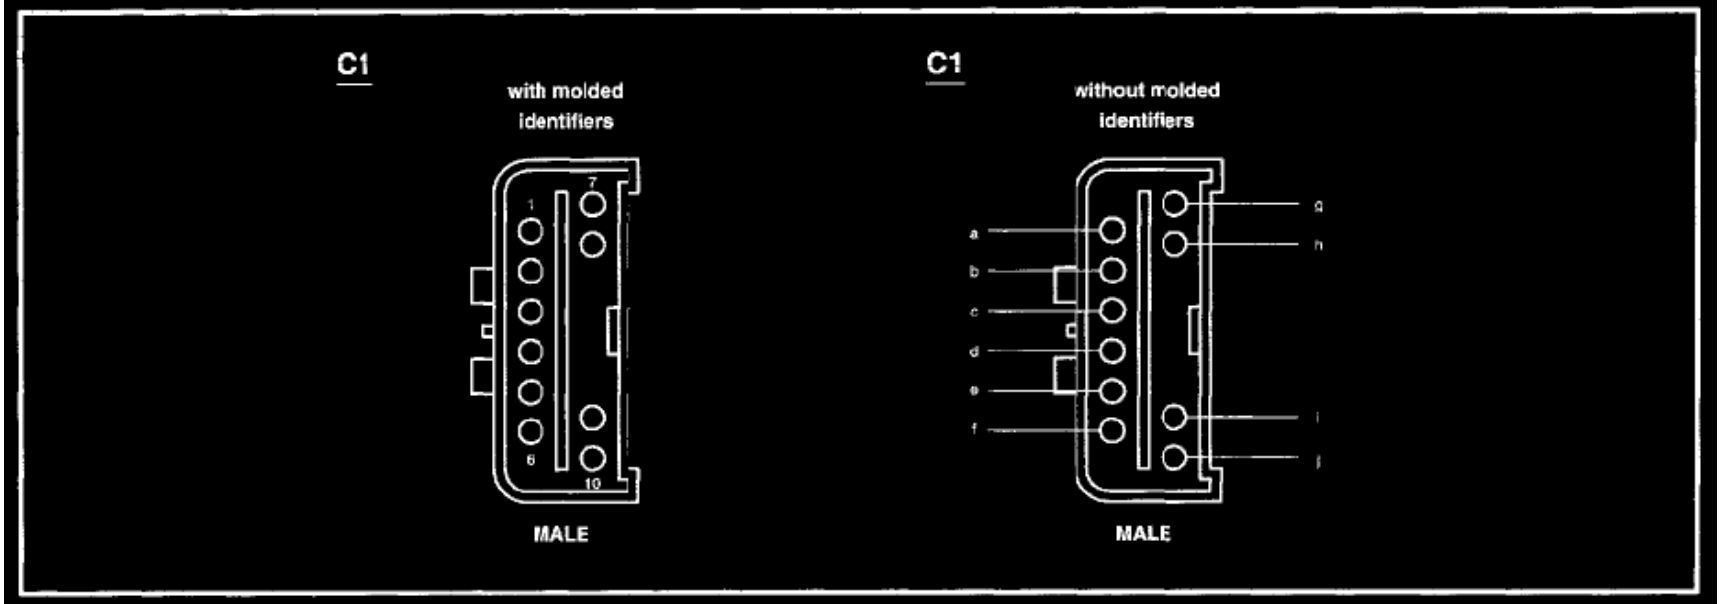
Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step–by–step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

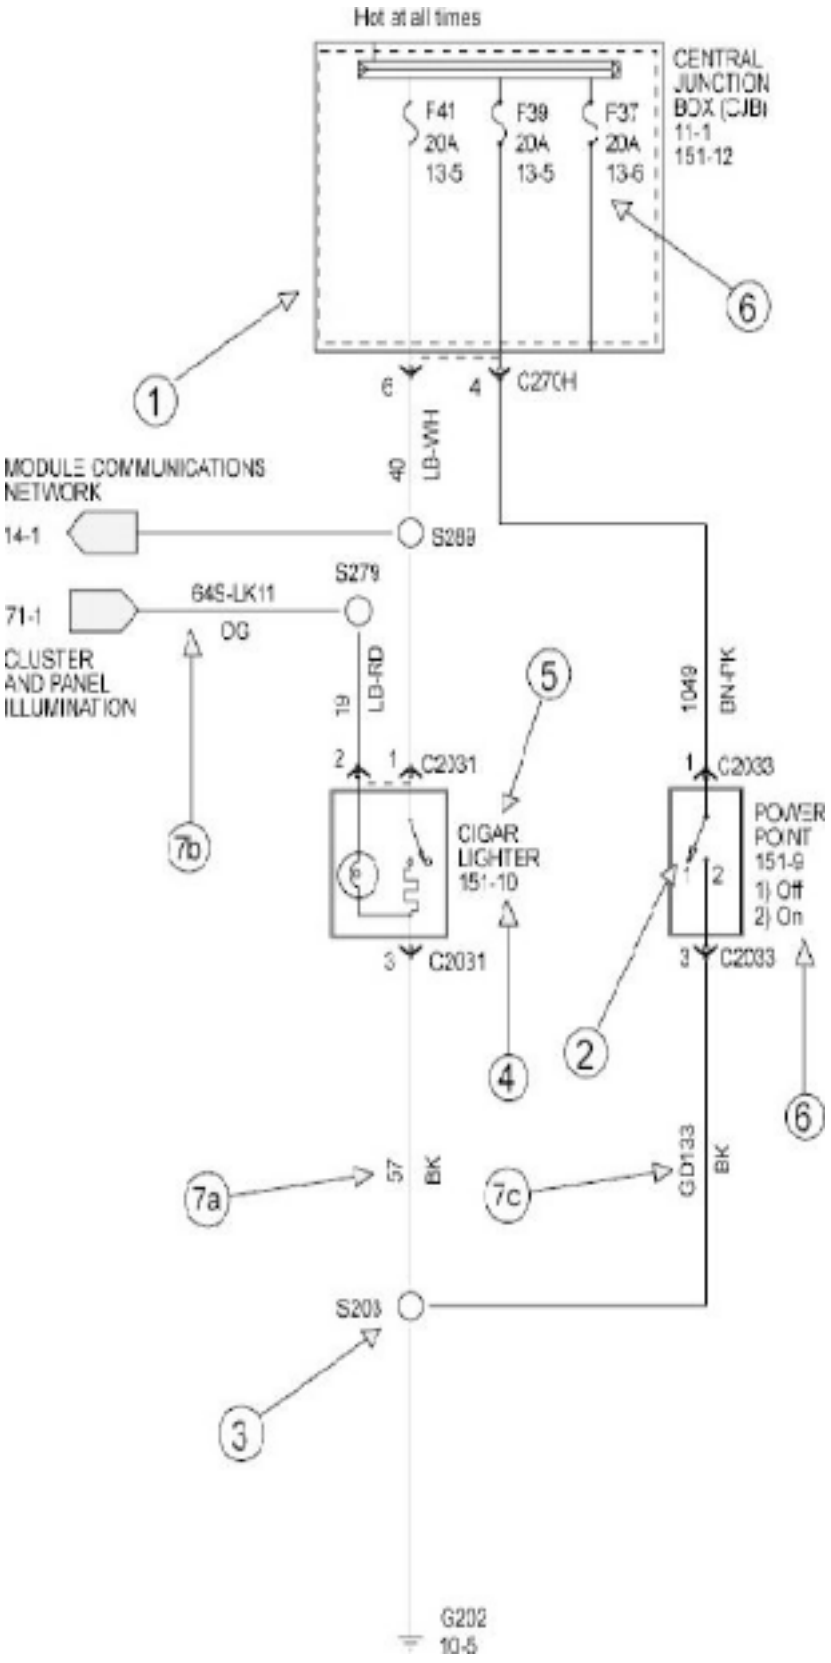
Ford Workshop Manuals > Accessories and Optional Equipment > Towing / Trailer System > Trailer Connector > Component Information > Diagrams > Diagram Information and Instructions



Trailer Connector: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

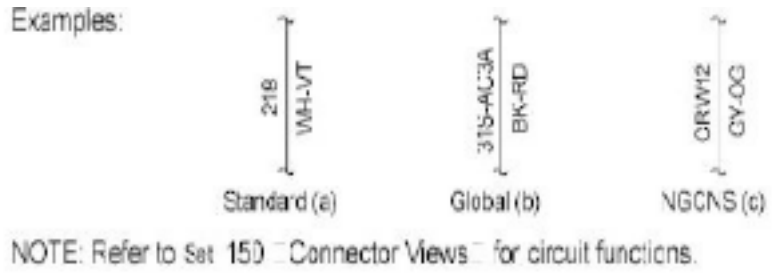
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

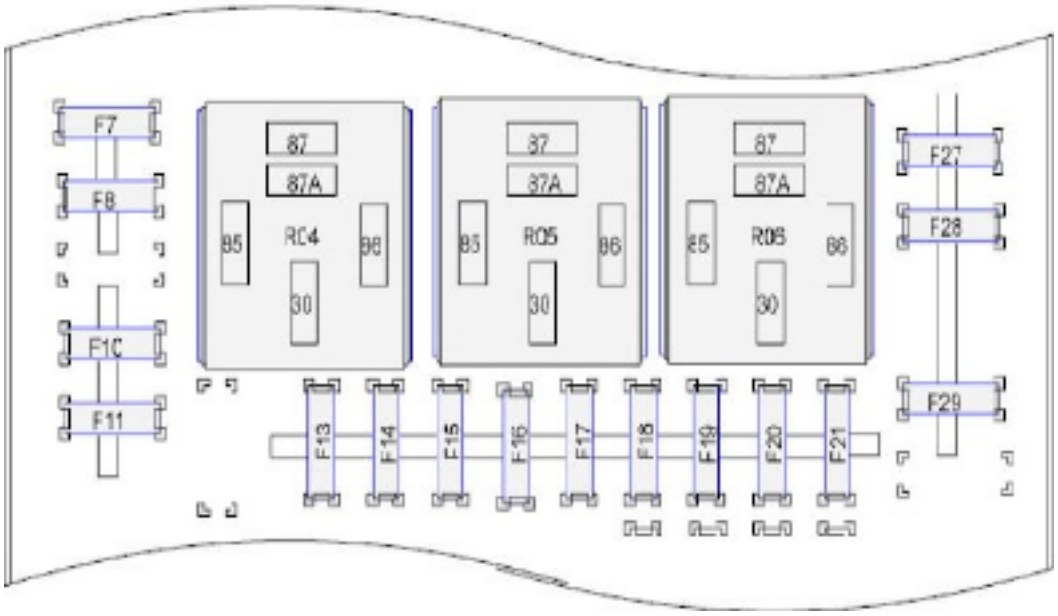
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

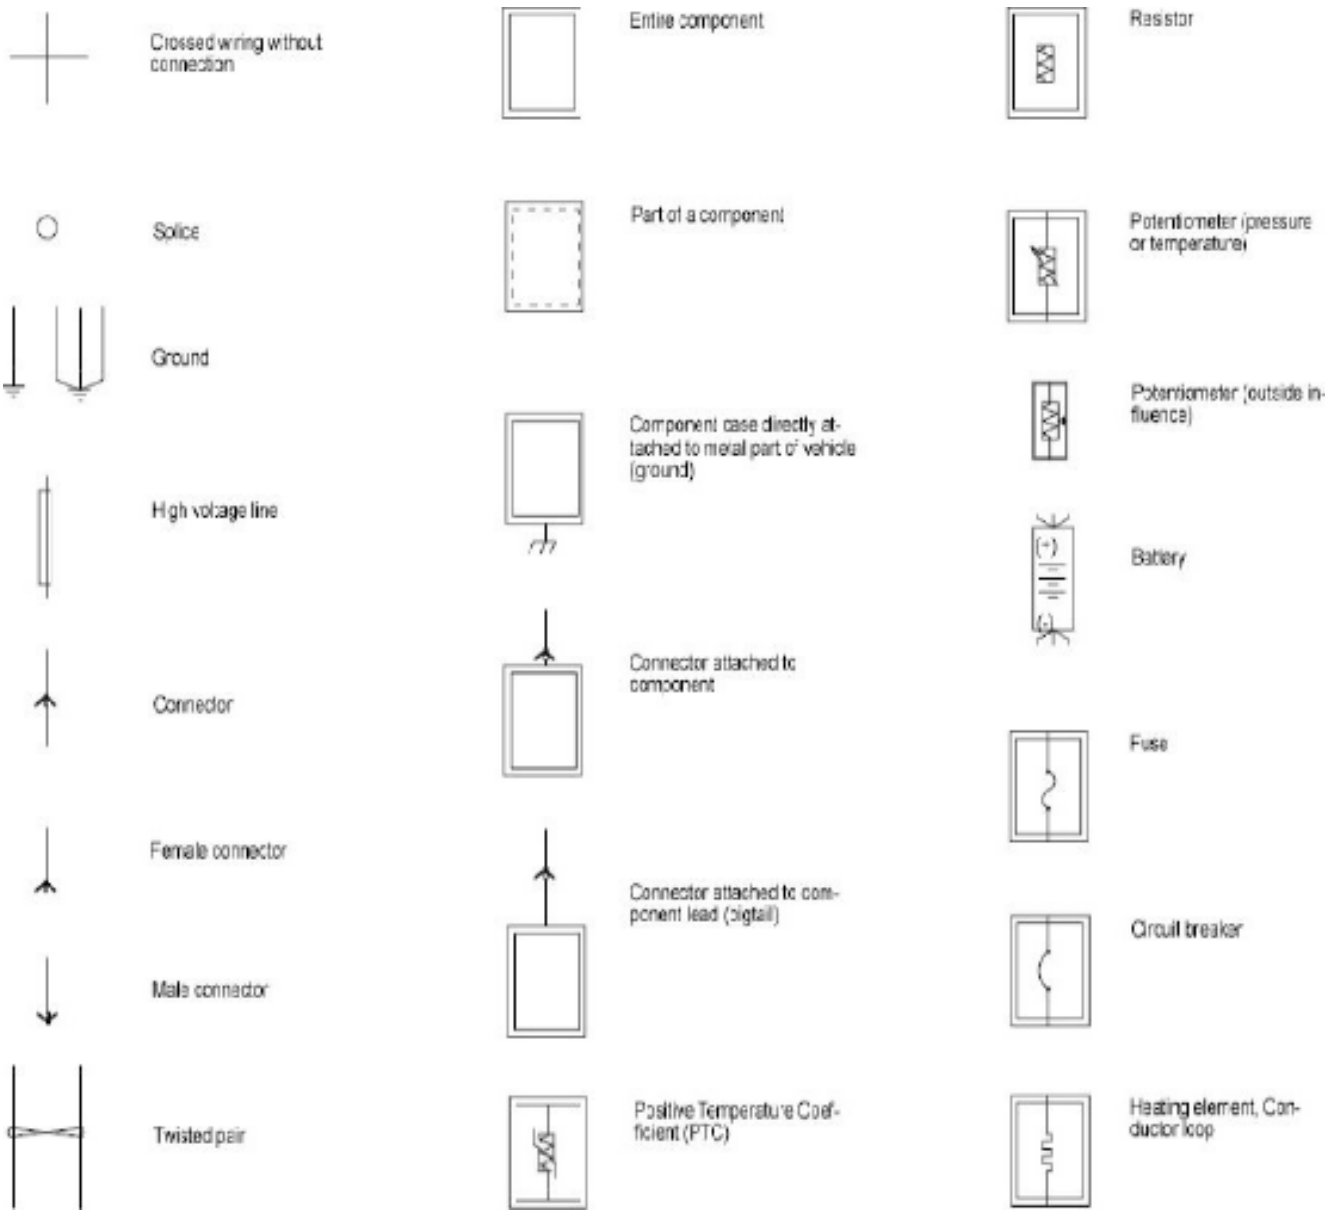
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Trailer Lamps: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

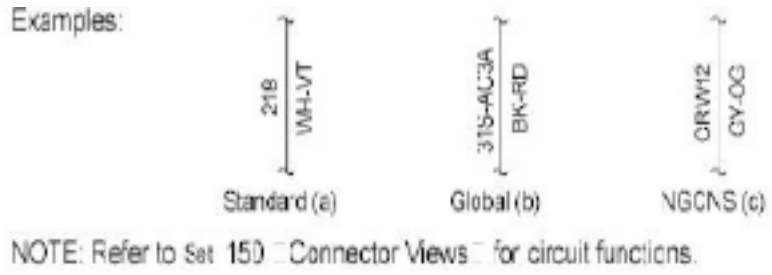
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

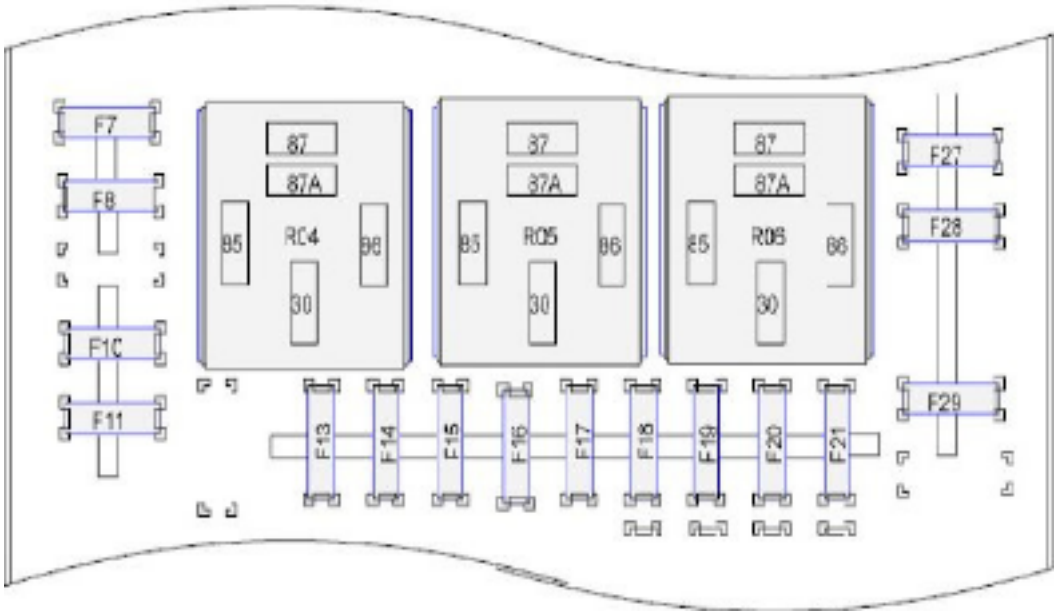
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

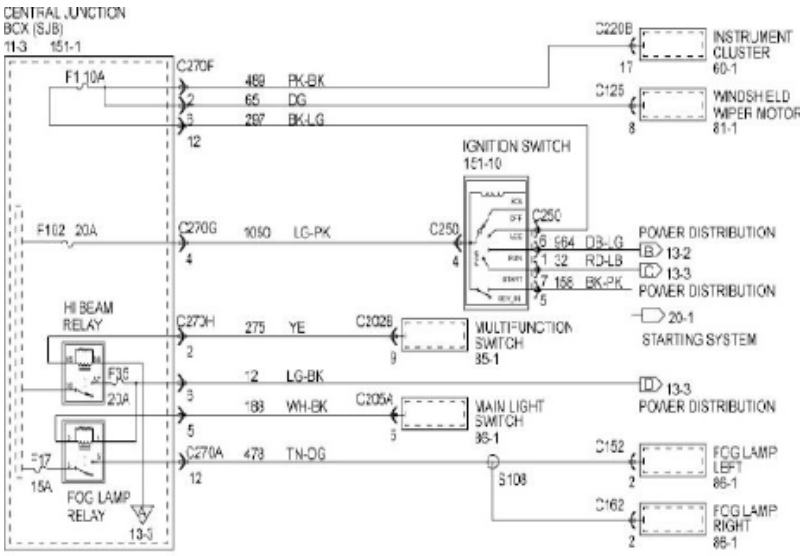
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

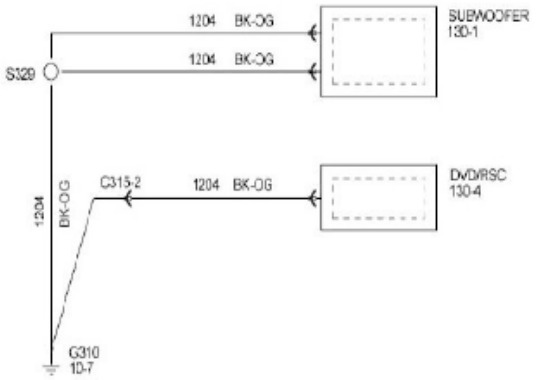
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

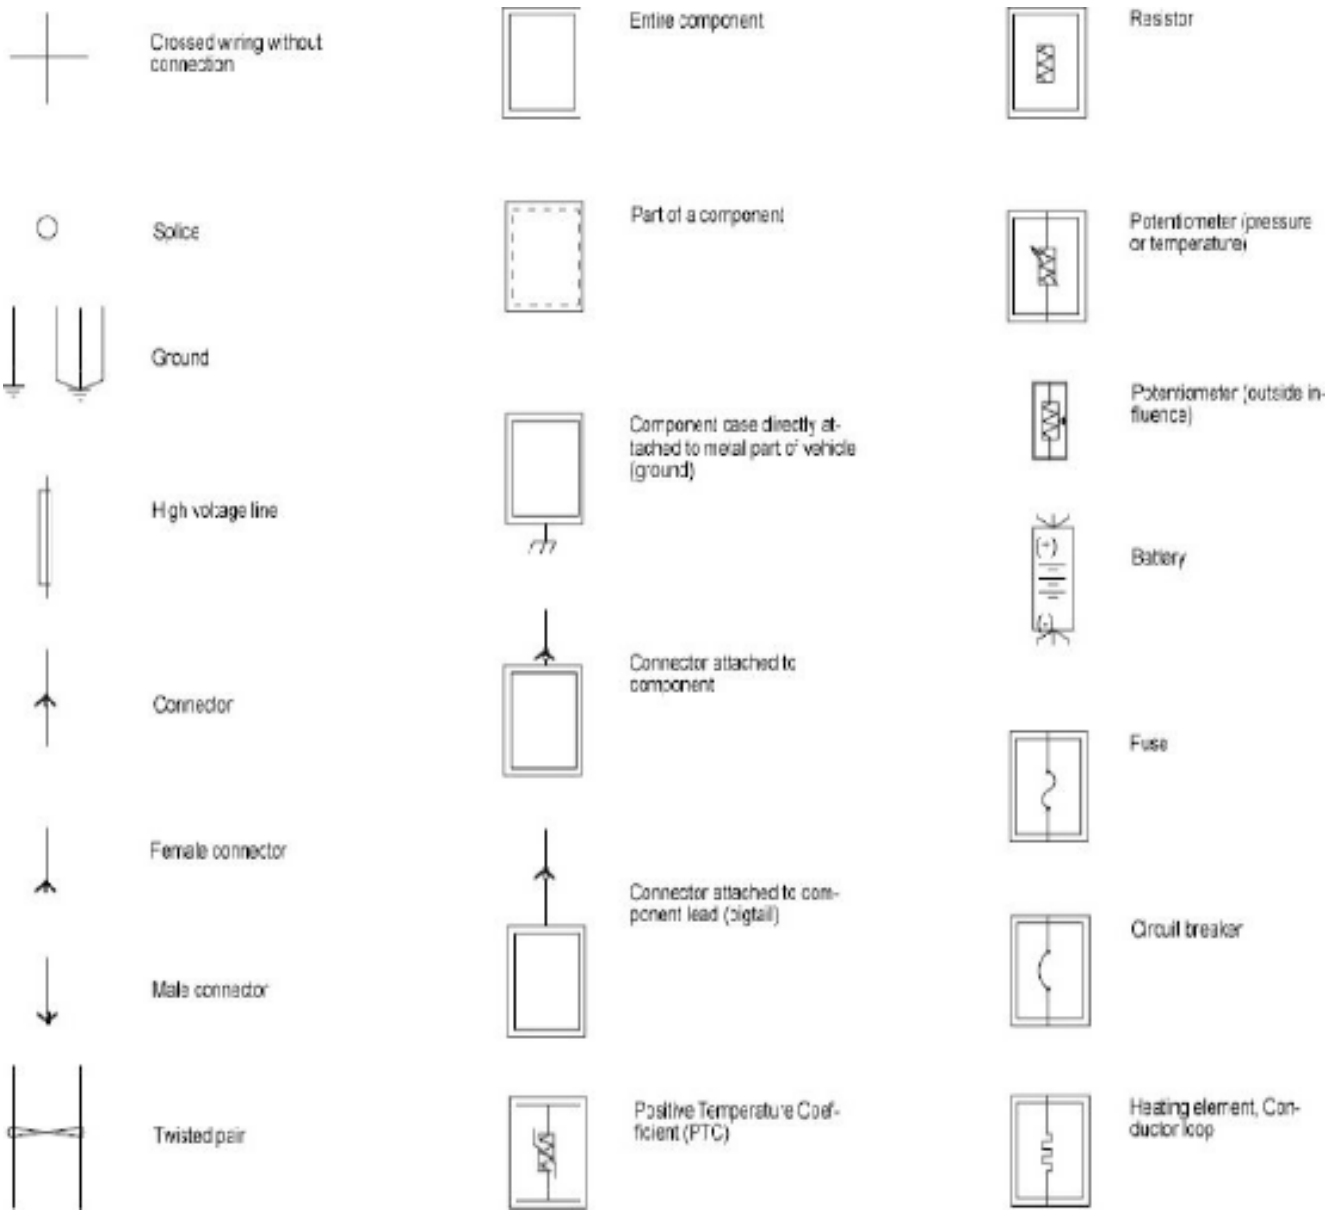
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

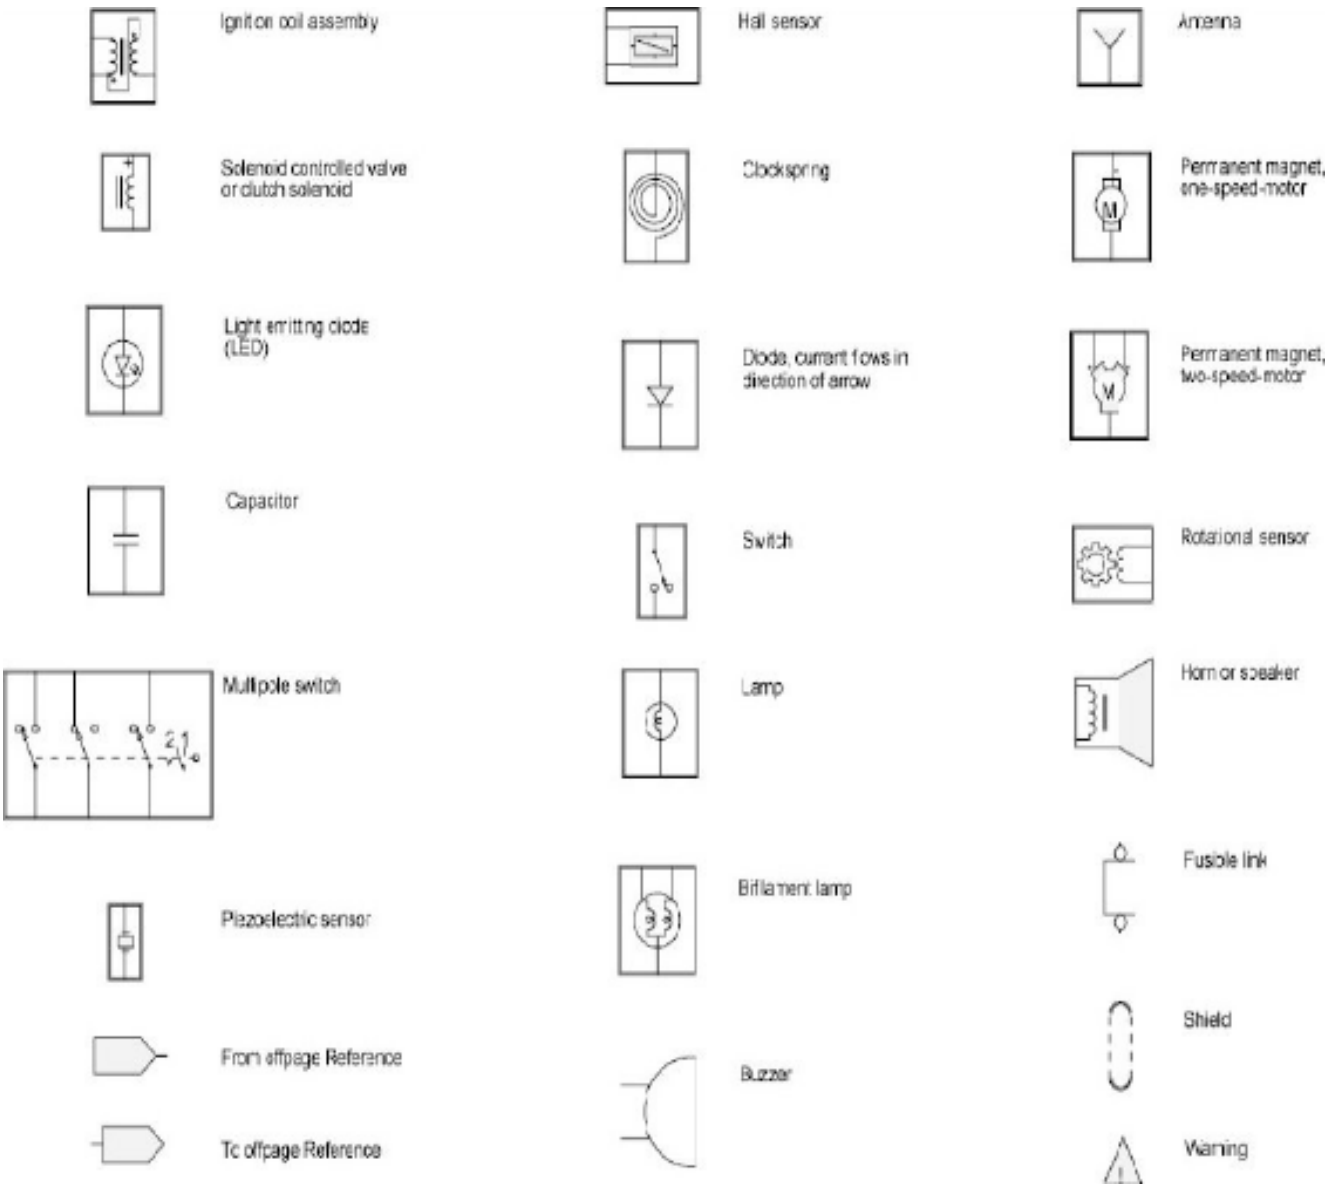
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

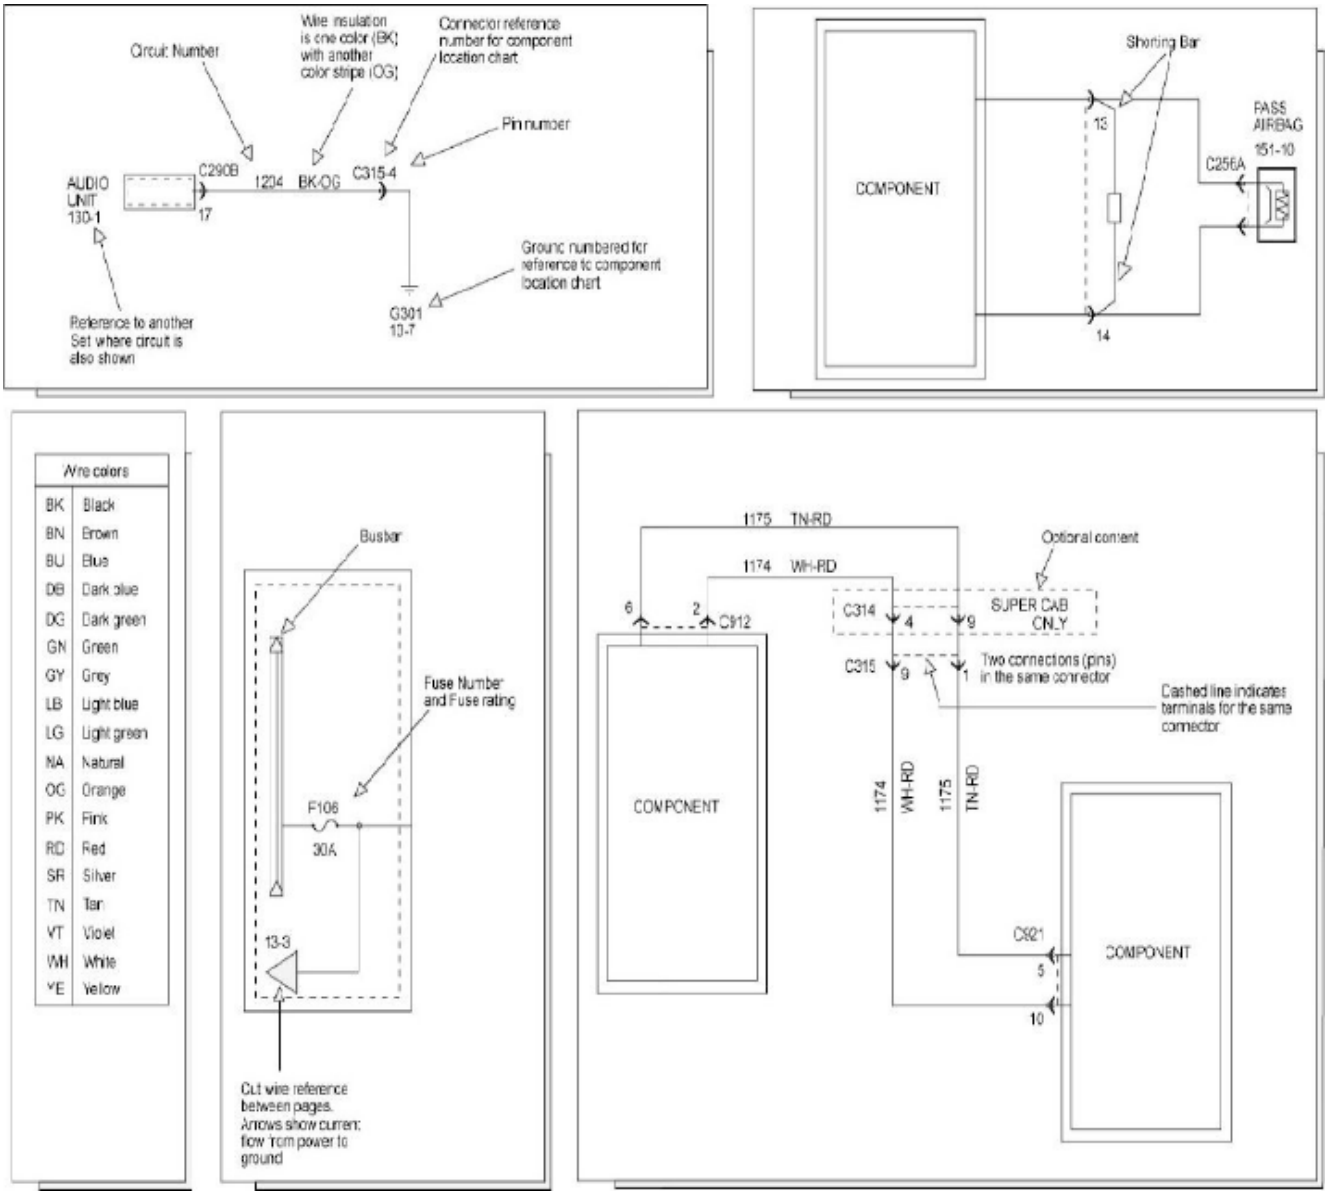
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

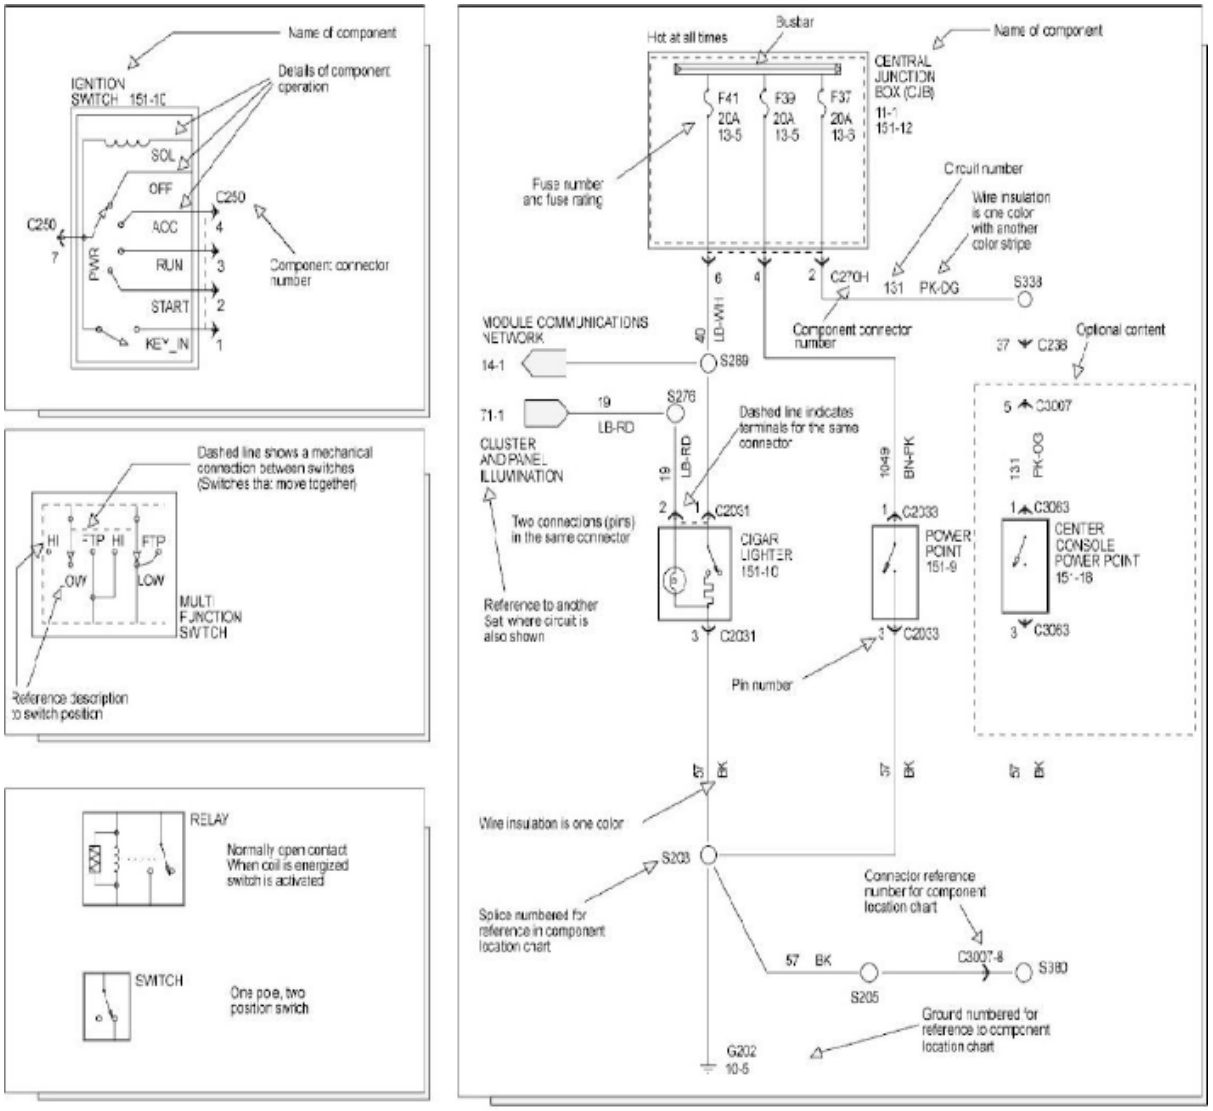
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Trailer Lamps: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

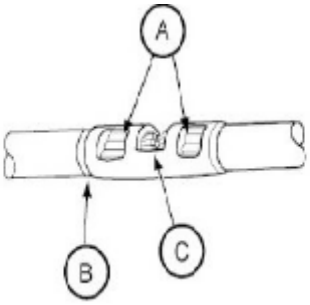
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

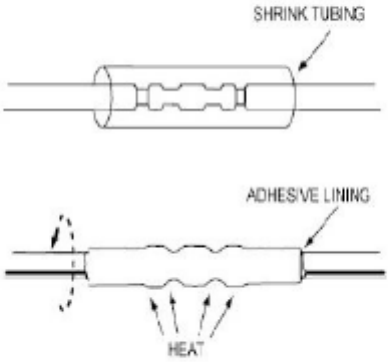
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x dia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Figtail only

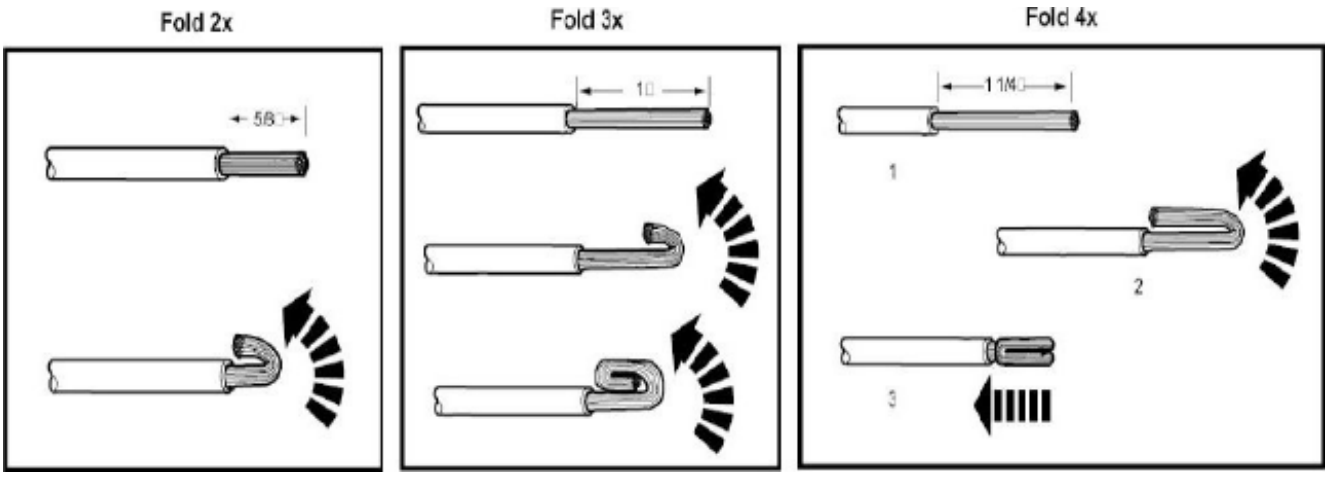
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Trailer Lamps: Initial Inspection and Diagnostic Overview

Principles of Operation

PRINCIPLES OF OPERATION

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

Circuitry is supplied to the trailer tow connector to support trailer parking lamps and stop/turn lamp functionality. When the vehicle parking lamps are on, the smart junction box (SJB) supplies voltage to the trailer tow connector for the trailer parking lamps. When the vehicle stop/turn lamps are operating, voltage is supplied to the trailer tow connector for the trailer stop/turn lamps.

Inspection and Verification

INSPECTION AND VERIFICATION

1. Verify the customer concern. 2. Verify the exterior lighting system of the vehicle is operating correctly. If not, refer to the appropriate pinpoint test. 3. Visually inspect for obvious signs of electrical damage.

VISUAL INSPECTION CHART

Electrical -

Battery junction box (BJB) fuse(s): -

38 (7.5A) (trailer tow RH stoplamp)

- 42 (7.5A) (trailer tow LH stoplamp)

- Smart junction box (SJB) fuse 2 (10A) (trailer tow parking lamps)

- Wiring, terminals or connectors

- Bulb(s)

- SJB

4. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step. 5. If the concern is not visually evident, verify the symptom. GO to Symptom Chart. See: Symptom Related Diagnostic Procedures

Symptom Chart

Condition	Possible Sources	Action
• All the trailer lamps are inoperative	• Wiring, terminals or connectors • Trailer	• GO to Pinpoint Test T.
• The trailer parking lamps are inoperative	• Fuse • Wiring, terminals or connectors • Smart junction box (SJB) • Trailer	• GO to Pinpoint Test U.

Symptom Chart (Continued)

Condition	Possible Sources	Action
• The individual trailer lamp is inoperative	• Fuse • Wiring, terminals or connectors • Trailer	• GO to Pinpoint Test V.

Trailer Lamps: Symptom Related Diagnostic Procedures

Symptom Chart (Part 1)

PINPOINT TEST T: ALL THE TRAILER LAMPS ARE INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step		Result / Action to Take
T1	**CHECK CIRCUIT RAT08 (WH) FOR AN OPEN** • Key in OFF position. • Disconnect: Trailer Tow C439. • Measure the resistance between the trailer tow C439-4, circuit RAT08 (WH), harness side and ground.  A0056326 • **Is the resistance less than 5 ohms?**	**Yes** The vehicle is operating correctly. SEND the trailer to an authorized camper/trailer repair facility. **No** REPAIR the circuit. TEST the system for normal operation.

Trailer Lamps: Pinpoint Tests

Test T: All The Trailer Lamps Are Inoperative

PINPOINT TEST T: ALL THE TRAILER LAMPS ARE INOPERATIVE

Normal Operation

The trailer tow connector is provided ground through circuit RAT08 (WH) for the trailer lamps.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors

- Trailer

T1

Test U: The Trailer Parking Lamps Are Inoperative

PINPOINT TEST U: THE TRAILER PARKING LAMPS ARE INOPERATIVE

Normal Operation

When the parking lamps are on, the smart junction box (SJB) provides voltage to the trailer tow connector through circuit CAT17 (BN/WH).

This pinpoint test is intended to diagnose the following:

- Fuse

- Wiring, terminals or connectors
- Trailer
- SJB

PINPOINT TEST U: THE TRAILER PARKING LAMPS ARE INOPERATIVE

⚠ **CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step		Result / Action to Take
U1	**CHECK CIRCUIT CAT17 (BN/WH) FOR VOLTAGE** • Key in OFF position. • Disconnect: Trailer Tow C439. • Place the headlamp switch in the PARKING LAMPS ON position. • Measure the voltage between the trailer tow C439-3, circuit CAT17 (BN/WH), harness side and ground.  A0056330 • **Is the voltage greater than 10 volts?**	**Yes** The vehicle is operating correctly. SEND the trailer to an authorized camper/trailer repair facility. **No** VERIFY the SJB fuse 2 (10A) is OK. If OK, GO to **U2**.
U2	**CHECK CIRCUIT CAT17 (BN/WH) FOR AN OPEN** • Place the headlamp switch in the OFF position. • Disconnect: SJB C2280c. • Measure the resistance between the SJB C2280c-25, circuit CAT17 (BN/WH), harness side and the trailer tow C439-3, circuit CAT17 (BN/WH), harness side.  N0072921 • **Is the resistance less than 5 ohms?**	**Yes** GO to **U3**. **No** REPAIR the circuit. TEST the system for normal operation.
U3	**CHECK FOR CORRECT SJB OPERATION** • Disconnect all the SJB connectors. • Check for: — corrosion — damaged pins — pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

U1-U3

Test V: The Individual Trailer Lamp Is Inoperative

PINPOINT TEST V: THE INDIVIDUAL TRAILER LAMP IS INOPERATIVE

Normal Operation

When the brake pedal is applied, voltage is provided to the trailer tow connector for the LH and RH trailer stoplamps through circuits CAT06 (YE) and CAT09 (GN), respectively.

This pinpoint test is intended to diagnose the following:

- Fuse

- Wiring, terminals or connectors

- Trailer

PINPOINT TEST V: THE INDIVIDUAL TRAILER LAMP IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step		Result / Action to Take
V1	**DETERMINE THE INOPERATIVE TRAILER LAMP**	
	• Place the headlamp switch in the PARKING LAMPS ON position. • While applying and releasing the brake pedal, observe the trailer tow lamps. • **Is an individual trailer parking lamp inoperative?**	**Yes** The vehicle is operating correctly. SEND the trailer to an authorized camper/trailer repair facility. **No** GO to **V2**.
V2	**CHECK CIRCUIT CAT06 (YE) (LH STOPLAMP) OR CIRCUIT CAT09 (GN) (RH STOPLAMP) FOR AN OPEN**	
	• While applying the brake pedal, measure the voltage between the trailer tow C439-2, circuit CAT06 (YE) (LH stoplamp), harness side and ground; or between the trailer tow C439-1, circuit CAT09 (GN) (RH stoplamp), harness side and ground.  A0056327 • **Is the voltage greater than 10 volts?**	**Yes** The vehicle is operating correctly. SEND the trailer to an authorized camper/trailer repair facility. **No** VERIFY the SJB fuse 42 (7.5A) (LH stoplamp) or fuse 38 (7.5A) (RH stoplamp) is OK. If OK, REPAIR the circuit in question. TEST the system for normal operation.

Trailer Lighting Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

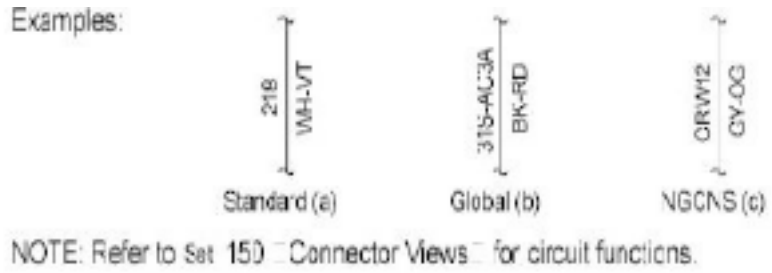
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

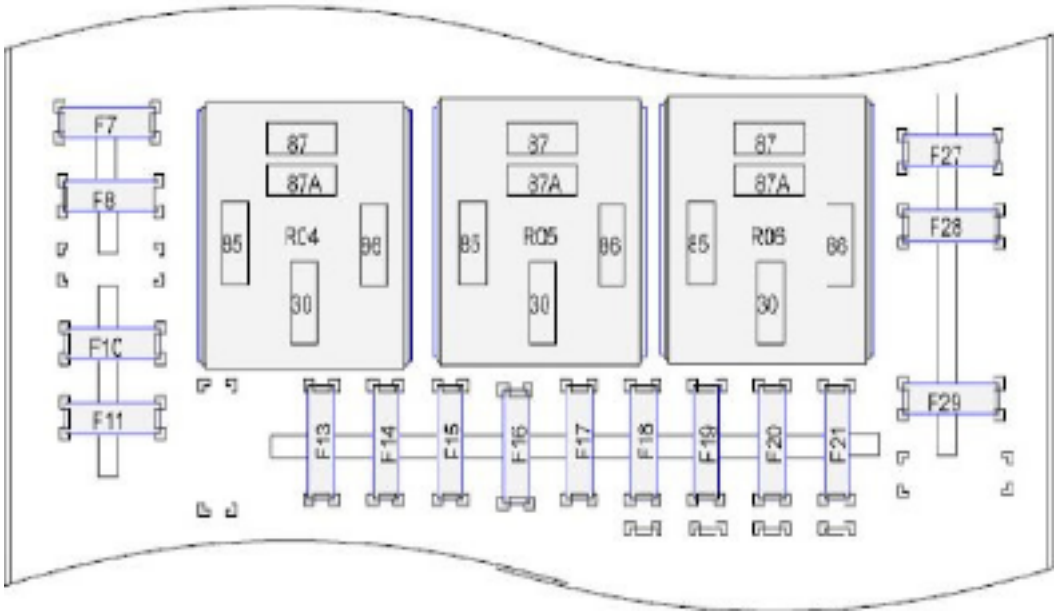
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

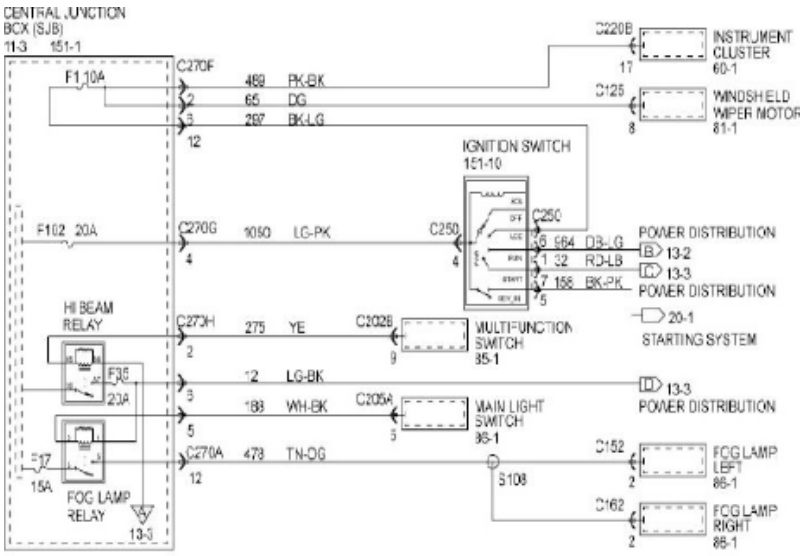
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

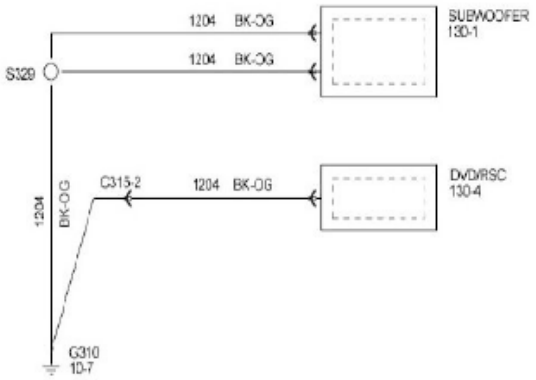
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

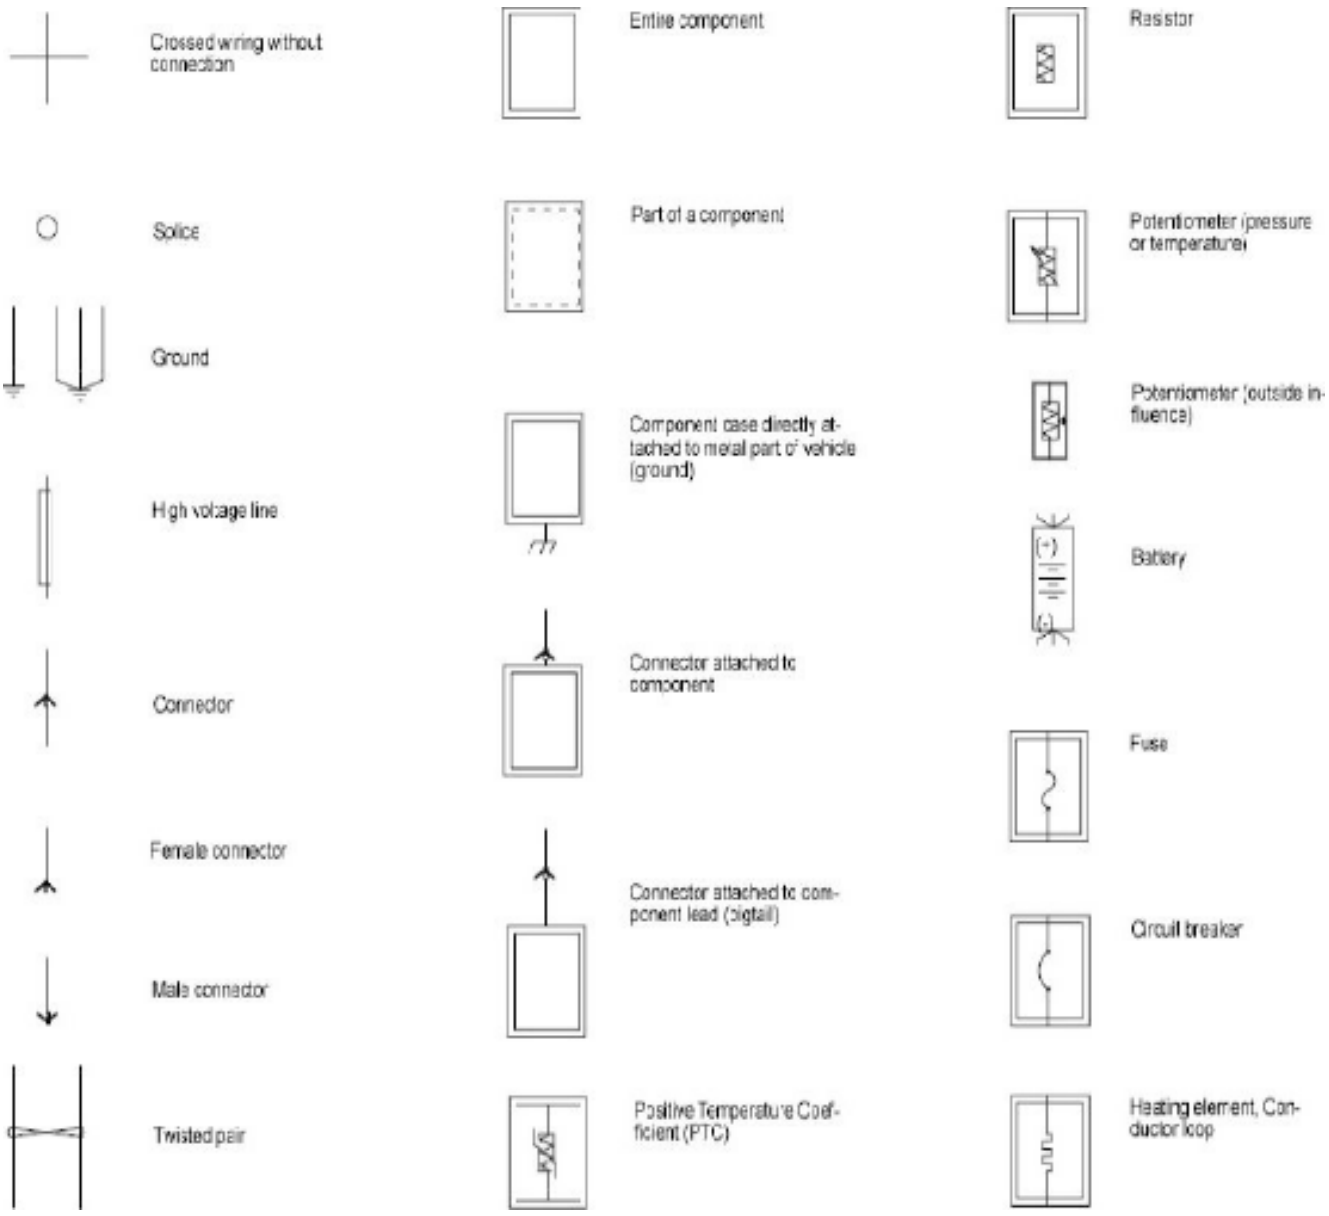
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

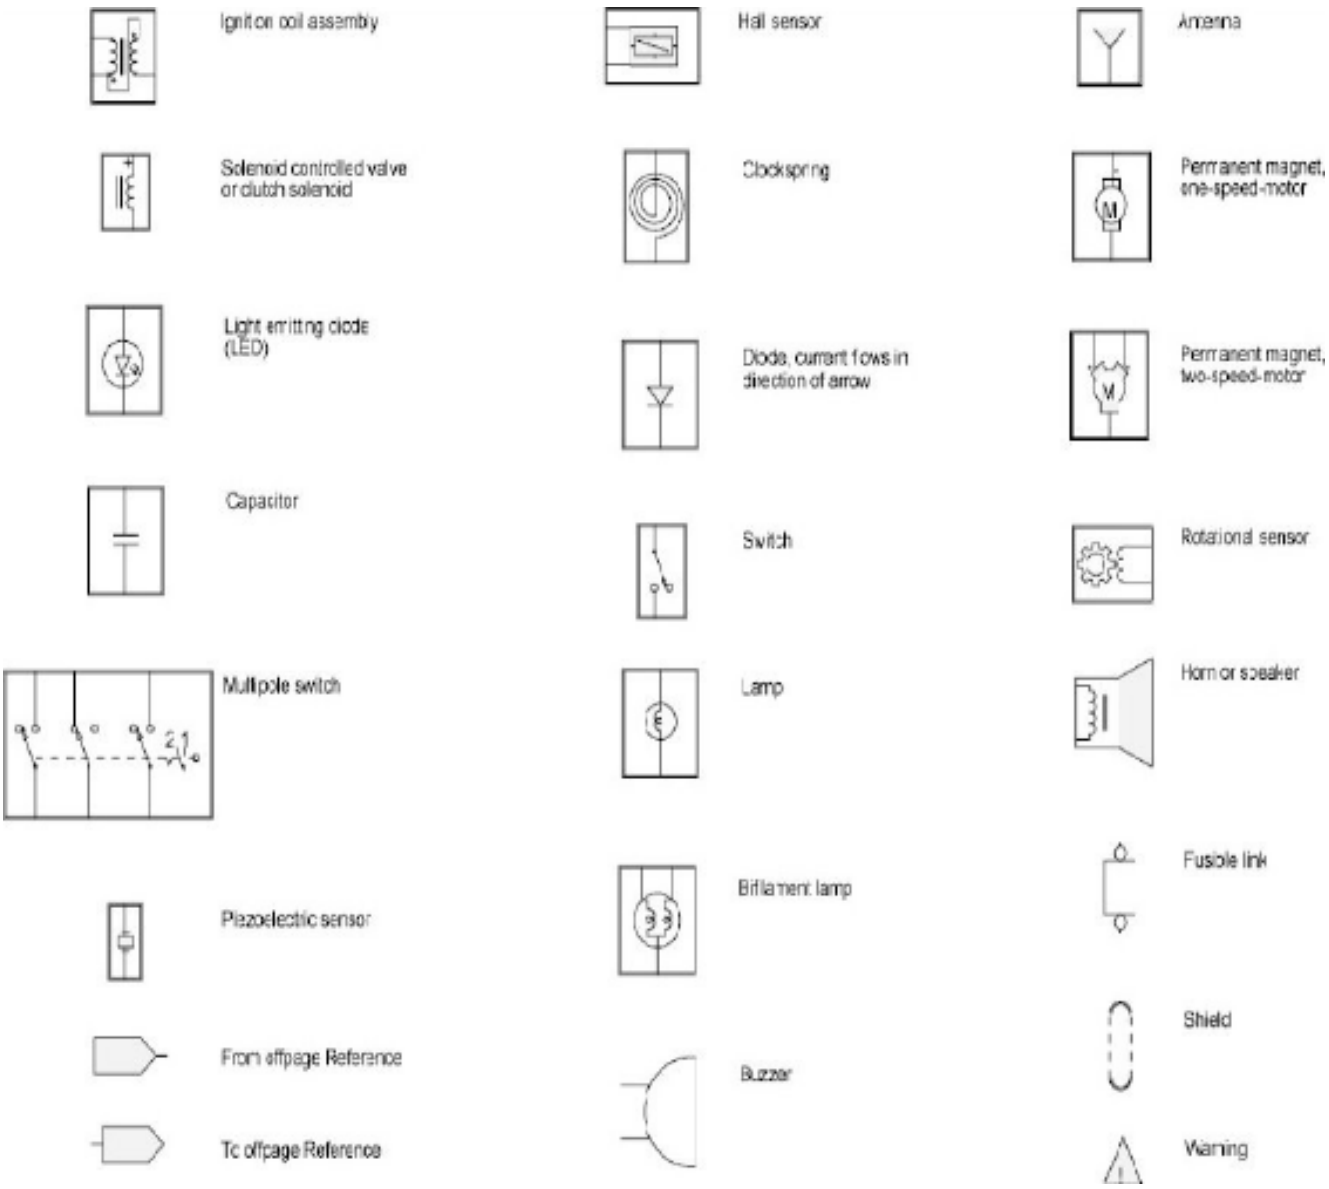
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

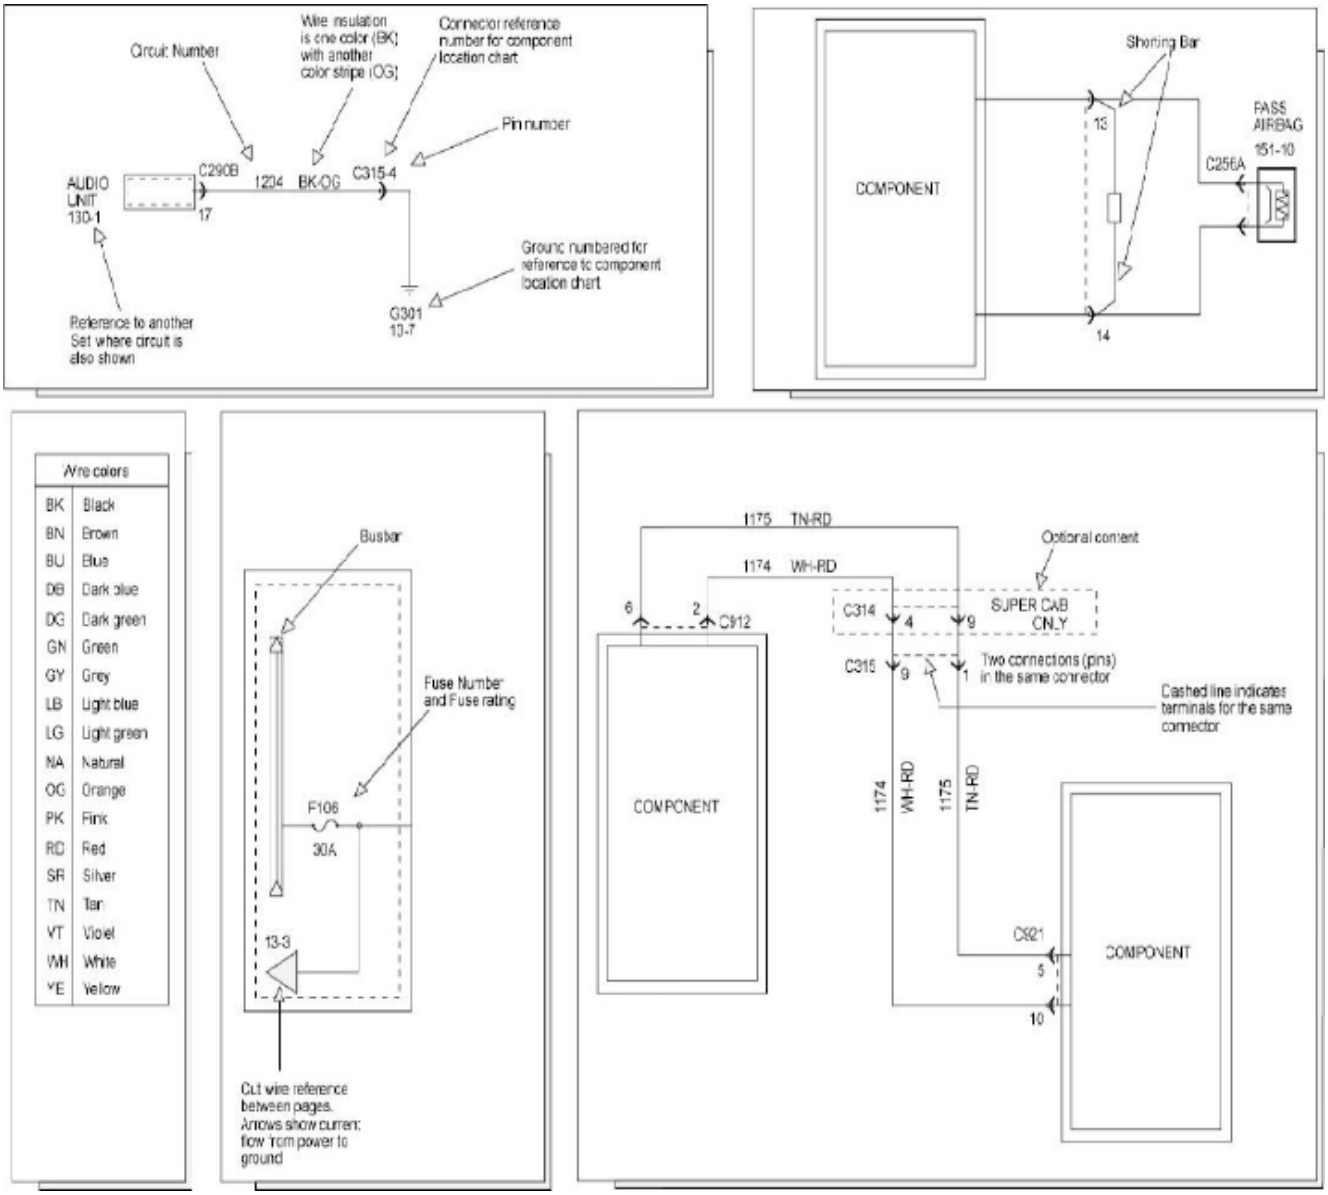
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

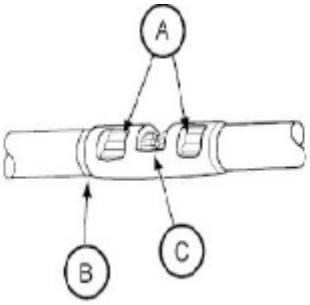
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

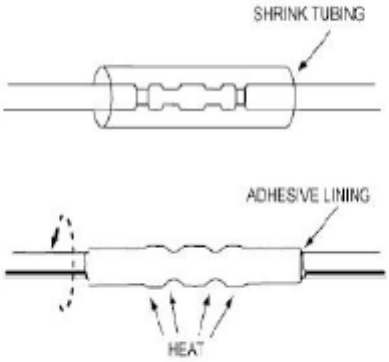
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x dia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

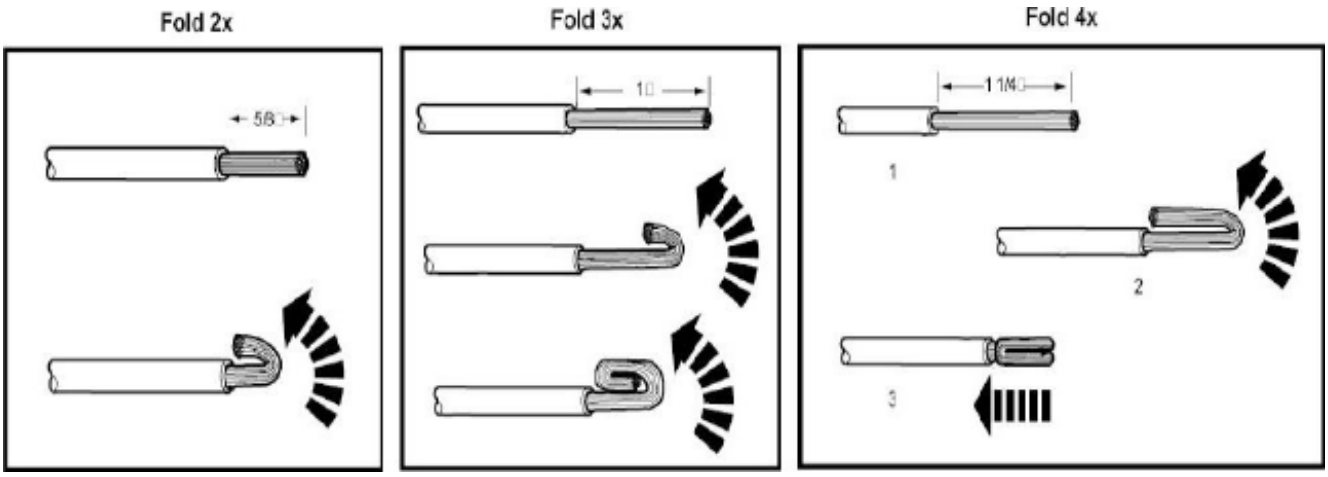
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



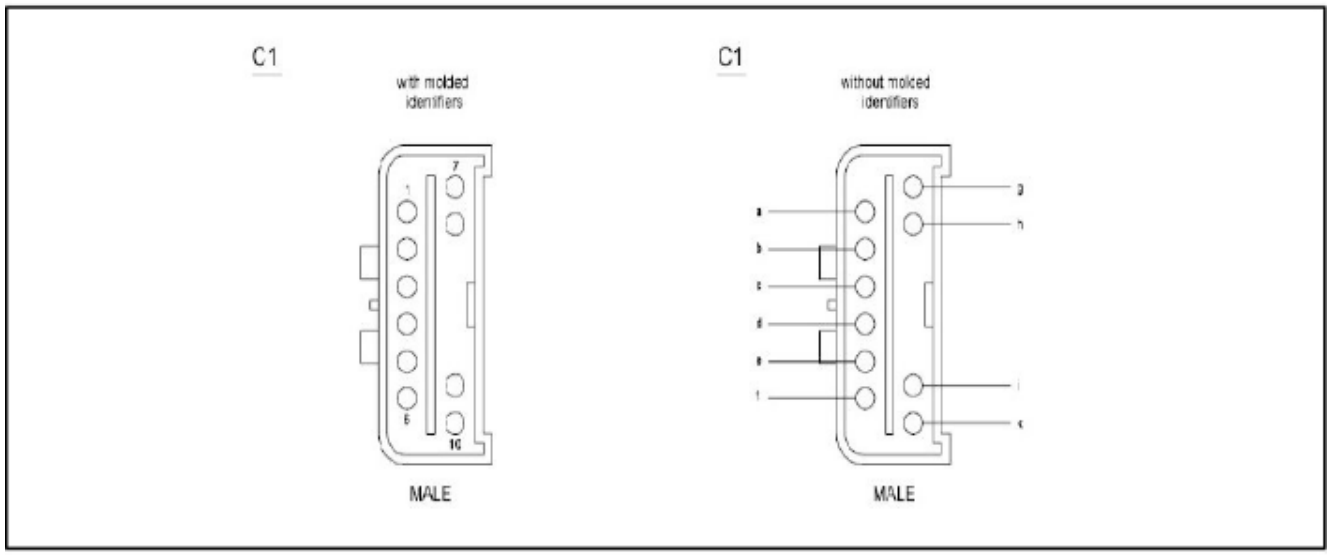
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals

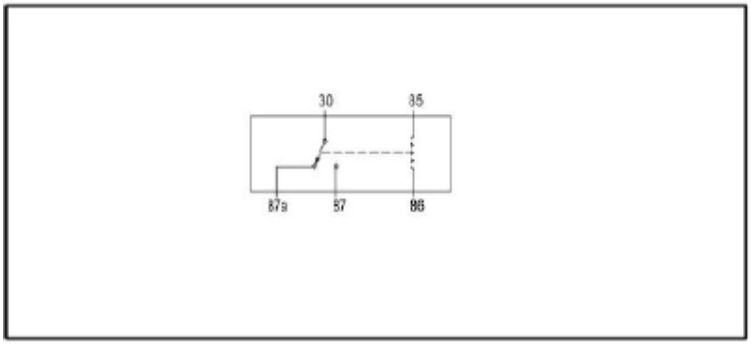


The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

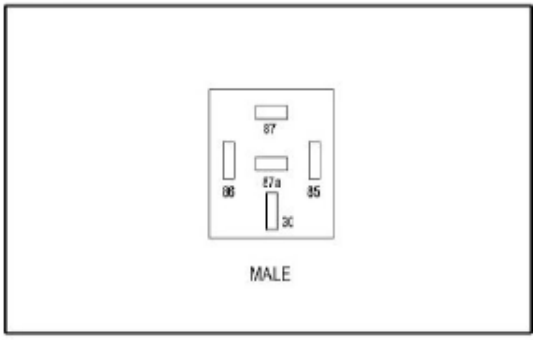
Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 □ 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Trailer Connector: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

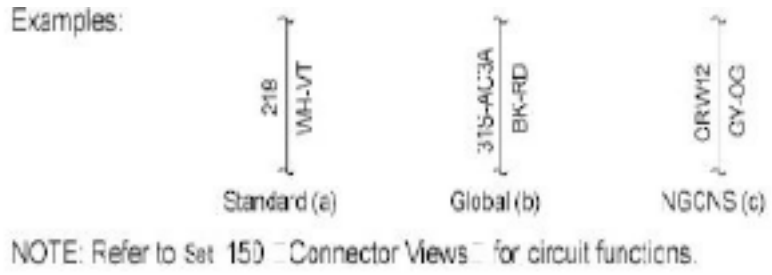
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

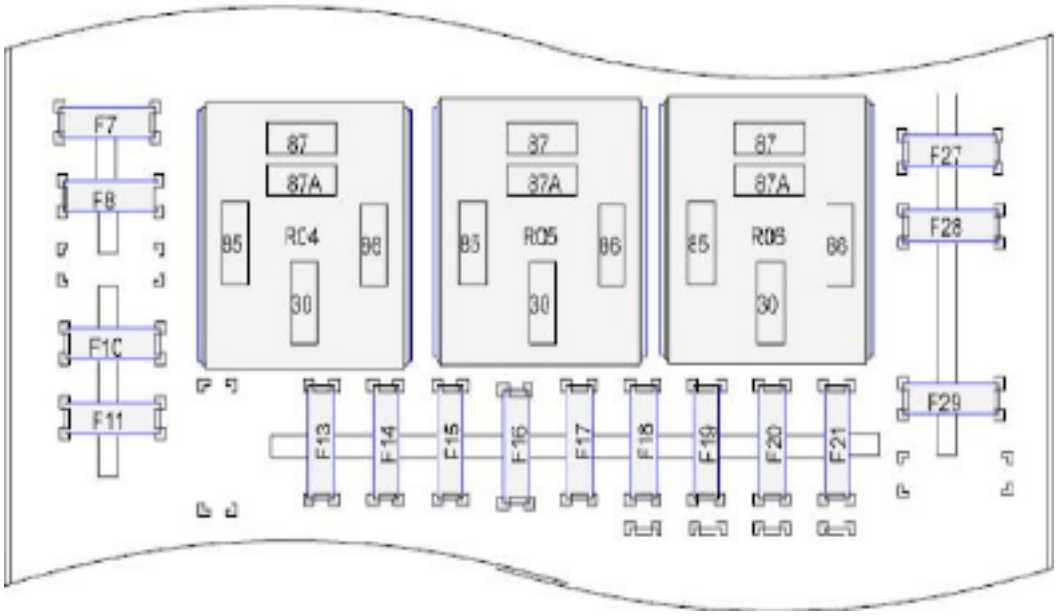
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

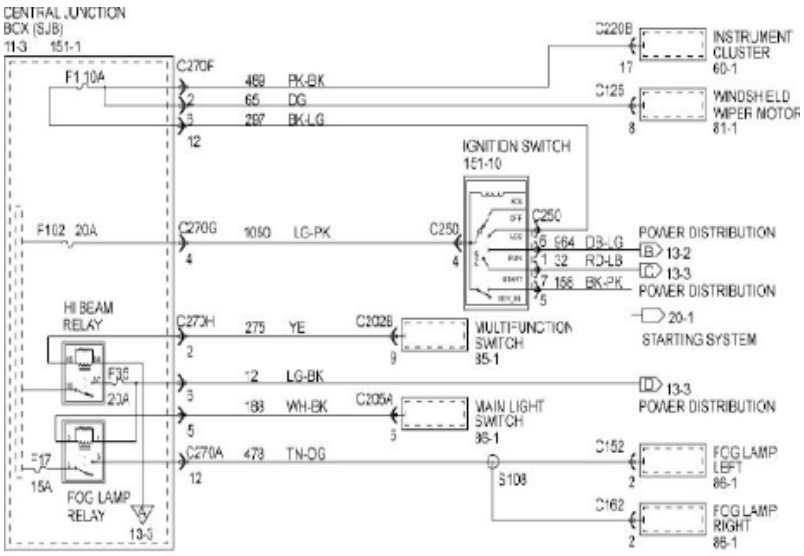
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

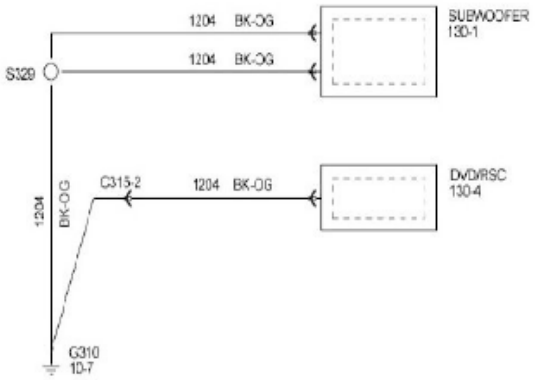
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

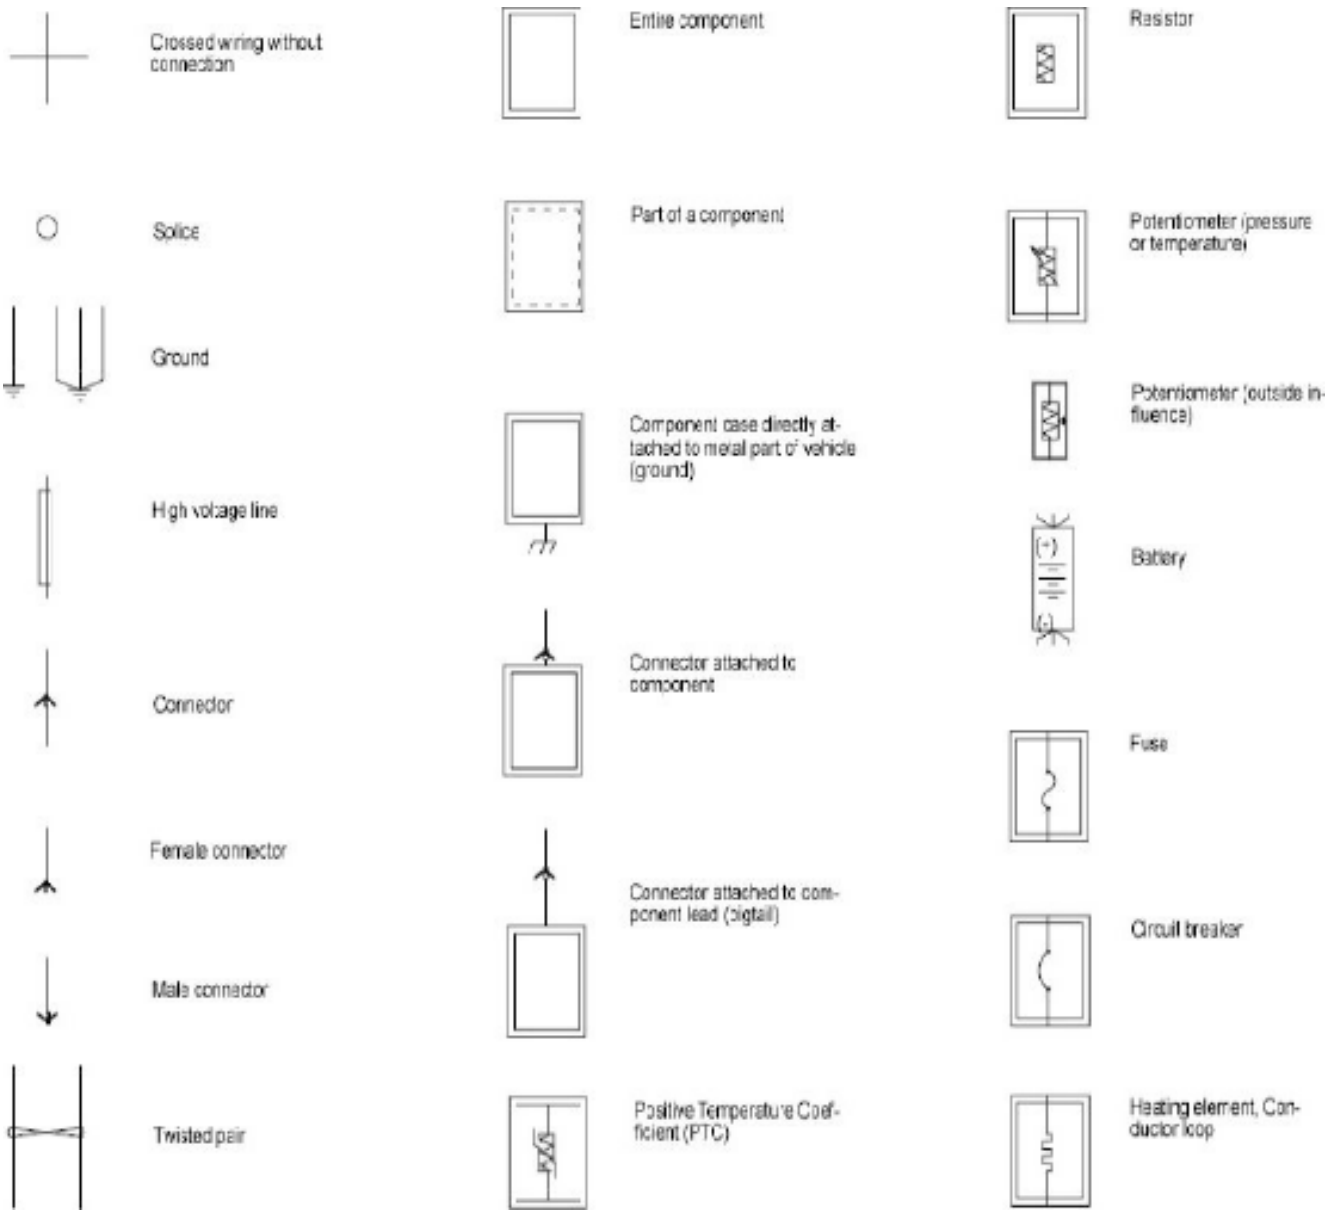
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

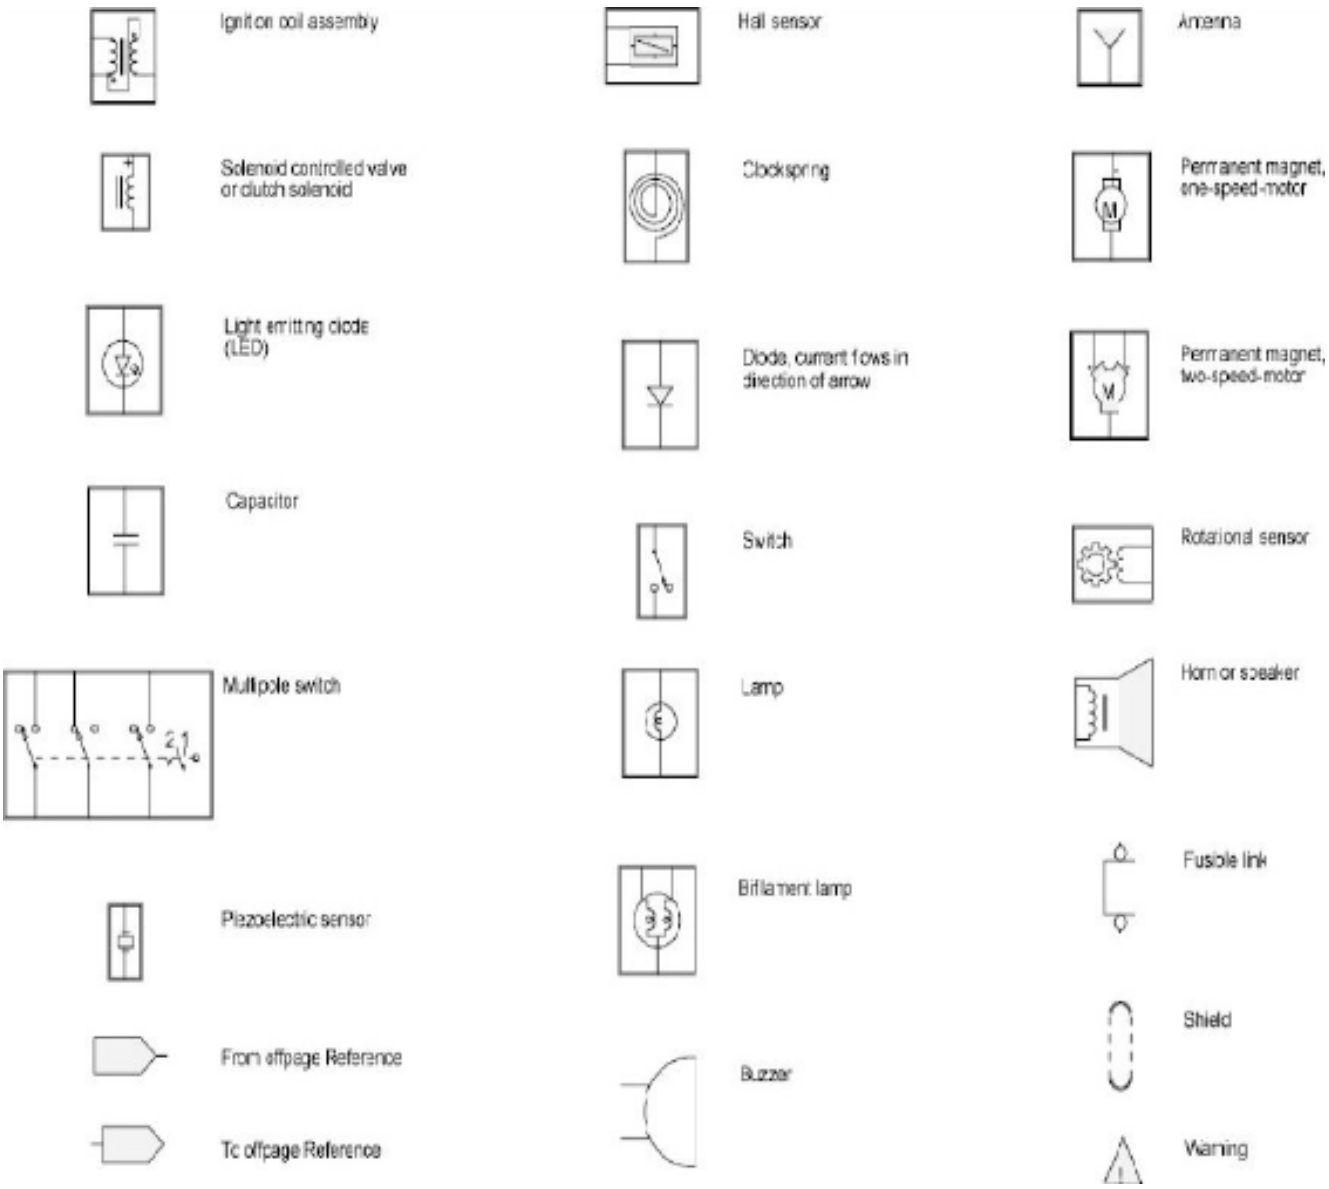
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

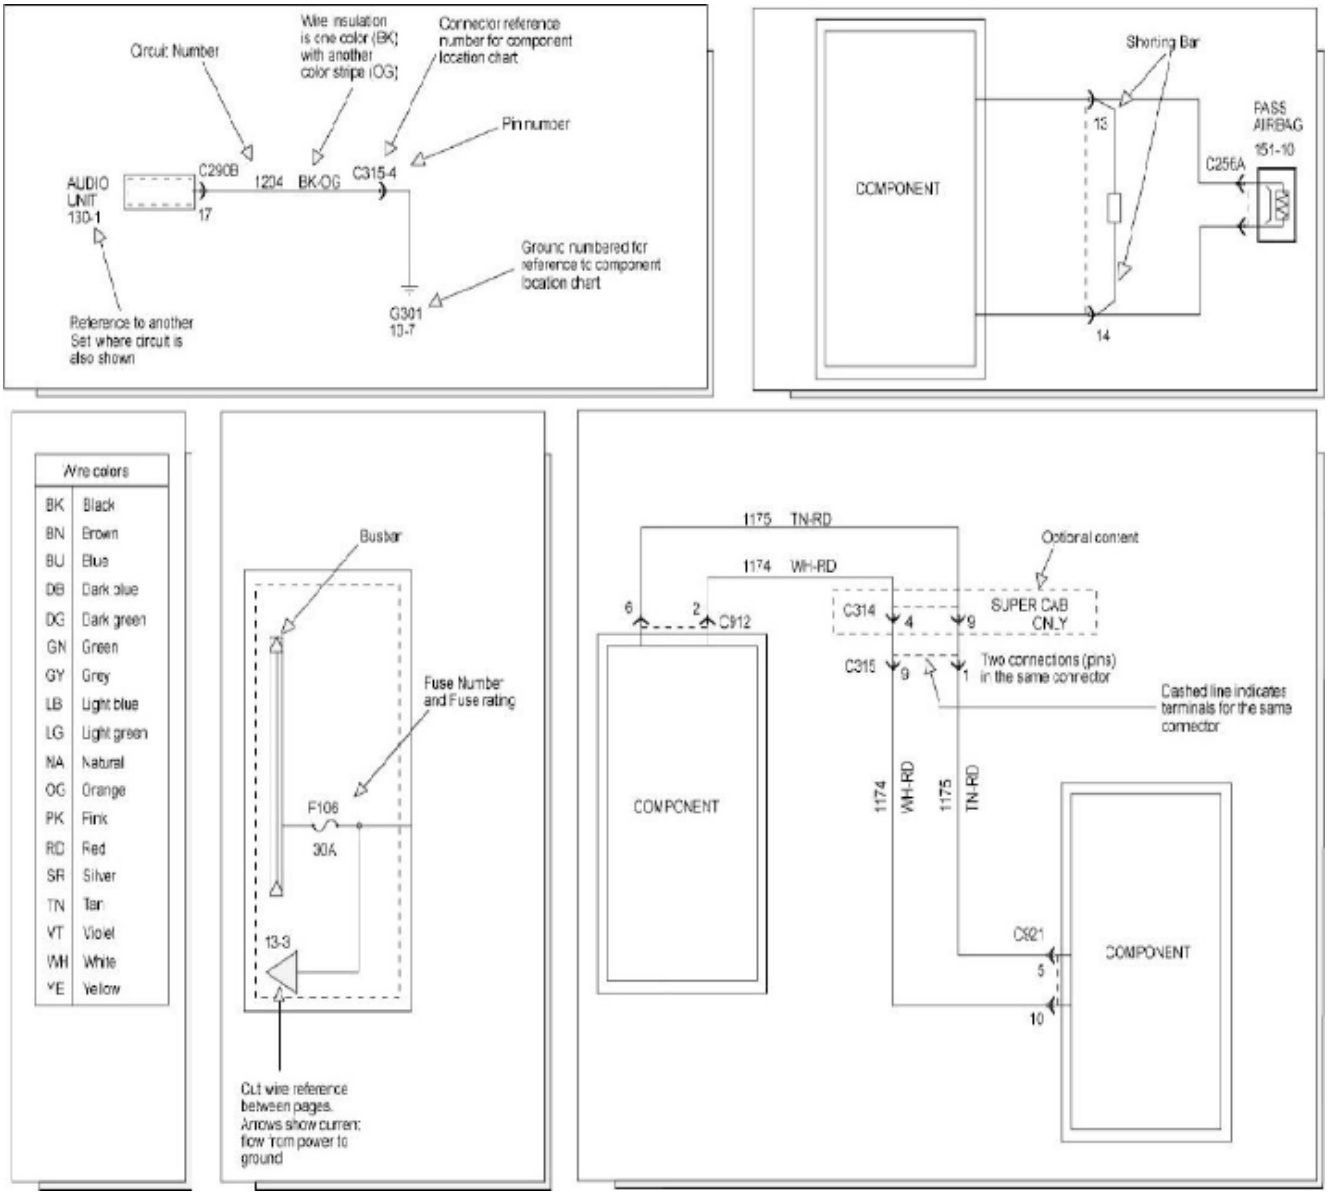
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

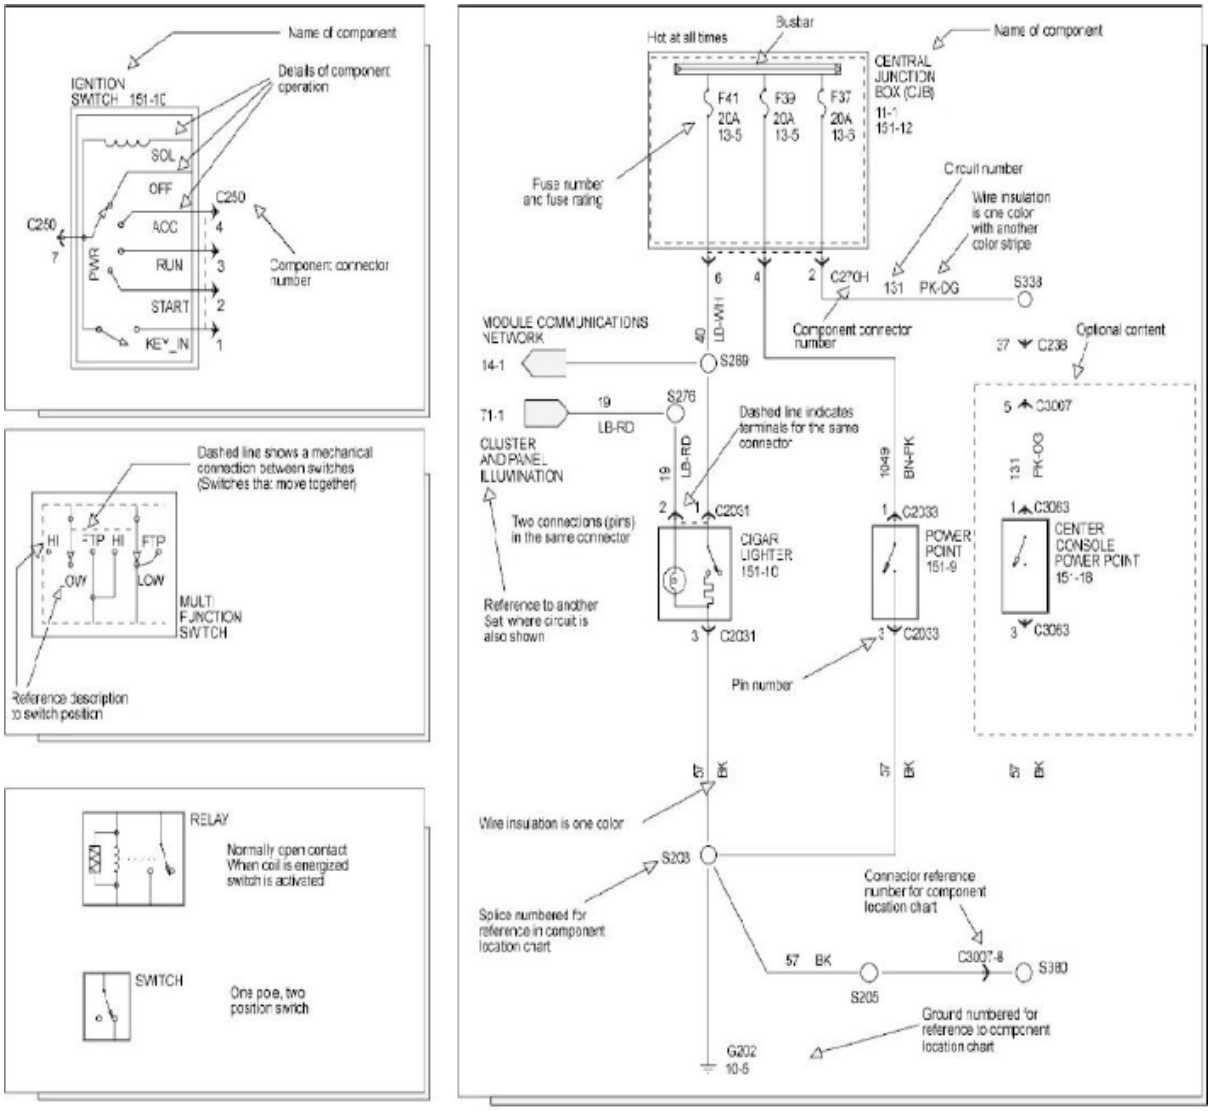
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel

Trailer Connector: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

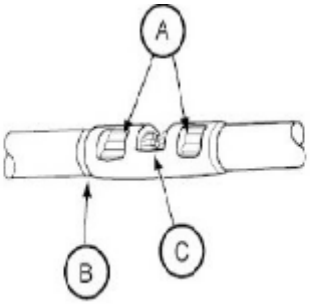
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

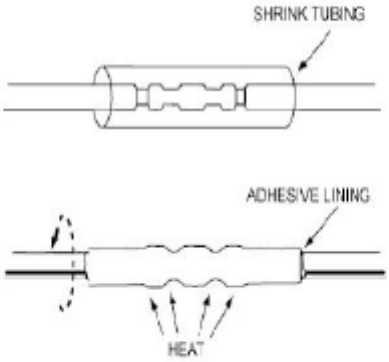
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x cia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Figtail only

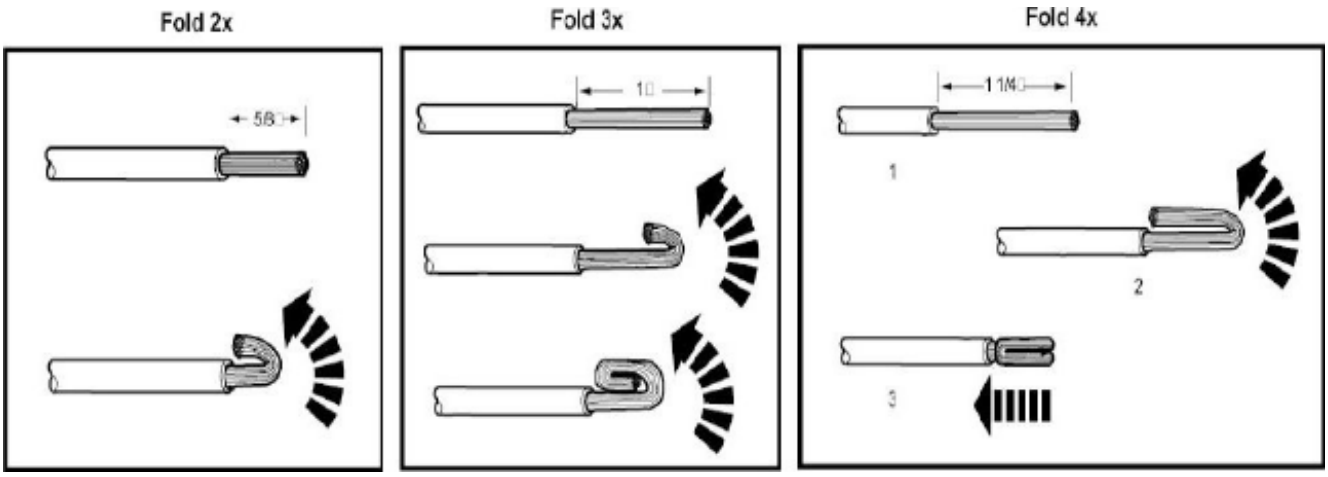
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Trailer Connector: Electrical Diagrams

PLEASE NOTE: Some diagrams may appear to be missing because of gaps in the number sequences. These "gaps" are actually for diagrams that do not apply to the vehicle model selected.

95-1

Diagrams: Other diagrams referred to by number (i.e. 13-2, 24-6, 10-2, etc.) within these diagrams can be found at Diagrams By Number. See:

Diagrams/Electrical Diagrams/Diagrams By Number

Locations: Location Views (reference numbers starting with 151-) referred to within these diagrams can be found at Location Views. See: Locations/Component Locations

Body Control Systems: Description and Operation

MODULE CONTROLLED FUNCTIONS

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

The SJB is the only multifunction electronic module on this vehicle. The SJB is a combination of a multifunction electronic module and a central junction box (CJB). The following systems are controlled by the SJB:

- Accessory delay relay
- Battery saver relay
- Daytime running lamps (DRL) driver
- Fog lamp relay
- Horn relay
- Illuminated entry and interior lighting
- Parking lamps
- Power door locks (if equipped)
- Remote keyless entry (RKE) system (if equipped)
- Tire pressure monitoring system (TPMS) (if equipped)

Body Control Systems: Initial Inspection and Diagnostic Overview

Inspection and Verification

INSPECTION AND VERIFICATION

1. Verify the customer concern. 2. Visually inspect for obvious signs of electrical damage.

VISUAL INSPECTION CHART

Electrical -

Battery junction box (BJB) fuse 5 (50A)

- Smart junction box (SJB) fuse 11 (10A)

- Wiring, terminals or connectors

3. If an obvious cause of an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. NOTE: Make sure to use the latest scan tool software release.

If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

5. NOTE: The vehicle communication module (VCM) prove-out confirms power and ground from the DLC are provided to the VCM.

If the scan tool does not communicate with the VCM: -

Check the VCM connection to the vehicle.

- Check the scan tool connection to the VCM.

- Refer to Information Bus (Module Communications Network), No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:

- Verify the ignition key is in the ON position.

- Verify the scan tool operation with a known good vehicle.

- Refer to Information Bus (Module Communications Network) to diagnose no response from the PCM.

7. Carry out the network test.

- If the scan tool responds with no communication for one or more modules, refer to Information Bus (Module Communications Network).

- If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB. 9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to Diagnostic Trouble Code (DTC) Chart. See:

Diagnostic Trouble Code Descriptions/Smart Junction Box (SJB) DTC Chart See: Diagnostic Trouble Code Descriptions/Diagnostic Trouble Code (DTC) Chart

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart. See: Symptom Related Diagnostic Procedures

Principles of Operation

PRINCIPLES OF OPERATION

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

The SJB is a multifunction module that controls many of the vehicle systems. Several SJB functions utilize hardwired inputs and/or outputs. The SJB controls the following hardwired functions, using the corresponding inputs and outputs:

Function	Input(s)	Output(s)
Daytime running lamps (DRL) (if equipped)	• Headlamp switch • Controller area network (CAN) messaging from instrument cluster (IC)	• Low beam headlamps
Fog lamps (if equipped)	• Headlamp switch	• Fog lamp relay
Horn	• Horn switch • Remote keyless entry (RKE) transmitter	• Horn relay
Interior lighting	• Door ajar switches • RKE transmitter	• Interior lamps relay
Parking lamps	• Headlamp switch	• Parking lamps relay
Power locks (if equipped)	• Driver door lock control switch • Passenger door lock control switch • RKE transmitter	• Door lock/unlock relays
RKE system (if equipped)	• RKE transmitter	• Door lock/unlock relays • Interior lamps relay
Tire pressure monitoring system (TPMS)	• TPMS sensors	• CAN message to instrument cluster (IC)

In addition, the SJB is involved in other vehicle systems through communication over the CAN. For a detailed list of SJB network inputs and outputs, refer to Information Bus (Module Communications Network), Principles of Operation.

Some SJB parameters are programmable. Two types of programmable parameters are available: vehicle configuration and customer preference.

The SJB utilizes a protective circuit strategy for many of its outputs (for example, the headlamp output circuit). Output loads are monitored by the SJB for excessive current (typically short circuits) and are shut down (voltage or ground provided by the module are turned off) when a fault is detected. A continuous DTC is stored at that time for the fault. The circuit will then reset after an ignition cycle or customer demand of the function (switching the component on, 30-minute battery saver being energized).

When an excessive circuit load occurs several times, the module shuts down the output until a service procedure is performed. At the same time, the continuous DTC that was stored on the first failure will not clear by a command to clear the continuous DTCs. The module will not allow this code to be cleared or the circuit restored to normal until a successful on-demand self-test proves that the fault has been repaired. After the on-demand self-test has successfully completed (no on-demand DTCs present), the continuous DTC will have been cleared and the circuit function will return.

Diagnostic Trouble Code (DTC) Chart

NOTE: Most powertrain (P-code) DTCs are diagnosed in Computers and Control Systems. If the P-code retrieved is not listed below, refer to Computers and Control Systems to continue diagnostics. The smart junction box (SJB) is also known as the generic electronic module (GEM).

DTC	Description	Source	Action
B106A	TPMS Sensor Pressure Range Bit Incorrect State	SJB	REFER to Wheels, Tires, and Alignment.
B106B	Tire Pressure Sensor Low Battery	SJB	REFER to Wheels, Tires, and Alignment.
B106E	Solid State Driver Disabled Due to Short Circuit	SJB	REFER to Smart Junction Box (SJB).
B106F	Module Disabled Due to External Fault	SJB	REFER to Smart Junction Box (SJB).
B1015	CEI Unconfigured	Instrument Cluster (IC)	REFER to Antitheft and Alarm Systems.
B1118	Passenger Front Crash Sensor Mount/Communication Fault	Restraints Control Module (RCM)	REFER to Air Bag Systems.
B1135	Passenger Front Crash Sensor Internal Fault	RCM	REFER to Air Bag Systems.
B1139	Invalid Transmitter Identification Code	SJB	REFER to Locks.
B1202	Fuel Sender Circuit Open	IC	REFER to Inst., Gauges, Warn Ind..
B1204	Fuel Sender Circuit Short to Ground	IC	REFER to Inst., Gauges, Warn Ind..
B1213	Anti-Theft Number of Programmed Keys is Below Minimum	IC	REFER to Antitheft and Alarm Systems.
B1231	Event Threshold Exceeded	Occupant Classification System Module (OCSM)	INSTALL a new OCSM. TEST the system for normal operation.
B1231	Event Threshold Exceeded	RCM	INSTALL a new RCM. TEST the system for normal operation.
B1302	Accessory Delay Relay Coil Circuit Failure	SJB	REFER to Windows.
B1304	Accessory Delay Relay Coil Circuit Short to Battery	SJB	REFER to Windows.
B1309	Power Door Lock Circuit Short to Ground	SJB	REFER to Locks.
B1317	Battery Voltage High	ABS Module	REFER to (*).
B1317	Battery Voltage High	4X4 Control Module	REFER to Charging System.

(*) Antilock Brakes / Traction Control Systems

B106F	Module Disabled Due to External Fault	GO to Pinpoint Test A.
U0100	Lost Communication With ECM/PCM	REFER to Information Bus.
U0155	Lost Communication With Instrument Panel Cluster (IC) Control Module	REFER to Information Bus (Module Communications Network).
All other DTCs	—	REFER to the Diagnostic Trouble Code (DTC) Chart.

U0300-U2511

B106E-B106F / U0100-U0155

Symptom Chart

Condition	Possible Sources	Action
• The smart junction box (SJB) does not respond to the scan tool	• Fuse • Wiring, terminals or connectors • SJB	• REFER to Information Bus (Module Communications Network).

Symptom Chart

PINPOINT TEST A: DTC B106E — SOLID STATE DRIVER DISABLED DUE TO SHORT CIRCUIT

CAUTION: If DTC B106F is present and the SJB is to be replaced, the fault condition must be corrected first. Failure to correct the fault condition first will cause damage to the new SJB, resulting in a repeat repair.

Test Step		Result / Action to Take
A1	REVIEW THE DTCs • Review the DTCs from the SJB self-test. • **Are only DTC B106E and DTC B106F present?**	**Yes** INSTALL a new SJB. TEST the system for normal operation. **No** CORRECT any DTCs present other than DTC B106E and DTC B106F. REFER to Diagnostic Trouble Code (DTC) Chart. After the repair, GO to **A2**.

(Continued)

PINPOINT TEST A: DTC B106E — SOLID STATE DRIVER DISABLED DUE TO SHORT CIRCUIT (Continued)

Test Step		Result / Action to Take
A2	CARRY OUT THE SJB SELF-TEST • Carry out the SJB self-test. • **Is DTC B106F present?**	**Yes** INSTALL a new SJB. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern was caused by a fault in one of the output circuits.

Body Control Systems: Pinpoint Tests

PINPOINT TEST A: DTC B106E - SOLID STATE DRIVER DISABLED DUE TO SHORT CIRCUIT

Normal Operation

The SJB controls the output of the daytime running lamps (DRL), fog lamps, one-touch down driver power window, accessory delay relay, windshield wiper park/run, windshield wiper speed, and windshield washer. When a repetitive fault causing a circuit overload is detected on any of the output circuits, the SJB disables the circuit by removing voltage, or ground, to the affected circuit. The circuit remains disabled until the fault is corrected and an on-demand self-test is run. After the on-demand self-test has been run, any DTCs related to the fault will be cleared.

- DTC B106E (Solid State Driver Disabled Due to Short Circuit) - sets when the SJB has temporarily disabled a circuit due to a repetitive fault causing a circuit overload. A corresponding DTC for the circuit in question will also set as follows:

- DTC B106F (Module Disabled Due to External Fault) - sets when one or more output functions are permanently disabled due to a repetitive circuit overload fault. DTC B106F will be set with DTC B106E. When DTC B106F is present, the SJB must be replaced after the fault condition has been corrected.

- DTC B1304 (Accessory Delay Relay Coil Circuit Short to Battery) - Accessory delay relay circuit short to battery voltage

- DTC B2512 (Front Fog Lamp Relay Ckt Short to Battery) - Fog lamp relay circuit short to battery voltage

- DTC B2973 (Daytime Running Lamp Output Shorted to Ground) - DRL output short to ground

This pinpoint test is intended to diagnose the following:

- Output circuit short to ground or voltage

- SJB

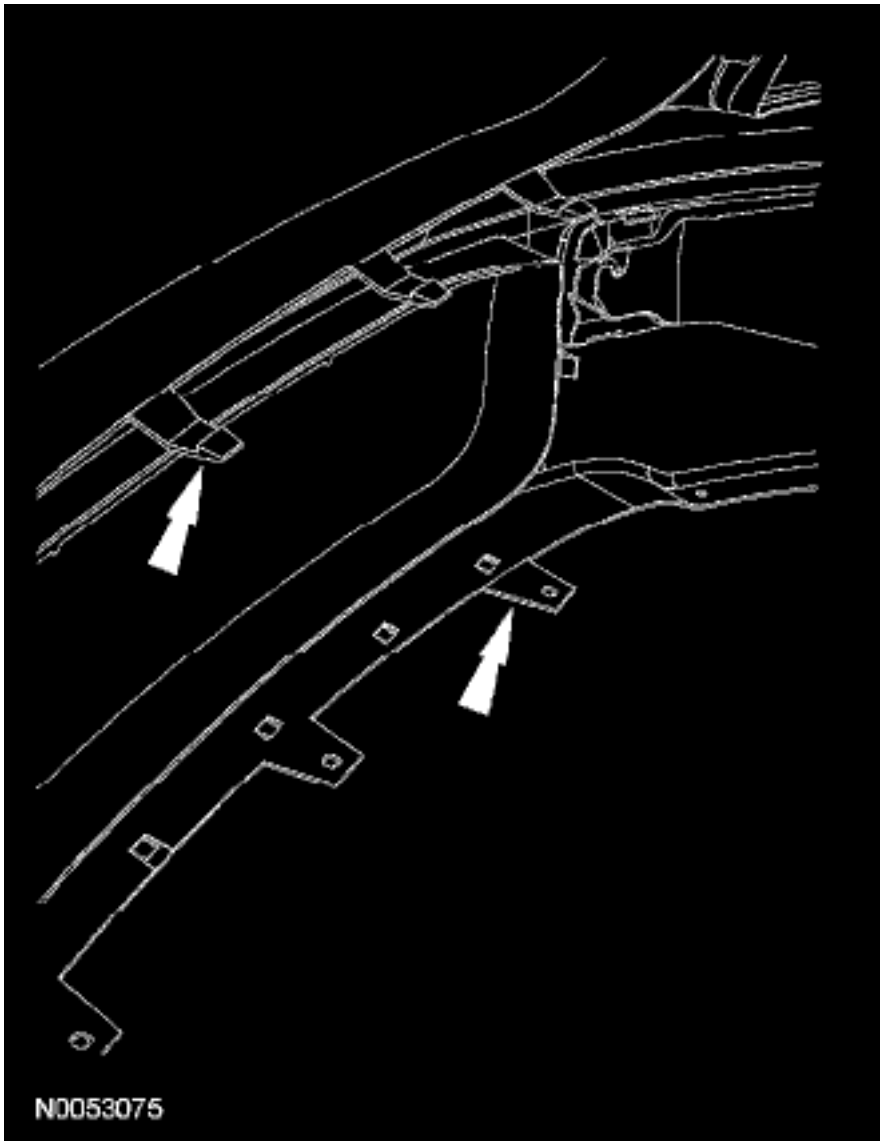
Special Tool(s)



Front Bumper Cover / Fascia: Procedures

TAB REPAIR - BUMPER

1. NOTE:

- Inspect the bumper cover to determine if part can be repaired to an acceptable level of quality of appearance, fit and durability. Will labor and material cost of the repair meet or exceed the cost of a new replacement bumper cover? If the bumper cover is determined to be repairable, proceed to the following steps.

- The following steps are to be used as a guideline. Depending on what brand of adhesives or patch materials are used, procedures may vary slightly.

Remove the affected bumper.

2. Clean the broken tab(s) with a plastics wax and grease remover.

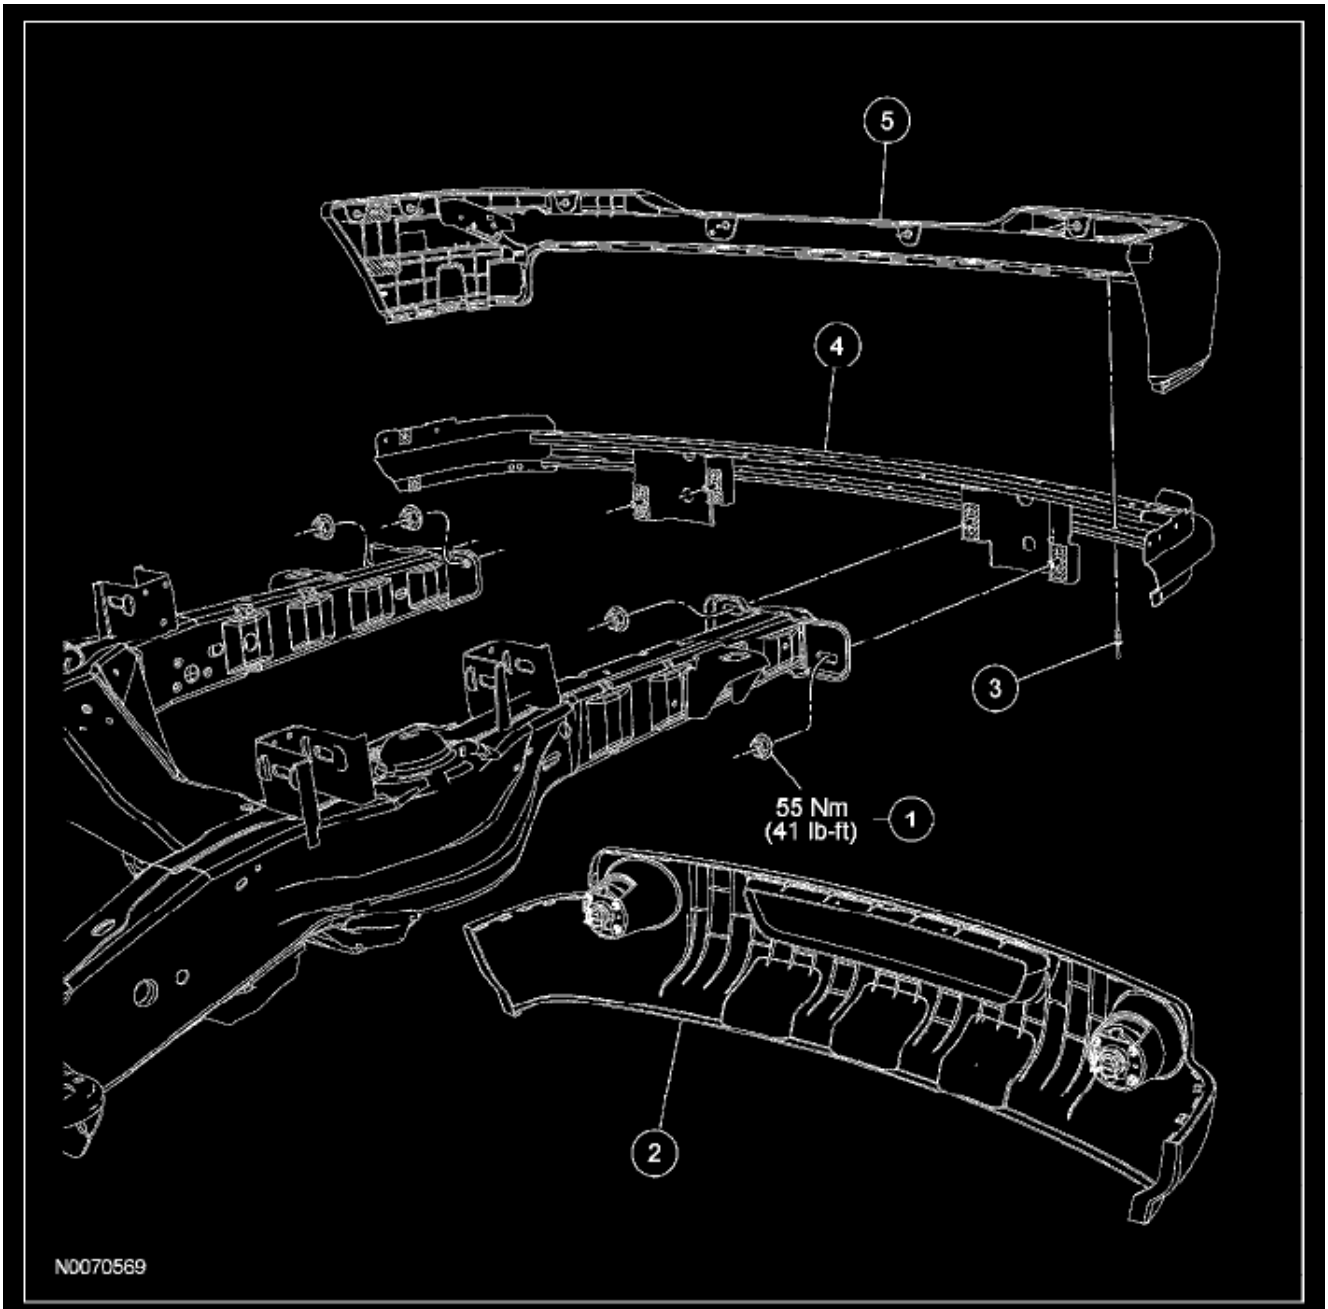
3. Hand sand the repair area with 80-grit sandpaper and remove any foreign material with compressed air. 4. Apply a plastics adhesion promoter per label directions to the repair area. 5. Measure and cut a patch of fiberglass cloth or equivalent large enough to form the front of the tab, then slope back in a wedge shape approximately

51 mm (2 in) from original tab.

6. Prepare the repair adhesive cloth patch per manufacturer's instructions and apply to the affected area.

- Immediately position the plastic repair material patch to form the tab shape.

7. Allow appropriate cure time and shape the repair tab using a small angle sander. Use extreme care to not sand through the exterior surface. 8. Carry out any required paint repair operations to the bumper cover using Ford-approved paint systems. 9. Reassemble and install the bumper cover.



Item	Part Number	Description
1	N621946-S	Front bumper nut (4 required)
2	17F792	Lower front bumper cover
3	—	Front bumper cover plastic rivet (14 required)

Special Tool(s)

Removal and Installation

Upper and lower bumper cover

1. Remove the front bumper assembly.

Lower bumper cover

2. Remove the lower bumper cover from the upper bumper cover.

- Disengage the lower cover from the clips on the upper cover.

3. Transfer the fog lamp assemblies to the new lower bumper cover, if necessary.

Upper bumper cover

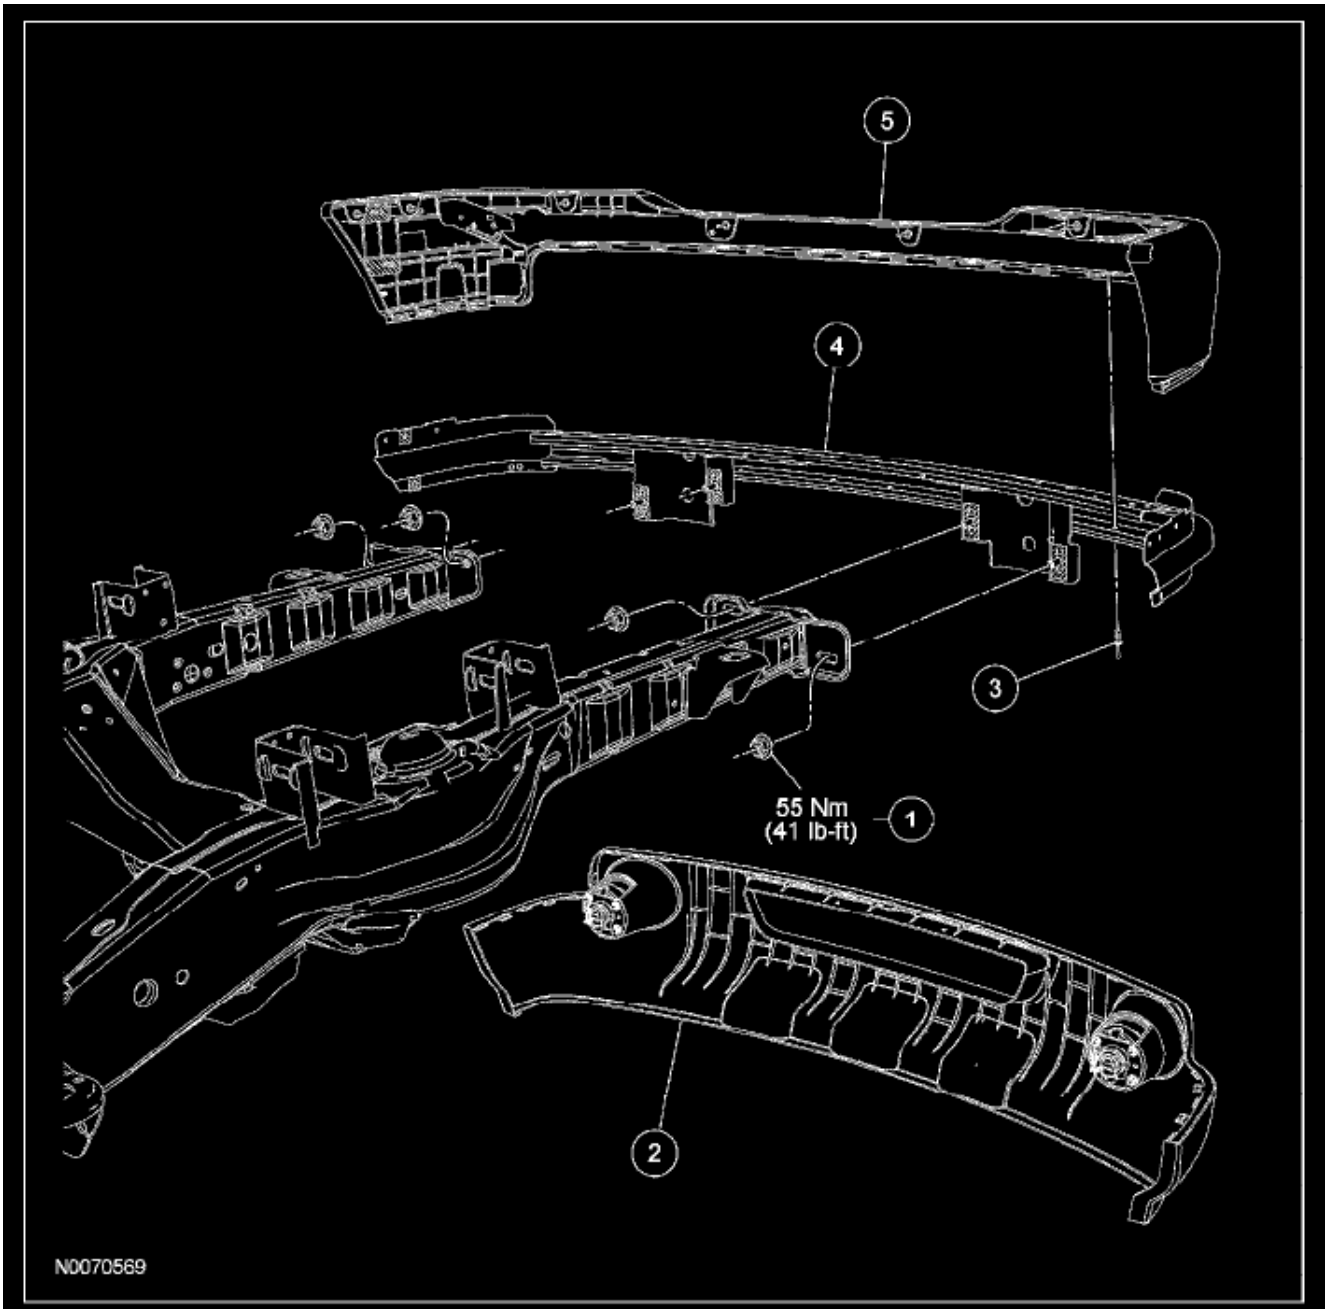
4. Remove the upper bumper cover from the bumper beam.

- Remove the 14 plastic rivets.

- Remove the upper bumper cover.

Upper and lower bumper cover

5. To install, reverse the removal procedure.



Item	Part Number	Description
1	N621946-S	Front bumper nut (4 required)
2	17F792	Lower front bumper cover
3	—	Front bumper cover plastic rivet (14 required)

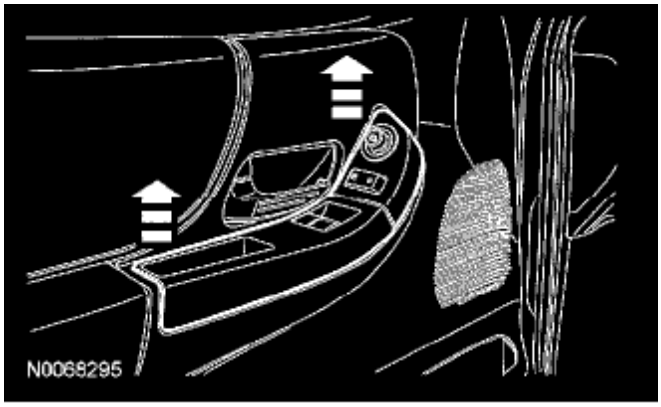
Front Door Panel: Service and Repair

DOOR TRIM PANEL - FRONT

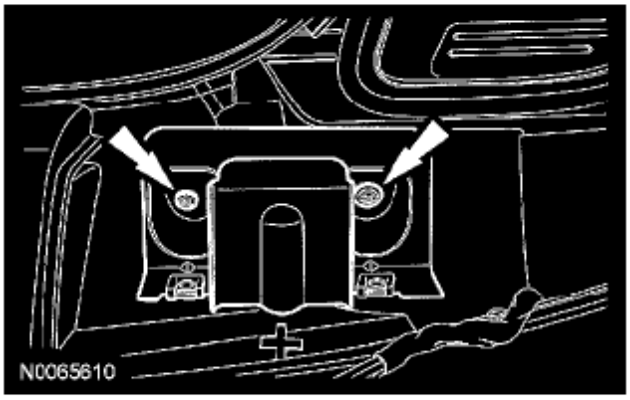
Removal and Installation

High series

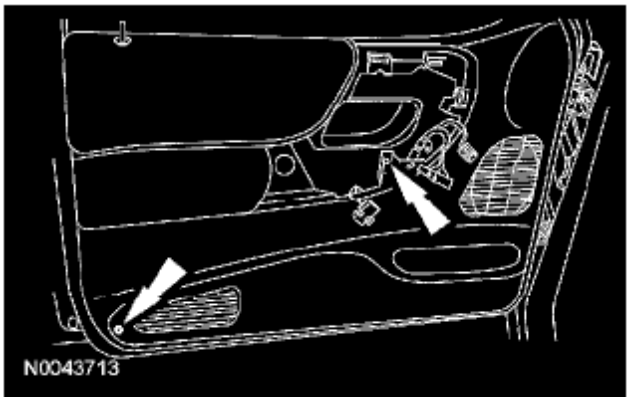
1. Remove the 2 door pull handle screws.



N0068295



N0065610



N0043713

2. Remove the door pull handle.

- Lift the door pull handle upward to release the door pull handle retaining clips.

- If equipped, disconnect the electrical connectors. -

Remove the wire harness pin-type retainer.

Low series

3. Remove the door pull handle screw. 4. Remove the window regulator handle.

All vehicles

5. Remove the front door trim finish panel.

- Pull the front door trim finish panel outward to release the front door trim finish panel retaining clips.

High series

6. Remove the door pull handle bracket.

- Remove the 2 door pull handle bracket screws.

7. Remove the 2 front door trim panel screws.

Low series

8. Remove the front door trim panel screw.

All vehicles

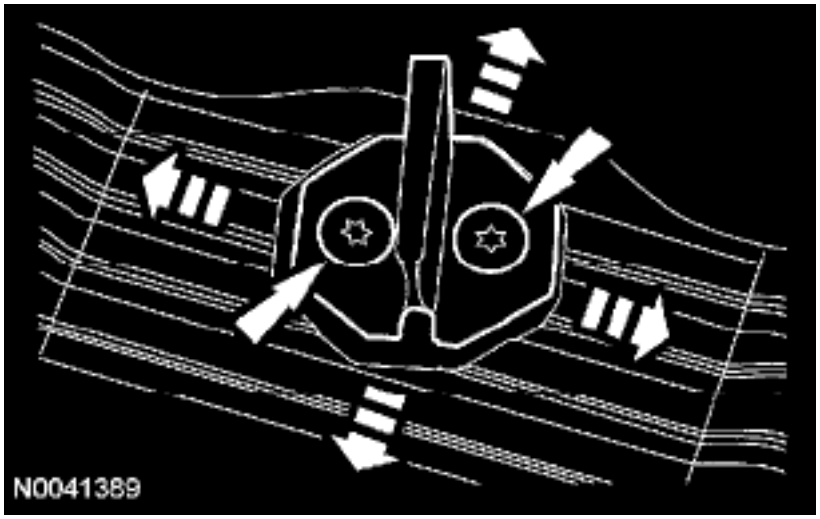
9. CAUTION: Do not pull directly outward on front door trim panel, as damage will occur.

Remove the front door trim panel. -

Lift upward to remove the front door trim panel.

10. CAUTION: Insert the lower panel tabs first or they may break when installing the front door trim panel.

To install, reverse the removal procedure.



Front Door Striker: Adjustments

STRIKER ADJUSTMENT

1. Open and support the door. 2. Mark the current position of the door strikers. 3. Loosen the door striker bolts enough to allow the striker to be moved. 4. Move the striker as needed to make the adjustment and tighten the door striker bolts.

- To install, tighten to 25 Nm (18 lb-ft).

Front Door Window Glass: Customer Interest Body - Window Chatter/Shudder During Operation

TSB 09-22-5

11/16/09

WINDOW CHATTER/SHUDDER

FORD: 2008-2009 Ranger

ISSUE Some 2008-2009 Ranger vehicles may experience window chatter/shudder when the window travels up or down.

ACTION Follow the Service Procedure steps to correct the condition.

SERVICE PROCEDURE

Verify correct grease amount on the window Run. Open the upper door glass Run attachment slot to allow further forward adjustment.

1. Remove door trim panel following Workshop Manual (WSM), Section 501-05.

2. Inspect window Run and add grease if necessary using Motorcraft® Multi-Purpose Grease. (Figure 1)

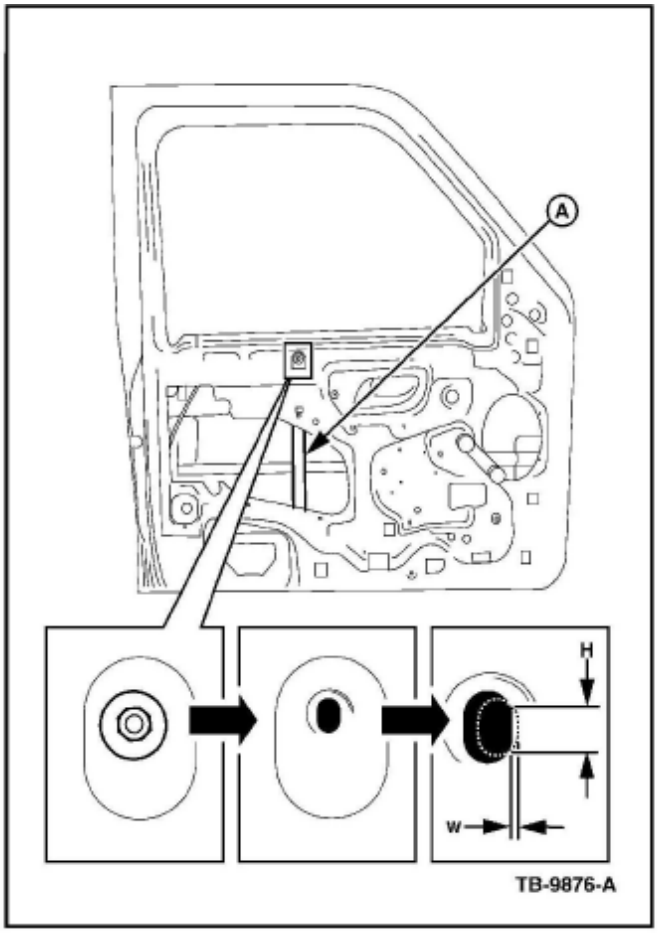

Figure 2

PART NUMBER	PART NAME
XG-4	Motorcraft® Multi-Purpose Grease
PM-13-A	Motorcraft® Anti-Corrosion Coating

3. With window in down position, remove the top and bottom center door glass Run retainer nuts and push door glass Run A to the side. (Figure 2)

4. Rework the upper glass Run attachment slot. (Figure 2)

a. Remove approximately 5/64" (2 mm) of material at W and 25/64" (10 mm) at H.

b. Remove material from the front of vehicle side of the slot. Be careful to not leave burrs on the panel.

c. Coat newly exposed metal areas with Motorcraft(R) Anti-Corrosion Coating.

5. Reposition glass Run A and loosely attach fasteners.

6. Raise glass to full up position. While pushing outward on the lower attachment. Torque glass Run attachment nuts, tighten to 106 lb-in. (12 N.m). Be

careful not to force a different position of the stud when installing the upper nut.

7. Install trim panel following WSM, Section 501-05-1.

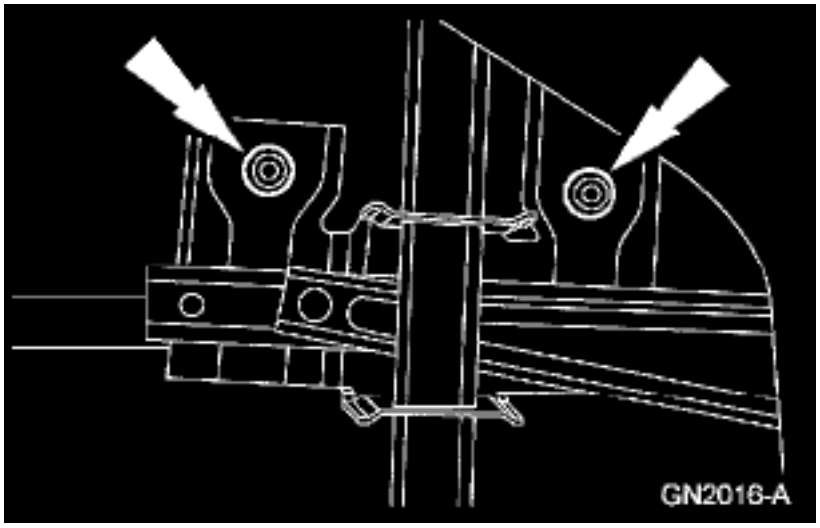
Removal and Installation



NOTE: Position the window glass halfway up to gain access to the rivets.

1. Remove the front door trim panel. 2. Remove the watershield. 3. Remove the door glass channel.

- Remove the bolt.

- To install, tighten to 12 Nm (9 lb-ft).

4. NOTE:

- Support window glass before removing the rivets.

- To remove the rivets, use a drift punch to remove the steel centers and a 6 mm (1/4 in) diameter drill bit to remove the rivets.

Remove the 2 window glass rivets.

5. Remove the front door window glass through the window opening. 6. To install, reverse the removal procedure.

- Use a heavy duty riveter to install the new rivets.

Special Tool(s)

Special Tool(s)

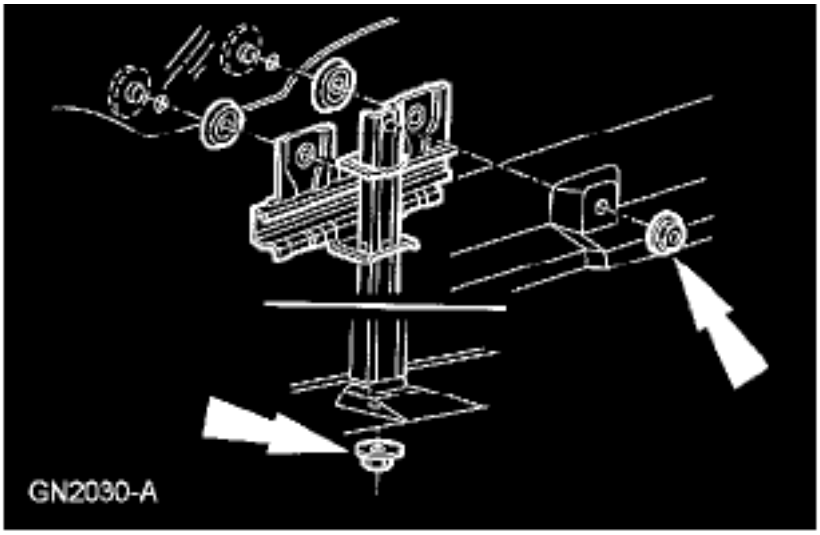
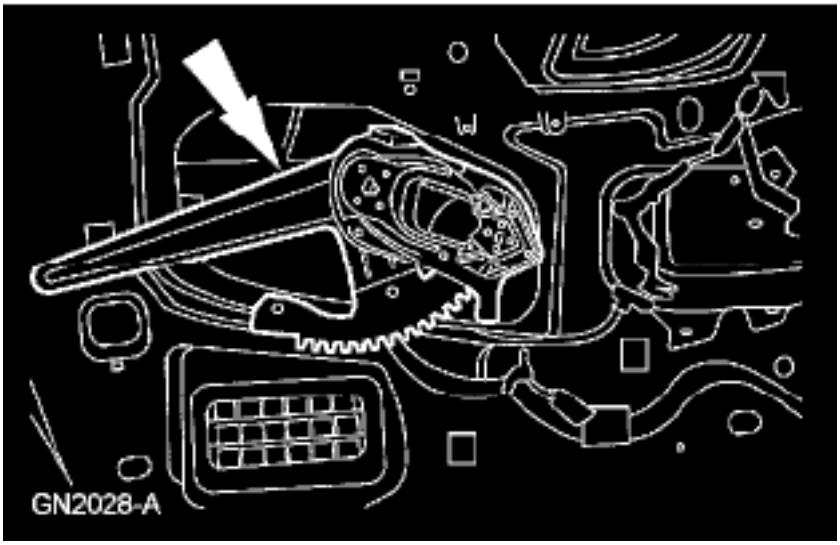
Removal and Installation





1. Remove the door trim panel. 2. Remove the watershield. 3. Support the window glass. 4. If equipped, disconnect the power window motor electrical connector. 5. Remove the top and bottom center door glass run retainer nuts.

- To install, tighten to 9 Nm (80 lb-in).

6. NOTE:

- To remove the rivets, use a drift punch to remove the steel centers and a 6.35 mm (1/4 in) diameter drill bit to remove the rivets.

- The power window regulator has 4 rivets; the manual has 3.

Remove the window regulator rivets. -

Remove the steel centers and rivets.

7. Remove the window regulator.

8. WARNING: When removing the window regulator motor, place the window in the full upward position or block the window regulator

arm to help prevent the counterbalance spring from unwinding with high force. Failure to follow this instruction may result in serious personal injury.

If necessary, remove the window glass motor. -

Remove the bolts.

- To install, tighten to 8 Nm (71 lb-in).

9. To install, reverse the removal procedure.

- Use a heavy duty riveter to install the new rivets.

Cross-Member: Service and Repair

TRANSMISSION SUPPORT CROSSMEMBER

Transmission Support Crossmember

1. With the vehicle in NEUTRAL, position it on a hoist. 2. Remove the 2 transmission mount nuts from the transmission support crossmember. Discard the nuts.

- To install, tighten to 90 Nm (66 lb-ft).

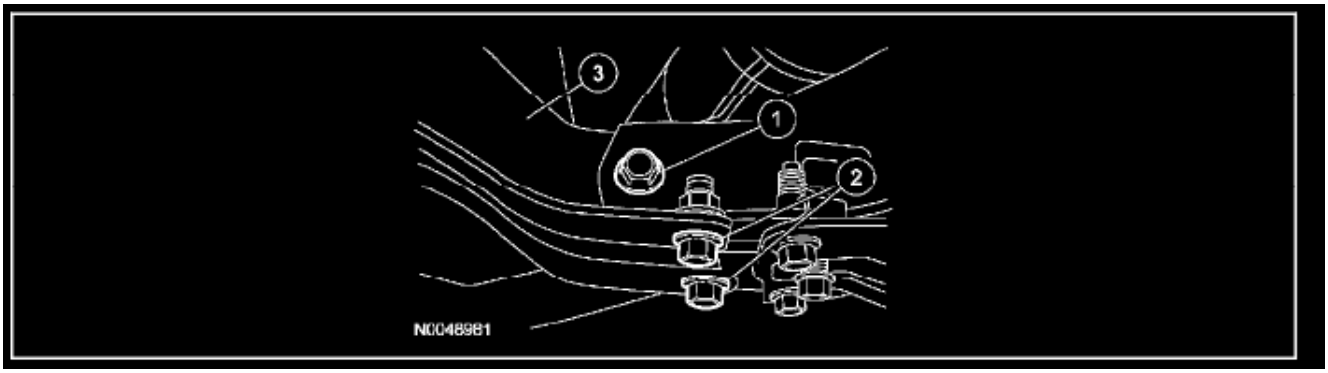
3. NOTE: Do not allow the transmission to hang freely.

Support the transmission with a suitable jack.

4. NOTE: Four-Wheel Drive (4WD) transmission support crossmember shown, Rear Wheel Drive (RWD) transmission support crossmember

similar.

Remove the transmission support crossmember. 1. Remove the 2 horizontal transmission support crossmember bolts and nuts (1 each side).



- To install, tighten to 127 Nm (94 lb-ft).

2. Remove the 4 vertical transmission support bolts and nuts (2 each side).

- To install, tighten to 99 Nm (73 lb-ft).

3. Remove the transmission support crossmember.

5. To install, reverse the removal procedure.

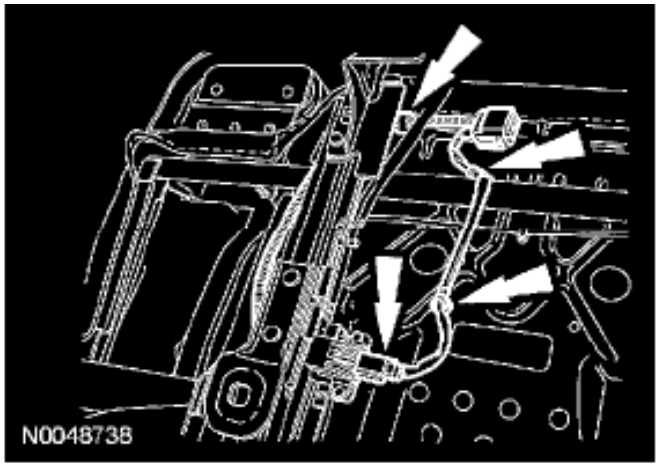
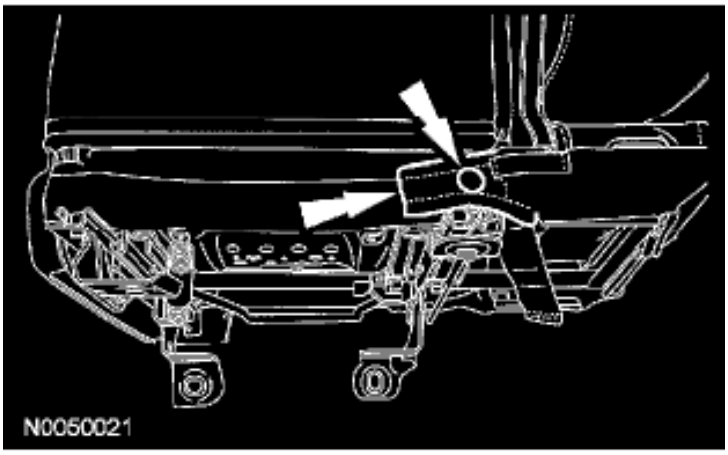
Removal

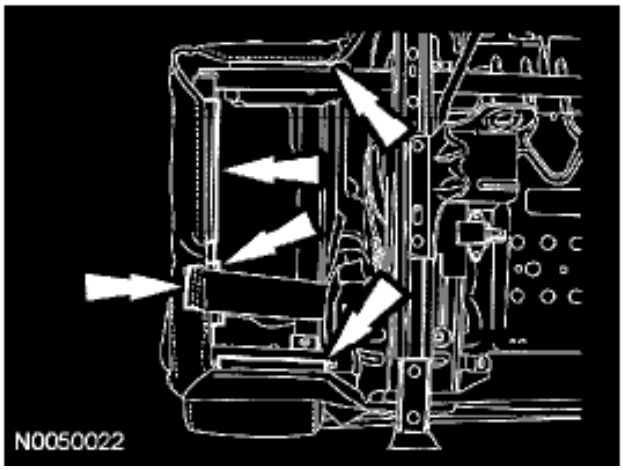
WARNING: Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.



N0048738



N0050021



N0050022

NOTE: -

The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1. Remove the 60 percent bench seat. 2. Remove the cup holder and 2 cup holder mounting screws, if equipped.

- Pull upward and forward to release the cup holder.

3. NOTE: Note the routing of the seat wiring harness for installation.

Detach the wiring harness from the cushion. -

Disconnect the seat position sensor electrical connector.

- Detach the wiring harness and electrical connector pin-type retainers.

- Route out the wiring harness.

4. Remove the nut and safety belt buckle pretensioner.

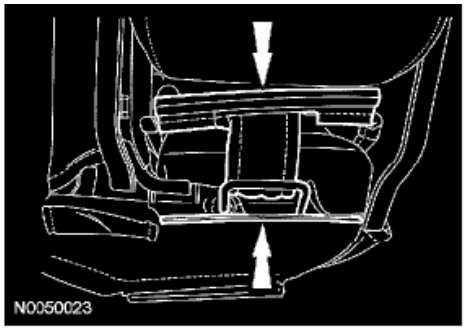
- To install, tighten to 40 Nm (30 lb-ft).

5. Release the rear hook-and-loop strip and detach the pin-type retainer.

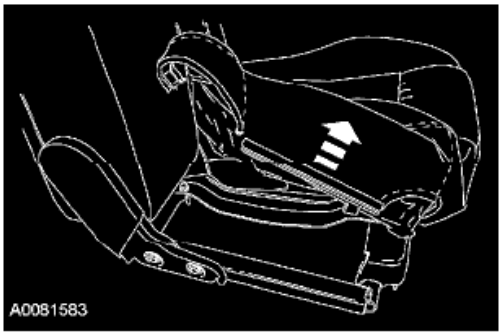
6. Release the underside hook-and-loop strip and J-clips.

7. Release the rear J-clip below the armrest and position aside the material from around the child safety seat tether anchor.

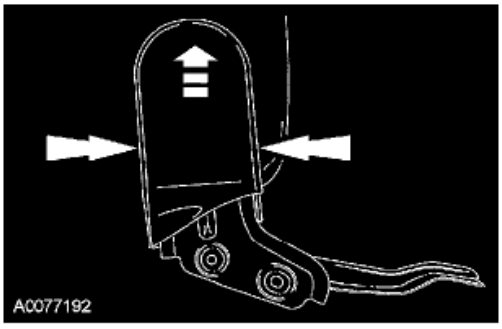
- Route out the trim flap through the child safety seat tether anchor.



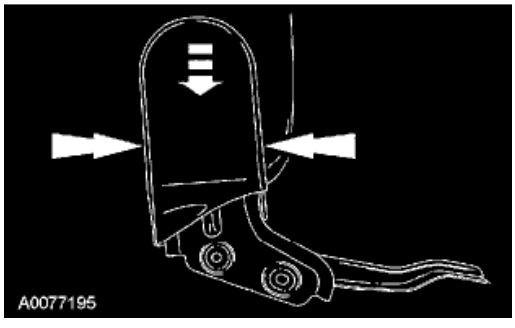
N0050023



A0081583



A0077192



A0077195

8. Lift the cushion cover and foam pad for access to the RH and LH armrest bracket-to-seat frame bolts.

9. Remove the 2 RH and 2 LH armrest bracket-to-seat frame bolts and remove the armrest assembly.

10. Release the trim cover clips and slide off the LH inner/outer and RH inner/outer trim covers (RH side shown).

11. Remove the 2 armrest pivot bolts and remove the LH and RH armrest brackets.

Installation

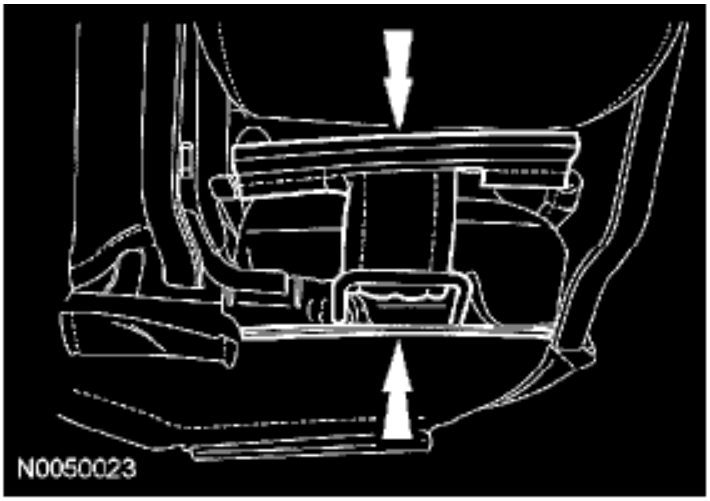
1. Install the LH and RH armrest brackets to the armrest and install the 2 armrest pivot bolts.

- Tighten to 11 Nm (8 lb-ft).

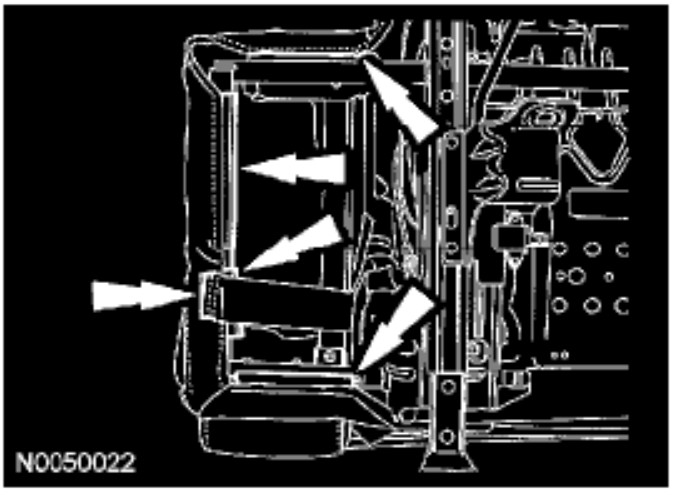
2. Slide on the LH inner/outer and RH inner/outer trim covers and clip in place (RH side shown).

3. Install the armrest assembly and install the 2 LH and 2 RH armrest bracket-to-seat frame bolts.

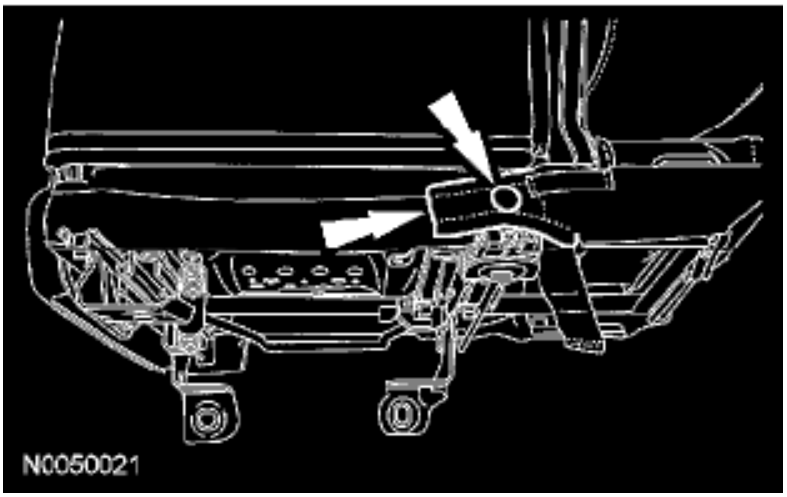
- Tighten to 25 Nm (18 lb-ft).



N0050023



N0050022



N0050021

4. Position the seat cushion foam pad and seat cover down. 5. Position the material around the child safety seat tether anchor and fasten the rear J-clip below the armrest.

- Route the trim flap through the child safety seat tether anchor.

6. Fasten the J-clips and fasten the underside hook-and-loop strip.

7. Install the pin-type retainer and fasten the rear hook-and-loop strip.

8. Install the safety belt buckle pretensioner and install the nut.

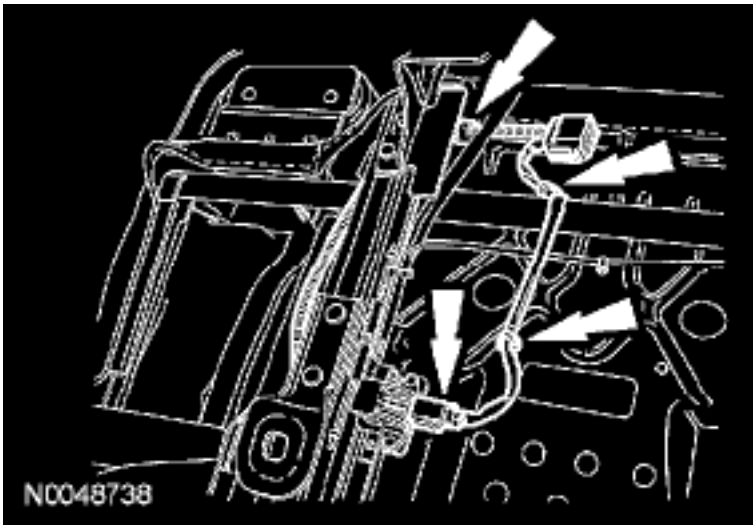
- Tighten to 40 Nm (30 lb-ft).

9. Route the wiring harness to the cushion.

- Route the wiring harness.

- Fasten the wiring harness and electrical connector pin-type retainers.

- Connect the seat position sensor electrical connector.



10. Install the 2 cup holder mounting screws and attach the cup holder.

- Tighten to 7 Nm (62 lb-in).

11. Install the 60 percent bench seat.

Floor Console With Speaker Enclosure

Removal and Installation

Vehicles with a speaker enclosure

1. Remove the floor console storage tray mat and screw. 2. Remove the floor console front cup holder mat and screw. 3. Remove the LH and RH floor console push-pin retainers. 4. Remove the floor console front section.

All vehicles

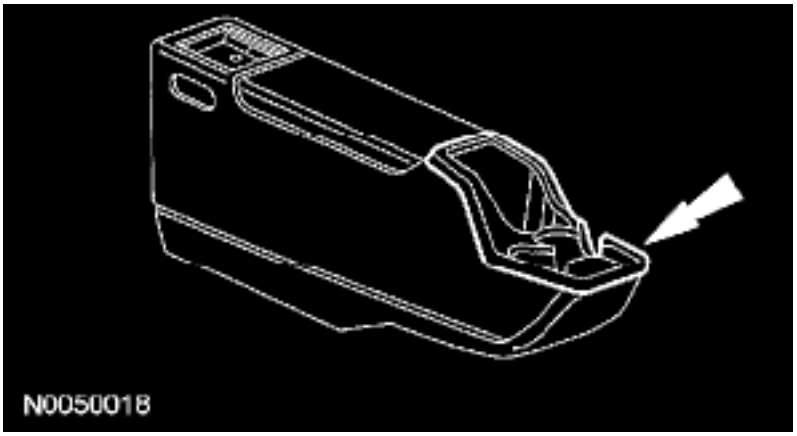
5. Move the front seats to the full forward position. 6. Remove the floor console armrest.

- Remove the LH and RH floor console armrest bolt covers.

- Remove the LH and RH floor console armrest bolts.

- To install, tighten to 5 Nm (44 lb-in).

7. Remove the floor console rear screw. 8. Move the front seats to the full rearward position.



Vehicles without a speaker enclosure

9. Remove the beverage tray.

All vehicles

10. Remove the 2 floor console front screws. 11. Remove the floor console.

- If equipped, lift the rear of the speaker enclosure slightly upward.

12. To install, reverse the removal procedures.

Special Tool(s)

ST2834-A

Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Air Bag(s) Arming and Disarming: Service and Repair Supplemental Restraint System (SRS) Depowering and Repowering

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) DEPOWERING AND REPOWERING

Special Tool(s)

Special Tool(s)

Depowering Procedure

WARNING:

- Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

- To reduce the risk of accidental deployment, do not use any memory saver devices. Failure to follow this instruction may result in serious personal injury or death.

NOTE:

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1. Turn all vehicle accessories OFF. 2. Turn the ignition switch to OFF. 3. At the smart junction box (SJB), located below the RH side of the instrument panel, remove the RH lower cowl trim panel and remove the

restraints control module (RCM) fuse 8 (10A) from the SJB.

4. Turn the ignition ON and visually monitor the air bag warning indicator for at least 30 seconds. The air bag warning indicator will remain lit

continuously (no flashing) if the correct RCM fuse has been removed. If the air bag warning indicator does not remain lit continuously, remove the correct RCM fuse before proceeding.

5. Turn the ignition OFF.

6. WARNING: Always deplete the backup power supply before repairing or installing any new front or side air bag supplemental restraint

system (SRS) component and before servicing, removing, installing, adjusting or striking components near the front or side impact sensors or the restraints control module (RCM). Nearby components include doors, instrument panel, console, door latches, strikers, seats and hood latches.

Refer to the Description and Operation portion of Air Bag Systems for location of the RCM and impact sensor(s).

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least 1 minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Failure to follow these instructions may result in serious personal injury or death in the event of an accidental deployment.

Disconnect the battery ground cable and wait at least one minute.

Repowering Procedure

1. Turn the ignition switch from OFF to ON. 2. Install the RCM fuse 8 (10A) to the SJB and install the RH lower cowl trim panel.

3. WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is

connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

Connect the battery ground cable.

4. Prove out the SRS as follows:

Turn the ignition key from ON to OFF. Wait 10 seconds, then turn the key back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning

indicator will light continuously for approximately 6 seconds and then turn off. If an air bag SRS fault is present, the air bag warning indicator will: -

fail to light.

- remain lit continuously.

- flash at a 5Hz rate (RCM not configured).

The air bag warning indicator may not illuminate until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.

Clear all continuous RCM and occupant classification system module (OCSM) DTCs using a scan tool.

Special Tool(s)

ST2621-A	Diagnostic Tool, Restraint System (2 required) 418-F395
ST2512-A	Diagnostic Tool, Restraint System 418-F403
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Air Bag(s) Arming and Disarming: Service and Repair Supplemental Restraint System (SRS) Deactivation and Reactivation

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) DEACTIVATION AND REACTIVATION

Special Tool(s)

Deactivation Procedure

WARNING:

- Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

- Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which

increases the risk of serious personal injury or death.

- To reduce the risk of accidental deployment, do not use any memory saver devices. Failure to follow this instruction may result in serious personal injury or death.

NOTE:

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

- No restraint system diagnostic tools are available for the safety belt buckle pretensioners. If the ignition switch is set to RUN or START with either the driver or passenger safety belt buckle pretensioner electrical connector disconnected, the DTCs for an open circuit fault will be active.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1. Turn all vehicle accessories OFF. 2. Turn the ignition switch to OFF. 3. At the smart junction box (SJB), located below the RH side of the instrument panel, remove the restraints control module (RCM) fuse 8 (10A)

from the SJB.

4. Turn the ignition ON and visually monitor the air bag warning indicator for at least 30 seconds. The air bag warning indicator will remain lit

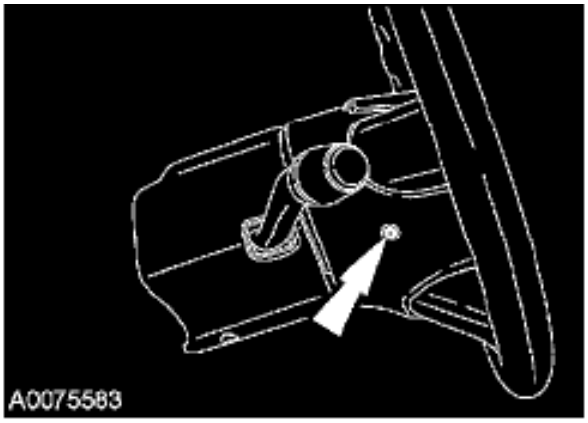
continuously (no flashing) if the correct RCM fuse has been removed. If the air bag warning indicator does not remain lit continuously, remove the correct RCM fuse before proceeding.

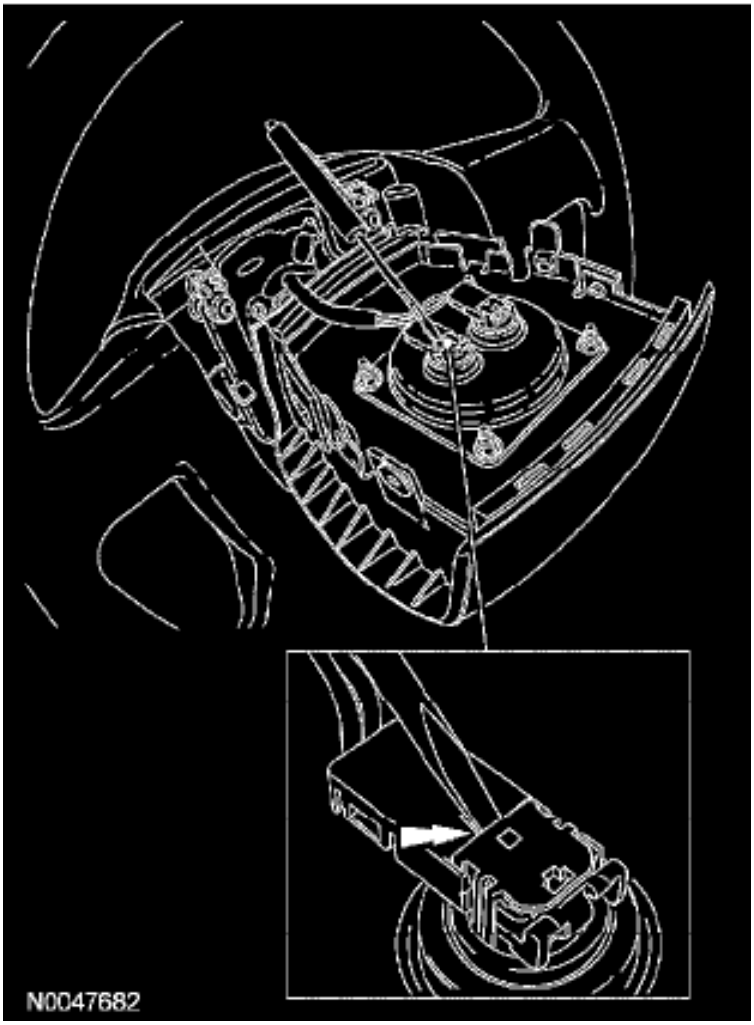
5. Turn the ignition OFF.

6. WARNING: Always deplete the backup power supply before repairing or installing any new front or side air bag supplemental restraint

system (SRS) component and before servicing, removing, installing, adjusting or striking components near the front or side impact sensors or the restraints control module (RCM). Nearby components include doors, instrument panel, console, door latches, strikers, seats and hood latches.

Refer to the Description and Operation portion of Air Bag Systems for location of the RCM and impact sensor(s).





To deplete the backup power supply energy, disconnect the battery ground cable and wait at least 1 minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Failure to follow these instructions may result in serious personal injury or death in the event of an accidental deployment.

Disconnect the battery ground cable and wait at least 1 minute.

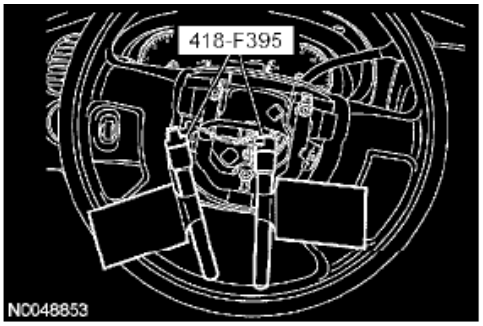
7. Remove the 2 driver air bag module bolts (1 shown).

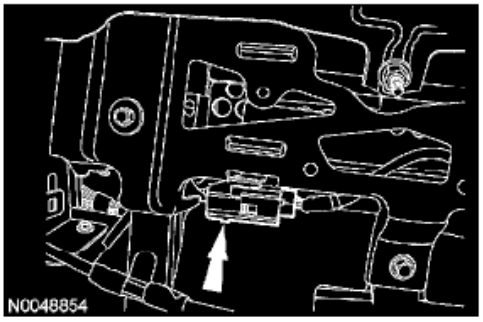
8. CAUTION: Do not pull the driver air bag module electrical connectors out by the locking buttons. Damage to the locking buttons may

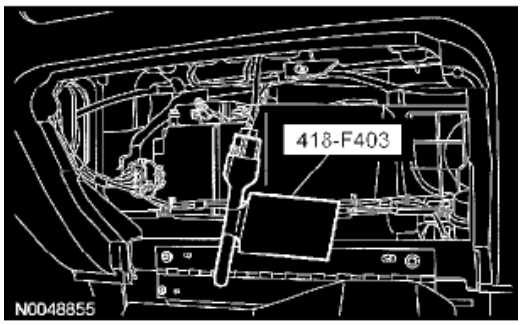
occur.

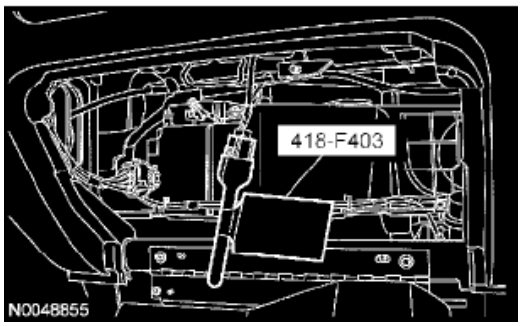
Using a small screwdriver as shown, lift up and release the locking buttons on the driver air bag module electrical connectors. With the locking buttons released, remove the electrical connectors and the driver air bag module.

9. Attach the restraint system diagnostic tools to the clockspring electrical connectors at the top of the steering column.









10. Open the glove compartment door fully to access the passenger air bag electrical connector.
11. Release the tab and disconnect the passenger air bag module electrical connector.

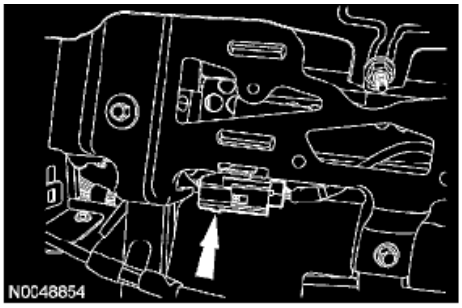
12. Attach the restraint system diagnostic tool to the vehicle harness side of the passenger air bag module electrical connector.

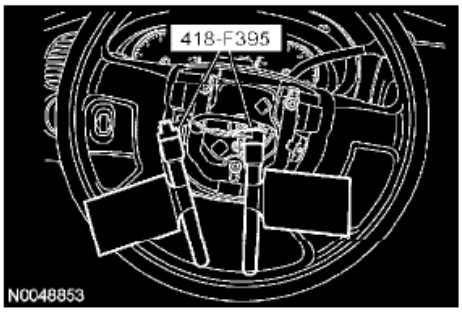
13. Install the RCM fuse 8 (10A) to the SJB. 14. Connect the battery ground cable.

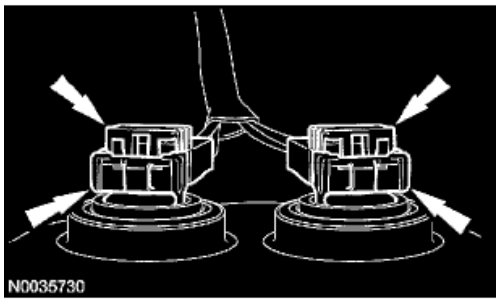
Reactivation Procedure

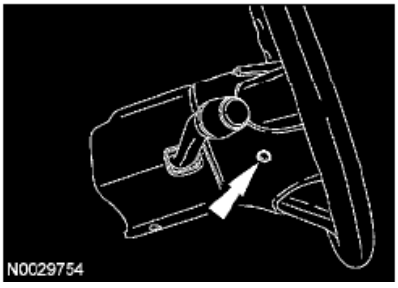
1. Remove the RCM fuse 8 (10A) from the SJB. 2. Disconnect the battery ground cable and wait at least one minute. 3. Remove the restraint system diagnostic tool from the vehicle harness side of the passenger air bag module electrical connector.

4. Connect the passenger air bag module electrical connector.









5. Close the glove compartment door. 6. Remove the restraint system diagnostic tools from the clockspring electrical connectors at the top of the steering column.

7. CAUTION:

- Do not install the driver air bag module electrical connectors by the locking buttons. Damage to the locking buttons may occur.

- The driver air bag module electrical connector locking buttons must be in the released position when the connector is being installed or connector damage may occur.

- The driver air bag module electrical connectors are unique and cannot be reversed when connected to the driver air bag module. Match the electrical connector key to the keyway in the driver air bag module. Do not force the electrical connectors into the driver air bag module. Damage to the connector or component may occur.

With the locking buttons released, install the driver air bag module electrical connectors fully into the driver air bag module and seat the locking buttons.

8. Install the 2 driver air bag module bolts (1 shown).

- Tighten to 6 Nm (53 lb-in).

9. WARNING: Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental

restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death

in a crash and possibly violate vehicle safety standards.

Make sure all restraint system diagnostic tool(s) that may have been installed during the repair have been removed from the vehicle and all SRS components are connected.

10. Turn the ignition from OFF to ON. 11. Install the restraint system control module fuse 8 (10A) to the SJB.

12. WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is

connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

Connect the battery ground cable.

13. Prove out the SRS as follows:

Turn the ignition key from ON to OFF. Wait 10 seconds, then turn the key back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an air bag SRS fault is present, the air bag warning indicator will: -

fail to light.

- remain lit continuously.

- flash at a 5Hz rate (RCM not configured).

The air bag warning indicator may not illuminate until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.

Clear all continuous RCM and occupant classification system module (OCSM) DTCs using a scan tool.

Part 2

Removal and Installation

NOTE:

- When a new lock cylinder is installed, both door and the ignition lock cylinders should be installed as a set. This eliminates carrying an extra key which fits only 1 lock. If a key is to be replaced, the new key code number is stamped on a metal tag attached to the key.

- Individual lock cylinders are repaired by discarding the inoperative cylinder and building a new lock cylinder using the appropriate lock repair package. The lock repair package includes a detailed instruction sheet to build the new lock cylinder to the correct key code of the vehicle.

1. Raise the front window. 2. Remove the front door trim panel. 3. Position the watershield aside. 4. Disconnect the front door lock cylinder actuating rod from the door lock cylinder lever. 5. Remove the door lock cylinder retainer and the door lock cylinder. 6. To install, reverse the removal procedure.

Keyless Entry Transmitter: Customer Interest Keyless Entry - Transmitter May Not Operate

TSB 08-12-9

06/23/08

INOPERATIVE RKE TRANSMITTER (KEY FOB) - DISCHARGED KEY FOB BATTERY

FORD: 2008 Crown Victoria, Focus, Mustang 2007-2008 F-150 2008 E-Series, Expedition, Explorer Sport Trac, Explorer, F-Super Duty, Ranger

LINCOLN: 2007-2008 Mark LT

MERCURY: 2008 Grand Marquis, Mountaineer

ISSUE Some 2007-2008 vehicles equipped with a remote keyless entry (RKE) transmitter may exhibit an inoperative Key Fob due to a discharged Key Fob battery. This may be caused by an internal issue with the Key Fob software. This concern only applies to vehicles built within a specific date range with Key Fobs manufactured within a specific date range.

ACTION Follow the Service Procedure steps to correct the condition.

SERVICE PROCEDURE

NOTE

PERFORMING THIS PROCEDURE WILL HAVE NO EFFECT ON KEY FOB RANGE. REFER TO WORKSHOP MANUAL (WSM), SECTION 501-14 FOR KEY FOB RANGE DIAGNOSTICS.

1. Refer to vehicle list for build date range. (Figure 1)

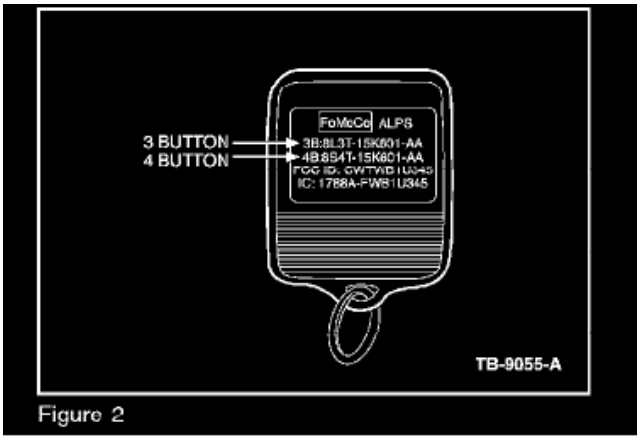

Figure 2

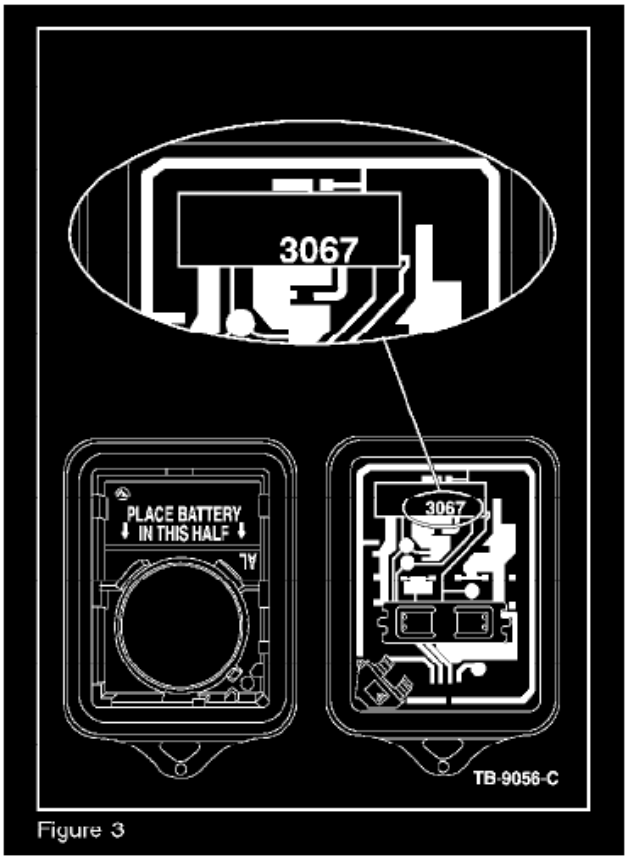

Figure 3

PART NUMBER	PART NAME
8L3Z-15K601-AA	3-Button Key Fob
8S4Z-15K601-A	4-Button Key Fob

a. If the vehicle was built within the date range, then continue with this procedure.

b. If not, then do not proceed. Continue with normal diagnostics per WSM, Section 501-14.

2. Is the vehicle Key Fob part number 8L3T-15K601-AA (3 button) or 8S4T-15K601-AA (4 button)? (Figure 2)

a. Yes - Go to Step 3.

b. No - Do not proceed. Continue with normal diagnostics per WSM, Section 501-14.

3. Using a thin coin, open the Key Fob and inspect manufacturer's date code sticker. The first three digits = day of year. The last digit = year. (Figure 3)

a. If the first 3 digits are equal to or between 005 and 306 (5th day through 306th day) and the last digit is 7 (year), then proceed to Step 4.

b. If the number is outside this specified range, then do not proceed. Continue with normal diagnostics per WSM, Section 501-14.

4. If the Key Fob is inoperative due to a discharged Key Fob battery, and the date code falls within the specified range, then replace Key Fob. Program the new Key Fob transmitter using the IDS RKE Transmitter Programming Procedure. Reassemble old Key Fob for warranty return analysis.

NOTE

KEY FOBS REPLACED UNDER WARRANTY WILL BE REQUESTED FOR ANALYSIS AND VERIFICATION OF THE DATE CODE.

a. IDS RKE Transmitter Programming Procedure

(1) Install known good battery into the suspect Key Fob so that IDS scan tool can identify it.

(2) Connect IDS to vehicle.

(3) From the Main Toolbox tab:

(a) Select - Body.

(b) Select - Security.

(c) Select - Remote Keyless Entry.

(4) Press the "Unlock" button on the suspect Key Fob to view the Transmitter Identification Code (TIC) in IDS.

5. Select "Erase One Key Fob" or the "Erase" button.

6. Select the suspect Key Fob TIC to erase from vehicle memory.

7. Remove battery from suspect Key Fob and reassemble for warranty return.

8. Select "Reprogram a New Keyfob" or the "Program" button.

9. Press the "Unlock" button on the NEW Key Fob.

10. Follow the instructions on the scan tool screen to complete the programming procedure.

WARRANTY STATUS: Eligible Under Provisions Of New Vehicle Limited Warranty Coverage
IMPORTANT: Warranty coverage limits/policies are not altered by a TSB. Warranty coverage limits are determined by the identified causal part.

Keyless Entry Transmitter: Testing and Inspection

REMOTE KEYLESS ENTRY TRANSMITTER PROGRAMMING

CAUTION: All remote keyless entry (RKE) transmitters must be programmed at the same time.

1. Before entering the program mode, the vehicle must be electronically unlocked with the RKE transmitter or the door lock control switch while the

driver door is open.

2. Turn the ignition switch from OFF to RUN 8 times within 10 seconds, with the eighth turn ending in RUN. If the module successfully enters

program mode, it locks and then unlocks all the doors.

3. Within 20 seconds, press any button on an RKE transmitter and the doors lock and then unlock to confirm that each RKE transmitter is

programmed. Repeat this step for each RKE transmitter.

4. If the door locks do not respond for any RKE transmitter, wait several seconds and press the button again. If the door locks still fail to respond,

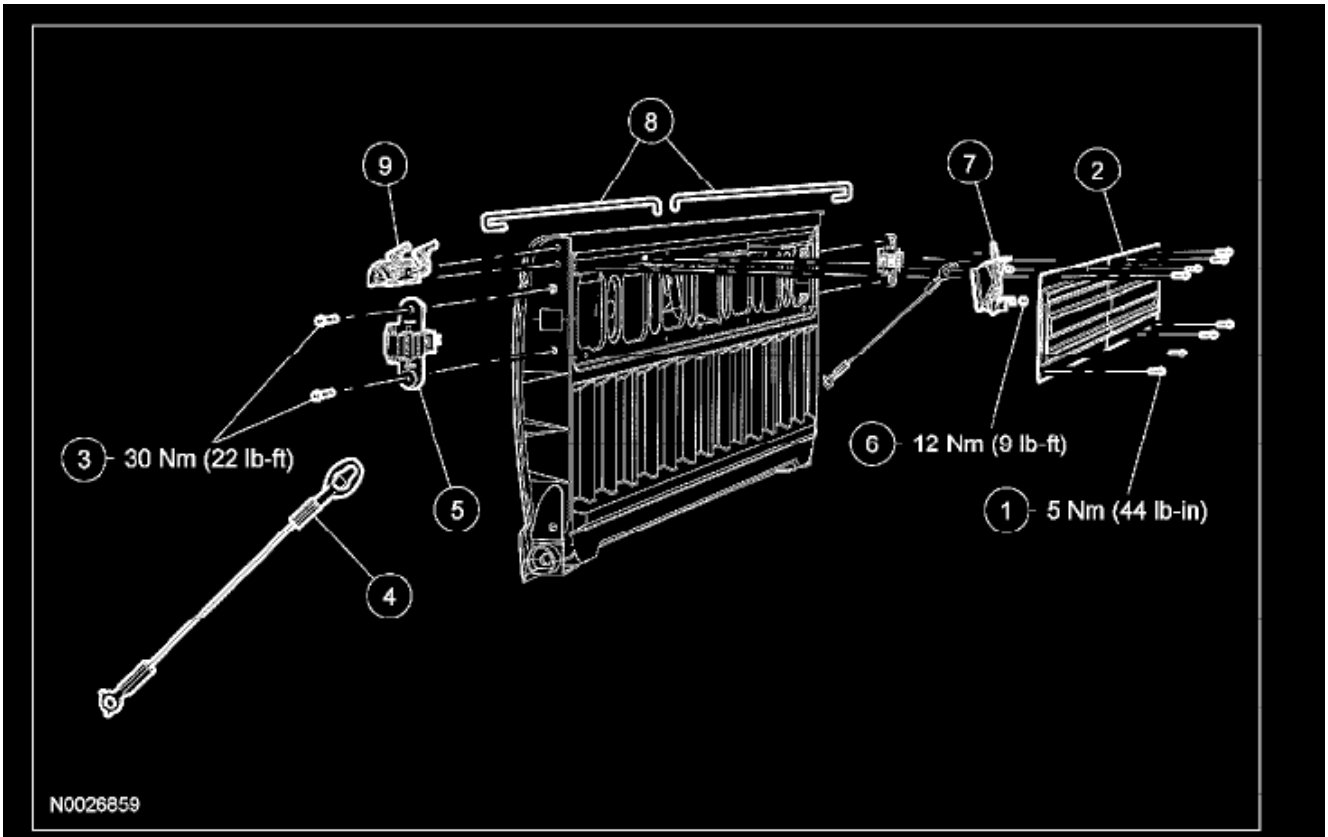
refer to Inspection and Verification. Make sure that no more than the maximum number of RKE transmitters is being programmed. See: Power Locks/Testing and Inspection/Initial Inspection and Diagnostic Overview/Inspection and Verification

5. Exiting the programming mode is accomplished if 1 of the following occurs:

- The key transitions to the OFF position.

- 20 seconds have passed since entering programming mode or since the last RKE transmitter was programmed.

- The maximum number of RKE transmitters have been programmed.



Item	Part Number	Description

Keyless Entry Transmitter: Service and Repair

TAILGATE LATCH REMOTE CONTROL

Exploded View

Removal and Installation

1. Remove the 8 screws and the tailgate access cover.

- To install, tighten to 5 Nm (44 lb-in).

2. Open the tailgate latch actuating rod retainers and disconnect the tailgate latch actuating rods from the tailgate latch remote control. 3. Remove the 2 tailgate latch remote control nuts.

- To install, tighten to 12 Nm (9 lb-ft).

4. Remove the tailgate latch remote control.

5. NOTE: Prior to installation, remove the slack in the tailgate latch release links by pulling the tailgate latch release links to the center of the

tailgate. Close the plastic clip over the thread of the tailgate latch release links.

To install, reverse the removal procedure.

Ford Ranger 2wd Workshop Manual (V6-3.0L (2008))
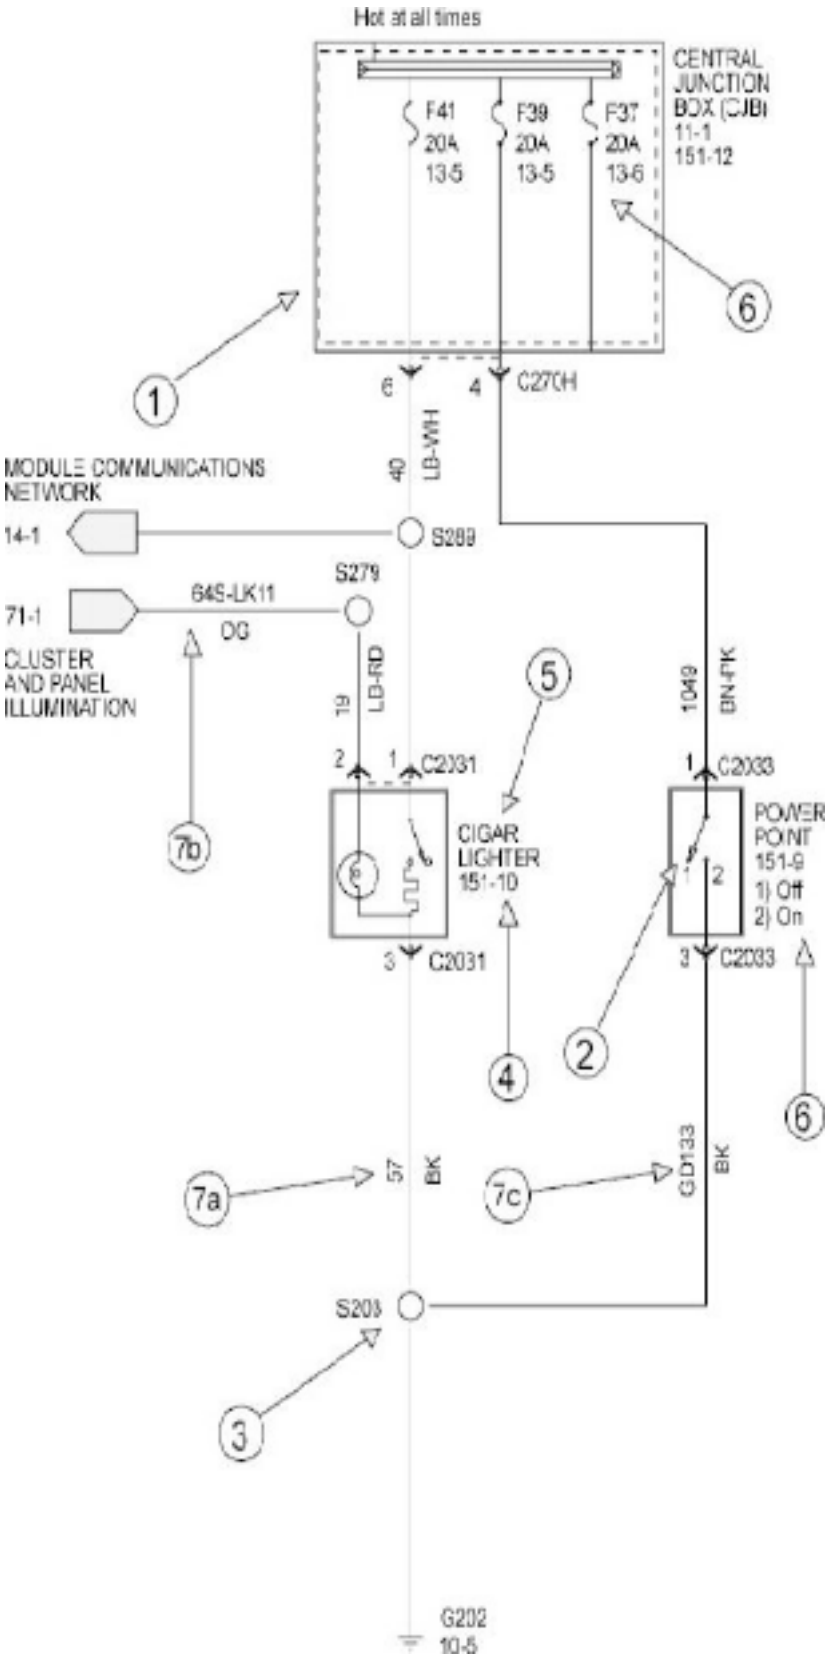
Ford Workshop Manuals > Body and Frame > Locks > Power Locks > Power Door Lock Relay > Component Information > Diagrams > Diagram Information and Instructions



Power Door Lock Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

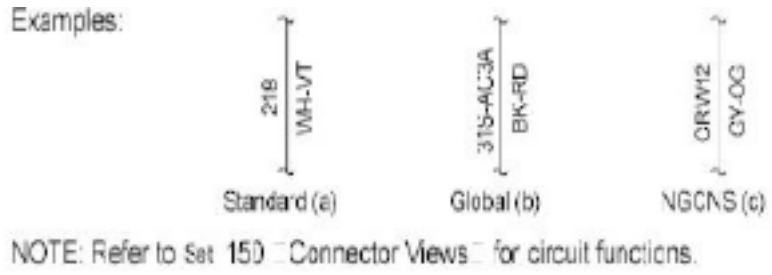
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

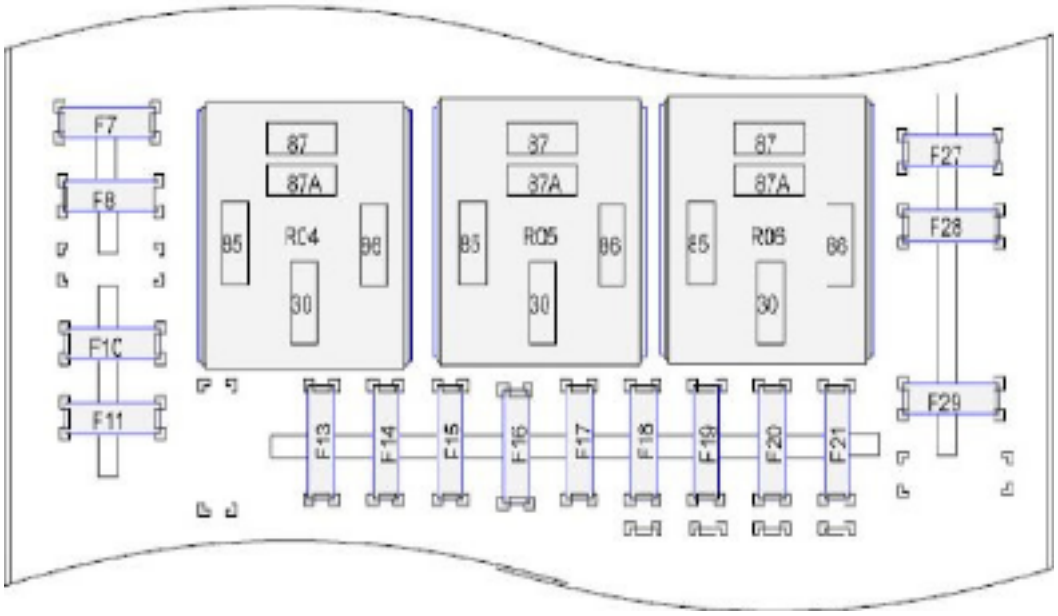
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

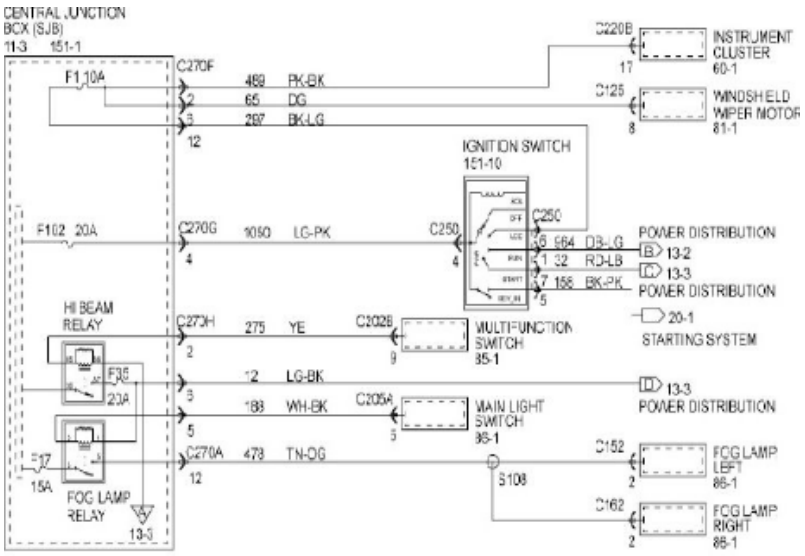
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

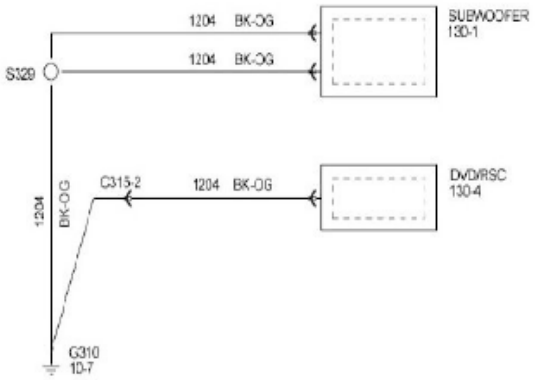
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

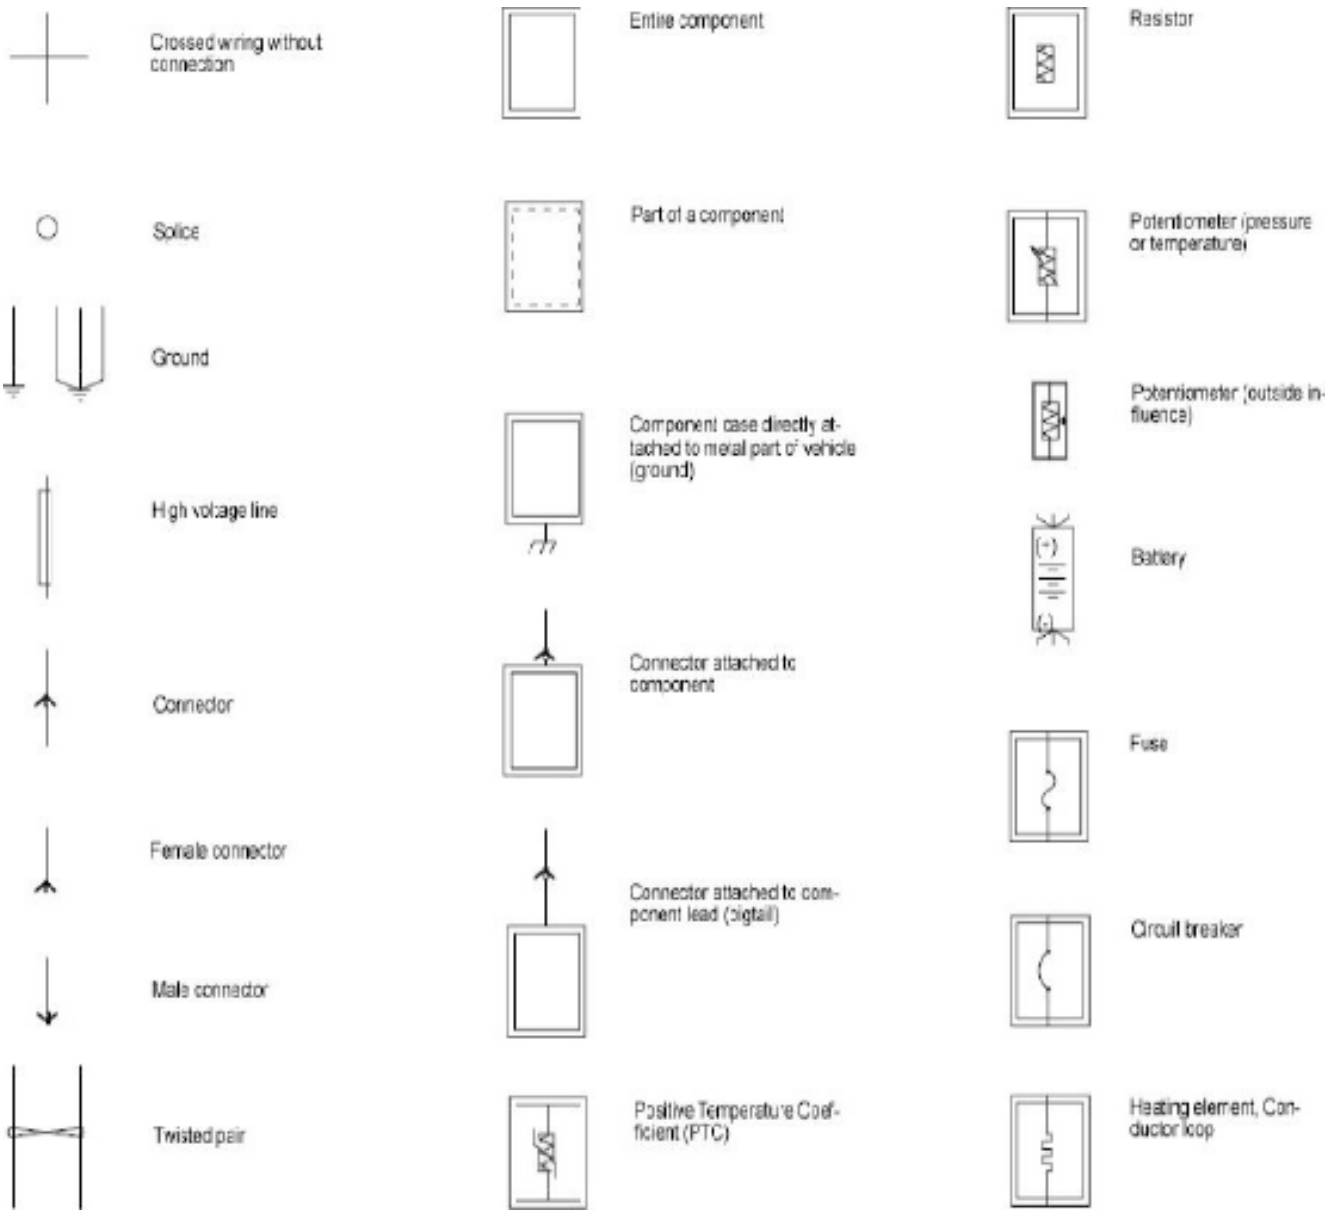
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

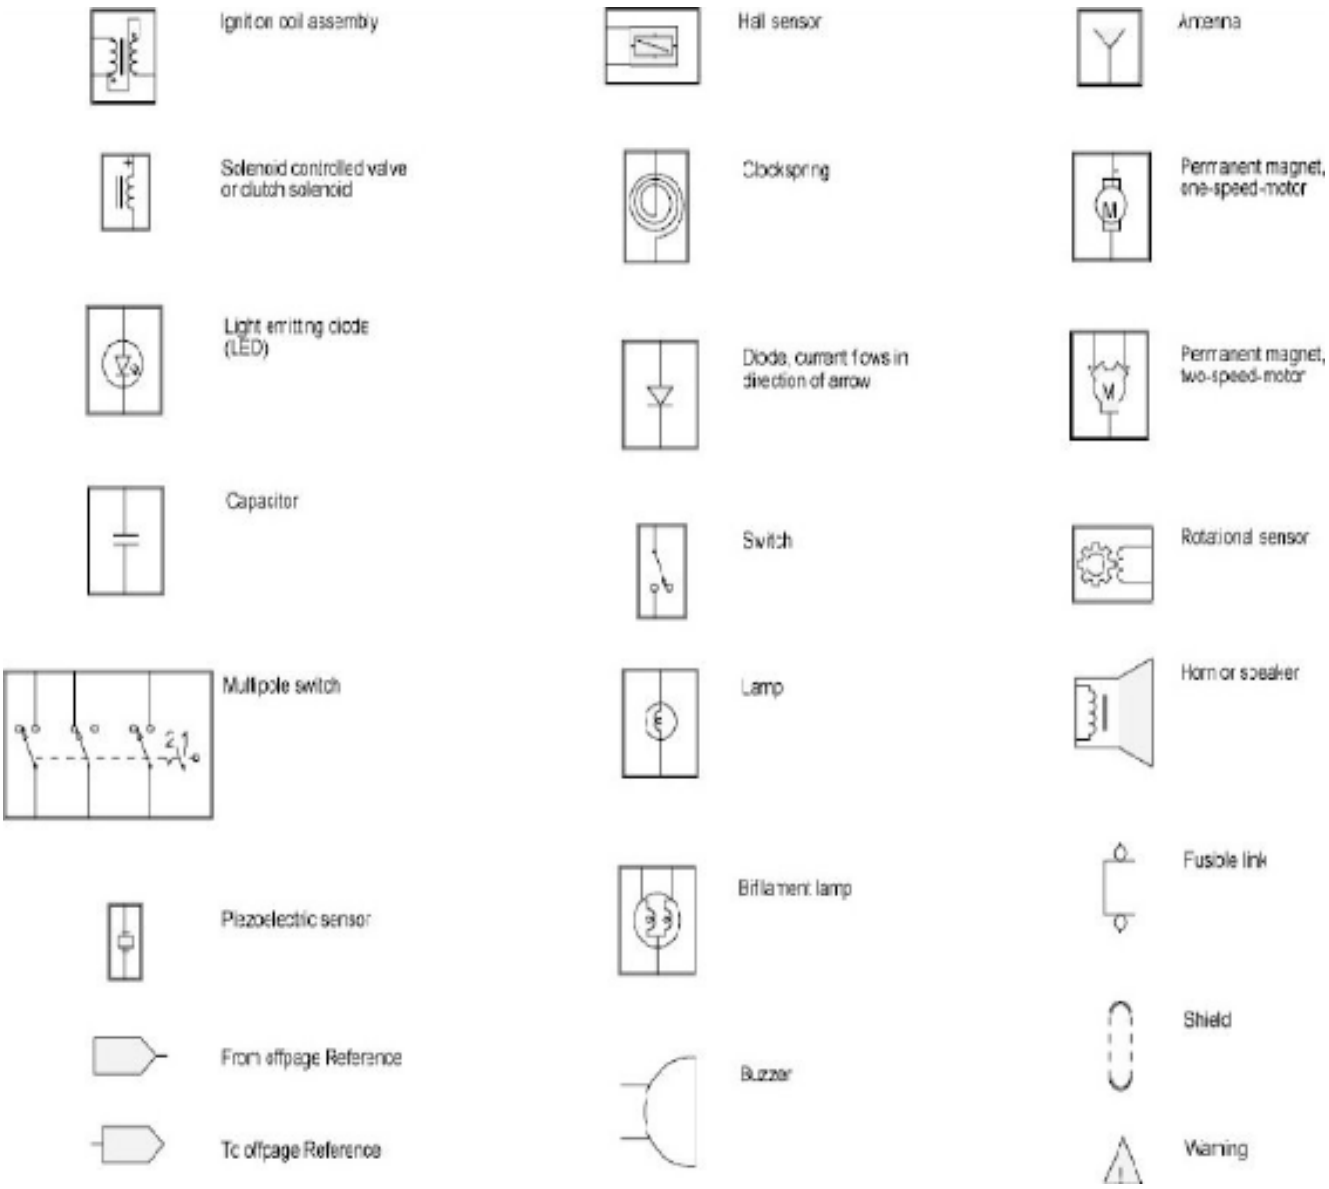
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

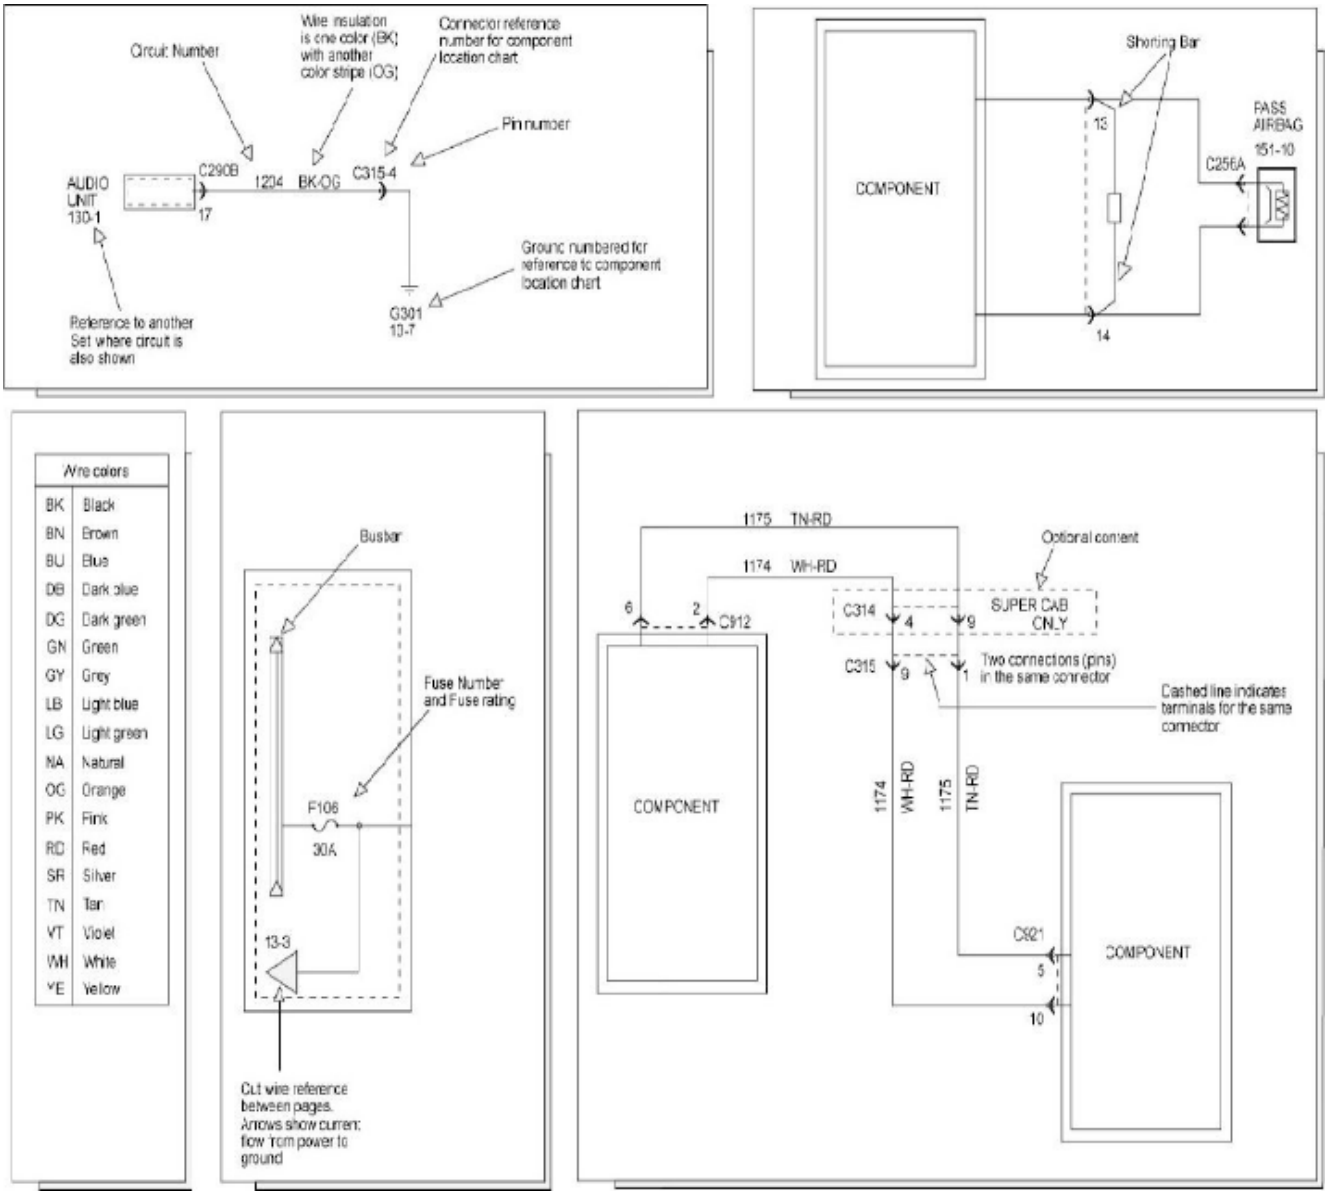
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

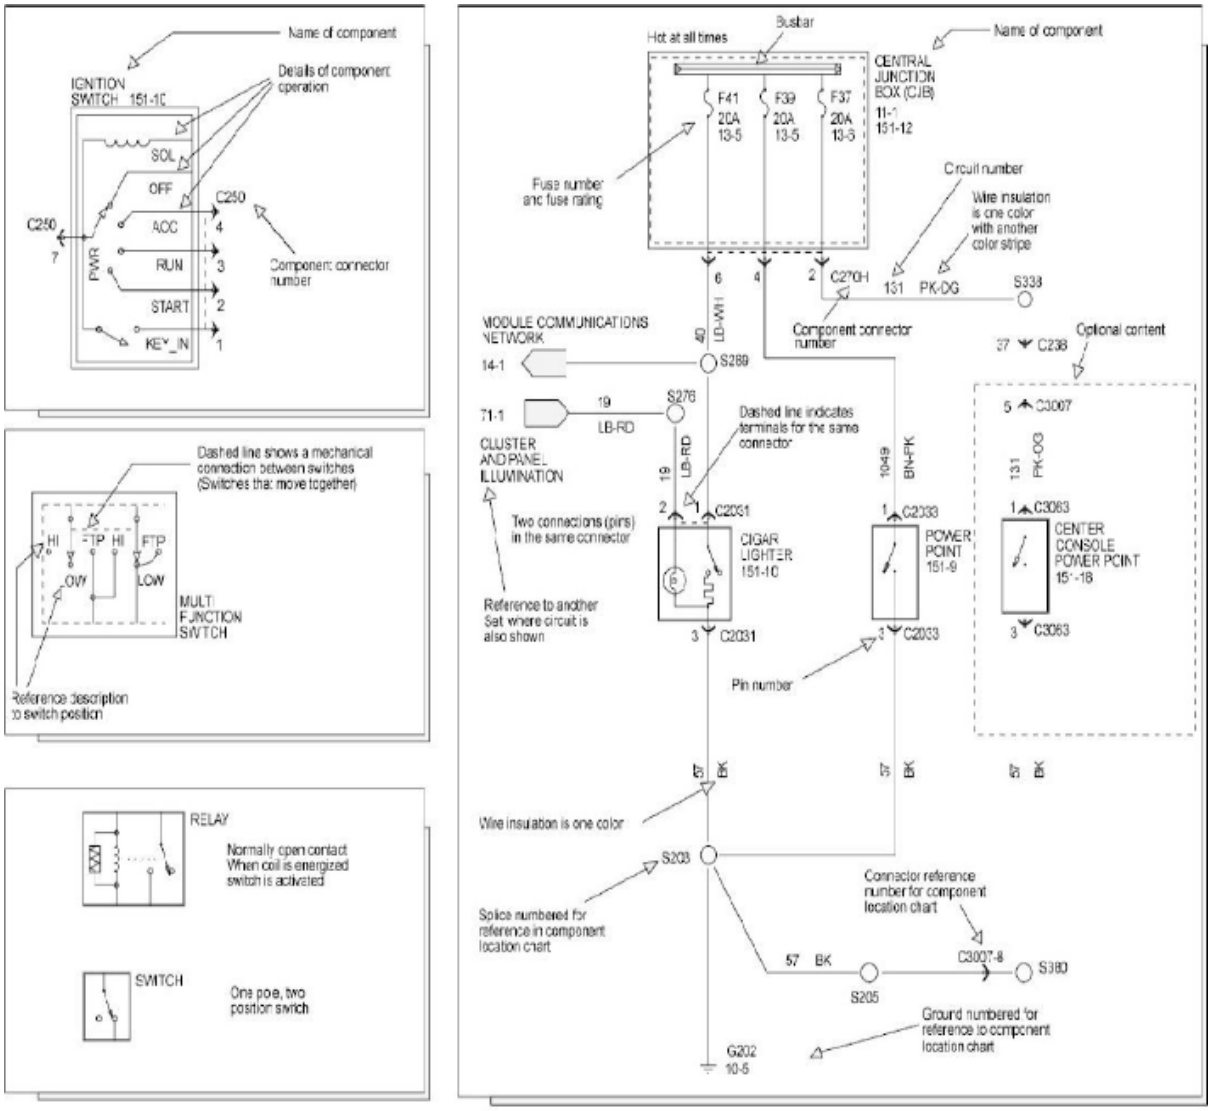
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Power Door Lock Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Defective insulation stripping

4 = Intermittent signals through pierced insulation

Partially mated connectors

1 = Seal

2 = Displaced tab

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Male half

7 = Intermittent contact

Lock may be displaced into an unlocked position; pull on the connector to verify the lock.

Deformed (enlarged) female terminals

1 = Enlarged

2 = Normal

Any probe entering the terminal may enlarge the contact spring opening creating an intermittent signal.

Insert the correct mating terminal (Location A) from the service kit and feel for a loose fit.

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

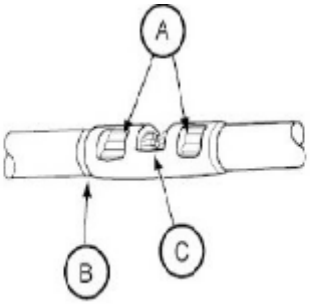
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

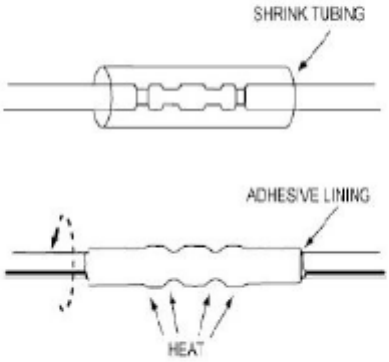
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x cia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Figtail only

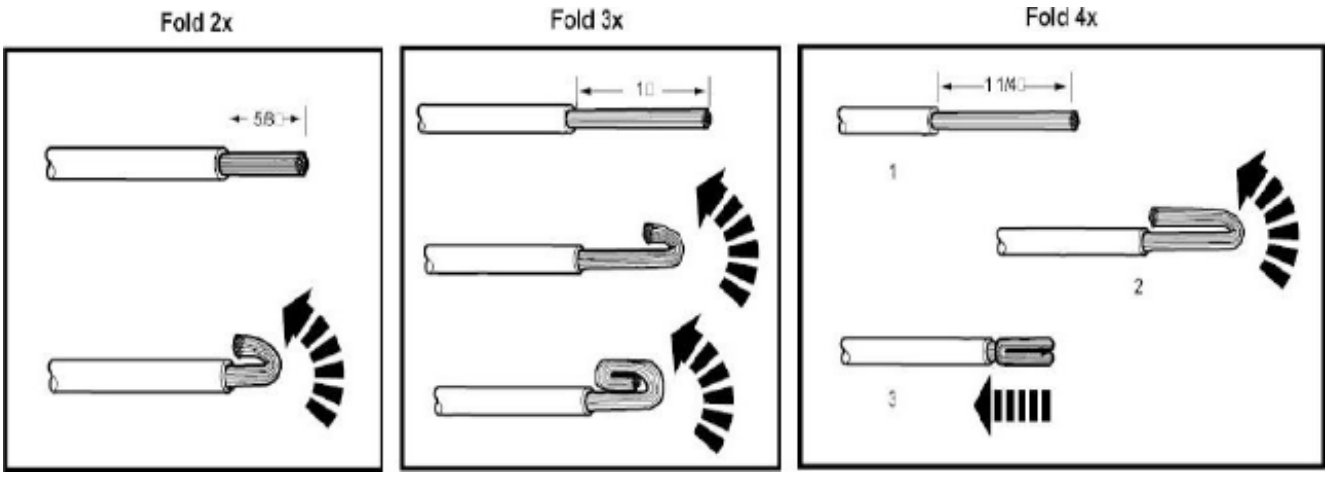
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



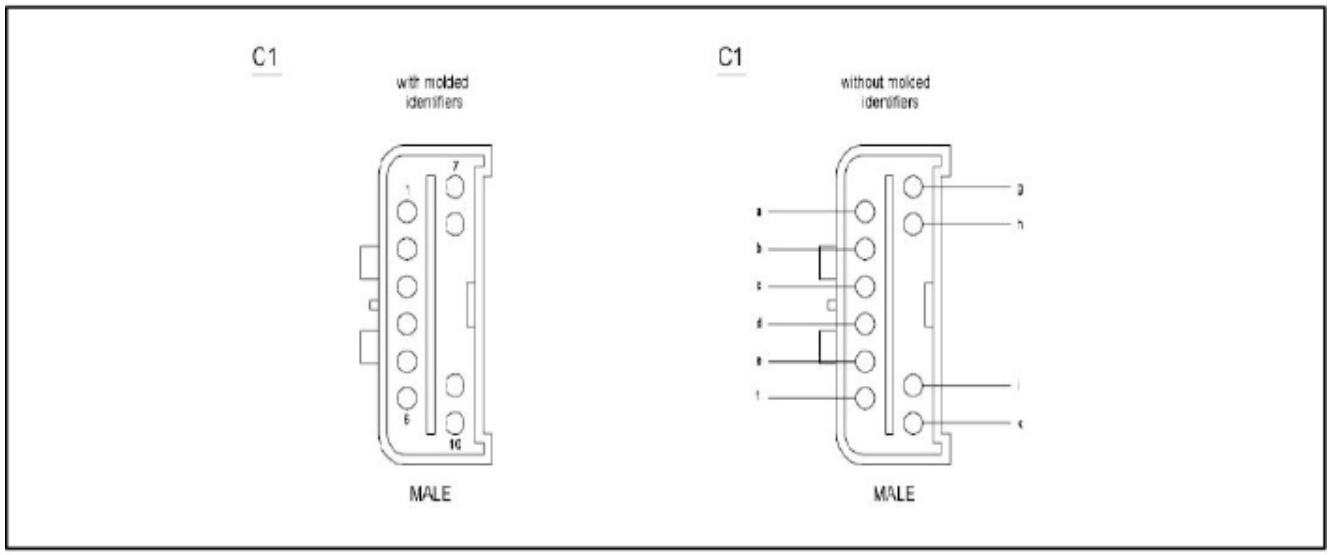
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



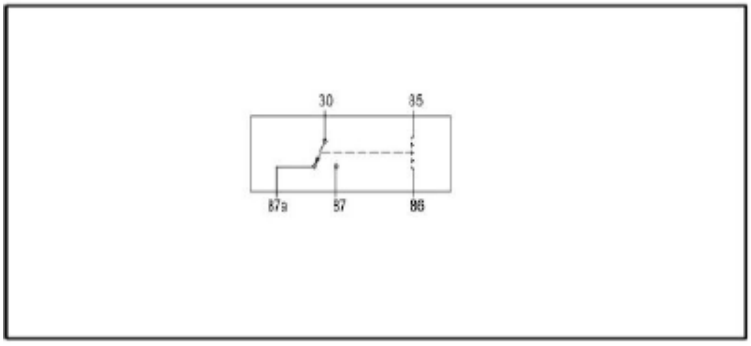
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

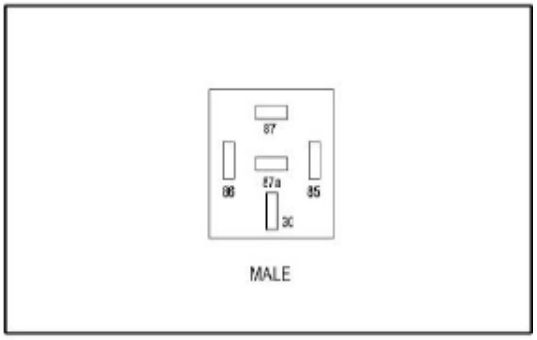
Power Door Lock Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	45 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Power Mirror Switch: Service and Repair

EXTERIOR MIRROR CONTROL SWITCH

Removal and Installation

1. Remove the 2 interior door handle trim panel screws. 2. Remove the interior door handle trim panel.

- Lift the interior door handle trim panel upward to release the interior door handle trim panel retaining clips.

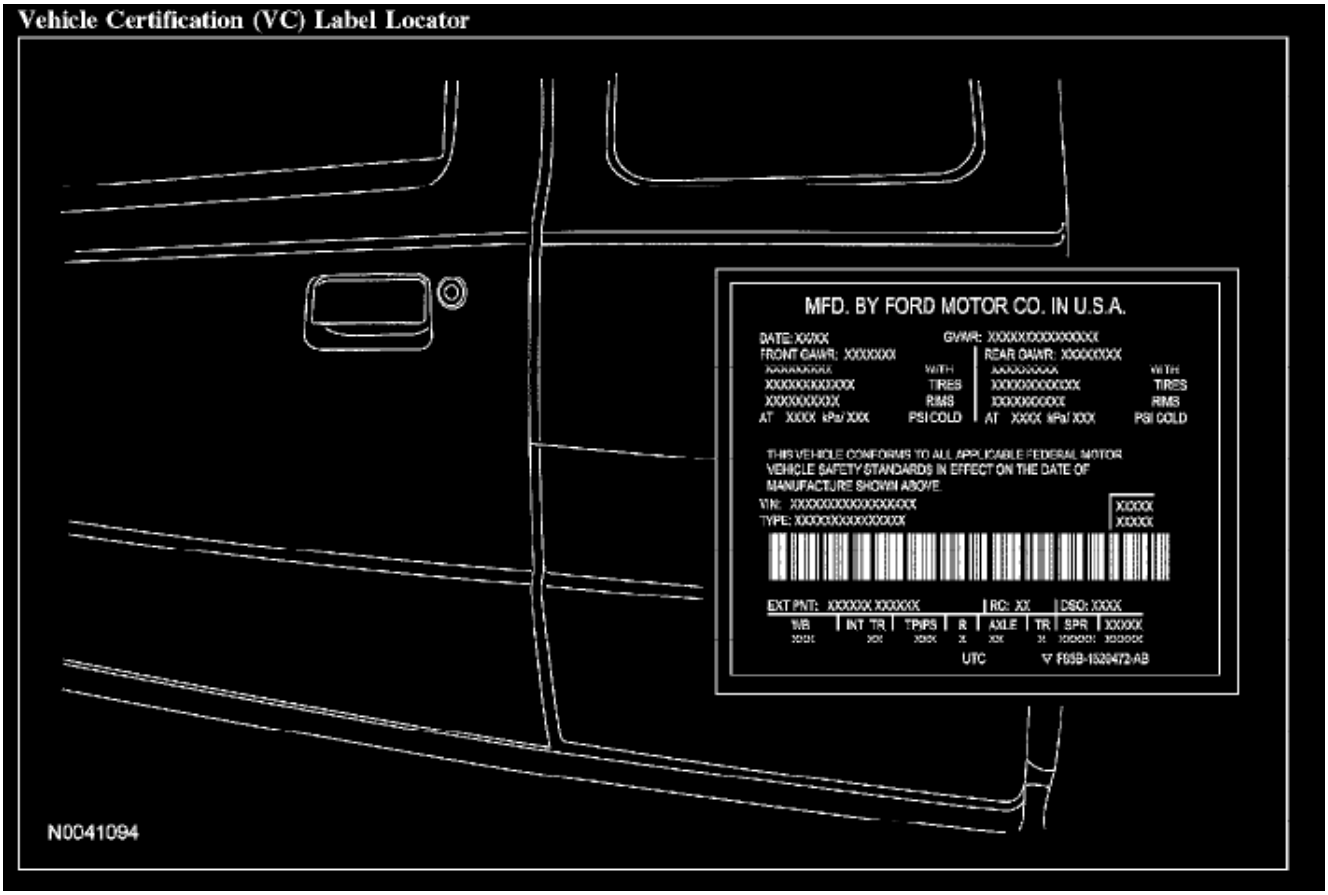
3. Remove the exterior mirror control switch.

- Disconnect the electrical connector.

- Press the 2 exterior mirror control switch retaining tabs.

- Remove the exterior mirror control switch from the interior door handle trim panel.

4. To install, reverse the removal procedure.



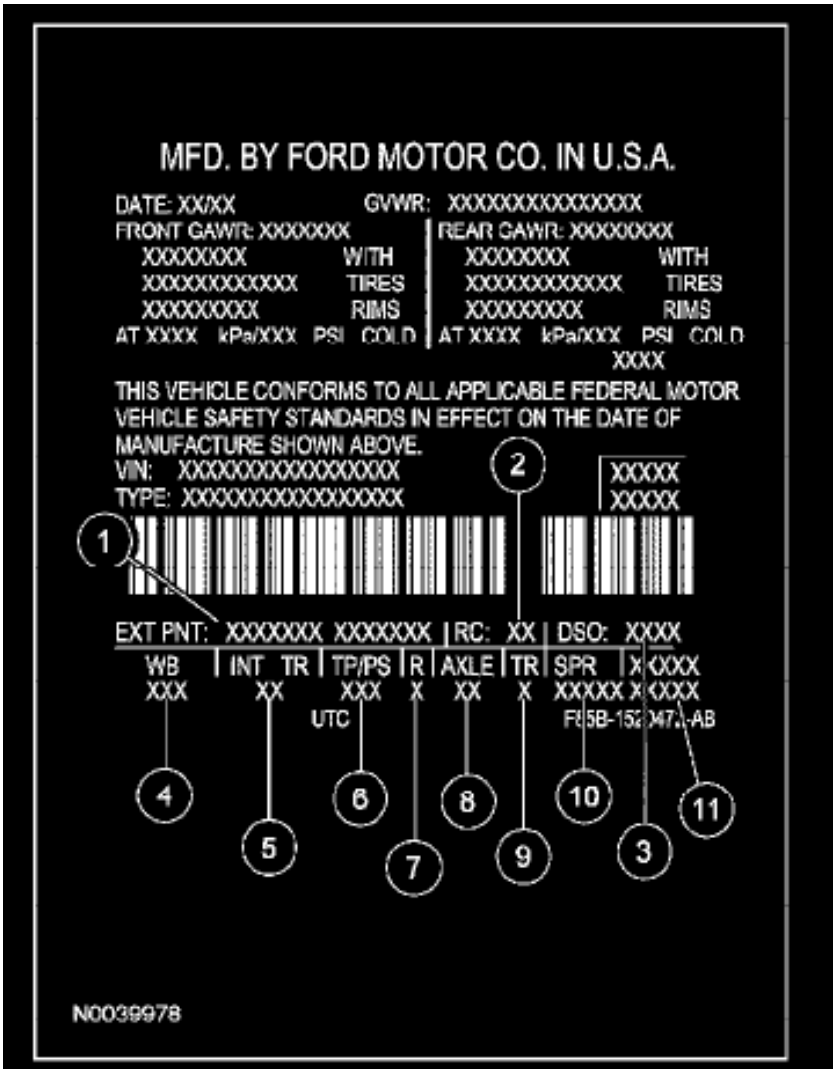
Paint: Application and ID Paint Codes

VEHICLE CERTIFICATION (VC) LABEL

Vehicle Certification (VC) Label Locator

The upper portion of the vehicle certification (VC) label contains the manufacturer name, the month and year of manufacture, the certification statement and the VIN. It also includes gross vehicle weight ratings (GVWR).

If a vehicle requires replacement of the VC label and is 4 years old or less, an authorized dealer must submit the VIN to their respective regional office. The regional office will submit a web form to the assembly plant for the replacement label. Once the label has been printed, a representative from the regional office will deliver the label to the dealer and witness installation on the vehicle. If a vehicle is more than 4 years old and requires a replacement label, the dealer must submit a request to the Department of Motor Vehicles.



Item	Description
1	Exterior paint code
2	Region code
3	Domestic special order code
4	Wheelbase code
5	Interior trim code
6	Tape/paint pinstripe code
7	Radio code
8	Axle code
9	Transmission code
10	Spring code
11	Calibration numbering

Paint Code

Exterior paint codes may be listed as a 2-part code. The first set of letters/numbers identify the vehicle primary body color. The second set of letters/number (if applicable) identify a 2-tone or accent body color. All colors are base coat/clear coat.

Primary Body Color -

CX - Dark Shadow Gray

- D3 - Torch Red

- G2 - Redfire

- G3 - Pueblo Gold

- G9 - Vista Blue

- U3 - Valencia

- UA - Ebony

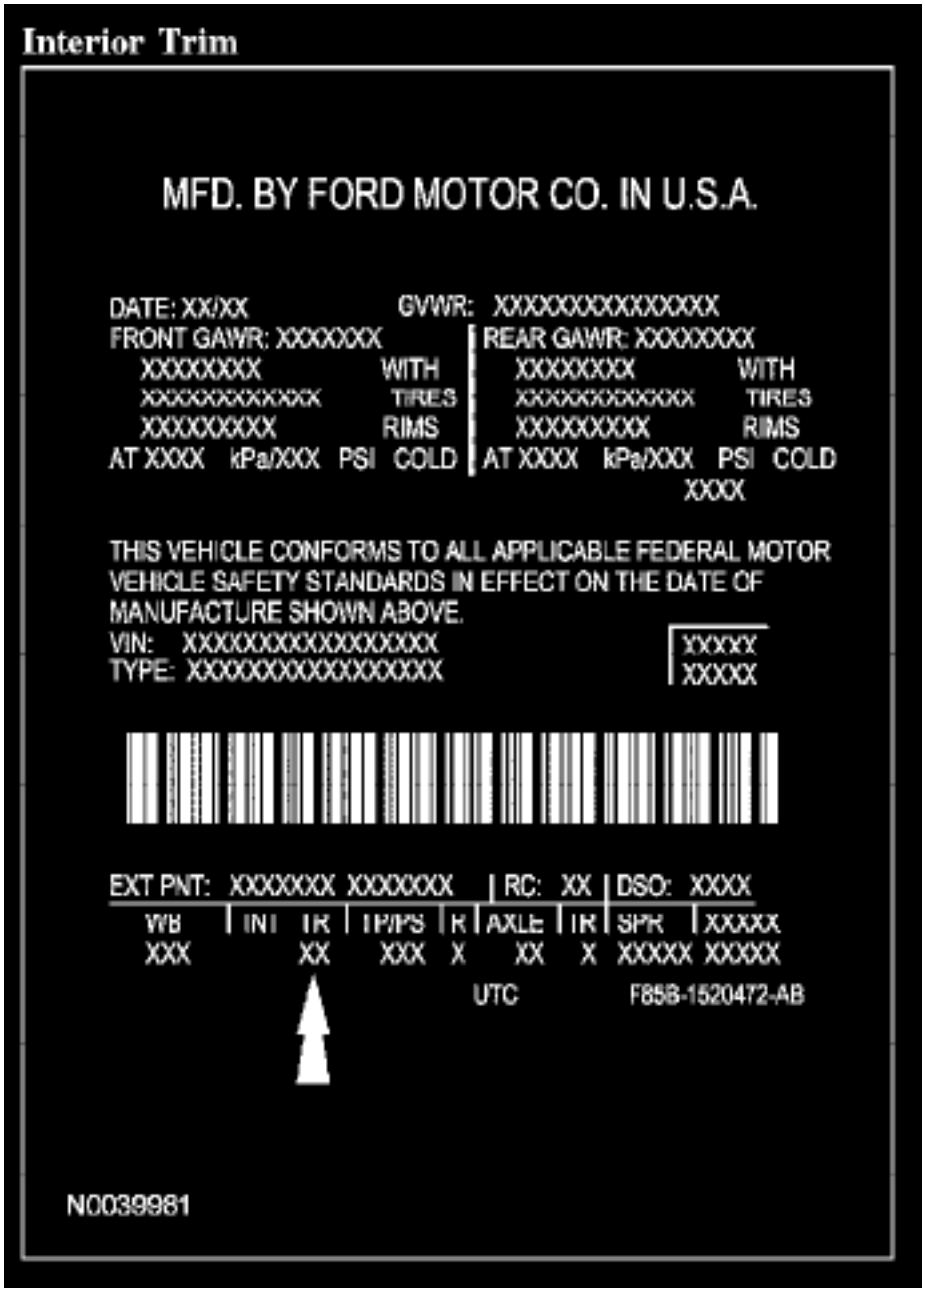
- YN - Silver Metallic #2

- YZ - Oxford White

Accent Body Color -

CX - Dark Shadow Gray

- UA - Ebony



Interior Trim

Interior trim codes are listed as a 2-part code. The first code listed identifies the trim level. The second code listed identifies the interior trim color.

Interior Trim Type -

L - Stockton cloth bucket seats

- M - Stockton 2 cloth bucket seats

- Q - Cenery grain vinyl 60/40 split bench seat

- R - Mortar cloth 60/40 split bench seat

- S - Mortar cloth bucket seats

- T - Imola leather 60/40 split bench seat

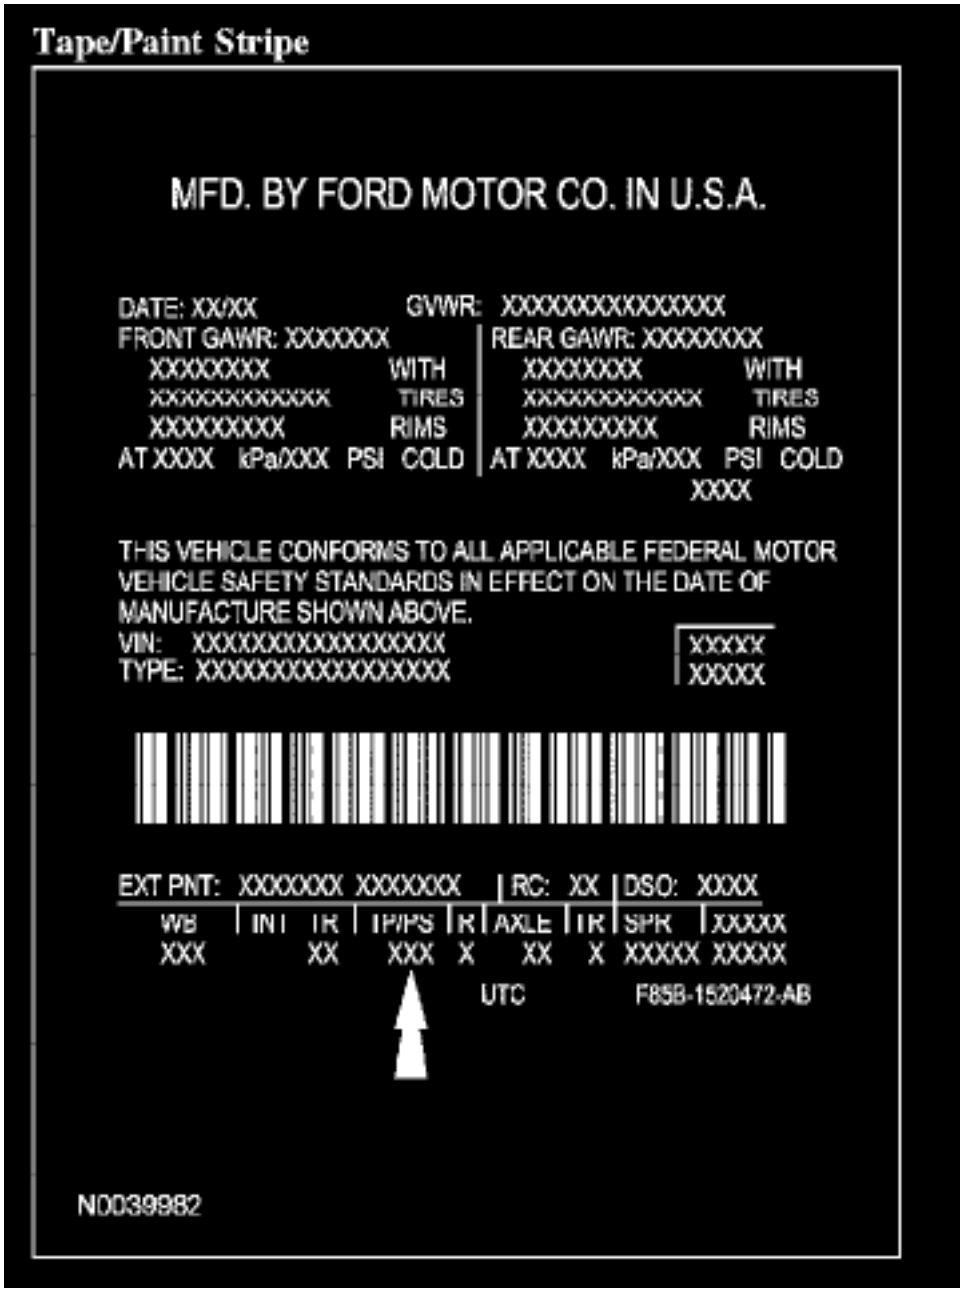
- U - Imola leather bucket seats

- V - Link weave cloth bucket seats

Interior Trim Color -

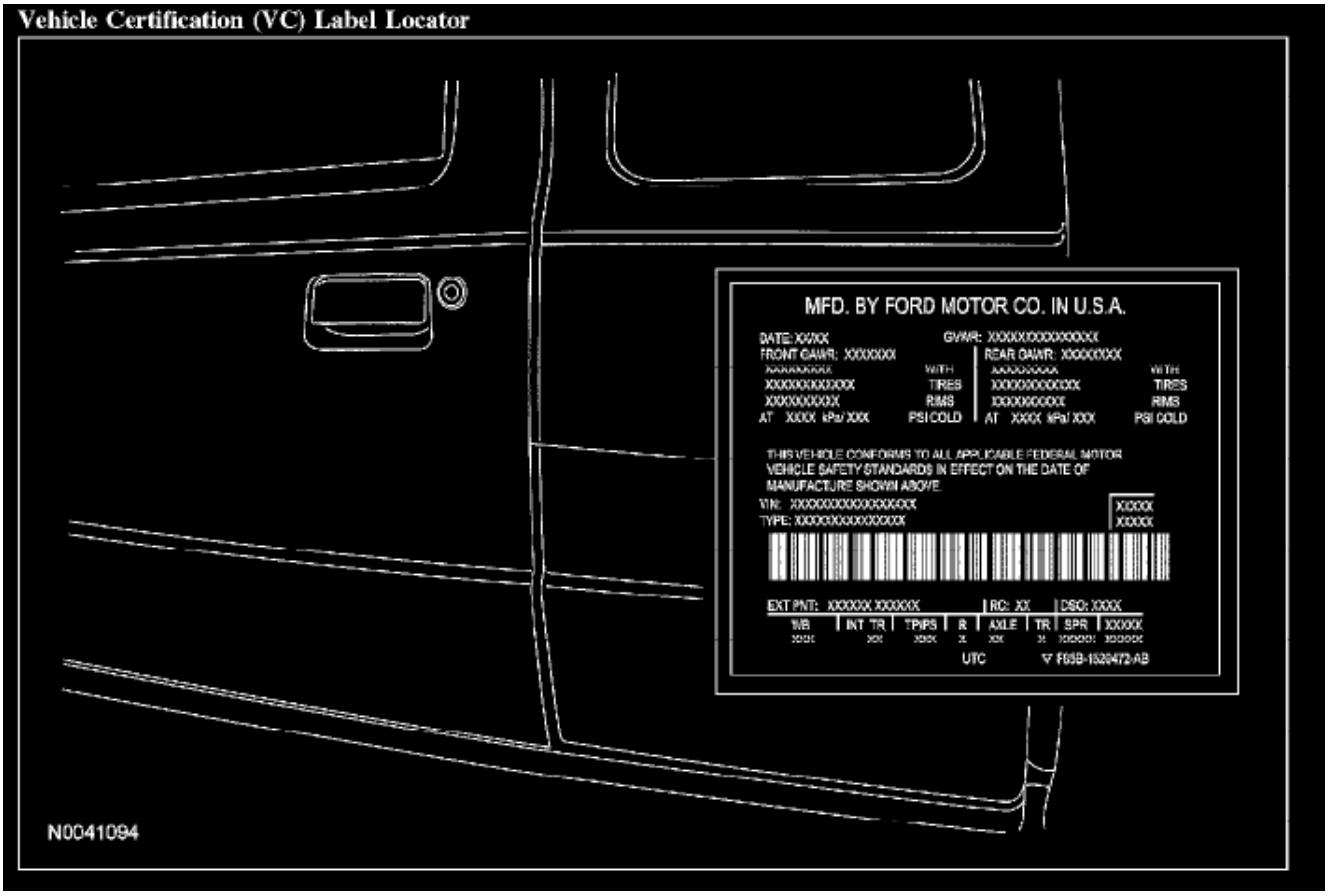
F - Medium/Dark Flint

- P - Medium Pebble



Tape/Paint Stripe

Tape and paint stripe codes do not apply.



Paint: Application and ID Paint Code Sticker Location

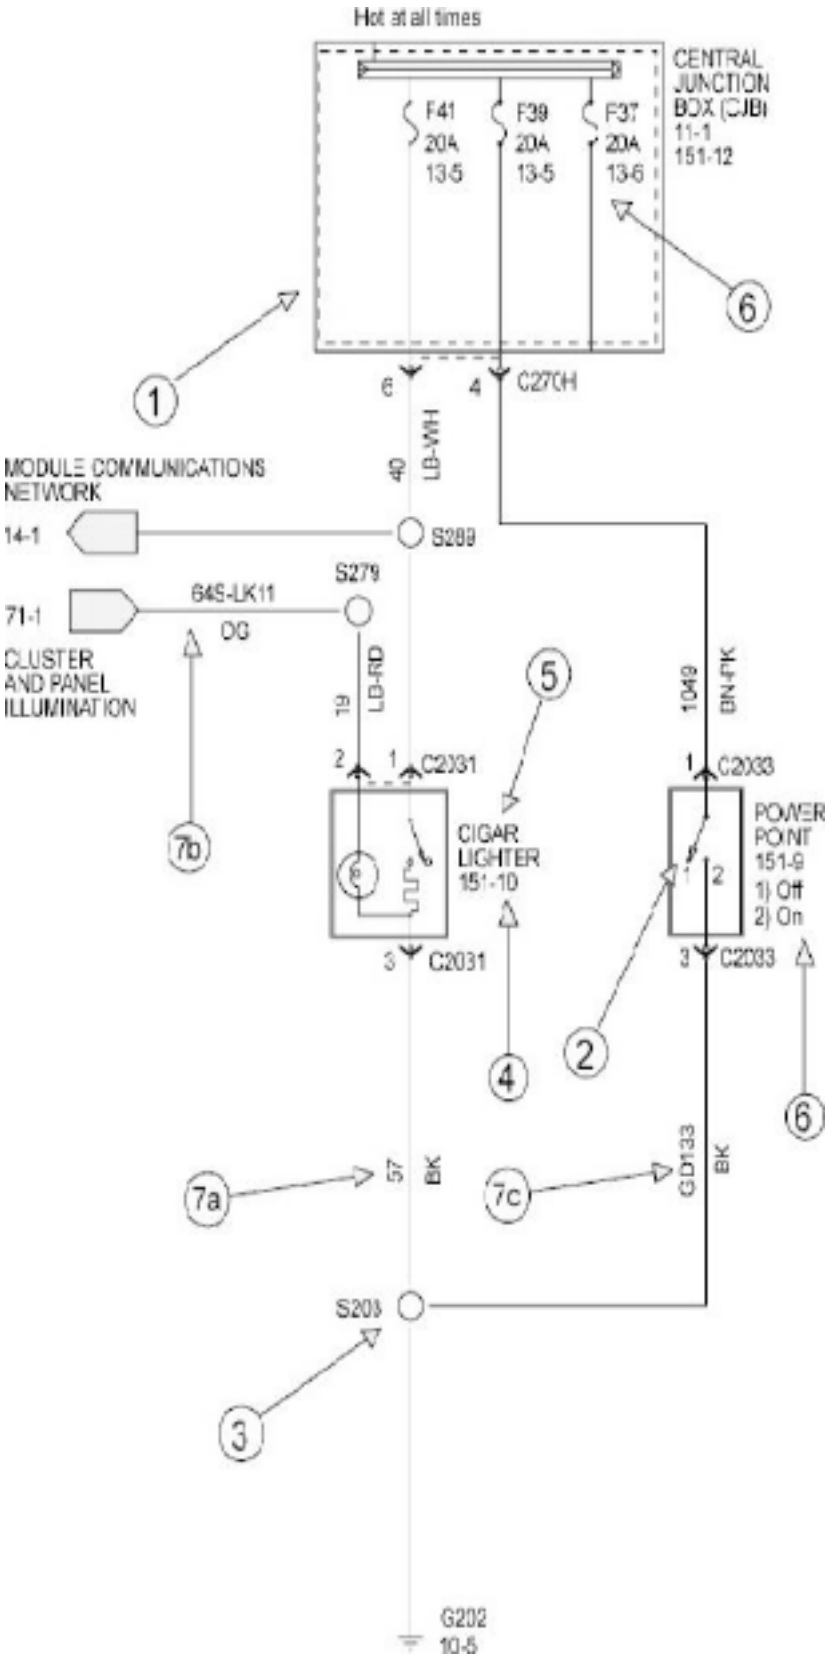
Ford Ranger 2wd Workshop Manual (V6-3.0L (2008))
Ford Workshop Manuals > Body and Frame > Relays and Modules - Body and Frame > Power Door Lock Relay > Component Information > Diagrams > Diagram Information and Instructions



Power Door Lock Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

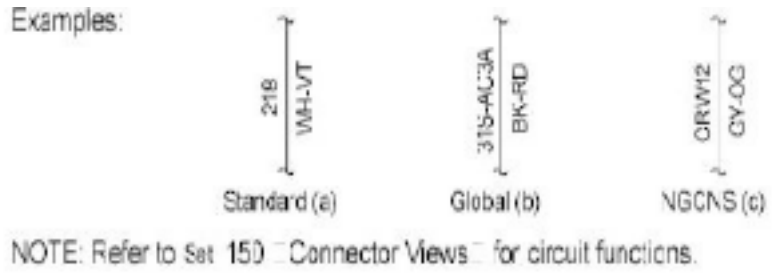
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

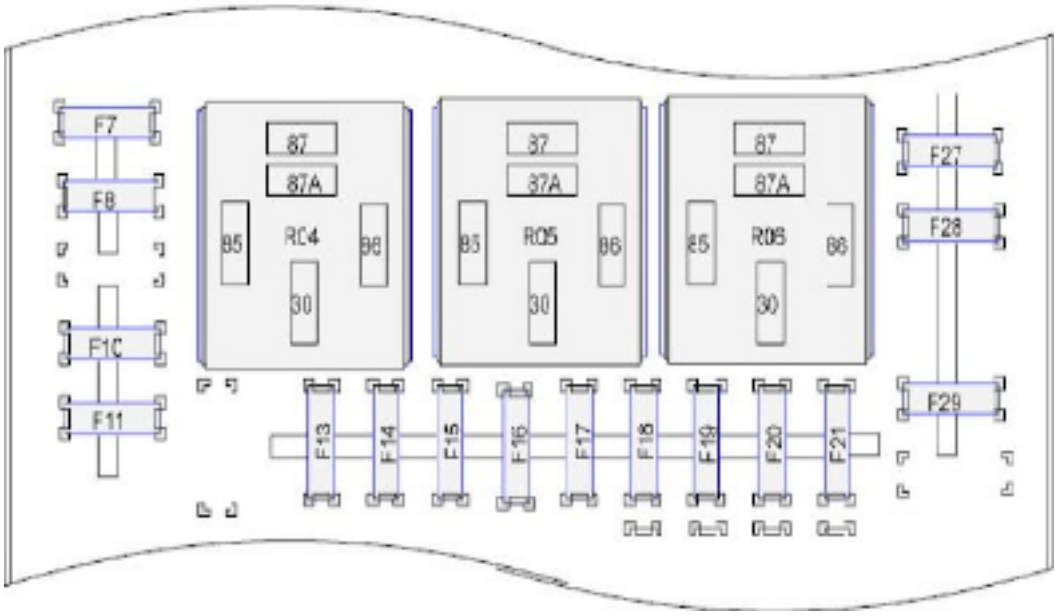
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

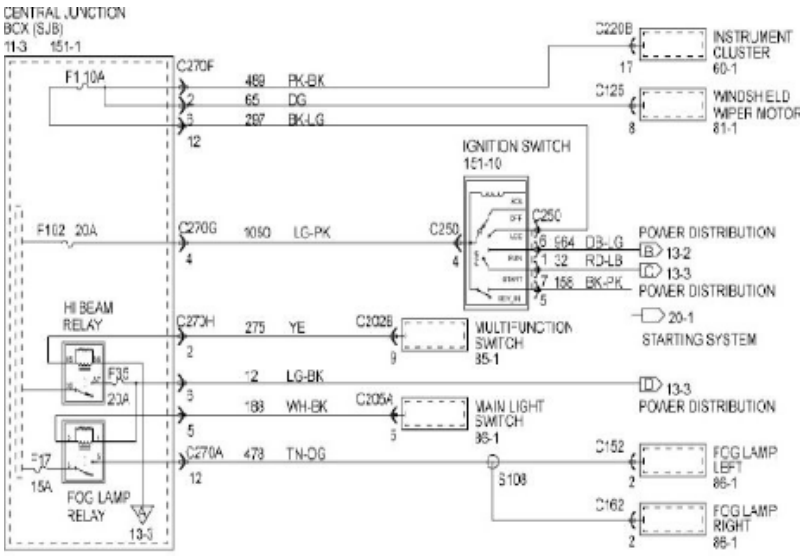
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

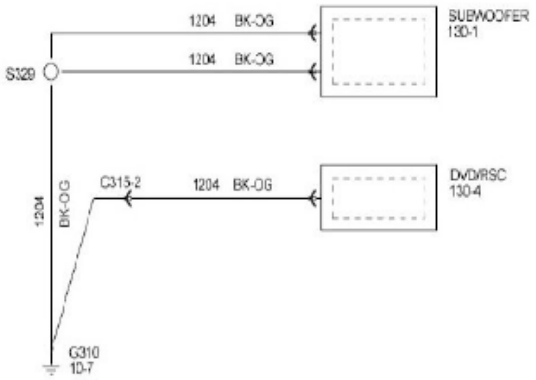
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

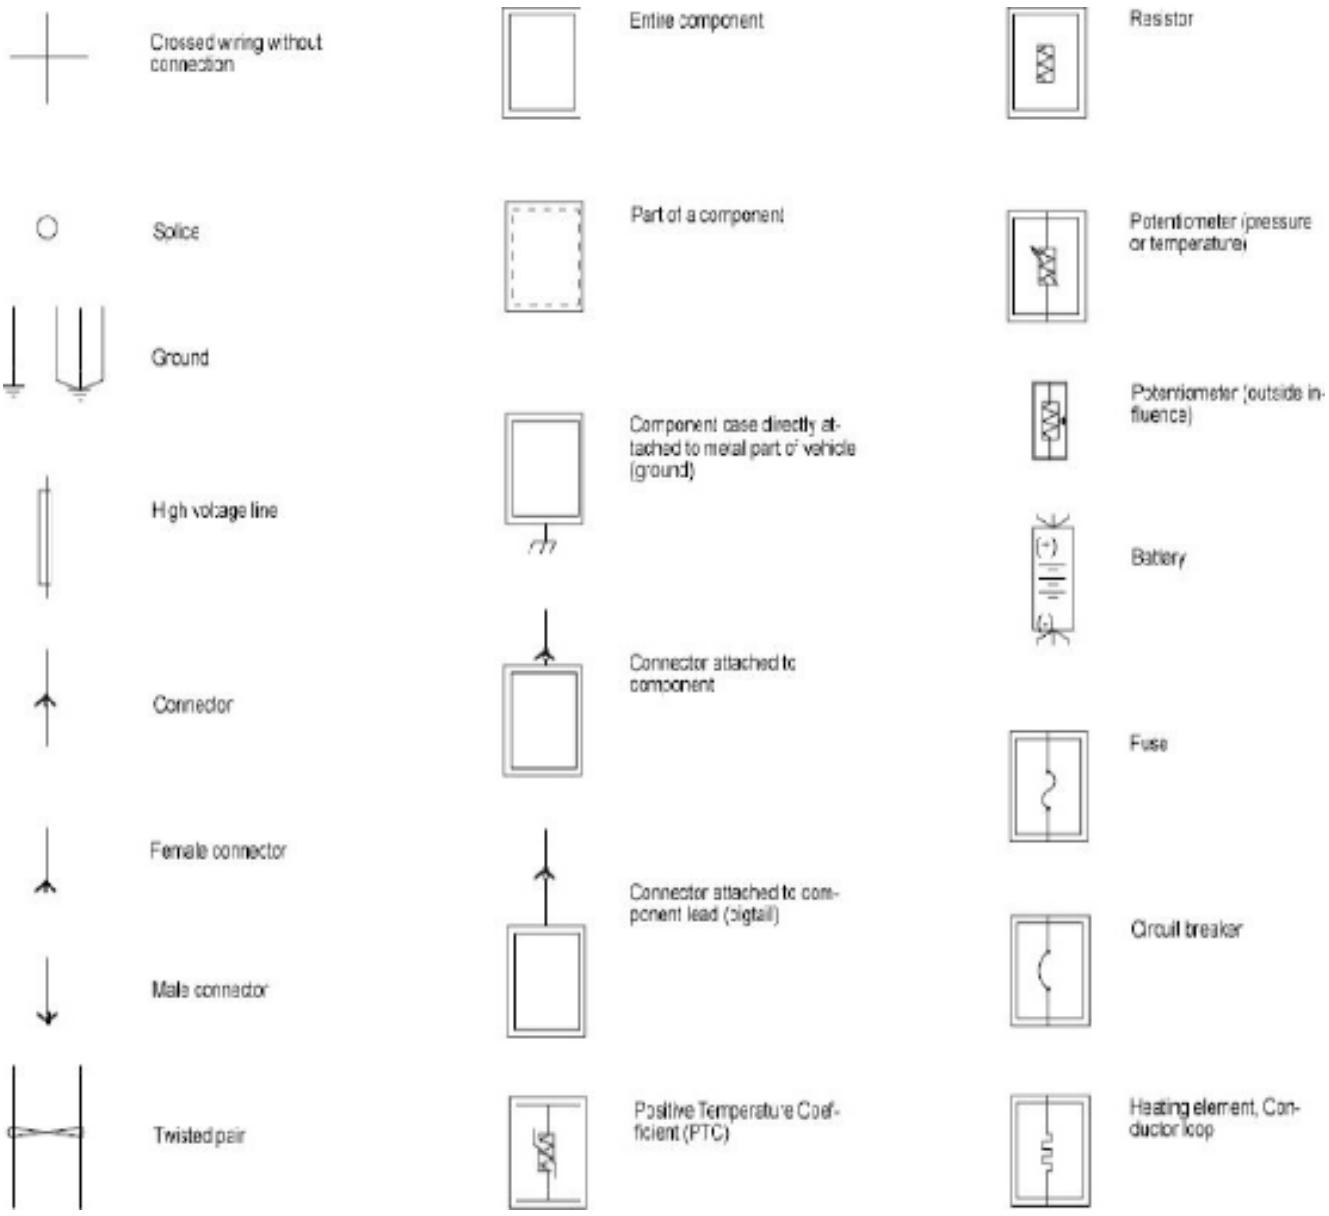
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

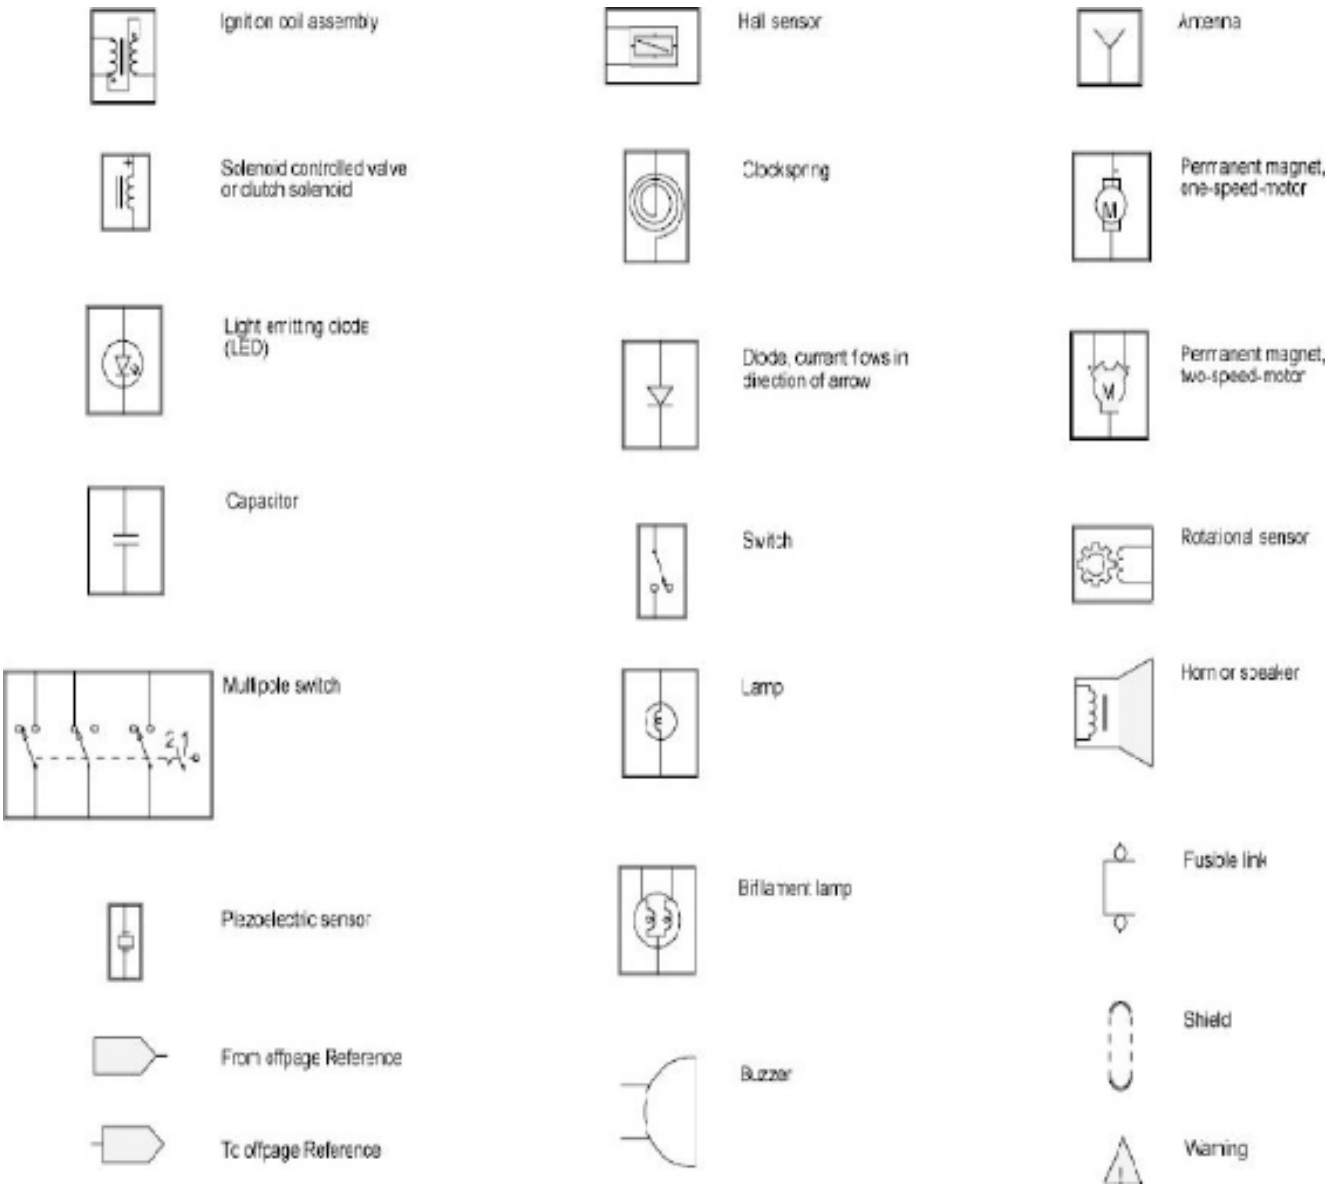
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

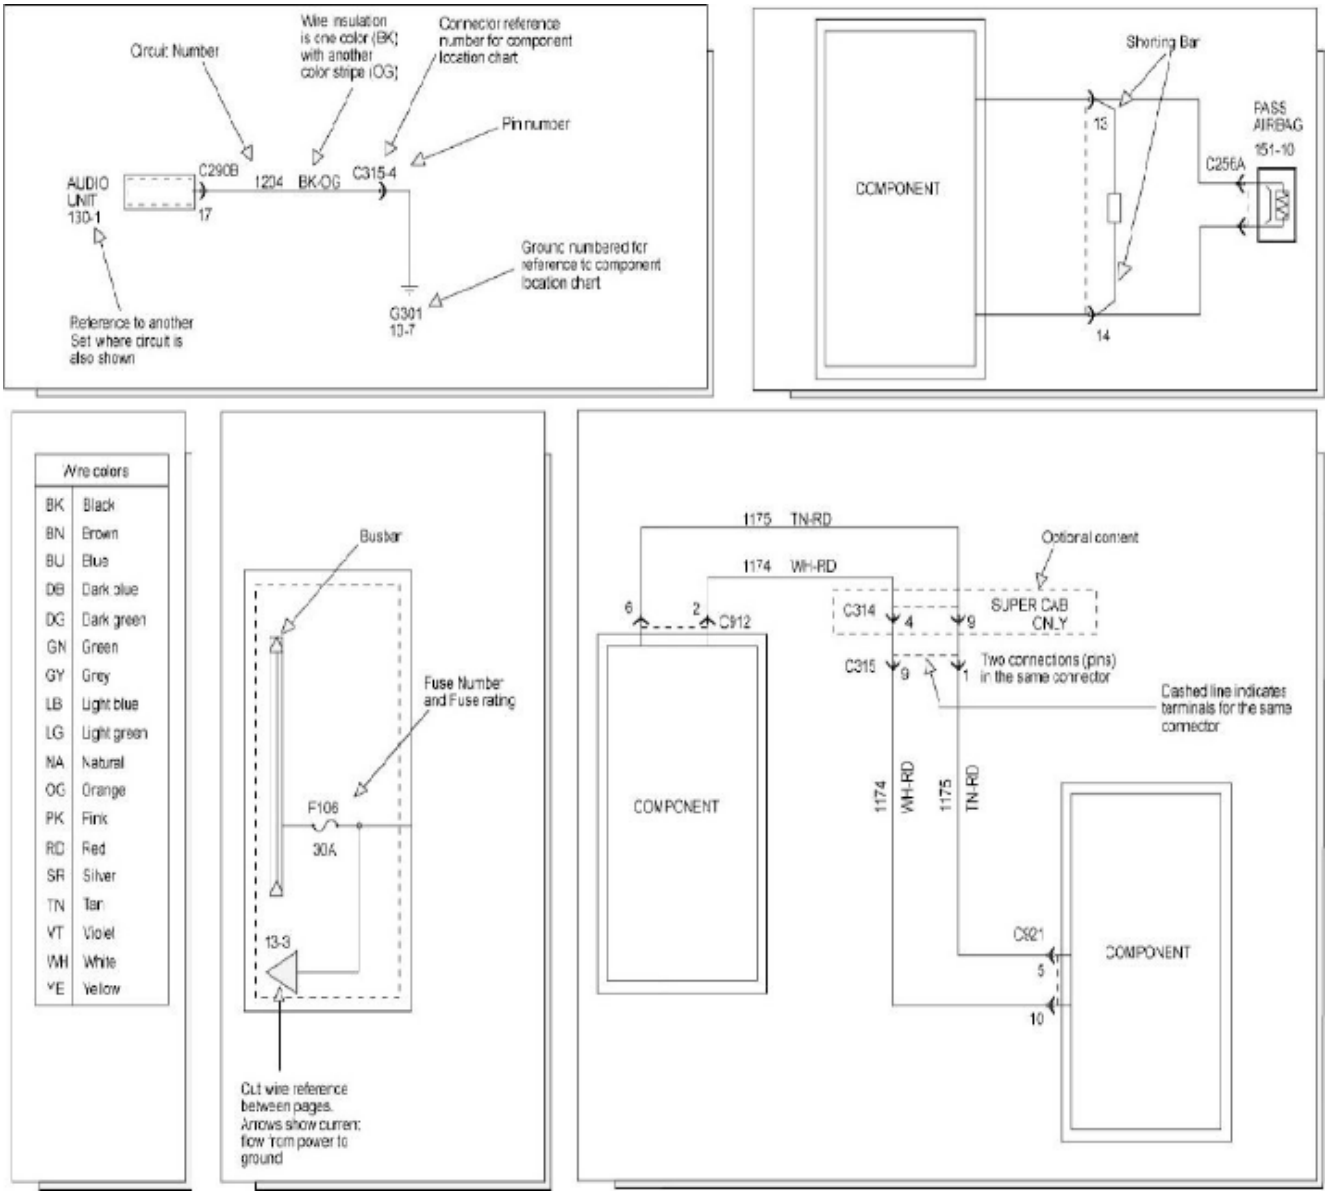
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

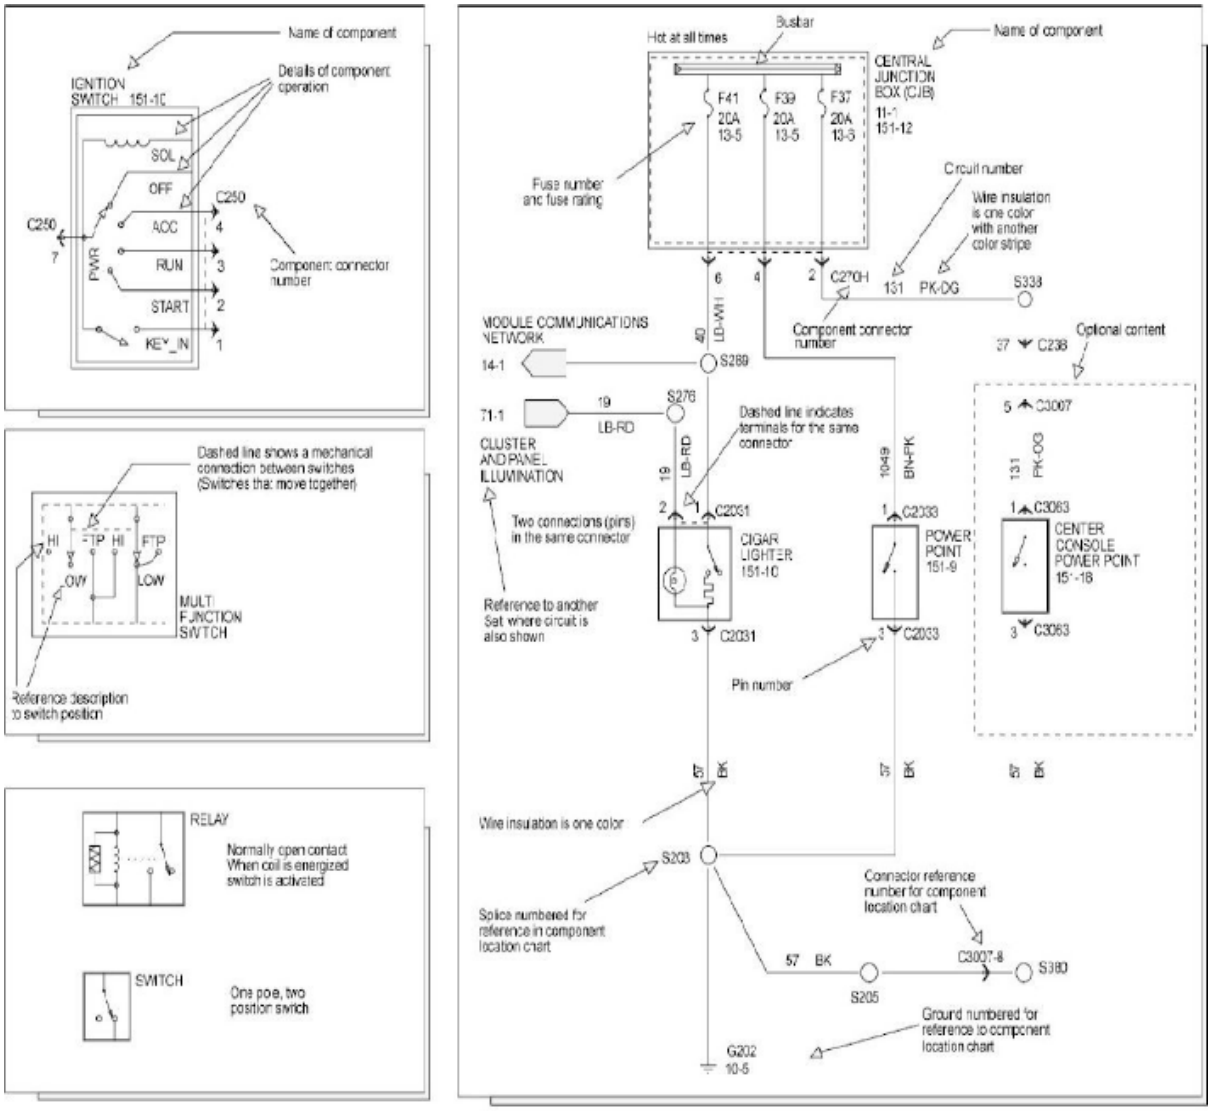
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Power Door Lock Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Defective insulation stripping

A

1 = Proper crimp

2 = Insulation not removed

3 = Wire strands missing

4 = Intermittent signals through pierced insulation

Partially mated connectors

1 = Seal

2 = Displaced tab

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Male half

7 = Intermittent contact

Lock may be displaced into an unlocked position; pull on the connector to verify the lock.

Deformed (enlarged) female terminals

1 = Enlarged

2 = Normal

Any probe entering the terminal may enlarge the contact spring opening creating an intermittent signal.

Insert the correct mating terminal (Location A) from the service kit and feel for a loose fit.

4 = Circuit insulation

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

WIRE STOPPER

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

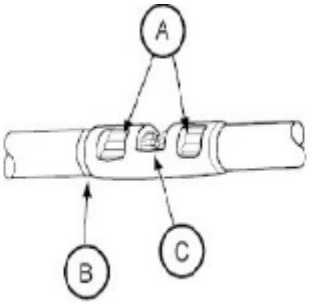
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

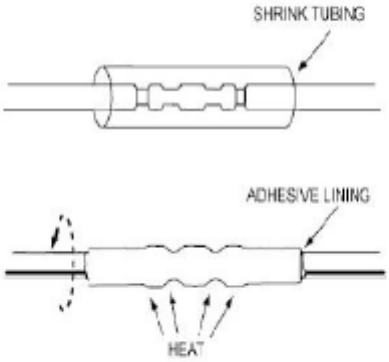
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x cia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Figtail only

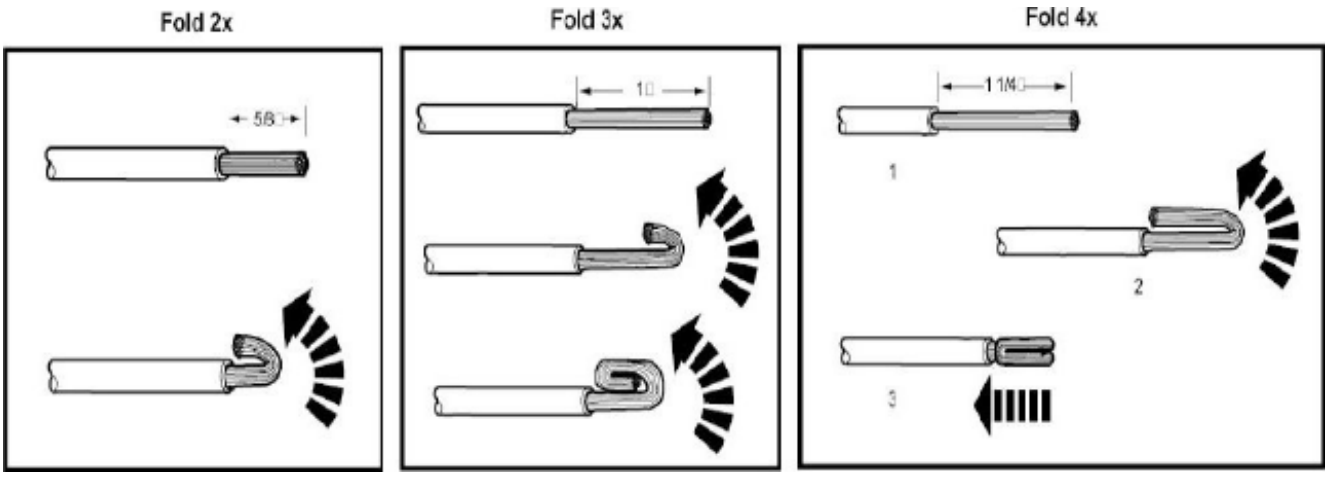
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



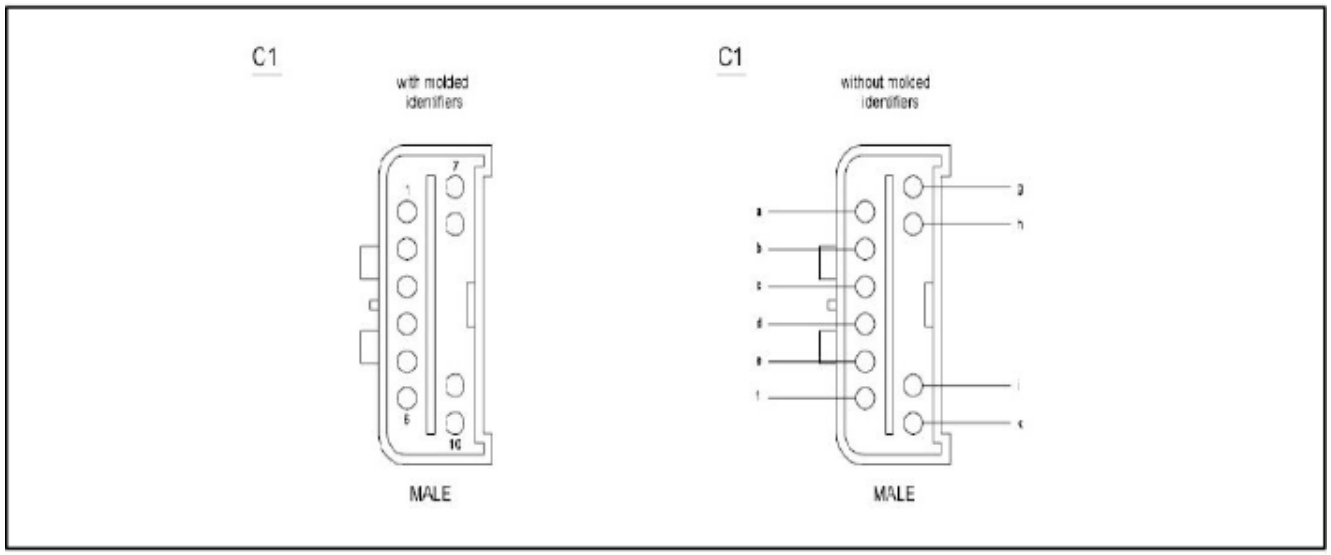
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



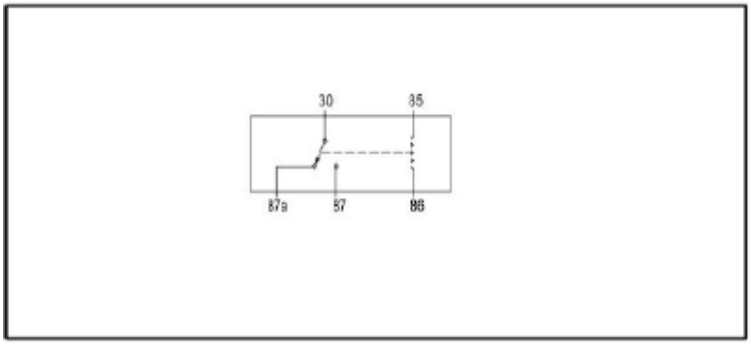
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

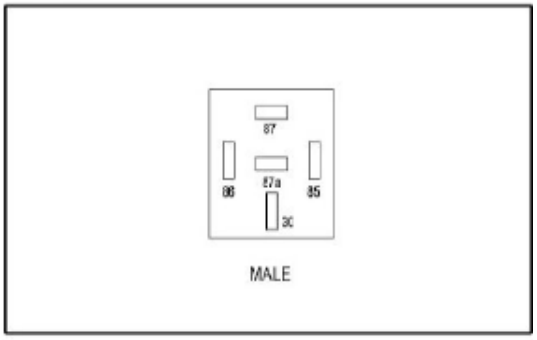
Power Door Lock Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	45 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 2 and 3 to 12V DC power and pin 1 to ground. Measure voltage between pin 5 and pin 1. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 2 and measure voltage between pin 4 and pin 1. If the voltage is 12V, the relay is okay. If not, replace the relay.

Child Seat: Description and Operation

ATTACHING SAFETY SEATS WITH TETHER STRAPS

Some manufacturers make child safety seats that include a tether strap that goes over the back of the vehicle seat and attaches to an anchoring point. Other manufacturers offer the tether strap as an accessory. Contact the manufacturer of the child safety seat for information about ordering a tether strap.

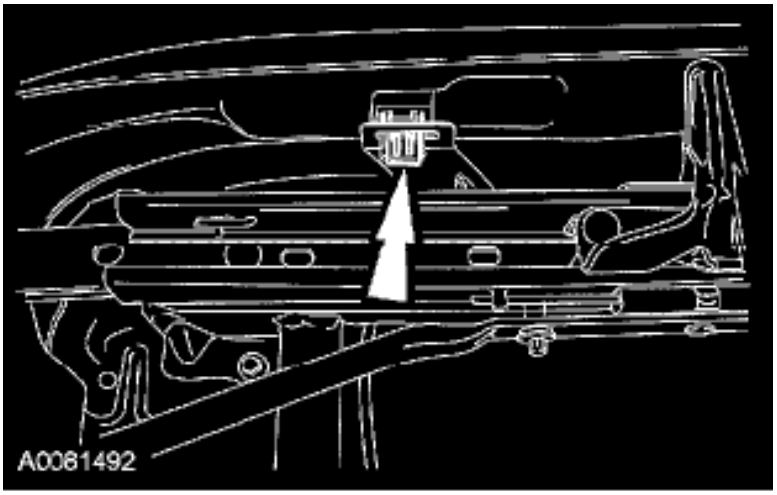
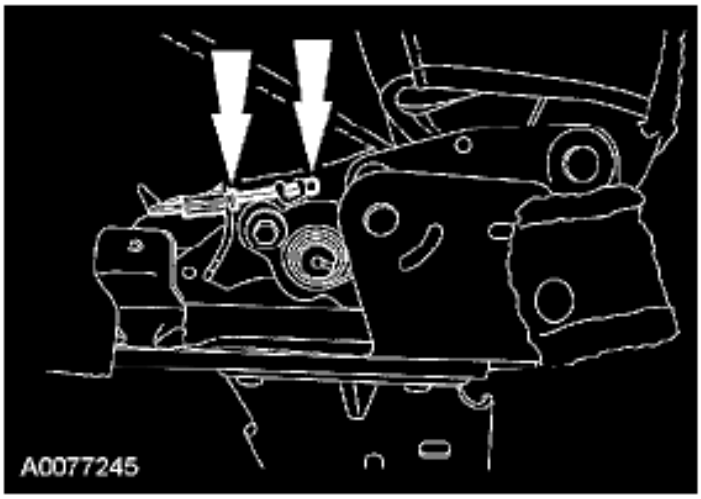
Removal

All seats

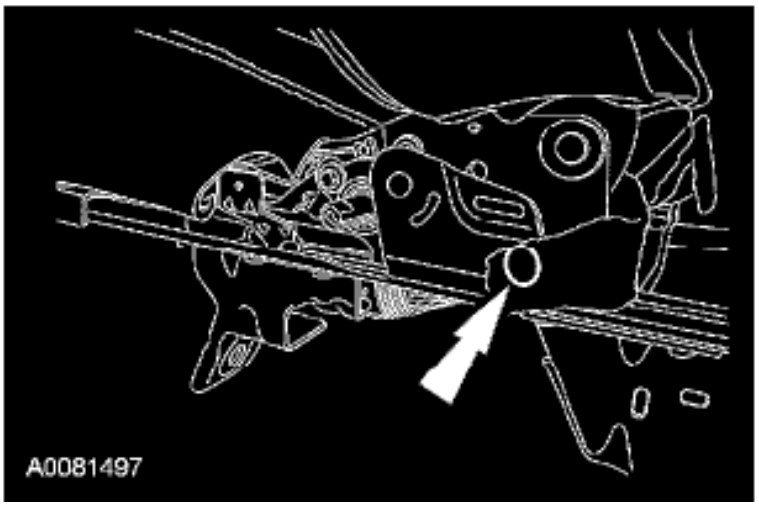
WARNING: Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which



A0061492



A0077245



A0081497

increases the risk of serious personal injury or death.

NOTE: -

The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1. Remove the 60 percent bench seat. 2. Remove the 60 percent bench armrest. 3. Remove the backrest recliner handle screw and the handle. 4. Remove the 2 side shield screws. 5. Pull out on the side and the rear of the side shield to detach the 2 clips (1 shown).

6. Remove the outboard recliner cable anchor and swivel and detach the recliner cable end.

7. Remove the outboard pin-type retainer and position the trim cover flap aside.

8. Remove the 2 outboard backrest-to-cushion bolts. 9. Remove the inboard seat backrest latch release cable anchor and swivel and detach the cable end.

Removal

WARNING: Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.

CAUTION: To prevent system failure, it is necessary to carry out the occupant classification sensor (OCS) system reset when a front passenger seat cushion is disassembled, a new trim cover installed or an OCS system service kit is installed. A scan tool is used to carry out the OCS system reset command.

NOTE: -

The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

- Driver seat shown, passenger seat similar.

All seats 1. Remove the affected seat. 2. Remove the seat back adjusting handle screw and handle.

Seats with manual lumbar

3. NOTE: The lumbar support assembly must be fully relaxed.

Relax the lumbar support assembly and remove the lumbar knob.

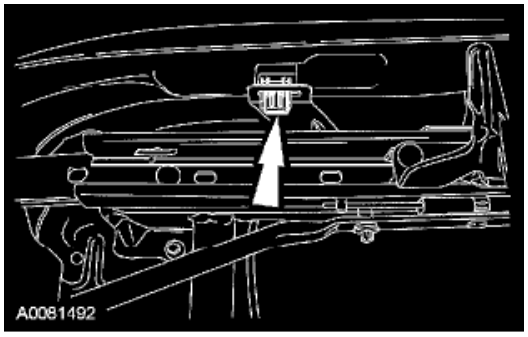
4. Remove the 2 screws and lumbar support adjuster.

5. NOTE: Note the routing of the lumbar cable.

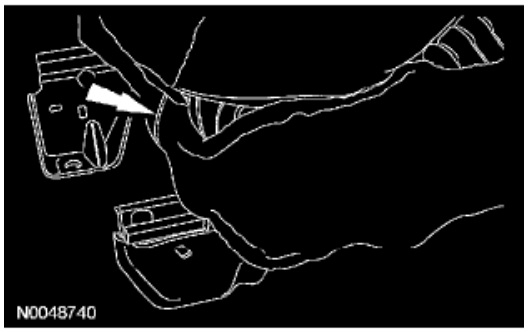
Disconnect the lumbar support adjuster. -

To separate the lumbar support adjuster from the lumbar adjustment cable, align the lumbar adjustment cable ball socket in the lumbar support adjuster keyway and bend the parts 90 degrees to each other.

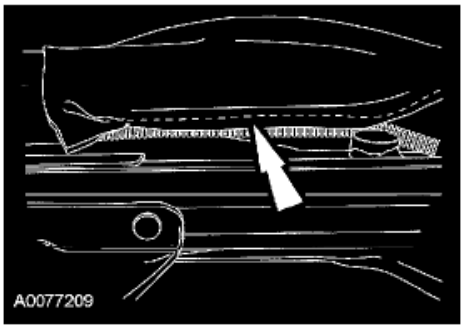
All seats 6. Remove the 2 side shield screws. 7. Pull out on the side and the rear of the side shield to detach the 2 clips (1 shown).



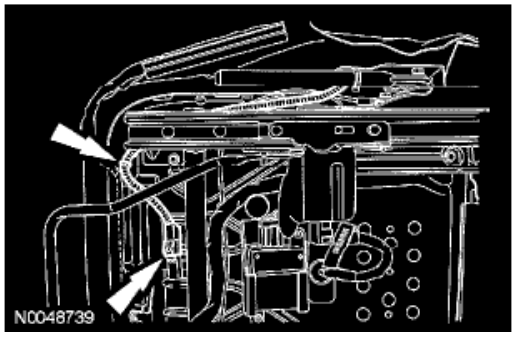
A0081492



N0048740



A0077209



N0048739

8. Release the inboard side rear hook-and-loop strip.

9. Release the inboard side bottom J-clip for access to the safety belt buckle pretensioner.

10. NOTE:

- Note the routing of the wire harness through the seat for installation.

- Passenger seat shown, driver seat similar.

Detach the pin-type retainers and safety belt buckle pretensioner wire harness from the seat cushion pan. -

For driver seat, disconnect the seat position electrical connector.

- For passenger seat, disconnect the safety belt buckle pretensioner electrical connector.

11. Remove the safety belt buckle pretensioner nut and remove the safety belt buckle pretensioner and wire harness. 12. Remove the outboard rear pin-type retainer and position the material to the side.

3
1
N0034838

13. Disconnect the outboard seat back latch release cable end.

1 Detach the cable from its anchor point.

2 Swivel the cable end and remove from the latch retainer.

3 Position the cable aside.

14. Disconnect the inboard seat back latch release cable end.

1 Detach the cable from its anchor point.

2 Swivel the cable end and remove from the latch retainer.

3 Position the cable aside.

15. Remove the 2 inboard seat backrest-to-cushion bolts. 16. Remove the 2 outboard seat backrest-to-cushion bolts.

17. NOTE: If equipped, note position of the lumbar cable where it comes through the seat cushion.

Remove the backrest assembly.

Installation

All seats 1. Install the backrest assembly. 2. Install the 2 outboard seat backrest-to-cushion bolts.

- Tighten to 25 Nm (18 lb-ft).

3. Install the 2 inboard seat backrest-to-cushion bolts.

- Tighten to 25 Nm (18 lb-ft).

4. Install the inboard seat backrest latch release cable.

1 Position the seat back latch release cable.

2 Install the seat back latch release cable end and swivel the cable.

3 Attach the cable at its anchor point.

5. Install the outboard seat backrest latch release cable.

1 Position the cable.

2 Install the seat backrest latch release cable end and swivel the cable.

3 Attach the cable to its anchor point.

6. Position the material and install the outboard pin-type retainer.

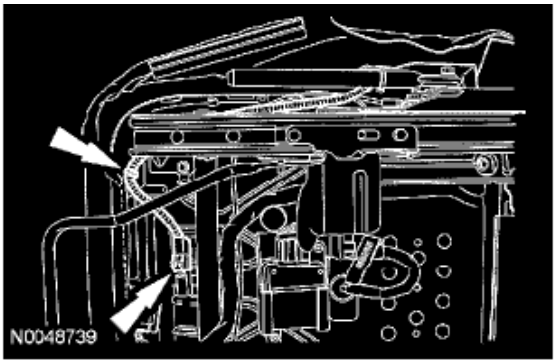
7. Install the safety belt buckle pretensioner and install the safety belt buckle pretensioner nut.

- Tighten to 40 Nm (30 lb-ft).

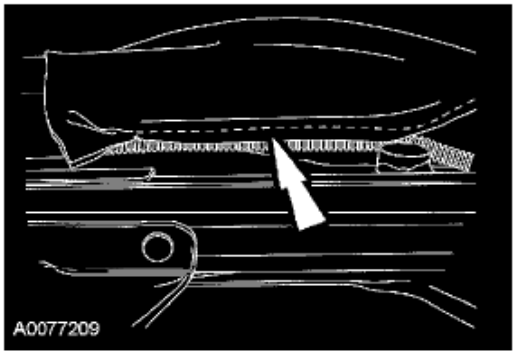
8. Route the safety belt buckle pretensioner wire harness and install the pin-type retainers.

- For driver seat, connect the seat position electrical connector.

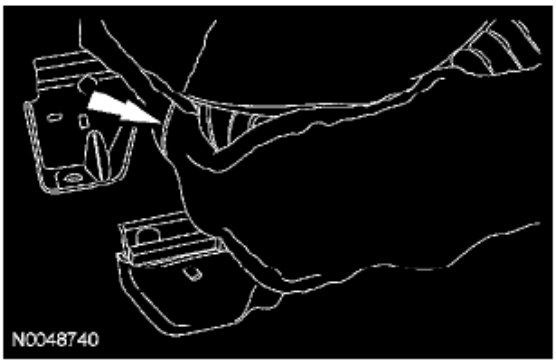
- For passenger seat, connect the safety belt buckle pretensioner electrical connector.



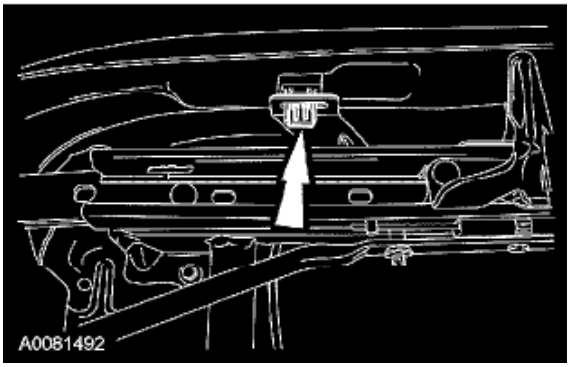
N0048739



A0077209



N0048740



A0081492

9. Install the safety belt buckle pretensioner cover and install the screw.

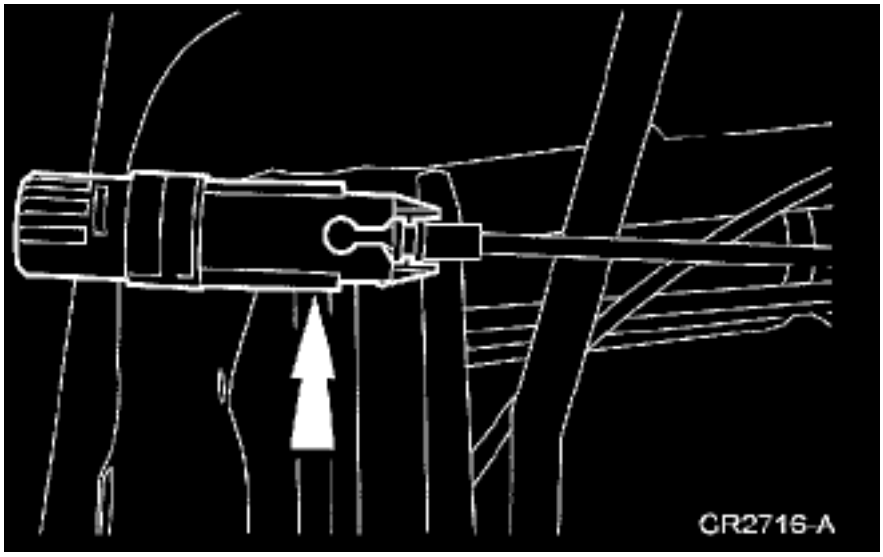
10. Attach the inboard side J-clip.

11. Fasten the inboard side rear hook-and-loop strip.

12. Position the side shield and install the 2 clips (1 shown).

13. Install the 2 front side shield screws.

Seats with manual lumbar 14. Route the lumbar adjustment cable as noted during removal. 15. Connect the lumbar support adjuster and the lumbar adjustment cable.



16. Install the lumbar support adjuster and the 2 screws. 17. Install the lumbar knob.

All seats 18. Install the seat backrest recliner handle and screw. 19. Install the seat. If a passenger seat has been serviced, do not prove out the SRS at this time.

Passenger seat

20. WARNING:

- Install a new occupant classification sensor (OCS) system service kit as a complete assembly. Never install only part of the kit components. Failure to follow this instruction may result in incorrect operation of the OCS system and increases the risk of serious personal injury or death in a crash.

- Make sure the front passenger seat repair is complete, the seat and all attached components (head restraint, seat side shield, etc.) are correctly assembled, and the seat is correctly installed to the vehicle before carrying out the System Reset. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increases the risk of serious personal injury or death in a crash.

CAUTION: -

To prevent system failure, it is necessary to carry out the occupant classification sensor (OCS) system reset when a front passenger seat cushion is disassembled, a new trim cover installed or an OCS system service kit is installed. A scan tool is used to carry out the OCS system reset command.

- To prevent system failure, the following precautions must be taken before carrying out the occupant classification sensor (OCS) system reset: -

Make sure the voltage to the occupant classification system module (OCSM) is above 8.0 volts and less than 18.0 volts.

- Make sure the OCS system is not at a temperature below 6°C (42°F) or above 36°C (97°F) when initiating the OCS system reset process. If the vehicle has been exposed to extreme cold or hot temperatures, the vehicle must be exposed and kept at a temperature within the limits, 6°C to 36°C (42°F to 97°F) for a minimum of 30 minutes.

- Make sure nothing is present on the passenger seat before carrying out the OCS system reset and nothing is placed on the seat during the process.

- Make sure a minimum 8-second time period has passed after cycling the ignition switch ON before the carrying out the OCS system reset process.

NOTE: If the first attempt to carry out the occupant classification sensor (OCS) system reset is unsuccessful, a second attempt must be made. If the second attempt is unsuccessful, a new OCS system service kit must be installed.

Carry out the OCS system reset active command.

21. NOTE: The ignition switch must be cycled after the OCS system reset.

Cycle the ignition switch from ON to OFF.

All seats 22. Prove out the SRS as follows:

Turn the ignition key from ON to OFF. Wait 10 seconds, then turn the key back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an SRS fault is present, the air bag warning indicator will: -

fail to light.

- remain lit continuously.

- flash at a 5Hz rate (RCM not configured).

The air bag warning indicator may not illuminate until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON

position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.

Clear all continuous RCM and occupant classification system module (OCSM) DTCs using a scan tool.

Special Tool(s)

Removal and Installation

WARNING:

- Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.

- Make sure the front passenger seat repair is complete, the seat and all attached components (head restraint, seat side shield, etc.) are correctly assembled, and the seat is correctly installed to the vehicle before carrying out the System Reset. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increases the risk of serious personal injury or death in a crash.

CAUTION: To prevent system failure, it is necessary to carry out the occupant classification sensor (OCS) system reset when a front passenger seat cushion is disassembled, a new trim cover installed or an OCS system service kit is installed. A scan tool is used to carry out the OCS system reset command.

NOTE:

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

- Driver 60 percent seat backrest shown, passenger and driver 40 percent seat backrest similar.

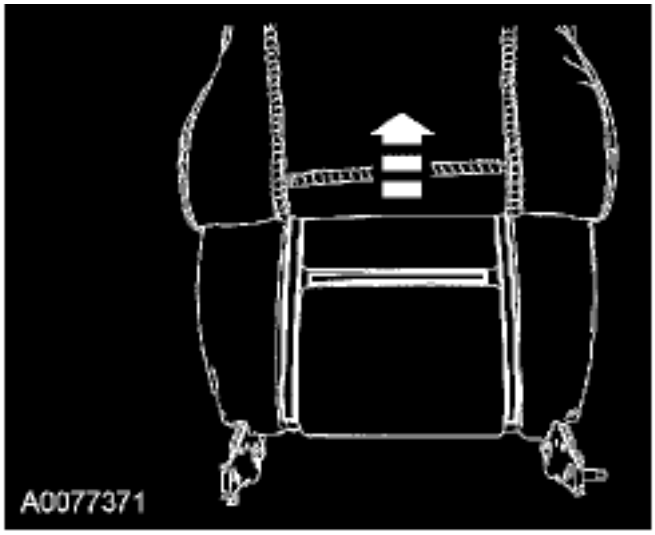
All seats

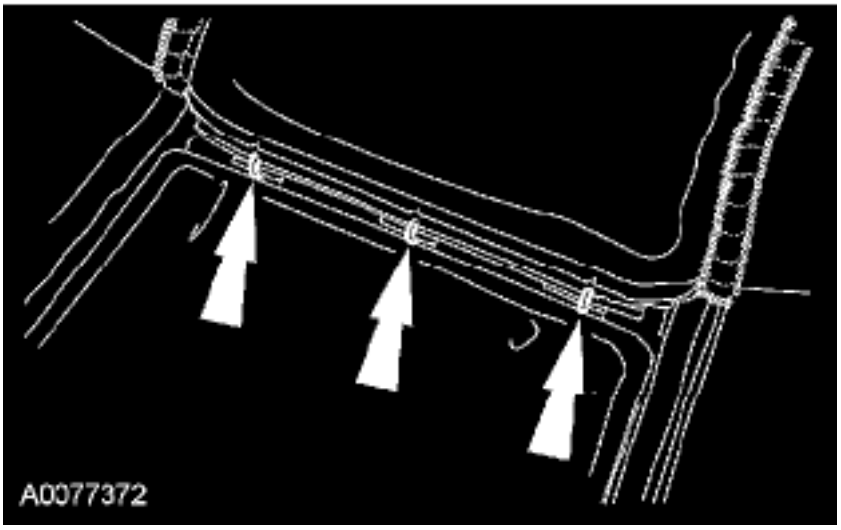
1. Remove the front seat. 2. Remove the front seat backrest. 3. Release the backrest J-clip.

4. CAUTION: Use care when separating the seat back trim cover from the hook-and-loop strips or the hook-and-loop strips may be torn

from the seat back foam.

Invert the backrest trim cover and release the hook-and-loop strips up to the row of hog rings.





5. Remove all the hog rings and remove the backrest trim cover from the backrest foam pad.

6. To install, reverse the removal procedure. 7. Install the front seat backrest. 8. Install the seat. If a passenger seat has been serviced, do not prove out the SRS at this time.

Passenger seat

9. WARNING:

- Install a new occupant classification sensor (OCS) system service kit as a complete assembly. Never install only part of the kit components. Failure to follow this instruction may result in incorrect operation of the OCS system and increases the risk of serious personal injury or death in a crash.

- Make sure the front passenger seat repair is complete, the seat and all attached components (head restraint, seat side shield, etc.) are correctly assembled, and the seat is correctly installed to

the vehicle before carrying out the System Reset. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increases the risk of serious personal injury or death in a crash.

CAUTION: -

To prevent system failure, it is necessary to carry out the occupant classification sensor (OCS) system reset when a front passenger seat cushion is disassembled, a new trim cover installed or an OCS system service kit is installed. A scan tool is used to carry out the OCS system reset command.

- To prevent system failure, the following precautions must be taken before carrying out the occupant classification sensor (OCS) system reset: -

Make sure the voltage to the occupant classification system module (OCSM) is above 8.0 volts and less than 18.0 volts.

- Make sure the OCS system is not at a temperature below 6°C (42°F) or above 36°C (97°F) when initiating the OCS system reset process. If the vehicle has been exposed to extreme cold or hot temperatures, the vehicle must be exposed and kept at a temperature within the limits, 6°C to 36°C (42°F to 97°F) for a minimum of 30 minutes.

- Make sure nothing is present on the passenger seat before carrying out the OCS system reset and nothing is placed on the seat during the process.

- Make sure a minimum 8-second time period has passed after cycling the ignition switch ON before the carrying out the OCS system reset process.

NOTE: If the first attempt to carry out the occupant classification sensor (OCS) system reset is unsuccessful, a second attempt must be made. If the second attempt is unsuccessful, a new OCS system service kit must be installed.

Carry out the OCS system reset active command.

10. NOTE: The ignition switch must be cycled after the OCS system reset.

Cycle the ignition switch from ON to OFF.

All seats

11. Prove out the SRS as follows:

Turn the ignition key from ON to OFF. Wait 10 seconds, then turn the key back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an SRS fault is present, the air bag warning indicator will: -

fail to light.

- remain lit continuously.

- flash at a 5Hz rate (RCM not configured).

The air bag warning indicator may not illuminate until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.

Clear all continuous RCM and occupant classification system module (OCSM) DTCs using a scan tool.

Seat Backrest, Front, 40 Percent

NOTE: Driver backrest shown, passenger backrest similar.

Removal

WARNING: -

Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.

- Make sure the front passenger seat repair is complete, the seat and all attached components (head restraint, seat side shield, etc.) are correctly assembled, and the seat is correctly installed to the vehicle before carrying out the System Reset. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increases the risk of serious personal injury or death in a crash.

CAUTION: To prevent system failure, it is necessary to carry out the occupant classification sensor (OCS) system reset when a front passenger seat cushion is disassembled, a new trim cover installed or an OCS system service kit is installed. A scan tool is used to carry out the OCS system reset command.

NOTE: -

The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

- When installing a new occupant classification sensor (OCS) system service kit, refer to Air Bag Systems for the OCS removal and installation procedure.

All seats 1. Remove the affected seat. 2. Remove the seat backrest assembly. 3. Release the trim cover rear J-clip from the seat cushion.

Passenger seat

4. NOTE: Note position of wire routing for installation.

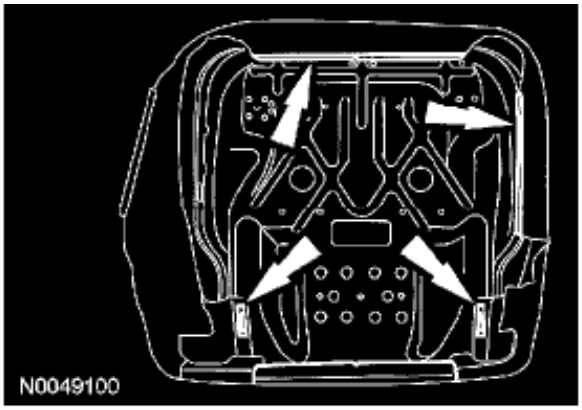
Release the seat wiring harness retainer clip and detach the seat wiring harness connector from the seat cushion frame.

All seats 5. Remove the 4 seat track-to-cushion frame bolts and remove the seat track assembly from the cushion frame.

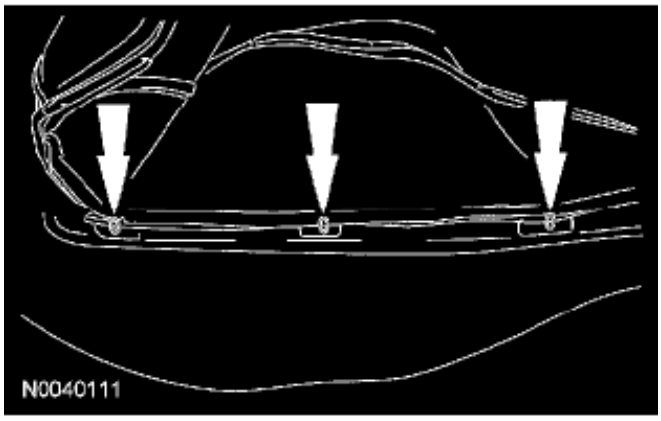
6. CAUTION: An occupant classification sensor (OCS) service kit will have the OCS bladder attached to the seat cushion foam pad. DO

not separate the OCS bladder from the seat cushion foam pad. Failure to follow these instructions may result in incorrect operation of the OCS system and may cause system failure.

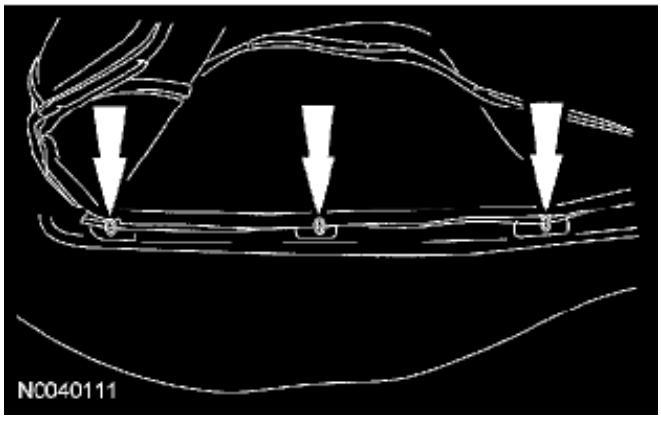
NOTE: Driver 40 percent seat shown, passenger and driver 60 percent seat similar.



N0049100



N0040111



N0040111

Release the J-clips. -

For 60 percent seat, release the side foam pad retainer strap.

7. Remove all rows of hog rings and remove the cushion trim cover.

Installation

All seats

1. CAUTION: Inspect the seat cushion pad and seat cushion trim cover for any foreign objects, before installing the seat cushion trim cover

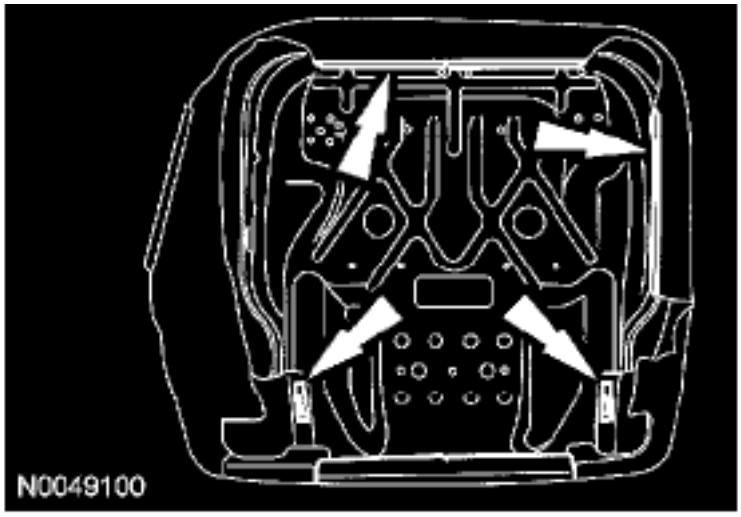
to the seat cushion pad. If any foreign objects are found, remove them. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and may cause system failure.

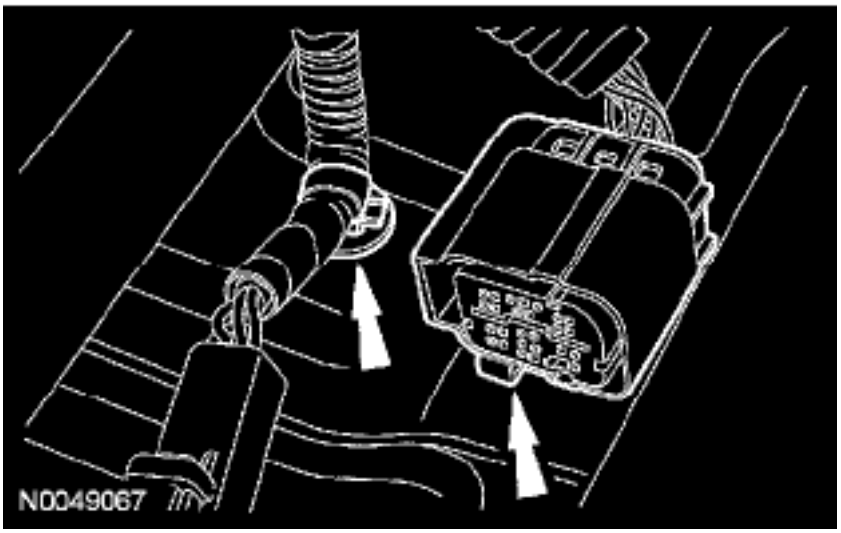
Position the cushion trim cover to the foam pad and install the rows of hog rings.

2. NOTE: Driver 40 percent seat shown, passenger and 60 percent seat similar.

Fasten the J-clips. -

For 60 percent seat, fasten the side foam pad retainer strap.





3. Position the seat track to the cushion frame assembly and install the 4 bolts.

- Tighten to 6 Nm (53 lb-in).

4. Attach the cushion trim cover rear J-clip.

Passenger seat 5. Install the seat wiring harness retainer clip and attach the seat wiring harness connector to the seat cushion frame.

All seats 6. Install the seat backrest. 7. Install the seat. If a passenger seat has been serviced, do not prove out the SRS at this time.

Passenger seat

8. WARNING:

- Install a new occupant classification sensor (OCS) system service kit as a complete assembly. Never install only part of the kit components. Failure to follow this instruction may result in incorrect operation of the OCS system and increases the risk of serious personal injury or death in a crash.

- Make sure the front passenger seat repair is complete, the seat and all attached components (head restraint, seat side shield, etc.) are correctly assembled, and the seat is correctly installed to the vehicle before carrying out the System Reset. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increases the risk of serious personal injury or death in a crash.

CAUTION: -

To prevent system failure, it is necessary to carry out the occupant classification sensor (OCS) system reset when a front passenger seat cushion is disassembled, a new trim cover installed or an OCS system service kit is installed. A scan tool is used to carry out the OCS system reset command.

- To prevent system failure, the following precautions must be taken before carrying out the occupant classification sensor (OCS) system reset: -

Make sure the voltage to the occupant classification system module (OCSM) is above 8.0 volts and less than 18.0 volts.

- Make sure the OCS system is not at a temperature below 6°C (42°F) or above 36°C (97°F) when initiating the OCS system reset process. If the vehicle has been exposed to extreme cold or hot temperatures, the vehicle must be exposed and kept at a temperature within the limits, 6°C to 36°C (42°F to 97°F) for a minimum of 30 minutes.

- Make sure nothing is present on the passenger seat before carrying out the OCS system reset and nothing is placed on the seat during the process.

- Make sure a minimum 8-second time period has passed after cycling the ignition switch ON before the carrying out the OCS system reset process.

NOTE: If the first attempt to carry out the occupant classification sensor (OCS) system reset is unsuccessful, a second attempt must be made. If the second attempt is unsuccessful, a new OCS system service kit must be installed.

Carry out the OCS system reset active command.

9. NOTE: The ignition switch must be cycled after the OCS system reset.

Cycle the ignition switch from ON to OFF.

All seats 10. Prove out the SRS as follows:

Turn the ignition key from ON to OFF. Wait 10 seconds, then turn the key back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an SRS fault is present, the air bag warning indicator will: -

fail to light.

- remain lit continuously.

- flash at a 5Hz rate (RCM not configured).

The air bag warning indicator may not illuminate until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.

Clear all continuous RCM and occupant classification system module (OCSM) DTCs using a scan tool.

Seat Cushion, Front Passenger (Part 2)

Disassembly

WARNING: -

Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.

- Install a new occupant classification sensor (OCS) system service kit as a complete assembly. Never install only part of the kit components. Failure to follow this instruction may result in incorrect operation of the OCS system and increases the risk of serious personal injury or death in a crash.

- Make sure the front passenger seat repair is complete, the seat and all attached components (head restraint, seat side shield, etc.) are correctly assembled, and the seat is correctly installed to the vehicle before carrying out the System Reset. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increases the risk of serious personal injury or death in a crash.

CAUTION: To prevent system failure, it is necessary to carry out the occupant classification sensor (OCS) system reset when a front passenger seat cushion is disassembled, a new trim cover installed or an OCS system service kit is installed. A scan tool is used to carry out the OCS system reset command.

NOTE: -

Occupant classification sensor (OCS) system components (seat cushion foam pad, bladder with pressure sensor and occupant classification system module [OCSM]) are calibrated to each other and are serviced as an assembly. The OCS system components are not to be installed separately. If a new OCS system, OCS system component or seat cushion foam pad are needed, a new OCS system service kit (seat cushion foam pad, bladder with pressure sensor, OCSM and seat wiring harness) must be installed as an assembly.

- To identify between a production occupant classification sensor (OCS) system and a OCS system service kit, inspect the occupant classification system module (OCSM) electrical connector.

A production OCS system allows the disconnection of the OCSM electrical connector.

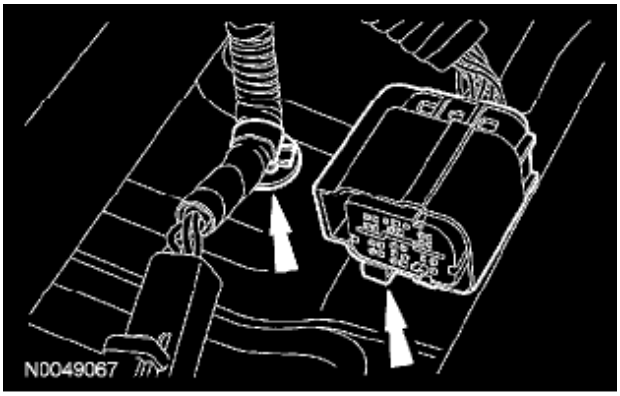
An OCS system service kit has the electrical connector glued to the module, it cannot and should not be disconnected or altered.

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

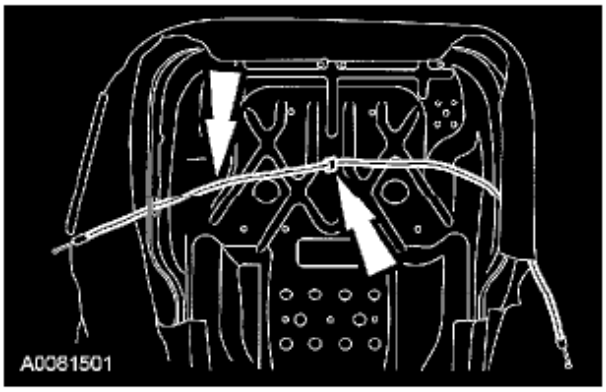
- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

- When installing a new OCS system service kit, refer to Air Bag Systems for the OCS removal and installation procedure.

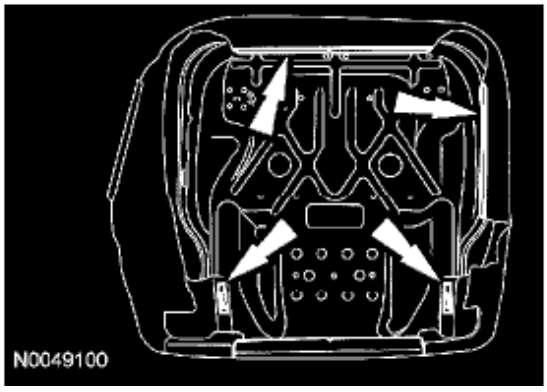
All seats 1. Remove the front seat. 2. Remove the front seat backrest. 3. Release the cushion trim cover rear J-clip from the seat cushion.



N0049067



A0081501



N0049100

Passenger seat

4. NOTE: Note position of wire routing for installation.

Release the seat wiring harness retainer clip and detach the seat wiring harness connector from the seat cushion frame.

All seats 5. Remove the 4 seat track-to-cushion frame bolts and remove the seat track assembly from the cushion frame.

Driver seat 6. Remove the 2 screws and seat position sensor from the seat track assembly.

All seats

7. NOTE: Note routing of the seat backrest latch release cable through the seat cushion frame.

Detach the pin-type retainer and remove the backrest latch release cable.

8. Release the remaining cushion trim cover J-clips.

- If driver seat, remove the cushion frame from the foam pad and cushion trim cover.

9. CAUTION: An occupant classification sensor (OCS) system service kit will have the OCS bladder attached to the seat cushion foam pad.

Do not separate the OCS bladder from the seat cushion foam pad. Failure to do so may result in component failure.

Remove all rows of hog rings and remove the cushion trim cover.

Passenger seat

10. NOTE: Note position of wire routing for installation.

Release the 2 seat wiring harness routing clips from the seat cushion frame.

11. Release the pressure sensor bracket retainer and slide the pressure sensor off the bracket.

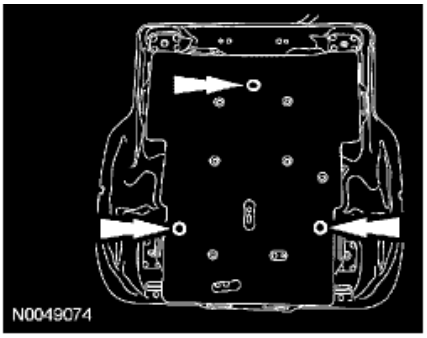
12. Remove the OCSM.

1 Remove the 2 screws from the OCSM.

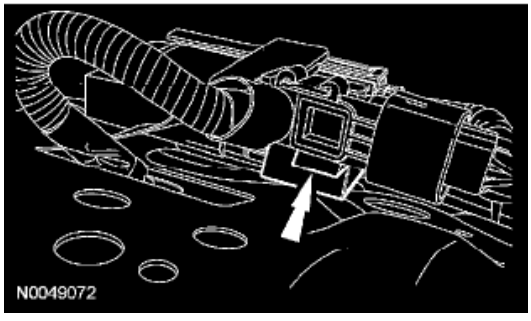
2 Release the OCSM bracket retainer and slide the OCSM off the bracket.

13. CAUTION: A production occupant classification sensor (OCS) bladder is shown. An OCS service kit will have the OCS bladder attached

to the seat cushion foam pad. Do not separate the OCS bladder from the seat cushion foam pad. Failure to do so can result in component failure.



N0049074



N0049072

Release the 3 OCS bladder pin-type retainers from the seat cushion frame.

14. NOTE: Note position of wire routing for installation.

Route the OCS bladder hose and pressure sensor, OCSM and seat wiring harness out through the seat cushion frame opening.

Assembly

Passenger seat

1. WARNING: Install a new occupant classification sensor (OCS) system service kit as a complete assembly. Never install only part of the

kit components. Failure to follow this instruction may result in incorrect operation of the OCS system and increases the risk of serious personal injury or death in a crash.

CAUTION: -

Inspect the occupant classification sensor (OCS) assembly, seat cushion frame and support assembly for any foreign objects before installing the OCS assembly to the seat cushion frame. If any foreign objects are found, remove them. Failure to follow these instructions may result in incorrect OCS system operation or failure.

- Failure to route the seat occupant sensor components through the correct seat cushion support opening can cause component failure.

- While positioning the seat cushion frame and occupant classification sensor assembly, be careful not to damage any of the components. Failure to do so can result in component failure.

NOTE: If the original equipment occupant classification sensor (OCS) is not being installed, install an OCS system service kit using all parts in the kit.

Position the OCS to the seat cushion frame. -

Route the OCS bladder hose and pressure sensor, OCSM and seat wiring harness through the seat cushion frame opening.

2. CAUTION: An occupant classification sensor (OCS) service kit will have the OCS bladder attached to the seat cushion foam pad. Do not

separate the OCS bladder from the seat cushion foam pad. Failure to do so may result in component failure.

Install the 3 OCS bladder pin-type retainers to the seat cushion frame.

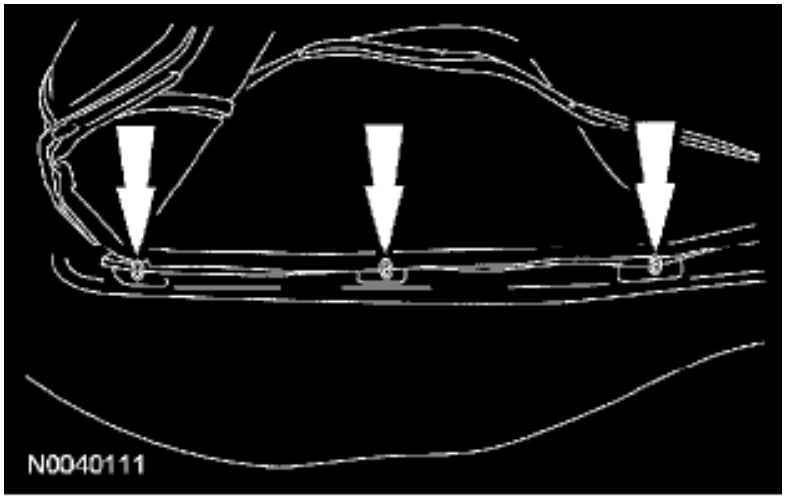
3. Install the OCSM.

- Slide the OCSM back on the OCSM bracket until it is fully seated and locked in past the OCSM bracket retainer.

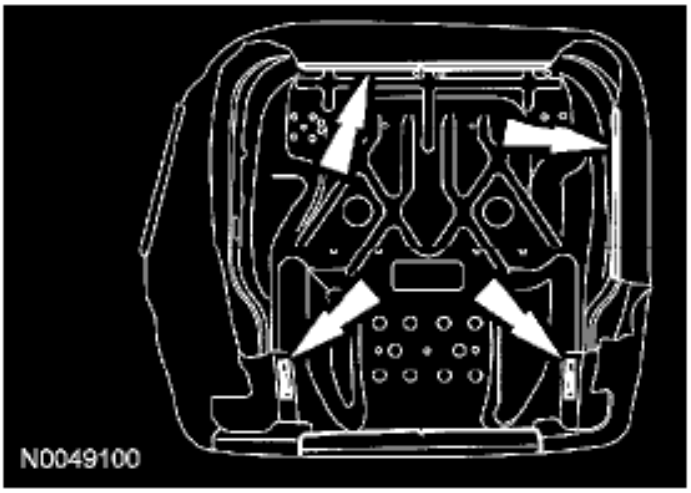
- Install the 2 screws in the OCSM.

4. Slide the pressure sensor on the bracket until it is fully seated and locked in past the bracket retainer.

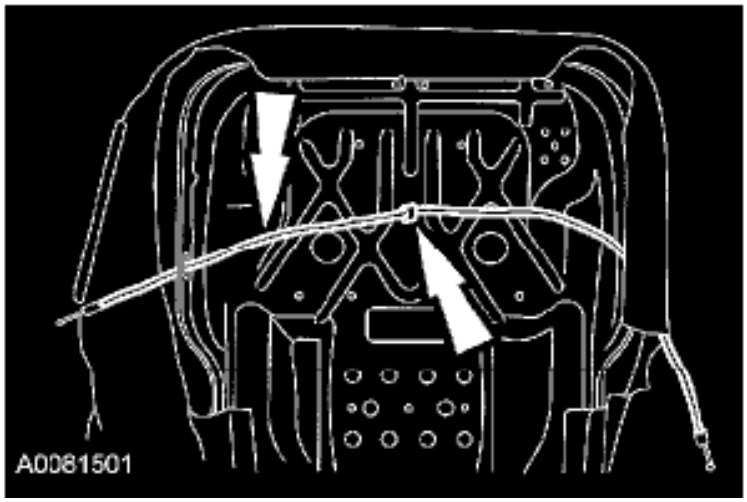
5. Install the 2 seat wiring harness routing clips to the seat cushion frame.



N0040111



N0049100



A0081501

All seats

6. CAUTION: Inspect the seat cushion pad and seat cushion trim cover for any foreign objects, before installing the seat cushion trim cover

to the seat cushion pad. If any foreign objects are found, remove them. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and may cause system failure.

Position the cushion trim cover to the foam pad and install the hog rings.

7. Install the foam pad and cushion trim cover to the cushion frame and fasten the J-clips.

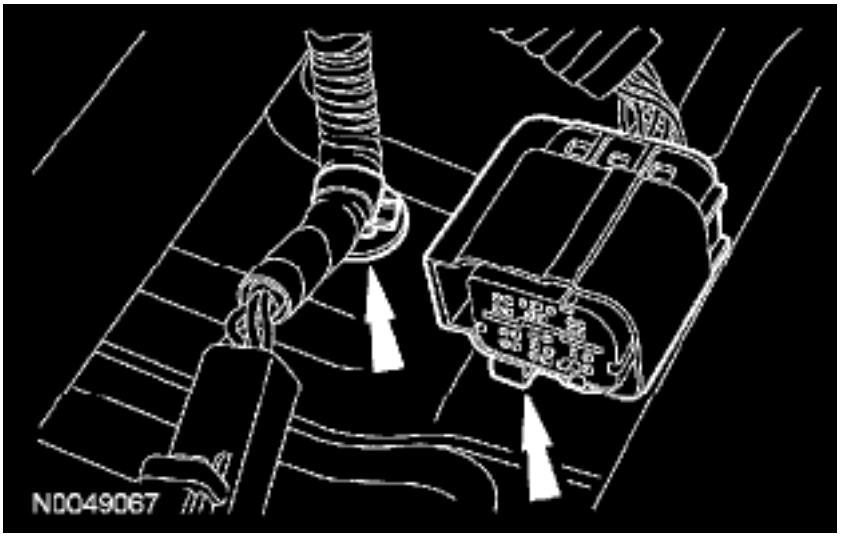
8. Route the backrest latch release cable through the cushion frame and install the pin-type retainer.

Driver seat 9. Install the seat position sensor and 2 screws to the seat track.

All seats 10. Install the seat track assembly and 4 bolts to the cushion frame.

- Tighten to 6 Nm (53 lb-in).

Passenger seat 11. Install the seat wiring harness retainer clip and attach the seat wiring harness connector to the seat cushion frame.



All seats 12. Attach the cushion trim cover rear J-clip. 13. Install the front seat backrest. 14. Install the seat. If a passenger seat has been serviced, do not prove out the SRS at this time.

Passenger seat

15. WARNING:

- Install a new occupant classification sensor (OCS) system service kit as a complete assembly. Never install only part of the kit components. Failure to follow this instruction may result in incorrect operation of the OCS system and increases the risk of serious personal injury or death in a crash.

- Make sure the front passenger seat repair is complete, the seat and all attached components (head restraint, seat side shield, etc.) are correctly assembled, and the seat is correctly installed to the vehicle before carrying out the System Reset. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increases the risk of serious personal injury or death in a crash.

CAUTION: -

To prevent system failure, it is necessary to carry out the occupant classification sensor (OCS) system reset when a front passenger seat cushion is disassembled, a new trim cover installed or an OCS system service kit is installed. A scan tool is used to carry out the OCS system reset command.

- To prevent system failure, the following precautions must be taken before carrying out the occupant classification sensor (OCS) system reset: -

Make sure the voltage to the occupant classification system module (OCSM) is above 8.0 volts and less than 18.0 volts.

- Make sure the OCS system is not at a temperature below 6°C (42°F) or above 36°C (97°F) when initiating the OCS system reset process. If the vehicle has been exposed to extreme cold or hot temperatures, the vehicle must be exposed and kept at a temperature within the limits, 6°C to 36°C (42°F to 97°F) for a minimum of 30 minutes.

- Make sure nothing is present on the passenger seat before carrying out the OCS system reset and nothing is placed on the seat during the process.

- Make sure a minimum 8-second time period has passed after cycling the ignition switch ON before the carrying out the OCS system reset process.

NOTE: If the first attempt to carry out the occupant classification sensor (OCS) system reset is unsuccessful, a second attempt must be made. If the second attempt is unsuccessful, a new OCS system service kit must be installed.

Carry out the OCS system reset active command.

16. NOTE: The ignition switch must be cycled after the OCS system reset.

Cycle the ignition switch from ON to OFF.

All seats 17. Prove out the SRS as follows:

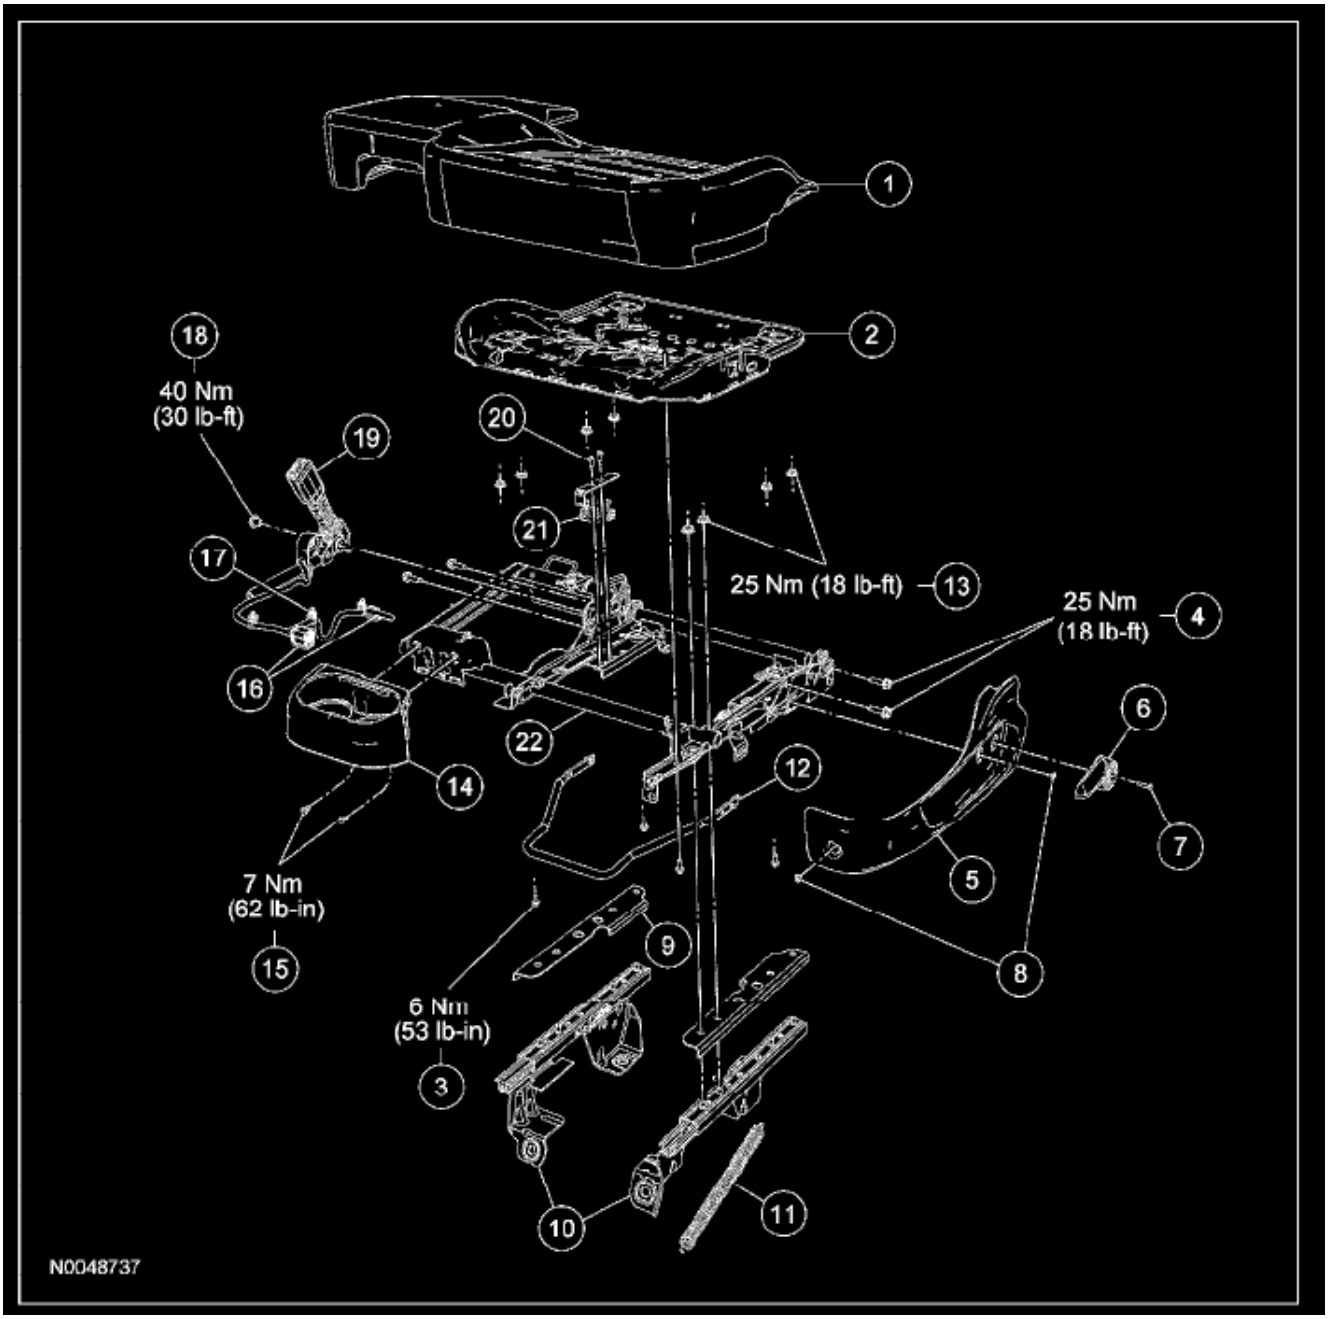
Turn the ignition key from ON to OFF. Wait 10 seconds, then turn the key back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an SRS fault is present, the air bag warning indicator will: -

fail to light.

- remain lit continuously.

- flash at a 5Hz rate (RCM not configured).

The air bag warning indicator may not illuminate until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be



diagnosed and repaired.

Clear all continuous RCM and occupant classification system module (OCSM) DTCs using a scan tool.

Part 2

Disassembly

WARNING: Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.

NOTE: -

The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1. Remove the affected seat. 2. Remove the armrest. 3. Remove the backrest assembly. 4. Remove the seat track. 5. Remove the 2 screws and seat track position sensor from the seat track. 6. Release the remaining trim cover J-clips.

7. NOTE: Note the routing of the seat back latch release cable through the seat cushion frame.

Release the pin-type retainer and remove the seat backrest latch release cable.

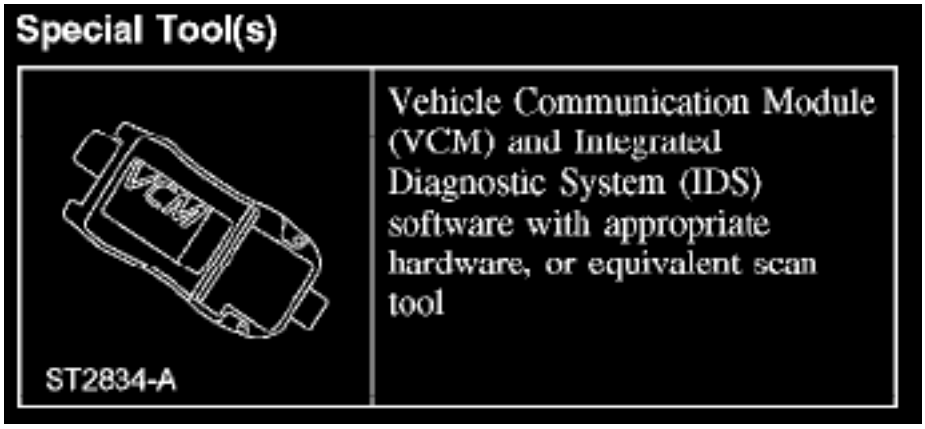
Special Tool(s)



Special Tool(s)

Removal

WARNING: -

Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.

- Make sure the front passenger seat repair is complete, the seat and all attached components (head restraint, seat side shield, etc.) are correctly assembled, and the seat is correctly installed to the vehicle before carrying out the System Reset. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increases the risk of serious personal injury or death in a crash.

CAUTION: To prevent system failure, it is necessary to carry out the occupant classification sensor (OCS) system reset when a front passenger seat cushion is disassembled, a new trim cover installed or an OCS system service kit is installed. A scan tool is used to carry out the OCS system reset command.

NOTE: -

Occupant classification sensor (OCS) system components (seat cushion foam pad, bladder with pressure sensor and occupant classification system module [OCSM]) are calibrated to each other and are serviced as an assembly. The OCS system components are not to be installed separately. If a new OCS system, OCS system component or seat cushion foam pad are needed, a new OCS system service kit (seat cushion foam pad, bladder with pressure sensor, OCSM and seat wiring harness) must be installed as an assembly.

- To identify between a production occupant classification sensor (OCS) system and a OCS system service kit, inspect the occupant classification system module (OCSM) electrical connector.

A production OCS system allows the disconnection of the OCSM electrical connector.

An OCS system service kit has the electrical connector glued to the module, it cannot and should not be disconnected or altered.

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

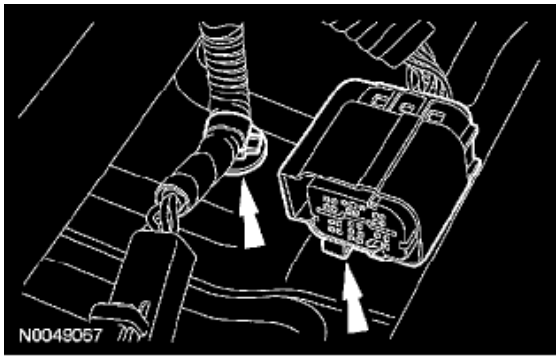
- When installing a new OCS system service kit, refer to Air Bag Systems for the OCS removal and installation procedure.

All seats 1. Remove the affected seat. 2. Remove the affected seat backrest assembly.

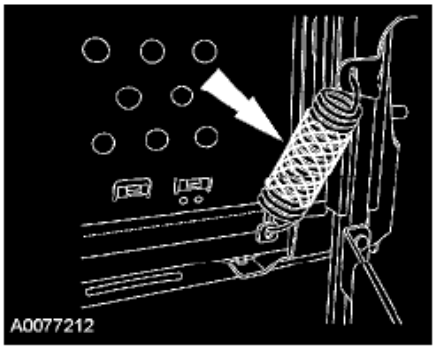
Passenger seat

3. NOTE: Note position of wire routing for installation.

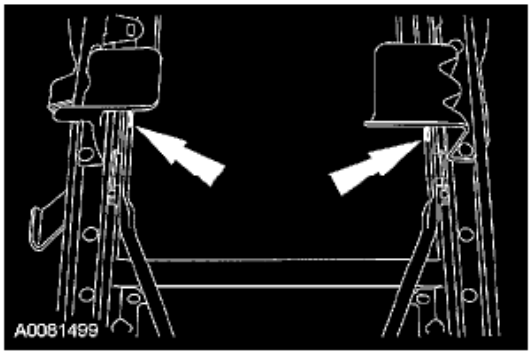
Release the seat wiring harness retainer clip and detach the seat wiring harness connector from the seat cushion frame.



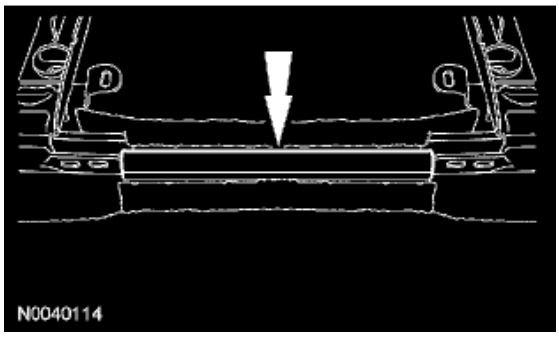
N0049057



A0077212



A0081499



N0040114

All seats 4. Remove the seat track assist spring.

5. Remove the 4 seat track-to-cushion frame bolts and remove the cushion assembly. 6. Remove the seat track adjustment handle.

- Remove one side of the seat track adjustment handle at a time.

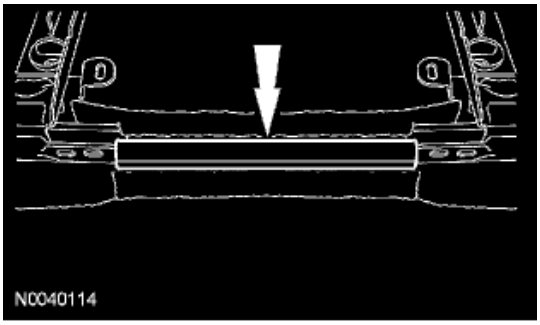
7. Release the cushion trim cover rear J-clip.

8. Remove the 8 rail-to-seat track nuts and separate the seat track rails from the seat track.

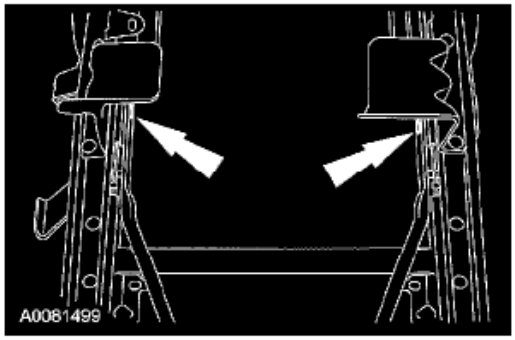
Installation

All seats 1. Install the seat track rails to the seat track and install the 8 nuts.

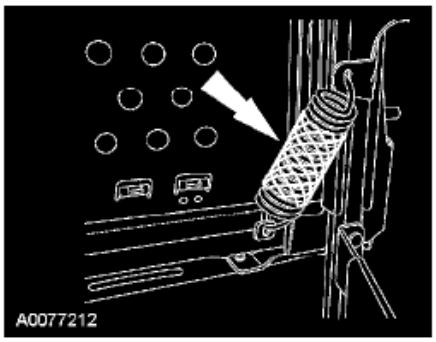
- Tighten to 25 Nm (18 lb-ft).



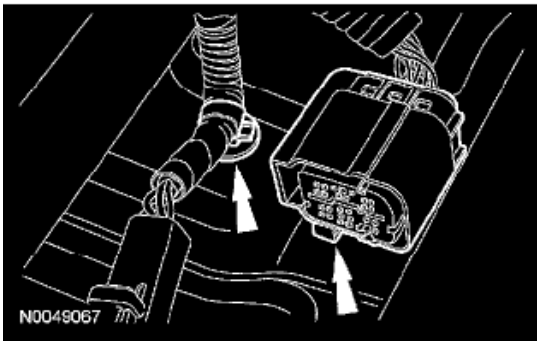
N0040114



A0081499



A0077212



N0049067

2. Fasten the cushion trim cover rear J-clip.

3. Install the seat track adjustment handle.

- Install one side of the seat track adjustment handle at a time.

4. Install the seat track to the cushion assembly and install the 4 seat track-to-cushion frame bolts.

- Tighten to 6 Nm (53 lb-in).

5. Install the seat track spring.

Passenger seat 6. Install the seat wiring harness retainer clip and attach the seat wiring harness connector to the seat cushion frame.

All seats 7. Attach the cushion trim cover rear J-clip.

8. Install the affected seat backrest assembly. 9. Install the seat. If a passenger seat has been serviced, do not prove out the SRS at this time.

Passenger seat

10. WARNING:

- Install a new occupant classification sensor (OCS) system service kit as a complete assembly. Never install only part of the kit components. Failure to follow this instruction may result in incorrect operation of the OCS system and increases the risk of serious personal injury or death in a crash.

- Make sure the front passenger seat repair is complete, the seat and all attached components (head restraint, seat side shield, etc.) are correctly assembled, and the seat is correctly installed to the vehicle before carrying out the System Reset. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increases the risk of serious personal injury or death in a crash.

CAUTION: -

To prevent system failure, it is necessary to carry out the occupant classification sensor (OCS) system reset when a front passenger seat cushion is disassembled, a new trim cover installed or an OCS system service kit is installed. A scan tool is used to carry out the OCS system reset command.

- To prevent system failure, the following precautions must be taken before carrying out the occupant classification sensor (OCS) system reset: -

Make sure the voltage to the occupant classification system module (OCSM) is above 8.0 volts and less than 18.0 volts.

- Make sure the OCS system is not at a temperature below 6°C (42°F) or above 36°C (97°F) when initiating the OCS system reset process. If the vehicle has been exposed to extreme cold or hot temperatures, the vehicle must be exposed and kept at a temperature within the limits, 6°C to 36°C (42°F to 97°F) for a minimum of 30 minutes.

- Make sure nothing is present on the passenger seat before carrying out the OCS system reset and nothing is placed on the seat during the process.

- Make sure a minimum 8-second time period has passed after cycling the ignition switch ON before the carrying out the OCS system reset process.

NOTE: If the first attempt to carry out the occupant classification sensor (OCS) system reset is unsuccessful, a second attempt must be made. If the second attempt is unsuccessful, a new OCS system service kit must be installed.

Carry out the OCS system reset active command.

11. NOTE: The ignition switch must be cycled after the OCS system reset.

Cycle the ignition switch from ON to OFF.

All seats 12. Prove out the SRS as follows:

Turn the ignition key from ON to OFF. Wait 10 seconds, then turn the key back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an SRS fault is present, the air bag warning indicator will: -

fail to light.

- remain lit continuously.

- flash at a 5Hz rate (RCM not configured).

The air bag warning indicator may not illuminate until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.

Clear all continuous RCM and occupant classification system module (OCSM) DTCs using a scan tool.

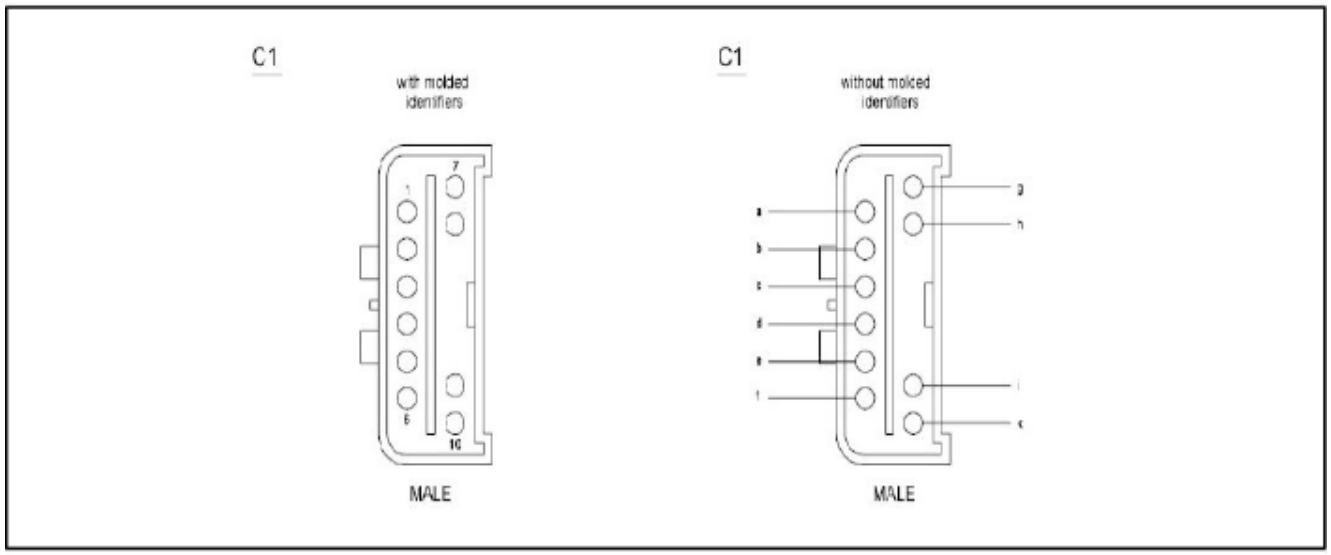
Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

Power Mirror Switch: Service and Repair

EXTERIOR MIRROR CONTROL SWITCH

Removal and Installation

1. Remove the 2 interior door handle trim panel screws. 2. Remove the interior door handle trim panel.

- Lift the interior door handle trim panel upward to release the interior door handle trim panel retaining clips.

3. Remove the exterior mirror control switch.

- Disconnect the electrical connector.

- Press the 2 exterior mirror control switch retaining tabs.

- Remove the exterior mirror control switch from the interior door handle trim panel.

4. To install, reverse the removal procedure.

Sound Proofing / Insulation: Description and Operation

INSULATION

Insulation is used as a sound-deadener to reduce exterior road and powertrain noises from the interior of the vehicle. Mastic insulators are also used as insulation. For information on the location of the mastic insulators, refer to Sound Proofing / Insulation. Insulation is installed:

- under the roof.

- above and below the instrument panel.

- at the cowl side panels.

- over the transmission tunnel.

- over the floor pans.

Tailgate Latch: Service and Repair

TAILGATE LATCH

Exploded View

Removal and Installation

1. Remove the 8 screws and the tailgate access cover.

- To install, tighten to 5 Nm (44 lb-in).

2. Open the tailgate latch actuating rod retainer and disconnect the tailgate latch actuating rods from the tailgate latch remote control. 3. Disconnect the tailgate support cables from the pickup bed strikers. 4. Remove the 2 tailgate latch bolts.

- To install, tighten to 30 Nm (22 lb-ft).

5. Position the tailgate latch aside. 6. Disconnect the tailgate latch actuating rod and remove the tailgate latch.

7. NOTE: Prior to installation, remove the slack in the tailgate latch release link by pulling the tailgate latch release link to the center of the tailgate.

Close the tailgate latch rod retainer over the thread of the tailgate latch release link.

To install, reverse the removal procedure.

Truck Bed: Adjustments Pickup Bed Alignment

PICKUP BED ALIGNMENT

1. NOTE: The pickup bed bolts are not identical and new bolts must be installed in the same location that they were removed from.

Remove the 6 pickup bed bolts. Discard the bolts.

2. Center the pickup bed on the rear of the pickup cab. 3. Set the gap between the leading edge of the pickup bed and the back of the cab.

4. Tighten the 6 pickup bed bolts.

- To install, tighten to 63 Nm (46 lb-ft).

Truck Bed: Adjustments Pickup Bed Lean

PICKUP BED LEAN

1. Check the vehicle ride height. 2. Measure and record the distance from the top center of both wheel well lips and calculate the difference. 3. If the difference between the 2 sides is between 0 and 13 mm (0 and 0.5 in), do nothing. The vehicle is within specification. 4. If the difference between the 2 measurements is between 13 and 19.5 mm (0.5 and 0.75 in) shim the pickup bed to the frame. For additional

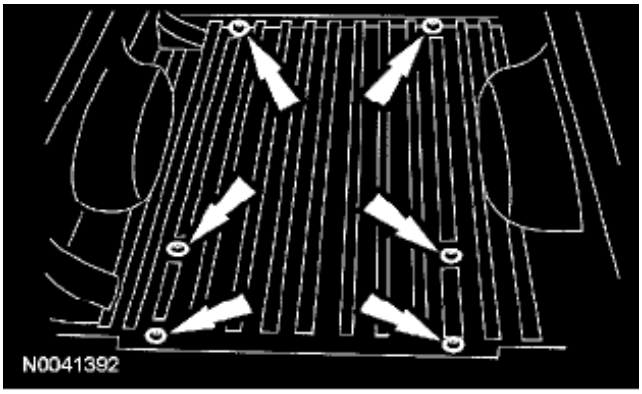
information, refer to Pickup Bed Shimming. See: Pickup Bed Shimming

5. If the difference between the 2 measurements is greater than 19.5 mm (0.75 in):

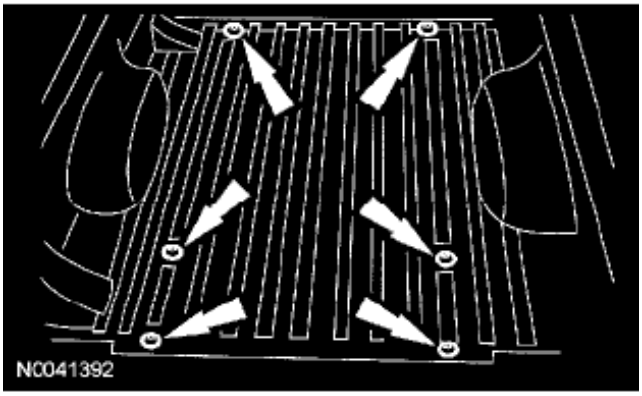
- First shim the axle. -

If additional shimming is needed, shim the pickup bed to the frame. Refer to Pickup Bed Shimming. See: Pickup Bed Shimming

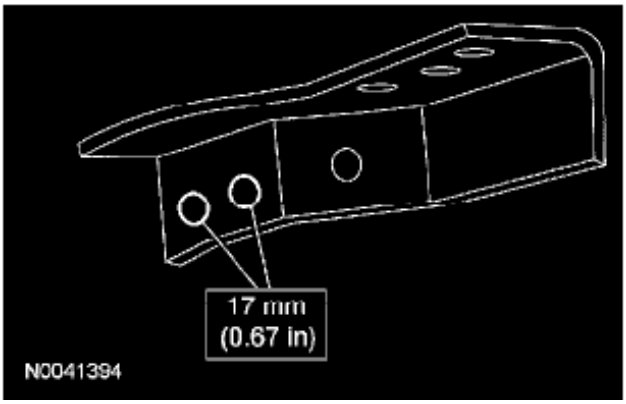
6. If necessary, align the pickup bed. For additional information, refer to Pickup Bed Alignment. See: Pickup Bed Alignment



N0041392



N0041392



17 mm
(0.67 in)
N0041394

Truck Bed: Adjustments Pickup Bed Shimming

PICKUP BED SHIMMING

1. Determine if the pickup bed requires shimming. For additional information, refer to Pickup Bed Lean. See: Pickup Bed Lean

2. NOTE: The pickup bed bolts are not identical and new bolts must be installed in the same location that they were removed from.

Remove the pickup bed bolts. Discard the bolts.

3. Raise the low side of the pickup bed and install the 3 mm (0.12 in) shims between the top of the frame and the bottom of the pickup box

crossmembers. -

Stack the shims as necessary to achieve the desired spacing. It may be necessary to shim both rear bolts on one side to avoid buckling the box when tightening the bolts.

- Paint the shims with frame wax or black paint.

4. Tighten the pickup bed bolts.

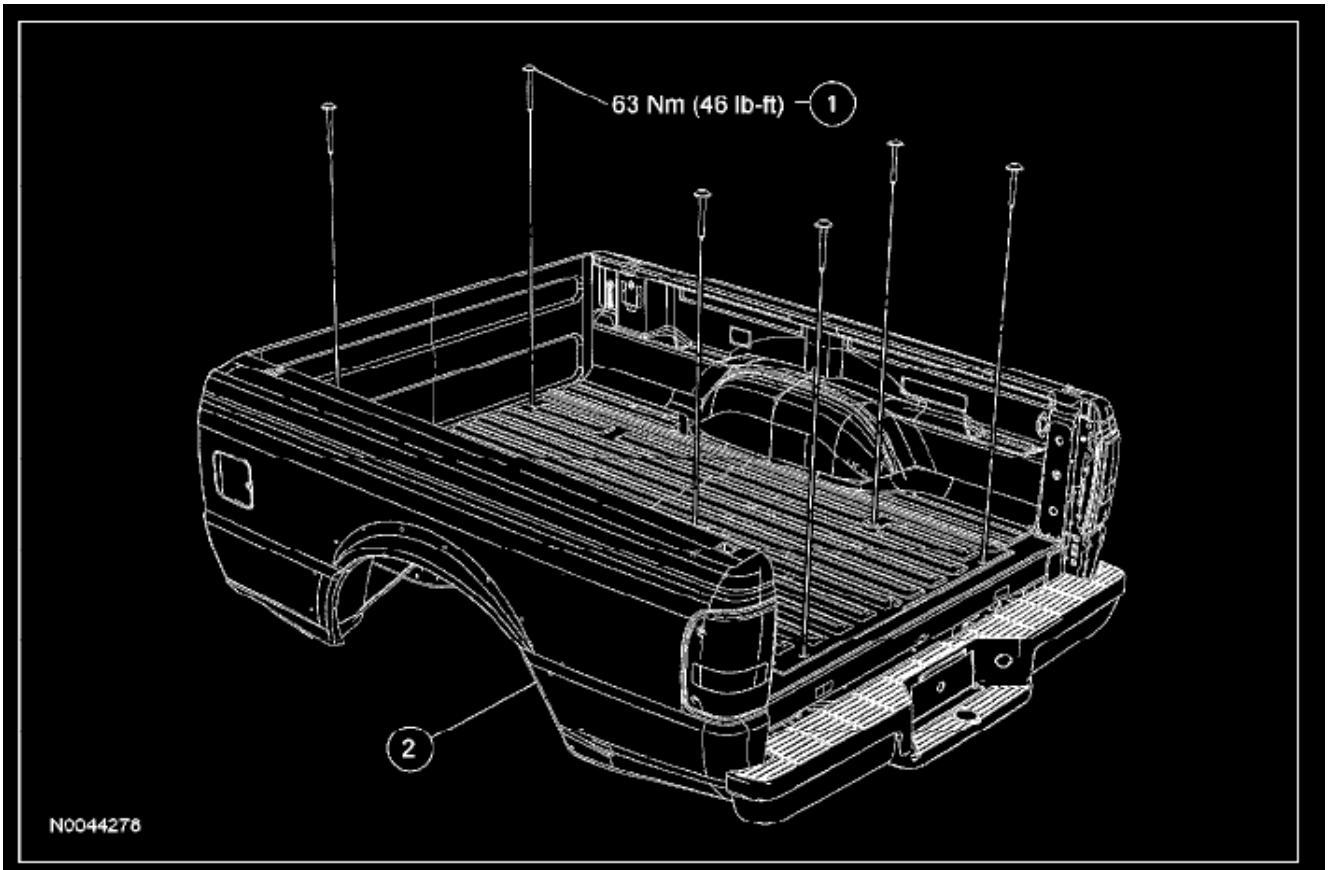
- To install, tighten to 63 Nm (46 lb-ft).

5. If necessary, align the pickup bed. For additional information, refer to Pickup Bed Alignment. See: Pickup Bed Alignment 6. Recheck the vehicle lean. For additional information, refer to Pickup Bed Lean. See: Pickup Bed Lean 7. If necessary, realign the rear bumper. Remove the rear bumper brackets. 8. Ream the holes in the rear bumper bracket for the rear bumper bolts.

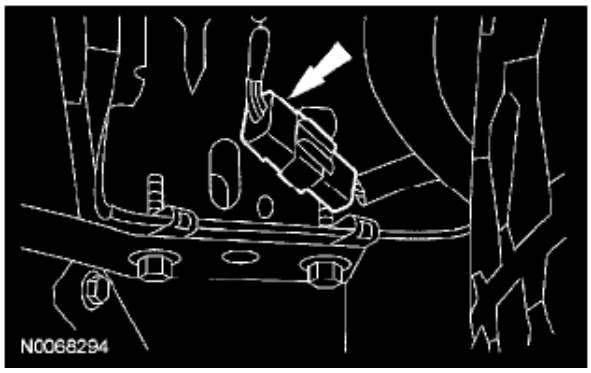
9. Install the rear bumper brackets.

10. NOTE: When installing the rear bumper, be sure to align the bumper with the pickup bed.

Install the rear bumper.



Item	Part Number	Description
1	N806251	Pickup bed bolt (6 required)
2	9928508	Pickup bed assembly



Truck Bed: Service and Repair

PICKUP BED

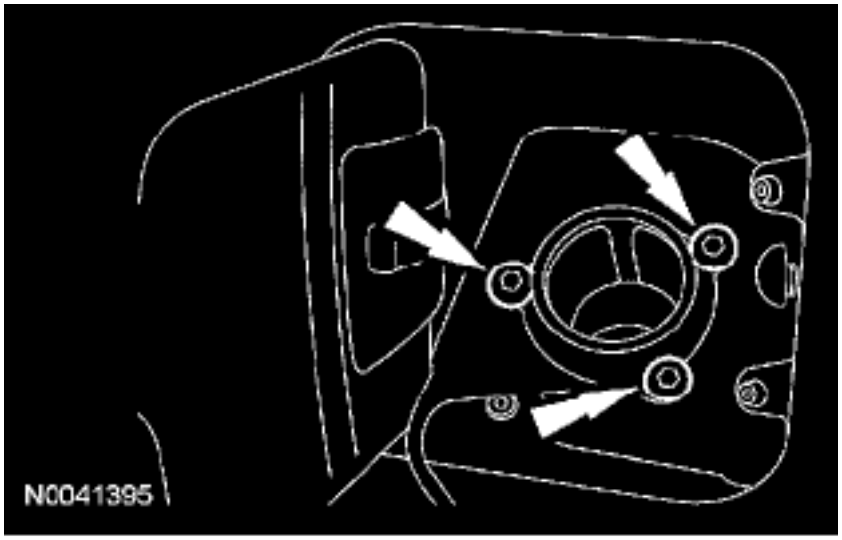
Removal and Installation

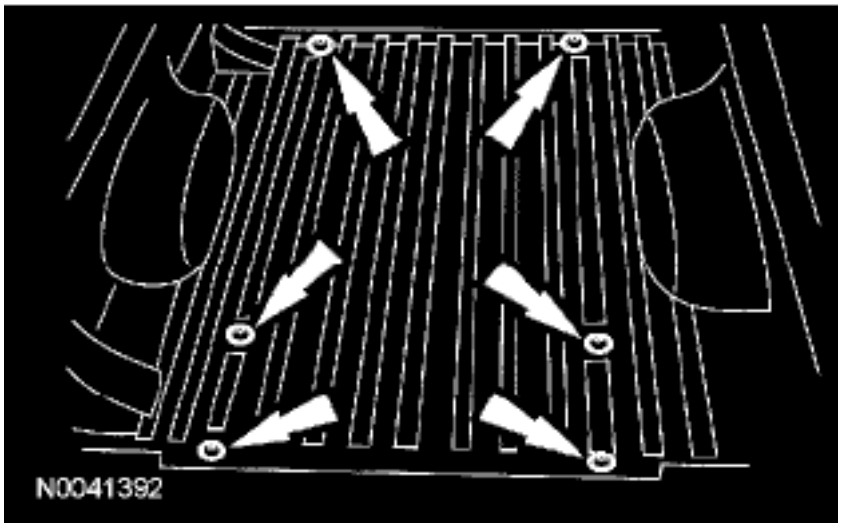
1. Remove the tailgate. 2. Disconnect the taillamp wiring harness electrical connector.

3. Remove the fuel filler cap.

4. NOTE: Mark the position of the fuel filler cap tether for correct installation.

Remove the fuel filler neck screws.





5. NOTE: The pickup bed bolts are not identical and new bolts must be installed in the same location that they were removed from.

Remove the pickup bed bolts. Discard the bolts. -

To install, tighten to 63 Nm (46 lb-ft).

6. NOTE: Lifting the pickup bed requires at least 2 people on each side.

Remove the pickup bed.

7. Inspect the J-nuts for damage. Install new J-nuts if they are damaged. 8. To install, reverse the removal procedure.

C278

Brake Switch (Cruise Control): Description and Operation

Brake Pedal Position (BPP) Switch

Typical BPP Switch

The BPP switch is sometimes referred to as the stoplamp switch. The BPP switch provides a signal to the PCM indicating that the brakes are applied. The BPP switch is normally open and is mounted on the brake pedal support. Depending on the vehicle application the BPP switch can be hardwired as follows: -

to the PCM supplying battery positive voltage (B+) when the vehicle brake pedal is applied.

- to the antilock brake system (ABS) module, or lighting control module (LCM), the BPP signal is then broadcast over the network to be received by the PCM.

- to the ABS traction control/stability assist module. The ABS module interprets the BPP switch input along with other ABS inputs and generates an output called the driver brake application (DBA) signal. The DBA signal is then sent to the PCM and to other BPP signal users.

Brake Pedal Switch (BPS)/Brake Deactivator Switch

The BPS, also called the brake deactivator switch, is for vehicle speed control deactivation. A normally closed switch supplies battery positive voltage (B+) to the PCM when the brake pedal is not applied. When the brake pedal is applied, the normally closed switch opens and power is removed from the PCM.

On some applications the normally closed BPS, along with the normally open BPP switch, are used for a brake rationality test within the PCM. The PCM misfire monitor profile learn function may be disabled if a brake switch concern occurs. If one or both brake pedal inputs to the PCM is not changing states when they were expected to, a diagnostic trouble code (DTC) is set by the PCM strategy.

Brake Switch (Cruise Control): Service and Repair

SPEED CONTROL DEACTIVATOR SWITCH

Removal and Installation

1. CAUTION: Do not press the brake pedal when removing or installing the speed control deactivator switch or damage to the switch will

occur.

Disconnect the speed control deactivator switch electrical connector.

2. Rotate the speed control deactivator switch counterclockwise 45 degrees and remove it.

- Disconnect the electrical connector.

3. NOTE: The speed control deactivator switch is self-adjusting. Do not press the brake pedal during installation. Initial installation of the speed

control deactivator switch allows for one adjustment. If additional adjustments are necessary, install a new speed control deactivator switch.

To install, reverse the removal procedure.

Clutch Switch: Description and Operation

CLUTCH PEDAL POSITION (CPP) SWITCH

Typical Clutch Pedal Position (CPP) Switch

The CPP switch is an input to the PCM indicating the clutch pedal position. The PCM provides a low current voltage on the CPP circuit. When the CPP switch is closed, this voltage is pulled low through the SIG RTN circuit. The CPP input to the PCM is used to detect a reduction in engine load. The PCM uses the load information for mass air flow and fuel calculations.

Cruise Control Servo: Service and Repair

SPEED CONTROL ACTUATOR

Removal and Installation

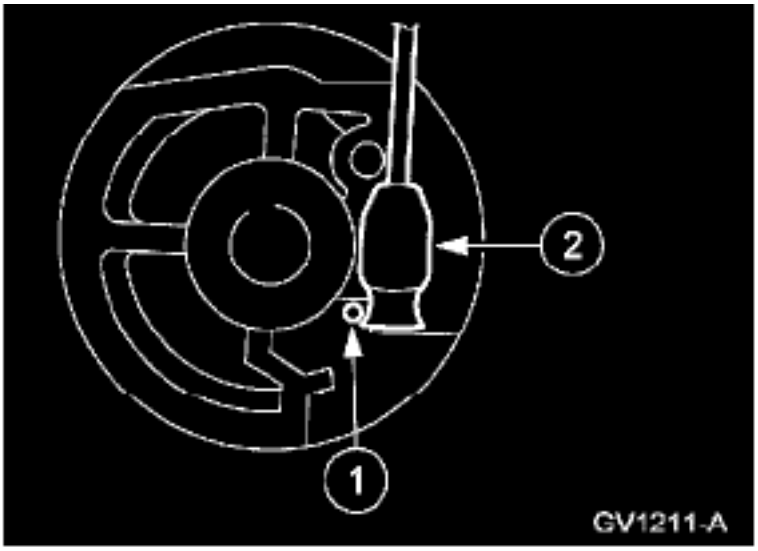
1. Disconnect the speed control actuator electrical connector. 2. Remove the speed control cable cap from the speed control actuator.

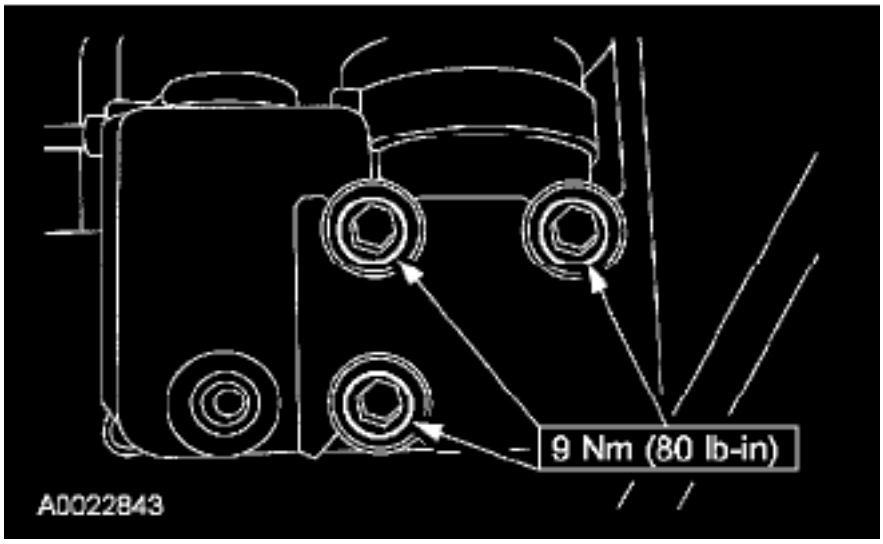
- Push in the locking arm on the speed control cable cap and rotate the cap counterclockwise.

3. Remove the speed control cable.

1 Press the spring retainer.

2 Slide the core wire end out of the speed control actuator pulley and remove the speed control cable.





4. Remove the bolt and the speed control actuator and bracket assembly.

- To install, tighten to 11 Nm (8 lb-ft).

5. Remove the 3 bolts and separate the speed control actuator bracket from the speed control actuator.

- To install, tighten to 9 Nm (80 lb-in).

6. NOTE: Make sure the rubber seal is fully seated onto the speed control cable cap.

To install, reverse the removal procedure.

NOTE: 4.0L shown, others similar.

7. Separate the speed control cable from the intake manifold.

1 Disconnect the cable from the throttle lever.

2 Press the locking tabs and separate the speed control cable from the intake manifold.

All vehicles

8. Remove the speed control cable cap from the speed control actuator.

- Push in the locking arm on the speed control cable cap then rotate the cap counterclockwise.

9. Remove the speed control cable.

1 Press the spring retainer.

2 Slide the core wire end out of the speed control actuator pulley and remove the speed control cable.

10. NOTE: Make sure the rubber seal is fully seated onto the speed control cable cap.

To install, reverse the removal procedure.

C278

Brake Switch (Cruise Control): Description and Operation

Brake Pedal Position (BPP) Switch

Typical BPP Switch

The BPP switch is sometimes referred to as the stoplamp switch. The BPP switch provides a signal to the PCM indicating that the brakes are applied. The BPP switch is normally open and is mounted on the brake pedal support. Depending on the vehicle application the BPP switch can be hardwired as follows: -

to the PCM supplying battery positive voltage (B+) when the vehicle brake pedal is applied.

- to the antilock brake system (ABS) module, or lighting control module (LCM), the BPP signal is then broadcast over the network to be received by the PCM.

- to the ABS traction control/stability assist module. The ABS module interprets the BPP switch input along with other ABS inputs and generates an output called the driver brake application (DBA) signal. The DBA signal is then sent to the PCM and to other BPP signal users.

Brake Pedal Switch (BPS)/Brake Deactivator Switch

The BPS, also called the brake deactivator switch, is for vehicle speed control deactivation. A normally closed switch supplies battery positive voltage (B+) to the PCM when the brake pedal is not applied. When the brake pedal is applied, the normally closed switch opens and power is removed from the PCM.

On some applications the normally closed BPS, along with the normally open BPP switch, are used for a brake rationality test within the PCM. The PCM misfire monitor profile learn function may be disabled if a brake switch concern occurs. If one or both brake pedal inputs to the PCM is not changing states when they were expected to, a diagnostic trouble code (DTC) is set by the PCM strategy.

Brake Switch (Cruise Control): Service and Repair

SPEED CONTROL DEACTIVATOR SWITCH

Removal and Installation

1. CAUTION: Do not press the brake pedal when removing or installing the speed control deactivator switch or damage to the switch will

occur.

Disconnect the speed control deactivator switch electrical connector.

2. Rotate the speed control deactivator switch counterclockwise 45 degrees and remove it.

- Disconnect the electrical connector.

3. NOTE: The speed control deactivator switch is self-adjusting. Do not press the brake pedal during installation. Initial installation of the speed

control deactivator switch allows for one adjustment. If additional adjustments are necessary, install a new speed control deactivator switch.

To install, reverse the removal procedure.

Typical Clutch Pedal Position (CPP) Switch

Clutch Switch: Description and Operation

CLUTCH PEDAL POSITION (CPP) SWITCH

Typical Clutch Pedal Position (CPP) Switch

The CPP switch is an input to the PCM indicating the clutch pedal position. The PCM provides a low current voltage on the CPP circuit. When the CPP switch is closed, this voltage is pulled low through the SIG RTN circuit. The CPP input to the PCM is used to detect a reduction in engine load. The PCM uses the load information for mass air flow and fuel calculations.

Air Bag Deactivation Indicator: Service and Repair

PASSENGER AIR BAG DEACTIVATION (PAD) INDICATOR

Removal and Installation

NOTE:

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

- Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

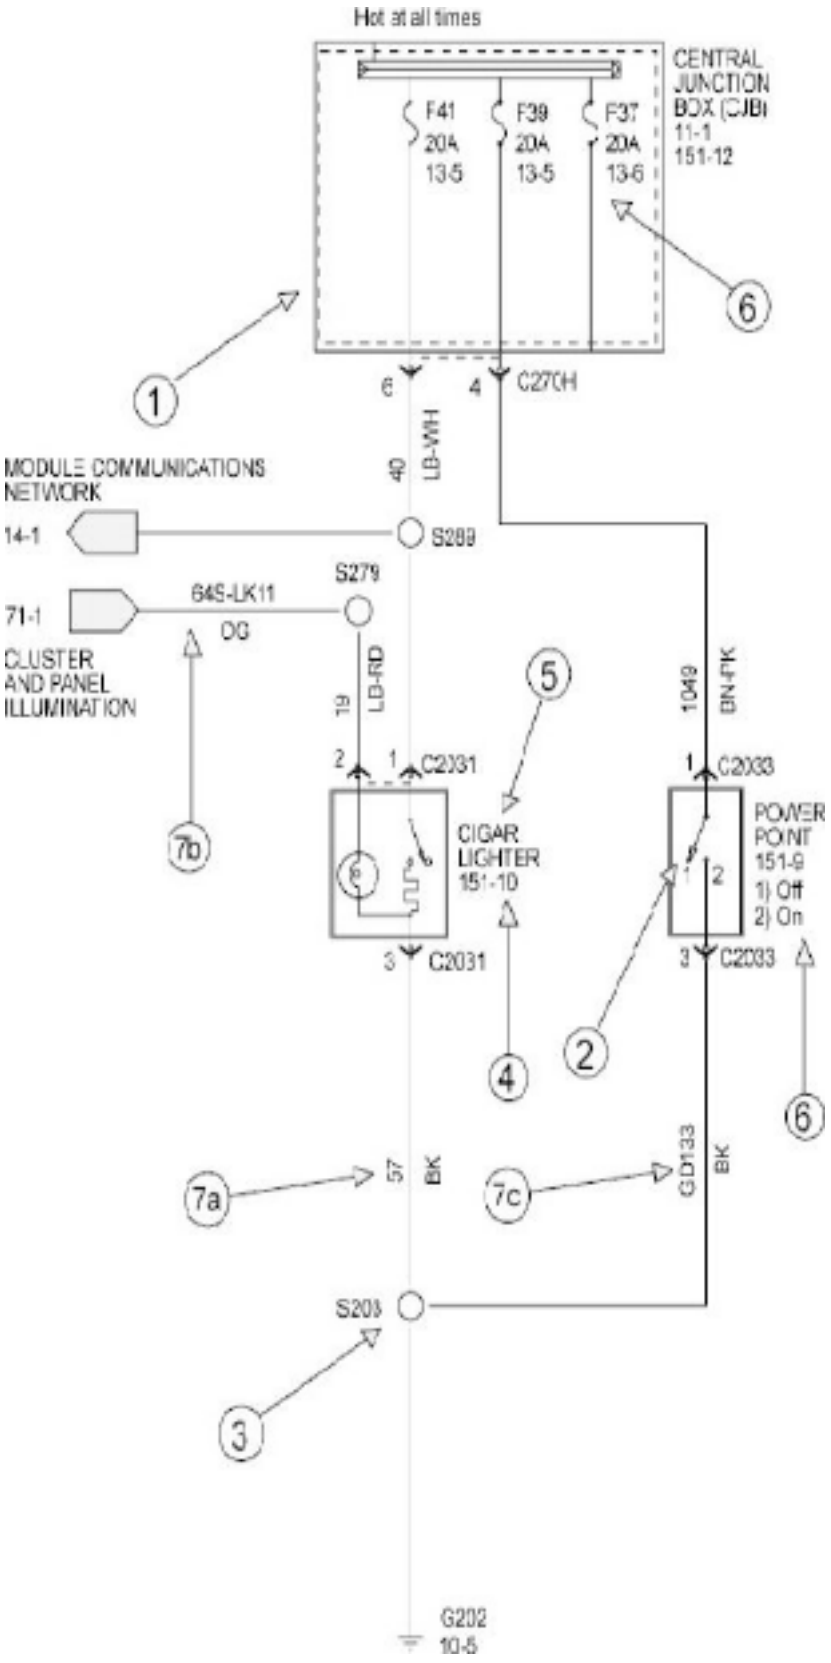
1. Depower the SRS. 2. Remove the 2 instrument panel (I/P) center finish panel screws. 3. Pull out to detach the 4 retaining clips and partially remove the I/P center trim panel. 4. Disconnect the passenger air bag deactivation (PAD) indicator electrical connector. 5. Remove the 2 screws from the PAD indicator and remove it from the I/P center finish panel. 6. To install, reverse the removal procedure. 7. Repower the SRS.

Audible Warning Device: Description and Operation

WARNING SYSTEM - DRIVER SAFETY BELT

The driver safety belt buckle incorporates a safety belt warning indicator switch, warning indicator and chime. The warning indicator and chime are reminders to fasten the safety belt.

Ford Ranger 2wd Workshop Manual (V6-3.0L (2008))
Ford Workshop Manuals > Instrument Panel, Gauges and Warning Indicators > Cigarette Lighter > Component Information > Diagrams > Diagram Information and Instructions



Cigarette Lighter: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

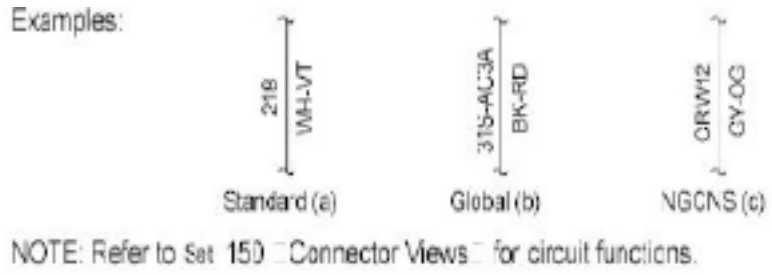
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

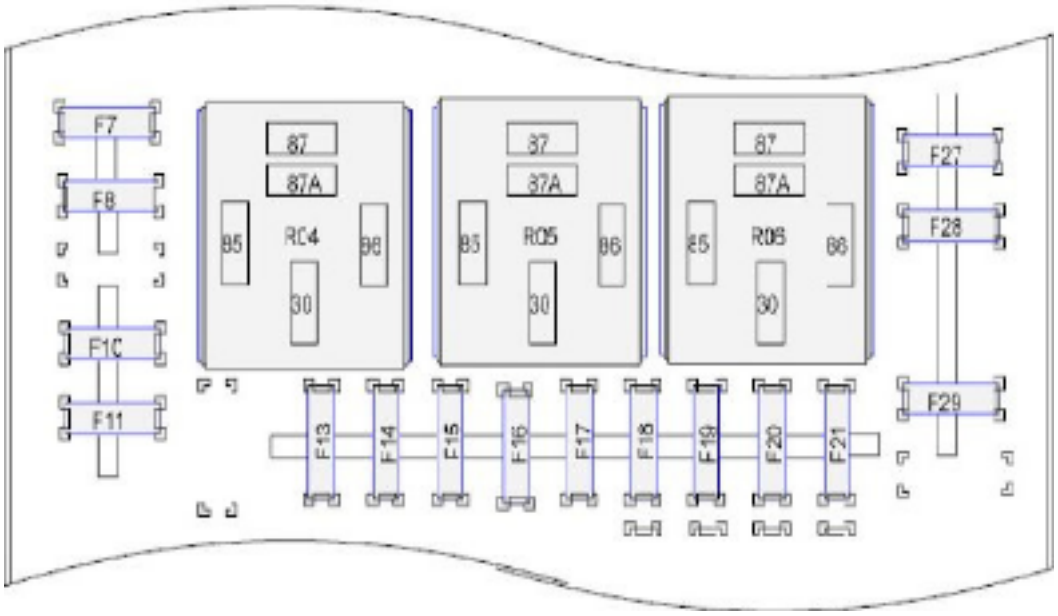
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

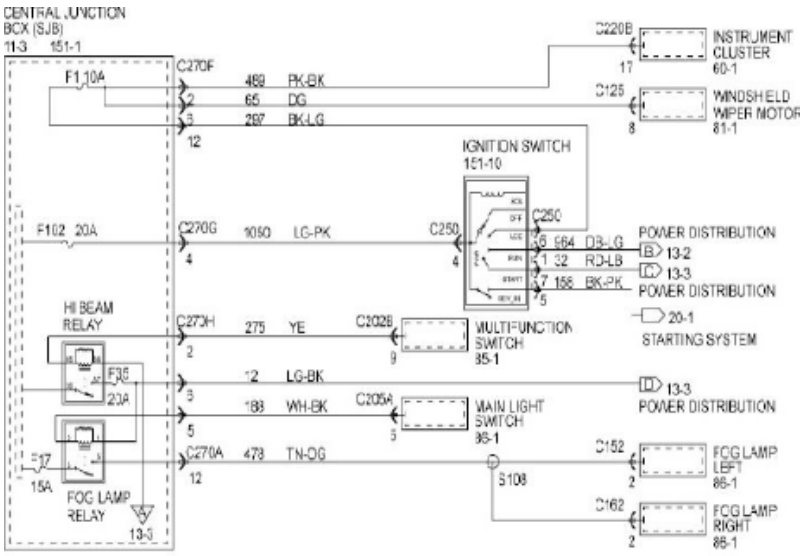
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

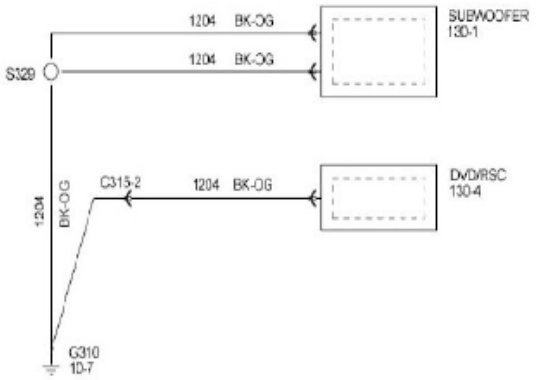
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

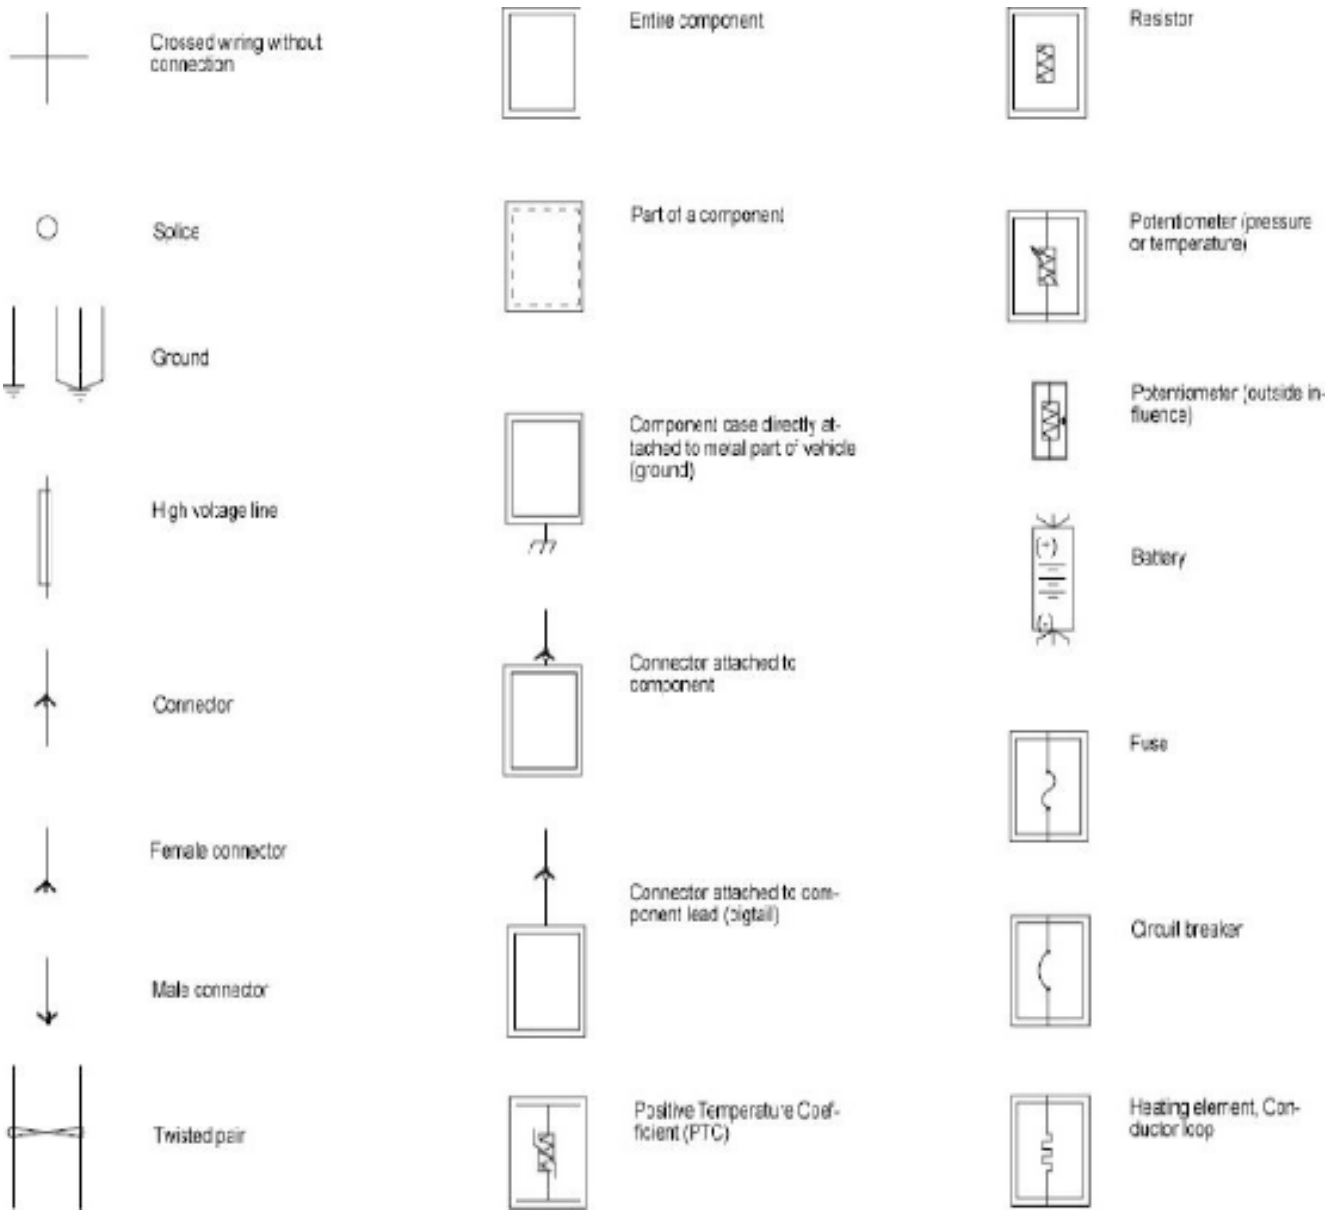
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

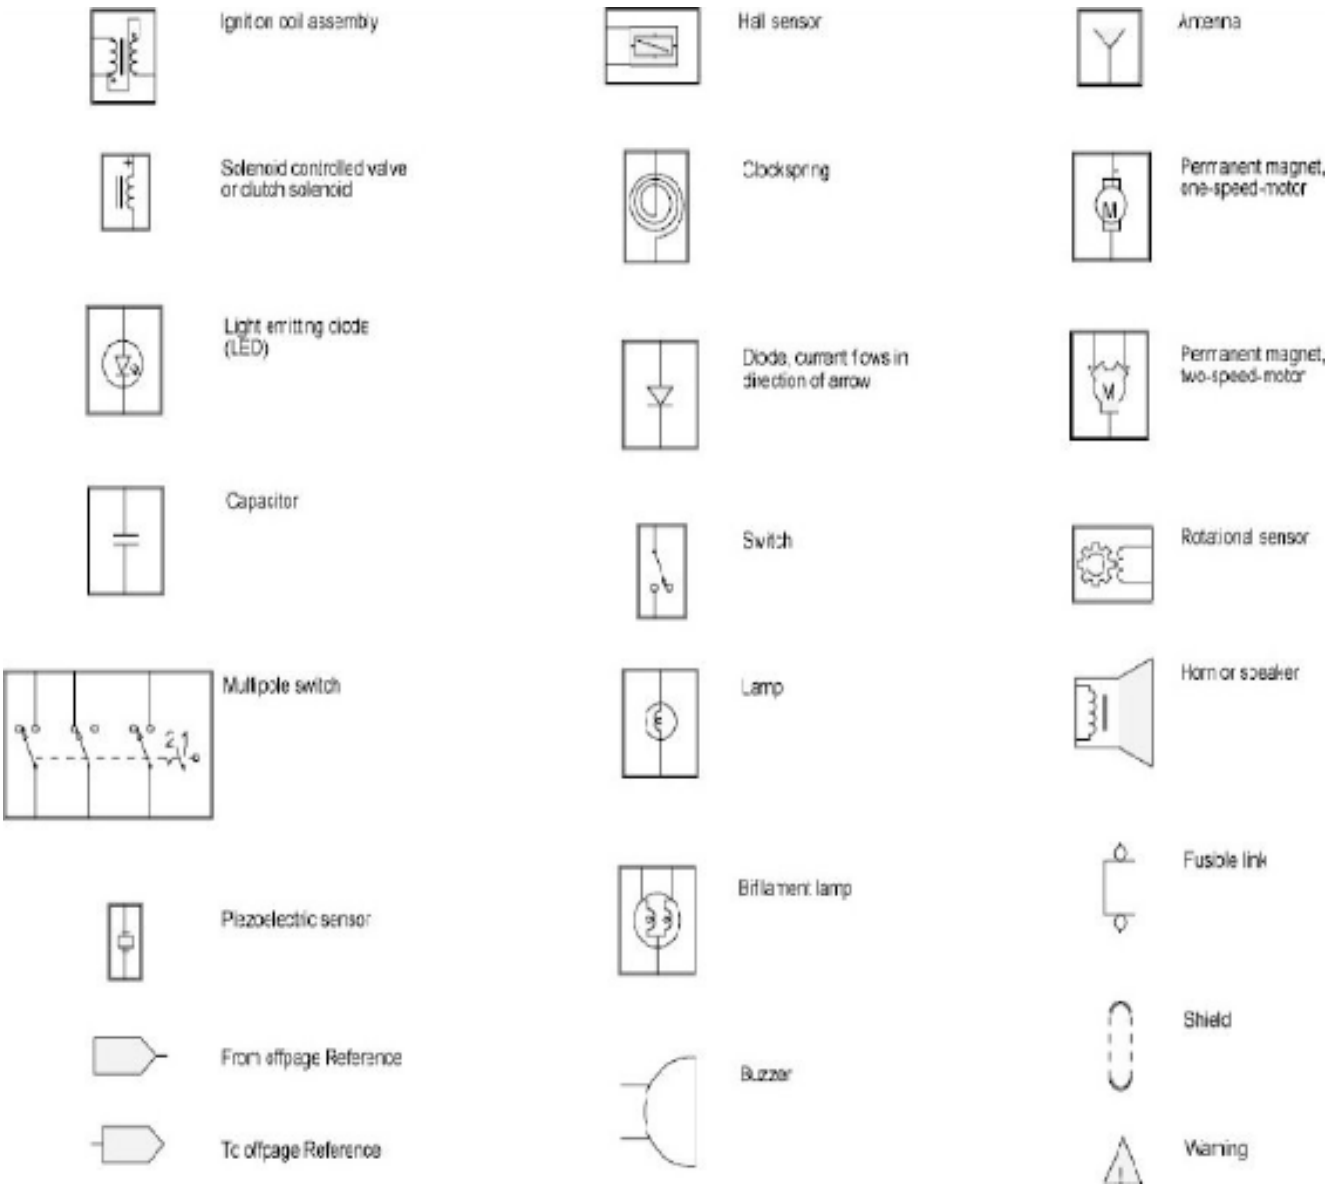
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

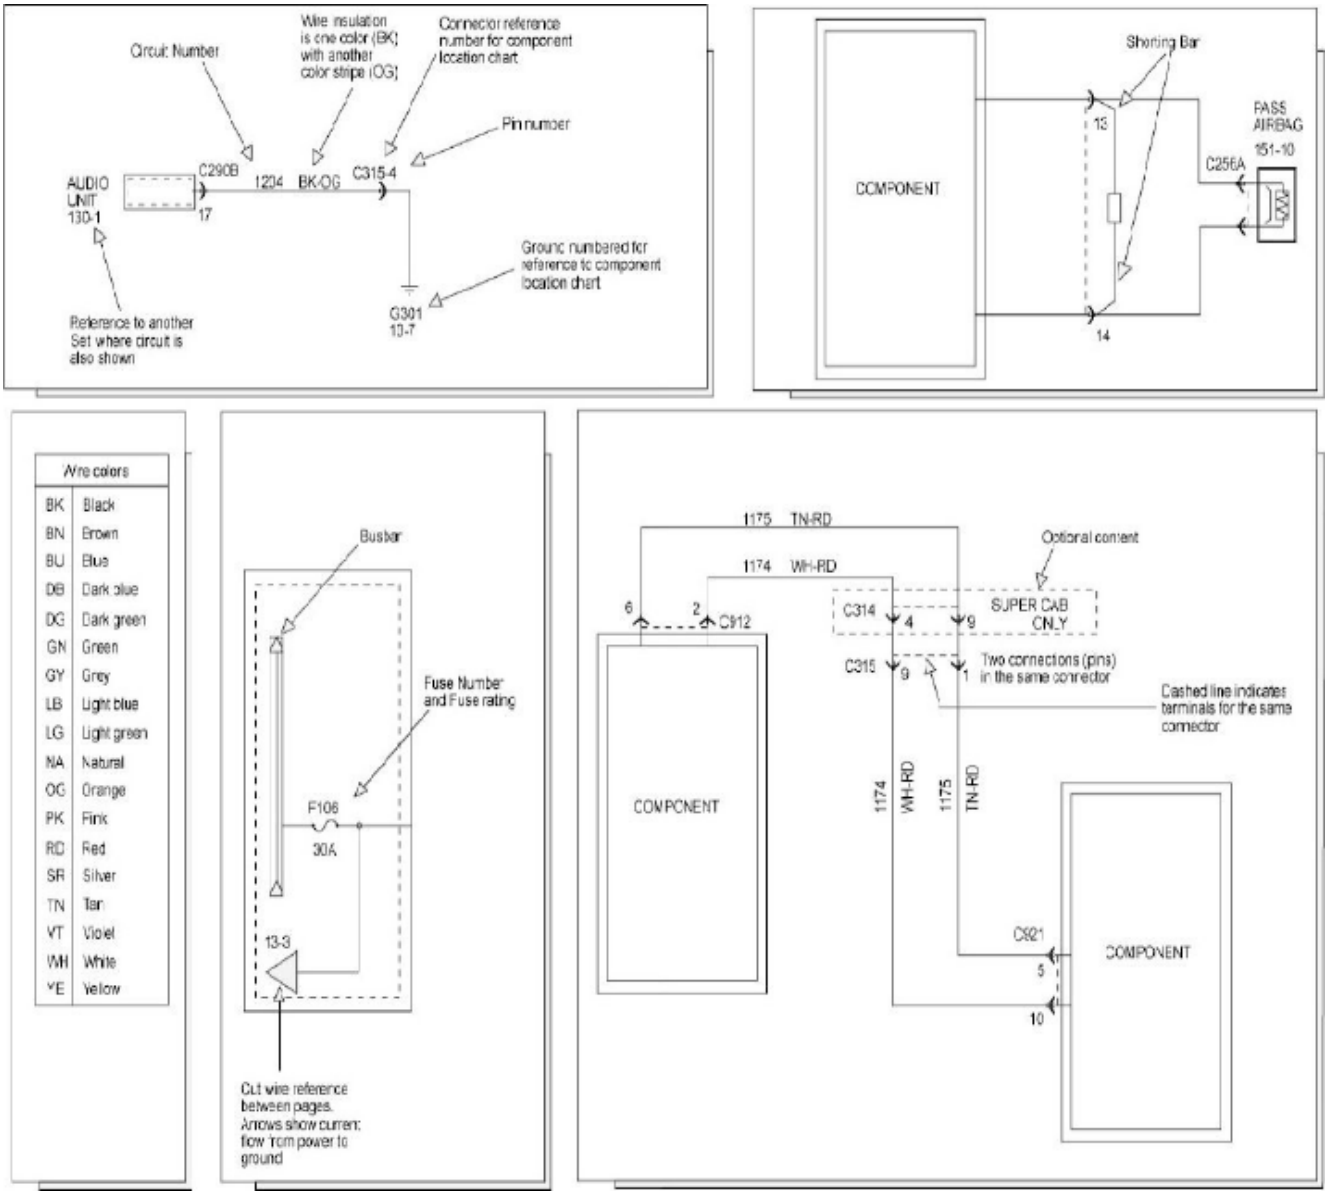
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

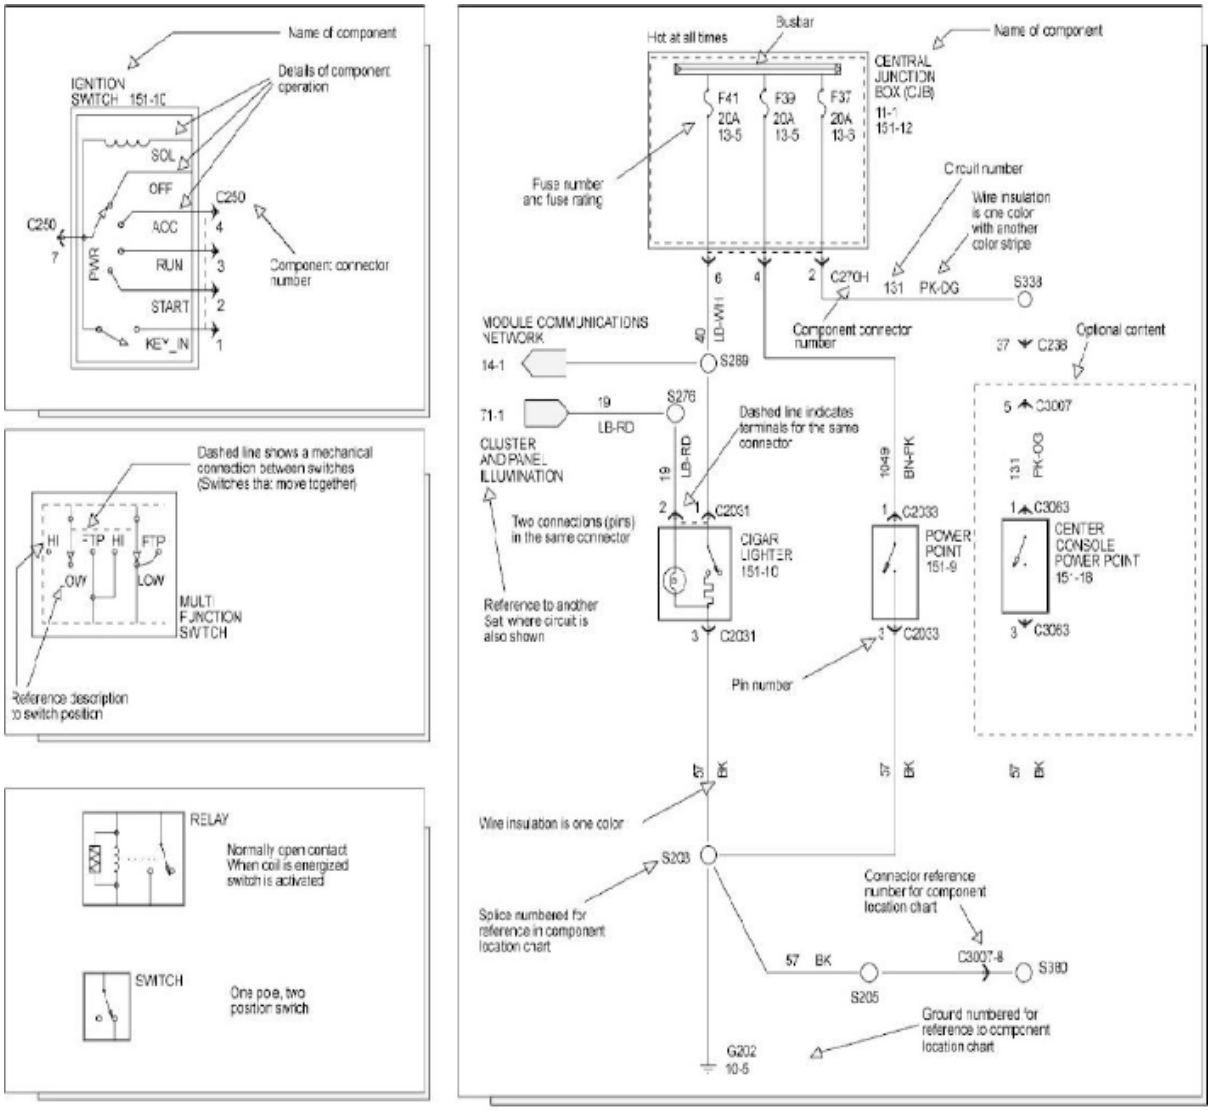
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel

Cigarette Lighter: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

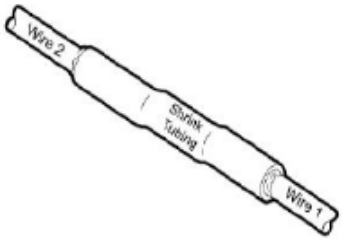
NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.



Wire 2

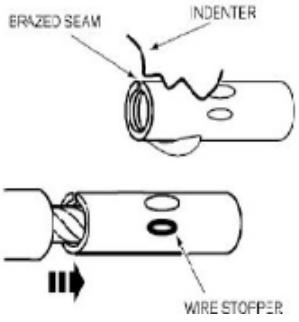
22-18
CRIMPING CHAMBER



BRAZED SEAM
INDENTER
WIRE STOPPER

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

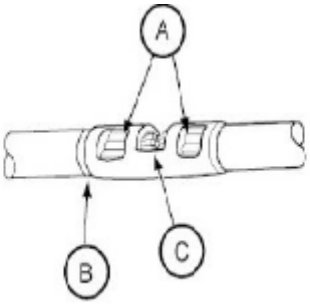
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

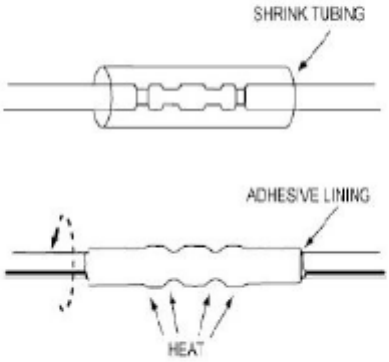
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4□ strip, cut 9 strands	* 1/4□ strip, cut 2 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip, fold 3x dia.
	16-14	* 1/4□ strip, cut 7 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip fold 2x dia	1□ strip, fold 3x dia.	1 1/4□ strip, fold 4x dia.	Not Recommended
	12-10	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip fold 3x cia.	1 1/4□ strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

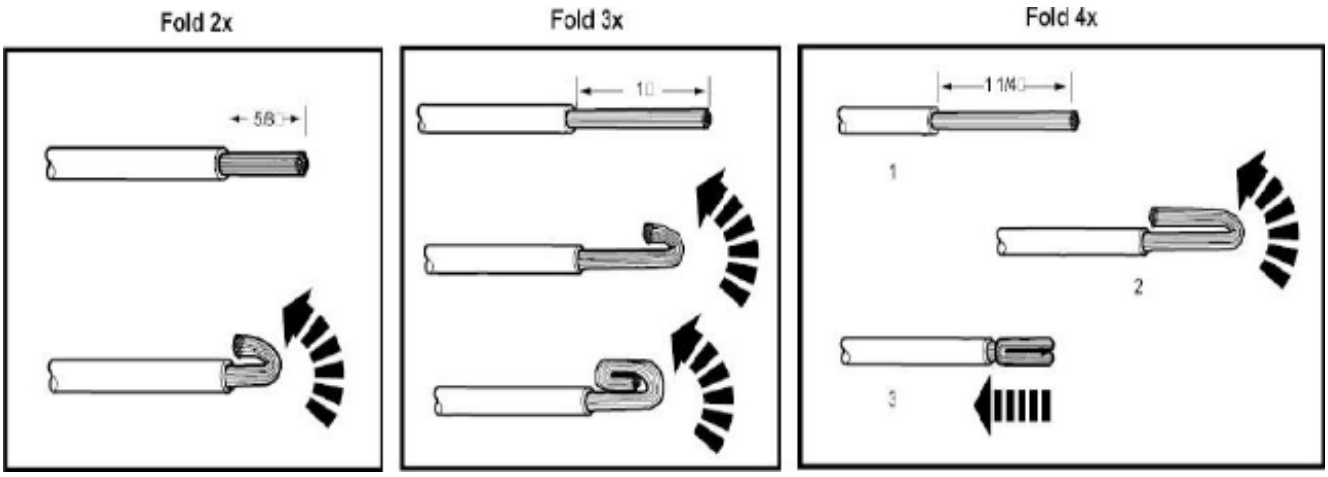
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Connector: C2031

Cigarette Lighter: Electrical Diagrams

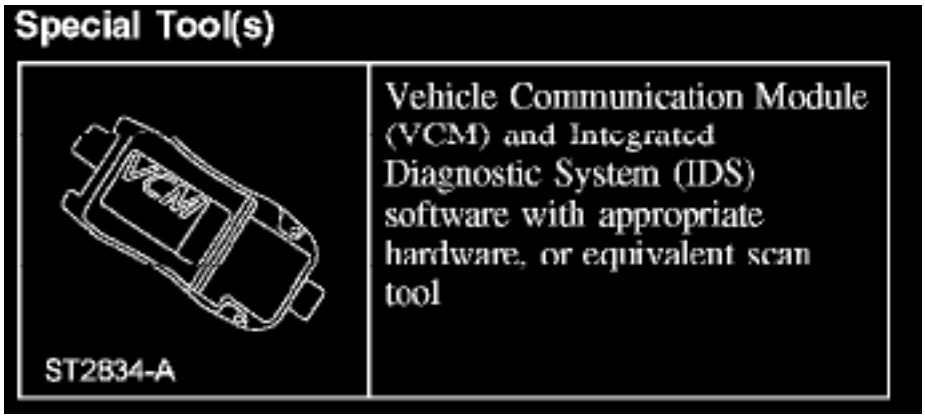
PLEASE NOTE: Some diagrams may appear to be missing because of gaps in the number sequences. These "gaps" are actually for diagrams that do not apply to the vehicle model selected.

44-1

Diagrams: Other diagrams referred to by number (i.e. 13-2, 24-6, 10-2, etc.) within these diagrams can be found at Diagrams By Number. See:

Diagrams/Electrical Diagrams/Diagrams By Number

Locations: Location Views (reference numbers starting with 151-) referred to within these diagrams can be found at Location Views. See: Locations/Component Locations



Air Bag(s) Arming and Disarming: Service and Repair Supplemental Restraint System (SRS) Depowering and Repowering

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) DEPOWERING AND REPOWERING

Special Tool(s)

Special Tool(s)

Depowering Procedure

WARNING:

- Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

- To reduce the risk of accidental deployment, do not use any memory saver devices. Failure to follow this instruction may result in serious personal injury or death.

NOTE:

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1. Turn all vehicle accessories OFF. 2. Turn the ignition switch to OFF. 3. At the smart junction box (SJB), located below the RH side of the instrument panel, remove the RH lower cowl trim panel and remove the

restraints control module (RCM) fuse 8 (10A) from the SJB.

4. Turn the ignition ON and visually monitor the air bag warning indicator for at least 30 seconds. The air bag warning indicator will remain lit

continuously (no flashing) if the correct RCM fuse has been removed. If the air bag warning indicator does not remain lit continuously, remove the correct RCM fuse before proceeding.

5. Turn the ignition OFF.

6. WARNING: Always deplete the backup power supply before repairing or installing any new front or side air bag supplemental restraint

system (SRS) component and before servicing, removing, installing, adjusting or striking components near the front or side impact sensors or the restraints control module (RCM). Nearby components include doors, instrument panel, console, door latches, strikers, seats and hood latches.

Refer to the Description and Operation portion of Air Bag Systems for location of the RCM and impact sensor(s).

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least 1 minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Failure to follow these instructions may result in serious personal injury or death in the event of an accidental deployment.

Disconnect the battery ground cable and wait at least one minute.

Repowering Procedure

1. Turn the ignition switch from OFF to ON. 2. Install the RCM fuse 8 (10A) to the SJB and install the RH lower cowl trim panel.

3. WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is

connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

Connect the battery ground cable.

4. Prove out the SRS as follows:

Turn the ignition key from ON to OFF. Wait 10 seconds, then turn the key back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning

indicator will light continuously for approximately 6 seconds and then turn off. If an air bag SRS fault is present, the air bag warning indicator will: -

fail to light.

- remain lit continuously.

- flash at a 5Hz rate (RCM not configured).

The air bag warning indicator may not illuminate until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.

Clear all continuous RCM and occupant classification system module (OCSM) DTCs using a scan tool.

Special Tool(s)

ST2621-A	Diagnostic Tool, Restraint System (2 required) 418-F395
ST2512-A	Diagnostic Tool, Restraint System 418-F403
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Air Bag(s) Arming and Disarming: Service and Repair Supplemental Restraint System (SRS) Deactivation and Reactivation

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) DEACTIVATION AND REACTIVATION

Special Tool(s)

Deactivation Procedure

WARNING:

- Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

- Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which

increases the risk of serious personal injury or death.

- To reduce the risk of accidental deployment, do not use any memory saver devices. Failure to follow this instruction may result in serious personal injury or death.

NOTE:

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

- No restraint system diagnostic tools are available for the safety belt buckle pretensioners. If the ignition switch is set to RUN or START with either the driver or passenger safety belt buckle pretensioner electrical connector disconnected, the DTCs for an open circuit fault will be active.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1. Turn all vehicle accessories OFF. 2. Turn the ignition switch to OFF. 3. At the smart junction box (SJB), located below the RH side of the instrument panel, remove the restraints control module (RCM) fuse 8 (10A)

from the SJB.

4. Turn the ignition ON and visually monitor the air bag warning indicator for at least 30 seconds. The air bag warning indicator will remain lit

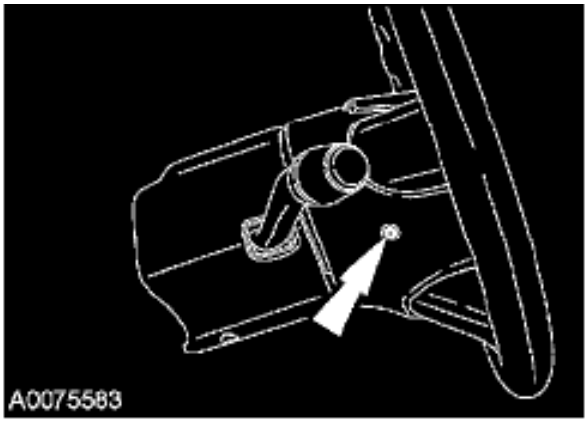
continuously (no flashing) if the correct RCM fuse has been removed. If the air bag warning indicator does not remain lit continuously, remove the correct RCM fuse before proceeding.

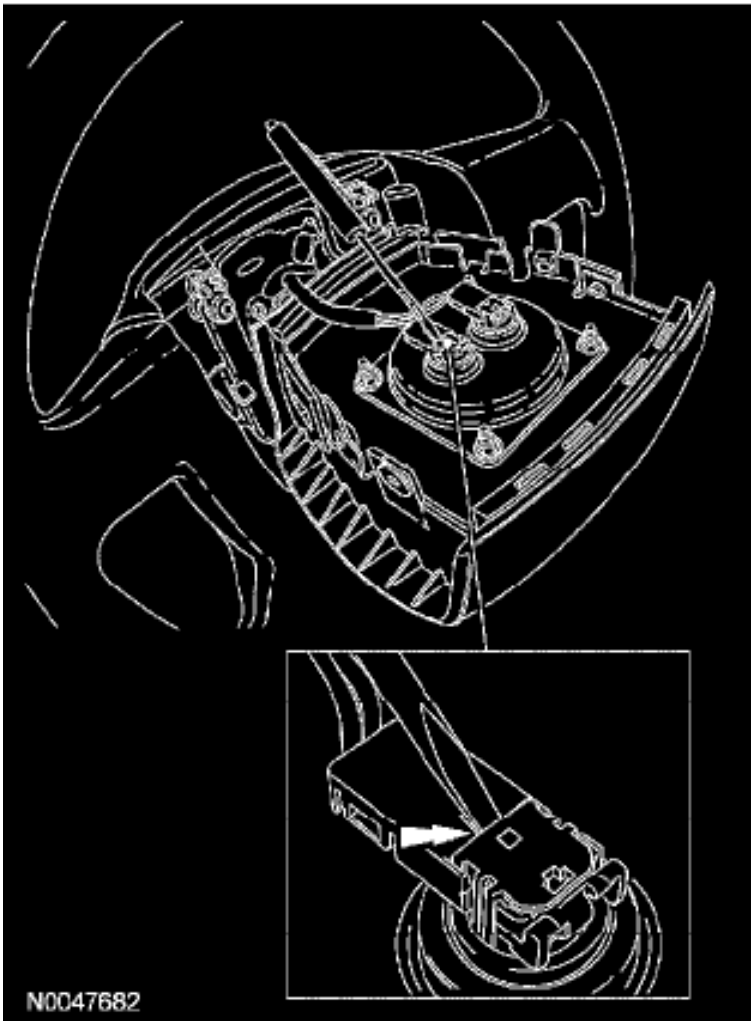
5. Turn the ignition OFF.

6. WARNING: Always deplete the backup power supply before repairing or installing any new front or side air bag supplemental restraint

system (SRS) component and before servicing, removing, installing, adjusting or striking components near the front or side impact sensors or the restraints control module (RCM). Nearby components include doors, instrument panel, console, door latches, strikers, seats and hood latches.

Refer to the Description and Operation portion of Air Bag Systems for location of the RCM and impact sensor(s).





To deplete the backup power supply energy, disconnect the battery ground cable and wait at least 1 minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Failure to follow these instructions may result in serious personal injury or death in the event of an accidental deployment.

Disconnect the battery ground cable and wait at least 1 minute.

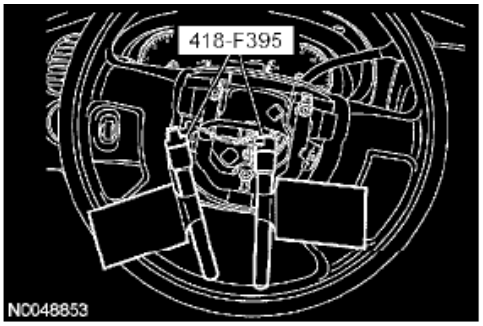
7. Remove the 2 driver air bag module bolts (1 shown).

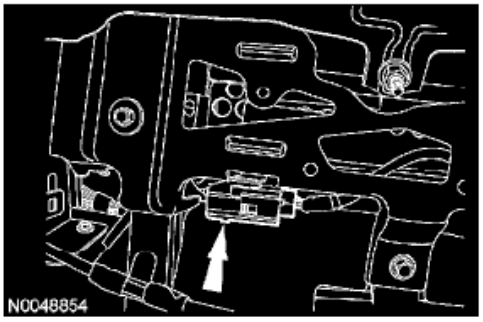
8. CAUTION: Do not pull the driver air bag module electrical connectors out by the locking buttons. Damage to the locking buttons may

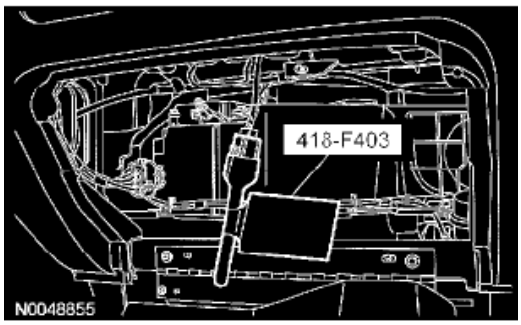
occur.

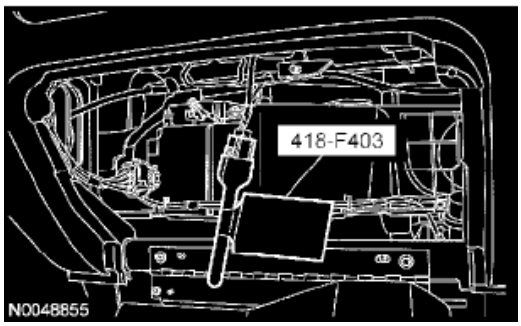
Using a small screwdriver as shown, lift up and release the locking buttons on the driver air bag module electrical connectors. With the locking buttons released, remove the electrical connectors and the driver air bag module.

9. Attach the restraint system diagnostic tools to the clockspring electrical connectors at the top of the steering column.









10. Open the glove compartment door fully to access the passenger air bag electrical connector.
11. Release the tab and disconnect the passenger air bag module electrical connector.

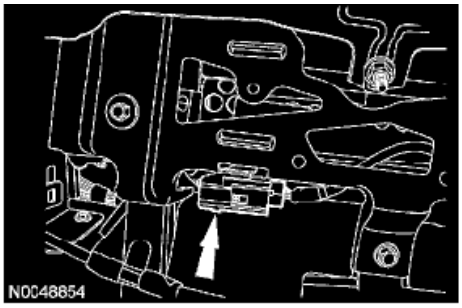
12. Attach the restraint system diagnostic tool to the vehicle harness side of the passenger air bag module electrical connector.

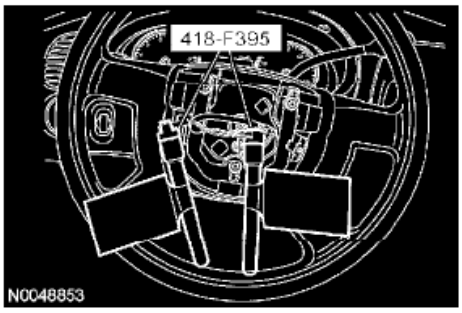
13. Install the RCM fuse 8 (10A) to the SJB. 14. Connect the battery ground cable.

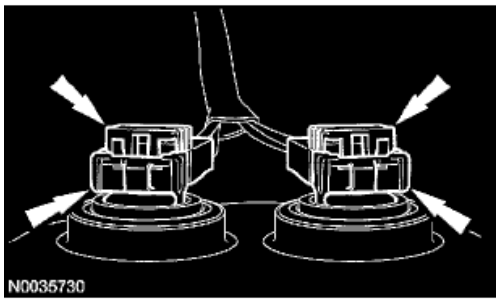
Reactivation Procedure

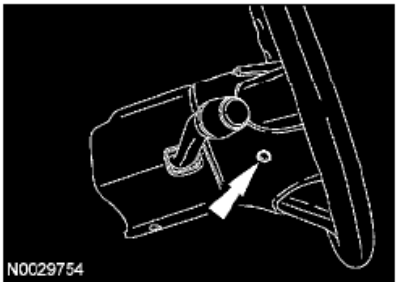
1. Remove the RCM fuse 8 (10A) from the SJB. 2. Disconnect the battery ground cable and wait at least one minute. 3. Remove the restraint system diagnostic tool from the vehicle harness side of the passenger air bag module electrical connector.

4. Connect the passenger air bag module electrical connector.









5. Close the glove compartment door. 6. Remove the restraint system diagnostic tools from the clockspring electrical connectors at the top of the steering column.

7. CAUTION:

- Do not install the driver air bag module electrical connectors by the locking buttons. Damage to the locking buttons may occur.

- The driver air bag module electrical connector locking buttons must be in the released position when the connector is being installed or connector damage may occur.

- The driver air bag module electrical connectors are unique and cannot be reversed when connected to the driver air bag module. Match the electrical connector key to the keyway in the driver air bag module. Do not force the electrical connectors into the driver air bag module. Damage to the connector or component may occur.

With the locking buttons released, install the driver air bag module electrical connectors fully into the driver air bag module and seat the locking buttons.

8. Install the 2 driver air bag module bolts (1 shown).

- Tighten to 6 Nm (53 lb-in).

9. WARNING: Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental

restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death

in a crash and possibly violate vehicle safety standards.

Make sure all restraint system diagnostic tool(s) that may have been installed during the repair have been removed from the vehicle and all SRS components are connected.

10. Turn the ignition from OFF to ON. 11. Install the restraint system control module fuse 8 (10A) to the SJB.

12. WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is

connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

Connect the battery ground cable.

13. Prove out the SRS as follows:

Turn the ignition key from ON to OFF. Wait 10 seconds, then turn the key back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an air bag SRS fault is present, the air bag warning indicator will: -

fail to light.

- remain lit continuously.

- flash at a 5Hz rate (RCM not configured).

The air bag warning indicator may not illuminate until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.

Clear all continuous RCM and occupant classification system module (OCSM) DTCs using a scan tool.

Dimmer Switch: Service and Repair

INSTRUMENT PANEL DIMMER SWITCH

Removal and Installation

1. Remove the radio. 2. Remove the center instrument panel finish panel.

- Remove the 2 screws.

- Disconnect the electrical connectors.

3. Remove the 2 bolts and position aside the hood latch release handle. 4. Remove the 2 screws and remove the instrument panel steering column cover. 5. Remove the 5 bolts and the lower instrument panel reinforcement.

- To install, tighten to 11 Nm (8 lb-ft).

6. If equipped, position the column-mounted transmission range selector lever to the lowest position. 7. Remove the instrument cluster finish panel.

- Remove the 5 screws.

- Disconnect the electrical connectors.

8. Remove the 2 screws and the instrument panel dimmer switch. 9. To install, reverse the removal procedure.

DOOR AJAR SWITCH - SUPERCAB FOUR-DOOR

Removal and Installation

1. Remove the rear door lower latch. 2. Release the locking tabs, rotate the door ajar switch and remove the door ajar switch. 3. To install, reverse the removal procedure.

Fuel Filler Cap Warning Indicator: Description and Operation

CHECK FUEL CAP INDICATOR

The check fuel cap indicator is a communications network message sent by the PCM. The PCM sends the message to illuminate the lamp when the strategy determines there is a concern in the EVAP system due to the fuel filler cap or capless fuel tank filler pipe not being sealed correctly. This would be detected by the inability to pull vacuum in the fuel tank, after a fueling event.

5	—	Fuel Pressure Regulator

Fuel Gauge Sender: Description and Operation

Fuel Pump (FP) Module

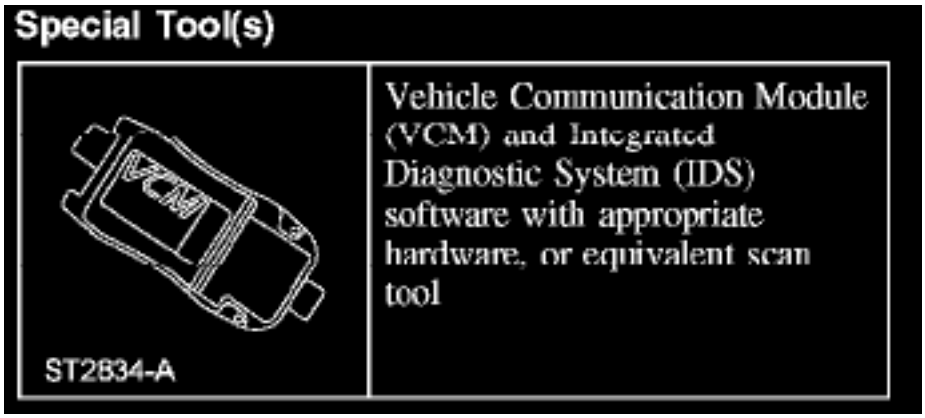
Typical Electronic Returnless Fuel Pump (FP) Module

Typical Mechanical Returnless Fuel Pump (FP) Module

The FP module is a device that contains the fuel pump and sender assembly. The fuel pump is located inside the FP module reservoir and supplies fuel through the FP module manifold to the engine and FP module jet pump. The jet pump continuously refills the reservoir with fuel, and a check valve located in the manifold outlet maintains system pressure when the fuel pump is not energized. A flapper valve located in the bottom of the reservoir allows fuel to enter the reservoir and prime the fuel pump during the initial fill.

Fuel Pump (FP) Module and Reservoir

The FP module is mounted inside the fuel tank in a reservoir. The pump has a discharge check valve that maintains the system pressure after the key has been turned off to minimize starting concerns. The reservoir prevents fuel flow interruptions during extreme vehicle maneuvers with low tank fill levels.



Air Bag(s) Arming and Disarming: Service and Repair Supplemental Restraint System (SRS) Depowering and Repowering

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) DEPOWERING AND REPOWERING

Special Tool(s)

Special Tool(s)

Depowering Procedure

WARNING:

- Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

- To reduce the risk of accidental deployment, do not use any memory saver devices. Failure to follow this instruction may result in serious personal injury or death.

NOTE:

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1. Turn all vehicle accessories OFF. 2. Turn the ignition switch to OFF. 3. At the smart junction box (SJB), located below the RH side of the instrument panel, remove the RH lower cowl trim panel and remove the

restraints control module (RCM) fuse 8 (10A) from the SJB.

4. Turn the ignition ON and visually monitor the air bag warning indicator for at least 30 seconds. The air bag warning indicator will remain lit

continuously (no flashing) if the correct RCM fuse has been removed. If the air bag warning indicator does not remain lit continuously, remove the correct RCM fuse before proceeding.

5. Turn the ignition OFF.

6. WARNING: Always deplete the backup power supply before repairing or installing any new front or side air bag supplemental restraint

system (SRS) component and before servicing, removing, installing, adjusting or striking components near the front or side impact sensors or the restraints control module (RCM). Nearby components include doors, instrument panel, console, door latches, strikers, seats and hood latches.

Refer to the Description and Operation portion of Air Bag Systems for location of the RCM and impact sensor(s).

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least 1 minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Failure to follow these instructions may result in serious personal injury or death in the event of an accidental deployment.

Disconnect the battery ground cable and wait at least one minute.

Repowering Procedure

1. Turn the ignition switch from OFF to ON. 2. Install the RCM fuse 8 (10A) to the SJB and install the RH lower cowl trim panel.

3. WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is

connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

Connect the battery ground cable.

4. Prove out the SRS as follows:

Turn the ignition key from ON to OFF. Wait 10 seconds, then turn the key back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning

indicator will light continuously for approximately 6 seconds and then turn off. If an air bag SRS fault is present, the air bag warning indicator will: -

fail to light.

- remain lit continuously.

- flash at a 5Hz rate (RCM not configured).

The air bag warning indicator may not illuminate until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.

Clear all continuous RCM and occupant classification system module (OCSM) DTCs using a scan tool.

Special Tool(s)

ST2621-A	Diagnostic Tool, Restraint System (2 required) 418-F395
ST2512-A	Diagnostic Tool, Restraint System 418-F403
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Air Bag(s) Arming and Disarming: Service and Repair Supplemental Restraint System (SRS) Deactivation and Reactivation

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) DEACTIVATION AND REACTIVATION

Special Tool(s)

Deactivation Procedure

WARNING:

- Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

- Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which

increases the risk of serious personal injury or death.

- To reduce the risk of accidental deployment, do not use any memory saver devices. Failure to follow this instruction may result in serious personal injury or death.

NOTE:

- The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

- No restraint system diagnostic tools are available for the safety belt buckle pretensioners. If the ignition switch is set to RUN or START with either the driver or passenger safety belt buckle pretensioner electrical connector disconnected, the DTCs for an open circuit fault will be active.

- The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1. Turn all vehicle accessories OFF. 2. Turn the ignition switch to OFF. 3. At the smart junction box (SJB), located below the RH side of the instrument panel, remove the restraints control module (RCM) fuse 8 (10A)

from the SJB.

4. Turn the ignition ON and visually monitor the air bag warning indicator for at least 30 seconds. The air bag warning indicator will remain lit

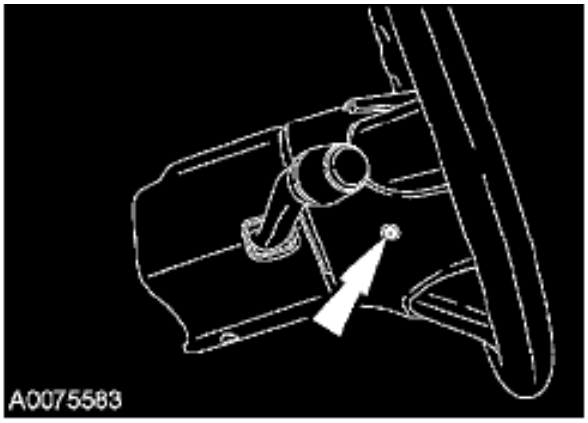
continuously (no flashing) if the correct RCM fuse has been removed. If the air bag warning indicator does not remain lit continuously, remove the correct RCM fuse before proceeding.

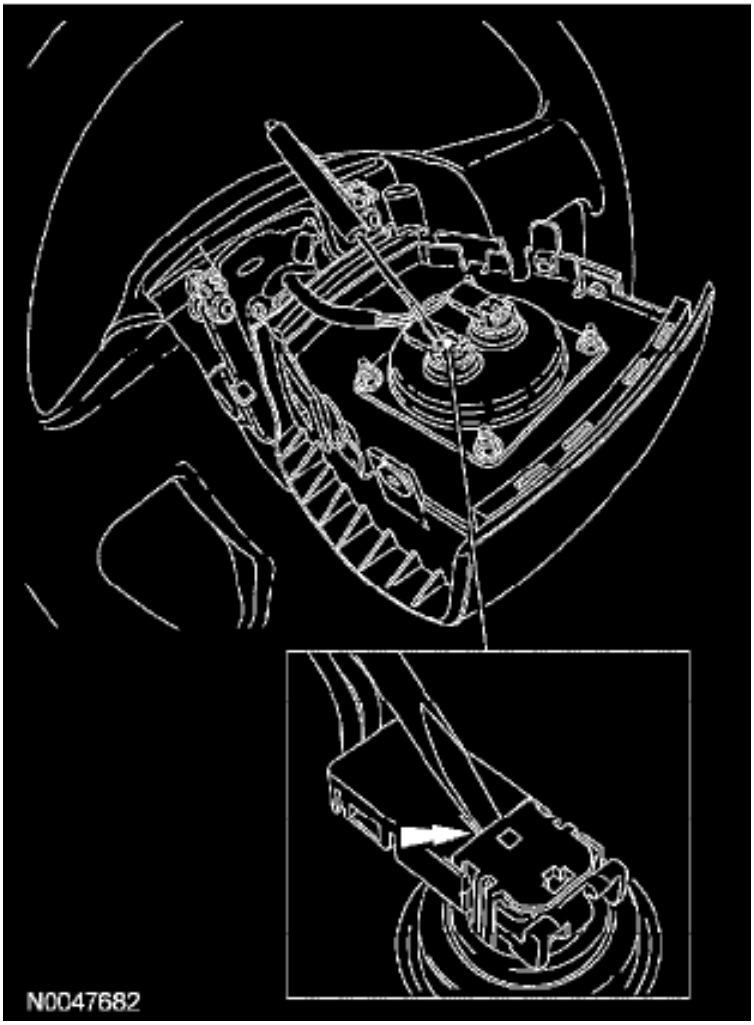
5. Turn the ignition OFF.

6. WARNING: Always deplete the backup power supply before repairing or installing any new front or side air bag supplemental restraint

system (SRS) component and before servicing, removing, installing, adjusting or striking components near the front or side impact sensors or the restraints control module (RCM). Nearby components include doors, instrument panel, console, door latches, strikers, seats and hood latches.

Refer to the Description and Operation portion of Air Bag Systems for location of the RCM and impact sensor(s).





To deplete the backup power supply energy, disconnect the battery ground cable and wait at least 1 minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Failure to follow these instructions may result in serious personal injury or death in the event of an accidental deployment.

Disconnect the battery ground cable and wait at least 1 minute.

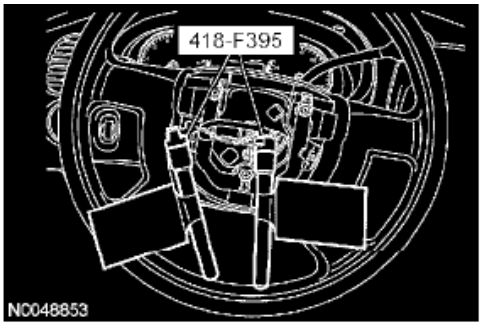
7. Remove the 2 driver air bag module bolts (1 shown).

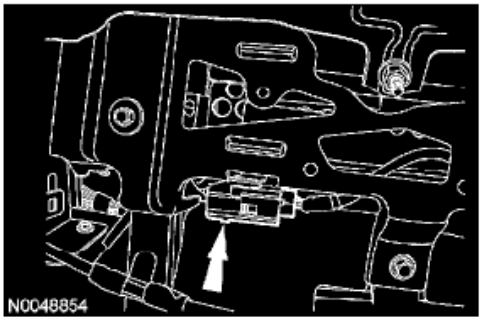
8. CAUTION: Do not pull the driver air bag module electrical connectors out by the locking buttons. Damage to the locking buttons may

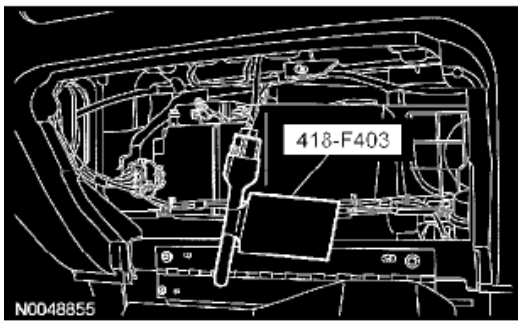
occur.

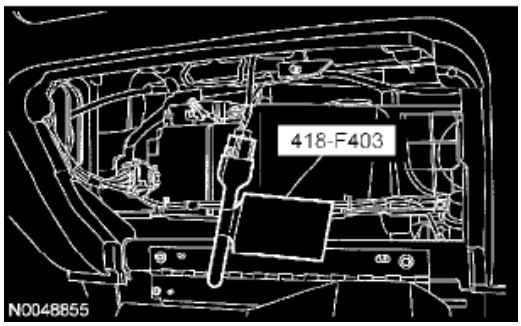
Using a small screwdriver as shown, lift up and release the locking buttons on the driver air bag module electrical connectors. With the locking buttons released, remove the electrical connectors and the driver air bag module.

9. Attach the restraint system diagnostic tools to the clockspring electrical connectors at the top of the steering column.









10. Open the glove compartment door fully to access the passenger air bag electrical connector.
11. Release the tab and disconnect the passenger air bag module electrical connector.

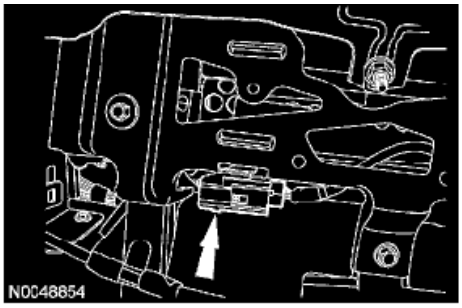
12. Attach the restraint system diagnostic tool to the vehicle harness side of the passenger air bag module electrical connector.

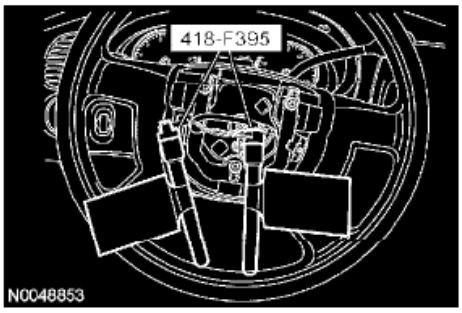
13. Install the RCM fuse 8 (10A) to the SJB. 14. Connect the battery ground cable.

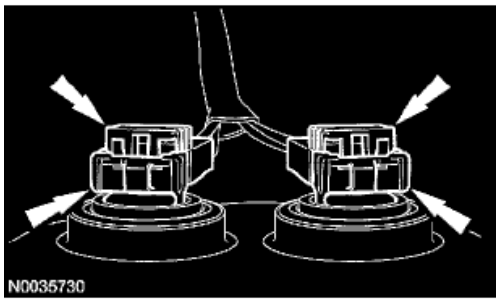
Reactivation Procedure

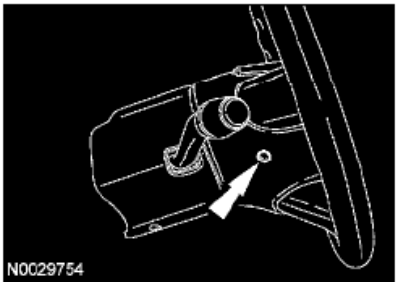
1. Remove the RCM fuse 8 (10A) from the SJB. 2. Disconnect the battery ground cable and wait at least one minute. 3. Remove the restraint system diagnostic tool from the vehicle harness side of the passenger air bag module electrical connector.

4. Connect the passenger air bag module electrical connector.









5. Close the glove compartment door. 6. Remove the restraint system diagnostic tools from the clockspring electrical connectors at the top of the steering column.

7. CAUTION:

- Do not install the driver air bag module electrical connectors by the locking buttons. Damage to the locking buttons may occur.

- The driver air bag module electrical connector locking buttons must be in the released position when the connector is being installed or connector damage may occur.

- The driver air bag module electrical connectors are unique and cannot be reversed when connected to the driver air bag module. Match the electrical connector key to the keyway in the driver air bag module. Do not force the electrical connectors into the driver air bag module. Damage to the connector or component may occur.

With the locking buttons released, install the driver air bag module electrical connectors fully into the driver air bag module and seat the locking buttons.

8. Install the 2 driver air bag module bolts (1 shown).

- Tighten to 6 Nm (53 lb-in).

9. WARNING: Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental

restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death

in a crash and possibly violate vehicle safety standards.

Make sure all restraint system diagnostic tool(s) that may have been installed during the repair have been removed from the vehicle and all SRS components are connected.

10. Turn the ignition from OFF to ON. 11. Install the restraint system control module fuse 8 (10A) to the SJB.

12. WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is

connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

Connect the battery ground cable.

13. Prove out the SRS as follows:

Turn the ignition key from ON to OFF. Wait 10 seconds, then turn the key back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an air bag SRS fault is present, the air bag warning indicator will: -

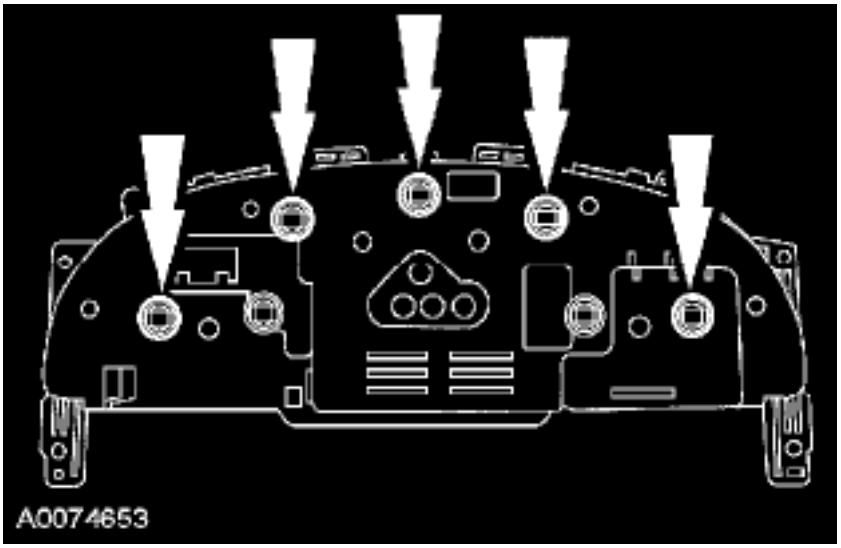
fail to light.

- remain lit continuously.

- flash at a 5Hz rate (RCM not configured).

The air bag warning indicator may not illuminate until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.

Clear all continuous RCM and occupant classification system module (OCSM) DTCs using a scan tool.



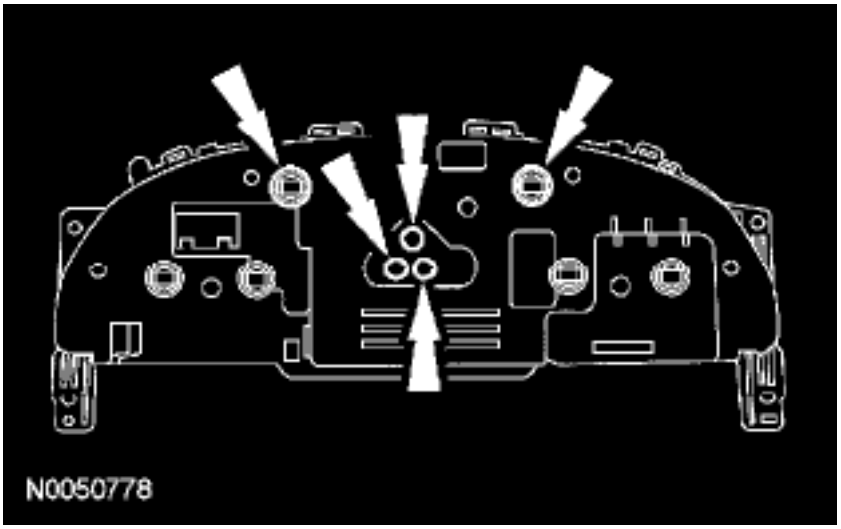
Instrument Panel Bulb: Service and Repair Instrument Cluster Bulb

INSTRUMENT CLUSTER BULB

Removal and Installation

1. Remove the instrument cluster (IC).

2. Remove the illumination sockets and bulbs. 3. To install, reverse the removal procedure.



Instrument Panel Bulb: Service and Repair Warning Indicator Bulb

WARNING INDICATOR BULB

Removal and Installation

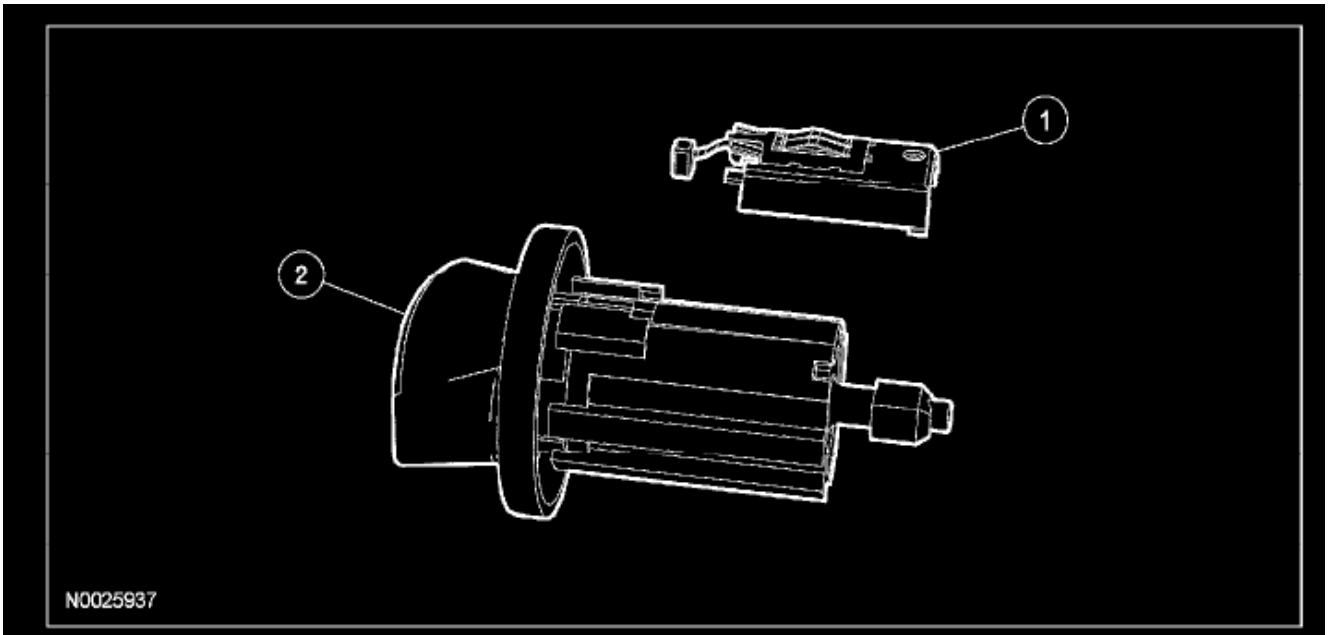
1. Remove the instrument cluster (IC).

2. NOTE: To remove the warning indicator bulb, rotate the bulb one quarter turn counterclockwise and lift it straight out from the instrument cluster

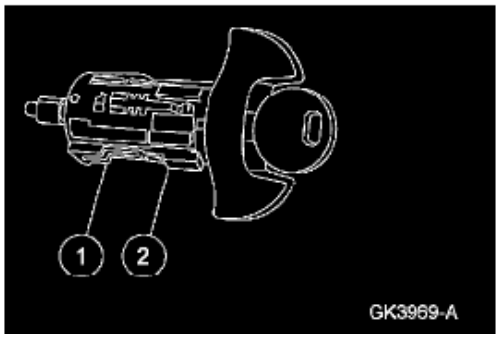
(IC).

Remove the warning indicator bulb in question.

3. To install, reverse the removal procedure.



Item	Part Number	Description
1	11A127	Key-in-ignition warning switch
2	11582	Ignition lock cylinder



Key Reminder Switch: Service and Repair

KEY-IN-IGNITION WARNING SWITCH

Removal and Installation

1. Remove the ignition lock cylinder. 2. Remove the key-in-ignition warning switch.

1 Pry the clip downward.

2 Release the key-in-ignition warning switch from the rear of the ignition lock cylinder.

3. To install, reverse the removal procedure.

Low Tire Pressure Indicator: Testing and Inspection

Tire Pressure Monitoring System (TPMS) Indicator and Message Center Messages

The TPMS indicator and vehicle message center (if equipped) sometimes displays faults that cannot be resolved by the customer. Treat these messages as TPMS faults that must be serviced.

Tire Pressure Monitoring System (TPMS) Indicator Illuminates Continuously

NOTE: If the spare tire is in use, the damaged road tire must be repaired and installed on the vehicle to restore complete TPMS functionality before carrying out any diagnosis.

NOTE: For vehicles with different front and rear tire pressures (such as E-Series and certain F-Series), the tire pressure sensors must be trained following a tire rotation. Failure to train the sensors will cause the TPMS indicator to illuminate.

For vehicles with the same tire pressures for front and rear tires, tire rotation will not affect the system.

1. The TPMS indicator remains on continuously for the following condition:

^ Low Tire Pressure - The TPMS indicator is illuminated solid and the message center displays LOW TIRE PRESSURE (if equipped). This is displayed when any of the tire pressures are low. When this condition exists, the tire pressure must be adjusted to the recommended cold pressure as indicated on the vehicle certification label.

2. NOTE: The TPMS sensors do not transmit when the vehicle is stationary. If the vehicle has been stationary for more than 30 minutes, it will be

necessary to wake up the sensors so they will transmit the latest tire pressure information to the SJB.

If the vehicle has been stationary for more than 30 minutes, refer to Tire Pressure Monitoring System (TPMS) Sensor Activation procedure.

Tire Pressure Monitoring System (TPMS) Indicator Flashes

The TPMS indicator flashes for 70 seconds and then remains ON solid when the ignition key is turned to the ON position for the following conditions: 1. Tire Pressure Sensor Fault - If equipped, the message center will display TIRE SENSOR FAULT when a tire pressure sensor is malfunctioning.

GO to Symptom Chart. See: Tire Monitoring System/Testing and Inspection/Symptom Related Diagnostic Procedures

2. No communication with the SJB (TPMS is integral to the SJB) - The TPMS indicator is illuminated when the instrument cluster has received no

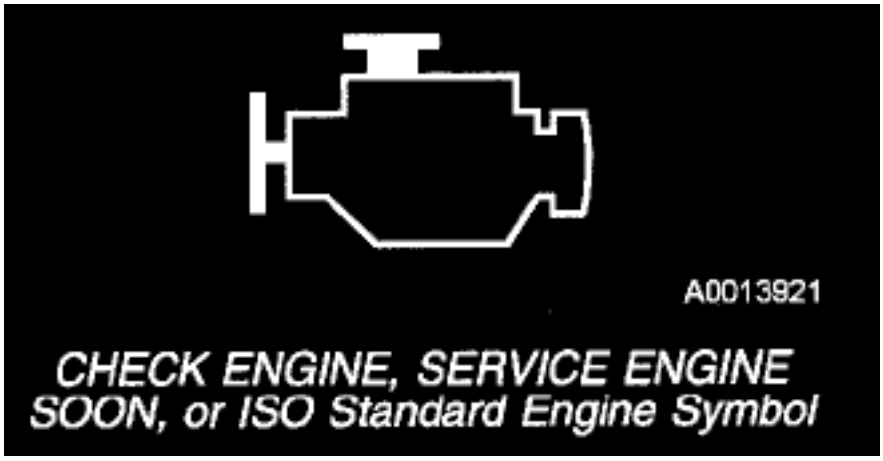
signals from the SJB for more than 5 seconds. If equipped, the message center displays TIRE MONITOR FAULT. GO to Symptom Chart. See: Tire Monitoring System/Testing and Inspection/Symptom Related Diagnostic Procedures

3. Tire Pressure Monitor Fault - If equipped, the message center will display TIRE MONITOR FAULT when the tire pressure monitoring system is

malfunctioning or communication with the instrument cluster has been lost. GO to Symptom Chart. See: Tire Monitoring System/Testing and Inspection/Symptom Related Diagnostic Procedures

Maintenance Required Lamp/Indicator: Service and Repair

This vehicle is not equipped with a Maintenance Required Lamp/Indicator.



Malfunction Indicator Lamp: Description and Operation

MALFUNCTION INDICATOR LAMP (MIL)

Check Engine, Service Engine Soon, Or ISO Standard Engine Symbol

The MIL notifies the driver that the powertrain control module (PCM) has detected an on board diagnostic (OBD) emission-related component or system concern. When this occurs, an OBD diagnostic trouble code (DTC) sets.

- The MIL is located in the instrument cluster and is labeled CHECK ENGINE, SERVICE ENGINE SOON or the international standards organization (ISO) standard engine symbol.

- The MIL is illuminated during the instrument cluster prove out for approximately 4 seconds.

- The MIL remains illuminated after instrument cluster prove out if: -

an emission-related concern and DTC exists.

- the PCM does not send a control message to the instrument cluster (applications with the MIL controlled through the communication link).

- the PCM is operating in the hardware limited operation strategy (HLOS).

- The MIL remains off during the instrument cluster prove out if an indicator or instrument cluster concern is present.

- To turn off the MIL after a repair, a reset command from the scan tool must be sent, or 3 consecutive drive cycles must be completed without a concern.

- For all MIL concerns, go to Symptom Charts. See: Powertrain Management/Computers and Control Systems/Testing and Inspection/Symptom Related Diagnostic Procedures

- If the MIL flashes at a steady rate, a severe misfire condition may exist.

- If the MIL flashes erratically, the PCM can reset while cranking if the battery voltage is low.

- The MIL flashes after a period of time with the key in the RUN position (engine not running) if DTC P1000 is set.

If...	Then...
The driver's and front passenger's safety belts are buckled before the ignition switch is turned to the ON position or less than 1-2 minutes have elapsed since the ignition switch has been turned ON...	The Belt-Minder® feature will not activate.
The driver's or front passenger's safety belt is not buckled when the vehicle has reached at least 5 km/h (3 mph) and 1-2 minutes have elapsed since the ignition switch has been turned to ON...	The Belt-Minder® feature is activated — the safety belt warning indicator illuminates and the warning chime sounds for 6 seconds every 30 seconds, repeating for approximately 5 minutes or until the safety belts are buckled.
The driver's or front passenger's safety belt becomes unbuckled for approximately one minute while the vehicle is traveling at least 5 km/h (3 mph) and more than 1-2 minutes have elapsed since the ignition switch has been turned to ON...	The Belt-Minder® feature is activated — the safety belt warning indicator illuminates and the warning chime sounds for 6 seconds every 30 seconds, repeating for approximately 5 minutes or until the safety belts are buckled.

Seat Belt Reminder Buzzer: Description and Operation

Safety Belt Warning Indicator and Chime

The safety belt warning indicator and chime remind the driver to fasten their safety belt. The following conditions will take place: -

If the driver's safety belt is not buckled before the ignition is turned to the ON position, the chime will turn on for 4-8 seconds and the indicator will illuminate for 1-2 minutes.

- If the driver's safety belt is buckled while the indicator is on and the chime is sounding, both the indicator and chime will turn off.

- If the driver's safety belt is buckled before the ignition is turned to the ON position, neither the indicator nor the chime will be active.

Belt-Minder(R)

The Belt-Minder(R) feature is a supplemental warning to the safety belt warning function. The feature provides additional reminders by intermittently sounding a chime and illuminating the safety belt warning indicator in the instrument cluster when the driver's and front passenger's safety belt is unbuckled.

The Belt-Minder(R) feature uses information from the front passenger sensing system to determine if a front seat passenger is present and therefore potentially in need of a warning. To avoid activating the Belt-Minder(R) feature for objects placed in the front passenger seat, warnings will only be given to large front seat occupants as determined by the front passenger sensing system.

Both the driver's and passenger's safety belt usages are monitored and either may activate the Belt-Minder(R) feature. The warnings are the same for the driver and front passenger. If the Belt-Minder(R) warnings have expired (warnings for approximately 5 minutes) for one occupant (driver or front passenger), the other occupant can still activate the Belt-Minder(R) feature.

The Belt-Minder(R) feature uses information from the OCS system on the front passenger seat to determine if a front seat passenger is present and therefore potentially in need of a warning. The warning is activated if the OCS system senses weight exceeding a programmed set point.

The driver and front passenger Belt-Minder(R) feature is deactivated/activated independently. When deactivating/activating the Belt-Minder(R) for a seat, do not buckle the safety belts on the other seat, or the process will be terminated. To deactivate/activate the Belt-Minder(R) feature, refer to Instrument Panel, Gauges and Warning Indicators or the Owner's Literature.

If...	Then...
The driver's and front passenger's safety belts are buckled before the ignition switch is turned to the ON position or less than 1-2 minutes have elapsed since the ignition switch has been turned ON...	The Belt-Minder® feature will not activate.
The driver's or front passenger's safety belt is not buckled when the vehicle has reached at least 5 km/h (3 mph) and 1-2 minutes have elapsed since the ignition switch has been turned to ON...	The Belt-Minder® feature is activated — the safety belt warning indicator illuminates and the warning chime sounds for 6 seconds every 30 seconds, repeating for approximately 5 minutes or until the safety belts are buckled.
The driver's or front passenger's safety belt becomes unbuckled for approximately one minute while the vehicle is traveling at least 5 km/h (3 mph) and more than 1-2 minutes have elapsed since the ignition switch has been turned to ON...	The Belt-Minder® feature is activated — the safety belt warning indicator illuminates and the warning chime sounds for 6 seconds every 30 seconds, repeating for approximately 5 minutes or until the safety belts are buckled.

Seat Belt Reminder Lamp: Description and Operation

Safety Belt Warning Indicator and Chime

The safety belt warning indicator and chime remind the driver to fasten their safety belt. The following conditions will take place: -

If the driver's safety belt is not buckled before the ignition is turned to the ON position, the chime will turn on for 4-8 seconds and the indicator will illuminate for 1-2 minutes.

- If the driver's safety belt is buckled while the indicator is on and the chime is sounding, both the indicator and chime will turn off.

- If the driver's safety belt is buckled before the ignition is turned to the ON position, neither the indicator nor the chime will be active.

Belt-Minder(R)

The Belt-Minder(R) feature is a supplemental warning to the safety belt warning function. The feature provides additional reminders by intermittently sounding a chime and illuminating the safety belt warning indicator in the instrument cluster when the driver's and front passenger's safety belt is unbuckled.

The Belt-Minder(R) feature uses information from the front passenger sensing system to determine if a front seat passenger is present and therefore potentially in need of a warning. To avoid activating the Belt-Minder(R) feature for objects placed in the front passenger seat, warnings will only be given to large front seat occupants as determined by the front passenger sensing system.

Both the driver's and passenger's safety belt usages are monitored and either may activate the Belt-Minder(R) feature. The warnings are the same for the driver and front passenger. If the Belt-Minder(R) warnings have expired (warnings for approximately 5 minutes) for one occupant (driver or front passenger), the other occupant can still activate the Belt-Minder(R) feature.

The Belt-Minder(R) feature uses information from the OCS system on the front passenger seat to determine if a front seat passenger is present and therefore potentially in need of a warning. The warning is activated if the OCS system senses weight exceeding a programmed set point.

The driver and front passenger Belt-Minder(R) feature is deactivated/activated independently. When deactivating/activating the Belt-Minder(R) for a seat, do not buckle the safety belts on the other seat, or the process will be terminated. To deactivate/activate the Belt-Minder(R) feature, refer to Instrument Panel, Gauges and Warning Indicators or the Owner's Literature.

Dimmer Switch: Service and Repair

INSTRUMENT PANEL DIMMER SWITCH

Removal and Installation

1. Remove the radio. 2. Remove the center instrument panel finish panel.

- Remove the 2 screws.

- Disconnect the electrical connectors.

3. Remove the 2 bolts and position aside the hood latch release handle. 4. Remove the 2 screws and remove the instrument panel steering column cover. 5. Remove the 5 bolts and the lower instrument panel reinforcement.

- To install, tighten to 11 Nm (8 lb-ft).

6. If equipped, position the column-mounted transmission range selector lever to the lowest position. 7. Remove the instrument cluster finish panel.

- Remove the 5 screws.

- Disconnect the electrical connectors.

8. Remove the 2 screws and the instrument panel dimmer switch. 9. To install, reverse the removal procedure.

Fuel Gauge Sender: Description and Operation

Fuel Pump (FP) Module

Typical Electronic Returnless Fuel Pump (FP) Module

Typical Mechanical Returnless Fuel Pump (FP) Module

The FP module is a device that contains the fuel pump and sender assembly. The fuel pump is located inside the FP module reservoir and supplies fuel through the FP module manifold to the engine and FP module jet pump. The jet pump continuously refills the reservoir with fuel, and a check valve located in the manifold outlet maintains system pressure when the fuel pump is not energized. A flapper valve located in the bottom of the reservoir allows fuel to enter the reservoir and prime the fuel pump during the initial fill.

Fuel Pump (FP) Module and Reservoir

The FP module is mounted inside the fuel tank in a reservoir. The pump has a discharge check valve that maintains the system pressure after the key has been turned off to minimize starting concerns. The reservoir prevents fuel flow interruptions during extreme vehicle maneuvers with low tank fill levels.

Shift Indicator: Adjustments

Selector Lever Indicator Adjustment

1. Remove the upper instrument panel steering column cover. 2. Place the selector lever in the (D) position.

^ Rotate the selector lever clockwise until it bottoms out (1st gear), then rotate 2 detents counterclockwise ((D) position).

3. Hang the 1.4 kg (3 lb) weight on the gearshift lever. 4. Center the pointer in the middle of the (D) position.

^ Rotate the thumb-wheel located on the bottom of the steering column to adjust the pointer.

5. Remove the 1.4 kg (3 lb) weight. 6. Carefully move the selector lever into each detent and compare with the transmission settings.

^ Readjust if necessary.

7. Install the upper instrument panel steering column cover.

Low Tire Pressure Indicator: Testing and Inspection

Tire Pressure Monitoring System (TPMS) Indicator and Message Center Messages

The TPMS indicator and vehicle message center (if equipped) sometimes displays faults that cannot be resolved by the customer. Treat these messages as TPMS faults that must be serviced.

Tire Pressure Monitoring System (TPMS) Indicator Illuminates Continuously

NOTE: If the spare tire is in use, the damaged road tire must be repaired and installed on the vehicle to restore complete TPMS functionality before carrying out any diagnosis.

NOTE: For vehicles with different front and rear tire pressures (such as E-Series and certain F-Series), the tire pressure sensors must be trained following a tire rotation. Failure to train the sensors will cause the TPMS indicator to illuminate.

For vehicles with the same tire pressures for front and rear tires, tire rotation will not affect the system.

1. The TPMS indicator remains on continuously for the following condition:

^ Low Tire Pressure - The TPMS indicator is illuminated solid and the message center displays LOW TIRE PRESSURE (if equipped). This is displayed when any of the tire pressures are low. When this condition exists, the tire pressure must be adjusted to the recommended cold pressure as indicated on the vehicle certification label.

2. NOTE: The TPMS sensors do not transmit when the vehicle is stationary. If the vehicle has been stationary for more than 30 minutes, it will be

necessary to wake up the sensors so they will transmit the latest tire pressure information to the SJB.

If the vehicle has been stationary for more than 30 minutes, refer to Tire Pressure Monitoring System (TPMS) Sensor Activation procedure.

Tire Pressure Monitoring System (TPMS) Indicator Flashes

The TPMS indicator flashes for 70 seconds and then remains ON solid when the ignition key is turned to the ON position for the following conditions: 1. Tire Pressure Sensor Fault - If equipped, the message center will display TIRE SENSOR FAULT when a tire pressure sensor is malfunctioning.

GO to Symptom Chart. See: Testing and Inspection/Symptom Related Diagnostic Procedures

2. No communication with the SJB (TPMS is integral to the SJB) - The TPMS indicator is illuminated when the instrument cluster has received no

signals from the SJB for more than 5 seconds. If equipped, the message center displays TIRE MONITOR FAULT. GO to Symptom Chart. See: Testing and Inspection/Symptom Related Diagnostic Procedures

3. Tire Pressure Monitor Fault - If equipped, the message center will display TIRE MONITOR FAULT when the tire pressure monitoring system is

malfunctioning or communication with the instrument cluster has been lost. GO to Symptom Chart. See: Testing and Inspection/Symptom Related Diagnostic Procedures

Special Tool(s)

ST2941-A	Activation Tool, Tire Pressure Monitor 204-363
ST2634-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Tire Pressure Sensor: Testing and Inspection Tire Pressure Monitoring System (TPMS) Sensor Training

Tire Pressure Monitoring System (TPMS) Sensor Training

NOTE: If the vehicle has been stationary for more than 30 minutes, the sensors will go into a "sleep mode" to conserve battery power. It will be necessary to wake them up so they will transmit the latest tire pressure information to the smart junction box (SJB). For additional information, refer to Tire Pressure Monitoring System (TPMS) Sensor Activation.

NOTE: The tire pressure sensor training procedure must be done on a single vehicle, in an area without radio frequency noise and at least 1 m (3 ft) away from other vehicles equipped with tire pressure monitoring system (TPMS). Radio frequency noise is generated by electrical motors and appliance operation, cellular telephones, remote transmitters, power inverters and portable entertainment equipment.

NOTE: If a sensor does not respond to the activation tool, attempt to activate the same sensor with the activation tool. If the sensor still does not respond, move the vehicle to rotate the wheels at least 1/4 of a turn and attempt to activate the same sensor again.

NOTE: The SJB has a 2-minute time limit between sensor responses. If the SJB does not recognize any 1 of the 4 tire pressure sensors during this time limit, the horn will sound twice and the message center (if equipped) will display TIRE NOT TRAINED REPEAT and the entire procedure must be repeated.

1. NOTE: For vehicles with different front and rear tire pressures (such as the E-Series and certain F-Series), the tire pressure sensors must be

trained following a tire rotation. Failure to train the sensors will cause the TPMS indicator to illuminate. For vehicles with the same tire pressure for front and rear tires, tire rotation will not affect the system.

Turn the ignition switch to the OFF position, then press and release the brake pedal.

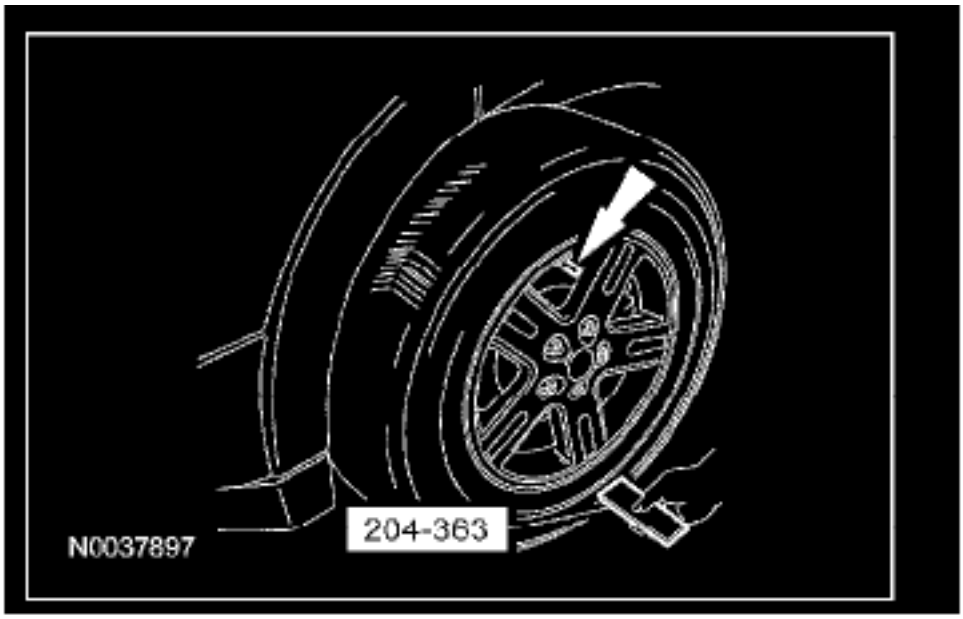
2. Cycle the ignition switch from the OFF position to the RUN position 3 times, ending in the RUN position. 3. Press and release the brake pedal. 4. Turn the ignition switch to the OFF position. 5. Turn the ignition switch from the OFF position to the RUN position 3 times, ending in the RUN position.

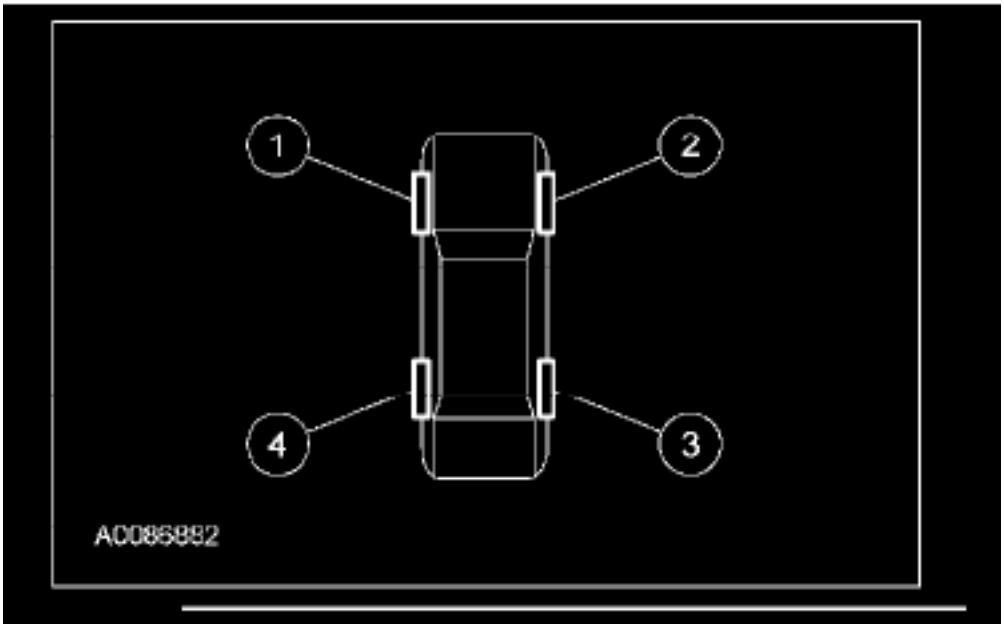
^ The horn will sound once and the TPMS indicator will flash if the training mode has been entered successfully. If equipped, the message center will display TRAIN LF TIRE.

6. NOTE: It may take up to 6 seconds to activate a tire pressure sensor. During this time, the activation tool must remain in place 180 degrees from

the valve stem.

Place the activation tool on the LF tire sidewall opposite (180 degrees) from the valve stem. Press and release the test button on the special tool. The horn will sound briefly to indicate that the tire pressure sensor has been recognized by the SJB.





7. Within 2 minutes of the horn sounding, place the activation tool on the RF tire sidewall opposite (180 degrees) from the valve stem and press and

release the test button to train the RF tire pressure sensor.

8. NOTE: Do not wait more than 2 minutes between training each sensor or the SJB will time out and the entire procedure must be repeated.

Repeat Step 7 for the RR and LR tires. ^

The procedure is completed after the last tire has been trained. When the training procedure is complete, the message center (if equipped) will display TIRE TRAINING COMPLETE.

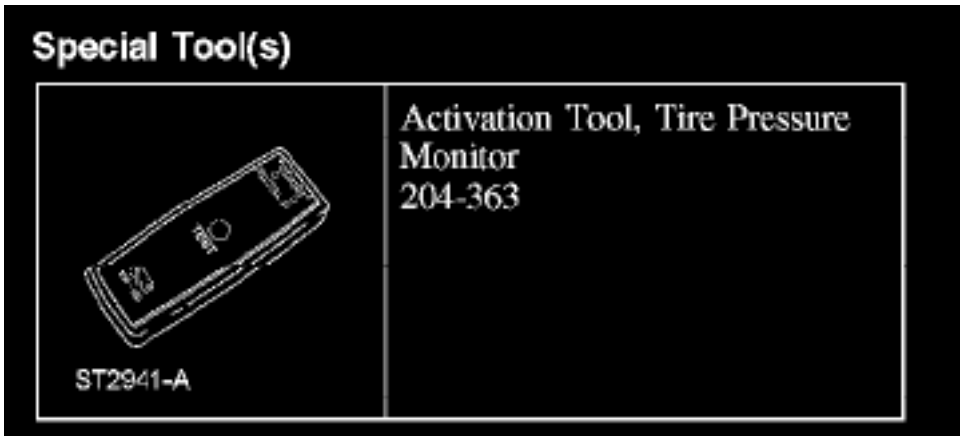
^ For vehicles not equipped with a message center, successful completion of the training procedure will be verified by turning the ignition switch to the OFF position without the horn sounding. If the horn sounds twice when the switch is turned to the OFF position, the training procedure was not successful.

9. Using the scan tool, locate the updated TPMS sensor IDs trained to the SJB and document them on the applicable warranty claim.

10. NOTE: This step is required to clear DTC C2780, cause the SJB to exit the manufacturing mode and to make sure there are no other concerns

with a newly programmed SJB.

If the sensors are being trained due to the installation of a new SJB, clear any DTCs and perform the SJB on-demand self test.



Tire Pressure Sensor: Testing and Inspection Tire Pressure Monitoring System (TPMS) Sensor Activation

Tire Pressure Monitoring System (TPMS) Sensor Activation

NOTE: The tire pressure sensors will go into a 14 sleep mode" after 30 minutes of inactivity to conserve battery power. The sensors do not transmit information while in sleep mode, it will be necessary to wake them up so they will transmit the latest tire pressure information.

1. Turn the ignition switch to the ON position. 2. Position the tire pressure monitor activation tool against the LF tire sidewall 180 degrees from the tire valve stem.

3. NOTE: The activation tool will provide feedback in the form of a flashing green light and a beep sound for each successful response from a tire

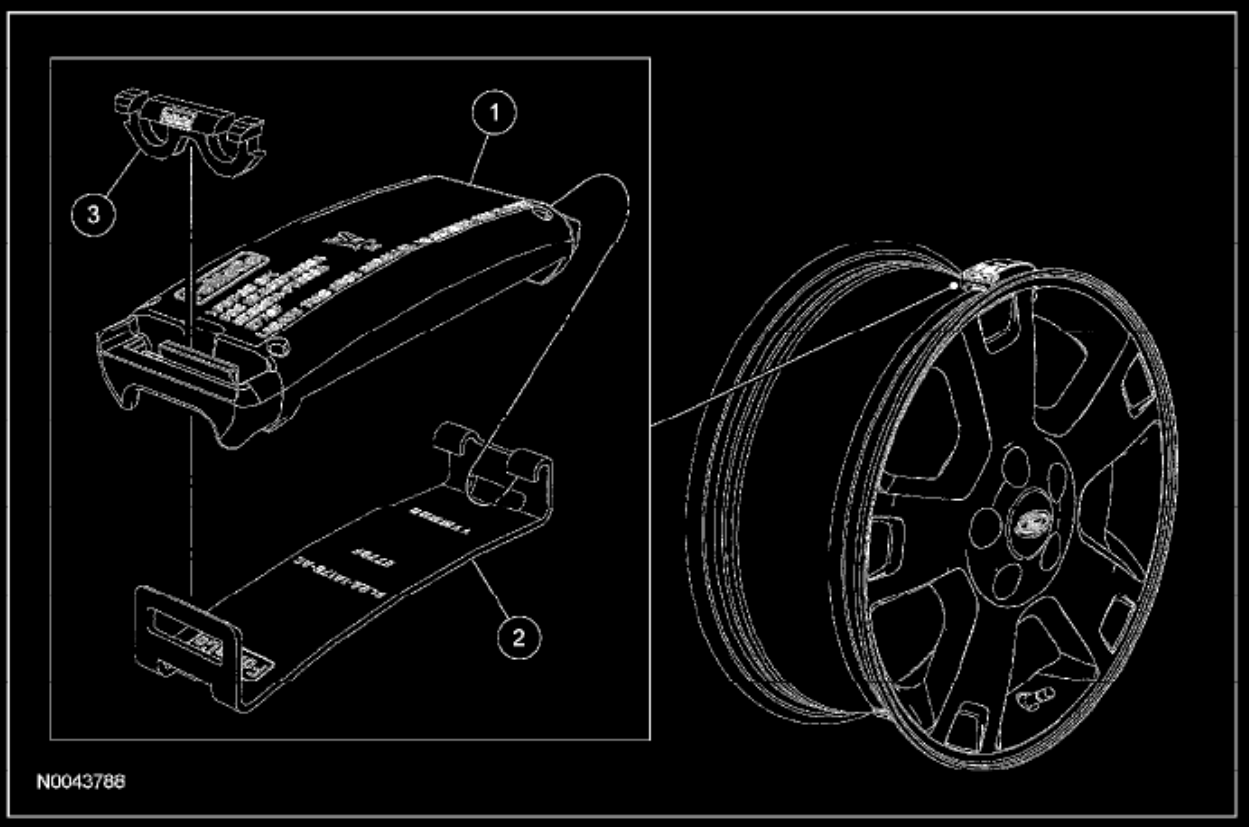
pressure sensor.

Press the test button on the activation tool to activate the sensor, activate the sensor at least 2 times.

4. Repeat Steps 2 and 3 for the remaining tires. 5. If the tire pressure monitoring system (TPMS) indicator remains illuminated after adjusting and activating each sensor, refer to the Symptom Chart

in Diagnosis and Testing.

Tire Pressure Monitoring System (TPMS) Sensor



Item	Part Number	Description
1	1A150/1A189	Tire pressure sensor/sensor kit
2	1A175	Sensor cradle

(Continued)

Item	Part Number	Description
3	14C202	Locking clip (also part of 1A189)

Tire Pressure Sensor: Service and Repair Tire Pressure Monitoring System (TPMS) Sensor

Tire Pressure Monitoring System (TPMS) Sensor

Tire Pressure Monitoring System (TPMS) Sensor

Disassembly

WARNING: The tire pressure monitoring system (TPMS) sensor battery may release hazardous chemicals if exposed to extreme mechanical damage. If these chemicals contact the skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If any part of the battery is swallowed, contact a physician immediately. When disposing of TPMS sensors, follow the correct procedures for hazardous material disposal. Failure to follow these instructions may result in serious personal injury.

NOTE: Tire pressure sensors are equipped with Lithium-ion batteries and must be disposed of accordingly.

NOTE: Tire pressure sensors are manufactured in multiple colors based on their application. When installing a new sensor, make sure the color of the sensor being installed matches the color of the sensor that was removed. The different colored sensors are not interchangeable.

NOTE: The sensor can be removed and installed without removing the strap or the cradle.

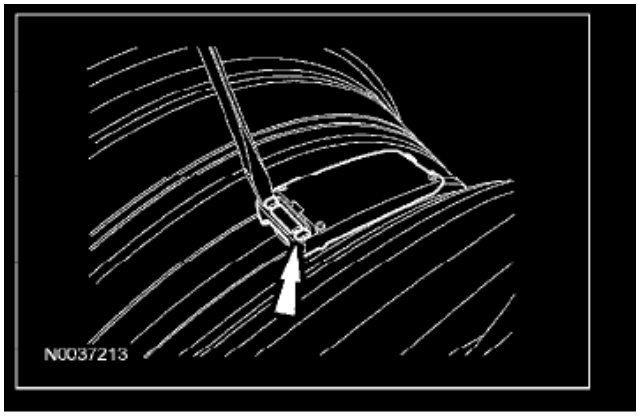
1. CAUTION: The sensor, cradle and strap may be damaged by incorrect tire mounting or dismounting. Dismount the tire only as

instructed.

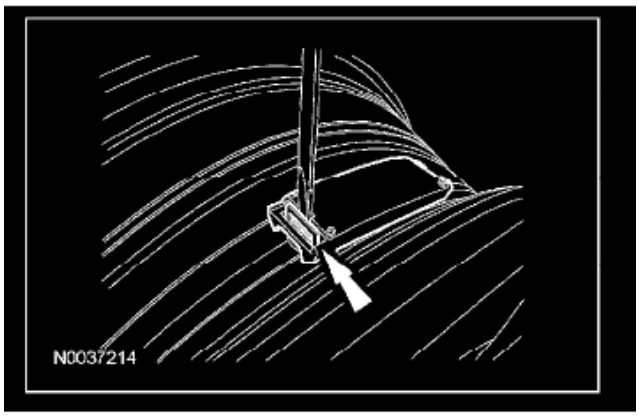
Remove the tire from the wheel.

2. CAUTION: Do not use a large screwdriver. Apply minimum force during removal or damage to the sensor locking clip may occur.

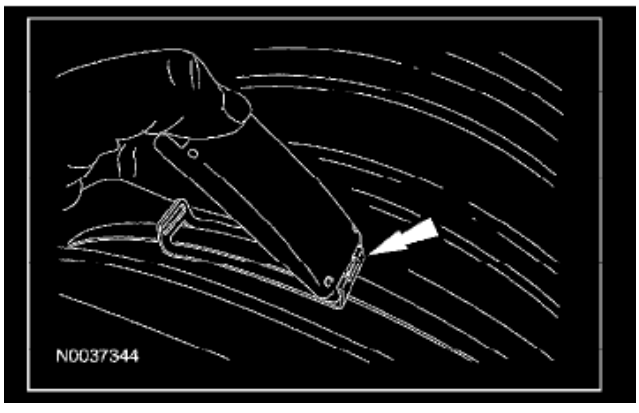
Using a pocket screwdriver or similar tool, remove the sensor locking clip.



N0037213



N0037214



N0037344

3. CAUTION: Do not use a large screwdriver. Apply minimum force during removal or damage to the sensor may occur.

Using a pocket screwdriver or similar tool, detach the sensor from the cradle.

4. Remove the sensor.

Assembly

1. CAUTION: Damage to the sensor may occur if excessive force is applied during sensor installation.

NOTE: Make sure the sensor is fully seated into the cradle. The sensor will make a "click" noise when correctly seated.

Position the sensor into the cradle by inserting the hinge end of the sensor into the hook end of the cradle and pushing the opposite end of the sensor down onto the cradle.

2. NOTE: The locking clip can only be fully seated when installed in the correct orientation. If the sensor locking clip cannot be fully inserted, then

the sensor may not be fully seated on the cradle or the locking clip may be inserted backward.

Insert a new locking clip into the sensor.

3. CAUTION: The sensor, cradle and strap may be damaged by incorrect tire mounting or dismounting. Mount the tire only as instructed.

Install the tire onto the wheel.

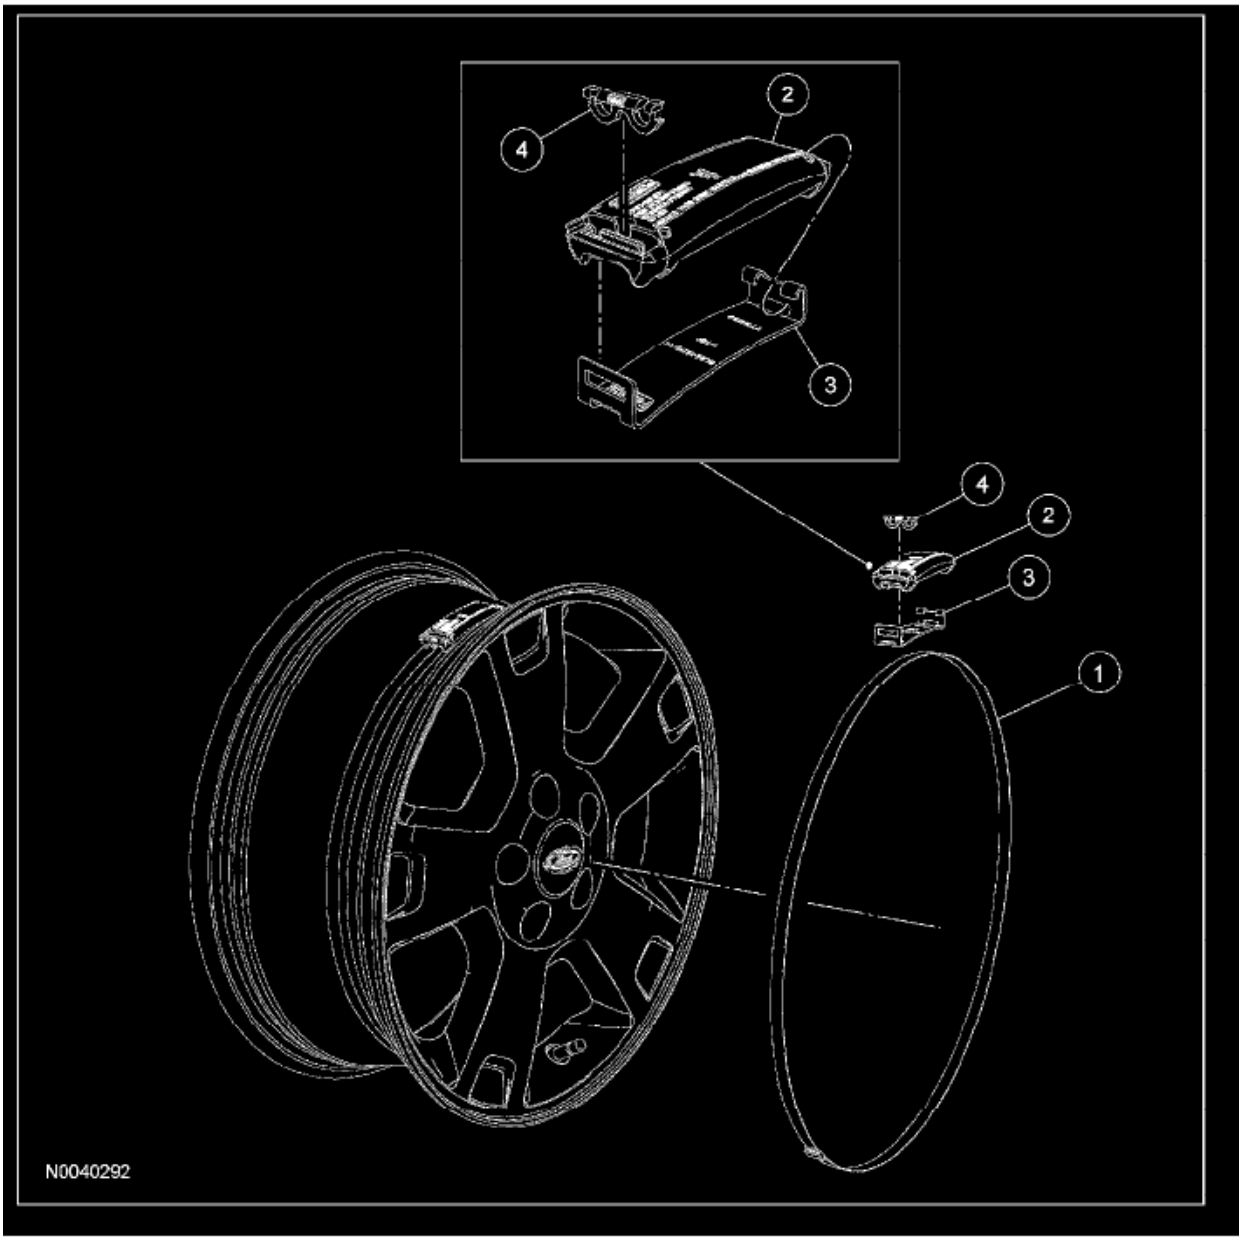
4. NOTE: A new tire pressure sensor is shipped in an off mode (or battery saver mode) and must be turned on before it can be trained. To turn the

sensor on, install it on a wheel, mount the tire and inflate the tire to the recommended inflation pressure. Wait at least 2 minutes, then continue with the sensor training procedure.

Train the tire pressure sensor(s).

Material

Item	Specification
Wheel and Tire Cleaner ZC-27-A or B	—



Item	Part Number	Description
1	1A177/1A193	Strap/strap kit
2	1A150/1A189	Tire pressure sensor/sensor kit

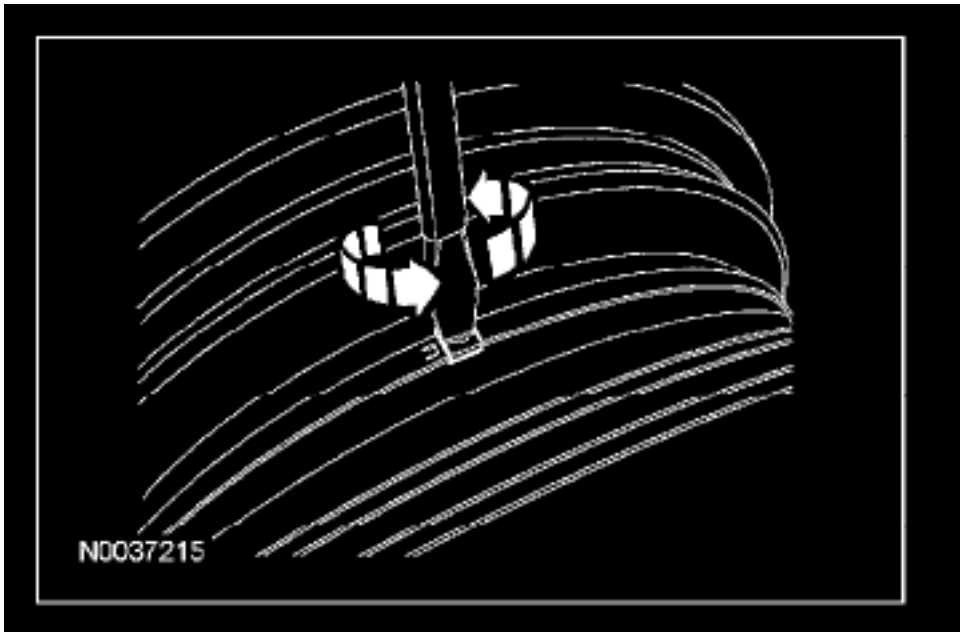
4	14C202	Locking clip (also part of 1A189)

Tire Pressure Sensor: Service and Repair Tire Pressure Monitoring System (TPMS) Strap and Cradle

Tire Pressure Monitoring System (TPMS) Strap and Cradle

Disassembly



WARNING: The tire pressure monitoring system (TPMS) sensor battery may release hazardous chemicals if exposed to extreme mechanical damage. If these chemicals contact the skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If any part of the battery is swallowed, contact a physician immediately. When disposing of TPMS sensors, follow the correct procedures for hazardous material disposal. Failure to follow these instructions may result in serious personal injury.

NOTE: Tire pressure sensors are equipped with Lithium-ion batteries and must be disposed of accordingly.

NOTE: Tire pressure sensors are manufactured in multiple colors based on their application. When installing a new sensor, make sure the color of the sensor being installed matches the color of the sensor that was removed. The different colored sensors are not interchangeable.

NOTE: The sensor is available separately, the cradle and strap are available as a strap kit. There are several different strap kits available based on wheel diameter but all strap kits share the same base part number.

1. Remove the tire pressure monitoring system (TPMS) sensor.

2. WARNING: Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

WARNING: Wear protective gloves when handling components or parts that have pointed or sharp edges. Failure to follow this instruction may result in serious personal injury.

Remove a factory installed strap in the following sequence: 1

Locate the strap buckle and secure the strap to the wheel using duct tape or a similar item, on both sides of the buckle approximately 25 mm (0.98 inch) from the buckle.

2 Using a large screwdriver and a twisting motion, unbuckle the strap.

3 Discard the strap.

3. To remove a dealer installed strap, turn the worm gear screw until the strap is fully released from the worm gear.

^ Discard the strap.

4. NOTE: To aid assembly, mark the location of the cradle prior to disassembly.

Using a screwdriver, or similar tool, remove the cradle by inserting the screwdriver under the cradle and prying up.

Assembly

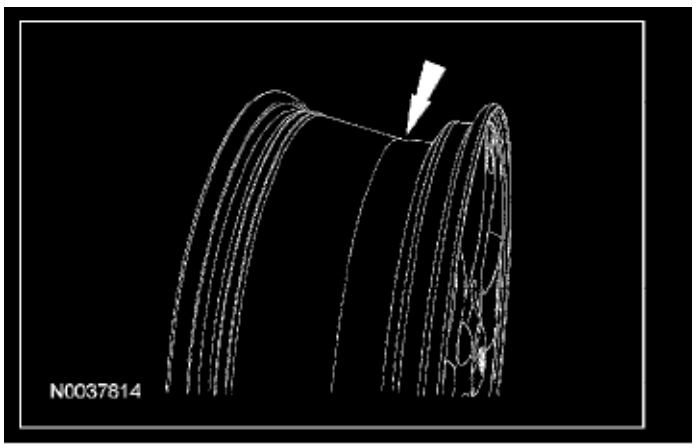
1. NOTE: Make sure the sensor is fully seated into the new cradle. The sensor will make a "click" noise when fully seated.

Position the sensor into the new cradle by inserting the hinge end of the sensor into the hook end of the cradle and pushing the opposite end of the sensor down onto the cradle.

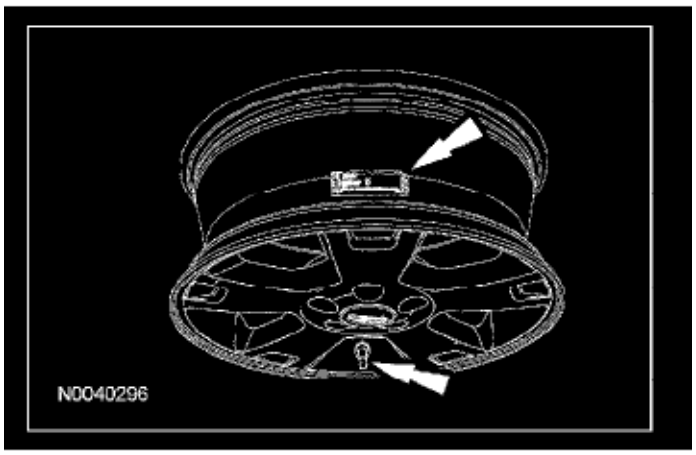
2. CAUTION: Metal scrapers may damage the wheel. Use only plastic or non-metallic scrapers to remove the cradle adhesive strip residue.

NOTE: The sensor and cradle must be installed in the drop well of the wheel, 180 degrees from the valve stem.

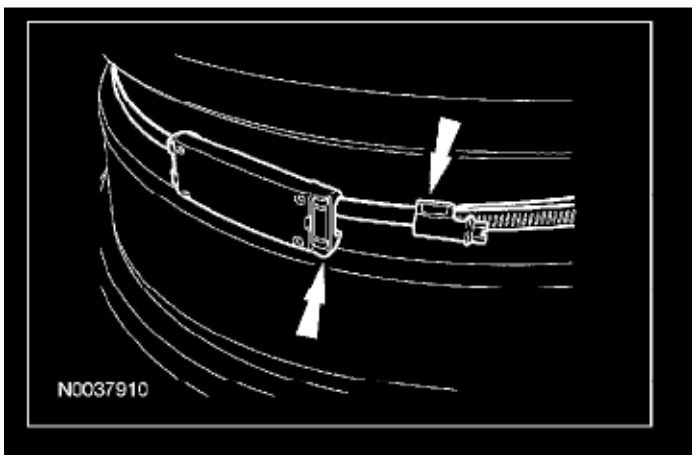
Clean the area where the sensor and cradle are to be installed.



N0037814



N0040296



N0037910

3. NOTE: The sensor and cradle must be positioned with the hinge side of the sensor on the RH side when viewed from the curb side (beauty side)

of the wheel.

NOTE: The sensor has raised markings indicating how to position the sensor.

Remove the adhesive tape liner from the cradle and position the sensor and cradle into the wheel drop well 180 degrees from the valve stem.

4. Install the tapered end of the strap through the opening of the cradle on the hinge side of the sensor. This will position the worm gear on the

locking clip side of the sensor.

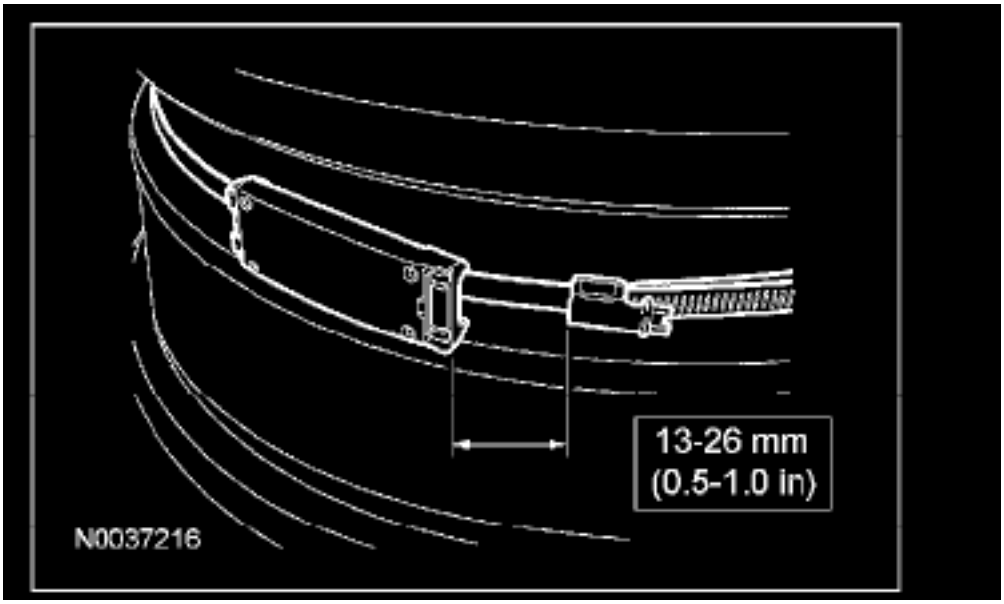
5. CAUTION: Steel wheels have a "high spot" along their circumference. Make sure the strap and sensor are mounted at the lowest spot

possible to avoid damaging the sensor during wheel and tire disassembly and assembly.

NOTE: Keep the strap parallel with the wheel flange while tightening the worm gear.

Position the worm gear 13-26 mm (0.5-1.0 inch) away from the sensor and tighten the worm gear.
^

Tighten to 3 Nm (27 lb-inch).



6. CAUTION: The sensor, cradle and strap may be damaged by incorrect tire mounting or dismounting. Mount the tire only as instructed.

Install the tire onto the wheel.

7. NOTE: A new tire pressure sensor is shipped in an off mode (or battery saver mode) and must be turned on before it can be trained. To turn the

sensor on, install it on a wheel, mount the tire and inflate the tire to the recommended inflation pressure. Wait at least 2 minutes, then continue with the sensor training procedure.

Train the tire pressure sensor(s).

Brake Lamp: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

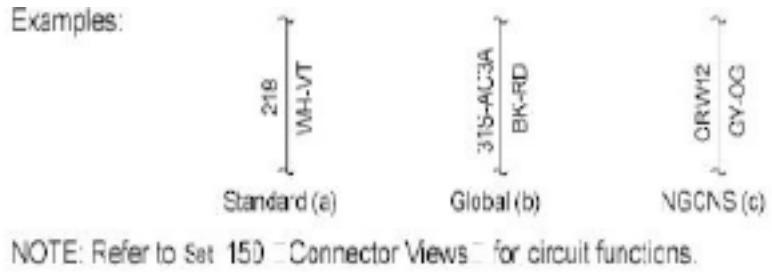
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

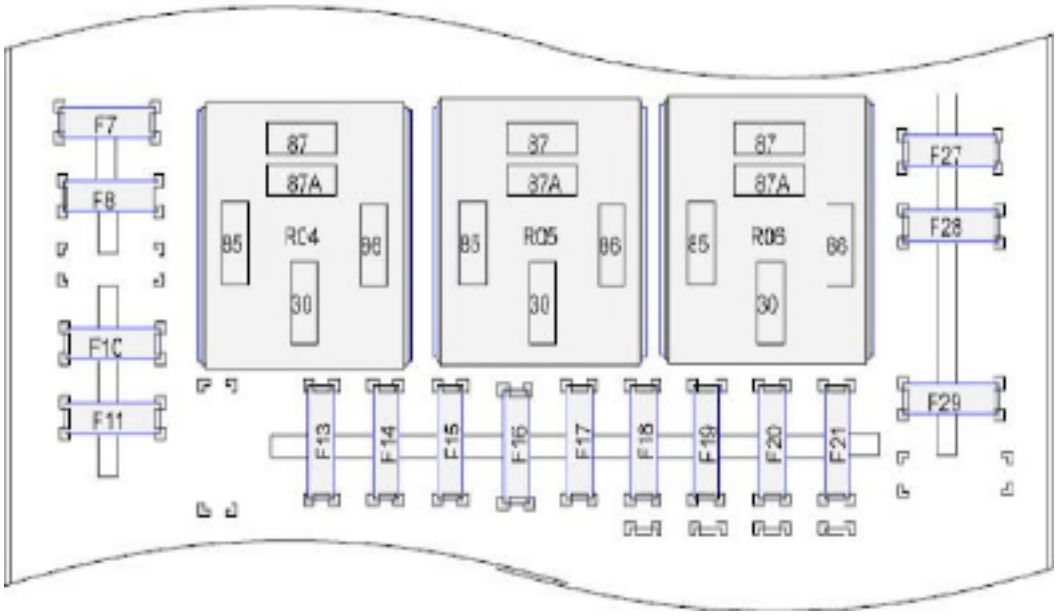
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

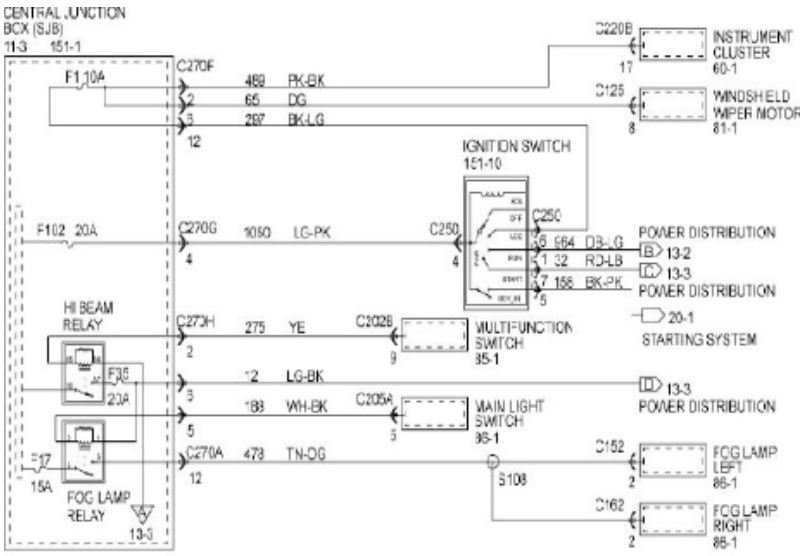
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

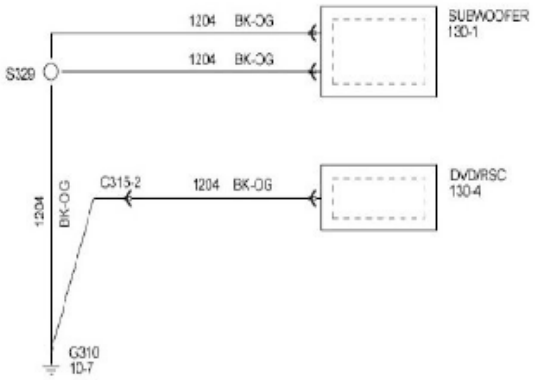
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

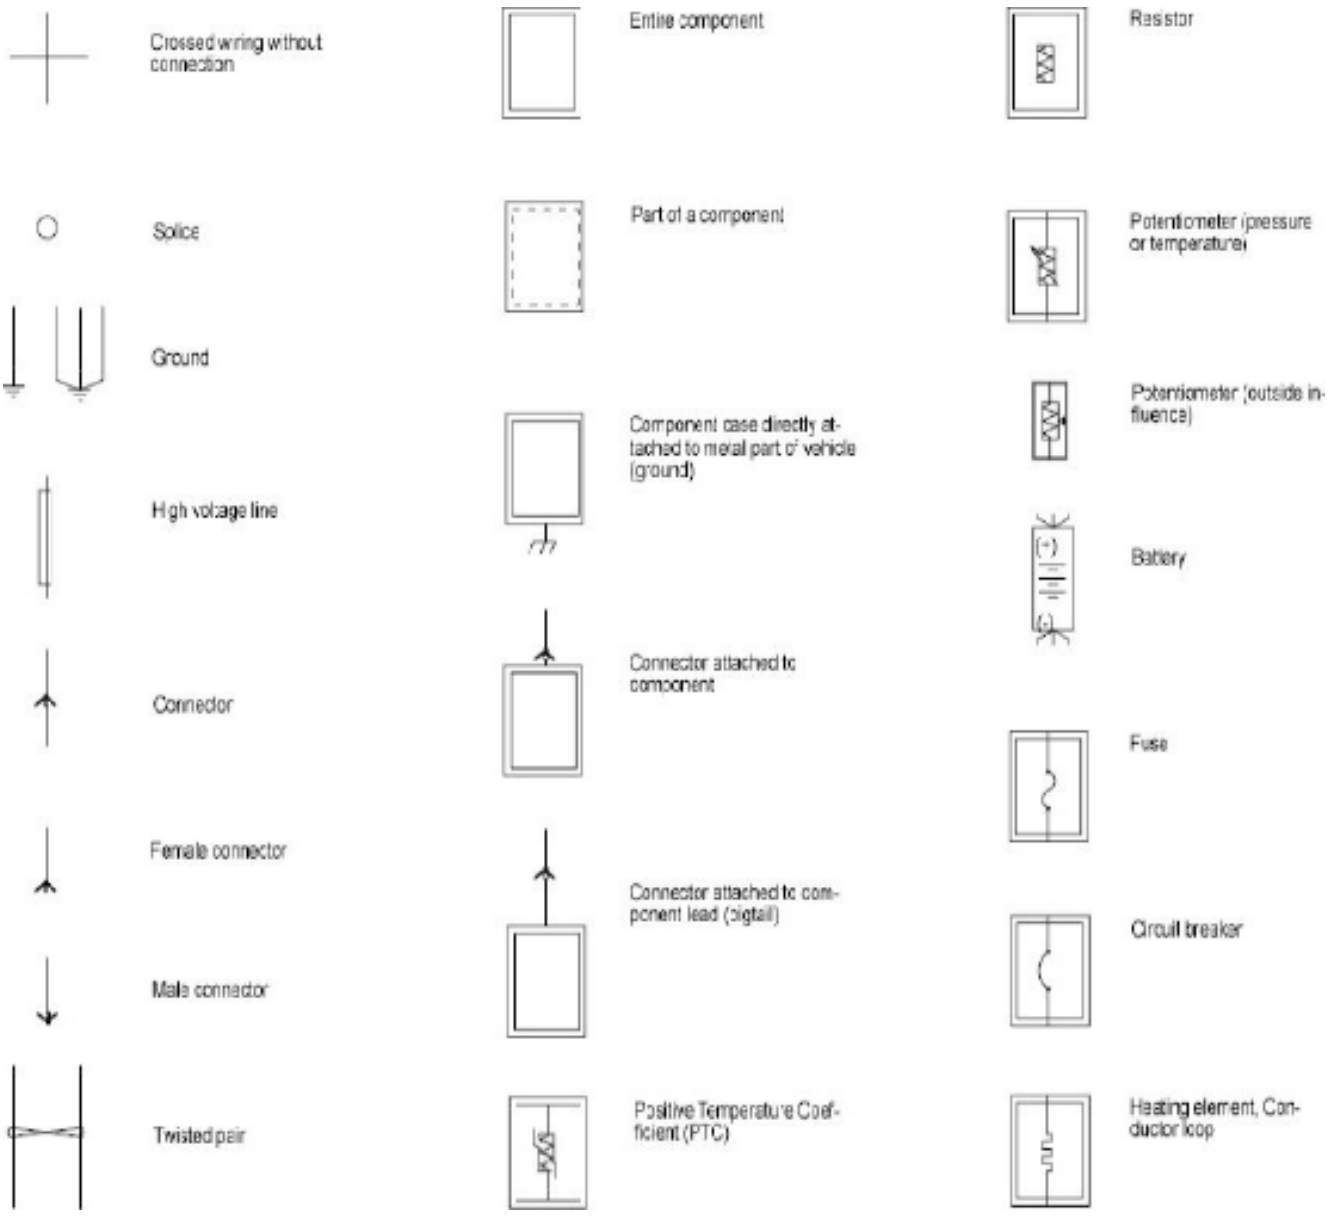
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

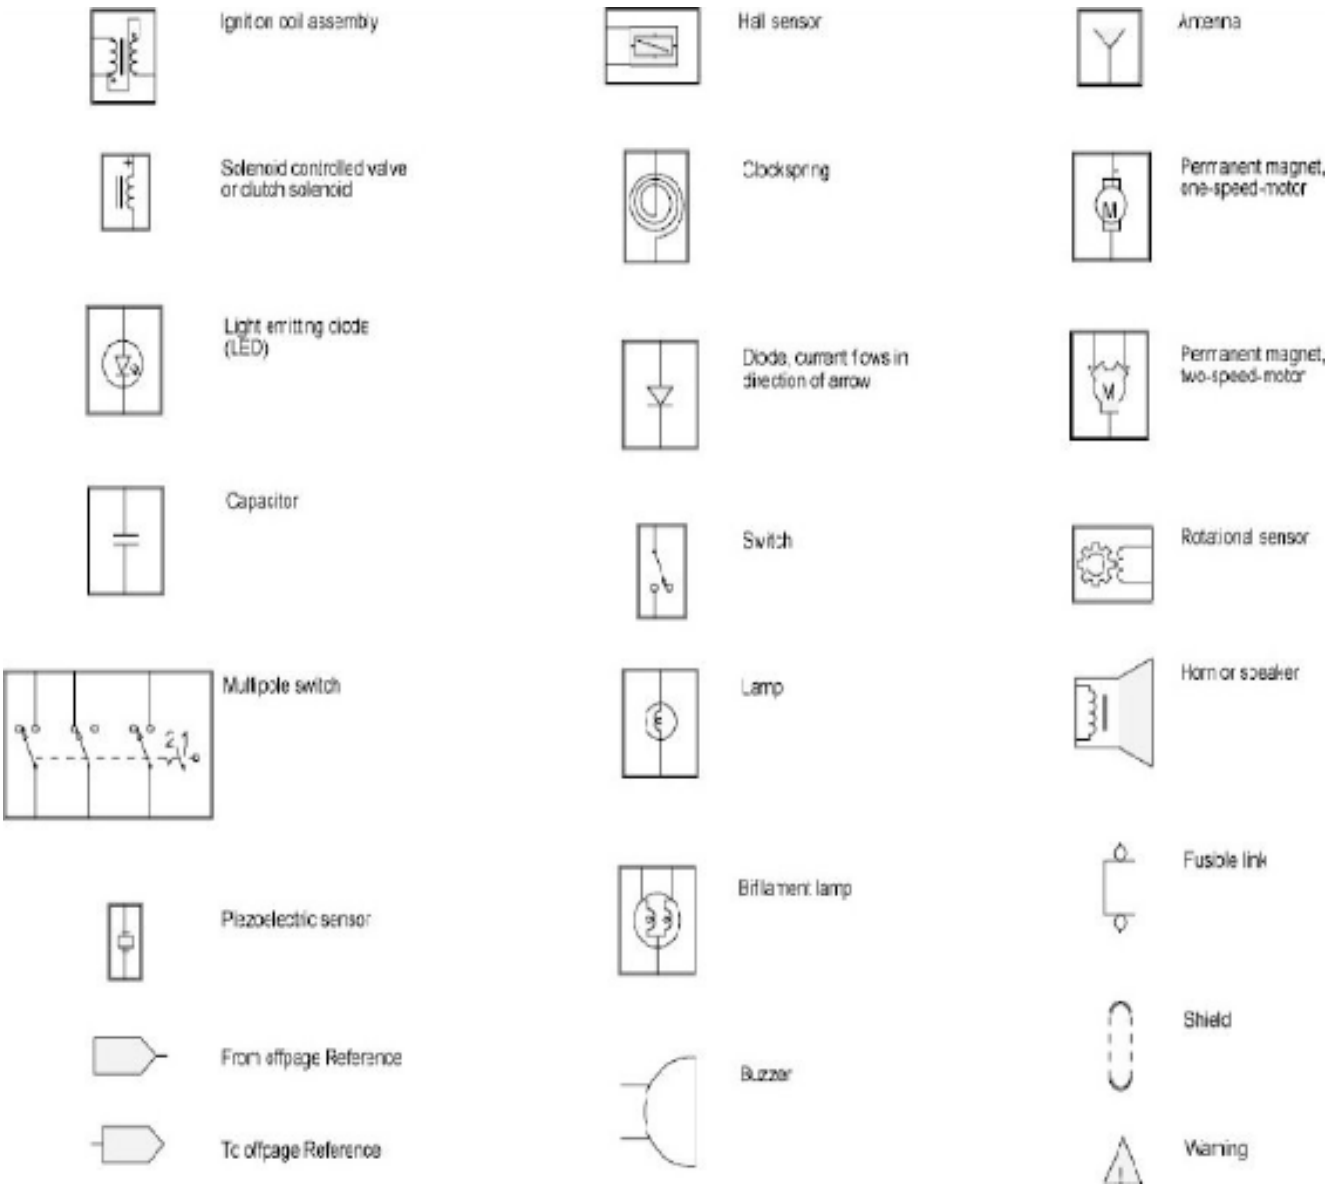
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

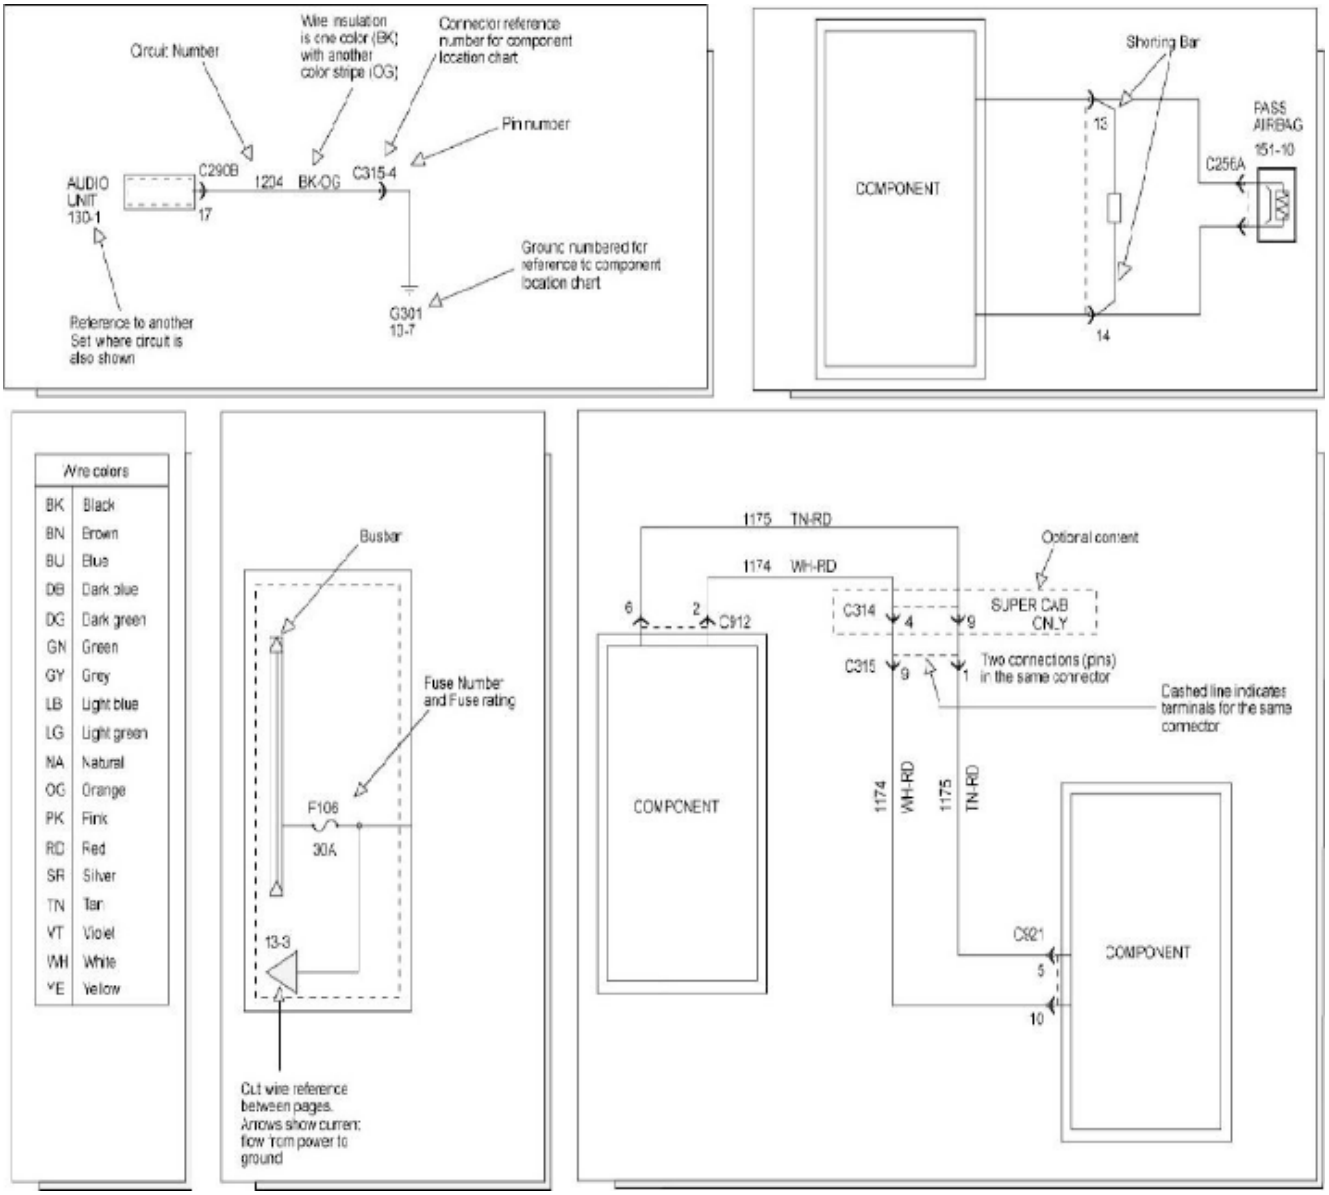
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

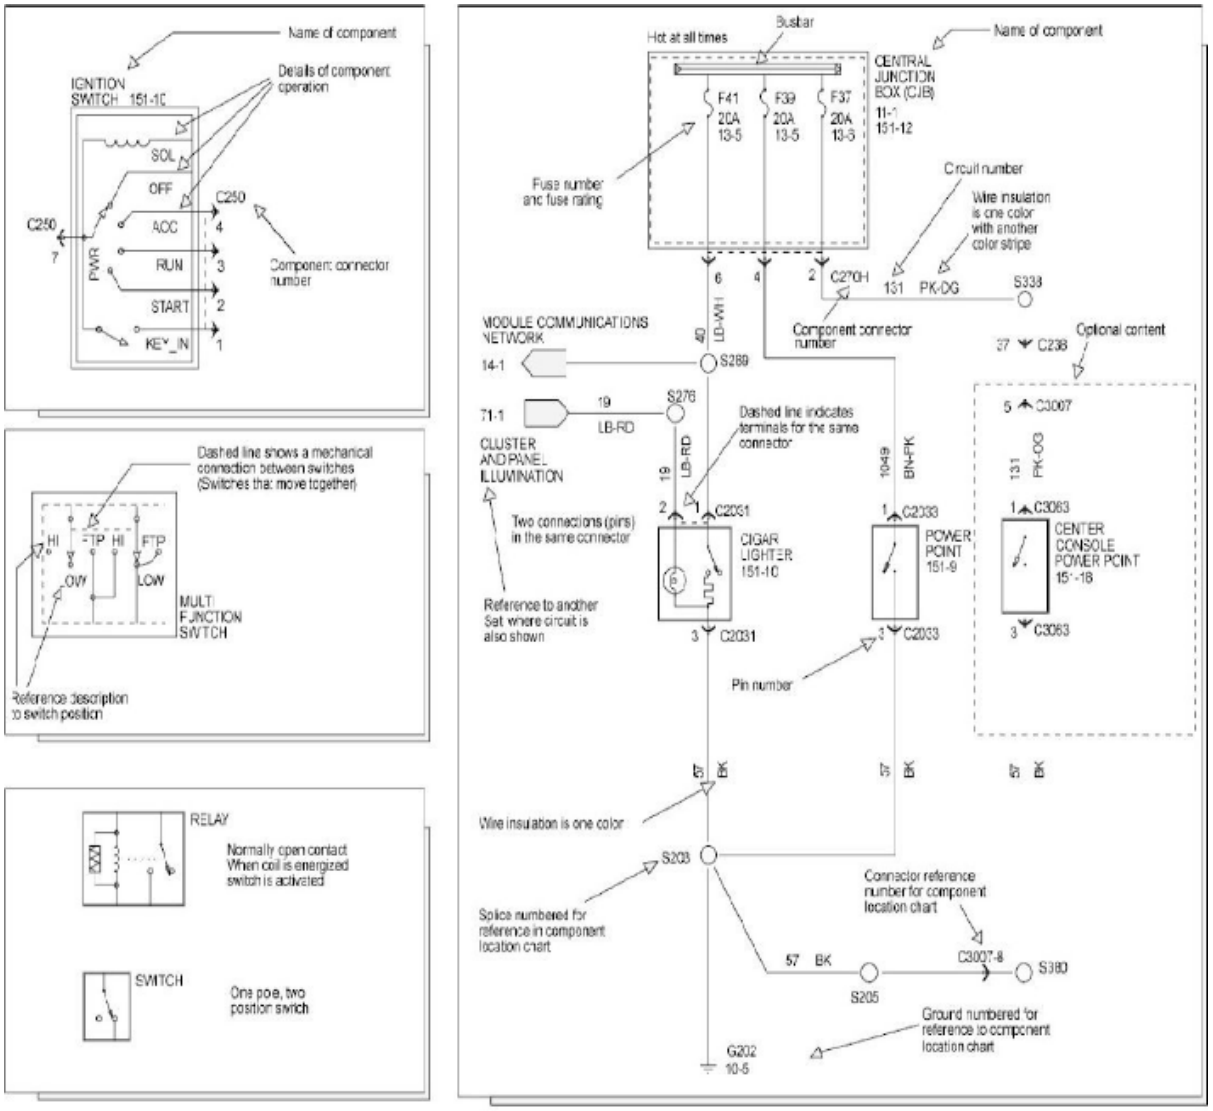
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Brake Lamp: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

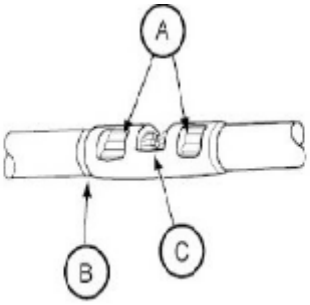
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

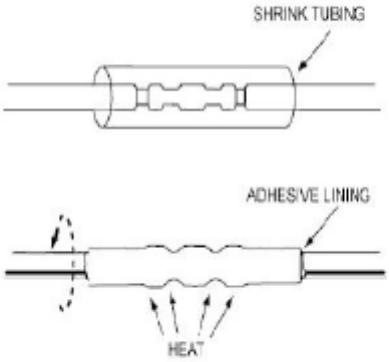
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x cia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Figtail only

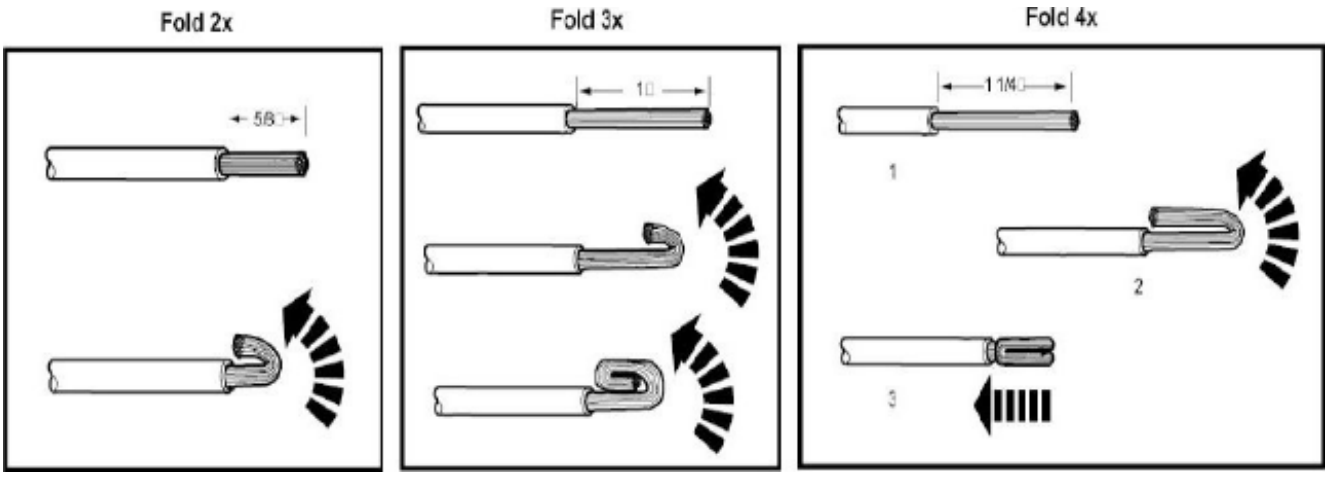
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Brake Lamp: Initial Inspection and Diagnostic Overview

Inspection and Verification

INSPECTION AND VERIFICATION

1. Verify the customer concern. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step. 4. If the concern is not visually evident, verify the symptom. GO to Symptom Chart. See: Symptom Related Diagnostic Procedures

Principles of Operation

PRINCIPLES OF OPERATION

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

Voltage is supplied at all times by the smart junction box (SJB) to the stoplamp switch. When the brake pedal is applied, voltage is supplied to the high mounted stoplamp and the multifunction switch, which routes the voltage to the rear lamps.

Symptom Chart

Condition	Possible Sources	Action
• One or more stoplamps are inoperative	• Fuse • Wiring, terminals or connectors • Stoplamp switch • High mounted stoplamp • Multifunction switch • Smart junction box (SJB)	• GO to Pinpoint Test G.
• The stoplamps are on continuously	• Wiring, terminals or connectors • Stoplamp switch • Multifunction switch	• GO to Pinpoint Test H.

Symptom Chart

PINPOINT TEST G: ONE OR MORE STOPLAMPS ARE INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step		Result / Action to Take
G1	DETERMINE THE INOPERATIVE STOPLAMP	
	• Key in OFF position. • Observe the stoplamps while applying the brake pedal. • **Are all the stoplamps inoperative?**	**Yes** GO to **G2**. **No** If the high mounted stoplamp is inoperative, GO to **G5**. If one rear stoplamp is inoperative, GO to **G7**. If both rear stoplamps are inoperative,GO to **G9**.
G2	CHECK THE VOLTAGE TO THE STOPLAMP SWITCH	
	• Disconnect: Stoplamp Switch C278. • Measure the voltage between the stoplamp switch C278-1, circuit SBP19 (BU/RD), harness side and ground.  GK7493-A • **Is the voltage greater than 10 volts?**	**Yes** GO to **G4**. **No** VERIFY the SJB fuse 19 (20A) is OK. If OK, GO to **G3**.
G3	CHECK CIRCUIT SBP19 (BU/RD) FOR AN OPEN	
	• Disconnect: SJB C2280b.	

(Continued)

Brake Lamp: Pinpoint Tests

Test G: One Or More Stoplamps Are Inoperative

PINPOINT TEST G: ONE OR MORE STOPLAMPS ARE INOPERATIVE

Normal Operation

The smart junction box (SJB) provides voltage to the stoplamp switch through circuit SBP19 (BU/RD). When the brake pedal is applied, voltage is routed to the high mounted stoplamp and the multifunction switch through circuit CCB08 (VT/WH). The multifunction switch then routes the voltage to the LH and RH rear lamps through circuits CLS35 (VT) and CLS36 (YE), respectively. Ground is provided through circuit GD161 (BK/YE) for the high mounted stoplamp and through circuit GD121 (BK/YE) for the rear lamps.

This pinpoint test is intended to diagnose the following:

- Fuse

- Wiring, terminals or connectors

- Stoplamp switch
- High mounted stoplamp
- Multifunction switch
- SJB

G1-G3

PINPOINT TEST G: ONE OR MORE STOPLAMPS ARE INOPERATIVE (Continued)

Test Step		Result / Action to Take
G3	CHECK CIRCUIT SBP19 (BU/RD) FOR AN OPEN (Continued)	
	• Measure the resistance between the SJB C2280b-31, circuit SBP19 (BU/RD), harness side and the stoplamp switch C278-1, circuit SBP19 (BU/RD), harness side.  A0079390 • **Is the resistance less than 5 ohms?**	**Yes** GO to **G11**. **No** REPAIR the circuit. TEST the system for normal operation.
G4	CHECK CIRCUIT CCB08 (VT/WH) FOR AN OPEN (ALL STOPLAMPS INOPERATIVE)	
	• Connect a fused (20A) jumper wire between the stoplamp switch C278-1, circuit SBP19 (BU/RD), harness side and the stoplamp switch C278-2, circuit CCB08 (VT/WH), harness side.  A0079391 • **Do the stoplamps illuminate?**	**Yes** REMOVE the jumper wire. INSTALL a new stoplamp switch. TEST the system for normal operation. **No** REMOVE the jumper wire. REPAIR the circuit. TEST the system for normal operation.
G5	CHECK CIRCUIT GD161 (BK/YE) FOR AN OPEN	
	• Disconnect: High Mounted Stoplamp C904. • Measure the resistance between the high mounted stoplamp C904-1, circuit GD161 (BK/YE), harness side and ground.  GK5849-A • **Is the resistance less than 5 ohms?**	**Yes** GO to **G6**. **No** REPAIR the circuit. TEST the system for normal operation.

(Continued)

G3-G5

PINPOINT TEST G: ONE OR MORE STOPLAMPS ARE INOPERATIVE (Continued)

Test Step		Result / Action to Take
G6	**CHECK CIRCUIT CCB08 (VT/WH) FOR AN OPEN (HIGH MOUNTED STOPLAMP)**	
	• While applying the brake pedal, measure the voltage between the high mounted stoplamp C904-2, circuit CCB08 (VT/WH), harness side and ground.  GK5848-A • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new high mounted stoplamp. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
G7	**CHECK CIRCUIT GD121 (BK/YE) FOR AN OPEN**	
	• Disconnect: Inoperative Rear Stoplamp. • Measure the resistance between the LH rear lamp C412-1, circuit GD121 (BK/YE), harness side and ground; or between the RH rear lamp C415-1, circuit GD121 (BK/YE), harness side and ground.  N0035224 • **Is the resistance less than 5 ohms?**	**Yes** GO to **G8**. **No** REPAIR the circuit. TEST the system for normal operation.
G8	**CHECK THE MULTIFUNCTION SWITCH**	
	• Disconnect: Multifunction Switch. • Carry out the multifunction switch component test. • **Is the multifunction switch OK?**	**Yes** REPAIR circuit CLS35 (VT) (LH rear stoplamp) or circuit CLS36 (YE) (RH rear stoplamp) for an open. TEST the system for normal operation. **No** INSTALL a new multifunction switch. TEST the system for normal operation.
G9	**CHECK CIRCUIT CCB08 (VT/WH) FOR AN OPEN (MULTIFUNCTION SWITCH)**	
	• Disconnect: Multifunction Switch C202b.	

(Continued)

PINPOINT TEST G: ONE OR MORE STOPLAMPS ARE INOPERATIVE (Continued)

Test Step		Result / Action to Take
G9	**CHECK CIRCUIT CCB08 (VT/WH) FOR AN OPEN (MULTIFUNCTION SWITCH) (Continued)** • While applying the brake pedal, measure the voltage between the multifunction switch C202b-1, circuit CCB08 (VT/WH), harness side and ground.  A0079392 • **Is the voltage greater than 10 volts?**	**Yes** GO to **G10**. **No** REPAIR the circuit. TEST the system for normal operation.
G10	**CHECK CIRCUIT GD121 (BK/YE) FOR AN OPEN** • Disconnect: Inoperative Rear Stoplamp. • Measure the resistance between the LH rear lamp C412-1, circuit GD121 (BK/YE), harness side and ground; or between the RH rear lamp C415-1, circuit GD121 (BK/YE), harness side and ground.  N0035224 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new multifunction switch. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
G11	**CHECK FOR CORRECT SJB OPERATION** • Disconnect all the SJB connectors. • Check for: — corrosion — damaged pins — pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

G9-G11

Test H: The Stoplamps Are On Continuously

PINPOINT TEST H: THE STOPLAMPS ARE ON CONTINUOUSLY

Normal Operation

When the brake pedal is applied, the voltage is routed to the high mounted stoplamp and the multifunction switch through circuit CCB08 (VT/WH). The multifunction switch then routes the voltage to the LH and RH rear lamps through circuits CLS35 (VT) and CLS36 (YE), respectively. Voltage to the LH and RH rear lamps also routes through the battery junction box (BJB) fuses 42 (7.5A) and 38 (7.5A) to circuits CAT06 (YE) and CAT09 (GN), respectively, for the trailer tow lamps.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors

- Stoplamp switch

- Multifunction switch

PINPOINT TEST H: THE STOPLAMPS ARE ON CONTINUOUSLY

Test Step		Result / Action to Take
H1	**CHECK THE STOPLAMP SWITCH** • Disconnect: Stoplamp Switch C278. • **Do the stoplamps continue to illuminate?**	**Yes** GO to **H2**. **No** INSTALL a new stoplamp switch. TEST the system for normal operation.
H2	**CHECK CIRCUIT CAT09 (GN) FOR A SHORT TO VOLTAGE** • Key in OFF position. • Disconnect: BJB Fuse 38 (7.5A). • **Do the stoplamps continue to illuminate?**	**Yes** GO to **H3**. **No** REPAIR the circuit. TEST the system for normal operation.
H3	**CHECK CIRCUIT CAT06 (YE) FOR A SHORT TO VOLTAGE** • Disconnect: BJB Fuse 42 (7.5A). • **Do the stoplamps continue to illuminate?**	**Yes** GO to **H4**. **No** REPAIR the circuit. TEST the system for normal operation.
H4	**CHECK THE MULTIFUNCTION SWITCH** • Disconnect: Multifunction Switch C202a. • **Do the stoplamps continue to illuminate?**	**Yes** If the high mounted stoplamp is on continuously, REPAIR circuit CCB08 (VT/WH). TEST the system for normal operation. If the LH rear stoplamp is on continuously, REPAIR circuit CLS35 (VT). TEST the system for normal operation. If the RH rear stoplamp is on continuously, REPAIR circuit CLS36 (YE). TEST the system for normal operation. **No** INSTALL a new multifunction switch. TEST the system for normal operation.

Brake Light Switch: Description and Operation

BRAKE PEDAL POSITION (BPP) SWITCH

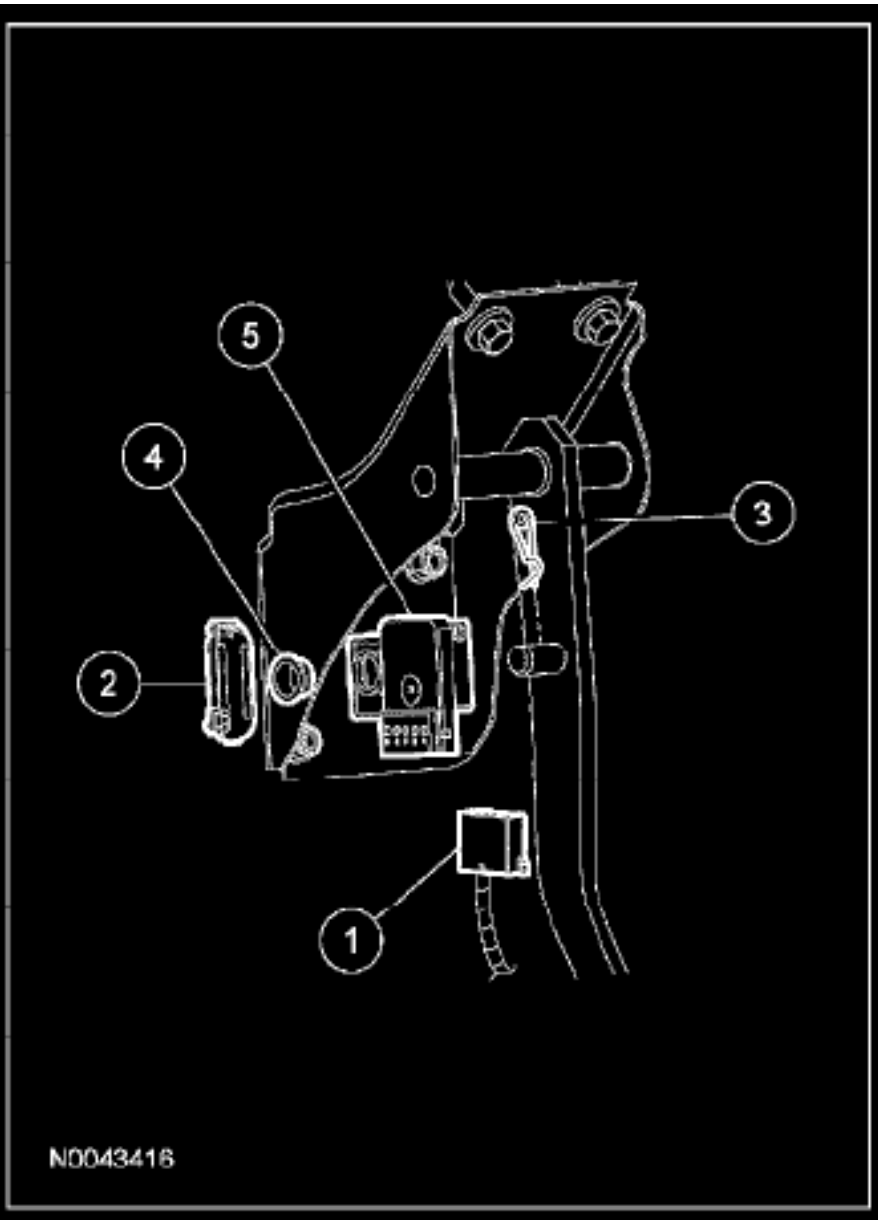
Typical BPP Switch

The BPP switch is sometimes referred to as the stoplamp switch. The BPP switch provides a signal to the PCM indicating that the brakes are applied. The BPP switch is normally open and is mounted on the brake pedal support. Depending on the vehicle application the BPP switch can be hardwired as follows:

- to the PCM supplying battery positive voltage (B+) when the vehicle brake pedal is applied.

- to the antilock brake system (ABS) module, or lighting control module (LCM), the BPP signal is then broadcast over the network to be received by the PCM.

- to the ABS traction control/stability assist module. The ABS module interprets the BPP switch input along with other ABS inputs and generates an output called the driver brake application (DBA) signal. The DBA signal is then sent to the PCM and to other BPP signal users.



Item	Part Number	Description
1	—	Stoplamp switch electrical connector (part of 14401)
2	2475	Stoplamp switch self-locking pin cover
3	380699	Stoplamp switch self-locking pin
4	2B219	Stoplamp switch spacer
5	13480	Stoplamp switch

Brake Light Switch: Service and Repair

STOPLAMP SWITCH

Removal and Installation

1. Disconnect the stoplamp switch electrical connector. 2. Remove the cover and the self-locking pin. 3. Remove the stoplamp switch from the brake booster push rod and the brake pedal assembly.

- Remove the spacer.

4. To install, reverse the removal procedure.

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

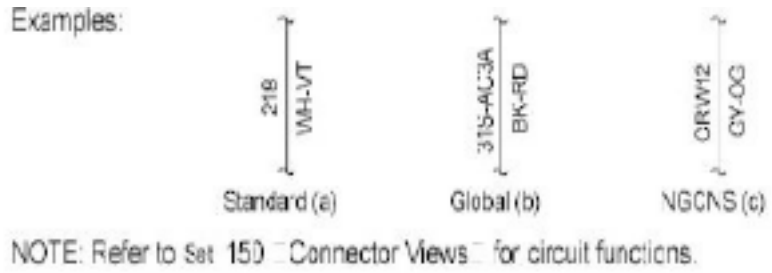
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

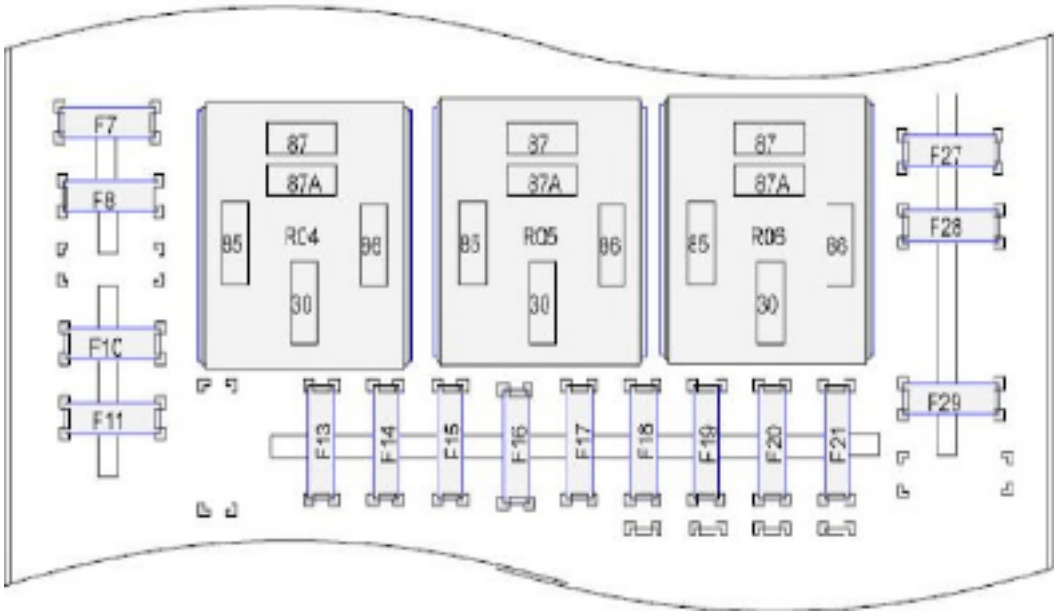
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

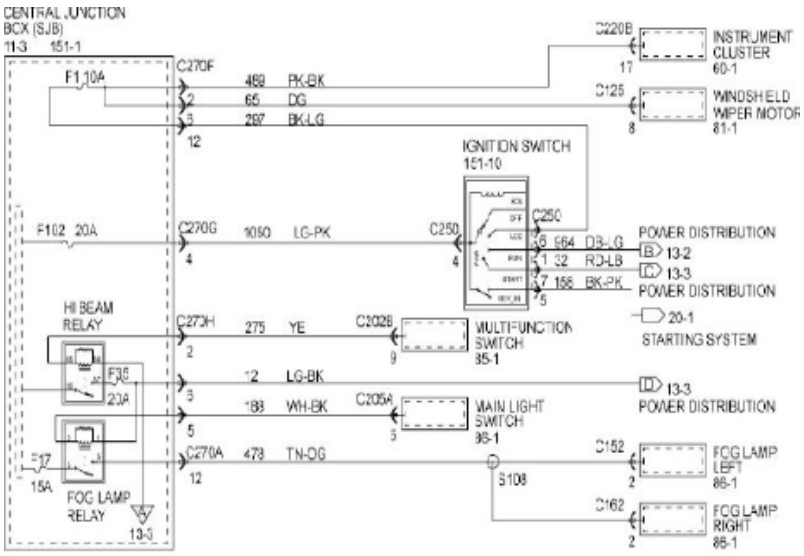
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

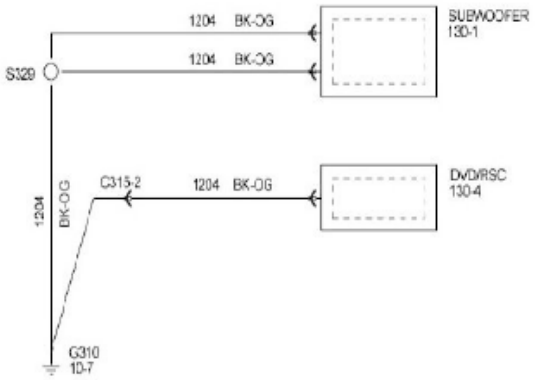
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

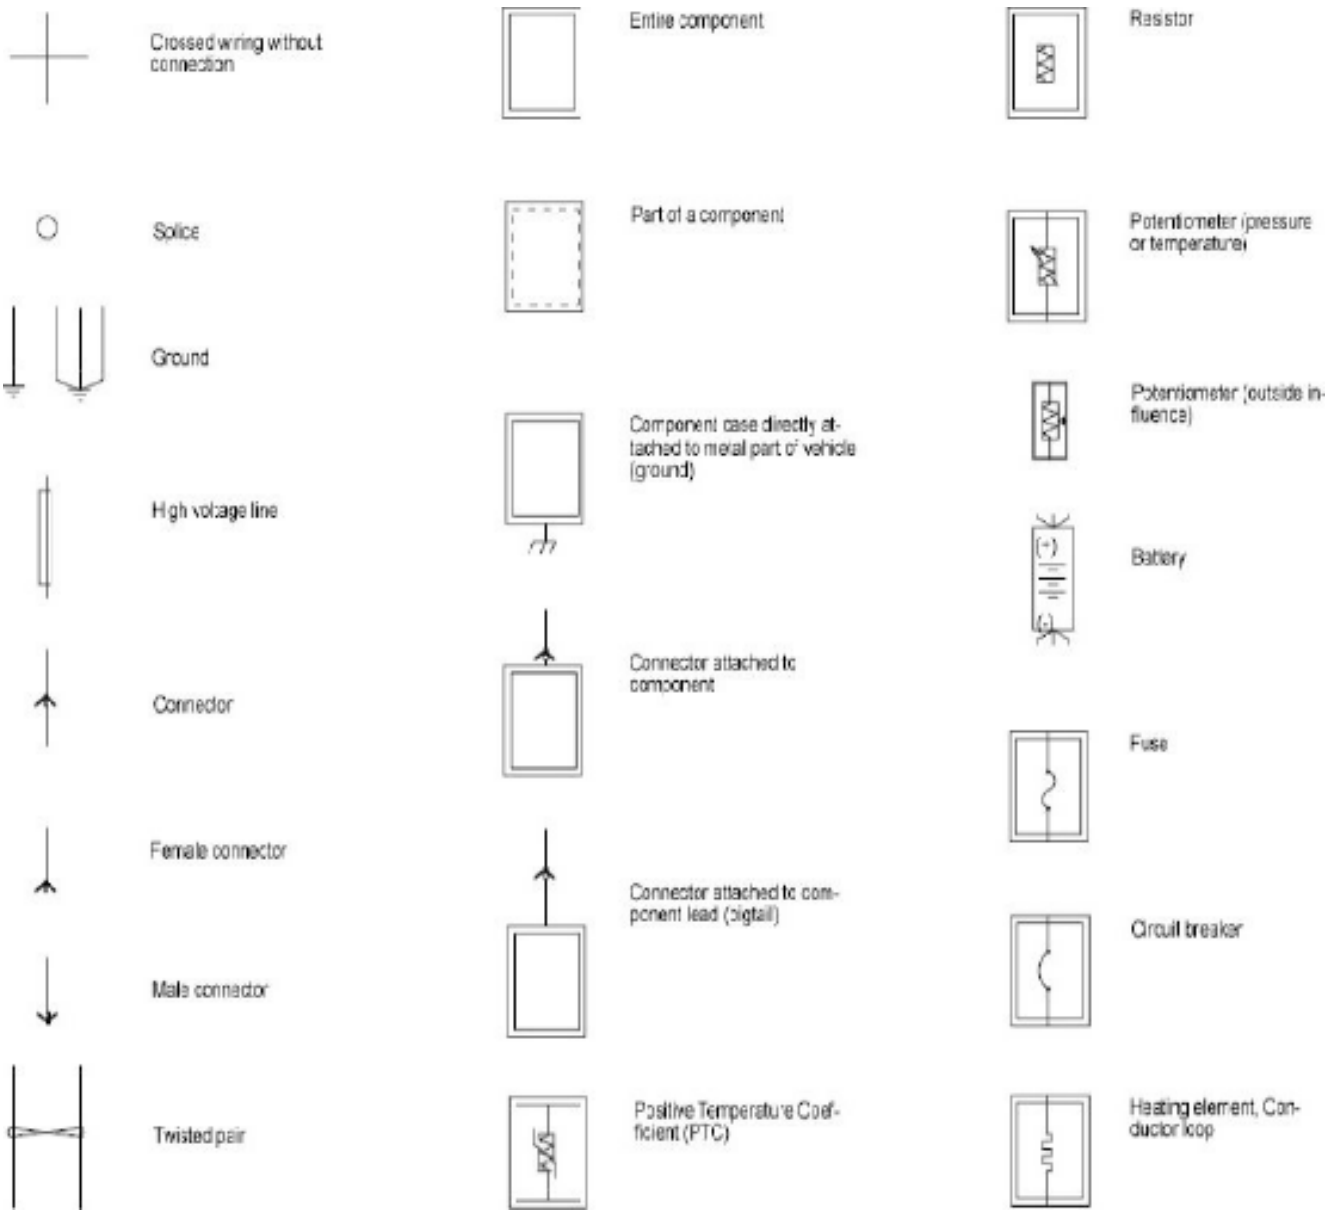
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

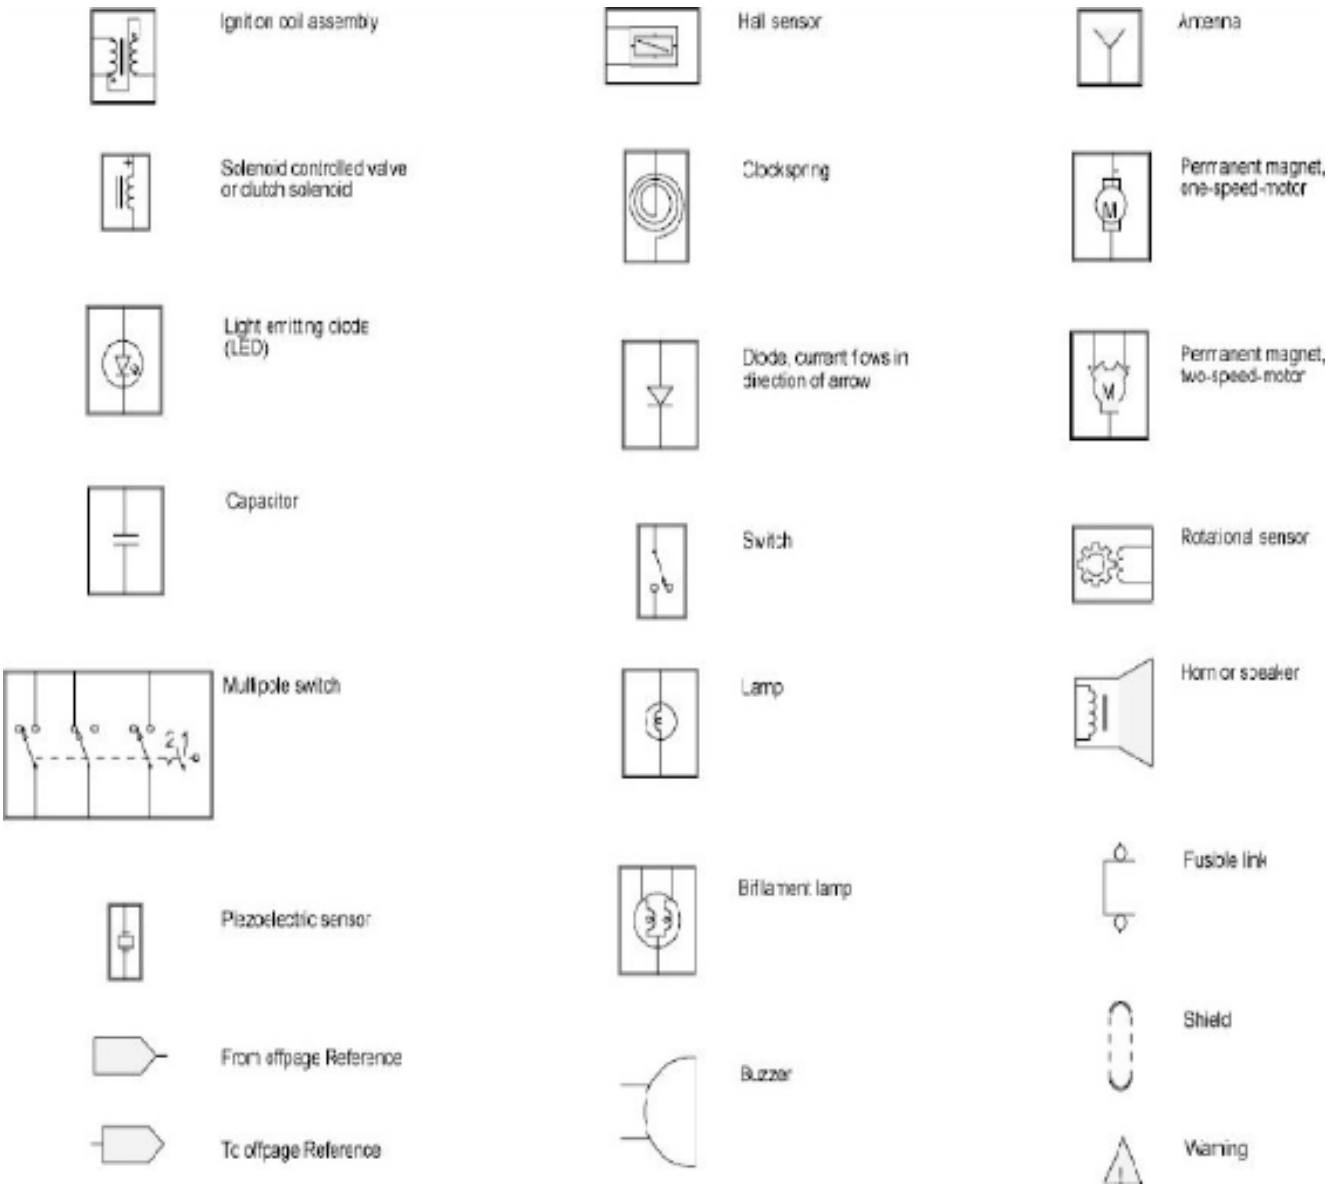
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

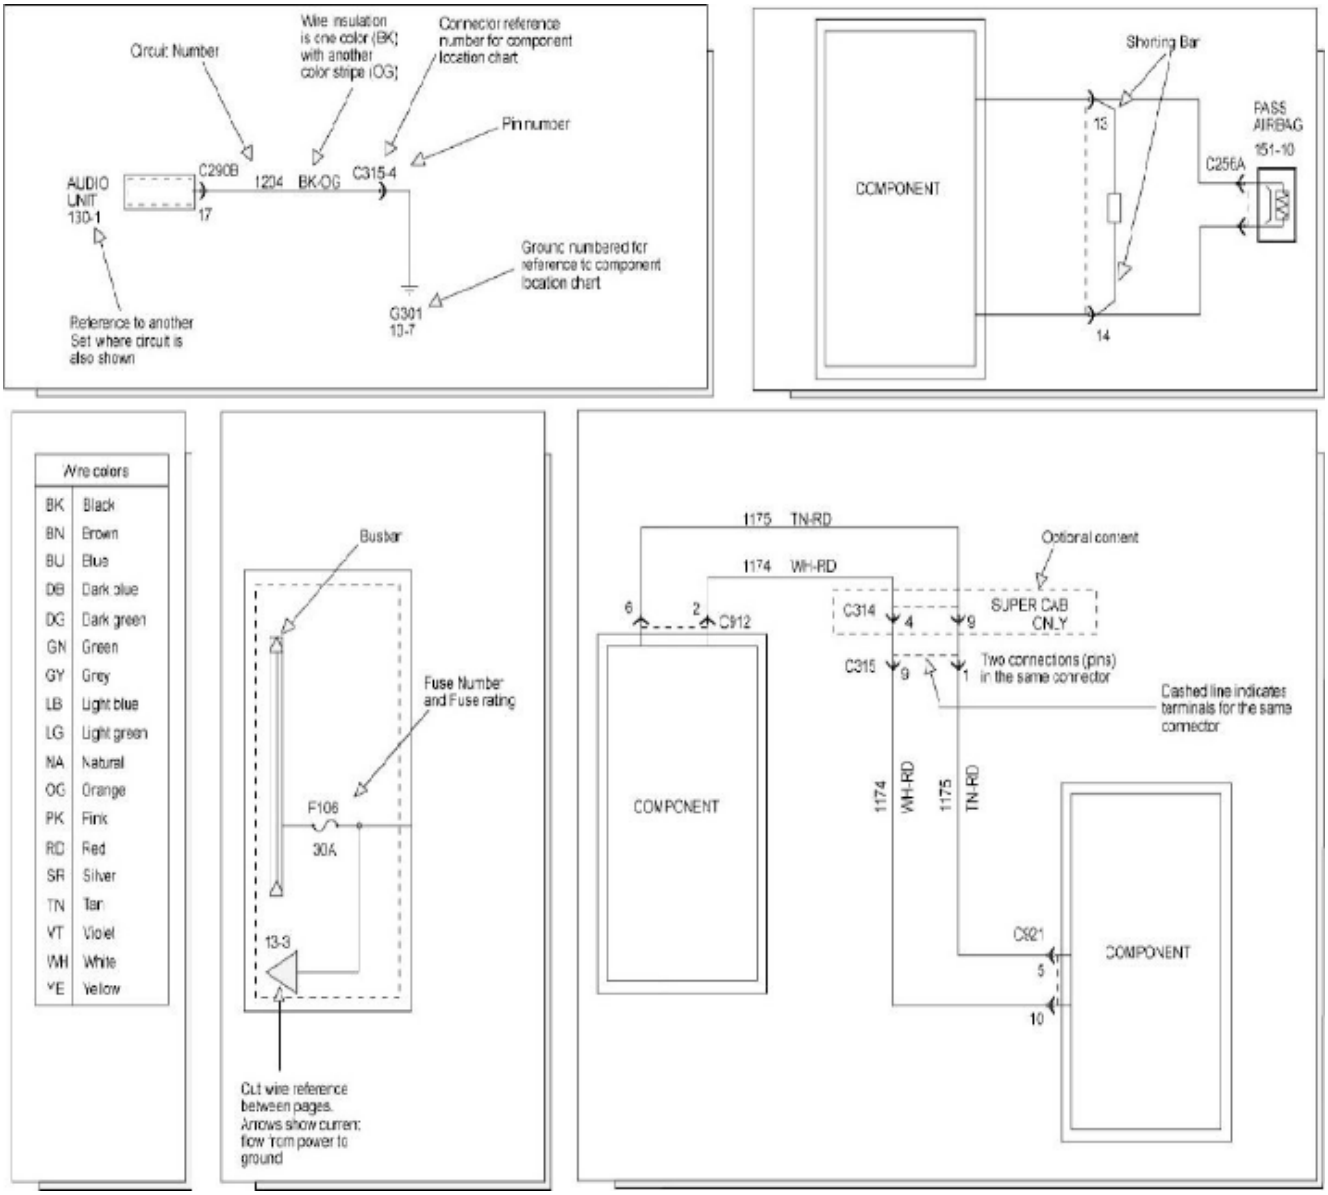
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

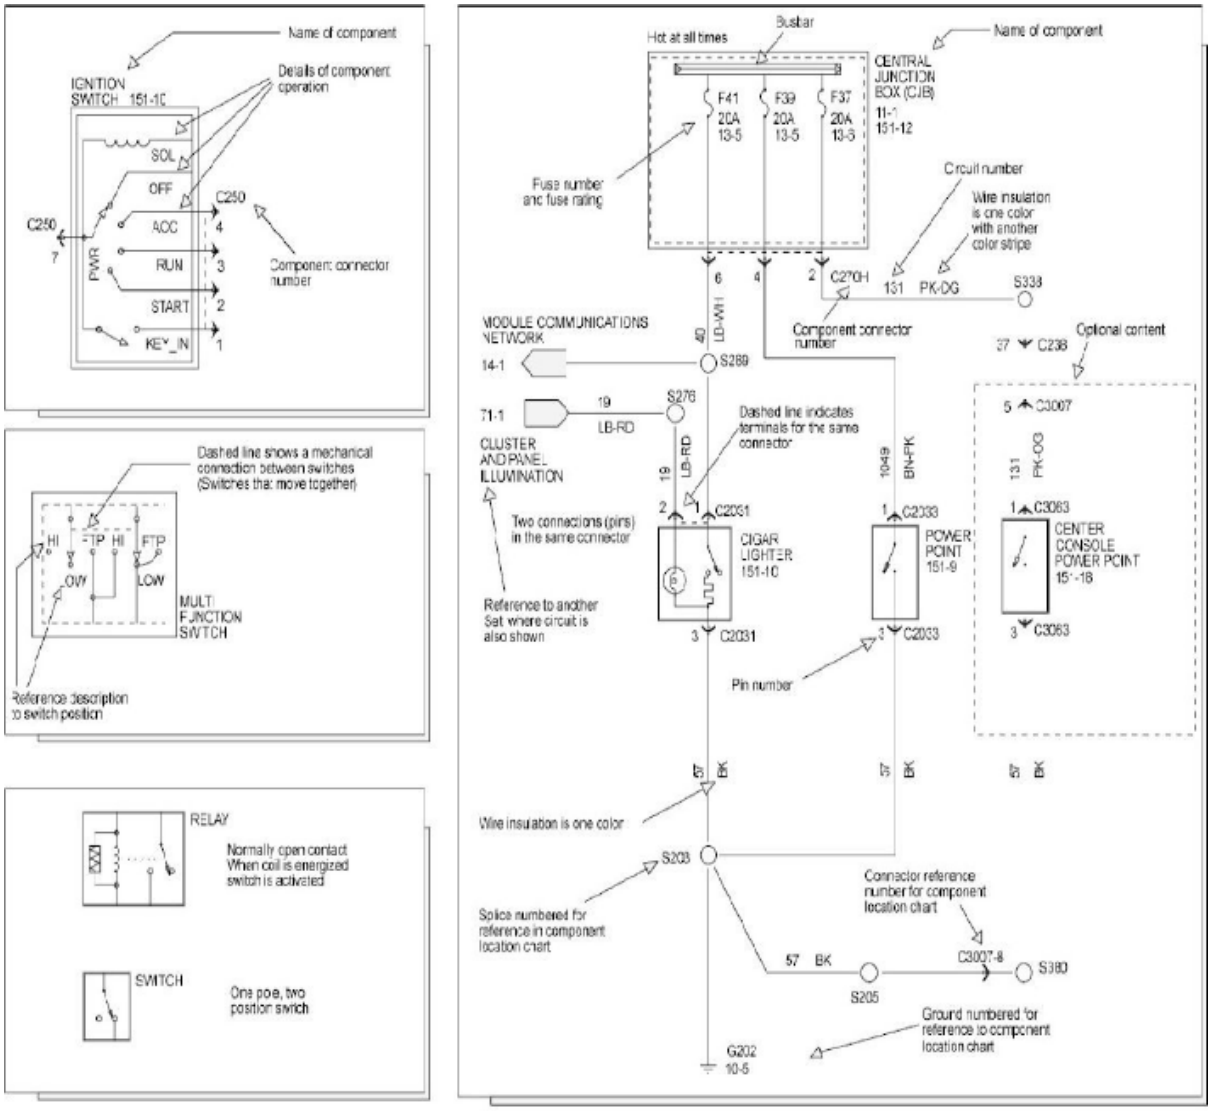
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

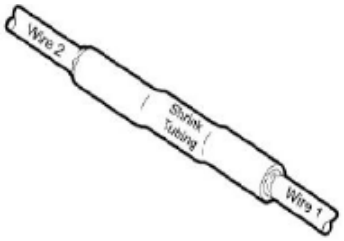
NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.



Wire 2

WIRE STOPPER

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

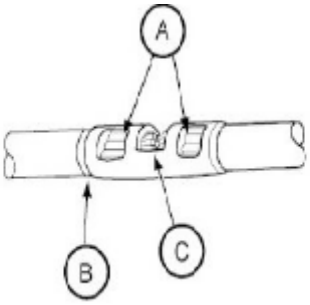
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

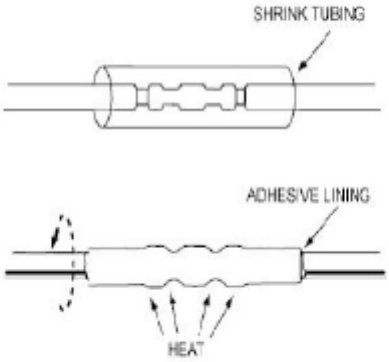
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4□ strip, cut 9 strands	* 1/4□ strip, cut 2 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip, fold 3x dia.
	16-14	* 1/4□ strip, cut 7 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip fold 2x dia	1□ strip, fold 3x dia.	1 1/4□ strip, fold 4x dia.	Not Recommended
	12-10	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip fold 3x cia.	1 1/4□ strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

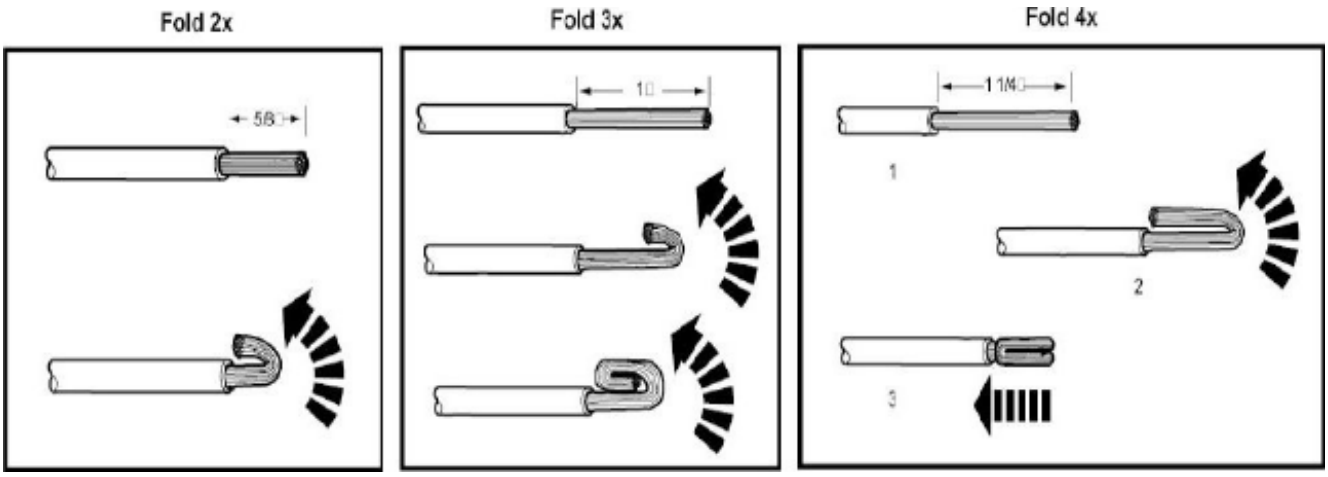
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Courtesy Lamp: Initial Inspection and Diagnostic Overview

Inspection and Verification

INSPECTION AND VERIFICATION

1. Verify the customer concern. 2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. NOTE: Make sure to use the latest scan tool software release.

If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

5. NOTE: The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

If the scan tool does not communicate with the VCM: -

Check the VCM connection to the vehicle.

- Check the scan tool connection to the VCM.

- Refer to Information Bus (Module Communications Network), No Power to the Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:

- Verify the ignition key is in the ON position.

- Verify the scan tool operation with a known good vehicle.

- Refer to Information Bus (Module Communications Network) to diagnose no response from the PCM.

7. Carry out the network test.

- If the scan tool responds with no communication for one or more modules, refer to Information Bus (Module Communications Network).

- If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB. 9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to Body Control Systems (Multifunction Electronic

Control Module). See: Diagnostic Trouble Code Descriptions

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart. See: Symptom Related Diagnostic Procedures

Principles of Operation

PRINCIPLES OF OPERATION

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

Interior Lighting

When the SJB detects a request for lighting, it turns on the interior lamp by supplying power to the lamp. The request for lighting can be a signal from a door ajar switch, an interior lighting on command from the instrument panel dimmer switch or an unlock command from a remote keyless entry (RKE) transmitter. The door ajar switches are hard-wired directly to the SJB. The door ajar switches are normally open when the doors are closed. All door ajar switches receives a voltage signal from the SJB and each has its own ground circuit. The instrument panel dimmer switch receives a voltage signal from the SJB and has its own ground circuit. The instrument panel dimmer switch provides variable resistance for backlighting the instrument cluster and a toggle on/off function for the courtesy lamp.

The inputs are: -

Ignition switch position

- LH front door ajar switch

- RH front door ajar switch

- LH rear door ajar switch

- RH rear door ajar switch

- RKE unlock signal

The output is: -

Interior lamp relay.

Illuminated Entry (Option)

The illuminated entry feature requests the interior lamp on when the ignition switch is in the OFF position and the operator activates an external unlock feature (key fob). The illuminated entry feature requests the interior lamp off when: 25 seconds have elapsed, the ignition transitions out of the OFF position, or the customer activates an external lock feature.

The inputs are: -

Ignition switch position

- Unlock request from the RKE transmitter

The output is: -

Interior lamp relay

Demand Lamp

The demand lamp function can be operated independently.

The demand lamp consists of a: -

Interior lamp

- Instrument panel dimmer switch

The demand lamp is also controlled by the interior lighting arbitrator and the interior lamp relay.

Interior Lighting Arbitrator

The interior lighting arbitrator decides between the interior lighting, the illuminated entry lighting, and the battery saver features to determine which feature has precedence for turning on and off the interior light. This feature is internal in the SJB.

The output is: -

Interior lamp relay

Battery Saver

When the ignition is off, the battery saver timer feature provides timed automatic shut-off of power to the interior lamp and the warning chimes. The battery saver has a time-out period of 5 minutes. The battery saver restores power to the interior lamp or resets the 5 minute timer if any of the following interactions are detected: -

The ignition is turned to any position other than OFF.

- Any door becomes ajar.

- Any button of a RKE transmitter which provides access to the vehicle is pressed (key fob).

The inputs are: -

Ignition switch position

- LH front door ajar switch
- RH front door ajar switch
- LH rear door ajar switch
- RH rear door ajar switch
- Any request from the RKE transmitter

The output is: -

Interior lamp relay

Smart Junction Box (SJB) DTC Chart

DTC	Description	Action
B1322	Driver Door Ajar Circuit Short to Ground	GO to Pinpoint Test B.

B1322-B1688

Symptom Chart

Condition	Possible Sources	Action
• The interior lamp is inoperative	• Fuse • Wiring, terminals or connectors • Interior lamp • Smart junction box (SJB)	• GO to Pinpoint Test A.
• The interior lamp stays on continuously	• Wiring, terminals or connectors • Instrument panel dimmer switch • Door ajar switch • Instrument cluster • Four wheel drive (4X4) control module (if equipped) • SJB	• GO to Pinpoint Test B.
• The interior lamp does not turn on with one door open	• Wiring, terminals or connectors • Door ajar switch • SJB	• GO to Pinpoint Test C.
• The illuminated entry is inoperative when using the remote keyless entry (RKE) transmitter	• RKE system • SJB	• GO to Pinpoint Test D.
• The demand lighting is inoperative	• Wiring, terminals or connectors • Instrument panel dimmer switch • SJB	• GO to Pinpoint Test E.
• The battery saver does not deactivate after time-out	• SJB	• INSTALL a new SJB. TEST the system for normal operation.

Symptom Chart

PINPOINT TEST A: THE INTERIOR LAMP IS INOPERATIVE

⚠ CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step		Result / Action to Take
A1	**CHECK CIRCUIT CLN28 (GN/BU) FOR VOLTAGE** • Key in ON position. • Disconnect: Interior Lamp C931. • Open one of the doors. • Measure the voltage between the interior lamp C931-1, circuit CLN28 (GN/BU), harness side and ground.  N0040916 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new interior lamp. TEST the system for normal operation. **No** VERIFY the SJB fuse 13 (15A) is OK. If OK, GO to **A2**.
A2	**CHECK CIRCUIT CLN28 (GN/BU) FOR AN OPEN** • Key in OFF position. • Disconnect: SJB C2280c. • Measure the resistance between the SJB C2280c-8, circuit CLN28 (GN/BU), harness side and the interior lamp C931-1, circuit CLN28 (GN/BU), harness side.  N0044476 • **Is the resistance less than 5 ohms?**	**Yes** GO to **A3**. **No** REPAIR the circuit. TEST the system for normal operation.

(Continued)

Courtesy Lamp: Pinpoint Tests

Test A: The Interior Lamp Is Inoperative

PINPOINT TEST A: THE INTERIOR LAMP IS INOPERATIVE

Normal Operation

Voltage is supplied to the SJB through circuit SBB05 (GY/RD). The SJB fuse 13 (15A) supplies voltage to the interior lamp relay (integral to the SJB). When any door is opened, the door ajar

switch closes, signalling the SJB. The SJB monitors the door ajar circuits, and the instrument panel dimmer switch input. Based on these inputs, the SJB supplies voltage to the interior lamp on circuit CLN28 (GN/BU).

This pinpoint test is intended to diagnose the following:

- Fuse

- Wiring, terminals or connectors

- Interior lamp

- SJB

A1-A2

PINPOINT TEST A: THE INTERIOR LAMP IS INOPERATIVE (Continued)

Test Step	Result / Action to Take
A3 CHECK CIRCUIT CLN28 (GN/BU) FOR A SHORT TO GROUND	
• Measure the resistance between the SJB C2280c-8, circuit CLN28 (GN/BU), harness side and ground.  N0044477 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to **A4**. **No** REPAIR the circuit. TEST the system for normal operation.
A4 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: — corrosion — damaged pins — pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

DTC Description	Fault Trigger Conditions
• B1322 — Driver Door Ajar Circuit Short to Ground	An on-demand DTC that sets when the SJB detects a short to ground from the LH front door ajar circuit.
• B1330 — Passenger Door Ajar Circuit Short to Ground	An on-demand DTC that sets when the SJB detects a short to ground from the RH front door ajar circuit.
• B1338 — Door Ajar RR Circuit Short to Ground	An on-demand DTC that sets when the SJB detects a short to ground from the RH rear door ajar circuit.
• B1574 — Door Ajar LR Circuit Short to Ground	An on-demand DTC that sets when the SJB detects a short to ground from the LH rear door ajar circuit.
• B1688 — Lamp Dome Input Circuit Short to Ground	An on-demand DTC that sets when the SJB detects a short to ground from the dimmer switch circuit.

A3-A4

Test B: The Interior Lamp Stays On Continuously

PINPOINT TEST B: THE INTERIOR LAMP STAYS ON CONTINUOUSLY

Normal Operation

When any door is opened, the door ajar switch closes, signalling the SJB. The SJB monitors the door ajar circuits, and the instrument panel dimmer switch input. Based on these inputs, the SJB will supply voltage to the interior lamp on circuit CLN28 (GN/BU).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors

- Instrument panel dimmer switch

- Four wheel drive (4X4) control module

- Instrument cluster

- Door ajar switch

- SJB

PINPOINT TEST B: THE INTERIOR LAMP STAYS ON CONTINUOUSLY

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step		Result / Action to Take
B1	CHECK THE DOOR AJAR PID STATUS WITH THE SCAN TOOL	
	• Key in ON position. • Close all the doors. • Enter the following diagnostic mode on the scan tool: SJB DataLogger. • Check the SJB PIDs D_DR_SW, P_DR_SW, RRDR_SW, LRDR_SW while opening and closing all the doors. • **Do the door ajar PIDs match the door positions?**	**Yes** GO to **B2**. **No** If the LH front door PID does not match the door position, GO to **B5**. If the RH front door PID does not match the door position, GO to **B10**. If the LH rear door PID (if equipped) does not match the door position, GO to **B12**. If the RH rear door PID (if equipped) does not match the door position, GO to **B14**.
B2	CHECK THE INSTRUMENT PANEL DIMMER SWITCH	
	• Key in OFF position. • Disconnect: Instrument Panel Dimmer Switch C2065. • **Is the interior lamp still illuminated?**	**Yes** GO to **B3**. **No** INSTALL a new instrument panel dimmer switch. TEST the system for normal operation.
B3	CHECK CIRCUIT CLN27 (WH/BN) FOR A SHORT TO GROUND	
	• Disconnect: SJB C2280d. • Measure the resistance between the SJB C2280d-10, circuit CLN27 (WH/BN), harness side and ground.  N0044474 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to **B4**. **No** REPAIR the circuit. TEST the system for normal operation.
B4	CHECK CIRCUIT CLN28 (GN/BU) FOR A SHORT TO VOLTAGE	
	• Disconnect: SJB C2280c. • **Is the interior lamp still illuminated?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to **B16**.
B5	CHECK THE LH FRONT DOOR AJAR SWITCH FOR A SHORT TO GROUND	
	• Disconnect: LH Front Door Ajar Switch C526. • Enter the following diagnostic mode on the scan tool: SJB DataLogger. • Monitor the SJB PID D_DR_SW. • **Did the door ajar PID change with the switch disconnected?**	**Yes** INSTALL a new door ajar switch. TEST the system for normal operation. **No** GO to **B6**.
B6	CHECK CIRCUIT CPL26 (GN/VT) FOR A SHORT TO GROUND	
	• Key in OFF position. • Disconnect: SJB C2280c.	

(Continued)

B1-B6

PINPOINT TEST B: THE INTERIOR LAMP STAYS ON CONTINUOUSLY (Continued)

Test Step		Result / Action to Take
B6	CHECK CIRCUIT CPL26 (GN/VT) FOR A SHORT TO GROUND (Continued)	
	• Measure the resistance between the LH front door ajar switch C526-1, circuit CPL26 (GN/VT), harness side and ground.  A0075035 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to **B7**. **No** REPAIR the circuit. TEST the system for normal operation.
B7	CHECK CIRCUIT CPL12 (VT/OG) FOR A SHORT TO GROUND	
	• Measure the resistance between the SJB C2280c-2, circuit CPL12 (VT/OG), harness side and ground.  N0044475 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to **B16**. **No** GO to **B8**.
B8	CHECK THE INSTRUMENT CLUSTER	
	• Disconnect: Instrument Cluster C220a. • Measure the resistance between the SJB C2280c-2, circuit CPL12 (VT/OG), harness side and ground.  N0044475 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to **B17**. **No** GO to **B9**.
B9	CHECK THE 4X4 CONTROL MODULE	
	• Disconnect: 4X4 Control Module C281a.	

(Continued)

B6-B9

PINPOINT TEST B: THE INTERIOR LAMP STAYS ON CONTINUOUSLY (Continued)

Test Step		Result / Action to Take
B9	CHECK THE 4X4 CONTROL MODULE (Continued)	
	• Measure the resistance between the SJB C2280c-2, circuit CPL12 (VT/OG), harness side and ground.  N0044475 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to **B18**. **No** REPAIR the circuit. TEST the system for normal operation.
B10	CHECK THE RH FRONT DOOR AJAR SWITCH FOR A SHORT TO GROUND	
	• Disconnect: RH Front Door Ajar Switch C602. • Enter the following diagnostic mode on the scan tool: SJB DataLogger. • Monitor the SJB PID P_DR_SW. • **Did the door ajar PID change with the switch disconnected?**	**Yes** INSTALL a new door ajar switch. TEST the system for normal operation. **No** GO to **B11**.
B11	CHECK CIRCUIT CPL31 (WH) FOR A SHORT TO GROUND	
	• Key in OFF position. • Disconnect: SJB C2280d. • Measure the resistance between the RH front door ajar switch C602-1, circuit CPL31 (WH), harness side and ground.  A0075035 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to **B16**. **No** REPAIR the circuit. TEST the system for normal operation.
B12	CHECK THE LH REAR DOOR AJAR SWITCH FOR A SHORT TO GROUND (IF EQUIPPED)	
	• Disconnect: LH Rear Door Ajar Switch C715. • Enter the following diagnostic mode on the scan tool: SJB DataLogger. • Monitor the SJB PID LRDR_SW. • **Did the door ajar PID change with the switch disconnected?**	**Yes** INSTALL a new door ajar switch. TEST the system for normal operation. **No** GO to **B13**.
B13	CHECK CIRCUIT CPL36 (GN) FOR A SHORT TO GROUND	
	• Key in OFF position. • Disconnect: SJB C2280d.	

(Continued)

B9-B13

PINPOINT TEST B: THE INTERIOR LAMP STAYS ON CONTINUOUSLY (Continued)

Test Step		Result / Action to Take
B13	CHECK CIRCUIT CPL36 (GN) FOR A SHORT TO GROUND (Continued)	
	• Measure the resistance between the RH rear door ajar switch C715-1, circuit CPL36 (GN), harness side and ground.  A0075035 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to **B16**. **No** REPAIR the circuit. TEST the system for normal operation.
B14	CHECK THE RH REAR DOOR AJAR SWITCH FOR A SHORT TO GROUND (IF EQUIPPED)	
	• Disconnect: RH Rear Door Ajar Switch C820. • Enter the following diagnostic mode on the scan tool: SJB DataLogger. • Monitor the SJB PID RRDR_SW. • **Did the door ajar PID change with the switch disconnected?**	**Yes** INSTALL a new door ajar switch. TEST the system for normal operation. **No** GO to **B15**.
B15	CHECK CIRCUIT CPL39 (YE) FOR A SHORT TO GROUND	
	• Key in OFF position. • Disconnect: SJB C2280d. • Measure the resistance between the LH rear door ajar switch C820-1, circuit CPL39 (YE), harness side and ground.  A0075035 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to **B16**. **No** REPAIR the circuit. TEST the system for normal operation.
B16	CHECK FOR CORRECT SJB OPERATION	
	• Disconnect all the SJB connectors. • Check for: — corrosion — damaged pins — pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

(Continued)

B13-B16

PINPOINT TEST B: THE INTERIOR LAMP STAYS ON CONTINUOUSLY (Continued)

Test Step		Result / Action to Take
B17	CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
	• Disconnect all the instrument cluster connectors. • Check for: — corrosion — damaged pins — pushed-out pins • Connect all the instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
B18	CHECK FOR CORRECT 4X4 CONTROL MODULE OPERATION	
	• Disconnect all the 4X4 control module connectors. • Check for: — corrosion — damaged pins — pushed-out pins • Connect all the 4X4 control module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new 4X4 control module. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST C: THE INTERIOR LAMP DOES NOT TURN ON WITH ONE DOOR OPEN

⚠ CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step		Result / Action to Take
C1	CHECK THE DOOR AJAR PIDs	
	• Key in ON position. • Enter the following diagnostic mode on the scan tool: SJB DataLogger. • Check the SJB PIDs D_DR_SW, P_DR_SW, RRDR_SW, LRDR_SW while opening and closing all the doors. • **Do the PID values agree with all the door positions?**	**Yes** GO to **C5**. **No** GO to **C2**.
C2	CHECK THE GROUND CIRCUIT FOR AN OPEN	
	• Key in OFF position. • Disconnect: Suspect Door Ajar Switch. • Measure the resistance between the suspect door ajar switch, harness side and ground as follows:	

(Continued)

B17-B18

Test C: The Interior Lamp Does Not Turn On With One Door Open

PINPOINT TEST C: THE INTERIOR LAMP DOES NOT TURN ON WITH ONE DOOR OPEN

Normal Operation

When any door is opened, the door ajar switch closes and signals the SJB. The SJB receives the door open signal and activates the interior lamp relay (integral to the SJB) and supplies voltage to circuit CLN28 (GN/BU).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors

- Door ajar switch

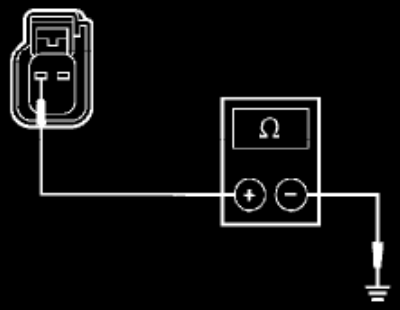
- SJB

C1-C2

PINPOINT TEST C: THE INTERIOR LAMP DOES NOT TURN ON WITH ONE DOOR OPEN (Continued)

Test Step	Result / Action to Take
C2 CHECK THE GROUND CIRCUIT FOR AN OPEN (Continued)	

Location	Connector-Pin	Circuit
LH front	C526-2	GD175 (BK/BU)
RH front	C602-2	GD161 (BK/YE)
LH rear	C715-2	GD161 (BK/YE)
RH rear	C820-2	GD161 (BK/YE)



A0075031

- **Is the resistance less than 5 ohms?**

Yes
GO to **C3**.
No
REPAIR the circuit. TEST the system for normal operation.

C3 CHECK THE DOOR AJAR SIGNAL CIRCUIT FOR AN OPEN

- Disconnect: SJB C2280c (LH Front) or C2280d (All Other Doors).
- Measure the resistance between the inoperative door ajar switch and the SJB as follows:

Location	Door Ajar Connector-Pin	SJB Connector-Pin	Circuit
LH front	C526-1	C2280c-6	CPL26 (GN/VT)
RH front	C602-1	C2280d-3	CPL31 (WH)
LH rear	C715-1	C2280d-4	CPL36 (GN)
RH rear	C820-1	C2280d-6	CPL39 (YE)

- **Is the resistance less than 5 ohms?**

Yes
GO to **C4**.
No
REPAIR the circuit in question. TEST the system for normal operation.

(Continued)

C2-C3

PINPOINT TEST C: THE INTERIOR LAMP DOES NOT TURN ON WITH ONE DOOR OPEN (Continued)

	Test Step	Result / Action to Take
C4	CHECK THE DOOR AJAR SWITCH	
	• Measure the resistance between the suspect door ajar switch pin 1, component side and the suspect door ajar switch pin 2, component side while toggling the switch open and closed.  A0075036 • **Is the resistance less than 5 ohms when the switch is released and greater than 10,000 ohms when the switch is pressed?**	**Yes** GO to **C5**. **No** INSTALL a new door ajar switch. TEST the system for normal operation.
C5	CHECK FOR CORRECT SJB OPERATION	
	• Disconnect all the SJB connectors. • Check for: — corrosion — damaged pins — pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST D: THE ILLUMINATED ENTRY IS INOPERATIVE WHEN USING THE REMOTE KEYLESS ENTRY (RKE) TRANSMITTER

	Test Step	Result / Action to Take
D1	CHECK THE DOOR LOCK OPERATION USING THE RKE TRANSMITTER	
	• Unlock and lock the doors using the RKE transmitter. • **Do the vehicle doors unlock and lock using the RKE transmitter?**	**Yes** GO to Pinpoint Test A. **No** REFER to Locks to continue diagnosis of the RKE system.

C4-C5

Test D: The Illuminated Entry Is Inoperative When Using the Remote Keyless Entry (RKE) Transmitter

PINPOINT TEST D: THE ILLUMINATED ENTRY IS INOPERATIVE WHEN USING THE REMOTE KEYLESS ENTRY (RKE) TRANSMITTER

Normal Operation

The illuminated entry provides interior lighting when the SJB receives an UNLOCK request from the RKE transmitter. The SJB receives the RKE signal it activates the interior lamp relay (integral to the SJB) and applies voltage to circuit CLN28 (GN/BU).

This pinpoint test is intended to diagnose the following:

- RKE system

- SJB

D1

Test E: The Demand Lighting Is Inoperative

PINPOINT TEST E: THE DEMAND LIGHTING IS INOPERATIVE

Normal Operation

The instrument panel dimmer switch controls the demand lighting function. When the instrument panel dimmer switch is closed, the voltage reference circuit signals from the SJB. The SJB monitors the instrument panel dimmer switch circuit, and based on the status, the SJB supplies voltage to the

PINPOINT TEST E: THE DEMAND LIGHTING IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step		Result / Action to Take
E1	CHECK CIRCUIT CLN27 (WH/BN) FOR VOLTAGE • Key in OFF position. • Disconnect: Instrument Panel Dimmer Switch C2065. • Key in ON position. • Measure the voltage between the dimmer control switch C2065-2, circuit CLN27 (WH/BN), harness side and ground.  N0047001 • **Is any voltage present?**	**Yes** GO to **E3**. **No** GO to **E2**.
E2	CHECK CIRCUIT CLN27 (WH/BN) FOR AN OPEN • Key in OFF position. • Disconnect: SJB C2280d. • Measure the resistance between the instrument panel dimmer switch C2065-2, circuit CLN27 (WH/BN), harness side and the SJB C2280d-10, circuit CLN27 (WH/BN), harness side.  N0044478 • **Is the resistance less than 5 ohms?**	**Yes** GO to **E5**. **No** REPAIR the circuit. TEST the system for normal operation.

(Continued)

interior lamp on circuit CLN28 (GN/BU). The interior lamp relay in the SJB deactivates the voltage after a predetermined time-out or if turned off from the instrument panel dimmer switch.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors

- Instrument panel dimmer switch

- SJB

E1-E2

PINPOINT TEST E: THE DEMAND LIGHTING IS INOPERATIVE (Continued)

Test Step		Result / Action to Take
E3	CHECK THE INSTRUMENT PANEL DIMMER SWITCH	
	• Connect a fused (5A) jumper wire between the instrument panel dimmer switch C2065-2, circuit CLN27 (WH/BN), harness side and the instrument panel dimmer switch C2065-4, circuit GD161 (BK/YE), harness side.  N0047002 • **Do the interior lamps illuminate?**	**Yes** REMOVE the jumper wire. INSTALL a new instrument panel dimmer switch. TEST the system for normal operation. **No** REMOVE the jumper wire. GO to **E4**.
E4	CHECK CIRCUIT GD161 (BK/YE) FOR AN OPEN	
	• Measure the resistance between the instrument panel dimmer switch C2065-4, circuit GD161 (BK/YE), harness side and ground.  N0044479 • **Is the resistance less than 5 ohms?**	**Yes** GO to **E5**. **No** REPAIR the circuit. TEST the system for normal operation.
E5	CHECK FOR CORRECT SJB OPERATION	
	• Disconnect all the SJB connectors. • Check for: — corrosion — damaged pins — pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Daytime Running Lamp: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

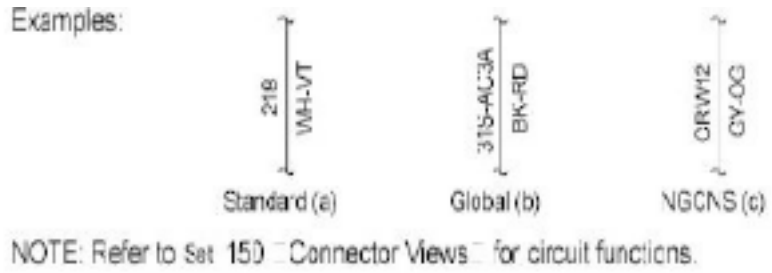
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

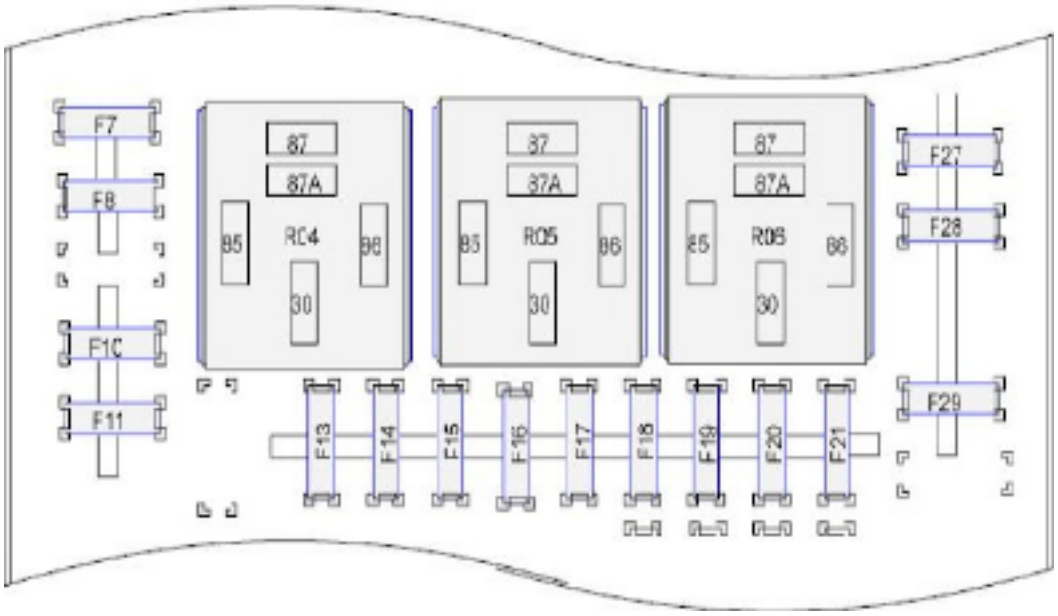
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

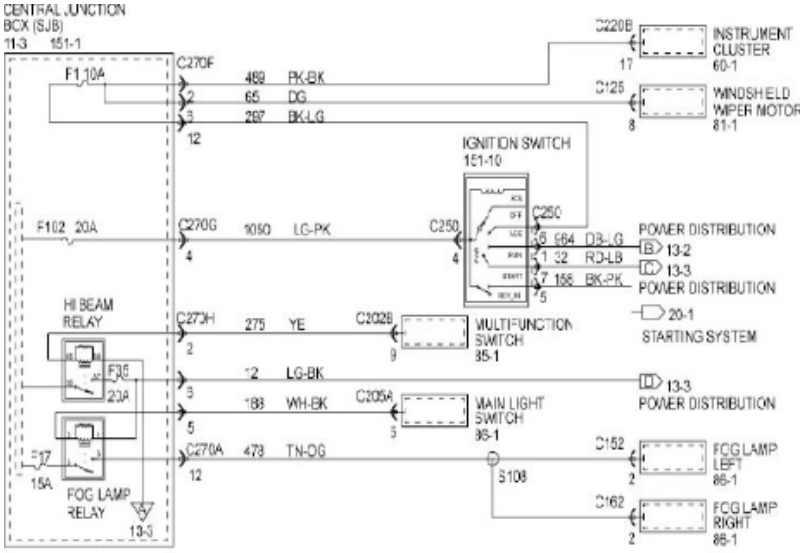
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

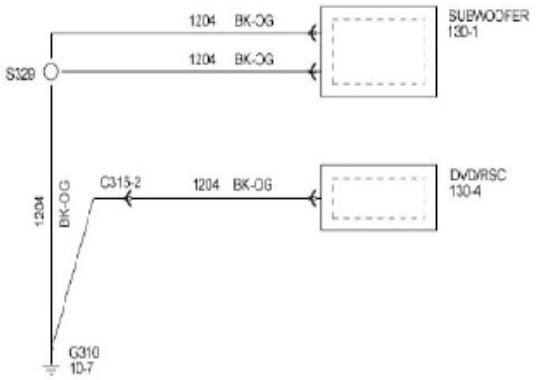
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

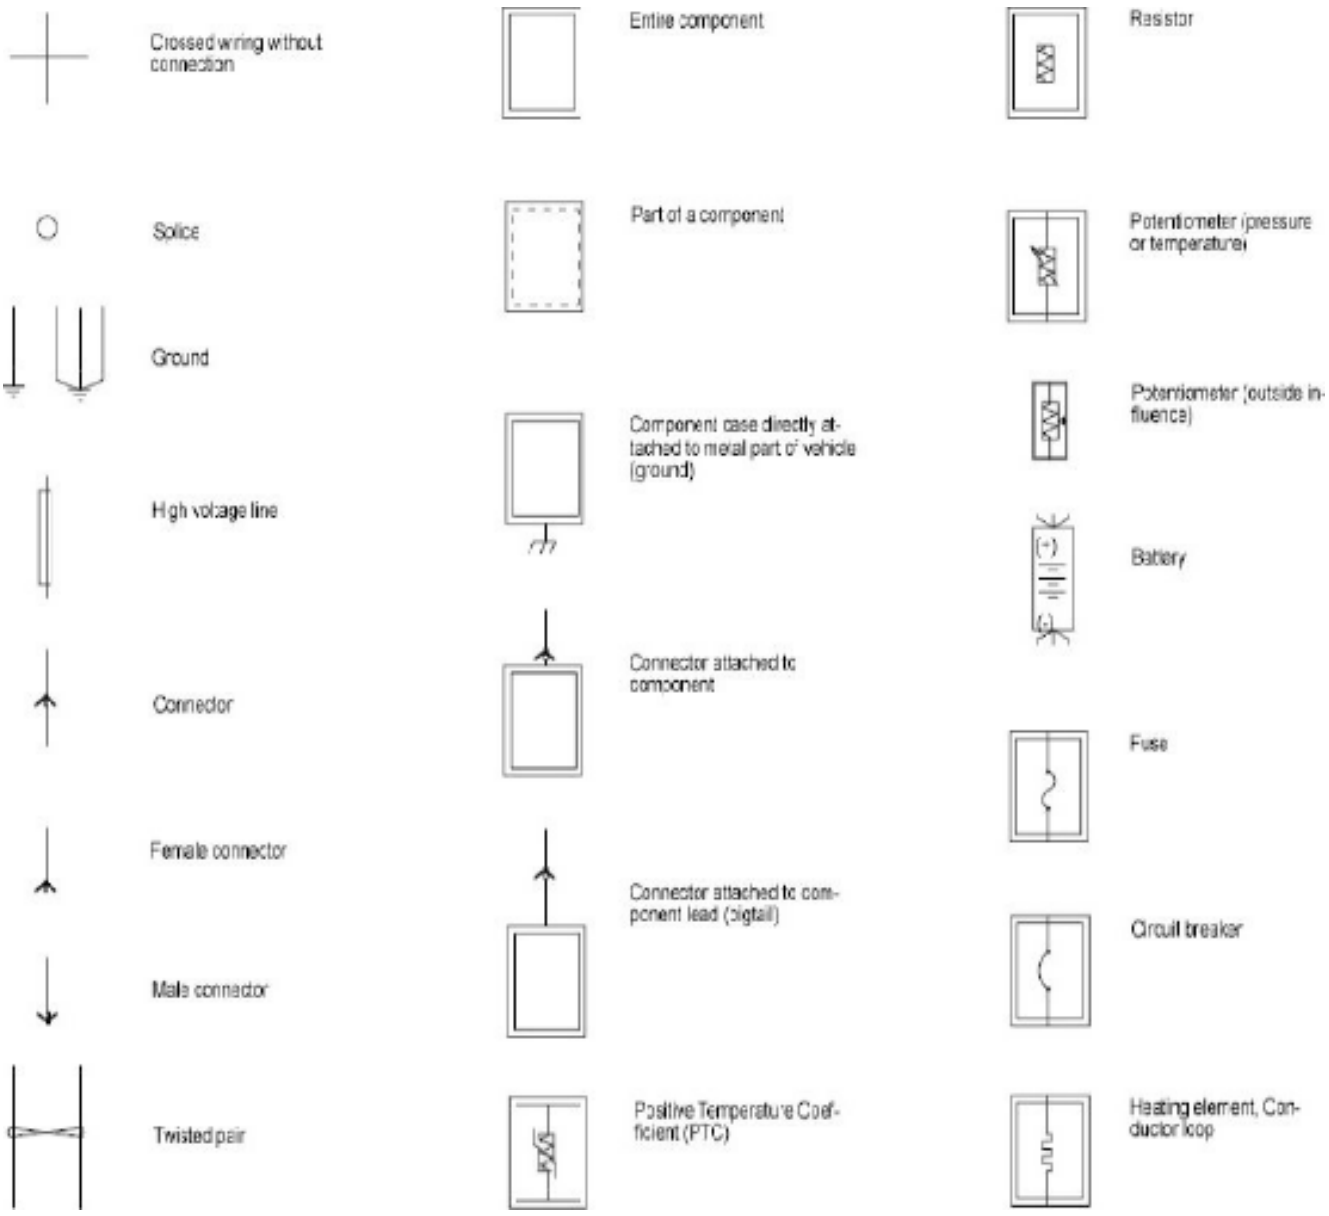
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

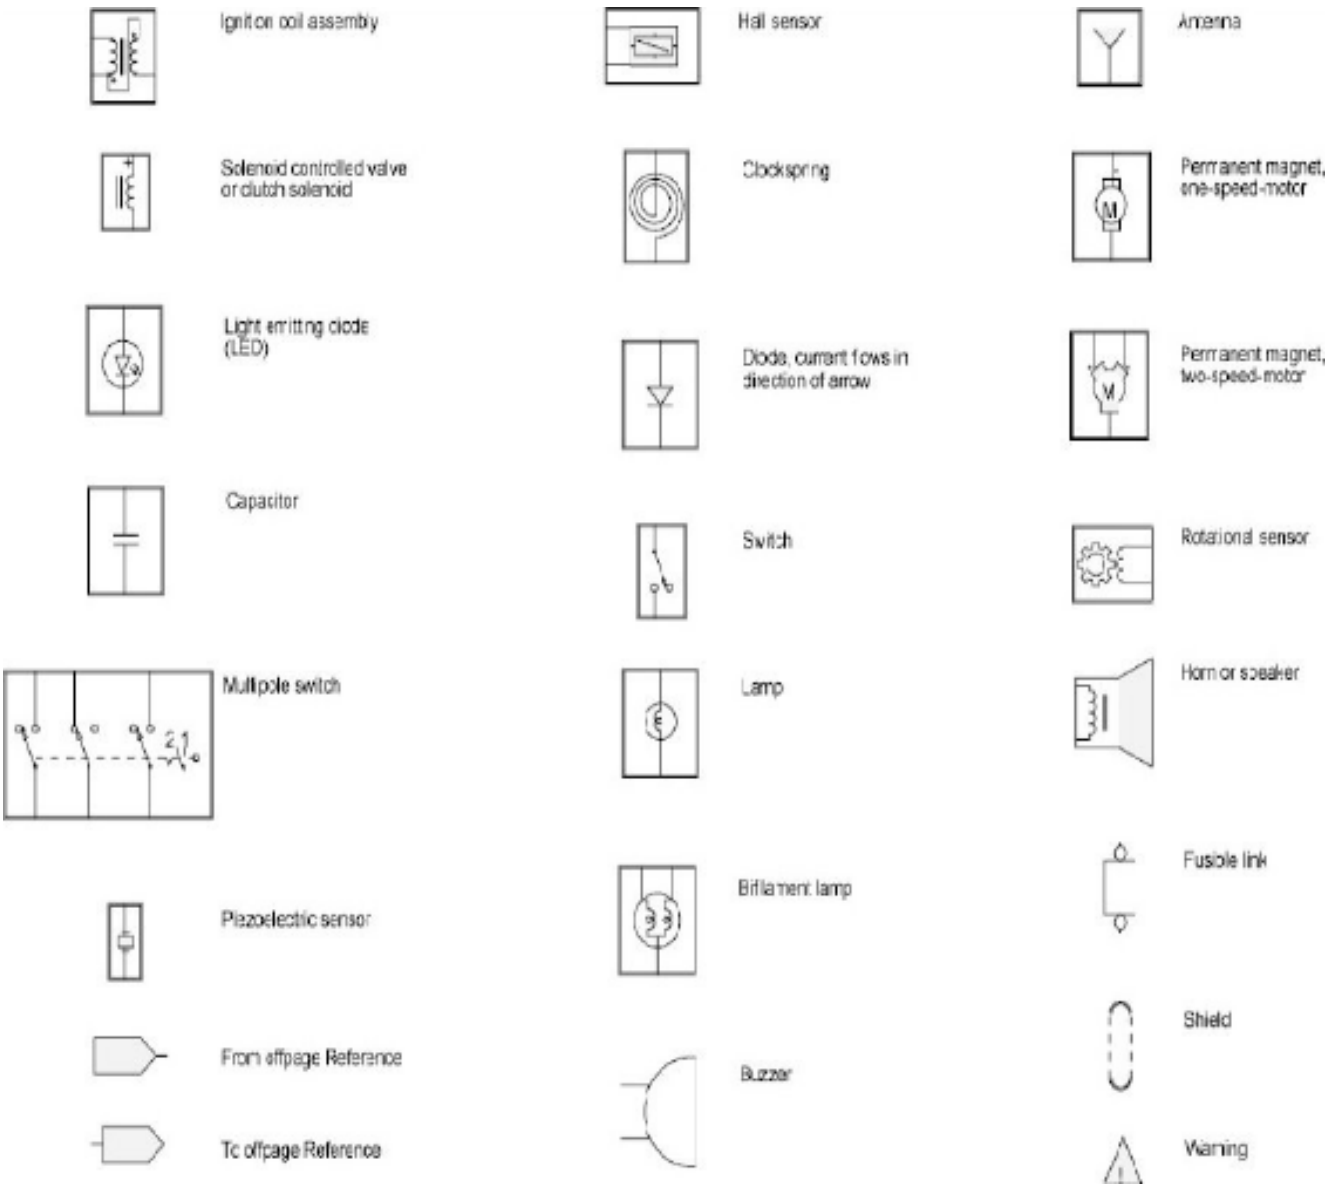
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

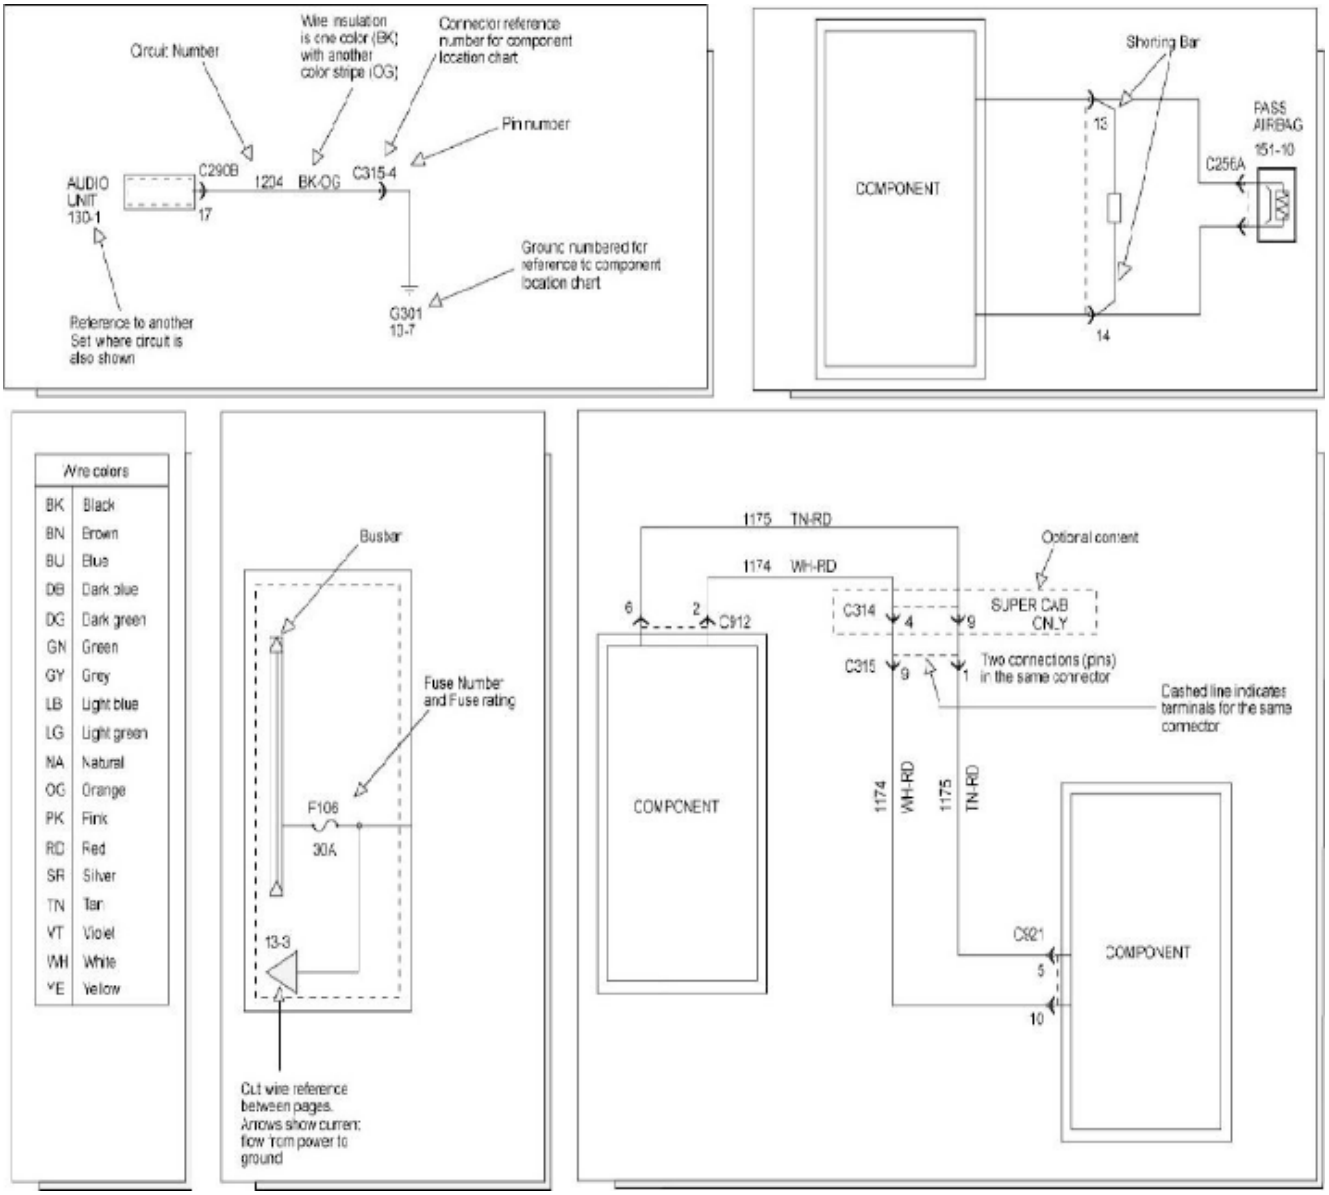
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

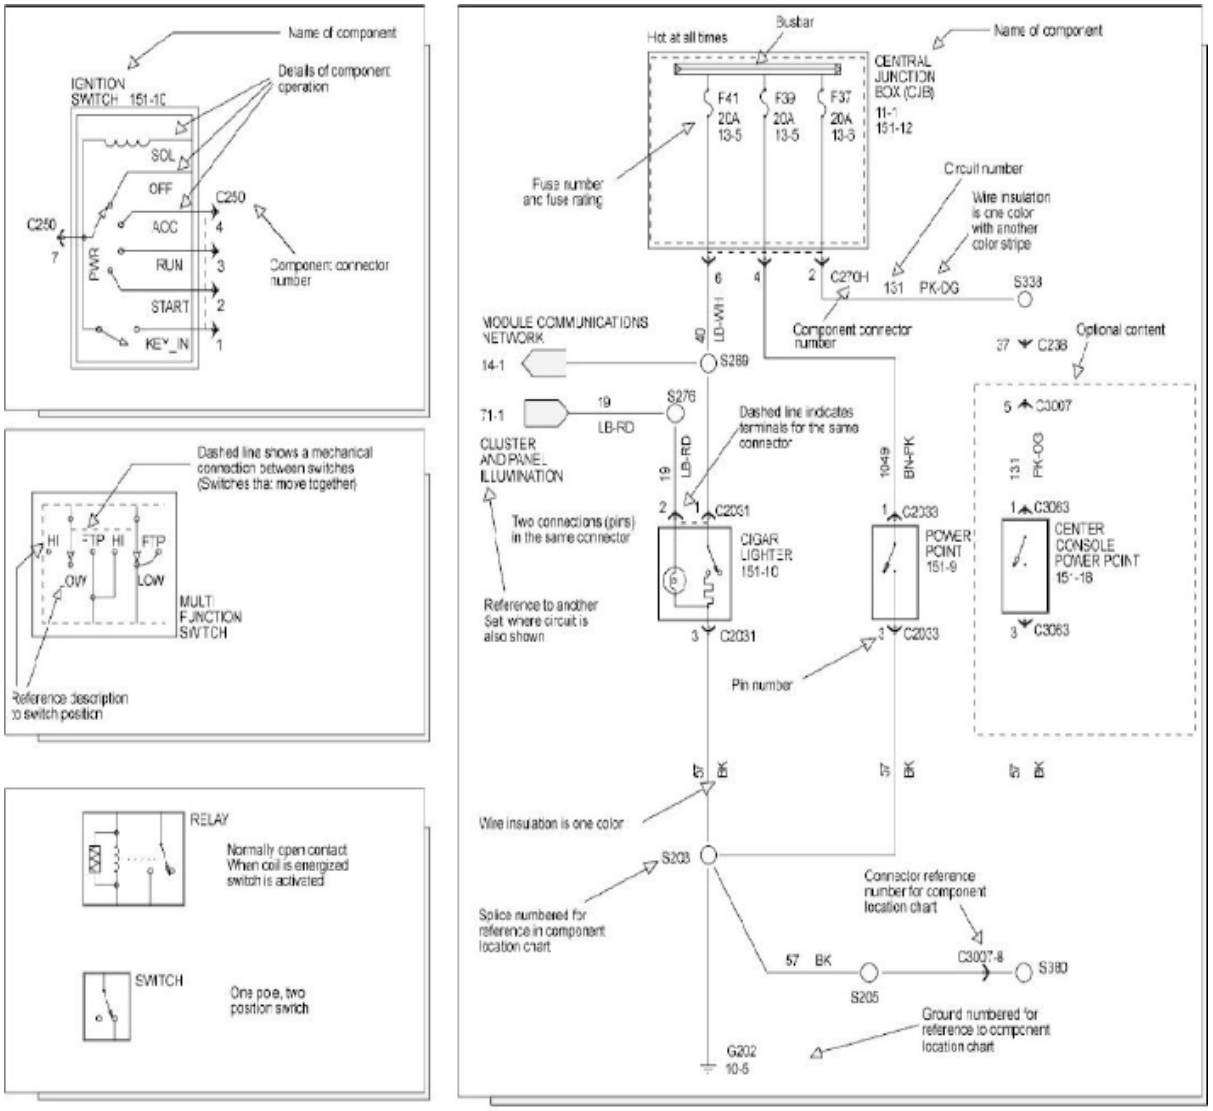
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Daytime Running Lamp: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

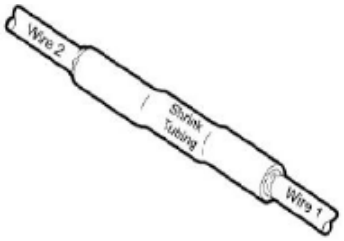
NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.



Wire 2

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

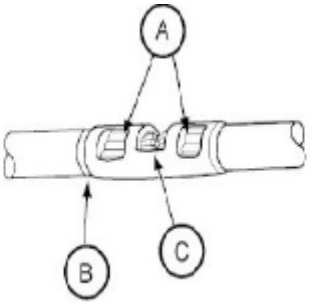
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

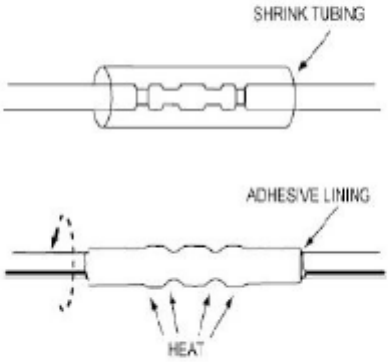
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x cia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Figtail only

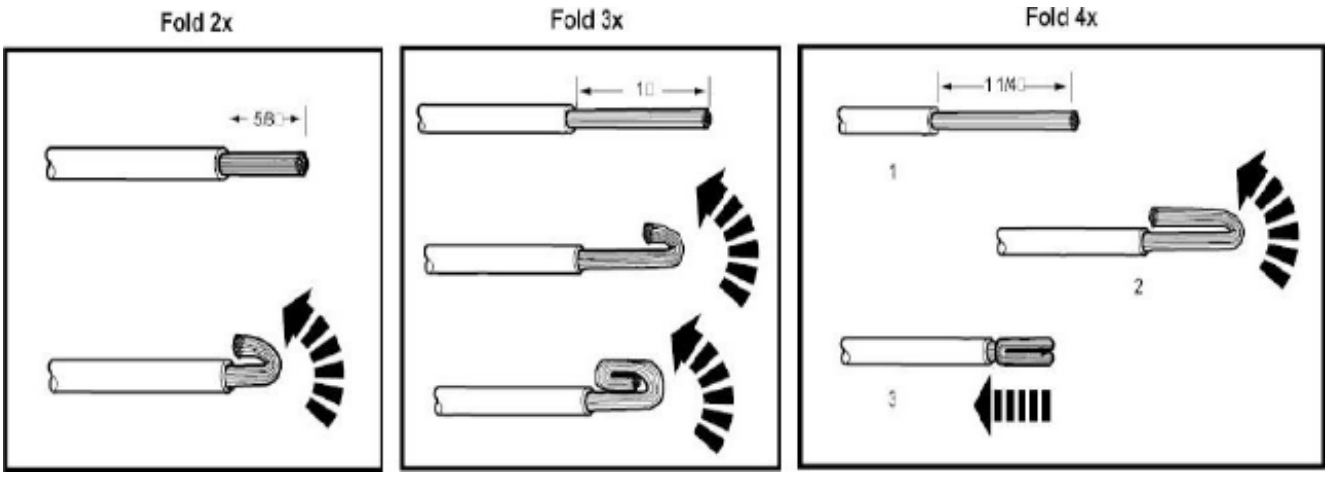
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

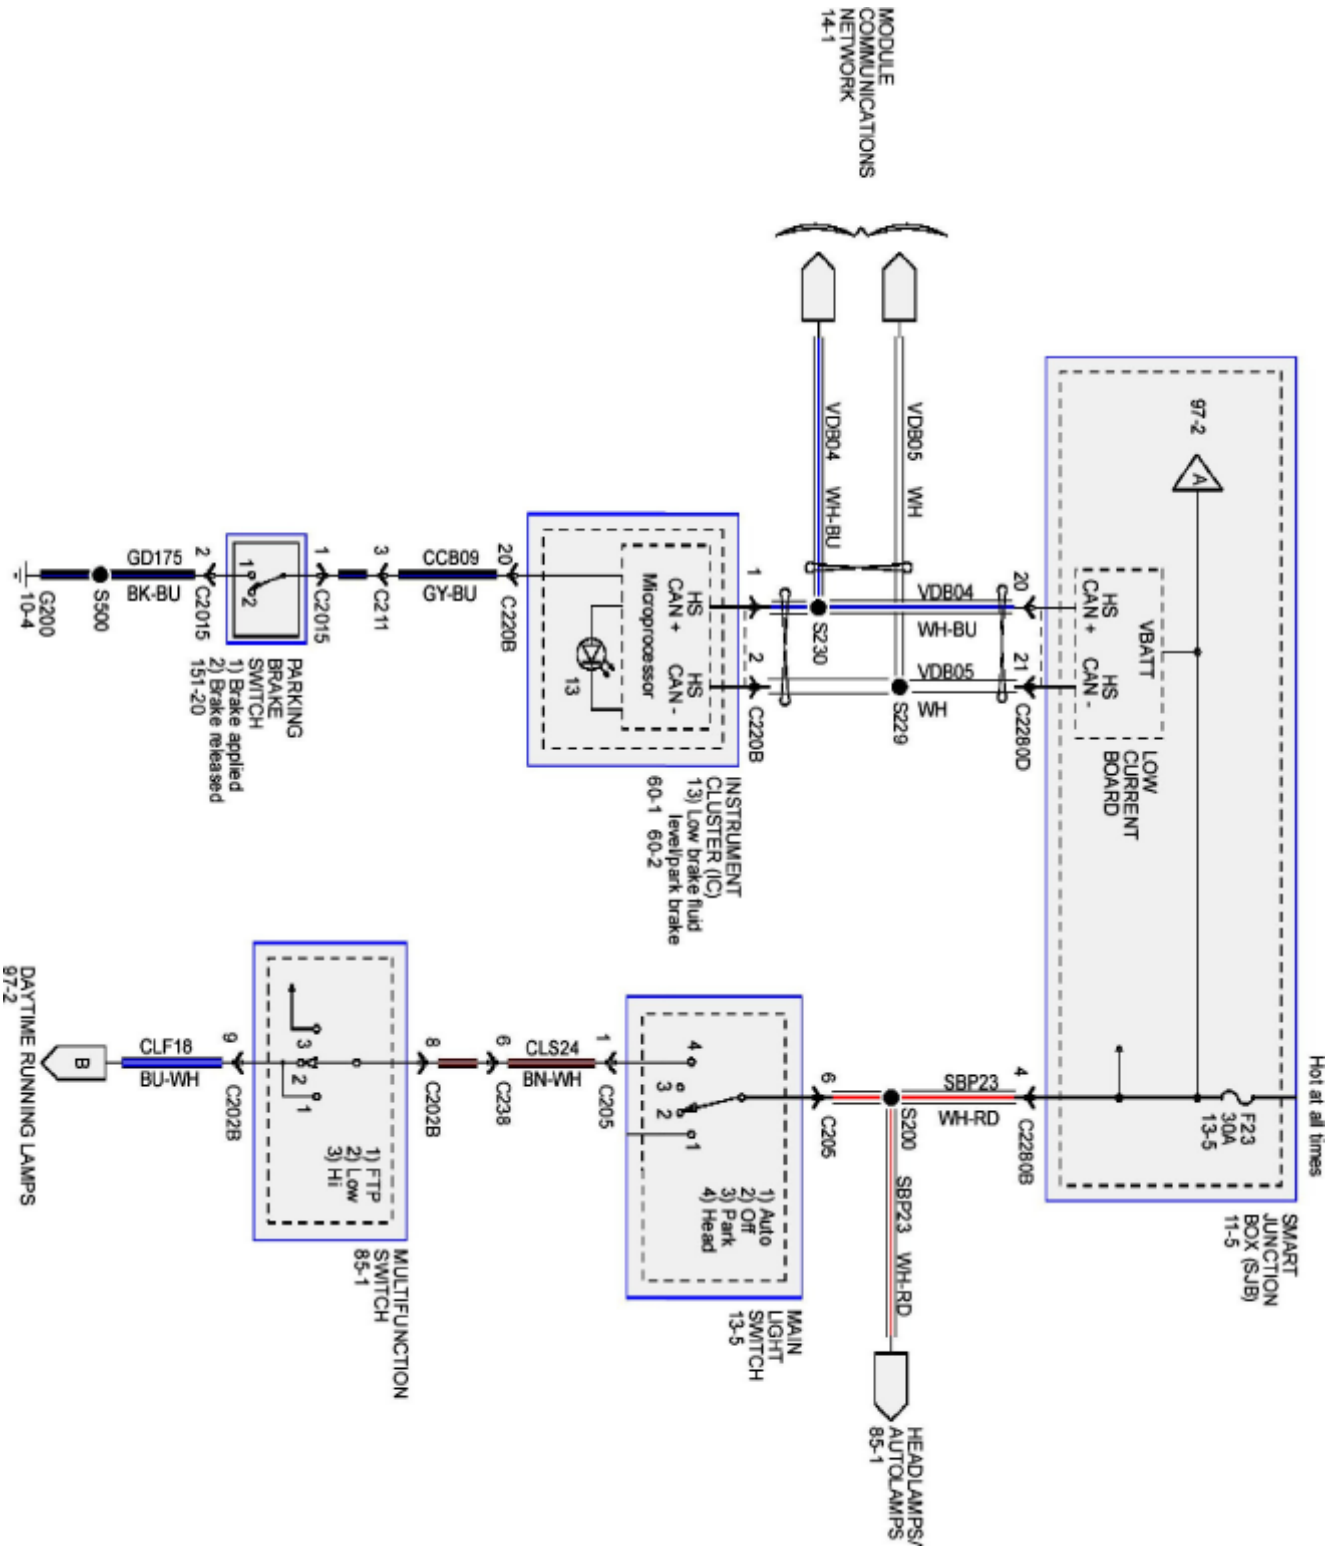
11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.



Daytime Running Lamp: Electrical Diagrams

Daytime Running Lamp: Initial Inspection and Diagnostic Overview

PRINCIPLES OF OPERATION

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

The DRL are controlled by the smart junction box (SJB). The SJB operates the low beam headlamps at a reduced intensity. The DRL driver (integral to the SJB) supplies pulse-width modulated (PWM) voltage to the low beam headlamps when the following conditions are met:

- The high beam headlamps are not on

- The ignition switch is in the RUN position

- The parking brake is not engaged

The SJB utilizes a protective circuit strategy for many of its outputs (for example, the headlamp output circuit). Output loads (current level) are monitored for excessive current (typically short circuits) and are shut down (turns off the voltage or ground provided by the module) when a fault is detected. A continuous DTC is stored at that time of the fault. The circuit then resets after an ignition cycle or customer demand of the function (switching the component on, battery saver being energized).

When an excessive circuit load occurs several times, the module shuts down the output until a service procedure is carried out. At the same time, the continuous DTC that was stored on the first failure cannot be cleared by a command to clear the continuous DTCs. The module does not allow this code to be cleared or the circuit restored to normal until a successful on-demand self-test proves that the fault has been repaired. After the on-demand self-test has successfully completed (no on-demand DTCs present), the continuous DTC clears and the circuit function returns.

Smart Junction Box (SJB) DTC Chart

DTC	Description	Action
B106E	Solid State Driver Disabled Due to Short	GO to Pinpoint Test W.
B2973	Daytime Running Lamps Output Shorted to Ground	GO to Pinpoint Test W.
U0155	Lost Communication With Instrument Panel Cluster (IC) Control Module	GO to Pinpoint Test X.
All other DTCs	—	REFER to Body Control Systems.

B106E-B2973 / U0155

Symptom Chart

Condition	Possible Sources	Action
• The daytime running lamps (DRL) are inoperative	• Headlamp bulbs • Smart junction box (SJB)	• **NOTE:** Make sure the SJB is configured for DRL. PLACE the headlamp switch in the HEADLAMPS ON position. — If the headlamps operate correctly, GO to Pinpoint Test W. — If the headlamps do not operate correctly, REFER to Headlamps.
• The daytime running lamps (DRL) are on with the parking brake set	• Parking brake switch input • SJB	• APPLY the parking brake with the ignition switch in the RUN position. — If the brake warning indicator operates correctly, INSTALL a new SJB. TEST the system for normal operation. — If the brake warning indicator does not operate correctly, REFER to Instrument Panel, Gauges and Warning Indicators to continue diagnosis of the brake warning indicator.

Symptom Chart

PINPOINT TEST W: THE DAYTIME RUNNING LAMPS (DRL) ARE INOPERATIVE

Test Step		Result / Action to Take
W1	CHECK THE HEADLAMP OPERATION	
	• Key in OFF position. • Place the headlamp switch in the HEADLAMPS ON position. • Place the multifunction switch in the LOW BEAM position. • **Do the low beam headlamps illuminate?**	**Yes** GO to **W2**. **No** REFER to Headlamps to continue diagnosis of the headlamps. After the repair, RUN the on-demand self-test (required to clear certain DTCs). CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation.
W2	CHECK FOR CORRECT HEADLAMP BULBS	
	NOTE: Due to varying wattage ratings and resulting current draw, certain aftermarket headlamp bulbs may cause the SJB to shut down the short circuit protection, resulting in the low beams becoming inoperative. • Place the headlamp switch in the OFF position. • Verify the SJB is configured for DRL. Refer to Information Bus (Module Communications Network). • Verify the headlamp bulbs meet Ford specifications. • **Do the headlamp bulbs meet Ford specifications?**	**Yes** GO to **W3**. **No** INSTALL new headlamp bulbs according to Ford specifications. RUN the on-demand self-test (required to clear certain DTCs). CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation.
W3	CHECK FOR CORRECT SJB OPERATION	
	• Disconnect all the SJB connectors. • Check for: — corrosion — damaged pins — pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Daytime Running Lamp: Pinpoint Tests

Test W: The Daytime Running Lamps (DRL) Are Inoperative

PINPOINT TEST W: THE DAYTIME RUNNING LAMPS (DRL) ARE INOPERATIVE

NOTE: When an excessive circuit load occurs several times, the module shuts down the output until a service procedure is carried out. At the same time, the continuous DTC that was stored on the first failure cannot be cleared by a command to clear the continuous DTCs. The module does not allow this code to be cleared or the circuit restored to normal until a successful on-demand self-test proves that the fault has been repaired. After the on-demand self-test has successfully completed (no on-demand DTCs present), the continuous DTC clears and the circuit function returns.

Normal Operation

The DRL are controlled by the smart junction box (SJB). The SJB operates the low beam headlamps at a reduced intensity. The DRL driver (integral to the SJB) supplies pulse-width modulated (PWM) voltage to the low beam headlamps.

This pinpoint test is intended to diagnose the following:

- Headlamp bulbs

- SJB

W1-W3

Test X: DTC U0155 - Lost Communication With Instrument Panel Cluster (IC) Control Module

PINPOINT TEST X: DTC U0155 - LOST COMMUNICATION WITH INSTRUMENT PANEL CLUSTER (IC) CONTROL MODULE

Normal Operation

The smart junction box (SJB) sets DTC U0155 if data messages received from the instrument cluster (IC) over the high speed controller area network (HS-CAN) are missing. For a complete list of all network messages, refer to Information Bus (Module Communications Network).

This pinpoint test is intended to diagnose the following:

- Communication network

- Instrument cluster (IC)

PINPOINT TEST X: DTC U0155 — LOST COMMUNICATION WITH INSTRUMENT PANEL CLUSTER (IC) CONTROL MODULE

Test Step		Result / Action to Take
X1	RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND SJB SELF-TESTS • Check for recorded SJB DTCs from the continuous and on-demand self-tests. • **Is DTC B1318 recorded?**	**Yes** REFER to Charging System. **No** GO to **X2**.

(Continued)

PINPOINT TEST X: DTC U0155 — LOST COMMUNICATION WITH INSTRUMENT PANEL CLUSTER (IC) CONTROL MODULE (Continued)

Test Step		Result / Action to Take
X2	RECHECK THE SJB DTCs • Enter the following diagnostic mode on the scan tool: SJB Self-Test. Clear the DTCs and repeat the SJB self-test. • **Is DTC U0155 still present?**	**Yes** GO to **X3**. **No** The system is operating correctly at this time. The DTC may have been set due to an intermittent communication drop off from high network traffic.
X3	RETRIEVE THE RECORDED DTCs FROM THE CONTINUOUS AND KOEO PCM SELF-TESTS • Enter the following diagnostic mode on the scan tool: PCM Self-Test. Check for recorded PCM DTCs from the continuous and KOEO self-tests. • **Is DTC U0155 recorded?**	**Yes** REFER to Information Bus (Module Communications Network) to diagnose no communication with the instrument cluster (IC). **No** GO to **X4**.
X4	CHECK THE NETWORK OPERATION • Enter the following diagnostic mode on the scan tool: Network Test. Carry out the network test. • **Does the instrument cluster (IC) pass the network test?**	**Yes** INSTALL a new instrument cluster (IC). TEST the system for normal operation. **No** REFER to Information Bus (Module Communications Network) to diagnose no communication with the instrument cluster (IC).

Dimmer Switch: Service and Repair

INSTRUMENT PANEL DIMMER SWITCH

Removal and Installation

1. Remove the radio. 2. Remove the center instrument panel finish panel.

- Remove the 2 screws.

- Disconnect the electrical connectors.

3. Remove the 2 bolts and position aside the hood latch release handle. 4. Remove the 2 screws and remove the instrument panel steering column cover. 5. Remove the 5 bolts and the lower instrument panel reinforcement.

- To install, tighten to 11 Nm (8 lb-ft).

6. If equipped, position the column-mounted transmission range selector lever to the lowest position. 7. Remove the instrument cluster finish panel.

- Remove the 5 screws.

- Disconnect the electrical connectors.

8. Remove the 2 screws and the instrument panel dimmer switch. 9. To install, reverse the removal procedure.

Battery Discharge Protection Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

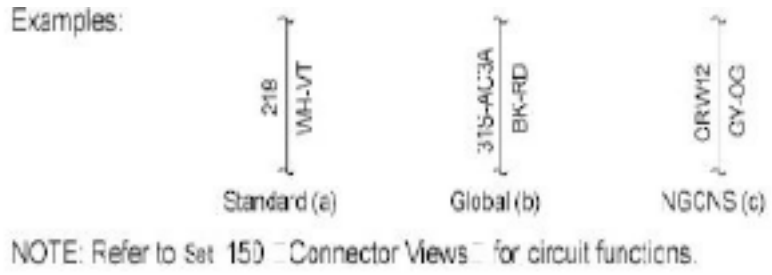
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

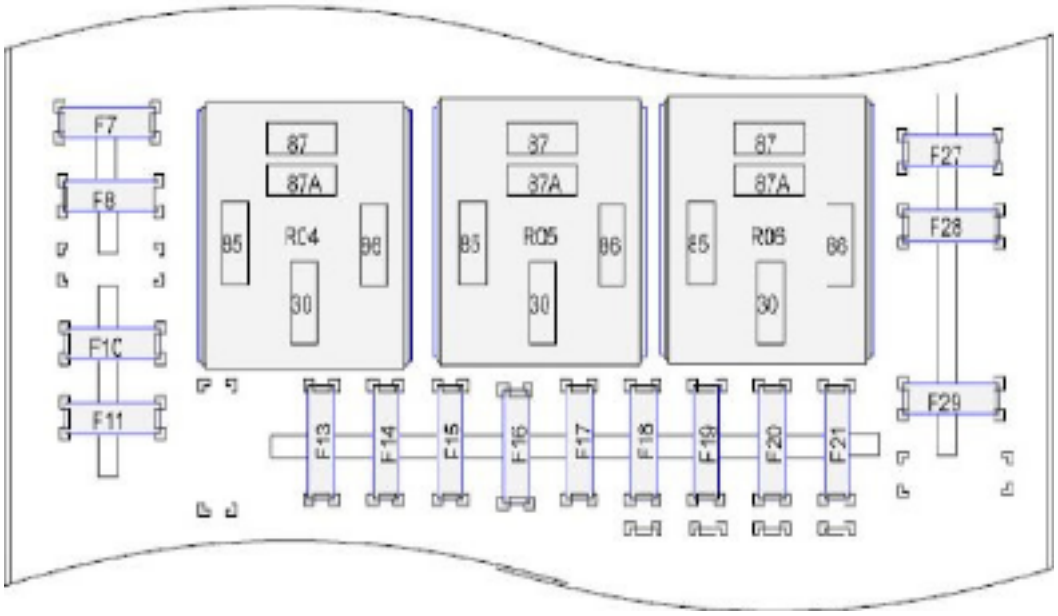
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

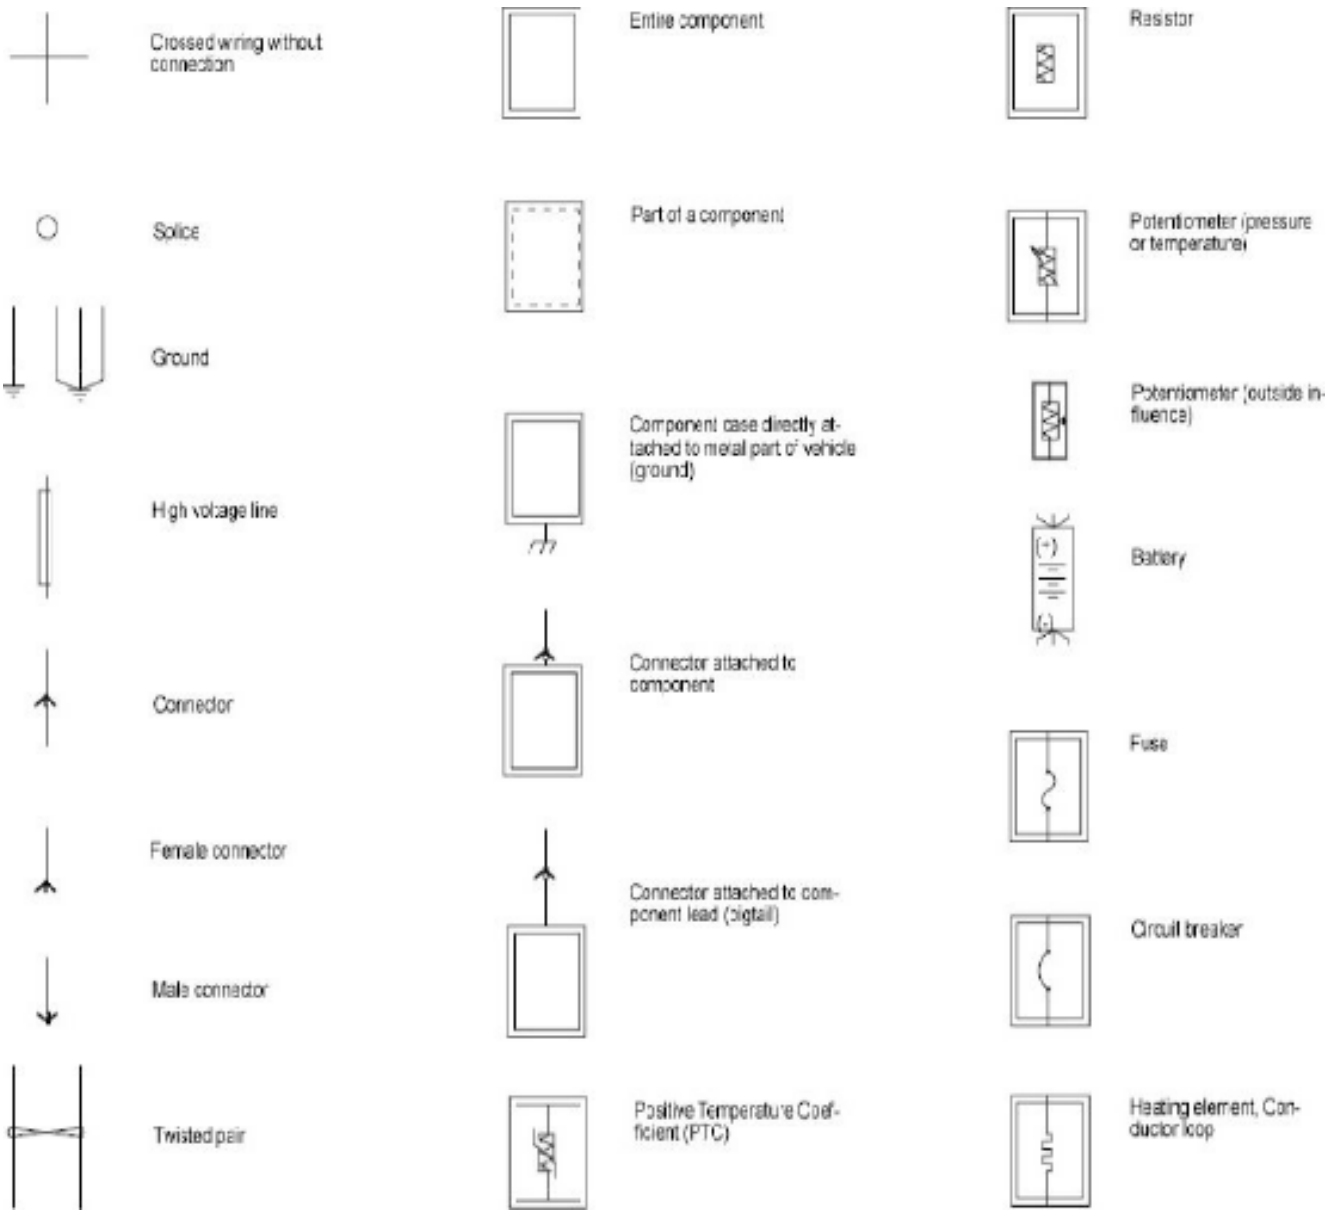
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Battery Discharge Protection Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

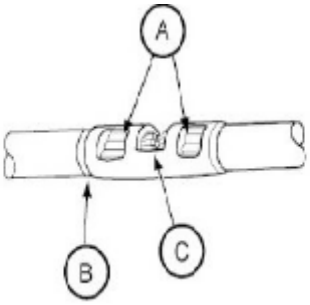
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

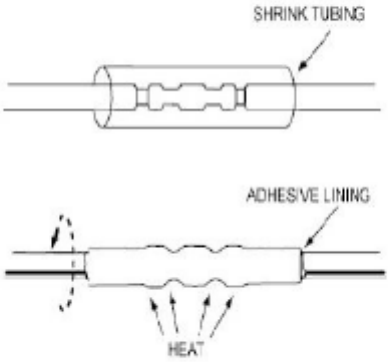
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x cia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Figtail only

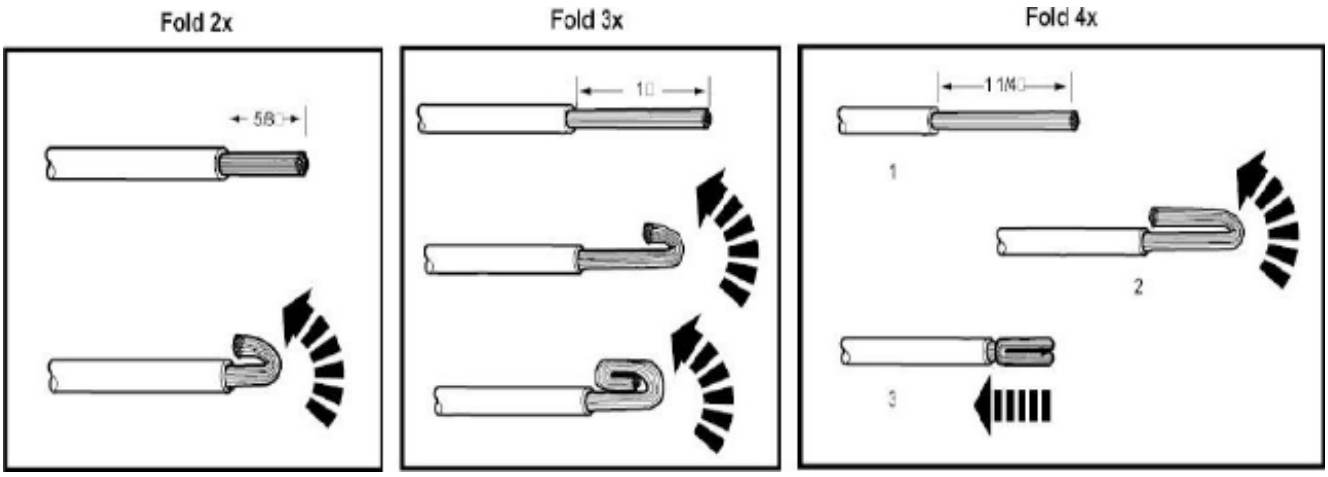
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



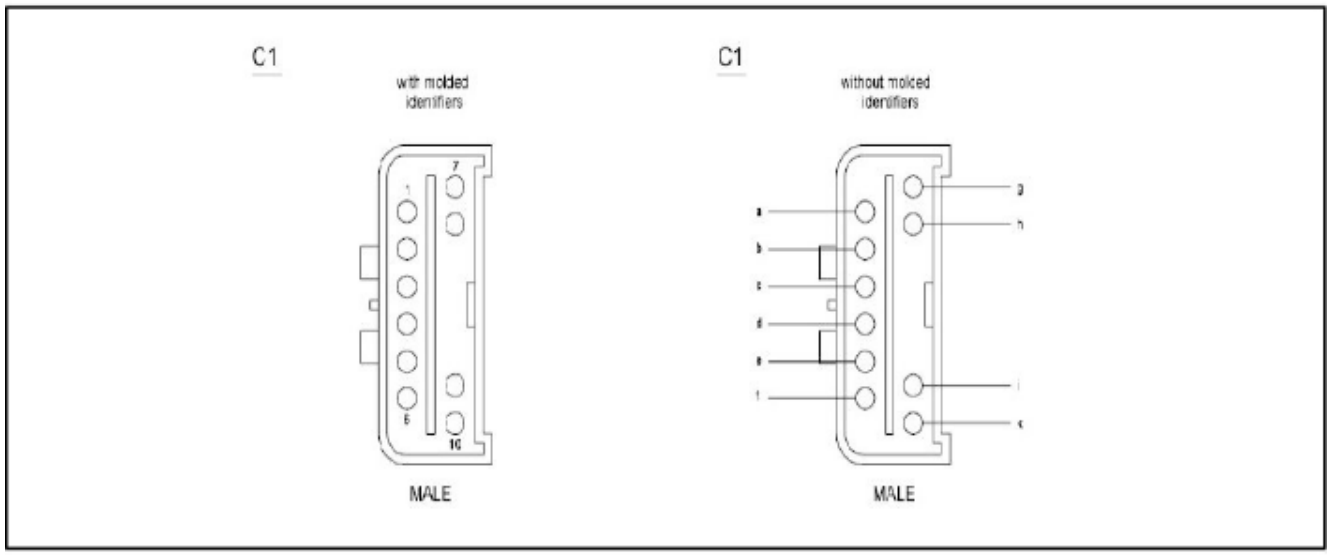
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



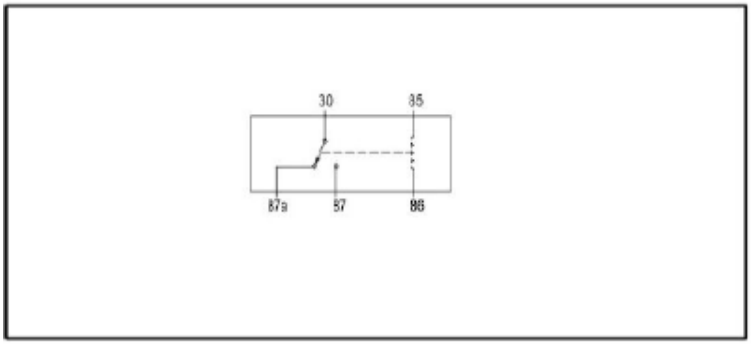
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

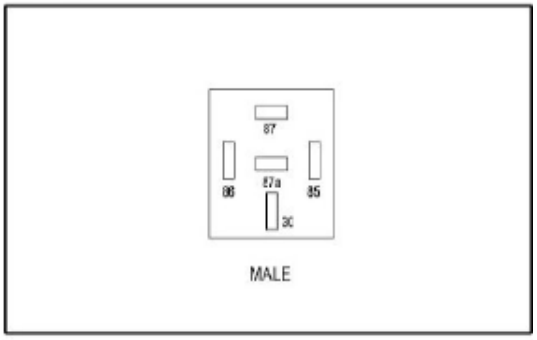
Battery Discharge Protection Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step–by–step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals

Fog/Driving Lamp Bulb: Service and Repair

FOG LAMP BULB

Removal and Installation

WARNING: The bulb contains gas under pressure. The bulb may shatter if the glass envelope is scratched or if the bulb is dropped. Handle the bulb only by its base. Avoid touching the glass envelope. Failure to follow these instructions may result in personal injury.

NOTE:

- The fog lamp bulb should not be removed from the fog lamp until just before a replacement bulb is installed. Removing the bulb for an extended period of time may affect fog lamp bulb performance. Contaminants may enter where they can settle on the lens and reflector. Never turn the fog lamps on with the bulb removed.

- Make sure the headlamp switch and the ignition switch are in the OFF position.

1. With the vehicle in NEUTRAL, position it on a hoist. 2. Disconnect the electrical connector and remove the fog lamp bulb. 3. To install, reverse the removal procedure.

Fog/Driving Lamp Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

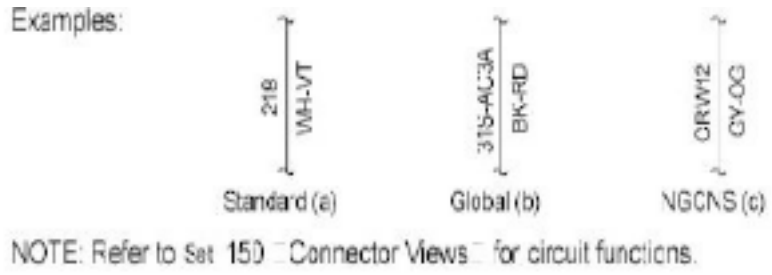
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

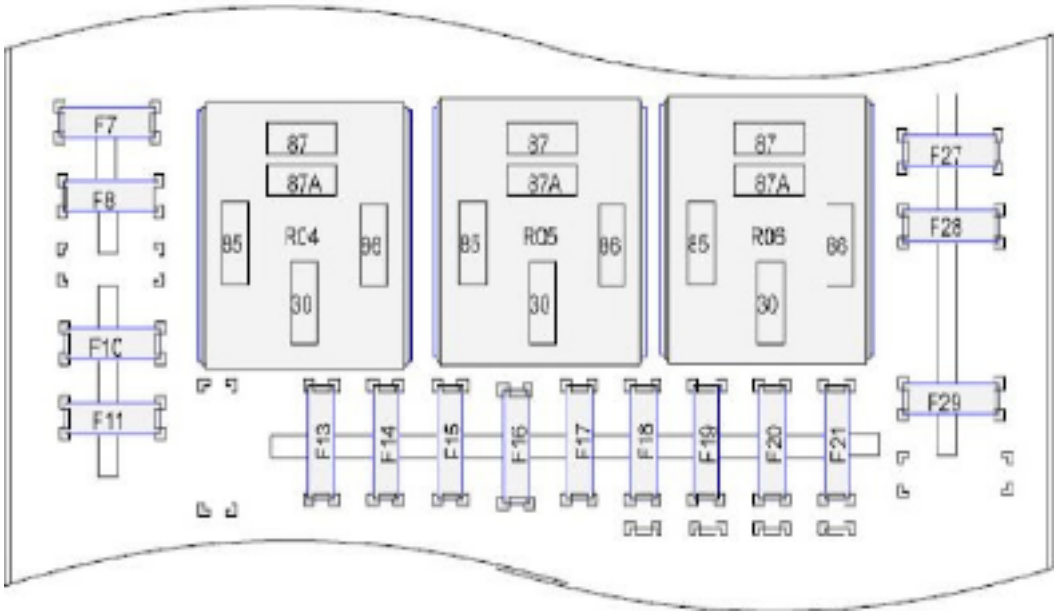
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution

It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

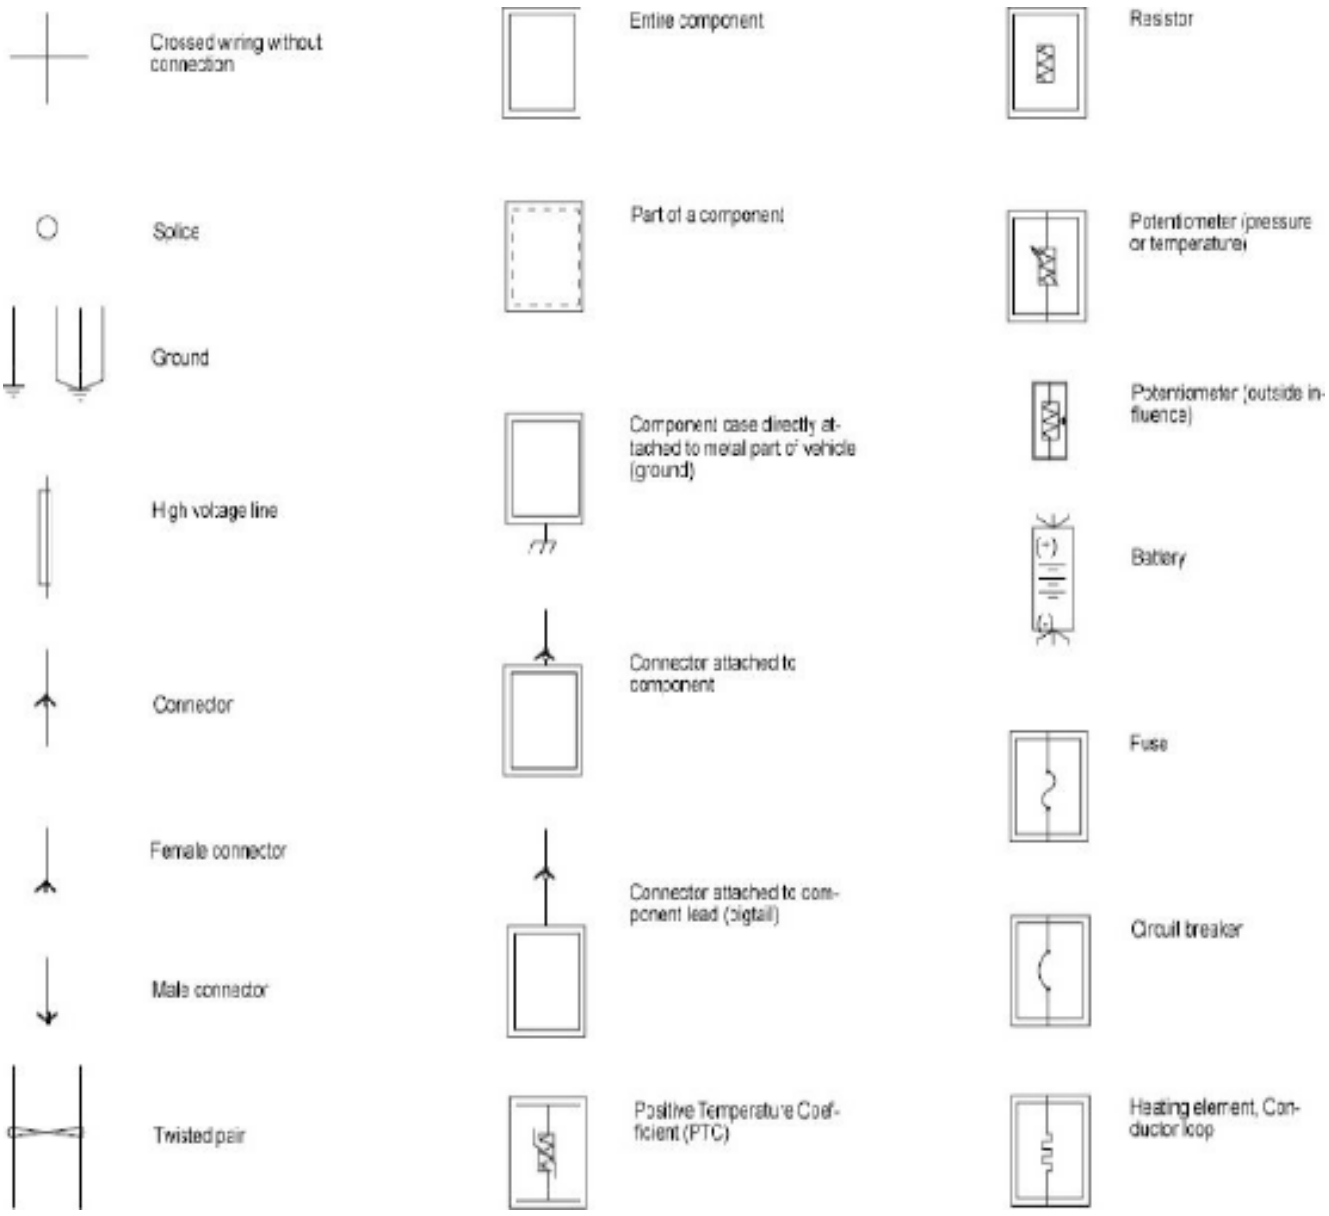
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

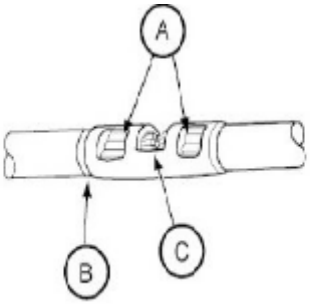
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

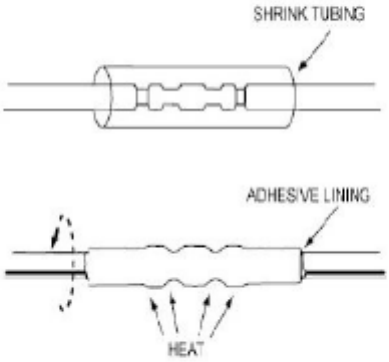
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x cia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Figtail only

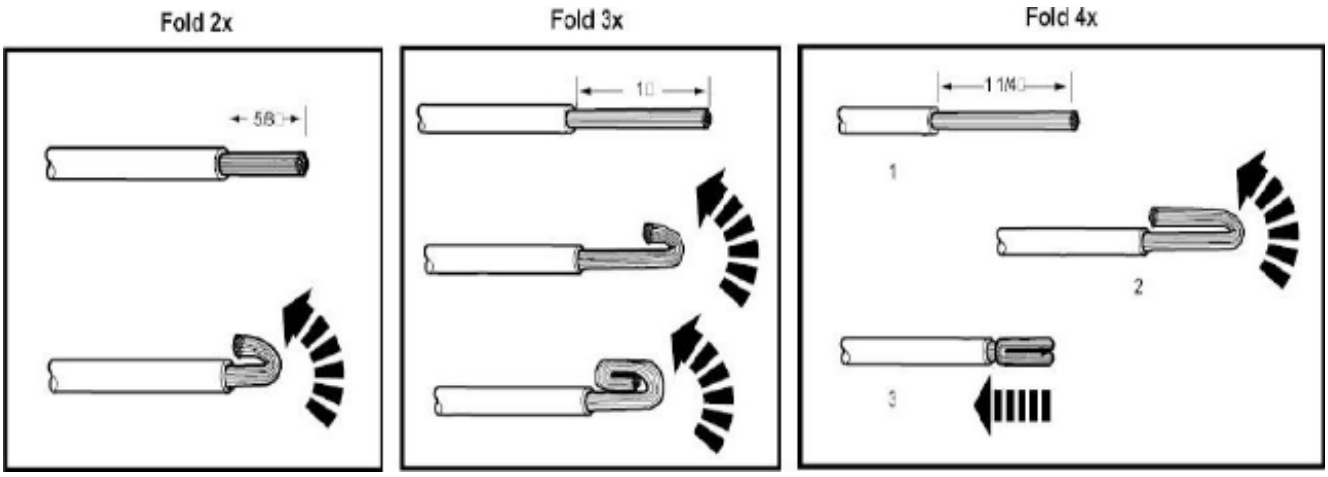
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



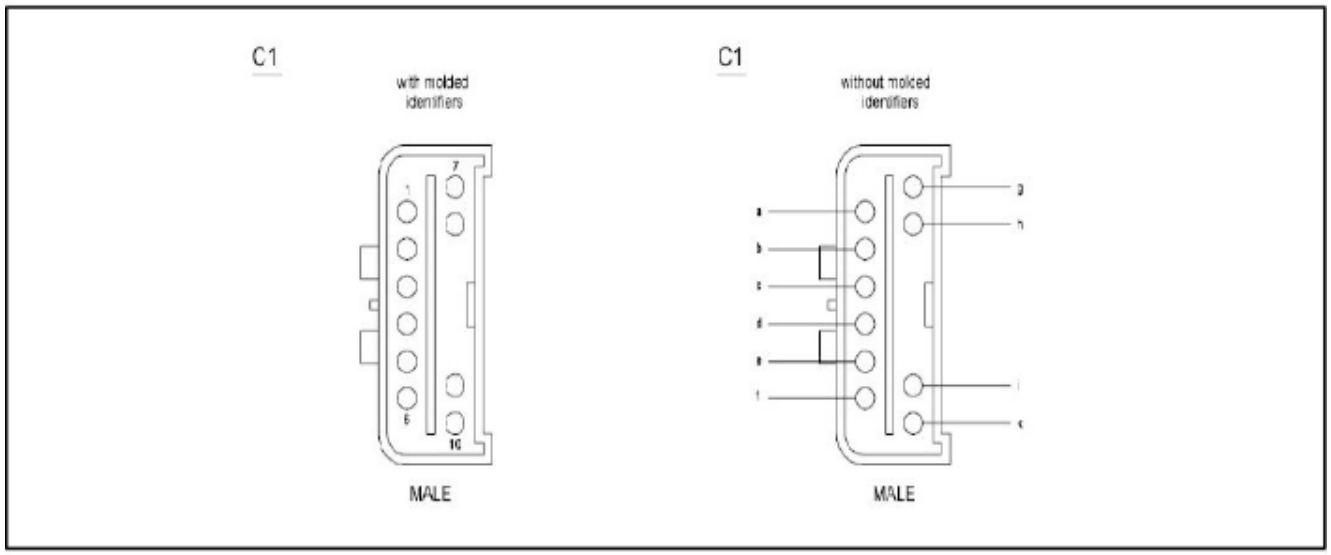
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



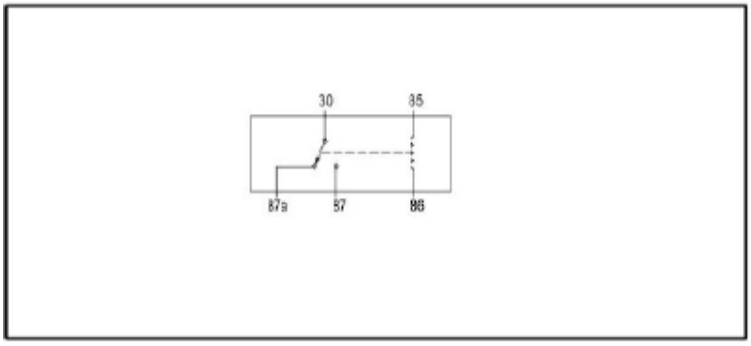
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

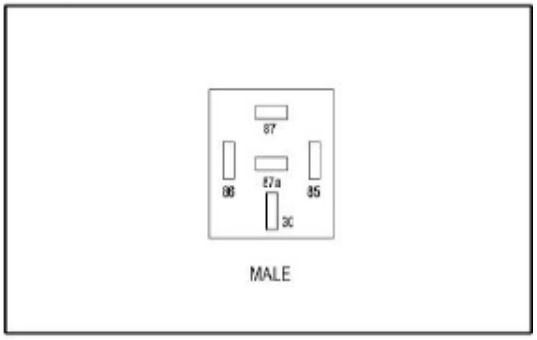
Fog/Driving Lamp Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Hazard Flasher Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

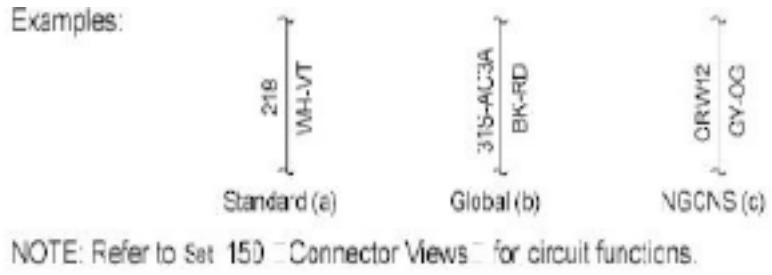
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

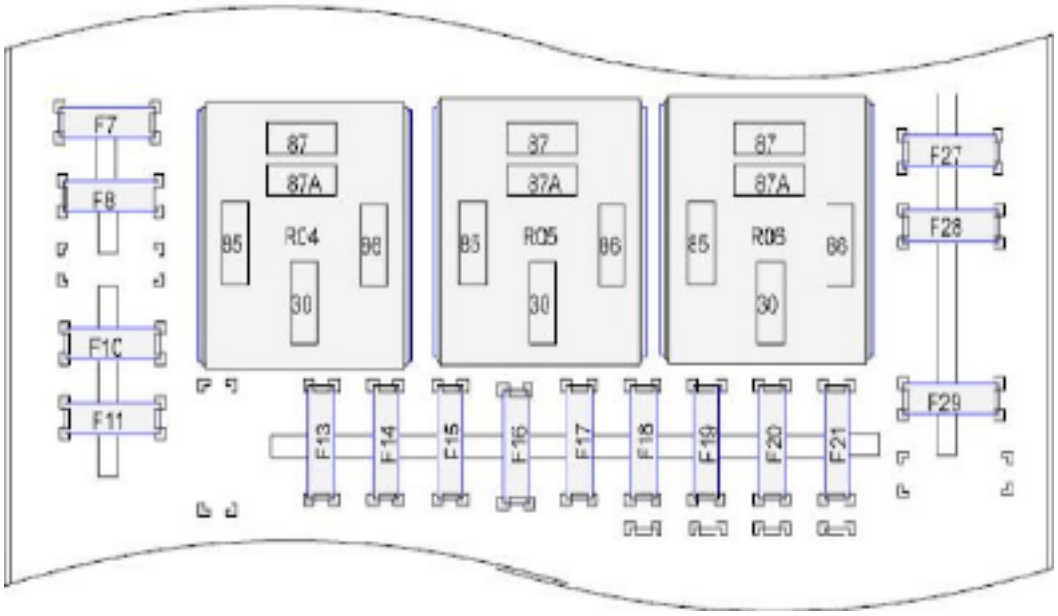
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

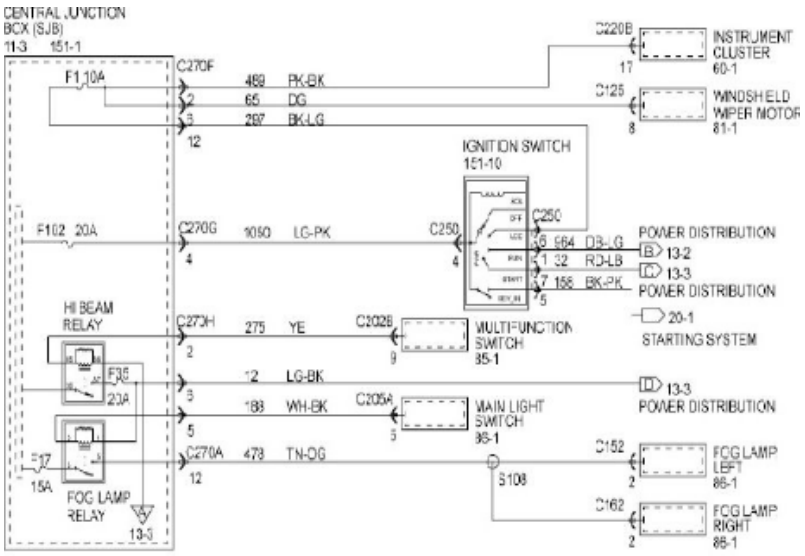
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

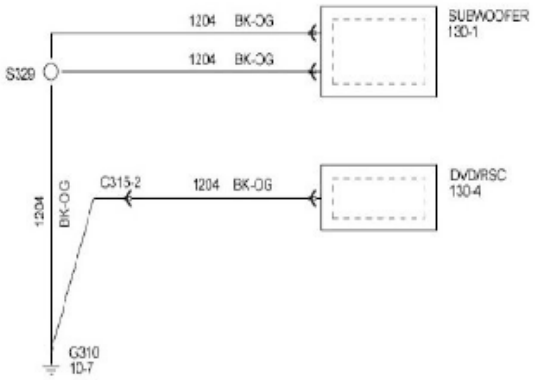
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

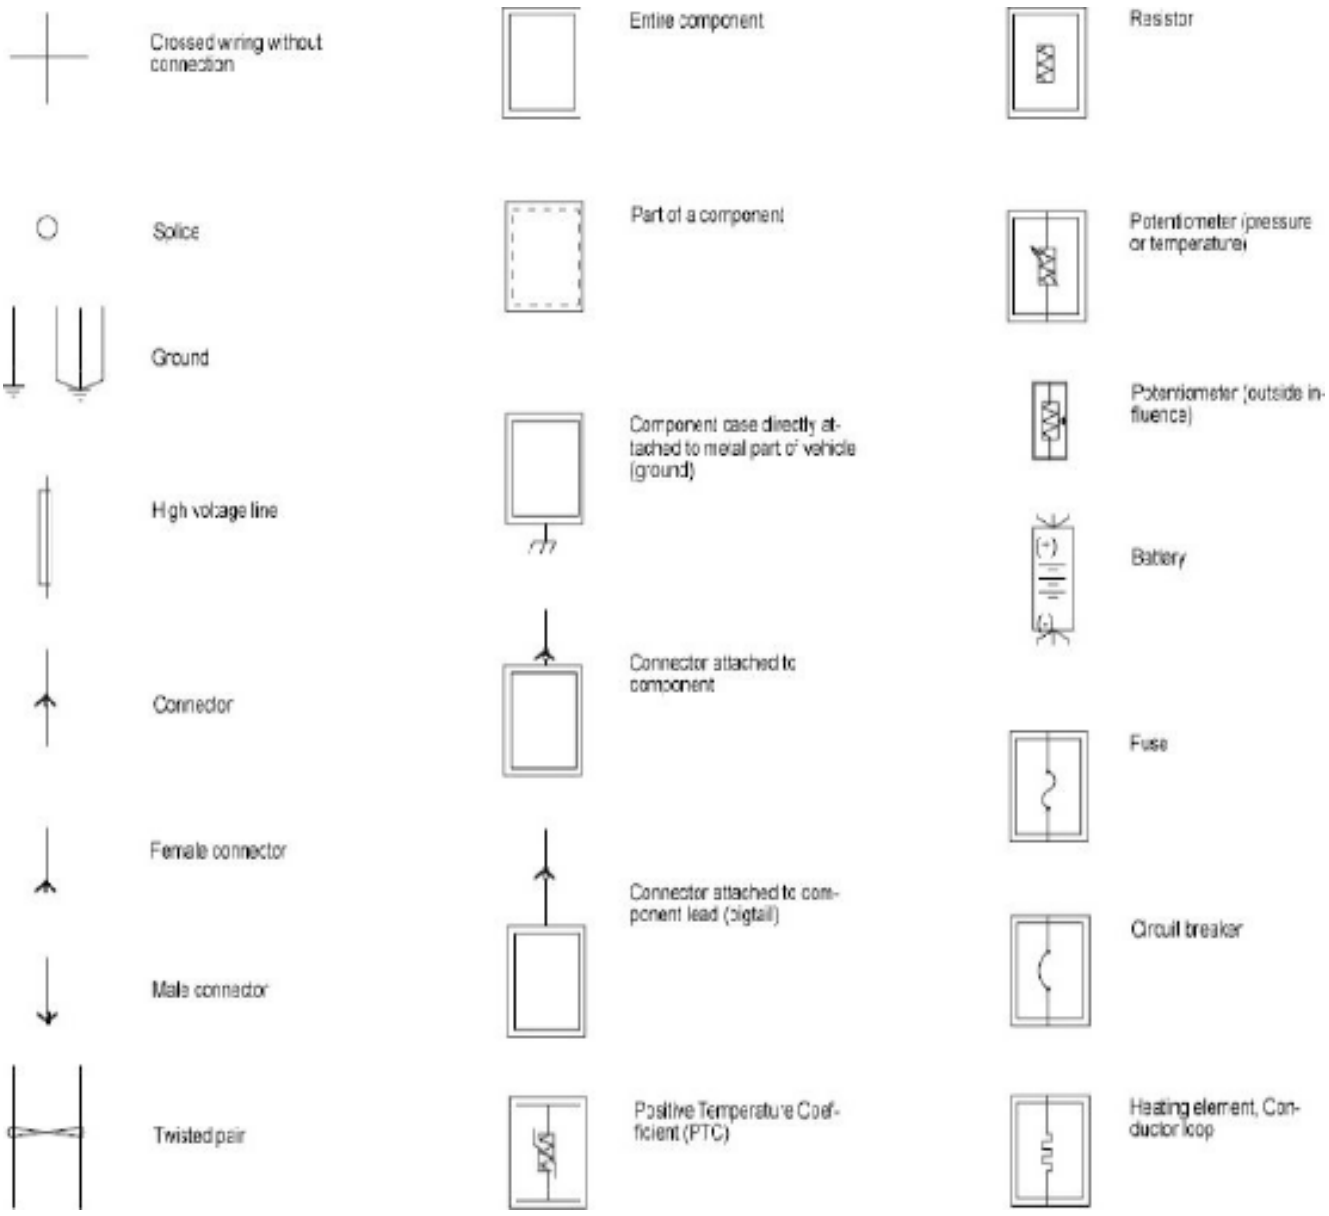
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

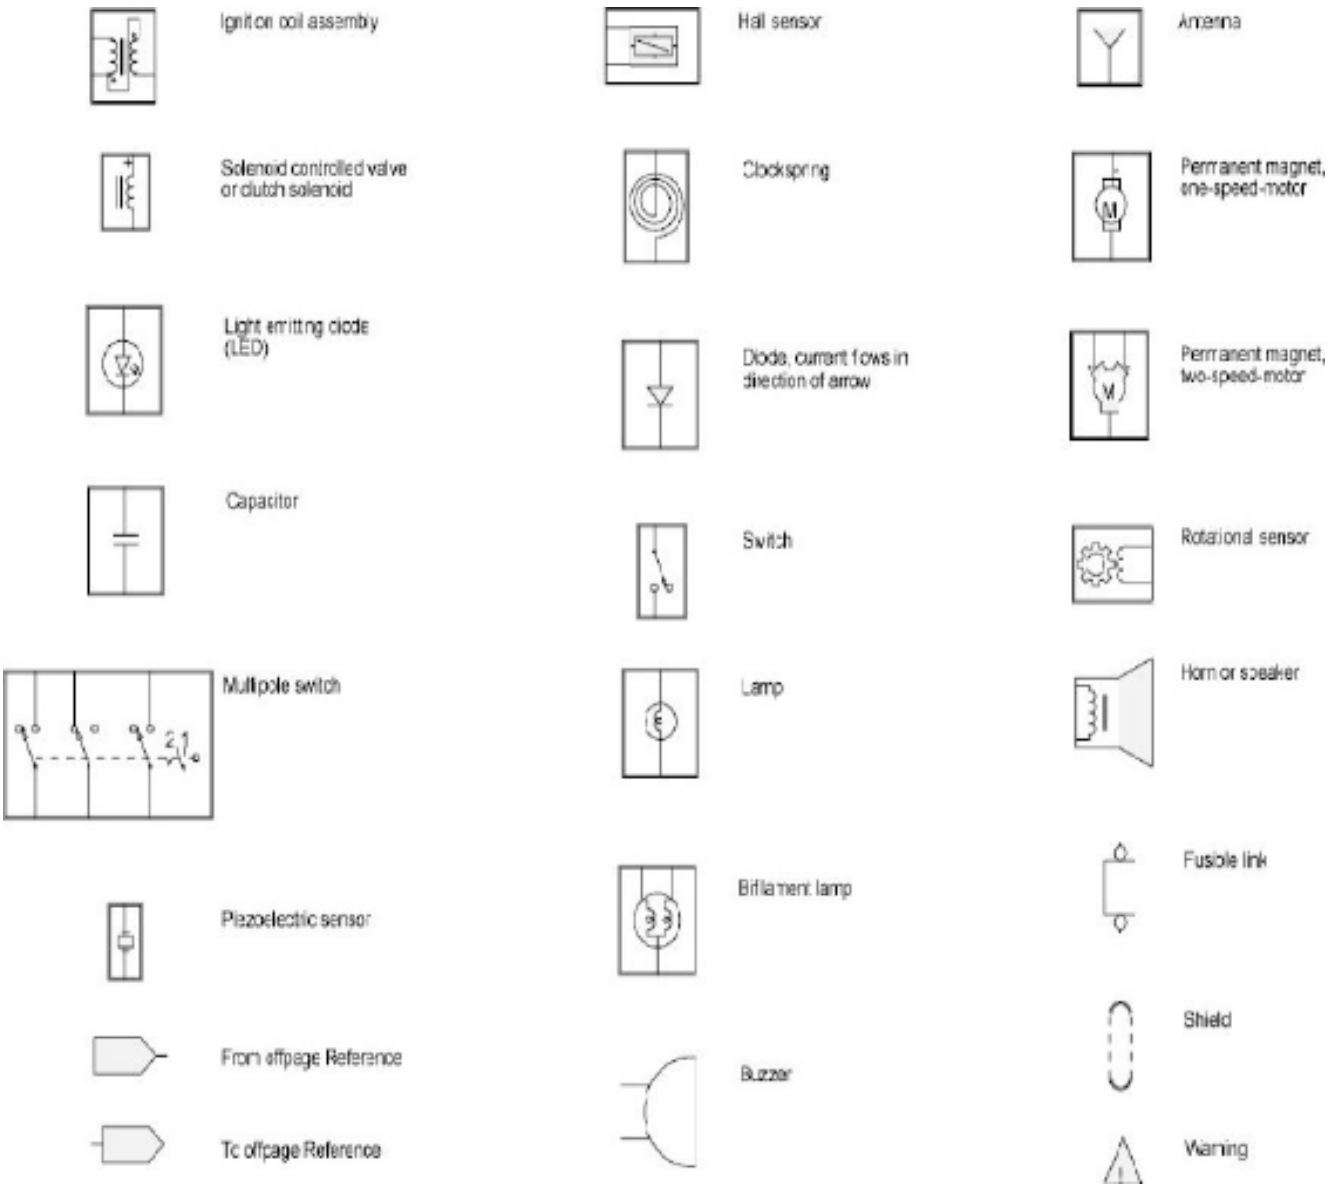
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

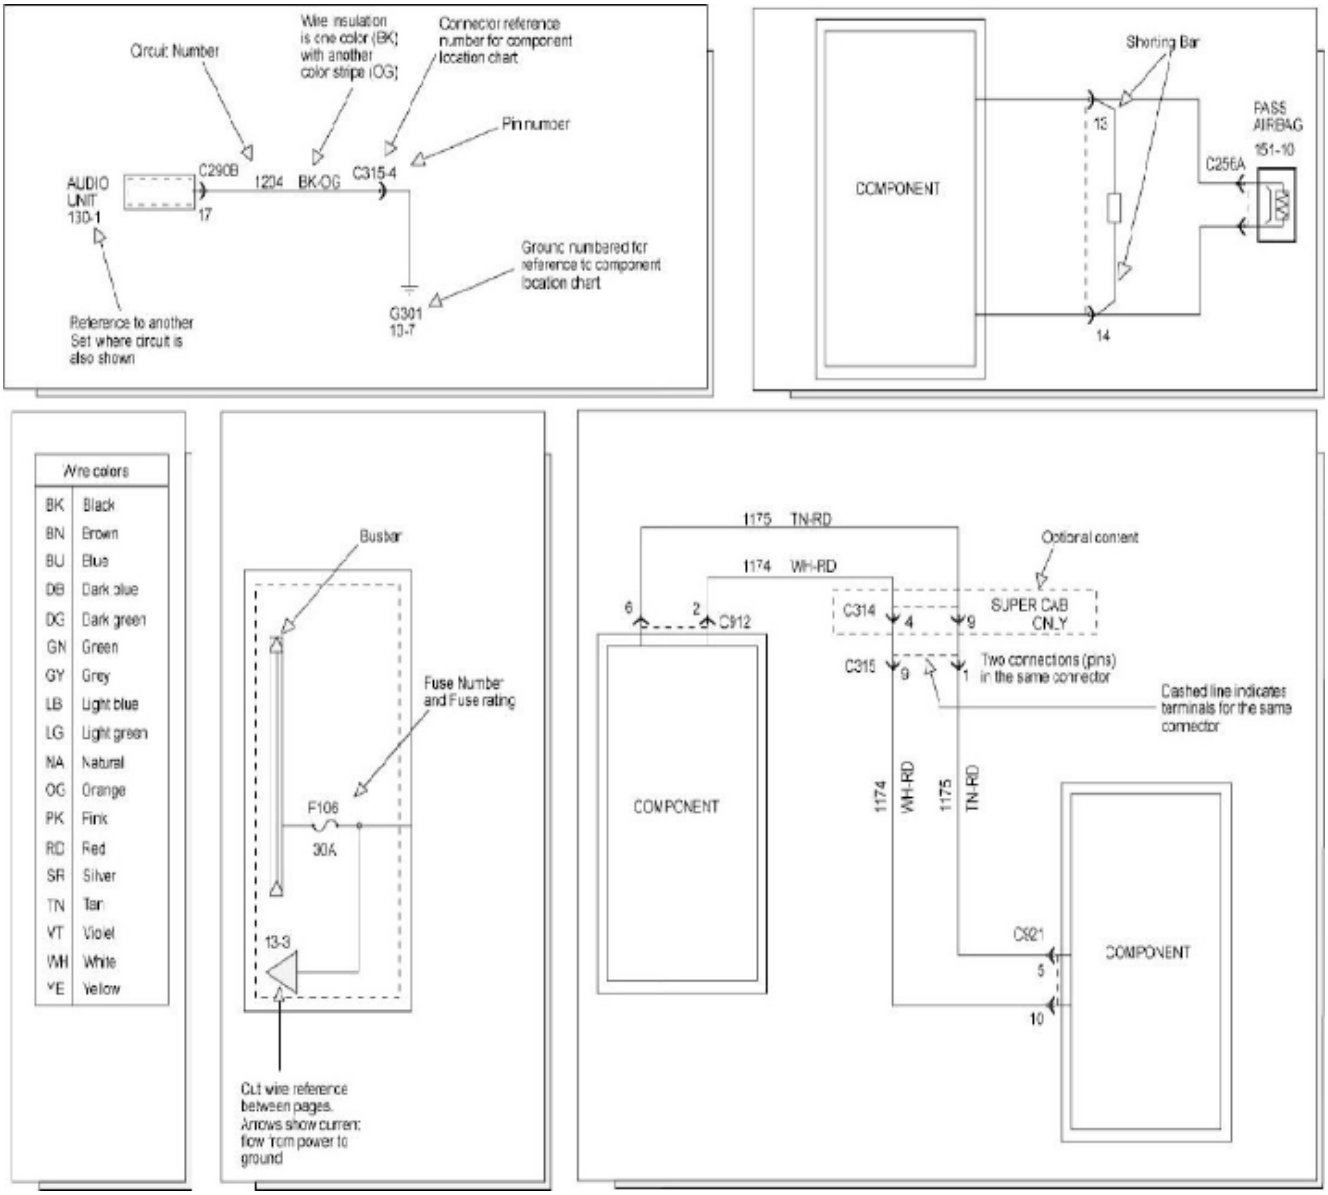
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

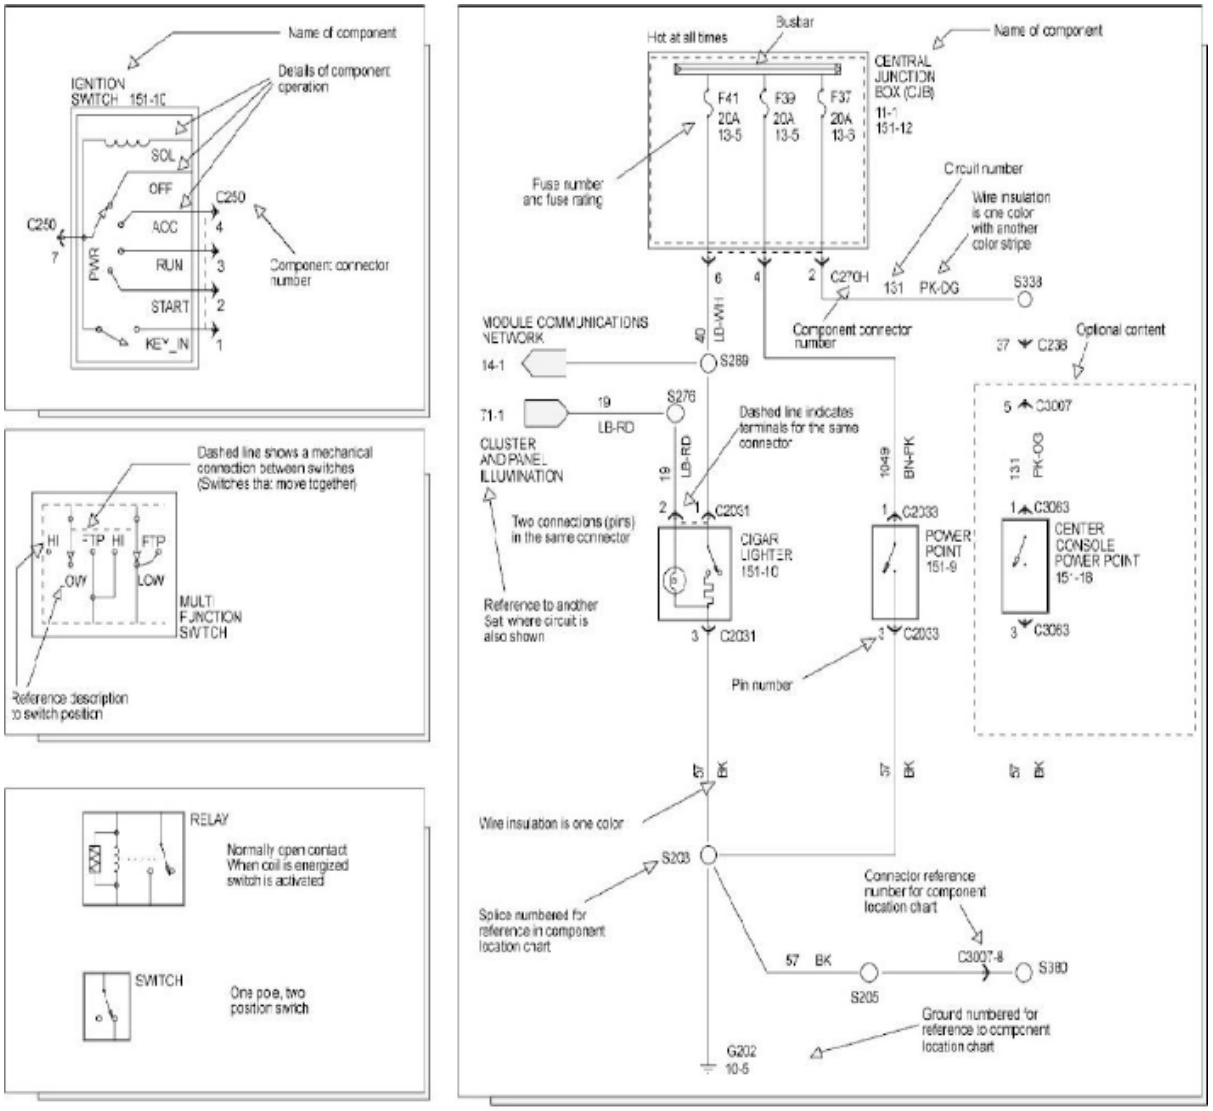
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Hazard Flasher Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

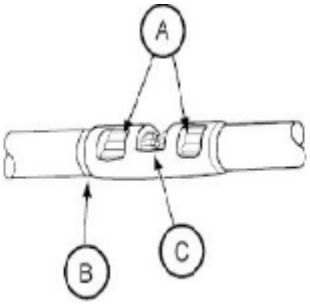
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

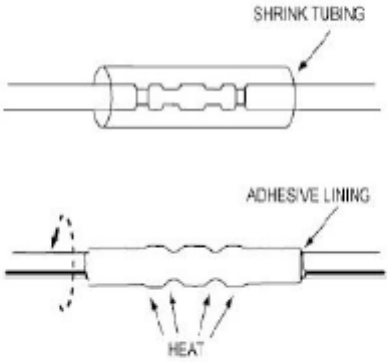
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4□ strip, cut 9 strands	* 1/4□ strip, cut 2 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip, fold 3x dia.

	12-10	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip fold 3x cia.	1 1/4□ strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Figtail only

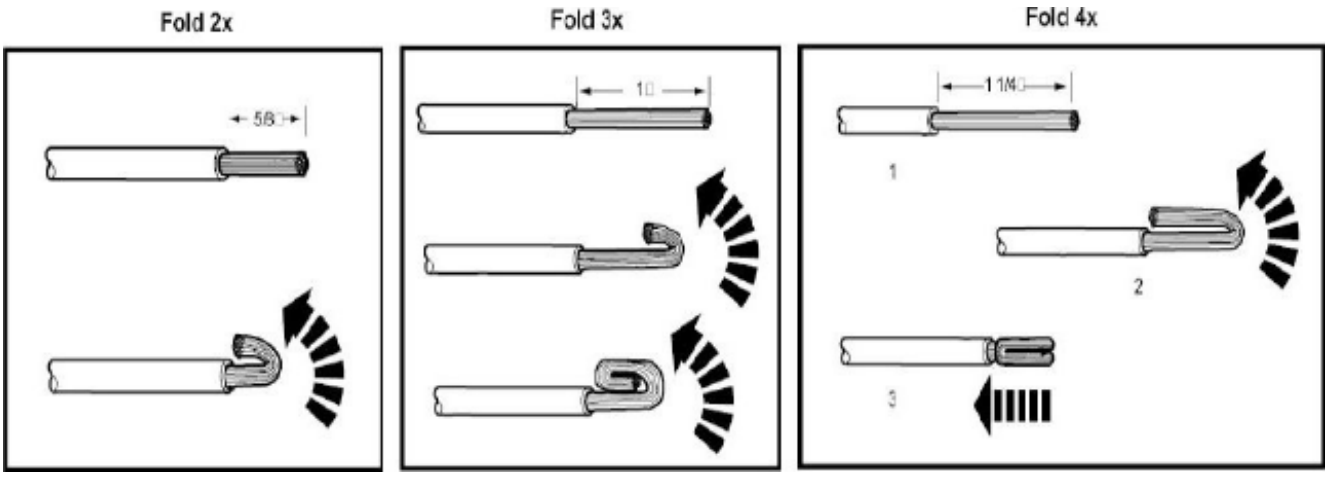
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

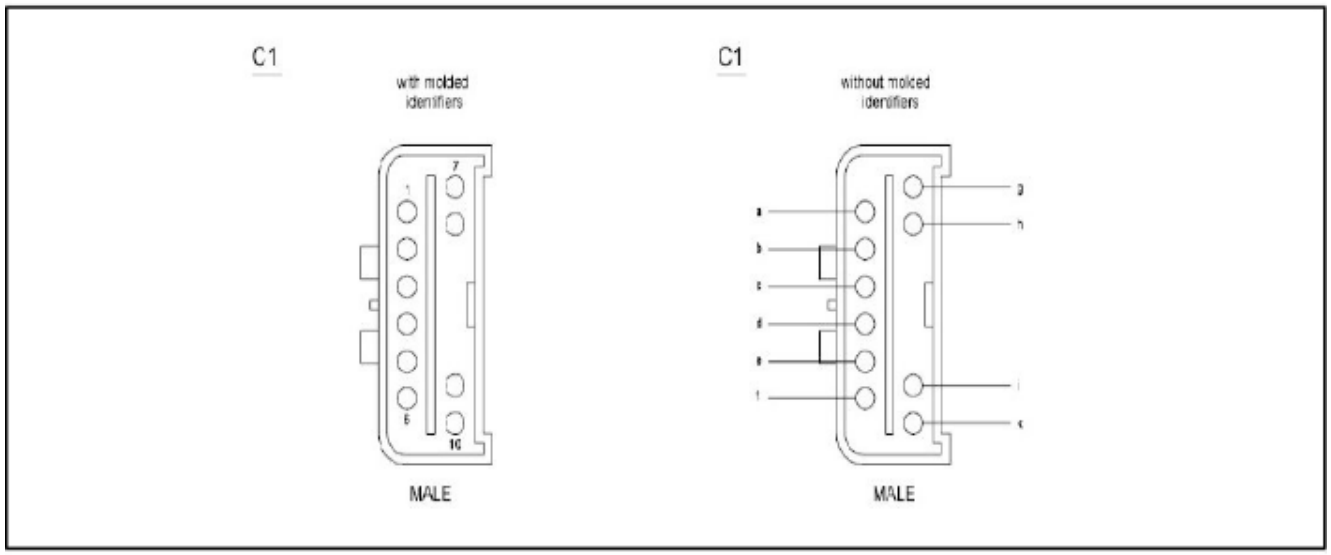
Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



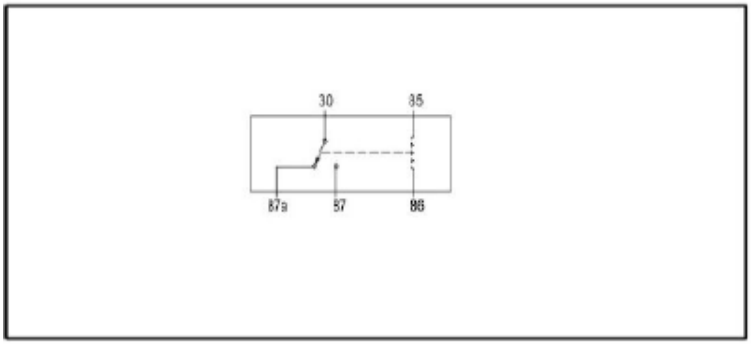
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

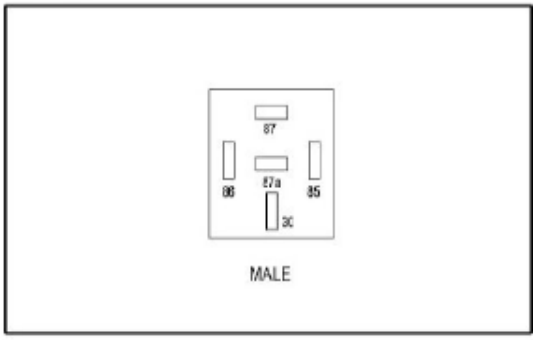
Hazard Flasher Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

2	13N021	Headlamp bulb

Headlamp Bulb: Service and Repair

HEADLAMP BULB

Removal and Installation

WARNING: The bulb contains gas under pressure. The bulb may shatter if the glass envelope is scratched or if the bulb is dropped. Handle the bulb only by its base. Avoid touching the glass envelope. Failure to follow these instructions may result in personal injury.

NOTE: The headlamp bulb should not be removed from the headlamp until just before a replacement bulb is installed. Removing the bulb for an extended period of time may affect headlamp bulb performance. Contaminants may enter the headlamp assembly where they can settle on the lens and reflector. Never turn the headlamps on with the bulb removed.

1. Remove the headlamp assembly. 2. Rotate the headlamp bulb retainer approximately one-eighth turn counterclockwise and remove it.

- Remove the headlamp bulb.

3. To install, reverse the removal procedure.

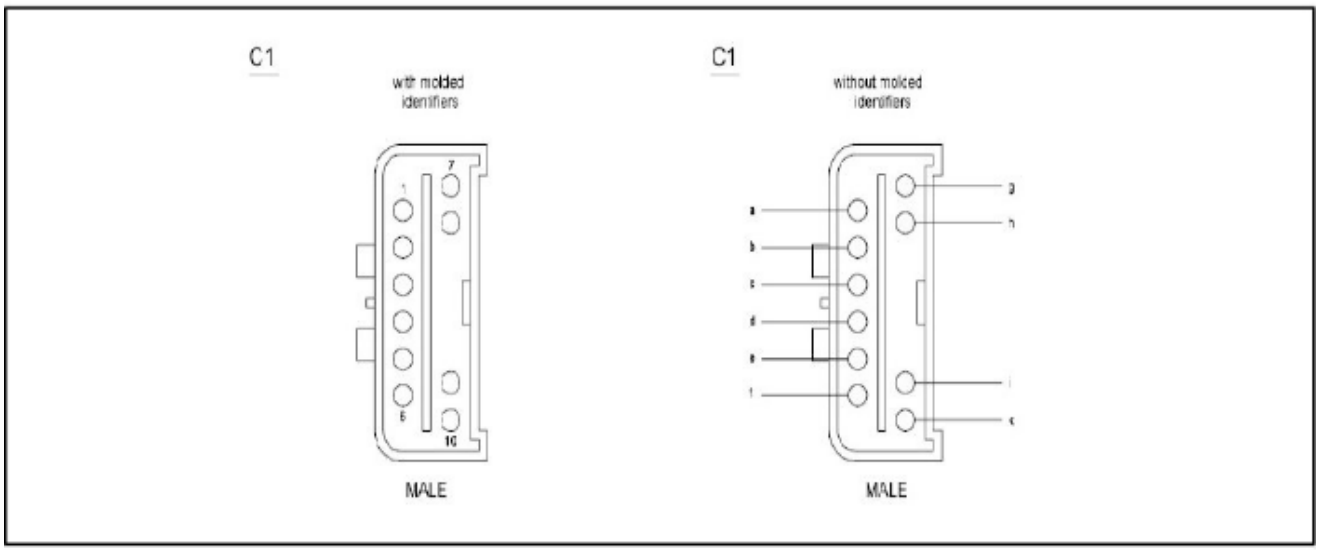
Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

Headlamp Dimmer Switch: Service and Repair

Steering Column Multifunction Switch

Steering Column Multifunction Switch

Removal and Installation

1. Remove the ignition switch lock cylinder.

1 Insert the ignition key into the ignition switch lock cylinder and turn to the RUN position.

2 Push the ignition switch lock cylinder release tab with a punch while pulling out the ignition switch lock cylinder.

2. If equipped, remove the tilt release lever/ handle.

3. Remove the 3 steering column shroud screws and the upper and lower steering column shrouds. 4. Disconnect the multi-function switch electrical connectors. 5. Remove the 2 multi-function switch screws and the multi-function switch.

^ To install, tighten to 3 Nm (27 lb-inch).

6. To install, reverse the removal procedure.

Horn Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

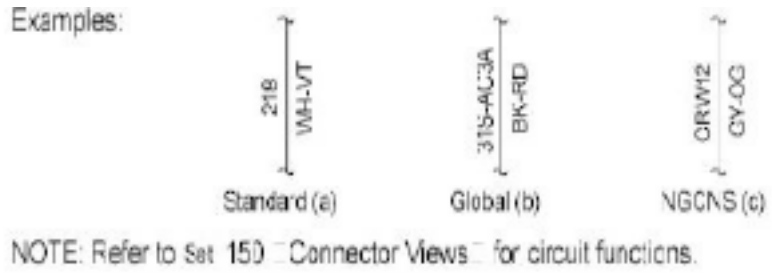
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

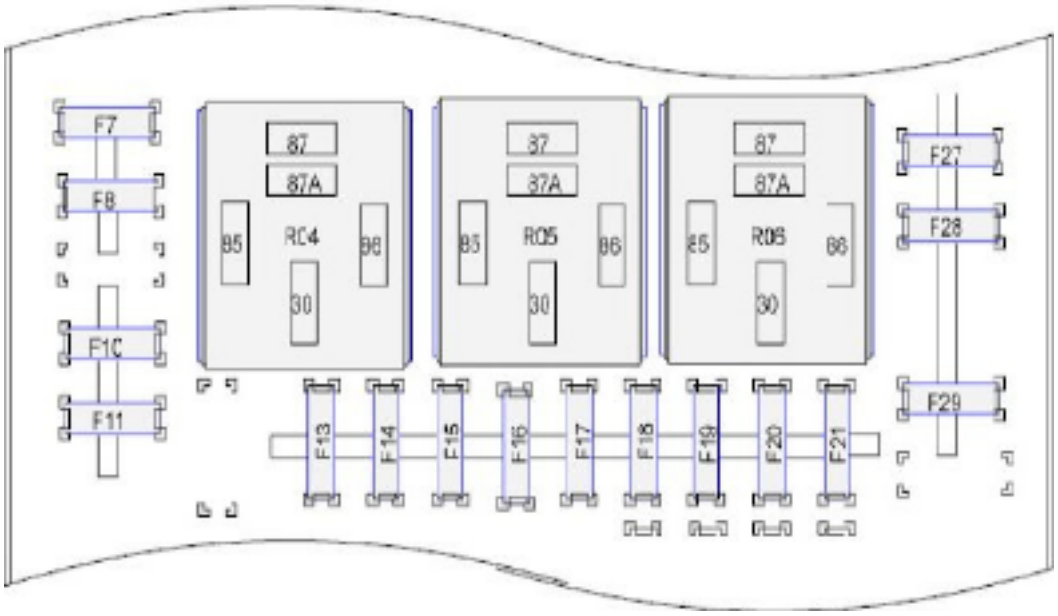
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

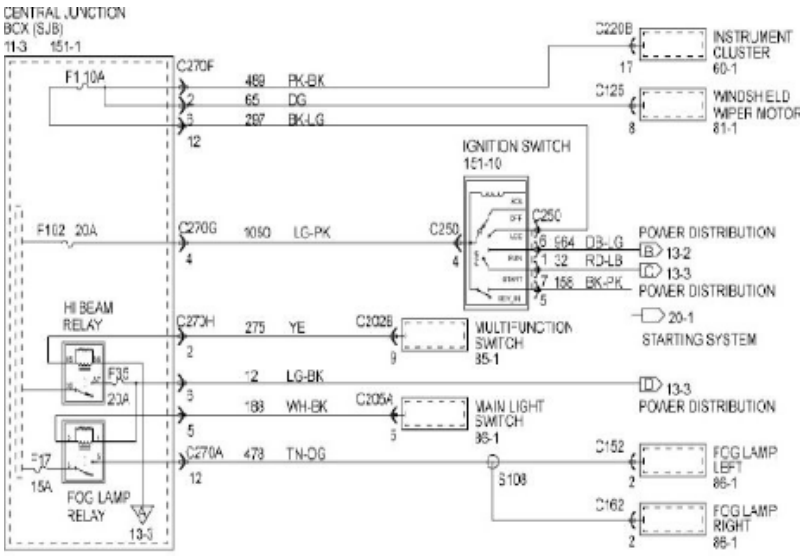
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

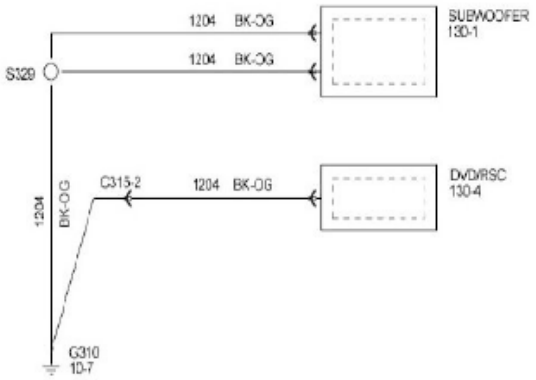
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

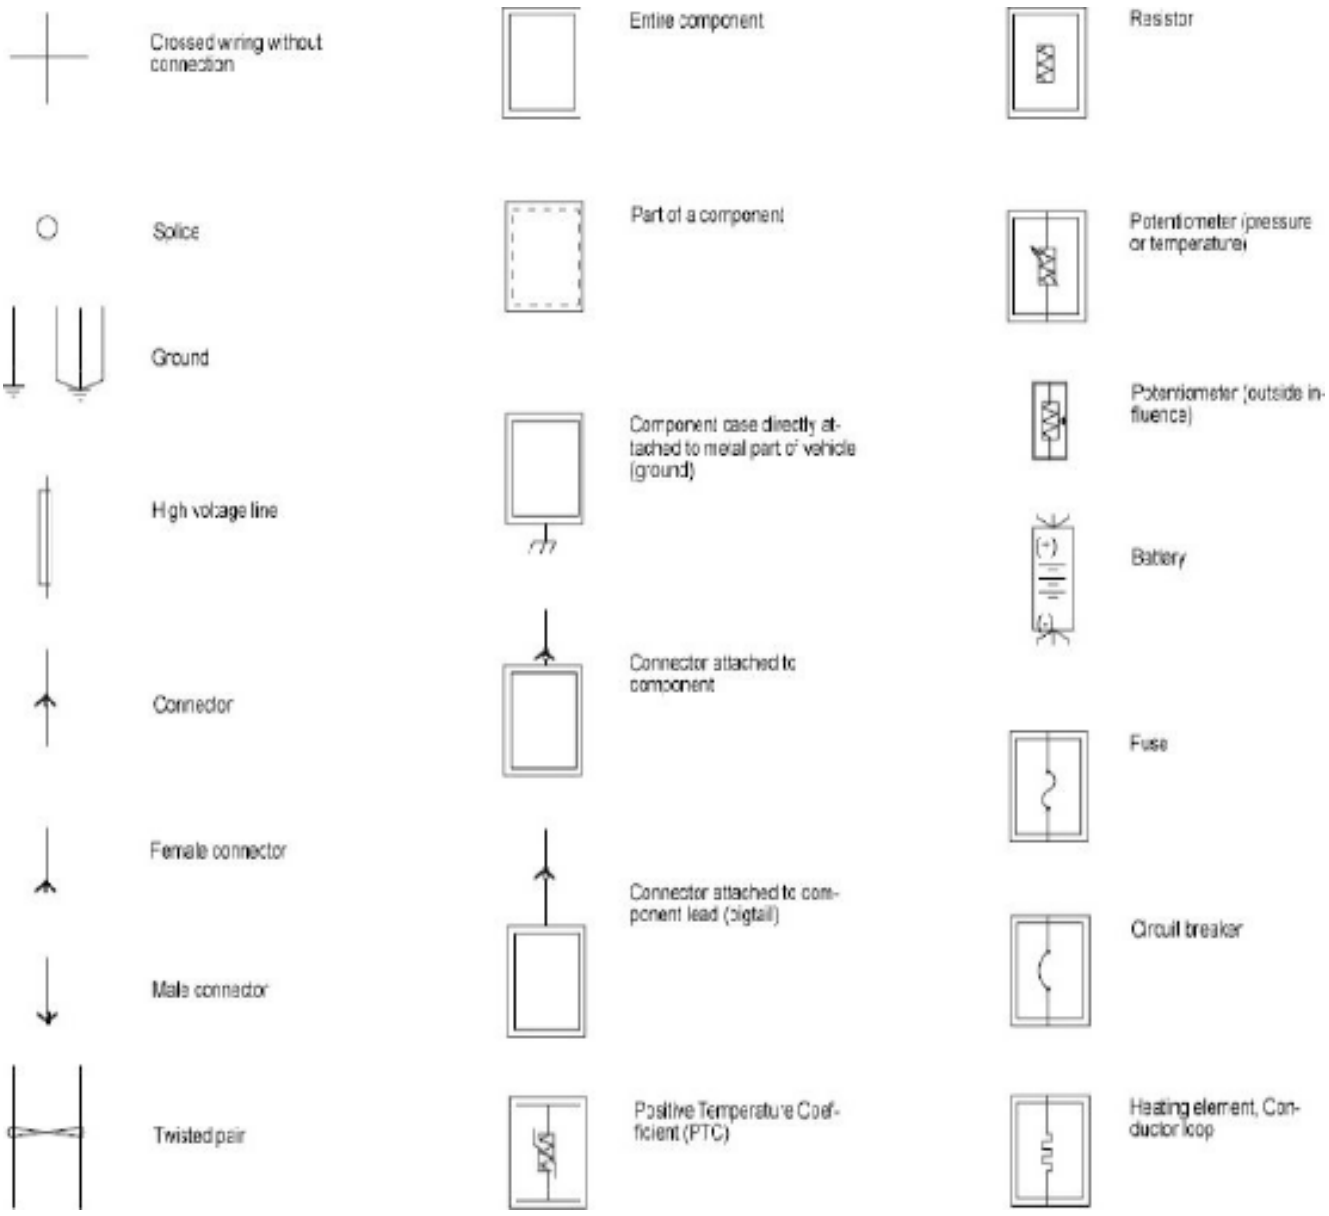
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

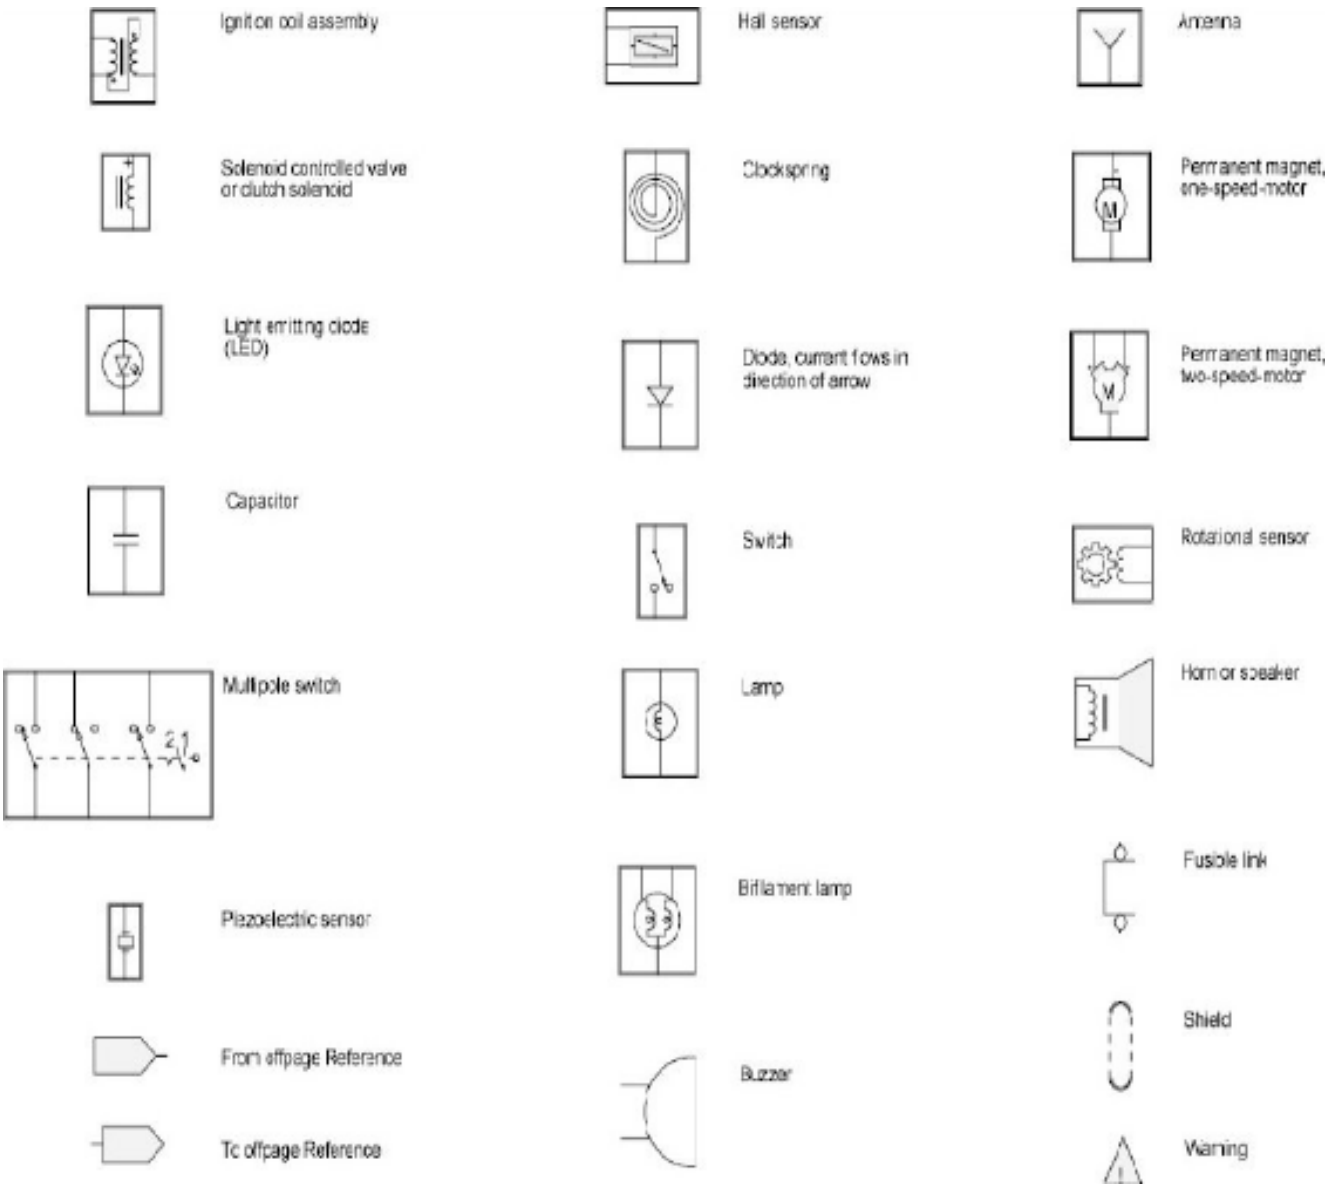
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

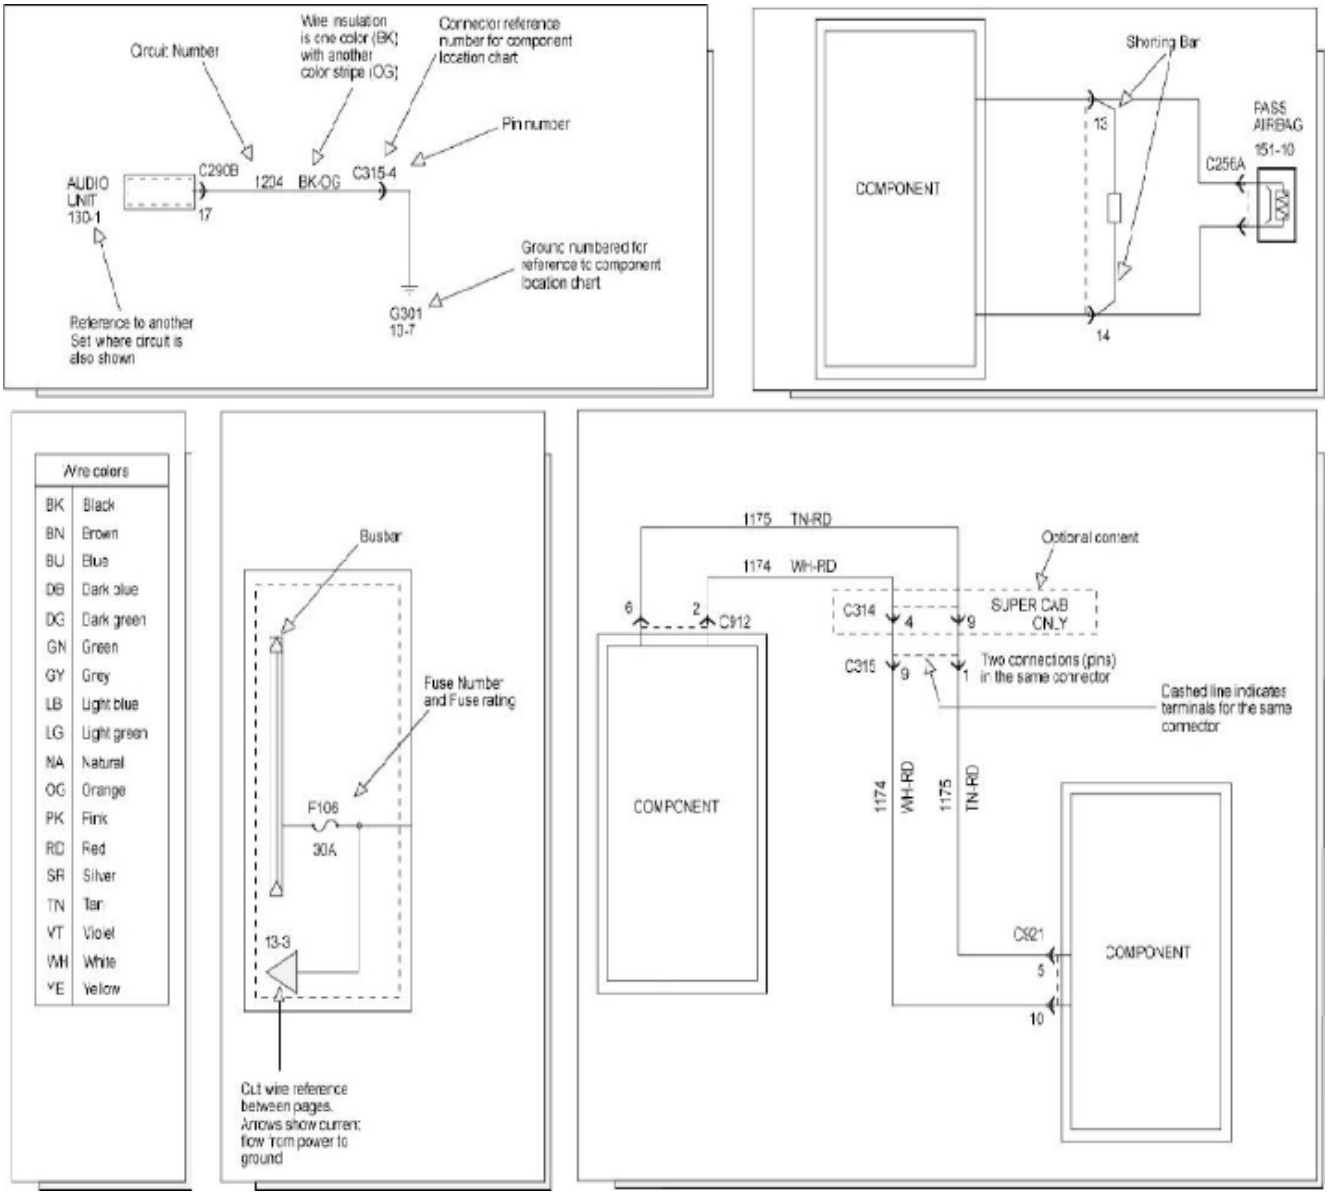
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

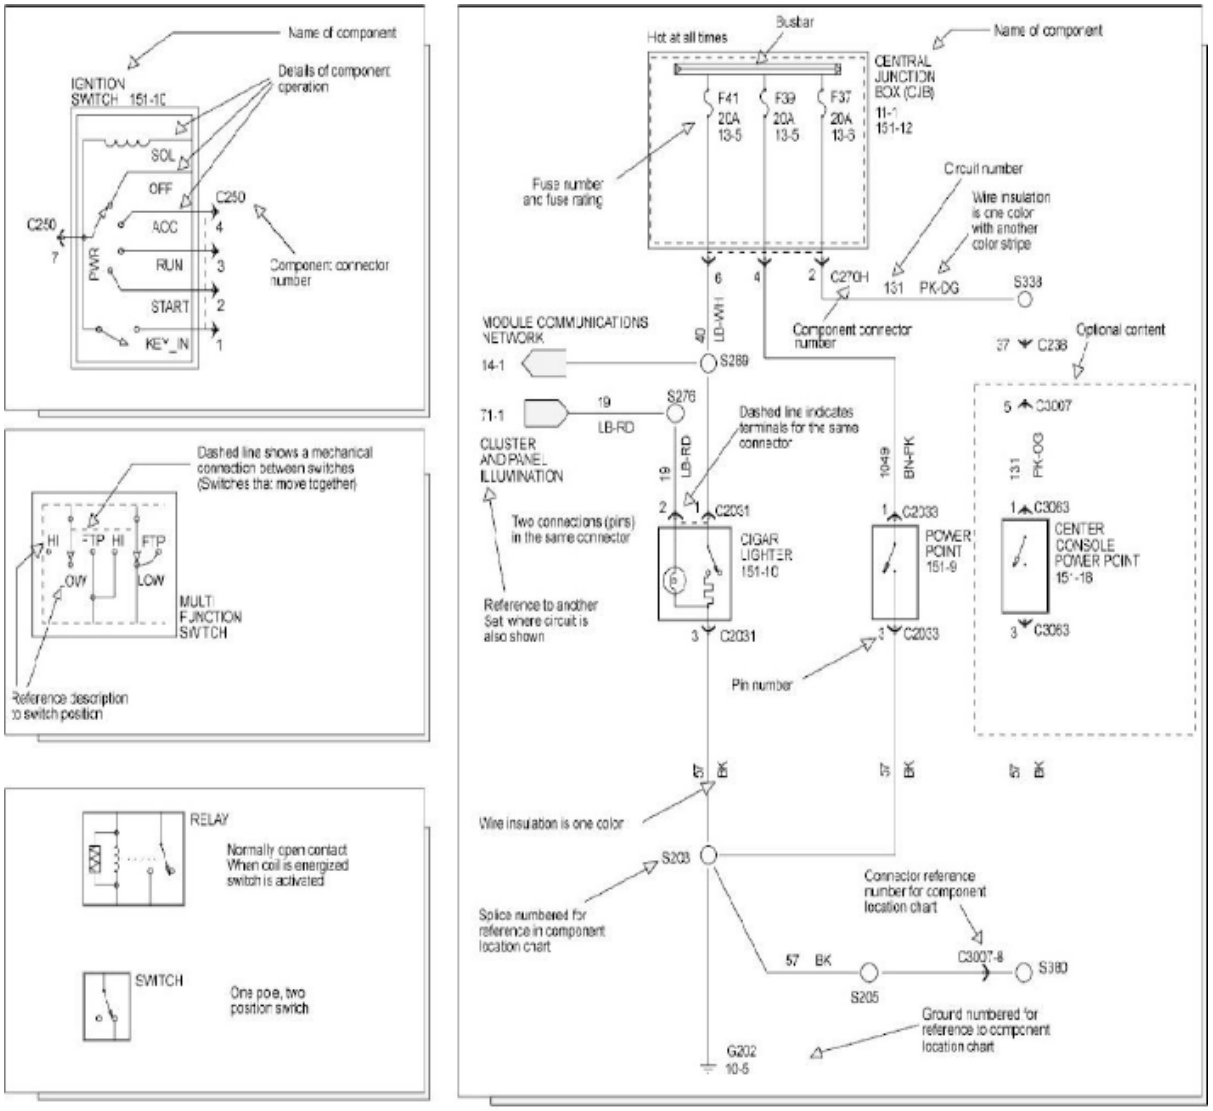
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Horn Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

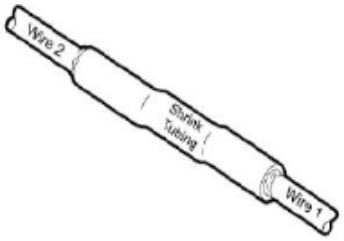
NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.



Wire 2

WIRE STOPPER

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

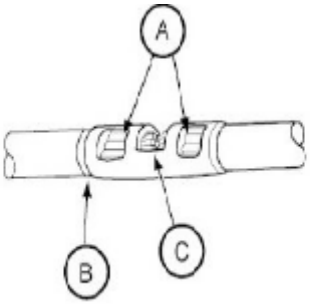
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

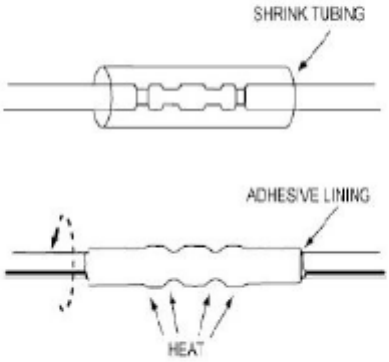
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x cia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Figtail only

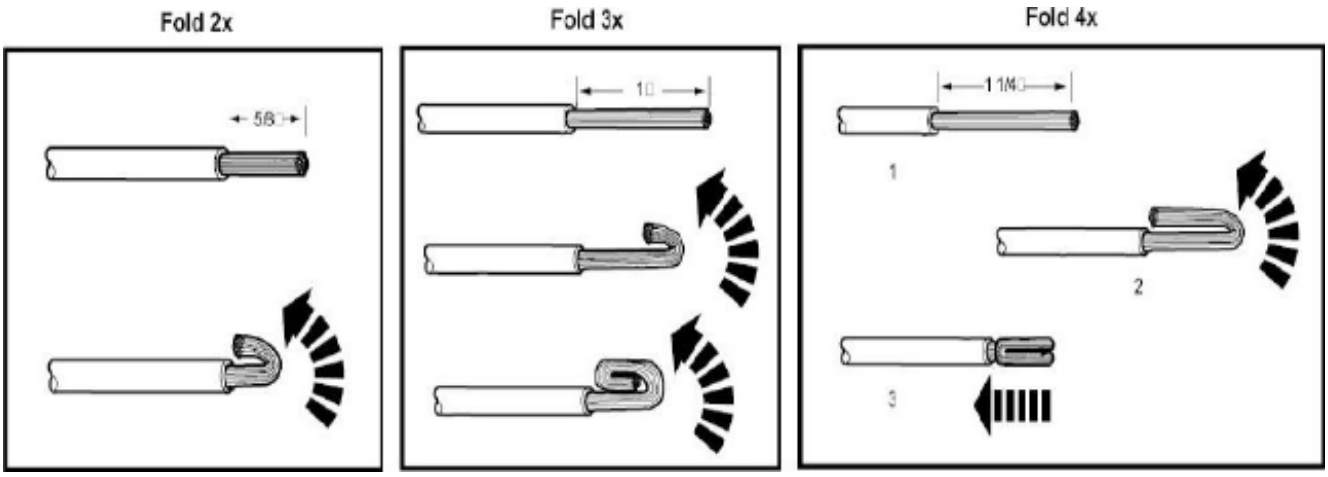
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



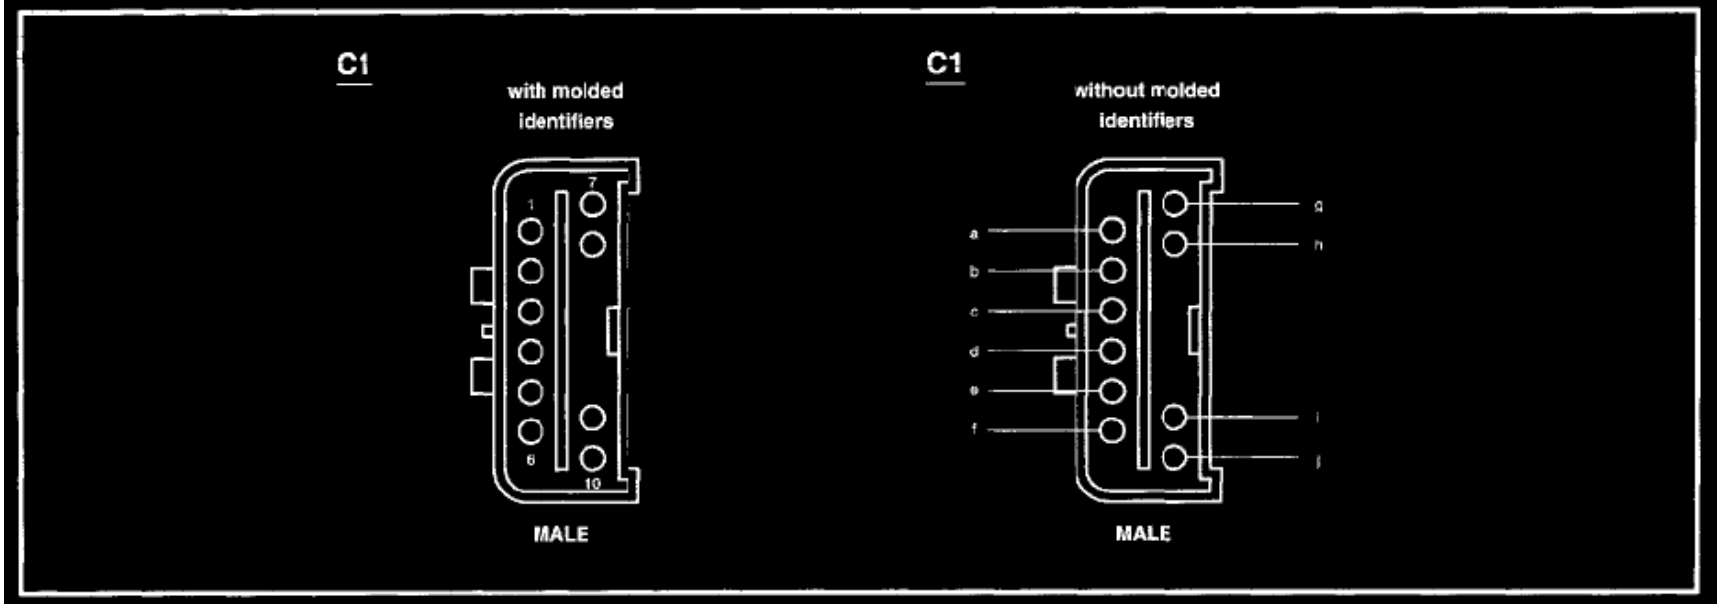
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step–by–step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



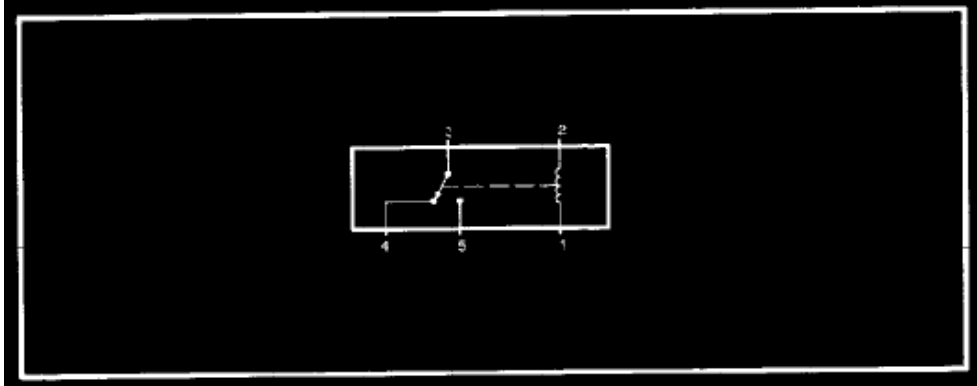
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

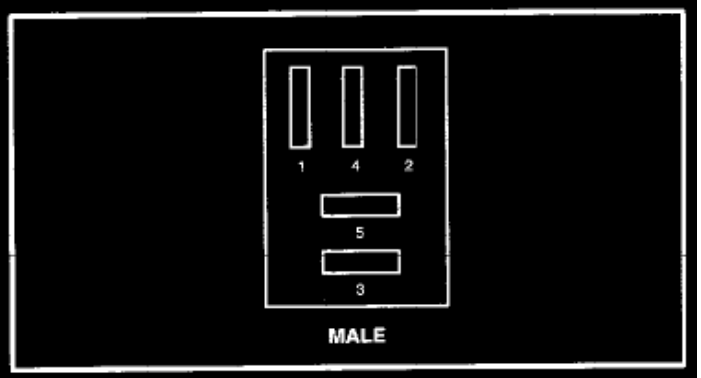
Horn Relay: Testing and Inspection Micro ISO Relay

Relay – Micro ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	1 and 2	63–102Ω
Contact	3 and 4	Closed circuit
	3 and 5	Open circuit
Coil – Contact	1 and 3	Open circuit
	1 and 4	Open circuit
	1 and 5	Open circuit

Component testing procedure (voltage applied)

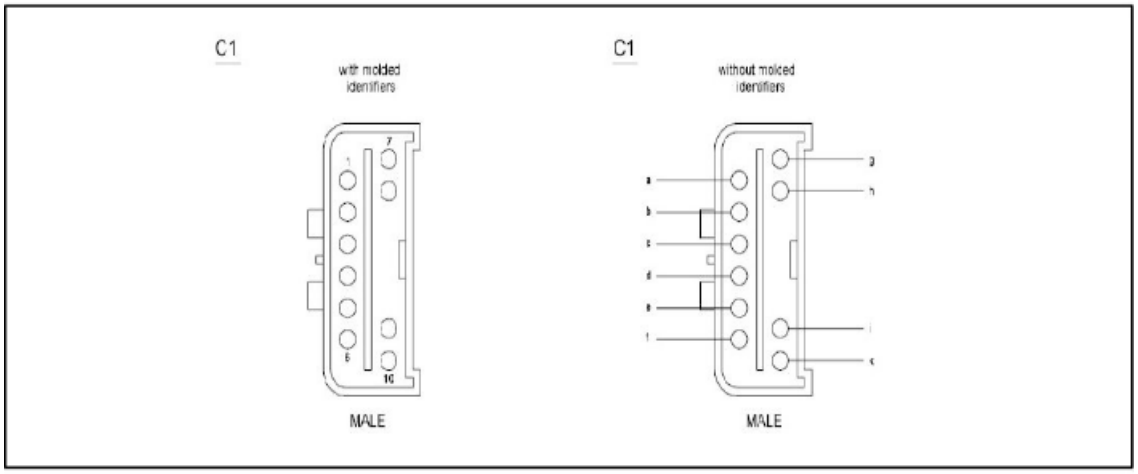
Disconnect the ohmmeter; connect pins 2 and 3 to 12V DC power and pin 1 to ground. Measure voltage between pin 5 and pin 1. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 2 and measure voltage between pin 4 and pin 1. If the voltage is 12V, the relay is okay. If not, replace the relay.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step□by□step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column □Circuit to test□. If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

Interior Lighting Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

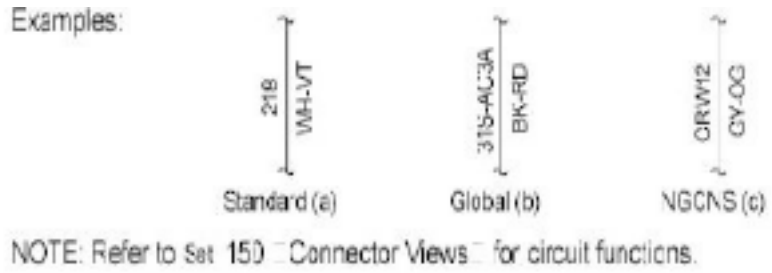
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

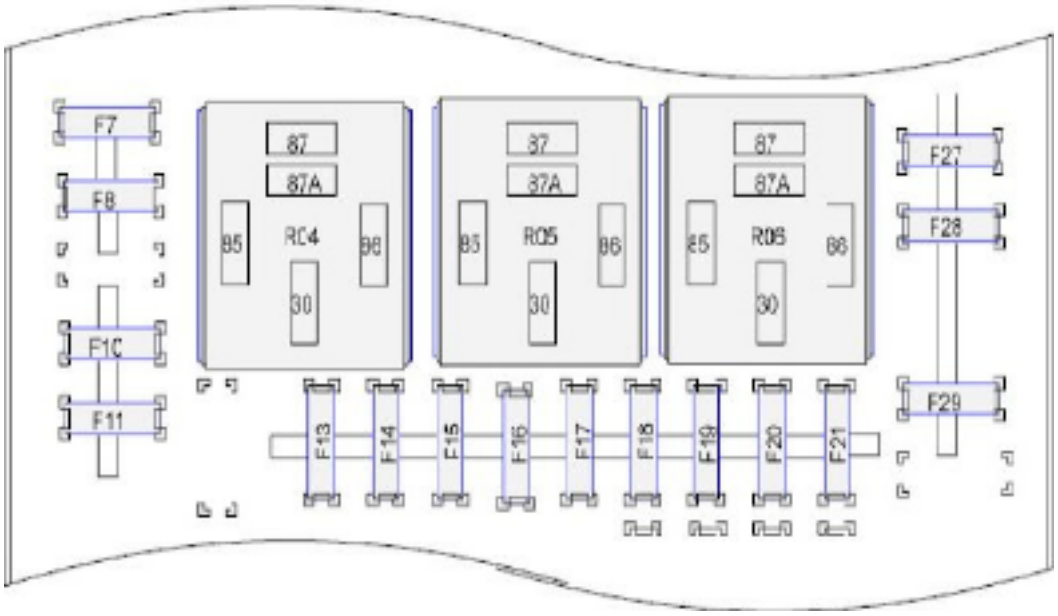
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

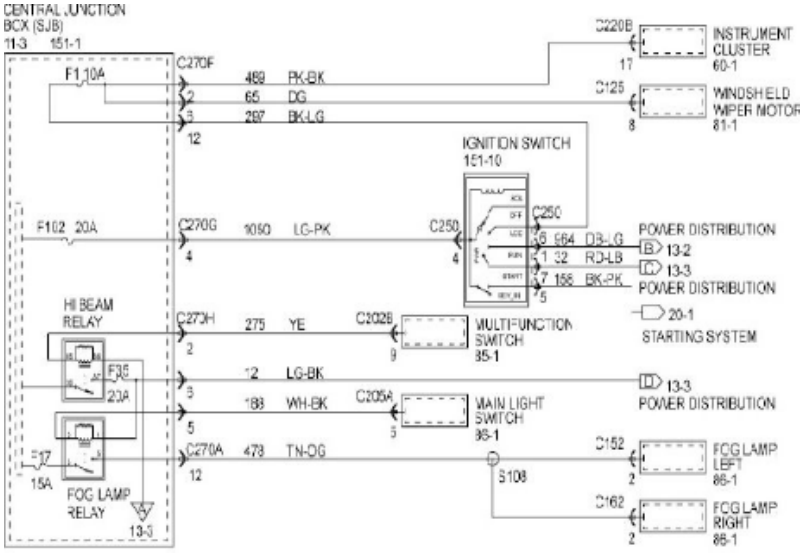
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

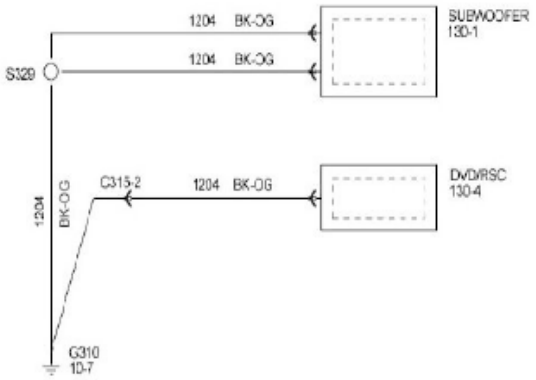
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

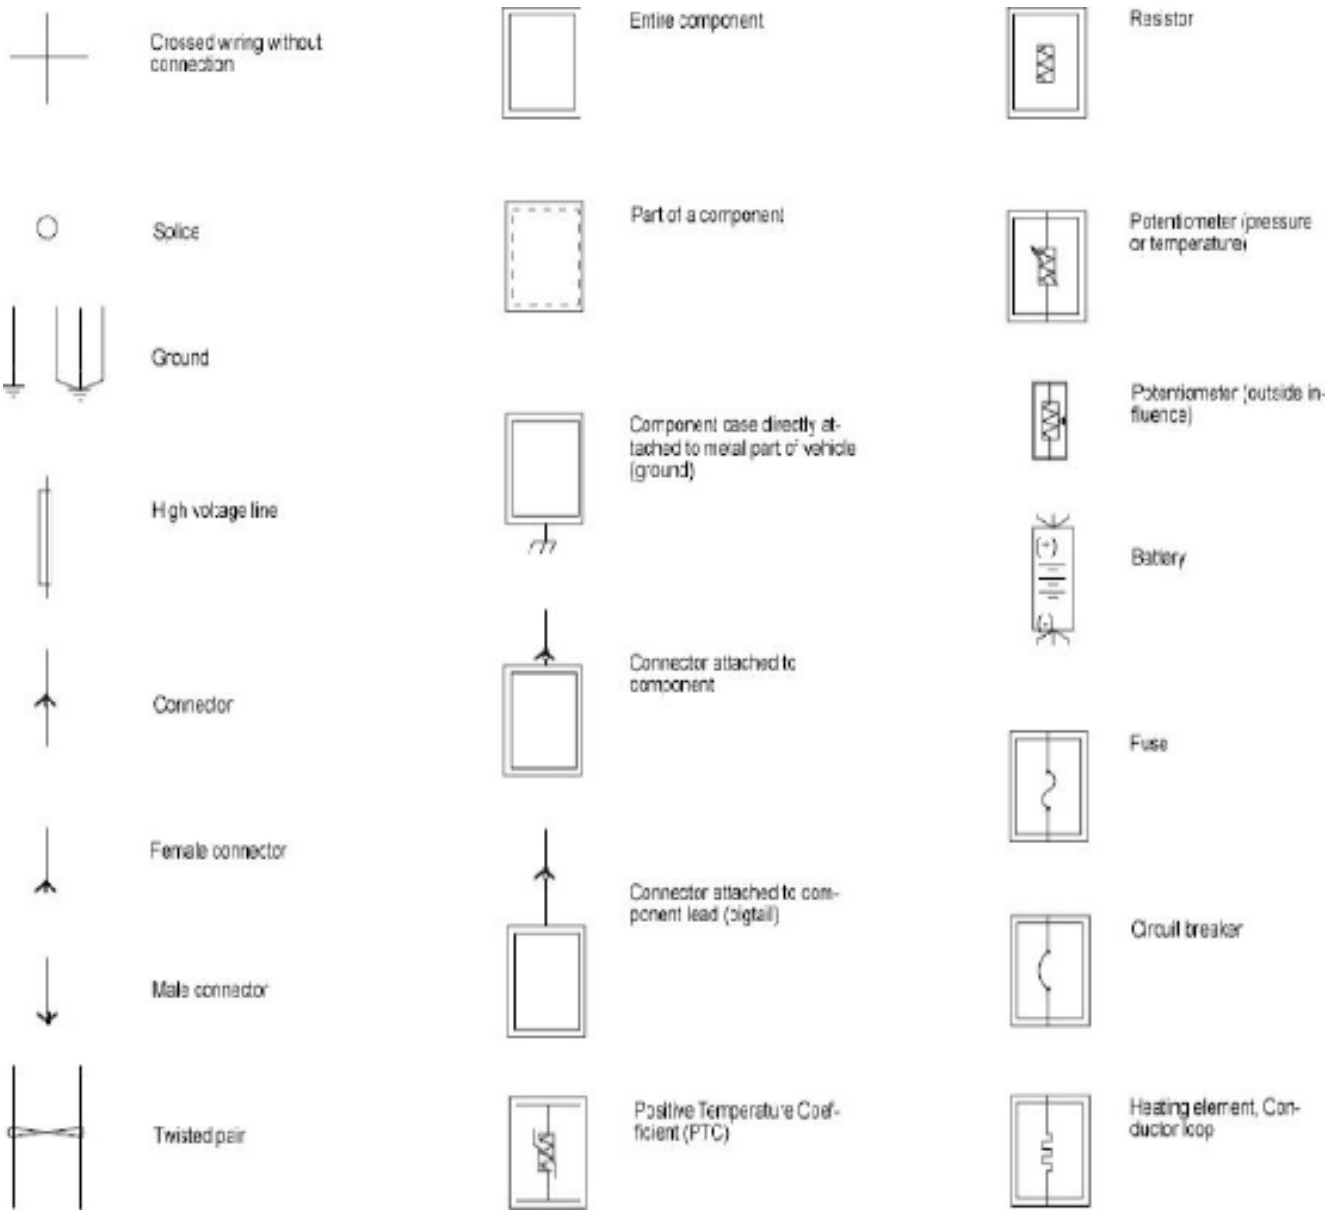
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

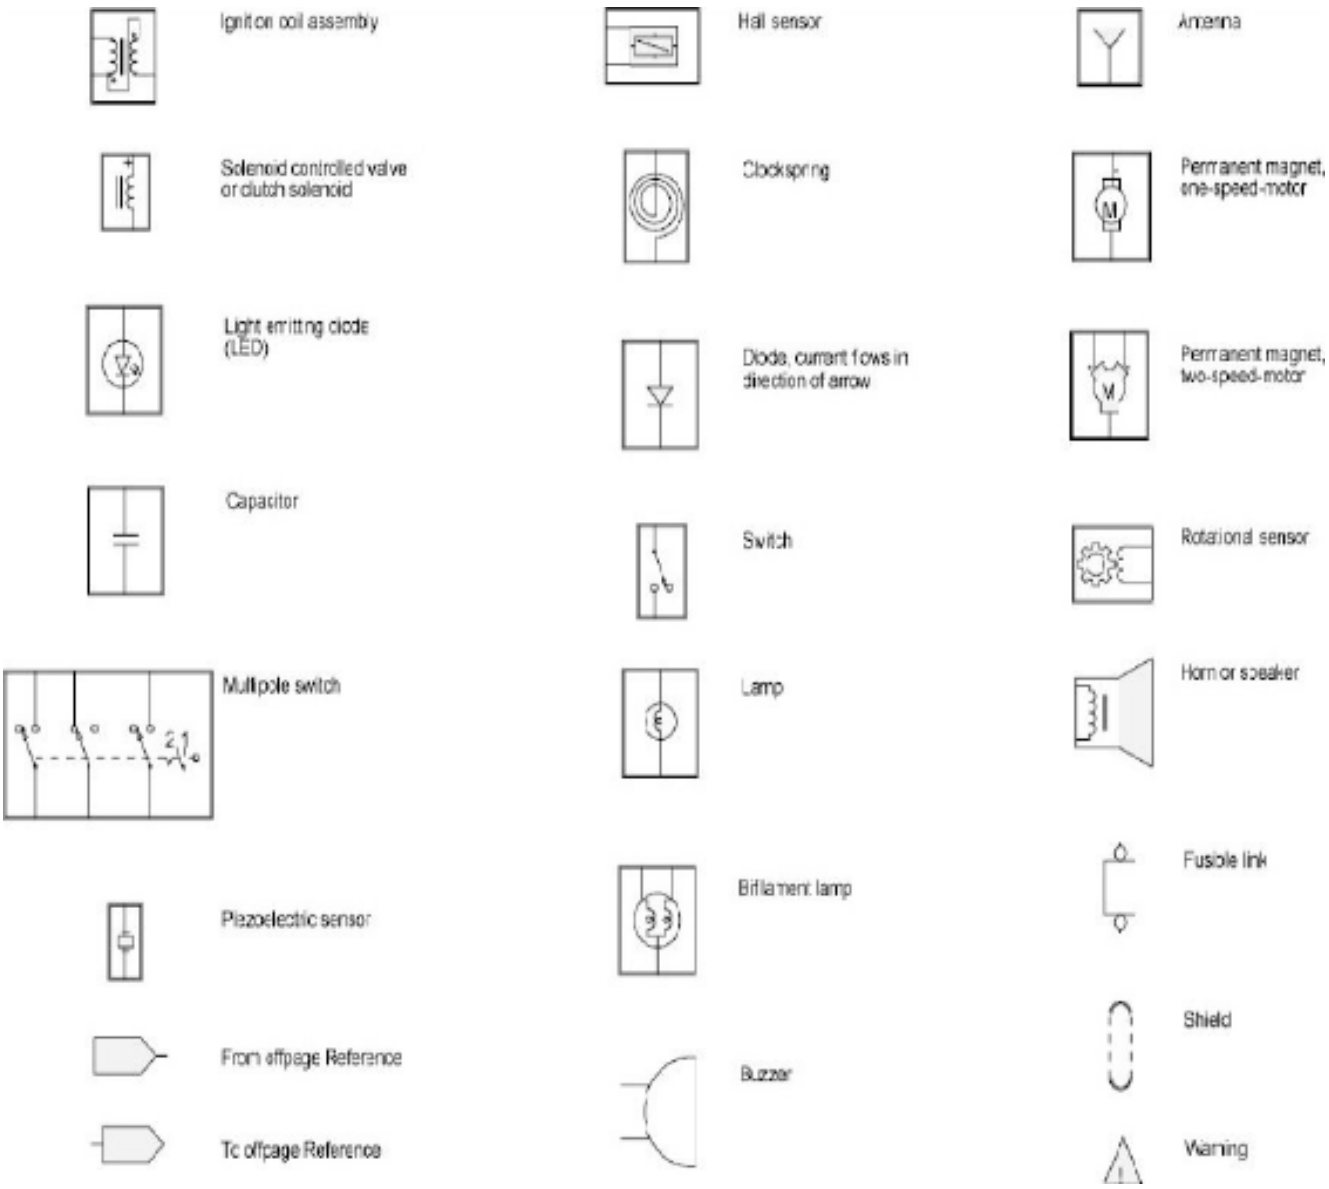
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

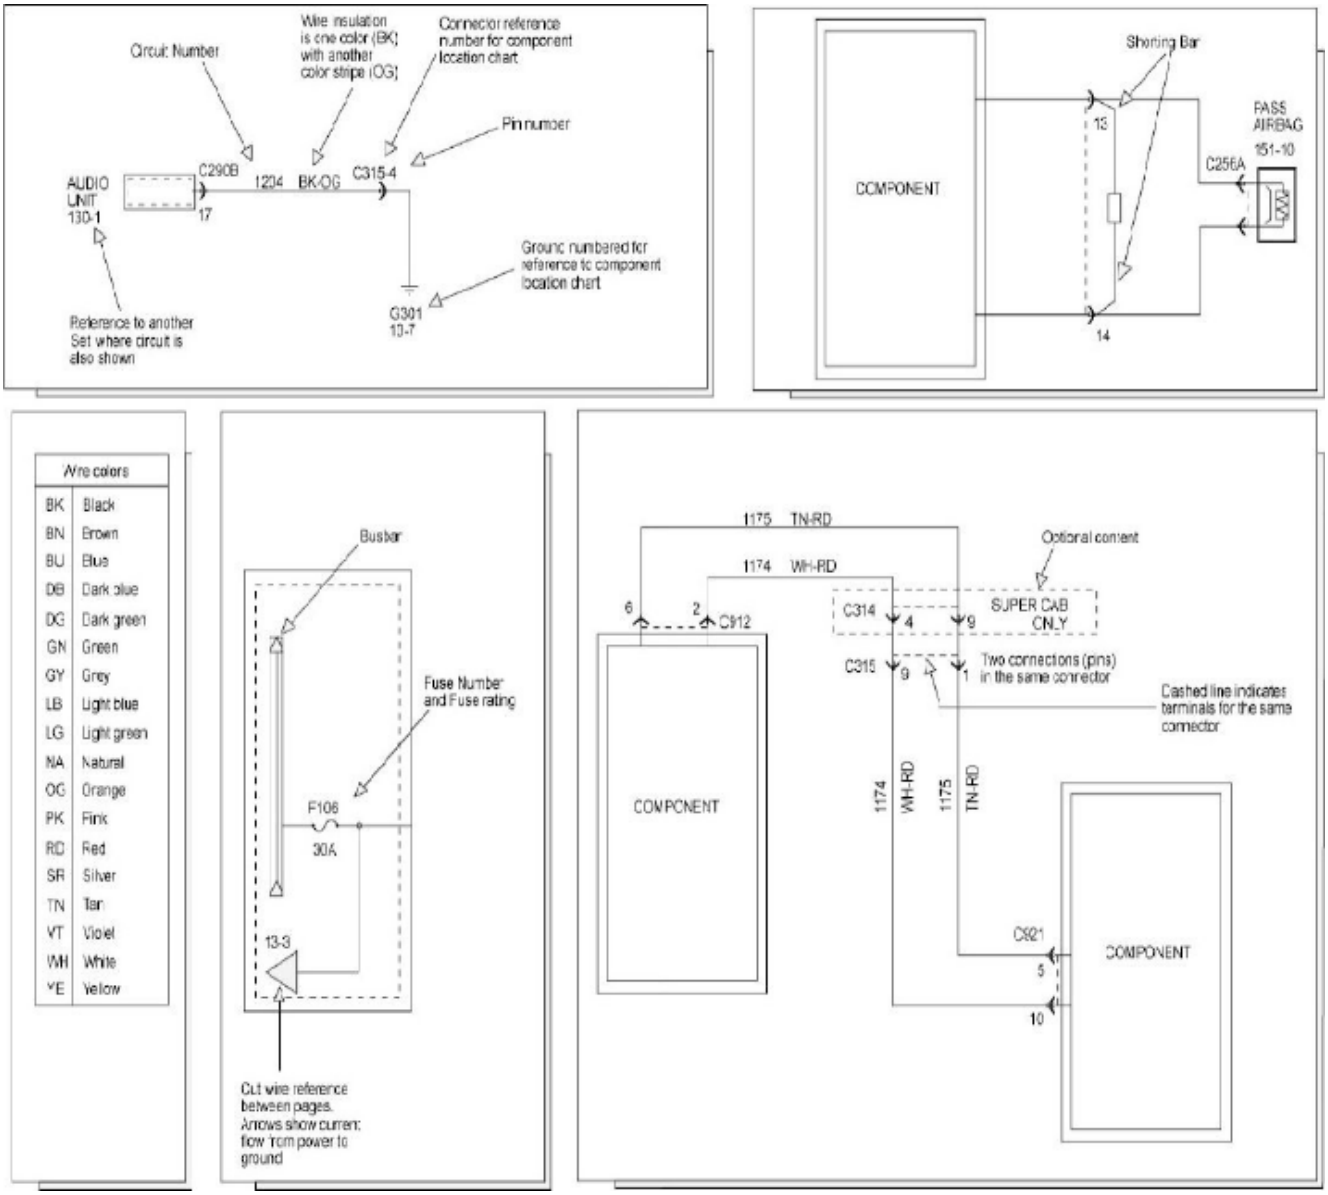
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

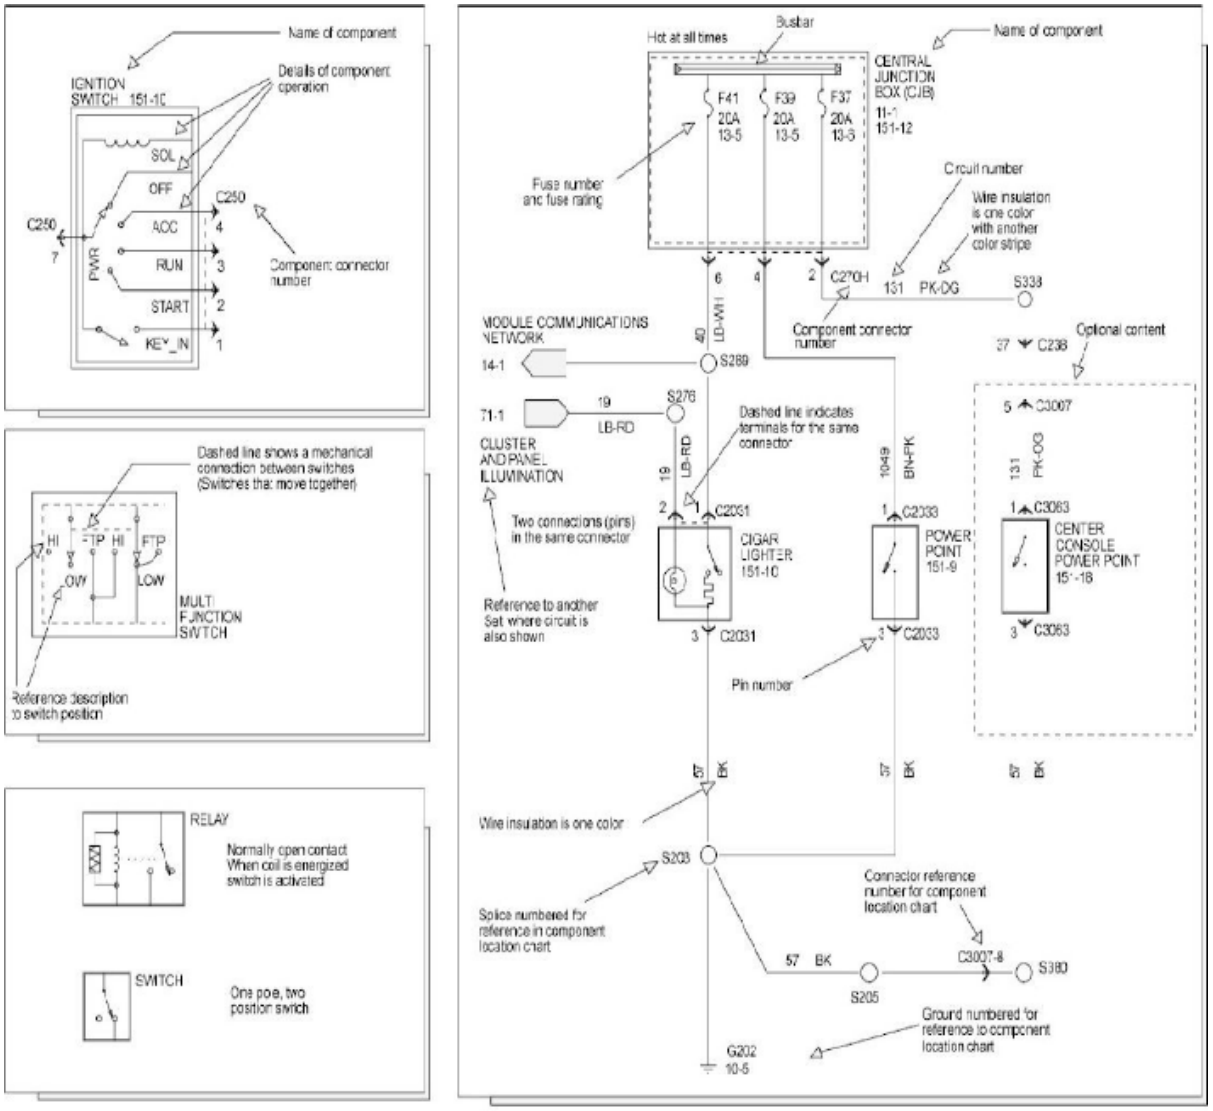
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left

Interior Lighting Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

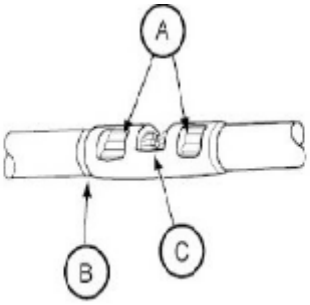
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

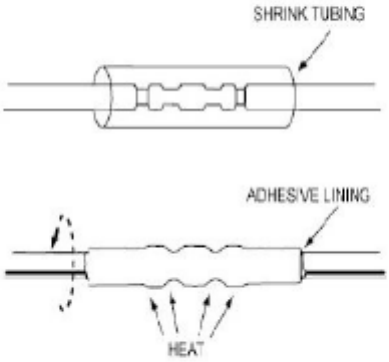
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4□ strip, cut 9 strands	* 1/4□ strip, cut 2 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip, fold 3x dia.
	16-14	* 1/4□ strip, cut 7 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip fold 2x dia	1□ strip, fold 3x dia.	1 1/4□ strip, fold 4x dia.	Not Recommended
	12-10	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip fold 3x cia.	1 1/4□ strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Figtail only

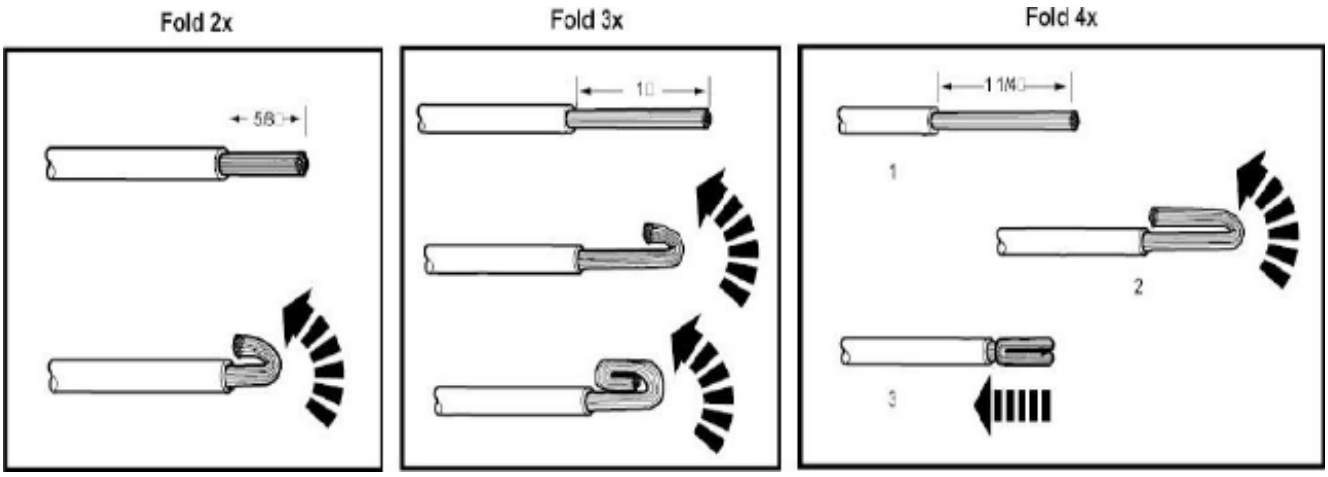
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



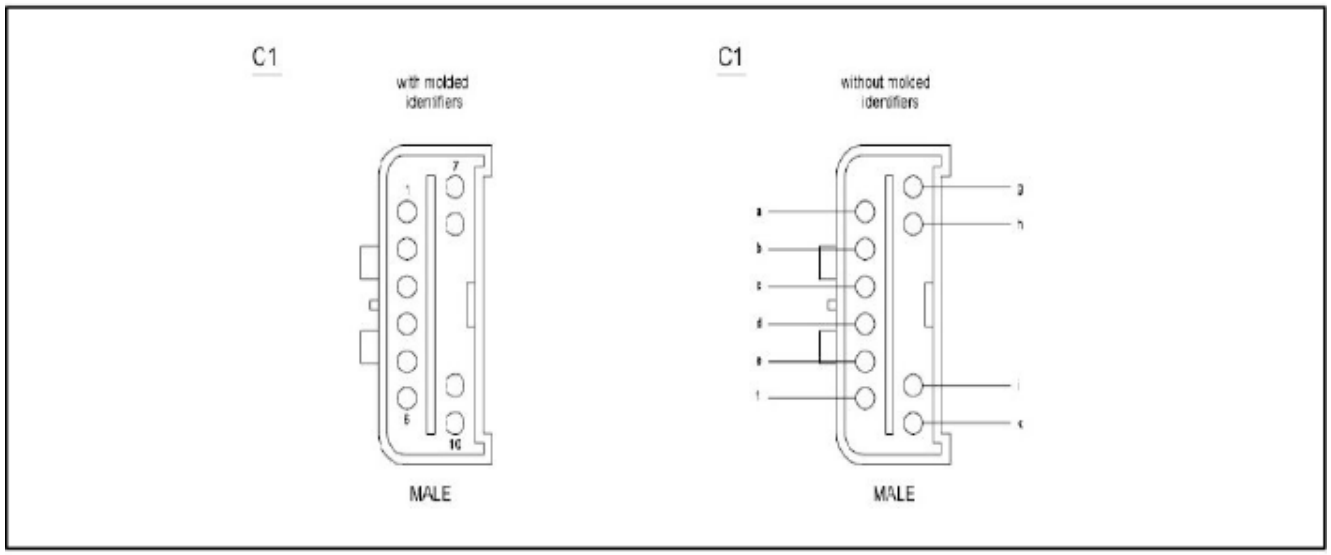
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step by step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



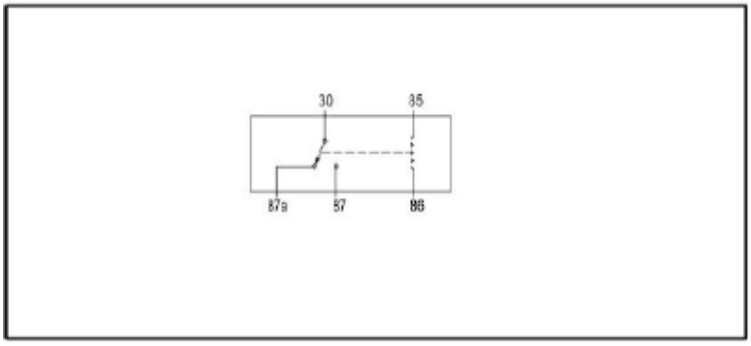
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

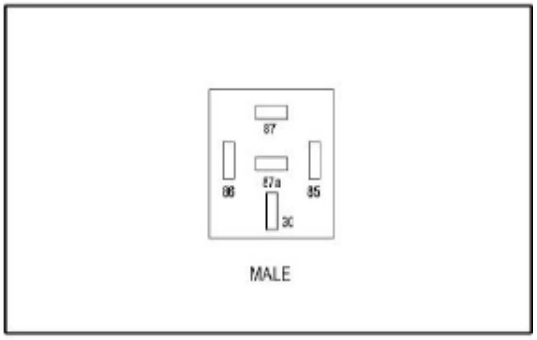
Interior Lighting Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step–by–step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals

License Plate Lamp: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

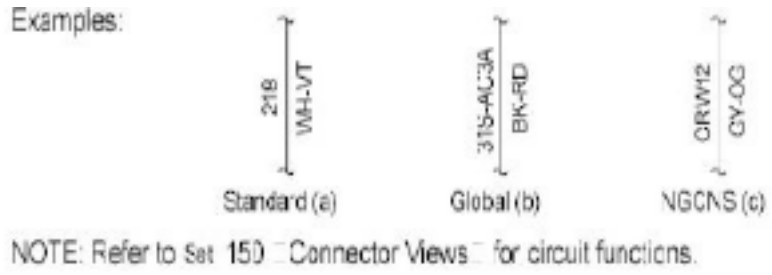
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

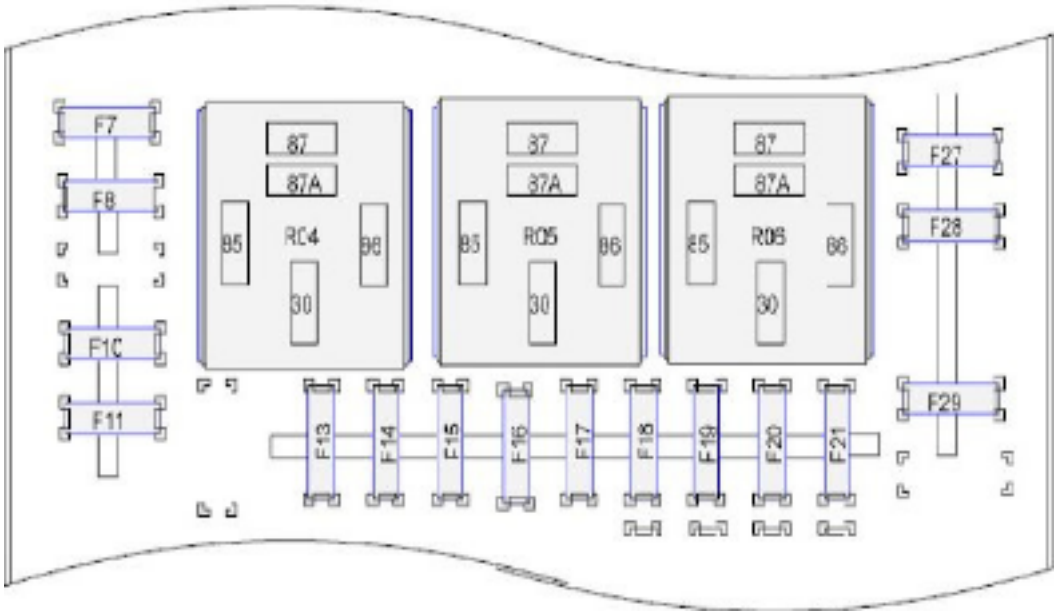
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

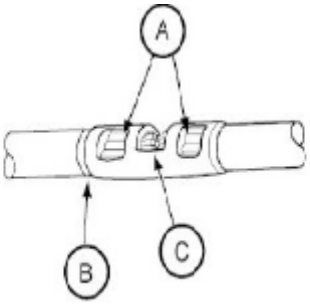
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

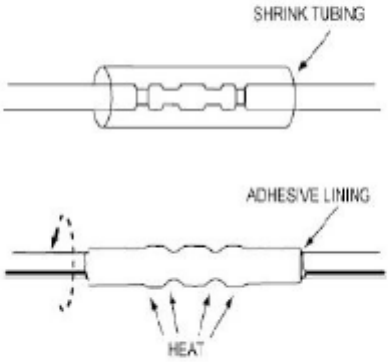
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x cia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Figtail only

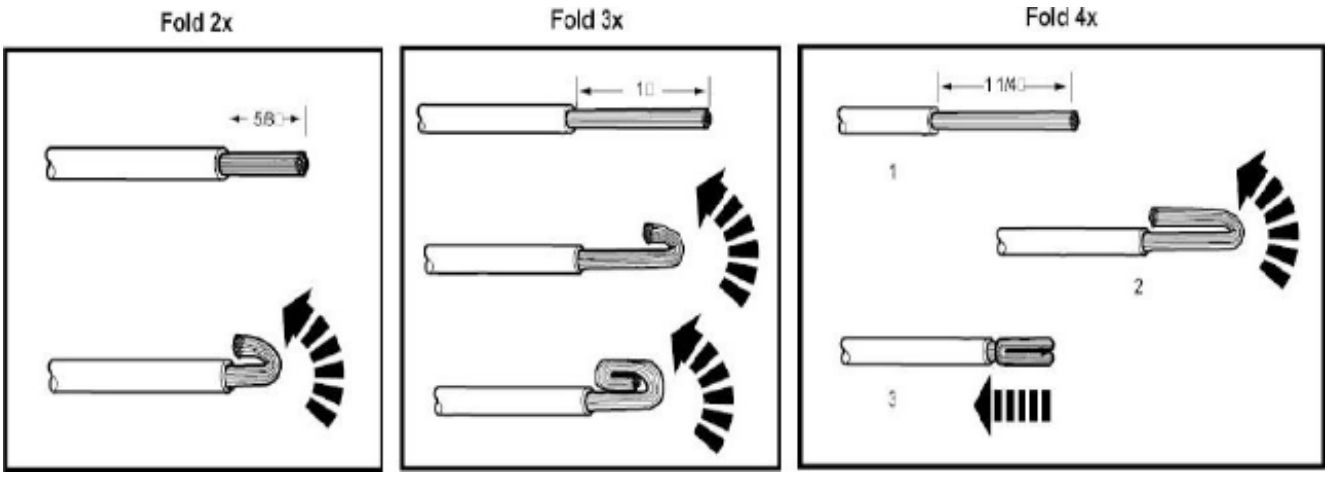
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Marker Lamp: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

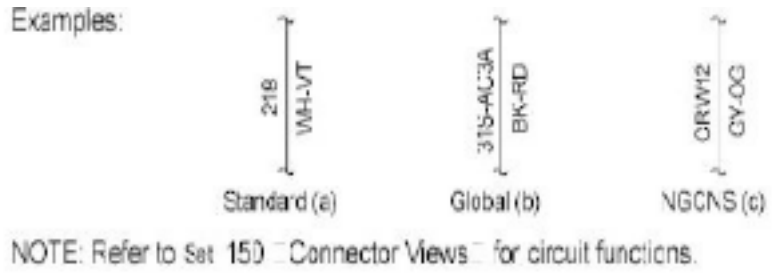
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

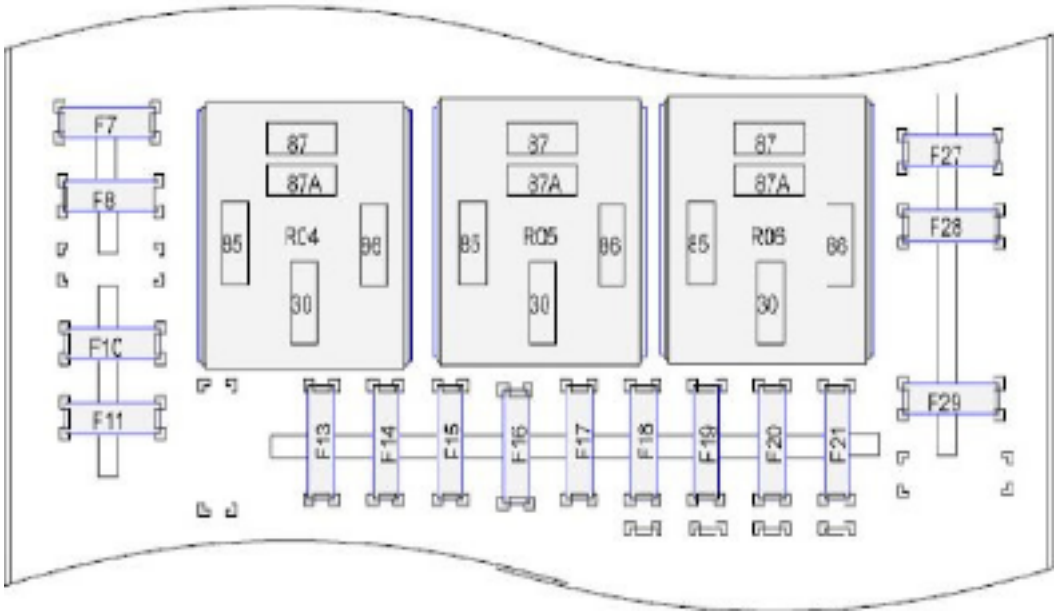
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

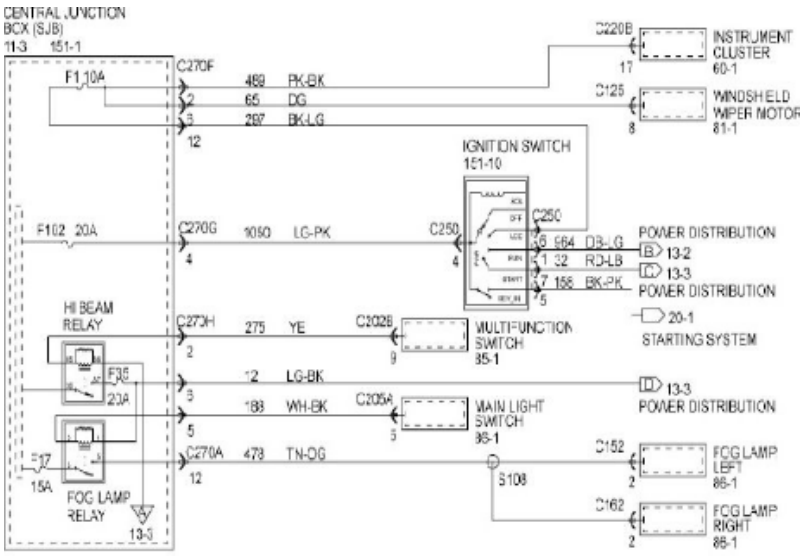
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

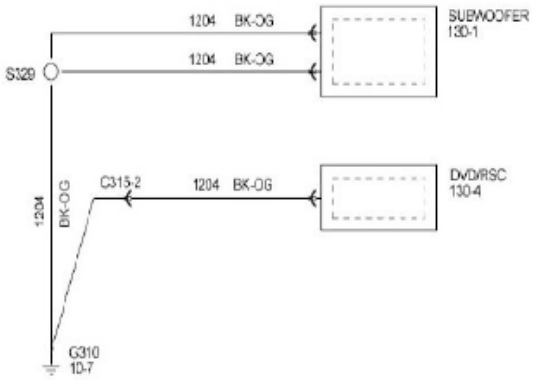
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

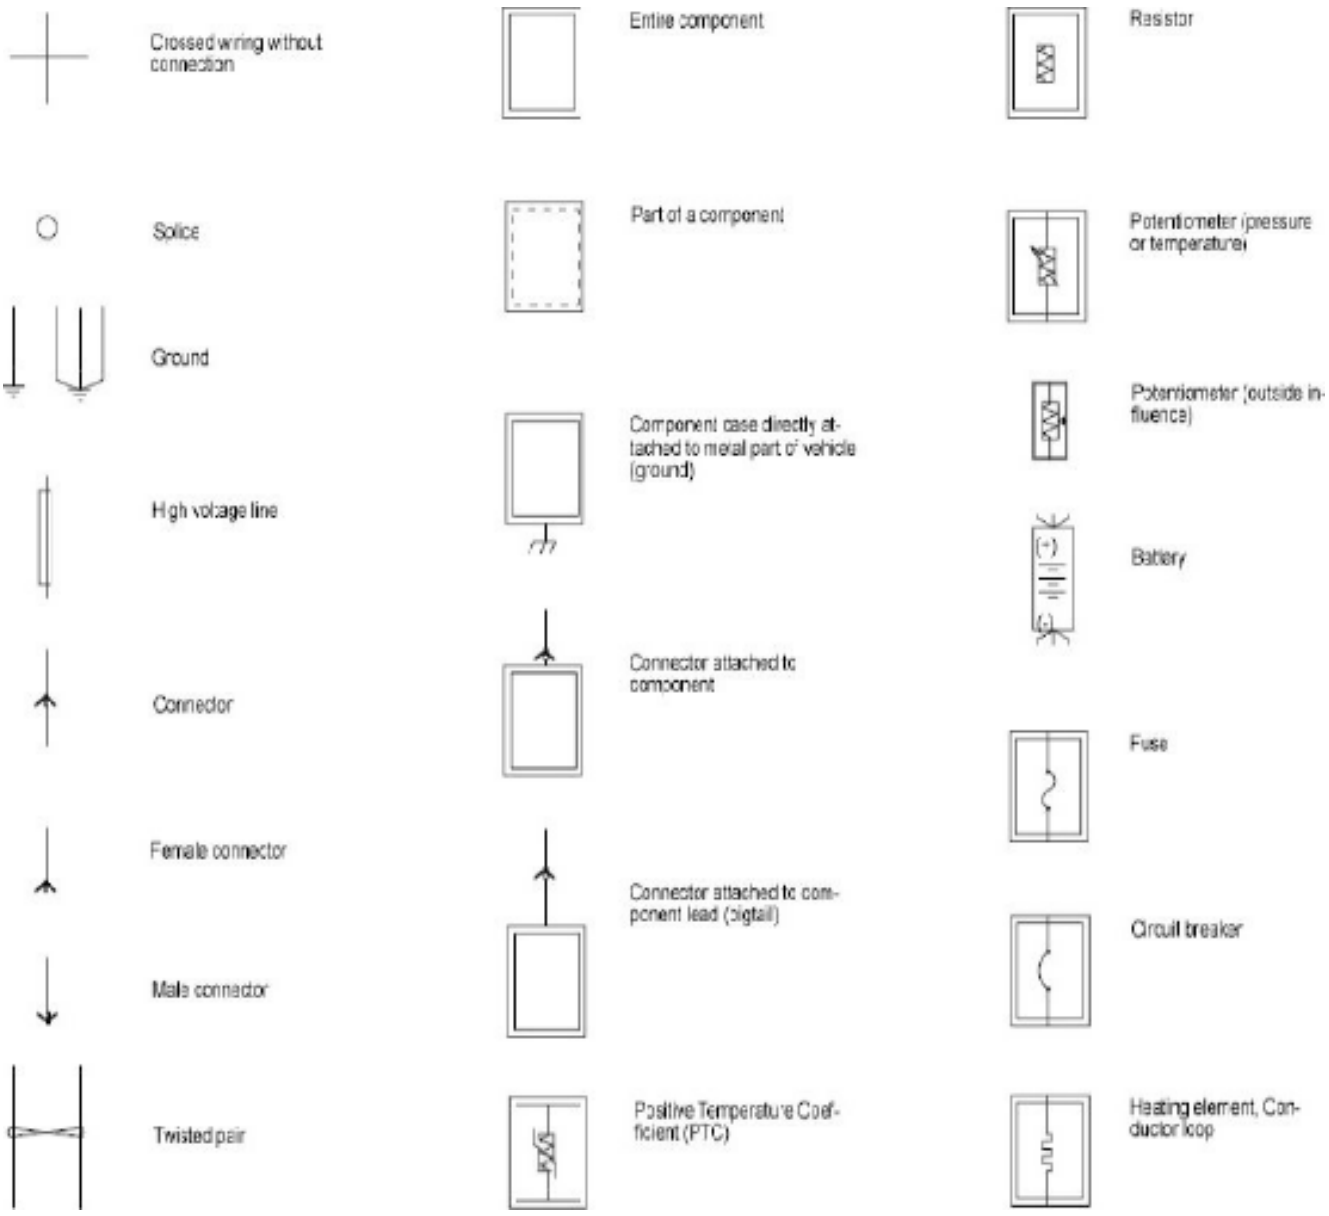
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

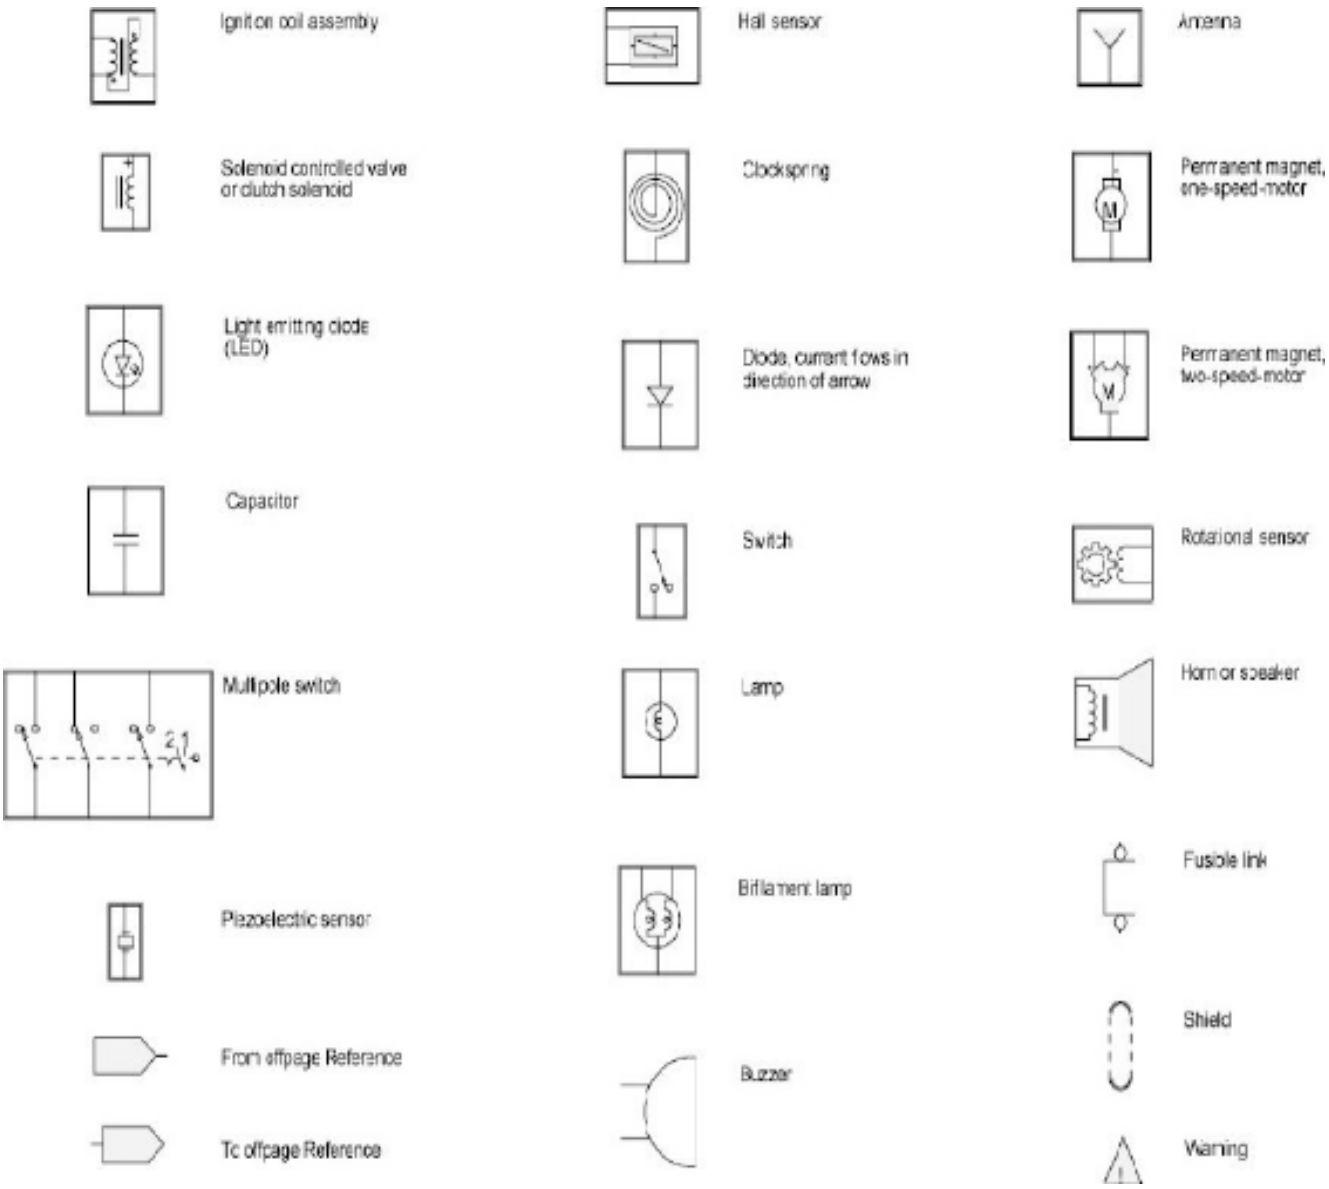
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

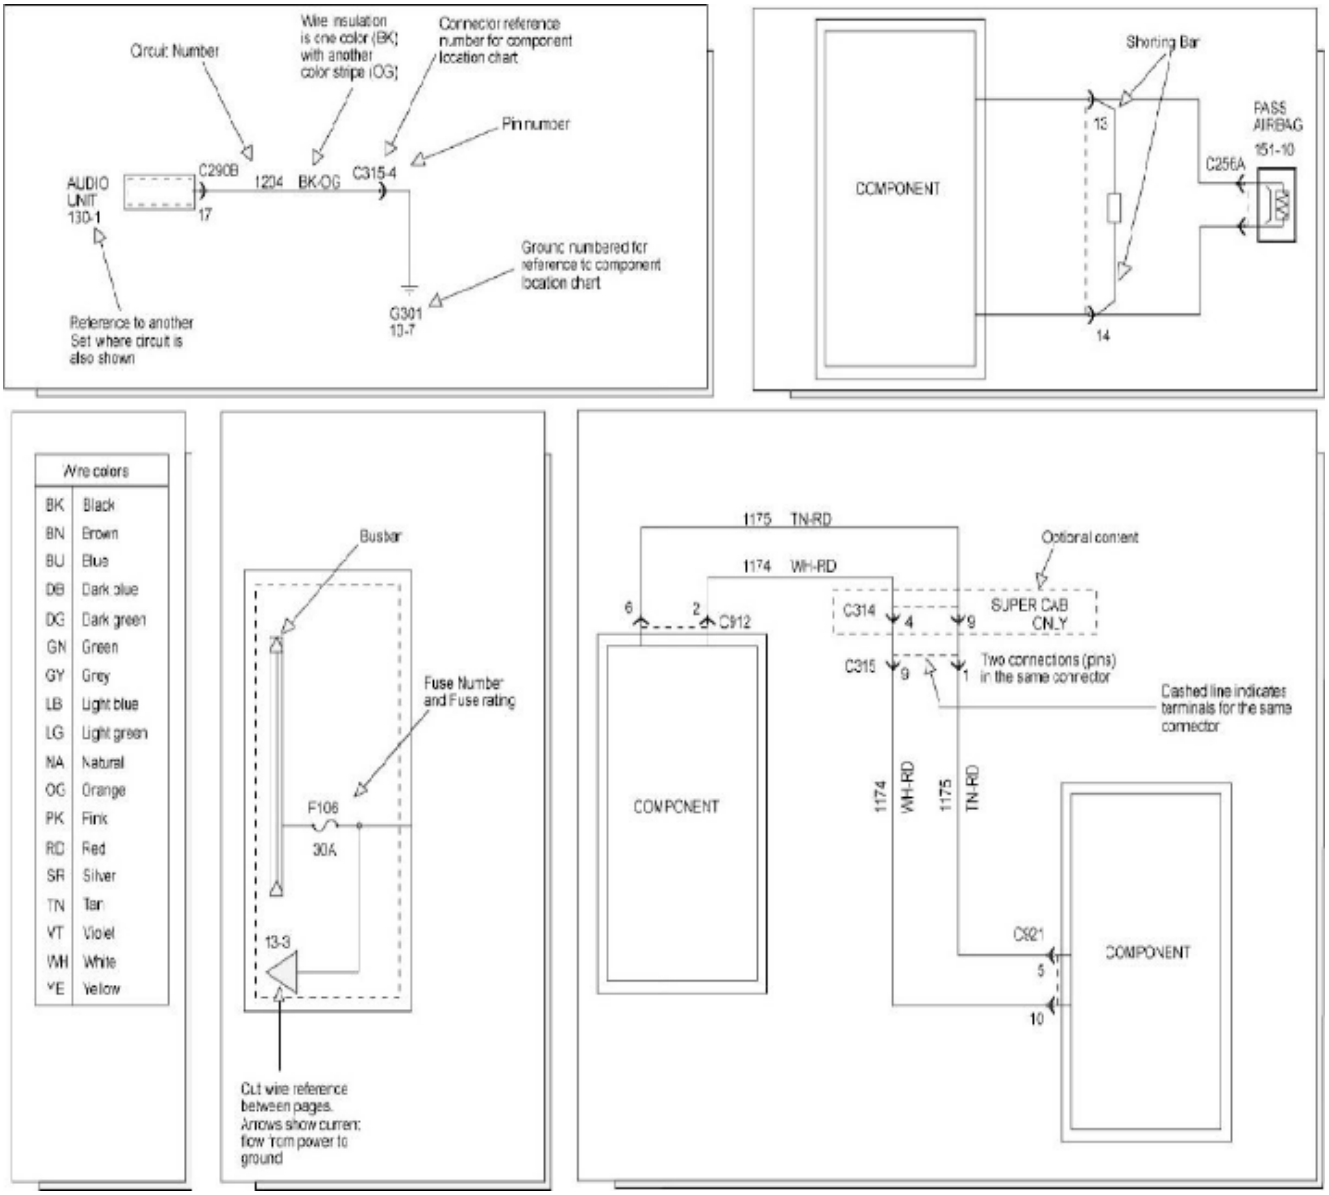
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

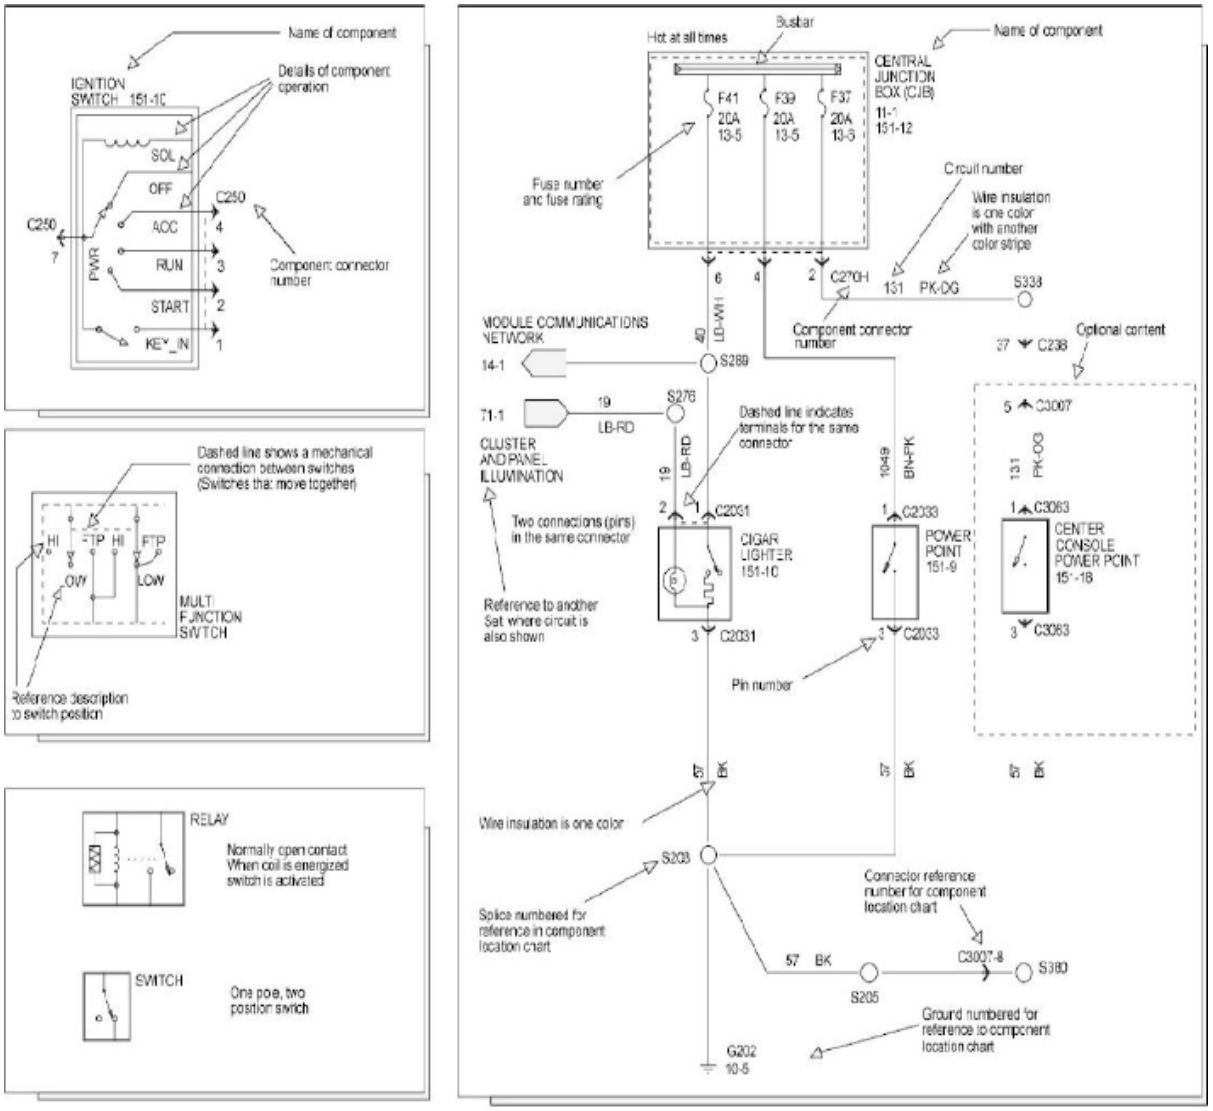
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Marker Lamp: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

4 = Circuit insulation

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

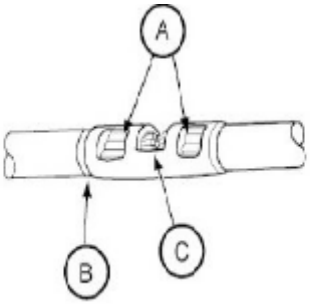
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

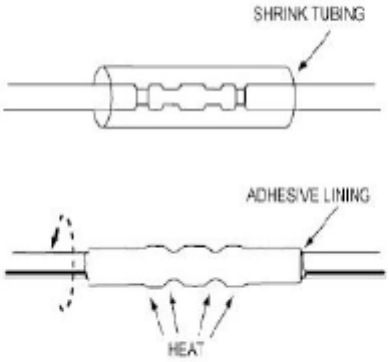
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4□ strip, cut 9 strands	* 1/4□ strip, cut 2 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip, fold 3x dia.
	16-14	* 1/4□ strip, cut 7 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip fold 2x dia	1□ strip, fold 3x dia.	1 1/4□ strip, fold 4x dia.	Not Recommended
	12-10	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip fold 3x cia.	1 1/4□ strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Figtail only

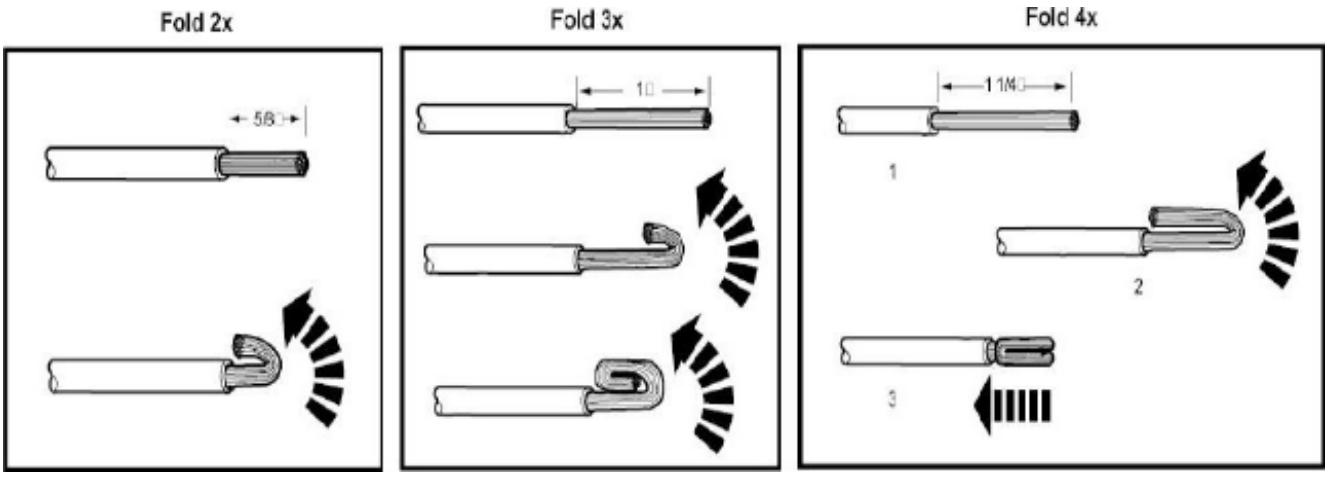
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

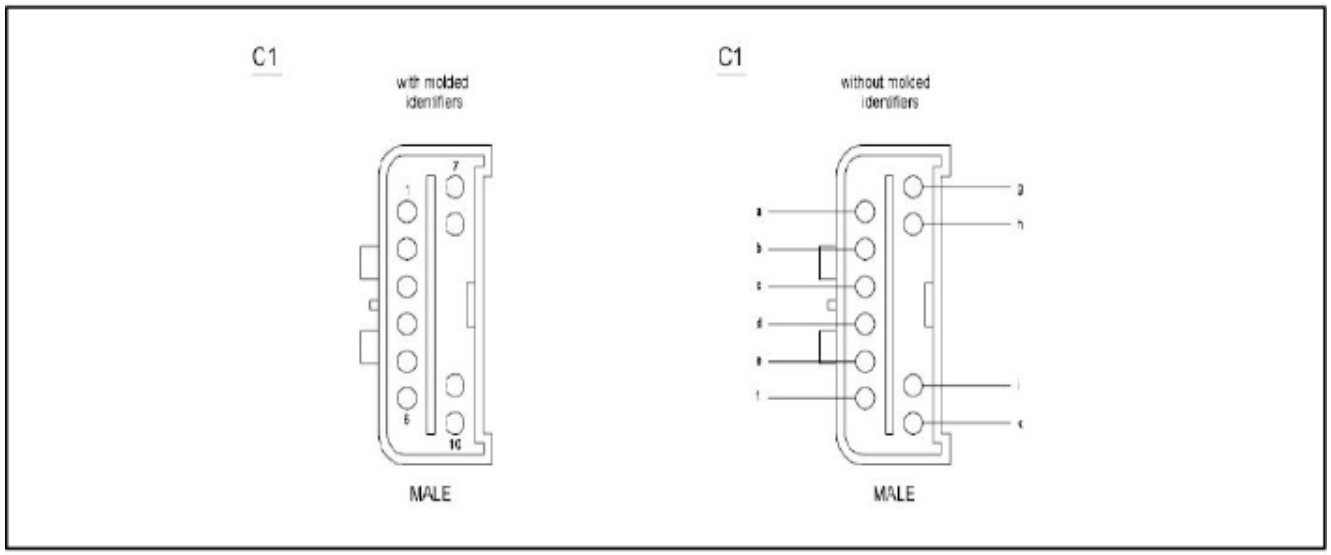
Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



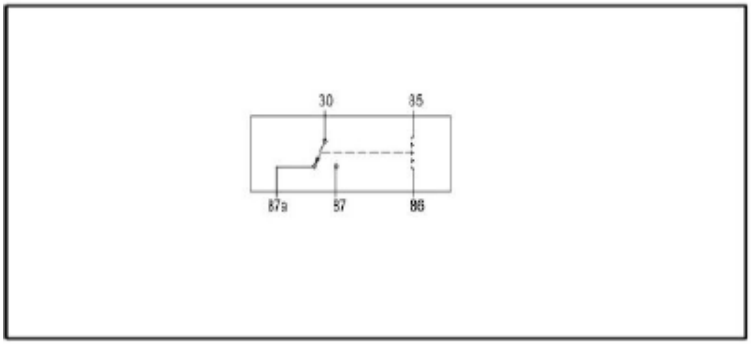
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

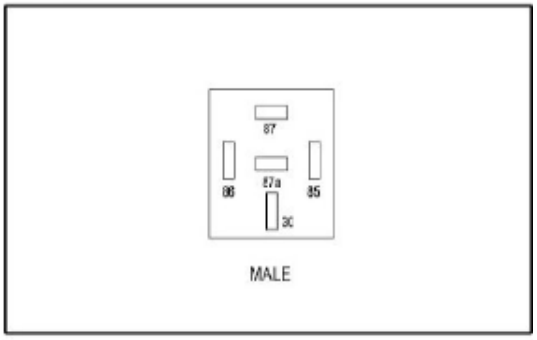
Parking Lamp Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 □ 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step–by–step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals

	1 and 5	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 2 and 3 to 12V DC power and pin 1 to ground. Measure voltage between pin 5 and pin 1. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 2 and measure voltage between pin 4 and pin 1. If the voltage is 12V, the relay is okay. If not, replace the relay.

Battery Discharge Protection Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

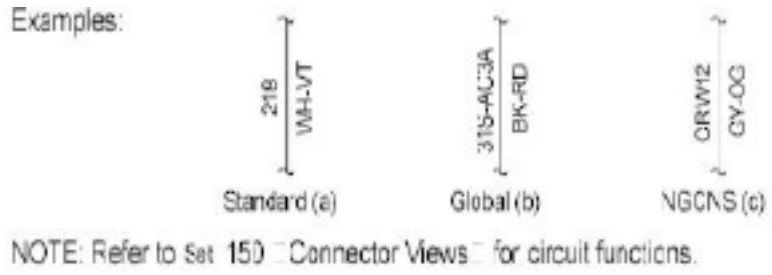
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

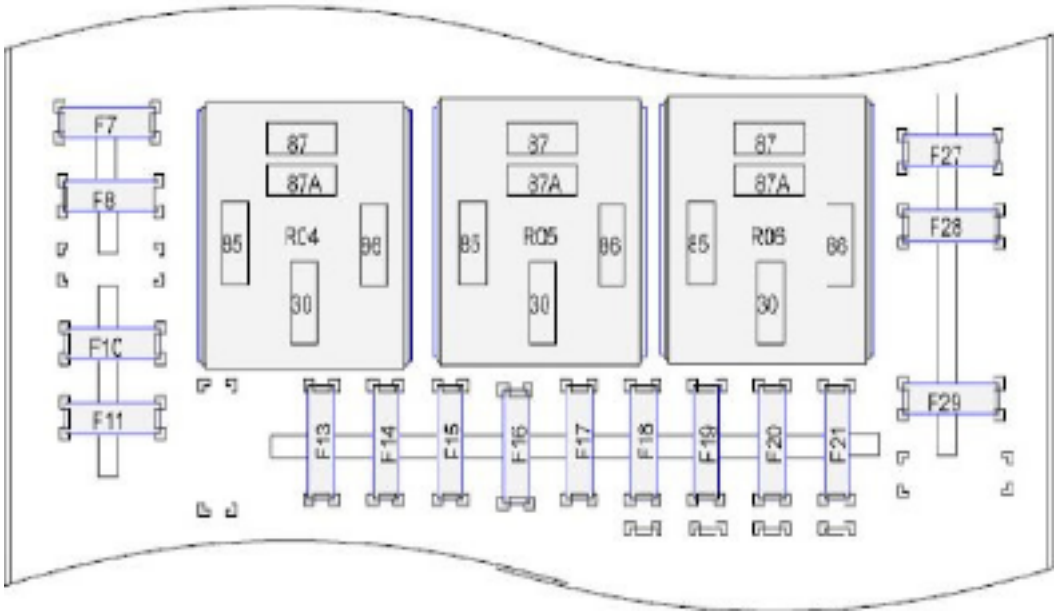
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

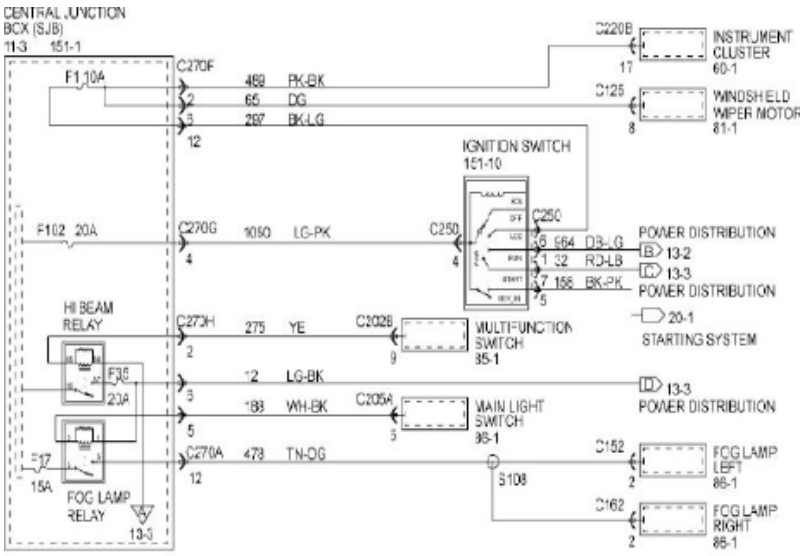
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

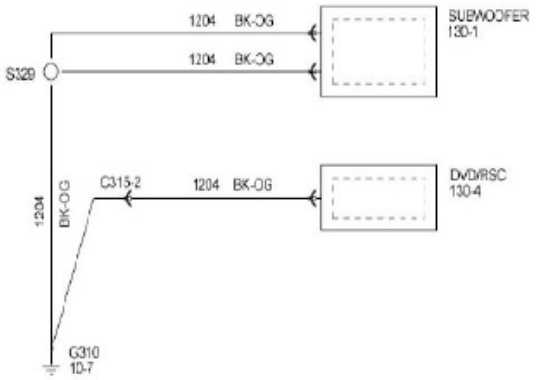
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

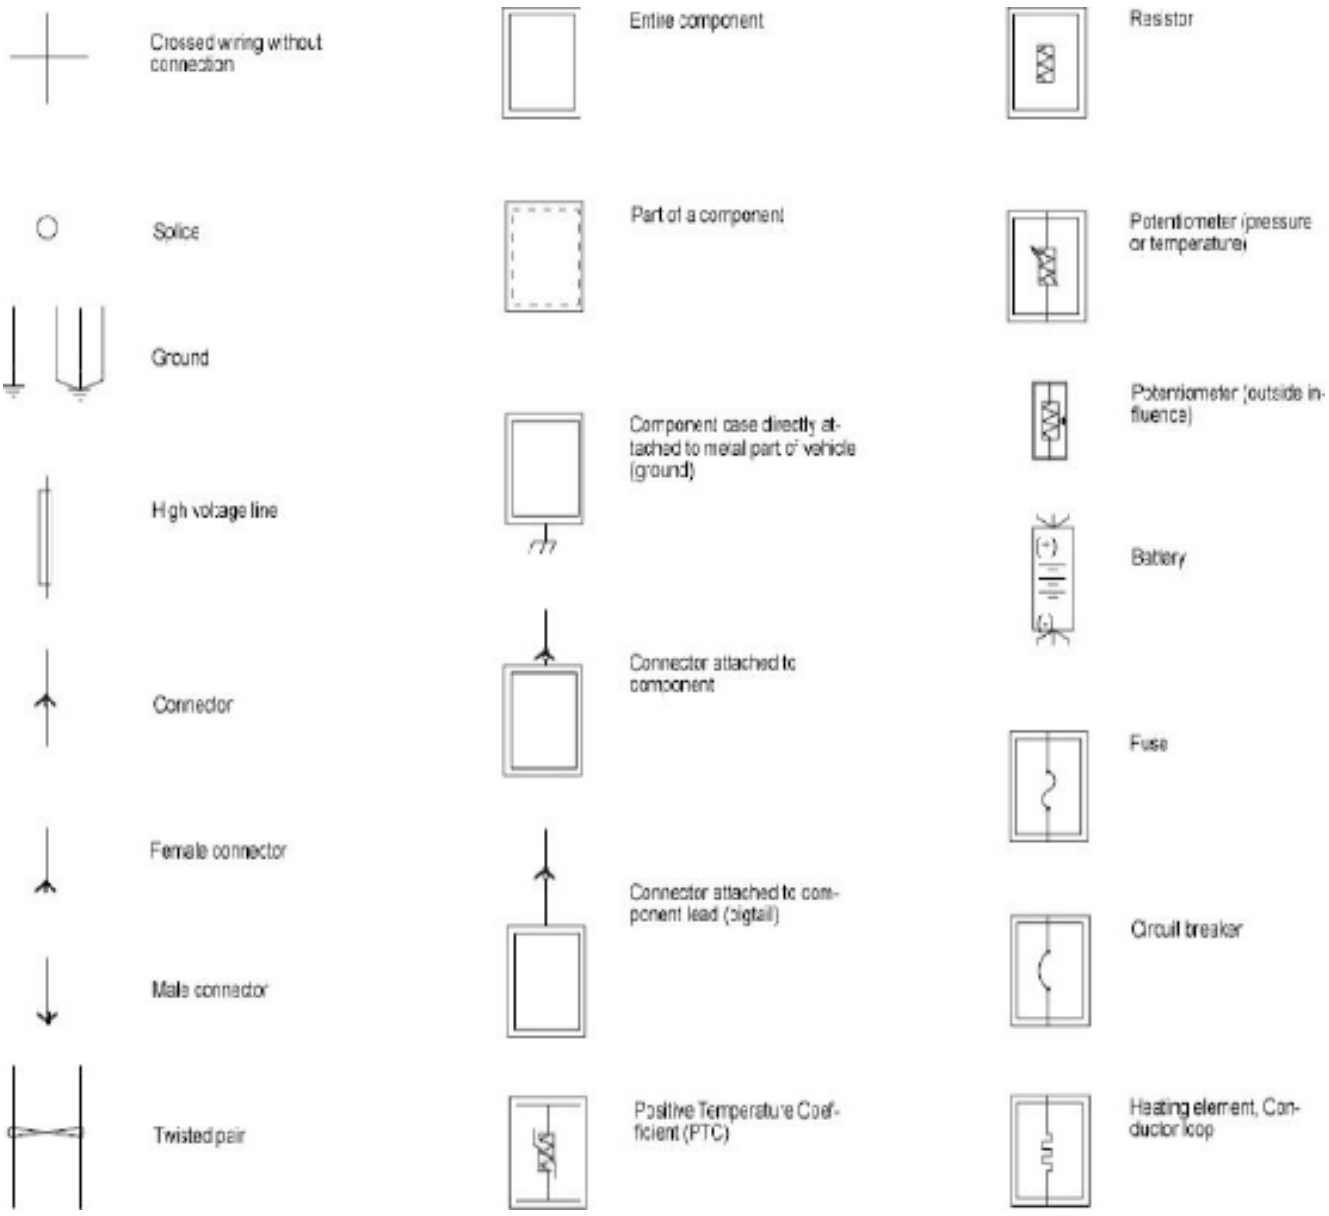
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

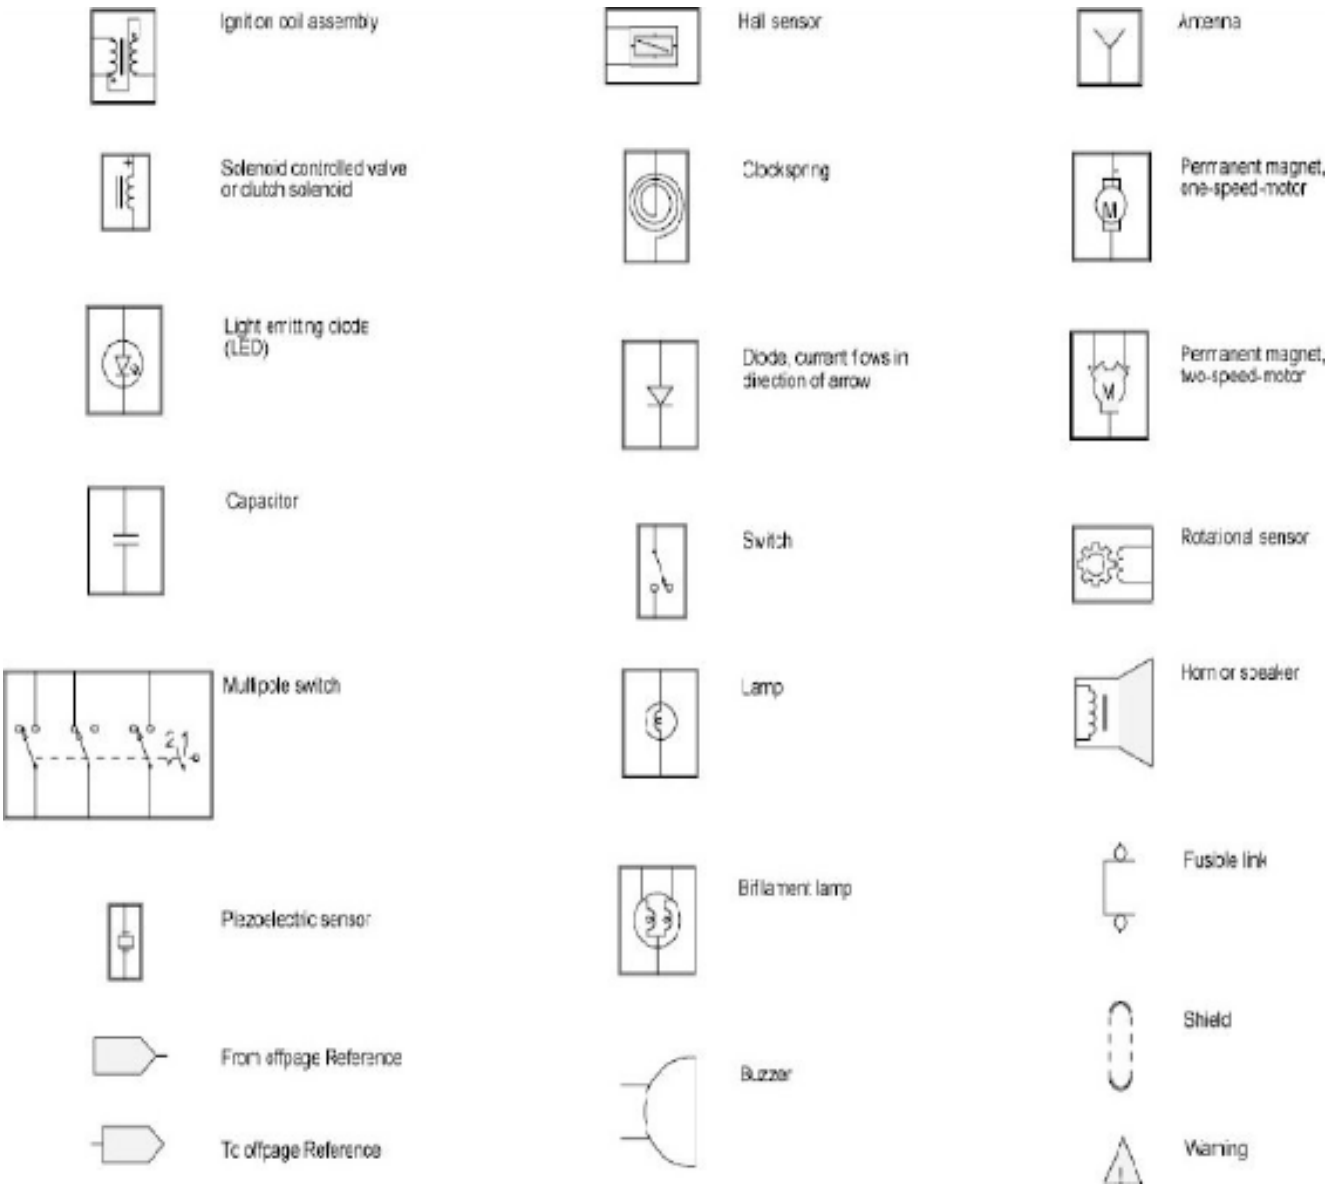
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

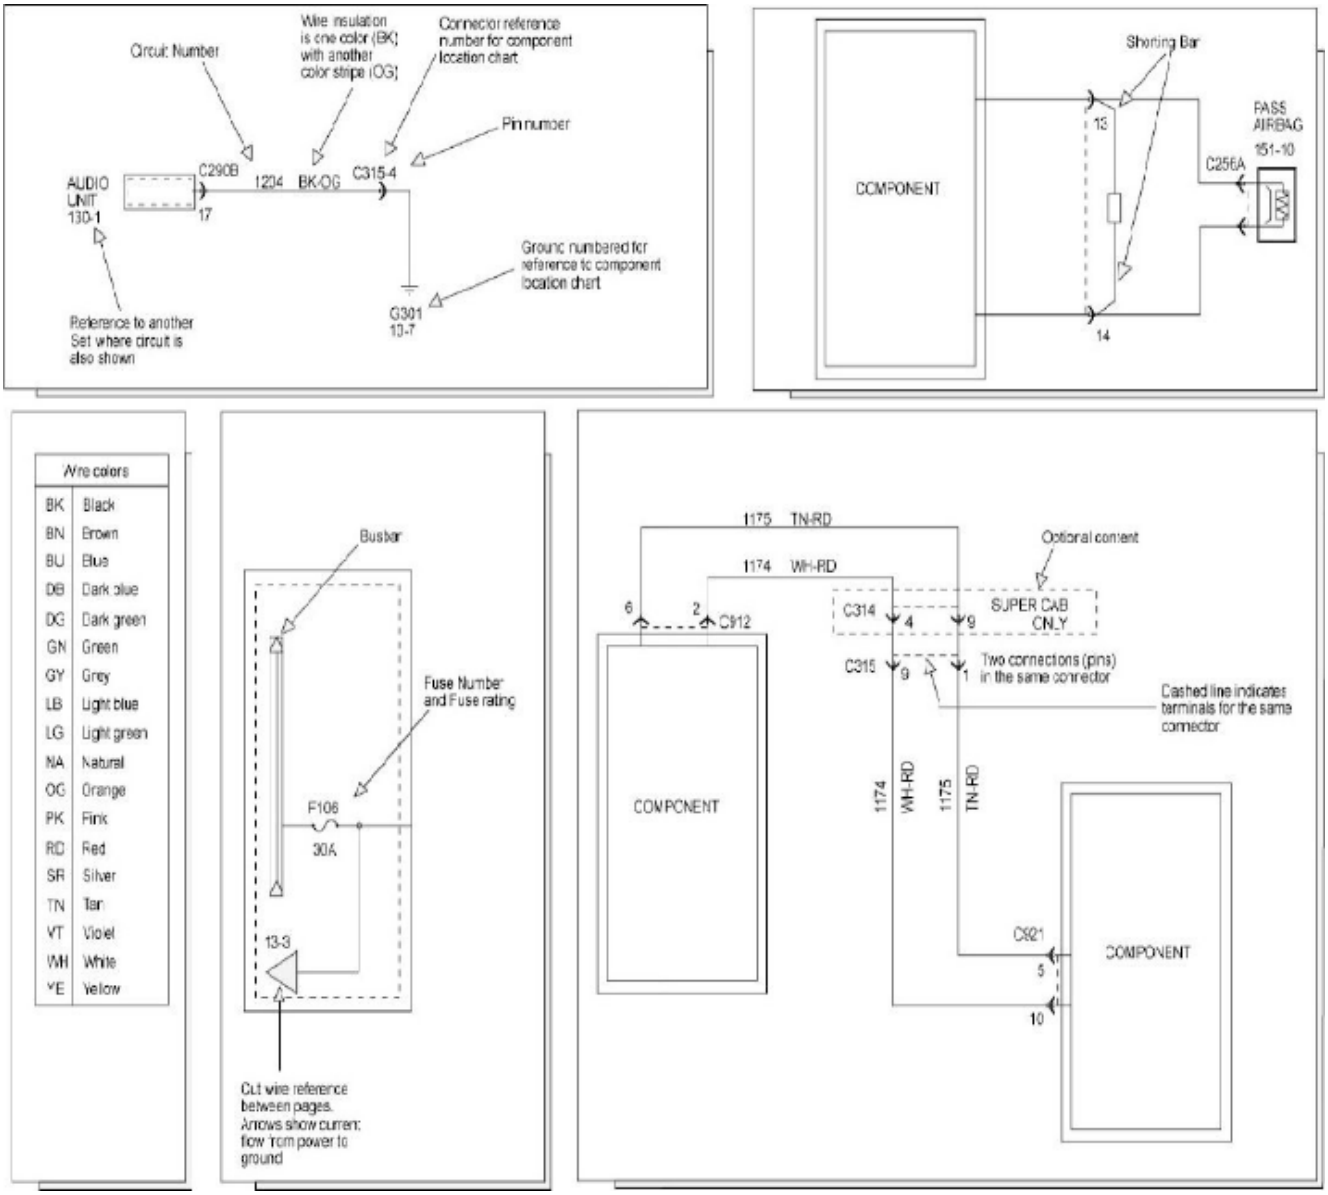
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

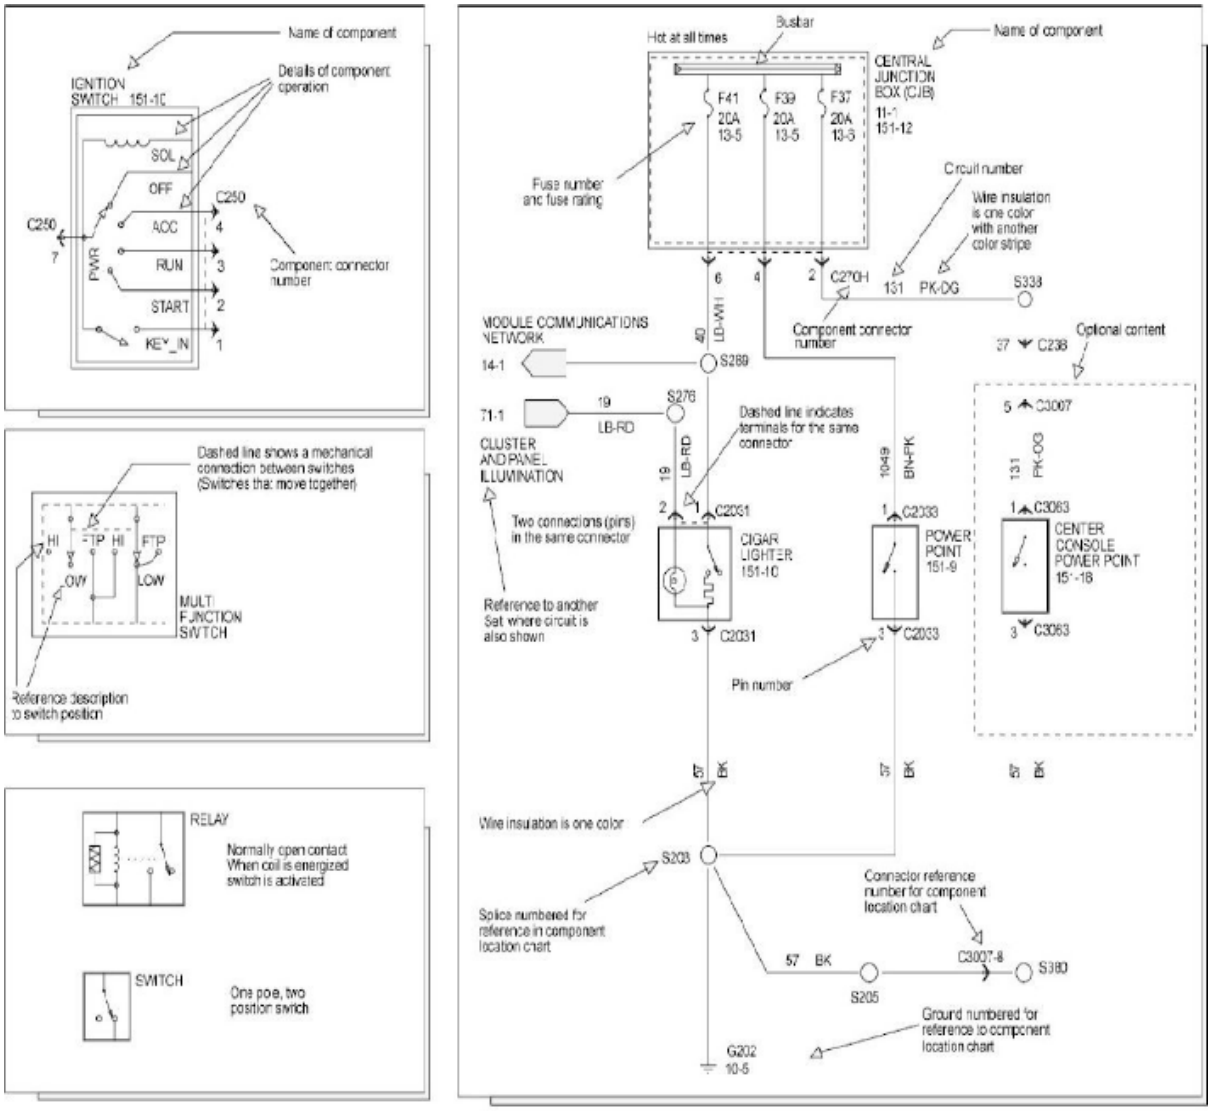
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left

Battery Discharge Protection Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

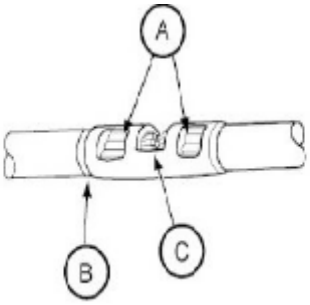
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

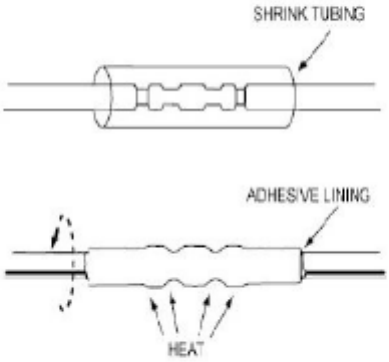
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x dia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

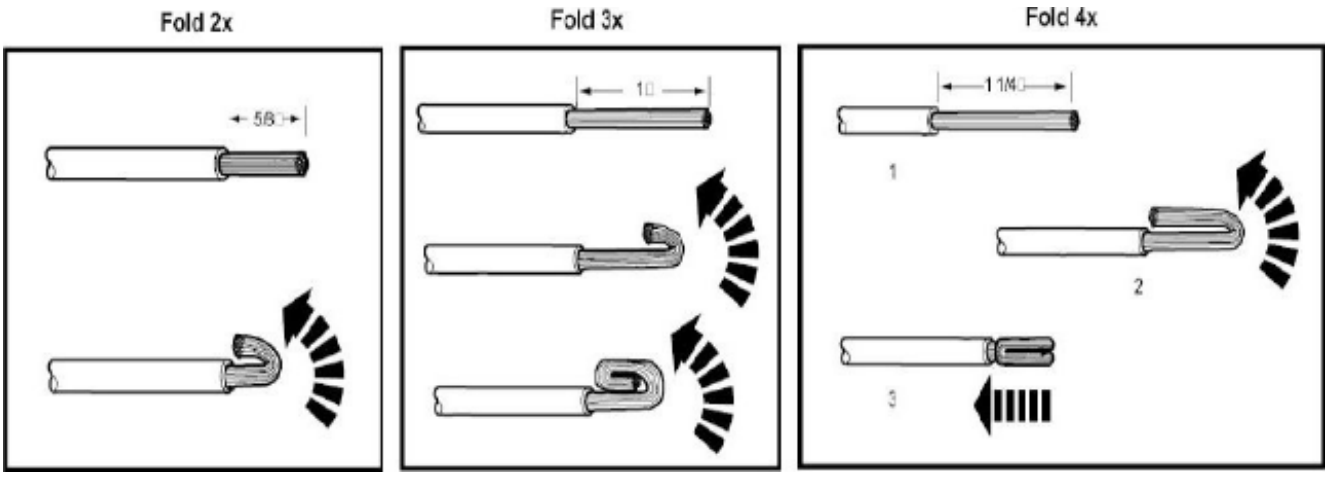
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



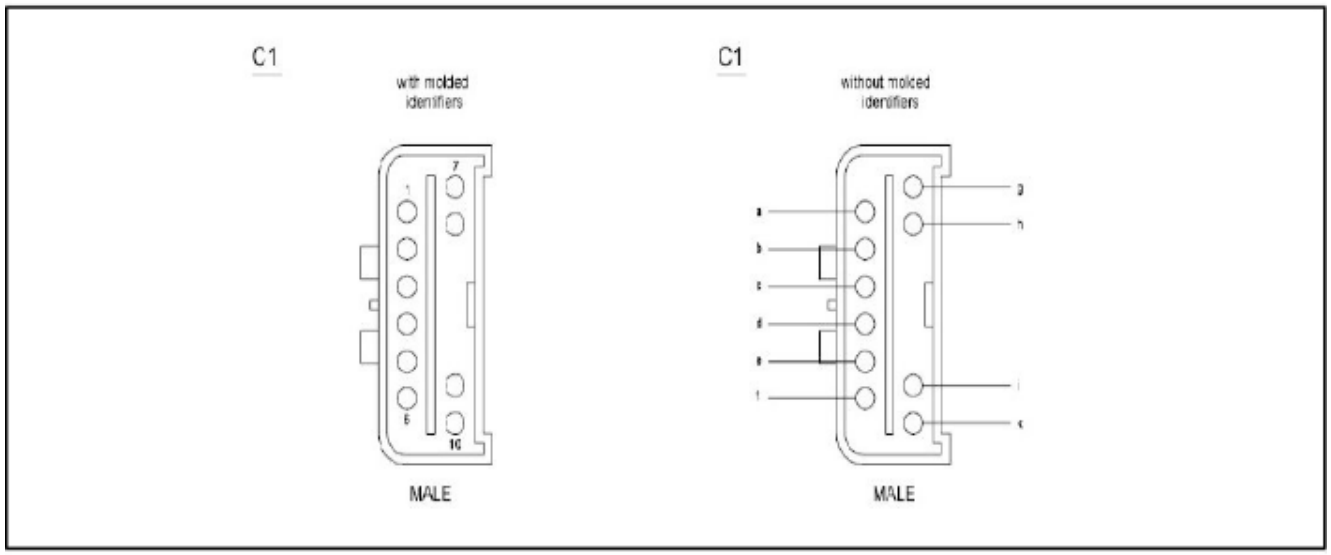
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

Fog/Driving Lamp Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

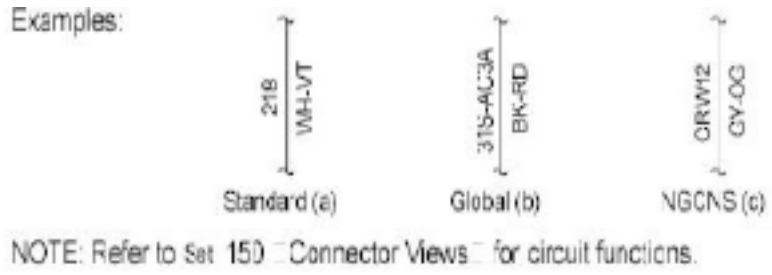
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

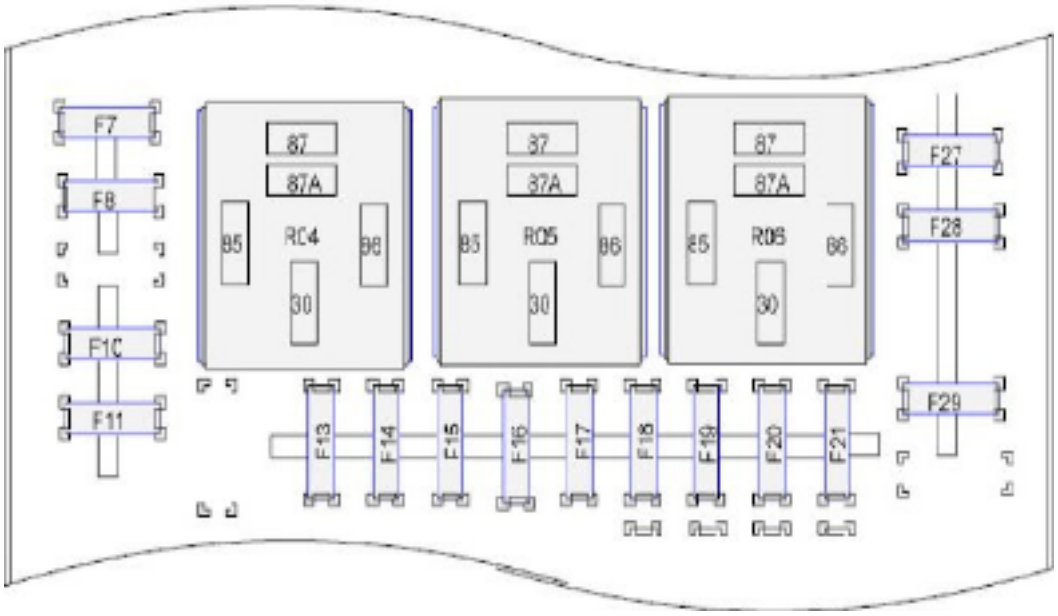
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

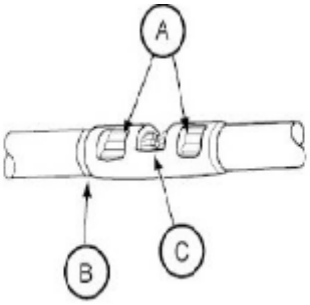
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

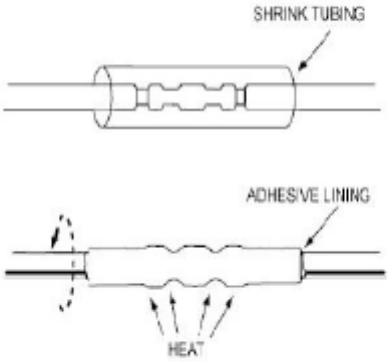
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x cia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Figtail only

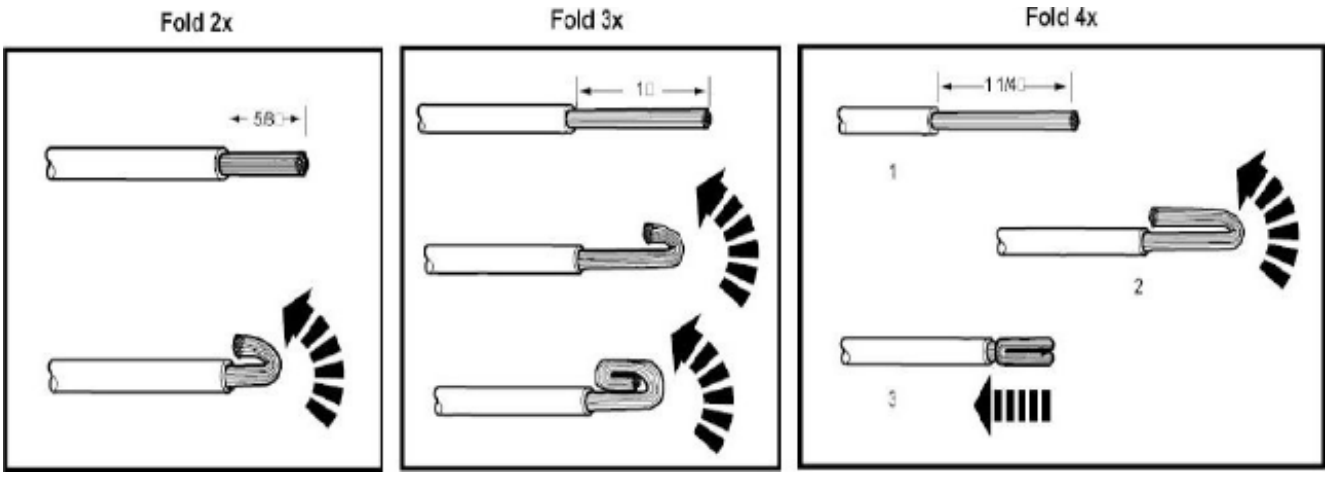
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



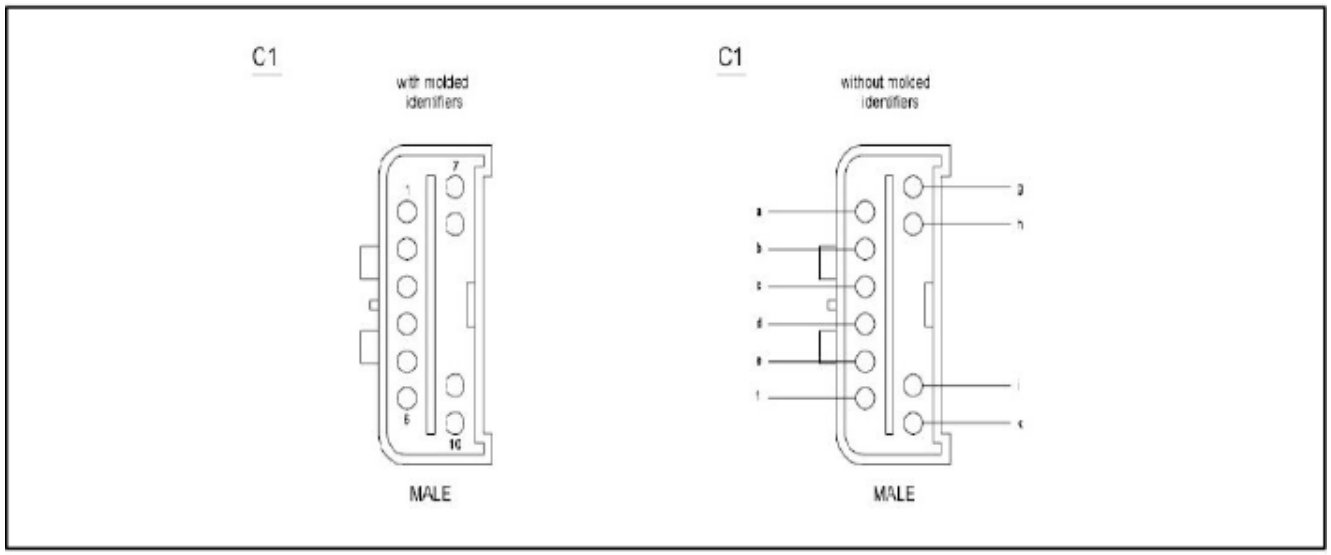
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



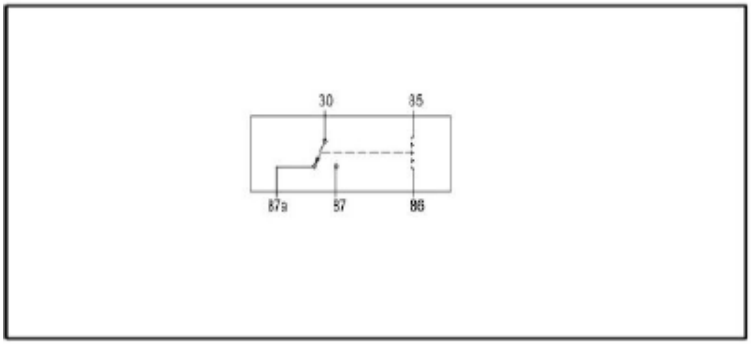
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

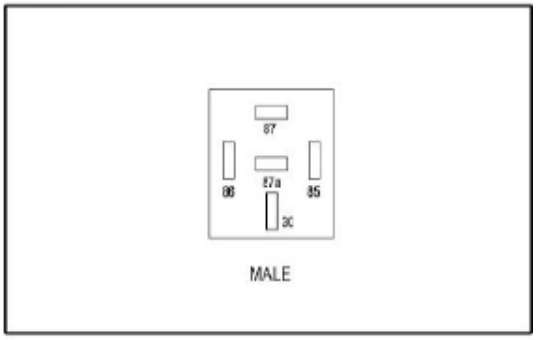
Fog/Driving Lamp Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Hazard Flasher Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

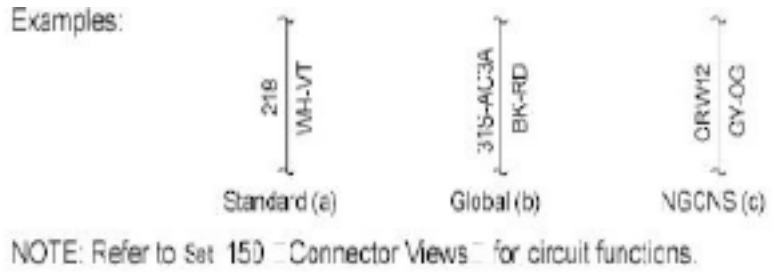
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

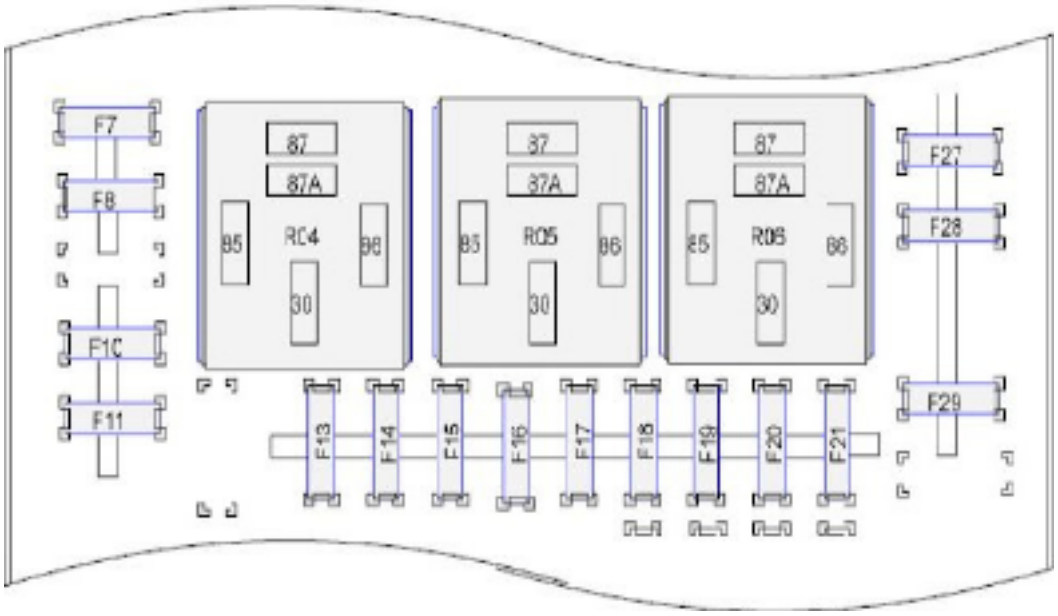
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

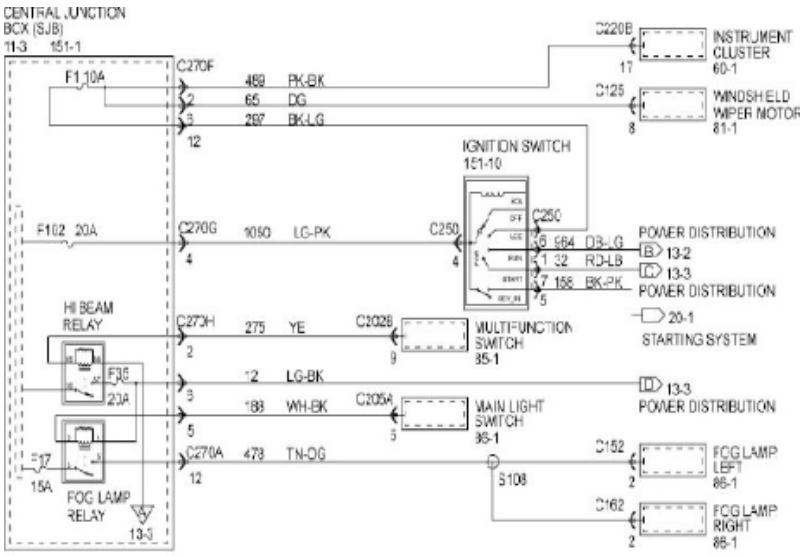
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

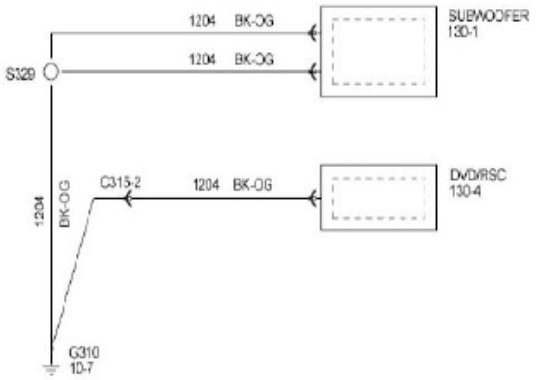
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

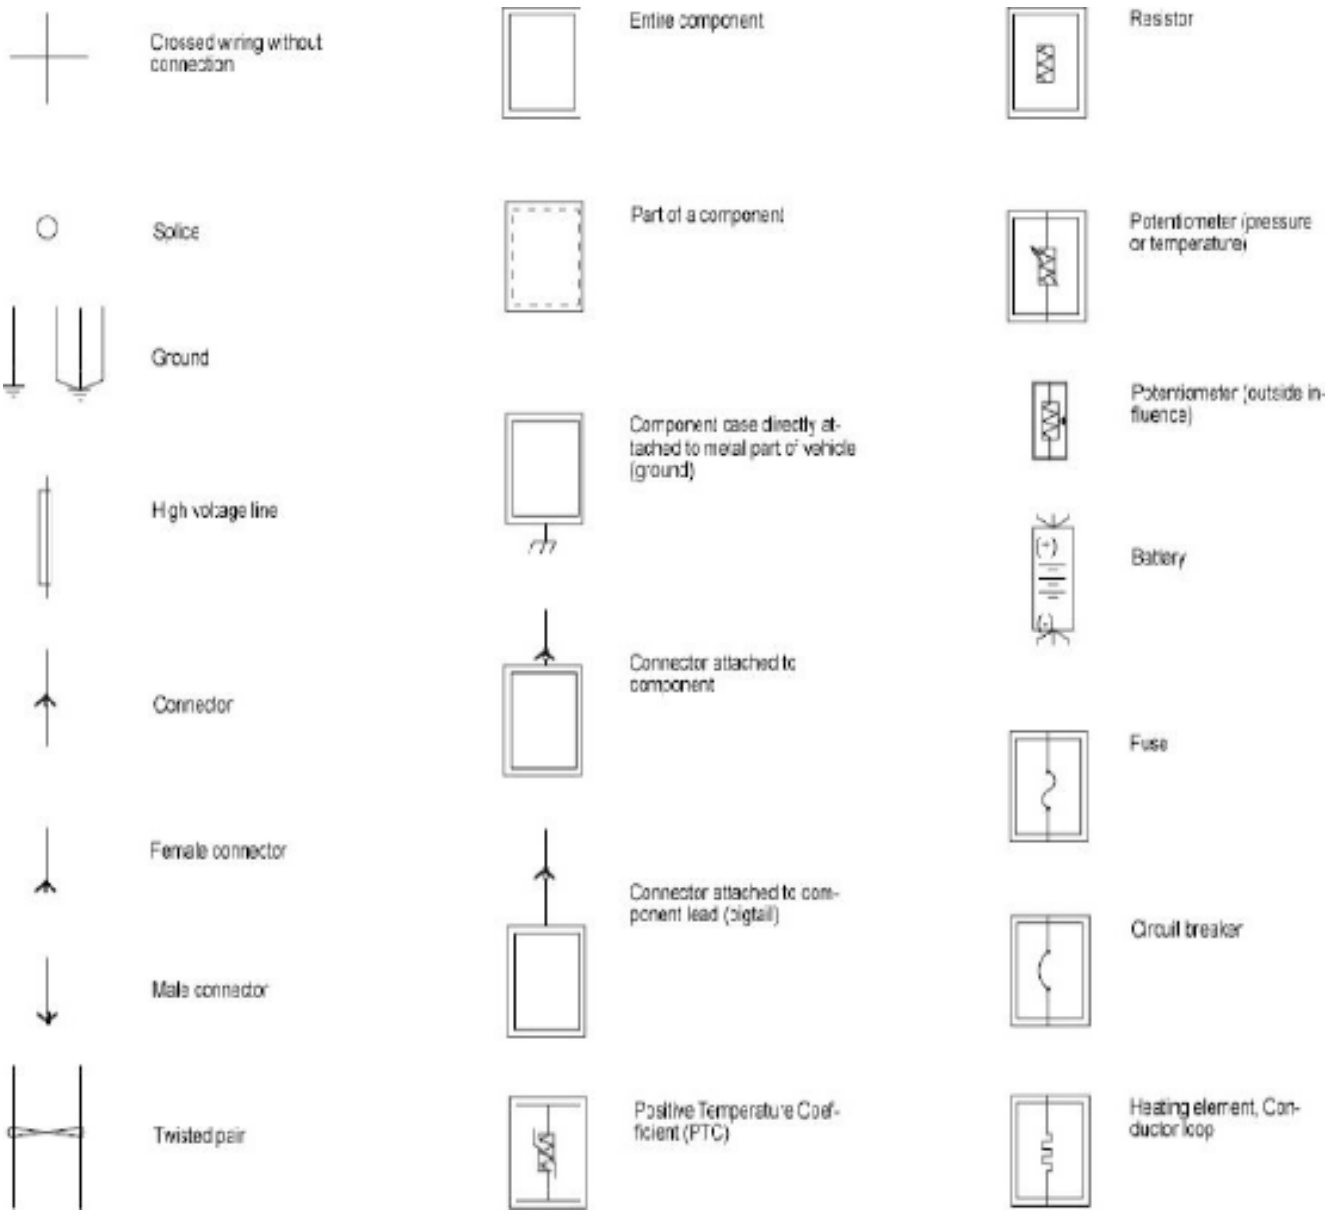
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

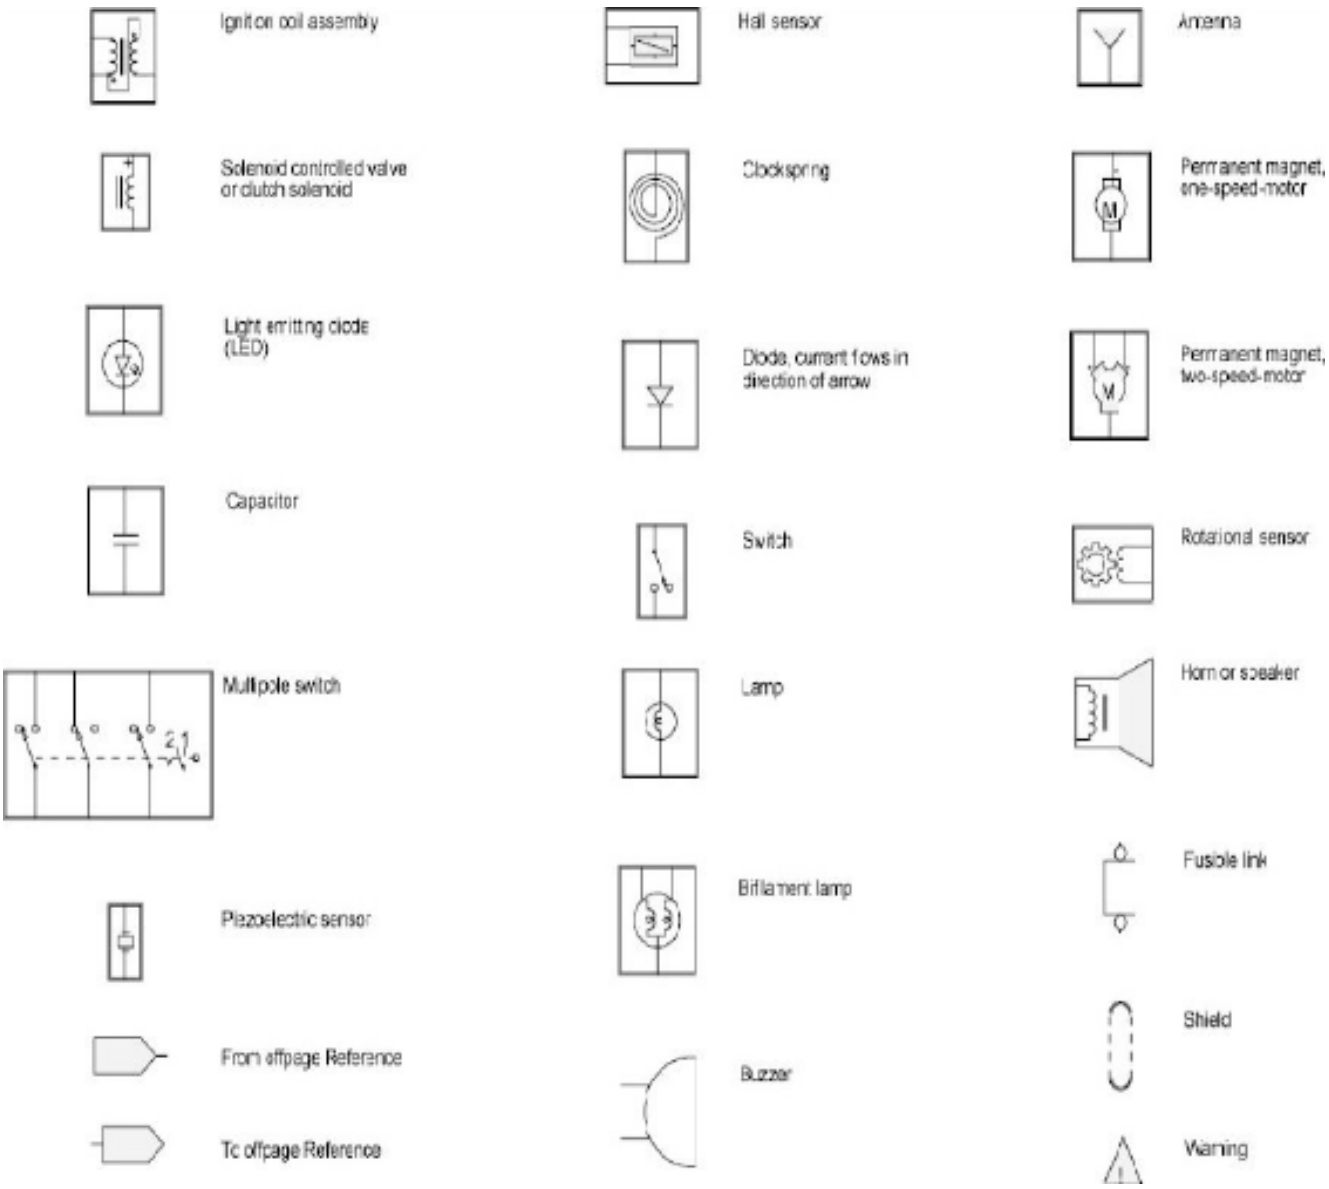
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

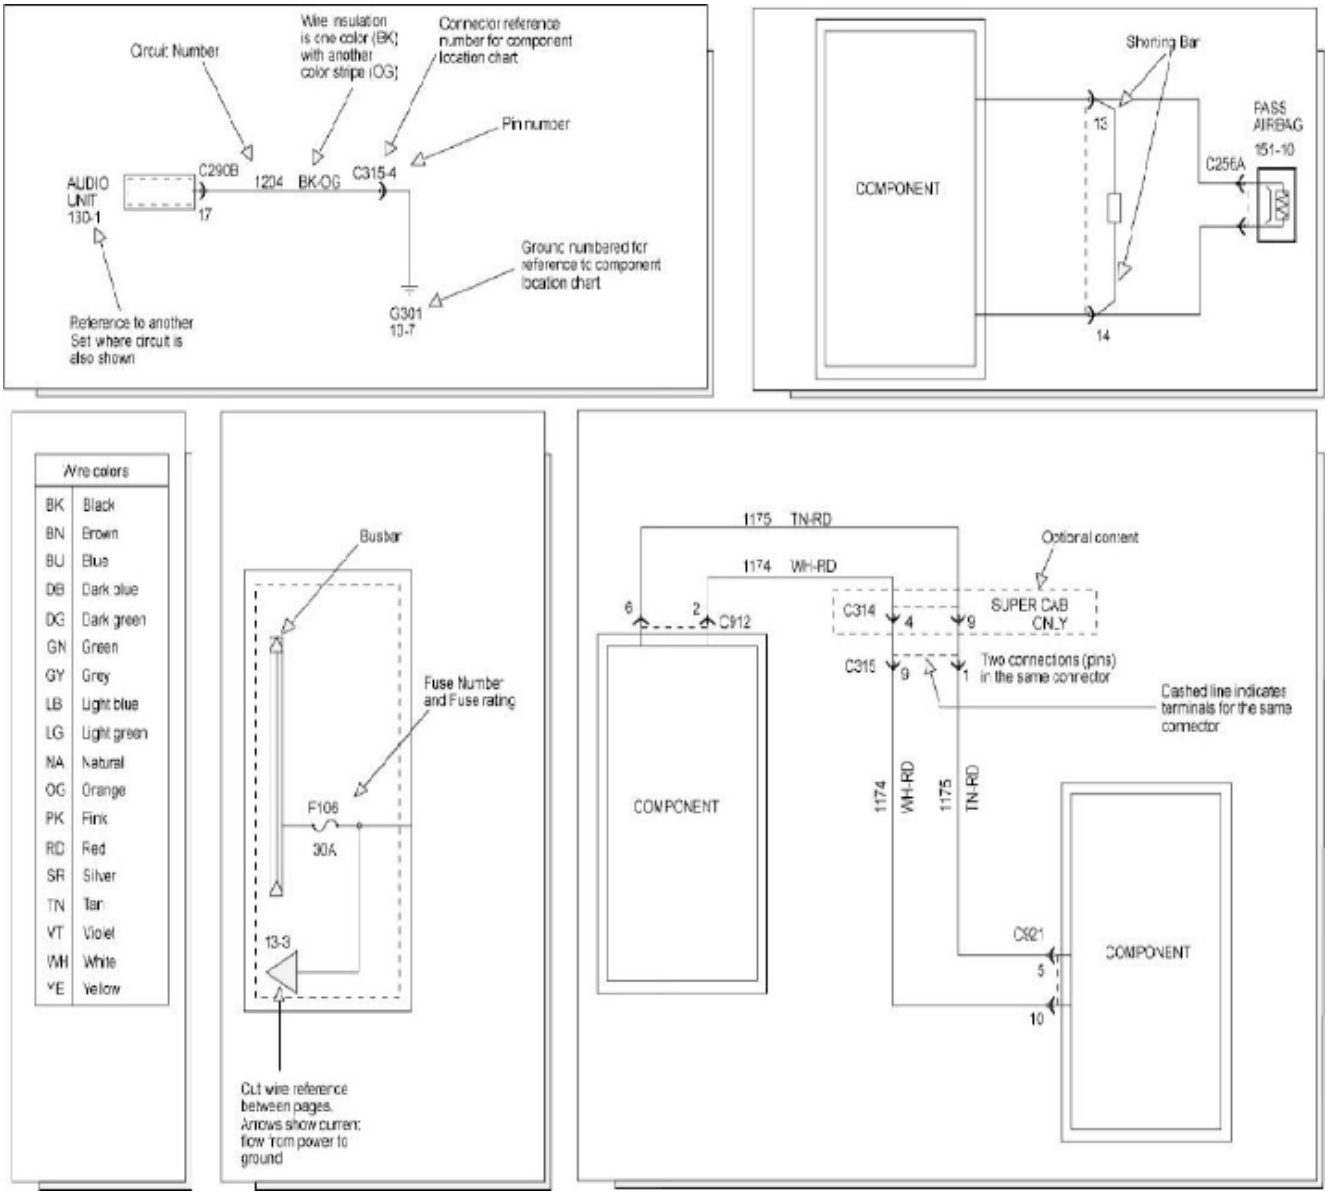
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

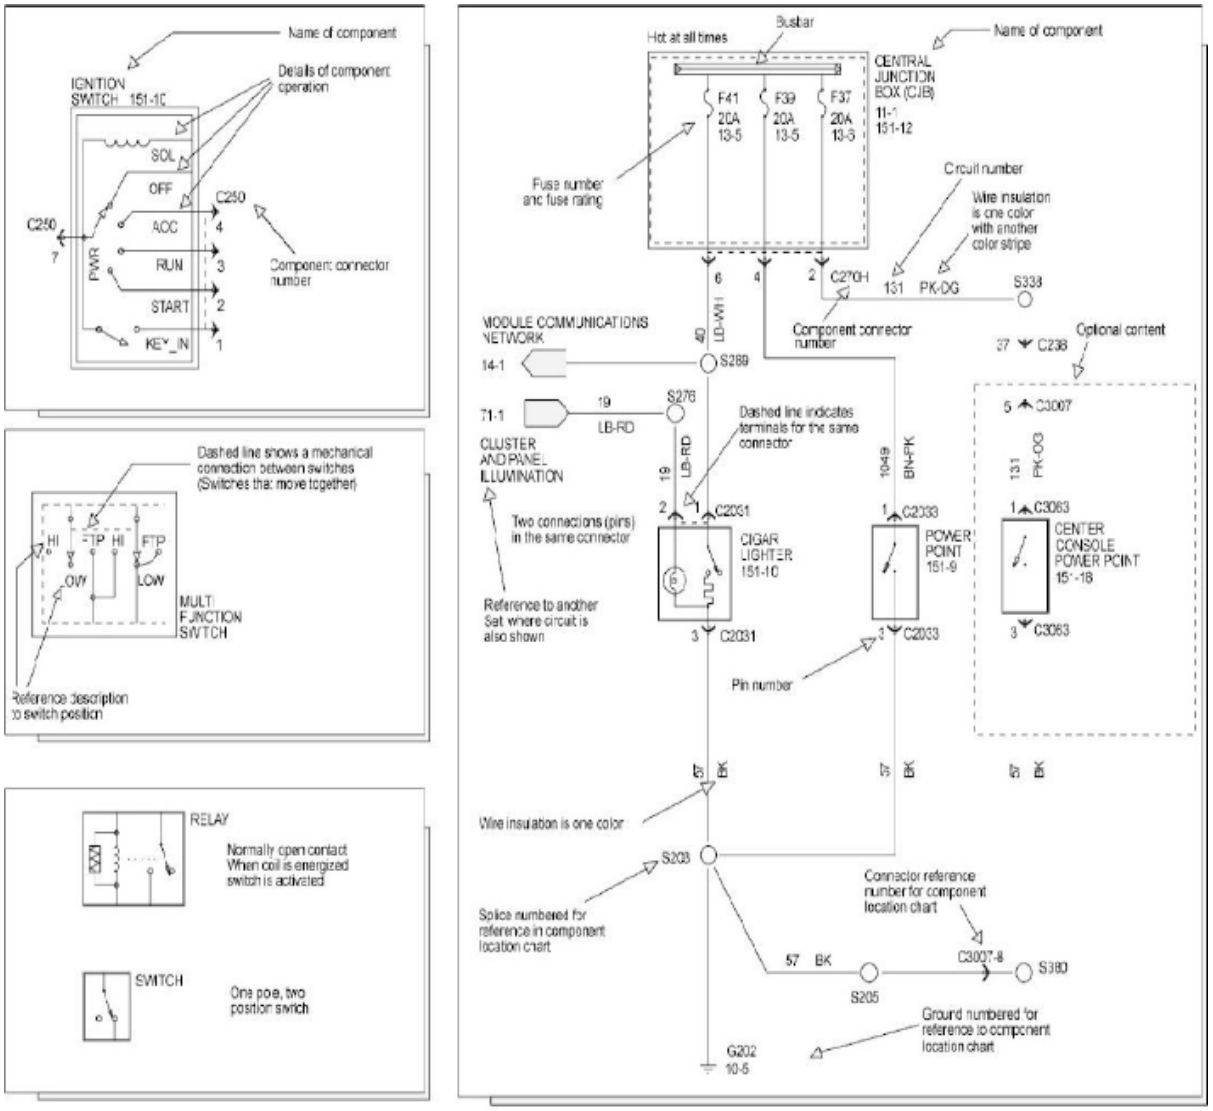
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Hazard Flasher Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

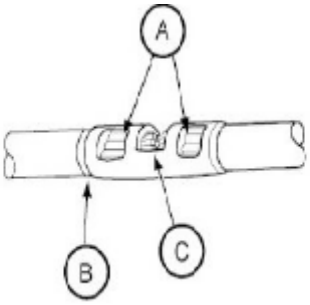
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

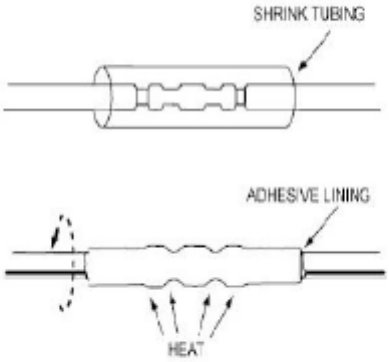
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x dia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

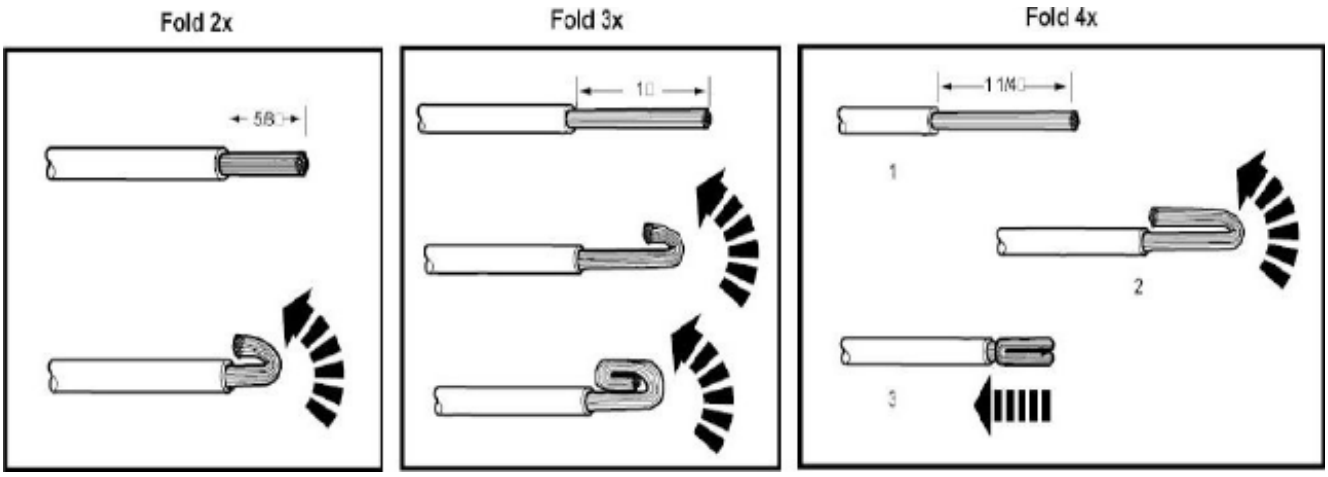
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

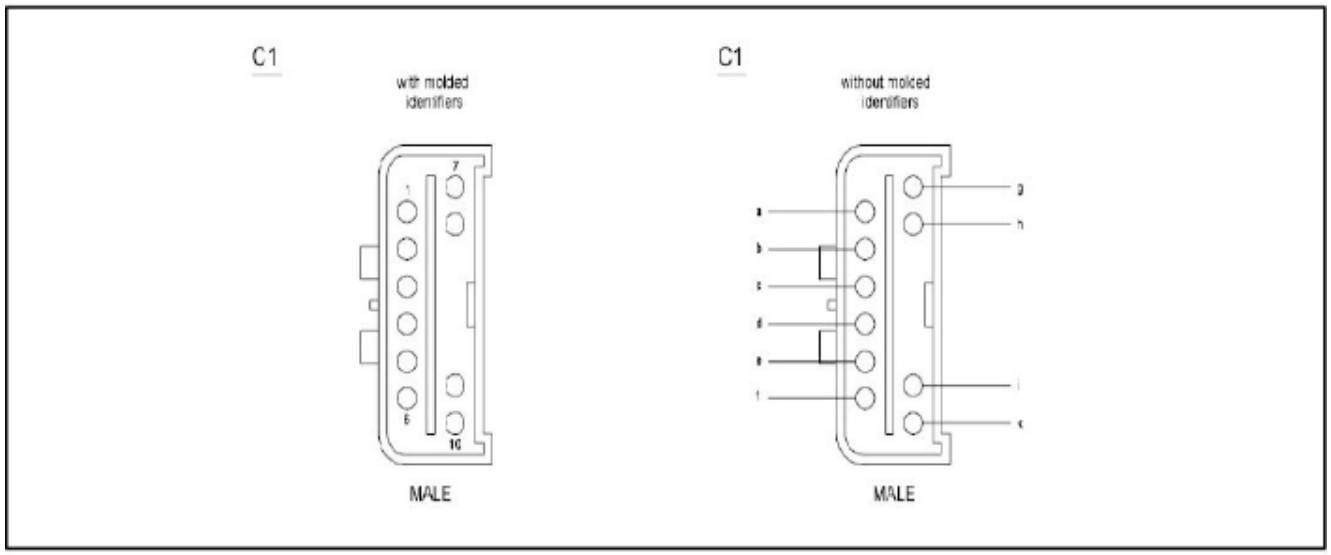
Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



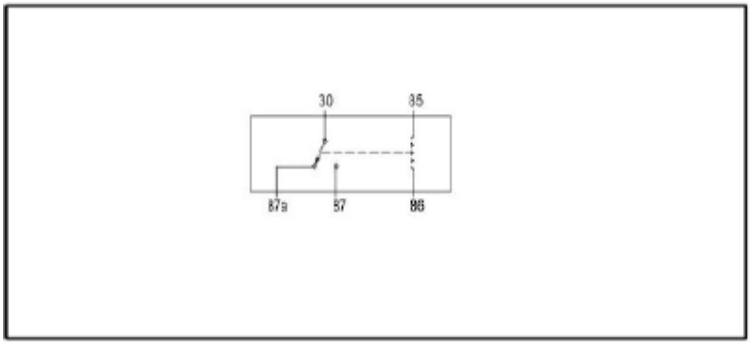
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

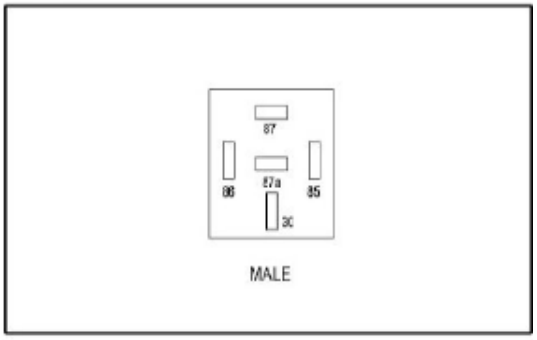
Hazard Flasher Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Horn Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

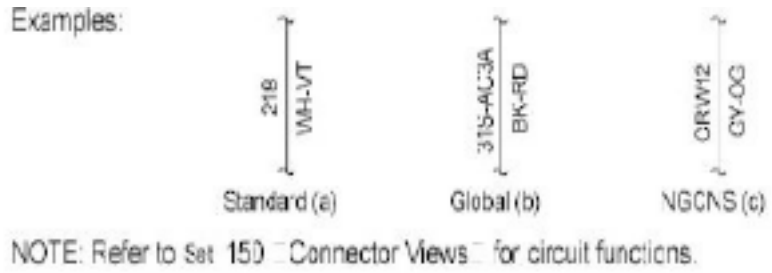
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

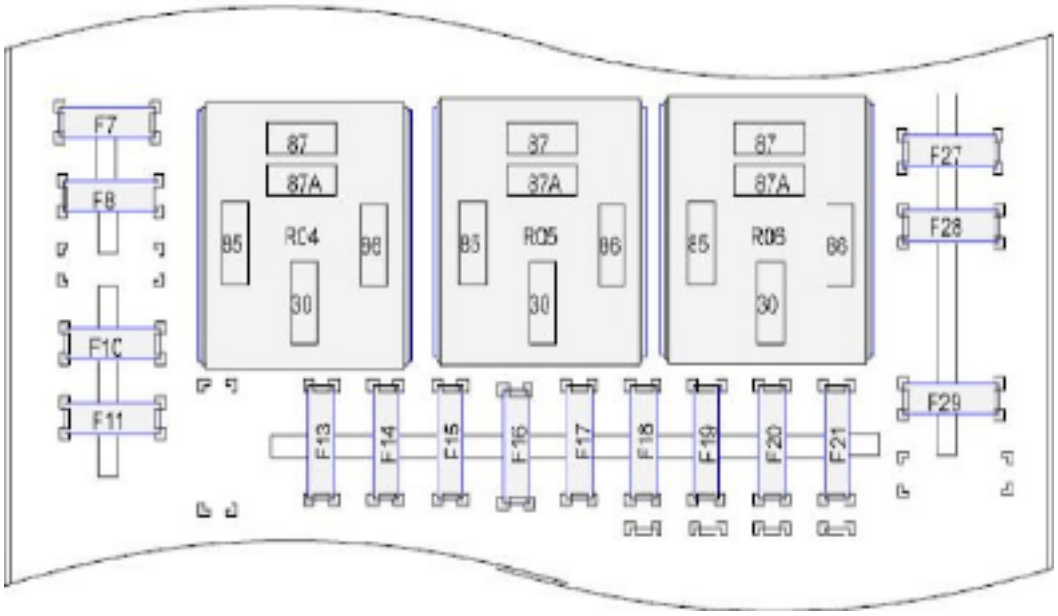
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

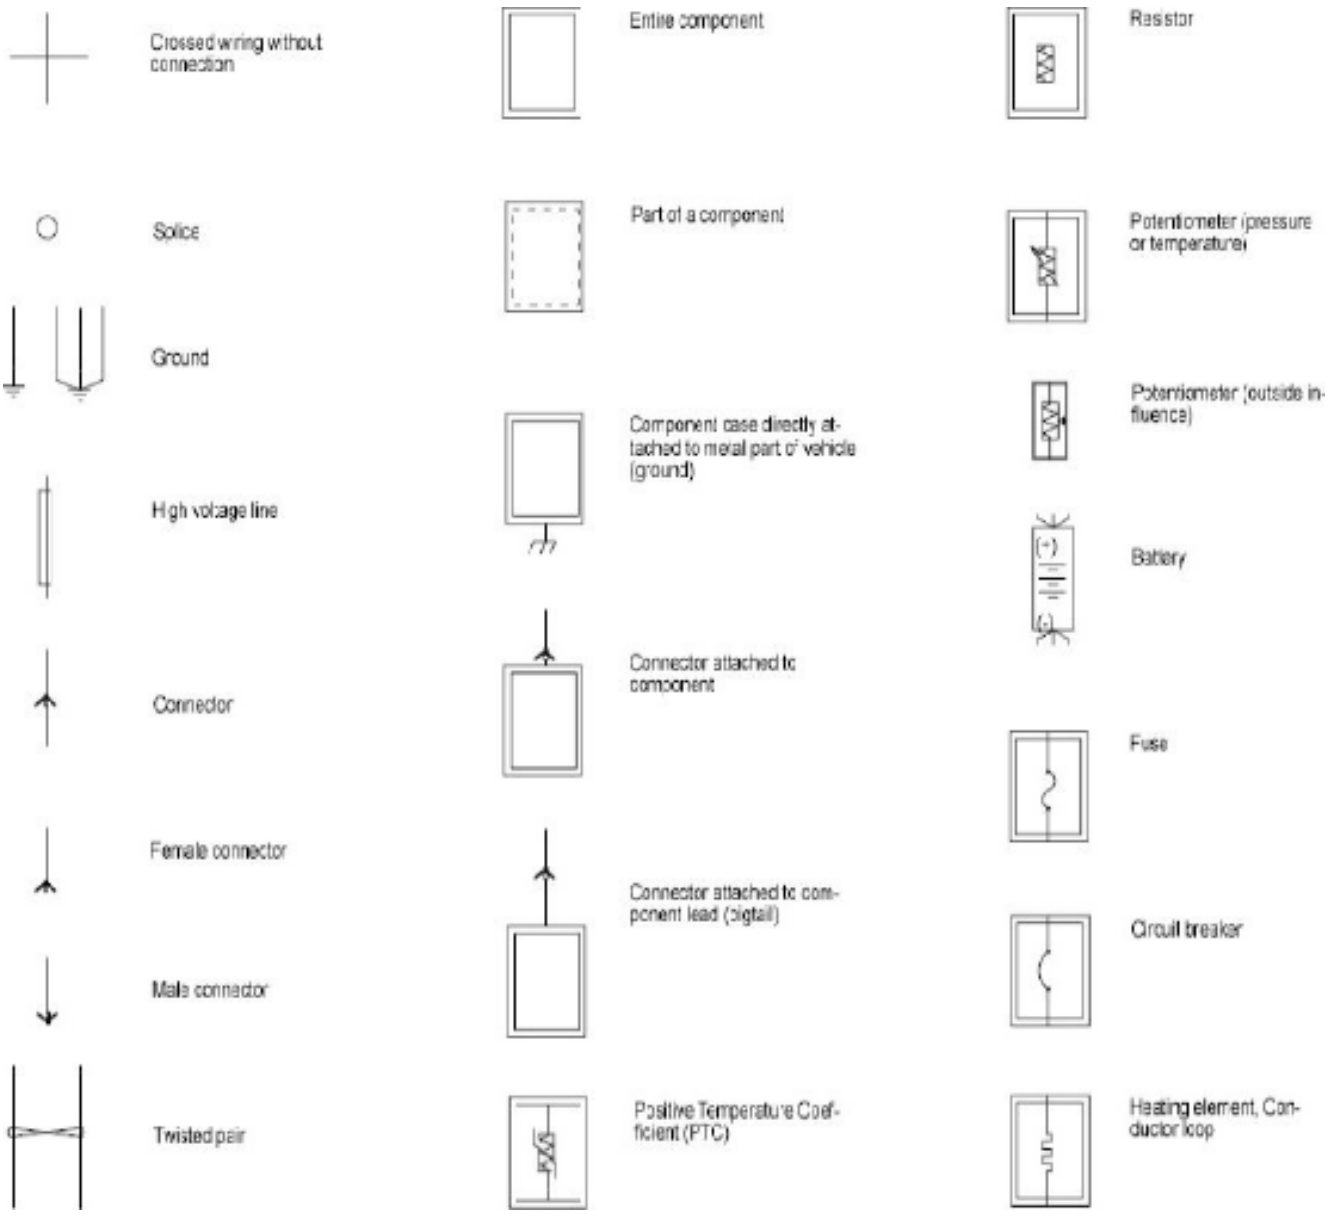
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

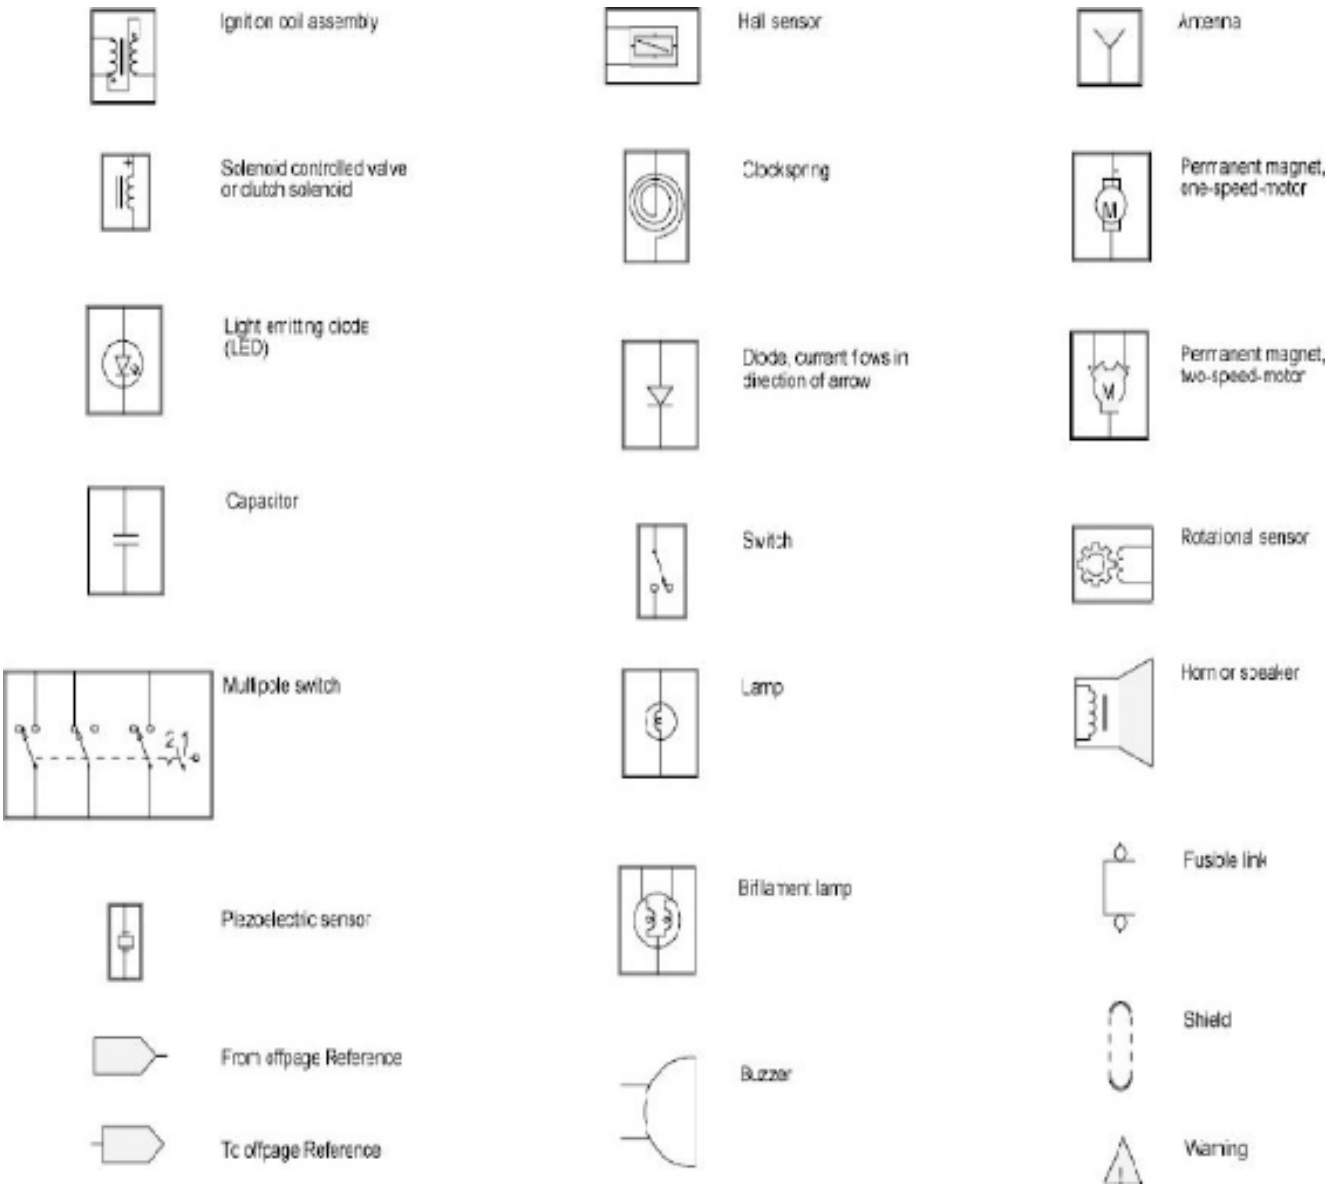
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

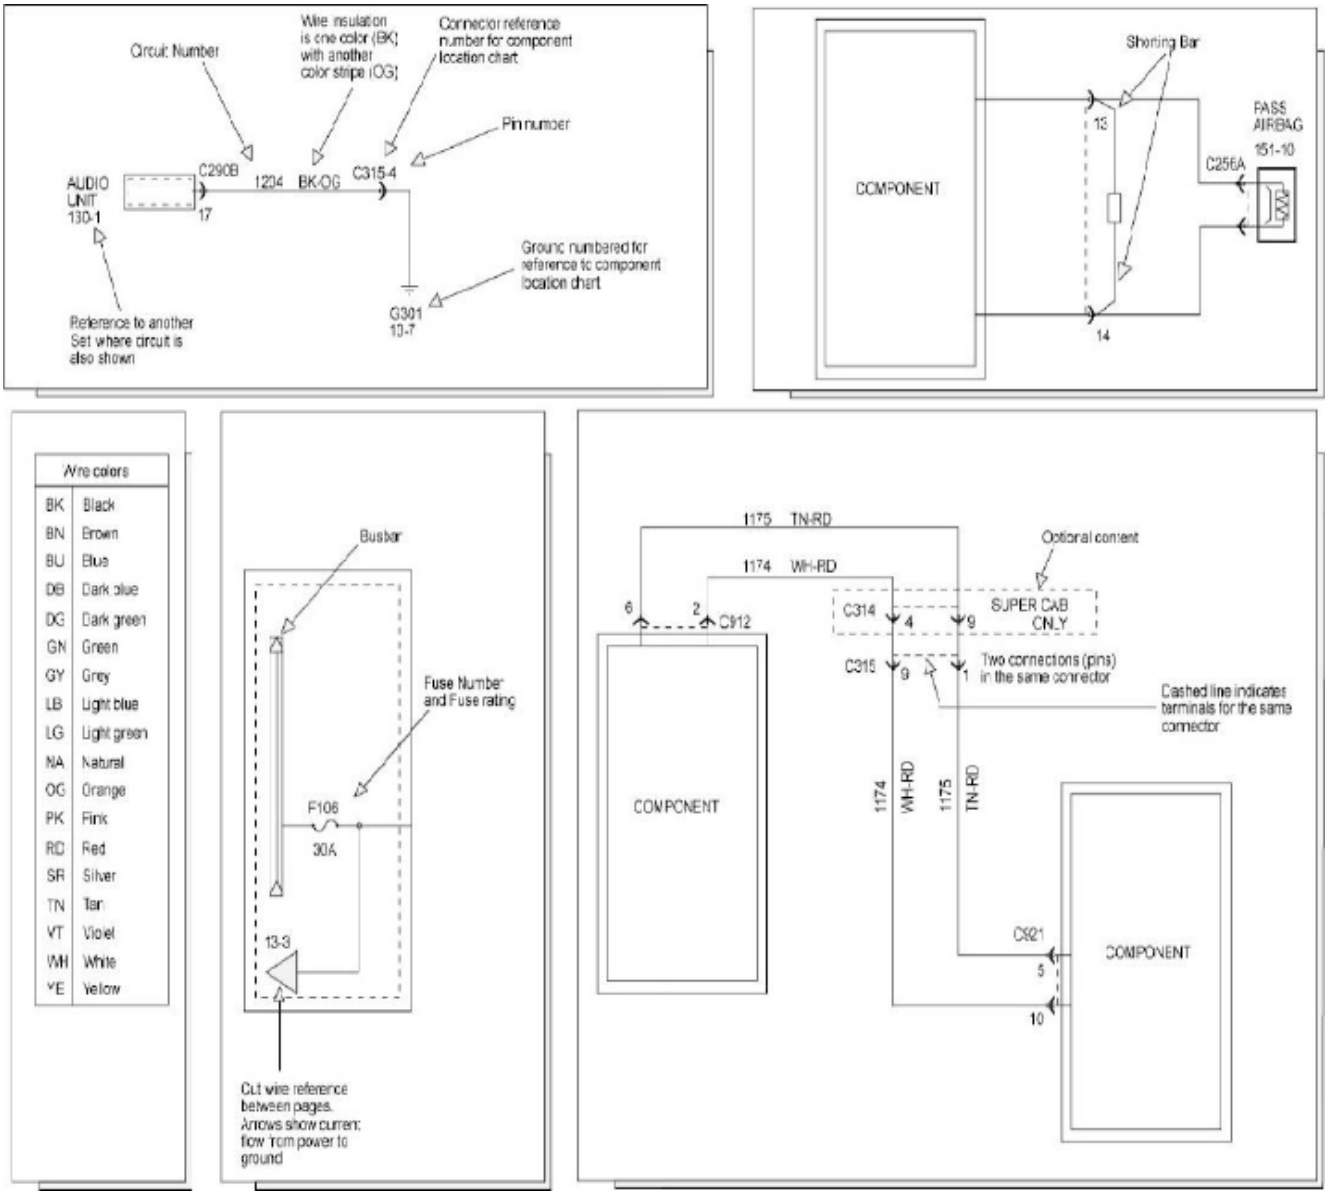
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

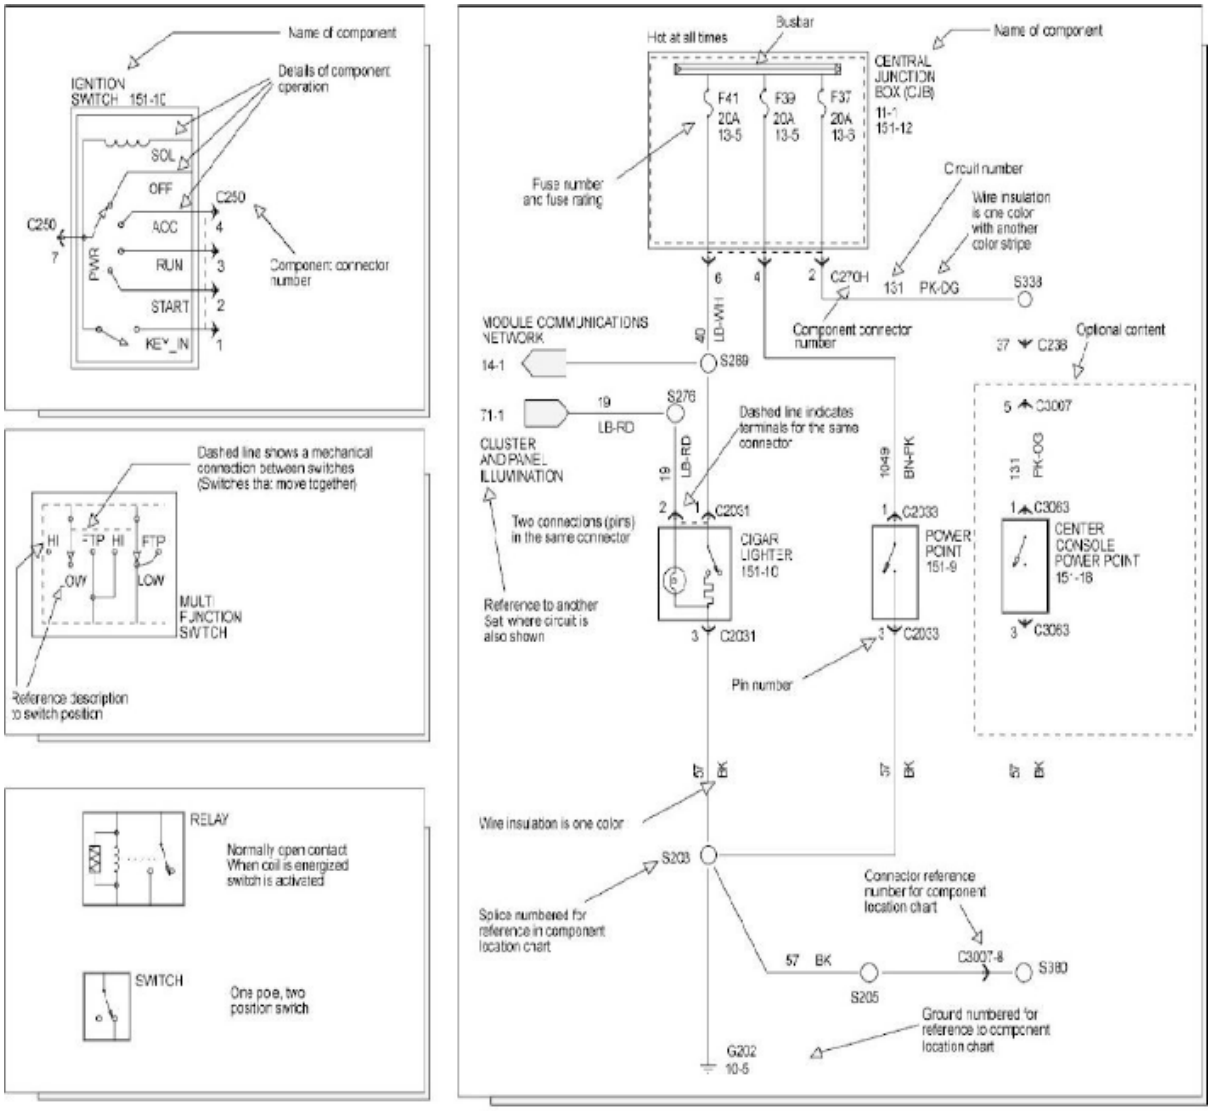
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door

Horn Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

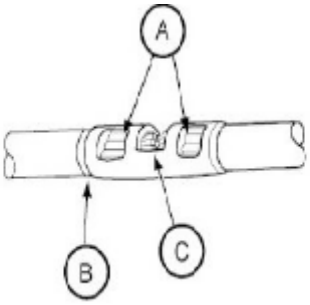
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

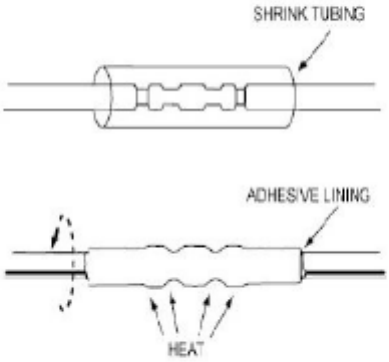
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4□ strip, cut 9 strands	* 1/4□ strip, cut 2 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip, fold 3x dia.
	16-14	* 1/4□ strip, cut 7 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip fold 2x dia	1□ strip, fold 3x dia.	1 1/4□ strip, fold 4x dia.	Not Recommended
	12-10	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip fold 3x dia.	1 1/4□ strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

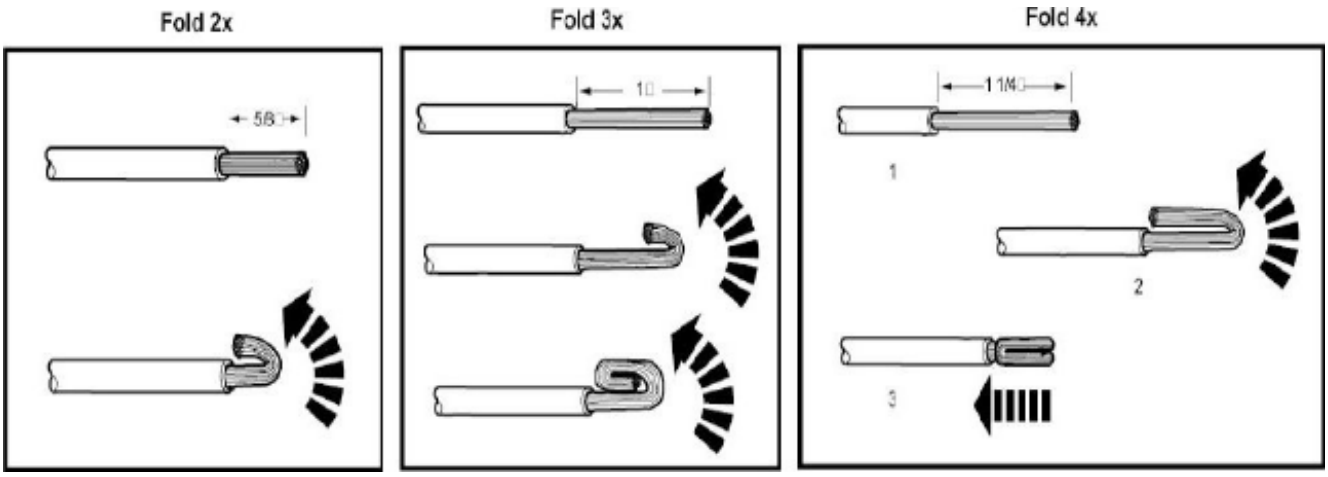
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step–by–step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals

The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

Horn Relay: Testing and Inspection Micro ISO Relay

Relay – Micro ISO

Schematic

Terminals

Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	1 and 2	63–102Ω
Contact	3 and 4	Closed circuit
	3 and 5	Open circuit
Coil – Contact	1 and 3	Open circuit
	1 and 4	Open circuit
	1 and 5	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 2 and 3 to 12V DC power and pin 1 to ground. Measure voltage between pin 5 and pin 1. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 2 and measure voltage between pin 4 and pin 1. If the voltage is 12V, the relay is okay. If not, replace the relay.

Introduction

Interior Lighting Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

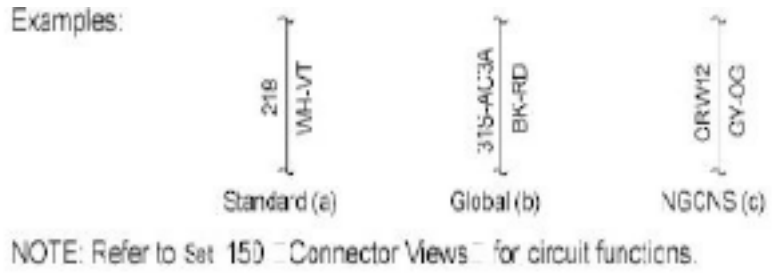
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

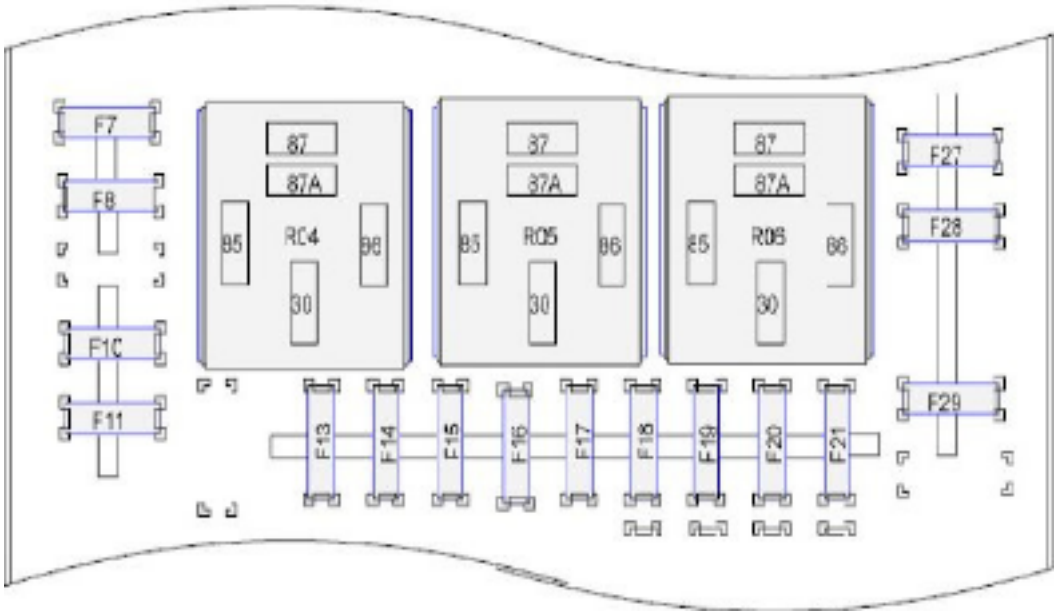
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

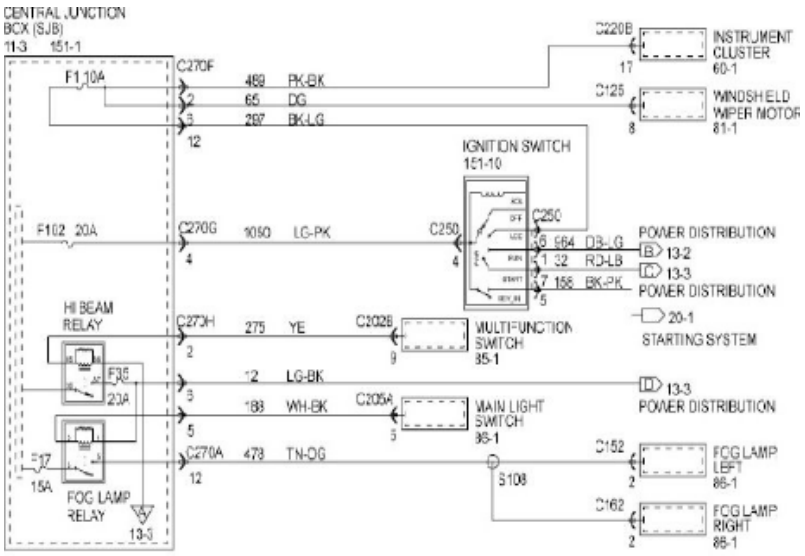
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

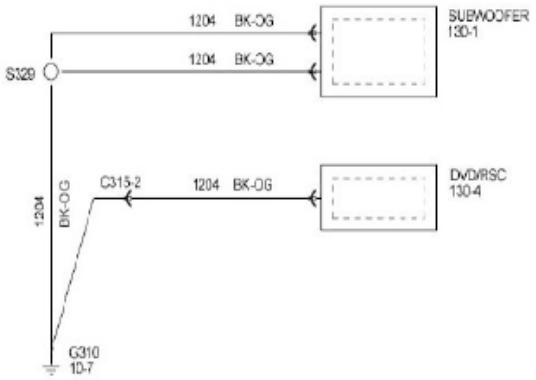
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

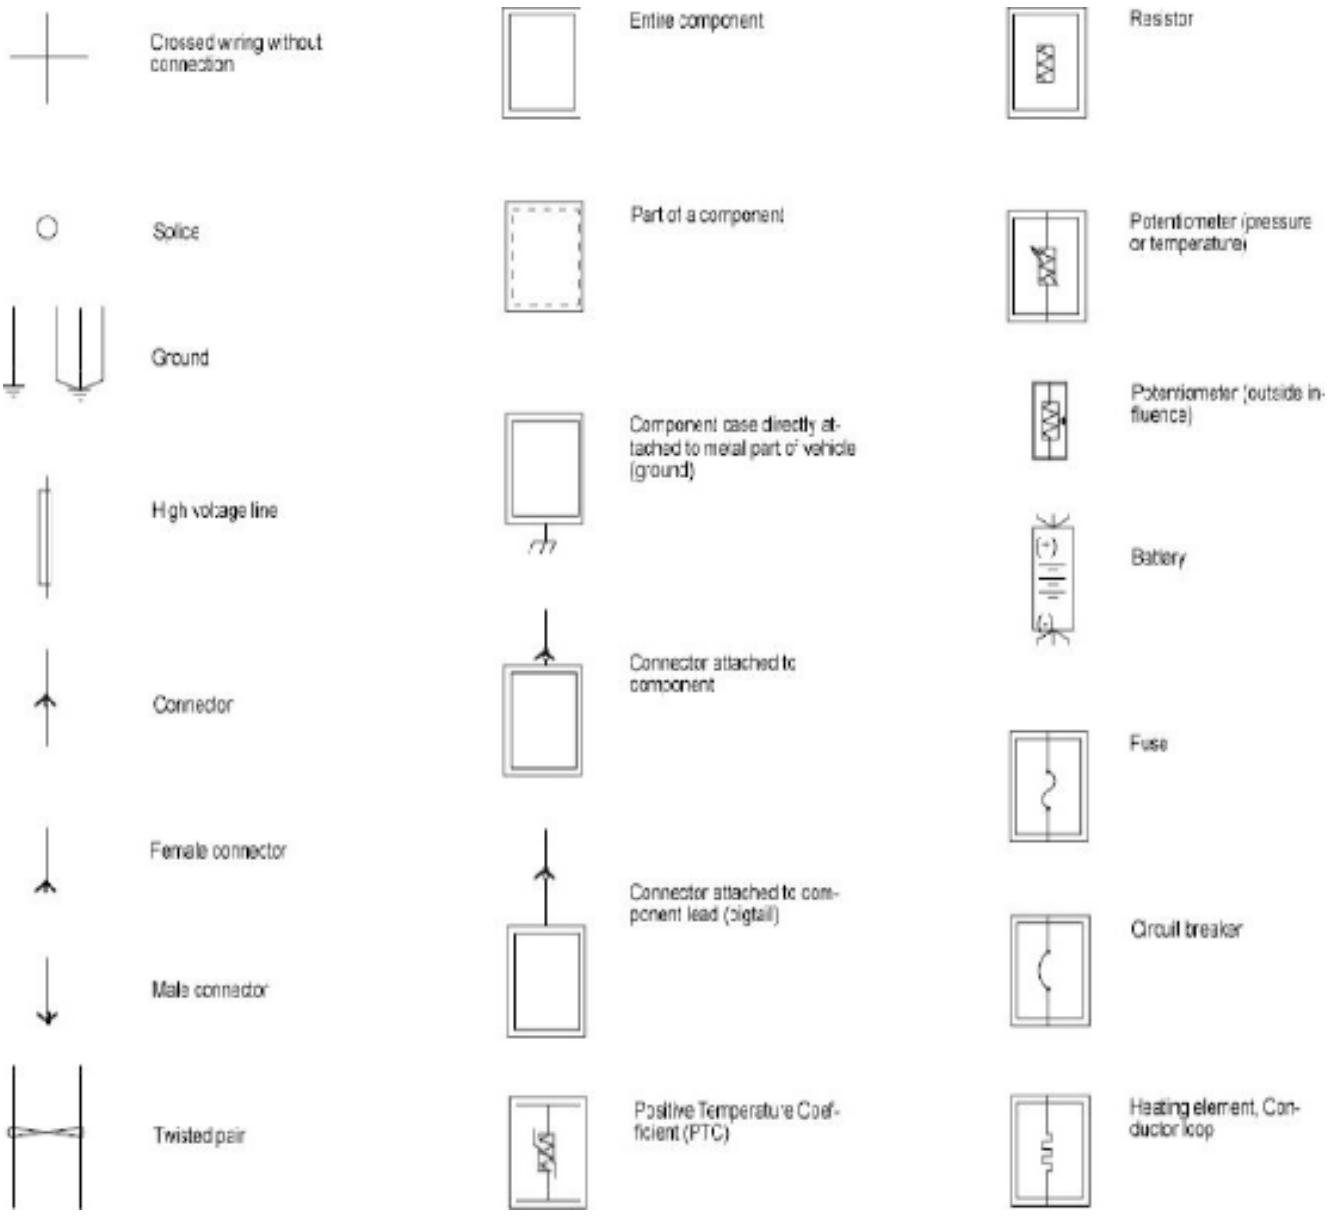
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

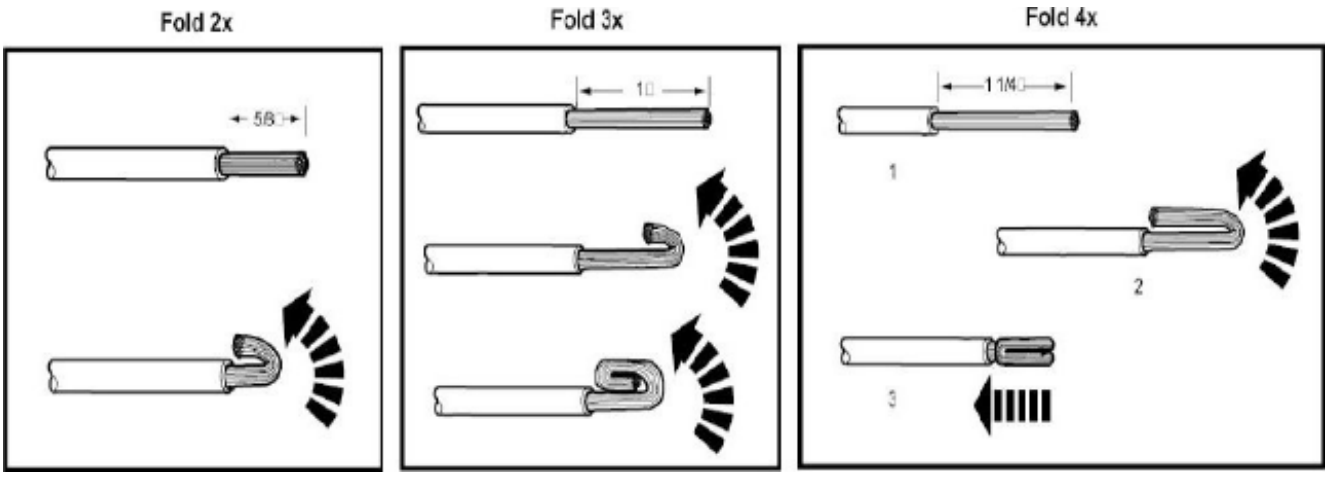
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals

The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

Interior Lighting Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic

Terminals

Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 2 and 3 to 12V DC power and pin 1 to ground. Measure voltage between pin 5 and pin 1. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 2 and measure voltage between pin 4 and pin 1. If the voltage is 12V, the relay is okay. If not, replace the relay.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step□by□step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals

The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column □Circuit to test□. If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

Relay □ Micro ISO

Schematic

Trailer Lighting Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

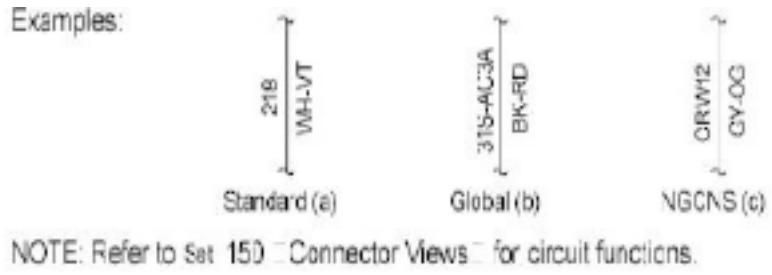
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

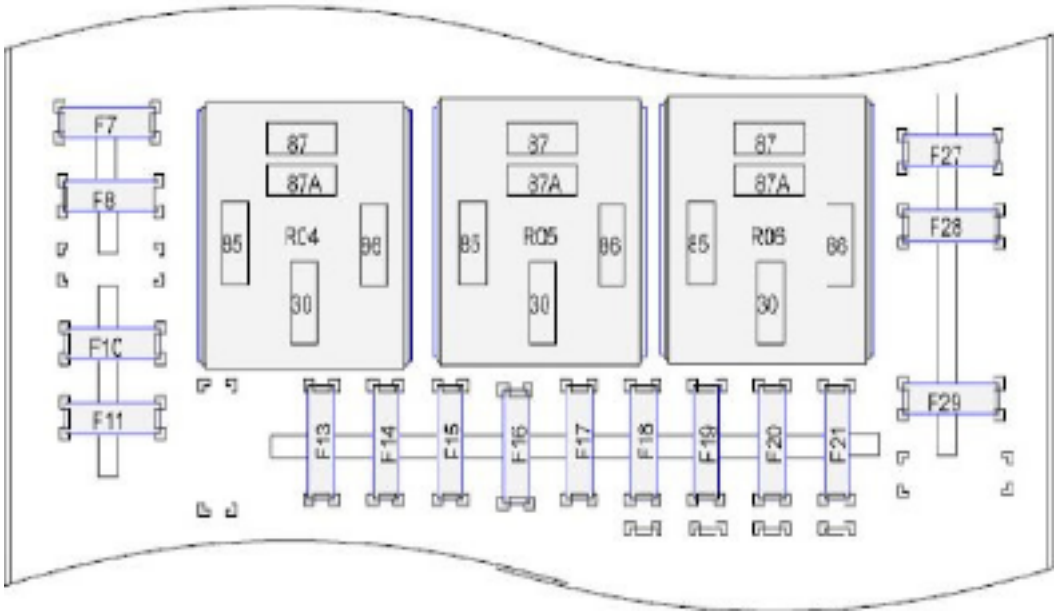
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

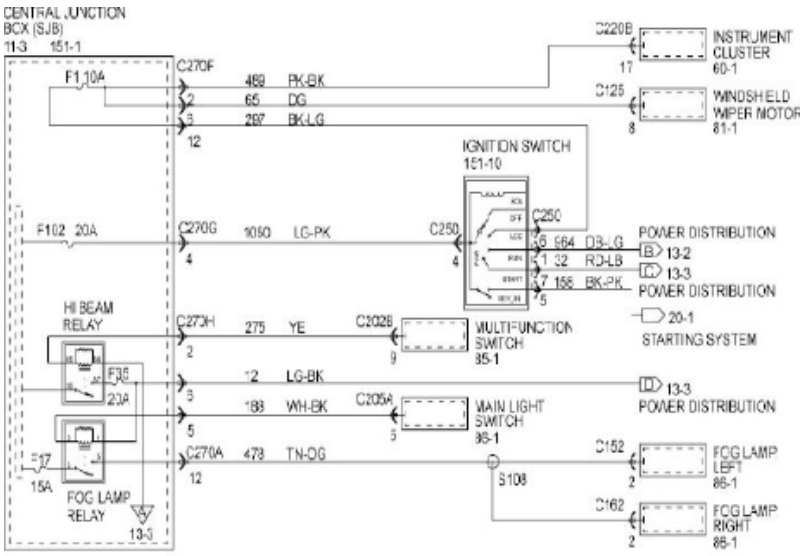
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

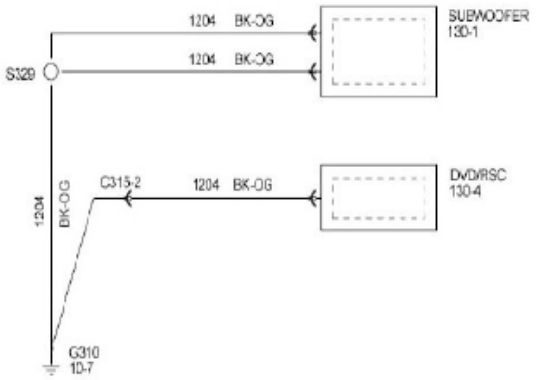
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

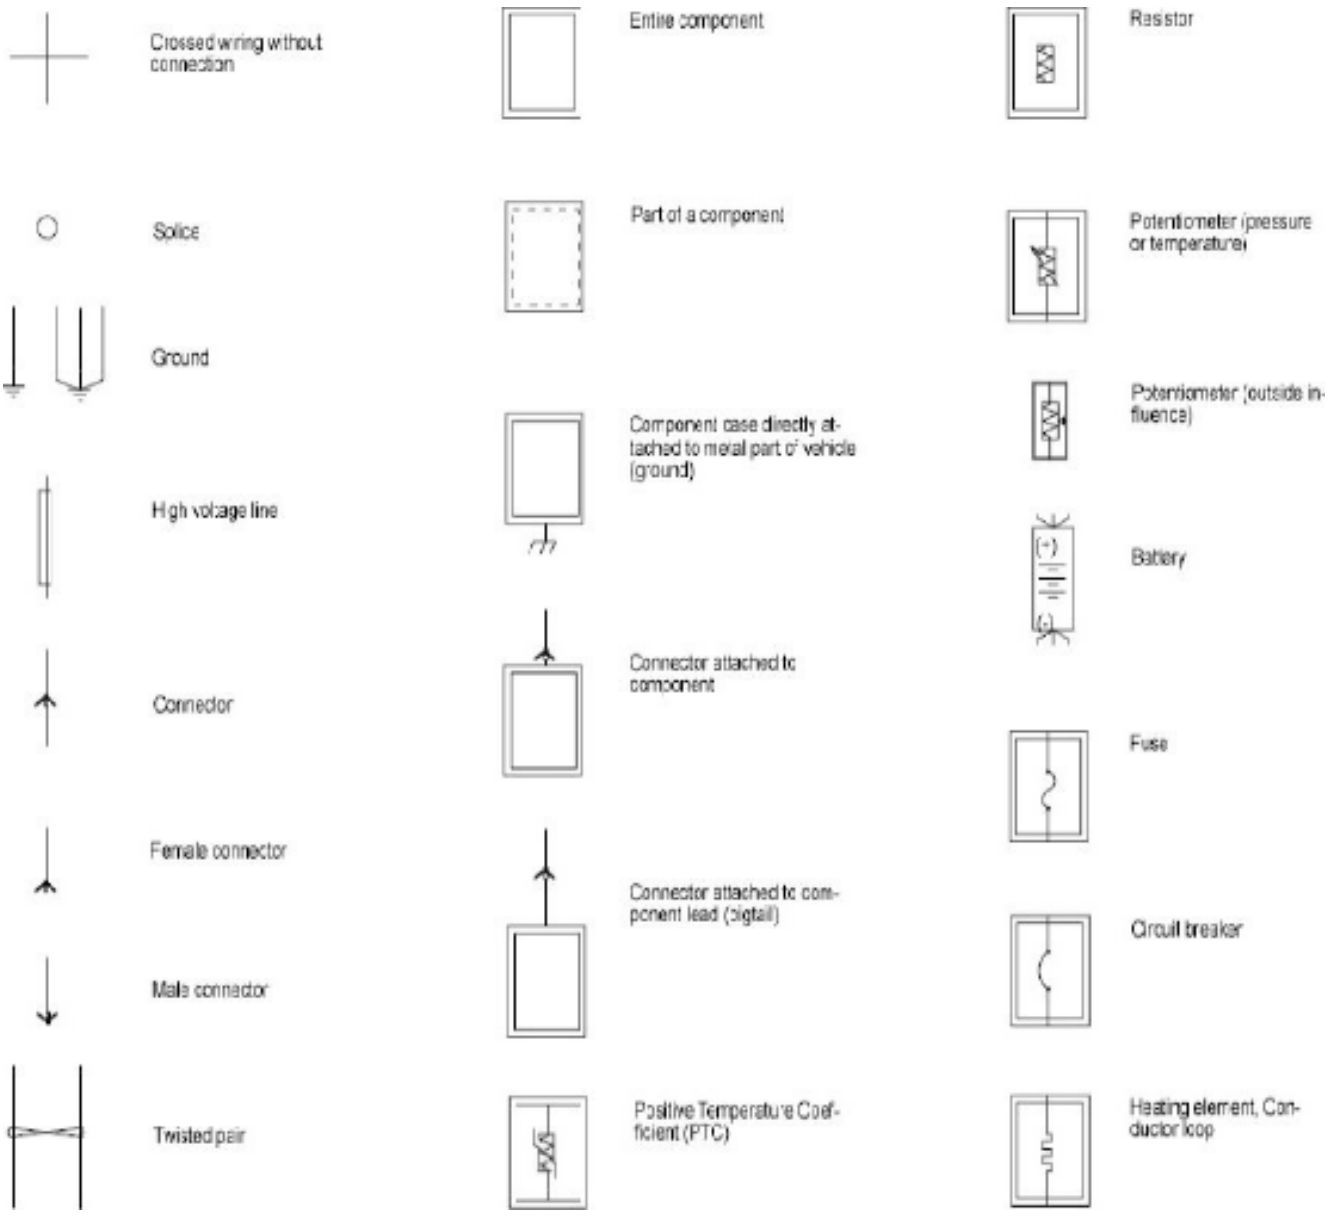
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

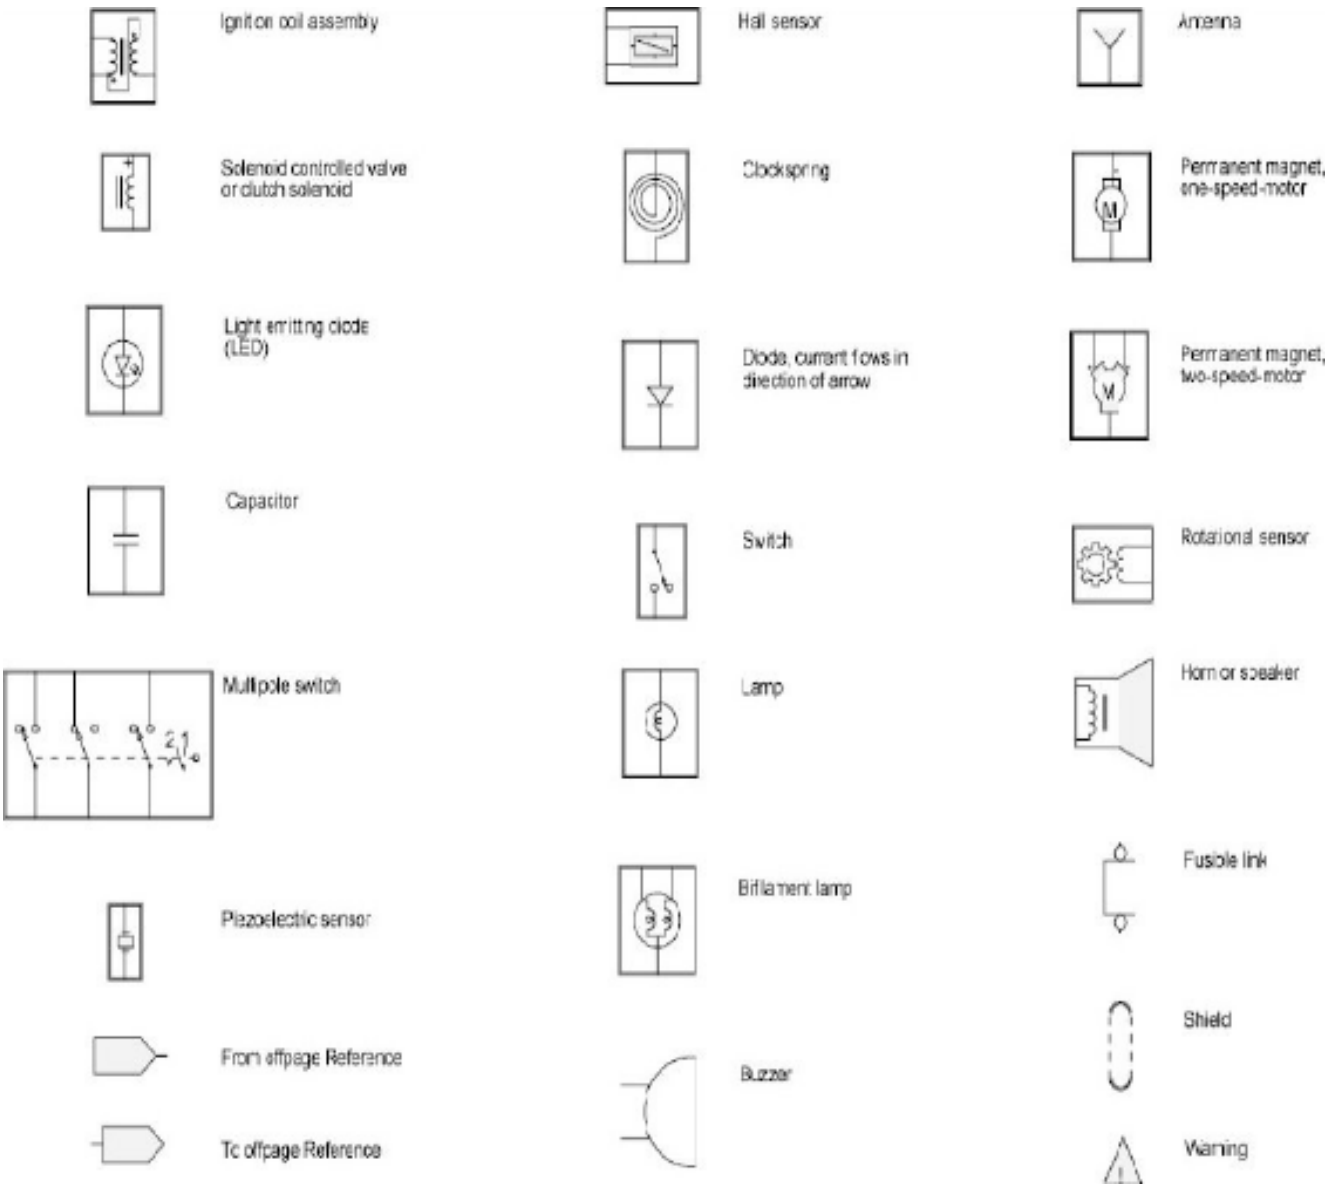
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

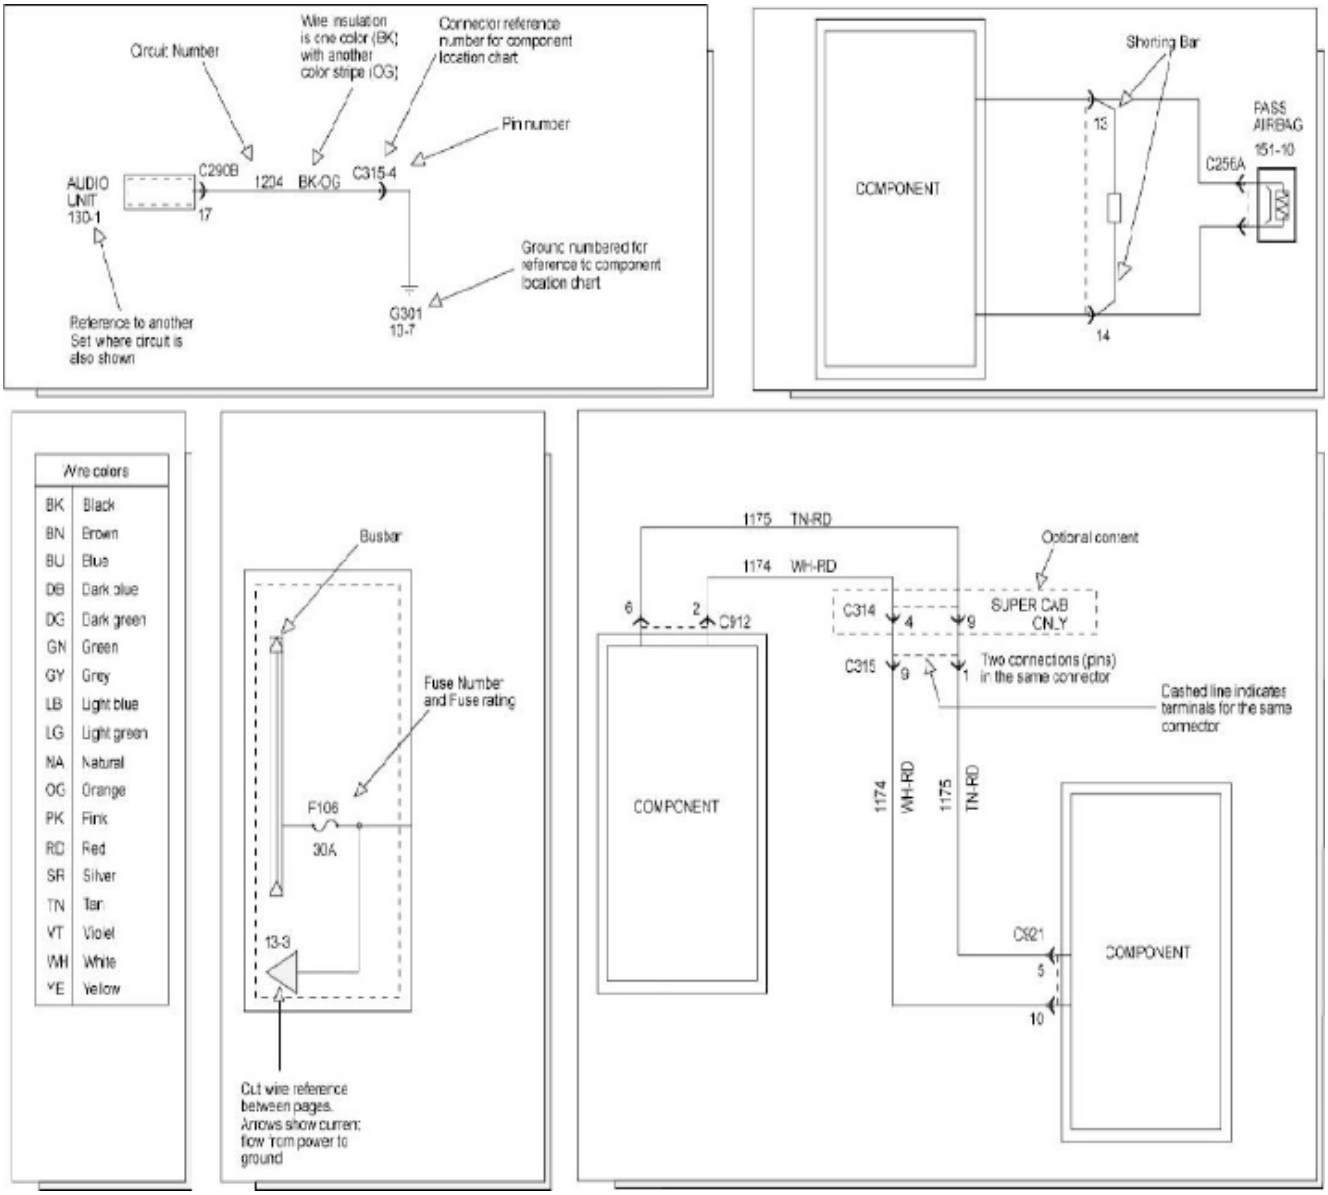
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

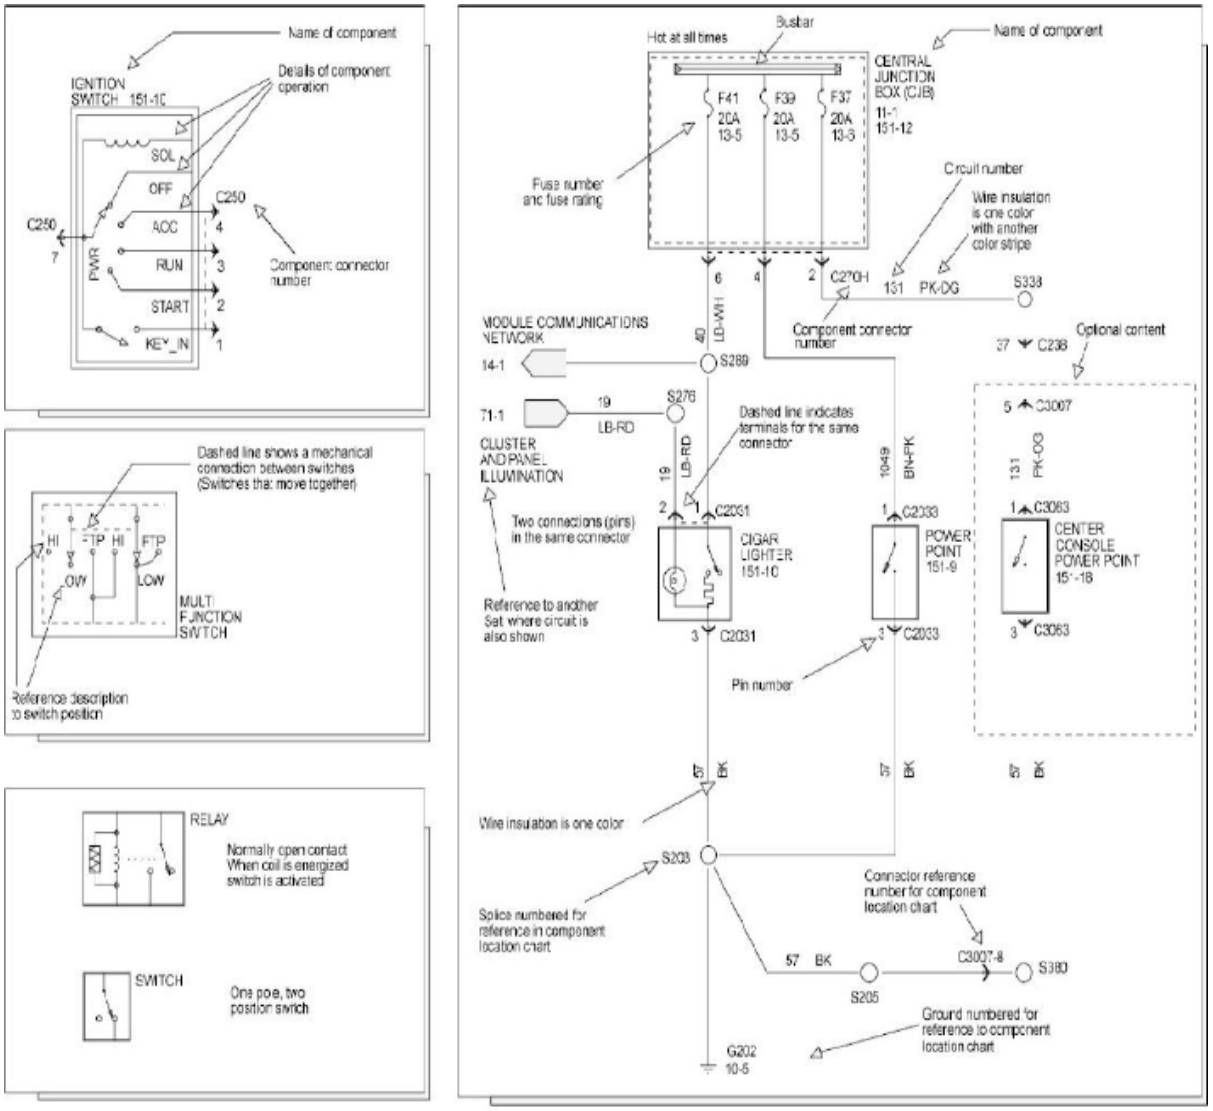
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Trailer Lighting Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

Wire 2

BRAZED SEAM
INDENTER
WIRE STOPPER

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

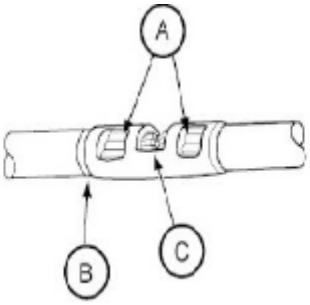
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

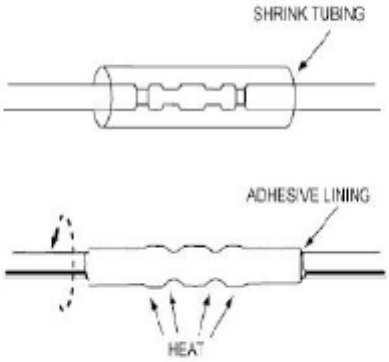
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x dia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

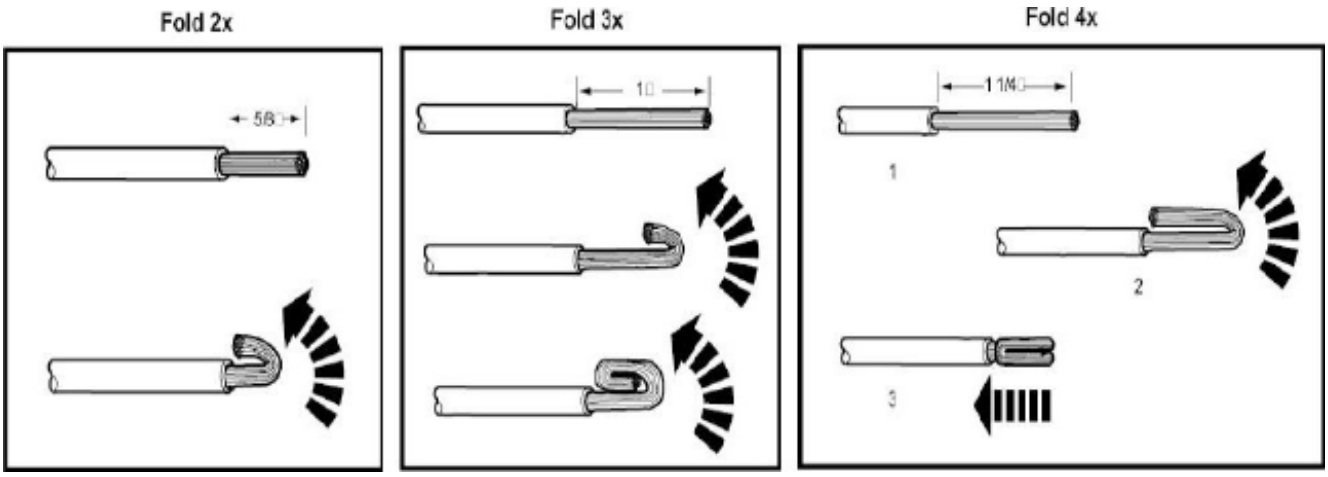
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals

The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

Relay □ Mini ISO

Schematic

Terminals

Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 - 90 Ω

Turn Signal Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

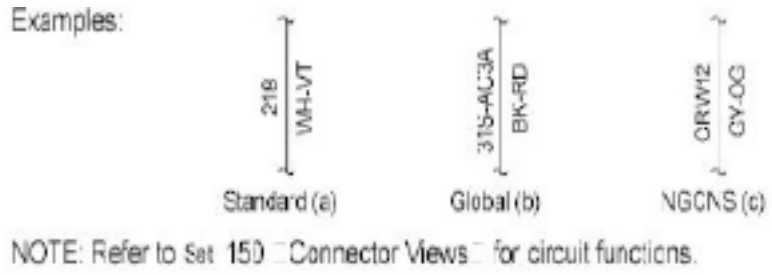
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

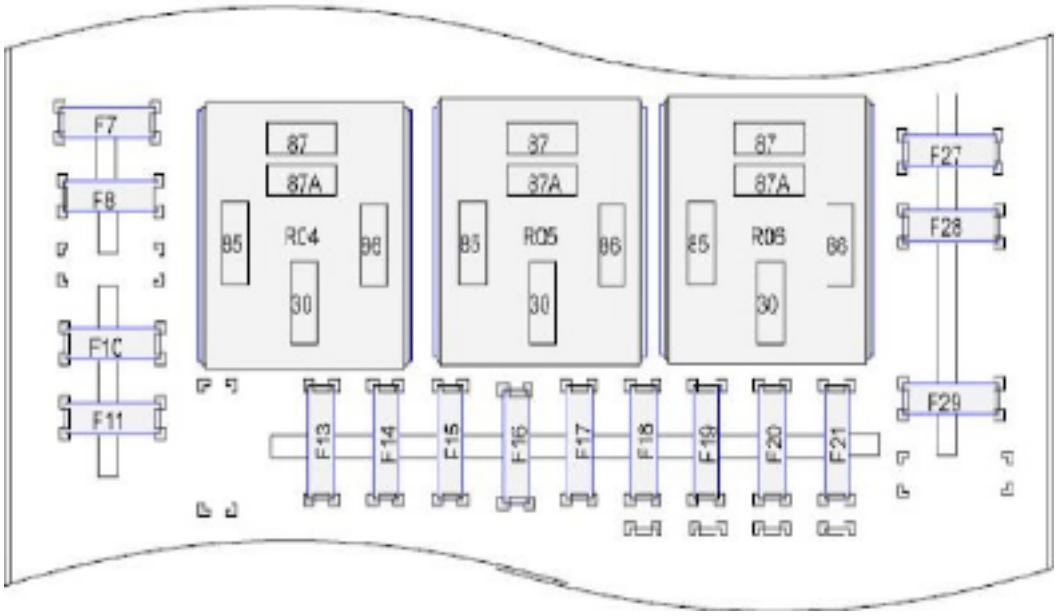
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution

3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

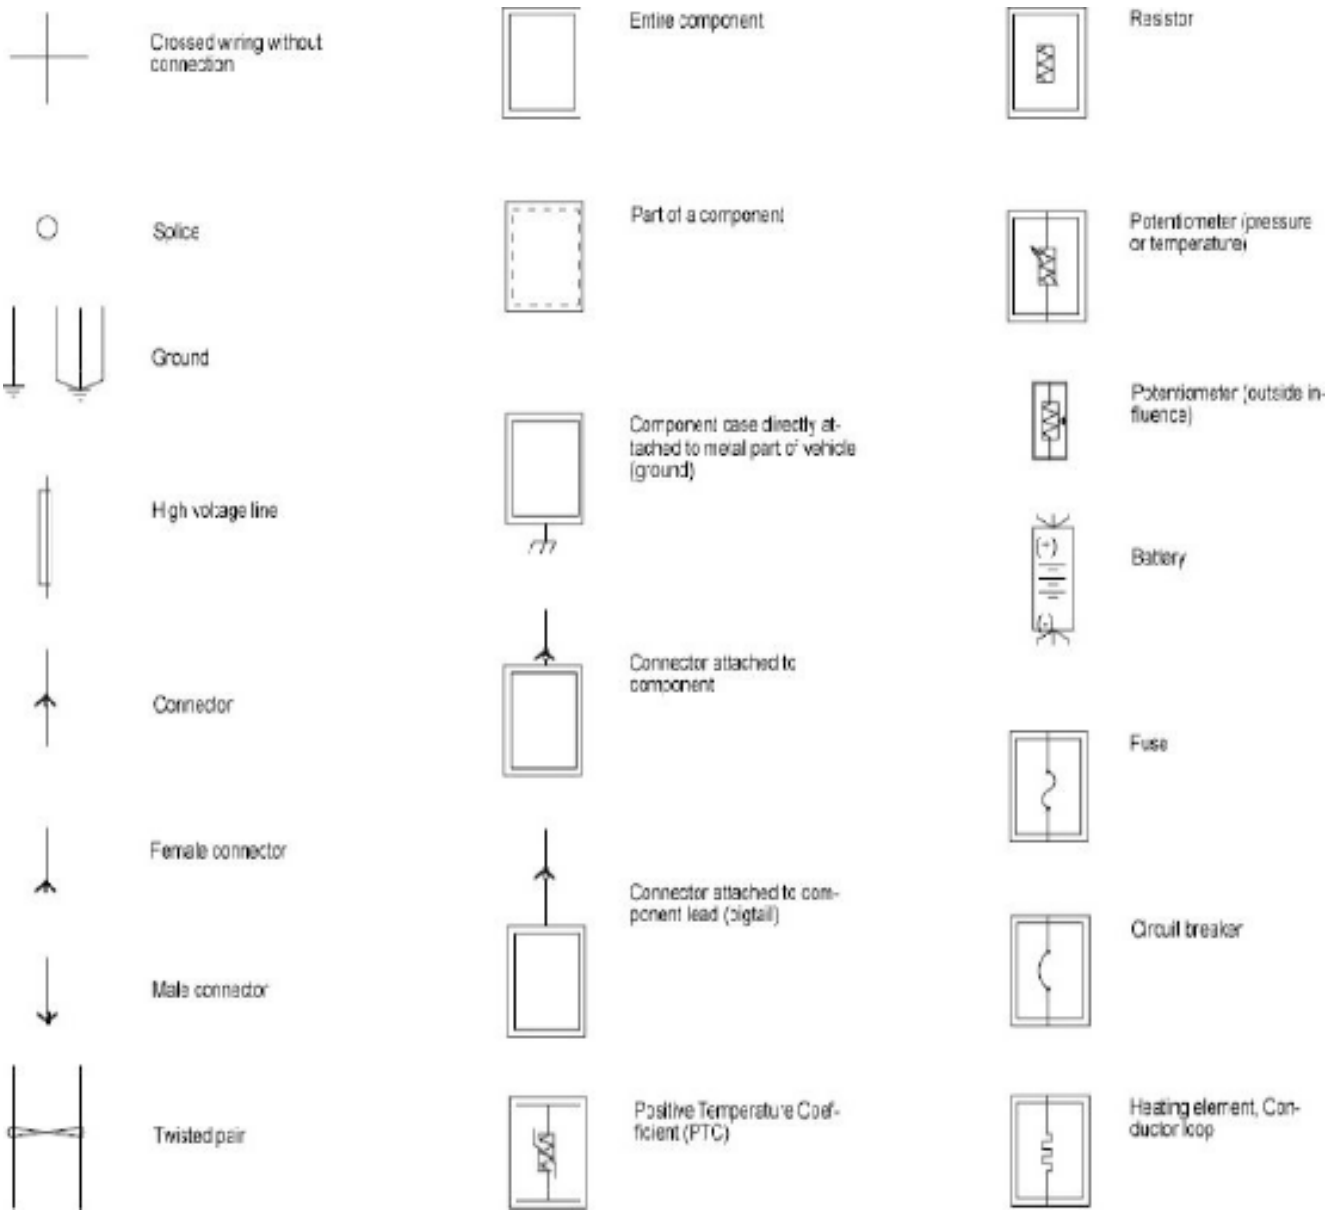
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

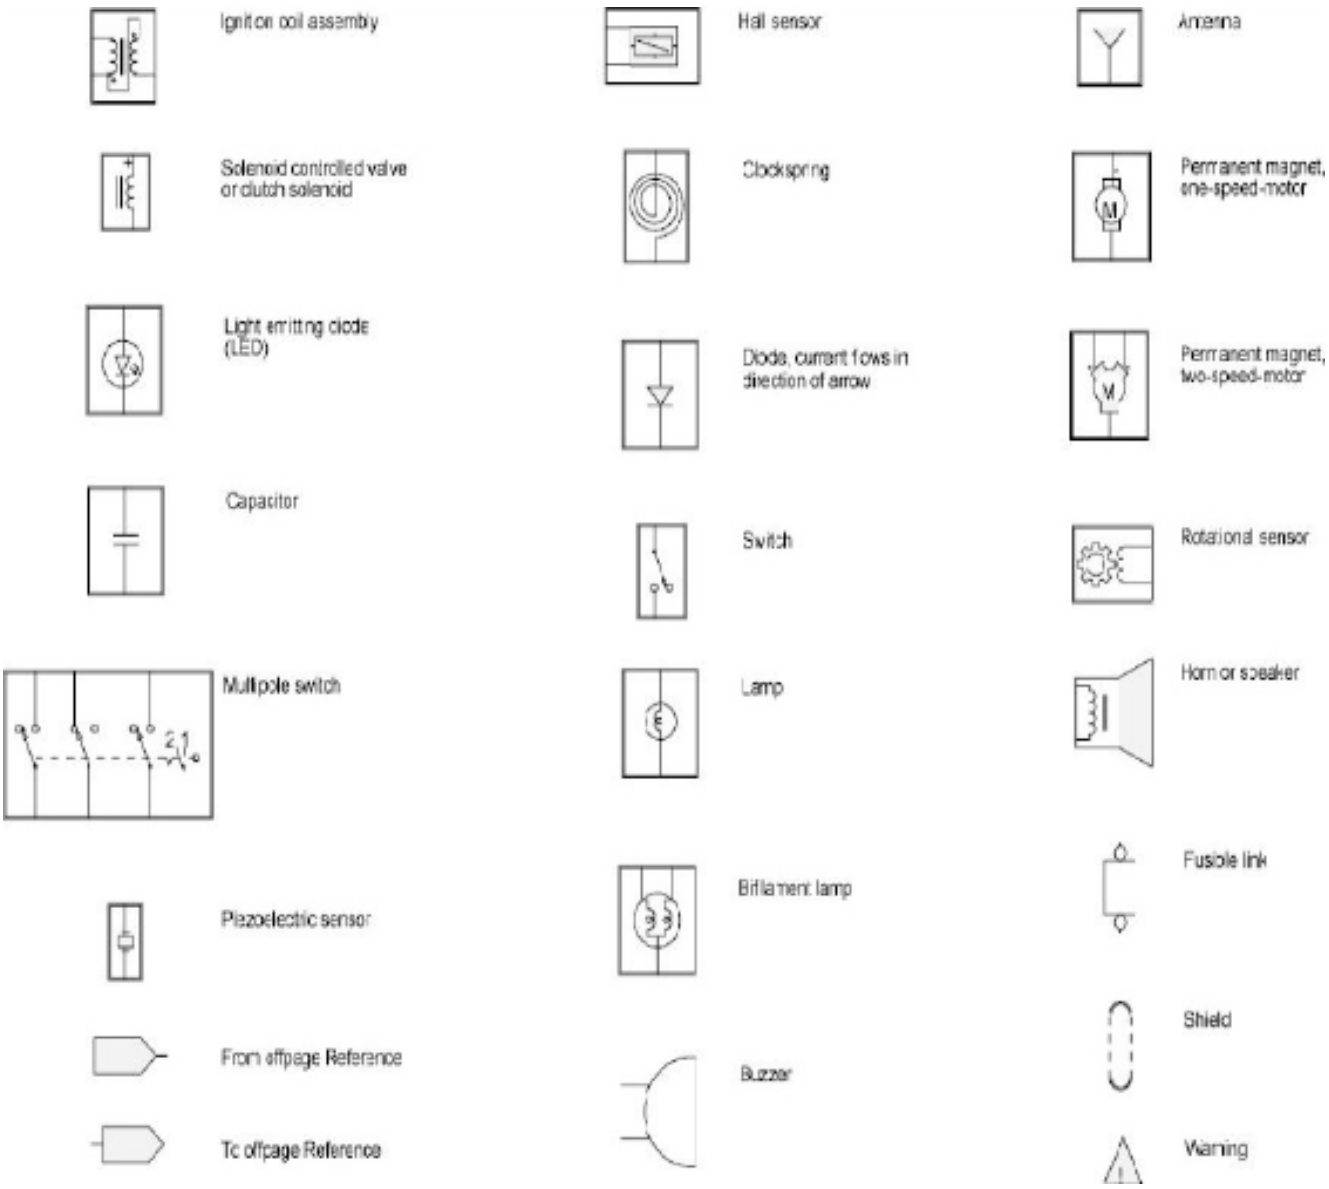
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

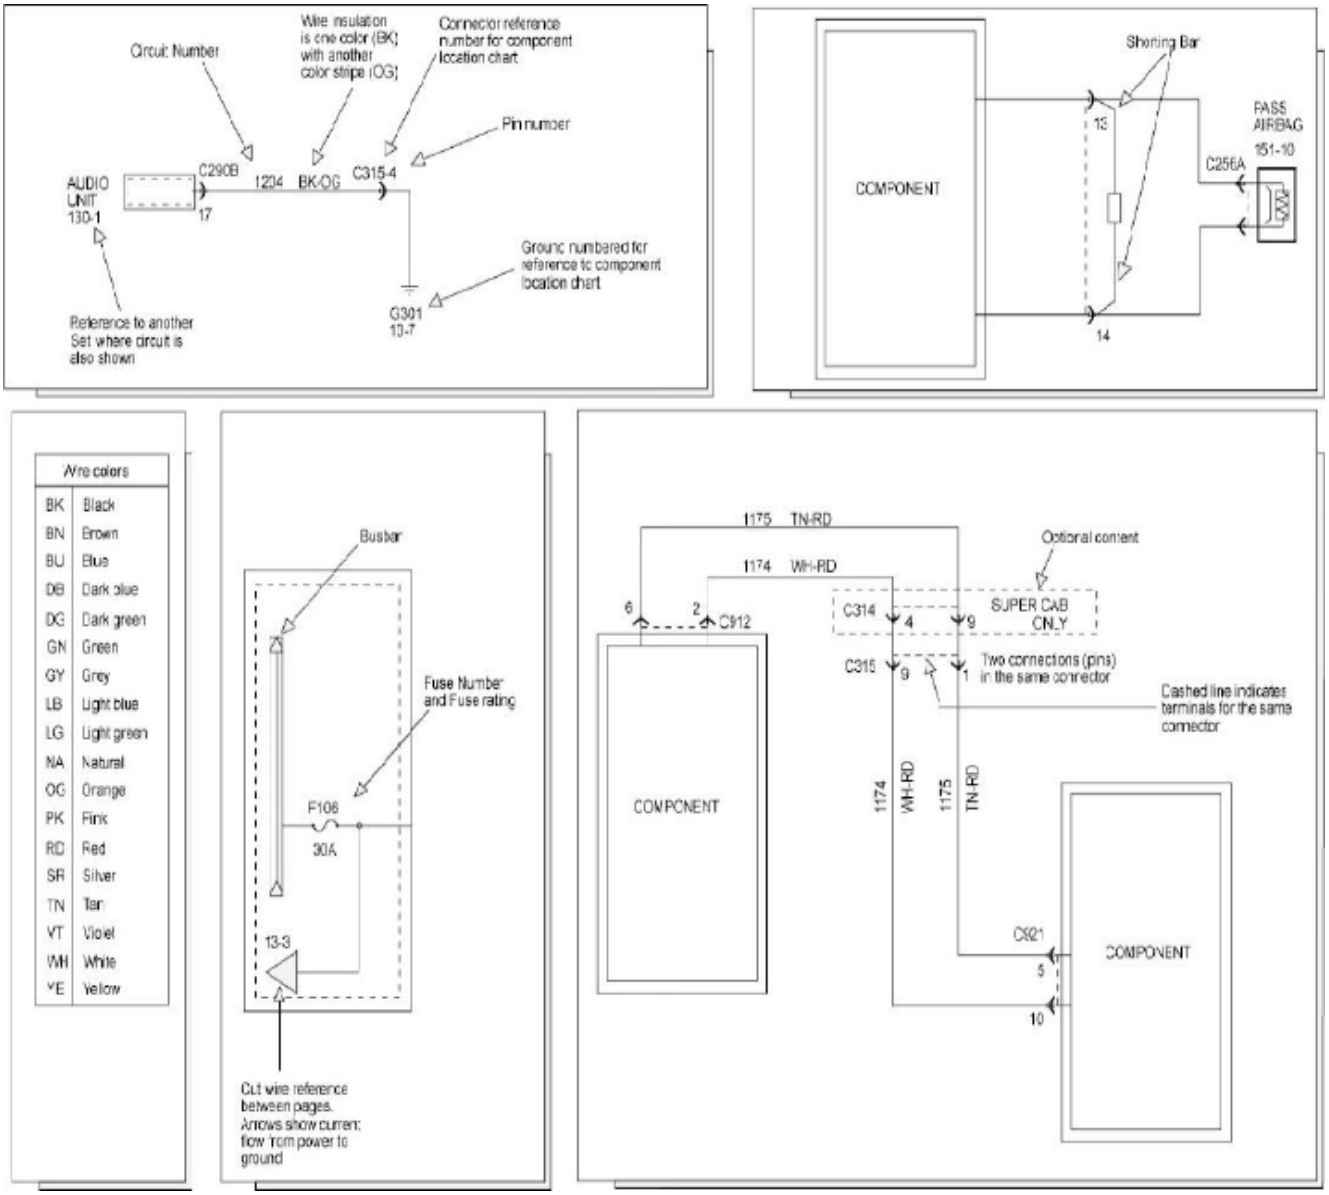
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

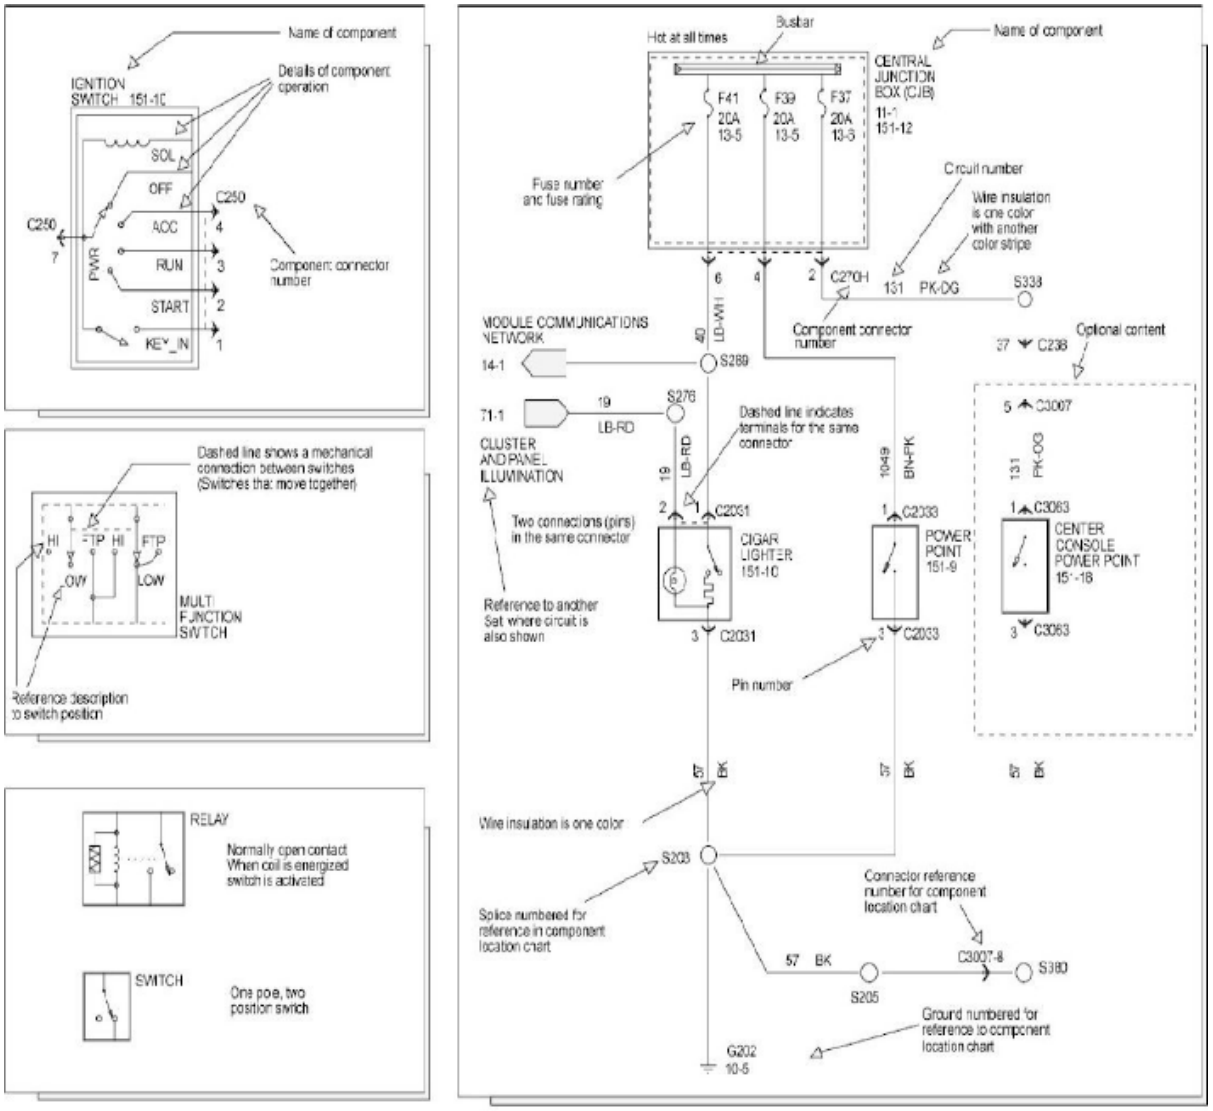
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Turn Signal Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

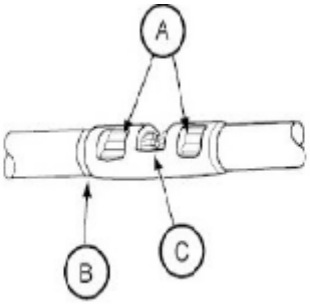
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

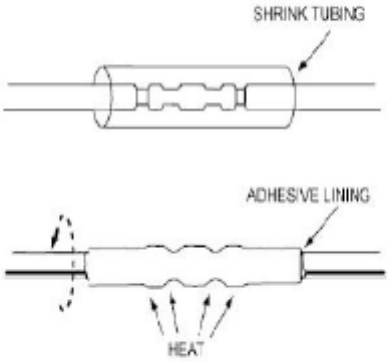
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x dia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

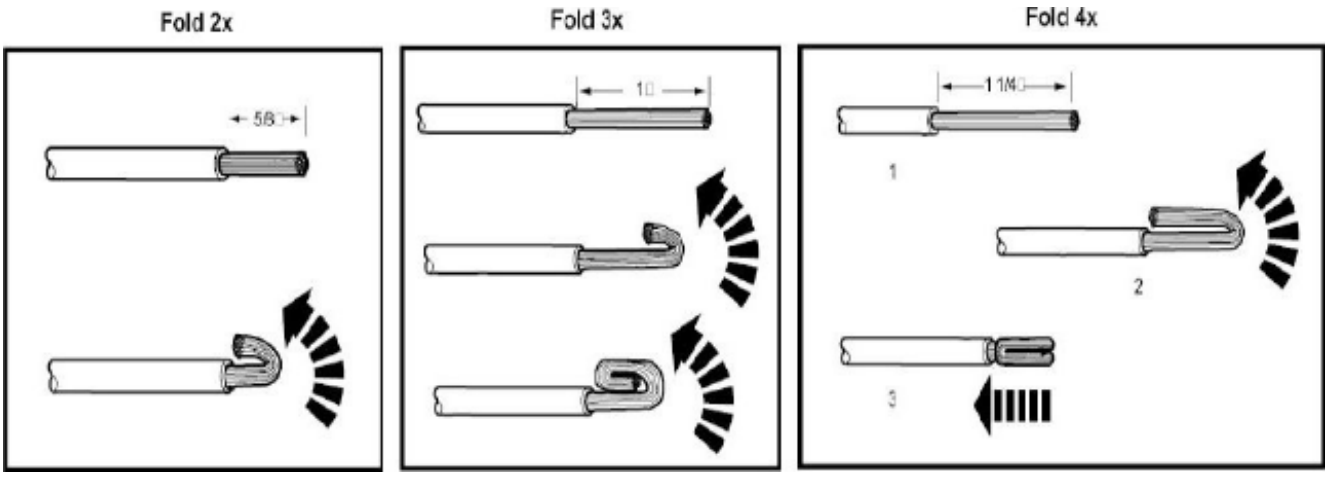
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals

The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

Turn Signal Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic

Terminals

Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Brake Light Switch: Description and Operation

BRAKE PEDAL POSITION (BPP) SWITCH

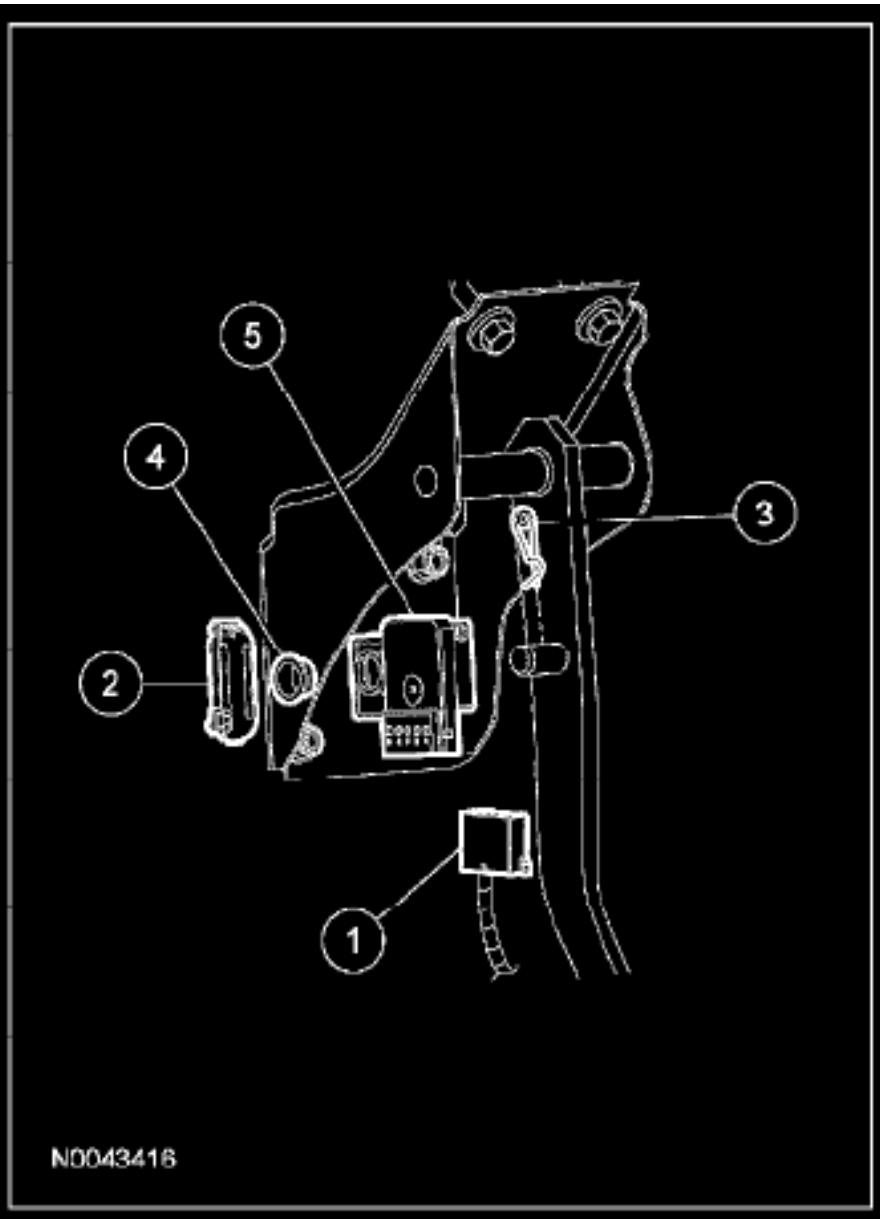
Typical BPP Switch

The BPP switch is sometimes referred to as the stoplamp switch. The BPP switch provides a signal to the PCM indicating that the brakes are applied. The BPP switch is normally open and is mounted on the brake pedal support. Depending on the vehicle application the BPP switch can be hardwired as follows:

- to the PCM supplying battery positive voltage (B+) when the vehicle brake pedal is applied.

- to the antilock brake system (ABS) module, or lighting control module (LCM), the BPP signal is then broadcast over the network to be received by the PCM.

- to the ABS traction control/stability assist module. The ABS module interprets the BPP switch input along with other ABS inputs and generates an output called the driver brake application (DBA) signal. The DBA signal is then sent to the PCM and to other BPP signal users.



Item	Part Number	Description
1	—	Stoplamp switch electrical connector (part of 14401)
2	2475	Stoplamp switch self-locking pin cover

Steering Column Multifunction Switch

Steering Column Multifunction Switch

Removal and Installation

1. Remove the ignition switch lock cylinder.

1 Insert the ignition key into the ignition switch lock cylinder and turn to the RUN position.

2 Push the ignition switch lock cylinder release tab with a punch while pulling out the ignition switch lock cylinder.

2. If equipped, remove the tilt release lever/ handle.

3. Remove the 3 steering column shroud screws and the upper and lower steering column shrouds. 4. Disconnect the multi-function switch electrical connectors. 5. Remove the 2 multi-function switch screws and the multi-function switch.

^ To install, tighten to 3 Nm (27 lb-inch).

6. To install, reverse the removal procedure.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step by step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals

The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

Tail Lamp: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

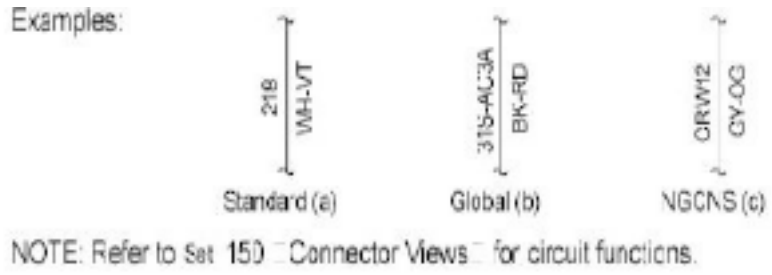
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

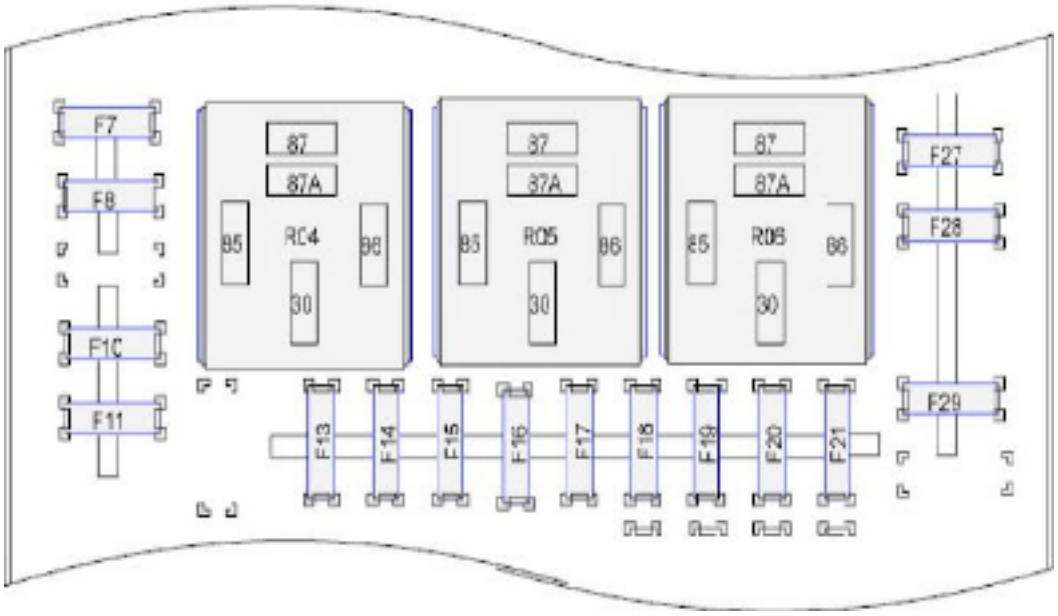
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

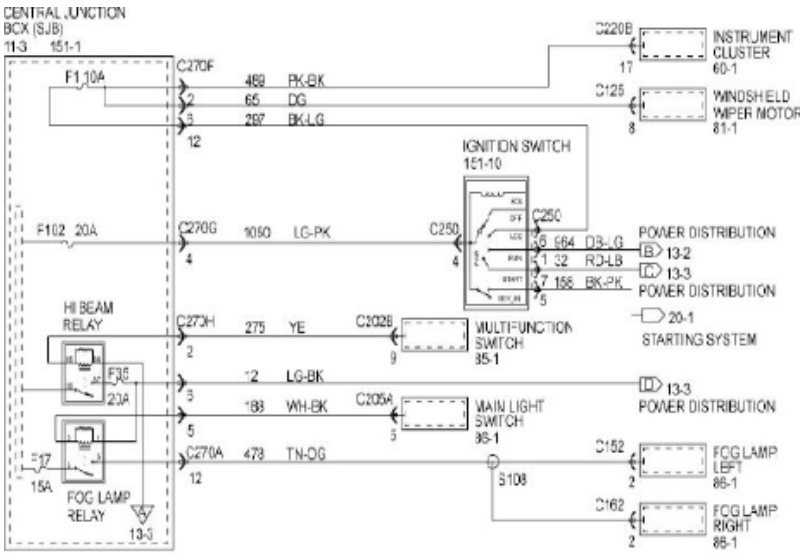
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

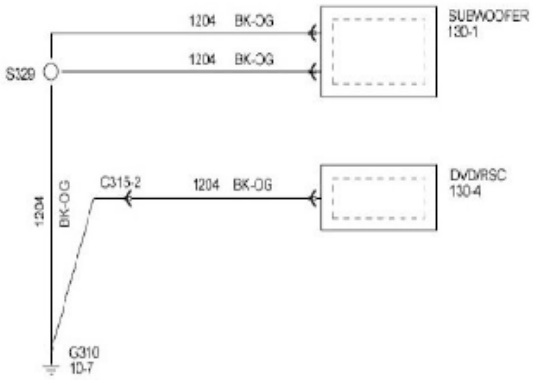
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

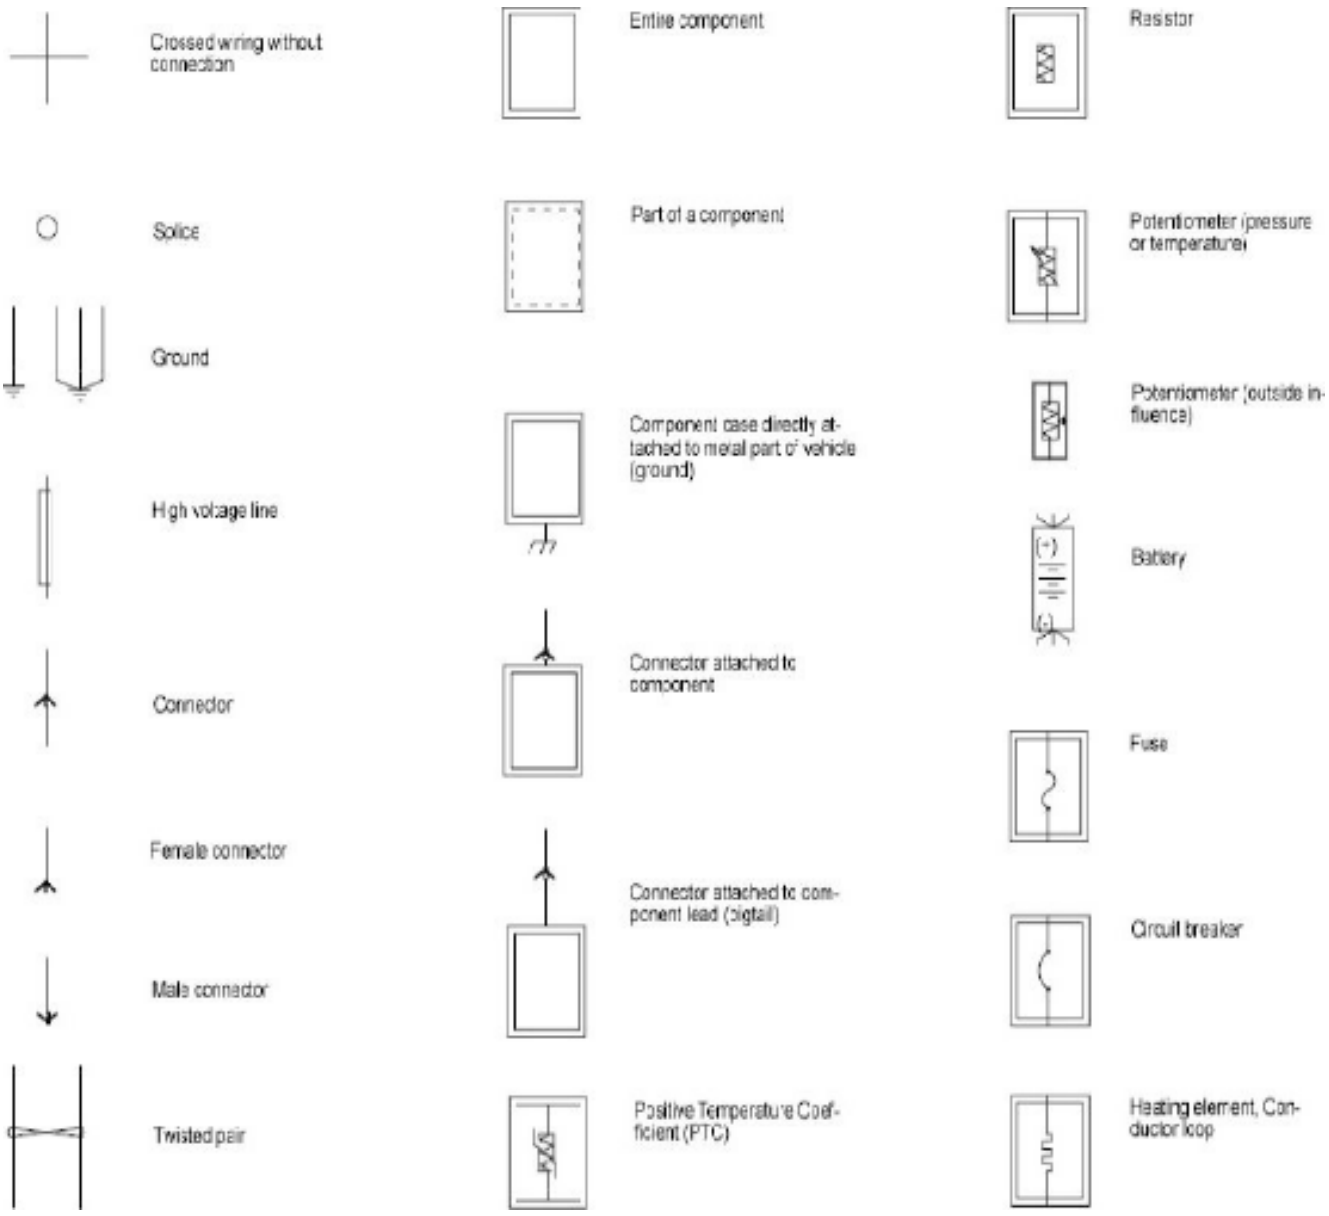
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

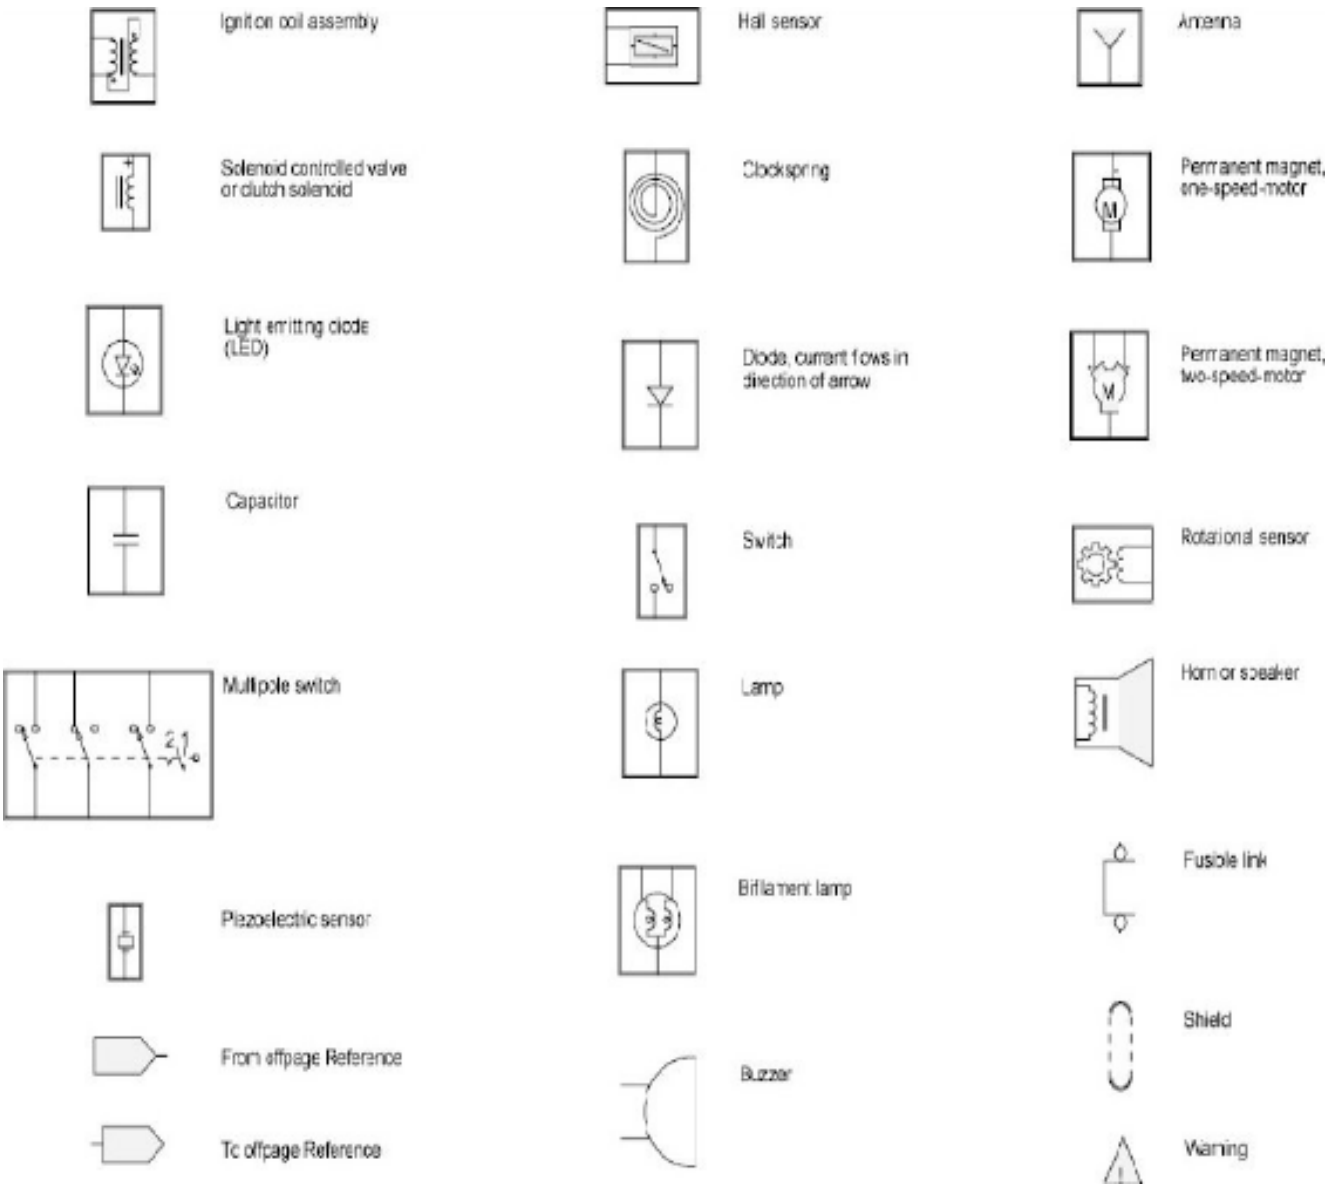
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

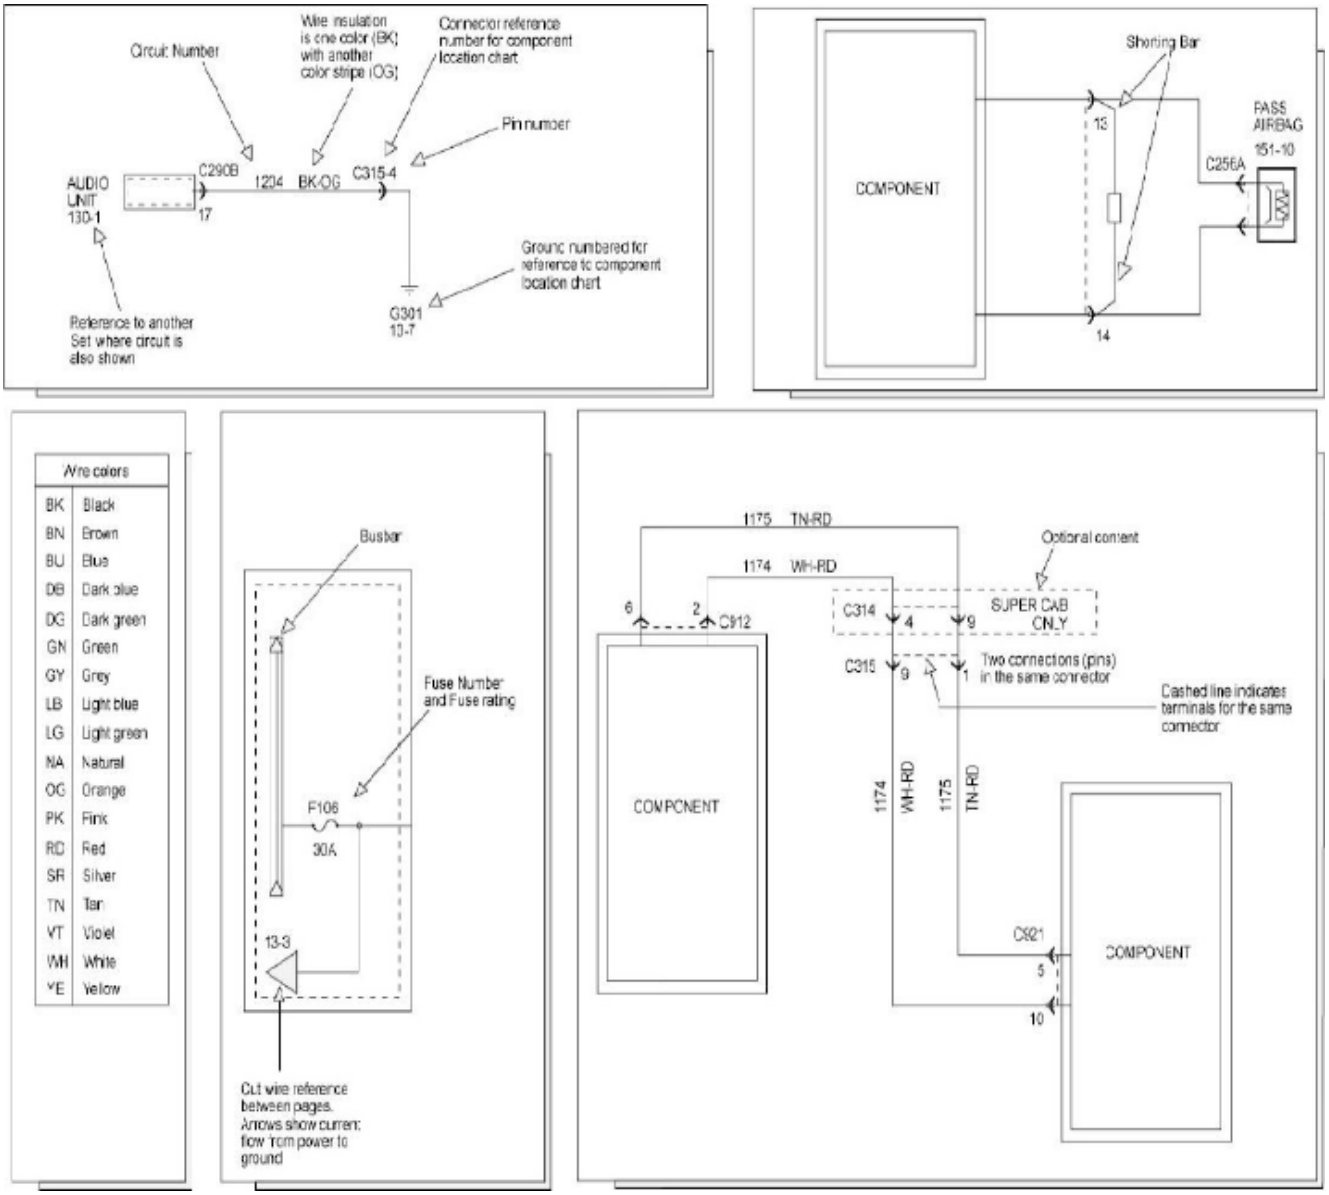
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

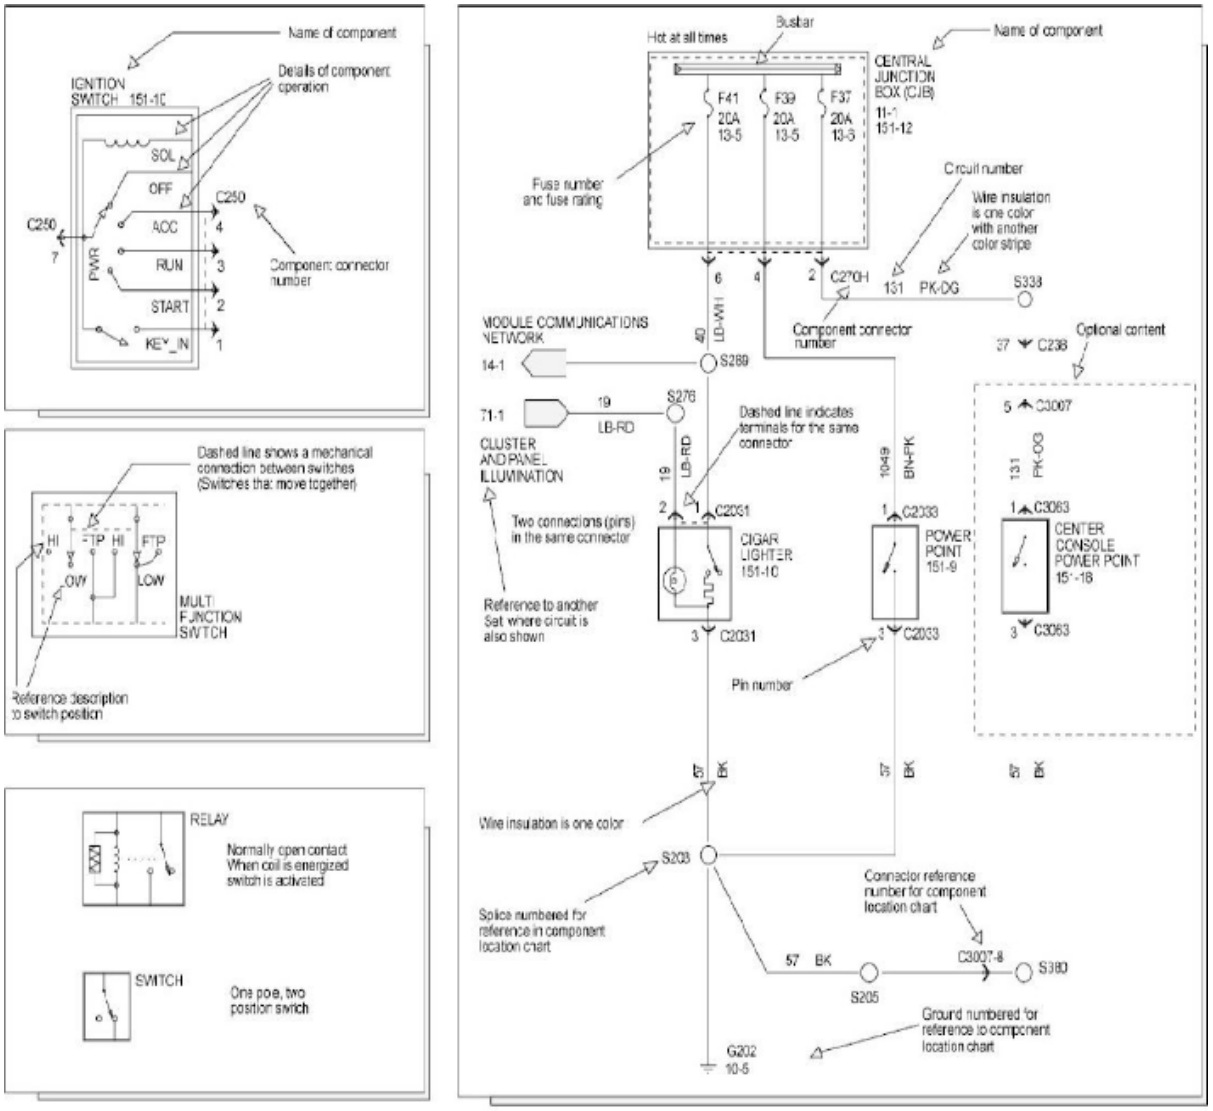
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left

Tail Lamp: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

WIRE STOPPER

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

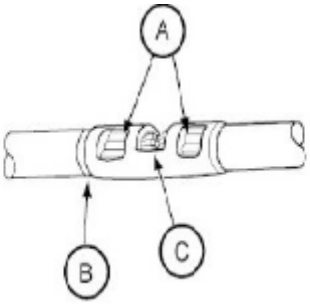
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

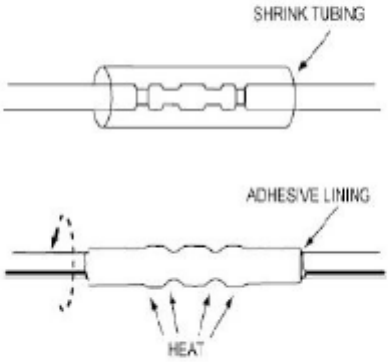
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x cia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Figtail only

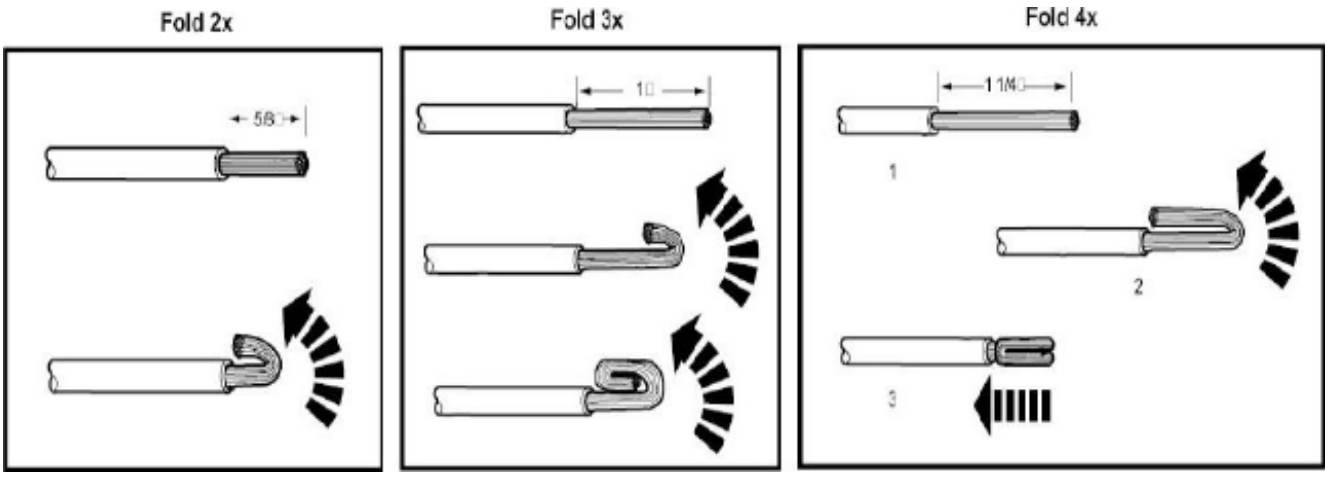
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Trailer Lamps: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

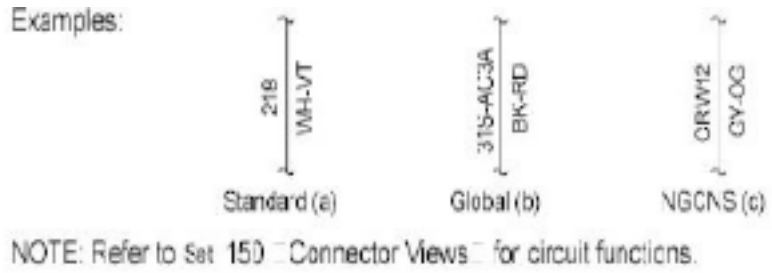
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

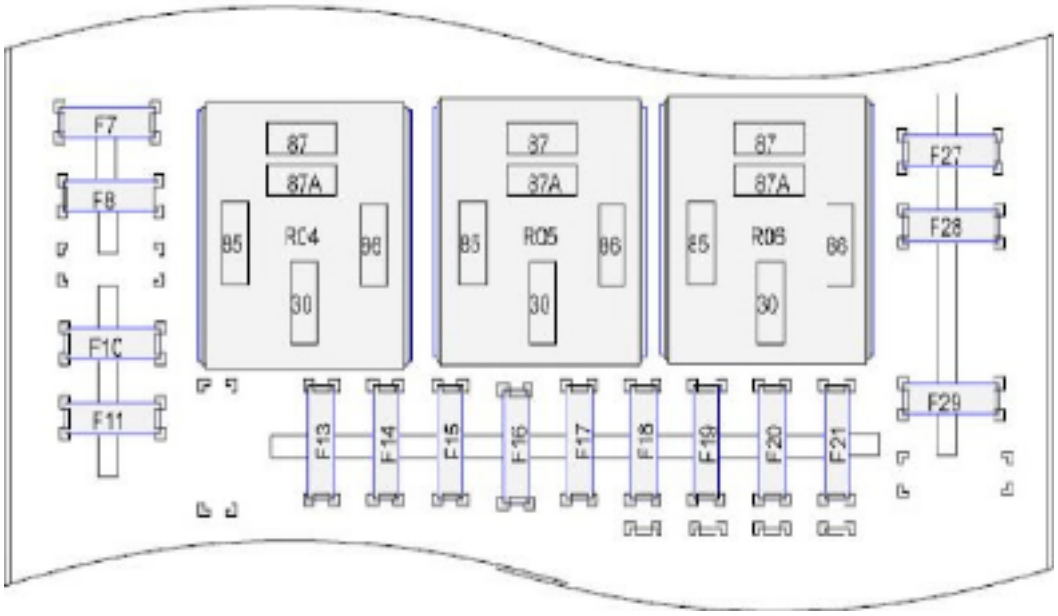
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

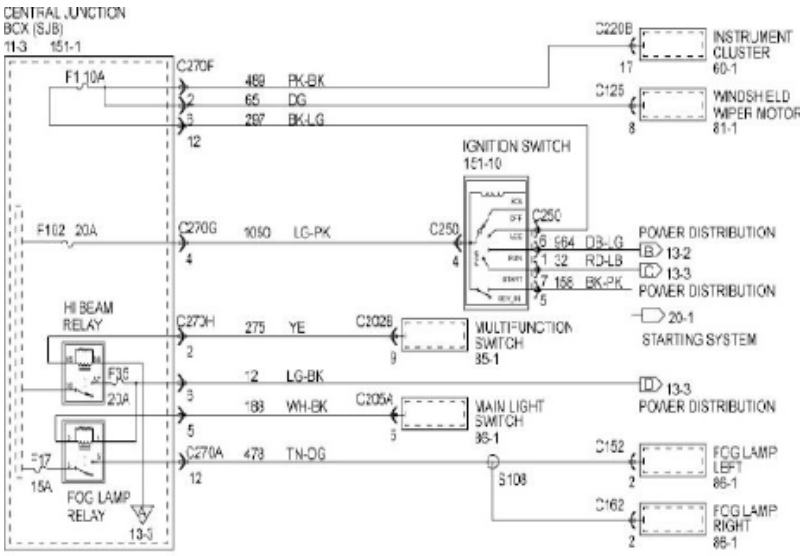
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

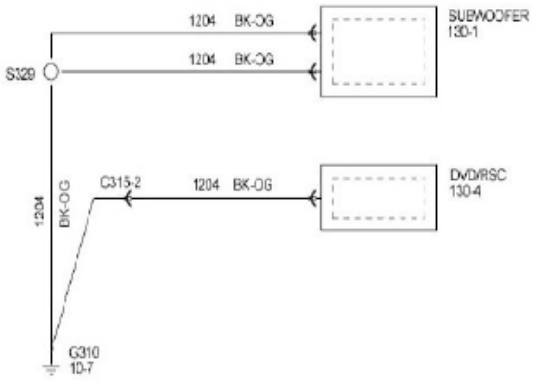
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

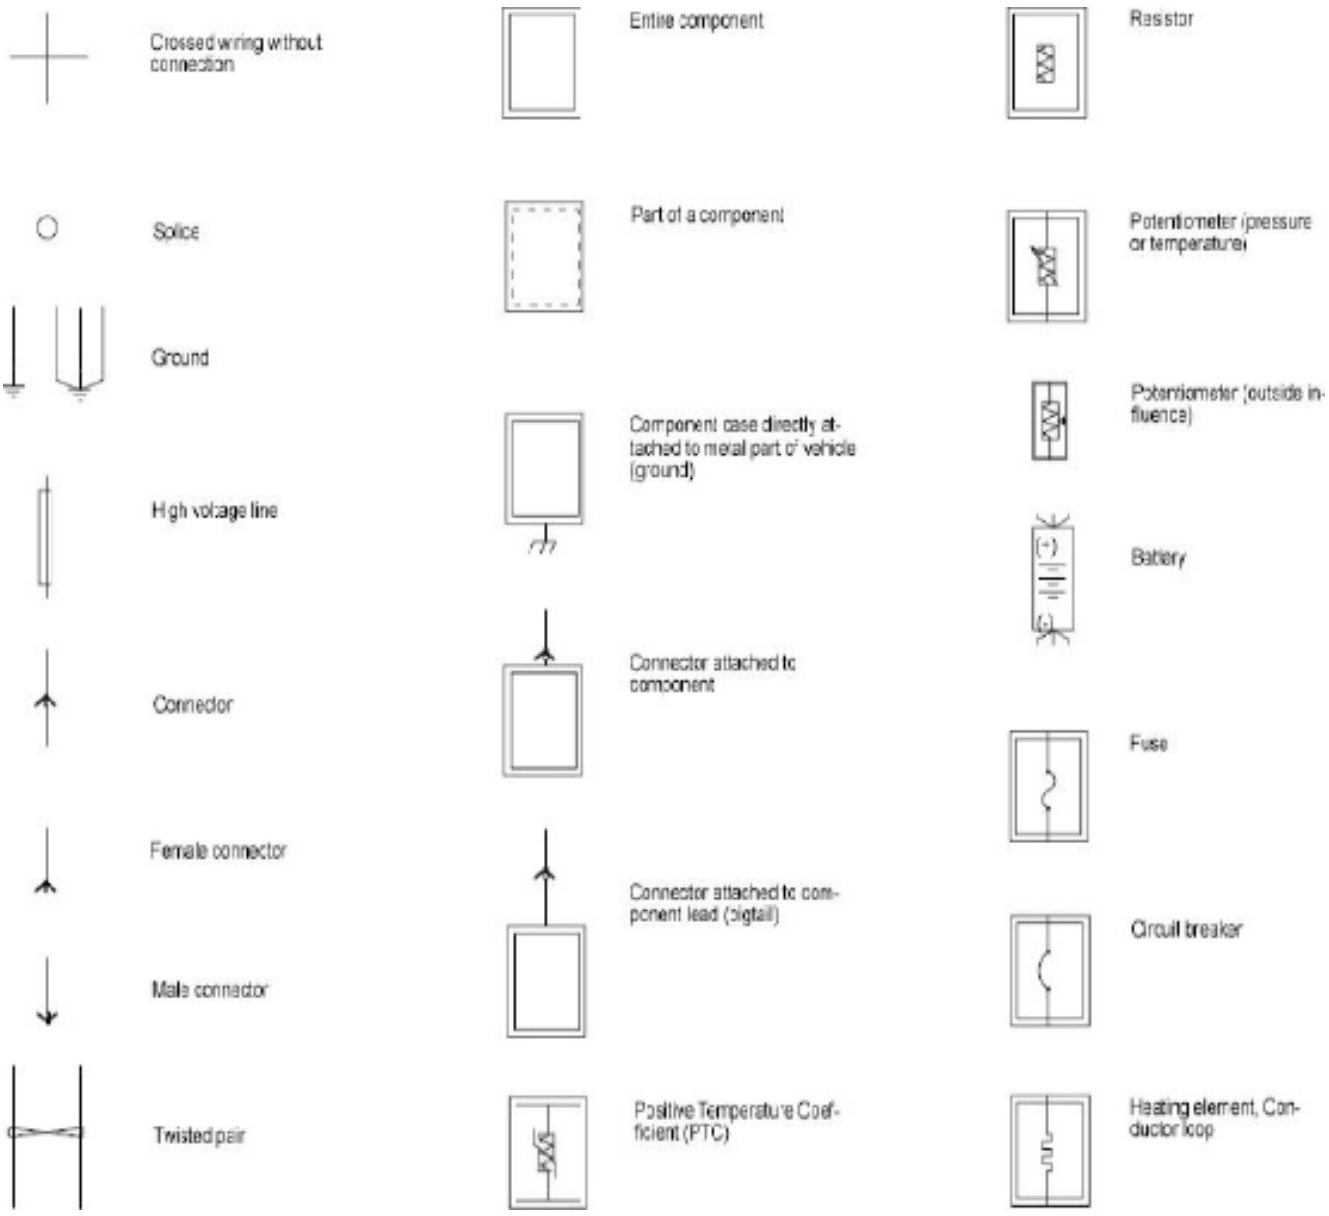
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

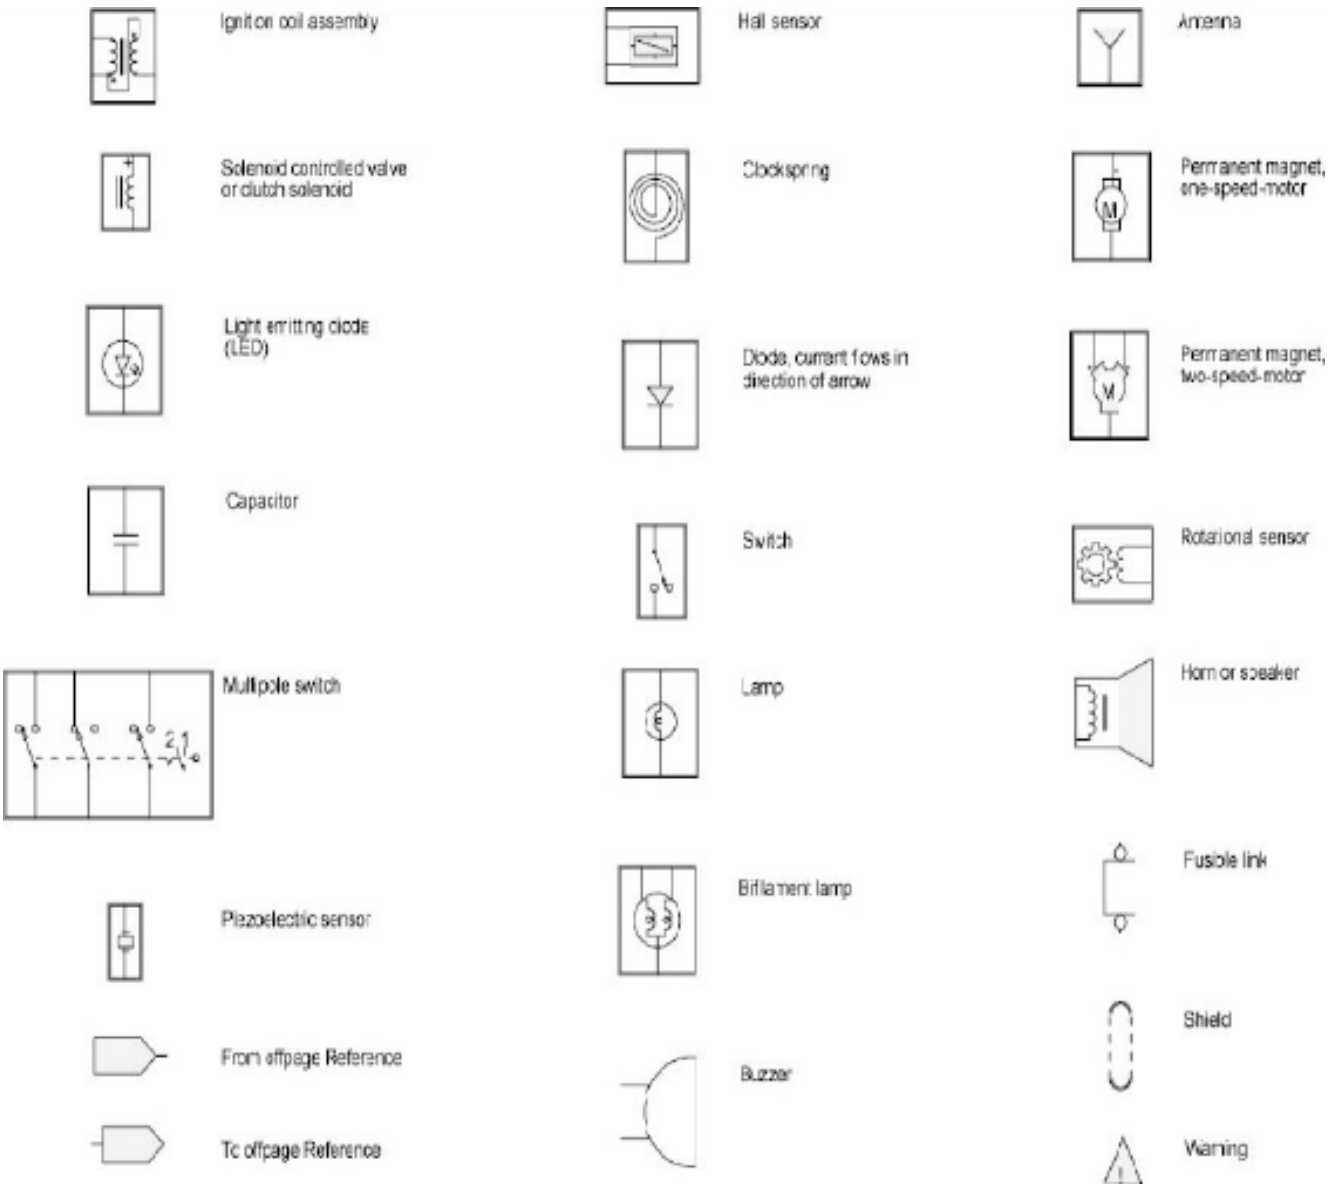
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

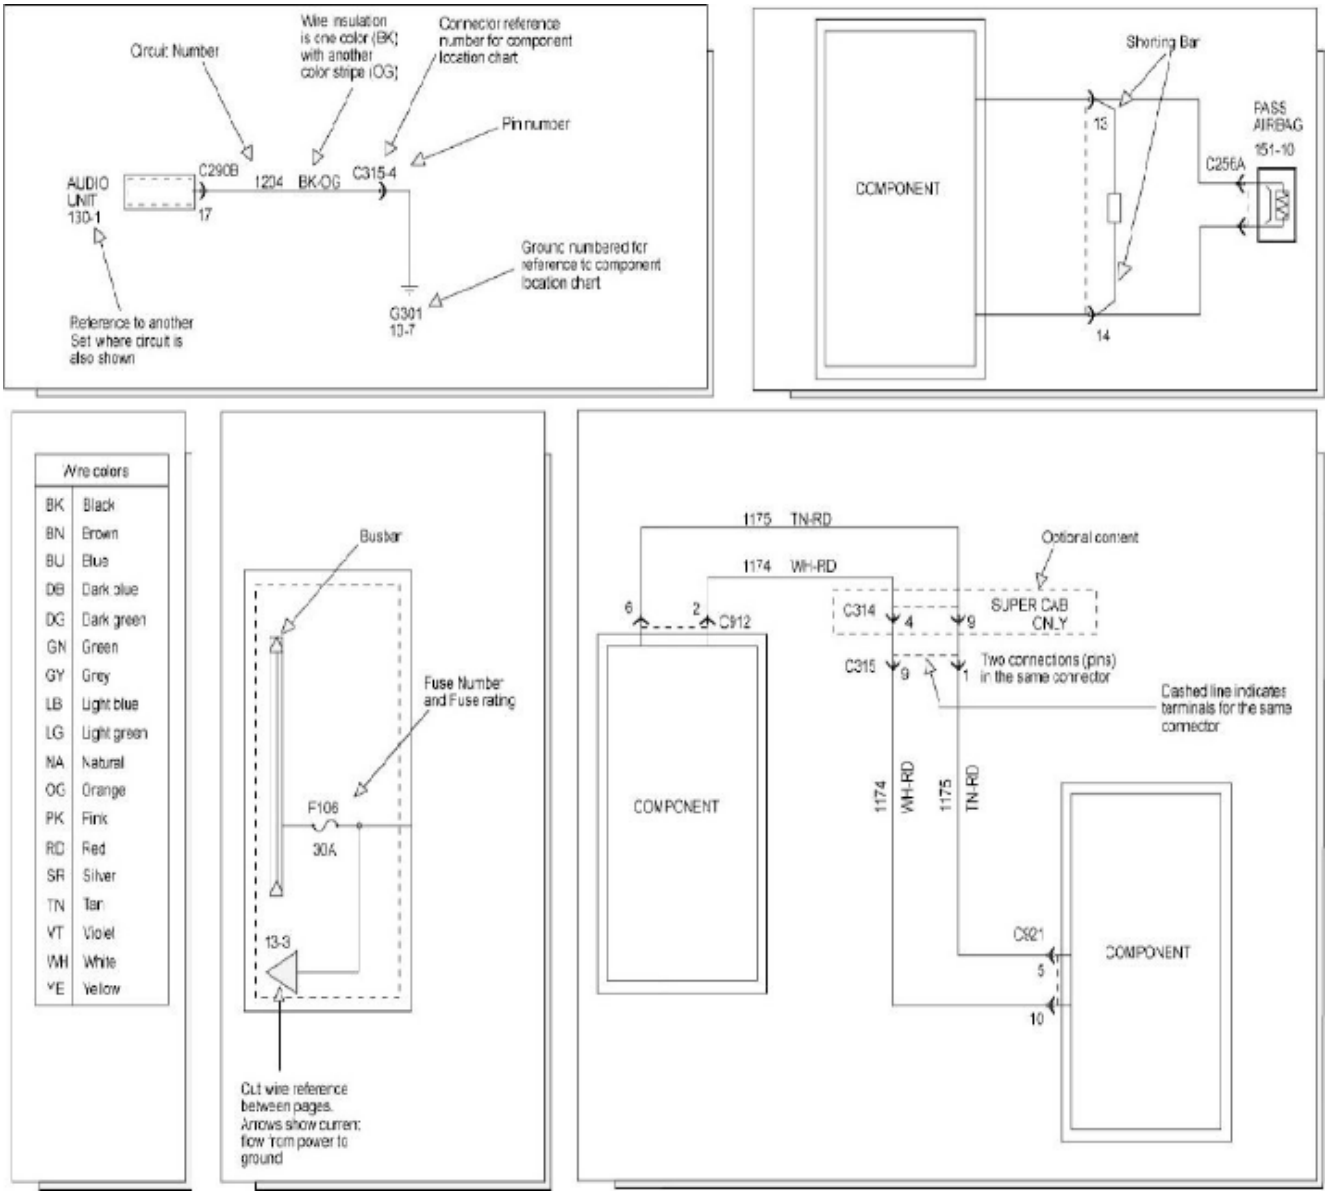
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

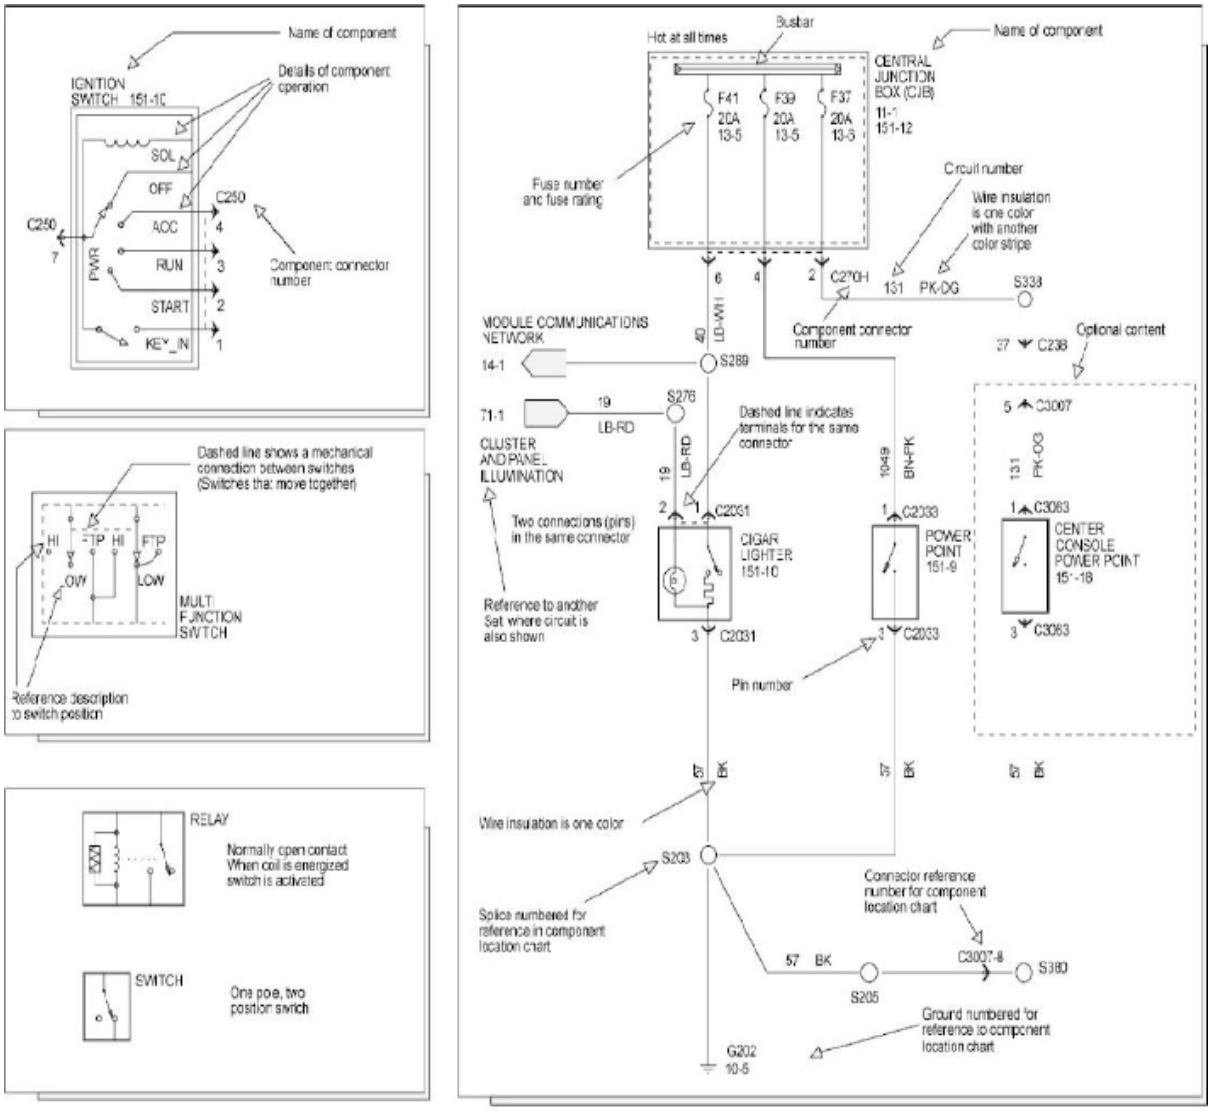
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Trailer Lamps: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Defective insulation stripping

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

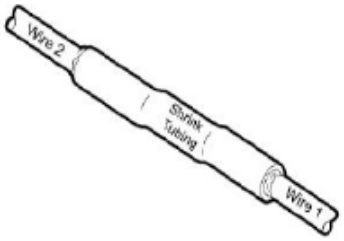
NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.



Wire 2

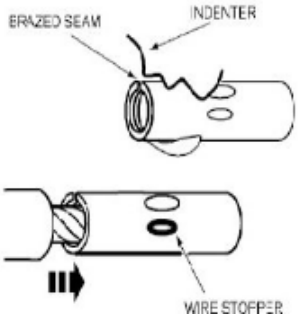
CRIMPING CHAMBER



BRAZED SEAM
INDENTER
WIRE STOPPER

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

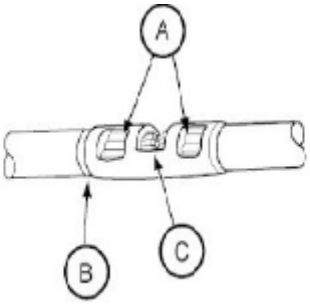
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

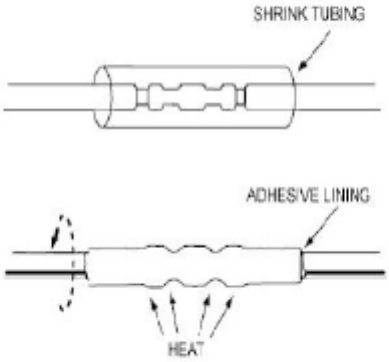
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x cia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Figtail only

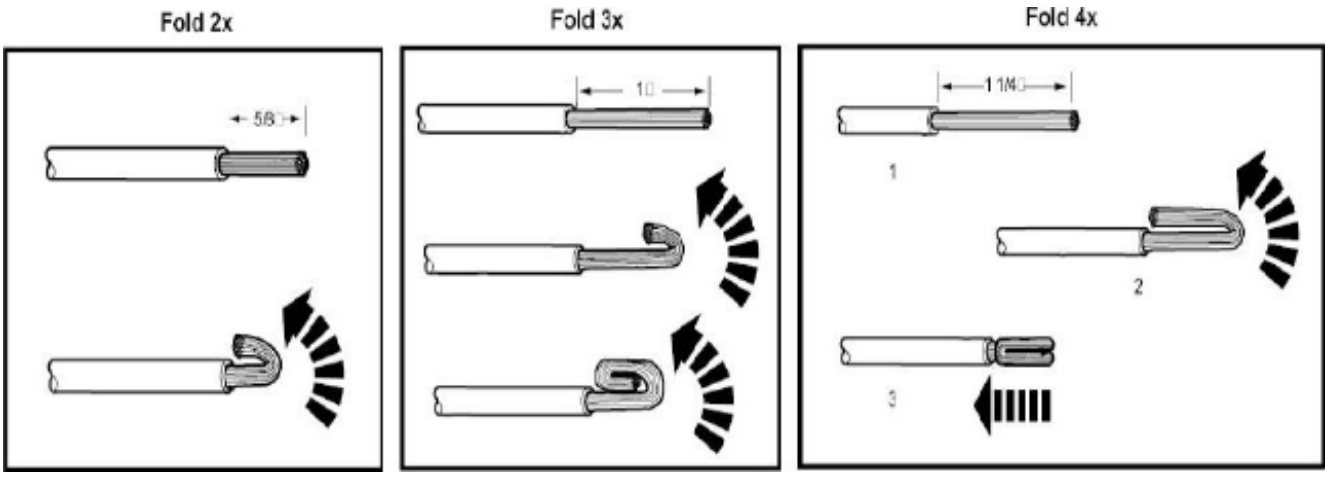
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Trailer Lamps: Electrical Diagrams

PLEASE NOTE: Some diagrams may appear to be missing because of gaps in the number sequences. These "gaps" are actually for diagrams that do not apply to the vehicle model selected.

95-1

Diagrams: Other diagrams referred to by number (i.e. 13-2, 24-6, 10-2, etc.) within these diagrams can be found at Diagrams By Number. See:

Diagrams/Electrical Diagrams/Diagrams By Number

Locations: Location Views (reference numbers starting with 151-) referred to within these diagrams can be found at Location Views. See: Locations/Component Locations

Trailer Lamps: Initial Inspection and Diagnostic Overview

Principles of Operation

PRINCIPLES OF OPERATION

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

Circuitry is supplied to the trailer tow connector to support trailer parking lamps and stop/turn lamp functionality. When the vehicle parking lamps are on, the smart junction box (SJB) supplies voltage to the trailer tow connector for the trailer parking lamps. When the vehicle stop/turn lamps are operating, voltage is supplied to the trailer tow connector for the trailer stop/turn lamps.

Inspection and Verification

INSPECTION AND VERIFICATION

1. Verify the customer concern. 2. Verify the exterior lighting system of the vehicle is operating correctly. If not, refer to the appropriate pinpoint test. 3. Visually inspect for obvious signs of electrical damage.

VISUAL INSPECTION CHART

Electrical -

Battery junction box (BJB) fuse(s): -

38 (7.5A) (trailer tow RH stoplamp)

- 42 (7.5A) (trailer tow LH stoplamp)

- Smart junction box (SJB) fuse 2 (10A) (trailer tow parking lamps)

- Wiring, terminals or connectors

- Bulb(s)

- SJB

4. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step. 5. If the concern is not visually evident, verify the symptom. GO to Symptom Chart. See: Symptom Related Diagnostic Procedures

Symptom Chart

Condition	Possible Sources	Action
• All the trailer lamps are inoperative	• Wiring, terminals or connectors • Trailer	• GO to Pinpoint Test T.
• The trailer parking lamps are inoperative	• Fuse • Wiring, terminals or connectors • Smart junction box (SJB) • Trailer	• GO to Pinpoint Test U.

Symptom Chart (Continued)

Condition	Possible Sources	Action
• The individual trailer lamp is inoperative	• Fuse • Wiring, terminals or connectors • Trailer	• GO to Pinpoint Test V.

Trailer Lamps: Symptom Related Diagnostic Procedures

Symptom Chart (Part 1)

Symptom Chart (Part 2)

PINPOINT TEST T: ALL THE TRAILER LAMPS ARE INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step		Result / Action to Take
T1	**CHECK CIRCUIT RAT08 (WH) FOR AN OPEN** • Key in OFF position. • Disconnect: Trailer Tow C439. • Measure the resistance between the trailer tow C439-4, circuit RAT08 (WH), harness side and ground.  A0056326 • **Is the resistance less than 5 ohms?**	**Yes** The vehicle is operating correctly. SEND the trailer to an authorized camper/trailer repair facility. **No** REPAIR the circuit. TEST the system for normal operation.

Trailer Lamps: Pinpoint Tests

Test T: All The Trailer Lamps Are Inoperative

PINPOINT TEST T: ALL THE TRAILER LAMPS ARE INOPERATIVE

Normal Operation

The trailer tow connector is provided ground through circuit RAT08 (WH) for the trailer lamps.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors

- Trailer

T1

Test U: The Trailer Parking Lamps Are Inoperative

PINPOINT TEST U: THE TRAILER PARKING LAMPS ARE INOPERATIVE

Normal Operation

When the parking lamps are on, the smart junction box (SJB) provides voltage to the trailer tow connector through circuit CAT17 (BN/WH).

This pinpoint test is intended to diagnose the following:

- Fuse

- Wiring, terminals or connectors
- Trailer
- SJB

PINPOINT TEST U: THE TRAILER PARKING LAMPS ARE INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
U1 CHECK CIRCUIT CAT17 (BN/WH) FOR VOLTAGE • Key in OFF position. • Disconnect: Trailer Tow C439. • Place the headlamp switch in the PARKING LAMPS ON position. • Measure the voltage between the trailer tow C439-3, circuit CAT17 (BN/WH), harness side and ground.  A0056330 • **Is the voltage greater than 10 volts?**	**Yes** The vehicle is operating correctly. SEND the trailer to an authorized camper/trailer repair facility. **No** VERIFY the SJB fuse 2 (10A) is OK. If OK, GO to **U2**.
U2 CHECK CIRCUIT CAT17 (BN/WH) FOR AN OPEN • Place the headlamp switch in the OFF position. • Disconnect: SJB C2280c. • Measure the resistance between the SJB C2280c-25, circuit CAT17 (BN/WH), harness side and the trailer tow C439-3, circuit CAT17 (BN/WH), harness side.  N0072921 • **Is the resistance less than 5 ohms?**	**Yes** GO to **U3**. **No** REPAIR the circuit. TEST the system for normal operation.
U3 CHECK FOR CORRECT SJB OPERATION • Disconnect all the SJB connectors. • Check for: — corrosion — damaged pins — pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Test V: The Individual Trailer Lamp Is Inoperative

PINPOINT TEST V: THE INDIVIDUAL TRAILER LAMP IS INOPERATIVE

Normal Operation

When the brake pedal is applied, voltage is provided to the trailer tow connector for the LH and RH trailer stoplamps through circuits CAT06 (YE) and CAT09 (GN), respectively.

This pinpoint test is intended to diagnose the following:

- Fuse

- Wiring, terminals or connectors

- Trailer

PINPOINT TEST V: THE INDIVIDUAL TRAILER LAMP IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step		Result / Action to Take
V1	DETERMINE THE INOPERATIVE TRAILER LAMP	
	• Place the headlamp switch in the PARKING LAMPS ON position. • While applying and releasing the brake pedal, observe the trailer tow lamps. • **Is an individual trailer parking lamp inoperative?**	**Yes** The vehicle is operating correctly. SEND the trailer to an authorized camper/trailer repair facility. **No** GO to **V2**.
V2	CHECK CIRCUIT CAT06 (YE) (LH STOPLAMP) OR CIRCUIT CAT09 (GN) (RH STOPLAMP) FOR AN OPEN	
	• While applying the brake pedal, measure the voltage between the trailer tow C439-2, circuit CAT06 (YE) (LH stoplamp), harness side and ground; or between the trailer tow C439-1, circuit CAT09 (GN) (RH stoplamp), harness side and ground.  A0056327 • **Is the voltage greater than 10 volts?**	**Yes** The vehicle is operating correctly. SEND the trailer to an authorized camper/trailer repair facility. **No** VERIFY the SJB fuse 42 (7.5A) (LH stoplamp) or fuse 38 (7.5A) (RH stoplamp) is OK. If OK, REPAIR the circuit in question. TEST the system for normal operation.

Trailer Lighting Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

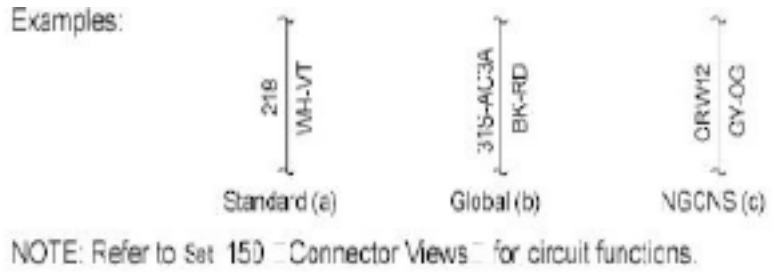
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

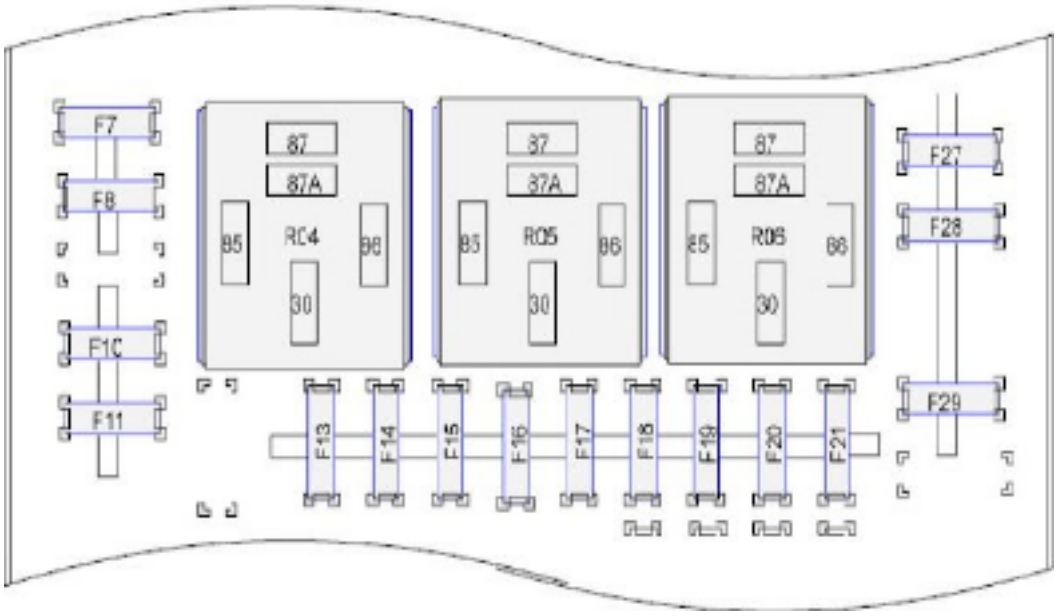
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

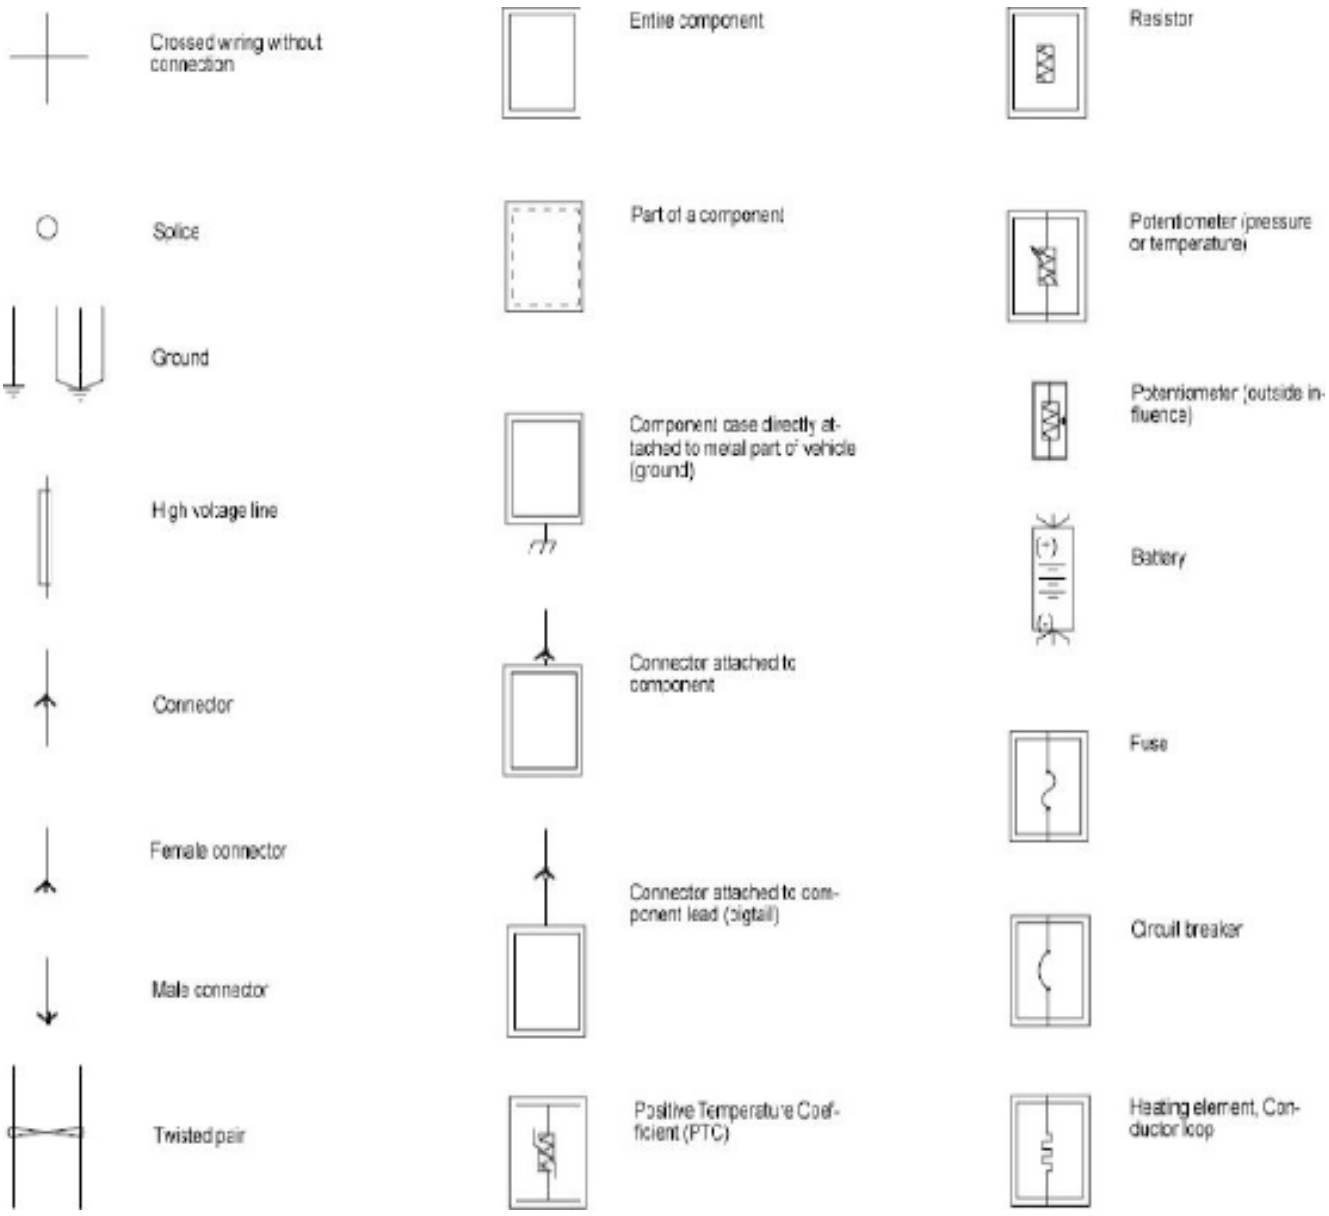
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

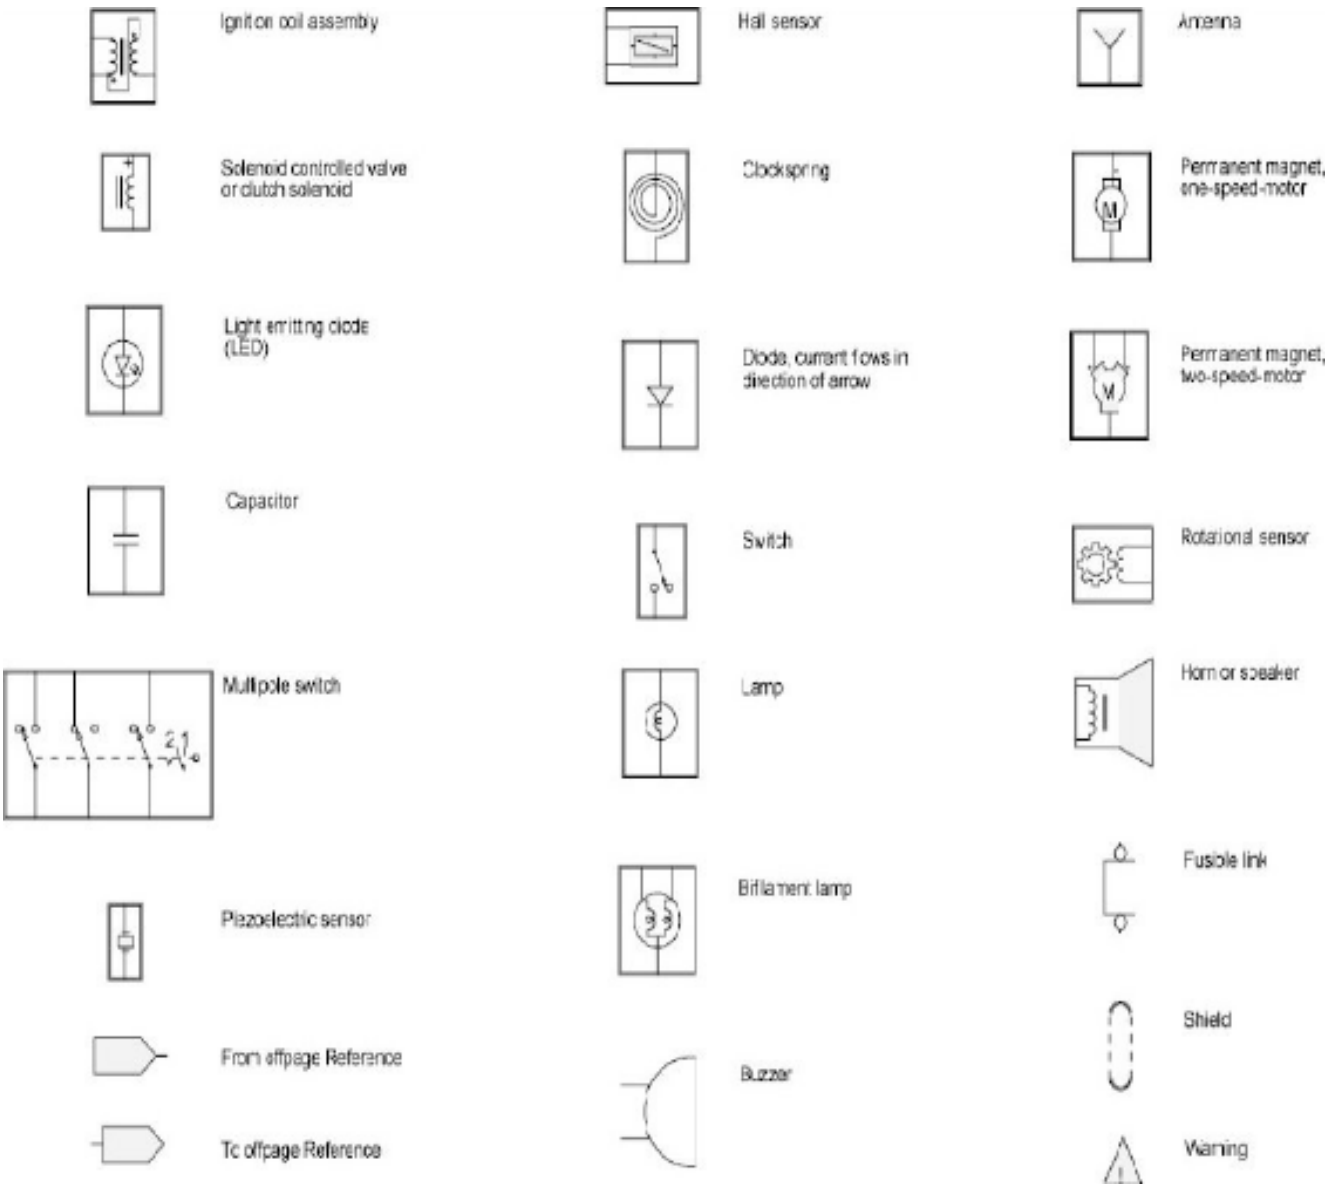
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

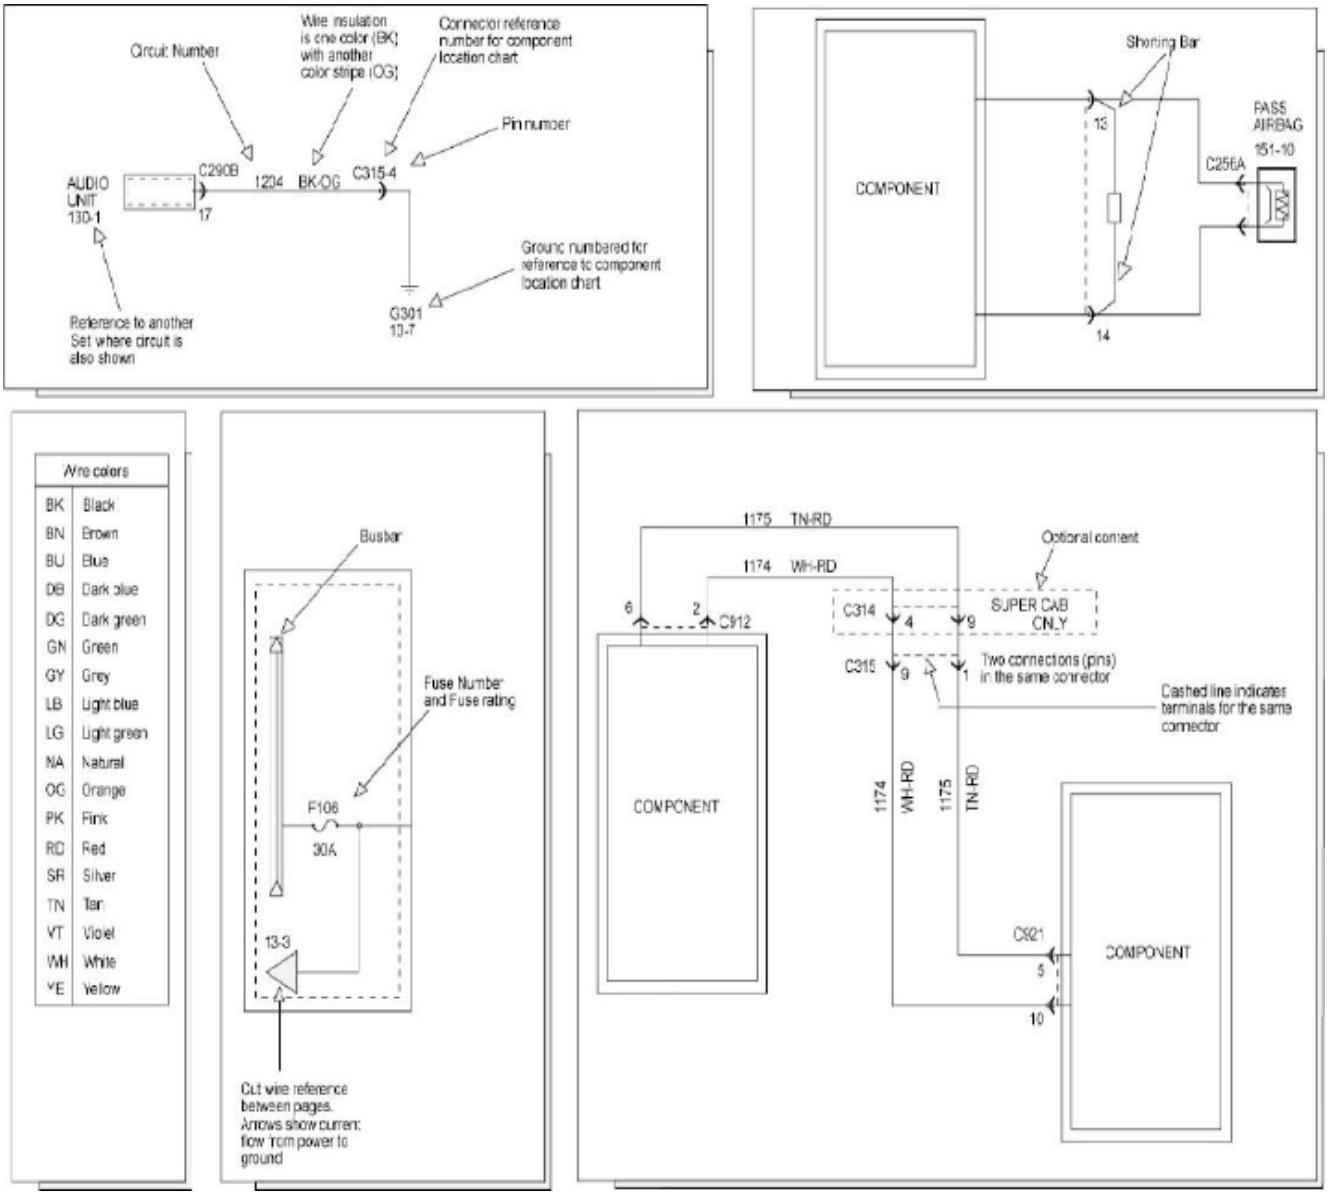
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

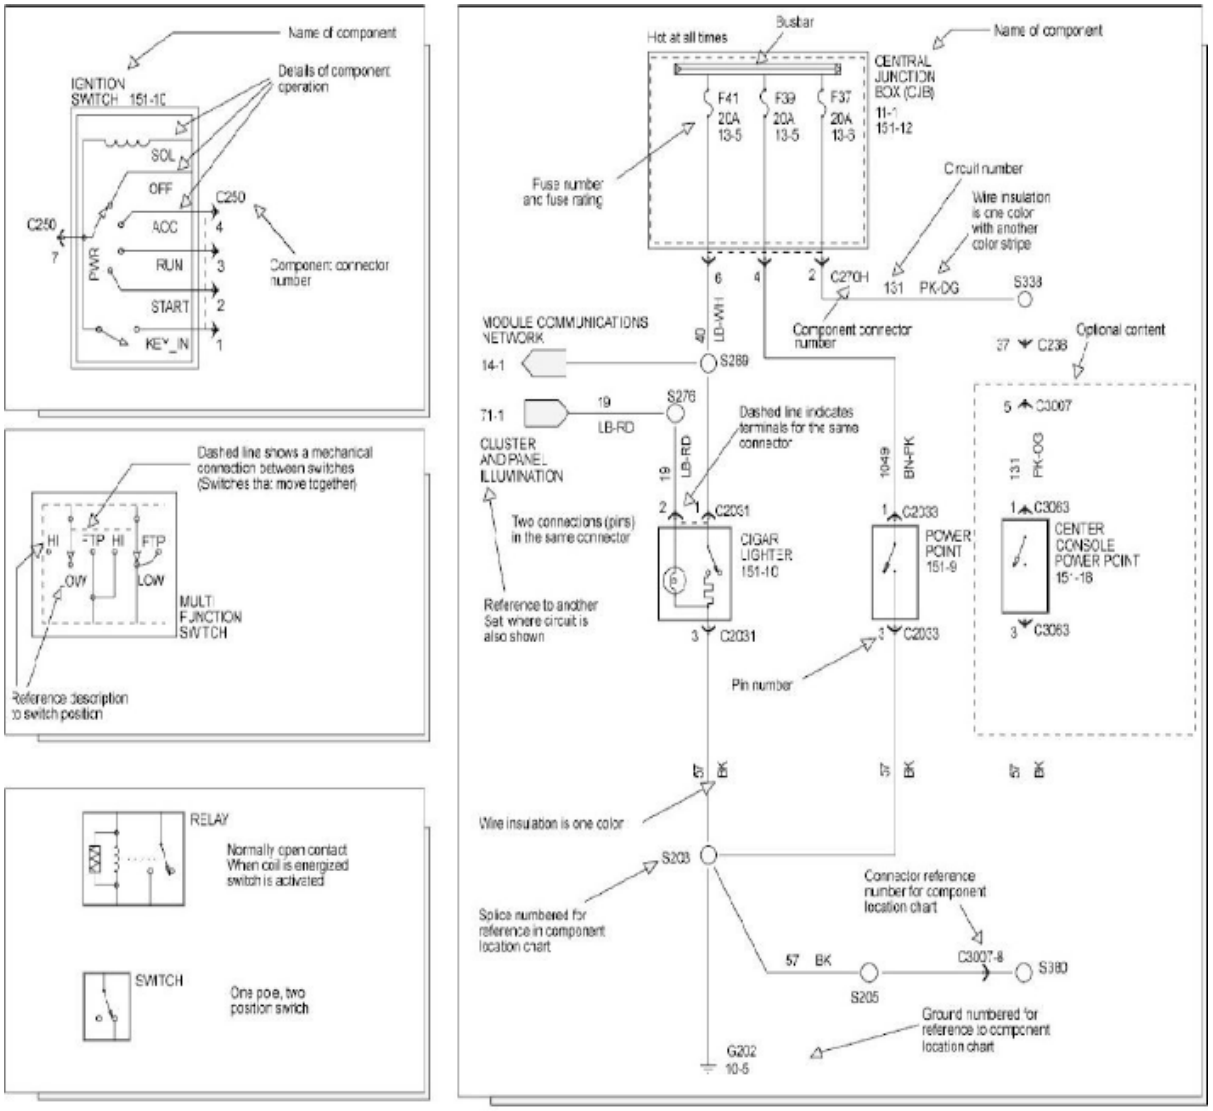
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right

Trailer Lighting Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

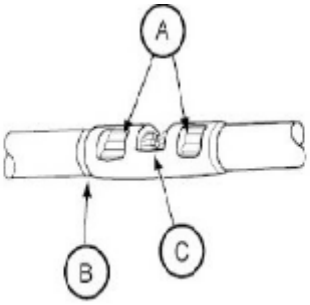
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

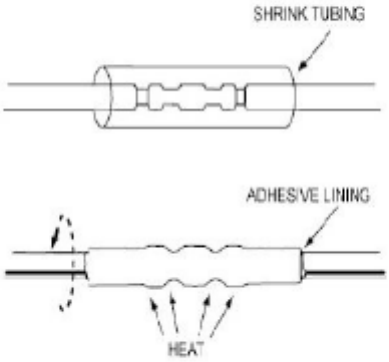
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4□ strip, cut 9 strands	* 1/4□ strip, cut 2 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip, fold 3x dia.
	16-14	* 1/4□ strip, cut 7 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip fold 2x dia	1□ strip, fold 3x dia.	1 1/4□ strip, fold 4x dia.	Not Recommended
	12-10	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip fold 3x cia.	1 1/4□ strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

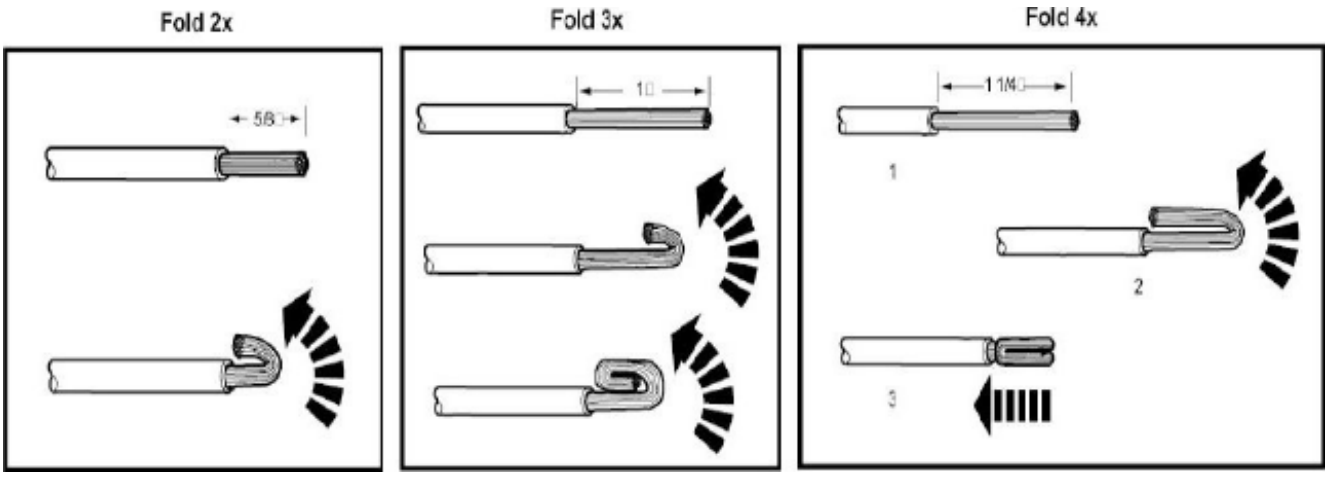
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



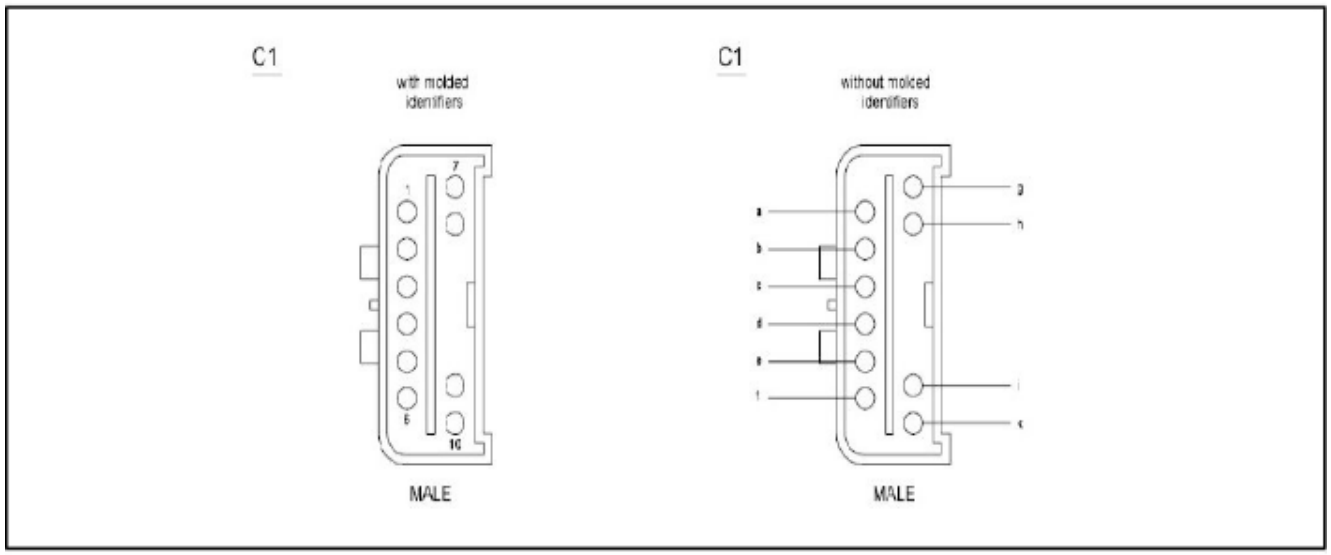
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



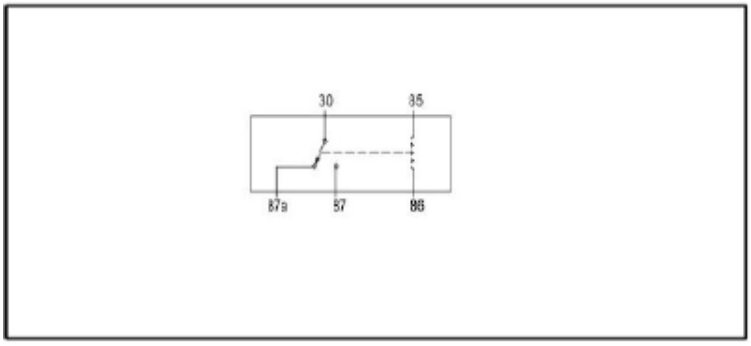
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

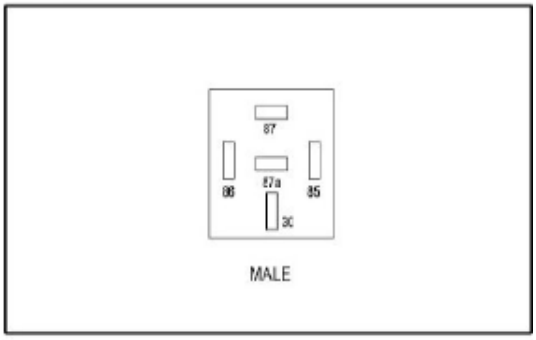
Trailer Lighting Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Turn Signal Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

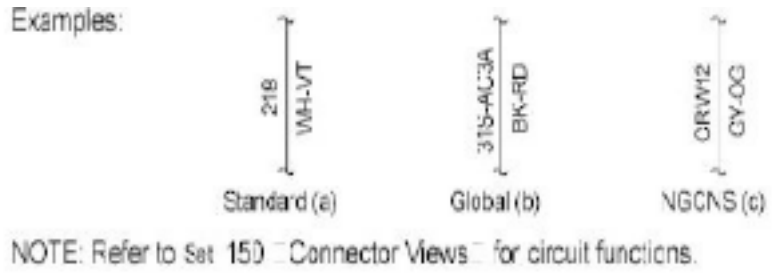
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

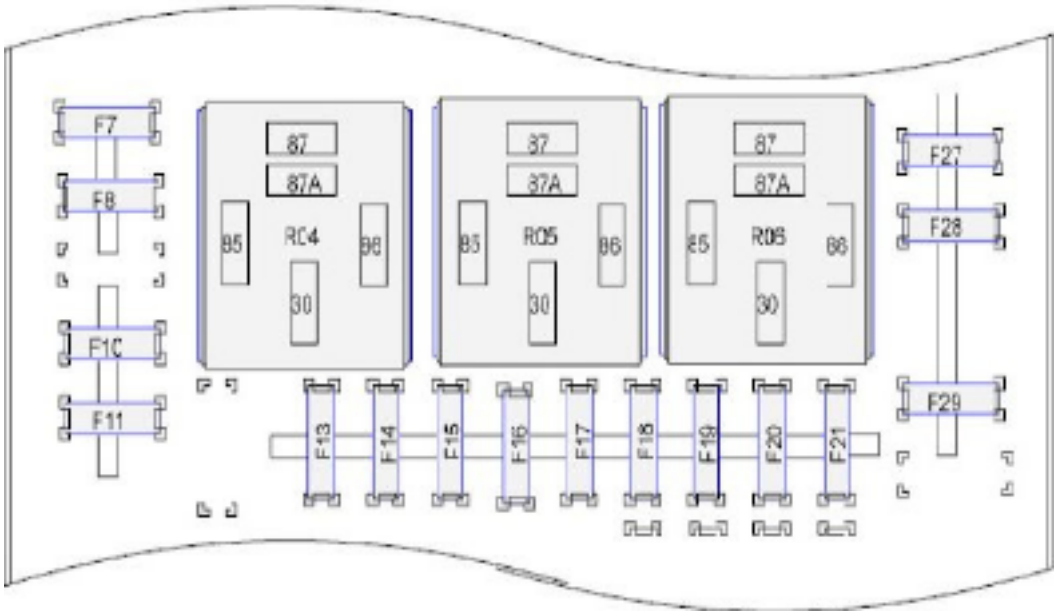
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

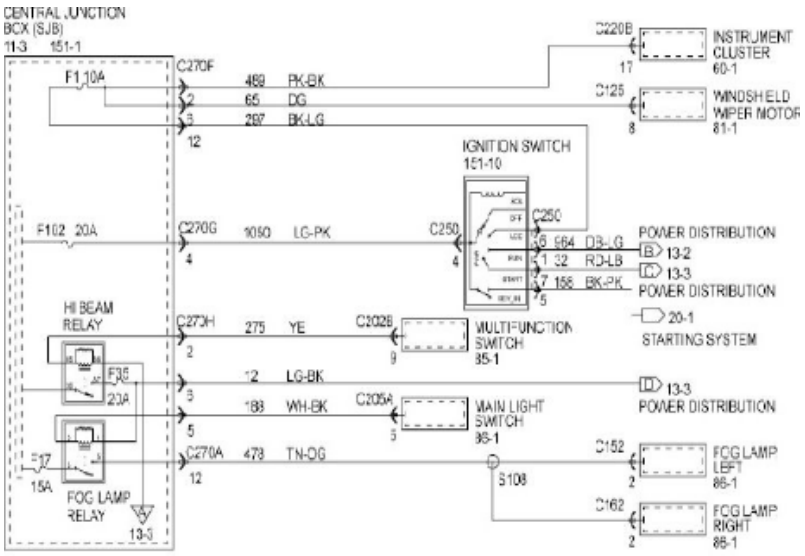
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

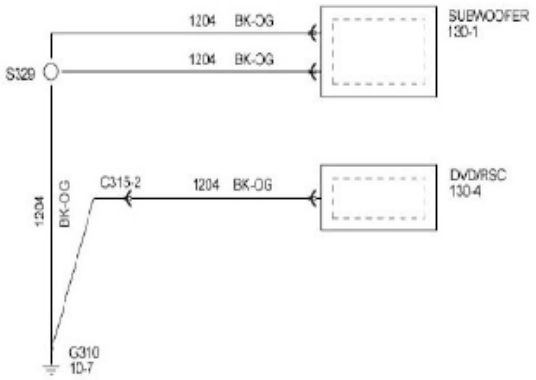
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

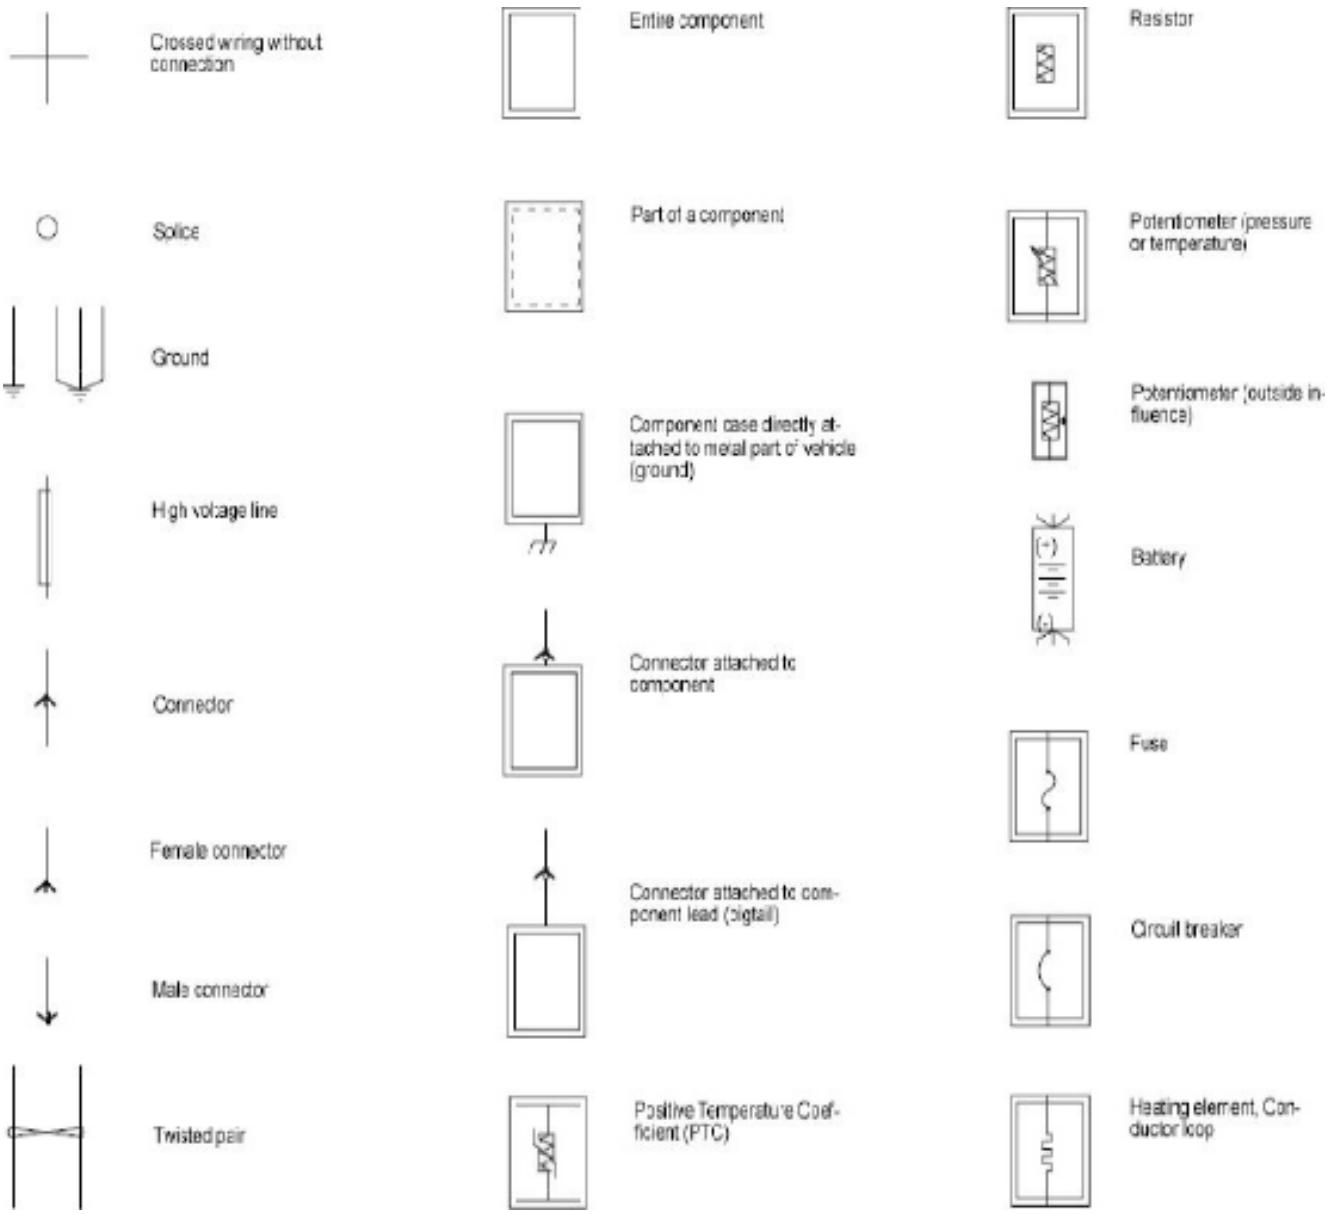
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

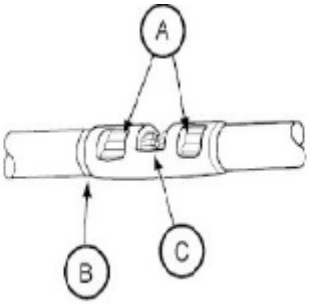
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

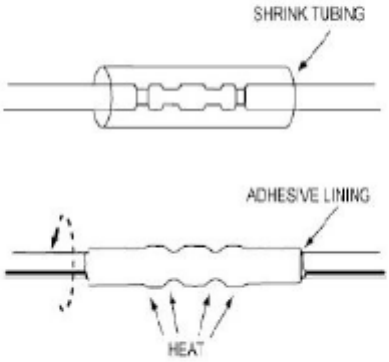
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.

	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x cia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Figtail only

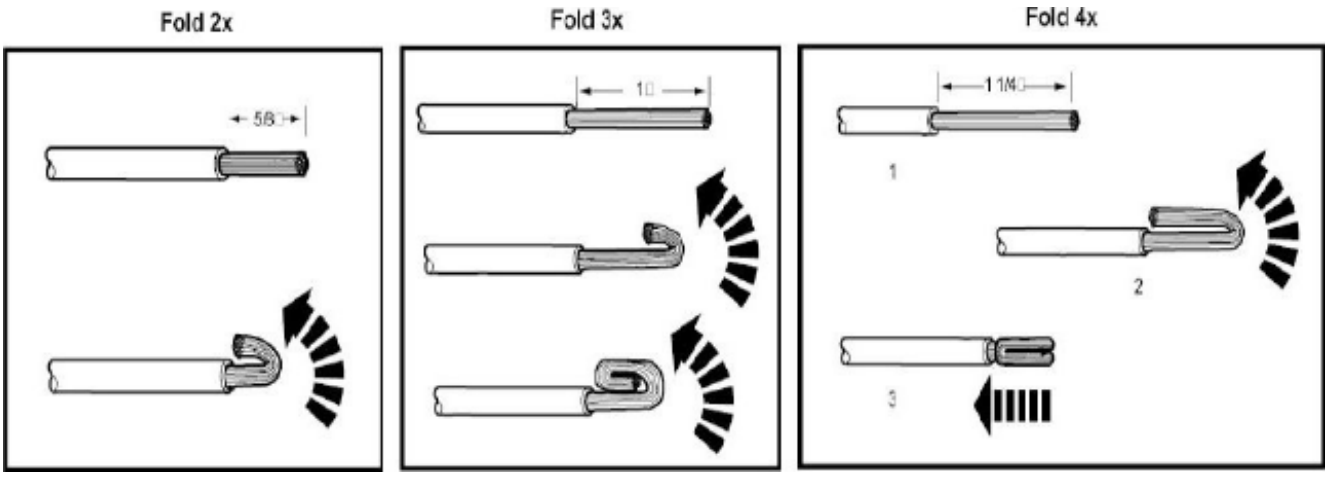
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

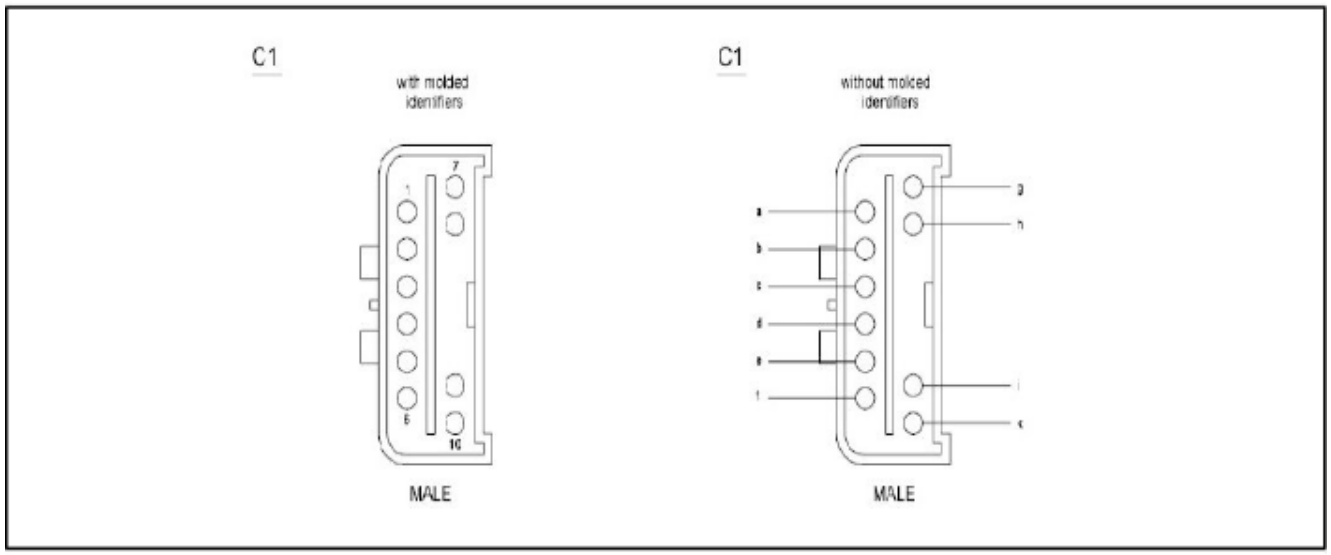
Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



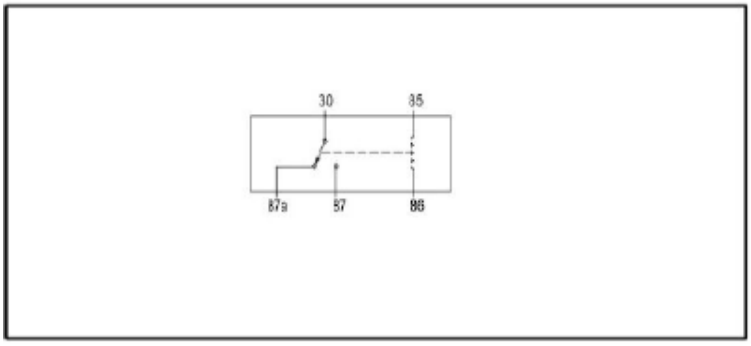
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

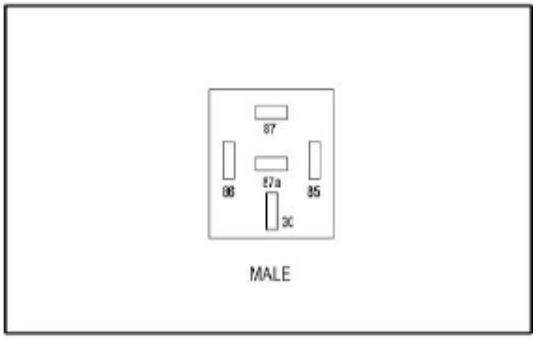
Turn Signal Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	45 □ 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

8	13K359	Steering column multi-function switch

Turn Signal Switch: Service and Repair

Steering Column Multifunction Switch

Steering Column Multifunction Switch

Removal and Installation

1. Remove the ignition switch lock cylinder.

1 Insert the ignition key into the ignition switch lock cylinder and turn to the RUN position.

2 Push the ignition switch lock cylinder release tab with a punch while pulling out the ignition switch lock cylinder.

2. If equipped, remove the tilt release lever/ handle.

3. Remove the 3 steering column shroud screws and the upper and lower steering column shrouds. 4. Disconnect the multi-function switch electrical connectors. 5. Remove the 2 multi-function switch screws and the multi-function switch.

^ To install, tighten to 3 Nm (27 lb-inch).

6. To install, reverse the removal procedure.

Power Window Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

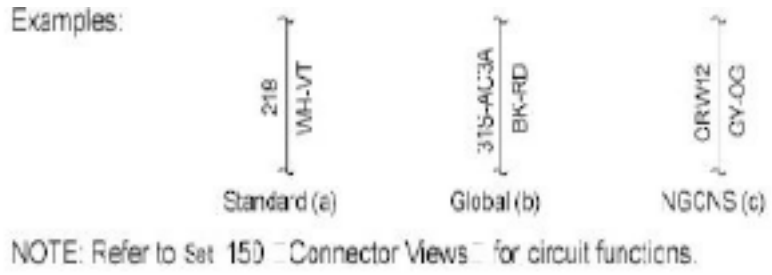
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

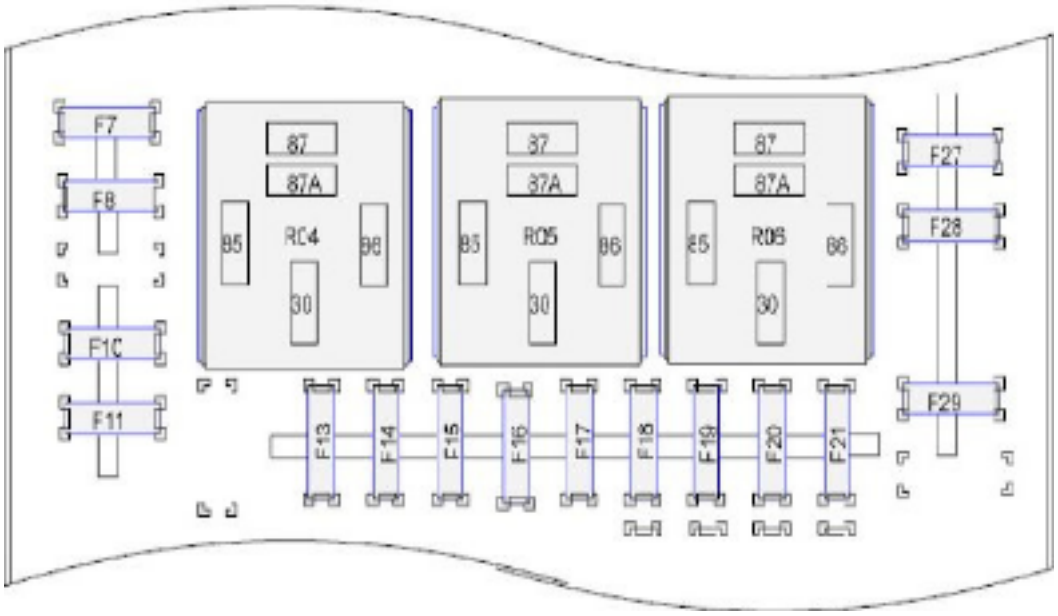
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

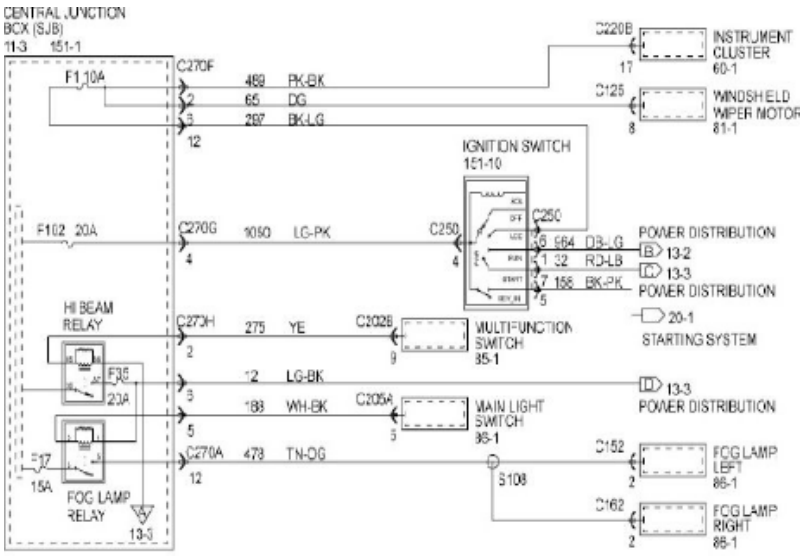
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

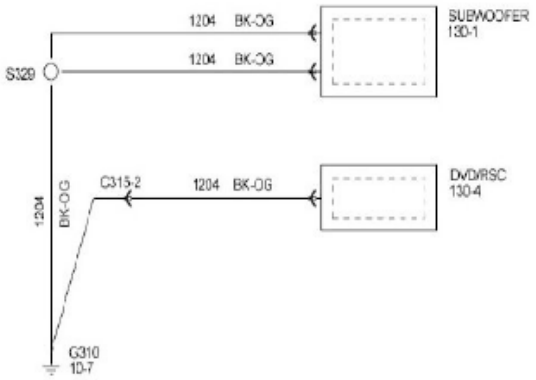
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

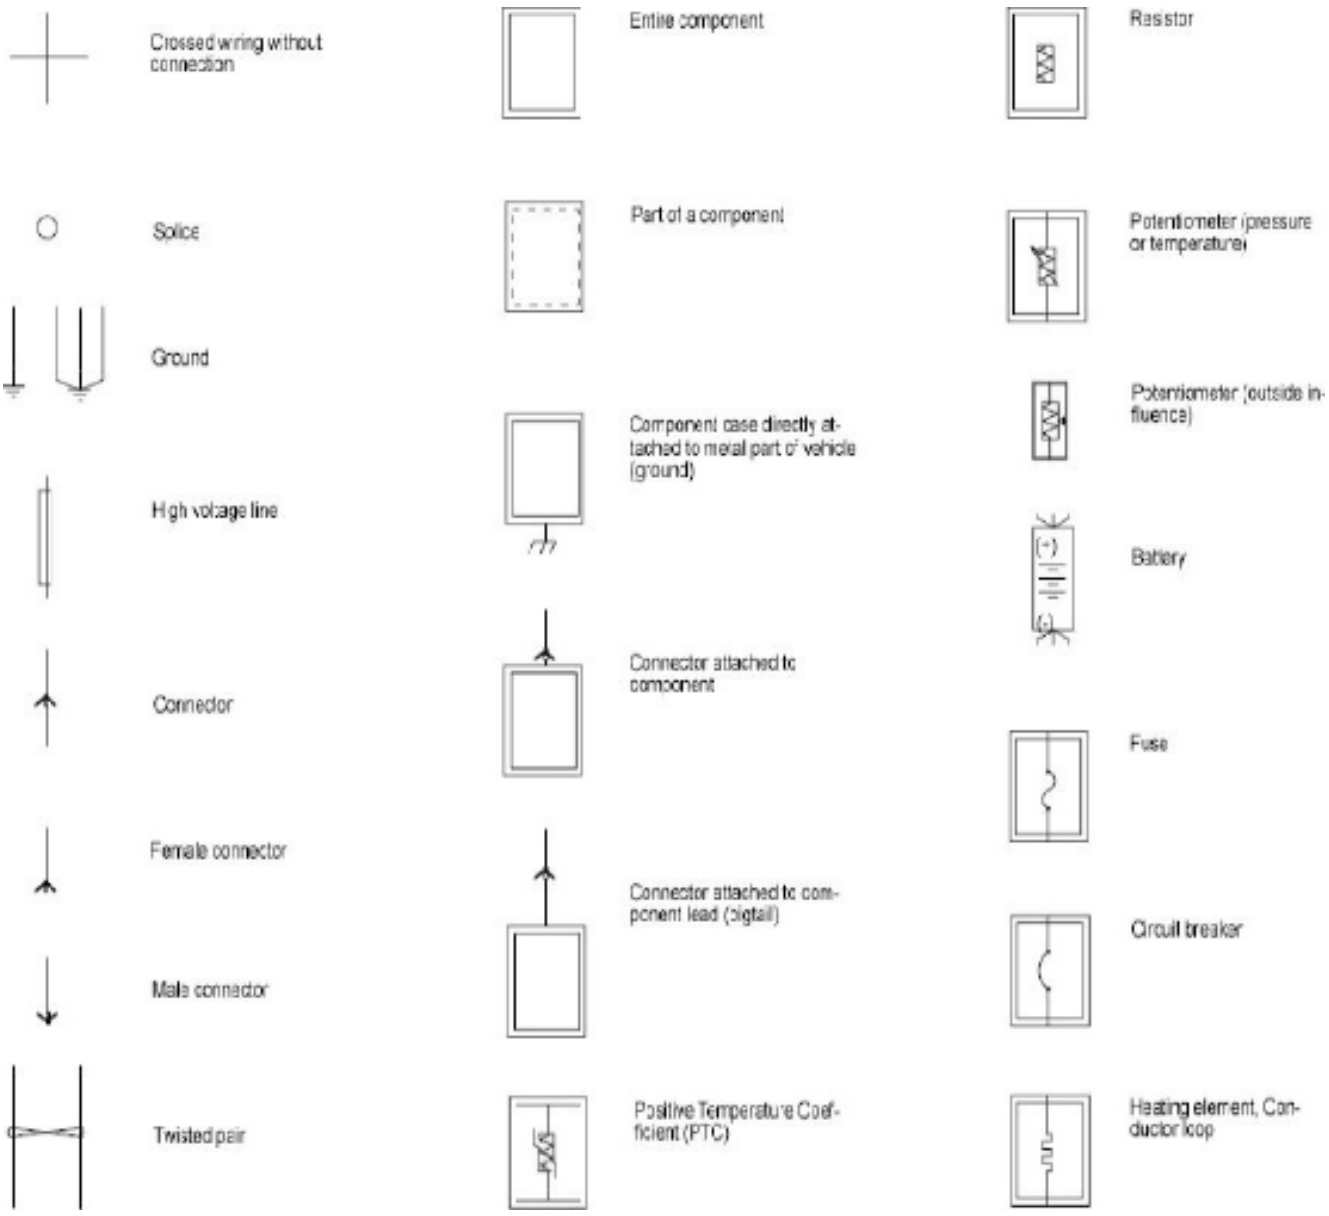
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

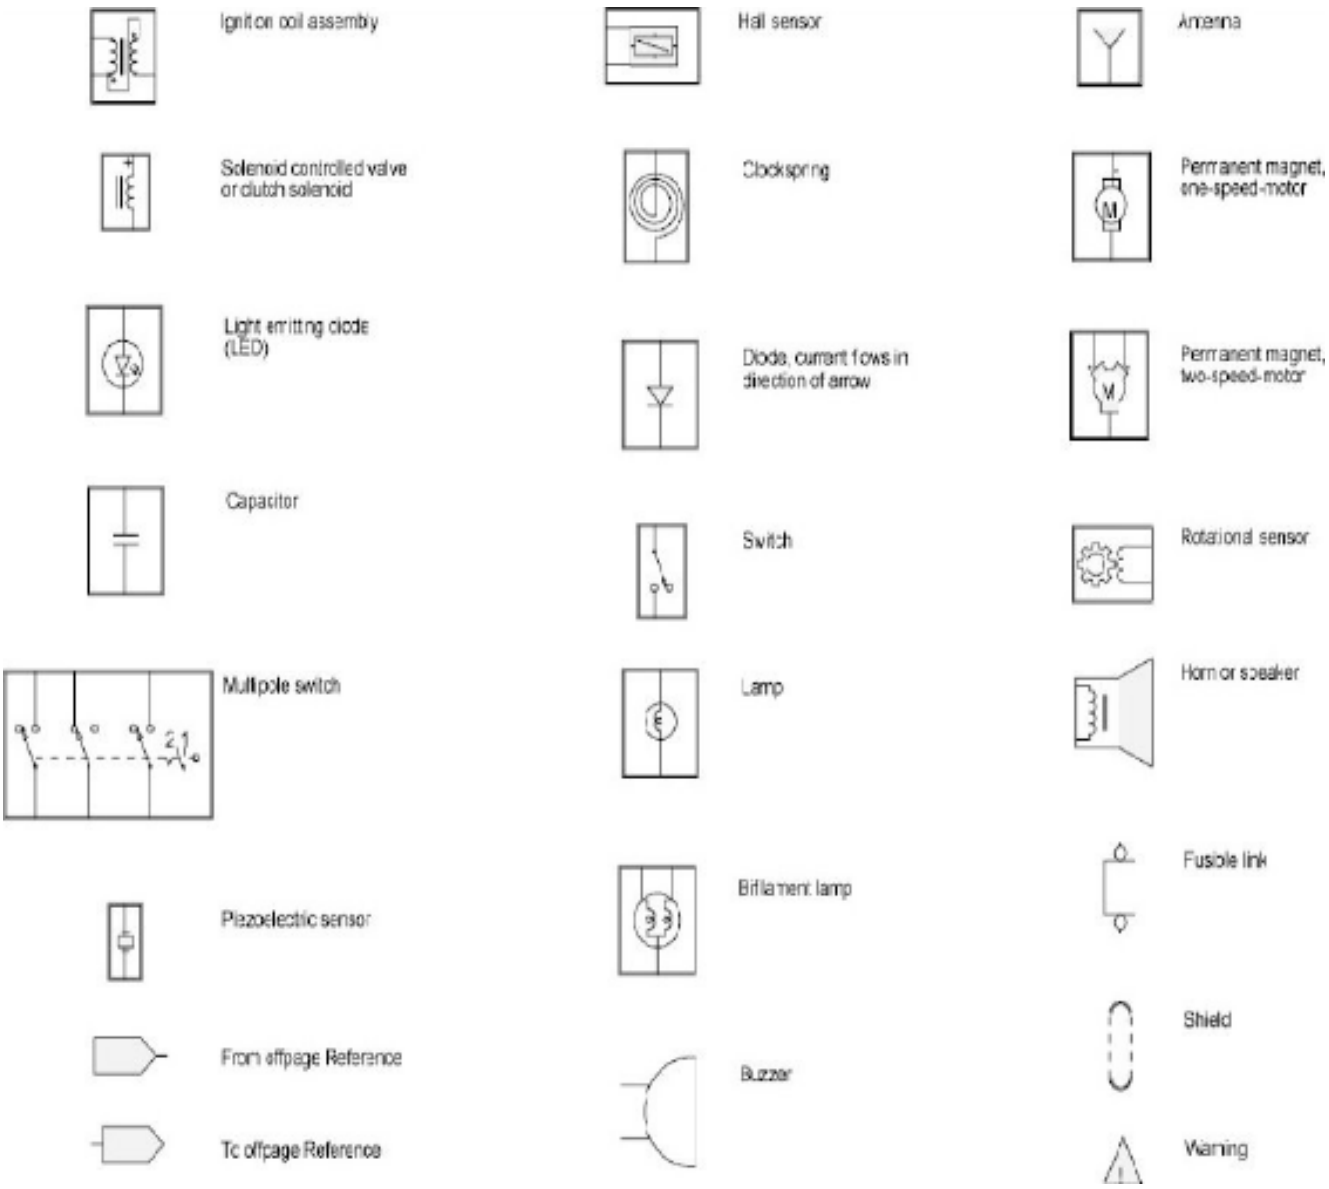
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

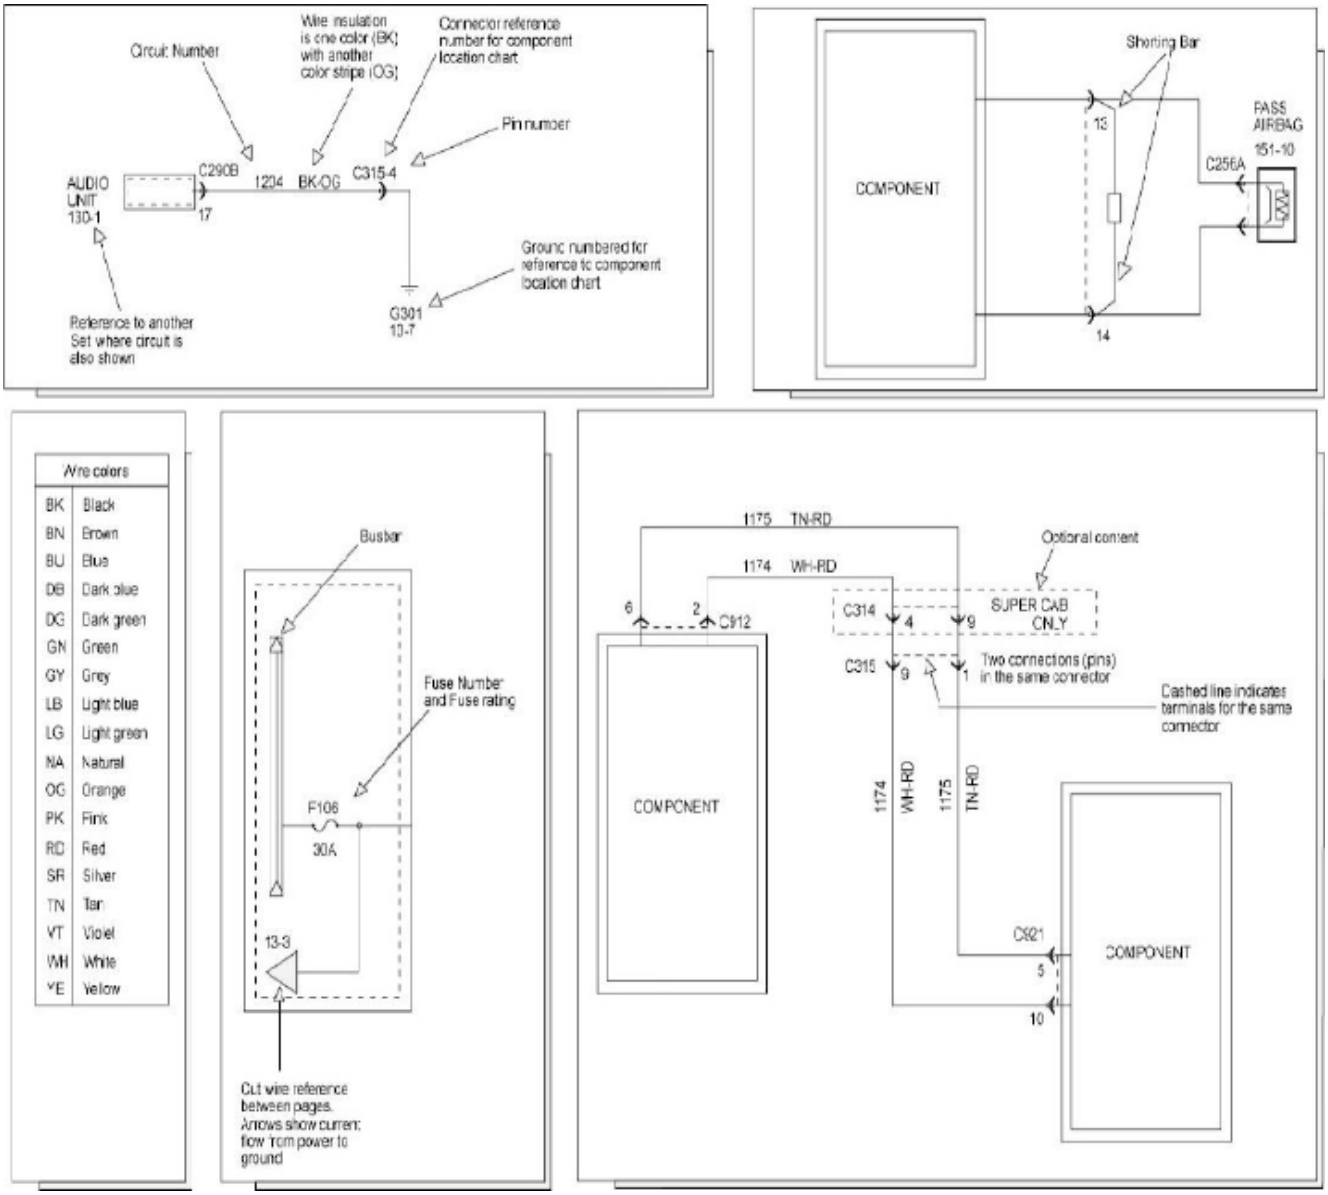
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

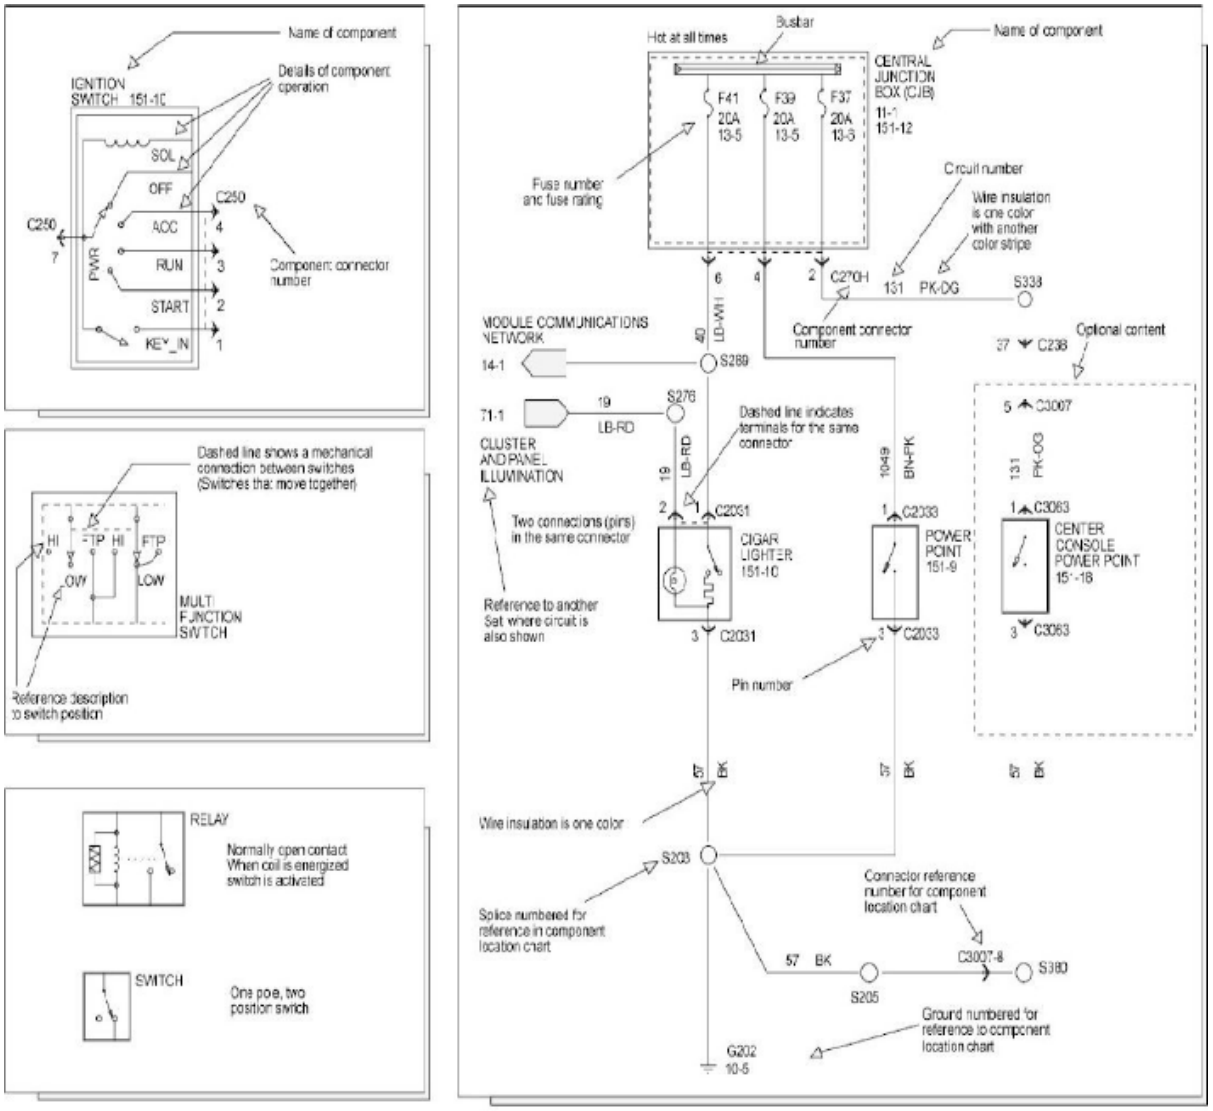
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front

Power Window Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

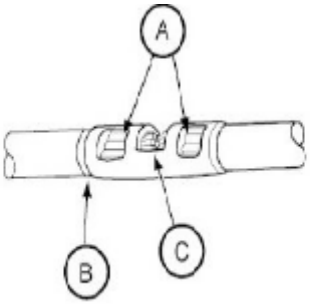
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

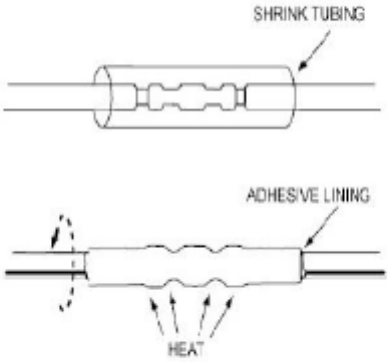
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x dia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Figtail only

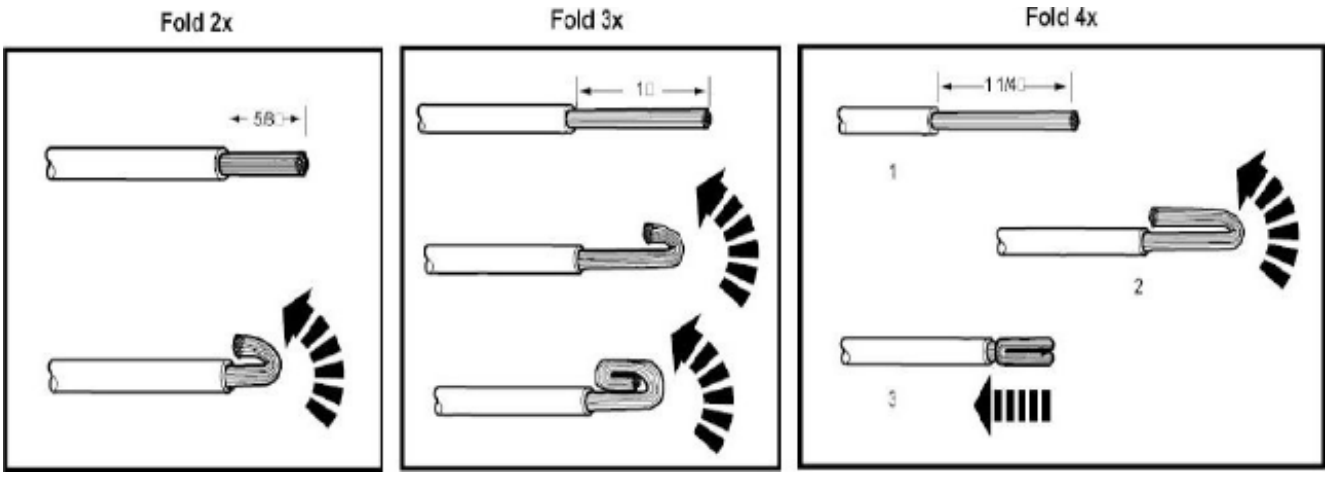
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



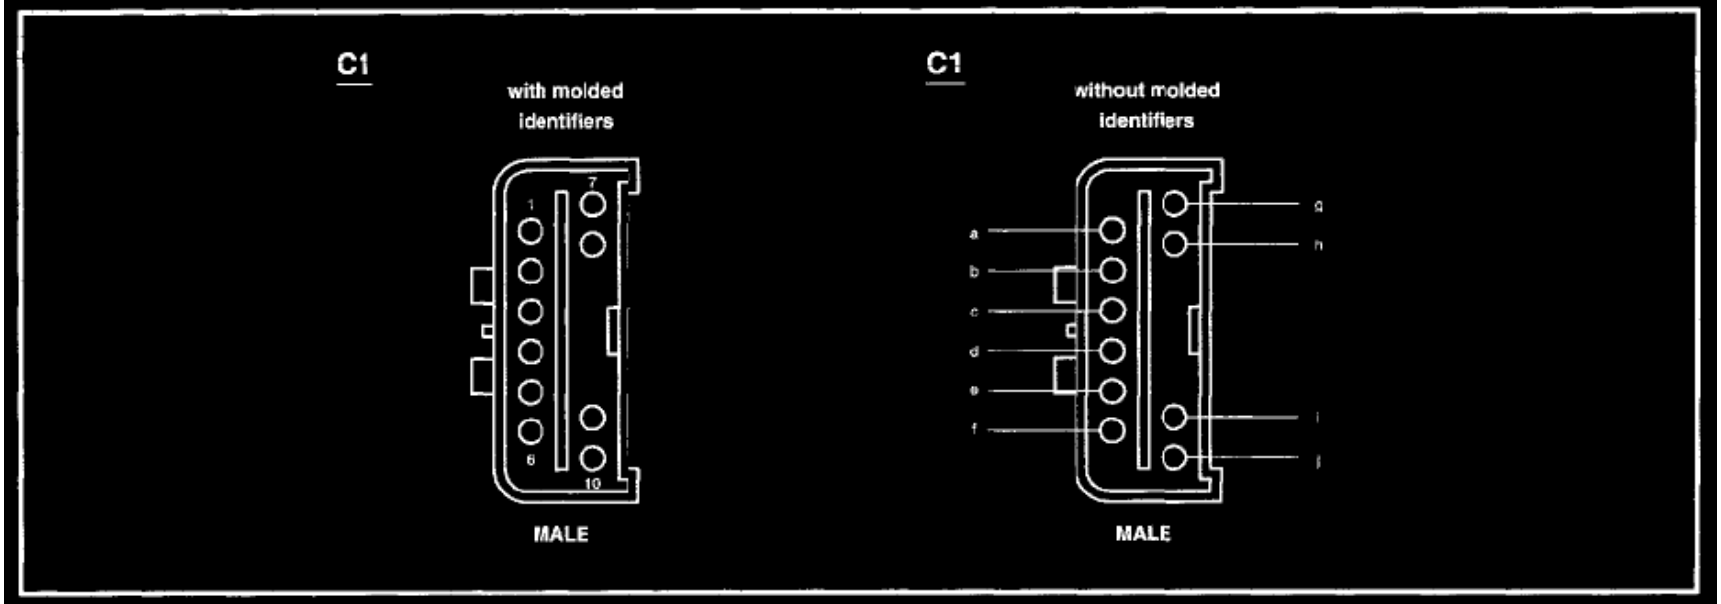
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step–by–step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



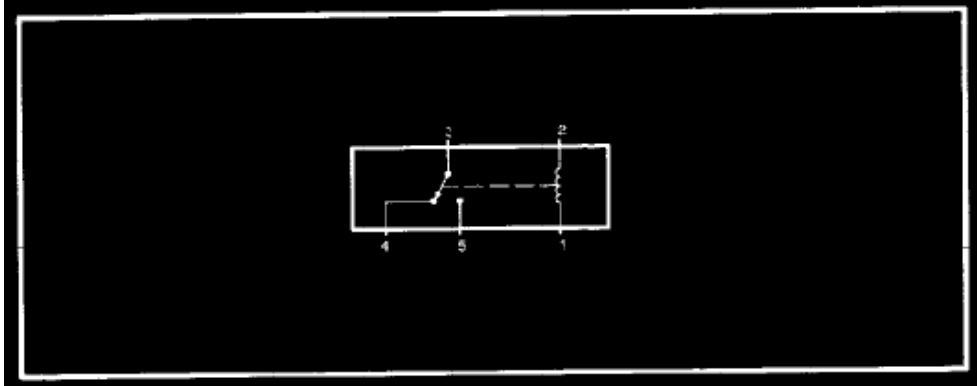
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

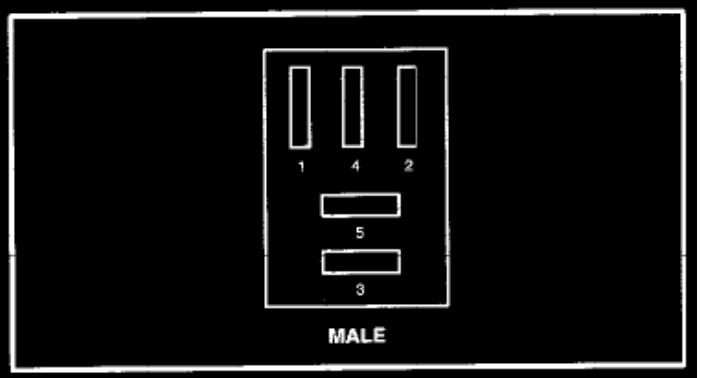
Power Window Relay: Testing and Inspection Micro ISO Relay

Relay – Micro ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	1 and 2	63–102Ω
Contact	3 and 4	Closed circuit
	3 and 5	Open circuit
Coil – Contact	1 and 3	Open circuit
	1 and 4	Open circuit
	1 and 5	Open circuit

Component testing procedure (voltage applied)

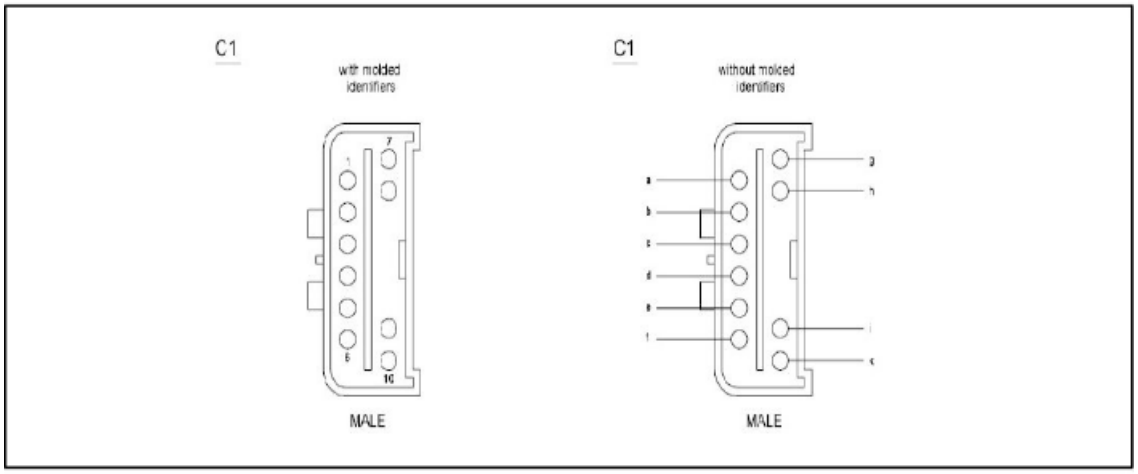
Disconnect the ohmmeter; connect pins 2 and 3 to 12V DC power and pin 1 to ground. Measure voltage between pin 5 and pin 1. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 2 and measure voltage between pin 4 and pin 1. If the voltage is 12V, the relay is okay. If not, replace the relay.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals

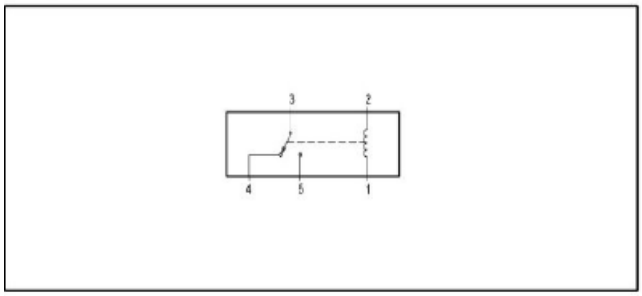


The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

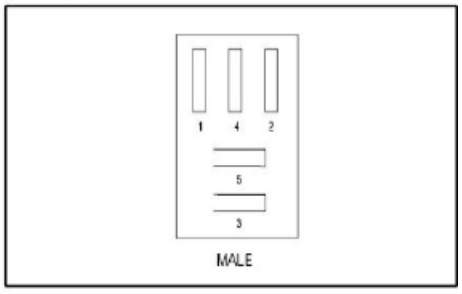
Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

Relay - Micro ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	1 and 2	63-102 Ω
Contact	3 and 4	Closed circuit
	3 and 5	Open circuit
Coil - Contact	1 and 3	Open circuit
	1 and 4	Open circuit
	1 and 5	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 2 and 3 to 12V DC power and pin 1 to ground. Measure voltage between pin 5 and pin 1. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 2 and measure voltage between pin 4 and pin 1. If the voltage is 12V, the relay is okay. If not, replace the relay.

Front Door Window Motor: Service and Repair

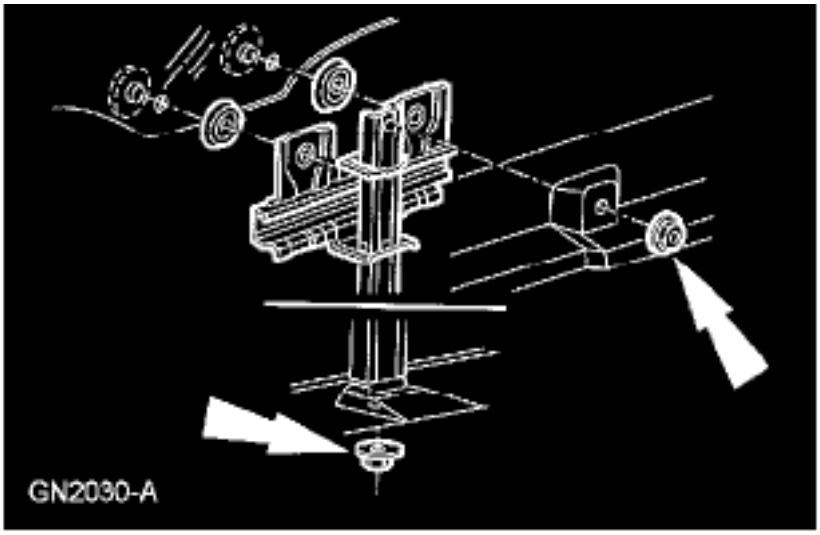
WINDOW REGULATOR AND MOTOR - FRONT DOOR

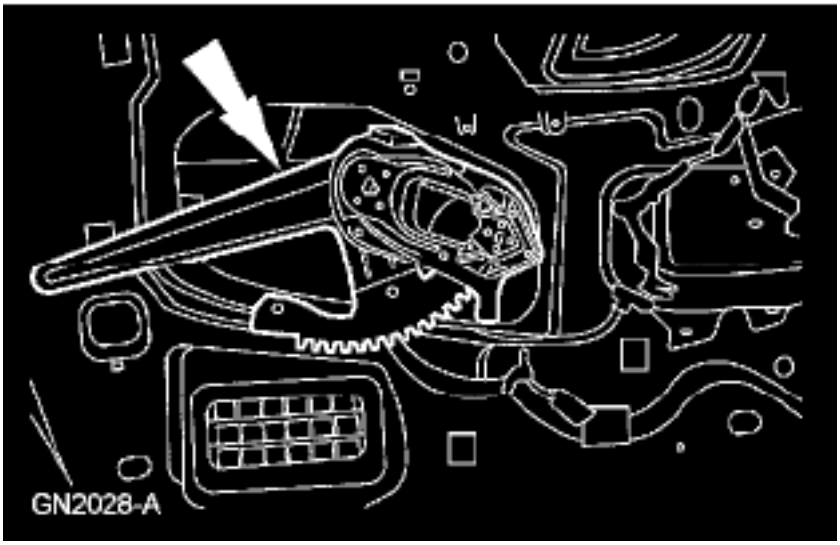
Exploded View

Special Tool(s)

Special Tool(s)

Removal and Installation





1. Remove the door trim panel. 2. Remove the watershield. 3. Support the window glass. 4. If equipped, disconnect the power window motor electrical connector. 5. Remove the top and bottom center door glass run retainer nuts.

- To install, tighten to 9 Nm (80 lb-in).

6. NOTE:

- To remove the rivets, use a drift punch to remove the steel centers and a 6.35 mm (1/4 in) diameter drill bit to remove the rivets.

- The power window regulator has 4 rivets; the manual has 3.

Remove the window regulator rivets. -

Remove the steel centers and rivets.

7. Remove the window regulator.

8. WARNING: When removing the window regulator motor, place the window in the full upward position or block the window regulator

arm to help prevent the counterbalance spring from unwinding with high force. Failure to follow this instruction may result in serious personal injury.

If necessary, remove the window glass motor. -

Remove the bolts.

- To install, tighten to 8 Nm (71 lb-in).

9. To install, reverse the removal procedure.

- Use a heavy duty riveter to install the new rivets.

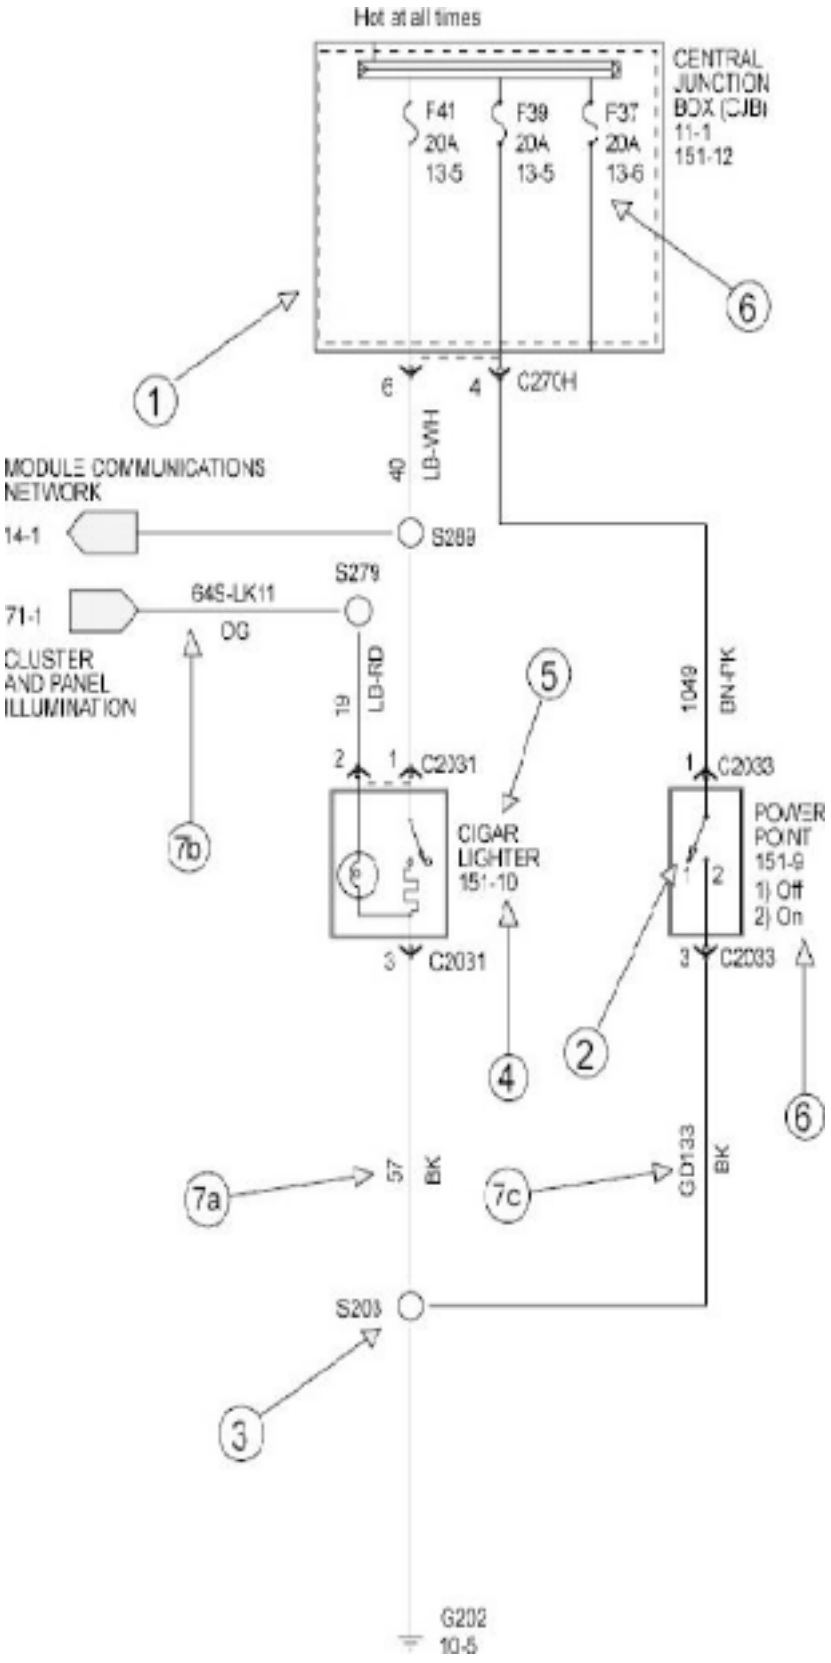
Ford Workshop Manuals > Windows and Glass > Windows > Power Window Relay > Component Information > Diagrams > Diagram Information and Instructions



Power Window Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

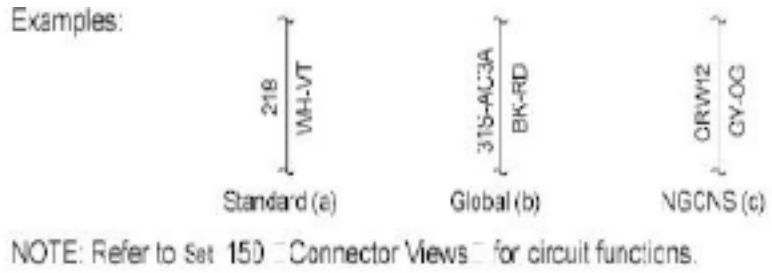
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

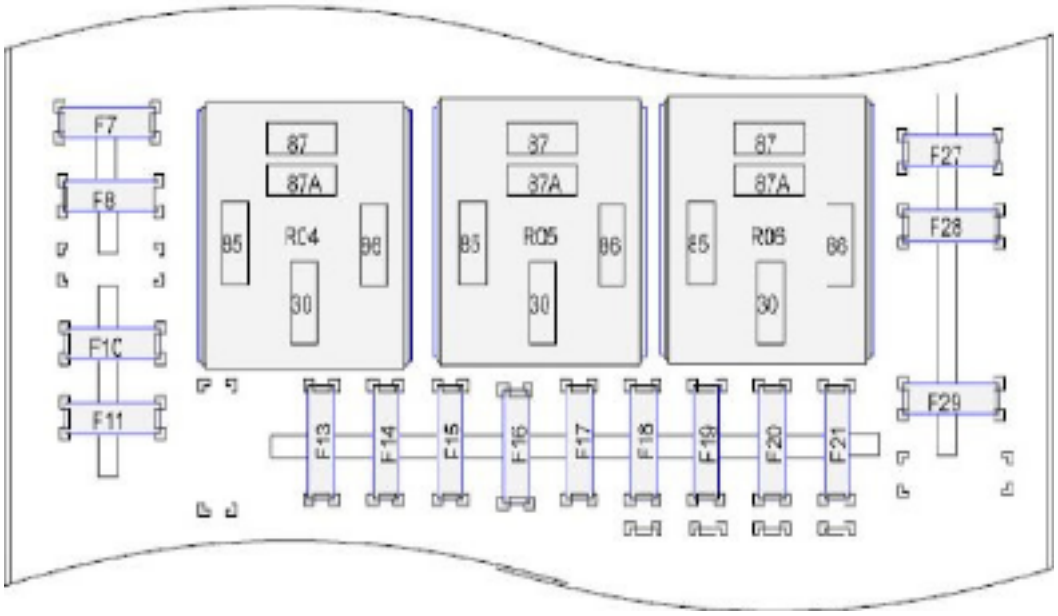
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

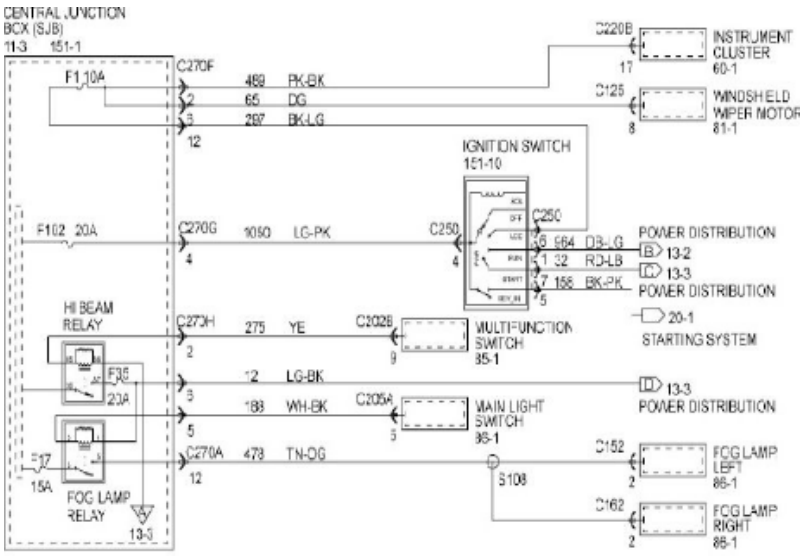
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

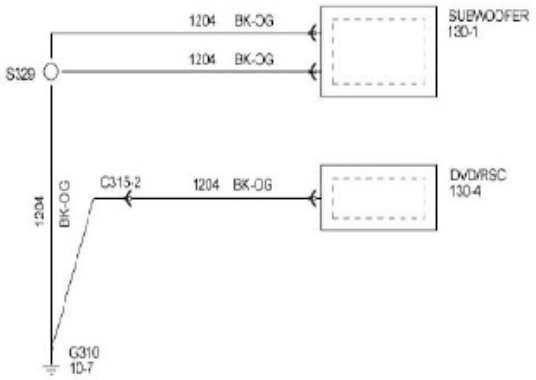
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

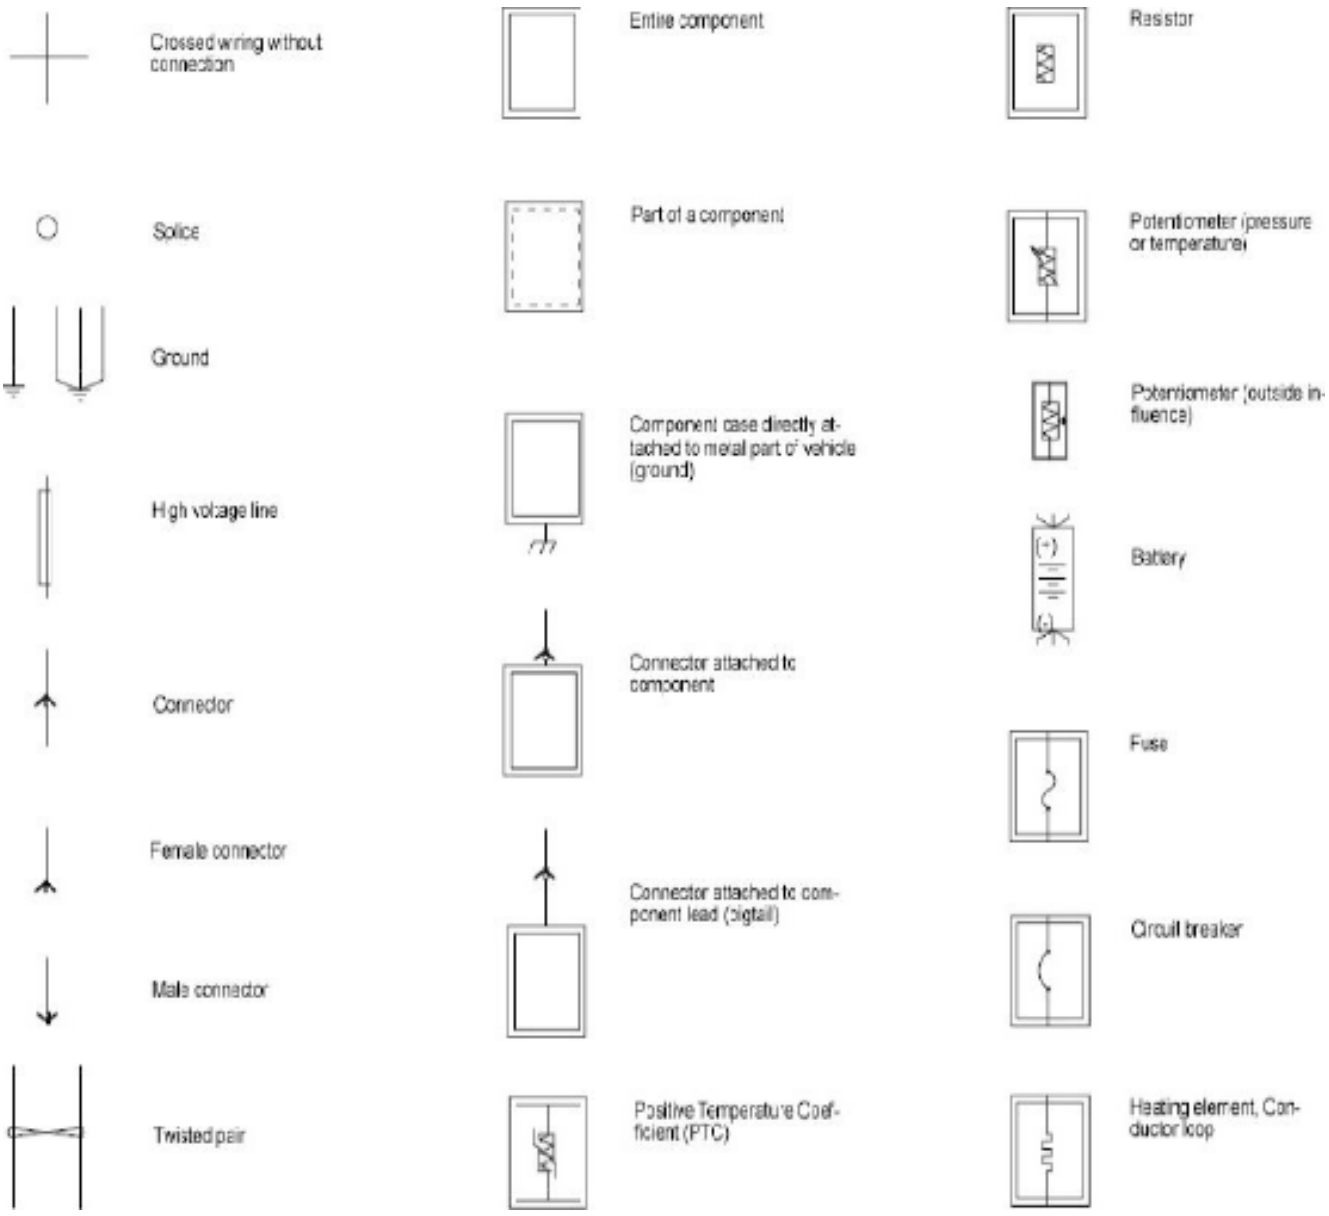
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

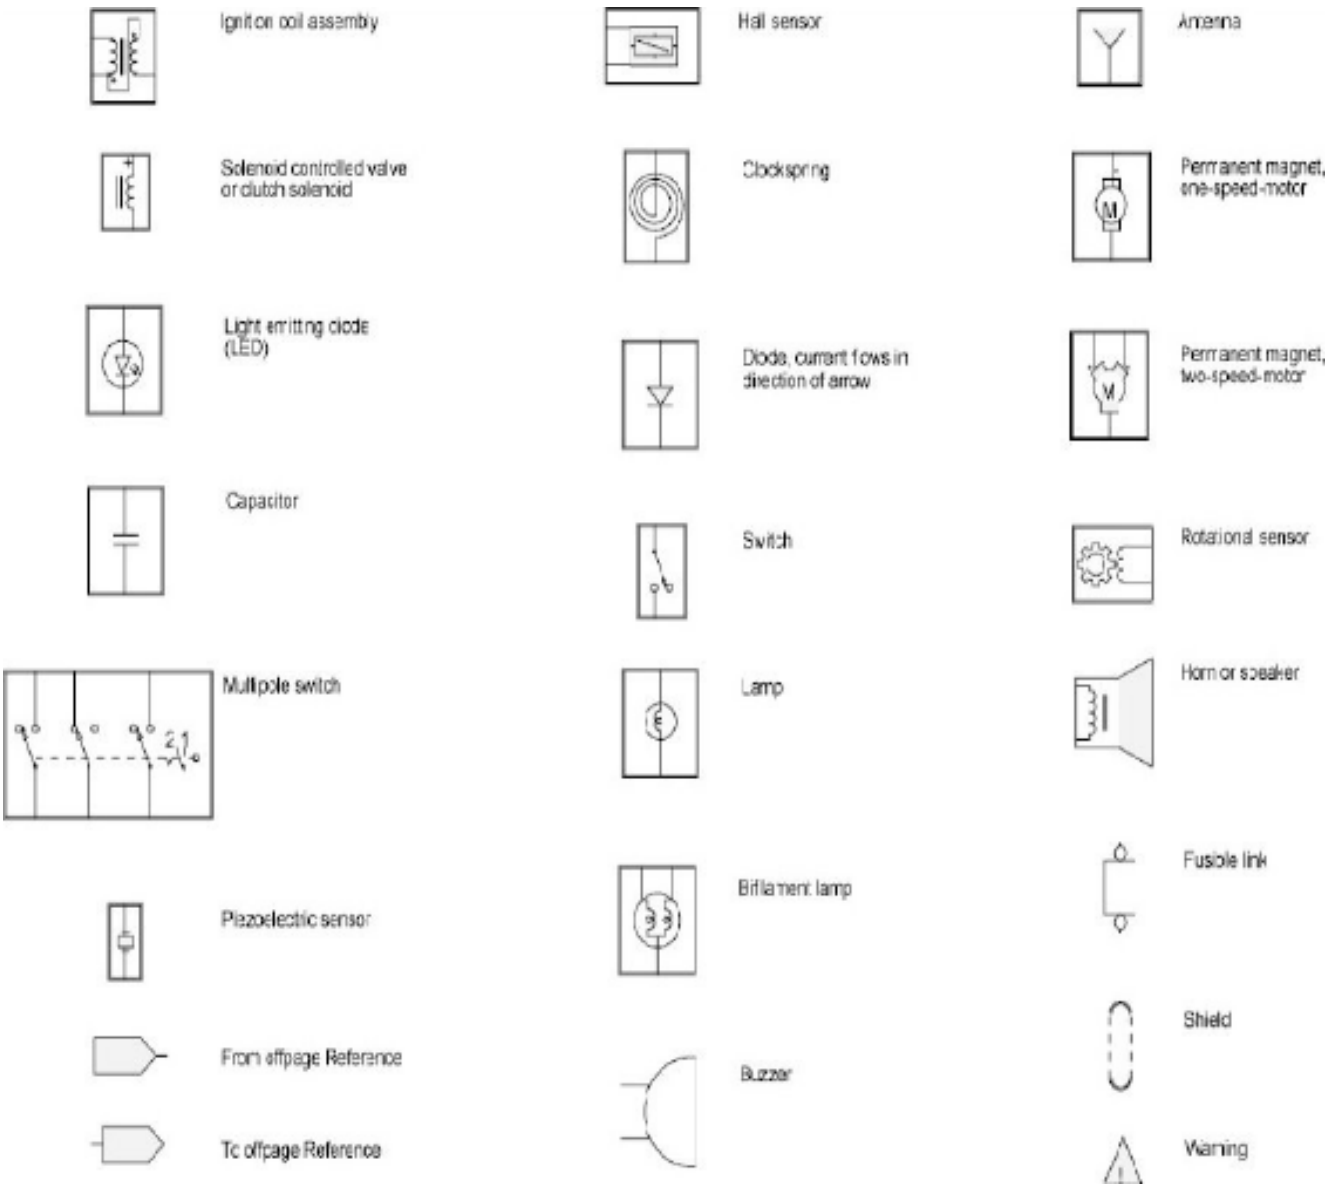
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

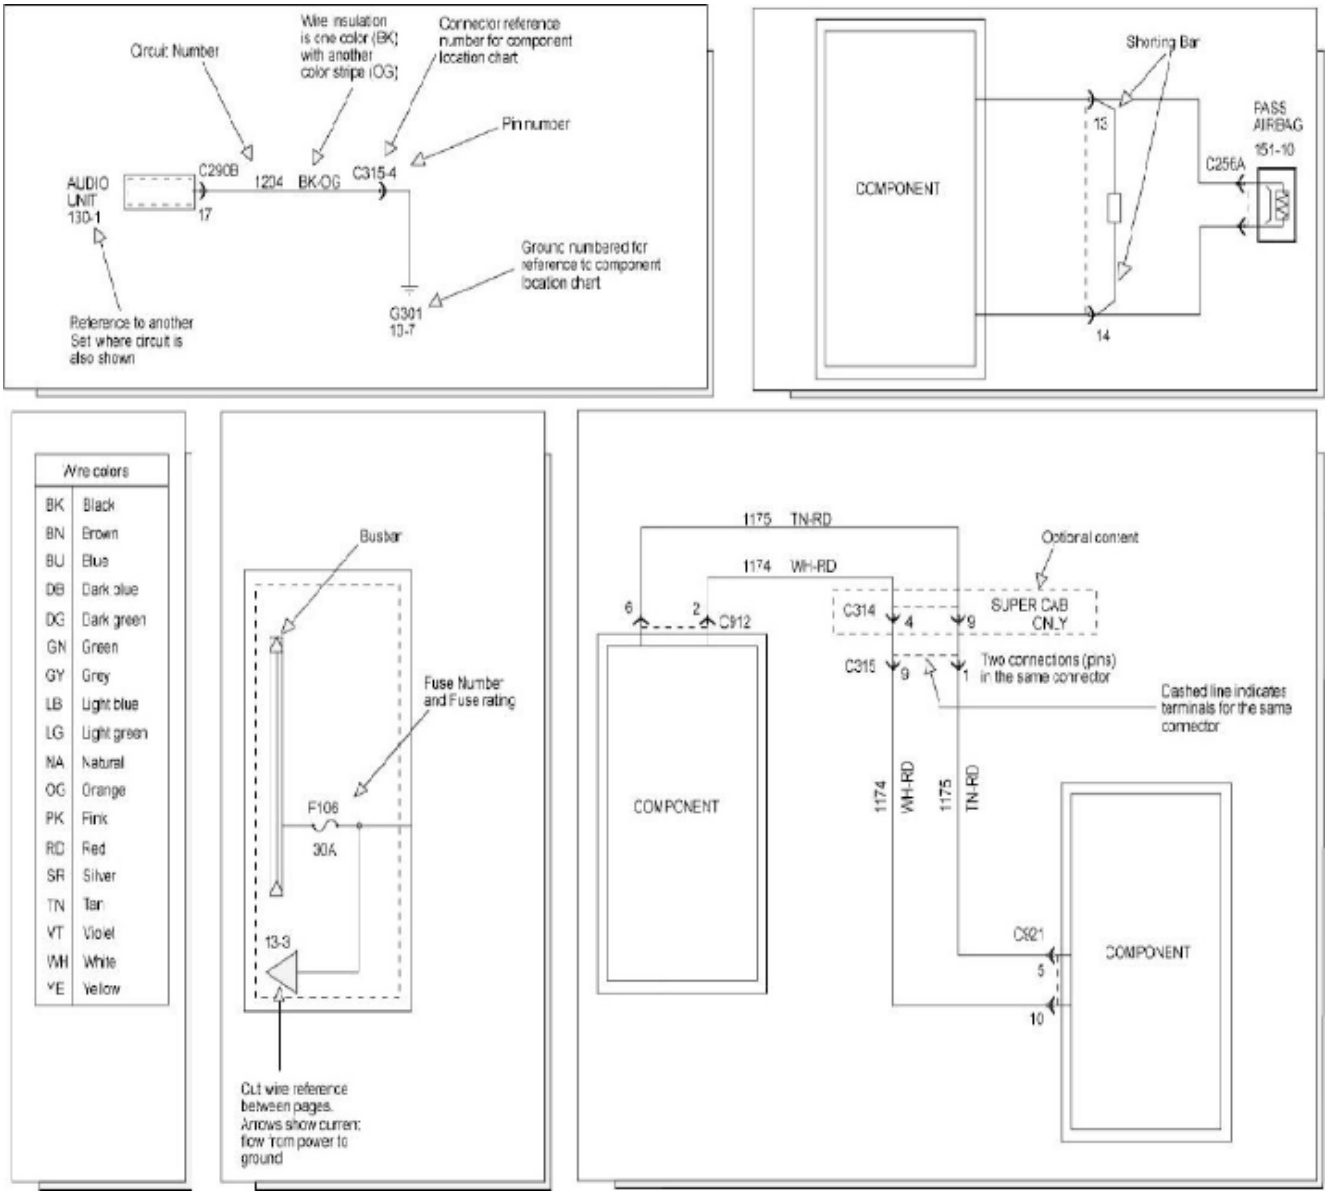
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

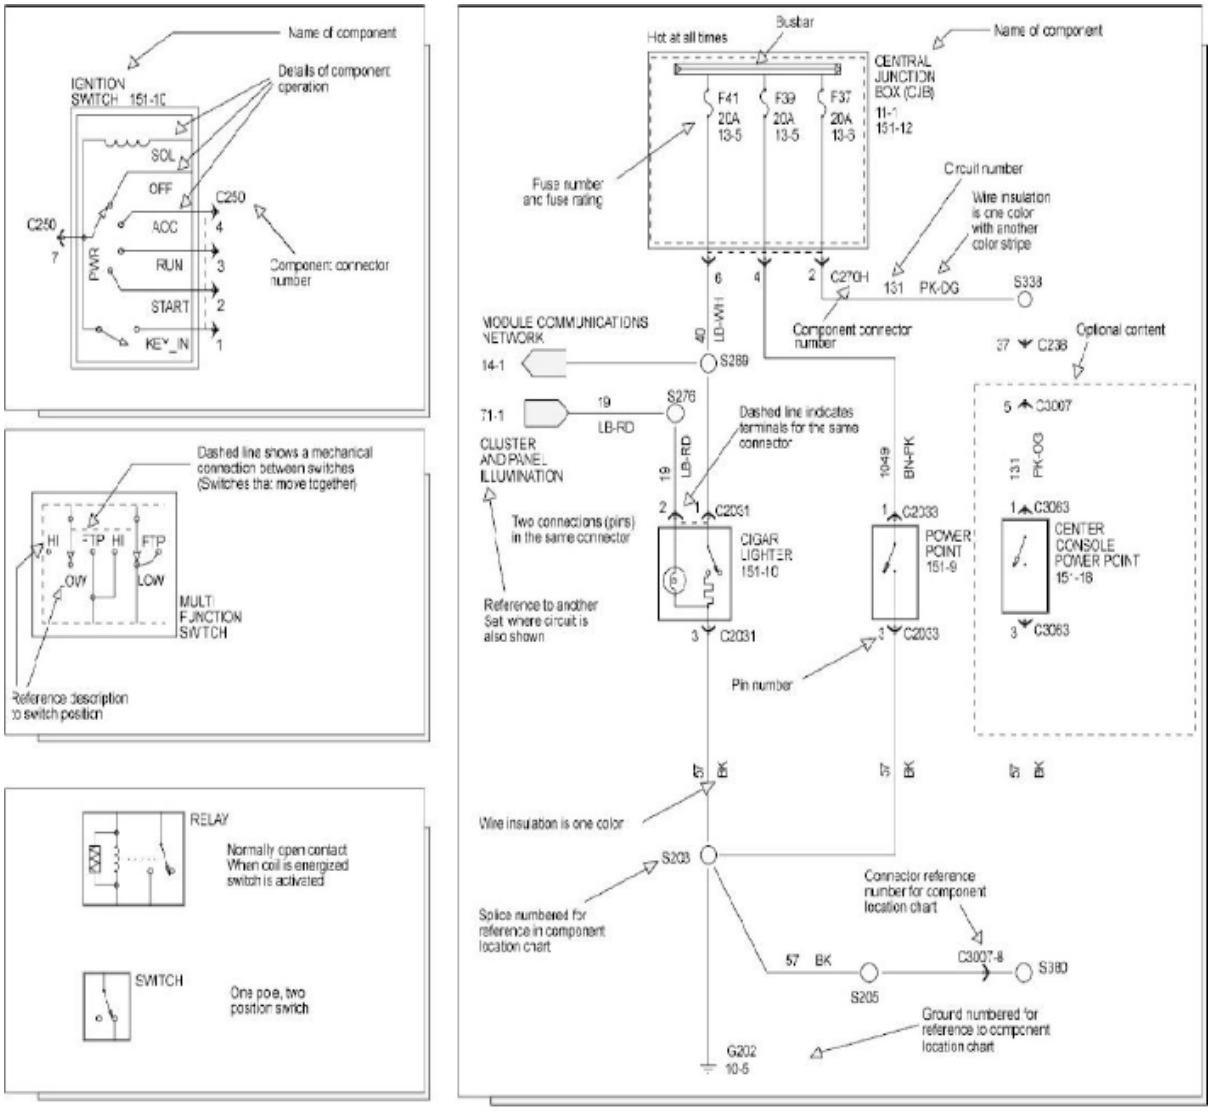
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Power Window Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

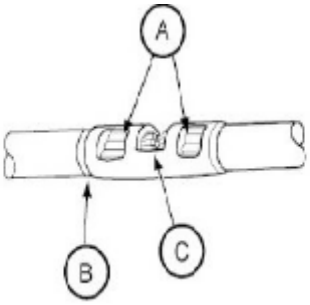
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

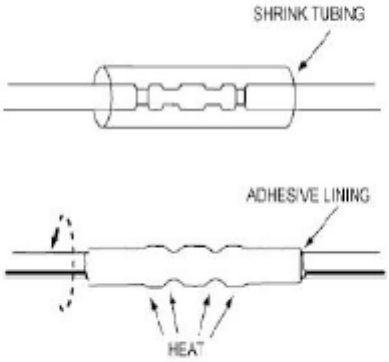
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x cia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Figtail only

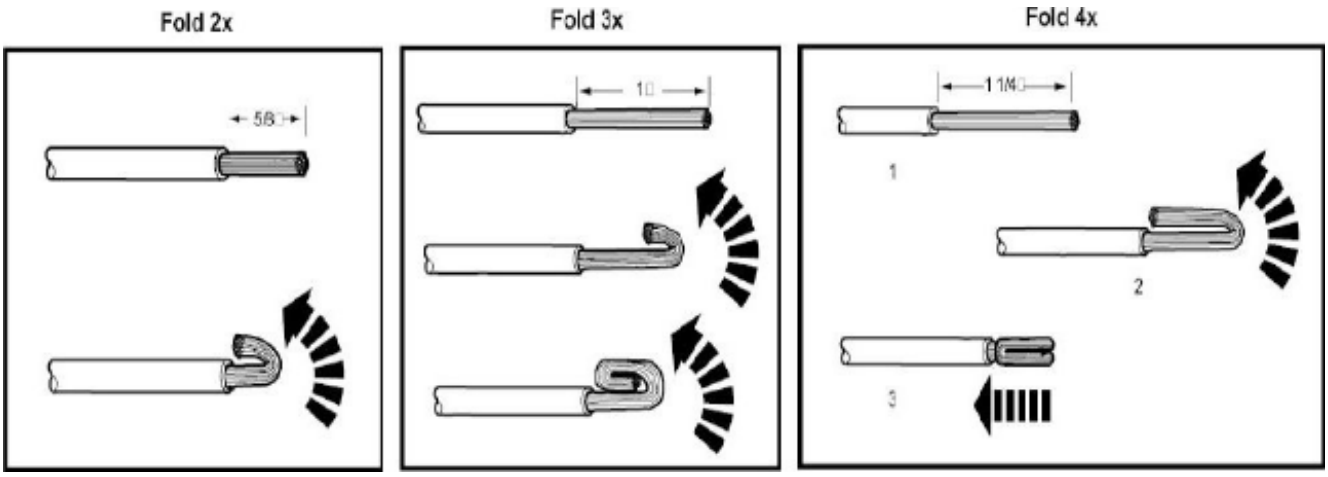
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



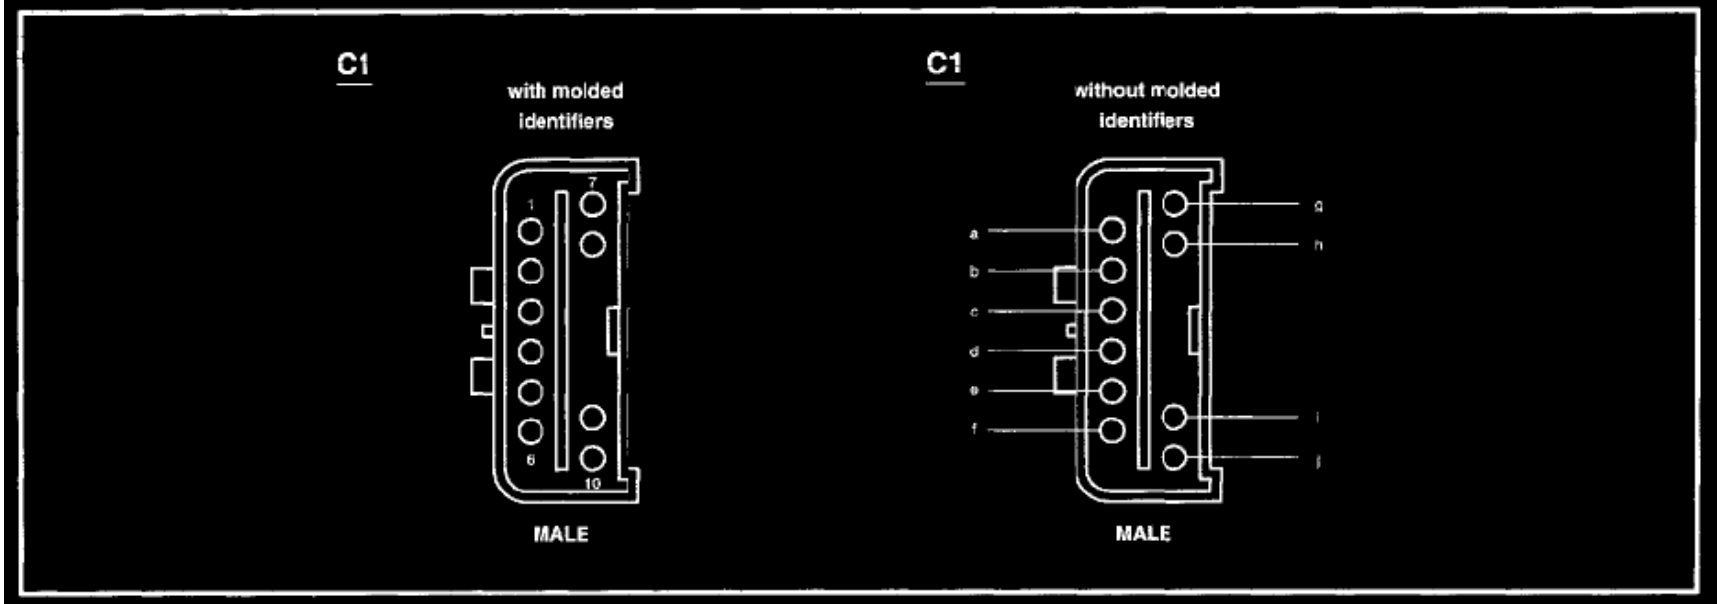
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step–by–step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



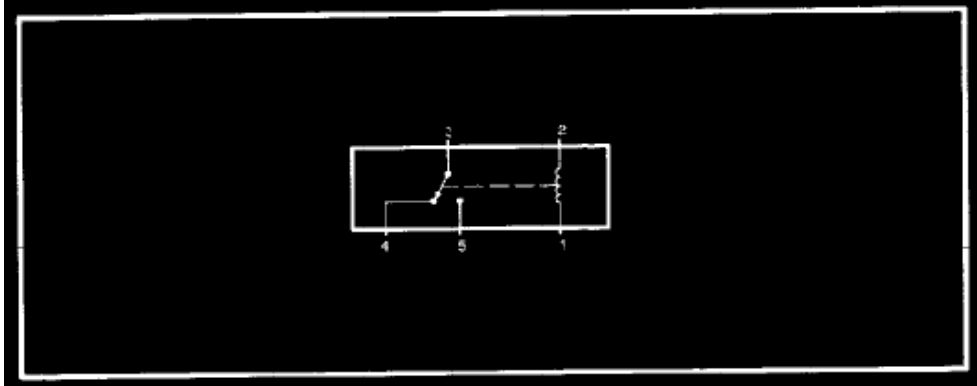
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

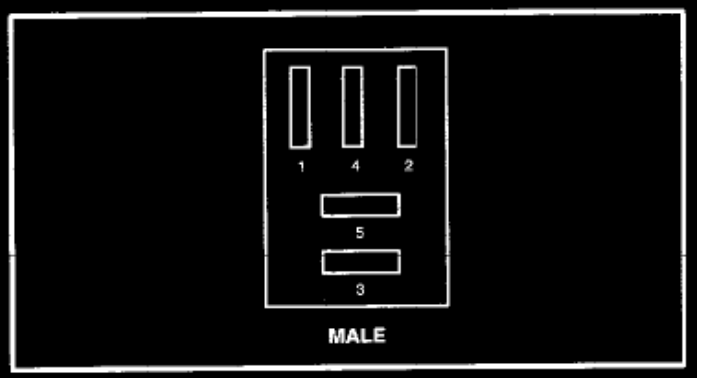
Power Window Relay: Testing and Inspection Micro ISO Relay

Relay – Micro ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

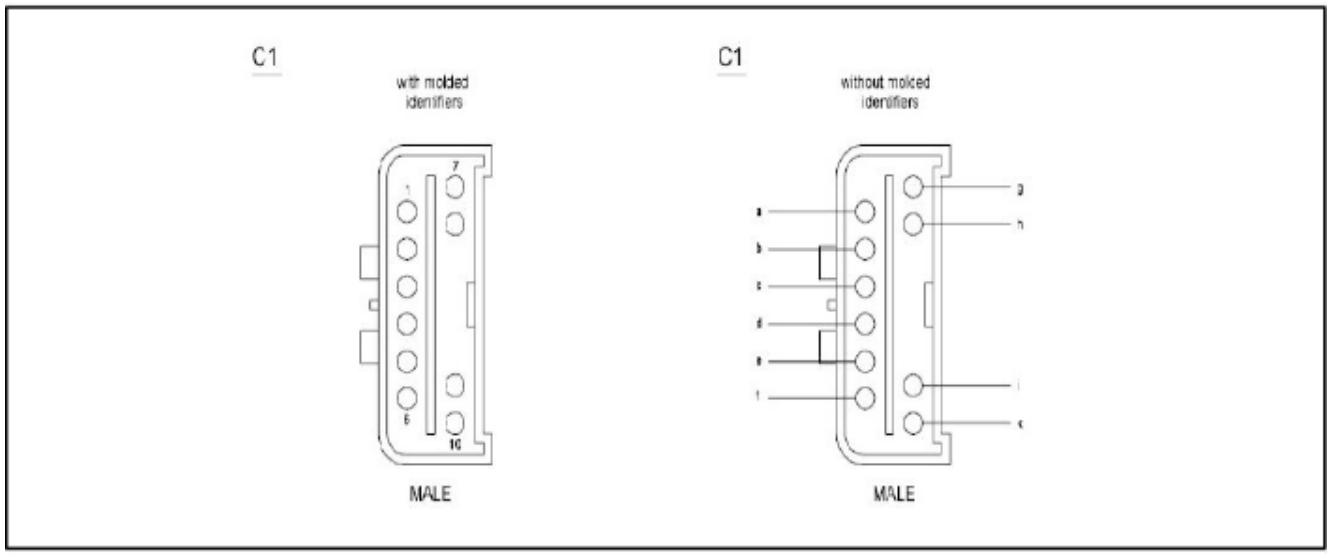
Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

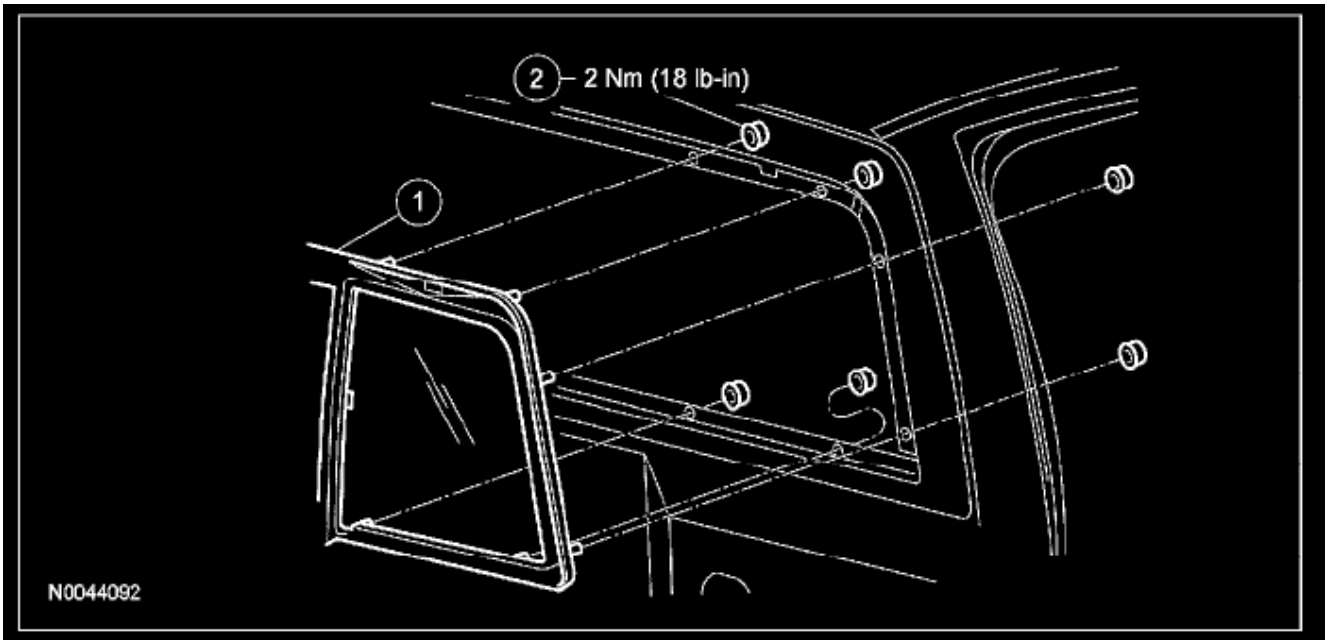
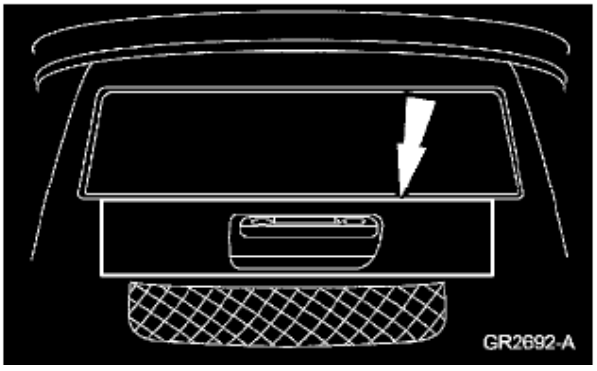
Exploded View

Material

Material



Item	Part Number	Description
1	422B30/42006	Rear window glass (sliding/fixed)
2	—	Rear window glass nut



Removal

NOTE: If the rear window glass is being removed to repair a dust/water leak, remove and reinstall the existing rear window glass.

1. Remove the rear window glass garnish moulding.

2. Lower the headliner. 3. Remove the rear window glass nuts.

4. NOTE: Use only a plastic windshield setting tool to slide under the seal to separate the foam core butyl from the glass. Once the glass starts to

separate from the body, constant hand pressure will break the seal and the glass can be removed. Failure to use a plastic windshield setting tool can damage the body or the glass frame.

Remove the rear window glass.

Installation

1. NOTE: Remove as much as possible of the foam core butyl from the body and rear window glass prior to installation

Install the rear window glass. -

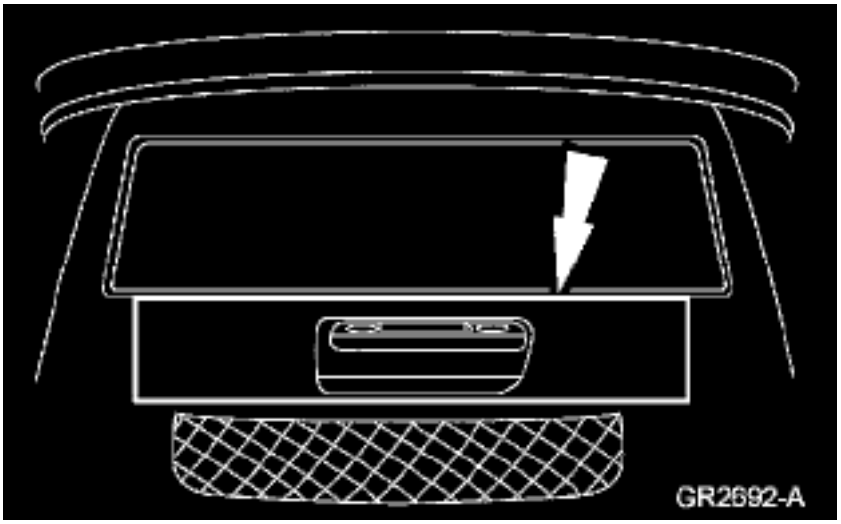
Apply foam core butyl to the window. Overlap the foam core butyl by 25 mm (1 in) at the bottom middle of the rear window glass.

- Carefully install the rear window glass into the body opening.

2. Install the rear window glass nuts.

- Tighten to 2 Nm (18 lb-in).

- Test the rear window glass for water leaks.



3. Install the headliner. 4. Install the rear window glass garnish moulding.

11/16/09

WINDOW CHATTER/SHUDDER

FORD: 2008-2009 Ranger

ISSUE Some 2008-2009 Ranger vehicles may experience window chatter/shudder when the window travels up or down.

ACTION Follow the Service Procedure steps to correct the condition.

SERVICE PROCEDURE

Verify correct grease amount on the window Run. Open the upper door glass Run attachment slot to allow further forward adjustment.

1. Remove door trim panel following Workshop Manual (WSM), Section 501-05.

2. Inspect window Run and add grease if necessary using Motorcraft® Multi-Purpose Grease. (Figure 1)

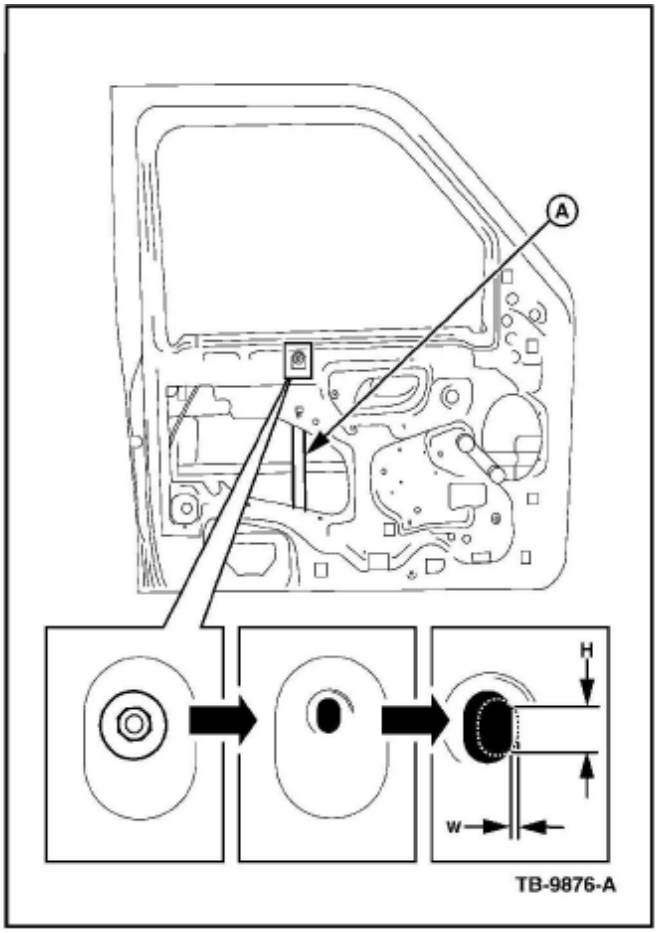

Figure 2

PART NUMBER	PART NAME
XG-4	Motorcraft® Multi-Purpose Grease
PM-13-A	Motorcraft® Anti-Corrosion Coating

3. With window in down position, remove the top and bottom center door glass Run retainer nuts and push door glass Run A to the side. (Figure 2)

4. Rework the upper glass Run attachment slot. (Figure 2)

a. Remove approximately 5/64" (2 mm) of material at W and 25/64" (10 mm) at H.

b. Remove material from the front of vehicle side of the slot. Be careful to not leave burrs on the panel.

c. Coat newly exposed metal areas with Motorcraft(R) Anti-Corrosion Coating.

5. Reposition glass Run A and loosely attach fasteners.

6. Raise glass to full up position. While pushing outward on the lower attachment. Torque glass Run attachment nuts, tighten to 106 lb-in. (12 N.m). Be

careful not to force a different position of the stud when installing the upper nut.

7. Install trim panel following WSM, Section 501-05-1.

TSB 09-22-5

11/16/09

WINDOW CHATTER/SHUDDER

FORD: 2008-2009 Ranger

ISSUE Some 2008-2009 Ranger vehicles may experience window chatter/shudder when the window travels up or down.

ACTION Follow the Service Procedure steps to correct the condition.

SERVICE PROCEDURE

Verify correct grease amount on the window Run. Open the upper door glass Run attachment slot to allow further forward adjustment.

1. Remove door trim panel following Workshop Manual (WSM), Section 501-05.

2. Inspect window Run and add grease if necessary using Motorcraft® Multi-Purpose Grease. (Figure 1)

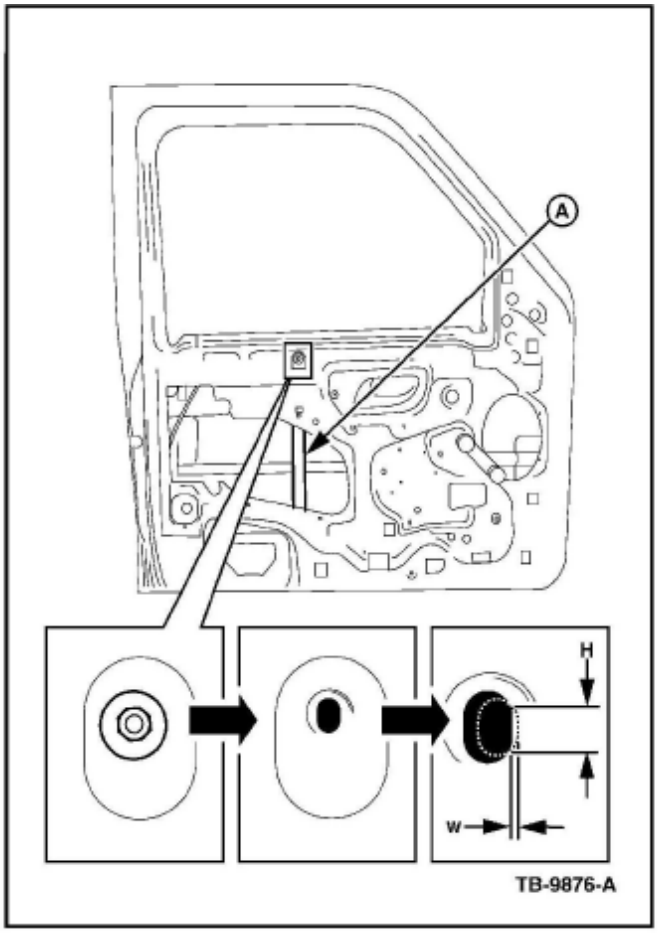

Figure 2

PART NUMBER	PART NAME
XG-4	Motorcraft® Multi-Purpose Grease
PM-13-A	Motorcraft® Anti-Corrosion Coating

3. With window in down position, remove the top and bottom center door glass Run retainer nuts and push door glass Run A to the side. (Figure 2)

4. Rework the upper glass Run attachment slot. (Figure 2)

a. Remove approximately 5/64" (2 mm) of material at W and 25/64" (10 mm) at H.

b. Remove material from the front of vehicle side of the slot. Be careful to not leave burrs on the panel.

c. Coat newly exposed metal areas with Motorcraft(R) Anti-Corrosion Coating.

5. Reposition glass Run A and loosely attach fasteners.

6. Raise glass to full up position. While pushing outward on the lower attachment. Torque glass Run attachment nuts, tighten to 106 lb-in. (12 N.m). Be

careful not to force a different position of the stud when installing the upper nut.

7. Install trim panel following WSM, Section 501-05-1.

Parts Block

WARRANTY STATUS: Eligible Under Provisions Of New Vehicle Limited Warranty Coverage
IMPORTANT: Warranty coverage limits/policies are not altered by a TSB. Warranty coverage limits are determined by the identified causal part.

Removal and Installation

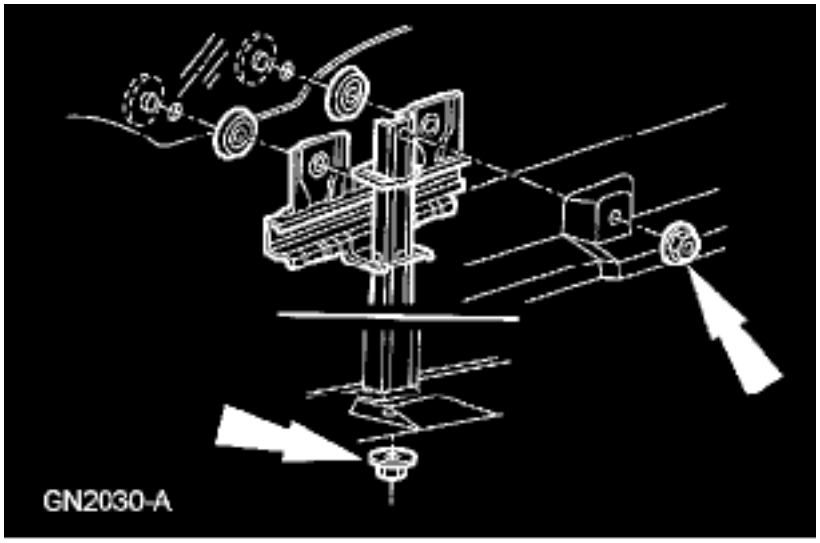
Top run and center run

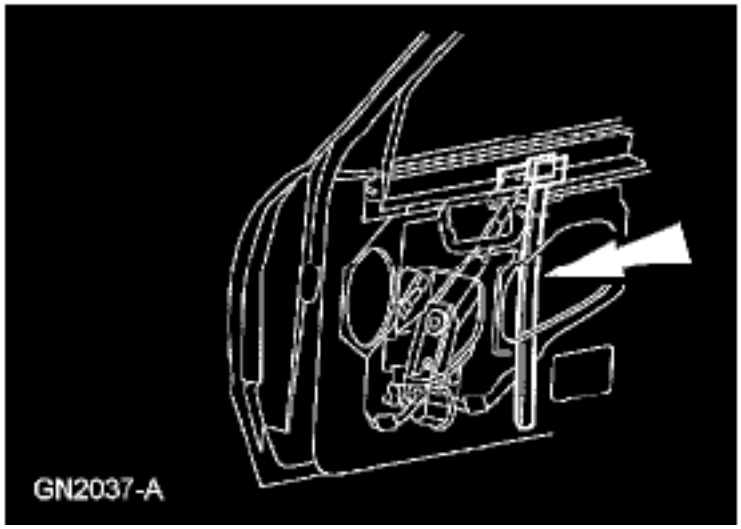
1. Remove the front door window glass.

Center run

2. Remove the top and bottom center door glass run retainer nuts.

- To install, tighten to 9 Nm (80 lb-in).





3. Remove the center door glass run.

Top run

4. Remove the front door beltline inside and outside weatherstrips. 5. Remove the door glass top run bolt.

- To install, tighten to 12 Nm (9 lb-ft).

6. Remove the door glass top run.

Top run and center run

7. To install, reverse the removal procedure.

Windshield: Description and Operation

WINDSHIELD GLASS

The windshield glass is standard plastic and glass laminate safety glass. The windshield glass is bonded to the window opening flange with urethane adhesive.

Removal

1. Remove the windshield wiper pivot arms. 2. Remove the A-pillar trim panel. 3. Remove the sun visors. 4. Remove the sun visor clips. 5. Lower the front portion of the headliner. 6. Remove the interior rear view mirror. 7. Using a soft brush or vacuum, remove any dirt or foreign material from the pinch weld area.

8. NOTE: Refer to manufacturer's instructions before using the tool.

Lubricate the urethane adhesive with water to aid the Interior Auto Glass Cut-Out Knife Kit when cutting the urethane adhesive.

9. WARNING:

- Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

- Wear protective gloves when handling components or parts that have pointed or sharp edges. Failure to follow this instruction may result in serious personal injury.

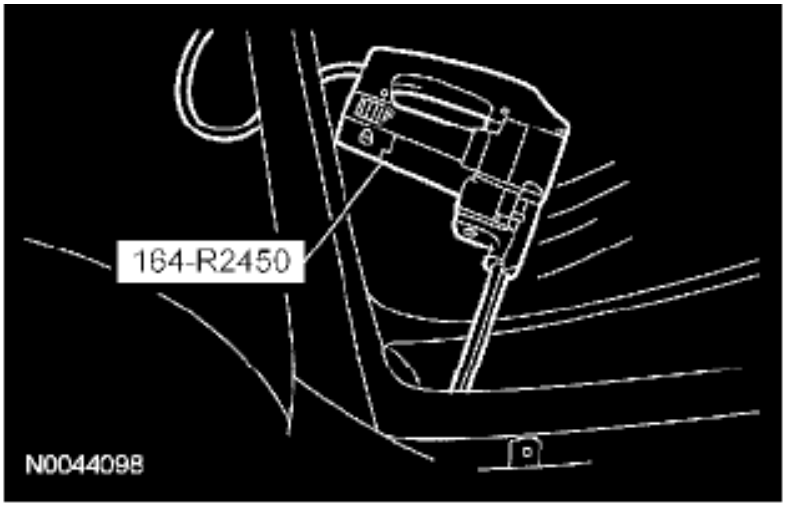
CAUTION: To avoid rust formation, use extreme care not to scratch the paint or primer, or otherwise damage the pinch weld during glass removal.

NOTE: -

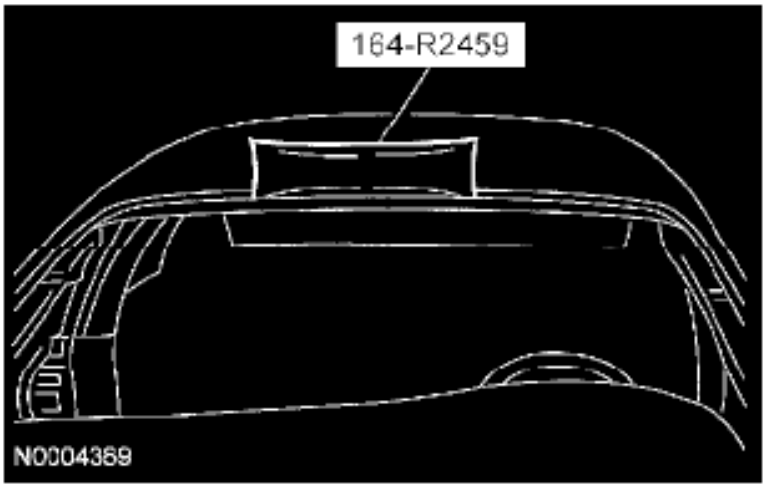
Insert the blade into the special tool so that the flat side is against the glass. This will leave the entire urethane adhesive bead on the pinch weld and allow a dry fit of the replacement windshield glass.

- Support the windshield glass as necessary to prevent the glass from dropping while cutting the urethane adhesive.

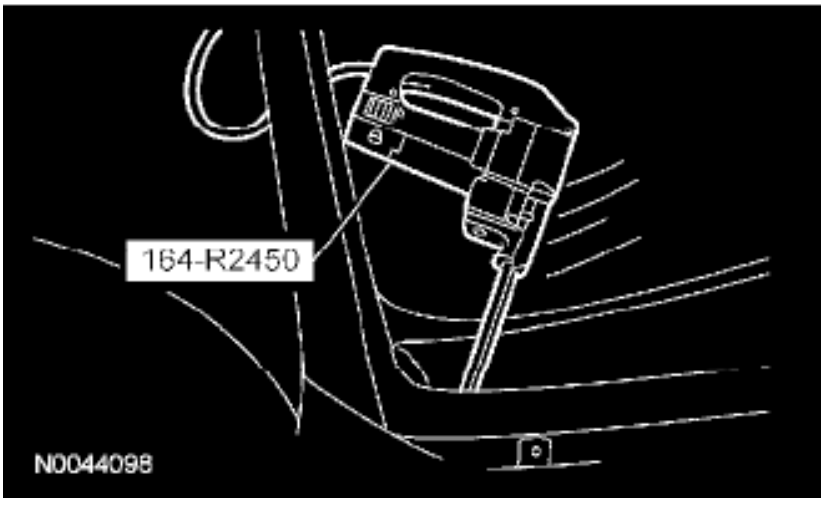
Insert the special tool at the upper center of the windshield glass and work toward the bottom corners.



164-R2450
N0044098



164-R2459
N0004369



164-R2450
N0044098

10. Using the special tool, distance the windshield glass from the body.

11. Using the special tool, cut the remaining urethane adhesive and carefully remove the windshield glass and place on a stable work surface.

Installation

1. Dry fit the windshield glass on the existing urethane bead on the pinch weld.

- Position the windshield glass on the pinch weld.

- Center the windshield glass in the opening.

- Adjust the windshield glass stop blocks (if equipped) as needed for best fit.

- Make alignment marks with tape or non-staining grease pencil (preferably at the windshield glass stop blocks, if equipped) on the windshield glass and the body.

2. After the dry-fit alignment, remove the glass from the windshield opening and place on a stable work surface with the interior side of the glass

facing up.

3. Using a clean shop towel, brush or oil-free compressed air, clean the pinch weld area around the existing urethane. Remove any foreign material or

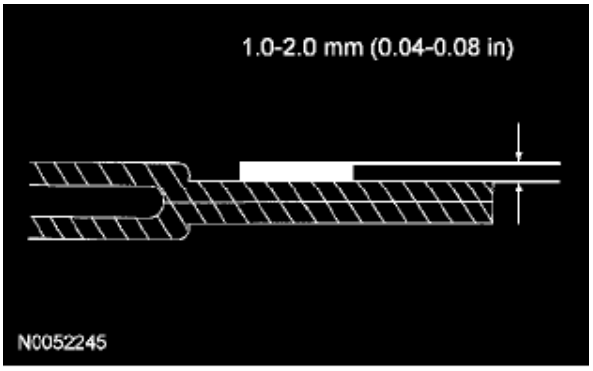
water that may have entered during windshield removal.

4. WARNING: Repair any corrosion found on the pinch weld. The pinch weld is a structural component of the vehicle. Corrosion left

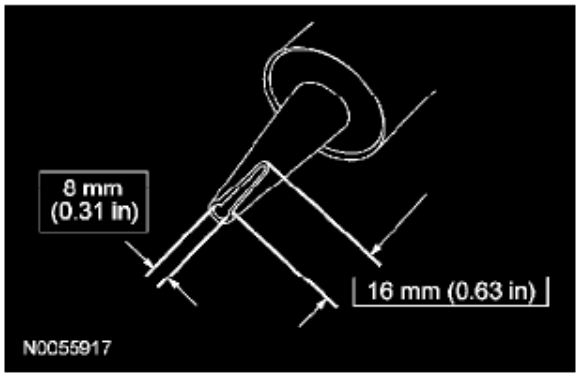
unrepaired may reduce the structural integrity of the vehicle. Failure to follow this instruction may result in serious injury to vehicle occupant(s).

NOTE: Avoid scratching the pinch weld. For minor scratches or exposed metal on the pinch weld, see the manufacturer's recommendations.

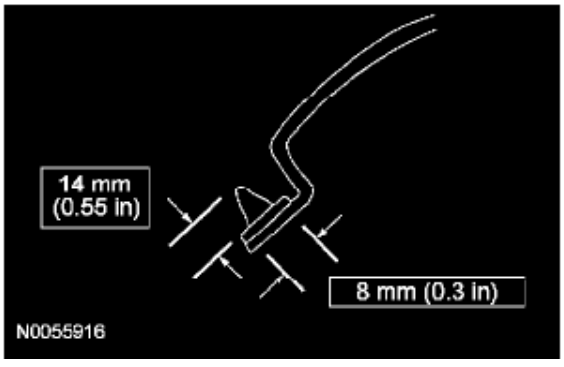
Using an appropriate tool, trim the urethane adhesive leaving a 1-2 mm (0.04-0.08 in) base of original equipment urethane on the pinch weld.



1.0-2.0 mm (0.04-0.08 in)
N0052245



8 mm
(0.31 in)
16 mm (0.63 in)
N0055917



14 mm
(0.55 in)
8 mm (0.3 in)
N0055916

5. If reinstalling the same windshield glass, remove the remaining urethane adhesive from the glass leaving a thin layer to bond with the new urethane

bead.

6. Clean the inside of the glass surface with glass cleaner.

7. NOTE:

- Be sure to use the same brand and cure-rate products for the adhesive and primer. Do not mix different brands of urethane and primer. Refer to the Material Chart in this procedure.

- Sika uses the same black primer for the glass and pinch weld area.

If installing a new windshield glass, apply urethane glass primer according to manufacturer's instructions. Allow at least 6 minutes to dry.

8. Cut the urethane applicator tip to specification.

9. NOTE: Use either a high-ratio, electric or battery-operated caulk gun that will apply the urethane with less effort and a continuous bead.

Apply urethane adhesive on top of the existing trimmed urethane adhesive bead on the pinch weld. Make sure that all gaps in the urethane adhesive are smoothed into one continuous bead starting and ending at the bottom of the windshield near the center.

WARNING: Do not drive vehicle until the urethane seal has cured. Follow urethane manufacturer's curing directions. Inadequate or incorrect curing of the urethane seal will adversely affect glass retention. Failure to follow these instructions may result in serious injury to vehicle occupant(s).

CAUTION: Before positioning the windshield glass, open vehicle window to prevent the air pressure of closing doors from affecting the adhesive bond.

10. Position the windshield glass, aligning the marks made previously.

11. NOTE: The urethane adhesive must cure for a minimum of one hour before testing for air or water leaks.

Check the installation for air and water leaks through the urethane bond and add urethane adhesive where needed.

12. Install the A-pillar trim panel. 13. Install the inside rear view mirror. 14. Install the sun visor clips. 15. Install the sun visors. 16. Install the windshield wiper pivot arms.

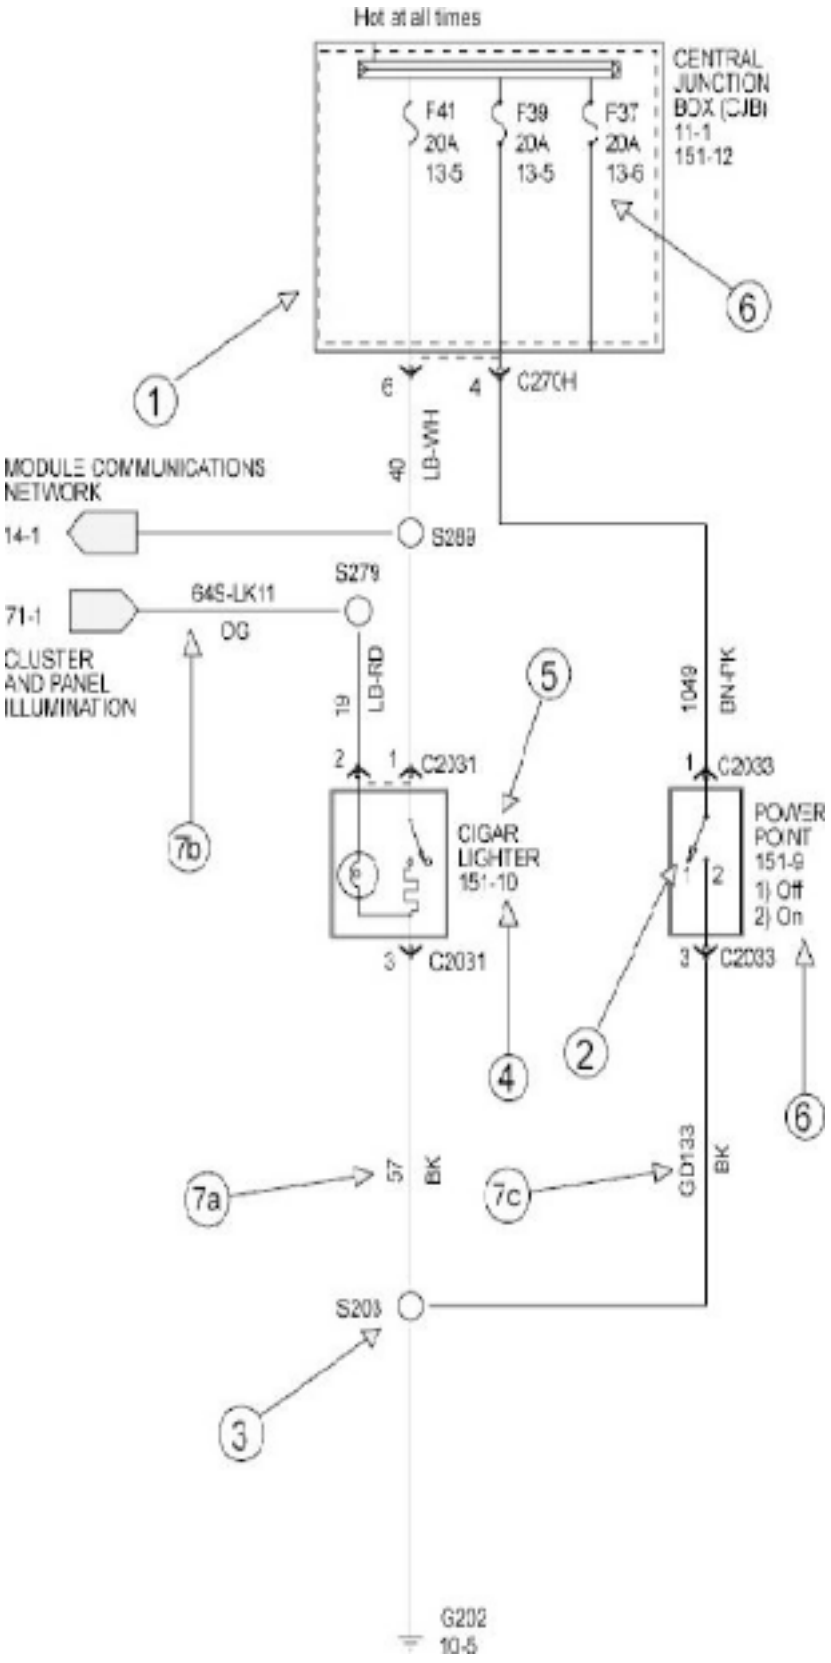
Ford Workshop Manuals > Wiper and Washer Systems > Relays and Modules - Wiper and Washer Systems > Windshield Washer Relay > Component Information > Diagrams > Diagram Information and Instructions



Windshield Washer Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

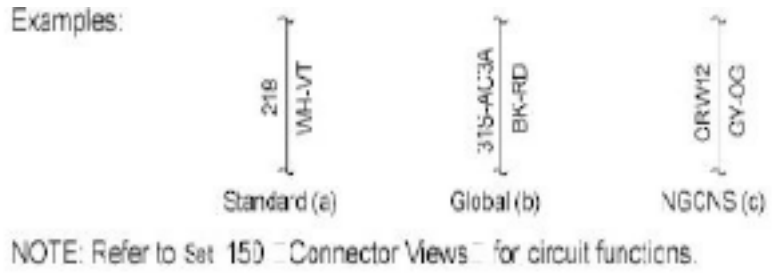
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

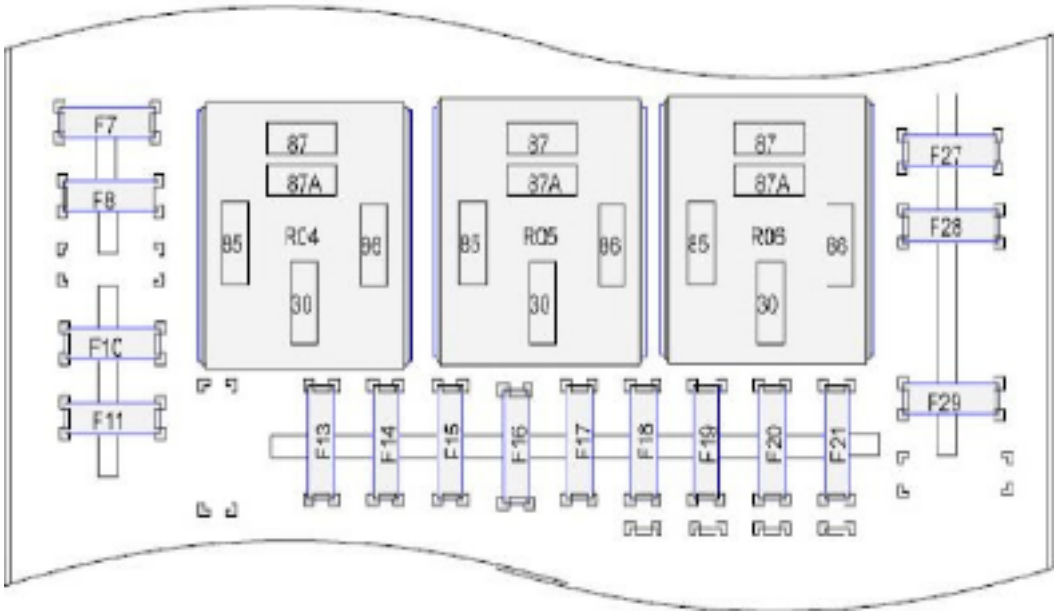
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

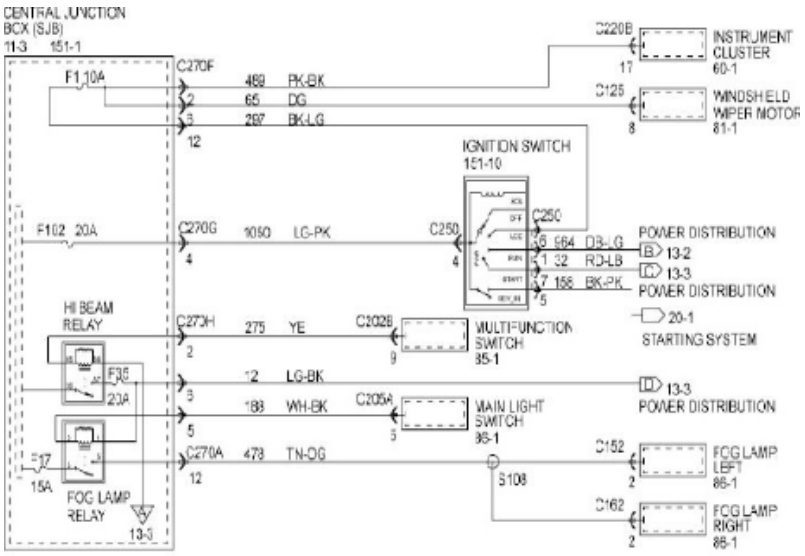
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

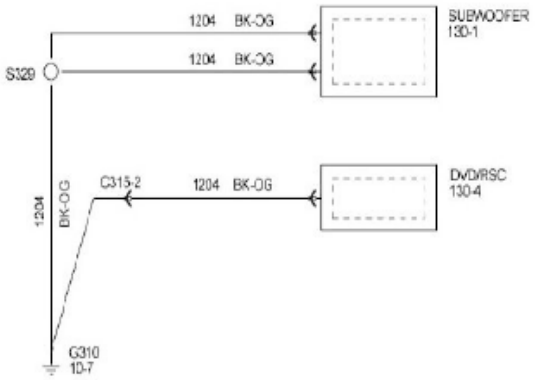
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

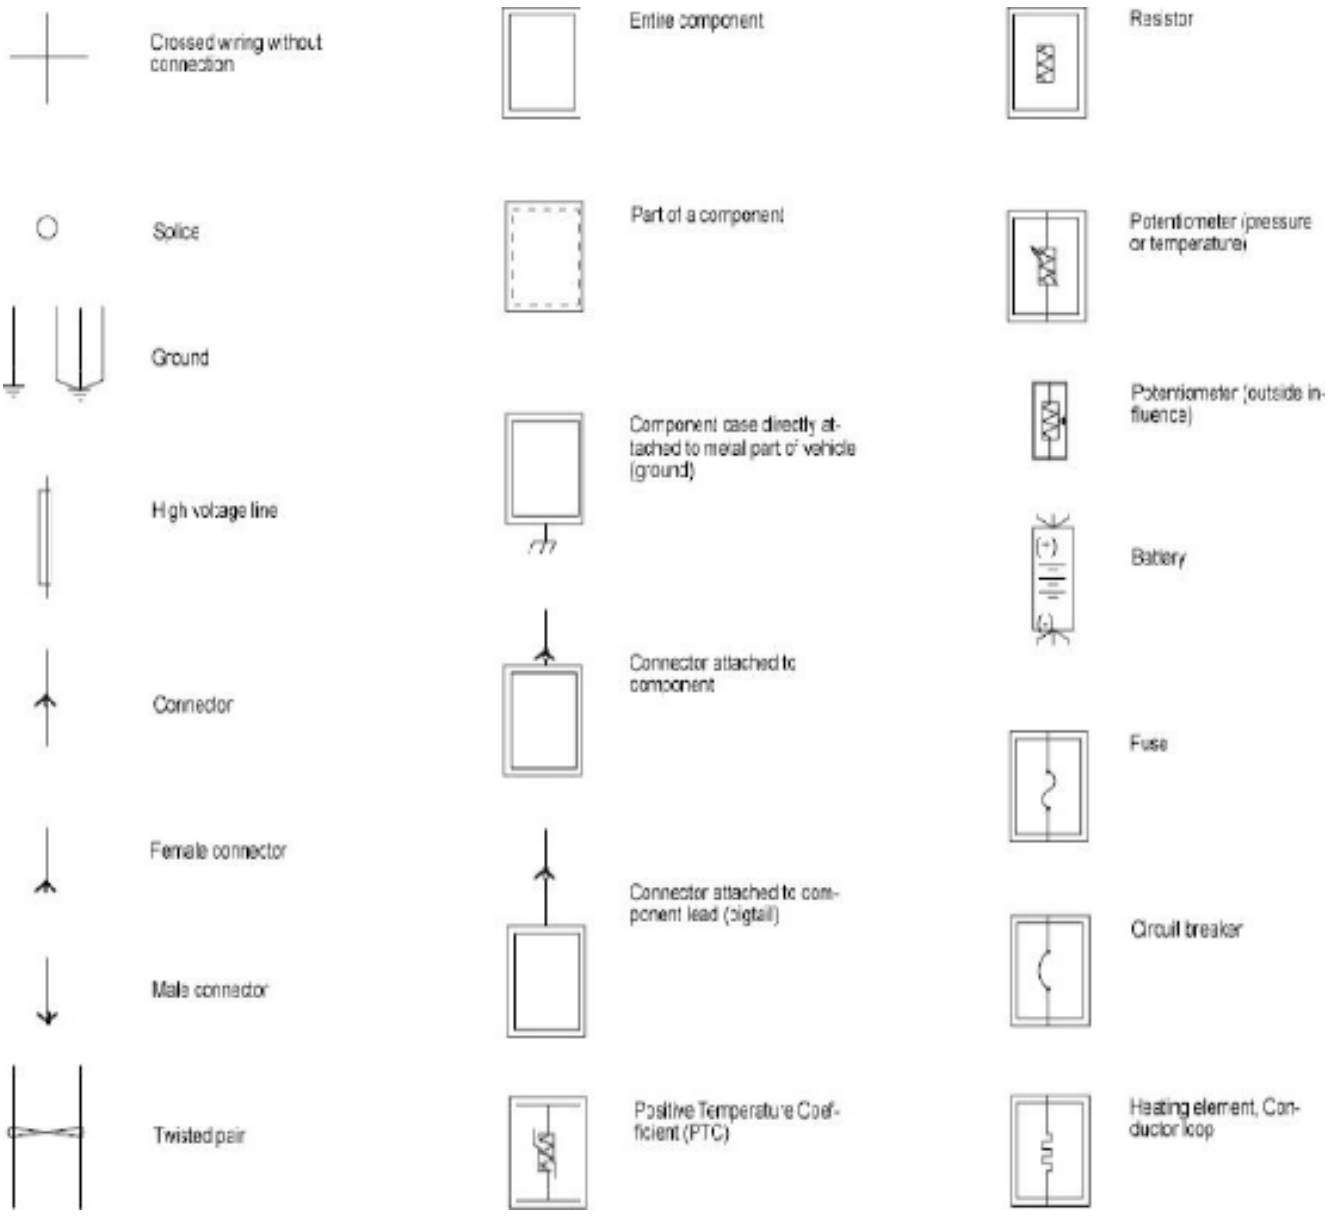
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

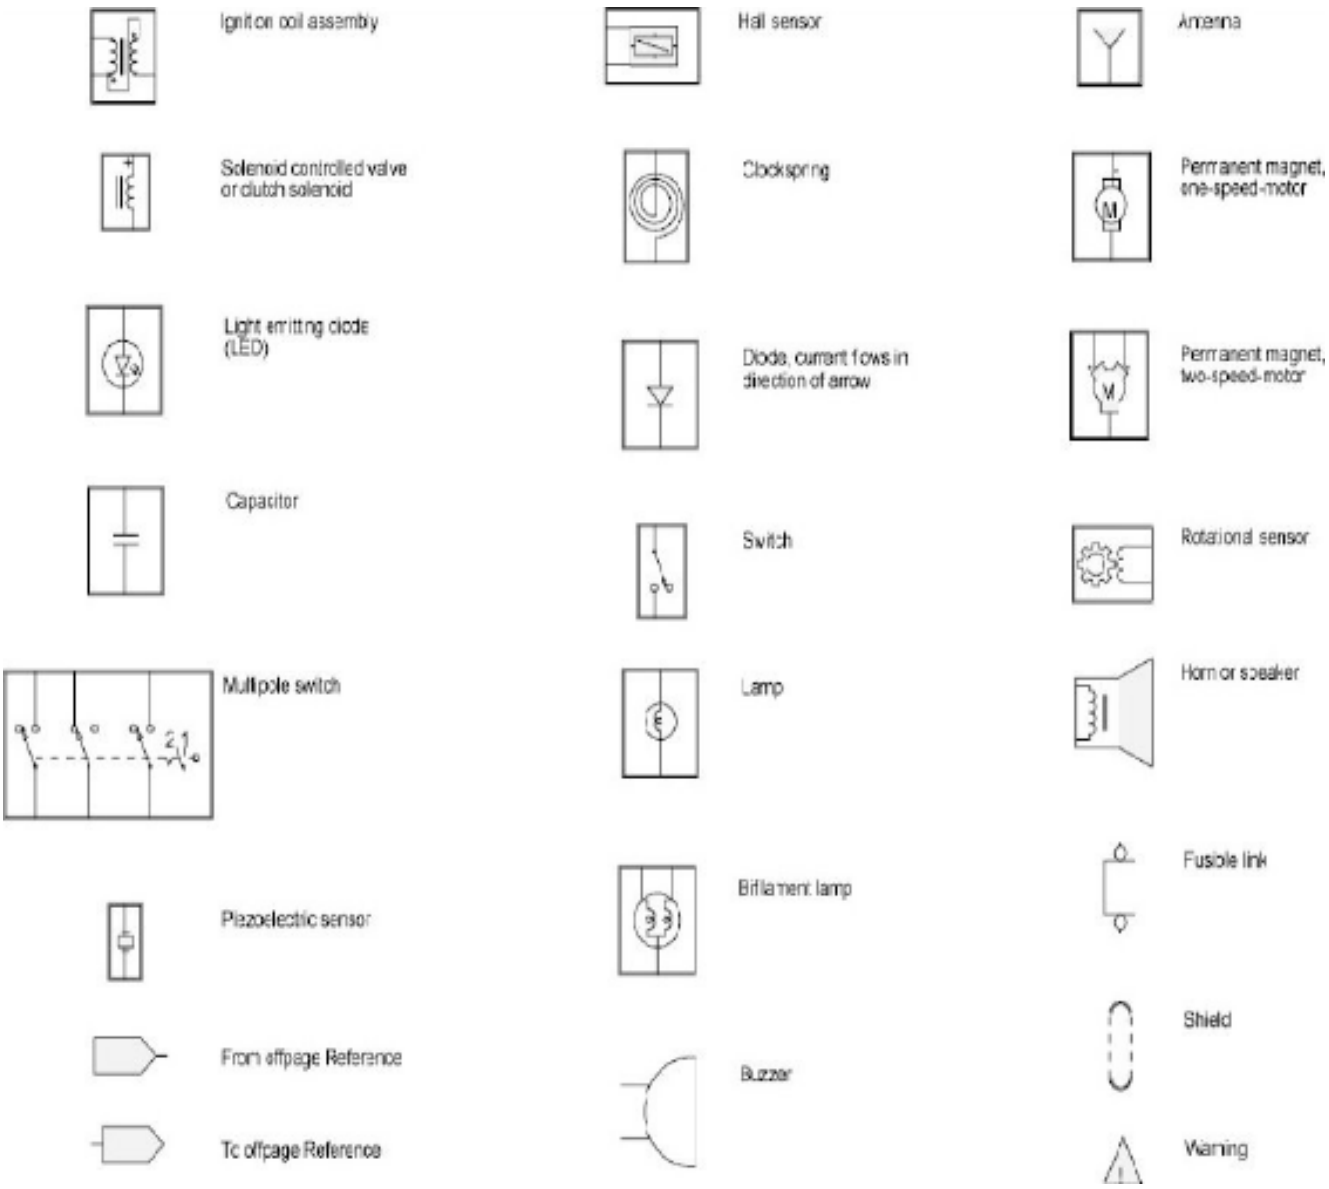
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

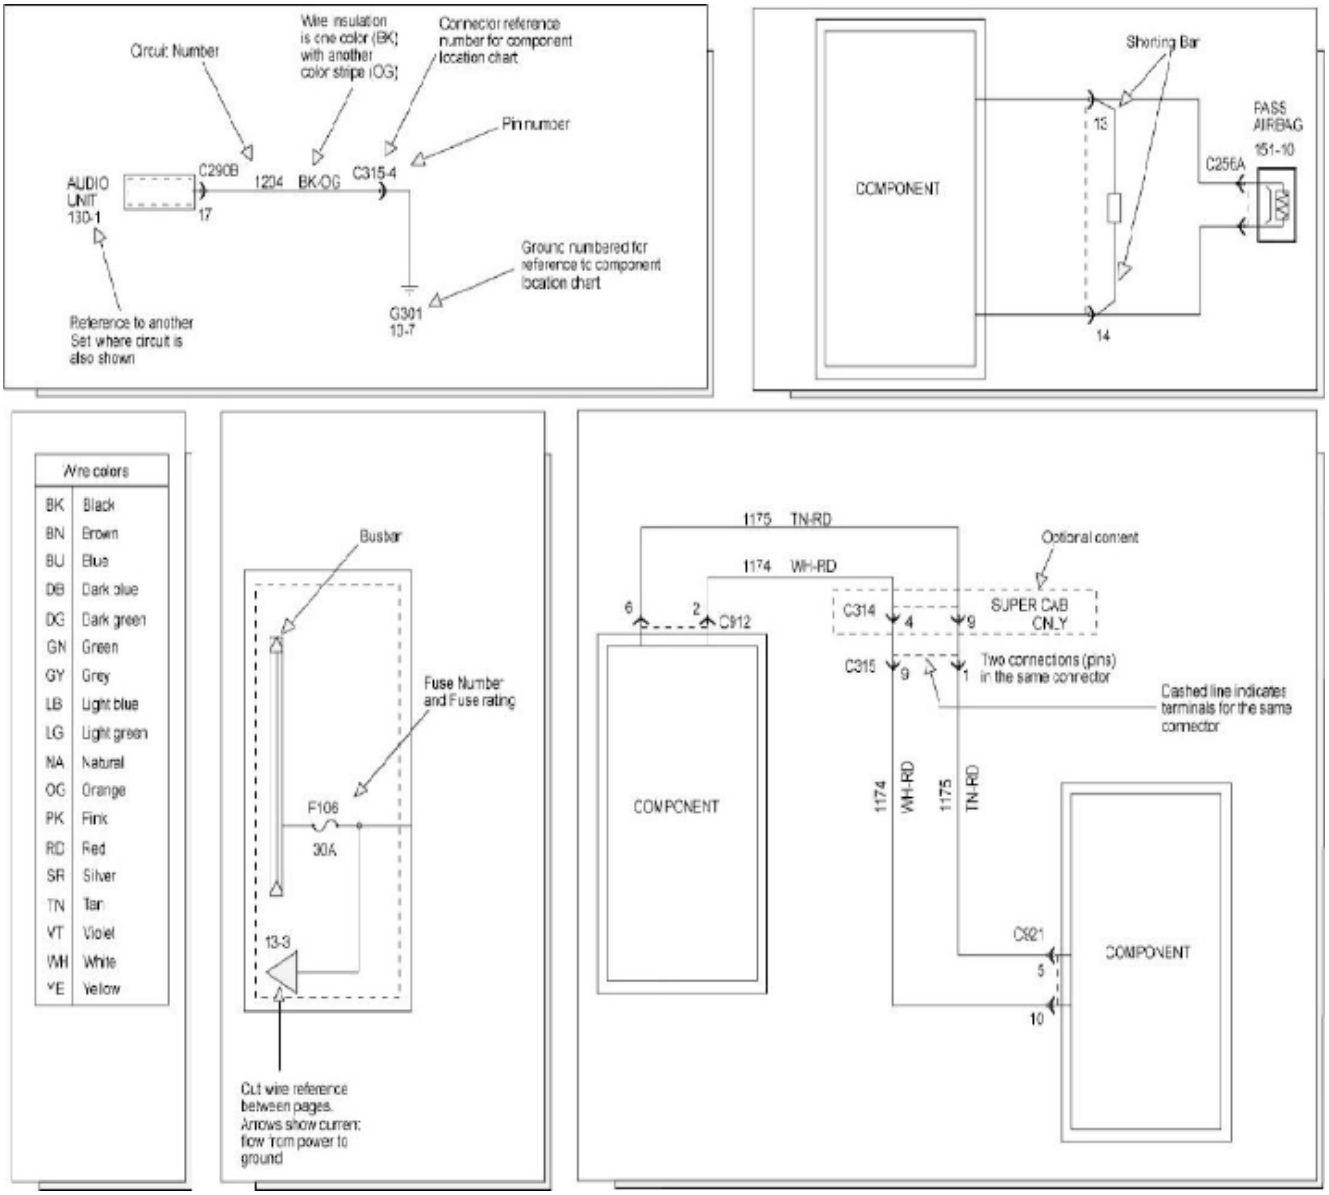
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

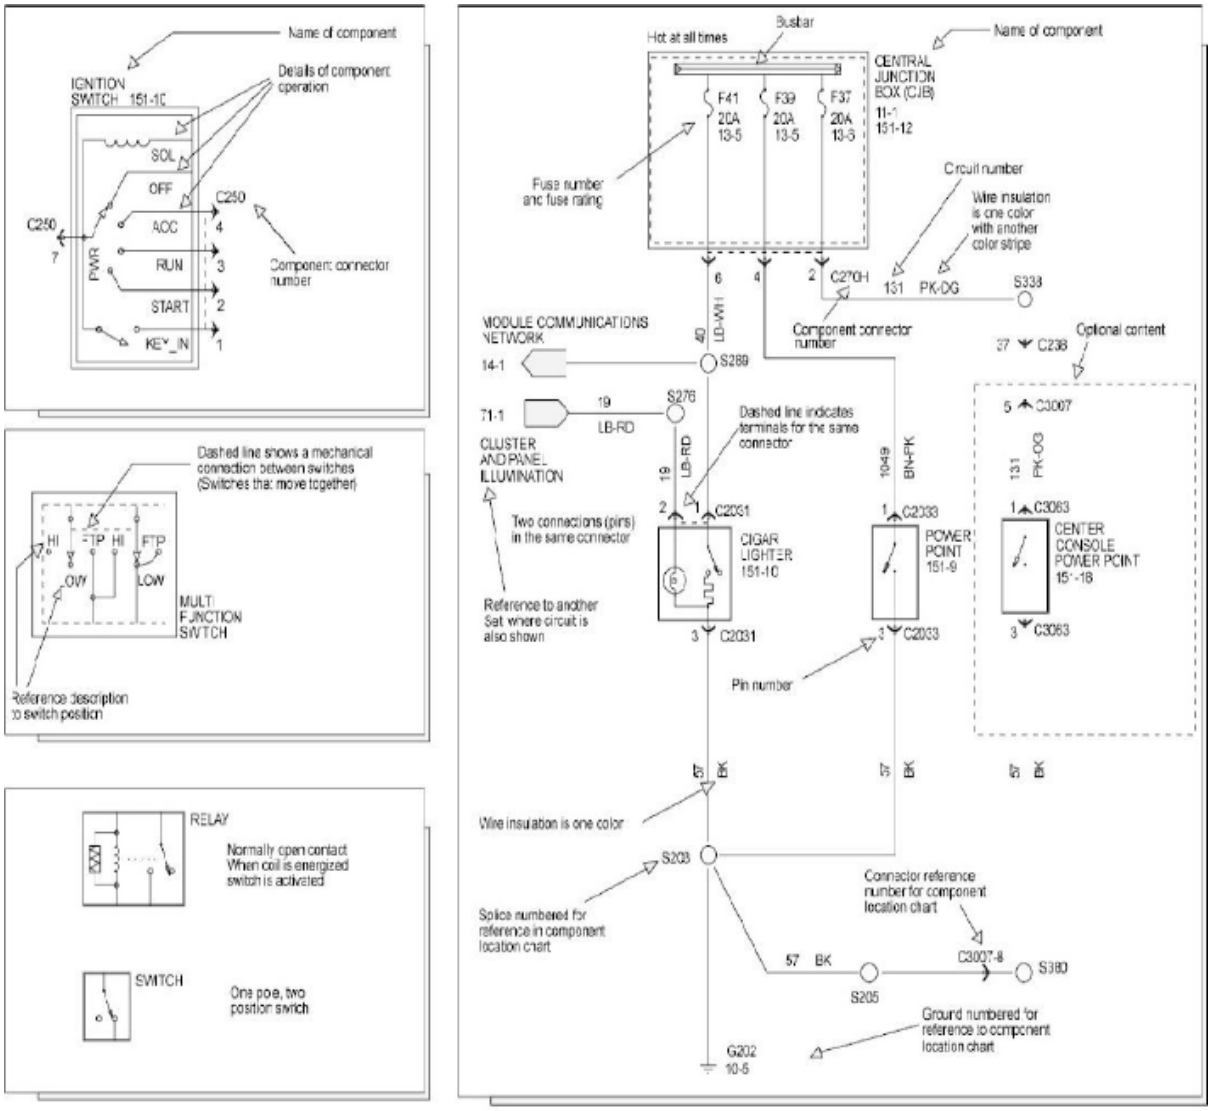
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right

Windshield Washer Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.

WIRE STOPPER

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

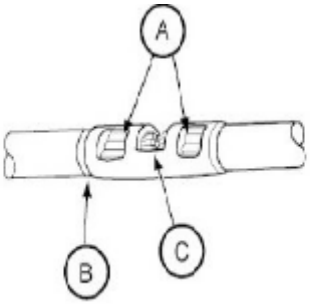
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

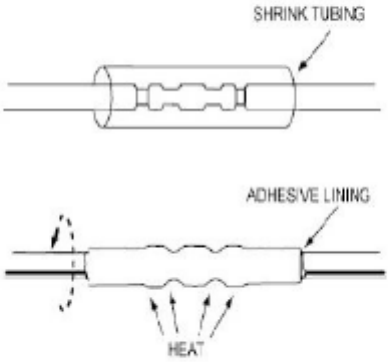
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x cia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Figtail only

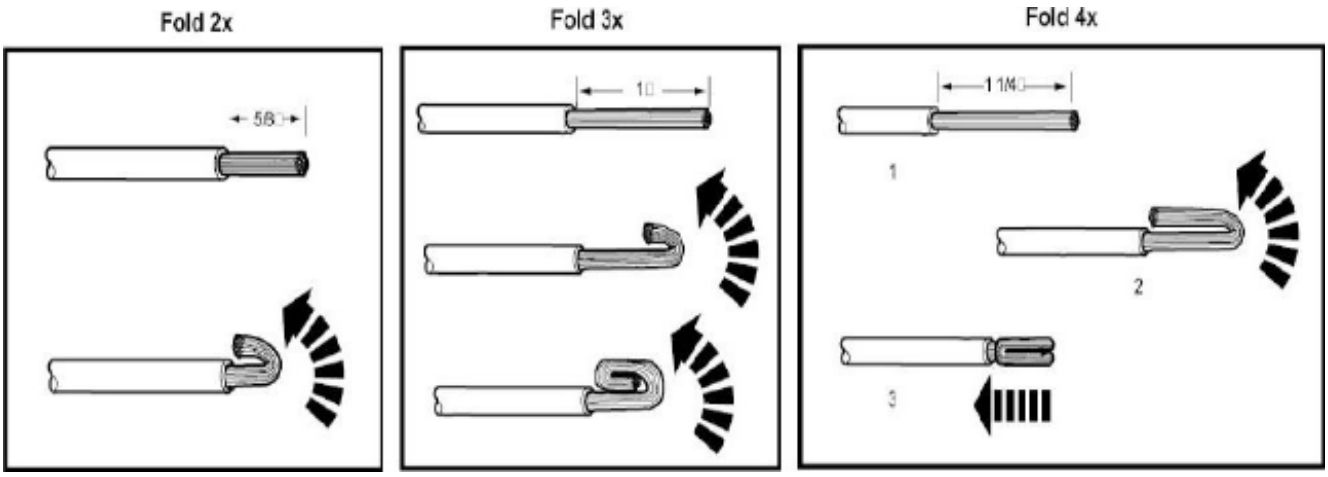
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



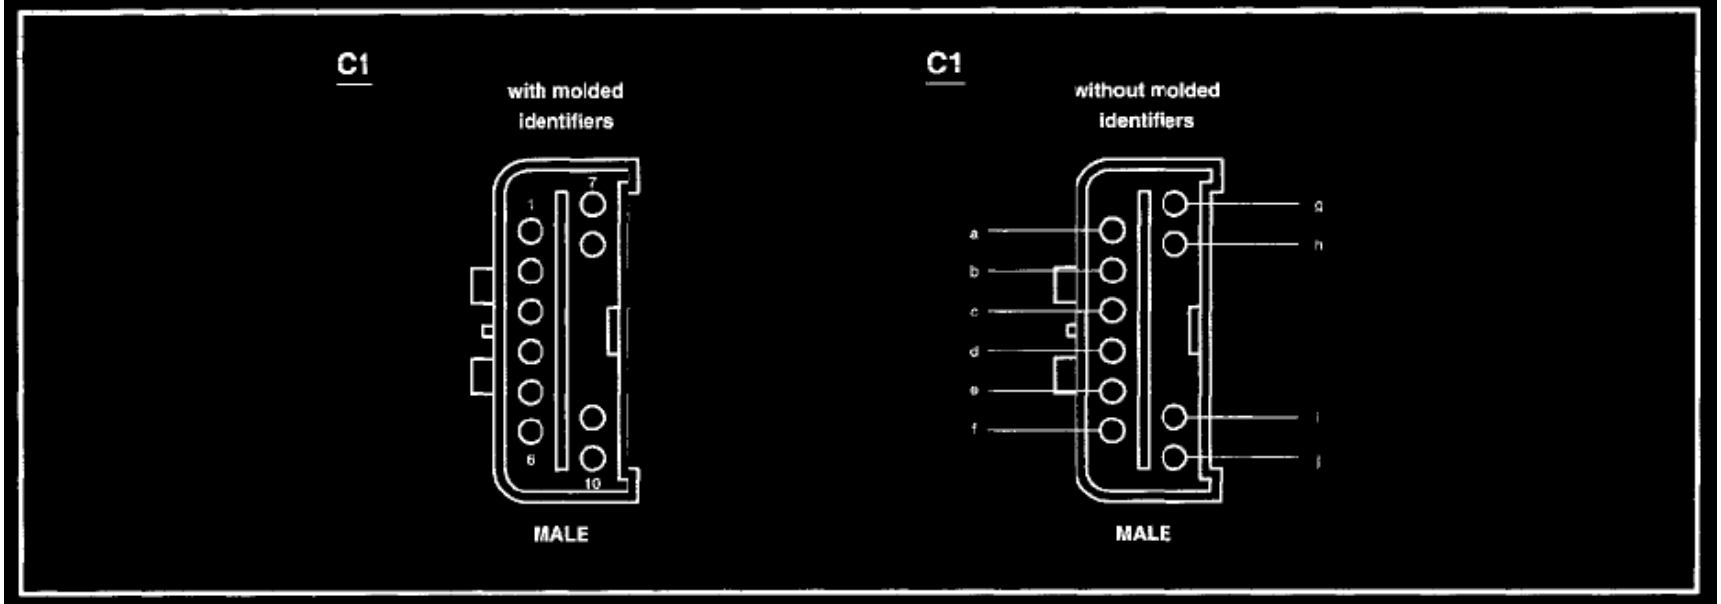
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step–by–step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

Windshield Washer Relay: Testing and Inspection Micro ISO Relay

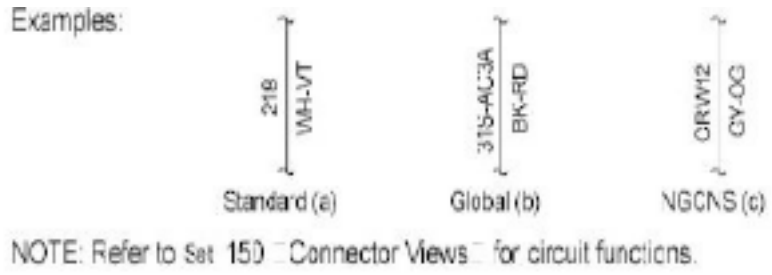
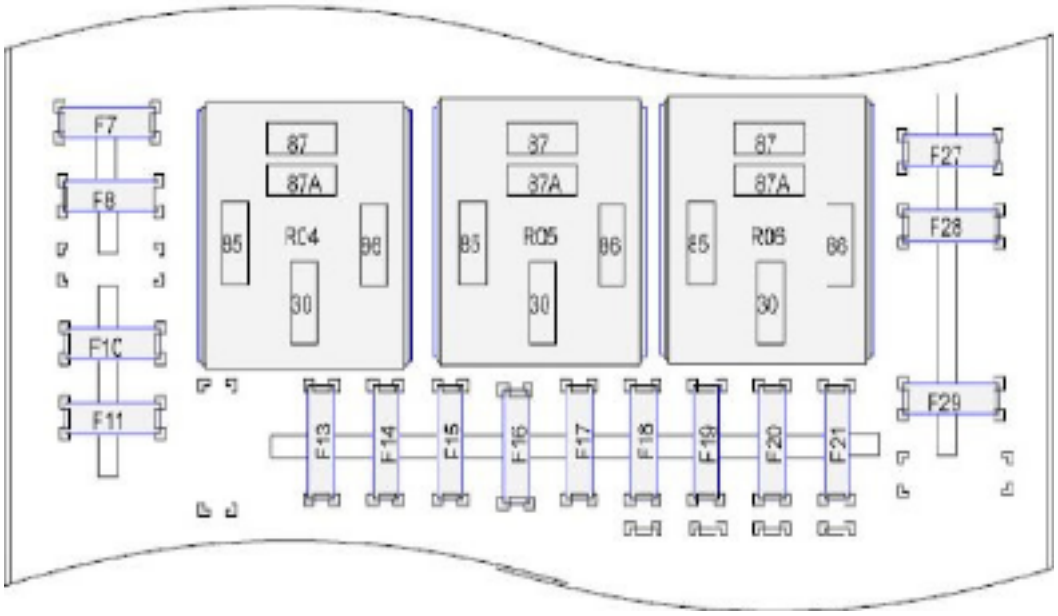
Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

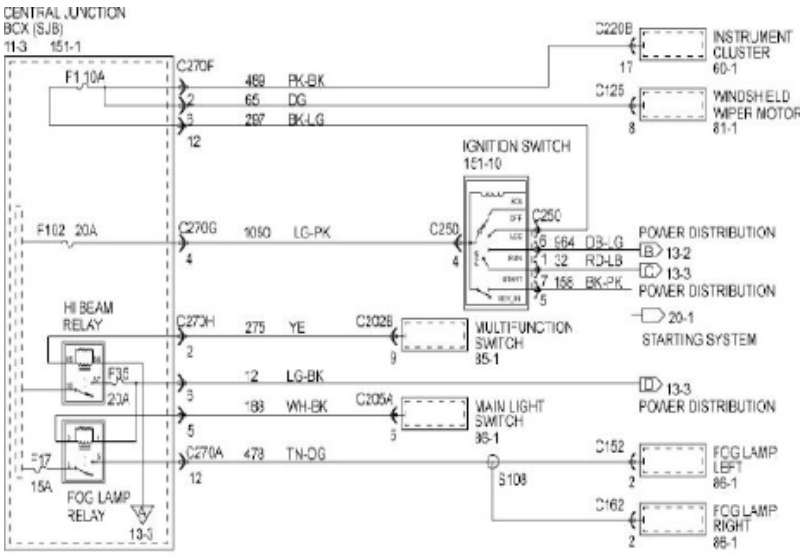
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

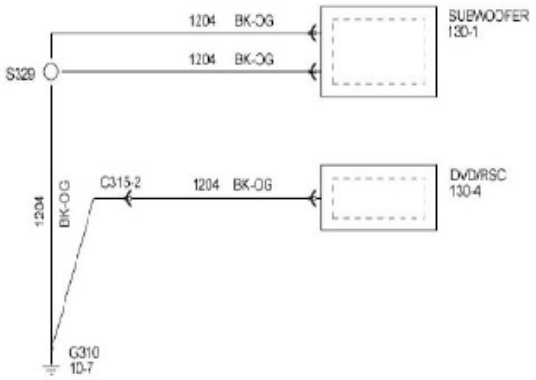
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

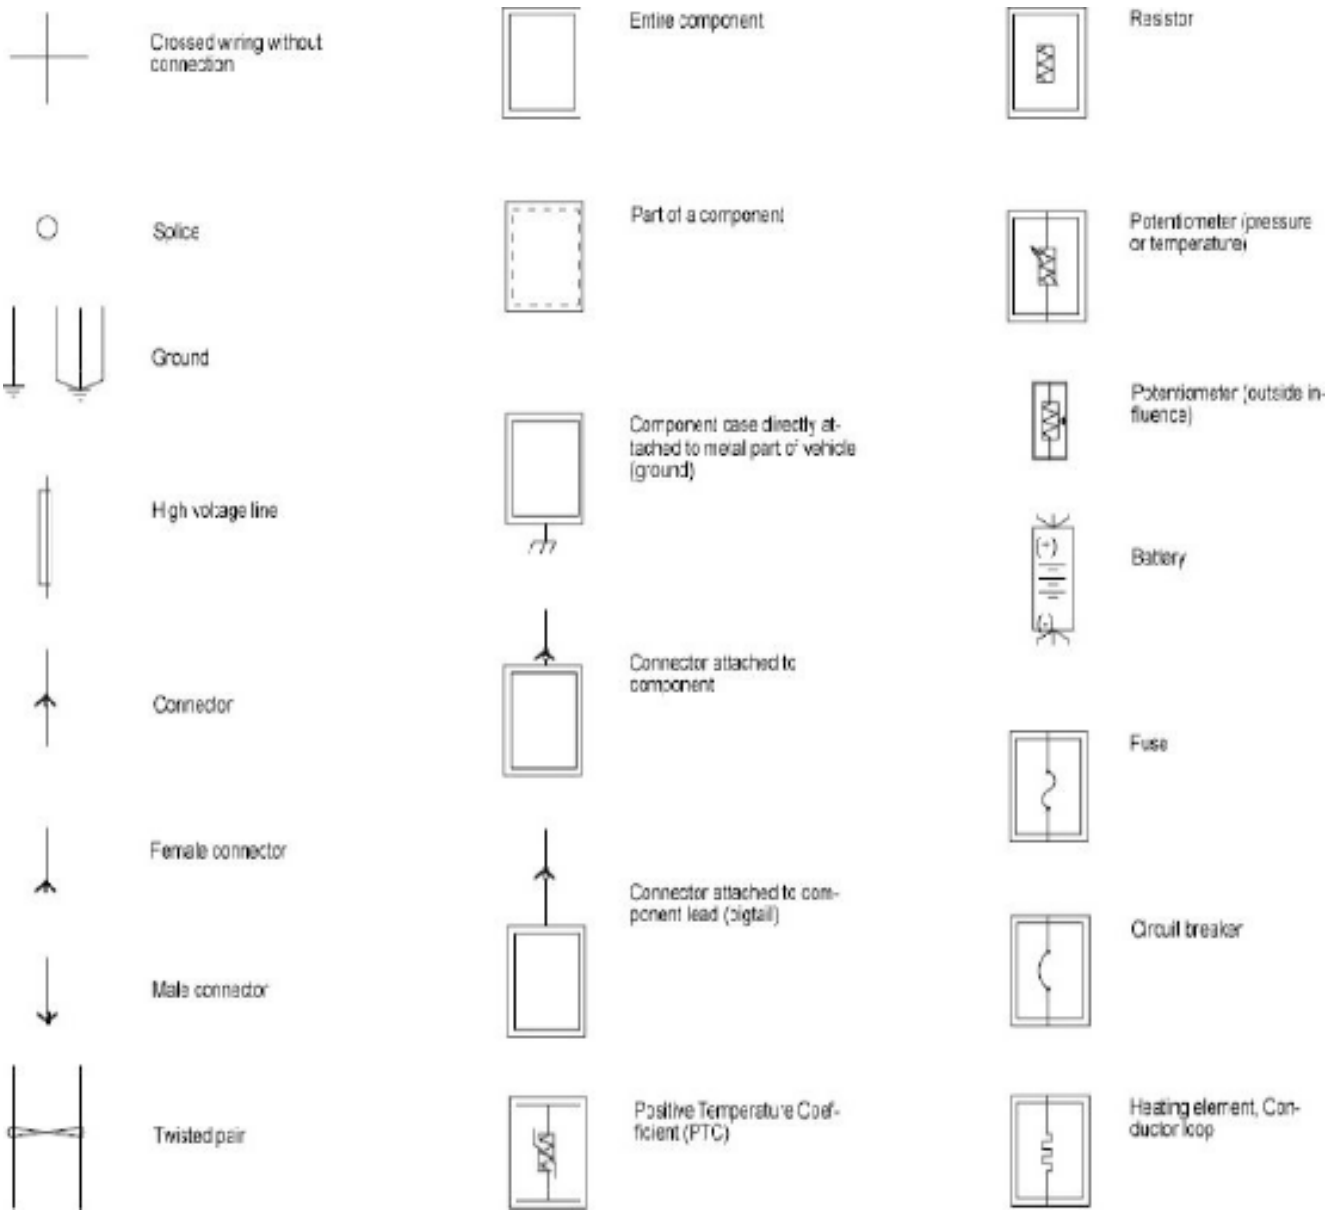
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

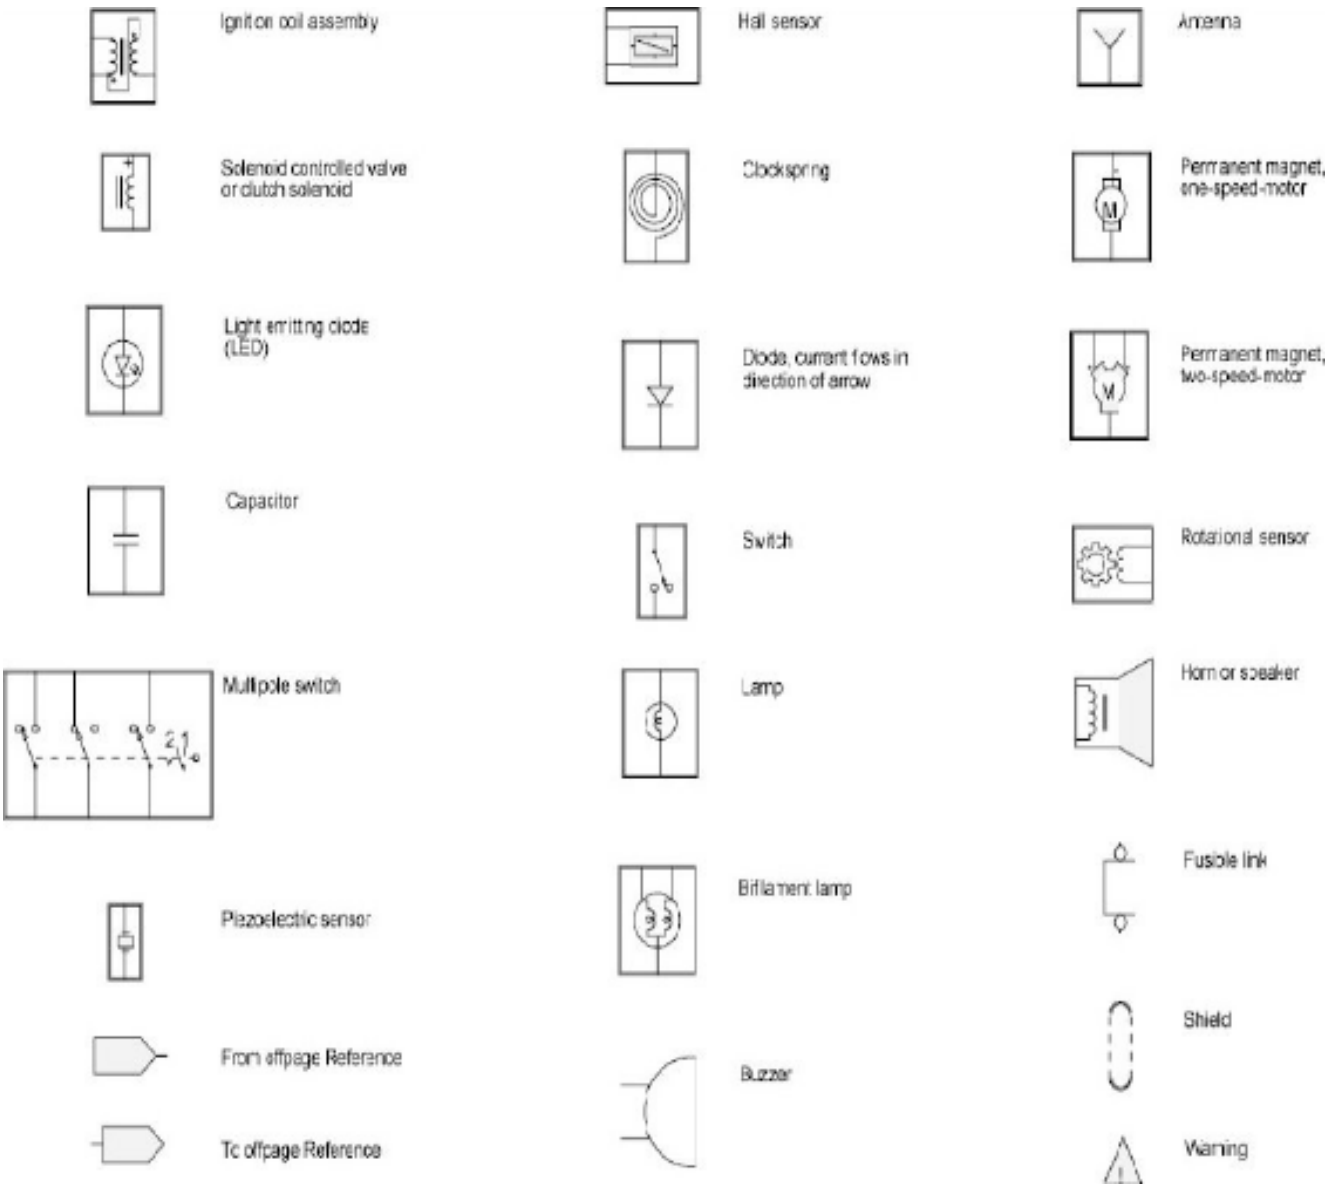
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

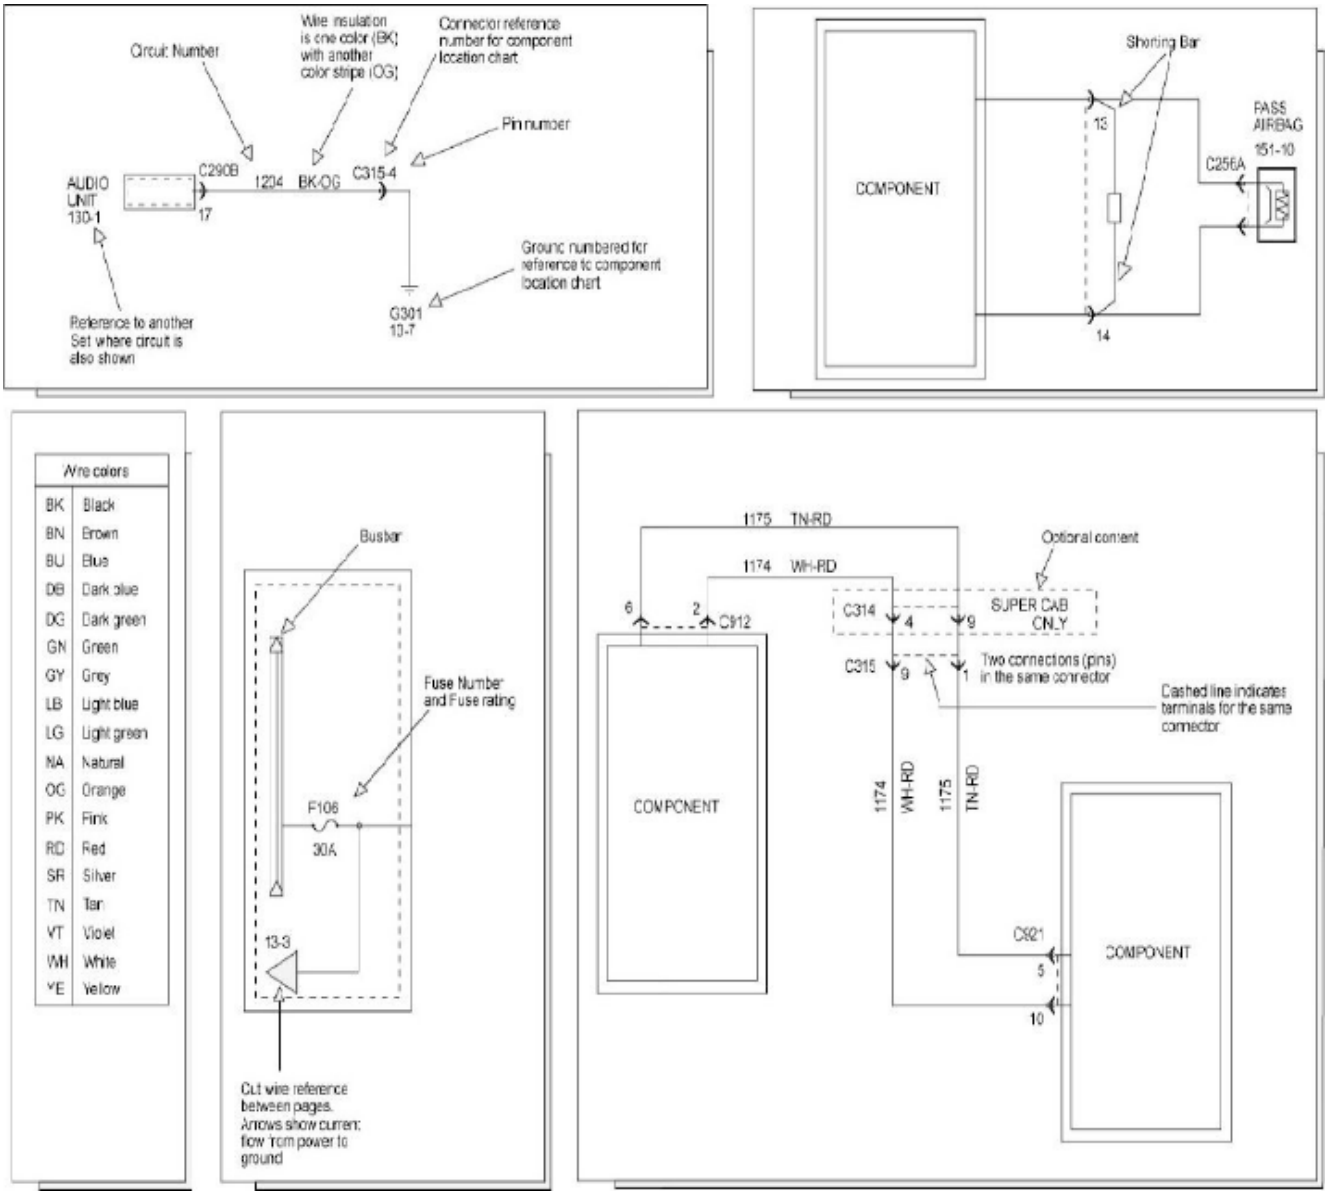
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

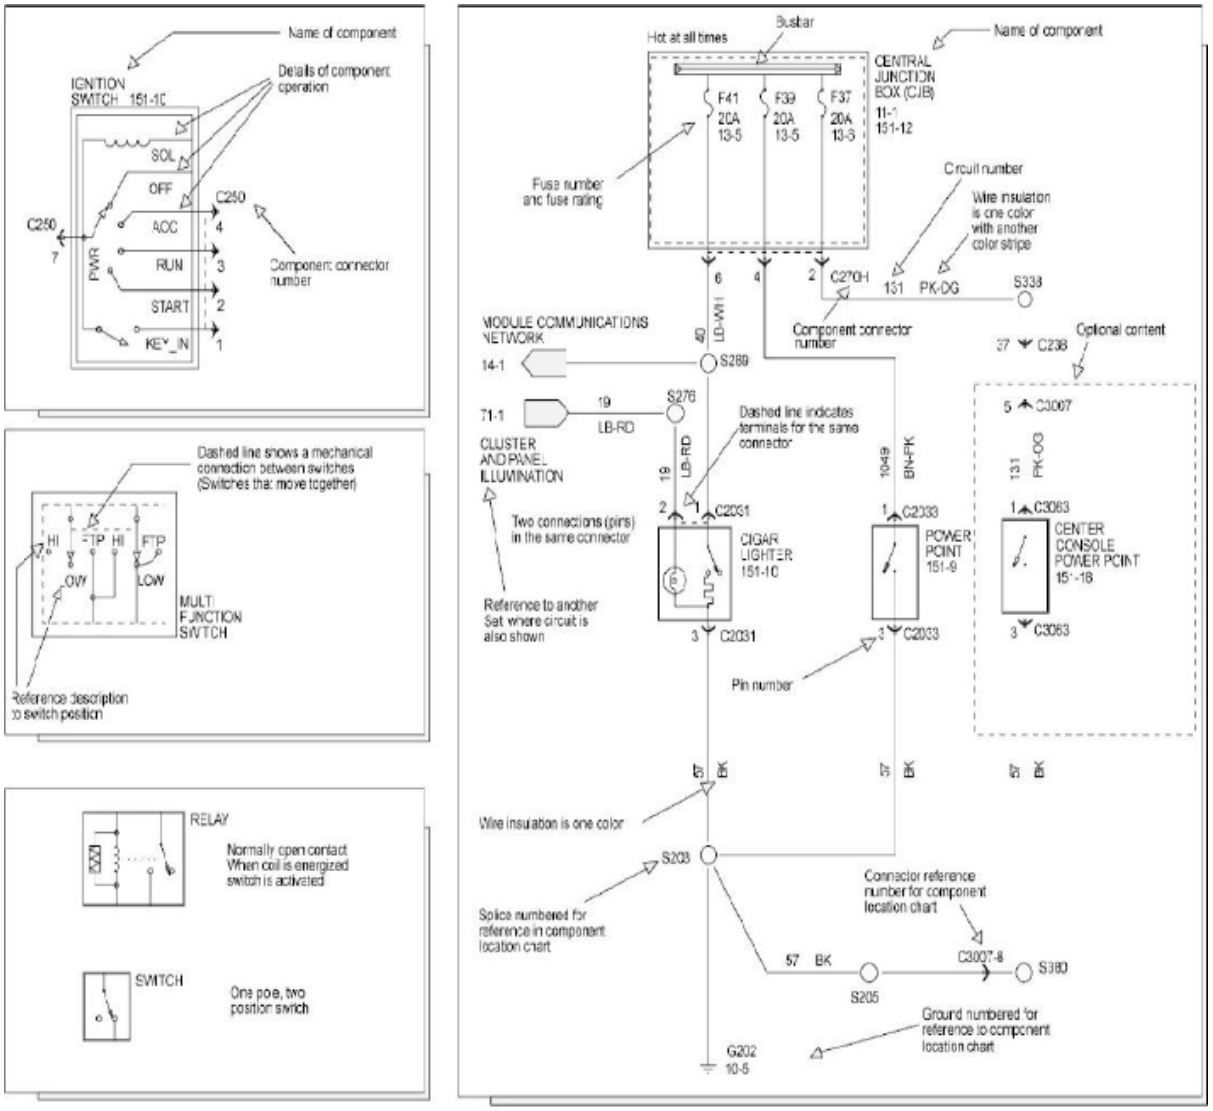
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Wiper Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Defective insulation stripping

1 = Proper crimp

2 = Insulation not removed

3 = Wire strands missing

4 = Intermittent signals through pierced insulation

Partially mated connectors

1 = Seal

2 = Displaced tab

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Male half

7 = Intermittent contact

Lock may be displaced into an unlocked position; pull on the connector to verify the lock.

Deformed (enlarged) female terminals

1 = Enlarged

2 = Normal

Any probe entering the terminal may enlarge the contact spring opening creating an intermittent signal.

Insert the correct mating terminal (Location A) from the service kit and feel for a loose fit.

4 = Circuit insulation

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

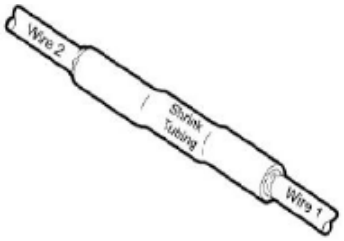
NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.



Wire 2

INDENTER
WIRE STOPPER

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

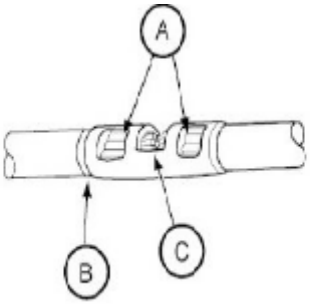
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

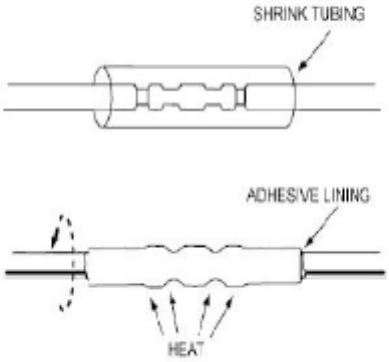
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4□ strip, cut 9 strands	* 1/4□ strip, cut 2 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip, fold 3x dia.
	16-14	* 1/4□ strip, cut 7 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip fold 2x dia	1□ strip, fold 3x dia.	1 1/4□ strip, fold 4x dia.	Not Recommended
	12-10	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip fold 3x cia.	1 1/4□ strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Figtail only

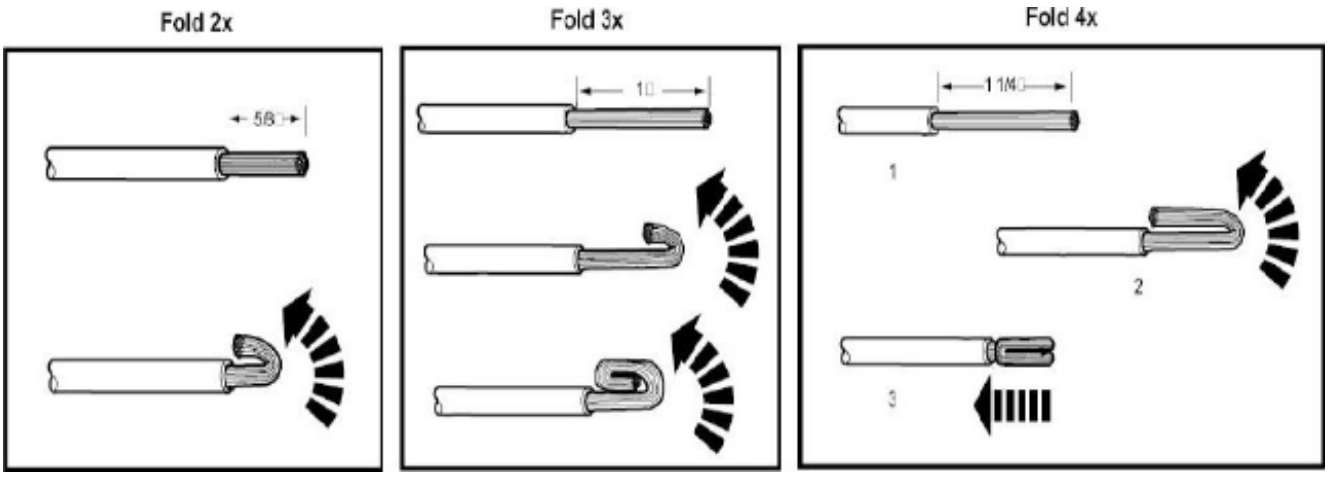
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



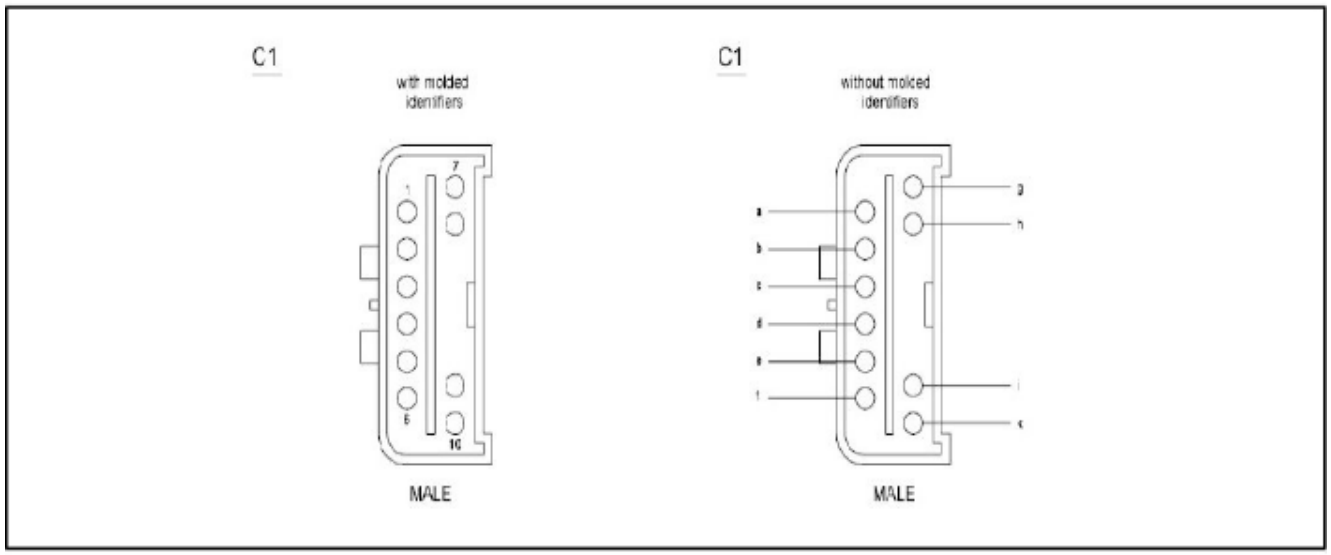
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



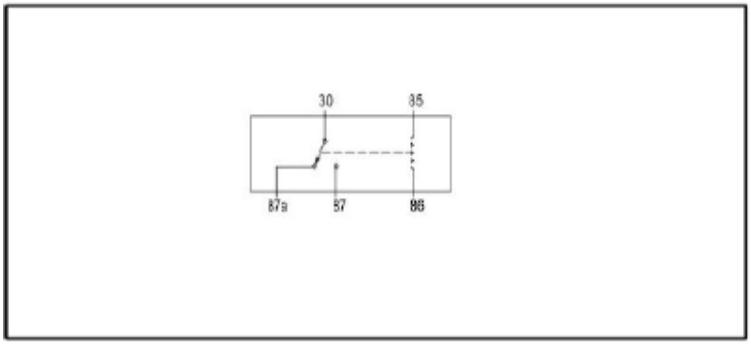
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

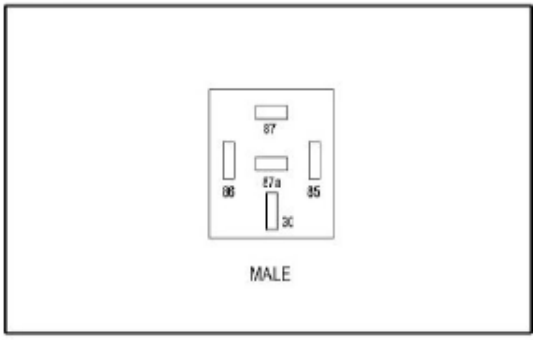
Wiper Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 - 90 Ω
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil □ Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

Removal and Installation

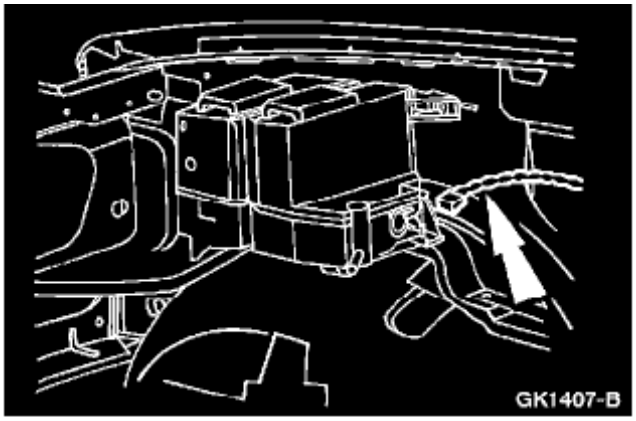
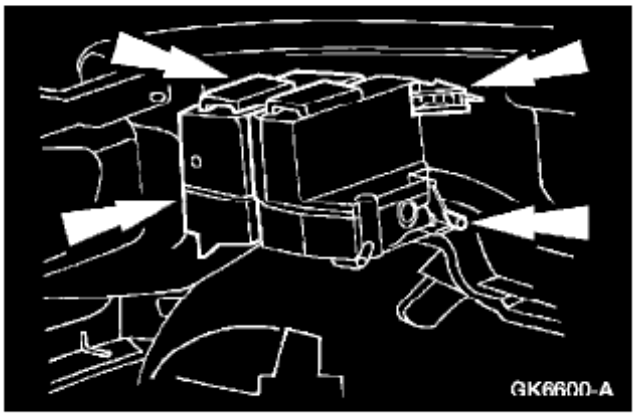
WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. Consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

NOTE: To prevent spilling windshield washer fluid, drain the windshield washer reservoir before removal.

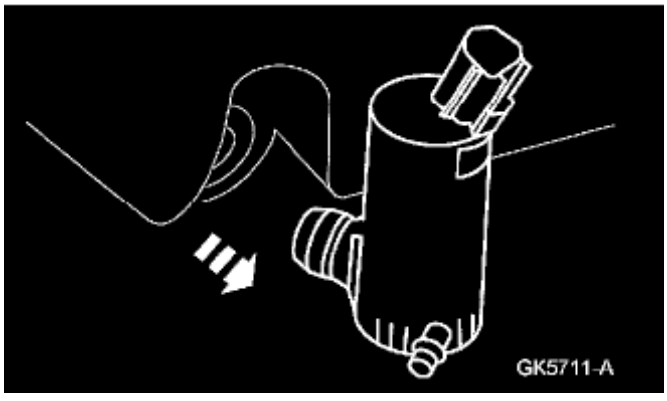
1. Disconnect the overflow hoses from the engine coolant overflow reservoir and plug the outlet ports of the reservoir. 2. Disconnect the windshield washer reservoir pump electrical connector.



GK1407-B



GK6600-A



GK5711-A

3. Remove the air cleaner assembly.

4. NOTE: The windshield washer reservoir and the washer pump are serviced independently.

Remove the 2 reservoir bolts and 2 reservoir nuts and remove the windshield washer reservoir. -

To install, tighten to 6 Nm (53 lb-in).

5. Disconnect the windshield washer hose from the windshield washer pump.

6. NOTE: When removing the washer pump from the washer reservoir, be sure not to damage the rubber grommet.

Remove the washer pump from the washer reservoir.

7. To install, reverse the removal procedure.

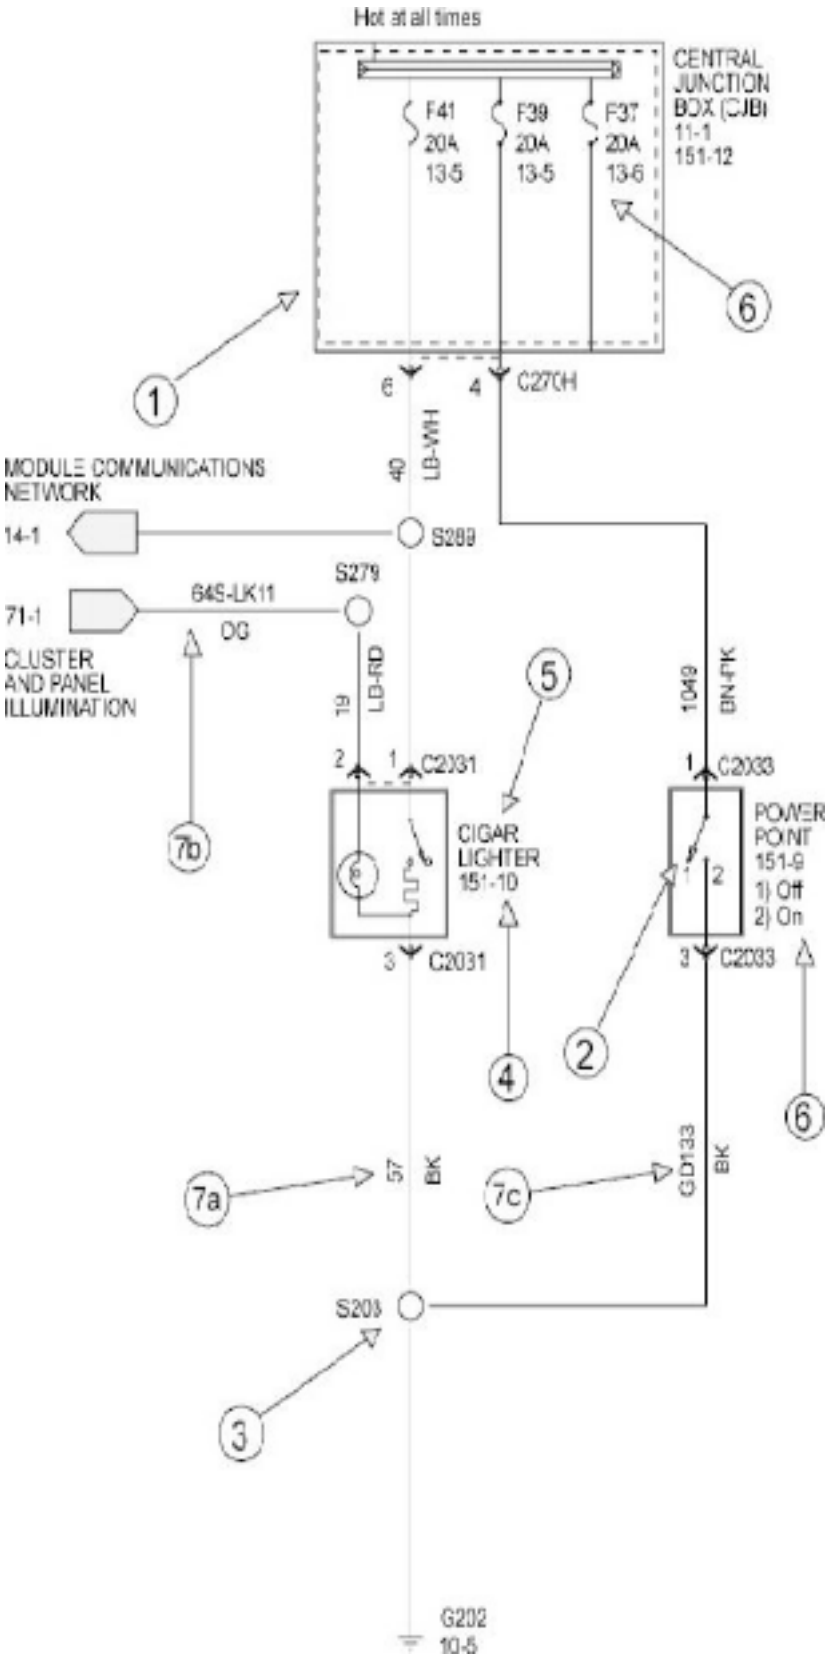
Ford Workshop Manuals > Wiper and Washer Systems > Windshield Washer Relay > Component Information > Diagrams > Diagram Information and Instructions



Windshield Washer Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

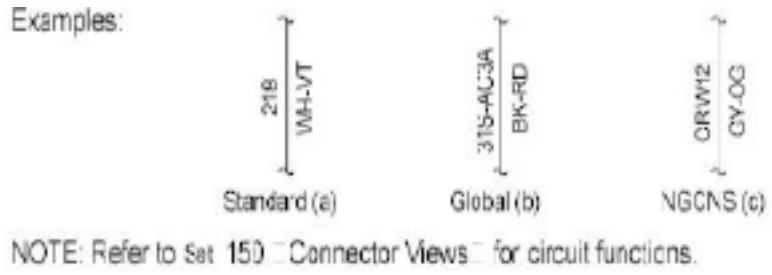
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

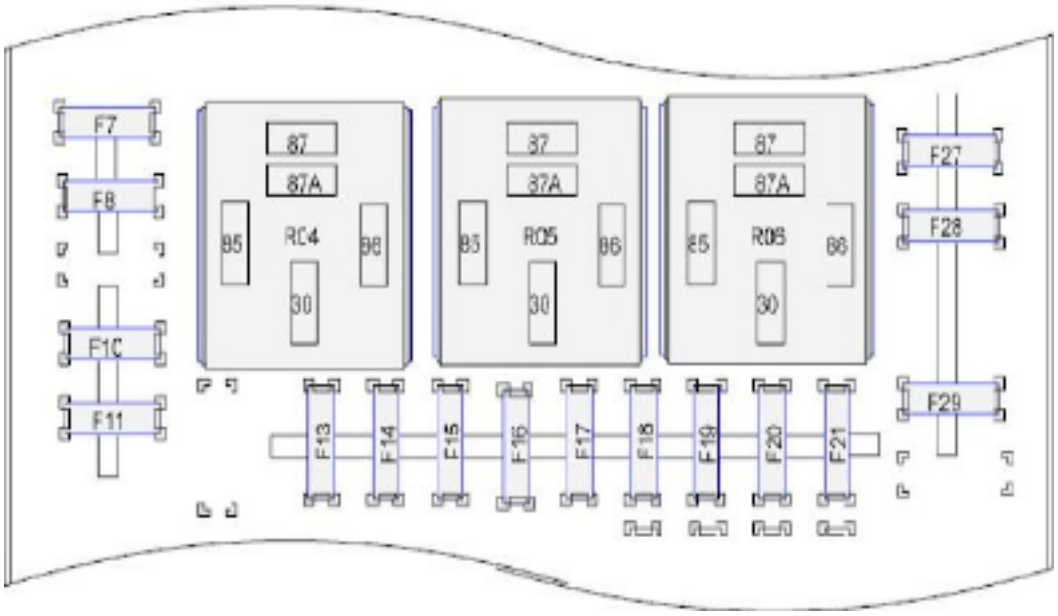
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

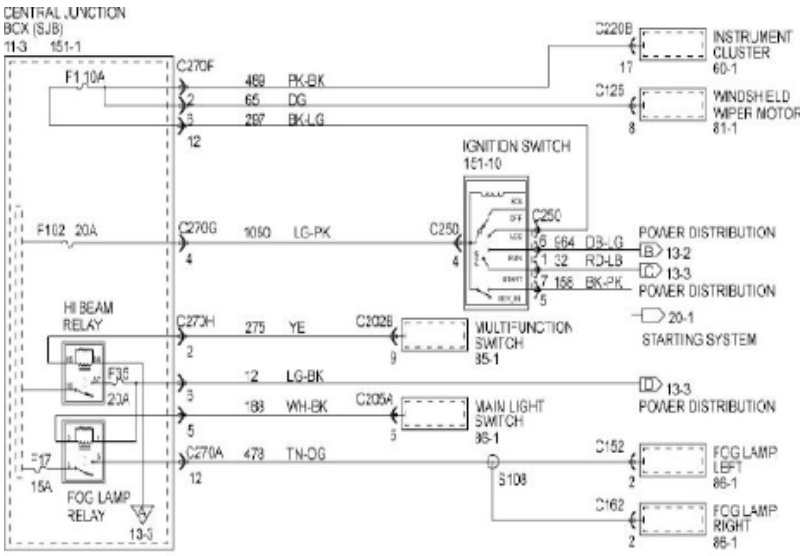
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

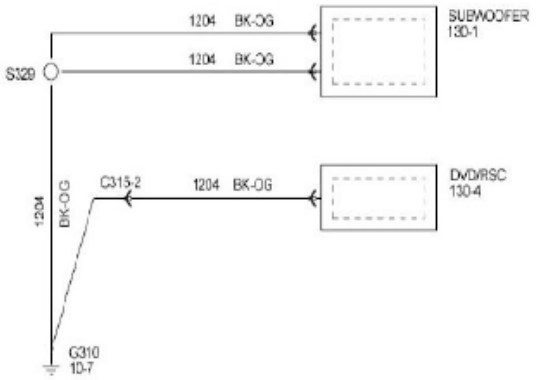
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

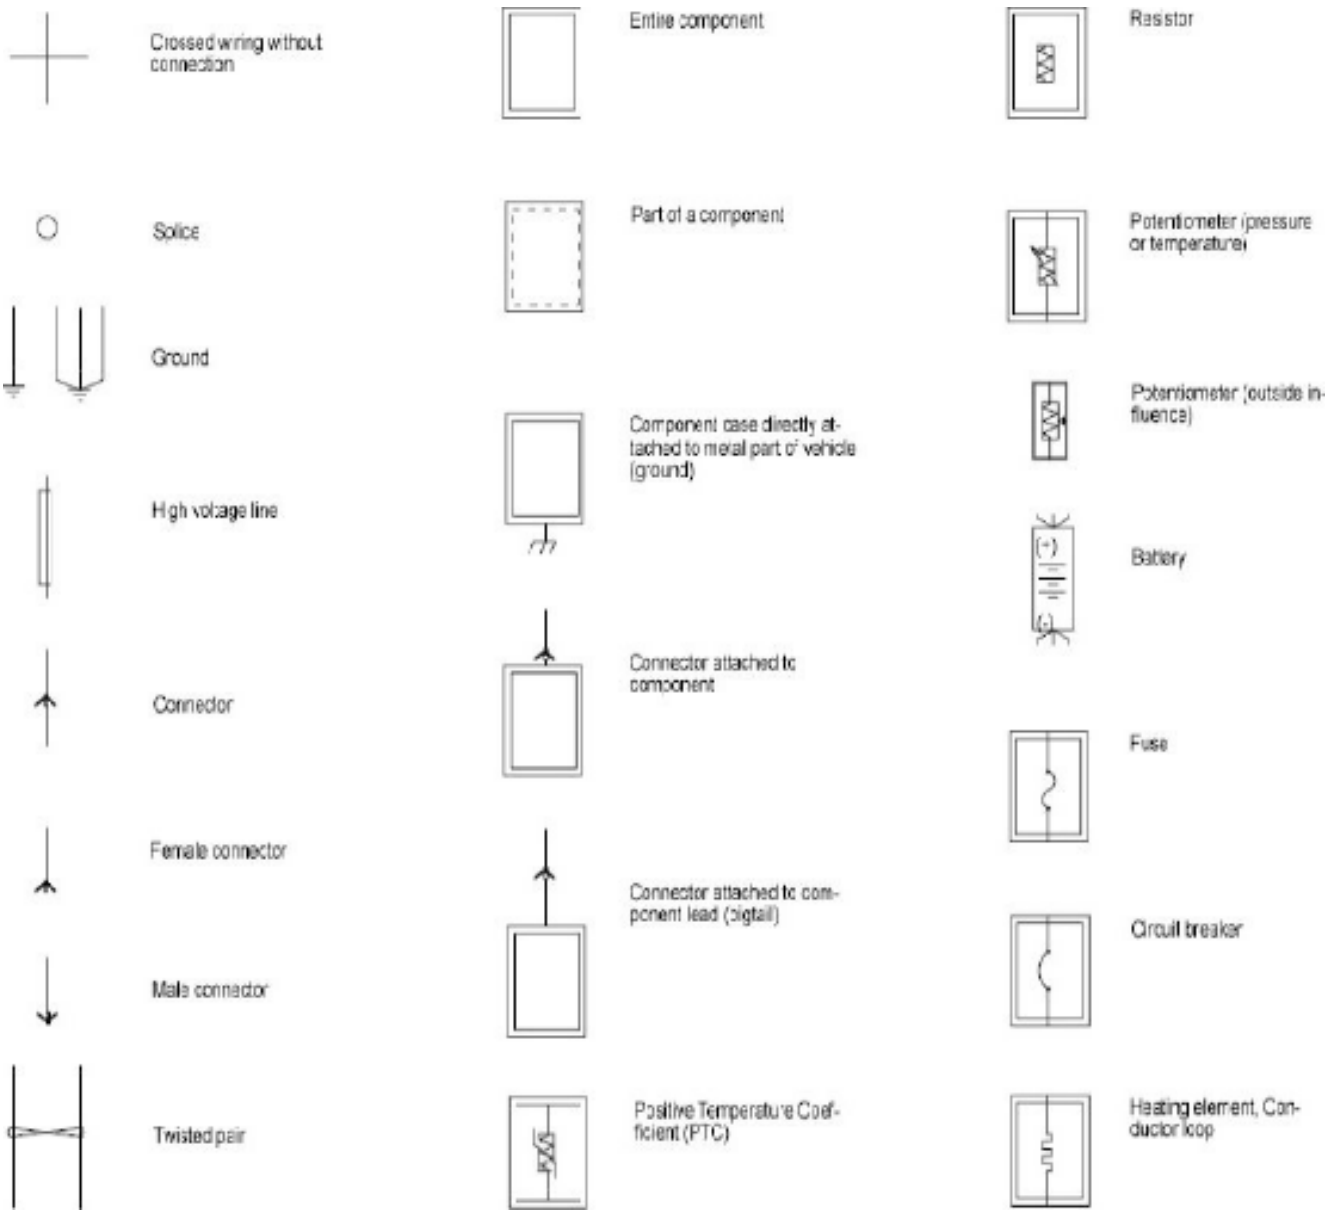
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

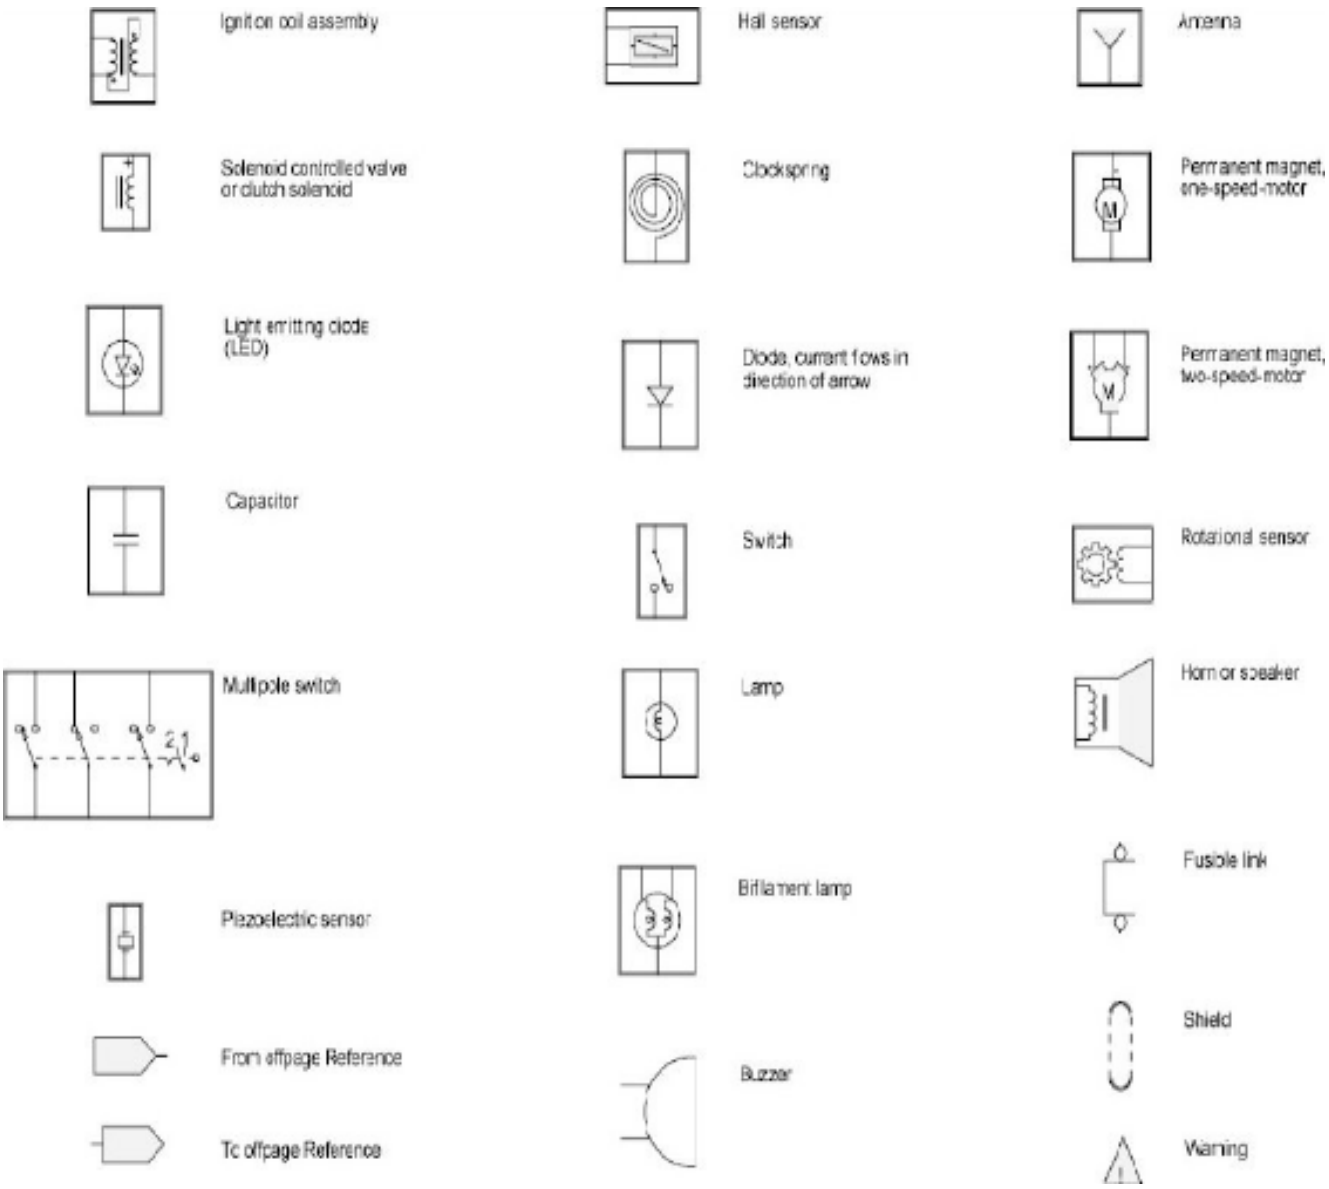
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

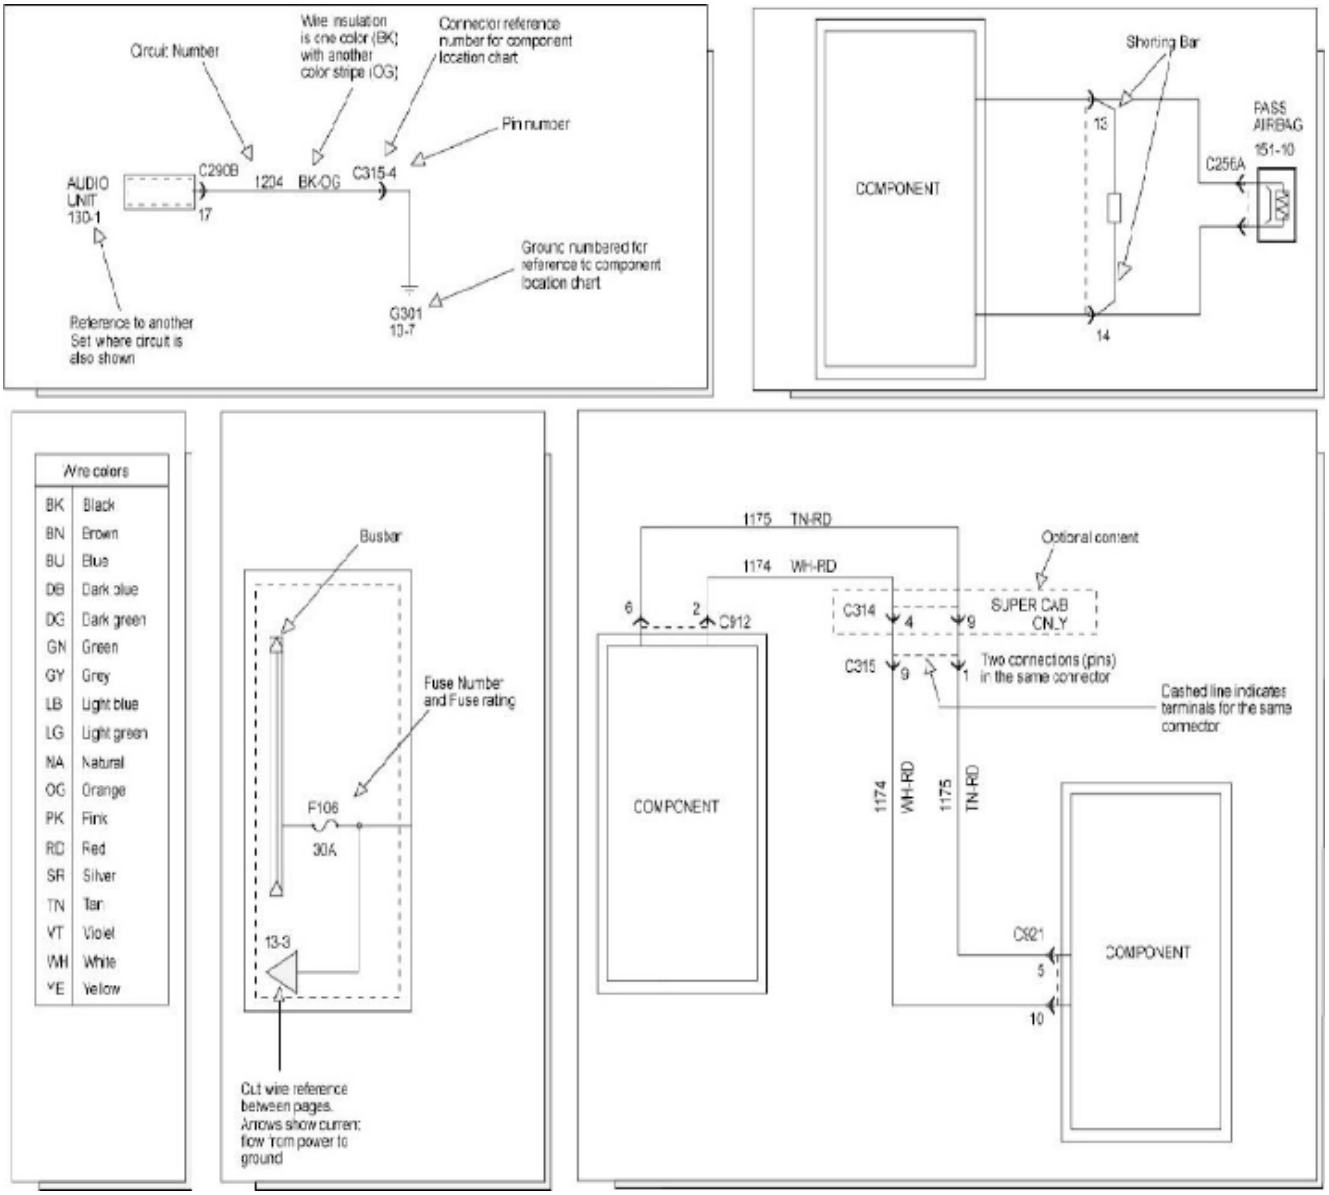
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

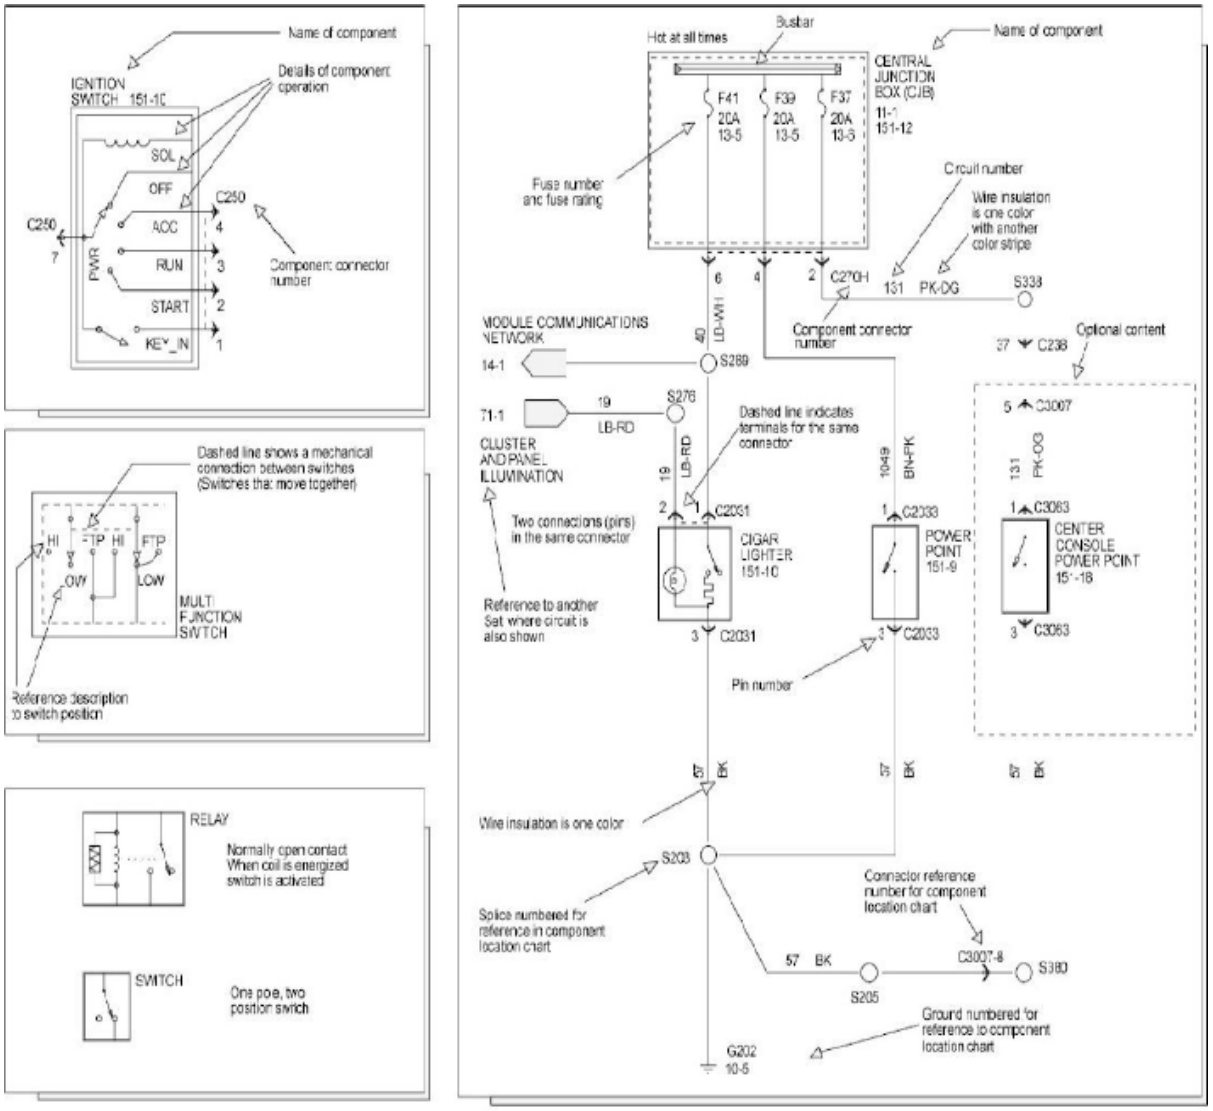
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Windshield Washer Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

Defective insulation stripping

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

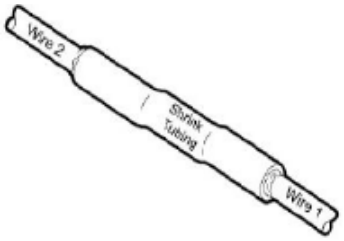
NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.



Wire 2

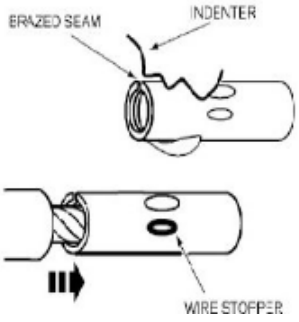
CRIMPING CHAMBER



BRAZED SEAM
INDENTER
WIRE STOPPER

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

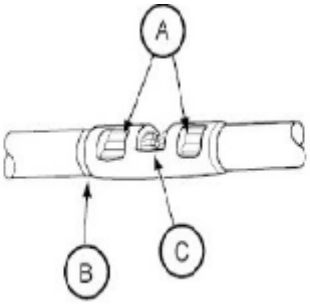
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

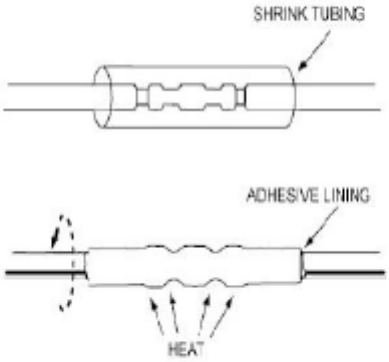
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4 strip, cut 9 strands	* 1/4 strip, cut 2 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip, fold 3x dia.
	16-14	* 1/4 strip, cut 7 strands	1/4 strip, no fold	1/4 strip, no fold	1/4 strip, no fold	5/8 strip fold 2x dia	1 strip, fold 3x dia.	1 1/4 strip, fold 4x dia.	Not Recommended
	12-10	1/4 strip, no fold	1/4 strip, no fold	5/8 strip, fold 2x dia.	1 strip fold 3x cia.	1 1/4 strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Figtail only

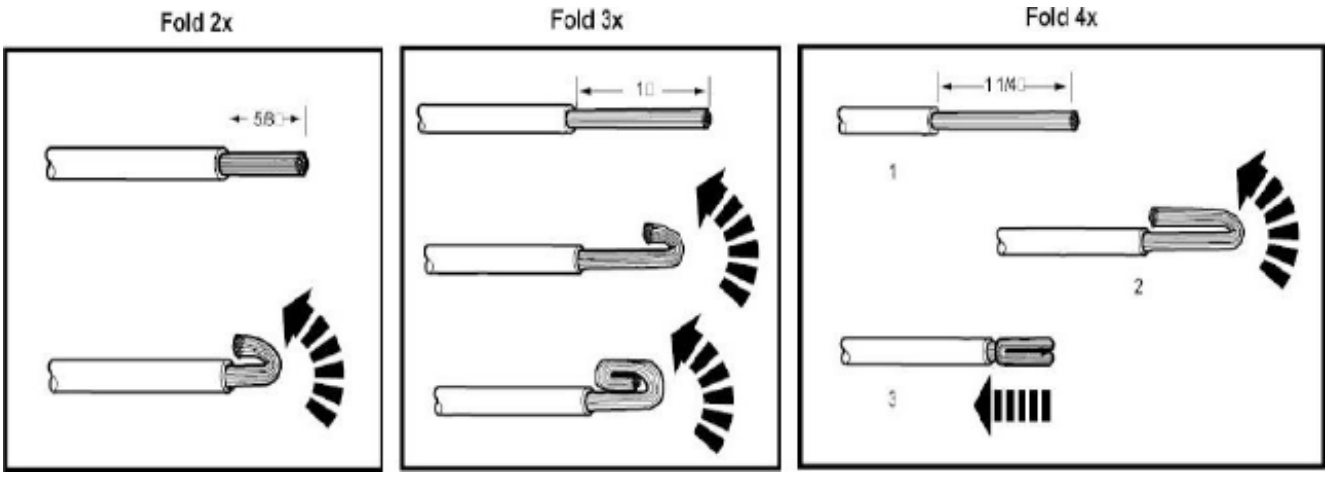
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



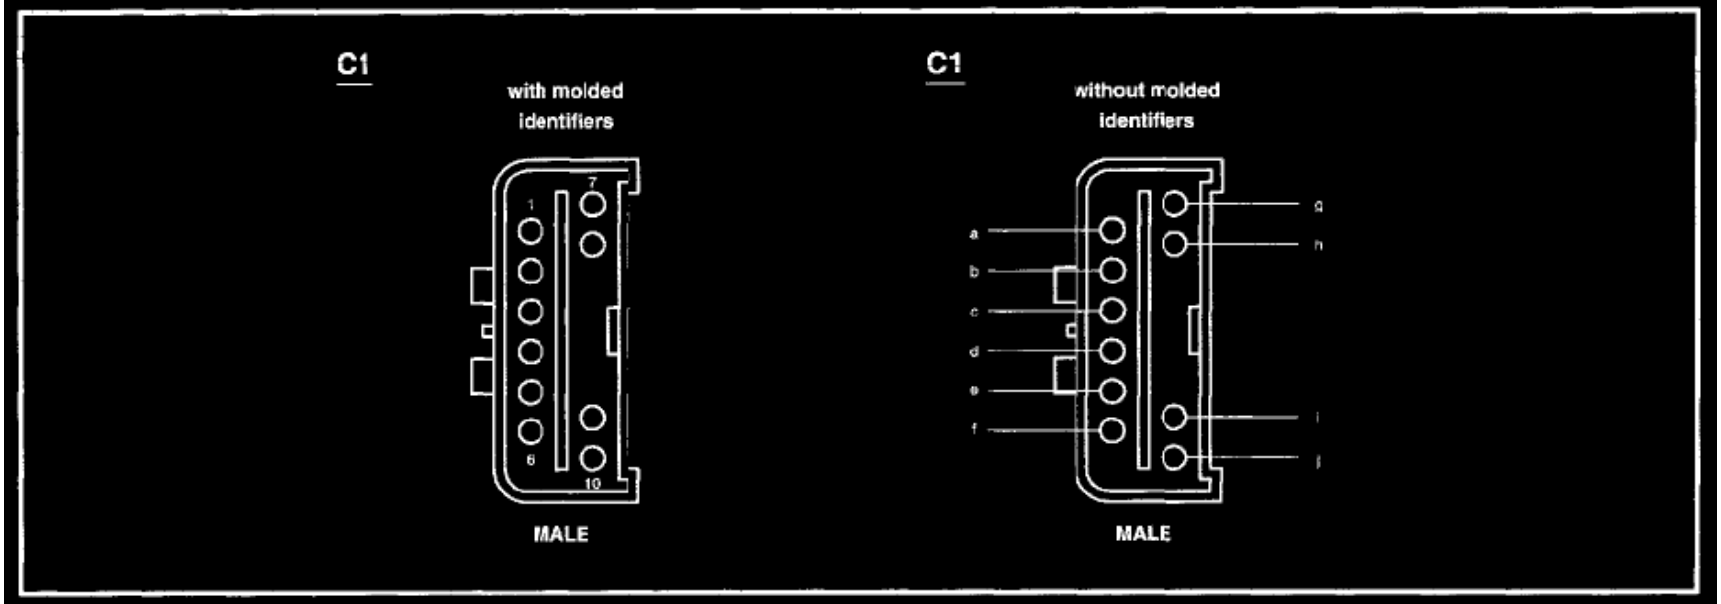
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step–by–step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



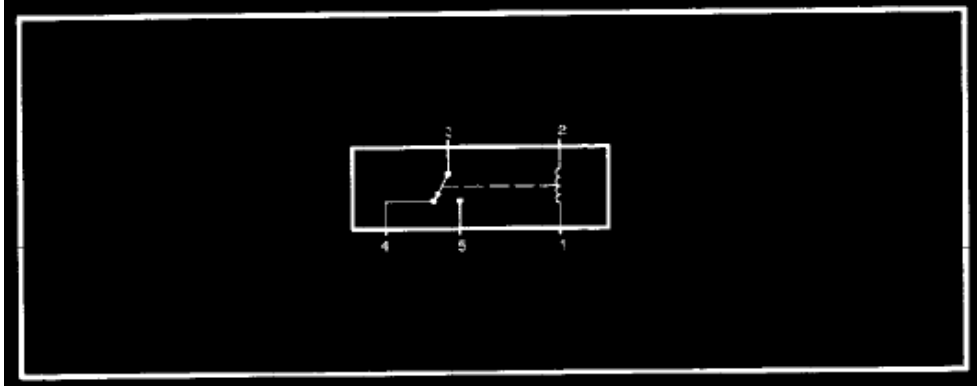
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

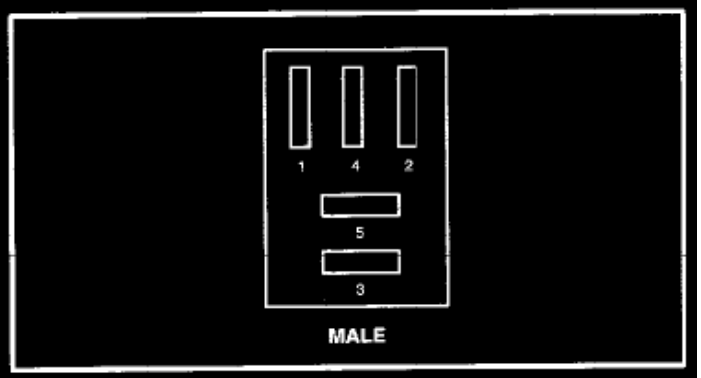
Windshield Washer Relay: Testing and Inspection Micro ISO Relay

Relay – Micro ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	1 and 2	63–102Ω
Contact	3 and 4	Closed circuit
	3 and 5	Open circuit
Coil – Contact	1 and 3	Open circuit
	1 and 4	Open circuit
	1 and 5	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 2 and 3 to 12V DC power and pin 1 to ground. Measure voltage between pin 5 and pin 1. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 2 and measure voltage between pin 4 and pin 1. If the voltage is 12V, the relay is okay. If not, replace the relay.

Introduction

- To install, tighten to 9 Nm (80 lb-in).

3. Remove the RH and LH windshield wiper pivot arms.

1 Pull up on the pivot arm.

2 Pull out on the retainer tab.

4. Position the PCM connector and harness aside.

1 Loosen the bolt.

2 Remove the nut and stud.

- Disconnect the PCM electrical connector and position the harness aside.

5. Remove the RH access cover.

1 Remove the screws.

2 Remove the access cover.

6. Position the power distribution box aside and remove the LH access cover.

1 Remove the screws.

2 Remove the access cover.

7. Reach through the RH access cover opening and remove the wiper motor clip from the RH mounting arm and pivot shaft.

8. Disconnect the (1) RH windshield wiper mounting arm and pivot shaft from the (2) LH windshield wiper mounting arm and pivot shaft, and move

both away from the (3) windshield wiper motor.

9. Remove the RH and LH pivot nuts.

- To install, tighten to 12 Nm (9 lb-ft).

10. Remove the RH and LH mounting arm and pivot shafts through the RH access opening.

11. CAUTION: To avoid possible damage to the windshield wiper adapter and connecting arm clip, be sure the clip is fully seated before

installing the adapter and connecting the arm clip on the windshield wiper motor crank pin.

NOTE: Be sure to install the RH windshield wiper mounting arm and pivot shaft onto the windshield wiper motor crank pin until it snaps into place.

To install, reverse the removal procedure.

Removal and Installation

CAUTION: The internal permanent magnets used in the windshield wiper motor are made of a glass-like material. To avoid damaging the magnets, do not strike the motor with a hammer or any other object.

NOTE: The windshield wiper motor is not a repairable item. If worn or damaged, a new motor must be installed.

1. Cycle the windshield wiper blades until they are in the straight UP position.

Wiper Relay: Diagram Information and Instructions

Introduction

Note

All wiring connections between components are shown exactly as they exist in the vehicles. It is important to realize, however, that no attempt has been made on the diagrams to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differency in a diagram from one that is only a few inches long. Furthermore, to aid in understanding electrical (electronic) operation, wiring inside complicated components has been simplified.

Complete Circuit Operation

Each circuit is shown completely and independently in one set. Other components that are connected to the circuits may not be shown unless they influence the circuit operation.

Current Flow (1)

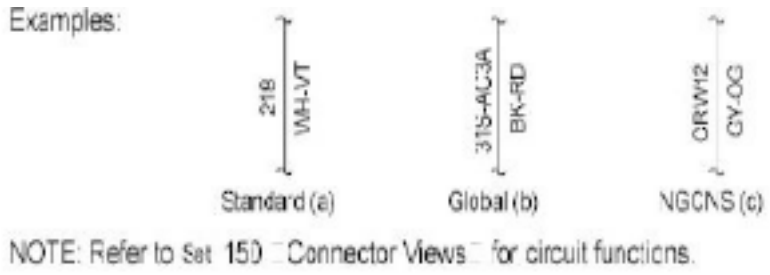
Each set normally starts with the component that powers the circuit, such as a fuse or the ignition switch. Current flow is shown from the power source at the top of the diagram to ground at the bottom of the diagram. A full representation of the power supply of a fuse or the power distribution from a fuse to various components is given in the Power and Ground Distribution Diagrams. Full representation of the ground connections are shown in the Power and Ground Distribution Diagrams.

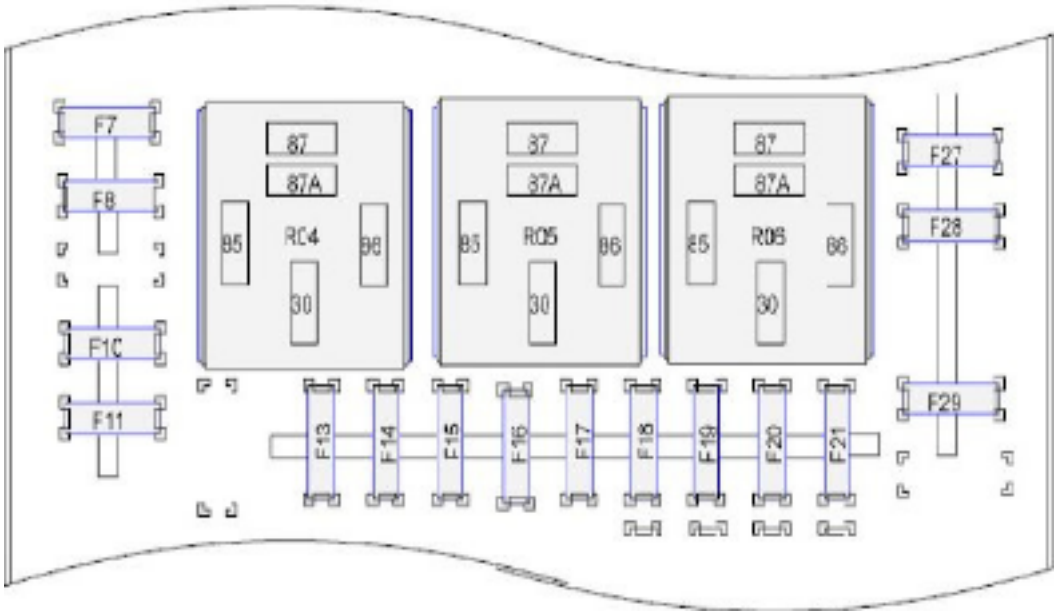
Switch Positions (2)

Within a diagram, all switches, sensors and relays are shown "at rest" (ignition switch OFF).

Splices (3)

Splices directly connecting to the power distribution are best represented on the power distribution diagram in the Power and Ground Distribution Diagrams. Splices connected to grounds can be seen completely in the Power and Ground Distribution Diagrams. For all other splices, a reference is given to each off diagram where that particular splice can be best viewed.





Component Referencing (4)

Components on a diagram have a reference to a component location view or the diagram where it is shown completely. The reference is located to the right of each component.

Component Names (5)

Component names are placed on the right hand side of each component when possible. Descriptions of the internals of the component are also included when available. The diagram where the component appears in full is listed in the Index. The base part number for a component is listed in parentheses next to or under a component.

Internal Name and Function Identification Numbers (6)

Some components on each diagram have internal symbols with an identification number located within it. You can identify the internal symbol or function by finding the corresponding number under the component name.

Circuit Numbering and Wire Identification (7)

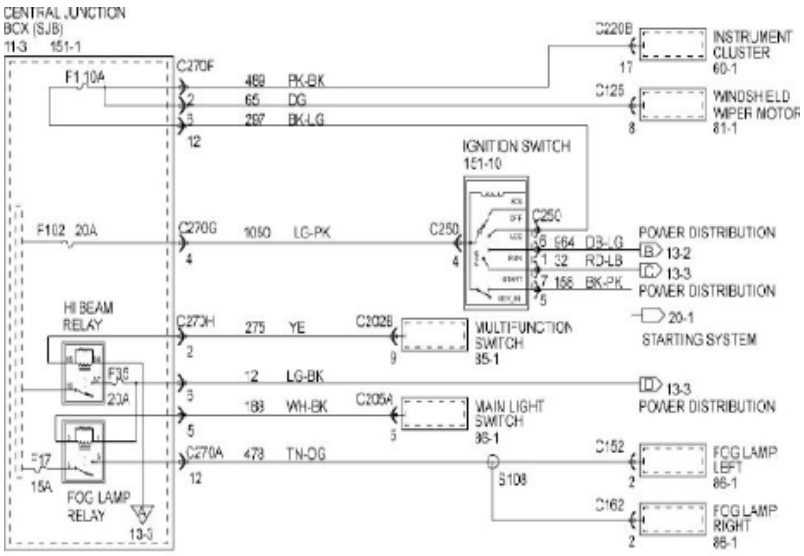
Ford Motor Company uses three different circuit numbering conventions: Standard Circuit Numbering System, Global Circuit Numbering System, and New Global Circuit Numbering System (NGCNS). With each, the circuit number (which identifies a specific circuit function) is followed by the wire color.

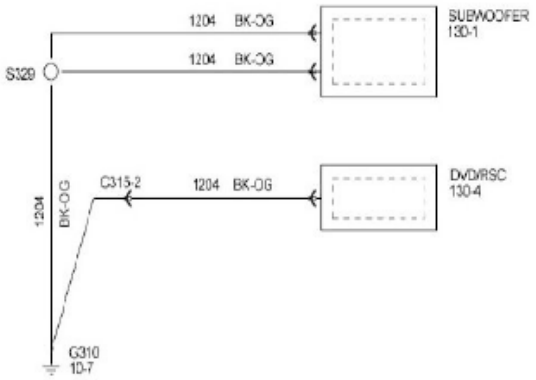
The wire identification consists of a basic color and possibly a stripe, and is determined directly from the wire's circuit number. In the diagrams, the wire colors are indicated next to the wires. The colors are abbreviated using the international norm IEC 757. The abbreviations are listed in set 4 "Symbols".

Fuse and Relay Information

Fuse/Locations and Relay/Locations contains a view of the fuse/relay box, in which all fuses and relays are identified, numbered and named. Fuse and relay numbering and naming follow the indication of the fuse panel cover. In addition, for all removable relays, pin positions are added to illustrate proper orientation.

Power Distribution





C904 (GY)

14290

REAR COMB/MAP LAMP (13M614)

Pin	Circuit	Gauge	Circuit Function	Qualifier
1	53 (BK-LB)	20	Courtesy lamp switch to courtesy lamp	
2	57 (BK)	20	Ground circuit	
3	705 (LG-OG)	20	Battery saver lamp feed	

Power and Ground Distribution Diagrams shows the current feed circuits. The current path is shown from the battery to the ignition switch and to all fuses. It also shows the circuits protected by each fuse. The circuit is traced from the fuse to the component. All details (wires, splices, connectors) between the fuse and the first component are shown.

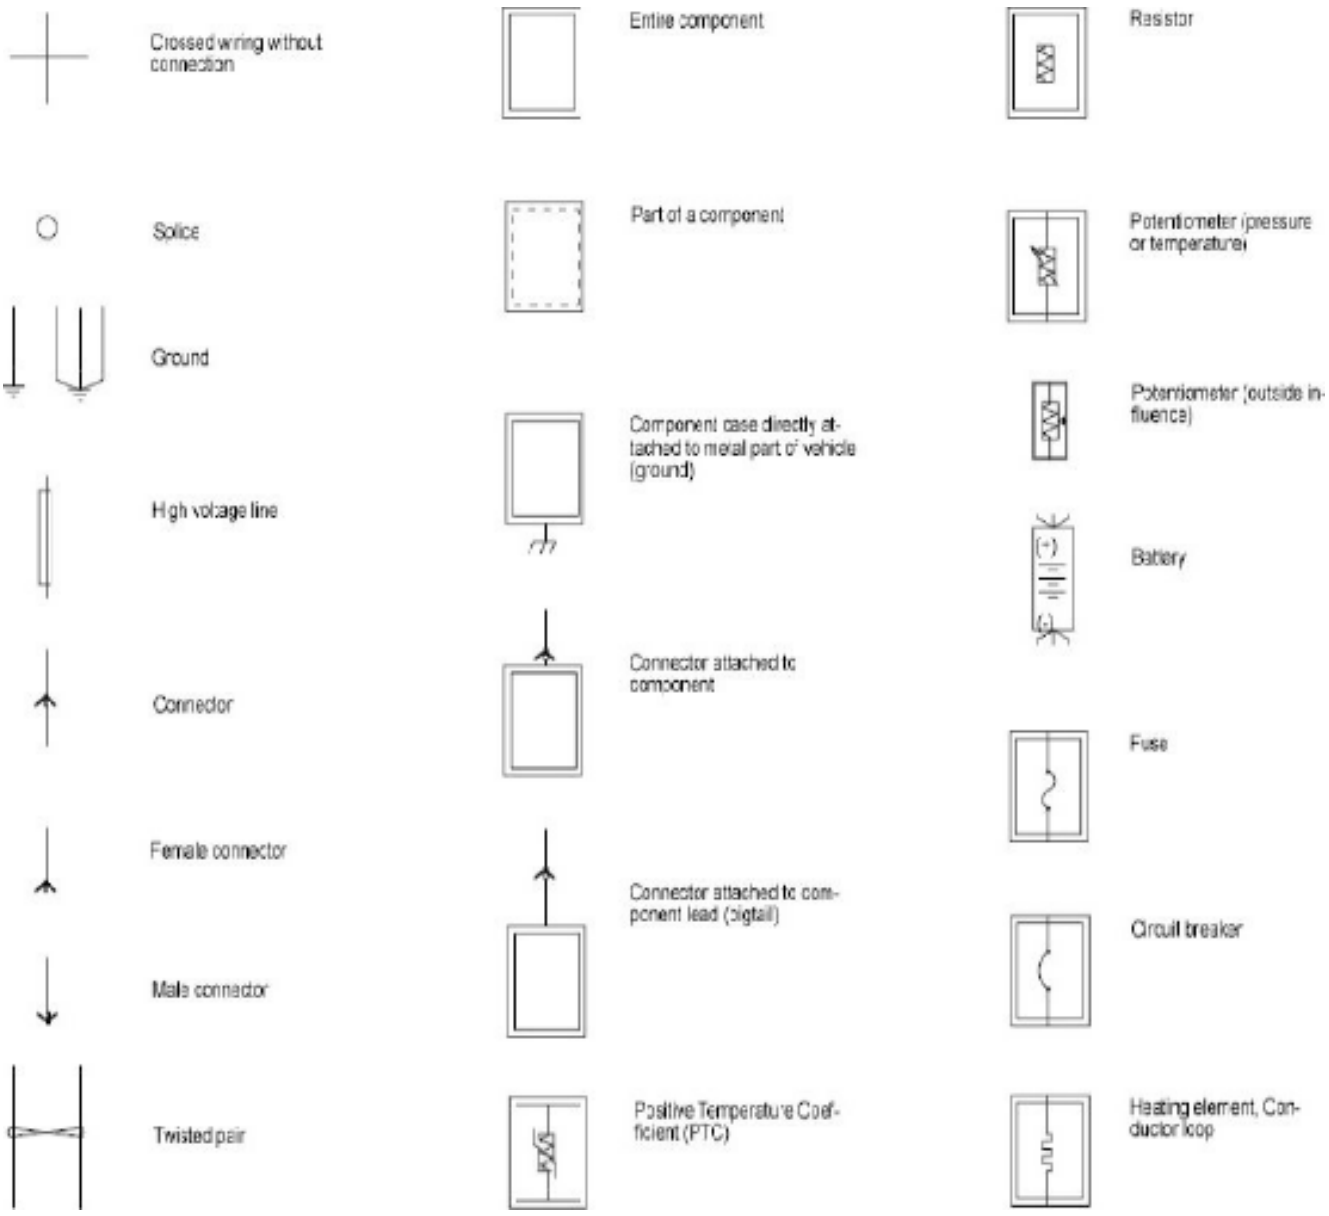
Ground Distribution

Power and Ground Distribution Diagrams contains the diagram that shows the complete details for each ground connection or main ground splice. This is useful in diagnosing a problem affecting several components at once (poor ground connection or ground splice). All details (wires, splices, connectors) between the ground point and the component are shown. These ground connection details are shown here in order to keep the individual set diagrams as uncluttered as possible.

Component and Connector Information

C904

Connector Views show the views of the pins and/or cavities of all connectors. The pin and cavity sides are shown separately as if the connector were disconnected. The color of the connector housing is indicated next to the connector number when available. The harness causal number is located above the connector view and below the connector number. The circuit function charts are located below each connector. The wiring harness designations are listed in Component Location Charts.



Component Location Views show the components and their connecting wires as they can be found on the vehicle.

Locations information that can be found at the vehicle level will help the user find where the various items depicted on the diagram can physically be found on the vehicle. A brief written description of the location is given, along with a reference to the component location views.

WARNINGS

- Always wear safety glasses for eye protection.

- Use safety stands whenever a procedure requires being under a vehicle.

- Be sure that the IGNITION SWITCH is always in the OFF position, unless otherwise required by the procedure.

- Set the parking brake when working on any vehicle. An automatic transmission should be in PARK. A manual transmission should be in NEUTRAL.

- Operate the engine only in a well-ventilated area to avoid danger of carbon monoxide.

- Keep away from moving parts, especially the fan and belts, when the engine is running.

- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, catalytic converter and muffler.

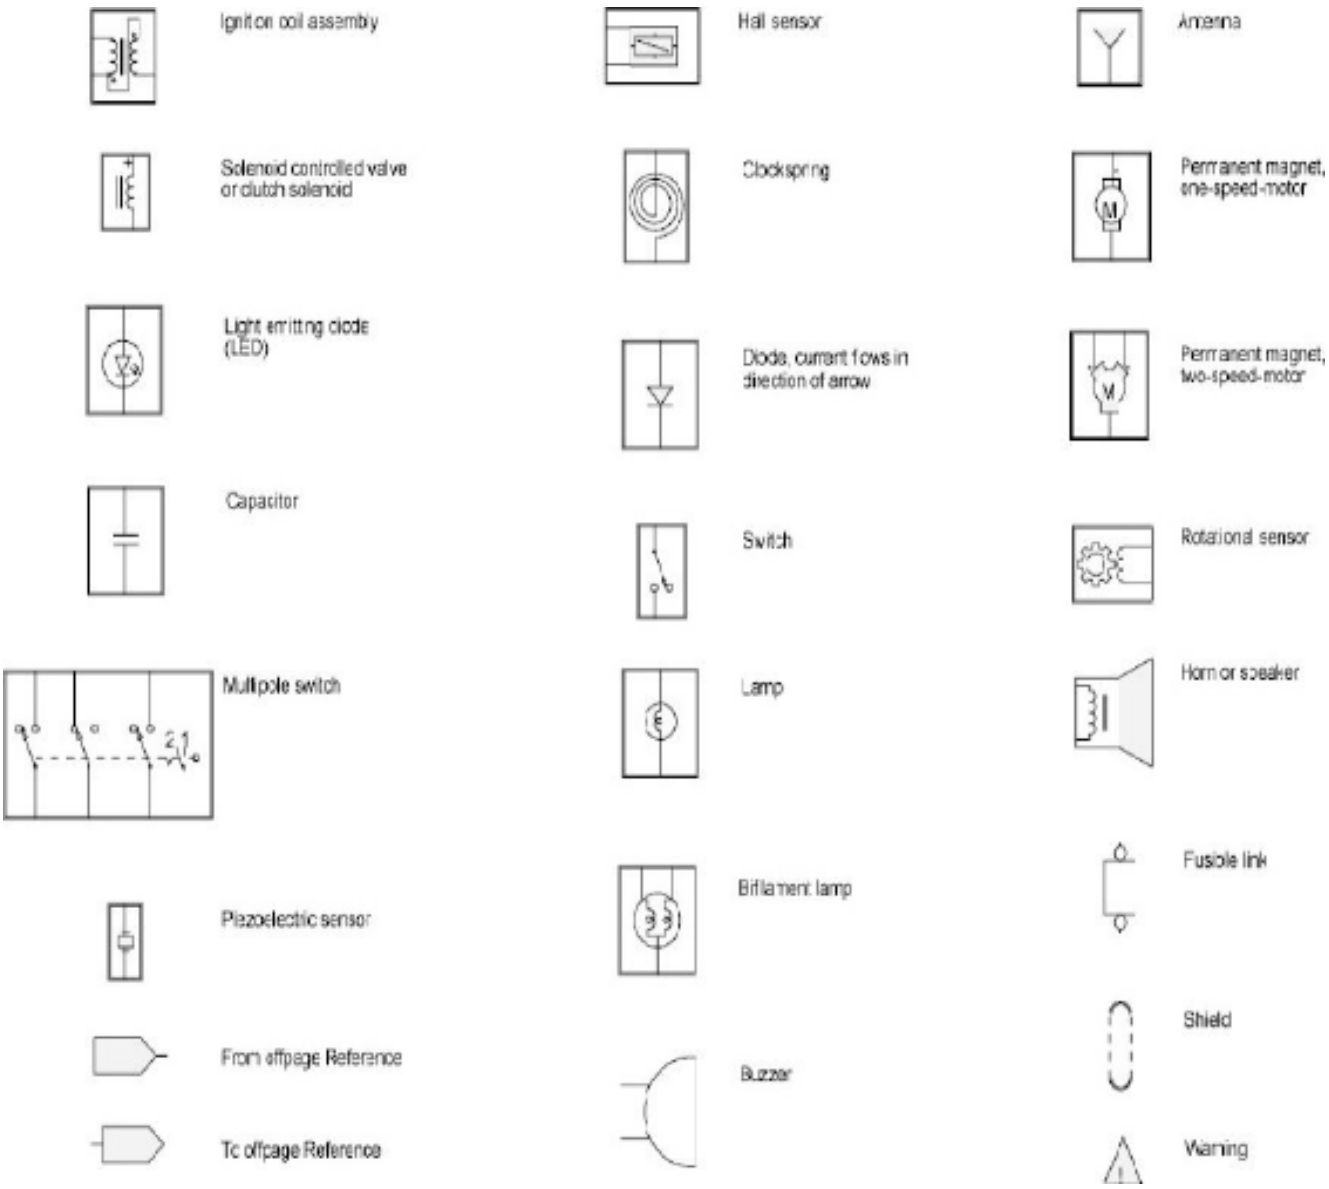
- Do not allow flame or sparks near the battery. Gases are always present in and around the battery set. An explosion could occur.

- Do not smoke when working on a vehicle.

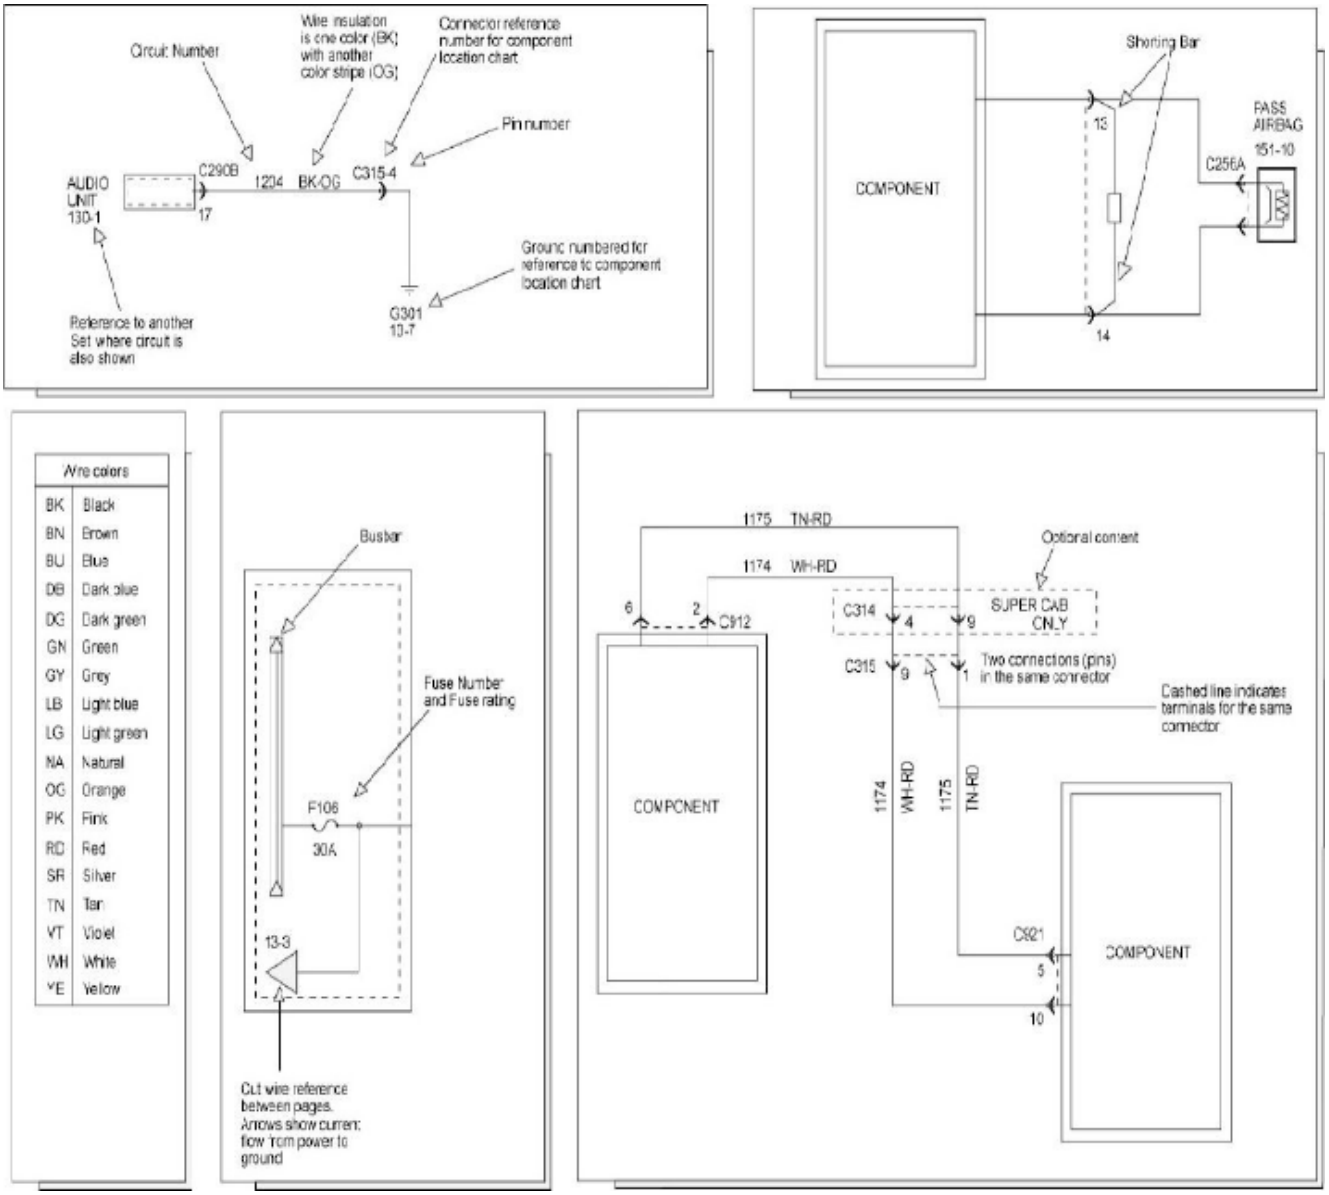
- To avoid injury, always remove rings, watches, loose hanging jewelry and avoid wearing lose clothing

Symbols

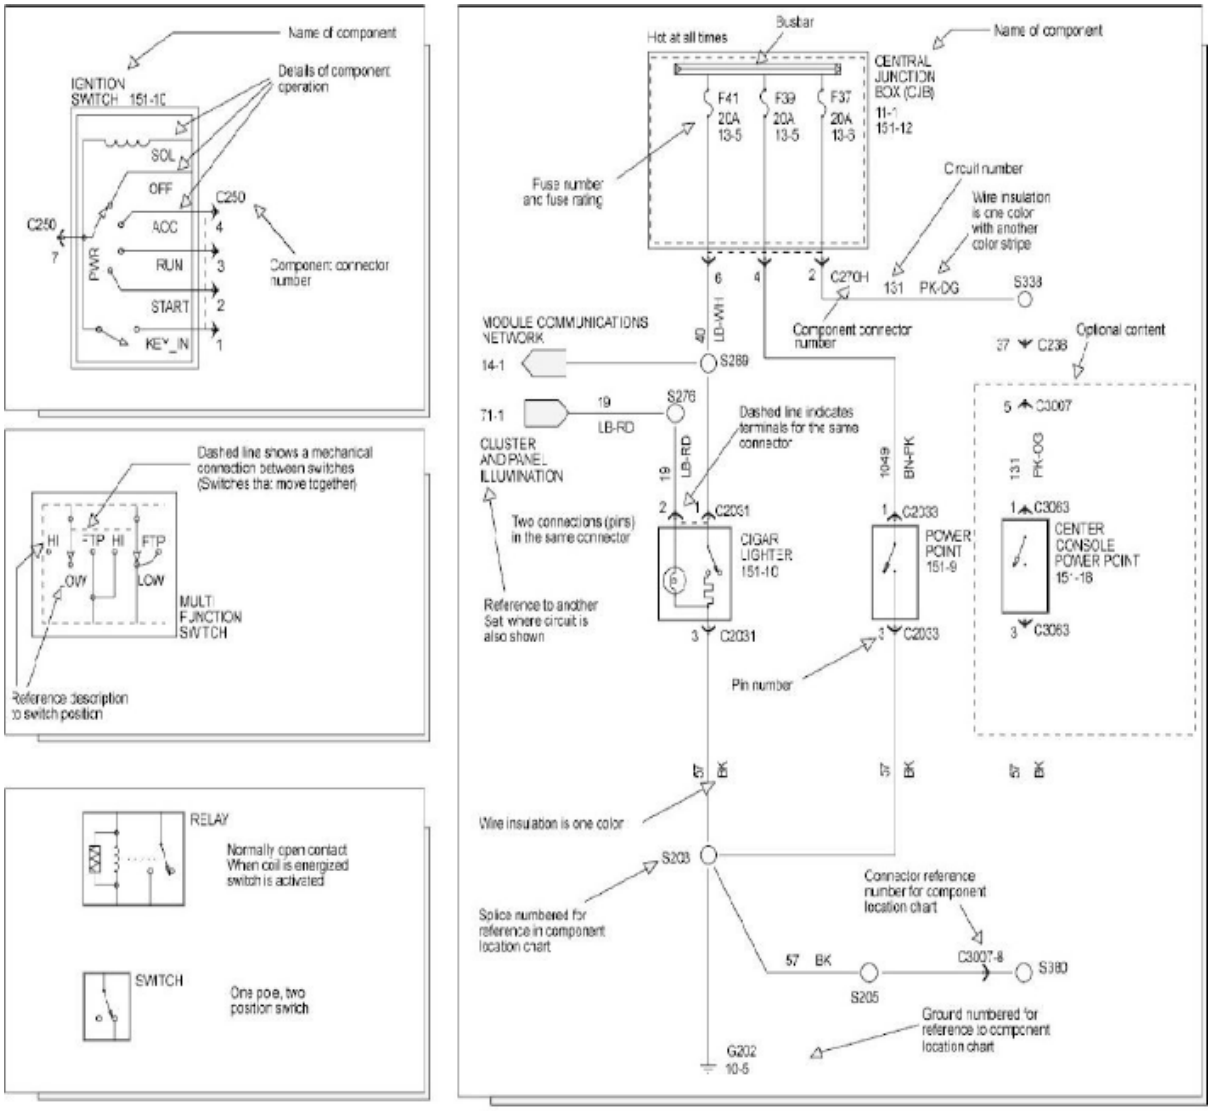
Symbols (Part 1)



Symbols (Part 2)



Symbols (Part 3)



Each connector, ground, and splice number used in this publication references an area of the vehicle. The chart below describes the different areas of the vehicle, and lists the numbers associated with each.

NUMBER	LOCATION
100-199 1000-1999	Engine compartment, powertrain (including transmission and front wheel drive axle/differential)
200-299 2000-2999	Instrument panel and console, steering wheel assembly
300-399 3000-3999	From instrument panel to rear seat, up to, and including, door trim panel
400-499 4000-4999	Behind rear seats to rear bumper, truck bed
500-599	Driver door
600-699	Passenger door, front
700-799	Rear door, left
800-899	Rear door, right
900-999	Above door trim panel and headliner

Wiper Relay: Diagnostic Aids

Troubleshooting wiring harness and connector hidden concerns

The illustrations are known examples of wiring harness, splices and connectors that will create intermittent electrical concerns. The concerns are hidden and can only be discovered by a physical evaluation as shown in each illustration.

NOTE: Several components, such as the PCM, utilize gold plated terminals in their connections to the wiring harness. If those terminals need to be replaced, they must be replaced with a gold plated terminal.

Terminal not properly seated

1 = Locked terminal

2 = Male half

3 = Female half

4 = Seal

5 = Intermittent contact

6 = Unlocked terminal (Hidden by wire seal)

7 = Seal

Check for unlocked terminal by pulling each wire at the end of the connector.

4 = Circuit insulation

Remove the tape and flex/feel each circuit for a reduction in diameter at break.

Recommended splicing method - Solder (For 16 AWG and Smaller Diameter Wire Only)

1. Disconnect battery ground cable. 2. Strip wires to appropriate length.

3. Install heat shrink tubing. 4. Twist wires together. 5. Solder wires together.

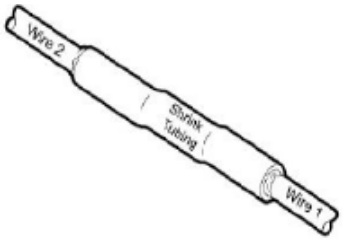
NOTE: -

Use rosin core mildly-activated (RMA) solder. Do not use acid core solder.

- Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seat wire splice.

6. Bend wire 1 back in a straight line.

NOTE: Wait for solder to cool before moving wires.



Wire 2

WIRE STOPPER

7. Evenly position heat shrink tubing over wire repair.

NOTE: Overlap tubing on both wires.

8. Use shielded heat gun to heat the repaired area until adhesive flows Out of both ends of heat shrink tubing. 9. Reconnect battery ground cable.

Recommended splicing method - Crimp (For 10-22 AWG Diameter Wire to Like Wire Diameter)

1. Disconnect battery ground cable. 2. Strip 6.35mm (1/4 in) of insulation from each wire end, taking care not to nick or cut wire strands. 3. Install heat shrink tubing.

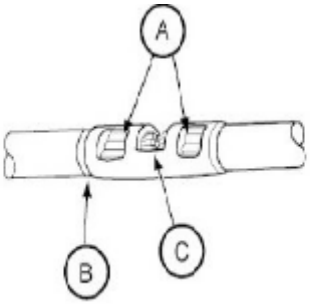
NOTE: Use heat shrinkable tubes marked with ES-1 (16-22 GA) or ES-2 (10-18 GA) to seal wire splice.

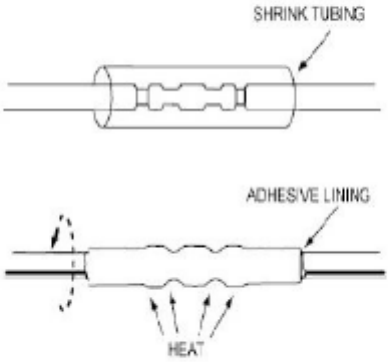
4. Select appropriate wire splice for the wires to be spliced. 5. Identify the appropriate crimping chamber on the Rotunda 164-R5901 Pro-Crimper by matching the wire size on the dies with the wire size

stamped on the butt splice.

NOTE: Rotunda 164-R5901 Pro-Crimper is the only tool that can be used with these splices.

6. Center one end of the wire splice in the appropriate crimping chamber. 7. If visible, be sure to place the brazed seam toward the indenter. 8. Insert stripped wire into the barrel.





This chart is to be used when pigtails or terminals are of different wire gauge than the vehicle harness.

		Wire Gauge Size							
		10	12	14	16	18	20	22	24
Butt Splice as Stamped	22-18	Not Recommended	* 1/4□ strip, cut 9 strands	* 1/4□ strip, cut 2 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip, fold 3x dia.
	16-14	* 1/4□ strip, cut 7 strands	1/4□ strip, no fold	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip fold 2x dia	1□ strip, fold 3x dia.	1 1/4□ strip, fold 4x dia.	Not Recommended
	12-10	1/4□ strip, no fold	1/4□ strip, no fold	5/8□ strip, fold 2x dia.	1□ strip fold 3x cia.	1 1/4□ strip, fold 4x dia	Not Recommended	Not Recommended	Not Recommended

* Pigtail only

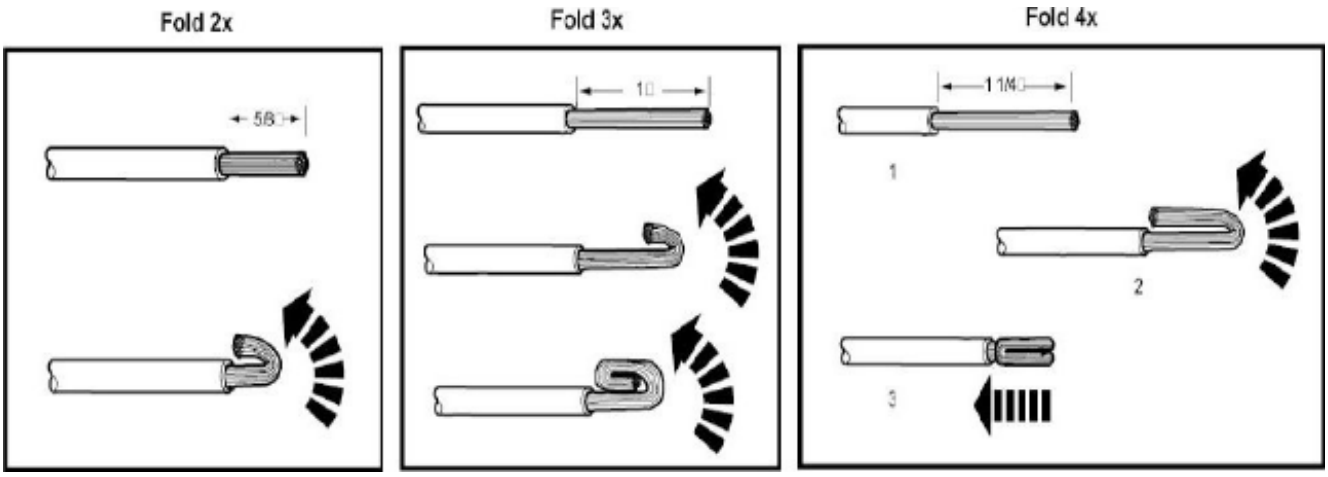
9. Holding the wire in place, barrel squeeze tool handles appropriate ratchet releases.

10. Repeating steps 5-7, crimp the other half of the splice.

11. Check for acceptable crimp.

a. Crimp should be centered on each end of the butt splice b. Wire insulation does not enter butt splice. c. Wire is visible through inspection hole of splices.

12. Evenly position supplied heat shrink tubing over wire repair. 13. Use shielded heat gun to heat the repaired area until adhesive flows out of both ends of the heat shrink tubing. 14. Reconnect battery ground cable.



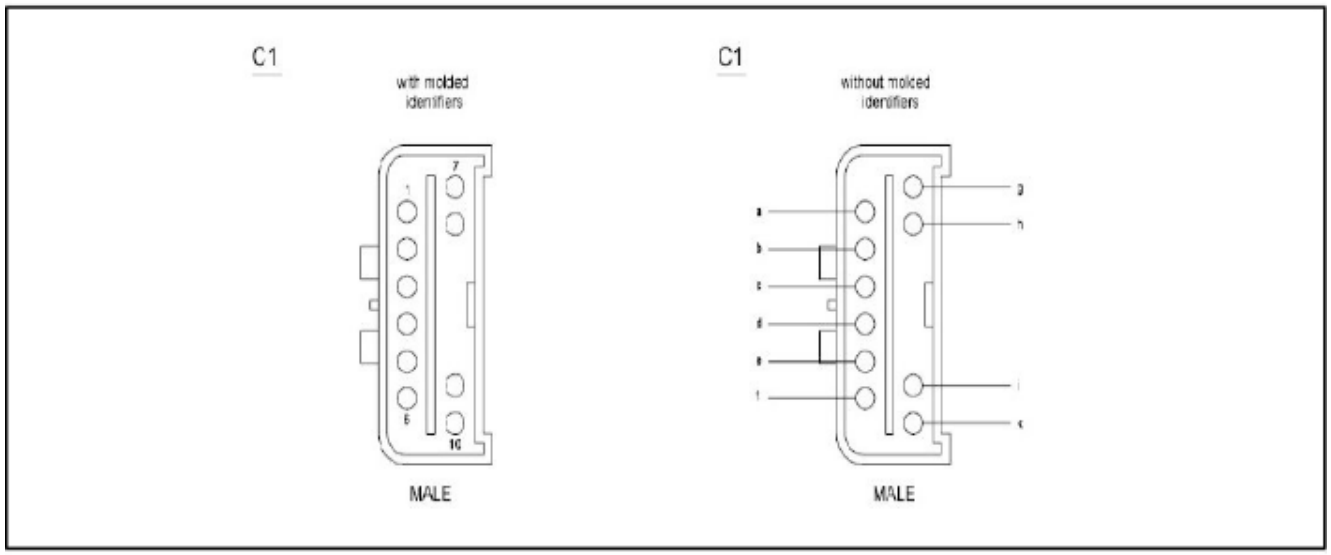
The given chart is to be used when pigtails or terminals are different wire gauge than the vehicle harness.

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



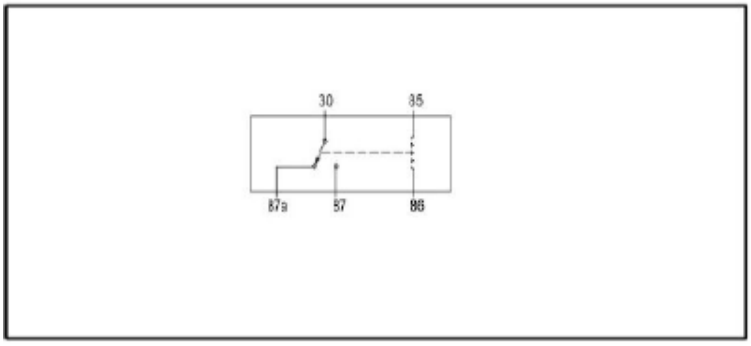
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

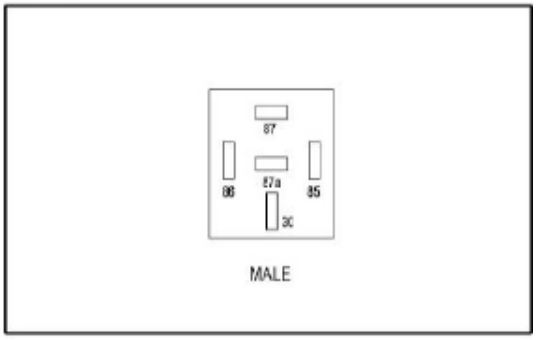
Wiper Relay: Testing and Inspection Mini ISO Relay

Relay □ Mini ISO

Schematic



Terminals



Component testing procedure (no voltage applied)

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	46 □ 90 Ω

Introduction

Component testing procedures are provided to determine whether a component is good or bad.

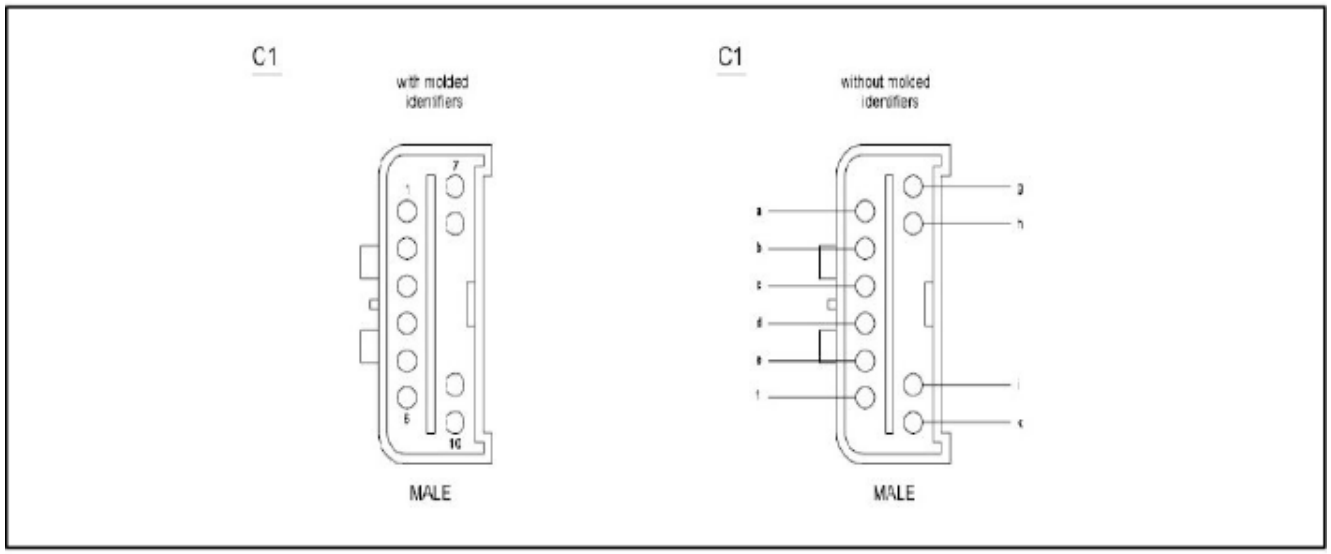
Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it.

Terminals



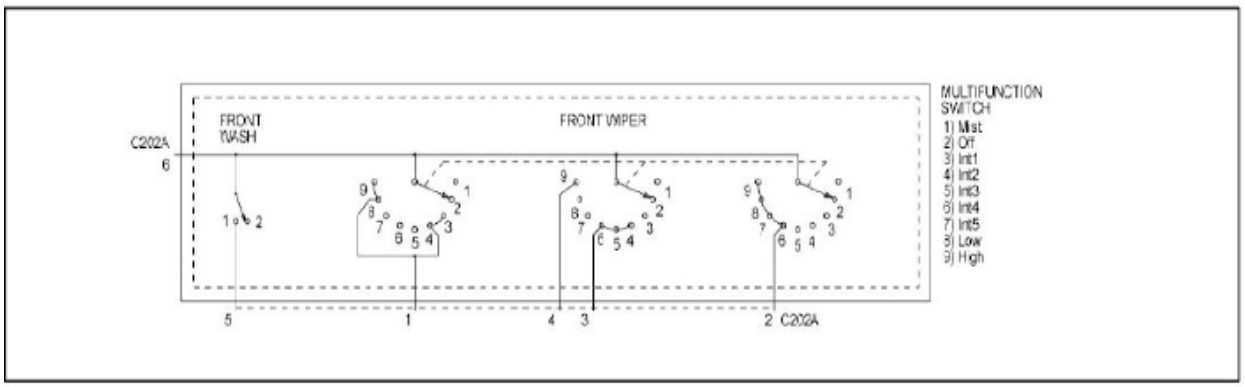
The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

Wiper Switch: Testing and Inspection

Multifunction Switch, Wiper/Washer Portion

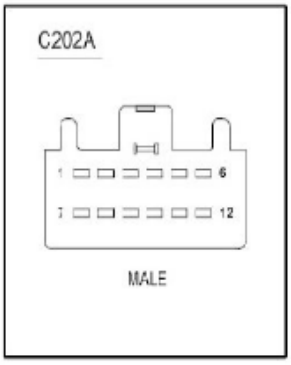
Schematic



Component testing procedure

Circuit to test	Connect self-powered test light or ohmmeter to terminals	Move switch to these positions	A good switch will indicate
Front washer switch circuit	5 and 3	Front washer	Closed circuit
		Off	Open circuit
Front wiper switch circuit	1 and 5	Off	Open circuit
		Low	Closed circuit
		High	
	4 and 3	Off	Open circuit
		Low	
		High	Closed circuit
	2 and 3	Off	Open circuit
		Low	Closed circuit
		High	

Terminals

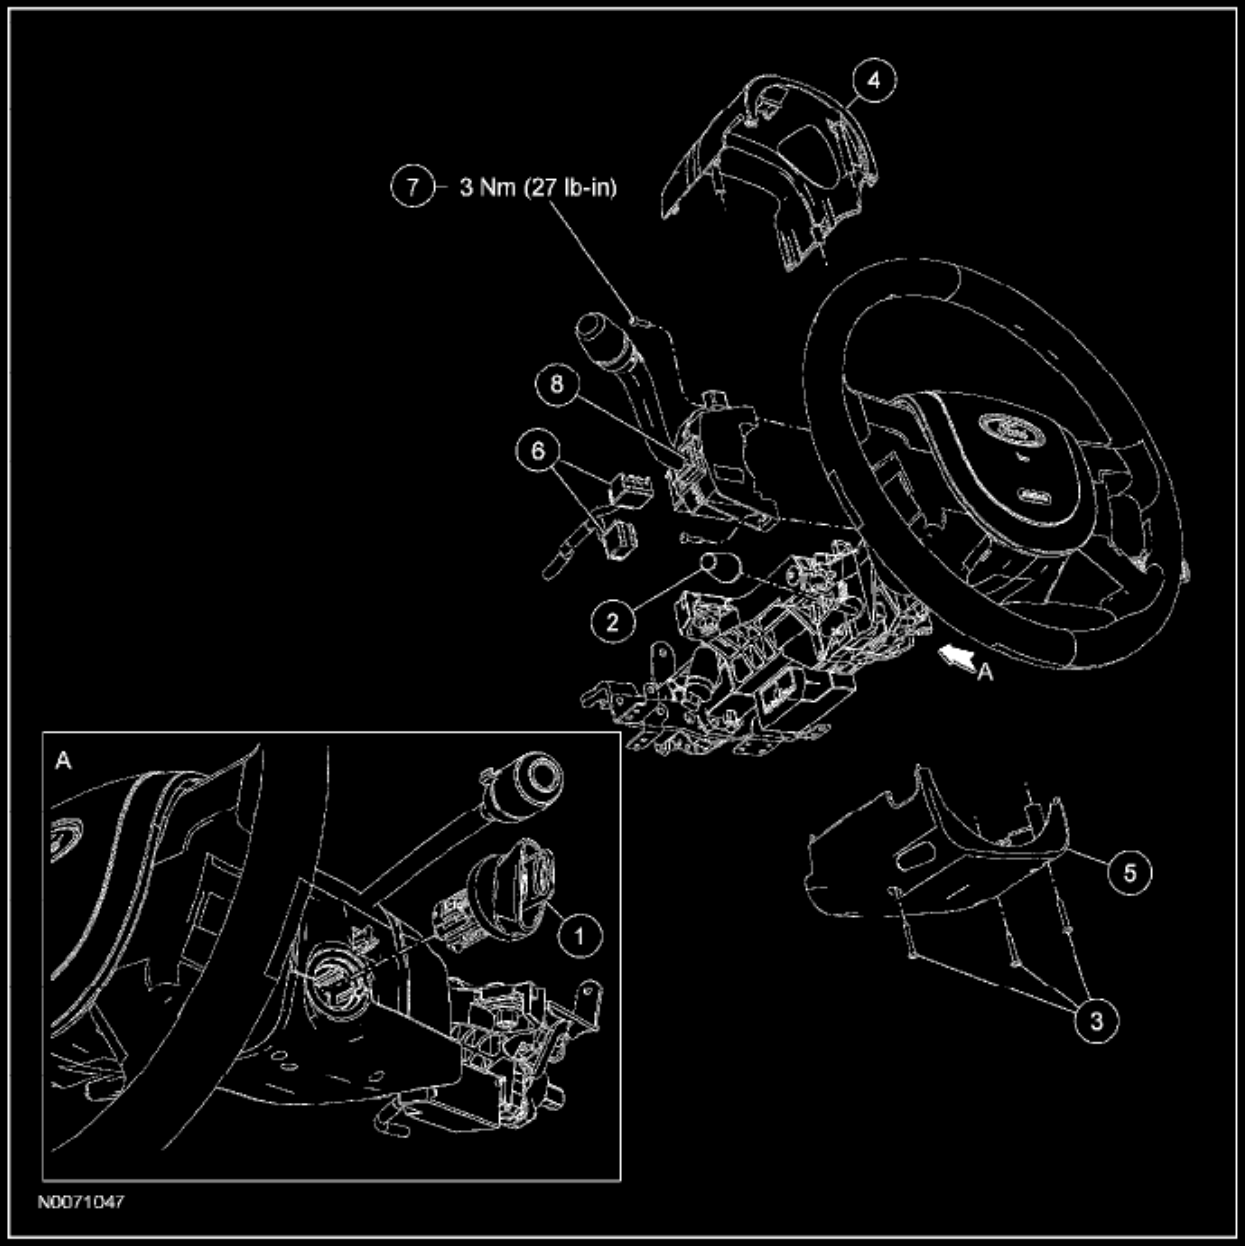


Multifunction Switch, Wiper/Washer Portion (continued)

Component testing procedure

Circuit to test	Connect self-powered test light or ohmmeter to terminals	Move switch to these positions	A good switch will indicate
Intermittent wiper circuit, front	1 and 6	Interval 1	Closed circuit
		Interval 2	
		Interval 3	Open circuit
		Interval 4	
		Interval 5	
	3 and 6	Interval 1	Open circuit
		Interval 2	Closed circuit
		Interval 3	
		Interval 4	
		Interval 5	Open circuit
	2 and 6	Interval 1	Open circuit
		Interval 2	
		Interval 3	
		Interval 4	Closed circuit
		Interval 5	

Steering Column Multifunction Switch



Item	Part Number	Description
1	11582	Ignition switch lock cylinder
2	3F609	Tilt release lever/ handle
3	391727	Steering column shroud screws (3 required)
4	3530	Upper steering column shroud
5	3533	Lower steering column shroud

(Continued)

Item	Part Number	Description
6	—	Steering column multi-function switch electrical connectors (part of 14A320)
7	390345	Steering column multi-function switch screws (2 required)
8	13K359	Steering column multi-function switch

Steering Column Multifunction Switch

Steering Column Multifunction Switch

Removal and Installation

1. Remove the ignition switch lock cylinder.

1 Insert the ignition key into the ignition switch lock cylinder and turn to the RUN position.

2 Push the ignition switch lock cylinder release tab with a punch while pulling out the ignition switch lock cylinder.

2. If equipped, remove the tilt release lever/ handle.
