TRANSFORMER WIRING		
B61-01-084	ASSY,WIRE,TERM CONNECTOR TO PWR WHT	
B61-01-085	ASSY,WIRE,TERM CONNECTOR TO PWR BLK	

Note:

- Both of the above Tranformer wires are required by code for field chage-out of transformers.
- Note on parts orders for transformers to attached transformer wiring prior to shipping.

Notes:

1. Purchase of any ECM motor must include the associated ECM program number from this table.
2. List price for ECM 2.3 Motors include complete motor and controller assembly.

Note: Use this table for lookup purposes only to locate and order the correct associated PM-02-xxxx part number.

ACTUATOR COMPATABILITY GUIDE

Many past (and some present) ENVIRO-TEC® controls were designed to drive a DC (two-wire) actuator. Early controls and the Series 7000 were designed to drive an AC (three-wire) actuator. All current replacement actuators require AC drive (three wire). The type of actuator drive for various controls can be determined from the lists below:

DC Drive Controls

- 1) Series 700 Sequences with an "A", "R", "S" or "SB" suffix. The first four letters of the model number will be "ETPD" or "ETPR". These controllers used a blue or blue-green circuit board.
- 2) Series 600 Sequences with an "A" suffix. The first four letters of the model number will be "ETRD". These controllers used a green circuit board without a flow transducer.
- 3) ETVT II zone controllers (not the bypass controller), models ETDD0, ETDD2F and ETDD3F.

AC Drive Controls

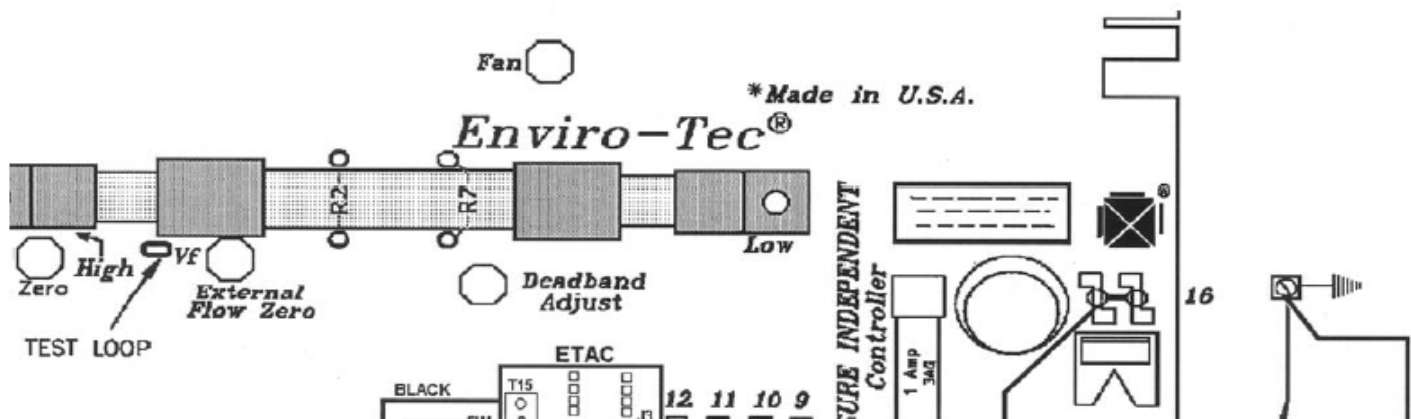

- 1) Series 700 Sequences with no suffix. The first four letters of the model number will be "ETPI". These controllers were housed in a black plastic case or used a green circuit board with a flow transducer.
- 2) Series 600 Sequences with no suffix. The first four letters of the model number will be "ETRC". These controllers were housed in a black plastic case without a flow transducer.
- 3) ETVT II bypass controllers, model ETDD6V.
- 4) ETVT I controllers. The first four letter of the model number will be "ETDC".
- 5) Old model Series 900 sequence controllers. The first four letter of the model number will be "ETDC".

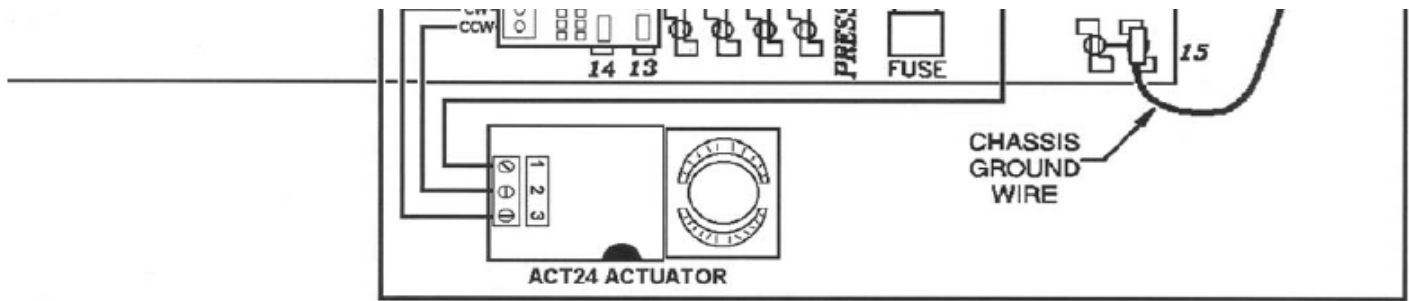

Replacing Mixed AC and DC Components

- 1) If the customer has an operational DC Drive Controller and is replacing the actuator with a current AC Actuator (ACT24 - 3 wire), an ETAC (DC to AC drive interface) will be required.
- 2) If the customer has an operational DC Actuator (two wire) and is replacing the controller with a current AC Drive Controller, either the actuator will need to be replaced with a current AC Actuator (ACT24 - recommended), or an ETADC (AC to DC drive interface) will be required. NOTE: For bypass terminals (BT600 series) having two operational DC Actuators, an ETADC1 (AC to DC drive interface) is required. Both actuators must be the same type - if both are DC, and one fails, both actuators need to be replaced with AC Actuators (ACT24's).

See Rotary Actuators and Interfaces for actuator interface pricing.

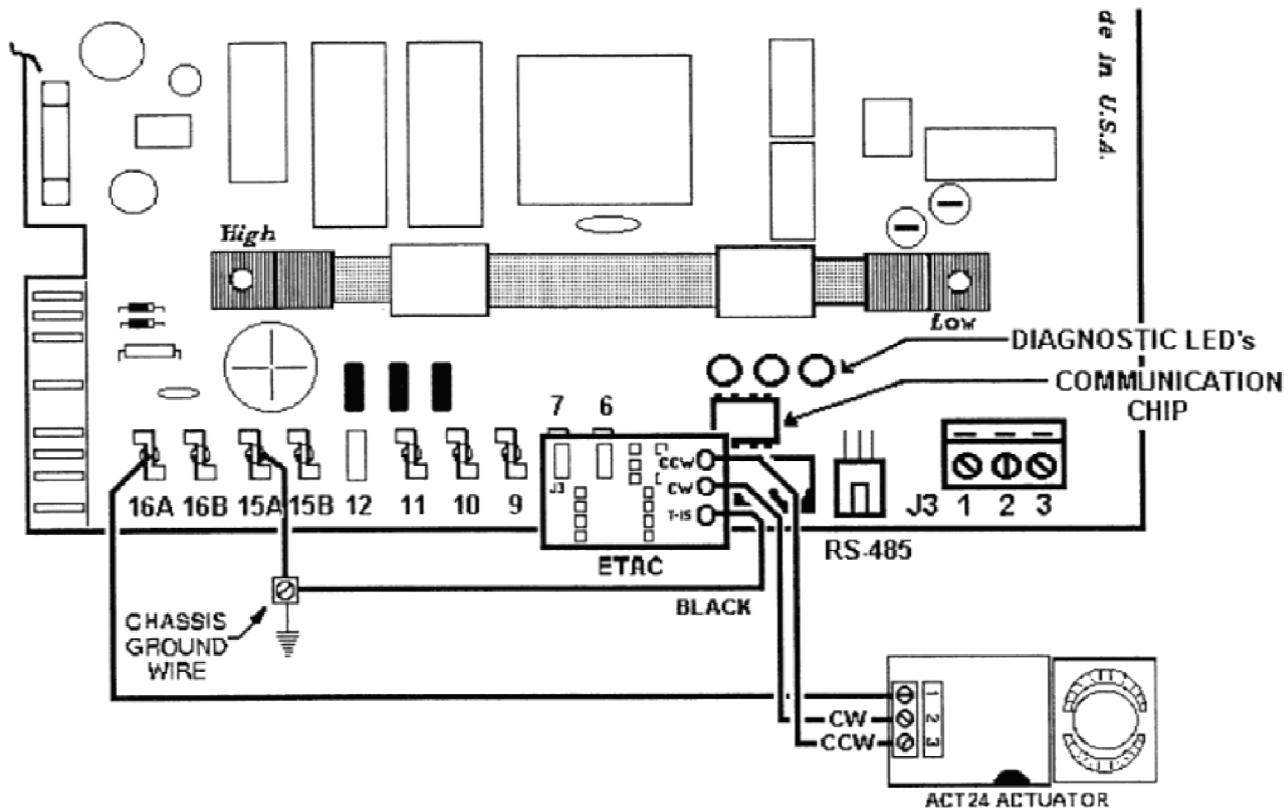

ETAC Installation With ACT24 700 Series Controller

- 1) Before installing the ETAC to the controller, wire terminal 3 of the ACT24 to the terminal labeled CW on the ETAC.
- 2) Wire terminal 2 of the ACT24 to the terminal labeled CCW on the ETAC.
- 3) Connect the black wire supplied with the ETAC to the chassis at the same location that the controller chassis wire is attached.
- 4) If not already installed, wire terminal 1 of the ACT24 to either terminal 16A or 16B of the controller (these terminals are electrically common).
- 5) Turn over the ETAC and carefully push the two male connectors onto the spade type actuator connectors on the controller (terminals 13 and 14). The screw terminal connector on the ETAC should be facing away from terminals 15 and 16; i.e., J3 on the ETAC should connect to terminal 13 on a 700 Series controller.

ETAC Installation With ACT24 ETVT II (DDC Series Controller)

- 1) Before installing the ETAC to the controller, wire terminal 2 of the ACT24 to the terminal labeled CW on the ETAC.
- 2) Wire terminal 3 of the ACT24 to the terminal labeled CCW on the ETAC.
- 3) Connect the black wire supplied with the ETAC to the chassis at the same location that the controller chassis wire is attached.

- chassis wire is attached.
- 4) If not already installed, wire terminal 1 of the ACT24 to either terminal 16A or 16B of the controller (these terminals are electrically common).
 - 5) Turn over the ETAC and carefully push the two male connectors onto the spade type actuator connectors on the controller (terminals 6 and 7). The screw terminal connector on the ETAC should be facing away from terminals 15 and 16; i.e., J3 on the ETAC should connect to terminal 7 on the ETVT II controller.

NOTE: The ETAC is never required with AC driver controllers, and will not work with them. This includes the complete Series 7000 and ETVT II pressure controller (ETDD6V).

STEP BY STEP GUIDE TO USING THE 600 TO 6000 CROSS REFERENCE TABLES

The Series 600 has been discontinued, but Series 6000 Controller are available as compatible replacements for all standard 600 controllers. Contact factory for replacements on special sequences.

If you know the Series 600 Controller Model Number:

- 1) Go to Table B to find the correct replacement Series 6000 Controller Assembly.
- 2) Go to Table C to find the LIST for the replacement Series 6000 Controller Assembly.

NOTE: You can also use Table B to find the correct replacement Series 6000 Controller Assembly for the old ETRC controllers (enclosed in black case) by substituting "ETRC" for "ETRD" in the 600 Controller Model Number column.

If you only know the Series 600 Sequence Number:

- 1) Go to Table A to find the Series 600 Controller Model Number.
- 2) Go to Table B to find the correct replacement Series 6000 Controller Assembly.
- 3) Go to Table C to find the LIST and Series 6000 Sequence Number for the replacement Series 6000 Controller Assembly.

STEP BY STEP GUIDE TO USING THE 700 TO 7000 CROSS REFERENCE TABLES

The Series 700 has been discontinued, but Series 7000 Controller are available as compatible replacements for all standard 700 controllers. Contact factory for replacements on special sequences.

If you know the Series 700 Controller Model Number:

- 1) If the model number starts with an ETPR or ETPD, go to Table H to find the correct replacement Series 7000 Controller Assembly.
- 2) If the model number starts with an ETPI, go to Table J to find the correct replacement Series 7000 Controller Assembly.
- 3) Go to Table K to find the LIST for the replacement Series 7000 Controller Assembly.

If you only know the Series 700 Sequence Number:

- 1) For sequences without a suffix (e.g., SD701), the controller was either enclosed in a black plastic case, or used a green circuit board
 - a) Go to Table G to find the Series 700 Controller Model Number.
 - b) Go to Table J to find the correct replacement Series 7000 Controller Assembly.
 - c) Go to Table K to find the LIST for the replacement Series 7000 Controller Assembly.
- 2) For sequences with an "A" suffix (e.g., SD701A), the controller used a blue or blue-green circuit board, drove a DC (two-wire) actuator, was calibrated to the old style linear probe used on boxes with 45 degree damper travel, and used the old style 3" by 4" thermostat.
 - a) Go to Table F to find the Series 700 Controller Model Number.
 - b) Go to Table H to find the correct replacement Series 7000 Controller Assembly.
 - c) Go to Table K to find the LIST for the replacement Series 7000 Controller Assembly.
- 3) For sequences with an "R" suffix (e.g., SD701R), the controller used a blue or blue-green circuit board, drove a DC (two-wire) actuator, was calibrated to the new FlowStar™ probe used on boxes with 90 degree damper travel, and used the old style 3" by 4" thermostat.
 - a) Go to Table E to find the Series 700 Controller Model Number.
 - b) Go to Table H to find the correct replacement Series 7000 Controller Assembly.
 - c) Go to Table K to find the LIST for the replacement Series 7000 Controller Assembly.
- 4) For sequences with an "S" or "SB" suffix (e.g., SD701S or SD701SB), the controller used a blue or bluegreen circuit board and the sequence incorporated the 2" low profile thermostat. The "S" suffix sequences used a DC (two-wire) actuator. The "SB" suffix sequences used an AC (three-wire) actuator and an ETAC DC to AC drive interface.
 - a) Go to Table D to find the Series 700 Controller Model Number.
 - b) Go to Table H to find the correct replacement Series 7000 Controller Assembly.
 - c) Go to Table K to find the LIST for the replacement Series 7000 Controller Assembly.

STEP BY STEP GUIDE TO FINDING SERIES 7000 MODULE LISTS

In most applications, a Series 7000 controller assembly can be repaired by replacing the faulty module rather than the whole assembly.

If you know the Series 7000 Module Model Number:

- 1) Go to Table N to find the LIST.

If you know the Series 7000 Sequence Number:

- 1) Go to Table L to find the Series 7000 Controller Assembly.
- 2) Go to Table M to find the modules used on the Series 7000 Controller assembly.
- 3) Go to Table N to find the module LIST.

OR

- 1) Find the Module Model Number from the sequence submittal drawing.
- 2) Go to Table N to find the module LIST.

Notes:

1. Electronic retrofit kits include 50VA transformer (must specify voltage), controller, thermostat, enclosure, electric actuator, mount and wire, duct sensor (if applicable), pressure switch (if applicable), and fan relay with fan powered terminals. Components are mounted and wired in a NEMA 1 control enclosure.

2. Actuator capable of controlling dampers up to 90° stroke range with 35 in. lbs. of torque.
3. For fan powered applications, specify fan voltage and horsepower if retrofit includes fan relay and/or transformer. If relay and transformer are not required, deduct \$21 List each.
4. Prior to receiving the retrofit kits, please download the 7000 Installation Operation & Maintenance Manual from www.enviro-tec.com and forward to your customer for start up and balancing of the unit.
