

# CMS Series Circuit Monitoring System

Power and productivity  
for a better world™

# CMS – Circuit Monitoring System

## A system packed with benefits

«The CMS is a compact AC and DC multichannel branch monitoring system.»

The measurement system consists of a Control Unit and sensors. The components can be installed quite simply and very clearly arranged inside control and distribution cabinets. During the system's development, special attention was paid to achieve the best possible user friendliness, a large measurement range (up to 160 A) and scalable solutions for every application. Thanks to its special design, the system is also ideal as a simple retrofit upgrade solution for existing installations. After all, no-one today wants to spend lots of time contemplating and installing the latest technology – all we want to do is make use of the technical benefits.

1 CMS system ( ● Measuring points) | 2 Sub-distribution | 3 UPS system  
4 Energy meter | 5 Power inverter | 6 Main distribution | 7 Combiner box

# This is the sign of success!

## Minimum space requirement

Small, smaller, CMS – everything needed for effective measuring has been accommodated in the width of a sugar cube.

## Very simple installation

The sensors are mounted in next to no time. No special tools are needed for the entire connection process – there is no need for the usual complicated wiring.

## User-friendly commissioning

Configuring can be this smart: thanks to the intuitive operating concept the system can be set up and made ready for measuring in a matter of minutes.

## One sensor for all types of current

Direct current, alternating current or mixed current – the CMS sensors measure everything. And in a huge measuring range of up to 160 A.

## Always retrofittable and upgradeable

The system can be supplemented or modified at any time as it is extremely flexible and modular. Retrofitting is also possible sensor by sensor.

## Maximum reliability

The contactless measuring process rules out potential sources of error right from the start. The negligible amount of wiring required ensures maximum system stability.

# CMS – thought through right down to the last detail

## System overview

The quality of a Circuit Monitoring System is dependent on the strengths of the individual components and how well they interact. ABB's CMS sets the bar particularly high. Regardless of whether we're talking compactness, technology, measurement results, user friendliness or flexibility, every component and every feature of this CMS has been fully optimized in terms of practicality and functionality.

Example illustration:  
Control Unit CMS-700 in combination  
with CMS open-core sensors

CMS-600

CMS-700

### CMS bus interface

A bus interface allows up to 32 sensors to be connected to the Control Unit.

### Control Units

The Control Unit is a kind of computing and communication center that, depending on the equipment connected to it, evaluates the different data picked up by the sensors and makes it available via the built-in interfaces.

You have a choice of two different units depending on your applications: CMS-600 and CMS-700.

### Connection technology

Connecting the sensors to the Control Unit is extremely simple and requires no special tools. All sensors are connected to the Control Unit by means of a flexible flat cable and insulation displacement connectors. The positioning of sensors is fully customizable so that they sit exactly where a measurement is required.

### Serial interfaces

Depending on the unit, numerous interfaces and protocols are available to ensure smooth network implementation: RS485 (Modbus RTU), LAN (TCP/IP and Modbus TCP)

Thanks to the built-in web server, an internet browser or a free Android or iOS app can be used to visualize the values measured. What's more, the measured values can also be exported to CSV files.

### Sensors

The CMS sensors form the heart of the system and they can be mounted anywhere without any problem. Initializing the sensors is also child's play, with the desired identifier being assigned to each individual sensor via the Control Unit in just a few simple steps. The entire configuration and commissioning procedure takes just a matter of minutes. All measurement functions are available immediately following initialization.

# The sensors – the heart of the CMS

## Top-level performance packed into a tiny space

No space is wasted here! Everything is built into an 18 or 25 mm wide unit to enable precise and effective measurements. This makes these CMS sensors the most compact and most powerful on the market.

Small format, colossal performance: Alternating (AC), direct (DC) or mixed (TRMS) currents – the CMS sensors monitor and measure all types of current and that over a measurement range of up to 160 A (TRMS). They even measure harmonic components in the signal curve.

As each sensor is equipped with its own microprocessor for processing the signal, the measurement data is transmitted digitally to the Control Unit via the bus interface. This minimizes the amount of cabling required in the distribution cabinet and maximizes measured-value transmission reliability. Disturbances like those experienced with analog data now most definitely belong to the past.

### Sensor designs

Our CMS sensors are available within a solid-core or open-core design. The solid-core units feature an enclosed structure and AC measurement accuracy\* of  $\leq \pm 0.5\%$ , and are therefore suitable for all applications in which maximum-precision measurement is crucial.

Thanks to their U shape, the open-core sensors can be retrofitted to existing installations with total ease without having to disconnect the cabling or shut down the equipment. With AC accuracy\* of  $\leq \pm 1.0\%$ , they can be used in a multitude of applications without any problem.

\*All accuracy specifications refer to the relevant full scale value and apply to 25 °C.

# Integrate however you want

## Thanks to multiple mounting options

Depending on the application, choose between up to four different mounting options to make integrating the CMS sensors in your installation as simple and as uncomplicated as possible.

### Special sensors for ABB installation devices

#### System pro M, SMISSLINE installation

CMS-120PS and CMS-100PS series sensors can be mounted on all ABB installation devices with twin terminals.

#### Installation on S800 installation devices

CMS-100S8 and CMS-200S8 series sensors can be mounted on all S800 high performance circuit breakers with cage terminals.

### Universal use sensors design

#### Mounting on a DIN rail

CMS-120DR, CMS-100DR, and CMS-200DR series sensors can be mounted on all DIN rails with the aid of a DIN rail mounting.

#### Cable tie mounting

If space is at a real premium, CMS-120CA, CMS-100CA, and CMS-200CA series sensors can be secured directly to the cable(s) to be measured by means of cable ties.

# Control Unit CMS-600

## Compact current monitoring for the Modbus architecture

The Control Unit CMS-600 is a compact Modbus variant for professional current monitoring.

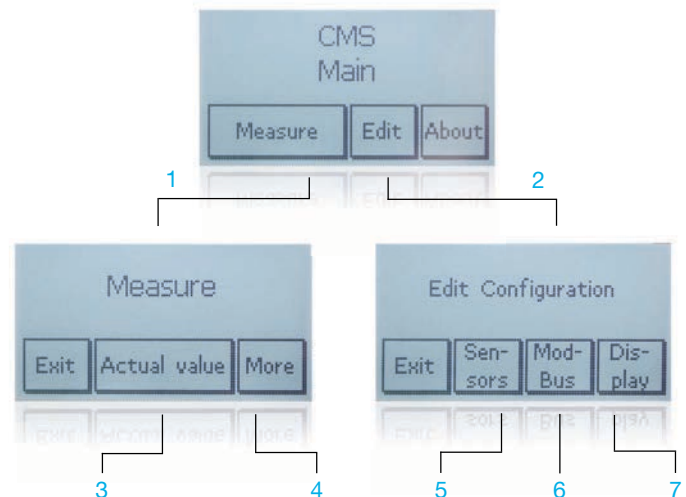

The CMS-600 system enables you to measure AC and DC currents in up to 64 branches.

For simple and fast operation, the Control Unit is equipped with an illuminated touch display that makes not only initialization but also control of the sensors extremely simple. A 2-wire RS485 Modbus RTU interface enables users to remotely query and process the measurement data. As such, the CMS-600 Control Unit can be very easily integrated into an existing Modbus architecture. As an option, the measured values can also be visualized and processed by means of a programmable logic control (PLC).

Among other things, Control Units CMS-600 are put to use in the critical power systems of hospitals and in similar industrial applications, too. Furthermore, these devices can also be found in functional buildings such as airports, hotels, office buildings, universities/colleges and museums or in industrial photovoltaics.

Great care has been taken to ensure that the navigation concept of the CMS software is highly intuitive. All functions and menus can be called up with just a few clicks. There's as good as no need at all for extensive and costly user tutorials, neither for initialization nor for subsequent operation. This saves a lot of time, effort and, last but not least, money.

### Crystal-clear menu navigation

- 1 Measurement | 2 Configuration | 3 Display of actual values  
4 Display of Max., Min. and Hold values | 5 Initialization/parameterization of sensors  
6 Modbus configuration | 7 Display settings

# Control Unit CMS-700

## Professional energy monitoring from open-plan offices to industrial plants

The Control Unit CMS-700 is the universal measuring instrument for metering performance and energy.

With the CMS-700, you can measure the AC and DC currents in the outgoing circuits via up to 3x32 sensors and in the process capture the energy and output data (line-side active and reactive power) of up to 96 sensors simultaneously.

Up to 246 different devices can be addressed when identifying the CMS-700 via Modbus RTU. If the CMS-700 is operated by means of Modbus TCP and SNMP, addressing is performed via an assigned IP address and is therefore open and independent of the operator of the LAN.

The Control Unit CMS-700 has been developed specifically to meet the requirements of critical power applications, such as those of computing centers. In addition, however, professional energy monitoring is becoming ever more important when it comes to identifying savings potentials in functional buildings such as office buildings.

### Greater convenience during parameterization and visualization thanks to a built-in web server

The Control Unit CMS-700 stands out thanks to its built-in web server that offers easy access not only to the measured data but also to the system parameters. The two interfaces – LAN (TCP/IP or Modbus TCP) and RS485 (Modbus RTU) – guarantee straight-forward integration into any IT infrastructure. What's more, the data can be read out by means of an SNMP protocol.

### Energy monitoring using the CMS-700 web server interface

# Tangible value added for you

## ABB circuit monitoring pays off twofold

### Early warning system (predictive maintenance) for increasing the availability of critical consumers

Continuous monitoring of the current flow at the circuit breaker makes it possible to detect overloaded lines before they lead to a service interruption. Apart from this, monitoring individual circuits indicates whether the loads are in the desired operating mode or not. In this way, system deviations can be ascertained instantaneously. What's more, the CMS can be used to detect unbalanced loads before they result in failure of the neutral conductor and consequently load failure.

### Cost analysis to reduce and assign energy costs

The cost of energy will rise continuously. In order to cut costs, you first have to know where they arise. The Control Unit helps illustrate and analyze the instantaneous energy consumption levels. Furthermore, the calculated active energy can be used to roughly allocate the costs at the output level.

CMS-600  
User Manual

### Control Unit CMS-600 – «Modbus RTU»

Supply voltage	[VDC]	24 (± 10 %)
Power input	[W]	4 – 24 (dep. on number of sensors)
Interface		RS485 2-wire
Protocol		Modbus RTU
Data rate	[Baud]	2400 ... 115200
Refresh time		≤1 sec with max. 64 sensors
Insulation strength	[VAC]	400
Screw-type terminals		0.5 ... 2.5 mm <sup>2</sup> , max. 0.6 Nm
Mounting method		35 mm DIN rail (DIN 50022) or SMISSLINE TP plug base
Dimensions	[mm]	71.8 x 87.0 x 64.9 (4 WM)
Operating temperature	[°C]	-25 ... +70
Bearing temperature	[°C]	-40 ... +85
Standards		IEC 61010-1 UL 508/ CSA C22.2 No. 14
