Part 1: AC7Z100C Core Board Introduction

AC7Z100C (core board model, the same below) FPGA core board, ZYNQ chip is based on XC7Z100-2FFG900 of XILINX company ZYNQ7000 series. The ZYNQ chip's PS system integrates two ARM Cortex™-A9 processors, AMBA® interconnects, internal memory, external memory interfaces and peripherals. The FPGA of the ZYNQ chip contains a wealth of programmable logic cells, DSP and internal RAM.

The core board uses four Micron 512MB DDR3 chips MT41J256M16HA-125 for a total capacity of 4GB. Two DDR3s are mounted on the PS and PL sides, respectively, which form a 32-bit bus width. The DDR3 SDRAM on the PS side can run at up to 533MHz (data rate 1066Mbps), and the DDR3 SDRAM on the PL side can run at speeds up to 800MHz (data rate 1600Mbps). In addition, two 256MBit QSPI FLASH and 8GB eMMC FLASH chips are integrated on the core board to boot the storage configuration and system files.

In order to connect with the carrier board, the four board-to-board connectors of the core board expand the USB interface, the Gigabit Ethernet interface, the SD card interface and other remaining IO ports of the PS side; and also extend the 8-pair high-speed transceiver GTX interface of the ZYNQ, almost all IO ports (144) on the PL side. The level of IO of BANK12 and BANK13 can be modified by replacing the LDO chip on the core board to meet the requirements of different level interfaces of users. For users who need a lot of IO, this core board will be a good choice. Moreover, the IO connection part, the routing between the ZYNQ chip and the interface is equal length and differential processing, and the core board size is only 80*60 (mm), which is very suitable for secondary development.

Part 3: DDR3 DRAM

The FPGA core board AC7Z100C is equipped with four Micron 512MB DDR3 chips, model MT41J256M16HA-125 (compatible with MT41K256M16HA-125), in which Two DDR3s are mounted on the PS and PL sides respectively. Two DDR3 SDRAMs form a 32-bit bus width. The PS-side DDR3 SDRAM has a maximum operating speed of 533MHz (data rate 1066Mbps), and two DDR3 memory systems are directly connected to the memory interface of the BANK 502 of the ZYNQ Processing System (PS). The PL-side DDR3 SDRAM has a maximum operating speed of 800MHz (data rate 1600Mbps), and two DDR3 memory systems are connected to the BANK33 and BANK34 interfaces of the FPGA. The specific configuration of DDR3 SDRAM is shown in Table 3-1.

Bit Number	Chip Model	Capacity	Factory
------------	------------	----------	---------

-------------	-------------------	--------------	--------

Table 3-1: DDR3 SDRAM Configuration

The hardware design of DDR3 requires strict consideration of signal integrity. We have fully considered the matching resistor/terminal resistance, trace impedance control, and trace length control in circuit design and PCB design to ensure high-speed and stable operation of DDR3.

Part 4: QSPI Flash

The FPGA core board AC7Z100C is equipped with two 256MBit Quad-SPI FLASH chips to form an 8-bit bandwidth data bus, the flash model is W25Q256FVEI, which uses the 3.3V CMOS voltage standard. Due to the non-volatile nature of QSPI FLASH, it can be used as a boot device for the system to store the boot image of the system. These images mainly include FPGA bit files, ARM application code, and other user data files. The specific models and related parameters of QSPI FLASH are shown in Table 4-1.

Part 9: Power Supply

The AC7Z100C FPGA core board is powered by DC5V and is powered by a connection carrier board. The power supply design diagram on the FPGA board is shown in Figure 9-1

Figure 9-1: Power interface section in the schematic

+5V generates +1.0V ZYNQ core power through DCDC power chip MYMGK1R820FRSR. MYMGK1R820FRSR output current is up to 20A, which is enough to meet the current demand of ZYNQ core voltage. The +5V power supply then uses the DCDC chip ETA1471 to generate four power supplies: MGTAVTT, +1.5V, +3.3V, +1.5V. The power supply of MGTAVTT is generated

by DCDC chip ETA8156. The VTT and VREF voltages of the DDR3 of the PS section and the PL section are generated by U7, U10. In addition, the IO power supply of BANK10 and BANK11 are generated by two-channel SPX3819M5-3-3. Users can change the IO input and output of these two BANKs to other voltage standards by replacing the LDO chip.

The functions of each power distribution are shown in the following table: :

Power Supply	Function
+1.0V	ZYNQ PS and PL section Core Voltage
+1.8V	ZYNQ PS and PL partial auxiliary voltage, BANK501, BANK35, eMMC
+3.3V	ZYNQ Bank0,Bank500, QSIP FLASH, Clock Crystal
+1.5V	DDR3, ZYNQ Bank502, Bank33,Bank34
VCCIO12	ZYNQ Bank12
VCCIO13	ZYNQ Bank13
VREF, VTT (+0.75V)	PS DDR3, PL DDR3
MGTAVCC(+1.0V)	ZYNQ Bank111, Bank112
MGTAVTT(+1.2V)	ZYNQ Bank111, Bank112
MGTVCCAUX (+1.8V)	ZYNQ Bank111, Bank112

Because the power supply of the ZYNQ FPGA has the power-on sequence requirements, in the circuit design, we have designed according to the power requirements of the chip. The power-on sequence is +1.0V->+1.8V->(+1.5 V, +3.3V, VCCIO12,VCCIO13) circuit design to ensure the normal operation of the chip.

Part 11: Board to Board Connectors Pin Assignment

The core board has a total of four high-speed expansion ports. It uses four 120-pin inter-board connectors (J29~J32) to connect to the carrier board. The connector uses the Panasonic AXK5A2147YG, and the connector type corresponding to the carrier board is AXK6A2337YG. J29 connects BANK10 IO and BANK11 IO, J30 connects GTX transceiver signal, J31 connects JTAG and BANK35 IO (1.8V level standard), J32 connects PS MIO, IO and +5V power supplies of the BANK11, BANK12.
