

Use and Care Manual

Installation: Without the need for any tools, assemble the 4 metal mesh panels with other components according to the structure to build an A-shaped frame.

Usage: Plant vining plants such as cucumbers, tomatoes, and peas on both sides of the trellis. When the plants start to climb and grow, use the 18 plant support clips or the 20-meter tie wire included in the package to gently fix the plant stems and vines to the metal mesh panels, and be careful not to damage the plants.

Cleaning: Regularly clean the fallen leaves, weeds, and residual plant vines on the trellis to prevent the accumulation of debris from affecting ventilation and aesthetics. Wipe the surface of the metal mesh panels with a damp cloth to remove dust and stains, and keep the trellis clean.

Inspection: Check whether the connections are firm and whether there are deformations or fractures on the metal mesh panels. If the support components are loose, reinforce them with the attached tie wire or plastic cable ties; if there is serious damage, replace the corresponding components in a timely manner.

Storage: In the non-planting season, easily disassemble and fold the trellis, and store it in a dry and ventilated indoor environment, avoiding direct sunlight and soaking in rainwater.
