STEP 1

IMPORTANT: Leave all screws loose until step 2b

Attach 2x **bracket pairs (B)** onto 2x **pillars (A)** and secure it by fastening the **bolts (E)** with your hands (do not tighten all the way). Make sure the longer part of the **bracket (B)** is facing down (see figure below). Make sure to leave the **bolts (E)** loose until directed to tighten in step 2b.

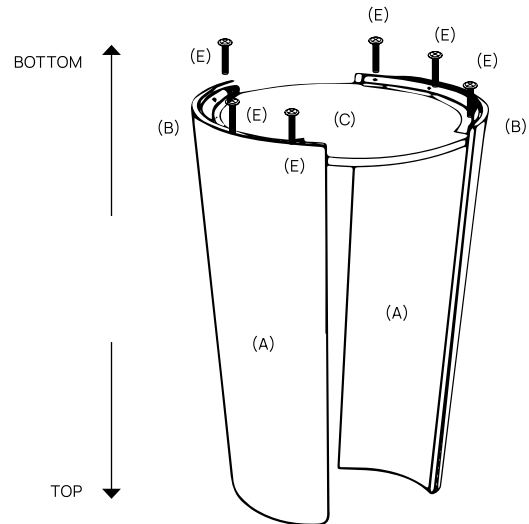

STEP 2

Start by placing the **pillars (A)** upside down, with their bottoms facing upwards. (Note: The image below shows the Castillo in an upside down position).

a) Attaching the Platform:

Locate the **bracket (B)** closest to the bottom of a **pillar (A)**. Hold the **platform (C)** underneath this bracket. With one hand holding the **platform (C)** in place, use your other hand to screw in the **6 bolts (E)** to attach the **platform (C)** to the **brackets (B)** without tightening all the way.

STEP 2

b) Tightening the bolts

Double-check that the **platform (C)** is securely attached to both sides of the **bracket (B)** before fully tightening **bolts (E)** on that platform.

Repeat Step 2 with the remaining platforms.

After all of the **platforms (C)** are installed and tightened, you can fully tighten all of the **brackets (B)** and **bolts (E)**.
